- 指示在智能卡接口模式下传输过程中检测到错误信号
- ssr\_fifo.fer和每个标志为0，并且接收数据少于接收FIFO缓冲区中的接收FIFO数据触发号码，它表明选择FIFO时15ETUSETALESE，而FCR.DRES位置为1。

#### (2) 接收数据满事件输出(SCIn\_RXI n=0to4 9)

- 简单IIC模式下SIMR2.IICINTM位为0表示检测到ACK
- 如果SIMR2.IICINTM位在simpleIIC模式下为1，则表示检测到第8位SCLn下降沿
- 当SIMR2.IICINTM位在simpleIIC模式下主机发送期间为1时，设置ELC以便不使用接收数据满事件

#### Non-FIFO selected

- 表示接收数据设置在接收数据寄存器（RDR或RDRHL）中。

#### FIFO selected

- 禁止使用该事件输出。

#### (3) 发送数据空事件输出 (SCIn\_TXI n=0to4 9)

- 表示SCR/SCR\_SMCI.TE位由0变为1

- Indicates that transmission is complete in smart card interface mode
- Indicates that NACK is detected if the SIMR2.IICINTM bit is 0 in simple IIC mode
- Indicates that the 9th-bit SCLn falling edge is detected if the SIMR2.IICINTM bit is 1 in simple IIC mode

**Non-FIFO selected**

- Indicates that transmit data is transferred from the Transmit Data Register (TDR or TDRHL) to the Transmit Shift Register (TSR).

**FIFO selected**

- Using this event output is prohibited.

**(4) Transmit end event output (SCIn\_TEI, n = 0 to 4, 9)**

- Indicates the completion of transmission
- Indicates that the starting condition, resumption condition, or termination condition is generated in simple IIC mode

Note: When FIFO is selected, using this event output is prohibited

**(5) Address match event output (SCIn\_AM, n = 0, 3, 4, 9)**

- Indicates a match of the comparison data (CDR.CMPD) with one frame of receive data when DCCR.DCME is set to 1 in asynchronous mode, including multi-processor mode.

**27.14 Address Non-match Event Output (SCIO\_DCUF)**

SCIO\_DCUF indicates the non-match of comparison data (CDR.CMPD) with receive data that is one frame of the data that is received when DCCR.DCME is set to 1 in asynchronous mode, including multi-processor mode. This event can be used for Snooze end request only. In detail, see [section 10, Low Power Modes](#).

**27.15 Noise Cancellation Function**

Figure 27.117 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of a 2-stage flip-flop circuit and a match detection circuit. When the input signals of the noise filter and the output signals of the 2-stage flip-flop circuits completely match, the matched level is conveyed as an internal signal. Unless otherwise matched, the previous value is retained. When the same level is retained for 3 cycles or longer on the sampling clock of the noise filter, it is considered as a valid receive signal. A change in pulse for 3 cycles or shorter is considered as noise, not as a receive signal.

When SEMR.ABCS = 0 and SEMR.ABCSE = 0, the cycle is 1/16 of a 1-bit period.

When SEMR.ABCS = 1 and SEMR.ABCSE = 0, the cycle is 1/8 of a 1-bit period.

When SEMR.ABCSE = 1, the cycle is 1/6 of a 1-bit period.

In asynchronous mode, the noise cancellation function can be applied to the receive signal input to the RXDn pin. The receive level of the RXDn is taken in the flip-flop circuit of the noise filter on the base clock of asynchronous mode.

In simple IIC mode, this function can be used for each input on SDAn and SCLn. The sampling clock is selected from four baud rate generator settings (1, 2, 4, and PCLK divided by 4) in SNFR.NFCS.

If the base clock is stopped once with the noise filter enabled and then the base clock input is restarted again, the noise filter operation resumes from the state where the clock was stopped. When SCR.TE and SCR.RE are set to 0 during base clock input, all of the noise filter flip-flop values are initialized to 1. Accordingly, if the input data is 1 when reception operation resumes, the function determines that a level match is detected and the result is conveyed as an internal signal. When the level being input corresponds to 0, the initial output of the noise filter is retained until the level matches in three consecutive sampling cycles.

- 表示在智能卡接口模式下传输完成
- SIMR2.IICINTM位在simpleIIC模式下为0表示检测到NACK
- 如果SIMR2.IICINTM位在simpleIIC模式下为1，则表示检测到第9位SCLn下降沿

**Non-FIFO selected**

- 表示发送数据从发送数据寄存器（TDR或TDRHL）传送到发送移位寄存器（TSR）。

**FIFO selected**

- 禁止使用该事件输出。

**(4) 发送结束事件输出(SCIn\_TEI n=0to4 9)**

- 表示传输完成
- 表示在简单IIC模式下产生启动条件、恢复条件或终止条件

Note: 选择FIFO时，禁止使用该事件输出

**(5) 地址匹配事件输出(SCIn\_AM n=0 3 4 9)**

- 在异步模式下，包括多处理器模式，当DCCR.DCME置1时，表示比较数据（CDR.CMPD）与一帧接收数据匹配。

**27.14 地址不匹配事件输出(SCIO\_DCUF)**

SCIO\_DCUF表示比较数据(CDR.CMPD)与接收数据不匹配，接收数据是在异步模式（包括多处理器模式）下DCCR.DCME设置为1时接收到的数据的一帧。此事件仅可用于贪睡结束请求。详细信息，请参见第10节，低功耗模式。

**27.15 降噪功能**

图27.117显示了用于噪声消除的噪声滤波器的配置。噪声滤波器由一个2级触发器电路和一个匹配检测电路组成。当噪声滤波器的输入信号和2级触发器电路的输出信号完全匹配时，匹配的电平作为内部信号传送。除非另有匹配，否则将保留先前的值。当相同电平在噪声滤波器的采样时钟上保持3个周期或更长时间时，它被认为是有效的接收信号。3个周期或更短的脉冲变化被认为是噪声，而不是接收信号。

当SEMR.ABCS=0和SEMR.ABCSE=0时，周期为1位周期的116。

当SEMR.ABCS=1且SEMR.ABCSE=0时，周期为1位周期的18。

当SEMR.ABCSE=1时，周期为1位周期的16。

在异步模式下，可以对输入到RXDn引脚的接收信号应用噪声消除功能。RXDn的接收电平是在异步模式的基本时钟上的噪声滤波器的触发器电路中获取的。

在简单IIC模式下，该功能可用于SDAn和SCLn上的每个输入。采样时钟从SNFR.NFCS中的四个波特率发生器设置（1、2、4和PCLK除以4）中选择。

如果在启用噪声滤波器的情况下基准时钟停止一次，然后再次重新启动基准时钟输入，则噪声滤波器操作将从时钟停止的状态恢复。当SCR.TE和SCR.RE在基本时钟输入期间设置为0时，所有噪声滤波器触发器值都被初始化为1。因此，如果在接收操作恢复时输入数据为1，则该函数确定一个电平检测到匹配并将结果作为内部信号传送。当输入的电平对应于0时，保留噪声滤波器的初始输出，直到电平在三个连续的采样周期中匹配。

## (2) Reception

**When address match function is not used as wake-up condition**

Before specifying the module-stop state or making a transition to Software Standby mode, stop the receive operations (RE = 0 in SCR/SCR\_SMCI). If transition is made during data reception, the received data is invalid.

Figure 27.121 shows an example flow of transition to Software Standby mode during reception.

**When address match function is used as wake-up condition**

Before specifying the module-stop state or making a transition to Software Standby mode:

1. Set the operations after cancellation of the low power state.
2. Set CDR.CMPD and DCCR.DCME to 1.
3. Set the receive operations (RE = 1 in SCR/SCR\_SMCI).
4. Set the module-stop state or Software Standby mode.

When SCI transfers to low power mode, if the receive data pin (RXD) is at the low level, set SEMR.RXDESEL = 0.

When setting SEMR.RXDESEL = 1, there is a possibility that a start bit (falling edge of RXD pin) cannot be detected on release of the low power mode.

Figure 27.122 shows an example flow of transition to Software Standby mode during reception with address match.

**When using SCI0 in Snooze mode**

When using SCI0 in Snooze mode, some restrictions apply, including maximum bit rates. For details, see [section 10, Low Power Modes](#).

## (2) Reception

**地址匹配功能不用作唤醒条件时**

在指定模块停止状态或转换到软件待机模式之前，停止接收操作（SCR/SCR\_SMCI中的RE=0）。如果在数据接收期间进行转换，则接收到的数据无效。

图27.121显示了接收期间转换到软件待机模式的示例流程。

**当地址匹配功能用作唤醒条件时**

在指定模块停止状态或转换到软件待机模式之前：

- 1.设置取消低功耗状态后的操作。
- 2.将CDR.CMPD和DCCR.DCME设置为1。
- 3.设置接收操作（在SCR/SCR\_SMCI中RE=1）。
- 4.设置模块停止状态或软件待机模式。

当SCI转移到低功耗模式时，如果接收数据引脚(RXD)为低电平，则设置SEMR.RXDESEL=0。

当设置SEMR.RXDESEL=1时，有可能在解除低功耗模式时无法检测到起始位（RXD引脚的下降沿）。

图27.122显示了在地址匹配的接收期间转换到软件待机模式的示例流程。

**在贪睡模式下使用SCI0时**

在贪睡模式下使用SCI0时，有一些限制，包括最大比特率。有关详细信息，请参阅第10节，[低电源模式](#)。

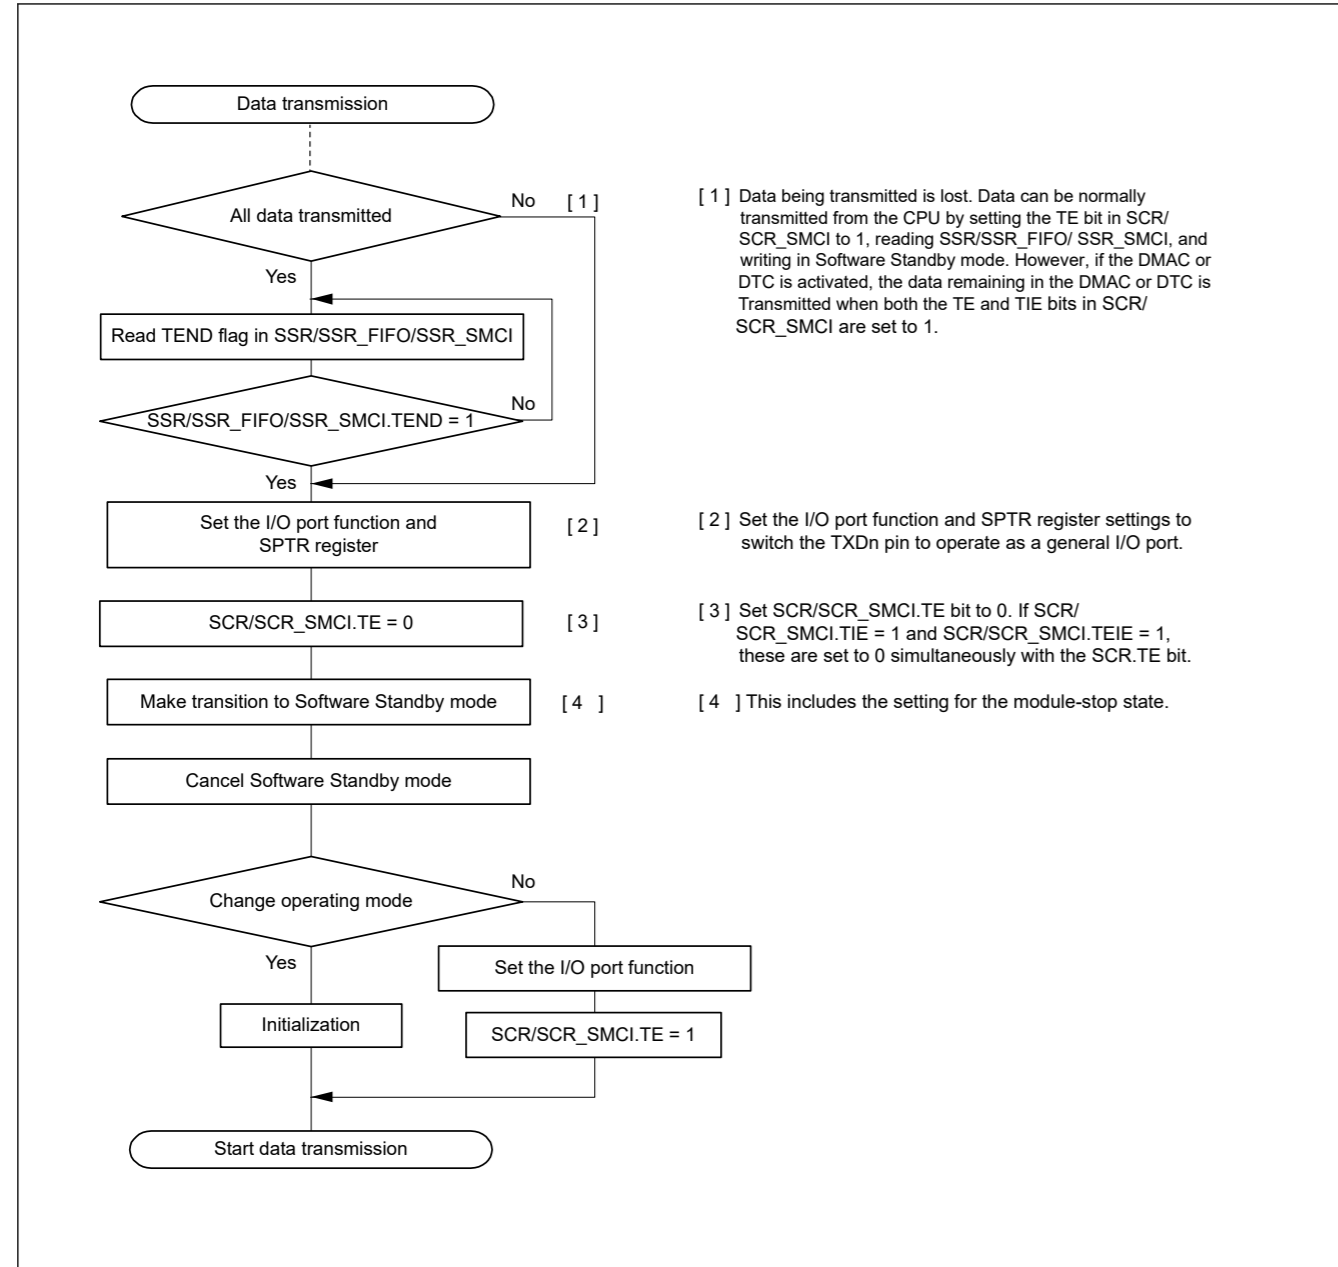

Figure 27.118 Example flow of transition to Software Standby mode during transmission

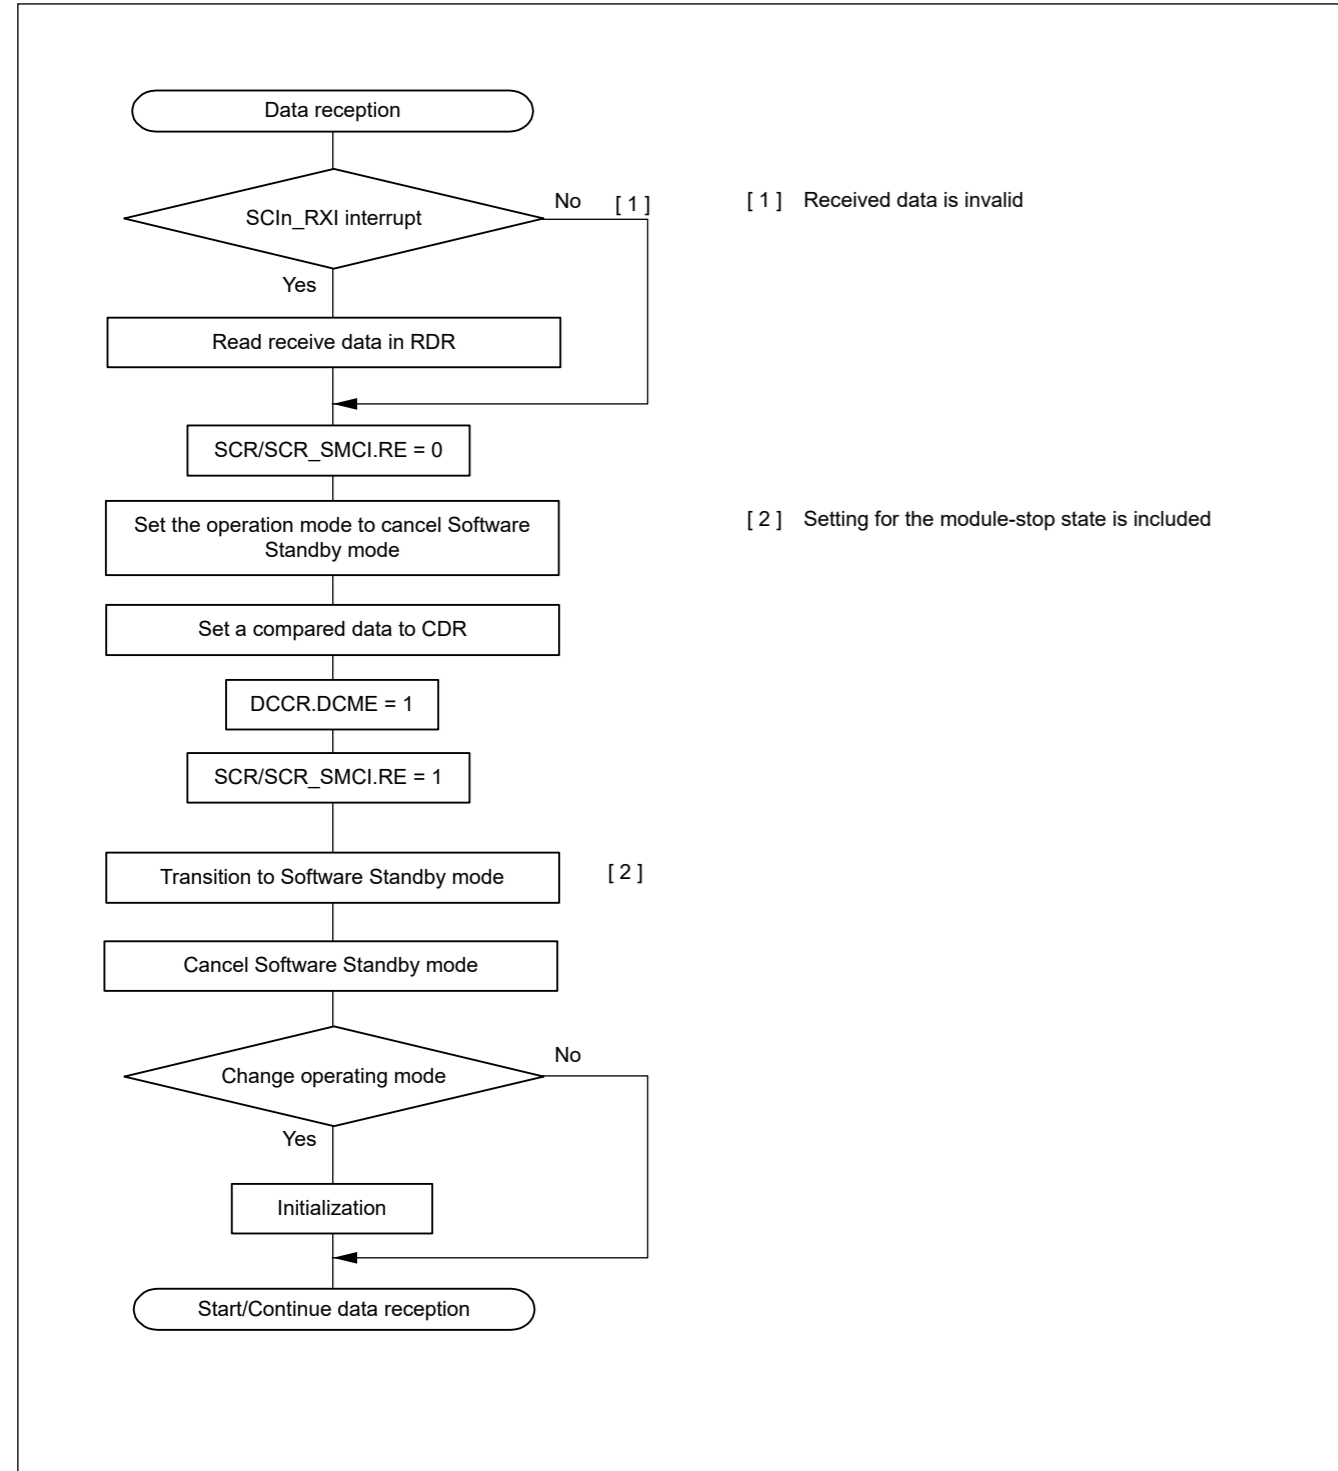

Figure 27.122 Example flow of transition to Software Standby mode during reception with address match

### 27.16.3 Break Detection and Processing

(1) Non-FIFO selected

When a framing error is detected, a break can be detected by reading the RXDn pin value directly. In a break, the input from the RXDn pin becomes all 0s, and the SSR.FER flag is set to 1 to indicate a framing error, and the SSR.PER flag might also be set to 1 to indicate a parity error. The SCI continues the receive operation even after a break is received. Therefore, even if the FER flag is 0, indicating that no framing error occurred, it is set to 1 again. When the SEMR.RXDESEL bit is 1, the SCI sets the SSR.FER flag to 1 and stops receiving operations until a start bit of the next data frame is detected. If the SSR.FER flag is set to 0, the SSR.FER flag retains 0 during the break.

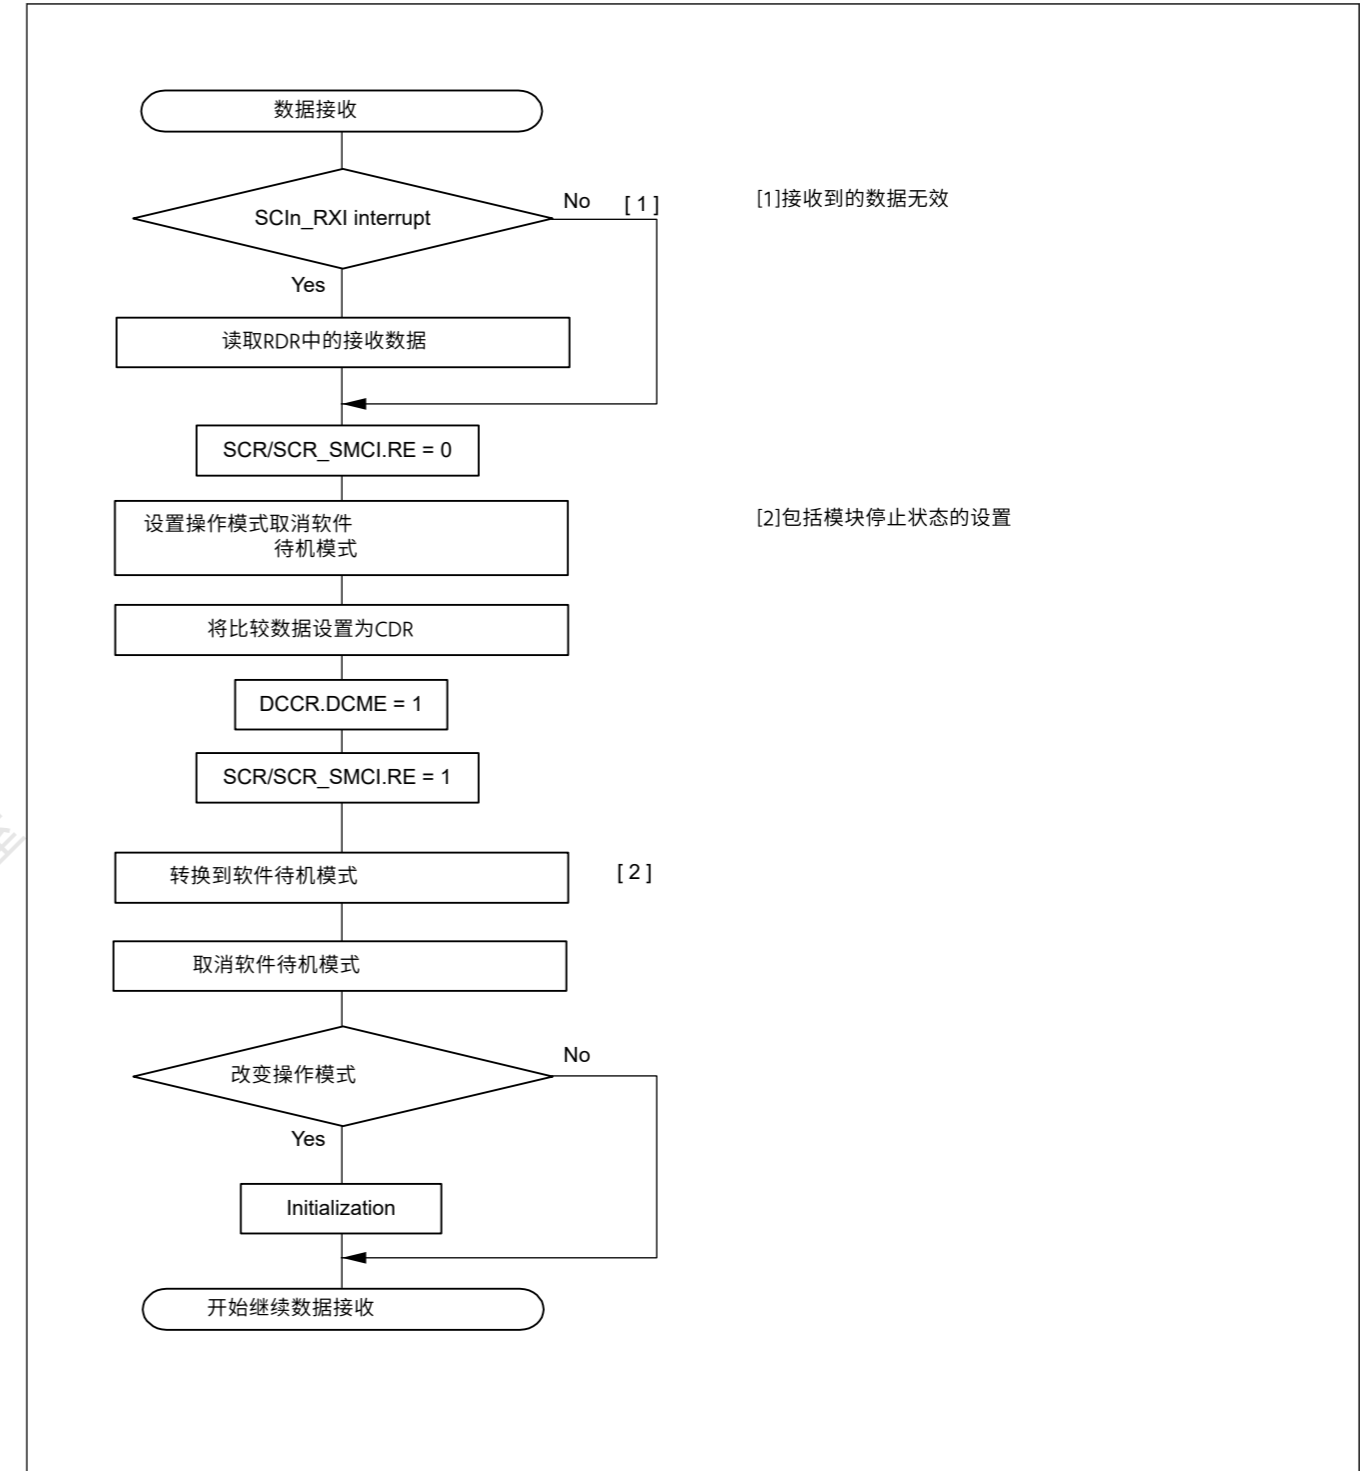

图27.122在地址匹配的接收期间转换到软件待机模式的示例流程

### 27.16.3 断裂检测和处理

(1) Non-FIFO selected

当检测到帧错误时，可以通过直接读取RXDn引脚值来检测中断。在中断时，来自RXDn引脚的输入变为全0，并且SSR.FER标志设置为1表示帧错误，SSR.PER标志也可能设置为1表示奇偶校验错误。即使在收到中断后，SCI仍继续接收操作。因此，即使FER标志为0，表示没有发生帧错误，它也会再次设置为1。当SEMR.RXDESEL位为1时，SCI将SSR.FER标志设置为1并停止接收操作，直到检测到下一个数据帧的起始位。如果

SSR.FER标志设置为0，SSR.FER标志在中断期间保持0。

When the RXDn pin is set to 1 and the break ends, detecting the beginning of the start bit on the first falling edge of the RXDn pin allows the SCI to start the receiving operation.

#### (2) FIFO selected

After a framing error is detected and when the SCI detects that continuous receive data is 0 for 1 frame, reception stops. When a framing error is detected, a break can be detected by reading the SPTR.RXDMON flag value. After the RXD signal is in high and the break is finished, data reception to the FRDRHL register resumes.

### 27.16.4 Mark State and Production of Breaks

When the SCR/SCR\_SMCI.TE bit is 0, disabling serial transmission, the state of the TXDn pin can be set using the SPTR.SPB2IO and SPTR.SPB2DT bits. With this approach, a TXDn pin can be placed in the mark state to transmit a break.

Before setting the SCR/SCR\_SMCI.TE bit to 1, enabling serial transmission, set the SPB2IO and SPB2DT bits to put the communication line in the mark state (the state of 1), and change the TXDn pin using I/O port function. To output a break on data transmission, after setting the TXDn pin to output 0 by setting the SPB2IO and SPB2DT bits, change the TXDn pin using the I/O port function and set the SCR/SCR\_SMCI.TE bit to 0. When the SCR/SCR\_SMCI.TE bit is set to 0, the transmitter is initialized regardless of the current state of transmission.

### 27.16.5 Receive Error Flags and Transmit Operation in Clock Synchronous Mode and Simple SPI Mode

Transmission cannot start when a receive error flag (ORER) in SSR/SSR\_FIFO is set to 1, even when data is written to TDR or FTDR\*1. Always set the receive error flags to 0 before starting transmission.

Note: The receive error flags cannot be set to 0 when the RE bit in SCR/SCR\_SMCI is set to 0 (serial reception is disabled).

Note 1. Do not use the FTDRH register in simple SPI mode.

### 27.16.6 Restrictions on Clock Synchronous Transmission in Clock Synchronous Mode and Simple SPI Mode

When the external clock source is used as a synchronization clock, the following restrictions apply.

#### (1) Start of transmission

Wait at least the following time from writing transmit data to TDR to the start of the external clock input:

1 PCLK cycle + data output delay time for the slave ( $t_{DO}$ ) + setup time for the master ( $t_{SU}$ ). See [Figure 27.123](#).

#### (2) Continuous transmission

Write the next transmit data to TDR or TDRHL before the falling edge of the transmit clock for bit [7]. See [Figure 27.123](#).

When updating TDR after bit [7] has started to transmit, update TDR while the synchronization clock is in the low-level period, and set the high-level width of the transmit clock (bit [7]) to 4 PCLK cycles or longer. See [Figure 27.123](#).

当RXDn引脚设置为1且中断结束时，在第一个下降沿检测起始位的开始RXDn引脚允许SCI开始接收操作。

#### (2) FIFO selected

检测到帧错误后，当SCI检测到1帧连续接收数据为0时，接收停止。当检测到帧错误时，可以通过读取SPTR.RXDMON标志值来检测中断。在RXD信号为高电平且中断完成后，FRDRHL寄存器的数据接收恢复。

### 27.16.4 标记状态和产生的中断

当SCRSCR\_SMCI.TE位为0时，禁用串行传输，TXDn引脚的状态可以使用SPTR.SPB2IO和SPTR.SPB2DT位。使用这种方法，可以将TXDn引脚置于标记状态以发送中断。

在设置SCRSCR\_SMCI.TE位为1，使能串行传输之前，设置SPB2IO和SPB2DT位使通信线处于标记状态（状态为1），并使用IO端口功能改变TXDn引脚。要输出数据传输中断，通过设置SPB2IO和SPB2DT位将TXDn引脚设置为输出0后，使用IO端口功能更改TXDn引脚并将SCRSCR\_SMCI.TE位设置为0。当SCRSCR\_SMCI.TE位设置为0，无论当前的传输状态如何，都初始化发送器。

### 27.16.5 在时钟同步模式下接收错误标志和发送操作和简单SPI模式

当SSRSSR\_FIFO中的接收错误标志(ORER)设置为1时，传输无法开始，即使数据已写入TDR或FTDR\*1。在开始传输之前，始终将接收错误标志设置为0。

Note: 当SCRSCR\_SMCI中的RE位设置为0（禁用串行接收）时，接收错误标志不能设置为0。

注1.不要在简单SPI模式下使用FTDRH寄存器。

### 27.16.6 时钟同步模式和简单SPI模式下时钟同步传输的限制

当外部时钟源用作同步时钟时，有以下限制。

#### (1) 传输开始

从将发送数据写入TDR到外部时钟输入开始，至少等待以下时间：

1个PCLK周期+从机的数据输出延迟时间( $t_{DO}$ )+主机的建立时间( $t_{SU}$ )。请参见图27.123。

#### (2) 连续传输

在位[7]的发送时钟下降沿之前将下一个发送数据写入TDR或TDRHL。请参见图27.123。

在bit[7]开始发送后更新TDR时，在同步时钟处于低电平期间更新TDR，并将发送时钟（bit[7]）的高电平宽度设置为4个PCLK周期或更长。请参见图27.123。

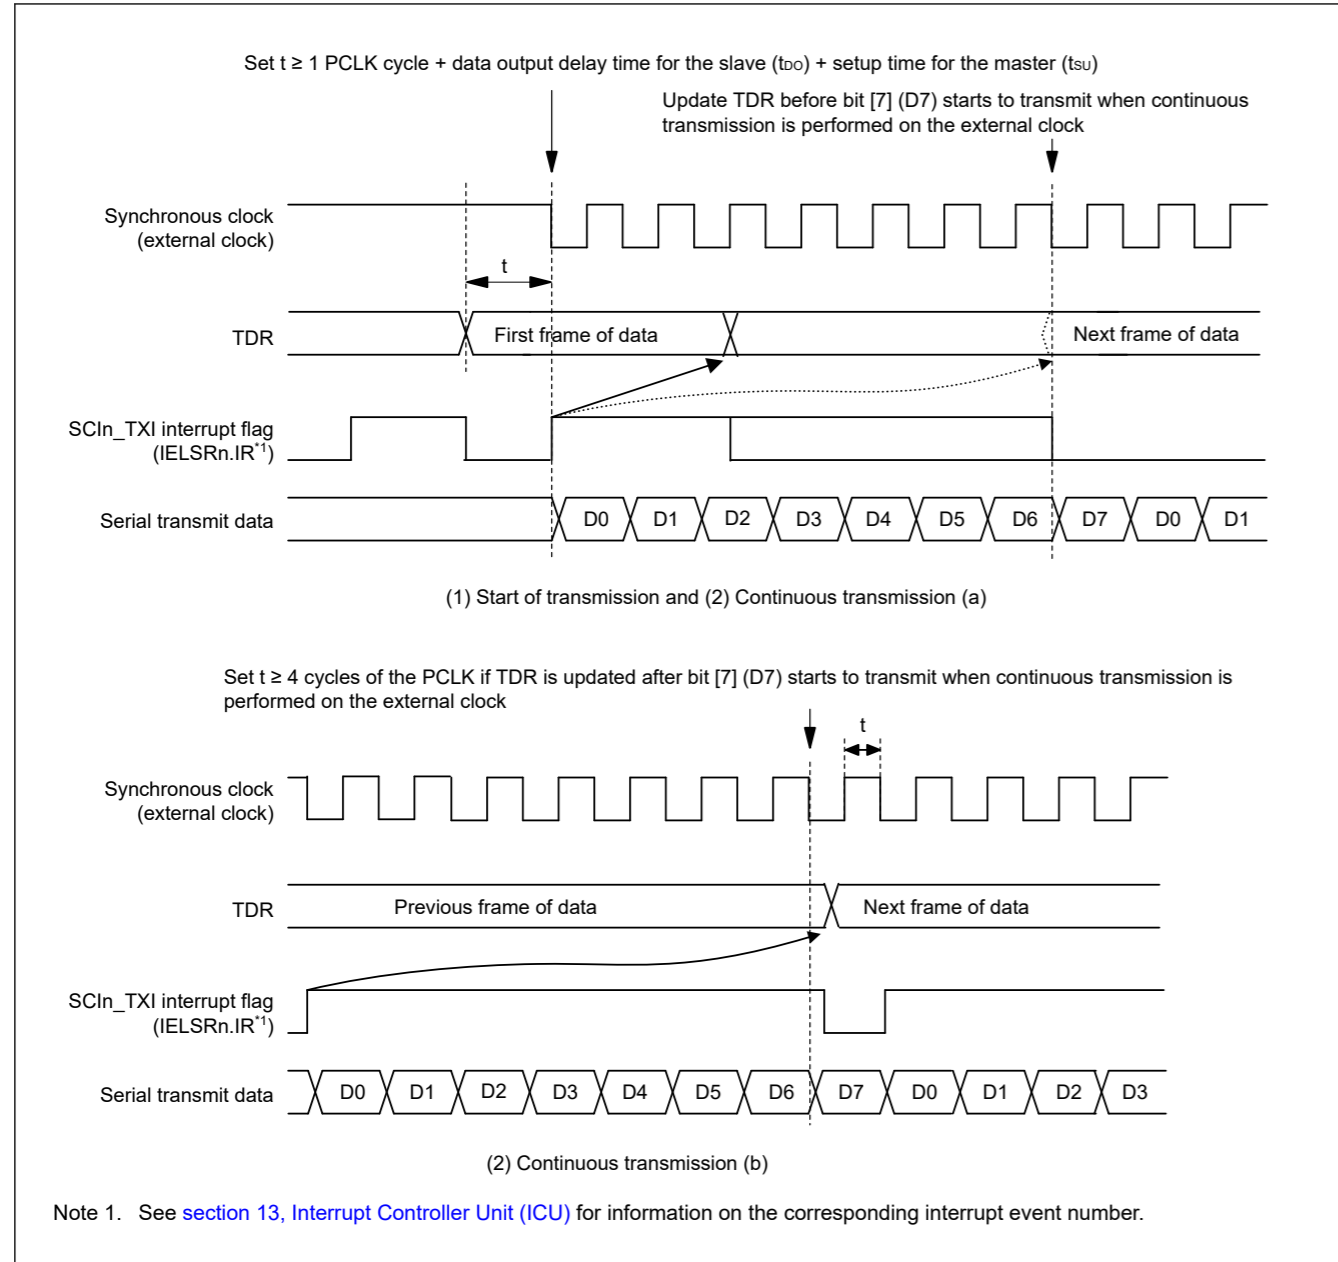

Figure 27.123 Restraints on use of external clock in clock synchronous transmission

### 27.16.7 Restrictions on Using DTC or DMAC

During transmission or reception operations using the DTC or DMAC, do not set transfer data for the DTC or DMAC.

#### (1) Writing data to TDR (FTDRHL)

##### Non-FIFO selected

Data can be written to TDR and TDRHL. However, if new data is written to TDR or TDRHL when transmit data remains in TDR or TDRHL, the previous data in TDR and TDRHL is lost because it was not transferred to TSR yet. When using DTC or DMAC, always write transmit data to TDR or TDRHL in the SCIn\_TXI interrupt request handling routine.

##### FIFO selected

It is possible to write data to the FTDRH and FTDRL registers when SCR.TE is 1. Confirm the amount of writable data using the FDR.T[4:0] bits.

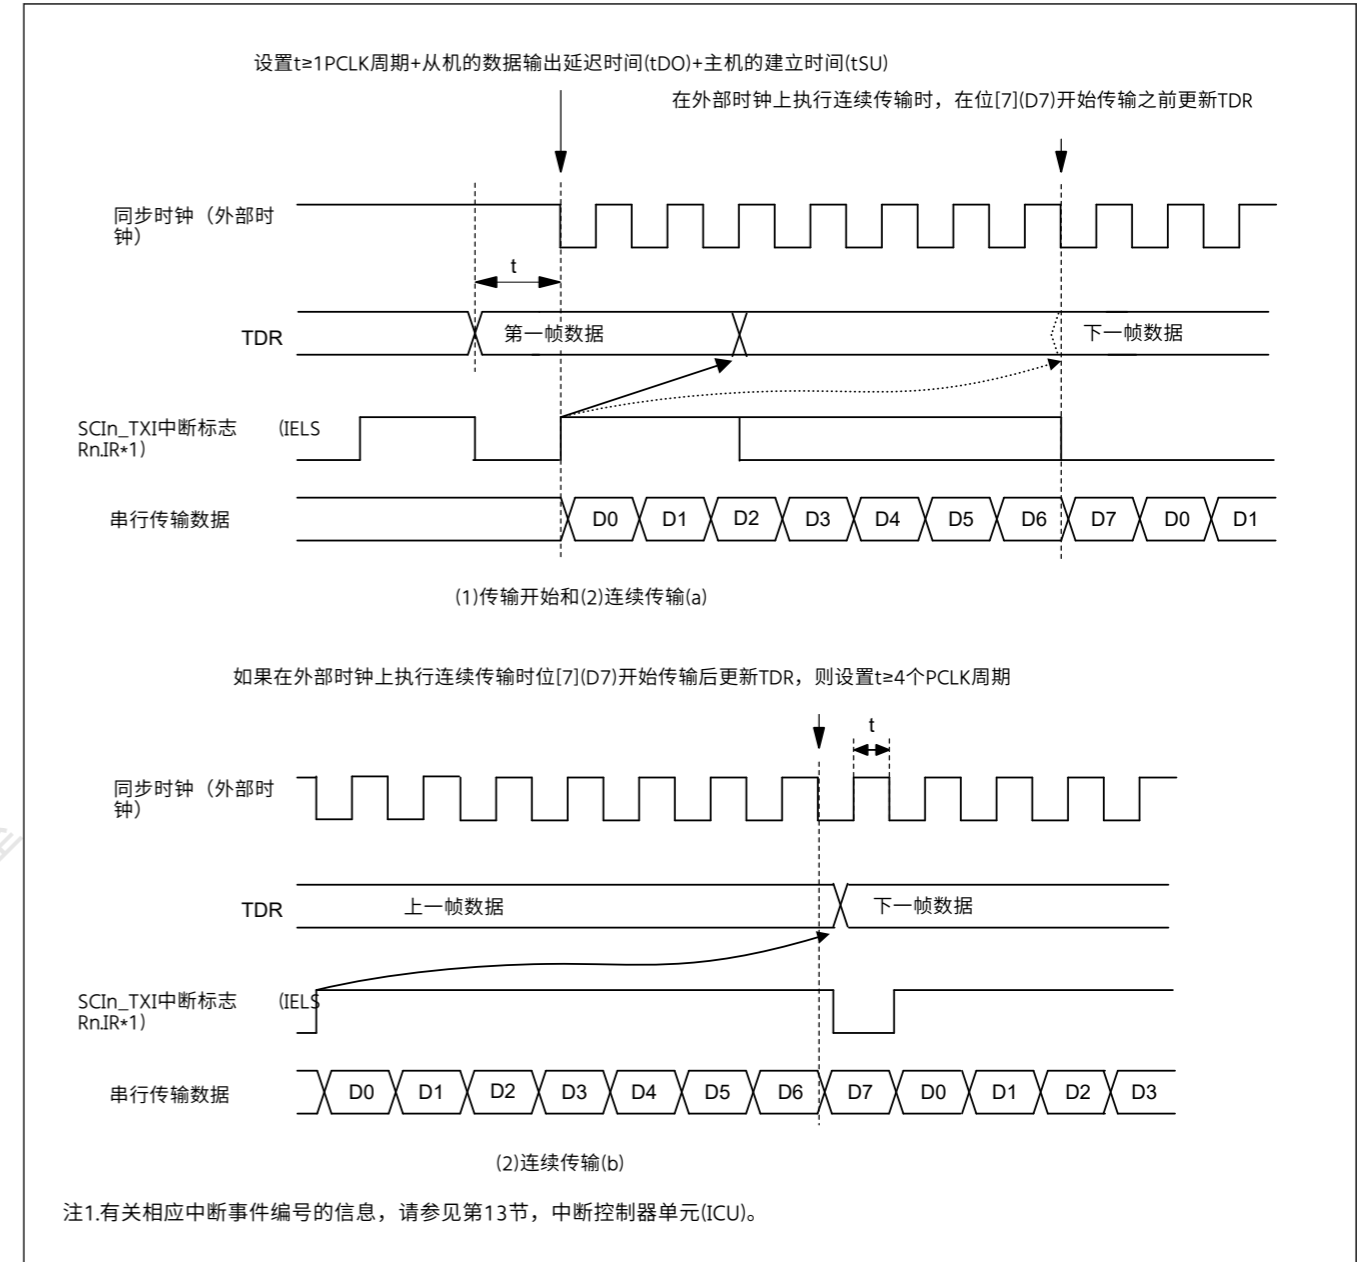

图27.123时钟同步传输中使用外部时钟的限制

### 27.16.7 使用DTC或DMAC的限制

在使用DTC或DMAC进行发送或接收操作期间, 请勿为DTC或DMAC设置传输数据。

#### (1) 将数据写入TDR(FTDRHL)

##### Non-FIFO selected

数据可以写入TDR和TDRHL。但是, 如果在发送数据保留在TDR或TDRHL中将新数据写入TDR或TDRHL, 则TDR和TDRHL中的先前数据将丢失, 因为它尚未传输到TSR。使用DTC或DMAC时, 始终在SCIn\_TXI中断请求处理程序中将发送数据写入TDR或TDRHL。

##### FIFO selected

当SCR.TE为1时, 可以将数据写入FTDRH和FTDRL寄存器。使用FDR.T[4:0]位确认可写入的数据量。

## (2) Reading data from RDR (FRDRHL)

When using the DTC or DMAC to read RDR and RDRHL, always set the receive data full interrupt (SCIn\_RXI) as the activation source of the relevant SCI.

### 27.16.8 Notes on Starting Transfer

At the point where transfer starts when the interrupt status flag (IELSRn.IR flag) in the ICU is 1, follow the procedure in this section to clear interrupt requests before permitting operations (by setting the SCR/SCR\_SMCI.TE or SCR/SCR\_SMCI.RE bit to 1). For details on the interrupt status flag, see [section 13, Interrupt Controller Unit \(ICU\)](#).

1. Confirm that transfer has stopped (the SCR/SCR\_SMCI.TE or SCR/SCR\_SMCI.RE bit is 0)
2. Set the associated interrupt enable bit (SCR/SCR\_SMCI.TIE or SCR/SCR\_SMCI.RIE) to 0
3. Read the associated interrupt enable bit (SCR/SCR\_SMCI.TIE or SCR/SCR\_SMCI.RIE bit) to check that it actually becomes 0
4. Set the interrupt status flag, IELSRn.IR, in the ICU to 0

### 27.16.9 External Clock Input in Clock Synchronous Mode and Simple SPI Mode

In clock synchronous mode and simple SPI mode, the external clock SCKn must be input as follows:

High-pulse period, low-pulse period = 2 PCLK cycles or more, period = 6 PCLK cycles or more.

### 27.16.10 Limitations on Simple SPI Mode

#### (1) Master mode

- Use a resistor to pull up or pull down the clock line matching the initial settings for the transfer clock set in the SPMR.CKPH and CKPOL bits when the SPMR.SSE bit is 1.

This prevents the clock line from being placed in the high-impedance state when the SCR.TE bit is set to 0 or unexpected edges from being generated on the clock line when the SCR.TE bit changes from 0 to 1. When the SPMR.SSE bit is 0 in single master mode, pulling up or pulling down the clock line is not required because the clock line is not placed in the high-impedance state even when the SCR.TE bit is set to 0.

- For the clock delay setting (SPMR.CKPH bit is 1), the receive data full interrupt (SCIn\_RXI) is generated before the final clock edge on the SCKn pin as indicated in [Figure 27.124](#). If the TE and RE bits in the SCR register become 0 before the final edge of the clock signal on the SCKn pin, the SCKn pin is placed in the high-impedance state, so the width of the last clock pulse of the transfer clock is shortened. Additionally, an SCIn\_RXI interrupt might lead to the input signal on the SSn pin of a connected slave going to the high level before the final edge of the clock signal on the SCKn pin, leading to incorrect operation of the slave.
- In a multi-master configuration, the SCKn pin output goes to high-impedance while the input on the SSn pin is at the low level if a mode fault error occurs while a character is being transferred, stopping supply of the clock signal to the connected slave. Reset the connected slave to avoid misaligned bits when transfer is restarted.

Figure 27.124 Timing of SCIn\_RXI interrupt in simple SPI mode with clock delay

## (2) 从RDR(FRDRHL)读取数据

使用DTC或DMAC读取RDR和RDRHL时，始终将接收数据满中断（SCIn\_RXI）设置为相关SCI的激活源。

### 27.16.8 开始转移注意事项

在ICU中的中断状态标志（IELSRn.IR标志）为1时开始传输的点，按照本节中的步骤在允许操作之前清除中断请求（通过设置SCRSCR\_SMCI.TE或SCRSCR\_SMCI.RE位到1）。有关中断状态标志的详细信息，请参见第13节，中断控制器单元(ICU)。

- 1.确认传输已停止（SCRSCR\_SMCI.TE或SCRSCR\_SMCI.RE位为0）
- 2.将相关的中断使能位（SCRSCR\_SMCI.TIE或SCRSCR\_SMCI.RIE）设置为0
- 3.读取相关的中断使能位（SCRSCR\_SMCI.TIE或SCRSCR\_SMCI.RIE位），检查它是否实际变为0
- 4.将ICU中的中断状态标志IELSRn.IR设置为0

### 27.16.9 时钟同步模式和简单SPI模式下的外部时钟输入

在时钟同步模式和简单SPI模式下，外部时钟SCKn必须输入如下：

高脉冲周期，低脉冲周期=2个PCLK周期或更多，周期=6个PCLK周期或更多。

### 27.16.10 简单SPI模式的限制

#### (1) 主模式

- 当SPMR.SSE位为1时，使用电阻上拉或下拉与SPMR.CKPH和CKPOL位中设置的传输时钟的初始设置相匹配的时钟线。

这可以防止当SCR.TE位设置为0时时钟线处于高阻抗状态，或者当SCR.TE位从0变为1时在时钟线上产生意外边沿。SSE位在单主机模式下为0，不需要上拉或下拉时钟线，因为即使SCR.TE位设置为0，时钟线也不会处于高阻抗状态。

- 对于时钟延迟设置（SPMR.CKPH位为1），接收数据满中断（SCIn\_RXI）在SCKn引脚的最后一个时钟沿之前产生，如图27.124所示。如果SCR寄存器中的TE和RE位在SCKn引脚上的时钟信号的最后一个边沿之前变为0，则SCKn引脚处于高阻状态，因此传输时钟的最后一个时钟脉冲的宽度为缩短。此外，SCIn\_RXI中断可能会导致所连接从机的SSn引脚上的输入信号在SCKn引脚上的时钟信号的最后一个边沿之前变为高电平，从而导致从机的错误操作。

- 在多主机配置中，如果在传输字符时发生模式故障错误，则SCKn引脚输出变为高阻态，而SSn引脚上的输入处于低电平，从而停止向主机提供时钟信号。连接的奴隶。重新启动传输时，重置连接的从机以避免未对齐的位。

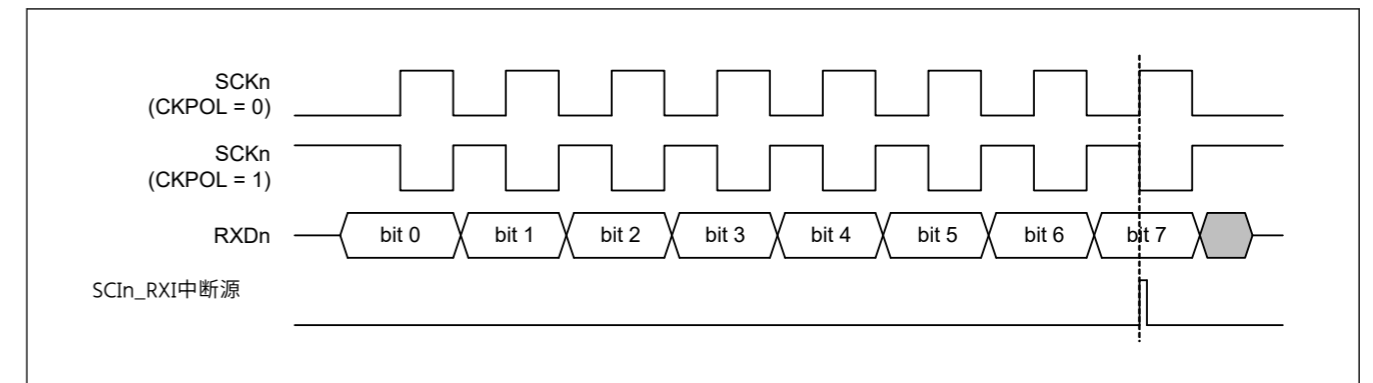

图27.124带时钟延迟的简单SPI模式下SCIn\_RXI中断的时序

## (2) Slave mode

- Wait at least the following time from writing transmit data in the TDR register to the start of the external clock input.  
1 PCLK cycle + data output delay for the slave ( $t_{DO}$ ) + setup time for the master ( $t_{SU}$ )  
Also wait at least 5 PCLK cycles from the input of the low level on the SSn pin to the start of the external clock input.
- Provide an external clock signal to the master the same as the data length for transfer
- Control the input on the SSn pin before the start and after the end of data transfer
- When the input level on the SSn pin is to be changed from low to high while a character is being transferred, set the TE and RE bits in the SCR register to 0 and, after restoring the settings, restart transfer of the first byte

## 27.16.11 Notes on Transmitt Enable bit (SCR.TE)

In initial register value, when SCR.TE bit is "0", the terminal as "TXDn" outputs high impedance.

So please make sure that the TXDn line won't be high impedance by the following one of ways.

1. The pull-up resistance is connected to the TXDn line.
2. Before SCR.TE bit is "0", the function of the terminal is changed to general-purpose input port or output port. And after SCR.TE bit is "1", the function of the terminal is changed to "TXDn".
3. In asynchronous mode, you can set SPTR and decided level of TXDn terminal during SCR.TE is "0".

In the Simple SPI mode slave operation, the RXDn terminal operates in the same way as the above TXDn terminal, so please deal with 1 or 2 in the same way. (3 can not be used.)

## 27.16.12 Limitation 1 on Usage of the Extended Serial Mode Control Section

When the PCR.SHARPS bit is set to 1, output on the TXDXn/RXDXn ( $n = 1, 2$ ) pin is only possible when the following conditions apply.

- The timer of the SCIH module is in Break Field low width output mode and the value of the TCR.TCST bit is 1 (when the TCST bit is set to 1, the high level continues to be output for up to one cycle of the clock source for counting by the timer counter before output of the low level)
- The value of the SCIn.SCR.TE bit is 1.

## 27.16.13 Limitation 2 on Usage of the Extended Serial Mode Control Section

An SCIG interrupt request is generated even if the extended serial mode is enabled. However, the SCIG interrupt should not be used during reception of a Start Frame because SCIH uses an SCIG interrupt request.

The two ways of dealing with this are described below. When a receive error is detected, clear the error flag of the SCIG and initialize the control section of the SCIH.

1. Set the SCR.RIE bit of the SCIG to 0 to disable the output of interrupt requests. Check the error flags in the SSR register for SCIG on completion of the reception of a Start Frame, because an ERI interrupt is not generated if a receive error occurs. After reception of the Start Frame is completed, set the SCR.RIE bit of the SCIG to 1 by the time the first byte of the Information Frame is received.
2. Set the SCR.RIE bit of the SCIG to 1 to disable RXI interrupts and enable ERI interrupts for ICU. Clear the IRn.IR flag to enable the acceptance of RXI interrupts by ICU by the time the first byte of the Information Frame is received after the completion of Start Frame reception.

## (2) 从机模式

- 从将发送数据写入TDR寄存器到外部时钟输入开始，至少等待以下时间。  
1个PCLK周期+从机的数据输出延迟( $t_{DO}$ )+主机的建立时间( $t_{SU}$ )  
还要等待至少5个PCLK周期，从SSn引脚上的低电平输入到外部时钟输入开始。
- 向主机提供与传输数据长度相同的外部时钟信号
- 在数据传输开始前和结束后控制SSn引脚上的输入
- 当在字符传输过程中SSn引脚的输入电平由低变为高时，将SCR寄存器中的TE和RE位设置为0，并在恢复设置后重新开始传输第一个字节

## 27.16.11 发送使能位(SCR.TE)的注意事项

在初始寄存器值中，当SCR.TE位为"0"时，"TXDn"端输出高阻抗。

所以请通过以下方式之一确保TXDn线不会高阻。

- 1.上拉电阻连接到TXDn线。
- 2.SCR.TE位为"0"之前，端子功能变为通用输入端口或输出端口。并且在SCR.TE位为"1"后，终端的thr功能变为"TXDn"。
- 3.在异步模式下，可以设置SPTR和SCR.TE期间TXDn端子的决定电平为"0"。

在SimpleSPI模式从机操作中，RXDn端子与上述TXDn端子的操作方式相同，因此请按相同方式处理1或2。（3个不能用。）

## 27.16.12 使用扩展串行模式控制部分的限制1

当PCR.SHARPS位设置为1时，TXDXn/RXDXn( $n=1, 2$ )引脚上的输出只有在以下条件适用时才可能。

- SCIH模块的定时器处于BreakField低宽度输出模式，TCR.TCST位的值为1（当TCST位设置为1时，最多持续输出高电平一个周期）低电平输出前由定时器计数器计数的时钟源）
- SCIn.SCR.TE位的值为1。

## 27.16.13 使用扩展串行模式控制部分的限制2

即使启用了扩展串行模式，也会产生SCIG中断请求。但是，在接收起始帧期间不应使用SCIG中断，因为SCIH使用SCIG中断请求。

下面介绍两种处理方法。当检测到接收错误时，清除SCIG的错误标志并初始化SCIH的控制部分。

- 1.将SCIG的SCR.RIE位设置为0，以禁用中断请求的输出。在完成接收起始帧时检查SSR寄存器中的错误标志是否有SCIG，因为如果发生接收错误，则不会产生ERI中断。开始帧接收完成后，在接收到信息帧的第一个字节时将SCIG的SCR.RIE位设置为1。
- 2.将SCIG的SCR.RIE位设置为1，以禁用RXI中断并启用ICU的ERI中断。  
清除IRn.IR标志以使ICU在信息的第一个字节之前接受RXI中断  
开始帧接收完成后接收帧。

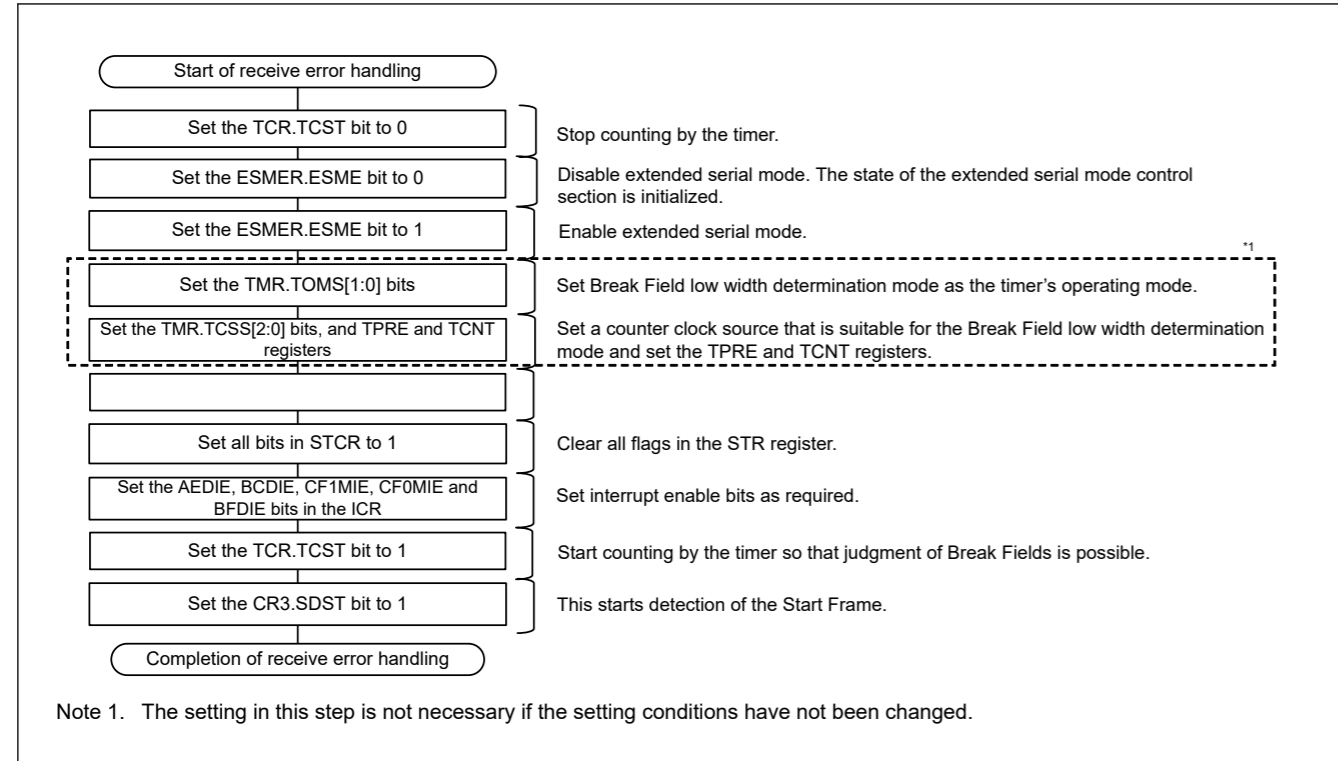

Figure 27.125 Example of Flowchart for Receive Error Handling (during Reception of the Start Frame)

27.16.14 Note on Stopping Reception When Using the RTS Function in Asynchronous Mode

One clock cycle of PCLK is required for the time from setting the SCR.RE bit to 0 to stopping the RTS signal generator in asynchronous mode.

When reading the RDR (or RDRL) register after setting the SCR.RE bit to 0, confirm that the RE bit has been set to 0 before reading the RDR (or RDRL) register to prevent these two processes from being performed consecutively.

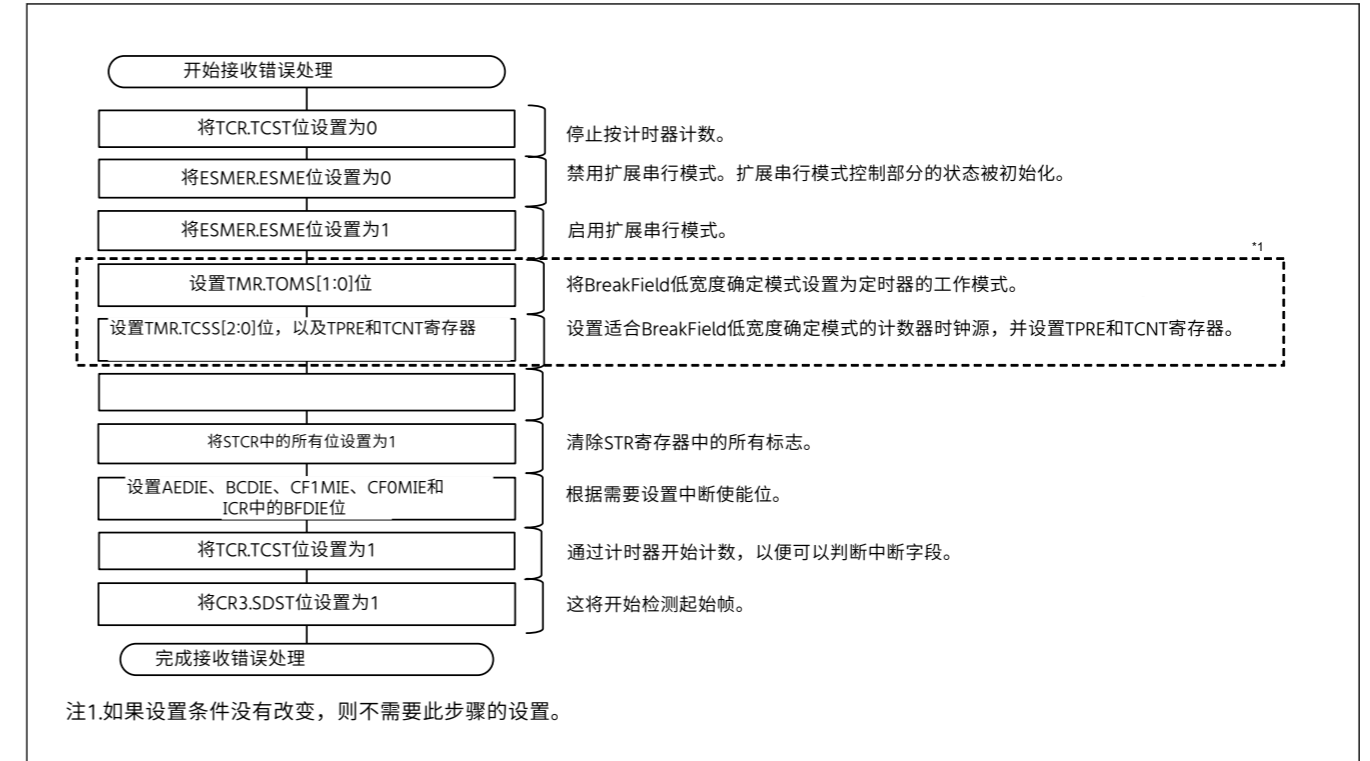

图27.125接收错误处理流程图示例 (接收起始帧期间)

27.16.14 异步使用RTS函数时停止接收的注意事项

从将SCR.RE位设置为0到在异步模式下停止RTS信号发生器,需要一个PCLK时钟周期。

在将SCR.RE位设置为0后读取RDR (或RDRL) 寄存器时,请在读取RDR (或RDRL) 寄存器之前确认RE位已设置为0,以防止这两个过程连续执行。

## 28. I<sup>2</sup>C Bus Interface (IIC)

### 28.1 Overview

The I<sup>2</sup>C bus interface (IIC) has 2 channels. The IIC module conforms with and provides a subset of the NXP I<sup>2</sup>C (Inter-Integrated Circuit) bus interface functions.

Table 28.1 lists the IIC specifications, Figure 28.1 shows a block diagram, and Figure 28.2 shows an example of I/O pin connections to external circuits, with an I<sup>2</sup>C bus configuration. Table 28.2 lists the I/O pins.

Table 28.1 IIC specifications (1 of 2)

| Parameter                        | Specifications  |
|----------------------------------|---|
| Communications format            | <ul style="list-style-type: none"> <li>I<sup>2</sup>C-bus format or SMBus format</li> <li>Master or slave mode selectable</li> <li>Automatic securing of the setup times, hold times, and bus-free times for the transfer rate</li> </ul>   |
| Transfer rate                    | <ul style="list-style-type: none"> <li>Fast-mode Plus supported, up to 1 Mbps</li> </ul>  |
| SCL clock                        | For master operation, the duty cycle of the SCL clock is selectable in the range from 4% to 96%   |
| Issuing and detecting conditions | <ul style="list-style-type: none"> <li>Start, restart, and stop conditions are automatically generated</li> <li>Start conditions (including restart conditions) and stop conditions are detectable</li> </ul>   |
| Slave address                    | <ul style="list-style-type: none"> <li>Configurable for up to three different slave addresses</li> <li>7- and 10-bit address formats supported, including simultaneous use</li> <li>General call addresses, device ID addresses, and SMBus host addresses detectable</li> </ul>   |
| Acknowledgment                   | <ul style="list-style-type: none"> <li>For transmission, automatic loading of the acknowledge bit<br/>Transfer of the next transmit data can be automatically suspended on detection of a not-acknowledge bit.</li> <li>For reception, automatic transmission of the acknowledge bit<br/>If a wait between the 8th and 9th clock cycles is selected, the software can control the value in the acknowledge field in response to the received value.</li> </ul>  |
| Wait function                    | During reception, the following wait periods are available by holding the SCL clock low: <ul style="list-style-type: none"> <li>Waiting between the eighth and ninth clock cycles</li> <li>Waiting between the ninth clock cycle and the 1st clock cycle of the next transfer</li> </ul>  |
| SDA output delay function        | Output timing of transmitted data, including the acknowledge bit, can be delayed  |
| Arbitration                      | <ul style="list-style-type: none"> <li>For multi-master operation: <ul style="list-style-type: none"> <li>SCL clock synchronization is possible when conflict occurs with the SCL signal from another master</li> <li>When issuing the start condition creates conflict on the bus, loss of arbitration is detected by testing for a mismatch between the internal signal for the SDA line and the level on the SDA line</li> <li>In master operation, loss of arbitration is detected by testing for non-matching between the signal on the SDA line and the internal signal for the SDA line</li> </ul> </li> <li>Loss of arbitration because the start condition occurs while the bus is busy is detectable, to prevent the issuing of double start conditions</li> <li>Loss of arbitration is detectable on transfer of a not-acknowledge bit because the internal signal for the SDA line and the level on the SDA line do not match</li> <li>Loss of arbitration because a mismatch of internal and line levels for data is detectable in slave transmission</li> </ul> |
| Timeout function                 | Internal detection of long-interval stops of the SCL clock  |
| Noise cancellation               | <ul style="list-style-type: none"> <li>Digital noise filters for both the SCL and SDA signals</li> <li>Programmable window for noise cancellation by the filters</li> </ul>   |
| Interrupt sources                | <ul style="list-style-type: none"> <li>Transfer error or event occurrence (arbitration-lost, NACK, timeout, start or restart condition, or stop condition)</li> <li>Receive data full, including matching with a slave address</li> <li>Transmit data empty, including matching with a slave address</li> <li>Transmit end</li> </ul>   |
| Module-stop function             | Module-stop state can be set  |
| IIC operating modes              | <ul style="list-style-type: none"> <li>Master transmit</li> <li>Master receive</li> <li>Slave transmit</li> <li>Slave receive</li> </ul>  |

## 28. I2C总线接口(IIC)

### 28.1 Overview

I2C总线接口(IIC)有2个通道。IIC模块符合并提供NXP I2C(Inter-Integrated Circuit)总线接口功能。

表28.1列出了IIC规范，图28.1显示了框图，图28.2显示了IO引脚连接到外部电路的示例，具有I2C总线配置。表28.2列出了IO引脚。

Table 28.1 IIC规格(1of2)

| Parameter            | Specifications   |
|----------------------|--|
| 通讯格式                 | <ul style="list-style-type: none"> <li>I2C-bus格式或SMBus格式</li> <li>可选择主从模式</li> <li>自动保护传输速率的设置时间、保持时间和无总线时间</li> </ul>   |
| 传输率                  | <ul style="list-style-type: none"> <li>支持快速模式Plus, 最高1Mbps</li> </ul>  |
| SCL clock            | 对于主机操作, SCL时钟的占空比可在4%至96%的范围内选择  |
| 发布和检测条件              | <ul style="list-style-type: none"> <li>自动生成启动、重启和停止条件</li> <li>可检测启动条件(包括重启条件)和停止条件</li> </ul>   |
| 从机地址                 | <ul style="list-style-type: none"> <li>最多可配置三个不同的从地址</li> <li>支持7位和10位地址格式, 包括同时使用</li> <li>可检测到广播呼叫地址、设备ID地址和SMBus主机地址</li> </ul>   |
| Acknowledgment       | <ul style="list-style-type: none"> <li>对于传输, 自动加载确认位<br/>检测到未确认位时, 可以自动暂停下一个发送数据的传输。</li> <li>对于接收, 确认位的自动传输<br/>如果选择了第8和第9个时钟周期之间的等待, 软件可以控制确认字段中的值以响应接收到的值。</li> </ul>   |
| 等待功能                 | 在接收期间, 将SCL时钟保持为低电平可获得以下等待周期: ● <ul style="list-style-type: none"> <li>在第八和第九个时钟周期之间等待</li> <li>在第9个时钟周期和下一次传输的第1个时钟周期之间等待</li> </ul>  |
| SDA输出延迟功能            | 传输数据的输出时序, 包括确认位, 可以延迟   |
| Arbitration          | <ul style="list-style-type: none"> <li>For multi-master operation: <ul style="list-style-type: none"> <li>当与来自另一个主机的SCL信号发生冲突时, 可以进行SCL时钟同步</li> <li>当发出启动条件在总线上产生冲突时, 通过测试SDA线的内部信号和SDA线上的电平之间的不匹配来检测仲裁丢失</li> <li>在主机操作中, 通过测试SDA线路上的信号与SDA线路的内部信号之间的不匹配来检测仲裁丢失</li> </ul> </li> <li>可检测到由于在总线繁忙时出现启动条件而导致的仲裁丢失, 以防止发出双启动条件</li> <li>由于SDA线的内部信号和SDA线上的电平不匹配, 在传输未确认位时可检测到仲裁丢失</li> <li>在从传输中可检测到数据的内部电平和线路电平不匹配而导致仲裁丢失</li> </ul> |

| 5   | CLO    | Extra SCL Clock Cycle Output<br>This bit clears automatically after 1 clock cycle is output.<br>0: Do not output extra SCL clock cycle (default)<br>1: Output extra SCL clock cycle  | R/W |
| 6   | IICRST | I <sup>2</sup> C Bus Interface Internal Reset<br>This setting clears the bit counter and the SCLn/SDAn output latch.<br>0: Release IIC reset or internal reset<br>1: Initiate IIC reset or internal reset                        | R/W |
| 7   | ICE    | I <sup>2</sup> C Bus Interface Enable<br>Used in combination with the IICRST bit to select either IIC or internal reset.<br>0: Disable (SCLn and SDA pins in inactive state)<br>1: Enable (SCLn and SDA pins in active state)    | R/W |

#### SDAO bit (SDA Output Control/Monitor) and SCLO bit (SCL Output Control/Monitor)

The SDAO and SCLO bits directly control the SDA pin and SCLn signals output from the IIC. When writing to these bits, also write 0 to the SOWP bit. Setting these bits results in input to the IIC by the input buffer. When slave mode is selected, a start condition might be detected and the bus might be released, depending on the bit settings.

Do not rewrite these bits during a start condition, stop condition, restart condition, transmission, or reception. Operation after rewriting under these conditions is not guaranteed. When reading these bits, the state of signals output from the IIC can be read.

#### CLO bit (Extra SCL Clock Cycle Output)

The CLO bit allows output of an extra SCL clock cycle for debugging or error processing. Normally, set this bit to 0. Setting the bit to 1 in a normal communication state causes a communication error. For details on this function, see [section 28.12.2. Extra SCL Clock Cycle Output Function](#).

#### IICRST bit (I<sup>2</sup>C Bus Interface Internal Reset)

The IICRST bit initiates an internal state reset of the IIC. Setting this bit to 1 initiates an IIC reset or internal reset. Whether an IIC reset or internal reset is initiated is determined by the settings of this bit in combination with the ICE bit. [Table 28.3](#) lists the IIC resets.

The IIC reset initializes all registers except ICCR1.ICE and ICCR1.IICRST bits and internal states of the IIC. In addition to the internal states of the IIC, the internal reset initializes the following:

- Bit counter (ICMR1.BC[2:0] bits)
- I<sup>2</sup>C Bus Shift Register (ICDRS)
- I<sup>2</sup>C Bus Status Registers (ICSR1 and ICSR2)
- SDAO and SCLO Output Control/Monitor (ICCR1.SDAO and ICCR1.SCLO bits)

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 1   | SCLI   | SCL线路监视器<br>0: SCLn线低1: SC<br>Ln线高   | R   |
| 2   | SDAO   | SDA Output Control/Monitor<br>0: 读: IIC将SDAn引脚驱动为低电平<br>写: IIC将SDAn引脚驱动为低电平<br>1: 读: IIC释放SDAn引脚写: I<br>C释放SDAn引脚                        | R/W |
| 3   | SCLO   | SCL Output Control/Monitor<br>使用外部上拉电阻将信号驱动为高电平。<br>0: 读: IIC将SCLn引脚驱动为低电平写<br>: IIC将SCLn引脚驱动为低电平<br>1: 读: IIC释放SCLn引脚写: IIC<br>释放SCLn引脚 | R/W |
| 4   | SOWP   | SCLO/SDAO写保护<br>该位读为1。<br>0: 写使能SCLO和SDAO位1: 写保护S<br>CLO和SDAO位   | W   |
| 5   | CLO    | 额外的SCL时钟周期输出<br>该位在输出1个时钟周期后自动清零。<br>0: 不输出额外的SCL时钟周期(默认) 1: 输出<br>额外的SCL时钟周期  | R/W |
| 6   | IICRST | I2C总线接口内部复位<br>该设置清除位计数器和SCLn/SDAn输出锁存器。<br>0: 释放IIC复位或内部复位1: 启动IIC<br>复位或内部复位   | R/W |
| 7   | ICE    | I2C总线接口使能<br>与IICRST位结合使用来选择IIC或内部复位。<br>0: 禁用(SCLn和SDAn引脚处于非活动状态) 1:<br>启用(SCLn和SDAn引脚处于活动状态)   | R/W |

#### SDAO位(SDA输出控制监视器)和SCLO位(SCL输出控制监视器)

SDAO和SCLO位直接控制IIC输出的SDAn和SCLn信号。写入这些位时,还要向SOWP位写入0。设置这些位会导致输入缓冲器向IIC输入。选择从模式时,可能会检测到启动条件并释放总线,具体取决于位设置。

不要在开始条件、停止条件、重启条件、发送或接收期间重写这些位。不保证在这些条件下重写后的操作。读取这些位时,可以读取IIC输出的信号状态。

#### CLO位(额外SCL时钟周期输出)

CLO位允许输出额外的SCL时钟周期用于调试或错误处理。通常,将此位设置为0。在正常通信状态下将此位设置为1会导致通信错误。有关此功能的详细信息,请参阅第28.12.2节。额外的SCL时钟周期输出功能。

#### IICRST位(I2C总线接口内部复位)

IICRST位启动IIC的内部状态复位。将此位设置为1会启动IIC复位或内部复位。是IIC复位还是内部复位由该位的设置和ICE位共同决定。表28.3列出了IIC复位。

IIC复位初始化除ICCR1.ICE和ICCR1.IICRST位和IIC内部状态之外的所有寄存器。除了IIC的内部状态之外,内部复位还会初始化以下内容:

- 位计数器(ICMR1.BC[2:0]位)
- I2C总线移位寄存器(ICDRS)
- I2C总线状态寄存器(ICSR1和ICSR2)
- SDAO和SCLO输出控制监视器(ICCR1.SDAO和ICCR1.SCLO位)

- I<sup>2</sup>C Bus Control Register 2 (except ICCR2.BBSY bit)

For the reset conditions for each register, see [section 28.15. State of Registers When Issuing Each Condition](#).

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the IIC without initializing the port settings and the control and setting registers of the IIC. If the IIC hangs in a low-level output state, resetting the internal states cancels the low-level output state and releases the bus with the SCLn pin and SDAn pin at high impedance.

**Note:** If an internal reset is initiated using the IICRST bit for a bus hang-up that occurs during communication with the master device in slave mode, the slave and master devices might enter different states, because the bit counter information differs. For this reason, do not initiate an internal reset in slave mode. Initiate recovery processing from the master device. If an internal reset is required because the IIC hangs with the SCLn line in a low-level output state in slave mode, initiate an internal reset, then issue a restart condition from the master device, or issue a stop condition and resume communication from the start condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start or restart condition from the master device, synchronization is lost because the master and slave devices operate asynchronously.

**Table 28.3 IIC resets**

| IICRST | ICE | State          | Specifications   |
|--------|-----|----------------|--|
| 1      | 0   | IIC reset      | Resets all registers except ICCR1.IICRST and ICCR1.ICE bits, and the internal states of the IIC  |
|        | 1   | Internal reset | Reset the following: <ul style="list-style-type: none"> <li>● ICMR1.BC[2:0] bits</li> <li>● ICSR1, ICSR2, ICDRS registers</li> <li>● SDAO and SCLO Output Control/Monitor (ICCR1.SDAO and ICCR1.SCLO bits)</li> <li>● I<sup>2</sup>C Bus Control Register 2 (except ICCR2.BBSY bit)</li> <li>● Internal states of the IIC</li> </ul> |

**ICE bit (I<sup>2</sup>C Bus Interface Enable)**

The ICE bit selects the active or inactive state of the SCLn and SDAn pins. It can also be combined with the IICRST bit to initiate two types of resets. See [Table 28.3](#) for the reset descriptions.

Set the ICE bit to 1 when using the IIC. The SCLn and SDAn pins are placed in the active state when the ICE bit is set to 1. Set the ICE bit to 0 when the IIC is not used. The SCLn and SDAn pins are placed in the inactive state when the ICE bit is set to 0. Do not assign the SCLn or SDAn pin to the IIC when setting up the pin function control. Slave address comparison is performed if the pins are assigned to the IIC.

**28.2.2 ICCR2 : I<sup>2</sup>C Bus Control Register 2**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x01

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | —      | This bit is read as 0. The write value should be 0.   | R/W |
| 1   | ST     | Start Condition Issuance Request<br>0: Do not issue a start condition request<br>1: Issue a start condition request       | R/W |
| 2   | RS     | Restart Condition Issuance Request<br>0: Do not issue a restart condition request<br>1: Issue a restart condition request | R/W |

- I2C总线控制寄存器2 (ICCR2.BBSY位除外)

关于各寄存器的复位条件，请参阅第28.15节。发出每个条件时的寄存器状态。

在操作期间将IICRST位设置为1（ICE位设置为1）启动的内部复位会复位IIC的内部状态，而无需初始化IIC的端口设置以及控制和设置寄存器。如果IIC在低电平输出状态下挂起，复位内部状态会取消低电平输出状态并释放总线，同时SCLn引脚和SDAn引脚处于高阻抗状态。

**Note:** 如果在从模式下与主设备通信期间发生的总线挂断使用IICRST位启动内部复位，则从设备和主设备可能会进入不同的状态，因为位计数器信息不同。因此，不要在从模式下启动内部复位。从主设备启动恢复处理。如果由于IIC在从模式下挂起且SCLn线处于低电平输出状态而需要内部复位，则启动内部复位，然后从主设备发出重新启动条件，或者发出停止条件并从主设备恢复通信开始条件。如果通过仅在从设备中启动复位来重新启动通信，而没有从主设备发出启动或重启条件，则由于主设备和从设备异步操作而失去同步。

**Table 28.3 IIC resets**

| IICRST | ICE | State     | Specifications  |
|--------|-----|-----------|---|
| 1      | 0   | IIC reset | 复位除ICCR1.IICRST和ICCR1.ICE位之外的所有寄存器，以及IIC的内部状态   |
|        | 1   | 内部复位      | 重置以下内容： <ul style="list-style-type: none"> <li>● bits</li> <li>● ICSR1, ICSR2, ICDRS registers</li> <li>● SDAO和SCLO输出控制监视器 (ICCR1.SDAO和ICCR1.SCLO bits)</li> <li>● I2C总线控制寄存器2 (ICCR2.BBSY位除外)</li> <li>● IIC的内部状态</li> </ul> |

**ICE位 (I2C总线接口使能)**

ICE位选择SCLn和SDAn引脚的有效或无效状态。它也可以与IICRST位组合来启动两种类型的复位。复位说明见表28.3。

使用IIC时将ICE位设置为1。当ICE位设置为1时，SCLn和SDAn引脚处于活动状态。不使用IIC时，将ICE位设置为0。当ICE位设置为0时，SCLn和SDAn引脚处于非活动状态。在设置引脚功能控制时，不要将SCLn或SDAn引脚分配给IIC。如果引脚分配给IIC，则执行从地址比较。

**28.2.2 ICCR2:I2C总线控制寄存器2**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x01

| Bit | Symbol | Function                                | R/W |
|-----|--------|---|-----|
| 0   | —      | 该位读取为0。写入值应为0。                          | R/W |
| 1   | ST     | 开始条件发布请求<br>0: 不发出启动条件请求<br>1: 发出启动条件请求 | R/W |
| 2   | RS     | 重启条件发布请求<br>0: 不发出重启条件请求<br>1: 发出重启条件请求 | R/W |

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 3   | SP     | Stop Condition Issuance Request<br>0: Do not issue a stop condition request<br>1: Issue a stop condition request                  | R/W              |
| 4   | —      | This bit is read as 0. The write value should be 0.   | R/W              |
| 5   | TRS    | Transmit/Receive Mode<br>0: Receive mode<br>1: Transmit mode  | R/W <sup>1</sup> |
| 6   | MST    | Master/Slave Mode<br>0: Slave mode<br>1: Master mode  | R/W <sup>1</sup> |
| 7   | BBSY   | Bus Busy Detection Flag<br>0: I <sup>2</sup> C bus released (bus free state)<br>1: I <sup>2</sup> C bus occupied (bus busy state) | R                |

Note 1. The MST and TRS bits can be written to when the ICMR1.MTWP bit is set to 1.

### ST bit (Start Condition Issuance Request)

The ST bit requests transition to master mode and triggers a start condition. When this bit is set to 1, a start condition is issued when the BBSY flag is set to 0 (bus free state). For details on this function, see [section 28.11. Start, Restart, and Stop Condition Issuing Function](#).

[Setting condition]

- When 1 is written to the ST bit.

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition is issued (a start condition is detected)
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: Only set the ST bit to 1 (start condition request) when the BBSY flag is set to 0 (bus free state). Arbitration might be lost if the ST bit is set to 1 (start condition request) when the BBSY flag is 1 (bus busy state).

### RS bit (Restart Condition Issuance Request)

The RS bit requests that a restart condition be issued in master mode. When this bit is set to 1 to request a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy state) and the MST bit is set to 1 (master mode). For details on this function, see [section 28.11. Start, Restart, and Stop Condition Issuing Function](#).

[Setting condition]

- When 1 is written to the RS bit with the BBSY flag in ICCR2 set to 1.

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition is issued (a start condition is detected)
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: Do not set the RS bit to 1 while issuing a stop condition.

Note: If 1 (restart condition request) is written to the RS bit in slave mode, the restart condition is not issued, but the RS bit remains set to 1. If the operating mode changes to master mode without the bit being cleared, a restart condition might be issued.

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 3   | SP     | 停止条件发出请求<br>0: 不发出停止条件请求<br>1: 发出停止条件请求              | R/W              |
| 4   | —      | 该位读取为0。写入值应为0。                                       | R/W              |
| 5   | TRS    | Transmit/Receive Mode<br>0: 接收模式<br>1: 发送模式          | R/W <sup>1</sup> |
| 6   | MST    | Master/Slave Mode<br>0: 从模式<br>1: 主模式                | R/W <sup>1</sup> |
| 7   | BBSY   | 总线忙检测标志<br>0: I2C总线释放 (总线空闲状态)<br>1: I2C总线占用 (总线忙状态) | R                |

注1.当ICMR1.MTWP位设置为1时，可以写入MST和TRS位。

### ST位 (开始条件发布请求)

ST位请求切换到主模式并触发启动条件。当该位设置为1时，当BBSY标志设置为0 (总线空闲状态) 时发出启动条件。有关此功能的详细信息，请参阅第28.11节。启动、重启和停止条件发布功能。

[Setting condition]

- ST位写入1时。

[Clearing conditions]

- ST位写入0时
- 发出启动条件时 (检测到启动条件)
- ICSR2中的AL (仲裁失败) 标志设置为1时
- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

Note: 仅当BBSY标志设置为0 (总线空闲状态) 时，才将ST位设置为1 (启动条件请求)。如果在BBSY标志为1 (总线繁忙状态) 时将ST位设置为1 (开始条件请求)，则仲裁可能会丢失。

### RS位 (重启条件发布请求)

RS位请求在主机模式下发出重启条件。当该位设置为1以请求重新启动条件时，当BBSY标志设置为1 (总线繁忙状态) 且MST位设置为1 (主模式) 时，发出重新启动条件。有关此功能的详细信息，请参阅第28.11节。启动、重启和停止条件发布功能。

[Setting condition]

- 当ICCR2中的BBSY标志设置为1时，将1写入RS位。

[Clearing conditions]

- 向RS位写入0时
- 发出重新启动条件时 (检测到启动条件)
- ICSR2中的AL (仲裁失败) 标志设置为1时
- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

Note: 发出停止条件时不要将RS位设置为1。

Note: 如果在从模式下将1 (重新启动条件请求) 写入RS位，则不会发出重新启动条件，但RS位保持设置为1。如果操作模式更改为主模式而未清除该位，则重新启动条件可能会发出。

**SP bit (Stop Condition Issuance Request)**

The SP bit requests that a stop condition be issued in master mode. When this bit is set to 1, a stop condition is issued when the BBSY flag is set to 1 (bus busy state) and the MST bit is set to 1 (master mode). For details on this function, see [section 28.11. Start, Restart, and Stop Condition Issuing Function](#).

[Setting condition]

- When 1 is written to the SP bit with both the BBSY flag and the MST bit in ICCR2 set to 1.

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition is issued (a stop condition is detected)
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: Writing to the SP bit is not possible while the BBSY flag is 0 (bus free state).

Note: Do not set the SP bit to 1 while a restart condition is being issued.

**TRS bit (Transmit/Receive Mode)**

The TRS bit indicates transmit or receive mode. The IIC is in receive mode when the TRS bit is 0 and in transmit mode when the bit is 1. The combination of this bit and the MST bit indicates the IIC operating mode.

The value of the TRS bit automatically changes to 1 for transmit mode or 0 for receive mode when a start condition is issued or detected and the R/W# bit is set. Although writing to the TRS bit is possible when the MTWP bit in ICMR1 is set to 1, writing to this bit is not required during normal usage.

[Setting conditions]

- When a start condition is issued normally because of a start condition request (when a start condition is detected with the ST bit set to 1)
- When a restart condition is issued normally because of a restart condition request (when a restart condition is detected with the RS bit set to 1)
- When the R/W# bit appended to the slave address is set to 0 in master mode
- When the address received in slave mode matches the address enabled in ICSEER, with the R/W# bit set to 1
- When 1 is written to the TRS bit with the MTWP bit in ICMR1 set to 1.

[Clearing conditions]

- When a stop condition is detected
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When the R/W# bit appended to the slave address is set to 1 in master mode
- In slave mode, on a match between the received address and the address enabled in ICSEER when the value of the received R/W# bit is 0, including when the received address is the general call address
- In slave mode, when a restart condition is detected (a restart condition is detected with ICCR2.BBSY = 1 and ICCR2.MST = 0)
- When 0 is written to the TRS bit with the MTWP bit in ICMR1 set to 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

**MST bit (Master/Slave Mode)**

The MST bit indicates master or slave mode. The IIC is in slave mode when the MST bit is 0 and is in master mode when the bit is 1. The combination of this bit and the TRS bit indicates the IIC operating mode.

The value of the MST bit automatically changes to 1 for master mode or 0 for slave mode when a start condition is issued or a stop condition is issued or detected. Although writing to the MST bit is possible when the MTWP bit in ICMR1 is set to 1, writing to this bit is not required during normal usage.

**SP位 (停止条件发布请求)**

SP位请求在主机模式下发出停止条件。当该位设置为1时，当BBSY标志设置为1（总线繁忙状态）且MST位设置为1（主模式）时，发出停止条件。有关此功能的详细信息，请参阅第28.11节。启动、重启和停止条件发布功能。

[Setting condition]

- 当ICCR2中的BBSY标志和MST位都设置为1时，将1写入SP位。

[Clearing conditions]

- SP位写入0时
- 发出停止条件时（检测到停止条件）
- ICSR2中的AL（仲裁失败）标志设置为1时
- 检测到启动条件和重启条件时
- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

Note: 当BBSY标志为0（总线空闲状态）时，不能写入SP位。

Note: 发出重启条件时不要将SP位设置为1。

**TRS bit (Transmit/Receive Mode)**

TRS位指示发送或接收模式。TRS位为0时IIC处于接收模式，该位为1时IIC处于发送模式。该位和MST位的组合表示IIC工作模式。

当发出或检测到启动条件并且设置RW#位时，TRS位的值自动更改为1（发送模式）或0（接收模式）。虽然当ICMR1的MTWP位设置为1时可以写入TRS位，但在正常使用期间不需要写入该位。

[Setting conditions]

- 因启动条件请求而正常发出启动条件时（ST位设置为1时检测到启动条件时）
- 因重新启动条件请求而正常发出重新启动条件时（在RS位设置为1的情况下检测到重新启动条件时）
- 在主机模式下，附加在从机地址上的RW#位设置为0时
- 从机模式接收到的地址与ICSEER中使能的地址匹配时，RW#位设置为1
- 当ICMR1中的MTWP位设置为1时将1写入TRS位。

[Clearing conditions]

- 检测到停止条件时
- ICSR2中的AL（仲裁失败）标志设置为1时
- 在主机模式下，附加在从机地址上的RW#位设置为1时
- 从机模式下，当接收到的RW#位的值为0时，接收到的地址与ICSEER中使能的地址匹配，包括当接收到的地址是广播地址时
- 在从模式下，检测到重启条件时（检测到重启条件时ICCR2.BBSY=1和ICCR2.MST=0）
- 当ICMR1中的MTWP位设置为1时，将0写入TRS位时
- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

**MST bit (Master/Slave Mode)**

MST位指示主机或从机模式。当MST位为0时，IIC处于从机模式，当该位为1时，IIC处于主机模式。该位和TRS位的组合表示IIC工作模式。

当发出启动条件或发出或检测到停止条件时，MST位的值自动变为1（主机模式）或0（从机模式）。虽然当ICMR1中的MTWP位设置为1时可以写入MST位，但在正常使用期间不需要写入该位。

[Setting conditions]

- When a start condition is issued normally because of a start condition request (when a start condition is detected with the ST bit set to 1)
- When 1 is written to the MST bit with the MTWP bit in ICMR1 set to 1.

[Clearing conditions]

- When a stop condition is detected
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When 0 is written to the MST bit with the MTWP bit in ICMR1 set to 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

**BBSY flag (Bus Busy Detection Flag)**

The BBSY flag indicates whether the I<sup>2</sup>C bus is occupied (bus busy state) or released (bus free state). The flag is set to 1 when the SDAn line changes from high to low when the SCLn line is high, assuming that a start condition was issued. The flag is set to 0 if a start condition is not detected for the bus free time (ICBRL setting), assuming that a stop condition was issued.

[Setting condition]

- When a start condition is detected.

[Clearing conditions]

- When a start condition is not detected for the bus free time (ICBRL setting) after detecting a stop condition
- When 1 is written to the IICRST bit in ICCR1 with the ICE bit in ICCR1 set to 0 (IIC reset).

28.2.3 ICMR1 : I<sup>2</sup>C Bus Mode Register 1

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x02

| Bit | Symbol   | Function  | R/W              |
|-----|----------|---|------------------|
| 2:0 | BC[2:0]  | Bit Counter<br>0 0 0: 9 bits<br>0 0 1: 2 bits<br>0 1 0: 3 bits<br>0 1 1: 4 bits<br>1 0 0: 5 bits<br>1 0 1: 6 bits<br>1 1 0: 7 bits<br>1 1 1: 8 bits | R/W <sup>1</sup> |
| 3   | BCWP     | BC Write Protect<br>This bit is read as 1.<br>0: Write enable BC[2:0] bits<br>1: Write protect BC[2:0] bits   | W <sup>1</sup>   |
| 6:4 | CKS[2:0] | Internal Reference Clock Select<br>Select the internal reference clock source (IICφ) for the IIC.<br>IICφ = (PCLKB / 2 <sup>CKS[2:0]</sup> ) clock  | R/W              |
| 7   | MTWP     | MST/TRS Write Protect<br>0: Write protect MST and TRS bits in ICCR2<br>1: Write enable MST and TRS bits in ICCR2                                    | R/W              |

Note 1. Rewrite the BC[2:0] bits and set the BCWP bit to 0 at the same time.

[Setting conditions]

- 因启动条件请求而正常发出启动条件时 (ST位设置为1时检测到启动条件时)
- 当ICMR1中的MTWP位设置为1时将1写入MST位。

[Clearing conditions]

- 检测到停止条件时
- ICSR2中的AL (仲裁失败) 标志设置为1时
- 当ICMR1中的MTWP位设置为1时, 将0写入MST位时
- 当ICCR1的IICRST位写入1时, 应用IIC复位或内部复位。

**BBSY标志 (总线忙检测标志)**

BBSY标志指示I2C总线是被占用 (总线繁忙状态) 还是被释放 (总线空闲状态)。当SCLn线为高时SDAn线从高变为低时, 该标志设置为1, 假设发出了启动条件。如果在总线空闲时间 (ICBRL设置) 没有检测到启动条件, 则该标志设置为0, 假设发出了停止条件。

[Setting condition]

- 检测到启动条件时。

[Clearing conditions]

- 检测到停止条件后, 在总线空闲时间 (ICBRL设置) 内未检测到启动条件时
- 当ICCR1的IICRST位写入1且ICCR1的ICE位设置为0时 (IIC复位)。

28.2.3 ICMR1:I2C总线模式寄存器1

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x02

| Bit | Symbol   | Function   | R/W              |
|-----|----------|--|------------------|
| 2:0 | BC[2:0]  | 位计数器<br>0 0 0: 9 bits<br>0 0 1: 2 bits<br>0 1 0: 3 bits<br>0 1 1: 4 bits<br>1 0 0: 5 bits<br>1 0 1: 6 bits<br>1 1 0: 7 bits<br>1 1 1: 8 bits | R/W <sup>1</sup> |
| 3   | BCWP     | BC写保护<br>该位读为1。<br>0: 写使能BC[2:0]位<br>1: 写保护BC[2:0]位  | W <sup>1</sup>   |
| 6:4 | CKS[2:0] | 内部参考时钟选择<br>选择IIC的内部参考时钟源(IICφ)。<br>IICφ = (PCLKB / 2 <sup>CKS[2:0]</sup> ) clock  | R/W              |

注1.重写BC[2:0]位, 同时将BCWP位设置为0。

**BC[2:0] bits (Bit Counter)**

The BC[2:0] bits function as a counter indicating the number of bits remaining to be transferred on detection of a rising edge on the SCLn line. Although BC[2:0] are read/write bits, it is not required to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one, for an additional acknowledge bit, between transferred frames when the SCLn line is at a low level. The value in the BC[2:0] bits returns to 000b at the end of a data transfer, including the acknowledge bit, or when a start or restart condition is detected.

**28.2.4 ICMR2 : I<sup>2</sup>C Bus Mode Register 2**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x03

|                    |      |           |   |   |   |      |      |      |
|--------------------|------|-----------|---|---|---|------|------|------|
| Bit position:      | 7    | 6         | 5 | 4 | 3 | 2    | 1    | 0    |

| 1   | TMOL      | Timeout L Count Control<br>0: Disable count while SCLn line is low<br>1: Enable count while SCLn line is low   | R/W |
| 2   | TMOH      | Timeout H Count Control<br>0: Disable count while SCLn line is high<br>1: Enable count while SCLn line is high   | R/W |
| 3   | —         | This bit is read as 0. The write value should be 0.  | R/W |
| 6:4 | SDDL[2:0] | SDA Output Delay Counter<br>0 0 0: No output delay<br>0 0 1: 1 IICφ cycle (When ICMR2.DLCS = 0 (IICφ))<br>1 or 2 IICφ cycles (When ICMR2.DLCS = 1 (IICφ/2))<br>0 1 0: 2 IICφ cycles (When ICMR2.DLCS = 0 (IICφ))<br>3 or 4 IICφ cycles (When ICMR2.DLCS = 1 (IICφ/2))<br>0 1 1: 3 IICφ cycles (When ICMR2.DLCS = 0 (IICφ))<br>5 or 6 IICφ cycles (When ICMR2.DLCS = 1 (IICφ/2))<br>1 0 0: 4 IICφ cycles (When ICMR2.DLCS = 0 (IICφ))<br>7 or 8 IICφ cycles (When ICMR2.DLCS = 1 (IICφ/2))<br>1 0 1: 5 IICφ cycles (When ICMR2.DLCS = 0 (IICφ))<br>9 or 10 IICφ cycles (When ICMR2.DLCS = 1 (IICφ/2))<br>1 1 0: 6 IICφ cycles (When ICMR2.DLCS = 0 (IICφ))<br>11 or 12 IICφ cycles (When ICMR2.DLCS = 1 (IICφ/2))<br>1 1 1: 7 IICφ cycles (When ICMR2.DLCS = 0 (IICφ))<br>13 or 14 IICφ cycles (When ICMR2.DLCS = 1 (IICφ/2)) | R/W |
| 7   | DLCS      | SDA Output Delay Clock Source Select<br>0: Select internal reference clock (IICφ) as the clock source for SDA output delay counter<br>1: Select internal reference clock divided by 2 (IICφ/2) as the clock source for SDA output delay counter*1  | R/W |

Note 1. The setting DLCS = 1 (IICφ/2) is only valid when SCL is low. When SCL is high, the DLCS = 1 setting becomes invalid and the clock source becomes the internal reference clock (IICφ).

**TMOS bit (Timeout Detection Time Select)**

The TMOS bit selects long or short mode for the timeout detection time when the timeout function is enabled (ICFER.TMOE = 1). When this bit is set to 0, long mode is selected. When it is set to 1, short mode is selected. In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14-bit counter. While the SCLn line is in the state that enables this counter as specified in the TMOH and TMOL bits, the counter

**BC[2:0] bits (Bit Counter)**

BC[2:0]位用作计数器，指示在检测到SCLn线上的上升沿时要传输的剩余位数。虽然BC[2:0]是读写位，但在正常情况下不需要访问这些位。

要写入这些位，在SCLn线处于低电平时，指定要传输的位数加1，作为附加确认位，在传输的帧之间。BC[2:0]位中的值在数据传输结束时返回到000b，包括确认位，或者当检测到启动或重启条件时。

**28.2.4 ICMR2:I2C总线模式寄存器2**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x03

|               |      |           |   |   |   |      |      |      |

| 7   | DLCS      | SDA输出延迟时钟源选择<br>0: 选择内部参考时钟 (IICφ) 作为SDA输出延迟计数器的时钟源<br>1: 选择内部参考时钟除以2(IICφ/2)作为SDA输出延迟计数器的时钟源*1  | R/W |

注1.设置DLCS=1(IICφ/2)仅在SCL为低电平时有效。当SCL为高电平时，DLCS=1设置无效，时钟源变为内部参考时钟(IICφ)。

**TMOS位 (超时检测时间选择)**

当使能超时功能 (ICFER.TMOE=1) 时，TMOS位为超时检测时间选择长模式或短模式。当该位设置为0时，选择长模式。当设置为1时，选择短模式。在长模式下，超时检测内部计数器用作16位计数器。在短模式下，计数器用作14位计数器。当SCLn线处于启用TMOH和TMOL位中指定的计数器的状态时，计数器

counts up in synchronization with the internal reference clock (IICφ) as a count source. For details on this function, see [section 28.12.1. Timeout Function](#).

**TMOL bit (Timeout L Count Control)**

The TMOL bit enables or disables up-counting on the internal counter of the timeout function while the SCLn line is held low and the timeout function is enabled (ICFER.TMOE = 1).

**TMOH bit (Timeout H Count Control)**

The TMOH bit enables or disables up-counting on the internal counter of the timeout function while the SCLn line is held high and the timeout function is enabled (ICFER.TMOE = 1).

**SDDL[2:0] bits (SDA Output Delay Counter)**

The SDDL[2:0] bits can be used to delay the SDA output. This counter works with the clock source selected in the DLCS bit. This setting can be used for all types of SDA output, including transmission of the acknowledge bit.

Set the SDA output delay to meet the I<sup>2</sup>C bus standard for the data enable time/acknowledge enable time,\*1 or the SMBus standard, within [data hold time (300 ns or more + the SCL clock low-level period) - the data setup time (250 ns)]. If a value outside the standard is set, communication between devices might malfunction or falsely indicate a start or stop condition, depending on the bus state.

For details on this function, see [section 28.5. SDA Output Delay Function](#).

Note 1. Data enable time/acknowledge enable time.

- 3,450 ns for up to 100 kbps: Standard mode (Sm)
- 900 ns for up to 400 kbps: Fast mode (Fm)
- 450 ns for up to 1 Mbps: Fast-mode Plus (Fm+)

**28.2.5 ICMR3 : I<sup>2</sup>C Bus Mode Register 3**

与作为计数源的内部参考时钟(IICφ)同步计数。有关此功能的详细信息，请参阅第28.12.1节。超时功能。

**TMOL位 (超时L计数控制)**

TMOL位启用或禁用超时功能内部计数器的递增计数，同时SCLn线保持低电平且启用超时功能(ICFER.TMOE=1)。

**TMOH位 (超时H计数控制)**

TMOH位启用或禁用超时功能内部计数器的递增计数，同时SCLn线保持高电平且启用超时功能(ICFER.TMOE=1)。

**SDDL[2:0]位 (SDA输出延迟计数器)**

SDDL[2:0]位可用于延迟SDA输出。该计数器与在DLCS位中选择的时钟源一起工作。该设置可用于所有类型的SDA输出，包括确认位的传输。

将SDA输出延迟设置为满足I2C总线标准的数据使能时间确认使能时间，\*1或SMBus标准，在[数据保持时间(300 ns或更长+SCL时钟低电平周期) - 数据建立时间(250ns)]。如果设置了超出标准的值，则设备之间的通信可能会发生故障或错误地指示开始或停止条件，具体取决于总线状态。

有关此功能的详细信息，请参阅第28.5节。SDA输出延迟功能。

注1.数据使能时间确认使能时间。

- 3 450ns, 最高100kbps: 标准模式(Sm)
- 900ns, 最高400kbps: 快速模式(Fm)
- 高达1Mbps时为450ns: Fast-modePlus(Fm+)

**28.2.5 ICMR3:I2C总线模式寄存器3**

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 6   | WAIT   | Low-hold is released by reading ICDRR.<br>0: No wait (The SCLn line is not held low during the period between the 9th clock cycle and the 1st clock cycle.)<br>1: Wait (The SCLn line is held low during the period between the 9th clock cycle and the 1st clock cycle.) | R/W <sup>2</sup> |
| 7   | SMBS   | SMBus/I <sup>2</sup> C Bus Select<br>0: Select I <sup>2</sup> C Bus<br>1: Select SMBus  | R/W              |

Note 1. Write to the ACKBT bit only while the ACKWP bit is already 1. If the application writes 1 to the ACKWP and ACKBT bits at the same time, the ACKBT bit is not set to 1.

Note 2. The WAIT and RDRFS bits are only valid in receive mode (invalid in transmit mode).

### NF[1:0] bits (Noise Filter Stage Select)

The NF[1:0] bits select the number of stages in the digital noise filter. For details on this function, see [section 28.6. Digital Noise Filter Circuits](#)

Note: Set the noise range to be filtered within a range less than the SCLn line high- or low-level period. If the noise range is set to a value of [SCL clock width: high- or low-level period, whichever is shorter] - [1.5 internal reference clock (IICφ) cycles + analog noise filter: 120 ns (reference values)] or more, the SCL clock is regarded as noise, which might prevent the IIC from operating normally.

### ACKBR bit (Receive Acknowledge)

The ACKBR bit stores the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

- When 1 is received as the acknowledge bit with the TRS bit in ICCR2 set to 1.

[Clearing conditions]

- When 0 is received as the acknowledge bit with the TRS bit in ICCR2 set to 1
- When 1 is written to the IICRST bit in ICCR1 while the ICE bit in ICCR1 is 0 (IIC reset).

### ACKBT bit (Transmit Acknowledge)

The ACKBT bit sets the acknowledge bit to be sent in receive mode

[Setting condition]

- When 1 is written to this bit with the ACKWP bit set to 1.

[Clearing conditions]

- When 0 is written to this bit with the ACKWP bit set to 1
- When stop condition request is detected with the SP bit in ICCR2 set to 1
- When 1 is written to the IICRST bit in ICCR1 while the ICE bit in ICCR1 is 0 (IIC reset).

### ACKWP bit (ACKBT Write Protect)

The ACKWP bit controls write enabling of the ACKBT bit.

### RDRFS bit (RDRF Flag Set Timing Select)

The RDRFS bit selects the RDRF flag set timing in receive mode and also selects whether to hold the SCLn line low on the falling edge of the 8th SCL clock cycle.

When the RDRFS bit is 0, the SCLn line is not held low on the falling edge of the 8th SCL clock cycle, and the RDRF flag is set to 1 on the rising edge of the 9th SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 on the rising edge of the 8th SCL clock cycle, and the SCLn line is held low on the falling edge of the 8th SCL clock cycle. The low-hold of the SCLn line is released by a write to the ACKBT bit.

After data is received with this setting, the SCLn line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1), based on the receive data.

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 6   | WAIT   | 通过读取ICDRR释放低保持。<br>0: 无等待 (在第9个时钟周期和第1个时钟周期之间的时间段内, SCLn线不保持低电平。)<br>1: 等待 (SCLn线在第9个时钟周期和第1个时钟周期之间保持低电平。) | R/W <sup>2</sup> |
| 7   | SMBS   | SMBusI2C总线选择<br>0: 选择I2C总线1<br>1: 选择SMBus  | R/W              |

注1.仅当ACKWP位已经为1时才写入ACKBT位。如果应用程序同时向ACKWP和ACKBT位写入1,则ACKBT位不会设置为1。

注2.WAIT和RDRFS位仅在接收模式下有效 (在发送模式下无效)。

### NF[1:0]位 (噪声滤波器级选择)

NF[1:0]位选择数字噪声滤波器的级数。关于此功能的详细信息,请参阅第28.6节。数字的噪声滤波电路

Note: 将要过滤的噪声范围设置在小于SCLn线高电平或低电平周期的范围内。如果噪声范围设置为[SCL时钟宽度: 高电平或低电平周期,以较短者为准][1.5内部参考时钟(IICφ)周期+模拟噪声滤波器: 120ns (参考值)]或更大的值,则SCL时钟被视为噪声,可能会妨碍IIC正常工作。

### ACKBR bit (Receive Acknowledge)

ACKBR位存储在发送模式下从接收设备接收到的确认位信息。

[Setting condition]

- 当ICCR2中的TRS位设置为1接收到1作为确认位时。

[Clearing conditions]

- 当ICCR2中的TRS位设置为1接收到0作为确认位时
- 当ICCR1中的IICRST位写入1而ICCR1中的ICE位为0时 (IIC复位)。

### ACKBT bit (Transmit Acknowledge)

ACKBT位设置要在接收模式下发送的确认位

[Setting condition]

- 当1写入该位且ACKWP位设置为1时。

[Clearing conditions]

- 当0写入该位且ACKWP位设置为1时
- ICCR2的SP位设置为1时检测到停止条件请求时
- 当ICCR1中的IICRST位写入1而ICCR1中的ICE位为0时 (IIC复位)。

### ACKWP位 (ACKBT写保护)

ACKWP位控制ACKBT位的写使能。

### RDRFS位 (RDRF标志设置时序选择)

RDRFS位选择接收模式下的RDRF标志设置时序,并选择是否在第8个SCL时钟周期的下降沿保持SCLn线为低电平。

当RDRFS位为0时,SCLn线在第8个SCL时钟周期的下降沿不保持低电平,并且RDRF标志在第9个SCL时钟周期的上升沿设置为1。

当RDRFS位为1时,RDRF标志在第8个SCL时钟周期的上升沿设置为1,并且SCLn线在第8个SCL时钟周期的下降沿保持低电平。SCLn线的低保持通过写ACKBT位来释放。

使用此设置接收数据后,SCLn线在发送确认位之前自动保持低电平。这使处理能够根据接收数据发送ACK(ACKBT=0)或NACK(ACKBT=1)。

**WAIT bit (WAIT)**

The WAIT bit controls whether to force a low-hold between the ninth SCL clock cycle and the first SCL clock cycle, until the receive data buffer (ICDRR) is completely read each time single-byte data is received in receive mode.

When the WAIT bit is 0, the receive operation continues without a low-hold between the ninth and the first SCL clock cycle. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCLn line is held low from the falling edge of the ninth clock cycle until the ICDRR value is read each time single-byte data is received. This enables receive operation in byte units.

Note: When the value of the WAIT bit is to be read, always read ICDRR first.

**SMBS bit (SMBus/I<sup>2</sup>C Bus Select)**

Setting the SMBS bit to 1 selects the SMBus and enables the HOAE bit in ICSEER.

**28.2.6 ICFER : I<sup>2</sup>C Bus Function Enable Register**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

| 6   | SCLE              | SCL Synchronous Circuit Enable<br>0: Do not use the SCL synchronous circuit<br>1: Use the SCL synchronous circuit  | R/W |
| 7   | FMPE <sup>1</sup> | Fast-Mode Plus Enable<br>0: Do not use the Fm+ slope control circuit for the SCLn and SDA n pins<br>1: Use the Fm+ slope control circuit for the SCLn and SDA n pins.  | R/W |

Note 1. The Fast-mode Plus enable bit (FMPE) is supported by IIC0 (SCL0\_A, SDA0\_A). Bit [7] is the reserved bit in the not supported channel.

**TMOE bit (Timeout Function Enable)**

The TMOE bit enables or disables the timeout function. For details on this function, see [section 28.12.1. Timeout Function](#).

**等待位 (等待)**

WAIT位控制是否在第9个SCL时钟周期和第一个SCL时钟周期之间强制保持低电平，直到每次在接收模式下接收到单字节数据时完全读取接收数据缓冲区(ICDRR)。

当WAIT位为0时，接收操作继续，在第9个和第一个SCL时钟周期之间没有低电平保持。当RDRFS和WAIT位都为0时，双缓冲器使能连续接收操作。

当WAIT位为1时，SCLn线从第9个时钟周期的下降沿保持低电平，直到每次接收到单字节数据时读取ICDRR值。这启用了以字节为单位的接收操作。

Note: 当要读取WAIT位的值时，总是先读取ICDRR。

**SMBS位 (SMBus/I<sup>2</sup>C总线选择)**

将SMBS位设置为1可选择SMBus并启用ICSEER中的HOAE位。

**28.2.6 ICFER:I2C总线功能使能寄存器**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

注1.IIC0(SCL0\_A SDA0\_A)支持Fast-modePlus使能位(FMPE)。位[7]是不支持通道中的保留位。

**TMOE位 (超时功能使能)**

TMOE位启用或禁用超时功能。有关此功能的详细信息，请参阅第28.12.1节。超时功能。

**MALE bit (Master Arbitration-Lost Detection Enable)**

The MALE bit specifies whether to use the arbitration-lost detection function in master mode. Normally, set this bit to 1.

**NALE bit (NACK Transmission Arbitration-Lost Detection Enable)**

The NALE bit specifies whether to cause arbitration to be lost when ACK is detected during transmission of NACK in receive mode, for example when slaves with the same address exist on the bus or when two or more masters select the same slave device simultaneously with a different number of receive bytes.

**SALE bit (Slave Arbitration-Lost Detection Enable)**

The SALE bit specifies whether to cause arbitration to be lost when a value different from the value being transmitted is detected on the bus in slave transmit mode, for example when slaves with the same address exist on the bus or when a mismatch with the transmit data occurs because of noise.

**NACKE bit (NACK Reception Transfer Suspension Enable)**

The NACKE bit specifies whether to continue or discontinue the transfer operation when NACK is received in transmit mode. Normally, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended. When the NACKE bit is 0, the next transfer operation continues regardless of the received acknowledge content.

For details, see [section 28.9.2. NACK Reception Transfer Suspension Function](#).

**SCLE bit (SCL Synchronous Circuit Enable)**

The SCLE bit specifies whether to synchronize the SCL clock with the SCL input clock. Normally, set this bit to 1.

When the SCLE bit is set to 0 (no SCL synchronous circuit used), the IIC does not synchronize the SCL clock with the SCL input clock. With this setting, the IIC outputs the SCL clock at the transfer rate set in ICBRH and ICBRL, regardless of the SCLn line state. For this reason, if the bus load of the I<sup>2</sup>C bus line is much larger than the specification value, or if the SCL clock output overlaps in multiple masters, a short-cycle SCL clock that does not meet the specification might be output. When no SCL synchronous circuit is used, it also affects the issuing of the start, restart, and stop conditions, and the continuous output of extra SCL clock cycles.

Do not set this bit to 0 except when checking the output of the set transfer rate.

**FMPE bit (Fast-Mode Plus Enable)**

The FMPE bit specifies whether to use a slope control circuit for Fast-mode Plus (Fm+).

When this bit is set to 1, a slope control circuit conforming to the I<sup>2</sup>C bus Fast-mode Plus (Fm+) standard (tof) is selected. When this bit is set to 0, a slope control circuit conforming to the I<sup>2</sup>C bus Standard-mode (Sm) and Fast-mode (Fm) standards (tof) is selected.

Set this bit to 1 when using transmission rates up to 1 Mbps (Fast-mode Plus (Fm+) standard). Set it to 0 when using other transmission rates (up to 100 kbps (Sm) or up to 400 kbps (Fm)) or for SMBus (10 to 100 kbps).

**28.2.7 IC SER : I<sup>2</sup>C Bus Status Enable Register**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x06

|                    |      |   |      |   |      |           |           |           |
|--------------------|------|---|------|---|------|-----------|-----------|-----------|
| Bit position:      | 7    | 6 | 5    | 4 | 3    | 2         | 1         | 0         |

| Value after reset: | 0    | 0 | 0    | 0 | 1    | 0         | 0         | 1         |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | SAR0E  | Slave Address Register 0 Enable<br>0: Disable slave address in SARL0 and SARU0<br>1: Enable slave address in SARL0 and SARU0 | R/W |

**MALE位 (主仲裁丢失检测使能)**

MALE位指定是否在主机模式下使用仲裁丢失检测功能。通常，将此位设置为1。

**NALE位 (NACK传输仲裁丢失检测使能)**

NALE位指定在接收模式下发送NACK期间检测到ACK时是否导致仲裁丢失，例如，当总线上存在具有相同地址的从设备时，或者当两个或多个主设备同时选择相同的从设备时接收字节数。

**SALE位 (从设备仲裁丢失检测使能)**

SALE位指定当在从发送模式下在总线上检测到与正在发送的值不同的值时，是否导致仲裁丢失，例如，当总线上存在具有相同地址的从机或与发送数据不匹配时由于噪音而发生。

**NACKE位 (NACK接收传输暂停使能)**

NACKE位指定在发送模式下接收到NACK时是继续还是停止传输操作。通常，将此位设置为1。

当在NACKE位设置为1的情况下接收到NACK时，暂停下一个传输操作。当NACKE位为0时，无论接收到的确认内容如何，下一次传输操作都会继续进行。

有关详细信息，请参阅第28.9.2节。NACK接收传输暂停功能。

**SCLE位 (SCL同步电路使能)**

SCLE位指定是否将SCL时钟与SCL输入时钟同步。通常，将此位设置为1。

当SCLE位设置为0 (不使用SCL同步电路) 时，IIC不会将SCL时钟与SCL输入时钟同步。使用此设置，无论SCLn线路状态如何，IIC都以ICBRH和ICBRL中设置的传输速率输出SCL时钟。因此，如果I2C总线的总线负载远大于规格值，或者多个主机的SCL时钟输出重叠，则可能会输出不符合规格的短周期SCL时钟。当不使用SCL同步电路时，也会影响启动、重启和停止条件的发出，以及额外SCL时钟周期的连续输出。

除非检查设置传输速率的输出，否则不要将此位设置为0。

**FMPE位 (Fast-Mode Plus Enable)**

FMPE位指定是否对Fast-mode Plus (Fm+) 使用斜率控制电路。

当该位设置为1时，选择符合I2C总线快速模式加(Fm+)标准(tof)的斜率控制电路。

当该位设置为0时，选择符合I2C总线标准模式(Sm)和快速模式(Fm)标准(tof)的斜率控制电路。

当使用高达1Mbps的传输速率 (Fast-mode Plus (Fm+) 标准) 时，将此位设置为1。当使用其他传输速率 (最高100kbps(Sm)或最高400kbps(Fm)) 或SMBus (10至100kbps) 时，将其设置为0。

**28.2.7 IC SER: I2C总线状态使能寄存器**

| 7   | HOAE   | Host Address Enable<br>0: Disable host address detection<br>1: Enable host address detection                                 | R/W |

**SARyE bit (Slave Address Register y Enable) (y = 0 to 2)**

The SARyE bit enables or disables the received slave address and the slave address set in SARLy and SARUy.

When this bit is set to 1, the slave address set in SARLy and SARUy is enabled and is compared with the received slave address. When this bit is set to 0, the slave address set in SARLy and SARUy is disabled and is ignored even if it matches the received slave address.

**GCAE bit (General Call Address Enable)**

The GCAE bit specifies whether to ignore the general call address (0000 000b + 0 [W]: All 0) when it is received.

When this bit is set to 1, if the received slave address matches the general call address, the IIC recognizes the received slave address as the general call address independently of the slave addresses set in SARLy and SARUy (y = 0 to 2) and performs the data receive operation. When this bit is set to 0, the received slave address is ignored even if it matches the general call address.

**DIDE bit (Device-ID Address Detection Enable)**

The DIDE bit specifies whether to recognize and execute the device-ID address when a device ID (1111 100b) is received in the first frame after a start or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the IIC recognizes that the device-ID address was received. When the next R/W# bit is 0 (W), the IIC recognizes the second and the subsequent frames as slave addresses and continues the receive operation. When this bit is set to 0, the IIC ignores the received first frame even if it matches the device-ID address, and it recognizes the first frame as a normal slave address.

For details on this function, see [section 28.7.3. Device-ID Address Detection](#).

**HOAE bit (Host Address Enable)**

The HOAE bit specifies whether to ignore the received host address (0001 000b) when the SMBS bit in ICMR3 is 1.

When this bit is set to 1 while the SMBS bit in ICMR3 is 1, if the received slave address matches the host address, the IIC recognizes the received slave address as the host address independently of the slave addresses set in SARLy and SARUy (y = 0 to 2) and performs the receive operation.

When the SMBS bit in ICMR3 or the HOAE bit is set to 0, the received slave address is ignored even if it matches the host address.

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 1   | SAR1E  | 从地址寄存器1使能<br>0: 禁用SARL1和SARU1中的从地址1: 启用SARL1和SARU1中的从地址 | R/W |
| 2   | SAR2E  | 从地址寄存器2使能<br>0: 禁用SARL2和SARU2中的从地址1: 启用SARL2和SARU2中的从地址 | R/W |
| 3   | GCAE   | 广播呼叫地址启用<br>0: 禁用广播地址检测1: 启用广播地址检测                      | R/W |
| 4   | —      | 该位读取为0。写入值应为0。  | R/W |
| 5   | DIDE   | 设备ID地址检测启用<br>0: 禁用设备ID地址检测1: 启用设备ID地址检测                | R/W |
| 6   | —      | 该位读取为0。写入值应为0。  | R/W |
| 7   | HOAE   | 主机地址启用<br>0: 禁用主机地址检测1: 启用主机地址检测                        | R/W |

**SARyE位（从地址寄存器y使能）（y=0到2）**

SARyE位启用或禁用接收到的从机地址和设置在SARLy和SARUy中的从机地址。

当该位设置为1时，设置在SARLy和SARUy中的从机地址被启用，并与接收到的从机地址进行比较。当该位设置为0时，设置在SARLy和SARUy中的从机地址被禁用并被忽略，即使它与接收到的从机地址匹配。

**GCAE位（广播呼叫地址使能）**

GCAE位指定接收到的广播调用地址（0000000b+0[W]：全0）是否忽略。

当该位设置为1时，如果接收到的从机地址与广播呼叫地址匹配，则IIC将接收到的从机地址识别为广播呼叫地址，而与在SARLy和SARUy中设置的从机地址（y=0到2）无关，并执行数据接收操作。当该位设置为0时，即使接收到的从机地址与广播呼叫地址匹配，也会忽略它。

**DIDE位（设备ID地址检测使能）**

DIDE位指定在检测到启动或重新启动条件后的第一帧中接收到设备ID(1111100b)时是否识别和执行设备ID地址。

当该位设置为1时，如果接收到的第一个帧与设备ID匹配，则IIC识别出设备ID地址已被接收。当下一个RW#位为0 (W)时，IIC将第二个和后续帧识别为从地址并继续接收操作。当该位设置为0时，IIC忽略接收到的第一帧，即使它与设备ID地址匹配，并将第一帧识别为正常的从地址。

有关此功能的详细信息，请参阅[第28.7.3节。设备ID地址检测](#)。

**HOAE位（主机地址使能）**

HOAE位指定当ICMR3中的SMBS位为1时是否忽略接收到的主机地址（0001000b）。

当该位设置为1而ICMR3中的SMBS位为1时，如果接收到的从机地址与主机地址匹配，则IIC将接收到的从机地址识别为主机地址，而与SARLy和SARUy中设置的从机地址无关（y=0到2）并执行接收操作。

当ICMR3中的SMBS位或HOAE位设置为0时，即使接收到的从机地址与主机地址匹配，也会忽略它。

28.2.8 ICIER : I<sup>2</sup>C Bus Interrupt Enable Register

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x07

**TMOIE bit (Timeout Interrupt Request Enable)**

The TMOIE bit enables or disables timeout interrupt (TMOI) requests when the TMOF flag in ICSR2 is 1. To cancel a TMOI interrupt request, set the TMOF flag or the TMOIE bit to 0.

**ALIE bit (Arbitration-Lost Interrupt Request Enable)**

The ALIE bit enables or disables arbitration-lost interrupt (ALI) requests when the AL flag in ICSR2 is 1. To cancel an ALI interrupt request, set the AL flag or the ALIE bit to 0.

**STIE bit (Start Condition Detection Interrupt Request Enable)**

The STIE bit enables or disables start condition detection interrupt (STI) requests when the START flag in ICSR2 is 1. To cancel an STI interrupt request, set the START flag or the STIE bit to 0.

**SPIE bit (Stop Condition Detection Interrupt Request Enable)**

The SPIE bit enables or disables stop condition detection interrupt (SPI) requests when the STOP flag in ICSR2 is 1. To cancel an SPI interrupt request, set the STOP flag or the SPIE bit to 0.

**NAKIE bit (NACK Reception Interrupt Request Enable)**

The NAKIE bit enables or disables NACK reception interrupt (NAKI) requests when the NACKF flag in ICSR2 is 1. To cancel a NAKI interrupt request, set the NACKF flag or the NAKIE bit to 0.

## 28.2.8 ICIER:I2C总线中断使能寄存器

| 7   | TIE    | 发送数据空中断请求使能<br>0: 禁止发送数据空中断 (IICn_TXI) 请求<br>1: 使能发送数据空中断 (IICn_TXI) 请求 | R/W |

**TMOIE位 (超时中断请求使能)**

当ICSR2中的TMOF标志为1时，TMOIE位启用或禁用超时中断(TMOI)请求。取消一个TMOI中断请求，设置TMOF标志或TMOIE位为0。

**ALIE位 (仲裁失败中断请求使能)**

当ICSR2中的AL标志为1时，ALIE位启用或禁用仲裁丢失中断(ALI)请求。要取消ALI中断请求，请将AL标志或ALIE位设置为0。

**STIE位 (启动条件检测中断请求使能)**

当ICSR2中的START标志为1时，STIE位启用或禁用启动条件检测中断(STI)请求。要取消STI中断请求，请将START标志或STIE位设置为0。

**SPIE位 (停止条件检测中断请求使能)**

当ICSR2中的STOP标志为1时，SPIE位启用或禁用停止条件检测中断(SPI)请求。要取消SPI中断请求，请将STOP标志或SPIE位设置为0。

**NAKIE位 (NACK接收中断请求使能)**

当ICSR2中的NACKF标志为1时，NAKIE位启用或禁用NACK接收中断(NAKI)请求。要取消NAKI中断请求，请将NACKF标志或NAKIE位设置为0。

**RIE bit (Receive Data Full Interrupt Request Enable)**

The RIE bit enables or disables receive data full interrupt (IICn\_RXI) requests when the RDRF flag in ICSR2 is 1.

**TEIE bit (Transmit End Interrupt Request Enable)**

The TEIE bit enables or disables transmit end interrupt (IICn\_TEI) requests when the TEND flag in ICSR2 is 1. To cancel an IICn\_TEI interrupt request, set the TEND flag or the TEIE bit to 0.

**TIE bit (Transmit Data Empty Interrupt Request Enable)**

The TIE bit enables or disables transmit data empty interrupt (IICn\_TXI) requests when the TDRE flag in ICSR2 is 1.

**28.2.9 ICSR1 : I<sup>2</sup>C Bus Status Register 1**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x08

Note 1. Only 0 can be written to clear the flag.

**AASy flag (Slave Address y Detection flag) (y = 0 to 2)**

The AASy flag indicates whether slave address y was detected.

[Setting conditions]

For 7-bit address format (SARUy.FS = 0):

- When the received slave address matches the SVA[6:0] value in SARLy, with the SARyE bit in ICSEY set to 1 (slave address y detection enabled).  
The AASy flag is set to 1 on the rising edge of the ninth SCL clock cycle in the frame.

For 10-bit address format: (SARUy.FS = 1):

**RIE位 (接收数据满中断请求使能)**

当ICSR2中的RDRF标志为1时, RIE位启用或禁用接收数据完整中断(IICn\_RXI)请求。

**TEIE位 (发送结束中断请求使能)**

当ICSR2中的TEND标志为1时, TEIE位启用或禁用发送结束中断(IICn\_TEI)请求。要取消IICn\_TEI中断请求, 请将TEND标志或TEIE位设置为0。

**TIE位 (发送数据空中断请求使能)**

当ICSR2中的TDRE标志为1时, TIE位启用或禁用发送数据空中断 (IICn\_TXI) 请求。

**28.2.9 ICSR1:I2C总线状态寄存器1**

| 5   | DID    | 设备ID地址检测标志<br>当检测到开始条件后立即接收到的第一个帧与(设备ID(1111100b)+0[W])的值匹配时, 该位设置为1。<br>0: 未检测到设备ID命令1: 检测到设备ID命令 | R/(W) <sup>*1</sup> |
| 6   | —      | 该位读取为0。写入值应为0。   | R/W                 |
| 7   | HOA    | 主机地址检测标志<br>当接收到的从机地址与主机地址(0001000b)匹配时, 该位设置为1。<br>0: 未检测到主机地址1: 检测到主机地址                          | R/(W) <sup>*1</sup> |

注1.只能写入0来清除标志。

**AASy标志 (从机地址y检测标志) (y=0到2)**

AASy标志指示是否检测到从地址y。

[Setting conditions]

对于7位地址格式(SARUy.FS=0):

- 当接收到的从地址与SARLy中的SVA[6:0]值匹配时, ICSEY中的SARyE位设置为1 (从地址y检测使能)。AASy标志在帧中第9个SCL时钟周期的上升沿设置为1。

对于10位地址格式: (SARUy.FS=1):

- When the received slave address matches a value of (11110b + SVA[1:0] in SARUy), and the subsequent address matches the SARLy value, with the SARyE bit in ICSEr set to 1 (slave address y detection enabled). The AASy flag is set to 1 on the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy flag after reading AASy = 1
- When a stop condition is detected
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

For 7-bit address format (SARUy.FS = 0):

- When the received slave address does not match the SVA[6:0] value in SARLy, with the SARyE bit in ICSEr set to 1 (slave address y detection enabled). The AASy flag is set to 0 on the rising edge of the ninth SCL clock cycle in the frame.

For 10-bit address format (SARUy.FS = 1):

- When the received slave address does not match a value of (11110b + SVA[1:0] in SARUy), with the SARyE bit in ICSEr set to 1 (slave address y detection enabled). The AASy flag is set to 0 on the rising edge of the ninth SCL clock cycle in the frame.
- When the received slave address matches a value of (11110b + SVA[1:0] in SARUy), and the subsequent address does not match the SARLy value, with the SARyE bit in ICSEr set to 1 (slave address y detection enabled). The AASy flag is set to 0 on the rising edge of the ninth SCL clock cycle in the frame.

#### GCA flag (General Call Address Detection Flag)

The GCA flag indicates whether the general call address was detected.

[Setting condition]

- When the received slave address matches the general call address (0000 000b + 0 [W]), with the GCAE bit in ICSEr set to 1 (general call address detection enabled). The GCA flag is set to 1 on the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA flag after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000 000b + 0 [W]), with the GCAE bit in ICSEr set to 1 (general call address detection enabled). The GCA flag is set to 0 on the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

#### DID flag (Device-ID Address Detection Flag)

The DID flag indicates whether the device-ID address was detected.

[Setting condition]

- When the first frame received immediately after a start or restart condition is detected matches a value of (device ID (1111 100b) + 0 [W]), with the DIDE bit in ICSEr set to 1 (device-ID address detection enabled). The DID flag is set to 1 on the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID flag after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start or restart condition is detected does not match a value of (device ID (1111 100b)), with the DIDE bit in ICSEr set to 1 (device-ID address detection enabled). The DID flag is set to 0 on the rising edge of the ninth SCL clock cycle in the frame.

- 当接收到的从地址与 (SARUy中的11110b+SVA[1:0]) 值匹配, 并且后续地址与SARLy值匹配时, ICSEr中的SARyE位设置为1 (启用从地址y检测)。AASy标志在帧中第9个SCL时钟周期的上升沿设置为1。

[Clearing conditions]

- 读取AASy=1后向AASy标志写入0时
- 检测到停止条件时
- 当ICCR1的IICRST位写入1时, 应用IIC复位或内部复位。

对于7位地址格式(SARUy.FS=0):

- 当接收到的从地址与SARLy中的SVA[6:0]值不匹配时, 将ICSEr中的SARyE位设置为1 (启用从地址y检测)。AASy标志在帧中第9个SCL时钟周期的上升沿设置为0。

对于10位地址格式(SARUy.FS=1):

- 当接收到的从地址与 (SARUy中的11110b+SVA[1:0]) 的值不匹配时, ICSEr中的SARyE位设置为1 (启用从地址y检测)。AASy标志在帧中第9个SCL时钟周期的上升沿设置为0。
- 当接收到的从地址与 (SARUy中的11110b+SVA[1:0]) 值匹配, 且后续地址与SARLy值不匹配时, ICSEr中的SARyE位设置为1 (启用从地址y检测)。AASy标志在帧中第9个SCL时钟周期的上升沿设置为0。

#### GCA标志 (广播呼叫地址检测标志)

GCA标志指示是否检测到广播呼叫地址。

[Setting condition]

- 当接收到的从机地址与广播呼叫地址 (0000000b+0[W]) 匹配时, ICSEr中的GCAE位设置为1 (启用广播呼叫地址检测)。GCA标志在帧中第9个SCL时钟周期的上升沿设置为1。

[Clearing conditions]

- 读取GCA=1后将0写入GCA标志时
- 检测到停止条件时
- 当接收到的从机地址与广播呼叫地址 (0000000b+0[W]) 不匹配时, 将ICSEr中的GCAE位设置为1 (启用广播呼叫地址检测)。GCA标志在帧中第9个SCL时钟周期的上升沿设置为0。
- 当ICCR1的IICRST位写入1时, 应用IIC复位或内部复位。

#### DID标志 (设备ID地址检测标志)

DID标志指示是否检测到设备ID地址。

[Setting condition]

- 当检测到启动或重启条件后立即接收到的第一帧与 (设备ID(1111100b)+0[W]) 的值匹配, 且ICSEr中的DIDE位设置为1 (启用设备ID地址检测)。DID标志在帧中第9个SCL时钟周期的上升沿设置为1。

[Clearing conditions]

- 读取DID=1后向DID标志写入0时
- 检测到停止条件时
- 当检测到启动或重启条件后立即接收到的第一帧与 (设备ID (1111100b)) 的值不匹配时, ICSEr中的DIDE位设置为1 (启用设备ID地址检测)。DID标志在帧中第9个SCL时钟周期的上升沿设置为0。

- When the first frame received immediately after a start or restart condition is detected matches a value of (device ID (1111 100b) + 0 [W]), and the second frame does not match any slave address from 0 to 2, with the DIDE bit in IC SER set to 1 (device-ID address detection enabled)  
The DID flag is set to 0 on the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

**HOA flag (Host Address Detection Flag)**

The HOA flag indicates whether the host address was detected.

[Setting condition]

- When the received slave address matches the host address (0001 000b), with the HOAE bit in IC SER set to 1 (host address detection enabled).  
The HOA flag is set to 1 on the rising edge of the ninth SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the HOA flag after reading HOA = 1
- When a stop condition is detected
- When the received slave address does not match the host address (0001 000b), with the HOAE bit in IC SER set to 1 (host address detection enabled)  
The HOA flag is set to 0 on the rising edge of the ninth SCL clock cycle in the frame.
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

**28.2.10 ICSR2 : I<sup>2</sup>C Bus Status Register 2**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x09

| Bit | Symbol | Function   | R/W                 |
|-----|--------|--|---------------------|
| 0   | TMOF   | Timeout Detection Flag<br>0: Timeout not detected<br>1: Timeout detected                         | R/(W) <sup>*1</sup> |
| 1   | AL     | Arbitration-Lost Flag<br>0: Arbitration not lost<br>1: Arbitration lost                          | R/(W) <sup>*1</sup> |

- 当检测到启动或重启条件后立即接收到的第一帧与（设备ID）的值匹配时（1111100b)+0[W]，并且第二帧不匹配从0到2的任何从机地址，且ICSER中的DIDE位设置为1（启用设备ID地址检测）DID标志设置为0在帧的第9个SCL时钟周期的上升沿。

- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

**HOA标志（主机地址检测标志）**

HOA标志指示是否检测到主机地址。

[Setting condition]

- 当接收到的从机地址与主机地址（0001000b）匹配时，ICSER中的HOAE位设置为1（主机地址检测使能）。HOA标志在帧中第9个SCL时钟周期的上升沿设置为1。

[Clearing conditions]

- 读取HOA=1后向HOA标志写入0时
- 检测到停止条件时
- 当接收到的从机地址与主机地址（0001000b）不匹配时，ICSER中的HOAE位设置为1（主机地址检测使能）在第9个SCL时钟周期的上升沿将HOA标志设置为0框架。
- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

**28.2.10 ICSR2: I2C总线状态寄存器2**

| 6   | TEND   | 发送结束标志<br>0: 数据发送中1: 数据发送完成              | R/(W) <sup>*1</sup> |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 7   | TDRE   | Transmit Data Empty Flag<br>0: ICDRT contains transmit data<br>1: ICDRT contains no transmit data | R   |

Note 1. Only 0 can be written, to clear the flag.

### TMOF flag (Timeout Detection Flag)

The TMOF flag is set to 1 when the IIC detects a timeout because the SCLn line state remains unchanged for the set period.

[Setting condition]

- When the SCLn line state remains unchanged for the period specified in the ICMR2.TMOH, TMOL, and TMOS bits while the ICFER.TMOE bit is 1 (timeout function enabled) in master or in slave mode and the received slave address matches.

[Clearing conditions]

- When 0 is written to the TMOF flag after reading TMOF = 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

### AL flag (Arbitration-Lost Flag)

The AL flag indicates that bus mastership was lost in arbitration because of a bus conflict or some other reason when a start condition was issued or an address and data was transmitted. The IIC monitors the level on the SDAn line during transmission and, if the level on the line does not match the value of the bit being output, is set the value of the AL flag to 1 to indicate that the bus is occupied by another device.

The IIC can also set the AL flag to indicate the detection of arbitration loss during NACK transmission or during data transmission.

[Setting conditions]

When master arbitration-lost detection is enabled (ICFER.MALE = 1):

- When the internal SDA output state does not match the SDAn line level on the rising edge of the SCL clock except for the ACK period during data transmission in master transmit mode
- When a start condition is detected while the ST bit in ICCR2 is 1 (start condition requested) or the internal SDA output state does not match the SDAn line level
- When the ST bit in ICCR2 is 1 (start condition requested), with the BBSY flag in ICCR2 set to 1.

When NACK arbitration-lost detection is enabled (ICFER.NALE = 1):

- When the internal SDA output state does not match the SDAn line level on the rising edge of the SCL clock in the ACK period during NACK transmission in receive mode.

When slave arbitration-lost detection is enabled (ICFER.SALE = 1):

- When the internal SDA output state does not match the SDAn line level on the rising edge of the SCL clock, except for the ACK period during data transmission in slave transmit mode.

[Clearing conditions]

- When 0 is written to the AL flag after reading AL = 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

| Bit | Symbol | Function                                 | R/W |
|-----|--------|--|-----|
| 7   | TDRE   | 传输数据空标志<br>0: ICDRT包含发送数据1: ICDRT不包含发送数据 | R   |

注1.只能写入0,清除标志。

### TMOF标志 (超时检测标志)

当IIC检测到超时时, TMOF标志设置为1, 因为SCLn线路状态在设置的周期内保持不变。

[Setting condition]

- SCLn线路状态在ICMR2.TMOH、TMOL和TMOS位指定的时间段内保持不变, 而ICFER.TMOE位在主机或从机模式下为1 (使能超时功能) 并且接收到的从机地址匹配。

[Clearing conditions]

- 读取TMOF=1后向TMOF标志写入0时
- 当ICCR1的IICRST位写入1时, 应用IIC复位或内部复位。

### AL标志 (仲裁失败标志)

AL标志表明在发出启动条件或传输地址和数据时, 由于总线冲突或其他原因, 总线控制权在仲裁中丢失。IIC在传输过程中监视SDAn线上的电平, 如果线上的电平与正在输出的位的值不匹配, 则将AL标志的值设置为1, 以指示总线被另一个设备占用。

IIC还可以设置AL标志以指示在NACK传输或数据传输期间检测到仲裁丢失。

[Setting conditions]

当启用主机仲裁丢失检测时(ICFER.MALE=1):

- 主机传输模式下数据传输期间, 除了ACK周期外, 当内部SDA输出状态在SCL时钟的上升沿与SDAn线电平不匹配时
- 当ICCR2的ST位为1 (请求启动条件) 或内部SDA输出状态与SDAn线电平不匹配时检测到启动条件
- ICCR2中的ST位为1 (请求启动条件) 时, ICCR2中的BBSY标志设置为1。

当启用NACK仲裁丢失检测时(ICFER.NALE=1):

- 在接收模式下的NACK传输过程中, 当内部SDA输出状态在ACK周期的SCL时钟上升沿与SDAn线电平不匹配时。

当启用从设备仲裁丢失检测时(ICFER.SALE=1):

- 当内部SDA输出状态在SCL时钟的上升沿与SDAn线电平不匹配时, 除了在从机传输模式下数据传输期间的ACK周期。

[Clearing conditions]

- 读取AL=1后向AL标志写入0时
- 当ICCR1的IICRST位写入1时, 应用IIC复位或内部复位。

Table 28.4 Relationship between arbitration-lost generation sources and arbitration-lost enable functions

| ICFER |      |      | ICSR2 |  | Error                          | Arbitration-lost generation source   |
|-------|------|------|-------|--|--------------------------------|--|
| MALE  | NALE | SALE | AL    |  |                                |  |
| 1     | x    | x    | 1     |  | Start condition issuance error | When internal SDA output state does not match SDA line level when a start condition is detected, while the ST bit in ICCR2 is 1<br>When ST in ICCR2 is set to 1 while BBSY in ICCR2 is 1 |
|       |      |      | 1     |  | Transmit data mismatch         | When transmit data (including slave address) does not match the bus state in master transmit mode  |
| x     | 1    | x    | 1     |  | NACK transmission mismatch     | When ACK is detected during transmission of NACK in master or slave receive mode   |
| x     | x    | 1    | 1     |  | Transmit data mismatch         | When transmit data does not match the bus state in slave transmit mode   |

x: Don't care

#### START flag (Start Condition Detection Flag)

The START flag indicates whether a start or restart condition was detected.

[Setting condition]

- When a start or restart condition is detected.

[Clearing conditions]

- When 0 is written to the START flag after reading START = 1
- When a stop condition is detected
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

#### STOP flag (Stop Condition Detection Flag)

The STOP flag indicates whether a stop condition was detected.

[Setting condition]

- When a stop condition is detected.

[Clearing conditions]

- When 0 is written to the STOP flag after reading STOP = 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

#### NACKF flag (NACK Detection Flag)

The NACKF flag indicates whether a NACK was detected.

[Setting condition]

- When acknowledge is not received (NACK received) from the receive device in transmit mode, with the NACKE bit in ICFER set to 1 (transfer suspension enabled).

[Clearing conditions]

- When 0 is written to the NACKF flag after reading NACKF = 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: When the NACKF flag is set to 1, the IIC suspends data transmission and reception. Writing to ICDRT in transmit mode or reading from ICDRR in receive mode with the NACKF flag set to 1 does not enable data transmit or receive operation. To restart data transmission or reception, set the NACKF flag to 0.

#### RDRF flag (Receive Data Full Flag)

The RDRF flag indicates whether the ICDRR contains receive data.

Table 28.4 仲裁丢失生成源和仲裁丢失使能函数之间的关系

| ICFER |      |      | ICSR2 |  | Error     | 仲裁失败的生成源   |
|-------|------|------|-------|--|-----------|--|
| MALE  | NALE | SALE | AL    |  |           |  |
| 1     | x    | x    | 1     |  | 开始条件发布错误  | 当检测到启动条件时内部SDA输出状态与SDAn线电平不匹配, 而ICCR2中的ST位为1<br>ICCR2中的ST设置为1而ICCR2中的BBSY为1时 |
|       |      |      | 1     |  | 传输数据不匹配   | 当发送数据(包括从地址)与主发送模式下的总线状态不匹配时   |
| x     | 1    | x    | 1     |  | NACK传输不匹配 | 在主机或从机接收模式下发送NACK期间检测到ACK时   |
| x     | x    | 1    | 1     |  | 传输数据不匹配   | 当发送数据与从发送模式下的总线状态不匹配时  |

x: Don't care

#### START标志(开始条件检测标志)

START标志指示是否检测到启动或重新启动条件。

[Setting condition]

- 检测到启动或重启条件时。

[Clearing conditions]

- 读取START=1后向START标志写入0时
- 检测到停止条件时
- 当ICCR1的IICRST位写入1时, 应用IIC复位或内部复位。

#### STOP标志(停止条件检测标志)

STOP标志指示是否检测到停止条件。

[Setting condition]

- 检测到停止条件时。

[Clearing conditions]

- 读取STOP=1后向STOP标志写入0时
- 当ICCR1的IICRST位写入1时, 应用IIC复位或内部复位。

#### NACKF标志(NACK检测标志)

NACKF标志指示是否检测到NACK。

[Setting condition]

- 当在发送模式下未从接收设备接收到确认(NACK接收)时, ICFER中的NACKE位设置为1(启用传输暂停)。

[Clearing conditions]

- 读取NACKF=1后向NACKF标志写入0时
- 当ICCR1的IICRST位写入1时, 应用IIC复位或内部复位。

Note: 当NACKF标志设置为1时, IIC暂停数据发送和接收。在NACKF标志设置为1的情况下, 在发送模式下写入ICDRT或在接收模式下从ICDRR读取不会启用数据发送或接收操作。要重新开始数据发送或接收, 请将NACKF标志设置为0。

#### RDRF标志(接收数据满标志)

RDRF标志指示ICDRR是否包含接收数据。

## [Setting conditions]

- When receive data is transferred from ICDRS to ICDRR  
The RDRF flag is set to 1 on the rising edge of the eighth or ninth SCL clock cycle (selected in the RDRFS bit in ICMR3).
- When the received slave address matches after a start or restart condition is detected with the TRS bit in ICCR2 set to 0.

## [Clearing conditions]

- When 0 is written to the RDRF flag after reading RDRF = 1
- When data is read from ICDRR
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

**TEND flag (Transmit End Flag)**

The TEND flag indicates completion of transmission.

## [Setting condition]

- On the rising edge of the ninth SCL clock cycle while the TDRE flag is 1.

## [Clearing conditions]

- When 0 is written to the TEND flag after reading TEND = 1
- When data is written to ICDRT
- When a stop condition is detected
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

**TDRE flag (Transmit Data Empty Flag)**

The TDRE flag indicates whether the ICDRT contains transmit data.

## [Setting conditions]

- When data is transferred from ICDRT to ICDRS and ICDRT becomes empty
- When the TRS bit in ICCR2 is set to 1
- When the received slave address matches while the TRS bit is 1.

## [Clearing conditions]

- When data is written to ICDRT
- When the TRS bit in ICCR2 is set to 0
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: When the NACKF flag is set to 1 while the NACKIE bit in ICFER is 1, the IIC suspends data transmission and reception. In this case, if the TDRE flag is 0 (next transmit data written), data is transferred to the ICDRS register and the ICDRT register becomes empty on the rising edge of the 9th clock cycle, but the TDRE flag does not set to 1.

**28.2.11 ICWUR : I<sup>2</sup>C Bus Wakeup Unit Register**

Base address: IIC0WU = 0x4009\_F014

Offset address: 0x02

|                    |     |      |     |           |   |   |   |           |
|--------------------|-----|------|-----|-----------|---|---|---|-----------|
| Bit position:      | 7   | 6    | 5   | 4         | 3 | 2 | 1 | 0         |
| Bit field:         | WUE | WUIE | WUF | WUAC<br>K | — | — | — | WUAF<br>A |
| Value after reset: | 0   | 0    | 0   | 1         | 0 | 0 | 0 | 0         |

## [Setting conditions]

- 接收数据从ICDRS传输到ICDRR时  
RDRF标志在第8个或第9个SCL时钟周期的上升沿设置为1（在RDRFS位中选择ICMR3）。
- 当ICCR2中的TRS位设置为0检测到启动或重启条件后接收到的从机地址匹配时。

## [Clearing conditions]

- 读取RDRF=1后向RDRF标志写入0时
- 从ICDRR读取数据时
- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

**TEND标志（发送结束标志）**

TEND标志表示传输完成。

## [Setting condition]

- 在第9个SCL时钟周期的上升沿，同时TDRE标志为1。

## [Clearing conditions]

- 读取TEND=1后向TEND标志写入0时
- 数据写入ICDRT时
- 检测到停止条件时
- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

**TDRE标志（传输数据空标志）**

TDRE标志指示ICDRT是否包含发送数据。

## [Setting conditions]

- 当数据从ICDRT传输到ICDRS并且ICDRT变为空时
- ICCR2的TRS位为1时
- TRS位为1时接收到的从机地址匹配时。

## [Clearing conditions]

- 数据写入ICDRT时
- ICCR2的TRS位设置为0时
- 当ICCR1的IICRST位写入1时，应用IIC复位或内部复位。

Note: 当ICFER的NACKIE位为1时NACKF标志设置为1，IIC暂停数据发送和接收。在这种情况下，如果TDRE标志为0（写入下一个发送数据），则数据被传送到ICDRS寄存器，并且ICDRT寄存器在第9个时钟周期的上升沿变为空，但TDRE标志不设置为1。

**28.2.11 ICWUR:I2C总线唤醒单元寄存器**

Base address: IIC0WU = 0x4009\_F014

Offset address: 0x02

Table 28.5 Wakeup mode

| IICRST | WUACK | Operation mode        | Description   |
|--------|-------|-----------------------|---|
| 0      | 0     | Normal wakeup mode 1  | ACK response on 9th SCL, and SCL low-hold after 9th SCL.  |
| 0      | 1     | Normal wakeup mode 2  | No ACK response immediately and SCL low-hold between 8th and 9th SCL. SCL low-hold release and ACK response on 9th SCL. |
| 1      | 0     | Command recovery mode | ACK response on 9th SCL and no SCL low-hold.  |
| 1      | 1     | EOP response mode     | NACK response on 9th SCL and no SCL low-hold.   |

**WUF flag (Wakeup Event Occurrence Flag)**

The WUF flag indicates whether the slave address is matching during wakeup.

[Setting condition]

- When PCLKB is supplied after a slave-address match in the first 8th SCL low during wakeup mode.

[Clearing conditions]

- When 0 is written to the WUF flag after reading WUF = 1
- When ICE = 0 and IICRST = 1.

| 1   | WUASYF | 唤醒功能异步操作状态标志<br>0: IIC同步电路使能条件1: IIC异步电路使能条件 | R   |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 2   | WUSYF  | Wakeup Function Synchronous Operation Status Flag<br>0: IIC asynchronous circuit enable condition<br>1: IIC synchronous circuit enable condition | R   |
| 7:3 | —      | These bits are read as 1. The write value should be 1.   | R/W |

**WUSEN bit (Wakeup Function Synchronous Enable)**

The WUSEN bit is used in combination with the WUASYF flag (or WUSYF flag) to switch between the PCLKB synchronous and asynchronous operation, when the wakeup effective function is enabled (ICWUR.WUE = 1).

The PCLKB operation switches from synchronous to asynchronous operation:

When the ICCR2.BBSY flag is 0, if 0 is written to the WUSEN bit while the WUASYF flag is 0. The reception occurs independently of the operation of PCLKB (with PCLKB stopped) after it switches to the PCLKB asynchronous operation, on wakeup event detection.

The PCLKB operation switches from asynchronous to synchronous operation:

- When 1 is written to the WUSEN bit, with the WUASYF flag at 1, when a wakeup event is detected. After writing 1, the WUASYF flag immediately becomes 0.
- When the stop condition is detected with a wakeup event undetected.

**WUASYF flag (Wakeup Function Asynchronous Operation Status Flag)**

The WUASYF flag can place the IIC in PCLKB asynchronous operation when the wakeup effective function is enabled (ICWUR.WUE = 1).

[Setting condition]

- When the ICCR2.BBSY flag is 0, and the WUSEN bit is set to 0 with the ICWUR.WUE bit set to 1.

[Clearing conditions]

- When 1 is written to the WUSEN bit after detecting the wake-up event with ICWUR.WUE bit set to 1.
- When a stop condition is detected with WUSEN bit set to 1 before detecting the wake-up event with WUASY flag set to 1 with ICWUR.WUE bit set to 1.
- When you write 1 in the WUSEN bit with the WUASYF flag detected 1 and the wake-up event in the state of ICWUR.WUE = 1.
- ICCR1.ICE = 0 and ICCRST = 1 (ICC reset)
- ICWUR.WUE = 0.

**WUSYF flag (Wakeup Function Synchronous Operation Status Flag)**

It is shown that IIC is in the PCLKB synchronous operation at wake-up effective function (ICWUR.WUE = 1). This flag is a value in which the WUASYF flag is always reserved.

[Setting conditions]

- When 1 is written to the WUSEN bit after detecting the wake-up event with ICWUR.WUE bit set to 1 with WUSYF flag set to 0 with ICWUR.WUE bit set to 1.
- When a stop condition is detected with WUSEN bit set to 1 before detecting the wake-up event with WUSYF flag set to 0 with ICWUR.WUE bit set to 1.
- ICCR1.ICE = 0 and ICCRST = 1 (ICC reset)
- ICWUR.WUE = 0.

[Clearing condition]

- When the ICCR2.BBSY flag is 0 with the ICWUR.WUE bit set to 1 after writing 0 to the WUSEN bit.

| Bit | Symbol | Function                                     | R/W |
|-----|--------|--|-----|
| 2   | WUSYF  | 唤醒功能同步操作状态标志<br>0: IIC异步电路使能条件1: IIC同步电路使能条件 | R   |
| 7:3 | —      | 这些位被读取为1。写入值应为1。                             | R/W |

**WUSEN位 (唤醒功能同步使能)**

WUSEN位与WUASYF标志 (或WUSYF标志) 结合使用, 在启用唤醒有效功能 (ICWUR.WUE=1) 时在PCLKB同步和异步操作之间切换。

PCLKB操作从同步操作切换到异步操作:

当ICCR2.BBSY标志为0时, 如果在WUASYF标志为0时将0写入WUSEN位。在唤醒事件切换到PCLKB异步操作后, 接收发生独立于PCLKB的操作 (PCLKB停止) 检测。

PCLKB操作从异步操作切换到同步操作:

- 当WUSEN位写入1且WUASYF标志为1时, 检测到唤醒事件。写入1后, WUASYF标志立即变为0。
- 当检测到停止条件且未检测到唤醒事件时。

**WUASYF标志 (唤醒功能异步操作状态标志)**

WUASYF标志可以在启用唤醒有效功能 (ICWUR.WUE=1) 时将IIC置于PCLKB异步操作中。

[Setting condition]

- ICCR2.BBSY标志为0且WUSEN位设置为0且ICWUR.WUE位设置为1时。

[Clearing conditions]

- 当检测到唤醒事件后将1写入WUSEN位, 且ICWUR.WUE位设置为1。
- 在检测到WUASY标志设置为1且ICWUR.WUE位设置为1的唤醒事件之前检测到WUSEN位设置为1的停止条件时。
- 当您在WUSEN位写入1时, 检测到WUASYF标志为1, 并且唤醒事件处于ICWUR.WUE=1的状态。
- ICCR1.ICE = 0 and ICCRST = 1 (ICC reset)
- ICWUR.WUE = 0.

**WUSYF标志 (唤醒功能同步操作状态标志)**

表明IIC在唤醒有效功能(ICWUR.WUE=1)时处于PCLKB同步操作。此标志是WUASYF标志始终保留的值。

[Setting conditions]

- 当检测到唤醒事件后将1写入WUSEN位时, 将ICWUR.WUE位设置为1, 将WUSYF标志设置为0, 并将ICWUR.WUE位设置为1。
- 在检测到WUSYF标志设置为0且ICWUR.WUE位设置为1的唤醒事件之前检测到WUSEN位设置为1的停止条件时。
- ICCR1.ICE = 0 and ICCRST = 1 (ICC reset)
- ICWUR.WUE = 0.

[Clearing condition]

- 当ICCR2.BBSY标志为0且ICWUR.WUE位在WUSEN位写入0后设置为1时。

## 28.2.13 SARLy : Slave Address Register Ly (y = 0 to 2)

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0A + 0x02 × y

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 0   | SVA0     | 10-bit Address LSB Slave address setting.                      | R/W |
| 7:1 | SVA[6:0] | 7-bit Address/10-bit Address Lower Bits Slave address setting. | R/W |

**SVA0 bit (10-bit Address LSB)**

When the 10-bit address format is selected (SARUy.FS = 1), the SVA0 bit functions as the LSB of a 10-bit address and is combined with the SVA[6:0] bits to form the lower 8 bits of a 10-bit address.

This bit is valid when the SARyE bit in ICSEr is set to 1 (SARLy and SARUy enabled) and the SARUy.FS bit is 1. When the SARUy.FS or SARyE bit is 0, the setting in this bit is ignored.

**SVA[6:0] bits (7-bit Address/10-bit Address Lower Bits)**

When the 7-bit address format is selected (SARUy.FS = 0), the SVA[6:0] bits function as a 7-bit address. When the 10-bit address format is selected (SARUy.FS = 1), these bits combine with the SVA0 bit to form the lower 8 bits of a 10-bit address.

When the SARyE bit in ICSEr is 0, the setting in these bits is ignored.

## 28.2.14 SARUy : Slave Address Register Uy (y = 0 to 2)

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0B + 0x02 × y

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 0   | FS       | 7-bit/10-bit Address Format Select<br>0: Select 7-bit address format<br>1: Select 10-bit address format | R/W |
| 2:1 | SVA[1:0] | 10-bit Address Upper Bits Slave address setting.  | R/W |
| 7:3 | —        | These bits are read as 0. The write value should be 0.  | R/W |

**FS bit (7-bit/10-bit Address Format Select)**

The FS bit selects 7- or 10-bit format for slave address y (in SARLy and SARUy).

When the SARyE bit in ICSEr is set to 1 (SARLy and SARUy enabled) and the SARUy.FS bit is 0, the 7-bit address format is selected for slave address y, the SVA[6:0] setting in SARLy is valid, and the SVA[1:0] and SVA0 settings in SARLy are ignored.

When the SARyE bit in ICSEr is set to 1 (SARLy and SARUy enabled) and the SARUy.FS bit is 1, the 10-bit address format is selected for slave address y and the SVA[1:0] and SARLy settings are valid.

When the SARyE bit in ICSEr is 0 (SARLy and SARUy disabled), the SARUy.FS setting is invalid.

## 28.2.13 SARLy: 从地址寄存器Ly (y=0到2)

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0A + 0x02 × y

| Bit | Symbol   | Function           | R/W |
|-----|----------|--------------------|-----|
| 0   | SVA0     | 10位地址LSB从机地址设置。    | R/W |
| 7:1 | SVA[6:0] | 7位地址10位地址低位从机地址设置。 | R/W |

**SVA0位 (10位地址LSB)**

When the 10-bit address format is selected (SARUy.FS=1) the SVA0 bit functions as the LSB of a 10-bit address and is combined with the SVA[6:0] bits to form the lower 8 bits of a 10-bit address.

当ICSEr中的SARyE位设置为1 (启用SARLy和SARUy) 且SARUy.FS位为1时, 该位有效。当SARUy.FS或SARyE位为0时, 忽略该位的设置。

**SVA[6:0]位 (7位地址10位地址低位)**

When the 7-bit address format is selected (SARUy.FS=0) the SVA[6:0] bits function as a 7-bit address. When the 10-bit address format is selected (SARUy.FS=1) these bits combine with the SVA0 bit to form the lower 8 bits of a 10-bit address.

当ICSEr中的SARyE位为0时, 这些位中的设置将被忽略。

## 28.2.14 SARUy: 从地址寄存器Uy (y=0到2)

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0B + 0x02 × y

| Bit | Symbol   | Function                               | R/W |
|-----|----------|--|-----|
| 0   | FS       | 7位10位地址格式选择<br>0: 选择7位地址格式1: 选择10位地址格式 | R/W |
| 2:1 | SVA[1:0] | 10位地址高位从机地址设置。                         | R/W |
| 7:3 | —        | 这些位被读取为0。写入值应为0。                       | R/W |

**FS位 (7位10位地址格式选择)**

FS位为从地址y选择7位或10位格式 (在SARLy和SARUy中)。

当ICSEr中的SARyE位设置为1 (启用SARLy和SARUy) 且SARUy.FS位为0时, 从机地址y选择7位地址格式, SARLy中的SVA[6:0]设置有效 并且忽略SARLy中的SVA[1:0]和SVA0设置。

当ICSEr中的SARyE位设置为1 (启用SARLy和SARUy) 且SARUy.FS位为1时, 从机地址y选择10位地址格式且SVA[1:0]和SARLy设置有效。

当ICSEr中的SARyE位为0 (SARLy和SARUy禁用) 时, SARUy.FS设置无效。

**SVA[1:0] bits (10-bit Address Upper Bits)**

When the 10-bit address format is selected (FS = 1), the SVA[1:0] bits function as the upper 2 bits of a 10-bit address.

These bits are valid when the SARyE bit in ICSEr is set to 1 (SARLy and SARUy enabled) and the SARUy.FS bit is 1. When the SARUy.FS or SARyE bit is 0, the setting in these bits is ignored.

**28.2.15 ICBRL : I2C Bus Bit Rate Low-Level Register**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x10

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 4:0 | BRL[4:0] | Bit Rate Low-Level Period<br>Low-level period of SCL clock. | R/W |
| 7:5 | —        | These bits are read as 1. The write value should be 1.      | R/W |

**BRL[4:0] bits (Bit Rate Low-Level Period)**

The BRL[4:0] bits set the low-level period of the SCL clock. ICBRL counts the low-level period with the internal reference clock source (IICφ) specified by the CKS[2:0] bits in ICMR1. ICBRL also generates the data setup time for automatic SCL low-hold operation, see [section 28.9. Automatic Low-Hold Function for SCL](#). When the IIC is used in slave mode, the BRL[4:0] bits must be set to a value longer than the data setup time\*1.

If the digital noise filter is enabled (NFE bit in ICFER is 1), set the BRL[4:0] bits to a value at least one greater than the number of stages in the noise filter. For details on the number of stages, see the description of the NF[1:0] bits in [section 28.2.5. ICMR3 : I2C Bus Mode Register 3](#).

Note 1. Data setup time (t<sub>SU</sub>: DAT)

- 250 ns for up to 100 kbps: Standard-mode (Sm)
- 100 ns for up to 400 kbps: Fast-mode (Fm)
- 50 ns for up to 1 Mbps: Fast-mode Plus (Fm+)

**28.2.16 ICBRH : I2C Bus Bit Rate High-Level Register**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x11

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 4:0 | BRH[4:0] | Bit Rate High-Level Period<br>High-level period of SCL clock. | R/W |
| 7:5 | —        | These bits are read as 1. The write value should be 1.        | R/W |

**BRH[4:0] bits (Bit Rate High-Level Period)**

The BRH[4:0] bits set the high-level period of SCL clock. BRH[4:0] bits are valid in master mode. If the IIC is used only in slave mode, do not set the BRH[4:0] bits.

**SVA[1:0]位 (10位地址高位)**

When the 10-bit address format is selected (FS = 1) the SVA[1:0] bits function as the upper 2 bits of a 10-bit address.

当ICSEr中的SARyE位设置为1 (启用SARLy和SARUy) 且SARUy.FS位为1时, 这些位有效。当SARUy.FS或SARyE位为0时, 这些位中的设置将被忽略。

**28.2.15 ICBRL: I2C总线比特率低电平寄存器**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x10

| Bit | Symbol   | Function                 | R/W |
|-----|----------|--------------------------|-----|
| 4:0 | BRL[4:0] | 比特率低电平周期<br>SCL时钟的低电平周期。 | R/W |
| 7:5 | —        | 这些位被读取为1。写入值应为1。         | R/W |

**BRL[4:0]位 (比特率低电平周期)**

BRL[4:0]位设置SCL时钟的低电平周期。ICBRL使用由ICMR1中的CKS[2:0]位指定的内部参考时钟源(IICφ)对低电平周期进行计数。ICBRL还为自动SCL低保持操作生成数据建立时间, 请参见第28.9节。SCL的自动低保持功能。当IIC在从机模式下使用时, BRL[4:0]位必须设置为比数据建立时间\*1更长的值。

如果启用了数字噪声滤波器 (ICFER中的NFE位为1), 请将BRL[4:0]位设置为至少比噪声滤波器中的级数大1的值。关于阶段数的详细信息, 请参见第28.2.5节中对NF[1:0]位的描述。ICMR3: I2C总线模式寄存器3。

注1.数据建立时间(t<sub>SU</sub>:DAT)

- 250ns, 最高100kbps: 标准模式(Sm)
- 100ns, 最高400kbps: 快速模式(Fm)
- 高达1Mbps时为50ns: Fast-modePlus(Fm+)

**28.2.16 ICBRH: I2C总线比特率高级寄存器**

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)

Offset address: 0x11

| Bit | Symbol   | Function               | R/W |
|-----|----------|------------------------|-----|
| 4:0 | BRH[4:0] | 比特率高级期<br>SCL时钟的高电平周期。 | R/W |
| 7:5 | —        | 这些位被读取为1。写入值应为1。       | R/W |

**BRH[4:0]位 (比特率高电平周期)**

BRH[4:0]位设置SCL时钟的高电平周期。BRH[4:0]位在主机模式下有效。如果IIC仅用于从机模式, 则不要设置BRH[4:0]位。

ICBRH counts the high-level period with the internal reference clock source (IIC $\phi$ ) specified in the CKS[2:0] bits in ICMR1.

If the digital noise filter is enabled (the NFE bit in ICFER is 1), set these bits to a value at least one greater than the number of stages in the noise filter. For the number of stages in the noise filter, see the description of the NF[1:0] bits in [section 28.2.5. ICMR3 : I<sup>2</sup>C Bus Mode Register 3](#).

The IIC transfer rate and the SCL clock duty are calculated using the following expressions (1) to (5):

- ICFER.SCLE = 0  
Transfer rate =  $1 / [ \{ (BRH + 1) + (BRL + 1) \} / IIC\phi * 1 + tr * 2 + tf * 2 ]$   
Duty cycle =  $[ tr + \{ (BRH + 1) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 1) + (BRL + 1) \} / IIC\phi ]$
- ICFER.SCLE = 1 and ICFER.NFE = 0 and CKS[2:0] = 000b (IIC $\phi$  = PCLKB)  
Transfer rate =  $1 / [ \{ (BRH + 3) + (BRL + 3) \} / IIC\phi + tr + tf ]$   
Duty cycle =  $[ tr + \{ (BRH + 3) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 3) + (BRL + 3) \} / IIC\phi ]$
- ICFER.SCLE = 1 and ICFER.NFE = 1 and CKS[2:0] = 000b (IIC $\phi$  = PCLKB)  
Transfer rate =  $1 / [ \{ (BRH + 3 + nf * 3) + (BRL + 3 + nf) \} / IIC\phi + tr + tf ]$   
Duty cycle =  $[ tr + \{ (BRH + 3 + nf) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 3 + nf) + (BRL + 3 + nf) \} / IIC\phi ]$
- ICFER.SCLE = 1 and ICFER.NFE = 0 and CKS[2:0]  $\neq$  000b  
Transfer rate =  $1 / [ \{ (BRH + 2) + (BRL + 2) \} / IIC\phi + tr + tf ]$   
Duty cycle =  $[ tr + \{ (BRH + 2) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 2) + (BRL + 2) \} / IIC\phi ]$
- ICFER.SCLE = 1 and ICFER.NFE = 1 and CKS[2:0]  $\neq$  000b  
Transfer rate =  $1 / [ \{ (BRH + 2 + nf) + (BRL + 2 + nf) \} / IIC\phi + tr + tf ]$   
Duty cycle =  $[ tr + \{ (BRH + 2 + nf) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 2 + nf) + (BRL + 2 + nf) \} / IIC\phi ]$

Note 1. IIC $\phi$  = PCLKB  $\times$  division ratio

Note 2. The SCLn line rise time (tr) and SCLn line fall time (tf) depend on the total bus line capacitance (Cb) and the pull-up resistor (Rp). For details, see the I<sup>2</sup>C bus standard from NXP Semiconductors.

Note 3. nf = Number of digital noise filters selected in the ICMR3.NF bit.

**Table 28.6 Example of ICBRH/ICBRL Settings for Transfer Rate IIC when SCLE = 0**

| Transfer rate (kbps) | CKS[2:0] (ICMR1) | BRH[4:0] (ICBRH) | BRL[4:0] (ICBRL) | PCLKB (MHz) | NF[1:0] | Computation expression |
|----------------------|------------------|------------------|------------------|-------------|---------|------------------------|

| 1000                 | 000b             | 10 (0xEA)        | 22 (0xF6)        | 50          | —       | (2)                    |

**Table 28.8 Example of ICBRH/ICBRL Settings for Transfer Rate when SCLE = 1 and NFE = 1**

| Transfer rate (kbps) | CKS[2:0] (ICMR1) | BRH[4:0] (ICBRH) | BRL[4:0] (ICBRL) | PCLKB (MHz) | NF[1:0] | Computation expression |
|----------------------|------------------|------------------|------------------|-------------|---------|------------------------|
| 100                  | 011b             | 21 (0xF5)        | 26 (0xFA)        | 50          | 01b     | (5)                    |
| 400                  | 001b             | 11 (0xEB)        | 29 (0xFD)        | 50          | 01b     | (5)                    |
| 1000                 | 000b             | 8 (0xE8)         | 20 (0xF4)        | 50          | 01b     | (3)                    |

ICBRH使用CKS[2:0]位中指定的内部参考时钟源(IIC $\phi$ )计算高电平周期ICMR1。

如果启用了数字噪声滤波器 (ICFER中的NFE位为1)，请将这些位设置为至少比噪声滤波器中的级数大1的值。关于噪声滤波器的级数，请参见第28.2.5节中对NF[1:0]位的说明。ICMR3：I2C总线模式寄存器3。

IIC传输速率和SCL时钟占空比使用以下表达式(1)到(5)计算：

- ICFER.SCLE = 0  
传输率 =  $1 / [ \{ (BRH + 1) + (BRL + 1) \} / IIC\phi * 1 + tr * 2 + tf * 2 ]$   
占空比 =  $[ tr + \{ (BRH + 1) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 1) + (BRL + 1) \} / IIC\phi ]$
- ICFER.SCLE = 1且ICFER.NFE = 0且CKS[2:0] = 000b (IIC $\phi$  = PCLKB) 传输速率 =  $1 / [ \{ (BRH + 3) + (BRL + 3) \} / IIC\phi + tr + tf ]$   
占空比 =  $[ tr + \{ (BRH + 3) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 3) + (BRL + 3) \} / IIC\phi ]$
- ICFER.SCLE = 1且ICFER.NFE = 1且CKS[2:0] = 000b (IIC $\phi$  = PCLKB) 传输速率 =  $1 / [ \{ (BRH + 3 + nf * 3) + (BRL + 3 + nf) \} / IIC\phi + tr + tf ]$   
占空比 =  $[ tr + \{ (BRH + 3 + nf) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 3 + nf) + (BRL + 3 + nf) \} / IIC\phi ]$
- ICFER.SCLE = 1且ICFER.NFE = 0且CKS[2:0]  $\neq$  000b 传输率 =  $1 / [ \{ (BRH + 2) + (BRL + 2) \} / IIC\phi + tr + tf ]$   
占空比 =  $[ tr + \{ (BRH + 2) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 2) + (BRL + 2) \} / IIC\phi ]$
- ICFER.SCLE = 1且ICFER.NFE = 1且CKS[2:0]  $\neq$  000b 传输率 =  $1 / [ \{ (BRH + 2 + nf) + (BRL + 2 + nf) \} / IIC\phi + tr + tf ]$   
占空比 =  $[ tr + \{ (BRH + 2 + nf) / IIC\phi \} ] / [ tr + tf + \{ (BRH + 2 + nf) + (BRL + 2 + nf) \} / IIC\phi ]$

注1.IIC $\phi$ =PCLKB $\times$ 分频比

注2.SCLn线路上升时间(tr)和SCLn线路下降时间(tf)取决于总线电容(Cb)和上拉电阻(Rp)。有关详细信息，请参阅NXP Semiconductors的I2C总线标准。

注3.nf=在ICMR3.NF位中选择的数字噪声滤波器的数量。

### 28.2.17 ICDRT : I<sup>2</sup>C Bus Transmit Data Register

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)  
Offset address: 0x12

When ICDRT detects a space in the I<sup>2</sup>C Bus Shift Register (ICDRS), it transfers the transmit data that was written to ICDRT to ICDRS and starts transmitting data in transmit mode. The double-buffer structure of ICDRT and ICDRS allows continuous transmit operation if the next transmit data is written to ICDRT while the ICDRS data is being transmitted.

ICDRT can always be read and written to. Write transmit data to ICDRT once when a transmit data empty interrupt (IICn\_TXI) request is generated.

### 28.2.18 ICDRR : I<sup>2</sup>C Bus Receive Data Register

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)  
Offset address: 0x13

When 1 byte of data is received, the received data is transferred from the I<sup>2</sup>C Bus Shift Register (ICDRS) to ICDRR to enable the next data to be received. The double-buffer structure of ICDRS and ICDRR allows continuous receive operation if the received data is read from ICDRR while ICDRS is receiving data. ICDRR cannot be written to. Read data from ICDRR once when a receive data full interrupt (IICn\_RXI) request is generated.

If ICDRR receives the next receive data before the current data is read from ICDRR (while the RDRF flag in ICSR2 is 1), the IIC automatically holds the SCL clock low 1 cycle before the RDRF flag is set to 1 next.

### 28.2.19 ICDRS : I<sup>2</sup>C Bus Shift Register

Base address: n/a  
Offset address: n/a

ICDRS is an 8-bit shift register for data transmit and receive. During transmission, transmit data is transferred from ICDRT to ICDRS and is transmitted from the SDAn pin. During reception, data is transferred from ICDRS to ICDRR after 1 byte of data is received. ICDRS cannot be accessed directly.

## 28.3 Operation

### 28.3.1 Communication Data Format

The I<sup>2</sup>C bus format consists of 8-bit data and 1-bit acknowledge. The frame following a start or restart condition is an address frame that specifies a slave device with which the master device communicates. The specified slave is valid until a new slave is specified or a stop condition is issued.

Figure 28.3 shows the I<sup>2</sup>C bus format, and Figure 28.4 shows the I<sup>2</sup>C bus timing.

### 28.2.17 ICDRT: I2C总线发送数据寄存器

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)  
Offset address: 0x12

当ICDRT检测到I2C总线移位寄存器(ICDRS)中有空间时，它将写入ICDRT的发送数据传输到ICDRS，并开始在发送模式下发送数据。ICDRT和ICDRS的双缓冲结构允许在传输ICDRS数据的同时将下一个传输数据写入ICDRT的连续传输操作。

ICDRT始终可以被读取和写入。当产生发送数据空中断 (IICn\_TXI) 请求时，将发送数据写入ICDRT。

### 28.2.18 ICDRR:I2C总线接收数据寄存器

Base address: IICn = 0x4009\_F000 + 0x0100 × n (n = 0, 1)  
Offset address: 0x13

当接收到1个字节的数据时，接收到的数据会从I2C总线移位寄存器(ICDRS)传输到ICDRR，以便接收下一个数据。如果在ICDRS正在接收数据时从ICDRR读取接收到的数据，ICDRS和ICDRR的双缓冲结构允许连续接收操作。无法写入ICDRR。当产生接收数据完全中断(IICn\_RXI)请求时，从ICDRR读取数据一次。

如果ICDRR在从ICDRR读取当前数据之前接收到下一个接收数据（此时ICSR2中的RDRF标志为1），则IIC在下一个RDRF标志设置为1之前自动将SCL时钟保持低1个周期。

### 28.2.19 ICDRS:I2C总线移位寄存器

Base address: n/a  
Offset address: n/a

ICDRS是一个用于数据发送和接收的8位移位寄存器。在传输期间，传输数据从ICDRT传输到ICDRS，并从SDAn引脚传输。在接收过程中，接收到1个字节的数据后，数据从ICDRS传输到ICDRR。ICDRS不能直接访问。

## 28.3 Operation

### 28.3.1 通讯数据格式

I2C总线格式由8位数据和1位确认组成。开始或重启条件之后的帧是地址帧，它指定与主设备通信的从设备。指定的从站有效，直到指定新的从站或发出停止条件。

图28.3显示了I2C总线格式，图28.4显示了I2C总线时序。

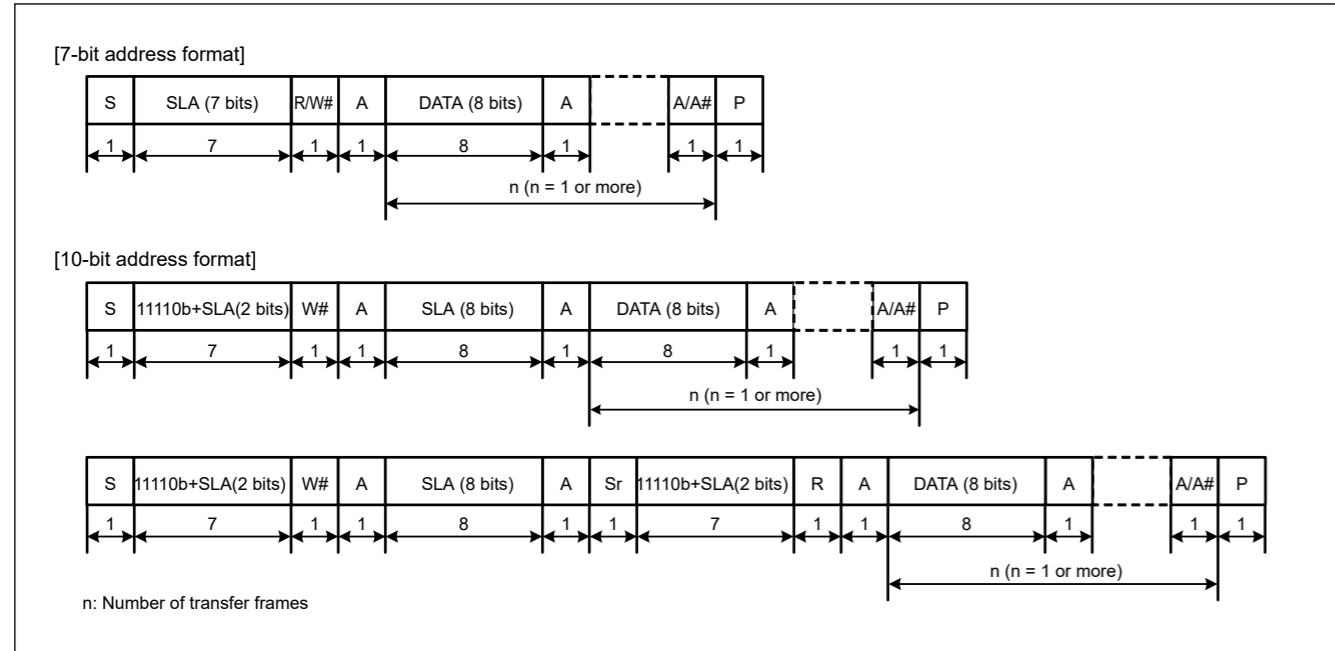

Figure 28.3 I2C bus format

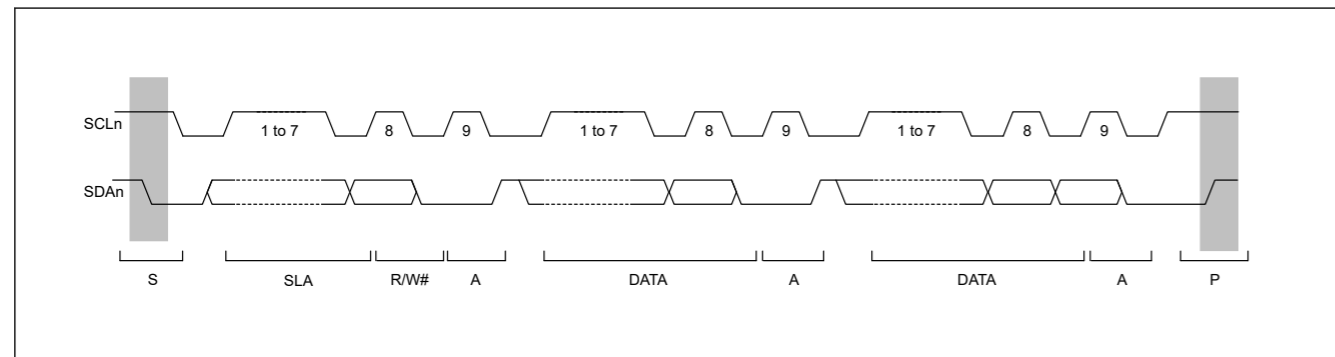

Figure 28.4 I2C bus timing when the SLA setting = 7 bits

- S: Start condition. The master device drives the SDAn line low from high while the SCLn line is high.
- SLA: Slave address, by which the master device selects a slave device.
- R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W# is 1, or from the master device to the slave device when R/W# is 0.
- A: Acknowledge. The receive device drives the SDAn line low. In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.
- A#: Not Acknowledge. The receive device drives the SDAn line high.
- Sr: Restart condition. The master device drives the SDAn line low from the high level after the setup time has elapsed with the SCLn line high.
- DATA: Transmitted or received data.
- P: Stop condition. The master device drives the SDAn line high from low while the SCLn line is high.

### 28.3.2 Initial Settings

Before starting data transmission or reception, initialize the IIC using the procedure shown in Figure 28.5.

1. Set the ICCR1.ICE bit to 0 to set the SCLn and SDAn pins to the inactive state.
2. Set the ICCR1.IICRST bit to 1 to initiate IIC reset.
3. Set the ICCR1.ICE bit to 1 to initiate internal reset.
4. Set the SARLy, SARUy, ICSEr, ICMR1, ICBRH, and ICBRL registers (y = 0 to 2), and set the other registers as required. For initial settings of the IIC, see Figure 28.5.

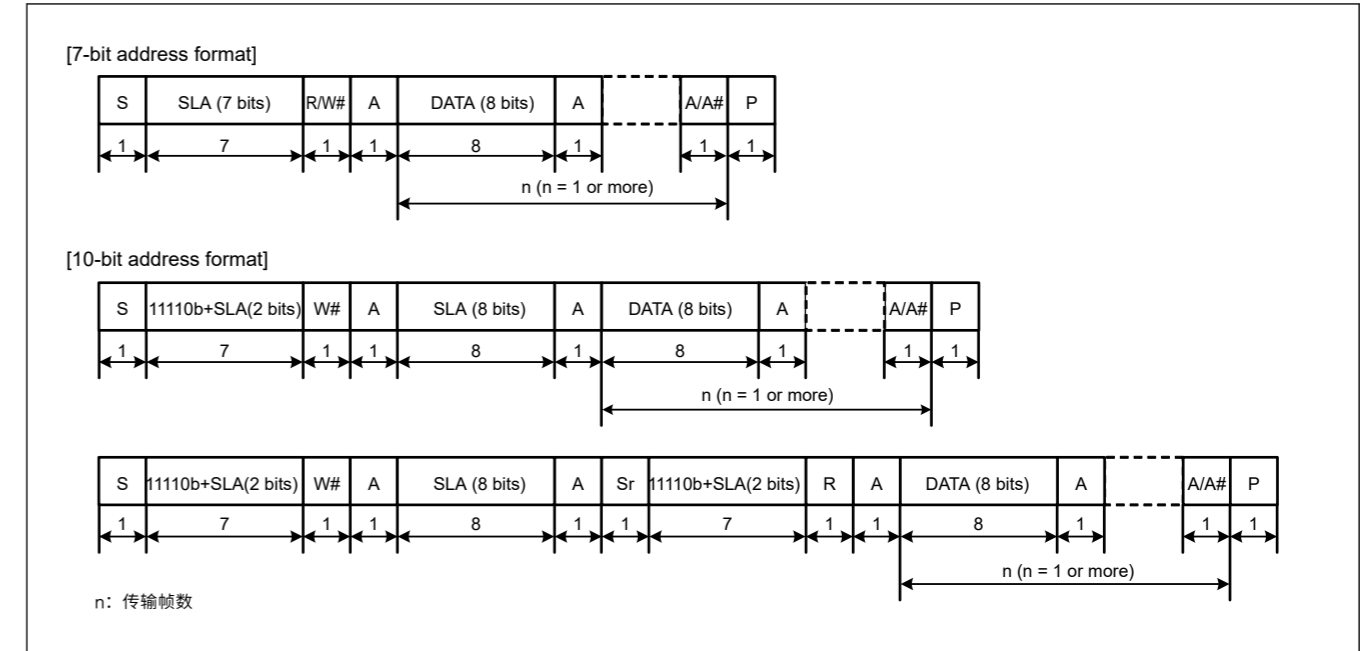

Figure 28.3 I2C总线格式

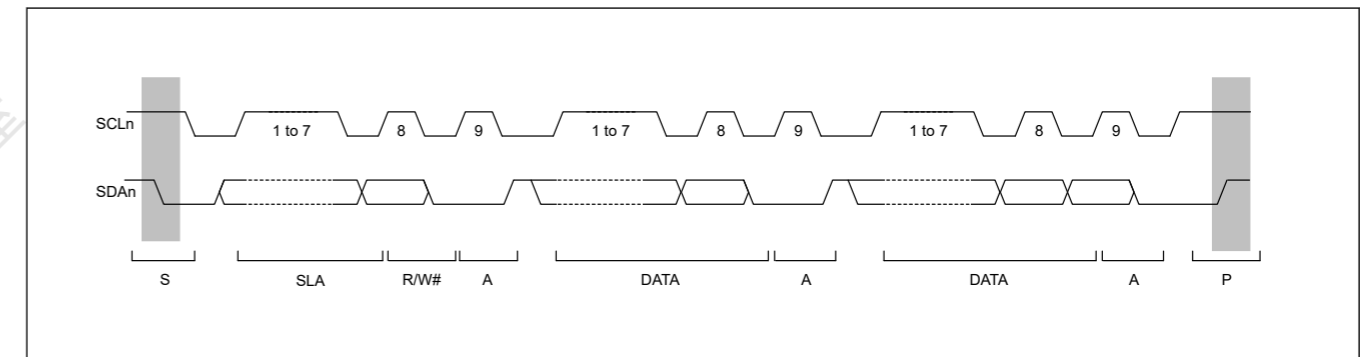

Figure 28.4 SLA设置=7位时的I2C总线时序

- S: 启动条件。主设备将SDAn线从高电平驱动为低电平，而SCLn线为高电平。
- SLA: 从地址，主设备通过该地址选择从设备。
- R/W#: 指示数据传输的方向：当RW#为1时从从设备到主设备，或者当RW#为0时从主设备到从设备。
- A: 承认。接收设备将SDAn线驱动为低电平。在主发送模式下，从设备返回确认。在主接收模式下，主设备返回确认。
- A#: 不承认。接收设备将SDAn线驱动为高电平。
- Sr: 重启条件。建立时间过后，主设备将SDAn线从高电平驱动为低电平 SCLn线高。
- DATA: 传输或接收的数据。
- P: 停止条件。主设备将SDAn线从低电平驱动至高电平，而SCLn线为高电平。

### 28.3.2 初始设置

在开始数据发送或接收之前，使用图28.5所示的过程初始化IIC。

1. 将ICCR1.ICE位设置为0，将SCLn和SDAn引脚设置为无效状态。
2. 将ICCR1.IICRST位设置为1以启动IIC复位。
3. 将ICCR1.ICE位设置为1以启动内部复位。
4. 设置SARLy、SARUy、ICSEr、ICMR1、ICBRH和ICBRL寄存器 (y=0到2)，并根据需要设置其他寄存器。IIC的初始设置见图28.5。

5. When the required register settings are complete, set the ICCR1.IICRST bit to 0 to release the IIC reset.

This procedure is not required if the IIC initialization is already complete.

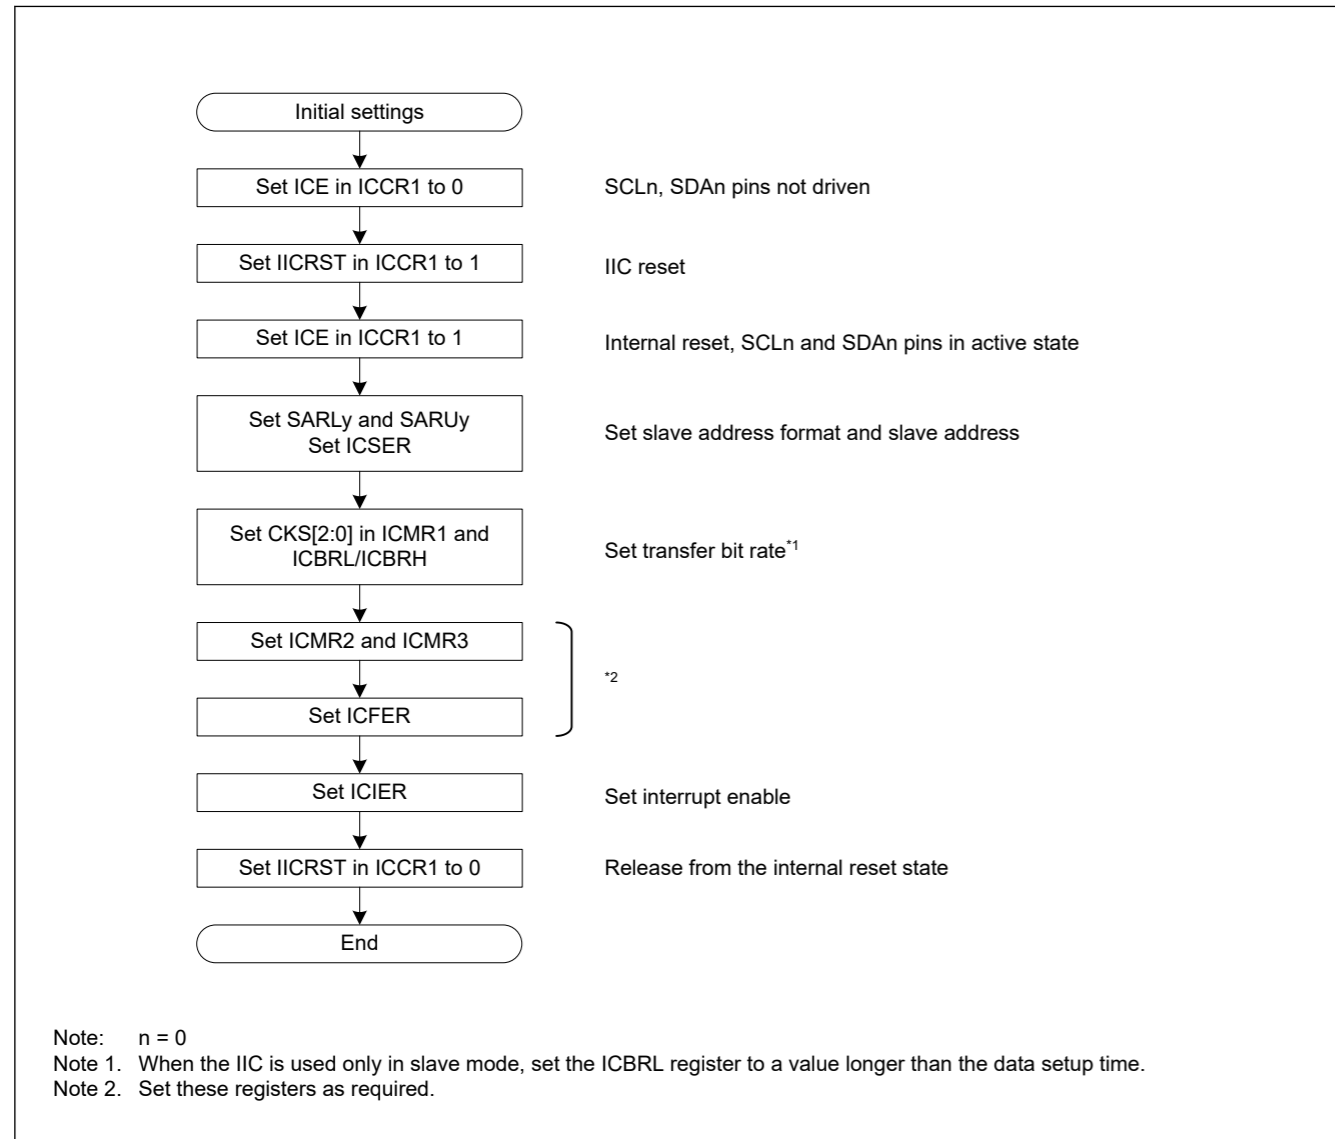

Figure 28.5 Example IIC initialization flow

### 28.3.3 Master Transmit Operation

In master transmit operation, the IIC outputs the SCL clock and transmitted data signals as the master device, and the slave device returns acknowledgments. Figure 28.6 shows an example of master transmission, and Figure 28.7 to Figure 28.9 show the operation timing in master transmission.

To set up and perform master transmission:

1. Process initial settings. For details, see section 28.3.2. Initial Settings.
2. Read the BBSY flag in ICCR2 to check that the bus is free, and then set the ST bit in ICCR2 to 1 (start condition request). On receiving the request, the IIC issues a start condition. At the same time, the BBSY and START flags in ICSR2 automatically set to 1 and the ST bit automatically is set to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDAn line match while the ST bit is 1, the IIC recognizes that issuance of the start condition as requested by the ST bit is successfully complete, and the MST and TRS bits in ICCR2 automatically set to 1, placing the IIC in master transmit mode. The TDRE flag in ICSR2 also automatically is set to 1 in response to the setting of the TRS bit to 1.

5.完成所需的寄存器设置后，将ICCR1.IICRST位设置为0以释放IIC复位。

如果IIC初始化已经完成，则不需要此过程。

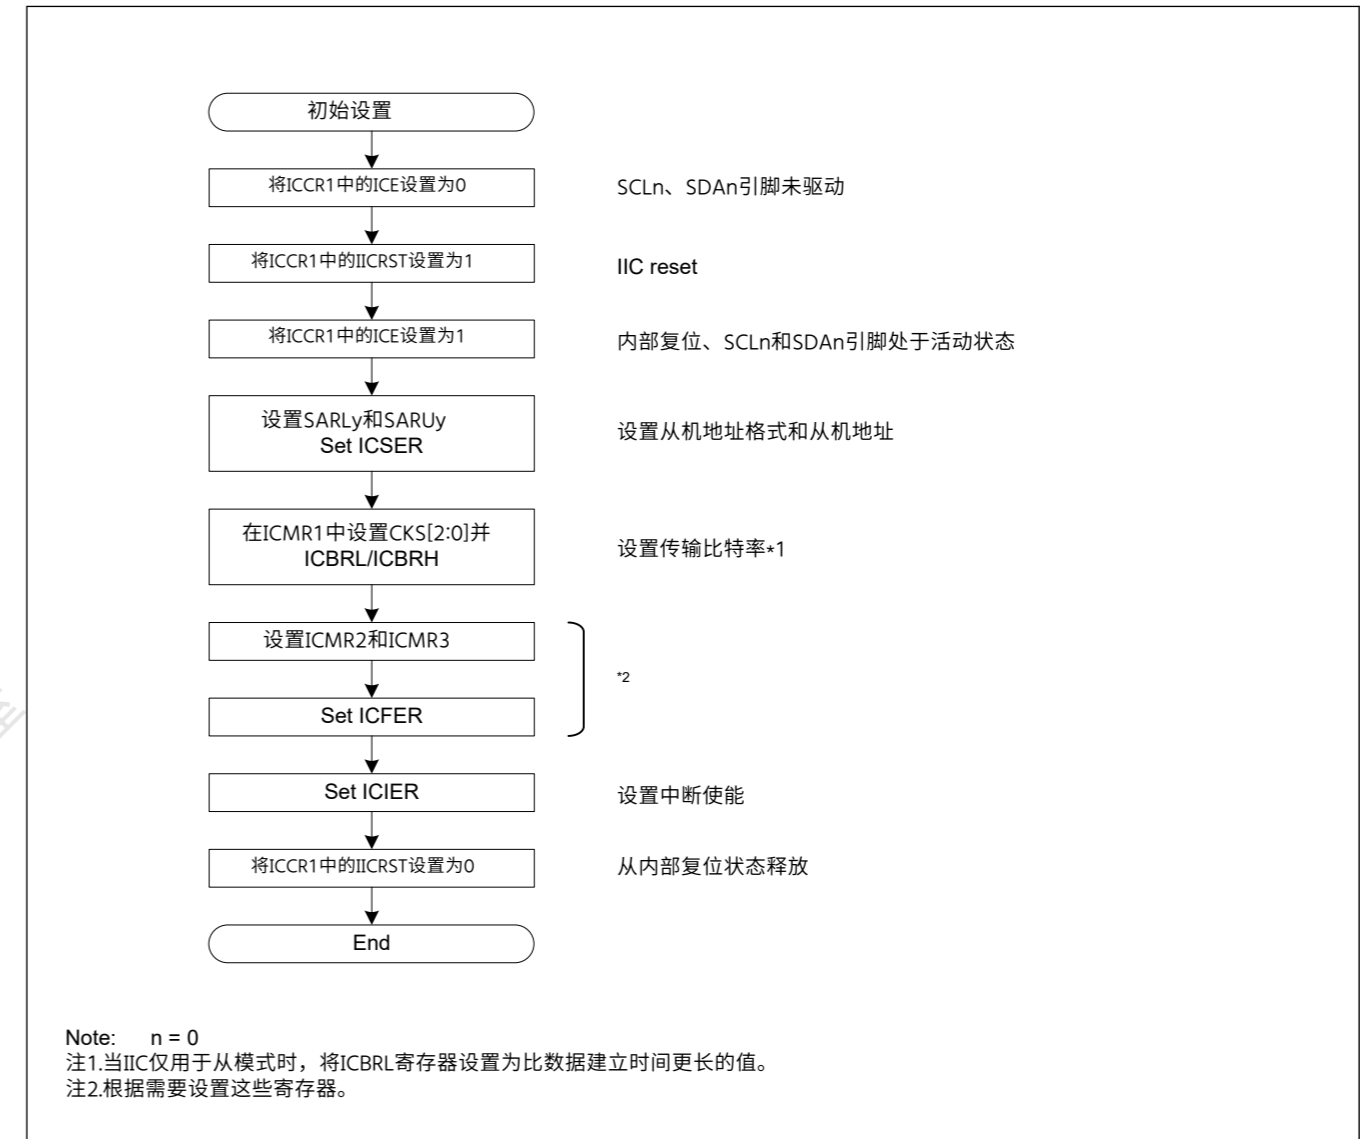

Figure 28.5 示例IIC初始化流程

### 28.3.3 主发送操作

在主设备发送操作中，IIC作为主设备输出SCL时钟和发送的数据信号，从设备返回确认。图28.6显示了主传输的示例，图28.7至图28.9显示了主传输中的操作时序。

设置和执行主传输：

- 1.处理初始设置。详见28.3.2节。初始设置。
- 2.读取ICCR2中的BBSY标志，检查总线是否空闲，然后将ICCR2中的ST位设置为1（启动条件要求）。收到请求后，IIC发出一个开始条件。同时，ICSR2中的BBSY和START标志位自动置1，ST位自动置0。此时，如果检测到启动条件，内部电平为SDA输出状态和当ST位为1时SDAn线匹配，IIC识别出ST位请求的启动条件的发布已成功完成，并且ICCR2中的MST和TRS位自动设置为1，将IIC置于主机发送模式。ICSR2中的TDRE标志也自动设置为1，以响应TRS位设置为1。

3. Check that the TDRE flag in ICSR2 is 1, and then write the value for transmission (the slave address and the R/W# bit) to ICDRT. When the transmit data is written to ICDRT, the TDRE flag automatically is set to 0, the data is transferred from ICDRT to ICDRS, and the TDRE flag again is set to 1. After the byte containing the slave address and R/W# bit is transmitted, the value of the TRS bit automatically updates to select master transmit or master receive mode based on the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the IIC continues in master transmit mode. Because the ICSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the ICCR2.SP bit to issue a stop condition. For data transmission with an address in the 10-bit format, start by writing 11110b, the 2 higher-order bits of the slave address, and W to ICDRT as the first address transmission. For the second address transmission, write the 8 lower-order bits of the slave address to ICDRT.
4. Check that the TDRE flag in ICSR2 is 1, and then write the transmit data to the ICDRT register. The IIC automatically holds the SCLn line low until the transmit data is ready or a stop condition is issued.
5. After all bytes of transmit data are written to the ICDRT register, wait until the value in the TEND flag in ICSR2 returns to 1, and then set the SP bit in ICCR2 to 1 (stop condition requested). On receiving a stop condition request, the IIC issues the stop condition. Regarding issuing a stop condition, see [section 28.11.3. Issuing a Stop Condition](#).
6. On detecting the stop condition, the IIC automatically sets the MST and TRS bits in ICCR2 to 00b and enters slave receive mode. Additionally, it automatically sets the TDRE and TEND flags to 0, and sets the STOP flag in ICSR2 to 1.
7. Check that the ICSR2.STOP flag is 1, and then set the ICSR2.NACKF and STOP flags to 0 for the next transfer operation.

3.检查ICSR2中的TDRE标志是否为1,然后将要发送的值(从机地址和RW#位)写入ICDRT。当发送数据写入ICDRT时,TDRE标志自动设置为0,数据从ICDRT传输到ICDRS,TDRE标志再次设置为1。在发送包含从机地址和RW#位的字节后,TRS位的值会自动更新,以根据发送的RW#位的值选择主机发送或主机接收模式。如果RW#位的值为0,则IIC继续处于主机发送模式。因为此时ICSR2.NACKF标志为1表示没有从设备识别该地址或通信中有错误,所以向ICCR2.SP位写入1以发出停止条件。对于地址为10位格式的数据传输,首先将11110b、从机地址的高2位和W写入ICDRT作为第一个地址传输。对于第二次地址传输,将从地址的低8位写入ICDRT。

4.检查ICSR2中的TDRE标志是否为1,然后将发送数据写入ICDRT寄存器。IIC自动将SCLn线保持为低电平,直到发送数据准备好或发出停止条件。

5.将发送数据的所有字节写入ICDRT寄存器后,等待ICSR2中的TEND标志中的值返回1,然后将ICCR2中的SP位设置为1(请求停止条件)。在收到停止条件请求时,IIC发出停止条件。关于发出停止条件,请参阅第28.11.3节。发出停止条件。

6.在检测到停止条件时,IIC自动将ICCR2中的MST和TRS位设置为00b并进入从机接收模式。此外,它自动将TDRE和TEND标志设置为0,并将ICSR2中的STOP标志设置为1。

7.检查ICSR2.STOP标志是否为1,然后将ICSR2.NACKF和STOP标志设置为0以进行下一次传输操作。

### 28.3.4 Master Receive Operation

In master receive operation, the IIC as a master device outputs the SCL clock, receives data from the slave device, and returns acknowledgments. Because the IIC must start by sending a slave address to the associated slave device, this part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

Figure 28.10 and Figure 28.11 show examples of master reception (7-bit address format), and Figure 28.12 to Figure 28.14 show the operation timing in master reception.

To set up and perform master reception:

1. Process initial settings. For details, see [section 28.3.2. Initial Settings](#).
2. Read the BBSY flag in ICCR2 to check that the bus is free, and then set the ST bit in ICCR2 to 1 (start condition request). On receiving the request, the IIC issues a start condition. When the IIC detects the start condition, the BBSY and START flags in ICSR2 automatically set to 1, and the ST bit automatically is set to 0. At this time, if the start condition is detected and the levels for the SDA output and the levels on the SDA<sub>n</sub> line match while the ST bit is 1, the IIC recognizes that issuance of the start condition as requested by the ST bit is successfully complete, and the MST and TRS bits in ICCR2 automatically set to 1, placing the IIC in master transmit mode. The TDRE flag in ICSR2 also automatically is set to 1 in response to the setting of the TRS bit to 1.
3. Check that the TDRE flag in ICSR2 is 1, and then write the value for transmission (the first byte indicates the slave address and value of the R/W# bit) to ICDRT. When the transmit data is written to ICDRT, the TDRE flag automatically is set to 0, the data is transferred from ICDRT to ICDRS, and the TDRE flag again is set to 1. When the byte containing the slave address and R/W# bit is transmitted, the value of the ICCR2.TRS bit automatically updates to select transmit or receive mode based on the value of the transmitted R/W# bit. If the value of the R/W# bit is 1, the TRS bit is set to 0 on the rising edge of the ninth cycle of the SCL clock, placing the IIC in master receive mode. At this time, the TDRE flag is set to 0 and the ICSR2.RDRF flag automatically is set to 1. Because the ICSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the ICCR2.SP bit to issue a stop condition. For master reception from a device with a 10-bit address, start by using master transmission to issue the 10-bit address, and then issue a restart condition. After that, transmitting 11110b, the two higher-order bits of the slave address, and the R bit places the IIC in master receive mode.
4. Dummy read ICDRR after confirming that the RDRF flag in ICSR2 is 1. This makes the IIC start output of the SCL clock and start data reception.

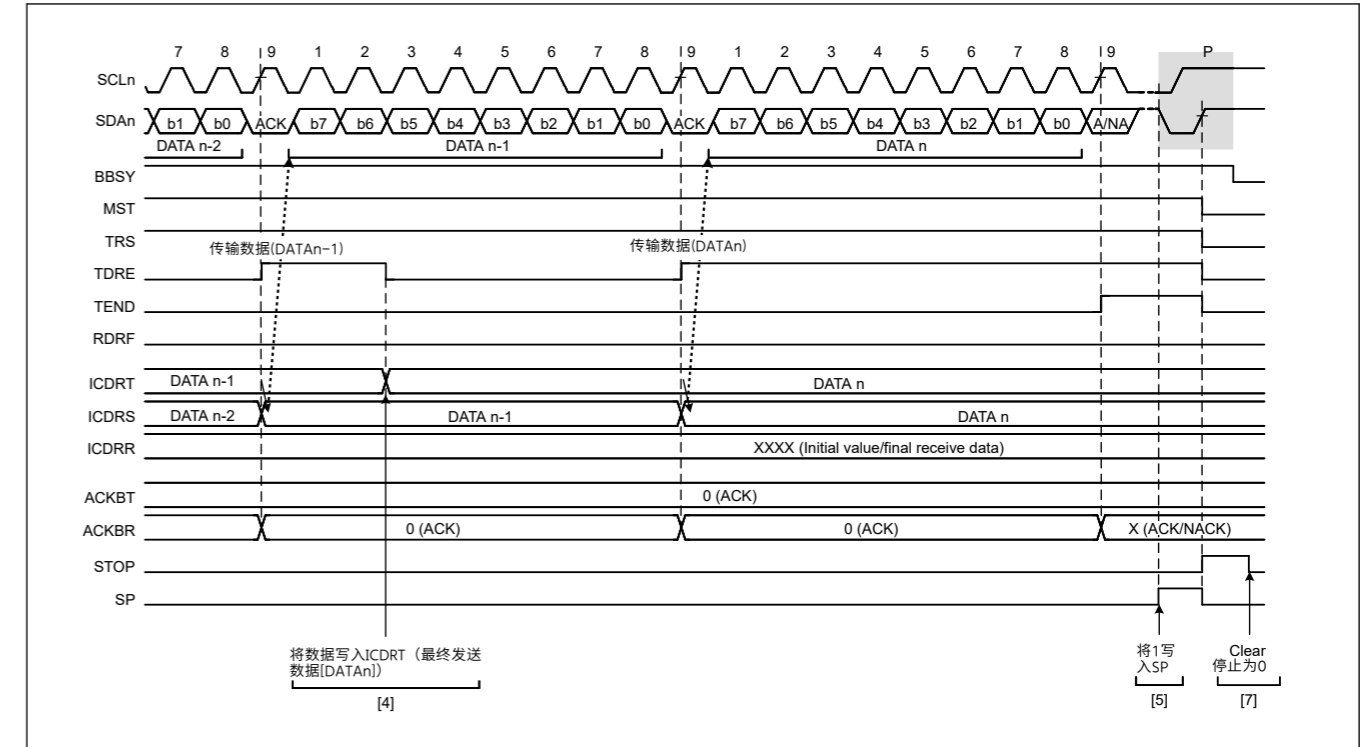

Figure 28.9 主机发送操作时序 (3)

### 28.3.4 主接收操作

在主设备接收操作中，作为主设备的IIC输出SCL时钟，从从设备接收数据，并返回确认。因为IIC必须首先向相关的从设备发送一个从地址，所以这部分程序在主发送模式下执行，但后续步骤在主接收模式下执行。

图28.10和图28.11显示了主机接收示例（7位地址格式），图28.12至图28.14显示了主机接收中的操作时序。

设置和执行主接收：

- 1.处理初始设置。详见28.3.2节。初始设置。
- 2.读取ICCR2中的BBSY标志，检查总线是否空闲，然后将ICCR2中的ST位设置为1（启动条件要求）。收到请求后，IIC发出一个开始条件。当IIC检测到启动条件时，ICSR2中的BBSY和START标志位自动置1，ST位自动置0。此时，如果检测到启动条件，则SDA输出的电平和平在ST位为1时SDA<sub>n</sub>线匹配时，IIC识别出由ST位请求的启动条件的发布已成功完成，并且MST和TRC2中的TRS位自动设置为1，将IIC置于主机发送模式。ICSR2中的TDRE标志也自动设置为1，以响应TRC2.S位设置为1。
- 3、检查ICSR2中的TDRE标志为1，然后写入值进行发送（第一个字节表示从机RW#位的地址和值）到ICDRT。当发送数据写入ICDRT时，TDRE标志自动设置为0，数据从ICDRT传输到ICDRS，TDRE标志再次设置为1。当发送包含从机地址和RW#位的字节时，ICCR2.TRS位的值自动更新以根据发送的RW#位的值选择发送或接收模式。如果RW#位的值为1，则在SCL时钟的第9个周期的上升沿将TRS位设置为0，将IIC置于主机接收模式。此时TDRE标志置0，ICSR2.RDRF标志自动置1。因为此时ICSR2.NACKF标志为1表示没有从设备识别该地址或通信出现错误，向ICCR2.SP位写入1以发出停止条件。对于来自具有10位地址的设备的主机接收，首先使用主机发送来发出10位地址，然后发出重启条件。之后，发送11110b、从机地址的两个高阶位和R位将IIC置于主机接收模式。
- 4.确认ICSR2中的RDRF标志为1后伪读ICDRR。这使得IIC开始输出SCL时钟并开始数据接收。

5. After 1 byte of data is received, the RDRF flag in ICSR2 is set to 1 on the rising edge of the 8th or 9th cycle of the SCL clock, as selected in the RDRFS bit in ICMR3. Reading ICDRR at this time produces the received data, and the RDRF flag is automatically set to 0 at the same time. Additionally, the value of the acknowledgment field received during the ninth cycle of the SCL clock is returned as the value set in the ICMR3.ACKBT bit. If the next byte to be received is the second-to-last byte, set the ICMR3.WAIT bit to 1 for wait insertion before reading ICDRR, containing the second-to-last byte. In addition to enabling NACK output, even when interrupts or other operations result in delays in setting the ICMR3.ACKBT bit to 1 (NACK) in step (6), this fixes the SCLn line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, which enables the issuing of a stop condition.
6. When the ICMR3.RDRFS bit is 0, and the slave device must be notified that it is to end transfer for data reception after transfer of the next and final byte, set the ICMR3.ACKBT bit to 1 (NACK).
7. After reading the second-to-last byte from the ICDRR register, if the value of the ICSR2.RDRF flag is 1, write 1 to the SP bit in ICCR2 (stop condition requested), and then read the last byte from ICDRR. When ICDRR is read, the IIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is complete or the SCLn line is released from the low-hold state.
8. On detecting the stop condition, the IIC automatically sets the MST and TRS bits in ICCR2 to 00b and enters slave receive mode. Additionally, detection of the stop condition sets the ICSR2.STOP flag to 1.
9. Check that the ICSR2.STOP flag is 1, then set the ICSR2.NACKF and STOP flags to 0 for the next transfer operation.

5. 接收到1个字节的數據后，在SCL时钟的第8或第9个周期的上升沿将ICSR2中的RDRF标志设置为1，这由ICMR3中的RDRFS位选择。此时读取ICDRR产生接收数据，同时RDRF标志位自动置0。此外，在SCL时钟的第9个周期内接收到的确认字段的值作为ICMR3.ACKBT位中设置的值返回。如果要接收的下一个字节是倒数第二个字节，则在读取包含倒数第二个字节的ICDRR之前将ICMR3.WAIT位设置为1以等待插入。除了使能NACK输出外，即使在中断或其他操作导致在步骤(6)中将ICMR3.ACKBT位设置为1(NACK)时出现延迟，这也会在第9次的上升沿将SCLn线固定为低电平接收最后一个字节的时钟周期，它可以发出停止条件。
6. 当ICMR3.RDRFS位为0时，必须通知从设备在传输下一个和最后一个字节后结束传输以进行数据接收，将ICMR3.ACKBT位设置为1(NACK)。
7. 从ICDRR寄存器中读取倒数第二个字节后，如果ICSR2.RDRF标志的值为1，则将1写入ICCR2中的SP位（请求停止条件），然后从ICDRR中读取最后一个字节。当读取ICDRR时，IIC从等待状态中释放，并在第9个时钟周期的低电平输出完成或SCLn线从低保持状态释放后发出停止条件。
8. 在检测到停止条件时，IIC自动将ICCR2中的MST和TRS位设置为00b并进入从机接收模式。此外，检测到停止条件会将ICSR2.STOP标志设置为1。
9. 检查ICSR2.STOP标志是否为1，然后将ICSR2.NACKF和STOP标志设置为0以进行下一次传输操作。

### 28.3.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL clock, the IIC transmits data as a slave device, and the master device returns acknowledgments.

Figure 28.15 shows an example of slave transmission, and Figure 28.16 and Figure 28.17 show the operation timing in slave transmission.

To set up and perform slave transmission:

1. Initialize the IIC using the procedure in section 28.3.2. Initial Settings.  
After initialization, the IIC stays in the standby state until it receives a slave address that matches.
2. After receiving a matching slave address, the IIC sets one of the associated ICSR1.HOA, GCA, and AASy flags (y = 0 to 2) to 1 on the rising edge of the ninth cycle of the SCL clock and outputs the value set in the ICMR3.ACKBT bit to the acknowledge bit on the ninth cycle of the SCL clock. If the value of the R/W# bit is 1, the IIC automatically places itself in slave transmit mode by setting both the ICCR2.TRS bit and the ICSR2.TDRE flag to 1.
3. Check that the ICSR2.TDRE flag is 1, then write the transmit data to the ICDRT register. If the IIC receives no acknowledge from the master device (receives an NACK signal) while the ICFER.NACKF bit is 1, the IIC suspends transfer of the next data.
4. Wait until the ICSR2.TEND flag is set to 1 while the ICSR2.TDRE flag is 1, after the ICSR2.NACKF flag is set to 1 or the last byte for transmission is written to the ICDRT register. When the ICSR2.NACKF flag or the TEND flag is 1, the IIC drives the SCLn line low on the ninth falling edge of the SCL clock.
5. When the ICSR2.NACKF or ICSR2.TEND flag is 1, dummy read ICDRR to complete the processing. This releases the SCLn line.
6. On detecting the stop condition, the IIC automatically sets the ICSR1.HOA, GCA, and AASy flags (y = 0 to 2), the ICSR2.TDRE and TEND flags, and the ICCR2.TRS bit to 0, and enters slave receive mode.
7. Check that the ICSR2.STOP flag is 1, then set the ICSR2.NACKF and STOP flags to 0 for the next transfer operation.

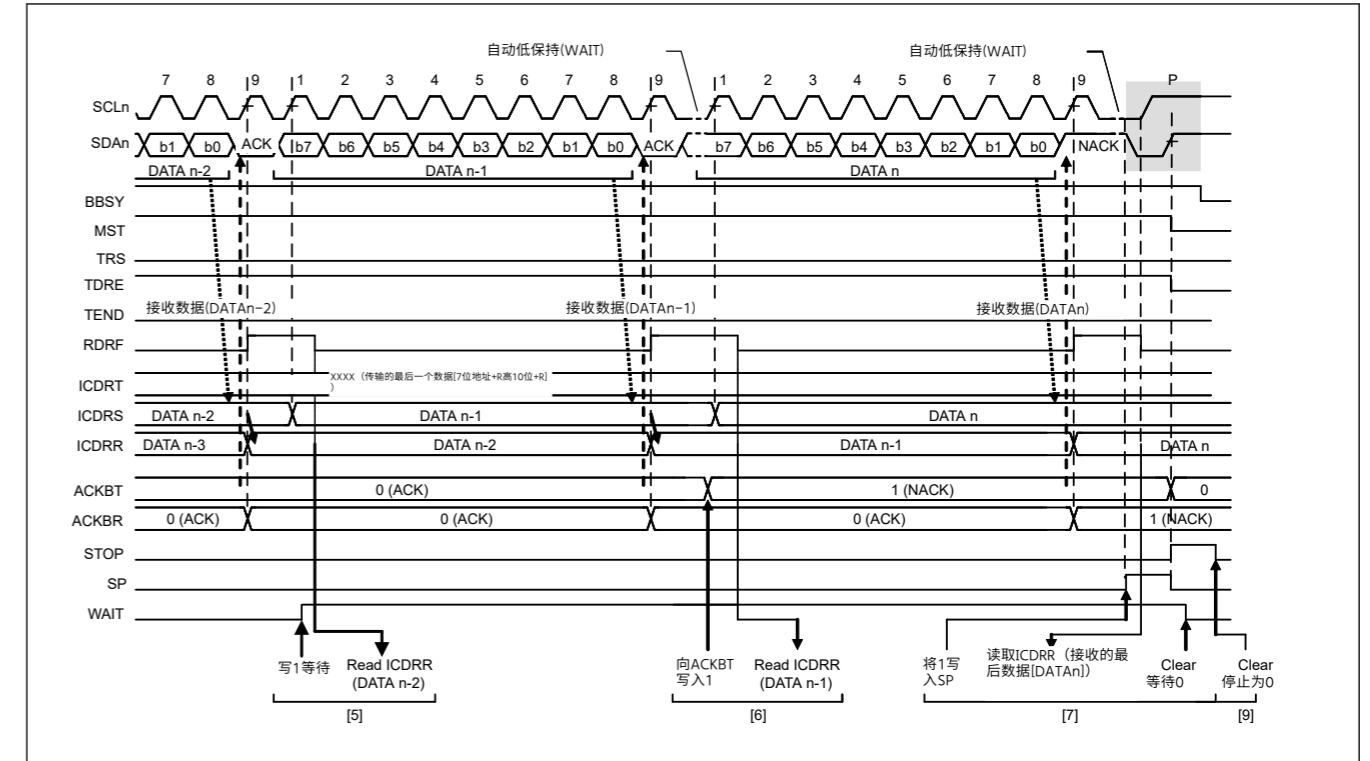

Figure 28.14 RDRFS=0时的主机接收操作时序(3)

### 28.3.5 从机发送操作

在从发送操作中，主设备输出SCL时钟，IIC作为从设备发送数据，主设备返回确认。

图28.15显示了从机传输的示例，图28.16和图28.17显示了从机传输的操作时序。

设置和执行从属传输：

- 1.使用第28.3.2节中的过程初始化IIC。初始设置。  
初始化后，IIC一直处于待机状态，直到收到匹配的从机地址。
- 2.接收到匹配的从地址后，IIC在SCL时钟的第9个周期的上升沿将相关的ICSR1.HOA、GCA和AASy标志之一（y=0到2）设置为1，并输出该值在SCL时钟的第9个周期将ICMR3.ACKBT位设置为确认位。如果RW#位的值为1，则IIC通过将ICCR2.TRS位和ICSR2.TDRE标志都设置为1自动将自身置于从发送模式。
- 3.检查ICSR2.TDRE标志是否为1，然后将发送数据写入ICDRT寄存器。如果IIC没有收到当ICFER.NACKF位为1时，来自主设备的确认（接收NACK信号），IIC暂停下一个数据的传输。
- 4.等到ICSR2.TEND标志设置为1，而ICSR2.TDRE标志为1，在ICSR2.NACKF标志设置为1或将要发送的最后一个字节写入ICDRT寄存器之后。当ICSR2.NACKF标志或TEND标志为1时，IIC在SCL时钟的第九个下降沿将SCLn线驱动为低电平。
- 5.当ICSR2.NACKF或ICSR2.TEND标志为1时，假读ICDRR完成处理。这将释放SCLn线。
- 6.在检测到停止条件时，IIC自动将ICSR1.HOA、GCA和AASy标志（y=0到2）、ICSR2.TDRE和TEND标志以及ICCR2.TRS位设置为0，并进入从机接收模式。
- 7.检查ICSR2.STOP标志是否为1，然后将ICSR2.NACKF和STOP标志设置为0以进行下一次传输操作。

Figure 28.15 Example slave transmission flow

### 28.3.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the IIC returns acknowledgments as a slave device.

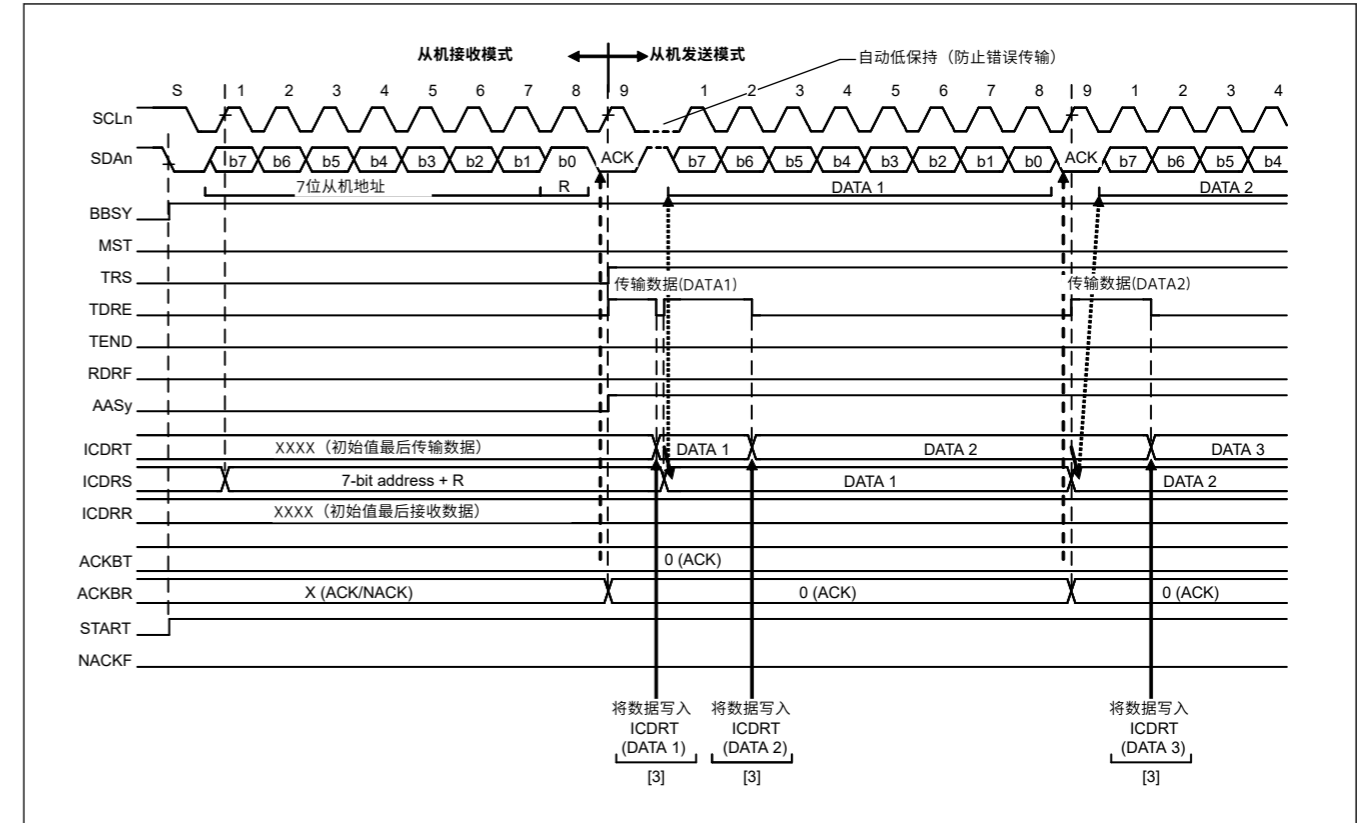

Figure 28.16 7位地址格式的从机发送操作时序(1)

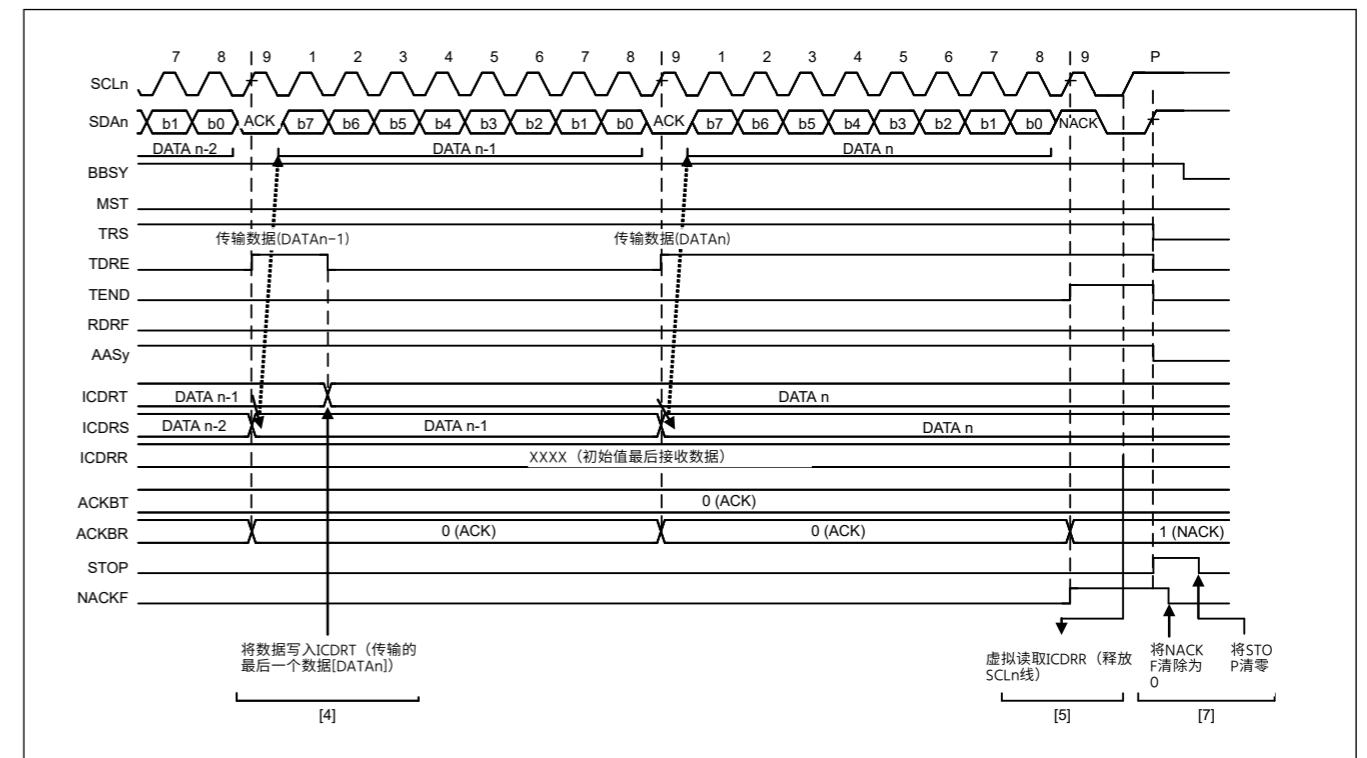

Figure 28.17 从机发送操作时序 (2)

### 28.3.6 从机接收操作

在从机接收操作中，主设备输出SCL时钟并发送数据，IIC作为从设备返回确认。

Figure 28.18 shows an example of slave reception, and Figure 28.19 and Figure 28.20 show the operation timing in slave reception.

To set up and perform slave reception:

1. Initialize the IIC using the procedure in section 28.3.2. Initial Settings.  
After initialization, the IIC stays in the standby state until it receives a slave address that matches.
2. After receiving a matching slave address, the IIC sets one of the associated ICSR1.HOA, GCA, and AASy flags (y = 0 to 2) to 1 on the rising edge of the ninth cycle of the SCL clock and outputs the value set in the ICMR3.ACKBT bit to the acknowledge bit on the ninth cycle of the SCL clock. If the value of the R/W# bit is 0, the IIC continues to place itself in slave receive mode and sets the RDRF flag in ICSR2 to 1.
3. Check that the ICSR2.STOP flag is 0 and the ICSR2.RDRF flag is 1, then dummy read ICDRR. The dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower 8 bits when the 10-bit address format is selected.
4. When ICDRR is read, the IIC automatically sets the ICSR2.RDRF flag to 0. If reading of ICDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the IIC holds the SCLn line low until 1 SCL cycle before the point where RDRF must be set. In this case, reading ICDRR releases the SCLn line from being held low. When the ICSR2.STOP flag is 1 and the ICSR2.RDRF flag is also 1, read ICDRR until all the data is completely received.
5. On detecting the stop condition, the IIC automatically clears the ICSR1.HOA, GCA, and AASy flags (y = 0 to 2) to 0.
6. Check that the ICSR2.STOP flag is 1, then set the ICSR2.STOP flag to 0 for the next transfer operation.

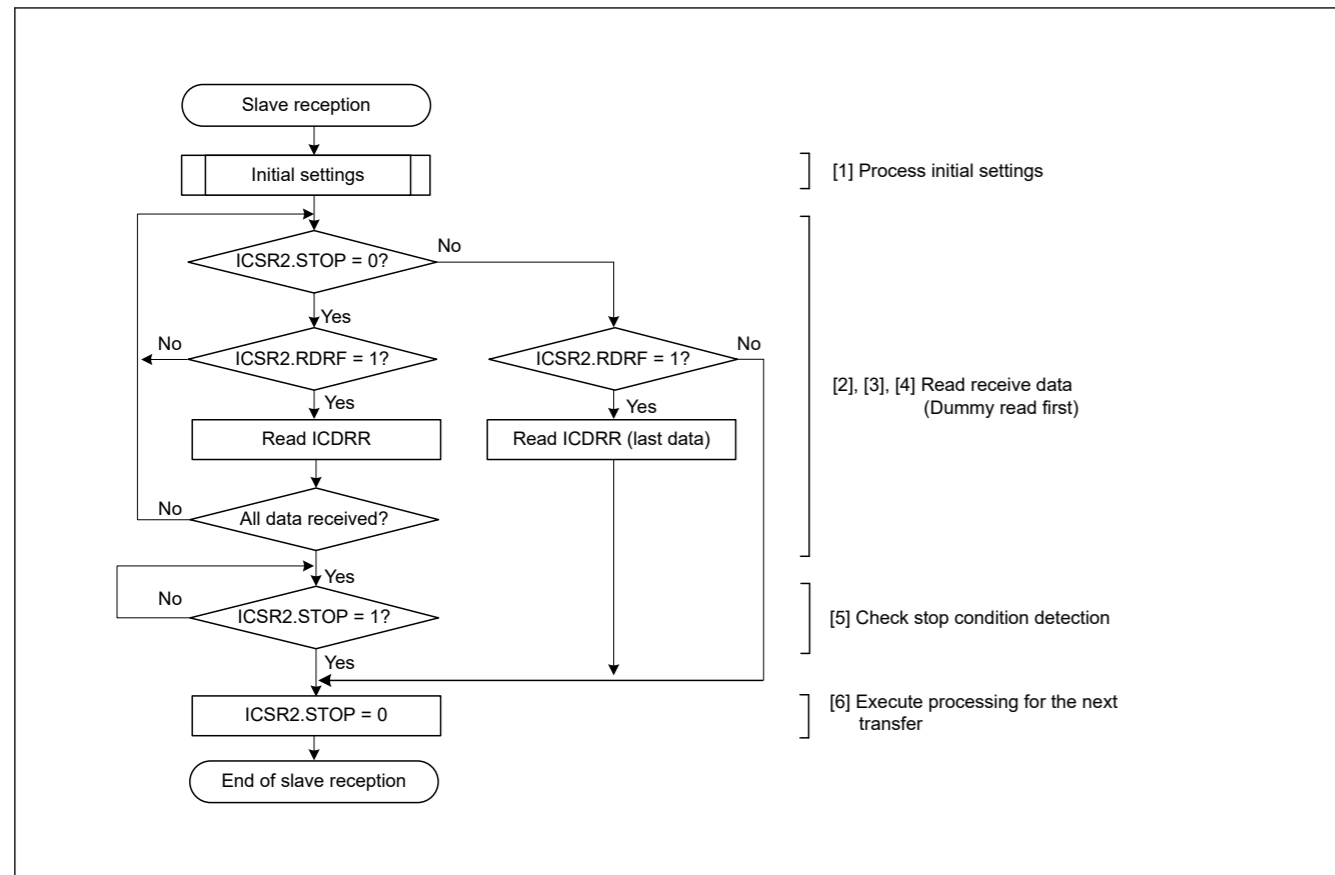

Figure 28.18 Example slave reception flow

图28.18显示了从机接收的示例，图28.19和图28.20显示了从机接收的操作时序。

设置和执行从属接收：

- 1.使用第28.3.2节中的过程初始化IIC。初始设置。  
初始化后，IIC一直处于待机状态，直到收到匹配的从机地址。
- 2.接收到匹配的从地址后，IIC在SCL时钟的第9个周期的上升沿将相关的ICSR1.HOA、GCA和AASy标志之一（y=0到2）设置为1，并输出该值在SCL时钟的第9个周期将ICMR3.ACKBT位设置为确认位。如果RW#位的值为0，则IIC继续将自身置于从机接收模式并将ICSR2中的RDRF标志设置为1。
- 3.检查ICSR2.STOP标志为0且ICSR2.RDRF标志为1，然后虚拟读取ICDRR。虚拟值选择7位地址格式时由从机地址和RW#位组成，选择10位地址格式时由低8位组成。
- 4.读取ICDRR时，IIC自动将ICSR2.RDRF标志设置为0。如果ICDRR的读取延迟并且在RDRF标志仍设置为1时接收到下一个字节，则IIC将SCLn线保持为低电平直到1SCL在必须设置RDRF的点之前循环。在这种情况下，读取ICDRR会释放SCLn线的低电平。当ICSR2.STOP标志为1且ICSR2.RDRF标志也为1时，读取ICDRR直到完全接收到所有数据。
- 5.在检测到停止条件时，IIC自动将ICSR1.HOA、GCA和AASy标志（y=0到2）清除为0。
- 6.检查ICSR2.STOP标志是否为1，然后将ICSR2.STOP标志设置为0以进行下一次传输操作。

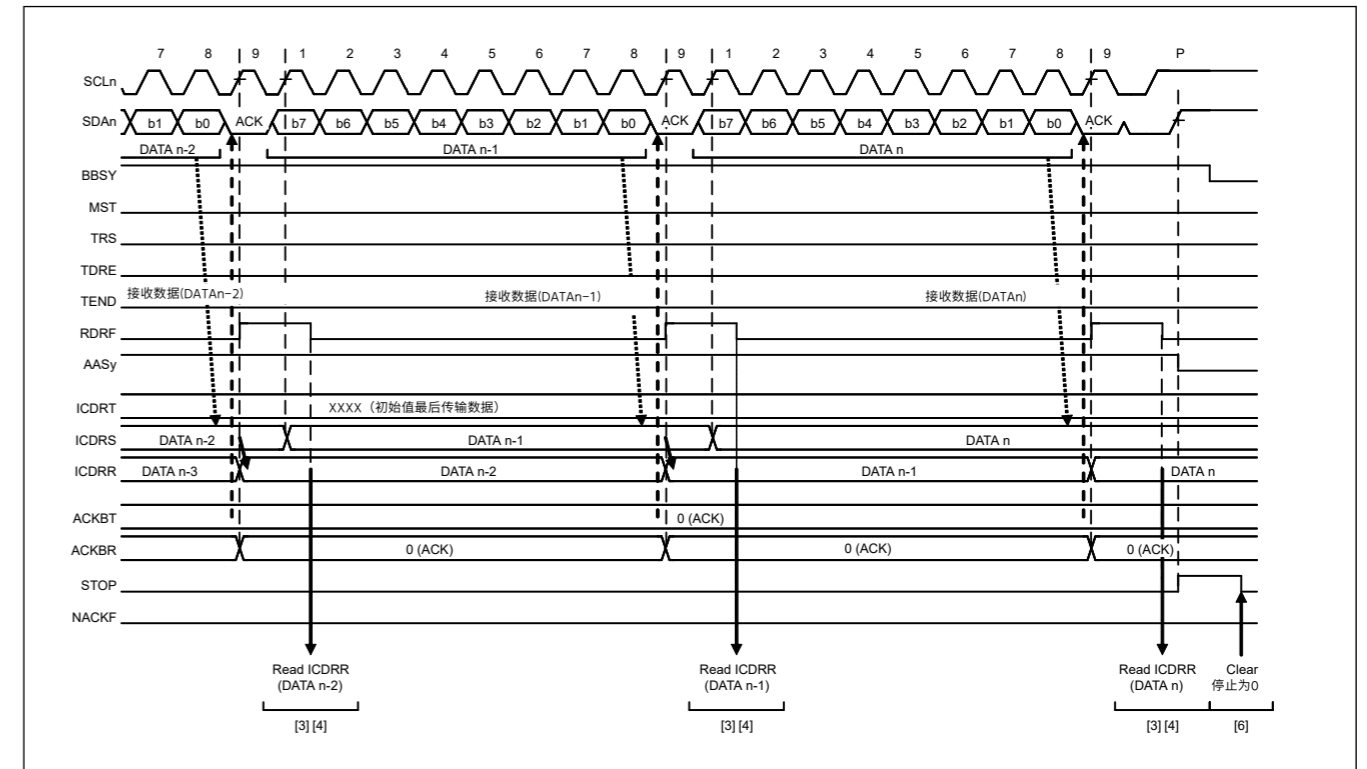

Figure 28.20 RDRFS=0时的从机接收操作时序(2)

### 28.4 SCL Synchronization Circuit

For generation of the SCL clock, the IIC starts counting the value for the high-level period specified in ICBRH when it detects a rising edge on the SCLn line, and it drives the SCLn line low when it completes counting. When the IIC detects the falling edge of the SCLn line, it starts counting the value for the low-level period specified in ICBRL, and then it stops

### 28.4 SCL同步电路

为了生成SCL时钟，IIC在检测到SCLn线上的上升沿时开始对ICBRH中指定的高电平周期的值进行计数，并在完成计数时将SCLn线驱动为低电平。当IIC检测到SCLn线的下降沿时，它开始计数ICBRL中指定的低电平周期的值，然后停止

driving the SCLn line, releasing the line, when it completes counting. The IIC repeats this process to generate the SCL clock.

If multiple master devices are connected to the I<sup>2</sup>C bus, a collision of SCL signals might arise because of contention with another master device. In such cases, the master devices must synchronize their SCL signals. Because this synchronization of SCL signals must be bit-by-bit, the IIC is equipped with an SCL synchronization circuit to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCLn line while in master mode.

When the IIC detects a rising edge on the SCLn line and starts counting the high-level period specified in ICBRH.BRH[4:0], and the level on the SCLn line falls because an SCL signal is being generated by another master device, the IIC performs the following:

1. Stops counting when it detects the falling edge.
2. Drives the level on the SCLn line low.
3. Starts counting the low-level period specified in ICBRL.BRL[4:0].

When the IIC finishes counting the low-level period, it stops driving the SCLn line low to release the line. If the low-level period of the SCL clock signal from the other master device is longer than the low-level period set in the IIC, the low-level period of the SCL signal is extended. When the low-level period for the other master device ends, the SCL signal rises because the SCLn line is released.

When the IIC finishes outputting the low-level period of the SCL clock, the SCLn line is released and the SCL clock rises. That is, when SCL signals from more than one master are contending, the high-level period of the SCL signal is synchronized with that of the clock with the narrower period, and the low-level period of the SCL signal is synchronized with that of the clock with the broader period. However, such synchronization of the SCL signal is only enabled when the SCLE bit in ICFER is set to 1.

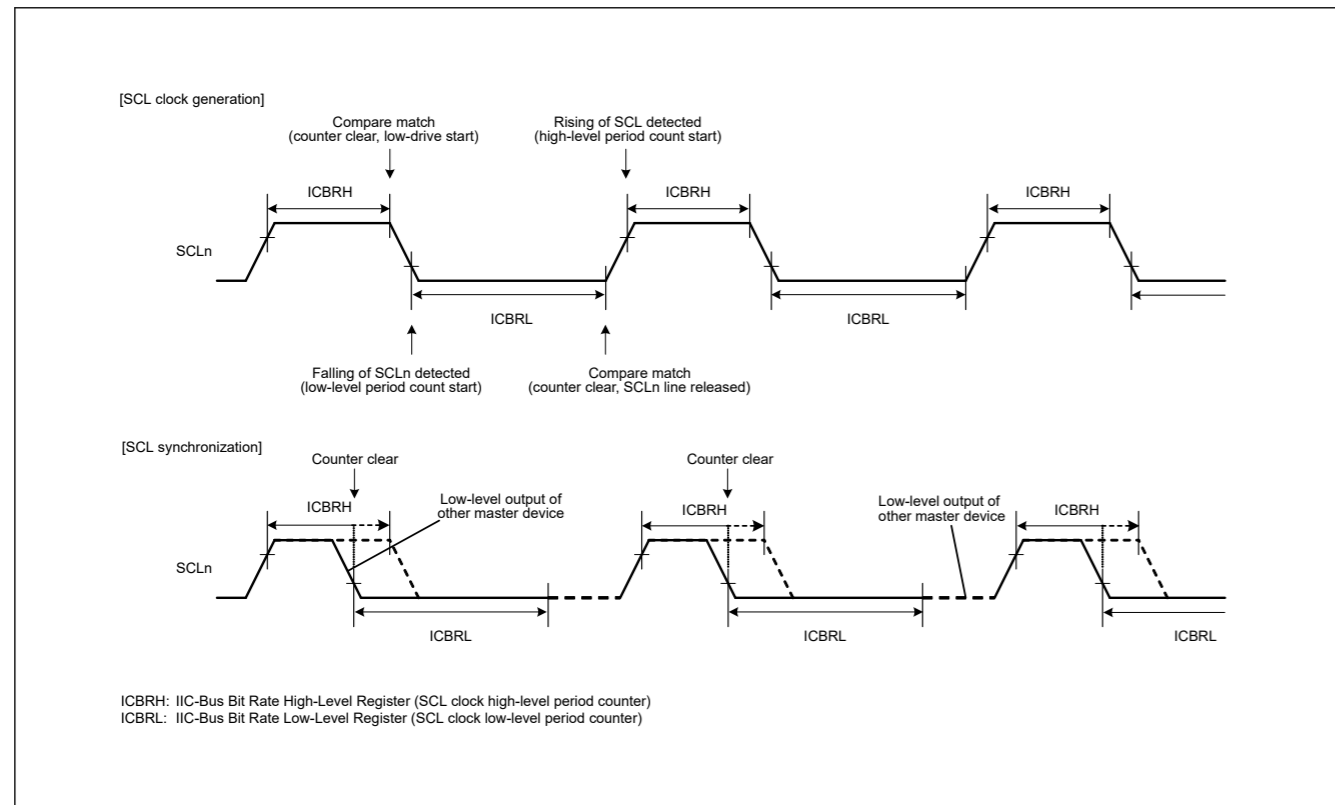

Figure 28.21 Generation and synchronization of SCL signal from IIC

### 28.5 SDA Output Delay Function

The IIC module incorporates a function for delaying output on the SDA line. The delay can be applied to all output on the SDA line, including issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals.

完成计数后，驱动SCLn线，释放线。IIC重复此过程以生成SCL时钟。

如果多个主设备连接到I2C总线，由于与另一个主设备争用，可能会出现SCL信号冲突。在这种情况下，主设备必须同步它们的SCL信号。因为SCL信号的这种同步必须是逐位的，所以IIC配备了一个SCL同步电路，通过在主机模式下监视SCLn线来获得SCL时钟信号的逐位同步。

当IIC检测到SCLn线上的上升沿并开始计数指定的高电平周期时 ICBRH.BRH[4:0]，并且SCLn线上的电平下降，因为另一个主设备正在生成SCL信号，IIC执行以下操作：

- 1.检测到下降沿停止计数。
- 2.将SCLn线上的电平拉低。
- 3.开始计算ICBRL.BRL[4:0]中指定的低电平周期。

当IIC完成对低电平周期的计数时，它停止将SCLn线驱动为低电平以释放该线。如果来自其他主设备的SCL时钟信号的低电平周期长于IIC中设置的低电平周期，则延长SCL信号的低电平周期。当另一个主设备的低电平周期结束时，SCL信号上升，因为SCLn线被释放。

当IIC输出完SCL时钟的低电平周期后，SCLn线被释放，SCL时钟上升。即当来自多个主控的SCL信号竞争时，SCL信号的高电平周期与周期较窄的时钟同步，SCL信号的低电平周期与主控的低电平周期同步。具有更广泛周期的时钟。但是，只有当ICFER中的SCLE位设置为1时，才会启用SCL信号的这种同步。

Figure 28.21 从IIC生成和同步SCL信号

### 28.5 SDA输出延迟功能

IIC模块包含延迟SDA线上输出的功能。延迟可以应用于所有输出SDA线，包括发出启动、重新启动和停止条件、数据以及ACK和NACK信号。

With this function, SDA output is delayed from the detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval during which the SCL clock is low. This approach helps prevent erroneous operation of communications devices, with the aim of satisfying the 300-ns minimum data-hold time requirement of the SMBus specification. The output delay function is enabled by setting the SDDL[2:0] bits in ICMR2 to a value other than 000b, and disabled by setting the same bits to 000b.

When the SDA output delay function is enabled, for example, the DLCS bit in ICMR2 selects the clock source for the SDA output delay counter, either as the internal base clock (IICφ) for the IIC module or as the internal base clock divided by 2 (IICφ/2). The counter counts the number of cycles set in the SDDL[2:0] bits in ICMR2. When the delay cycles count is reached, the IIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.

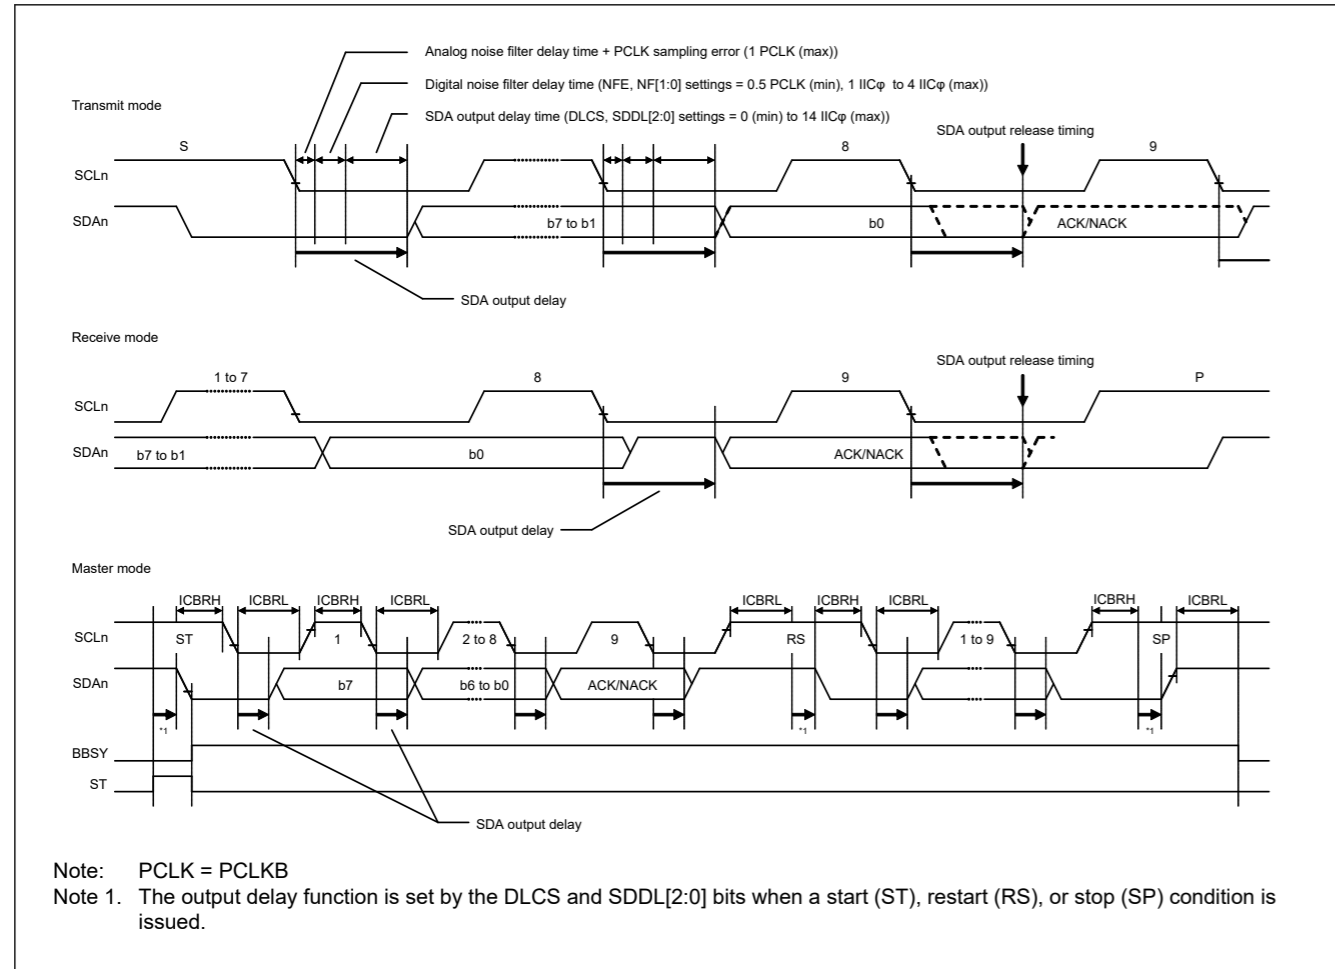

Figure 28.22 SDA output delay function

### 28.6 Digital Noise Filter Circuits

The internal circuitry sees the states of the SCLn and SDA n pins through analog and digital noise-filter circuits. Figure 28.23 shows a block diagram of the digital noise-filter circuit.

The on-chip digital noise-filter circuit of the IIC consists of four flip-flop circuit stages connected in series and a match-detection circuit. The number of valid stages in the digital noise filter is selected in the NF[1:0] bits in ICMR3. The selected number of valid stages determines the noise-filtering capability as a period from 1 to 4 IICφ cycles.

The input signal to the SCLn pin (or SDA n pin) is sampled on falling edges of the IICφ signal. When the input signal level matches the output level of the number of valid flip-flop circuit stages as selected in the NF[1:0] bits in ICMR3, the signal level is seen in the the subsequent stage. If the signal levels do not match, the previous value is saved.

If the ratio between the frequency of the internal operating clock (PCLKB) and the transfer rate is small, for example, if data transfer is 400 kbps with PCLKB = 4 MHz, the characteristics of the digital noise filter might lead to the elimination of

使用此功能，SDA输出从检测到SCL信号的下沿开始延迟，以确保在SCL时钟为低电平的时间间隔内输出SDA信号。这种方法有助于防止通信设备的错误操作，旨在满足SMBus规范的300ns最小数据保持时间要求。通过将ICMR2中的SDDL[2:0]位设置为000b以外的值来启用输出延迟功能，通过将相同位设置为000b来禁用输出延迟功能。

例如，当SDA输出延迟功能使能时，ICMR2中的DLCS位选择SDA输出延迟计数器的时钟源，或者作为IIC模块的内部基准时钟(IICφ)，或者作为内部基准时钟除以2(IICφ/2)。计数器计算ICMR2中SDDL[2:0]位中设置的周期数。当达到延迟周期计数时，IIC模块将所需的输出（启动、重启或停止条件、数据或ACK或NACK信号）放在SDA线上。

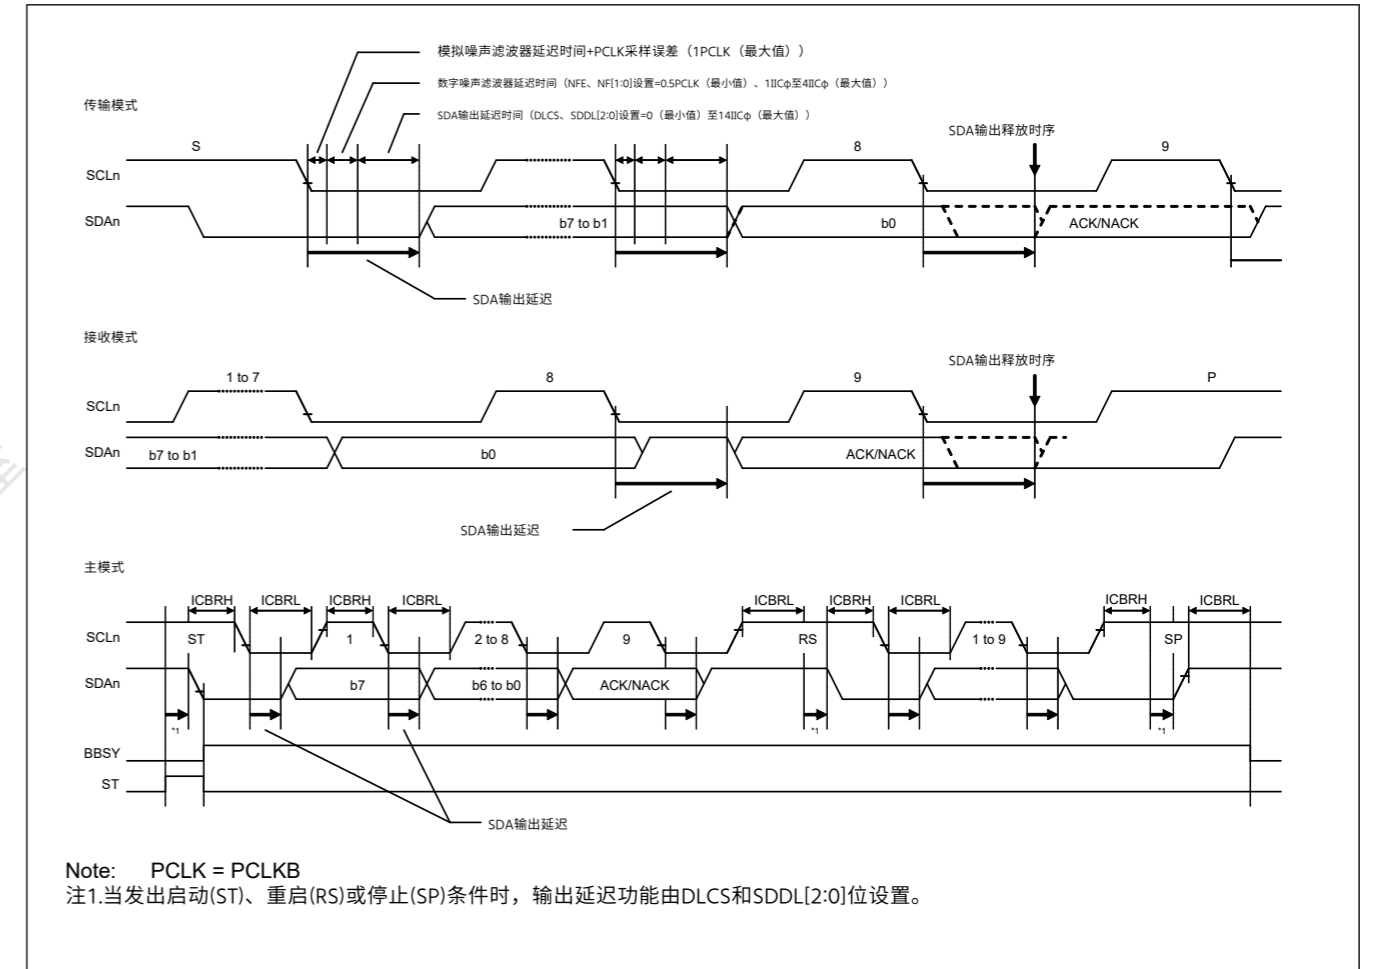

Figure 28.22 SDA输出延迟功能

### 28.6 数字噪声滤波器电路

内部电路通过模拟和数字噪声滤波器电路查看SCLn和SDA n引脚的状态。图28.23显示了数字噪声滤波器电路的框图。

IIC的片上数字噪声滤波器电路由四个串联的触发器电路级和一个匹配检测电路组成。数字噪声滤波器的有效级数在ICMR3的NF[1:0]位中选择。选定的有效级数决定了噪声过滤能力，周期为1到4个IICφ周期。

SCLn引脚（或SDA n引脚）的输入信号在IICφ信号的下沿采样。当输入信号电平与在ICMR3的NF[1:0]位中选择的有效触发器电路级数的输出电平相匹配时，将在后续级中看到信号电平。如果信号电平不匹配，则保存先前的值。

如果内部工作时钟(PCLKB)的频率与传输速率之间的比率很小，例如，如果数据传输为400kbps，PCLKB=4MHz，则数字噪声滤波器的特性可能会导致消除

required signals as noise. In such cases, it is possible to disable the digital noise-filter circuit by setting the ICFER.NFE bit to 0, and use only the analog noise filter circuit.

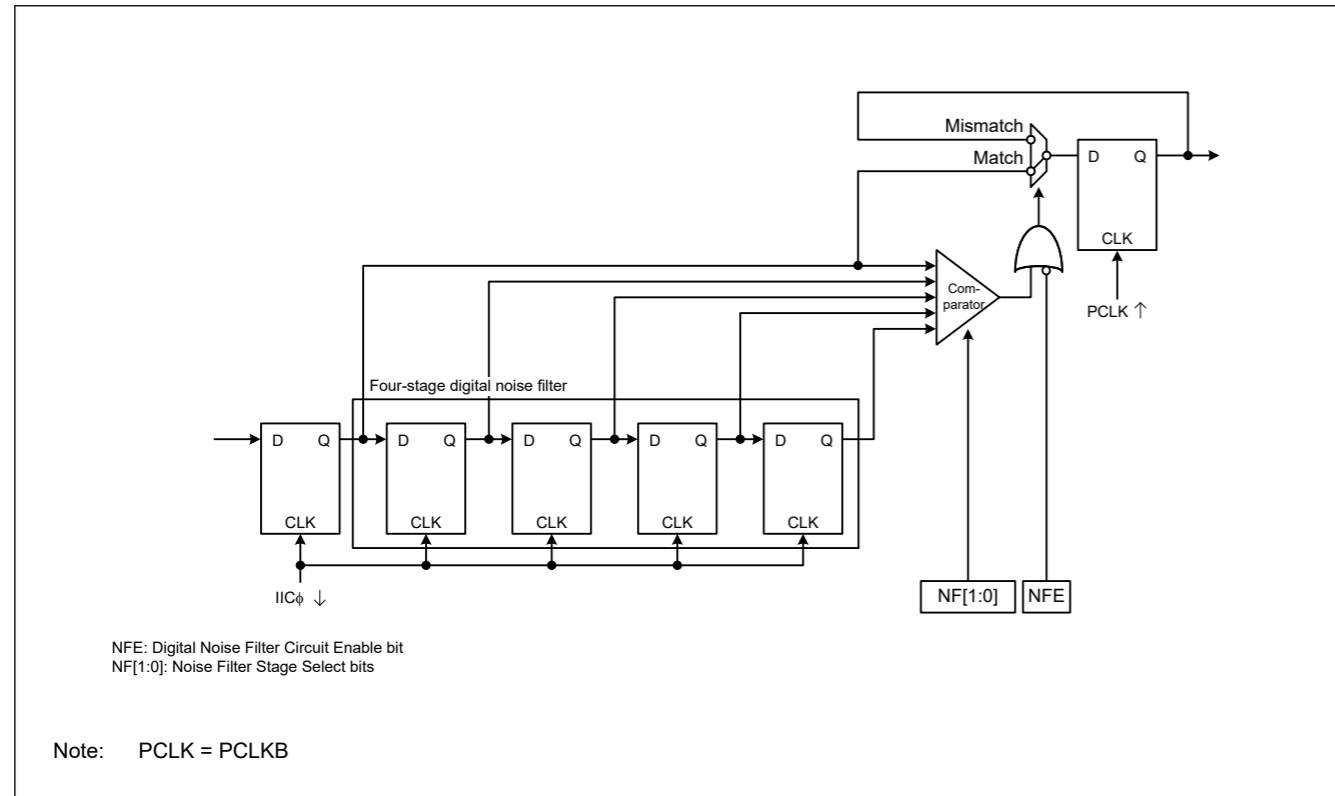

Figure 28.23 Digital noise filter circuit block diagram

## 28.7 Address Match Detection

The IIC can set three unique slave addresses in addition to the general call address and host address. The slave addresses can be 7-bit or 10-bit slave addresses.

### 28.7.1 Slave-Address Match Detection

The IIC can set three unique slave addresses and has a slave address detection function for each unique slave address. When the SARyE bit ( $y = 0$  to 2) in ICSER is set to 1, the slave addresses set in SARUy and SARLy ( $y = 0$  to 2) can be detected.

When the IIC detects a match of the set slave address, the associated AASy flag ( $y = 0$  to 2) in ICSR1 is set to 1 on the rising edge of the ninth SCL clock cycle, and the RDRF flag in ICSR2 or the TDRE flag in ICSR2 is set to 1 by the subsequent R/W# bit. This causes a receive data full interrupt (IICn\_RXI) or transmit data empty interrupt (IICn\_TXI) to be generated. The AASy flag identifies which slave address is specified.

Figure 28.24 to Figure 28.26 show the AASy flag set timing in three cases.

所需的信号作为噪声。在这种情况下，可以通过将ICFER.NFE位设置为0来禁用数字噪声滤波器电路，并仅使用模拟噪声滤波器电路。

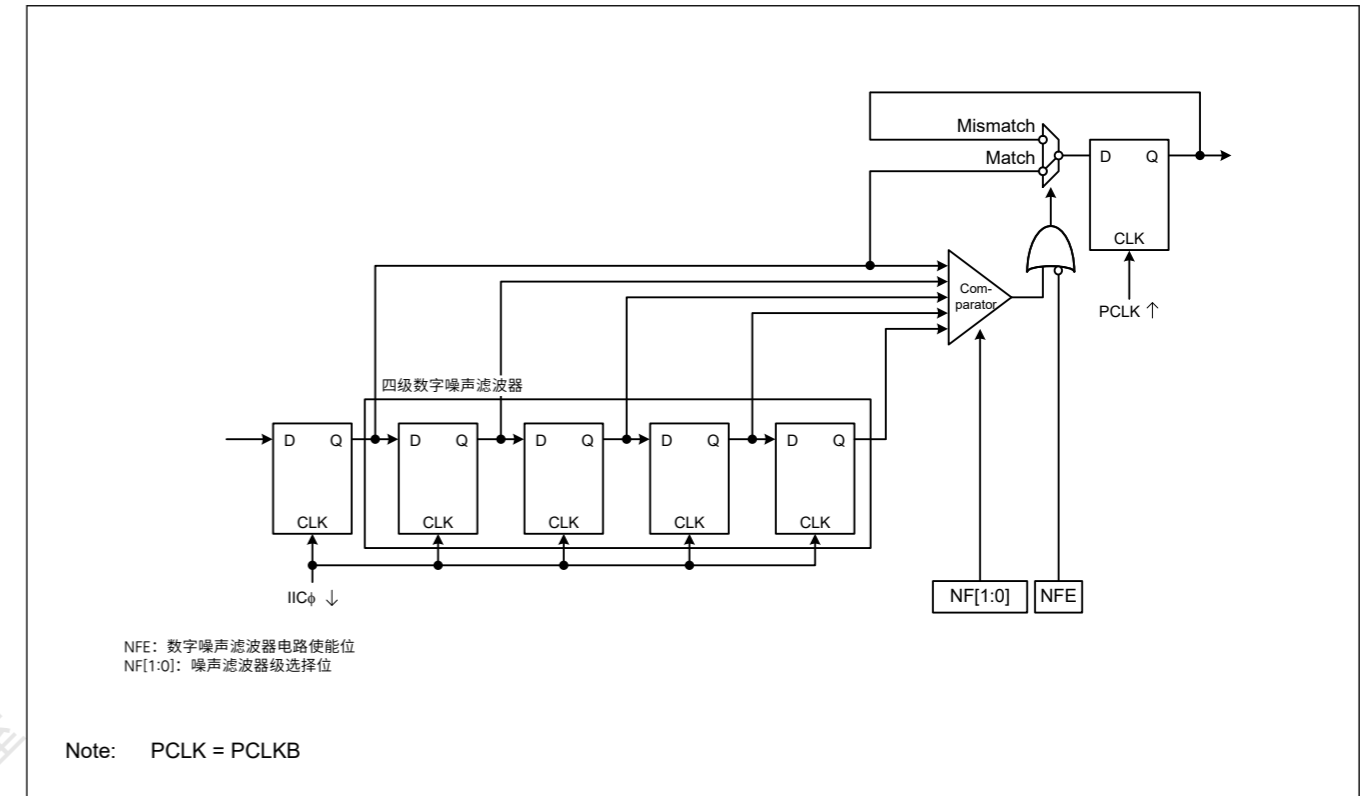

Figure 28.23 数字噪声滤波器电路框图

## 28.7 地址匹配检测

IIC除了广播地址和主机地址外，还可以设置三个唯一的从机地址。从地址可以是7位或10位从地址。

### 28.7.1 从地址匹配检测

IIC可以设置三个唯一的从机地址，并对每个唯一的从机地址具有从机地址检测功能。当ICSER中的SARyE位（ $y=0$ 到2）设置为1时，可以检测到设置在SARUy和SARLy（ $y=0$ 到2）中的从机地址。

当IIC检测到与设置的从地址匹配时，ICSR1中相关的AASy标志（ $y=0$ 到2）在第9个SCL时钟周期的上升沿设置为1，并且ICSR2中的RDRF标志或TDRE标志ICSR2中的1由随后的RW#位设置为1。这会导致产生接收数据满中断（IICn\_RXI）或发送数据空中断（IICn\_TXI）。AASy标志标识指定了哪个从地址。

图28.24到图28.26显示了三种情况下的AASy标志设置时序。

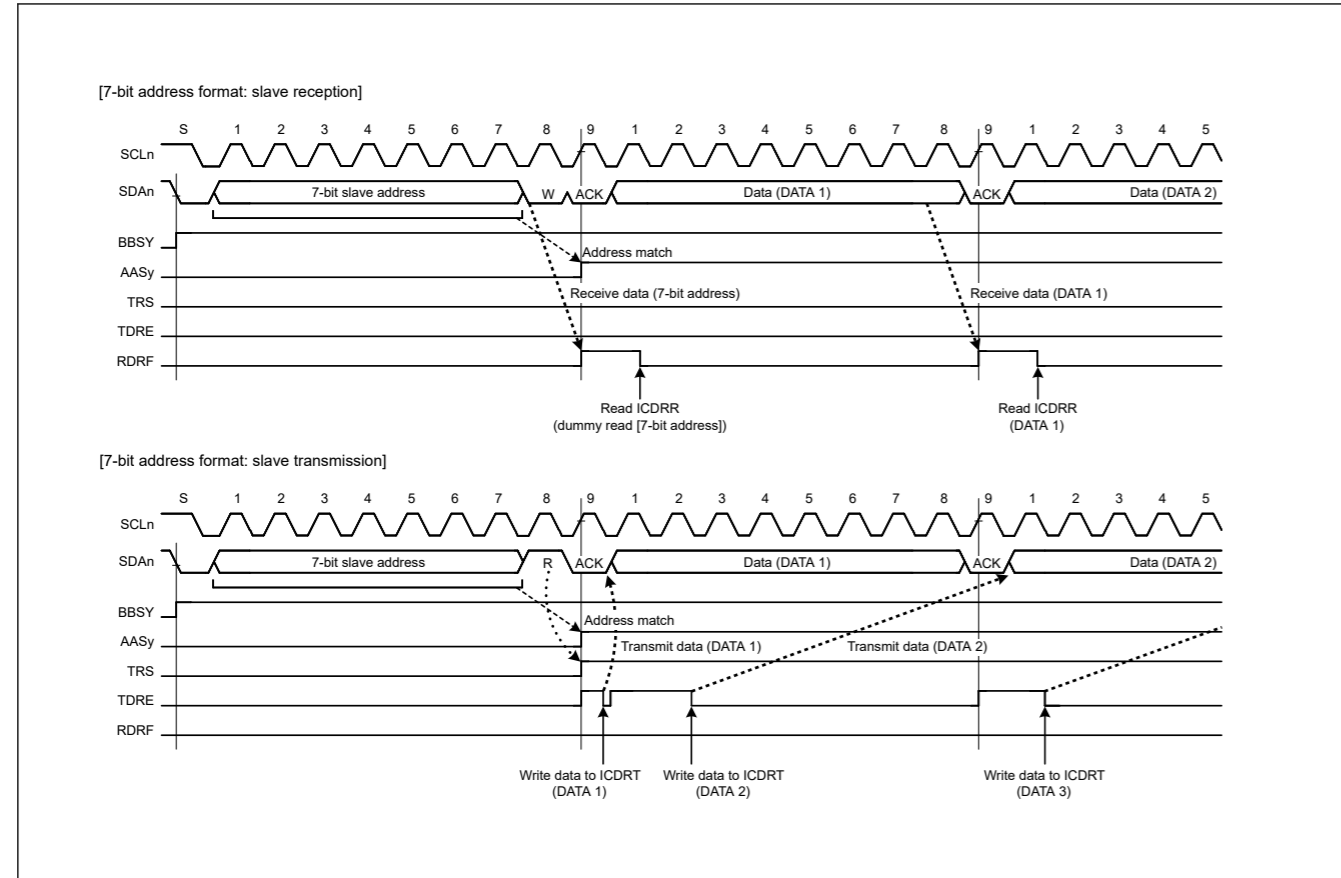

Figure 28.24 AASy flag set timing with 7-bit address format

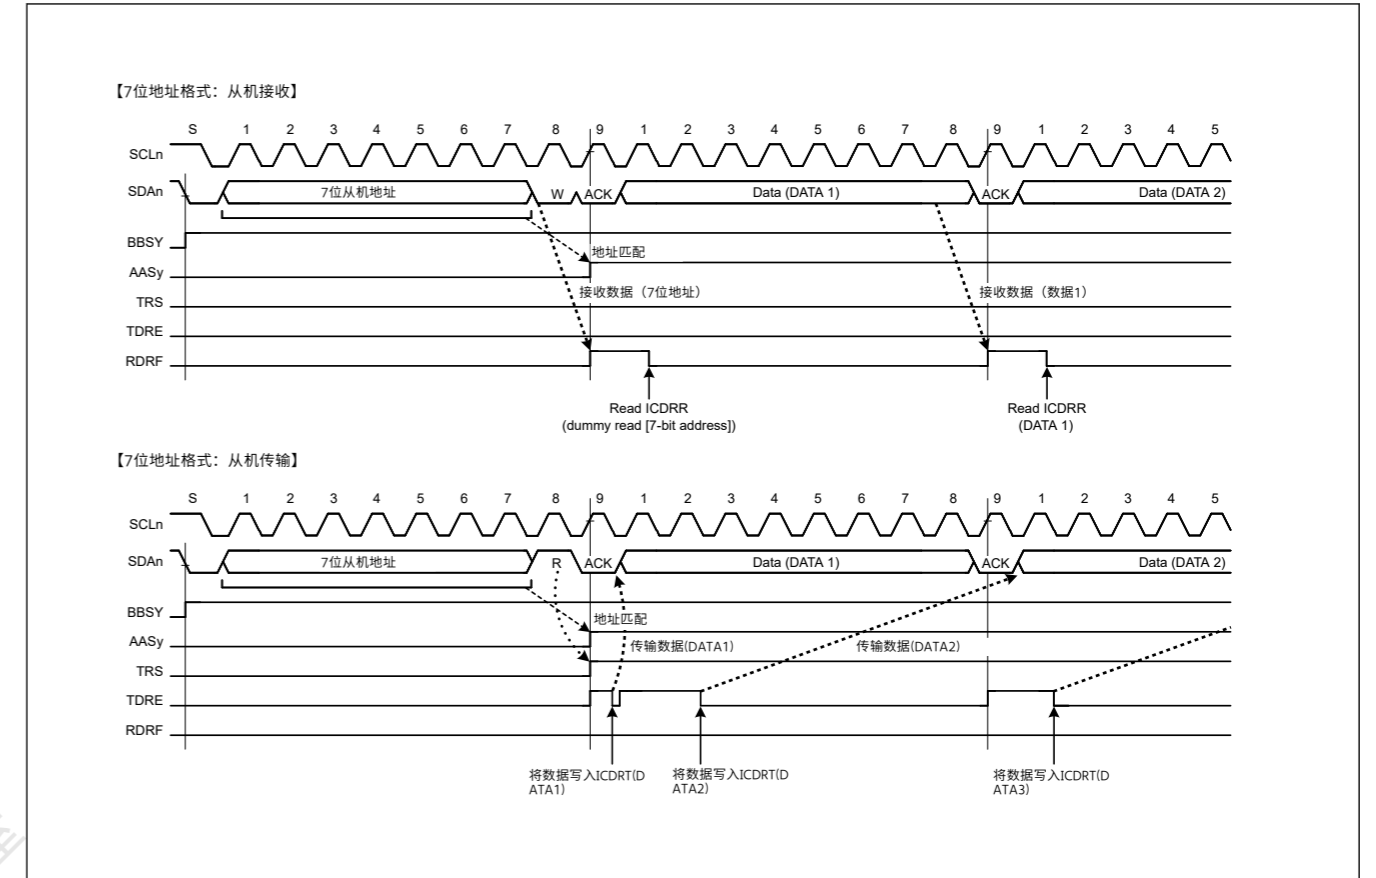

Figure 28.24 7位地址格式的AASy标志设置时序

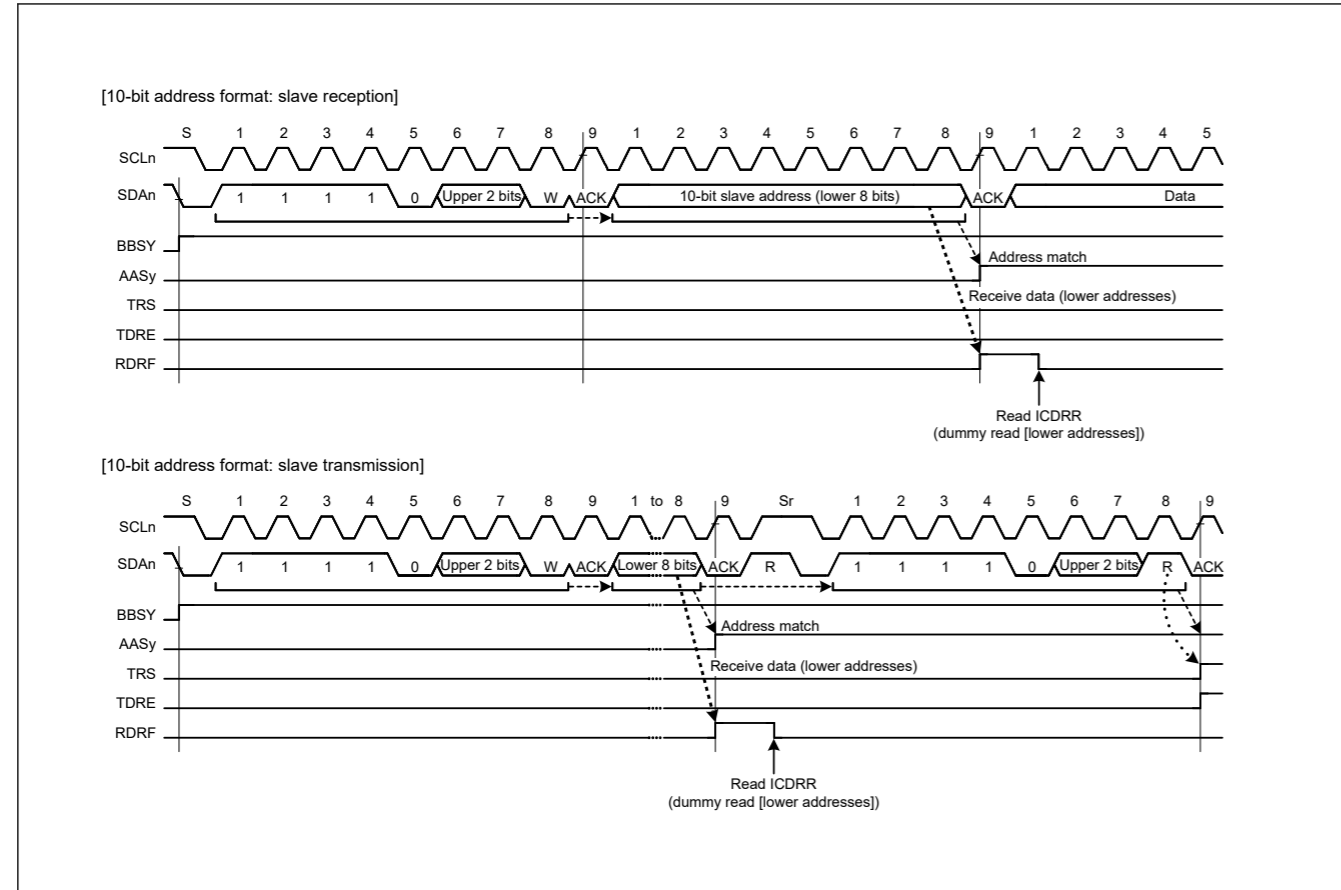

Figure 28.25 AASy flag set timing with 10-bit address format

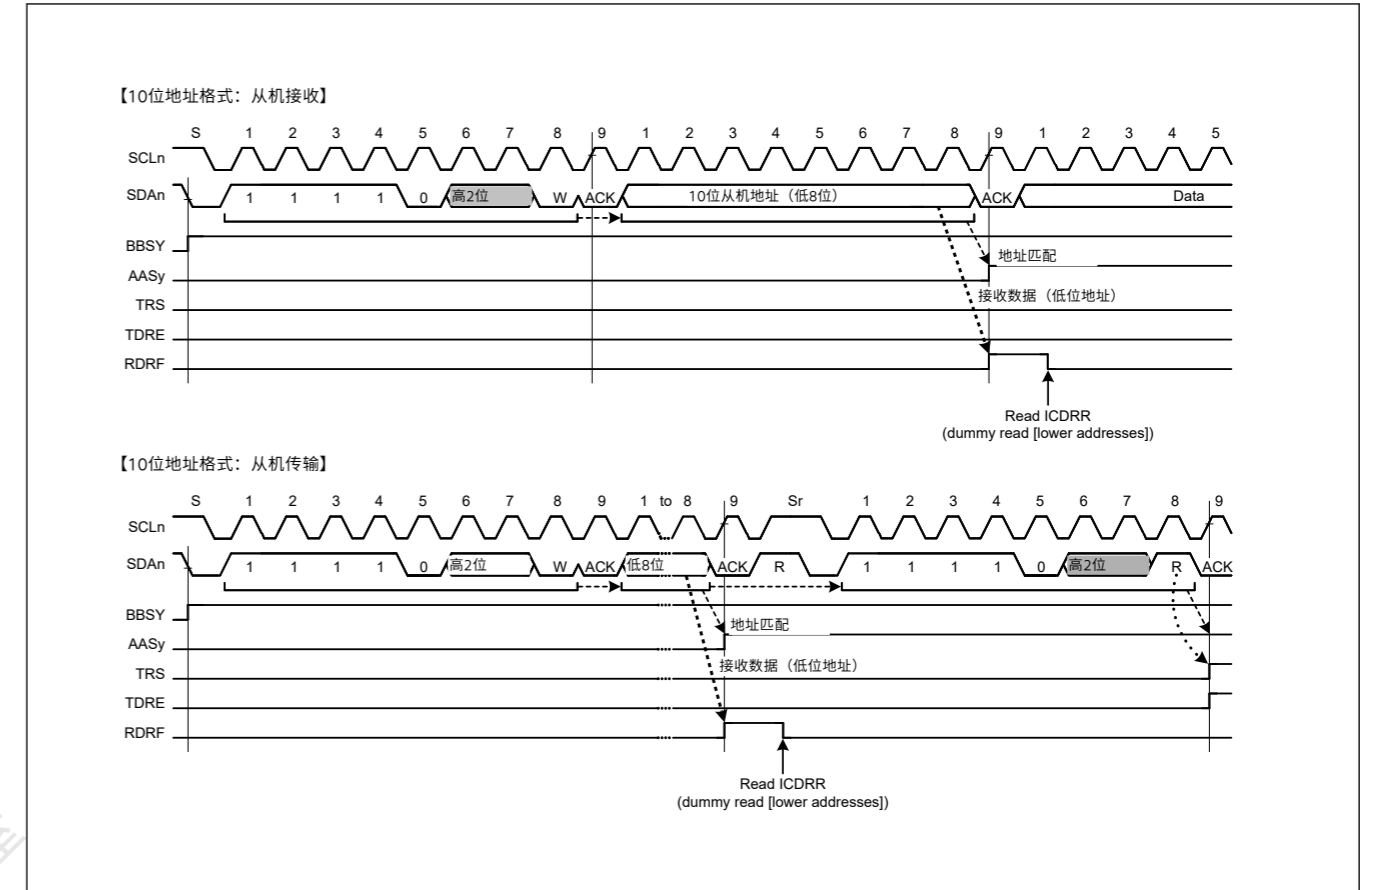

Figure 28.25 10位地址格式的AASy标志设置时序

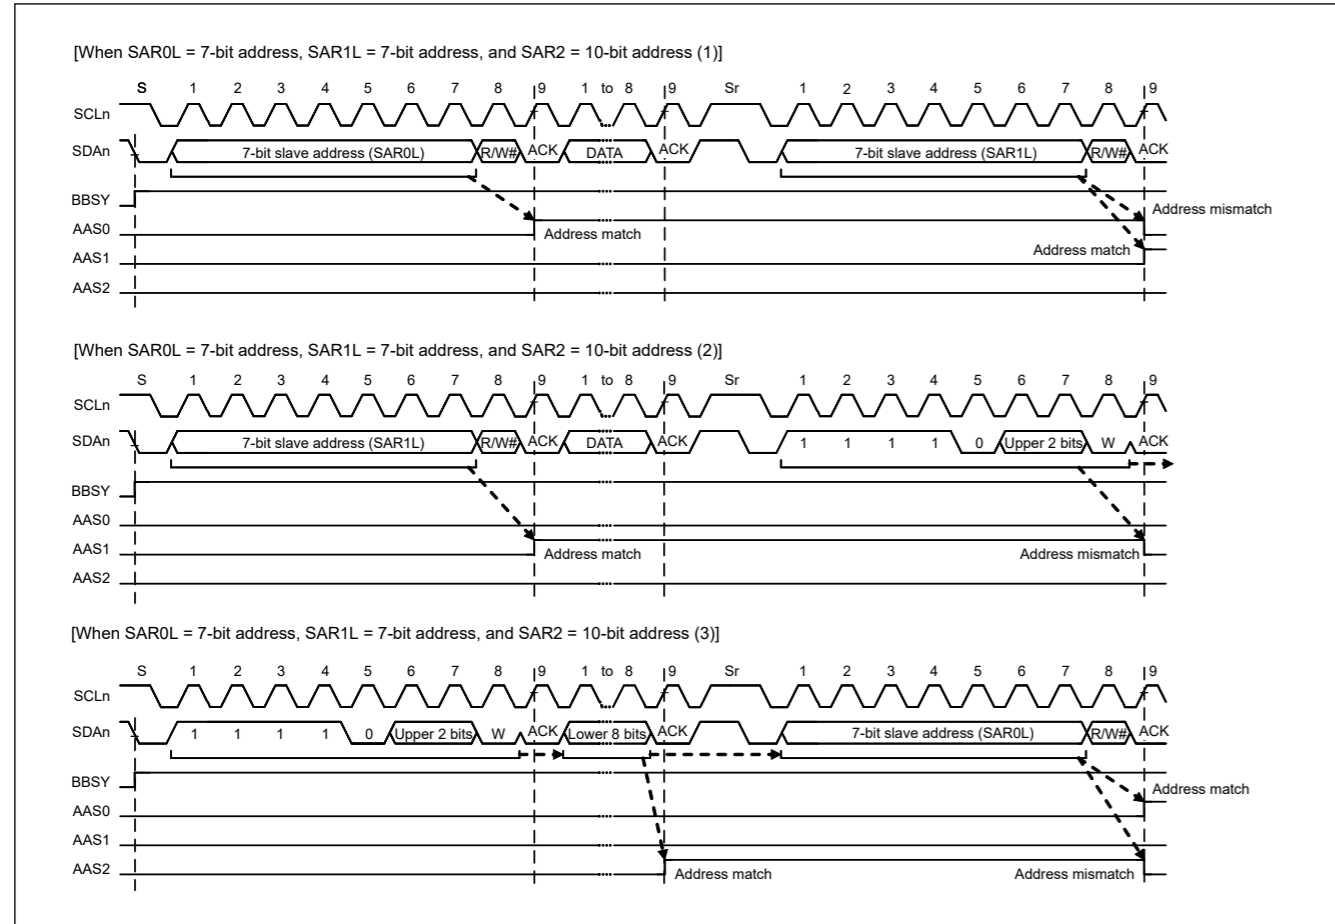

Figure 28.26 AASy flag set and clear timing with mixed 7-bit and 10-bit address formats

28.7.2 Detection of General Call Address

The IIC provides detection of the general call address (0000 000b + 0 [W]). This is enabled by setting the GCAE bit in IC SER to 1.

If the address received after a start or restart condition is issued is 0000 000b + 1[R] (start byte), the IIC recognizes this as the address of a slave device with an all-zero address, but not as the general call address.

When the IIC detects the general call address, both the GCA flag in ICSR1 and the RDRF flag in ICSR2 set to 1 on the rising edge of the ninth cycle of the SCL clock. This leads to the generation of a receive data full interrupt (IICn\_RXI). The value of the GCA flag can be checked to confirm that the general call address was transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

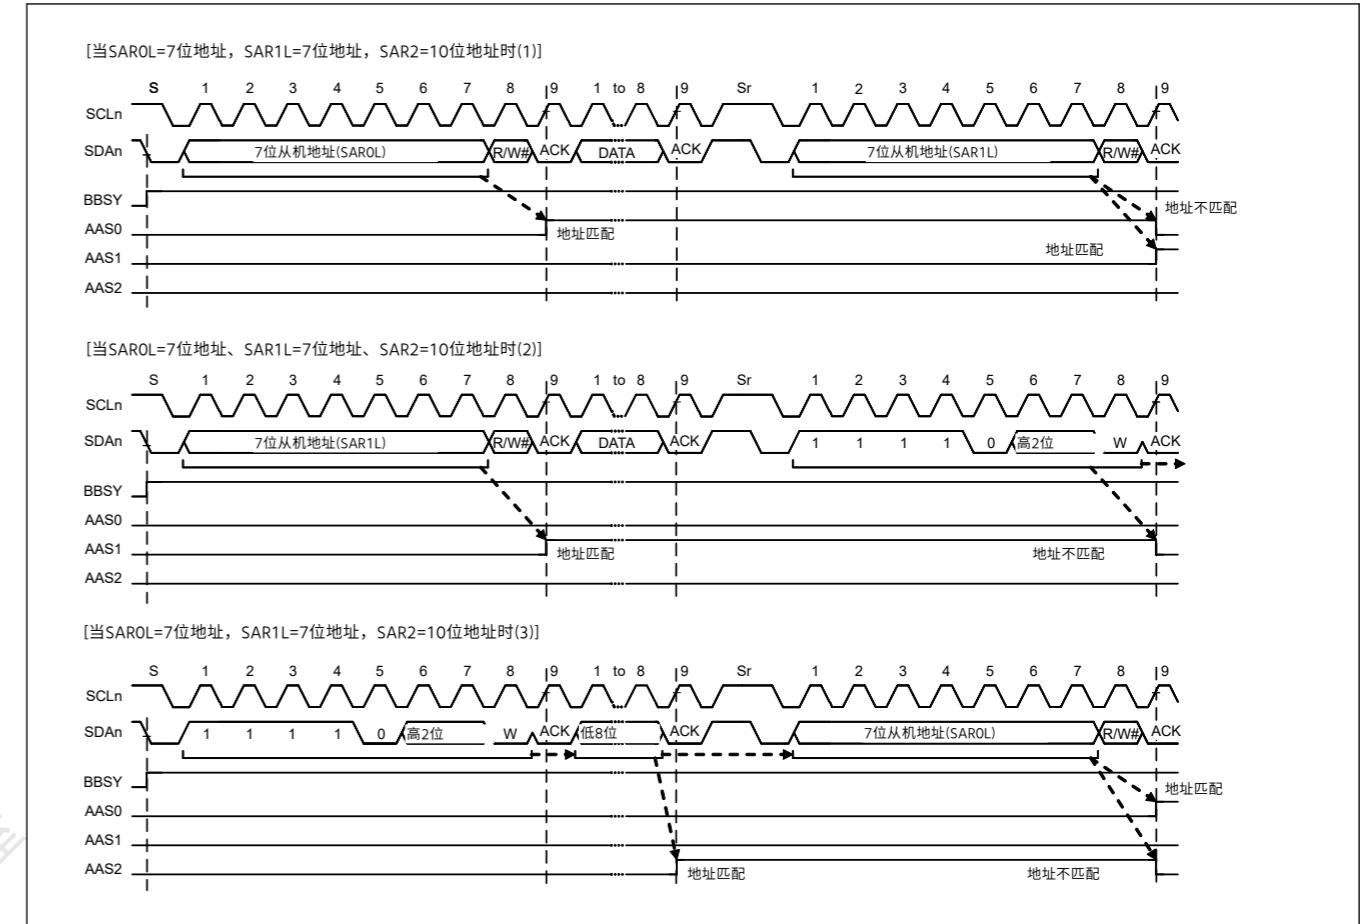

Figure 28.26 混合7位和10位地址格式的AASy标志设置和清除时序

28.7.2 广播呼叫地址检测

IIC提供对广播呼叫地址(0000000b+0[W])的检测。这是通过设置GCAE位启用 IC SER to 1。

如果在发出启动或重新启动条件后接收到的地址是0000000b+1[R] (起始字节)，则IIC将其识别为具有全零地址的从设备的地址，但不是广播地址。

当IIC检测到广播呼叫地址时，ICSR1中的GCA标志和ICSR2中的RDRF标志都在SCL时钟的第9个周期的上升沿设置为1。这会导致接收数据完全中断(IICn\_RXI)的产生。可以检查GCA标志的值以确认广播呼叫地址已被传输。

检测到广播呼叫地址后的操作与正常的从机接收操作相同。

Figure 28.27 Timing of GCA flag setting during reception of general call address

### 28.7.3 Device-ID Address Detection

The IIC module provides detection of device-ID address compliant with the I<sup>2</sup>C bus specification (revision 03). When the IIC receives 1111 100b as the first byte after a start or restart condition is issued with the DIDE bit in ICSER set to 1, it recognizes the address as a device ID, sets the DID flag in ICSR1 to 1 on the rising edge of the ninth SCL clock cycle when the subsequent R/W# bit is 0, then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the IIC sets the associated AASy flag (y = 0 to 2) in ICSR1 to 1.

When the first byte received after the issue of a start or restart condition matches the device ID address (1111 100b) again and the subsequent R/W# bit is 1, the IIC does not compare the second and subsequent bytes and sets the ICSR2.TDRE flag to 1.

In the device ID address detection function, the IIC sets the DID flag to 0 if a match with the IIC slave address is not obtained or a match with the device ID address is not obtained after a match with the IIC slave address and a restart condition is not detected. If the first byte after detection of a start or restart condition matches the device ID address (1111 100b), and the R/W# bit is 0, the IIC sets the DID flag to 1 and compares the second and subsequent bytes with the slave address of the IIC. If the R/W# bit is 1, the DID flag holds the previous value and the IIC does not compare the second and subsequent bytes. Therefore, the reception of a device ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Additionally, prepare the device ID fields (3 bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal transmit data. For details on the information that must be included in device ID fields, contact NXP Semiconductors.

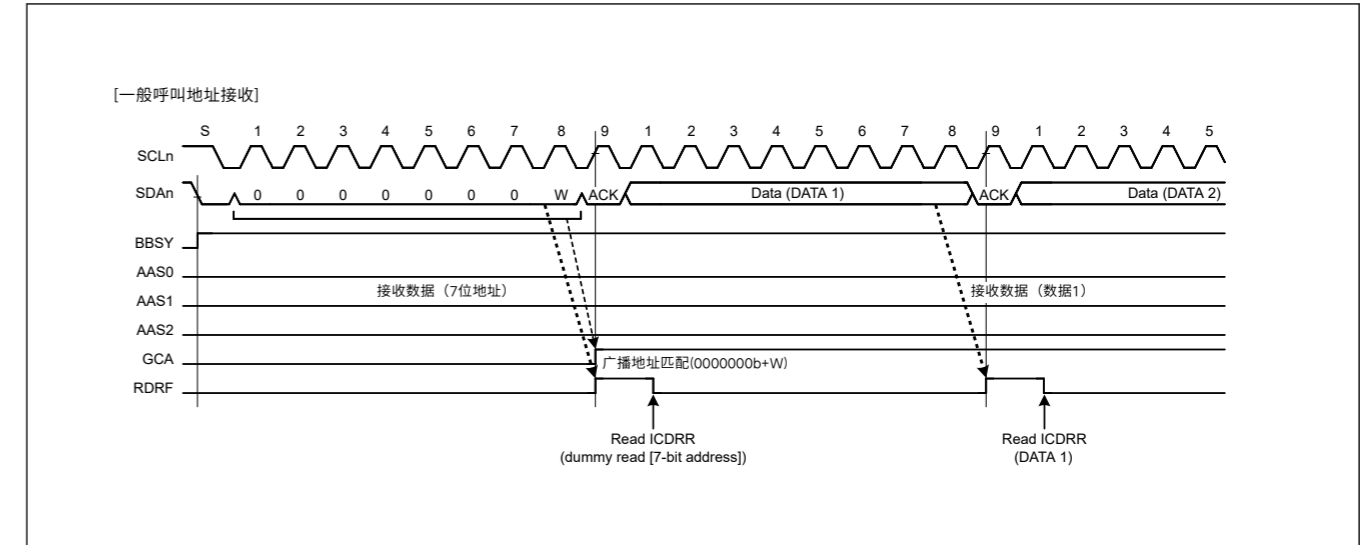

Figure 28.27 在接收广播呼叫地址期间设置GCA标志的时机

### 28.7.3 设备ID地址检测

IIC模块提供符合I2C总线规范（修订版03）的设备ID地址检测。当。。。的时候 IIC在ICSER中的DIDE位设置为1的情况下，在发出启动或重启条件后接收1111100b作为第一个字节，它将地址识别为设备ID，在第9个上升沿将ICSR1中的DID标志设置为1当后续RW#位为0时，SCL时钟周期，然后将第二个和后续字节与其自己的从地址进行比较。如果地址与从地址寄存器中的值匹配，则IIC将ICSR1中相关的AASy标志（y=0到2）设置为1。

当发出启动或重启条件后接收到的第一个字节再次与设备ID地址(1111100b)匹配且后续RW#位为1时，IIC不比较第二个和后续字节并设置ICSR2.TDRE标志为1。

在设备ID地址检测功能中，如果没有获得与IIC从机地址匹配或在与IIC从机地址匹配和重启条件后未获得与设备ID地址匹配，则IIC将DID标志设置为0未检测到。如果检测到启动或重启条件后的第一个字节与设备ID地址(1111100b)匹配，并且RW#位为0，则IIC将DID标志设置为1，并将第二个和后续字节与从机地址进行比较IIC。如果RW#位为1，则DID标志保持前一个值，并且IIC不比较第二个和后续字节。因此，在确认TDRE=1后，可以通过读取DID标志来检查设备ID地址的接收。

此外，准备设备ID字段（3个字节：12位表示制造商+9位表示部件+3位表示版本）在接收到连续的设备ID字段作为正常发送数据后必须发送到主机。有关必须包含在设备ID字段中的信息的详细信息，请联系NXP Semiconductors。

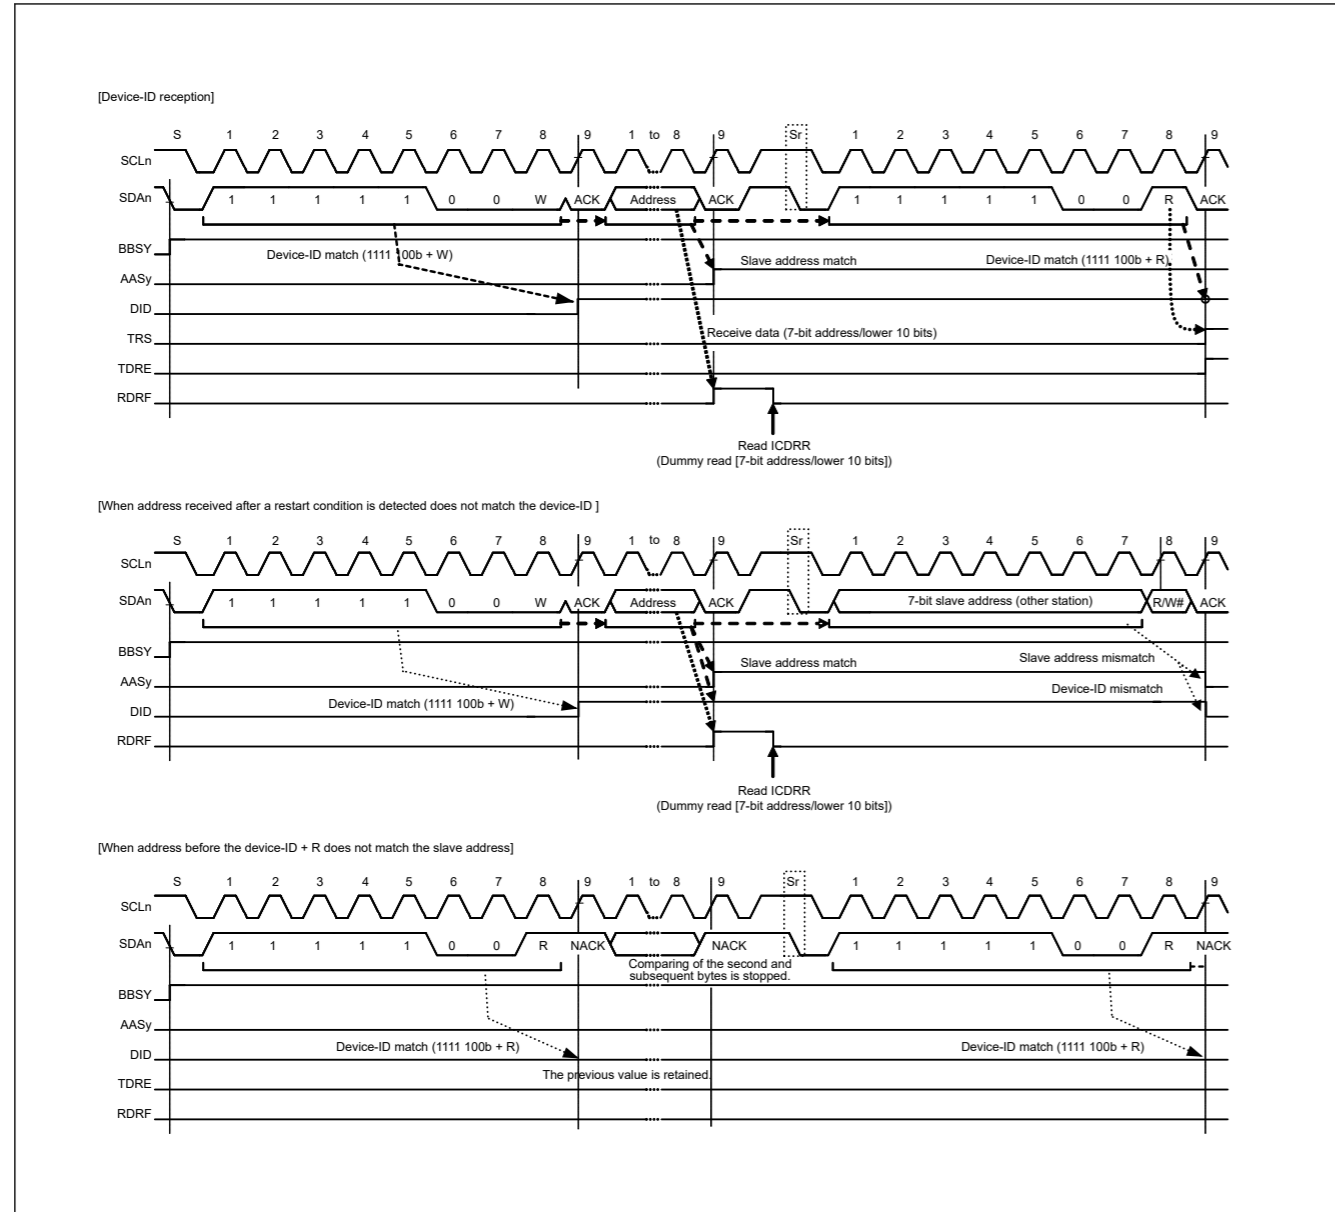

Figure 28.28 AASy and DID flag set and clear timing during reception of device ID

### 28.7.4 Host Address Detection

The IIC provides host address detection when operating in SMBus. When the HOAE bit in IC SER is set to 1 while the SMBS bit in ICMR3 is 1, the IIC can detect the host address (0001 000b) in slave receive mode (MST and TRS bits = 00b in ICCR2).

When the IIC detects the host address, the HOA flag in ICSR1 is set to 1 on the rising edge of the 9th SCL clock cycle, and at the same time, the RDRF flag in ICSR2 is set to 1 when the R/W# bit is 0 (Wr bit). This causes a receive data full interrupt (IICn\_RXI) to be generated. The HOA flag indicates that the host address was sent from another device.

If the bit following the host address (0001 000b) is an Rd bit (R/W# bit = 1), the IIC can also detect the host address. After the host address is detected, the IIC operates in the same manner as in normal slave operation.

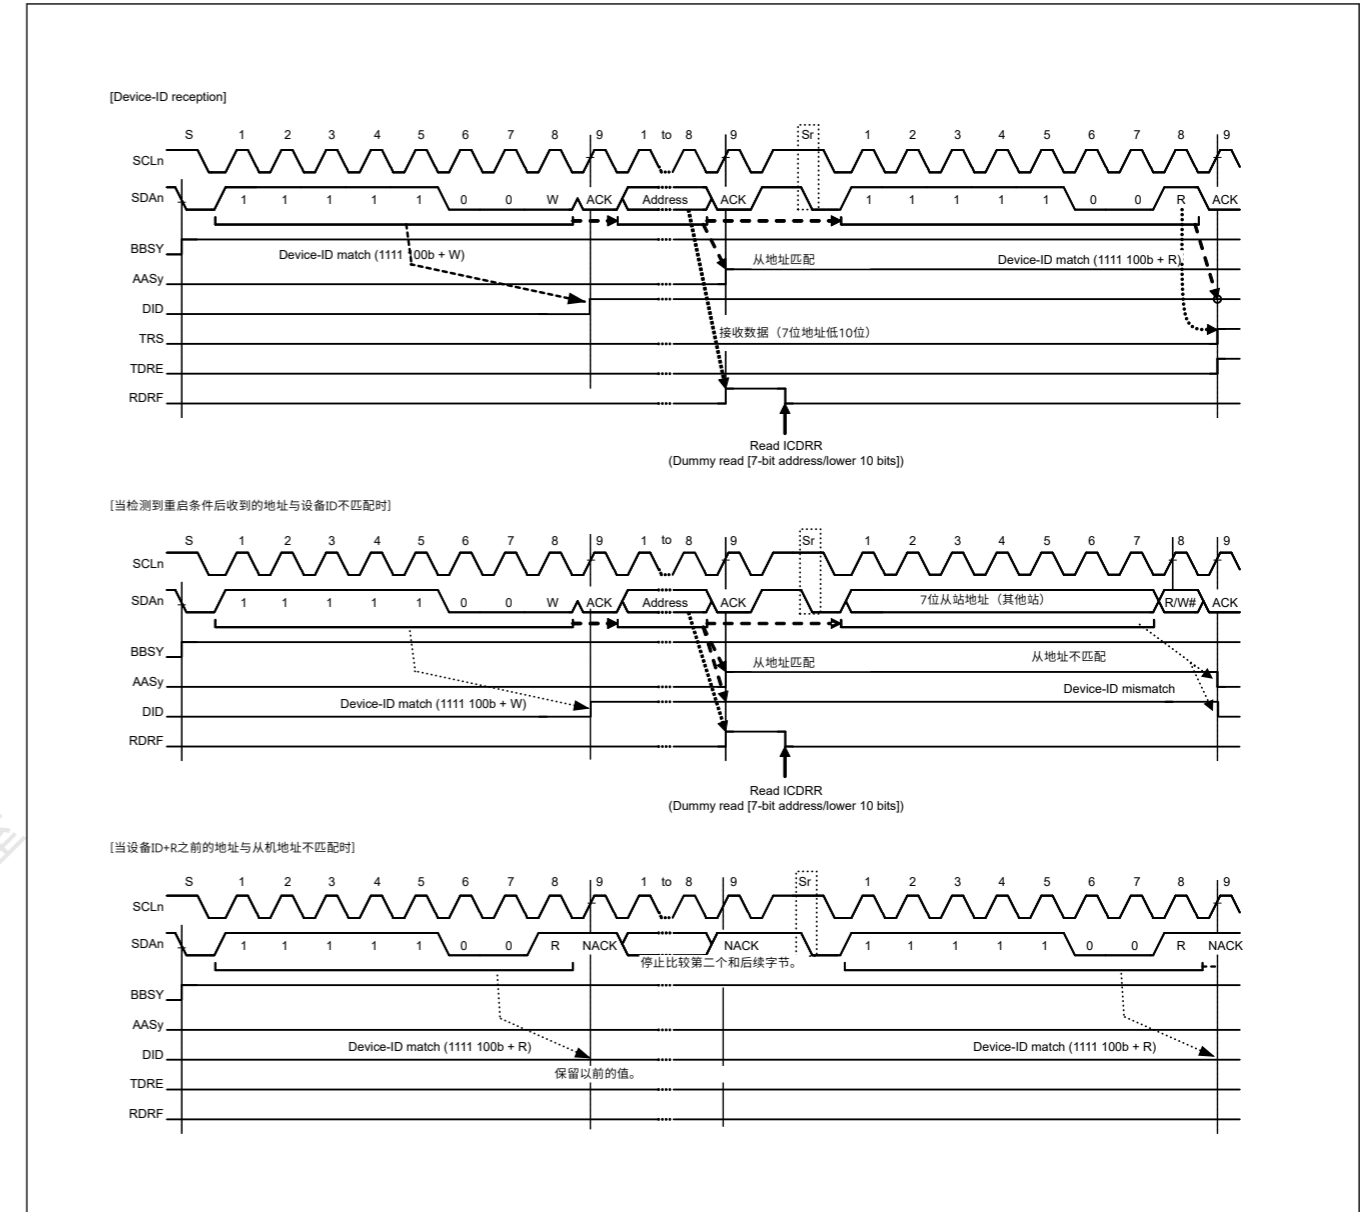

Figure 28.28 在接收设备ID期间设置AASy和DID标志并清除时序

### 28.7.4 主机地址检测

IIC在SMBus中运行时提供主机地址检测。当ICSER中的HOAE位设置为1而ICMR3中的SMBS位为1，IIC可以在从机接收模式下检测主机地址（0001000b）（ICCR2中的MST和TRS位=00b）。

当IIC检测到主机地址时，ICSR1中的HOA标志在第9个SCL时钟周期的上升沿置1，同时ICSR2中的RDRF标志在RW#位为0时置1（写位）。这会导致产生接收数据完全中断（IICn\_RXI）。HOA标志表明主机地址是从另一个设备发送的。

如果主机地址（0001000b）后面的位是Rd位（RW#位=1），则IIC也可以检测主机地址。检测到主机地址后，IIC以与正常从机操作相同的方式运行。

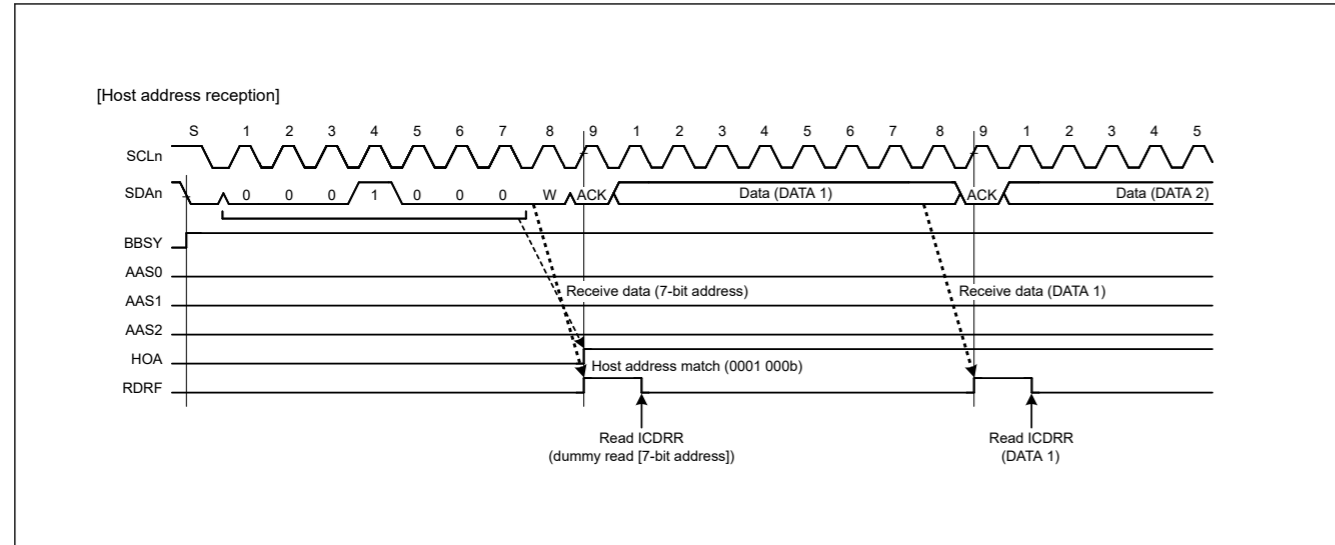

Figure 28.29 HOA flag set timing during reception of host address

### 28.8 Wakeup Function

The IIC provides a wakeup function that causes the MCU to transition from Software Standby mode or Snooze mode to normal operation. The wakeup function enables the reception of data when the system clock (PCLKB) is stopped, and generates a wakeup interrupt signal on a match of the slave address of the received data. This wakeup interrupt signal triggers the return to normal operation. After the wakeup interrupt occurs, switch the IIC to PCLKB synchronous operation so that communication can continue.

The wakeup function has four operation modes:

- Normal wakeup mode 1
- Normal wakeup mode 2
- Command recovery mode
- EEP response mode

Table 28.9 describes the behavior in these modes.

Table 28.9 Wakeup operation modes

| Operation mode        | ACK response timing  | ACK response before wakeup to PCLKB synchronous operation                      | SCL state during wakeup to PCLKB synchronous operation |
|-----------------------|--|--|--|
| Normal wakeup mode 1  | Before wakeup to PCLKB synchronous operation <sup>*1</sup>   | ACK  | Fixed low  |
| Normal wakeup mode 2  | After wakeup to PCLKB synchronous operation <sup>*2</sup>    | Before wakeup: no response (NACK level retained)<br>After wakeup: ACK response | Fixed low  |
| Command recovery mode | Before wakeup to PCLKB synchronous operation <sup>*1</sup>   | ACK  | Open   |
| EEP response mode     | Before recovery to PCLKB synchronous operation <sup>*1</sup> | NACK   | Open   |

Note 1. Switching timing from PCLKB asynchronous operation to PCLKB synchronous operation is the falling edge of the 9th clock of the SCL.

Note 2. Switching timing from PCLKB asynchronous operation to PCLKB synchronous operation is the falling edge of the 8th clock of the SCL.

The following can be selected as wakeup interrupt sources:

- Host address detection (valid when IC SER.HOAE = 1)
- General call address detection (valid when IC SER.GCAE = 1)
- Slave address 0<sup>\*1</sup> detection (valid when IC SER.SAR0E = 1)

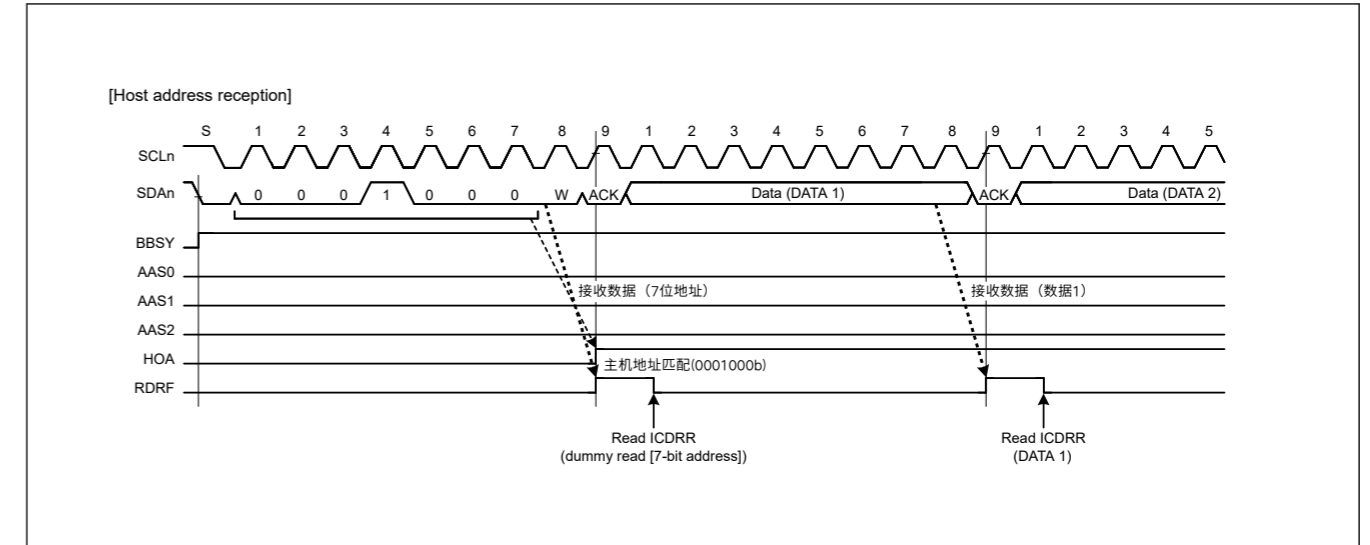

Figure 28.29 接收主机地址期间的HOA标志设置时序

### 28.8 唤醒功能

IIC提供唤醒功能，使MCU从软件待机模式或贪睡模式转换到正常操作。唤醒功能在系统时钟（PCLKB）停止时启用数据接收，并在接收到的数据的从地址匹配时产生唤醒中断信号。该唤醒中断信号触发恢复正常操作。唤醒中断发生后，将IIC切换为PCLKB同步操作，以便继续通信。

唤醒功能有四种操作模式：

- 正常唤醒模式1
- 正常唤醒模式2
- 命令恢复模式
- EEP响应方式

表28.9描述了这些模式下的行为。

Table 28.9 唤醒操作模式

| 操作模式    | ACK响应时间          | 唤醒前的ACK响应到PCLKB同步操作            | 唤醒到PCLKB同步操作期间的SCL状态 |
|---------|------------------|--------------------------------|----------------------|
| 正常唤醒模式1 | 唤醒到PCLKB同步操作之前*1 | ACK                            | 固定低                  |
| 正常唤醒模式2 | 唤醒到PCLKB同步操作后*2  | 唤醒前：无响应（保留NACK电平）<br>唤醒后：ACK响应 | 固定低                  |
| 命令恢复模式  | 唤醒到PCLKB同步操作之前*1 | ACK                            | Open                 |
| EEP响应模式 | 恢复到PCLKB同步操作之前*1 | NACK                           | Open                 |

注1.从PCLKB异步操作切换到PCLKB同步操作的时序是第9个时钟的下降沿SCL。

注2.从PCLKB异步操作切换到PCLKB同步操作的时序是第8个时钟的下降沿SCL。

可以选择以下作为唤醒中断源：

- 主机地址检测（当IC SER.HOAE=1时有效）
- 广播地址检测（IC SER.GCAE=1时有效）
- 从机地址0\*1检测（在IC SER.SAR0E=1时有效）

- Slave address 1<sup>\*1</sup> detection (valid when IC SER.SAR1E = 1)
- Slave address 2<sup>\*1</sup> detection (valid when IC SER.SAR2E = 1)

Note 1. Only 7-bit address can be set. Set the FS bit in SARUy (y = 0 to 2) to 0.

### Precautions on the use of the wakeup function

- Do not change the content of the IIC registers except the WUSEN bit in ICWUR2 while the WUASYF flag in ICWUR2 is 1 (during PCLKB asynchronous operation).
- Set ICWUR.WUE and ICWUR.WUIE to 1, and ICCR2.MST and ICCR2.TRS to 0 (slave reception mode) before switching to PCLKB asynchronous mode.
- The device ID and the 10-bit slave address cannot be selected for the wakeup interrupt source. Set the DIDE bit in IC SER and FS bit in SARUy (y = 0 to 2) to 0.
- Set bits TIE, TEIE, RIE, NAKIE, SPIE, STIE, ALIE, and TMOIE in the ICIER register to 0 (interrupt disabled) before switching to the asynchronous operation.
- When the wakeup function is enabled, do not use the timeout function (ICWUR.WUE = 1)
- Even when a wakeup interrupt is generated during PCLKB asynchronous operation (when ICWUR2.WUASYF = 1), if the slave addresses match in PCLKB synchronous mode (ICWUR2.WUASYF = 0), the wakeup interrupt does not occur and the WUF flag is not set.
- If the timing of writing 0 to the ICWUR2.WUSEN bit and the timing of detecting a start condition conflict, the IIC might start the next reception in PCLKB synchronous operation mode. In this case, ICWUR2.WUASYF flag becomes 1 (switch to PCLKB asynchronous mode) when data communication is complete, a stop condition is detected, and detection of a wakeup event starts.
- After writing 0 to the WUSEN bit in ICWUR2, do not change registers relate to the IIC operation mode setting (ICMR3, IC SER, and SARLy) until the mode is switched to PCLKB asynchronous operation from PCLKB synchronous operation (while the ICWUR2.WUASYF flag is 1). If the register value changes during this period by an interrupt handling or another factor, the IIC might malfunction before switching to the asynchronous operation.

#### 28.8.1 Normal Wakeup Mode 1

This section describes the behavior, the timing, and an example operation of normal wakeup mode 1.

In normal wakeup mode 1, a wakeup interrupt triggered by the match of the slave address initiates the transition to normal operation as follows:

Before wakeup: ACK is sent in response to the data received with its own slave address of the IIC.  
 During wakeup: ACK response is made on the 9th clock cycle of SCL, after which SCL is held low<sup>\*1</sup>.  
 After wakeup: Normal operation continues.

Note 1. Between the 9th clock cycle and 1st clock cycle during wakeup, WAIT = 1 is invalid.

If the slave address does not match, the SCL line is not held low after the 9th clock cycle of SCL, and the slave operation continues. Figure 28.30 shows an operation example, and Figure 28.32 shows the detailed timing.

If the transition from Software Standby mode or Snooze mode is triggered by an interrupt other than a wakeup interrupt, for example the IRQn, the WUF flag is not set to 1. Figure 28.31 shows an operation example.

- 从机地址1\*1检测（当IC SER.SAR1E=1时有效）
- 从机地址2\*1检测（当IC SER.SAR2E=1时有效）

注1.只能设置7位地址。将SARUy (y=0到2) 中的FS位设置为0。

### 唤醒功能使用注意事项

- 当ICWUR2的WUASYF标志为1时（PCLKB异步操作期间），不要改变ICWUR2中除WUSEN位以外的IIC寄存器的内容。
- 在切换到PCLKB异步模式之前，将ICWUR.WUE和ICWUR.WUIE设置为1，并将ICCR2.MST和ICCR2.TRS设置为0（从接收模式）。
- 唤醒中断源不能选择设备ID和10位从机地址。将IC SER中的DIDE位和SARUy (y=0到2) 中的FS位设置为0。
- 在切换到异步操作之前，将ICIER寄存器中的TIE、TEIE、RIE、NAKIE、SPIE、STIE、ALIE和TMOIE位设置为0（禁止中断）。
- 启用唤醒功能时，不要使用超时功能（ICWUR.WUE=1）
- 即使在PCLKB异步操作期间（ICWUR2.WUASYF=1）产生唤醒中断，如果在PCLKB同步模式下从机地址匹配（ICWUR2.WUASYF=0），唤醒中断不会发生并且WUF标志不放。
- 如果向ICWUR2.WUSEN位写入0的时序与检测启动条件的时序冲突，则IIC可能会在PCLKB同步操作模式下开始下一次接收。在这种情况下，当数据通信完成时，ICWUR2.WUASYF标志变为1（切换到PCLKB异步模式），检测到停止条件，并开始检测唤醒事件。
- 在ICWUR2的WUSEN位写入0后，不要更改与IIC操作模式设置相关的寄存器（ICMR3、IC SER和SARLy），直到模式从PCLKB同步操作切换到PCLKB异步操作（同时ICWUR2.WUASYF标志是1）。如果在此期间寄存器值因中断处理或其他因素而发生变化，则IIC可能会在切换到异步操作之前发生故障。

#### 28.8.1 正常唤醒模式1

本节介绍正常唤醒模式1的行为、时序和示例操作。

在正常唤醒模式1中，由匹配从机地址触发的唤醒中断启动到正常操作的转换，如下所示：

Before wakeup: ACK是响应接收到的带有IIC从机地址的数据而发送的。  
 During wakeup: 在SCL的第9个时钟周期做出ACK响应，之后SCL保持低电平\*1。  
 After wakeup: 正常操作继续。

注1.在唤醒期间的第9个时钟周期和第1个时钟周期之间，WAIT=1无效。

如果从机地址不匹配，则SCL线在SCL的第9个时钟周期后不保持低电平，从机操作继续。图28.30显示了一个操作示例，图28.32显示了详细的时序。

如果从软件待机模式或贪睡模式的转换是由唤醒中断以外的中断触发的，例如IRQn，则WUF标志不设置为1。图28.31显示了一个操作示例。

Figure 28.30 Example operation of normal wakeup mode 1 when wakeup is triggered by a wakeup interrupt on match of the slave address

Note: See [Precautions on the use of the wakeup function](#).

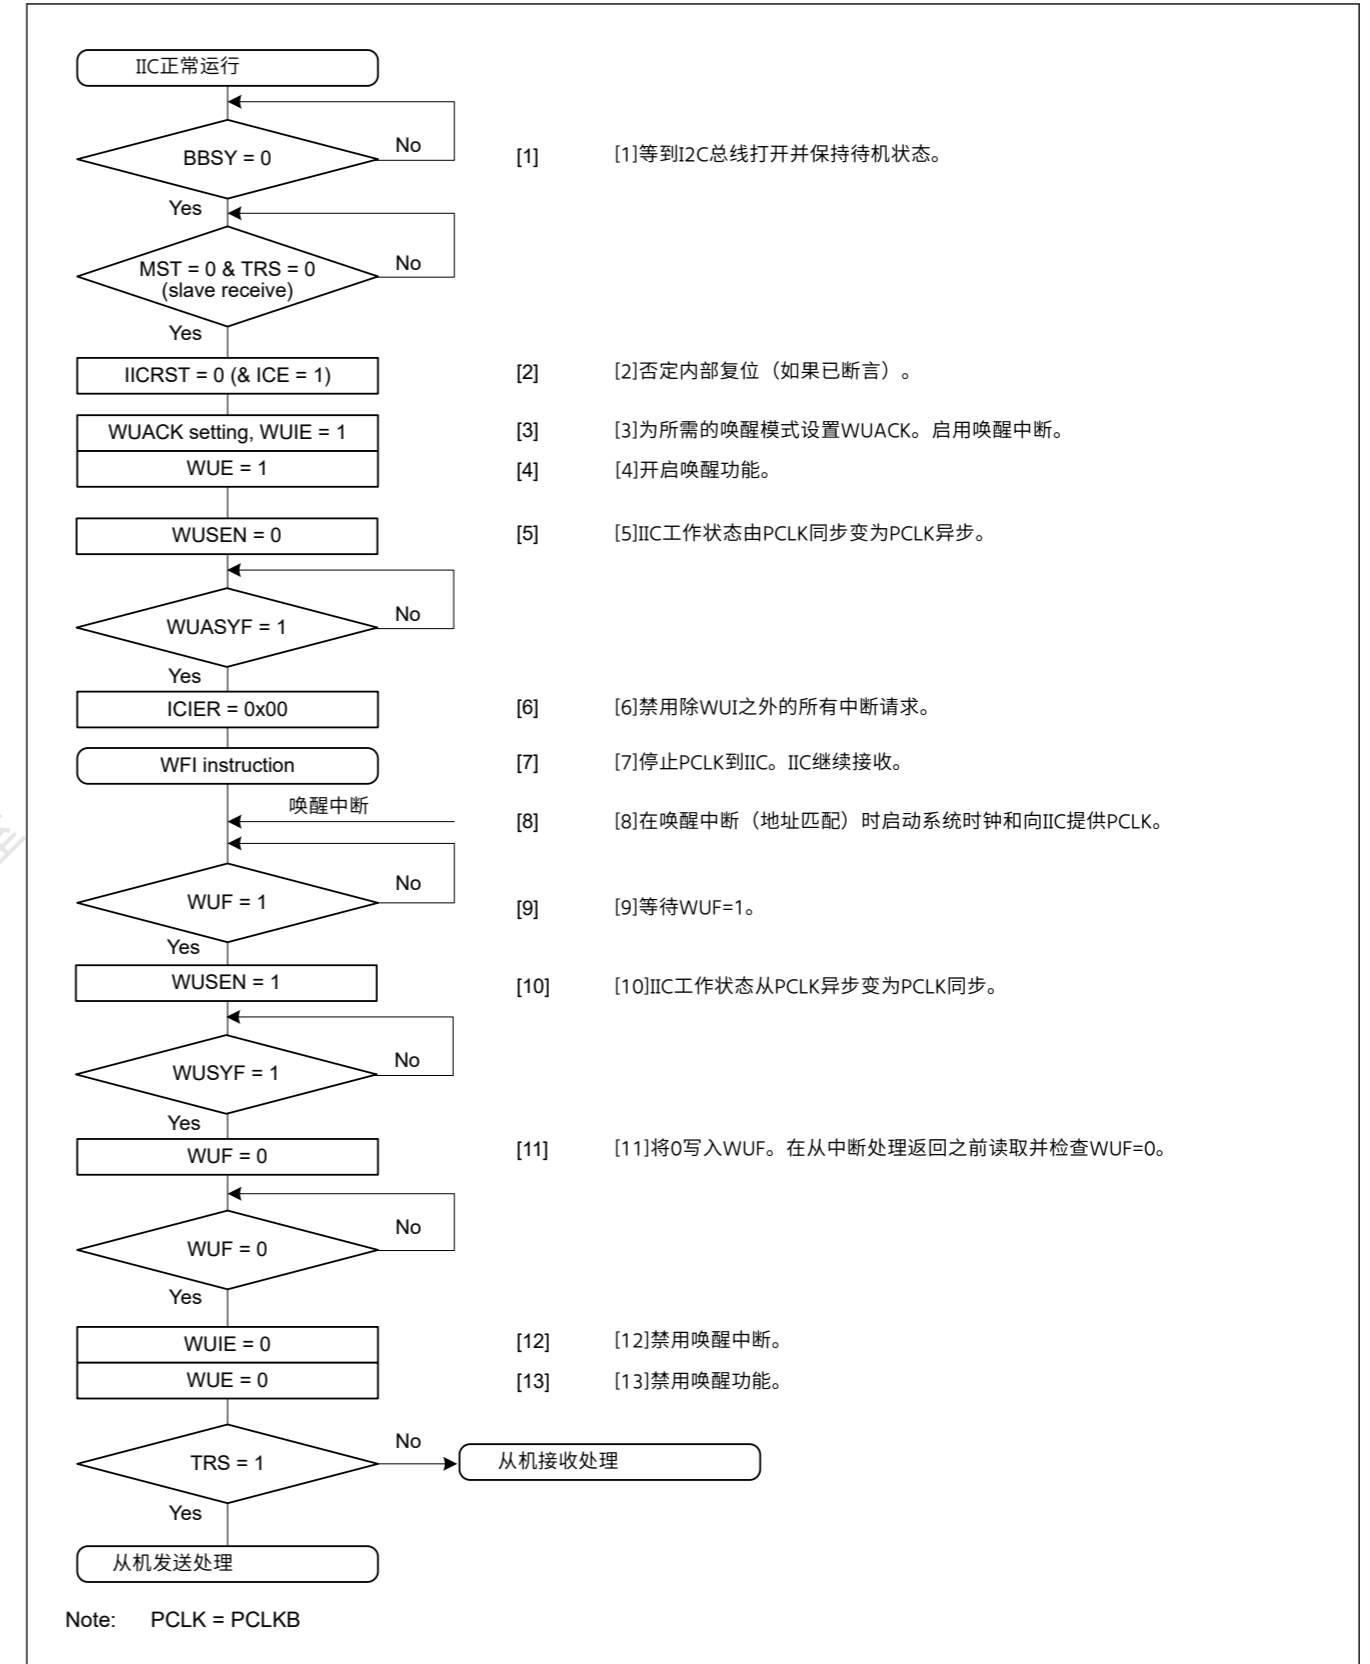

Figure 28.30 正常唤醒模式1的示例操作，当唤醒由从地址匹配时的唤醒中断触发时

Note: 请参阅[唤醒功能使用注意事项](#)。

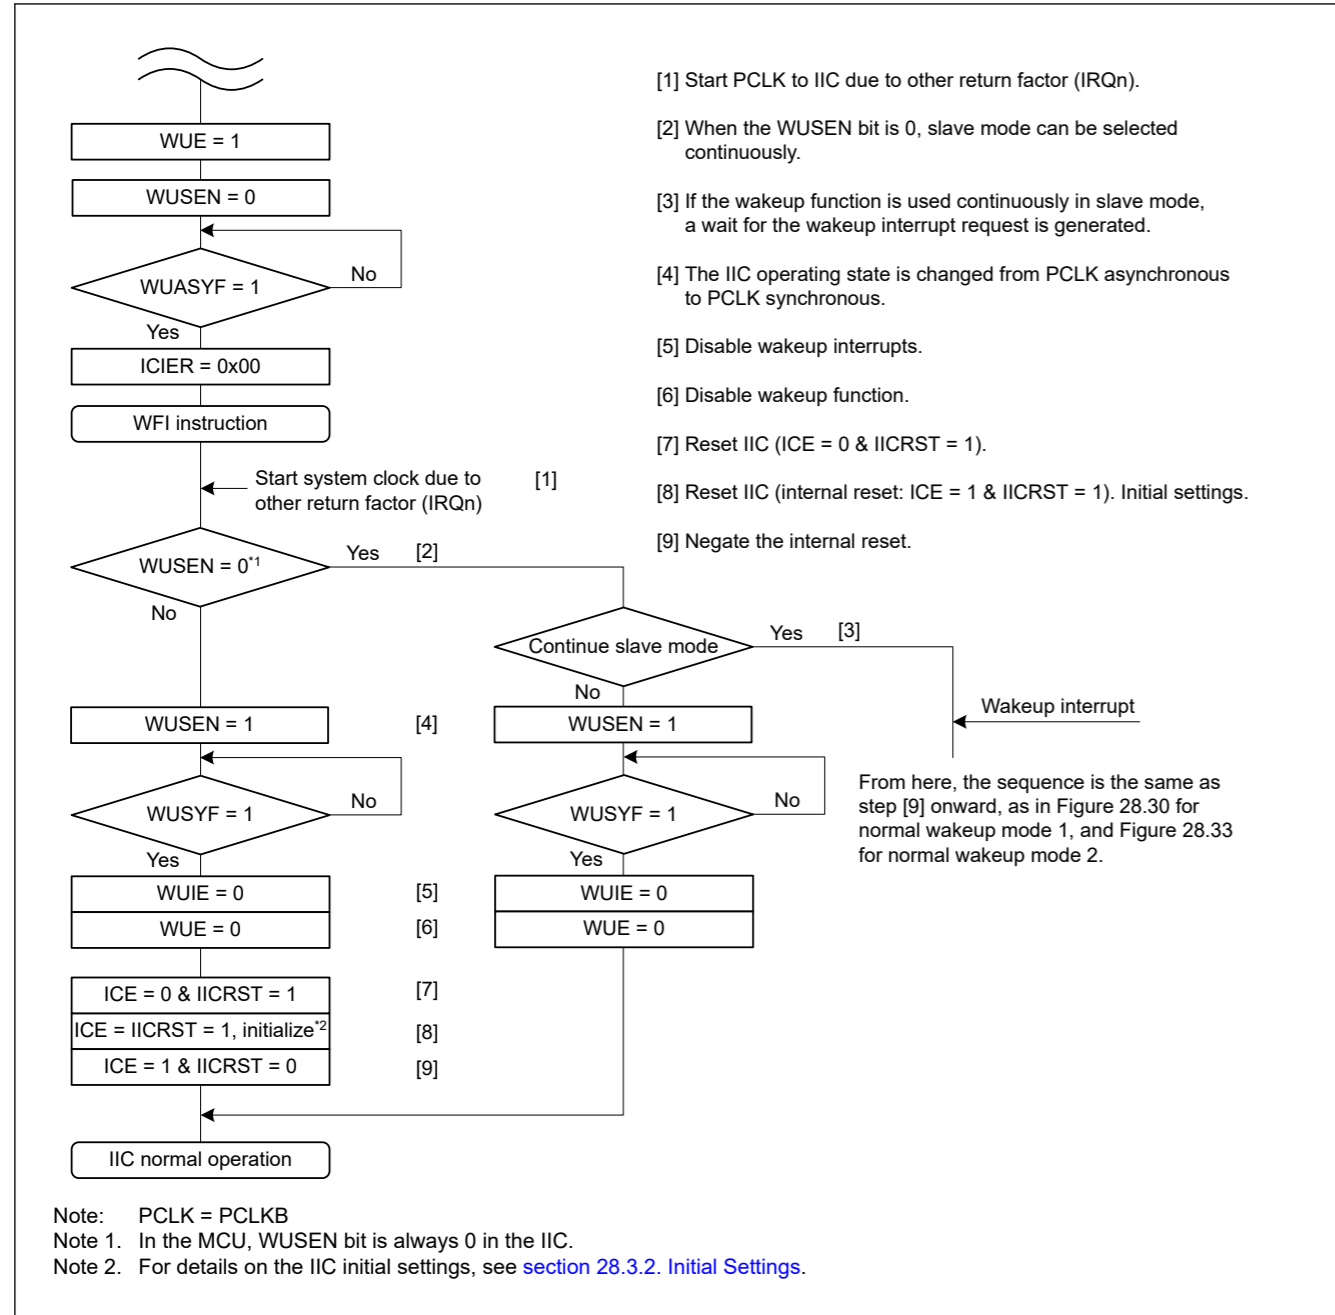

Figure 28.31 Example operation of normal wakeup modes 1 and 2 when wakeup is triggered by an interrupt other than IIC wakeup interrupt, for example, the IRQn

Note: For details on the IIC initial settings, see section 28.3.2. Initial Settings.

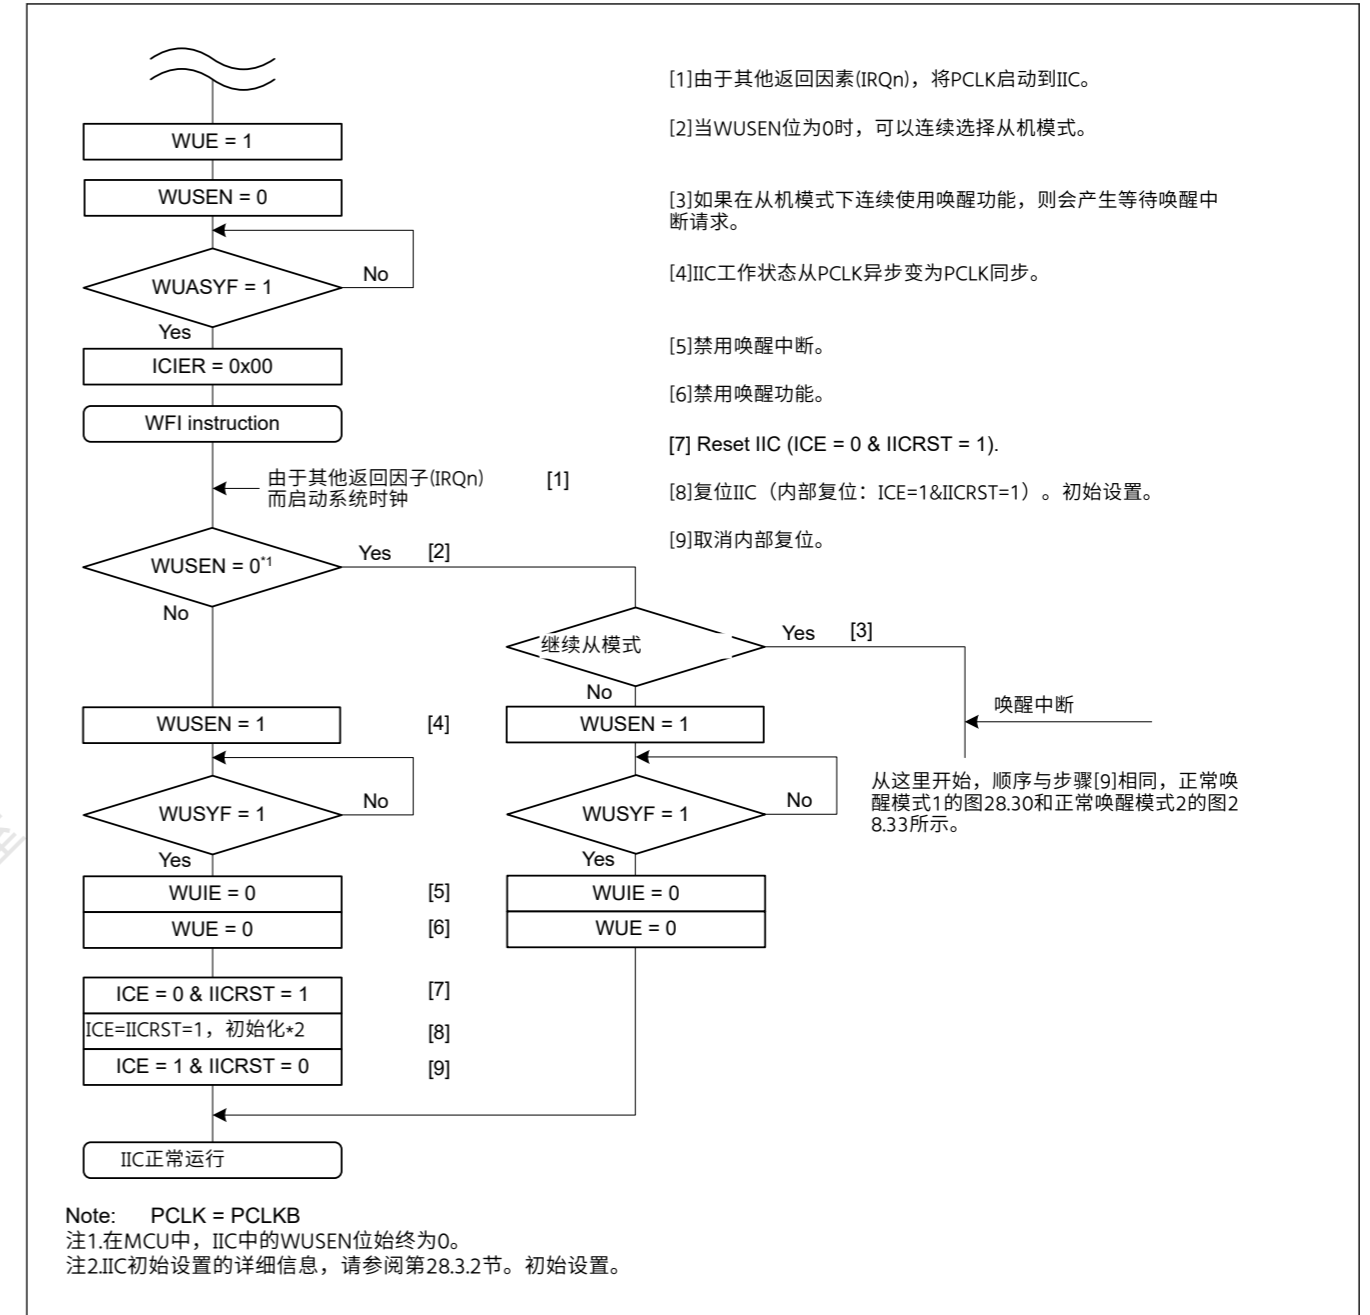

Figure 28.31 当唤醒由IIC唤醒中断以外的中断（例如IRQn）触发时，正常唤醒模式1和2的示例操作

Note: 有关IIC初始设置的详细信息，请参阅第28.3.2节。初始设置。

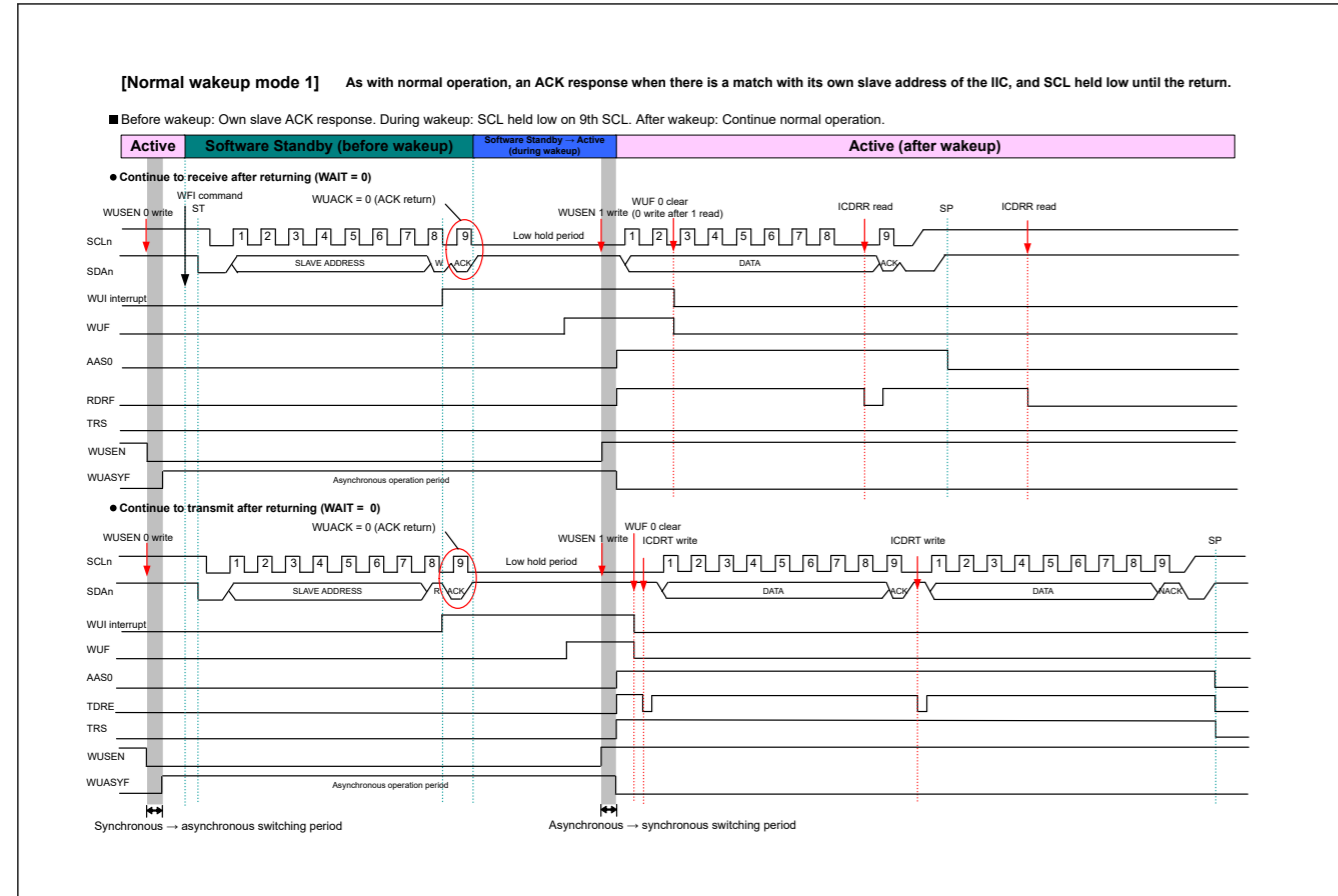

Figure 28.32 Timing of normal wakeup mode 1

### 28.8.2 Normal Wakeup Mode 2

This section describes the behavior, the timing, and an example operation of normal wakeup mode 2.

In normal wakeup mode 2, a wakeup interrupt triggered by a match of the slave address initiates the transition to normal operation as follows:

- Before wakeup: No response to data received with its own slave address until the end of the 8th SCL cycle.
- During wakeup: SCL line held low during the 8th and 9th clock cycles.
- After wakeup: ACK returns on the 9th clock cycle of SCL, and normal operation continues.

If the slave address does not match, the SCL line is not held low after the 8th SCL clock cycle, and the slave operation continues. Figure 28.33 shows an example operation, and Figure 28.34 shows the detailed timing.

If the transition from Software Standby mode or Snooze mode is triggered by an interrupt other than a wakeup interrupt, such as the IRQn, for example, the WUF flag is not set to 1. Figure 28.31 shows an operation example.

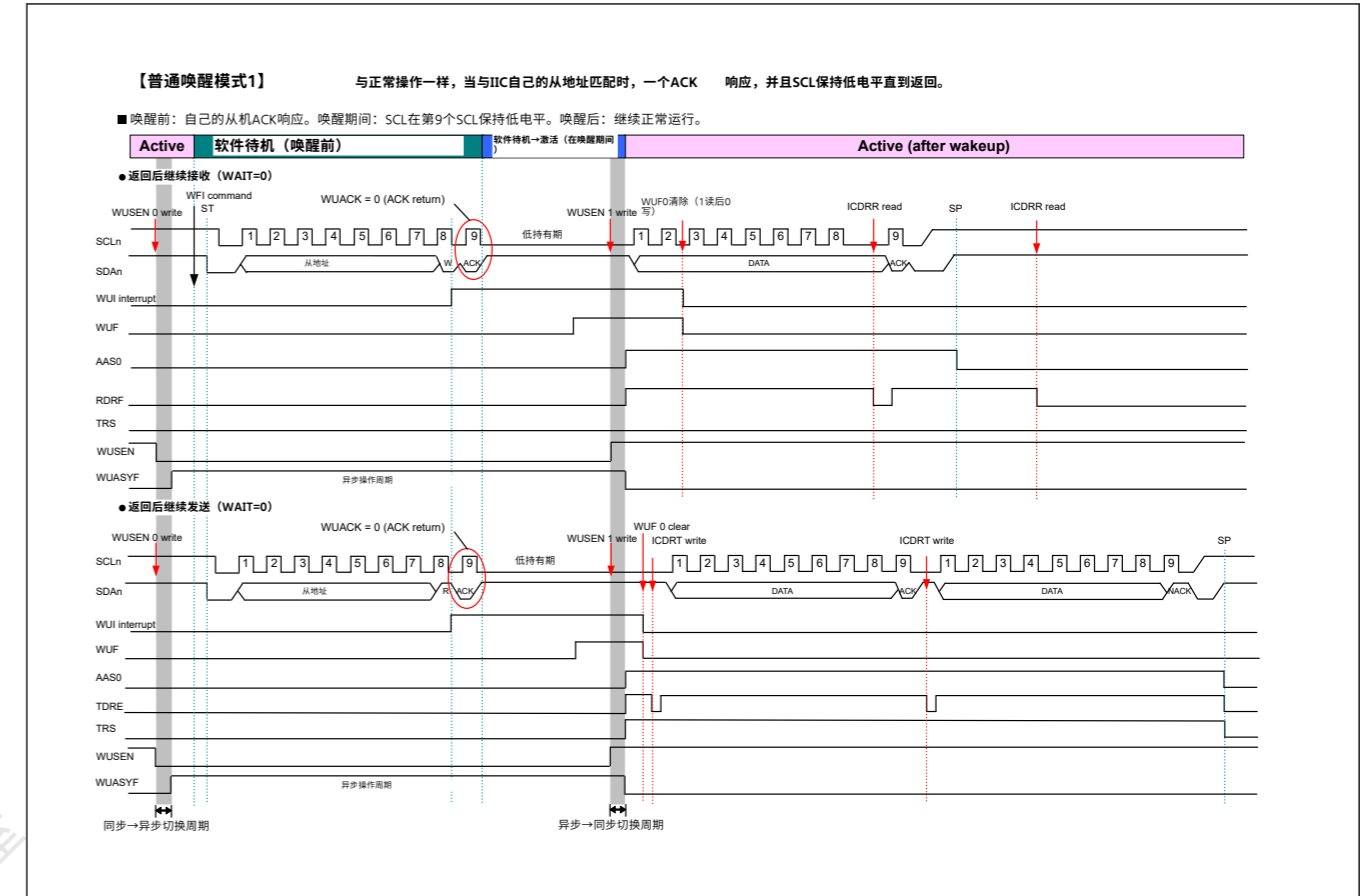

Figure 28.32 正常唤醒模式1的时序

### 28.8.2 正常唤醒模式2

本节介绍正常唤醒模式2的行为、时序和示例操作。

在正常唤醒模式2中，由匹配从机地址触发的唤醒中断会启动到正常操作的转换，如下所示：

- Before wakeup: 直到第8个SCL周期结束，才对接收到的带有自己的从地址的数据作出响应。
- During wakeup: SCL线在第8和第9个时钟周期内保持低电平。
- After wakeup: ACK在SCL的第9个时钟周期返回，并继续正常操作。

如果从机地址不匹配，则SCL线在第8个SCL时钟周期后不会保持低电平，从机操作继续。图28.33显示了一个示例操作，图28.34显示了详细的时序。

如果从软件待机模式或贪睡模式的转换是由唤醒中断以外的中断触发的，例如IRQn，则WUF标志不设置为1。图28.31显示了一个操作示例。

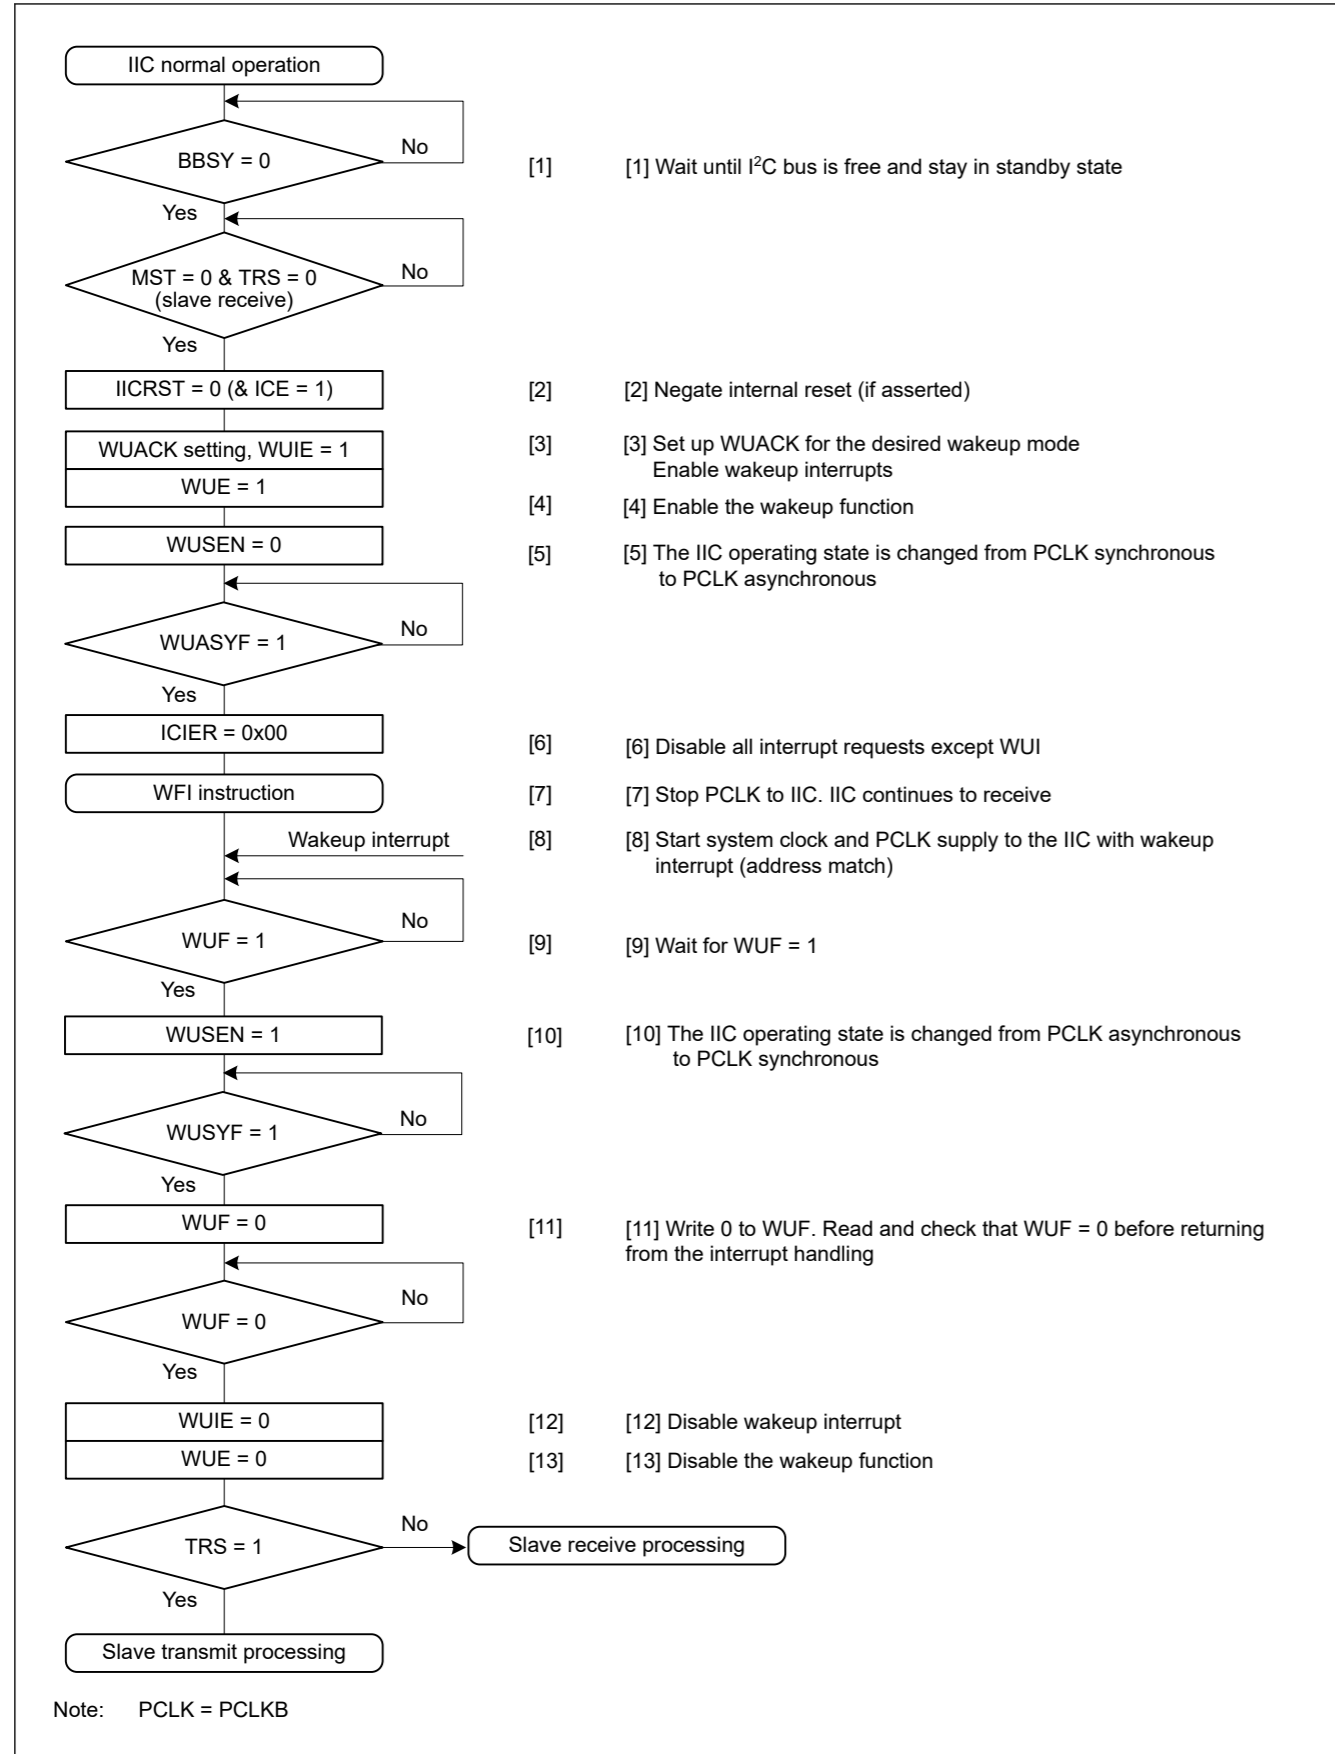

Figure 28.33 Example operation of normal wakeup mode 2 when wakeup is triggered by a wakeup interrupt on match of the slave address

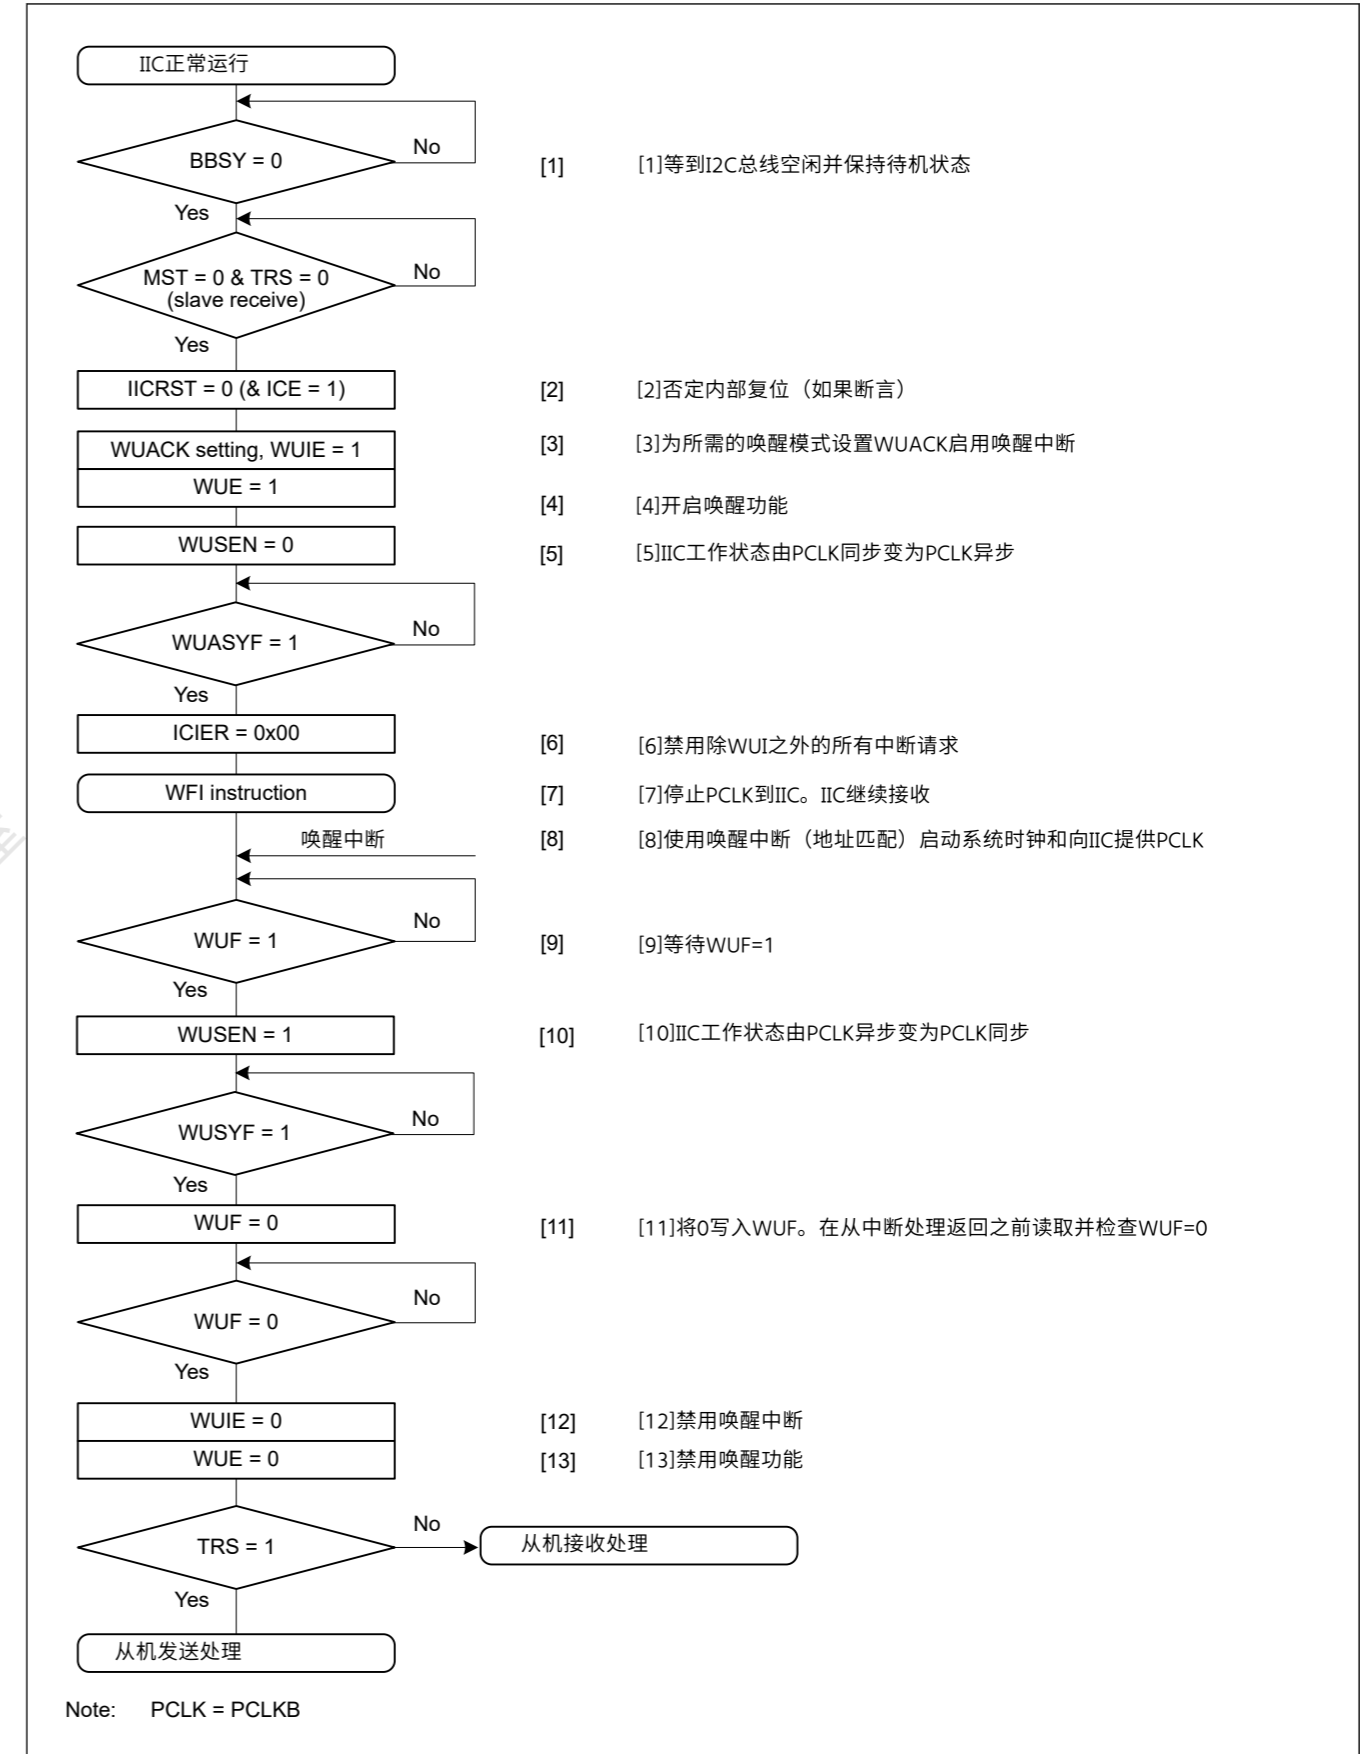

Figure 28.33 正常唤醒模式2的示例操作，当唤醒由从地址匹配时的唤醒中断触发时

Note: See [Precautions on the use of the wakeup function](#).

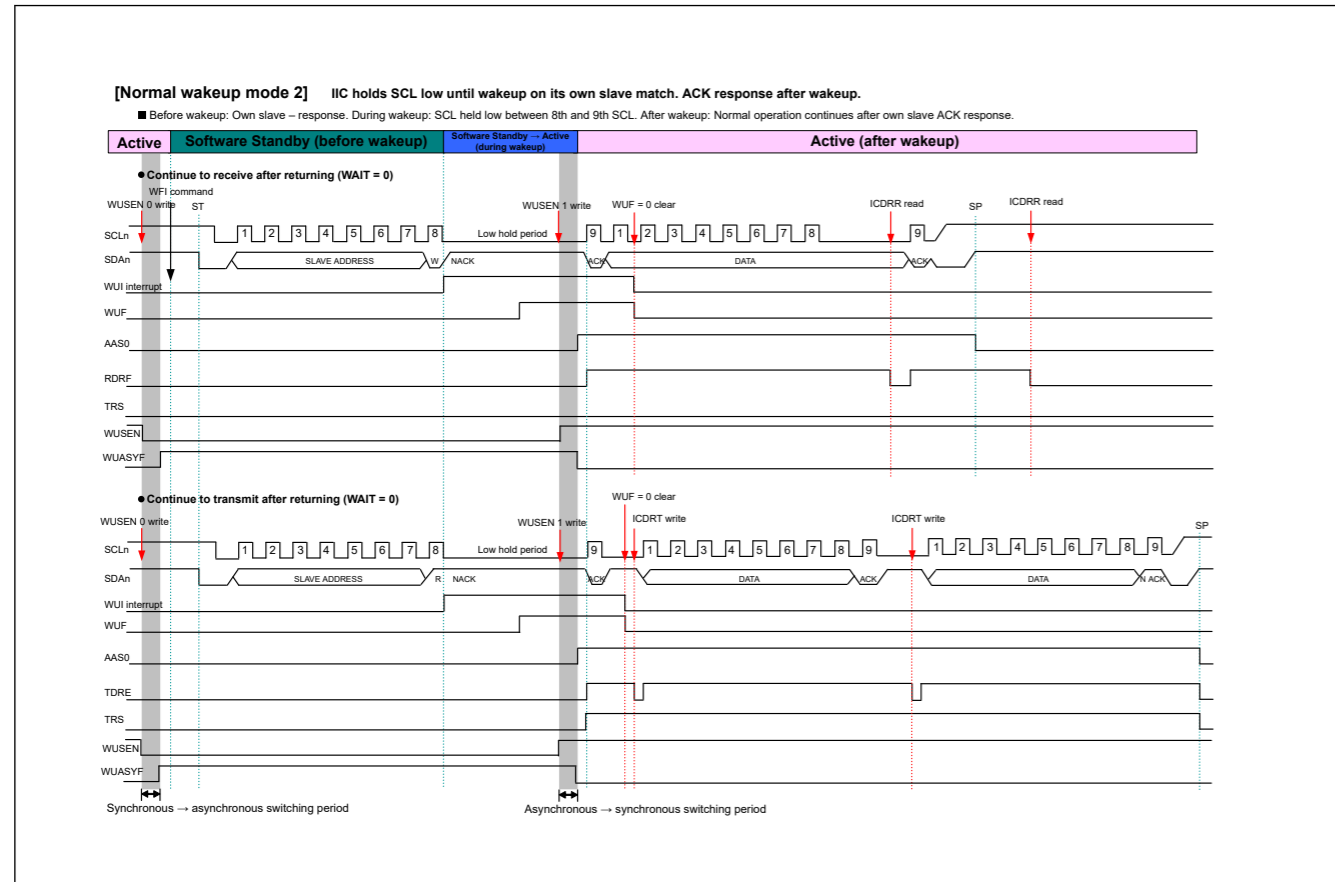

Figure 28.34 Timing of normal wakeup mode 2

### 28.8.3 Command Recovery Mode and EEP Response Mode (Special Wakeup Modes)

This section describes the behavior, the timing, and example operations of the command recovery and EEP response modes.

In the command recovery and EEP response modes, the SCL line is not held low during the wakeup period (after the rise of the 9th clock cycle of SCL). Therefore, other IIC devices can use the I<sup>2</sup>C bus during this period.

A wakeup interrupt triggered by a match of the slave address initiates the transition to normal operation as follows:

- Before wakeup: In response to the data received with its own slave address, the IIC returns ACK (command recovery mode) or NACK (EEP response mode).
- During wakeup: The SCL line is not held low.
- After wakeup: Normal operation continues after IIC initialization.

If the slave address does not match, the slave operation continues.

Note: Because the SCL line is not held low during wakeup, transmission or reception of the data that follows the slave address is not possible.

Note: The command recovery and EEP response modes are internal reset states (ICE = IICRST = 1). Therefore, the match of the slave address does not set the flags, HOA, GCA, ASS0, ASS1, and ASS2 in the ICSR1 register.

Figure 28.35 shows an example operation in recovery and EEP response modes. Figure 28.37 shows the detailed timing.

If the transition from Software Standby mode or Snooze mode is triggered by an interrupt other than a wakeup interrupt, such as IRQn for example, the WUF flag is not set to 1. Follow the processing shown in Figure 28.36.

Note: 请参阅[唤醒功能使用注意事项](#)。

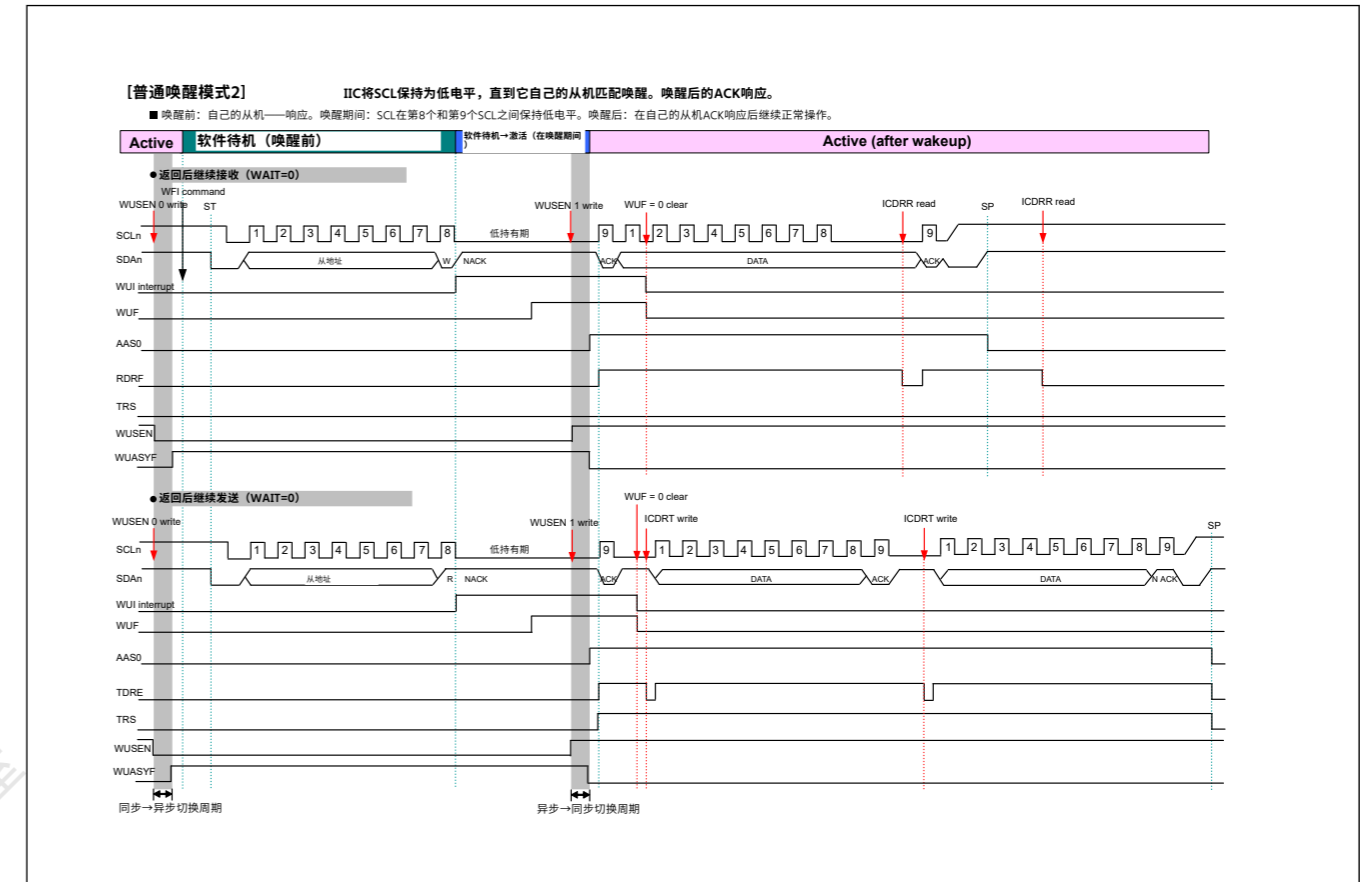

Figure 28.34 正常唤醒模式2的时序

### 28.8.3 命令恢复模式和EEP响应模式（特殊唤醒模式）

本节介绍命令恢复和EEP响应模式的行为、时序和示例操作。

在命令恢复和EEP响应模式下，SCL线在唤醒期间（在SCL的第9个时钟周期上升之后）不保持低电平。因此，其他IIC设备在此期间可以使用I2C总线。

由匹配从地址触发的唤醒中断会启动到正常操作的转换，如下所示：

- Before wakeup: IIC响应使用自己的从机地址接收到的数据，返回ACK（命令恢复模式）或NACK（EEP响应模式）。
- During wakeup: SCL线没有保持低电平。
- After wakeup: IIC初始化后继续正常操作。

如果从机地址不匹配，从机操作继续。

Note: 因为SCL线在唤醒期间没有保持低电平，所以无法发送或接收跟随从地址的数据。

Note: 命令恢复和EEP响应模式是内部复位状态(ICE=IICRST=1)。因此，从地址的匹配不会设置ICSR1寄存器中的标志位HOA、GCA、ASS0、ASS1和ASS2。

图28.35显示了恢复和EEP响应模式下的示例操作。图28.37显示了详细的时序。

如果从软件待机模式或贪睡模式的转换是由唤醒中断以外的中断触发的，例如IRQn，则WUF标志不设置为1。按照图28.36中所示的处理。

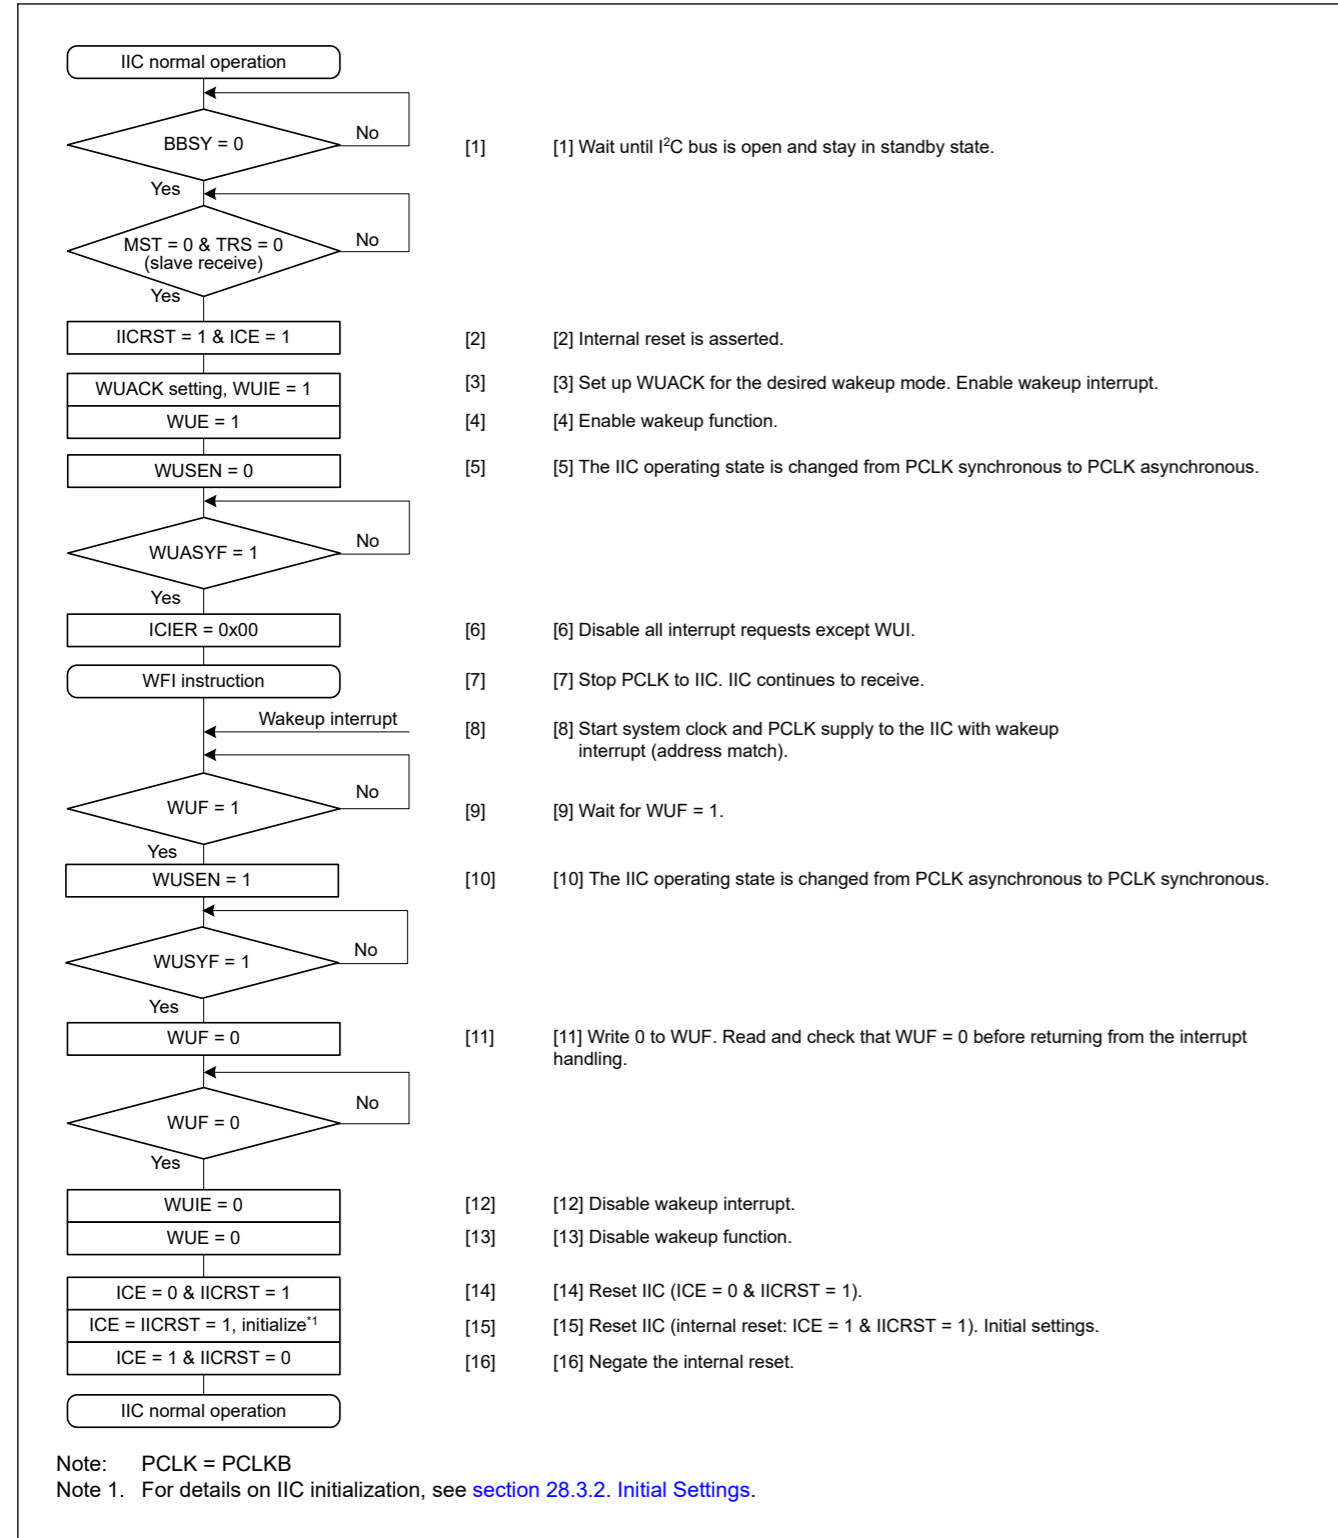

Figure 28.35 Example operation of command recovery mode and EEP response mode when wakeup is triggered by a wakeup interrupt on match of the slave address

Note: See [Precautions on the use of the wakeup function.](#)

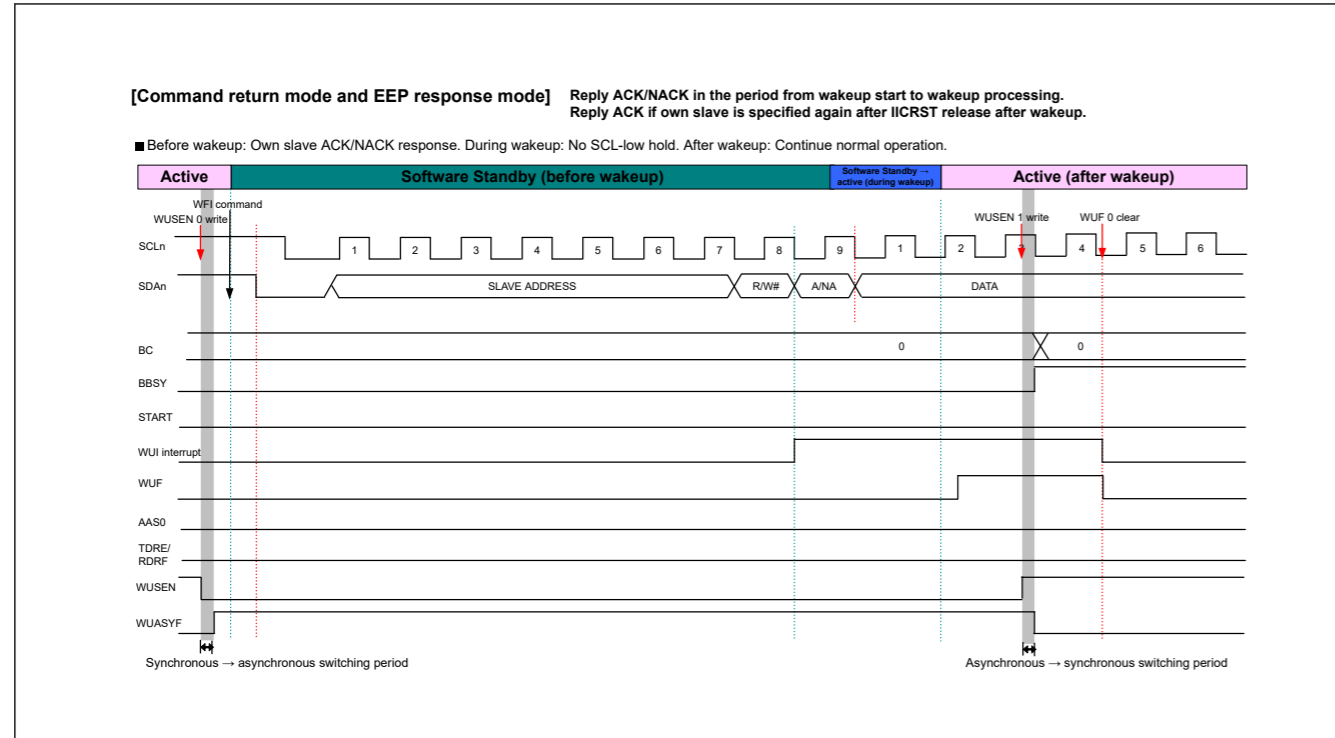

Figure 28.37 Timing of command recovery and EEP response modes

## 28.9 Automatic Low-Hold Function for SCL

### 28.9.1 Function to Prevent Wrong Transmission of Transmit Data

If the I<sup>2</sup>C Bus Shift Register (ICDRS) is empty and data has not been written to the I<sup>2</sup>C Bus Transmit Data Register (ICDRT) with the IIC in transmission mode (TRS bit = 1 in ICCR2), the SCLn line is automatically held low over the subsequent intervals. This low-hold period is extended until the transmit data is written, which prevents the unintended transmission of erroneous data.

Master transmit mode:

- Low-level interval after a start or restart condition is issued
- Low-level interval between the 9th clock cycle of one transfer and the 1st clock cycle of the next.

Slave transmit mode:

- Low-level interval between the 9th clock cycle of one transfer and the 1st clock cycle of the next.

Figure 28.37 命令恢复和EEP响应模式的时序

## 28.9 SCL的自动低保持功能

### 28.9.1 防止传输数据错误传输的功能

如果I2C总线移位寄存器(ICDRS)为空且数据尚未写入I2C总线发送数据寄存器(ICDRT)且IIC处于传输模式 (TRS位=ICCR2中的1)，则SCLn线为在随后的时间间隔内自动保持低电平。这个低保持期一直延长到发送数据被写入，这样可以防止错误数据的意外传输。

主传输模式:

- 发出启动或重启条件后的低电平间隔
- 一次传输的第9个时钟周期和下一次传输的第1个时钟周期之间的低电平间隔。

从机发送模式:

- 一次传输的第9个时钟周期和下一次传输的第1个时钟周期之间的低电平间隔。

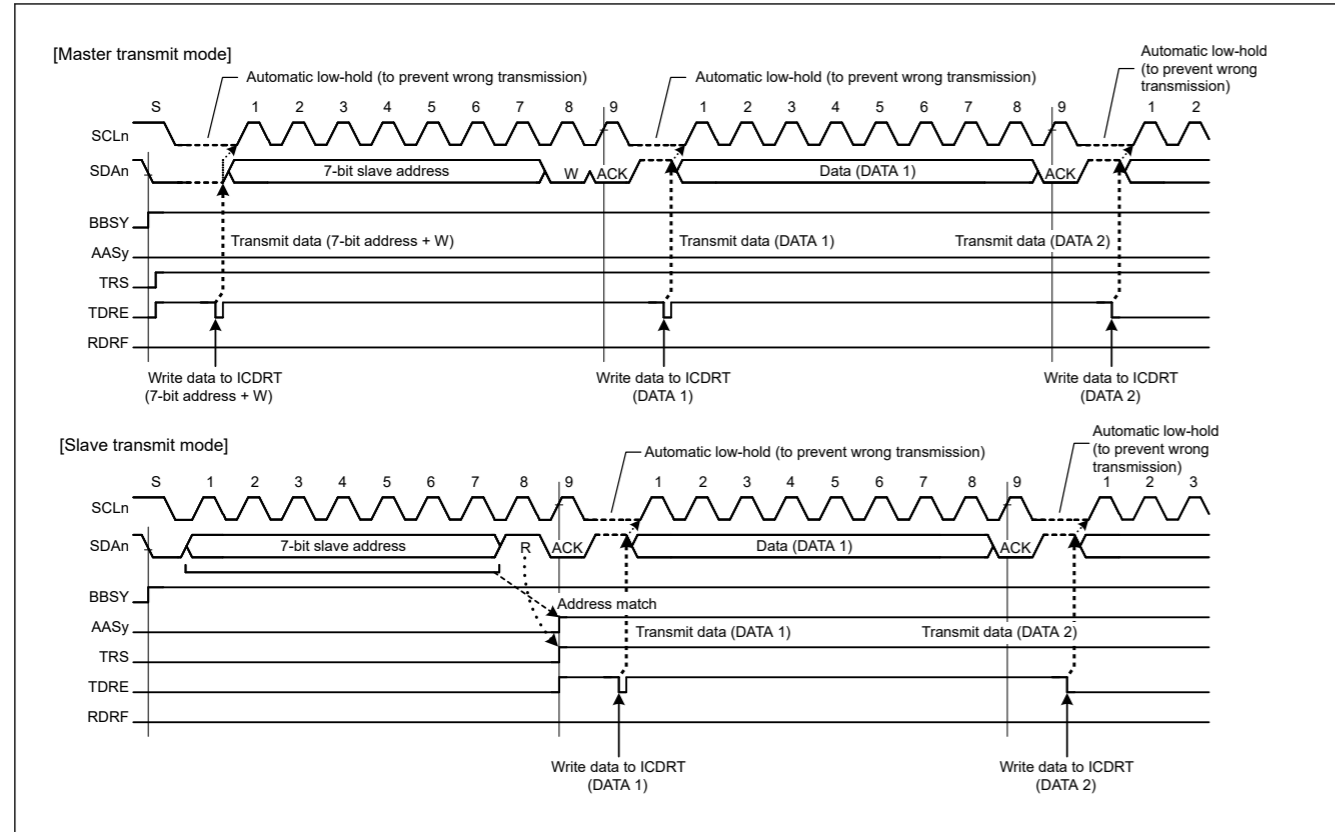

Figure 28.38 Automatic low-hold operation in transmit mode

### 28.9.2 NACK Reception Transfer Suspension Function

This function suspends transfer operation when NACK is received in transmit mode (TRS bit = 1 in ICCR2). This function is enabled when the NACKEN bit in ICFER is set to 1. If the next transmit data is already written (TDRE flag = 0 in ICSR2) when NACK is received, the next data transmission on the falling edge of the 9th SCL clock cycle is automatically suspended. This prevents the SDAn line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (NACKF flag = 1 in ICSR2), transmit and receive operations are discontinued. To restore transmit or receive operation, after issuing the restart condition, you need to set the NACKF flag to 0 and try again, or set the NACKF flag to 0 after issuing the stop condition and then start again from issuing the start condition..

Figure 28.38 发送模式下的自动低保持操作

### 28.9.2 NACK接收传输暂停功能

当在发送模式下接收到NACK (ICCR2中的TRS位=1) 时, 该函数暂停传输操作。当ICFER中的NACKEN位设置为1时, 此功能使能。如果在收到NACK时已经写入下一个发送数据 (ICSR2中的TDRE标志=0), 则在第9个SCL时钟周期的下降沿进行下一个数据发送被自动挂起。这可以防止SDAn线路输出电平在下一个发送数据的MSB为0时保持低电平。

如果传输操作被该函数挂起 (ICSR2中的NACKF标志=1), 发送和接收操作将中断。要恢复发送或接收操作, 在发出重启条件后, 您需要将NACKF标志设置为0并重试, 或者在发出停止条件后将NACKF标志设置为0, 然后从发出启动条件重新开始。

Figure 28.39 Suspension of data transfer when NACK is received, when NACKCE = 1

### 28.9.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (ICDRR) read is delayed for a period of one transfer frame or more with receive data full (RDRF flag = 1 in ICSR2) in receive mode (TRS = 0 in ICCR2), the IIC holds the SCLn line low automatically immediately before the next data is received to prevent a failure to receive data.

This function is enabled even if the read processing of the final receive data is delayed and, in the meantime, the IIC slave address is designated after a stop condition is issued. This function does not interfere with other communication because the IIC does not hold the SCLn line low when a mismatch with its own slave address occurs after a stop condition is issued.

Periods in which the SCLn line is held low can be selected with a combination of the WAIT and RDRFS bits in ICMR3.

#### (1) 1-byte receive operation and automatic low-hold function using the WAIT bit

When the WAIT bit in ICMR3 is set to 1, the IIC performs a 1-byte receive operation using the WAIT bit function. Additionally, when the ICMR3.RDRFS bit is 0, the IIC automatically sends the ACKBT bit value in ICMR3 for the acknowledge bit in the period from the falling edge of the 8th SCL clock cycle to the falling edge of the 9th SCL clock cycle, and automatically holds the SCLn line low on the falling edge of the 9th SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from ICDRR, which enables byte-wise receive operation.

The WAIT bit function is enabled for receive frames after a match with the IIC slave address, including the general call address and host address, is obtained in master or slave receive mode.

#### (2) 1-byte receive operation (ACK/NACK transmission control) and automatic low-hold function using the RDRFS bit

When the RDRFS bit in ICMR3 is set to 1, the IIC performs a 1-byte receive operation using the RDRFS bit function. When the RDRFS bit is set to 1, the RDRF flag in ICSR2 is set to 1 (receive data full) on the rising edge of the eighth SCL clock cycle, and the SCLn line is automatically held low on the falling edge of the eighth SCL clock cycle. This low-hold is released by writing a value to the ACKBT bit in ICMR3, but cannot be released by reading data from ICDRR, which enables receive operation through the ACK or NACK transmission control based on the data received in byte units.

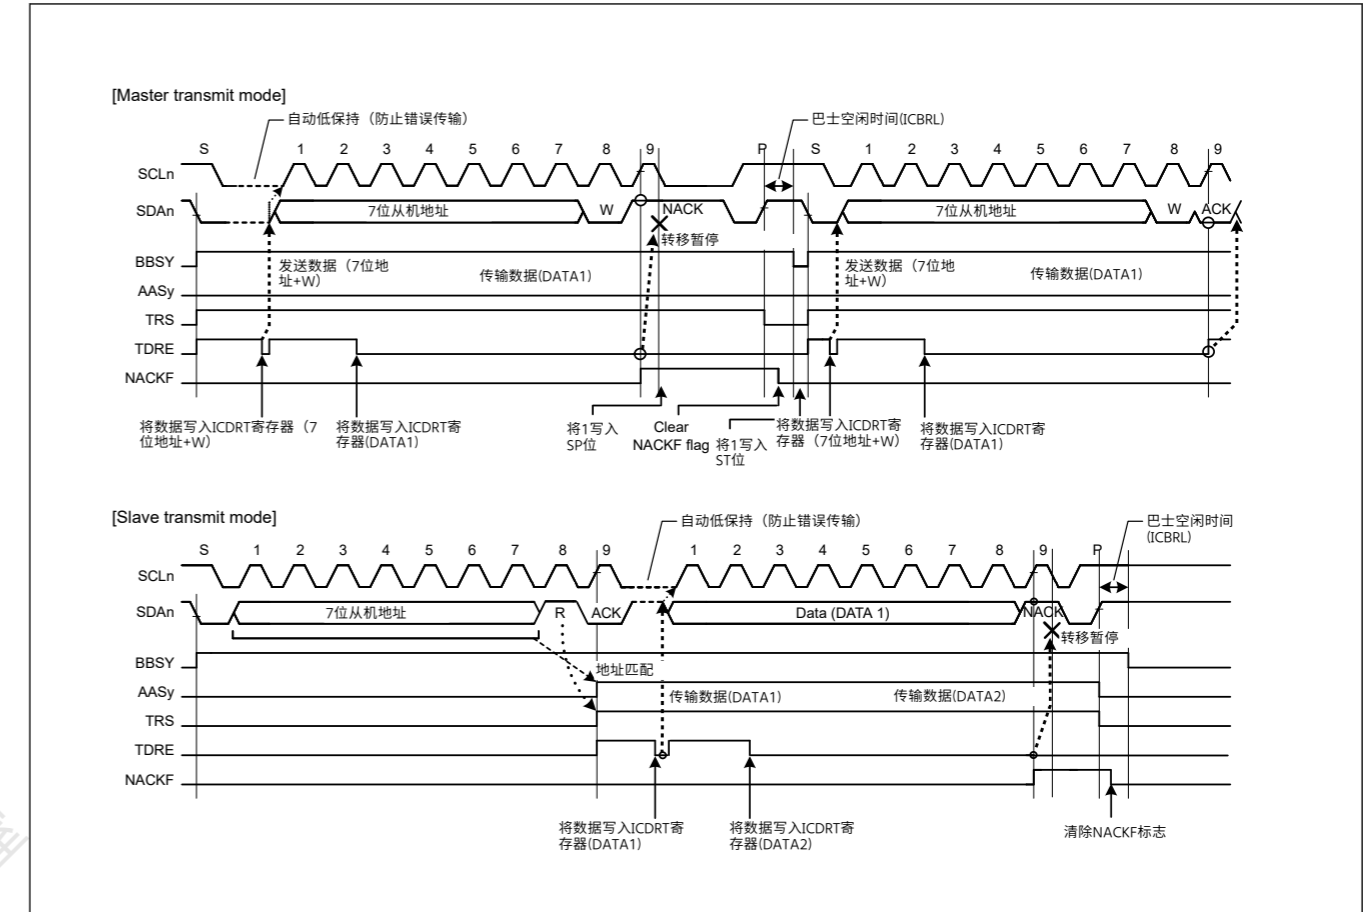

Figure 28.39 接收到NACK时暂停数据传输, 当NACKCE=1

### 28.9.3 防止数据接收失败的功能

如果在接收模式 (ICCR2中的TRS=0) 下接收数据 (ICDRR) 读取延迟一个传输帧或更长时间且接收数据已满 (ICSR2中的RDRF标志=1) 时响应处理延迟, 则IIC保持在接收到下一个数据之前, SCLn线自动变为低电平, 以防止接收数据失败。

即使最终接收数据的读取处理延迟, 该功能也有效, 同时, 在发出停止条件后指定IIC从机地址。此功能不会干扰其他通信, 因为在发出停止条件后发生与其自己的从地址不匹配时, IIC不会将SCLn线保持为低电平。

SCLn线保持低电平的周期可以通过ICMR3中的WAIT和RDRFS位的组合来选择。

#### (1) 使用WAIT位的1字节接收操作和自动低保持功能

当ICMR3中的WAIT位设置为1时, IIC使用WAIT位功能执行1字节接收操作。此外, 当ICMR3.RDRFS位为0时, IIC会在第8个SCL时钟周期的下降沿到第9个SCL时钟周期的下降沿期间自动发送ICMR3中的ACKBT位值作为确认位, 并且使用WAIT位功能在第9个SCL时钟周期的下降沿自动将SCLn线保持为低电平。该低保持通过从ICDRR读取数据来释放, 从而启用逐字节接收操作。

在主机或从机接收模式下获得与IIC从机地址 (包括广播地址和主机地址) 匹配后的接收帧启用WAIT位功能。

#### (2) 1字节接收操作 (ACK/NACK传输控制) 和使用RDRFS位的自动低保持功能

当ICMR3中的RDRFS位设置为1时, IIC使用RDRFS位功能执行1字节接收操作。当RDRFS位为1时, ICSR2中的RDRF标志位在第8个SCL时钟周期的上升沿置1 (接收数据满), 并且SCLn线在第8个SCL的下降沿自动保持为低电平。该低保持通过向ICMR3中的ACKBT位写入值来释放, 但不能通过从ICDRR读取数据来释放, ICDRR可以根据以字节为单位接收的数据通过ACK或NACK传输控制进行接收操作。

The RDRFS bit function is enabled for receive frames after a match with the IIC slave address, including the general call address and host address, is obtained in master or slave receive mode.

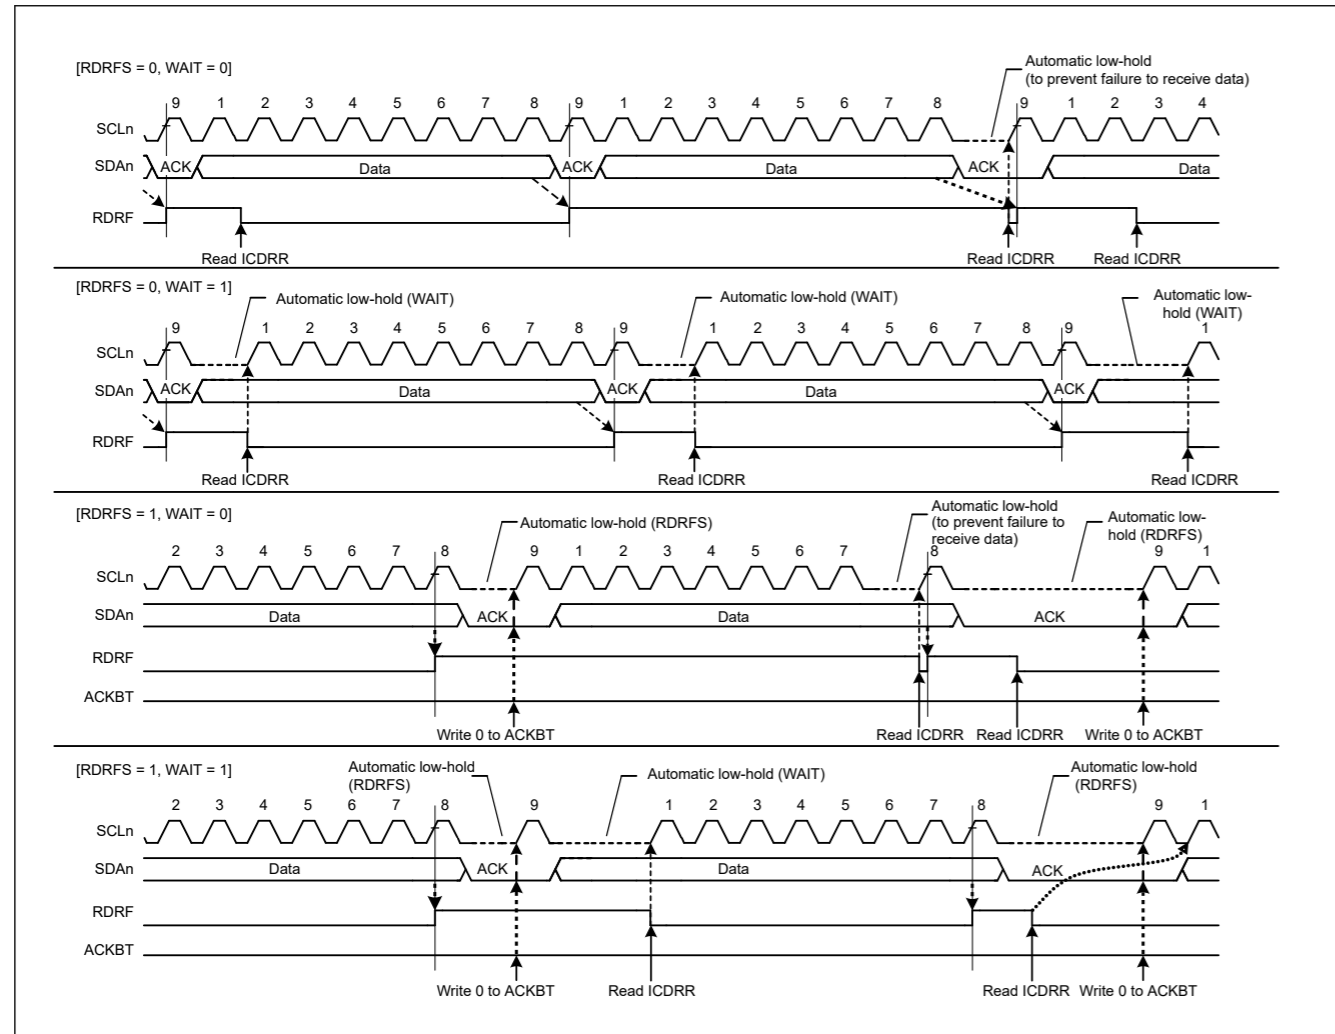

Figure 28.40 Automatic low-hold operation in receive mode using the RDRFS and WAIT bits

### 28.10 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I<sup>2</sup>C bus standard, the IIC provides functions to prevent double-issue of a start condition, detect arbitration-lost during transmission of NACK, and detect arbitration-lost in slave transmit mode.

#### 28.10.1 Master Arbitration-Lost Detection (MALE Bit)

The IIC drives the SDA<sub>n</sub> line low to issue a start condition. However, if the SDA<sub>n</sub> line was already driven low by another master device issuing a start condition, the IIC regards its own start condition as an error and considers this a loss in arbitration. Priority is given to transfer by the other master device. Similarly, if a request to issue a start condition is made by setting the ST bit in ICCR2 to 1 while the bus is busy (BBSY flag = 1 in ICCR2), the IIC regards this as a double-issuing-of-start-condition error and considers itself to have lost in arbitration. This prevents a failure of transfer resulting from a start condition being issued while transfer is in progress.

When a start condition is issued successfully, if the transmit data including the address bits (internal SDA output level) and the level on the SDA<sub>n</sub> line do not match (high output as the internal SDA output, meaning the SDA<sub>n</sub> pin is in the high-impedance state) and a low level is detected on the SDA<sub>n</sub> line, the IIC loses in arbitration.

After a loss in arbitration of mastership, the IIC immediately enters slave receive mode. If a slave address, including the general call address, matches its own address at this time, the IIC continues in slave operation.

在主机或从机接收模式下获得与IIC从机地址（包括广播地址和主机地址）匹配后的接收帧启用RDRFS位功能。

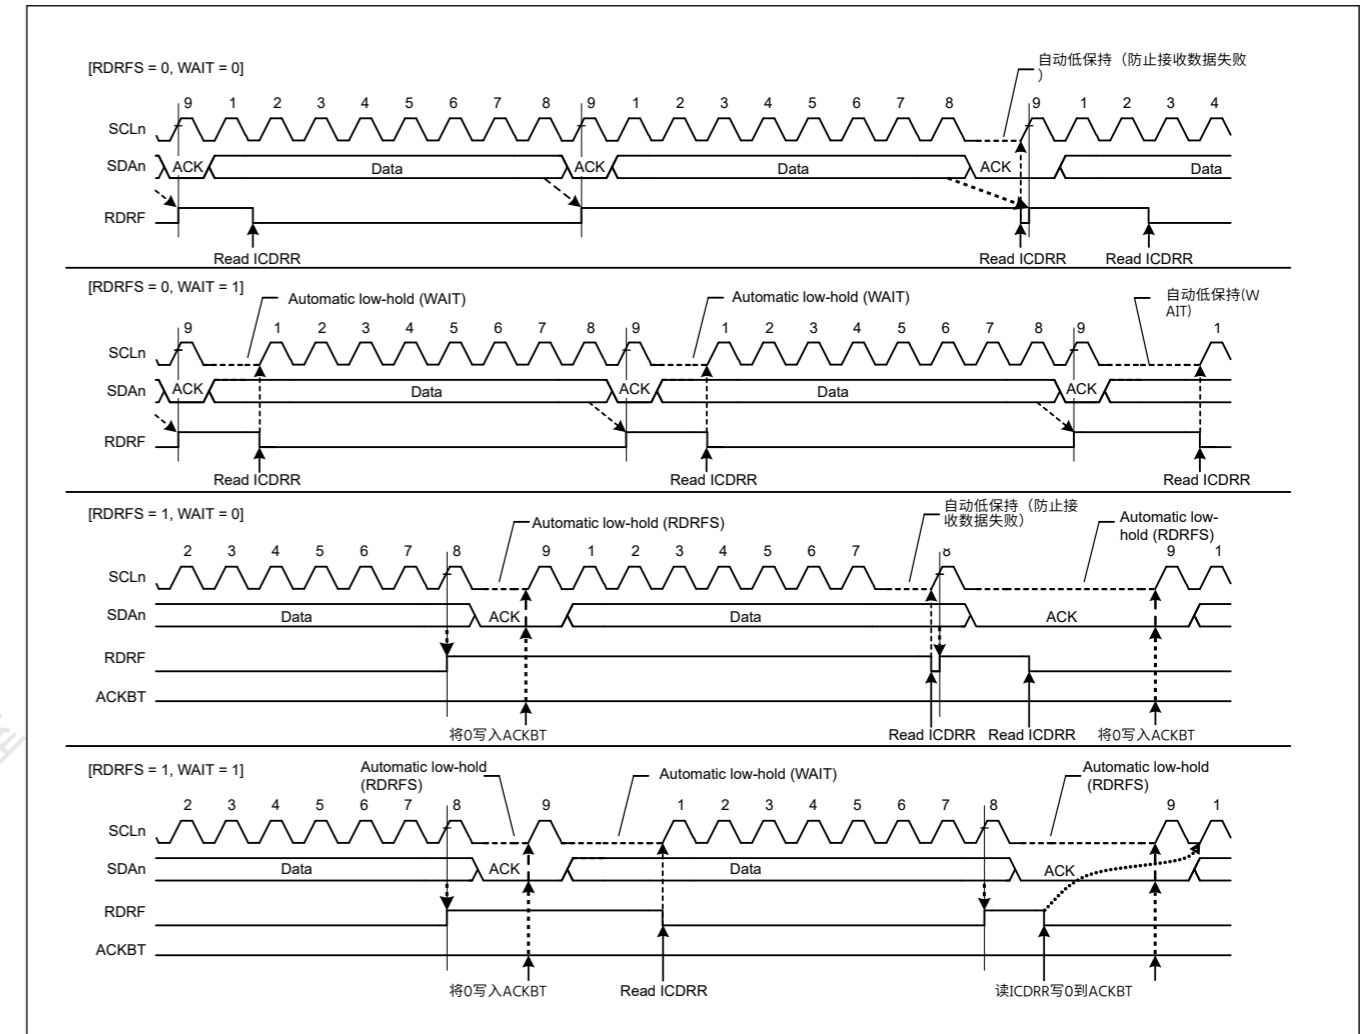

Figure 28.40 使用RDRFS和WAIT位在接收模式下自动保持低电平操作

### 28.10 仲裁丢失检测功能

除了I2C总线标准定义的正常仲裁丢失检测功能外，IIC还提供防止重复发出启动条件、在NACK传输期间检测仲裁丢失以及在从机发送中检测仲裁丢失的功能模式。

#### 28.10.1 主仲裁丢失检测 (MALE位)

IIC将SDA<sub>n</sub>线驱动为低电平以发出启动条件。但是，如果SDA<sub>n</sub>线已经被另一个发出启动条件的主设备驱动为低电平，则IIC将其自己的启动条件视为错误，并认为这是仲裁失败。其他主设备优先传输。类似地，如果在总线繁忙时通过将ICCR2中的ST位设置为1来请求发出启动条件（ICCR2中的BBSY标志=1），则IIC将此视为双重发出启动条件错误，并且认为自己在仲裁中败诉。这可以防止由于在传输过程中发出启动条件而导致传输失败。

当启动条件成功发出时，如果发送数据包括地址位（内部SDA输出电平）与SDA<sub>n</sub>线上的电平不匹配（高输出作为内部SDA输出，意味着SDA<sub>n</sub>引脚处于高阻抗状态）并且在SDA<sub>n</sub>线上检测到低电平，则IIC在仲裁中失败。

在主仲裁失败后，IIC立即进入从机接收模式。如果此时从机地址（包括广播地址）与自己的地址匹配，则IIC继续从机操作。

A loss in arbitration of mastership is detected when the following conditions are met while the MALE bit in ICFER is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Mismatching of the internal level for output on SDA and the level on the SDA<sub>n</sub> line after a start condition was issued by setting the ST bit in ICCR2 to 1 while the BBSY flag in ICCR2 is set to 0 (erroneous issuing of a start condition)
- Setting of the ST bit in ICCR2 to 1 (start condition double-issue error) while the BBSY flag is 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDA<sub>n</sub> line in master transmit mode (MST and TRS bits = 11b in ICCR2).

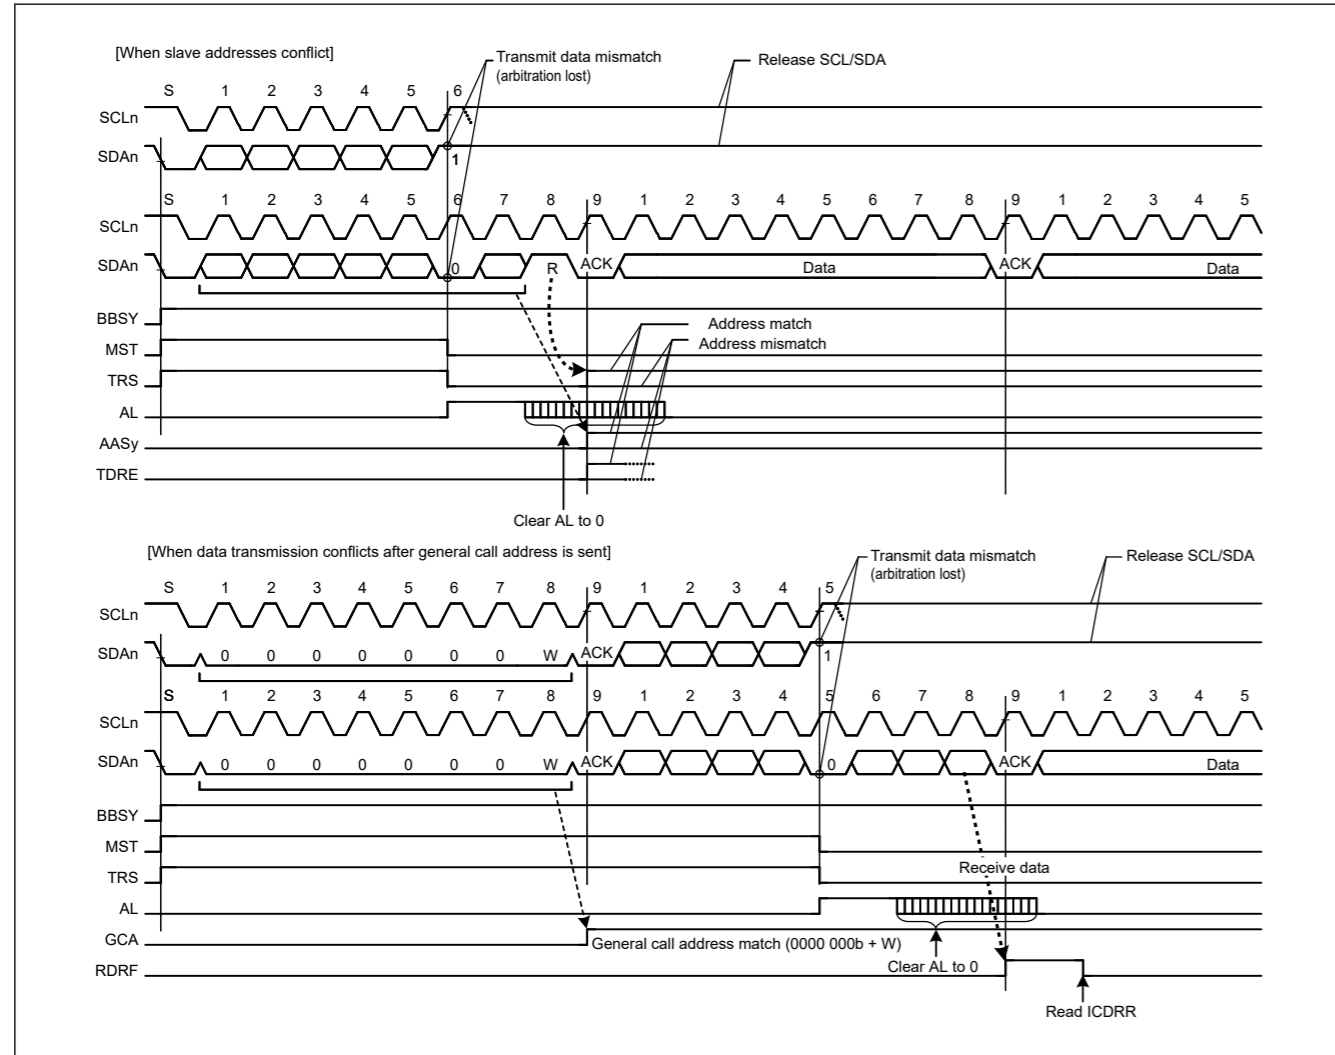

Figure 28.41 Examples of master arbitration-lost detection when MALE = 1

当ICFER中的MALE位为1（启用主仲裁丢失检测）时满足以下条件时，检测到主控仲裁丢失。

[Master arbitration-lost conditions]

- 通过将ICCR2中的ST位设置为1，同时将ICCR2中的BBSY标志设置为0，发出启动条件后，SDA输出的内部电平与SDA<sub>n</sub>线上的电平不匹配（错误发出启动条件）
- 在BBSY标志为1时将ICCR2中的ST位设置为1（启动条件双发错误）
- 当发送数据不包括确认（内部SDA输出电平）与主发送模式下SDA<sub>n</sub>线上的电平不匹配时（ICCR2中的MST和TRS位=11b）。

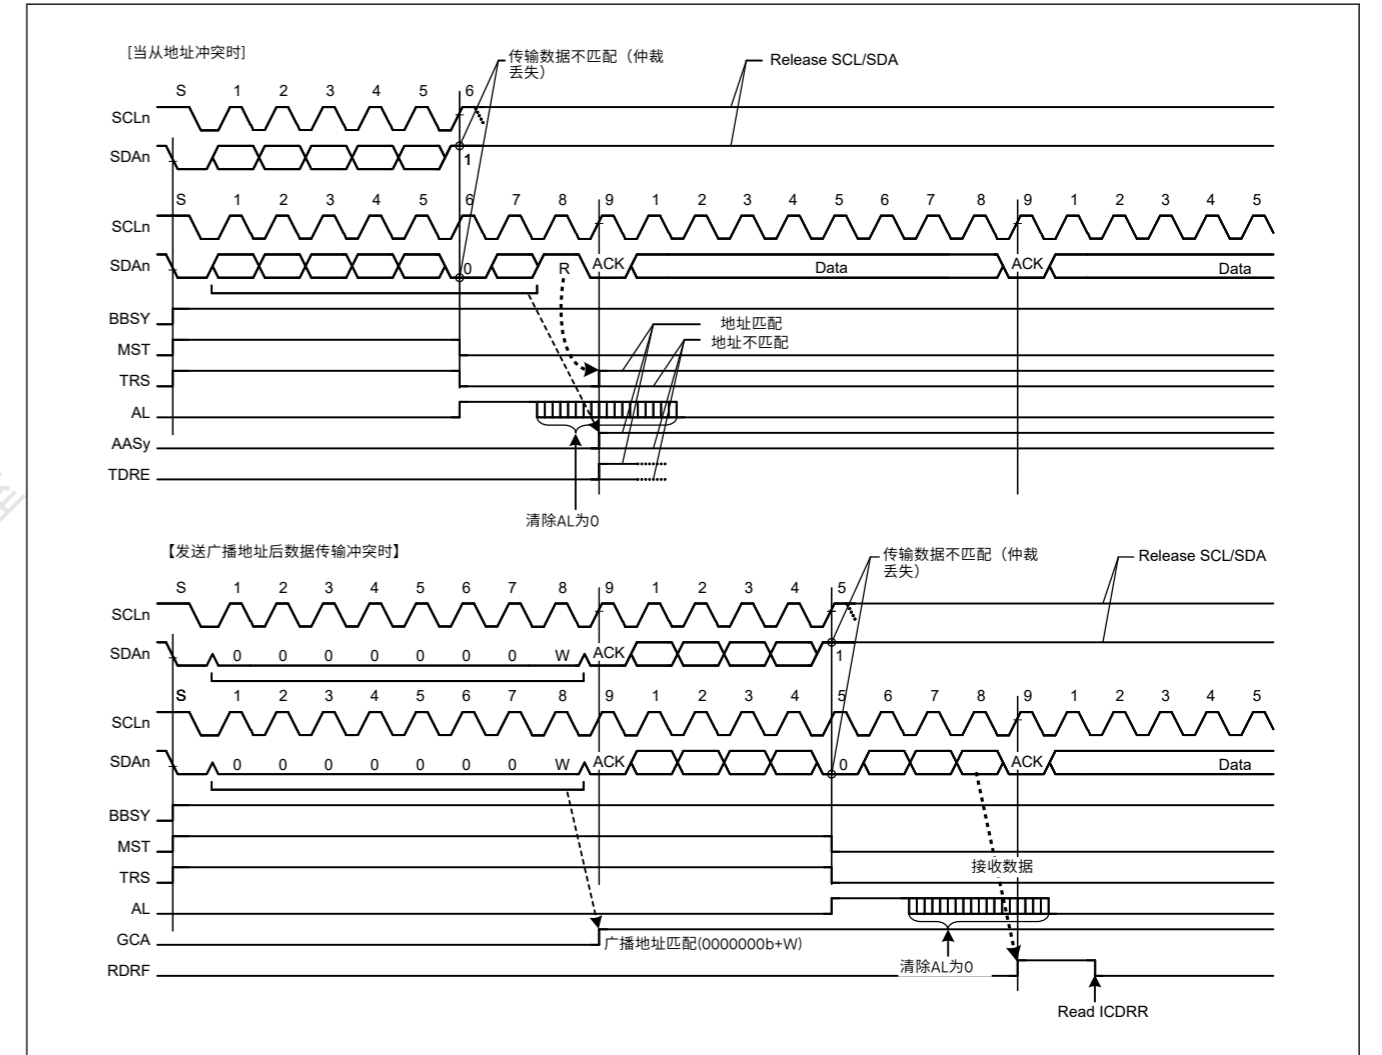

Figure 28.41 MALE=1时的主仲裁丢失检测示例

Figure 28.42 Arbitration-lost when start condition is issued when MALE = 1

28.10.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

This function causes arbitration to be lost if the internal SDA output level does not match the level on the SDAAn line (high output as the internal SDA output, meaning the SDAAn pin is in the high-impedance state) and the low level is detected on the SDAAn line during transmission of NACK in receive mode. Arbitration is lost because of a conflict between NACK and ACK transmissions when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such a conflict occurs when multiple master devices send or receive the same information through a single slave device. Figure 28.43 shows an example of arbitration-lost detection during transmission of NACK.

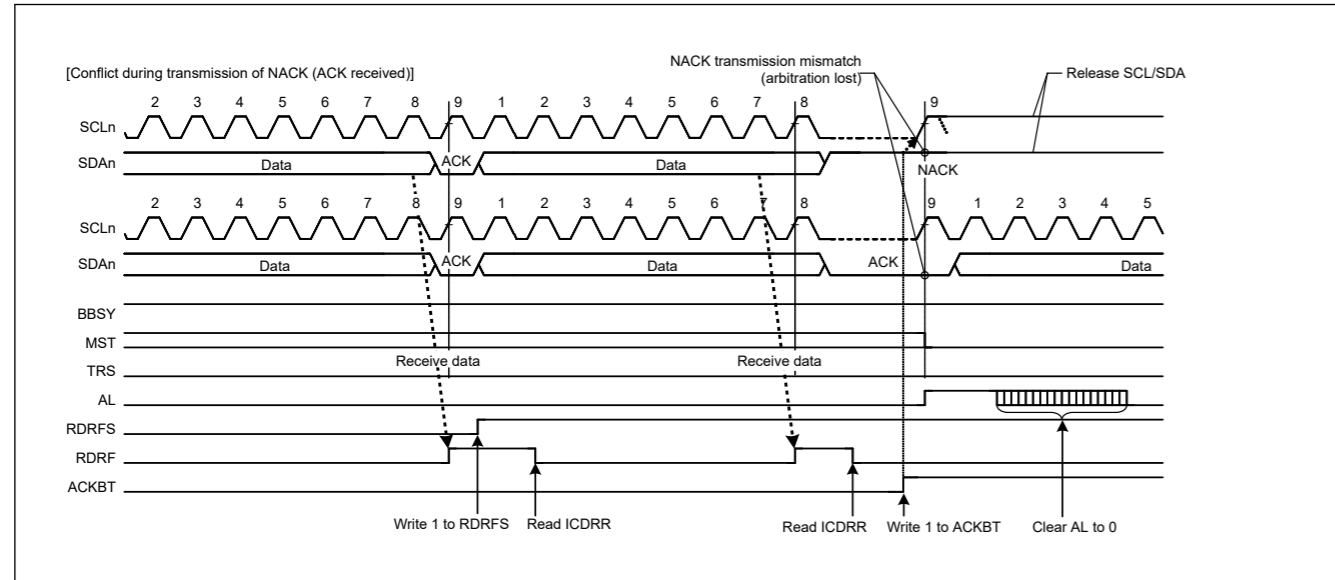

Figure 28.43 Example of arbitration-lost detection during transmission of NACK when NALE = 1

The following explains arbitration-lost detection using an example in which two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives 2 bytes of data from the slave device, and master B receives 4 bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in either master A or master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Master A sends NACK when it has received 2 final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received the required 4 bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like

Figure 28.42 MALE=1时发出启动条件时仲裁失败

28.10.2 在NACK传输期间检测仲裁丢失的功能 (NALE位)

如果内部SDA输出电平与SDAAn线上的电平不匹配 (高输出作为内部SDA输出, 意味着SDAAn引脚处于高阻抗状态) 并且在上检测到低电平, 此功能会导致仲裁丢失在接收模式下发送NACK期间的SDAAn线。当多主控系统中两个或多个主控设备同时从同一从属设备接收数据时, 由于NACK和ACK传输之间的冲突, 仲裁会丢失。当多个主设备通过单个从设备发送或接收相同的信息时, 就会发生这种冲突。图28.43显示了在NACK传输期间检测仲裁丢失的示例。

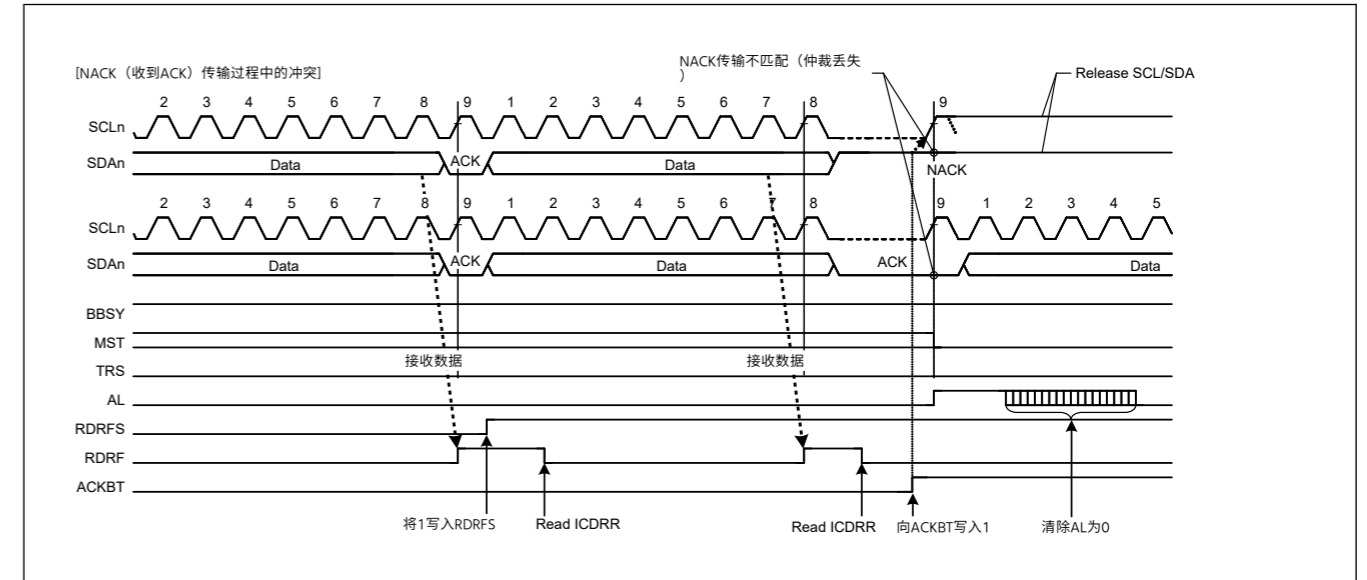

Figure 28.43 NALE=1时NACK传输期间仲裁丢失检测的示例

下面以两个主设备 (主设备A和主设备B) 和一个从设备通过总线连接的示例来说明仲裁丢失检测。在本例中, 主设备A从从设备接收2个字节的数据, 主设备B从从设备接收4个字节的数据。

如果主设备A和主设备B同时访问从设备, 因为从设备地址相同, 在访问从设备期间, 主设备A或主设备B都不会丢失仲裁。因此, 主机A和主机B都承认他们已经获得了总线控制权并照此运行。主设备A在从从设备接收到2个最终字节的数据时发送NACK。同时, masterB发送ACK, 因为它没有收到所需的4字节数据。此时, 来自masterA的NACK传输和来自masterB的ACK传输冲突。一般来说, 如果像这样的冲突

this occurs, master A cannot detect the ACK transmitted by master B and issues a stop condition. The stop condition issue conflicts with the SCL clock output of master B, which disrupts communication.

When the IIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost. If arbitration is lost during transmission of NACK, the IIC immediately cancels the slave match condition and enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

Similarly, in the ARP command processing of SMBus, the function to detect loss of arbitration during transmission of NACK is also available for eliminating the extra clock cycle processing, such as 0xFF transmission processing, which is required if the UDID (Unique Device Identifier) of the assigned address does not match in the Get UDID general processing after the Assign Address command.

The IIC detects arbitration-lost during transmission of NACK when the following condition is met with the NALE bit in ICFER set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

- When the internal SDA output level does not match the SDA<sub>n</sub> line (ACK is received) during transmission of NACK (ACKBT bit = 1 in ICMR3).

### 28.10.3 Slave Arbitration-Lost Detection (SALE Bit)

This function causes arbitration to be lost if the transmit data (internal SDA output level) and the level on the SDA<sub>n</sub> line do not match (high output as the internal SDA output, meaning the SDA<sub>n</sub> pin is in the high-impedance state), and the low level is detected on the SDA<sub>n</sub> line in slave transmit mode. This arbitration-lost detection function is mainly used when transmitting a UDID (Unique Device Identifier) over an SMBus.

When the IIC loses slave arbitration, the IIC is immediately released from the slave-matched state and enters slave receive mode. This function can detect conflicts of data during transmission of UDIDs over an SMBus and eliminates subsequent redundant processing for the transmission of 0xFF.

The IIC detects slave arbitration-lost when the following condition is met with the SALE bit in ICFER set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

- When transmit data excluding acknowledge (internal SDA output level) does not match the SDA<sub>n</sub> line in slave transmit mode (MST and TRS bits = 01b in ICCR2).

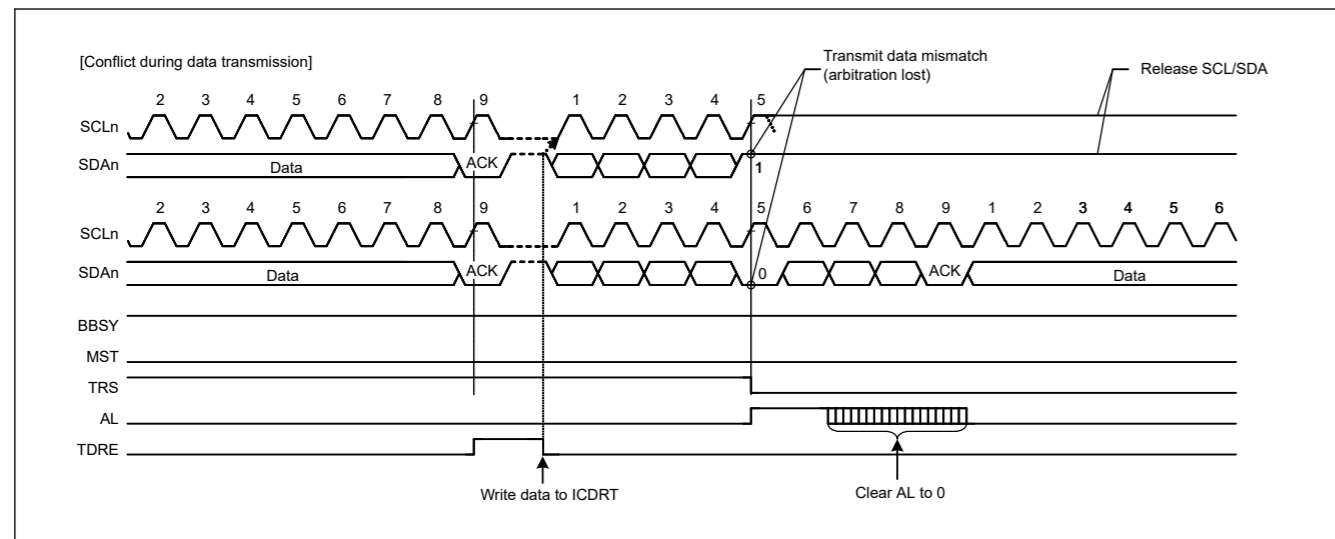

Figure 28.44 Example of slave arbitration-lost detection when SALE = 1

发生这种情况时，主机A无法检测到主机B发送的ACK并发出停止条件。停止条件问题与主B的SCL时钟输出冲突，从而中断通信。

当IIC在NACK传输过程中收到ACK时，它会检测到与其他主设备冲突的失败并导致仲裁丢失。如果在NACK传输过程中仲裁丢失，IIC立即取消从机匹配条件并进入从机接收模式。这可以防止发出停止条件，从而防止总线上的通信故障。

同样，在SMBus的ARP命令处理中，检测传输过程中仲裁丢失的功能NACK也可用于消除额外的时钟周期处理，例如0xFF传输处理，如果分配地址的UDID（唯一设备标识符）在分配地址命令后的获取UDID常规处理中不匹配，则需要此处理。

IIC在NACK传输期间检测到仲裁丢失，当满足以下条件时ICFER设置为1（启用NACK传输期间的仲裁丢失检测）。

[在NACK传输期间仲裁丢失的条件]

- 在发送NACK（ICMR3中的ACKBT位=1）期间，当内部SDA输出电平与SDA<sub>n</sub>线不匹配时（接收到ACK）。

### 28.10.3 从设备仲裁丢失检测（SALE位）

如果发送数据（内部SDA输出电平）与SDA<sub>n</sub>线上的电平不匹配（高输出作为内部SDA输出，意味着SDA<sub>n</sub>引脚处于高阻状态），此功能会导致仲裁丢失，并且在从机发送模式下，SDA<sub>n</sub>线上检测到低电平。这种仲裁丢失检测功能主要用于通过SMBus传输UDID（唯一设备标识符）时。

当IIC失去从机仲裁时，IIC立即从从机匹配状态中释放并进入从机接收模式。该功能可以检测通过SMBus传输UDID期间的数据冲突，并消除后续对0xFF传输的冗余处理。

当ICFER中的SALE位设置为1（启用从设备仲裁丢失检测）满足以下条件时，IIC检测从设备仲裁丢失。

[从机仲裁失败的条件]

- 当发送数据不包括确认（内部SDA输出电平）与从发送模式下的SDA<sub>n</sub>线不匹配时（MST和TRS位=ICCR2中的01b）。

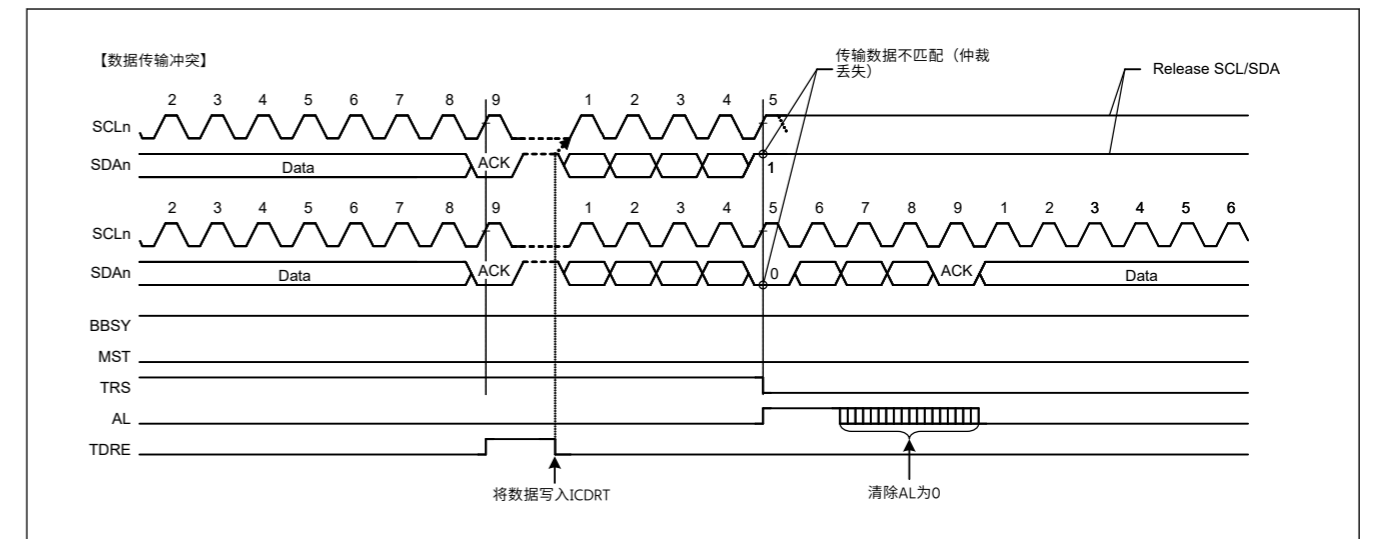

Figure 28.44 SALE=1时从设备仲裁丢失检测示例

## 28.11 Start, Restart, and Stop Condition Issuing Function

### 28.11.1 Issuing a Start Condition

The IIC issues a start condition when the ST bit in ICCR2 is set to 1. When the ST bit is set to 1, a start condition request is made, and the IIC issues a start condition when the BBSY flag in ICCR2 is 0 (bus free state). When a start condition is issued normally, the IIC automatically shifts to the master transmit mode.

To issue a start condition:

1. Drive the SDA<sub>n</sub> line low (high level to low level).
2. Ensure that the time set in ICBRH and the start condition hold time elapse.
3. Drive the SCL<sub>n</sub> line low (high level to low level).
4. Detect low level on the SCL<sub>n</sub> line and ensure the low-level period of the SCL<sub>n</sub> line set in ICBRL elapses.

### 28.11.2 Issuing a Restart Condition

The IIC issues a restart condition when the RS bit in ICCR2 is set to 1. When the RS bit is set to 1, a restart condition request is made, and the IIC issues a restart condition when the BBSY flag in ICCR2 is 1 (bus busy state) and the MST bit in ICCR2 is 1 (master mode).

To issue a restart condition:

1. Release the SDA<sub>n</sub> line.
2. Ensure the low-level period of the SCL<sub>n</sub> line set in ICBRL elapses.
3. Release the SCL<sub>n</sub> line (low level to high level).
4. Detect a high level on the SCL<sub>n</sub> line and ensure the time set in ICBRL and the restart condition setup time elapse.
5. Drive the SDA<sub>n</sub> line low (high level to low level).
6. Ensure the time set in ICBRH and the restart condition hold time elapse.
7. Drive the SCL<sub>n</sub> line low (high level to low level).
8. Detect a low level on the SCL<sub>n</sub> line and ensure the low-level period of the SCL<sub>n</sub> line set in ICBRL elapses.

Note: When issuing restart condition requests, write the slave address to ICDRT after confirming that ICCR2.RS = 0. Data written while ICCR2.RS = 1 is not forwarded because of the retransmission condition before the occurrence.

Figure 28.45 Start and restart condition issue timing using the ST and RS bits

## 28.11 启动、重启和停止条件发布功能

### 28.11.1 发出开始条件

当ICCR2中的ST位设置为1时，IIC发出启动条件。当ST位设置为1时，发出启动条件请求，当ICCR2中的BBSY标志为0时，IIC发出启动条件（总线自由状态）。当启动条件正常发出时，IIC自动切换到主机发送模式。

发出开始条件：

- 1.将SDAn线拉低（高电平转低电平）。
- 2.确保ICBRH中设置的时间和启动条件保持时间已过。
- 3.将SCLn线拉低（高电平转低电平）。
- 4.检测SCLn线的低电平，确保ICBRL中设置的SCLn线的低电平周期过去。

### 28.11.2 发出重启条件

当ICCR2中的RS位设置为1时，IIC发出重启条件。当RS位设置为1时，发出重启条件请求，当ICCR2中的BBSY标志为1时，IIC发出重启条件（总线忙状态）并且ICCR2中的MST位为1（主模式）。

发出重启条件：

- 1.释放SDAn线。
- 2.确保ICBRL中设置的SCLn线的低电平周期已过。
- 3.释放SCLn线（低电平到高电平）。
- 4.检测SCLn线上的高电平并确保ICBRL中设置的时间和重启条件设置时间已过。
- 5.将SDAn线拉低（高电平转低电平）。
- 6.确保ICBRH中设置的时间和重启条件保持时间已过。
- 7.将SCLn线拉低（从高电平到低电平）。
- 8.检测SCLn线上的低电平，确保ICBRL中设置的SCLn线的低电平周期过去。

Note: 发出重启条件请求时，确认ICCR2.RS=0后，将从机地址写入ICDRT。在ICCR2.RS=1时写入的数据由于发生前的重传条件而不会转发。

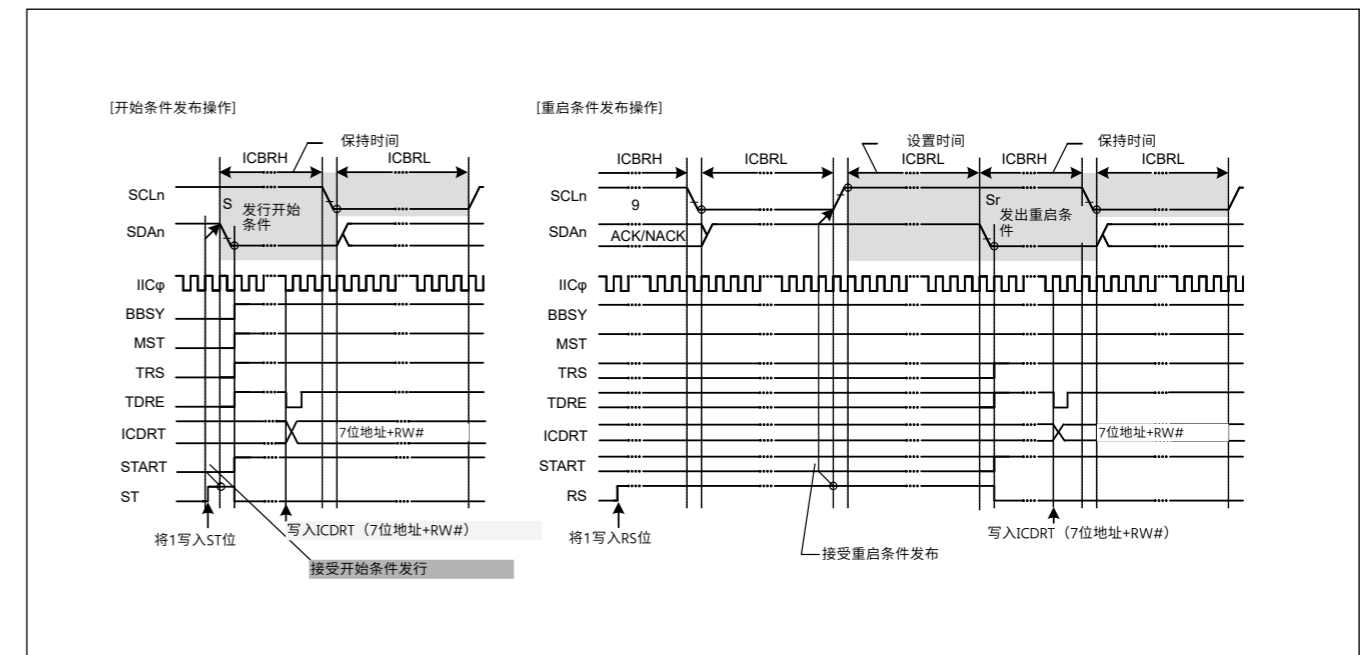

Figure 28.45 使用ST和RS位的启动和重启条件发出时序

Figure 28.46 shows the operation timing when a restart condition is issued after the master transmission.

[To issue a restart condition after the master transmission:]

1. Initialize the IIC using the procedure in section 28.3.2. Initial Settings.
2. Read the BBSY flag in ICCR2 to check that the bus is open, then set the ST bit in ICCR2 to 1 (start condition issuance request). On receiving the request, the IIC issues a start condition. At the same time, the BBSY and the START flags in ICSR2 are automatically set to 1 and the ST bit is automatically set to 0. If the start condition is detected and the internal levels for the SDA output state and the levels on the SDA line match while the ST bit is 1, the IIC recognizes that a start condition is successfully issued as requested by the ST bit has been successfully completed. The MST and TRS bits in ICCR2 are automatically set to 1, placing the IIC in master transmit mode. The TDRE flag in ICSR2 is also automatically set to 1 when the TRS bit is set to 1.
3. Check that the TDRE flag in ICSR2 is 1, and then write the value for transmission (the slave address and the R/W# bit) to ICDRT. After the data for transmission is written to ICDRT, the TDRE flag is automatically set to 0, data is transferred from ICDRT to ICDRS, and the TDRE flag is again set to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode according to the value of the transmitted R/W# bit. If the value of the R/W# bit is 0, the IIC continues in master transmit mode. If the ICSR2.NACKF flag is 1 at this time, indicating that no slave device recognized the address or that there was an error in communications, write 1 to ICCR2.SP bit to issue a stop condition. To transmit data with an address in the 10-bit format, start by writing 1111 0b, the 2 upper bits of the slave address, and W to ICDRT as the first address transmission. Then, as the second address transmission, write the 8 lower bits of the slave address to ICDRT.
4. After confirming that the TDRE flag in ICSR2 is 1, write data for transmission to the ICDRT register. The IIC automatically holds the SCLn line low until data for transmission is ready, a restart condition is issued or a stop condition is issued.
5. After all bytes of data for transmission are written to the ICDRT register, wait until the value of the TEND flag in ICSR2 returns to 1. Then after checking that the START flag in ICSR2 is 1, set the START flag in ICSR2 to 0.
6. Set the RS bit in ICCR2 to 1 (restart condition issue request). On receiving the request, the IIC issues a restart condition.
7. After checking that the START flag in ICSR2 is 1, write the value for transmission (the slave address and the R/W# bit) to ICDRT.

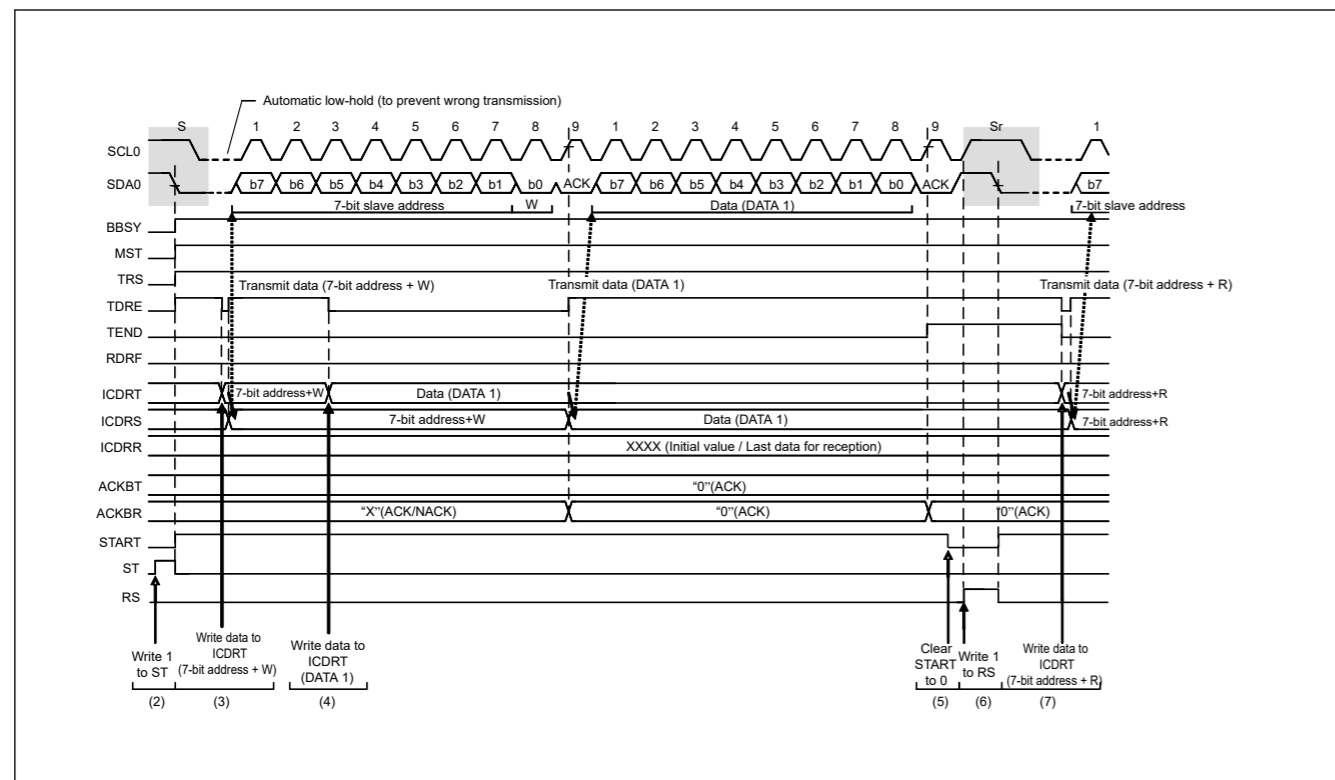

Figure 28.46 Restart condition issue timing after master transmission.

图28.46显示了在主机发送后发出重新启动条件时的操作时序。

[在主传输后发出重启条件:]

- 1.使用第28.3.2节中的过程初始化IIC。初始设置。
- 2.读取ICCR2中的BBSY标志以检查总线是否打开，然后将ICCR2中的ST位设置为1（开始条件发出请求）。收到请求后，IIC发出一个开始条件。同时，ICSR2中的BBSY和START标志位自动设置为1，ST位自动设置为0。如果检测到启动条件，则内部电平为SDA输出状态和SDAn线上的电平当ST位为1时匹配，IIC识别成功发出启动条件，因为ST位请求已成功完成。ICCR2中的MST和TRS位自动设置为1，将IIC置于主机发送模式。当TRS位设置为1时，ICSR2中的TDRE标志也自动设置为1。
- 3.检查ICSR2中的TDRE标志是否为1，然后将要发送的值（从机地址和RW#位）写入ICDRT。待传输数据写入ICDRT后，TDRE标志自动置0，数据从ICDRT传输到ICDRS，TDRE标志再次置1。发送时，TRS位的值会根据发送的RW#位的值自动更新以选择主机发送或主机接收模式。如果RW#位的值为0，则IIC继续处于主机发送模式。如果此时ICSR2.NACKF标志位为1，表示没有从设备识别该地址或通信出现错误，向ICCR2.SP位写入1发出停止条件。要使用10位格式的的地址传输数据，首先将11110b、从机地址的高2位和W写入ICDRT作为第一个地址传输。然后，作为第二次地址传输，将从地址的低8位写入ICDRT。
- 4.确认ICSR2中的TDRE标志为1后，将要发送的数据写入ICDRT寄存器。IIC自动将SCLn线保持为低电平，直到传输数据准备好、发出重启条件或发出停止条件。
- 5.待发送的所有字节数据写入ICDRT寄存器后，等待ICSR2中的TEND标志的值返回1。然后检查ICSR2中的START标志为1后，将ICSR2中的START标志设置为0。
- 6.将ICCR2中的RS位设置为1（重新启动条件发出请求）。收到请求后，IIC发出重启条件。
- 7.检查ICSR2中的START标志为1后，将要发送的值（从机地址和RW#位）写入ICDRT。

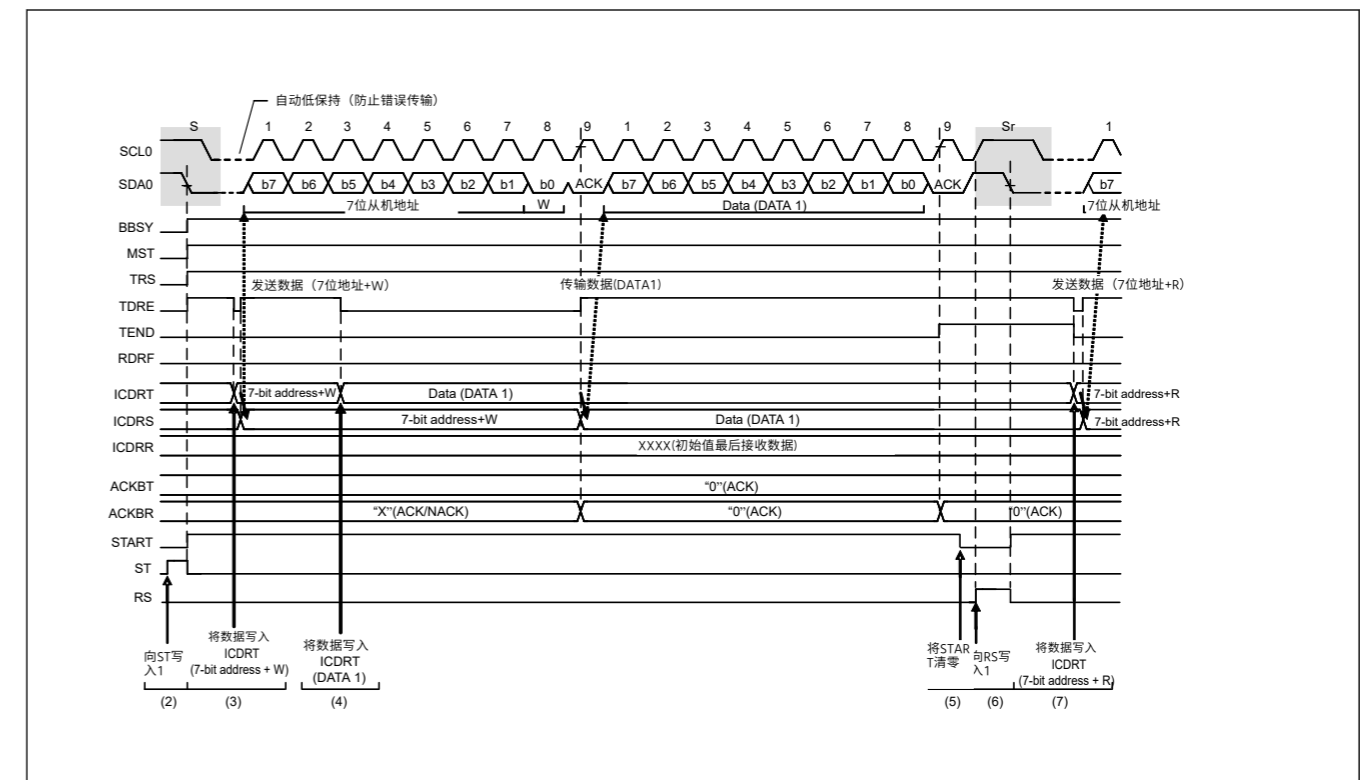

Figure 28.46 主传输后重启条件发出时序。

### 28.11.3 Issuing a Stop Condition

The IIC issues a stop condition when the SP bit in ICCR2 is set to 1. When the SP bit is set to 1, a stop condition request is made, and the IIC issues a stop condition when the BBSY flag in ICCR2 is 1 (bus busy state) and the MST bit in ICCR2 is 1 (master mode).

To issue a stop condition:

1. Drive the SDA<sub>n</sub> line low (high level to low level).
2. Ensure the low-level period of the SCL<sub>n</sub> line set in ICBRL elapses.
3. Release the SCL<sub>n</sub> line (low level to high level).
4. Detect a high level on the SCL<sub>n</sub> line and ensure the time set in ICBRH and the stop condition setup time elapse.
5. Release the SDA<sub>n</sub> line (low level to high level).
6. Ensure the time set in ICBRL and the bus free time elapse.
7. Clear the BBSY flag to 0 to release the bus mastership.

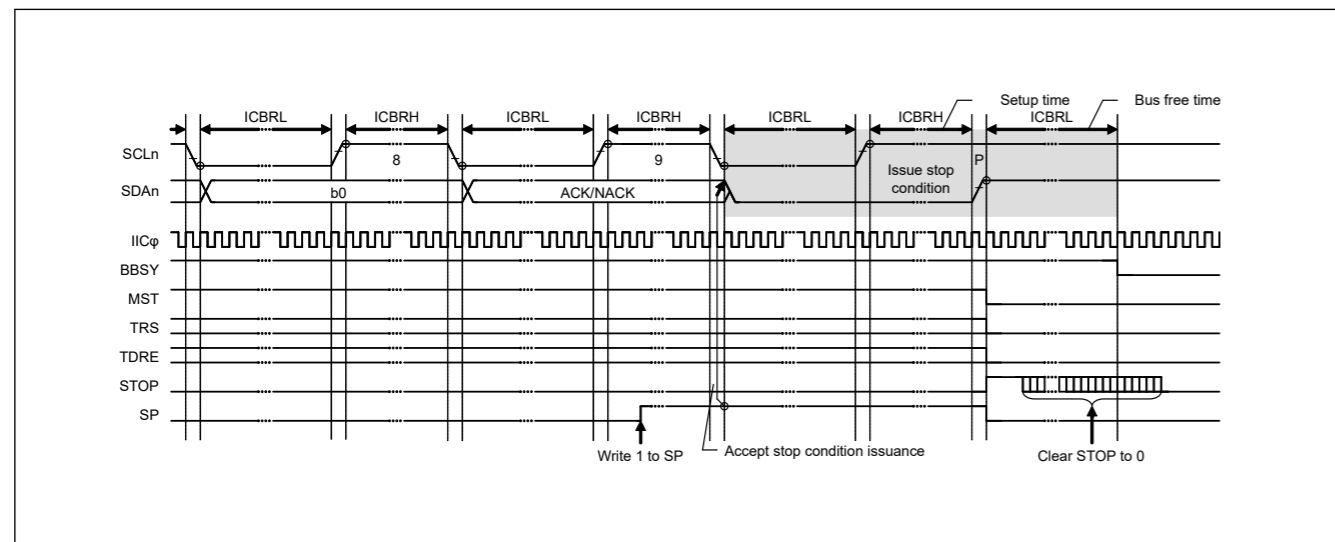

Figure 28.47 Stop condition issue timing using the SP bit

### 28.12 Bus Hanging

If the clock signals from the master and slave devices are out of synchronization because of noise or other factors, the I<sup>2</sup>C bus might hang with a fixed level on the SCL<sub>n</sub> line or SDA<sub>n</sub> line.

To manage bus hanging, the IIC has a timeout function to detect hanging by monitoring the SCL<sub>n</sub> line, and a function for outputting an extra SCL clock cycle to release the bus from:

- A timeout function to detect hanging by monitoring the SCL<sub>n</sub> line
- The IIC reset function
- An internal reset function.

By checking the SCLO, SDAO, SCLI, and SDAI bits in ICCR1, it is possible to see whether the IIC or its communicating partner is placing the low level on the SCL<sub>n</sub> or SDA<sub>n</sub> line.

#### 28.12.1 Timeout Function

The timeout function can detect when the SCL<sub>n</sub> line is stuck longer than the predetermined time. The IIC can detect an abnormal bus state by monitoring that the SCL<sub>n</sub> line is stuck low or high for a predetermined time.

The timeout function monitors the SCL<sub>n</sub> line state and counts the low- or high-level period using the internal counter. The timeout function resets the internal counter each time the SCL<sub>n</sub> line changes (rises or falls), but continues to count unless the SCL<sub>n</sub> line changes. If the internal counter overflows because no SCL<sub>n</sub> line changes, the IIC can detect the timeout and report the bus hung state.

### 28.11.3 发出停止条件

当ICCR2中的SP位设置为1时，IIC发出停止条件。当SP位设置为1时，发出停止条件请求，当ICCR2中的BBSY标志为1时，IIC发出停止条件（总线忙状态）并且ICCR2中的MST位为1（主模式）。

发出停止条件：

- 1.将SDAn线拉低（高电平转低电平）。
- 2.确保ICBRL中设置的SCLn线的低电平周期已过。
- 3.释放SCLn线（低电平到高电平）。
- 4.检测SCLn线上的高电平并确保ICBRH中设置的时间和停止条件设置时间已过。
- 5.释放SDAn线（低电平到高电平）。
- 6.确保ICBRL中设置的时间和巴士空闲时间已过。
- 7.将BBSY标志清为0以释放总线控制权。

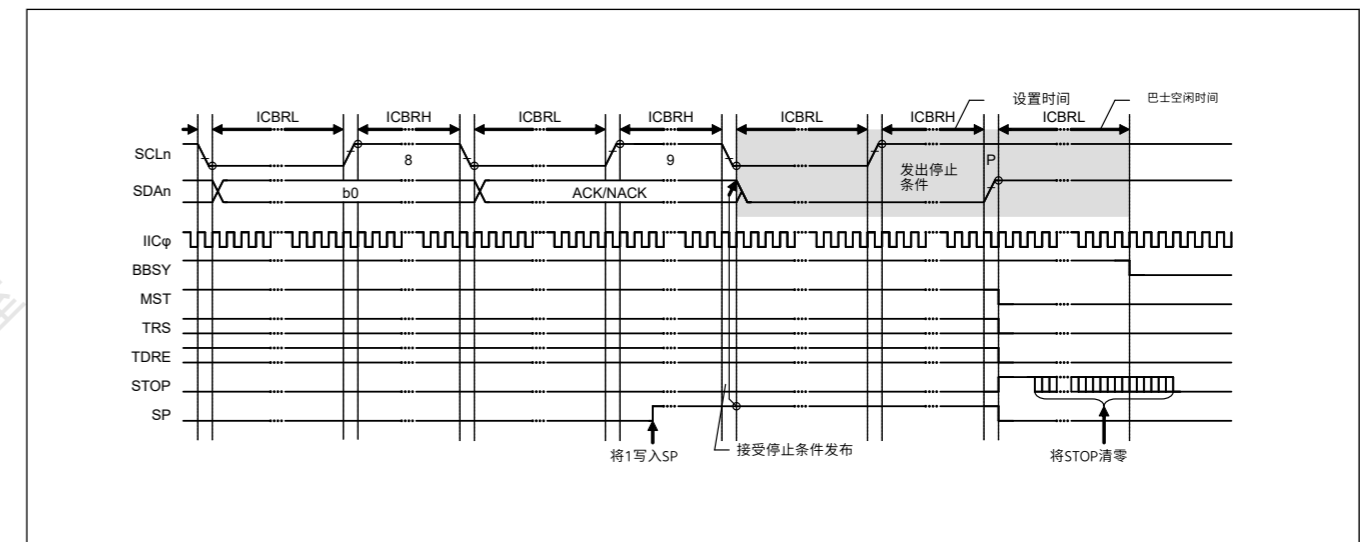

Figure 28.47 使用SP位的停止条件发出时序

### 28.12 巴士挂

如果来自主设备的时钟信号由于噪声或其他因素不同步，则I2C总线可能会在SCL<sub>n</sub>线或SDA<sub>n</sub>线上以固定电平挂起。

为了管理总线挂起，IIC具有通过监视SCL<sub>n</sub>线检测挂起的超时功能，以及输出额外SCL时钟周期以释放总线的功能：

- 通过监控SCL<sub>n</sub>线路来检测挂起的超时功能
- IIC复位功能
- 内部复位功能。

通过检查ICCR1中的SCLO、SDAO、SCLI和SDAI位，可以查看IIC或其通信伙伴是否将SCL<sub>n</sub>或SDA<sub>n</sub>线置于低电平。

#### 28.12.1 超时功能

超时功能可以检测SCL<sub>n</sub>线路何时卡住超过预定时间。IIC可以通过监视SCL<sub>n</sub>线在预定时间内保持低电平或高电平来检测异常总线状态。

超时功能监控SCL<sub>n</sub>线路状态并使用内部计数器计算低电平或高电平周期。每次SCL<sub>n</sub>线改变（上升或下降）时，超时功能都会复位内部计数器，但除非SCL<sub>n</sub>线改变，否则会继续计数。如果内部计数器因为SCL<sub>n</sub>线没有变化而溢出，IIC可以检测到超时并报告总线挂起状态。

This timeout function is enabled when the ICFER.TMOE bit is 1. It detects a hung state when the SCLn line is stuck low or high during the following conditions:

- The bus is busy (ICCR2.BBSY flag is 1) in master mode (ICCR2.MST bit is 1)
- The IIC slave address is detected (ICSR1 register is not 0x00) and the bus is busy (ICCR2.BBSY flag is 1) in slave mode (ICCR2.MST bit is 0)
- The bus is open (ICCR2.BBSY flag is 0) while a start condition is requested (ICCR2.ST bit is 1).

The internal counter of the timeout function uses the internal reference clock (IIC $\phi$ ) set in the CKS[2:0] bits in ICMR1 as a count source. It functions as a 16-bit counter when long mode is selected (TMOS bit = 0 in ICMR2) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCLn line level (low, high, or both levels) during which this counter is activated can be selected in the TMOH and TMOL bits in ICMR2. If both TMOL and TMOH bits are set to 0, the internal counter is disabled.

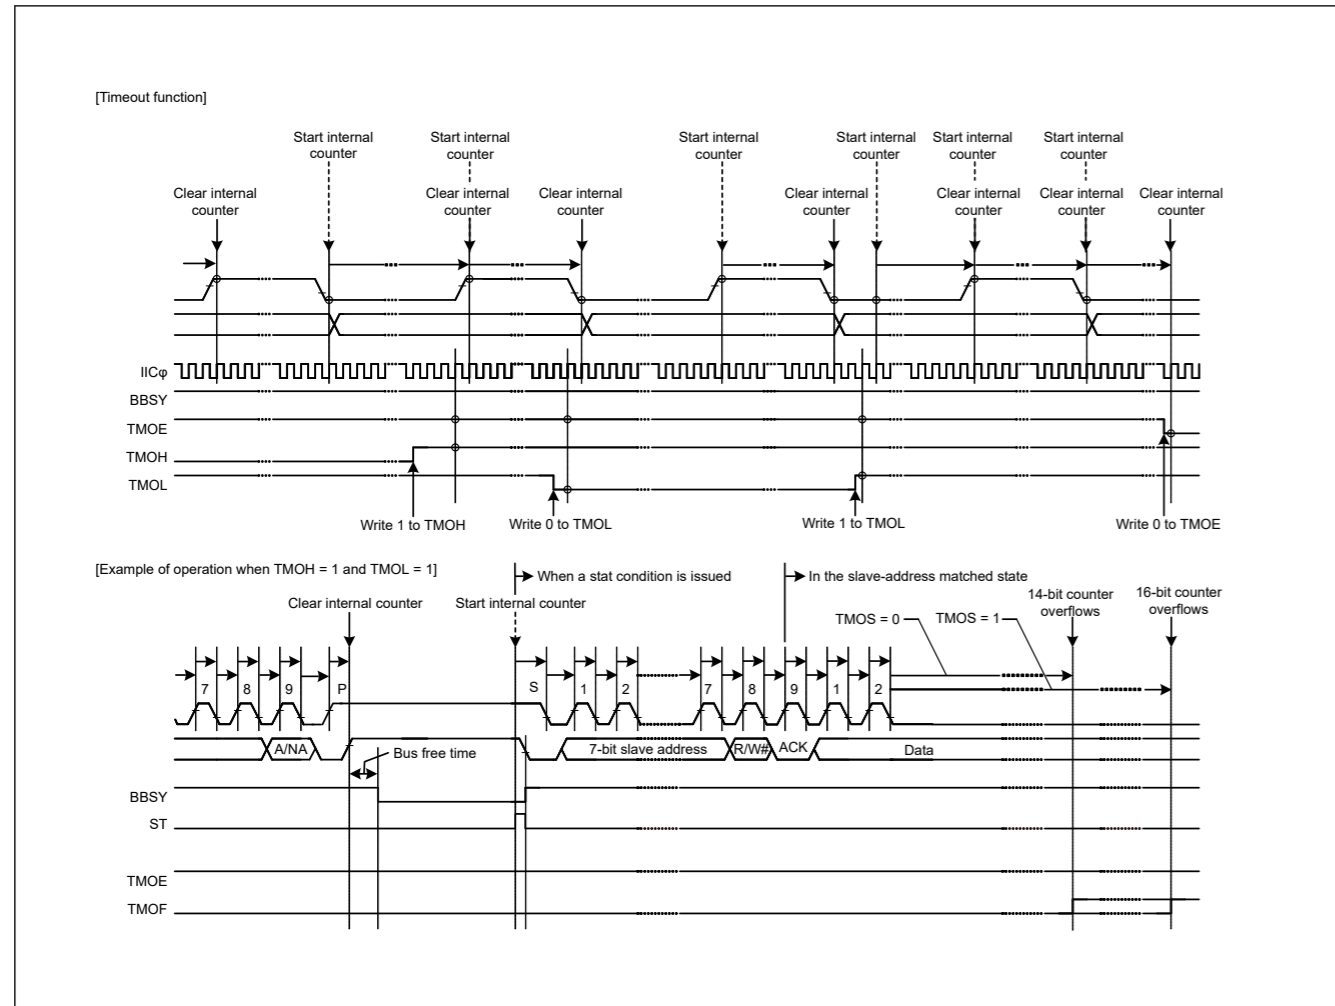

Figure 28.48 Timeout function using the TMOE, TMOS, TMOH, and TMOL bits

### 28.12.2 Extra SCL Clock Cycle Output Function

In master mode, this function outputs extra SCL clock cycles to release the SDAn line of the slave device from being held low because the master is out of synchronization with the slave device. This function is mainly used in master mode to release the SDAn line of the slave device from being fixed low by including extra cycles of SCL output from the IIC. It uses single cycles of the SCL clock for a bus error where the IIC cannot issue a stop condition because the slave device is holding the SDAn line at the low level. Do not use this function in normal situations. Using it when communications are proceeding correctly leads to malfunctions.

When the CLO bit in ICCR1 is set to 1 in master mode, a single cycle of the SCL clock at the frequency specified in the CKS[2:0] bits in ICMR1, and in the ICBRH and ICBRL registers, is output as an extra clock cycle. After output of this

此超时功能在ICFER.TMOE位为1时启用。在以下情况下，当SCLn线卡在低电平或高电平时，它会检测到挂起状态：

- 总线繁忙 (ICCR2.BBSY标志为1) 在主机模式 (ICCR2.MST位为1)
- 检测到IIC从机地址 (ICSR1寄存器不是0x00) 并且在从机模式下总线忙 (ICCR2.BBSY标志为1) (ICCR2.MST位为0)
- 请求启动条件时 (ICCR2.ST位为1)，总线打开 (ICCR2.BBSY标志为0)。

超时功能的内部计数器使用ICMR1的CKS[2:0]位中设置的内部参考时钟(IIC $\phi$ )作为计数源。It functions as a 16-bit counter when long mode is selected (TMOS bit = 0 in ICMR2) or a 14-bit counter when short mode is selected (TMOS bit = 1).

可以在TMOH和ICMR2中的TMOL位。如果TMOL和TMOH位都设置为0，则内部计数器被禁用。

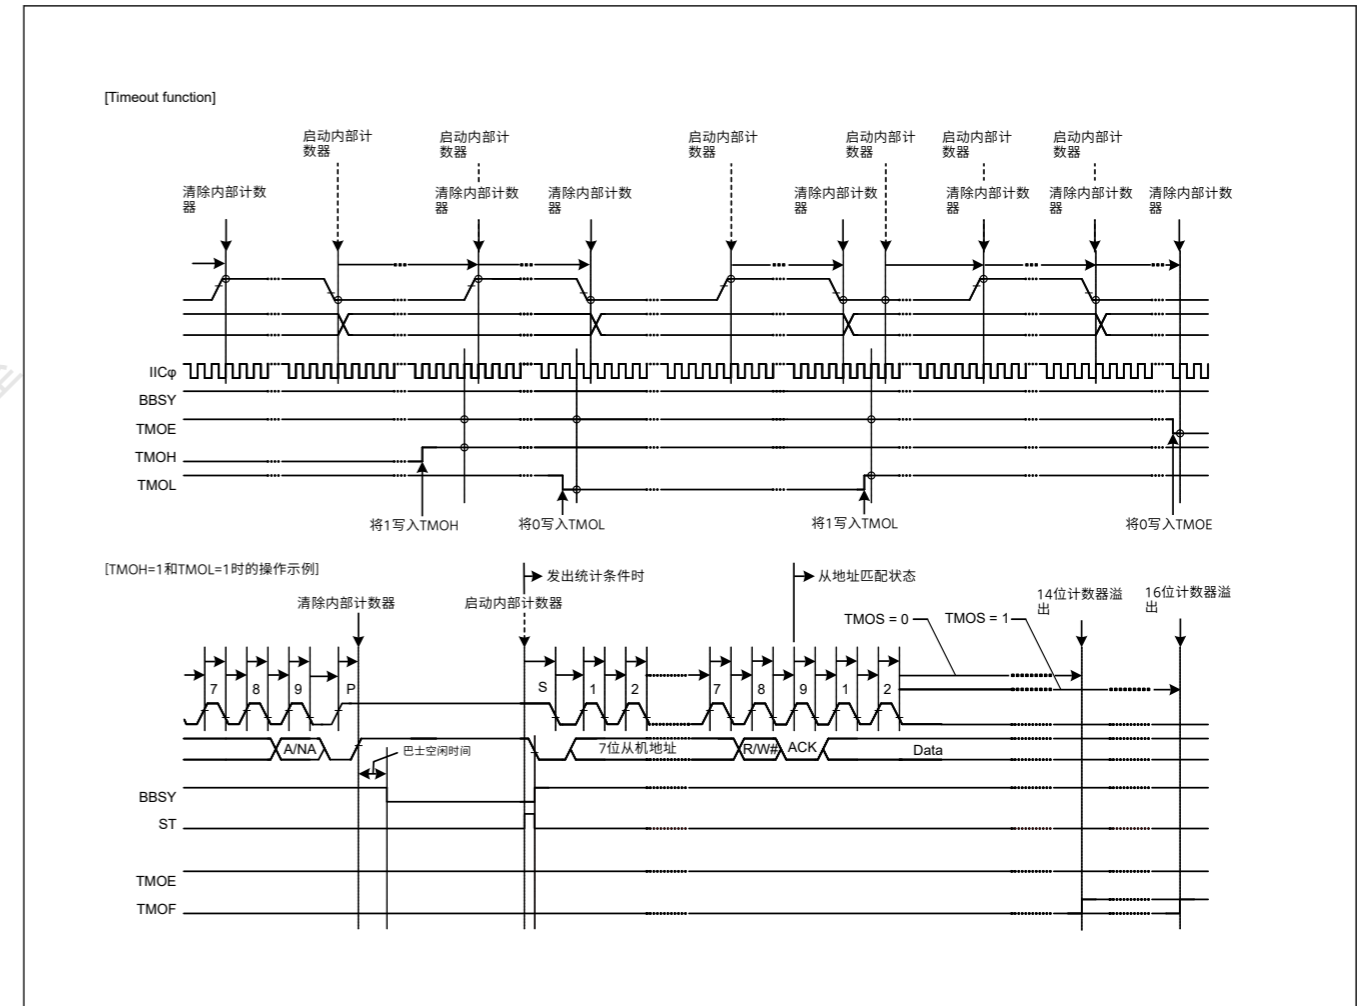

Figure 28.48 使用TMOE、TMOS、TMOH和TMOL位的超时功能

### 28.12.2 额外的SCL时钟周期输出功能

在主模式下，该函数输出额外的SCL时钟周期，以释放从设备的SDAn线保持低电平，因为主设备与从设备不同步。该功能主要用于主机模式，通过包含IIC的额外SCL输出周期来释放从机设备的SDAn线固定为低电平。它使用SCL时钟的单个周期来处理IIC无法发出停止条件的总线错误，因为从设备将SDAn线保持在低电平。在正常情况下不要使用此功能。在通信正常进行时使用它会导致故障。

当ICCR1中的CLO位在主机模式下设置为1时，以ICMR1中的CKS[2:0]位以及ICBRH和ICBRL寄存器中指定的频率的SCL时钟的单个周期作为额外输出输出时钟周期。这个输出后

single cycle of the SCL clock, the CLO bit is automatically set to 0. At this time, if ICCR2.BBSY = 1, the SCL pin goes low, and when ICCR2.BBSY = 0, the SCL pin goes high. After confirming that the CLO bit is 0 by software, write 1 to the CLO bit to output the additional clock continuously.

When the IIC module is in master mode and the slave device is holding the SDA<sub>n</sub> line low because synchronization with the slave device is lost because of effects like noise, the output of a stop condition is not possible. This function can be used to output extra cycles of SCL one by one to make the slave device release the SDA<sub>n</sub> line from being held low, and so recover the bus from an unusable state. Release of the SDA<sub>n</sub> line by the slave device can be monitored by reading the SDAI bit in ICCR1. After confirming the release of the SDA<sub>n</sub> line by the slave device, complete communications by reissuing the stop condition.

[Output conditions for using the CLO bit in ICCR1]

- When the bus is open (BBSY flag in ICCR2 = 0) or in master mode (MST bit = 1 and BBSY flag = 1 in ICCR2)
- When the communication device does not hold the SCL<sub>n</sub> line low.

Figure 28.49 shows the operation timing of the extra SCL clock cycle output function (CLO bit).

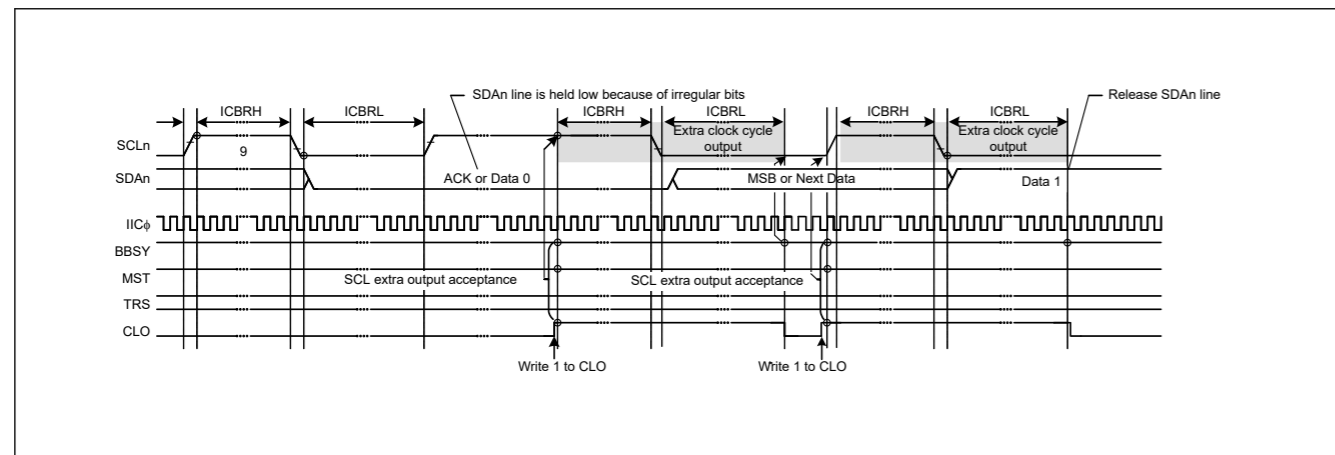

Figure 28.49 Extra SCL clock cycle output function using the CLO bit

### 28.12.3 IIC Reset and Internal Reset

The IIC module incorporates a function for resetting itself. It uses two types of resets:

- An IIC reset, which initializes all registers, including the BBSY flag in ICCR2.
- An internal reset, which releases the IIC from the slave-address matched state and initializes the internal counter while saving other settings.

After issuing a reset, always set the IICRST bit in ICCR1 to 0. Both types of resets are valid for release from bus-hung states, because both restore the output state of the SCL<sub>n</sub> and SDA<sub>n</sub> pins to the high-impedance state.

Issuing a reset during slave operation might lead to a loss of synchronization between the master device clock and the slave device clock, so avoid this when possible. In addition, monitoring of the bus state, such as for the presence of a start condition, is not possible during an IIC reset (ICE and IICRST bits = 01b in ICCR1).

For a detailed description of the IIC and internal resets, see [section 28.15. State of Registers When Issuing Each Condition](#).

### 28.13 SMBus Operation

The IIC supports data communication conforming to the SMBus Specification (version 2.0). To perform SMBus communication, set the SMBS bit in ICMR3 to 1. To use the transfer rate within a range of 10 to 100 kbps of the SMBus standard, set the CKS[2:0] bits in ICMR1, the ICBRH, and ICBRL registers. In addition, specify the values in the DLCS bit in ICMR2 and the SDDL[2:0] bits in ICMR2 to meet the data hold time specification of 300 ns or more. When the IIC is used only as a slave device, the transfer rate setting is not required, but ICBRL must be set to a value longer than the data setup time (250 ns).

For the SMBus device default address (1100 001b), use one of the slave address registers L0 to L2 (SARL0, SARL1, and SARL2), and set the associated FS bit (7- or 10-bit address format select) in SARU<sub>y</sub> (y = 0 to 2) to 0 (7-bit address format).

在SCL时钟的一个周期内，CLO位自动设置为0。此时，如果ICCR2.BBSY=1，SCL引脚变为低电平，当ICCR2.BBSY=0时，SCL引脚变为高电平。通过软件确认CLO位为0后，向CLO位写入1以连续输出附加时钟。

当IIC模块处于主模式且从设备保持SDA<sub>n</sub>线为低电平时，由于噪声等影响与从设备失去同步，因此无法输出停止条件。该功能可用于逐个输出额外的SCL周期，使从设备释放SDA<sub>n</sub>线的低电平状态，从而将总线从不可用状态恢复。从设备释放SDA<sub>n</sub>线可以通过读取ICCR1中的SDAI位来监控。从设备确认SDA<sub>n</sub>线的释放后，通过重新发出停止条件完成通信。

[使用ICCR1中CLO位的输出条件]

- 当总线打开（ICCR2中的BBSY标志=0）或主机模式（ICCR2中的MST位=1和BBSY标志=1）时
- 当通信设备不保持SCL<sub>n</sub>线为低电平时。

图28.49显示了额外SCL时钟周期输出功能（CLO位）的操作时序。

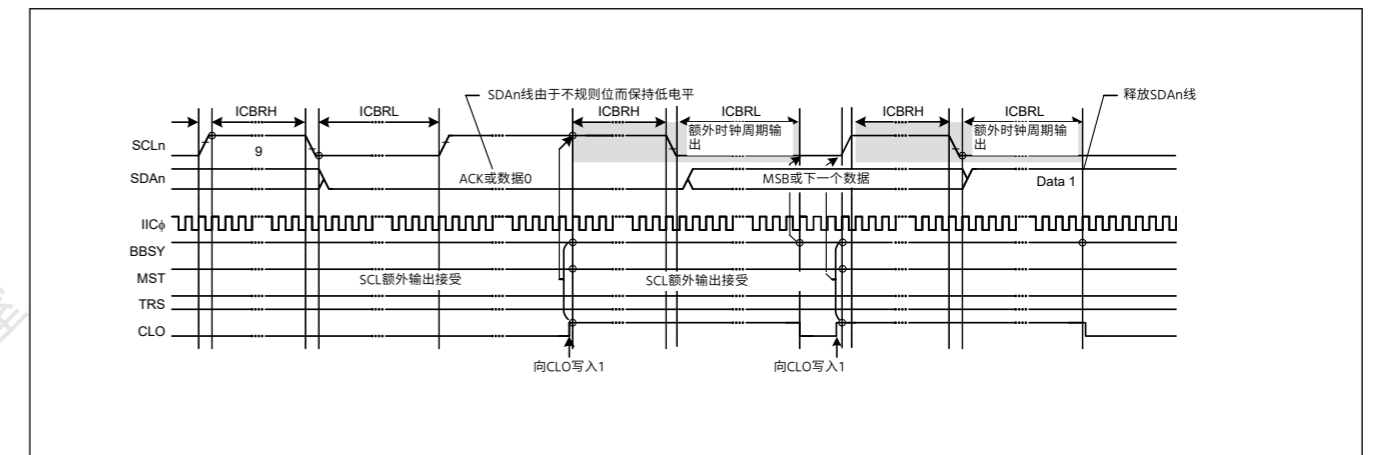

Figure 28.49 使用CLO位的额外SCL时钟周期输出功能

### 28.12.3 IIC复位和内部复位

IIC模块包含一个自我复位功能。它使用两种类型的重置：

- IIC复位，初始化所有寄存器，包括ICCR2中的BBSY标志。
- 内部复位，将IIC从从地址匹配状态释放并初始化内部计数器，同时保存其他设置。

发出复位后，始终将ICCR1中的IICRST位设置为0。两种类型的复位都对从总线挂起状态释放有效，因为两者都将SCL<sub>n</sub>和SDA<sub>n</sub>引脚的输出状态恢复为高阻状态。

在从机操作期间发出复位可能会导致主设备时钟和从设备时钟之间失去同步，因此请尽可能避免这种情况。此外，在IIC复位（ICE和IICRST位=ICCR1中的01b）期间无法监控总线状态，例如是否存在启动条件。

有关IIC和内部复位的详细说明，请参见第28.15节。发出每个条件时的寄存器状态。

### 28.13 SMBus Operation

IIC支持符合SMBus规范（2.0版）的数据通信。要执行SMBus通信，请将ICMR3中的SMBS位设置为1。要使用SMBus标准的10至100kbps范围内的传输速率，请设置ICMR1、ICBRH和ICBRL寄存器中的CKS[2:0]位。此外，请指定ICMR2中的DLCS位和ICMR2中的SDDL[2:0]位中的值，以满足300ns或更长的数据保持时间规范。当IIC仅用作从设备时，不需要设置传输速率，但必须将ICBRL设置为比数据建立时间（250ns）更长的值。

对于SMBus器件默认地址(1100001b)，使用从地址寄存器L0到L2之一（SARL0、SARL1和SARL2），并将SARU<sub>y</sub>(y=0到2)中相关的FS位（7位或10位地址格式选择）设置为0（7位地址格式）。

When transmitting the UDID (Unique Device Identifier), set the SALE bit in ICFER to 1 to enable the slave arbitration-lost detection function.

### 28.13.1 SMBus Timeout Measurement

#### (1) Measuring slave device timeout

The following period (timeout interval:  $T_{LOW:SEXT}$ ) must be measured for slave devices in SMBus communication:

- From start condition to stop condition.

To measure timeout for slave devices, measure the period from start condition detection to stop condition detection with the GPT using the IIC start condition detection interrupt (STIn) and stop condition detection interrupt (SPIn). The measured timeout period must be within the total clock low-level period [slave device]  $T_{LOW:SEXT}$ : 25 ms (maximum) of the SMBus standard.

If the time measured with the GPT exceeds the clock low-level detection timeout  $T_{TIMEOUT}$ : 25 ms (minimum) of the SMBus standard, the slave device must release the bus by writing 1 to the IICRST bit in ICCR1 to issue an internal reset of the IIC. When an internal reset is issued, the IIC stops driving the bus for the SCLn and SDA n pins, making them output high-impedance, which releases the bus.

#### (2) Measuring master device timeout

The following periods (timeout interval:  $T_{LOW:MEXT}$ ) must be measured for master devices in SMBus communication:

- From start condition to acknowledge bit
- Between acknowledge bits
- From acknowledge bit to stop condition.

To measure timeout for master devices, measure these periods with the GPT using the IIC start condition detection interrupt (STIn), stop condition detection interrupt (SPIn), transmit end interrupt (IICn\_TEI), or receive data full interrupt (IICn\_RXI). The measured timeout period must be within the total clock low-level extended period (master device)  $T_{LOW:MEXT}$ : 10 ms (maximum) of the SMBus standard, and the total of all  $T_{LOW:MEXT}$  values from start condition to stop condition must be within  $T_{LOW:SEXT}$ : 25 ms (maximum).

For the ACK receive timing (rising edge of the 9th SCL clock cycle), monitor the TEND flag in ICSR2 in master transmit mode (master transmitter) and the RDRF flag in ICSR2 in master receive mode (master receiver). Perform byte-wise transmit operations in master transmit mode, and hold the RDRFS bit in ICMR3 at 0 until the byte immediately before reception of the final byte in master receive mode. While the RDRFS bit is 0, the RDRF flag is set to 1 on the rising edge of the 9th SCL clock cycle.

If the period measured with the GPT exceeds the total clock low-level extended period (master device)  $T_{LOW:MEXT}$ : 10 ms (maximum) of the SMBus standard or the total of measured periods exceeds the clock low-level detection timeout  $T_{TIMEOUT}$ : 25 ms (minimum) of the SMBus standard, the master device must stop the transaction by issuing a stop condition. In master transmit mode, immediately stop the transmit operation (stop writing data to ICDRT).

发送UDID (UniqueDeviceIdentifier) 时, 将ICFER中的SALE位设置为1, 以能从机仲裁丢失检测功能。

### 28.13.1 SMBus超时测量

#### (1) 测量从设备超时

对于SMBus通信中的从设备, 必须测量以下周期 (超时间隔:  $T_{LOW:SEXT}$ ):

- 从开始条件到停止条件。

要测量从设备的超时, 请使用GPT使用IIC启动条件检测中断(STIn)和停止条件检测中断(SPIn)测量从启动条件检测到停止条件检测的周期。测得的超时周期必须在总时钟低电平周期[从设备] $T_{LOW:SEXT}$ :SMBus标准的25ms (最大值) 内。

如果用GPT测量的时间超过时钟低电平检测超时 $T_{TIMEOUT}$ :25ms (最小值) SMBus标准, 从设备必须通过向ICCR1中的IICRST位写入1来释放总线, 以发出IIC的内部复位。当发出内部复位时, IIC停止驱动SCLn和SDAn引脚的总线, 使它们输出高阻抗, 从而释放总线。

#### (2) 测量主设备超时

对于SMBus通信中的主设备, 必须测量以下周期 (超时间隔:  $T_{LOW:MEXT}$ ):

- 从开始条件到确认位
- 确认位之间
- 从确认位到停止条件。

要测量主设备的超时, 请使用GPT使用IIC开始条件检测中断(STIn)、停止条件检测中断(SPIn)、发送结束中断(IICn\_TEI)或接收数据完整中断(IICn\_RXI)来测量这些周期。测量的超时周期必须在总时钟低电平扩展周期 (主设备)  $T_{LOW:MEXT}$ : 10ms (最大值) 内。

$T_{LOW:MEXT}$ : SMBus标准的10毫秒 (最大值), 从开始条件到停止条件的所有 $T_{LOW:MEXT}$ 值的总和必须在 $T_{LOW:SEXT}$ : 25毫秒 (最大值) 内。

对于ACK接收时序 (第9个SCL时钟周期的上升沿), 在主机发送模式 (主机发送器) 下监控ICSR2中的TEND标志, 在主机接收模式 (主机接收器) 下监控ICSR2中的RDRF标志。在主机发送模式下执行逐字节发送操作, 并将ICMR3中的RDRFS位保持为0, 直到在主机接收模式下接收到最后一个字节之前的字节。当RDRFS位为0时, RDRF标志在第9个SCL时钟周期的上升沿设置为1。

如果用GPT测量的周期超过总时钟低电平延长周期 (主设备)  $T_{LOW:MEXT}$ :SMBus标准的10ms (最大值) 或总测量周期超过时钟低电平检测超时 $T_{TIMEOUT}$ : SMBus标准的25ms (最小值), 主设备必须通过发出停止条件来停止事务。在主机发送模式下, 立即停止发送操作 (停止向ICDRT写入数据)。

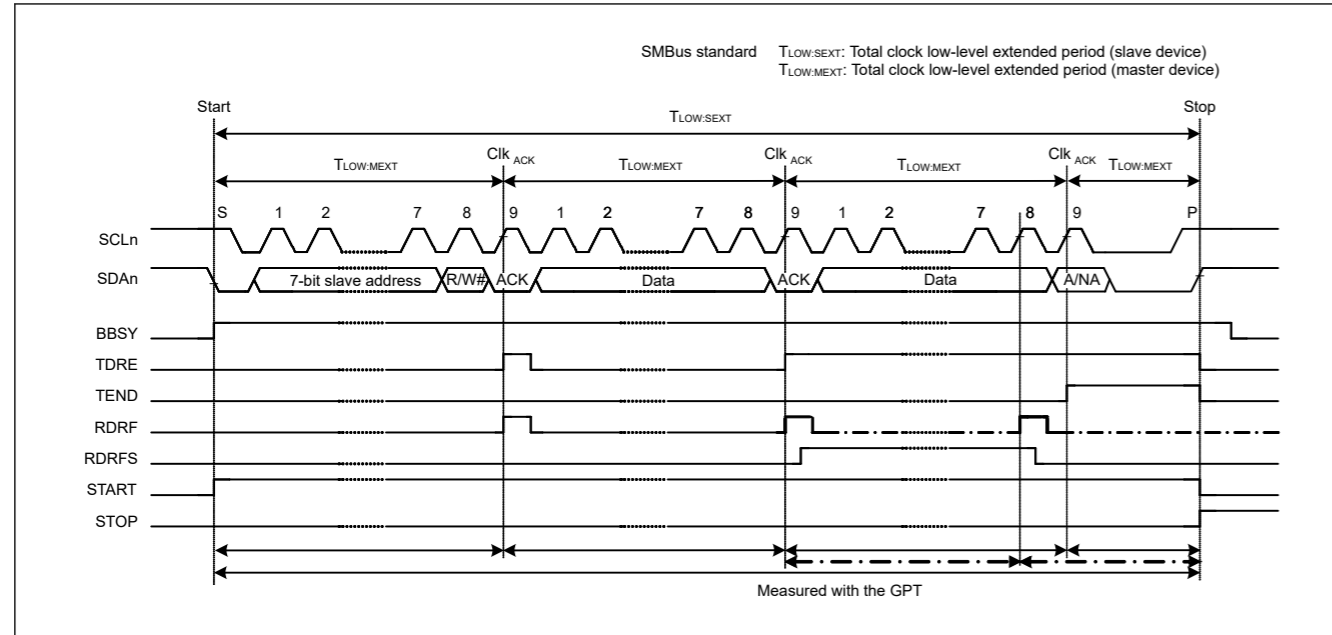

Figure 28.50 SMBus timeout measurement

### 28.13.2 Packet Error Code (PEC)

The MCU provides a CRC calculator that enables transmission of a Packet Error Code (PEC) or allows checking of the received data in SMBus data communication for the IIC. For the CRC-generating polynomials of the CRC calculator, see [section 34, Cyclic Redundancy Check \(CRC\) Calculator](#).

In master transmit mode, the PEC data can be generated by writing all transmit data to the CRC Data Input Register (CRCDIR) in the CRC calculator.

In master receive mode, the PEC data can be checked by writing all receive data to CRCDIR in the CRC calculator and comparing the obtained value in the CRC Data Output Register (CRCDOR) with the received PEC data.

To send ACK or NACK based on the match or mismatch result when the final byte is received as a result of the PEC code check, set the RDRFS bit in ICMR3 to 1 before the rising edge of the 8th SCL clock cycle during reception of the final byte, and hold the SCLn line low on the falling edge of the 8th clock cycle.

### 28.13.3 SMBus Host Notification Protocol (Notify ARP Master Command)

In communicating over an SMBus, a slave device can temporarily act as a master device to notify the SMBus host (or ARP master) of its own slave address, or to request its own slave address from the SMBus host.

For a product using the MCU to operate as an SMBus host or ARP master, the host address (0001 000b) sent from the slave device must be detected as a slave address, and so the IIC provides a function for detecting the host address. To detect the host address as a slave address, set the SMBS bit in ICMR3 and the HOAE bit in ICSEB to 1. Operation after the host address is detected is the same as normal slave operation.

## 28.14 Interrupt Sources

The IIC issues five types of interrupt requests:

- Transfer error or event generation (arbitration-lost, NACK detection, timeout detection, start condition detection, and stop condition detection)
- Receive data full
- Transmit data empty
- Transmit end
- Address match during wakeup function

[Table 28.10](#) lists details about the interrupt requests. The receive data full and transmit data empty interrupts can activate data transfer by the DTC or DMAC.

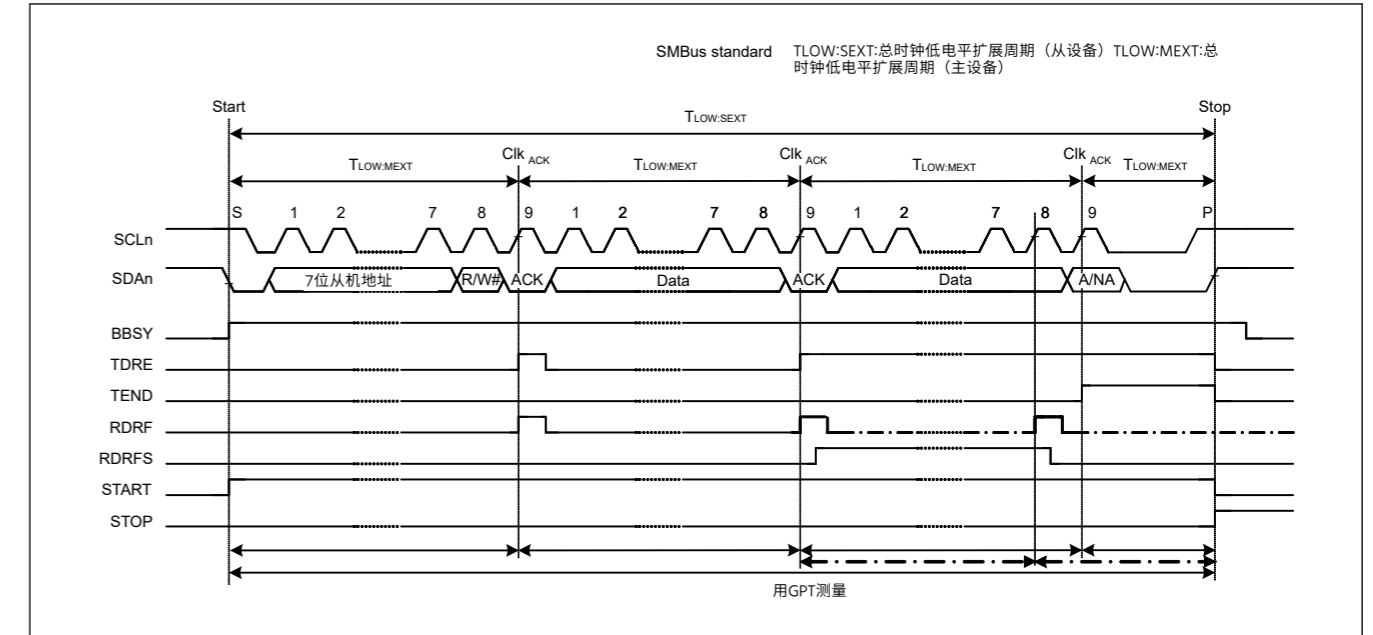

Figure 28.50 SMBus超时测量

### 28.13.2 数据包错误代码(PEC)

MCU提供了一个CRC计算器，可以传输数据包错误代码(PEC)或检查IIC的SMBus数据通信中接收到的数据。有关CRC计算器的CRC生成多项式，请参阅第34节，循环冗余校验(CRC)计算器。

在主机发送模式下，可以通过将所有发送数据写入CRC计算器中的CRC数据输入寄存器(CRCDIR)来生成PEC数据。

在主机接收模式下，可以通过将所有接收数据写入CRC计算器中的CRCDIR并将获得的CRC数据输出寄存器(CRCDOR)中的值与接收到的PEC数据进行比较来检查PEC数据。

当作为PEC代码检查的结果接收到最后一个字节时，要根据匹配或不匹配结果发送ACK或NACK，请在接收最后一个字节期间的第8个SCL时钟周期的上升沿之前将ICMR3中的RDRFS位设置为1字节，并在第8个时钟周期的下降沿保持SCLn线为低电平。

### 28.13.3 SMBus主机通知协议（通知ARP主机命令）

在通过SMBus进行通信时，从设备可以临时充当主设备来通知SMBus主机（或ARP主机）它自己的从地址，或者从SMBus主机请求它自己的从地址。

对于使用MCU作为SMBus主机或ARP主机的产品，从机发送的主机地址（0001000b）必须被检测为从机地址，因此IIC提供了主机地址检测功能。要将主机地址检测为从机地址，请将ICMR3中的SMBS位和ICSEB中的HOAE位设置为1。检测到主机地址后的操作与正常从机操作相同。

## 28.14 中断源

IIC发出五种类型的中断请求：

- 传输错误或事件发生（仲裁丢失、NACK检测、超时检测、开始条件检测和停止条件检测）
- 接收数据已满
- 传输数据为空
- 发送端
- 唤醒功能期间的地址匹配

表28.10列出了有关中断请求的详细信息。接收数据满和发送数据空中断可以通过DTC或DMAC激活数据传输。

Table 28.10 Interrupt sources

| Symbol                    | Interrupt source                           | Interrupt flag | DTC or DMAC activation | Interrupt condition  |
|---------------------------|--|----------------|------------------------|--|
| IICn_EEI <sup>*5</sup>    | Transfer error or event occurrence         | AL             | Not possible           | AL = 1, ALIE = 1   |
|                           |  | NACKF          |                        | NACKF = 1, NAKIE = 1   |
|                           |  | TMOF           |                        | TMOF = 1, TMOIE = 1  |
|                           |  | START          |                        | START = 1, STIE = 1  |
|                           |  | STOP           |                        | STOP = 1, SPIE = 1   |
| IICn_RXI <sup>*2 *5</sup> | Receive data full                          | RDRF           | Possible               | RDRF = 1, RIE = 1  |
| IICn_TXI <sup>*1 *5</sup> | Transmit data empty                        | RDRF           | Possible               | TDRE = 1, TIE = 1  |
| IICn_TEI <sup>*3 *5</sup> | Transmit end                               | TEND           | Not possible           | TEND = 1, TEIE = 1   |
| IIC0_WUI <sup>*4</sup>    | Slave address match during wakeup function | WUF            | Not possible           | Slave address match<br>Slave receive complete<br>RWAK operation ASY0 = 1<br>WUIE = 1 |

Note: There is a delay between the execution of a write instruction for a peripheral module by the CPU and the actual writing to the module. When an interrupt flag is cleared or masked, read the relevant flag again to check whether clearing or masking is complete, then return from interrupt handling. Not doing so creates the possibility of repeated processing of the same interrupt.

Note 1. Because IICn\_TXI is edge-detected, it does not require clearing. Additionally, the TDRE flag in ICSR2 (condition for IICn\_TXI) is automatically set to 0 when transmit data is written to the ICDRT register or a stop condition is detected (STOP flag = 1 in ICSR2).

Note 2. Because IICn\_RXI is edge-detected, it does not require clearing. Additionally, the RDRF flag in ICSR2 (condition for IICn\_RXI) is automatically set to 0 when data is read from ICDRR.

Note 3. When using the IICn\_TEI interrupt, clear the TEND flag in ICSR2 in the IICn\_TEI interrupt handling. The TEND flag in ICSR2 automatically is set to 0 when transmit data is written to the ICDRT register or a stop condition is detected (STOP flag = 1 in ICSR2).

Note 4. Only channel 0 has a wakeup function, so IIC0\_WUI is for channel 0 only.

Note 5. Channel number (n = 0, 1).

Clear or mask each flag during interrupt handling.

### 28.14.1 Buffer Operation for IICn\_TXI and IICn\_RXI Interrupts

If the conditions for generating an IICn\_TXI or IICn\_RXI interrupt are satisfied while the associated IR flag is 1, the interrupt request is not output for the ICU but is saved internally. One request per source can be saved internally.

An interrupt request that is saved in the ICU is output when the ICU.IELSRn.IR flag becomes 0. Internally saved interrupt requests are automatically cleared under normal conditions. They can also be cleared by writing 0 to the interrupt enable bit within the associated peripheral module.

### 28.15 State of Registers When Issuing Each Condition

The IIC has two dedicated resets, IIC reset and Internal reset. Table 28.11 lists the registers states when issuing each condition.

Table 28.11 Register states when issuing each condition (1 of 2)

| Registers | Reset       | IIC reset (ICE = 0, IICRST = 1) | Internal reset (ICE = 1, IICRST = 1) | Start or restart condition detection | Stop condition detection |          |
|-----------|-------------|---------------------------------|--------------------------------------|--------------------------------------|--------------------------|----------|
| ICCR1     | ICE, IICRST | In reset                        | Saved                                | Saved                                | Saved                    |          |
|           | SCLO, SDAO  | In reset                        | In reset                             |                                      |                          |          |
|           | Others      |                                 | Saved                                |                                      |                          |          |
| ICCR2     | BBSY        | In reset                        | In reset                             | Set                                  | In reset                 |          |
|           | ST, RS      |                                 |                                      | In reset                             | Saved                    |          |
|           | SP          |                                 |                                      |                                      | Set or saved             | In reset |
|           | TRS         |                                 |                                      | In reset                             |                          | Saved    |
|           | MST         |                                 |                                      |                                      |                          | Saved    |

Table 28.10 中断源

| Symbol                    | 中断源           | 中断标志  | DTC或DMAC激活 | 中断条件   |
|---------------------------|---------------|-------|------------|--|
| IICn_EEI <sup>*5</sup>    | 传输错误或事件发生     | AL    | 不可能        | AL = 1, ALIE = 1                                       |

|                           |               | STOP  |            | STOP = 1, SPIE = 1                                     |
| IICn_RXI <sup>*2 *5</sup> | 接收数据已满        | RDRF  | Possible   | RDRF = 1, RIE = 1                                      |
| IICn_TXI <sup>*1 *5</sup> | 传输数据为空        | RDRF  | Possible   | TDRE = 1, TIE = 1                                      |
| IICn_TEI <sup>*3 *5</sup> | 发射端           | TEND  | 不可能        | TEND = 1, TEIE = 1                                     |
| IIC0_WUI <sup>*4</sup>    | 唤醒功能期间的从机地址匹配 | WUF   | 不可能        | 从地址匹配<br>从机接收完成<br>RWAK operation ASY0 = 1<br>WUIE = 1 |

Note: CPU执行外围模块的写指令与实际写入模块之间存在延迟。当一个中断标志被清除或屏蔽时，再次读取相关标志，检查清除或屏蔽是否完成，然后从中断处理返回。不这样做会产生重复处理同一中断的可能性。

注1.因为IICn\_TXI是边沿检测，所以不需要清零。此外，当发送数据写入ICDRT寄存器或检测到停止条件（ICSR2中的STOP标志=1）时，ICSR2中的TDRE标志（IICn\_TXI的条件）自动设置为0。

注2.因为IICn\_RXI是边沿检测，所以不需要清零。此外，从ICDRR读取数据时，ICSR2中的RDRF标志（IICn\_RXI的条件）自动设置为0。

注3.使用IICn\_TEI中断时，在IICn\_TEI中断处理中清除ICSR2中的TEND标志。当发送数据写入ICDRT寄存器或检测到停止条件（ICSR2中的STOP标志=1）时，ICSR2中的TEND标志自动设置为0。

注4.只有通道0有唤醒功能，所以IIC0\_WUI仅适用于通道0。

注5.通道编号(n=0 1)。

在中断处理期间清除或屏蔽每个标志。

### 28.14.1 IICn\_TXI和IICn\_RXI中断的缓冲区操作

如果在相关的IR标志为1时满足产生IICn\_TXI或IICn\_RXI中断的条件，则中断请求不会输出给ICU，而是在内部保存。每个源的一个请求可以在内部保存。

当ICU.IELSRn.IR标志变为0时，输出ICU中保存的中断请求。在正常情况下，内部保存的中断请求会自动清除。它们也可以通过向相关外围模块中的中断使能位写入0来清除。

### 28.15 发布每个条件时的寄存器状态

IIC有两个专用复位，IIC复位和内部复位。表28.11列出了发出每个条件时的寄存器状态。

Table 28.11 发出每个条件时注册状态 (2个中的1个)

| Registers | Reset       | IIC reset (ICE = 0, IICRST = 1) | 内部复位 (ICE=1, IICRST=1) | 启动或重启条件检测 | 停止条件检测 |          |       |          |

## 28.16 Event Link Output

The IIC0 module handles the event output for the Event Link Controller (ELC) for the following sources:

### (1) Transfer error event

When a transfer error event occurs, the associated event signal can be output to another module by the ELC.

### (2) Receive data full

When a receive data register becomes full, the associated event signal can be output to another module by the ELC.

### (3) Transmit data empty

When a transmit data register becomes empty, the associated event signal can be output to another module by the ELC.

### (4) Transmit end

On completion of the transfer, the associated event signal can be output to another module by the ELC.

## 28.16.1 Interrupt Handling and Event Linking

Each of the IIC interrupt types (see Table 28.10) has an enable bit to control enabling and disabling of the associated interrupt signal. An interrupt request signal is output to the CPU when an interrupt source condition is satisfied while the associated enable bit is set.

Table 28.11 发布每个条件时注册状态 (2个中的2个)

| Registers                                  | Reset   | IIC reset<br>(ICE = 0, IICRST = 1) | 内部复位 (ICE=1, IICRST=1) | 启动或重启条件检测 | 停止条件检测    |

## 28.16 事件链接输出

IIC0模块为以下源处理事件链接控制器(ELC)的事件输出:

### (1) 传输错误事件

当发生传输错误事件时, ELC可以将相关事件信号输出到另一个模块。

### (2) 接收数据已满

当接收数据寄存器变满时, ELC可以将相关的事件信号输出到另一个模块。

### (3) 传输数据为空

当发送数据寄存器变为空时, ELC可以将相关的事件信号输出到另一个模块。

### (4) 发射端

传输完成后, ELC可以将相关的事件信号输出到另一个模块。

## 28.16.1 中断处理和事件链接

每种IIC中断类型(见表28.10)都有一个启用位来控制相关中断信号的启用和禁用。当相关的使能位设置时, 中断源条件成立时, 将向CPU输出中断请求信号。

The associated event link output signals are sent to other modules as event signals by the ELC when the interrupt source conditions are satisfied, regardless of the interrupt enable bit settings. For details on interrupt sources, see [Table 28.10](#).

## 28.17 Usage Notes

### 28.17.1 Settings for the Module-Stop Function

The Module Stop Control Register B (MSTPCRB) can enable or disable IIC operation. The IIC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

### 28.17.2 Notes on Starting Transfer

If the IR flag associated with the IIC interrupt is 1 when transfer is started (ICCR1.ICE bit = 1), follow the procedure in this section to clear the interrupts before enabling operations. Starting transfer with the IR flag set to 1 while the ICCR1.ICE bit is 1 leads to an interrupt request being internally saved after transfer starts, and this can lead to unexpected behavior of the IR flag.

To clear interrupts before starting transfer operation:

1. Confirm that the ICCR1.ICE bit is 0.
2. Set the relevant interrupt enable bits, such as ICIER.TIE to 0.
3. Read the relevant interrupt enable bits, such as ICIER.TIE, and confirm that the value is 0.
4. Set the IR flag to 0.

当满足中断源条件时，ELC将关联的事件链接输出信号作为事件信号发送到其他模块，而不管中断使能位设置如何。有关中断源的详细信息，请参见表28.10。

## 28.17 使用说明

### 28.17.1 模块停止功能的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用IIC操作。IIC在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

### 28.17.2 开始转移注意事项

如果在传输开始时与IIC中断相关的IR标志为1（ICCR1.ICE位=1），请按照本节中的步骤在使能操作之前清除中断。在ICCR1.ICE位为1时将IR标志设置为1开始传输会导致在传输开始后内部保存中断请求，这可能导致IR标志的意外行为。

在开始传输操作之前清除中断：

- 1.确认ICCR1.ICE位为0。
- 2.设置相关的中断使能位，如ICIER.TIE为0。
- 3、读取相关的中断使能位，如ICIER.TIE，确认值为0。
- 4.将IR标志设置为0。

## 29. Controller Area Network (CAN) Module

### 29.1 Overview

The Controller Area Network (CAN) module uses a message-based protocol to receive and transmit data between multiple slaves and masters in electromagnetically noisy applications. The module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported. The CAN module requires an additional external CAN transceiver.

Table 29.1 lists the CAN specifications and Figure 29.1 shows a block diagram.

**Table 29.1 CAN specifications (1 of 2)**

| Parameter                            | Specifications   |
|--------------------------------------|--|
| Data transfer rate                   | ISO11898-1-compliant for standard and extended frames  |
| Bit rate                             | Data transfer rate programmable up to 1 Mbps (fCAN ≥ 8 MHz)<br>fCAN: CAN clock source  |
| Message box                          | 32 mailboxes, with two selectable mailbox modes <ul style="list-style-type: none"> <li>Normal mode: 32 mailboxes independently configurable for either transmission or reception</li> <li>FIFO mode: 24 mailboxes independently configurable for either transmission or reception, with remaining mailboxes used for receive (RX) and transmit (TX) 4-stage FIFOs</li> </ul>   |
| Reception                            | <ul style="list-style-type: none"> <li>Support for data frame and remote frame reception</li> <li>Reception ID format selectable to only standard ID, only extended ID, or mixed IDs</li> <li>Programmable one-shot reception function</li> <li>Selectable between overwrite mode (unread message overwritten) and overrun mode (unread message saved)</li> <li>Reception complete interrupt independently enabled or disabled for each mailbox</li> </ul>   |
| Acceptance filter                    | <ul style="list-style-type: none"> <li>Eight acceptance masks (one for every four mailboxes)</li> <li>Masks independently enabled or disabled for each mailbox</li> </ul>  |
| Transmission                         | <ul style="list-style-type: none"> <li>Support for data frame and remote frame transmission</li> <li>Transmission ID format selectable to only standard ID, only extended ID, or mixed IDs</li> <li>Programmable one-shot transmission function</li> <li>Broadcast messaging function</li> <li>Priority mode selectable based on message ID or mailbox number</li> <li>Support for transmission request abort, with abort completion confirmed in status flag</li> <li>Transmission complete interrupt independently enabled or disabled for each mailbox</li> </ul> |
| Mode transition for bus-off recovery | Mode transition for the recovery from the bus-off state selectable to: <ul style="list-style-type: none"> <li>ISO11898-1 specification-compliant</li> <li>Automatic invoking of CAN halt mode on bus-off entry</li> <li>Automatic invoking of CAN halt mode on bus-off end</li> <li>Invoking of CAN halt mode through the software</li> <li>Transition to error-active state through the software</li> </ul>   |
| Error status monitoring              | <ul style="list-style-type: none"> <li>Monitoring of CAN bus errors, including stuff error, form error, ACK error, 15-bit CRC error, bit error, and ACK delimiter error</li> <li>Detection of transition to error states, including error-warning, error-passive, bus-off entry, and bus-off recovery</li> <li>Supports reading of error counters</li> </ul>   |
| Time stamping                        | <ul style="list-style-type: none"> <li>Time stamp function using a 16-bit counter</li> <li>Reference clock selectable to 1-bit, 2-bit, 4-bit, and 8-bit time periods</li> </ul>  |
| Interrupt function                   | Support for five interrupt sources: <ul style="list-style-type: none"> <li>Reception complete</li> <li>Transmission complete</li> <li>Receive FIFO</li> <li>Transmit FIFO</li> <li>Error interrupts</li> </ul>   |
| CAN sleep mode                       | CAN clock stopped to reduce power consumption  |

## 29. 控制器局域网(CAN)模块

### 29.1 Overview

控制器局域网(CAN)模块使用基于消息的协议在电磁噪声应用中的多个从机和主机之间接收和传输数据。该模块符合ISO11898-1(CAN2.0A/CAN2.0B)标准,最多支持32个邮箱,可配置为普通邮箱和FIFO模式下的发送或接收。支持标准(11位)和扩展(29位)消息格式。CAN模块需要额外的外部CAN收发器。

表29.1列出了CAN规范,图29.1显示了框图。

**Table 29.1 CAN规格(1of2)**

| Parameter    | Specifications  |
|--------------|---|
| 数据传输率        | 标准和扩展框架符合ISO11898-1   |
| 比特率          | 数据传输速率可编程高达1Mbps(fCAN≥8MHz)fCAN: CAN时钟源   |
| 消息框          | 32个邮箱,两种邮箱模式可选● <ul style="list-style-type: none"> <li>正常模式: 32个邮箱可独立配置用于发送或接收</li> <li>FIFO模式: 24个邮箱可独立配置用于发送或接收,其余邮箱用于接收(RX)和发送(TX)4级FIFO</li> </ul>  |
| Reception    | <ul style="list-style-type: none"> <li>支持数据帧和远程帧接收</li> <li>接收ID格式可选择仅标准ID、仅扩展ID或混合ID</li> <li>可编程一次性接收功能</li> <li>在覆盖模式(覆盖未读消息)和溢出模式(保存未读消息)之间选择</li> </ul> <ul style="list-style-type: none"> <li>为每个邮箱独立启用或禁用接收完成中断</li> </ul> |
| 验收过滤器        | <ul style="list-style-type: none"> <li>八个接受面具(每四个邮箱一个)</li> <li>为每个邮箱独立启用或禁用掩码</li> </ul>   |
| Transmission | <ul style="list-style-type: none"> <li>支持数据帧和远程帧传输</li> <li>传输ID格式可选择仅标准ID、仅扩展ID或混合ID</li> <li>可编程一次性传输功能</li> <li>广播消息功能</li> <li>可根据消息ID或邮箱号码选择优先模式</li> <li>支持传输请求中止,在状态标志中确认中止完成</li> <li>为每个邮箱独立启用或禁用传输完成中断</li> </ul>       |
| 总线关闭恢复的模式转换  | 从总线关闭状态恢复的模式转换可选择: ● <ul style="list-style-type: none"> <li>在总线关闭进入时自动调用CAN停止模式</li> <li>总线关闭端自动调用CAN停机模式</li> <li>通过软件调用CAN停机模式</li> <li>通过软件转换到错误激活状态</li> </ul>  |
| 错误状态监控       | <ul style="list-style-type: none"> <li>监控CAN总线错误,包括填充错误、格式错误、ACK错误、15位CRC错误、位错误和ACK分隔符错误</li> <li>检测到错误状态的转换,包括错误警告、错误被动、总线关闭进入和总线关闭恢复</li> <li>支持读取错误计数器</li> </ul>  |
| 时间戳          | <ul style="list-style-type: none"> <li>使用16位计数器的时间戳功能</li> <li>可选择1位、2位、4位和8位时间周期的参考时钟</li> </ul>   |
| 中断功能         | 支持五个中断源: ● <ul style="list-style-type: none"> <li>接待完成</li> <li>传输完成</li> <li>Receive FIFO</li> <li>Transmit FIFO</li> <li>错误中断</li> </ul>  |
| CAN睡眠模式      | CAN时钟停止以降低功耗  |

Table 29.1 CAN specifications (2 of 2)

| Parameter             | Specifications  |
|-----------------------|---|
| Software support unit | Three software support units: <ul style="list-style-type: none"> <li>● Acceptance filter support</li> <li>● Mailbox search support, including receive mailbox search, transmit mailbox search, and message lost search</li> <li>● Channel search support</li> </ul> |
| CAN clock source      | CANMCLK or PCLKB  |
| Test mode             | Three test modes available for evaluation purposes: <ul style="list-style-type: none"> <li>● Listen-only mode</li> <li>● Self-test mode 0 (external loopback)</li> <li>● Self-test mode 1 (internal loopback)</li> </ul>  |
| TrustZone Filte       | Security attribution can be set   |

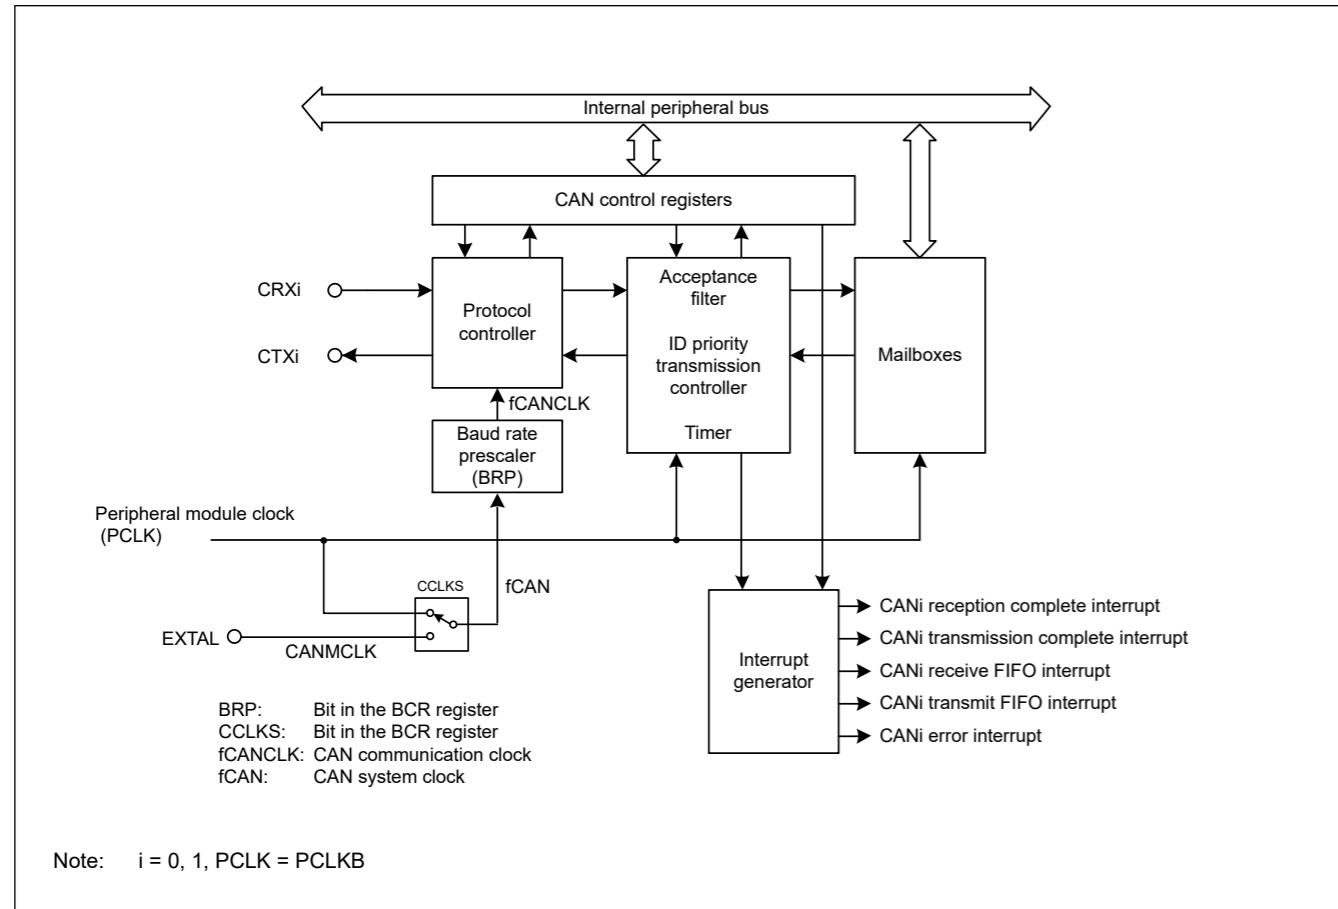

Figure 29.1 CAN module block diagram

The CAN module includes the following blocks:

- CAN input and output pins  
CRXi and CTXi (i = 0, 1)
- Protocol controller  
Handles CAN protocol processing such as bus arbitration, bit timing during transmission and reception, stuffing, and error handling.
- Mailboxes  
Consists of 32 mailboxes, which can be configured as either transmit or receive. Each mailbox has an individual ID, data length code (DLC), data field (8 bytes), and a time stamp.

Table 29.1 CAN规格 (2个中的2个)

| Parameter       | Specifications  |
|-----------------|---|
| 软件支持单位          | 三个软件支持单元: ●<br>接受过滤器支持<br>● 邮箱搜索支持, 包括接收邮箱搜索、发送邮箱搜索、邮件丢失搜索<br>● 频道搜索支持                                |
| CAN时钟源          | CANMCLK or PCLKB  |
| 测试模式            | 三种可用于评估目的的测试模式: ●<br>● Self-test mode 0 (external loopback)<br>● Self-test mode 1 (internal loopback) |
| TrustZone Filte | 可设置安全属性   |

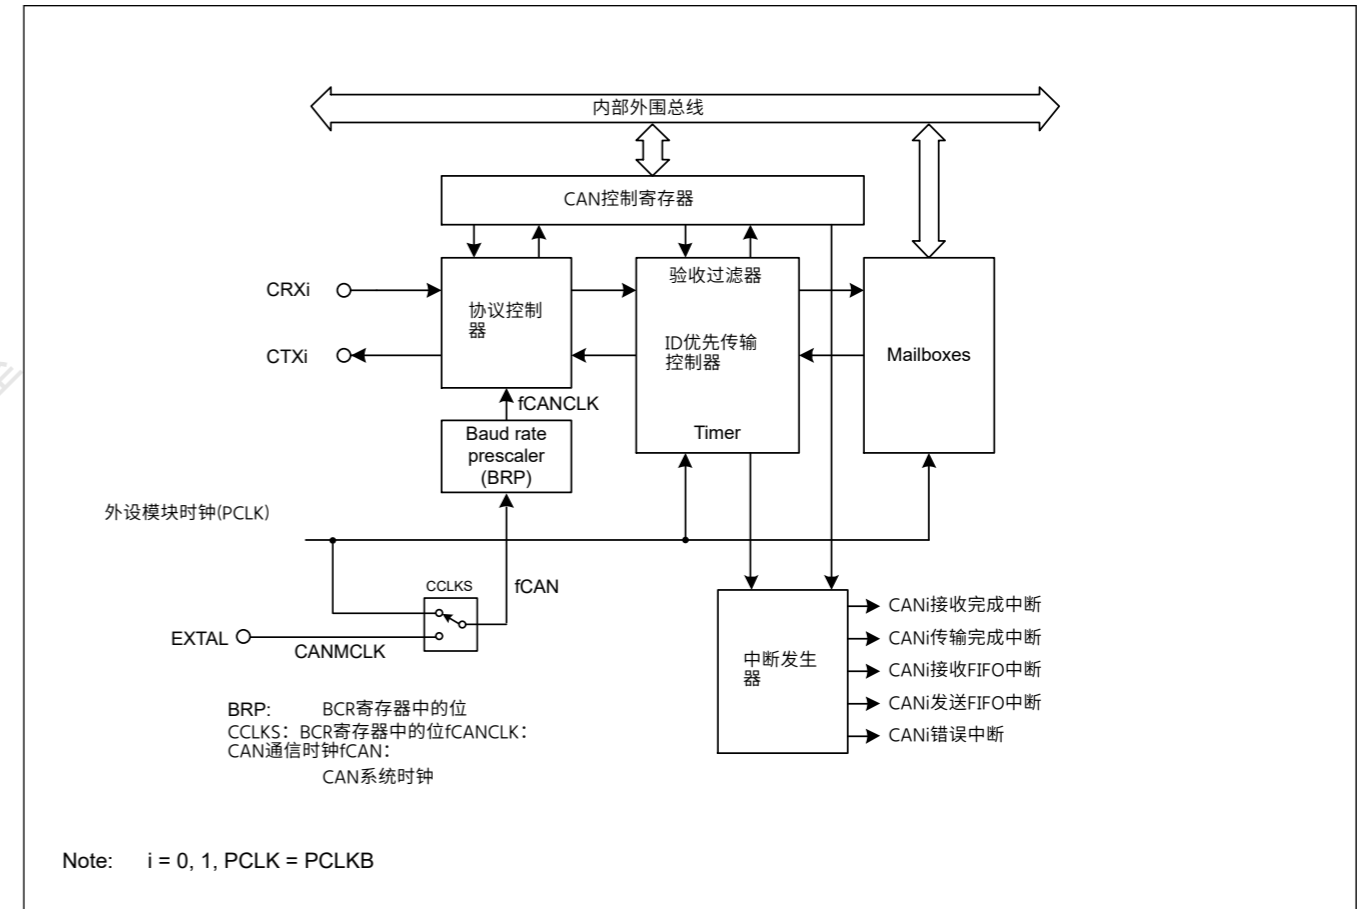

Figure 29.1 CAN模块框图

CAN模块包括以下模块:

- CAN输入输出引脚  
CRXi and CTXi (i = 0, 1)
- 协议控制器  
处理CAN协议处理, 例如总线仲裁、发送和接收期间的位时序、填充和错误处理。
- Mailboxes  
包含32个邮箱, 可配置为发送或接收。每个邮箱都有一个单独的ID、数据长度代码(DLC)、数据字段 (8个字节) 和一个时间戳。

- Acceptance filter  
Performs filtering of received messages. MKR0 to MKR7 are used for the filtering process.
- Timer  
Used for the time stamp function. The timer value when a message is stored in the mailbox is written as the time stamp value.
- Interrupt generator for five types of interrupts:
  - CANi reception complete interrupt
  - CANi transmission complete interrupt
  - CANi receive FIFO interrupt
  - CANi transmit FIFO interrupt
  - CANi error interrupt

Table 29.2 lists the CAN module pins. These pins are multiplexed with other signals on the MCU. For details, see section 19, I/O Ports.

Table 29.2 CAN module I/O pins (i = 0, 1)

| Pin name | I/O    | Function      |
|----------|--------|---------------|
| CRXi     | Input  | Data receive  |
| CTXi     | Output | Data transmit |

## 29.2 Register Descriptions

### 29.2.1 CTLR : Control Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x840

|                    |    |    |      |          |      |           |           |      |     |     |           |     |   |   |   |   |
|--------------------|----|----|------|----------|------|-----------|-----------|------|-----|-----|-----------|-----|---|---|---|---|
| Bit position:      | 15 | 14 | 13   | 12       | 11   | 10        | 9         | 8    | 7   | 6   | 5         | 4   | 3 | 2 | 1 | 0 |

| Value after reset: | 0  | 0  | 0    | 0        | 0    | 1         | 0         | 1    | 0   | 0   | 0         | 0   | 0 | 0 | 0 | 0 |

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 0   | MBM       | CAN Mailbox Mode Select*1<br>0: Normal mailbox mode<br>1: FIFO mailbox mode   | R/W |
| 2:1 | IDFM[1:0] | ID Format Mode Select*1<br>00: Standard ID mode<br>All mailboxes, including FIFO mailboxes, handle only standard IDs<br>01: Extended ID mode<br>All mailboxes, including FIFO mailboxes, handle only extended IDs<br>10: Mixed ID mode<br>All mailboxes, including FIFO mailboxes, handle both standard and extended IDs. In normal mailbox mode, use the associated IDE bit to differentiate standard and extended IDs. In FIFO mailbox mode, the associated IDE bits are used for mailboxes 0 to 23, the IDE bits in FIDCR0 and FIDCR1 are used for the receive FIFO, and the IDE bit associated with mailbox 24 is used for the transmit FIFO.<br>11: Setting prohibited | R/W |
| 3   | MLM       | Message Lost Mode Select*1<br>0: Overwrite mode<br>1: Overrun mode  | R/W |

- 验收过滤器  
对收到的消息执行过滤。MKR0到MKR7用于过滤过程。
- Timer  
用于时间戳功能。将消息存储在邮箱中的计时器值作为时间戳值写入。
- 用于五种中断的中断发生器:
  - CANi接收完成中断
  - CANi传输完成中断
  - CANi接收FIFO中断
  - CANi发送FIFO中断
  - CANi错误中断

表29.2列出了CAN模块引脚。这些引脚与MCU上的其他信号复用。有关详细信息，请参阅第19节，IO端口。

Table 29.2 CAN模块IO引脚(i=0 1)

| 引脚名称 | I/O    | Function |
|------|--------|----------|
| CRXi | Input  | 数据接收     |
| CTXi | Output | 数据传输     |

## 29.2 注册说明

### 29.2.1 CTLR:控制寄存器

| 13    | RBOC      | Forcible Return from Bus-Off*2<br>0: No return occurred<br>1: Forced return from bus-off state*3   | R/W |
| 15:14 | —         | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. Write to the BOM[1:0], TSPS[1:0], TPM, MLM, IDFM[1:0], and MBM bits in CAN reset mode.

Note 2. Set the RBOC bit to 1 in the bus-off state.

Note 3. This bit is automatically set to 0 after being set to 1. It should read as 0.

Note 4. Set the TSRC bit to 1 in CAN operation mode.

Note 5. When the CANM[1:0] and SLPM bits are changed, check STR to ensure that the mode is switched. Do not change the CANM[1:0] bits or SLPM bit until the mode is switched.

Note 6. Write to the SLPM bit in CAN reset mode or CAN halt mode. When changing the SLPM bit, write 0 or 1 only to the SLPM bit.

#### MBM bit (CAN Mailbox Mode Select)

When the MBM bit is 0 (normal mailbox mode), mailboxes 0 to 31 are configured as transmit or receive mailboxes. When the MBM bit is 1 (FIFO mailbox mode):

- Mailboxes 0 to 23 are configured as transmit or receive mailboxes
- Mailboxes 24 to 27 are configured as transmit FIFO
- Mailboxes 28 to 31 are configured as receive FIFO

Transmit data is written into mailbox 24, a window mailbox for the transmit FIFO. Receive data is read from mailbox 28, a window mailbox for the receive FIFO.

Table 29.3 lists the mailbox configuration.

#### IDFM[1:0] bits (ID Format Mode Select)

The IDFM[1:0] bits specify the ID format.

#### MLM bit (Message Lost Mode Select)

The MLM bit specifies the operation when a new message is captured in an unread mailbox. Overwrite mode or overrun mode can be selected. In both cases, the mode applies to all mailboxes, including the receive FIFO.

When the MLM bit is 0, all mailboxes are set to overwrite mode. Any new message received overwrites the pre-existing message.

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 4     | TPM       | 传输优先模式选择*1<br>0: ID优先传输模式1: 邮箱号码优先传输模式   | R/W |
| 5     | TSRC      | 时间戳计数器复位命令*4<br>0: 不复位时间戳计数器1: 复位时间戳计数器*3  | R/W |
| 7:6   | TSPS[1:0] | 时间戳预分频器选择*1<br>00: 每1位时间01: 每2位时间10: 每4位时间11: 每8位时间  | R/W |
| 9:8   | CANM[1:0] | CAN操作模式选择*5<br>00: CAN操作模式01: CAN复位模式10: CAN暂停模式11: CAN复位模式(强制转换)  | R/W |
| 10    | SLPM      | CAN睡眠模式*5*6<br>0: 所有其他模式1: CAN睡眠模式   | R/W |
| 12:11 | BOM[1:0]  | 总线关闭恢复模式*1<br>00: 正常模式(符合ISO11898-1) 01: 进入总线关闭状态时自动进入CAN停止模式1<br>0: 在总线关闭状态结束时自动进入CAN停止模式11: 在总线关闭状态下自动进入CAN停止模式通过软件请求的总线关闭恢复 | R/W |
| 13    | RBOC      | Bus-Off强制返回*2<br>0: 未发生返回1: 从总线关闭状态强制返回*3  | R/W |
| 15:14 | —         | 这些位被读取为0。写入值应为0。   | R/W |

注1.在CAN复位模式下写入BOM[1:0]、TSPS[1:0]、TPM、MLM、IDFM[1:0]和MBM位。

注2.在总线关闭状态下将RBOC位设置为1。

注3.该位设置为1后自动设置为0，应读为0。

注4.在CAN操作模式下，将TSRC位设置为1。

注5.当CANM[1:0]和SLPM位改变时，检查STR以确保模式切换。在切换模式之前不要更改CANM[1:0]位或SLPM位。

注6.在CAN复位模式或CAN暂停模式下写入SLPM位。更改SLPM位时，仅向SLPM位写入0或1。

#### MBM位 (CAN邮箱模式选择)

当MBM位为0 (正常邮箱模式) 时，邮箱0到31被配置为发送或接收邮箱。当MBM位为1 (FIFO邮箱模式) 时:

- 邮箱0到23被配置为发送或接收邮箱
- 邮箱24到27被配置为发送FIFO
- 邮箱28到31配置为接收FIFO

发送数据写入邮箱24，这是发送FIFO的窗口邮箱。接收数据从邮箱28中读取，该邮箱是接收FIFO的窗口邮箱。

表29.3列出了邮箱配置。

#### IDFM[1:0]位 (ID格式模式选择)

IDFM[1:0]位指定ID格式。

#### MLM位 (消息丢失模式选择)

MLM位指定在未读邮箱中捕获新消息时的操作。可以选择覆盖模式或溢出模式。在这两种情况下，该模式都适用于所有邮箱，包括接收FIFO。

当MLM位为0时，所有邮箱都设置为覆盖模式。收到的任何新消息都会覆盖先前存在的消息。

When the MLM bit is 1, all mailboxes are set to overrun mode. Any new message received does not overwrite the preexisting message, and it is discarded.

#### TPM bit (Transmission Priority Mode Select)

The TPM bit specifies the priority when transmitting messages. ID priority transmit mode or mailbox number transmit mode can be selected. All mailboxes are set for either ID priority transmission or mailbox number priority transmission.

When TPM is 0, ID priority transmit mode is selected and transmission priority is arbitrated as defined in the ISO11898-1 CAN specification. In ID priority transmit mode, mailboxes 0 to 31 (in normal mailbox mode), and mailboxes 0 to 23 (in FIFO mailbox mode), and the transmit FIFO are compared for the IDs of mailboxes configured for transmission. If two or more mailbox IDs are the same, the mailbox with the smaller number has higher priority.

Only the next message to be transmitted from the transmit FIFO is included in the transmission arbitration. If a FIFO message is being transmitted, the next pending message within the transmit FIFO is included in the transmission arbitration.

When TPM is 1, mailbox number transmit mode is selected and the transmit mailbox with the smallest mailbox number has the highest priority. In FIFO mailbox mode, the transmit FIFO has lower priority than normal mailboxes (0 to 23).

#### TSRC bit (Time Stamp Counter Reset Command)

The TSRC bit resets the time stamp counter. When it is set to 1, TSR is set to 0x0000. TSRC is set to 0 automatically.

#### TSPS[1:0] bits (Time Stamp Prescaler Select)

The TSPS[1:0] bits select the prescaler for the time stamp. The reference clock for the time stamp can be selected to 1-bit, 2-bit, 4-bit, or 8-bit time periods.

#### CANM[1:0] bits (CAN Operating Mode Select)

The CANM[1:0] bits select one of the following modes for the CAN module:

- CAN operation mode
- CAN reset mode
- CAN halt mode

The CAN sleep mode is set in the SLPM bit. For details, see [section 29.3. Operation Modes](#).

When the CAN module enters CAN halt mode based on the BOM[1:0] setting, the CANM[1:0] bits are automatically set to 10b.

#### SLPM bit (CAN Sleep Mode)

When the SLPM bit is set to 1, the CAN module enters CAN sleep mode. When the SLPM bit is set to 0, the CAN module exits CAN sleep mode. For details, see [section 29.3. Operation Modes](#).

#### BOM[1:0] bits (Bus-Off Recovery Mode)

The BOM[1:0] bits select bus-off recovery mode for the CAN module.

When the BOM[1:0] bits are 00b, the recovery from bus-off is compliant with the ISO11898-1 CAN specification. The CAN module recovers CAN communication (error-active state) after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request occurs when recovering from bus-off.

When the BOM[1:0] bits are 01b and the CAN module reaches the bus-off state, the CANM[1:0] bits in CTRLR are set to 10b to enter CAN halt mode. No bus-off recovery interrupt request occurs when recovering from bus-off, and TECR and RECR are set to 0x00.

When the BOM[1:0] bits are 10b, the CANM[1:0] bits are set to 10b as soon as the CAN module reaches the bus-off state. The CAN module enters CAN halt mode after the recovery from the bus-off state, and after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request occurs when recovering from bus-off, and TECR and RECR are set to 0x00.

When the BOM[1:0] bits are 11b, the CAN module enters CAN halt mode by setting the CANM[1:0] bits to 10b while the CAN module is still in the bus-off state. No bus-off recovery interrupt request occurs when recovering from bus-off, and TECR and RECR are set to 0x00. However, if the CAN module recovers from bus-off after detecting 11 consecutive recessive bits 128 times before the CANM[1:0] bits are set to 10b, a bus-off recovery interrupt request is generated.

当MLM位为1时，所有邮箱都设置为溢出模式。收到的任何新消息都不会覆盖先前存在的消息，并且会被丢弃。

#### TPM位 (传输优先模式选择)

TPM位指定传输消息时的优先级。可选择ID优先传输模式或邮箱号码传输模式。所有信箱都设置为ID优先传输或信箱号码优先传输。

当TPM为0时，选择ID优先传输模式，传输优先级按照ISO11898-1CAN规范中的定义进行仲裁。在ID优先传输模式下，邮箱0到31（在普通邮箱模式下）和邮箱0到23（在FIFO邮箱模式下）和传输FIFO会针对配置为传输的邮箱ID进行比较。如果两个或多个邮箱ID相同，则编号较小的邮箱优先级较高。

只有从发送FIFO发送的下一条消息包含在发送仲裁中。如果正在发送FIFO消息，则发送FIFO中的下一个待处理消息将包含在发送仲裁中。

当TPM为1时，选择邮箱号发送模式，邮箱号最小的发送邮箱优先级最高。在FIFO邮箱模式下，发送FIFO的优先级低于普通邮箱（0到23）。

#### TSRC位 (时间戳计数器复位命令)

TSRC位复位时间戳计数器。当它设置为1时，TSR设置为0x0000。TSRC自动设置为0。

#### TSPS[1:0]位 (时间戳预分频器选择)

TSPS[1:0]位选择时间戳的预分频器。时间戳的参考时钟可以选择为1位、2位、4位或8位时间段。

#### CANM[1:0]位 (CAN操作模式选择)

CANM[1:0]位为CAN模块选择以下模式之一：

- CAN操作模式
- CAN复位模式
- CAN停机模式

CAN睡眠模式在SLPM位中设置。有关详细信息，请参阅第29.3节。操作模式。

当CAN模块根据BOM[1:0]设置进入CAN暂停模式时，CANM[1:0]位自动设置为10b。

#### SLPM位 (CAN休眠模式)

当SLPM位设置为1时，CAN模块进入CAN睡眠模式。当SLPM位设置为0时，CAN模块退出CAN睡眠模式。有关详细信息，请参阅第29.3节。操作模式。

#### BOM[1:0]位 (总线关闭恢复模式)

BOM[1:0]位选择CAN模块的总线关闭恢复模式。

当BOM[1:0]位为00b时，总线关闭恢复符合ISO11898-1CAN规范。这CAN模块在检测到11个连续隐性位128次后恢复CAN通信（错误激活状态）。从总线关闭中恢复时会出现总线关闭恢复中断请求。

当BOM[1:0]位为01b且CAN模块达到总线关闭状态时，CTRLR中的CANM[1:0]位设置为10b以进入CAN停止模式。总线关闭恢复时不产生总线关闭恢复中断请求，TECR和RECR设置为0x00。

当BOM[1:0]位为10b时，CAN模块一到达总线关闭状态，CANM[1:0]位就会设置为10b。CAN模块从总线关闭状态恢复后，并在检测到11个连续的隐性位128次后进入CAN停止模式。从总线关闭恢复时产生总线关闭恢复中断请求，TECR和RECR设置为0x00。

当BOM[1:0]位为11b时，CAN模块通过将CANM[1:0]位设置为10b进入CAN暂停模式，而CAN模块仍处于总线关闭状态。从总线关闭恢复时没有总线关闭恢复中断请求发生，并且TECR和RECR设置为0x00。但是，如果CAN模块在CANM[1:0]位设置为10b之前128次检测到11个连续隐性位后从总线关闭中恢复，则会产生总线关闭恢复中断请求。

If the CPU requests an entry to CAN reset mode at the same time as the CAN module attempts to enter CAN halt mode (at bus-off entry when the BOM[1:0] bits are 01b, or at bus-off end when the BOM[1:0] bits are 10b), then the CPU request has higher priority.

**RBOC bit (Forcible Return from Bus-Off)**

When the RBOC bit is set to 1 in the bus-off state, the CAN module forcibly exits the bus-off state. It is set to 0 automatically, and the error state changes from bus-off to error-active. When the RBOC bit is set to 1, RECR and TECR are set to 0x00 and the BOST bit in STR is set to 0, indicating that the CAN module is not in bus-off state. The other registers remain unchanged when RBOC is set to 1. No bus-off recovery interrupt request occurs by this recovery from the bus-off state. Use the RBOC bit only when the BOM[1:0] bits are 00b (normal mode).

**Table 29.3 Mailbox configuration**

| Mailbox            | MBM bit = 0 (normal mailbox mode) | MBM bit = 1 (FIFO mailbox mode)*1 to *5 |
|--------------------|-----------------------------------|---|
| Mailboxes 0 to 23  | Normal mailbox                    | Normal mailbox                          |
| Mailboxes 24 to 27 |                                   | Transmit FIFO                           |
| Mailboxes 28 to 31 |                                   | Receive FIFO                            |

- Note 1. The transmit FIFO is controlled by TFCR. The MCTL\_TX[j] registers associated with mailboxes 24 to 27 are disabled. MCTL\_TX[24] to MCTL\_TX[27] cannot be used by the transmit FIFO.
- Note 2. The receive FIFO is controlled by RFCR. The MCTL\_RX[j] registers associated with mailboxes 28 to 31 are disabled. MCTL\_RX[28] to MCTL\_RX[31] cannot be used by the receive FIFO.
- Note 3. See the MIER\_FIFO description for information on the FIFO interrupts.
- Note 4. The bits in MKIVLR associated with mailboxes 24 to 31 are disabled. Set these bits to 0.
- Note 5. The transmit and receive FIFOs can be used for both data frames and remote frames.

**29.2.2 BCR : Bit Configuration Register**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x844

| Bit  | Symbol     | Function   | R/W |
|------|------------|--|-----|
| 0    | CCLKS      | CAN Clock Source Selection<br>0: PCLKB (generated by the PLL clock)<br>1: CANMCLK (generated by the main clock oscillator)                                   | R/W |
| 7:1  | —          | These bits are read as 0. The write value should be 0.   | R/W |
| 10:8 | TSEG2[2:0] | Time Segment 2 Control<br>0 0 0: Setting prohibited<br>0 0 1: 2 Tq<br>0 1 0: 3 Tq<br>0 1 1: 4 Tq<br>1 0 0: 5 Tq<br>1 0 1: 6 Tq<br>1 1 0: 7 Tq<br>1 1 1: 8 Tq | R/W |
| 11   | —          | This bit is read as 0. The write value should be 0.  | R/W |

如果CPU在CAN模块尝试进入CAN暂停模式的同时请求进入CAN复位模式（当BOM[1:0]位为01b时在总线关闭进入，或者当BOM[1:0]位为10b），则CPU请求具有更高的优先级。

**RBOC位（从总线关闭强制返回）**

当RBOC位在总线关闭状态下设置为1时，CAN模块强制退出总线关闭状态。它自动设置为0，错误状态从总线关闭变为错误激活。当RBOC位设置为1时，RECR和TECR设置为0x00，STR中的BOST位设置为0，表示CAN模块不处于总线关闭状态。当RBOC设置为1时，其他寄存器保持不变。从总线关闭状态恢复不会产生总线关闭恢复中断请求。仅当BOM[1:0]位为00b（正常模式）时才使用RBOC位。

**Table 29.3 邮箱配置**

| Mailbox | MBM位=0（正常邮箱模式） | MBM位=1（FIFO邮箱模式）*1至*5 |
|---------|----------------|-----------------------|
| 邮箱0到23  | 普通邮箱           | 普通邮箱                  |
| 邮箱24至27 |                | Transmit FIFO         |
| 邮箱28至31 |                | Receive FIFO          |

- 注1.发送FIFO由TFCR控制。与邮箱24到27关联的MCTL\_TX[j]寄存器被禁用。发送FIFO不能使用MCTL\_TX[24]到MCTL\_TX[27]。
- 注2.接收FIFO由RFCR控制。与邮箱28到31关联的MCTL\_RX[j]寄存器被禁用。MCTL\_RX[28]到MCTL\_RX[31]不能被接收FIFO使用。
- 注3.有关FIFO中断的信息，请参见MIER\_FIFO描述。
- 注4.MKIVLR中与邮箱24到31相关的位被禁用。将这些位设置为0。
- 注5.发送和接收FIFO可用于数据帧和远程帧。

**29.2.2 BCR：位配置寄存器**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x844

| Bit  | Symbol     | Function  | R/W |
|------|------------|---|-----|
| 0    | CCLKS      | CAN时钟源选择<br>0: PCLKB (由PLL时钟产生) 1: CANMCLK (由主时钟振荡器产生)                                  | R/W |
| 7:1  | —          | 这些位被读取为0。写入值应为0。  | R/W |

| 11   | —          | 该位读取为0。写入值应为0。  | R/W |

| Bit   | Symbol     | Function   | R/W |
|-------|------------|--|-----|
| 13:12 | SJW[1:0]   | Synchronization Jump Width Control<br>0 0: 1 Tq<br>0 1: 2 Tq<br>1 0: 3 Tq<br>1 1: 4 Tq   | R/W |
| 15:14 | —          | These bits are read as 0. The write value should be 0.   | R/W |
| 25:16 | BRP[9:0]   | Baud Rate Prescaler Select*1<br>These bits set the frequency of the CAN communication clock (fCANCLK).   | R/W |
| 27:26 | —          | These bits are read as 0. The write value should be 0.   | R/W |
| 31:28 | TSEG1[3:0] | Time Segment 1 Control<br>0x3: 4 Tq<br>0x4: 5 Tq<br>0x5: 6 Tq<br>0x6: 7 Tq<br>0x7: 8 Tq<br>0x8: 9 Tq<br>0x9: 10 Tq<br>0xA: 11 Tq<br>0xB: 12 Tq<br>0xC: 13 Tq<br>0xD: 14 Tq<br>0xE: 15 Tq<br>0xF: 16 Tq<br>Others: Setting prohibited | R/W |

Note: Tq: Time Quantum

Note 1. Do not select a value less than or equal to 1 while the SCKSCR.CKSEL[2:0] bits are 011b (selecting the main clock oscillator).

For details about setting the bit timing, see [section 29.4. Data Transfer Rate Configuration](#). Set BCR before entering CAN halt or CAN operation mode from CAN reset mode. After the setting is made once, this register can be written to in CAN reset or CAN halt mode. A 32-bit read/write accesses must be performed carefully so as not to change bits [7:0].

#### CCLKS bit (CAN Clock Source Selection)

The CCLKS bit selects CAN clock source. When the CCLKS bit is 0, the peripheral module clock (PCLKB) produced by the PLL frequency synthesizer is used as the CAN clock source (fCAN). When the CCLKS bit is 1, CANMCLK produced externally by the EXTAL pins is used as the CAN clock source (fCAN).

#### TSEG2[2:0] bits (Time Segment 2 Control)

The TSEG2[2:0] bits specify the length of the phase buffer segment 2 (PHASE\_SEG2) with a Tq value. A value from 2 to 8 Tq can be set. Set a value smaller than that in the TSEG1[3:0] bits.

#### SJW[1:0] bits (Synchronization Jump Width Control)

The SJW[1:0] bits specify the synchronization jump width with a Tq value. A value from 1 to 4 Tq can be set. Set a value smaller than or equal to that in the TSEG2[2:0] bits.

#### BRP[9:0] bits (Baud Rate Prescaler Select)

The BRP[9:0] bits set the frequency of the CAN communication clock (fCANCLK). The fCANCLK cycle is 1 Tq. If the setting is P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

#### TSEG1[3:0] bits (Time Segment 1 Control)

The TSEG1[3:0] bits specify the total length of the propagation time segment (PROP\_SEG) and phase buffer segment 1 (PHASE\_SEG1) with a time quantum (Tq) value. A value from 4 to 16 Tq can be set.

| Bit   | Symbol     | Function   | R/W |
|-------|------------|--|-----|
| 13:12 | SJW[1:0]   | 同步跳转宽度控制<br>0 0: 1 Tq<br>0 1: 2 Tq<br>1 0: 3 Tq<br>1 1: 4 Tq   | R/W |
| 15:14 | —          | 这些位被读取为0。写入值应为0。   | R/W |
| 25:16 | BRP[9:0]   | 波特率预分频器选择*1<br>这些位设置CAN通信时钟(fCANCLK)的频率。   | R/W |
| 27:26 | —          | 这些位被读取为0。写入值应为0。   | R/W |
| 31:28 | TSEG1[3:0] | 时间段1控制<br>0x3: 4 Tq<br>0x4: 5 Tq<br>0x5: 6 Tq<br>0x6: 7 Tq<br>0x7: 8 Tq<br>0x8: 9 Tq<br>0x9: 10 Tq<br>0xA: 11 Tq<br>0xB: 12 Tq<br>0xC: 13 Tq<br>0xD: 14 Tq<br>0xE: 15 Tq<br>0xF: 16 Tq<br>其他: 禁止设置 | R/W |

Note: Tq: 时间量子

注1.当SCKSCR.CKSEL[2:0]位为011b (选择主时钟振荡器)时, 请勿选择小于或等于1的值。

有关设置位时序的详细信息, 请参阅第29.4节。数据传输率配置。在从CAN复位模式进入CAN停止或CAN操作模式之前设置BCR。设置一次后, 可在CAN复位或CAN停止模式下写入该寄存器。必须小心执行32位读写访问, 以免更改位[7:0]。

#### CCLKS位 (CAN时钟源选择)

CCLKS位选择CAN时钟源。当CCLKS位为0时, PLL频率合成器产生的外设模块时钟 (PCLKB) 用作CAN时钟源 (fCAN)。当CCLKS位为1时, 由EXTAL引脚从外部产生的CANMCLK用作CAN时钟源(fCAN)。

#### TSEG2[2:0]位 (时间段2控制)

TSEG2[2:0]位用Tq值指定相位缓冲段2(PHASE\_SEG2)的长度。一个从2到8的值可以设置Tq。设置一个小于TSEG1[3:0]位的值。

#### SJW[1:0]位 (同步跳转宽度控制)

SJW[1:0]位用Tq值指定同步跳转宽度。可以设置1到4Tq的值。设置一个小于或等于TSEG2[2:0]位的值。

#### BRP[9:0]位 (波特率预分频器选择)

BRP[9:0]位设置CAN通信时钟(fCANCLK)的频率。fCANCLK周期为1Tq。如果设置为P (0到1023), 则波特率预分频器将fCAN除以P+1。

#### TSEG1[3:0]位 (时间段1控制)

TSEG1[3:0]位用时间量子(Tq)值指定传播时间段(PROP\_SEG)和相位缓冲段1(PHASE\_SEG1)的总长度。可以设置4到16Tq的值。

29.2.3 MKR[k] : Mask Register k (k = 0 to 7)

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x400 + 0x04 × k

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 17:0  | EID[17:0] | Extended ID<br>0: Do not compare associated EID[17:0] bits<br>1: Compare associated EID[17:0] bits | R/W |
| 28:18 | SID[10:0] | Standard ID<br>0: Do not compare associated SID[10:0] bits<br>1: Compare associated SID[10:0] bits | R/W |
| 31:29 | —         | The read values are undefined. The write value should be 0.  | R/W |

For the mask function in FIFO mailbox mode, see section 29.6. Acceptance Filtering and Masking Functions.

Write to MKR0 to MKR7 in CAN reset mode or CAN halt mode.

EID[17:0] bits (Extended ID)

The EID[17:0] bits are the filter mask bits associated with the CAN extended ID bits. They are used to receive extended ID messages. When an EID[17:0] bit is set to 0, the received ID is not compared with the associated mailbox ID. When an EID[17:0] bit is set to 1, the received ID is compared with the associated mailbox ID.

SID[10:0] bits (Standard ID)

The SID[10:0] bits are the filter mask bits associated with the CAN standard ID bits. They are used to receive both standard ID and extended ID messages. When an SID[10:0] bit is set to 0, the received ID is not compared with the associated mailbox ID. When an SID[10:0] bit is set to 1, the received ID is compared with the associated mailbox ID.

29.2.4 FIDCRk : FIFO Received ID Compare Register k (k = 0, 1)

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x420 + 0x04 × k

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 17:0  | EID[17:0] | Extended ID of data and remote frames                           | R/W |
| 28:18 | SID[10:0] | Standard ID of data and remote frames                           | R/W |
| 29    | —         | The read value is undefined. The write value should be 0.       | R/W |
| 30    | RTR       | Remote Transmission Request<br>0: Data frame<br>1: Remote frame | R/W |
| 31    | IDE       | ID Extension*1<br>0: Standard ID<br>1: Extended ID              | R/W |

Note 1. The IDE bit is enabled when the CTLR.IDFM[1:0] bits are 10b (mixed ID mode). When the IDFM[1:0] bits are not 10b, only write 0 to IDE. It reads as 0.

29.2.3 MKR[k]:掩码寄存器k(k=0to7)

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x400 + 0x04 × k

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 17:0  | EID[17:0] | 扩展ID<br>0: 不比较关联的EID[17:0]位<br>1: 比较关联的EID[17:0]位 | R/W |
| 28:18 | SID[10:0] | 标准标识<br>0: 不比较关联的SID[10:0]位<br>1: 比较关联的SID[10:0]位 | R/W |
| 31:29 | —         | 读取的值未定义。写入值应为0。                                   | R/W |

关于FIFO邮箱模式下的屏蔽功能，请参见第29.6节。接受过滤和屏蔽功能。

在CAN复位模式或CAN暂停模式下写入MKR0至MKR7。

EID[17:0] bits (Extended ID)

EID[17:0]位是与CAN扩展ID位相关的过滤器掩码位。它们用于接收扩展ID消息。当EID[17:0]位设置为0时，接收到的ID不会与关联的邮箱ID进行比较。当EID[17:0]位设置为1时，接收到的ID将与关联的邮箱ID进行比较。

SID[10:0] bits (Standard ID)

SID[10:0]位是与CAN标准ID位相关的过滤器掩码位。它们用于接收两个标准ID和扩展ID消息。当SID[10:0]位设置为0时，接收到的ID不会与关联的邮箱ID进行比较。当SID[10:0]位设置为1时，接收到的ID将与关联的邮箱ID进行比较。

29.2.4 FIDCRk:FIFO接收ID比较寄存器k(k=0 1)

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x420 + 0x04 × k

| Bit   | Symbol    | Function                      | R/W |
|-------|-----------|-------------------------------|-----|
| 17:0  | EID[17:0] | 数据和远程帧的扩展ID                   | R/W |
| 28:18 | SID[10:0] | 数据和远程帧的标准ID                   | R/W |
| 29    | —         | 读取值未定义。写入值应为0。                | R/W |
| 30    | RTR       | 远程传输请求<br>0: 数据帧<br>1: 远程帧    | R/W |
| 31    | IDE       | 身份证扩展*1<br>0: 标准ID<br>1: 扩展ID | R/W |

注1.当CTLR.IDFM[1:0]位为10b（混合ID模式）时，IDE位被使能。当IDFM[1:0]位不是10b时，只写0到IDE。它读作0。

FIDCR0 and FIDCR1 are enabled when the MBM bit in CTRL is set to 1 (FIFO mailbox mode). In this mode, the EID[17:0], SID[10:0], RTR, and IDE bits in mailboxes 28 to 31 are disabled. Write to FIDCR0 and FIDCR1 in CAN reset mode or CAN halt mode. For information on using FIDCR0 and FIDCR1, see [section 29.6. Acceptance Filtering and Masking Functions](#).

#### EID[17:0] bits (Extended ID of data and remote frames)

The EID[17:0] bits set the extended ID of data frames and remote frames. These bits are used to receive extended ID messages.

#### SID[10:0] bits (Standard ID of data and remote frames)

The SID[10:0] bits set the standard ID of data frames and remote frames. These bits are used to receive both standard ID and extended ID messages.

#### RTR bit (Remote Transmission Request)

The RTR bit sets the frame format to data frames or remote frames:

- When the RTR bits in both FIDCR0 and FIDCR1 registers are set to 0, only data frames are received
- When the RTR bits in both FIDCR0 and FIDCR1 registers are set to 1, only remote frames are received
- When the RTR bits in both FIDCR0 and FIDCR1 registers are set to different values, both data frames and remote frames are received

#### IDE bit (ID Extension)

The IDE bit sets the ID format to standard ID or extended ID. The IDE bit is enabled when the IDFM[1:0] bits in CTRL are 10b (mixed ID mode):

- When the IDE bits in both FIDCR0 and FIDCR1 registers are set to 0, only standard ID frames are received
- When the IDE bits in both FIDCR0 and FIDCR1 registers are set to 1, only extended ID frames are received
- When the IDE bits in both FIDCR0 and FIDCR1 registers are set to different values, both standard ID and extended ID frames are received

### 29.2.5 MKIVLR : Mask Invalid Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x428

|                    |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|--------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| Bit position:      | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Bit field:         | MB31 | MB30 | MB29 | MB28 | MB27 | MB26 | MB25 | MB24 | MB23 | MB22 | MB21 | MB20 | MB19 | MB18 | MB17 | MB16 |
| Value after reset: | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    |
| Bit position:      | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Bit field:         | MB15 | MB14 | MB13 | MB12 | MB11 | MB10 | MB9  | MB8  | MB7  | MB6  | MB5  | MB4  | MB3  | MB2  | MB1  | MB0  |
| Value after reset: | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    |

| Bit  | Symbol      | Function   | R/W |
|------|-------------|--|-----|
| 31:0 | MB31 to MB0 | Mask Invalid<br>0: Mask valid<br>1: Mask invalid | R/W |

Each bit in MKIVLR is associated with a mailbox of the same number. Bit [0] in MKIVLR corresponds to mailbox 0 (MB0), and bit [31] corresponds to mailbox 31 (MB31).\*1

When a bit is set to 1, the associated acceptance mask register becomes invalid for the associated mailbox. When a mask invalid bit is set to 1, a message is received by the associated mailbox only if the receive message ID matches the mailbox ID exactly.

Write to MKIVLR in CAN reset or halt mode.

当CTRL中的MBM位设置为1 (FIFO邮箱模式) 时, FIDCR0和FIDCR1被使能。在这种模式下, 邮箱28到31中的EID[17:0]、SID[10:0]、RTR和IDE位被禁用。在CAN复位模式或CAN暂停模式下写入FIDCR0和FIDCR1。有关使用FIDCR0和FIDCR1的信息, 请参阅第29.6节。接受过滤和屏蔽功能。

#### EID[17:0]位 (数据和远程帧的扩展ID)

EID[17:0]位设置数据帧和远程帧的扩展ID。这些位用于接收扩展ID消息。

#### SID[10:0]位 (数据和远程帧的标准ID)

SID[10:0]位设置数据帧和远程帧的标准ID。这些位用于接收标准ID和扩展ID消息。

#### RTR位 (远程传输请求)

RTR位将帧格式设置为数据帧或远程帧:

- 当FIDCR0和FIDCR1寄存器的RTR位都设置为0时, 只接收数据帧
- 当FIDCR0和FIDCR1寄存器的RTR位都设置为1时, 只接收远程帧
- 当FIDCR0和FIDCR1寄存器的RTR位设置为不同的值时, 数据帧和远程帧都被接收

#### IDE位 (ID扩展)

IDE位将ID格式设置为标准ID或扩展ID。当CTRL中的IDFM[1:0]位为10b (混合ID模式) 时, IDE位被使能:

- 当FIDCR0和FIDCR1寄存器中的IDE位都设置为0时, 只接收标准ID帧
- 当FIDCR0和FIDCR1寄存器中的IDE位都设置为1时, 只接收扩展ID帧
- 当FIDCR0和FIDCR1寄存器中的IDE位设置为不同的值时, 标准ID和扩展ID帧都被接收

### 29.2.5 MKIVLR:屏蔽无效寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x428

|               |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|---------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| Bit position: | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Bit field:    | MB31 | MB30 | MB29 | MB28 | MB27 | MB26 | MB25 | MB24 | MB23 | MB22 | MB21 | MB20 | MB19 | MB18 | MB17 | MB16 |
| 重置后的值:        | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    |
| Bit position: | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Bit field:    | MB15 | MB14 | MB13 | MB12 | MB11 | MB10 | MB9  | MB8  | MB7  | MB6  | MB5  | MB4  | MB3  | MB2  | MB1  | MB0  |
| 重置后的值:        | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    |

| Bit  | Symbol      | Function                   | R/W |
|------|-------------|----------------------------|-----|
| 31:0 | MB31 to MB0 | 掩码无效<br>0: 屏蔽有效<br>1: 屏蔽无效 | R/W |

MKIVLR中的每个位都与一个相同号码的邮箱相关联。MKIVLR中的位[0]对应邮箱0(MB0), 位[31]对应邮箱31(MB31)。\*1

当某个位设置为1时, 相关联的接受屏蔽寄存器对于相关联的邮箱变得无效。当掩码无效位设置为1时, 只有当接收消息ID与邮箱ID完全匹配时, 相关邮箱才会接收消息。

在CAN复位或暂停模式下写入MKIVLR。

Note 1. Set bits [31:24] to 0 in FIFO mailbox mode.

### 29.2.6 Mailbox Registers

Table 29.4 lists the CANi mailbox memory mapping, and Table 29.5 lists the CAN data frame configuration.

The value of the CANi mailbox after reset is undefined.

Write to MBj\_ID, MBj\_DL, MBj\_Dm, and MBj\_TS only when the related MCTL\_TX[j] or MCTL\_RX[j] register (j = 0 to 31) is 0x00 and the associated mailbox is not processing an abort request.

See Table 29.4 for detailed on register addresses.

**Table 29.4 CANi mailbox memory mapping (i = 0, 1)**

| Address                              | Message content             |
|--------------------------------------|-----------------------------|
| <b>CANn (n = 0, 1)</b>               | <b>Memory mapping</b>       |
| 0x4005_0200 + 1000 × n + 16 × j + 0  | IDE, RTR, SID10 to SID6     |
| 0x4005_0200 + 1000 × n + 16 × j + 1  | SID5 to SID0, EID17, EID16  |
| 0x4005_0200 + 1000 × n + 16 × j + 2  | EID15 to EID8               |
| 0x4005_0200 + 1000 × n + 16 × j + 3  | EID7 to EID0                |
| 0x4005_0200 + 1000 × n + 16 × j + 4  | —                           |
| 0x4005_0200 + 1000 × n + 16 × j + 5  | Data length code (DLC[3:0]) |
| 0x4005_0200 + 1000 × n + 16 × j + 6  | Data byte 0                 |
| 0x4005_0200 + 1000 × n + 16 × j + 7  | Data byte 1                 |
| 0x4005_0200 + 1000 × n + 16 × j + 8  | Data byte 2                 |
| 0x4005_0200 + 1000 × n + 16 × j + 9  | Data byte 3                 |
| 0x4005_0200 + 1000 × n + 16 × j + 10 | Data byte 4                 |
| 0x4005_0200 + 1000 × n + 16 × j + 11 | Data byte 5                 |
| 0x4005_0200 + 1000 × n + 16 × j + 12 | Data byte 6                 |
| 0x4005_0200 + 1000 × n + 16 × j + 13 | Data byte 7                 |
| 0x4005_0200 + 1000 × n + 16 × j + 14 | Time stamp upper byte       |
| 0x4005_0200 + 1000 × n + 16 × j + 15 | Time stamp lower byte       |

**Table 29.5 CAN data frame configuration**

|               |              |                |               |              |              |       |       |     |       |
|---------------|--------------|----------------|---------------|--------------|--------------|-------|-------|-----|-------|
| SID10 to SID6 | SID5 to SID0 | EID17 to EID16 | EID15 to EID8 | EID7 to EID0 | DLC3 to DLC1 | DATA0 | DATA1 | ... | DATA7 |
|---------------|--------------|----------------|---------------|--------------|--------------|-------|-------|-----|-------|

The previous value of each mailbox is retained unless a new message is received.

#### 29.2.6.1 MBj\_ID : Mailbox ID Register j (j = 0 to 31)

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x200 + 0x10 × j

|                    |           |     |    |           |    |    |    |    |    |    |    |    |    |    |    |           |
|--------------------|-----------|-----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|-----------|
| Bit position:      | 31        | 30  | 29 | 28        | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16        |
| Bit field:         | IDE       | RTR | —  | SID[10:0] |    |    |    |    |    |    |    |    |    |    |    | EID[17:0] |
| Value after reset: | x         | x   | x  | x         | x  | x  | x  | x  | x  | x  | x  | x  | x  | x  | x  | x         |
| Bit position:      | 15        | 14  | 13 | 12        | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0         |
| Bit field:         | EID[17:0] |     |    |           |    |    |    |    |    |    |    |    |    |    |    |           |
| Value after reset: | x         | x   | x  | x         | x  | x  | x  | x  | x  | x  | x  | x  | x  | x  | x  | 0         |

注1.在FIFO邮箱模式下将位[31:24]设置为0。

### 29.2.6 邮箱寄存器

表29.4列出了CANi邮箱内存映射，表29.5列出了CAN数据帧配置。

复位后CANi邮箱的值未定义。

仅当相关的MCTL\_TX[j]或MCTL\_RX[j]寄存器 (j=0到31) 为0x00且相关邮箱未处理中止请求时，才写入MBj\_ID、MBj\_DL、MBj\_Dm和MBj\_TS。

有关寄存器地址的详细信息，请参见表29.4。

**Table 29.4 CANi邮箱内存映射(i=0 1)**

| Address                              | 留言内容                       |
|--------------------------------------|----------------------------|
| <b>CANn (n = 0, 1)</b>               | <b>内存映射</b>                |
| 0x4005_0200 + 1000 × n + 16 × j + 0  | IDE、RTR、SID10到SID6         |
| 0x4005_0200 + 1000 × n + 16 × j + 1  | SID5 to SID0, EID17, EID16 |
| 0x4005_0200 + 1000 × n + 16 × j + 2  | EID15 to EID8              |
| 0x4005_0200 + 1000 × n + 16 × j + 3  | EID7 to EID0               |
| 0x4005_0200 + 1000 × n + 16 × j + 4  | —                          |
| 0x4005_0200 + 1000 × n + 16 × j + 5  | 数据长度码 (DLC[3:0])           |
| 0x4005_0200 + 1000 × n + 16 × j + 6  | 数据字节0                      |
| 0x4005_0200 + 1000 × n + 16 × j + 7  | 数据字节1                      |
| 0x4005_0200 + 1000 × n + 16 × j + 8  | 数据字节2                      |
| 0x4005_0200 + 1000 × n + 16 × j + 9  | 数据字节3                      |
| 0x4005_0200 + 1000 × n + 16 × j + 10 | 数据字节4                      |
| 0x4005_0200 + 1000 × n + 16 × j + 11 | 数据字节5                      |
| 0x4005_0200 + 1000 × n + 16 × j + 12 | 数据字节6                      |
| 0x4005_0200 + 1000 × n + 16 × j + 13 | 数据字节7                      |
| 0x4005_0200 + 1000 × n + 16 × j + 14 | 时间戳高字节                     |
| 0x4005_0200 + 1000 × n + 16 × j + 15 | 时间戳低字节                     |

**Table 29.5 CAN数据帧配置**

|               |              |                |               |              |              |       |       |     |       |
|---------------|--------------|----------------|---------------|--------------|--------------|-------|-------|-----|-------|
| SID10 to SID6 | SID5 to SID0 | EID17 to EID16 | EID15 to EID8 | EID7 to EID0 | DLC3 to DLC1 | DATA0 | DATA1 | ... | DATA7 |
|---------------|--------------|----------------|---------------|--------------|--------------|-------|-------|-----|-------|

除非收到新邮件，否则保留每个邮箱的先前值。

#### 29.2.6.1 MBj\_ID:邮箱ID寄存器j(j=0到31)

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x200 + 0x10 × j

|               |           |     |    |           |    |    |    |    |    |    |    |    |    |    |    |           |

| Bit field:    | EID[17:0] |     |    |           |    |    |    |    |    |    |    |    |    |    |    |           |
| 重置后的值:        | x         | x   | x  | x         | x  | x  | x  | x  | x  | x  | x  | x  | x  | x  | x  | 0         |

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 17:0  | EID[17:0] | Extended ID of data and remote frames*1                         | R/W |
| 28:18 | SID[10:0] | Standard ID of data and remote frames                           | R/W |
| 29    | —         | The read value is undefined. The write value should be 0.       | R/W |
| 30    | RTR       | Remote Transmission Request<br>0: Data frame<br>1: Remote frame | R/W |
| 31    | IDE       | ID Extension*2<br>0: Standard ID<br>1: Extended ID              | R/W |

Note 1. If the mailbox receives a standard ID message, the EID bits in the mailbox are undefined.

Note 2. The IDE bit is enabled when the CTLR.IDFM[1:0] bits are 10b (mixed ID mode). When the IDFM[1:0] bits are not 10b, only write 0 to IDE. It reads as 0.

**EID[17:0] bits (Extended ID of data and remote frames)**

The EID[17:0] bits set the extended ID of data frames and remote frames. They are used to transmit or receive extended ID messages.

**SID[10:0] bits (Standard ID of data and remote frames)**

The SID[10:0] bits set the standard ID of data frames and remote frames. They are used to transmit or receive both standard ID and extended ID messages.

**RTR bit (Remote Transmission Request)**

The RTR bit sets the frame format of data frames or remote frames.

- The receive mailbox only receives frames with the format specified in the RTR bit
- The transmit mailbox transmits with the frame format specified in the RTR bit
- The receive FIFO mailbox receives the data frame, remote frame, or both frames specified in the RTR bit in FIDCR0 and FIDCR1
- The transmit FIFO mailbox transmits the data frame or remote frame specified in the RTR bit in the transmit message

**IDE bit (ID Extension)**

The IDE bit sets the ID format to standard IDs or extended IDs. The IDE bit is enabled when the IDFM[1:0] bits in CTLR are 10b (mixed ID mode).

- The receive mailbox only receives the ID format specified in the IDE bit
- The transmit mailbox transmits with the ID format specified in the IDE bit
- The receive FIFO mailbox receives messages with the standard ID and extended ID settings specified in the IDE bit in FIDCR0 and FIDCR1
- The transmit FIFO mailbox transmits messages with the standard ID or extended ID settings specified in the IDE bit in the transmit message

**29.2.6.2 MB<sub>j</sub>\_DL : Mailbox Data Length Register j (j = 0 to 31)**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x204 + 0x10 × j

| Bit   | Symbol    | Function                   | R/W |
|-------|-----------|----------------------------|-----|
| 17:0  | EID[17:0] | 数据和远程帧的扩展ID*1              | R/W |
| 28:18 | SID[10:0] | 数据和远程帧的标准ID                | R/W |
| 29    | —         | 读取值未定义。写入值应为0。             | R/W |
| 30    | RTR       | 远程传输请求<br>0: 数据帧1: 远程帧     | R/W |
| 31    | IDE       | 身份证扩展名*2<br>0: 标准ID1: 扩展ID | R/W |

注1.如果邮箱接收到标准ID消息，则邮箱中的EID位未定义。

注2.当CTLR.IDFM[1:0]位为10b（混合ID模式）时，IDE位被使能。当IDFM[1:0]位不是10b时，只写0到IDE。它读作0。

**EID[17:0]位（数据和远程帧的扩展ID）**

EID[17:0]位设置数据帧和远程帧的扩展ID。它们用于传输或接收扩展ID消息。

**SID[10:0]位（数据和远程帧的标准ID）**

SID[10:0]位设置数据帧和远程帧的标准ID。它们用于传输或接收这两种标准ID和扩展ID消息。

**RTR位（远程传输请求）**

RTR位设置数据帧或远程帧的帧格式。

- 接收邮箱只接收RTR位指定格式的帧
- 发送邮箱以RTR位指定的帧格式发送
- 接收FIFO邮箱接收FIDCR0和FIDCR1中的RTR位指定的数据帧、远程帧或同时接收这两个帧
- 发送FIFO邮箱发送发送报文中RTR位指定的数据帧或远程帧

**IDE位（ID扩展）**

IDE位将ID格式设置为标准ID或扩展ID。当CTLR中的IDFM[1:0]位为10b（混合ID模式）时，IDE位被使能。

- 接收邮箱只接收IDE位指定的ID格式
- 发送邮箱以IDE位指定的ID格式发送
- 接收FIFO邮箱接收具有标准ID和扩展ID设置的消息，这些设置在FIDCR0和FIDCR1的IDE位中指定
- 发送FIFO邮箱使用发送消息中IDE位指定的标准ID或扩展ID设置发送消息

**29.2.6.2 MB<sub>j</sub>\_DL：邮箱数据长度寄存器j（j=0到31）**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x204 + 0x10 × j

| Bit  | Symbol   | Function  | R/W |
|------|----------|---|-----|
| 3:0  | DLC[3:0] | Data Length Code*1<br>0x0: Data length = 0 byte<br>0x1: Data length = 1 byte<br>0x2: Data length = 2 bytes<br>0x3: Data length = 3 bytes<br>0x4: Data length = 4 bytes<br>0x5: Data length = 5 bytes<br>0x6: Data length = 6 bytes<br>0x7: Data length = 7 bytes<br>Others: Data length = 8 bytes | R/W |
| 15:4 | —        | The read values are undefined. The write value should be 0.   | R/W |

Note 1. If the mailbox receives a message with data length (set in DLC[3:0]) of n bytes, where n is less than 8, the data in DATAn to DATA7 registers in the mailbox is undefined. DATA0 to DATA7 are data registers for this mailbox. For example, if data length is 6 bytes (DLC[3:0] = 0x6), the data in DATA6 and DATA7 registers is undefined.

**DLC[3:0] bits (Data Length Code)**

The DLC[3:0] bits specify the data length to be transmitted in data frames. When a remote frame is used to request data, this field specifies the requested data length.

When a data frame is received, the received data length is stored in this field. When a remote frame is received, this field stores the requested data length.

**29.2.6.3 MBj\_Dm : Mailbox Data Register j (j = 0 to 31, m = 0 to 7)**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: (0x206 + m) + 0x10 × j

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 7:0 | DATA0 to DATA7 | Data Bytes 0 to 7*1*2<br>DATA0 to DATA7 store the transmitted or received CAN message data. Transmission or reception starts from DATA0. The bit order on the CAN bus is MSB-first, and transmission or reception starts from bit [7]. | R/W |

Note 1. If the mailbox receives a message with n bytes, where n is less than 8 bytes, the values of DATAn to DATA7 in the mailbox are undefined.

Note 2. If the mailbox receives a remote frame, the previous values of DATA0 to DATA7 in the mailbox are saved.

**29.2.6.4 MBj\_TS : Mailbox Time Stamp Register j (j = 0 to 31)**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x20E + 0x10 × j

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 7:0 | TSL[7:0] | Time Stamp Lower Byte<br>The TSH[7:0] and TSL[7:0] bits store the counter value of the time stamp when received messages are stored in the mailbox. | R/W |

| Bit  | Symbol   | Function  | R/W |
|------|----------|---|-----|
| 3:0  | DLC[3:0] | 数据长度代码*1<br>0x0: 数据长度=0字节0x1: 数据长度=1字节0x2: 数据长度=2字节0x3: 数据长度=3字节0x4: 数据长度=4字节0x5: 数据长度=5字节0x6: 数据长度=6字节0x7: 数据长度=7个字节<br>其他: 数据长度=8字节 | R/W |
| 15:4 | —        | 读取的值未定义。写入值应为0。   | R/W |

注1.如果邮箱接收到数据长度（在DLC[3:0]中设置）为n字节的消息，其中n小于8，则邮箱中DATAn到DATA7寄存器中的数据未定义。DATA0到DATA7是该邮箱的数据寄存器。例如，如果数据长度为6字节（DLC[3:0]=0x6），则DATA6和DATA7寄存器中的数据未定义。

**DLC[3:0]位（数据长度代码）**

DLC[3:0]位指定要在数据帧中传输的数据长度。当使用远程帧请求数据时，该字段指定请求的数据长度。

当接收到一个数据帧时，接收到的数据长度存储在该字段中。当接收到远程帧时，该字段存储请求的数据长度。

**29.2.6.3 MBj\_Dm: 邮箱数据寄存器j (j=0到31, m=0到7)**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: (0x206 + m) + 0x10 × j

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 7:0 | DATA0 to DATA7 | 数据字节0到7*1*2<br>DATA0到DATA7存储发送或接收的CAN报文数据。发送或接收从DATA0开始。CAN总线上的位顺序是MSB优先，发送或接收从位[7]开始。 | R/W |

注1.如果邮箱收到n字节的消息，其中n小于8字节，邮箱中的DATAn到DATA7的值是未定义的。

注2: 如果邮箱接收到远程帧，邮箱中的DATA0到DATA7之前的值将被保存。

**29.2.6.4 MBj\_TS: 邮箱时间戳寄存器j (j=0到31)**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x20E + 0x10 × j

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 7:0 | TSL[7:0] | 时间戳低字节<br>当收到的消息存储在邮箱中时，TSH[7:0]和TSL[7:0]位存储时间戳的计数器值。 | R/W |

| Bit  | Symbol   | Function   | R/W |
|------|----------|--|-----|
| 15:8 | TSH[7:0] | Time Stamp Higher Byte<br>The TSH[7:0] and TSL[7:0] bits store the counter value of the time stamp when received messages are stored in the mailbox. | R/W |

### 29.2.7 MIER : Mailbox Interrupt Enable Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x42C

|                    |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

MIER can enable interrupts for each mailbox independently. This register is available in normal mailbox mode. Do not access this register in FIFO mailbox mode.

Each bit is associated with the mailbox having the same number. These bits enable or disable transmission and reception complete interrupts for the associated mailboxes as follows:

- Bit [0] in MIER corresponds to mailbox 0 (MB0)
- Bit [31] in MIER corresponds to mailbox 31 (MB31)

Write to MIER only when the associated MCTL\_TX[j] or MCTL\_RX[j] register (j = 0 to 31) is 0x00 and the associated mailbox is not processing a transmission or reception abort request.

### 29.2.8 MIER\_FIFO : Mailbox Interrupt Enable Register for FIFO Mailbox Mode

| 重置后的值:        | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    |

| Bit  | Symbol      | Function  | R/W |
|------|-------------|---|-----|
| 31:0 | MB31 to MB0 | 中断使能<br>位[31]与邮箱31(MB31)相关联，位[0]与邮箱0(MB0)相关联。<br>0: 禁用中断1: 启用中断 | R/W |

MIER可以独立为每个邮箱启用中断。该寄存器在正常邮箱模式下可用。不要在FIFO邮箱模式下访问该寄存器。

每个位与具有相同编号的邮箱相关联。这些位启用或禁用相关邮箱的发送和接收完成中断，如下所示：

- MIER中的位[0]对应邮箱0(MB0)
- MIER中的位[31]对应邮箱31(MB31)

仅当关联的MCTL\_TX[j]或MCTL\_RX[j]寄存器 (j=0到31) 为0x00并且关联的邮箱未处理发送或接收中止请求时才写入MIER。

### 29.2.8 MIER\_FIFO:FIFO邮箱模式的邮箱中断使能寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x42C

|               |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

| 重置后的值:        | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    | x    |

| Bit  | Symbol      | Function  | R/W |
|------|-------------|---|-----|
| 23:0 | MB23 to MB0 | 中断使能<br>位[23]与邮箱23(MB23)相关联，位[0]与邮箱0(MB0)相关联。<br>0: 禁用中断1: 启用中断 | R/W |

| Bit   | Symbol | Function   | R/W |
|-------|--------|--|-----|
| 24    | MB24   | Transmit FIFO Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt  | R/W |
| 25    | MB25   | Transmit FIFO Interrupt Generation Timing Control<br>0: Generate every time transmission completes<br>1: Generate when the transmit FIFO empties on transmission completion              | R/W |
| 27:26 | —      | The read values are undefined. The write value should be 0.  | R/W |
| 28    | MB28   | Receive FIFO Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt   | R/W |
| 29    | MB29   | Receive FIFO Interrupt Generation Timing Control*1<br>0: Generate every time reception completes<br>1: Generate when the receive FIFO becomes a buffer warning*2 on reception completion | R/W |
| 31:30 | —      | The read values are undefined. The write value should be 0.  | R/W |

Note 1. No interrupt request occurs when the receive FIFO becomes buffer warning because it is full.  
Note 2. Buffer warning indicates a state in which the third message is stored in the receive FIFO.

MIER\_FIFO can independently enable interrupts for each mailbox and FIFO. This register is available in FIFO mailbox mode. Do not access it in normal mailbox mode.

The MB0 to MB23 bits are associated with the mailbox of the same number. These bits enable or disable transmission and reception complete interrupts for the associated mailboxes:

- Bit [0] in MIER\_FIFO is associated with mailbox 0 (MB0)
- Bit [23] in MIER\_FIFO is associated with mailbox 23 (MB23)

MB24, MB25, MB28, and MB29 specify whether transmit and receive FIFO interrupts are enabled or disabled, and the timing of interrupt requests.

Write to MIER\_FIFO only when the associated MCTL\_TX[j] or MCTL\_RX[j] register (j = 0 to 31) is 0x00 and the associated mailbox is not processing a transmission or reception abort request. In addition, change the bits in MIER\_FIFO for the associated FIFO only when all of the following conditions are true:

- The TFE bit in TFCR is 0 and the TFEST bit is 1.
- The RFE bit in RFCR is 0 and the RFEST bit in RFCR is 1.

### 29.2.9 MCTL\_TX[j] : Message Control Register for Transmit (j = 0 to 31)

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x820 + 0x01 × j

|                    |            |            |   |             |   |            |               |              |
|--------------------|------------|------------|---|-------------|---|------------|---------------|--------------|
| Bit position:      | 7          | 6          | 5 | 4           | 3 | 2          | 1             | 0            |
| Bit field:         | TRMR<br>EQ | RECR<br>EQ | — | ONES<br>HOT | — | TRMA<br>BT | TRMA<br>CTIVE | SENT<br>DATA |
| Value after reset: | 0          | 0          | 0 | 0           | 0 | 0          | 0             | 0            |

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 0   | SENTDATA  | Transmission Complete Flag*1 *2<br>0: Transmission not complete<br>1: Transmission complete                     | R/W |
| 1   | TRMACTIVE | Transmission-in-Progress Status Flag<br>0: Transmission pending or not requested<br>1: Transmission in progress | R   |

| Bit   | Symbol | Function  | R/W |
|-------|--------|---|-----|
| 24    | MB24   | 发送FIFO中断使能<br>0: 禁用中断1: 启用中断                                | R/W |
| 25    | MB25   | 发送FIFO中断产生时序控制<br>0: 每次发送完成时生成1: 发送完成时发送FIFO清空时生成           | R/W |
| 27:26 | —      | 读取的值未定义。写入值应为0。   | R/W |
| 28    | MB28   | 接收FIFO中断使能<br>0: 禁用中断1: 启用中断                                | R/W |
| 29    | MB29   | 接收FIFO中断发生时序控制*1<br>0: 每次接收完成时产生1: 当接收FIFO变为缓冲区警告时产生*2接收完成时 | R/W |
| 31:30 | —      | 读取的值未定义。写入值应为0。   | R/W |

注1.当接收FIFO已满而变为缓冲区警告时，不会发生中断请求。  
注2.缓冲区警告表示第三条消息存储在接收FIFO中的状态。

MIER\_FIFO可以独立启用每个邮箱和FIFO的中断。该寄存器在FIFO邮箱模式下可用。不要在普通邮箱模式下访问它。

MB0到MB23位与相同编号的邮箱相关联。这些位启用或禁用相关邮箱的发送和接收完成中断:

- MIER\_FIFO中的位[0]与邮箱0(MB0)相关联
- MIER\_FIFO中的位[23]与邮箱23(MB23)相关联

MB24、MB25、MB28和MB29指定是启用还是禁用发送和接收FIFO中断，以及中断请求的时序。

仅当关联的MCTL\_TX[j]或MCTL\_RX[j]寄存器 (j=0到31) 为0x00并且关联的邮箱未处理发送或接收中止请求时才写入MIER\_FIFO。此外，仅当以下所有条件都为真时，才更改关联FIFO的MIER\_FIFO中的位:

- TFCR中的TFE位为0，TFEST位为1。
- RFCR中的RFE位为0，RFCR中的RFEST位为1。

### 29.2.9 MCTL\_TX[j] : 用于发送的消息控制寄存器 (j=0到31)

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x820 + 0x01 × j

|               |            |            |   |    |   |            |               |          |
|---------------|------------|------------|---|----|---|------------|---------------|----------|
| Bit position: | 7          | 6          | 5 | 4  | 3 | 2          | 1             | 0        |
| Bit field:    | TRMR<br>EQ | RECR<br>EQ | — | 热门 | — | TRMA<br>BT | TRMA<br>CTIVE | 发送<br>数据 |
| 重置后的值:        | 0          | 0          | 0 | 0  | 0 | 0          | 0             | 0        |

| Bit | Symbol    | Function                      | R/W |
|-----|-----------|-------------------------------|-----|
| 0   | SENTDATA  | 传输完成标志*1*2<br>0: 传输未完成1: 传输完成 | R/W |
| 1   | TRMACTIVE | 传输中状态标志<br>0: 传输未决或未请求1: 传输中  | R   |

| Bit | Symbol  | Function  | R/W |
|-----|---------|---|-----|
| 2   | TRMABT  | Transmission Abort Complete Flag <sup>*1 *2</sup><br>0: Transmission started, transmission abort failed because transmission completed, or transmission abort not requested<br>1: Transmission abort complete | R/W |
| 3   | —       | This bit is read as 0. The write value should be 0.   | R/W |
| 4   | ONESHOT | One-Shot Enable <sup>*2 *3</sup><br>0: Disable one-shot transmission<br>1: Enable one-shot transmission   | R/W |
| 5   | —       | This bit is read as 0. The write value should be 0.   | R/W |
| 6   | RECREQ  | Receive Mailbox Request <sup>*2 *3 *4 *5</sup><br>0: Do not configure for reception<br>1: Configure for reception   | R/W |
| 7   | TRMREQ  | Transmit Mailbox Request <sup>*2 *4</sup><br>0: Do not configure for transmission<br>1: Configure for transmission  | R/W |

Note 1. Write 0 only. Writing 1 has no effect.

Note 2. When writing to bits of this register, write 1 to SENTDATA and TRMABT flags if these bits are not the write target.

Note 3. To enter one-shot transmit mode, write 1 to the ONESHOT bit at the same time as setting the TRMREQ bit to 1. To exit one-shot transmit mode, write 0 to the ONESHOT bit after the message is transmitted or aborted.

Note 4. Do not set both the RECREQ and TRMREQ bits to 1.

Note 5. When setting the RECREQ bit to 0, set the SENTDATA, TRMACTIVE, and TRMABT flags to 0 simultaneously.

MCTL\_TX[j] sets mailbox j to transmit mode or receive mode. In transmit mode, MCTL\_TX[j] also controls and indicates the transmission status. Do not access MCTL\_TX[j] if mailbox j is in receive mode. Only write to MCTL\_TX[j] in CAN operation or halt mode. Do not use MCTL\_TX24 to MCTL\_TX31 in FIFO mailbox mode.

#### SENTDATA flag (Transmission Complete Flag)

The SENTDATA flag is set to 1 when data transmission from the associated mailbox is complete. This flag is set to 0 through a software write. To set this flag to 0, first set the TRMREQ bit to 0. The SENTDATA flag and the TRMREQ bit cannot be set to 0 simultaneously. To transmit a new message from the associated mailbox, set the SENTDATA flag to 0.

#### TRMACTIVE flag (Transmission-in-Progress Status Flag)

The TRMACTIVE flag is set to 1 when the associated mailbox of the CAN module begins to transmit a message. It is set to 0 when the CAN module loses the CAN bus arbitration, when a CAN bus error occurs, or when data transmission completes.

#### TRMABT flag (Transmission Abort Complete Flag)

The TRMABT flag is set to 1 in the following cases:

- Following a transmission abort request, when the transmission abort is complete before starting transmission
- Following a transmission abort request, when the CAN module detects CAN bus arbitration-lost or a CAN bus error
- In one-shot transmission mode (RECREQ = 0, TRMREQ = 1, and ONESHOT = 1), when the CAN module detects a CAN bus arbitration-lost or a CAN bus error.

The TRMABT flag is not set to 1 when data transmission is complete. The SENTDATA flag is set to 1, and the TRMABT flag is set to 0 through a software write.

#### ONESHOT bit (One-Shot Enable)

When the ONESHOT bit is set to 1 in transmit mode (RECREQ = 0 and TRMREQ = 1), the CAN module transmits a message only one time. The CAN module does not transmit the message again if a CAN bus error or CAN bus arbitration-lost occurs. When transmission is complete, the SENTDATA flag is set to 1. If transmission does not complete because of a CAN bus error or CAN bus arbitration-lost error, the TRMABT flag is set to 1. Set the ONESHOT bit to 0 after the SENTDATA or TRMABT flag is set to 1.

#### RECREQ bit (Receive Mailbox Request)

The RECREQ bit selects the receive modes listed in [Table 29.10](#).

| Bit | Symbol  | Function   | R/W |
|-----|---------|--|-----|
| 2   | TRMABT  | 传输中止完成标志*1*2<br>0: 传输开始, 传输中止失败, 因为传输完成, 或者没有请求传输中止<br>1: 传输中止完成 | R/W |
| 3   | —       | 该位读取为0。写入值应为0。   | R/W |
| 4   | ONESHOT | One-Shot Enable <sup>*2 *3</sup><br>0: 禁止一次性发送<br>1: 允许一次性发送     | R/W |
| 5   | —       | 该位读取为0。写入值应为0。   | R/W |
| 6   | RECREQ  | 接收邮箱请求*2*3*4*5<br>0: 不配置接收<br>1: 配置接收                            | R/W |
| 7   | TRMREQ  | 发送邮箱请求*2*4<br>0: 不配置传输<br>1: 配置传输                                | R/W |

注1.只写0。写1无效。

注2.当写入该寄存器的位时, 如果这些位不是写入目标, 则将1写入SENTDATA和TRMABT标志。

注3.要进入一次性发送模式, 请在将TRMREQ位设置为1的同时将1写入ONESHOT位。要退出一次性发送模式, 请在发送或中止消息后向ONESHOT位写入0。

注4.不要将RECREQ和TRMREQ位都设置为1。

注5.将RECREQ位设置为0时, 同时将SENTDATA、TRMACTIVE和TRMABT标志设置为0。

MCTL\_TX[j]将邮箱j设置为发送模式或接收模式。在传输模式下, MCTL\_TX[j]也控制和指示传输状态。如果邮箱j处于接收模式, 则不要访问MCTL\_TX[j]。仅在CAN操作或暂停模式下写入MCTL\_TX[j]。不要在FIFO邮箱模式下使用MCTL\_TX24到MCTL\_TX31。

#### SENTDATA标志 (传输完成标志)

当来自相关邮箱的数据传输完成时, SENTDATA标志设置为1。该标志通过软件写入设置为0。要将此标志设置为0, 首先将TRMREQ位设置为0。SENTDATA标志和TRMREQ位不能同时设置为0。要从关联邮箱发送新消息, 请将SENTDATA标志设置为0。

#### TRMACTIVE标志 (传输中状态标志)

当CAN模块的相关邮箱开始发送消息时, TRMACTIVE标志设置为1。当CAN模块失去CAN总线仲裁、发生CAN总线错误或数据传输完成时, 它设置为0。

#### TRMABT标志 (传输中止完成标志)

在以下情况下, TRMABT标志设置为1:

- 在发送中止请求之后, 在开始发送前完成发送中止时
- 在发送中止请求后, CAN模块检测到CAN总线仲裁丢失或CAN总线错误
- 单次传输模式 (RECREQ=0, TRMREQ=1, ONESHOT=1), 当CAN模块检测到CAN总线仲裁失败或CAN总线错误时。

当数据传输完成时, TRMABT标志不设置为1。SENTDATA标志设置为1, TRMABT标志通过软件写入设置为0。

#### ONESHOT bit (One-Shot Enable)

在发送模式下 (RECREQ=0且TRMREQ=1) 将ONESHOT位设置为1时, CAN模块仅发送一次报文。如果发生CAN总线错误或CAN总线仲裁丢失, CAN模块不会再次发送消息。传输完成时, SENTDATA标志设置为1。如果由于CAN总线错误或CAN总线仲裁丢失导致传输未完成, 则TRMABT标志设置为1。在发送后将ONESHOT位设置为0

SENTDATA或TRMABT标志设置为1。

#### RECREQ位 (接收邮箱请求)

RECREQ位选择表29.10中列出的接收模式。

When the RECREQ bit is set to 1, the associated mailbox is configured for reception of a data or remote frame.

When the RECREQ bit is set to 0, the associated mailbox is not configured for reception of a data or remote frame.

Due to hardware protection, the RECREQ bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from the acceptance filter processing (the beginning of the CRC field)
- Hardware protection is released:
  - For the mailbox that is specified to receive the incoming message, after the received data is stored in the mailbox or a CAN bus error occurs. This means that the maximum period of hardware protection is from the beginning of CRC field to the end of the 7th bit of EOF.
  - For the other mailboxes, after acceptance filter processing
  - If no mailbox is specified to receive the message, after acceptance filter processing.

When setting the RECREQ bit to 1, do not set the TRMREQ bit to 1. To change the configuration of a mailbox from transmission to reception, first abort the transmission, then set the SENTDATA and TRMABT flags to 0 before changing to reception.

Note: MCTL\_TX[j].RECREQ is the mirror bit of MCTL\_RX[j].RECREQ.

**TRMREQ bit (Transmit Mailbox Request)**

The TRMREQ bit selects the transmit modes listed in Table 29.10.

When the TRMREQ bit is set to 1, the associated mailbox is configured for transmission of a data or remote frame.

When the TRMREQ bit is set to 0, the associated mailbox is not configured for transmission of a data or remote frame.

If the TRMREQ bit is changed from 1 to 0 to cancel the associated transmission request, either the TRMABT or SENTDATA flag is set to 1. When setting the TRMREQ bit to 1, do not set the RECREQ bit to 1. To change the configuration of a mailbox from reception to transmission, first abort the reception, then set the NEWDATA and MSGLOST flags to 0 before changing to transmission.

Note: MCTL\_TX[j].TRMREQ is the mirror bit of MCTL\_RX[j].TRMREQ.

**29.2.10 MCTL\_RX[j] : Message Control Register for Receive (j = 0 to 31)**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x820 + 0x01 × j

|                    |         |         |   |          |   |          |            |          |
|--------------------|---------|---------|---|----------|---|----------|------------|----------|
| Bit position:      | 7       | 6       | 5 | 4        | 3 | 2        | 1          | 0        |
| Bit field:         | TRMR EQ | RECR EQ | — | ONES HOT | — | MSGL OST | INVAL DATA | NEWD ATA |
| Value after reset: | 0       | 0       | 0 | 0        | 0 | 0        | 0          | 0        |

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 0   | NEWDATA   | Reception Complete Flag*1 *2<br>0: No data received, or 0 was written to the flag<br>1: New message being stored or was stored in the mailbox | R/W |
| 1   | INVALDATA | Reception-in-Progress Status Flag<br>0: Message valid<br>1: Message being updated   | R   |
| 2   | MSGLOST   | Message Lost Flag*1 *2<br>0: Message not overwritten or overrun<br>1: Message overwritten or overrun  | R/W |
| 3   | —         | This bit is read as 0. The write value should be 0.   | R/W |
| 4   | ONESHOT   | One-Shot Enable*2 *3<br>0: Disable one-shot reception<br>1: Enable one-shot reception   | R/W |

当RECREQ位设置为1时，相关邮箱配置为接收数据或远程帧。

当RECREQ位设置为0时，相关邮箱未配置为接收数据或远程帧。

由于硬件保护，RECREQ位在以下期间不能通过软件写入设置为0:

- 硬件保护从验收过滤处理开始 (CRC字段的开始)
- 硬件保护解除:
  - 对于指定接收传入消息的邮箱，在接收到的数据存储于邮箱中或发生CAN总线错误后。这意味着硬件保护的周期是从CRC字段的开始到EOF的第7位结束。

对于其他邮箱，接受过滤处理后  
如果没有指定邮箱接收消息，则在接受过滤处理之后。

将RECREQ位设置为1时，不要将TRMREQ位设置为1。要将邮箱配置从发送更改为接收，首先中止发送，然后在更改为接收之前将SENTDATA和TRMABT标志设置为0。

Note: MCTL\_TX[j].RECREQ是MCTL\_RX[j].RECREQ的镜像位。

**TRMREQ位 (发送邮箱请求)**

TRMREQ位选择表29.10中列出的发送模式。

当TRMREQ位设置为1时，相关邮箱配置为传输数据或远程帧。

当TRMREQ位设置为0时，相关邮箱未配置为传输数据或远程帧。

如果TRMREQ位从1更改为0以取消相关的发送请求，则TRMABT或SENTDATA标志设置为1。将TRMREQ位设置为1时，不要将RECREQ位设置为1。要更改邮箱从接收到发送，首先中止接收，然后将NEWDATA和MSGLOST标志设置为0，然后再更改为发送。

Note: MCTL\_TX[j].TRMREQ是MCTL\_RX[j].TRMREQ的镜像位。

**29.2.10 MCTL\_RX[j]:接收消息控制寄存器(j=0to31)**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x820 + 0x01 × j

|               |         |         |   |    |   |          |            |          |
|---------------|---------|---------|---|----|---|----------|------------|----------|
| Bit position: | 7       | 6       | 5 | 4  | 3 | 2        | 1          | 0        |
| Bit field:    | TRMR EQ | RECR EQ | — | 热门 | — | MSGL OST | INVAL DATA | NEWD ATA |
| 重置后的值:        | 0       | 0       | 0 | 0  | 0 | 0        | 0          | 0        |

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 0   | NEWDATA   | 接收完成标志*1*2<br>0: 未接收到数据，或标志位已写入0<br>1: 新消息正在存储或已存储在邮箱中 | R/W |
| 1   | INVALDATA | 接收中状态标志<br>0: 消息有效<br>1: 消息正在更新                        | R   |
| 2   | MSGLOST   | 消息丢失标志*1*2<br>0: 信息未被覆盖或溢出<br>1: 信息被覆盖或溢出              | R/W |
| 3   | —         | 该位读取为0。写入值应为0。   | R/W |
| 4   | ONESHOT   | One-Shot Enable*2 *3<br>0: 关闭一键接收<br>1: 打开一键接收         | R/W |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 5   | —      | This bit is read as 0. The write value should be 0.  | R/W |
| 6   | RECREQ | Receive Mailbox Request*2 *3 *4 *5<br>0: Do not configure for reception<br>1: Configure for reception  | R/W |
| 7   | TRMREQ | Transmit Mailbox Request*2 *4<br>0: Do not configure for transmission<br>1: Configure for transmission | R/W |

Note 1. Write 0 only. Writing 1 has no effect.

Note 2. When writing to bits of this register, write 1 to the NEWDATA and MSGLOST flags if they are not the write target.

Note 3. To enter one-shot receive mode, write 1 to the ONESHOT bit at the same time as setting the RECREQ bit to 1. To exit one-shot receive mode, write 0 to the ONESHOT bit after writing 0 to the RECREQ bit and confirming that it is 0.

Note 4. Do not set both the RECREQ and TRMREQ bits to 1.

Note 5. When setting the RECREQ bit to 0, set MSGLOST, NEWDATA, and RECREQ to 0 simultaneously.

MCTL\_RX[j] sets mailbox j to transmit or receive mode. In receive mode, MCTL\_RX[j] also controls and indicates the reception status. Do not access MCTL\_RX[j] if mailbox j is in transmit mode. Only write to the MCTL\_RX[j] in CAN operation or halt mode. Do not use MCTL\_RX24 to MCTL\_RX31 in FIFO mailbox mode.

#### NEWDATA flag (Reception Complete Flag)

The NEWDATA flag is set to 1 when a new message is being stored or was stored in the mailbox. Always set this bit to 1 simultaneously with the INVALIDDATA flag. The NEWDATA flag is set to 0 through a software write. The NEWDATA flag cannot be set to 0 through a software write while the associated INVALIDDATA flag is 1.

#### INVALIDDATA flag (Reception-in-Progress Status Flag)

After the completion of a message reception, the INVALIDDATA flag is set to 1 while the received message is updated in the associated mailbox. The INVALIDDATA flag is set to 0 immediately after the message is stored. If the mailbox is read while the INVALIDDATA flag is 1, the data is undefined.

#### MSGLOST flag (Message Lost Flag)

The MSGLOST flag is set to 1 when the mailbox is overwritten or overrun by a new received message while the NEWDATA flag is 1. The MSGLOST flag is set to 1 at the end of the 6th bit of EOF. The MSGLOST flag is set to 0 through a software write.

In both overwrite and overrun modes, the MSGLOST flag cannot be set to 0 through a software write during the 5 PCLKB cycles following the 6th bit of EOF.

#### ONESHOT bit (One-Shot Enable)

When the ONESHOT bit is set to 1 in receive mode (RECREQ = 1 and TRMREQ = 0), the mailbox receives a message only one time. The mailbox does not behave as a receive mailbox after having received a message one time. The behavior of the NEWDATA and INVALIDDATA flags is the same as in normal receive mode. In one-shot receive mode, the MSGLOST flag is not set to 1. To set the ONESHOT bit to 0, first write 0 to the RECREQ bit and ensure that it is 0.

#### RECREQ bit (Receive Mailbox Request)

The RECREQ bit selects receive modes listed in Table 29.10.

When the RECREQ bit is set to 1, the associated mailbox is configured for reception of a data or remote frame.

When the RECREQ bit is set to 0, the associated mailbox is not configured for reception of a data or remote frame.

Due to hardware protection, the RECREQ bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from the acceptance filter processing (the beginning of the CRC field)
- Hardware protection is released:
  - For the mailbox that is specified to receive the incoming message, after the received data is stored in the mailbox or a CAN bus error occurs. This means that the maximum period of hardware protection is from the beginning of the CRC field to the end of the 7th bit of EOF.
  - For the other mailboxes, after acceptance filter processing
  - If no mailbox is specified to receive the message, after acceptance filter processing.

| Bit | Symbol | Function                          | R/W |
|-----|--------|-----------------------------------|-----|
| 5   | —      | 该位读取为0。写入值应为0。                    | R/W |
| 6   | RECREQ | 接收邮箱请求*2*3*4*5<br>0: 不配置接收1: 配置接收 | R/W |
| 7   | TRMREQ | 发送邮箱请求*2*4<br>0: 不配置传输1: 配置传输     | R/W |

注1.只写0。写1无效。

注2.当写入该寄存器的位时，如果NEWDATA和MSGLOST标志不是写入目标，则向它们写入1。

注3.要进入一次性接收模式，请在将RECREQ位设置为1的同时向ONESHOT位写入1。要退出一次性接收模式，请在向RECREQ位写入0后向ONESHOT位写入0并确认它是0。

注4.不要将RECREQ和TRMREQ位都设置为1。

注5.将RECREQ位设置为0时，同时将MSGLOST、NEWDATA和RECREQ设置为0。

MCTL\_RX[j]将邮箱j设置为发送或接收模式。在接收模式下，MCTL\_RX[j]也控制和指示接收状态。如果邮箱j处于发送模式，则不要访问MCTL\_RX[j]。仅在CAN操作或暂停模式下写入MCTL\_RX[j]。不要在FIFO邮箱模式下使用MCTL\_RX24到MCTL\_RX31。

#### NEWDATA标志 (接收完成标志)

当新消息正在存储或已存储在邮箱中时，NEWDATA标志设置为1。始终将此位与INVALIDDATA标志同时设置为1。NEWDATA标志通过软件写入设置为0。当相关的INVALIDDATA标志为1时，不能通过软件写入将NEWDATA标志设置为0。

#### INVALIDDATA标志 (接收进行中状态标志)

消息接收完成后，INVALIDDATA标志设置为1，同时在相关邮箱中更新接收到的消息。INVALIDDATA标志在消息存储后立即设置为0。如果在INVALIDDATA标志为1时读取邮箱，则数据未定义。

#### MSGLOST标志 (消息丢失标志)

当邮箱被新收到的消息覆盖或溢出时，MSGLOST标志设置为1，而NEWDATA标志为1。MSGLOST标志在EOF的第6位末尾设置为1。MSGLOST标志通过软件写入设置为0。

在覆盖和溢出模式下，MSGLOST标志不能在EOF第6位之后的5个PCLKB周期内通过软件写入设置为0。

#### ONESHOT bit (One-Shot Enable)

在接收模式下 (RECREQ=1和TRMREQ=0) 将ONESHOT位设置为1时，邮箱只接收一次消息。邮箱在收到一次消息后不再充当接收邮箱。NEWDATA和INVALIDDATA标志的行为与正常接收模式相同。在单次接收模式下，MSGLOST标志不设置为1。要将ONESHOT位设置为0，首先将0写入RECREQ位并确保其为0。

#### RECREQ位 (接收邮箱请求)

RECREQ位选择表29.10中列出的接收模式。

当RECREQ位设置为1时，相关邮箱配置为接收数据或远程帧。

当RECREQ位设置为0时，相关邮箱未配置为接收数据或远程帧。

由于硬件保护，RECREQ位在以下期间不能通过软件写入设置为0:

- 硬件保护从验收过滤处理开始 (CRC字段的开始)
- 硬件保护解除:

对于指定接收传入消息的邮箱，在接收到的数据存储于邮箱中或发生CAN总线错误后。这意味着硬件保护的周期是从CRC字段的开始到EOF的第7位结束。

对于其他邮箱，接受过滤处理后

如果没有指定邮箱接收消息，则在接受过滤处理之后。

When setting the RECREQ bit to 1, do not set the TRMREQ bit to 1. To change the configuration of a mailbox from transmission to reception, first abort the transmission, then set the SENTDATA and TRMABT flags to 0 before changing to reception.

Note: MCTL\_RX[j].RECREQ is the mirror bit of MCTL\_TX[j].RECREQ.

**TRMREQ bit (Transmit Mailbox Request)**

The TRMREQ bit selects the transmit modes listed in Table 29.10.

When the TRMREQ bit is set to 1, the associated mailbox is configured for transmission of a data or remote frame.

When the TRMREQ bit is set to 0, the associated mailbox is not configured for transmission of a data or remote frame.

If the TRMREQ bit is changed from 1 to 0 to cancel the associated transmission request, either the TRMABT or SENTDATA flag is set to 1. When setting the TRMREQ bit to 1, do not set the RECREQ bit to 1. To change the configuration of a mailbox from reception to transmission, first abort the reception, then set the NEWDATA and MSGLOST flags to 0 before changing to transmission.

Note: MCTL\_RX[j].TRMREQ is the mirror bit of MCTL\_TX[j].TRMREQ.

**29.2.11 RFCR : Receive FIFO Control Register**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x848

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 0   | RFE        | Receive FIFO Enable<br>0: Disable receive FIFO<br>1: Enable receive FIFO  | R/W |
| 3:1 | RFUST[2:0] | Receive FIFO Unread Message Number Status<br>0 0 0: No unread message<br>0 0 1: 1 unread message<br>0 1 0: 2 unread messages<br>0 1 1: 3 unread messages<br>1 0 0: 4 unread messages<br>1 0 1: Reserved<br>1 1 0: Reserved<br>1 1 1: Reserved | R   |
| 4   | RFMLF      | Receive FIFO Message Lost Flag<br>0: Receive FIFO message not lost<br>1: Receive FIFO message lost  | R/W |
| 5   | RFFST      | Receive FIFO Full Status Flag<br>0: Receive FIFO not full<br>1: Receive FIFO full (4 unread messages)   | R   |
| 6   | RFWST      | Receive FIFO Buffer Warning Status Flag<br>0: Receive FIFO is not buffer warning<br>1: Receive FIFO is buffer warning (3 unread messages)   | R   |
| 7   | RFEST      | Receive FIFO Empty Status Flag<br>0: Unread message in receive FIFO<br>1: No unread message in receive FIFO   | R   |

Write to RFCR in CAN operation or halt mode.

**RFE bit (Receive FIFO Enable)**

When the RFE bit is set to 1, the receive FIFO is enabled.

将RECREQ位设置为1时，不要将TRMREQ位设置为1。要将邮箱配置从发送更改为接收，首先中止发送，然后在更改为接收之前将SENTDATA和TRMABT标志设置为0。

Note: MCTL\_RX[j].RECREQ是MCTL\_TX[j].RECREQ的镜像位。

**TRMREQ位 (发送邮箱请求)**

TRMREQ位选择表29.10中列出的发送模式。

当TRMREQ位设置为1时，相关邮箱配置为传输数据或远程帧。

当TRMREQ位设置为0时，相关邮箱未配置为传输数据或远程帧。

如果TRMREQ位从1更改为0以取消相关的发送请求，则TRMABT或SENTDATA标志设置为1。将TRMREQ位设置为1时，不要将RECREQ位设置为1。要更改邮箱从接收到发送，首先中止接收，然后将NEWDATA和MSGLOST标志设置为0，然后再更改为发送。

Note: MCTL\_RX[j].TRMREQ是MCTL\_TX[j].TRMREQ的镜像位。

**29.2.11 RFCR：接收FIFO控制寄存器**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x848

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 0   | RFE        | 接收FIFO使能<br>0: 禁用接收FIFO1: 启用接收FIFO   | R/W |
| 3:1 | RFUST[2:0] | 接收FIFO未读消息编号状态<br>000: 没有未读消息001: 1条未读消息010: 2条未读消息011: 3条未读消息100: 4条未读消息101: 保留110: 保留111: 保留 | R   |
| 4   | RFMLF      | 接收FIFO消息丢失标志<br>0: 接收FIFO报文不丢失1: 接收FIFO报文丢失  | R/W |
| 5   | RFFST      | 接收FIFO满状态标志<br>0: 接收FIFO未读满1: 接收FIFO已读满 (4个未读消息)   | R   |
| 6   | RFWST      | 接收FIFO缓冲区警告状态标志<br>0: 接收FIFO不是缓冲区警告1: 接收FIFO是缓冲区警告 (3个未读消息)                                    | R   |
| 7   | RFEST      | 接收FIFO空状态标志<br>0: 接收FIFO中有未读报文1: 接收FIFO中没有未读报文   | R   |

在CAN操作或暂停模式下写入RFCR。

**RFE bit (Receive FIFO Enable)**

当RFE位设置为1时，启用接收FIFO。

When the RFE bit is set to 0, the receive FIFO is disabled for reception and becomes empty (RFEST bit = 1). Write 0 to the RFE bit simultaneously with the RFMLF flag setting.

Do not set this bit to 1 in normal mailbox mode (MBM bit in CTLR = 0). Due to hardware protection, the RFE bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from acceptance filter processing (the beginning of the CRC field)
- When hardware protection is released:
  - If the receive FIFO is specified to receive the incoming message, after the received data is stored in the receive FIFO or a CAN bus error occurs. This means that the maximum period of hardware protection is from the beginning of the CRC field to the end of the 7th bit of EOF.
  - If the receive FIFO is not specified to receive the message, after acceptance filter processing.

#### RFUST[2:0] bits (Receive FIFO Unread Message Number Status)

The RFUST[2:0] bits indicate the number of unread messages in the receive FIFO. The value of the RFUST[2:0] bits are initialized to 000b when the RFE bit is set to 0.

#### RFMLF flag (Receive FIFO Message Lost Flag)

The RFMLF flag is set to 1 (receive FIFO message lost) when the receive FIFO receives a new message and is full. It is set to 1 at the end of the 6th bit of EOF.

The RFMLF flag is set to 0 through a software write. Writing 1 has no effect. In both overwrite and overrun modes, if the receive FIFO is full and determined to have received a message, the RFMLF flag cannot be set to 0 (no receive FIFO message lost) through a software write during the 5 PCLKB cycles following the 6th bit of EOF.

#### RFFST flag (Receive FIFO Full Status Flag)

The RFFST flag is set to 1 (receive FIFO is full) when the number of unread messages in the receive FIFO is 4. The flag is 0 (receive FIFO is not full) when the number of unread messages in the receive FIFO is less than 4. The flag is set to 0 when the RFE bit is 0.

#### RFWST flag (Receive FIFO Buffer Warning Status Flag)

The RFWST flag is set to 1 (receive FIFO is a buffer warning) when the number of unread messages in the receive FIFO is 3. The flag is 0 (receive FIFO is not a buffer warning) when the number of unread messages in the receive FIFO is less than 3 or equal to 4. The RFWST flag is set to 0 when the RFE bit is 0.

#### RFEST flag (Receive FIFO Empty Status Flag)

The RFEST flag is set to 1 (no unread message in receive FIFO) when the number of unread messages in the receive FIFO is 0. The flag is set to 1 when the RFE bit is set to 0. The flag is set to 0 (unread message in receive FIFO) when the number of unread messages in the receive FIFO is one or more.

Figure 29.2 shows the receive FIFO mailbox operation.

当RFE位设置为0时，接收FIFO禁止接收并变为空（RFEST位=1）。将0写入RFE位与RFMLF标志设置同时进行。

在正常邮箱模式下不要将此位设置为1（CTLR中的MBM位=0）。由于硬件保护，RFE位在以下期间不能通过软件写入设置为0：

- 硬件保护从验收过滤处理开始（CRC字段的开始）
- 硬件保护解除时：
  - 如果指定接收FIFO接收传入报文，则在接收到的数据存储在接收FIFO中或发生CAN总线错误后。这意味着硬件保护的最大周期是从CRC字段的开始到EOF的第7位结束。

如果接收FIFO未指定接收报文，则在接受过滤处理之后。

#### RFUST[2:0]位（接收FIFO未读消息编号状态）

RFUST[2:0]位指示接收FIFO中未读消息的数量。当RFE位设置为0时，RFUST[2:0]位的值被初始化为000b。

#### RFMLF标志（接收FIFO消息丢失标志）

当接收FIFO接收到新消息并已满时，RFMLF标志设置为1（接收FIFO消息丢失）。它在EOF的第6位末尾设置为1。

RFMLF标志通过软件写入设置为0。写1无效。在覆盖和溢出模式下，如果接收FIFO已满并确定已接收到消息，则RFMLF标志不能通过软件在第6位之后的5个PCLKB周期内通过软件写入设置为0（没有接收FIFO消息丢失）。EOF。

#### RFFST标志（接收FIFO满状态标志）

当接收FIFO中未读消息数为4时，RFFST标志设置为1（接收FIFO已满）。当接收FIFO中未读消息数小于4。当RFE位为0时，标志设置为0。

#### RFWST标志（接收FIFO缓冲区警告状态标志）

当接收FIFO中的未读报文数为3时，RFWST标志设置为1（接收FIFO为缓冲区警告）。当接收中未读报文数为0时，该标志为0（接收FIFO不是缓冲区警告）FIFO小于3或等于4。当RFE位为0时，RFWST标志设置为0。

#### RFEST标志（接收FIFO空状态标志）

当接收FIFO中的未读报文数为0时，RFEST标志设置为1（接收FIFO中没有未读报文）。当RFE位设置为0时，该标志设置为1。该标志设置为0（接收FIFO中的未读消息）当接收FIFO中的未读消息数为1或多个时。

图29.2显示了接收FIFO邮箱操作。

Figure 29.2 Receive FIFO mailbox operation when bits [29] and [28] in MIER\_FIFO = 01b or 11b

29.2.12 RFPCR : Receive FIFO Pointer Control Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x849

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 7:0 | n/a    | The CPU pointer for the receive FIFO is incremented by writing 0xFF to RFPCR. | W   |

When the receive FIFO is not empty, write 0xFF to RFPCR through software to increment the CPU pointer to the next mailbox location. Do not write to RFPCR when the RFE bit in RFCR is 0 (receive FIFO disabled).

Both the CAN and CPU pointers are incremented when a new message is received and the RFFST flag is 1 (receive FIFO is full) in overwrite mode. When the RFMLF flag is 1 in this condition, the CPU pointer does not increment on a software write to RFPCR.

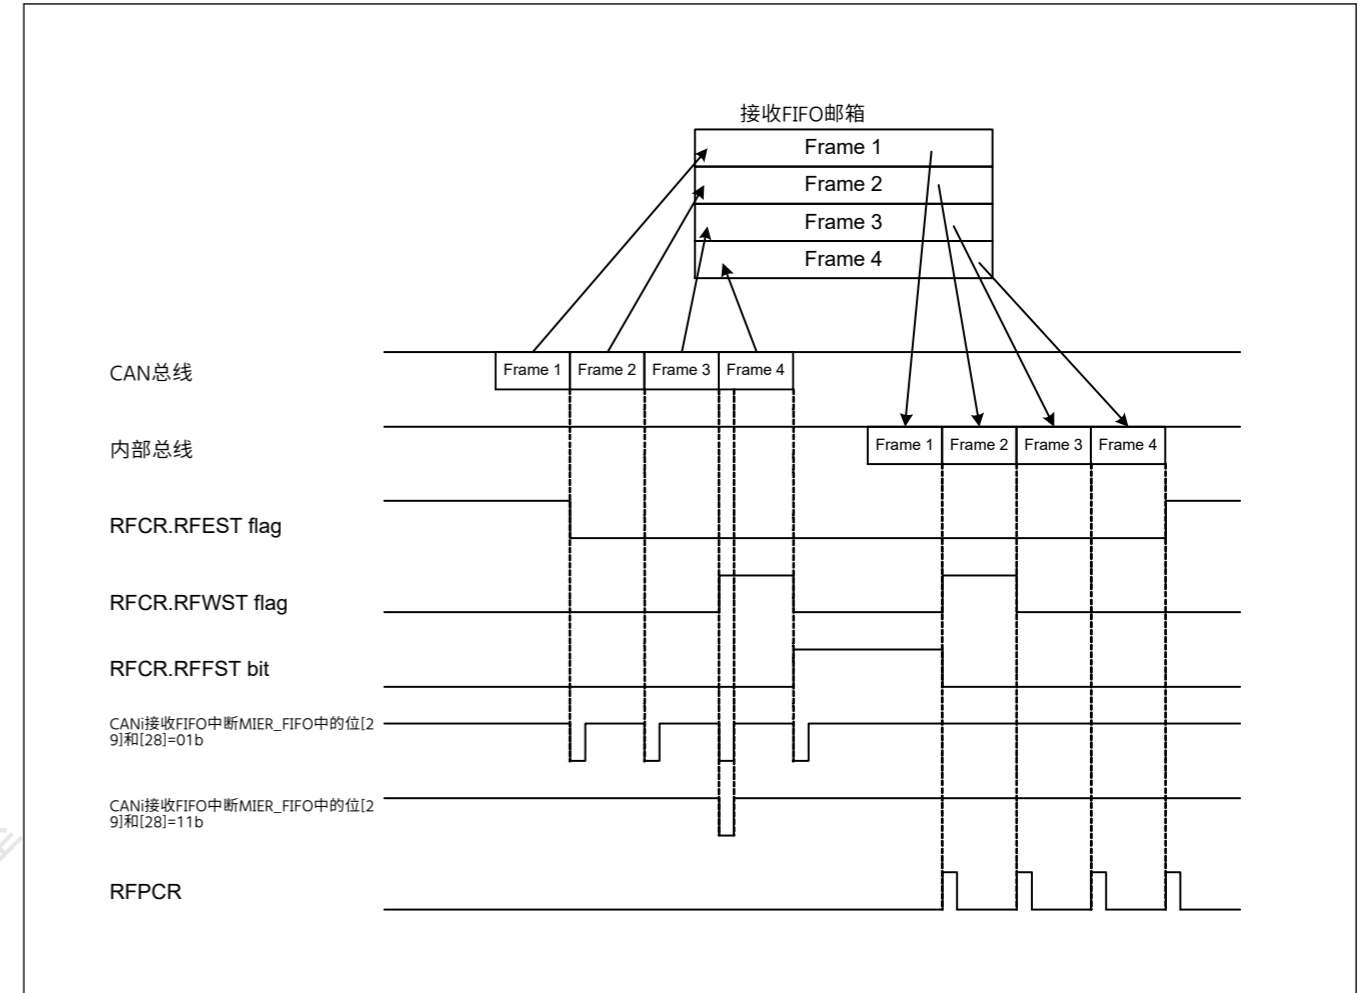

Figure 29.2 当MIER\_FIFO中的位[29]和[28]=01b或11b时接收FIFO邮箱操作

29.2.12 RFPCR：接收FIFO指针控制寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x849

| Bit | Symbol | Function                       | R/W |
|-----|--------|--------------------------------|-----|
| 7:0 | n/a    | 通过将0xFF写入RFPCR，接收FIFO的CPU指针递增。 | W   |

当接收FIFO不为空时，通过软件向RFPCR写入0xFF以使CPU指针递增到下一个邮箱位置。当RFCR中的RFE位为0（禁用接收FIFO）时，不要写入RFPCR。

当接收到新消息并且在覆盖模式下RFFST标志为1（接收FIFO已满）时，CAN和CPU指针都会递增。在这种情况下，当RFMLF标志为1时，CPU指针不会在软件写入RFPCR时递增。

## 29.2.13 TFCR : Transmit FIFO Control Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84A

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 0   | TFE        | Transmit FIFO Enable<br>0: Disable transmit FIFO<br>1: Enable transmit FIFO  | R/W |
| 3:1 | TFUST[2:0] | Transmit FIFO Unsent Message Number Status<br>0 0 0: 0 unsent messages<br>0 0 1: 1 unsent message<br>0 1 0: 2 unsent messages<br>0 1 1: 3 unread messages<br>1 0 0: 4 unread messages<br>1 0 1: Reserved<br>1 1 0: Reserved<br>1 1 1: Reserved | R   |
| 5:4 | —          | These bits are read as 0. The write value should be 0.   | R/W |
| 6   | TFFST      | Transmit FIFO Full Status<br>0: Transmit FIFO not full<br>1: Transmit FIFO full (4 unsent messages)  | R   |
| 7   | TFEST      | Transmit FIFO Empty Status<br>0: Unsent message in transmit FIFO<br>1: No unsent message in transmit FIFO  | R   |

Write to TFCR in CAN operation or halt mode.

**TFE bit (Transmit FIFO Enable)**

Setting the TFE bit set to 1 enables the transmit FIFO. Setting the TFE bit to 0 empties the transmit FIFO (TFEST bit = 1), and unsent messages in the transmit FIFO are lost in the following ways:

- Immediately if a message from the transmit FIFO is not scheduled for the next transmission or is already in transmission
- On completion of transmission, on a CAN bus error, CAN bus arbitration-lost, or entry to CAN halt mode, if a message from the transmit FIFO is scheduled for the next transmission or is already in transmission.

Before setting the TFE bit to 1 again, ensure that the TFEST bit is set to 1. After setting the TFE bit to 1, write transmit data to mailbox 24.

Do not set the TFE bit to 1 in normal mailbox mode (MBM bit in CTRL = 0).

**TFUST[2:0] bits (Transmit FIFO Unsent Message Number Status)**

The TFUST[2:0] bits indicate the number of unsent messages in the transmit FIFO. These bits are set to 000b after the TFE bit is set to 0 and transmission is aborted or completes.

**TFFST bit (Transmit FIFO Full Status)**

The TFFST bit is set to 1 (transmit FIFO is full) when the number of unsent messages in the transmit FIFO is 4. The TFFST bit is set to 0 (transmit FIFO is not full) when the number of unsent messages in the transmit FIFO is less than 4. The TFFST bit is set to 0 when transmission from the transmit FIFO is aborted.

## 29.2.13 TFCR:发送FIFO控制寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84A

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 0   | TFE        | 发送FIFO使能<br>0: 禁用发送FIFO<br>1: 启用发送FIFO   | R/W |
| 3:1 | TFUST[2:0] | 发送FIFO未发送消息编号状态<br>000: 0条未发送消息<br>001: 1条未发送消息<br>010: 2条未发送消息<br>011: 3条未读消息<br>100: 4条未读消息<br>101: 保留<br>110: 保留<br>111: 保留 | R   |
| 5:4 | —          | 这些位被读取为0。写入值应为0。   | R/W |
| 6   | TFFST      | 发送FIFO满状态<br>0: 发送FIFO未满<br>1: 发送FIFO已满 (4个未发送消息)  | R   |
| 7   | TFEST      | 发送FIFO空状态<br>0: 发送FIFO中未发送消息<br>1: 发送FIFO中没有未发送消息  | R   |

在CAN操作或暂停模式下写入TFCR。

**TFE bit (Transmit FIFO Enable)**

将TFE位设置为1会启用发送FIFO。将TFE位设置为0会清空发送FIFO (TFEST位=1)，发送FIFO中未发送的消息会通过以下方式丢失:

- 如果来自发送FIFO的消息未安排下一次发送或已在发送中，则立即发送
- 在传输完成、CAN总线错误、CAN总线仲裁丢失或进入CAN暂停模式时，如果来自传输FIFO的消息被安排用于下一次传输或已经在传输中。

再次将TFE位设置为1之前，请确保TFEST位设置为1。将TFE位设置为1后，将发送数据写入邮箱24。

不要在正常邮箱模式下将TFE位设置为1 (CTRL中的MBM位=0)。

**TFUST[2:0]位 (发送FIFO未发送消息编号状态)**

TFUST[2:0]位指示发送FIFO中未发送消息的数量。在TFE位设置为0并且传输被中止或完成后，这些位设置为000b。

**TFFST位 (发送FIFO满状态)**

当发送FIFO中未发送消息的数量为4时，TFFST位设置为1 (发送FIFO已满)。当发送FIFO中未发送消息的数量为4时，TFFST位设置为0 (发送FIFO未满) 小于4。当来自发送FIFO的发送被中止时，TFFST位设置为0。

**TFEST bit (Transmit FIFO Empty Status)**

The TFEST bit is set to 1 (no message in transmit FIFO) when the number of unsent messages in the transmit FIFO is 0. The TFEST bit is set to 1 when transmission from the transmit FIFO is aborted. The TFEST bit is set to 0 (message in transmit FIFO) when the number of unsent messages in the transmit FIFO is not 0.

Figure 29.3 shows the transmit FIFO mailbox operation.

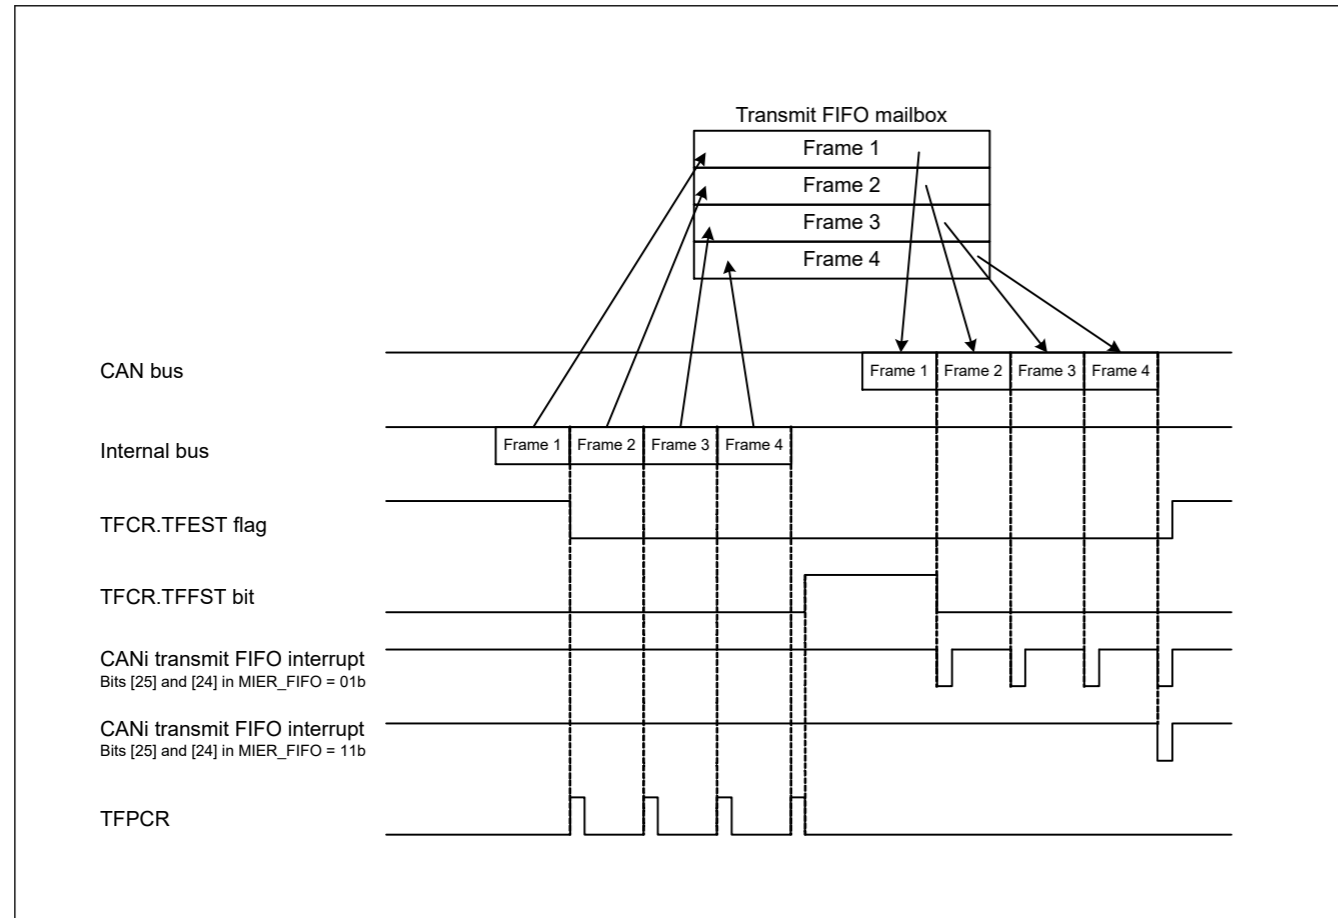

Figure 29.3 Transmit FIFO mailbox operation when bits [25] and [24] in MIER\_FIFO = 01b or 11b

**29.2.14 TFPCR : Transmit FIFO Pointer Control Register**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84B

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 7:0 | n/a    | The CPU pointer for the transmit FIFO is incremented by writing 0xFF to TFPCR. | W   |

When the transmit FIFO is not full, write 0xFF to TFPCR through software to increment the CPU pointer for the transmit FIFO to the next mailbox location.

Do not write to TFPCR when the TFE bit in TFCR is 0 (transmit FIFO disabled).

**TFEST位 (发送FIFO空状态)**

当发送FIFO中未发送消息的数量为0时，TFEST位设置为1（发送FIFO中没有消息）。当来自发送FIFO的发送被中止时，TFEST位设置为1。当发送FIFO中未发送消息的数量不为0时，TFEST位设置为0（发送FIFO中的消息）。

图29.3显示了发送FIFO邮箱操作。

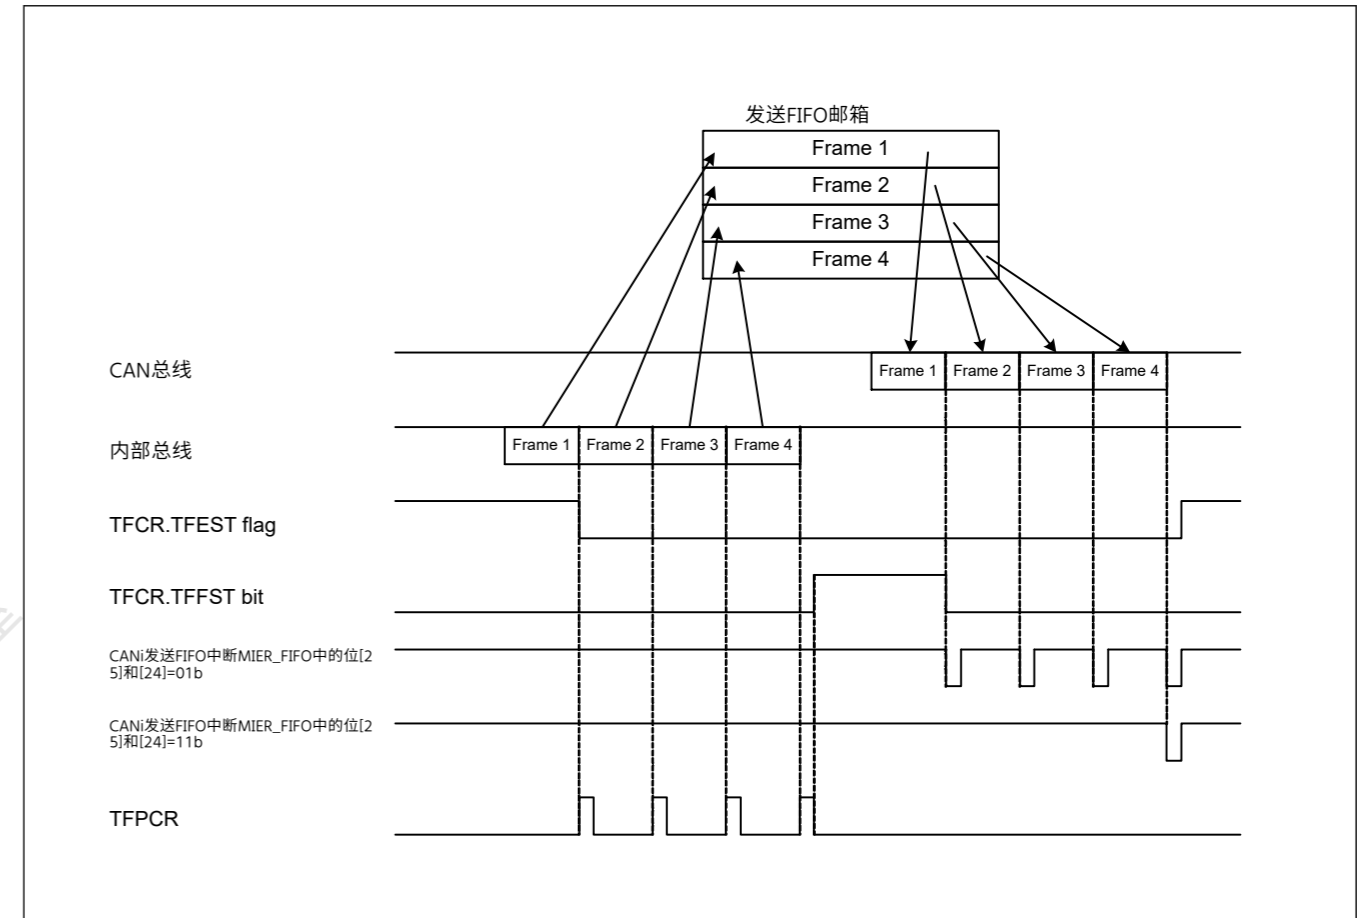

Figure 29.3 当MIER\_FIFO中的位[25]和[24]=01b或11b时发送FIFO邮箱操作

**29.2.14 TFPCR: 发送FIFO指针控制寄存器**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84B

| Bit | Symbol | Function                       | R/W |
|-----|--------|--------------------------------|-----|
| 7:0 | n/a    | 通过将0xFF写入TFPCR，发送FIFO的CPU指针递增。 | W   |

当发送FIFO未满载时，通过软件向TFPCR写入0xFF以增加发送的CPU指针FIFO到下一个邮箱位置。

当TFCR中的TFE位为0（禁用发送FIFO）时，不要写入TFPCR。

## 29.2.15 STR : Status Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

| Bit | Symbol | Function               | R/W |
|-----|--------|------------------------|-----|
| 15  | —      | This bit is read as 0. | R   |

**NDST flag (NEWDATA Status Flag)**

The NDST flag is set to 1 when at least one NEWDATA flag in MCTL\_RX[j] (j = 0 to 31) is 1, regardless of the value of MIER or MIER\_FIFO. The NDST flag is set to 0 when all NEWDATA flags are 0.

**SDST flag (SENTDATA Status Flag)**

The SDST flag is set to 1 when at least one SENTDATA flag in MCTL\_TX[j] (j = 0 to 31) is 1, regardless of the value of MIER or MIER\_FIFO. The SDST flag is set to 0 when all SENTDATA flags are 0.

**RFST flag (Receive FIFO Status Flag)**

The RFST flag is set to 1 when the receive FIFO is not empty. The RFST flag is set to 0 when the receive FIFO is empty or normal mailbox mode is selected.

**TFST flag (Transmit FIFO Status Flag)**

The TFST flag is set to 1 when the transmit FIFO is not full. The TFST flag is set to 0 when the transmit FIFO is full or normal mailbox mode is selected.

**NMLST flag (Normal Mailbox Message Lost Status Flag)**

The NMLST flag is set to 1 when at least one MSGLOST flag in MCTL\_RX[j] (j = 0 to 31) is 1, regardless of the value of MIER or MIER\_FIFO. The NMLST flag is set to 0 when all MSGLOST flags are 0.

**FMLST flag (FIFO Mailbox Message Lost Status Flag)**

The FMLST flag is set to 1 when the RFMLF flag in RFCR is 1, regardless of the value of MIER\_FIFO. The FMLST flag is set to 0 when the RFMLF flag is 0.

**TABST flag (Transmission Abort Status Flag)**

The TABST flag is set to 1 when at least one TRMABT flag in MCTL\_TX[j] (j = 0 to 31) is 1, regardless of the value of MIER or MIER\_FIFO. The TABST flag is set to 0 when all TRMABT flags are 0.

**EST flag (Error Status Flag)**

The EST flag is set to 1 when at least one error is detected by EIFR, regardless of the value of EIER. The EST flag is set to 0 when no error is detected by EIFR.

**RSTST flag (CAN Reset Status Flag)**

The RSTST flag is set to 1 when the CAN module is in CAN reset mode. The RSTST flag is 0 when the CAN module is not in CAN reset mode. Even when the state changes from CAN reset mode to CAN sleep mode, the flag remains 1.

**HLTST flag (CAN Halt Status Flag)**

The HLTST flag is set to 1 when the CAN module is in CAN halt mode. The HLTST is set to 0 when the CAN module is not in CAN halt mode. Even when the state changes from CAN halt mode to CAN sleep mode, the flag remains 1.

**SLPST flag (CAN Sleep Status Flag)**

The SLPST flag is set to 1 when the CAN module is in CAN sleep mode. The SLPST flag is set to 0 when the CAN module is not in CAN sleep mode.

**EPST flag (Error-Passive Status Flag)**

The EPST flag is set to 1 when the value of TECR or RECR exceeds 127 and the CAN module is in the error-passive state ( $128 \leq \text{TEC} < 256$  or  $128 \leq \text{REC} < 256$ ). The EPST flag is set to 0 when the CAN module is not in the error-passive state.

**BOST flag (Bus-Off Status Flag)**

The BOST flag is set to 1 when the value of TECR exceeds 255 and the CAN module is in the bus-off state ( $\text{TEC} \geq 256$ ). The BOST flag is set to 0 when the CAN module is not in the bus-off state.

| Bit | Symbol | Function | R/W |
|-----|--------|----------|-----|
| 15  | —      | 该位读为0。   | R   |

**NDST标志 (NEWDATA状态标志)**

当MCTL\_RX[j](j=0到31)中的至少一个NEWDATA标志为1时，NDST标志设置为1，无论MIER或MIER\_FIFO。当所有NEWDATA标志为0时，NDST标志设置为0。

**SDST标志 (SENTDATA状态标志)**

当MCTL\_TX[j](j=0到31)中的至少一个SENTDATA标志为1时，SDST标志设置为1，无论MIER或MIER\_FIFO。当所有SENTDATA标志为0时，SDST标志设置为0。

**RFST标志 (接收FIFO状态标志)**

当接收FIFO不为空时，RFST标志设置为1。当接收FIFO为空或选择正常邮箱模式时，RFST标志设置为0。

**TFST标志 (发送FIFO状态标志)**

当发送FIFO未滿时，TFST标志设置为1。当发送FIFO已滿或选择正常邮箱模式时，TFST标志设置为0。

**NMLST标志 (普通邮箱消息丢失状态标志)**

当MCTL\_RX[j](j=0到31)中的至少一个MSGLOST标志为1时，NMLST标志设置为1，无论MIER或MIER\_FIFO。当所有MSGLOST标志为0时，NMLST标志设置为0。

**FMLST标志 (FIFO邮箱消息丢失状态标志)**

当RFCR中的RFMLF标志为1时，无论MIER\_FIFO的值如何，FMLST标志都设置为1。当RFMLF标志为0时，FMLST标志设置为0。

**TABST标志 (传输中止状态标志)**

当MCTL\_TX[j](j=0到31)中的至少一个TRMABT标志为1时，TABST标志设置为1，无论MIER或MIER\_FIFO。当所有TRMABT标志为0时，TABST标志设置为0。

**EST标志 (错误状态标志)**

当EIFR检测到至少一个错误时，无论EIER的值如何，EST标志设置为1。当EIFR未检测到错误时，EST标志设置为0。

**RSTST标志 (CAN复位状态标志)**

当CAN模块处于CAN复位模式时，RSTST标志设置为1。当CAN模块未处于CAN复位模式时，RSTST标志为0。即使状态从CAN复位模式更改为CAN睡眠模式，该标志仍保持为1。

**HLTST标志 (CAN停止状态标志)**

当CAN模块处于CAN暂停模式时，HLTST标志设置为1。当CAN模块未处于CAN暂停模式时，HLTST设置为0。即使状态从CAN停止模式更改为CAN睡眠模式，该标志仍保持为1。

**SLPST标志 (CAN睡眠状态标志)**

当CAN模块处于CAN睡眠模式时，SLPST标志设置为1。当CAN模块未处于CAN睡眠模式时，SLPST标志设置为0。

**EPST标志 (错误被动状态标志)**

当TECR或RECR的值超过127并且CAN模块处于错误被动状态 ( $128 \leq \text{TEC} < 256$  或  $128 \leq \text{REC} < 256$ ) 时，EPST标志设置为1。当CAN模块不处于被动错误状态时，EPST标志设置为0。

**BOST标志 (总线关闭状态标志)**

当TECR的值超过255并且CAN模块处于总线关闭状态 ( $\text{TEC} \geq 256$ ) 时，BOST标志设置为1。当CAN模块不处于总线关闭状态时，BOST标志设置为0。

**TRMST flag (Transmit Status Flag)**

The TRMST flag is set to 1 when the CAN module performs as a transmitter node or is in the bus-off state. The TRMST flag is set to 0 when the CAN module performs as a receiver node or is in the bus-idle state.

**RECST flag (Receive Status Flag)**

The RECST flag is set to 1 when the CAN module performs as a receiver node. The RECST flag is set to 0 when the CAN module performs as a transmitter node or is in the bus-idle state.

**29.2.16 MSMR : Mailbox Search Mode Register**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x853

|                    |   |   |   |   |   |   |           |   |

| 7:2 | —         | These bits are read as 0. The write value should be 0.   | R/W |

Write to MSMR in CAN operation or halt mode.

**MBSM[1:0] bits (Mailbox Search Mode Select)**

The MBSM[1:0] bits select the search mode for the mailbox search function.

When the MBSM[1:0] bits are 00b, receive mailbox search mode is selected. In this mode, the search targets are the NEWDATA flag in MCTL\_RX[j] (j = 0 to 31) for the normal mailbox and the RFEST flag in RFCR.

When the MBSM[1:0] bits are 01b, transmit mailbox search mode is selected. In this mode, the search target is the SENTDATA flag in MCTL\_TX[j].

When the MBSM[1:0] bits are 10b, message lost search mode is selected. In this mode, the search targets are the MSGLOST flag in MCTL\_RX[j] for the normal mailbox and the RFMLF flag in RFCR.

When the MBSM[1:0] bits are 11b, channel search mode is selected. In this mode, the search target is CSSR. See [section 29.2.18. CSSR : Channel Search Support Register](#).

**29.2.17 MSSR : Mailbox Search Status Register**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x852

|                    |      |   |   |            |   |   |   |   |

| 7:2 | —         | 这些位被读取为0。写入值应为0。   | R/W |

在CAN操作或暂停模式下写入MSMR。

**MBSM[1:0]位 (邮箱搜索模式选择)**

MBSM[1:0]位选择邮箱搜索功能的搜索模式。

当MBSM[1:0]位为00b时，选择接收邮箱搜索模式。在这种模式下，搜索目标是MCTL\_RX[j]中的NEWDATA标志 (j=0到31) 用于普通邮箱和RFCR中的RFEST标志。

当MBSM[1:0]位为01b时，选择发送邮箱搜索模式。在这种模式下，搜索目标是MCTL\_TX[j]中的SENTDATA标志。

当MBSM[1:0]位为10b时，选择消息丢失搜索模式。在这种模式下，搜索目标是正常邮箱的MCTL\_RX[j]中的MSGLOST标志和RFCR中的RFMLF标志。

当MBSM[1:0]位为11b时，选择频道搜索模式。在这种模式下，搜索目标是CSSR。请参阅第29.2.18节。CSSR：频道搜索支持寄存器。

**29.2.17 MSSR: 邮箱搜索状态寄存器**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x852

|               |      |   |   |            |   |   |   |   |

|-----|------------|--|-----|
| 4:0 | MBNST[4:0] | 搜索结果邮箱号码状态<br>这些位输出在MSMR中选择的每个搜索模式中找到的最小邮箱号。 | R   |
| 6:5 | —          | 这些位读为0。                                      | R   |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 7   | SEST   | Search Result Status<br>0: Search result found<br>1: No search result | R   |

**MBNST[4:0] bits (Search Result Mailbox Number Status)**

In all mailbox search modes, the MBNST[4:0] bits output the smallest found mailbox number. In receive mailbox search mode, transmit mailbox search mode, and message lost search mode, the value of the mailbox (the search result to be output) is updated under the following conditions:

- When the associated NEWDATA, SENTDATA, or MSGLOST flag is set to 0 for a mailbox output by MBNST[4:0]
- When the associated NEWDATA, SENTDATA, or MSGLOST flag is set to 1 for a mailbox with a smaller number than that in MBNST[4:0]

If the MBSM[1:0] bits are set to 00b (receive mailbox search mode) or 10b (message lost search mode), the receive FIFO (mailbox 28) is output when it is not empty and there are no unread received messages and no lost messages in any of the normal mailboxes 0 to 23. If the MBSM[1:0] bits are set to 01b (transmit mailbox search mode), the transmit FIFO (mailbox 24) is not output. Table 29.6 lists the behavior of the MBNST[4:0] bits in FIFO mailbox mode.

In channel search mode, the MBNST[4:0] bits output the associated channel number. After MSSR is read by software, the next target channel number is output.

**SEST bit (Search Result Status)**

The SEST bit is set to 1 (no search result) when no associated mailbox is found after searching all mailboxes. For example, in transmit mailbox search mode, the SEST bit is set to 1 when no SENTDATA flag is 1 for any mailbox. The SEST bit is set to 0 when at least one SENTDATA flag is 1. When the SEST bit is 1, the value of the MBNST[4:0] bits is undefined.

**Table 29.6 Behavior of MBNST[4:0] bits in FIFO mailbox mode**

| MBSM[1:0] bits | Mailbox 24 (transmit FIFO) | Mailbox 28 (receive FIFO)  |
|----------------|----------------------------|--|
| 00b            | Mailbox 24 is not output.  | Mailbox 28 is output when no MCTL_RX[j].NEWDATA flag for the normal mailboxes is set to 1 (new message is being stored or was stored in the mailbox) and the receive FIFO is not empty.                            |
| 01b            |                            | Mailbox 28 is not output.  |
| 10b            |                            | Mailbox 28 is output when no MCTL_RX[j].MSGLOST flag for the normal mailboxes is set to 1 (message is overwritten or overrun) and the RFCR.RFMLF flag is set to 1 (receive FIFO message lost) in the receive FIFO. |
| 11b            |                            | Mailbox 28 is not output.  |

**29.2.18 CSSR : Channel Search Support Register**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x851

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 7:0 | n/a    | When the value for the channel search is input, the channel number is output to MSSR. | R/W |

The bits that are set to 1 in CSSR, are encoded by an 8/3 encoder (the LSB position has the higher priority) and output to the MBNST[4:0] bits in MSSR. MSSR outputs the updated value whenever it is read by software.

Write to CSSR only when the MSRM.MBSM[1:0] bits are 11b (channel search mode). Write to CSSR in CAN operation mode or CAN halt mode.

Figure 29.4 shows the write and read operations of the CSSR and MSSR registers.

| Bit | Symbol | Function                         | R/W |
|-----|--------|----------------------------------|-----|
| 7   | SEST   | 搜索结果状态<br>0: 找到搜索结果<br>1: 没有搜索结果 | R   |

**MBNST[4:0]位 (搜索结果邮箱号码状态)**

在所有邮箱搜索模式中，MBNST[4:0]位输出找到的最小邮箱号。在接收邮箱搜索模式、发送邮箱搜索模式和消息丢失搜索模式下，邮箱的值（要输出的搜索结果）在以下条件下更新：

- 当MBNST[4:0]为邮箱输出的相关NEWDATA、SENTDATA或MSGLOST标志设置为0时
- 当邮箱的相关NEWDATA、SENTDATA或MSGLOST标志设置为1时，邮箱的编号小于MBNST[4:0]中的编号

如果MBSM[1:0]位设置为00b（接收邮箱搜索模式）或10b（邮件丢失搜索模式），则在接收FIFO（邮箱28）不为空且没有未读接收到的消息时输出在任何正常邮箱0到23中都没有丢失消息。如果MBSM[1:0]位设置为01b（发送邮箱搜索模式），则不输出发送FIFO（邮箱24）。表29.6列出了MBNST[4:0]位在FIFO邮箱模式下的行为。

在频道搜索模式下，MBNST[4:0]位输出相关的频道号。软件读取MSSR后，输出下一个目标通道号。

**SEST位 (搜索结果状态)**

当搜索所有邮箱后未找到相关邮箱时，SEST位设置为1（无搜索结果）。例如，在发送邮箱搜索模式中，当没有任何邮箱的SENTDATA标志为1时，SEST位设置为1。当至少一个SENTDATA标志为1时，SEST位设置为0。当SEST位为1时，MBNST[4:0]位的值未定义。

**Table 29.6 FIFO邮箱模式下MBNST[4:0]位的行为**

| MBSM[1:0] bits | Mailbox 24 (transmit FIFO) | Mailbox 28 (receive FIFO)   |
|----------------|----------------------------|---|
| 00b            | 邮箱24不输出。                   | 当正常邮箱的MCTL_RX[j].NEWDATA标志未设置为1（新消息正在存储或已存储在邮箱中）且接收FIFO不为空时，输出邮箱28。                     |
| 01b            |                            | 邮箱28不输出。  |
| 10b            |                            | 当正常邮箱的MCTL_RX[j].MSGLOST标志未设置为1（消息被覆盖或溢出）且接收FIFO中的RFCR.RFMLF标志设置为1（接收FIFO消息丢失）时，输出邮箱28。 |
| 11b            |                            | 邮箱28不输出。  |

**29.2.18 CSSR: 频道搜索支持注册**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x851

| Bit | Symbol | Function               | R/W |
|-----|--------|------------------------|-----|
| 7:0 | n/a    | 输入频道搜索的值时，频道号将输出到MSSR。 | R/W |

CSSR中设置为1的位由8/3编码器（LSB位置具有较高优先级）编码并输出到MSSR中的MBNST[4:0]位。每当软件读取时，MSSR就会输出更新的值。

仅当MSRM.MBSM[1:0]位为11b（通道搜索模式）时才写入CSSR。在CAN操作模式或CAN暂停模式下写入CSSR。

图29.4显示了CSSR和MSSR寄存器的写和读操作。

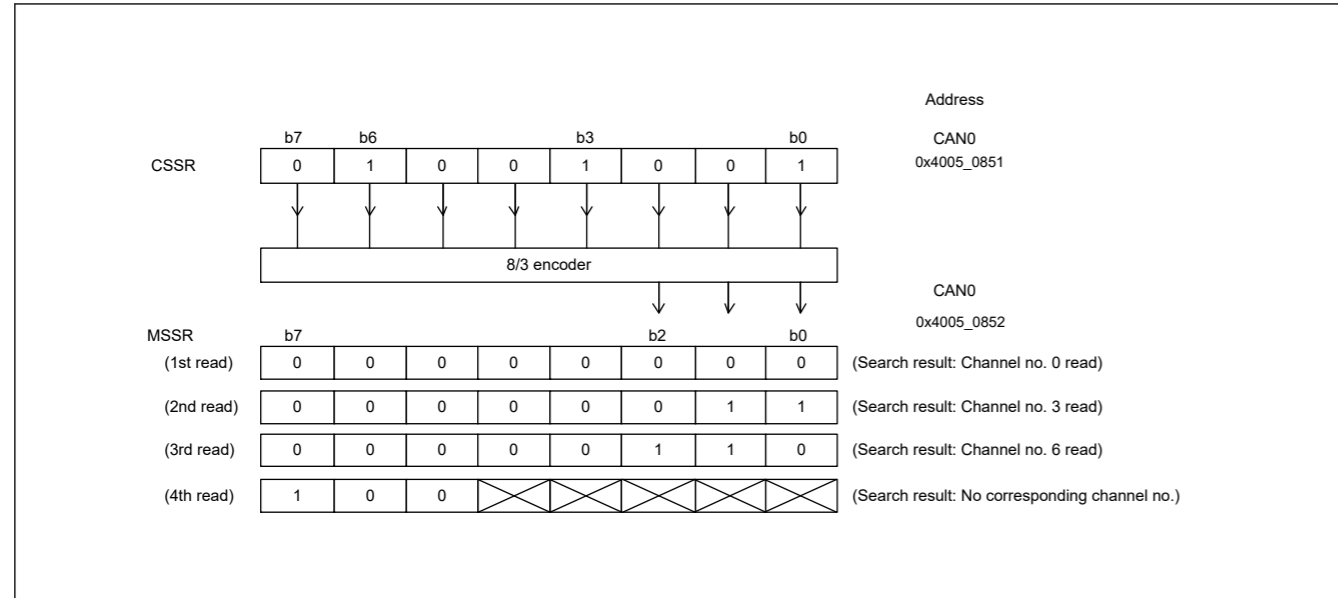

Figure 29.4 Write and read operations of the CSSR and MSSR registers

The value of CSSR is also updated whenever MSSR is read. On this read, the value prior to conversion by the 8/3 encoder can be read.

29.2.19 AFSR : Acceptance Filter Support Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x856

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 15:0 | n/a    | After the standard ID of a received message is written, the value converted for data table search can be read. | R/W |

Note: Write to AFSR in CAN operation mode or CAN halt mode.

The acceptance filter support unit (ASU) can be used for data table (8 bits × 256) searches. In the data table, all standard IDs that are created are set as valid or invalid in bit units. When AFSR is written with data in 16-bit units including the SID[10:0] bits in MBj\_ID (j = 0 to 31), in which a received standard ID is stored, a decoded row (byte offset) position and column (bit) position for data table search can be read. The ASU can be used for standard (11-bit) IDs only.

The ASU is enabled in the following cases:

- When the ID to be received cannot be masked by the acceptance filter. For example, if IDs to be received are 0x078, 0x087, and 0x111.
- When there are too many IDs to receive, and the software filtering time is expected to be shortened.

Note: AFSR cannot be set in CAN reset mode.

Figure 29.5 shows the write and read operations in the AFSR register.

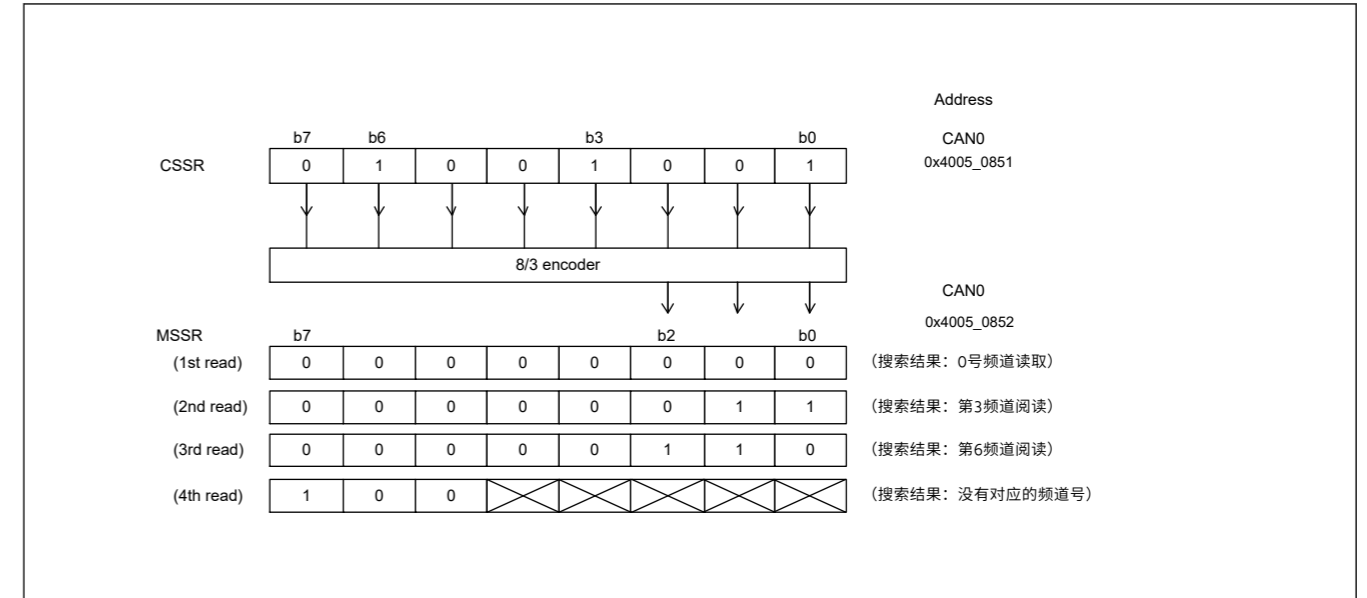

Figure 29.4 CSSR和MSSR寄存器的写和读操作

每当读取MSSR时，CSSR的值也会更新。在此读取中，可以读取83编码器转换之前的值。

29.2.19 AFSR：接受过滤器支持寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x856

| Bit  | Symbol | Function                         | R/W |
|------|--------|----------------------------------|-----|
| 15:0 | n/a    | 将接收到的消息的标准ID写入后，就可以读取为数据查表转换的值了。 | R/W |

Note: 在CAN操作模式或CAN暂停模式下写入AFSR。

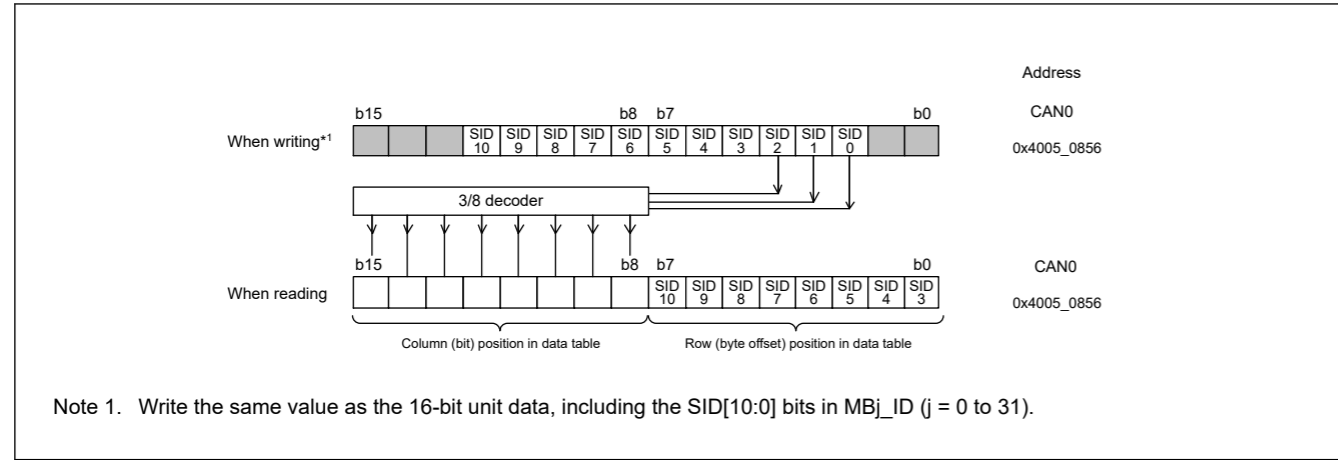

验收滤波器支持单元(ASU)可用于数据表 (8位×256) 搜索。在数据表中，所有创建的标准ID都以位为单位设置为有效或无效。当AFSR以16位单元写入数据时，包括MBj\_ID(j=0到31)中的SID[10:0]位，其中存储了接收到的标准ID，解码的行 (字节偏移) 位置和列 (位) 数据表搜索的位置可以被读取。ASU只能用于标准 (11位) ID。

ASU在以下情况下启用：

- 当接收的ID不能被接受过滤器屏蔽时。例如，如果要接收的ID是0x078、0x087和0x111。
- 接收的ID过多，预计软件过滤时间会缩短。

Note: CAN复位模式下不能设置AFSR。

图29.5显示了AFSR寄存器中的写和读操作。

Note 1. Write the same value as the 16-bit unit data, including the SID[10:0] bits in MBj\_ID (j = 0 to 31).

Figure 29.5 Write and read operations in the AFSR register

29.2.20 EIER : Error Interrupt Enable Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84C

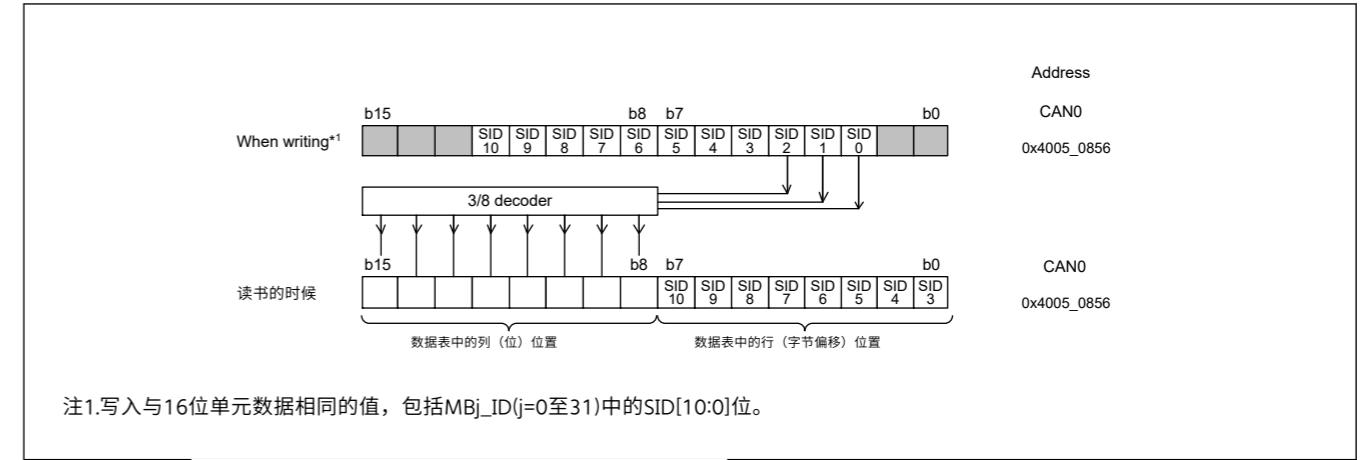

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | BEIE   | Bus Error Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt               | R/W |
| 1   | EWIE   | Error-Warning Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt           | R/W |
| 2   | EPIE   | Error-Passive Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt           | R/W |
| 3   | BOEIE  | Bus-Off Entry Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt           | R/W |
| 4   | BORIE  | Bus-Off Recovery Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt        | R/W |
| 5   | ORIE   | Overrun Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt                 | R/W |
| 6   | OLIE   | Overload Frame Transmit Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt | R/W |
| 7   | BLIE   | Bus Lock Interrupt Enable<br>0: Disable interrupt<br>1: Enable interrupt                | R/W |

The EIER register enables or disables each error interrupt source independently in EIFR. Write to EIER in CAN reset mode.

**BEIE bit (Bus Error Interrupt Enable)**

When the BEIE bit is 0, no error interrupt request occurs even if the BEIF flag in EIFR is 1. When the BEIE bit is 1, an error interrupt request occurs if the BEIF flag is set to 1.

注1.写入与16位单元数据相同的值，包括MBj\_ID(j=0至31)中的SID[10:0]位。

Figure 29.5 AFSR寄存器中的写和读操作

29.2.20 EIER:错误中断使能寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84C

重置后的值: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function                     | R/W |
|-----|--------|------------------------------|-----|
| 0   | BEIE   | 总线错误中断使能<br>0: 禁用中断1: 启用中断   | R/W |
| 1   | EWIE   | 错误警告中断使能<br>0: 禁用中断1: 启用中断   | R/W |
| 2   | EPIE   | 错误被动中断使能<br>0: 禁用中断1: 启用中断   | R/W |
| 3   | BOEIE  | 总线关闭进入中断使能<br>0: 禁用中断1: 启用中断 | R/W |
| 4   | BORIE  | 总线关闭恢复中断使能<br>0: 禁用中断1: 启用中断 | R/W |
| 5   | ORIE   | 溢出中断使能<br>0: 禁用中断1: 启用中断     | R/W |
| 6   | OLIE   | 过载帧发送中断使能<br>0: 禁用中断1: 启用中断  | R/W |
| 7   | BLIE   | 总线锁定中断使能<br>0: 禁用中断1: 启用中断   | R/W |

EIER寄存器在EIFR中独立启用或禁用每个错误中断源。在CAN复位模式下写入EIER。

**BEIE位 (总线错误中断使能)**

当BEIE位为0时，即使EIFR中的BEIF标志为1，也不会发生错误中断请求。当BEIE位为1时，如果BEIF标志位设置为1，则发生错误中断请求。

**EWIE bit (Error-Warning Interrupt Enable)**

When the EWIE bit is 0, no error interrupt request occurs even if the EWIF flag in EIFR is 1. When the EWIE bit is 1, an error interrupt request is generated if the EWIF flag is set to 1.

**EPIE bit (Error-Passive Interrupt Enable)**

When the EPIE bit is 0, no error interrupt request occurs even if the EPIF flag in EIFR is 1. When the EPIE bit is 1, an error interrupt request occurs if the EPIF flag is set to 1.

**BOEIE bit (Bus-Off Entry Interrupt Enable)**

When the BOEIE bit is 0, no error interrupt request occurs even if the BOEIF flag in EIFR is 1. When the BOEIE bit is 1, an error interrupt request occurs if the BOEIF flag is set to 1.

**BORIE bit (Bus-Off Recovery Interrupt Enable)**

When the BORIE bit is 0, no error interrupt request occurs even if the BORIF flag in EIFR is 1. When the BORIE bit is 1, an error interrupt request occurs if the BORIF flag is set to 1.

**ORIE bit (Overrun Interrupt Enable)**

When the ORIE bit is 0, no error interrupt request occurs even if the ORIF flag in EIFR is 1. When the ORIE bit is 1, an error interrupt request occurs if the ORIF flag is set to 1.

**OLIE bit (Overload Frame Transmit Interrupt Enable)**

When the OLIE bit is 0, no error interrupt request occurs even if the OLIF flag in EIFR is 1. When the OLIE bit is 1, an error interrupt request occurs if the OLIF flag is set to 1.

**BLIE bit (Bus Lock Interrupt Enable)**

When the BLIE bit is 0, no error interrupt request occurs even if the BLIF flag in EIFR is 1. When the BLIE bit is 1, an error interrupt request occurs if the BLIF flag is set to 1.

**29.2.21 EIFR : Error Interrupt Factor Judge Register**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84D

|                    |      |      |      |       |       |      |      |      |

| 2   | EPIF   | Error-Passive Detect Flag<br>0: No error-passive detected<br>1: Error-passive detected          | R/W |
| 3   | BOEIF  | Bus-Off Entry Detect Flag<br>0: No bus-off entry detected<br>1: Bus-off entry detected          | R/W |
| 4   | BORIF  | Bus-Off Recovery Detect Flag<br>0: No bus-off recovery detected<br>1: Bus-off recovery detected | R/W |

**EWIE位 (错误警告中断使能)**

当EWIE位为0时, 即使EIFR中的EWIF标志为1, 也不会产生错误中断请求。当EWIE位为1时, 如果EWIF标志位设置为1, 则产生错误中断请求。

**EPIE位 (错误被动中断使能)**

当EPIE位为0时, 即使EIFR中的EPIF标志为1, 也不会发生错误中断请求。当EPIE位为1时, 如果EPIF标志位设置为1, 则会发生错误中断请求。

**BOEIE位 (总线关闭进入中断允许)**

当BOEIE位为0时, 即使EIFR中的BOEIF标志为1, 也不会产生错误中断请求。当BOEIE位为1时, 如果将BOEIF标志设置为1, 则会产生错误中断请求。

**BORIE位 (总线关闭恢复中断使能)**

当BORIE位为0时, 即使EIFR中的BORIF标志为1, 也不会产生错误中断请求。当BORIE位为1时, 如果将BORIF标志设置为1, 则会产生错误中断请求。

**ORIE位 (溢出中断使能)**

当ORIE位为0时, 即使EIFR中的ORIF标志为1, 也不会发生错误中断请求。当ORIE位为1时, 如果将ORIF标志设置为1, 则会发生错误中断请求。

**OLIE位 (过载帧发送中断使能)**

当OLIE位为0时, 即使EIFR中的OLIF标志为1, 也不会产生错误中断请求。当OLIE位为1时, 如果OLIF标志被设置为1, 则产生错误中断请求。

**BLIE位 (总线锁定中断使能)**

当BLIE位为0时, 即使EIFR中的BLIF标志为1, 也不会发生错误中断请求。当BLIE位为1时, 如果BLIF标志位设置为1, 则会发生错误中断请求。

**29.2.21 EIFR:错误中断因素判断寄存器**

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84D

|               |      |      |      |       |       |      |      |      |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 5   | ORIF   | Receive Overrun Detect Flag<br>0: No receive overrun detected<br>1: Receive overrun detected                                     | R/W |
| 6   | OLIF   | Overload Frame Transmission Detect Flag<br>0: No overload frame transmission detected<br>1: Overload frame transmission detected | R/W |
| 7   | BLIF   | Bus Lock Detect Flag<br>0: No bus lock detected<br>1: Bus lock detected  | R/W |

If an event associated with an EIFR flag occurs, the associated bit in EIFR is set to 1, regardless of the setting of EIER.

Clear the bits to 0 through a software write. If a bit is set to 1 at the same time that the software clears it, it becomes 1. When setting a single bit to 0 in software, use the transfer instruction (MOV) to ensure that only the specified bit is set to 0 and the other bits are set to 1. Writing 1 has no effect to these bit values.

#### BEIF flag (Bus Error Detect Flag)

The BEIF flag is set to 1 when a bus error is detected.

#### EWIF flag (Error-Warning Detect Flag)

The EWIF flag is set to 1 when the value of the receive error counter (REC) or transmit error counter (TEC) exceeds 95. The EWIF flag is set to 1 only when REC or TEC initially exceeds 95. If software writes 0 to this flag while the REC or TEC value remains greater than 95, the EWIF flag does not set to 1 until the REC or TEC value goes below 95, and then exceeds 95 again.

#### EPIF flag (Error-Passive Detect Flag)

The EPIF flag is set to 1 when the CAN error state becomes error-passive, when the REC or TEC value exceeds 127. The EPIF flag is set to 1 only when the REC or TEC value initially exceeds 127. If software writes 0 to this flag while REC or TEC remains greater than 127, the EPIF flag is not set to 1 until REC or TEC goes below 127, and then exceeds 127 again.

#### BOEIF flag (Bus-Off Entry Detect Flag)

The BOEIF flag is set to 1 when the CAN error state becomes bus-off, when the TEC value exceeds 255. The BOEIF flag is also set to 1 when the BOM[1:0] bits in CTRLR are 01b (automatic entry to CAN halt mode on bus-off entry) and the CAN module becomes the bus-off state.

#### BORIF flag (Bus-Off Recovery Detect Flag)

The BORIF flag is set to 1 when the CAN module recovers from the bus-off state normally by detecting 11 consecutive bits 128 times in the following conditions:

- When the BOM[1:0] bits in CTRLR are 00b
- When the BOM[1:0] bits in CTRLR are 10b
- When the BOM[1:0] bits in CTRLR are 11b

The BORIF flag is not set to 1 if the CAN module recovers from the bus-off state in the following conditions:

- When the CANM[1:0] bits in CTRLR are set to 01b or 11b (CAN reset mode)
- When the RBOC bit in CTRLR is set to 1 (forced return from bus-off)
- When the BOM[1:0] bits in CTRLR are set to 01b
- When the BOM[1:0] bits in CTRLR are set to 11b and the CANM[1:0] bits in CTRLR are set to 10b (CAN halt mode) before normal recovery occurs

Table 29.7 lists the behavior of the BOEIF and BORIF flags for each CTRLR.BOM[1:0] bits setting.

| Bit | Symbol | Function                                 | R/W |
|-----|--------|--|-----|
| 5   | ORIF   | 接收溢出检测标志<br>0: 未检测到接收溢出<br>1: 检测到接收溢出    | R/W |
| 6   | OLIF   | 过载帧传输检测标志<br>0: 未检测到过载帧传输<br>1: 检测到过载帧传输 | R/W |
| 7   | BLIF   | 总线锁定检测标志<br>0: 未检测到总线锁定<br>1: 检测到总线锁定    | R/W |

如果发生与EIFR标志相关的事件，则EIFR中的相关位设置为1，而与EIER的设置无关。

通过软件写入将这些位清除为0。如果在软件清零的同时将某个位设置为1，则该位变为1。在软件中设置单个位为0时，使用传输指令(MOV)确保只有指定位设置为0，其他位设置为1。写1对这些位值没有影响。

#### BEIF标志 (总线错误检测标志)

当检测到总线错误时，BEIF标志设置为1。

#### EWIF标志 (错误警告检测标志)

当接收错误计数器(REC)或发送错误计数器(TEC)的值超过95时，EWIF标志设置为1。仅当REC或TEC最初超过95时，EWIF标志才设置为1。如果软件将0写入此当REC或TEC值保持大于95时，EWIF标志不会设置为1，直到REC或TEC值低于95，然后再次超过95。

#### EPIF标志 (错误被动检测标志)

当CAN错误状态变为被动错误时，当REC或TEC值超过127时，EPIF标志设置为1。仅当REC或TEC值最初超过127时，EPIF标志才设置为1。如果软件将0写入此当REC或TEC保持大于127时，EPIF标志不会设置为1，直到REC或TEC低于127，然后再次超过127。

#### BOEIF标志 (总线关闭进入检测标志)

当CAN错误状态变为总线关闭时，当TEC值超过255时，BOEIF标志设置为1。当CTRLR中的BOM[1:0]位为01b (自动进入CAN进入总线关闭时的停止模式) 并且CAN模块变为总线关闭状态。

#### BORIF标志 (总线关闭恢复检测标志)

当CAN模块通过检测11个连续位128次从总线关闭状态正常恢复时，BORIF标志设置为1，条件如下：

- CTRLR的BOM[1:0]位为00b时
- CTRLR的BOM[1:0]位为10b时
- CTRLR的BOM[1:0]位为11b时

如果CAN模块在以下情况下从总线关闭状态恢复，则BORIF标志不设置为1：

- CTRLR中的CANM[1:0]位设置为01b或11b时 (CAN复位模式)
- CTRLR的RBOC位设置为1时 (强制从总线关闭返回)
- 当CTRLR的BOM[1:0]位设置为01b时
- CTRLR中的BOM[1:0]位设置为11b且CTRLR中的CANM[1:0]位设置为10b时 (CAN停止模式) 在正常恢复发生之前

表29.7列出了每个CTRLR.BOM[1:0]位设置的BOEIF和BORIF标志的行为。

Table 29.7 Behavior of BOEIF and BORIF flags for each CTRL.BOM[1:0] setting

| BOM[1:0] bits | BOEIF flag                             | BORIF flag  |
|---------------|--|---|
| 00b           | Set to 1 on entry to the bus-off state | Sets to 1 on exit from the bus-off state  |
| 01b           |  | Do not set to 1   |
| 10b           |  | Set to 1 on exit from the bus-off state   |
| 11b           |  | Set to 1 if normal bus-off recovery occurs before the CANM[1:0] bits are set to 10b (CAN halt mode) |

**ORIF flag (Receive Overrun Detect Flag)**

The ORIF flag is set to 1 when a receive overrun occurs. This flag is not set to 1 in overwrite mode.

In overwrite mode, a reception complete interrupt request occurs if an overwrite condition occurs and the ORIF flag is not set to 1.

In overrun mode with normal mailbox mode, if an overrun occurs in any of mailboxes 0 to 31, the ORIF flag is set to 1. In overrun mode with FIFO mailbox mode, if an overrun occurs in any of mailboxes 0 to 23 or the receive FIFO, this flag is set to 1.

**OLIF flag (Overload Frame Transmission Detect Flag)**

The OLIF flag is set to 1 if the transmitting condition of an overload frame is detected when the CAN module is transmitting or receiving.

**BLIF flag (Bus Lock Detect Flag)**

The BLIF flag is set to 1 if 32 consecutive dominant bits are detected on the CAN bus while the CAN module is in CAN operation mode. After the BLIF flag is set to 1, 32 consecutive dominant bits are detected again in either of the following conditions:

- Recessive bits are detected after the BLIF flag changes to 0 from 1
- The CAN module enters CAN reset or halt mode and then enters CAN operation mode again after the BLIF flag changes to 0 from 1

## 29.2.22 RECR : Receive Error Count Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84E

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 7:0 | n/a    | Receive error count function. RECR increments or decrements the counter value based on the error status of the CAN module during reception. | R   |

RECR indicates the value of the receive error counter. See the CAN specification (ISO11898-1) for information on the increment and decrement conditions of the receive error counter.

The value of RECR in the bus-off state is undefined.

Table 29.7 每个CTRL.BOM[1:0]设置的BOEIF和BORIF标志的行为

| BOM[1:0] bits | BOEIF flag    | BORIF flag   |
|---------------|---------------|--|
| 00b           | 进入总线关闭状态时设置为1 | 退出总线关闭状态时设置为1                                      |
| 01b           |               | 不要设置为1   |
| 10b           |               | 退出总线关闭状态时设置为1                                      |
| 11b           |               | 如果在CANM[1:0]位设置为10b (CAN停止模式) 之前发生正常的总线关闭恢复, 则设置为1 |

**ORIF标志 (接收溢出检测标志)**

当发生接收溢出时, ORIF标志设置为1。此标志在覆盖模式下不设置为1。

在覆盖模式下, 如果出现覆盖条件且ORIF标志未设置为1, 则会产生接收完成中断请求。

在具有正常邮箱模式的溢出模式中, 如果在任何邮箱0到31中发生溢出, 则ORIF标志设置为1。在具有FIFO邮箱模式的溢出模式中, 如果在任何邮箱0到23或接收中发生溢出FIFO, 此标志设置为1。

**OLIF标志 (过载帧传输检测标志)**

如果在CAN模块发送或接收时检测到过载帧的发送条件, 则OLIF标志设置为1。

**BLIF标志 (总线锁定检测标志)**

如果在CAN模块处于CAN操作模式时在CAN总线上检测到32个连续显性位, 则BLIF标志设置为1。将BLIF标志设置为1后, 在以下任一条件下再次检测到32个连续的显性位:

- BLIF标志由1变为0后检测隐性位
- CAN模块进入CAN复位或停止模式, 待BLIF标志位由1变为0后再次进入CAN工作模式

## 29.2.22 RECR:接收错误计数寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x84E

| Bit | Symbol | Function                                | R/W |
|-----|--------|---|-----|
| 7:0 | n/a    | 接收错误计数功能。RECR根据接收期间CAN模块的错误状态递增或递减计数器值。 | R   |

RECR指示接收错误计数器的值。有关接收错误计数器的递增和递减条件的信息, 请参见CAN规范(ISO11898-1)。

总线关闭状态下RECR的值未定义。

29.2.23 TECR : Transmit Error Count Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x84F

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 7:0 | n/a    | Transmit error count function. TECR increments or decrements the counter value based on the error status of the CAN module during transmission. | R   |

TECR indicates the value of the transmit error counter. See the CAN specification (ISO11898-1) for information on the increment and decrement conditions of the transmit error counter.

The value of TECR in the bus-off state is undefined.

29.2.24 ECSR : Error Code Store Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x850

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | SEF    | Stuff Error Flag*1 *2<br>0: No stuff error detected<br>1: Stuff error detected                               | R/W |
| 1   | FEF    | Form Error Flag*1 *2<br>0: No form error detected<br>1: Form error detected                                  | R/W |
| 2   | AEF    | ACK Error Flag*1 *2<br>0: No ACK error detected<br>1: ACK error detected                                     | R/W |
| 3   | CEF    | CRC Error Flag*1 *2<br>0: No CRC error detected<br>1: CRC error detected                                     | R/W |
| 4   | BE1F   | Bit Error (recessive) Flag*1 *2<br>0: No bit error (recessive) detected<br>1: Bit error (recessive) detected | R/W |
| 5   | BE0F   | Bit Error (dominant) Flag*1 *2<br>0: No bit error (dominant) detected<br>1: Bit error (dominant) detected    | R/W |
| 6   | ADEF   | ACK Delimiter Error Flag*1 *2<br>0: No ACK delimiter error detected<br>1: ACK delimiter error detected       | R/W |
| 7   | EDPM   | Error Display Mode Select*3 *4<br>0: Output first detected error code<br>1: Output accumulated error code    | R/W |

Note 1. Writing 1 has no effect on these bit values.

29.2.23 TECR: 发送错误计数寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x84F

| Bit | Symbol | Function                                  | R/W |
|-----|--------|---|-----|
| 7:0 | n/a    | 发送错误计数功能。TECR根据CAN模块在传输过程中的错误状态递增或递减计数器值。 | R   |

TECR指示发送错误计数器的值。有关发送错误计数器的递增和递减条件的信息，请参见CAN规范(ISO11898-1)。

总线关闭状态下的TECR值未定义。

29.2.24 ECSR: 错误代码存储寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)  
 Offset address: 0x850

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | SEF    | 填充错误标志*1*2<br>0: 未检测到填充错误1:<br>检测到填充错误                | R/W |
| 1   | FEF    | 表格错误标志*1*2<br>0: 未检测到表单错误1:<br>检测到表单错误                | R/W |
| 2   | AEF    | ACK错误标志*1*2<br>0: 未检测到ACK错误1:<br>检测到ACK错误             | R/W |
| 3   | CEF    | CRC错误标志*1*2<br>0: 未检测到CRC错误1:<br>检测到CRC错误             | R/W |
| 4   | BE1F   | 位错误 (隐性) 标志*1*2<br>0: 未检测到位错误 (隐性) 1: 检<br>测到位错误 (隐性) | R/W |
| 5   | BE0F   | 位错误 (显性) 标志*1*2<br>0: 未检测到位错误 (显性) 1: 检<br>测到位错误 (显性) | R/W |
| 6   | ADEF   | ACK分隔符错误标志*1*2<br>0: 未检测到ACK分隔符错误1: 检<br>检测到ACK分隔符错误  | R/W |
| 7   | EDPM   | 错误显示模式选择*3*4<br>0: 输出第一个检测到的错误代码1<br>: 输出累积错误代码       | R/W |

注1.写1对这些位值没有影响。

Note 2. To write 0 to the SEF, FEF, AEF, CEF, BE1F, BE0F, and ADEF bits, use the transfer (MOV) instruction to ensure that only the specified bit is set to 0 and the other bits are set to 1.

Note 3. Write to the EDPM bit in CAN reset or halt mode.

Note 4. If more than one error condition is detected simultaneously, all related bits are set to 1.

ECSR indicates whether an error occurs on the CAN bus. See the CAN specification (ISO11898-1) for the conditions when each error occurs.

Clear all of the bits, except for the EDPM bit, to 0 through a software write. If the ECSR bit is set to 1 at the same time that software writes 0 to it, the bit becomes 1.

#### SEF flag (Stuff Error Flag)

The SEF flag is set to 1 when a stuff error is detected.

#### FEF flag (Form Error Flag)

The FEF flag is set to 1 when a form error is detected.

#### AEF flag (ACK Error Flag)

The AEF flag is set to 1 when an ACK error is detected.

#### CEF flag (CRC Error Flag)

The CEF flag is set to 1 when a CRC error is detected.

#### BE1F flag (Bit Error (recessive) Flag)

The BE1F flag is set to 1 when a recessive bit error is detected.

#### BE0F flag (Bit Error (dominant) Flag)

The BE0F flag is set to 1 when a dominant bit error is detected.

#### ADEF flag (ACK Delimiter Error Flag)

The ADEF flag is set to 1 when a form error is detected with the ACK delimiter during transmission.

#### EDPM bit (Error Display Mode Select)

The EDPM bit selects the output mode of ECSR. When the EDPM bit is set to 0, ECSR outputs the first error code. When the EDPM bit is set to 1, ECSR outputs the accumulated error code.

### 29.2.25 TSR : Time Stamp Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x854

|                    |             |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------------------|-------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position:      | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | [Empty box] |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 15:0 | n/a    | Free-running counter value for the time stamp function | R   |

Note: Read TSR in 16-bit units.

Reading the TSR register returns the current value of the 16-bit free-running time stamp counter. The time stamp counter reference clock is configured in the TSPS[1:0] bits in CTLR. The counter stops in CAN sleep mode and CAN halt mode, and is initialized in CAN reset mode. The time stamp counter value is stored in the TSL[7:0] and TSH[7:0] bits in MBj\_TS when a received message is stored in a receive mailbox.

注2.要将0写入SEF、FEF、AEF、CEF、BE1F、BE0F和ADEF位,请使用传输(MOV)指令确保只有指定位设置为0,其他位设置为1。

注3.在CAN复位或暂停模式下写入EDPM位。

注4.如果同时检测到多个错误条件,则所有相关位都设置为1。

ECSR指示CAN总线上是否发生错误。有关每个错误发生的条件,请参见CAN规范(ISO11898-1)。

通过软件写入将除EDPM位之外的所有位清零。如果ECSR位在软件写入0的同时设置为1,则该位变为1。

#### SEF标志 (填充错误标志)

当检测到填充错误时,SEF标志设置为1。

#### FEF标志 (表格错误标志)

当检测到表单错误时,FEF标志设置为1。

#### AEF标志 (ACK错误标志)

当检测到ACK错误时,AEF标志设置为1。

#### CEF标志 (CRC错误标志)

当检测到CRC错误时,CEF标志设置为1。

#### BE1F标志 (位错误 (隐性) 标志)

当检测到隐性位错误时,BE1F标志设置为1。

#### BE0F标志 (位错误 (显性) 标志)

当检测到显性位错误时,BE0F标志设置为1。

#### ADEF标志 (ACK分隔符错误标志)

当在传输过程中使用ACK定界符检测到格式错误时,ADEF标志设置为1。

#### EDP M位 (错误显示模式选择)

EDP M位选择ECSR的输出模式。当EDPM位设置为0时,ECSR输出第一个错误代码。当EDPM位设置为1时,ECSR输出累积的错误代码。

### 29.2.25 TSR:时间戳寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x854

|               |             |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|---------------|-------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | [Empty box] |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| 重置后的值:        | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol | Function       | R/W |
|------|--------|----------------|-----|
| 15:0 | n/a    | 时间戳功能的自由运行计数器值 | R   |

Note: 以16位为单位读取TSR。

读取TSR寄存器返回16位自由运行时间戳计数器的当前值。时间戳计数器参考时钟在CTLR的TSPS[1:0]位中配置。计数器在CAN睡眠模式和CAN暂停模式下停止,并在CAN复位模式下初始化。当收到的消息存储在接收邮箱中时,时间戳计数器值存储在MBj\_TS中的TSL[7:0]和TSH[7:0]位中。

29.2.26 TCR : Test Control Register

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x858

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 0   | TSTE      | CAN Test Mode Enable<br>0: Disable CAN test mode<br>1: Enable CAN test mode   | R/W |
| 2:1 | TSTM[1:0] | CAN Test Mode Select<br>00: Not CAN test mode<br>01: Listen-only mode<br>10: Self-test mode 0 (external loopback)<br>11: Self-test mode 1 (internal loopback) | R/W |
| 7:3 | —         | These bits are read as 0. The write value should be 0.  | R/W |

TCR controls the CAN test mode. Write to TCR in CAN halt mode only.

(1) Listen-only mode

The CAN specification (ISO11898-1) recommends an optional bus monitoring mode. In listen-only mode, valid data frames and valid remote frames can be received. However, only recessive bits can be sent on the CAN bus. The ACK bit, overload flag, and active error flag cannot be sent.

Listen-only mode can be used for baud rate detection. Do not request transmission from any mailboxes in listen-only mode.

Figure 29.6 shows the connection when listen-only mode is selected.

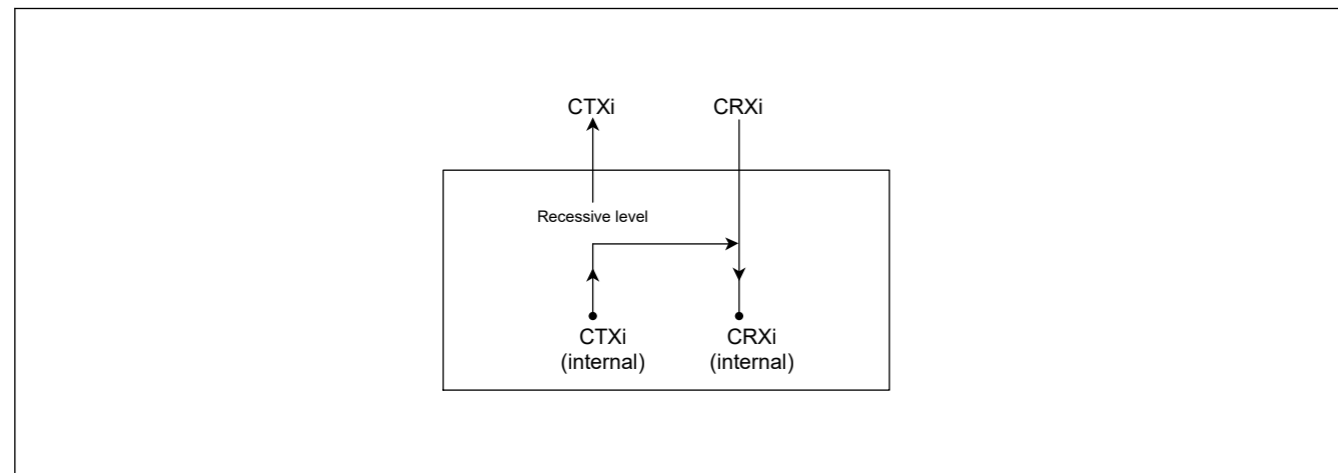

Figure 29.6 Connection when listen-only mode is selected (i = 0, 1)

(2) Self-test mode 0 (external loopback)

Self-test mode 0 is provided for CAN transceiver tests. In this mode, the protocol module treats its own transmitted messages as those received by the CAN transceiver and stores them into the receive mailbox. To be independent from external stimulation, the protocol module generates the ACK bit. Connect the CTXi and CRXi pins to the transceiver.

Figure 29.7 shows the connection when self-test mode 0 is selected.

29.2.26 TCR:测试控制寄存器

Base address: CANn = 0x400A\_8000 + 0x1000 × n (n = 0, 1)

Offset address: 0x858

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 0   | TSTE      | CAN测试模式启用<br>0: 禁用CAN测试模式1:<br>启用CAN测试模式                              | R/W |
| 2:1 | TSTM[1:0] | CAN测试模式选择<br>00: 非CAN测试模式01: 只听模式10:<br>自测模式0 (外部环回) 11: 自测模式1 (内部环回) | R/W |
| 7:3 | —         | 这些位被读取为0。写入值应为0。  | R/W |

TCR控制CAN测试模式。仅在CAN停止模式下写入TCR。

(1) Listen-only mode

CAN规范(ISO11898-1)推荐一种可选的总线监控模式。在只听模式下，可以接收到有效的数据帧和有效的远程帧。但是，只能在CAN总线上发送隐性位。不能发送ACK位、过载标志和活动错误标志。

只听模式可用于波特率检测。不要在只听模式下从任何邮箱请求传输。

图29.6显示了选择只听模式时的连接。

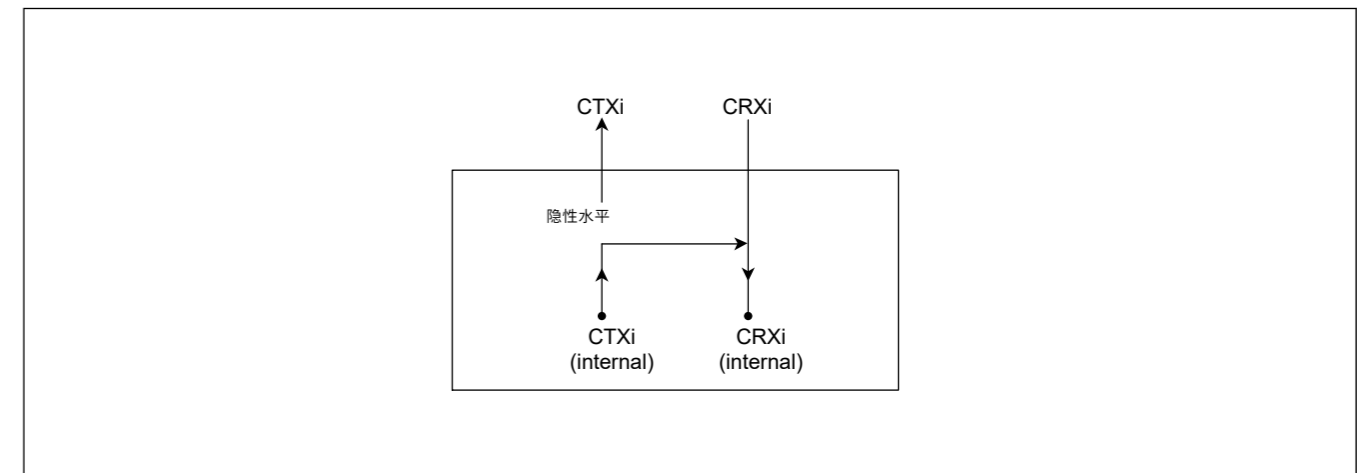

Figure 29.6 选择只听模式时的连接(i=0 1)

(2) Self-test mode 0 (external loopback)

自测模式0用于CAN收发器测试。在该模式下，协议模块将自己发送的报文视为CAN收发器接收到的报文，并将其存储到接收邮箱中。为独立于外部刺激，协议模块生成ACK位。将CTXi和CRXi引脚连接到收发器。

图29.7显示了选择自检模式0时的连接。

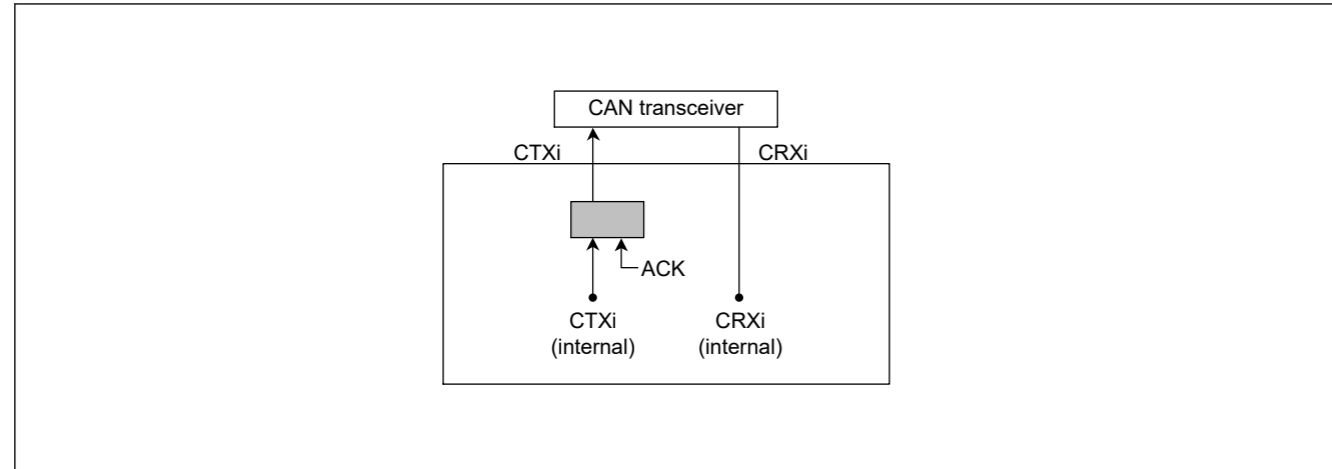

Figure 29.7 Connection when self-test mode 0 is selected (i = 0, 1)

### (3) Self-test mode 1 (internal loopback)

Self-test mode 1 is provided for self-test functions. In this mode, the protocol controller treats its transmitted messages as received messages and stores them into the receive mailbox. To be independent from external stimulation, the protocol controller generates the ACK bit.

In self-test mode 1, the protocol controller performs an internal feedback from the internal CTXi pin to the internal CRXi pin. The input value of the external CRXi pin is ignored. The external CTXi pin outputs only recessive bits. The CTXi and CRXi pins are not required to be connected to the CAN bus or any external device.

Figure 29.8 shows the connection when self-test mode 1 is selected.

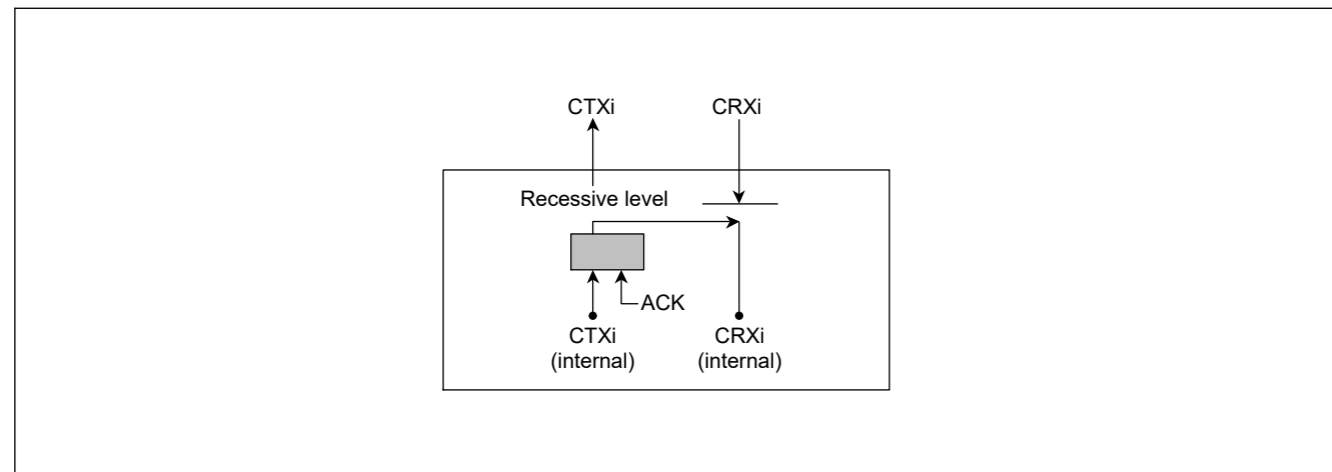

Figure 29.8 Connection when self-test mode 1 is selected (i = 0, 1)

## 29.3 Operation Modes

The CAN module operation includes the following modes:

- CAN reset mode
- CAN halt mode
- CAN operation mode
- CAN sleep mode

Figure 29.9 shows the transitions between different operation modes.

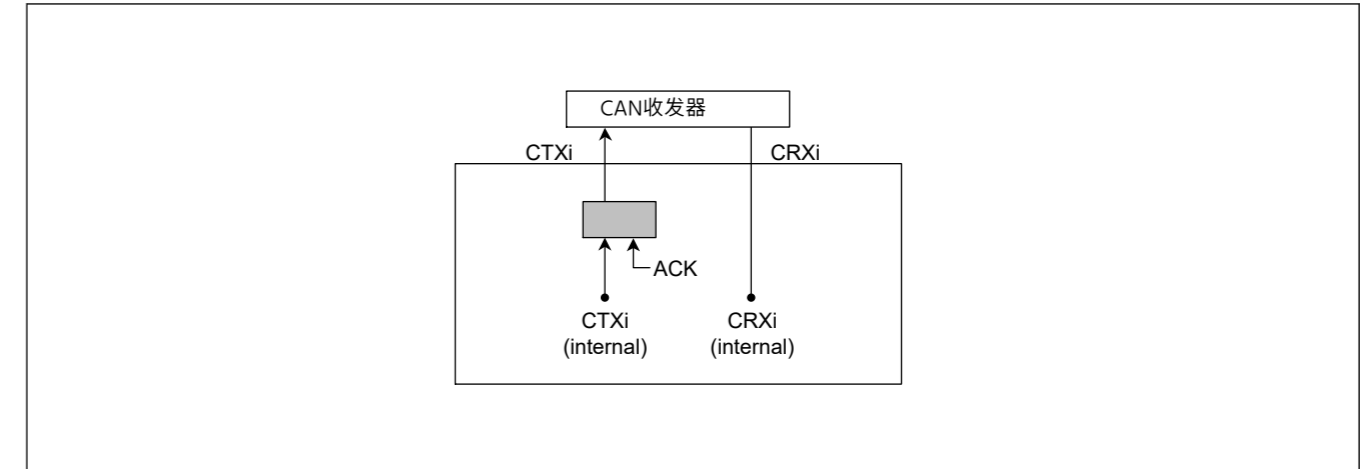

Figure 29.7 选择自检模式0时的连接(i=0 1)

### (3) Self-test mode 1 (internal loopback)

自检模式1用于自检功能。在这种模式下，协议控制器将其发送的消息视为接收的消息，并将它们存储到接收邮箱中。为了独立于外部刺激，协议控制器生成ACK位。

在自检模式1中，协议控制器执行从内部CTXi引脚到内部CRXi引脚的内部反馈。外部CRXi引脚的输入值被忽略。外部CTXi引脚仅输出隐性位。CTXi和CRXi引脚不需要连接到CAN总线或任何外部设备。

图29.8显示了选择自检模式1时的连接。

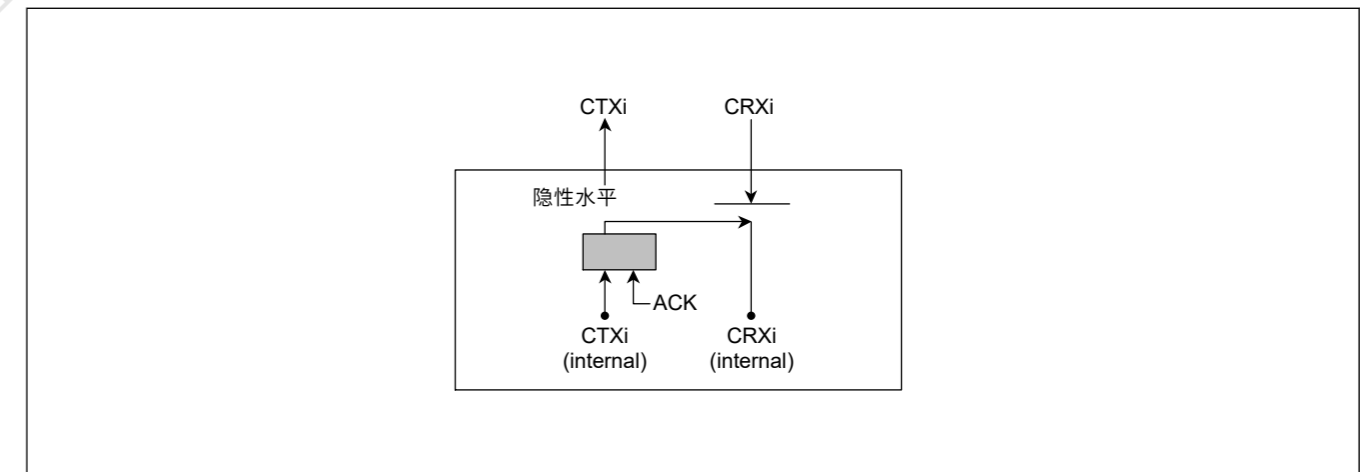

Figure 29.8 选择自检模式1时的连接(i=0 1)

## 29.3 操作模式

CAN模块操作包括以下模式：

- CAN复位模式
- CAN停机模式
- CAN操作模式
- CAN休眠模式

图29.9显示了不同操作模式之间的转换。

- MIER and MIER\_FIFO
- EIER
- BCR
- CSSR
- ECSR (only the EDPM bit)
- MBj\_ID, MBj\_DL, MBj\_Dm and MBj\_TS
- MKRk
- FIDCR0 and FIDCR1
- MKIVLR
- AFSR
- RFPCR
- TFPCR

### 29.3.2 CAN Halt Mode

CAN halt mode is used for mailbox configuration and test mode setting.

When the CTRL.CANM[1:0] bits are set to 10b, CAN halt mode is selected, and the STR.HLTST bit is set to 1. Do not change the CTRL.CANM[1:0] bits until the HLTST bit is 1.

See Table 29.8 for the state transition conditions when transmitting or receiving.

All registers except for the RSTST, HLTST, and SLPST bits in STR remain unchanged when the CAN enters CAN halt mode. Do not change CTRL (except for the CANM[1:0] and SLPM bits) and EIER in CAN halt mode. BCR can be changed in CAN halt mode only when listen-only mode is selected for automatic baud rate detection.

Table 29.8 Operation in CAN reset mode and CAN halt mode

| Operation mode                                     | Receiver   | Transmitter  | Bus-off  |
|--|--|--|--|
| CAN reset mode (forced transition) CANM[1:0] = 11b | CAN module enters CAN reset mode without waiting for the end of message reception.   | CAN module enters CAN reset mode without waiting for the end of message transmission.    | CAN module enters CAN reset mode without waiting for the end of bus-off recovery.  |
| CAN reset mode CANM[1:0] = 01b                     | CAN module enters CAN reset mode without waiting for the end of message reception.   | CAN module enters CAN reset mode after waiting for the end of message transmission.*1 *4 | CAN module enters CAN reset mode without waiting for the end of bus-off recovery.  |
| CAN halt mode                                      | CAN module enters CAN halt mode after waiting for the end of message reception.*2 *3 | CAN module enters CAN halt mode after waiting for the end of message transmission.*1 *4  | <ul style="list-style-type: none"> <li>• When the BOM[1:0] bits are 00b: A halt request from software is accepted only after bus-off recovery.</li> <li>• When the BOM[1:0] bits are 01b: CAN module automatically enters CAN halt mode without waiting for the end of bus-off recovery, regardless of a halt request from the software.</li> <li>• When the BOM[1:0] bits are 10b: CAN module automatically enters CAN halt mode after waiting for the end of bus-off recovery, regardless of a halt request from software.</li> <li>• When the BOM[1:0] bits are 11b: CAN module enters CAN halt mode without waiting for the end of bus-off recovery, if a halt is requested by software during bus-off.</li> </ul> |

Note: BOM[1:0] bits: Bits in CTRL.

Note 1. If transmission of multiple messages is requested, a mode transition occurs on completion of the first transmission. If the CAN reset mode is being requested during suspend transmission, mode transition occurs when the bus is idle, the next transmission ends, or the CAN module becomes a receiver.

Note 2. If the CAN bus is locked at the dominant level, the program can detect this state by monitoring the BLIF flag in EIFR.

Note 3. If a CAN bus error occurs during reception after CAN halt mode is requested, the CAN module transitions to CAN halt mode.

- MIER and MIER\_FIFO
- EIER
- BCR
- CSSR
- ECSR (only the EDPM bit)
- MBj\_ID, MBj\_DL, MBj\_Dm and MBj\_TS
- MKRk
- FIDCR0 and FIDCR1
- MKIVLR
- AFSR
- RFPCR
- TFPCR

### 29.3.2 CAN暂停模式

CAN暂停模式用于邮箱配置和测试模式设置。

当CTRL.CANM[1:0]位设置为10b时，选择CAN停止模式，并且STR.HLTST位设置为1。在HLTST位之前不要更改CTRL.CANM[1:0]位是1。

发送或接收时的状态转换条件见表29.8。

当CAN进入CAN暂停模式时，除STR中的RSTST、HLTST和SLPST位之外的所有寄存器都保持不变。不要在CAN暂停模式下更改CTRL（CANM[1:0]和SLPM位除外）和EIER。只有在为自动波特率检测选择只听模式时，才能在CAN暂停模式下更改BCR。

Table 29.8 CAN复位模式和CAN暂停模式下的操作

| 操作模式                       | Receiver                      | Transmitter                   | Bus-off  |
|----------------------------|-------------------------------|-------------------------------|--|
| CAN复位模式（强制转换）CANM[1:0]=11b | CAN模块无需等待报文接收结束即可进入CAN复位模式。   | CAN模块无需等待报文传输结束就进入CAN复位模式。    | CAN模块无需等待总线关闭恢复结束即可进入CAN复位模式。  |
| CAN复位模式CANM[1:0]=01b       | CAN模块无需等待报文接收结束即可进入CAN复位模式。   | CAN模块等待报文传输结束后进入CAN复位模式。*1*4  | CAN模块无需等待总线关闭恢复结束即可进入CAN复位模式。  |
| CAN暂停模式                    | CAN模块在等待报文接收结束后进入CAN停止模式。*2*3 | CAN模块在等待报文传输结束后进入CAN停止模式。*1*4 | <ul style="list-style-type: none"> <li>• 当BOM[1:0]位为00b时：仅在总线关闭恢复后才接受来自软件的暂停请求。</li> <li>• 当BOM[1:0]位为01b时：CAN模块自动进入CAN停止模式，无需等待总线关闭恢复结束，无论来自软件的停止请求如何。</li> <li>• 当BOM[1:0]位为10b时：CAN模块在等待总线关闭恢复结束后自动进入CAN停止模式，无论软件是否有停止请求。</li> <li>• 当BOM[1:0]位为11b时：如果在总线关闭期间软件请求停止，CAN模块无需等待总线关闭恢复结束即可进入CAN停止模式。</li> </ul> |

Note: BOM[1:0]位: CTRL中的位。

注1.如果请求发送多个消息，则在第一次发送完成时发生模式转换。如果在暂停传输期间请求CAN复位模式，则在总线空闲、下一次传输结束或CAN模块成为接收器时发生模式转换。

注2.如果CAN总线被锁定在显性电平，程序可以通过监控EIFR中的BLIF标志来检测该状态。

注3.如果在请求CAN暂停模式后接收期间发生CAN总线错误，CAN模块将转换到CAN暂停模式。

Note 4. If a CAN bus error or arbitration-lost occurs during transmission after CAN reset mode or CAN halt mode is requested, the CAN module transitions to the requested CAN mode.

### 29.3.3 CAN Sleep Mode

CAN sleep mode reduces power consumption by stopping the clock supply to the CAN module. After a reset from an MCU pin or a software reset, the CAN module starts from CAN sleep mode.

When the SLPB bit in CTRL is set to 1, the CAN module enters CAN sleep mode, and the SLPST bit in STR is set to 1. Do not change the value of the SLPB bit until the SLPST bit is 1. The other registers remain unchanged when the CAN module enters CAN sleep mode.

Write to the SLPB bit in CAN reset mode and CAN halt mode. Do not change any registers (except for the SLPB bit) during CAN sleep mode. Read operation is still allowed.

When the SLPB bit is set to 0, the CAN module is released from CAN sleep mode. When the CAN module exits CAN sleep mode, the other registers remain unchanged.

### 29.3.4 CAN Operation Mode (Excluding Bus-Off State)

CAN operation mode is used for CAN communication.

When the CANM[1:0] bits in CTRL are set to 00b, the CAN module enters CAN operation mode. The RSTST and HLTST bits in STR are set to 0. Do not change the value of the CANM[1:0] bits until the RSTST and HLTST bits are 0.

If 11 consecutive recessive bits are detected after entering CAN operation mode:

- The CAN module becomes an active node on the network, which enables transmission and reception of CAN messages.
- Error monitoring of the CAN bus, such as receive and transmit error counters, is performed.

During CAN operation mode, the CAN module might be in one of the following three sub-modes, depending on the status of the CAN bus:

- Idle mode: No transmission or reception occurs.
- Receive mode: A CAN message sent by another node is being received.
- Transmit mode: A CAN message is being transmitted. The CAN module receives a message transmitted by the local node simultaneously when self-test mode 0 (TSTM[1:0] bits in TCR = 10b) or self-test mode 1 (TSTM[1:0] bits = 11b) is selected.

Figure 29.10 shows the sub-modes of CAN operation mode.

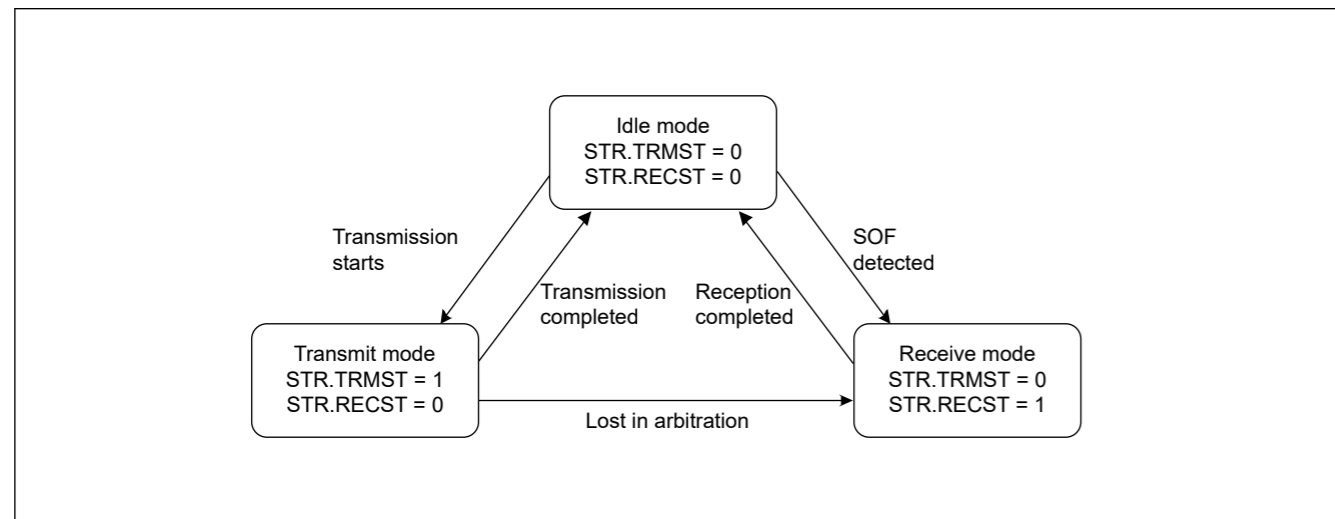

Figure 29.10 Sub-modes of CAN operation mode

注4.如果在请求CAN复位模式或CAN暂停模式后的传输过程中发生CAN总线错误或仲裁丢失，则CAN模块将转换到请求的CAN模式。

### 29.3.3 CAN睡眠模式

CAN睡眠模式通过停止向CAN模块提供时钟来降低功耗。在从MCU引脚复位或软件复位后，CAN模块从CAN睡眠模式启动。

当CTRL中的SLPB位为1时，CAN模块进入CAN休眠模式，同时STR中的SLPST位为1。在SLPST位为1之前不要改变SLPB位的值。其他寄存器保持不变CAN模块进入CAN休眠模式时不变。

在CAN复位模式和CAN暂停模式下写入SLPB位。在CAN睡眠模式期间不要更改任何寄存器（SLPB位除外）。仍然允许读取操作。

当SLPB位设置为0时，CAN模块从CAN睡眠模式中释放。当CAN模块退出CAN休眠模式时，其他寄存器保持不变。

### 29.3.4 CAN操作模式（不包括总线关闭状态）

CAN操作模式用于CAN通信。

当CTRL中的CANM[1:0]位设置为00b时，CAN模块进入CAN操作模式。STR中的RSTST和HLTST位设置为0。在RSTST和HLTST位为0之前，不要更改CANM[1:0]位的值。

如果进入CAN操作模式后检测到11个连续的隐性位：

- CAN模块成为网络上的一个活动节点，实现CAN报文的发送和接收。
- 执行CAN总线的错误监控，例如接收和发送错误计数器。

在CAN操作模式期间，CAN模块可能处于以下三种子模式之一，具体取决于CAN总线的状态：

- 空闲模式：不发送或接收。
- 接收模式：正在接收另一个节点发送的CAN报文。
- 传输模式：正在传输CAN报文。CAN模块接收本地发送的报文  
nodesimultaneouslywhenself-testmode0(TSTM[1:0]bitsinTCR=10b)orself-testmode1(TSTM[1:0]bits=11b)is elected.

图29.10显示了CAN操作模式的子模式。

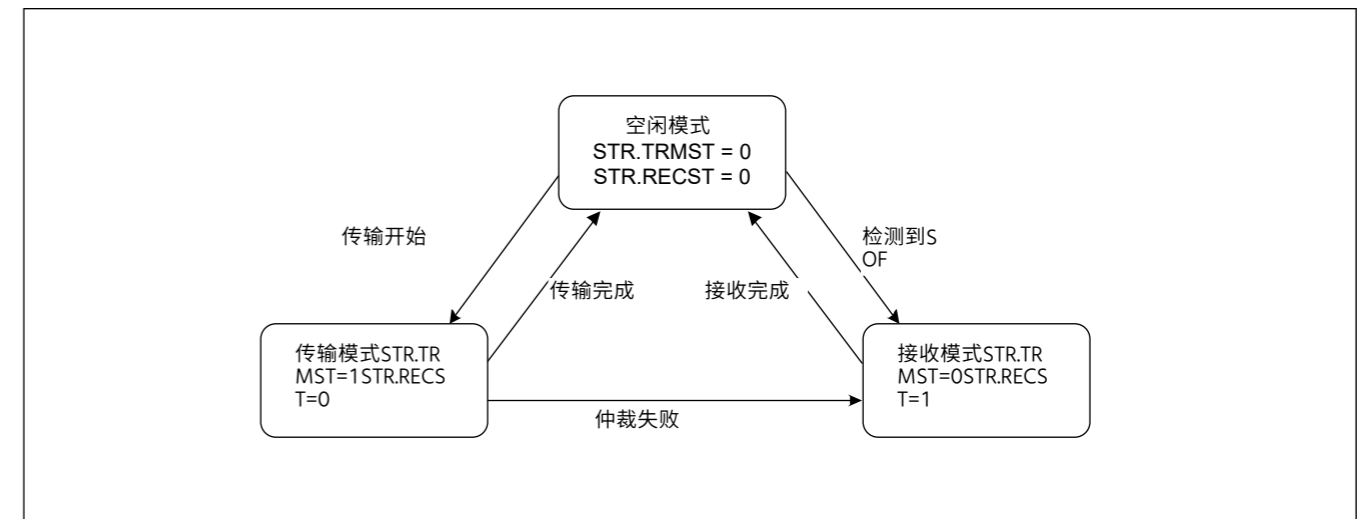

Figure 29.10 CAN操作模式的子模式

### 29.3.5 CAN Operation Mode (Bus-Off State)

The CAN module enters the bus-off state based on the incrementing or decrementing rules for the transmit and error counters defined in the CAN specifications.

The following cases apply when the CAN module is recovering from the bus-off state. When the CAN module is in the bus-off state, the values of the CAN module registers remain unchanged, except for those in STR, EIFR, RECR, TECR, and TSR.

#### (1) When CTLR.BOM[1:0] = 00b (normal mode)

The CAN module enters the error-active state after it completes recovery from the bus-off state and CAN communication is enabled. The BORIF flag in EIFR is set to 1 (bus-off recovery detected).

#### (2) When CTLR.RBOC = 1 (forced return from bus-off)

The CAN module enters the error-active state when it is in the bus-off state and the RBOC bit is 1. CAN communication is enabled again after 11b consecutive recessive bits are detected. The BORIF flag is not set to 1.

#### (3) When CTLR.BOM[1:0] = 01b (automatic transition to CAN halt mode on bus-off entry)

The CAN module enters CAN halt mode when it reaches the bus-off state. The BORIF flag is not set to 1.

#### (4) When CTLR.BOM[1:0] = 10b (automatic transition to CAN halt mode on bus-off end)

The CAN module enters CAN halt mode when it completes recovery from bus-off. The BORIF flag is set to 1.

#### (5) When CTLR.BOM[1:0] = 11b (automatic transition to CAN halt mode through software) and CTLR.CANM[1:0] = 10b (CAN halt mode) during bus-off state

The CAN module enters CAN halt mode when it is in the bus-off state and the CANM[1:0] bits are set to 10b (CAN halt mode). The BORIF flag is not set to 1.

If the CANM[1:0] bits are not set to 10b during bus-off, the same behavior as (1) applies.

## 29.4 Data Transfer Rate Configuration

This section describes how to configure the data transfer rate.

### 29.4.1 Clock Setting

The CAN module provides a CAN clock generator. The CAN clock can be set in the CCLKS and BRP[9:0] bits in BCR. Figure 29.11 shows a block diagram of the CAN clock generator.

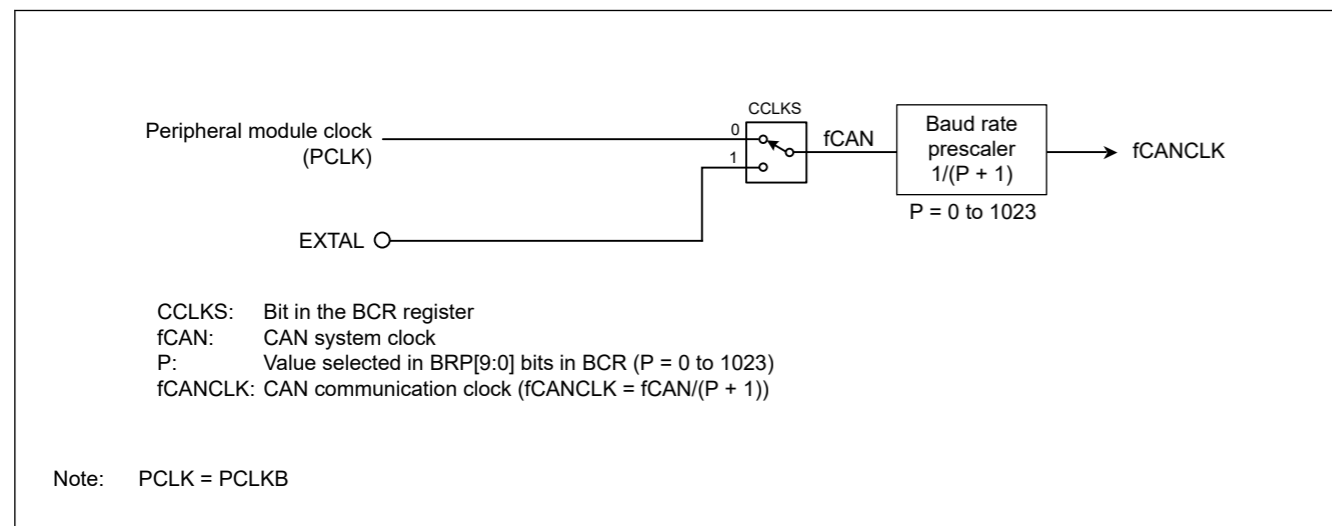

Figure 29.11 Block diagram of CAN clock generator

### 29.3.5 CAN操作模式 (总线关闭状态)

CAN模块根据CAN规范中定义的发送和错误计数器的递增或递减规则进入总线关闭状态。

以下情况适用于CAN模块从总线关闭状态恢复时。当CAN模块处于busoff状态时，CAN模块寄存器的值保持不变，除了STR、EIFR、RECR、TECR和TSR中的值。

#### (1) When CTLR.BOM[1:0] = 00b (normal mode)

CAN模块在完成从总线关闭状态恢复并启用CAN通信后进入错误激活状态。EIFR中的BORIF标志设置为1 (检测到总线关闭恢复)。

#### (2) 当CTLR.RBOC=1时 (从总线关闭强制返回)

当CAN模块处于总线关闭状态且RBOC位为1时，进入错误激活状态。在检测到11b个连续的隐性位后再次启用CAN通信。BORIF标志未设置为1。

#### (3) 当CTLR.BOM[1:0]=01b时 (在总线关闭进入时自动转换到CAN暂停模式)

CAN模块在达到总线关闭状态时进入CAN停止模式。BORIF标志未设置为1。

#### (4) 当CTLR.BOM[1:0]=10b时 (在总线关闭结束时自动转换到CAN暂停模式)

CAN模块在完成总线关闭恢复后进入CAN暂停模式。BORIF标志设置为1。

#### (5) 当CTLR.BOM[1:0]=11b (通过软件自动转换到CAN暂停模式) 并且总线关闭状态期间CTLR.CANM[1:0]=10b (CAN停止模式)

CAN模块在总线关闭状态且CANM[1:0]位设置为10b (CAN停止模式) 时进入CAN停止模式。BORIF标志未设置为1。

如果在总线关闭期间CANM[1:0]位未设置为10b，则适用与(1)相同的行为。

## 29.4 数据传输率配置

本节介绍如何配置数据传输速率。

### 29.4.1 时钟设置

CAN模块提供一个CAN时钟发生器。CAN时钟可以在BCR的CCLKS和BRP[9:0]位中设置。图29.11显示了CAN时钟发生器的框图。

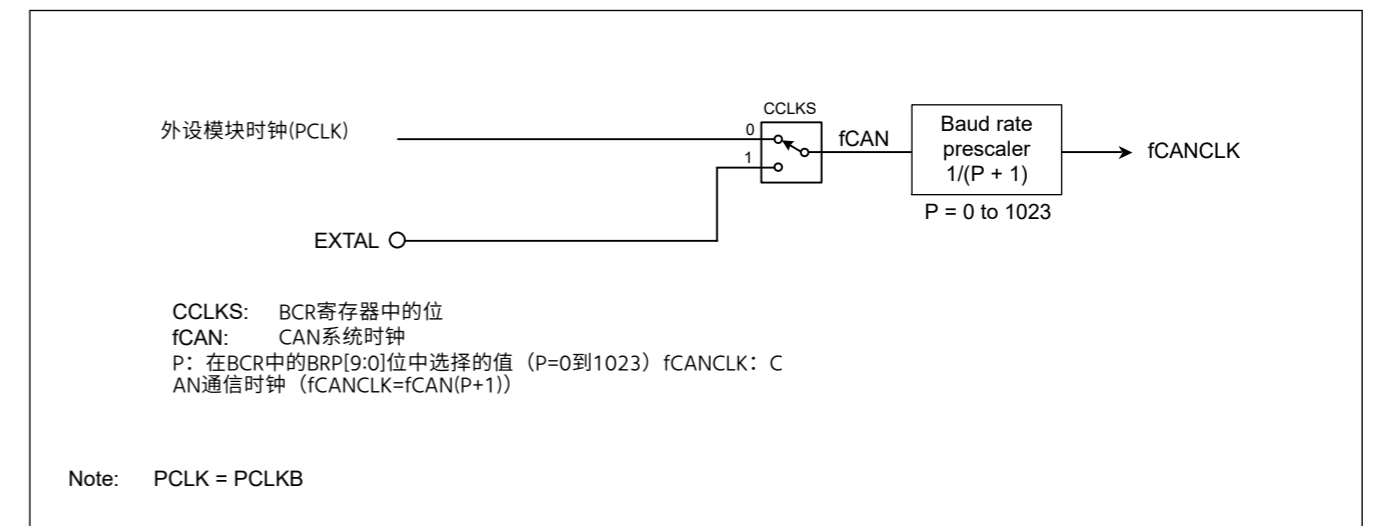

Figure 29.11 CAN时钟发生器框图

### 29.4.2 Bit Timing Setting

The bit timing consists of three segments as shown in Figure 29.12.

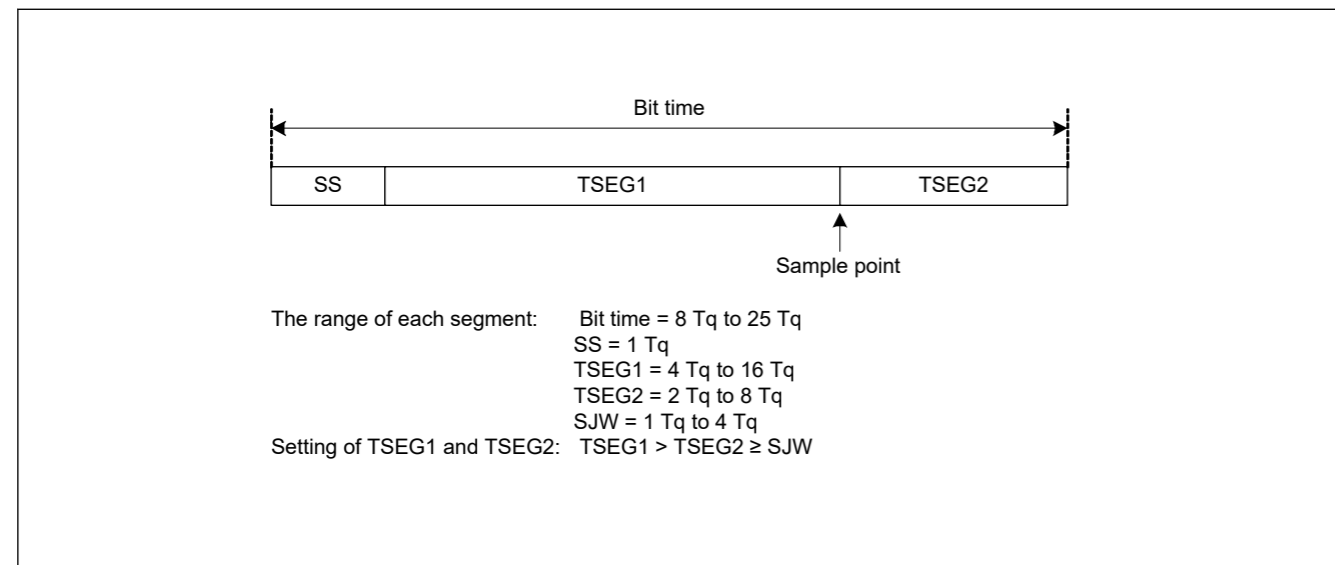

Figure 29.12 Bit timing

### 29.4.3 Data Transfer Rate

The data transfer rate depends on the division value of fCAN (CAN system clock), the division value of the baud rate prescaler, and the Tq count for 1 bit time.

The division value of baud rate prescaler = P + 1 (P: 0 to 1023), where P is the BRP[9:0] setting in BCR.

$$\text{Data transfer rate (bps)} = \frac{f_{CAN}}{\text{Baud rate prescaler division value} \times \text{Tq count for 1 bit time}} = \frac{f_{CANCLK}}{\text{Tq count for 1 bit time}}$$

Table 29.9 lists data transfer rate examples.

Table 29.9 Data transfer rate examples

| fCAN               | 20 MHz   |       |
|--------------------|----------|-------|
| Data transfer rate | Tq count | P + 1 |
| 1 Mbps             | 5 Tq     | 4     |
|                    | 10 Tq    | 2     |
| 500 kbps           | 5 Tq     | 8     |
|                    | 10 Tq    | 4     |
| 250 kbps           | 5 Tq     | 16    |
|                    | 10 Tq    | 8     |
| 125 kbps           | 5 Tq     | 32    |
|                    | 10 Tq    | 16    |
| 83.3 kbps          | 5 Tq     | 48    |
|                    | 10 Tq    | 24    |
| 33.3 kbps          | 5 Tq     | 120   |
|                    | 8 Tq     | 75    |
|                    | 10 Tq    | 60    |

### 29.5 Mailbox and Mask Register Structure

Figure 29.13 shows the structure of the 32 mailbox registers: MBj\_ID, MBj\_DL, MBj\_Dm, and MBj\_TS.

### 29.4.2 位时序设置

位时序由三个部分组成，如图29.12所示。

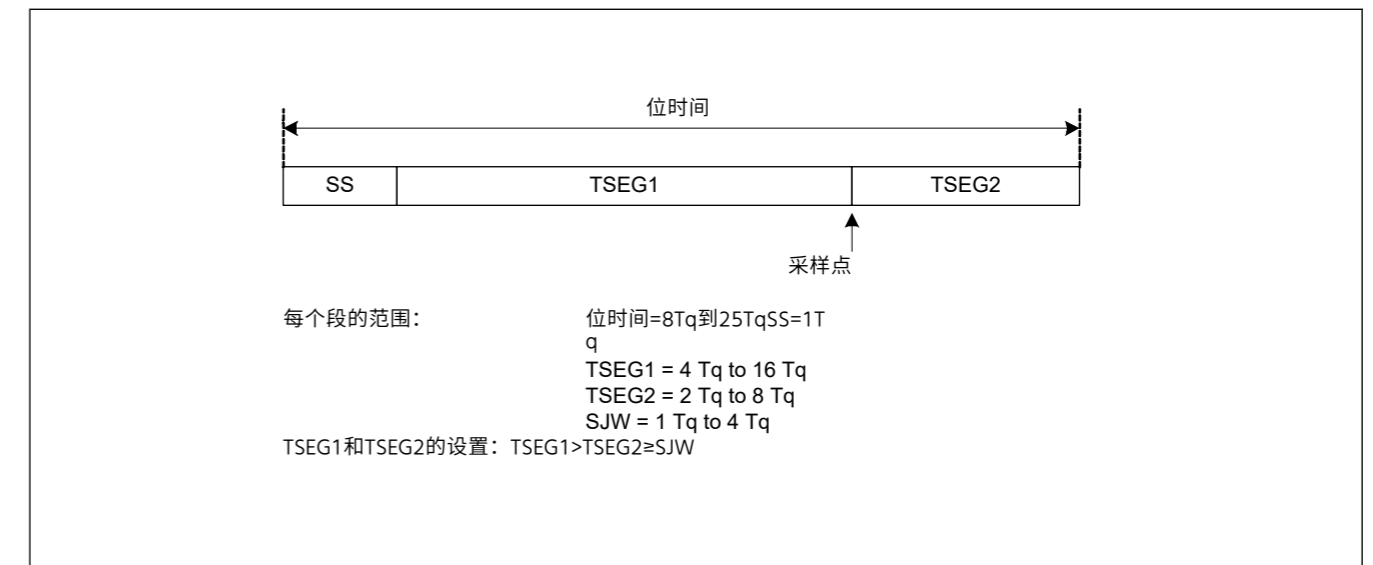

Figure 29.12 位时序

### 29.4.3 数据传输率

数据传输率取决于fCAN (CAN系统时钟) 的分频值、波特率预分频器的分频值和1位时间的Tq计数。

波特率预分频器的分频值=P+1(P:0到1023)，其中P是BCR中的BRP[9:0]设置。

$$\text{数据传输率(bps)} = \frac{f_{CAN}}{\text{波特率预分频器分频值} \times \text{1位时间的Tq计数}} = \frac{\text{1位时间的} f_{CANCLK} \text{Tq计数}}{\text{计数}}$$

表29.9列出了数据传输率示例。

Table 29.9 数据传输率示例

| fCAN      | 20 MHz   |       |
|-----------|----------|-------|
| 数据传输率     | Tq count | P + 1 |
| 1 Mbps    | 5 Tq     | 4     |
|           | 10 Tq    | 2     |
| 500 kbps  | 5 Tq     | 8     |
|           | 10 Tq    | 4     |
| 250 kbps  | 5 Tq     | 16    |
|           | 10 Tq    | 8     |
| 125 kbps  | 5 Tq     | 32    |
|           | 10 Tq    | 16    |
| 83.3 kbps | 5 Tq     | 48    |
|           | 10 Tq    | 24    |
| 33.3 kbps | 5 Tq     | 120   |
|           | 8 Tq     | 75    |
|           | 10 Tq    | 60    |

### 29.5 邮箱和掩码寄存器结构

图29.13显示了32个邮箱寄存器的结构：MBj\_ID、MBj\_DL、MBj\_Dm和MBj\_TS。

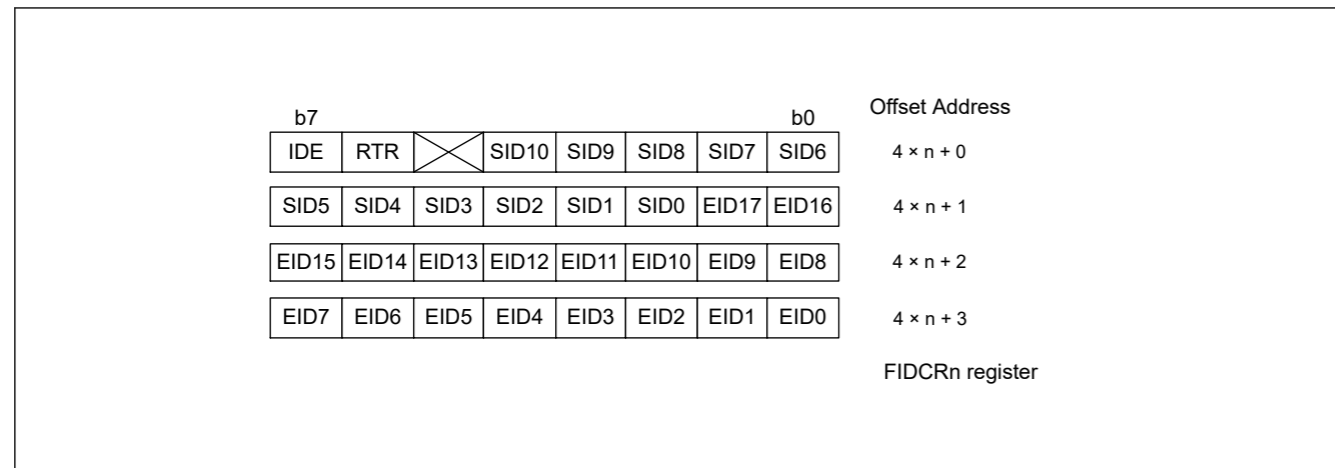

Figure 29.15 Structure of the FIDCRn registers (n = 0, 1)

## 29.6 Acceptance Filtering and Masking Functions

The acceptance filtering and masking functions allow you to select and receive messages with multiple IDs for mailboxes within a specified range.

The MKRk registers can mask the standard ID and the extended ID of 29 bits.

- MKR0 controls mailboxes 0 to 3
- MKR1 controls mailboxes 4 to 7
- MKR2 controls mailboxes 8 to 11
- MKR3 controls mailboxes 12 to 15
- MKR4 controls mailboxes 16 to 19
- MKR5 controls mailboxes 20 to 23
- MKR6 controls mailboxes 24 to 27 in normal mailbox mode and the receive FIFO mailboxes 28 to 31 in FIFO mailbox mode
- MKR7 controls mailboxes 28 to 31 in normal mailbox mode and the receive FIFO mailboxes 28 to 31 in FIFO mailbox mode

MKIVLR disables acceptance filtering independently for each mailbox.

The IDE bit in MBj\_ID is valid when the IDFM[1:0] bits in CTRL are 10b (mixed ID mode).

The RTR bit in MBj\_ID selects a data or remote frame.

In FIFO mailbox mode, normal mailboxes 0 to 23 use one associated register from MKR0 to MKR5 for acceptance filtering. The receive FIFO mailboxes 28 to 31 use two registers, MKR6 and MKR7, for acceptance filtering.

The receive FIFO also uses two registers, FIDCR0 and FIDCR1, for ID comparison. The EID[17:0], SID[10:0], RTR, and IDE bits in MB28 to MB31 for the receive FIFO are disabled. As acceptance filtering depends on the result of two logic AND operations, two ranges of IDs can be received into the receive FIFO. MKIVLR is disabled for the receive FIFO.

If different standard ID and extended ID values are set in the IDE bits in FIDCR0 and FIDCR1, both ID formats are received.

If different data frame and remote frame values are set in the RTR bits in FIDCR0 and FIDCR1, both data and remote frames are received.

When a combination of two ranges of IDs is not required, set the same mask value and the same ID into both the FIFO ID and mask registers.

Figure 29.16 shows the associations between the mask registers and mailboxes. Figure 29.17 shows the acceptance filtering.

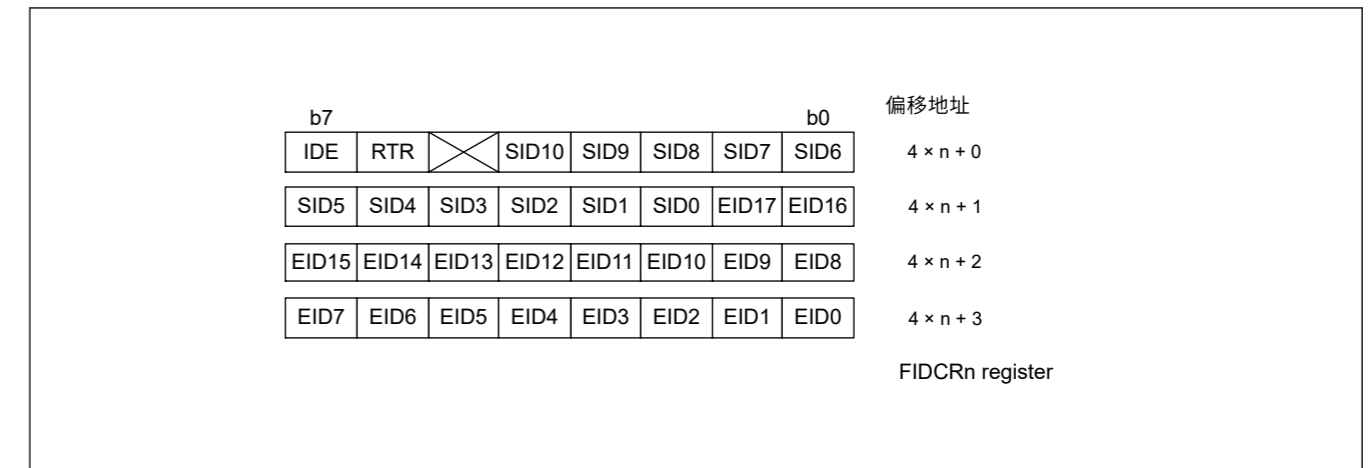

Figure 29.15 FIDCRn寄存器的结构(n=0 1)

## 29.6 接受过滤和屏蔽功能

接受过滤和屏蔽功能允许您为指定范围内的邮箱选择和接收具有多个ID的消息。

MKRk寄存器可以屏蔽标准ID和29位扩展ID。

- MKR0控制邮箱0到3
- MKR1控制邮箱4到7
- MKR2控制邮箱8到11
- MKR3控制邮箱12到15
- MKR4控制邮箱16到19
- MKR5控制邮箱20到23
- MKR6在普通邮箱模式下控制邮箱24到27，在FIFO邮箱模式下控制接收FIFO邮箱28到31
- MKR7在普通邮箱模式下控制邮箱28到31，在FIFO邮箱模式下控制接收FIFO邮箱28到31

MKIVLR为每个邮箱单独禁用接受过滤。

当CTRL中的IDFM[1:0]位为10b（混合ID模式）时，MBj\_ID中的IDE位有效。

MBj\_ID中的RTR位选择数据或远程帧。

在FIFO邮箱模式下，普通邮箱0到23使用一个从MKR0到MKR5的关联寄存器用于接受过滤。接收FIFO邮箱28到31使用两个寄存器，MKR6和MKR7，用于接受过滤。

接收FIFO还使用两个寄存器FIDCR0和FIDCR1进行ID比较。EID[17:0]、SID[10:0]、RTR和MB28到MB31中用于接收FIFO的IDE位被禁用。由于验收过滤取决于两个逻辑的结果AND操作，可以将两个范围的ID接收到接收FIFO中。MKIVLR对接收FIFO禁用。

如果在FIDCR0和FIDCR1的IDE位中设置了不同的标准ID和扩展ID值，则会接收两种ID格式。

如果在FIDCR0和FIDCR1的RTR位中设置了不同的数据帧和远程帧值，则数据帧和远程帧都被接收。

当不需要两个ID范围的组合时，将相同的掩码值和相同的ID设置到FIFOID和掩码寄存器中。

图29.16显示了掩码寄存器和邮箱之间的关联。图29.17显示了接受过滤。

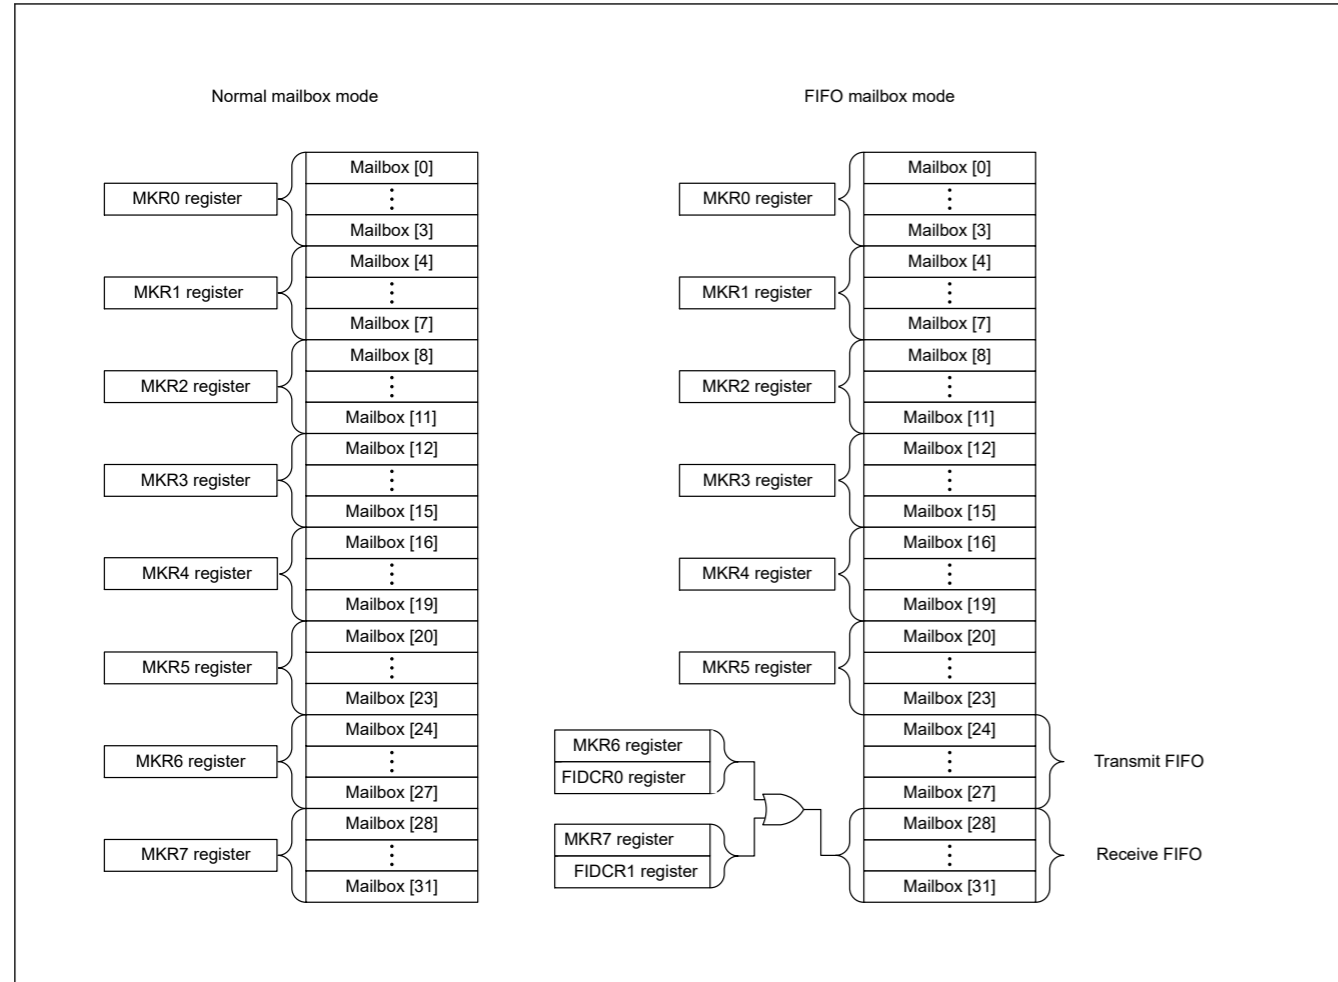

Figure 29.16 Associations between mask registers and mailboxes

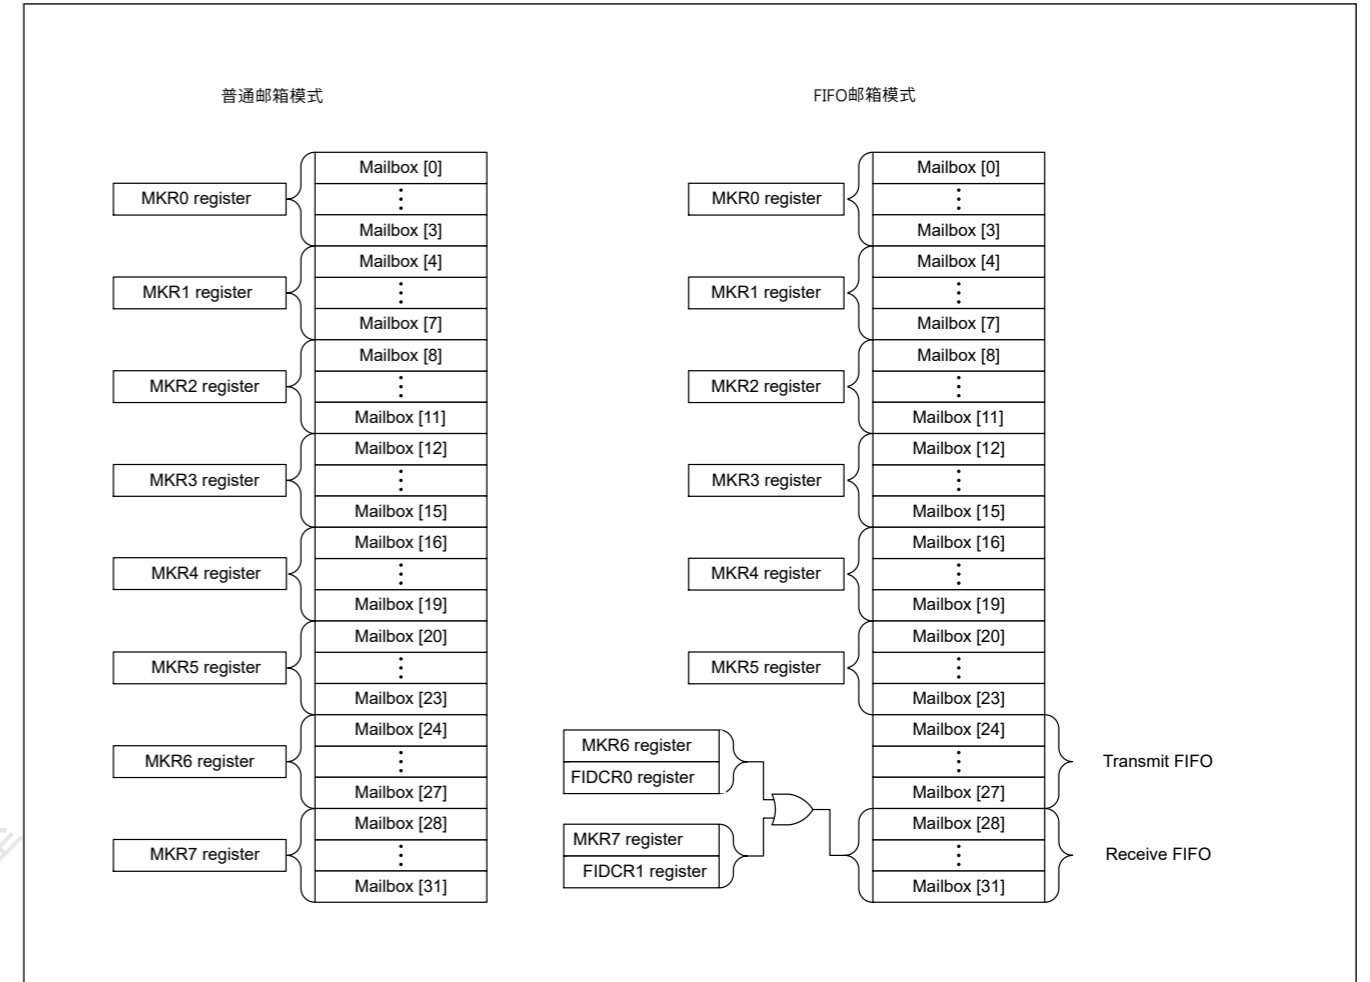

Figure 29.16 掩码寄存器和邮箱之间的关联

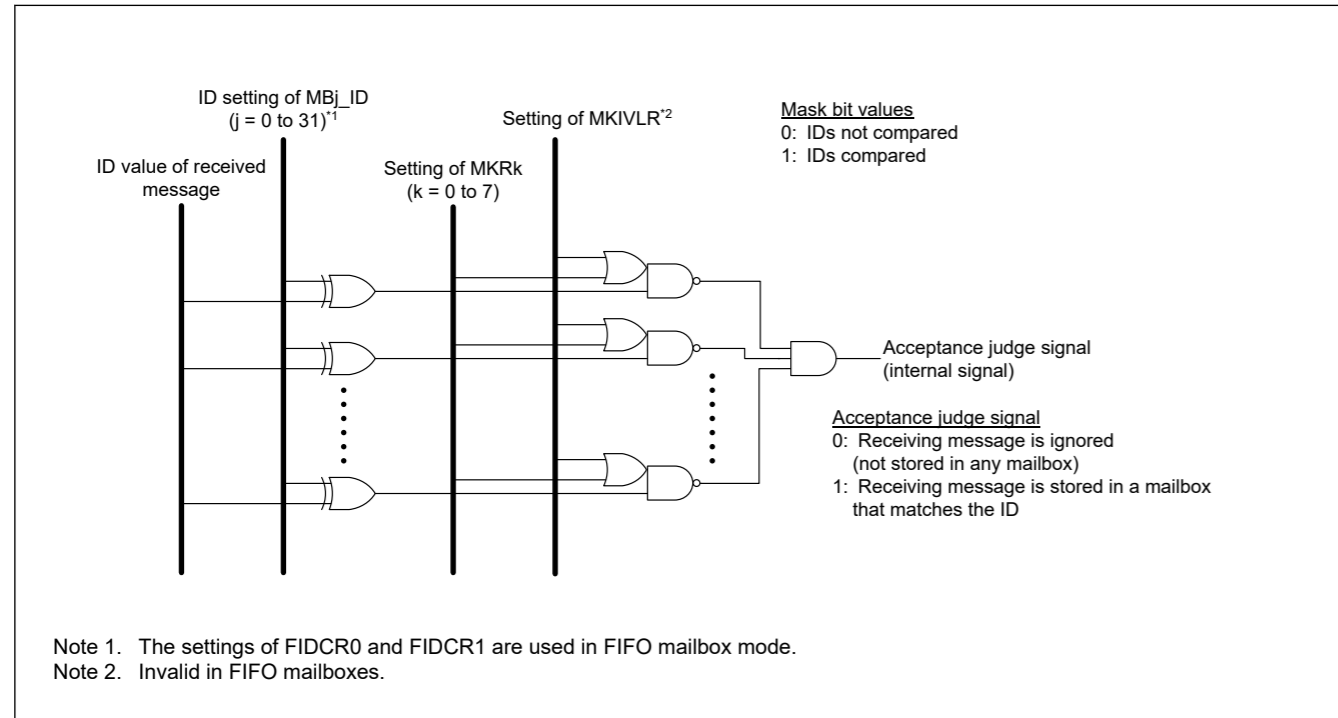

Figure 29.17 Acceptance filtering

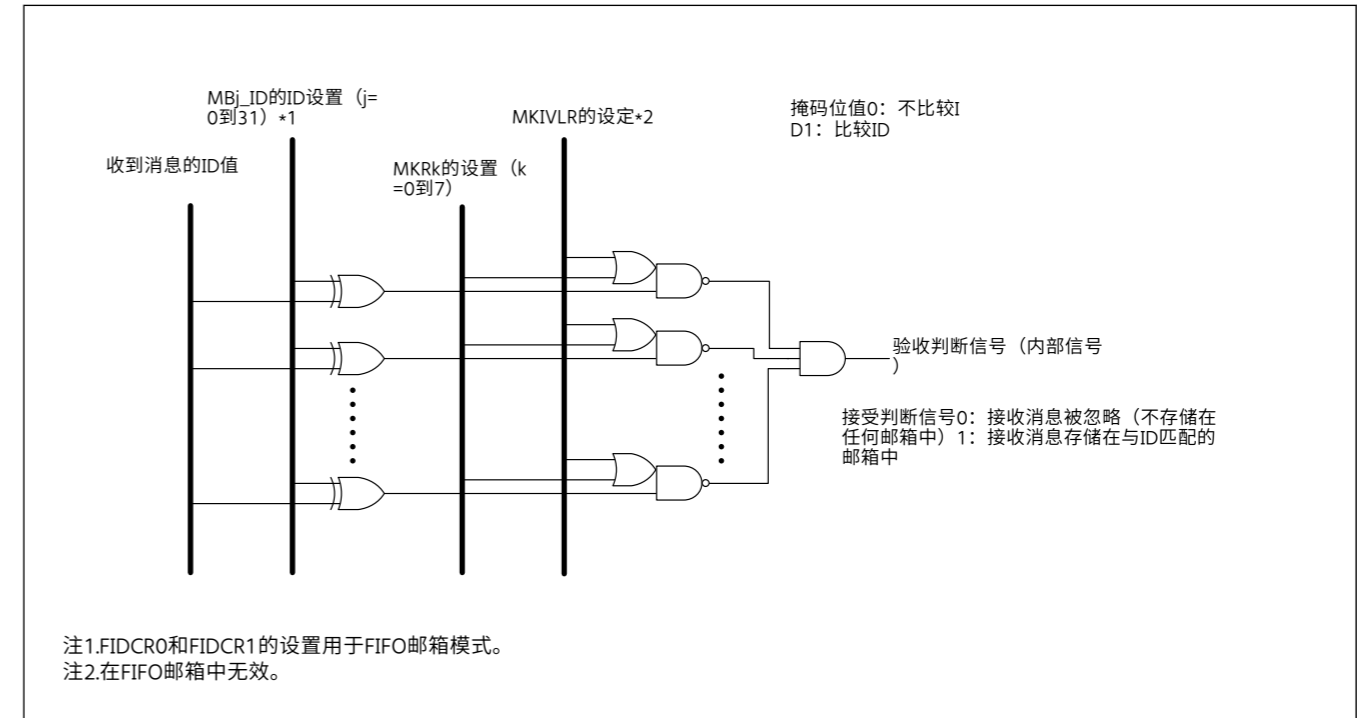

Figure 29.17 验收过滤

## 29.7 Reception and Transmission

Table 29.10 lists the CAN communication mode settings.

Table 29.10 Settings for CAN receive and transmit modes

| MCTL_TX[j].TRMREQ<br>and<br>MCTL_RX[j].TRMREQ | MCTL_TX[j].RECREQ<br>and<br>MCTL_RX[j].RECREQ | MCTL_TX[j].ONESHOT<br>and<br>MCTL_RX[j].ONESHOT | Mailbox communication mode  |
|---|---|---|---|
| 0   | 0   | 0   | Mailbox disabled or transmission being aborted  |
| 0   | 0   | 1   | Can be configured only when transmission or reception from a mailbox programmed in one-shot mode is aborted |
| 0   | 1   | 0   | Configured as a receive mailbox for a data or remote frame  |
| 0   | 1   | 1   | Configured as a one-shot receive mailbox for a data or remote frame.  |
| 1   | 0   | 0   | Configured as a transmit mailbox for a data or remote frame.  |
| 1   | 0   | 1   | Configured as a one-shot transmit mailbox for a data or remote frame.                                       |
| 1   | 1   | 0   | Do not set.   |
| 1   | 1   | 1   | Do not set.   |

Note: j = 0 to 31

When a mailbox is configured as a receive mailbox or a one-shot receive mailbox, the following restrictions apply:

- Before configuring the mailbox, set MCTL\_RX[j] to 0x00.
- A received message is stored in the first mailbox that matches the condition resulting from the receive mode settings and acceptance filtering. The matching mailbox with the smallest number takes priority for storing the received message.
- In CAN operation mode, the CAN module does not receive its own transmitted data even when the ID is a match. In self-test mode, however, the CAN module receives its own transmitted data and returns ACK.

When configuring a mailbox as a transmit mailbox or a one-shot transmit mailbox, the following constraint applies:

- Before configuring a mailbox, ensure that MCTL\_TX[j] is 0x00 and that there is no pending abort process.

### 29.7.1 Reception

Figure 29.18 shows an operation example of data frame reception in overwrite mode. The example shows the overwriting of the first message when the CAN module receives two consecutive CAN messages that match the receiving conditions in MCTL\_RX[j] (j = 0 to 31).

## 29.7 接收和传输

表29.10列出了CAN通信模式设置。

Table 29.10 CAN接收和发送模式的设置

| MCTL_TX[j].TRMREQ<br>and<br>MCTL_RX[j].TRMREQ | MCTL_TX[j].RECREQ<br>and<br>MCTL_RX[j].RECREQ | MCTL_TX[j].ONESHOT<br>and<br>MCTL_RX[j].ONESHOT | 邮箱通讯方式                        |
|---|---|---|-------------------------------|
| 0   | 0   | 0   | 邮箱禁用或传输被中止                    |
| 0   | 0   | 1   | 只有在一次性模式中编程的邮箱的发送或接收被中止时才可以配置 |
| 0   | 1   | 0   | 配置为数据或远程帧的接收邮箱                |
| 0   | 1   | 1   | 配置为数据或远程帧的一次性接收邮箱。            |
| 1   | 0   | 0   | 配置为数据或远程帧的传输邮箱。               |
| 1   | 0   | 1   | 配置为数据或远程帧的一次性发送邮箱。            |
| 1   | 1   | 0   | 不要设置。                         |
| 1   | 1   | 1   | 不要设置。                         |

Note: j = 0 to 31

当邮箱配置为接收邮箱或一次性接收邮箱时，以下限制适用：

- 配置邮箱前，将MCTL\_RX[j]设置为0x00。
- 收到的消息存储在第一个符合接收模式设置和接受过滤条件的邮箱中。编号最小的匹配邮箱优先存储收到的消息。
- 在CAN操作模式下，即使ID匹配，CAN模块也不会接收到自己发送的数据。然而，在自检模式下，CAN模块接收自己发送的数据并返回ACK。

将邮箱配置为传输邮箱或一次性传输邮箱时，适用以下约束：

- 在配置邮箱之前，请确保MCTL\_TX[j]为0x00，并且没有挂起的中止进程。

### 29.7.1 Reception

图29.18显示了覆盖模式下数据帧接收的操作示例。该示例显示当CAN模块接收到与MCTL\_RX[j] (j=0到31) 中的接收条件匹配的两个连续CAN报文时，第一条报文的覆盖。

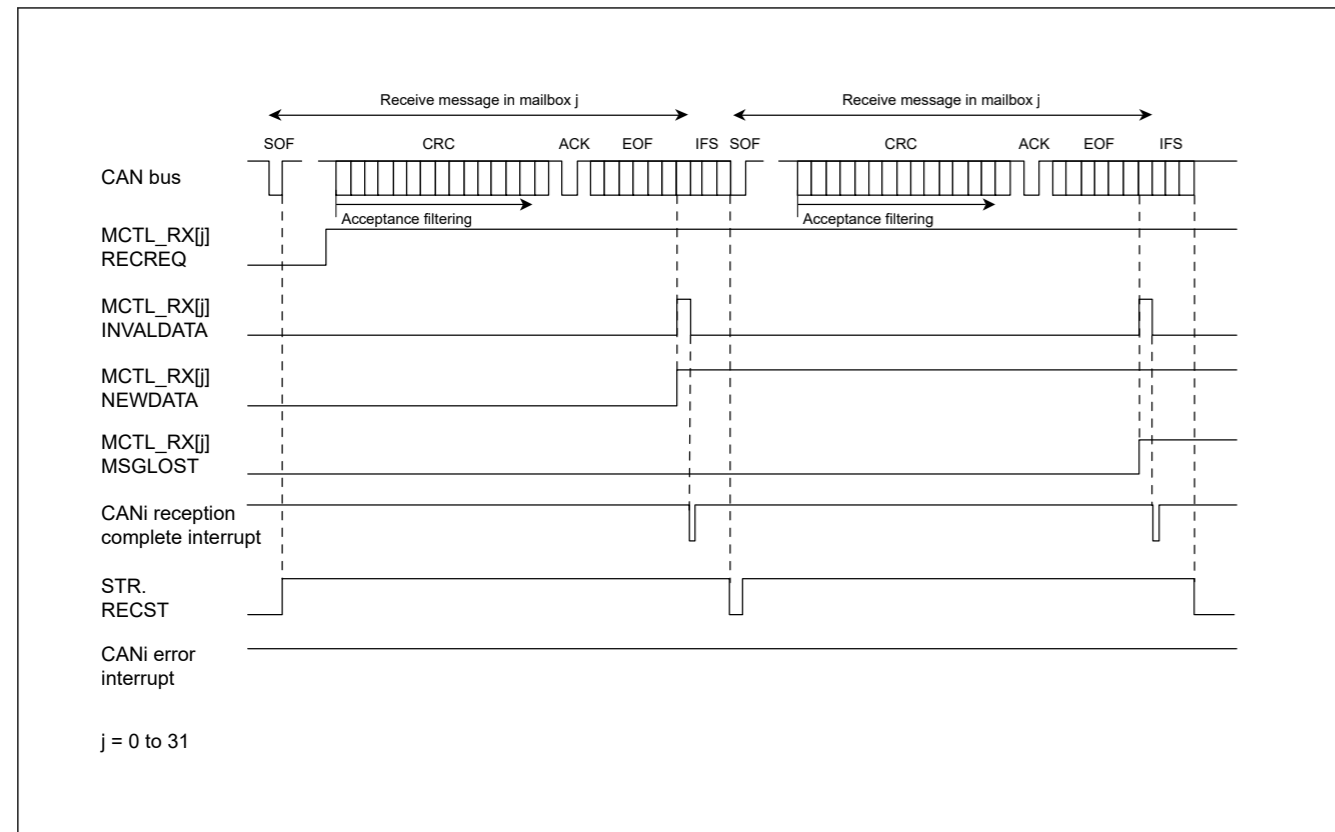

Figure 29.18 Operation example of data frame reception in overwrite mode

1. When an SOF is detected on the CAN bus, the RECST bit in STR is set to 1 (reception in progress) if the CAN module has no message ready to start transmission.
2. Acceptance filtering starts at the beginning of the CRC field to select the receive mailbox.
3. After a message is received, the NEWDATA flag in MCTL\_RX[j] for the receive mailbox is set to 1 (new message is being stored or was stored in the mailbox). The INVALIDDATA flag in MCTL\_RX[j] is set to 1 (message is being updated) at the same time, and then the INVALIDDATA flag is set to 0 (message valid) again after the complete message is transferred to the mailbox.
4. When the interrupt enable bit in MIER for the receive mailbox is 1 (interrupt enabled), the INVALIDDATA flag is set to 0, which triggers a CAN0 reception complete interrupt request.
5. After reading the message from the mailbox, the NEWDATA flag must be set to 0 by software.
6. In overwrite mode, if the next CAN message is received before the NEWDATA flag in MCTL\_RX[j] is set to 1, the MSGLOST flag in MCTL\_RX[j] is set to 1 (message was overwritten). The new received message is transferred to the mailbox. The CAN0 reception complete interrupt request occurs the same as in step 4.

Figure 29.19 shows an operation example of data frame reception in overrun mode. The example shows the overrun of the second message when the CAN module receives two consecutive CAN messages that match the receiving conditions in MCTL\_RX[j] (j = 0 to 31).

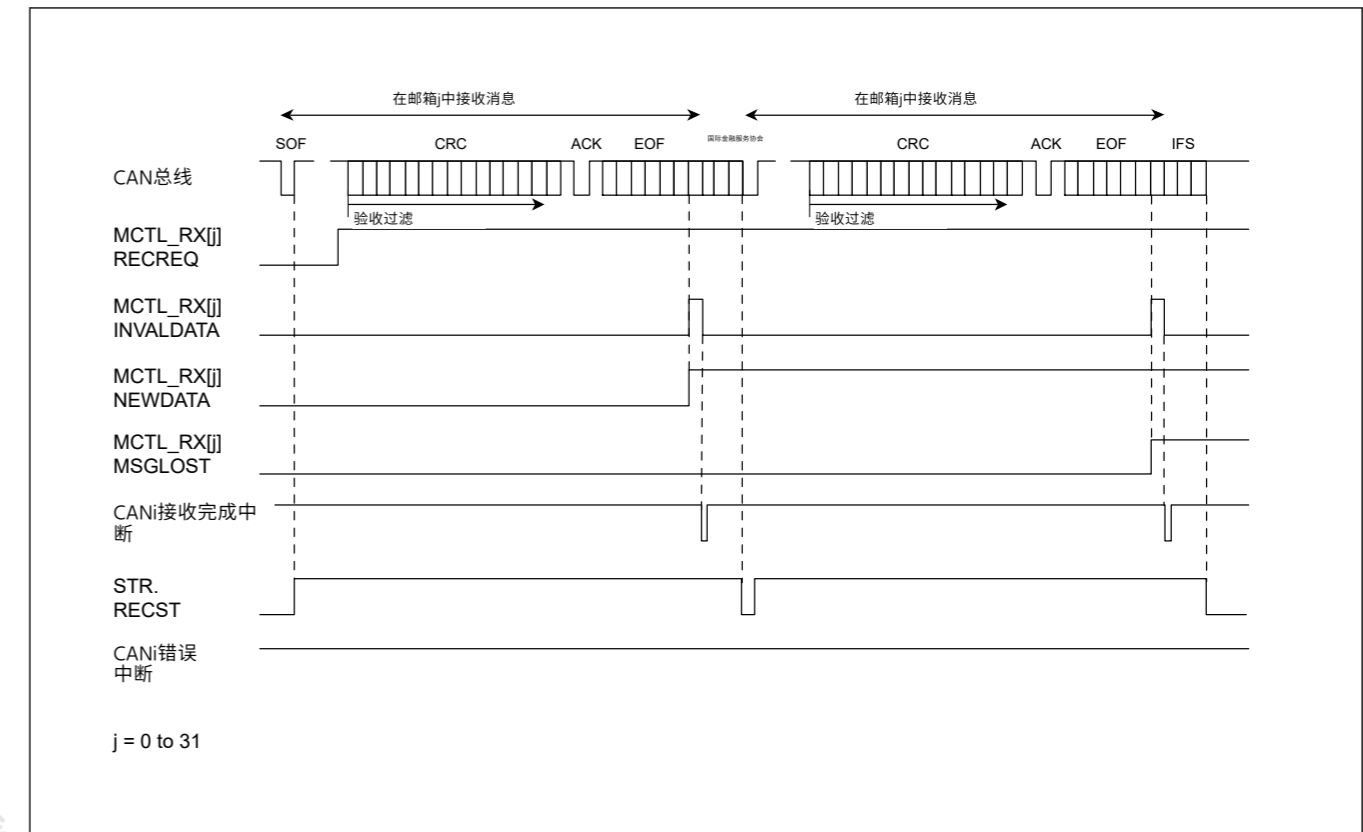

Figure 29.18 覆盖模式下数据帧接收的操作示例

1. 当CAN总线上检测到SOF时，如果CAN模块没有准备好开始发送的消息，则STR中的RECST位设置为1（正在接收）。
2. 接受过滤从CRC字段的开头开始，以选择接收邮箱。
3. 收到消息后，接收邮箱的MCTL\_RX[j]中的NEWDATA标志设置为1（新消息正在存储或已存储在邮箱中）。MCTL\_RX[j]中的INVALIDDATA标志同时设置为1（消息正在更新），然后在完整的消息传送到邮箱后再次将INVALIDDATA标志设置为0（消息有效）。
4. 当接收邮箱的MIER中的中断使能位为1（中断使能）时，INVALIDDATA标志设置为0，触发CAN0接收完成中断请求。
5. 从邮箱读取消息后，NEWDATA标志必须由软件设置为0。
6. 在覆盖模式下，如果在MCTL\_RX[j]中的NEWDATA标志设置为1之前接收到下一个CAN报文，则MCTL\_RX[j]中的MSGLOST标志设置为1（消息被覆盖）。新收到的消息被传送到邮箱。CAN0接收完成中断请求的发生与步骤4相同。

图29.19显示了溢出模式下数据帧接收的操作示例。该示例显示当CAN模块接收到与MCTL\_RX[j] (j=0到31) 中的接收条件匹配的两个连续CAN报文时，第二条报文的溢出。

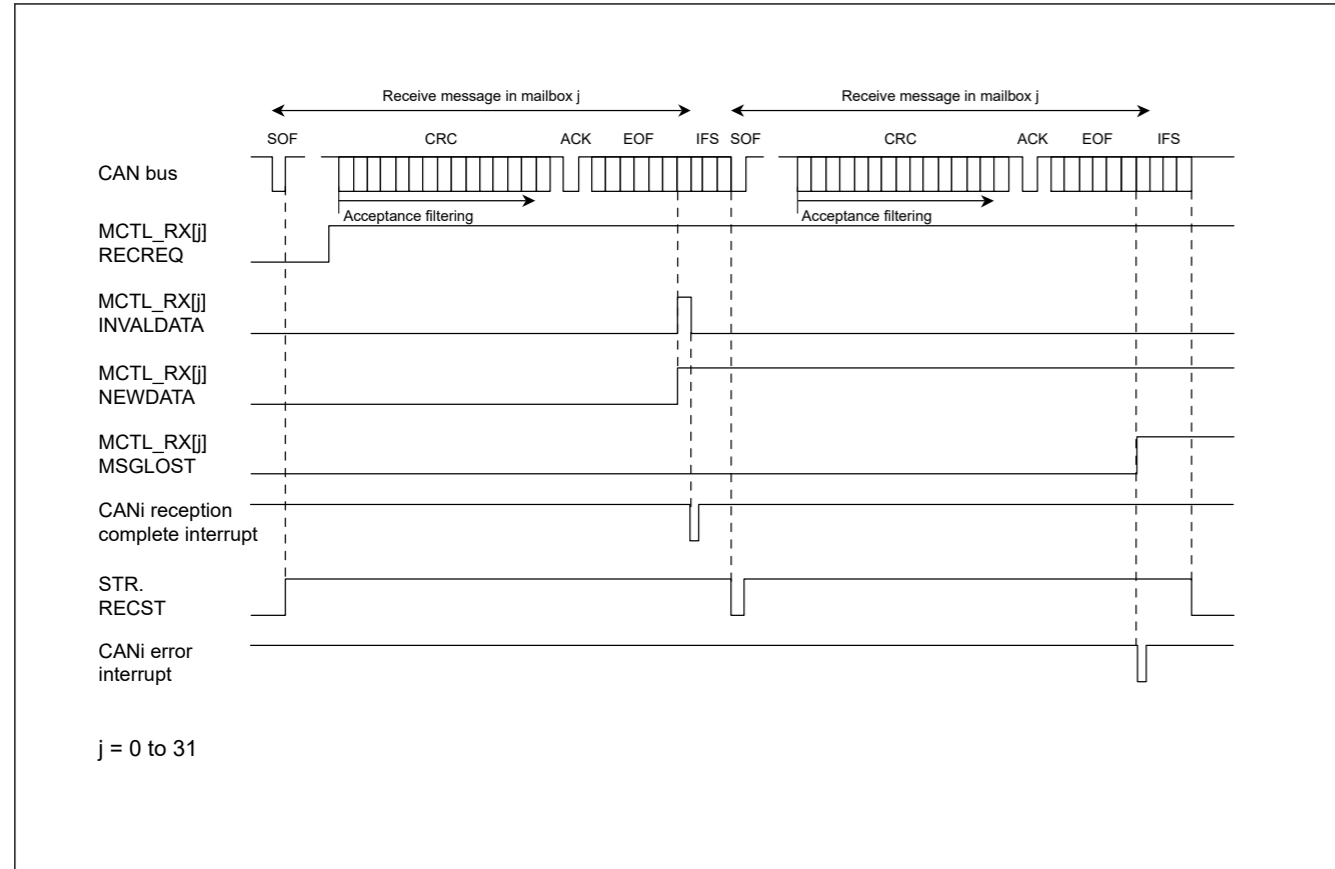

Figure 29.19 Operation example of data frame reception in overrun mode

1. When an SOF is detected on the CAN bus, the RECST bit in STR is set to 1 (reception in progress) if the CAN module has no message ready to start transmission.
2. Acceptance filtering starts at the beginning of the CRC field to select the receive mailbox.
3. After a message is received, the NEWDATA flag in MCTL\_RX[j] for the receive mailbox is set to 1 (new message is being stored or was stored in the mailbox). The INVALIDDATA flag in MCTL\_RX[j] is set to 1 (message is being updated) at the same time, and then the INVALIDDATA flag is set to 0 (message valid) again after the complete message is transferred to the mailbox.
4. When the interrupt enable bit in MIER for the receive mailbox is 1 (interrupt enabled), the INVALIDDATA flag is set to 0, which triggers a CAN0 reception complete interrupt request.
5. After reading the message from the mailbox, the NEWDATA flag must be set to 0 by software.
6. In overrun mode, if the next CAN message is received before the NEWDATA flag in MCTL\_RX[j] is set to 0, the MSGLOST flag in MCTL\_RX[j] is set to 1 (message was saved). The new received message is discarded and a CANi error interrupt request occurs if the associated interrupt enable bit in EIER is set to 1 (interrupt enabled).

### 29.7.2 Transmission

Figure 29.20 shows an operation example of data frame transmission.

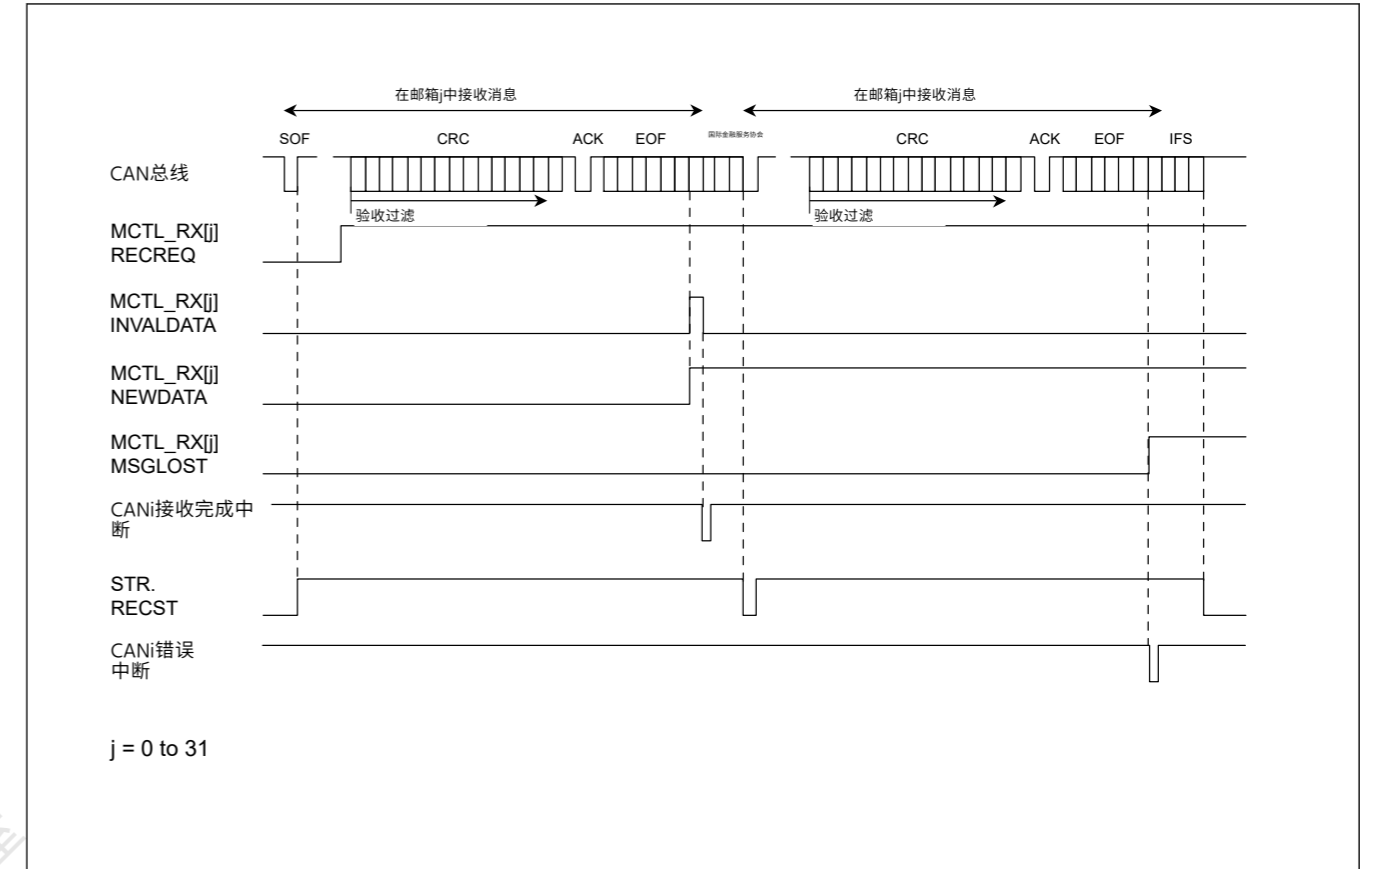

Figure 29.19 溢出模式下数据帧接收的操作示例

1. 当CAN总线上检测到SOF时，如果CAN模块没有准备好开始发送的消息，则STR中的RECST位设置为1（正在接收）。
2. 接受过滤从CRC字段的开头开始，以选择接收邮箱。
3. 收到消息后，接收邮箱的MCTL\_RX[j]中的NEWDATA标志设置为1（新消息正在存储或已存储在邮箱中）。MCTL\_RX[j]中的INVALIDDATA标志同时设置为1（消息正在更新），然后在完整的消息传送到邮箱后再次将INVALIDDATA标志设置为0（消息有效）。
4. 当接收邮箱的MIER中的中断使能位为1（中断使能）时，INVALIDDATA标志设置为0，触发CAN0接收完成中断请求。
5. 从邮箱读取消息后，NEWDATA标志必须由软件设置为0。
6. 在溢出模式下，如果在MCTL\_RX[j]中的NEWDATA标志设置为0之前接收到下一个CAN报文，则MCTL\_RX[j]中的MSGLOST标志设置为1（消息已保存）。如果EIER中的相关中断使能位设置为1（中断使能），则丢弃新接收到的消息并产生CANi错误中断请求。

### 29.7.2 Transmission

图29.20显示了数据帧传输的操作示例。

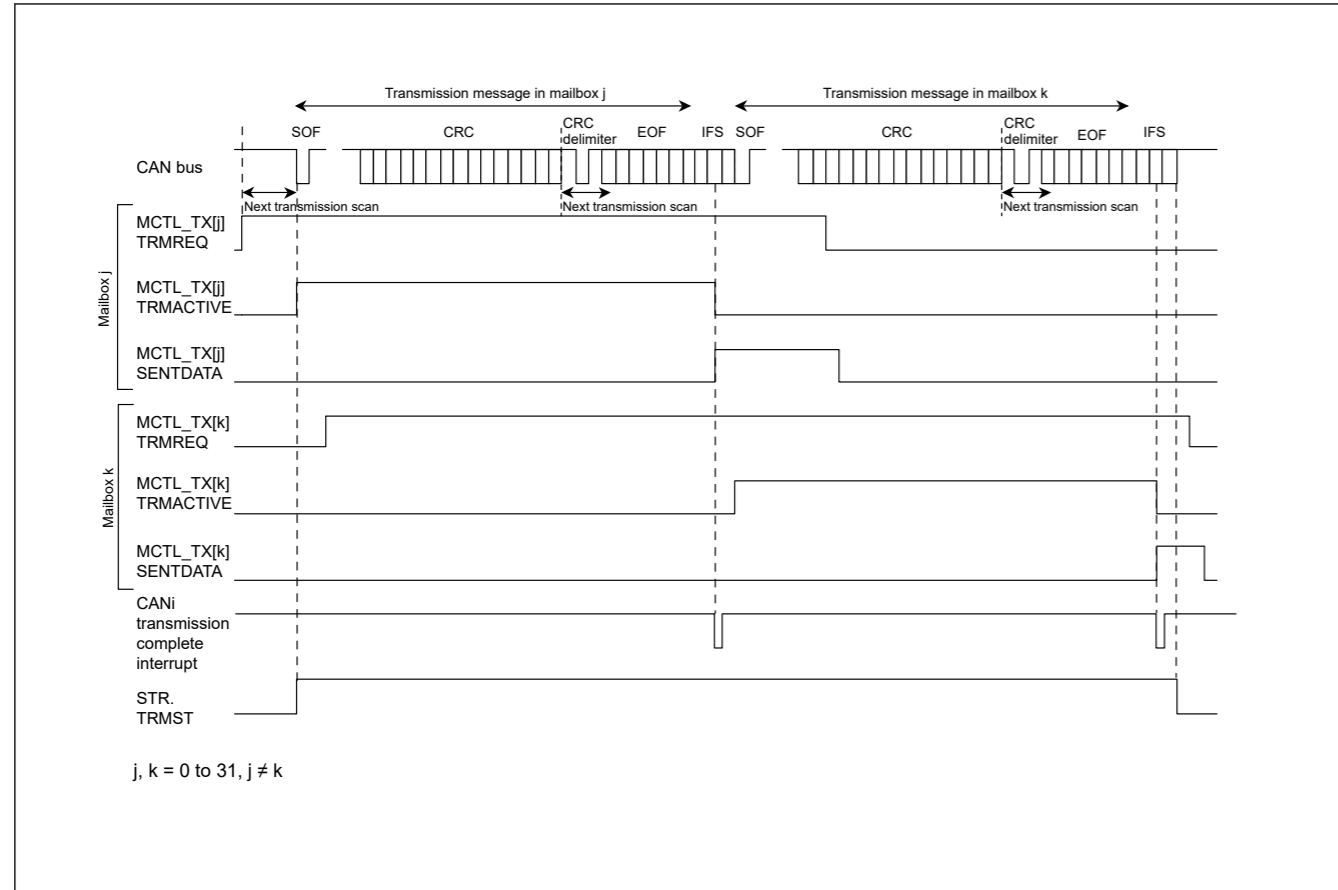

Figure 29.20 Operation example of data frame transmission

1. When a TRMREQ bit in MCTL\_TX[j] (j = 0 to 31) is set to 1 (transmit mailbox) in the bus-idle state, mailbox scanning starts to decide the highest-priority mailbox for transmission. When the transmit mailbox is decided, the TRMACTIVE flag in MCTL\_TX[j] is set to 1 (from acceptance of transmission request to completion of transmission, or error or arbitration-lost), the TRMST bit in STR is set to 1 (transmission in progress), and the CAN module starts transmission.\*1
2. If other TRMREQ bits are set, the transmission scanning starts with the CRC delimiter for the next transmission.
3. If transmission is complete without losing arbitration, the SENTDATA flag in MCTL\_TX[j] is set to 1 (transmission complete) and the TRMACTIVE flag is set to 0 (transmission is pending or transmission is not requested). If the interrupt enable bit in MIER is 1 (interrupt enabled), the CANi transmission complete interrupt request is generated.
4. When requesting the next transmission from the same mailbox, set the SENTDATA flag and TRMREQ bit to 0, and then set the TRMREQ bit to 1 after checking that the SENTDATA flag and TRMREQ bit are set to 0.

Note 1. If arbitration is lost after the CAN module starts transmission, the TRMACTIVE flag is set to 0. Transmission scanning is performed again to search for the highest-priority transmit mailbox from the beginning of the CRC delimiter. If an error occurs either during transmission or following arbitration-lost, transmission scanning is performed again to search for the highest-priority transmit mailbox from the start of the error delimiter.

### 29.8 Interrupts

The CAN module provides the following interrupts for each channel. Table 29.11 lists the CAN interrupts.

- CANi reception complete interrupt for mailboxes 0 to 31 (CANi\_RXM)
- CANi transmission complete interrupt for mailboxes 0 to 31 (CANi\_TXM)
- CANi receive FIFO interrupt (CANi\_RXF)
- CANi transmit FIFO interrupt (CANi\_TXF)
- CANi error interrupt (CANi\_ERS)

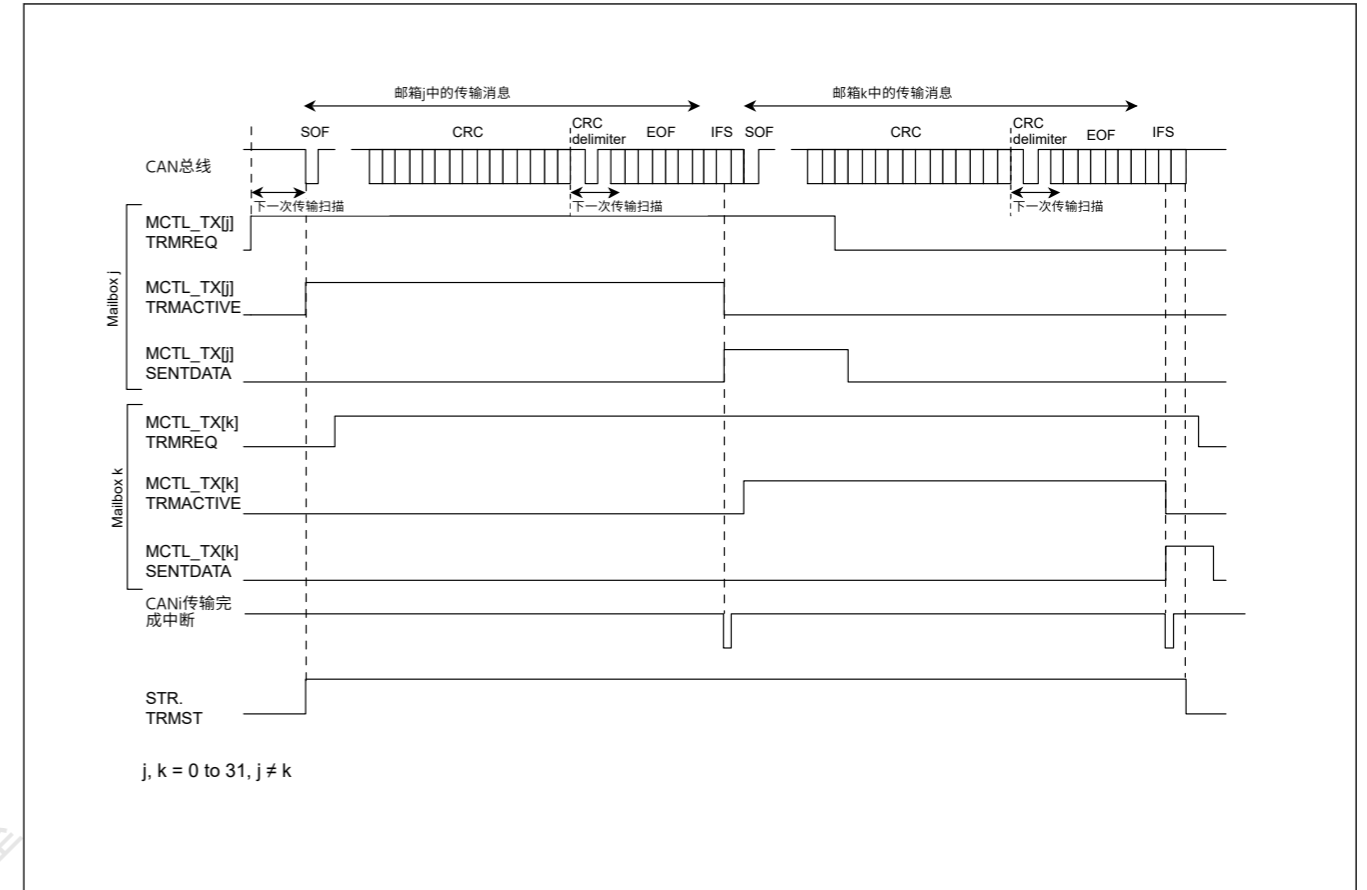

Figure 29.20 数据帧传输的操作示例

- 1.当MCTL\_TX[j] (j=0到31) 中的TRMREQ位在总线空闲状态下设置为1 (发送邮箱) 时, 邮箱扫描开始决定发送的最高优先级邮箱。当确定发送邮箱时, MCTL\_TX[j]中的TRMACTIVE标志置1 (从接受发送请求到发送完成, 或错误或仲裁丢失), STR中的TRMST位设置为1 (发送进度), CAN模块开始传输。\*1
- 2.如果设置了其他TRMREQ位, 则传输扫描以CRC定界符开始, 以进行下一次传输。
- 3.如果传输完成且没有丢失仲裁, 则MCTL\_TX[j]中的SENTDATA标志设置为1 (传输完成) 并且TRMACTIVE标志设置为0 (传输未决或未请求传输)。如果MIER中的中断使能位为1 (中断使能), 则产生CANi传输完成中断请求。
- 4.从同一邮箱请求下一次发送时, 将SENTDATA标志和TRMREQ位设置为0, 然后在检查SENTDATA标志和TRMREQ位设置为0后将TRMREQ位设置为1。

注1.如果CAN模块开始发送后仲裁丢失, 则TRMACTIVE标志设置为0。再次执行发送扫描以从CRC分隔符的开头搜索优先级最高的发送邮箱。如果在传输过程中或仲裁丢失后发生错误, 则再次执行传输扫描以从错误分隔符的开头搜索最高优先级的传输邮箱。

### 29.8 Interrupts

CAN模块为每个通道提供以下中断。表29.11列出了CAN中断。

- 邮箱0到31(CANi\_RXM)的CANi接收完成中断
- 邮箱0到31(CANi\_TXM)的CANi传输完成中断
- CANi接收FIFO中断 (CANi\_RXF)
- CANi发送FIFO中断(CANi\_TXF)
- CANi错误中断(CANi\_ERS)

Eight interrupt sources are available for CANi error interrupts. Check EIFR to determine the interrupt sources:

- Bus error
- Error-warning
- Error-passive
- Bus-off entry
- Bus-off recovery
- Receive overrun
- Overload frame transmission
- Bus lock

Table 29.11 CAN interrupts

| Module          | Interrupt name | Interrupt source  | Source flag                             |
|-----------------|----------------|---|---|
| CANi (i = 0, 1) | CANi_ERS       | Bus lock detected   | EIFR.BLIF                               |
|                 |                | Overload frame transmission detected                              | EIFR.OLIF                               |
|                 |                | Overrun detected  | EIFR.ORIF                               |
|                 |                | Bus-off recovery detected   | EIFR.BORIF                              |
|                 |                | Bus-off entry detected  | EIFR.BOEIF                              |
|                 |                | Error-passive detected  | EIFR.EPIF                               |
|                 |                | Error-warning detected  | EIFR.EWIF                               |
|                 |                | Bus error detected  | EIFR.BEIF                               |
|                 | CANi_RXF       | Receive FIFO message received (MIER_FIFO.MB29 = 0)                | RFCR.RFUST[2:0]                         |
|                 |                | Receive FIFO warning (MIER_FIFO.MB29 = 1)                         |   |
|                 | CANi_TXF       | Transmit FIFO message transmission completed (MIER_FIFO.MB25 = 0) | TFCR.TFUST[2:0]                         |
|                 |                | FIFO last message transmission completed (MIER_FIFO.MB25 = 1)     |   |
|                 | CANi_RXM       | Mailbox 0 to 31 message received                                  | MCTL_RX0.NEWDATA to MCTL_RX31.NEWDATA   |
|                 | CANi_TXM       | Mailbox 0 to 31 message transmission completed                    | MCTL_TX0.SENTDATA to MCTL_TX31.SENTDATA |

## 29.9 Usage Notes

### 29.9.1 Settings for the Module-Stop State

The MSTPCRB can enable or disable CAN operation. The CAN module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

### 29.9.2 Settings for the Operating Clock

The settings for the operating clock can be made as follows:

- The following clock constraint must be satisfied for the CAN module:
 
$$PCLKB \geq CANMCLK$$
- The peripheral module clock source must be PLL for the CAN module when the CCLKS bit is 0.

八个中断源可用于CANi错误中断。检查EIFR以确定中断源：

- 总线错误
- Error-warning
- Error-passive
- Bus-off entry
- Bus-off recovery
- 接收溢出
- 超载帧传输
- 巴士锁

Table 29.11 CAN中断

| Module          | 中断名称     | 中断源                              | 源标志                                     |
|-----------------|----------|----------------------------------|---|
| CANi (i = 0, 1) | CANi_ERS | 检测到总线锁                           | EIFR.BLIF                               |
|                 |          | 检测到超载帧传输                         | EIFR.OLIF                               |
|                 |          | 检测到溢出                            | EIFR.ORIF                               |
|                 |          | 检测到总线关闭恢复                        | EIFR.BORIF                              |
|                 |          | 检测到总线关闭条目                        | EIFR.BOEIF                              |
|                 |          | Error-passive detected           | EIFR.EPIF                               |
|                 |          | Error-warning detected           | EIFR.EWIF                               |
|                 |          | 检测到总线错误                          | EIFR.BEIF                               |
|                 | CANi_RXF | 接收接收到的FIFO消息(MIER_FIFO.MB29=0)   | RFCR.RFUST[2:0]                         |
|                 |          | 接收FIFO警告(MIER_FIFO.MB29=1)       |   |
|                 | CANi_TXF | 传输FIFO消息传输完成(MIER_FIFO.MB25=0)   | TFCR.TFUST[2:0]                         |
|                 |          | FIFO最后一条消息传输完成(MIER_FIFO.MB25=1) |   |
|                 | CANi_RXM | 邮箱0到31收到消息                       | MCTL_RX0.NEWDATA to MCTL_RX31.NEWDATA   |
|                 | CANi_TXM | 邮箱0到31消息传输完成                     | MCTL_TX0.SENTDATA to MCTL_TX31.SENTDATA |

## 29.9 使用说明

### 29.9.1 模块停止状态的设置

MSTPCRB可以启用或禁用CAN操作。CAN模块在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

### 29.9.2 工作时钟设置

工作时钟的设置可按如下方式进行：

- CAN模块必须满足以下时钟约束：
 
$$PCLKB \geq CANMCLK$$
- 当CCLKS位为0时，外围模块时钟源必须为CAN模块的PLL。

## 30. Serial Peripheral Interface (SPI)

### 30.1 Overview

The Serial Peripheral Interface (SPI) provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices. Table 30.1 lists the SPI specifications, Figure 30.1 shows a block diagram, and Table 30.2 lists the I/O pins.

Table 30.1 SPI specifications (1 of 2)

| Parameter                  | Specifications   |
|----------------------------|--|
| Number of channels         | One channel  |
| SPI transfer functions     | <ul style="list-style-type: none"> <li>Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows serial communications through SPI operation (4-wire method) or clock synchronous operation (3-wire method)</li> <li>Transmit-only operation available</li> <li>Receive-only operation is available (Slave mode only)</li> <li>Communication mode selectable to full-duplex or transmit-only</li> <li>RSPCK polarity switching</li> <li>RSPCK phase switching</li> </ul>   |
| Data format                | <ul style="list-style-type: none"> <li>MSB-first or LSB-first selectable</li> <li>Transfer bit length selectable to 8, 9, 10, 11, 12, 13, 14, 15, 16, 20, 24, or 32 bits</li> <li>128-bit transmit and receive buffers</li> <li>Up to four frames transferable in one round of transmission or reception (each frame consisting of up to 32 bits)</li> <li>Byte swap operating function</li> <li>Transmit/receive data can be inverted.</li> </ul>   |
| Bit rate                   | <ul style="list-style-type: none"> <li>In master mode, the on-chip baud rate generator generates RSPCK by frequency-dividing PCLKA (the division ratio ranges from divided by 2 to divided by 4096)</li> <li>In slave mode, the minimum PCLKA clock divided by 4 can be input as RSPCK (PCLKA divided by 4 is the maximum RSPCK frequency)</li> <li>Width at high level: 2 PCLKA cycles; width at low level: 2 PCLKA cycles</li> </ul>   |
| Buffer configuration       | <ul style="list-style-type: none"> <li>Double buffer configuration for the transmit and receive buffers</li> <li>128 bits for the transmit and receive buffers</li> </ul>  |

| Control in master transfer | <ul style="list-style-type: none"> <li>Transfers of up to eight commands each can be executed sequentially in looped execution</li> <li>For each command, the following can be set:<br/>SSL signal value, bit rate, RSPCK polarity and phase, transfer data length, MSB- or LSB-first, burst, RSPCK delay, SSL negation delay, and next-access delay</li> <li>Transfers can be initiated by writing to the transmit buffer</li> <li>MOSI signal value specifiable in SSL negation</li> <li>RSPCK auto-stop function</li> </ul>   |

## 30. 串行外设接口(SPI)

### 30.1 Overview

串行外围接口(SPI)提供与多个处理器和外围设备的高速全双工同步串行通信。表30.1列出了SPI规格，图30.1显示了框图，表30.2列出了IO引脚。

Table 30.1 SPI规格 (2个中的1个)

| Parameter | Specifications  |
|-----------|---|
| 通道数       | 一个频道  |
| SPI传输函数   | <ul style="list-style-type: none"> <li>使用MOSI (主输出从输入)、MISO (主输入从输出)、SSL (从选择) 和RSPCK (SPI时钟) 信号允许通过SPI操作 (4线方法) 或时钟同步操作 (3-线法)</li> <li>仅传输操作可用</li> <li>仅接收操作可用 (仅从模式)</li> <li>通信模式可选择全双工或仅传输</li> <li>RSPCK极性切换</li> <li>RSPCK相位切换</li> </ul>   |
| 数据格式      | <ul style="list-style-type: none"> <li>可选择MSB优先或LSB优先</li> <li>传输位长度可选择为8、9、10、11、12、13、14、15、16、20、24或32位</li> <li>128位发送和接收缓冲器</li> <li>在一轮发送或接收中最多可传输四帧 (每帧最多包含32位)</li> <li>字节交换操作功能</li> <li>发送接收数据可以反转。</li> </ul>  |
| 比特率       | <ul style="list-style-type: none"> <li>在主机模式下, 片内波特率发生器通过分频产生RSPCK<br/>PCLKA (分频比范围从2分频到4096分频)</li> <li>在从机模式下, 可以输入最小PCLKA时钟4分频作为RSPCK (PCLKA4分频为最大RSPCK频率)<br/>高电平宽度: 2个PCLKA周期; 低电平宽度: 2个PCLKA周期</li> </ul>   |
| 缓冲区配置     | <ul style="list-style-type: none"> <li>发送和接收缓冲区的双缓冲区配置</li> <li>128位用于发送和接收缓冲区</li> </ul>   |
| 错误检测      | <ul style="list-style-type: none"> <li>模式故障错误检测</li> <li>欠载错误检测</li> <li>溢出错误检测*1</li> <li>奇偶校验错误检测</li> </ul>  |
| SSL控制功能   | <ul style="list-style-type: none"> <li>每个通道有四个SSL引脚 (SSLn: SSLn0到SSLn3) (n=A、B)</li> <li>在单主模式下, 输出SSLn0到SSLn3引脚</li> <li>在多主模式下, SSLn0引脚用于输入, SSLn1至SSLn3引脚用于输出或未使用</li> <li>在从机模式下, SSLn0引脚用于输入</li> <li>从SSL输出断言到RSPCK操作的可控延迟 (RSPCK延迟)<br/>范围: 1到8个RSPCK循环 (以RSPCK循环为单位设置)</li> <li>从RSPCK停止到SSL输出否定的可控延迟 (SSL否定延迟)<br/>范围: 1到8个RSPCK循环 (以RSPCK循环为单位设置)</li> <li>下一次访问SSL输出断言的可控等待 (下一次访问延迟)<br/>范围: 1到8个RSPCK循环 (以RSPCK循环为单位设置)</li> <li>更改SSL极性的功能</li> <li>突发传输中帧之间的延迟是可设置的, 并且SSLn1到SSLn3引脚未使用</li> </ul> |
| 主传输中的控制   | <ul style="list-style-type: none"> <li>最多可传输8个命令, 每个命令可以在循环执行中顺序执行</li> <li>对于每个命令, 可以设置以下内容:<br/>SSL信号值、比特率、RSPCK极性和相位、传输数据长度、MSB或LSB在前、突发、RSPCK延迟、SSL否定延迟和下一次访问延迟</li> <li>可以通过写入发送缓冲区来启动传输</li> <li>在SSL否定中可指定的MOSI信号值</li> <li>RSPCK auto-stop function</li> </ul>  |

Table 30.1 SPI specifications (2 of 2)

| Parameter            | Specifications  |
|----------------------|---|
| Interrupt sources    | Interrupt sources: <ul style="list-style-type: none"> <li>• Receive buffer full interrupt</li> <li>• Transmit buffer empty interrupt</li> <li>• SPI error interrupt (mode fault error, overrun error, parity error)</li> <li>• SPI idle interrupt (SPI idle)</li> <li>• Transmission-complete interrupt</li> </ul>            |
| Event link function  | The following events can be output to the Event Link Controller (ELC): <ul style="list-style-type: none"> <li>• Receive buffer full signal</li> <li>• Transmit buffer empty signal</li> <li>• Mode fault, underrun, overrun, or parity error signal</li> <li>• SPI idle signal</li> <li>• Communication end signal</li> </ul> |
| Other functions      | <ul style="list-style-type: none"> <li>• Switching between CMOS output and open-drain output</li> <li>• SPI initialization function</li> <li>• Loopback mode</li> </ul>   |
| Module-stop function | Module-stop state can be set to reduce power consumption.   |
| TrustZone Filter     | Security attribution can be set   |

Note 1. In master reception and when the RSPCK auto-stop function is enabled, an overrun error does not occur because the transfer clock is stopped on overrun error detection.

Table 30.1 SPI规范 (2个中的2个)

| Parameter            | Specifications  |
|----------------------|---|
| 中断源                  | Interrupt sources: <ul style="list-style-type: none"> <li>• 接收缓冲区满中断</li> <li>• 发送缓冲区空中断</li> <li>• SPI错误中断 (模式错误错误、溢出错误、奇偶校验错误)</li> <li>• SPI空闲中断 (SPI空闲)</li> <li>• Transmission-complete interrupt</li> </ul> |
| 事件链接功能               | 以下事件可以输出到事件链接控制器(ELC): ● <ul style="list-style-type: none"> <li>• 接收缓冲区满信号</li> <li>• 发送缓冲区空信号</li> <li>• 模式故障、欠载、溢出或奇偶校验错误信号</li> <li>• SPI空闲信号</li> <li>• 通讯结束信号</li> </ul>                                     |
| 其他功能                 | <ul style="list-style-type: none"> <li>• 在CMOS输出和开漏输出之间切换</li> <li>• SPI初始化函数</li> <li>• Loopback mode</li> </ul>   |
| Module-stop function | 可设置模块停止状态以降低功耗。   |
| TrustZone Filter     | 可设置安全属性   |

注1.在主机接收和启用RSPCK自动停止功能时,不会发生溢出错误,因为在检测到溢出错误时会停止传输时钟。

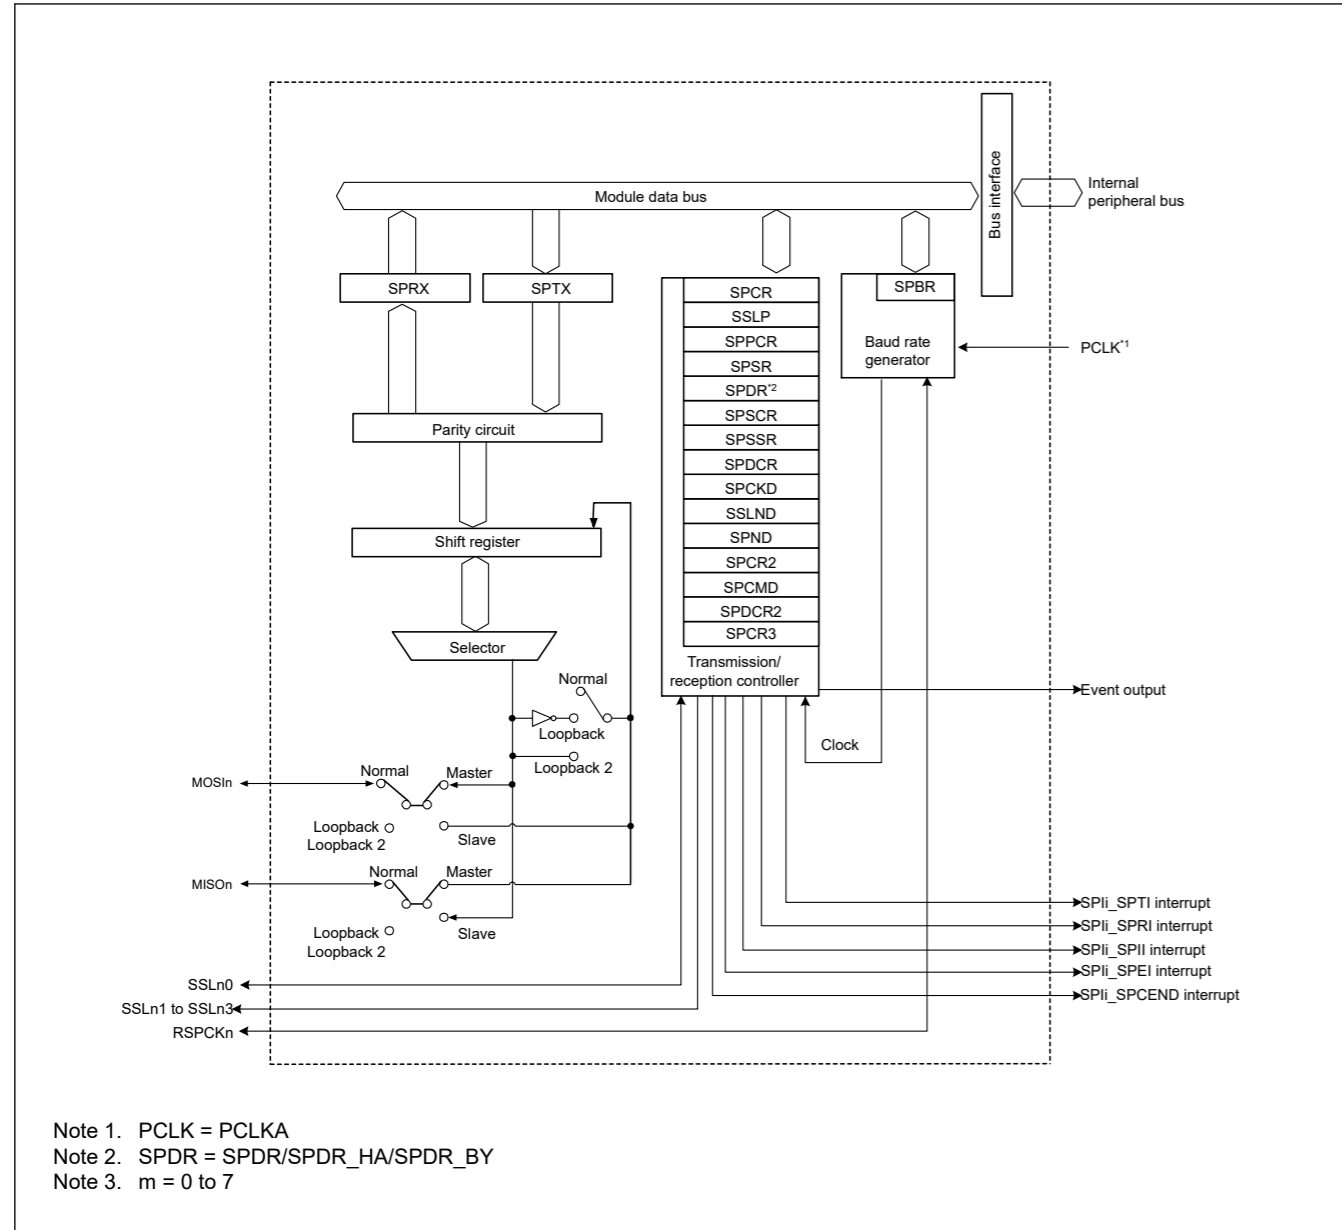

Figure 30.1 SPI block diagram

The SPI automatically switches the I/O direction of the SSLn0 pin. SSLn0 is set as an output when the SPI is a single master, and as an input when the SPI is a multi-master or a slave. The RSPCKn, MOSIn, and MISOIn pins are automatically set as inputs or outputs based on the master or slave setting and the level input on the SSLn0 pin. For details, see [section 30.3.2. Controlling the SPI Pins](#).

Table 30.2 SPI I/O pins

| Channel | Pin name       | I/O    | Description                       |
|---------|----------------|--------|-----------------------------------|
| SPI0    | RSPCKA         | I/O    | Clock input/output pin            |
|         | SSLA0          | I/O    | Slave selection input/output      |
|         | SSLA1 to SSLA3 | Output | Slave selection output            |
|         | MOSIA          | I/O    | Master transmit data input/output |
|         | MISOA          | I/O    | Slave transmit data input/output  |

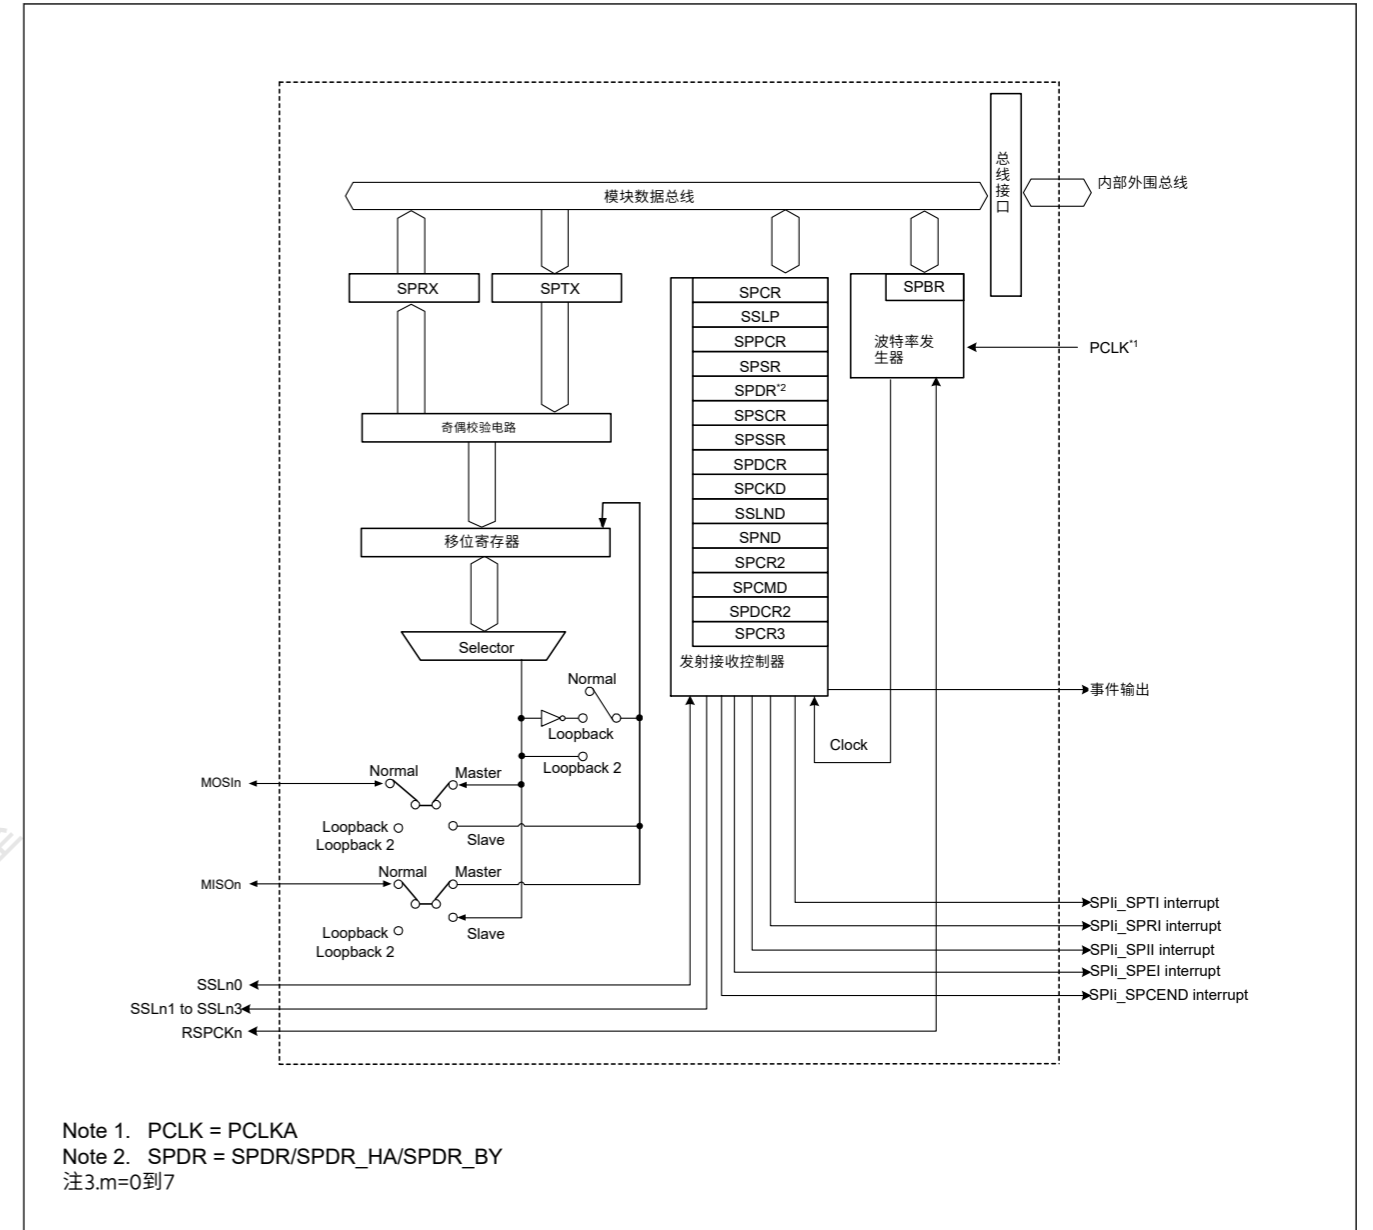

Figure 30.1 SPI框图

SPI自动切换SSLn0引脚的IO方向。当SPI为单主机时SSLn0设置为输出，当SPI为多主机或从机时设置为输入。RSPCKn、MOSIn和MISOIn引脚会根据主机或从机设置以及SSLn0引脚上的电平输入自动设置为输入或输出。有关详细信息，请参阅第30.3.2节。控制SPI引脚。

Table 30.2 SPIIO引脚

| Channel | 引脚名称           | I/O    | Description |
|---------|----------------|--------|-------------|
| SPI0    | RSPCKA         | I/O    | 时钟输入输出引脚    |
|         | SSLA0          | I/O    | 从机选择输入输出    |
|         | SSLA1 to SSLA3 | Output | 从机选择输出      |
|         | MOSIA          | I/O    | 主机发送数据输入输出  |
|         | MISOA          | I/O    | 从机发送数据输入输出  |

## 30.2 Register Descriptions

## 30.2.1 SPCR : SPI Control Register

Base address: SPI0 = 0x4011\_A000

Offset address: 0x00

|                    |       |     |       |       |      |         |      |      |

| 4   | SPEIE  | SPI Error Interrupt Enable<br>0: Disable SPI error interrupt requests<br>1: Enable SPI error interrupt requests   | R/W |
| 5   | SPTIE  | Transmit Buffer Empty Interrupt Enable<br>0: Disable transmit buffer empty interrupt requests<br>1: Enable transmit buffer empty interrupt requests       | R/W |
| 6   | SPE    | SPI Function Enable<br>0: Disable SPI function<br>1: Enable SPI function  | R/W |
| 7   | SPRIE  | SPI Receive Buffer Full Interrupt Enable<br>0: Disable SPI receive buffer full interrupt requests<br>1: Enable SPI receive buffer full interrupt requests | R/W |

**SPMS bit (SPI Mode Select)**

The SPMS bit selects SPI operation (4-wire method) or clock synchronous operation (3-wire method).

The SSLn0 to SSLn3 pins are not used in clock synchronous operation. The RSPCKn, MOSIn, and MISON pins handle communications. For clock synchronous operation in master mode (MSTR = 1), the SPCMDm.CPHA bit can be set to either 0 or 1. For clock synchronous operation in slave mode (MSTR = 0), always set the CPHA bit to 1. Do not perform operations if the CPHA bit is set to 0 for clock synchronous operation in slave mode (MSTR = 0).

**TXMD bit (Communications Operating Mode Select)**

The TXMD bit selects full-duplex synchronous serial communications or transmit-only operations. When this bit is set to 1, the SPI only performs transmit operations and not receive operations (see [section 30.3.6. Data Transfer Modes](#)), and receive buffer full interrupt requests cannot be used.

TXMD setting is invalid in receive only slave mode.

**MODFEN bit (Mode Fault Error Detection Enable)**

The MODFEN bit enables or disables the detection of mode fault errors (see [section 30.3.9. Error Detection](#)). In addition, the SPI determines the I/O direction of the SSLni pins based on combination of the MODFEN and MSTR bits (see [section 30.3.2. Controlling the SPI Pins](#)).

## 30.2 注册说明

## 30.2.1 SPCR:SPI控制寄存器

Base address: SPI0 = 0x4011\_A000

Offset address: 0x00

|               |       |     |       |       |      |         |      |      |
|---------------|-------|-----|-------|-------|------|---------|------|------|

| 1   | TXMD   | 通讯操作模式选择<br>0: 选择全双工同步串行通信1: 选择只发送串行通信                | R/W |
| 2   | MODFEN | 模式故障错误检测启用<br>0: 禁用模式故障错误检测1: 启用模式故障错误检测              | R/W |
| 3   | MSTR   | SPI主从模式选择<br>0: 选择从模式1: 选择主模式                         | R/W |
| 4   | SPEIE  | SPI错误中断使能<br>0: 禁用SPI错误中断请求1: 启用SPI错误中断请求             | R/W |
| 5   | SPTIE  | 发送缓冲区空中断使能<br>0: 禁止发送缓冲区空中断请求1: 允许发送缓冲区空中断请求          | R/W |
| 6   | SPE    | SPI功能使能<br>0: 禁用SPI功能1: 启用SPI功能                       | R/W |
| 7   | SPRIE  | SPI接收缓冲器满中断使能<br>0: 禁止SPI接收缓冲器满中断请求1: 使能SPI接收缓冲器满中断请求 | R/W |

**SPMS位 (SPI模式选择)**

SPMS位选择SPI操作（4线方法）或时钟同步操作（3线方法）。

SSLn0到SSLn3引脚不用于时钟同步操作。RSPCKn、MOSIn和MION引脚处理通信。对于主机模式下的时钟同步操作(MSTR=1)，SPCMDm.CPHA位可以设置为0或1。对于从机模式下的时钟同步操作(MSTR=0)，始终将CPHA位设置为1。不要如果CPHA位设置为0以在从机模式下进行时钟同步操作（MSTR=0），则执行操作。

**TXMD位 (通信操作模式选择)**

TXMD位选择全双工同步串行通信或仅发送操作。当该位设置为1时，SPI只执行发送操作而不执行接收操作（参见第30.3.6节。数据传输模式），并且不能使用接收缓冲器满中断请求。

TXMD设置在只接收从机模式下无效。

**MODFEN位 (模式故障错误检测使能)**

MODFEN位启用或禁用模式故障错误检测（请参阅第30.3.9节。错误检测）。此外，SPI根据MODFEN和MSTR位的组合确定SSLni引脚的IO方向（参见第30.3.2节。控制SPI引脚）。

**MSTR bit (SPI Master/Slave Mode Select)**

The MSTR bit selects master or slave mode for the SPI. Based on the MSTR bit settings, the SPI determines the direction of the RSPCKn, MOSIn, MISOOn, and SSLn pins.

**SPEIE bit (SPI Error Interrupt Enable)**

The SPEIE bit enables or disables the generation of SPI error interrupt requests when one of the following occurs:

- The SPI detects a mode fault error or underrun error and sets the SPSR.MODF flag to 1
- The SPI detects an overrun error and sets the SPSR.OVRF flag to 1
- The SPI detects a parity error and sets the SPSR.PERF flag to 1

For details, see [section 30.3.9. Error Detection](#).

**SPTIE bit (Transmit Buffer Empty Interrupt Enable)**

The SPTIE bit enables or disables the generation of transmit buffer empty interrupt requests when the SPI detects that the transmit buffer is empty. To generate a transmit buffer empty interrupt request when transmission starts, set the SPE and SPTIE bits to 1 at the same time or set the SPE bit to 1 after setting the SPTIE bit to 1.

When the SPTIE bit is 1, transmit buffer interrupts are generated even when the SPI function is disabled (when the SPE bit is changed to 0).

**SPE bit (SPI Function Enable)**

The SPE bit enables or disables the SPI function. The SPE bit cannot be set to 1 when the SPSR.MODF flag is 1. For details, see [section 30.3.9. Error Detection](#).

Setting the SPE bit to 0 disables the SPI function and initializes a part of the module function. For details, see [section 30.3.10. Initializing the SPI](#). In addition, a transmit buffer empty interrupt request is generated when the SPE bit is changed from 0 to 1 or from 1 to 0.

**SPRIE bit (SPI Receive Buffer Full Interrupt Enable)**

The SPRIE bit enables or disables the generation of an SPI receive buffer full interrupt request when the SPI detects a receive buffer full write after completion of a serial transfer.

**30.2.2 SSLP : SPI Slave Select Polarity Register**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x01

|                    |   |   |   |   |       |       |       |       |
|--------------------|---|---|---|---|-------|-------|-------|-------|
| Bit position:      | 7 | 6 | 5 | 4 | 3     | 2     | 1     | 0     |
| Bit field:         | — | — | — | — | SSL3P | SSL2P | SSL1P | SSL0P |
| Value after reset: | 0 | 0 | 0 | 0 | 0     | 0     | 0     | 0     |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | SSL0P  | SSLn0 Signal Polarity Setting<br>0: Set SSLn0 signal to active-low<br>1: Set SSLn0 signal to active-high | R/W |
| 1   | SSL1P  | SSLn1 Signal Polarity Setting<br>0: Set SSLn1 signal to active-low<br>1: Set SSLn1 signal to active-high | R/W |
| 2   | SSL2P  | SSLn2 Signal Polarity Setting<br>0: Set SSLn2 signal to active-low<br>1: Set SSLn2 signal to active-high | R/W |
| 3   | SSL3P  | SSLn3 Signal Polarity Setting<br>0: Set SSLn3 signal to active-low<br>1: Set SSLn3 signal to active-high | R/W |
| 7:4 | —      | These bits are read as 0. The write value should be 0.   | R/W |

**MSTR位 (SPI主从模式选择)**

MSTR位选择SPI的主模式或从模式。根据MSTR位设置，SPI确定RSPCKn、MOSIn、MISOOn和SSLn引脚的方向。

**SPEIE位 (SPI错误中断使能)**

当发生以下情况之一时，SPEIE位启用或禁用SPI错误中断请求的生成：

- SPI检测到模式故障错误或欠载错误并将SPSR.MODF标志设置为1
- SPI检测到溢出错误并将SPSR.OVRF标志设置为1
- SPI检测到奇偶校验错误并将SPSR.PERF标志设置为1

有关详细信息，请参阅[第30.3.9节。错误检测](#)。

**SPTIE位 (发送缓冲区空中断允许)**

当SPI检测到发送缓冲区为空时，SPTIE位使能或禁止生成发送缓冲区空中断请求。要在发送开始时产生发送缓冲区空中断请求，请将SPE和SPTIE位同时设置为1，或在将SPTIE位设置为1后将SPE位设置为1。

当SPTIE位为1时，即使禁用SPI功能（当SPE位变为0时）也会产生发送缓冲区中断。

**SPE位 (SPI功能使能)**

SPE位启用或禁用SPI功能。当SPSR.MODF标志为1时，SPE位不能设置为1。详情请参见[30.3.9节。错误检测](#)。

将SPE位设置为0将禁用SPI功能并初始化部分模块功能。有关详细信息，请参阅[第30.3.10节。初始化SPI](#)。此外，当SPE位从0变为1或从1变为0时，会产生发送缓冲区空中断请求。

**SPRIE位 (SPI接收缓冲器满中断使能)**

当SPI在串行传输完成后检测到接收缓冲区已满写入时，SPRIE位启用或禁用SPI接收缓冲区已满中断请求的生成。

**30.2.2 SSLP: SPI从机选择极性寄存器**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x01

|               |   |   |   |   |       |       |       |       |
|---------------|---|---|---|---|-------|-------|-------|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3     | 2     | 1     | 0     |
| Bit field:    | — | — | — | — | SSL3P | SSL2P | SSL1P | SSL0P |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0     | 0     | 0     | 0     |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | SSL0P  | SSLn0信号极性设置<br>0: 将SSLn0信号设置为低电平有效<br>1: 将SSLn0信号设置为高电平有效 | R/W |
| 1   | SSL1P  | SSLn1信号极性设置<br>0: 将SSLn1信号设置为低电平有效<br>1: 将SSLn1信号设置为高电平有效 | R/W |
| 2   | SSL2P  | SSLn2信号极性设置<br>0: 将SSLn2信号设置为低电平有效<br>1: 将SSLn2信号设置为高电平有效 | R/W |
| 3   | SSL3P  | SSLn3信号极性设置<br>0: 设置SSLn3信号为低电平有效<br>1: 设置SSLn3信号为高电平有效   | R/W |
| 7:4 | —      | 这些位被读取为0。写入值应为0。  | R/W |

## 30.2.3 SPPCR : SPI Pin Control Register

Base address: SPI0 = 0x4011\_A000

Offset address: 0x02

|                    |   |   |       |       |   |   |       |      |
|--------------------|---|---|-------|-------|---|---|-------|------|
| Bit position:      | 7 | 6 | 5     | 4     | 3 | 2 | 1     | 0    |
| Bit field:         | — | — | MOIFE | MOIFV | — | — | SPLP2 | SPLP |
| Value after reset: | 0 | 0 | 0     | 0     | 0 | 0 | 0     | 0    |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | SPLP   | SPI Loopback<br>0: Normal mode<br>1: Loopback mode (receive data = inverted transmit data)   | R/W |
| 1   | SPLP2  | SPI Loopback 2<br>0: Normal mode<br>1: Loopback mode (receive data = transmit data)  | R/W |
| 3:2 | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 4   | MOIFV  | MOSI Idle Fixed Value<br>0: Set level output on MOSIn pin during MOSI idling to low<br>1: Set level output on MOSIn pin during MOSI idling to high                   | R/W |
| 5   | MOIFE  | MOSI Idle Value Fixing Enable<br>0: Set MOSI output value to equal final data from previous transfer<br>1: Set MOSI output value to equal value set in the MOIFV bit | R/W |
| 7:6 | —      | These bits are read as 0. The write value should be 0.   | R/W |

**SPLP bit (SPI Loopback)**

The SPLP bit selects the mode of the SPI pins. When this bit is set to 1, the SPI shuts off the path between the MISO pin and the shift register if the SPCR.MSTR bit is 1, and between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0. The SPI then inverts the value of the input path for the shift register and connects it to the output path (loopback mode). For more information, see [section 30.3.13. Loopback Mode](#).

**SPLP2 bit (SPI Loopback 2)**

The SPLP2 bit selects the mode of the SPI pins. When this bit is set to 1, the SPI shuts off the path between the MISO pin and the shift register if the SPCR.MSTR bit is 1, and between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0. The SPI then connects the value of the input path for the shift register to the output path (loopback mode) without inverting the value. For more information, see [section 30.3.13. Loopback Mode](#).

**MOIFV bit (MOSI Idle Fixed Value)**

The MOIFV bit determines the MOSIn pin output value during the SSL negation period (including the SSL retention period during a burst transfer) when the MOIFE bit is 1 in master mode.

**MOIFE bit (MOSI Idle Value Fixing Enable)**

The MOIFE bit fixes the MOSIn output value when the SPI is in master mode and in an SSL negation period (including the SSL retention period during a burst transfer). When the MOIFE bit is 0, the SPI outputs the last data from the previous serial transfer during the SSL negation period to the MOSIn pin. When the MOIFE bit is 1, the SPI outputs the fixed value set in the MOIFV bit to the MOSIn pin.

## 30.2.3 SPPCR:SPI引脚控制寄存器

Base address: SPI0 = 0x4011\_A000

Offset address: 0x02

|               |   |   |       |       |   |   |       |      |
|---------------|---|---|-------|-------|---|---|-------|------|
| Bit position: | 7 | 6 | 5     | 4     | 3 | 2 | 1     | 0    |
| Bit field:    | — | — | MOIFE | MOIFV | — | — | SPLP2 | SPLP |
| 重置后的值:        | 0 | 0 | 0     | 0     | 0 | 0 | 0     | 0    |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | SPLP   | SPI Loopback<br>0: 正常模式1: 环回模式 (接收数据=反转发送数据)                            | R/W |
| 1   | SPLP2  | SPI Loopback 2<br>0: 正常模式1: 环回模式 (接收数据=发送数据)                            | R/W |
| 3:2 | —      | 这些位被读取为0。写入值应为0。  | R/W |
| 4   | MOIFV  | MOSI空闲固定值<br>0: 在MOSI空闲期间将MOSIn引脚的电平输出设置为低1: 在MOSI空闲期间将MOSIn引脚的电平输出设置为高 | R/W |
| 5   | MOIFE  | MOSI空闲值固定启用<br>0: 设置MOSI输出值等于上次传输的最终数据1: 设置MOSI输出值等于MOIFV位中设置的值         | R/W |
| 7:6 | —      | 这些位被读取为0。写入值应为0。  | R/W |

**SPLP bit (SPI Loopback)**

SPLP位选择SPI引脚的模式。当该位设置为1时，如果SPCR.MSTR位为1，则SPI关闭MISO引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则关闭MOSIn引脚和移位寄存器之间的路径。SPI然后反转移寄存器的输入路径的值并将其连接到输出路径（环回模式）。有关详细信息，请参阅第30.3.13节。环回模式。

**SPLP2 bit (SPI Loopback 2)**

SPLP2位选择SPI引脚的模式。当该位设置为1时，如果SPCR.MSTR位为1，则SPI关闭MISO引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则关闭MOSIn引脚和移位寄存器之间的路径。然后SPI将移位寄存器的输入路径的值连接到输出路径（环回模式），而不反转该值。有关详细信息，请参阅第30.3.13节。环回模式。

**MOIFV位 (MOSI空闲固定值)**

MOIFV位决定主模式下MOIFE位为1时SSL否定期间（包括突发传输期间的SSL保持期间）的MOSIn引脚输出值。

**MOIFE位 (MOSI空闲值固定启用)**

MOIFE位固定SPI处于主机模式和SSL否定周期（包括突发传输期间的SSL保持周期）时的MOSIn输出值。当MOIFE位为0时，SPI输出上一个串行的最后一个数据在SSL否定期间传输到MOSIn引脚。当MOIFE位为1时，SPI将MOIFV位中设置的固定值输出到MOSIn引脚。

## 30.2.4 SPSR : SPI Status Register

Base address: SPI0 = 0x4011\_A000

Offset address: 0x03

|                    |      |           |           |      |      |      |       |      |
|--------------------|------|-----------|-----------|------|------|------|-------|------|
| Bit position:      | 7    | 6         | 5         | 4    | 3    | 2    | 1     | 0    |
| Bit field:         | SPRF | CEND<br>F | SPTE<br>F | UDRF | PERF | MODF | IDLNF | OVRF |
| Value after reset: | 0    | 0         | 1         | 0    | 0    | 0    | 0     | 0    |

| Bit | Symbol | Function  | R/W                 |
|-----|--------|---|---------------------|
| 0   | OVRF   | Overrun Error Flag<br>0: No overrun error occurred<br>1: Overrun error occurred   | R/W <sup>1</sup>    |
| 1   | IDLNF  | SPI Idle Flag<br>0: SPI is in the idle state<br>1: SPI is in the transfer state   | R                   |
| 2   | MODF   | Mode Fault Error Flag<br>0: No mode fault or underrun error occurred<br>1: Mode fault error or underrun error occurred                                | R/W <sup>1</sup>    |
| 3   | PERF   | Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred  | R/W <sup>1</sup>    |
| 4   | UDRF   | Underrun Error Flag<br>The UDRF bit is valid when MODF flag is 1.<br>0: Mode fault error occurred (MODF = 1)<br>1: Underrun error occurred (MODF = 1) | R/W <sup>1</sup> *2 |
| 5   | SPTEF  | SPI Transmit Buffer Empty Flag<br>0: Data is in the transmit buffer<br>1: No data is in the transmit buffer   | R/W <sup>3</sup>    |
| 6   | CENDF  | Communication End Flag<br>0: Not communicating or communicating<br>1: Communication completed   | R/W <sup>1</sup>    |
| 7   | SPRF   | SPI Receive Buffer Full Flag<br>0: No valid data is in SPDR/SPDR_HA<br>1: Valid data is in SPDR/SPDR_HA   | R/W <sup>3</sup>    |

Note 1. Only 0 can be written to clear the flag after reading 1.

Note 2. Clear the UDRF flag at the same time as the MODF flag.

Note 3. The write value should be 1.

**OVRF flag (Overrun Error Flag)**

The OVRF flag indicates the occurrence of an overrun error. In master mode (SPCR.MSTR bit = 1) and when the RSPCK clock auto-stop function is enabled (SPCR1.SCKASE bit = 1), overrun errors do not occur. This flag does not set to 1. For details, see [section 30.3.9.1. Overrun errors](#).

[Setting condition]

When the next serial transfer ends and the receive buffer is full, and satisfy one of following.

- The SPCR.TXMD bit = 0. (transmit-receive master mode or transmit-receive slave mode or receive only slave mode)
- The SPCR.MSTR bit = 0, and the SPCR3.ETXMD bit = 1. (receive only slave mode)

[Clearing condition]

- When 0 is written to the OVRF flag after the OVRF flag is confirmed to be 1 by a read of SPSR.

**IDLNF flag (SPI Idle Flag)**

The IDLNF flag indicates the transfer status of the SPI.

[Setting conditions]

## 30.2.4 SPSR: SPI状态寄存器

Base address: SPI0 = 0x4011\_A000

Offset address: 0x03

|               |      |           |           |      |      |      |       |      |
|---------------|------|-----------|-----------|------|------|------|-------|------|
| Bit position: | 7    | 6         | 5         | 4    | 3    | 2    | 1     | 0    |
| Bit field:    | SPRF | CEND<br>F | SPTE<br>F | UDRF | PERF | MODF | IDLNF | OVRF |
| 重置后的值:        | 0    | 0         | 1         | 0    | 0    | 0    | 0     | 0    |

| Bit | Symbol | Function  | R/W                 |
|-----|--------|---|---------------------|
| 0   | OVRF   | 溢出错误标志<br>0: 未发生溢出错误1: 发生溢出错误   | R/W <sup>1</sup>    |
| 1   | IDLNF  | SPI空闲标志<br>0: SPI处于空闲状态1: SPI处于传输状态                                       | R                   |
| 2   | MODF   | 模式故障错误标志<br>0: 未发生模式故障或欠载错误1: 发生模式故障错误或欠载错误                               | R/W <sup>1</sup>    |
| 3   | PERF   | 奇偶校验错误标志<br>0: 未发生奇偶校验错误1: 发生奇偶校验错误                                       | R/W <sup>1</sup>    |
| 4   | UDRF   | 欠载错误标志<br>当MODF标志为1时, UDRF位有效。<br>0: 发生模式故障错误 (MODF=1) 1: 发生欠载错误 (MODF=1) | R/W <sup>1</sup> *2 |
| 5   | SPTEF  | SPI发送缓冲区空标志<br>0: 发送缓冲区中有数据1: 发送缓冲区中没有数据                                  | R/W <sup>3</sup>    |
| 6   | CENDF  | 通讯结束标志<br>0: 不通讯或通讯1: 通讯完成  | R/W <sup>1</sup>    |
| 7   | SPRF   | SPI接收缓冲区满标志<br>0: SPDRSPDR_HA中没有有效数据1: SPDRSPDR_HA中有有效数据                  | R/W <sup>3</sup>    |

注1.读1后只能写0清除标志。

注2.在清除MODF标志的同时清除UDRF标志。

注3.写入值应为1。

**OVRF标志 (溢出错误标志)**

OVRF标志指示发生溢出错误。在主机模式 (SPCR.MSTR位=1) 和启用RSPCK时钟自动停止功能 (SPCR1.SCKASE位=1) 时, 不会发生溢出错误。此标志不设置为1。有关详细信息, 请参阅第30.3.9.1节。溢出错误。

[Setting condition]

当下一次串行传输结束且接收缓冲区已满时, 满足以下条件之一。

- SPCR.TXMD位=0。(发送-接收主模式或发送-接收从模式或仅接收从模式)
- SPCR.MSTR位=0, SPCR3.ETXMD位=1。(仅接收从机模式)

[Clearing condition]

- 在通过读取SPSR确认OVRF标志为1后, 向OVRF标志写入0时。

**IDLNF标志 (SPI空闲标志)**

IDLNF标志指示SPI的传输状态。

[Setting conditions]

## Master mode

- When none of the conditions in the master mode [Clearing condition] is met.

## Slave mode

- When the SPE bit in SPCR is 1, enabling the SPI function.

## [Clearing conditions]

## Master mode

When condition 1 or all other conditions are satisfied.

Condition 1: The SPE bit in SPCR is 0, indicating that the SPI is initialized.

Condition 2: The transmit buffer (SPTX) is empty, indicating that data for the next transfer is not set.

Condition 3: The SPI internal sequencer is in the idle state, indicating that operation up to next-access delay is complete.

Condition 4: The SPCP[2:0] bits in SPSSR are 000 (at the beginning of sequence control)

## Slave mode

- When condition 1 is satisfied.

**MODF flag (Mode Fault Error Flag)**

The MODF flag indicates the occurrence of a mode fault error or an underrun error. The UDRF flag indicates which error occurred.

## [Setting conditions]

## Multi-master mode

- When the input level of the SSLni pin changes to the active level while the SPCR.MSTR bit is 1 (master mode) and the SPCR.MODFEN bit is 1 (mode fault error detection is enabled), triggering a mode fault error.

## Slave mode

- When condition 1 or 2 is satisfied.

Condition 1: The SSLni pin is negated before the RSPCK cycle required for data transfer ends while the SPCR.MSTR bit is 0 (slave mode) and the SPCR.MODFEN bit is 1 (mode fault error detection is enabled), triggering a mode fault error.

Condition 2: The serial transfer begins with the SPCR.MSTR bit is set to 0 (slave mode), the SPCR.SPE bit is set to 1, and the transmission data not prepared, triggering an underrun error.

The active level of the SSLni signal is determined by the SSLP.SSLiP bit (SSLi signal polarity setting).

## [Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

**PERF flag (Parity Error Flag)**

The PERF flag indicates the occurrence of a parity error.

## [Setting condition]

When a serial transfer ends while the SPCR2.SPPE bit is 1, triggering a parity error, and satisfy one of following.

- The SPCR.TXMD bit = 0. (transmit-receive master mode or transmit-receive slave mode or receive only slave mode)
- The SPCR.MSTR bit = 0, and the SPCR3.ETXMD bit = 1. (receive only slave mode)

## [Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

**UDRF flag (Underrun Error Flag)**

The UDRF flag indicates the occurrence of an underrun error.

## [Setting condition]

## 主模式

- 当主模式[清除条件]中的条件均不满足时。

## 从机模式

- 当SPCR的SPE位为1时，使能SPI功能。

## [Clearing conditions]

## 主模式

当满足条件1或所有其他条件时。

条件1: SPCR中的SPE位为0，表示SPI已初始化。

条件2: 发送缓冲区 (SPTX) 为空，表示未设置下一次传输的数据。

条件3: SPI内部定序器处于空闲状态，表示到next-accessdelay的操作已完成。

条件4: SPSSR中的SPCP[2:0]位为000 (在序列控制开始时)

## 从机模式

- 满足条件1时。

**MODF标志 (模式故障错误标志)**

MODF标志指示发生模式故障错误或欠载错误。UDRF标志指示发生了哪个错误。

## [Setting conditions]

## Multi-master mode

- 当SPCR.MSTR位为1 (主模式) 且SPCR.MODFEN位为1 (使能模式故障错误检测) 时，SSLni管脚的输入电平变为有效电平时，触发模式故障错误。

## 从机模式

- 满足条件1或2时。

条件1: 当SPCR.MSTR位为0 (从模式) 且SPCR.MODFEN位为1 (启用模式故障错误检测) 时，SSLni引脚在数据传输所需的RSPCK周期结束前被取反，触发模式故障错误。

条件2: 串行传输开始时SPCR.MSTR位设置为0 (从模式)，SPCR.SPE位设置为1，传输数据未准备好，触发欠载错误。

SSLni信号的有效电平由SSLP.SSLiP位 (SSLi信号极性设置) 确定。

## [Clearing condition]

- 当此标志为1时读取SPSR，然后将0写入此标志。

**PERF标志 (奇偶校验错误标志)**

PERF标志指示奇偶校验错误的发生。

## [Setting condition]

当SPCR2.SPPE位为1时串行传输结束，触发奇偶校验错误，并满足以下之一。

- SPCR.TXMD位=0。(发送-接收主模式或发送-接收从模式或仅接收从模式)
- SPCR.MSTR位=0，SPCR3.ETXMD位=1。(仅接收从机模式)

## [Clearing condition]

- 当此标志为1时读取SPSR，然后将0写入此标志。

**UDRF标志 (欠载错误标志)**

UDRF标志指示发生了欠载错误。

## [Setting condition]

- When the serial transfer begins with the SPCR.MSTR bit is set to 0 (slave mode), the SPCR3.ETXMD bit =0 (transmit-receive slave mode or transmit slave mode) the SPCR.SPE bit is set to 1, and the transmission data not prepared, triggering an underrun error.

[Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

#### SPTEF flag (SPI Transmit Buffer Empty Flag)

The SPTEF flag indicates the status of the transmit buffer for the SPI Data Register (SPDR/SPDR\_HA).

[Setting conditions]

- When condition 1. or 2. is satisfied.
  1. The SPCR.SPE bit is 0, indicating that the SPI is initialized.
  2. Transmit data (the frame size specified by the SPDCR.SPFC[1:0]) is transferred from the transmit buffer to the shift register.

[Clearing condition]

- When data is written to SPDR/SPDR\_HA/SPDR\_BY equals the number of frames set in the SPFC[1:0] bits in the SPI Data Control Register (SPDCR).

Data can only be written to SPDR/SPDR\_HA/SPDR\_BY when the SPTEF flag is 1. If data is written to the transmit buffer of SPDR/SPDR\_HA when the SPTEF flag is 0, data in the transmit buffer is not updated.

#### CENDF flag (Communication End Flag)

This flag indicates communication end status of RSPI. It turns 1 at communication end, and turns 0 at starting next communication.

[Setting condition]

##### Mastar mode

The following 3 conditions are met.

- The transmit buffer(SPTX) is empty. (There is no next transmission data.)
- The SPSSR.SPCP[2:0] are 000b. (It means the head of the sequential control.)
- The state of RSPI internal sequencer transferred to the idle state. (It means the next access delay has been completed.)

##### Transmit-receive / transmit only slave mode in SPI serial communication (4-wire: the SPCR.SPMS bit is 0)

The following 3 conditions are met.

- The transmit buffer(SPTX) is empty. (There is no next transmission data.)
- The transmission shift register is empty. (It means RSPI does not do serial transfer.)
- SSL0 was negated.

##### Transmit-receive / transmit only slave mode in clock synchronous (3-wire: the SPCR.SPMS bit is 1)

The following 3 conditions are met.

- The transmit buffer(SPTX) is empty. (There is no next transmission data.)
- The transmission shift register is empty. (It means RSPI does not do serial transfer.)
- The last even edge of RSPCK of the last data was detected. (When the SPCMD.CPHA bit is "1".)

##### Receive only slave mode in SPI serial communication (4-wire: the SPCR.SPMS bit is 0)

The following condition is met.

- SSL0 was negated after the last data was written in the received buffer.

##### Receive only slave mode in clock synchronous (3-wire: the SPCR.SPMS bit is 1)

The following condition is met.

- 当串行传输开始时SPCR.MSTR位设置为0（从机模式），SPCR3.ETXMD位=0（发送接收从机模式或发送从机模式）SPCR.SPE位设置为1，发送数据未准备好，触发欠载错误。

[Clearing condition]

- 当此标志为1时读取SPSR，然后将0写入此标志。

#### SPTEF标志（SPI发送缓冲区空标志）

SPTEF标志指示SPI数据寄存器(SPDRSPDR\_HA)的发送缓冲区的状态。

[Setting conditions]

- 满足条件1.或2.时。
  - 1.SPCR.SPE位为0，表示SPI初始化。
  - 2.发送数据（由SPDCR.SPFC[1:0]指定的帧大小）从发送缓冲器传送到移位寄存器。

[Clearing condition]

- 当数据写入SPDRSPDR\_HASPCR\_BY等于SPI数据控制寄存器(SPDCR)的SPFC[1:0]位中设置的帧数。

数据只能在SPTEF标志为1时写入SPDRSPDR\_HASPCR\_BY。如果在SPTEF标志为0时将数据写入SPDRSPDR\_HA的发送缓冲区，则发送缓冲区中的数据不会更新。

#### CENDF标志（通信结束标志）

该标志指示RSPI的通信结束状态。通讯结束时变为1，开始下一次通讯时变为0。

[Setting condition]

##### Mastar mode

满足以下3个条件。

- 发送缓冲区(SPTX)为空。（没有下一个传输数据。）
- SPSSR.SPCP[2:0]为000b。（表示顺序控制的头部。）
- RSPI内部定序器的状态转为空闲状态。（表示下一次访问延迟已经完成。）

##### SPI串行通信中的发送-接收仅发送从机模式（4线：SPCR.SPMS位为0）

满足以下3个条件。

- 发送缓冲区(SPTX)为空。（没有下一个传输数据。）
- 传输移位寄存器为空。（这意味着RSPI不进行串行传输。）
- SSL0被否定。

##### 时钟同步中的发送-接收仅发送从模式（3线：SPCR.SPMS位为1）

满足以下3个条件。

- 发送缓冲区(SPTX)为空。（没有下一个传输数据。）
- 传输移位寄存器为空。（这意味着RSPI不进行串行传输。）
- 检测到最后一个数据的RSPCK的最后一个偶边沿。（当SPCMD.CPHA位为"1"时。）

##### SPI串行通信中仅接收从机模式（4线：SPCR.SPMS位为0）

满足以下条件。

- 最后一个数据写入接收缓冲区后，SSL0被否定。

##### 在时钟同步下仅接收从模式（3线：SPCR.SPMS位为1）

满足以下条件。

- The last even edge of RSPCK of the last data was detected. (When the SPCMD.CPHA bit is 1.)

[Clearing condition]

Master mode

Satisfy one of following.

- The next transmit data was written to the transmit buffer (SPTX).
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1

Transmit-receive / transmit only slave mode

Satisfy one of following.

- The next transmit data was written to the transmit buffer(SPTX).
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Receive only slave mode in SPI serial communication (4-wire: the SPCR.SPMS bit is 0)

Satisfy one of following.

- SSL0 assertion of next data was detected.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Receive only slave mode in clock synchronous (3-wire: the SPCR.SPMS bit is 1)

Satisfy one of following.

- The first edge of RSPCK of the next data was detected.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

**SPRF flag (SPI Receive Buffer Full Flag)**

The SPRF flag indicates the status of the receive buffer for the SPI Data Register (SPDR/SPDR\_HA).

[Setting condition]

- Received data with the frame size specified by the SPDCR.SPFC[1:0] bits have been transferred to the SPDR from the shift register while the SPRF flag is 0. And satisfy one of following. However, the SPRF flag does not change from 0 to 1 while the OVRF flag = 1.
  - The SPCR.TXMD bit is 0 (transmit-receive master mode, transmit-receive slave mode, or receive only slave mode)
  - The SPCR.MSTR bit is 0 and the SPCR3.ETXMD bit is 1 (receive only slave mode)

[Clearing condition]

- When received data is read from the SPDR/SPDR\_HA.

**30.2.5 SPDR/SPDR\_HA/SPDR\_BY : SPI Data Register**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x04

| Bit  | Symbol | Function | R/W |
|------|--------|----------|-----|
| 31:0 | n/a    | SPI Data | R/W |

SPDR/SPDR\_HA/SPDR\_BY is the interface with the buffers that hold data for transmission and reception by the SPI. When accessing this register in words (the SPDCR.SPLW bit is 1), access SPDR. When accessing it in halfwords (the SPLW bit is 0), access SPDR\_HA. When accessing it in byte (the SPDCR.SPBYT bit is 1), access SPDR\_BY.

- 检测到最后一个数据的RSPCK的最后一个偶边沿。（当SPCMD.CPHA位为1时。）

[Clearing condition]

主模式

满足以下之一。

- 下一个发送数据被写入发送缓冲区(SPTX)。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0

发送-接收仅发送从模式

满足以下之一。

- 下一个发送数据被写入发送缓冲区(SPTX)。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

SPI串行通信中仅接收从机模式（4线：SPCR.SPMS位为0）

满足以下之一。

- 检测到下一个数据的SSL0断言。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

在时钟同步下仅接收从模式（3线：SPCR.SPMS位为1）

满足以下之一。

- 检测到下一个数据的RSPCK的第一个边沿。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

**SPRF标志（SPI接收缓冲区满标志）**

SPRF标志指示SPI数据寄存器(SPDR/SPDR\_HA)的接收缓冲区的状态。

[Setting condition]

- 在SPRF标志为0时，接收到的具有SPDCR.SPFC[1:0]位指定的帧大小的数据已从移位寄存器传送到SPDR。并且满足以下之一。但是，当OVRF标志=1时，SPRF标志不会从0变为1。

SPCR.TXMD位为0（发送-接收主机模式、发送-接收从机模式或仅接收从机模式）

SPCR.MSTR位为0，SPCR3.ETXMD位为1（仅接收从模式）

[Clearing condition]

- 从SPDR/SPDR\_HA读取接收数据时。

**30.2.5 SPDR/SPDR\_HA/SPDR\_BY:SPI数据寄存器**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x04

| Bit  | Symbol | Function | R/W |
|------|--------|----------|-----|
| 31:0 | n/a    | SPI数据    | R/W |

SPDR/SPDR\_HA/SPDR\_BY是与缓冲区的接口，缓冲区保存数据以供SPI发送和接收。以字访问该寄存器时（SPDCR.SPLW位为1），访问SPDR。当以半字访问它时（SPLW位为0），访问SPDR\_HA。当按字节访问时（SPDCR.SPBYT位为1），访问SPDR\_BY。

The transmit buffer (SPTX) and receive buffer (SPRX) are independent but are both mapped to SPDR/SPDR\_HA. Figure 30.2 shows the configuration of the SPDR/SPDR\_HA register.

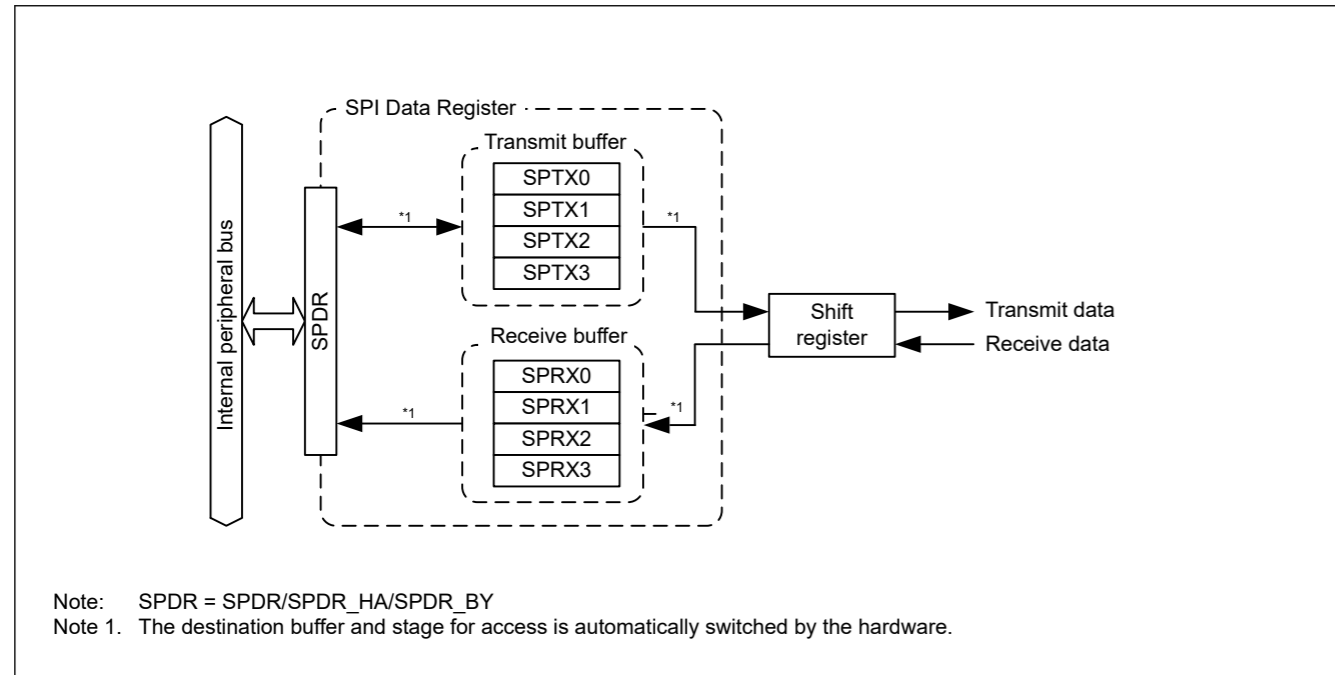

Figure 30.2 Configuration of SPDR/SPDR\_HA/SPDR\_BY

The transmit and receive buffers each have one stages. The four stages of the buffer are all mapped to the single address of SPDR/SPDR\_HA/SPDR\_BY.

Data written to SPDR/SPDR\_HA/SPDR\_BY is written to a transmit-buffer stage (SPTX<sub>n</sub>) (n = 0 to 3), and then transmitted from the buffer. The receive buffer holds received data on completion of reception. The receive buffer is not updated if an overrun is generated.

Additionally, if the data length is not 32 bits, bits not referred to in SPTX<sub>n</sub> (n = 0 to 3) are stored in the associated bits in SPRX<sub>n</sub> (n = 0 to 3). For example, if the data length is 9 bits, the received data is stored in the SPRX<sub>n</sub>[8:0] bits, and the SPTX<sub>n</sub>[31:9] bits are stored in the SPRX<sub>n</sub>[31:9] bits.

#### (1) Bus interface

SPDR/SPDR\_HA/SPDR\_BY is an interface with 32-bit wide transmit and receive buffers, each of which has one stages, for a total of 32 bytes. The 32 bytes are mapped to the 4-byte address space for SPDR/SPDR\_HA/SPDR\_BY. Additionally, the unit of access for SPDR/SPDR\_HA/SPDR\_BY is selected by the SPI Word Access/Halfword Access Specification bit in the SPI Data Control Register (SPDCR.SPLW). SPDR can also be accessed with the access size specified by the SPI Byte Access bit in the SPI Data Control Register (SPDCR.SPBYT).

Flush the transmission data at the LSB end of the register, and store the received data at the LSB end.

The following sections describe the operations involved in writing to and reading from SPDR/SPDR\_HA/SPDR\_BY.

#### Writing

Data written to SPDR/SPDR\_HA/SPDR\_BY is written to a transmit buffer (SPTX<sub>n</sub>). This is not affected by the value of the SPDCR.SPRDTD bit, unlike when reading from SPDR/SPDR\_HA/SPDR\_BY. The transmit buffer includes a transmit buffer write pointer that is automatically updated to reference the next stage each time data is written to SPDR/SPDR\_HA/SPDR\_BY.

Figure 30.3 shows the configuration of the bus interface with the transmit buffer when writing to SPDR/SPDR\_HA/SPDR\_BY.

发送缓冲区(SPTX)和接收缓冲区(SPRX)是独立的，但都映射到SPDR/SPDR\_HA。图30.2显示了SPDR/SPDR\_HA寄存器的配置。

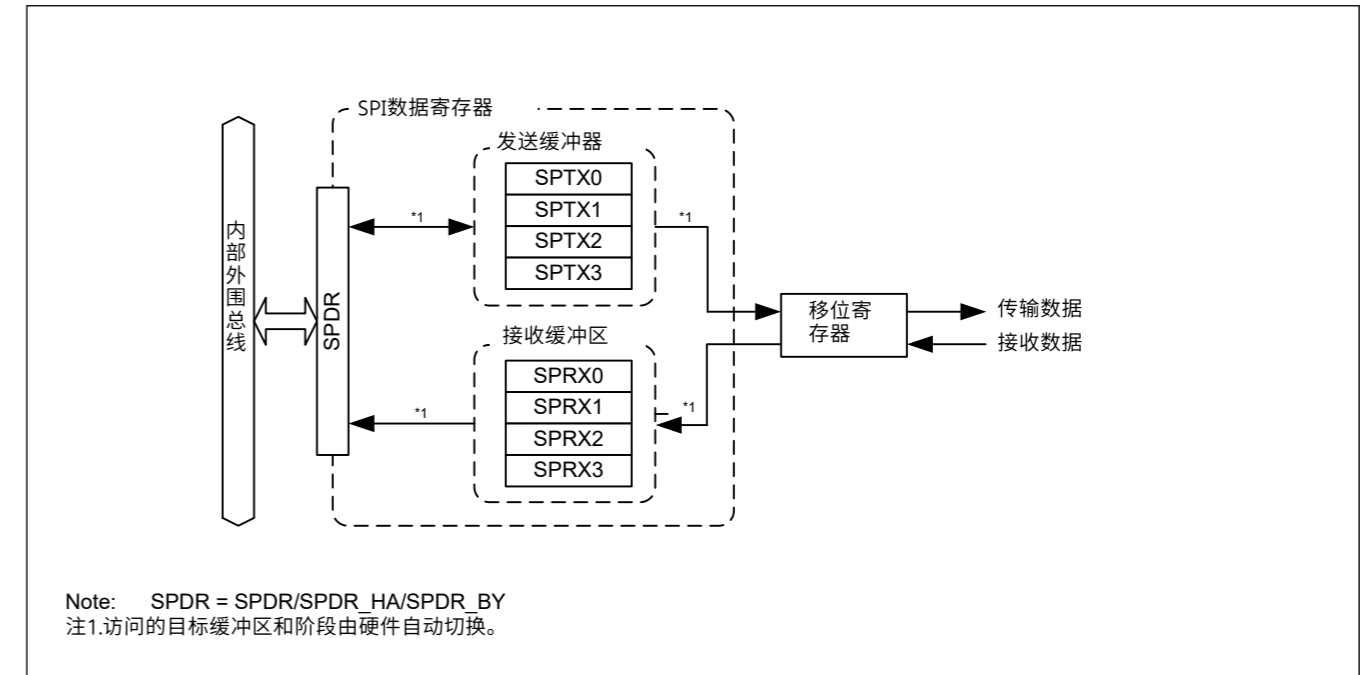

Figure 30.2 SPDR/SPDR\_HA/SPDR\_BY的配置

发送和接收缓冲器各有一级。缓冲区的四个阶段都映射到单个地址 SPDR/SPDR\_HA/SPDR\_BY。

写入SPDR/SPDR\_HA/SPDR\_BY的数据被写入发送缓冲区级(SPTX<sub>n</sub>)(n=0到3)，然后从缓冲区发送。接收缓冲器在接收完成时保存接收到的数据。如果产生溢出，接收缓冲器不会更新。

此外，如果数据长度不是32位，SPTX<sub>n</sub>(n=0到3)中未提及的位将存储在 SPRX<sub>n</sub> (n=0到3)。例如，如果数据长度为9位，则接收到的数据存储在SPRX<sub>n</sub>[8:0]位中，而 SPTX<sub>n</sub>[31:9]位存储在SPRX<sub>n</sub>[31:9]位中。

#### (1) 总线接口

SPDR/SPDR\_HA/SPDR\_BY是一个具有32位宽的发送和接收缓冲区的接口，每个缓冲区都有一个阶段，总共32个字节。32个字节映射到SPDR/SPDR\_HA/SPDR\_BY的4字节地址空间。此外，SPDR/SPDR\_HA/SPDR\_BY的访问单元由SPI数据控制寄存器(SPDCR.SPLW)中的SPI字访问半字访问规范位选择。SPDR也可以通过SPI字节指定的访问大小进行访问。

SPI数据控制寄存器(SPDCR.SPBYT)中的访问位。

在寄存器的LSB端刷新发送数据，在LSB端存储接收到的数据。

以下部分描述了写入和读取SPDR/SPDR\_HA/SPDR\_BY所涉及的操作。

#### Writing

写入SPDR/SPDR\_HA/SPDR\_BY的数据被写入发送缓冲区(SPTX<sub>n</sub>)。这不受SPDCR.SPRDTD位的影响，与从SPDR/SPDR\_HA/SPDR\_BY读取时不同。发送缓冲区包括一个发送缓冲区写指针，每次将数据写入SPDR/SPDR\_HA/SPDR\_BY时，该指针会自动更新以引用下一阶段。

图30.3显示了写入SPDR/SPDR\_HA时带有发送缓冲区的总线接口的配置 SPDR\_BY。

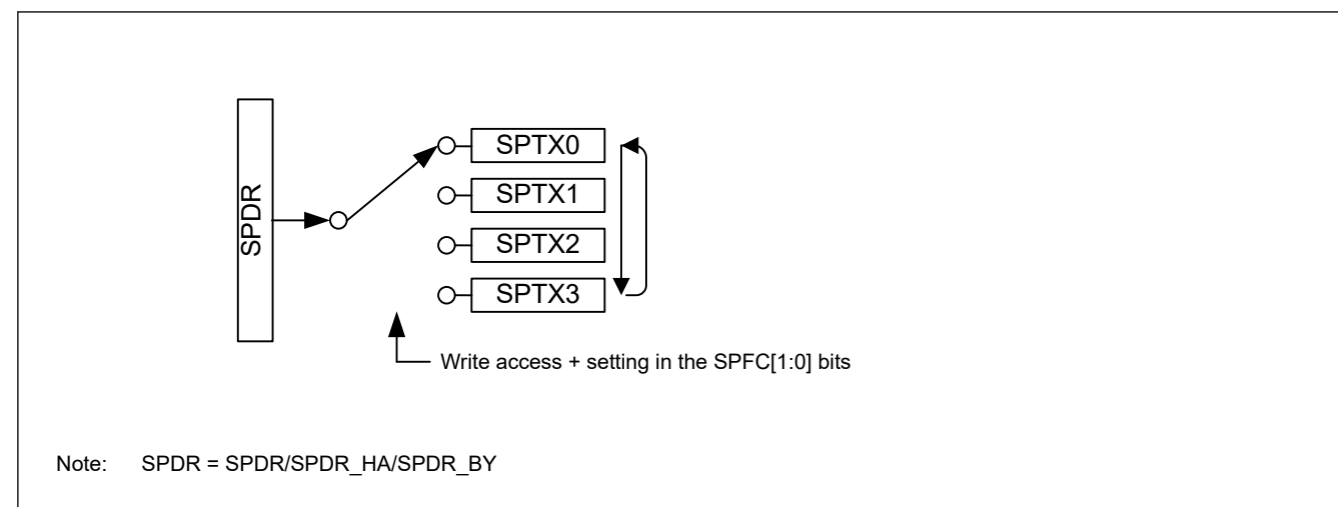

Figure 30.3 Configuration of SPDR/SPDR\_HA/SPDR\_BY for write access

The sequence for switching the transmit buffer write pointer differs with the setting of the number of frames specification bits in the SPI Data Control Register (SPDCR.SPFC[1:0]). The relationship of the SPFC[1:0] setting and the sequence of pointer switching from SPTX0 to SPTX3 is as follows:

- When SPFC[1:0] = 00b: SPTX0 → SPTX0 → SPTX0 → ...
- When SPFC[1:0] = 01b: SPTX0 → SPTX1 → SPTX0 → SPTX1 → ...
- When SPFC[1:0] = 10b: SPTX0 → SPTX1 → SPTX2 → SPTX0 → SPTX1 → ...
- When SPFC[1:0] = 11b: SPTX0 → SPTX1 → SPTX2 → SPTX3 → SPTX0 → SPTX1 → ...

When 1 is written to the SPI Function Enable bit in the SPI Control Register (SPCR.SPE) while the bit is 0, SPTX0 is the destination for the next write.

When writing to the transmit buffer (SPTXn) after generating the transmit buffer empty interrupt (when SPSR.SPTEF is 1), write the number of frames set in SPFC[1:0] in the SPI Data Control Register (SPDCR). Even when the specified number of frames is written to the transmit buffer (SPTXn), the value of the buffer is not updated after completion of the writing and before generation of the next transmit buffer empty interrupt (when SPTEF is 0).

#### Reading

SPDR/SPDR\_HA/SPDR\_BY can be accessed to read the value of a receive buffer (SPRXn) or a transmit buffer (SPTXn). The setting in the SPI Receive/Transmit Data Select bit in the SPI Data Control Register (SPDCR.SPRDTD) selects whether reading is of the receive or transmit buffer. The sequence of reading the SPDR/SPDR\_HA/SPDR\_BY register is controlled by the independent receive buffer and transmit buffer read pointers.

Figure 30.4 shows the configuration of the bus interface with the receive and transmit buffers for reading from SPDR/SPDR\_HA/SPDR\_BY.

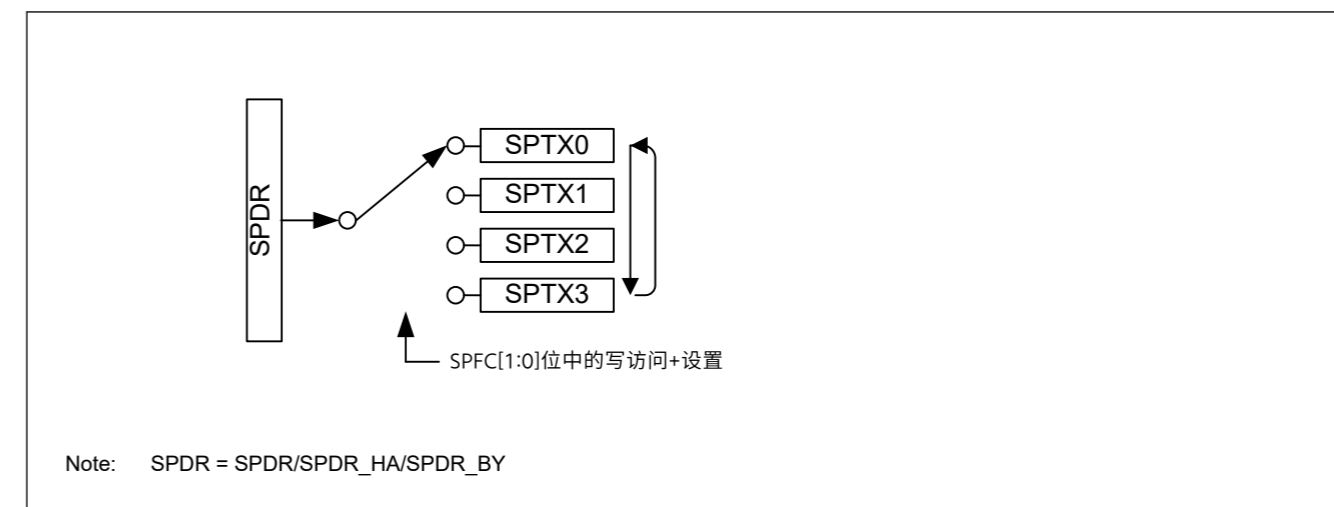

Figure 30.3 为写访问配置SPDR/SPDR\_HA/SPDR\_BY

发送缓冲区写指针的切换顺序因SPI数据控制寄存器(SPDCR.SPFC[1:0])中帧数规范位的设置而异。SPFC[1:0]设置与指针从SPTX0切换到SPTX3的顺序关系如下:

- When SPFC[1:0] = 00b: SPTX0 → SPTX0 → SPTX0 → ...
- When SPFC[1:0] = 01b: SPTX0 → SPTX1 → SPTX0 → SPTX1 → ...
- When SPFC[1:0] = 10b: SPTX0 → SPTX1 → SPTX2 → SPTX0 → SPTX1 → ...
- When SPFC[1:0] = 11b: SPTX0 → SPTX1 → SPTX2 → SPTX3 → SPTX0 → SPTX1 → ...

当1写入SPI控制寄存器(SPCR.SPE)中的SPI功能使能位且该位为0时，SPTX0是下一次写入的目标。

在产生发送缓冲区空中断后写入发送缓冲区(SPTXn)时(当SPSR.SPTEF为1时)，将SPFC[1:0]中设置的帧数写入SPI数据控制寄存器(SPDCR)。即使指定的帧数被写入发送缓冲区(SPTXn)，缓冲区的值在写入完成后和下一个发送缓冲区空中断发生之前(SPTEF为0时)也不会更新。

#### Reading

SPDR/SPDR\_HA可以访问SPDR\_BY以读取接收缓冲区(SPRXn)或发送缓冲区(SPTXn)的值。SPI数据控制寄存器(SPDCR.SPRDTD)的SPI接收发送数据选择位中的设置选择读取接收缓冲区还是发送缓冲区。读取SPDR/SPDR\_HA/SPDR\_BY寄存器的顺序由独立的接收缓冲区和发送缓冲区读取指针控制。

图30.4显示了带有用于从SPDR读取的接收和发送缓冲区的总线接口配置SPDR\_HA/SPDR\_BY。

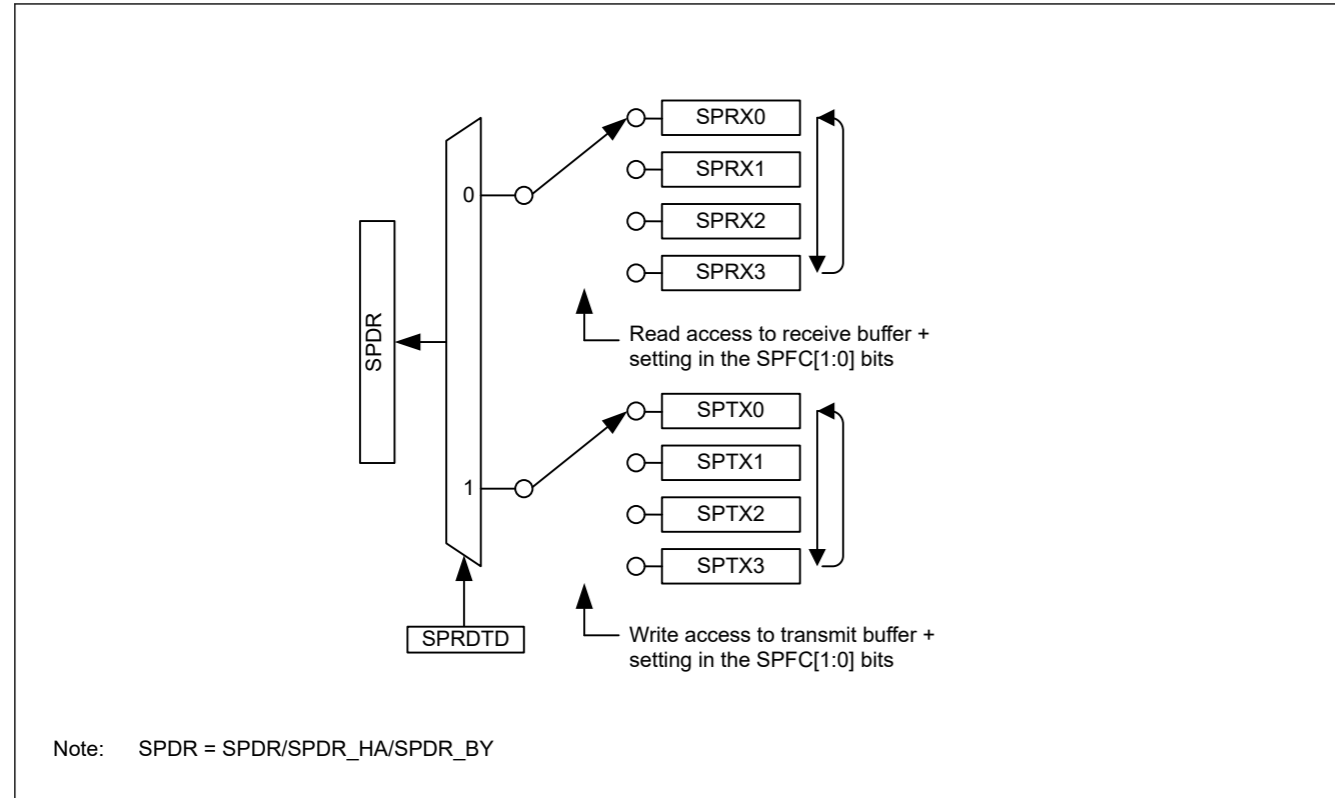

Figure 30.4 Configuration of SPDR/SPDR\_HA/SPDR\_BY for read access

Reading the receive buffer switches the receive buffer read pointer to the next buffer automatically. The switching sequence for the receive buffer read pointer is the same as that for the transmit buffer write pointer. However, when 1 is written to the SPI Function Enable bit in the SPI Control Register (SPCR.SPE) while the value of the bit is 1, SPRX0 is referenced by the buffer read pointer for the next read.

The transmit buffer read pointer is updated when writing to SPDR/SPDR\_HA/SPDR\_BY, but not updated when reading from the transmit buffer. When reading from the transmit buffer, the value most recently written to SPDR/SPDR\_HA/SPDR\_BY is read.

After a transmit buffer empty interrupt is generated, reading from the transmit buffer returns all 0s after the completion of writing the number of frames of data specified in the SPDCR.SPFC[1:0] bits, until the next buffer empty interrupt is generated (when SPTEF is 0).

### 30.2.6 SPSCR : SPI Sequence Control Register

Base address: SPI0 = 0x4011\_A000

Offset address: 0x08

|                    |   |   |   |   |   |            |   |   |
|--------------------|---|---|---|---|---|------------|---|---|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2          | 1 | 0 |
| Bit field:         | — | — | — | — | — | SPSLN[2:0] |   |   |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0          | 0 | 0 |

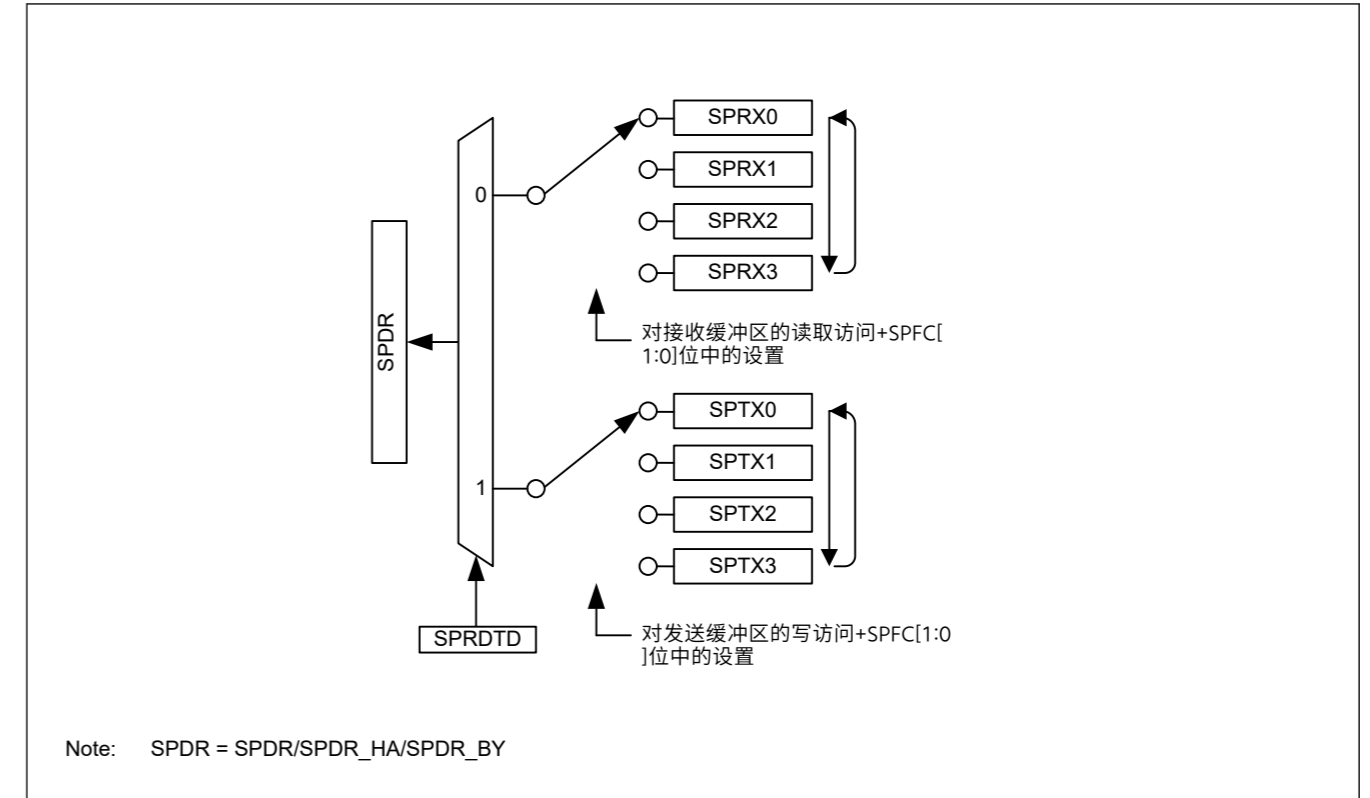

Figure 30.4 为读取访问配置SPDR/SPDR\_HA/SPDR\_BY

读取接收缓冲区会自动将接收缓冲区读取指针切换到下一个缓冲区。接收缓冲区读指针的切换顺序与发送缓冲区写指针的切换顺序相同。但是，当1写入SPI控制寄存器(SPCR.SPE)中的SPI功能使能位且该位的值为1时，缓冲区读取指针将引用SPRX0以进行下一次读取。

发送缓冲区读指针在写入SPDR/SPDR\_HA/SPDR\_BY时更新，但在从发送缓冲区读取时不更新。从发送缓冲区读取时，会读取最近写入SPDR/SPDR\_HA/SPDR\_BY的值。

产生发送缓冲区空中断后，在完成写入SPDCR.SPFC[1:0]位中指定的数据帧数后，从发送缓冲区读取返回全0，直到产生下一个缓冲区空中断（当SPTEF为0时）。

### 30.2.6 SPSCR:SPI序列控制寄存器

Base address: SPI0 = 0x4011\_A000

Offset address: 0x08

|               |   |   |   |   |   |            |   |   |
|---------------|---|---|---|---|---|------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2          | 1 | 0 |
| Bit field:    | — | — | — | — | — | SPSLN[2:0] |   |   |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0          | 0 | 0 |

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 2:0 | SPSLN[2:0] | <p>SPI Sequence Length Specification</p> <p>The sequence length that is set in these bits determines the order in which the SPCMD0 to SPCMD07 registers are referenced. The setting defines the relationship between the sequence length and the SPCMD0 to SPCMD7 registers referenced by the SPI. In slave mode, the SPI references SPCMD0.</p> <p>0 0 0: Sequence Length is 1 (Referenced SPCMDn, n = 0→0→...)<br/>                     0 0 1: Sequence Length is 2 (Referenced SPCMDn, n = 0→1→0→...)<br/>                     0 1 0: Sequence Length is 3 (Referenced SPCMDn, n = 0→1→2→0→...)<br/>                     0 1 1: Sequence Length is 4 (Referenced SPCMDn, n = 0→1→2→3→0→...)<br/>                     1 0 0: Sequence Length is 5 (Referenced SPCMDn, n = 0→1→2→3→4→0→...)<br/>                     1 0 1: Sequence Length is 6 (Referenced SPCMDn, n = 0→1→2→3→4→5→0→...)<br/>                     1 1 0: Sequence Length is 7 (Referenced SPCMDn, n = 0→1→2→3→4→5→6→0→...)<br/>                     1 1 1: Sequence Length is 8 (Referenced SPCMDn, n = 0→1→2→3→4→5→6→7→0→...)</p> | R/W |
| 7:3 | —          | These bits are read as 0. The write value should be 0.   | R/W |

SPSCR specifies the sequence length when the SPI operates in master mode. Before changing the SPSLN[2:0] bits while both the SPCR.MSTR and SPCR.SPE bits are 1, check that the SPSR.IDLNF flag is 0.

**SPSLN[2:0] bits (SPI Sequence Length Specification)**

The SPSLN[2:0] bits specify the sequence length when the SPI in master mode performs sequential operations. The SPI in master mode changes the SPCMD0 to SPCMD7 registers to be referenced, and the order in which they are referenced is based on this sequence length setting. In slave mode, SPCMD0 is referenced.

**30.2.7 SPSSR : SPI Sequence Status Register**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x09

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 2:0 | SPCP[2:0]  | <p>SPI Command Pointer</p> <p>0 0 0: SPCMD0<br/>                     0 0 1: SPCMD1<br/>                     0 1 0: SPCMD2<br/>                     0 1 1: SPCMD3<br/>                     1 0 0: SPCMD4<br/>                     1 0 1: SPCMD5<br/>                     1 1 0: SPCMD6<br/>                     1 1 1: SPCMD7</p> | R   |
| 3   | —          | This bit is read as 0.   | R   |
| 6:4 | SPECM[2:0] | <p>SPI Error Command</p> <p>0 0 0: SPCMD0<br/>                     0 0 1: SPCMD1<br/>                     0 1 0: SPCMD2<br/>                     0 1 1: SPCMD3<br/>                     1 0 0: SPCMD4<br/>                     1 0 1: SPCMD5<br/>                     1 1 0: SPCMD6<br/>                     1 1 1: SPCMD7</p>   | R   |
| 7   | —          | This bit is read as 0.   | R   |

SPSSR indicates the sequence control status when the SPI operates in master mode. Any writes to SPSSR are ignored.

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 2:0 | SPSLN[2:0] | <p>SPI序列长度规范</p> <p>在这些位中设置的序列长度决定了SPCMD0到SPCMD7寄存器。该设置定义了序列长度与SPI引用的SPCMD0到SPCMD7寄存器之间的关系。在从机模式下，SPI参考SPCMD0。</p> <p>000: 序列长度为1 (参考SPCMDn, n=0→0→...) 001: 序列长度为2 (参考SPCMDn, n=0→1→0→...) 010: 序列长度为3 (参考SPCMDn, n=0→1→2→0→...) 011: 序列长度为4 (参考SPCMDn, n=0→1→2→3→0→...) 100: 序列长度为5 (参考SPCMDn, n=0→1→2→3→4→0→...) 101: 序列长度为6 (参考SPCMDn, n=0→1→2→3→4→5→0→...) 110: 序列长度为7 (参考SPCMDn, n=0→1→2→3→4→5→6→0→...) 111: 序列长度为8 (参考SPCMDn, n=0→1→2→3→4→5→6→7→0→...)</p> | R/W |
| 7:3 | —          | 这些位被读取为0。写入值应为0。  | R/W |

SPSCR指定SPI在主模式下工作时的序列长度。在SPCR.MSTR和SPCR.SPE位均为1时更改SPSLN[2:0]位之前，请检查SPSR.IDLNF标志是否为0。

**SPSLN[2:0]位 (SPI序列长度规范)**

SPSLN[2:0]位指定SPI在主模式下执行顺序操作时的序列长度。主机模式下的SPI将SPCMD0到SPCMD7寄存器更改为被引用，它们被引用的顺序基于此序列长度设置。在从模式下，以SPMD0为参考。

**30.2.7 SPSSR: SPI序列状态寄存器**

| 6:4 | SPECM[2:0] | <p>SPI错误命令</p> <p>0 0 0: SPCMD0<br/>                     0 0 1: SPCMD1<br/>                     0 1 0: SPCMD2<br/>                     0 1 1: SPCMD3<br/>                     1 0 0: SPCMD4<br/>                     1 0 1: SPCMD5<br/>                     1 1 0: SPCMD6<br/>                     1 1 1: SPCMD7</p> | R   |
| 7   | —          | 该位读为0。   | R   |

SPSSR指示SPI在主模式下工作时的序列控制状态。对SPSSR的任何写入都将被忽略。

**SPCP[2:0] bits (SPI Command Pointer)**

The SPCP[2:0] bits indicate the SPCMDm register that is referenced to by the pointer during sequence control by the SPI. For the SPI sequence control, see [section 30.3.11.1. Master mode operation](#).

**SPECM[2:0] bits (SPI Error Command)**

The SPECM[2:0] bits indicate the SPCMDm register that is specified in the SPCP[2:0] bits when an error is detected during sequence control by the SPI. The SPI updates the SPECM[2:0] bits only when an error is detected. If both the SPSR.OVRF and SPSR.MODF flags are 0 and there is no error, the values of the SPECM[2:0] bits have no meaning.

For the SPI error detection function, see [section 30.3.9. Error Detection](#). For the SPI sequence control, see [section 30.3.11.1. Master mode operation](#).

**30.2.8 SPBR : SPI Bit Rate Register**

Base address: SPI0 = 0x4011\_A000  
Offset address: 0x0A

| Bit | Symbol | Function | R/W |
|-----|--------|----------|-----|
| 7:0 | n/a    | Bit rate | R/W |

SPBR sets the bit rate in master mode.

When the SPI is in slave mode, the bit rate depends on the bit rate of the input clock, regardless of the settings in SPBR and the SPCMDm.BRDV[1:0] bits (bit rate division setting). Use bit rates that satisfy the electrical characteristics of the device.

The bit rate is determined by combinations of the SPBR and SPCMDm.BRDV[1:0] settings in the SPI Command Register. The equation for calculating the bit rate is given as follows:

$$\text{Bit rate} = \frac{f(\text{PCLK})}{2 \times (n + 1) \times 2^N}$$

( PCLK = PCLKA )

In the equation, n denotes an SPBR setting (0, 1, 2, ..., 255), and N denotes a BRDV[1:0] setting (0, 1, 2, 3).

[section 30.2.8. SPBR : SPI Bit Rate Register](#) lists examples of the relationship between the SPBR settings, the BRDV[1:0] settings, and bit rates.

**30.2.9 SPDCR : SPI Data Control Register**

Base address: SPI0 = 0x4011\_A000  
Offset address: 0x0B

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 1:0 | SPFC[1:0] | Number of Frames Specification<br>0 0: 1 frame<br>0 1: 2 frames<br>1 0: 3 frames<br>1 1: 4 frames | R/W |
| 3:2 | —         | These bits are read as 0. The write value should be 0.  | R/W |

**SPCP[2:0]位 (SPI命令指针)**

SPCP[2:0]位指示在SPI序列控制期间指针所引用的SPCMDm寄存器。有关SPI序列控制，请参阅第30.3.11.1节。主模式操作。

**SPECM[2:0]位 (SPI错误命令)**

SPECM[2:0]位指示在SPI序列控制期间检测到错误时在SPCP[2:0]位中指定的SPCMDm寄存器。SPI仅在检测到错误时更新SPECM[2:0]位。如果SPSR.OVRF和SPSR.MODF标志均为0且没有错误，则SPECM[2:0]位的值没有意义。

关于SPI错误检测功能，请参见第30.3.9节。错误检测。有关SPI序列控制，请参阅第30.3.11.1节。主模式操作。

**30.2.8 SPBR:SPI比特率寄存器**

Base address: SPI0 = 0x4011\_A000  
Offset address: 0x0A

| Bit | Symbol | Function | R/W |
|-----|--------|----------|-----|
| 7:0 | n/a    | 比特率      | R/W |

SPBR在主模式下设置比特率。

当SPI处于从机模式时，比特率取决于输入时钟的比特率，与SPBR和SPMDm.BRDV[1:0]位（比特率分频设置）的设置无关。使用满足设备电气特性的比特率。

比特率由SPI命令寄存器中的SPBR和SPMDm.BRDV[1:0]设置的组合确定。计算比特率的公式如下：

$$\text{比特率} = \frac{f(\text{PCLK})}{2 \times (n + 1) \times 2^N}$$

( PCLK = PCLKA )

在等式中，n表示SPBR设置(0 1 2 ... 255)，N表示BRDV[1:0]设置(0 1 2 3)。

第30.2.8节。SPBR:SPI比特率寄存器列出了SPBR设置、BRDV[1:0]设置和比特率之间的关系示例。

**30.2.9 SPDCR:SPI数据控制寄存器**

Base address: SPI0 = 0x4011\_A000  
Offset address: 0x0B

| Bit | Symbol    | Function                                | R/W |
|-----|-----------|---|-----|
| 1:0 | SPFC[1:0] | 帧数规格<br>00: 1帧01:<br>2帧10: 3帧1<br>1: 4帧 | R/W |
| 3:2 | —         | 这些位被读取为0。写入值应为0。                        | R/W |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 4   | SPRDTD | SPI Receive/Transmit Data Select<br>0: Read SPDR/SPDR_HA values from receive buffer<br>1: Read SPDR/SPDR_HA values from transmit buffer, but only if the transmit buffer is empty | R/W |
| 5   | SPLW   | SPI Word Access/Halfword Access Specification<br>0: Set SPDR_HA to valid for halfword access<br>1: Set SPDR to valid for word access  | R/W |
| 6   | SPBYT  | SPI Byte Access Specification<br>0: SPDR/SPDR_HA is accessed in halfword or word (SPLW is valid)<br>1: SPDR_BY is accessed in byte (SPLW is invalid)                              | R/W |
| 7   | —      | This bit is read as 0. The write value should be 0.   | R/W |

The SPI Data Control Register (SPDCR) is used to read the number of frames that can be stored in the SPDR register, read the SPDR register, and to set the access width for the SPDR register to word access, halfword access, or byte access. Up to four frames can be transmitted or received in one round of transmission or reception. The amount of data in each transfer is controlled by the combination of the SPCMDm.SP3[3:0] bits, the SPSCR.SP3SLN[2:0] bits, and the SPFC[1:0] bits.

When changing the SPFC[1:0] bits while the SPCR.SPE bit is 1, check that the SPSR.IDLNF flag is 0.

#### SPFC[1:0] bits (Number of Frames Specification)

The SPFC[1:0] bits specify the number of frames that can be stored in SPDR/SPDR\_HA per transfer activation. Up to four frames can be transmitted or received in one round of transmission or reception.

When the number of transmission data frames specified in the SPFC[1:0] bits is written to the SPDR/SPDR\_HA register, SPI clears the SPSR.SPTEF flag to 0 and begins transmitting. After that, when the number of transmission data frames specified in the SPFC[1:0] bits is transmitted to the shift register, the SPI generates the transmit buffer empty interrupt (SPSR.SPTEF sets to 1).

When the number of data frames specified in the SPFC[1:0] bits is received, the SPI generates the receive buffer full interrupt (SPSR.SPRF sets to 1).

**Table 30.3** Settable combinations of the SP3SLN[2:0] and SPFC[1:0] bits

| Setting | SP3SLN[2:0] | SPFC[1:0] | Number of frames in a single sequence | Number of frames at which transmission or receive buffer is filled |
|---------|-------------|-----------|---------------------------------------|--|
| 1-1     | 000b        | 00b       | 1                                     | 1  |
| 1-2     | 000b        | 01b       | 2                                     | 2  |
| 1-3     | 000b        | 10b       | 3                                     | 3  |
| 1-4     | 000b        | 11b       | 4                                     | 4  |
| 2-1     | 001b        | 01b       | 2                                     | 2  |
| 2-2     | 001b        | 11b       | 4                                     | 4  |
| 3       | 010b        | 10b       | 3                                     | 3  |
| 4       | 011b        | 11b       | 4                                     | 4  |
| 5       | 100b        | 00b       | 5                                     | 1  |
| 6       | 101b        | 00b       | 6                                     | 1  |
| 7       | 110b        | 00b       | 7                                     | 1  |
| 8       | 111b        | 00b       | 8                                     | 1  |

#### SPRDTD bit (SPI Receive/Transmit Data Select)

The SPRDTD bit selects whether the SPDR/SPDR\_HA reads values from the receive buffer or from the transmit buffer. If reading is from the transmit buffer, the last value written to SPDR/SPDR\_HA register is read. Read the transmit buffer after an SPI transmit buffer empty interrupt is generated until data of frames specified by SPFC[1:0] has been written (while the SPSR.SPTEF flag is 1).

For details, see [section 30.2.5. SPDR/SPDR\\_HA/SPDR\\_BY : SPI Data Register](#).

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 4   | SPRDTD | SPI接收发送数据选择<br>0: 从接收缓冲区读取SPDRSPDR_HA值1: 从发送缓冲区读取SPDRSPDR_HA值, 但前提是发送缓冲区为空 | R/W |
| 5   | SPLW   | SPI字访问半字访问规范<br>0: 将SPDR_HA设置为对半字访问有效1: 将SPDR设置为对字访问有效                     | R/W |
| 6   | SPBYT  | SPI字节访问规范<br>0: SPDRSPDR_HA以半字或字访问 (SPLW有效) 1: SPDR_BY以字节访问 (SPLW无效)       | R/W |
| 7   | —      | 该位读取为0。写入值应为0。   | R/W |

SPI数据控制寄存器(SPDCR)用于读取SPDR寄存器中可存储的帧数, 读取SPDR寄存器, 并将SPDR寄存器的访问宽度设置为字访问、半字访问或字节访问。在一轮发送或接收中最多可以发送或接收四帧。每次传输中的数据量由SPCMDm.SP3[3:0]位、SPSCR.SP3SLN[2:0]位和SPFC[1:0]位的组合控制。

在SPCR.SPE位为1时更改SPFC[1:0]位时, 检查SPSR.IDLNF标志是否为0。

#### SPFC[1:0]位 (帧数规范)

SPFC[1:0]位指定每次传输激活时可以存储在SPDRSPDR\_HA中的帧数。在一轮发送或接收中最多可以发送或接收四帧。

当SPFC[1:0]位中指定的传输数据帧数写入SPDRSPDR\_HA寄存器时, SPI将SPSR.SPTEF标志清除为0并开始发送。之后, 当SPFC[1:0]位中指定的发送数据帧数被发送到移位寄存器时, SPI产生发送缓冲区空中断 (SPSR.SPTEF设置为1)。

当接收到SPFC[1:0]位中指定的数据帧数时, SPI产生接收缓冲区满中断 (SPSR.SPRF设置为1)。

**Table 30.3** SP3SLN[2:0]和SPFC[1:0]位的可设置组合

| Setting | SP3SLN[2:0] | SPFC[1:0] | 单个序列中的帧数 | 填充传输或接收缓冲区的帧数 |
|---------|-------------|-----------|----------|---------------|
| 1-1     | 000b        | 00b       | 1        | 1             |
| 1-2     | 000b        | 01b       | 2        | 2             |
| 1-3     | 000b        | 10b       | 3        | 3             |
| 1-4     | 000b        | 11b       | 4        | 4             |
| 2-1     | 001b        | 01b       | 2        | 2             |
| 2-2     | 001b        | 11b       | 4        | 4             |
| 3       | 010b        | 10b       | 3        | 3             |
| 4       | 011b        | 11b       | 4        | 4             |
| 5       | 100b        | 00b       | 5        | 1             |
| 6       | 101b        | 00b       | 6        | 1             |
| 7       | 110b        | 00b       | 7        | 1             |
| 8       | 111b        | 00b       | 8        | 1             |

#### SPRDTD位 (SPI接收发送数据选择)

SPRDTD位选择SPDRSPDR\_HA是从接收缓冲区还是从发送缓冲区读取值。如果从发送缓冲区读取, 则读取写入SPDRSPDR\_HA寄存器的最后一个值。在产生SPI发送缓冲区空中断后读取发送缓冲区, 直到SPFC[1:0]指定的帧数据被写入 (此时SPSR.SPTEF标志为1)。

有关详细信息, 请参阅[第30.2.5节. SPDRSPDR\\_HASPD\\_BY: SPI数据寄存器](#)。

**SPLW bit (SPI Word Access/Halfword Access Specification)**

The SPLW bit specifies the access width for SPDR. Access to SPDR\_HA in halfwords is valid when the SPLW bit is 0 and access to SPDR in words is valid when the SPLW bit is 1. Also, when this bit is 0, set the SPI data length setting bits, SPCMDm.SPB[3:0], from 8 to 16 bits. Do not perform any operations when a data length of 20, 24, or 32 bits is specified.

**SPBYT bit (SPI Byte Access Specification)**

The SPBYT bit is used to set the data width of access to the SPI Data Register (SPDR). When SPBYT = 0, use word or half word access to SPDR/SPDR\_HA. When SPBYT = 1 (in that case, SPLW is invalid), use byte access to SPDR\_BY.

When SPBYT = 1, set the SPI data length bits (SPB[3:0]) in the SPI Command Register m (SPCMDm) to 8 bits. If SPB[3:0] are set to 9 to 16, 20, 24, or 32 bit, subsequent operation is not guaranteed.

**30.2.10 SPCKD : SPI Clock Delay Register**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x0C

|                    |   |   |   |   |   |            |   |   |
|--------------------|---|---|---|---|---|------------|---|---|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2          | 1 | 0 |
| Bit field:         | — | — | — | — | — | SCKDL[2:0] |   |   |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0          | 0 | 0 |

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 2:0 | SCKDL[2:0] | RSPCK Delay Setting<br>0 0 0: 1 RSPCK<br>0 0 1: 2 RSPCK<br>0 1 0: 3 RSPCK<br>0 1 1: 4 RSPCK<br>1 0 0: 5 RSPCK<br>1 0 1: 6 RSPCK<br>1 1 0: 7 RSPCK<br>1 1 1: 8 RSPCK | R/W |
| 7:3 | —          | These bits are read as 0. The write value should be 0.  | R/W |

SPCKD specifies the RSPCK delay, the period from the beginning of SSLni signal assertion to RSPCK oscillation, when the SPCMDm.SCKDEN bit is 1.

**SCKDL[2:0] bits (RSPCK Delay Setting)**

The SCKDL[2:0] bits specify an RSPCK delay value when the SPCMDm.SCKDEN bit is 1. When using the SPI in slave mode, set the SCKDL[2:0] bits to 000b.

**30.2.11 SSLND : SPI Slave Select Negation Delay Register**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x0D

|                    |   |   |   |   |   |            |   |   |
|--------------------|---|---|---|---|---|------------|---|---|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2          | 1 | 0 |
| Bit field:         | — | — | — | — | — | SLNDL[2:0] |   |   |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0          | 0 | 0 |

**SPLW位 (SPI字访问半字访问规范)**

SPLW位指定SPDR的访问宽度。当SPLW位为0时，以半字访问SPDR\_HA有效，当SPLW位为1时，以字访问SPDR有效。此外，当该位为0时，设置SPI数据长度设置位SPMDm.SPB[3:0]，从8到16位。当指定数据长度为20、24或32位时，请勿执行任何操作。

**SPBYT位 (SPI字节访问规范)**

SPBYT位用于设置访问SPI数据寄存器(SPDR)的数据宽度。当SPBYT=0时，使用字或半字访问SPDR/SPDR\_HA。当SPBYT=1时（在这种情况下，SPLW无效），使用对SPDR\_BY的字节访问。

当SPBYT=1时，将SPI命令寄存器m(SPCMDm)中的SPI数据长度位(SPB[3:0])设置为8位。如果SPB[3:0]设置为9至16、20、24或32位，不保证后续操作。

**30.2.10 SPCKD:SPI时钟延迟寄存器**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x0C

|               |   |   |   |   |   |            |   |   |
|---------------|---|---|---|---|---|------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2          | 1 | 0 |
| Bit field:    | — | — | — | — | — | SCKDL[2:0] |   |   |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0          | 0 | 0 |

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 2:0 | SCKDL[2:0] | RSPCK延迟设置<br>0 0 0: 1 RSPCK<br>0 0 1: 2 RSPCK<br>0 1 0: 3 RSPCK<br>0 1 1: 4 RSPCK<br>1 0 0: 5 RSPCK<br>1 0 1: 6 RSPCK<br>1 1 0: 7 RSPCK<br>1 1 1: 8 RSPCK | R/W |
| 7:3 | —          | 这些位被读取为0。写入值应为0。  | R/W |

SPCKD指定RSPCK延迟，即从SSLni信号断言开始到RSPCK振荡的周期，当SPCMDm.SCKDEN位为1时。

**SCKDL[2:0]位 (RSPCK延迟设置)**

当SPCMDm.SCKDEN位为1时，SCKDL[2:0]位指定RSPCK延迟值。在从机模式下使用SPI时，将SCKDL[2:0]位设置为000b。

**30.2.11 SSLND:SPI从机选择否定延迟寄存器**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x0D

|               |   |   |   |   |   |            |   |   |
|---------------|---|---|---|---|---|------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2          | 1 | 0 |
| Bit field:    | — | — | — | — | — | SLNDL[2:0] |   |   |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0          | 0 | 0 |

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 2:0 | SLNDL[2:0] | SSL Negation Delay Setting<br>0 0 0: 1 RSPCK<br>0 0 1: 2 RSPCK<br>0 1 0: 3 RSPCK<br>0 1 1: 4 RSPCK<br>1 0 0: 5 RSPCK<br>1 0 1: 6 RSPCK<br>1 1 0: 7 RSPCK<br>1 1 1: 8 RSPCK | R/W |
| 7:3 | —          | These bits are read as 0. The write value should be 0.   | R/W |

SSLND specifies the SSL negation delay, the period from the transmission of a final RSPCK edge to the negation of the SSLni signal during a serial transfer by the SPI in master mode. If the contents of SSLND are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

#### SLNDL[2:0] bits (SSL Negation Delay Setting)

The SLNDL[2:0] bits specify an SSL negation delay value when the SLNDEN bit in SPCMDn is 1 and the SPI is in master mode. When using the SPI in slave mode, set the SLNDL[2:0] bits to 000b.

### 30.2.12 SPND : SPI Next-Access Delay Register

Base address: SPI0 = 0x4011\_A000

Offset address: 0x0E

|                    |   |   |   |   |   |            |   |   |
|--------------------|---|---|---|---|---|------------|---|---|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2          | 1 | 0 |
| Bit field:         | — | — | — | — | — | SPNDL[2:0] |   |   |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0          | 0 | 0 |

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 2:0 | SPNDL[2:0] | SPI Next-Access Delay Setting<br>0 0 0: 1 RSPCK + 2 PCLKA<br>0 0 1: 2 RSPCK + 2 PCLKA<br>0 1 0: 3 RSPCK + 2 PCLKA<br>0 1 1: 4 RSPCK + 2 PCLKA<br>1 0 0: 5 RSPCK + 2 PCLKA<br>1 0 1: 6 RSPCK + 2 PCLKA<br>1 1 0: 7 RSPCK + 2 PCLKA<br>1 1 1: 8 RSPCK + 2 PCLKA | R/W |
| 7:3 | —          | These bits are read as 0. The write value should be 0.  | R/W |

SPND specifies the next-access delay, the non-active period of the SSLni signal after termination of a serial transfer, when the SPCMDm.SPNDEN bit is 1.

#### SPNDL[2:0] bits (SPI Next-Access Delay Setting)

The SPNDL[2:0] bits specify a next-access delay when the SPCMDm.SPNDEN bit is 1. When using the SPI in slave mode, set the SPNDL[2:0] bits to 000b.

### 30.2.13 SPCR2 : SPI Control Register 2

Base address: SPI0 = 0x4011\_A000

Offset address: 0x0F

|                    |   |   |   |            |     |      |      |      |
|--------------------|---|---|---|------------|-----|------|------|------|
| Bit position:      | 7 | 6 | 5 | 4          | 3   | 2    | 1    | 0    |
| Bit field:         | — | — | — | SCKA<br>SE | PTE | SPIE | SPOE | SPPE |
| Value after reset: | 0 | 0 | 0 | 0          | 0   | 0    | 0    | 0    |

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 2:0 | SLNDL[2:0] | SSL否定延迟设置<br>0 0 0: 1 RSPCK<br>0 0 1: 2 RSPCK<br>0 1 0: 3 RSPCK<br>0 1 1: 4 RSPCK<br>1 0 0: 5 RSPCK<br>1 0 1: 6 RSPCK<br>1 1 0: 7 RSPCK<br>1 1 1: 8 RSPCK | R/W |
| 7:3 | —          | 这些位被读取为0。写入值应为0。  | R/W |

SSLND指定SSL否定延迟，从传输最终RSPCK边缘到否定SPI在主模式下进行串行传输期间的SSLni信号。如果SSLND的内容发生更改，而SPCR.MSTR和SPCR.SPE位为1，不执行后续操作。

#### SLNDL[2:0]位 (SSL否定延迟设置)

当SPCMDn中的SLNDEN位为1且SPI处于主模式时，SLNDL[2:0]位指定SSL否定延迟值。在从机模式下使用SPI时，将SLNDL[2:0]位设置为000b。

### 30.2.12 SPND:SPI下一次访问延迟寄存器

Base address: SPI0 = 0x4011\_A000

Offset address: 0x0E

|               |   |   |   |   |   |            |   |   |
|---------------|---|---|---|---|---|------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2          | 1 | 0 |
| Bit field:    | — | — | — | — | — | SPNDL[2:0] |   |   |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0          | 0 | 0 |

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 2:0 | SPNDL[2:0] | SPI下一次访问延迟设置<br>0 0 0: 1 RSPCK + 2 PCLKA<br>0 0 1: 2 RSPCK + 2 PCLKA<br>0 1 0: 3 RSPCK + 2 PCLKA<br>0 1 1: 4 RSPCK + 2 PCLKA<br>1 0 0: 5 RSPCK + 2 PCLKA<br>1 0 1: 6 RSPCK + 2 PCLKA<br>1 1 0: 7 RSPCK + 2 PCLKA<br>1 1 1: 8 RSPCK + 2 PCLKA | R/W |
| 7:3 | —          | 这些位被读取为0。写入值应为0。   | R/W |

当SPMDm.SPNDEN位为1时，SPND指定下一次访问延迟，即串行传输终止后SSLni信号的非活动期。

#### SPNDL[2:0]位 (SPI下一次访问延迟设置)

当SPMDm.SPNDEN位为1时，SPNDL[2:0]位指定下一次访问延迟。在从机模式下使用SPI时，将SPNDL[2:0]位设置为000b。

### 30.2.13 SPCR2: SPI控制寄存器2

Base address: SPI0 = 0x4011\_A000

Offset address: 0x0F

|               |   |   |   |            |     |      |      |      |
|---------------|---|---|---|------------|-----|------|------|------|
| Bit position: | 7 | 6 | 5 | 4          | 3   | 2    | 1    | 0    |
| Bit field:    | — | — | — | SCKA<br>SE | PTE | SPIE | SPOE | SPPE |
| 重置后的值:        | 0 | 0 | 0 | 0          | 0   | 0    | 0    | 0    |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | SPPE   | Parity Enable<br>0: Do not add parity bit to transmit data and do not check parity bit of receive data<br>1: When SPCR.TXMD = 0: Add parity bit to transmit data and check parity bit of receive data<br>When SPCR.TXMD = 1: Add parity bit to transmit data but do not check parity bit of receive data | R/W |
| 1   | SPOE   | Parity Mode<br>0: Select even parity for transmission and reception<br>1: Select odd parity for transmission and reception   | R/W |
| 2   | SPIIE  | SPI Idle Interrupt Enable<br>0: Disable idle interrupt requests<br>1: Enable idle interrupt requests   | R/W |
| 3   | PTE    | Parity Self-Testing<br>0: Disable self-diagnosis function of the parity circuit<br>1: Enable self-diagnosis function of the parity circuit   | R/W |
| 4   | SCKASE | RSPCK Auto-Stop Function Enable<br>0: Disable RSPCK auto-stop function<br>1: Enable RSPCK auto-stop function   | R/W |
| 7:5 | —      | These bits are read as 0. The write value should be 0.   | R/W |

**SPPE bit (Parity Enable)**

The SPPE bit enables or disables the parity function.

When the SPCR.TXMD bit is 0 and this bit is 1, the parity bit is added to transmit data and parity checking is performed for receive data.

When the SPCR.TXMD bit is 1 and this bit is 1, the parity bit is added to transmit data but parity checking is not performed for receive data.

**SPOE bit (Parity Mode)**

The SPOE bit specifies odd or even parity.

When even parity is set, parity bit addition is performed so that the total number of bits whose value is 1 in the transmit or receive character plus the parity bit is even. Similarly, when odd parity is set, parity bit addition is performed so that the total number of bits whose value is 1 in the transmit or receive character plus the parity bit is odd.

The SPOE bit is only valid when the SPPE bit is 1.

**SPIIE bit (SPI Idle Interrupt Enable)**

The SPIIE bit enables or disables the generation of SPI idle interrupt requests when an idle state is detected in the SPI and the SPSR.IDLNF flag clears is set to 0.

**PTE bit (Parity Self-Testing)**

The PTE bit enables self-diagnosis of the parity circuit to check whether the parity function is operating correctly.

**SCKASE bit (RSPCK Auto-Stop Function Enable)**

The SCKASE bit enables or disables the RSPCK auto-stop function. When this function is enabled, the RSPCK clock is stopped before an overrun error occurs, when data is received in master mode. For details, see [section 30.3.9.1. Overrun errors](#).

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | SPPE   | 奇偶校验使能<br>0: 发送数据不添加奇偶校验位, 接收数据不校验校验位<br>1: 当SPCR.TXMD=0: 发送数据添加校验位, 接收数据校验校验位<br>当SPCR.TXMD=1: 添加校验位发送数据但不检查接收数据的奇偶校验位 | R/W |
| 1   | SPOE   | 奇偶校验模式<br>0: 发送和接收选择偶校验<br>1: 发送和接收选择奇校验  | R/W |
| 2   | SPIIE  | SPI空闲中断使能<br>0: 禁用空闲中断请求<br>1: 启用空闲中断请求   | R/W |
| 3   | PTE    | Parity Self-Testing<br>0: 禁用奇偶电路自诊断功能<br>1: 启用奇偶电路自诊断功能   | R/W |
| 4   | SCKASE | RSPCK自动停止功能启用<br>0: 禁用RSPCK自动停止功能<br>1: 启用RSPCK自动停止功能   | R/W |
| 7:5 | —      | 这些位被读取为0。写入值应为0。  | R/W |

**SPPE bit (Parity Enable)**

SPPE位启用或禁用奇偶校验功能。

当SPCR.TXMD位为0且该位为1时, 发送数据添加奇偶校验位, 接收数据执行奇偶校验。

当SPCR.TXMD位为1且该位为1时, 发送数据添加奇偶校验位, 但接收数据不执行奇偶校验。

**SPOE bit (Parity Mode)**

SPOE位指定奇校验或偶校验。

当设置了偶校验时, 执行奇偶校验位相加, 以使发送或接收字符中值为1的总位数加上奇偶校验位为偶数。类似地, 当设置奇校验时, 执行校验位相加, 使得发送或接收字符中值为1的位加上奇偶校验位的总数为奇数。

SPOE位仅在SPPE位为1时有效。

**SPIIE位 (SPI空闲中断允许)**

当在SPI中检测到空闲状态并且SPSR.IDLNF标志清除设置为0时, SPIIE位启用或禁用SPI空闲中断请求的生成。

**PTE bit (Parity Self-Testing)**

PTE位启用奇偶校验电路的自诊断, 以检查奇偶校验功能是否正常运行。

**SCKASE位 (RSPCK自动停止功能使能)**

SCKASE位启用或禁用RSPCK自动停止功能。启用此功能后, 在主机模式下接收数据时, RSPCK时钟会在发生溢出错误之前停止。有关详细信息, 请参见第30.3.9.1节。溢出错误。

## 30.2.14 SPCMDm : SPI Command Register m (m = 0 to 7)

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 15  | SCKDEN | RSPCK Delay Setting Enable<br>0: Select RSPCK delay of 1 RSPCK<br>1: Select RSPCK delay equal to the setting in the SPI Clock Delay Register (SPCKD) | R/W |

The SPCMDm registers specify the transfer format for the SPI in master mode. Each channel has eight SPCMDm (m = 0 to 7). Some of the bits in the SPCMD0 registers are used to set the transfer mode for the SPI in slave mode. The SPI in master mode sequentially references the SPCMDm registers based on the settings in the SPSCR.SPSSLN[2:0] bits and executes the serial transfer that is set in the referenced SPCMDm registers.

Set the SPCMDm registers while the transmit buffer is empty (SPSR.SPTEF is 1 and data for the next transfer is not set) and before the setting of the data to be transmitted when that SPCMDm registers is referenced.

The SPCMDm registers referenced by the SPI in master mode can be checked by means of the SPSSR.SPCP[2:0] bits.

#### CPHA bit (RSPCK Phase Setting)

The CPHA bit selects the RSPCK phase of the SPI in master or slave mode. Data communications between SPI modules require the same RSPCK phase setting between the modules.

#### CPOL bit (RSPCK Polarity Setting)

The CPOL bit selects the RSPCK polarity of the SPI in master or slave mode. Data communications between SPI modules require the same RSPCK polarity setting between the modules.

#### BRDV[1:0] bits (Bit Rate Division Setting)

The BRDV[1:0] bits determine the bit rate in combination with the settings in the SPBR register. (see [section 30.2.8. SPBR : SPI Bit Rate Register](#)). The SPBR settings determine the base bit rate. The BRDV[1:0] setting selects the bit rate obtained by dividing the base bit rate by 1, 2, 4, or 8. Different BRDV[1:0] bit settings can be specified in the SPCMD0 register. This enables execution of serial transfers at different bit rates for each command.

#### SSLA[2:0] bits (SSL Signal Assertion Setting)

The SSLA[2:0] bits control the SSLni signal assertion when the SPI performs serial transfers in master mode. When an SSLni signal is asserted, its polarity is determined by the value set in the associated SSLP. When the SSLA[2:0] bits are set to 000b in multi-master mode, serial transfers are performed with all the SSL signals in the negated state (as the SSLn0 pin acts as input).

When using the SPI in slave mode, set the SSLA[2:0] bits to 000b.

#### SSLKP bit (SSL Signal Level Keeping)

When the SPI in master mode performs a serial transfer, the SSLKP bit specifies whether the SSLni signal level for the current command is to be kept or negated between the SSL negation associated with the current command and the SSL assertion associated with the next command. Setting the SSLKP bit to 1 enables a burst transfer. For details, see [section 30.3.11.1. Master mode operation](#). When using the SPI in slave mode, set the SSLKP bit to 0.

#### SPB[3:0] bits (SPI Data Length Setting)

The SPB[3:0] bits specify the transfer data length for the SPI in master or slave mode.

#### LSBF bit (SPI LSB First)

The LSBF bit specifies the data format of the SPI in master or slave mode to MSB-first or LSB-first.

#### SPNDEN bit (SPI Next-Access Delay Enable)

The SPNDEN bit specifies the next-access delay, the period from the time the SPI in master mode terminates a serial transfer and sets the SSLni signal inactive until the SPI enables the SSLni signal assertion for the next access. If the SPNDEN bit is 0, the SPI sets the next-access delay to 1 RSPCK + 2 PCLKA. If the SPNDEN bit is 1, the SPI inserts a next-access delay according to the SPND setting.

When using the SPI in slave mode, set the SPNDEN bit to 0.

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 15  | SCKDEN | RSPCK延迟设置启用<br>0: 选择RSPCK延迟为1RSPCK1: 选择RSPCK延迟等于SPI时钟延迟寄存器(SPCKD)中的设置 | R/W |

SPCMDm寄存器指定主模式下SPI的传输格式。每个通道有8个SPCMDm (m=0到7)。SPCMD0寄存器中的一些位用于设置SPI在从机模式下的传输模式。主机模式下的SPI根据SPSCR.SPSSLN[2:0]位中的设置顺序引用SPCMDm寄存器，并执行在引用的SPCMDm寄存器中设置的串行传输。

在发送缓冲区为空时 (SPSR.SPTEF为1且未设置下一次传输的数据) 和设置要发送的数据之前，当引用该SPCMDm寄存器时设置SPCMDm寄存器。

SPI在主模式下引用的SPCMDm寄存器可以通过SPSSR.SPCP[2:0]位进行检查。

#### CPHA位 (RSPCK相位设置)

CPHA位在主模式或从模式下选择SPI的RSPCK相位。SPI模块之间的数据通信需要模块之间相同的RSPCK相位设置。

#### CPOL位 (RSPCK极性设置)

CPOL位在主模式或从模式下选择SPI的RSPCK极性。SPI模块之间的数据通信要求模块之间的RSPCK极性设置相同。

#### BRDV[1:0]位 (比特率划分设置)

BRDV[1:0]位结合SPBR寄存器中的设置确定比特率。(参见第30.2.8节。SPBR: SPI比特率寄存器)。SPBR设置决定了基本比特率。BRDV[1:0]设置选择通过将基本比特率除以1、2、4或8获得的比特率。可以在SPCMD0寄存器中指定不同的BRDV[1:0]位设置。这使得每个命令能够以不同的比特率执行串行传输。

#### SSLA[2:0]位 (SSL信号断言设置)

当SPI在主模式下执行串行传输时，SSLA[2:0]位控制SSLni信号断言。当一个SSLni信号被置位，其极性由相关SSLP中设置的值确定。当SSLA[2:0]位在多主机模式下设置为000b时，串行传输在所有SSL信号处于否定状态时执行 (因为SSLn0引脚用作输入)。

在从机模式下使用SPI时，将SSLA[2:0]位设置为000b。

#### SSLKP位 (SSL信号电平保持)

当主模式的SPI执行串行传输时，SSLKP位指定当前命令的SSLni信号电平是在与当前命令关联的SSL否定和与下一个命令关联的SSL断言之间保持还是否定。将SSLKP位设置为1可启用突发传输。有关详细信息，请参阅第30.3.11.1节。主模式操作。在从机模式下使用SPI时，将SSLKP位设置为0。

#### SPB[3:0]位 (SPI数据长度设置)

SPB[3:0]位指定SPI在主模式或从模式下的传输数据长度。

#### LSBF bit (SPI LSB First)

LSBF位指定SPI在主模式或从模式下的数据格式为MSB优先或LSB优先。

#### SPNDEN位 (SPI下一次访问延迟使能)

SPNDEN位指定下一次访问延迟，即从主模式下的SPI终止串行传输并将SSLni信号设置为无效到SPI为下一次访问启用SSLni信号断言的时间段。如果SPNDEN位为0，则SPI将下一次访问延迟设置为1RSPCK+2PCLKA。如果SPNDEN位为1，则SPI根据SPND设置插入下一次访问延迟。

在从机模式下使用SPI时，将SPNDEN位设置为0。

**SLNDEN bit (SSL Negation Delay Setting Enable)**

The SLNDEN bit specifies the SSL negation delay, the period from the time the SPI in master mode stops RSPCK oscillation until the SPI sets the SSLni signal to inactive. If the SLNDEN bit is 0, the SPI sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, the SPI negates the SSL signal at the SSL negation delay according to the SSLND setting.

When using the SPI in slave mode, set the SLNDEN bit to 0.

**SCKDEN bit (RSPCK Delay Setting Enable)**

The SCKDEN bit specifies the SPI clock delay, the period from the point when the SPI in master mode asserts the SSLni signal until the RSPCK starts oscillation. If the SCKDEN bit is 0, the SPI sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, the SPI starts the oscillation of RSPCK at an RSPCK delay according to the SPCKD setting.

When using the SPI in slave mode, set the SCKDEN bit to 0.

**30.2.15 SPDCR2 : SPI Data Control Register 2**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x20

|                    |   |   |   |   |   |   |      |      |
|--------------------|---|---|---|---|---|---|------|------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1    | 0    |
| Bit field:         | — | — | — | — | — | — | SINV | BYSW |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0    | 0    |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | BYSW   | Byte Swap Operating Mode Select<br>0: Byte Swap OFF<br>1: Byte Swap ON       | R/W |
| 1   | SINV   | Serial Data Invert Bit<br>0: Not invert serial data<br>1: Invert serial data | R/W |
| 7:2 | —      | These bits are read as 0. The write value should be 0.                       | R/W |

SPI Data Control Register 2 (SPDCR2) is the setting register, that is to swap a transmit/receive data in byte units and to invert serial data. If these bits are modified while the SPI in slave mode is enabled (SPCR.SPE = 1), subsequent operation is not guaranteed.

**BYSW bit (Byte Swap Operating Mode Select)**

It is a setting bit, that is to swap a transmit/receive data in byte units. When byte access is valid (SPDCR.SPBYT = 1), byte swap is invalid. When byte swap is valid, parity function must be invalid (SPCR2.SPPE bit = 0). Setting change of BYSW bit must be SPCR.SPE bit = 0.

A data after byte swap is different by a data length (setting of SPCMD.SPB[3:0]).

When byte swap, A data length (setting of SPB[3:0]) must be set to 32 bit or 16bit. Other case of data length (that is 8 to 15, 20, 24 bit length), byte swap is not guaranteed. Before swap and after swap are shown below (length data (32 bit/16 bit)).

- Length data 32 bits (SPB[3:0] = 0010b or 0011b)  
Before swap: [31:24] [23:16] [15:8] [7:0]  
After swap: [7:0] [15:8] [23:16] [31:24]
- Length data 16 bit (SPB[3:0] = 1111b)  
Before swap: [31:24] [23:16]  
After swap: [23:16] [31:24]

When byte access mode (SPDCR.SPBT = 1), byte swap setting is invalid.

When byte swap is valid, set parity function to invalid (SPCR2.SPPE = 0). When the parity function set to valid, the behavior is not guaranteed.

**SLNDEN位 (SSL否定延迟设置启用)**

SLNDEN位指定SSL否定延迟，即从主模式下的SPI停止RSPCK振荡到SPI将SSLni信号设置为无效的时间段。如果SLNDEN位为0，则SPI将SSL否定延迟设置为1RSPCK。如果SLNDEN位为1，则SPI根据SSLND设置在SSL否定延迟时否定SSL信号。

在从机模式下使用SPI时，将SLNDEN位设置为0。

**SCKDEN位 (RSPCK延迟设置使能)**

SCKDEN位指定SPI时钟延迟，即从主模式下的SPI断言SSLni信号到RSPCK开始振荡的周期。如果SCKDEN位为0，则SPI将RSPCK延迟设置为1RSPCK。如果SCKDEN位为1，则SPI根据SPCKD设置以RSPCK延迟启动RSPCK的振荡。

在从机模式下使用SPI时，将SCKDEN位设置为0。

**30.2.15 SPDCR2:SPI数据控制寄存器2**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x20

|               |   |   |   |   |   |   |      |      |
|---------------|---|---|---|---|---|---|------|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1    | 0    |
| Bit field:    | — | — | — | — | — | — | SINV | BYSW |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0    | 0    |

| Bit | Symbol | Function                              | R/W |
|-----|--------|---------------------------------------|-----|
| 0   | BYSW   | 字节交换操作模式选择<br>0: 字节交换关闭1<br>1: 字节交换开启 | R/W |
| 1   | SINV   | 串行数据反转位<br>0: 不反转串行数据1:<br>反转串行数据     | R/W |
| 7:2 | —      | 这些位被读取为0。写入值应为0。                      | R/W |

SPI数据控制寄存器2(SPDCR2)是设置寄存器，即以字节为单位交换发送接收数据和反转串行数据。如果在使能从模式下的SPI(SPCR.SPE=1)时修改这些位，则无法保证后续操作。

**BYSW位 (字节交换操作模式选择)**

它是一个设置位，即以字节为单位交换一个发送接收数据。当字节访问有效时 (SPDCR.SPBYT=1)，字节交换无效。当字节交换有效时，奇偶校验功能必须无效 (SPCR2.SPPE位=0)。BYSW位的设置更改必须是SPCR.SPE位=0。

字节交换后的数据因数据长度不同 (SPCMD.SPB[3:0]的设置)。

字节交换时，A数据长度 (SPB[3:0]的设置) 必须设置为32位或16位。其他数据长度情况 (即8到15、20、24位长度)，不保证字节交换。交换前和交换后如下所示 (长度数据 (32位16位))。

- 长度数据32位 (SPB[3:0]=0010b或0011b)  
Before swap: [31:24] [23:16] [15:8] [7:0]  
After swap: [7:0] [15:8] [23:16] [31:24]
- 长度数据16位 (SPB[3:0]=1111b)  
Before swap: [31:24] [23:16]  
After swap: [23:16] [31:24]

当字节访问模式 (SPDCR.SPBT=1) 时，字节交换设置无效。

当字节交换有效时，将奇偶校验功能设置为无效 (SPCR2.SPPE=0)。当奇偶校验函数设置为有效时，行为不被保证。

**SINV bit (Serial Data Invert Bit)**

This bit is used to invert transmit data and receive data.

When the SINV bit is set to 1, transmit buffer (SPTX) data is inverted to invert transmit data and receive data, and then the inverted data is stored in the receive buffer (SPRX). The parity bit is the value corresponding to the inverted transmission/reception data.

**30.2.16 SPCR3 : SPI Control Register 3**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x21

|                    |   |   |   |            |   |   |      |       |
|--------------------|---|---|---|------------|---|---|------|-------|
| Bit position:      | 7 | 6 | 5 | 4          | 3 | 2 | 1    | 0     |
| Bit field:         | — | — | — | CENDI<br>E | — | — | BFDS | ETXMD |
| Value after reset: | 0 | 0 | 0 | 0          | 0 | 0 | 0    | 0     |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | ETXMD  | Extended Communication Mode Select<br>0: Full-duplex synchronous or transmit-only serial communications. [the SPCR.TXMD bit is enabled]<br>1: Receive-only serial communications in slave mode (SPCR.MSTR bit = 0). [the SPCR.TXMD bit is disabled]<br>Setting is prohibited in master mode (SPCR.MSTR bit = 1). | R/W |
| 1   | BFDS   | Between Burst Transfer Frames Delay Select<br>0: Delay (RSPCK delay, SSL negation delay and next-access delay) between frames is inserted in burst transfer.<br>1: Delay between frames is not inserted in burst transfer.   | R/W |
| 3:2 | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 4   | CENDIE | RSPI Communication End Interrupt Enable<br>0: Communication end interrupt request is disabled.<br>1: Communication end interrupt request is enabled.   | R/W |
| 7:5 | —      | These bits are read as 0. The write value should be 0.   | R/W |

SPI control register 3 (SPCR3) is control register for operation mode. If you change the value of ETXMD and BFDS when the SPCR.SPE bit is 1, the SPI operation does not guarantee.

**ETXMD bit (Extended Communication Mode Select)**

This bit is valid on slave mode only (the SPCR.MSTR bit is 0). This bit select receive only operation. When the ETXMD bit is 1 on slave mode, the communication is only received not transmit (see [section 30.3.6. Data Transfer Modes](#)). When the ETXMD is 1, transmit data empty interrupt can not be used.

The communication state by each mode (master mode, slave mode) is shown as below. It is controlled by the ETXMD bit, the SPCR.MSTR bit and the TXMD bit.

**Table 30.4 RSPI communication state (master/slave mode)**

| SPCR.MSTR bit | SPCR3.ETXMD bit | SPCR.TXMD bit | Communication state                   |
|---------------|-----------------|---------------|---------------------------------------|
| 1             | 0               | 0             | Transmit-receive master mode          |
| 1             | 0               | 1             | Transmit master mode                  |
| 0             | 0               | 0             | Transmit-receive slave mode (default) |
| 0             | 0               | 1             | Transmit slave mode                   |
| 0             | 1               | —             | Receive slave mode                    |

**BFDS bit (Between Burst Transfer Frames Delay Select)**

This bit controls whether insert the delay time between the burst transfer frames.

This bit is valid when the SPCMD.SSLKP bit is 1 in master mode (the SPCR.MSTR bit is 1).

**SINV位 (串行数据反转位)**

该位用于反转发送数据和接收数据。

当SINV位设置为1时，发送缓冲器(SPTX)数据反转以反转发送数据和接收数据，然后将反转的数据存储在接收缓冲器(SPRX)中。奇偶校验位是对应于反转的发送接收数据的值。

**30.2.16 SPCR3：SPI控制寄存器3**

Base address: SPI0 = 0x4011\_A000

Offset address: 0x21

|               |   |   |   |            |   |   |      |       |
|---------------|---|---|---|------------|---|---|------|-------|
| Bit position: | 7 | 6 | 5 | 4          | 3 | 2 | 1    | 0     |
| Bit field:    | — | — | — | CENDI<br>E | — | — | BFDS | ETXMD |
| 重置后的值:        | 0 | 0 | 0 | 0          | 0 | 0 | 0    | 0     |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | ETXMD  | 扩展通信模式选择<br>0: 全双工同步或仅传输串行通信。[启用SPCR.TXMD位]<br>1: 从机模式下仅接收串行通信 (SPCR.MSTR位=0)。[SPCR.TXMD位禁用]主机模式下禁止设置 (SPCR.MSTR位=1)。 | R/W |
| 1   | BFDS   | 突发传输帧之间延迟选择<br>0: 在突发传输中插入帧之间的延迟 (RSPCK延迟、SSL否定延迟和下一次访问延迟)。<br>1: 突发传输中不插入帧间延迟。                                       | R/W |
| 3:2 | —      | 这些位被读取为0。写入值应为0。  | R/W |
| 4   | CENDIE | RSPI通信结束中断使能<br>0: 禁止通讯结束中断请求。1: 使能通信结束中断请求。  | R/W |
| 7:5 | —      | 这些位被读取为0。写入值应为0。  | R/W |

SPI控制寄存器3(SPCR3)是操作模式的控制寄存器。如果在SPCR.SPE位为1时更改ETXMD和BFDS的值，则SPI操作不保证。

**ETXMD位 (扩展通信模式选择)**

该位仅在从模式下有效 (SPCR.MSTR位为0)。该位选择只接收操作。当ETXMD位在从机模式下为1时，通信只接收不发送 (参见第30.3.6节。数据传输模式)。当ETXMD为1时，不能使用发送数据空中断。

各模式 (主模式、从模式) 的通信状态如下所示。它由ETXMD位、SPCR.MSTR位和TXMD位控制。

**Table 30.4 RSPI通信状态 (主从模式)**

| SPCR.MSTR bit | SPCR3.ETXMD bit | SPCR.TXMD bit | 通讯状态         |
|---------------|-----------------|---------------|--------------|
| 1             | 0               | 0             | 收发主模式        |
| 1             | 0               | 1             | 传输主模式        |
| 0             | 0               | 0             | 发送接收从模式 (默认) |
| 0             | 0               | 1             | 传输从模式        |
| 0             | 1               | —             | 接收从机模式       |

**BFDS位 (突发传输帧之间延迟选择)**

该位控制是否在突发传输帧之间插入延迟时间。

当SPCMD.SSLKP位在主机模式下为1 (SPCR.MSTR位为1) 时，该位有效。

This bit should be set to 0 in slave mode. The usage of SSL delay control between transfer frames is shown as below. See (4)Burst transfers in detail.

**Table 30.5 Usage of SSL delay control between transfer frames (Master mode)**

| Transmit                                    |   | SPCMD.SSLK P bit | SPCR3.BFDS bit | SSL delay control register*1 (RSPCK clock delay, SSL negation delay, next access delay)   |
|---|---|------------------|----------------|---|
| Non-burst transmit                          |   | 0                | 0              | Any given value. You can control each delay value according to setting for RSPCK clock delay, SSL negation delay and next access delay.   |
| Burst transmit with delay between frames    | From the 1st frame to the last previous frame | 1                | 0              |   |
|   | The last frame                                | 0                | 0              |   |
| Burst transmit with no delay between frames | From the 1st frame to the last previous frame | 1                | 1              | Any given value. But delay is inserted only below. <ul style="list-style-type: none"> <li>RSPCK clock delay of the 1st frame</li> <li>SSL negation delay and next access delay of the last frame</li> </ul> |
|   | The last frame                                | 0                | 1              |   |

Note 1. Whether the setting value of following bits are valid or not depends on the setting value of the SPCMD.SPNDEN bit (see section 30.2.14. SPCMDm : SPI Command Register m (m = 0 to 7)).  
The SPCKD.SCKDL[2:0] bits: RSPCK delay  
The SSLND.SLNDL[2:0] bits: SSL negate delay  
The SPND.SPNDL[2:0] bits: Next access delay

#### CENDIE bit (RSPI Communication End Interrupt Enable)

This bit controls generation of a communication end interrupt request.

### 30.3 Operation

In this section, the serial transfer period refers to the period from the beginning of driving valid data to the fetching of the final valid data.

#### 30.3.1 Overview of SPI Operation

The SPI is capable of synchronous serial transfers in the following modes:

- Slave mode (SPI operation)
- Single master mode (SPI operation)
- Multi-master mode (SPI operation)
- Slave mode (clock synchronous operation)
- Master mode (clock synchronous operation)

The SPI mode can be selected by using the MSTR, MODFEN, and SPMS bits in SPCR. Table 30.6 lists the relationship between SPI modes and SPCR settings, and a description of each mode.

**Table 30.6 Relationship between SPCR settings and SPI modes (1 of 2)**

| Mode               | Slave (SPI operation) | Single-master (SPI operation) | Multi-master (SPI operation) | Slave (clock synchronous operation) | Master (clock synchronous operation) |
|--------------------|-----------------------|-------------------------------|------------------------------|-------------------------------------|--------------------------------------|
| MSTR bit setting   | 0                     | 1                             | 1                            | 0                                   | 1                                    |
| MODFEN bit setting | 0 or 1                | 0                             | 1                            | 0                                   | 0                                    |
| SPMS bit setting   | 0                     | 0                             | 0                            | 1                                   | 1                                    |
| RSPCKn pins        | Input                 | Output                        | Output/Hi-Z                  | Input                               | Output                               |
| MOSIn pin          | Input                 | Output                        | Output/Hi-Z                  | Input                               | Output                               |
| MISOOn pin         | Output/Hi-Z           | Input                         | Input                        | Output                              | Input                                |

在从机模式下，该位应设置为0。传输帧之间的SSL延迟控制的使用如下所示。详见(4)突发传输。

**Table 30.5 传输帧之间使用SSL延迟控制（主模式）**

| Transmit           |           | SPCMD.SSLK P bit | SPCR3.BFDS bit | SSL延迟控制寄存器*1 (RSPCK时钟延迟、SSL否定延迟、下一次访问延迟)                       |
|--------------------|-----------|------------------|----------------|--|
| Non-burst transmit |           | 0                | 0              | 任何给定的值。您可以根据对RSPCK时钟延迟、SSL否定延迟和下一次访问延迟的设置来控制每个延迟值。             |
| 帧之间有延迟的突发传输        | 从第一帧到最后一帧 | 1                | 0              |  |
|                    | 最后一帧      | 0                | 0              |  |
| 帧间无延迟的突发传输         | 从第一帧到最后一帧 | 1                | 1              | 任何给定的值。但是延迟只在下面插入。●<br>第一帧的RSPCK时钟延迟<br>● 最后一帧的SSL否定延迟和下一次访问延迟 |
|                    | 最后一帧      | 0                | 1              |  |

注1.以下位的设置值是否有效取决于SPCMD.SPNDEN位的设置值（参见第30.2.14节。SPCMDm：SPI命令寄存器m（m=0至7））。SPCKD.SCKDL[2:0]位：RSPCK延迟

SSLND.SLNDL[2:0]位：SSL否定延迟SPND.SPNDL[2:0]位：下一次访问延迟

#### CENDIE位（RSPI通信结束中断使能）

该位控制通信结束中断请求的产生。

### 30.3 Operation

在本节中，串行传输周期是指从开始驱动有效数据到获取最终有效数据的周期。

#### 30.3.1 SPI操作概述

SPI能够在以下模式下进行同步串行传输：

- 从机模式（SPI操作）
- 单主模式（SPI操作）
  - Multi-master mode (SPI operation)
- 从机模式（时钟同步操作）
- 主模式（时钟同步操作）

可以使用SPCR中的MSTR、MODFEN和SPMS位选择SPI模式。表30.6列出了SPI模式和SPCR设置之间的关系，以及每种模式的说明。

**Table 30.6 SPCR设置和SPI模式之间的关系(1 of 2)**

| Mode        | Slave (SPI operation) | Single-master (SPI operation) | Multi-master (SPI operation) | 从机（时钟同步操作） | 主控（时钟同步操作） |
|-------------|-----------------------|-------------------------------|------------------------------|------------|------------|
| MSTR位设置     | 0                     | 1                             | 1                            | 0          | 1          |
| MODFEN位设置   | 0 or 1                | 0                             | 1                            | 0          | 0          |
| SPMS位设置     | 0                     | 0                             | 0                            | 1          | 1          |
| RSPCKn pins | Input                 | Output                        | Output/Hi-Z                  | Input      | Output     |

| Underrun error detection        | Supported <sup>5</sup>                | Not supported   | Not supported   | Supported <sup>5</sup>              | Not supported   |

Note 1. This function is not supported in this mode.

Note 2. When the SPCR.TXMD bit is 1, detection of receiver buffer full, overrun error, and parity error are not performed.

Note 3. When the SPCR2.SPPE bit is 0, parity error detection is not performed.

Note 4. When the SPCR2.SCKASE bit is 1, overrun error detection does not proceed.

Note 5. When SPI is receive only slave mode, none of transmit buffer empty and underrun error is detected.

### 30.3.2 Controlling the SPI Pins

Based on the settings of the MSTR, MODFEN, and SPMS bits in SPCR and the PmnPFS.NCODR bit for I/O Ports, the SPI can switch pin states. Table 30.7 lists the relationship between pin states and bit settings. Setting the PmnPFS.NCODR bit for an I/O port to 0 selects the CMOS output. Setting it to 1 selects the open-drain output. The I/O port settings must follow this relationship.

Table 30.6 SPCR设置和SPI模式之间的关系(2of2)

| Mode          | Slave (SPI operation)    | Single-master (SPI operation)    | Multi-master (SPI operation)     | 从机 (时钟同步操作)            | 主控 (时钟同步操作)                      |
|---------------|--------------------------|----------------------------------|----------------------------------|------------------------|----------------------------------|

注1.此模式不支持此功能。

注2.当SPCR.TXMD位为1时,不执行接收缓冲区满、溢出错误和奇偶校验错误的检测。

注3.当SPCR2.SPPE位为0时,不执行奇偶校验错误检测。

注4.当SPCR2.SCKASE位为1时,不进行溢出错误检测。

注5.当SPI为仅接收从机模式时,不会检测到发送缓冲区为空和欠载错误。

### 30.3.2 控制SPI引脚

根据SPCR中的MSTR、MODFEN和SPMS位以及IO端口的PmnPFS.NCODR位的设置, SPI可以切换引脚状态。表30.7列出了引脚状态和位设置之间的关系。将IO端口的PmnPFS.NCODR位设置为0可选择CMOS输出。将其设置为1选择开漏输出。IO端口设置必须遵循这种关系。

Table 30.7 Relationship between pin states and bit settings

| Mode   | Pin                            | Pin state*2                        |                                    |
|--|--------------------------------|------------------------------------|------------------------------------|
|  |                                | PmnPFS.NCODR bit for I/O ports = 0 | PmnPFS.NCODR bit for I/O ports = 1 |

|  | MISO <sub>n</sub>              | CMOS output                        | Open-drain output                  |

Note 1. This function is not supported in this mode.

Note 2. SPI settings are not reflected in multiplexed pins for which the SPI function is not selected.

Note 3. When SSLn0 is at the active level, the pin state is Hi-Z. Whether or not the input signal is at the active level determines the setting of the SSLP.SSL0P bit.

Note 4. When SSLn0 is at the non-active level or the SPCR.SPE bit is 0, the pin state is Hi-Z. Whether or not the input signal is at the active level determines the setting of the SSLP.SSL0P bit.

Note 5. These pins are available for use as I/O port pins.

The SPI in single-master mode (SPI operation) or multi-master mode (SPI operation) determines the MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) based on the MOIFE and MOIFV bit settings in SPPCR, as listed in Table 30.8.

Table 30.8 MOSI signal value determination during SSL negation

| MOIFE bit | MOIFV bit | MOSIn signal value during SSL negation |
|-----------|-----------|--|
| 0         | 0, 1      | Final data from previous transfer      |
| 1         | 0         | Low                                    |
| 1         | 1         | High                                   |

Table 30.7 引脚状态和位设置之间的关系

| Mode   | Pin                            | 引脚状态*2               |                        |

|  | MOSIn                          | Input                | Input                  |
|  | MISO <sub>n</sub>              | CMOS output          | Open-drain output      |

注1.此模式不支持此功能。

注2.SPI设置不反映在未选择SPI功能的复用引脚中。

注3.当SSLn0处于有效电平时，引脚状态为Hi-Z。输入信号是否处于活动电平决定SSLP.SSL0P位的设置。

注4.当SSLn0处于无效电平或SPCR.SPE位为0时，引脚状态为Hi-Z。输入信号是否处于活动电平决定SSLP.SSL0P位的设置。

注5.这些引脚可用作IO端口引脚。

单主机模式 (SPI操作) 或多主机模式 (SPI操作) 下的SPI根据中的MOIFE和MOIFV位设置确定SSL否定期间 (包括突发传输期间的SSL保留期间) 的MOSI信号值SPPCR, 如表30.8中所列。

Table 30.8 SSL否定期间的MOSI信号值确定

| MOIFE bit | MOIFV bit | SSL否定期间的MOSIn信号值 |
|-----------|-----------|------------------|
| 0         | 0, 1      | 上次传输的最终数据        |
| 1         | 0         | Low              |
| 1         | 1         | High             |

### 30.3.3 SPI System Configuration Examples

#### 30.3.3.1 Single-master/single-slave with the MCU as a master

Figure 30.5 shows a single-master/single-slave SPI system configuration example where the MCU is used as a master. In the single-master/single-slave configuration, the SSLn<sub>i</sub> outputs of the MCU (master) are not used. The SSL input of the SPI slave is fixed to the low level, and the SPI slave is maintained in the selected state.\*1

Note 1. In the transfer format configured when the SPCMDm.CPHA bit is 0, the SSL signal for some slave devices cannot be fixed to an active level. In this case, always connect the SSLn<sub>i</sub> output of the MCU to the SSL input of the slave device.

The MCU (master) drives the RSPCKn and MOSIn signals. The SPI slave drives the MISO signal.

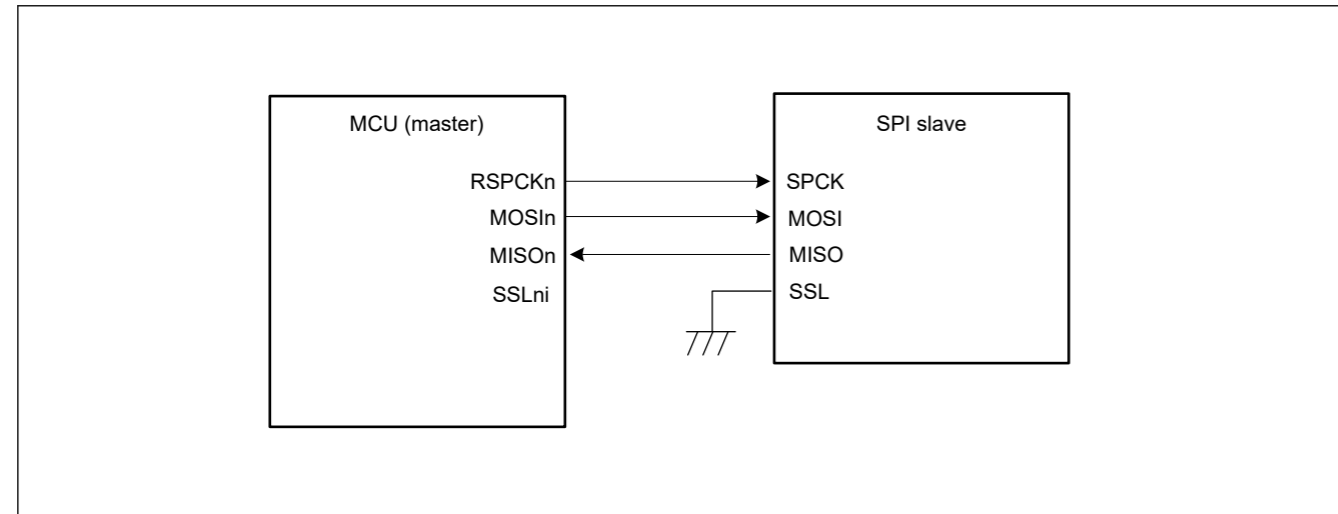

Figure 30.5 Single-master/single-slave configuration example with the MCU as a master

#### 30.3.3.2 Single-master/single-slave with the MCU as a slave

Figure 30.6 shows a single-master/single-slave SPI system configuration example where the MCU is used as a slave. When the MCU operates as a slave, the SSLn<sub>0</sub> pin is used as SSL input. The SPI master drives the RSPCK and MOSI signals. The MCU (slave) drives the MISO signal.\*1

Note 1. When SSLn<sub>0</sub> is at a non-active level, the pin state is Hi-Z.

In the single-slave configuration when the SPCMDm.CPHA bit is set to 1, the SSLn<sub>0</sub> input of the MCU (slave) is fixed to the low level and the MCU (slave) is maintained in the selected state. This enables serial transfer execution (Figure 30.7). However, the communication end interrupt does not output when SSL<sub>0</sub> input is fixed as Figure 30.7.

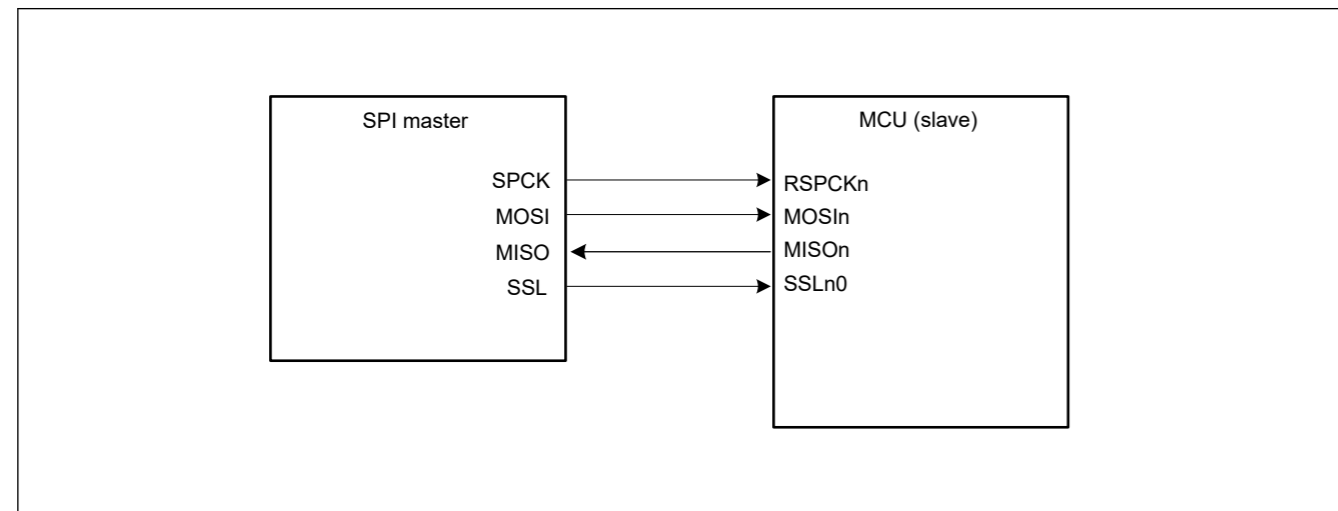

Figure 30.6 Single-master/single-slave configuration example with the MCU as a slave and CPHA = 0

### 30.3.3 SPI系统配置示例

#### 30.3.3.1 单主单从单片机为主

图30.5显示了单主单从SPI系统配置示例，其中MCU用作主机。在单主单从配置中，不使用MCU（主）的SSLn<sub>i</sub>输出。SPI从机的SSL输入固定为低电平，SPI从机保持在选中状态。\*1

注1.在SPCMDm.CPHA位为0时配置的传输格式中，某些从设备的SSL信号不能固定为有效电平。在这种情况下，请始终将MCU的SSLn<sub>i</sub>输出连接到从设备的SSL输入。

MCU（主控）驱动RSPCKn和MOSIn信号。SPI从机驱动MISO信号。

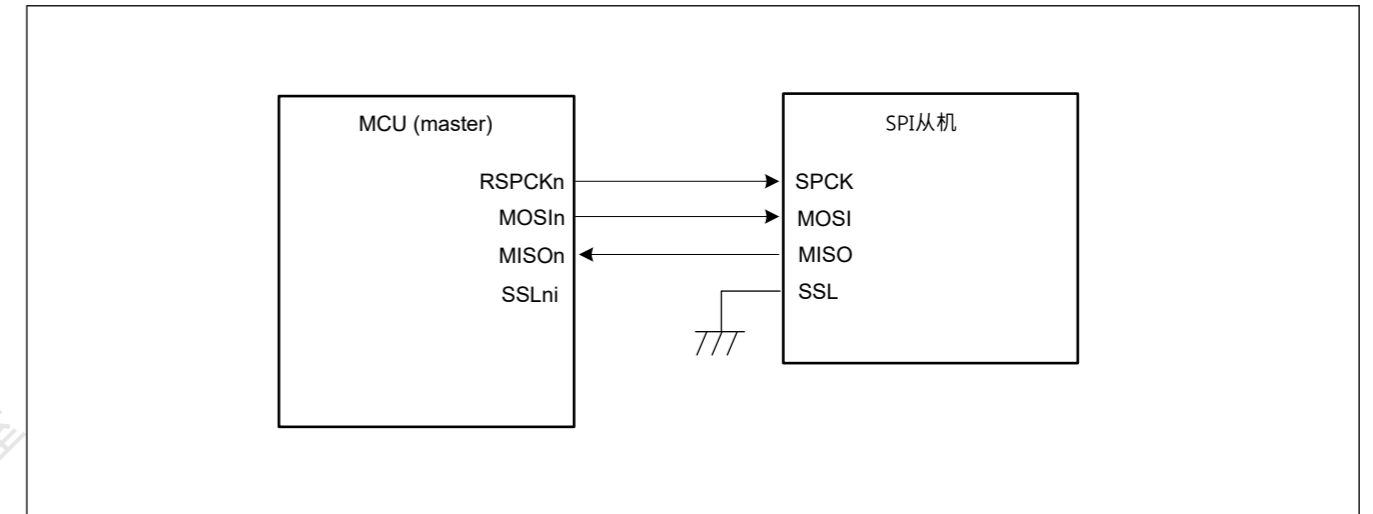

Figure 30.5 MCU为主的单主单从配置示例

#### 30.3.3.2 单主单从单片机作为从机

图30.6显示了单主单从SPI系统配置示例，其中MCU用作从机。当MCU作为从机运行时，SSLn<sub>0</sub>引脚用作SSL输入。SPI主机驱动RSPCK和MOSI信号。MCU（从机）驱动MISO信号。\*1

注1.当SSLn<sub>0</sub>处于非活动电平时，引脚状态为Hi-Z。

在单从机配置中，当SPCMDm.CPHA位设置为1时，MCU（从机）的SSLn<sub>0</sub>输入固定为低电平，MCU（从机）保持在选中状态。这将启用串行传输执行（图30.7）。但是，如图30.7那样固定SSL<sub>0</sub>输入时，不输出通信结束中断。

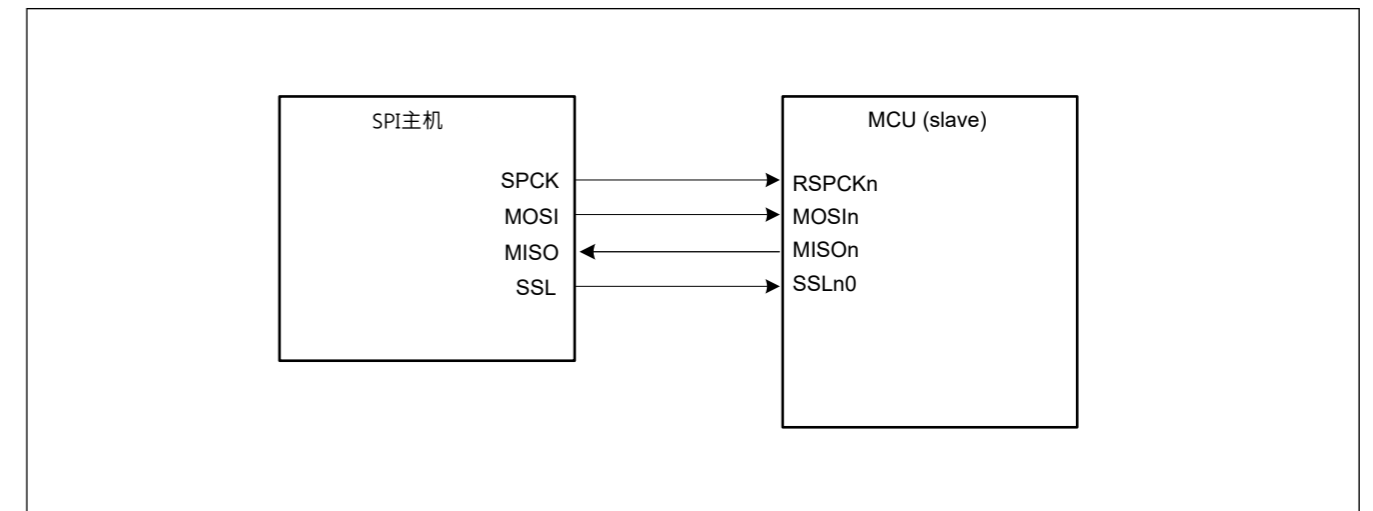

Figure 30.6 单主单从配置示例，单片机作为从机，CPHA=0

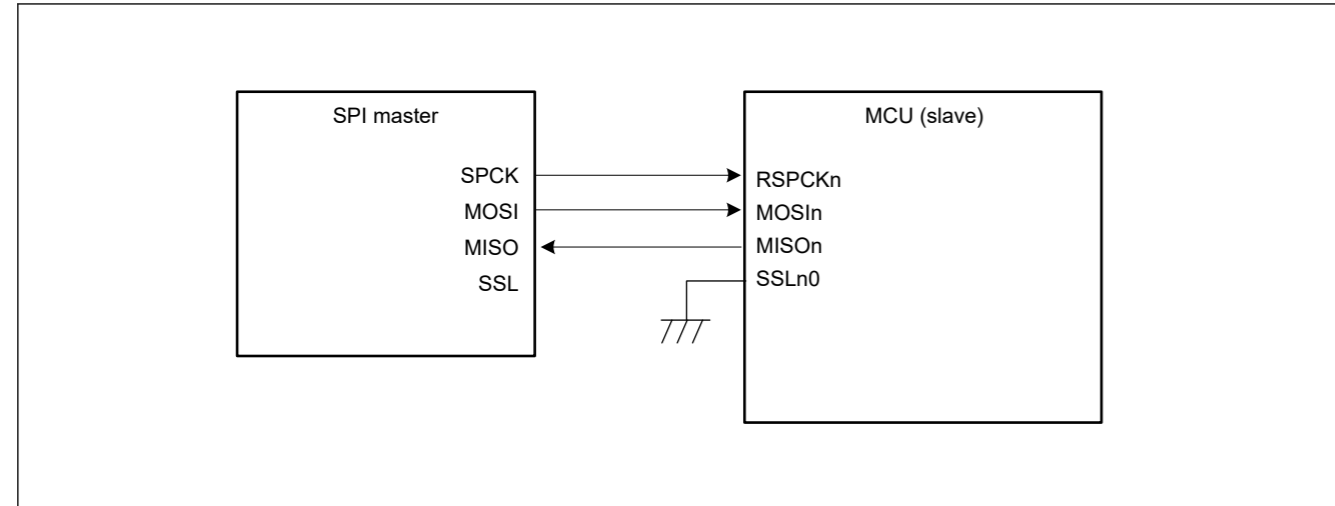

Figure 30.7 Single-master/single-slave configuration example with the MCU as a slave and CPHA = 1

### 30.3.3.3 Single-master/multi-slave with the MCU as a master

Figure 30.8 shows a single-master/multi-slave SPI system configuration example where the MCU is used as a master. In this example, the SPI system includes the MCU (master) and four slaves (SPI slave 0 to SPI slave 3).

The RSPCKn and MOSIn outputs of the MCU (master) are connected to the RSPCK and MOSI inputs of SPI slaves 0 to 3. The MISO outputs of SPI slaves 0 to 3 are all connected to the MISO input of the MCU (master). The SSLn0 to SSLn3 outputs of the MCU (master) are connected to the SSL inputs of SPI slaves 0 to 3, respectively.

The MCU (master) drives the RSPCKn, MOSIn, and SSLn0 to SSLn3 signals. Of the SPI slaves 0 to 3, the slave that receives low-level input into the SSL input drives the MISO signal.

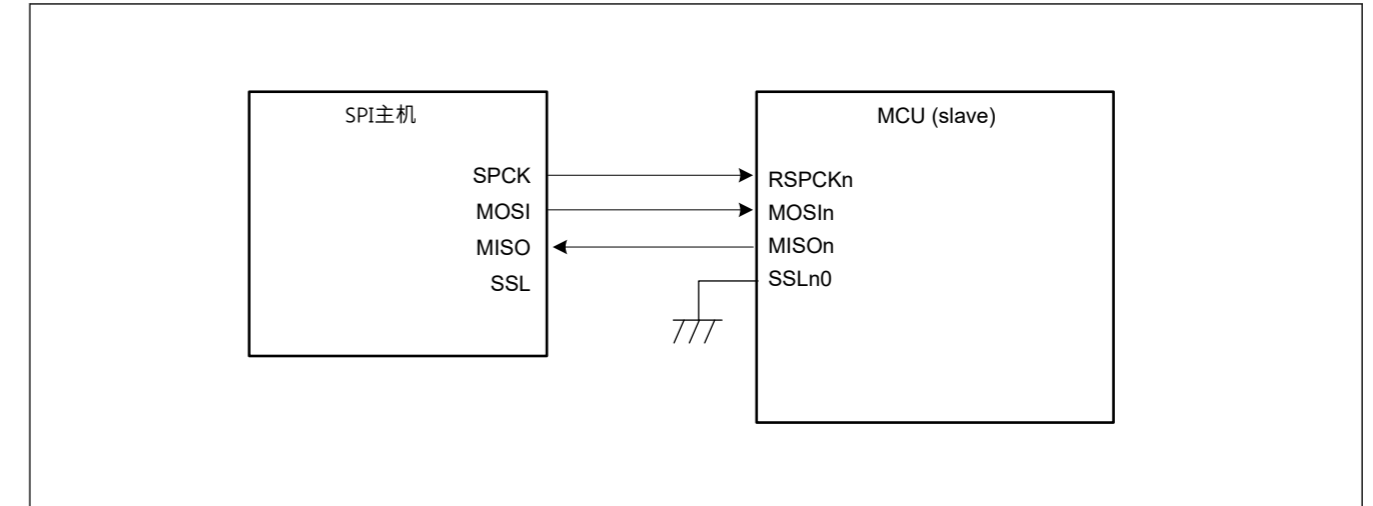

Figure 30.7 MCU作为从机且CPHA=1的单主单从配置示例

### 30.3.3.3 单主多从，单片机为主

图30.8显示了单主多从SPI系统配置示例，其中MCU用作主控。在本例中，SPI系统包括MCU（主机）和四个从机（SPI从机0到SPI从机3）。

MCU（主机）的RSPCKn和MOSIn输出连接到SPI从机0到3的RSPCK和MOSI输入。SPI从机0到3的MISO输出都连接到MCU（主机）的MISO输入。MCU（主机）的SSLn0到SSLn3输出分别连接到SPI从机0到3的SSL输入。

MCU（主控）驱动RSPCKn、MOSIn和SSLn0到SSLn3信号。在SPI从机0到3中，接收到SSL输入的低电平输入的从机驱动MISO信号。

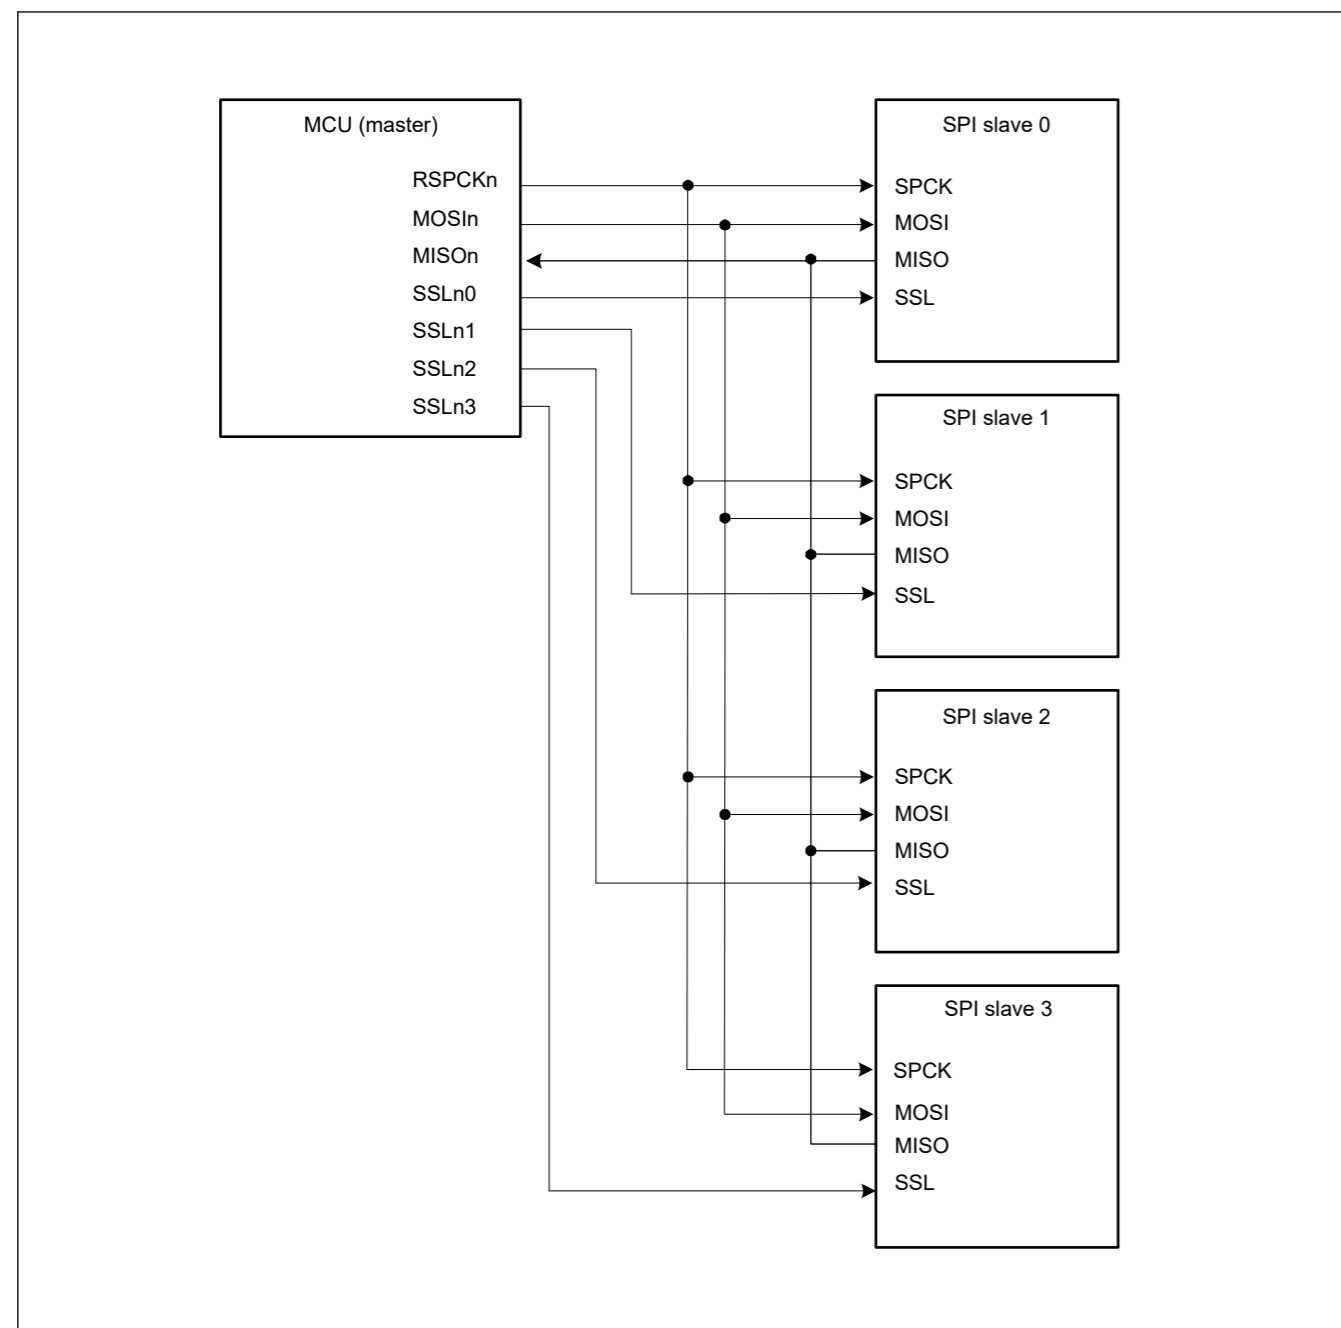

Figure 30.8 Single-master/multi-slave configuration example with the MCU as a master

30.3.3.4 Single-master/multi-slave with the MCU as a slave

Figure 30.9 shows a single-master/multi-slave SPI system configuration example where the MCU is used as a slave. In this example, the SPI system includes an SPI master and two MCUs (slaves X and Y).

The SPCK and MOSI outputs of the SPI master are connected to the RSPCKn and MOSIn inputs of the MCUs (slaves X and Y). The MISO outputs of the MCUs (slaves X and Y) are all connected to the MISO input of the SPI master. The SSLX and SSLY outputs of the SPI master are connected to the SSLn0 inputs of the MCUs (slaves X and Y, respectively).

The SPI master drives the SPCK, MOSI, SSLX, and SSLY signals. Of the MCUs (slaves X and Y), the slave that receives low-level input into the SSLn0 input drives the MISO signal.

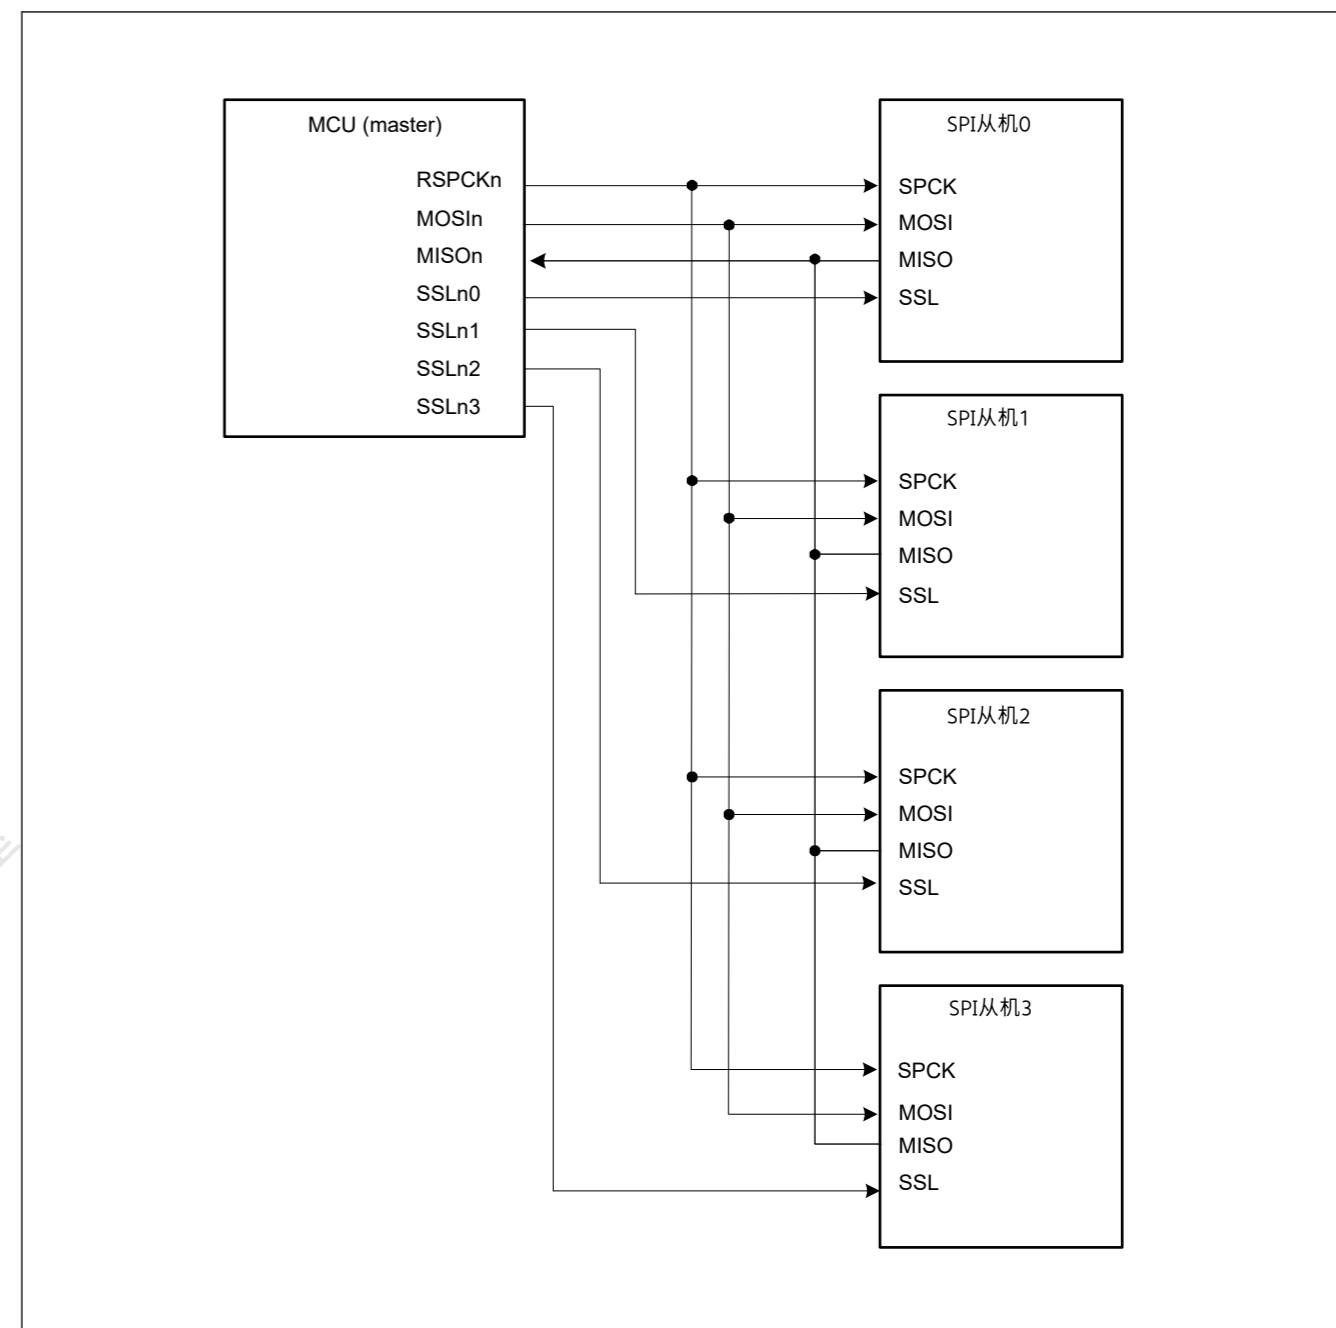

Figure 30.8 MCU为主的单主多从配置示例

30.3.3.4 单主多从，单片机作为从机

图30.9显示了单主多从SPI系统配置示例，其中MCU用作从设备。在本例中，SPI系统包括一个SPI主控和两个MCU（从属X和Y）。

SPI主机的SPCK和MOSI输出连接到MCU（从机X和Y）的RSPCKn和MOSIn输入。MCU（从机X和Y）的MISO输出都连接到SPI主机的MISO输入。SPI主机的SSLX和SSLY输出连接到MCU的SSLn0输入（分别为从机X和Y）。

SPI主机驱动SPCK、MOSI、SSLX和SSLY信号。在MCU（从机X和Y）中，接收到SSLn0输入的低电平输入的从机驱动MISO信号。

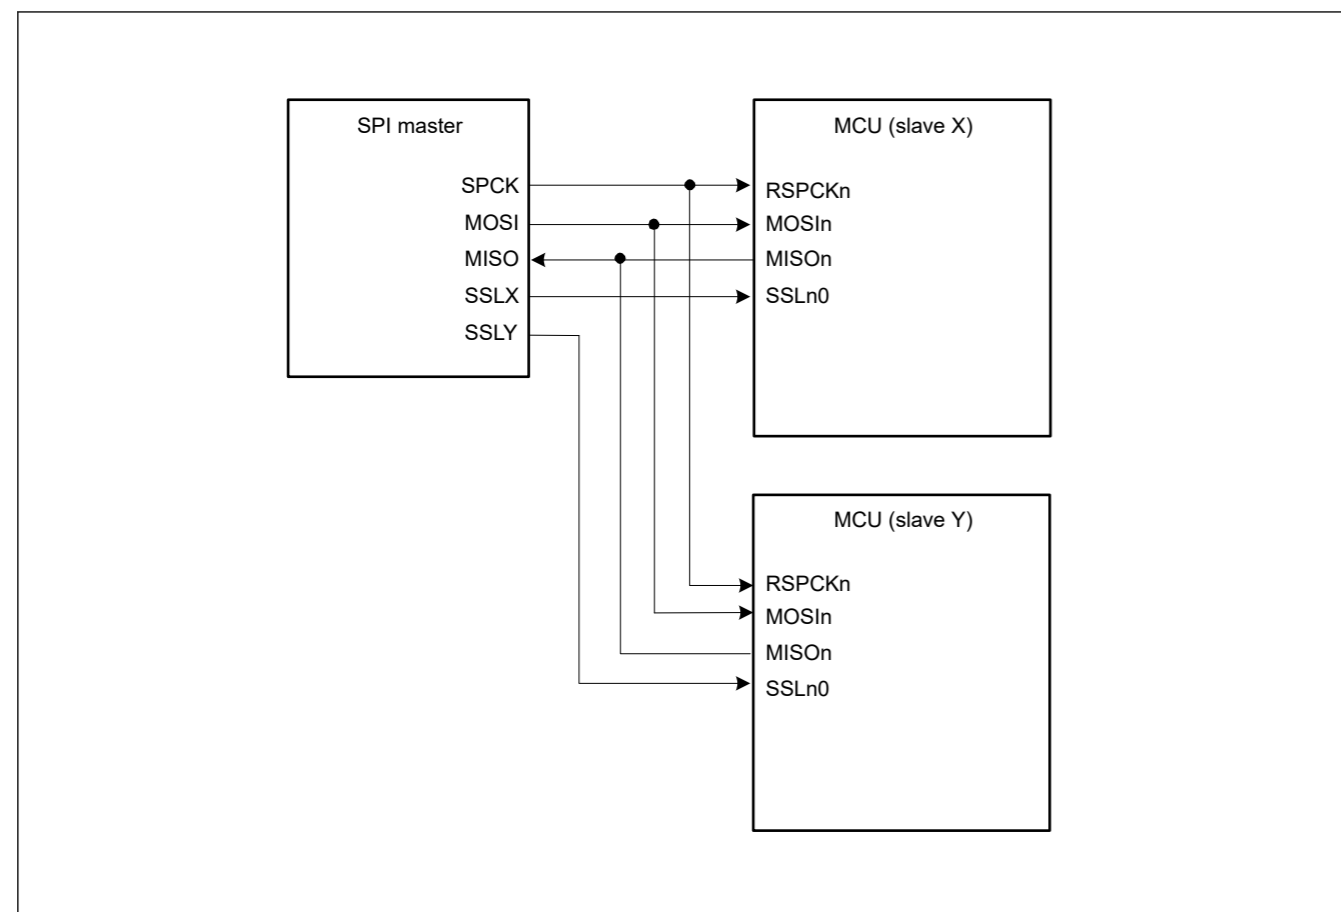

Figure 30.9 Single-master/multi-slave configuration example with the MCU as a slave

### 30.3.3.5 Multi-master/multi-slave with the MCU as a master

Figure 30.10 shows a multi-master/multi-slave SPI system configuration example where the MCU is used as a master. In this example, the SPI system includes two MCUs (masters X and Y) and two SPI slaves (SPI slaves 1 and 2).

The RSPCKn and MOSIn outputs of the MCUs (masters X and Y) are connected to the RSPCK and MOSI inputs of SPI slaves 1 and 2. The MISO outputs of SPI slaves 1 and 2 are connected to the MISOOn inputs of the MCUs (masters X and Y). Any generic port Y output from the MCU (master X) is connected to the SSLn0 input of the MCU (master Y). Any generic port X output of the MCU (master Y) is connected to the SSLn0 input of the MCU (master X). The SSLn1 and SSLn2 outputs of the MCUs (masters X and Y) are connected to the SSL inputs of the SPI slaves 1 and 2. In this configuration example, because the system can be comprised solely of SSLn0 input, and SSLn1 and SSLn2 outputs for slave connections, the SSLn3 output of the MCU is not required.

The MCU drives the RSPCKn, MOSIn, SSLn1, and SSLn2 signals when the SSLn0 input level is high. When the SSLn0 input level is low, the MCU detects a mode fault error, sets RSPCKn, MOSIn, SSLn1, and SSLn2 to Hi-Z, and releases the SPI bus directly to the other master. Of the SPI slaves 1 and 2, the slave that receives low-level input into the SSL input drives the MISO signal.

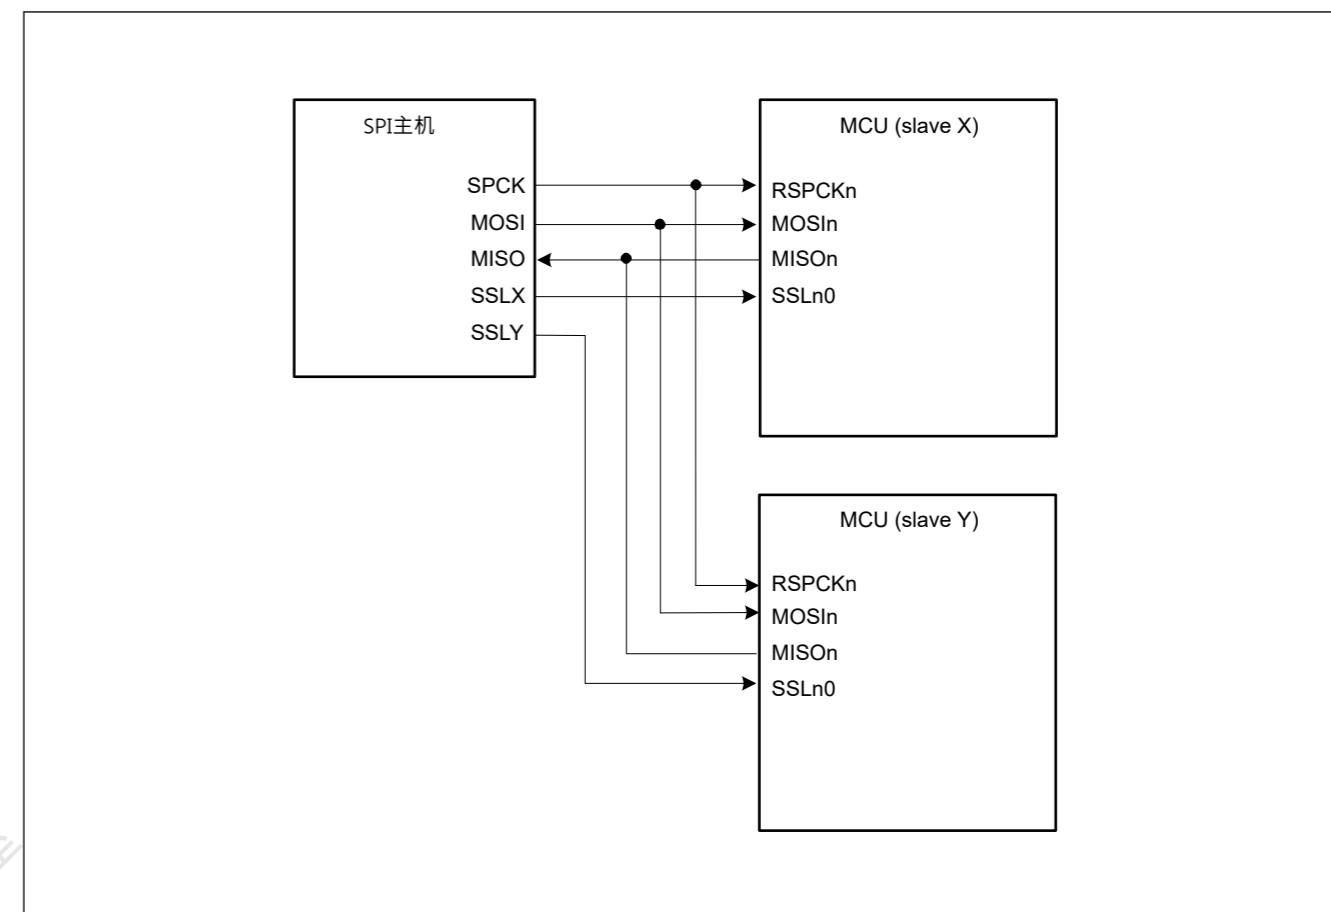

Figure 30.9 MCU作为从机的单主多从配置示例

### 30.3.3.5 以单片机为主的多主多从

图30.10显示了一个多主机多从机SPI系统配置示例，其中MCU用作主机。在此示例中，SPI系统包括两个MCU（主X和Y）和两个SPI从机（SPI从机1和2）。

MCU（主机X和Y）的RSPCKn和MOSIn输出连接到SPI从机1和2的RSPCK和MOSI输入。SPI从机1和2的MISO输出连接到MCU（主机X）的MISOOn输入和Y）。来自MCU（主X）的任何通用端口Y输出都连接到MCU（主Y）的SSLn0输入。MCU（主设备Y）的任何通用端口X输出都连接到MCU（主设备X）的SSLn0输入。MCU（主机X和Y）的SSLn1和SSLn2输出连接到SPI从机1和2的SSL输入。在此配置示例中，因为系统可以仅由SSLn0输入和SSLn1和SSLn2输出组成从连接，不需要MCU的SSLn3输出。

当SSLn0输入电平为高电平时，MCU驱动RSPCKn、MOSIn、SSLn1和SSLn2信号。当SSLn0输入电平为低时，MCU检测到模式故障错误，将RSPCKn、MOSIn、SSLn1和SSLn2设置为Hi-Z，并将SPI总线直接释放到另一个主控。在SPI从机1和2中，接收到SSL输入的低电平输入的从机驱动MISO信号。

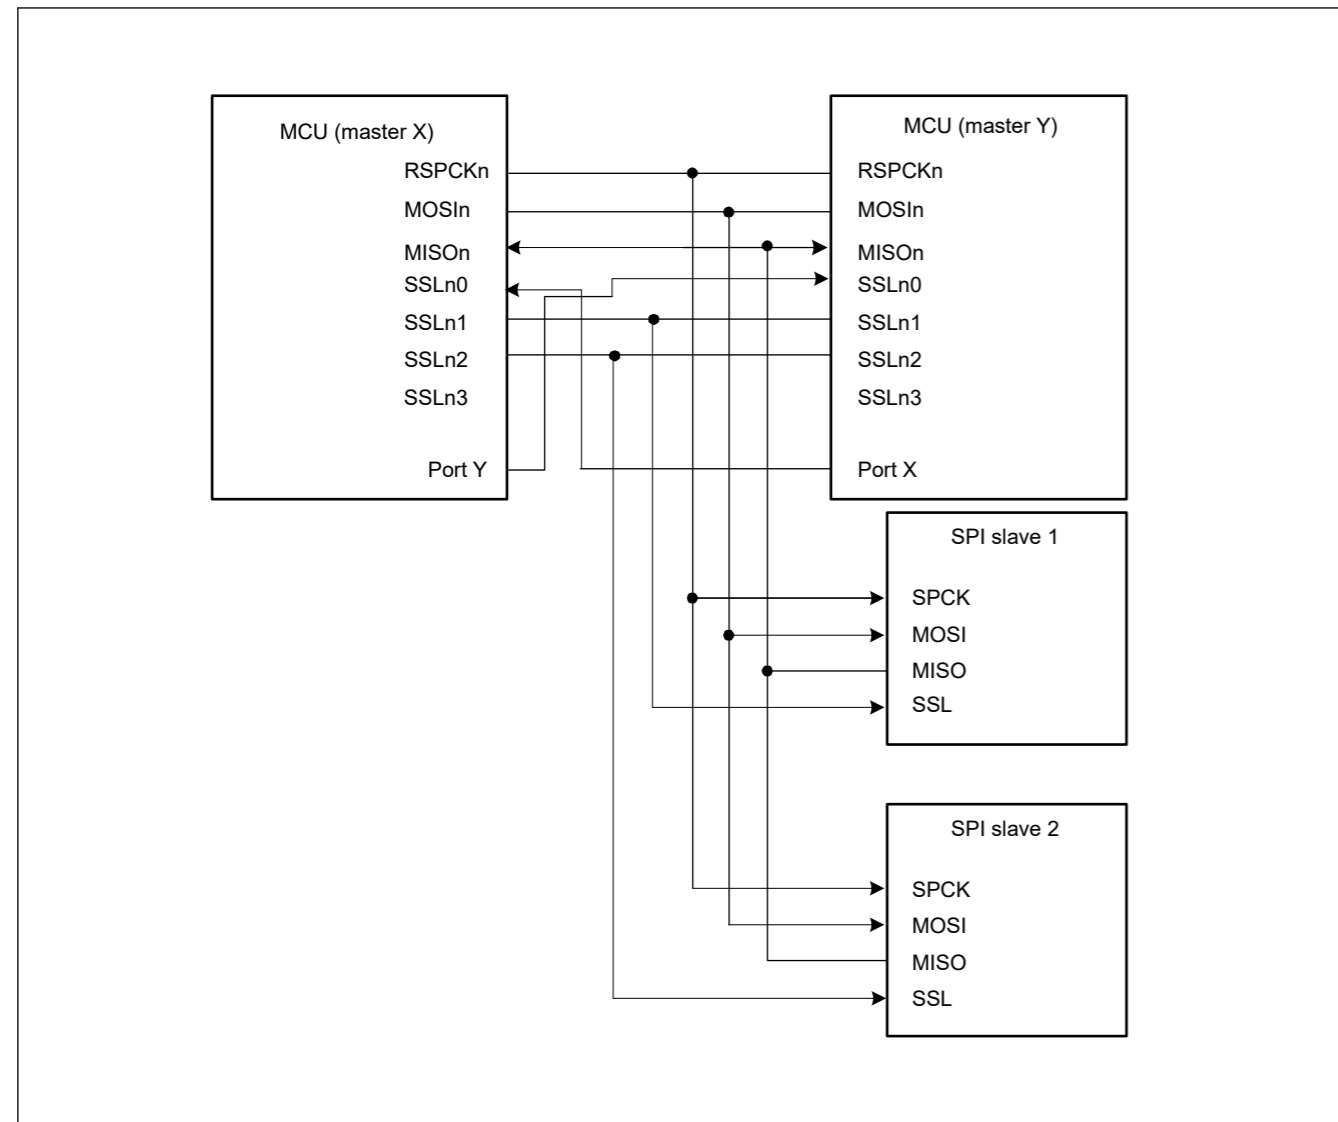

Figure 30.10 Multi-master/multi-slave configuration example with the MCU as a master

30.3.3.6 Master and slave in clock synchronous mode with the MCU configured as a master

Figure 30.11 shows a master and slave in clock synchronous mode configuration example where the MCU is used as a master. In this configuration, SSLni of the MCU (master) are not used.

The MCU (master) drives the RSPCKn and MOSIn signals. The SPI slave drives the MISO signal.

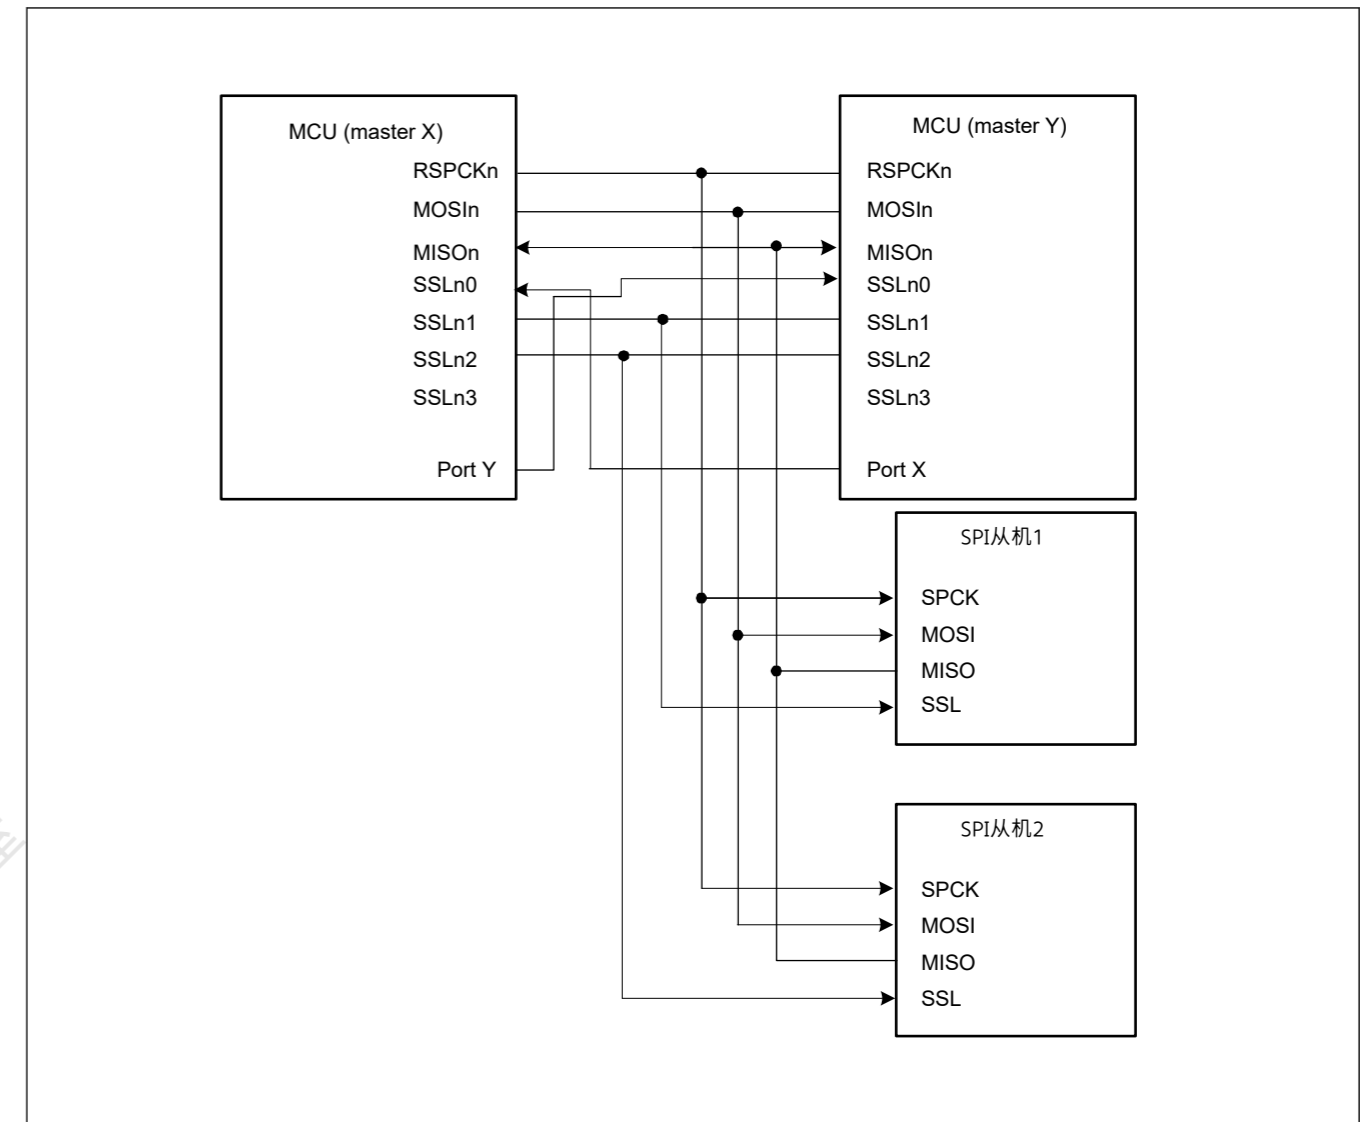

Figure 30.10 MCU为主的多主多从配置示例

30.3.3.6 主从时钟同步模式，MCU配置为主

图30.11显示了时钟同步模式下的主从配置示例，其中MCU用作主控。在此配置中，不使用MCU（主）的SSLni。

MCU（主控）驱动RSPCKn和MOSIn信号。SPI从机驱动MISO信号。

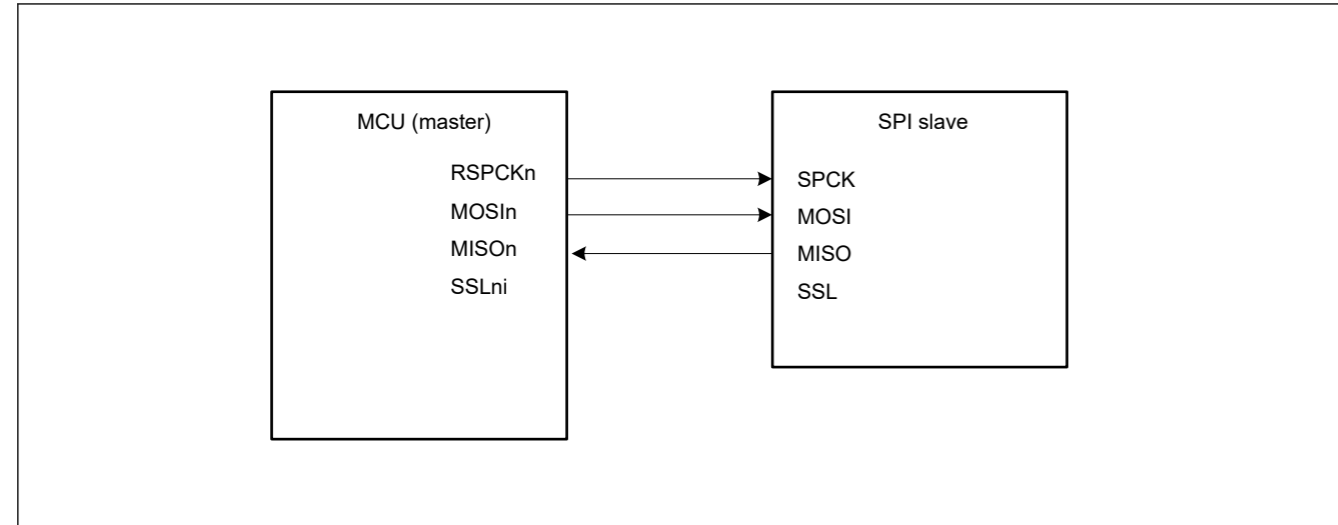

Figure 30.11 Clock synchronous master/slave configuration example with the MCU as a master

### 30.3.3.7 Master and slave in clock synchronous mode with the MCU as a slave

Figure 30.12 shows a master and slave in clock synchronous mode configuration example where the MCU is used as a slave. When the MCU operates as a slave (clock synchronous operation), the MCU (slave) drives the MISO signal and the SPI master drives the SPCK and MOSI signals. In addition, SSLn0 to SSLn3 of the MCU (slave) are not used.

The MCU (slave) can only execute serial transfers in the single-slave configuration when the SPCMDm.CPHA bit is set to 1.

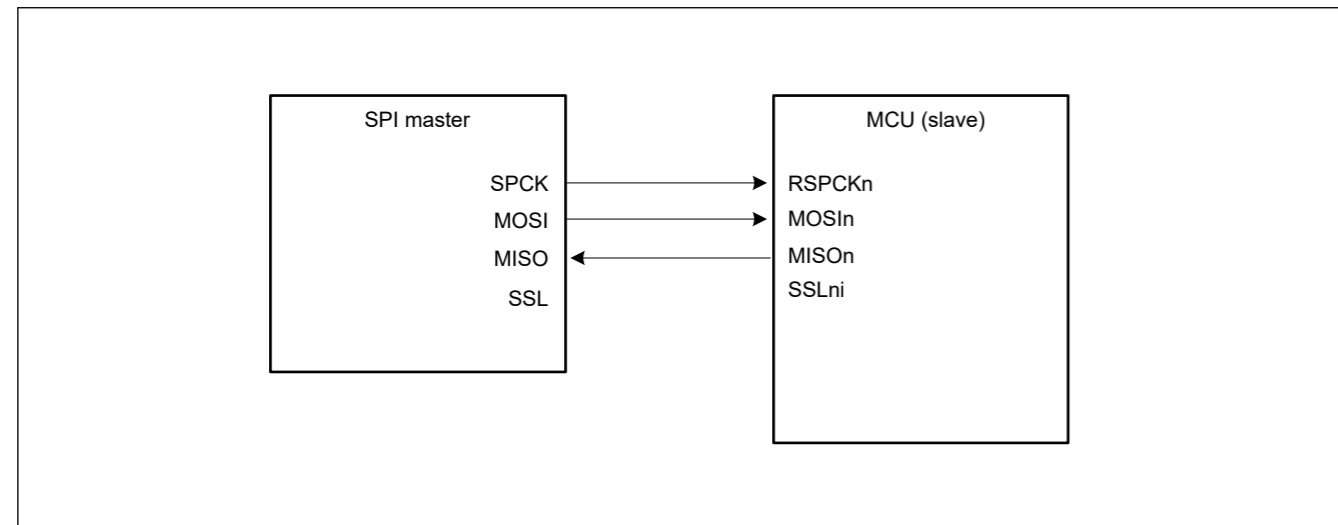

Figure 30.12 Clock synchronous master/slave configuration example with the MCU as a slave and CPHA = 1

### 30.3.4 Data Formats

The data format of the SPI depends on the settings in SPI Command Register m (SPCMDm) and the parity enable bit in SPI Control Register 2 (SPCR2.SPPE). Regardless of whether the MSB or LSB is first, the SPI treats the range from the LSB bit in the SPI Data Register (SPDR/SPDR\_HA) to the bit associated with the selected data length, as transfer data.

This section shows the format of one frame of data before or after transfer.

#### Data format with parity disabled

When parity is disabled, transmission or reception of data proceeds with the length in bits selected in the SPI data length setting in SPI Command Register m (SPCMDm.SPB[3:0]).

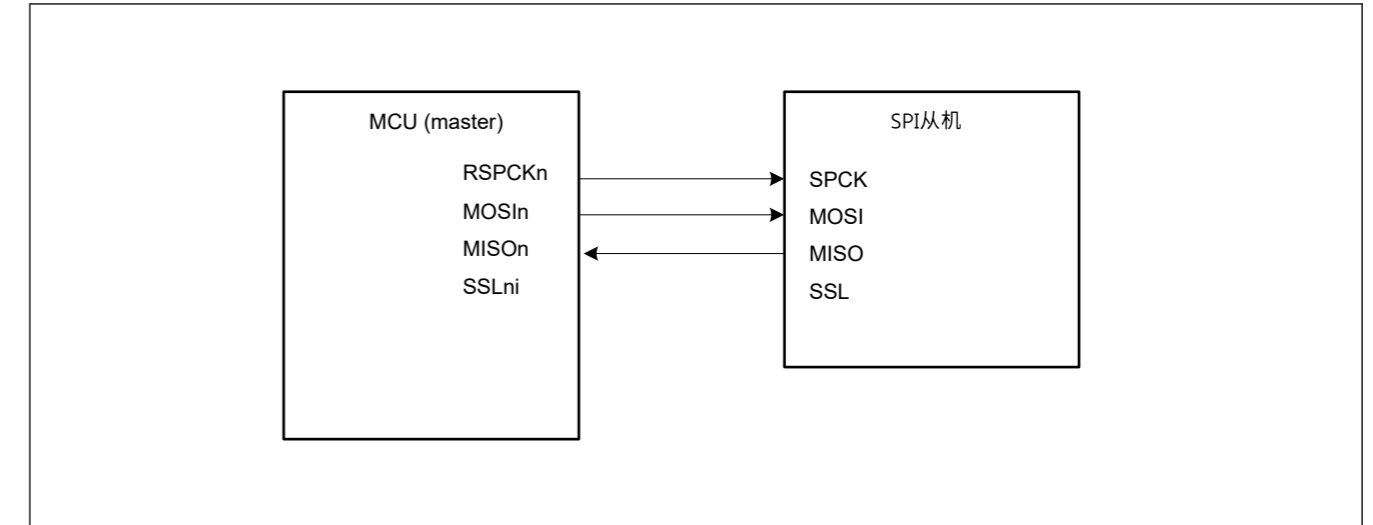

Figure 30.11 以MCU为主的时钟同步主从配置示例

### 30.3.3.7 主从时钟同步模式，单片机作为从机

图30.12显示了时钟同步模式下的主机和从机配置示例，其中MCU用作从机。当MCU作为从机运行时（时钟同步操作），MCU（从机）驱动MIO信号，SPI主机驱动SPCK和MOSI信号。此外，不使用MCU（从机）的SSLn0到SSLn3。

当SPCMDm.CPHA位设置为1时，MCU（从机）只能在单从机配置中执行串行传输。

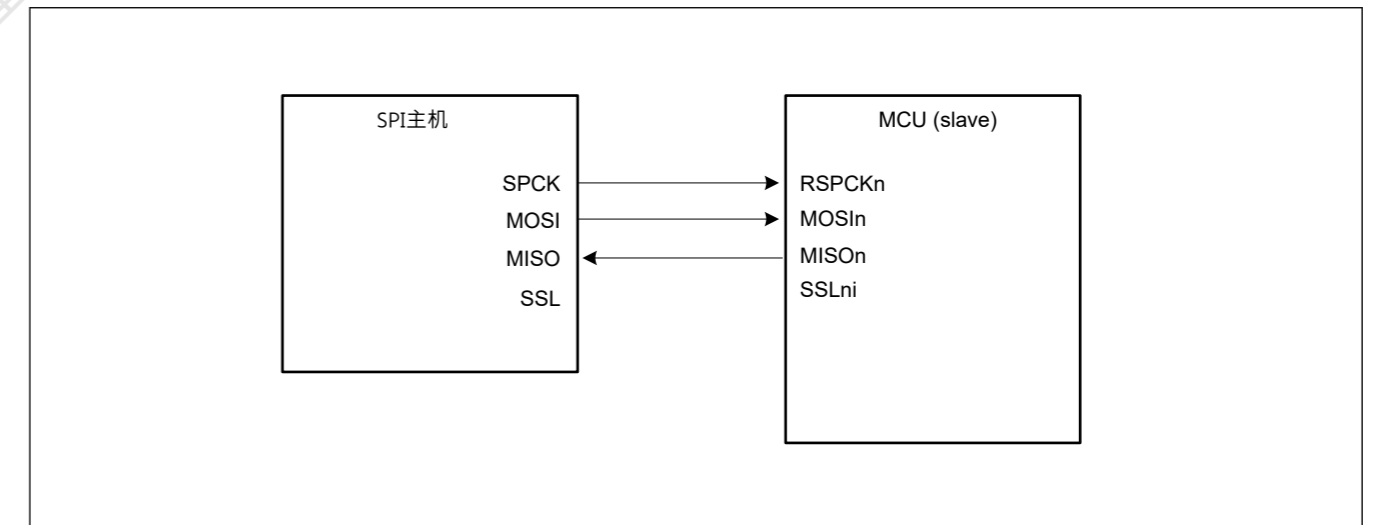

Figure 30.12 以MCU作为从机且CPHA=1的时钟同步主从配置示例

### 30.3.4 数据格式

SPI的数据格式取决于SPI命令寄存器m (SPCMDm)中的设置和SPI控制寄存器2 (SPCR2.SPPE)中的奇偶校验使能位。无论MSB还是LSB在前，SPI都会将SPI数据寄存器 (SPDR/SPDR\_HA)中的LSB位到与所选数据长度相关的位的范围视为传输数据。

本节显示传输前后一帧数据的格式。

#### 禁用奇偶校验的数据格式

当奇偶校验被禁用时，数据的发送或接收将按照在SPI命令寄存器m (SPCMDm.SPB[3:0])的SPI数据长度设置中选择的位长度进行。

**Data format with parity enabled**

When parity is enabled, transmission or reception of data proceeds with the length in bits selected in the SPI data length setting in SPI Command Register m (SPCMDm.SPB[3:0]). In this case, however, the last bit is a parity bit.

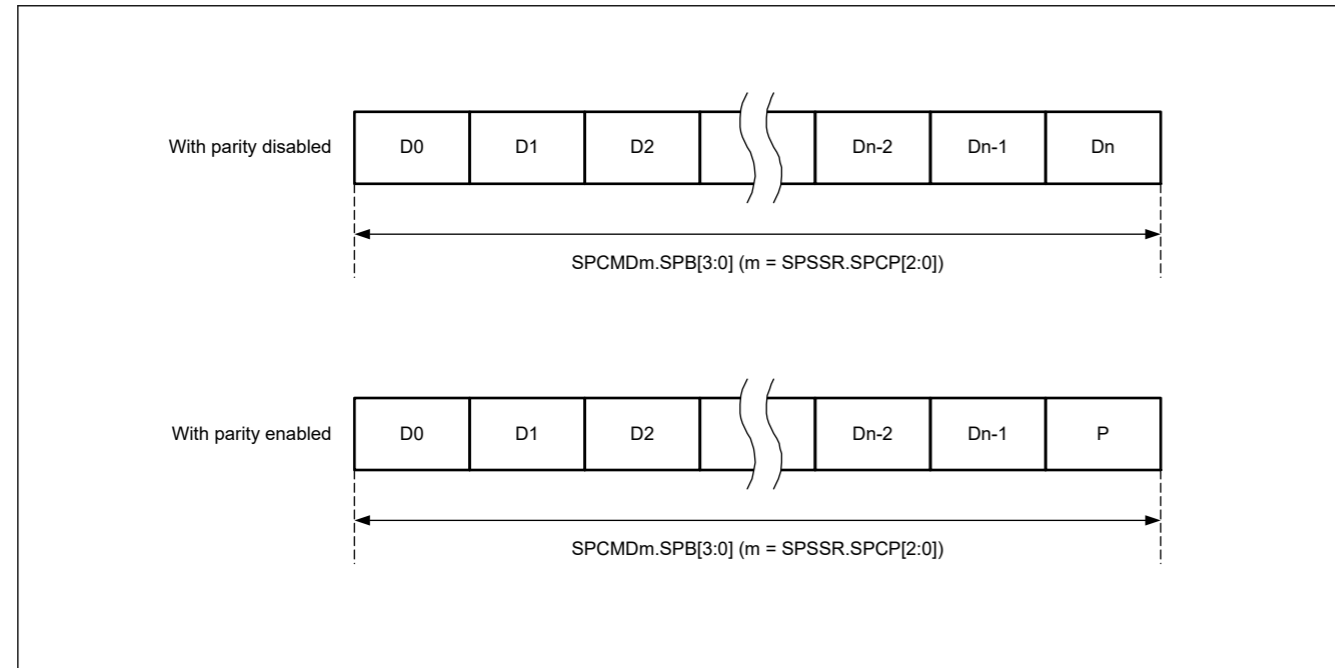

Figure 30.13 Data format with parity disabled and enabled

**30.3.4.1 Operation when parity is disabled (SPCR2.SPPE = 0)**

When parity is disabled, data for transmission is copied to the shift register with no pre-processing. This section describes the connection between the SPI Data Register (SPDR/SPDR\_HA) and the shift register in terms of the combination of MSB- or LSB-first order and data length.

**(1) MSB-first transfer with 32-bit data**

Figure 30.14 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity disabled, a SPI data length of 32 bits, and MSB-first selected.

In transmission, bits T31 to T00 from the current stage of the transmit buffer are copied to the shift register. Data for transmission is shifted out from the shift register from T31 to T30, and continuing to T00.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R31 to R00 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.

**启用奇偶校验的数据格式**

当奇偶校验使能时，数据的发送或接收按照在SPI命令寄存器m(SPCMDm.SPB[3:0])的SPI数据长度设置中选择的位长度进行。然而，在这种情况下，最后一位是奇偶校验位。

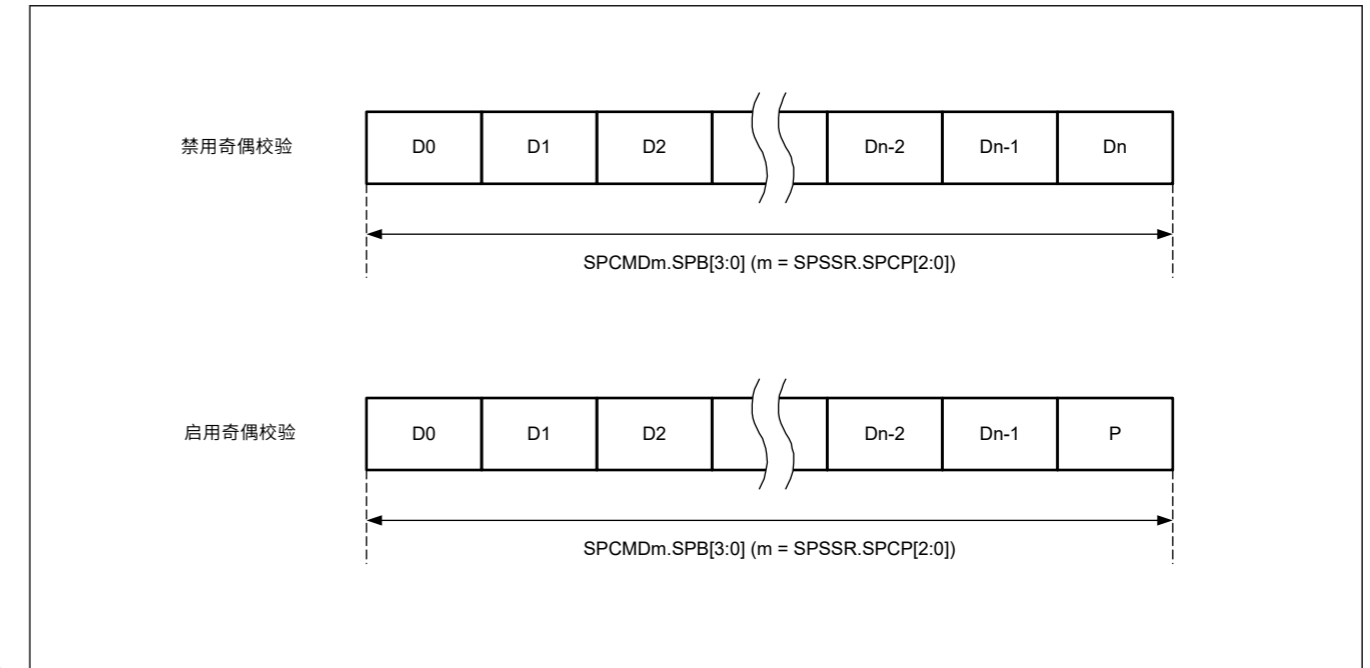

Figure 30.13 禁用和启用奇偶校验的数据格式

**30.3.4.1 禁用奇偶校验时的操作(SPCR2.SPPE=0)**

当奇偶校验被禁用时，用于传输的数据被复制到移位寄存器而不进行预处理。本节从MSB或LSB-first order和数据长度的组合来描述SPI数据寄存器(SPDR/SPDR\_HA)和移位寄存器之间的连接。

**(1) 32位数据的MSB优先传输**

图30.14显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用的传输中的操作，a SPI数据长度为32位，且MSB优先选择。

在发送过程中，发送缓冲器当前级的T31到T00位被复制到移位寄存器。发送数据从移位寄存器从T31移出到T30，并继续到T00。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需的RSPCK周期数后收集R31至R00位时，将移位寄存器中的值复制到接收缓冲区。

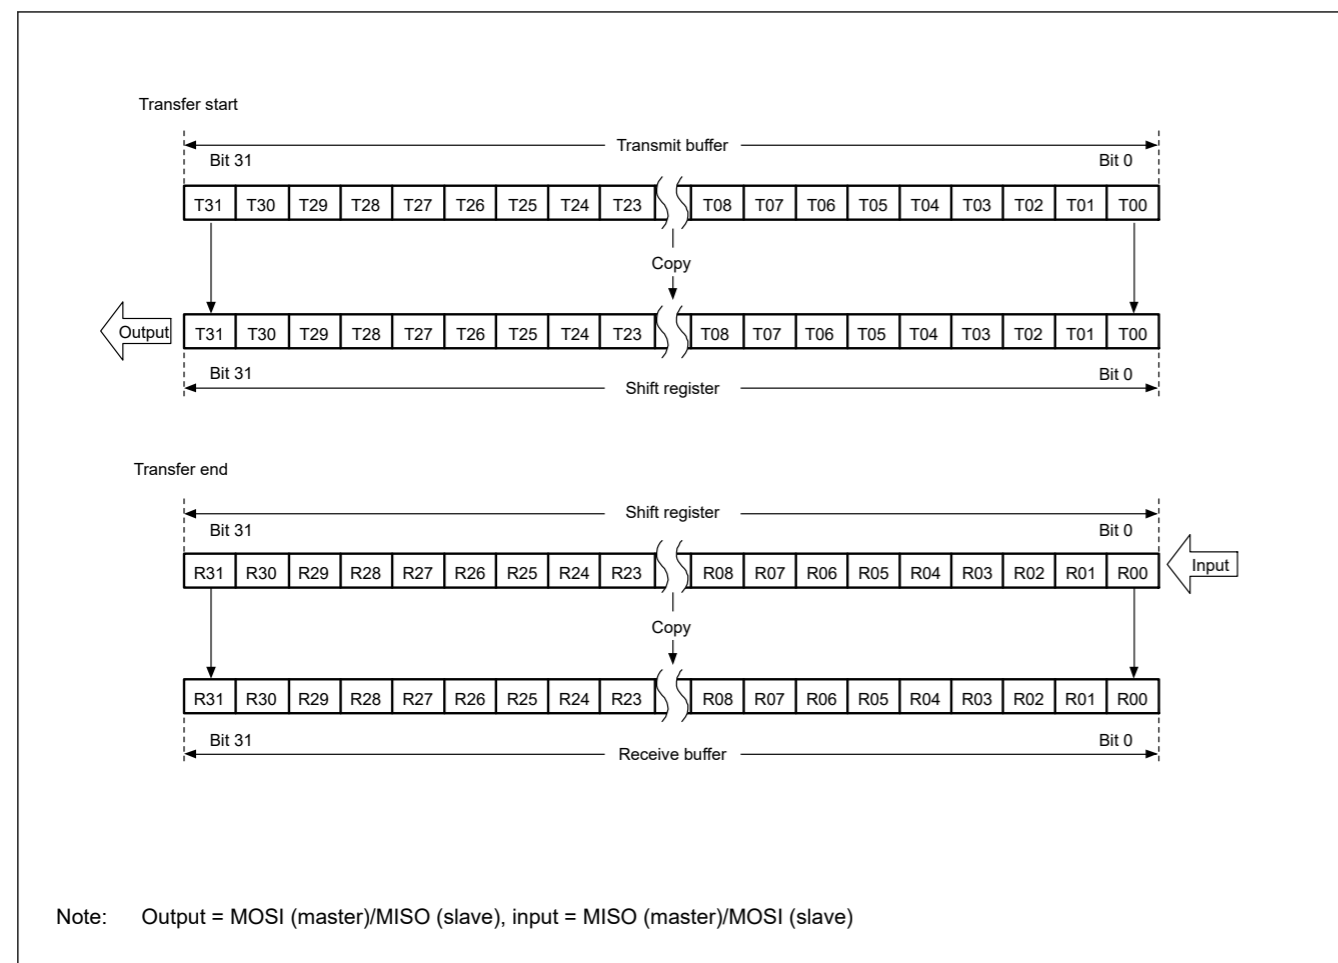

Figure 30.14 MSB-first transfer with 32-bit data and parity disabled

## (2) MSB-first transfer with 24-bit data

Figure 30.15 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity disabled, an SPI data length of 24 bits for an example that is not 32 bits, and MSB-first selected.

In transmission, the lower 24 bits (T23 to T00) from the current stage of the transmit buffer are copied to the shift register. Data for transmission is shifted out from the shift register from T23 to T22, and continuing to T00.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R23 to R00 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer in case of transmit-receive operation. Writing 0 to bits T31 to T24 during transmission leads to 0 being inserted in the upper 8 bits of the receive buffer. On the other hand, the upper 8-bits of the receive buffer is written 0 in case of receive only operation.

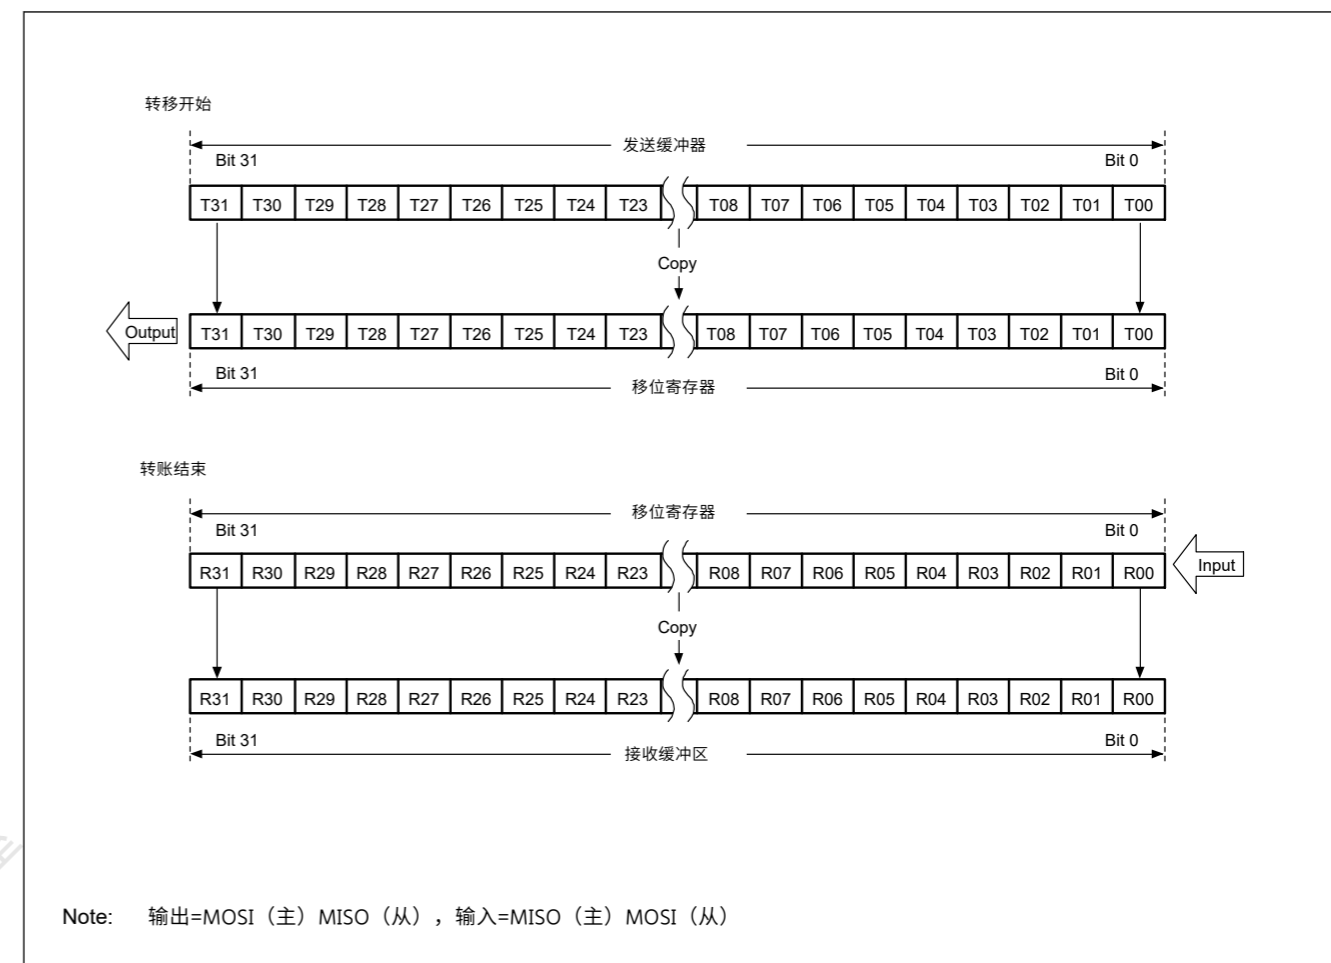

Figure 30.14 禁用32位数据和奇偶校验的MSB优先传输

## (2) 24位数据的MSB优先传输

图30.15显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用的传输中的操作，以24位SPI数据长度为例，即不是32位，并且选择MSB优先。

在发送过程中，来自发送缓冲器当前阶段的低24位（T23到T00）被复制到移位寄存器。发送的数据从移位寄存器从T23移出到T22，并继续到T00。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后，当R23到R00位被收集时，移位寄存器中的值被复制到接收缓冲区。在发送-接收操作的情况下，发送缓冲区的高8位存储在接收缓冲区的高8位中。在传输过程中将0写入位T31到T24会导致将0插入接收缓冲区的高8位。另一方面，在只接收操作的情况下，接收缓冲区的高8位被写入0。

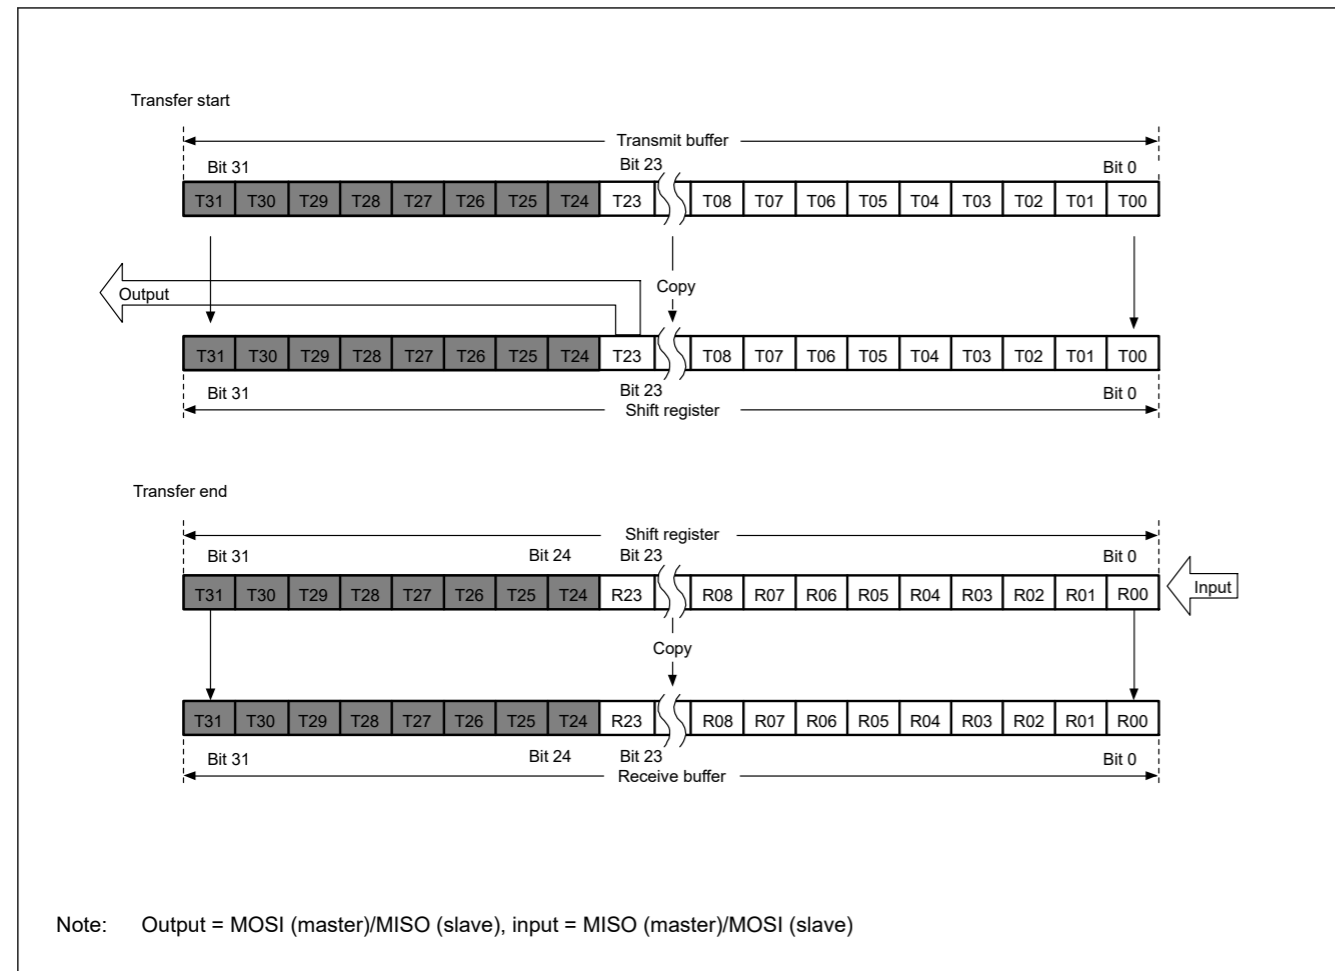

Figure 30.15 MSB-first transfer with 24-bit data and parity disabled

## (3) LSB-first transfer with 32-bit data

Figure 30.16 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity disabled, an SPI data length of 32 bits, and LSB-first selected.

In transmission, bits T31 to T00 from the current stage of the transmit buffer are reordered bit-by-bit to obtain the order T00 to T31 for copying to the shift register. Data for transmission is shifted out from the shift register in order from T00 to T01, and continuing to T31.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R00 to R31 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.

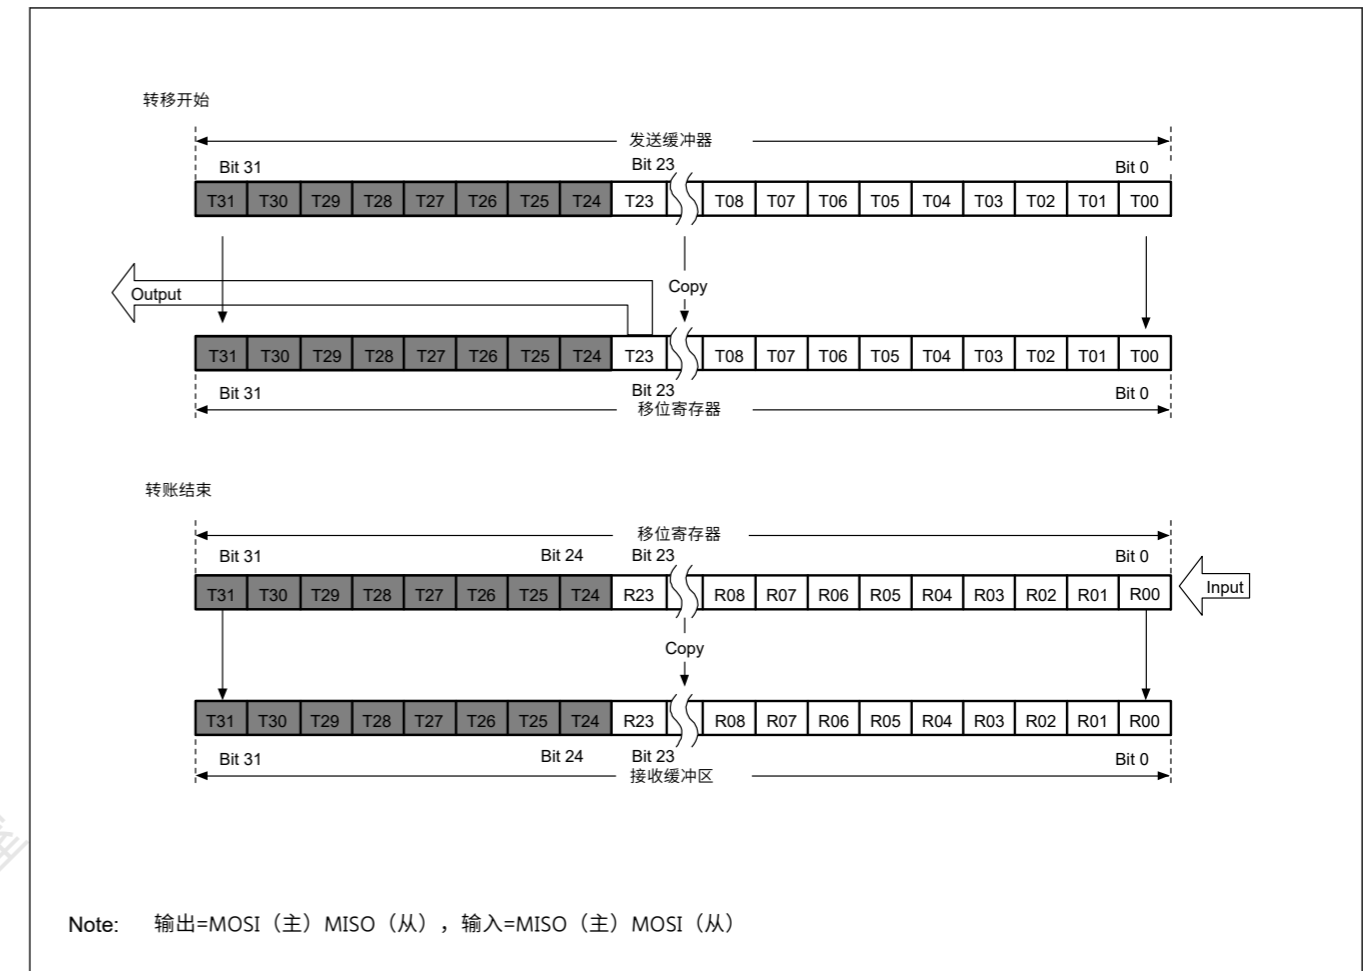

Figure 30.15 禁用24位数据和奇偶校验的MSB优先传输

## (3) 32位数据的LSB优先传输

图30.16显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用的传输中的操作，SPI数据长度为32位，并选择LSB-first。

在传输过程中，传输缓冲器当前级的位T31到T00被逐位重新排序，以获得用于复制到移位寄存器的顺序T00到T31。传输的数据从移位寄存器中按顺序从T00移出到T01，并继续到T31。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后收集R00至R31位时，将移位寄存器中的值复制到接收缓冲区。

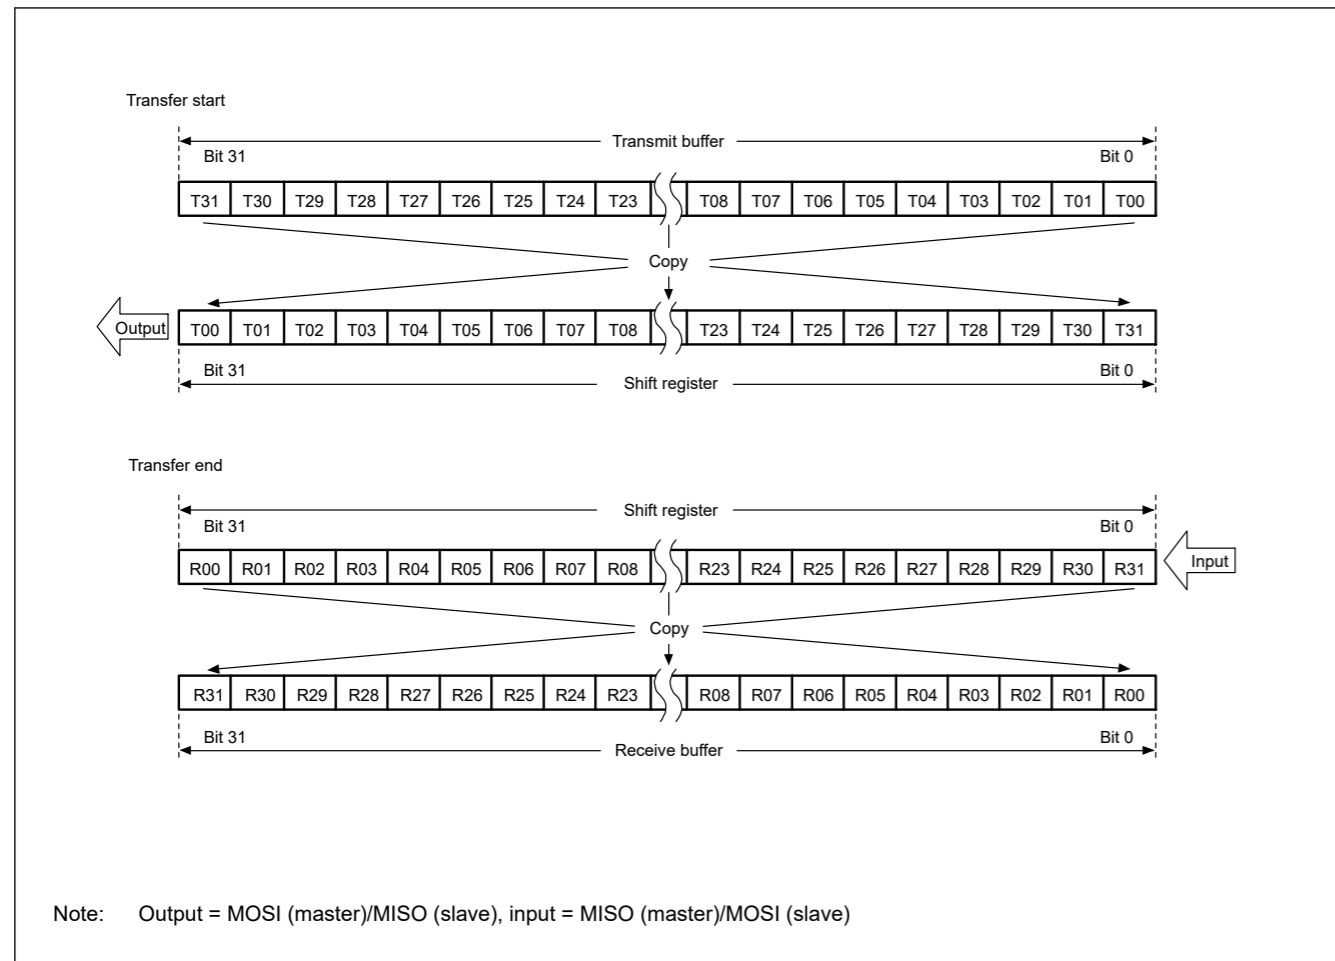

Figure 30.16 LSB-first transfer with 32-bit data and parity disabled

## (4) LSB-first transfer with 24-bit data

Figure 30.17 shows the operation of the SPI Data Register (SPDR) and the shift register in transfers with parity disabled, an SPI data length of 24 bits for an example that is not 32, and LSB-first selected.

In transmission, the lower 24 bits (T23 to T00) from the current stage of the transmit buffer are reordered bit-by-bit to obtain the order T00 to T23 for copying to the shift register. Data for transmission is shifted out from the shift register from T00 to T01, and continuing to T23.

In reception, received data is shifted in bit-by-bit through bit[8] of the shift register. When the R00 to R23 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.

The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer in case of transmit-receive operation. Writing 0 to T31 to T24 during transmission leads to 0 being inserted in the upper 8 bits of the receive buffer. On the other hand, the upper 8-bits of the receive buffer is written 0 in case of receive only operation.

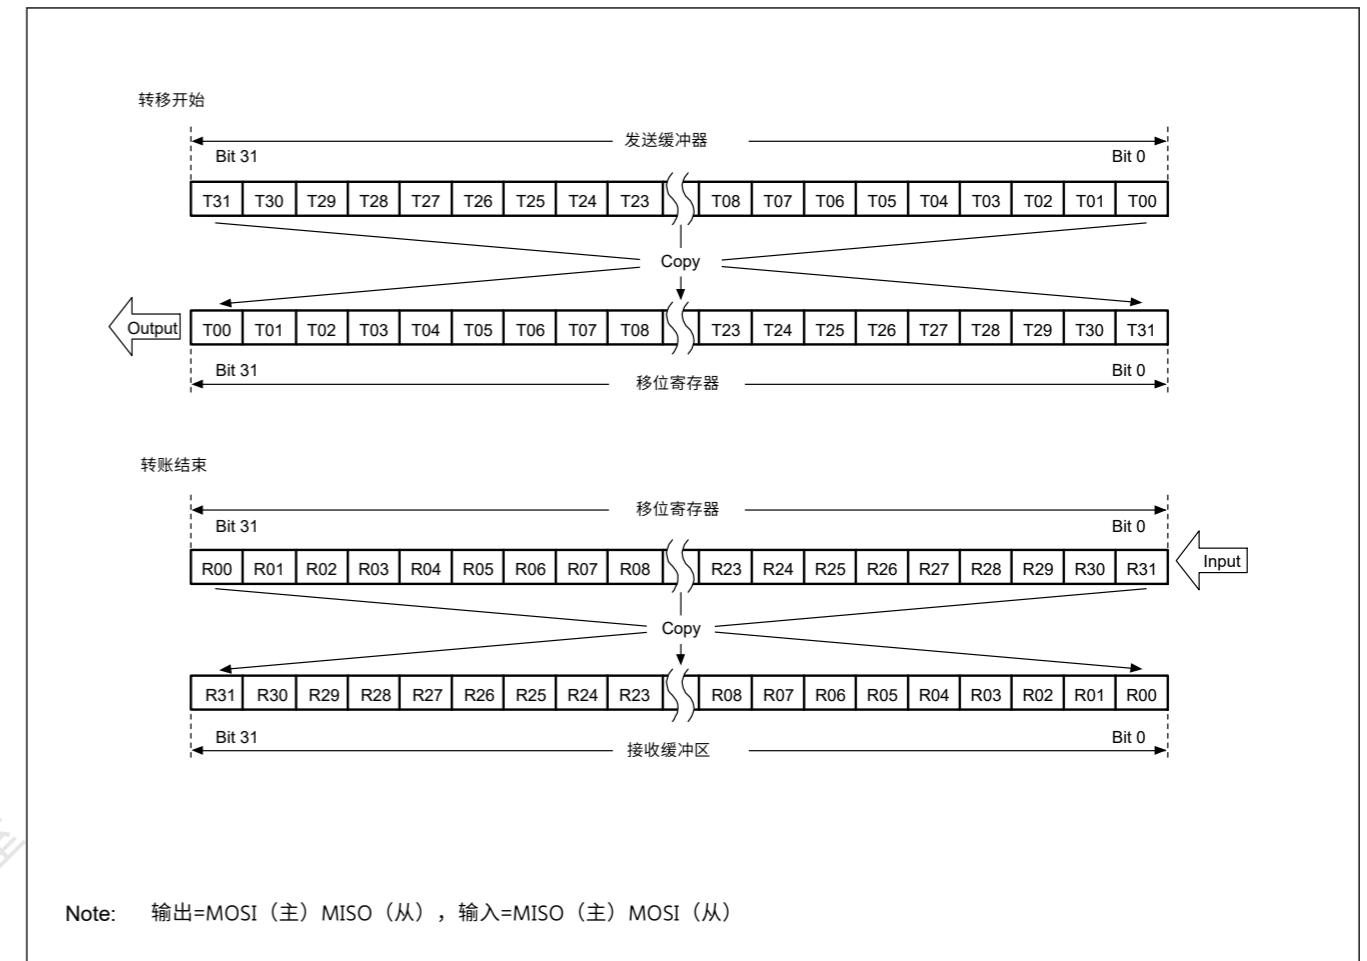

Figure 30.16 LSB优先传输，32位数据和奇偶校验禁用

## (4) 24位数据的LSB优先传输

图30.17显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用的传输中的操作，一个SPI数据长度为24位，例如不是32位，并且选择LSB优先。

发送时，将发送缓冲区当前级的低24位（T23到T00）逐位重新排序，得到T00到T23的顺序，用于复制到移位寄存器。发送的数据从移位寄存器从T00移出到T01，并继续到T23。

在接收中，接收到的数据通过移位寄存器的bit[8]逐位移位。在输入所需的RSPCK周期数后收集R00至R23位时，将移位寄存器中的值复制到接收缓冲区。

在发送-接收操作的情况下，发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送过程中将0写入T31到T24会导致将0插入接收缓冲区的高8位。另一方面，在只接收操作的情况下，接收缓冲区的高8位被写入0。

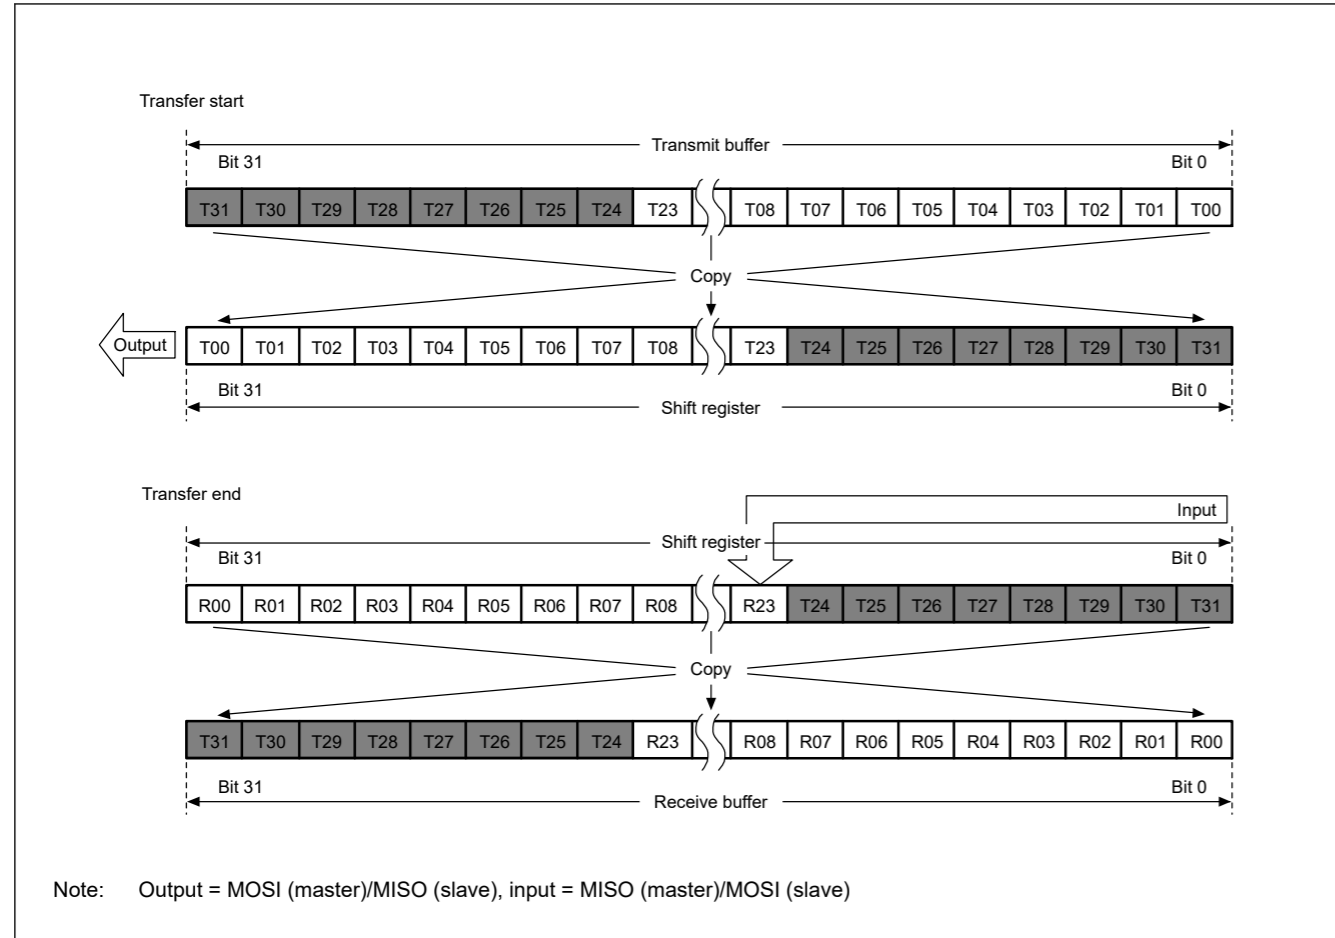

Figure 30.17 LSB-first transfer with 24-bit data and parity disabled

30.3.4.2 Operation when parity is enabled (SPCR2.SPPE = 1)

When parity is enabled, the lowest-order bit of the data for transmission becomes a parity bit. Hardware calculates the value of the parity bit.

(1) MSB-first transfer with 32-bit data

Figure 30.18 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity enabled, an SPI data length of 32 bits, and MSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T31 to T01. This replaces the final bit, T00, and the whole value is copied to the shift register. Data is transmitted in the order T31, T30, ..., T01, and P.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R31 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R31 to P is checked for parity.

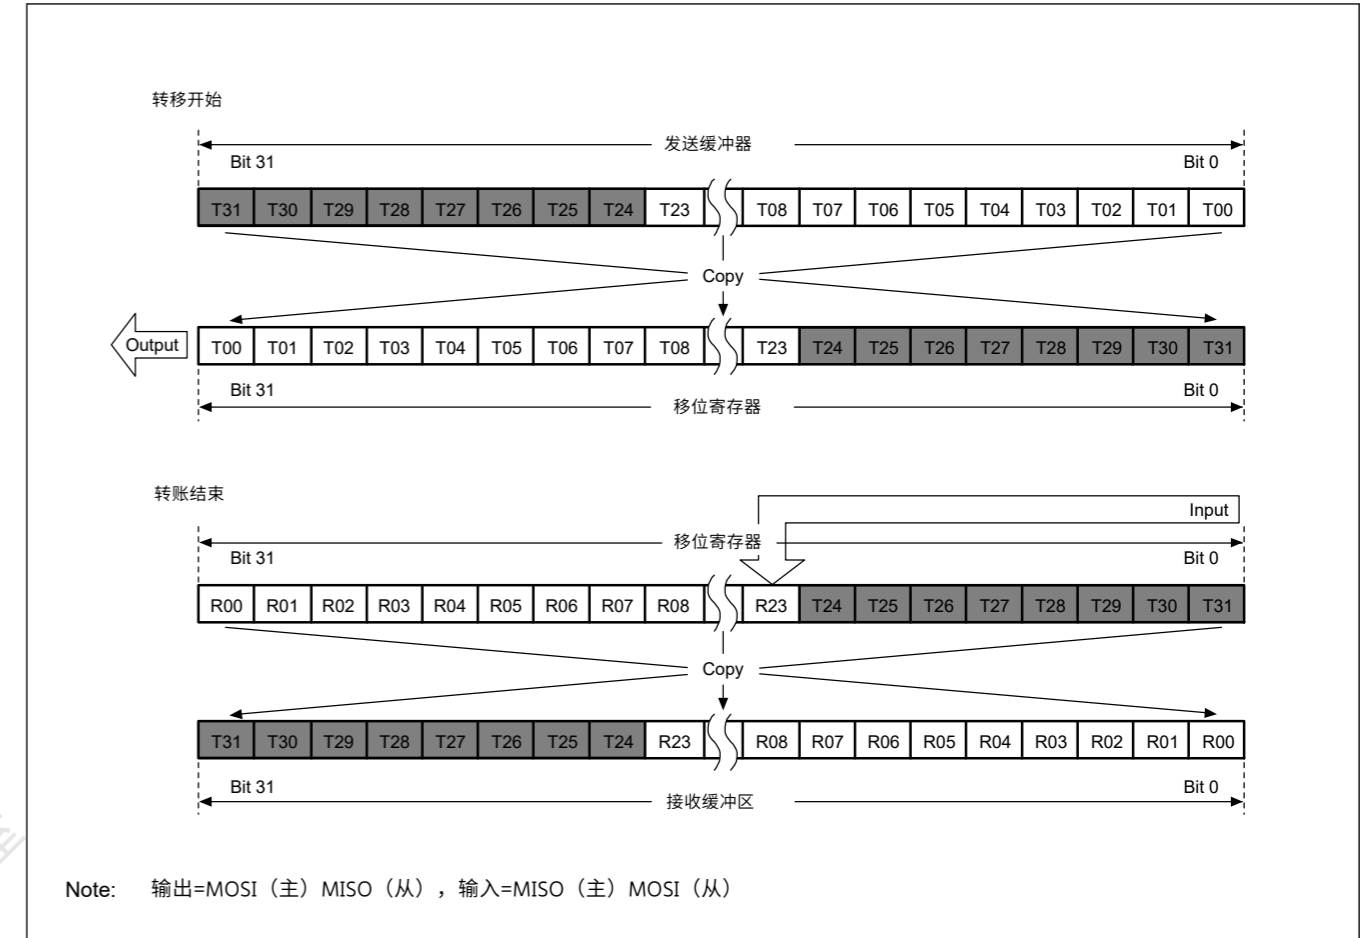

Figure 30.17 LSB优先传输，24位数据和奇偶校验禁用

30.3.4.2 启用奇偶校验时的操作(SPCR2.SPPE=1)

启用奇偶校验时，传输数据的最低位变为奇偶校验位。硬件计算奇偶校验位的值。

(1) 32位数据的MSB优先传输

图30.18显示了SPI数据寄存器(SPDR)和移位寄存器在启用奇偶校验的传输中的操作，SPI数据长度为32位，且MSB优先选择。

在传输中，奇偶校验位(P)的值是从位T31到T01计算的。这将替换最后一位T00，并将整个值复制到移位寄存器。数据按T31、T30、……、T01和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后收集R31至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R31到P的数据的奇偶性。

Figure 30.18 MSB-first transfer with 32-bit data and parity enabled

## (2) MSB-first transfer with 24-bit data

Figure 30.19 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity enabled, a SPI data length of 24 bits, and MSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T23 to T01. This replaces the final bit, T00, and the whole value is copied to the shift register. Data is transmitted in the order T23, T22, ..., T01, and P.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R23 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R23 to P is checked for parity. The upper 8 bits of the transmit buffer is stored in the upper 8 bits of the receive buffer in case of transmit-receive operation. Writing 0 to T31 to T24 during transmission leads to 0 being inserted in the upper 8 bits of the receive buffer. On the other hand, the upper 8-bits of the receive buffer is written 0 in case of receive only operation.

Figure 30.18 启用32位数据和奇偶校验的MSB优先传输

## (2) 24位数据的MSB优先传输

图30.19显示了SPI数据寄存器(SPDR)和移位寄存器在启用奇偶校验的传输中的操作，a SPI数据长度为24位，且MSB优先选择。

在传输中，奇偶校验位(P)的值是从位T23到T01计算的。这将替换最后一位T00，并将整个值复制到移位寄存器。数据按T23、T22、……、T01和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后收集R23至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R23到P的数据的奇偶性。在发送-接收操作的情况下，发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送过程中将0写入T31到T24会导致将0插入接收缓冲区的高8位。另一方面，在只接收操作的情况下，接收缓冲区的高8位被写入0。

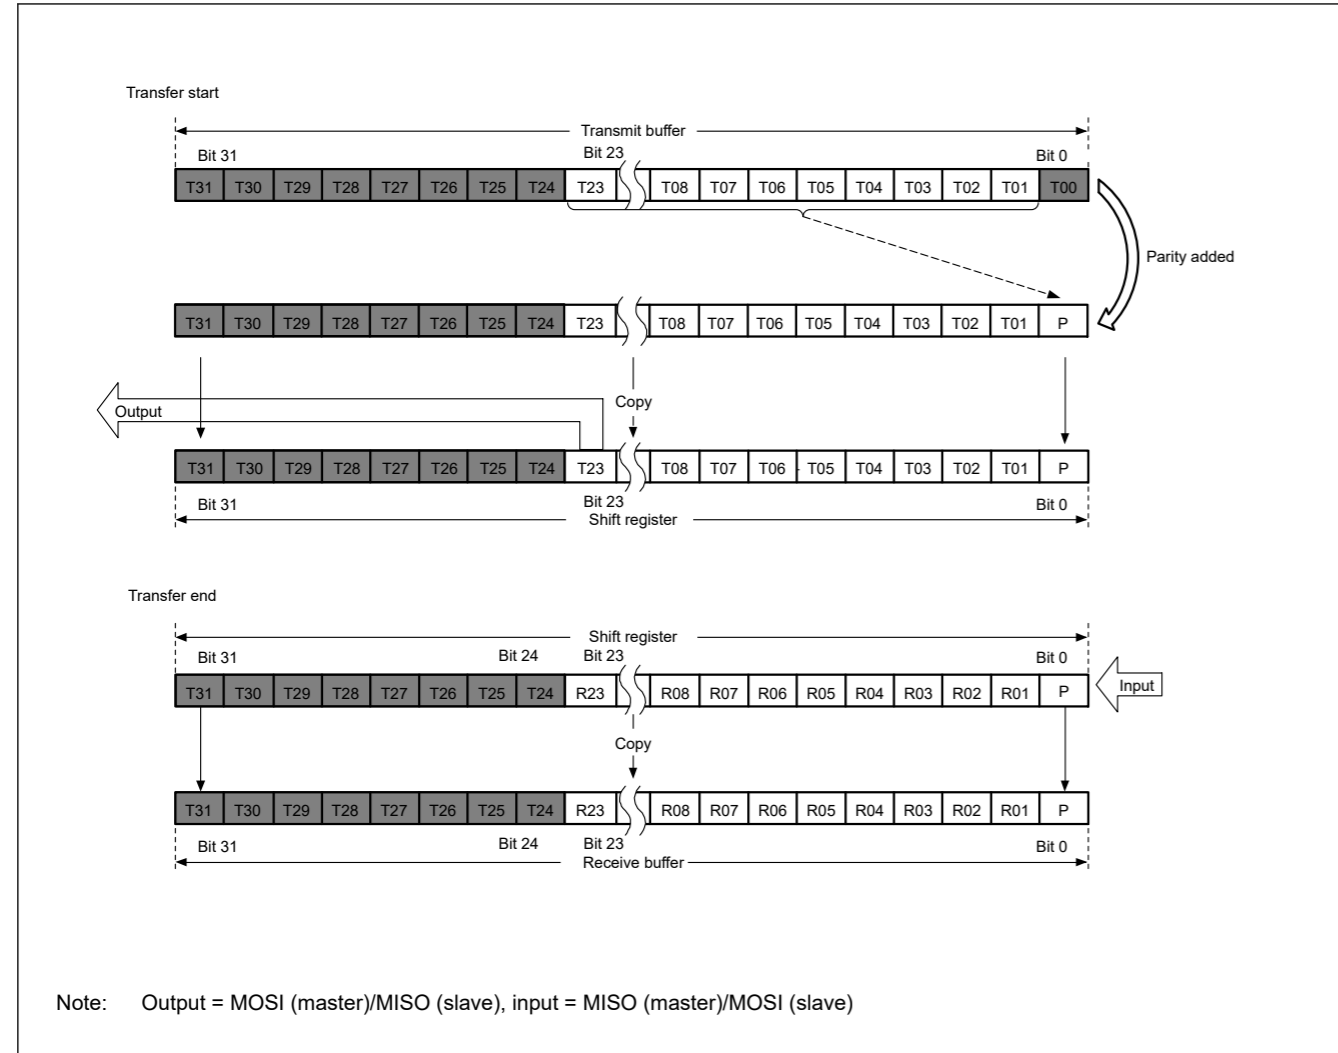

Figure 30.19 MSB-first transfer with 24-bit data and parity enabled

(3) LSB-first transfer with 32-bit data

Figure 30.20 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity enabled, an SPI data length of 32 bits, and LSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T30 to T00. This replaces the final bit, T31, and the whole value is copied to the shift register. Data is transmitted in the order T00, T01, ..., T30, and P.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R00 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R00 to P is checked for parity.

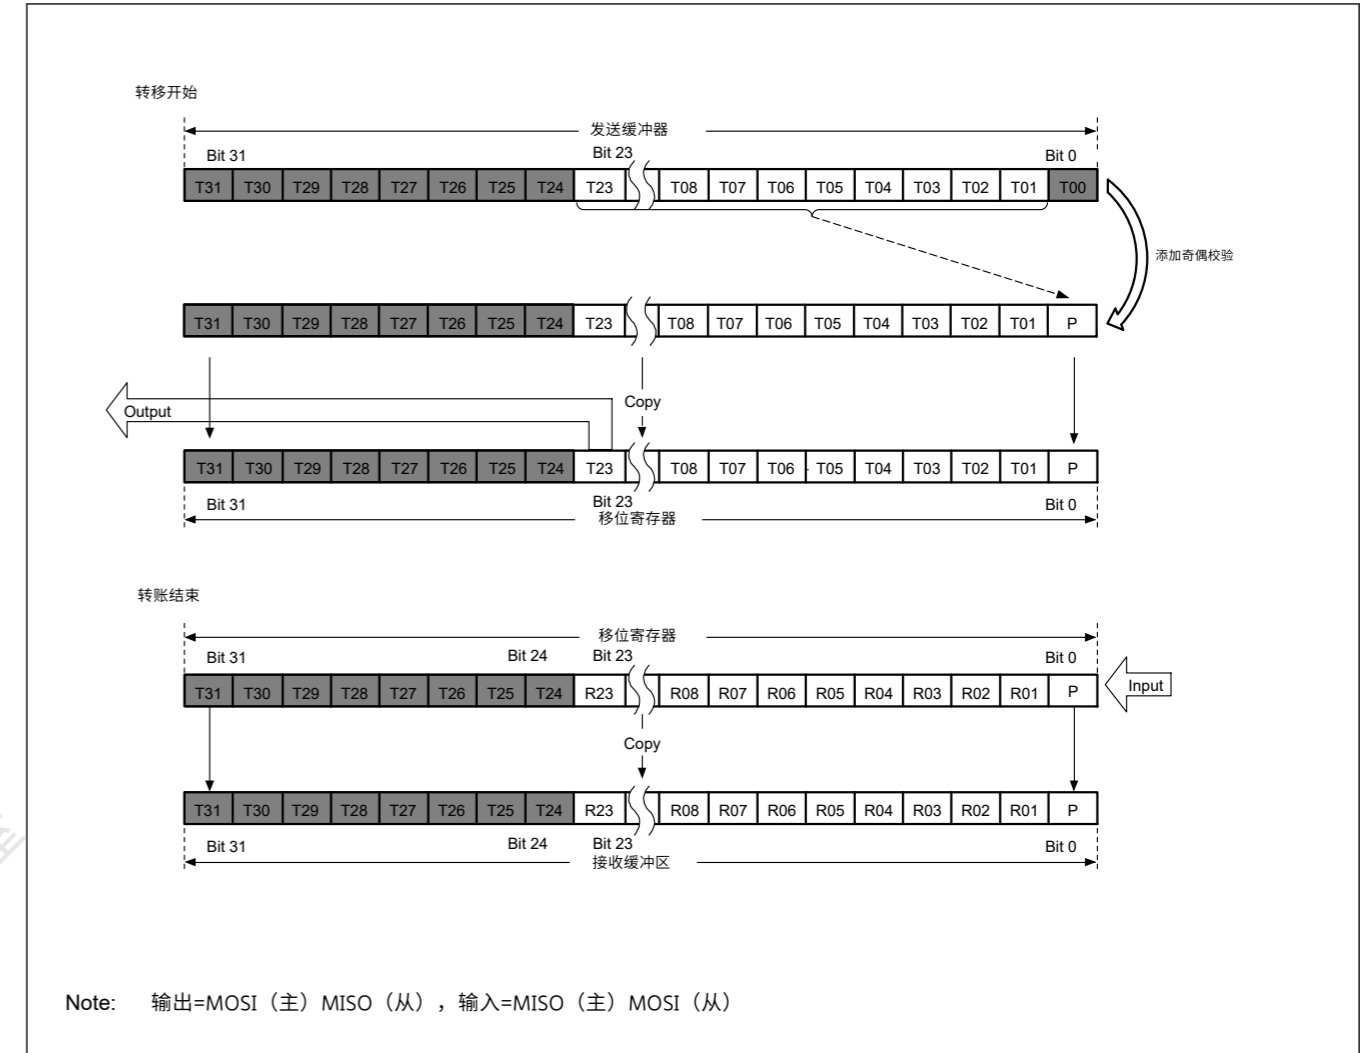

Figure 30.19 启用24位数据和奇偶校验的MSB优先传输

(3) 32位数据的LSB优先传输

图30.20显示了SPI数据寄存器(SPDR)和移位寄存器在启用奇偶校验的传输中的操作，SPI数据长度为32位，并选择LSB-first。

在传输中，奇偶校验位(P)的值是从位T30到T00计算的。这将替换最后一位T31，并将整个值复制到移位寄存器。数据按T00、T01、……、T30和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后收集R00至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R00到P的数据的奇偶性。

Figure 30.20 LSB-first transfer with 32-bit data and parity enabled

(4) LSB-first transfer with 24-bit data

Figure 30.21 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity enabled, a SPI data length of 24 bits, and LSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T22 to T00. This replaces the final bit, T23, and the whole value is copied to the shift register. Data is transmitted in the order T00, T01, ..., T22, and P.

In reception, received data is shifted in bit-by-bit through bit[8] of the shift register. When the R00 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R00 to P is checked for parity. The upper 8 bits of the transmit buffer is stored in the upper 8 bits of the receive buffer in case of transmit-receive operation. Writing 0 to T31 to T24 during transmission leads to 0 being inserted in the upper 8 bits of the receive buffer. On the other hand, the upper 8-bits of the receive buffer is written 0 in case of receive only operation.

Figure 30.20 启用32位数据和奇偶校验的LSB优先传输

(4) 24位数据的LSB优先传输

图30.21显示了SPI数据寄存器(SPDR)和移位寄存器在启用奇偶校验的传输中的操作，a SPI数据长度为24位，并选择LSB优先。

在传输中，奇偶校验位(P)的值是从位T22到T00计算的。这将替换最后一位T23，并将整个值复制到移位寄存器。数据按T00、T01、……、T22和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的bit[8]逐位移位。在输入所需数量的RSPCK周期后收集R00至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R00到P的数据的奇偶性。在发送-接收操作的情况下，发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送过程中将0写入T31到T24会导致将0插入接收缓冲区的高8位。另一方面，在只接收操作的情况下，接收缓冲区的高8位被写入0。

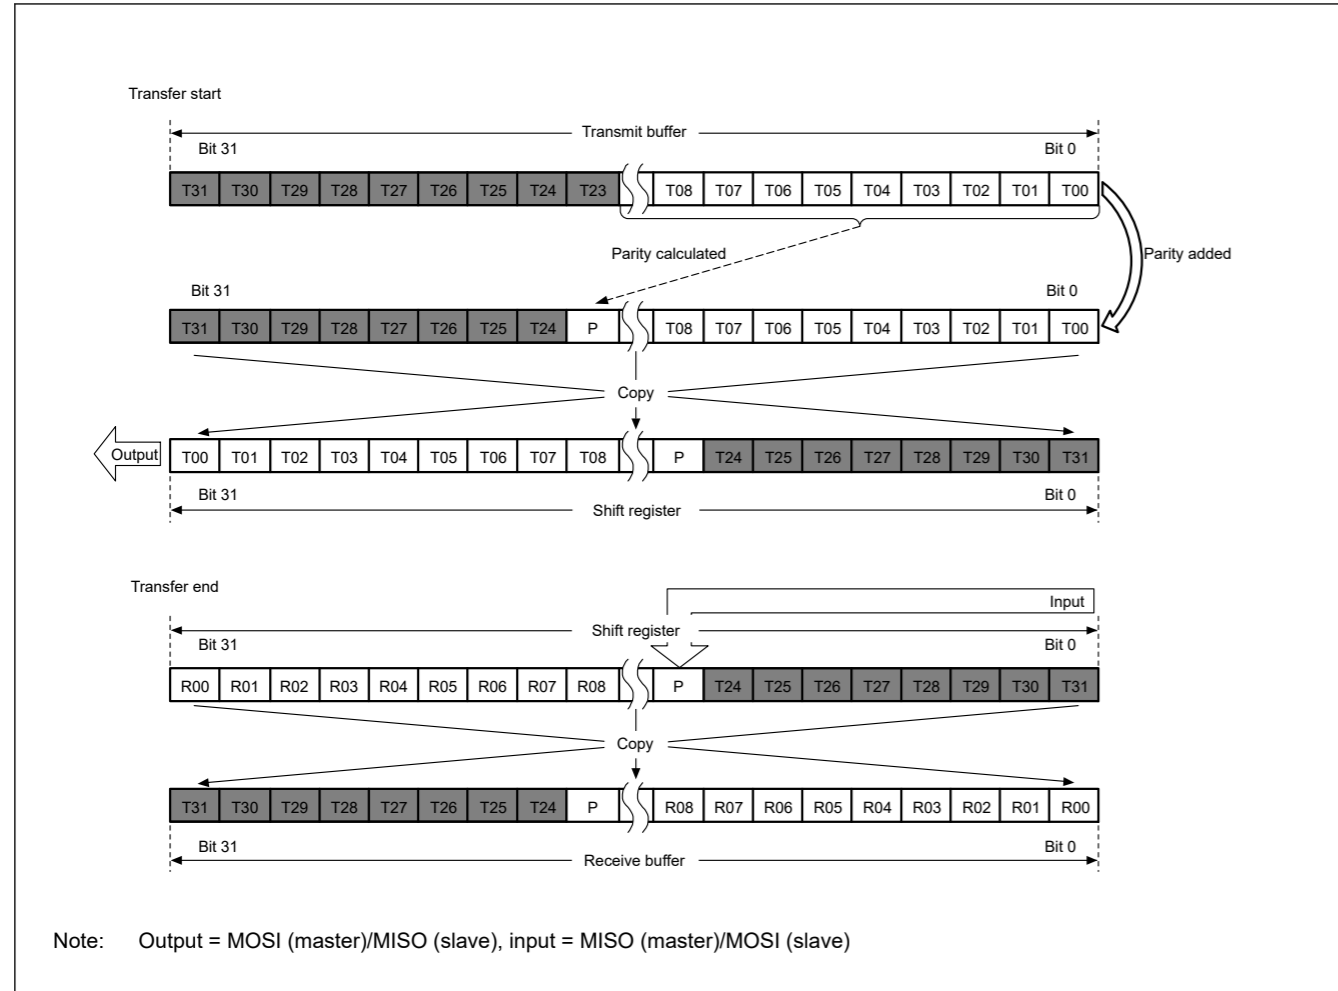

Figure 30.21 LSB-first transfer with 24-bit data and parity enabled

### 30.3.4.3 Byte Swap Transmission

#### (1) MSB-first transfer. (When the byte swap is disabled.)

Data (Byte0 [T31 to T24] to Byte3 [T07 to T00]) in the transmit buffer are copied to the shift register.

Bit values in the shift register are shifted and transmitted in the order of T31 → T30 → ... → T00 as transmit data.

#### (2) MSB-first transfer. (When the byte swap is enabled.)

Byte values of the transmit buffer (Byte0 [T31 to T24] to Byte3 [T07 to T00]) are reversed in byte units and are copied to the shift register in the order of Byte3 [T07 to T00] to Byte0 [T31 to T24].

Bit values in the shift register are shifted and transmitted in the order of T07 → T06 → ... → T00 → T15 → T14 → ... → T08 → T23 → T22 → ... → T16 → T31 → T30 → ... → T24 as transmit data.

#### (3) LSB-first transfer. (When the byte swap is disabled.)

Bit values of the transmit buffer (Byte0 [T31 to T24] to Byte3 [T07 to T00]) are reversed in bit units and are copied to the shift register in the order of Byte3 [T00 to T07] to Byte0 [T24 to T31].

Bit values in the shift register are shifted and transmitted in the order of T00 → T01 → ... → T31 as transmit data.

#### (4) LSB-first transfer. (When the byte swap is enabled.)

Bit values of each byte of the transmit buffer (Byte0 [T31 to T24] to Byte3 [T07 to T00]) are reversed in bit units and are copied to the shift register in the order of Byte0 [T24 to T31] to Byte3 [T00 to T07].

Bit values in the shift register are shifted and transmitted in the order of T24 → T25 → ... → T31 → T16 → T17 → ... → T23 → T08 → T09 → ... → T15 → T00 → T01 → ... → T07 as transmit data.

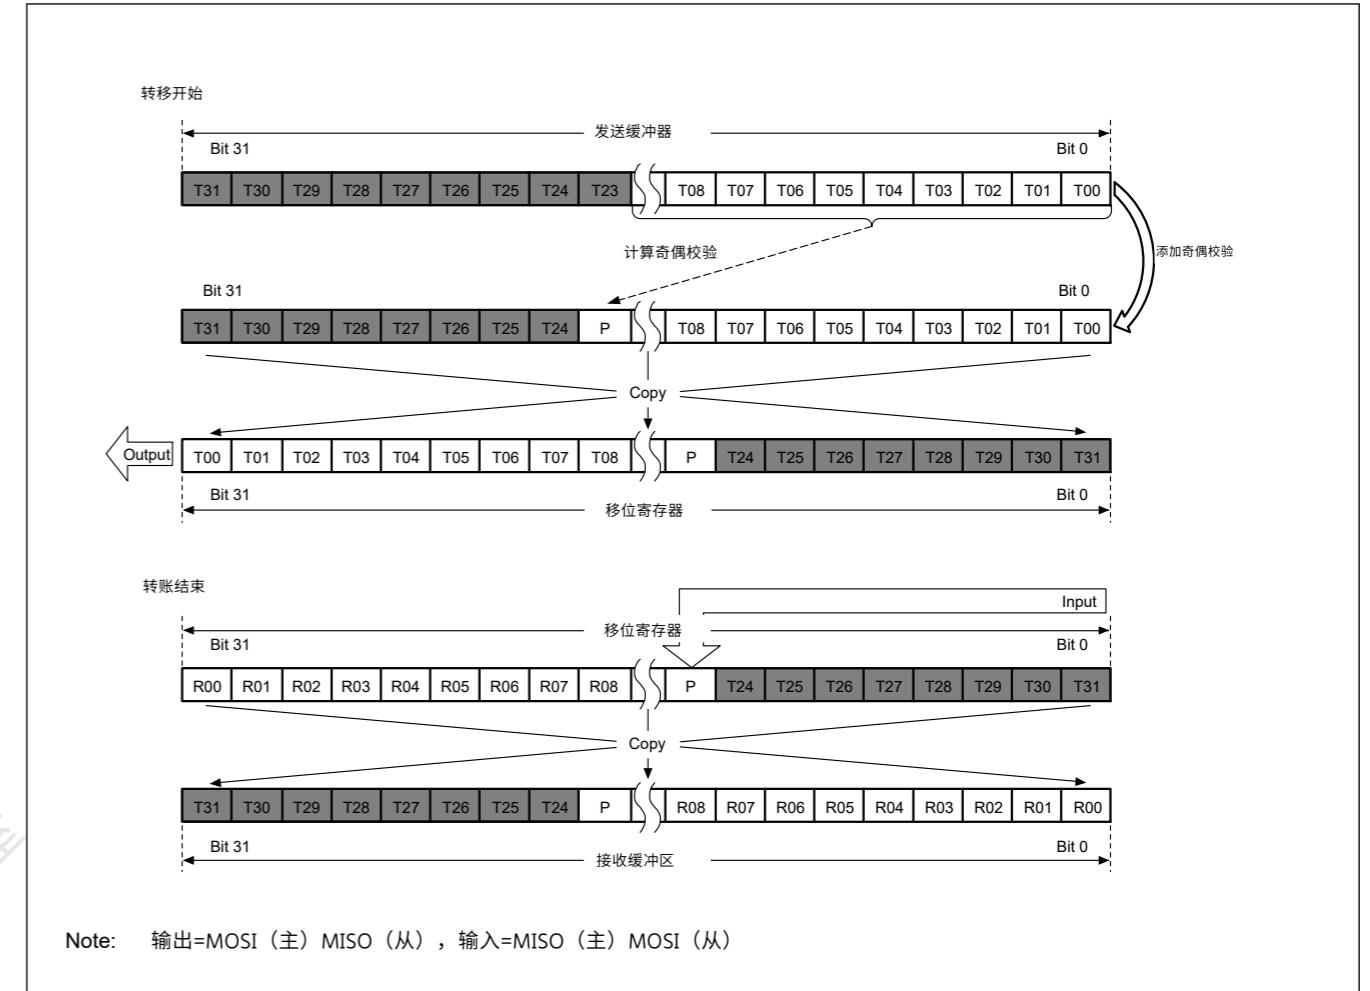

Figure 30.21 启用24位数据和奇偶校验的LSB优先传输

### 30.3.4.3 字节交换传输

#### (1) MSB优先传输。(禁用字节交换时。)

发送缓冲器中的数据 (Byte0[T31到T24]到Byte3[T07到T00]) 被复制到移位寄存器。

移位寄存器中的位值按照T31→T30→...→T00的顺序移位和传输，作为传输数据。

#### (2) MSB优先传输。(启用字节交换时。)

发送缓冲区的字节值 (Byte0[T31到T24]到Byte3[T07到T00]) 以字节为单位反转，并按照Byte3[T07到T00]到Byte0[T31到T24]的顺序复制到移位寄存器。

移位寄存器中的位值按照T07→T06→...→T00→T15→T14→...→T08→T23→T22→...→T16→T31→T30→...→T24作为传输数据。

#### (3) LSB优先传输。(禁用字节交换时。)

发送缓冲区的位值 (Byte0[T31到T24]到Byte3[T07到T00]) 以位为单位反转，并按照Byte3[T00到T07]到Byte0[T24到T31]的顺序复制到移位寄存器。

移位寄存器中的位值按照T00→T01→...→T31的顺序移位和发送，作为发送数据。

#### (4) LSB优先传输。(启用字节交换时。)

发送缓冲区 (Byte0[T31到T24]到Byte3[T07到T00]) 的每个字节的位值以位为单位反转，并按照Byte0[T24到T31]到Byte3[T00]的顺序复制到移位寄存器到T07。

移位寄存器中的位值按照T24→T25→...→T31→T16→T17→...→T23→T08→T09→...→T15→T00→T01→...→T07作为传输数据。

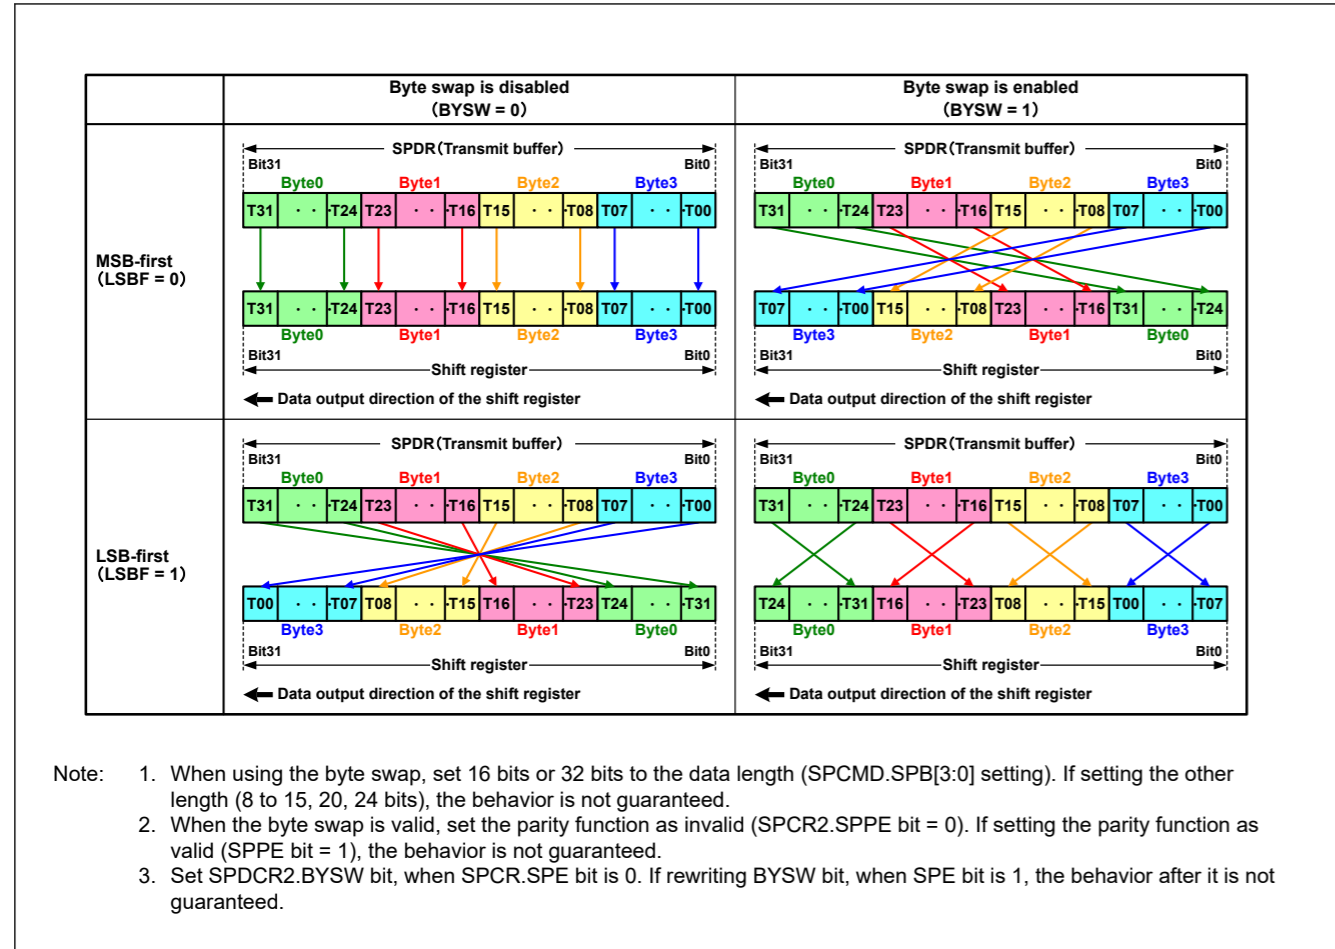

Figure 30.22 Byte swap with MSB/LSB transfer

### 30.3.4.4 Byte Swap Reception

#### (1) MSB-first transfer. (When the byte swap is disabled.)

The first received data (R31) is stored in bit 0 of the shift register, and received data is shifted in the order of R31 → R30 → ... → R00.

When necessary RSPCK cycles are input and data is stored from Byte0 [R31 to R24] to Byte3 [R07 to R00], the shift register value is copied to the receive buffer.

#### (2) MSB-first transfer. (When the byte swap is enabled.)

The first received data (R07) is stored in bit 0 of the shift register, and received data is shifted in the order of R07 → R06 → ... → R00 → R15 → R14 → ... → R08 → R23 → R22 → ... → R16 → R31 → R30 → ... → R24.

When necessary RSPCK cycles are input and data is stored from Byte3 [R07 to R00] to Byte0 [R31 to R24], byte values in the shift register are reversed in byte units and are copied to the receive buffer in the order of Byte0 [R31 to R24] to Byte3 [R07 to R00].

#### (3) LSB-first transfer. (When the byte swap is disabled.)

The first received data (R00) is stored in bit 0 of the shift register, and received data is shifted in the order of R00 → R01 → ... → R31.

When necessary RSPCK cycles are input and data is stored from Byte3 [R00 to R07] to Byte0 [R24 to R31], bit values in the shift register are reversed in bit units and are copied to the receive buffer in the order of Byte0 [R31 to R24] to Byte3 [R07 to R00].

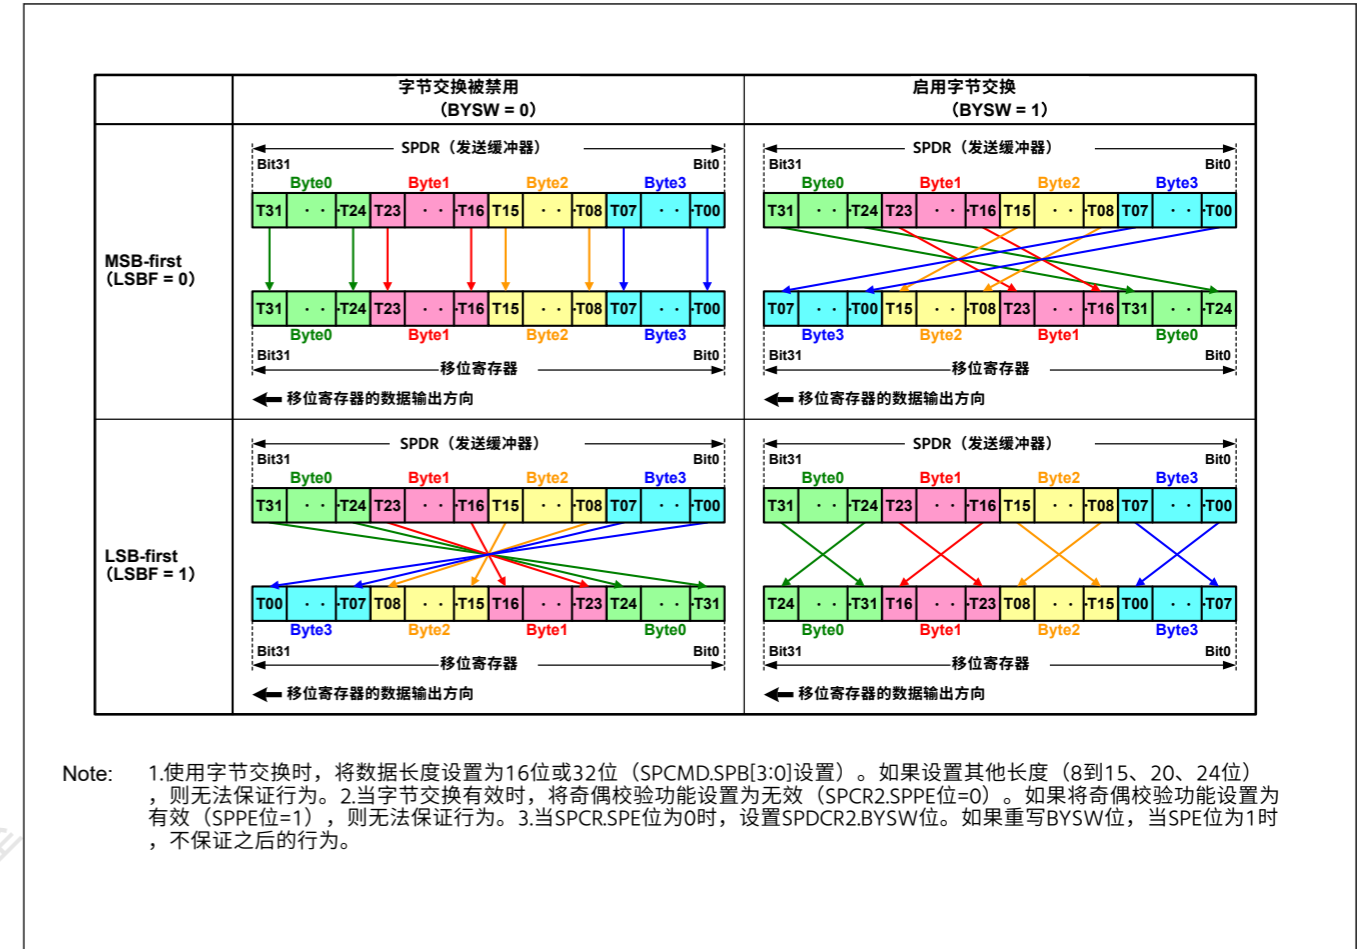

Figure 30.22 带MSBLSB传输的字节交换

### 30.3.4.4 字节交换接收

#### (1) MSB优先传输。（禁用字节交换时。）

第一个接收到的数据（R31）存储在移位寄存器的第0位，接收到的数据按照R31→R30→...→R00的顺序进行移位。

当输入必要的RSPCK周期并将数据从Byte0[R31到R24]存储到Byte3[R07到R00]时，移位寄存器值被复制到接收缓冲区。

#### (2) MSB优先传输。（启用字节交换时。）

第一个接收到的数据（R07）存放在移位寄存器的第0位，接收到的数据按照R07→R06→...→R00→R15→R14→...→R08→R23→R22→...→R16→R31→R30→...→R24的顺序移位。

当输入必要的RSPCK周期并将数据从Byte3[R07到R00]存储到Byte0[R31到R24]时，移位寄存器中的字节值以字节为单位进行反转，并按Byte0[R31的顺序复制到接收缓冲区到R24]到字节3[R07到R00]。

#### (3) LSB优先传输。（禁用字节交换时。）

第一个接收到的数据（R00）存放在移位寄存器的第0位，接收到的数据按照R00→R01→...→R31的顺序移位。

当输入必要的RSPCK周期并将数据从Byte3[R00到R07]存储到Byte0[R24到R31]时，移位寄存器中的位值以位为单位反转，并按Byte0[R31的顺序复制到接收缓冲区到R24]到字节3[R07到R00]。

(4) LSB-first transfer. (When the byte swap is enabled.)

The first received data (R24) is stored in bit 0 of the shift register, and received data is shifted in the order of R24 → R25 → ... → R31 → R16 → R17 → ... → R23 → R08 → R09 → ... → R15 → R00 → R01 → ... → R07.

When necessary RSPCK cycles are input and data is stored from Byte0 [R24 to R31] to Byte3 [R00 to R07], bit values of each byte in the shift register are reversed in bit units and are copied to the receive buffer in the order of Byte0 [R31 to R24] to Byte3 [R07 to R00].

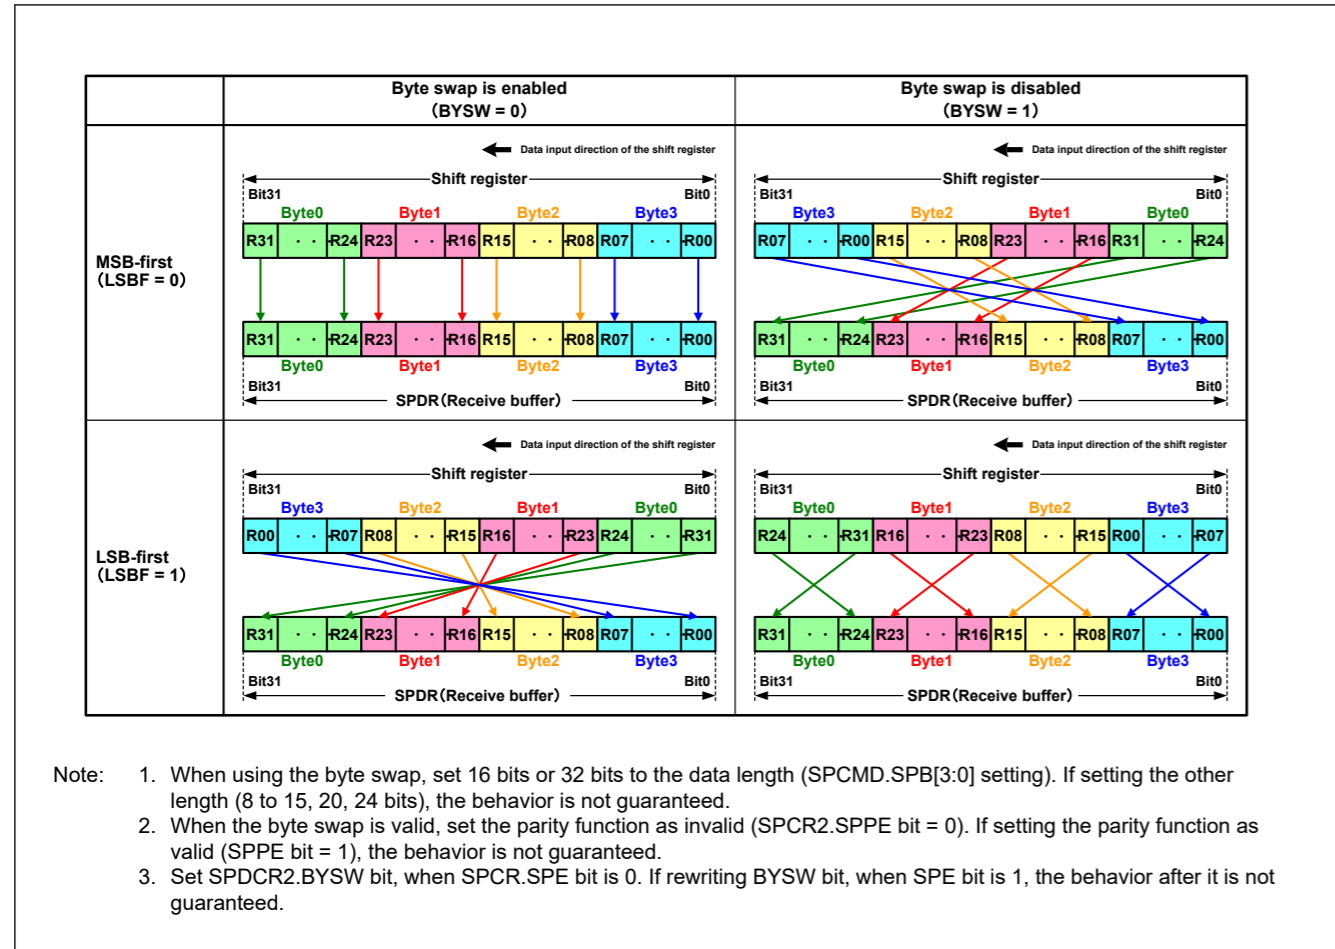

Figure 30.23 Byte swap with MSB/LSB transfer

30.3.5 Transfer Formats

30.3.5.1 When CPHA = 0

Figure 30.24 shows an example transfer format for the serial transfer of 8-bit data when the SPCMDm.CPHA bit is 0. Do not perform clock synchronous operation (SPCR.SPMS = 1) when the SPI operates in slave mode (SPCR.MSTR = 0) and the CPHA bit is 0. In Figure 30.24, RSPCKn (CPOL = 0) indicates the RSPCKn signal waveform when the SPCMDm.CPOL bit is 0, and RSPCKn (CPOL = 1) indicates the RSPCKn signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which the SPI fetches serial transfer data into the shift register. The I/O directions of the signals depend on the SPI settings. For details, see section 30.3.2. Controlling the SPI Pins.

When the SPCMDm.CPHA bit is 0, the driving of valid data to the MOSIn and MISOOn signals begins at an SSLni signal assertion. The first RSPCKn signal change that occurs after the SSLni signal assertion becomes the first transfer data fetch. After this, data is sampled every 1 RSPCK cycle. The change timing for MOSIn and MISOOn signals is 1/2 RSPCK cycles after the transfer data fetch timing. The CPOL bit setting does not affect the RSPCK signal operation timing as it only affects the signal polarity.

t1 denotes the RSPCK delay, the period from an SSLni signal assertion to RSPCKn oscillation. t2 denotes the SSL negation delay, the period from the termination of RSPCKn oscillation to an SSLni signal negation. t3 denotes the next-access delay,

(4) LSB优先传输。(启用字节交换时。)

第一个接收到的数据 (R24) 存放在移位寄存器的第0位, 接收到的数据按R24→R25→...→R31→R16→R17→...→R23→R08→R09→...→R15→的顺序移位R00→R01→...→R07。

当输入必要的RSPCK周期并将数据从Byte0[R24到R31]到Byte3[R00到R07]存储时, 移位寄存器中每个字节的位值以位为单位反转, 并按顺序复制到接收缓冲区Byte0[R31到R24]到Byte3[R07到R00]。

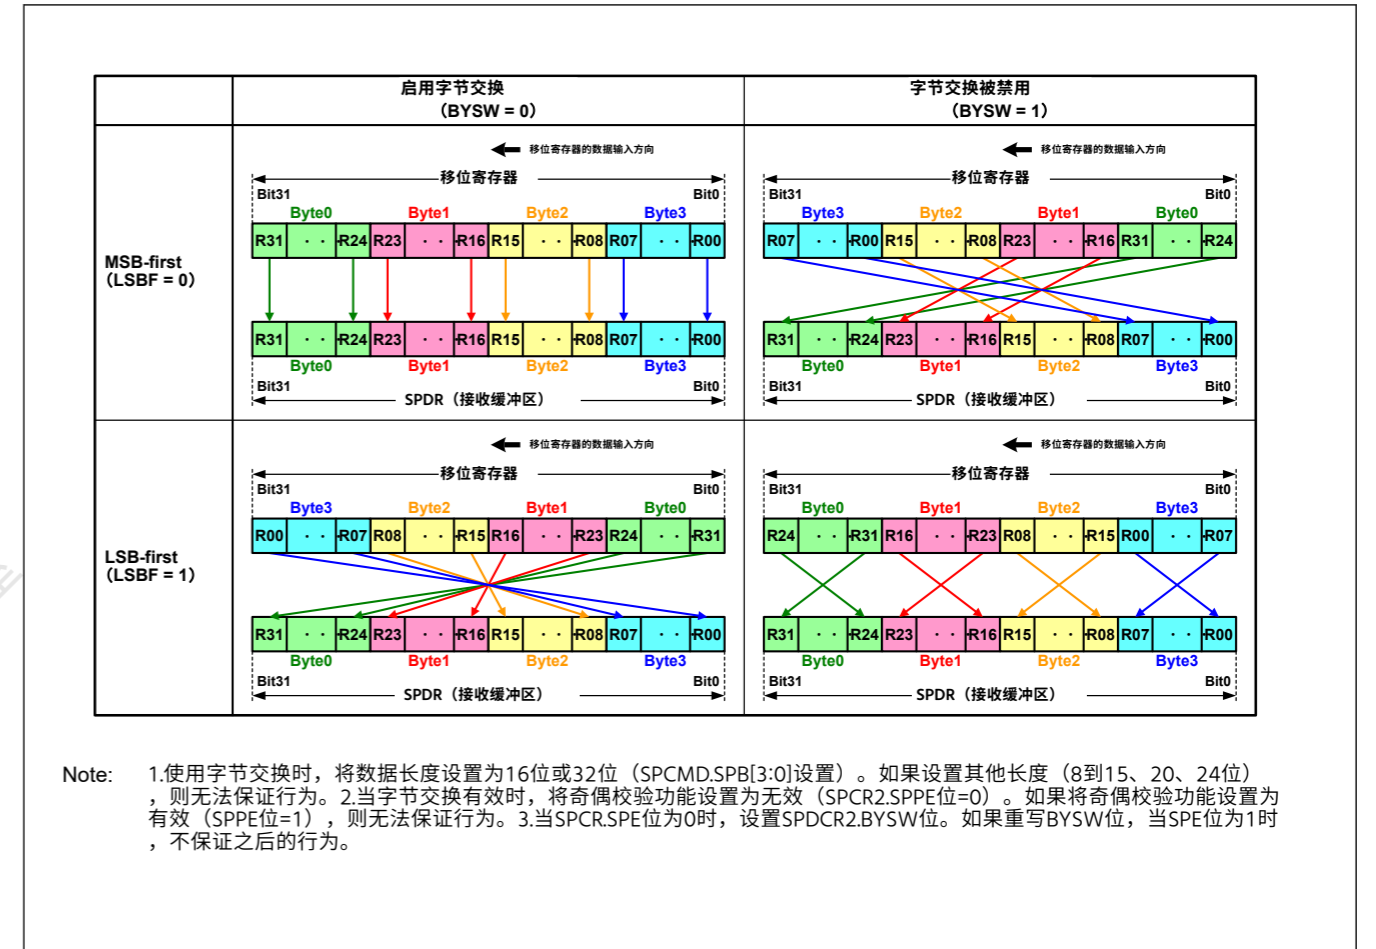

Figure 30.23 带MSB/LSB传输的字节交换

30.3.5 传输格式

30.3.5.1 When CPHA = 0

图30.24显示了当SPCMDm.CPHA位为0时串行传输8位数据的示例传输格式。当SPI在从机模式下运行时 (SPCR.MSTR=0)且CPHA位为0。在图30.24中, RSPCKn(CPOL=0)表示SPCMDm.CPOL位为0时的RSPCKn信号波形, RSPCKn(CPOL=1)表示CPOL位为1时的RSPCKn信号波形。采样时序表示SPI将串行传输数据取入移位寄存器的时序。信号的IO方向取决于SPI设置。有关详细信息, 请参阅第30.3.2节。控制SPI引脚。

当SPCMDm.CPHA位为0时, 将有效数据驱动到MOSIn和MISOOn信号开始于SSLni信号断言。在SSLni信号断言之后发生的第一个RSPCKn信号变化成为第一次传输数据获取。此后, 每1个RSPCK周期对数据进行采样。MOSIn和MISOOn信号的变化时序是传输数据获取时序之后的1/2 RSPCK周期。CPOL位设置不影响RSPCK信号操作时序, 因为它只影响信号极性。

t1表示RSPCK延迟, 即从SSLni信号断言到RSPCKn振荡的周期。t2表示SSL否定延迟, 即从RSPCKn振荡终止到SSLni信号否定的周期。t3表示下一次访问延迟,

the period in which SSLni signal assertion is suppressed for the next transfer after the end of serial transfer. t1, t2, and t3 are controlled by a master device running on the SPI system. For a description of t1, t2, and t3 when the SPI is in master mode, see [section 30.3.11.1. Master mode operation](#).

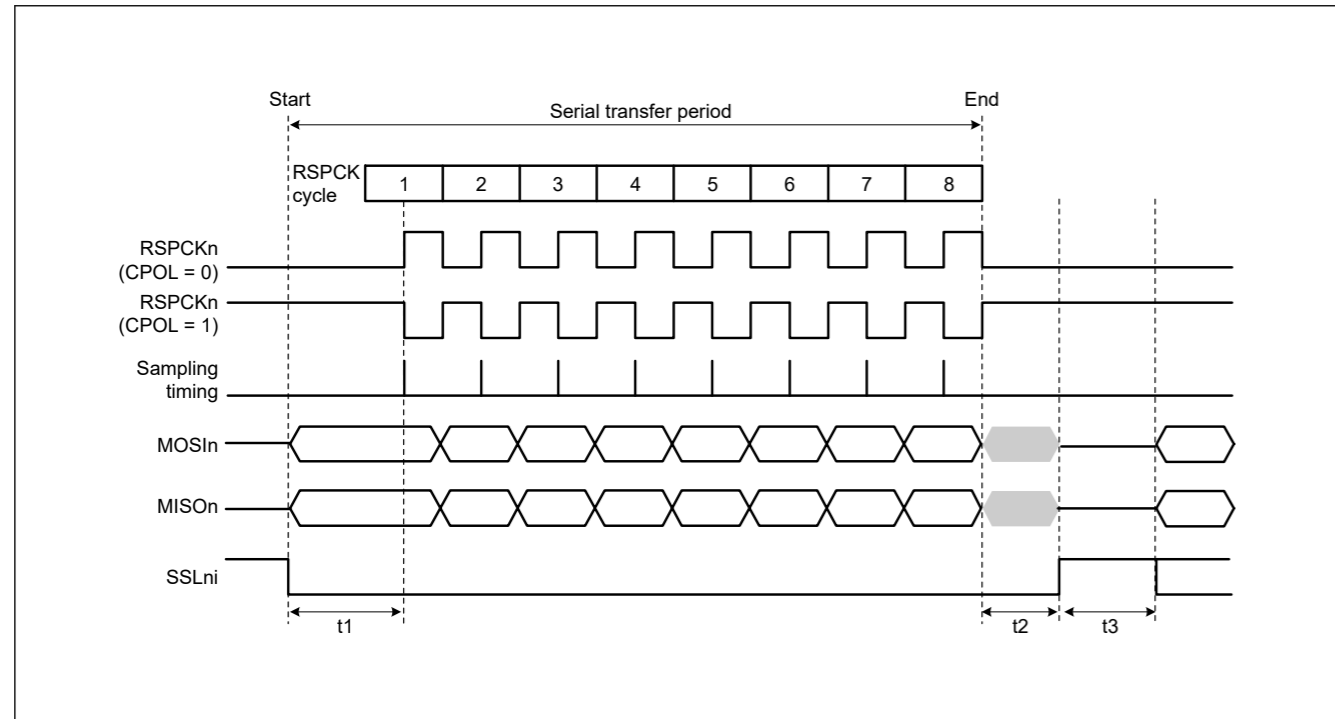

Figure 30.24 SPI transfer format when CPHA = 0

### 30.3.5.2 When CPHA = 1

Figure 30.25 shows an example transfer format for the serial transfer of 8-bit data when the SPCMDm.CPHA bit is 1. However, when the SPCR.SPMS bit is 1, the SSLni signals are not used, and only the three signals RSPCKn, MOSIn, and MISOOn handle communications. In Figure 30.25, RSPCK (CPOL = 0) indicates the RSPCKn signal waveform when the SPCMDm.CPOL bit is 0 and RSPCK (CPOL = 1) indicates the RSPCKn signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which the SPI fetches serial transfer data into the shift register. The I/O directions of the signals depend on the SPI mode (master or slave mode). For details, see [section 30.3.2. Controlling the SPI Pins](#).

When the SPCMDm.CPHA bit is 1, the driving of invalid data to the MISOOn signal begins at an SSLni signal assertion. The output of valid data to the MOSIn and MISOOn signals begins at the first RSPCKn signal change that occurs after the SSLni signal assertion. After this, data is updated every 1 RSPCK cycle. The transfer data fetch timing is 1/2 RSPCK cycles after the data update timing. The SPCMDm.CPOL bit setting does not affect the RSPCKn signal operation timing. It only affects the signal polarity.

t1, t2, and t3 are the same as those when CPHA = 0. For a description of t1, t2, and t3 when the SPI of the MCU is in master mode, see [section 30.3.11.1. Master mode operation](#).

在串行传输结束后，为下一次传输抑制SSLni信号断言的时间段。t1、t2和t3由在SPI系统上运行的主设备控制。有关SPI处于主模式时的t1、t2和t3的说明，请参见第30.3.11.1节。主模式操作。

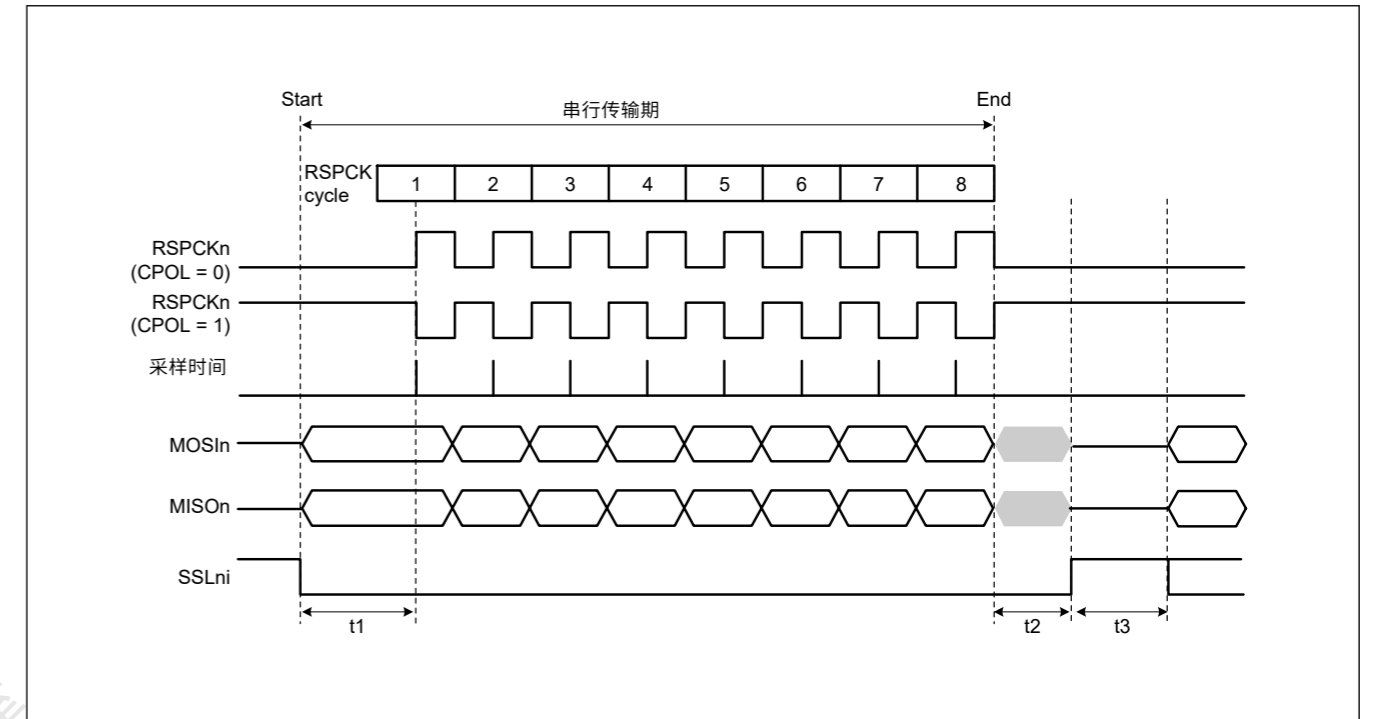

Figure 30.24 CPHA=0时的SPI传输格式

### 30.3.5.2 When CPHA = 1

图30.25显示了当SPCMDm.CPHA位为1时串行传输8位数据的示例传输格式。但是，当SPCR.SPMS位为1时，不使用SSLni信号，只有RSPCKn、MOSIn和MISOOn处理通信。在图30.25中，RSPCK(CPOL=0)表示SPCMDm.CPOL位为0时的RSPCKn信号波形，RSPCK(CPOL=1)表示CPOL位为1时的RSPCKn信号波形。SPI将串行传输数据提取到移位寄存器中。信号的IO方向取决于SPI模式（主模式或从模式）。有关详细信息，请参阅第30.3.2节。控制SPI引脚。

当SPCMDm.CPHA位为1时，将无效数据驱动到MISOOn信号开始于SSLni信号断言。在SSLni信号置位后发生的第一个RSPCKn信号变化时，开始向MOSIn和MISOOn信号输出有效数据。此后，每1个RSPCK周期更新一次数据。传输数据获取时序是数据更新时序之后的1/2个RSPCK周期。SPCMDm.CPOL位设置不影响RSPCKn信号操作时序。它只影响信号极性。

t1、t2、t3与CPHA=0时相同。MCU的SPI为主机模式时t1、t2、t3的说明见30.3.11.1节。主模式操作。

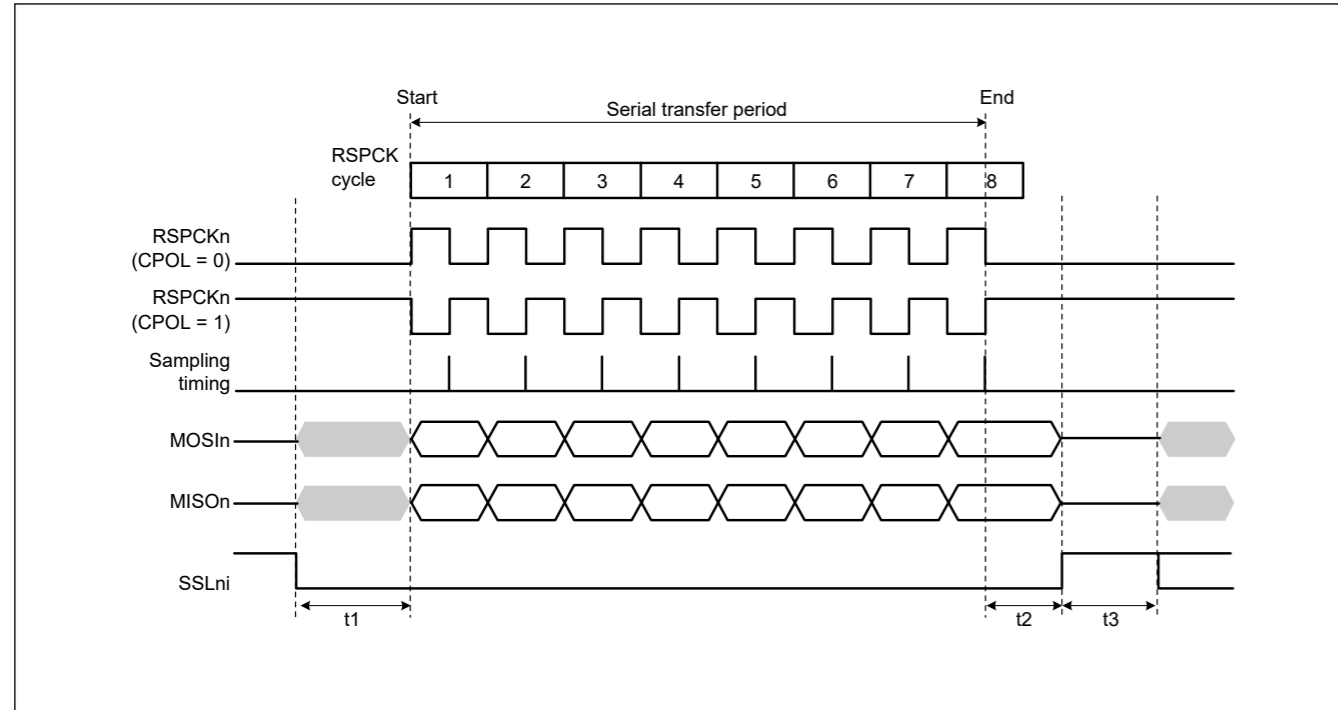

Figure 30.25 SPI transfer format when CPHA = 1

### 30.3.6 Data Transfer Modes

Full-duplex synchronous serial communications or transmit operations can only be selected in the Communications Operating Mode Select bit (SPCR.TXMD) when the extended communication mode select bit (ETXMD) in the SPI control register 3 (SPCR3) is 0. The SPI operation is receive only in slave mode (SPCR.MSTR = 0) when the SPCR3.ETXMD bit is 1, because SPCR.TXMD bit does not affect the SPI operation. The register accesses shown in Figure 30.26, Figure 30.27, and Figure 30.28 indicate the condition of access to the SPDR/SPDR\_HA register, where W denotes a write cycle.

#### 30.3.6.1 Full-duplex synchronous serial communications (SPCR3.ETXMD = 0, SPCR.TXMD = 0)

Figure 30.26 shows an example of operation when the extended communication mode select bit (ETXMD) in the SPI control register 3 (SPCR3) is set to 0 and the Communications Operating Mode Select bit (SPCR.TXMD) is set to 0. In this example, the SPI performs an 8-bit serial transfer when SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

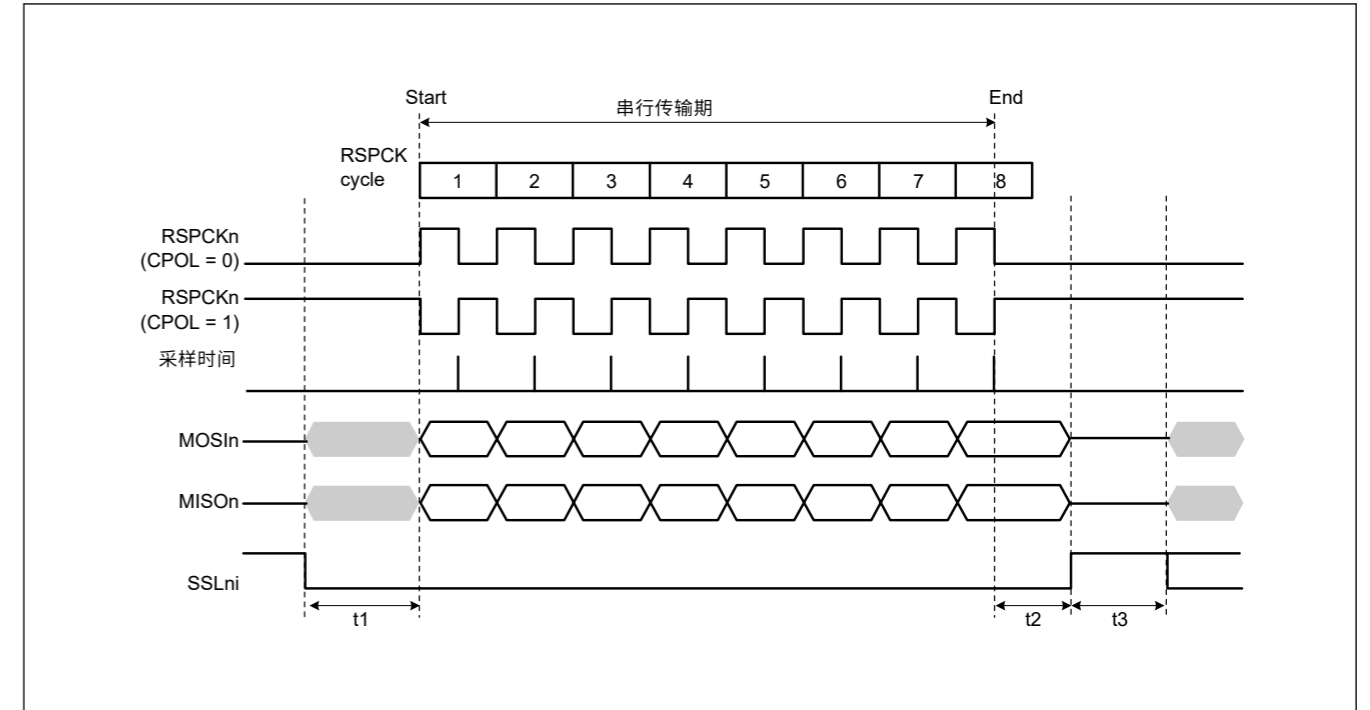

Figure 30.25 CPHA=1时的SPI传输格式

### 30.3.6 数据传输模式

全双工同步串行通信或传输操作只能在通信中选择  
当SPI控制寄存器3(SPCR3)中的扩展通信模式选择位(ETXMD)为0时，工作模式选择位(SPCR.TXMD)。当SPCR3.ETXMD位为1，因为SPCR.TXMD位不影响SPI操作。图30.26、图30.27和图30.28所示的寄存器访问表示访问SPDR/SPDR\_HA寄存器的条件，其中W表示写周期。

#### 30.3.6.1 全双工同步串行通信 (SPCR3.ETXMD=0, SPCR.TXMD = 0)

图30.26显示了当SPI控制寄存器3(SPCR3)中的扩展通信模式选择位(ETXMD)设置为0并且通信操作模式选择位(SPCR.TXMD)设置为0时的操作示例。在此示例中，当SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为1、SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的位数。

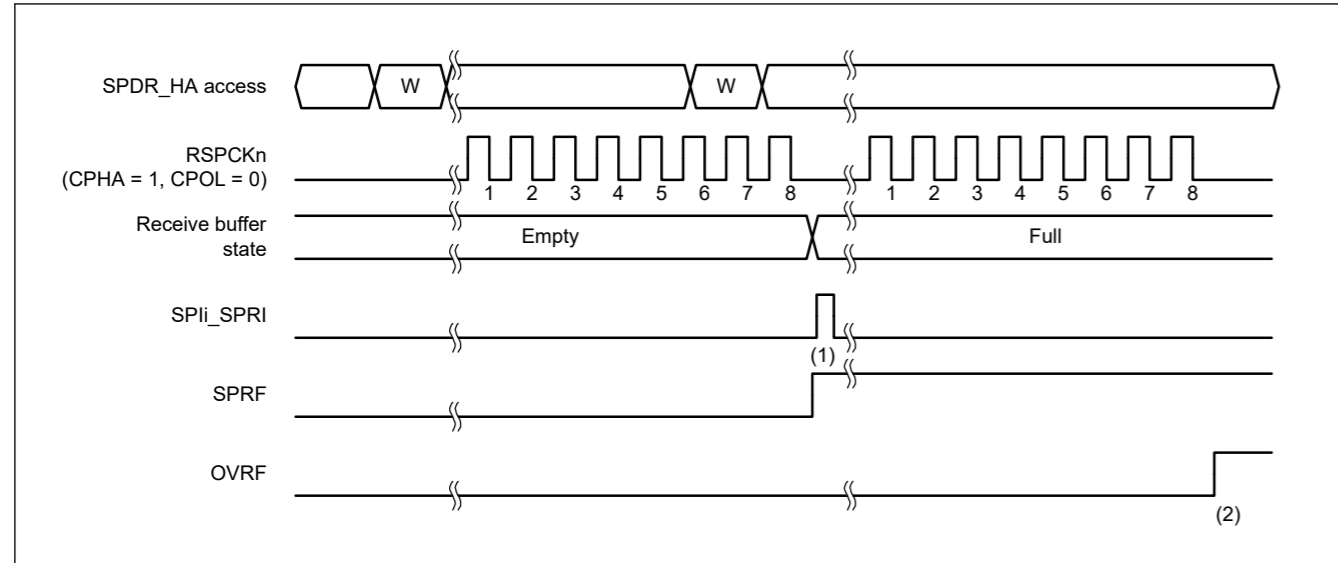

Figure 30.26 Operation example when SPCR3.ETXMD = 0 and SPCR.TXMD = 0

The operation of the flags at timings (1) and (2) in Figure 30.26 is as follows:

1. When a serial transfer ends with the receive buffer of SPDR\_HA empty, the SPI generates a receive buffer full interrupt request (SPIi\_SPRI), the SPI sets the SPSR.SPRF flag to 1, and copies the received data in the shift register to the receive buffer.
2. When a serial transfer ends with the receive buffer of SPDR\_HA holding data that was received in the previous serial transfer, the SPI sets the SPSR.OVRF flag to 1, and discards the received data in the shift register. For details about the operation of the SPSR.OVRF flag, see section 30.3.9.1. Overrun errors.

### 30.3.6.2 Transmit-Only Serial Communications (SPCR3.ETXMD = 0, SPCR.TXMD = 1)

Figure 30.27 shows an example of operation when the extended communication mode select bit (ETXMD) in the SPI control register 3 (SPCR3) is set to 0 and the Communications Operating Mode Select bit (SPCR.TXMD) is set to 1. In this example, the SPI performs an 8-bit serial transfer when SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

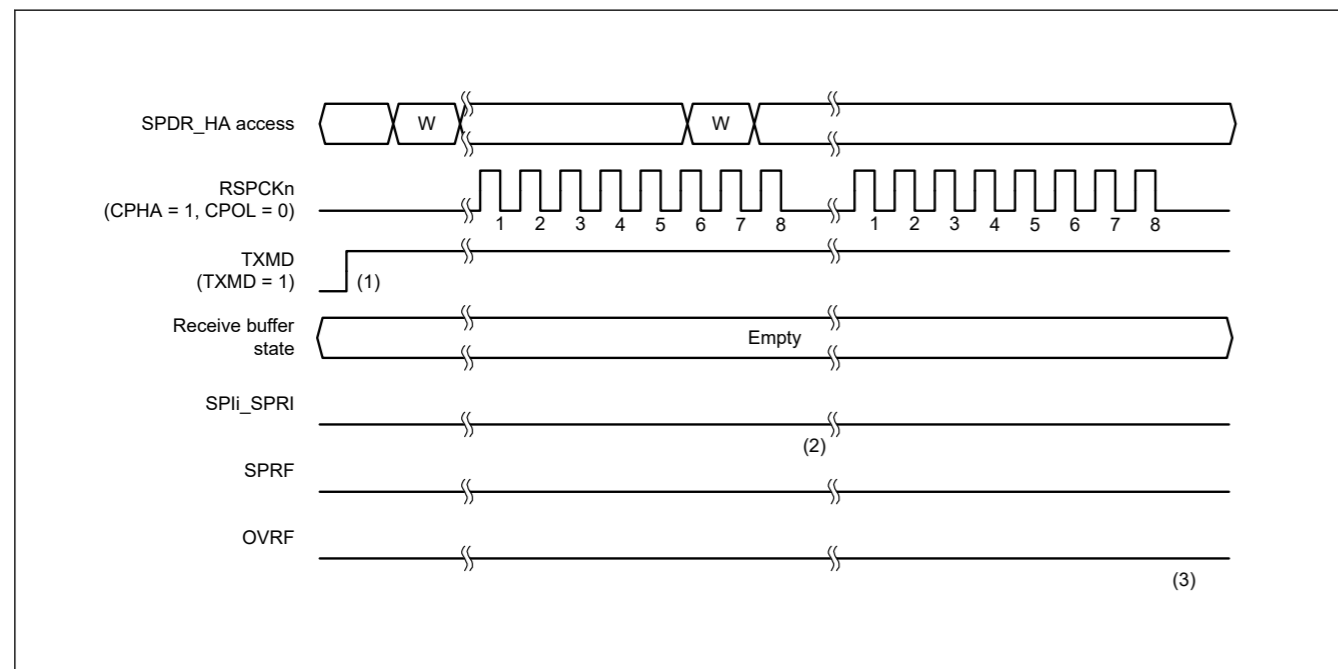

Figure 30.27 Operation example when SPCR3.ETXMD = 0 and SPCR.TXMD = 1

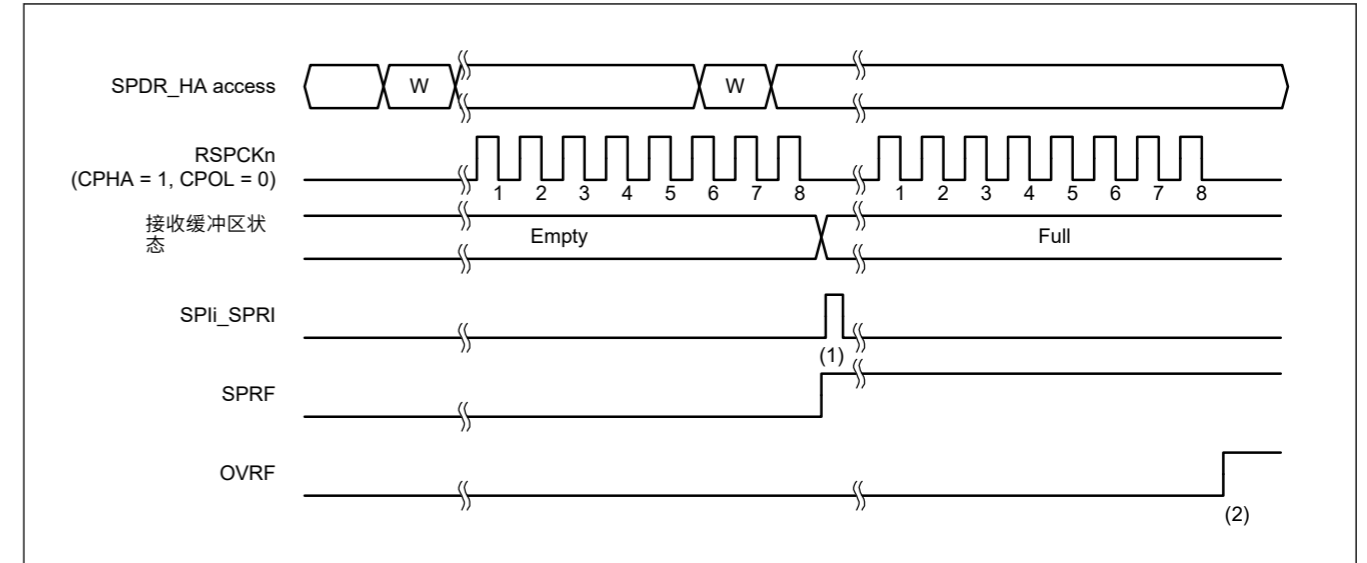

Figure 30.26 SPCR3.ETXMD=0和SPCR.TXMD=0时的操作示例

图30.26中时序(1)和(2)的标志操作如下:

- 1.当串行传输结束且SPDR\_HA的接收缓冲区为空时，SPI产生接收缓冲区满中断请求（SPIi\_SPRI），SPI将SPSR.SPRF标志设置为1，并将接收到的移位寄存器中的数据复制到接收缓冲区。
- 2.当串行传输结束时，SPDR\_HA的接收缓冲区保存了前一次串行传输中接收到的数据，SPI将SPSR.OVRF标志设置为1，并丢弃移位寄存器中接收到的数据。有关SPSR.OVRF标志操作的详细信息，请参见第30.3.9.1节。溢出错误。

### 30.3.6.2 仅发送串行通信 (SPCR3.ETXMD=0, SPCR.TXMD=1)

图30.27显示了当SPI控制寄存器3 (SPCR3) 中的扩展通信模式选择位 (ETXMD) 设置为0并且通信操作模式选择位 (SPCR.TXMD) 设置为1时的操作示例。在此示例中，当SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为1、SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的位数。

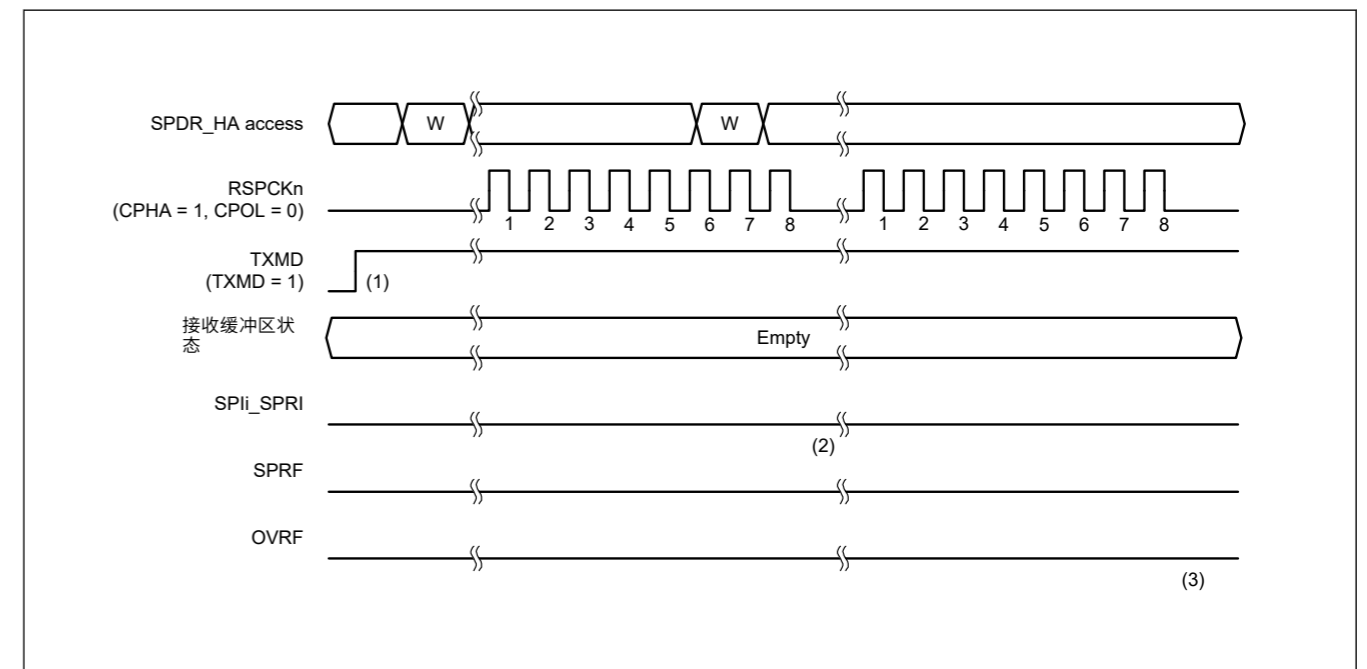

Figure 30.27 SPCR3.ETXMD=0和SPCR.TXMD=1时的操作示例

The operation of the flags at timings (1) to (3) in Figure 30.27 is as follows:

1. Make sure there is no data left in the receive buffer (the SPSR.SPRF flag is 0) and the SPSR.OVRF flag is 0 before entering transmit-only mode (SPCR3.ETXMD = 0, SPCR.TXMD = 1).
2. When a serial transfer ends with the receive buffer of SPDR\_HA empty, if the transmit-only mode is selected (SPCR3.ETXMD = 0, SPCR.TXMD = 1), the SPSR.SPRF flag retains the value of 0, and the SPI does not copy the data in the shift register to the receive buffer.
3. Because the receive buffer of SPDR\_HA does not hold data that was received in the previous serial transfer, even when a serial transfer ends, the SPSR.OVRF flag retains the value of 0, and the data in the shift register is not copied to the receive buffer.

In transmit-only mode (SPCR3.ETXMD = 0, SPCR.TXMD = 1), the SPI transmits data but does not receive data. Therefore, the SPSR.SPRF and SPSR.OVRF flags remain 0 at timings (1) to (3).

### 30.3.6.3 Receive-Only Serial Communication (MSTR = 0, ETXMD = 1)

Figure 30.28 shows an example of operation when the SPI master/slave mode select bit (MSTR) in the SPI control register (SPCR) is set to 0 and the extended communication mode select bit (ETXMD) in the SPI control register 3 (SPCR3) is set to 1. In the example in Figure 30.28, the SPI performs 8-bit data serial transfer with the settings of SPFC[1:0] in the SPI data control register (SPDCR) = 00b, CPHA in the SPI command register (SPCMD) = 1, and CPOL in SPCMD = 0. Numbers under the RSPCK waveform show the number of RSPCK cycles (number of transfer bits).

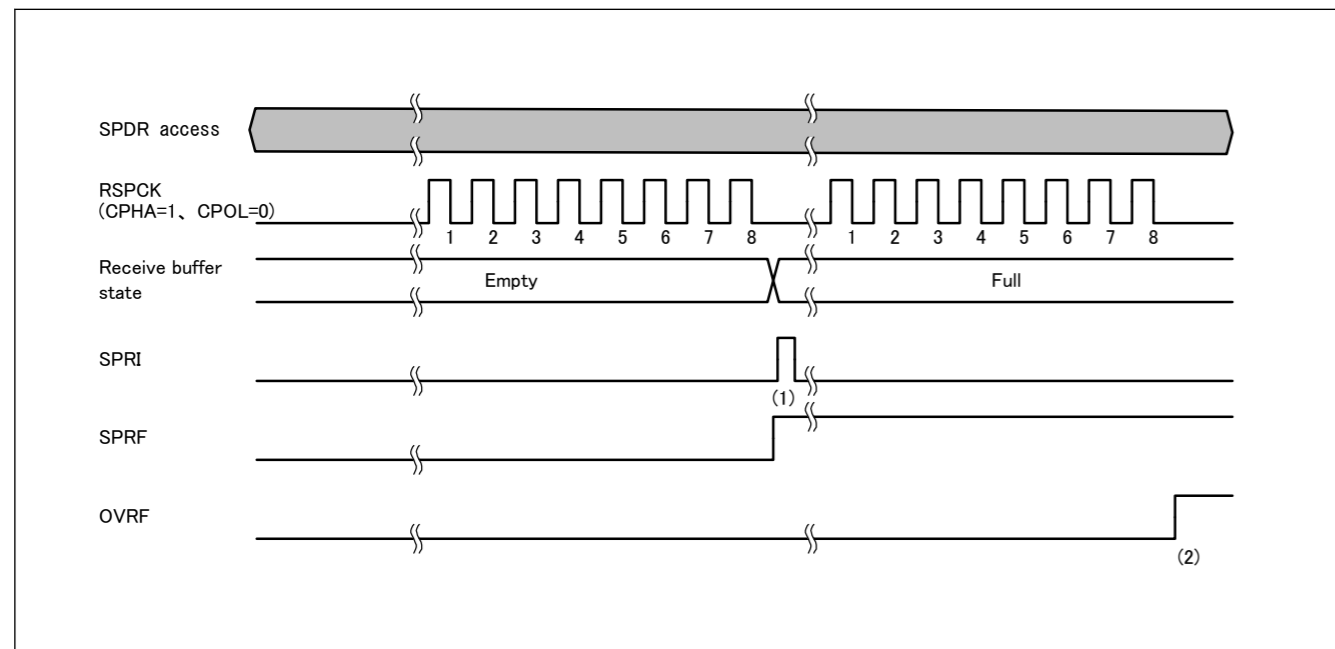

Figure 30.28 Example of Operation when MSTR = 0 and ETXMD = 1

The following describes operation of flags at timings (1) and (2) in the figure above.

- (1) When serial transfer ends while the SPDR's receive buffer is empty, the SPI generates a receive buffer full interrupt request SPRI (setting the SPSR.SPRF flag to 1) and copies the received data in the shift register to the receive buffer
- (2) When serial transfer ends while previously received data is remaining in the SPDR's receive buffer, the SPI sets the OVRF flag in the SPI status register (SPSR) to 1 and discards the received data in the shift register.

### 30.3.7 Transmit Buffer Empty and Receive Buffer Full Interrupts

Figure 30.29 and Figure 30.30 show examples of operation of the transmit buffer empty interrupt (SPIi\_SPTI) and the receive buffer full interrupt (SPIi\_SPRI). The SPDR\_HA register accesses shown in these figures indicate the conditions of access to the register, where W denotes a write cycle and R a read cycle. In Figure 30.29, the SPI performs an 8-bit serial transfer when SPCR.TXMD bit is 0, the SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 0, and the SPCMDm.CPOL bit is 0. In Figure 30.30, the SPI performs an 8-bit serial transfer when SPCR.TXMD bit is 0, the

图30.27中时间(1)到(3)的标志操作如下:

- 1.在进入仅发送模式 (SPCR3.ETXMD=0, SPCR.TXMD=1) 之前, 确保接收缓冲区中没有剩余数据 (SPSR.SPRF标志为0) 且SPSR.OVRF标志为0。
- 2.当串行传输结束且SPDR\_HA的接收缓冲区为空时, 如果选择了仅传输模式 (SPCR3.ETXMD=0 SPCR.TXMD=1), SPSR.SPRF标志保持0的值, SPI不将移位寄存器中的数据复制到接收缓冲区。
- 3.因为SPDR\_HA的接收缓冲区中没有保存上一次串行传输接收到的数据, 所以即使一次串行传输结束, SPSR.OVRF标志保持值0, 移位寄存器中的数据不会被复制到接收缓冲区。

在仅发送模式下 (SPCR3.ETXMD=0, SPCR.TXMD=1), SPI发送数据但不接收数据。因此, SPSR.SPRF和SPSR.OVRF标志在时间(1)到(3)保持0。

### 30.3.6.3 仅接收串行通信 (MSTR=0, ETXMD=1)

图30.28显示了当SPI控制寄存器(SPCR)中的SPI主从模式选择位(MSTR)设置为0并且SPI控制寄存器3(SPCR3)中的扩展通信模式选择位(ETXMD)为设置为1。在图30.28的示例中, SPI执行8位数据串行传输, 设置SPI数据控制寄存器 (SPDCR) 中的SPFC[1:0]=00b, SPI命令寄存器中的CPHA (SPCMD)=1, SPCMD中的CPOL=0。RSPCK波形下的数字表示RSPCK周期数 (传输位数)。

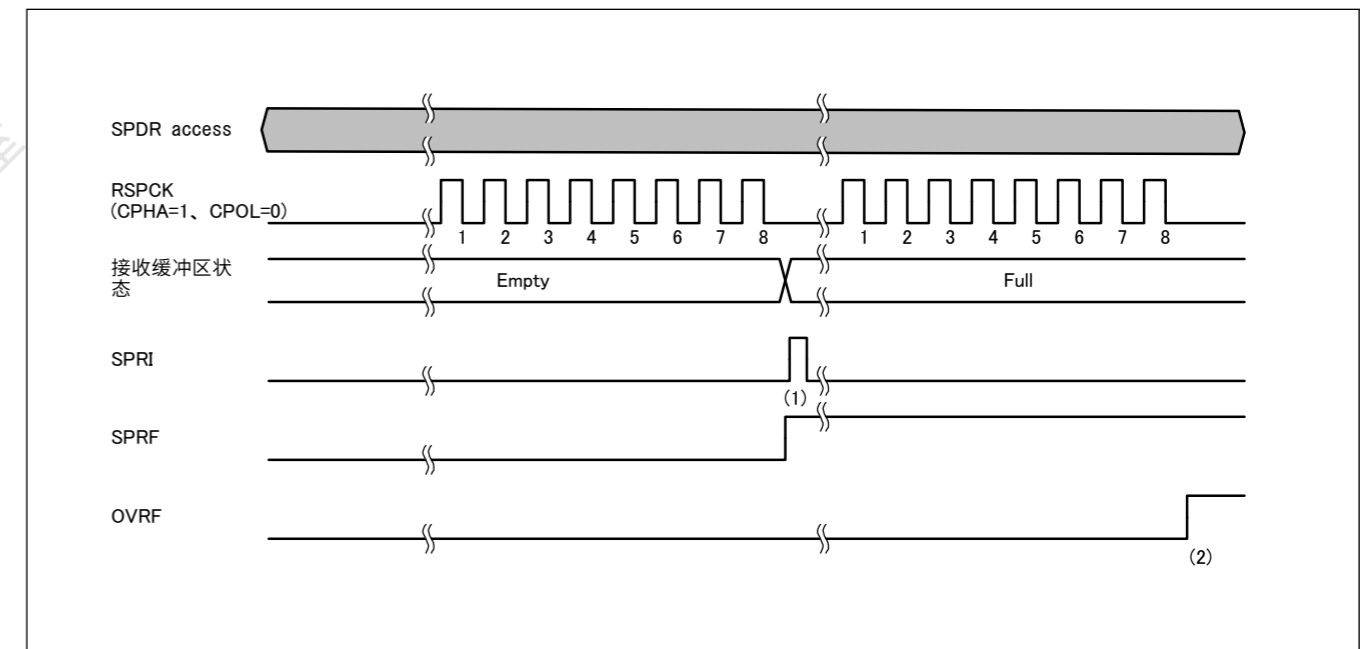

Figure 30.28 MSTR=0和ETXMD=1时的操作示例

下面描述在上图中的时间(1)和(2)的标志的操作。

- (1)当串行传输结束而SPDR的接收缓冲区为空时, SPI产生接收缓冲区满中断请求SPRI (将SPSR.SPRF标志设置为1) 并将接收到的移位寄存器中的数据复制到接收缓冲区
- (2)当串行传输结束而先前接收的数据仍留在SPDR的接收缓冲区中时, SPI将SPI状态寄存器(SPSR)中的OVRF标志设置为1, 并丢弃移位寄存器中的接收数据。

### 30.3.7 发送缓冲区空和接收缓冲区满中断

图30.29和图30.30显示了发送缓冲区空中断(SPIi\_SPTI)和接收缓冲区满中断(SPIi\_SPRI)的操作示例。这些图中显示的SPDR\_HA寄存器访问表示访问寄存器的条件, 其中W表示写周期, R表示读周期。在图30.29中, 当SPCR.TXMD位为0、SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为0、SPCMDm.CPOL位为0时, SPI执行8位串行传输。在图30.30中, 当SPCR.TXMD位为0时, SPI执行8位串行传输,

SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

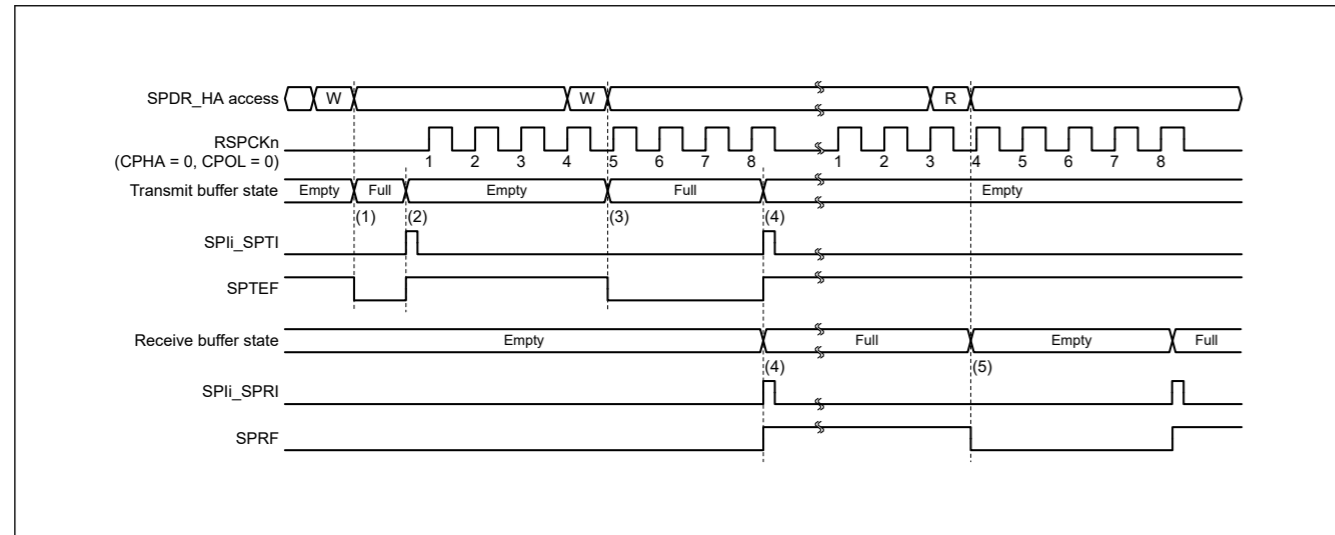

Figure 30.29 Operation example of the SPIi\_SPTI and SPIi\_SPRI interrupts when CPHA = 0 and CPOL = 0 in master mode

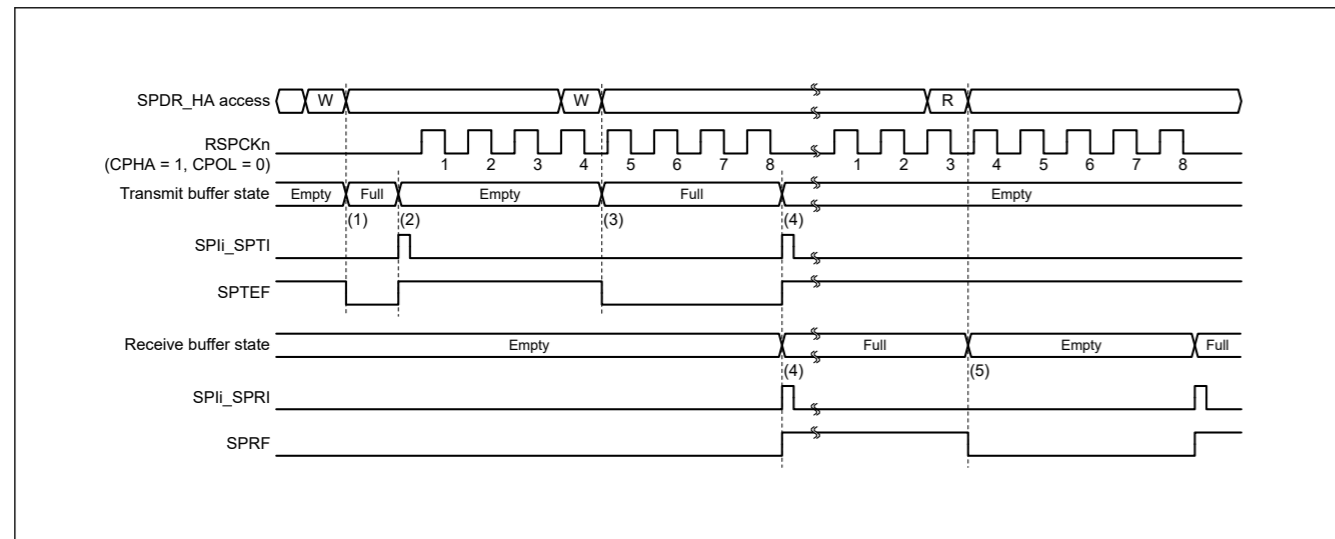

Figure 30.30 Operation example of the SPIi\_SPTI and SPIi\_SPRI interrupts when CPHA = 1 and CPOL = 0 in master mode

The operation of the SPI at timings (1) to (5) in Figure 30.29 and Figure 30.30 is as follows:

1. When transmit data is written to SPDR\_HA with the transmit buffer of SPDR\_HA is empty and data for the next transfer is not set, the SPI writes data to the transmit buffer and clears the SPSR.SPTEF flag to 0.
2. If the shift register is empty, the SPI copies the data in the transmit buffer to the shift register, generates a transmit buffer empty interrupt request (SPIi\_SPTI), and sets the SPSR.SPTEF flag to 1. How a serial transfer is started depends on the SPI mode. For details, see [section 30.3. Operation](#), and [section 30.3.12. Clock Synchronous Operation](#).
3. When transmit data is written to SPDR\_HA either by the transmit buffer empty interrupt routine, or by the processing of the transmit buffer empty using the SPTEF flag, the SPI writes data to the transmit buffer and clears the SPTEF flag to 0. Because the data being transferred serially is stored in the shift register, the SPI does not copy the data in the transmit buffer to the shift register.
4. When the serial transfer ends with the receive buffer of SPDR\_HA empty, the SPI copies the receive data in the shift register to the receive buffer, generates a receive buffer full interrupt request (SPIi\_SPRI), and sets the SPRF flag to 1. Because the shift register becomes empty on completion of the serial transfer, if the transmit buffer is full before the serial transfer ended, the SPI sets the SPTEF flag to 1 and copies data in the transmit buffer to the shift register. Even

SPDCR.SPFC[1:0]位为00b, SPCMDm.CPHA位为1, SPCMDm.CPOL位为0。波形中的RSPCKn表示RSPCK周期数, 例如传输的位数。

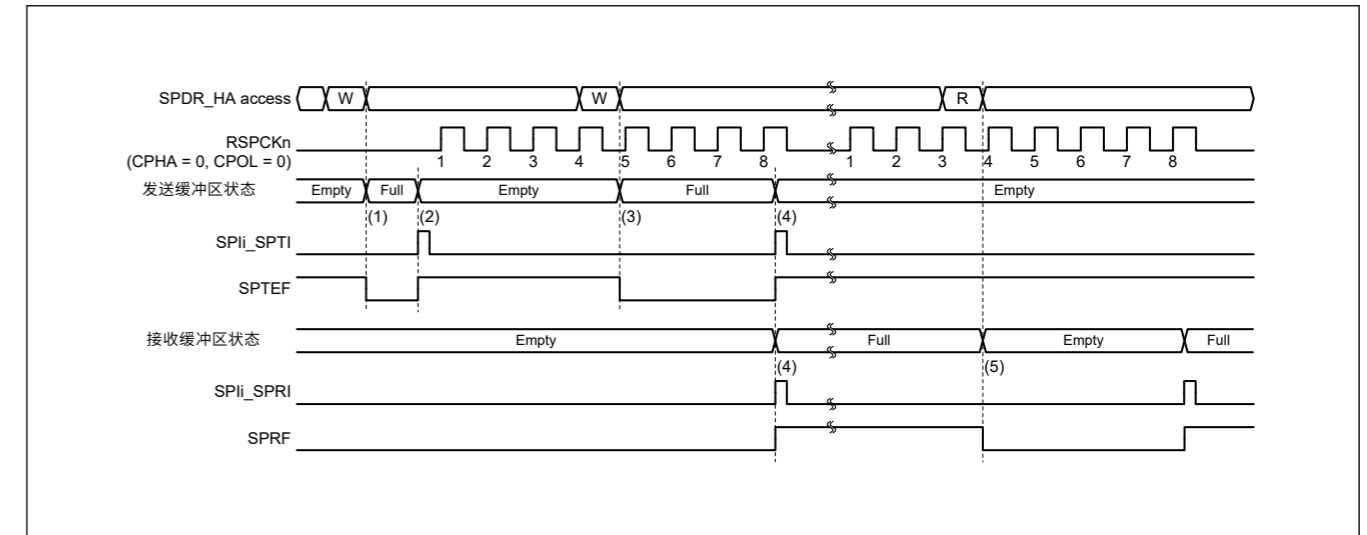

Figure 30.29 主机模式下CPHA=0和CPOL=0时SPIi\_SPTI和SPIi\_SPRI中断的操作示例

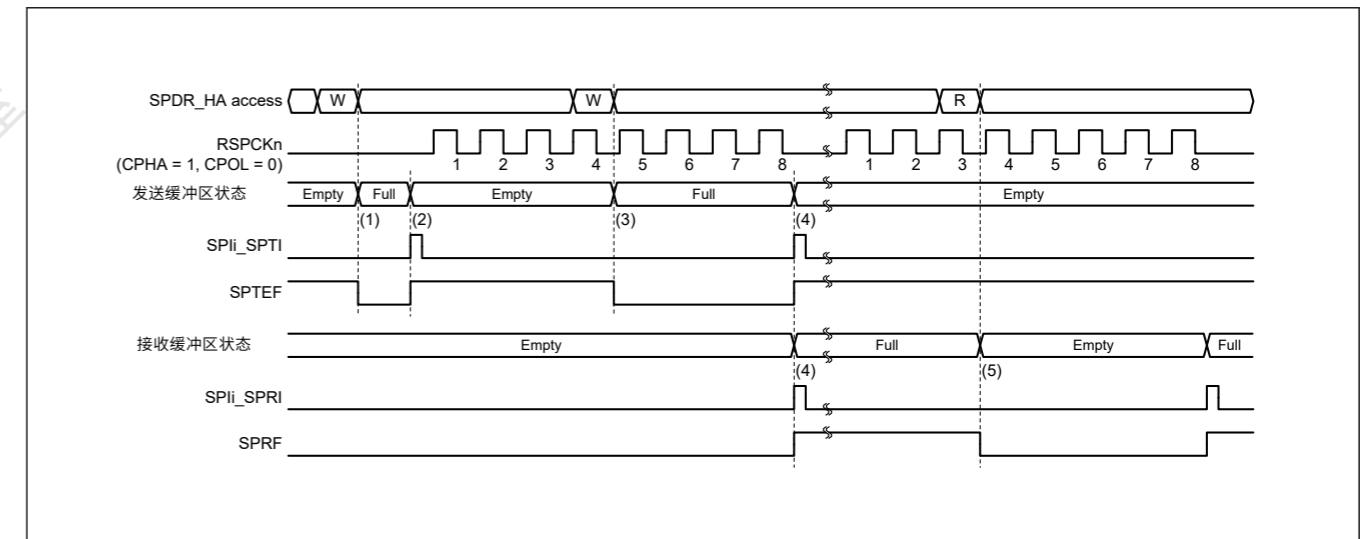

Figure 30.30 主机模式下CPHA=1和CPOL=0时SPIi\_SPTI和SPIi\_SPRI中断的操作示例

SPI在图30.29和图30.30中时序(1)到(5)的操作如下:

- 1.当发送数据写入SPDR\_HA且SPDR\_HA的发送缓冲区为空且未设置下一次传输的数据时, SPI将数据写入发送缓冲区并将SPSR.SPTEF标志清除为0。
- 2.如果移位寄存器为空, SPI将发送缓冲区中的数据复制到移位寄存器, 产生发送缓冲区空中断请求(SPIi\_SPTI), 并将SPSR.SPTEF标志设置为1。如何启动串行传输取决于SPI模式。有关详细信息, 请参阅第30.3节。操作和第30.3.12节。时钟同步操作。
- 3.当发送数据被发送缓冲区空中断程序写入SPDR\_HA时, 或者通过使用SPTEF标志处理发送缓冲区空时, SPI将数据写入发送缓冲区并将SPTEF标志清除为0。因为串行传输的数据存储在移位寄存器中, SPI不会将发送缓冲区中的数据复制到移位寄存器中。
- 4.当串行传输结束且SPDR\_HA的接收缓冲区为空时, SPI将移位寄存器中的接收数据复制到接收缓冲区, 产生接收缓冲区满中断请求(SPIi\_SPRI), 并将SPRF标志设置为1。因为串行传输完成后移位寄存器变为空, 如果在串行传输结束前发送缓冲区已满, SPI将SPTEF标志设置为1, 并将发送缓冲区中的数据复制到移位寄存器。甚至

when received data is not copied from the shift register to the receive buffer in an overrun error status, on completion of the serial transfer, the SPI determines that the shift register is empty, so data transfer from the transmit buffer to the shift register is enabled.

- When SPDR\_HA is read either by the receive buffer full interrupt routine or processing of the receive buffer full interrupt using the SPRF flag, the receive data can be read.

If SPDR\_HA is written to when the transmit buffer holds data that is not yet transmitted (the SPTEF flag is 0), the SPI does not update data in the transmit buffer. When writing to SPDR\_HA, always use either a transmit buffer empty interrupt request or processing of the transmit buffer empty interrupt using the SPTEF flag. To use a transmit buffer empty interrupt, set the SPTIE bit in SPCR to 1. If the SPI function is disabled (the SPCR.SPE bit is 0), set the SPTIE bit to 0.

When serial transfer ends and the receive buffer is full (the SPRF flag is 1), the SPI does not copy data from the shift register to the receive buffer, and it detects an overrun error (see [section 30.3.9. Error Detection](#)). To prevent a receive data overrun error, read the received data using a receive buffer full interrupt request before the next serial transfer ends. To use an SPI receive buffer full interrupt, set the SPCR.SPRIE bit to 1.

Transmission and reception interrupts or the associated IELSRn.IR flags (where n is the interrupt vector number) in the ICU can be used to confirm the states of the transmit and receive buffers.

Similarly, the SPTEF and SPRF flags can be used to confirm the states of the transmit and receive buffers. See [section 13, Interrupt Controller Unit \(ICU\)](#) for the interrupt vector numbers.

### 30.3.8 Communication End Interrupt

#### 30.3.8.1 Transmit-Receive/Transmit in Master Mode

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1, when following conditions are satisfied in transmit-receive master mode and transmit master mode. The set timing of the CENDF flag is same as IDLNF flag. The communication end interrupt (SPCI) is one PCLKUSCIX width and low active.

- When the value of the SPSSR.SPCP[2:0] bits are same as the SPSCR.SPSSLN[2:0] bits.
- When there is no next transmission data.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- When the next transmission data is written to the transmit buffer (SPTX).
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

[Figure 30.31](#) shows an example of communication end interrupt operation during transmit-receive/transmit master mode.

当接收到的数据在溢出错误状态下没有从移位寄存器复制到接收缓冲区时，在串行传输完成时，SPI确定移位寄存器为空，因此从发送缓冲区到移位寄存器的数据传输被启用。

- 当接收缓冲区满中断程序或使用SPRF标志处理接收缓冲区满中断读取SPDR\_HA时，可以读取接收数据。

如果在发送缓冲区保存尚未发送的数据时写入SPDR\_HA（SPTEF标志为0），则SPI不会更新发送缓冲区中的数据。写入SPDR\_HA时，始终使用发送缓冲区空中断请求或使用SPTEF标志处理发送缓冲区空中断。要使用发送缓冲区空中断，请将SPCR中的SPTIE位设置为1。如果禁用SPI功能（SPCR.SPE位为0），请将SPTIE位设置为0。

当串行传输结束且接收缓冲区已满（SPRF标志为1）时，SPI不会将数据从移位寄存器复制到接收缓冲区，它会检测到溢出错误（参见第30.3.9节。错误检测）。为防止接收数据溢出错误，请在下一次串行传输结束前使用接收缓冲区满中断请求读取接收数据。要使用SPI接收缓冲区满中断，请将SPCR.SPRIE位设置为1。

ICU中的发送和接收中断或相关的IELSRn.IR标志（其中n是中断向量号）可用于确认发送和接收缓冲区的状态。

类似地，SPTEF和SPRF标志可用于确认发送和接收缓冲区的状态。见第13节，用于中断向量编号的中断控制器单元(ICU)。

### 30.3.8 通讯结束中断

#### 30.3.8.1 主控模式下的发送-接收发送

在发送-接收主机模式和发送主机模式下满足以下条件时，将产生通信结束中断(SPCI)并将CENDF标志设置为1。CENDF标志的设置时序与IDLNF标志相同。通信结束中断(SPCI)是一个PCLKUSCIX宽度和低电平有效。

- 当SPSSR.SPCP[2:0]位的值与SPSCR.SPSSLN[2:0]位的值相同时。
- 当没有下一个传输数据时。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- 下一个发送数据写入发送缓冲区（SPTX）时。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图30.31显示了发送-接收发送主机模式下的通信结束中断操作示例。

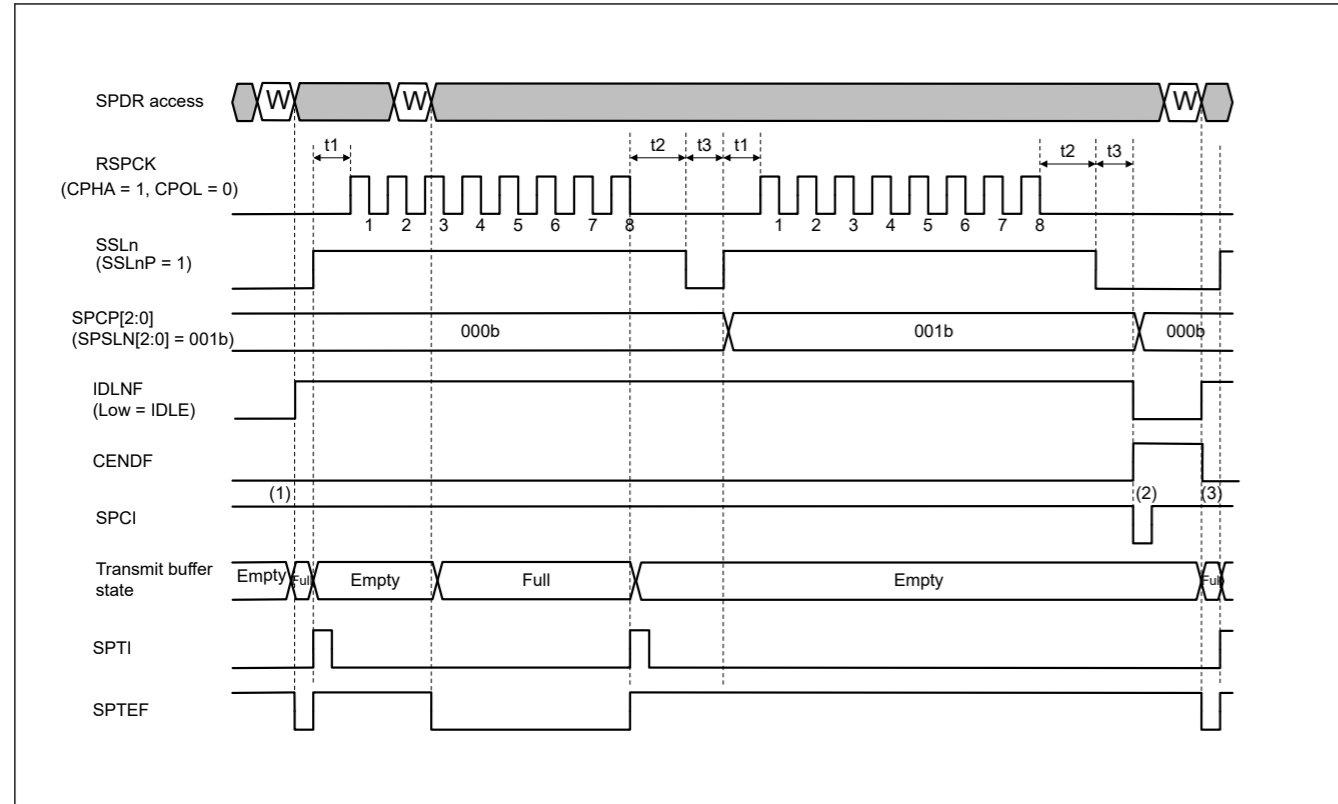

Figure 30.31 Example of Communication End Interrupt Operation (Transmit-Receive/Transmit Master mode)

1. The CENDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the end of t3 cycle, because the next command is 000b and there is no next transmit data, and then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared when the next transmission data is written to the transmit buffer (SPTX). Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

In slave mode operation, the output timing of the communication end interrupt is deferent due to the value of the SPCR.SPMS bit (RSPI mode select bit), and the clear timing of the communication end interrupt is deferent due to the communication mode (transmit-receive or transmit-only or receive-only).

### 30.3.8.2 Transmit-Receive/Transmit in Slave Mode on SPI Operation (4-wire)

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1, when both SPTX buffer and transmit shift buffer are empty in transmit-receive/transmit slave mode on SPI Operation (4-wire). The set timing of the CENDF flag is same as SSL0 negate timing. The communication end interrupt (SPCI) is one PCLKUSCIx width and low active.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- When the next transmission data is written to the transmit buffer (SPTX).
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 30.32 shows an example of communication end interrupt operation during transmit-receive/transmit slave mode on SPI operation.

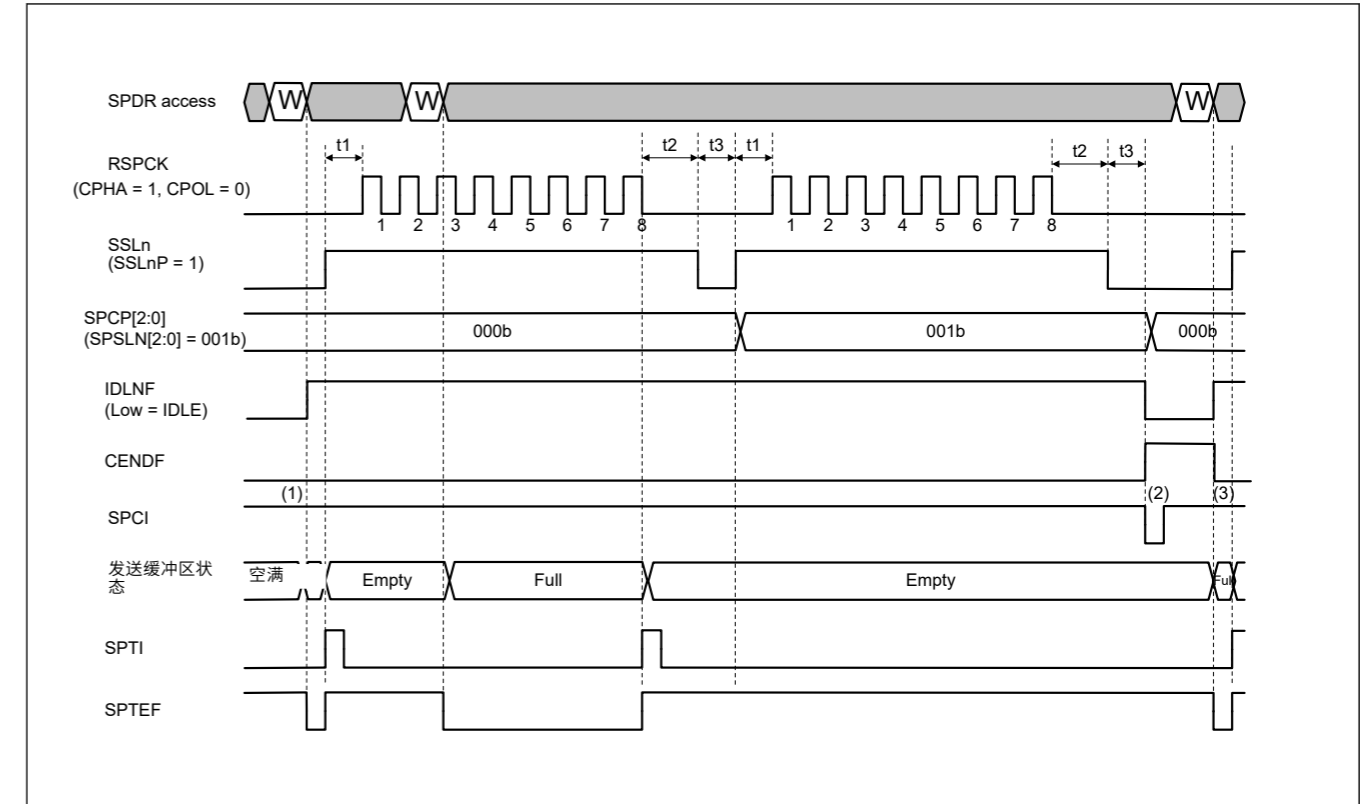

Figure 30.31 通信结束中断操作示例（发送-接收发送主机模式）

- 1、通信开始前CENDF标志为0，SPCI的电平为1，在通信过程中一直保持。
- 2.CENDF标志在t3周期结束时为1（通讯结束），因为下一条指令为000b，没有下一条发送数据，当CENDIE位为1时SPCI中断输出。
- 3.CENDF标志在下一个发送数据写入发送缓冲区（SPTX）时被清除。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

在从模式操作中，通信结束中断的输出时序是不同的，因为SPCR.SPMS位（RSPI模式选择位），通信结束中断的清除时序因通信模式（发送-接收或仅发送或仅接收）而异。

### 30.3.8.2 SPI操作（4线）从模式下的发送-接收发送

在SPI操作（4线）的发送-接收发送从模式下，当SPTX缓冲区和发送移位缓冲区都为空时，将产生通信结束中断(SPCI)并将CENDF标志设置为1。CENDF标志的设置时序与SSL0否定时序相同。通信结束中断(SPCI)是一个PCLKUSCIx宽度和低电平有效。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- 下一个发送数据写入发送缓冲区（SPTX）时。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图30.32显示了在发送-接收发送从模式开启期间的通信结束中断操作示例SPI操作。

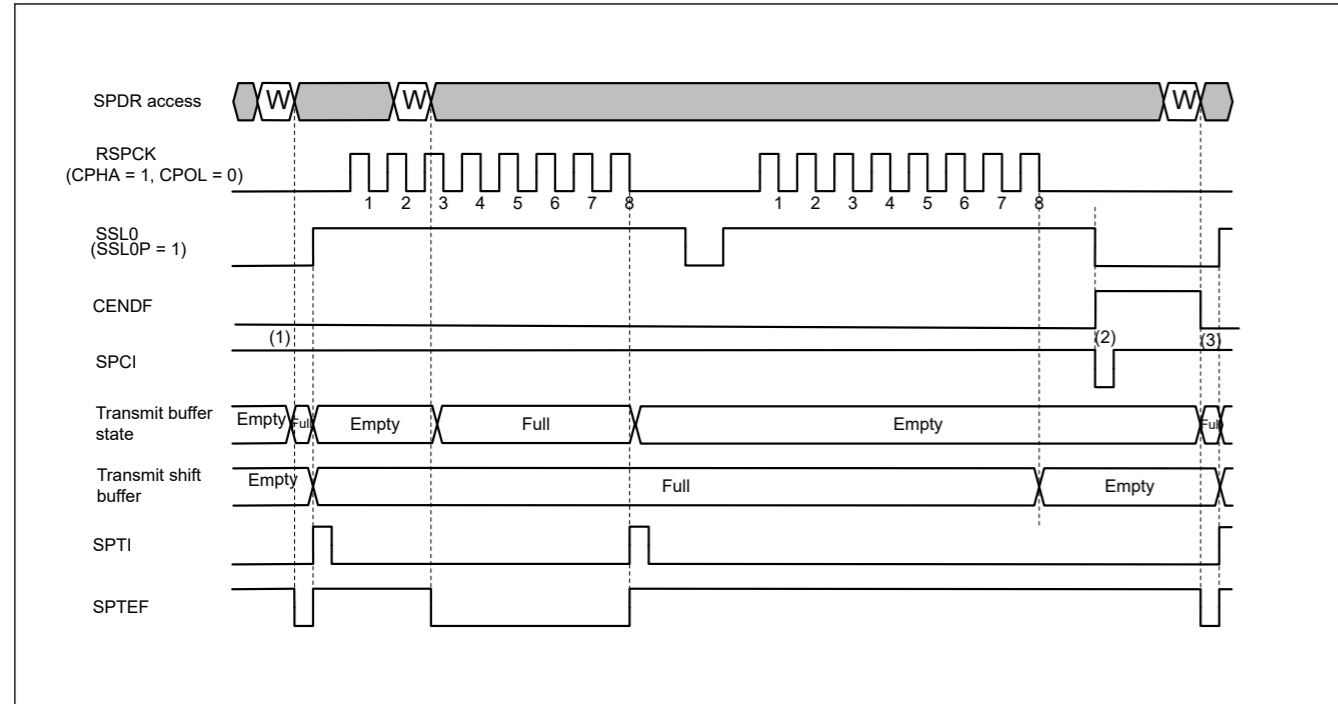

Figure 30.32 Example of Communication End Interrupt Operation (Transmit-Receive/Transmit Slave mode on SPI Operation)

1. The CENDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the timing of SSL0 negate, when both SPTX buffer and transmit shift buffer are empty, and then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared when the next transmission data is written to the transmit buffer (SPTX). Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

### 30.3.8.3 Receive Only in Slave Mode on SPI Operation (4-wire)

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1 at the SSL0 negate timing in receive only slave mode on SPI operation (4-wire). The number of transmission frame is set by the SPDCR.SPFC[1:0]. Then the SSL0 is negated at the last frame transmission end. The communication end interrupt (SPCI) is one PCLKUSCix width and low active.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- The SSL0 assert timing of next transmission.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 30.33 shows an example of communication end interrupt operation during receive only slave mode on SPI operation (4-wire).

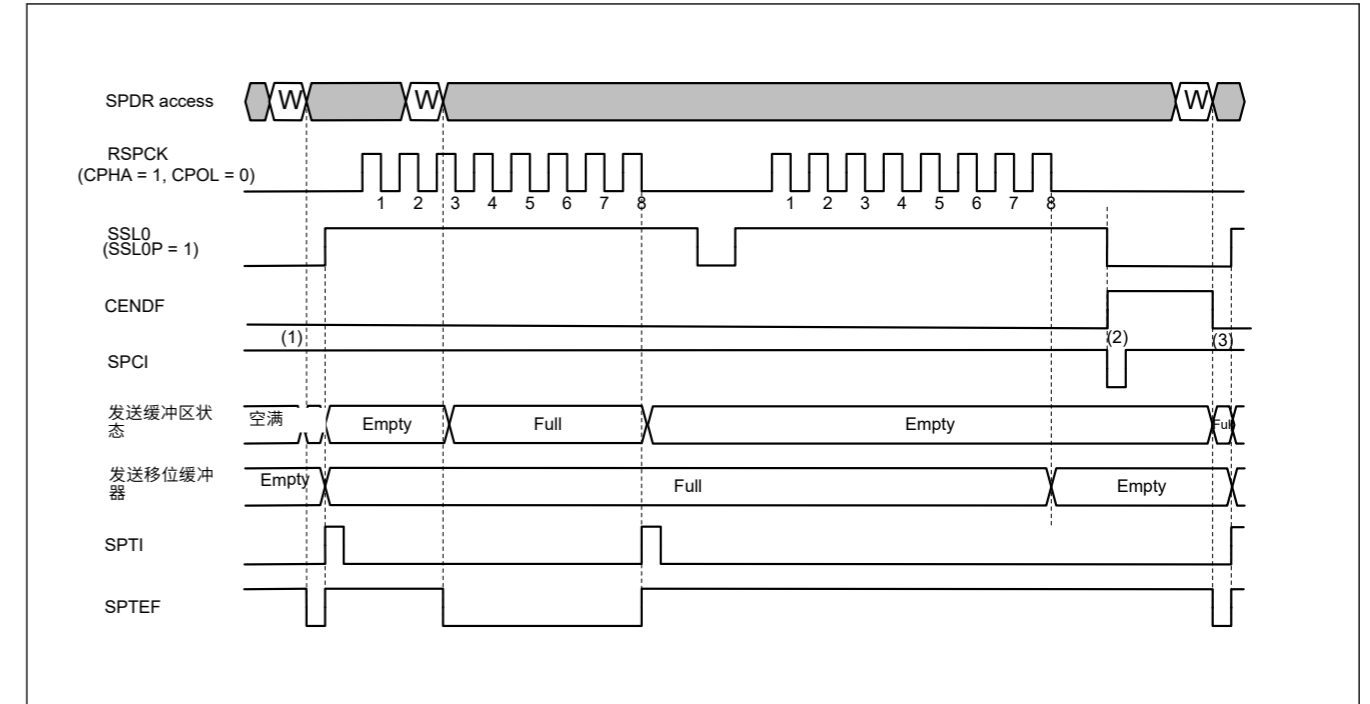

Figure 30.32 通信结束中断操作示例 (SPI操作上的发送-接收发送从模式)

- 1、通信开始前CENDF标志为0，SPCI的电平为1，在通信过程中一直保持。
- 2.在SSL0否定的时刻，当SPTX缓冲区和发送移位缓冲区都为空时，CENDF标志将为1（通信结束），然后当CENDIE位为1时输出SPCI中断。
- 3.CENDF标志在下一个发送数据写入发送缓冲区（SPTX）时被清除。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

### 30.3.8.3 SPI操作时仅在从模式下接收（4线）

在SPI操作（4线）上仅接收从机模式下，在SSL0否定时序产生通信结束中断(SPCI)并将CENDF标志设置为1。传输帧数由SPDCR.SPFC[1:0]设置。然后在最后一帧传输结束时对SSL0取反。通信结束中断(SPCI)是一个PCLKUSCix宽度和低电平有效。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- SSL0断言下一次传输的时序。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图30.33显示了SPI操作（4线）上仅接收从机模式期间的通信结束中断操作示例。

Figure 30.33 Example of Communication End Interrupt Operation (Receive only Slave mode on SPI Operation)

1. The CENDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the timing of SSL0 negate, when the last frame transmission ends, and then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared at the SSL0 assert when the next transmission start. Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

#### 30.3.8.4 Transmit-Receive/Transmit in Slave Mode on Clock Synchronous Operation (3-wire)

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1 when both SPTX buffer and transmit shift register are empty in transmit-receive/transmit slave mode on clock synchronous operation (3-wire). The set timing of CENDF flag is same as the last data sampling of the RSPCK (the last odd edge of RSPCK when the SPCMD0.CPHA bit is 0, the last even edge of RSPCK when the SPCMD0.CPHA bit is 1). The communication end interrupt (SPCI) is one PCLKUSCix width and low active.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- The SSL0 assert timing of next transmission.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 30.34 shows an example of communication end interrupt operation during transmig-receive/transmit slave mode on clock synchronous operation (3-wire).

Figure 30.33 通信结束中断操作示例 (SPI上仅接收从模式 Operation)

- 1、通信开始前CENDF标志为0，SPCI的电平为1，在通信过程中一直保持。
- 2.CENDF标志位在SSL0否定的时刻，即最后一帧传输结束时为1（通信结束），然后当CENDIE位为1时输出SPCI中断。
- 3.CENDF标志在下次传输开始时在SSL0断言处被清除。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

#### 30.3.8.4 在时钟同步操作（3线）的从模式下发送-接收发送

在时钟同步操作（3线）的发送-接收发送从模式下，当SPTX缓冲器和发送移位寄存器都为空时，产生通信结束中断(SPCI)并将CENDF标志设置为1。CENDF标志的设置时序与RSPCK的最后一次数据采样相同（SPCMD0.CPHA位为0时RSPCK的最后一个奇边沿，SPCMD0.CPHA位为1时RSPCK的最后一个偶边沿）。通信结束中断(SPCI)是一个PCLKUSCix宽度和低电平有效。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- SSL0断言下一次传输的时序。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图30.34显示了在时钟同步操作（3线）下发送接收发送从模式期间的通信结束中断操作示例。

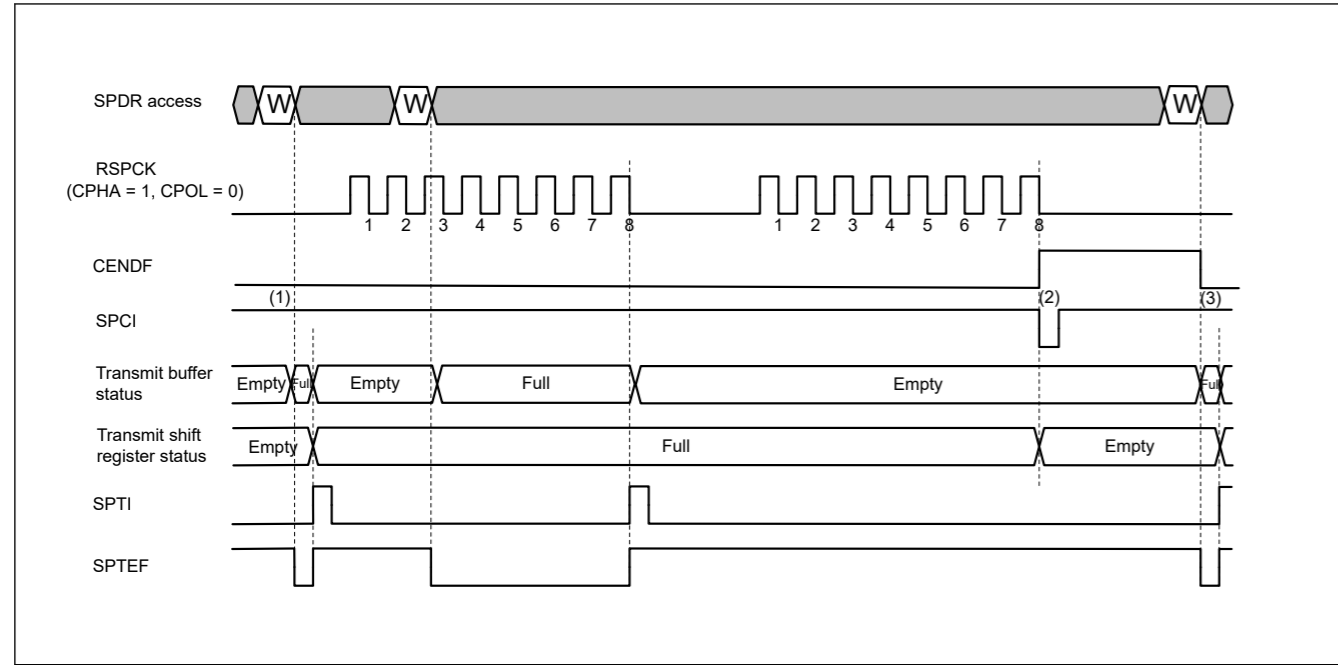

Figure 30.34 Example of Communication End Interrupt Operation (Transmit-Receive/Transmit Slave mode on Clock Synchronous Operation)

1. The CENDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the last data sampling timing of RSPCK, when both SPTX buffer and transmit shift buffer are empty, and then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared when the next transmission data is written to the transmit buffer (SPTX). Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

### 30.3.8.5 Receive Only in Slave Mode on Clock Synchronous Operation (3-wire)

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1 at the last data sampling of the last transmission frame in receive only slave mode on clock synchronous operation (3-wire). The sampling timing is the last odd edge of RSPCK when the SPCMD0.CPHA bit is 0, the last even edge of RSPCK when the SPCMD0.CPHA bit is 1. The number of transmission frame is set by the SPDCR.SPFC[1:0]. The communication end interrupt (SPCI) is one PCLKUSCIX width and low active.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following two conditions.

- The first edge of RSPCK for next transmission.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 30.35 shows an example of communication end interrupt operation during receive only slave mode on clock synchronous operation.

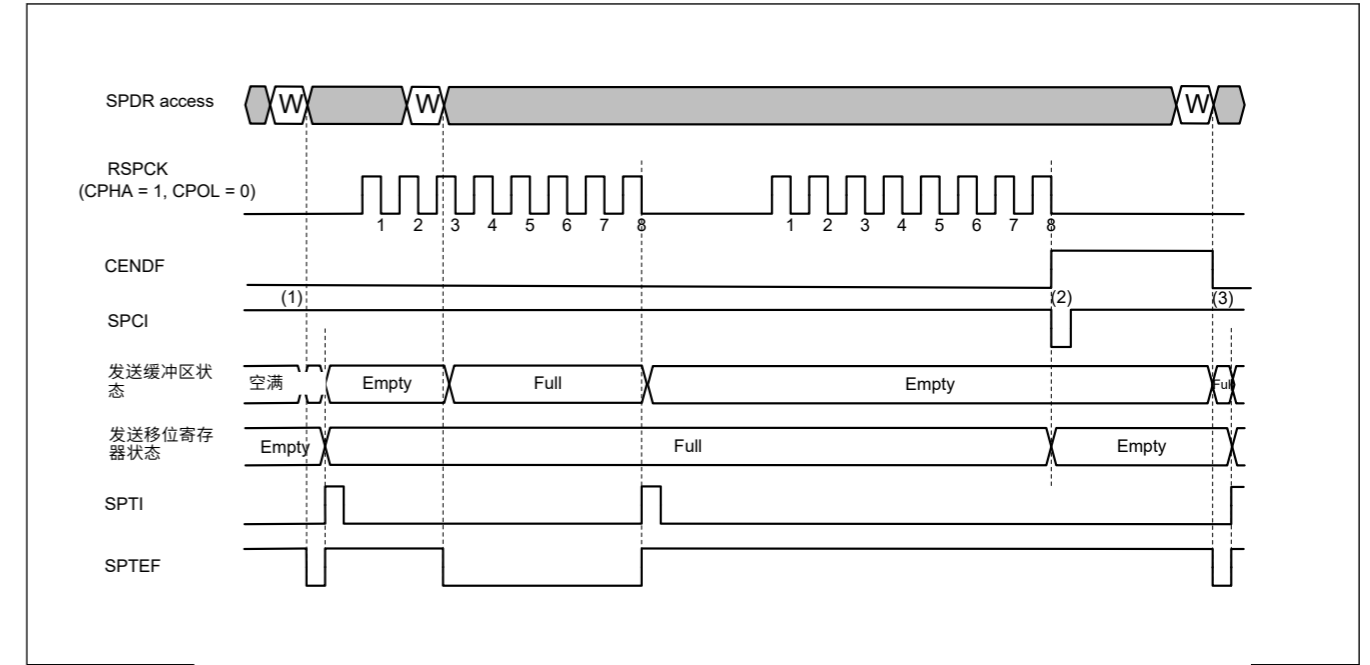

Figure 30.34 通信结束中断操作示例 (时钟同步操作的发送-接收发送从模式)

- 1、通信开始前CENDF标志为0，SPCI的电平为1，在通信过程中一直保持。
- 2.在RSPCK的最后一个数据采样时序，当SPTX缓冲区和发送移位缓冲区都为空时，CENDF标志为1（通信结束），然后当CENDIE位为1时输出SPCI中断。
- 3.CENDF标志在下一个发送数据写入发送缓冲区（SPTX）时被清除。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

### 30.3.8.5 在时钟同步操作（3线）上仅在从模式下接收

在时钟同步操作（3线）仅接收从机模式下，在最后一个传输帧的最后一个数据采样时产生通信结束中断(SPCI)并将CENDF标志设置为1。采样时序在SPCMD0.CPHA位为0时为RSPCK的最后一个奇边沿，当SPCMD0.CPHA位为1时为RSPCK的最后一个偶边沿。发送帧数由SPDCR.SPFC[1:0]设置。通信结束中断(SPCI)是一个PCLKUSCIX宽度和低电平有效。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- RSPCK的第一个边沿用于下一次传输。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图30.35显示了时钟同步操作下仅接收从机模式期间的通信结束中断操作示例。

Figure 30.35 Example of Communication End Interrupt Operation (Receive-only Slave mode on Clock Synchronous Operation)

1. The CENDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the last data sampling timing of RSPCK, when the last frame transmission end. The number of transmission frame is set by the SPDCR.SPFC[1:0]. And then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared at the first edge of RSPCK for the next transmission. Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

### 30.3.8.6 Common Operation

In this chapter, the operation common to each mode / area option communication in section 30.3.8.1. Transmit-Receive/ Transmit in Master Mode to section 30.3.8.5. Receive Only in Slave Mode on Clock Synchronous Operation (3-wire) is explained. When the enable of RSPI communication end interrupt (CENDIE) is 0, at the time of communication completion, a flag of communication end (CENDF) is set and an event of communication end (sp\_elccend) is output, but no interrupt is output. However, if the enable of communication end interrupt (CENDIE) is set to 1 before clearing the flag of communication end (CENDF) while the enable of RSPI function (SPE) is 1, the communication end interrupt is output.

Figure 30.36 Example of Communication End Interrupt Operation (Enable control)

1. When the enable of RSPI communication end interrupt (CENDIE) is 1, at the time of communication completion, the following three are the same timing.
  - A flag of communication end (CENDF)
  - An event of communication end (sp\_elccend)
  - The communication end interrupt

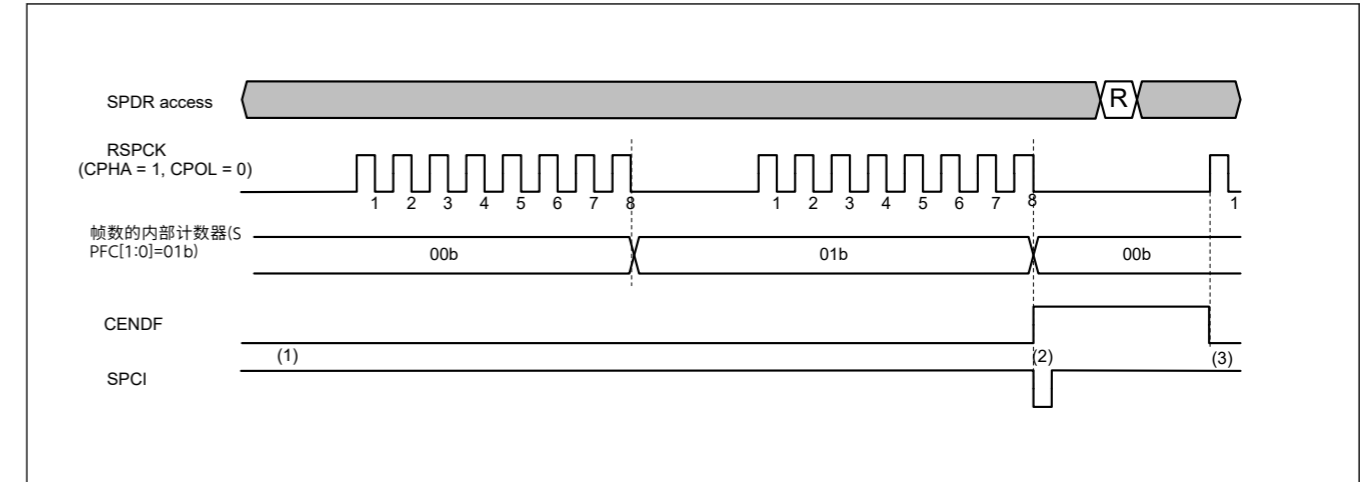

Figure 30.35 通信结束中断操作示例 (时钟上的仅接收从模式) Synchronous Operation)

- 1、通信开始前CENDF标志为0，SPCI的电平为1，在通信过程中一直保持。
- 2.CENDF标志位在RSPCK的最后一个数据采样定时为1（通信结束），即最后一帧传输结束。传输帧数由SPDCR.SPFC[1:0]设置。然后在CENDIE位为1时输出SPCI中断。
- 3.CENDF标志在RSPCK的第一个边沿被清除以进行下一次传输。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

### 30.3.8.6 常用操作

在本章中，30.3.8.1节中的每个模式区域选项通信的通用操作。发送-接收在主模式下发送到第30.3.8.5节。解释了时钟同步操作（3线）时仅在从模式下接收。当RSPI通信结束中断（CENDIE）使能为0时，通信完成时，设置通信结束标志（CENDF）并输出通信结束事件（sp\_elccend），但不输出中断。但是，如果在清除通信结束标志（CENDF）之前将通信结束中断（CENDIE）的使能设置为1，而RSPI功能（SPE）的使能为1，则输出通信结束中断。

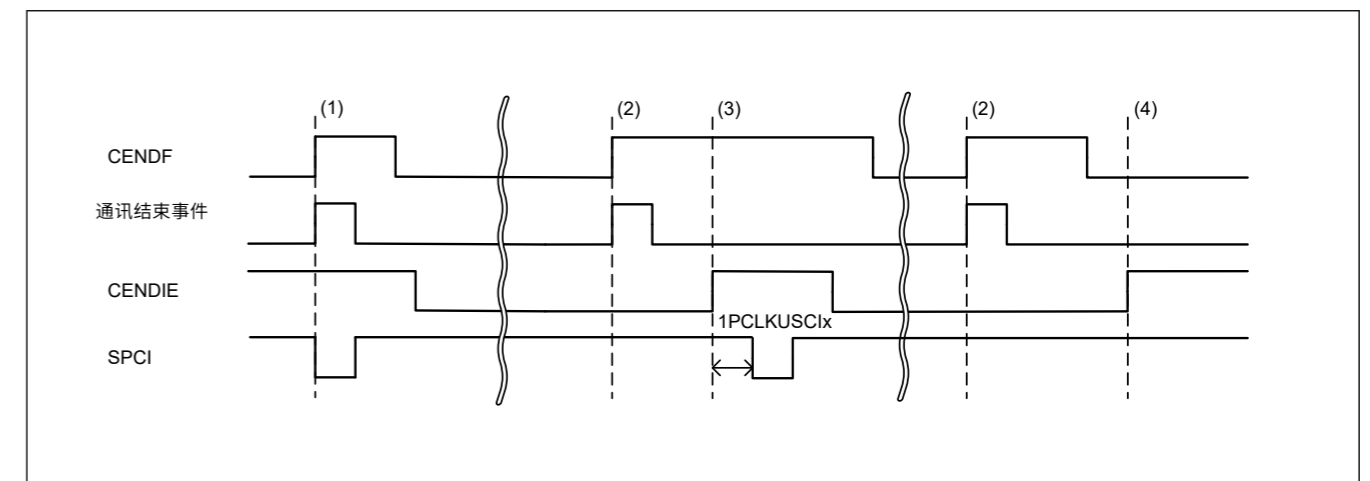

Figure 30.36 通信结束中断操作示例 (启用控制)

- 1、当RSPI通讯结束中断（CENDIE）使能为1时，通讯完成时，以下三个是相同的时序。
  - 通讯结束标志（CENDF）
  - 通信结束事件（sp\_elccend）
  - 通讯结束中断

- When the enable of RSPI communication end interrupt (CENDIE) is 0, at the time of communication completion, the following two are the same timing, but no interrupt.
  - A flag of communication end (CENDF)
  - An event of communication end (sp\_elccend)
- After (2), if the enable of communication end interrupt (CENDIE) is set when the enable of RSPI function (SPE) and the flag of communication end (CENDF) are 1, the communication end interrupt is output after 1 PCLKUSCIX.
- After (2), even if the enable of communication end interrupt (CENDIE) is set when the enable of RSPI function (SPE) or the flag of communication end (CENDF) is 0, the communication end interrupt is not output.

### 30.3.9 Error Detection

In normal SPI serial transfers, data written to the transmit buffer of SPDR/SPDR\_HA is transmitted, and received data can be read from the receive buffer of SPDR/SPDR\_HA. If access is made to SPDR/SPDR\_HA, an abnormal transfer might occur, depending on the status of the transmit or receive buffer or the status of the SPI at the beginning or end of serial transfer.

If an abnormal transfer occurs, the SPI detects the event as an underrun error, overrun error, parity error, or mode fault error. Table 30.9 lists the relationship between non-normal transfer operations and the SPI error detection function.

Table 30.9 Relationship between non-normal transfer operations and SPI error detection

| Operation | Occurrence condition   | SPI operation   | Error detection  |
|-----------|--|---|------------------|
| 1         | SPDR/SPDR_HA is written when the transmit buffer is full.  | <ul style="list-style-type: none"> <li>The contents of the transmit buffer are kept</li> <li>Write data is missing</li> </ul>   | None             |
| 2         | SPDR/SPDR_HA is read when the receive buffer is empty.   | The contents of the receive buffer and previously received data are output.   | None             |
| 3         | Serial transfer is started in slave mode when the SPI is not able to transmit data.  | <ul style="list-style-type: none"> <li>Serial transfer is suspended</li> <li>Transmit or receive data is missing</li> <li>Driving of the MISO output signal is stopped</li> <li>SPI function is disabled</li> </ul>                           | Underrun error   |
| 4         | Serial transfer terminates when the receive buffer is full.  | <ul style="list-style-type: none"> <li>Keeps the contents of the receive buffer</li> <li>Missing receive data</li> </ul>  | Overrun error    |
| 5         | An incorrect parity bit is received during full-duplex synchronous serial communication with the parity function enabled in following mode: <ul style="list-style-type: none"> <li>Transmit-receive master mode</li> <li>Transmit-receive slave mode</li> <li>Receive-only slave mode</li> </ul> | The parity error flag is asserted   | Parity error     |
| 6         | The SSLn0 input signal is asserted when the serial transfer is idle in multi-master mode.  | <ul style="list-style-type: none"> <li>Driving of the RSPCKn, MOSIn, SSLn1 to SSLn3 output signals is stopped</li> <li>SPI function is disabled</li> </ul>  | Mode fault error |
| 7         | The SSLn0 input signal is asserted during serial transfer in multi-master mode.  | <ul style="list-style-type: none"> <li>Serial transfer is suspended</li> <li>Transmit or receive data is missing</li> <li>Driving of the RSPCKn, MOSIn, SSLn1 to SSLn3 output signals is stopped</li> <li>SPI function is disabled</li> </ul> | Mode fault error |
| 8         | The SSLn0 input signal is negated during serial transfer in slave mode.  | <ul style="list-style-type: none"> <li>Serial transfer is suspended</li> <li>Transmit or receive data is missing</li> <li>Driving of the MISO output signal is stopped</li> <li>SPI function is disabled</li> </ul>                           | Mode fault error |

In operation 1 described in Table 30.9, the SPI does not detect an error. To prevent data omission during writes to SPDR/SPDR\_HA, the writes to SPDR/SPDR\_HA must be executed using a transmit buffer empty interrupt request (when the SPSR.SPTEF flag is 1).

Similarly, the SPI does not detect an error in operation 2. To prevent extraneous data from being read, SPDR/SPDR\_HA read must be executed with an SPI receive buffer full interrupt request (when the SPSR.SPRF flag is 1).

For information on the other errors, see the following sections:

- 当RSPI通讯结束中断 (CENDIE) 使能为0时, 通讯完成时, 以下两者时序相同, 但无中断。
  - 通讯结束标志 (CENDF)
  - 通信结束事件 (sp\_elccend)

3. (2) 之后, 如果在RSPI功能 (SPE) 使能和通信结束标志 (CENDF) 为1的情况下设置通信结束中断 (CENDIE) 使能, 则在1个PCLKUSCIX后输出通信结束中断。

4.(2)后, 即使在RSPI功能(SPE)使能或通信结束标志(CENDF)为0时设置通信结束中断(CENDIE)使能, 也不输出通信结束中断。

### 30.3.9 错误检测

在正常的SPI串行传输中, 写入到SPDRSPDR\_HA的发送缓冲区的数据被发送, 接收到的数据可以从SPDRSPDR\_HA的接收缓冲区中读取。如果访问SPDRSPDR\_HA, 可能会发生异常传输, 具体取决于发送或接收缓冲区的状态或串行传输开始或结束时SPI的状态。

如果发生异常传输, SPI会将事件检测为欠载错误、溢出错误、奇偶校验错误或模式故障错误。表30.9列出了非正常传输操作和SPI错误检测功能之间的关系。

Table 30.9 非正常传输操作与SPI错误检测的关系

| Operation | 发生条件   | SPI操作   | 错误检测           |
|-----------|--|---|----------------|
| 1         | SPDRSPDR_HA在发送缓冲区已满时写入。  | <ul style="list-style-type: none"> <li>发送缓冲区的内容被保留</li> <li>写入数据丢失</li> </ul>   | None           |
| 2         | SPDRSPDR_HA在接收缓冲区为空时读取。  | 输出接收缓冲区的内容和先前接收的数据。   | None           |
| 3         | 当SPI无法传输数据时, 串行传输在从模式下启动。  | <ul style="list-style-type: none"> <li>串行传输被暂停</li> <li>发送或接收数据丢失</li> <li>MIO输出信号的驱动停止</li> </ul> <ul style="list-style-type: none"> <li>SPI功能被禁用</li> </ul> | Underrun error |
| 4         | 当接收缓冲区已满时, 串行传输终止。   | <ul style="list-style-type: none"> <li>保留接收缓冲区的内容</li> <li>缺少接收数据</li> </ul>  | 溢出错误           |
| 5         | 全双工同步串行通信时接收到错误的奇偶校验位, 并在以下模式下启用奇偶校验功能: ● <ul style="list-style-type: none"> <li>收发主模式</li> <li>收发从模式</li> <li>只接收从模式</li> </ul> | 奇偶错误标志被置位   | 奇偶校验错误         |
| 6         | 当串行传输在多主模式下空闲时, SSLn0输入信号被置位。  | <ul style="list-style-type: none"> <li>将RSPCKn、MOSIn、SSLn1驱动到SSLn3输出信号停止</li> <li>SPI功能被禁用</li> </ul>   | 模式故障错误         |
| 7         | SSLn0输入信号在多主机模式下的串行传输期间被置位。  | <ul style="list-style-type: none"> <li>串行传输被暂停</li> <li>发送或接收数据丢失</li> <li>将RSPCKn、MOSIn、SSLn1驱动到SSLn3输出信号停止</li> <li>SPI功能被禁用</li> </ul>                     | 模式故障错误         |
| 8         | SSLn0输入信号在从模式下的串行传输期间被否定。  | <ul style="list-style-type: none"> <li>串行传输被暂停</li> <li>发送或接收数据丢失</li> <li>MIO输出信号的驱动停止</li> </ul> <ul style="list-style-type: none"> <li>SPI功能被禁用</li> </ul> | 模式故障错误         |

在表30.9中描述的操作1中, SPI未检测到错误。防止写入SPDR期间的数据遗漏 SPDR\_HA, 对SPDRSPDR\_HA的写入必须使用发送缓冲区空中断请求 (当 SPSR.SPTEF标志为1)。

同样, SPI不会检测到操作2中的错误。为防止读取无关数据, 必须使用SPI接收缓冲区满中断请求 (当 SPSR.SPRF标志为1时) 执行SPDRSPDR\_HA读取。

有关其他错误的信息, 请参阅以下部分:

- Underrun error, indicated in operation 3, see [section 30.3.9.4. Underrun errors](#)
- Overrun error, indicated in operation 4, see [section 30.3.9.1. Overrun errors](#)
- Parity error, indicated in operation 5, see [section 30.3.9.2. Parity errors](#)
- Mode fault error, indicated in operations 6 to 8, see [section 30.3.9.3. Mode fault errors](#)
- For the transmit and receive interrupts, see [section 30.3.7. Transmit Buffer Empty and Receive Buffer Full Interrupts](#).

### 30.3.9.1 Overrun errors

If a serial transfer ends when the receive buffer of SPDR/SPDR\_HA is full, the SPI detects an overrun error and sets the SPSR.OVRF flag to 1. When the OVRF flag is 1, the SPI does not copy data from the shift register to the receive buffer, so the data prior to the error occurrence is retained in the receive buffer. To set the OVRF flag to 0, write 0 to the OVRF flag after the CPU reads SPSR with the OVRF flag set to 1.

Figure 30.37 shows an example of operation of the OVRF and SPRF flags. The SPSR and SPDR\_HA accesses shown in Figure 30.37 indicate the condition of accesses to the SPSR and SPDR\_HA register, where W denotes a write cycle, and R a read cycle. In this example, the SPI performs an 8-bit serial transfer when SPCMDm.CPHA bit is 1 and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

Figure 30.37 Operation example of the OVRF and SPRF flags

The operation of the flags at timings (1) to (4) in Figure 30.37 is as follows:

1. If a serial transfer terminates with the SPRF flag set to 1 (receive buffer full), the SPI detects an overrun error, and sets the OVRF flag to 1. The SPI does not copy the data in the shift register to the receive buffer. Even when the SPPE bit is 1, parity errors are not detected.
2. When SPDR/SPDR\_HA is read, the SPI outputs the data in the receive buffer. The SPRF flag is then set to 0. The receive buffer becoming empty does not set the OVRF flag to 0.
3. If the serial transfer ends with the OVRF flag set to 1 (overrun error occurred), the SPI does not copy data in the shift register to the receive buffer (the SPRF flag does not set to 1). A receive buffer full interrupt is not generated. Even when the SPPE bit is 1, parity errors are not detected. In an overrun error state when the SPI does not copy the received data from the shift register to the receive buffer, on termination of the serial transfer, the SPI determines that the shift register is empty. This enables data transfer from the transmit buffer to the shift register.
4. If 0 is written to the OVRF flag after SPSR is read when the OVRF flag is 1, the OVRF flag clears is set to 0.

The occurrence of an overrun can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. When executing a serial transfer, you must ensure that overrun errors are detected early, for example by reading SPSR immediately after SPDR/SPDR\_HA/SPDR\_BY is read.

If an overrun error occurs and the OVRF flag sets to 1, normal reception operations cannot be performed until the OVRF flag is set to 0.

- 欠载错误，在操作3中指示，参见第30.3.9.4节。欠载错误
- 超限错误，在操作4中显示，参见第30.3.9.1节。溢出错误
- 奇偶校验错误，在操作5中指示，参见第30.3.9.2节。奇偶校验错误
- 模式故障错误，在操作6到8中指示，参见第30.3.9.3节。模式故障错误
- 关于发送和接收中断，参见30.3.7节。发送缓冲区空和接收缓冲区满中断。

### 30.3.9.1 溢出错误

如果在SPDR/SPDR\_HA的接收缓冲区已满时串行传输结束，则SPI检测到溢出错误并设置SPSR.OVRF标志为1。当OVRF标志为1时，SPI不会将数据从移位寄存器复制到接收缓冲区，因此错误发生之前的数据会保留在接收缓冲区中。要将OVRF标志设置为0，请在CPU读取OVRF标志设置为1的SPSR后将0写入OVRF标志。

图30.37显示了OVRF和SPRF标志的操作示例。SPSR和SPDR\_HA访问显示在图30.37表示访问SPSR和SPDR\_HA寄存器的条件，其中W表示写周期，R表示读周期。在本例中，当SPCMDm.CPHA位为1且SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的位数。

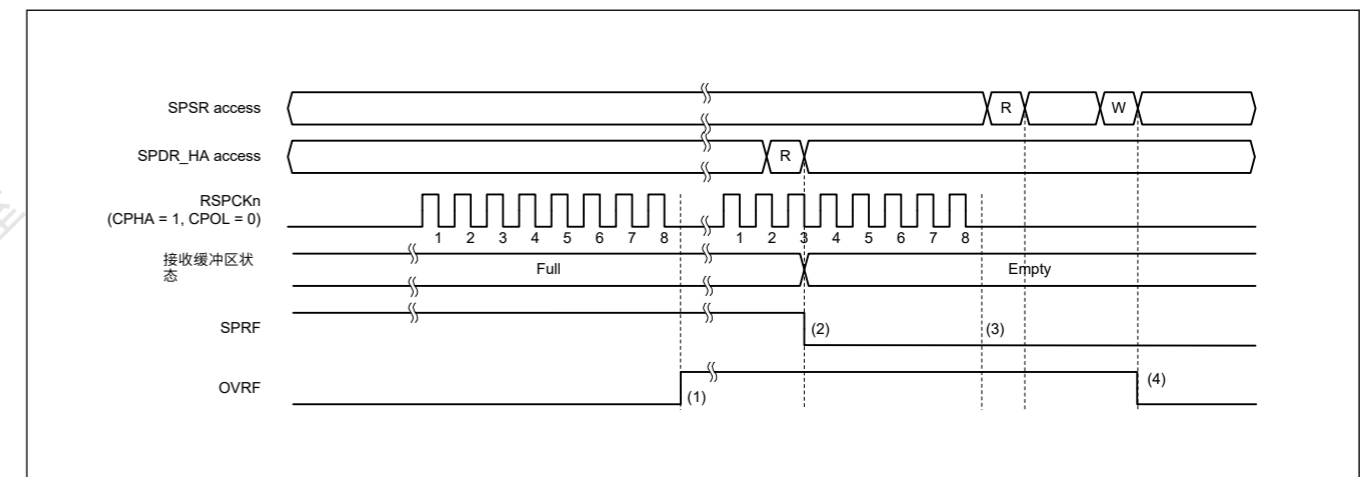

Figure 30.37 OVRF和SPRF标志的操作示例

图30.37中时间(1)到(4)的标志操作如下：

- 1.如果串行传输终止且SPRF标志设置为1（接收缓冲区已满），则SPI检测到溢出错误，并将OVRF标志设置为1。SPI不会将移位寄存器中的数据复制到接收缓冲区。即使SPPE位为1，也不会检测到奇偶校验错误。
- 2.读取SPDR/SPDR\_HA时，SPI输出接收缓冲区中的数据。然后SPRF标志设置为0。接收缓冲区变空不会将OVRF标志设置为0。
- 3.如果串行传输结束时OVRF标志设置为1（发生溢出错误），则SPI不会将移位寄存器中的数据复制到接收缓冲区（SPRF标志不设置为1）。不产生接收缓冲区满中断。即使SPPE位为1，也不会检测到奇偶校验错误。在SPI未将接收到的数据从移位寄存器复制到接收缓冲区的溢出错误状态下，在串行传输终止时，SPI确定移位寄存器为空。这使数据能够从发送缓冲器传输到移位寄存器。
- 4.如果在OVRF标志为1时读取SPSR后向OVRF标志写入0，则OVRF标志清除设置为0。

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查溢出的发生。执行串行传输时，必须确保及早检测到溢出错误，例如在读取SPDR/SPDR\_HA/SPDR\_BY后立即读取SPSR。

如果发生溢出错误并且OVRF标志设置为1，则在OVRF标志设置为0之前无法执行正常接收操作。

When the RSPCK auto-stop function is enabled (SPCR2.SCKASE = 1) in master mode, an overrun error does not occur. Figure 30.38 and Figure 30.39 show the clock stop waveform when a serial transfer continues while the receive buffer is full in master mode.

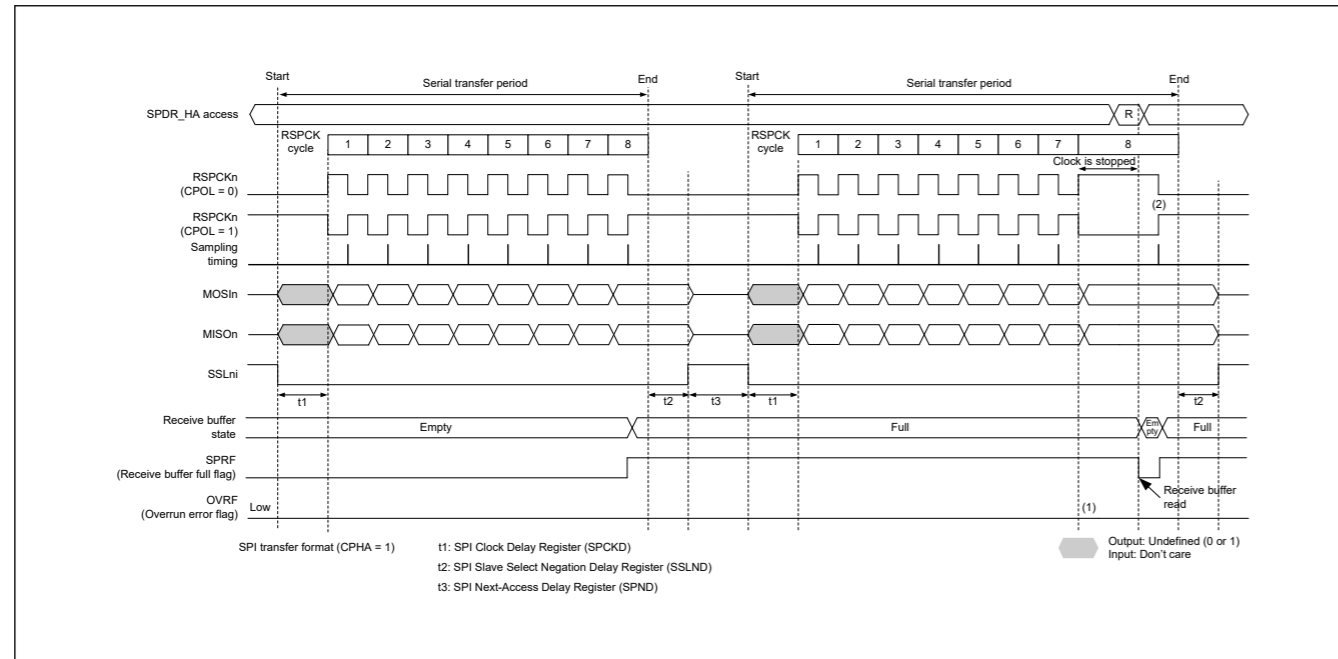

Figure 30.38 Clock stop waveform when serial transfer continues while receive buffer is full in master mode (CPHA = 1)

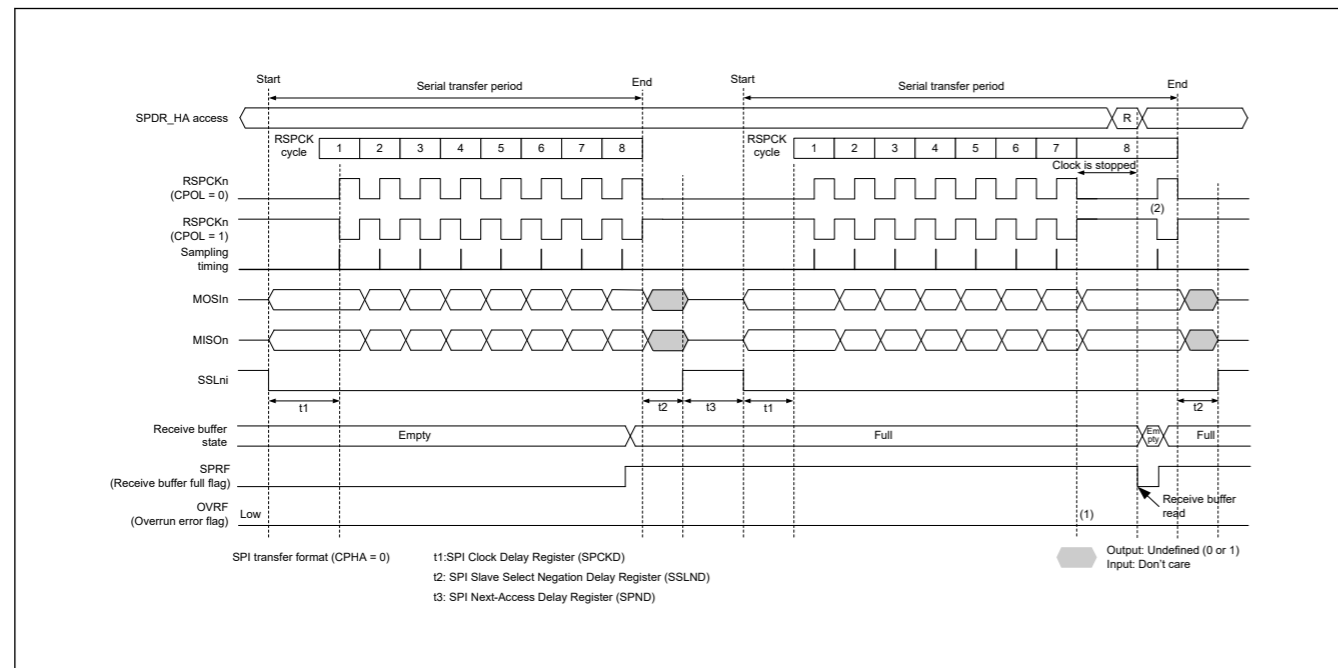

Figure 30.39 Clock stop waveform when serial transfer continues while receive buffer is full in master mode (CPHA = 0)

The operation of the flags at timings (1) and (2) in Figure 30.38 and Figure 30.39 is as follows:

1. When the receive buffer is full, an overrun error does not occur because the RSPCK clock is stopped.
2. If SPDR/SPDR\_HA is read while the clock is stopped, data in the receive buffer can be read. The RSPCK clock restarts after reading the receive buffer (after the SPSR.SPRF is set to 0).

在主机模式下启用RSPCK自动停止功能 (SPCR2.SCKASE=1) 时, 不会发生溢出错误。图30.38和图30.39显示了在主机模式下接收缓冲器已满时串行传输继续时的时钟停止波形。

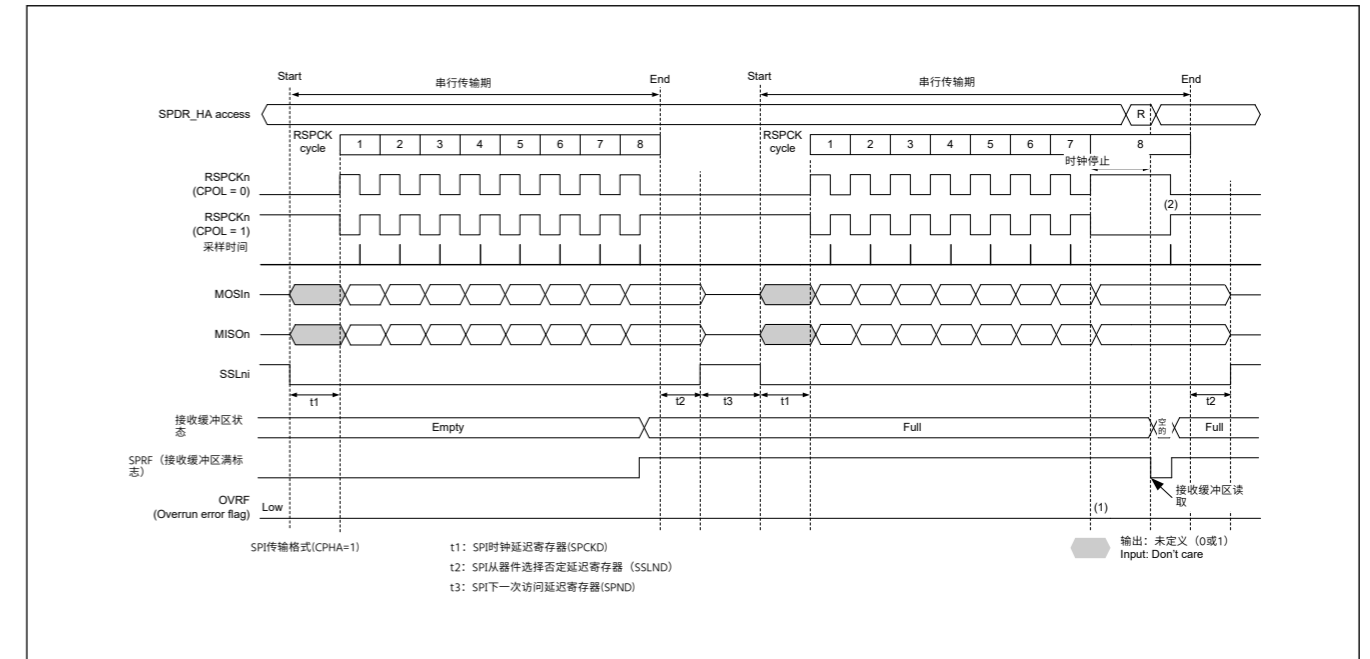

Figure 30.38 主机模式下接收缓冲器满时串行传输继续时的时钟停止波形(CPHA=1)

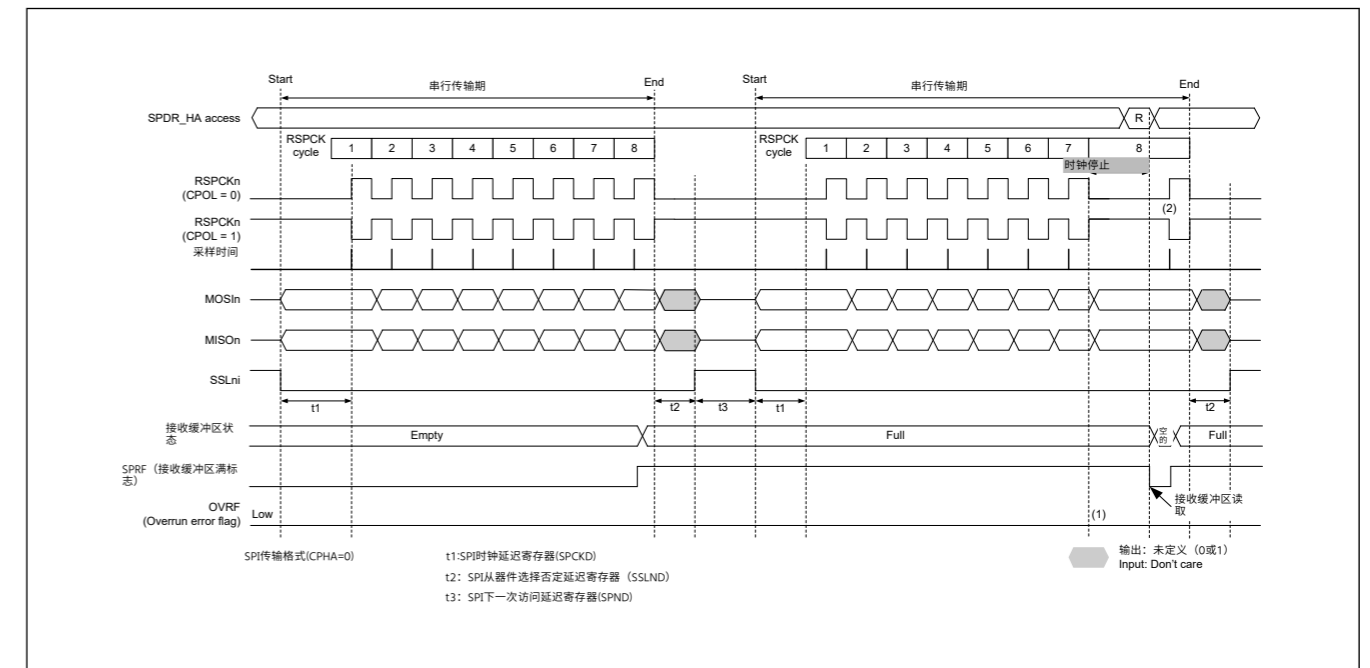

Figure 30.39 主机模式下接收缓冲器满时串行传输继续时的时钟停止波形(CPHA=0)

图30.38和图30.39中时序 (1) 和 (2) 的标志操作如下:

- 1.当接收缓冲区已满时, 不会发生溢出错误, 因为RSPCK时钟已停止。
- 2.如果在时钟停止时读取SPDR/SPDR\_HA, 则可以读取接收缓冲区中的数据。RSPCK时钟在读取接收缓冲区后重新启动 (在SPSR.SPRF标志设置为0后)。

Overrun error does not occur when RSPCK automatic stop function is enabled for transfer with no delay of between frames during burst transfer in master mode. Figure 30.40 and Figure 30.41 show the clock stop waveform, when there is no delay between frames at burst transfer and the serial transfer continues in the reception buffer full state.

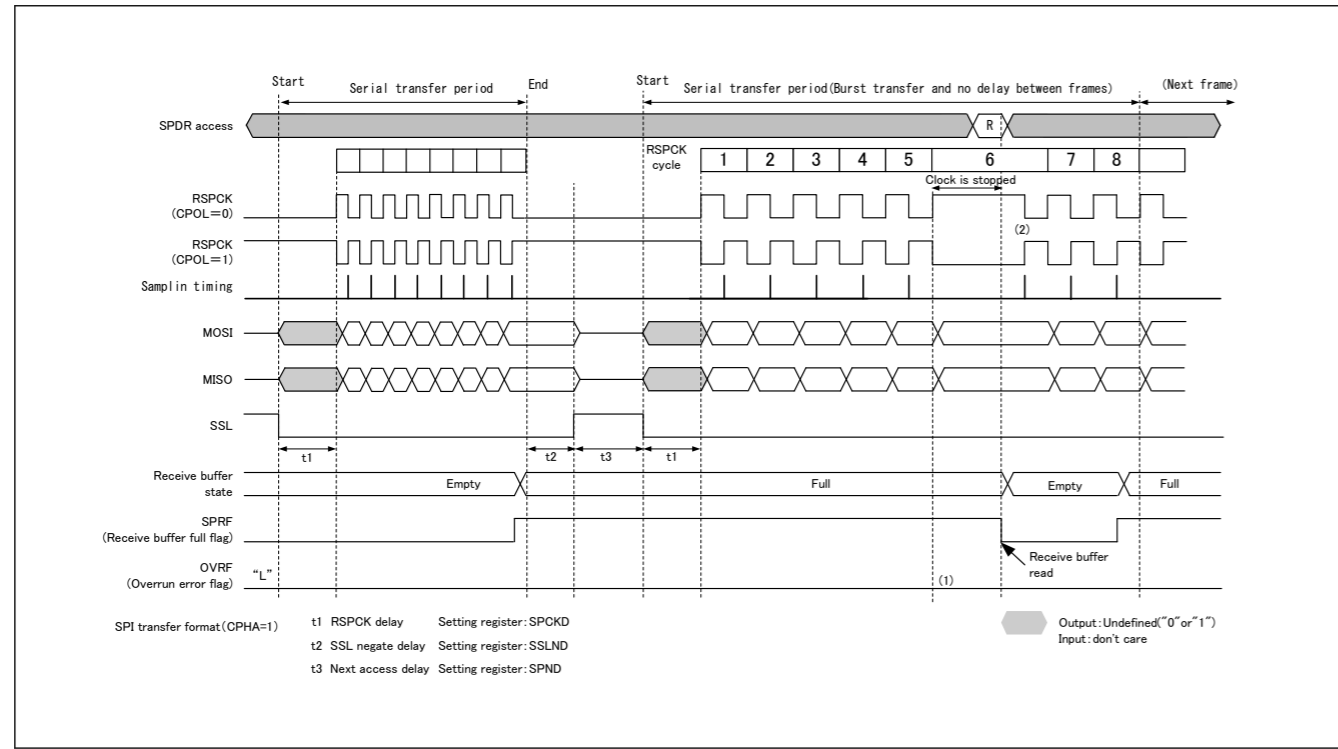

Figure 30.40 Clock Stop Waveform when Serial Transfer Continues in the Receive Buffer Full in Master Mode (at burst transfer and no delay between frames CPHA = 1)

在主模式下的突发传输期间，如果传输启用RSPCK自动停止功能且帧之间没有延迟，则不会发生溢出错误。图30.40和图30.41显示了时钟停止波形，当突发传输的帧之间没有延迟并且串行传输在接收缓冲器满状态下继续时。

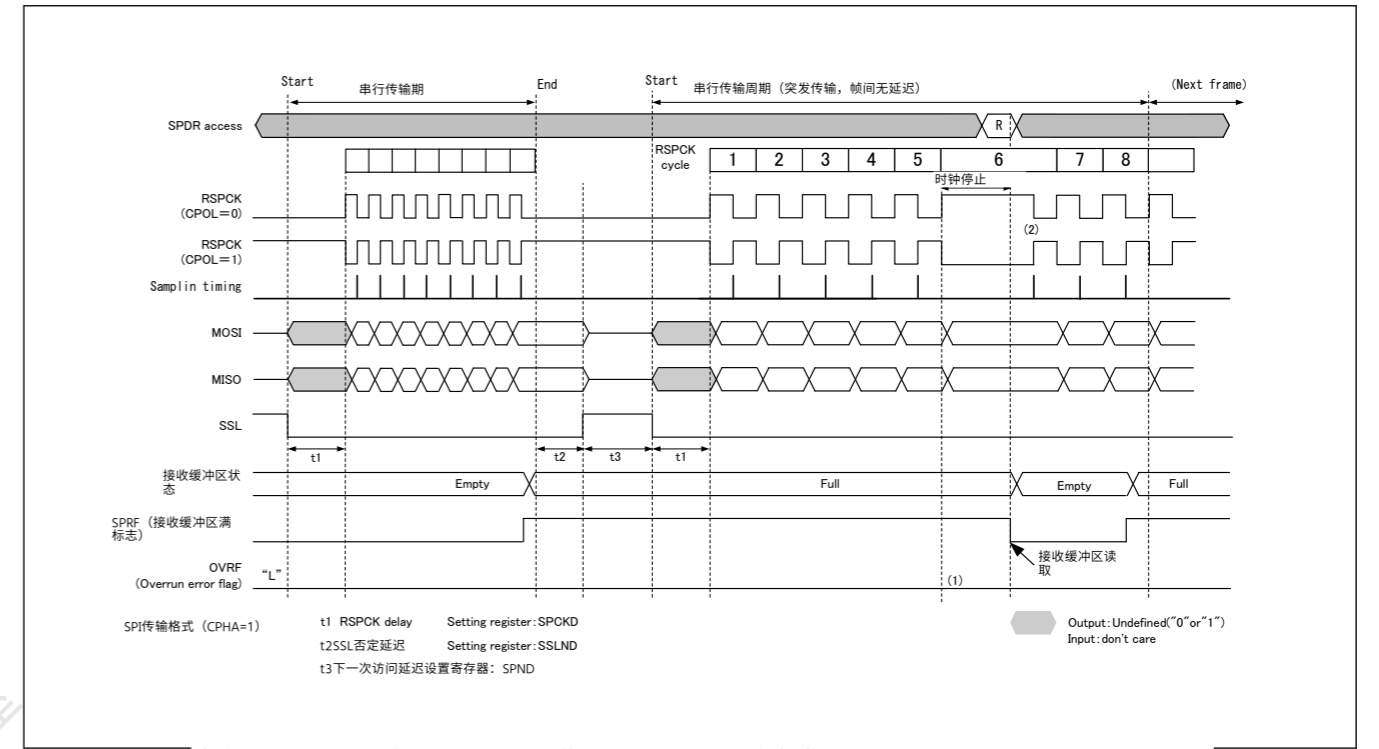

Figure 30.40 当串行传输在主机中的接收缓冲器满时继续时的时钟停止波形模式 (突发传输且帧之间无延迟CPHA=1)

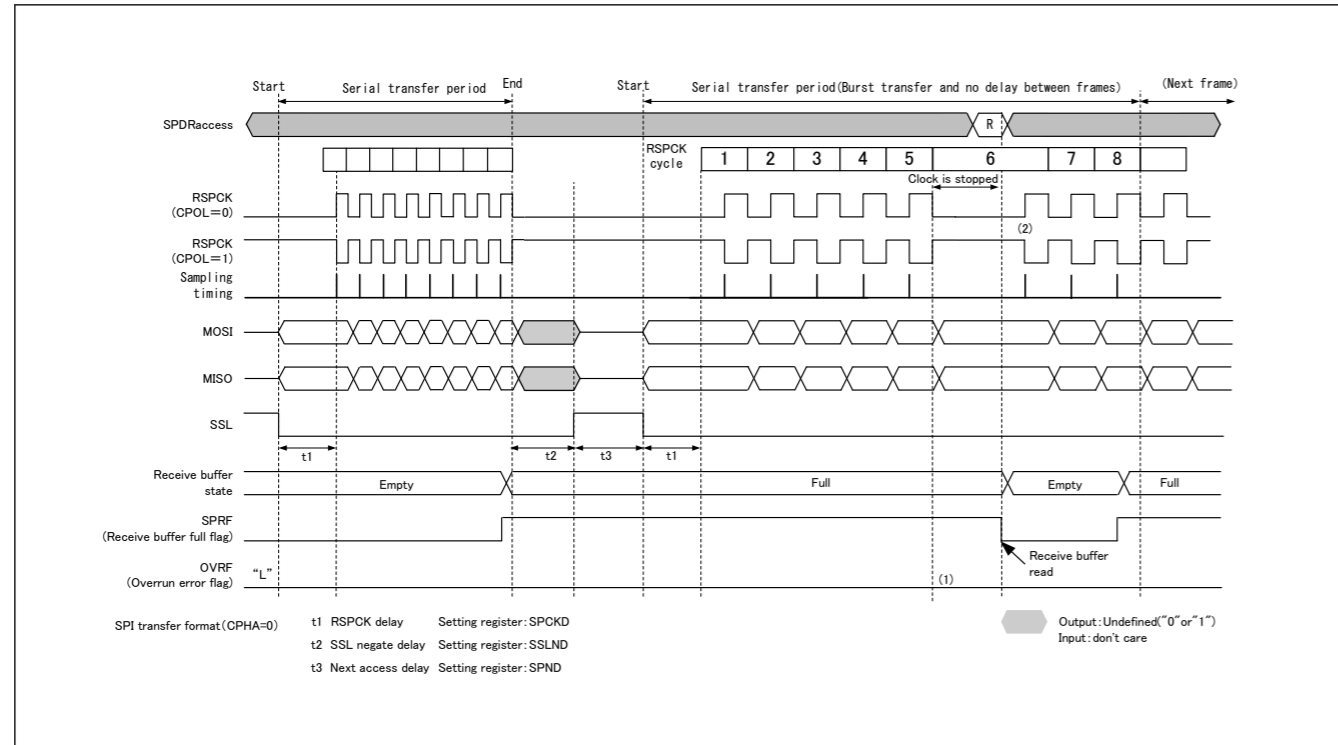

Figure 30.41 Clock Stop Waveform when Serial Transfer Continues in the Receive Buffer Full in Master Mode (at burst transfer and no delay between frames CPHA = 0)

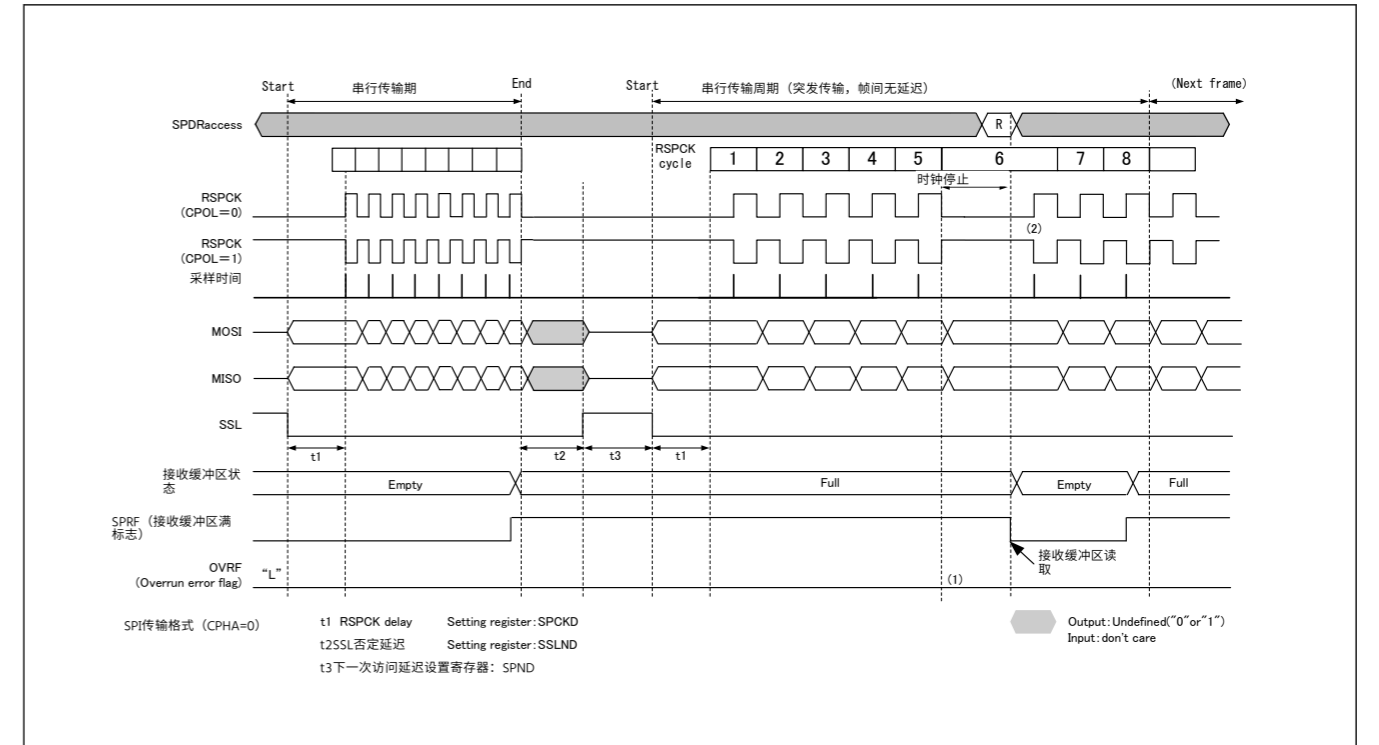

Figure 30.41 当串行传输在主机中的接收缓冲器满时继续时的时钟停止波形模式 (突发传输且帧之间无延迟CPHA=0)

The following describes operation of flags at timings (1) and (2) in the figure above.

下面描述在上图中的时间(1)和(2)的标志的操作。

1. While the receive buffer is full, the RSPCK clock is deactivated and no overrun error occurs.
2. Receive buffer data can be read by reading SPDR during clock stop. After the receive buffer data has been read (after the SPSR.SPRF flag has been cleared to 0), the RSPCK clock restarts.

### 30.3.9.2 Parity errors

When full-duplex synchronous serial communications is performed with the SPCR.TXMD bit set to 0 and the SPCR2.SPPE bit set to 1, when serial transfer ends, the SPI checks whether there are parity errors. On detecting a parity error in the received data, the SPI sets the SPSR.PERF flag to 1. Because the SPI does not copy data in the shift register to the receive buffer when the SPSR.OVRF flag is set to 1, parity error detection is not performed for the received data. To set the PERF flag to 0, write 0 to the PERF flag after the SPSR register is read with the PERF flag set to 1.

Figure 30.42 shows an example of operation of the OVRF and PERF flags. The SPSR access shown in Figure 30.42 indicates the condition of access to the register, where W denotes a write cycle, and R a read cycle. In this example, full-duplex serial communication is performed while the SPCR2.SPPE bit is 1. The SPI performs an 8-bit serial transfer when SPCMDm.CPHA bit is 1 and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

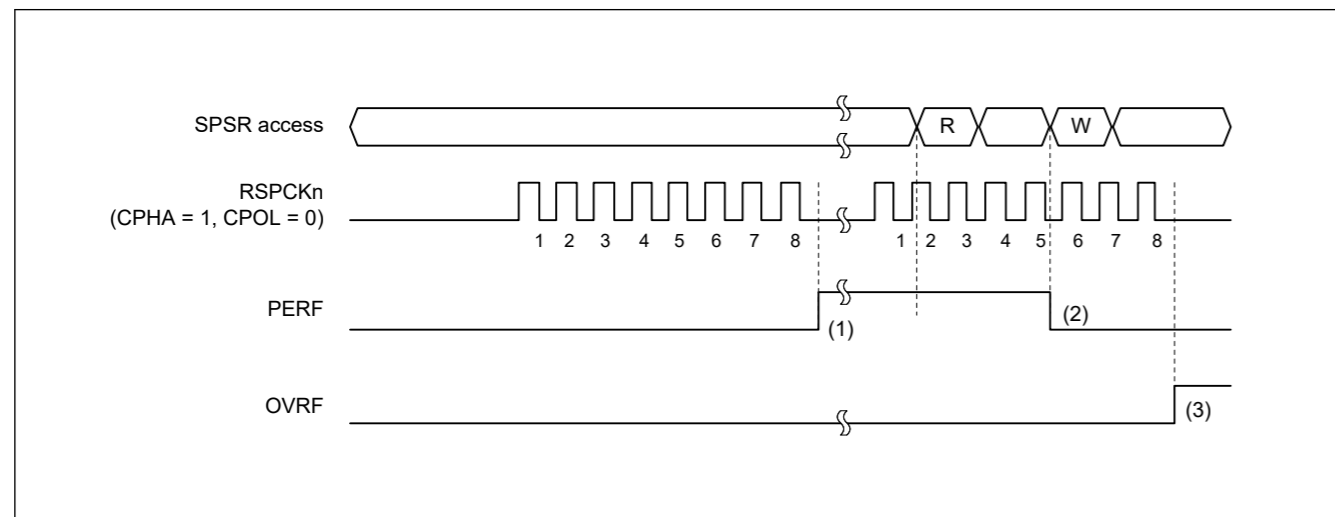

Figure 30.42 Operation example of the PERF flag

The operation of the flags at timings (1) to (3) in Figure 30.42 is as follows:

1. If a serial transfer terminates with the SPI not detecting an overrun error, the SPI copies the data in the shift register to the receive buffer. The SPI checks the received data at this time and sets the PERF flag to 1 if a parity error is detected.
2. If 0 is written to the PERF flag after the SPSR register is read when the PERF flag is 1, the PERF flag is set to 0.
3. When the SPI detects an overrun error and serial transfer is terminated, the data in the shift register is not copied to the receive buffer. The SPI does not perform parity error detection at this time.

Parity errors can be checked for by either reading the SPSR register or using an SPI error interrupt and reading the SPSR register. When executing a serial transfer, such checks are required to ensure early detection of parity errors. When the SPI is used in master mode, the pointer value to the SPCMDm register at the occurrence of the error can be checked by reading the SPSR.SPECM[2:0] bits (Only SPI0).

### 30.3.9.3 Mode fault errors

The SPI operates in multi-master mode when the SPCR.MSTR bit is 1, the SPCR.SPMS bit is 0, and the SPCR.MODFEN bit is 1. If the active level is input for the SSLn0 input signal of the SPI in multi-master mode, the SPI detects a mode fault error regardless of the status of the serial transfer, and sets the SPSR.MODF flag to 1. On detecting the mode fault error, the SPI copies the value of the pointer to SPCMDm to the SPDCR.SPFC[1:0] bits. The active level of the SSLn0 signal is determined by the SSLP.SSL0P bit.

When the MSTR bit is 0, the SPI operates in slave mode. The SPI detects a mode fault error if the MODFEN bit of the SPI in slave mode is 1, and the SPMS bit is 0, and if the SSLn0 input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched).

- 1.当接收缓冲器已满时，RSPCK时钟被停用，不会发生溢出错误。
- 2.在时钟停止时，可以通过读取SPDR来读取接收缓冲数据。读取接收缓冲区数据后（在SPSR.SPRF标志被清除为0后），RSPCK时钟重新启动。

### 30.3.9.2 奇偶校验错误

当SPCR.TXMD位设置为0且SPCR2.SPPE位设置为1进行全双工同步串行通信时，串行传输结束时，SPI会检查是否有奇偶校验错误。在检测到接收数据中的奇偶校验错误时，SPI将SPSR.PERF标志设置为1。因为当SPSR.OVRF标志设置为1时，SPI不会将移位寄存器中的数据复制到接收缓冲区，所以奇偶校验错误检测不针对接收到的数据执行。要将PERF标志设置为0，请在读取SPSR寄存器并将PERF标志设置为1后将0写入PERF标志。

图30.42显示了OVRF和PERF标志的操作示例。图30.42所示的SPSR访问表示访问寄存器的条件，其中W表示写周期，R表示读周期。在本例中，当SPCR2.SPPE位为1时执行全双工串行通信。当SPCMDm.CPHA位为1且SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形表示RSPCK周期数，例如传输的位数。

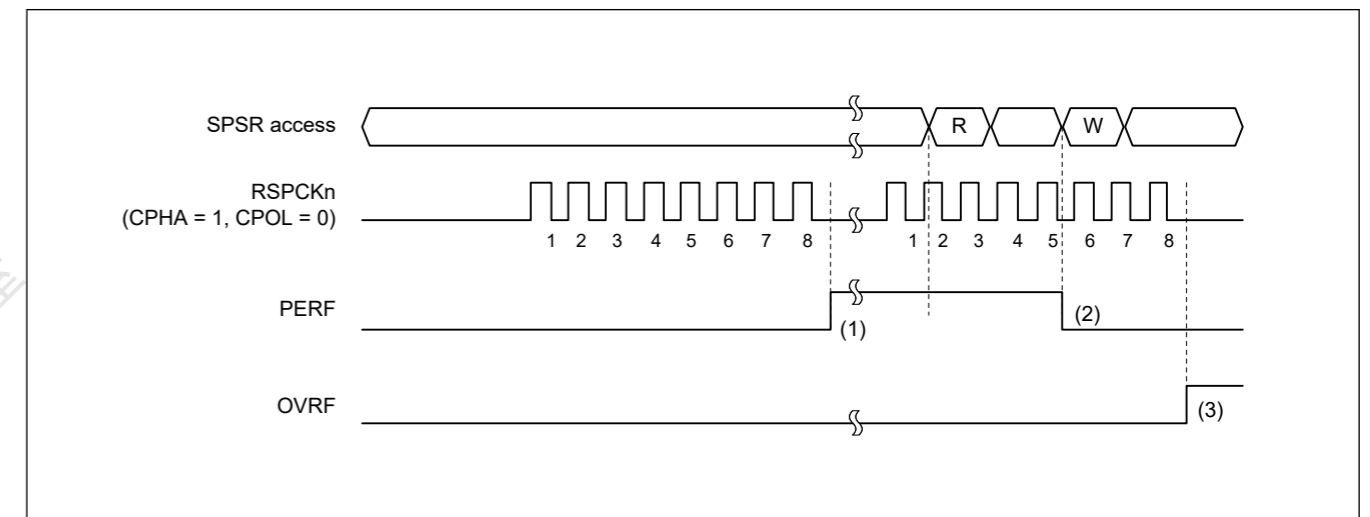

Figure 30.42 PERF标志的操作示例

图30.42中时间(1)到(3)的标志操作如下:

- 1.如果串行传输终止且SPI未检测到溢出错误，则SPI将移位寄存器中的数据复制到接收缓冲区。此时SPI会检查接收到的数据，如果检测到奇偶校验错误，则将PERF标志设置为1。
- 2.如果在PERF标志为1时读取SPSR寄存器后将0写入PERF标志，则将PERF标志设置为0。
- 3.当SPI检测到溢出错误并终止串行传输时，移位寄存器中的数据不会复制到接收缓冲区。此时SPI不执行奇偶校验错误检测。

可以通过读取SPSR寄存器或使用SPI错误中断并读取SPSR寄存器来检查奇偶校验错误。在执行串行传输时，需要进行此类检查以确保及早发现奇偶校验错误。当SPI用于主机模式时，可以通过读取SPSSR.SPECM[2:0]位（仅SPI0）来检查发生错误时指向SPCMDm寄存器的指针值。

### 30.3.9.3 模式故障错误

当SPCR.MSTR位为1、SPCR.SPMS位为0、SPCR.MODFEN位为1时，SPI工作在多主机模式。如果在多主机模式下SPI的SSLn0输入信号输入有效电平-主模式，无论串行传输的状态如何，SPI都会检测到模式故障错误，并将SPSR.MODF标志设置为1。在检测到模式故障错误时，SPI将指向SPCMDm的指针的值复制到SPDCR.SPFC[1:0]位。SSLn0信号的有效电平由SSLP.SSL0P位决定。

当MSTR位为0时，SPI工作在从机模式。如果从机模式下SPI的MODFEN位为1，SPMS位为0，并且在串行传输期间（从驱动有效数据开始到获取最终有效数据的时间）。

On detecting a mode fault error, the SPI stops the driving of the output signals and clears the SPCR.SPE bit to 0 (see [section 30.3.10. Initializing the SPI](#)). For multi-master configuration, detection of a mode fault error is used to stop the driving of output signals and the SPI function, which allows the master to be released.

The occurrence of a mode fault error can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. Detecting mode-fault errors without using the SPI error interrupt requires polling of SPSR. When using the SPI in master mode, the value of the pointer to the SPCMDm register at the occurrence of the error can be checked by reading the SPSSR.SPECM[2:0] bits.

When the MODF flag is 1, writing 1 to the SPE bit is ignored by the SPI. To enable the SPI function after the detection of a mode fault error, the MODF flag must be set to 0.

#### 30.3.9.4 Underrun errors

While the SPI is operating in slave mode (SPCR.MSTR bit = 0) and the Extended Communication Mode Select bit (ETXMD) in the SPI Control Register 3 (SPCR3) is set to 0, if serial transfer is started before transmit data output is ready with the SPCR.SPE bit set to 1 (SPI function enabled), the SPI detects an underrun error and sets the SPSR.MODF and SPSR.UDRF flags to 1.

On detecting an underrun error, the SPI stops the driving of output signals and clears the SPCR.SPE bit to 0 (see [section 30.3.10. Initializing the SPI](#)).

The occurrence of underrun errors can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. Detecting underrun errors without using the SPI error interrupt requires polling of SPSR.

When the MODF flag is 1, writing 1 to the SPE bit is ignored by the SPI. To enable the SPI function after the detection of an underrun error, the MODF flag must be set to 0.

### 30.3.10 Initializing the SPI

If 0 is written to the SPCR.SPE bit or if the SPI sets the SPE bit to 0 because it detected a mode fault error or an underrun error, the SPI disables the SPI function and initializes some of the module functions. When a system reset is generated, the SPI initializes all of the module functions. This section describes initialization by clearing of the SPCR.SPE bit and by a system reset.

#### 30.3.10.1 Initialization by clearing of the SPCR.SPE bit

When the SPCR.SPE bit is set to 0, the SPI initializes by:

- Suspending any serial transfer that is being executed
- Stopping the driving of output signals (Hi-Z) in slave mode
- Initializing the internal state of the SPI
- Initializing the transmit buffer of the SPI (the SPSR.STEF flag sets to 1)

Initialization by clearing of the SPE bit does not initialize the control bits of the SPI. For this reason, the SPI can be started in the same transfer mode in use prior to initialization when the SPE bit is set to 1 again.

The SPSR.CENDF, SPSR.SPRF, SPSR.OVRF, SPSR.MODF, SPSR.PERF, and SPSR.UDRF flags are not initialized, and the value of the SPI Sequence Status Register (SPSSR) is not initialized. Therefore, even after the SPI is initialized, data from the receive buffer can be read to check the communication completion status and the error status during an SPI transfer.

The transmit buffer is initialized to an empty state (the SPSR.SPTEF flag sets to 1). Therefore, if the SPCR.SPTIE bit is set to 1 after SPI initialization, a transmit buffer empty interrupt is generated. To disable any transmit buffer empty interrupts when the SPI is initialized, write 0 to the SPTIE bit simultaneously while writing 0 to the SPE bit.

#### 30.3.10.2 Initialization by system reset

A system reset completely initializes the SPI by initializing all SPI control bits, status bits, and data registers, in addition to meeting the requirements described in [section 30.3.10.1. Initialization by clearing of the SPCR.SPE bit](#).

在检测到模式故障错误时，SPI停止驱动输出信号并将SPCR.SPE位清零（参见第30.3.10节。初始化SPI）。对于多主机配置，检测到模式故障错误用于停止驱动输出信号和SPI功能，从而释放主机。

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查模式故障错误的发生。在不使用SPI错误中断的情况下检测模式错误需要轮询SPSR。在主模式下使用SPI时，可以通过读取SPSSR.SPECM[2:0]位来检查发生错误时指向SPCMDm寄存器的指针的值。

当MODF标志为1时，向SPE位写入1会被SPI忽略。要在检测到模式故障错误后启用SPI功能，MODF标志必须设置为0。

#### 30.3.9.4 Underrun errors

当SPI工作在从机模式（SPCR.MSTR位=0）并且SPI控制寄存器3（SPCR3）中的扩展通信模式选择位（ETXMD）设置为0时，如果串行传输在发送数据输出之前开始准备好将SPCR.SPE位设置为1（启用SPI功能），SPI检测到欠载错误并将SPSR.MODF和SPSR.UDRF标志设置为1。

检测到欠载错误时，SPI停止驱动输出信号并将SPCR.SPE位清零（参见第30.3.10节。初始化SPI）。

可以通过读取SPSR或使用SPI错误中断并读取SPSR。在不使用SPI错误中断的情况下检测欠载错误需要轮询SPSR。

当MODF标志为1时，向SPE位写入1会被SPI忽略。要在检测到欠载错误后启用SPI功能，MODF标志必须设置为0。

### 30.3.10 初始化SPI

如果将0写入SPCR.SPE位，或者如果SPI由于检测到模式故障错误或欠载错误而将SPE位设置为0，则SPI将禁用SPI功能并初始化一些模块功能。当产生系统复位时，SPI初始化所有模块功能。本节介绍通过清除SPCR.SPE位和系统复位进行的初始化。

#### 30.3.10.1 通过清除SPCR.SPE位进行初始化

当SPCR.SPE位设置为0时，SPI通过以下方式初始化：

- 暂停任何正在执行的串行传输
- 从机模式下停止驱动输出信号（Hi-Z）
- 初始化SPI的内部状态
- 初始化SPI的发送缓冲区（SPSR.STEF标志设置为1）

通过清除SPE位进行的初始化不会初始化SPI的控制位。因此，当SPE位再次设置为1时，SPI可以在初始化之前以相同的传输模式启动。

SPSR.CENDF、SPSR.SPRF、SPSR.OVRF、SPSR.MODF、SPSR.PERF和SPSR.UDRF标志未初始化，SPI序列状态寄存器（SPSSR）的值未初始化。因此，即使在SPI初始化之后，也可以从接收缓冲区读取数据，以检查SPI传输期间的通信完成状态和错误状态。

发送缓冲区初始化为空状态（SPSR.SPTEF标志设置为1）。因此，如果SPCR.SPTIE位在SPI初始化后设置为1，则会产生发送缓冲区空中断。要在SPI初始化时禁用任何发送缓冲区空中断，请同时将0写入SPTIE位，同时将0写入SPE位。

#### 30.3.10.2 通过系统复位初始化

除了满足第30.3.10.1节中描述的要求外，系统复位还通过初始化所有SPI控制位、状态位和数据寄存器来完全初始化SPI。通过清除SPCR.SPE位进行初始化。

### 30.3.11 SPI Operation

#### 30.3.11.1 Master mode operation

The only difference between single- and multi-master mode operation is the use of mode fault error detection (see [section 30.3.9. Error Detection](#)). In single-master mode, the SPI does not detect mode fault errors whereas in multi-master mode, it does. This section explains operations that are common to both modes.

##### (1) Starting a serial transfer

The SPI updates the data in the transmit buffer (SPTX) when data is written to the SPI Data Register (SPDR/SPDR\_HA) with the SPI transmit buffer empty, data for the next transfer is not set, and the SPSR.STEF flag is 0. When the shift register is empty after the number of frames set in the SPDCR.SPFC[1:0] bits are written to the SPDR/SPDR\_HA/SPDR\_BY, the SPI copies data from the transmit buffer to the shift register and starts serial transfer. On copying transmit data to the shift register, the SPI changes the status of the shift register to full. On termination of the serial transfer, it changes the status of the shift register to empty. The status of the shift register cannot be referenced.

The polarity of the SSLni output pins depends on the SSLP register settings. For details on the SPI transfer format, see [section 30.3.5. Transfer Formats](#).

##### (2) Terminating a serial transfer

Regardless of the SPCMDm.CPHA bit setting, the SPI terminates the serial transfer after transmitting an RSPCKn edge associated with the final sampling timing. If free space is available in the receive buffer (SPRX) (the SPSR.SPRF flag is 0), on termination of the serial transfer, the SPI copies data from the shift register to the receive buffer of the SPDR/SPDR\_HA register.

The final sampling timing varies depending on the bit length of transfer data. In master mode, the SPI data length depends on the SPCMDm.SPB[3:0] bit settings. The polarity of the SSLni output pin depends on the SSLP register settings. For details on the SPI transfer format, see [section 30.3.5. Transfer Formats](#).

##### (3) Sequence control

The transfer format used in master mode is determined by the SPSCR, SPCMDm, SPBR, SPCKD, SSLND, and SPND registers.

The SPSCR register determines the sequence configuration for serial transfers that are executed by the SPI in master mode. The following items are set in the SPCMDm register:

- SSLni pin output signal value
- MSB- or LSB-first
- Data length
- Some of the bit rate settings
- RSPCK polarity and phase
- Whether SPCKD is to be referenced
- Whether SSLND is to be referenced
- Whether SPND is to be referenced

SPBR holds some of the bit rate settings, including SPCKD (SPI clock delay), SSLND (SSL negation delay), and SPND (next-access delay).

Based on the sequence length assigned in SPSCR, the SPI makes up a sequence comprised of a part or all of the SPCMDm register. The SPI contains a pointer to the SPCMDm register that makes up the sequence. The value of this pointer can be checked by reading the SPSSR.SPCP[2:0] bits. When the SPCR.SPE bit is set to 1 and the SPI function is enabled, the SPI loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. The SPI increments the pointer each time the next-access delay period for a data transfer ends. On completion of the serial transfer that corresponds to the final command in the sequence, the SPI sets the pointer to SPCMD0, and in this way the sequence is executed repeatedly.

### 30.3.11 SPI操作

#### 30.3.11.1 主模式操作

单主机模式和多主机模式操作之间的唯一区别是使用模式故障错误检测（请参阅第30.3.9节。错误检测）。在单主机模式下，SPI不检测模式故障错误，而在多主机模式下，它可以。本节介绍两种模式共有的操作。

##### (1) 开始串行传输

当数据写入SPI数据寄存器(SPDRSPDR\_HA)且SPI发送缓冲区为空、未设置下一次传输的数据且SPSR.STEF标志为0时，SPI更新发送缓冲区(SPTX)中的数据。当SPDCR.SPFC[1:0]位设置的帧数写入SPDRSPDR\_HASPDR\_BY后移位寄存器为空时，SPI将数据从发送缓冲区复制到移位寄存器并开始串行传输。在将发送数据复制到移位寄存器时，SPI将移位寄存器的状态更改为已满。在串行传输终止时，它将移位寄存器的状态更改为空。无法引用移位寄存器的状态。

SSLni输出引脚的极性取决于SSLP寄存器设置。有关SPI传输格式的详细信息，请参见第30.3.5节。传输格式。

##### (2) 终止串行传输

无论SPMDm.CPHA位设置如何，SPI在发送与最终采样时序相关的RSPCKn边沿后终止串行传输。如果接收缓冲区(SPRX)中有可用空间(SPSR.SPRF标志为0)，则在串行传输终止时，SPI将数据从移位寄存器复制到SPDRSPDR\_HA寄存器的接收缓冲区。

最终的采样时序根据传输数据的位长而变化。在主模式下，SPI数据长度取决于SPMDm.SPB[3:0]位设置。SSLni输出引脚的极性取决于SSLP寄存器设置。有关SPI传输格式的详细信息，请参见第30.3.5节。传输格式。

##### (3) 顺序控制

主机模式中使用的传输格式由SPSCR、SPCMDm、SPBR、SPCKD、SSLND和SPND寄存器确定。

SPSCR寄存器确定由SPI在主模式下执行的串行传输的序列配置。在SPCMDm寄存器中设置以下项目：

- SSLni管脚输出信号值
- MSB- or LSB-first
- 数据长度
- 一些比特率设置
- RSPCK极性和相位
- 是否引用SPCKD
- 是否引用SSLND
- 是否引用SPND

SPBR保存一些比特率设置，包括SPCKD（SPI时钟延迟）、SSLND（SSL否定延迟）和SPND（下一次访问延迟）。

根据在SPSCR中分配的序列长度，SPI组成一个由部分或全部SPMDm寄存器组成的序列。SPI包含一个指向构成序列的SPCMDm寄存器的指针。该指针的值可以通过读取SPSSR.SPCP[2:0]位来检查。当SPCR.SPE位设置为1且SPI功能使能时，SPI加载指向SPCMD0中命令的指针，并在串行传输开始时将SPCMD0设置合并到传输格式中。每次数据传输的下一个访问延迟周期结束时，SPI都会递增指针。在完成对应于序列中最终命令的串行传输后，SPI将指针设置为

SPCMD0，并以这种方式重复执行序列。

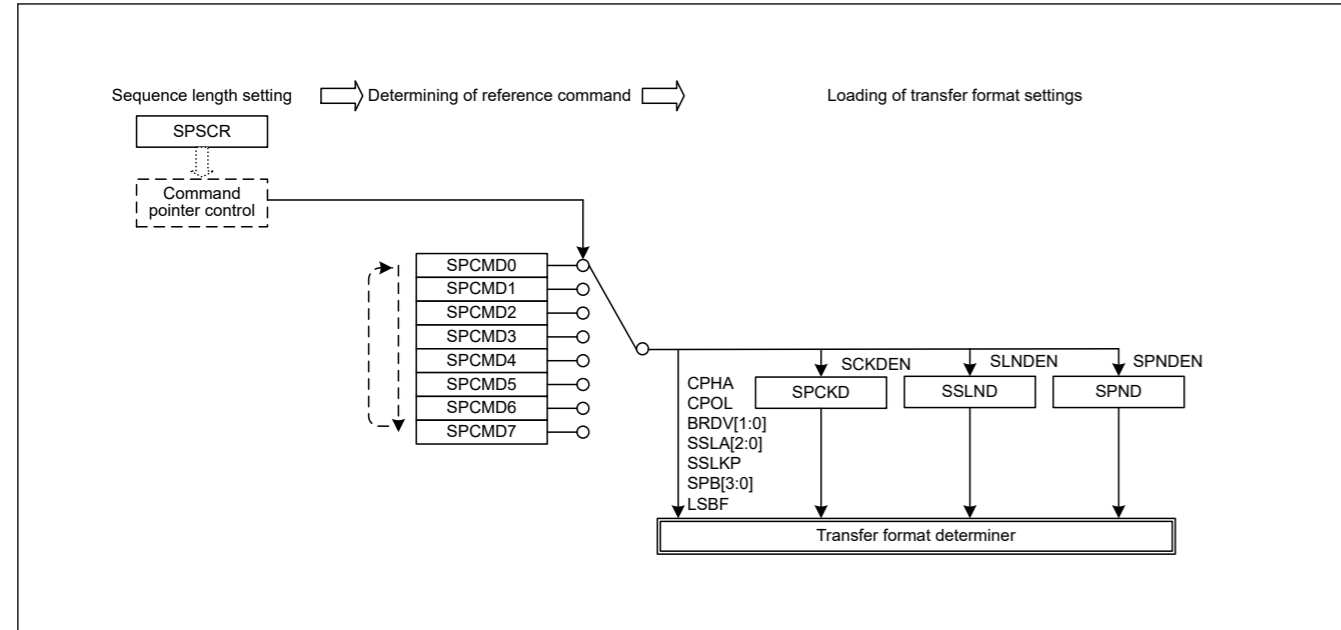

Figure 30.43 Procedure for determining the form of a serial transfer in master mode

In this section, a frame is the combination of the data in SPDR/SPDR\_HA and the settings in SPCMDm.

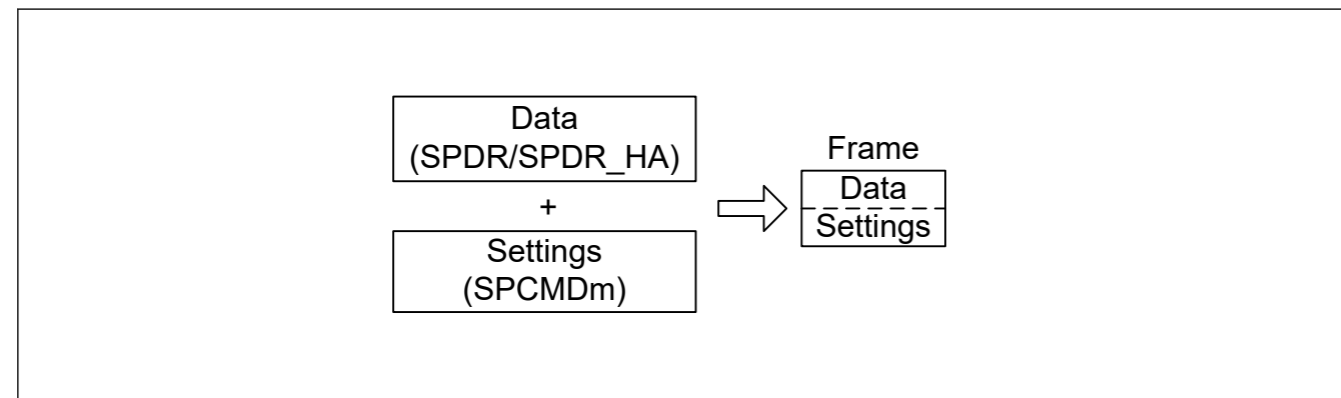

Figure 30.44 Conceptual diagram of frames

Figure 30.45 shows the correspondence between the commands and the transmit and receive buffers in the sequence of operations specified by the settings in Table 30.3.

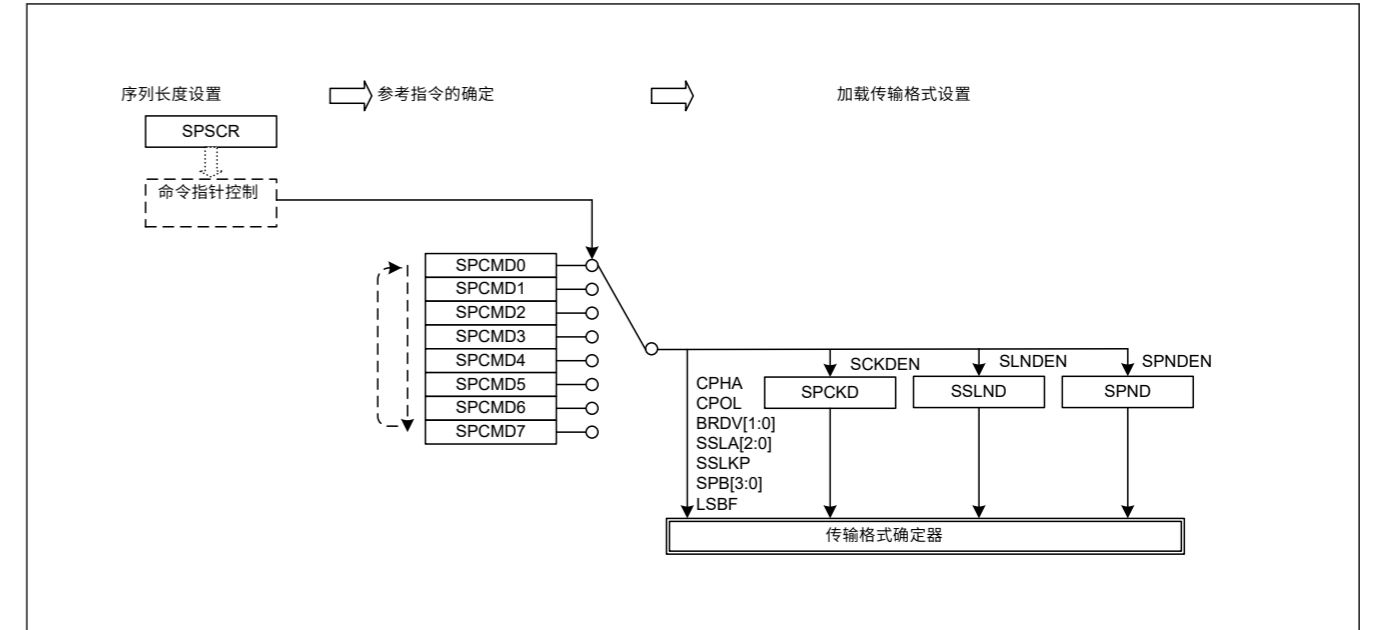

Figure 30.43 确定主模式下串行传输形式的过程

在本节中，帧是SPDR/SPDR\_HA中的数据和SPCMDm中的设置的组合。

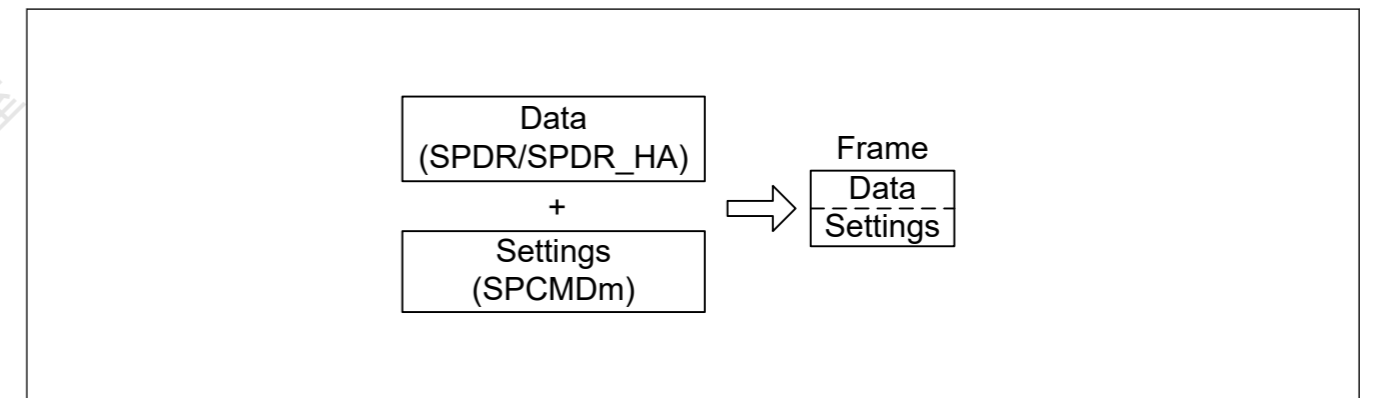

Figure 30.44 框架的概念图

图30.45显示了在表30.3中设置指定的操作顺序中命令与发送和接收缓冲区之间的对应关系。

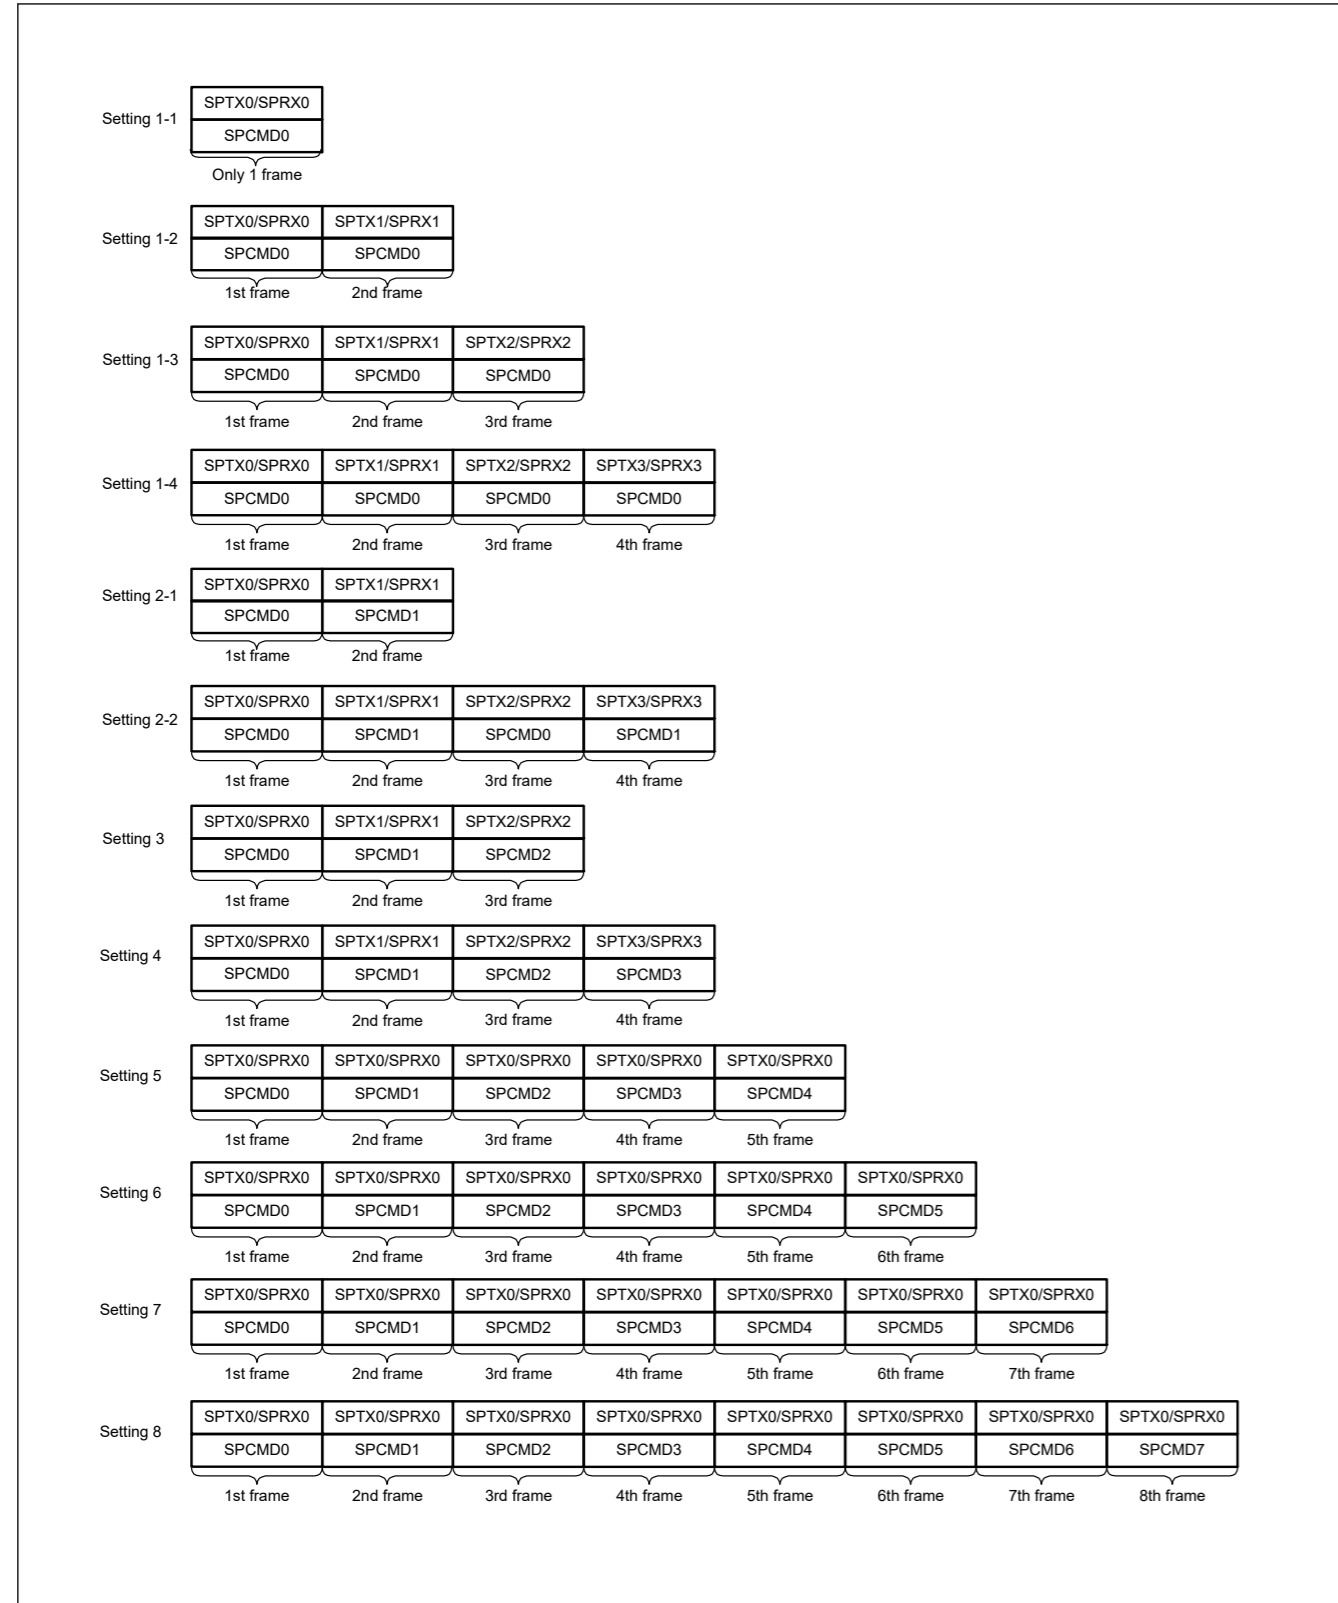

Figure 30.45 Correspondence between SPI Command Register and transmit and receive buffers in sequence operations

(4) Burst transfers

If the SPCMDm.SSLKP bit that the SPI references during the current serial transfer is 1, the SPI maintains the SSLni signal level during the serial transfer until the beginning of the SSLni signal assertion for the next serial transfer. If the SSLni

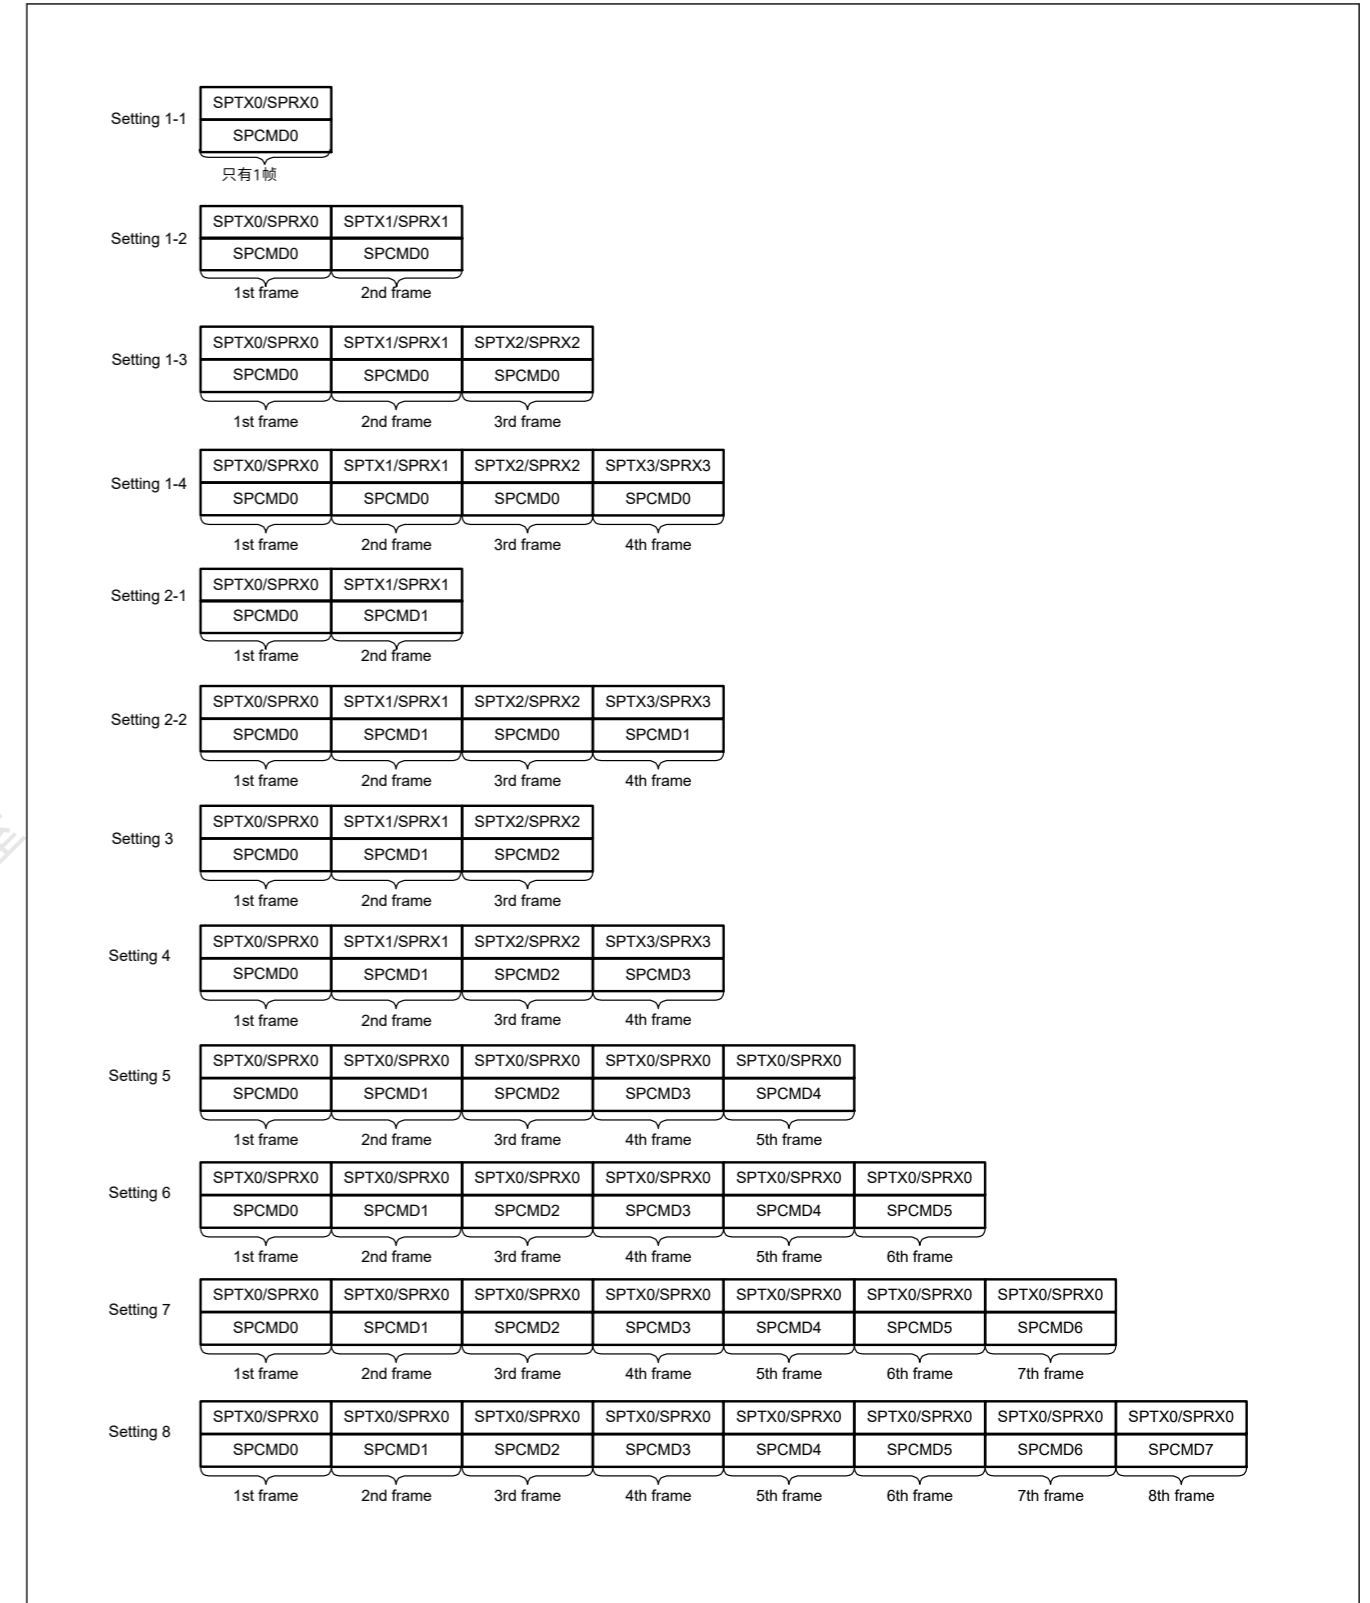

Figure 30.45 顺序操作中SPI命令寄存器与发送接收缓冲区的对应关系

(4) 突发传输

如果SPI在当前串行传输期间引用的SPCMDm.SSLKP位为1，则SPI在串行传输期间保持SSLni信号电平，直到下一次串行传输的SSLni信号断言开始。如果SSLni

signal level for the next serial transfer is the same as the SSLni signal level for the current serial transfer, the SPI can execute continuous serial transfers while keeping the SSLni signal assertion status (burst transfer).

- When Between Burst Transfer Frames Delay Select bit (BFDS) of SPI control register 3 (SPCR3) is 0.

Figure 30.46 shows an example of an SSLni signal operation for a burst transfer that is implemented using the SPCMD0 and SPCMD1 register settings. This section describes SPI operations (1) to (8) shown in Figure 30.46.

Note: The polarity of the SSLni output signal depends on the SSLP register settings.

Figure 30.46 Example of burst transfer operation using the SSLKP bit (BFDS = 0)

The SPI operation at times (1) to (8) in the figure is as follows:

- Based on the SPCMD0 settings, the SPI asserts the SSLni signal and inserts RSPCK delays.
- The SPI executes serial transfers in accordance with the SPCMD0 settings.
- The SPI inserts an SSL negation delay.
- Because the SPCMD0.SSLKP bit is 1, the SPI keeps the SSLni signal value specified in SPCMD0. This period is sustained at a minimum for a period equal to the next-access delay in SPCMD0. If the shift register is empty after the passage of the minimum period, this period is sustained until the transmit data is stored in the shift register for the next transfer.
- Based on the SPCMD1 settings, the SPI asserts the SSLni signal and inserts RSPCK delays.
- The SPI executes serial transfers in accordance with the SPCMD1 settings.
- Insert SSL negate delay.
- Because the SPCMD1.SSLKP bit is 0, the SPI negates the SSLni signal. In addition, a next-access delay is inserted in accordance with SPCMD1.

If the SSLni signal output settings in the SPCMDm register where 1 is assigned to the SSLKP bit are different from the SSLni signal output settings in the SPCMDm register to be used in the next transfer, the SPI switches the SSLni signal status to SSLni signal assertion as shown in (5) in Figure 30.46. This corresponds to the command for the next transfer.

Note: If such an SSLni signal switching occurs, the slaves that drive the MISO signal compete, and collision of signal levels might occur.

The SPI in master mode references the SSLni signal operation within the module when the SSLKP bit is not used. When the SPCMDm.CPHA bit is 0, the SPI can accurately start serial transfers by using the SSLni signal assertion for the next transfer that is detected internally.

- When Between Burst Transfer Frames Delay Select bit (BFDS) of SPI control register 3 (SPCR3) is 1.

Figure 30.47 shows an example of SSL signal operation when burst transfer is achieved by using the settings of SPCMD0 and SPCMD1. The following describes SPI operations of (1) to (6) shown in Figure 30.47. The SSL output signal polarity depends on the set SPI slave select polarity register (SSLP) value.

下一次串行传输的信号电平与当前串行传输的SSLni信号电平相同，SPI可以在保持SSLni信号断言状态（突发传输）的同时执行连续串行传输。

- 当SPI控制寄存器3(SPCR3)的突发传输帧之间延迟选择位(BFDS)为0时。

图30.46显示了使用SPCMD0和SPCMD1寄存器设置实现的突发传输的SSLni信号操作示例。本节介绍图30.46所示的SPI操作(1)至(8)。

Note: SSLni输出信号的极性取决于SSLP寄存器设置。

Figure 30.46 使用SSLKP位(BFDS=0)的突发传输操作示例

图中(1)到(8)时刻的SPI操作如下:

- 基于SPCMD0设置，SPI断言SSLni信号并插入RSPCK延迟。
- SPI根据SPMD0设置执行串行传输。
- SPI插入SSL否定延迟。
- 由于SPCMD0.SSLKP位为1，SPI保持SPCMD0中指定的SSLni信号值。这个时期是至少持续一段时间等于SPMD0中的下一次访问延迟。如果在经过最小周期后移位寄存器为空，则该周期一直持续到发送数据存储到移位寄存器中以供下一次传输。
- 基于SPCMD1设置，SPI断言SSLni信号并插入RSPCK延迟。
- SPI根据SPMD1设置执行串行传输。
- 插入SSL否定延迟。
- 由于SPCMD1.SSLKP位为0，SPI否定SSLni信号。此外，根据SPMD1插入下一个访问延迟。

如果SPCMDm寄存器中的SSLni信号输出设置（其中1分配给SSLKP位）与SPCMDm寄存器中用于下一次传输的SSLni信号输出设置不同，则SPI将SSLni信号状态切换为SSLni信号断言，如下所示如图30.46（5）所示。这对应于下一次传输的命令。

Note: 如果发生这种SSLni信号切换，驱动MISO信号的从机竞争，可能会发生信号电平冲突。

当不使用SSLKP位时，主模式下的SPI参考模块内的SSLni信号操作。当。。。的时候 SPCMDm.CPHA位为0，SPI可以通过使用SSLni信号断言来准确启动串行传输，以进行内部检测到的下一次传输。

- 当SPI控制寄存器3(SPCR3)的突发传输帧之间延迟选择位(BFDS)为1时。

图30.47显示了使用SPCMD0和SPCMD1的设置实现突发传输时SSL信号操作的示例。下面描述图30.47所示的(1)到(6)的SPI操作。SSL输出信号极性取决于设置的SPI从机选择极性寄存器(SSLP)值。

Figure 30.47 Example of Burst Transfer Operation Using SSLKP Bit (BFDS = 1)

1. Assert the SSL signal and insert an RSPCK delay according to SPCMD0. The RSPCK delay is inserted only the first frame of burst transmission.
2. Perform serial transfer according to SPCMD0. Wait last clock until the next transmit data is stored in the shift register, if the shift register is empty during RSPCK negate period between frames.
3. The value of SSL signal according to SPCMD0 is hold, because the SPCMD0.SSLKP bit is 1. RSPCK negate period between frames is 0.5RSPCK, if the shift register is not empty.
4. Perform serial transfer according to SPCMD1.
5. Insert SSL negate delay for the last frame.
6. The SSL signal is negated because the SSLKP bit in SPCMD1 is 0. Furthermore, the next-access delay is inserted according to SPCMD1.

(5) RSPCK delay (t1)

The RSPCK delay value of the SPI in master mode depends on the SPCMDm.SCKDEN bit setting and the SPCKD.SCKDL[2:0] bits setting. The SPI determines the SPCMDm register to be referenced during a serial transfer by pointer control, and determines an RSPCK delay using the SPCMDm.SCKDEN bit and SPCKD.SCKDL[2:0] bits, as listed in Table 30.10. For a definition of RSPCK delay, see section 30.3.5. Transfer Formats.

RSPCK delay insert to only the first frame of burst transmission, when transmit without “Between Burst Transfer Frames Delay”. (The SPCMD.SSLKP bit is 1 and the SPCR3.BFDS bit is 1.)

Table 30.10 Relationship between the SPCMDm.SCKDEN bit, SPCKD.SCKDL[2:0] bits, and RSPCK delay

| SPCMDm.SCKDEN bit | SPCKD.SCKDL[2:0] bits | RSPCK delay |
|-------------------|-----------------------|-------------|
| 0                 | 000b to 111b          | 1 RSPCK     |
| 1                 | 000b                  | 1 RSPCK     |
|                   | 001b                  | 2 RSPCK     |
|                   | 010b                  | 3 RSPCK     |
|                   | 011b                  | 4 RSPCK     |
|                   | 100b                  | 5 RSPCK     |
|                   | 101b                  | 6 RSPCK     |
|                   | 110b                  | 7 RSPCK     |
|                   | 111b                  | 8 RSPCK     |

(6) SSL negation delay (t2)

The SSL negation delay value of the SPI in master mode depends on the SPCMDm.SLNDEN bit setting and the SSLND.SLNDL[2:0] bits setting. The SPI determines the SPCMDm register to be referenced by pointer control during a serial transfer, and determines an SSL negation delay using the SPCMDm.SLNDEN bit and SSLND.SLNDL[2:0] bits, as listed in Table 30.11. For a definition of SSL negation delay, see section 30.3.5. Transfer Formats.

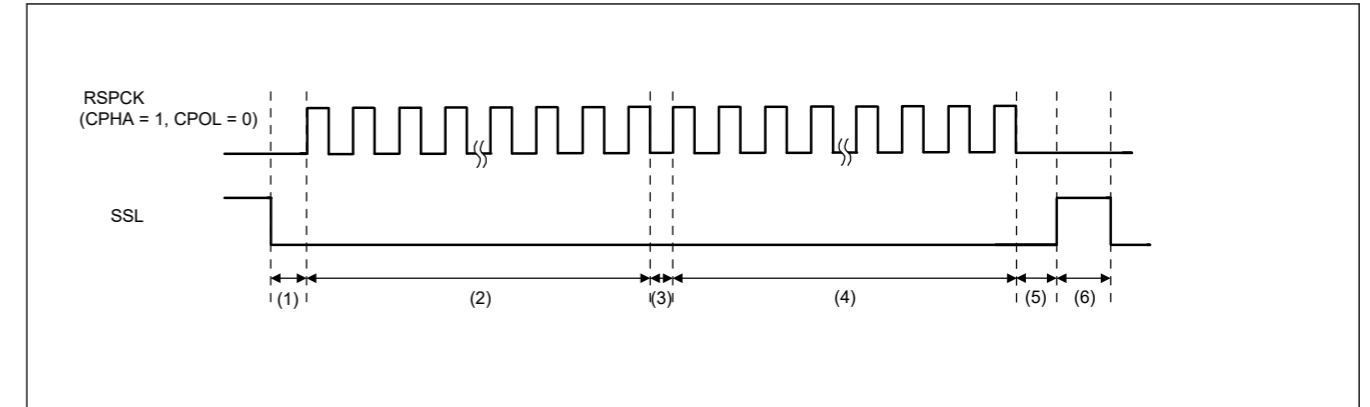

Figure 30.47 使用SSLKP位(BFDS=1)的突发传输操作示例

1. 置位SSL信号并根据SPMD0插入一个RSPCK延迟。RSPCK延迟仅插入突发传输的第一帧。
2. 根据SPMD0进行串行传输。如果在帧之间的RSPCK否定周期内移位寄存器为空，则等待最后一个时钟，直到下一个发送数据存储在移位寄存器中。
3. SPCMD0的SSL信号值被保持，因为SPCMD0.SSLKP位为1。如果移位寄存器不为空，则帧之间的RSPCK否定周期为0.5RSPCK。
4. 根据SPMD1进行串行传输。
5. 为最后一帧插入SSL否定延迟。
6. SSL信号被取反，因为SPCMD1中的SSLKP位为0。另外，根据SPCMD1插入下一个访问延迟。

(5) RSPCK delay (t1)

主机模式下SPI的RSPCK延迟值取决于SPMDm.SCKDEN位设置和SPCKD.SCKDL[2:0]位设置。SPI通过指针控制确定串行传输期间要引用的SPCMDm寄存器，并使用SPCMDm.SCKDEN位和SPCKD.SCKDL[2:0]位确定RSPCK延迟，如表30.10中所列。有关RSPCK延迟的定义，请参见第30.3.5节。传输格式。

当没有“BetweenBurstTransferFrames”传输时，RSPCK延迟仅插入到突发传输的第一帧延迟”。(SPCMD.SSLKP位为1，SPCR3.BFDS位为1。)

Table 30.10 SPCMDm.SCKDEN位、SPCKD.SCKDL[2:0]位和RSPCK延迟之间的关系

| SPCMDm.SCKDEN bit | SPCKD.SCKDL[2:0] bits | RSPCK delay |
|-------------------|-----------------------|-------------|
| 0                 | 000b to 111b          | 1 RSPCK     |
| 1                 | 000b                  | 1 RSPCK     |
|                   | 001b                  | 2 RSPCK     |
|                   | 010b                  | 3 RSPCK     |
|                   | 011b                  | 4 RSPCK     |
|                   | 100b                  | 5 RSPCK     |
|                   | 101b                  | 6 RSPCK     |
|                   | 110b                  | 7 RSPCK     |
|                   | 111b                  | 8 RSPCK     |

(6) SSL否定延迟(t2)

主模式下SPI的SSL否定延迟值取决于SPMDm.SLNDEN位设置和SSLND.SLNDL[2:0]位设置。SPI确定串行传输期间指针控制要引用的SPCMDm寄存器，并使用SPCMDm.SLNDEN位和SSLND.SLNDL[2:0]位确定SSL否定延迟，如表30.11中所列。有关SSL否定延迟的定义，请参见第30.3.5节。传输格式。

An SSL negation delay is inserted to only the last frame of the burst transmission, that is, transmit without “between burst transfer frames delay”. (SPCMD.SSLKP bit is 1 and SPCR3.BFDS bit is 1).

**Table 30.11 Relationship between the SPCMDm.SLNDEN bit, SSLND.SLNDL[2:0] bits, and SSL negation delay**

| SPCMDm.SLNDEN bit | SSLND.SLNDL[2:0] bits | SSL negation delay |
|-------------------|-----------------------|--------------------|
| 0                 | 000b to 111b          | 1 RSPCK            |
| 1                 | 000b                  | 1 RSPCK            |
|                   | 001b                  | 2 RSPCK            |
|                   | 010b                  | 3 RSPCK            |
|                   | 011b                  | 4 RSPCK            |
|                   | 100b                  | 5 RSPCK            |
|                   | 101b                  | 6 RSPCK            |
|                   | 110b                  | 7 RSPCK            |
|                   | 111b                  | 8 RSPCK            |

#### (7) Next-access delay (t3)

The next-access delay value of the SPI in master mode depends on the SPCMDm.SPNDEN bit setting and the SPND.SPNDL[2:0] bits setting. The SPI determines the SPCMDm register to be referenced during serial transfer by pointer control, and then determines a next-access delay during serial transfer using the SPCMDm.SPNDEN bit and SPND.SPNDL[2:0] bits, as listed in [Table 30.12](#). For a definition of next-access delay, see [section 30.3.5. Transfer Formats](#).

A next-Access delay is inserted to only the last frame of the burst transmission, that is, transmit without “between burst transfer frames delay”. (SPCMD.SSLKP bit is 1 and SPCR3.BFDS bit is 1).

**Table 30.12 Relationship between the SPCMDm.SPNDEN bit, SPND.SPNDL[2:0] bits, and next-access delay**

| SPCMDm.SPNDEN bit | SPND.SPNDL[2:0] bits | Next-access delay |
|-------------------|----------------------|-------------------|
| 0                 | 000b to 111b         | 1 RSPCK + 2 PCLKA |
| 1                 | 000b                 | 1 RSPCK + 2 PCLKA |
|                   | 001b                 | 2 RSPCK + 2 PCLKA |
|                   | 010b                 | 3 RSPCK + 2 PCLKA |
|                   | 011b                 | 4 RSPCK + 2 PCLKA |
|                   | 100b                 | 5 RSPCK + 2 PCLKA |
|                   | 101b                 | 6 RSPCK + 2 PCLKA |

|                   | 111b                 | 8 RSPCK + 2 PCLKA |

#### (8) Initialization flow

[Figure 30.48](#) shows an example of SPI initialization flow when the SPI is in master mode. For information on how to set up the Interrupt Controller Unit (ICU), DMAC and I/O ports, see the descriptions given in the individual blocks.

SSL否定延迟仅插入到突发传输的最后一帧，即没有“突发传输帧之间延迟”的传输。（SPCMD.SSLKP位为1，SPCR3.BFDS位为1）。

**Table 30.11 SPCMDm.SLNDEN位、SSLND.SLNDL[2:0]位和SSL否定延迟之间的关系**

| SPCMDm.SLNDEN bit | SSLND.SLNDL[2:0] bits | SSL否定延迟 |
|-------------------|-----------------------|---------|
| 0                 | 000b to 111b          | 1 RSPCK |
| 1                 | 000b                  | 1 RSPCK |
|                   | 001b                  | 2 RSPCK |
|                   | 010b                  | 3 RSPCK |
|                   | 011b                  | 4 RSPCK |
|                   | 100b                  | 5 RSPCK |
|                   | 101b                  | 6 RSPCK |
|                   | 110b                  | 7 RSPCK |
|                   | 111b                  | 8 RSPCK |

#### (7) Next-access delay (t3)

主机模式下SPI的下次访问延迟值取决于SPMDm.SPNDEN位设置和SPND.SPNDL[2:0]位设置。SPI通过指针控制确定串行传输期间要引用的SPCMDm寄存器，然后使用SPCMDm.SPNDEN位和SPND.SPNDL[2:0]位确定串行传输期间的下次访问延迟，如表30.12中所列。有关下次访问延迟的定义，请参见第30.3.5节。传输格式。

仅在突发传输的最后一帧中插入下一个访问延迟，即，在没有“突发传输帧之间延迟”的情况下进行传输。（SPCMD.SSLKP位为1，SPCR3.BFDS位为1）。

**Table 30.12 SPMDm.SPNDEN位、SPND.SPNDL[2:0]位和下次访问延迟之间的关系**

| SPCMDm.SPNDEN bit | SPND.SPNDL[2:0] bits | Next-access delay |
|-------------------|----------------------|-------------------|
| 0                 | 000b to 111b         | 1 RSPCK + 2 PCLKA |
| 1                 | 000b                 | 1 RSPCK + 2 PCLKA |
|                   | 001b                 | 2 RSPCK + 2 PCLKA |
|                   | 010b                 | 3 RSPCK + 2 PCLKA |
|                   | 011b                 | 4 RSPCK + 2 PCLKA |
|                   | 100b                 | 5 RSPCK + 2 PCLKA |
|                   | 101b                 | 6 RSPCK + 2 PCLKA |
|                   | 110b                 | 7 RSPCK + 2 PCLKA |
|                   | 111b                 | 8 RSPCK + 2 PCLKA |

#### (8) 初始化流程

图30.48显示了SPI处于主机模式时的SPI初始化流程示例。有关如何设置中断控制器单元(ICU)、DMAC和IO端口的信息，请参见各个块中给出的说明。

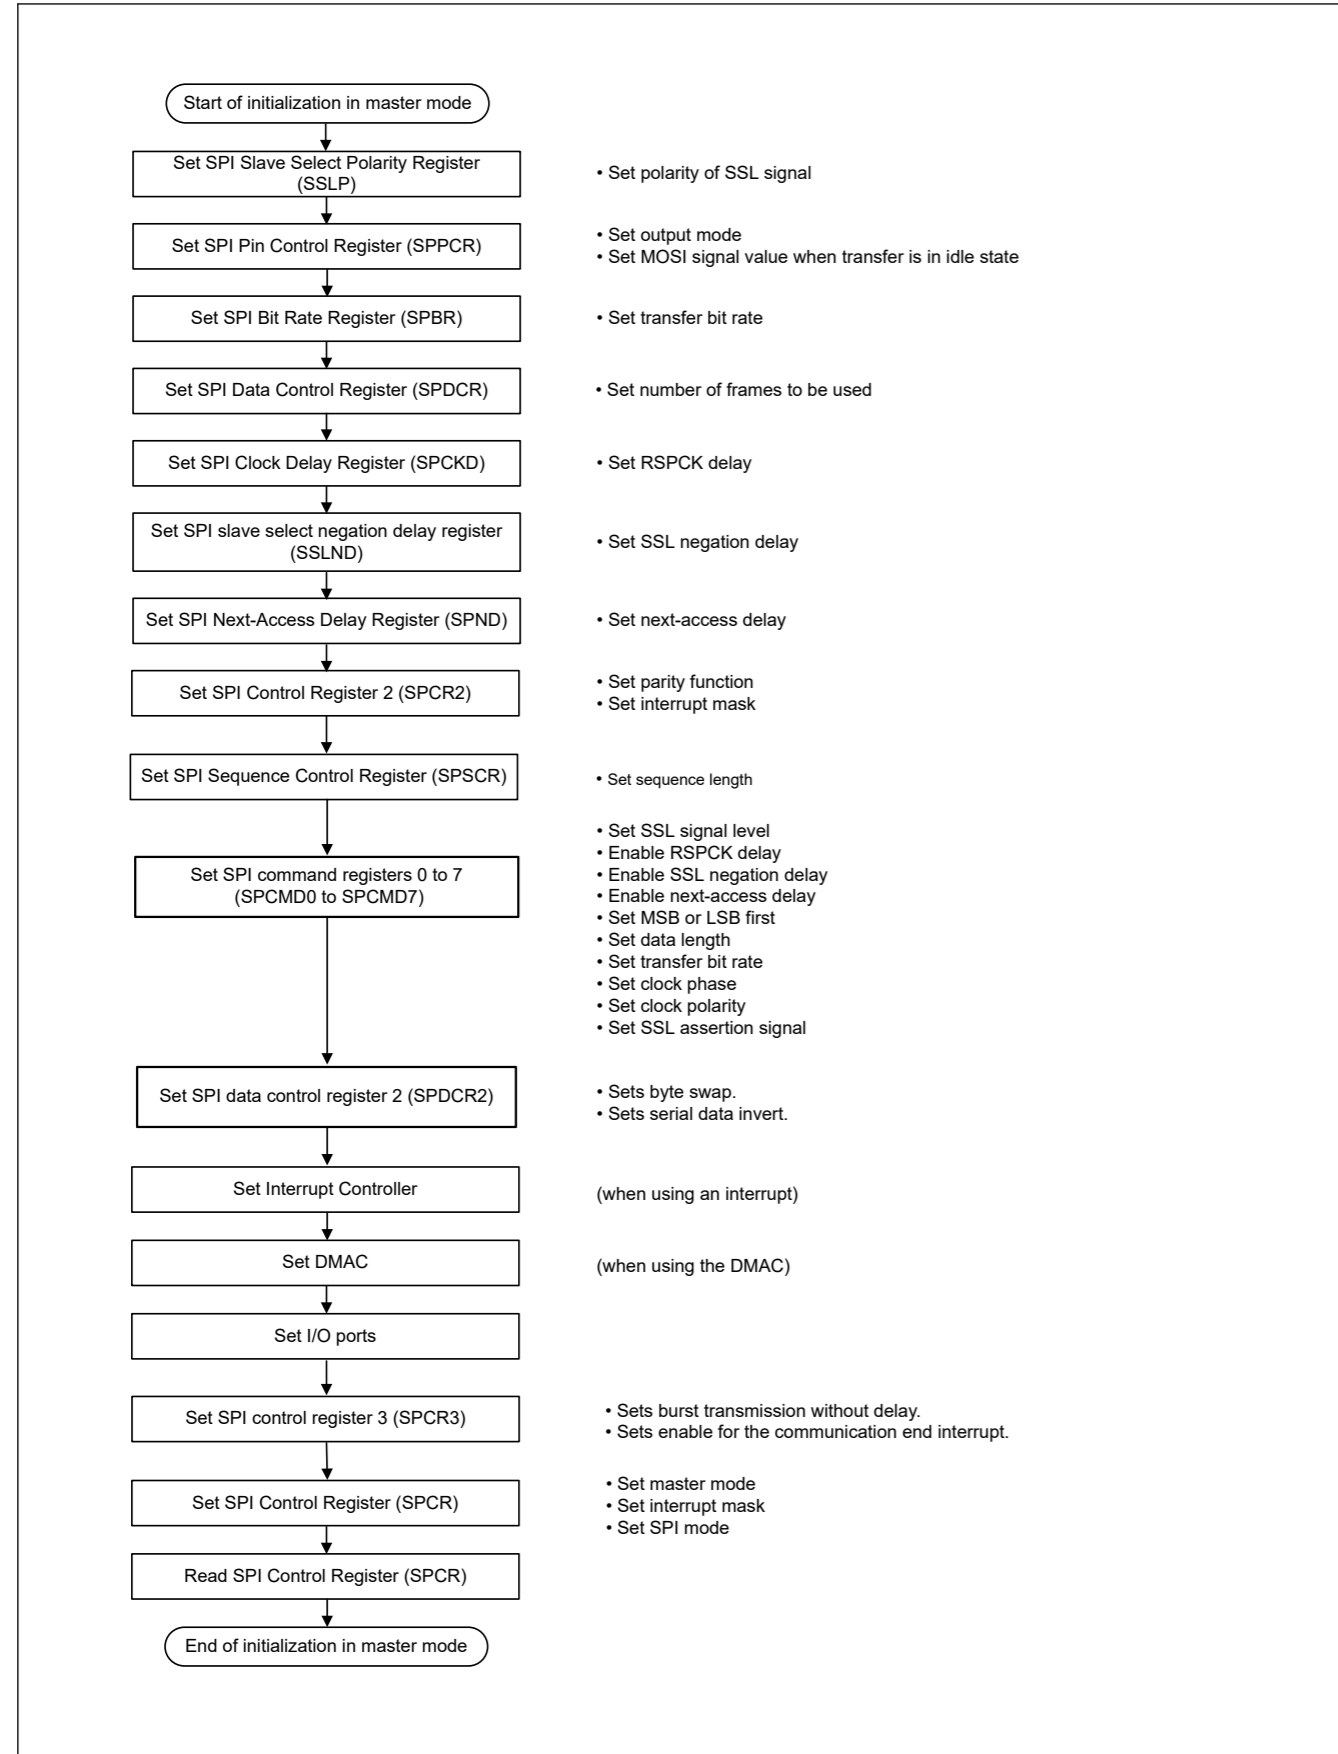

Figure 30.48 Example of initialization flow in master mode for SPI operation

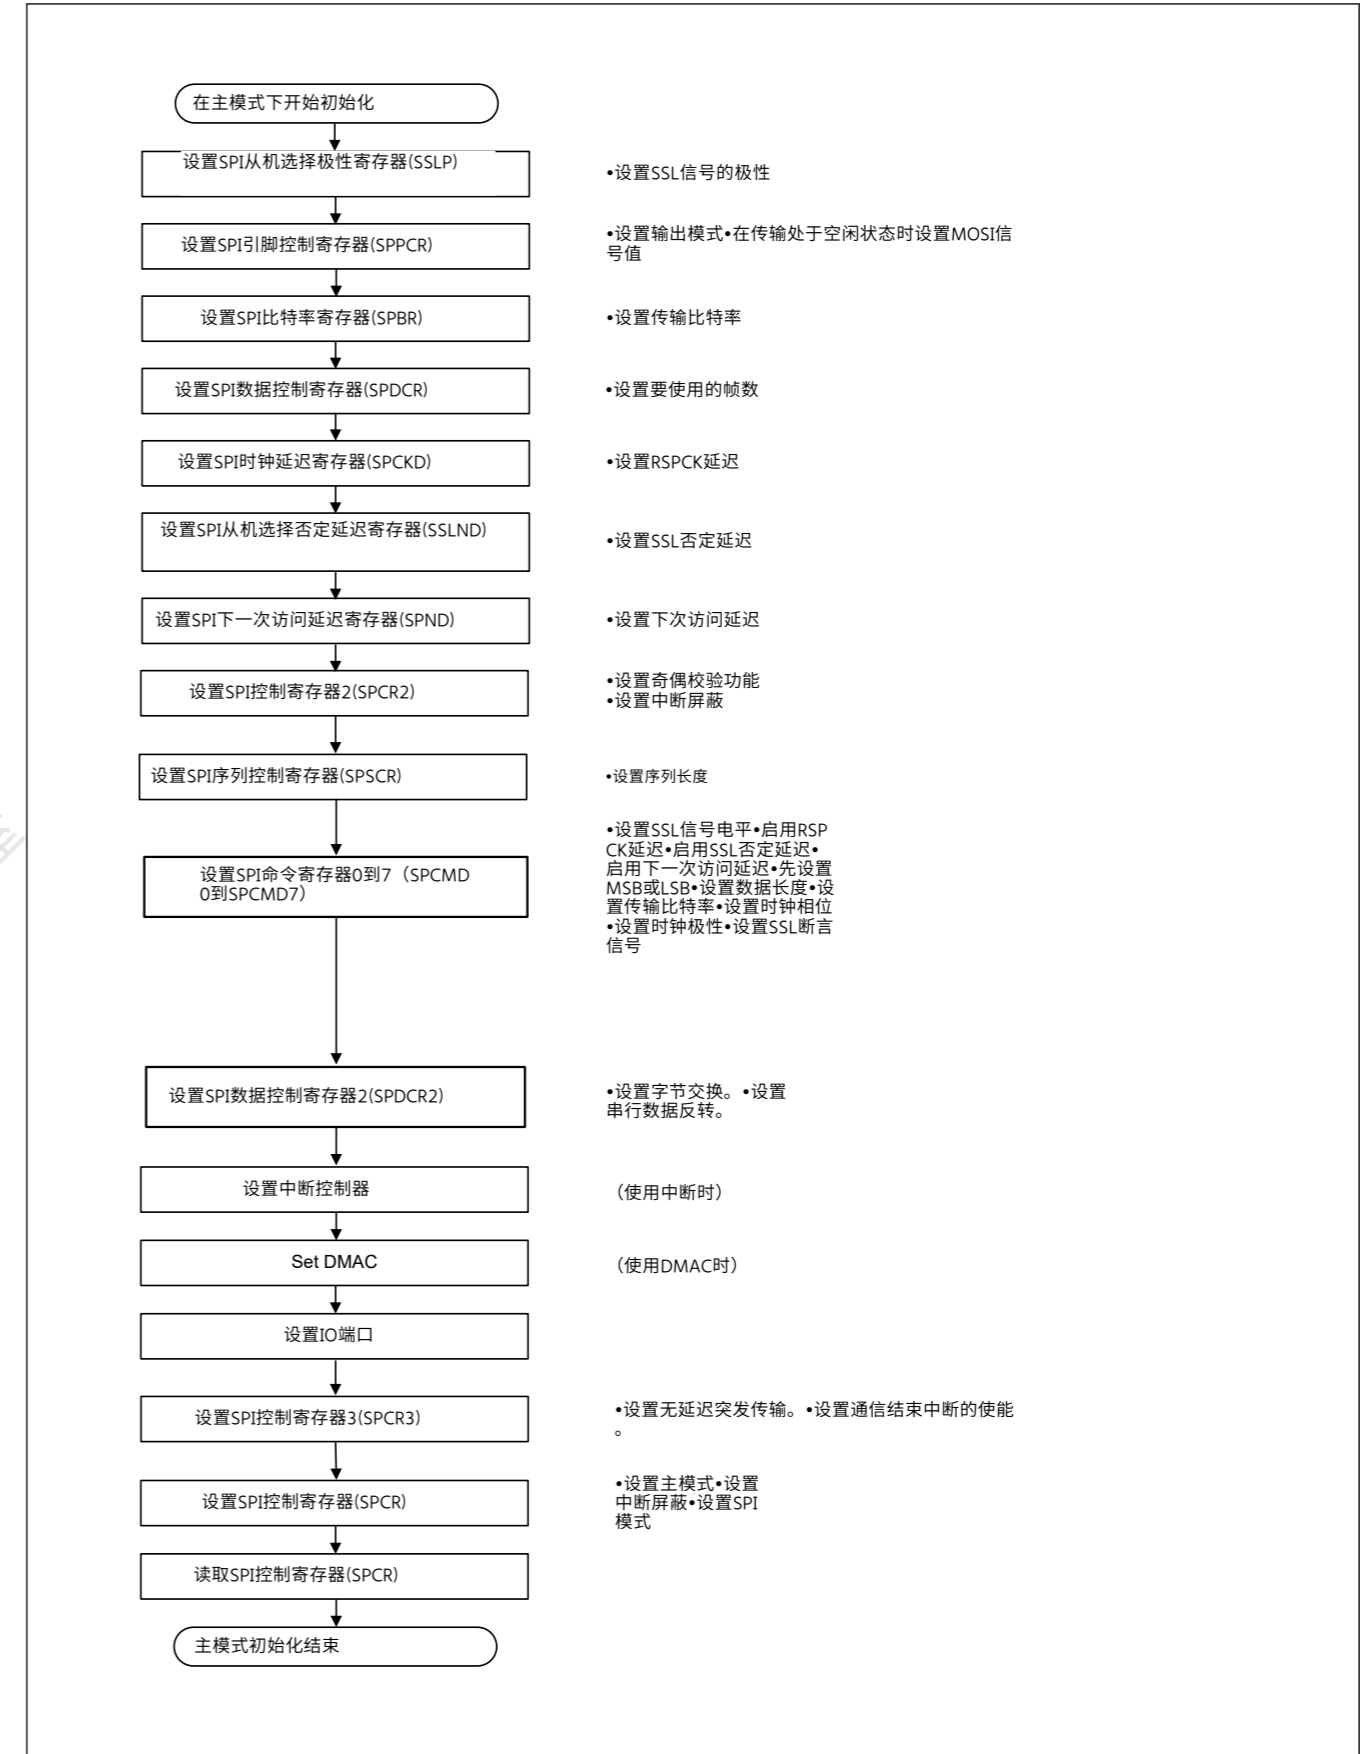

Figure 30.48 SPI操作的主模式初始化流程示例

(9) Software processing flow

Figure 30.49 to Figure 30.51 show examples of the software processing flow.

Transmit processing flow

When transmitting data, with the SPI<sub>i</sub> SPII interrupt enabled, the CPU is notified of the completion of data transmission after the last data write for transmission.

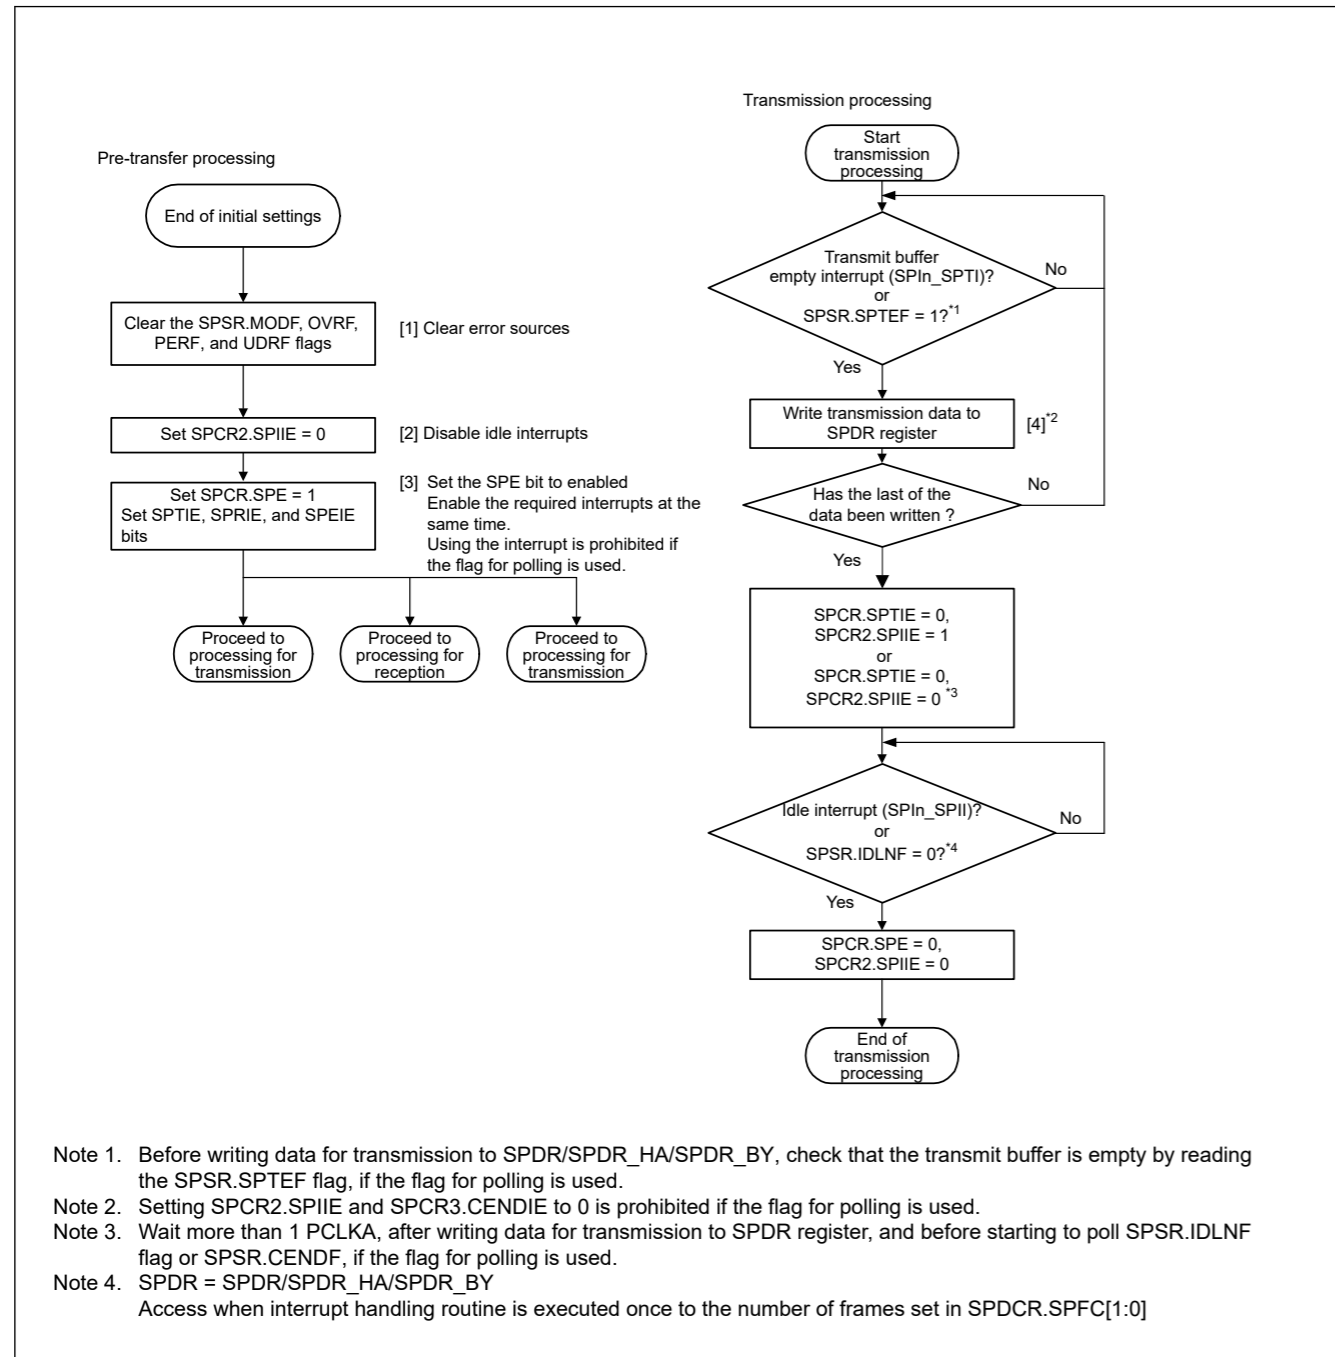

Figure 30.49 Transmission flow in master mode

Receive processing flow

The SPI has receive only operation in slave mode.

(9) 软件处理流程

图30.49至图30.51显示了软件处理流程的示例。

传输处理流程

发送数据时，SPI<sub>i</sub> SPII中断使能，在最后一次数据写入发送后通知CPU数据发送完成。

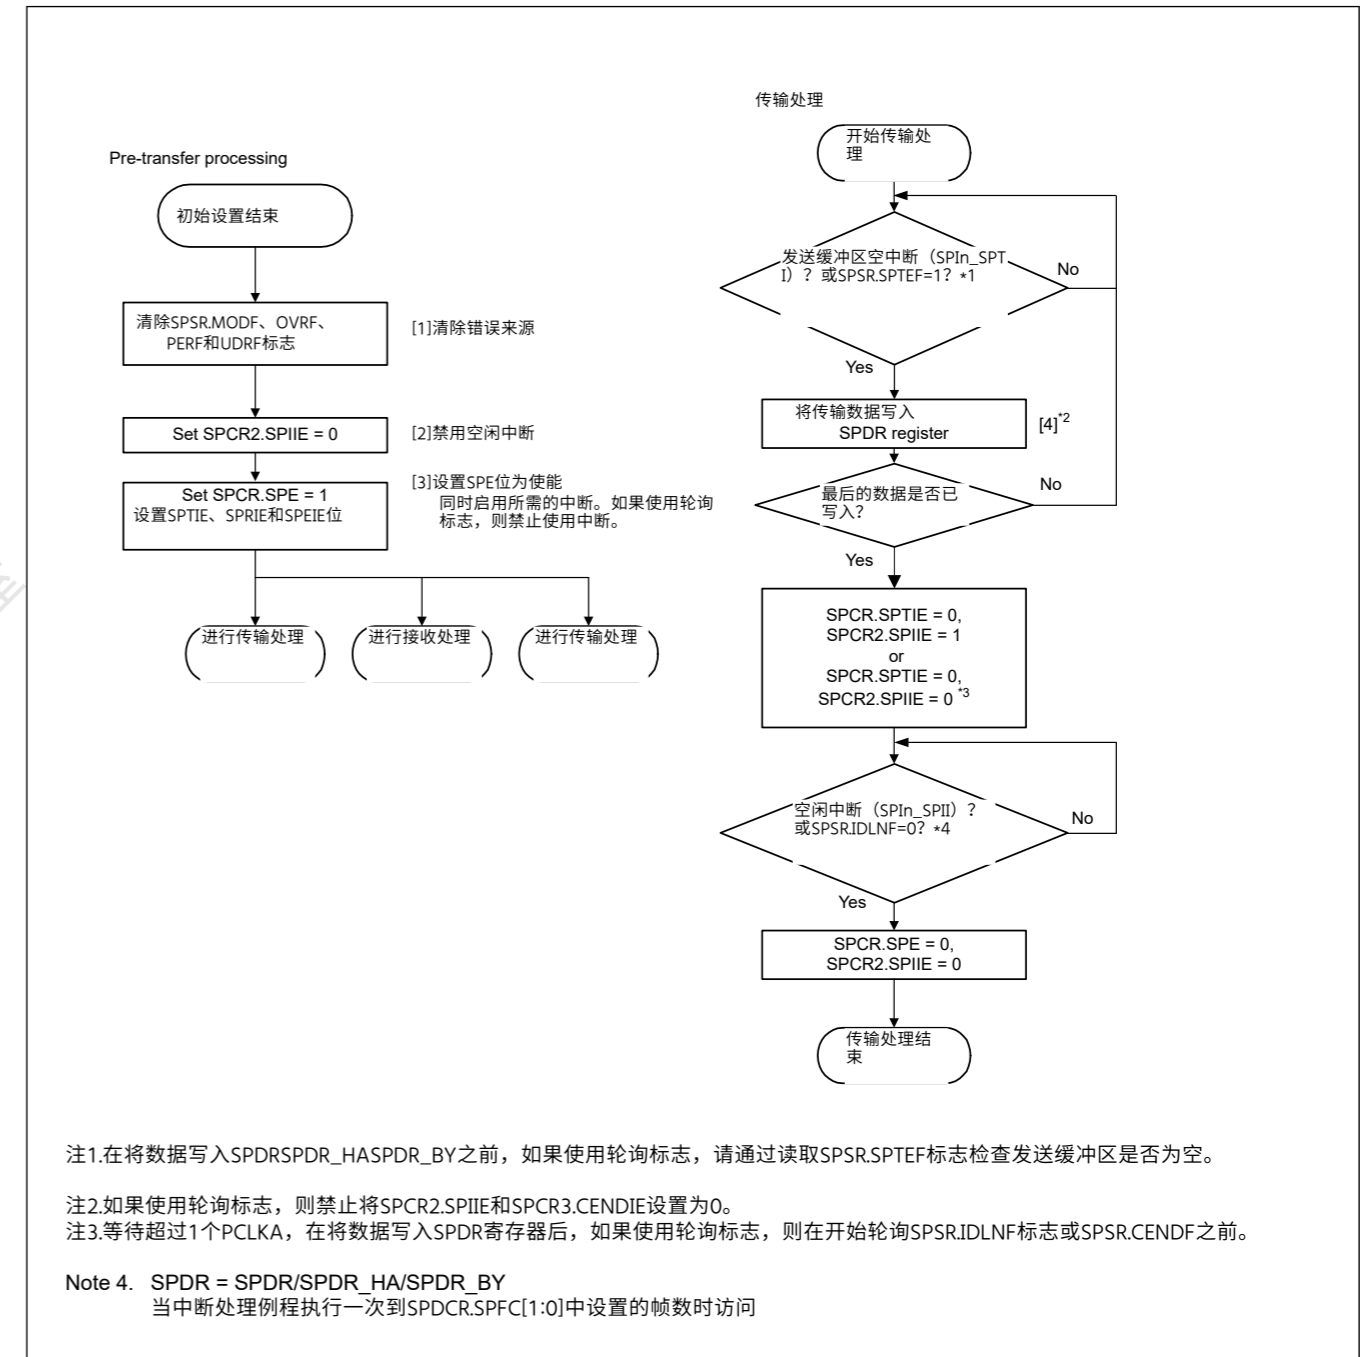

Figure 30.49 主模式下的传输流

接收处理流程

SPI在从机模式下仅接收操作。

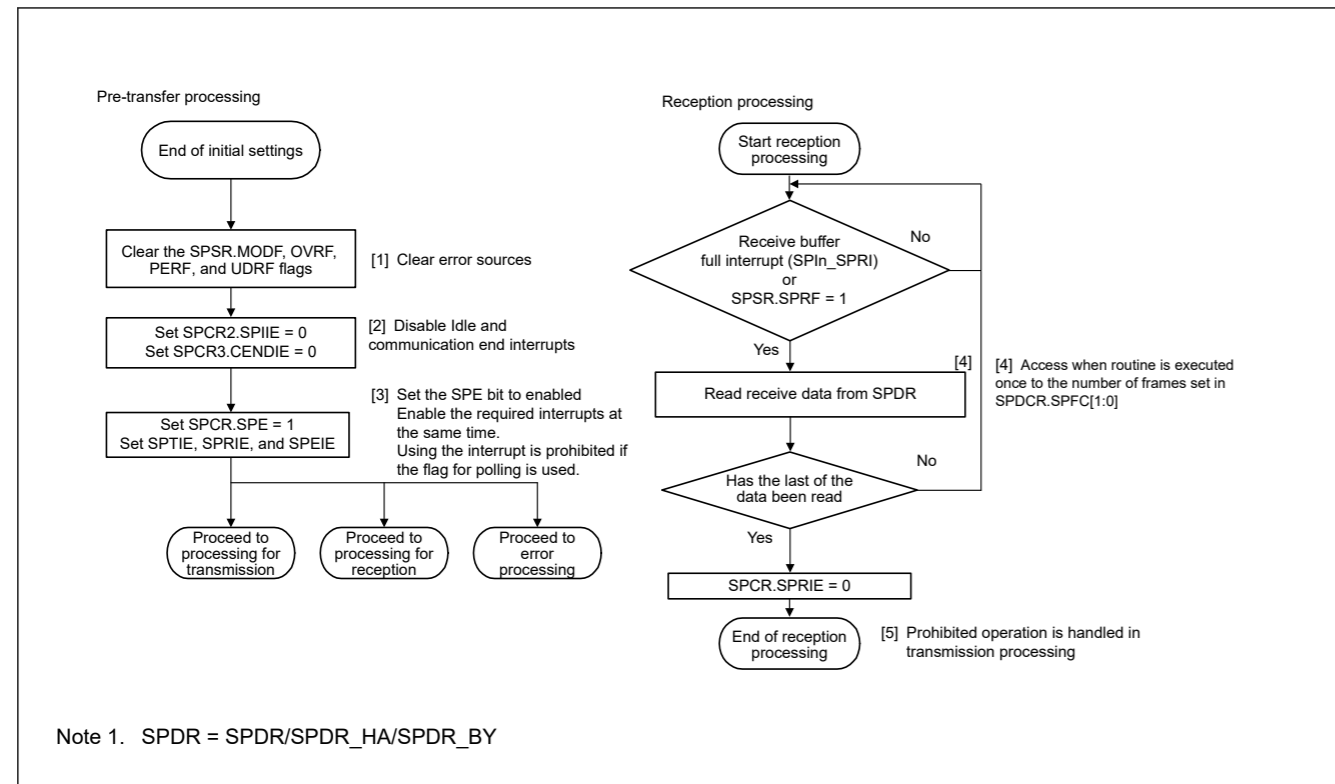

Figure 30.50 Reception flow in master mode

**Error processing flow**

The SPI detects the following errors:

- Mode fault error
- Underrun error
- Overrun error
- Parity error

When a mode fault error is generated, the SPCR.SPE bit is automatically cleared, stopping operations for transmission and reception. For errors from other sources, the SPCR.SPE bit is not cleared and operations for transmission and reception continue. Therefore, Renesas recommends clearing the SPCR.SPE bit to stop operations for errors other than mode fault errors. Not doing so leads to updating of the SPSSR.SPECM[2:0] bits.

When an error is detected using an interrupt, clear the ICU.IELSRn.IR flag in the error processing routine. If this is not done, the ICU.IELSRn.IR flag might continue to indicate the SPIi\_SPTI or SPIi\_SPRI interrupt request. If the SPIi\_SPRI interrupt request is indicated, read the receive buffer and initialize the sequencer in the SPI.

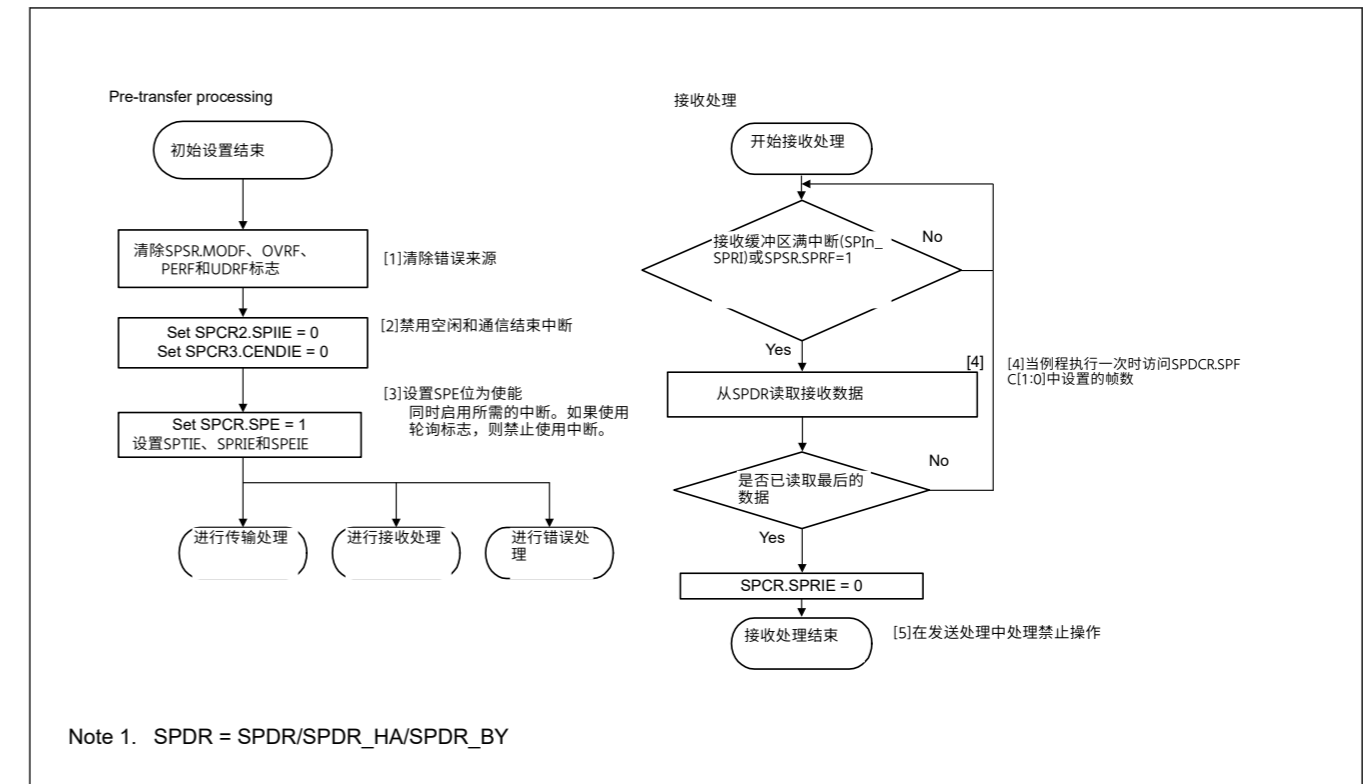

Figure 30.50 主模式下的接收流程

**错误处理流程**

SPI检测到以下错误:

- 模式故障错误
- Underrun error
- 超限错误
- 奇偶校验错误

当产生模式故障错误时，SPCR.SPE位自动清零，停止发送和接收操作。对于其他来源的错误，SPCR.SPE位不会被清除，发送和接收操作会继续。因此，瑞萨建议清除SPCR.SPE位以停止除模式故障错误以外的错误操作。不这样做会导致更新SPSSR.SPECM[2:0]位。

当使用中断检测到错误时，清除错误处理例程中的ICU.IELSRn.IR标志。如果不这样做，ICU.IELSRn.IR标志可能会继续指示SPIi\_SPTI或SPIi\_SPRI中断请求。如果指示了SPIi\_SPRI中断请求，则读取接收缓冲区并初始化SPI中的定序器。

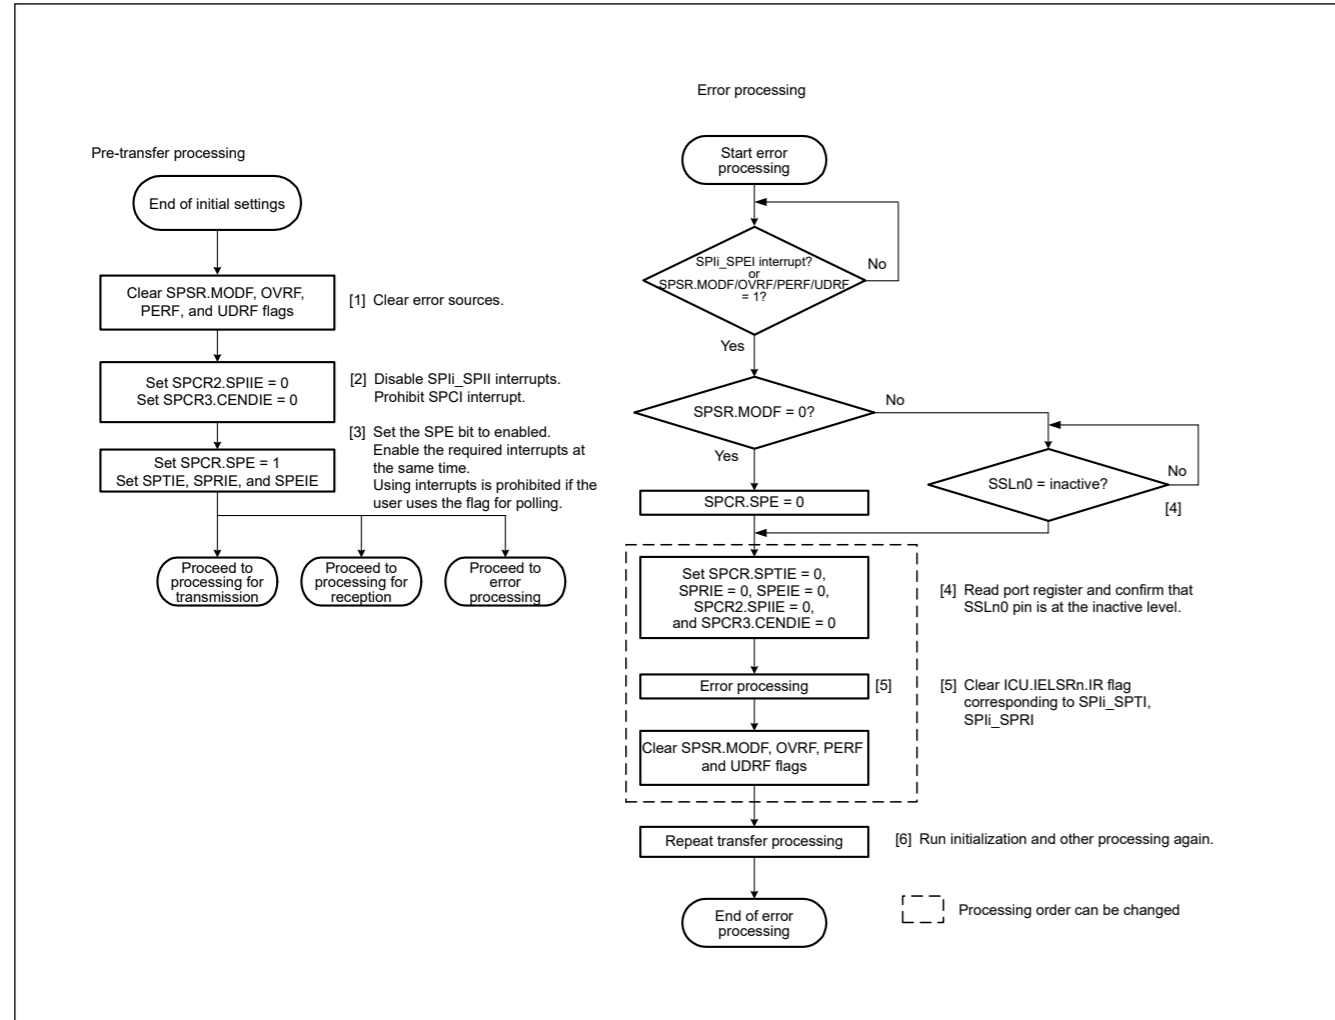

Figure 30.51 Error processing flow in master mode

30.3.11.2 Slave mode operation

(1) Starting a serial transfer

When the SPCMD0.CPHA bit is 0, if the SPI detects an SSLn0 input signal assertion, it must drive valid data to the MISO<sub>n</sub> output signal. For this reason, when the CPHA bit is 0, the assertion of the SSLn0 input signal triggers the start of a serial transfer.

When the CPHA bit is 1, if the SPI detects the first RSPCK<sub>n</sub> edge in an SSLn0 signal asserted condition, it must drive valid data to the MISO<sub>n</sub> output signal. For this reason, when the CPHA bit is 1, the first RSPCK<sub>n</sub> edge in an SSLn0 signal asserted condition triggers the start of a serial transfer.

Regardless of the CPHA bit setting, the SPI drives the MISO<sub>n</sub> output signal on SSLn0 signal assertion. The data that is output by the SPI is either valid or invalid, depending on the CPHA bit setting.

For details on the SPI transfer format, see section 30.3.5. Transfer Formats. The polarity of the SSLn0 input signal depends on the SSLP.SSL0P setting.

(2) Terminating a serial transfer

Regardless of the SPCMD0.CPHA bit setting, the SPI terminates the serial transfer after detecting an RSPCK<sub>n</sub> edge corresponding to the final sampling timing. When free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies received data from the shift register to the receive buffer of the SPDR/SPDR\_HA register. On termination of a serial transfer, the SPI changes the status of the shift register to empty, regardless of the receive buffer state. A mode fault error occurs if the SPI detects an SSLn0 input signal negation from the beginning of serial transfer to the end of serial transfer (see section 30.3.9. Error Detection).

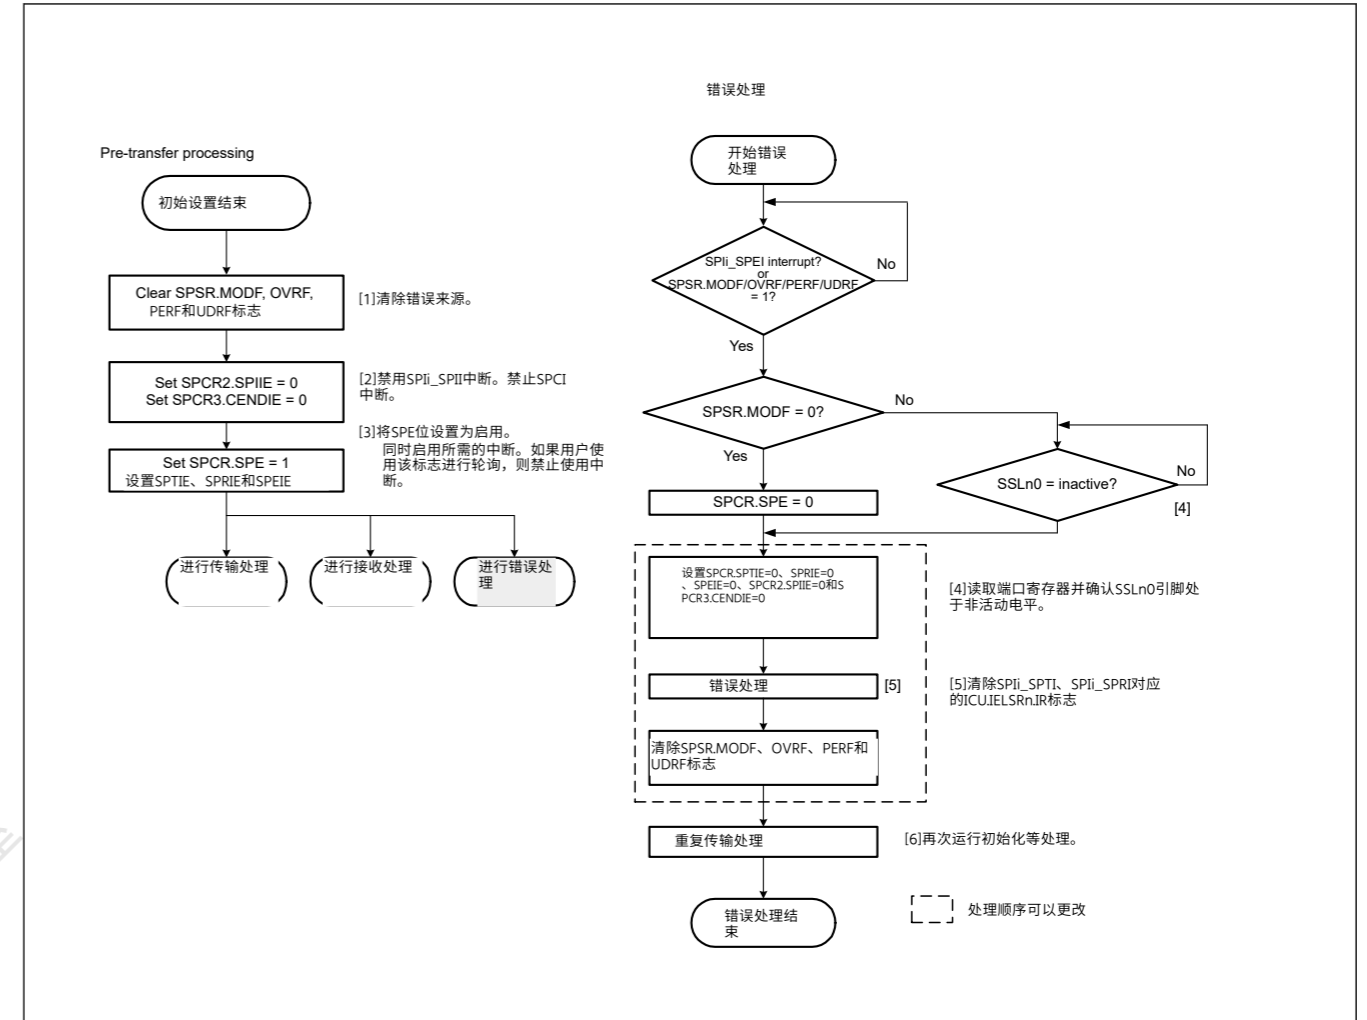

Figure 30.51 主模式下的错误处理流程

30.3.11.2 从模式操作

(1) 开始串行传输

当SPCMD0.CPHA位为0时，如果SPI检测到SSLn0输入信号断言，它必须将有效数据驱动到MISO<sub>n</sub>输出信号。因此，当CPHA位为0时，SSLn0输入信号的断言触发串行传输的开始。

当CPHA位为1时，如果SPI在SSLn0信号置位条件下检测到第一个RSPCK<sub>n</sub>边沿，它必须将有效数据驱动到MISO<sub>n</sub>输出信号。因此，当CPHA位为1时，SSLn0信号断言条件中的第一个RSPCK<sub>n</sub>边沿触发串行传输的开始。

无论CPHA位设置如何，SPI都会在SSLn0信号置位时驱动MISO<sub>n</sub>输出信号。SPI输出的数据是有效还是无效，取决于CPHA位设置。

有关SPI传输格式的详细信息，请参见第30.3.5节。传输格式。SSLn0输入信号的极性取决于SSLP.SSL0P设置。

(2) 终止串行传输

无论SPCMD0.CPHA位设置如何，SPI在检测到对应于最终采样时序的RSPCK<sub>n</sub>边沿后终止串行传输。当接收缓冲区中有可用空间时（SPSR.SPRF标志为0），在串行传输终止时，SPI将接收到的数据从移位寄存器复制到SPDR/SPDR\_HA寄存器的接收缓冲区。在串行传输终止时，SPI将移位寄存器的状态更改为空，而与接收缓冲区状态无关。如果SPI从串行传输开始到串行传输结束检测到SSLn0输入信号取反，则会发生模式故障错误（请参阅第30.3.9节。错误检测）。

The final sampling timing changes depending on the bit length of transfer data. In slave mode, the SPI data length is determined by the SPCMD0.SPB[3:0] bits setting. The polarity of the SSLn0 input signal is determined by the SSLP.SSLOP bit setting. For details on the SPI transfer format, see [section 30.3.5. Transfer Formats](#).

### (3) Notes on single-slave operations

If the SPCMD0.CPHA bit is 0, the SPI starts serial transfers when it detects the assertion edge for an SSLn0 input signal. In the configuration shown in [Figure 30.7](#), if the SPI is used in single-slave mode, the SSLn0 signal is fixed at an active state. Therefore, when the CPHA bit is set to 0, the SPI cannot correctly start a serial transfer. For the SPI to correctly execute transmit and receive operations in slave mode when the SSLn0 input signal is fixed at an active state, the CPHA bit must be set to 1. Do not fix the SSLn0 input signal if there is a requirement for setting the CPHA bit to 0.

### (4) Burst transfer

If the SPCMD0.CPHA bit is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSLn0 input signal. When the CPHA bit is 1, the serial transfer period is the period from the first RSPCKn edge to the sampling timing for the reception of the final bit in an SSLn0 signal active state. Even when the SSLn0 input signal remains at the active level, the SPI can accommodate burst transfers, because it can detect the start of an access.

When the CPHA bit is 0, the second and subsequent serial transfers during burst transfer cannot be executed correctly.

### (5) Initialization flow

[Figure 30.52](#) shows an example of initialization flow for SPI operation when the SPI is in slave mode. For a description of how to set up the ICU, DTC, and I/O ports, see the descriptions given in the individual blocks.

最终的采样时序根据传输数据的位长而变化。在从机模式下，SPI数据长度由SPCMD0.SPB[3:0]位设置决定。SSLn0输入信号的极性由SSLP.SSLOP位设置决定。有关SPI传输格式的详细信息，请参见第30.3.5节。传输格式。

### (3) 单从操作注意事项

如果SPCMD0.CPHA位为0，则SPI在检测到SSLn0输入信号的断言边沿时开始串行传输。在图30.7所示的配置中，如果SPI用于单从模式，则SSLn0信号固定在激活状态。因此，当CPHA位设置为0时，SPI无法正确启动串行传输。为使SPI在SSLn0输入信号固定为活动状态时正确执行从模式下的发送和接收操作，CPHA位必须设置为1。如果需要设置CPHA，请不要固定SSLn0输入信号位为0。

### (4) 突发传输

如果SPCMD0.CPHA位为1，则可以执行连续串行传输（突发传输），同时保持SSLn0输入信号的断言状态。当CPHA位为1时，串行传输周期是从第一个RSPCKn边沿到SSLn0信号有效状态下接收最后一个位的采样时序的周期。即使SSLn0输入信号保持在有效电平，SPI也可以适应突发传输，因为它可以检测访问的开始。

当CPHA位为0时，突发传输期间的第二次和后续串行传输无法正确执行。

### (5) 初始化流程

图30.52显示了SPI处于从机模式时SPI操作的初始化流程示例。有关如何设置ICU、DTC和IO端口的说明，请参见各个块中给出的说明。

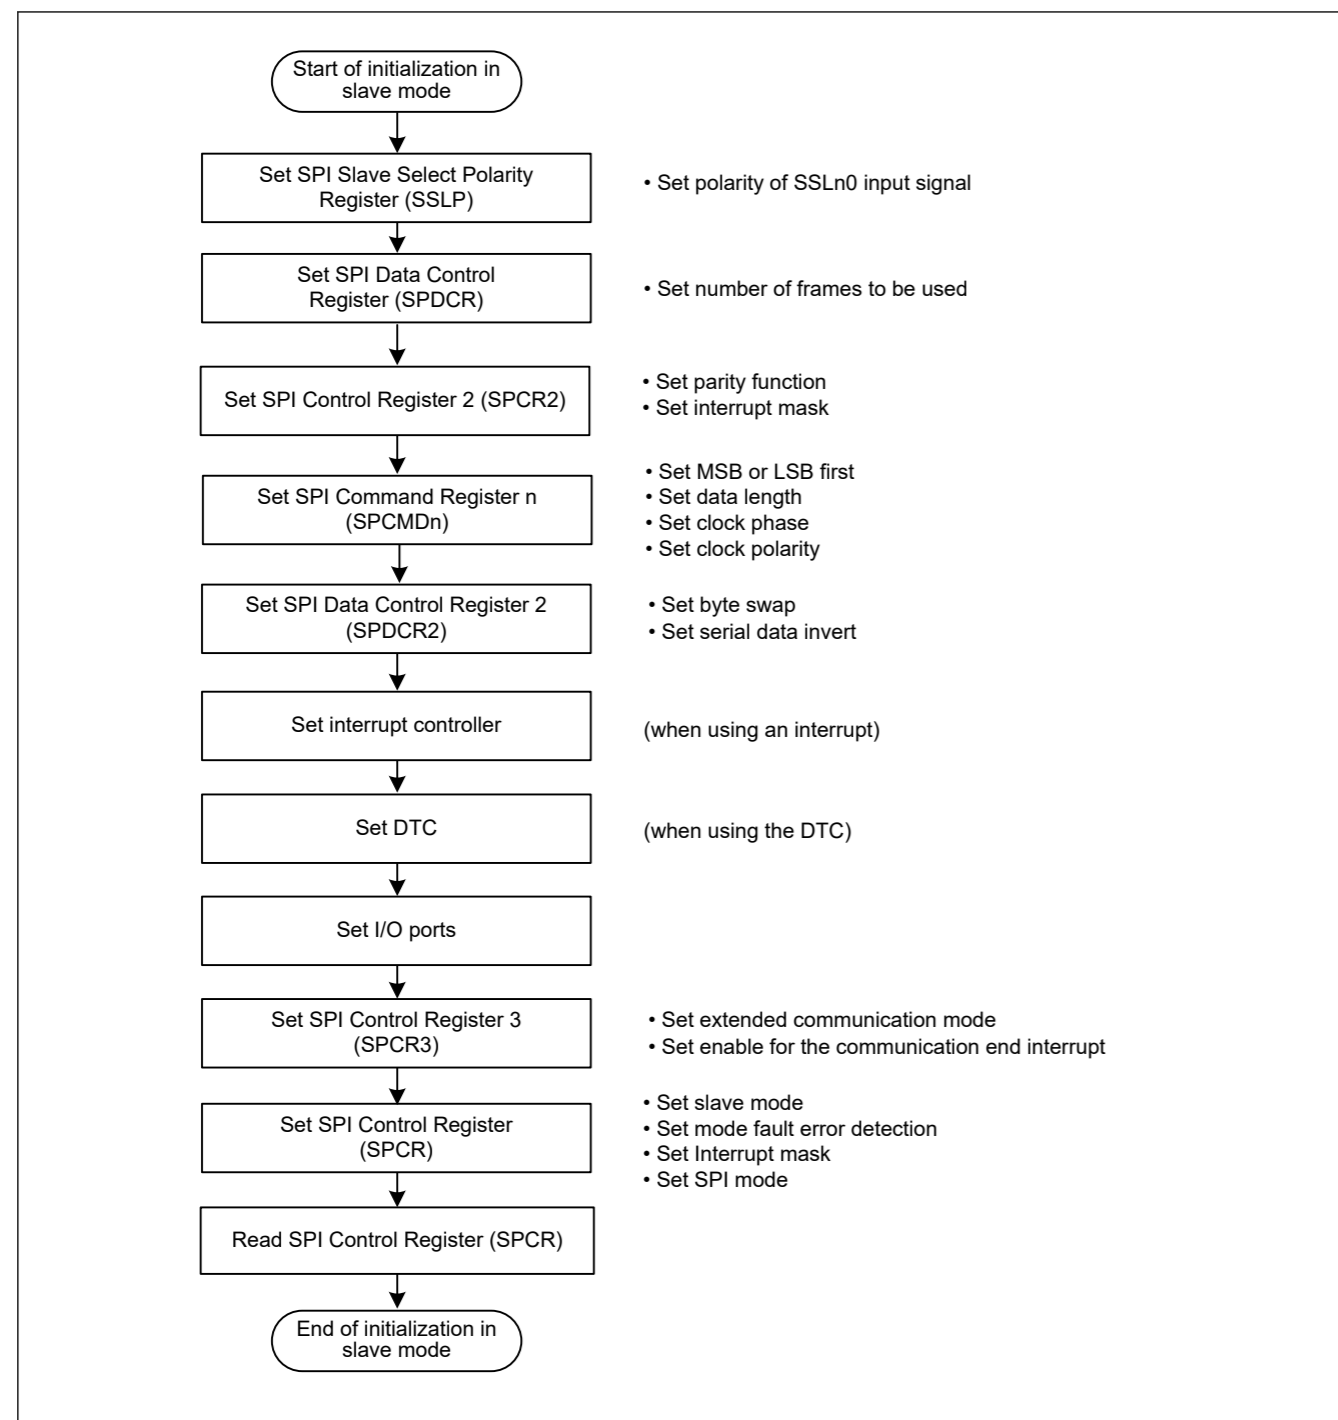

Figure 30.52 Example initialization flow in slave mode for SPI operation

(6) Software processing flow

Figure 30.53 to Figure 30.55 show examples of the flow of software processing.

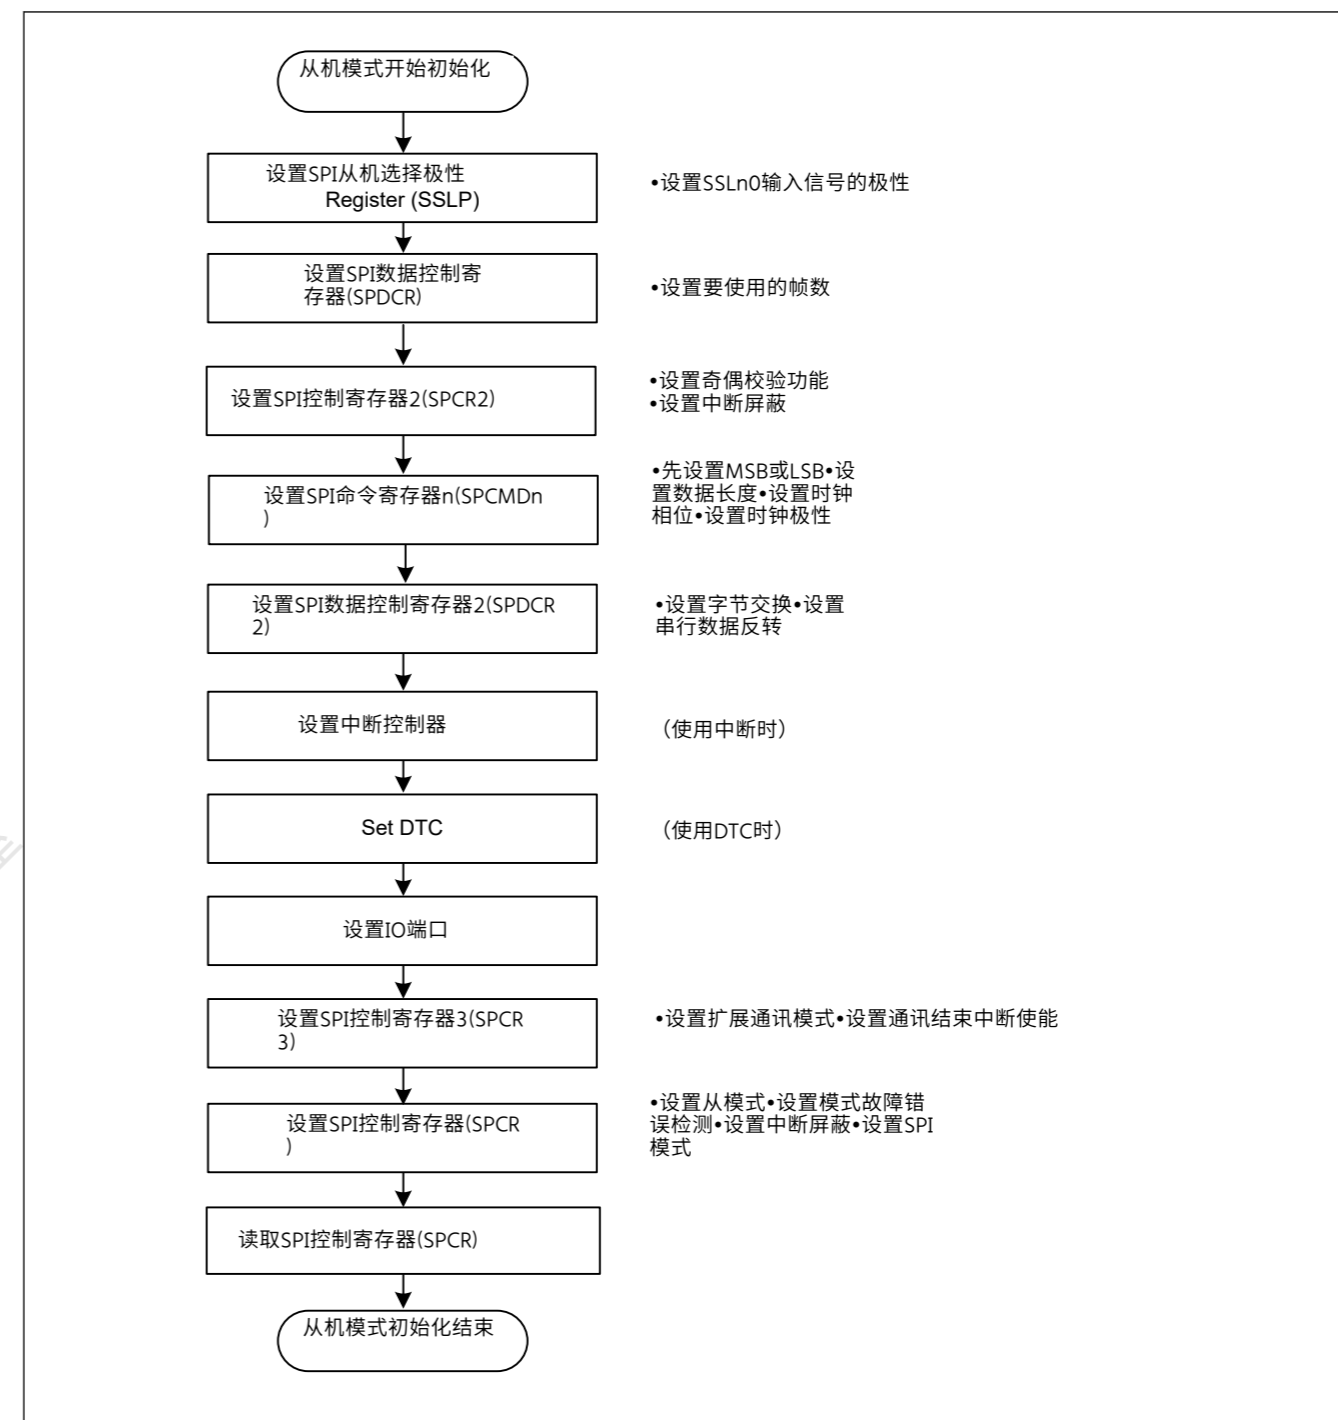

Figure 30.52 SPI操作的从模式初始化流程示例

(6) 软件处理流程

图30.53至图30.55显示了软件处理流程的示例。

Transmit processing flow

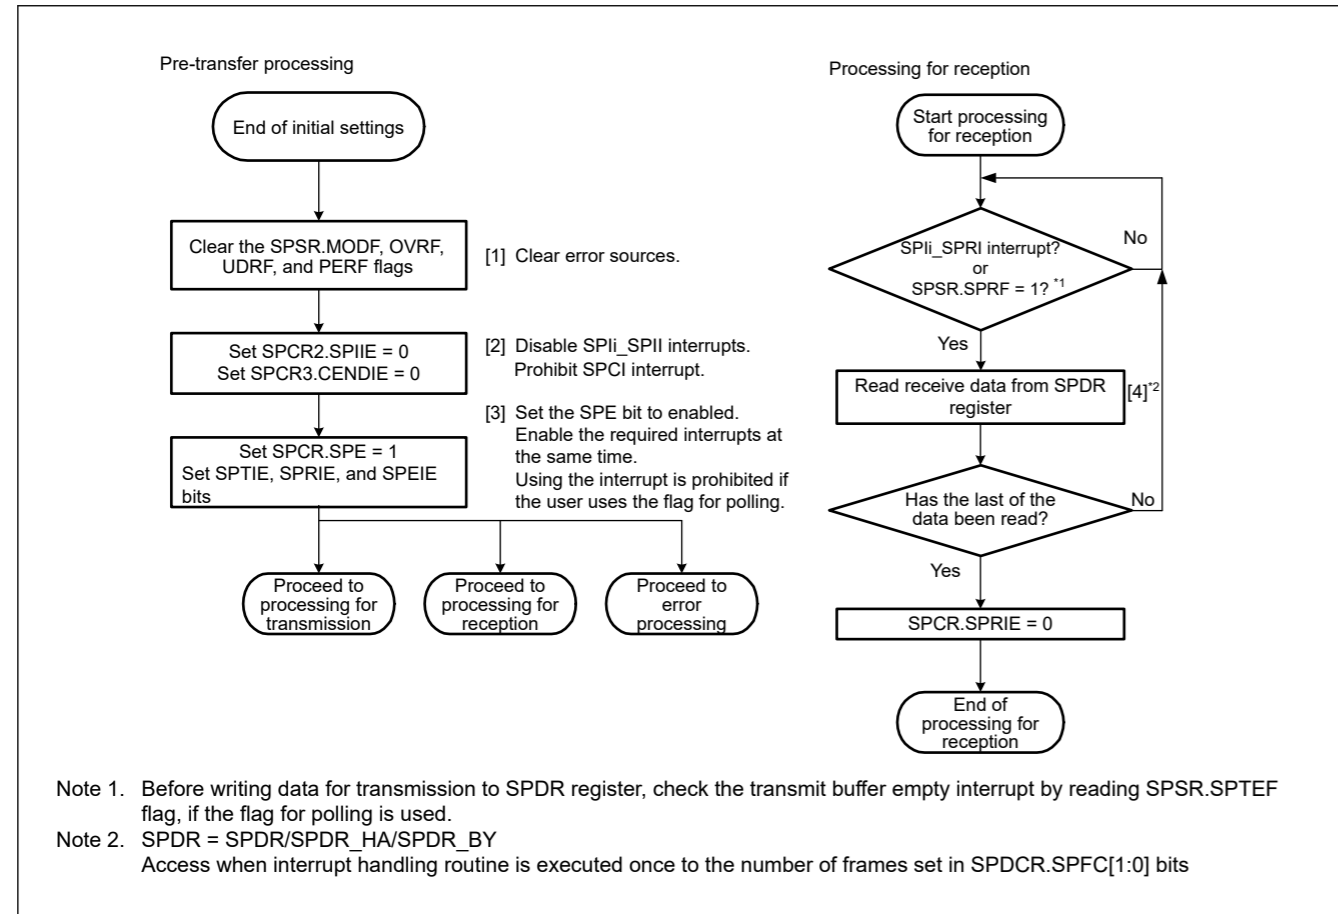

Figure 30.53 Transmission flow in slave mode

Receive processing flow

The SPI does not handle receive-only operation, so processing for transmission is required.

传输处理流程

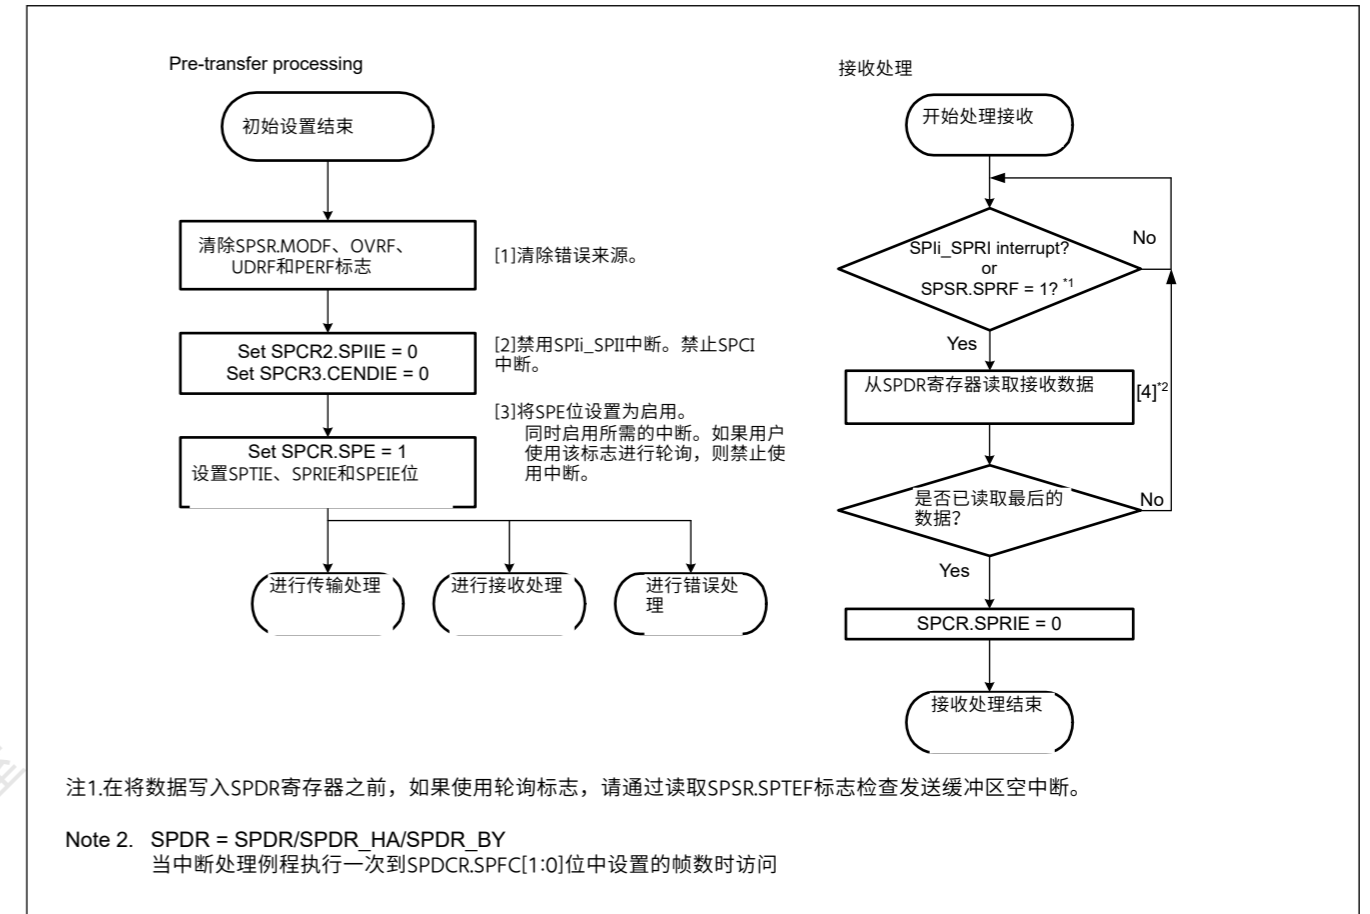

Figure 30.53 从模式下的传输流

接收处理流程

SPI不处理只接收操作，因此需要处理传输。

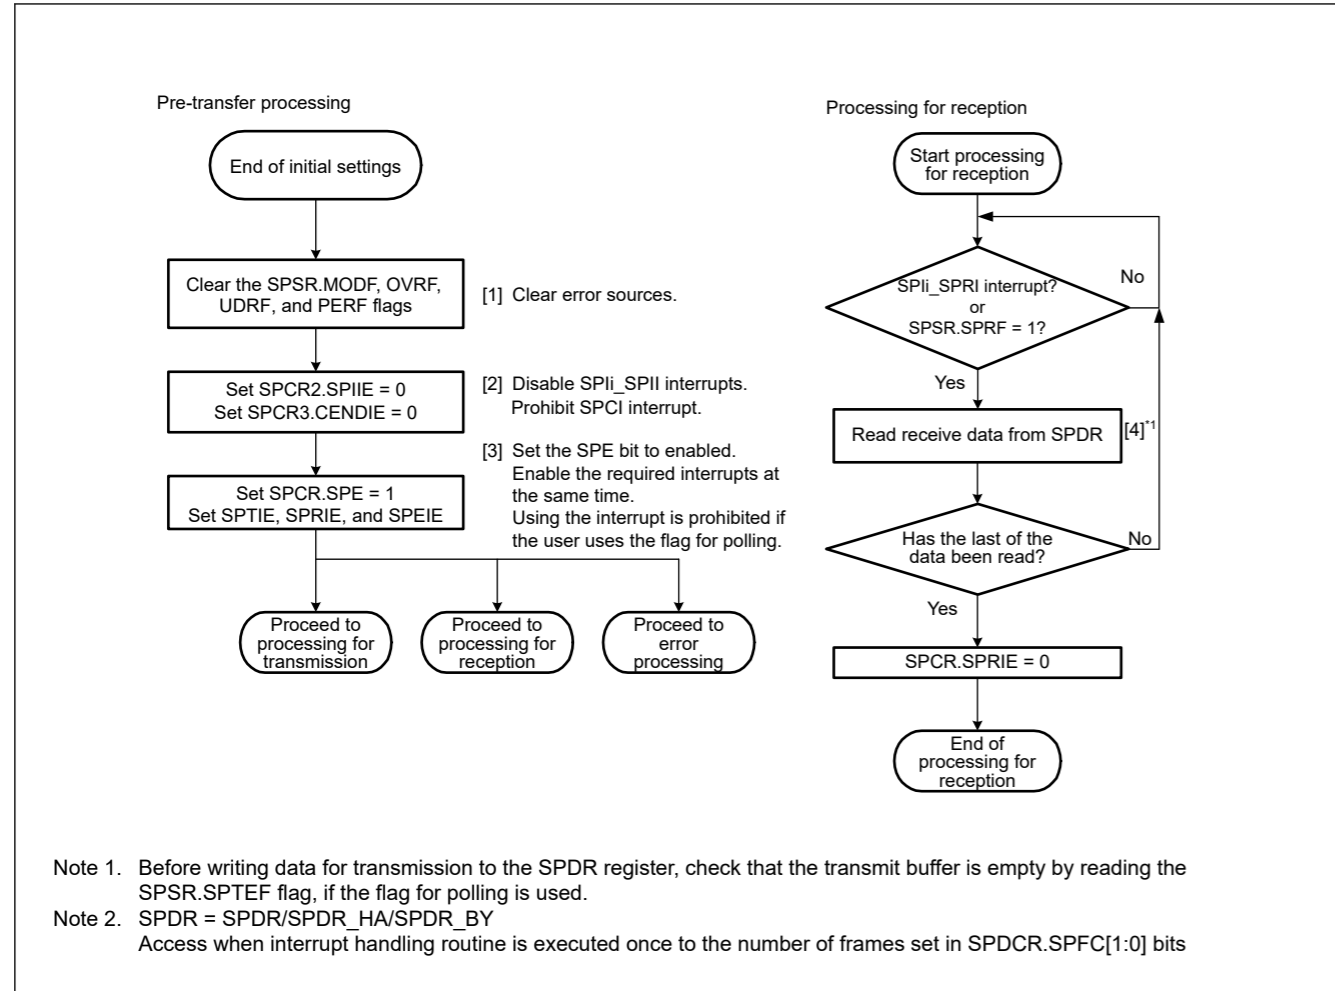

Figure 30.54 Reception flow in slave mode

**Error processing flow**

In slave mode operation, even when a mode fault error is generated, the SPSR.MODF flag can be cleared regardless of the state of the SSLn0 pin.

When an error is detected by using an interrupt, clear the ICU.IELSRn.IR flag in the error processing routine. If this is not done, the ICU.IELSRn.IR flag might continue to indicate the SPIi\_SPTI or SPIi\_SPRI interrupt request. If the SPIi\_SPRI interrupt request is indicated, read the receive buffer and initialize the sequencer in the SPI.

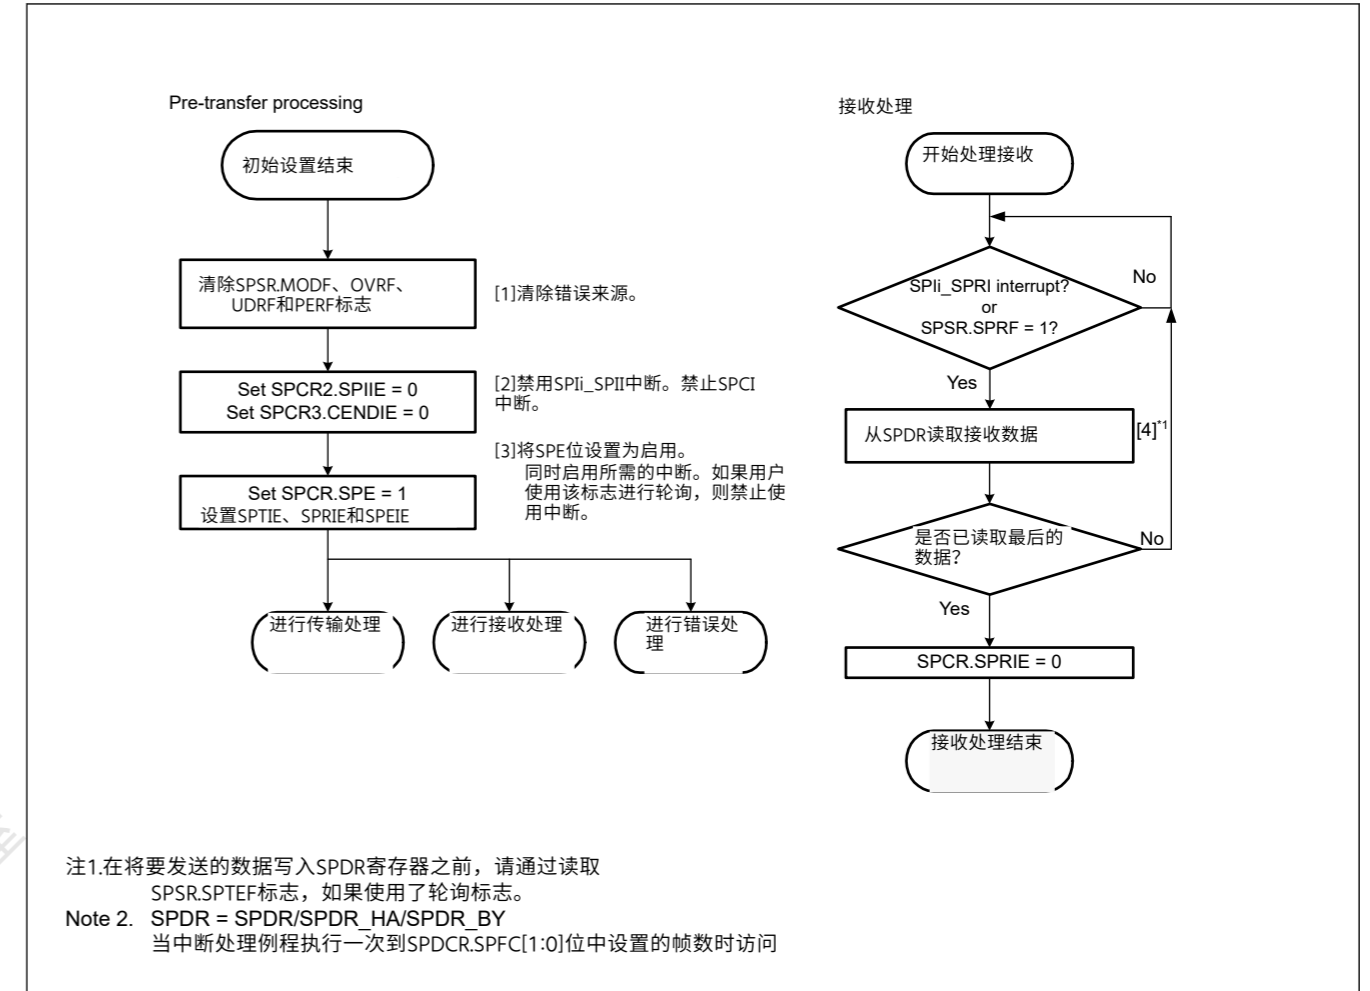

Figure 30.54 从机模式下的接收流程

**错误处理流程**

在从模式操作中，即使产生了模式故障错误，SPSR.MODF标志也可以被清除，而与SSLn0引脚的状态无关。

当使用中断检测到错误时，清除错误处理例程中的ICU.IELSRn.IR标志。如果不这样做，ICU.IELSRn.IR标志可能会继续指示SPIi\_SPTI或SPIi\_SPRI中断请求。如果指示了SPIi\_SPRI中断请求，则读取接收缓冲区并初始化SPI中的定序器。

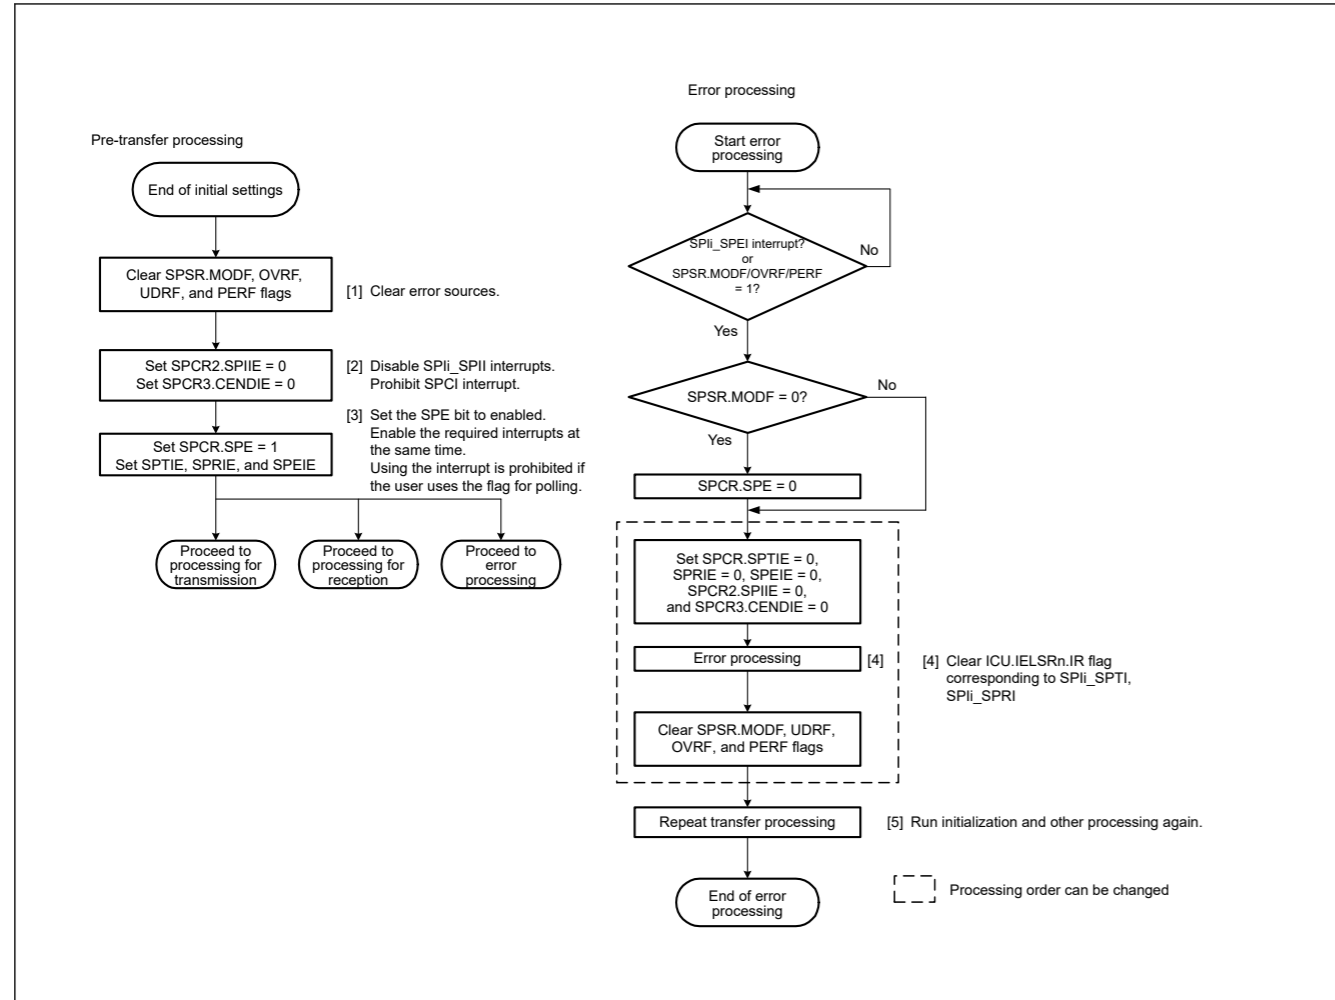

Figure 30.55 Error processing flow for slave mode

### 30.3.12 Clock Synchronous Operation

Setting the SPCR.SPMS bit to 1 selects clock synchronous operation of the SPI. In clock synchronous operation, the SSLnI pin is not used, and the RSPCKn, MOSIn, and MISON pins handle communications. All SSLnI pins are available as I/O port pins.

Although clock synchronous operation does not require the use of the SSLnI pin, operation of the module is the same as in SPI operation. In both master mode and slave mode operations, communications can be performed with the same flow as in SPI operation. However, mode fault errors are not detected, because the SSLnI pin is not used.

Additionally, do not perform operation if clock synchronous operation is enabled when the SPCMDm.CPHA bit is set to 0 in slave mode (SPCR.MSTR = 0).

#### 30.3.12.1 Master mode operation

##### (1) Starting serial transfer

The SPI updates the data in the transmit buffer (SPTX) of SPDR/SPDR\_HA when data is written to the SPDR/SPDR\_HA register with the transmit buffer empty, the data for the next transfer not set and the SPSR.SPTEF flag is 1. When the shift register is empty after the number of frames set in the SPDCR.SPFC[1:0] bits are written to the SPDR/SPDR\_HA, the SPI copies data from the transmit buffer to the shift register and starts serial transmission. On copying transmit data to the shift register, the SPI changes the status of the shift register to full, and on termination of serial transfer, it changes the status of the shift register to empty. The status of the shift register cannot be referenced.

Transfer in clock synchronous operation is conducted without the SSLn0 output signal. For details on the SPI transfer format, see section 30.3.5. Transfer Formats.

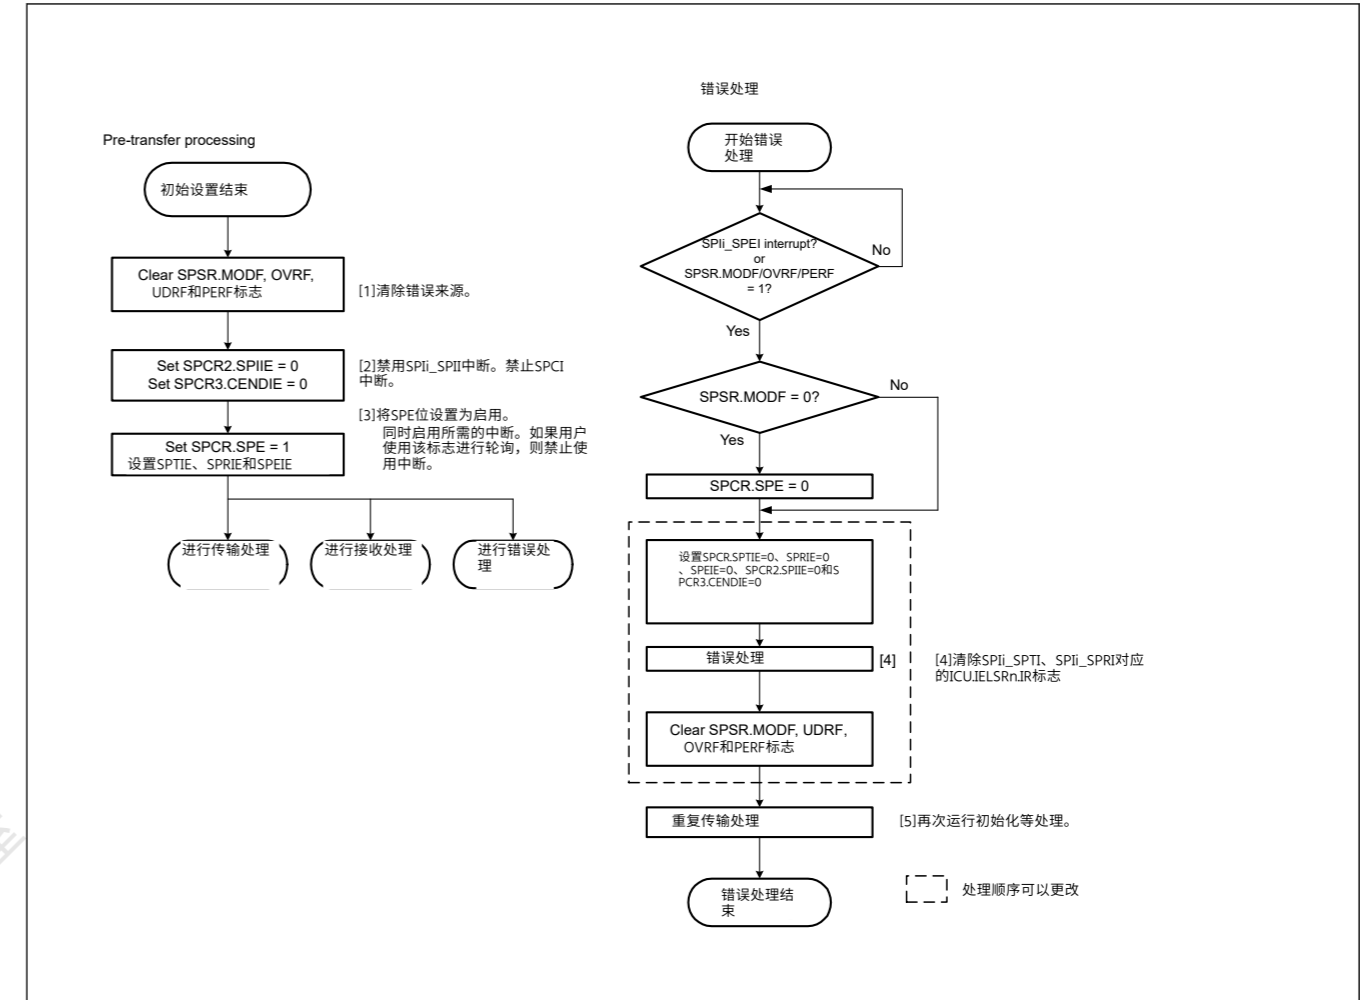

Figure 30.55 从机模式的错误处理流程

### 30.3.12 时钟同步操作

将 SPCR.SPMS 位设置为 1 可选择 SPI 的时钟同步操作。在时钟同步操作中，不使用 SSLnI 引脚，而 RSPCKn、MOSIn 和 MISON 引脚处理通信。所有 SSLnI 引脚都可用作 IO 端口引脚。

虽然时钟同步操作不需要使用 SSLnI 引脚，但模块的操作与 SPI 操作相同。在主模式和从模式操作中，可以使用与在相同的流程中执行通信 SPI 操作。但是，未检测到模式故障错误，因为未使用 SSLnI 引脚。

此外，如果在从模式 (SPCR.MSTR=0) 下 SPCMDm.CPHA 位设置为 0 时使能时钟同步操作，则不要执行操作。

此外，如果在从模式 (SPCR.MSTR=0) 下 SPCMDm.CPHA 位设置为 0 时使能时钟同步操作，则不要执行操作。

#### 30.3.12.1 主模式操作

##### (1) 开始串行传输

当数据写入 SPDR/SPDR\_HA 寄存器且发送缓冲区为空、未设置下一次传输的数据且 SPSR.SPTEF 标志为 1 时，SPI 更新 SPDR/SPDR\_HA 的发送缓冲区 (SPTX) 中的数据。将 SPDCR.SPFC[1:0] 位中设置的帧数写入 SPDR/SPDR\_HA 后，寄存器为空，SPI 将数据从发送缓冲区复制到移位寄存器并开始串行传输。将发送数据复制到移位寄存器时，SPI 将移位寄存器的状态更改为满，而在串行传输终止时，它将移位寄存器的状态更改为空。无法引用移位寄存器的状态。

在没有 SSLn0 输出信号的情况下进行时钟同步操作的传输。有关 SPI 传输格式的详细信息，请参见第 30.3.5 节。传输格式。

## (2) Terminating serial transfer

The SPI terminates the serial transfer after transmitting an RSPCKn edge corresponding to the sampling timing. If free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies data from the shift register to the receive buffer of the SPI Data Register (SPDR/SPDR\_HA).

The final sampling timing varies depending on the bit length of transfer data. In master mode, the SPI data length depends on the SPCMDm.SPB[3:0] bits setting. Transfer in clock synchronous operation is conducted without the SSLn0 output signal. For details on the SPI transfer format, see [section 30.3.5. Transfer Formats](#).

## (3) Sequence control

The transfer format used in master mode is determined by the SPSCR, SPCMDm, SPBR, SPCKD, SSLND, and SPND registers. Although the SSLni signals are not output in clock synchronous operation, these settings are valid.

The SPSCR register determines the sequence configuration for serial transfers that are executed by the SPI in master mode. The following parameters are specified in the SPCMDm register:

- SSLni output signal value
- MSB or LSB first
- Data length
- Some of the bit rate settings
- RSPCKn polarity and phase
- Whether SPCKD is to be referenced
- Whether SSLND is to be referenced
- Whether SPND is to be referenced

SPBR holds some of the bit rate settings such as SPCKD, an SPI clock delay value, SSLND, an SSL negation delay, and SPND, a next-access delay value.

Based on the sequence length that is assigned to SPSCR, the SPI makes up a sequence comprised of a part or all of SPCMDm register. The SPI contains a pointer to the SPCMDm register that makes up the sequence. The value of this pointer can be checked by reading the SPSSR.SPCP[2:0] bits. When the SPCR.SPE bit is set to 1 and the SPI function is enabled, the SPI loads the pointer to the commands in SPCMD0 register, and incorporates the SPCMD0 register setting into the transfer format at the beginning of serial transfer. The SPI increments the pointer each time the next-access delay period for a data transfer ends. On completion of the serial transfer that corresponds to the final command comprising the sequence, the SPI sets the pointer to the SPCMD0 register, and in this manner the sequence is executed repeatedly.

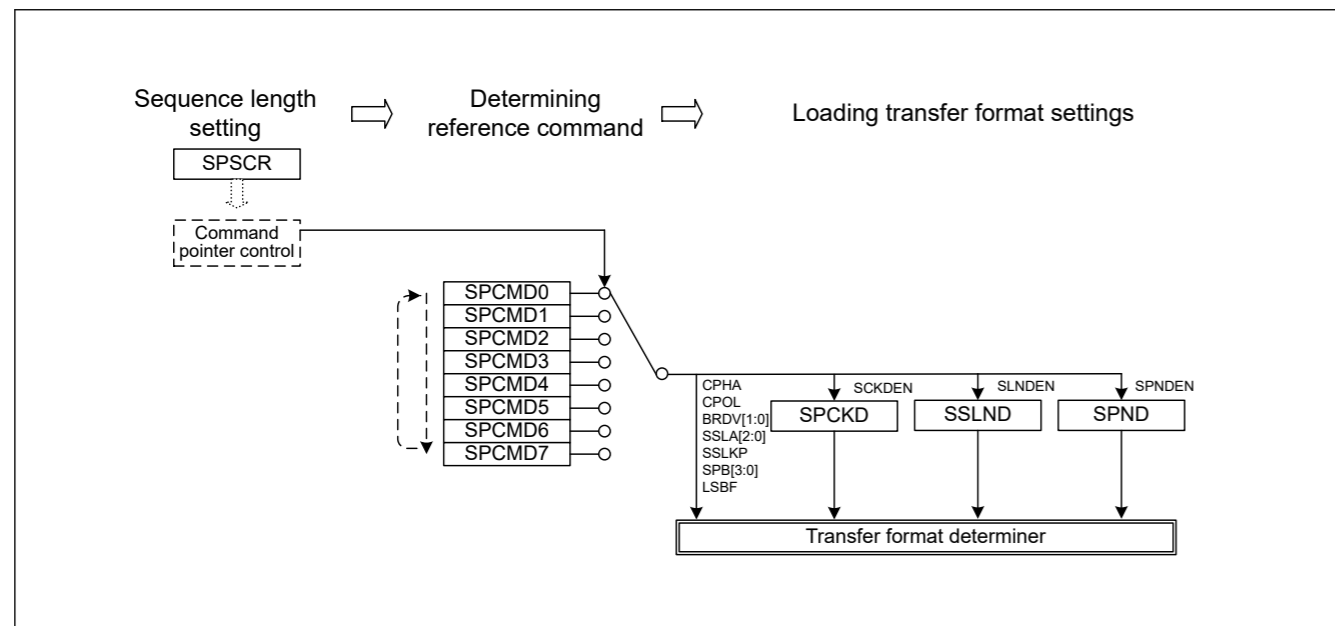

Figure 30.56 Procedure for determining the form of serial transmission in master mode

## (2) 终止串行传输

SPI在发送对应于采样时序的RSPCKn边沿后终止串行传输。如果接收缓冲区中有可用空间 (SPSR.SPRF标志为0)，则在串行传输终止时，SPI将数据从移位寄存器复制到SPI数据寄存器(SPDR/SPDR\_HA)的接收缓冲区。

最终的采样时序根据传输数据的位长而变化。在主机模式下，SPI数据长度取决于SPMDm.SPB[3:0]位设置。在没有SSLn0输出信号的情况下进行时钟同步操作的传输。有关SPI传输格式的详细信息，请参见第30.3.5节。传输格式。

## (3) 顺序控制

主机模式中使用的传输格式由SPSCR、SPCMDm、SPBR、SPCKD、SSLND和SPND寄存器确定。虽然在时钟同步操作中不输出SSLni信号，但这些设置是有效的。

SPSCR寄存器确定由SPI在主模式下执行的串行传输的序列配置。SPCMDm寄存器中指定了以下参数：

- SSLni输出信号值
- MSB或LSB在前
- 数据长度
- 一些比特率设置
- RSPCKn极性和相位
- 是否引用SPCKD
- 是否引用SSLND
- 是否引用SPND

SPBR保存一些比特率设置，例如SPCKD、SPI时钟延迟值、SSLND、SSL否定延迟和SPND，下一次访问延迟值。

根据分配给SPSCR的序列长度，SPI组成一个序列，该序列由部分或全部SPMDm寄存器。SPI包含一个指向构成序列的SPCMDm寄存器的指针。该指针的值可以通过读取SPSSR.SPCP[2:0]位来检查。当SPCR.SPE位设置为1且SPI功能使能时，SPI将指针加载到SPCMD0寄存器中的命令，并在串行传输开始时将SPCMD0寄存器设置合并到传输格式中。每次数据传输的下一个访问延迟周期结束时，SPI都会递增指针。在完成对应于包含序列的最终命令的串行传输后，SPI将指针设置为SPMD0寄存器，并以这种方式重复执行序列。

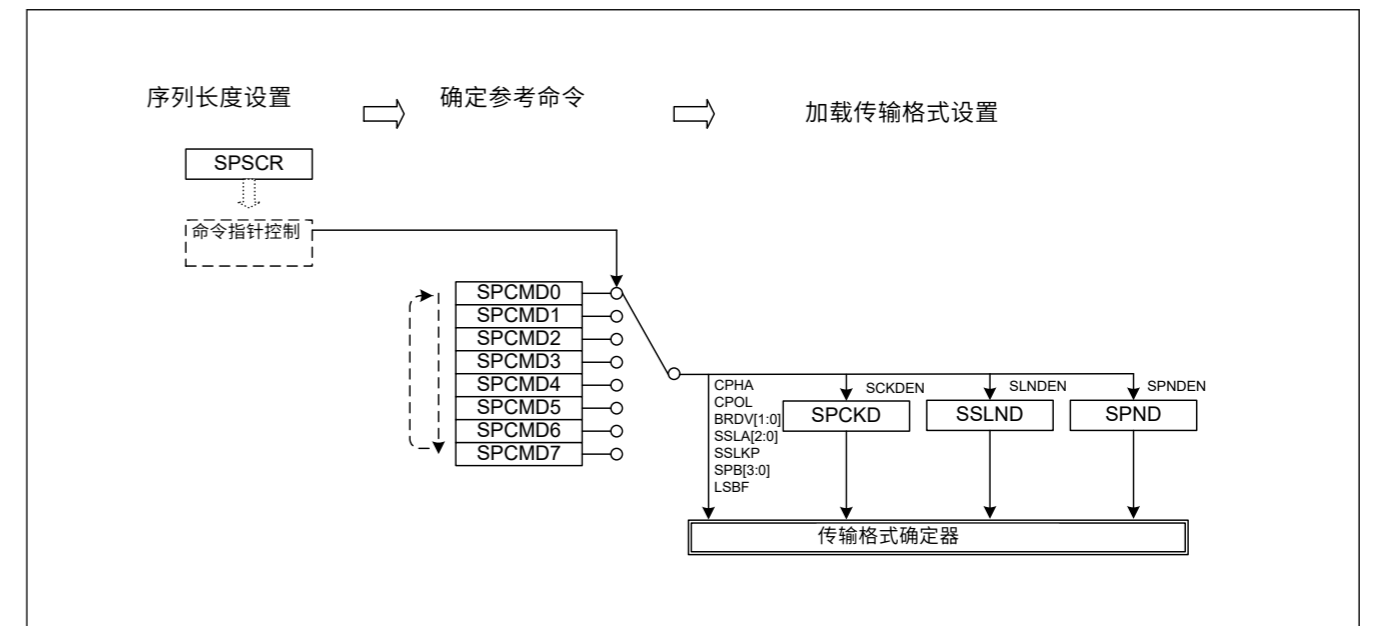

Figure 30.56 确定主机模式下串行传输形式的程序

In this section, a frame is the combination of the data (SPDR/SPDR\_HA) and the settings (SPCMDm).

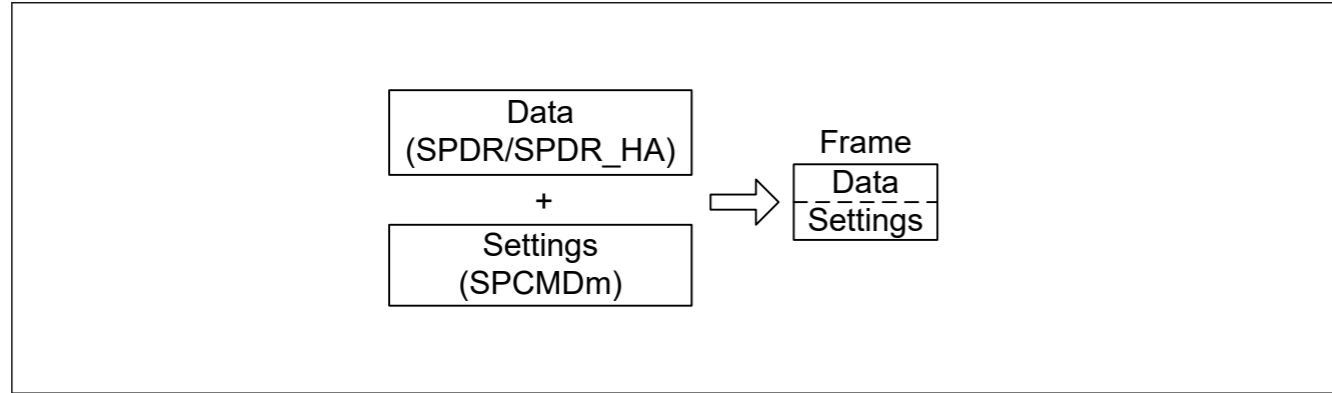

Figure 30.57 Conceptual diagram of frames

Figure 30.58 shows the relationship between the command and the transmit and receive buffers in the sequence of operations specified by the settings in Table 30.3.

在本节中，帧是数据(SPDR/SPDR\_HA)和设置(SPCMDm)的组合。

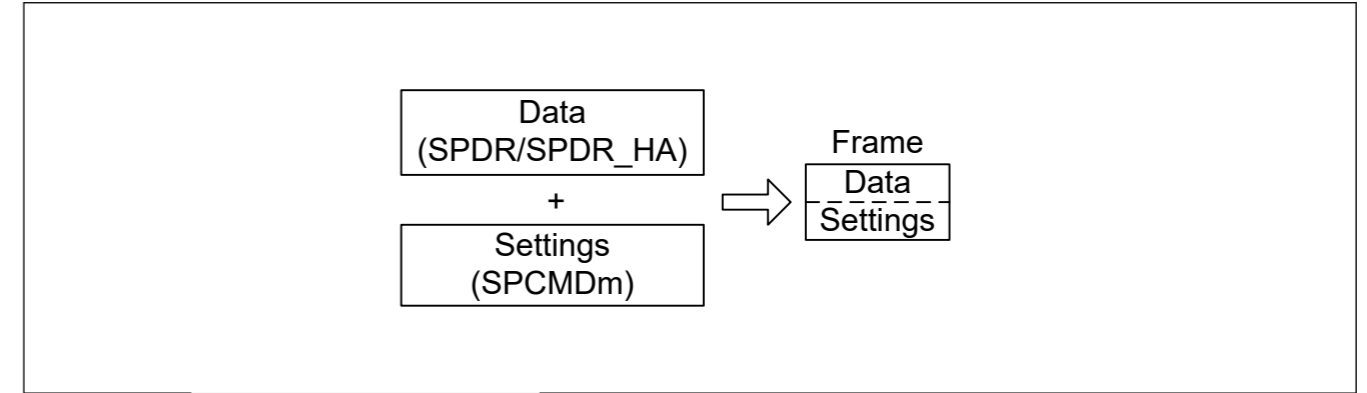

Figure 30.57 框架的概念图

图30.58显示了在表30.3中设置指定的操作顺序中命令与发送和接收缓冲区之间的关系。

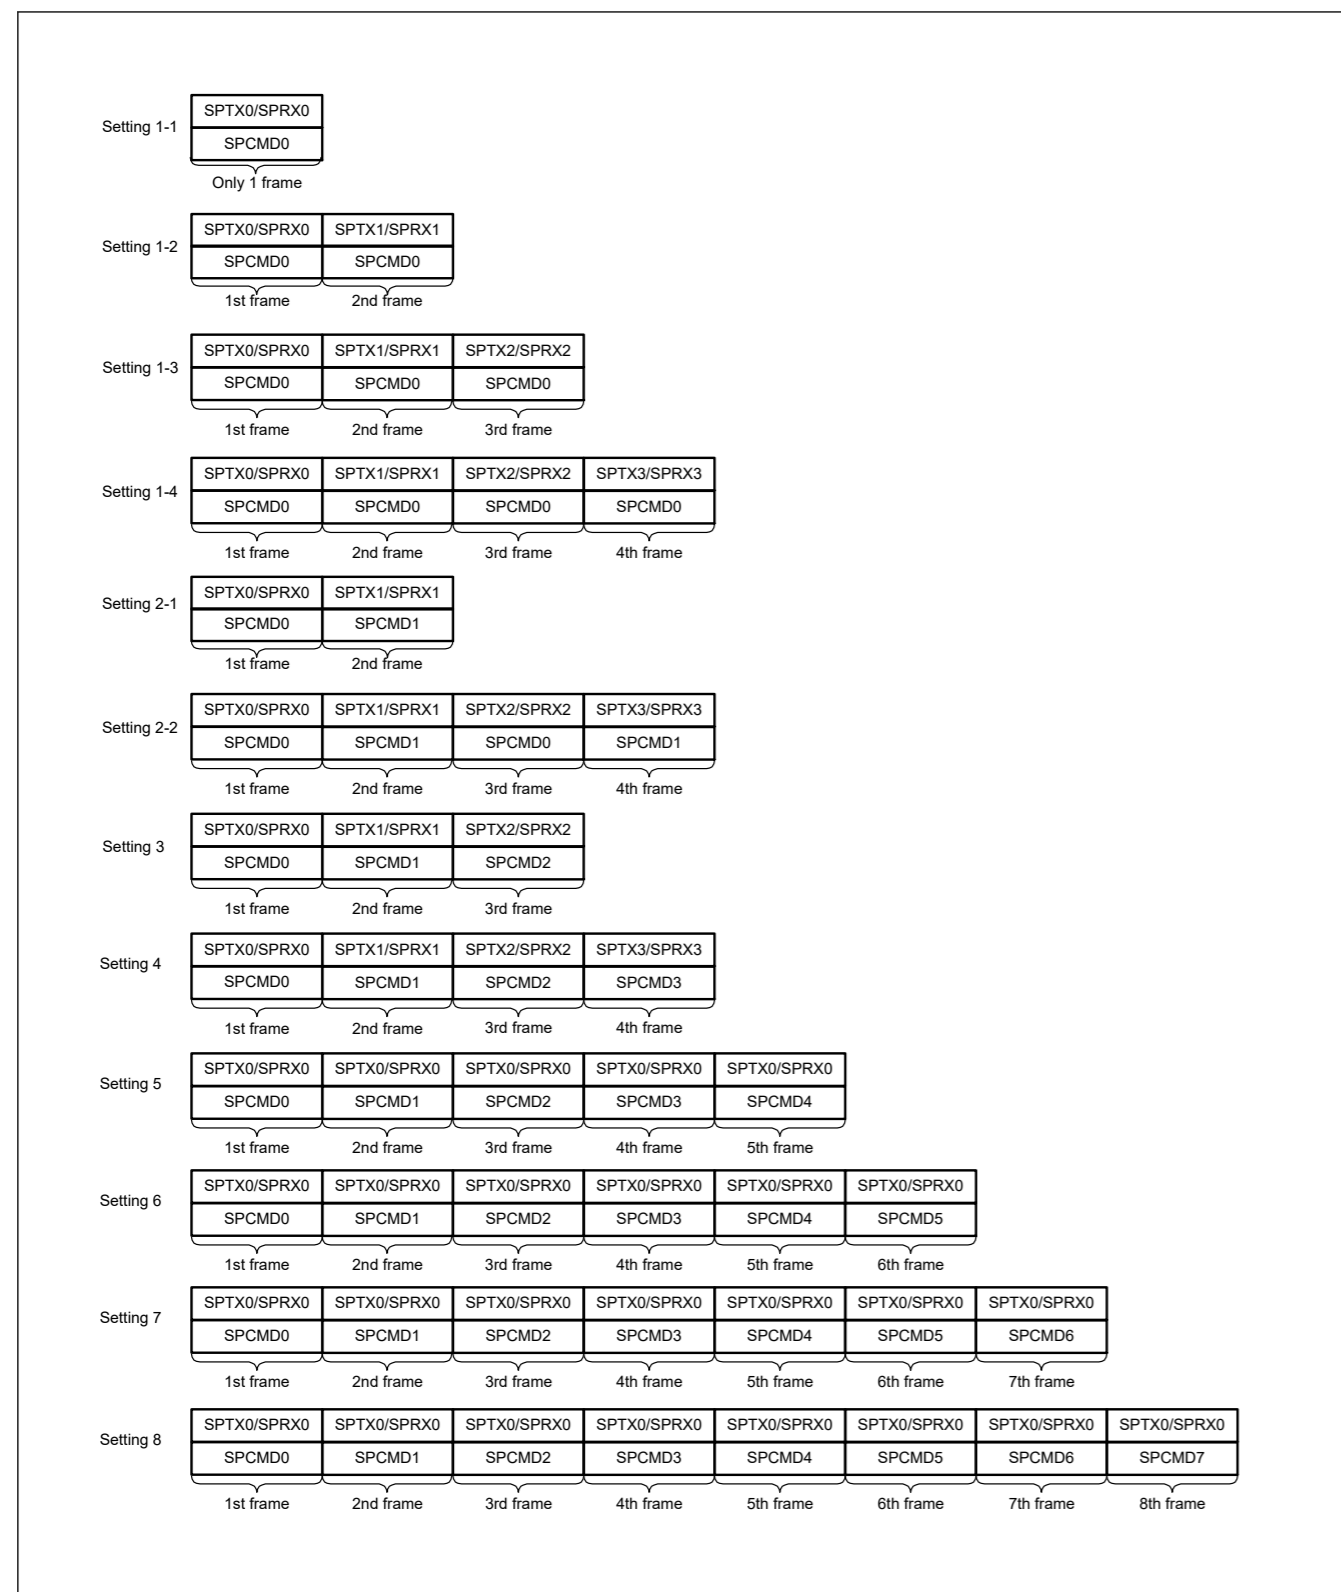

Figure 30.58 Correspondence between SPI Command Register and transmit and receive buffers in sequence operations

(4) Initialization flow

Figure 30.59 shows an example of initialization flow for clock synchronous operation when the SPI is used in master mode. For information on how to set up the ICU, DMAC or DTC, and I/O ports, see the descriptions given in the individual blocks.

(4) 初始化流程

图30.59显示了在主模式下使用SPI时钟同步操作的初始化流程示例。有关如何设置ICU、DMAC或DTC以及IO端口的信息，请参阅各个块中给出的说明。

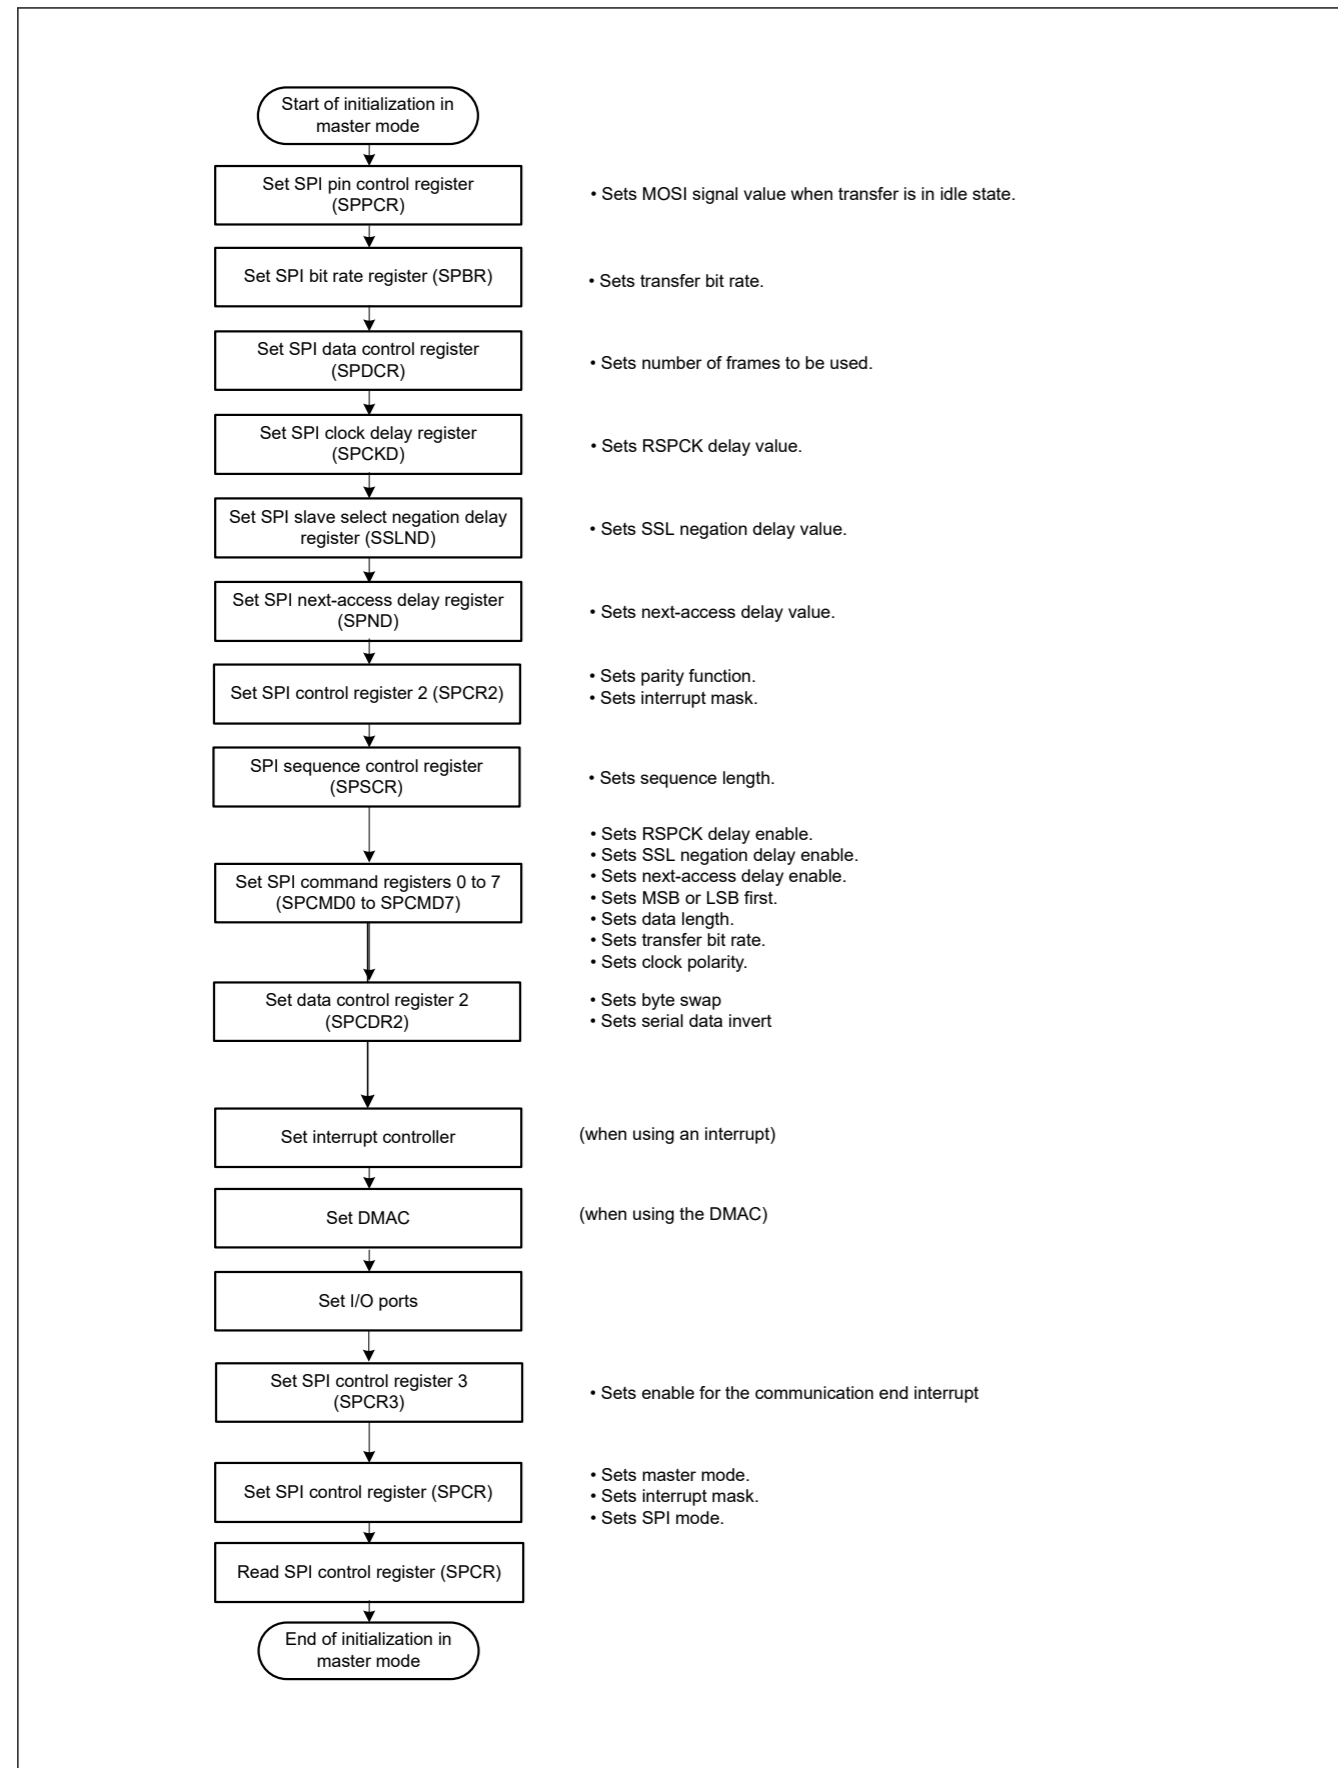

Figure 30.59 Example of initialization flow in master mode for clock synchronous operation

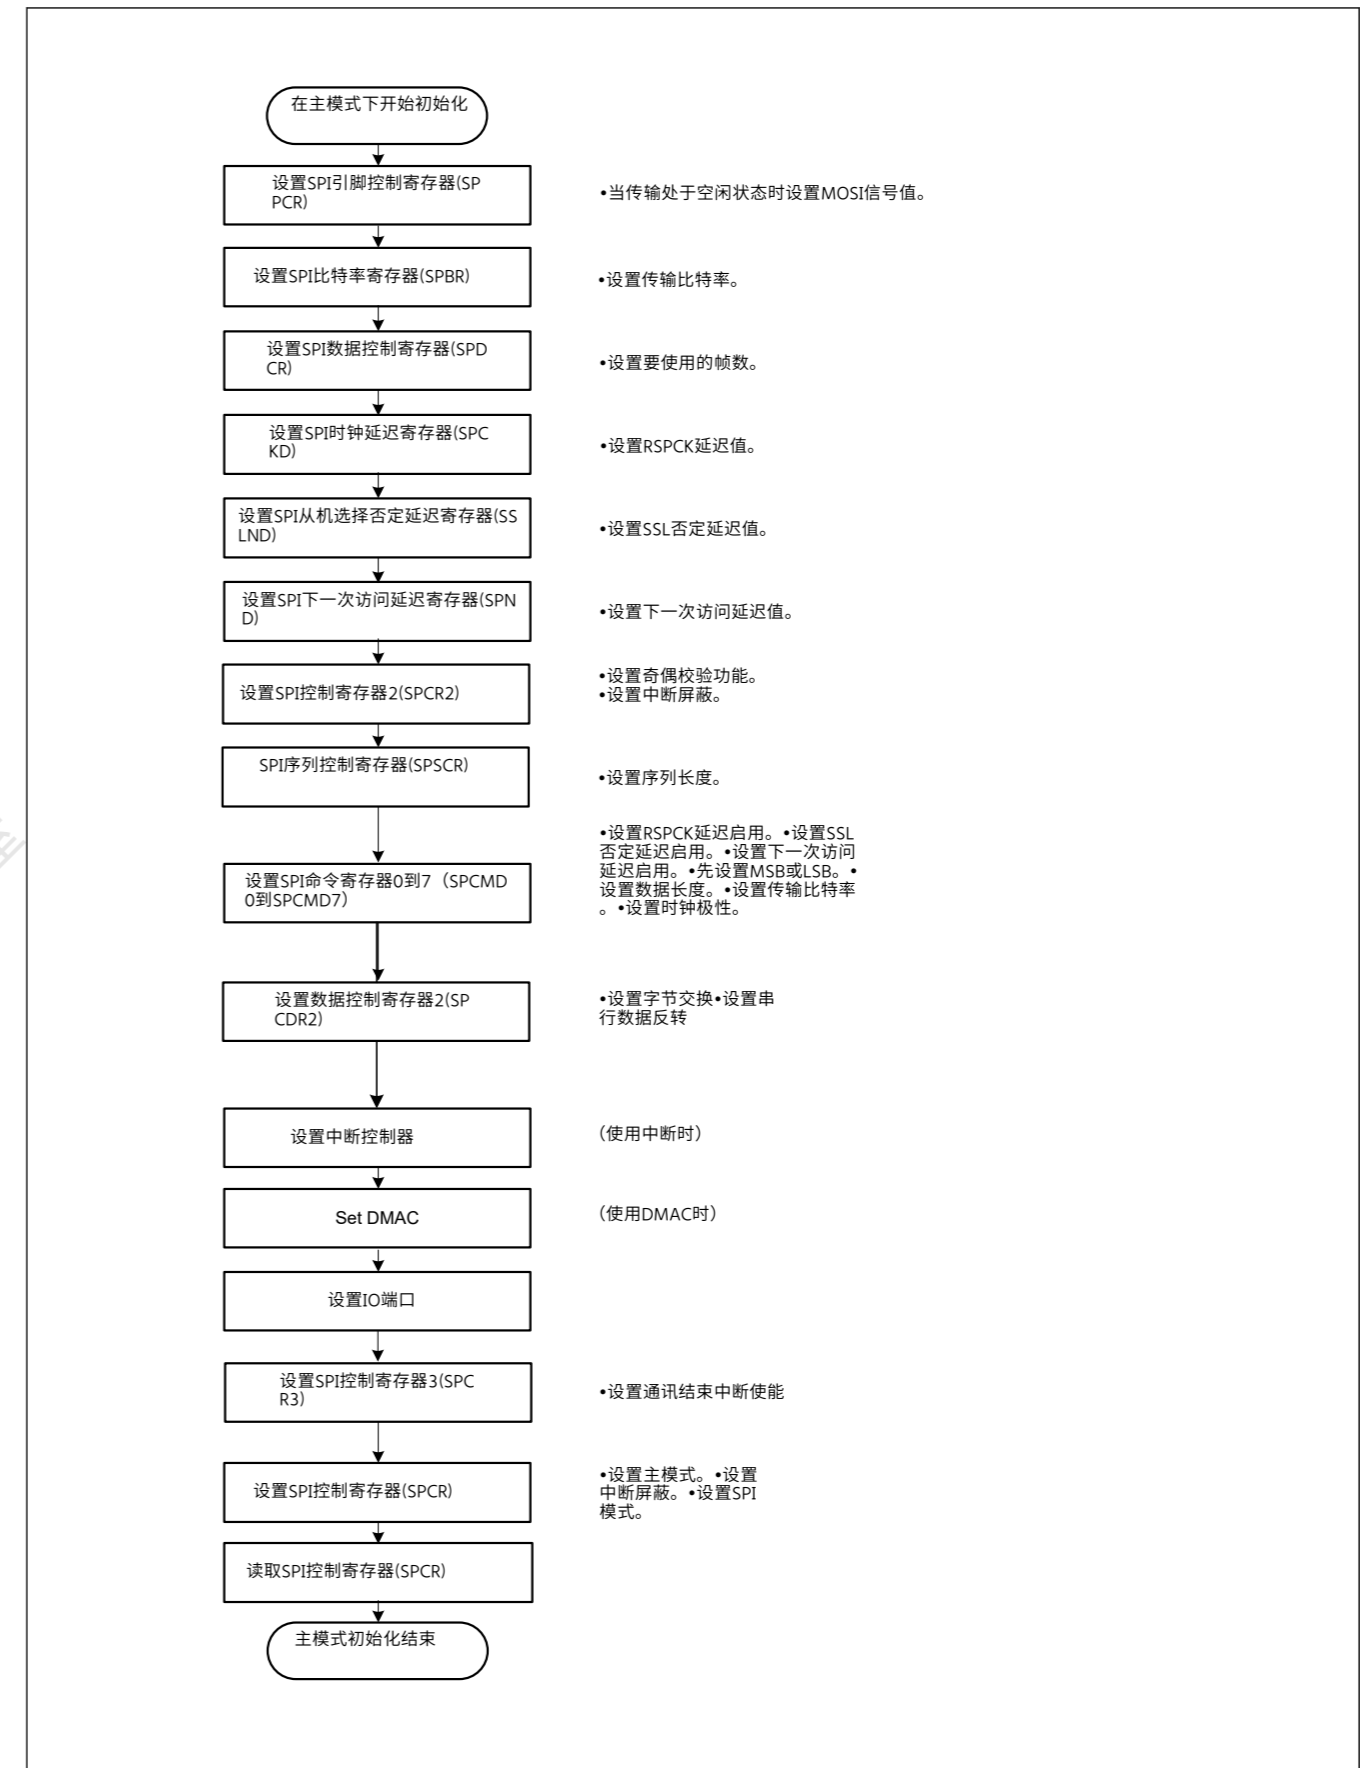

Figure 30.59 时钟同步操作的主模式初始化流程示例

### (5) Software processing flow

Software processing during clock synchronous master operation is the same as that for SPI master operation. For details, see (9) Software processing flow in [section 30.3.11.1. Master mode operation](#). Mode fault errors do not occur in clock synchronous operation.

### 30.3.12.2 Slave mode operation

#### (1) Starting serial transfer

When the SPCR.SPMS bit is 1, the first RSPCKn edge triggers the start of a serial transfer in the SPI, and the SPI drives the MISO output signal. The SSL0 input signal is not used in clock synchronous operation. For details on the SPI transfer format, see [section 30.3.5. Transfer Formats](#).

#### (2) Terminating serial transfer

The SPI terminates the serial transfer after detecting an RSPCKn edge corresponding to the final sampling timing. When free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies received data from the shift register to the receive buffer of the SPDR/SPDR\_HA register. On termination of a serial transfer, the SPI changes the status of the shift register to empty regardless of the receive buffer.

The final sampling timing changes depending on the bit length of transfer data. In slave mode, the SPI data length depends on the SPCMD0.SPB[3:0] bits setting. For details on the SPI transfer format, see [section 30.3.5. Transfer Formats](#).

#### (3) Initialization flow

[Figure 30.60](#) shows an example of initialization flow for clock synchronous operation when the SPI is used in slave mode. For a description of how to set up the ICU, DTC, and I/O ports, see the descriptions given in the individual blocks.

### (5) 软件处理流程

时钟同步主机操作期间的软件处理与SPI主机操作相同。详见30.3.11.1 (9) 软件处理流程。主模式操作。时钟同步操作中不会发生模式故障错误。

### 30.3.12.2 从模式操作

#### (1) 开始串行传输

当SPCR.SPMS位为1时，第一个RSPCKn边沿触发SPI中串行传输的开始，并且SPI驱动MISO输出信号。SSL0输入信号不用于时钟同步操作。有关SPI传输格式的详细信息，请参见第30.3.5节。传输格式。

#### (2) 终止串行传输

SPI在检测到对应于最终采样时序的RSPCKn边沿后终止串行传输。当接收缓冲区中有可用空间（SPSR.SPRF标志为0）时，串行传输终止时，SPI将接收到的数据从移位寄存器复制到SPDRSPDR\_HA寄存器的接收缓冲区。在串行传输终止时，SPI将移位寄存器的状态更改为空，而与接收缓冲区无关。

最终的采样时序根据传输数据的位长而变化。在从机模式下，SPI数据长度取决于SPCMD0.SPB[3:0]位设置。有关SPI传输格式的详细信息，请参见第30.3.5节。传输格式。

#### (3) 初始化流程

图30.60显示了在从模式下使用SPI时时钟同步操作的初始化流程示例。有关如何设置ICU、DTC和IO端口的说明，请参见各个块中给出的说明。

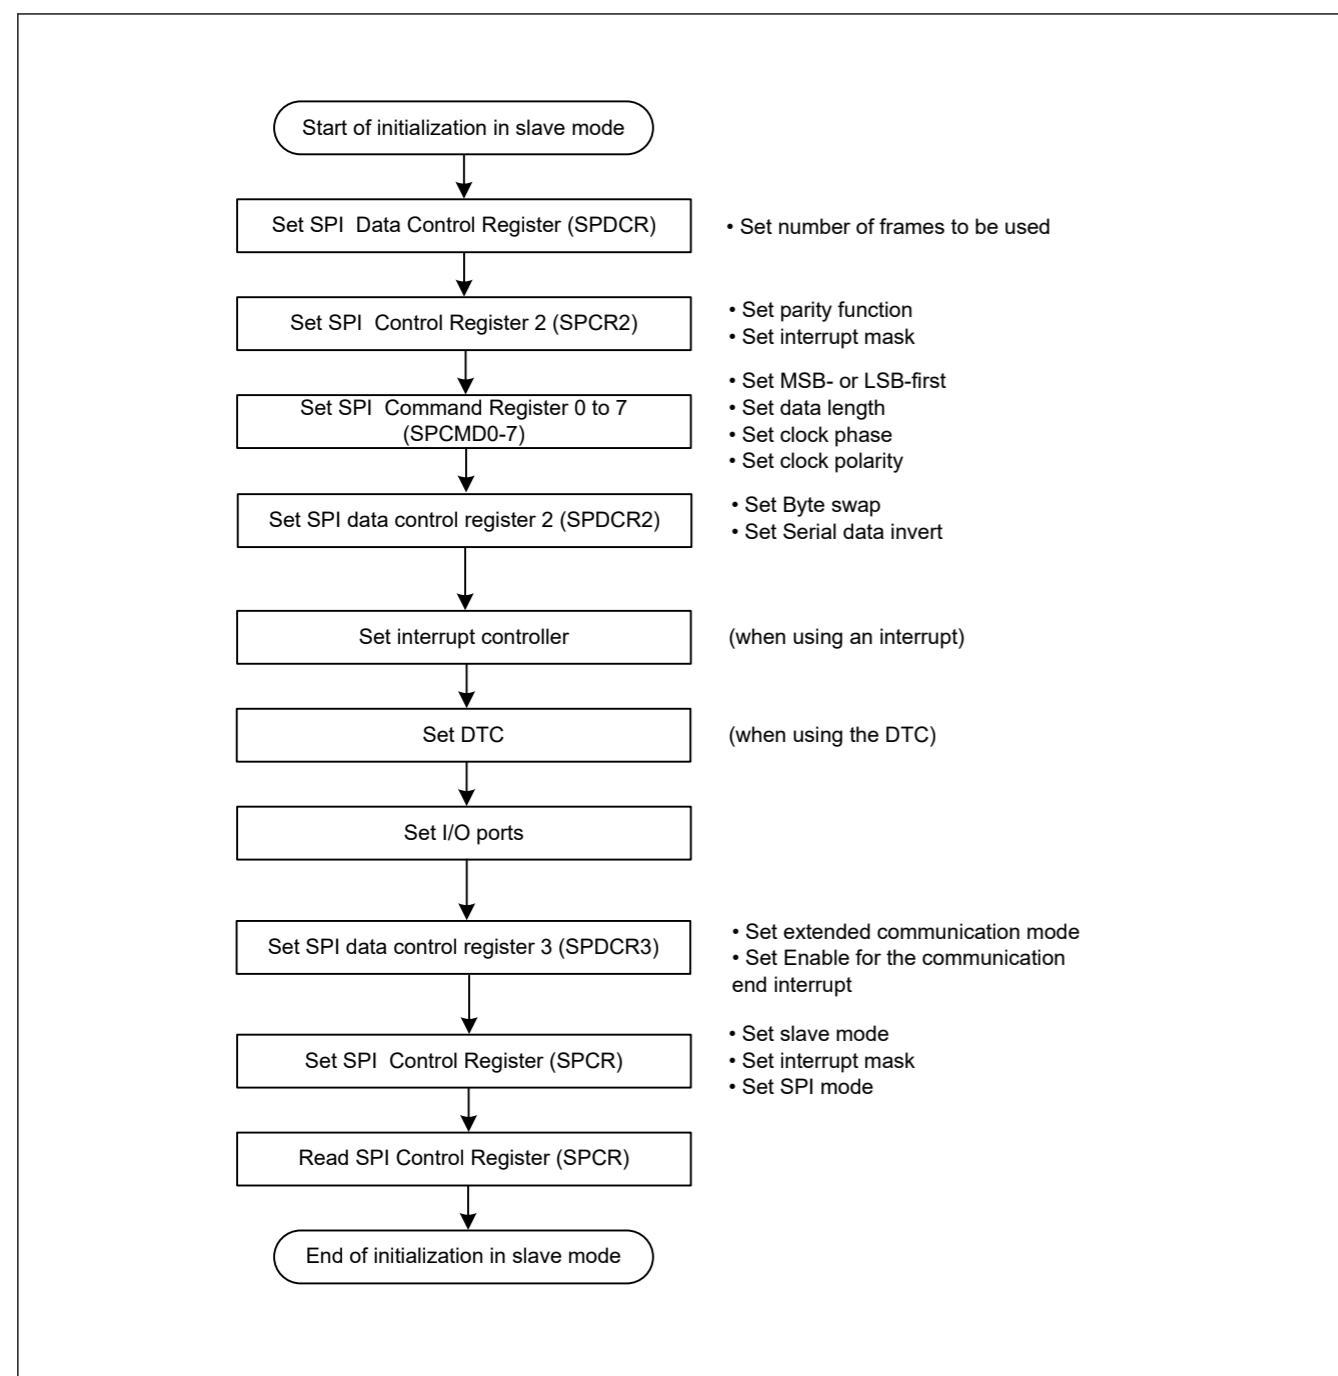

Figure 30.60 Example of initialization flow in slave mode for clock synchronous operation

#### (4) Software processing flow

Software processing during clock synchronous slave operation is the same as that for SPI slave operation. For details, see (6) [Software processing flow](#). Mode fault errors do not occur in clock synchronous mode.

#### 30.3.13 Loopback Mode

When 1 is written to the SPPCR.SPLP2 bit or SPPCR.SPLP bit, the SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, or between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0, and connects the input and output paths of the shift register, establishing a loopback mode. The SPI does not shut off the path between the MOSIn pin and the shift register if the SPCR.MSTR bit is 1, or between the MISOn pin and the shift register if the SPCR.MSTR bit is 0. This is called loopback mode. When a serial transfer is executed in loopback mode, the transmit data for the SPI or the reversed transmit data becomes the received data for the SPI.

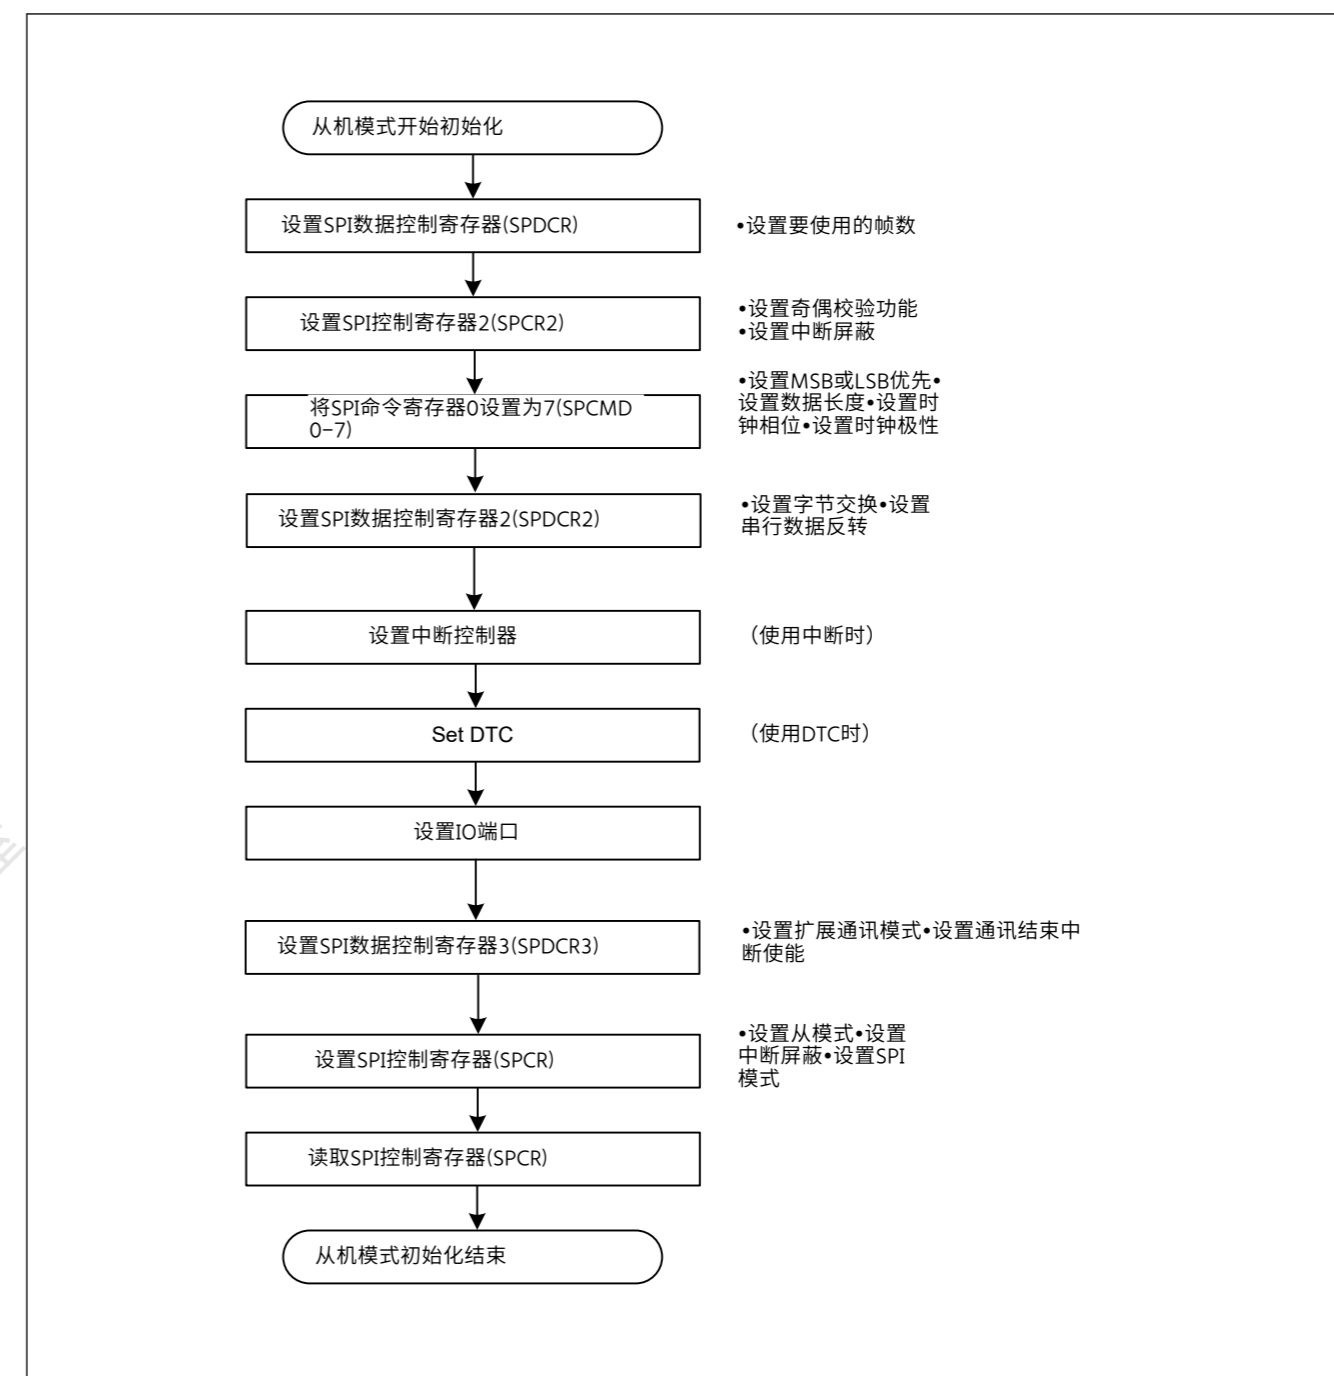

Figure 30.60 时钟同步操作的从模式初始化流程示例

#### (4) 软件处理流程

时钟同步从机操作期间的软件处理与SPI从机操作相同。详见 (6) [软件处理流程](#)。时钟同步模式下不会发生模式故障错误。

#### 30.3.13 Loopback Mode

当向SPPCR.SPLP2位或SPPCR.SPLP位写入1时，如果SPCR.MSTR位为1，则SPI关闭MISOn引脚和移位寄存器之间的路径，或者如果SPCR.MSTR位为0，连接移位寄存器的输入和输出路径，建立环回模式。如果SPCR.MSTR位为1，SPI不关闭MOSIn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则SPI不关闭MISOn引脚和移位寄存器之间的路径。这称为环回模式。当在环回模式下执行串行传输时，SPI的发送数据或反向发送数据将成为SPI的接收数据。

Table 30.13 lists the relationship between the SPLP2 and SPLP bits and the received data. Figure 30.61 shows the configuration of the shift register I/O paths when the SPI in master mode is set to loopback mode (SPPCR.SPLP2 = 0, SPPCR.SPLP = 1).

Table 30.13 SPLP2 and SPLP bit settings and received data

| SPPCR.SPLP2 bit | SPPCR.SPLP bit | Received data                             |
|-----------------|----------------|---|
| 0               | 0              | Input data from the MOSIn pin or MISO pin |
| 0               | 1              | Inverted transmit data                    |
| 1               | 0              | Transmit data                             |
| 1               | 1              | Transmit data                             |

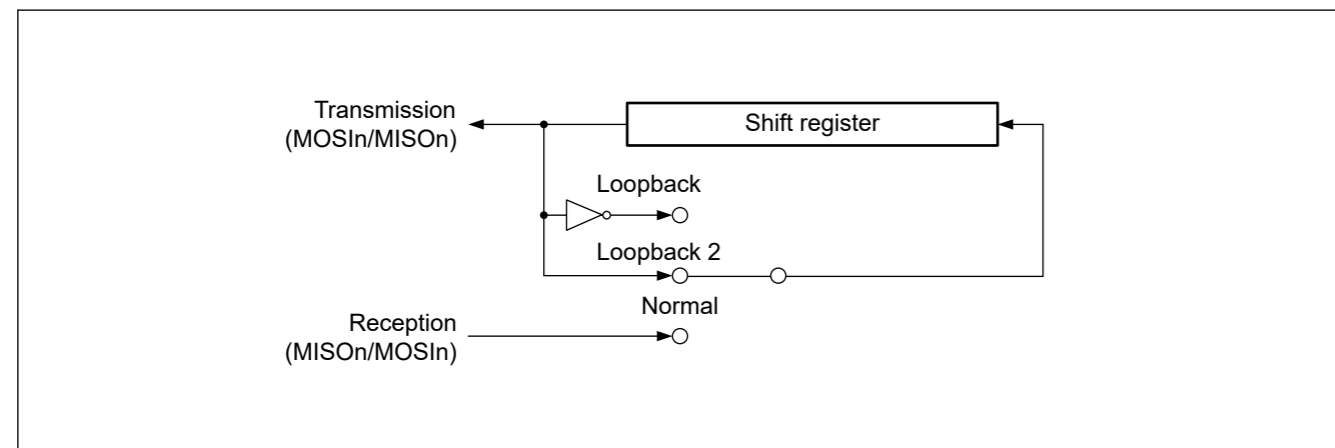

Figure 30.61 Configuration of shift register I/O paths in loopback mode for master mode

### 30.3.14 Self-Diagnosis of Parity Bit Function

The parity circuit consists of a parity bit adding unit used for transmit data and an error detecting unit used for received data. To detect defects in the parity bit adding unit and error detecting unit, the parity circuit performs self-diagnosis as shown in Figure 30.62.

表30.13列出了SPLP2和SPLP位与接收数据之间的关系。图30.61显示了当主模式下的SPI设置为环回模式 (SPPCR.SPLP2=0, SPPCR.SPLP=1) 时移位寄存器IO路径的配置。

Table 30.13 SPLP2和SPLP位设置和接收数据

| SPPCR.SPLP2 bit | SPPCR.SPLP bit | 接收数据                |
|-----------------|----------------|---------------------|
| 0               | 0              | 从MOSIn引脚或MISO引脚输入数据 |
| 0               | 1              | 反相传输数据              |
| 1               | 0              | 传输数据                |
| 1               | 1              | 传输数据                |

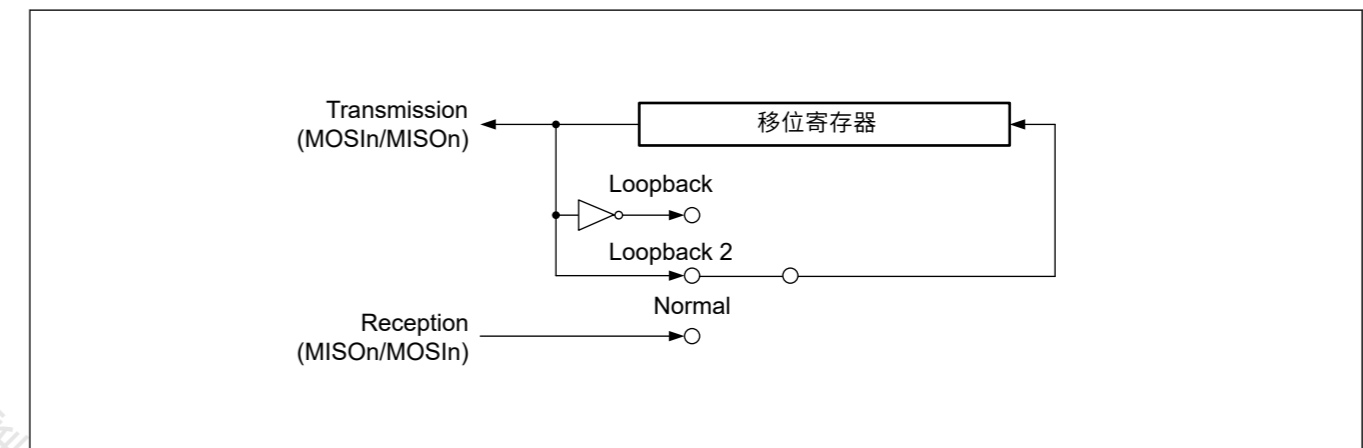

Figure 30.61 在主模式的环回模式下配置移位寄存器IO路径

### 30.3.14 奇偶校验位功能自诊断

奇偶校验电路由用于发送数据的奇偶校验位添加单元和用于接收数据的错误检测单元组成。为了检测奇偶校验位添加单元和错误检测单元中的缺陷，奇偶校验电路执行自诊断，如图所示 Figure 30.62.

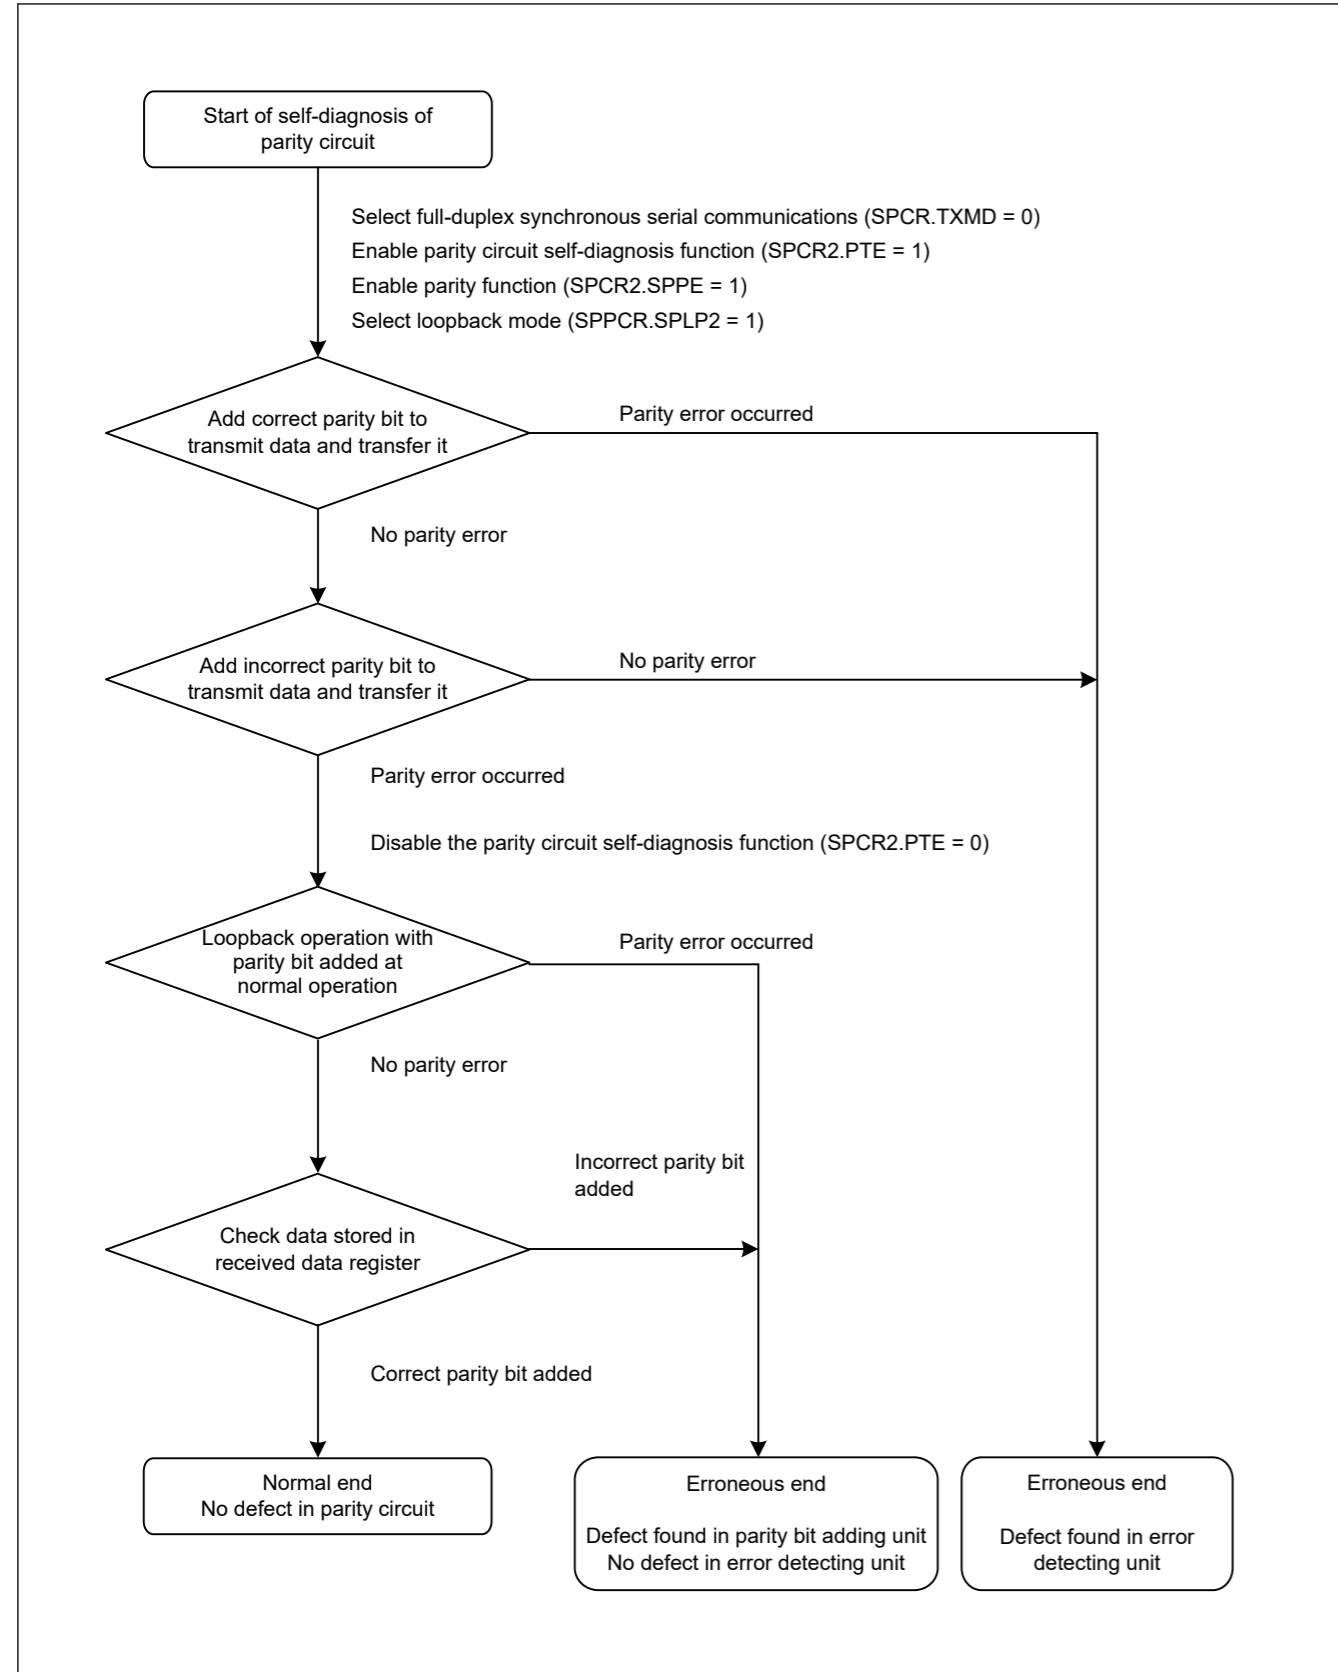

Figure 30.62 Self-diagnosis flow for parity circuit

### 30.3.15 Interrupt Sources

The SPI has the following interrupt sources:

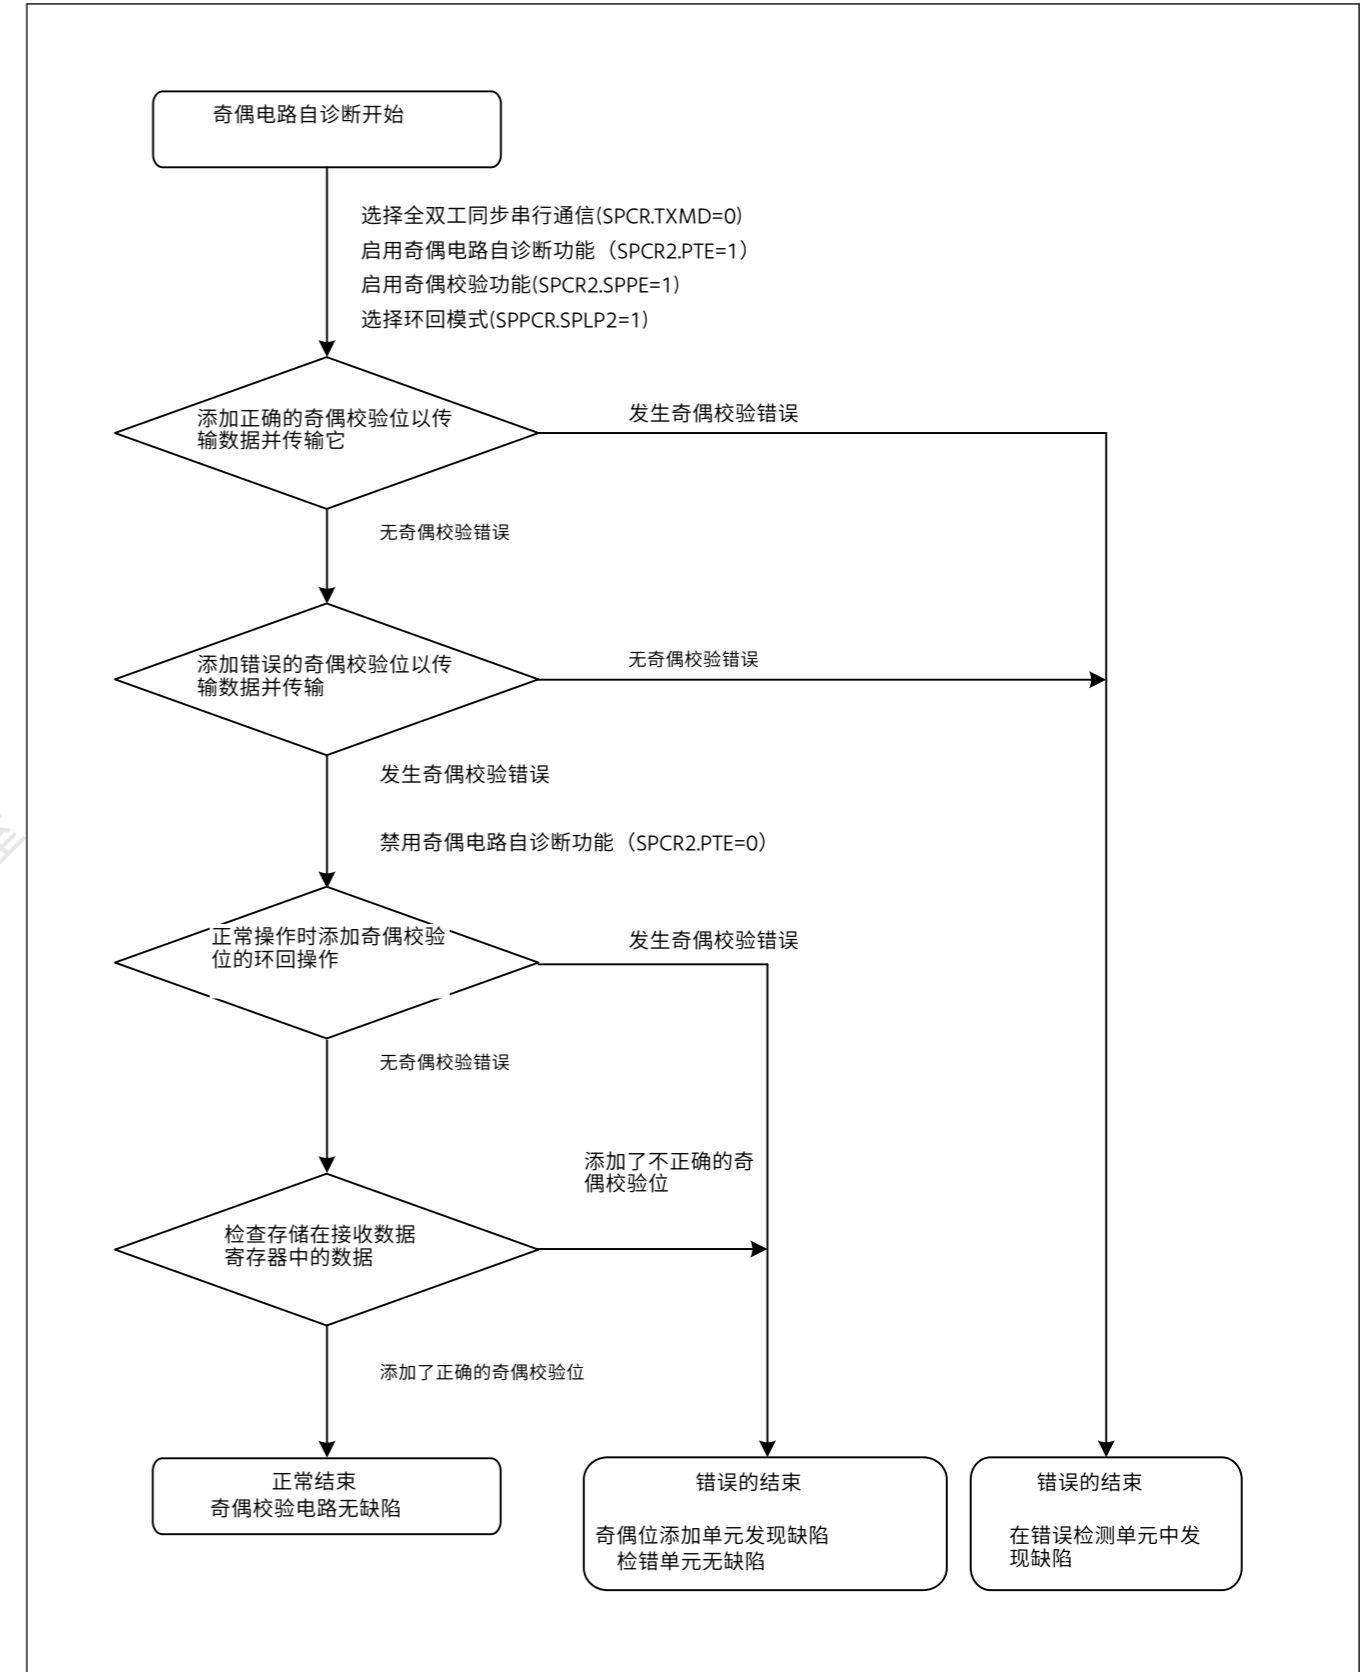

Figure 30.62 奇偶校验电路的自诊断流程

### 30.3.15 中断源

SPI有以下中断源:

- Receive buffer full
- Transmit buffer empty
- SPI error (mode-fault, underrun, overrun, or parity error)
- SPI idle
- Communication-end

The DMAC or DTC can be activated by the receive buffer full or transmit buffer empty interrupt to perform data transfer.

Because the vector address for the SPI<sub>i</sub>\_SPEI (SPI error interrupt) is allocated to interrupt requests on mode-fault, underrun, overrun, and parity errors, the actual interrupt source must be determined from the flags. Interrupt sources for the SPI are listed in Table 30.14. An interrupt is generated on satisfaction of one of the interrupt conditions in Table 30.14. Clear the receive buffer full and transmit buffer empty sources through a data transfer.

When using the DMAC or DTC to perform data transmission and reception, you must first set up the DMAC or DTC to be in a transfer-enabled status before setting the SPI. For information on setting up the DMAC or DTC, see section 16, DMA Controller (DMAC) and section 17, Data Transfer Controller (DTC).

If the conditions for generating a transmit buffer empty or receive buffer full interrupt occur while the ICU.IELSRn.IR flag is 1, the interrupt is not output as a request for the ICU but is retained internally (the capacity for retention is one request per source). A retained interrupt request is output when the ICU.IELSRn.IR flag becomes 0. A retained interrupt request is automatically discarded when it is output as an actual interrupt request. The interrupt enable bit (the SPCR.SPTIE or SPCR.SPRIE bit) for an internally retained interrupt request can also be set to 0.

Table 30.14 SPI interrupt sources

| Interrupt source   | Symbol                 | Interrupt condition  | DTC/DMAC activation |
|--|------------------------|--|---------------------|
| Receive buffer full  | SPI <sub>i</sub> _SPRI | The receive buffer becomes full (SPSR.SPRF flag is 1) while the SPCR.SPRIE bit is 1    | Possible            |
| Transmit buffer empty                                      | SPI <sub>i</sub> _SPTI | The transmit buffer becomes empty (SPSR.SPTEF flag is 1) while the SPCR.SPTIE bit is 1 | Possible            |
| SPI error (mode-fault, underrun, overrun, or parity error) | SPI <sub>i</sub> _SPEI | The SPSR.MODF, OVRF, UDRF or PERF flag sets to 1 while the SPCR.SPEIE bit is 1         | Impossible          |
| SPI idle   | SPI <sub>i</sub> _SPII | The SPSR.IDLNF flag sets to 0 while the SPCR2.SPIIE bit is 1                           | Impossible          |
| Communication-end  | SPI <sub>i</sub> _SPCI | CENDIE = 1 and CENDF = 1   | Impossible          |

### 30.4 Event Link Controller Event Output

The Event Link Controller (ELC) can produce the following event output signals:

- Receive buffer full event output
- Transmit buffer empty event output
- Mode-fault, underrun, overrun, or parity error event output
- SPI idle event output
- Transmission-completed event output

The event link output signal is output regardless of the interrupt enable bit setting.

#### 30.4.1 Receive Buffer Full Event Output

This event signal is output when received data is transferred from the shift register to the SPDR/SPDR\_HA on completion of serial transfer.

#### 30.4.2 Transmit Buffer Empty Event Output

This event signal is output when data for transmission is transferred from the transmit buffer to the shift register and when the value of the SPE bit changes from 0 to 1.

- 接收缓冲区已满
- 发送缓冲区空
- SPI错误（模式故障、欠载、溢出或奇偶校验错误）
- SPI空闲
- Communication-end

DMAC或DTC可由接收缓冲区满或发送缓冲区空中断激活以执行数据传输。

由于SPI<sub>i</sub>\_SPEI（SPI错误中断）的向量地址分配给模式错误、欠载、溢出和奇偶校验错误的中断请求，因此必须根据标志确定实际中断源。表30.14列出了SPI的中断源。满足表30.14中的中断条件之一时会产生中断。通过数据传输清除接收缓冲区满和发送缓冲区空源。

使用DMAC或DTC进行数据收发时，必须先将DMAC或DTC设置为传输使能状态，然后再设置SPI。有关设置DMA C或DTC的信息，请参阅第16节，DMA控制器(DMAC)和第17节，数据传输控制器(DTC)。

如果在ICU.IELSRn.IR标志为1时发生发送缓冲区空或接收缓冲区满中断的条件，则该中断不会作为对ICU的请求输出，而是在内部保留（保留容量为每个请求一个请求）资源。当ICU.IELSRn.IR标志变为0时，输出保留中断请求。当作为实际中断请求输出时，自动丢弃保留中断请求。内部保留中断请求的中断使能位（SPCR.SPTIE或SPCR.SPRIE位）也可以设置为0。

Table 30.14 SPI中断源

| 中断源                      | Symbol                 | 中断条件  | DTC/DMAC activation |
|--------------------------|------------------------|---|---------------------|
| 接收缓冲区已满                  | SPI <sub>i</sub> _SPRI | 当SPCR.SPRIE位为1时，接收缓冲区变满（SPSR.SPRF标志为1）        | Possible            |
| 发送缓冲区为空                  | SPI <sub>i</sub> _SPTI | 当SPCR.SPTIE位为1时，发送缓冲区变为空（SPSR.SPTEF标志为1）      | Possible            |
| SPI错误（模式错误、欠载、溢出或奇偶校验错误） | SPI <sub>i</sub> _SPEI | SPSR.MODF、OVRF、UDRF或PERF标志设置为1，而SPCR.SPEIE位为1 | Impossible          |
| SPI空闲                    | SPI <sub>i</sub> _SPII | SPSR.IDLNF标志设置为0，而SPCR2.SPIIE位为1              | Impossible          |
| Communication-end        | SPI <sub>i</sub> _SPCI | CENDIE = 1 and CENDF = 1                      | Impossible          |

### 30.4 事件链接控制器事件输出

事件链接控制器(ELC)可以产生以下事件输出信号：

- 接收缓冲区满事件输出
- 发送缓冲区空事件输出
- 模式故障、欠载、溢出或奇偶校验错误事件输出
- SPI空闲事件输出
- 传输完成事件输出

无论中断允许位设置如何，都会输出事件链接输出信号。

#### 30.4.1 接收缓冲区满事件输出

串行传输完成后，当接收到的数据从移位寄存器传输到SPDR/SPDR\_HA时，输出此事件信号。

#### 30.4.2 发送缓冲区空事件输出

当要发送的数据从发送缓冲器传送到移位寄存器时，以及SPE位的值从0变为1时，输出该事件信号。

### 30.4.3 Mode-Fault, Underrun, Overrun, or Parity Error Event Output

This event signal is output when mode-fault, underrun, overrun, or parity error is detected. See [section 30.5.4. Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output](#) if using this event signal.

#### (1) Mode-fault

[Table 30.15](#) lists the conditions for occurrence of a mode-fault event.

**Table 30.15 Conditions for mode-fault occurrence**

| SPI mode  | SPCR.MODFEN bit | SSLn0 pin  | Remarks  |
|---|-----------------|------------|--|
| SPI operation (SPMS = 0)<br>Slave (SPCR.MSTR = 0) | 1               | Not active | Event is output only when the SSLn0 pin is deactivated during transmission |

#### (2) Underrun

This event signal is output in response to an underrun when a serial transfer starts while the transmission data is not ready, and the value of the SPCR.MSTR bit is 0 and the SPCR.SPE bit is 1. Under these conditions, the MODF and UDRF flags are set to 1.

#### (3) Overrun

This event signal is output in response to an overrun when a serial transfer completes while the receive buffer contains unread data and the value of the SPCR.TXMD bit is 0. Under these conditions, the OVRF flag is set to 1.

#### (4) Parity error

This event signal is output in response to a parity error detected on completion of a serial transfer while the value of the TXMD bit in SPCR is 0 and the value of the SPPE bit in SPCR2 is 1.

### 30.4.4 SPI Idle Event Output

#### (1) In master mode

In master mode, an event is output when the condition for setting the IDLNF flag (SPI idle flag) to 0 is satisfied.

#### (2) In slave mode

In slave mode, an event is output when the SPCR.SPE bit is set to 0 (SPI is initialized).

### 30.4.5 Communication End Event Output

In master mode, an event is output when the IDLNF flag (RSPI idle flag) changes from 1 to 0. In slave mode, an event occurs with conditions shown in [Table 30.16](#) and [Table 30.17](#)

**Table 30.16 Communication End Event Generating Conditions (transmit-receive/transmit slave mode)**

|  | Transmit Buffer Status | Shift Register Status | Others   |
|--|------------------------|-----------------------|--|
| SPI operation (SPMS = 0)               | Empty                  | Empty                 | SSL0 input is negated  |
| Clock synchronous operation (SPMS = 1) | Empty                  | Empty                 | The last even edge of RSPCK of last data was detected (CPHA = 1) |

**Table 30.17 Communication End Event Generating Conditions (receive only slave mode)**

|  | Others   |
|--|--|
| SPI operation (SPMS = 0)               | SSL0 input is negated  |
| Clock synchronous operation (SPMS = 1) | The last even edge of RSPCK of last data was detected (CPHA = 1) |

Regardless of master mode or slave mode, no event is output when 0 is written to the SPCR.SPE bit during transmission or when the SPCR.SPE bit is cleared due to a mode fault error or an underrun error.

### 30.4.3 模式故障、欠载、溢出或奇偶校验错误事件输出

当检测到模式故障、欠载、溢出或奇偶校验错误时，输出此事件信号。请参阅第30.5.4节。如果使用此事件信号，则对模式故障、欠载、溢出或奇偶校验错误事件输出的约束。

#### (1) Mode-fault

表30.15列出了模式故障事件发生的条件。

**Table 30.15 模式故障发生的条件**

| SPI模式                            | SPCR.MODFEN bit | SSLn0 pin | Remarks                  |
|----------------------------------|-----------------|-----------|--------------------------|
| SPI操作(SPMS=0)从机(SP<br>CR.MSTR=0) | 1               | 不活跃       | 只有在传输过程中禁用SSLn0引脚时才会输出事件 |

#### (2) Underrun

当串行传输开始而传输数据尚未准备好，并且SPCR.MSTR位的值为0且SPCR.SPE位为1时，输出此事件信号以响应欠载。在这些条件下，MODF和UDRF标志设置为1。

#### (3) Overrun

当串行传输完成而接收缓冲区包含未读数据且SPCR.TXMD位的值为0时，输出此事件信号以响应溢出。在这些情况下，OVRF标志设置为1。

#### (4) 奇偶校验错误

该事件信号是响应在串行传输完成时检测到的奇偶校验错误而输出的，而SPCR中的TXMD位为0，SPCR2中的SPPE位的值为1。

### 30.4.4 SPI空闲事件输出

#### (1) 在主模式

在主机模式下，当将IDLNF标志（SPI空闲标志）设置为0的条件成立时输出事件。

#### (2) 在从模式

在从机模式下，当SPCR.SPE位设置为0（SPI初始化）时，会输出一个事件。

### 30.4.5 通讯结束事件输出

在主机模式下，当IDLNF标志（RSPI空闲标志）从1变为0时输出事件。在从机模式下，事件发生的条件如表30.16和表30.17所示

**Table 30.16 通信结束事件发生条件（发送-接收发送从模式）**

|                | 发送缓冲区状态 | 移位寄存器状态 | Others                          |
|----------------|---------|---------|---------------------------------|
| SPI操作(SPMS=0)  | Empty   | Empty   | SSL0输入被否定                       |
| 时钟同步操作(SPMS=1) | Empty   | Empty   | 检测到最后一个数据的RSPCK的最后一个偶边沿(CPHA=1) |

**Table 30.17 通信结束事件发生条件（仅接收从模式）**

|                | Others                          |
|----------------|---------------------------------|
| SPI操作(SPMS=0)  | SSL0输入被否定                       |
| 时钟同步操作(SPMS=1) | 检测到最后一个数据的RSPCK的最后一个偶边沿(CPHA=1) |

无论主模式还是从模式，在传输过程中向SPCR.SPE位写入0或由于模式故障错误或欠载错误而清除SPCR.SPE位时，不输出任何事件。

A communication end event is output at the following timing. The communication end event output timing in master operation is omitted because it is output at the same timing as an idle event.

Figure 30.63 Communication End Event Output Timing (Transmit slave mode, SPI Operation)

Figure 30.64 Communication End Event Output Timing (Transmit slave mode, Clock Synchronous Operation)

Figure 30.65 Communication End Event Output Timing (Receive only slave mode, SPI Operation)

在以下定时输出通信结束事件。主操作中的通信结束事件输出时序被省略，因为它与空闲事件在相同的时序输出。

Figure 30.63 通信结束事件输出时序 (发送从机模式, SPI操作)

Figure 30.64 通信结束事件输出时序 (发送从机模式, 时钟同步 Operation)

Figure 30.65 通信结束事件输出时序 (仅接收从机模式, SPI操作)

Figure 30.66 Communication End Event Output Timing (Receive only slave mode, Clock Synchronous Operation)

## 30.5 Usage Notes

### 30.5.1 Settings for the Module-Stop State

The Module Stop Control Register B (MSTPCRB) can enable or disable the SPI operation. The SPI is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details on the Module Stop Control Register B, see [section 10, Low Power Modes](#).

### 30.5.2 Constraint on Low-Power Functions

When using the module-stop function and entering a low-power mode other than Sleep mode, set the SPCR.SPE bit to 0 before completing communication.

### 30.5.3 Constraints on Starting Transfer

If the ICU.IELSRn.IR flag is 1 when transfer starts, the interrupt request is internally retained, which can lead to unanticipated behavior of the ICU.IELSRn.IR flag.

To prevent this, use the following procedure to clear interrupt requests before enabling operations (by setting the SPCR.SPE bit to 1):

1. Confirm that transfer stopped (the SPCR.SPE bit is 0).
2. Set the associated interrupt enable bit (SPCR.SPTIE bit or SPCR.SPRIE bit) to 0.
3. Read the associated interrupt enable bit (SPCR.SPTIE bit or SPCR.SPRIE bit) and confirm that its value is 0.
4. Set the ICU.IELSRn.IR flag to 0.

### 30.5.4 Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output

Using the mode-fault, underrun, overrun, or parity error event is prohibited if the SPI is in multi-master mode (when the SPCR.SPMS bit is 0, the SPCR.MSTR bit is 1, and the SPCR.MODFEN bit is 1).

### 30.5.5 Constraints on the SPSR.SPRF and SPSR.SPTEF Flags

If the polling flags, SPRF and SPTEF, are used, using the interrupts is prohibited, and you must set the SPCR.SPRIE and SPCR.SPTIE bits to 0. Either the interrupts or the flags can be used, but not both.

Figure 30.66 通信结束事件输出时序 (仅接收从机模式, 时钟同步 Operation)

## 30.5 使用说明

### 30.5.1 模块停止状态的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用SPI操作。SPI在复位后最初停止。释放模块停止状态可以访问寄存器。有关模块停止控制寄存器B的详细信息, 请参见第10节, 低功耗模式。

### 30.5.2 对低功耗功能的约束

当使用模块停止功能并进入除睡眠模式以外的低功耗模式时, 在完成通信之前将SPCR.SPE位设置为0。

### 30.5.3 开始传输的限制

如果ICU.IELSRn.IR标志在传输开始时为1, 则内部保留中断请求, 这可能导致ICU.IELSRn.IR标志的意外行为。

为防止这种情况发生, 请使用以下程序在使能操作之前清除中断请求 (通过将SPCR.SPE位设置为1) :

1. 确认传输停止 (SPCR.SPE位为0)。
2. 将相关的中断使能位 (SPCR.SPTIE位或SPCR.SPRIE位) 设置为0。
3. 读取相关的中断使能位 (SPCR.SPTIE位或SPCR.SPRIE位) 并确认其值为0。
4. 将ICU.IELSRn.IR标志设置为0。

### 30.5.4 模式故障、欠载、溢出或奇偶校验错误事件输出的约束

如果SPI处于多主模式 (当 SPCR.SPMS位为0, SPCR.MSTR位为1, SPCR.MODFEN位为1)。

### 30.5.5 SPSR.SPRF和SPSR.SPTEF标志的约束

如果使用轮询标志SPRF和SPTEF, 则禁止使用中断, 您必须设置SPCR.SPRIE和SPCR.SPTIE位为0。可以使用中断或标志, 但不能同时使用。

## 31. Quad Serial Peripheral Interface (QSPI)

### 31.1 Overview

The QSPI is a memory controller for connecting a serial ROM (nonvolatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface.

Table 31.1 lists the QSPI specifications, Figure 31.1 shows a block diagram, and Table 31.2 lists the I/O pins.

**Table 31.1 QSPI specifications**

| Parameter                      | Specifications   |
|--------------------------------|--|
| Number of channels             | 1 channel  |
| SPI protocols                  | <ul style="list-style-type: none"> <li>Single SPI protocol, extended SPI protocol to achieve full-duplex communications<br/>Note: Standard or fast reading can only be used in single SPI operation.<br/>Four-wire communications with the serial flash memory by using the QSSL, QSPCLK, QIO0, and QIO1 pins (QIO0, QSSL, and QSPCLK for output, and QIO1 for input)</li> <li>Dual SPI protocol to achieve half-duplex communications<br/>Four-wire communications with the serial flash memory by using the QSSL, QSPCLK, QIO0, and QIO1 pins (QSSL and QSPCLK for output, and QIO0 and QIO1 for input and output)</li> <li>Quad SPI protocol to achieve half-duplex communications<br/>Six-wire communications with the serial flash memory by using the QSSL, QSPCLK, and QIO0 to QIO3 pins (QSSL and QSPCLK for output, and QIO0 to QIO3 for input and output)</li> </ul> |
| SPI mode                       | <ul style="list-style-type: none"> <li>SPI mode 0: The QSPCLK signal is driven low when the SPI bus is not active.</li> <li>SPI mode 3: The QSPCLK signal is driven high when the SPI bus is not active.</li> </ul>  |
| SPI timing adjustment function | <p>The following settings are possible to suit various types of serial flash memory device:</p> <ul style="list-style-type: none"> <li>SPI bus reference cycle (SFMSKC.SFMDV[4:0])</li> <li>Duty cycle correction (SFMSKC.SFMDTY)</li> <li>Adjustment of the number of dummy cycles (SFMSDC.SFMDN[3:0])</li> <li>Minimum width at high level for the QSSL signal (SFMSSC.SFMSW[3:0])</li> <li>QSSL signal setup time (SFMSSC.SFMSLD)</li> <li>QSSL signal hold time (SFMSSC.SFMSHD)</li> <li>Serial data output enable hold time (SFMSMD.SFMOEX)</li> </ul>  |
| ROM access mode                | <ul style="list-style-type: none"> <li>Support for Standard Read, Fast Read, Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, and Fast Read Quad I/O instructions</li> <li>Substitutable instruction code</li> <li>Prefetch function (data are sequentially stored in a buffer after one request without waiting for further requests to read the serial flash memory)</li> <li>Polling processing</li> <li>SPI bus cycle extension function</li> <li>XIP mode (allowing skipping of the reception of an instruction code to read the serial flash memory)</li> </ul> <p>Note: ROM access mode is only possible with reading .</p>  |
| Direct communication mode      | Flexible support for a wide variety of serial flash memory instructions and functions through software control, including erase, ID read, and power-down control   |
| Interrupt source               | Error interrupts   |
| Module-stop function           | Module-stop state can be set to reduce power consumption.  |
| TrustZone Filter               | Security attribution is always non-secure  |

## 31. 四路串行外设接口(QSPI)

### 31.1 Overview

QSPI是一种存储器控制器，用于连接串行ROM（非易失性存储器，例如串行闪存、串行具有SPI兼容接口的EEPROM或串行FeRAM）。

表31.1列出了QSPI规范，图31.1显示了框图，表31.2列出了IO引脚。

**Table 31.1 QSPI specifications**

| Parameter            | Specifications   |
|----------------------|--|
| 通道数                  | 1 channel  |
| SPI协议                | <ul style="list-style-type: none"> <li>单SPI协议，扩展SPI协议实现全双工通信<br/>Note: 标准或快速读取只能在单个SPI操作中使用。<br/>使用QSSL、QSPCLK、QIO0和串行闪存进行四线通信<br/>QIO1引脚（QIO0、QSSL和QSPCLK用于输出，QIO1用于输入）</li> <li>双SPI协议实现半双工通信<br/>使用QSSL、QSPCLK、QIO0和串行闪存进行四线通信<br/>QIO1引脚（QSSL和QSPCLK用于输出，QIO0和QIO1用于输入和输出）</li> <li>QuadSPI协议实现半双工通信<br/>通过使用QSSL、QSPCLK和QIO0与串行闪存进行六线通信<br/>QIO3引脚（QSSL和QSPCLK用于输出，QIO0到QIO3用于输入和输出）</li> </ul> |
| SPI模式                | <ul style="list-style-type: none"> <li>SPI模式0: 当SPI总线处于非活动状态时，QSPCLK信号被驱动为低电平。</li> <li>SPI模式3: 当SPI总线不活动时，QSPCLK信号被驱动为高电平。</li> </ul>   |
| SPI时序调整功能            | <p>可以进行以下设置以适应各种类型的串行闪存设备：</p> <ul style="list-style-type: none"> <li>SPI总线参考周期(SFMSKC.SFMDV[4:0])</li> <li>占空比校正(SFMSKC.SFMDTY)</li> <li>调整虚拟周期数(SFMSDC.SFMDN[3:0])</li> <li>QSSL信号的高电平最小宽度(SFMSSC.SFMSW[3:0])</li> <li>QSSL信号建立时间(SFMSSC.SFMSLD)</li> <li>QSSL信号保持时间(SFMSSC.SFMSHD)</li> <li>串行数据输出使能保持时间(SFMSMD.SFMOEX)</li> </ul>  |
| ROM访问模式              | <ul style="list-style-type: none"> <li>支持标准读取、快速读取、快速读取双输出、快速读取双IO、快速读取四路输出和快速读取四路IO指令</li> <li>可替换指令代码</li> <li>预取功能（数据在一个请求后顺序存储在缓冲区中，无需等待进一步的请求来读取串行闪存）</li> <li>轮询处理</li> <li>SPI总线周期扩展功能</li> <li>XIP模式（允许跳过接收指令码来读取串行闪存）注意：</li> </ul> <p>ROM访问模式仅适用于读取。</p>   |
| 直接通讯方式               | 通过软件控制灵活支持各种串行闪存指令和功能，包括擦除、ID读取和断电控制   |
| 中断源                  | 错误中断   |
| Module-stop function | 可设置模块停止状态以降低功耗。  |
| TrustZone Filter     | 安全归因始终是不安全的  |

| 3     | —          | This bit is read as 0. The write value should be 0.   | R/W |
| 5:4   | SFMSE[1:0] | QSSL extension function select after SPI bus access<br>0 0: Do not extend QSSL<br>0 1: Extend QSSL by 33 QSPCLK<br>1 0: Extend QSSL by 129 QSPCLK<br>1 1: Extend QSSL infinitely  | R/W |
| 6     | SFMPE      | Prefetch function select<br>0: Disable function<br>1: Enable function   | R/W |
| 7     | SFMPE      | Function select for stopping prefetch at locations other than on byte boundaries*1<br>0: Disable function<br>1: Enable function   | R/W |
| 8     | SFMMD3     | SPI mode select.<br>0: SPI mode 0<br>1: SPI mode 3  | R/W |
| 9     | SFMOEX     | Extension select for the I/O buffer output enable signal for the serial interface<br>0: Do not extend<br>1: Extend by 1 QSPCLK  | R/W |
| 10    | SFMOHW     | Hold time adjustment for serial transmission<br>0: Do not extend high-level width of QSPCLK during transmission<br>1: Extend high-level width of QSPCLK by 1 PCLKA during transmission  | R/W |
| 11    | SFMOSW     | Setup time adjustment for serial transmission<br>0: Do not extend low-level width of QSPCLK during transmission<br>1: Extend low-level width of QSPCLK by 1 PCLKA during transmission   | R/W |
| 14:12 | —          | These bits are read as 0. The write value should be 0.  | R/W |
| 15    | SFMCCE     | Read instruction code select<br>0: Uses automatically generated SPI instruction code*2<br>1: Use instruction code in the SFMSIC register  | R/W |
| 31:16 | —          | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. The QSPI outputs additional one clock without accompanying data reception. For details, see [section 31.5.9. Serial Data Receiving Latency](#).

Note 2. When QSPI accesses serial flash memory, the instruction code is based on the SFMSAC register and SFMSMD register settings. See [section 31.6.1. SPI Instructions That Are Automatically Generated](#).

### 31.2.2 SFMSSC : Chip Selection Control Register

Base address: QSPI = 0x6400\_0000

Offset address: 0x004

Note 1. Only 0 can be written to this bit.

### 31.2.8 SFMSIC : Instruction Code Register

Base address: QSPI = 0x6400\_0000

Offset address: 0x020

| Bit  | Symbol      | Function   | R/W |
|------|-------------|--|-----|
| 7:0  | SFMCIC[7:0] | Serial flash instruction code to substitute            | R/W |
| 31:8 | —           | These bits are read as 0. The write value should be 0. | R/W |

### 31.2.7 SFMCST:通讯状态寄存器

Base address: QSPI = 0x6400\_0000

Offset address: 0x018

| Bit  | Symbol | Function                                     | R/W                 |
|------|--------|--|---------------------|
| 0    | COMBSY | 直接通信中的SPI总线周期完成状态<br>0: 未处理串行传输1: 正在处理串行传输   | R                   |
| 6:1  | —      | 这些位被读取为0。写入值应为0。                             | R/W                 |
| 7    | EROMR  | 直接通信模式下的ROM访问检测状态<br>0: 未检测到ROM访问1: 检测到ROM访问 | R/(W) <sup>*1</sup> |
| 31:8 | —      | 这些位被读取为0。写入值应为0。                             | R/W                 |

注1.该位只能写入0。

### 31.2.8 SMSIC:指令代码寄存器

Base address: QSPI = 0x6400\_0000

Offset address: 0x020

| Bit  | Symbol      | Function         | R/W |
|------|-------------|------------------|-----|
| 7:0  | SFMCIC[7:0] | 替代的串行闪存指令代码      | R/W |
| 31:8 | —           | 这些位被读取为0。写入值应为0。 | R/W |

31.2.9 SFMSAC : Address Mode Control Register

Base address: QSPI = 0x6400\_0000  
Offset address: 0x024

| Bit  | Symbol     | Function  | R/W |
|------|------------|---|-----|
| 1:0  | SFMAS[1:0] | Number of address bytes select for the serial interface<br>0 0: 1 byte<br>0 1: 2 bytes<br>1 0: 3 bytes<br>1 1: 4 bytes  | R/W |
| 3:2  | —          | These bits are read as 0. The write value should be 0.  | R/W |
| 4    | SFM4BC     | Selection of instruction code automatically generated when the serial interface address width is 4 bytes<br>0: Do not use 4-byte address read instruction code<br>1: Use 4-byte address read instruction code | R/W |
| 31:5 | —          | These bits are read as 0. The write value should be 0.  | R/W |

31.2.10 SFMSDC : Dummy Cycle Control Register

Base address: QSPI = 0x6400\_0000  
Offset address: 0x028

31.2.9 SFMSAC:地址模式控制寄存器

Base address: QSPI = 0x6400\_0000  
Offset address: 0x024

| Bit  | Symbol     | Function   | R/W |
|------|------------|--|-----|
| 1:0  | SFMAS[1:0] | 为串行接口选择的地址字节数<br>00: 1个字节0<br>01: 2个字节10<br>10: 3个字节11<br>11: 4个字节 | R/W |
| 3:2  | —          | 这些位被读取为0。写入值应为0。   | R/W |
| 4    | SFM4BC     | 串行接口地址宽度为4字节时自动生成的指令代码选择<br>0: 不使用4字节地址读取指令码<br>1: 使用4字节地址读取指令码    | R/W |
| 31:5 | —          | 这些位被读取为0。写入值应为0。   | R/W |

31.2.10 SFMSDC:虚拟周期控制寄存器

Base address: QSPI = 0x6400\_0000  
Offset address: 0x028

| Bit   | Symbol     | Function  | R/W |
|-------|------------|---|-----|
| 3:0   | SFMDN[3:0] | Number of dummy cycles select for Fast Read instructions<br>0x0: Default dummy cycles for each instruction:<br>- Fast Read Quad I/O: 6 QSPCLK<br>- Fast Read Quad Output: 8 QSPCLK<br>- Fast Read Dual I/O: 4 QSPCLK<br>- Fast Read Dual Output: 8 QSPCLK<br>- Fast Read: 8 QSPCLK<br>0x1: 3 QSPCLK*1<br>0x2: 4 QSPCLK<br>0x3: 5 QSPCLK<br>0x4: 6 QSPCLK<br>0x5: 7 QSPCLK<br>0x6: 8 QSPCLK<br>0x7: 9 QSPCLK<br>0x8: 10 QSPCLK<br>0x9: 11 QSPCLK<br>0xA: 12 QSPCLK<br>0xB: 13 QSPCLK<br>0xC: 14 QSPCLK<br>0xD: 15 QSPCLK<br>0xE: 16 QSPCLK<br>0xF: 17 QSPCLK | R/W |
| 5:4   | —          | These bits are read as 0. The write value should be 0.  | R/W |
| 6     | SFMXST     | XIP mode status<br>0: Normal (non-XIP) mode<br>1: XIP mode  | R   |
| 7     | SFMXEN     | XIP mode permission<br>0: Prohibit XIP mode<br>1: Permit XIP mode   | R/W |
| 15:8  | SFMXD[7:0] | Mode data for serial flash (Controls XIP mode.)*2   | R/W |
| 31:16 | —          | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. To avoid a conflict with the input/output switch of the serial flash memory pin connected to QIO0 pin, select more than four cycles of QSPCLK as the number of dummy cycles for the fast read instruction when the output enable signal is extended by setting the SFMOEX bit in the SFMSMD register to 1.

Note 2. As the mode data for serial flash memory, specify the XIP mode setting data set in actual serial flash memory.

### 31.2.11 SFMSPC : SPI Protocol Control Register

Base address: QSPI = 0x6400\_0000

Offset address: 0x030

|                    |    |    |    |    |    |    |    |    |    |    |    |         |    |    |            |    |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|------------|----|
| Bit position:      | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20      | 19 | 18 | 17         | 16 |
| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —       | —  | —  | —          | —  |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0       | 0  | 0  | 0          | 0  |
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4       | 3  | 2  | 1          | 0  |
| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | SFMS DE | —  | —  | SFMSP[1:0] | —  |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 1       | 0  | 0  | 0          | 0  |

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 1:0 | SFMSP[1:0] | SPI protocol select*1<br>0 0: Single SPI Protocol, Extended SPI protocol<br>0 1: Dual SPI protocol<br>1 0: Quad SPI protocol<br>1 1: Setting prohibited | R/W |

| Bit   | Symbol     | Function  | R/W |
|-------|------------|---|-----|
| 3:0   | SFMDN[3:0] | 为快速读取指令选择的虚拟周期数<br>0x0: 每条指令的默认虚拟周期: 快速读取四路I/O: 6QSPCLK快速读取四路输出: 8QSPCLK快速读取双路I/O: 4QSPCLK快速读取双路输出: 8QSPCLK快速读取: 8QSPCLK<br>0x1: 3 QSPCLK*1<br>0x2: 4 QSPCLK<br>0x3: 5 QSPCLK<br>0x4: 6 QSPCLK<br>0x5: 7 QSPCLK<br>0x6: 8 QSPCLK<br>0x7: 9 QSPCLK<br>0x8: 10 QSPCLK<br>0x9: 11 QSPCLK<br>0xA: 12 QSPCLK<br>0xB: 13 QSPCLK<br>0xC: 14 QSPCLK<br>0xD: 15 QSPCLK<br>0xE: 16 QSPCLK<br>0xF: 17 QSPCLK | R/W |
| 5:4   | —          | 这些位被读取为0。写入值应为0。  | R/W |
| 6     | SFMXST     | XIP模式状态<br>0: 正常 (非XIP) 模式1: XIP模式  | R   |
| 7     | SFMXEN     | XIP模式权限<br>0: 禁止XIP模式1: 允许XIP模式   | R/W |
| 15:8  | SFMXD[7:0] | 串行闪存的模式数据 (控制XIP模式。)*2  | R/W |
| 31:16 | —          | 这些位被读取为0。写入值应为0。  | R/W |

注1.为免与连接到QIO0引脚的串行闪存引脚的输入输出开关冲突, 请选择4个以上的周期QSPCLK作为快速读取指令的虚拟周期数, 当输出使能信号通过设置SFMSMD寄存器中的SFMOEX位为1。

注2.作为串行闪存的模式数据, 指定实际串行闪存中设置的XIP模式设置数据。

### 31.2.11 SFMSPC:SPI协议控制寄存器

Base address: QSPI = 0x6400\_0000

Offset address: 0x030

|               |    |    |    |    |    |    |    |    |    |    |    |         |    |    |            |    |

### 31.3 Memory Map

#### 31.3.1 External Bus Space

The locations of a serial flash memory and control register on the address space are determined by the address range of the area set in the configuration.

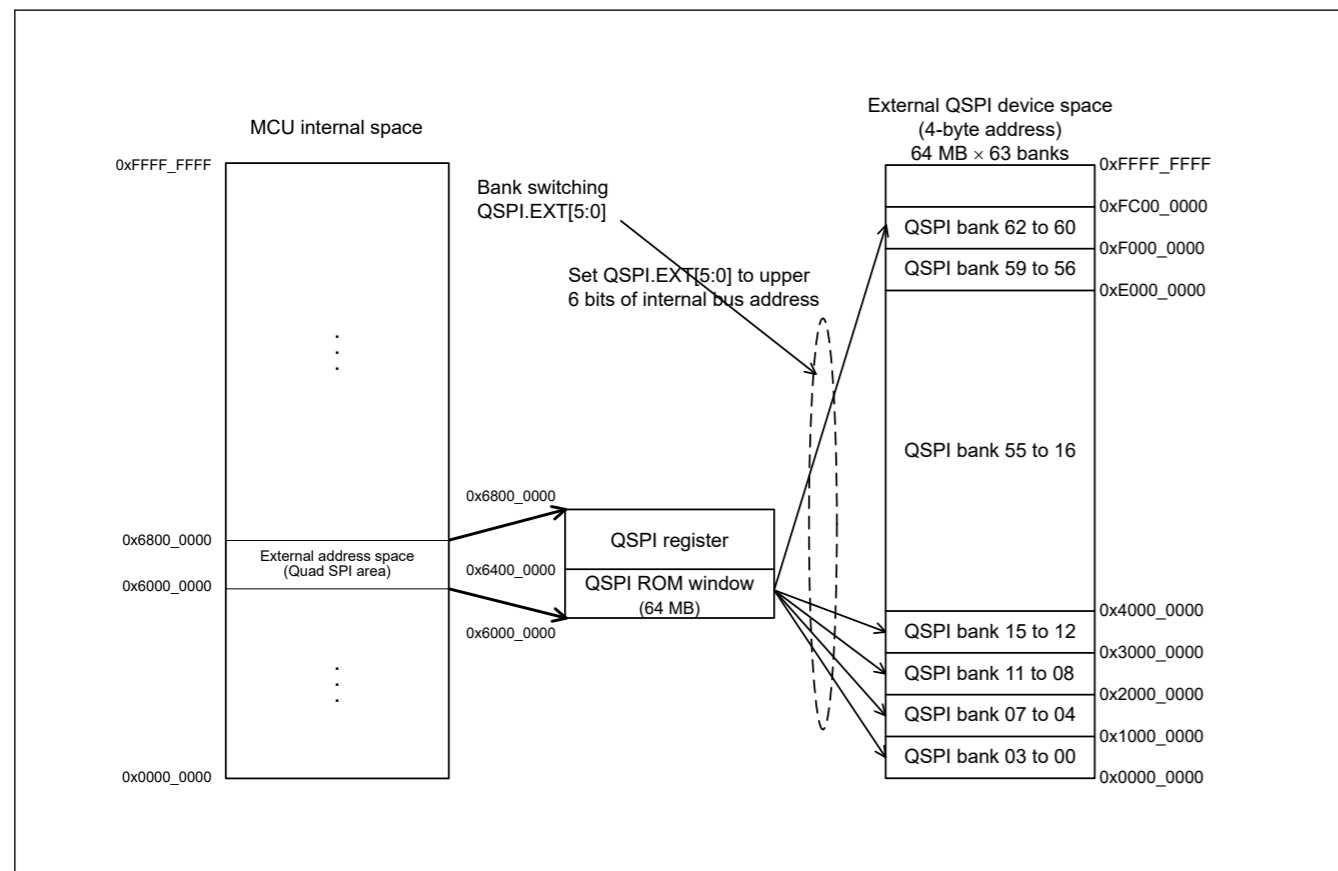

Figure 31.2 Default area setting and memory map

#### 31.3.2 Address Width of the SPI Space and SPI Bus

The SPI space has a 32-bit address width for referencing the serial flash memory. When the SPI space is accessed for a read, an SPI bus cycle starts automatically, and data read from the serial flash is returned.

The address width of the SPI space is fixed at 32 bits. However, the address width of the SPI bus is selectable to 8, 16, 24, or 32 bits in the SFMAS[1:0] bits in the Address Mode Control Register (SFMSAC) register. If 8, 16, or 24 bits is selected as the address width of the SPI bus, only the lower part of the address used to access the SPI space is posted to the serial flash memory through the SPI bus. As a result, the mirror image of the serial flash corresponding to the address width of the SPI bus repeatedly appears in the SPI space.

| Bit   | Symbol        | Function   | R/W |
|-------|---------------|--|-----|

### 31.3 内存映射

#### 31.3.1 外部总线空间

串行闪存和控制寄存器在地址空间上的位置由配置中设置的区域的地址范围决定。

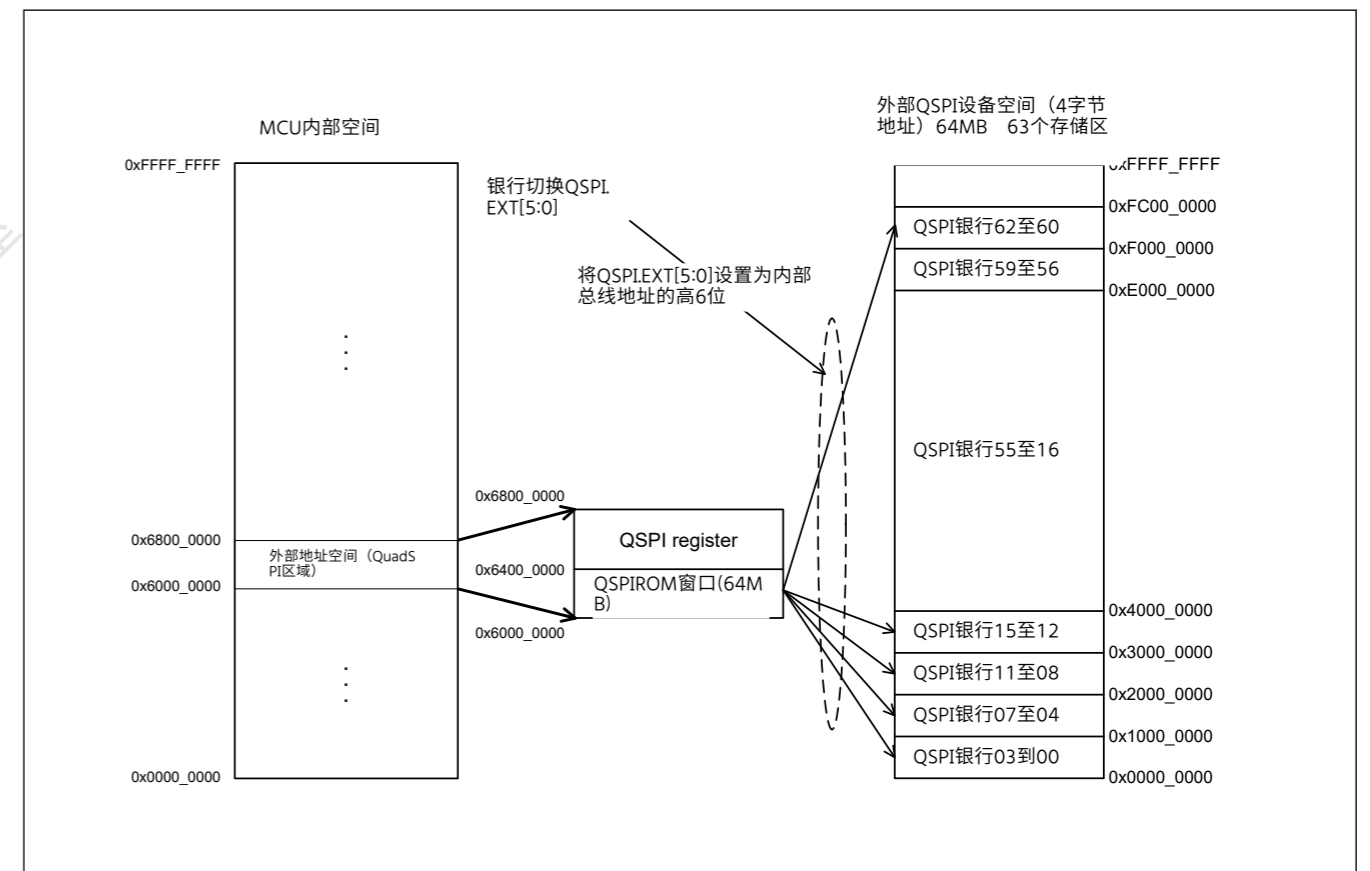

Figure 31.2 默认区域设置和内存映射

#### 31.3.2 SPI空间和SPI总线的地址宽度

SPI空间具有32位地址宽度，用于引用串行闪存。当访问SPI空间进行读取时，会自动启动一个SPI总线周期，并返回从串行闪存读取的数据。

SPI空间的地址宽度固定为32位。但是，SPI总线的地址宽度可选择为地址模式控制寄存器(SFMSAC)寄存器中的SFMAS[1:0]位中的8、16、24或32位。如果选择8位、16位或24位作为SPI总线的地址宽度，则只有用于访问SPI空间的地址的低部分通过SPI总线发布到串行闪存中。结果，对应于SPI总线地址宽度的串行闪存的镜像在SPI空间中反复出现。

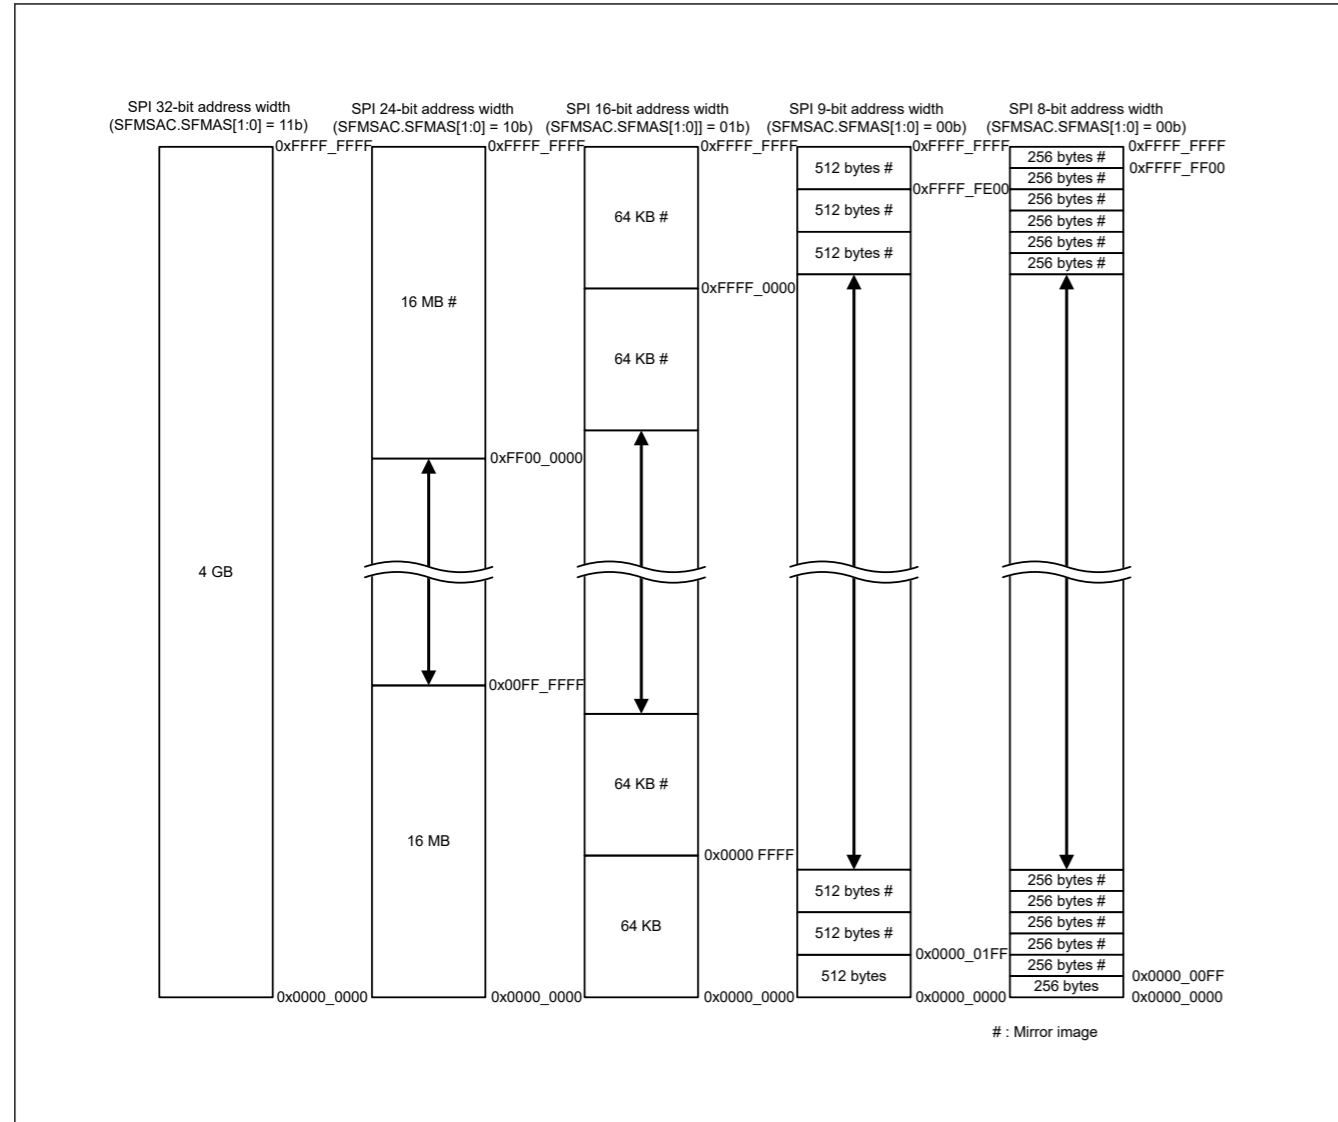

Figure 31.3 Memory map of SPI space

Note: The SPI bus address width is selectable to 8, 16, 24, or 32 bits in the SFMAS[1:0] bits in the SFMSAC register (cases 1 to 3 and 5 in the figure correspond to the respective address widths). When an 8-bit address width is selected, the address information of the ninth bit can be embedded in the Read instruction code. The memory map in case 4 in the figure is for the 9-bit address width. For details on the Read instruction, see [section 31.6.2. Standard Read Instruction](#).

### 31.4 SPI Bus

#### 31.4.1 SPI Protocol

Single SPI, extended SPI, dual SPI, and quad SPI are supported in addition to the SPI protocol used for serial flash memory connection.

The initial state of the SPI protocol is Single SPI, extended SPI and can be changed with the SFMSPI[1:0] bits in the SPI Protocol Control Register (SFMSPC) register.

The address and data pins used in the Single SPI, extended SPI protocol change depending on the setting of the serial interface read mode select bits SFMRM[2:0] in Transfer Mode Control Register (SFMSMD). [Table 31.3](#) and [Table 31.4](#) list the pins used for instruction code, addresses, and data in each of the SPI protocols.

Note: In read operation, the QSPI outputs additional one clock without accompanying data reception per one SPI bus cycle. For details, see [section 31.5.9. Serial Data Receiving Latency](#).

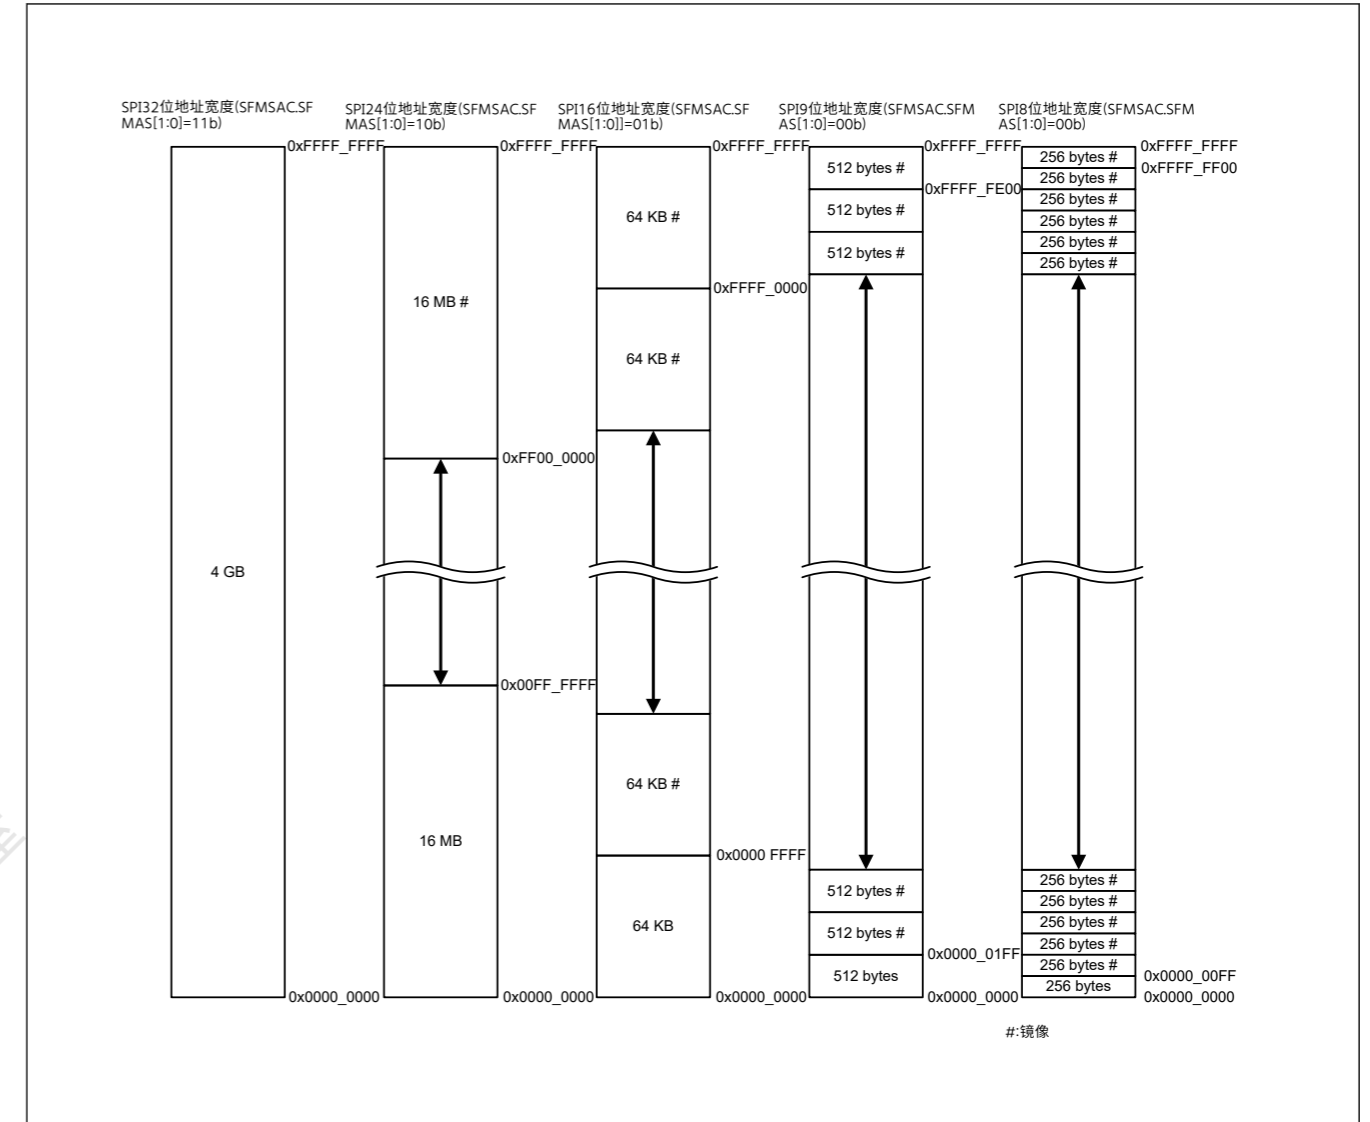

Figure 31.3 SPI空间的内存映射

Note: SPI总线地址宽度在SFMSAC寄存器的SFMAS[1:0]位中可选择为8、16、24或32位（图中的情况1到3和5对应于各自的地址宽度）。When an 8-bit address width is selected the address information of the ninth bit can be embedded in the Read instruction code.图中案例4中的内存映射是针对9位地址宽度的。有关读取指令的详细信息，请参阅第31.6.2节。标准阅读说明。

### 31.4 SPI总线

#### 31.4.1 SPI协议

除了用于串行闪存连接的SPI协议外，还支持单SPI、扩展SPI、双SPI和四SPI。

SPI协议的初始状态是Single SPI，扩展SPI，可以通过SPI中的SFMSPI[1:0]位改变协议控制寄存器(SFMSPC)寄存器。

单SPI、扩展SPI协议中使用的地址和数据引脚根据传输模式控制寄存器(SFMSMD)中串行接口读取模式选择位SFMRM[2:0]的设置而变化。表31.3和表31.4列出了每个SPI协议中用于指令代码、地址和数据的引脚。

Note: 在读操作中，QSPI会在每个SPI总线周期输出额外的一个时钟，而不会伴随数据接收。有关详细信息，请参阅第31.5.9节。串行数据接收延迟。

Table 31.3 List of SPI Protocols (1)

| SPI Protocol (SFMSPC.SFMSP[1:0])                    | Single SPI Protocol, Extended SPI Protocol |                          |                          |                          |                                      |                                      |
|---|--|--------------------------|--------------------------|--------------------------|--------------------------------------|--------------------------------------|
| Serial interface read mode select (SFMSMD.SFM[2:0]) | Standard read                              | Fast read                | Fast read dual output    | Fast read dual I/O       | Fast read quad output                | Fast read quad I/O                   |
| All pins used                                       | QSPCLK, QSSL, QIO0, QIO1                   | QSPCLK, QSSL, QIO0, QIO1 | QSPCLK, QSSL, QIO0, QIO1 | QSPCLK, QSSL, QIO0, QIO1 | QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3 | QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3 |
| Pins used for instruction code                      | QIO0                                       | QIO0                     | QIO0                     | QIO0                     | QIO0                                 | QIO0                                 |
| Pins used for addresses                             | QIO0                                       | QIO0                     | QIO0                     | QIO0, QIO1               | QIO0                                 | QIO0, QIO1, QIO2, QIO3               |
| Pins used for data                                  | QIO0/QIO1                                  | QIO0/QIO1                | QIO0, QIO1               | QIO0, QIO1               | QIO0, QIO1, QIO2, QIO3               | QIO0, QIO1, QIO2, QIO3               |

Note: Single SPI protocol operation is for standard read and fast read. Extended SPI protocol operation is fast read dual output, fast read dual I/O, fast read quad output, and fast read quad I/O.

Table 31.4 List of SPI Protocols (2)

| SPI Protocol (SFMSPC.SFMSP[1:0])                    | Dual-SPI Protocol        |                          | Quad-SPI Protocol                    |                                      |
|---|--------------------------|--------------------------|--------------------------------------|--------------------------------------|
| Serial interface read mode select (SFMSMD.SFM[2:0]) | Fast read dual output    | Fast read dual I/O       | Fast read quad output                | Fast read quad I/O                   |
| All pins used                                       | QSPCLK, QSSL, QIO0, QIO1 | QSPCLK, QSSL, QIO0, QIO1 | QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3 | QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3 |
| Pins used for instruction code                      | QIO0, QIO1               | QIO0, QIO1               | QIO0, QIO1, QIO2, QIO3               | QIO0, QIO1, QIO2, QIO3               |
| Pins used for addresses                             | QIO0, QIO1               | QIO0, QIO1               | QIO0, QIO1, QIO2, QIO3               | QIO0, QIO1, QIO2, QIO3               |
| Pins used for data                                  | QIO0, QIO1               | QIO0, QIO1               | QIO0, QIO1, QIO2, QIO3               | QIO0, QIO1, QIO2, QIO3               |

In single SPI protocol and extended SPI protocol, the instruction code is always output from the QIO0 pin. Address and data input/output operations are performed according to the settings in SFMSMD.SFM[2:0].

Table 31.3 SPI协议列表(1)

| SPI协议(SFMSPC.SFMSP[1:0])    | 单SPI协议, 扩展SPI协议          |                          |                          |                          |                                      |                                      |
|-----------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------------------|--------------------------------------|
| 串行接口读取模式选择(SFMSMD.SFM[2:0]) | 标准阅读                     | 快速阅读                     | 快速读取双输出                  | 快速读取双IO                  | 快速读取四路输出                             | 快速读取四路IO                             |

| 用于指令代码的引脚                   | QIO0                     | QIO0                     | QIO0                     | QIO0                     | QIO0                                 | QIO0                                 |
| 用于地址的引脚                     | QIO0                     | QIO0                     | QIO0                     | QIO0, QIO1               | QIO0                                 | QIO0, QIO1, QIO2, QIO3               |
| 用于数据的引脚                     | QIO0/QIO1                | QIO0/QIO1                | QIO0, QIO1               | QIO0, QIO1               | QIO0, QIO1, QIO2, QIO3               | QIO0, QIO1, QIO2, QIO3               |

Note: 单SPI协议操作作用于标准读取和快速读取。扩展的SPI协议操作是快速读取双输出、快速读取双IO、快速读取四输出和快速读取四IO。

Table 31.4 SPI协议列表(2)

| SPI协议(SFMSPC.SFMSP[1:0])    | Dual-SPI Protocol        |                          | Quad-SPI Protocol                    |                                      |
|-----------------------------|--------------------------|--------------------------|--------------------------------------|--------------------------------------|
| 串行接口读取模式选择(SFMSMD.SFM[2:0]) | 快速读取双输出                  | 快速读取双IO                  | 快速读取四路输出                             | 快速读取四路I/O                            |
| 使用的所有引脚                     | QSPCLK, QSSL, QIO0, QIO1 | QSPCLK, QSSL, QIO0, QIO1 | QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3 | QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3 |
| 用于指令代码的引脚                   | QIO0, QIO1               | QIO0, QIO1               | QIO0, QIO1, QIO2, QIO3               | QIO0, QIO1, QIO2, QIO3               |
| 用于地址的引脚                     | QIO0, QIO1               | QIO0, QIO1               | QIO0, QIO1, QIO2, QIO3               | QIO0, QIO1, QIO2, QIO3               |
| 用于数据的引脚                     | QIO0, QIO1               | QIO0, QIO1               | QIO0, QIO1, QIO2, QIO3               | QIO0, QIO1, QIO2, QIO3               |

在单SPI协议和扩展SPI协议中, 指令代码总是从QIO0引脚输出。地址和数据输入输出操作根据SFMSMD.SFM[2:0]中的设置执行。

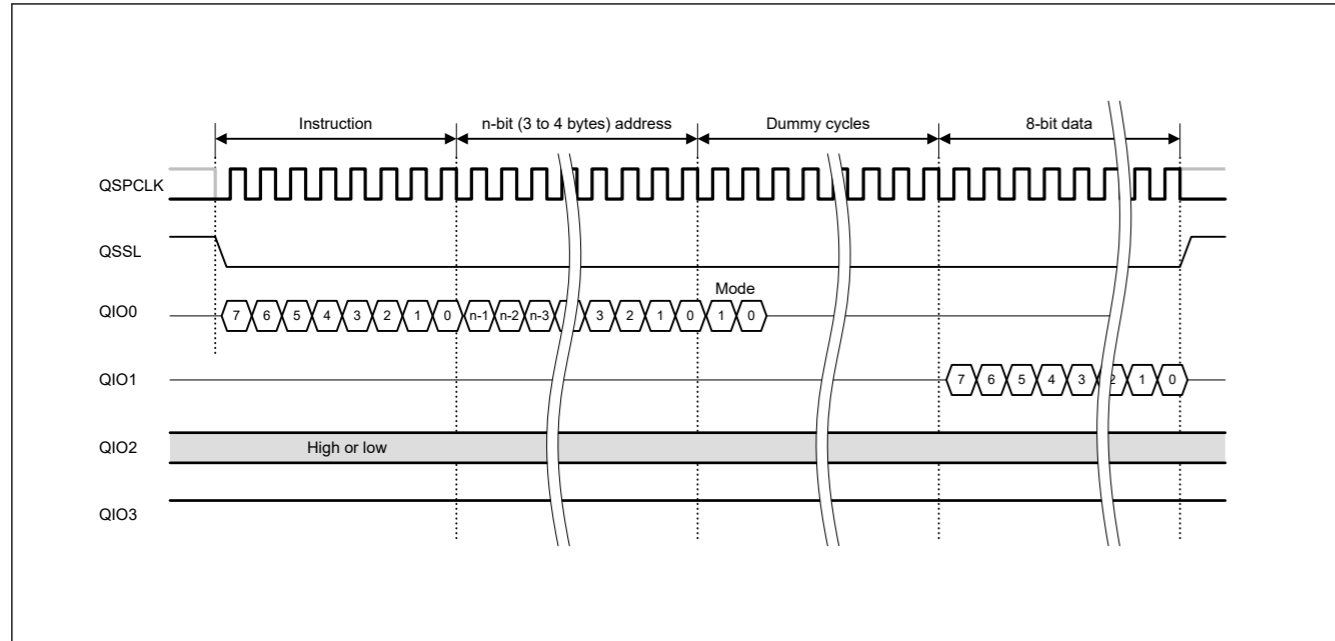

Figure 31.4 Single SPI Protocol example for Fast Read

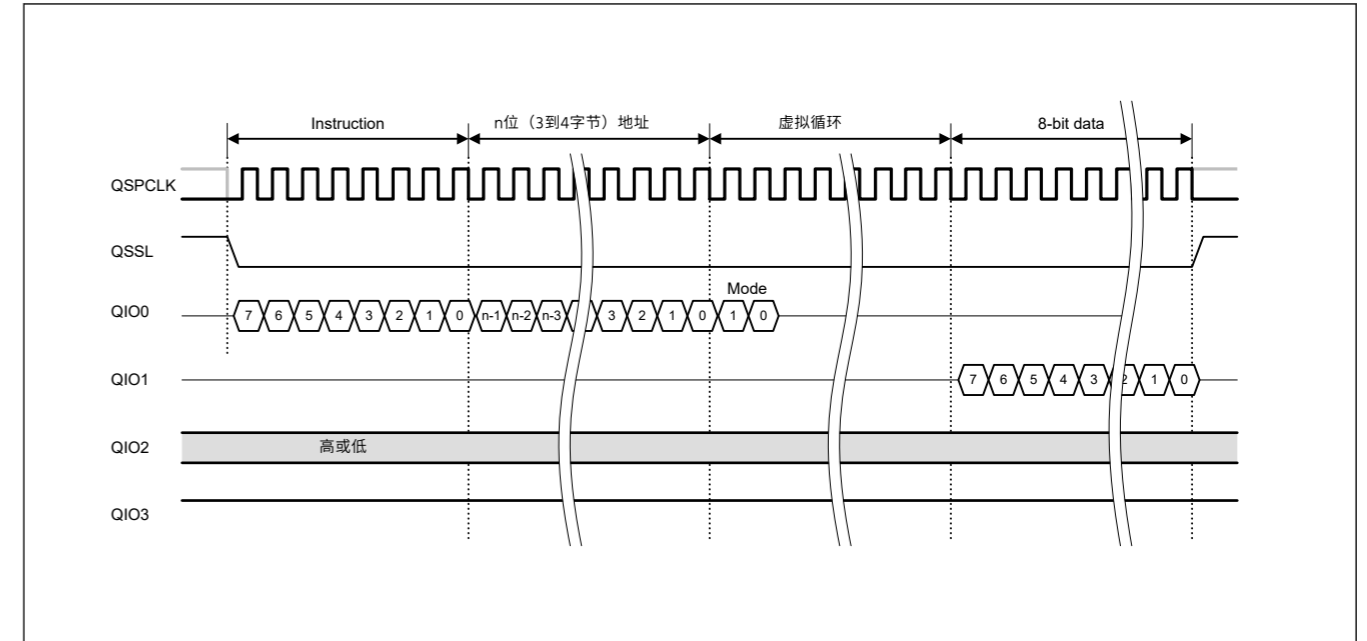

Figure 31.4 用于快速读取的单SPI协议示例

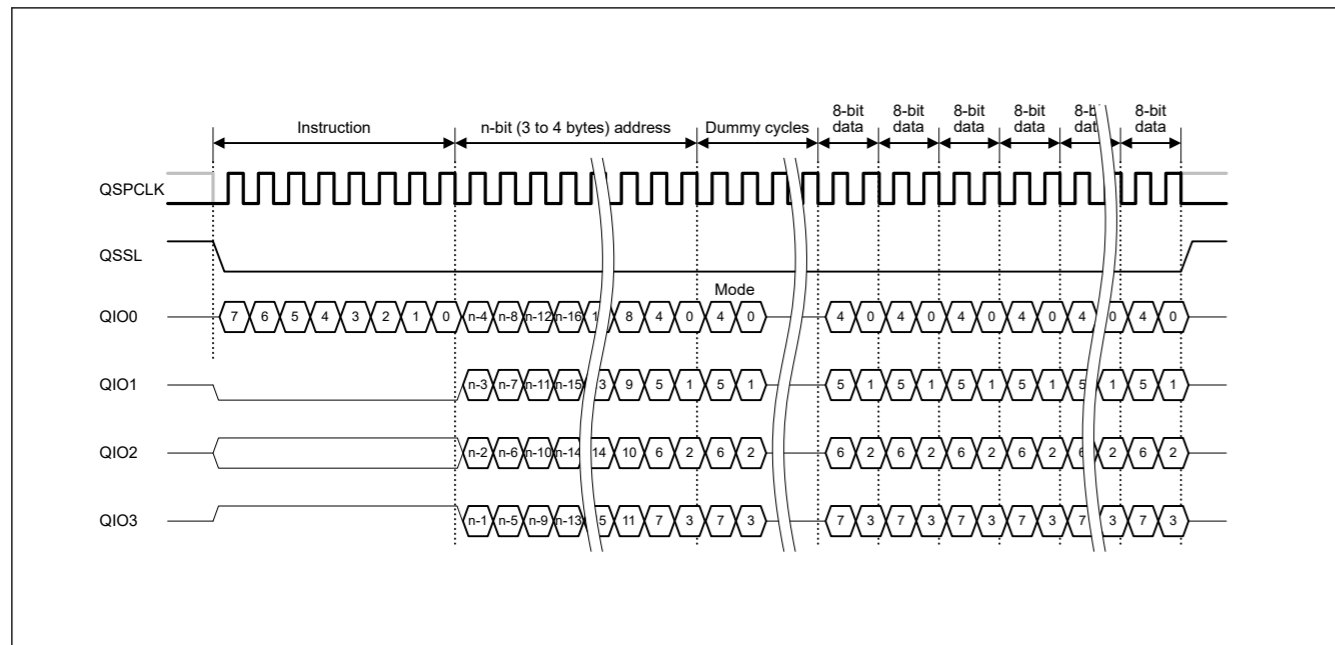

Figure 31.5 Extended SPI Protocol example for Fast Read Quad I/O

The Dual SPI protocol performs I/O operation of all signals such as instruction codes, addresses, and data using two pins, QIO0 and QIO1.

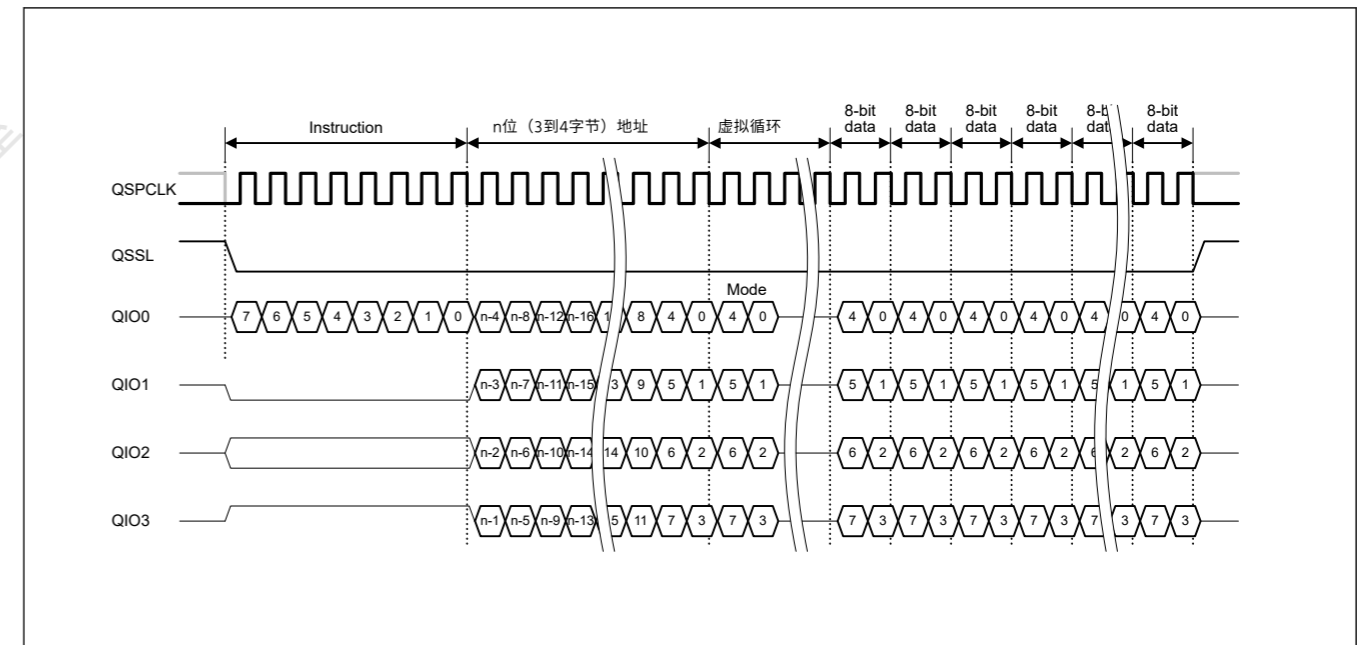

Figure 31.5 快速读取四路IO的扩展SPI协议示例

DualSPI协议使用两个引脚执行指令代码、地址和数据等所有信号的IO操作，QIO0 and QIO1.

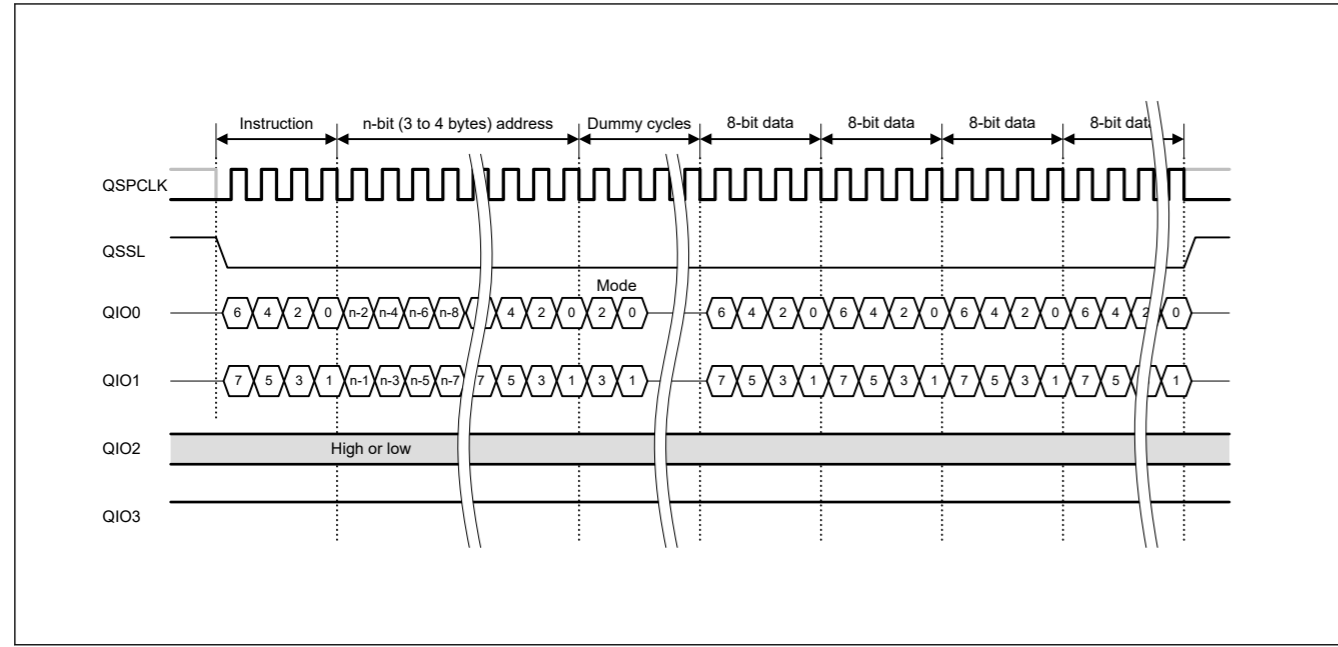

Figure 31.6 Dual SPI protocol example for Fast Read Quad I/O

The Quad SPI protocol performs I/O operation of all signals such as instruction codes, addresses, and data using four pins, QIO0, QIO1, QIO2, and QIO3.

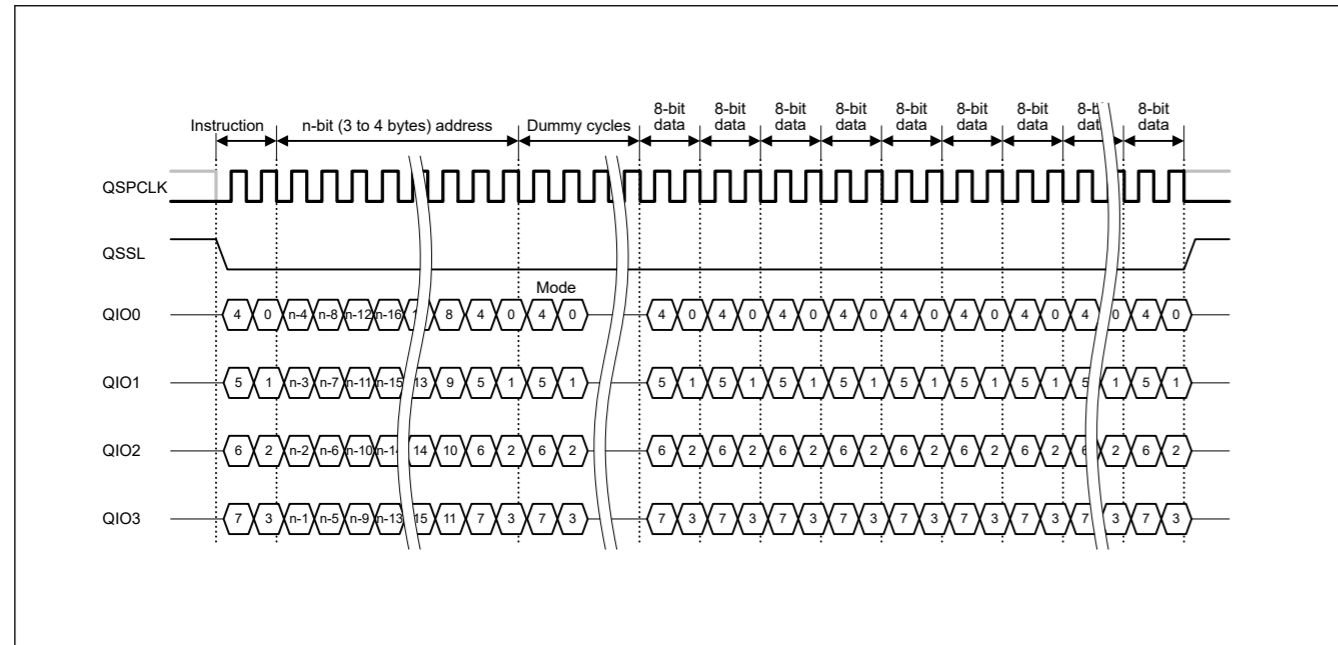

Figure 31.7 Quad SPI protocol example for Fast Read Quad I/O

### 31.4.2 SPI Mode

Either SPI mode 0 or SPI mode 3 can be selected as the SPI mode by the SFMSMD.SFMMMD3 bit. This can be switched by changing the register setting during operation. The difference between SPI modes 0 and 3 is the state of the QSPCLK signal when it is inactive. The standby level of the QSPCLK signal in SPI mode 0 is low, and high in SPI mode 3.

Serial data is output from the QSPI on a falling edge of the serial clock and is read into the serial flash memory on a rising edge of the serial clock. Serial data is output from the serial flash memory on a falling edge of the serial clock and is read into the QSPI on the next falling edge of the serial clock.

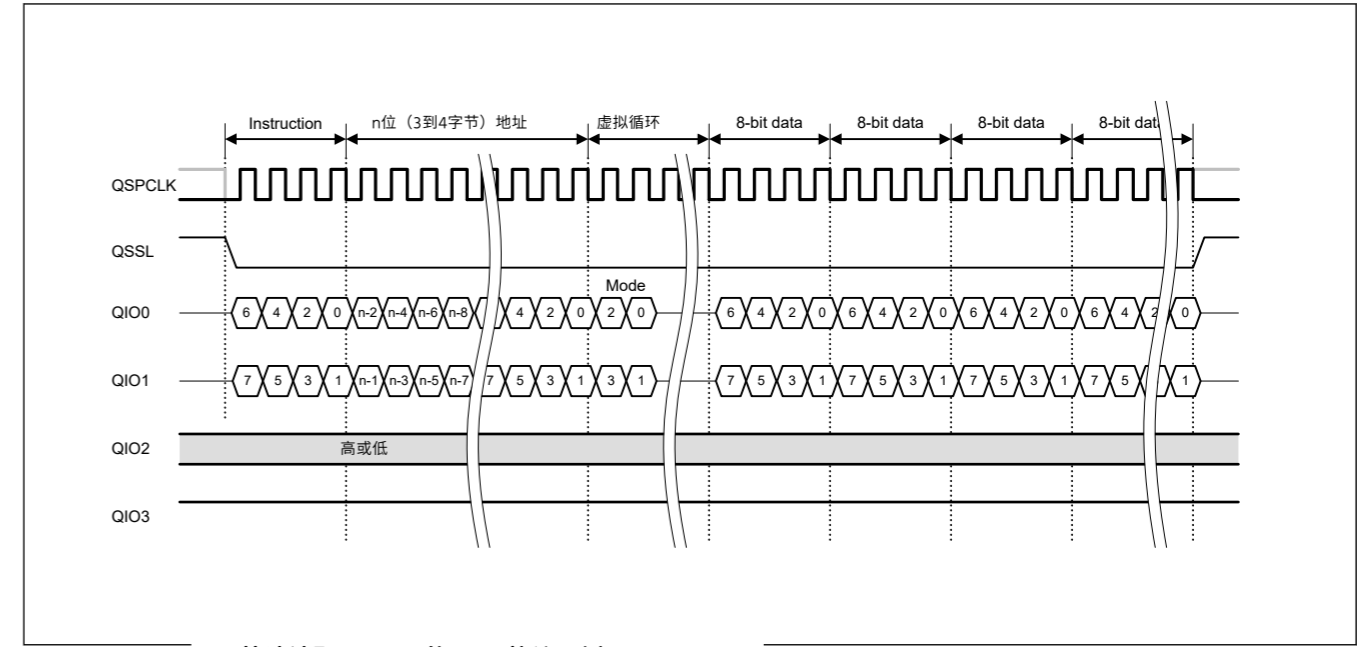

Figure 31.6 用于快速读取QuadIO的双SPI协议示例

QuadSPI协议使用四个引脚执行指令代码、地址和数据等所有信号的IO操作，QIO0, QIO1, QIO2, and QIO3。

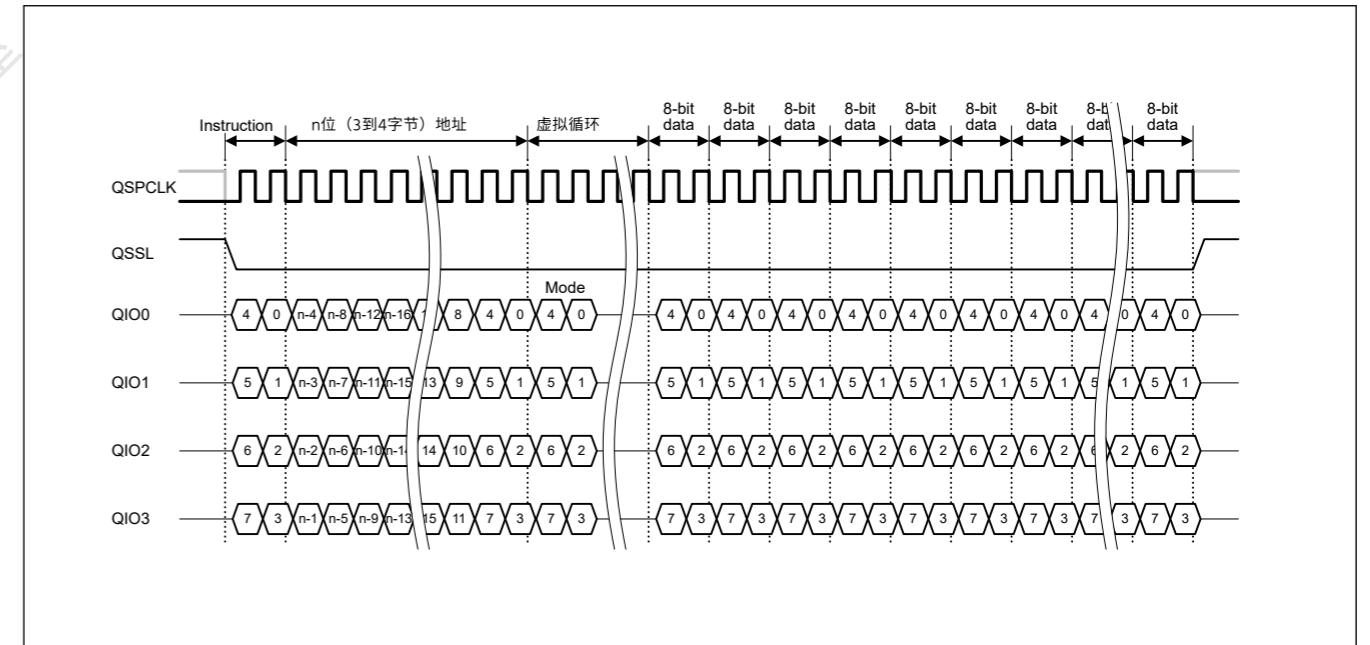

Figure 31.7 用于快速读取QuadIO的QuadSPI协议示例

### 31.4.2 SPI模式

可以通过SFMSMD.SFMMMD3位选择SPI模式0或SPI模式3作为SPI模式。这可以通过在操作期间更改寄存器设置来切换。SPI模式0和3之间的区别在于QSPCLK信号处于非活动状态时的状态。QSPCLK信号在SPI模式0中的待机电平为低，在SPI模式3中为高。

串行数据在串行时钟的下降沿从QSPI输出，并在串行时钟的上升沿读入串行闪存。串行数据在串行时钟的下降沿从串行闪存输出，并在串行时钟的下一个下降沿读入QSPI。

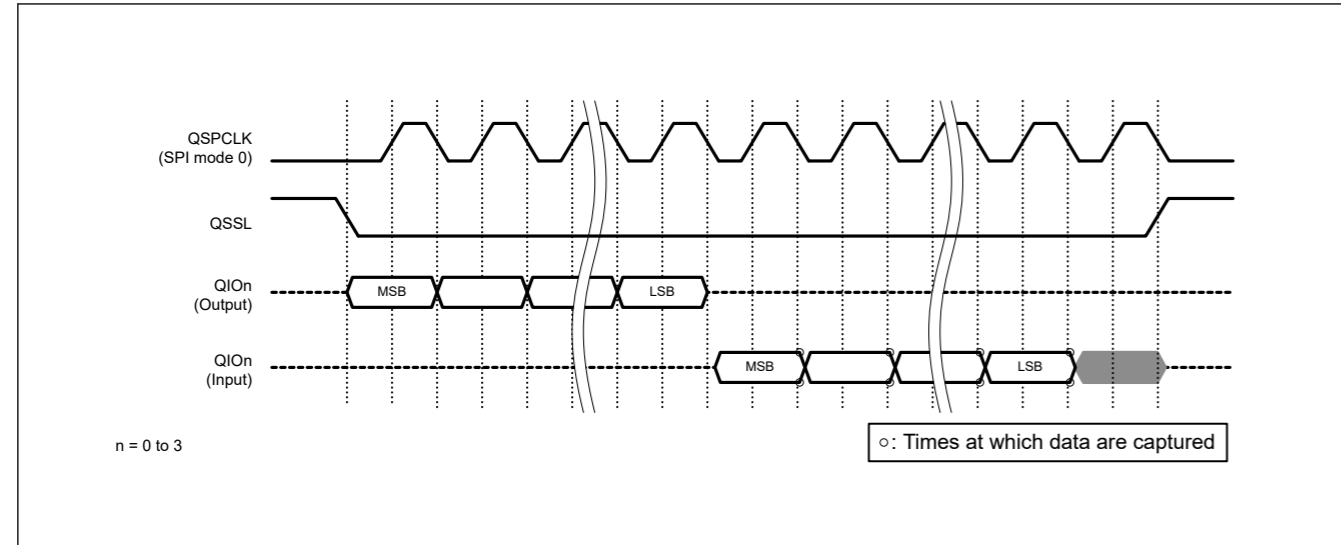

Figure 31.8 Basic serial interface timing (SPI mode 0)

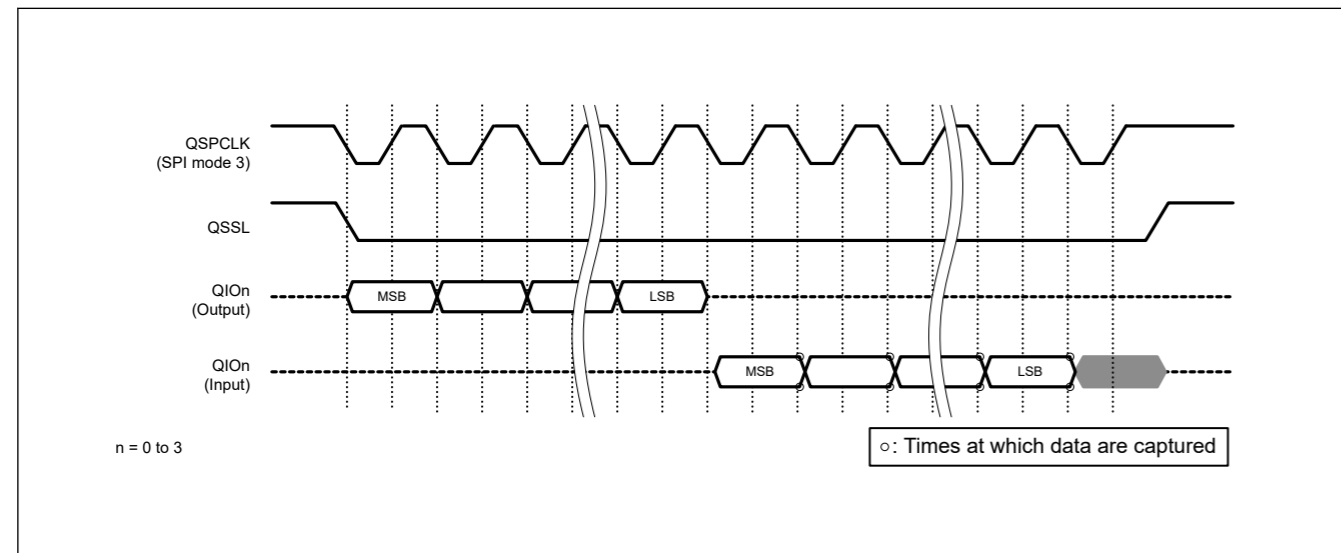

Figure 31.9 Basic serial interface timing (SPI mode 3)

### 31.5 SPI Bus Timing Adjustment

The timing of the SPI bus signal can be adjusted in the registers. The configured timing is applied to all SPI bus accesses, for both ROM access and direct communication.

#### 31.5.1 SPI Bus Reference Cycles

The SPI bus operates on reference cycles obtained by multiplying PCLKA by an integer. The reference cycles are selectable within the range of PCLKA multiplied by 2 to 48 in the SFMDV[4:0] bits in the Transfer Mode Control Register (SFMSKC) register.

Table 31.5 Relationship among SFMDV[4:0] bits, cycle multiplier, and serial clock frequencies (1 of 2)

| SFMDV[4:0] | Cycle multiplier | PCLKA = 100 [MHz] |
|------------|------------------|-------------------|
| 11111b     | 48               | 2.08              |
| 11110b     | 46               | 2.17              |
| 11101b     | 44               | 2.27              |
| 11100b     | 42               | 2.38              |
| 11011b     | 40               | 2.50              |

Figure 31.8 基本串行接口时序 (SPI模式0)

Figure 31.9 基本串行接口时序 (SPI模式3)

### 31.5 SPI总线时序调整

SPI总线信号的时序可以在寄存器中调整。配置的时序适用于所有SPI总线访问，包括ROM访问和直接通信。

#### 31.5.1 SPI总线参考周期

SPI总线在通过将PCLKA乘以一个整数获得的参考周期上运行。参考周期可在传输模式控制寄存器(SFMSKC)寄存器的SFMDV[4:0]位中的PCLKA乘以2到48的范围内选择。

Table 31.5 SFMDV[4:0]位、周期乘数和串行时钟频率之间的关系 (1of2)

| SFMDV[4:0] | 循环乘数 | PCLKA = 100 [MHz] |
|------------|------|-------------------|
| 11111b     | 48   | 2.08              |
| 11110b     | 46   | 2.17              |
| 11101b     | 44   | 2.27              |
| 11100b     | 42   | 2.38              |
| 11011b     | 40   | 2.50              |

Table 31.5 Relationship among SFMDV[4:0] bits, cycle multiplier, and serial clock frequencies (2 of 2)

| SFMDV[4:0] | Cycle multiplier | PCLKA = 100 [MHz] |
|------------|------------------|-------------------|
| 11010b     | 38               | 2.63              |
| 11001b     | 36               | 2.78              |
| 11000b     | 34               | 2.94              |
| 10111b     | 32               | 3.13              |
| 10110b     | 30               | 3.33              |
| 10101b     | 28               | 3.57              |
| 10100b     | 26               | 3.85              |
| 10011b     | 24               | 4.17              |
| 10010b     | 22               | 4.55              |
| 10001b     | 20               | 5.00              |
| 10000b     | 18               | 5.56              |
| 01111b     | 17               | 5.88              |
| 01110b     | 16               | 6.25              |
| 01101b     | 15               | 6.67              |
| 01100b     | 14               | 7.14              |
| 01011b     | 13               | 7.69              |
| 01010b     | 12               | 8.33              |
| 01001b     | 11               | 9.09              |
| 01000b     | 10               | 10.00             |
| 00111b     | 9                | 11.11             |
| 00110b     | 8                | 12.50             |
| 00101b     | 7                | 14.29             |
| 00100b     | 6                | 16.67             |
| 00011b     | 5                | 20.00             |
| 00010b     | 4                | 25.00             |

### 31.5.2 QSPCLK Signal Duty Ratio

When the reference clock is configured as PCLKA divided by an odd number without duty ratio correction, the duty ratio of the QSPCLK signal will not be 50%. When the reference clock is PCLKA divided by an odd number, be sure to enable the duty ratio correction function (SFMSKC.SFMDTY = 1).

When the reference clock is PCLKA divided by an even number, the SFMDTY setting in the SFMSKC register is ignored.

Table 31.5 SFMDV[4:0]位、周期乘数和串行时钟频率之间的关系(2of2)

| SFMDV[4:0] | 循环乘数 | PCLKA = 100 [MHz] |
|------------|------|-------------------|
| 11010b     | 38   | 2.63              |
| 11001b     | 36   | 2.78              |
| 11000b     | 34   | 2.94              |
| 10111b     | 32   | 3.13              |
| 10110b     | 30   | 3.33              |
| 10101b     | 28   | 3.57              |
| 10100b     | 26   | 3.85              |

| 00011b     | 5    | 20.00             |
| 00010b     | 4    | 25.00             |
| 00001b     | 3    | 33.33             |
| 00000b     | 2    | 50.00             |

### 31.5.2 QSPCLK信号占空比

当参考时钟配置为PCLKA除以奇数而不进行占空比校正时，QSPCLK信号的占空比不会为50%。当参考时钟为PCLKA除以奇数时，请务必启用占空比校正功能（SFMSKC.SFMDTY=1）。

当参考时钟为PCLKA除以偶数时，SFMSKC寄存器中的SFMDTY设置被忽略。

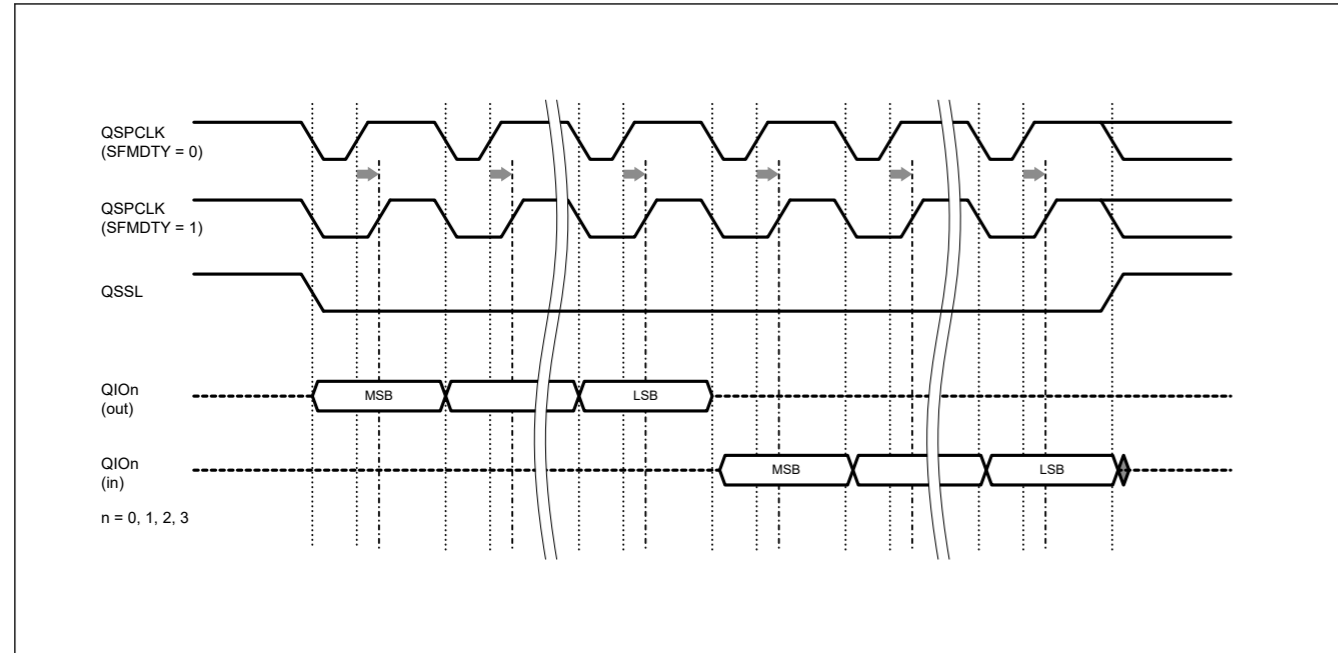

Figure 31.10 Example correction of the QSPCLK signal duty ratio using the SFMDTY bit, when PCLKA is multiplied by 3

### 31.5.3 Minimum High-Level Width for the QSSL Signal

Between adjacent SPI bus cycles, the QSSL signal must be held high (inactive) for a sufficient time to satisfy the deselect time required by the serial flash memory. The minimum high-level width of the QSSL output signal is selectable as the reference cycle multiplied by an integer from 1 to 16 in the SFMSW[3:0] bits in the Instruction Code Register (SFMSSC) register.

### 31.5.4 QSSL Signal Setup Time

The QSSL signal setup time that the serial flash memory requires after the QSSL signal is driven active low until the first rising edge of the QSPCLK signal can be configured. The setup time can be selected as 0.5 or 1.5 cycles of QSPCLK in the SFMSLD bit of the SFMSSC register.

Set a value that meets the most constrained timing condition for your application.

Figure 31.11 Setup time adjustment for the QSSL signal using the SFMSLD bit

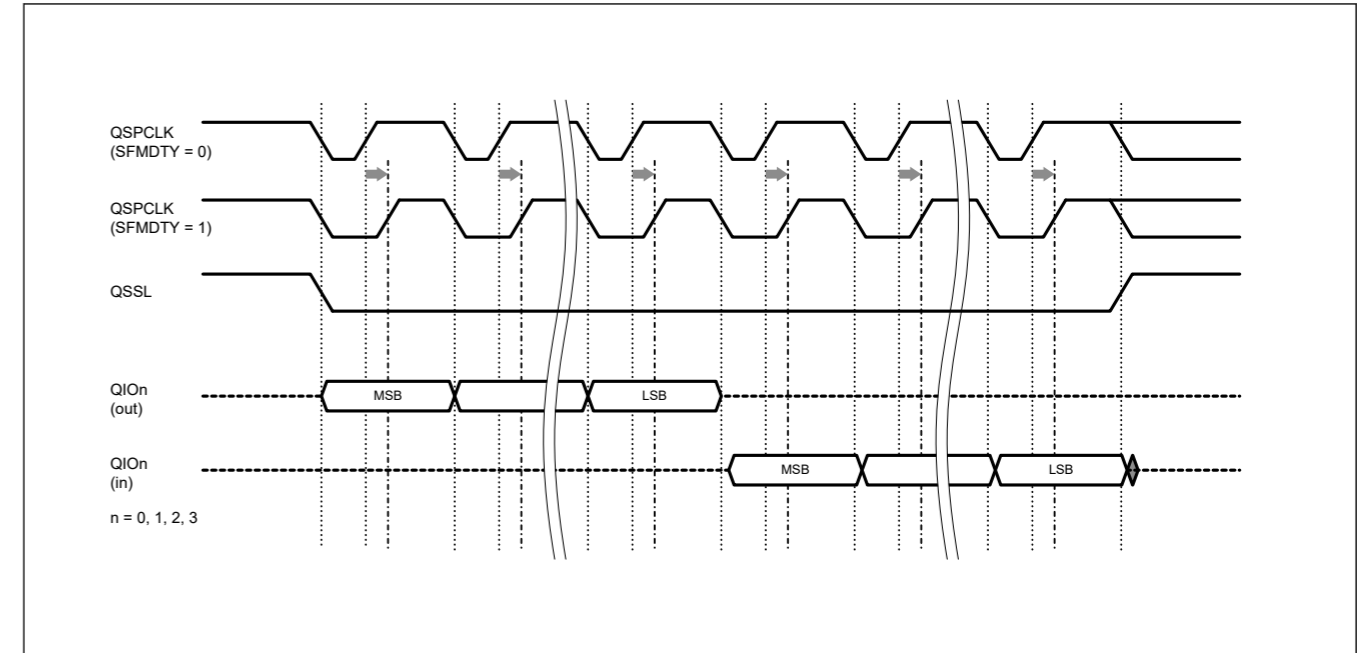

Figure 31.10 当PCLKA乘以3时，使用SFMDTY位校正QSPCLK信号占空比的示例

### 31.5.3 QSSL信号的最小高电平宽度

在相邻的SPI总线周期之间，QSSL信号必须保持高电平（无效）足够长的时间，以满足串行闪存所需的取消选择时间。QSSL输出信号的最小高电平宽度可选择为参考周期乘以指令代码寄存器(SFMSSC)寄存器中SFMSW[3:0]位中的1到16的整数。

### 31.5.4 QSSL信号建立时间

从QSSL信号被驱动为低电平有效到QSPCLK信号的第一个上升沿可以配置，串行闪存所需的QSSL信号建立时间。设置时间可以在SFMSLD位中选择为0.5或1.5个QSPCLK周期。

为您的应用设置一个满足最受约束的时序条件的值。

Figure 31.11 使用SFMSLD位调整QSSL信号的建立时间

### 31.5.5 QSSL Signal Hold Time

The QSSL signal hold time that the serial flash memory requires until the QSSL signal is driven high after the last rising edge of the QSPCLK signal can be configured. The hold time can be selected as 0.5 or 1.5 cycles of QSPCLK in the SFMSHD bit of the SFMSSC register.

Figure 31.12 Hold time adjustment for the QSSL signal using the SFMSSD bit

### 31.5.6 Hold Time of the Serial Data Output Enable

The buffer output enable of the QIO0, QIO1, QIO2, or QIO3 pin can be extended by 1 QSPCLK using the SFMOEX bit in the SFMSMD register.

For a standard read instruction, it is extended immediately after an address code. For other read instructions, it is extended after two cycles of mode data (XIP mode control) of the serial flash memory in dummy cycles.

Figure 31.13 Hold time adjustment for output enable using the SFMOEX bit (Standard Read)

### 31.5.5 QSSL信号保持时间

可以配置在QSPCLK信号的最后一个上升沿之后，直到QSSL信号被驱动为高电平之前，串行闪存所需的QSSL信号保持时间。保持时间可以在SFMSSC寄存器的SFMSSD位中选择为0.5或1.5个QSPCLK周期。

Figure 31.12 使用SFMSSD位调整QSSL信号的保持时间

### 31.5.6 串行数据输出使能的保持时间

可以使用SFMSMD寄存器中的SFMOEX位将QIO0、QIO1、QIO2或QIO3引脚的缓冲器输出使能扩展1个QSPCLK。

对于标准读指令，它在地址码之后立即扩展。对于其他读指令，它在串行闪存的两个模式数据（XIP模式控制）周期后以虚拟周期进行扩展。

Figure 31.13 使用SFMOEX位（标准读取）调整输出使能的保持时间

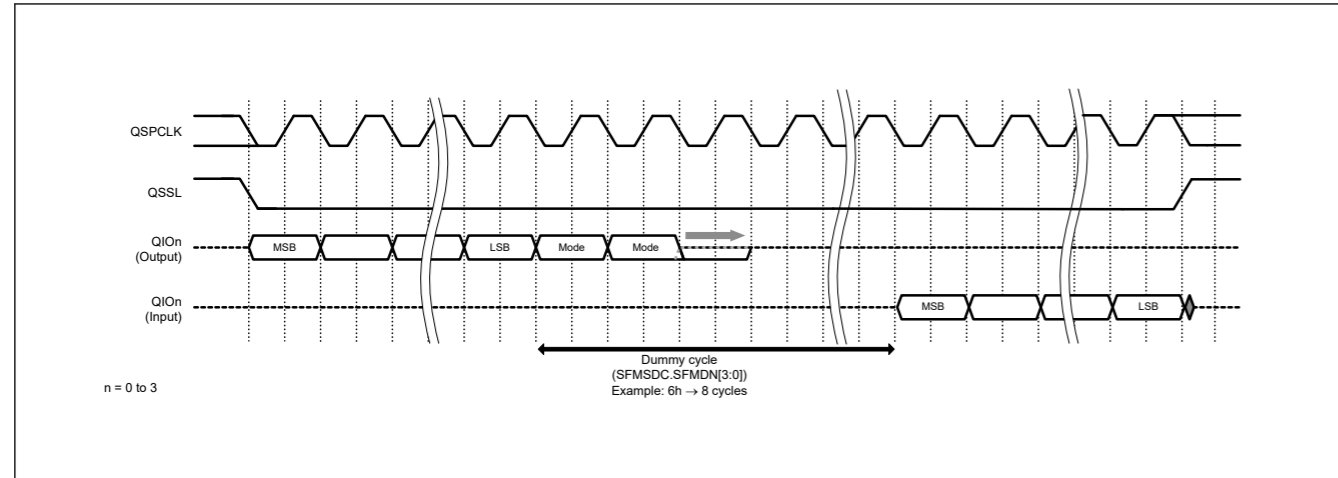

Figure 31.14 Hold Time Adjustment of Output Enabling Using the SFMOEX Bit (Fast Read)

### 31.5.7 Setup Time for Serial Data Output

When a command or address is transmitted to the serial flash memory, the setup time begins on serial data output and ends when the QSPCLK signal rises. If this setup time is insufficient, it can be extended by 1 PCLKA using the SFMOSW bit in the SFMSMD register. When SFMOSW is 1, the low-level width of QSPCLK during serial data transmission is extended by 1 PCLKA while data is being output from the QSPI. This function has no effect on serial data reception.

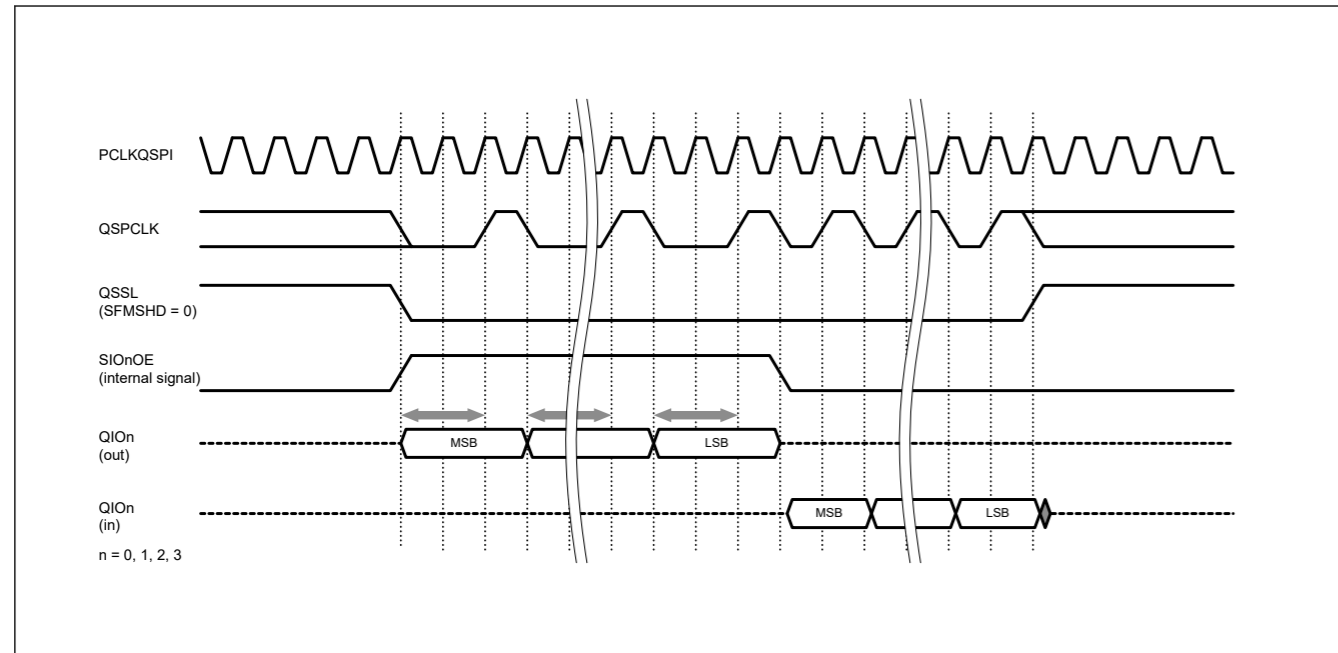

Figure 31.15 Setup time adjustment for serial data output using the SFMOSW bit

### 31.5.8 Hold Time for Serial Data Output

When a command or address is transmitted to the serial flash memory, the hold time begins on the rising edge of QSPCLK and ends when the serial data makes another transmission. If this hold time is insufficient, it can be extended by 1 PCLKA using the SFMOHW bit in the SFMSMD register. When SFMOSW is 1, the high-level width of QSPCLK during serial data transmission is extended by 1 PCLKA while data is being output from the QSPI. This function has no effect on serial data reception.

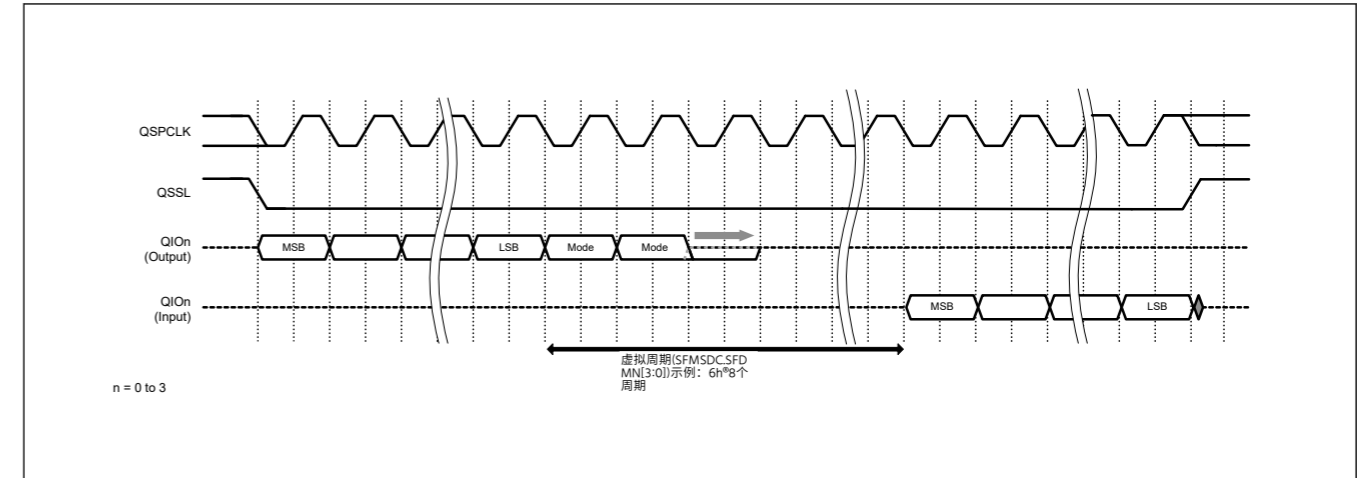

Figure 31.14 使用SFMOEX位（快速读取）调整输出使能的保持时间

### 31.5.7 串行数据输出的建立时间

当命令或地址传输到串行闪存时，设置时间从串行数据输出开始，到QSPCLK信号上升时结束。如果此建立时间不足，可以使用SFMSMD寄存器中的SFMOSW位将其延长1个PCLKA。当SFMOSW为1时，在从QSPI输出数据时，串行数据传输期间QSPCLK的低电平宽度扩展1PCLKA。该功能对串行数据接收没有影响。

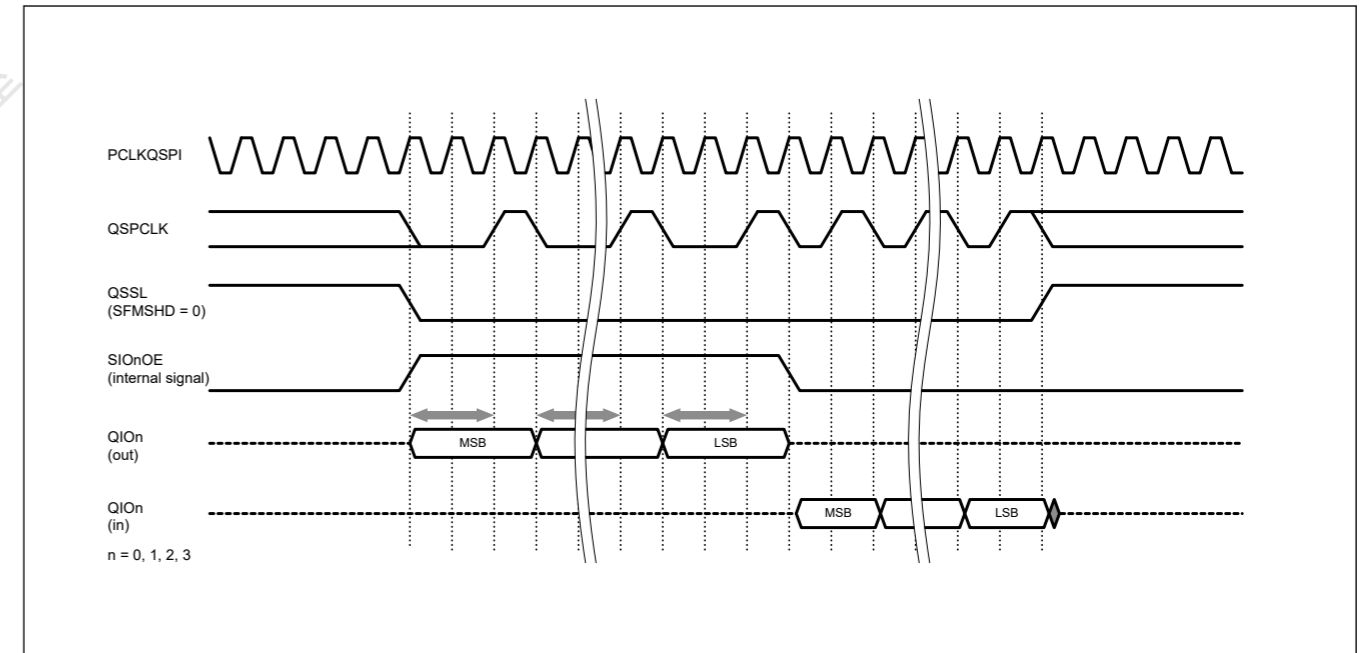

Figure 31.15 使用SFMOSW位调整串行数据输出的建立时间

### 31.5.8 串行数据输出的保持时间

当命令或地址传输到串行闪存时，保持时间从QSPCLK的上升沿开始，并在串行数据进行另一次传输时结束。如果该保持时间不足，可以使用SFMSMD寄存器中的SFMOHW位将其延长1个PCLKA。当SFMOSW为1时，在从QSPI输出数据时，串行数据传输期间QSPCLK的高电平宽度扩展1PCLKA。该功能对串行数据接收没有影响。

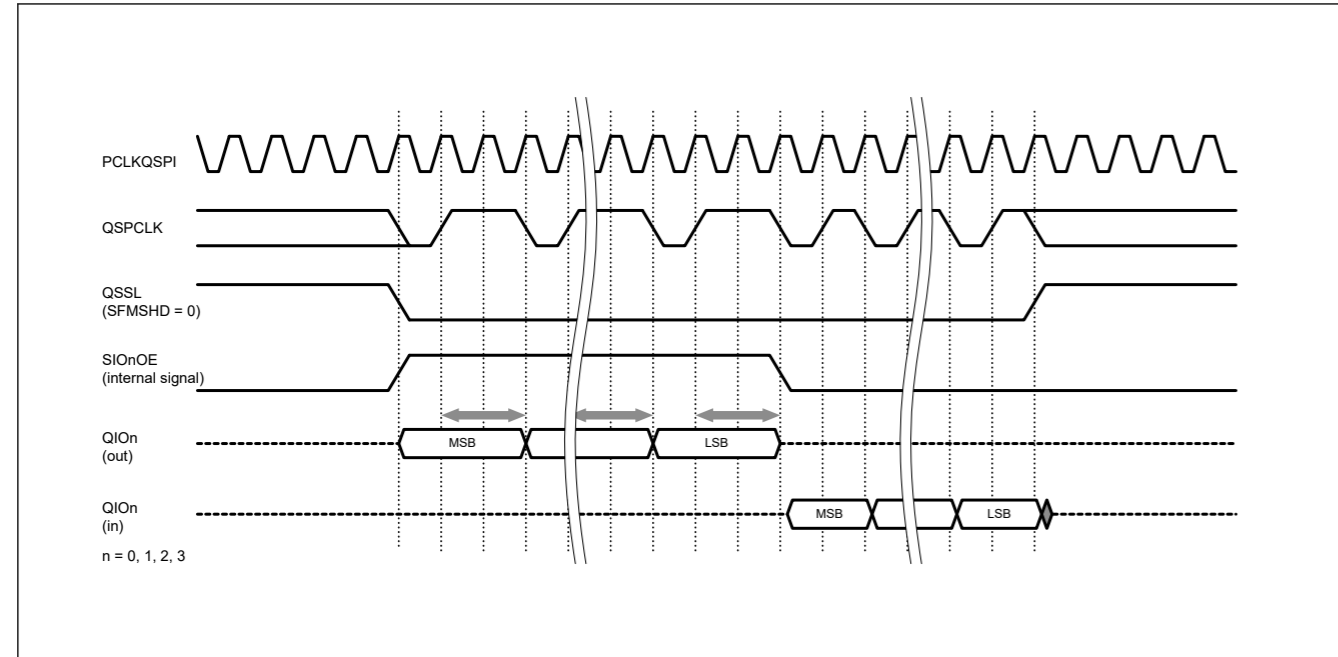

Figure 31.16 Hold time adjustment for serial data output using the SFMOHW bit

### 31.5.9 Serial Data Receiving Latency

The serial flash outputs data in synchronization with the falling edge of the QSPCLK signal. The QSPI receives that data in synchronization with the falling edge of the subsequent QSPCLK signal. The delay from when the serial flash starts outputting data until the QSPI receives that data is called the receiving latency. The QSPI adds a latency adjustment cycle immediately before the first data reception cycle in the SPI bus cycle. From the serial flash side, this is seen as an increase in the number of data reception cycles. This added latency adjustment cycle is not generated in the SPI bus cycle without accompanying data reception.

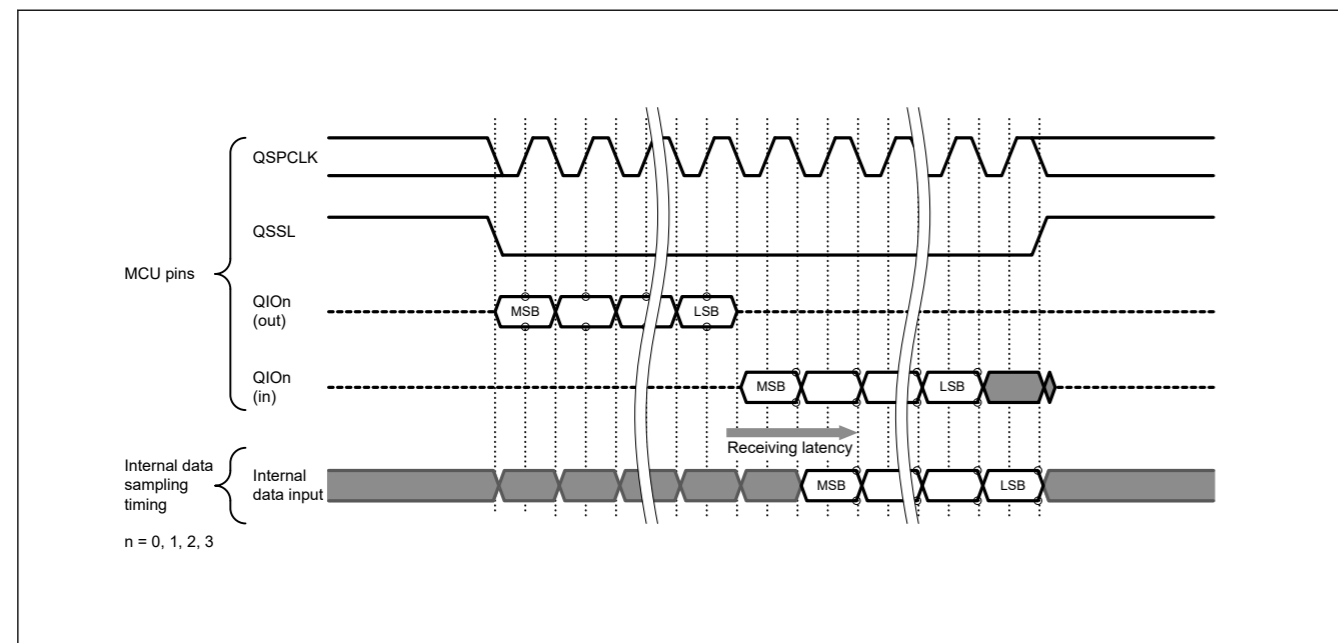

Figure 31.17 Receiving latency

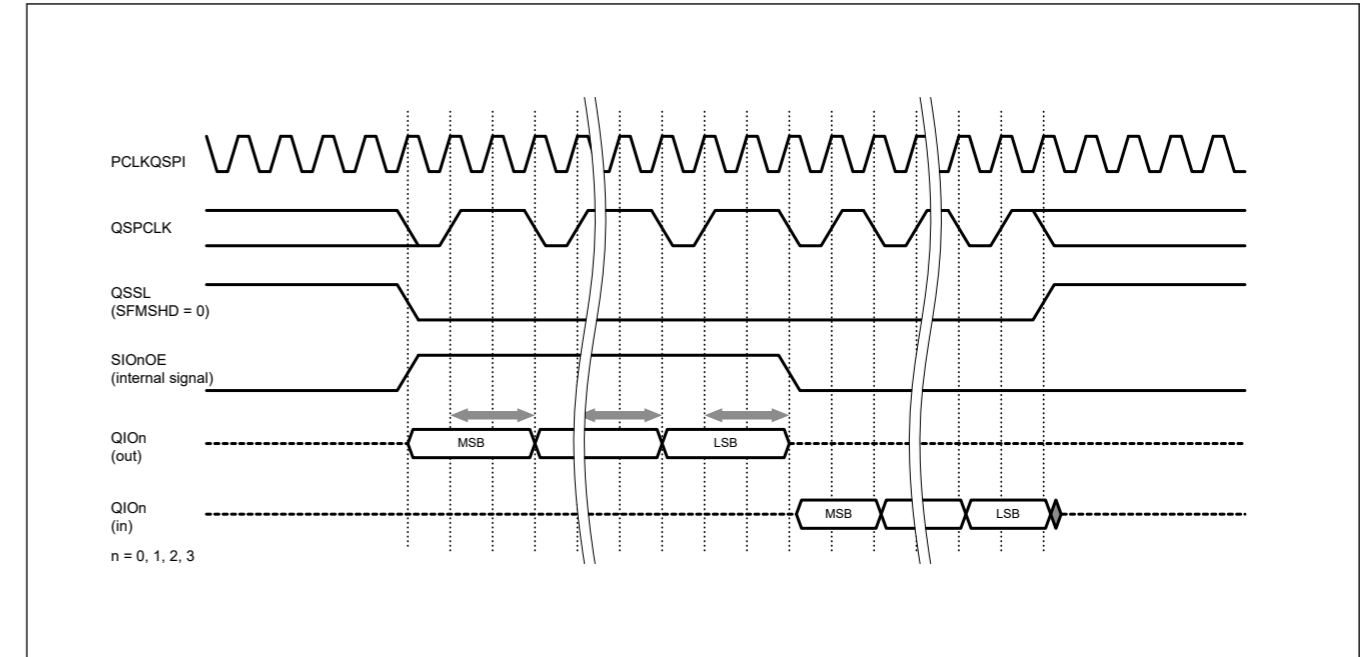

Figure 31.16 使用SFMOHW位调整串行数据输出的保持时间

### 31.5.9 串行数据接收延迟

串行闪存与QSPCLK信号的下降沿同步输出数据。QSPI与随后的QSPCLK信号的下降沿同步接收该数据。从串行闪存开始输出数据到QSPI接收到该数据的延迟称为接收延迟。QSPI在SPI总线周期的第一个数据接收周期之前添加一个延迟调整周期。从串行闪存方面来看，这被视为数据接收周期数的增加。如果没有伴随的数据接收，则不会在SPI总线周期中生成这个增加的延迟调整周期。

Figure 31.17 接收延迟

## 31.6 SPI Instruction Set Used for Serial Flash Memory Access

## 31.6.1 SPI Instructions That Are Automatically Generated

When the serial flash memory is accessed, an SPI bus cycle using the instructions described in Table 31.6 to Table 31.10 is automatically generated based on the settings in the SFMSAC register and in the SFMSMD register.

Table 31.6 SPI instructions automatically generated when SFMAS[1:0] = 00b

| SPI instruction | Instruction code   | Address bytes | Dummy cycles | Data bytes | Remarks                   |
|-----------------|--------------------|---------------|--------------|------------|---------------------------|
| Standard Read   | 0x03 <sup>*1</sup> | 1             | —            | 1 to ∞     | SFMRM[2:0] = 000b, A8 = 0 |
|                 | 0x0B <sup>*1</sup> | 1             | —            | 1 to ∞     | SFMRM[2:0] = 000b, A8 = 1 |

Note 1. If the SFMSMD.SFMCCE bit is set to 1, the SFMCIC[7:0] bits in the Instruction Code Register (SFMSIC) setting is used as an instruction code.

Table 31.7 SPI instructions automatically generated when SFMAS[1:0] = 01b

| SPI instruction | Instruction code   | Address bytes | Dummy cycles | Data bytes | Remarks           |
|-----------------|--------------------|---------------|--------------|------------|-------------------|
| Standard Read   | 0x03 <sup>*1</sup> | 2             | —            | 1 to ∞     | SFMRM[2:0] = 000b |

Note 1. If the SFMSMD.SFMCCE bit is set to 1, the SFMSIC.SFMCIC[7:0] setting is used as an instruction code.

Table 31.8 SPI instructions automatically generated when SFMAS[1:0] = 10b

| SPI instruction       | Instruction code   | Address bytes | Dummy cycles    | Data bytes | Remarks                       |
|-----------------------|--------------------|---------------|-----------------|------------|-------------------------------|
| Standard Read         | 0x03 <sup>*1</sup> | 3             | —               | 1 to ∞     | SFMRM[2:0] = 000b             |
| Fast Read             | 0x0B <sup>*1</sup> | 3             | 8 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 001b |
| Fast Read Dual Output | 0x3B <sup>*1</sup> | 3             | 8 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 010b |
| Fast Read Dual I/O    | 0xBB <sup>*1</sup> | 3             | 4 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 011b |
| Fast Read Quad Output | 0x6B <sup>*1</sup> | 3             | 8 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 100b |
| Fast Read Quad I/O    | 0xEB <sup>*1</sup> | 3             | 6 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 101b |

Note 1. If the SFMSMD.SFMCCE bit is set to 1, the SFMSIC.SFMCIC[7:0] setting is used as an instruction code.

Note 2. The number of dummy cycles is configurable by using SFMDN[3:0] bits in the Dummy Cycle Control Register (SFMSDC).

Table 31.9 SPI instructions automatically generated when SFMAS[1:0] = 11b and SFM4BC = 0

| SPI instruction       | Instruction code   | Address bytes | Dummy cycles    | Data bytes | Remarks                       |
|-----------------------|--------------------|---------------|-----------------|------------|-------------------------------|
| Standard Read         | 0x03 <sup>*1</sup> | 4             | —               | 1 to ∞     | SFMRM[2:0] = 000b             |
| Fast Read             | 0x0B <sup>*1</sup> | 4             | 8 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 001b |
| Fast Read Dual Output | 0x3B <sup>*1</sup> | 4             | 8 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 010b |
| Fast Read Dual I/O    | 0xBB <sup>*1</sup> | 4             | 4 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 011b |
| Fast Read Quad Output | 0x6B <sup>*1</sup> | 4             | 8 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 100b |
| Fast Read Quad I/O    | 0xEB <sup>*1</sup> | 4             | 6 <sup>*2</sup> | 1 to ∞     | Selectable: SFMRM[2:0] = 101b |

Note 1. If the SFMSMD.SFMCCE bit is set to 1, the SFMSIC.SFMCIC[7:0] setting is used as an instruction code.

Note 2. The number of dummy cycles is configurable by using the SFMSDC.SFMDN[3:0] bits.

Table 31.10 SPI instructions automatically generated when SFMAS[1:0] = 11b and SFM4BC = 1 (1 of 2)

| SPI instruction | Instruction code   | Address bytes | Dummy cycles | Data bytes | Remarks           |
|-----------------|--------------------|---------------|--------------|------------|-------------------|
| Standard Read   | 0x13 <sup>*1</sup> | 4             | —            | 1 to ∞     | SFMRM[2:0] = 000b |

## 31.6 用于串行闪存访问的SPI指令集

## 31.6.1 自动生成的SPI指令

访问串行闪存时，会根据SFMSAC寄存器和SFMSMD寄存器中的设置自动生成使用表31.6至表31.10中描述的指令的SPI总线周期。

Table 31.6 SFMAS[1:0]=00b时自动生成SPI指令

| SPI指令 | 指令码                | 地址字节 | 虚拟循环 | 数据字节   | Remarks                   |
|-------|--------------------|------|------|--------|---------------------------|
| 标准阅读  | 0x03 <sup>*1</sup> | 1    | —    | 1 to ∞ | SFMRM[2:0] = 000b, A8 = 0 |
|       | 0x0B <sup>*1</sup> | 1    | —    | 1 to ∞ | SFMRM[2:0] = 000b, A8 = 1 |

注1.如果SFMSMD.SFMCCE位设置为1，则指令代码寄存器(SFMSIC)设置中的SFMCIC[7:0]位用作指令代码。

Table 31.7 SFMAS[1:0]=01b时自动生成SPI指令

| SPI指令 | 指令码                | 地址字节 | 虚拟循环 | 数据字节   | Remarks           |
|-------|--------------------|------|------|--------|-------------------|
| 标准阅读  | 0x03 <sup>*1</sup> | 2    | —    | 1 to ∞ | SFMRM[2:0] = 000b |

注1.如果SFMSMD.SFMCCE位设置为1，则SFMSIC.SFMCIC[7:0]设置用作指令代码。

Note 1. If the SFMSMD.SFMCCE bit is set to 1, the SFMSIC.SFMCIC[7:0] setting is used as an instruction code.  
 Note 2. The number of dummy cycles is configurable by using the SFMSDC.SFMDN[3:0] bits..

### 31.6.2 Standard Read Instruction

The standard Read instruction is a common read instruction supported by most serial flash memory. When an SPI bus cycle starts, the QSSL signal (serial flash memory select) is asserted, and the instruction code (0x03 or 0x13)<sup>\*1</sup> is output. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted. Data is then received.

This standard Read instruction is selected in the initial QSPI settings.

Note 1. Many 4-KB serial flash memory devices have an address field not larger than 1 byte (A7-A0) to minimize the overhead and to receive A8 information from bit 3 of the Read instruction code. To support these devices, the QSPI only outputs A8 (address bit 8) to bit [3] of the standard Read instruction code when an address width of 1 byte is specified (SFMAS[1:0] = 00). This means that 0x0B might be output instead of 0x03 as the standard Read instruction code. This code duplicates the Fast Read instruction code. However, for most of the 2-KB or smaller serial flash memory, with an address width of 1 byte, bit 3 of a command is designed to be excluded from decoding as a don't-care bit, so such a Read instruction code is recognized correctly as the standard Read instruction code. In rare cases, some serial flash memory allow bit 3 to be decoded. When such a serial flash memory is connected, configure your application to avoid access resulting in A8 = 1.

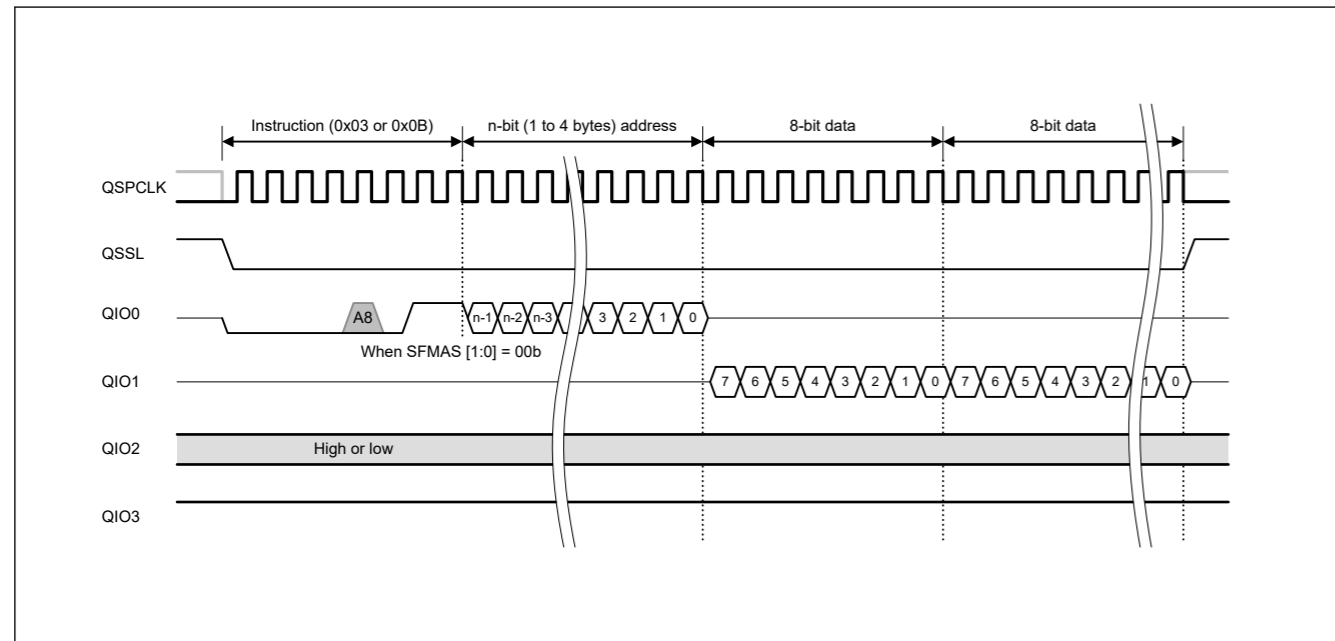

Figure 31.18 Standard Read bus cycle

### 31.6.3 Fast Read Instruction

The Fast Read instruction is a read instruction that supports a higher communication clock speed than the standard Read instruction. When an SPI bus cycle starts, the QSSL signal is asserted, and the instruction code (0x0B or 0x0C) is output.

Table 31.10 当SFMAS[1:0]=11b和SFM4BC=1(2of2)时自动生成SPI指令

| SPI指令    | 指令码                | 地址字节 | 虚拟循环            | 数据字节   | Remarks                       |
|----------|--------------------|------|-----------------|--------|-------------------------------|
| 快速阅读     | 0x0C <sup>*1</sup> | 4    | 8 <sup>*2</sup> | 1 to ∞ | Selectable: SFMRM[2:0] = 001b |
| 快速读取双输出  | 0x3C <sup>*1</sup> | 4    | 8 <sup>*2</sup> | 1 to ∞ | Selectable: SFMRM[2:0] = 010b |
| 快速读取双IO  | 0xBC <sup>*1</sup> | 4    | 4 <sup>*2</sup> | 1 to ∞ | Selectable: SFMRM[2:0] = 011b |
| 快速读取四路输出 | 0x6C <sup>*1</sup> | 4    | 8 <sup>*2</sup> | 1 to ∞ | Selectable: SFMRM[2:0] = 100b |
| 快速读取四路IO | 0xEC <sup>*1</sup> | 4    | 6 <sup>*2</sup> | 1 to ∞ | Selectable: SFMRM[2:0] = 101b |

注1.如果SFMSMD.SFMCCE位设置为1, 则SFMSIC.SFMCIC[7:0]设置用作指令代码。  
 注2.虚拟周期数可通过使用SFMSDC.SFMDN[3:0]位进行配置。

### 31.6.2 标准阅读说明

标准读指令是大多数串行闪存支持的常见读指令。当SPI总线周期开始时, QSSL信号(串行闪存选择)被置位, 并输出指令代码(0x03或0x13)<sup>\*1</sup>。接下来, 发送宽度为1到4字节的地址, 在SFMSAC寄存器的SFMAS[1:0]位中指定。然后接收数据。

在初始QSPI设置中选择此标准读取指令。

注1.许多4KB串行闪存器件的地址字段不大于1字节(A7-A0), 以尽量减少开销并从读取指令代码的第3位接收A8信息。为了支持这些器件, 当指定地址宽度为1字节(SFMAS[1:0]=00)时, QSPI仅将A8(地址位8)输出到标准读取指令代码的位[3]。这意味着可能会输出0x0B而不是0x03作为标准读取指令代码。此代码复制了快速读取指令代码。然而, 对于大多数2-KB或更小的串行闪存, 地址宽度为1字节, 命令的第3位被设计为作为无关位从解码中排除, 因此这样的读取指令代码被正确识别为标准读取指令代码。在极少数情况下, 某些串行闪存允许对第3位进行解码。连接此类串行闪存时, 配置您的应用程序以避免访问导致A8=1。

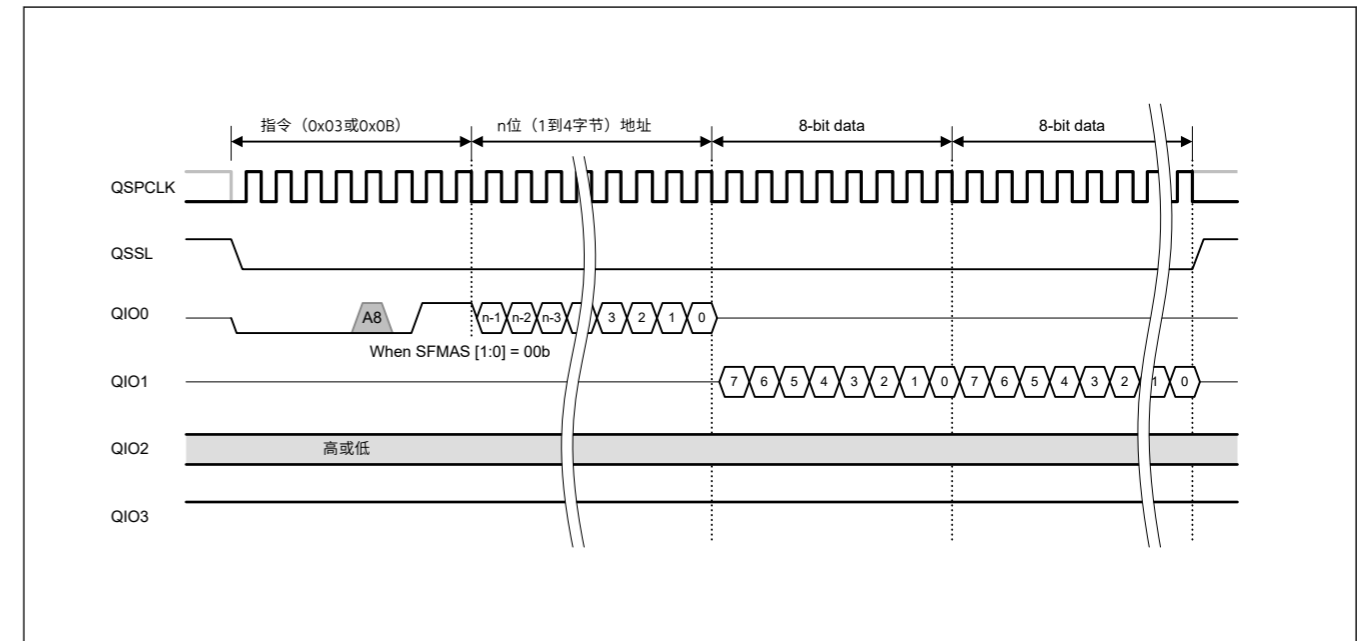

Figure 31.18 标准读总线周期

### 31.6.3 快速阅读说明

快速读取指令是一种读取指令, 它支持比标准读取指令更高的通信时钟速度。当一个SPI总线周期开始时, QSSL信号被置位, 并输出指令代码(0x0B或0x0C)。

Next, an address with a width of 1 to 4 bytes specified by the SFMSAC.SFMAS [1: 0] bits is transmitted, a dummy cycle specified by the SFMSDC register is generated, then the data is received.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see [section 31.8. XIP Control](#).

Switching to the Fast Read instruction is controlled in the SFMSMD register.

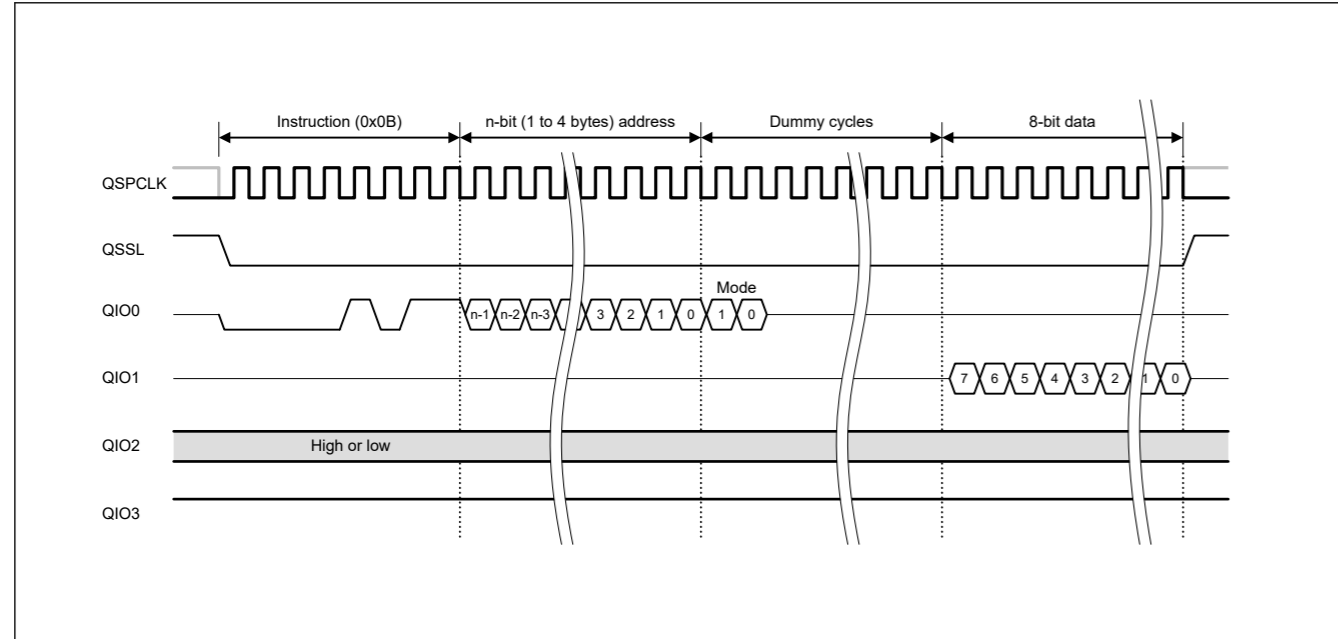

Figure 31.19 Fast Read bus cycle

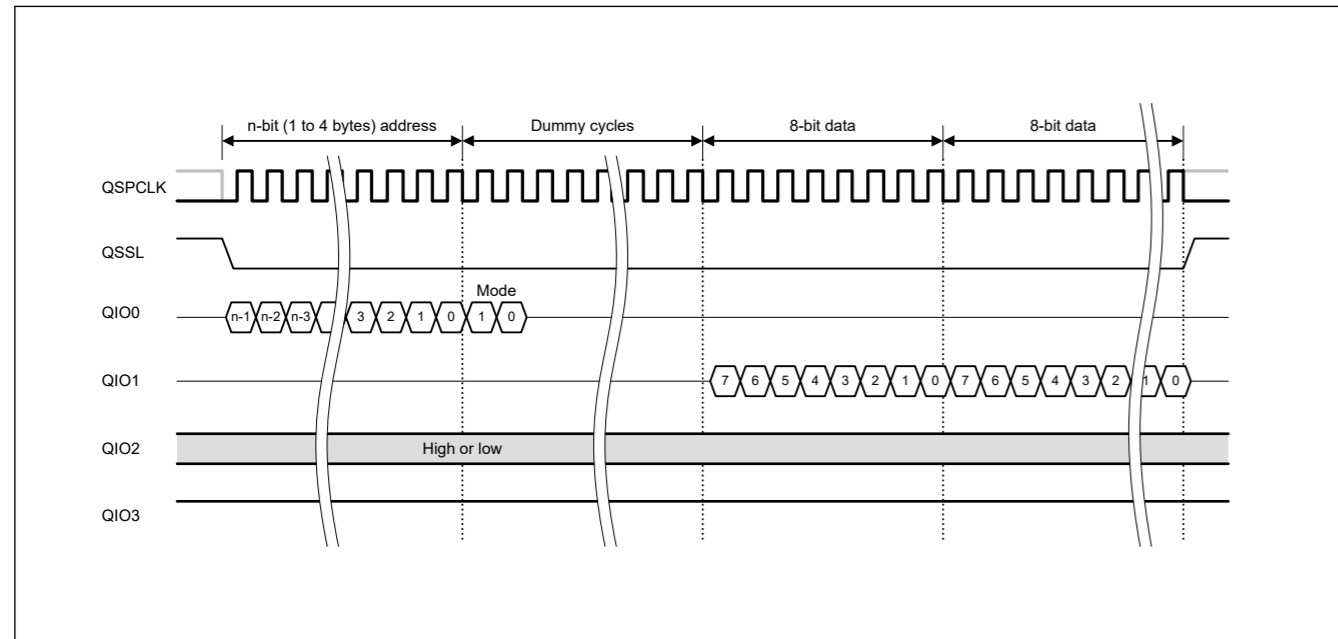

Figure 31.20 Fast Read bus cycle in XIP mode

Note: To use the Fast Read instruction, a serial flash memory that supports Fast Read transfers is required.

### 31.6.4 Fast Read Dual Output Instruction

The Fast Read Dual Output instruction is a read instruction that uses two signal lines to receive data. When the SPI bus cycle starts, the QSSL signal is asserted. The instruction code (0x3B or 0x3C) and an address with a width of 1 to 4 bytes,

接下来，发送由SFMSAC.SFMAS[1:0]位指定的1到4字节宽度的地址，生成由SFMSDC寄存器指定的虚拟周期，然后接收数据。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第31.8节。XIP控制。

切换到快速读取指令在SFMSMD寄存器中进行控制。

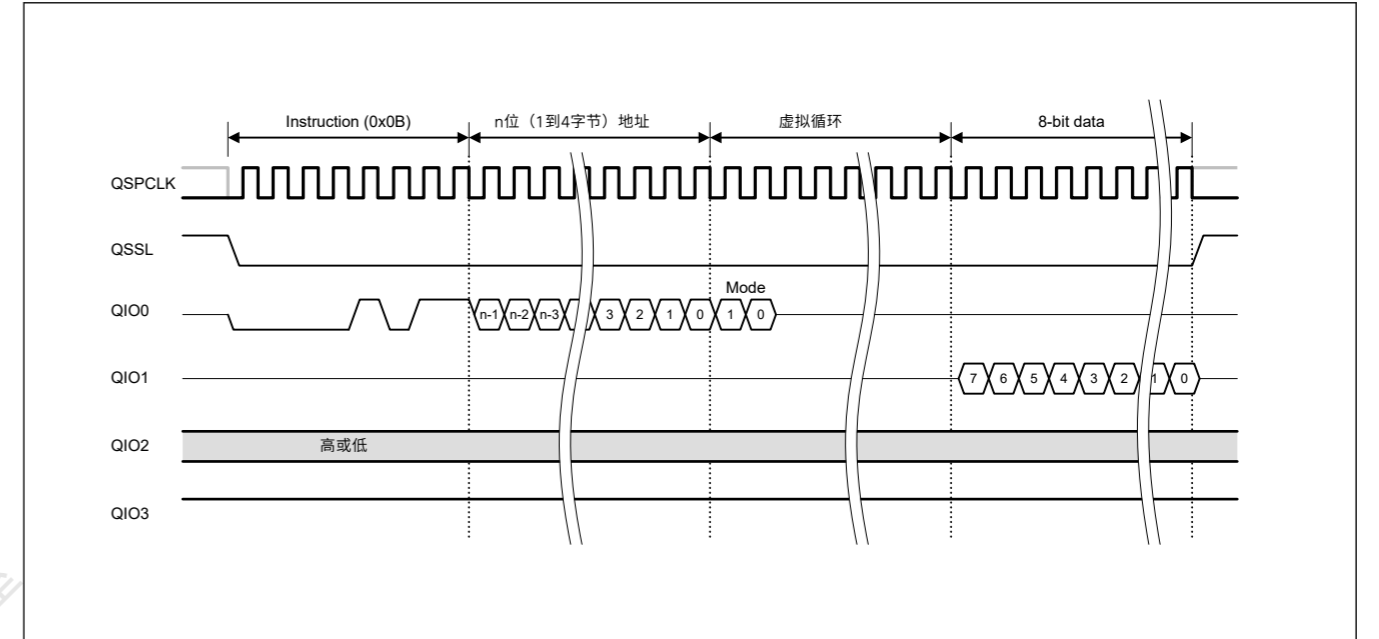

Figure 31.19 快速读取总线周期

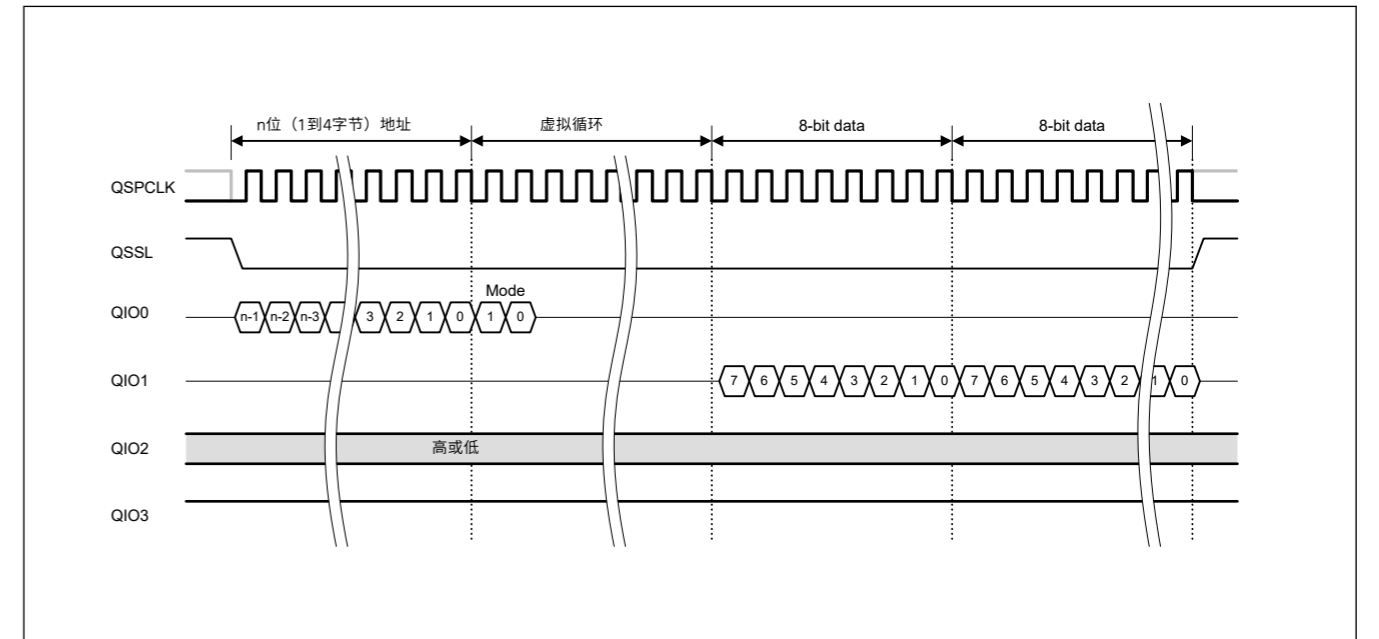

Figure 31.20 XIP模式下的快速读取总线周期

Note: 要使用快速读取指令，需要支持快速读取传输的串行闪存。

### 31.6.4 快速读取双输出指令

快速读取双输出指令是使用两条信号线接收数据的读取指令。当SPI总线周期开始时，QSSL信号被置位。指令代码 (0x3B或0x3C) 和一个宽度为1到4个字节的地址，

specified by the SFMSAC.SFMAS [1: 0] bits are transmitted from the QIO0 pin in the extended SPI protocol, and transmitted from the QIO0 and QIO1 pins in the Dual-SPI protocol. Next, a certain number of dummy cycles, specified in the SFMSDC register, is generated. Data is then received through the QIO0 and QIO1 pins. Even bit data is received from the QIO0 pin and odd bit data is received from the QIO1 pin.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see [section 31.8. XIP Control](#).

Switching to Fast Read Dual Output is controlled in the SFMSMD register.

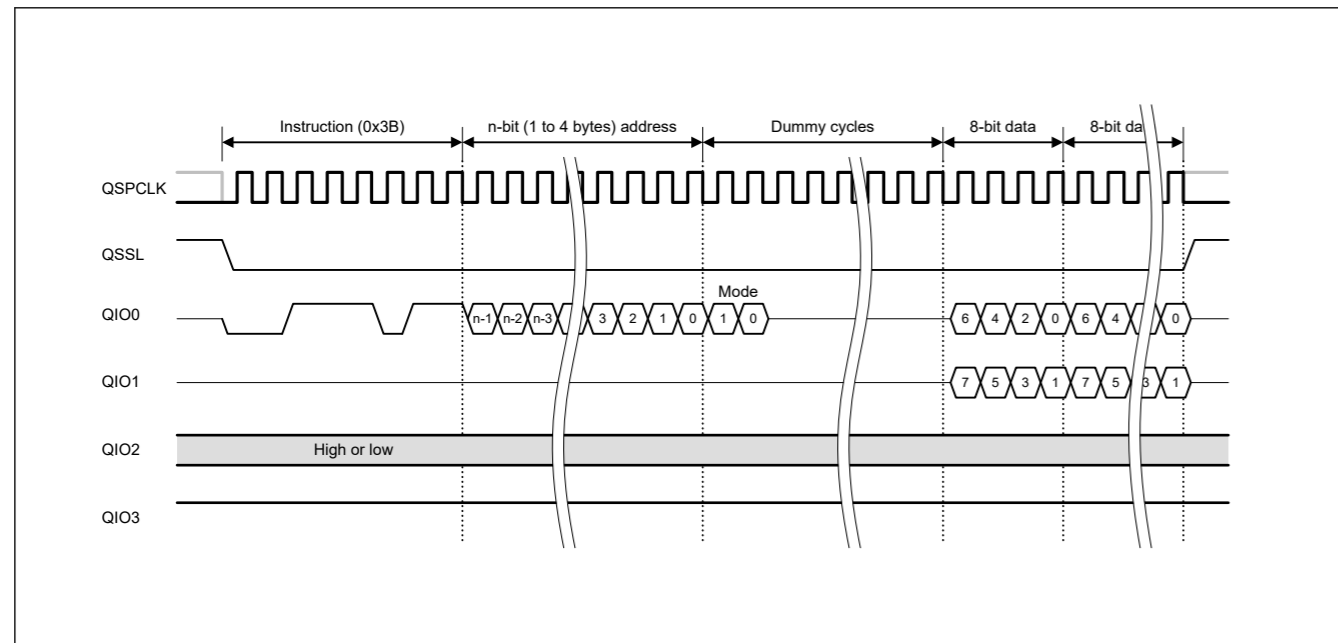

Figure 31.21 Fast Read Dual Output bus cycle (with extended SPI protocol)

31.6.5 Fast Read Dual I/O Instruction

The Fast Read Dual I/O instruction is a read instruction that uses two signal lines to transmit an address and receive data. When the SPI bus cycle starts, the QSSL signal is asserted, and the instruction code (0xBB / 0xBC) is transmitted from QIO0 pin in the extended SPI protocol and from QIO0, and QIO1 pins in the Dual SPI protocol. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted through the QIO0 and QIO1 pins, and a certain number of dummy cycles, specified in the SFMSDC register, is generated. Data is then received through the QIO0 and QIO1 pins. Address and dummy cycle transmission and data reception are performed through the QIO0 pin for even bits and through the QIO1 pin for odd bits.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 31.8. XIP Control.

Switching to Fast Read Dual I/O is controlled in the SFMSMD register.

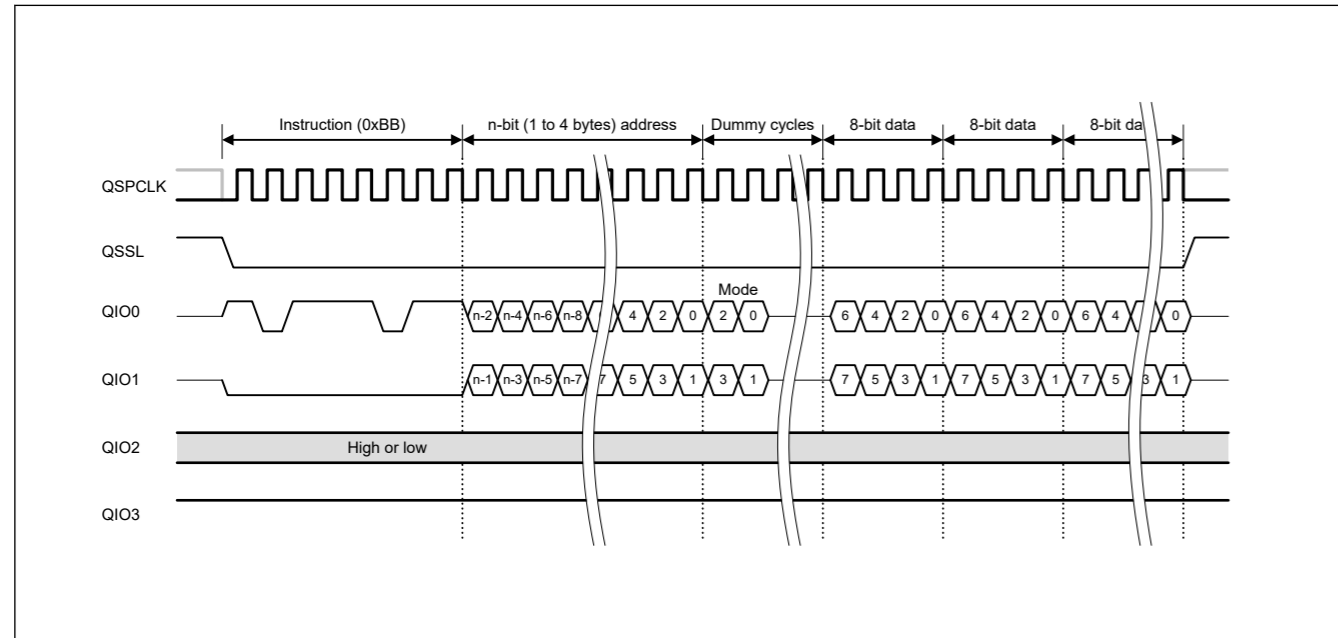

Figure 31.23 Fast Read Dual I/O bus cycle (with extended SPI protocol)

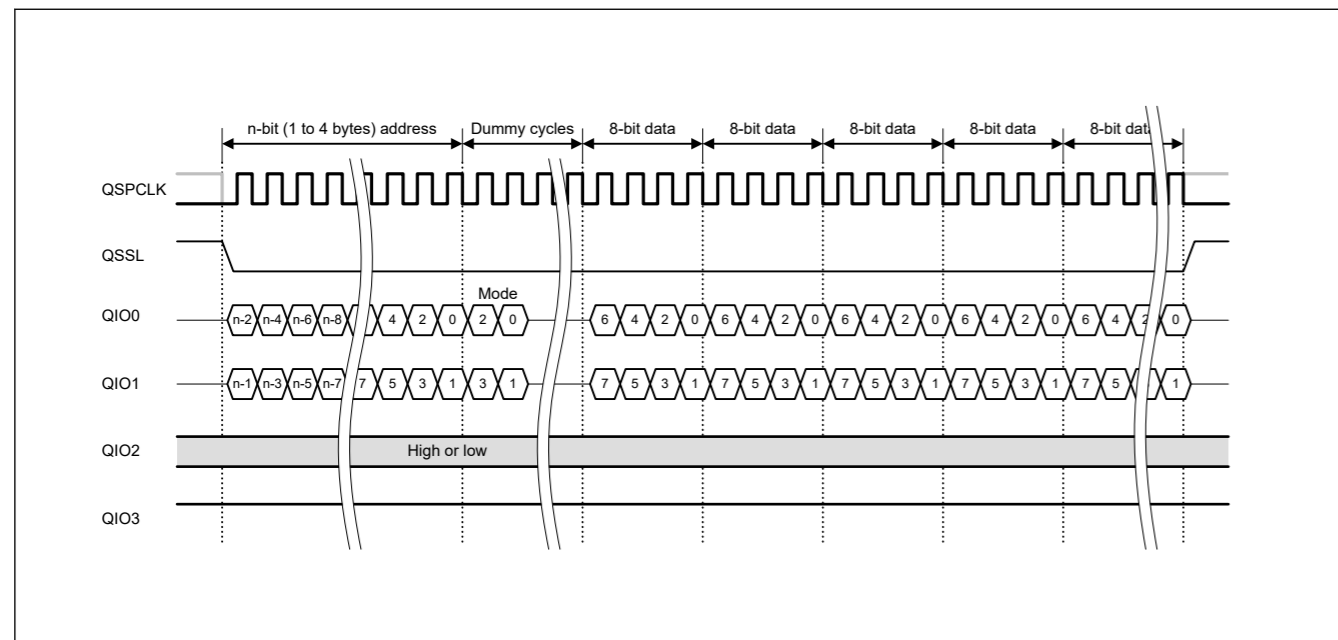

Figure 31.24 Fast Read Dual I/O bus cycle in XIP mode

31.6.5 快速读取双IO指令

FastReadDualIO指令是使用两条信号线传输地址和接收数据的读取指令。当SPI总线周期开始时，QSSL信号被置位，指令代码 (0xBB/0xBC) 从扩展SPI协议中的QIO0引脚和双SPI协议中的QIO0和QIO1引脚传输。接下来，在SFMSAC寄存器的SFMAS[1:0]位中指定的1到4字节宽度的地址通过QIO0和QIO1引脚以及在SFMSDC寄存器中指定的一定数量的空周期发送生成。然后通过QIO0和QIO1引脚接收数据。地址和虚拟周期的发送和数据接收通过QIO0引脚（偶数位）和QIO1引脚（奇数位）执行。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第31.8节。XIP控制。

切换到快速读取双IO由SFMSMD寄存器控制。

Note: To use the Fast Read Dual I/O instruction, a serial flash memory that supports Fast Read Dual I/O transfers is required.

### 31.6.6 Fast Read Quad Output Instruction

The Fast Read Quad Output instruction is a read instruction that uses four signal lines to receive data. When the SPI bus cycle starts, the QSSL signal is asserted. The instruction code (0x6B or 0x6C) and an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, are output from the QIO0 pin. Next, a certain number of dummy cycles, specified in the SFMDN[3:0] bits in the SFMSMD register, are generated. Data is then received through the QIO0, QIO1, QIO2, and QIO3 pins.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see [section 31.8. XIP Control](#).

Switching to Fast Read Quad Output is controlled in the SFMSMD register.

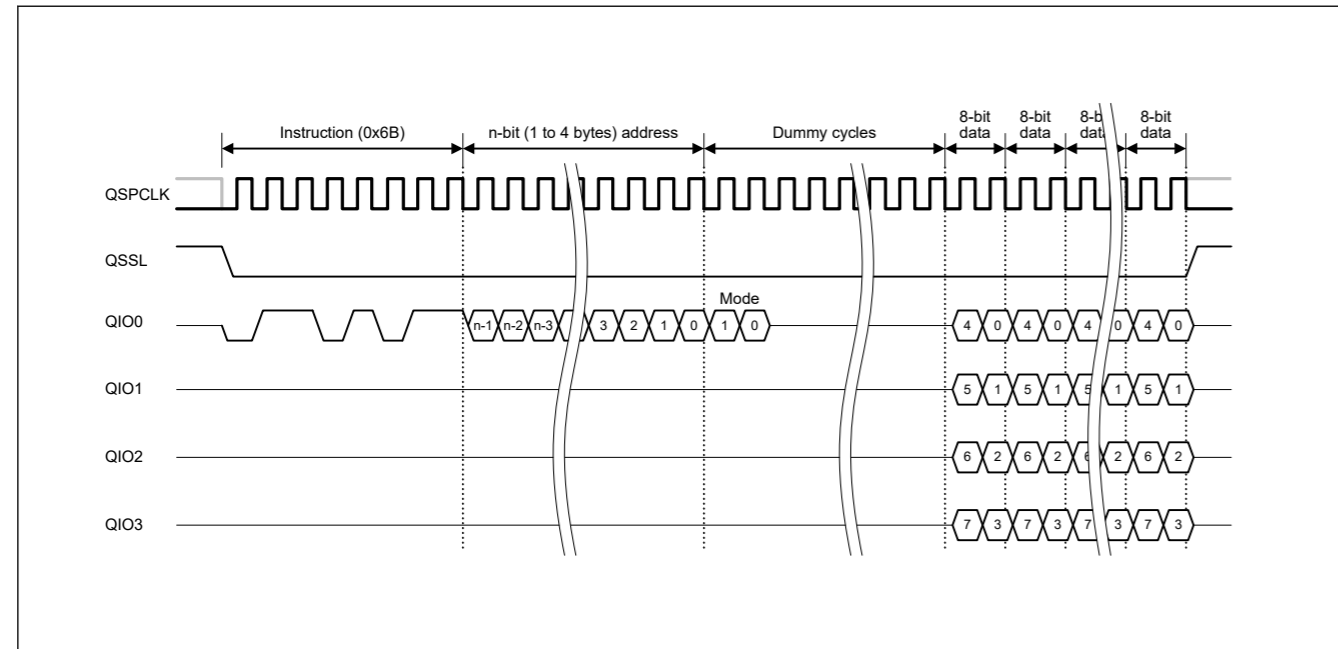

Figure 31.25 Fast Read Quad Output bus cycle (with extended SPI protocol)

Note: 要使用快速读取双IO指令，需要支持快速读取双IO传输的串行闪存。

### 31.6.6 快速读取四路输出指令

快速读取四路输出指令是使用四根信号线接收数据的读取指令。当SPI总线周期开始时，QSSL信号被置位。在SFMSAC寄存器的SFMAS[1:0]位中指定的指令代码（0x6B或0x6C）和宽度为1到4字节的地址从QIO0引脚输出。接下来，生成一定数量的空周期，在SFMSMD寄存器的SFMDN[3:0]位中指定。然后通过QIO0、QIO1、QIO2和QIO3引脚接收数据。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第31.8节。XIP控制。

切换到快速读取四路输出由SFMSMD寄存器控制。

Note: To use Fast Read Quad Output, a serial flash memory that supports Fast Read Quad Output transfer is required.

### 31.6.7 Fast Read Quad I/O Instruction

The Fast Read Quad I/O instruction is a read instruction that uses four signal lines to transmit an address and receive data. When the SPI bus cycle starts, the QSSL signal is asserted, and the instruction code (0xEB / 0xEC) is transmitted from QIO0 pin in the extended SPI protocol and from QIO0, QIO1, QIO2, and QIO3 pins in the Quad-SPI protocol. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted through the QIO0, QIO1, QIO2, and QIO3 pins, and a certain number of dummy cycles, specified in the SFMDN[3:0] bits in the SFMSMD register, is generated. Data is then received through the QIO0, QIO1, QIO2, and QIO3 pins.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see [section 31.8. XIP Control](#).

Switching to Fast Read Quad I/O is controlled in the SFMSMD register.

Note: 要使用快速读取四路输出，需要支持快速读取四路输出传输的串行闪存。

### 31.6.7 快速读取QuadIO指令

FastReadQuadIO指令是使用四根信号线传输地址和接收数据的读取指令。当SPI总线周期开始时，QSSL信号被置位，指令代码（0xEB/0xEC）从扩展SPI协议的QIO0引脚和Quad-SPI协议的QIO0、QIO1、QIO2和QIO3引脚传输。接下来，在SFMSAC寄存器的SFMAS[1:0]位中指定的1到4字节宽度的地址通过QIO0、QIO1、QIO2和QIO3引脚和一定数量的空周期传输，在SFMDN[3:0]位中指定

SFMSMD寄存器，生成。然后通过QIO0、QIO1、QIO2和QIO3引脚接收数据。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第31.8节。XIP控制。

切换到快速读取四线IO由SFMSMD寄存器控制。

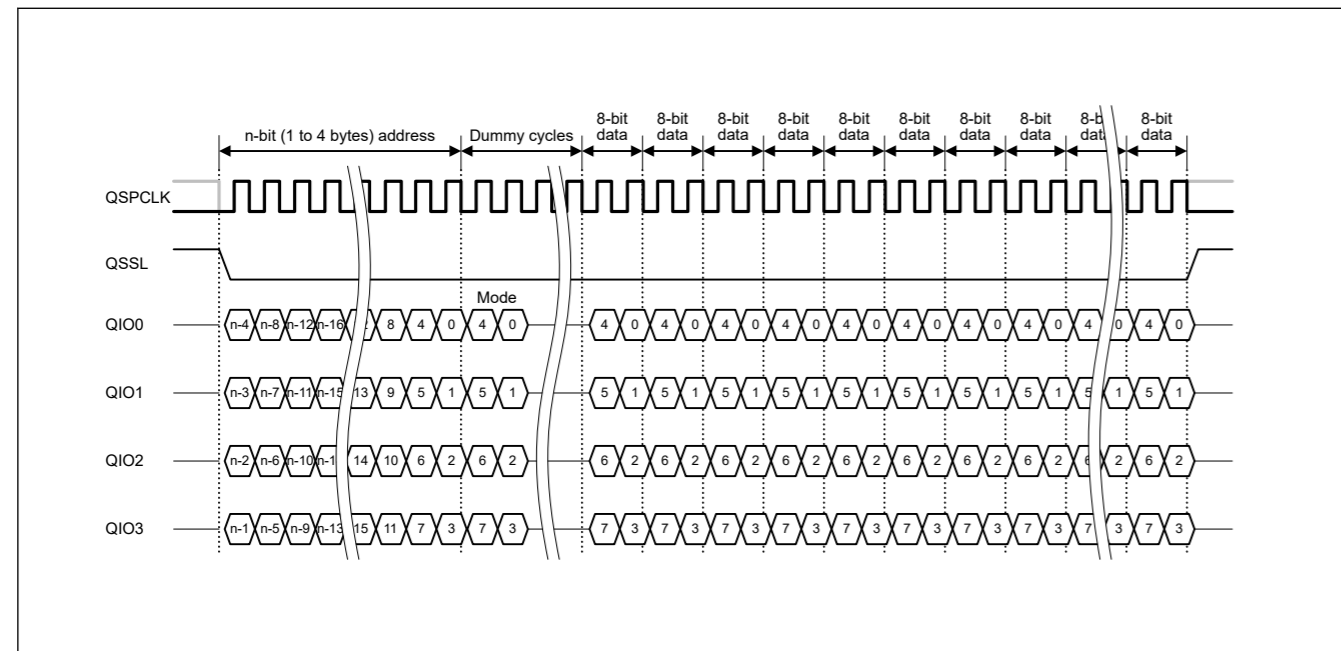

Figure 31.28 Fast Read Quad I/O bus cycle in XIP mode

Note: To use the Fast Read Quad I/O instruction, a serial flash memory that supports Fast Read Quad I/O transfers is required.

### 31.6.8 Enter 4-Byte Mode Instruction

The Enter 4-Byte Mode instruction sets the serial flash address width to 4 bytes. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (0xB7) is output.

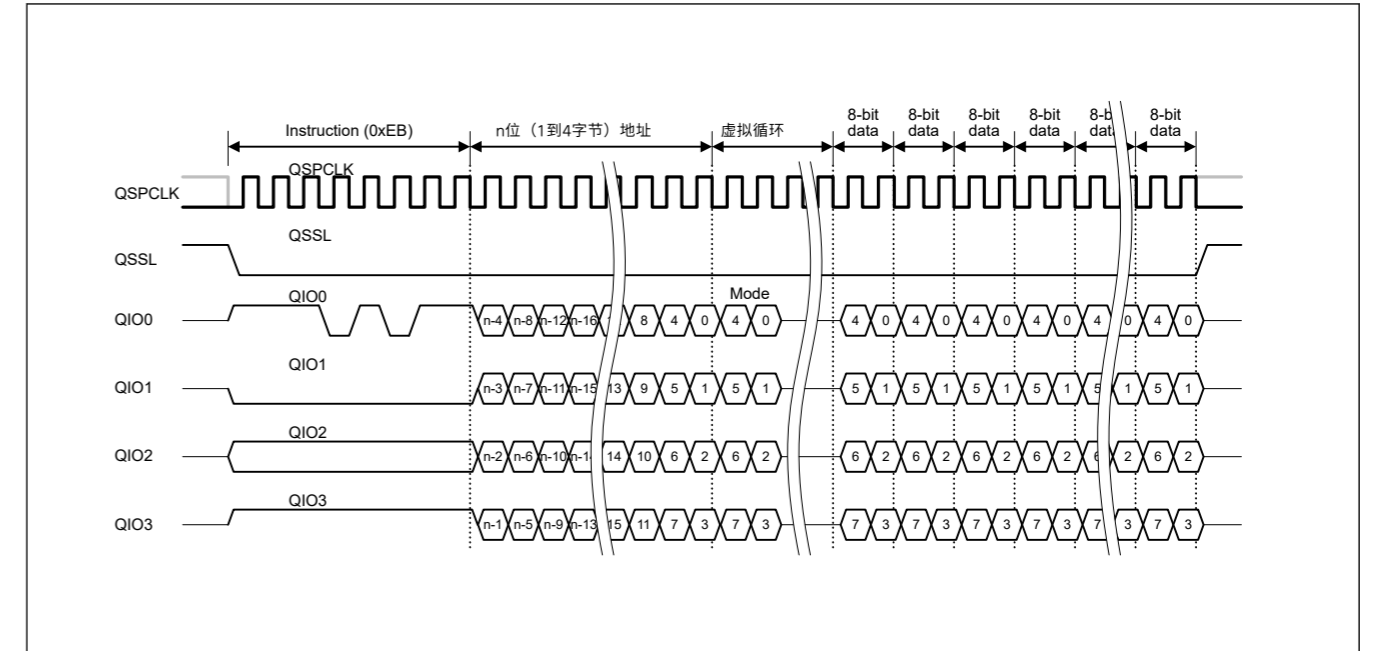

Figure 31.27 快速读取四IO总线周期

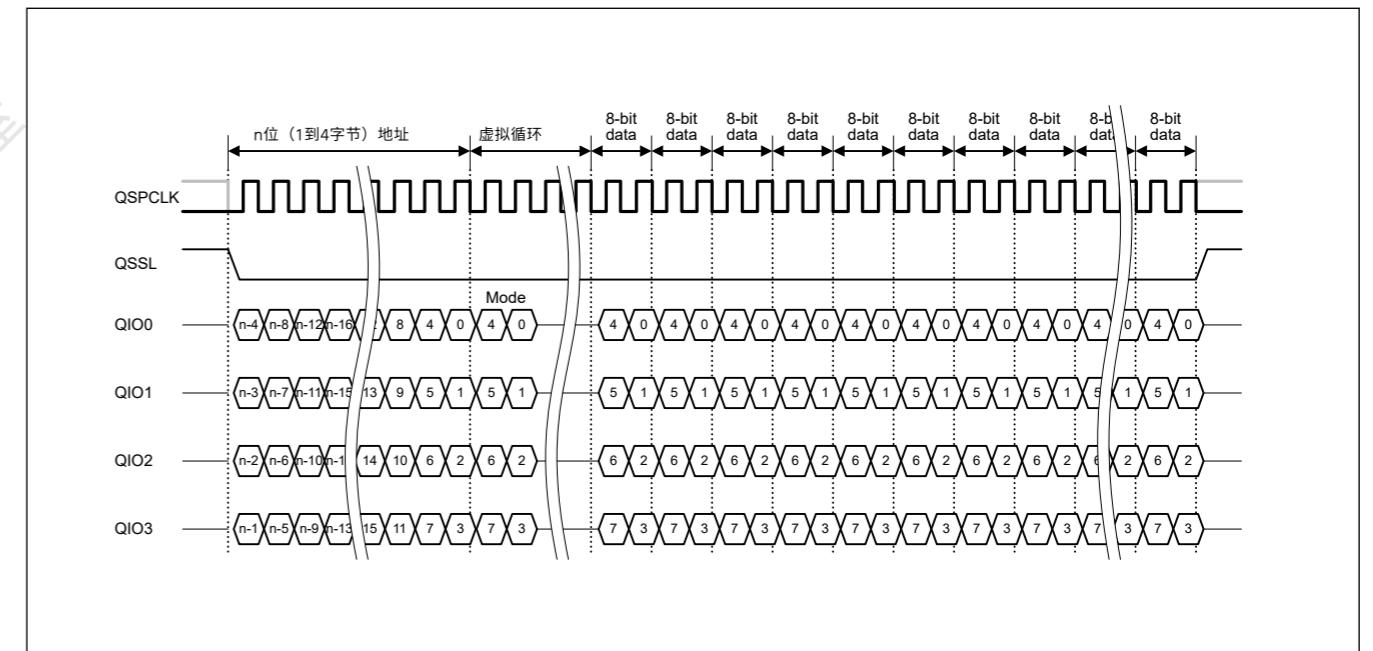

Figure 31.28 XIP模式下的快速读取QuadIO总线周期

Note: 要使用FastReadQuadIO指令，需要支持FastReadQuadIO传输的串行闪存。

### 31.6.8 进入4字节模式指令

进入4字节模式指令将串行闪存地址宽度设置为4字节。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（0xB7）。

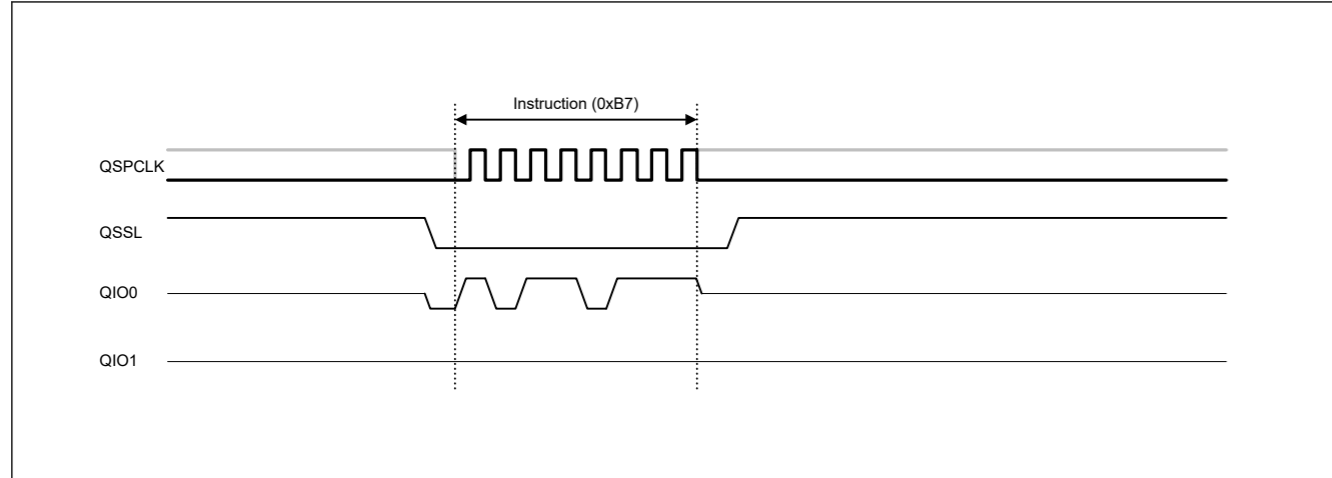

Figure 31.29 Enter 4-Byte Mode bus cycle

Note: The Enter 4-Byte Mode instruction is issued regardless of whether the serial flash is in 3- or 4-byte mode.

### 31.6.9 Exit 4-Byte Mode Instruction

The Exit 4-Byte Mode instruction sets the serial flash address width to 3 bytes. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (0xE9) is output.

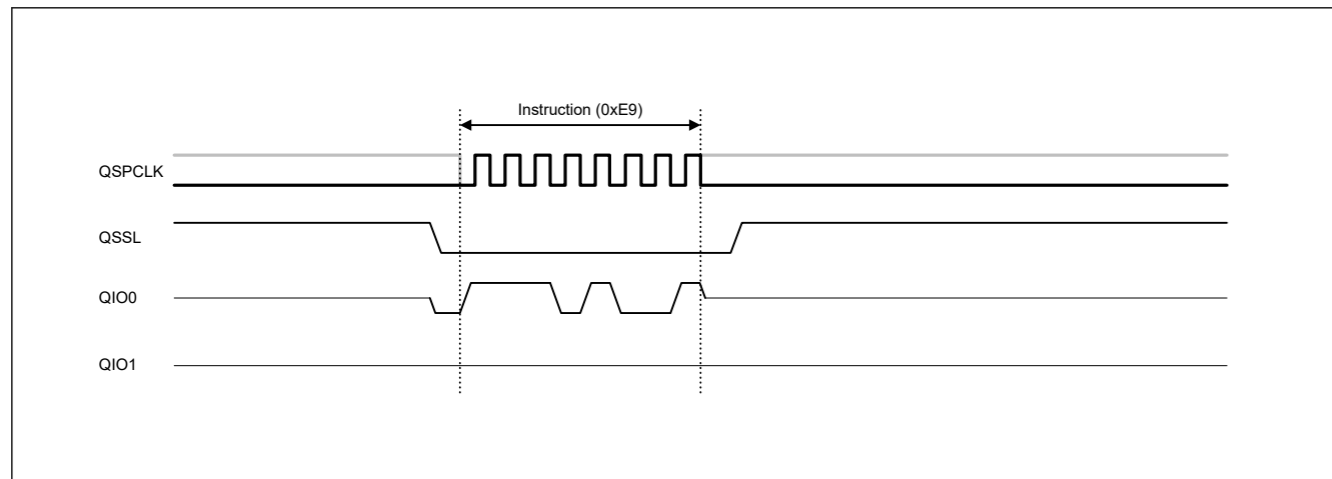

Figure 31.30 Exit 4-Byte Mode bus cycle

Note: The Exit 4-Byte Mode instruction is issued regardless of whether the serial flash is in 3- or 4-byte mode.

### 31.6.10 Write Enable Instruction

The Write Enable instruction enables changing of the serial flash address width. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (0x06) is output.

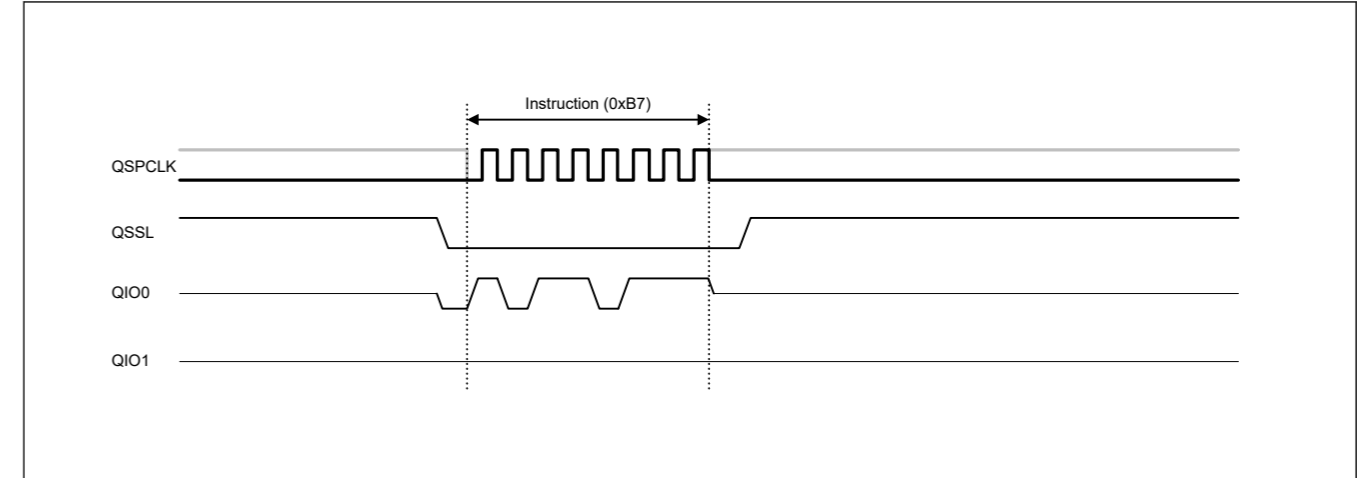

Figure 31.29 进入4字节模式总线周期

Note: 无论串行闪存处于3字节模式还是4字节模式，都会发出进入4字节模式指令。

### 31.6.9 退出4字节模式指令

退出4字节模式指令将串行闪存地址宽度设置为3字节。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（0xE9）。

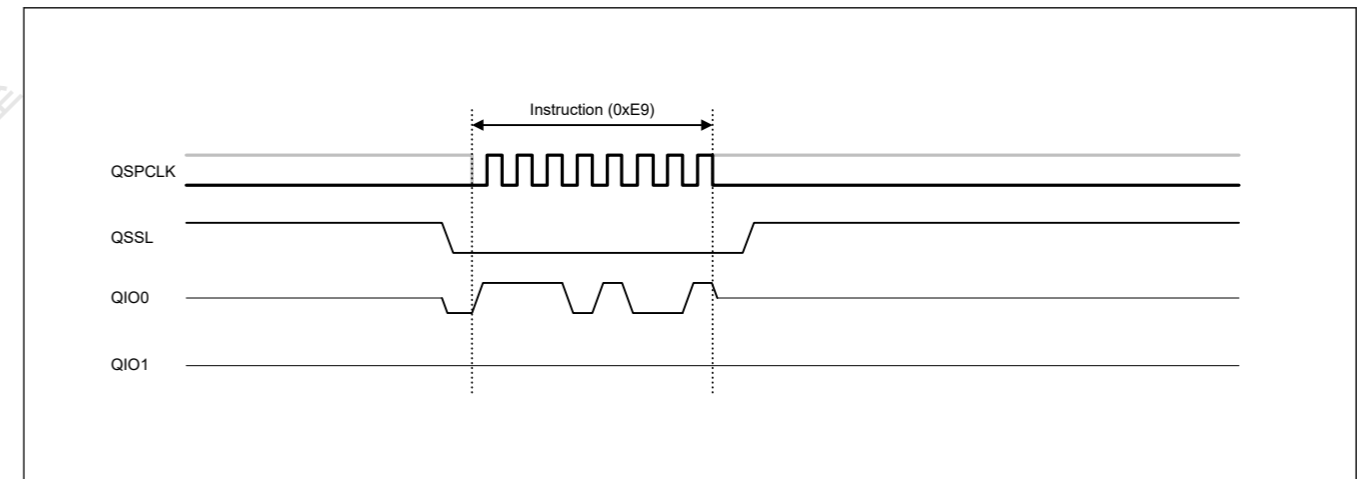

Figure 31.30 退出4字节模式总线周期

Note: 无论串行闪存处于3字节模式还是4字节模式，都会发出退出4字节模式指令。

### 31.6.10 写使能指令

写使能指令可以改变串行闪存地址宽度。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（0x06）。

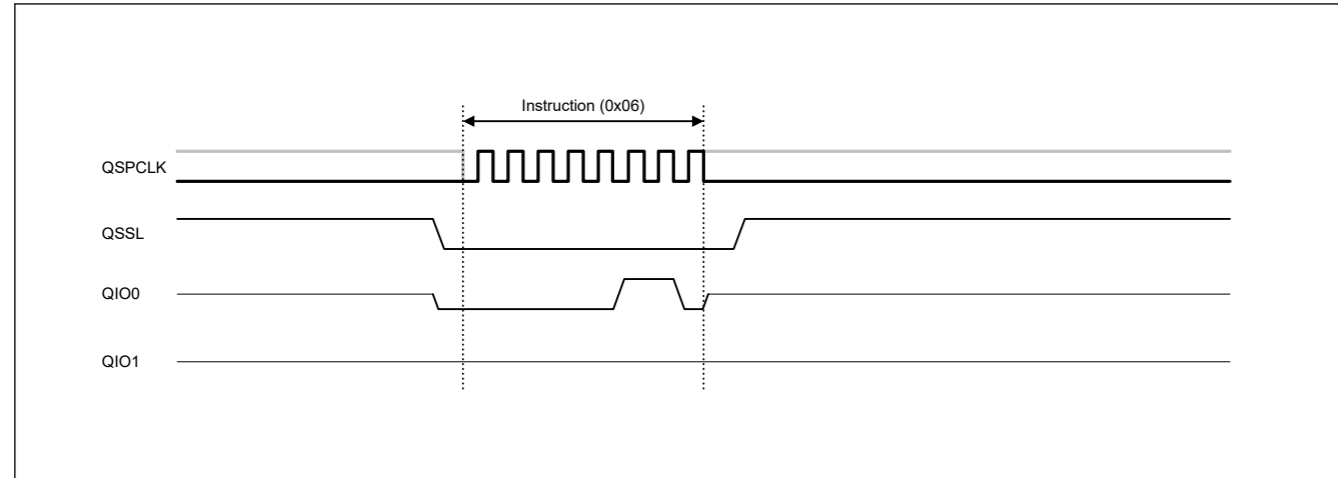

Figure 31.31 Write Enable bus cycle

### 31.7 SPI Bus Cycle Arrangement

#### 31.7.1 Serial Flash Memory Read Based on Individual Conversion

ROM read bus cycles are individually converted to SPI bus cycles on a one-to-one basis. When a ROM read bus cycle is detected, the QSSL signal is asserted, and an SPI bus cycle starts. When the data receiving is finished from the serial flash memory, the QSSL signal is negated and the SPI bus cycle is complete.

When the next ROM read bus cycle is detected, the QSSL signal set by the SFMSSC.SFMSW[3: 0] bits is asserted again, then the next SPI bus cycle starts.

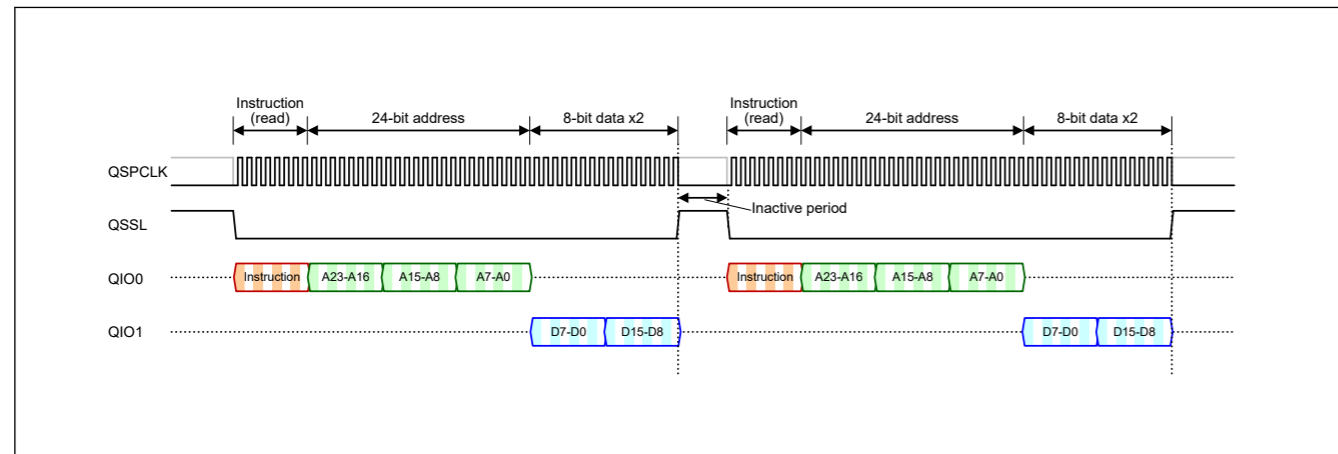

Figure 31.32 Successive data read operations based on individual conversion

#### 31.7.2 Serial Flash Memory Read Using the Prefetch Function

In operations such as CPU instruction execution and block data transfer, data is often read in ascending order from contiguous addresses. Serial flash memory provides the ability to repeat data reception without reissuing an instruction code and address. To work with this function, the QSPI has a prefetch function for continuous data reception. However, if the CPU issues a flash read request for discontinuous flash addresses, SPI bus cycles are separated from each other, disabling the prefetch function.

To enable the prefetch function of the QSPI, set the SFMPFE bit in the SFMSMD register to 1. When the prefetch function is enabled, data is received continuously and stored in the prefetch buffer of the QSPI, without waiting for another flash read request. When the CPU issues a flash read request, an address check is made. If an address match is confirmed, the data in the buffer is passed to the CPU. If an address mismatch is detected, the data in the buffer is discarded and a new SPI bus cycle is issued.

The buffer for prefetching is 18 bytes long. When this buffer is full, the SPI bus cycle is ended. When the buffer data is read to create free space, a new SPI bus cycle is automatically started to resume prefetching.

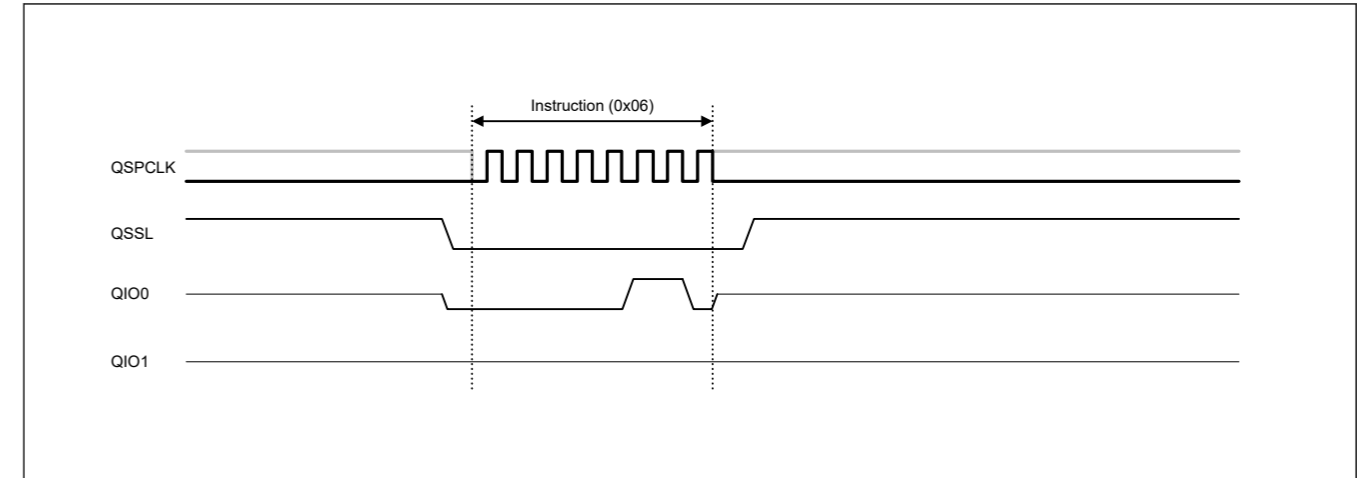

Figure 31.31 写使能总线周期

### 31.7 SPI总线周期安排

#### 31.7.1 基于单独转换的串行闪存读取

ROM读取总线周期以一对一的方式单独转换为SPI总线周期。当检测到ROM读取总线周期时，QSSL信号被置位，并且SPI总线周期开始。当从串行闪存完成数据接收时，QSSL信号被取反，SPI总线周期完成。

当检测到下一个ROM读取总线周期时，由SFMSSC.SFMSW[3:0]位设置的QSSL信号再次置位，然后下一个SPI总线周期开始。

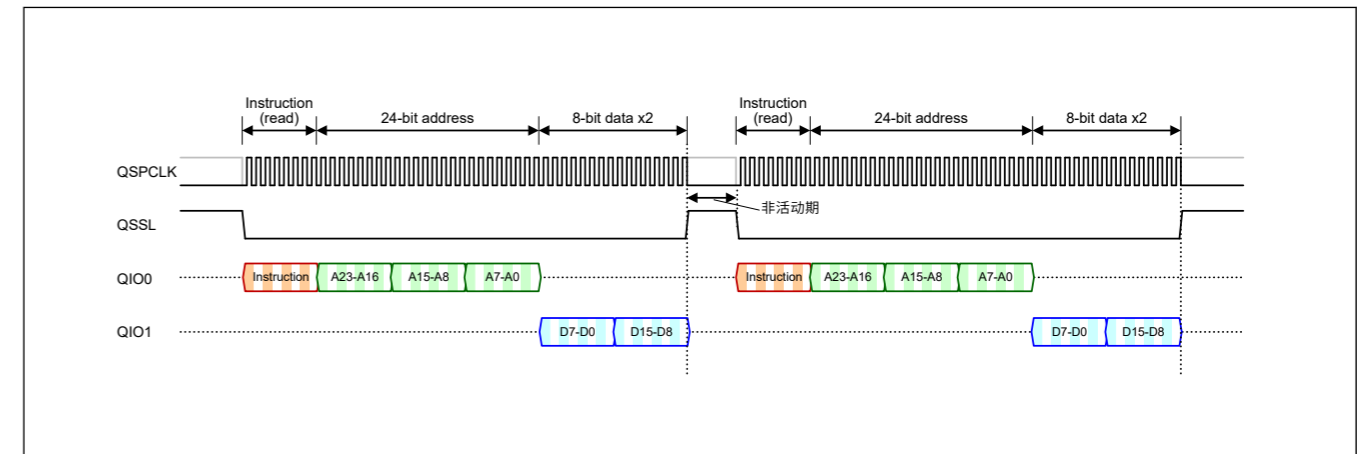

Figure 31.32 基于单独转换的连续数据读取操作

#### 31.7.2 使用预取功能读取串行闪存

在CPU指令执行和块数据传输等操作中，数据通常是从连续地址按升序读取的。串行闪存提供了重复数据接收的能力，而无需重新发出指令代码和地址。为了使用此功能，QSPI具有用于连续数据接收的预取功能。但是，如果CPU对不连续的闪存地址发出闪存读取请求，则SPI总线周期会相互分离，从而禁用预取功能。

要启用QSPI的预取功能，请将SFMSMD寄存器中的SFMPFE位设置为1。当使能预取功能时，会连续接收数据并存储在QSPI的预取缓冲区中，而无需等待另一个闪存读取请求。当CPU发出闪存读取请求时，会进行地址检查。如果确认地址匹配，则将缓冲区中的数据传递给CPU。如果检测到地址不匹配，则丢弃缓冲区中的数据并发送新的SPI总线周期。

用于预取的缓冲区为18字节长。当此缓冲区满时，SPI总线周期结束。当缓冲区数据被读取以创建空闲空间时，会自动启动一个新的SPI总线周期以恢复预取。

The prefetch function allows for efficient transfer operations when data is read in ascending order from contiguous addresses, as in instruction fetch and block data transfer.

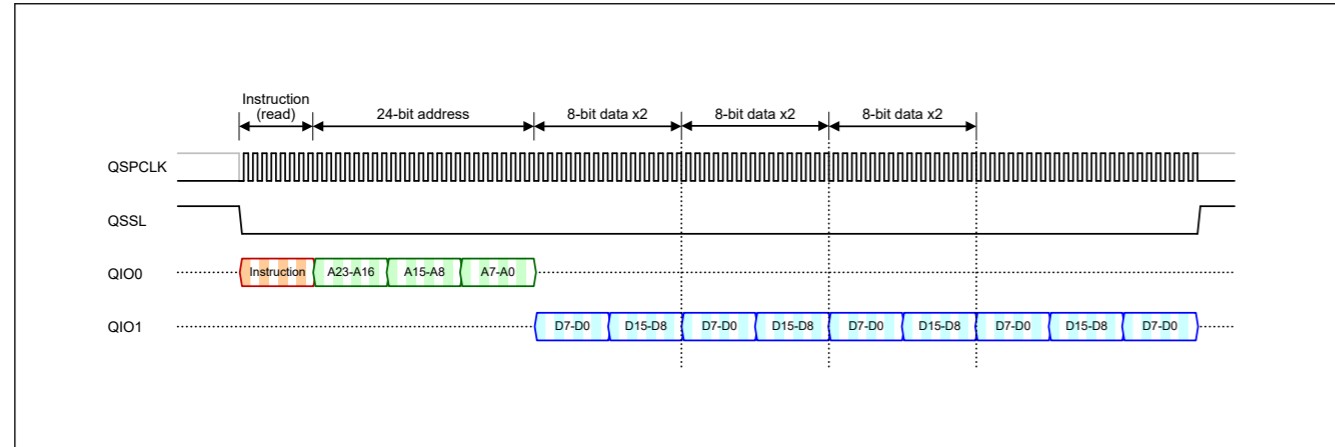

Figure 31.33 Successive data read operations using the prefetch function

### 31.7.3 Halt of Prefetching

If a serial flash memory read request for discontinuous addresses is issued when continuous data is being received by the prefetch function, the transfer of continuous data being made is halted and a new SPI bus cycle is started. Usually, such a halt of serial transfer occurs on data reception byte boundaries. However, if the SFMPAE bit in the SFMSMD register is set to 1, the halt can occur on locations other than byte boundaries.

### 31.7.4 Direct Specification of Prefetch Destination

When the prefetch function is enabled (SFMSMD.SFMPFE = 1), when writing to the QSPI window area occurs, after the writing is completed, prefetching starts from the write start address. Writes to serial flash memory cannot be performed.

Combining this function with described in section 31.7.5. Prefetch State Polling, can reduce the load on the internal bus when data is read from a low-speed serial flash memory.

Note: Writing to the QSPI window area with a data size of 2 bytes or more causes a hardfault.

### 31.7.5 Prefetch State Polling

A read by CPU from a low-speed serial flash memory causes the CPU system bus to be occupied until completion of the SPI reception bus cycle. The prefetch state polling function is provided to reduce this load.

The PFOFF bit in the Status Register (SFMSST) register indicates the state of the prefetch function, and the PFCNT[4:0] bits in the SFMSST register indicate the number of data bytes already prefetched. Place the polling program in the SRAM of this device.

```
//
// copy 1K byte (32bit x 256 word) data from serial flash to internal SRAM
//
unsigned long *sptr; // pointer for the serial flash
unsigned long *dptr; // pointer for the destination
int i;

SFMSMD |= 0x0040; // set SFMPFE bit to enable prefetch
*( (volatile unsigned char *) sptr ) = 0; // make the TAG valid to start prefetch

for ( i = 0 ; i < 256 ; i++ ){
while ( ( SFMSST & 0x00FF ) < 0x04 ){}; // waiting for 4-byte data to be received
*(dptr++) = *(sptr++);
}
```

Note: When executing a polling program, place the program outside of the serial flash memory. If the polling program is executed when the program is placed on the serial flash memory, the prefetch target frequently switches to an instruction code. This eliminates the effect of polling, and an infinite loop can result because the prefetch buffer is not filled.

当从连续地址以升序读取数据时，预取功能允许有效的传输操作，如在指令取指和块数据传输中。

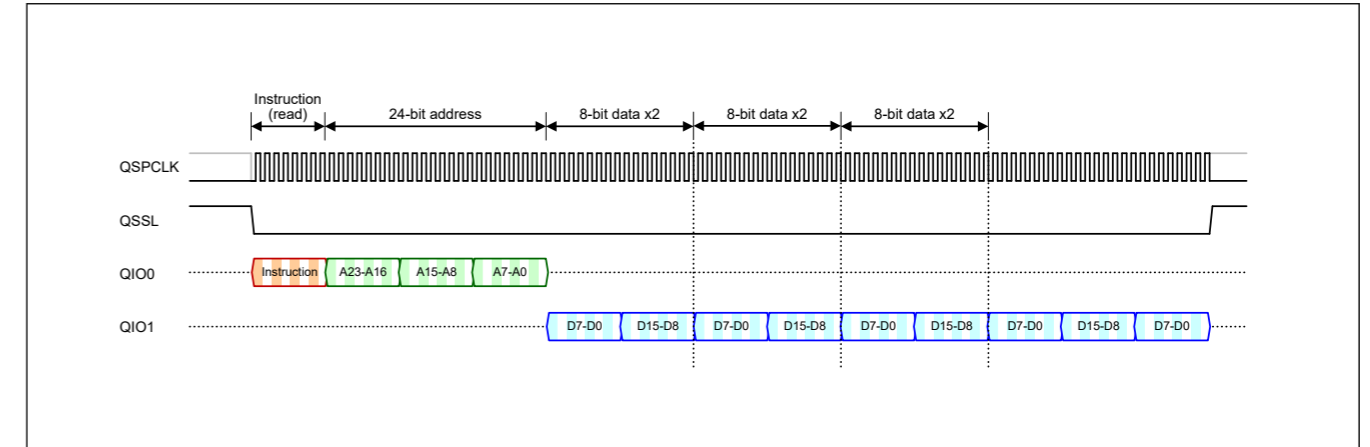

Figure 31.33 使用预取功能的连续数据读取操作

### 31.7.3 停止预取

如果在预取功能正在接收连续数据时发出对不连续地址的串行闪存读取请求，则正在进行的连续数据的传输将停止并开始新的SPI总线周期。通常，这种串行传输的停止发生在数据接收字节边界上。但是，如果SFMSMD寄存器中的SFMPAE位设置为1，则停止可能发生在字节边界以外的位置。

### 31.7.4 直接指定预取目的地

当预取功能使能时 (SFMSMD.SFMPFE=1)，当写入QSPI窗口区域时，写入完成后，从写入起始地址开始预取。无法执行对串行闪存的写入。

将此功能与第31.7.5节中的描述相结合。PrefetchStatePolling，可以减少从低速串行闪存读取数据时内部总线的负载。

Note: 写入数据大小为2字节或更大的QSPI窗口区域会导致硬故障。

### 31.7.5 预取状态轮询

CPU从低速串行闪存中读取会导致CPU系统总线被占用，直到完成SPI接收总线周期。提供了预取状态轮询功能来减少这种负载。

状态寄存器(SFMSST)寄存器中的PFOFF位指示预取功能的状态，SFMSST寄存器中的PFCNT[4:0]位指示已经预取的数据字节数。将轮询程序放在本设备的SRAM中。

```
将1K字节（32位x256字）数据从 串行闪存复制到内部SRAM无符号长*sptr；串行闪存指针un
signedlong*dptr;目标inti的指针；

SFMSMD=0x0040; 设置SFMPFE位以启用预取*((volatileunsignedchar*)sptr)=0;使TAG有效以开始预
取

for(i=0;i<256;i++){而((SFMSST&0x00FF)<0x04){ ;等待接收4字节数据*(dptr++)=*(sptr++);
```

Note: 执行轮询程序时，请将程序置于串行闪存之外。如果轮询程序在程序放在串行闪存上时执行，则预取目标频繁切换到指令代码。这消除了轮询的影响，并且由于未填充预取缓冲区可能导致无限循环。

### 31.7.6 SPI Bus Cycle Extension Function

If the SFMSE[1:0] bits in the SFMSMD register are set to a value other than 00b, the QSPI waits for the next flash read. At this time, the QSPCLK signal stops, the QSSL signal is kept active low even after data is obtained from the serial flash memory, and the SPI bus cycle is suspended.

If the address of the next flash read is contiguous in ascending order, the toggling of the QSPCLK signal is restarted to continue reception of subsequent data. If the address of the next flash read is not contiguous in ascending order, the QSSL signal is driven high once to end the SPI bus cycle being suspended. A new SPI bus cycle is then started.

When data is read intermittently from ascending order contiguous addresses, this function enables an efficient transfer operation to be performed by reducing the overhead for instruction code and address transmission.

The SPI bus cycle extension time is selectable in the SFMSE[1:0] bits in the SFMSMD register. When the specified extension time elapses, the QSSL signal returns to the high level to automatically end the SPI bus cycle being suspended. If the SFMSE[1:0] bits are set to 11b, QSSL is extended infinitely. This increases the power consumption of the serial flash memory.

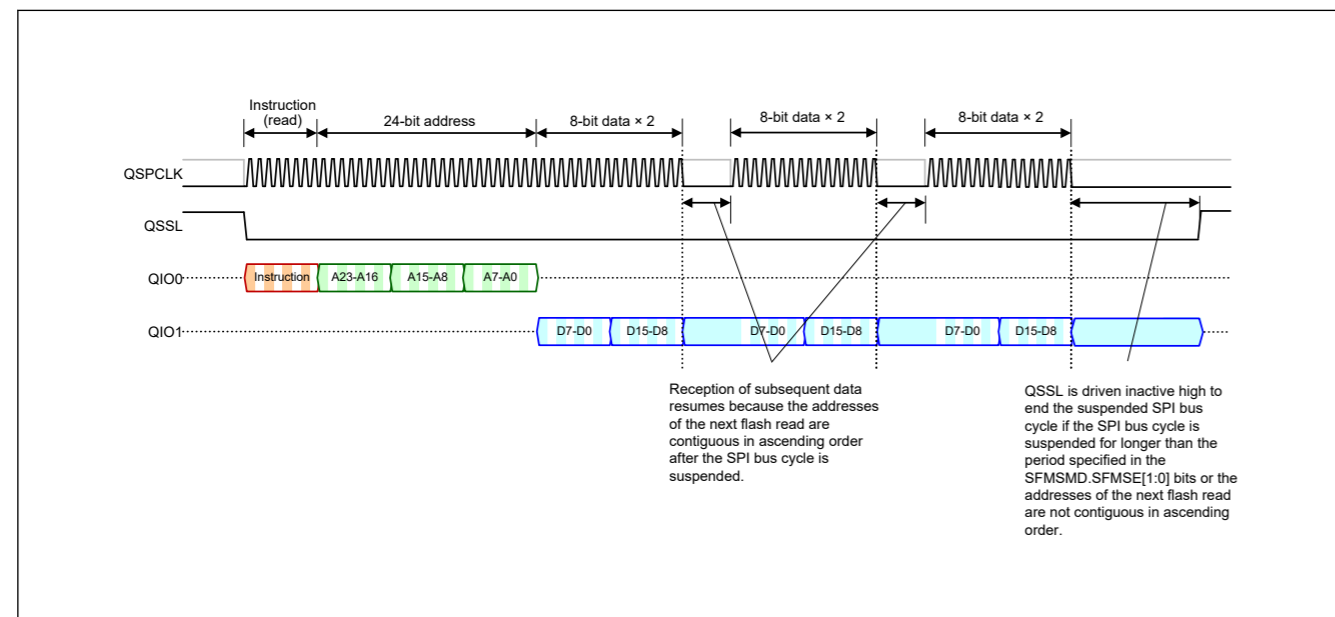

Figure 31.34 Successive data read operations using the SPI bus cycle extension

### 31.8 XIP Control

Some serial flash memory devices allow latencies to be reduced by skipping instruction code reception for flash reads. This instruction code skip function is selected in mode data received during the dummy cycle period of the previous serial bus cycle.

In the dummy cycle of the Fast Read instructions, the QSPI controls the XIP mode of the serial flash memory by using the serial data signal to send the mode data set in the SFMXD[7:0] bits in the SFMSDC register during the first 2 cycles, as shown in Figure 31.35.

The mode data to enable the XIP mode differs for each serial flash memory. Accordingly, set the appropriate mode data in the SFMXD[7:0] bits.

### 31.7.6 SPI总线周期扩展功能

如果SFMSMD寄存器中的SFMSE[1:0]位设置为00b以外的值,则QSPI等待下一次闪存读取。此时,QSPCLK信号停止,即使从串行闪存中获取数据后,QSSL信号也保持低电平有效,并且暂停SPI总线周期。

如果下一次闪存读取的地址按升序连续,则重新启动QSPCLK信号的翻转以继续接收后续数据。如果下一次flash读取的地址升序不连续,则QSSL信号被驱动一次高电平以结束暂停的SPI总线周期。然后开始一个新的SPI总线周期。

当从升序连续地址间歇性地读取数据时,该功能通过减少指令代码和地址传输的开销来实现高效的传输操作。

SPI总线周期延长时间可在SFMSMD寄存器的SFMSE[1:0]位中选择。当指定的延长时间过去后,QSSL信号返回高电平,自动结束暂停的SPI总线周期。如果SFMSE[1:0]位设置为11b,QSSL将无限扩展。这增加了串行闪存的功耗。

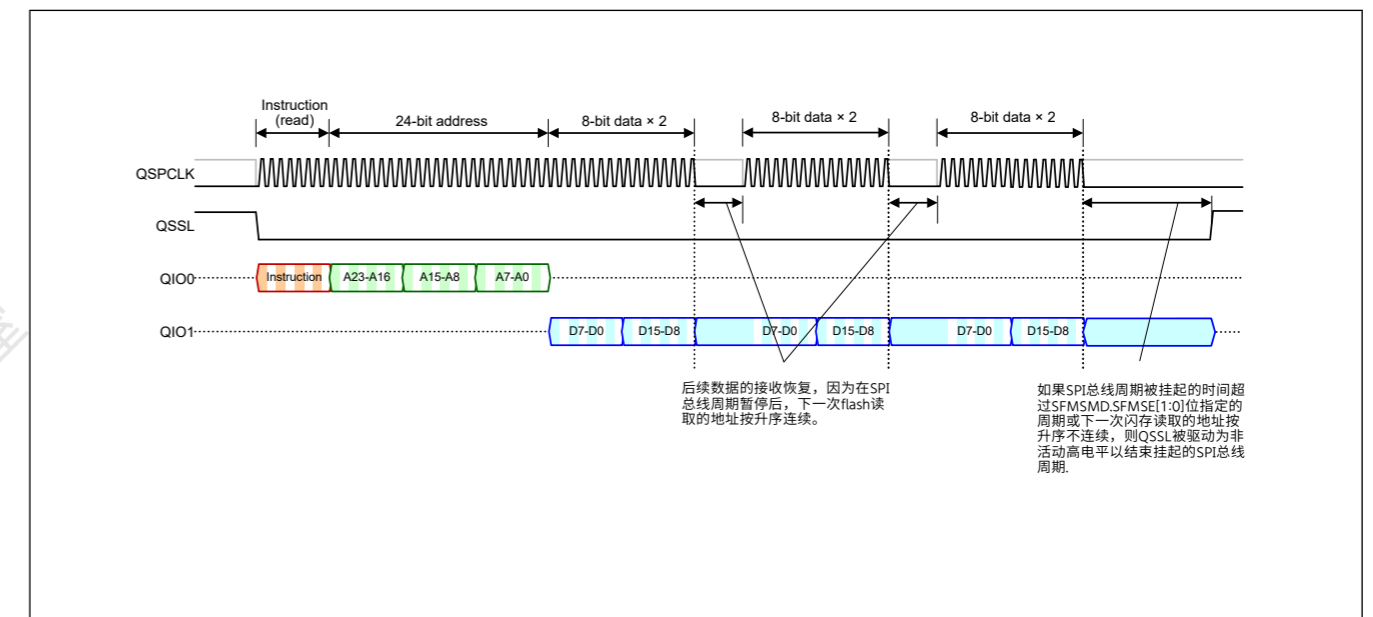

Figure 31.34 使用SPI总线周期扩展的连续数据读取操作

### 31.8 XIP Control

一些串行闪存设备允许通过跳过用于闪存读取的指令代码接收来减少延迟。在前一个串行总线周期的虚拟周期期间接收到的模式数据中选择此指令代码跳过功能。

在快速读取指令的空周期中,QSPI在前2循环,如图31.35所示。

启用XIP模式的模式数据因串行闪存而异。因此,在SFMXD[7:0]位中设置适当的模式数据。

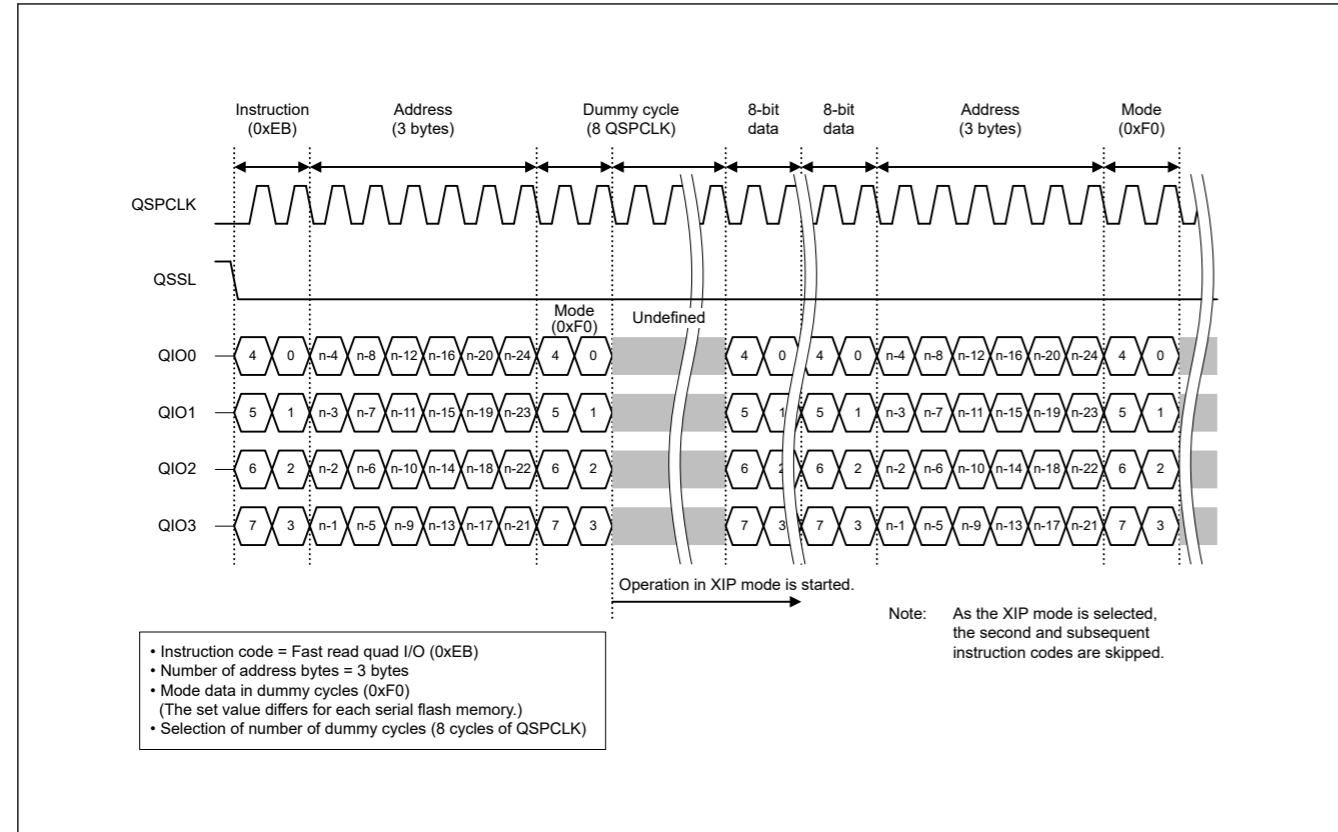

Figure 31.35 XIP mode control data

### 31.8.1 Setting XIP Mode

To start XIP mode in serial flash memory, perform the following register settings:

- Set a mode data value in the SFMXD[7:0] bits in the SFMSDC register.\*1
- Set the SFMXEN bit in the SFMSDC register to 1.

In the dummy cycle of the first fast read cycle after these registers are set, the mode data value set in the register is transferred. From that point, XIP mode is enabled in the serial flash memory. To confirm the current XIP mode status, read the SFMXST flag in the SFMSDC register.

Note 1. In the SFMXD[7:0] bits in the SFMSDC register, set the mode data that follows the specifications for the actual serial flash memory.

The following figure shows an example of the XIP mode setting procedure.

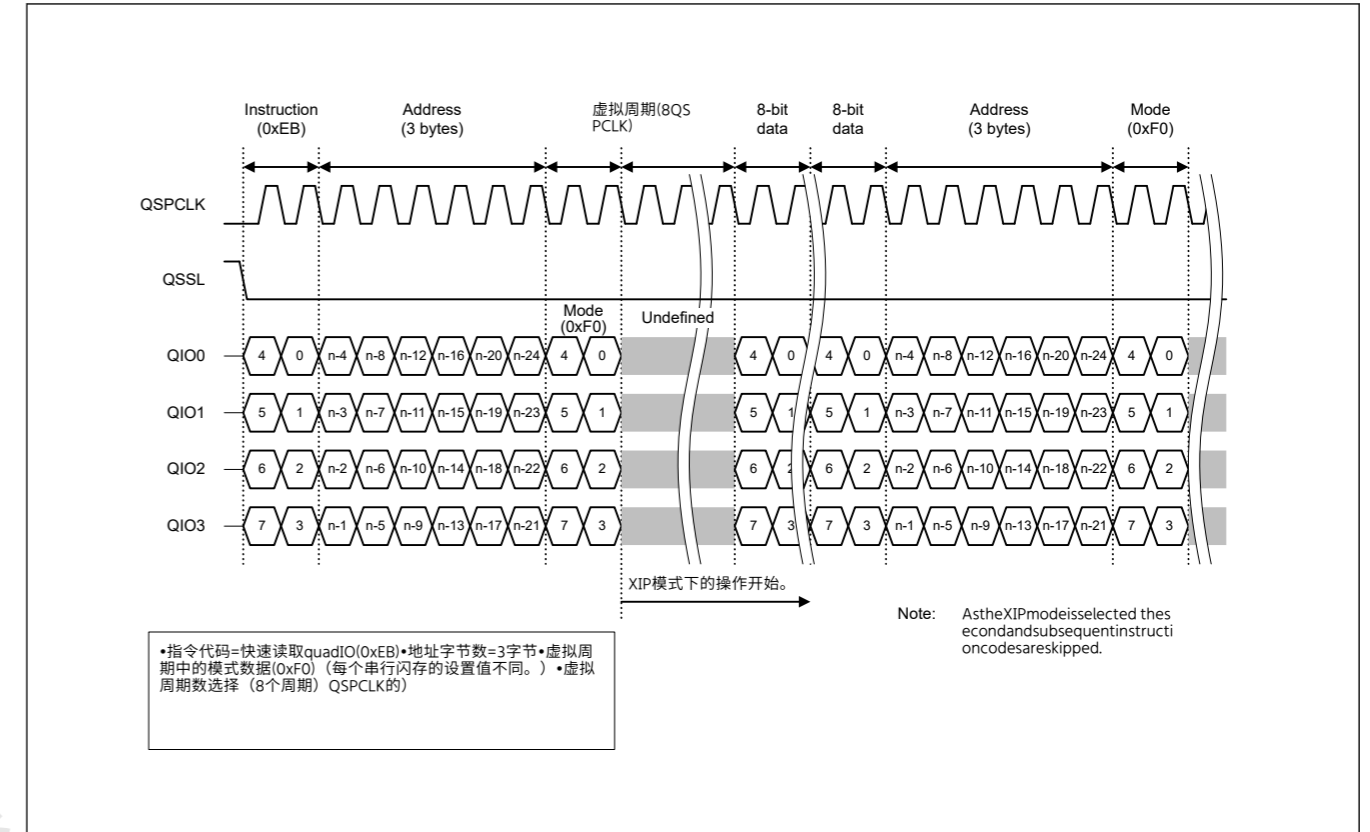

Figure 31.35 XIP模式控制数据

### 31.8.1 设置XIP模式

要在串行闪存中启动XIP模式，请执行以下寄存器设置：

- 在SFMSDC寄存器的SFMXD[7:0]位中设置模式数据值。\*1
- 将SFMSDC寄存器中的SFMXEN位设置为1。

在设置这些寄存器后的第一个快速读取周期的空周期中，传输寄存器中设置的模式数据值。从那时起，串行闪存中的XIP模式被启用。要确认当前XIP模式状态，请读取SFMSDC寄存器中的SFMXST标志。

注1.在SFMSDC寄存器的SFMXD[7:0]位中，设置符合实际串行闪存规范的模式数据。

下图显示了XIP模式设置过程的示例。

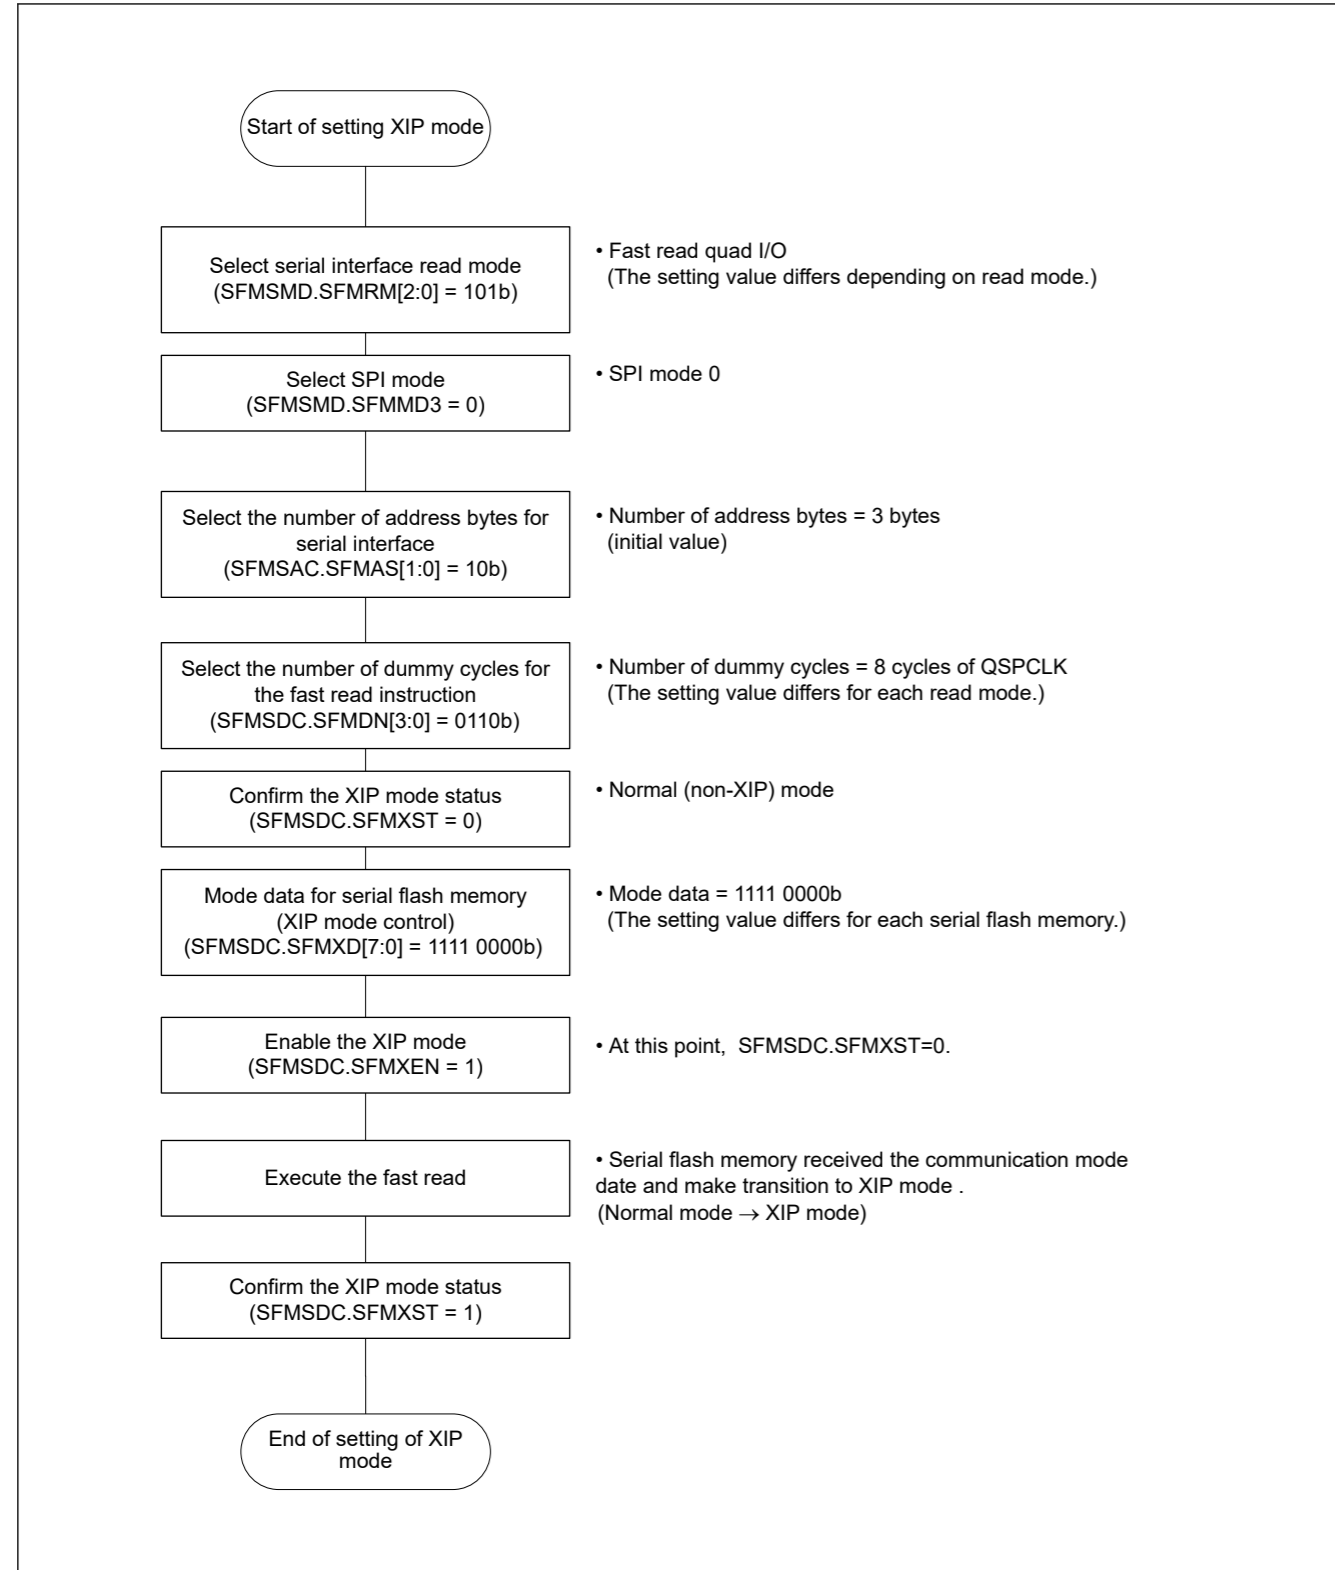

Figure 31.36 Flowchart of XIP Mode

### 31.8.2 Releasing the XIP Mode

To release XIP mode in serial flash memory, perform the following register setting:

- Set the mode data value to disable XIP mode in SFMSDC.SFMXD [7: 0] bits\*1
- Set the SFMXEN bit in the SFMSDC register to 0.

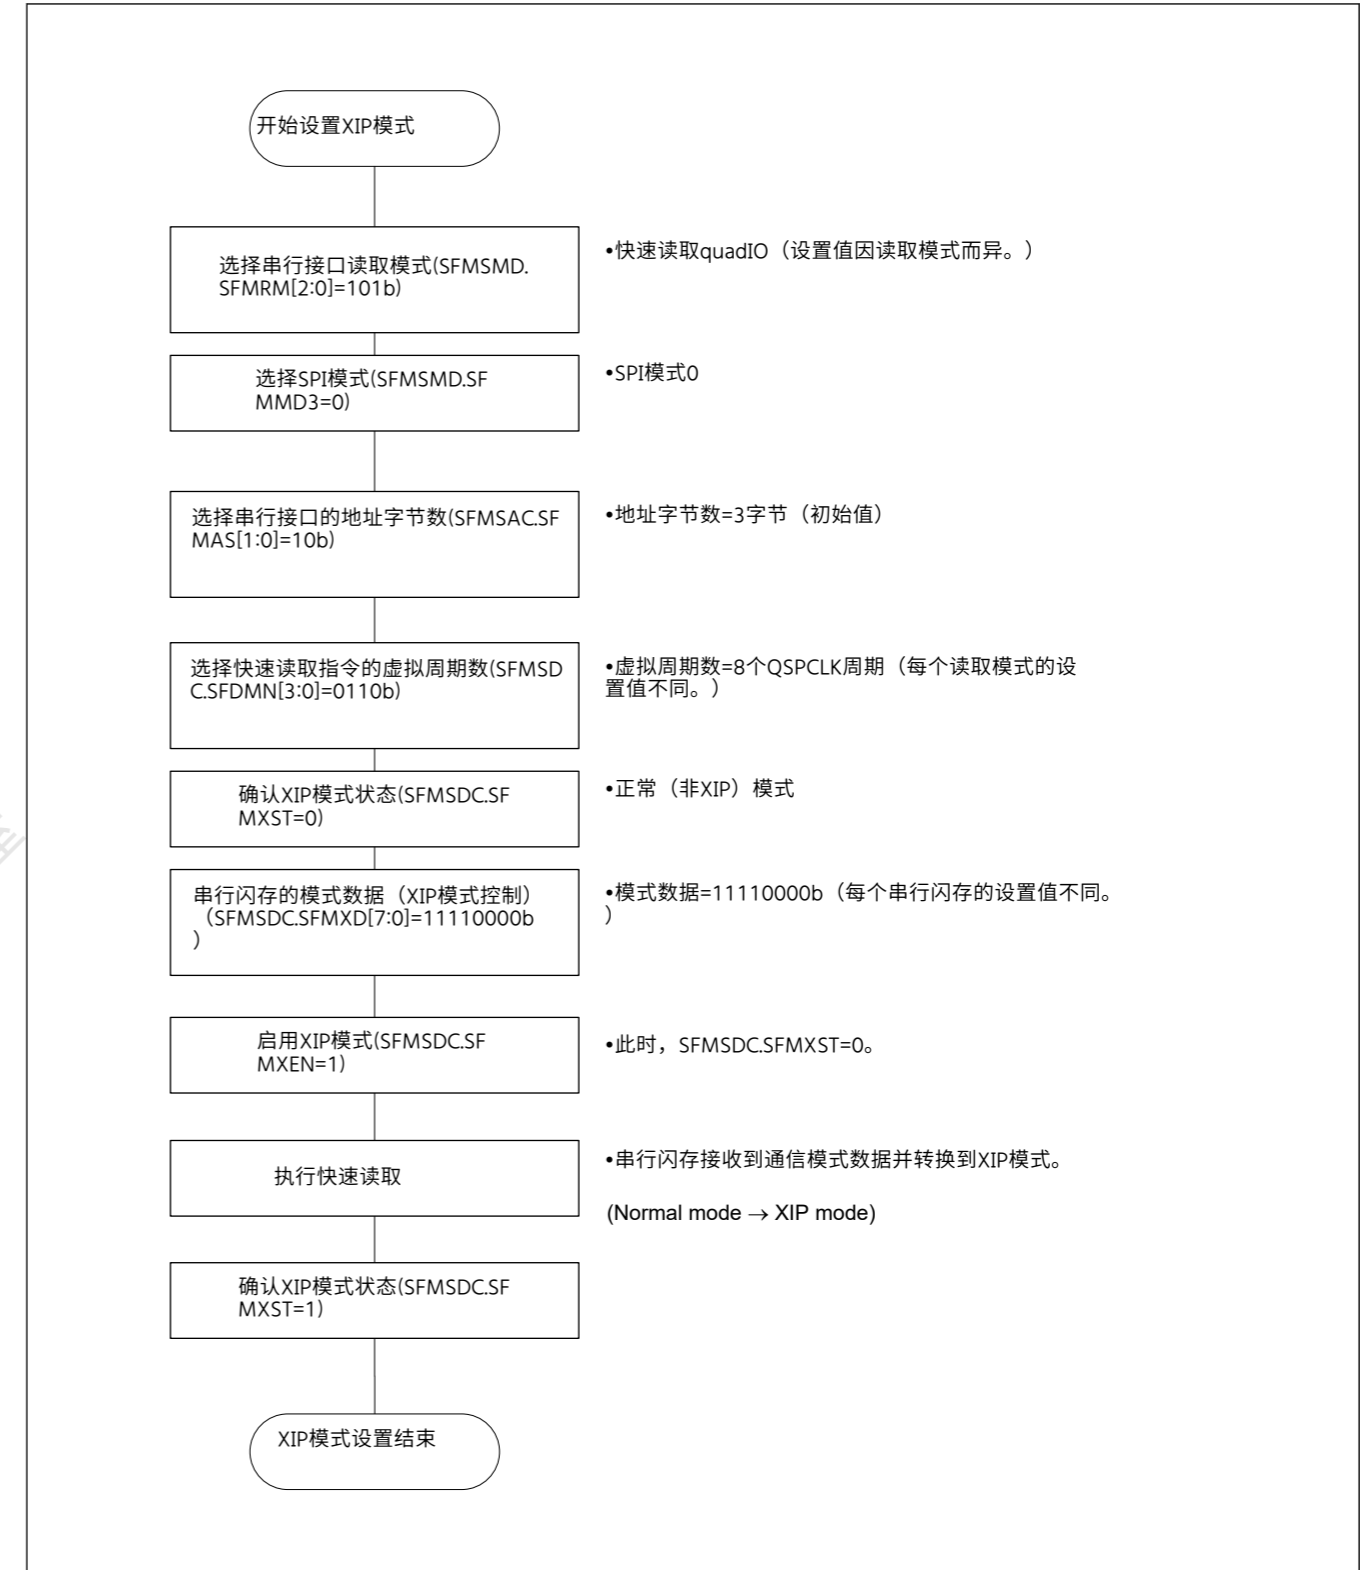

Figure 31.36 XIP模式流程图

### 31.8.2 释放XIP模式

要在串行闪存中释放XIP模式, 请执行以下寄存器设置:

- 在SFMSDC.SFMXD[7:0]位中设置模式数据值以禁用XIP模式\*1
- 将SFMSDC寄存器中的SFMXEN位设置为0。

In the dummy cycle of the first fast read cycle after this register is set, The mode data value that disables the XIP mode set in the register is transferred. From that point, XIP mode is disabled in the serial flash memory. To confirm the current XIP mode status, read the SFMXST flag in the SFMSDC register.

Note 1. Set the mode data in the SFMSDC.SFMXD [7: 0] bits according to the specifications of the serial flash memory.

Figure 31.37 shows an example of the procedure for releasing XIP mode.

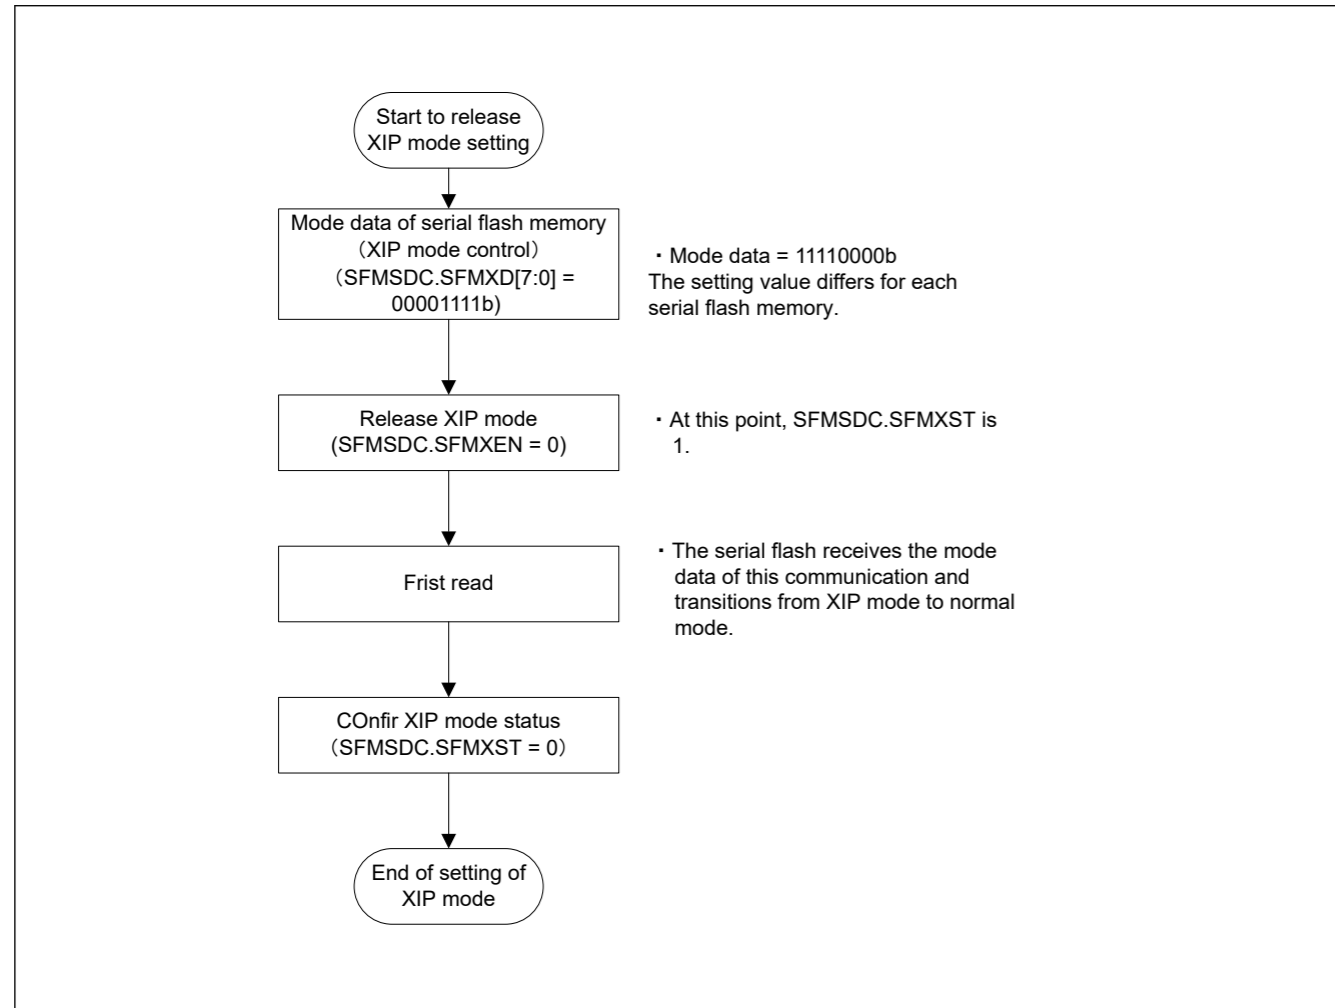

Figure 31.37 Releasing XIP mode (flowchart)

### 31.9 QIO2 and QIO3 Pin States

The QIO2 and QIO3 pin states depend on the serial interface read mode specified in the SFMRM[2:0] bits in the SFMSMD register.

Table 31.11 QIO2 and QIO3 pin states (1 of 2)

| SFMSMD.SFMRM[2:0] bits | QIO2 pin state*1  | QIO3 pin state*2  | Remarks               |
|------------------------|---|---|-----------------------|
| 111                    | Setting prohibited  |   |                       |
| 110                    |   |   |                       |
| 101                    | Input or output as serial data signal (The pin is in the Hi-Z state when it is inactive.) | Input or output as serial data signal (The pin is in the Hi-Z state when it is inactive.) | Fast Read Quad I/O    |
| 100                    |   |   | Fast Read Quad Output |

在设置该寄存器后的第一个快速读取周期的空周期中，传输寄存器中设置的禁用XIP模式的模式数据值。从那时起，串行闪存中的XIP模式被禁用。要确认当前XIP模式状态，请读取SFMSDC寄存器中的SFMXST标志。

注1.根据串行闪存的规格设置SFMSDC.SFMXD[7:0]位中的模式数据。

图31.37显示了释放XIP模式的过程示例。

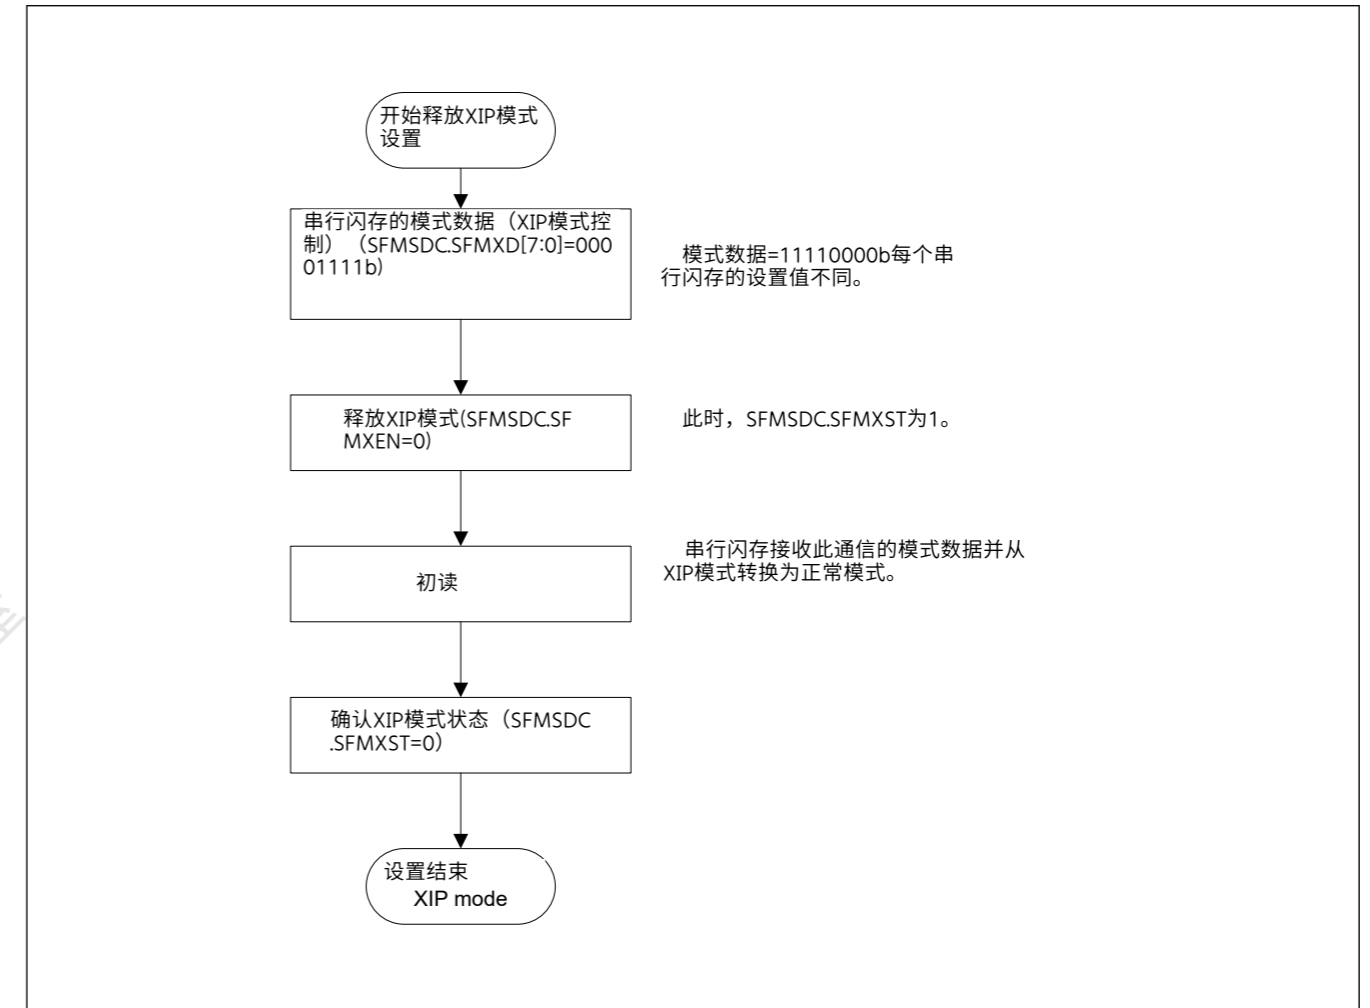

Figure 31.37 释放XIP模式 (流程图)

### 31.9 QIO2和QIO3引脚状态

QIO2和QIO3引脚状态取决于SFMSMD寄存器的SFMRM[2:0]位中指定的串行接口读取模式。

Table 31.11 QIO2和QIO3引脚状态 (1of2)

| SFMSMD.SFMRM[2:0] bits | QIO2引脚状态*1                           | QIO3引脚状态*2                           | Remarks  |
|------------------------|--------------------------------------|--------------------------------------|----------|
| 111                    | 禁止设定                                 |                                      |          |
| 110                    |                                      |                                      |          |
| 101                    | 作为串行数据信号的输入或输出 (引脚处于非活动状态时处于Hi-Z状态。) | 作为串行数据信号的输入或输出 (引脚处于非活动状态时处于Hi-Z状态。) | 快速读取四路IO |
| 100                    |                                      |                                      | 快速读取四路输出 |

Table 31.11 QIO2 and QIO3 pin states (2 of 2)

| SFMSMD.SFMRM[2:0] bits | QIO2 pin state*1  | QIO3 pin state*2  | Remarks                       |
|------------------------|---|-------------------|-------------------------------|
| 011                    | Output SFMWPL bit variable of the Port Control Register (SFMPMD) (initial value is low level) | Output high level | Fast Read Dual I/O            |
| 010                    |   |                   | Fast Read Dual Output         |
| 001                    |   |                   | Fast Read                     |
| 000                    |   |                   | Standard Read (Initial State) |

Note 1. The serial flash memory can also use the QIO2 pin for the write protect (WP) function. The WP function prohibits writes to the status registers. (The function is available in mode other than Quad-SPI mode.)

Note 2. The serial flash memory can also use the QIO3 pin for the HOLD or RESET function. The hold function places the I/O pin in an inactive state without deselecting the chip. (The function is available in mode other than Quad-SPI mode.) The reset function resets the serial flash memory. (The function is available when the QSSL pin function is disabled or in a mode in which the QIO3 pin is not used.)

## 31.10 Direct Communication Mode

### 31.10.1 About Direct Communication

The QSPI can read the serial flash memory contents by automatically converting from reading the QSPI window area to SPI bus cycles. However, serial flash memory have many different functions in addition to memory data read, including ID information read, erase, programming, and status information read. There is no standardized instruction set for using these functions, and more functions are being added rapidly by different vendors to different devices. Therefore, to support these functions, the software can create any required SPI bus cycle by communicating directly with serial flash memory.

### 31.10.2 Using Direct Communication Mode

To communicate directly with serial flash memory, transition to direct communication mode by setting the DCOM bit in the Communication Mode Control Register (SFMCMDCMD) register to 1. While direct communications mode is selected, the read operation to the serial flash memory by the QSPI window is invalid.

Note: If the QSPI is set to the XIP mode, you must terminate the XIP mode before starting direct communication mode.

### 31.10.3 Generating the SPI Bus Cycle during Direct Communication

The SPI bus cycle in direct communications starts on the first access to the SFMCOM register, and after a series of input / output operations are executed via the SFMCOM register, the bus cycle ends when 1 is written to the SFMCMDCMD register. At that point, a write to the SFMCOM port is converted to a one-byte transmission to the SPI bus, and a read from the SFMCOM register is converted to a one-byte reception from the SPI bus.

During the period from the first access to the SFMCOM register to the last write operation to the SFMCMDCMD register, the QSSL signal is held active to notify the serial flash memory that a series of SPI bus cycles is in progress.

Note: In direct communication mode, all writes to registers other than SFMCMDCMD and SFMCOM (including SFMSMD, SFMSSC, SFMSKC, SFMSST, SFMCST, SFMSIC, SFMSAC, SFMSDC, SFMSPC, and SFMPMD) are disabled.

Figure 31.38 to Figure 31.40 show direct communication program examples, and Figure 31.41 shows ID read direct communication timing examples.

Table 31.11 QIO2和QIO3引脚状态 (2个中的2个)

| SFMSMD.SFMRM[2:0] bits | QIO2引脚状态*1                                | QIO3引脚状态*2 | Remarks     |
|------------------------|---|------------|-------------|
| 011                    | 输出端口控制寄存器 (SFMPMD) 的 SFMWPL 位变量 (初始值为低电平) | 输出高电平      | 快速读取双IO     |
| 010                    |   |            | 快速读取双输出     |
| 001                    |   |            | 快速阅读        |
| 000                    |   |            | 标准读取 (初始状态) |

注1. 串行闪存也可以将QIO2引脚用于写保护(WP)功能。WP功能禁止写入状态寄存器。(该功能在Quad-SPI模式以外的模式下可用。)

注2. 串行闪存也可以将QIO3引脚用于HOLD或RESET功能。保持功能将IO引脚置于非活动状态, 而无需取消选择芯片。(该功能在除Quad-SPI mode.) 复位功能复位串行闪存。(当QSSL引脚功能被禁用或处于未使用QIO3引脚的模式时, 该功能可用。)

## 31.10 直接通讯方式

### 31.10.1 关于直接沟通

QSPI可以通过从读取QSPI窗口区域自动转换为SPI总线周期来读取串行闪存内容。然而, 串行闪存除了读取存储器数据外, 还有许多不同的功能, 包括ID信息读取、擦除、编程和状态信息读取。使用这些功能没有标准化的指令集, 更多的功能正在由不同的供应商迅速添加到不同的设备中。因此, 为了支持这些功能, 软件可以通过直接与串行闪存通信来创建任何所需的SPI总线周期。

### 31.10.2 使用直接通信模式

要直接与串行闪存通信, 通过设置DCOM位转换到直接通信模式 CommunicationModeControlRegister(SFMCMDCMD)register to 1. While direct communications mode is selected, the read operation to the serial flash memory by the QSPI window is invalid.

Note: 如果QSPI设置为XIP模式, 则必须在启动直接通信模式之前终止XIP模式。

### 31.10.3 在直接通信期间生成SPI总线周期

直接通信中的SPI总线周期从第一次访问SFMCOM寄存器开始, 通过SFMCOM寄存器执行一系列输入输出操作后, 总线周期在SFMCMDCMD寄存器写入1时结束。此时, 对SFMCOM端口的写入转换为向SPI总线发送一个字节, 从SFMCOM寄存器读取转换为从SPI总线接收一个字节。

在从第一次访问SFMCOM寄存器到最后一次写入SFMCMDCMD寄存器期间, QSSL信号保持有效, 以通知串行闪存一系列SPI总线周期正在进行中。

Note: 在直接通信模式下, 所有写入除SFMCMDCMD和SFMCOM以外的寄存器 (包括SFMSMD、SFMSSC、SFMSKC、SFMSST、SFMCST、SFMSIC、SFMSAC、SFMSDC、SFMSPC和SFMPMD) 被禁用。

图31.38至图31.40为直接通信程序示例, 图31.41为ID读取直接通信时序示例。

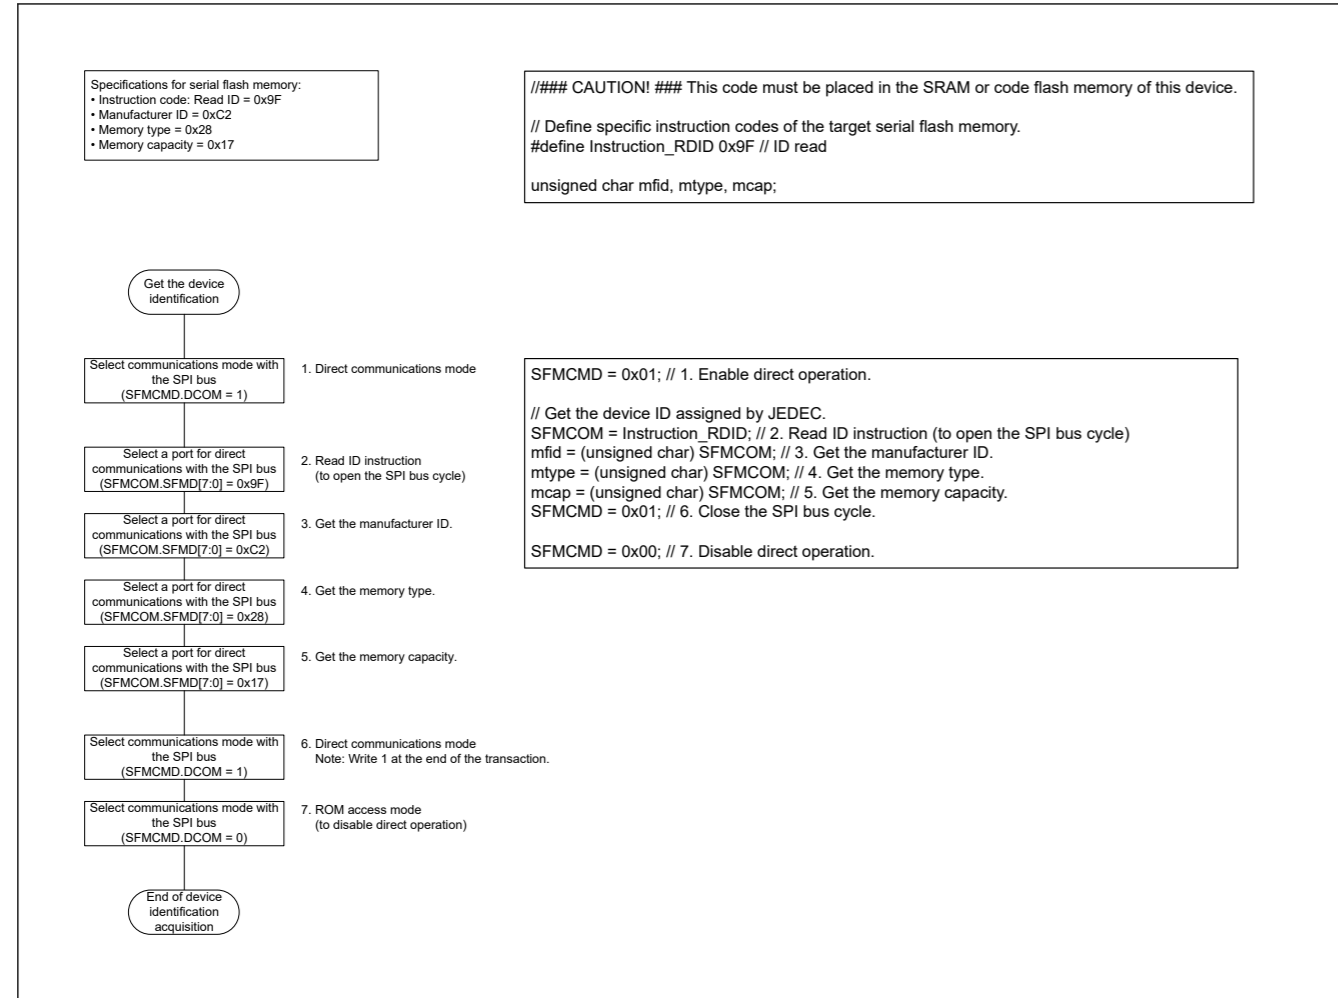

Figure 31.38 Flowchart of Device ID Acquisition

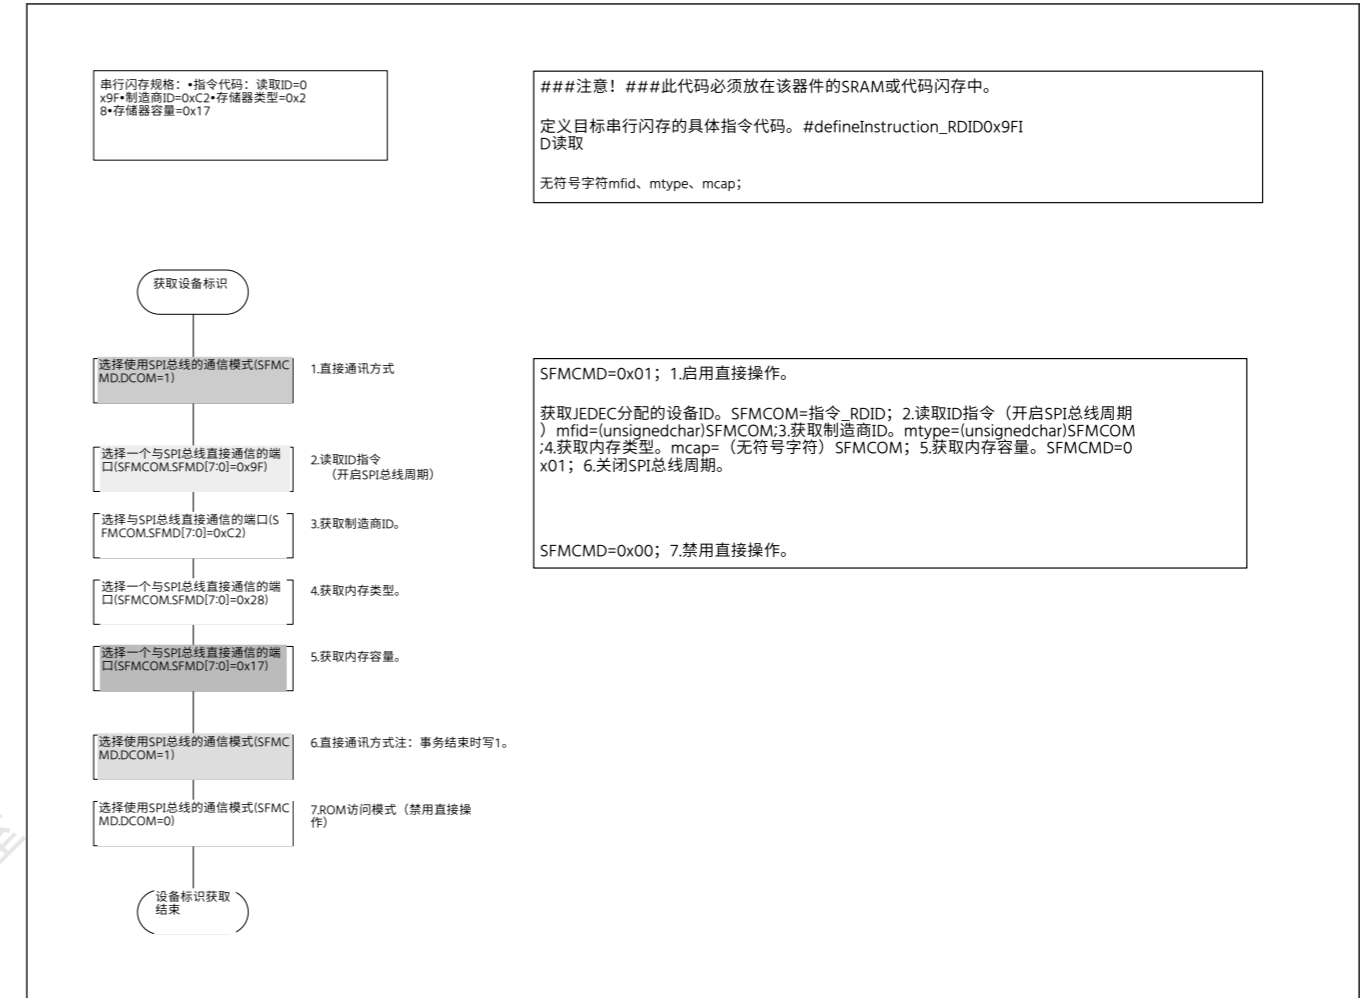

Figure 31.38 设备ID获取流程图

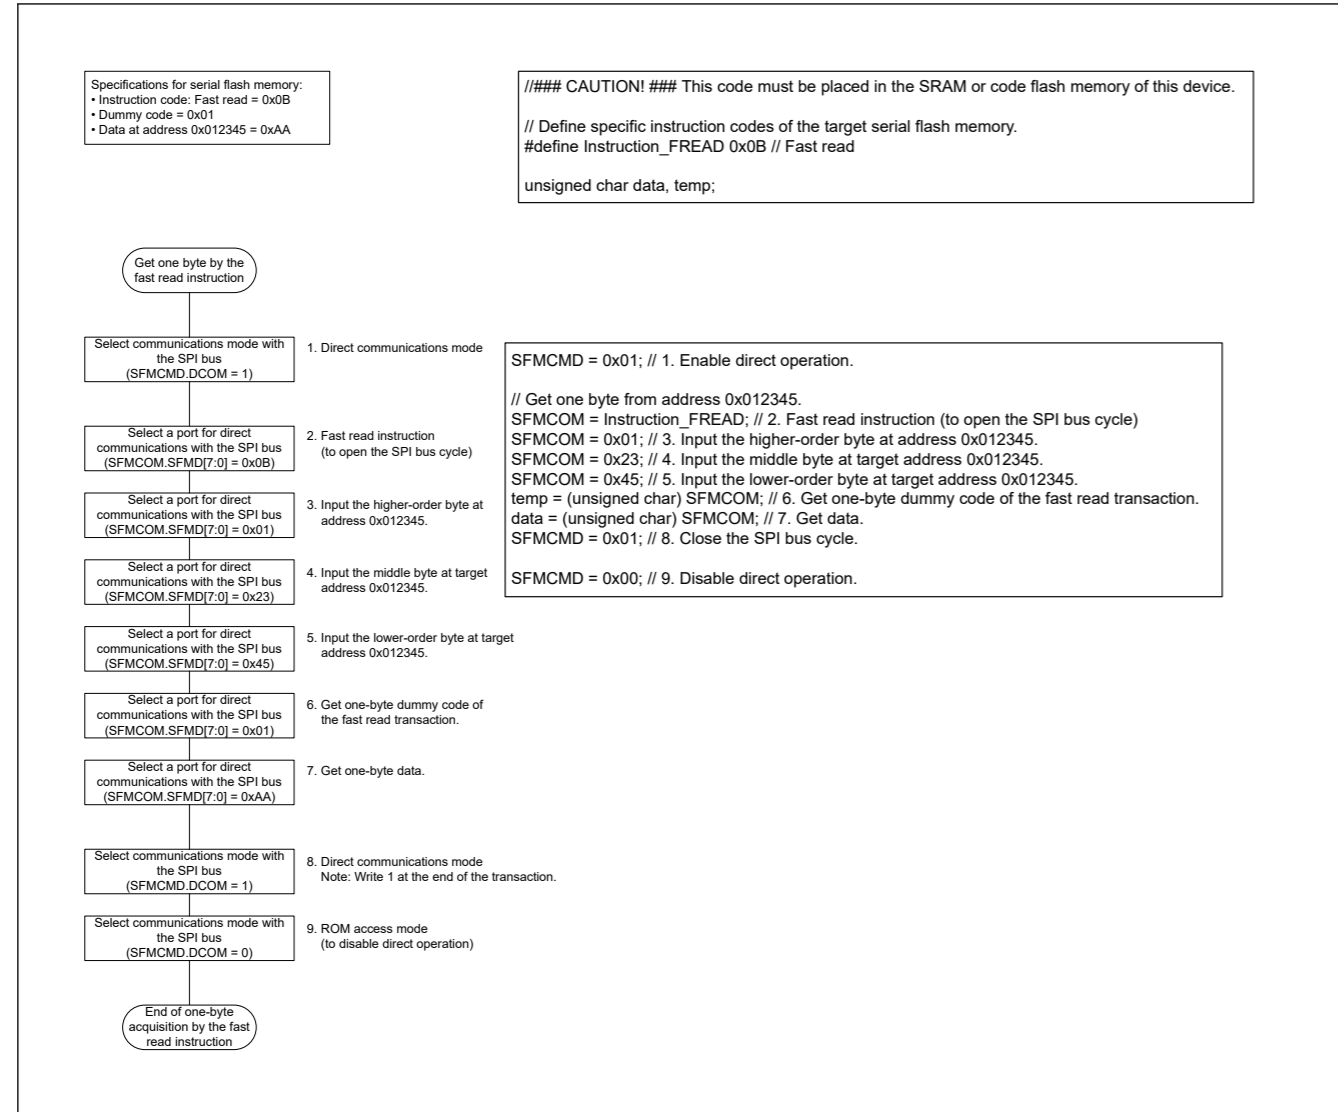

Figure 31.39 Flowchart of One-byte Acquisition by the Fast Read Instruction

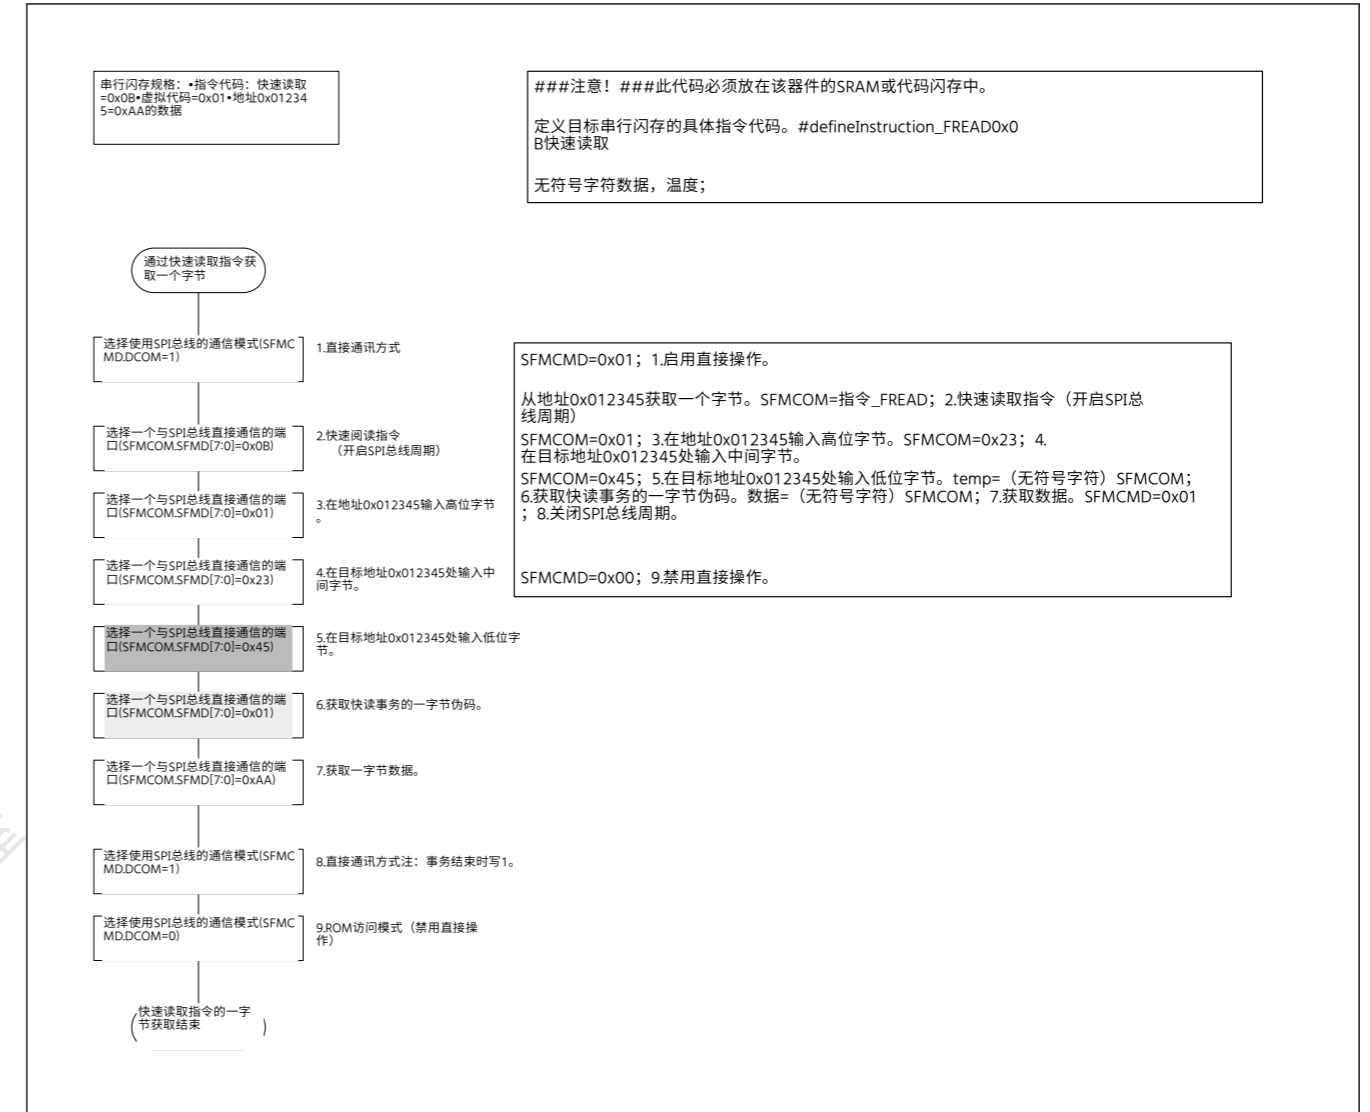

Figure 31.39 快速读取指令获取一字节的流程图

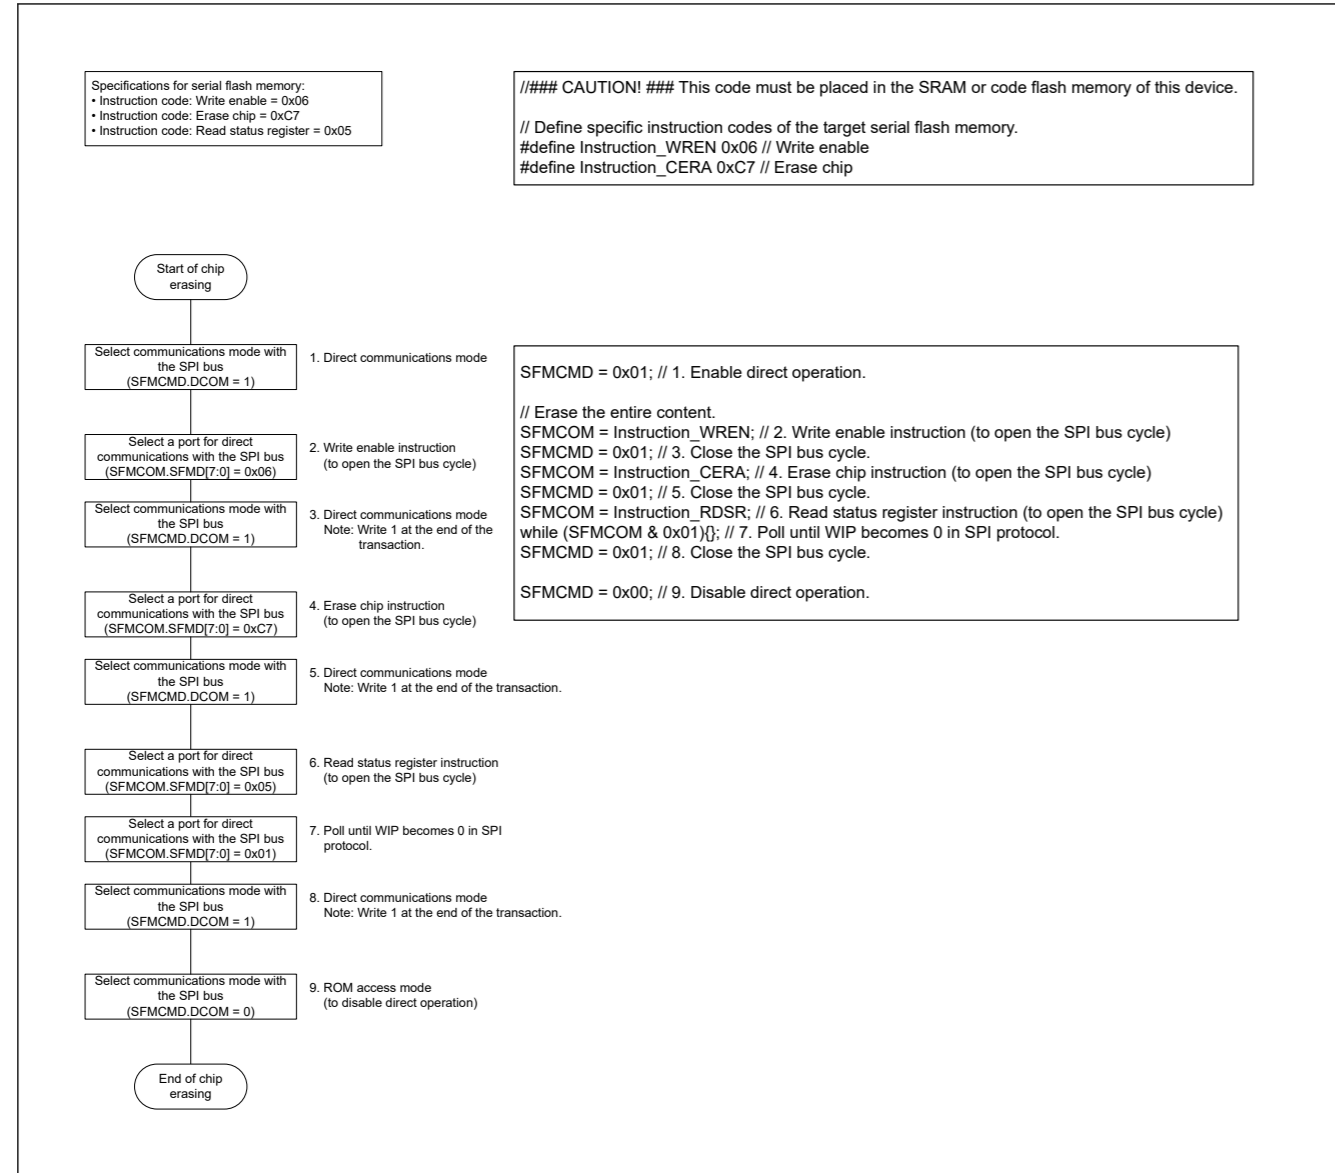

Figure 31.40 Flowchart of Chip Erasing

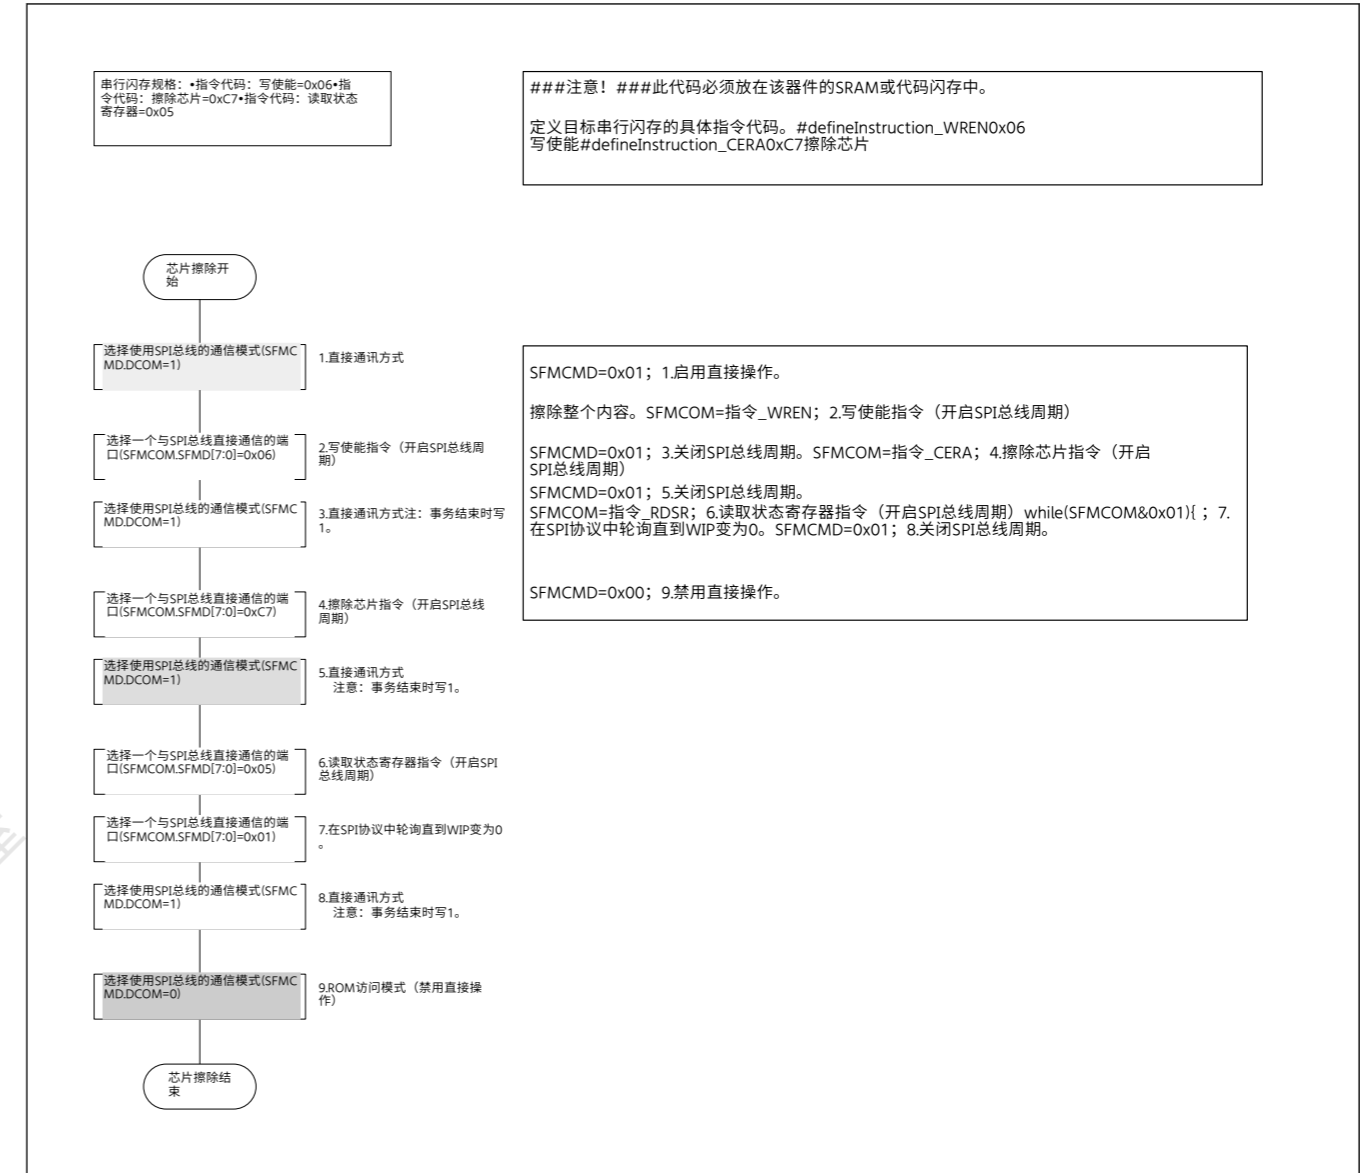

Figure 31.40 芯片擦除流程图

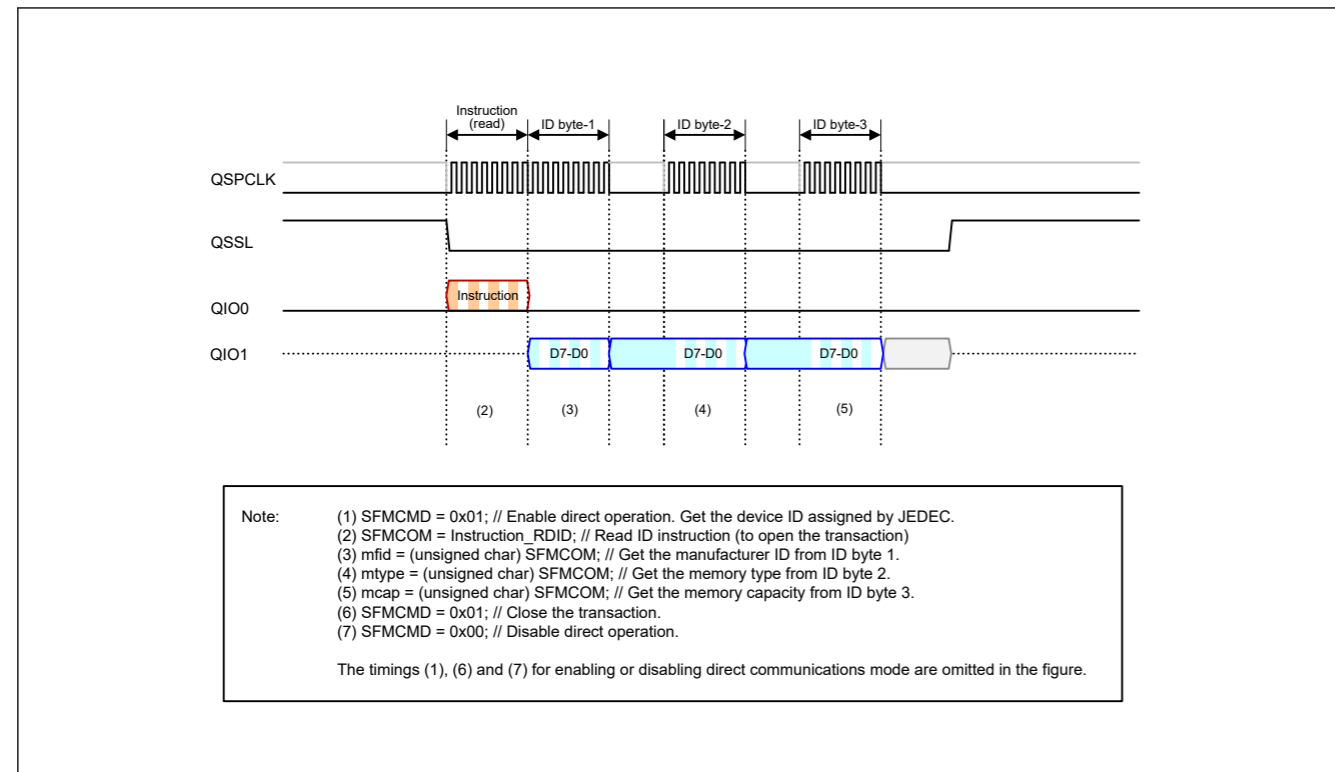

Figure 31.41 Example of direct communication timing for ID read

Note: When the Single SPI Protocol, Extended SPI Protocol is used in direct communication mode, the standard Read or Fast Read instruction must be used to reference the contents of the serial flash memory. The QSPI does not support Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, or Fast Read Quad I/O transfers in this configuration. When these Fast Read operations are required, use ROM access memory.

### 31.11 Interrupts

When ROM read access is detected in direct communication mode, the SPMCST.EROMR flag is set to 1 and QSPI generates an interrupt request. Interrupt requests are retained until the EROMR flag is cleared by a 0 write. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

### 31.12 Usage Note

#### 31.12.1 Settings for the Module-Stop Function

QSPI operation can be disabled or enabled using Module Stop Control Register B (MSTPCRB). The QSPI is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

#### 31.12.2 Procedure for Changing Settings in Multiple Control Registers

The settings of the QSPI control registers can be modified dynamically during system operation. However, when the settings of multiple control registers are changed sequentially, an SPI bus cycle might occur before all of the registers are updated. The register setting sequence must be designed so that the SPI bus timing specifications are satisfied at all stages of register setting modification.

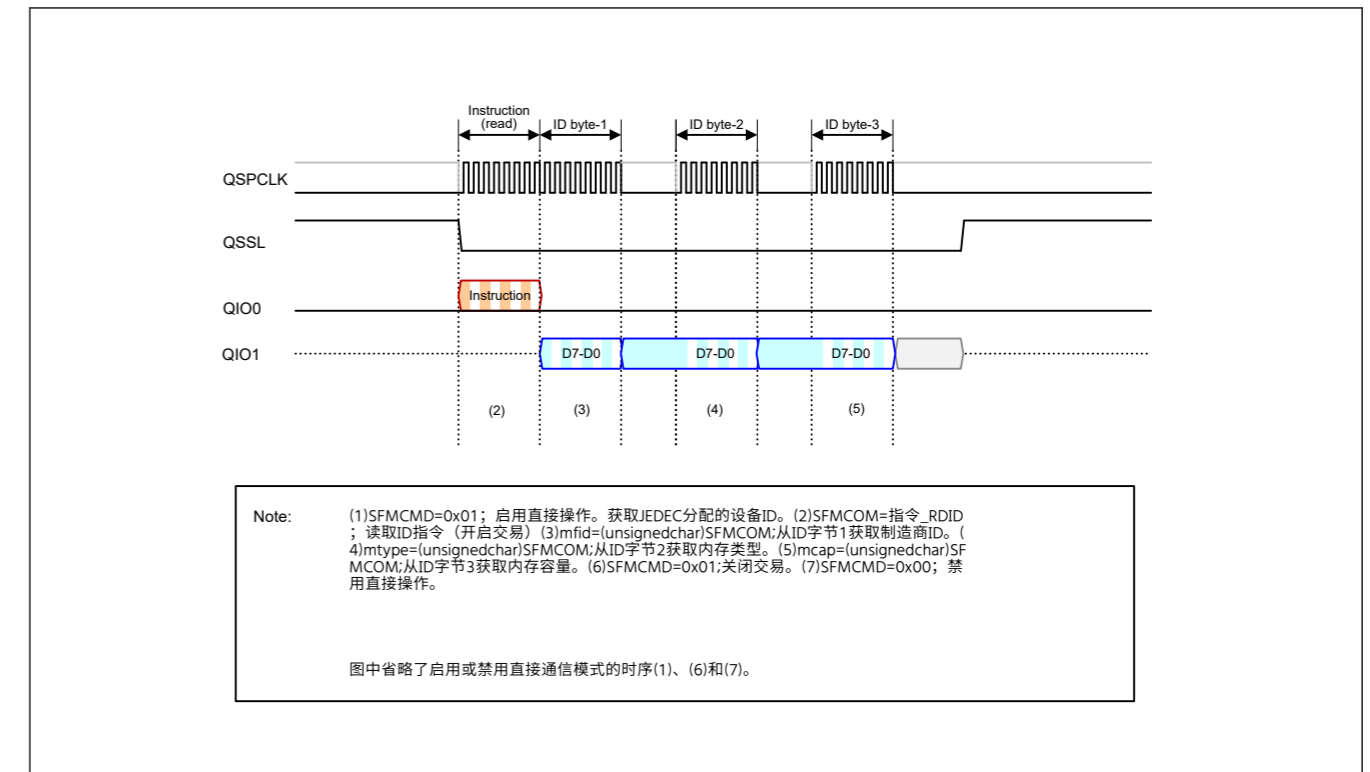

Figure 31.41 ID读取的直接通信时序示例

Note: 当单SPI协议、扩展SPI协议用于直接通信模式时，标准的Read或必须使用快速读取指令来引用串行闪存的内容。QSPI不支持此配置中的快速读取双输出、快速读取双IO、快速读取四输出或快速读取四IO传输。当需要这些快速读取操作时，请使用ROM存取存储器。

### 31.11 Interrupts

当在直接通信模式下检测到ROM读访问时，SPMCST.EROMR标志设置为1，并且QSPI产生中断请求。中断请求被保留，直到EROMR标志被0写入清除。有关详细信息，请参阅第13节，中断控制器单元(ICU)。

### 31.12 使用说明

#### 31.12.1 模块停止功能的设置

可以使用模块停止控制寄存器B(MSTPCRB)禁用或启用QSPI操作。QSPI在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

#### 31.12.2 更改多个控制寄存器中的设置的步骤

QSPI控制寄存器的设置可以在系统运行期间动态修改。但是，当多个控制寄存器的设置依次更改时，可能会在所有寄存器更新之前发生一个SPI总线周期。必须设计寄存器设置序列，以便在寄存器设置修改的所有阶段都满足SPI总线时序规范。

## 32. Serial Sound Interface Enhanced (SSIE)

### 32.1 Overview

The Serial Sound Interface Enhanced (SSIE) can transmit and receive audio data to and from various devices that support any of audio data formats, such as I<sup>2</sup>S, monaural, and TDM.

### 32.2 Features

Table 32.1 Features of SSIE

| Item   | Description   |  |
|--|---|--|
| Number of channels   | One channel, SSIE0  |  |
| Communication mode   | <ul style="list-style-type: none"> <li>Master/slave</li> <li>Transmission/reception (SSIE0 full duplex communication or half-duplex communication)</li> </ul>   |  |
| Communication format   | <ul style="list-style-type: none"> <li>I<sup>2</sup>S format</li> <li>Monaural format</li> <li>TDM format</li> </ul>  |  |
| Serial data  | <ul style="list-style-type: none"> <li>MSB first</li> <li>Data can be left-justified or right-justified.</li> <li>Data delay (1 clock cycle) or no delay selectable for the period from SSILRCK/SSIFS to SSITXD0/SSIRXD0/SSIDATA0</li> <li>System word length: 8, 16, 24, 32, 48, 64, 128, or 256 bits</li> <li>Data word length: 8, 16, 18, 20, 22, 24, or 32 bits</li> <li>Padding polarity: Low or high</li> </ul> |  |
| Bit clock (SSIBCK)   | In master mode  | <ul style="list-style-type: none"> <li>Two clock sources available (AUDIO_CLK/GPT output (GTIOC2A))</li> <li>Clock source division ratio: 1/1, 1/2, 1/4, 1/6, 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, 1/64, 1/96, and 1/128.</li> <li>Supply/stop is selectable while communication is halted.</li> </ul> |
|  | In master/slave mode  | <ul style="list-style-type: none"> <li>Polarity (rising edge or falling edge) selectable</li> </ul>  |
| LR clock/frame synchronization (SSILRCK/SSIFS)                       | In master mode  | <ul style="list-style-type: none"> <li>Polarity (low level or high level) selectable</li> <li>Supply/stop is selectable while communication is halted.</li> </ul>  |
| Transmit data (SSITXD0/SSIDATA0) and receive data (SSIRXD0/SSIDATA0) | Transmission  | <ul style="list-style-type: none"> <li>Muting method (transmission of transmit FIFO data or transmission of data fixed to 0) selectable</li> </ul>   |
| FIFO   | Capacity  | <ul style="list-style-type: none"> <li>Transmit FIFO/receive FIFO: 4 bytes × 32 stages</li> </ul>  |
|  | Data alignment  | <ul style="list-style-type: none"> <li>Data alignment method (left-justification or right-justification) selectable for the data transfer between FIFO and shift register</li> </ul>   |
| Interrupt  | Interrupt output  | <ul style="list-style-type: none"> <li>Communication error/idle mode</li> <li>Receive data full</li> <li>Transmit data empty</li> </ul>  |
| Low power consumption function                                       |   |  |
| Module stop function   | <ul style="list-style-type: none"> <li>Module stop state can be set to reduce power consumption.</li> </ul>   |  |
| TrustZone Filter   | <ul style="list-style-type: none"> <li>Security attribution can be set.</li> </ul>  |  |

The following table lists and defines the terms used for the communication formats SSIE can use:

Table 32.2 Definition of terms (1 of 2)

| Term          | Definition   |
|---------------|--|
| Start trigger | First edge of the signal on the SSILRCK/SSIFS pin when the signal is set to the value specified in LRCKP to enable communication |

## 32. 串行声音接口增强(SSIE)

### 32.1 Overview

增强型串行声音接口(SSIE)可以向各种支持任何音频数据格式(例如I<sup>2</sup>S、单声道和TDM)的设备发送和接收音频数据。

### 32.2 Features

Table 32.1 SSIE的特点

| Item   | Description  |   |
|--|--|---|
| 通道数  | 一个通道, SSIE0  |   |
| 通讯方式   | <ul style="list-style-type: none"> <li>Master/slave</li> <li>发送接收 (SSIE0全双工通信或半双工通信)</li> </ul>  |   |

| 30                                      | CKS                    | Selects an Audio Clock for Master-mode Communication*1<br>0: Selects the AUDIO_CLK input<br>1: Selects the GTIOC2A (GPT output)   | R/W                                     |  |  |  |          |                        |                |           |     |   |   |                    |     |                    |                    |   |     |  |  |   |     |  |  |   |     |
| 31                                      | —                      | This bit is read as 0. The write value should be 0.   | R/W                                     |  |  |  |          |                        |                |           |     |   |   |                    |     |                    |                    |   |     |  |  |   |     |  |  |   |     |

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If the value of these bits is changed by rewriting, subsequent operation is unpredictable.

Note 2. If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If the value of the TEN or REN bit is changed by rewriting, subsequent operation is unpredictable. For example, when transmission or reception is enabled, check that SSISR.IIRQ is 0; when transmission or reception is disabled, check that SSISR.IIRQ is 1.

With this register, select an audio clock, control interrupt requests, select data formats, and set an operation mode.

| 30                      | CKS                    | 选择主模式通信的音频时钟*1<br>0: 选择AUDIO_CLK输入<br>1: 选择GTIOC2A (GPT输出)  | R/W                     |  |  |  |          |                        |                |           |     |   |   |      |     |      |      |   |     |  |  |   |     |  |  |   |     |
| 31                      | —                      | 该位读取为0。写入值应为0。  | R/W                     |  |  |  |          |                        |                |           |     |   |   |      |     |      |      |   |     |  |  |   |     |  |  |   |     |

注1.禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果这些位的值通过重写而改变,后续的操作是不可预知的。

注2.如果TEN位或REN位被重写,请确保SSISR.IIRQ位处于所需状态。如果TEN或REN位的值因重写而改变,后续操作将无法预测。例如,启用发送或接收时,检查SSISR.IIRQ是否为0;当发送或接收被禁用时,检查SSISR.IIRQ是否为1。

使用该寄存器,选择音频时钟、控制中断请求、选择数据格式和设置操作模式。

**TEN and REN bits (Transmission and Reception Enable)**

The TEN and REN bits enable/disable transmission and reception. When 1 is written to one of these bits, the corresponding communication operation starts in synchronization with a start trigger by the SSILRCK/SSIFS signal. For details, see [section 32.8.2. Transmission](#) to [section 32.8.4. Transmission and Reception](#). When 0 is written to this bit, the current communication operation stops at the next frame boundary. To use SSIE for both transmission and reception, always write 1 to these bits together. When stopping the communication using SSIE, always disable both transmission and reception (write 0 to the TEN and REN bits).

If you want to stop SSIE before a frame boundary is reached, perform a software reset procedure.

**MUEN bit (Mute Enable)**

The MUEN bit sets/clears the mute function for the data output from the SSITXD0/SSIDATA0 pin. When this bit is set to 1 in the middle of a frame, the SSITXD0/SSIDATA0 output changes to 0 at the next frame boundary. When this bit is set to 0 in the middle of a frame, the SSITXD0/SSIDATA0 output changes to the data of transmit FIFO data register at the next frame boundary. Note that this bit controls data only. Status flags and interrupt signals are normally generated.

Changing the value of this bit must be performed only after setting the communication format to be used.

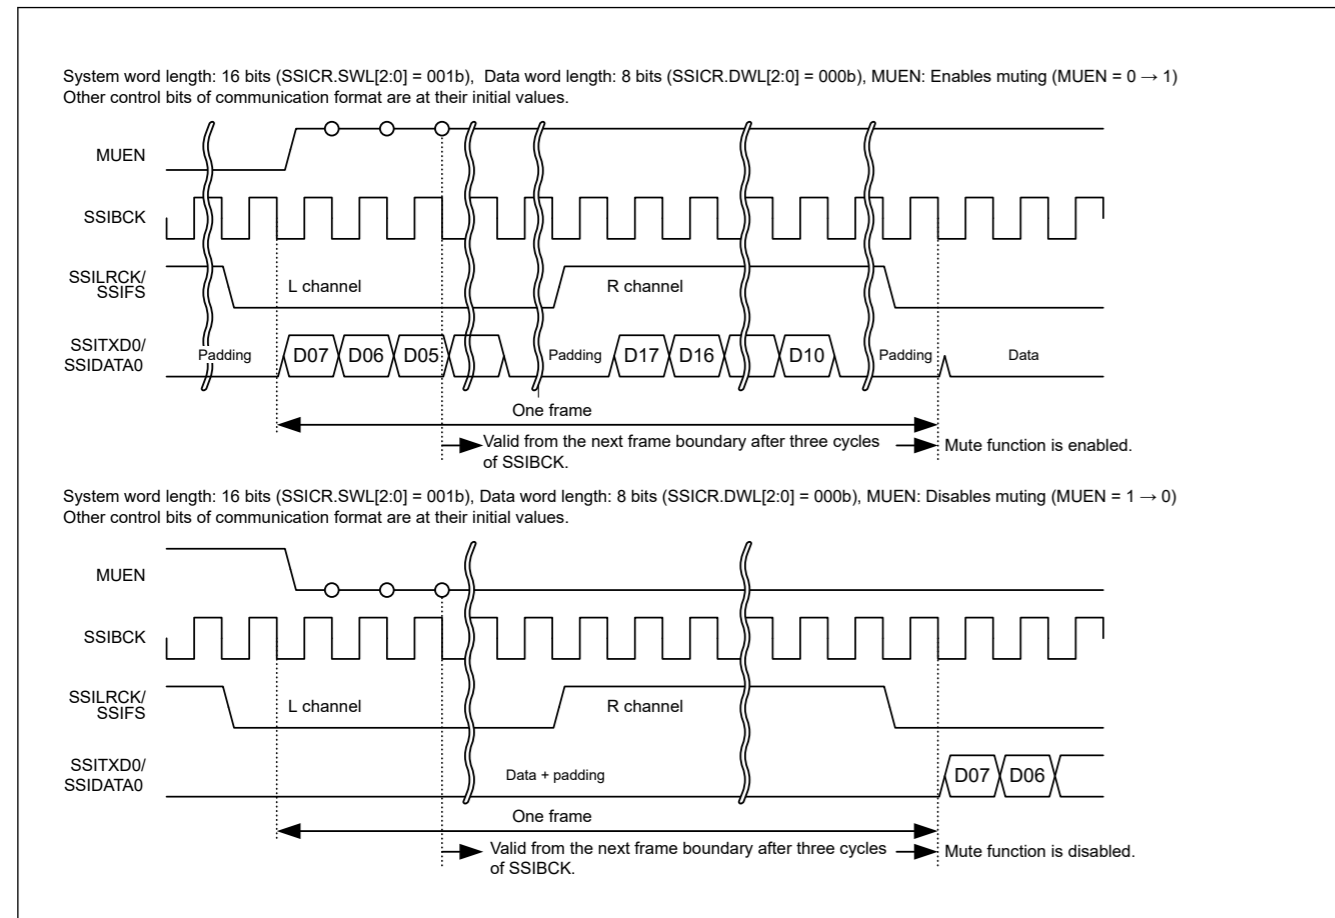

Figure 32.5 Transmit data with the mute function set

**CKDV[3:0] bits (Selects Bit Clock Division Ratio)**

The CKDV[3:0] bits set the division ratio of the bit clock based on AUDIO\_MCK in master-mode communication (MST=1). In slave-mode communication (MST=0), setting of these bits are invalid.

Writing to this bit must be performed when the supply of AUDIO\_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in [section 32.4.3. SSIFCR : FIFO Control Register](#).

**TEN和REN位 (发送和接收使能)**

TEN和REN位使能禁用发送和接收。当这些位之一写入1时，相应的通信操作与SSILRCK/SSIFS信号的开始触发同步开始。有关详细信息，请参阅第32.8.2节。传输到第32.8.4节。传输和接收。当向该位写入0时，当前通信操作在下一帧边界处停止。要同时使用SSIE进行发送和接收，请始终将1一起写入这些位。使用SSIE停止通信时，始终禁用发送和接收（将0写入TEN和REN位）。

如果要在达到帧边界之前停止SSIE，请执行软件复位程序。

**MUEN bit (Mute Enable)**

MUEN位设置清除SSITXD0/SSIDATA0引脚数据输出的静音功能。当该位在帧中间设置为1时，SSITXD0/SSIDATA0输出在下一帧边界变为0。当该位在帧中间设置为0时，SSITXD0/SSIDATA0输出在下一帧边界变为发送FIFO数据寄存器的数据。请注意，该位仅控制数据。通常会产生状态标志和中断信号。

只有在设置要使用的通信格式后才能更改该位的值。

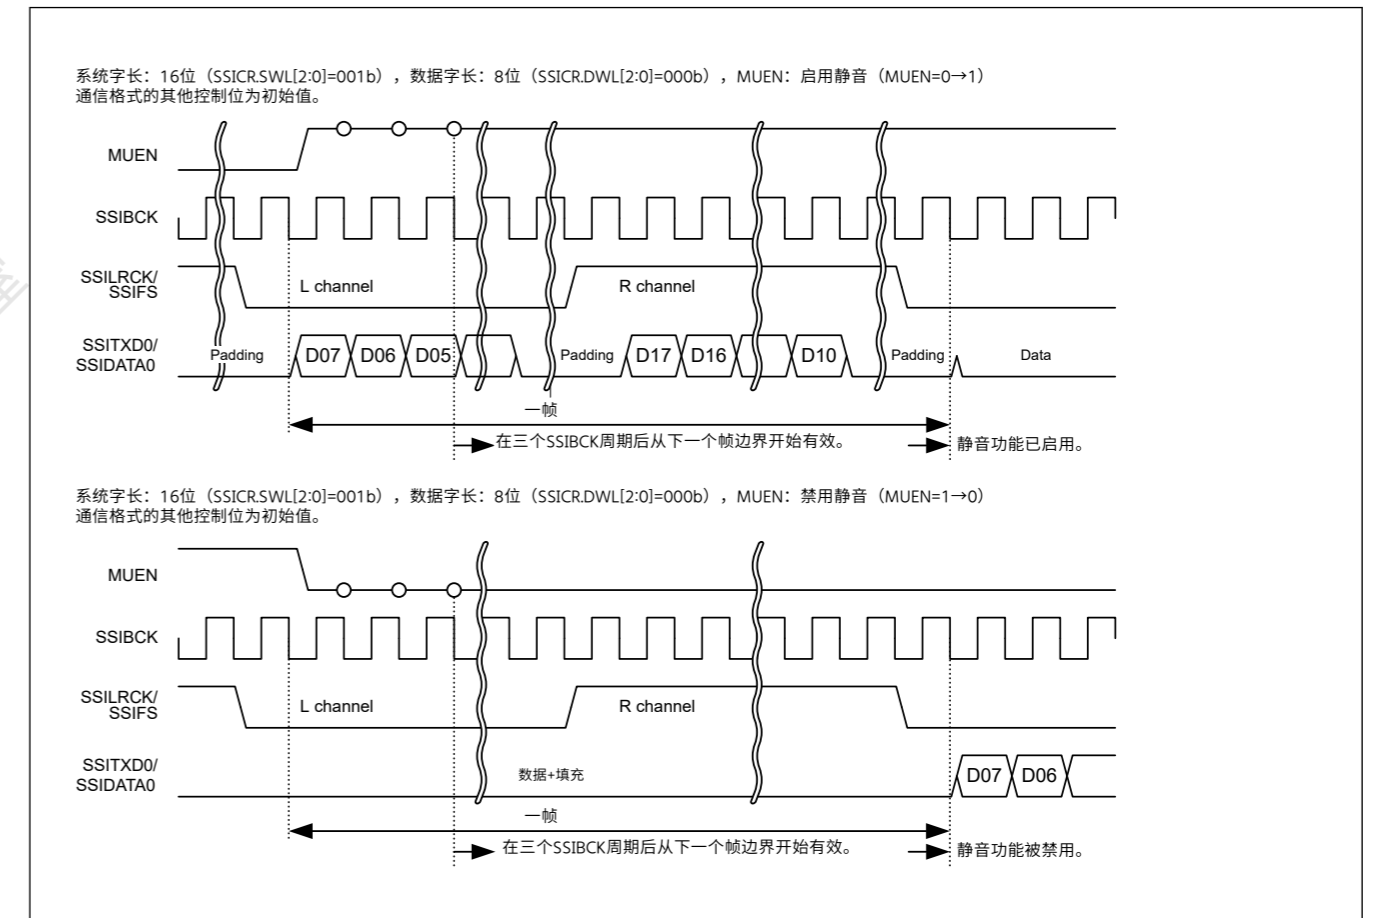

Figure 32.5 设置静音功能传输数据

**CKDV[3:0]位 (选择位时钟分频比)**

CKDV[3:0]位在主模式通信(MST=1)中根据AUDIO\_MCK设置位时钟的分频比。在从机模式通信(MST=0)中，这些位的设置无效。

当停止提供AUDIO\_MCK时，必须执行写入该位。有关时序的详细信息，请参见第32.4.3节中对AUCKE位的详细说明。SSIFCR: FIFO控制寄存器。

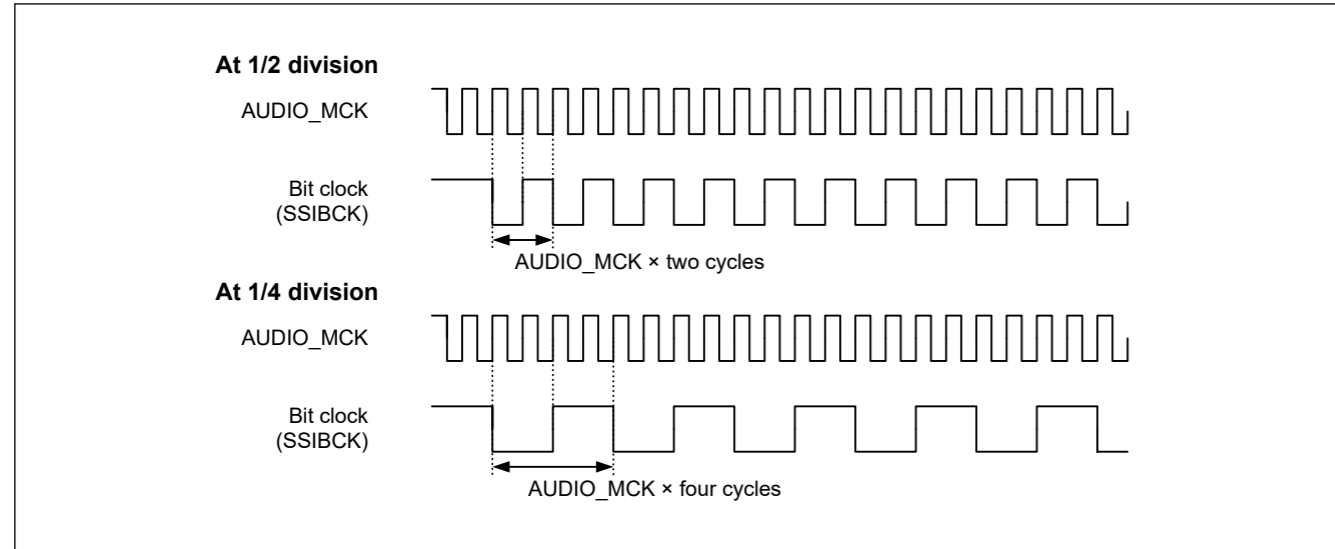

Figure 32.6 Sampling frequencies in master-mode communication

**DEL bit (Selects Serial Data Delay)**

The DEL bit sets whether or not there will be a delay between SSILRCK/SSIFS and SSITXD0/SSIRXD0/SSIDATA0.

For the I<sup>2</sup>S or TDM format, set the DEL bit to 0. When the monaural format is used, setting of this bit changes the high period width of SSILRCK/SSIFS. For details, see section 32.5.2. **Monaural Format**. When using a compatible communication format, specify a setting of this bit that enables communication.

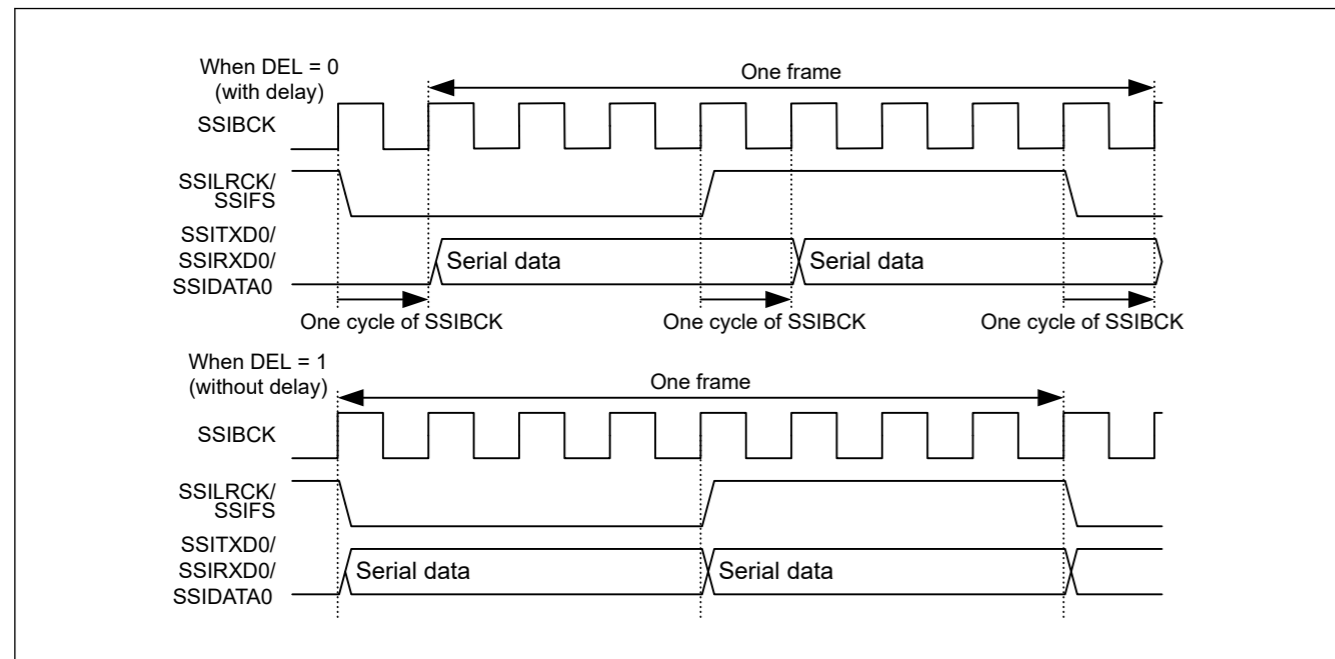

Figure 32.7 Setting of delay in serial data

**PDTA bit (Selects Placement Data Alignment)**

The PDTA bit sets how to align placement data. With the setting of data word length as 32 bits (SSICR.DWL[2:0] = 110b), this bit is invalid.

At transmission, see Figure 32.8.

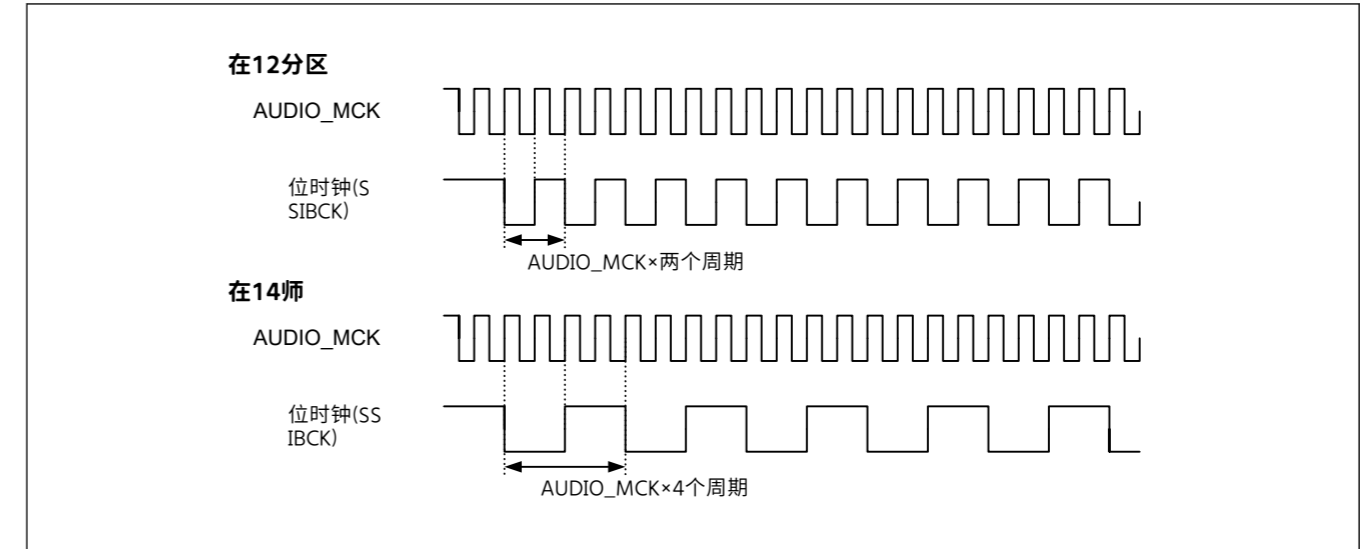

Figure 32.6 主模式通信中的采样频率

**DEL位 (选择串行数据延迟)**

DEL位设置SSILRCKSSIFS和SSITXD0SSIRXD0SSIDATA0之间是否会有延迟。

对于I<sup>2</sup>S或TDM格式，将DEL位设置为0。当使用单声道格式时，该位的设置会改变SSILRCKSSIFS的高周期宽度。有关详细信息，请参阅第32.5.2节。单声道格式。使用兼容的通信格式时，指定该位的设置以启用通信。

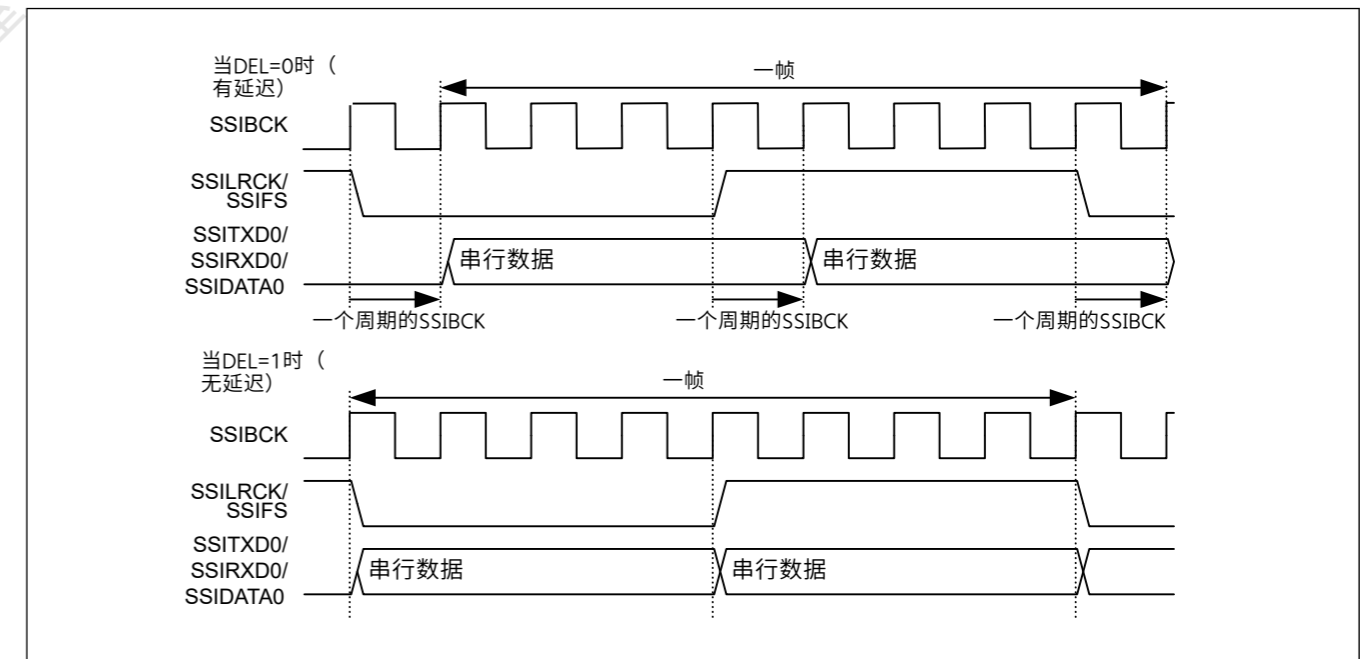

Figure 32.7 串行数据延迟设置

**PDTA位 (选择布局数据对齐)**

PDTA位设置如何对齐布局数据。数据字长设置为32位 (SSICR.DWL[2:0]=110b) 时，该位无效。

传输时，见图32.8。

Figure 32.9 Alignment of placement data at reception

**SDTA bit (Selects Serial Data Delay)**

The SDTA bit sets how to align serial data and padding bits. For communication without padding bits, this bit is invalid.

Figure 32.9 在接收时对齐放置数据

**SDTA位 (选择串行数据延迟)**

SDTA位设置如何对齐串行数据和填充位。对于没有填充位的通信，该位无效。

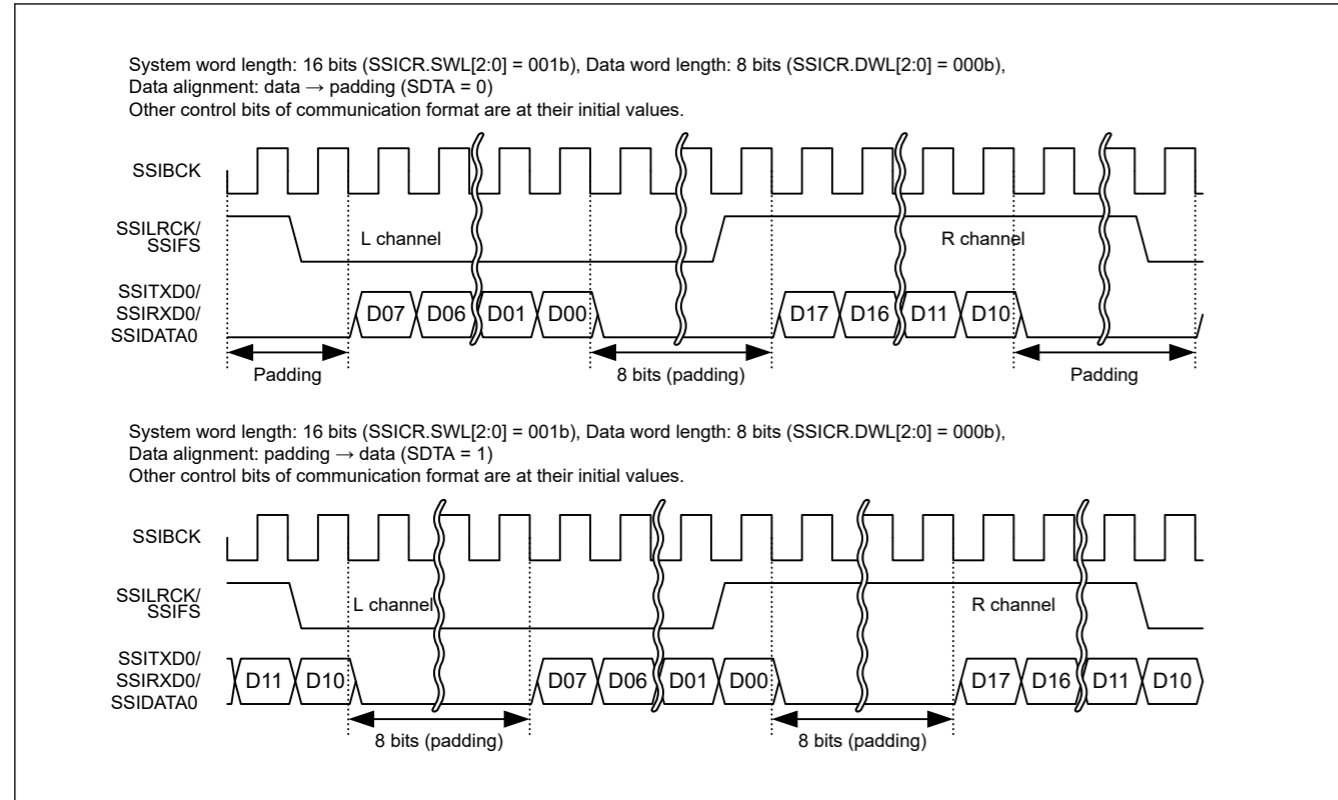

Figure 32.10 Alignment setting of serial data with padding bits

**SPDP bit (Selects Serial Padding Polarity)**

The SPDP bit sets polarity of padding bits.

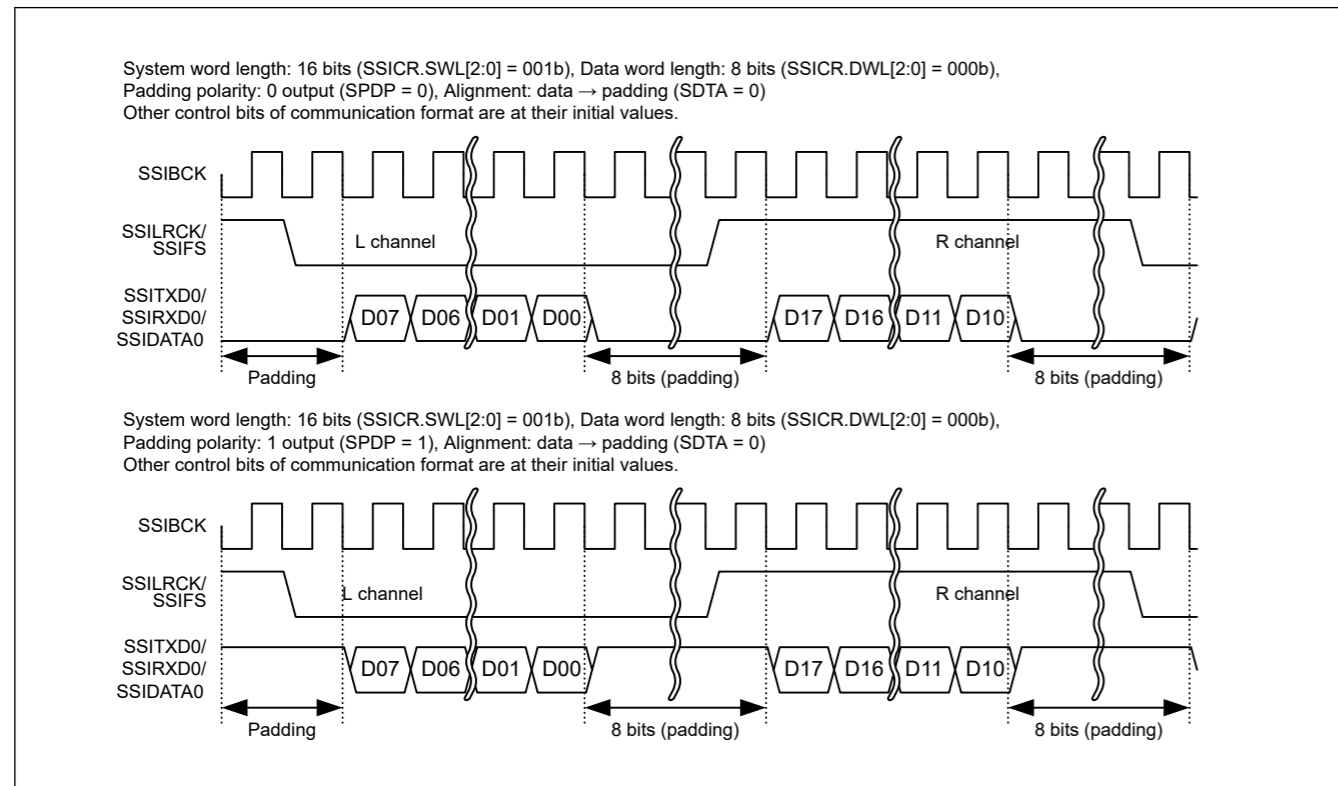

Figure 32.11 Padding bit polarity

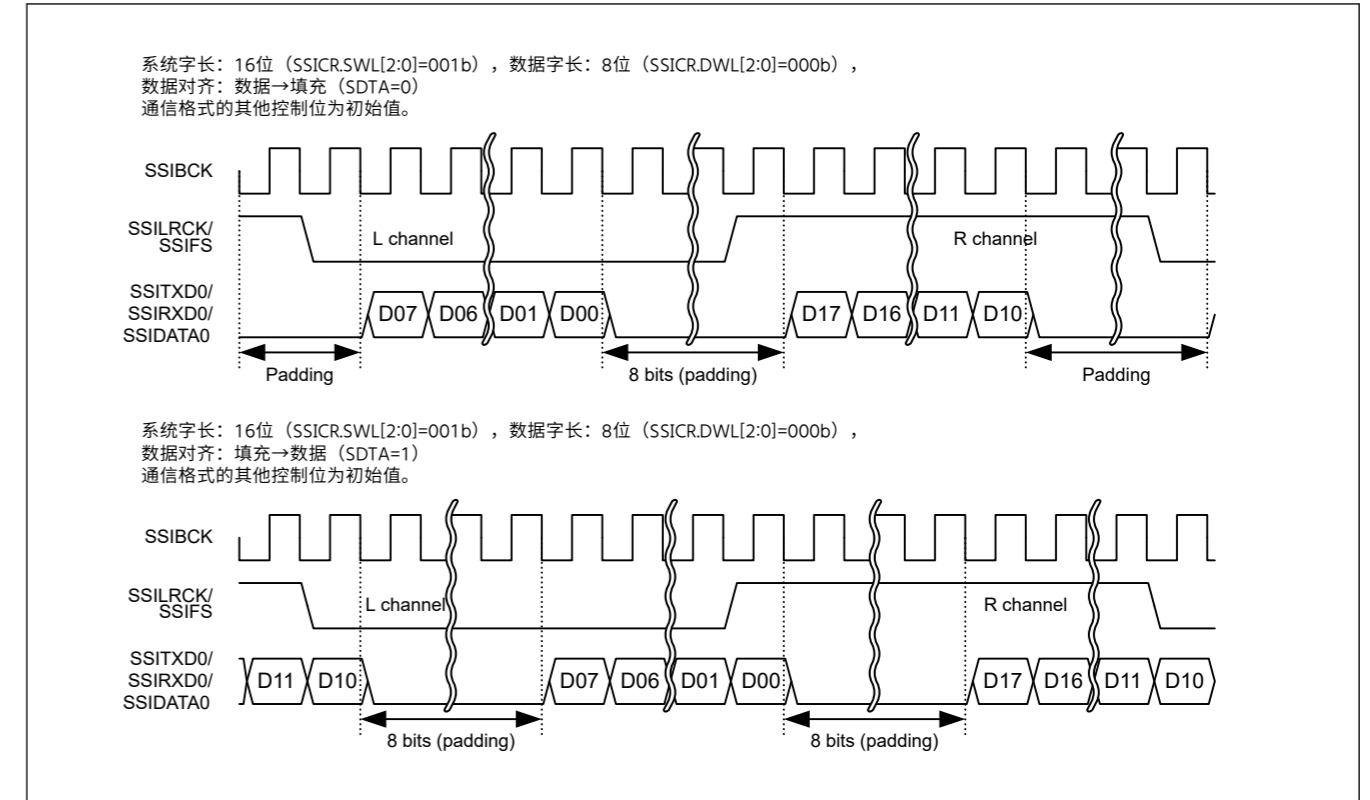

Figure 32.10 串行数据的对齐设置与填充位

**SPDP位 (选择串行填充极性)**

SPDP位设置填充位的极性。

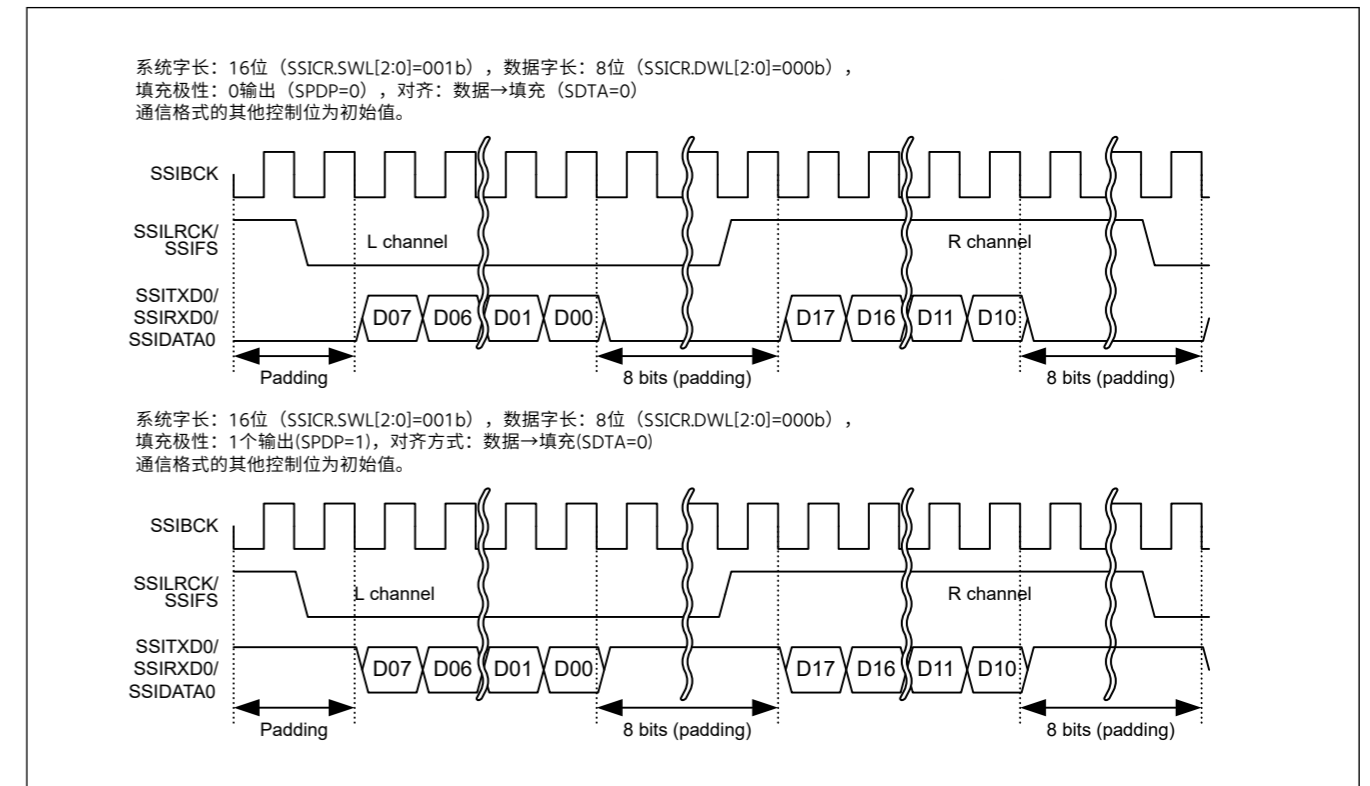

Figure 32.11 填充位极性

**LRCKP bit (Selects the Initial Value and Polarity of LR Clock/Frame Synchronization Signal)**

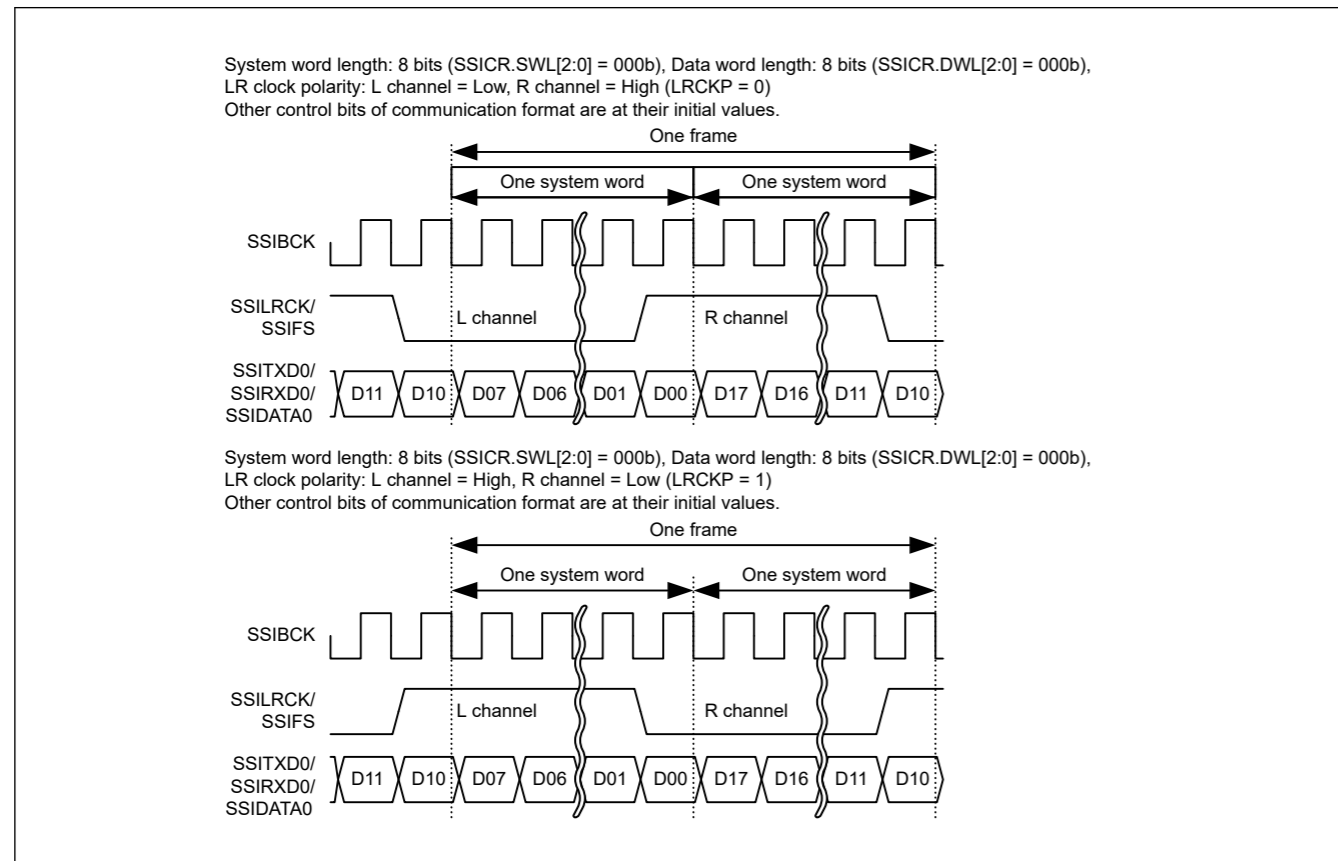

The LRCKP bit sets the initial value and polarity of SSILRCK/SSIFS. Set this bit according to the communication format to be used in SSIE. See Table 32.3 Initial output value and polarity of SSILRCK/SSIFS pin. For the slave-mode communication (MST = 0), only the start trigger is used.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in section 32.4.7. SSIOFR : Audio Format Register.

**Table 32.3 Initial output value and polarity of SSILRCK/SSIFS pin**

| Communication Format | Expected Initial State | Setting Value of LRCKP |
|----------------------|------------------------|------------------------|
| I <sup>2</sup> S     | High                   | 0                      |
| Monaural             | Low                    | 1                      |
| TDM                  | Low                    | 1                      |

Note: When the format to be used is compatible with the I<sup>2</sup>S, monaural, or TDM format, specify settings to enable communication with the respective formats.

**Figure 32.12 LR clock/frame synchronization polarity setting**

**BCKP bit (Selects Bit Clock Polarity)**

The BCKP bit sets the bit clock polarity.

Writing to this bit must be performed when the supply of AUDIO\_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in section 32.4.3. SSIFCR : FIFO Control Register.

**Table 32.4 Bit clock polarity (1 of 2)**

| Communication | Master/Slave | Timing                       | BCKP = 0           | BCKP = 1            |
|---------------|--------------|------------------------------|--------------------|---------------------|
| Reception     | Slave        | At SSILRCK/SSIFS sampling    | SSIBCK rising edge | SSIBCK falling edge |
|               | Master/slave | At SSIRXD0/SSIDATA0 sampling | SSIBCK rising edge | SSIBCK falling edge |

**LRCKP位 (选择LR时钟帧同步信号的初始值和极性)**

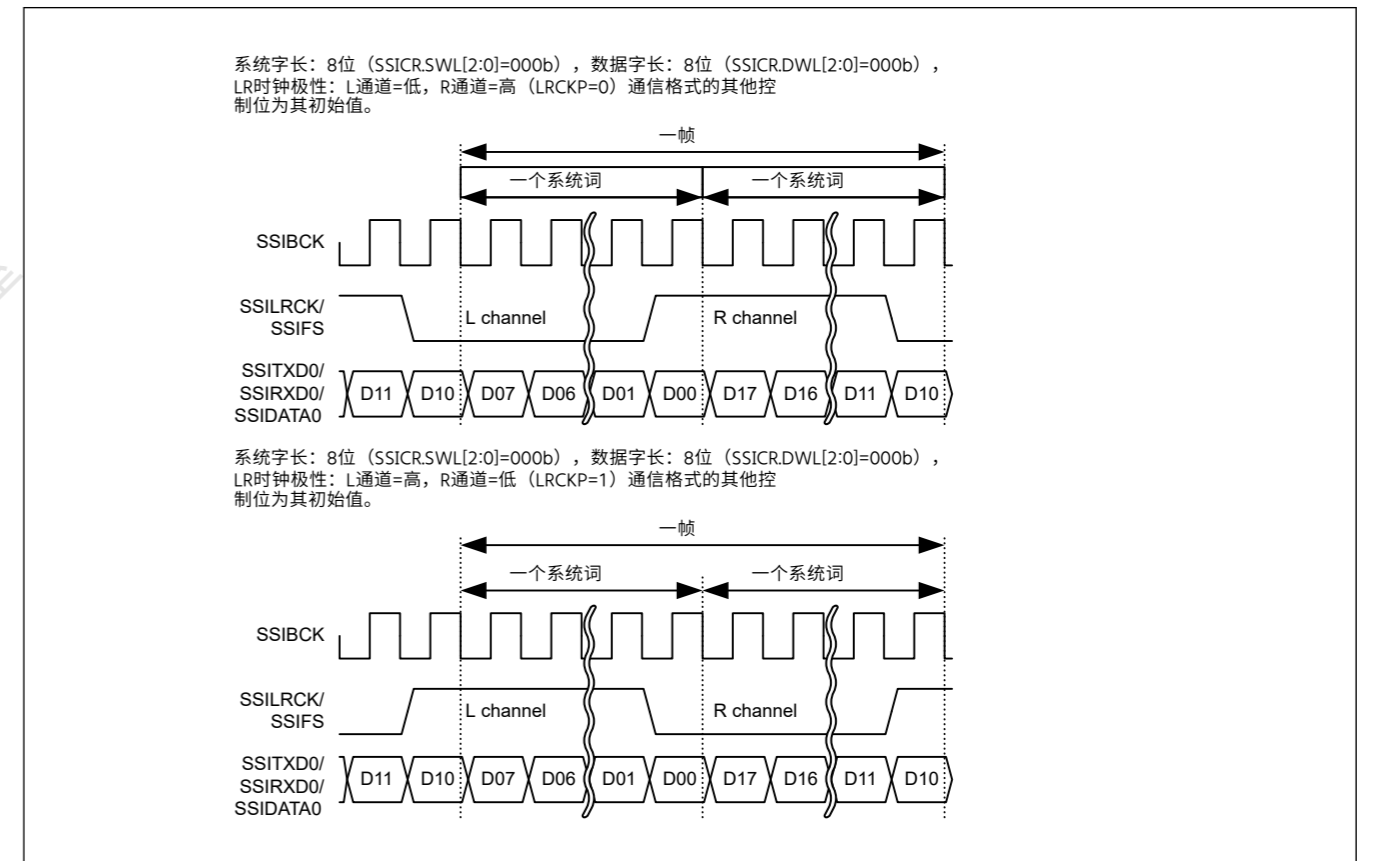

LRCKP位设置SSILRCKSSIFS的初始值和极性。根据要在SSIE中使用的通信格式设置该位。请参见表32.3SSILRCKSSIFS引脚的初始输出值和极性。对于从模式通信(MST=0)，仅使用启动触发器。

当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。LR时钟的输出详见32.4.7节LRCONT位的详细说明。SSIOFR：音频格式寄存器。

**Table 32.3 SSILRCKSSIFS管脚的初始输出值和极性**

| 通讯格式             | 预期的初始状态 | LRCKP设定值 |
|------------------|---------|----------|
| I <sup>2</sup> S | High    | 0        |
| Monaural         | Low     | 1        |
| TDM              | Low     | 1        |

Note: 当要使用的格式与I2S、单声道或TDM格式兼容时，指定设置以启用与相应格式的通信。

**Figure 32.12 LR时钟帧同步极性设置**

**BCKP位 (选择位时钟极性)**

BCKP位设置位时钟极性。

当停止提供AUDIO\_MCK时，必须执行写入该位。有关时序的详细信息，请参见第32.4.3节中对AUCKE位的详细说明。SSIFCR：FIFO控制寄存器。

**Table 32.4 位时钟极性 (1of2)**

| Communication | Master/Slave | Timing             | BCKP = 0  | BCKP = 1  |
|---------------|--------------|--------------------|-----------|-----------|
| Reception     | Slave        | 在SSILRCKSSIFS采样    | SSIBCK上升沿 | SSIBCK下降沿 |
|               | Master/slave | 在SSIRXD0SSIDATA0采样 | SSIBCK上升沿 | SSIBCK下降沿 |

Table 32.4 Bit clock polarity (2 of 2)

| Communication | Master/Slave | Timing                               | BCKP = 0            | BCKP = 1           |
|---------------|--------------|--------------------------------------|---------------------|--------------------|
| Transmission  | Master       | At change of SSILRCK/SSIFS output    | SSIBCK falling edge | SSIBCK rising edge |
|               | Master/slave | At change of SSITXD0/SSIDATA0 output | SSIBCK falling edge | SSIBCK rising edge |

**MST bit (Master Enable)**

The MST bit sets master-/slave-mode communication.

Writing to this bit must be performed when the supply of AUDIO\_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in [section 32.4.3. SSIFCR : FIFO Control Register](#).

**SWL[2:0] bits (Selects System Word Length)**

The SWL[2:0] bits set the number of bits in one system word. Padding bits are sent and received in relation with one data word set with DWL[2:0]. See [Table 32.11](#) for details.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in [section 32.4.7. SSIOFR : Audio Format Register](#).

**DWL[2:0] bits (Selects Data Word Length)**

The DWL[2:0] bits set the number of bits in one data word. The data word length (number of bits per data word) must not exceed the system word length (number of bits per system word). For details, see [Table 32.11](#).

**FRM[1:0] bits (Selects Frame Word Number)**

The FRM[1:0] bits set the frame word number in individual communication formats.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in [section 32.4.7. SSIOFR : Audio Format Register](#).

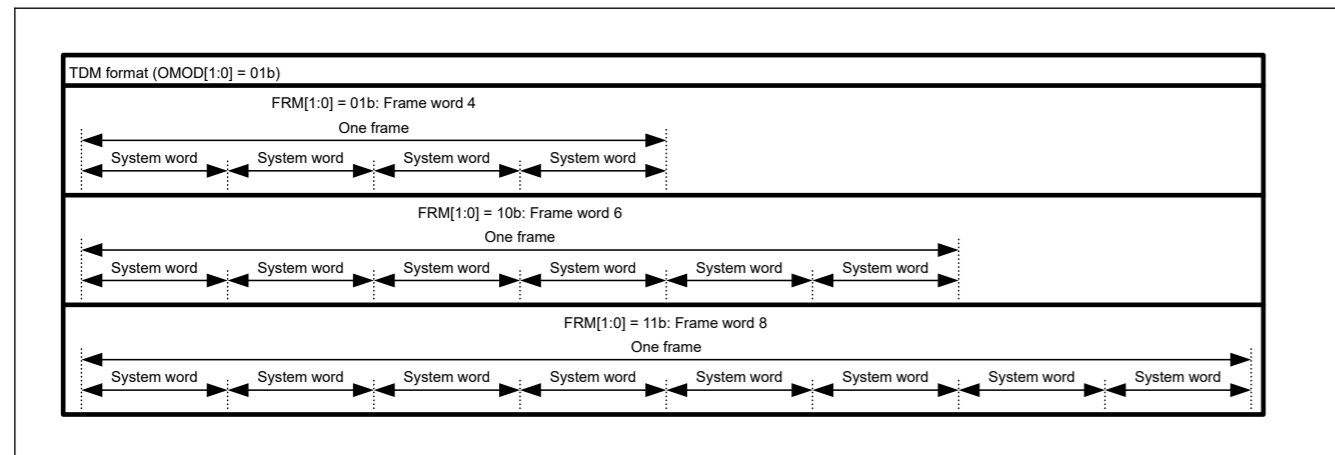

Figure 32.13 Frame word number

**IEN bit (Idle Mode Interrupt Output Enable)**

The IEN bit enables/disables output of idle mode interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.IIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.IIRQ = 1.

**ROIEN bit (Receive Overflow Interrupt Output Enable)**

The ROIEN bit enables/disables output of receive overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.ROIQR = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.ROIQR = 1.

**RUIEN bit (Receive Underflow Interrupt Output Enable)**

The RUIEN bit enables/disables output of receive underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.RUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.RUIRQ = 1.

Table 32.4 位时钟极性 (2之2)

| Communication | Master/Slave | Timing                | BCKP = 0  | BCKP = 1  |
|---------------|--------------|-----------------------|-----------|-----------|
| Transmission  | Master       | 在改变SSILRCKSSIFS输出时    | SSIBCK下降沿 | SSIBCK上升沿 |
|               | Master/slave | 在SSITXD0SSIDATA0输出变化时 | SSIBCK下降沿 | SSIBCK上升沿 |

**MST bit (Master Enable)**

MST位设置主从模式通信。

当停止提供AUDIO\_MCK时，必须执行写入该位。有关时序的详细信息，请参见第32.4.3节中对AUCKE位的详细说明。SSIFCR：FIFO控制寄存器。

**SWL[2:0]位 (选择系统字长)**

SWL[2:0]位设置一个系统字中的位数。填充位的发送和接收与使用DWL[2:0]设置的一个数据字相关。详见表32.11。

当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。LR时钟的输出详见32.4.7节LRCONT位的详细说明。SSIOFR：音频格式寄存器。

**DWL[2:0]位 (选择数据字长)**

DWL[2:0]位设置一个数据字中的位数。数据字长（每个数据字的位数）不得超过系统字长（每个系统字的位数）。详见表32.11。

**FRM[1:0]位 (选择帧字号)**

FRM[1:0]位设置各个通信格式中的帧字号。

当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。LR时钟的输出详见32.4.7节LRCONT位的详细说明。SSIOFR：音频格式寄存器。

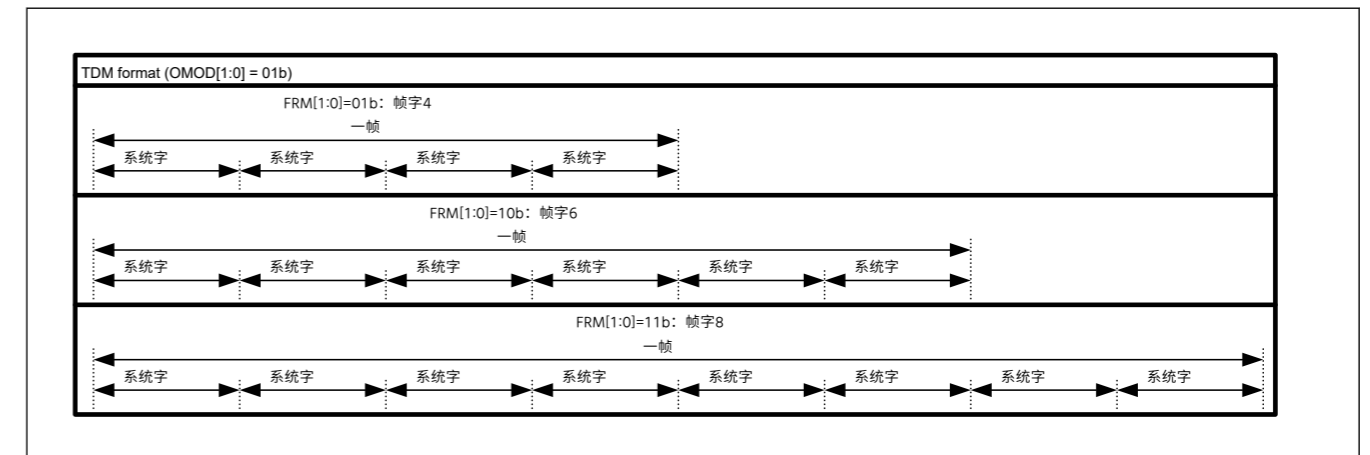

Figure 32.13 帧字数

**IEN位 (空闲模式中断输出使能)**

IEN位启用禁用空闲模式中断的输出。通过启用该位（将其设置为1），在SSISR.IIRQ=1的上升沿输出中断。当SSISR.IIRQ=1时该位从0变为1时也会输出中断。

**ROIEN位 (接收溢出中断输出使能)**

ROIEN位使能禁止接收溢出中断的输出。通过启用该位（将其设置为1），在SSISR.ROIQR=1的上升沿输出中断。当SSISR.ROIQR=1时该位从0变为1时也会输出中断。

**RUIEN位 (接收下溢中断输出使能)**

RUIEN位启用禁用接收下溢中断的输出。通过启用该位（将其设置为1），在SSISR.RUIRQ=1的上升沿输出中断。当SSISR.RUIRQ=1时该位从0变为1时也会输出中断。

**TOIEN bit (Transmit Overflow Interrupt Output Enable)**

The TOIEN bit enables/disables output of transmit overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TOIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TOIRQ = 1.

**TUIEN bit (Transmit Underflow Interrupt Output Enable)**

The TUIEN bit enables/disables output of transmit underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TUIRQ = 1.

**CKS bit (Selects an Audio Clock for Master-mode Communication)**

The CKS bit sets the audio clock in master-mode communication (MST = 1). In slave-mode communication (MST = 0), setting of this bit is invalid.

Writing to this bit must be performed when the supply of AUDIO\_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in [section 32.4.3. SSIFCR : FIFO Control Register](#).

**32.4.2 SSISR : Status Register**

Base address: SSIE0 = 0x4009\_D000

Offset address: 0x04

|                    |    |    |       |       |       |       |      |    |    |    |    |    |    |    |    |    |

| 31:30 | —      | These bits are read as 0. The write value should be 0.  | R/W |

This register is configured with status flags that indicate SSIE operational state.

**IIRQ flag (Idle Mode Status Flag)**

The IIRQ flag is a status flag that indicates the idle state. It indicates whether SSIE is in the idle state or communication state.

For details, see [Figure 32.14](#) and [Figure 32.15](#).

**TOIEN位 (发送溢出中断输出使能)**

TOIEN位使能禁用发送溢出中断的输出。通过启用该位 (将其设置为1)，在SSISR.TOIRQ=1的上升沿输出中断。当SSISR.TOIRQ=1时该位从0变为1时也会输出中断。

**TUIEN位 (发送下溢中断输出使能)**

TUIEN位使能禁用发送下溢中断的输出。通过启用该位 (将其设置为1)，在SSISR.TUIRQ=1的上升沿输出中断。当SSISR.TUIRQ=1时该位从0变为1时也会输出中断。

**CKS位 (选择主模式通信的音频时钟)**

CKS位设置主模式通信中的音频时钟(MST=1)。在从机模式通信(MST=0)中，该位的设置无效。

当停止提供AUDIO\_MCK时，必须执行写入该位。有关时序的详细信息，请参见第32.4.3节中对AUCKE位的详细说明。SSIFCR：FIFO控制寄存器。

**32.4.2 SSISR：状态寄存器**

| 29    | TUIRQ  | 发送下溢错误状态标志<br>0: 不产生发送下溢错误。1: 产生发送下溢错误。 | R/W |
| 31:30 | —      | 这些位被读取为0。写入值应为0。                        | R/W |

该寄存器配置有指示SSIE操作状态的状态标志。

**IIRQ标志 (空闲模式状态标志)**

IIRQ标志是指示空闲状态的状态标志。它指示SSIE是处于空闲状态还是通信状态。

详见图32.14和图32.15。

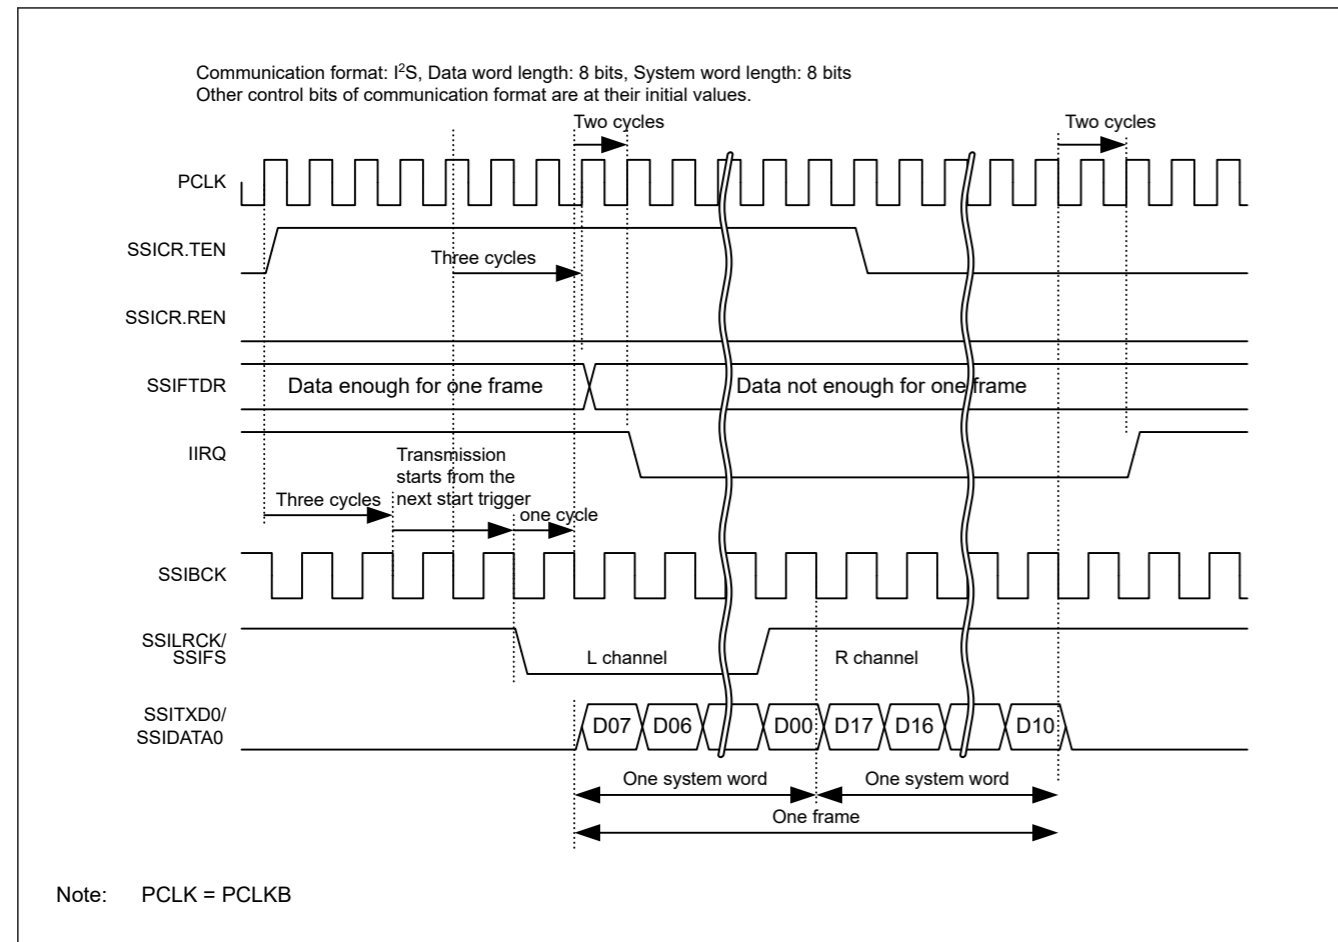

Figure 32.14 IIRQ setting timing (transmission)

- Transmitter (dedicated to transmission)

[Clearing condition]

While transmission was enabled (SSICR.TEN = 1 and SSICR.REN = 0), the transmit data for a transmission frame was written to the SSIFTDR register, and a start trigger was generated by the SSILRCK/SSIFS signal.

[Clearing timing]

1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger that is the clearing condition.

[Setting condition]

While transmission and reception were disabled (SSICR.TEN = 0 and SSICR.REN = 0), transmission of one frame was complete.

[Setting timing]

2 PCLKB cycles after the end of transmission (at a frame boundary) that is the setting condition.

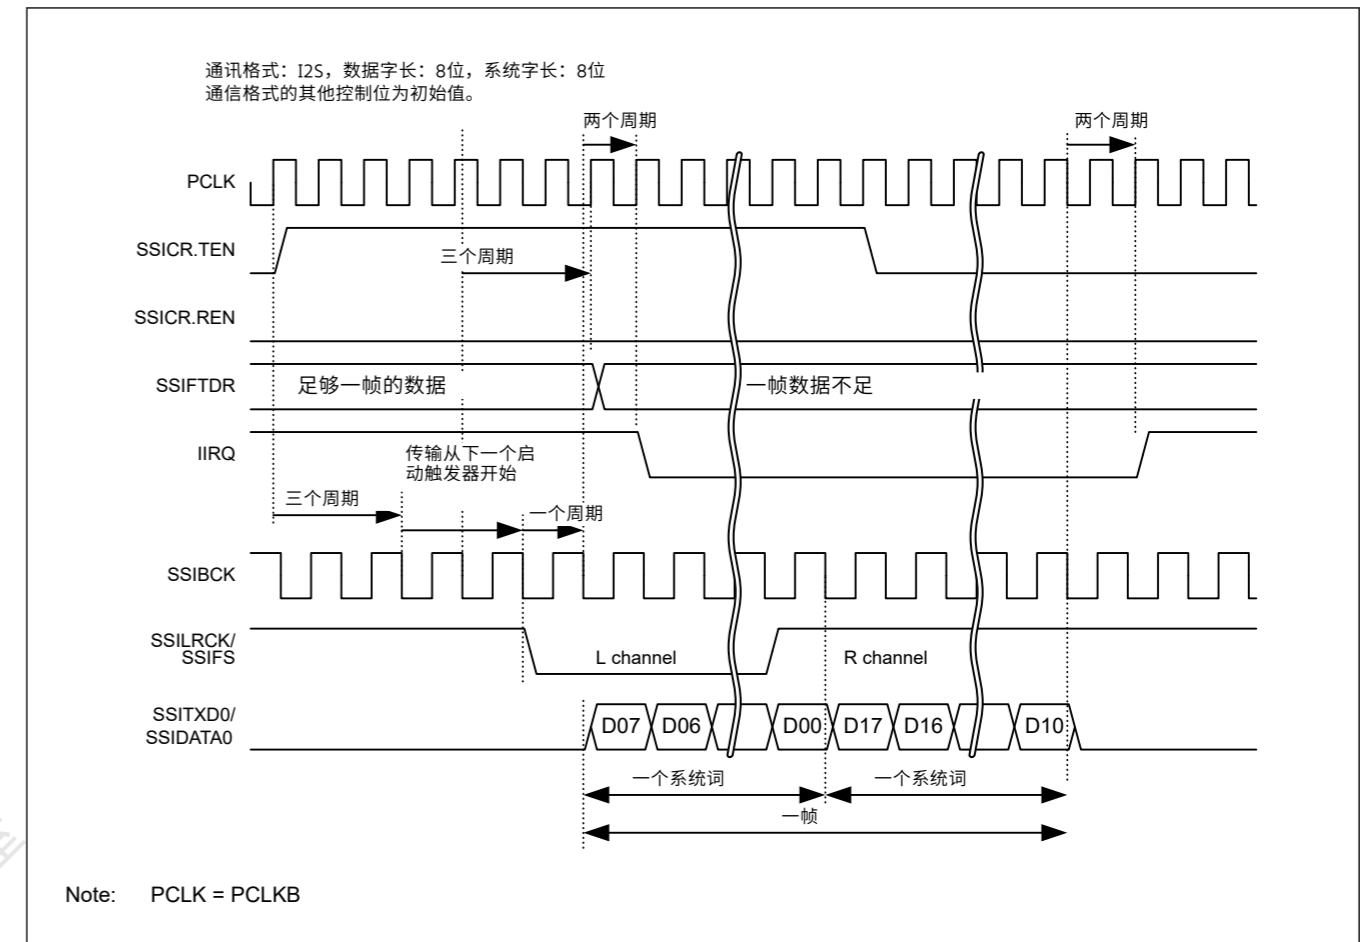

Figure 32.14 IIRQ设置时序 (传输)

- 发射器 (传输专用)

[Clearing condition]

启用传输时 (SSICR.TEN=1和SSICR.REN=0), 传输帧的传输数据被写入SSIFTDR寄存器, 并由SSILRCK/SSIFS信号生成启动触发。

[Clearing timing]

1个SSIBCK周期+2个PCLKB周期在产生作为清除条件的启动触发之后。

[Setting condition]

当发送和接收被禁用时 (SSICR.TEN=0和SSICR.REN=0), 一帧的发送完成。

[Setting timing]

在作为设置条件的传输结束后 (在帧边界处) 的2个PCLKB周期。

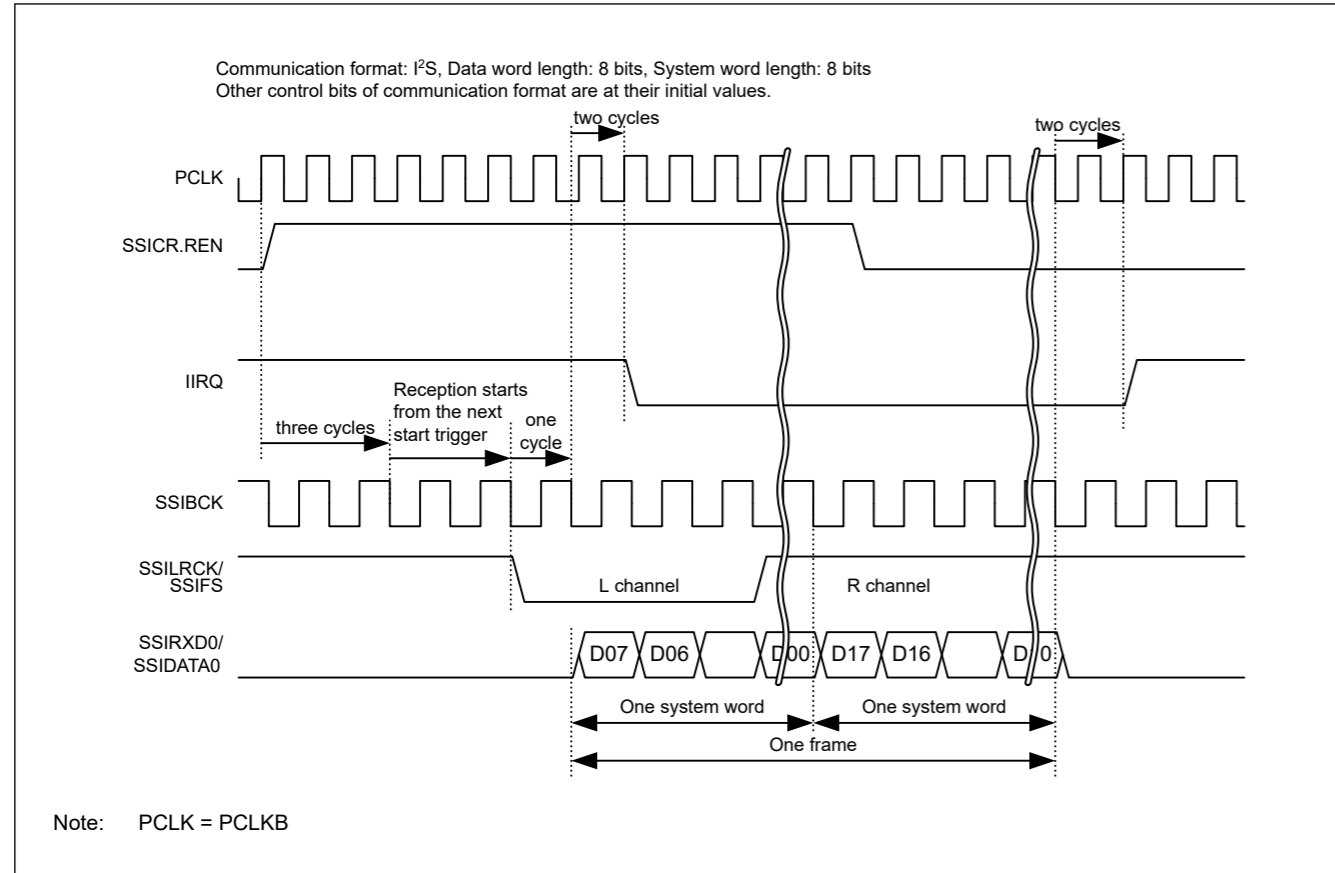

Figure 32.15 IIRQ setting timing (reception)

- Receiver (dedicated to reception)

[Clearing condition]

While reception was enabled (SSICR.TEN = 0 and SSICR.REN = 01, a start trigger was generated by the SSILRCK/SSIFS signal.

[Clearing timing]

1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger that is the clearing condition.

[Setting condition]

While transmission and reception were disabled (SSICR.TEN = 0 and SSICR.REN = 0), reception of one frame was complete.

[Setting timing]

2 PCLKB cycles after the end of reception (at a frame boundary) that is the setting condition.

- Transceiver (transmission and reception)

[Clearing condition]

While transmission and reception were enabled (SSICR.TEN = 1 and SSICR.REN = 1), the transmit data for a transmission frame was written to the SSIFTDR register, and a start trigger was generated by the SSILRCK/SSIFS signal.

[Clearing timing]

1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger that is the clearing condition.

[Setting condition]

While transmission and reception were disabled (SSICR.TEN = 0 and SSICR.REN = 0), transmission of one frame was complete.

[Setting timing]

2 PCLKB cycles after the end of transmission (at a frame boundary) that is the setting condition.

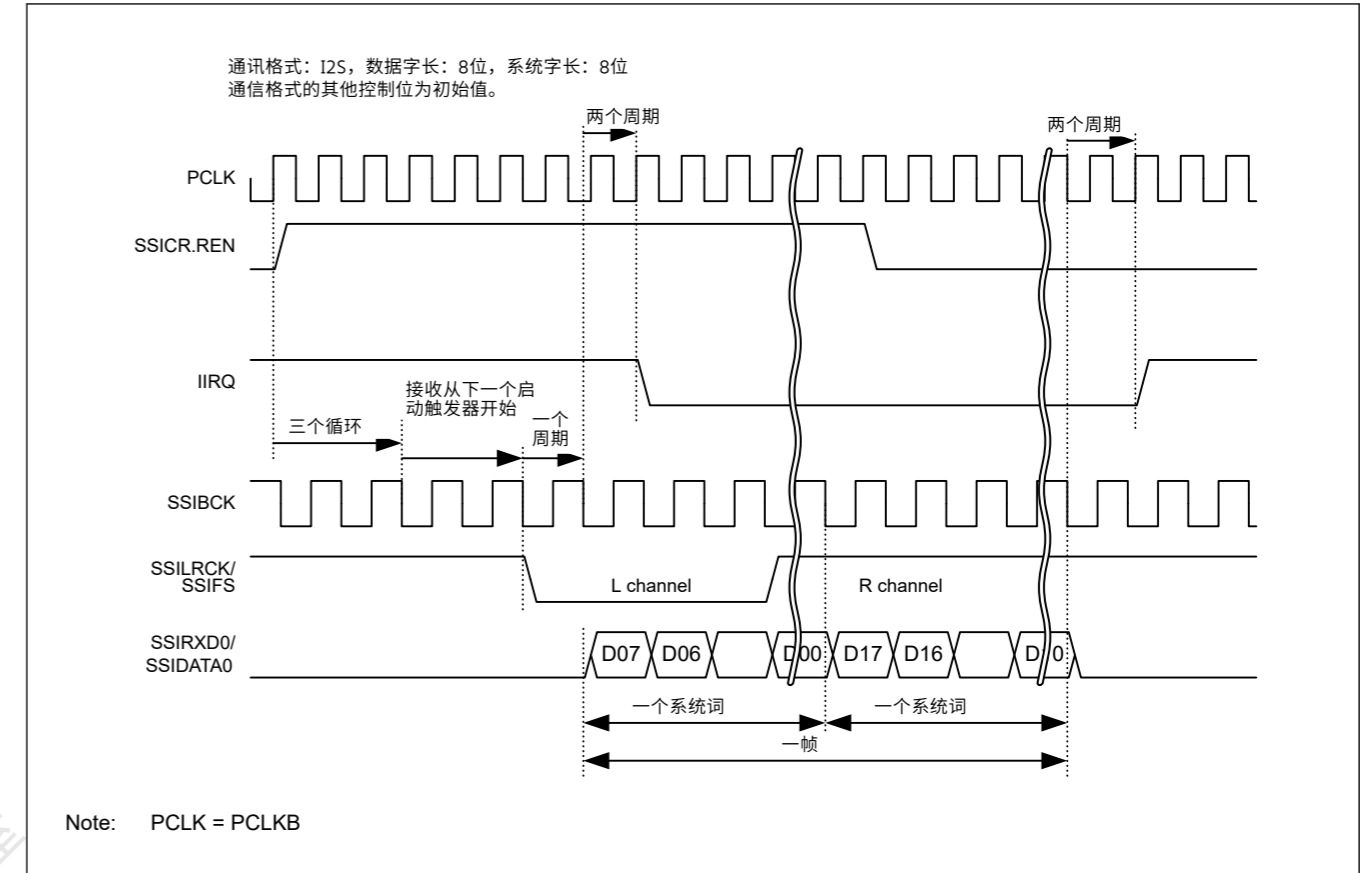

Figure 32.15 IIRQ设置时序 (接收)

- 接收器 (接收专用)

[Clearing condition]

在启用接收时 (SSICR.TEN=0和SSICR.REN=01, 由SSILRCKSSIFS信号生成启动触发信号。

[Clearing timing]

1个SSIBCK周期+2个PCLKB周期在产生作为清除条件的启动触发之后。

[Setting condition]

当发送和接收被禁用时 (SSICR.TEN=0和SSICR.REN=0), 一帧的接收完成。

[Setting timing]

在作为设置条件的接收结束 (在帧边界) 之后的2个PCLKB周期。

- 收发器 (发送和接收)

[Clearing condition]

在使能发送和接收时 (SSICR.TEN=1和SSICR.REN=1), 发送帧的发送数据被写入SSIFTDR寄存器, 并由SSILRCKSSIFS信号生成开始触发。

[Clearing timing]

1个SSIBCK周期+2个PCLKB周期在产生作为清除条件的启动触发之后。

[Setting condition]

当发送和接收被禁用时 (SSICR.TEN=0和SSICR.REN=0), 一帧的发送完成。

[Setting timing]

在作为设置条件的传输结束后 (在帧边界处) 的2个PCLKB周期。

**ROIRQ flag (Receive Overflow Error Status Flag)**

The ROIRQ flag is a status flag that indicates a receive overflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that received data is supplied at a higher rate than requested. Data is not transferred from the receive shift register to SSIFRDR where a receive overflow error is generated. For the procedure to recover from the overflow error, see [section 32.8.6. Error Handling](#). This flag is not cleared by a receive FIFO data register reset (SSIFCR.RFRST).

[Priority order for setting and clearing]

Setting is prioritized.\*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit\*2
2. Enabling communication (changing SSICR.REN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition:

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in [Figure 32.19](#))
2. 1 PCLKB cycle after writing 1 to SSICR.REN.\*3

[Setting condition]

At completion of receiving new data while SSIFRDR is full.

[Setting timing]

3 cycles of PCLKB after reception is completed.

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:

- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.REN.

Note 3. After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

**ROIRQ标志 (接收溢出错误状态标志)**

ROIRQ标志是指接收溢出错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表示接收到的数据以高于请求的速率提供。数据不会从接收移位寄存器传送到产生接收溢出错误的SSIFRDR。有关从溢出错误中恢复的过程，请参阅第32.8.6节。错误处理。该标志不会被接收FIFO数据寄存器复位(SSIFCR.RFRST)清除。

[设置和清除的优先顺序]

设置优先。\*1

[Clearing condition]

完成以下任一操作时：

- 1.从该位读取1后向该位写入0\*2
- 2.启用通信（将SSICR.REN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机：

- 1.当从该位读取1后向该位写入0时（与图32.19中的时序相同）
- 2.向SSICR.REN写入1后的1个PCLKB周期。\*3

[设置条件]在SSIFRDR已满时完成接收新数据时。

[设置时序]接收完成后的3个PCLKB周期。

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。

注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：●软件复位(SSIFCR.SSIRST=1)完成。●读1后，写0完成。●在向SSICR.REN写入1之后经过1个PCLKB周期。

注3.使能通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

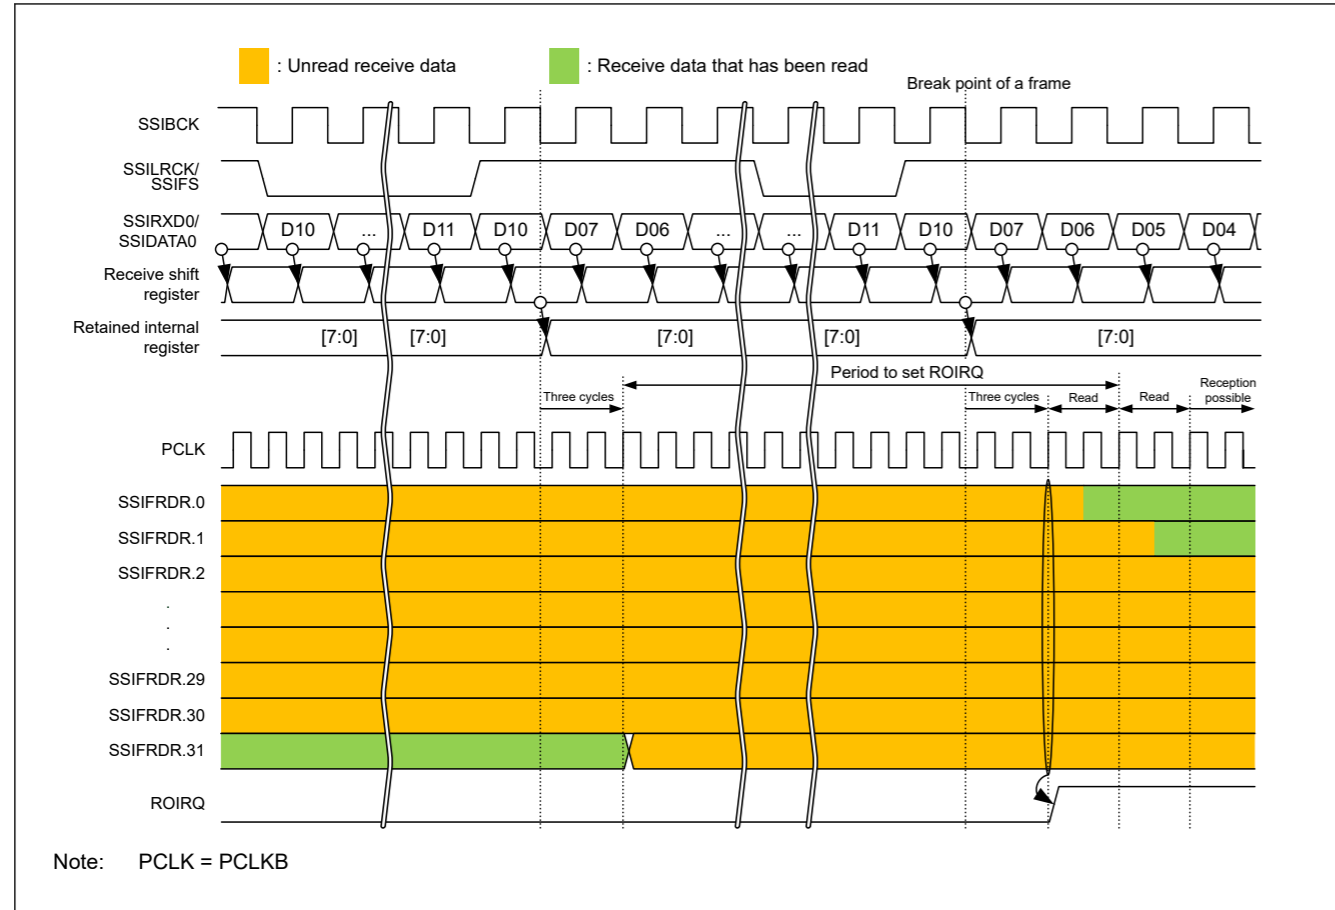

Figure 32.16 ROIRQ setting timing

**RUIRQ flag (Receive Underflow Error Status Flag)**

The RUIRQ flag is a status flag that indicates a receive underflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that SSIFRDR is read while it is empty. Data read from SSIFRDR where a receive underflow error is generated is invalid. See section 32.8.6. Error Handling for the error recovery procedure. This flag is not cleared by a receive FIFO data register reset (SSIFCR.RFRST). Note, however, that this flag is not set even if the SSIFRDR register is read while the receive FIFO data register is reset (by setting SSIFCR.RFRST to 1).

[Priority order for setting and clearing]

Setting is prioritized.\*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit\*2
2. Enabling communication (changing SSICR.REN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 32.19)
2. 1 PCLKB cycle after writing 1 to SSICR.REN.\*3

[Setting condition]

Reading from SSIFRDR while it is empty.

[Setting timing]

At completion of reading from SSIFRDR. See Figure 32.17.

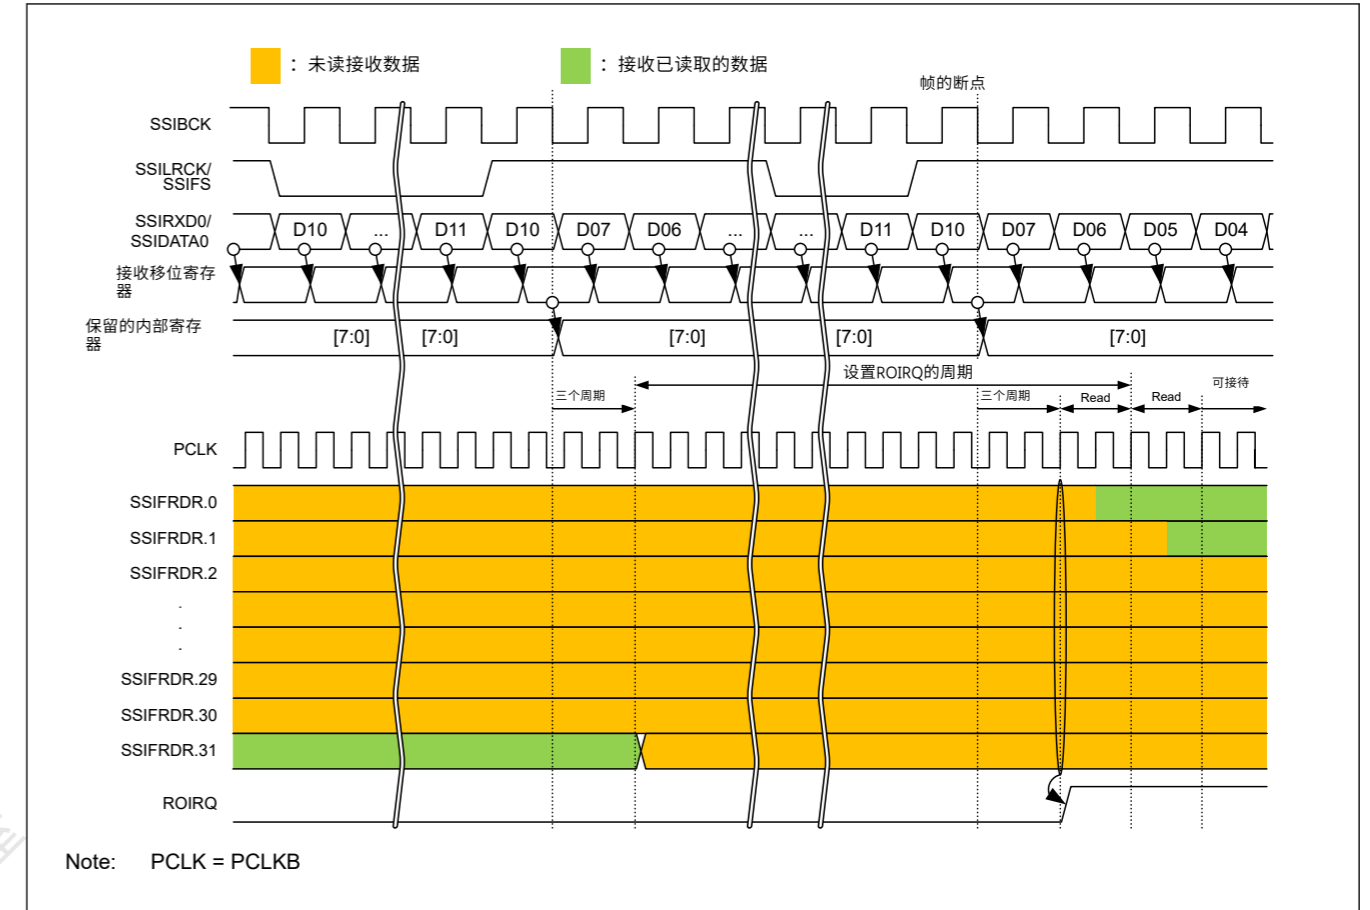

Figure 32.16 ROIRQ设置时序

**RUIRQ标志 (接收下溢错误状态标志)**

RUIRQ标志是指示接收下溢错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。此标志指示SSIFRDR在为空时被读取。从产生接收下溢错误的SSIFRDR读取的数据无效。请参阅第32.8.6节。错误恢复过程的错误处理。该标志不会被接收FIFO数据寄存器复位(SSIFCR.RFRST)清除。但是请注意，即使在接收FIFO数据寄存器复位（通过将SSIFCR.RFRST设置为1）时读取SSIFRDR寄存器，该标志也不会设置。

[设置和清除的优先顺序]

设置优先。\*1

[Clearing condition]

完成以下任一操作时：

- 1.从该位读取1后向该位写入0\*2
- 2.启用通信（将SSICR.REN从0更改为1）。

【清零时机】与上述清零条件对应的清零时机

- 1.当从该位读取1后向该位写入0时（与图32.19中的时序相同）
- 2.向SSICR.REN写入1后的1个PCLKB周期。\*3

[Setting condition]

在SSIFRDR为空时读取。

[Setting timing]

从SSIFRDR读取完成时。请参见图32.17。

- Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.
- Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
  - After 1 has been read, writing of 0 is complete.
  - 1 PCLKB cycle passes after 1 has been written to SSICR.REN.
- Note 3. After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

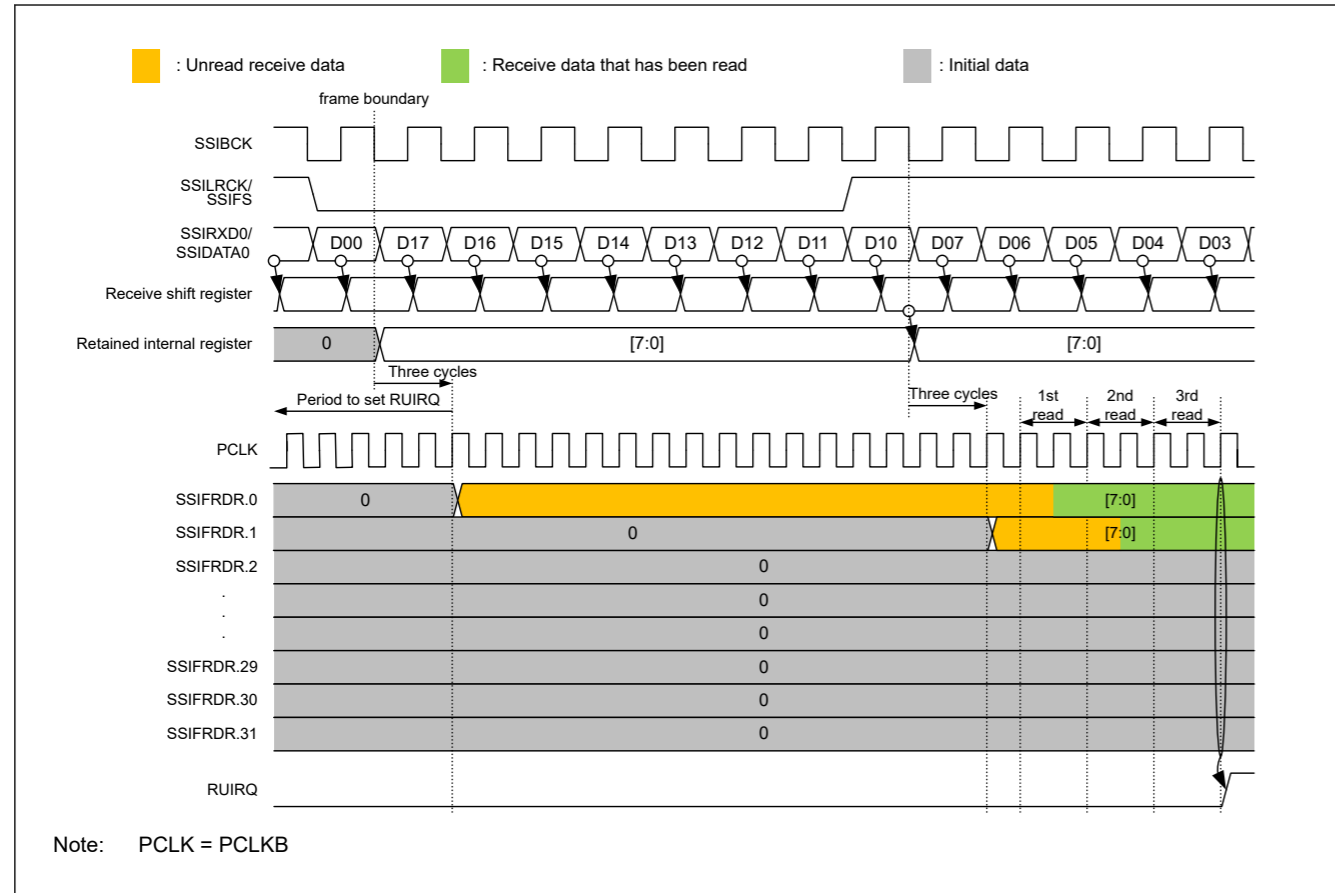

Figure 32.17 RUIRQ setting timing

**TOIRQ flag (Transmit Overflow Error Status Flag)**

The TOIRQ flag is a status flag that indicates a transmit overflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that an attempt has been made to write data to the SSIFTDR register when the register is full of data. The data writing that causes a transmit overflow is ignored. For the procedure to recover from the overflow error, see [section 32.8.6. Error Handling](#). This flag is not cleared by a transmit FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.\*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit\*2
2. Enabling communication (changing SSICR.TEN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。

- 注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：●
- 完成软件复位(SSIFCR.SSIRST=1)。
  - 读取1后，写入0完成。
  - 在将1写入SSICR.REN后经过1个PCLKB周期。

注3.使能通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

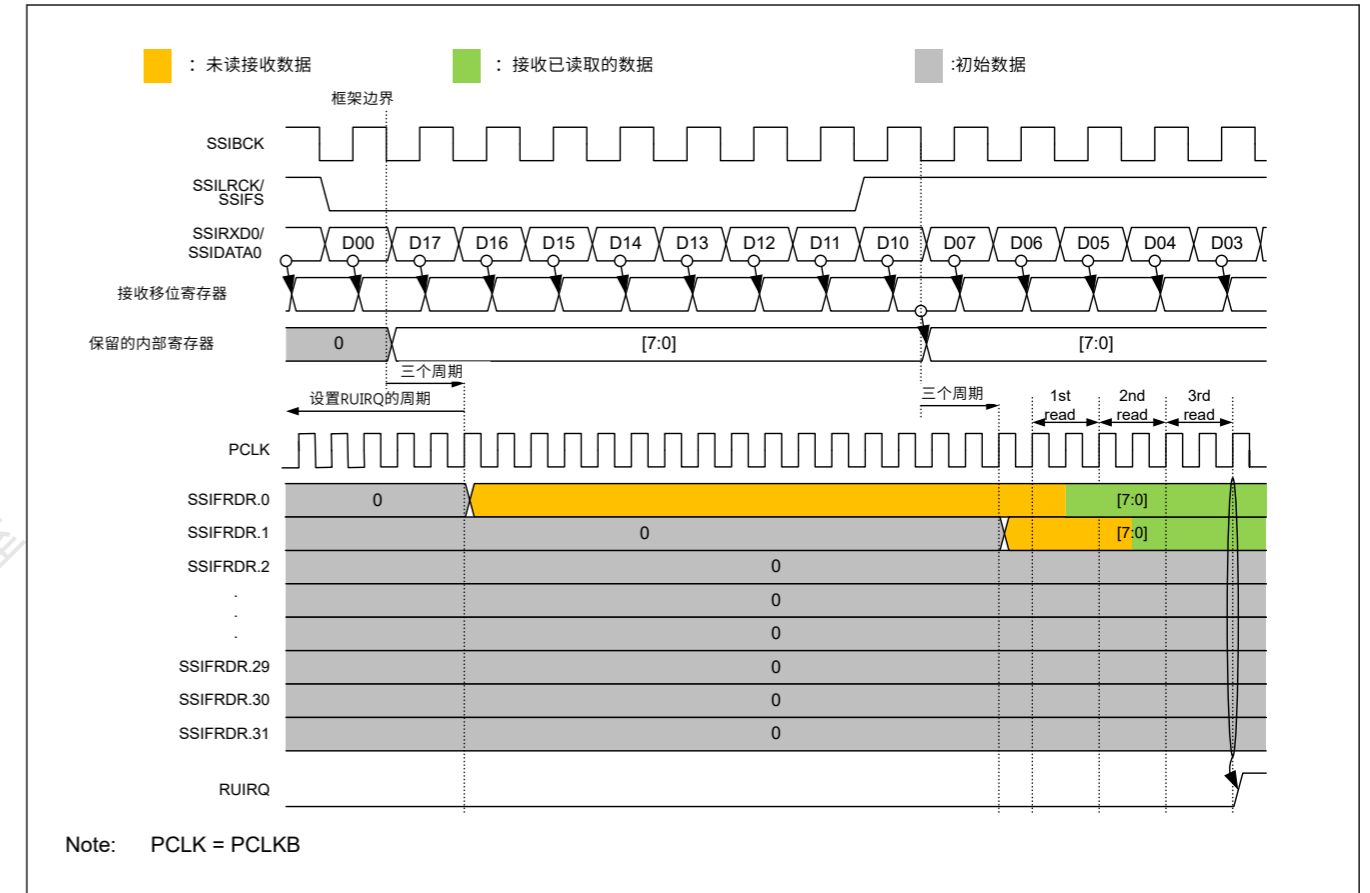

Figure 32.17 RUIRQ设置时序

**TOIRQ标志（发送溢出错误状态标志）**

TOIRQ标志是指示发送溢出错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表明当寄存器已满时尝试将数据写入SSIFTDR寄存器。导致发送溢出的数据写入将被忽略。有关从溢出错误中恢复的过程，请参阅第32.8.6节。错误处理。该标志不会被发送FIFO数据寄存器复位(SSIFCR.TFRST)清除。

[设置和清除的优先顺序]

设置优先。\*1

[Clearing condition]

完成以下任一操作时：

- 1.从该位读取1后向该位写入0\*2
- 2.启用通信（将SSICR.TEN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in [Figure 32.19](#))
2. 1 PCLKB cycle after writing 1 to SSICR.TEN.\*3

[Setting condition]

An attempt was made to write data to the SSIFTDR register when the register is full of data.

[Setting timing]

At completion of writing to SSIFTDR. For details, see [Figure 32.18](#).

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:

- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.TEN.

Note 3. After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

- 1.当从该位读取1后向该位写入0时（与图32.19中的时序相同）
- 2.向SSICR.TEN写入1后的1个PCLKB周期。\*3

[Setting condition]

当寄存器已满时，尝试将数据写入SSIFTDR寄存器。

[Setting timing]

完成对SSIFTDR的写入。详见图32.18。

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。

注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：●软件复位(SSIFCR.SSIRST=1)完成。●读1后，写0完成。●在向SSICR.TEN写入1后经过1个PCLKB周期。

注3.使能通信后（通过将SSICR.TEN位的值从0更改为1），传输错误标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

Figure 32.18 TOIRQ setting timing

**TUIRQ flag (Transmit Underflow Error Status flag)**

The TUIRQ flag is a status flag that indicates a transmit underflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that writing the serial data required for a frame to SSIFTDR did not catch up with transmission of the frame. Even if this flag is cleared after it has been set, the SSITXD0/SSIDATA0 output remains to be 0. To output the data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA0 pin, follow the communication stop procedure in Figure 32.56 and error-handling procedure in Figure 32.57. For the procedure to recover from an error, see section 32.8.6. Error Handling. This flag is not cleared by a reset of transmit FIFO data register (by the SSIFCR.TFRST signal).

[Priority order for setting and clearing]

Setting is prioritized.\*1

[Clearing condition]

When either of the following operations is done:

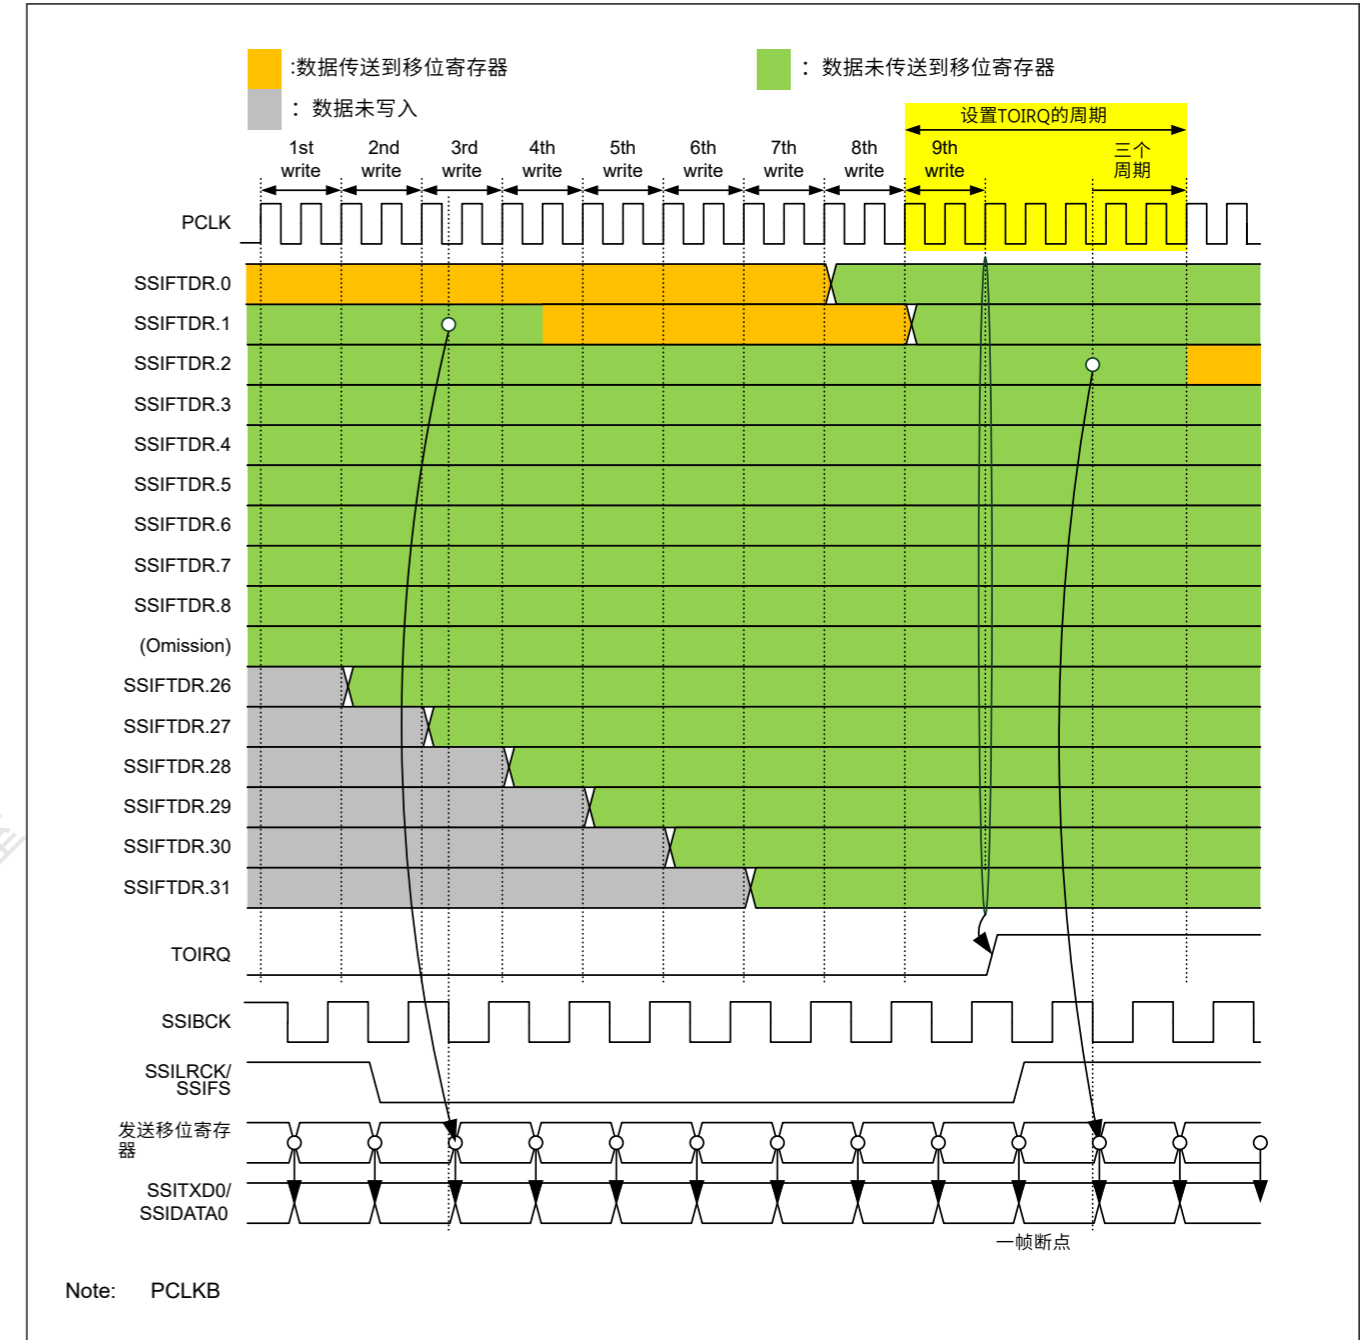

Figure 32.18 TOIRQ设置时序

**TUIRQ标志 (发送下溢错误状态标志)**

TUIRQ标志是指示发送下溢错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表示将帧所需的串行数据写入SSIFTDR没有赶上帧的传输。即使该标志在设置后被清除，SSITXD0SSIDATA0输出仍保持为0。要将写入发送FIFO数据寄存器(SSIFTDR)的数据输出到SSITXD0SSIDATA0引脚，请遵循图32.56中的通信停止程序并图32.57中的错误处理过程。有关从错误中恢复的过程，请参阅第32.8.6节。错误处理。该标志不会通过发送FIFO数据寄存器的复位（通过SSIFCR.TFRST信号）清除。

[设置和清除的优先顺序]

设置优先。\*1

[Clearing condition]

完成以下任一操作时：

1. Writing 0 to this bit after reading 1 from this bit\*2
2. Enabling communication (changing SSICR.TEN from 0 to 1).

## [Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit
2. 1 PCLKB cycle after writing 1 to SSICR.TEN.\*3

Figure 32.19 TUIRQ clearing timing

- Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.
- Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
  - After 1 has been read, writing of 0 is complete.
  - 1 PCLKB cycle passes after 1 has been written to SSICR.TEN.
- Note 3. After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

## [Setting condition]

When communication continues over a frame boundary, the transmit data required for the next frame has not been written to SSIFTDR. For details, see [Figure 32.20](#) and [Figure 32.21](#).

## [Setting timing]

3 PCLKB cycles after the frame boundary. For details, see [Figure 32.20](#).

- 1.从该位读取1后向该位写入0\*2
- 2.启用通信（将SSICR.TEN从0更改为1）。

## [Clearing timing]

与上述清零条件对应的清零时机

- 1.从该位读取1后向该位写入0
- 2.向SSICR.TEN写入1后的1个PCLKB周期。\*3

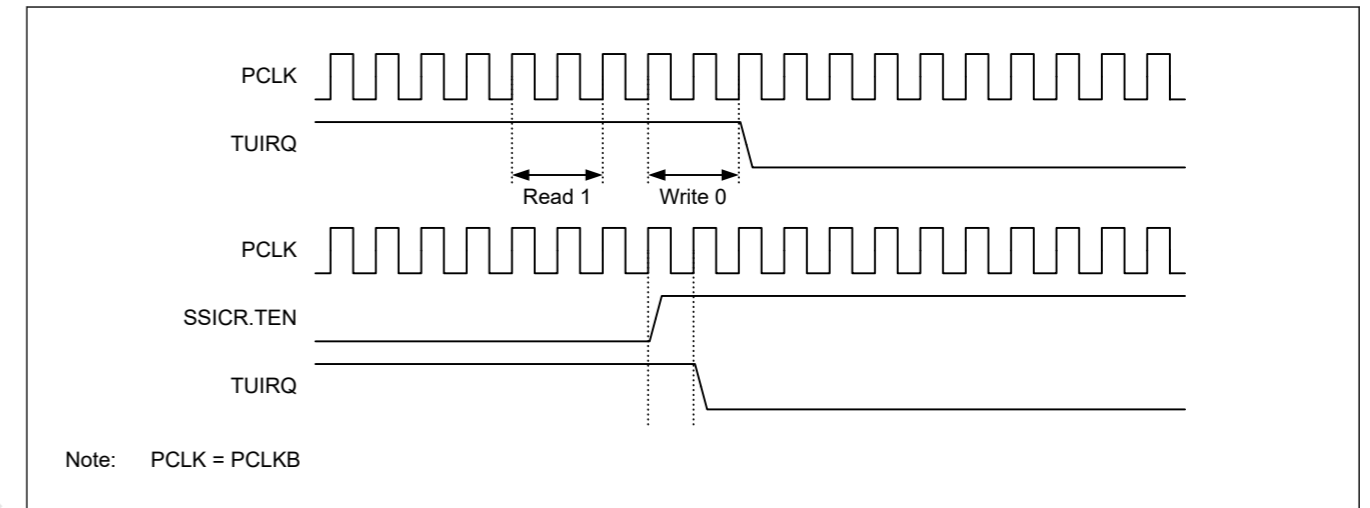

Figure 32.19 TUIRQ清零时机

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。

- 注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：●
- 完成软件复位(SSIFCR.SSIRST=1)。
  - 读取1后，写入0完成。
  - 在将1写入SSICR.TEN之后经过1个PCLKB周期。

注3.使能通信后（通过将SSICR.TEN位的值从0更改为1），传输错误标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

## [Setting condition]

当通信继续通过帧边界时，下一帧所需的传输数据尚未写入 SSIFTDR。详见图32.20和图32.21。

## [Setting timing]

帧边界后3个PCLKB周期。详见图32.20。

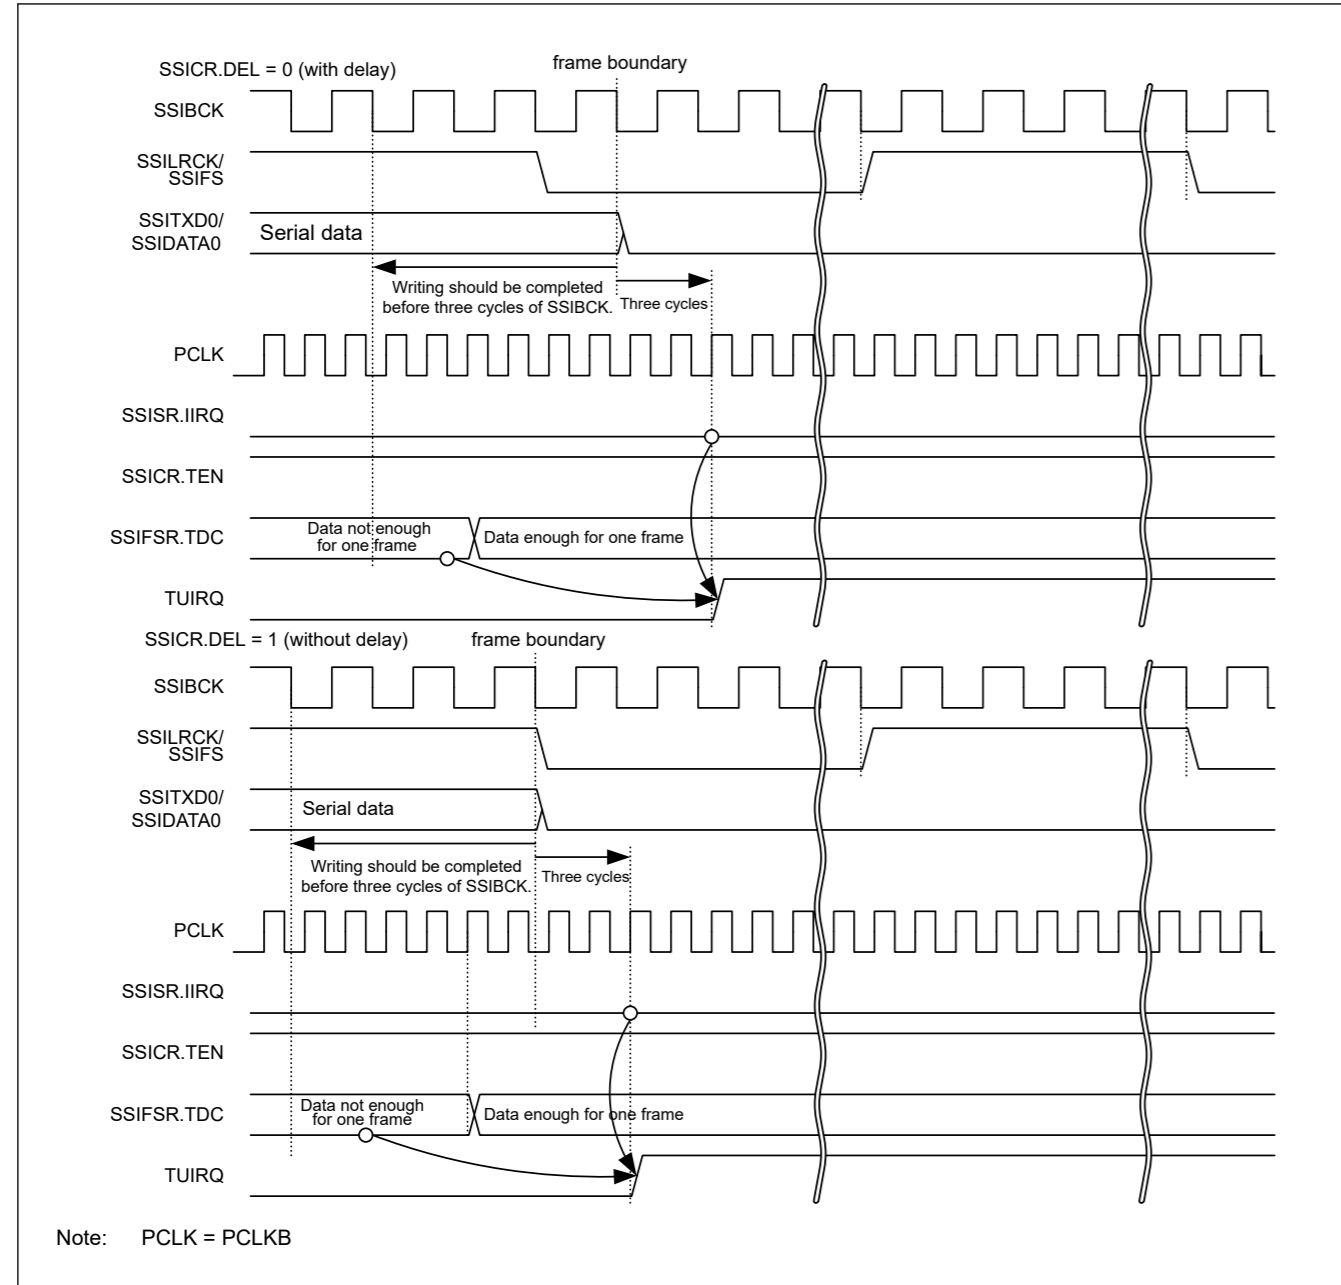

Figure 32.20 TUIRQ setting timing (when communication continues)

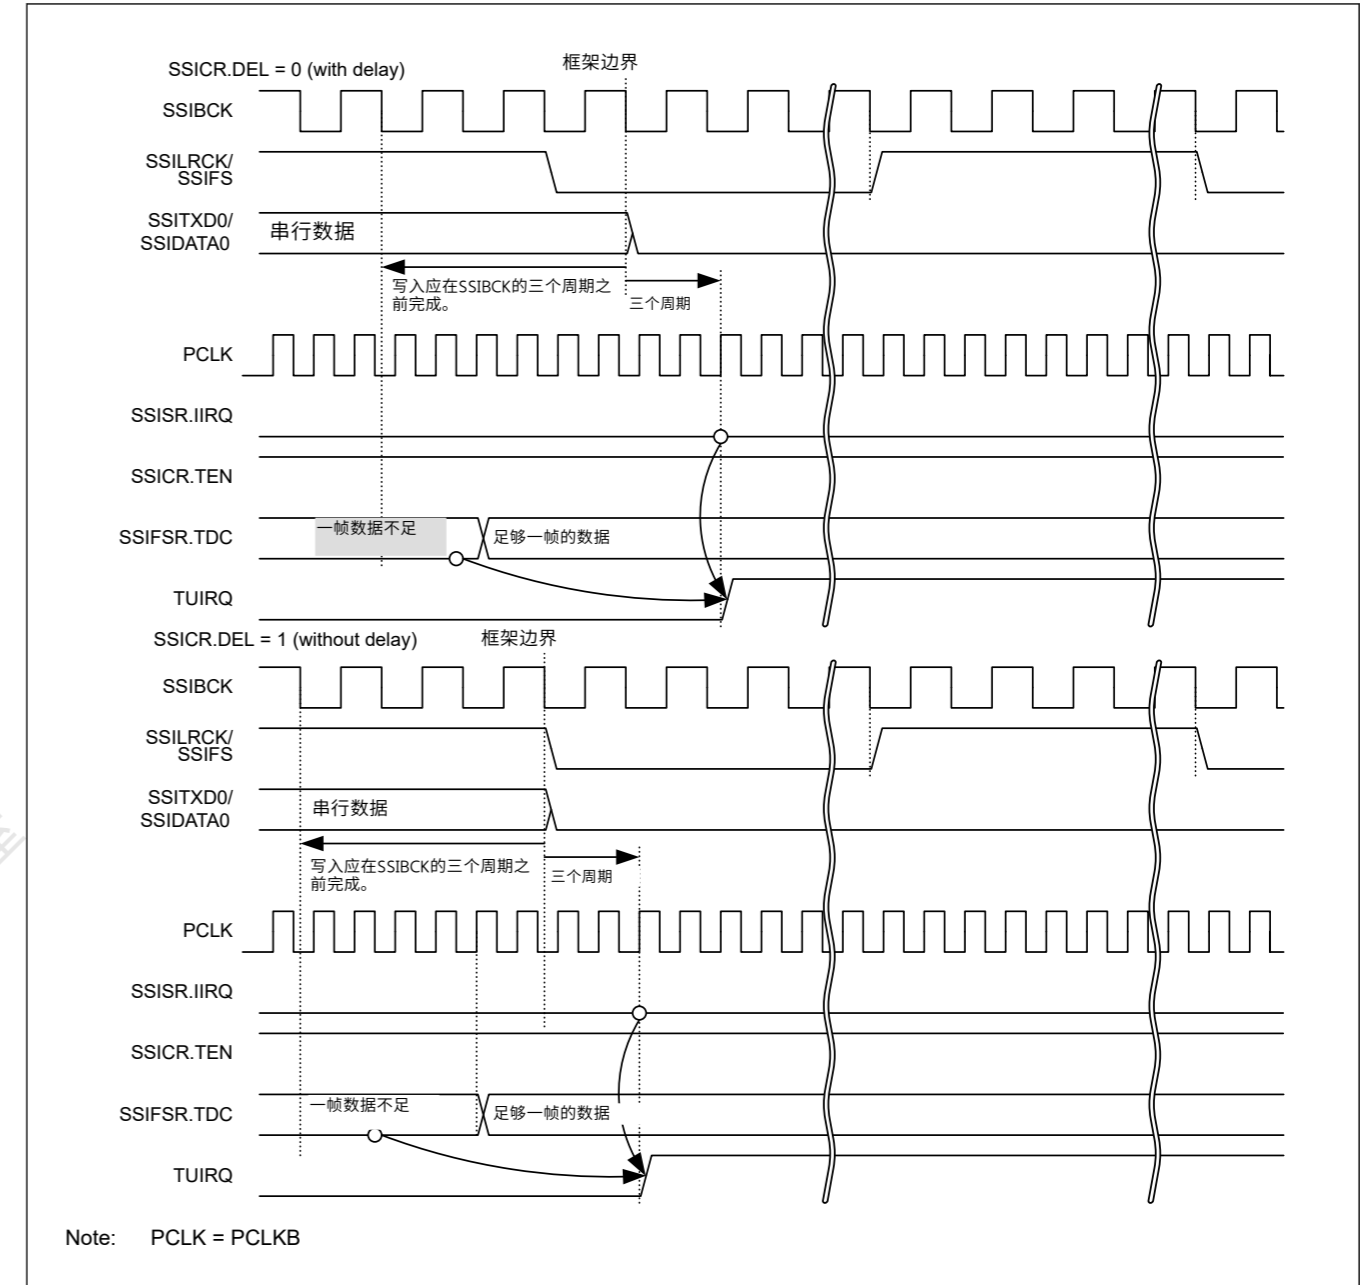

Figure 32.20 TUIRQ设置时间 (通信继续时)

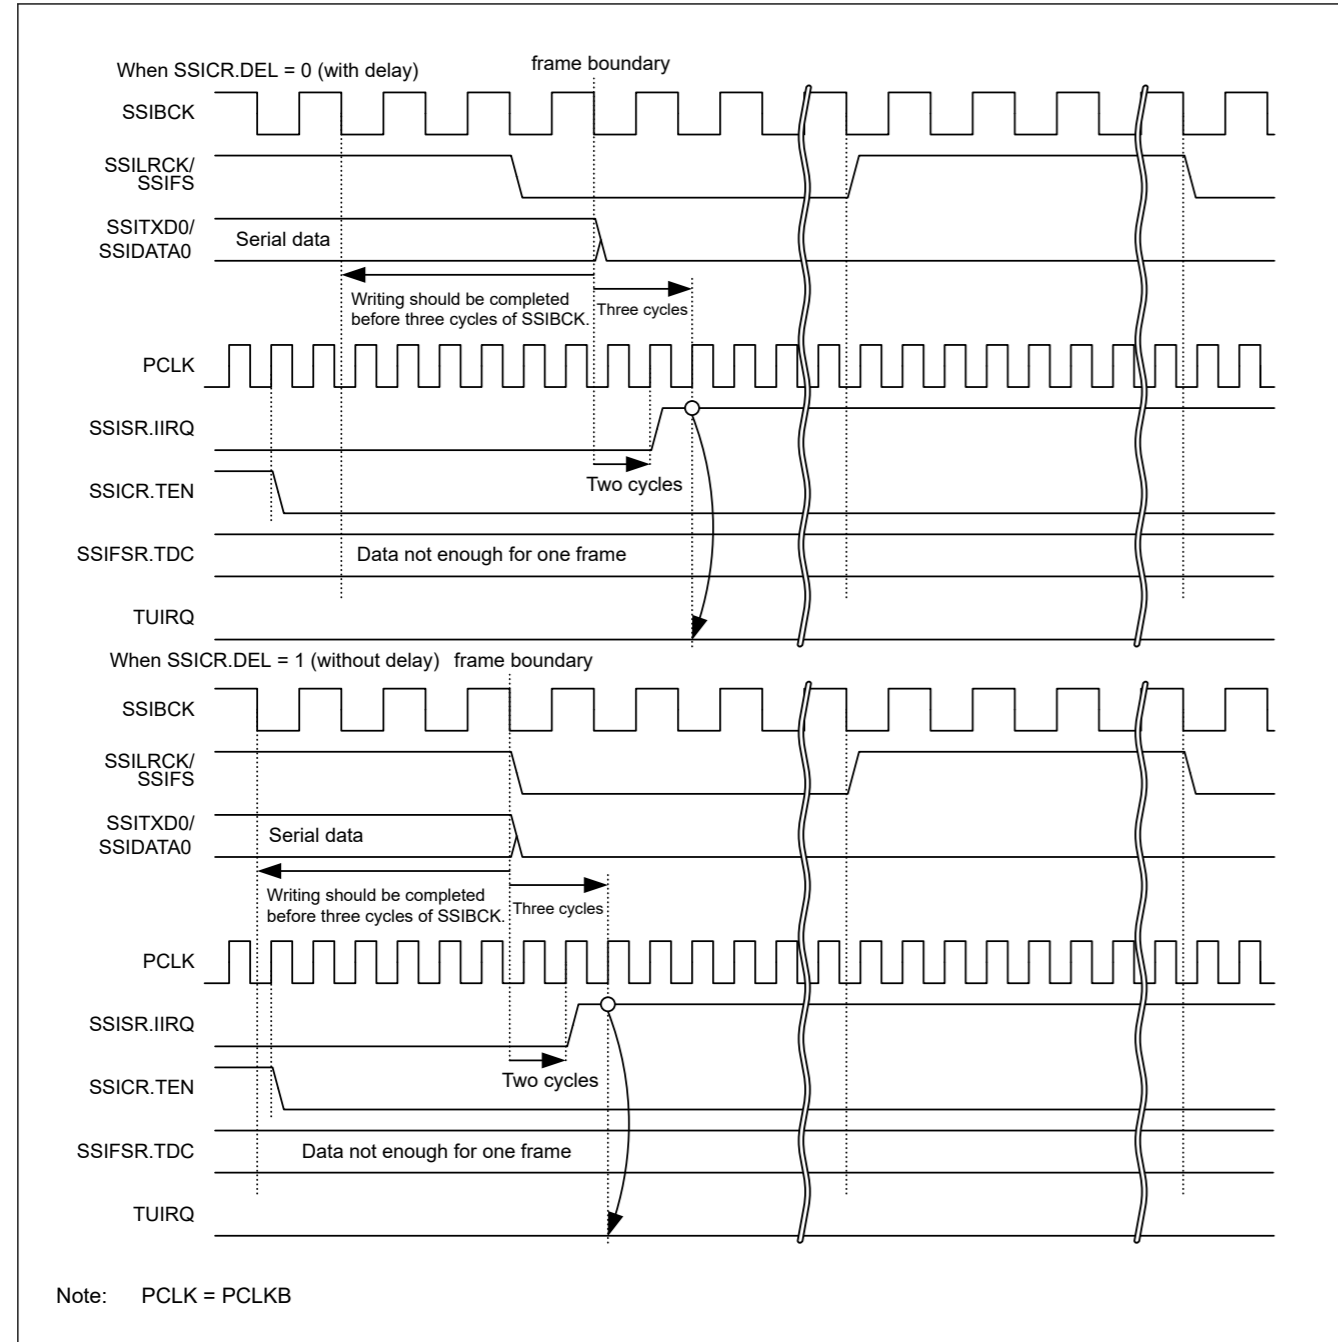

Figure 32.21 TUIRQ setting timing (when communication stops)

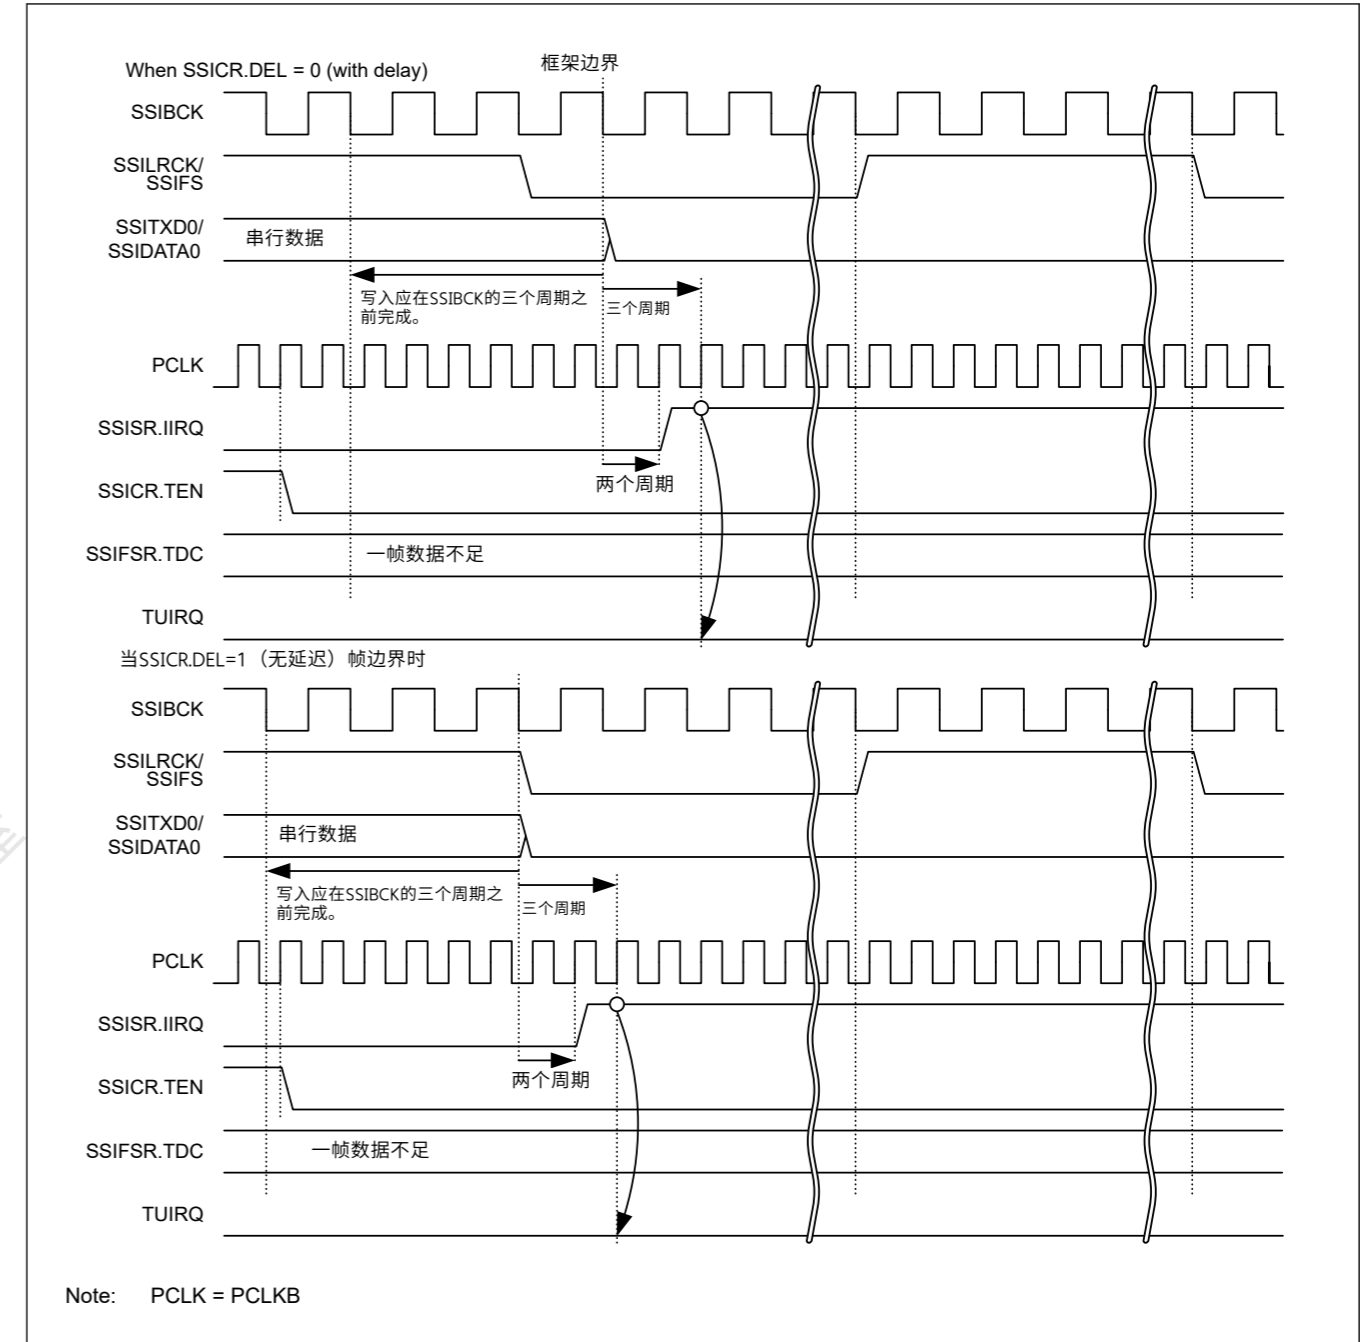

Figure 32.21 TUIRQ设置时间 (通信停止时)

## 32.4.3 SSIFCR : FIFO Control Register

Base address: SSIE0 = 0x4009\_D000

Offset address: 0x10

|                    |       |    |    |    |     |    |    |    |    |    |    |    |     |     |       |        |

| 2     | RIE    | Receive Data Full Interrupt Output Enable<br>0: Disables receive data full interrupts<br>1: Enables receive data full interrupts                  | R/W |
| 3     | TIE    | Transmit Data Empty Interrupt Output Enable<br>0: Disables transmit data empty interrupts<br>1: Enables transmit data empty interrupts            | R/W |
| 10:4  | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 11    | BSW    | Byte Swap Enable <sup>*1</sup><br>0: Disables byte swap<br>1: Enables byte swap   | R/W |
| 15:12 | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 16    | SSIRST | Software Reset<br>0: Clears a software reset condition<br>1: Sets a software reset condition  | R/W |
| 30:17 | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 31    | AUCKE  | AUDIO_MCK Enable in Mastermode Communication <sup>*1</sup><br>0: Disables supply of AUDIO_MCK<br>1: Enables supply of AUDIO_MCK                   | R/W |

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If the value of these bits is changed by rewriting, subsequent operation is unpredictable.

This register sets a software reset, byte swap, and enable/disable of interrupt requests.

**RFRST bit (Receive FIFO Data Register Reset)**

The RFRST bit sets a software reset of the receive FIFO data register (SSIFRDR). Writing 1 to this bit initializes the internal state related to SSIFRDR. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 32.5. Because this bit is not automatically cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

This bit is subject to the software reset by the SSIRST bit. Because the software reset by the SSIRST bit has priority over the reset by this bit, setting this bit is ignored when the SSIRST bit is set.

## 32.4.3 SSIFCR:FIFO控制寄存器

Base address: SSIE0 = 0x4009\_D000

Offset address: 0x10

|               |       |    |    |    |     |    |    |    |    |    |    |    |    |     |     |        |       |

| 31    | AUCKE  | AUDIO_MCK在主模式通信中启用*1<br>0: 禁用AUDIO_MCK供应1: 启用AUDIO_MCK供应 | R/W |

注1.禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果这些位的值通过重写而改变,后续的操作是不可预知的。

该寄存器设置软件复位、字节交换和中断请求的启用禁用。

**RFRST位 (接收FIFO数据寄存器复位)**

RFRST位设置接收FIFO数据寄存器(SSIFRDR)的软件复位。向该位写入1初始化与SSIFRDR相关的内部状态。受该位触发的软件复位的寄存器位在表32.5中用阴影表示。由于该位在被设置后不会自动清零,因此向该位写入0以从软件复位中释放寄存器位。向该位写入0后,请务必在开始下一个程序步骤之前检查该位是否为0。

该位受SSIRST位软件复位的影响。由于SSIRST位的软件复位优先于该位的复位,所以当SSIRST位置位时,该位的设置将被忽略。

Table 32.5 Bits subject to software reset by the RFRST bit

| Symbol  | Address (BASE+) | +0 |             |     |          |           |        |        |           | +1      |           |          |           |       |          |     |         |

**TFRST bit (Transmit FIFO Data Register Reset)**

The TFRST bit sets a software reset of the transmit FIFO data register (SSIFTDR). Writing 1 to this bit initializes the internal state related to SSIFTDR. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 32.6. Because this bit is not automatically cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

This bit is subject to the software reset by the SSIRST bit. Because the software reset by the SSIRST bit has priority over the reset by this bit, setting this bit is ignored when the SSIRST bit is set.

Table 32.6 Bits subject to software reset by the TFRST bit (1 of 2)

**TFRST位 (发送FIFO数据寄存器复位)**

TFRST位设置发送FIFO数据寄存器(SSIFTDR)的软件复位。向该位写入1初始化与SSIFTDR相关的内部状态。受该位触发的软件复位的寄存器位在表32.6中用阴影表示。由于该位在被设置后不会自动清零，因此向该位写入0以从软件复位中释放寄存器位。向该位写入0后，请务必在开始下一个程序步骤之前检查该位是否为0。

该位受SSIRST位软件复位的影响。由于SSIRST位的软件复位优先于该位的复位，所以当SSIRST位置位时，该位的设置将被忽略。

**RIE bit (Receive Data Full Interrupt Output Enable)**

The RIE bit enables/disables output of receive data full interrupts. Use a receive data full interrupt as an interrupt to trigger data reading from the receive FIFO data register. Write 1 to this bit after specifying the setting condition for receive data full interrupt (by using the SSISCR.RDFS bit). Figure 32.22 shows the timing of generating the receive data full interrupt.

Figure 32.22 Timing of receive data full interrupt

**TIE bit (Transmit Data Empty Interrupt Output Enable)**

The TIE bit enables/disables output of transmit data empty interrupts. Use a transmit data empty interrupt as an interrupt to trigger data writing to the transmit FIFO data register. Write 1 to this bit after specifying the setting condition for transmit data empty interrupt (by using the SSISCR.TDES bit). Figure 32.23 shows the timing of generating the transmit data empty interrupt.

**RIE位 (接收数据满中断输出使能)**

RIE位启用禁用接收数据完整中断的输出。使用接收数据满中断作为中断来触发从接收FIFO数据寄存器读取数据。指定接收数据满中断的设置条件后（通过使用SSISCR.RDFS位）向该位写入1。图32.22显示了产生接收数据满中断的时序。

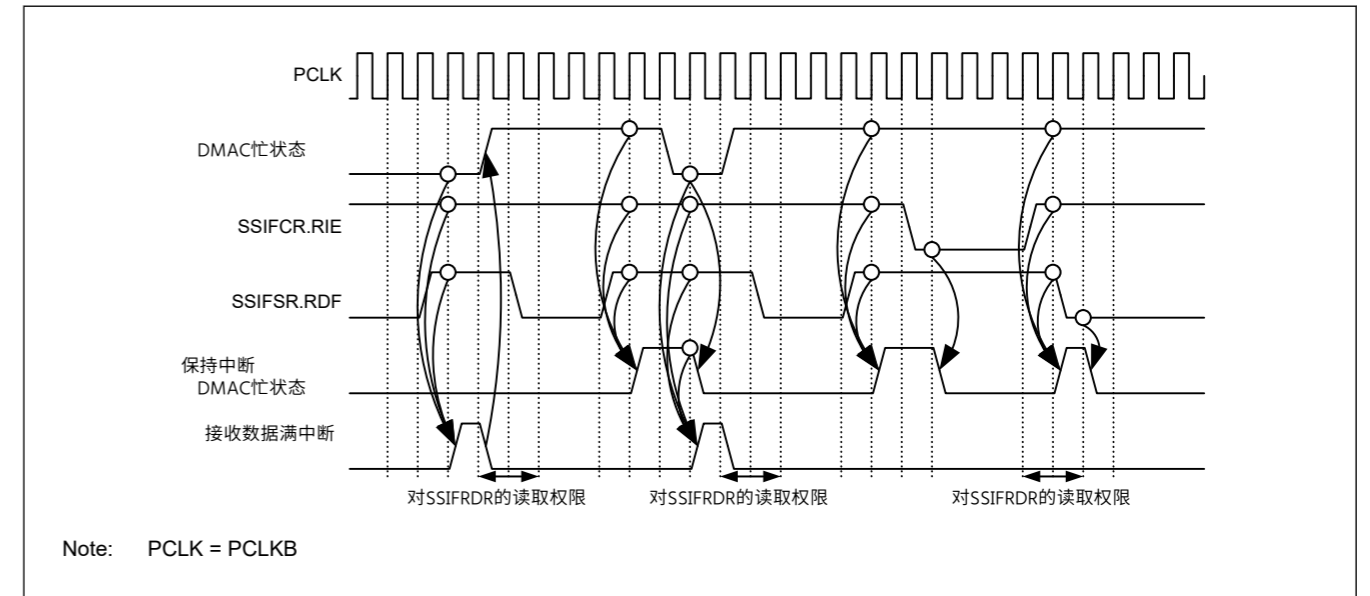

Figure 32.22 接收数据满中断的时序

**TIE位 (发送数据空中断输出使能)**

TIE位使能禁用发送数据空中断的输出。使用发送数据空中断作为中断来触发数据写入发送FIFO数据寄存器。在指定发送数据空中断的设置条件后（通过使用SSISCR.TDES位）向该位写入1。图32.23显示了产生发送数据空中断的时序。

Figure 32.23 Timing of transmit data empty interrupt

**BSW bit (Byte Swap Enable)**

The BSW bit enables/disables byte swap of register access for the transmit FIFO data register (SSIFTDR) and the receive FIFO data register (SSIFRDR). This bit is valid only with 16-bit access or 32-bit access to SSIFTDR and SSIFRDR. For details, see Figure 32.24.

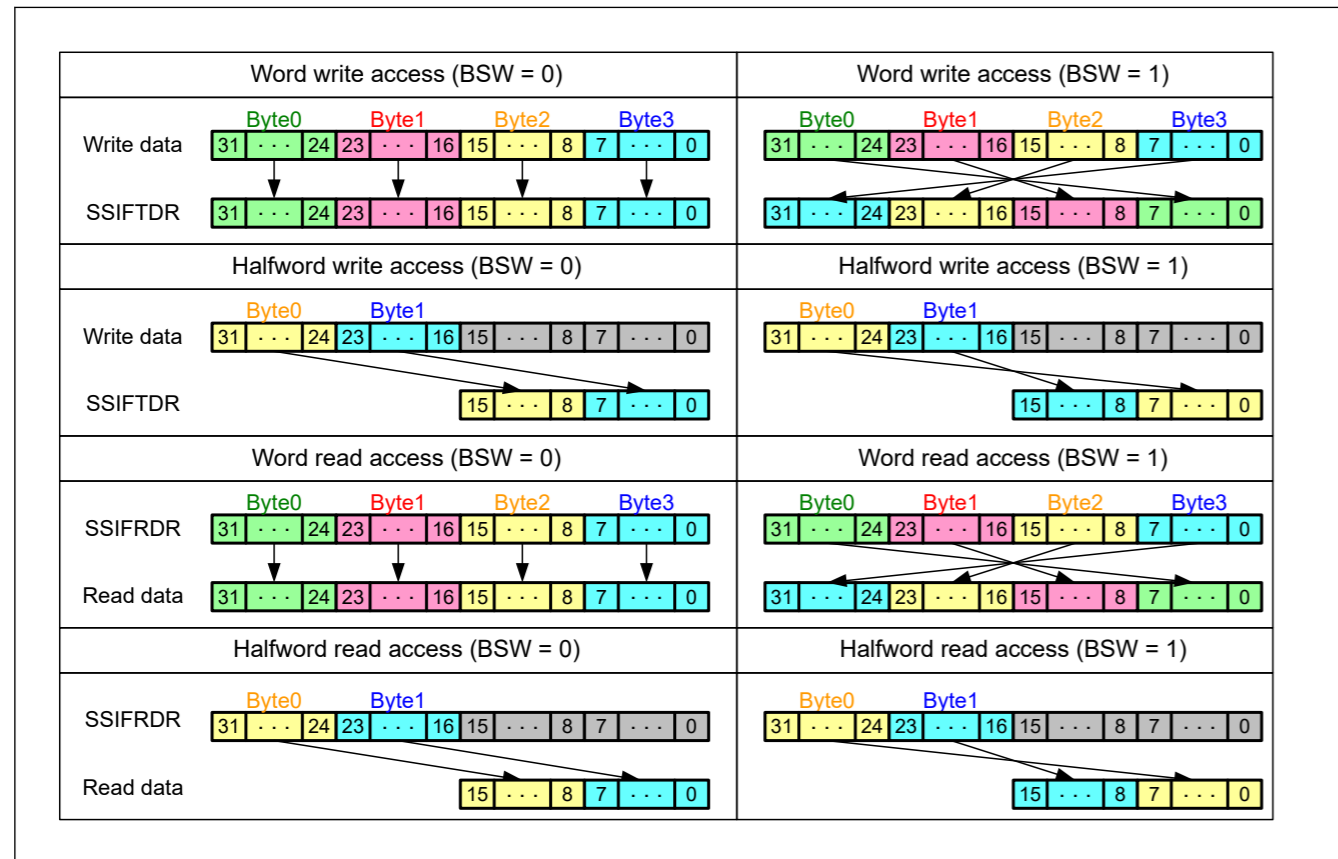

Figure 32.24 Operation example of byte swap

**SSIRST bit (Software Reset)**

The SSIRST bit sets a software reset of SSIE. Writing 1 to this bit initializes the internal state of SSIE. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 32.7. Because this bit is not automatically

Figure 32.23 发送数据空中断的时序

**BSW位 (字节交换使能)**

BSW位启用禁用发送FIFO数据寄存器(SSIFTDR)和接收FIFO数据寄存器(SSIFRDR)的寄存器访问字节交换。该位仅对SSIFTDR和SSIFRDR的16位访问或32位访问有效。详见图32.24。

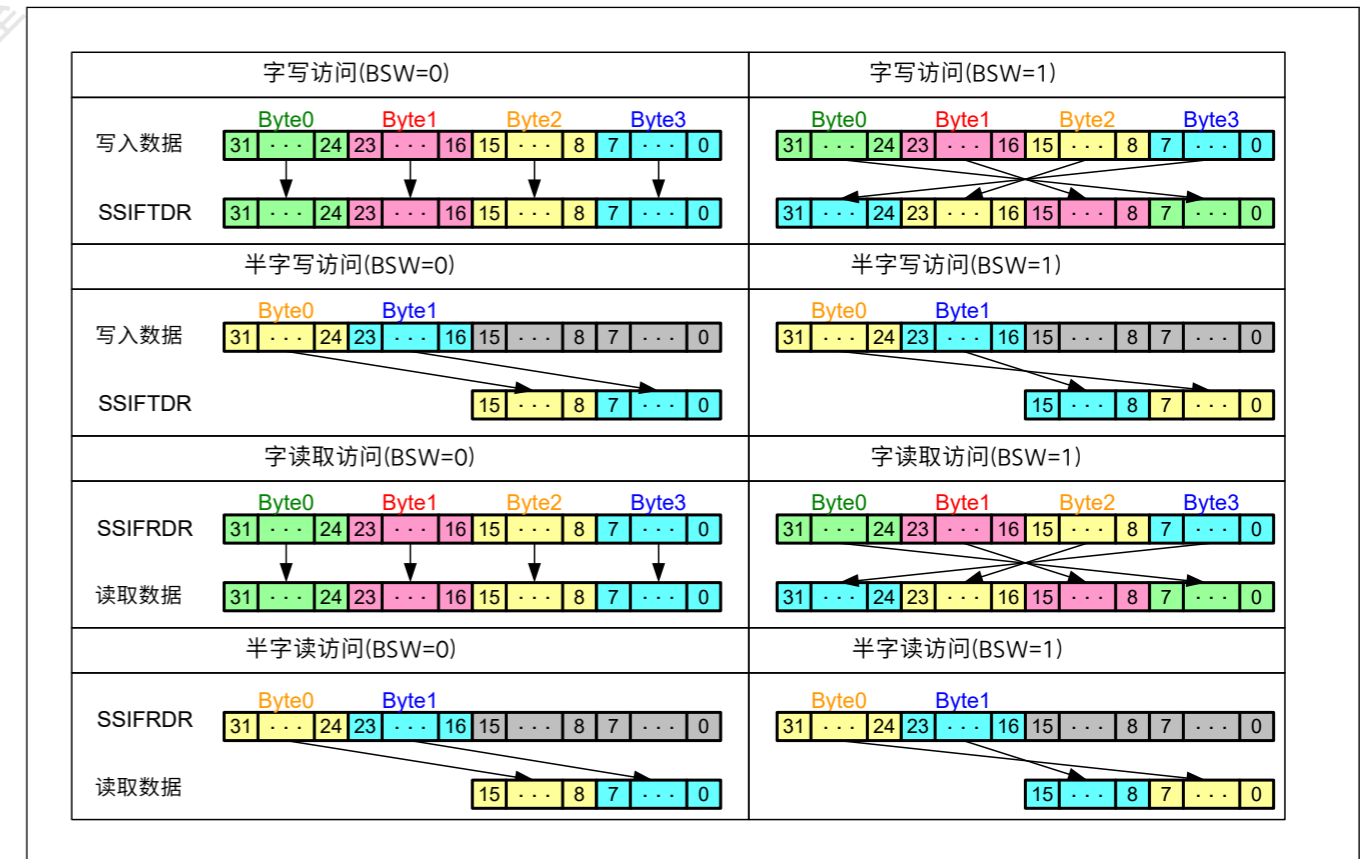

Figure 32.24 字节交换操作示例

**SSIRST bit (Software Reset)**

SSIRST位设置SSIE的软件复位。向该位写入1初始化SSIE的内部状态。受该位触发的软件复位的寄存器位在表32.7中用阴影表示。因为这个位不是自动的

cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

To stop communication of SSIE immediately, after turning off the peripheral functions, write 1 to this bit. Initialization by a software reset is performed without any relation with the bit clock.

**Table 32.7 Bits subject to software reset by the SSIRST bit**

| Symbol  | Address (BASE+) |    | +0          |     |          |           |        |        |           |         | +1        |          |           |       |          |        |         |           |

**AUCKE bit (AUDIO\_MCK Enable in Mastermode Communication)**

The AUCKE bit enables/disables supply to AUDIO\_MCK while in master-mode communication (MST = 1).

Changing the value of this bit must be performed only after specifying the settings related to AUDIO\_MCK (by using the CKS, MST, BCKP, and CKDV bits in the SSICR register).

置位后清零，向该位写入0以从软件复位中释放寄存器位。向该位写入0后，请务必在开始下一个程序步骤之前检查该位是否为0。

要立即停止SSIE通信，请在关闭外围功能后，向该位写入1。通过软件复位进行的初始化与位时钟没有任何关系。

**Table 32.7 受SSIRST位软件复位的位**

| Symbol  | Address (BASE+) |    | +0          |     |          |           |        |        |           |         | +1        |          |           |     |          |        |         |           |
|---------|-----------------|----|-------------|-----|----------|-----------|--------|--------|-----------|---------|-----------|----------|-----------|-----|----------|--------|---------|-----------|

**AUCKE位 (在主模式通信中启用AUDIO\_MCK)**

在主模式通信(MST=1)时，AUCKE位启用禁用对AUDIO\_MCK的供电。

只有在指定与AUDIO\_MCK相关的设置后才能更改该位的值 (通过使用SSICR寄存器中的CKS、MST、BCKP和CKDV位)。

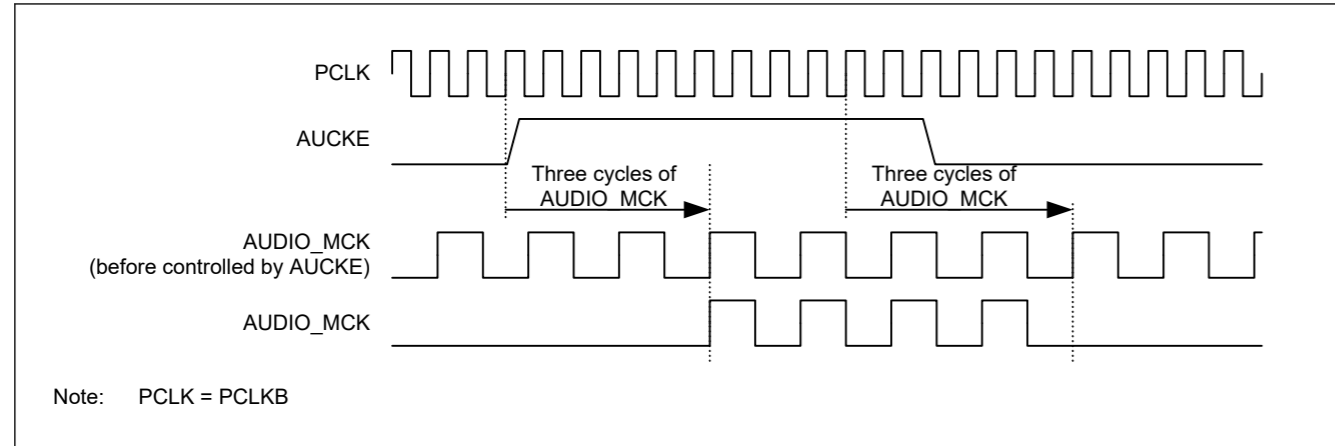

Figure 32.25 Stop/resume of AUDIO\_MCK

Note: In slave-mode communication (SSICR.MST = 0), SSIE needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIE is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIE becomes idle, take the procedure to start communication in Figure 32.52 or wait for an idle state by taking the procedure to resume communication in Figure 32.58.

In master-mode communication (SSICR.MST = 1), SSIE operates with the audio clock (AUDIO\_MCK). To stop SSIE completely, make sure that SSIE is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIE becomes idle, take the procedure to start communication in Figure 32.52.

Figure 32.26 and Figure 32.27 show the timings of signal operation in the period from setting this bit to 1 to the output to the SSIBCK pin.

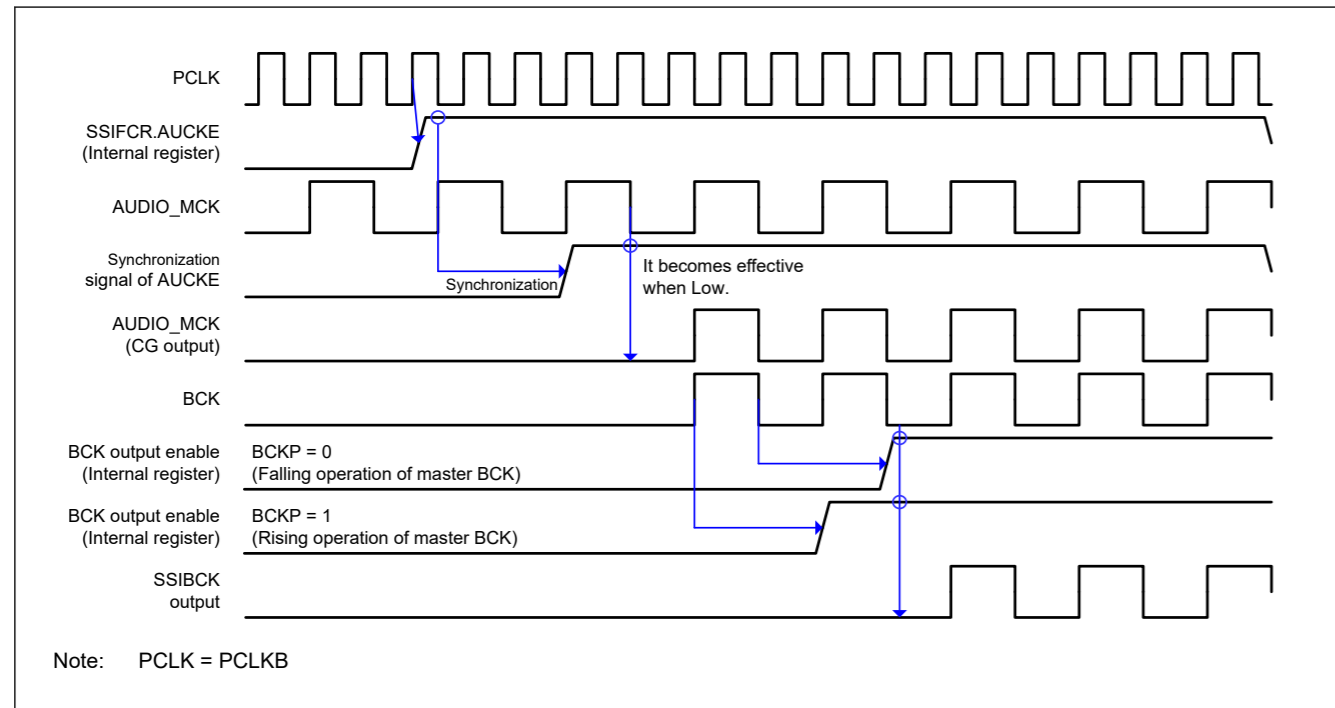

Figure 32.26 Timing diagram for the operation from system reset to start of master-mode communication

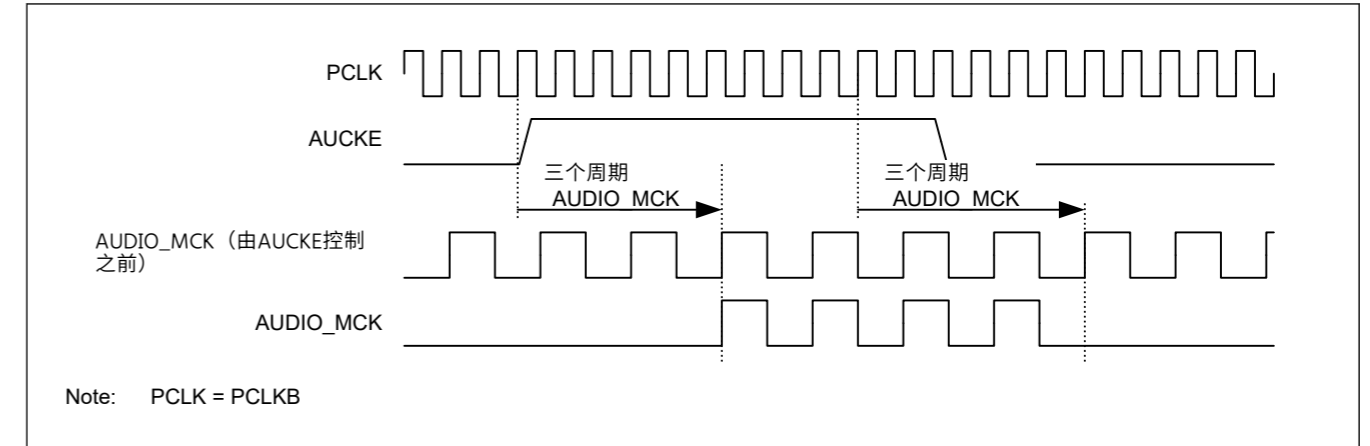

Figure 32.25 Stop/resume of AUDIO\_MCK

Note: 在从模式通信(SSICR.MST=0)中, SSIE需要提供SSIBCK。要在主设备端停止BCK, 请确保SSIE处于空闲状态(SSISR.IIRQ=1)。如果BCK在SSIE空闲之前停止, 则按照图32.52中的程序开始通信, 或按照图32.58中的程序恢复通信等待空闲状态。

在主模式通信(SSICR.MST=1)中, SSIE使用音频时钟(AUDIO\_MCK)运行。要完全停止SSIE, 请确保SSIE处于空闲状态(SSISR.IIRQ=1), 然后将0写入SSIFCR.ADCKE。如果在SSIE空闲之前将0写入SSIFCR.ADCKE, 则按照图32.52中的过程开始通信。

图32.26和图32.27显示了从将该位设置为1到输出到SSIBCK引脚期间的信号操作时序。

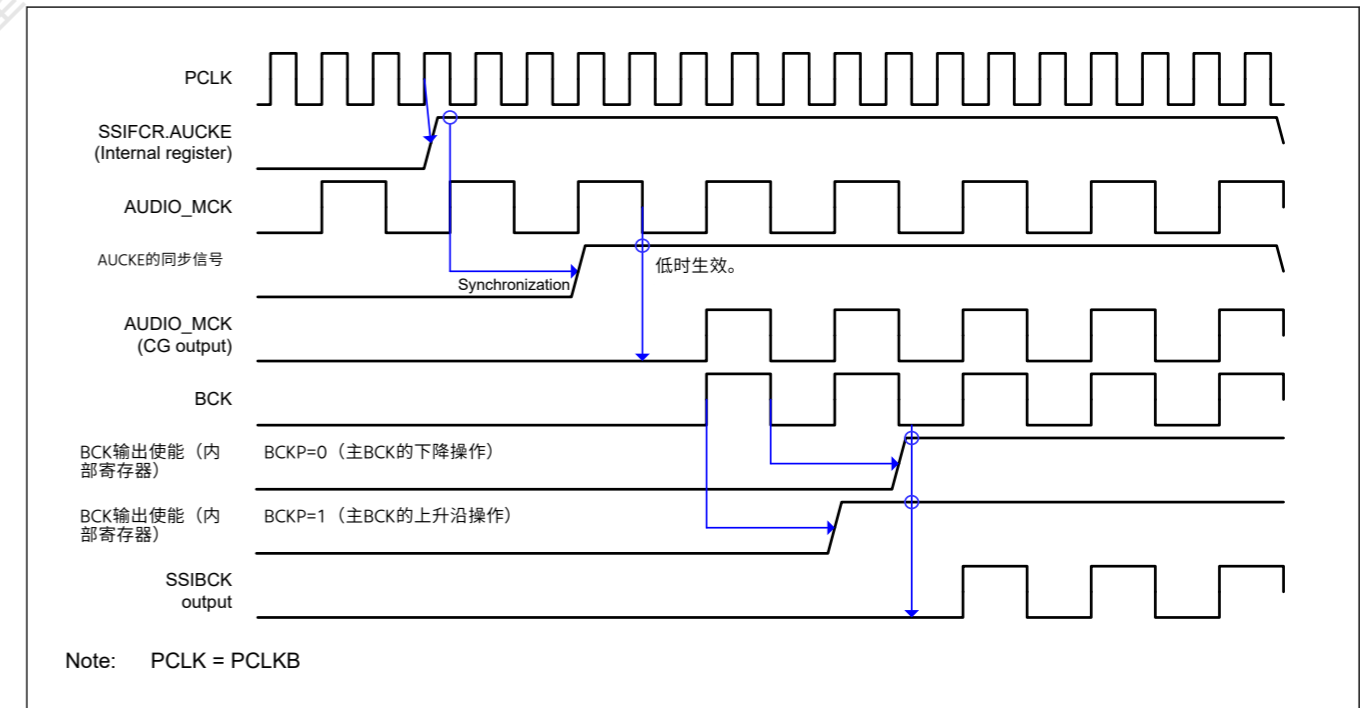

Figure 32.26 从系统复位到主模式通信开始的时序图

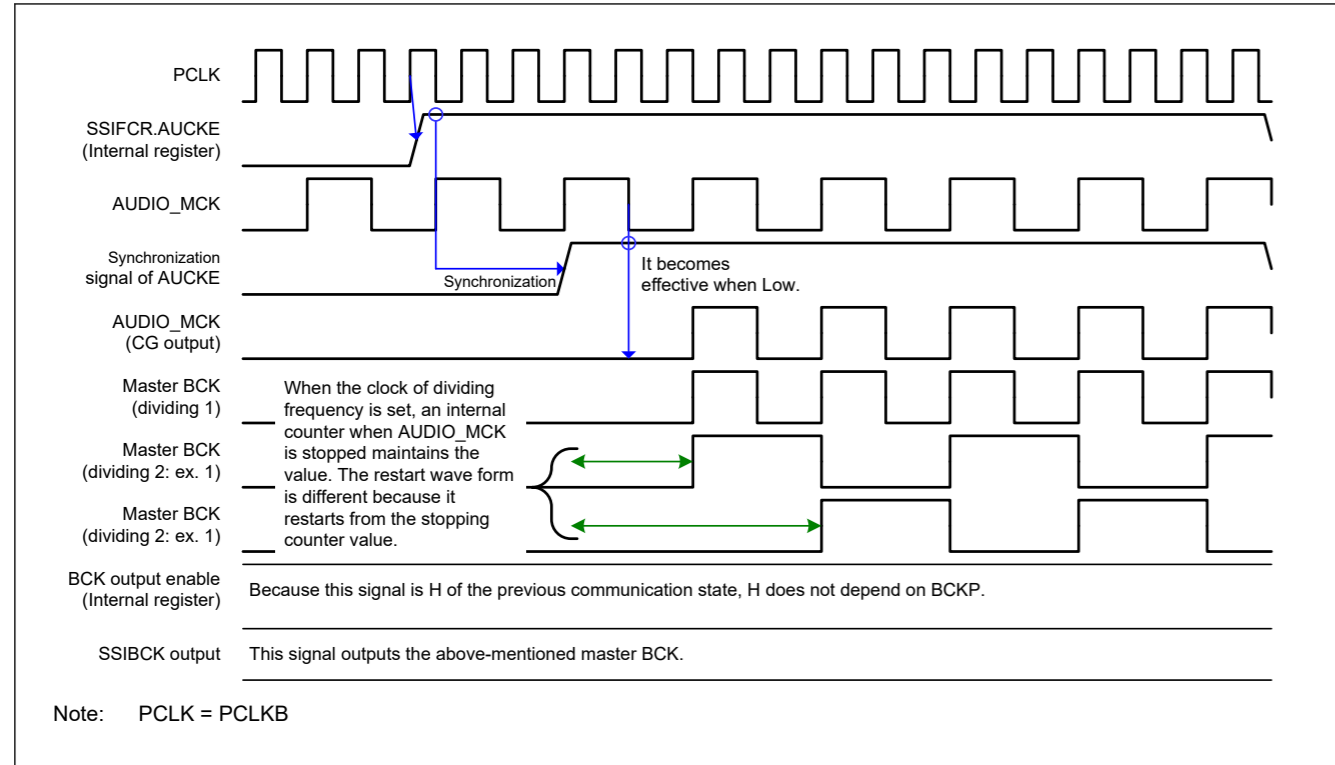

Figure 32.27 Timing diagram for the operation from stop of communication to start of master-mode communication

Note: If the supply of AUDIO\_MCK stops, the value of the SSIBCK pin is held. Therefore, the SSIBCK signal might stop in the H (high level) state.

This register is configured with status flags that indicate the status of the transmit FIFO data register and the receive FIFO data register.

#### RDF flag (Receive Data Full Flag)

The RDF flag indicates that the receive FIFO data register (SSIFRDR) has unread received data not less than the amount set with the SSISCR.RDFS bit plus one. This flag is set by automatic determination but it must be cleared by register access.

[Priority order for setting and clearing]

Clearing is prioritized.

[Clearing condition]

Either of the following two:<sup>\*1</sup>

1. Writing 0 to this bit after reading 1 from this bit (CPU operation)<sup>\*2</sup>
2. Last access (DTC/DMAC operation) to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 32.19)
2. After the PCLKB cycle in which the last access instruction is issued to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

[Setting condition]

SSIFTDR has free space not less than the amount set with the SSIFCR.TTRG bit plus one.

[Setting timing]

At completion of transfer from the shift register that results in SSIFRDR having data not less than the amount set with the SSISCR.RDFS bit plus one.

Note 1. These bits are cleared by a software reset (SSIFCR.SSIRST = 1) and receive FIFO data register reset (SSIFCR.RFRST = 1). Reset conditions available for these bits are the software reset and receive FIFO data register reset as well as the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following four conditions is met:

- A software reset is done (SSIFCR.SSIRST = 1).
- A receive FIFO data register reset is done (SSIFCR.RFRST = 1).
- After 1 has been read, writing of 0 is complete.
- Last access is performed to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

| Bit   | Symbol   | Function  | R/W |
|-------|----------|---|-----|
| 16    | TDE      | 传输数据空标志<br>0: SSIFTDR的可用空间不大于SSISCR.TDES的值。1: SSIFTDR的可用空间不小于SSISCR.TDES的值加一。 | R/W |
| 23:17 | —        | 这些位被读取为0。写入值应为0。  | R/W |
| 29:24 | TDC[5:0] | 发送FIFO数据指示标志数<br>发送FIFO数据数指示标志  | R   |
| 31:30 | —        | 这些位被读取为0。写入值应为0。  | R/W |

该寄存器配置有状态标志，指示发送FIFO数据寄存器和接收FIFO数据寄存器的状态。

#### RDF标志（接收数据满标志）

RDF标志表示接收FIFO数据寄存器(SSIFRDR)的未读接收数据不少于SSISCR.RDFS位设置的数量加一。该标志由自动确定设置，但必须通过寄存器访问清除。

[设置和清除的优先顺序]

清算优先。

[Clearing condition]

以下两种之一：<sup>\*1</sup>

- 1.从该位读取1后向该位写入0（CPU操作）<sup>\*2</sup>
- 2.最后一次访问（DTC/DMAC操作）通过使用DTC和DMAC的中断例程从SSIFRDR读取数据。

[Clearing timing]

与上述清零条件对应的清零时机

- 1.当从该位读取1后向该位写入0时（与图32.19中的时序相同）
- 2.在发出最后一个访问指令以通过使用DTC和DMAC的中断例程从SSIFRDR读取数据的PCLKB周期之后。

[Setting condition]

SSIFTDR的可用空间不小于SSIFCR.TTRG位设置的数量加一。

[Setting timing]

在完成从移位寄存器的传输时，导致SSIFRDR的数据不小于用SSISCR.RDFS位加一。

注1.这些位通过软件复位(SSIFCR.SSIRST=1)和接收FIFO数据寄存器复位清零(SSIFCR.RFRST=1)。这些位可用的复位条件是软件复位和接收FIFO数据寄存器复位以及上述清除条件。

注2.从该位读取1后，当满足以下四个条件之一时，该位被清除：●软件复位完成(SSIFCR.SSIRST=1)。●完成接收FIFO数据寄存器复位(SSIFCR.RFRST=1)。●读1后，写0完成。●使用DTC和DMAC的中断例程执行最后一次访问以从SSIFRDR读取数据。

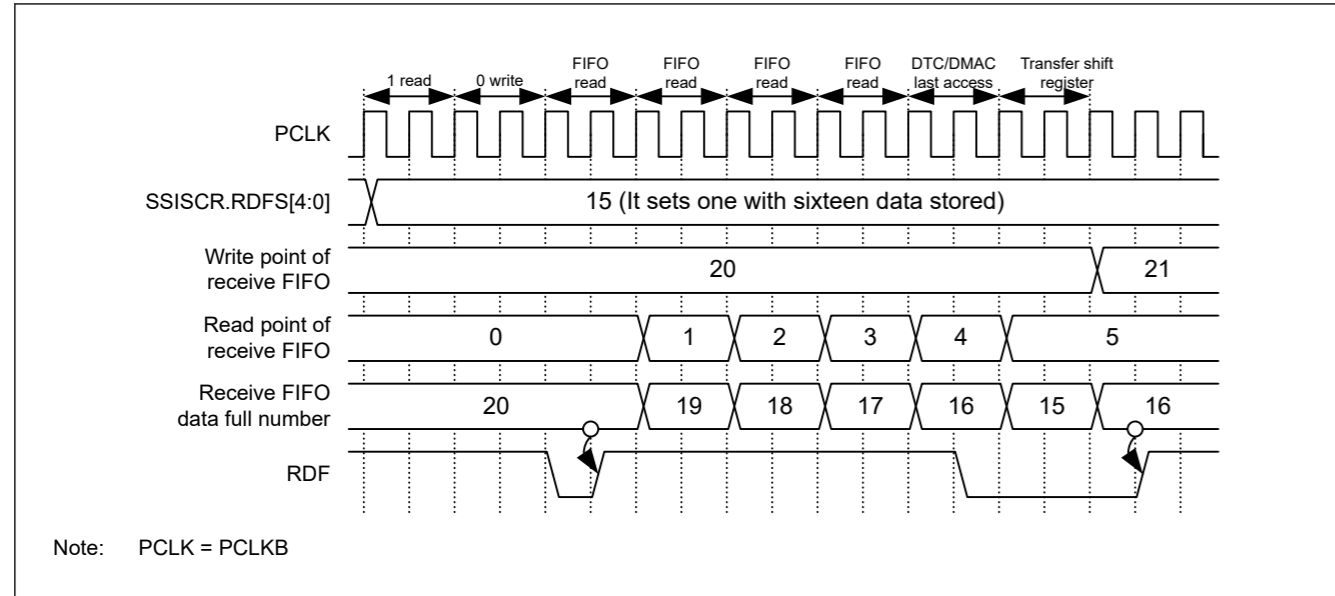

Figure 32.28 Timing diagram for setting and clearing RDF

**RDC[5:0] flags (Number of Receive FIFO Data Indication Flag)**

The RDC[5:0] flags indicate the number of valid data that are stored in the receive FIFO data register (SSIFRDR). With this flag as 0x00, there is no received data. With 0x20, the register is filled with received data and there is no free space.

**TDE flag (Transmit Data Empty Flag)**

The TDE flag indicates that the transmit FIFO data register (SSIFTDR) has free space not less than the amount set with the SSIFCR.TTRG bit plus one. This flag is set by automatic determination but it must be cleared by register access.

[Priority order for setting and clearing]

Clearing is prioritized.\*1

[Clearing condition]

Either of the following two:

1. Writing 0 to this bit after reading 1 from this bit (CPU operation)\*2
2. Last access (DTC/DMAC operation) to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 32.19)
2. Last access (DTC/DMAC operation) to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

[Setting condition]

SSIFTDR has free space not less than the amount set with the SSIFCR.TTRG bit plus one.

[Setting timing]

While operating on PCLKB, SSIFTDR is found to have free space not less than “size set in the SSISCR.TDES bits + 1.”

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1) and transmit FIFO data register reset (SSIFCR.TFRST = 1). The software reset and transmit FIFO data register reset have priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following four conditions is met:

- A software reset is done (SSIFCR.SSIRST = 1).
- A transmit FIFO data register reset is done (SSIFCR.TFRST = 1).
- After 1 has been read, writing of 0 is complete.
- Last access is performed to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

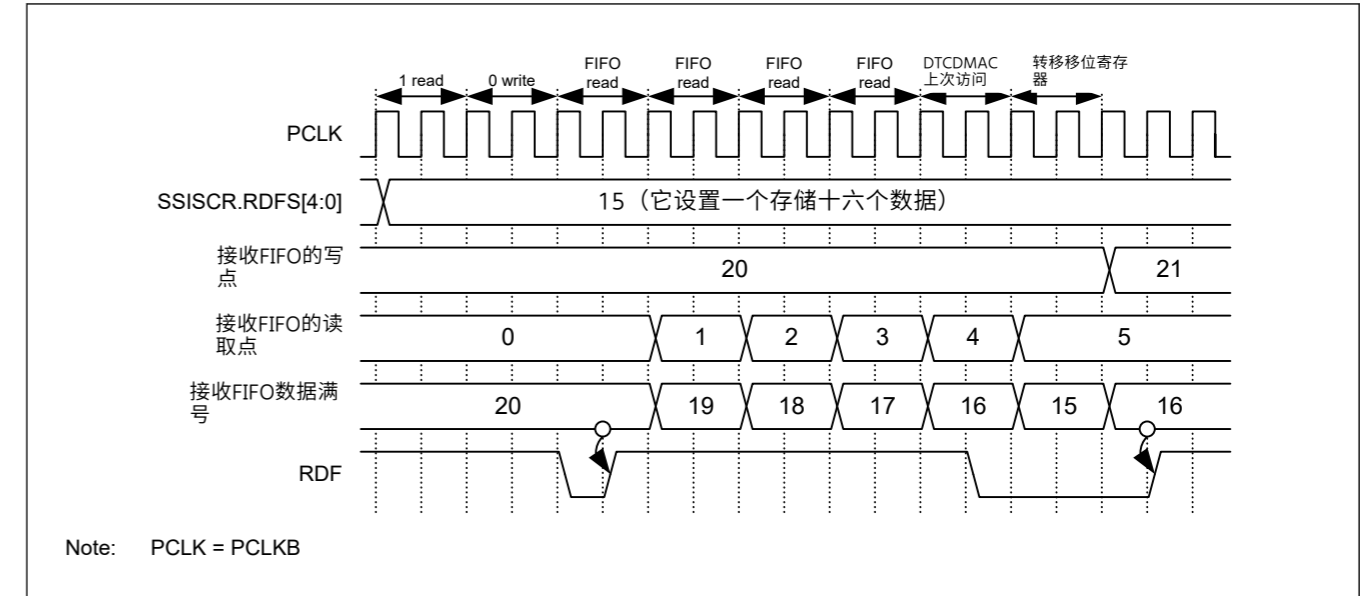

Figure 32.28 设置和清除RDF的时序图

**RDC[5:0] flags (接收FIFO数据指示标志数)**

RDC[5:0]标志指示存储在接收FIFO数据寄存器(SSIFRDR)中的有效数据数量。此标志为0x00时，没有接收到数据。使用0x20，寄存器被接收到的数据填充，没有可用空间。

**TDE标志 (传输数据空标志)**

TDE标志表示发送FIFO数据寄存器(SSIFTDR)的可用空间不小于用SSIFCR.TTRG位加一。该标志由自动确定设置，但必须通过寄存器访问清除。

[设置和清除的优先顺序]

清算优先。\*1

[Clearing condition]

以下两种之一：

- 1.从该位读取1后向该位写入0 (CPU操作) \*2
- 2.最后访问 (DTCDMAC操作) 通过使用DTC和DMAC的中断例程将数据写入SSIFTDR。

[Clearing timing]

与上述清零条件对应的清零时机

- 1.当从该位读取1后向该位写入0时 (与图32.19中的时序相同)
- 2.最后访问 (DTCDMAC操作) 通过使用DTC和DMAC的中断例程将数据写入SSIFTDR。

[Setting condition]

SSIFTDR的可用空间不小于SSIFCR.TTRG位设置的数量加一。

[Setting timing]

在PCLKB上运行时，发现SSIFTDR的可用空间不小于“SSISCR.TDES位中设置的大小+1”。

注1.该位通过软件复位(SSIFCR.SSIRST=1)和发送FIFO数据寄存器复位(SSIFCR.TFRST=1)清零。软件复位和发送FIFO数据寄存器复位优先于上述所有清除条件。

注2.从该位读取1后，当满足以下四个条件之一时，该位被清除：●软件复位完成(SSIFCR.SSIRST=1)。●发送FIFO数据寄存器复位完成(SSIFCR.TFRST=1)。●读1后，写0完成。●使用DTC和DMAC的中断例程执行最后访问以将数据写入SSIFTDR。

Figure 32.29 Timing diagram for setting and clearing TDE

**TDC[5:0] flags (Number of Transmit FIFO Data Indication Flag)**

The TDC[5:0] flags indicate the number of valid data that are stored in the transmit FIFO data register (SSIFTDR). With this flag as 0x00, there is no data to be transmitted. With 0x20, there is no space to write data.

**32.4.5 SSIFTDR : Transmit FIFO Data Register**

Base address: SSIE0 = 0x4009\_D000  
Offset address: 0x18

| Bit  | Symbol        | Function           | R/W |
|------|---------------|--------------------|-----|
| 31:0 | SSIFTDR[31:0] | Transmit FIFO Data | W   |

This register stores data to be serially transmitted. 0 is returned when this register is read.

When you use this register for transmission, specify data writing to this register as the DTC/DMAC operation that is triggered by a transmit data empty interrupt. Determine the access size to this register according to the data word length to be communicated in Table 32.8.

Table 32.8 Register access restriction to FIFOs (1 of 2)

| Access Size    |                  | Byte | Halfword | Word |
|----------------|------------------|------|----------|------|
| SSICR.DWL[2:0] | Data Word Length |      |          |      |
| 000b           | 8                | ✓    | —        | —    |
| 001b           | 16               | —    | ✓        | —    |
| 010b           | 18               | —    | —        | ✓    |
| 011b           | 20               | —    | —        | ✓    |

| 110b           | 32               | —    | —        | ✓    |

Figure 32.29 设置和清除TDE的时序图

**TDC[5:0]flags (发送FIFO数据指示标志数)**

TDC[5:0]标志指示存储在发送FIFO数据寄存器(SSIFTDR)中的有效数据数量。此标志为0x00时，没有要传输的数据。使用0x20，没有空间可以写入数据。

**32.4.5 SSIFTDR: 发送FIFO数据寄存器**

Base address: SSIE0 = 0x4009\_D000  
Offset address: 0x18

| Bit  | Symbol        | Function | R/W |
|------|---------------|----------|-----|
| 31:0 | SSIFTDR[31:0] | 发送FIFO数据 | W   |

该寄存器存储要串行传输的数据。读取该寄存器时返回0。

当您使用该寄存器进行传输时，将数据写入该寄存器指定为由传输数据空中断触发的DTC/DMAC操作。根据表32.8中要通信的数据字长确定对该寄存器的访问大小。

Table 32.8 对FIFO的寄存器访问限制 (1of2)

| 访问大小           |      | Byte | Halfword | Word |
|----------------|------|------|----------|------|
| SSICR.DWL[2:0] | 数据字长 |      |          |      |
| 000b           | 8    | ✓    | —        | —    |
| 001b           | 16   | —    | ✓        | —    |
| 010b           | 18   | —    | —        | ✓    |
| 011b           | 20   | —    | —        | ✓    |
| 100b           | 22   | —    | —        | ✓    |
| 101b           | 24   | —    | —        | ✓    |
| 110b           | 32   | —    | —        | ✓    |

Table 32.8 Register access restriction to FIFOs (2 of 2)

| Access Size    |                    | Byte | Halfword | Word |

Figure 32.31 发送FIFO数据寄存器和发送移位寄存器的配置，以及FIFO操作示例

## 32.4.6 SSIFRDR : Receive FIFO Data Register

Base address: SSIE0 = 0x4009\_D000

Offset address: 0x1C

Bit position: 31 0

Bit field: SSIFRDR[31:0]

Value after reset: 0

| Bit  | Symbol        | Function          | R/W |
|------|---------------|-------------------|-----|
| 31:0 | SSIFRDR[31:0] | Receive FIFO Data | R   |

When you use this register for reception, specify data reading from this register as the DTC/DMAC operation that is triggered by a transmit data empty interrupt. Determine the access size to this register according to the data word length to be communicated in [Table 32.8](#).

Register access to the receive FIFO data register is same as for the transmit FIFO data register.

[Figure 32.31](#) shows the configurations and operation examples of the receive FIFO data register and receive shift register.

## 32.4.6 SSIFRDR:接收FIFO数据寄存器

Base address: SSIE0 = 0x4009\_D000

Offset address: 0x1C

Bit position: 31 0

Bit field: SSIFRDR[31:0]

重置后的值: 0

| Bit  | Symbol        | Function | R/W |
|------|---------------|----------|-----|
| 31:0 | SSIFRDR[31:0] | 接收FIFO数据 | R   |

当您使用该寄存器进行接收时，将从该寄存器读取的数据指定为由发送数据空中断触发的DTC/DMAC操作。根据表32.8中要通信的数据字长确定对该寄存器的访问大小。

对接收FIFO数据寄存器的寄存器访问与对发送FIFO数据寄存器的访问相同。

图32.31显示了接收FIFO数据寄存器和接收移位寄存器的配置和操作示例。

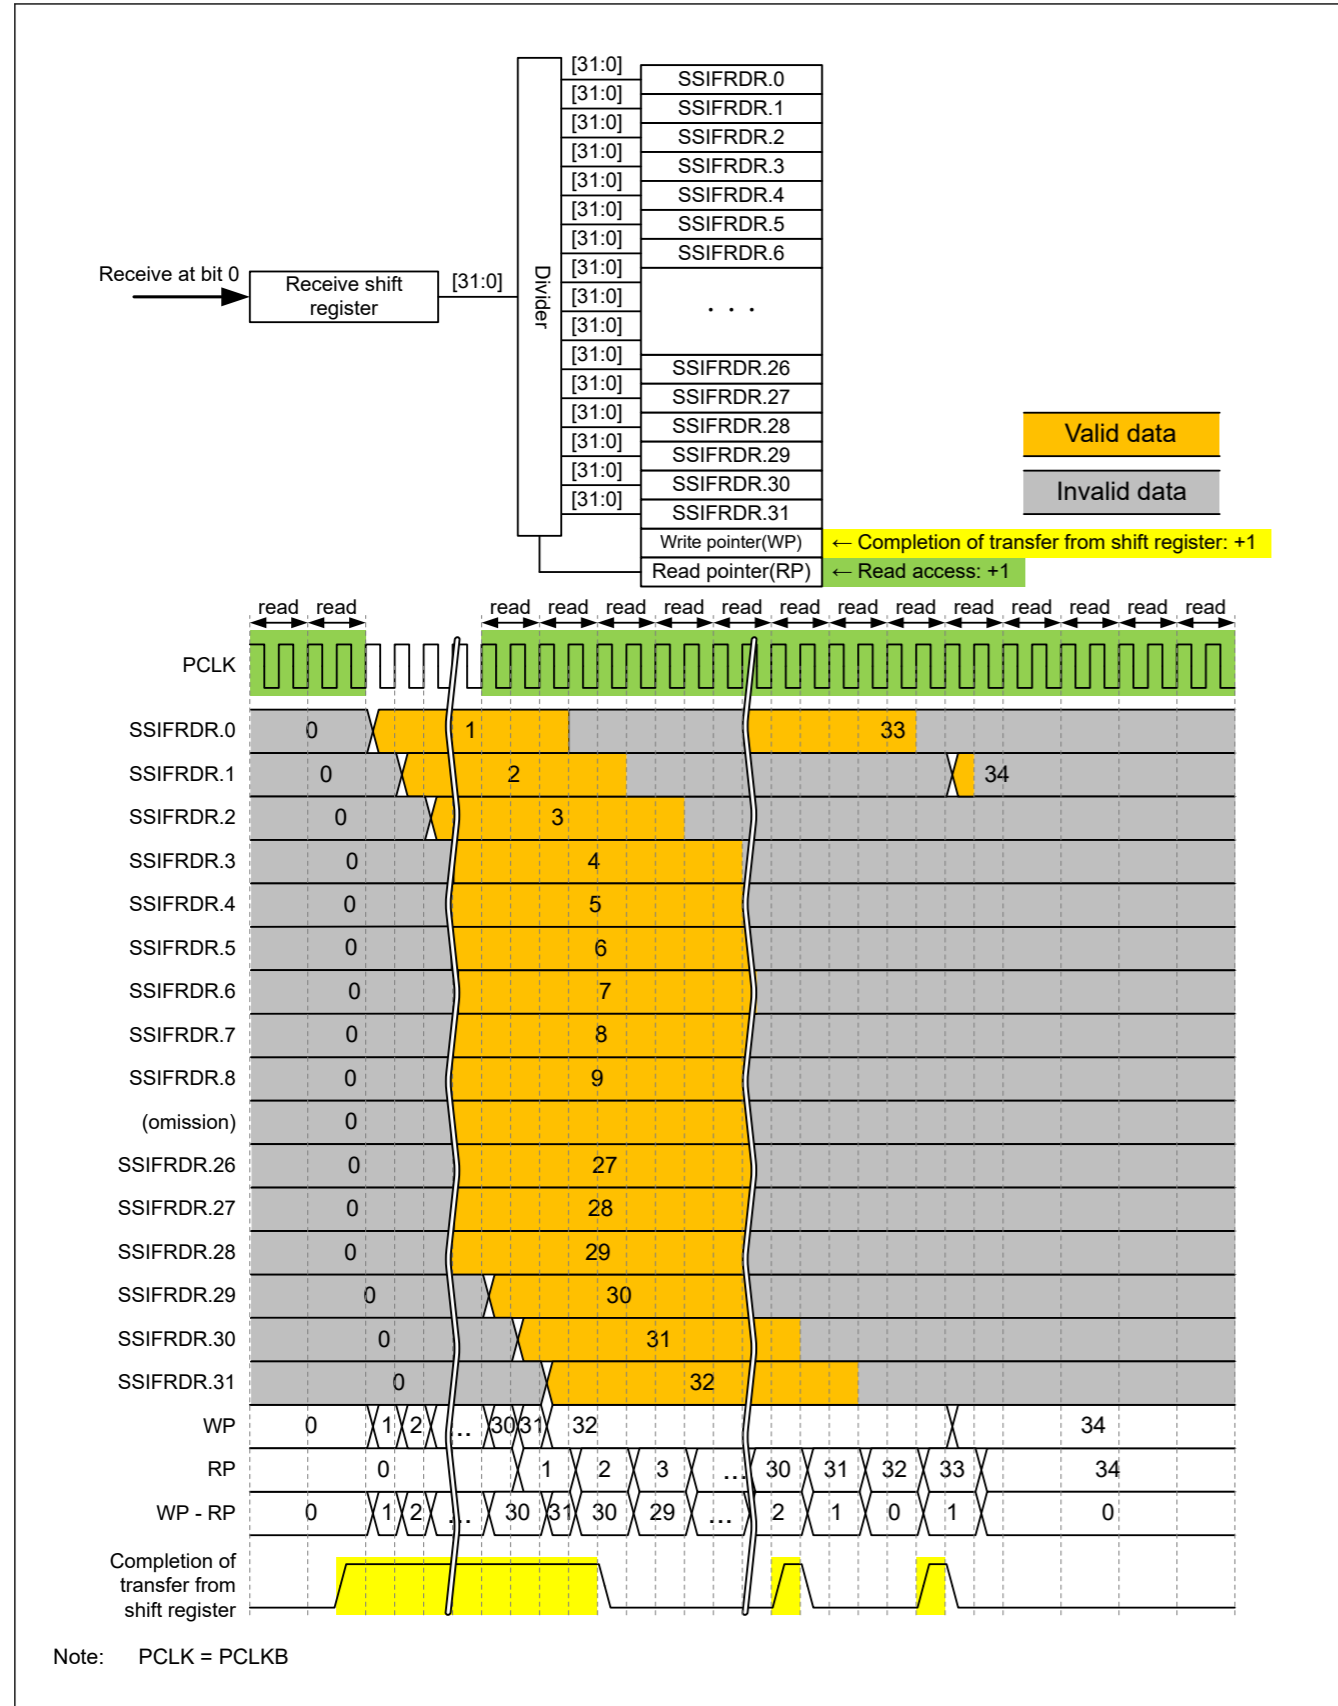

Figure 32.32 Configuration of the transmit FIFO data register and transmit shift register, and FIFO operation example

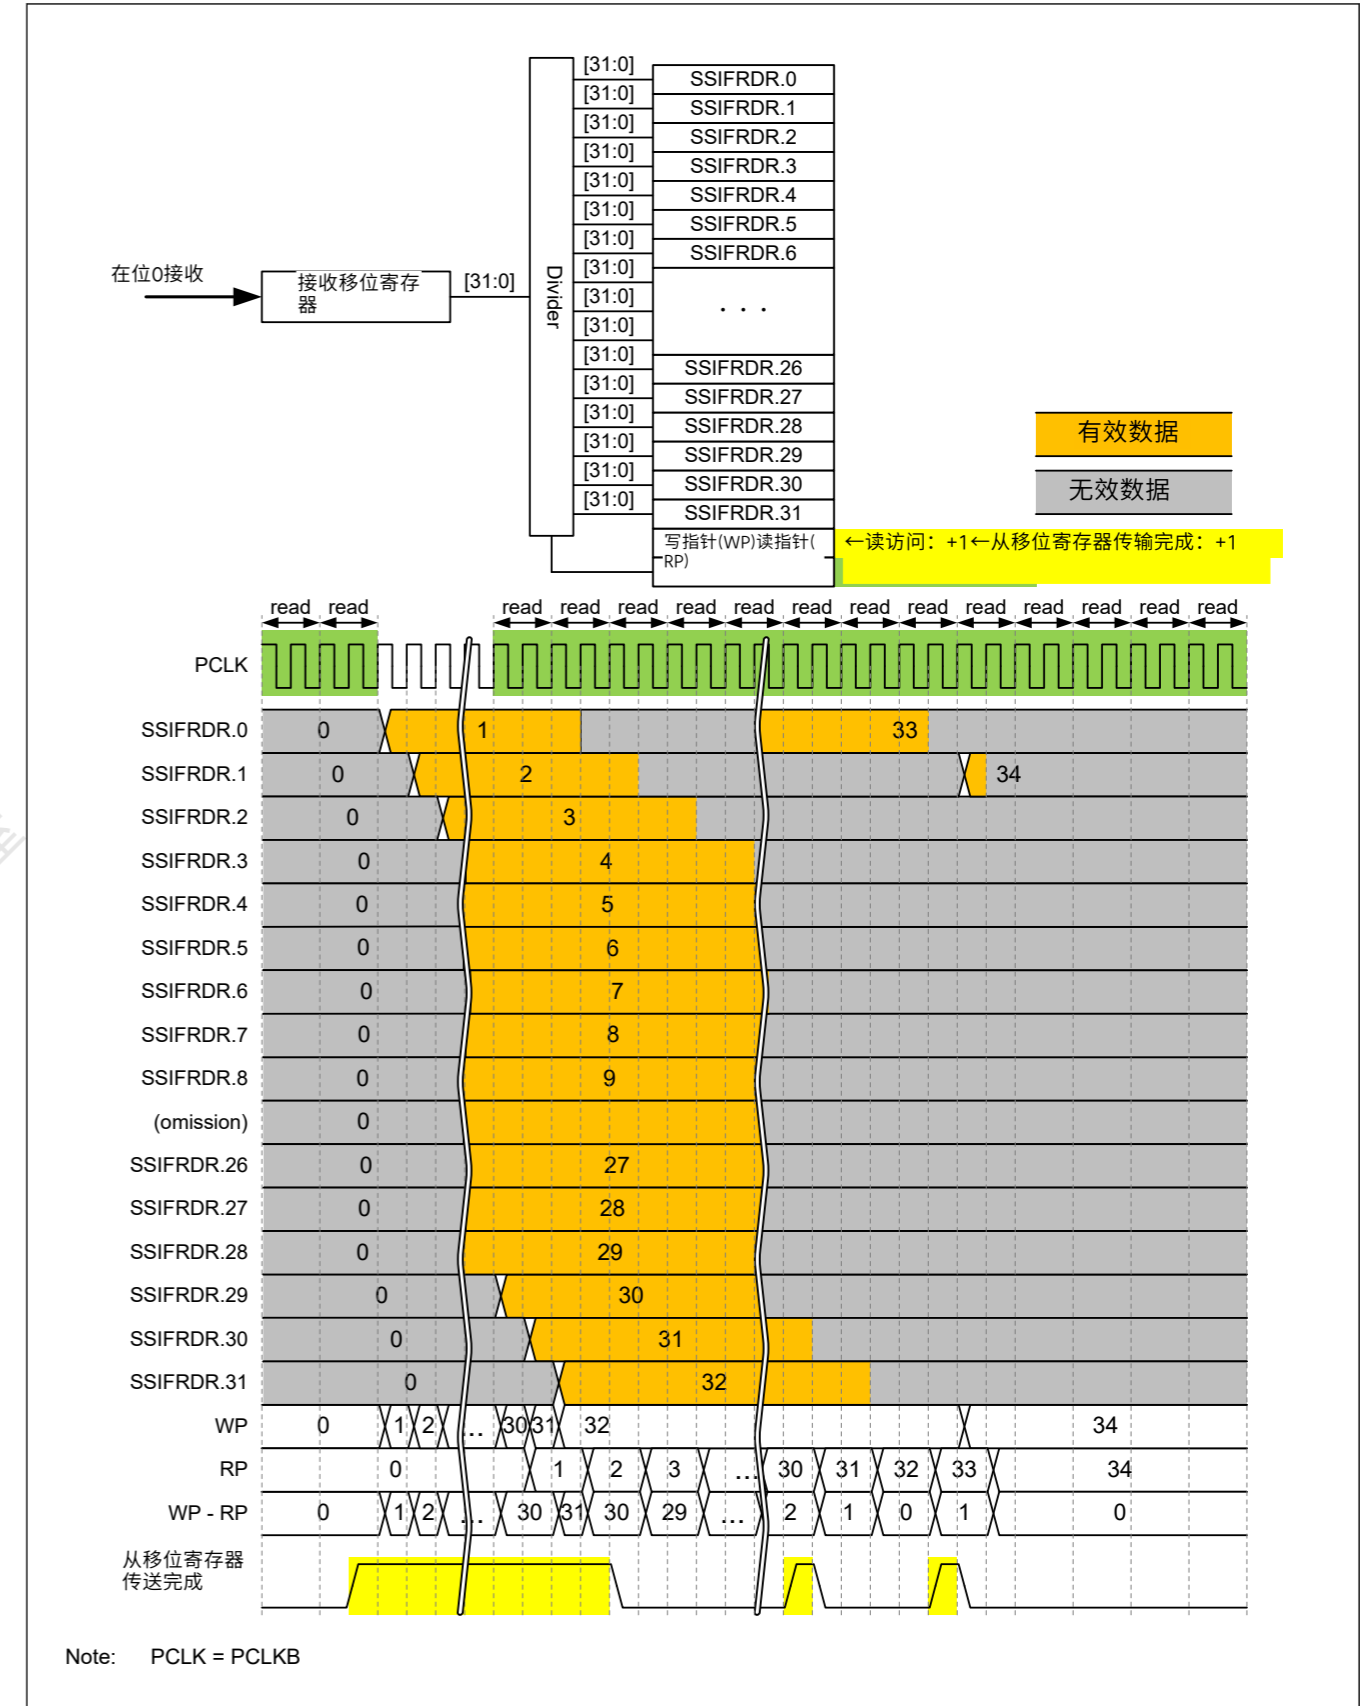

Figure 32.32 发送FIFO数据寄存器和发送移位寄存器的配置，以及FIFO操作示例

## 32.4.7 SSIOFR : Audio Format Register

Base address: SSIE0 = 0x4009\_D000

Offset address: 0x20

|                    |    |    |    |    |    |    |             |            |    |    |    |    |    |    |    |           |
|--------------------|----|----|----|----|----|----|-------------|------------|----|----|----|----|----|----|----|-----------|
| Bit position:      | 31 | 30 | 29 | 28 | 27 | 26 | 25          | 24         | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16        |
| Bit field:         | —  | —  | —  | —  | —  | —  | —           | —          | —  | —  | —  | —  | —  | —  | —  | —         |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0           | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0         |
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9           | 8          | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0         |
| Bit field:         | —  | —  | —  | —  | —  | —  | BCKA<br>STP | LRCO<br>NT | —  | —  | —  | —  | —  | —  | —  | OMOD[1:0] |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0           | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0         |

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 1:0   | OMOD[1:0] | Audio Format Select <sup>*3 *4</sup><br>0 0: I <sup>2</sup> S format<br>0 1: TDM format<br>1 0: Monaural format<br>1 1: Setting prohibited   | R/W |
| 7:2   | —         | These bits are read as 0. The write value should be 0.   | R/W |
| 8     | LRCONT    | Whether to Enable LRCK/FS Continuation <sup>*1 *2</sup><br>0: Disables LRCK/FS continuation<br>1: Enables LRCK/FS continuation   | R/W |
| 9     | BCKASTP   | Whether to Enable Stopping BCK Output When SSIE is in Idle Status <sup>*1 *2</sup><br>0: Always outputs BCK to the SSIBCK pin<br>1: Automatically controls output of BCK to the SSIBCK pin | R/W |
| 31:10 | —         | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. This bit is valid only in master-mode communication (SSICR.MST = 1). The setting is invalid in slave-mode communication (SSICR.MST = 0).

Note 2. The BCKASTP and LRCONT bits must not be set to 1 together.

Note 3. While SSIE is communicating (SSISR.IIRQ = 0), writing to these bits is prohibited. If the value of these bits is changed by writing, subsequent operation is unpredictable.

Note 4. If the communication format of other-party device is compatible with a communication format of SSIE, specify and use the communication format that enables communication with the other-party device.

This register is used to set an audio format (which involves the settings of communication format, LR clock/frame synchronization continuation mode, and BCK output stop).

**OMOD[1:0] bits (Audio Format Select)**

The OMOD[1:0] bits set an audio format. Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in [section 32.4.7. SSIOFR : Audio Format Register](#).

**LRCONT bit (Whether to Enable LRCK/FS Continuation)**

The LRCONT bit enables or disables the output from SSILRCK/SSIFS pin when the communication mode is master-mode communication (SSICR.MST = 1) and SSIE is in the idle state (SSISR.IIRQ = 1).

Even in the idle state, a signal can output from the SSILRCK/SSIFS pin when this bit is set to 1 (to enable LR clock/frame synchronization continuation) in master mode (SSICR.MST = 1).

## 32.4.7 SSIOFR:音频格式寄存器

Base address: SSIE0 = 0x4009\_D000

Offset address: 0x20

|               |    |    |    |    |    |    |             |            |    |    |    |    |    |    |    |           |
|---------------|----|----|----|----|----|----|-------------|------------|----|----|----|----|----|----|----|-----------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25          | 24         | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16        |
| Bit field:    | —  | —  | —  | —  | —  | —  | —           | —          | —  | —  | —  | —  | —  | —  | —  | —         |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0           | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0         |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9           | 8          | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0         |
| Bit field:    | —  | —  | —  | —  | —  | —  | BCKA<br>STP | LRCO<br>NT | —  | —  | —  | —  | —  | —  | —  | OMOD[1:0] |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0           | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0         |

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 1:0   | OMOD[1:0] | 音频格式选择 <sup>*3*4</sup><br>00: I2S格式01: TDM<br>格式10: 单声道格式1<br>1: 禁止设置              | R/W |
| 7:2   | —         | 这些位被读取为0。写入值应为0。   | R/W |
| 8     | LRCONT    | 是否开启LRCKFSContinuation <sup>*1*2</sup><br>0: 禁用LRCKFS延续1: 启用LRCKFS<br>S延续          | R/W |
| 9     | BCKASTP   | SSIE空闲时是否使能停止BCK输出 <sup>*1*2</sup><br>0: 始终向SSIBCK引脚输出BCK1: 自动控制向SSIBCK引脚<br>输出BCK | R/W |
| 31:10 | —         | 这些位被读取为0。写入值应为0。   | R/W |

注1.该位仅在主模式通信(SSICR.MST=1)中有效。该设置在从模式通信中无效(SSICR.MST=0)。

注2.BCKASTP和LRCONT位不能一起设置为1。

注3.当SSIE正在通信时(SSISR.IIRQ=0)，禁止写入这些位。如果这些位的值通过写来改变，后续的操作是不可预知的。

注4.如果对方设备的通信格式与SSIE的通信格式兼容，请指定并使用能够与对方设备进行通信的通信格式。

该寄存器用于设置音频格式（涉及通信格式、LR时钟帧同步持续模式、BCK输出停止的设置）。

**OMOD[1:0]位（音频格式选择）**

OMOD[1:0]位设置音频格式。当LR时钟提供给SSILRCK/SSIFS引脚停止。LR时钟的输出详见32.4.7节LRCONT位的详细说明。SSIOFR：音频格式寄存器。

**LRCONT位（是否使能LRCKFSContinuation）**

当通信模式为主机模式通信(SSICR.MST=1)且SSIE处于空闲状态(SSISR.IIRQ=1)时，LRCONT位启用或禁用SSILRCK/SSIFS引脚的输出。

即使在空闲状态下，当该位在主模式(SSICR.MST=1)下设置为1（以启用LR时钟帧同步继续）时，也可以从SSILRCK/SSIFS引脚输出信号。

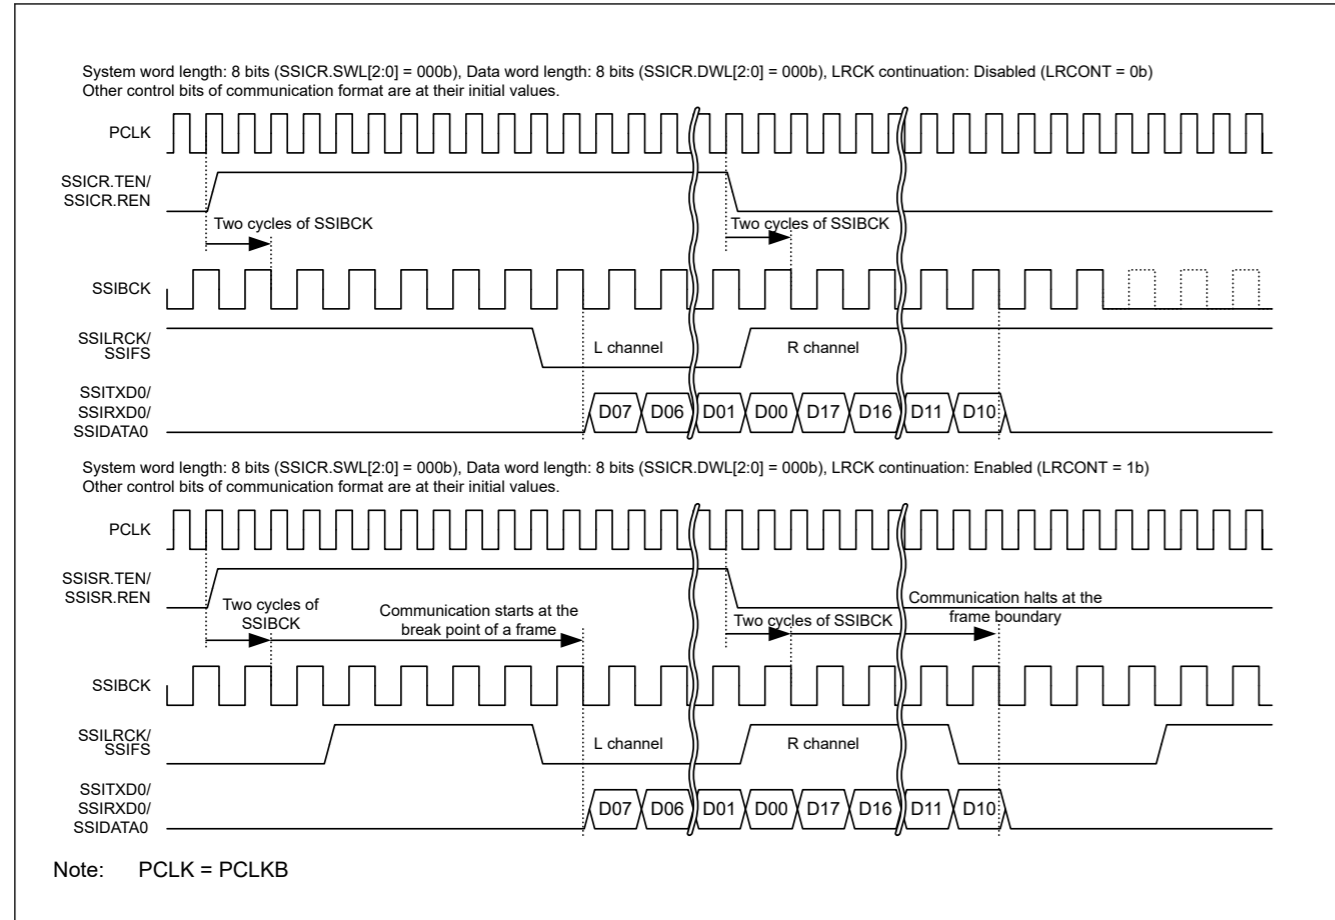

Figure 32.33 Example of LR clock/frame synchronization continuation operation

**BCKASTP bit (Whether to Enable Stopping BCK Output When SSIE is in Idle Status)**

The BCKASTP bit turns on or off the function to output BCK to the SSIBCK pin according to the communication shown in Figure 32.34 and Figure 32.35 in master-mode communication (SSICR.MST = 1).

Changing the value of this bit must be performed only after setting the communication format to be used.

This bit must be used in the following way:

Write 0 to the BCKASTP bit, and then start communication. During the communication, write 1 to the BCKASTP bit. By this operation, the bit clock output to the SSIBCK pin stops automatically when the communication stops. To resume the communication, set SSIE to the idle state (SSICR.IIRQ = 1), enable the supply of AUDIO\_MCK (SSIFCR.AUCKE = 1), and then write 0 to the BCKASTP bit.

When the communication mode is master-mode communication (SSICR.MST = 1) and SSIE is in the idle state (SSICR.IIRQ = 1):

Table 32.9 BCKASTP bit status and SSIBCK pin output

| BCKASTP Bit | SSIBCK Pin Output Status |
|-------------|--------------------------|
| 0           | Output                   |
| 1           | Stopped                  |

Note: The BCKASTP bit cannot be used when the other-party device (which is a slave) requires the clock output from the SSIBCK pin before and during communication. In such a case, use the BCKASTP bit to stop the clock only after communication. For the timing of enabling the clock stop function, see Figure 32.34.

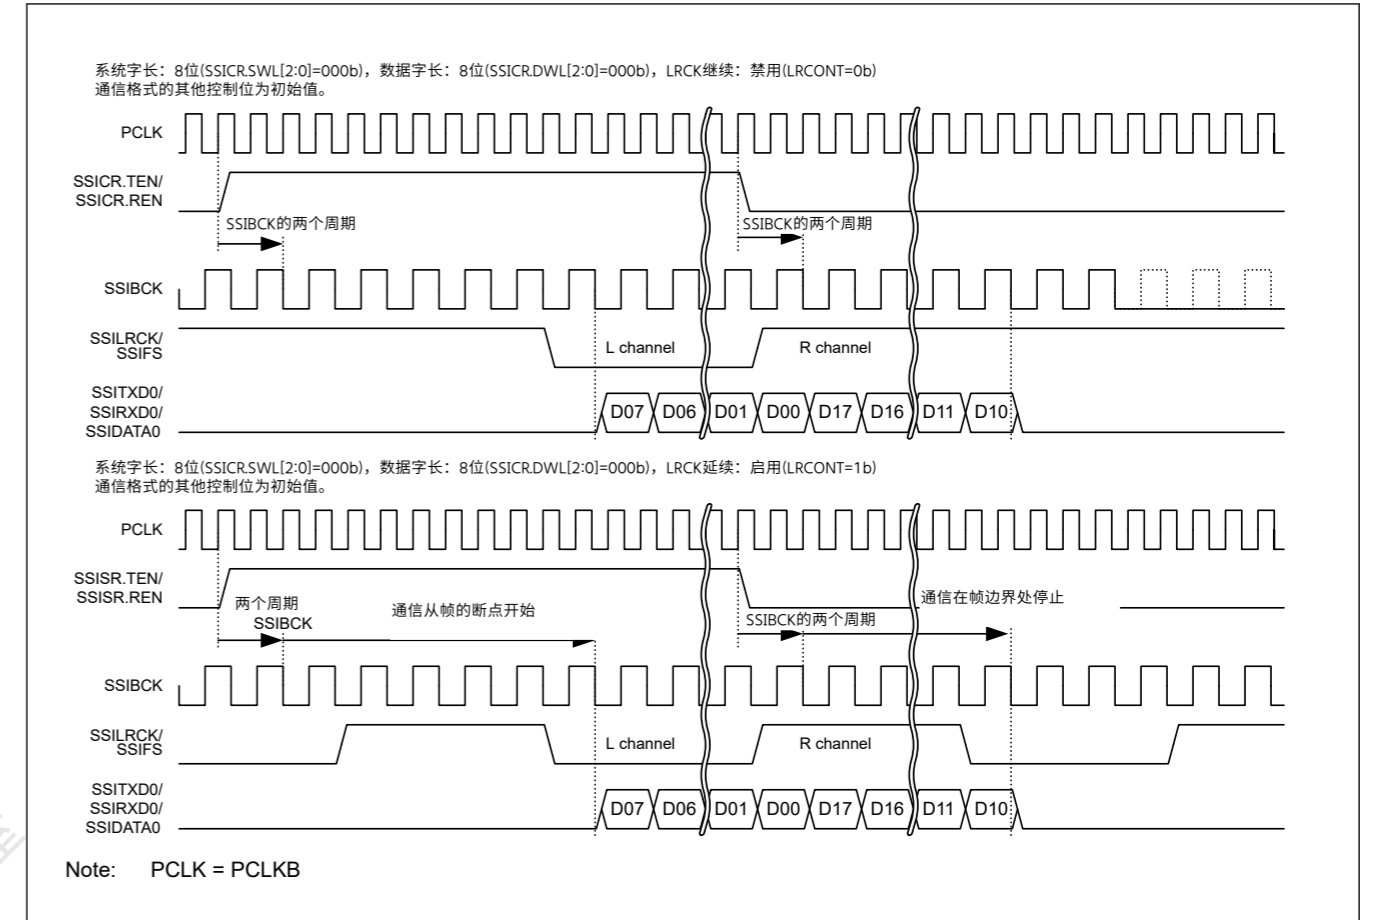

Figure 32.33 LR时钟帧同步继续操作示例

**BCKASTP位 (SSIE空闲时是否使能停止BCK输出)**

BCKASTP位根据中所示的通信打开或关闭将BCK输出到SSIBCK引脚的功能图32.34和图32.35在主模式通信(SSICR.MST=1)。

只有在设置要使用的通信格式后才能更改该位的值。

该位必须按以下方式使用:

将0写入BCKASTP位, 然后开始通信。在通信期间, 将1写入BCKASTP位。通过该操作, 当通信停止时, 向SSIBCK引脚输出的位时钟自动停止。要恢复通信, 请将SSIE设置为空闲状态(SSICR.IIRQ=1), 启用AUDIO\_MCK电源(SSIFCR.AUCKE=1), 然后将0写入BCKASTP位。

当通信模式为主模式通信 (SSICR.MST=1) 且SSIE处于空闲状态 (SSICR.IIRQ=1) 时:

Table 32.9 BCKASTP位状态和SSIBCK引脚输出

| BCKASTP Bit | SSIBCK引脚输出状态 |
|-------------|--------------|
| 0           | Output       |
| 1           | Stopped      |

Note: 当对方设备 (作为从设备) 在通信之前和通信期间需要从SSIBCK引脚输出时钟时, 不能使用BCKASTP位。在这种情况下, 仅在通信后使用BCKASTP位停止时钟。时钟停止功能的开启时序见图32.34。

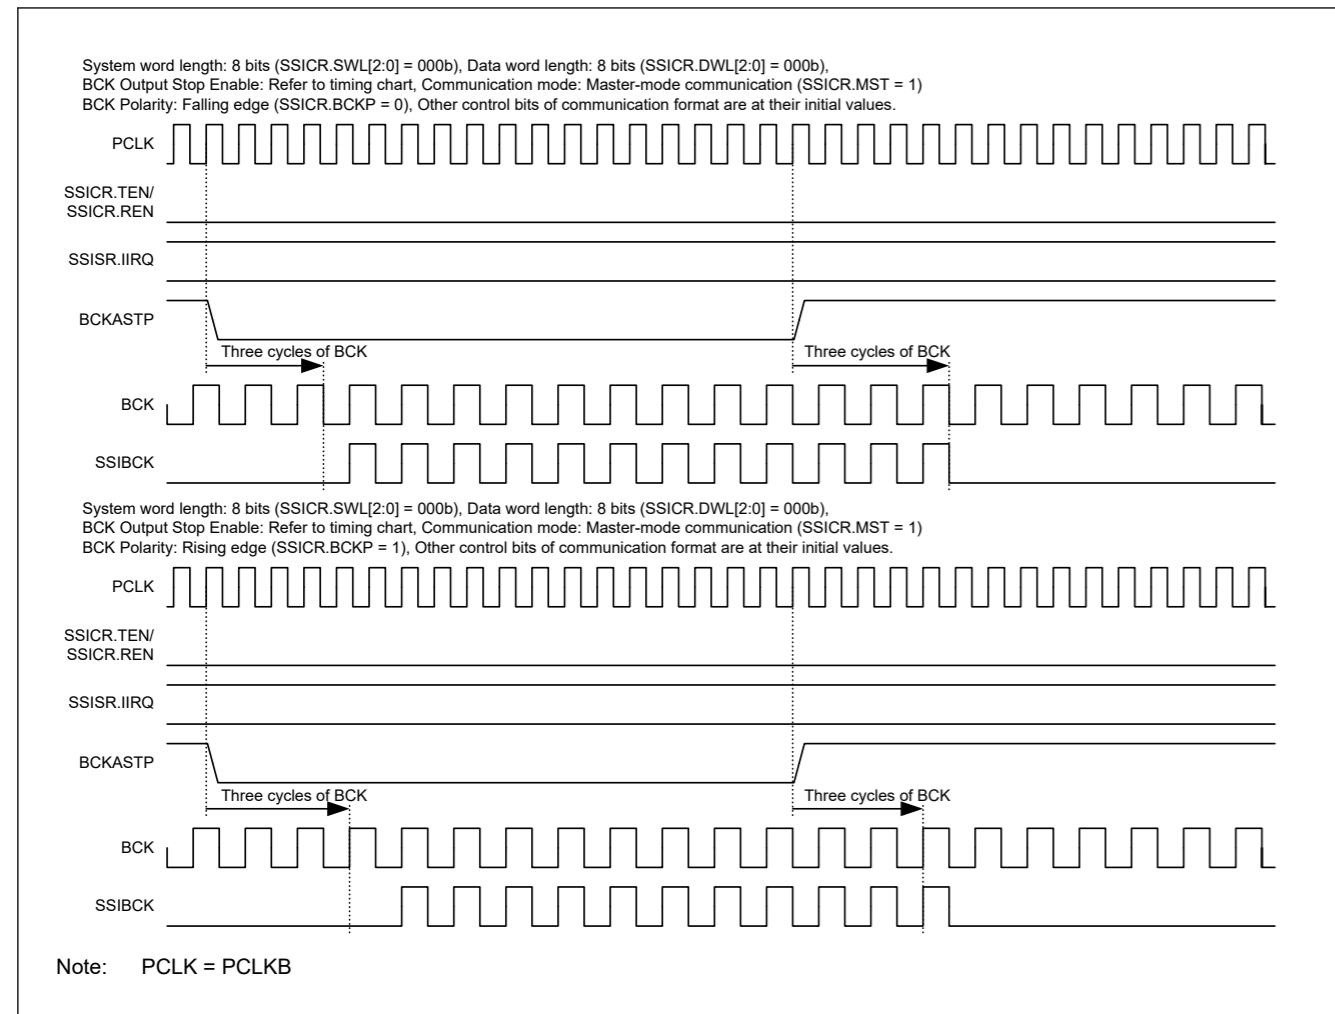

Figure 32.34 Example operation of the BCKASTP bit (idle state)

When the communication mode is master-mode communication (SSICR.MST = 1) and the BCK output stop function is enabled (BCKASTP = 1):

Details of the BCK output to the SSIBCK pin are as follows:

Output start timing: BCK is output in appropriate timing so that a valid edge is generated when the LR clock/frame synchronization signal shifts to a valid value.

Output stop timing: 1 to 1.5 clock cycles after a frame boundary.

For details about the timings, see the timing diagram in Figure 32.35.

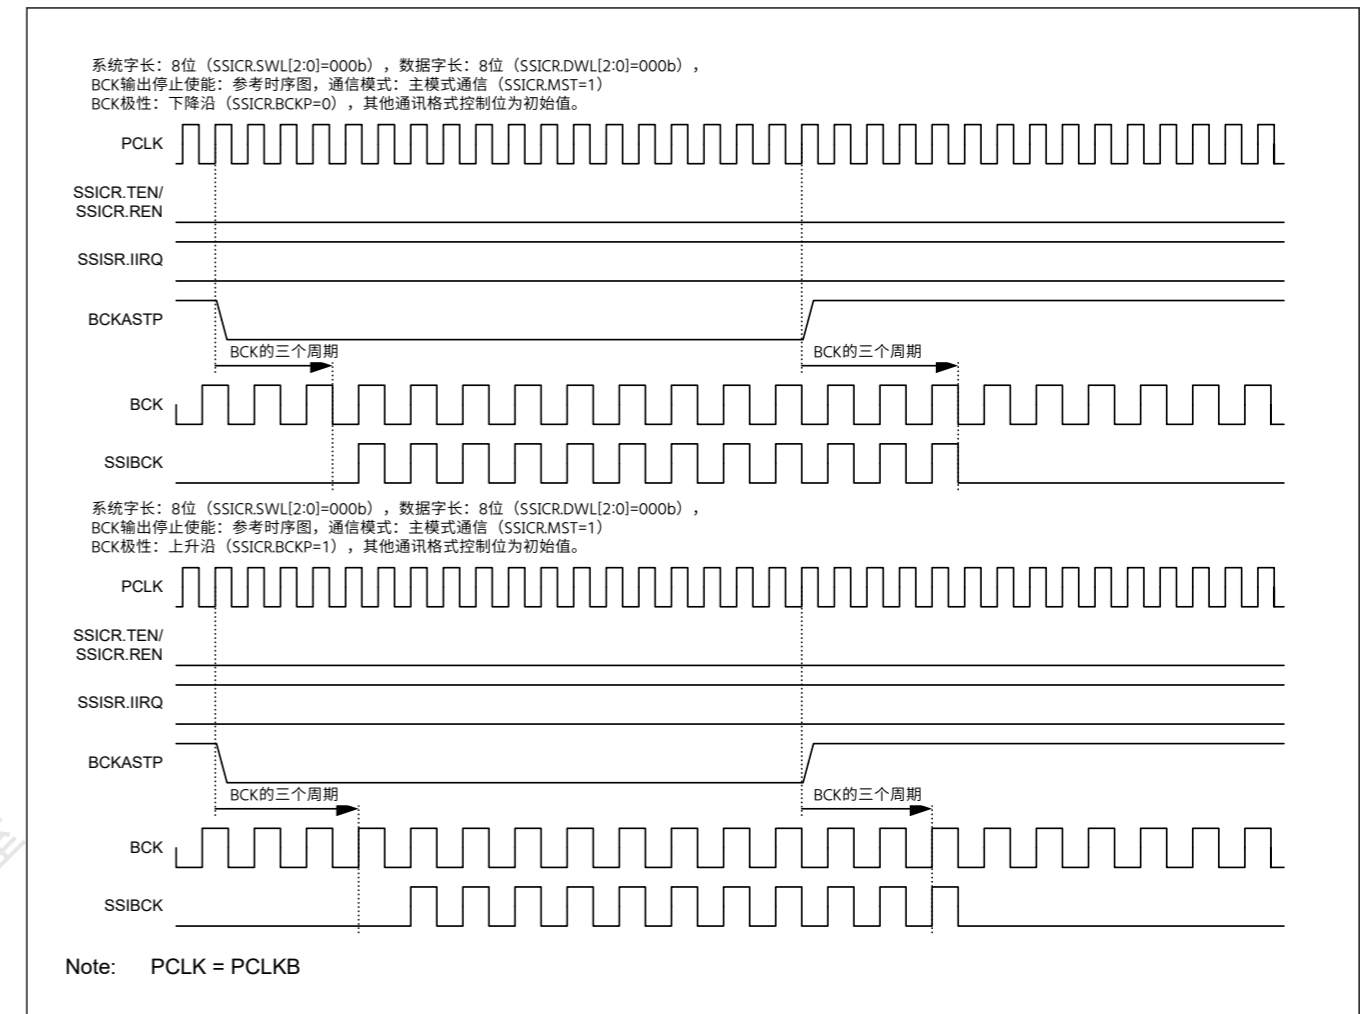

Figure 32.34 BCKASTP位的示例操作 (空闲状态)

当通信模式为主机模式通信(SSICR.MST=1)且BCK输出停止功能启用(BCKASTP=1)时:

BCK输出到SSIBCK引脚的详细信息如下:

输出开始时序: 在适当的时序输出BCK, 以便在LR时钟帧同步信号移位到有效值时产生有效边沿。

输出停止时序: 帧边界后1到1.5个时钟周期。

有关时序的详细信息, 请参见图32.35中的时序图。

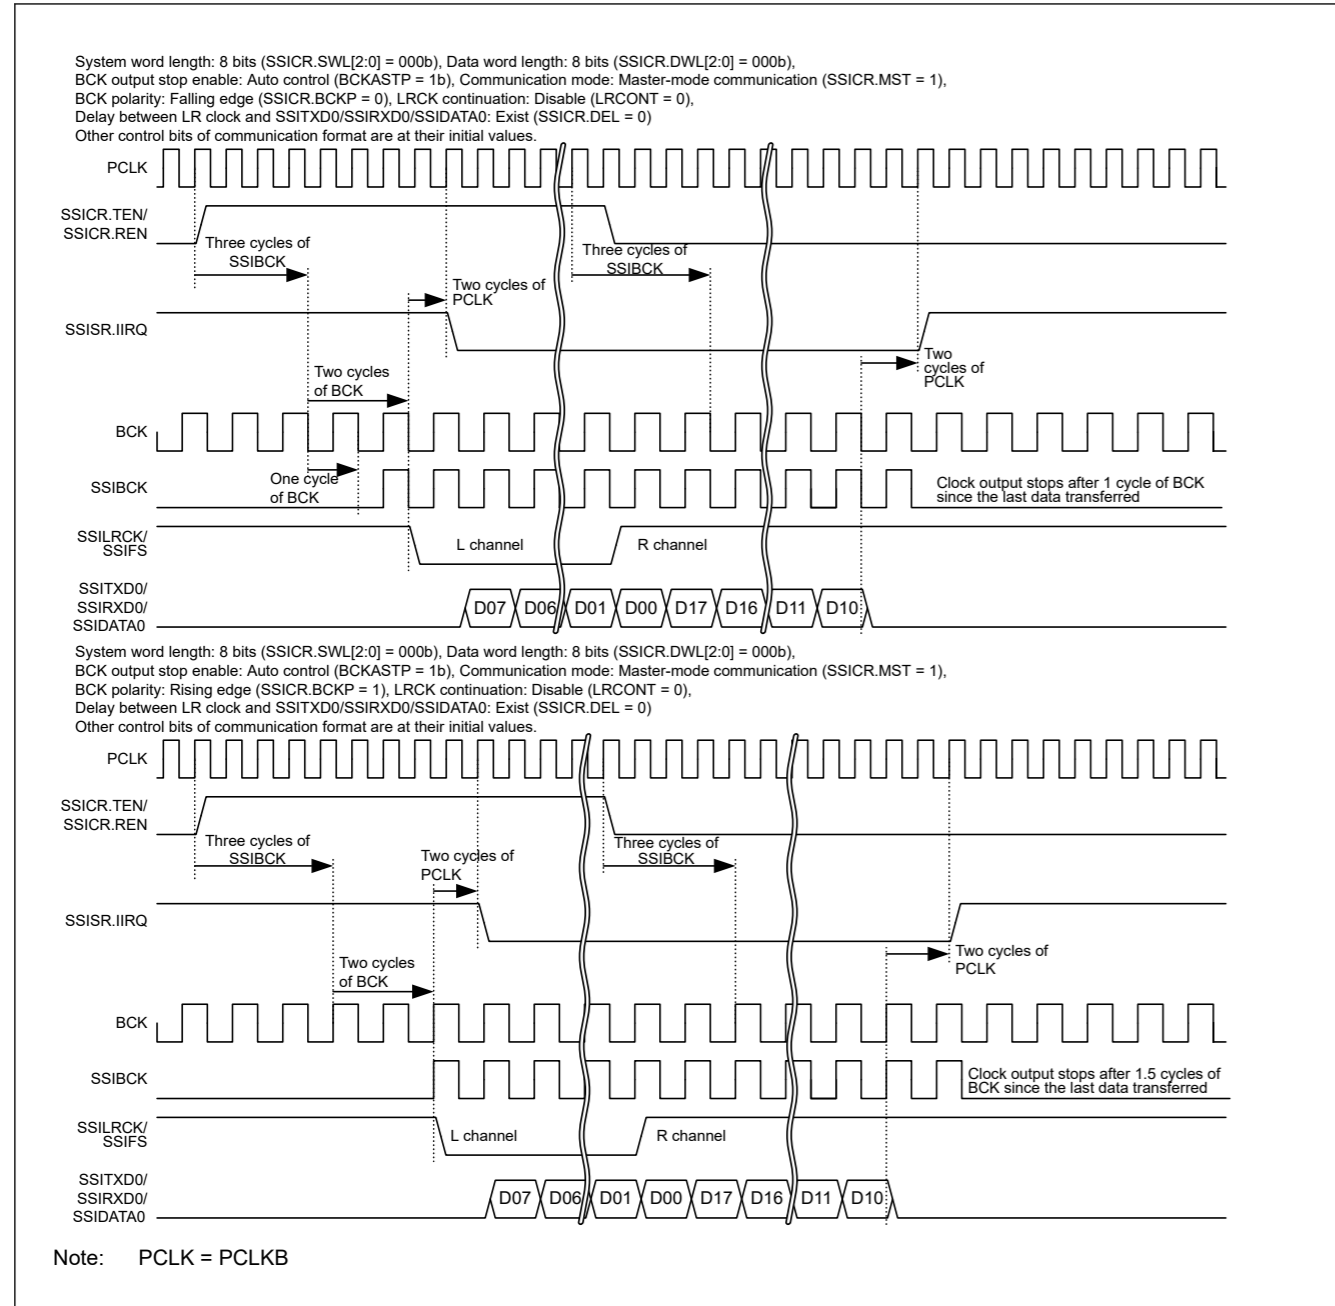

Figure 32.35 Example operation of the BCKASTP bit (communication operation with BCKASTP = 1)

32.4.8 SSISCR : Status Control Register

Base address: SSIE0 = 0x4009\_D000  
 Offset address: 0x24

|                    |    |    |    |           |    |    |    |    |    |    |           |    |    |    |    |    |   |

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 4:0   | RDFS[4:0] | RDF Setting Condition Select*1<br>0x00: SSIFRDR has one stage or more data size.<br>0x01: SSIFRDR has two stages or more data size.<br>⋮<br>0x1E: SSIFRDR has thirty-one stages or more data size.<br>0x1F: SSIFRDR has thirty-two stages or more data size.     | R/W |
| 7:5   | —         | These bits are read as 0. The write value should be 0.   | R/W |
| 12:8  | TDES[4:0] | TDE Setting Condition Select*1<br>0x00: SSIFTDR has one stage or more free space.<br>0x01: SSIFTDR has two stages or more free space.<br>⋮<br>0x1E: SSIFTDR has thirty-one stages or more free space.<br>0x1F: SSIFTDR has thirty-two stages or more free space. | R/W |
| 31:13 | —         | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

**RDFS[4:0] bits (RDF Setting Condition Select)**

The RDFS[4:0] bits set the setting condition of the receive data full flag (RDF).

**TDES[4:0] bits (TDE Setting Condition Select)**

The TDES[4:0] bits set the setting condition of the transmit data empty flag (TDE).

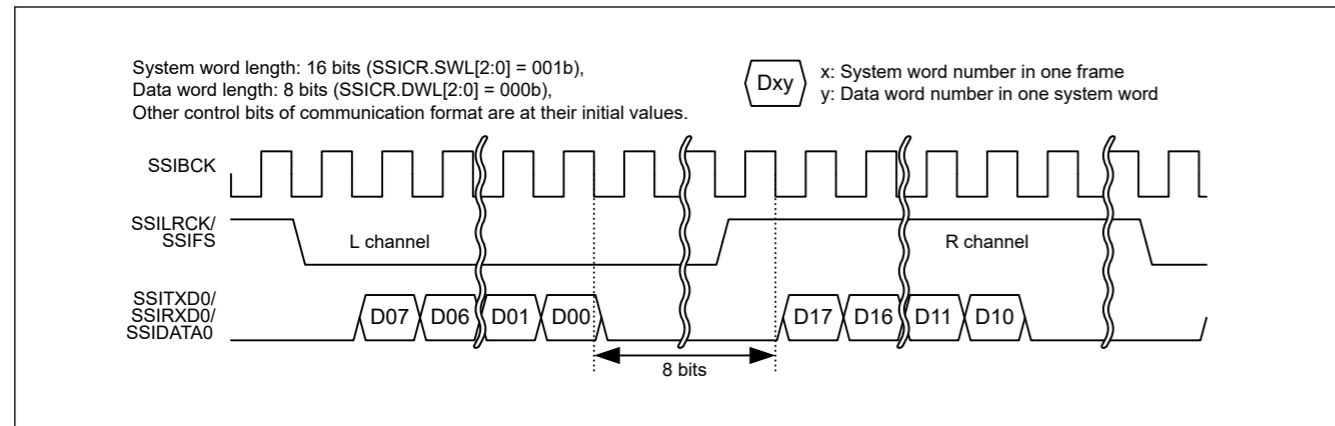

**32.5 Communication Formats**

SSIE supports three communication formats. Table 32.10 shows supported communication formats.

**Table 32.10 Supported communication formats**

| Communication Format    | SSIOFR.OMOD[1:0] |
|-------------------------|------------------|
| I <sup>2</sup> S format | 00               |
| TDM format              | 01               |
| Monaural format         | 10               |

The following describes the serial data structure shared by communication formats. A serial data structure is defined by the system word length (set in SSICR.SWL[2:0]) and the data word length (set in SSICR.DWL[2:0]). If the data word length is shorter than the system word length, padding bits are transferred in the serial data. For details, see Figure 32.36.

**Figure 32.36 Example of padding bit transfer (I<sup>2</sup>S format: system word length > data word length)**

Table 32.11 lists the number of padding bits to be transferred with each combination of system word length (SSICR.SWL[2:0]) and data word length (SSICR.DWL[2:0]). “-” indicates that the setting is prohibited.

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 4:0   | RDFS[4:0] | RDF设置条件选择*1<br>0x00: SSIFRDR具有一级或更多数据大小。0x01: SSIFRDR具有两级或更多数据大小。<br>⋮<br>0x1E: SSIFRDR具有31级或更多数据大小。0x1F: SSIFRDR具有32级或更多数据大小。 | R/W |
| 7:5   | —         | 这些位被读取为0。写入值应为0。   | R/W |
| 12:8  | TDES[4:0] | TDE设定条件选择*1<br>0x00: SSIFTDR有一级或更多可用空间。0x01: SSIFTDR有两级或更多可用空间。<br>⋮<br>0x1E: SSIFTDR有31个或更多的可用空间。0x1F: SSIFTDR有32级或更多可用空间。    | R/W |
| 31:13 | —         | 这些位被读取为0。写入值应为0。   | R/W |

注1.禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果写入，则不保证写入后立即执行的操作。

**RDFS[4:0]位 (RDF设置条件选择)**

RDFS[4:0]位设置接收数据满标志(RDF)的设置条件。

**TDES[4:0]位 (TDE设置条件选择)**

TDES[4:0]位设置发送数据空标志(TDE)的设置条件。

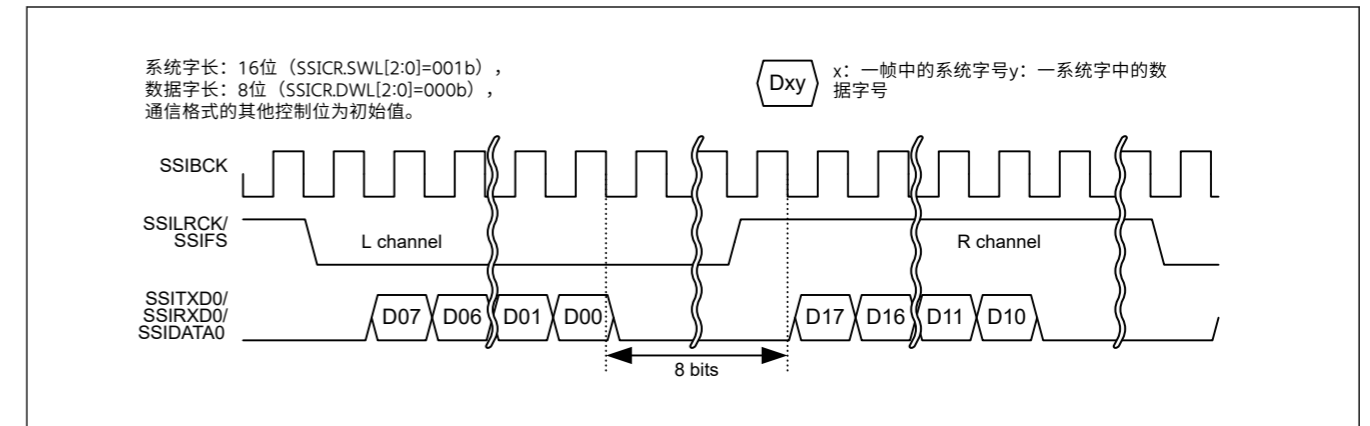

**32.5 通讯格式**

SSIE支持三种通信格式。表32.10显示了支持的通信格式。

**Table 32.10 支持的通讯格式**

| 通讯格式                    | SSIOFR.OMOD[1:0] |
|-------------------------|------------------|
| I <sup>2</sup> S format | 00               |
| TDM format              | 01               |
| Monaural format         | 10               |

下面介绍通信格式共享的串行数据结构。串行数据结构由系统字长（在SSICR.SWL[2:0]中设置）和数据字长（在SSICR.DWL[2:0]中设置）定义。如果数据字长短于系统字长，则在串行数据中传输填充位。详见图32.36。

**Figure 32.36 填充位传输示例 (I<sup>2</sup>S格式: 系统字长>数据字长)**

表32.11列出了使用系统字长(SSICR.SWL[2:0])和数据字长(SSICR.DWL[2:0])的每种组合传输的填充位数。“-”表示禁止设置。

Table 32.11 Number of padding bits

|                | SSICR.DWL[2:0]     | 000b | 001b | 010b | 011b | 100b | 101b | 110b | 111b               |
|----------------|--------------------|------|------|------|------|------|------|------|--------------------|
| SSICR.SWL[2:0] | System Word Length | 8    | 16   | 18   | 20   | 22   | 24   | 32   | Setting prohibited |
| 000b           | 8                  | 0    | —    | —    | —    | —    | —    | —    | —                  |
| 001b           | 16                 | 8    | 0    | —    | —    | —    | —    | —    | —                  |
| 010b           | 24                 | 16   | 8    | 6    | 4    | 2    | 0    | —    | —                  |
| 011b           | 32                 | 24   | 16   | 14   | 12   | 10   | 8    | 0    | —                  |
| 100b           | 48                 | 40   | 32   | 30   | 28   | 26   | 24   | 16   | —                  |
| 101b           | 64                 | 56   | 48   | 46   | 44   | 42   | 40   | 32   | —                  |
| 110b           | 128                | 120  | 112  | 110  | 108  | 106  | 104  | 96   | —                  |
| 111b           | 256                | 248  | 240  | 238  | 236  | 234  | 232  | 224  | —                  |

### 32.5.1 I<sup>2</sup>S Format

The I<sup>2</sup>S format is a communication format used for connection with I<sup>2</sup>S-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 00b), one frame is configured with two system words, one for the channel L and the other for channel R. The SSILRCK/SSIFS signals are at a low level for the channel L and at a high level for the channel R. Set the polarity of the signals with the SSICR.LRCKP bit. Figure 32.37 shows the I<sup>2</sup>S format without padding. See Figure 32.36 for the format with padding.

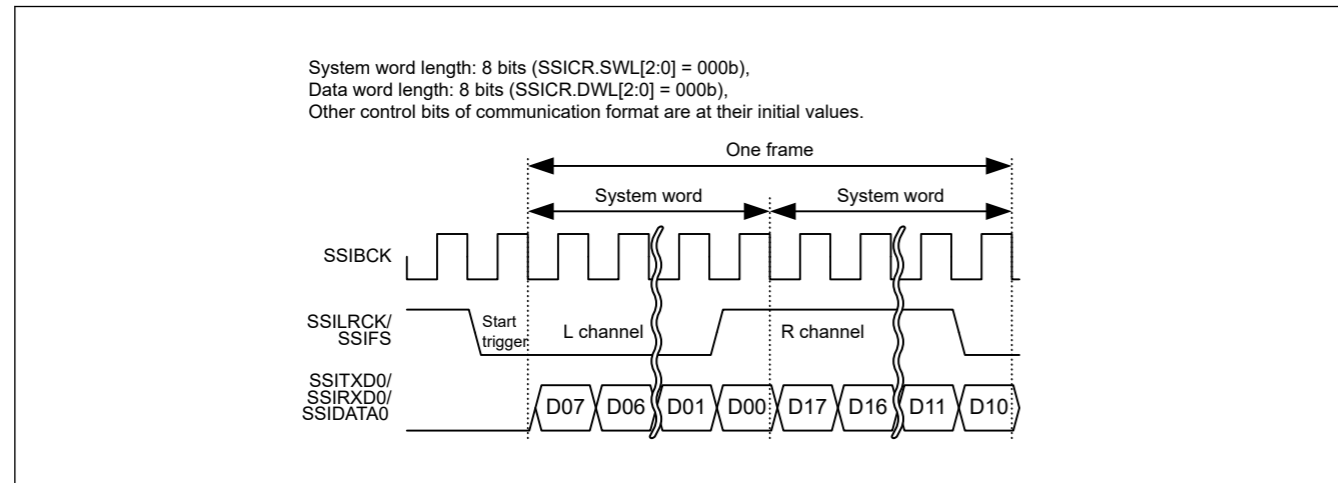

Figure 32.37 I<sup>2</sup>S format (without padding: system word length = data word length)

For the state of external pins when SSIE is in the idle state, see section 32.7.1. Idle State.

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

### 32.5.2 Monaural Format

The monaural format is a communication format used for connection with monaural-compatible serial devices. When the monaural format is specified (SSIOFR.OMOD[1:0] = 10b) for use, one frame consists of one system word. Also, a rising edge of the SSILRCK/SSIFS signal indicates a communication start trigger. Figure 32.38 and Figure 32.39 respectively show the monaural formats without and with padding.

Table 32.11 填充位数

|                | SSICR.DWL[2:0] | 000b | 001b | 010b | 011b | 100b | 101b | 110b | 111b |
|----------------|----------------|------|------|------|------|------|------|------|------|
| SSICR.SWL[2:0] | 系统字 Length     | 8    | 16   | 18   | 20   | 22   | 24   | 32   | 禁止设定 |
| 000b           | 8              | 0    | —    | —    | —    | —    | —    | —    | —    |
| 001b           | 16             | 8    | 0    | —    | —    | —    | —    | —    | —    |
| 010b           | 24             | 16   | 8    | 6    | 4    | 2    | 0    | —    | —    |
| 011b           | 32             | 24   | 16   | 14   | 12   | 10   | 8    | 0    | —    |
| 100b           | 48             | 40   | 32   | 30   | 28   | 26   | 24   | 16   | —    |
| 101b           | 64             | 56   | 48   | 46   | 44   | 42   | 40   | 32   | —    |
| 110b           | 128            | 120  | 112  | 110  | 108  | 106  | 104  | 96   | —    |
| 111b           | 256            | 248  | 240  | 238  | 236  | 234  | 232  | 224  | —    |

### 32.5.1 I<sup>2</sup>S Format

I<sup>2</sup>S格式是用于连接I<sup>2</sup>S兼容串行设备的通信格式。使用此格式设置(SSIOFR.OMOD[1:0]=00b)，一帧配置有两个系统字，一个用于通道L，另一个用于通道R。SSILRCKSSIFS信号对于通道处于低电平L和通道R为高电平。使用SSICR.LRCKP位设置信号的极性。图32.37显示了没有填充的I<sup>2</sup>S格式。带填充的格式见图32.36。

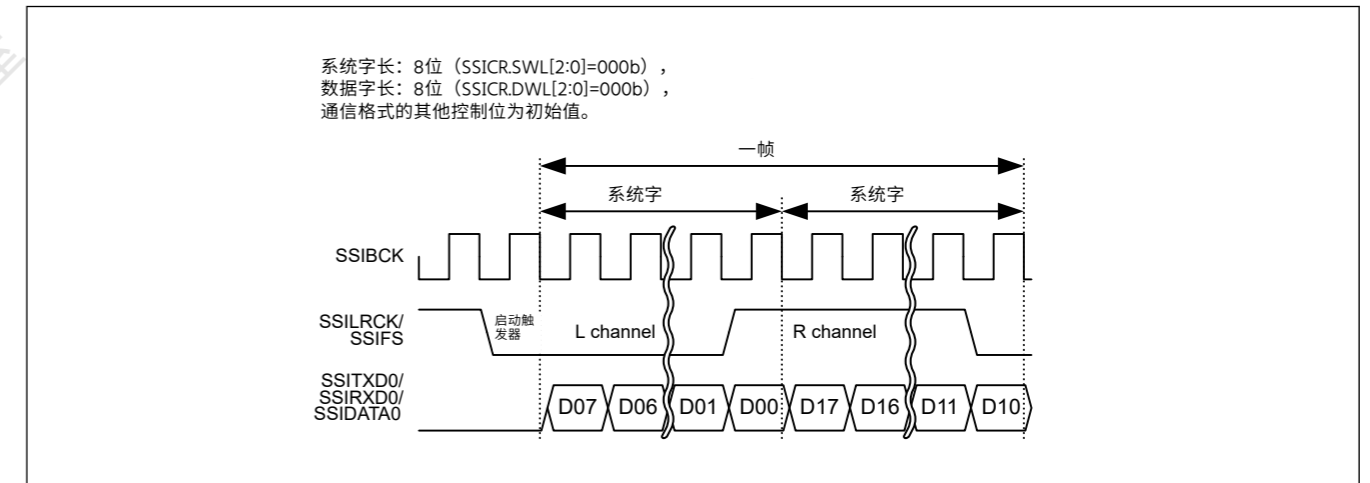

Figure 32.37 I<sup>2</sup>S格式 (无填充: 系统字长=数据字长)

SSIE处于空闲状态时外部管脚的状态见32.7.1节。空闲状态。

Note: SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式 (SSICR.MST=0) 时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

### 32.5.2 Monaural Format

单声道格式是用于连接单声道兼容串行设备的通信格式。当指定使用单声道格式(SSIOFR.OMOD[1:0]=10b)时，一帧由一个系统字组成。此外，SSILRCKSSIFS信号的上升沿表示通信开始触发。图32.38和图32.39分别显示了没有和有填充的单声道格式。

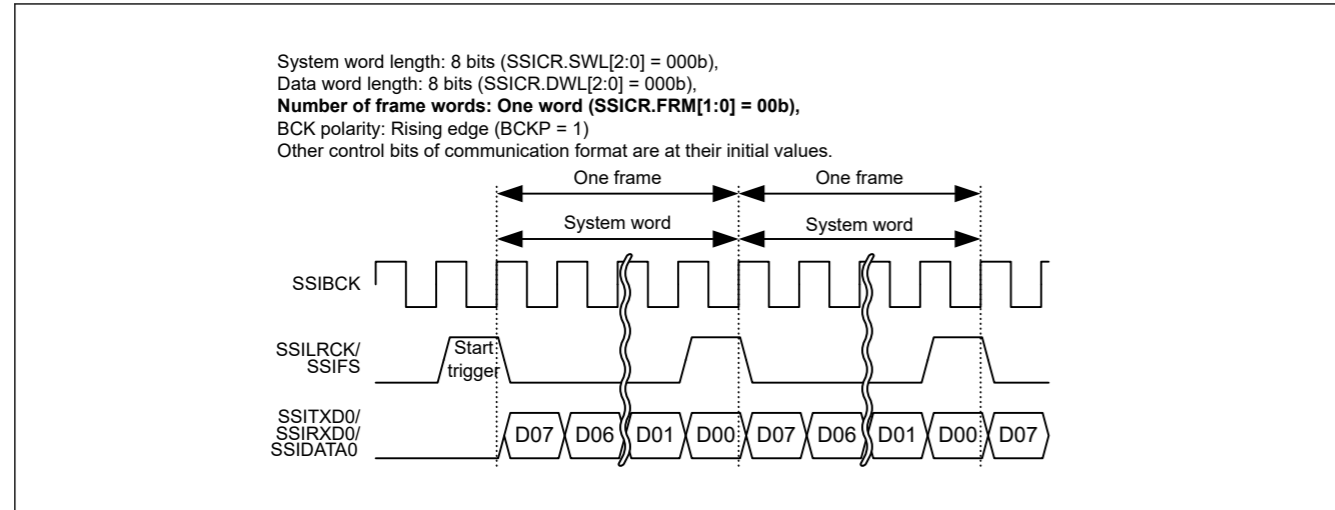

Figure 32.38 Short frame in monaural format (without padding: system word length = data word length)

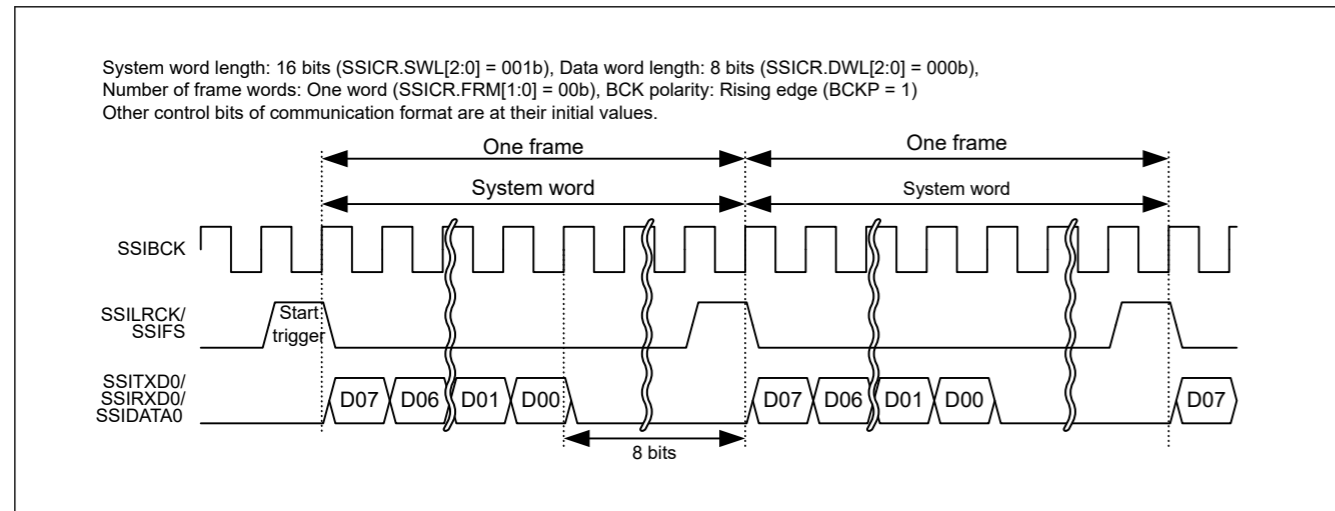

Figure 32.39 Short frame in monaural format (with padding: system word length > data word length)

The monaural formats supported by SSIE consist of short frames and long frames. See [section 32.5.2.1. Short frame](#) and [section 32.5.2.2. Long frame](#) for the difference between these two frames.

For the state of external pins state when SSIE is in the idle state, see [section 32.7.1. Idle State](#).

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

### 32.5.2.1 Short frame

When a short frame is used (SSICR.DEL = 0), the SSILRCK/SSIFS signal indicating the start of serial data is set to high level only for 1 cycle of SSIBCK. Data transfer starts at the falling edge of the signal.

### 32.5.2.2 Long frame

When a long frame is used (SSICR.DEL = 1), the SSILRCK/SSIFS signal indicating the start of serial data is set to high level only for 2 cycles of SSIBCK. See [Figure 32.40](#). Data transfer starts at the rising edge of the signal.

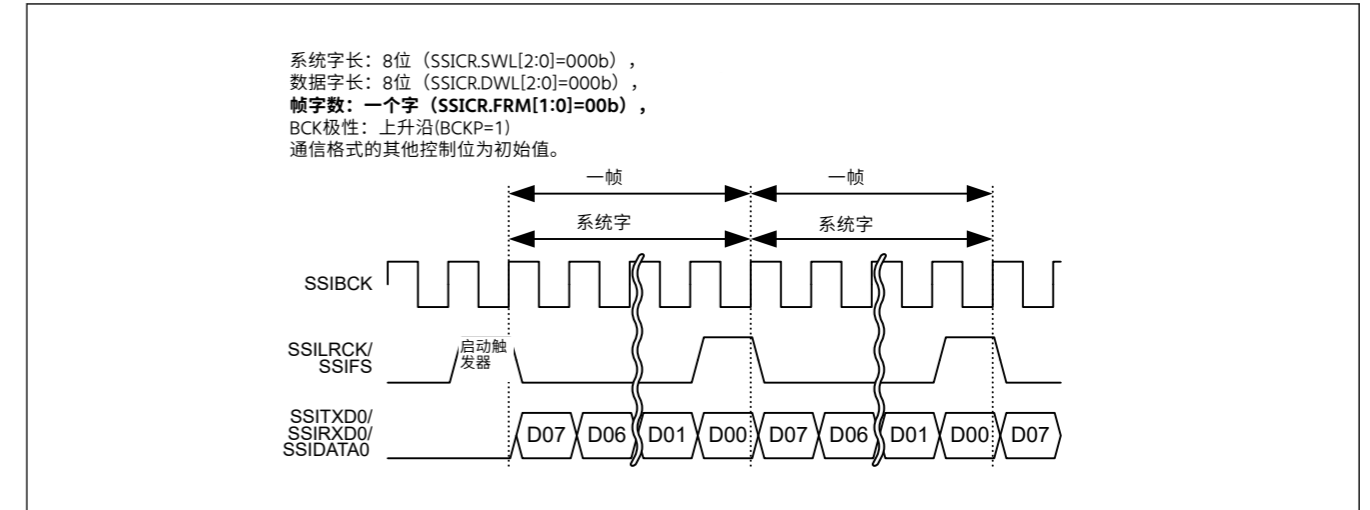

Figure 32.38 单声道格式的短帧 (无填充: 系统字长=数据字长)

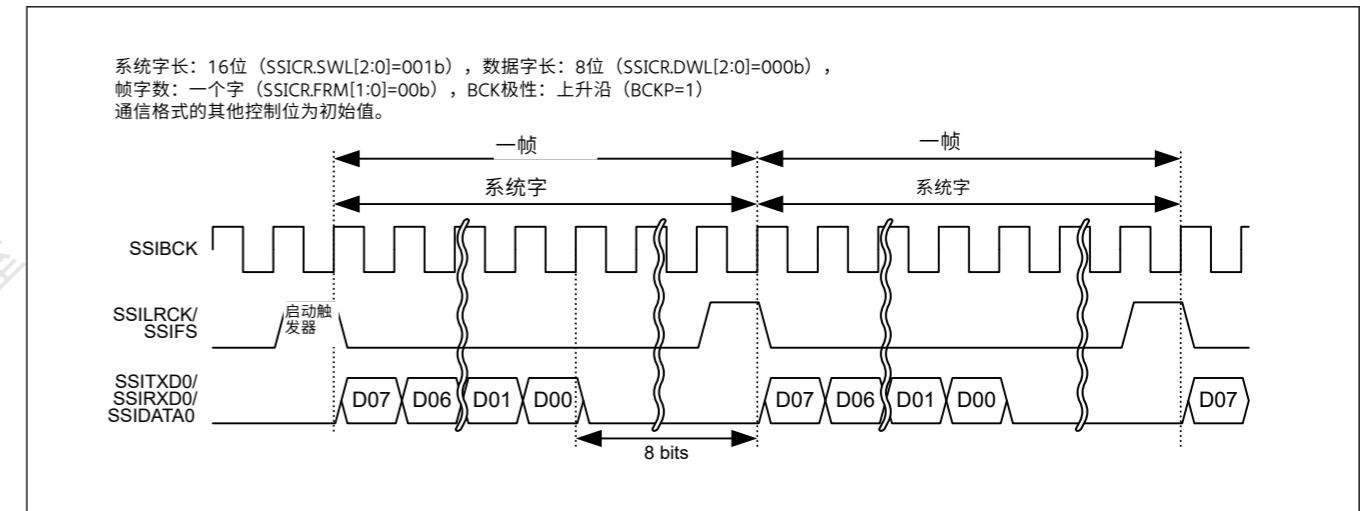

Figure 32.39 单声道格式的短帧 (带填充: 系统字长>数据字长)

SSIE支持的单声道格式包括短帧和长帧。请参见第32.5.2.1节。短框架和第32.5.2.2节。长帧为这两个帧的区别。

SSIE处于空闲状态时外部引脚状态的状态见32.7.1节。空闲状态。

Note: SSIE有SSILRCKSSIFS引脚, 表示通信同步。当SSIE处于从机模式 (SSICR.MST=0) 时, SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

### 32.5.2.1 短框

当使用短帧时 (SSICR.DEL=0), 指示串行数据开始的SSILRCKSSIFS信号仅在SSIBCK的1个周期内设置为高电平。数据传输从信号的下降沿开始。

### 32.5.2.2 长框

当使用长帧时 (SSICR.DEL=1), 指示串行数据开始的SSILRCKSSIFS信号仅在SSIBCK的2个周期内设置为高电平。请参见图32.40。数据传输从信号的上升沿开始。

Figure 32.40 Long frame in mono format (without padding)

32.5.3 TDM Format

The TDM format is a communication format used for connection with TDM-compatible multi-channel devices. With this format setting (SSIOFR.OMOD[1:0] = 01b), one frame is configured with four to eight system words set with the SSICR.FRM[1:0] bits. With this format, the SSILRCK/SSIFS signal is at a high level for the first one system word and at a low level for the rest. The pulse generated on the SSILRCK/SSIFS signal is defined as the SYNC pulse and its rising edge means a start of one frame. Figure 32.41 and Figure 32.42 respectively show the TDM formats without and with padding.

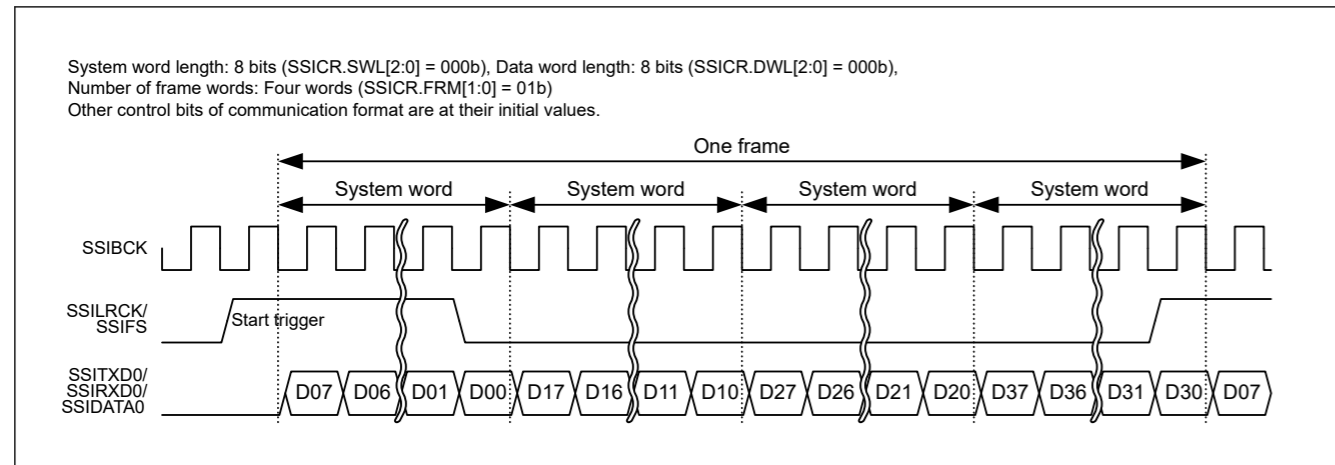

Figure 32.41 TDM format (without padding: system word length = data word length)

Figure 32.42 TDM format (with padding: system word length > data word length)

For the state of external pins when SSIE is in the idle state, see section 32.7.1. Idle State.

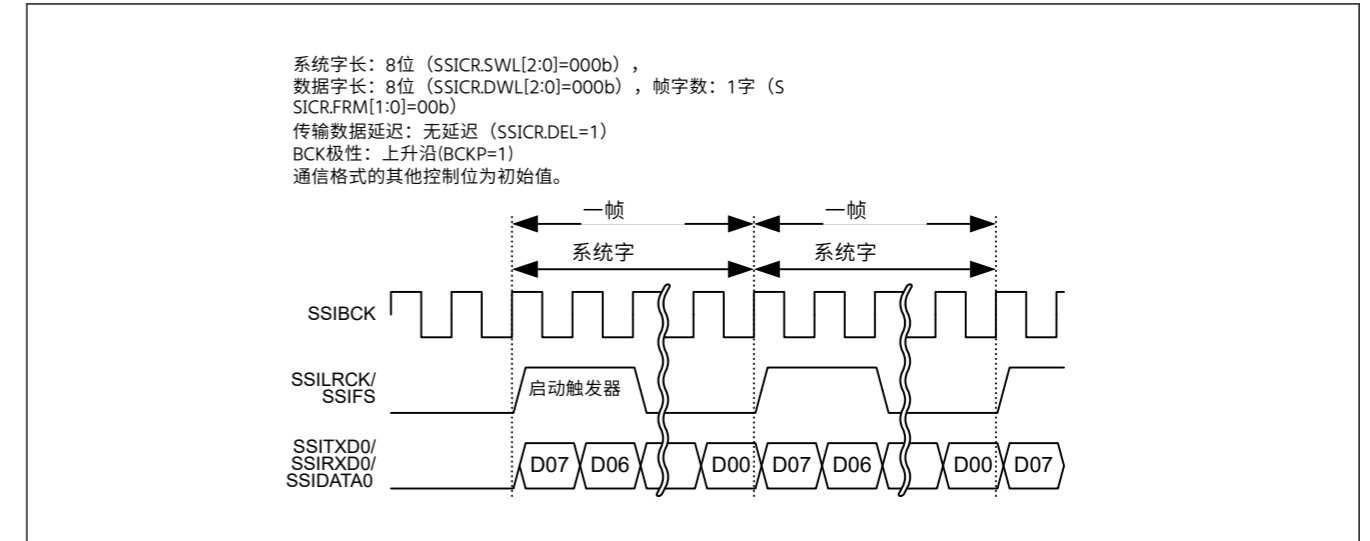

Figure 32.40 单声道格式的长帧 (无填充)

32.5.3 TDM Format

TDM格式是一种用于与兼容TDM的多通道设备连接的通信格式。使用此格式设置(SSIOFR.OMOD[1:0]=01b)，一帧配置有四到八个通过SSICR.FRM[1:0]位设置的系统字。使用这种格式，SSILRCKSSIFS信号对于第一个系统字处于高电平，而对于其余系统字处于低电平。SSILRCKSSIFS信号上产生的脉冲被定义为SYNC脉冲，其上升沿表示一帧的开始。图32.41和图32.42分别显示了没有和有填充的TDM格式。

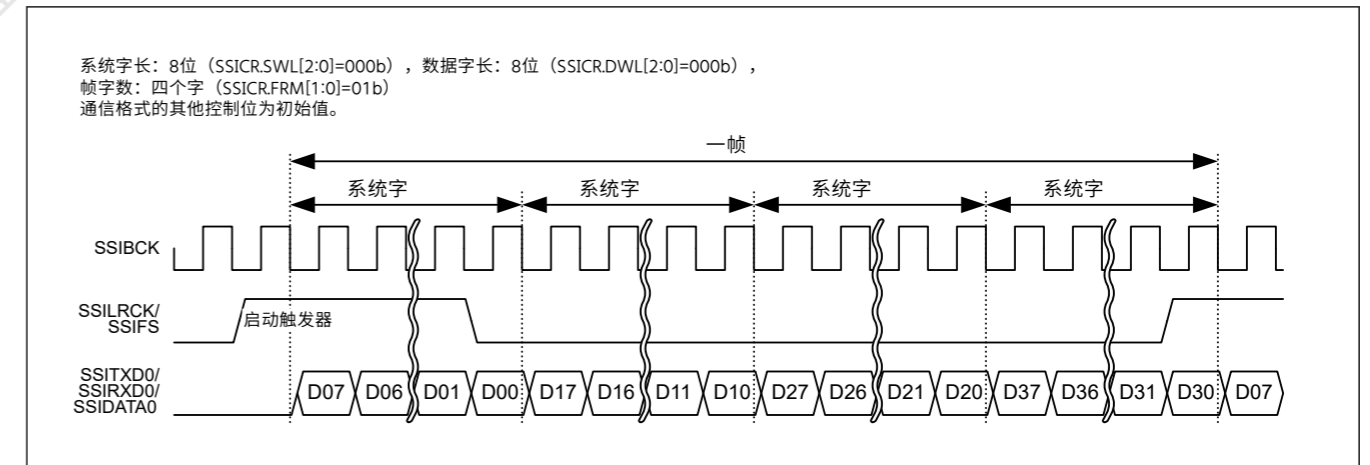

Figure 32.41 TDM格式 (无填充: 系统字长=数据字长)

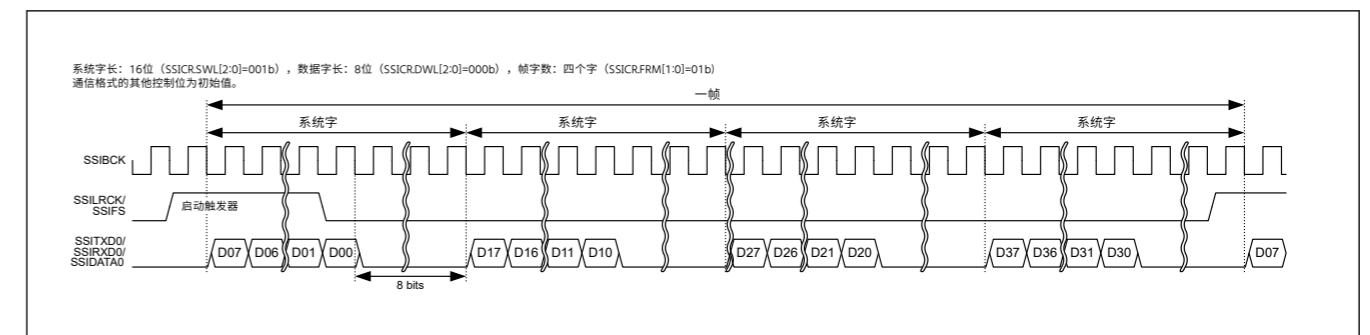

Figure 32.42 TDM格式 (带填充: 系统字长>数据字长)

SSIE处于空闲状态时外部管脚的状态见32.7.1节。空闲状态。

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

### 32.6 Communication Modes

SSIE supports the following communication modes. Table 32.13 lists the control bits that are not available with each communication mode. See section 32.6.1. Slave-mode Communication to section 32.6.5. Transmission and Reception for details of these communication modes.

Table 32.12 Communication modes

| Communication Mode                     | SSICR.MST Bit | SSICR.REN Bit | SSICR.TEN Bit |
|--|---------------|---------------|---------------|
| Slave-mode transmission                | 0             | 0             | 1             |
| Slave-mode reception                   | 0             | 1             | 0             |
| Slave-mode transmission and reception  | 0             | 1             | 1             |
| Master-mode transmission               | 1             | 0             | 1             |
| Master-mode reception                  | 1             | 1             | 0             |
| Master-mode transmission and reception | 1             | 1             | 1             |

Table 32.13 Control bits that cannot be used in each communication mode

| Control Bit    | Slave-mode Reception | Slave-mode Transmission | Slave-mode Transmission and Reception | Master-mode Reception | Master-mode Transmission | Master-mode Transmission and Reception |
|----------------|----------------------|-------------------------|---------------------------------------|-----------------------|--------------------------|--|
| SSICR.CKS      | Invalid              | Invalid                 | Invalid                               | Available             | Available                | Available                              |
| SSICR.CKDV     | Invalid              | Invalid                 | Invalid                               | Available             | Available                | Available                              |
| SSICR.MUEN     | Invalid              | Available               | Available                             | Invalid               | Available                | Available                              |
| SSICR.TEN      | Invalid              | Available               | Available                             | Invalid               | Available                | Available                              |
| SSICR.REN      | Available            | Invalid                 | Available                             | Available             | Invalid                  | Available                              |
| SSIFCR.AUCKEN  | Invalid              | Invalid                 | Invalid                               | Available             | Available                | Available                              |
| SSIFCR.TIE     | Invalid              | Available               | Available                             | Invalid               | Available                | Available                              |
| SSIFCR.RIE     | Available            | Invalid                 | Available                             | Available             | Invalid                  | Available                              |
| SSIFCR.TFRST   | Invalid              | Available               | Available                             | Invalid               | Available                | Available                              |
| SSIFCR.RFRST   | Available            | Invalid                 | Available                             | Available             | Invalid                  | Available                              |
| SSIOFR.BCKASTP | Invalid              | Invalid                 | Invalid                               | Available             | Available                | Available                              |
| SSIOFR.LRCONT  | Invalid              | Invalid                 | Invalid                               | Available             | Available                | Available                              |
| SSIOFR.OMOD    | Available            | Available               | Available                             | Available             | Available                | Available                              |
| SSISCR.TDES    | Invalid              | Available               | Available                             | Invalid               | Available                | Available                              |
| SSISCR.RDFS    | Available            | Invalid                 | Available                             | Available             | Invalid                  | Available                              |

“Invalid” means it has no effect on operation. Writing is possible.

#### 32.6.1 Slave-mode Communication

SSIE operates in slave mode with SSICR.MST = 0. The SSIBCK and SSILRCK/SSIFS signals to be used for serial-data communication must be supplied from an external device. If these signals do not match the communication format set for SSIE, operation is not guaranteed.

#### 32.6.2 Master-mode Communication

SSIE operates in master mode with SSICR.MST = 1. The SSIBCK and SSILRCK/SSIFS signals to be used for serialdata communication must be internally generated from the audio clock. These signals use the format according to the setting of

Note: SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

### 32.6 通讯方式

SSIE支持以下通信模式。表32.13列出了每种通信模式不可用的控制位。请参阅第32.6.1节。从模式通信到第32.6.5节。有关这些通信模式的详细信息，请参见发送和接收。

Table 32.12 通讯方式

| 通讯方式                     | SSICR.MST Bit | SSICR.REN Bit | SSICR.TEN Bit |
|--------------------------|---------------|---------------|---------------|
| Slave-mode transmission  | 0             | 0             | 1             |
| Slave-mode reception     | 0             | 1             | 0             |
| 从模式发送和接收                 | 0             | 1             | 1             |
| Master-mode transmission | 1             | 0             | 1             |
| Master-mode reception    | 1             | 1             | 0             |
| 主模式传输和接收                 | 1             | 1             | 1             |

Table 32.13 不能在每种通信模式下使用的控制位

| 控制位            | Slave-mode Reception | Slave-mode Transmission | Slave-mode 传输和接收 | Master-mode Reception | Master-mode Transmission | 主模式传输和接收  |

| SSIOFR.BCKASTP | Invalid              | Invalid                 | Invalid          | Available             | Available                | Available |
| SSIOFR.LRCONT  | Invalid              | Invalid                 | Invalid          | Available             | Available                | Available |
| SSIOFR.OMOD    | Available            | Available               | Available        | Available             | Available                | Available |
| SSISCR.TDES    | Invalid              | Available               | Available        | Invalid               | Available                | Available |
| SSISCR.RDFS    | Available            | Invalid                 | Available        | Available             | Invalid                  | Available |

“无效”是指对操作没有影响。写作是可能的。

#### 32.6.1 Slave-mode Communication

SSIE在SSICR.MST=0的从机模式下运行。用于串行数据通信的SSIBCK和SSILRCKSSIFS信号必须由外部设备提供。如果这些信号与为SSIE设置的通信格式不匹配，则无法保证操作。

#### 32.6.2 Master-mode Communication

SSIE在SSICR.MST=1的主模式下运行。用于串行数据通信的SSIBCK和SSILRCKSSIFS信号必须由音频时钟在内部生成。这些信号使用根据设置的格式

SSIE. If the communication format the slave device uses does not match the communication format set for SSIE, the operation is unpredictable.

### 32.6.3 Transmission

SSIE transmits serial data to the other-party device when the SSICR.TEN bit is 1 and the SSICR.REN bit is 0. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

### 32.6.4 Reception

SSIE receives serial data from the other-party device when the SSICR.TEN bit is 0 and the SSICR.REN bit is 1. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

### 32.6.5 Transmission and Reception

SSIE transmits and receives serial data to and from the other-party device when the SSICR.TEN bit is 1 and the SSICR.REN bit is 1. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

## 32.7 Operation

SSIE has the following two main operation states [Figure 32.43](#) shows SSIE state transition.

- Idle state (SSISR.IIRQ = 1)
- Communication state (SSISR.IIRQ = 0).

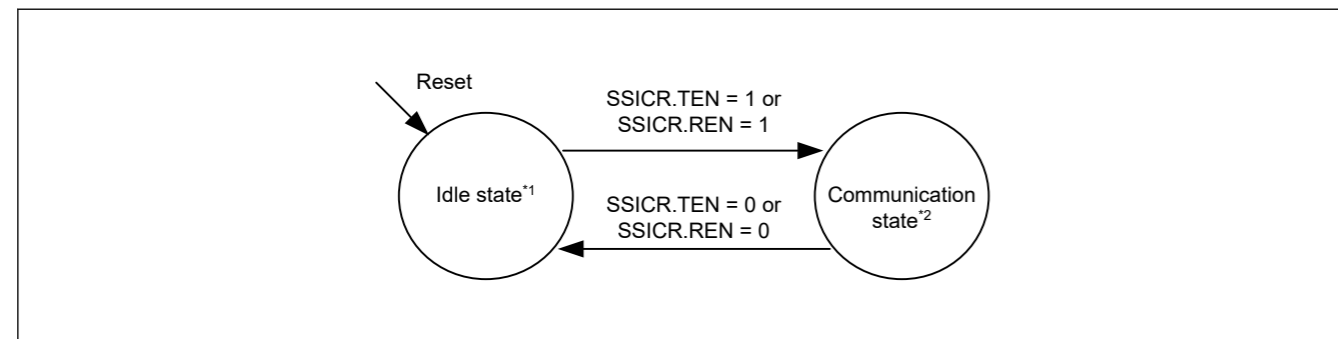

Figure 32.43 SSIE state transition

Note: See [section 32.8.1. Start Communication](#) for details of the idle state.  
See [section 32.8.2. Transmission](#) for details of the communication state.

### 32.7.1 Idle State

In this state, communication of SSIE is halted. If, however, the SSICR.MST bit is 1, output of the BCK and LR clock/frame synchronization signals to external pins can be controlled according to the settings of SSIOFR.BCKASTP and SSIOFR.LRCONT bits. This function is common to all formats. For details, see [Table 32.14](#).

Table 32.14 Output from external pins in the idle state (1 of 2)

| SSICR.MST | SSIOFR.BCKASTP | SSIOFR.LRCONT | Output from Pins |               |                  |
|-----------|----------------|---------------|------------------|---------------|------------------|
|           |                |               | SSIBCK           | SSILRCK/SSIFS | SSITXD0/SSIDATA0 |
| 0         | —              | —             | Stop             | Stop          | Stop             |
| 1         | 0              | 0             | Supply           | Stop          | Stop             |
| 1         | 0              | 1             | Supply           | Supply        | Stop             |
| 1         | 1              | 0             | Stop             | Stop          | Stop             |

SSIE。如果从设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作是不可预测的。

### 32.6.3 Transmission

当SSICR.TEN位为1且SSICR.REN位为0时，SSIE向对方设备发送串口数据。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作为不可预料的。

### 32.6.4 Reception

当SSICR.TEN位为0且SSICR.REN位为1时，SSIE从对方设备接收串行数据。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作为不可预料的。

### 32.6.5 传输和接收

当SSICR.TEN位为1且SSICR.REN位为1。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作不可预知。

## 32.7 Operation

SSIE有以下两个主要操作状态图32.43显示了SSIE状态转换。

- 空闲状态 (SSISR.IIRQ=1)
- 通信状态 (SSISR.IIRQ=0)。

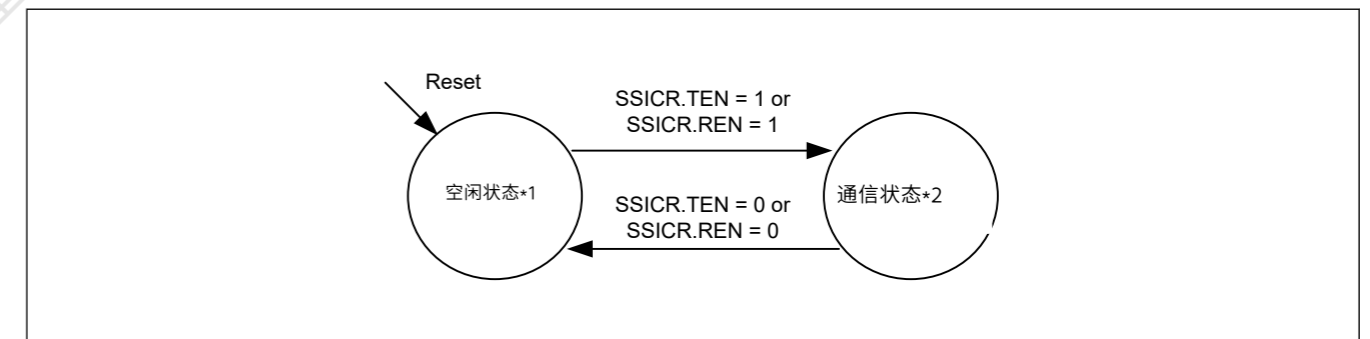

Figure 32.43 SSIE状态转换

Note: 请参阅第32.8.1节。开始通信以了解空闲状态的详细信息。  
请参阅第32.8.2节。传输以获取通信状态的详细信息。

### 32.7.1 空闲状态

在这种状态下，SSIE的通信停止。但是，如果SSICR.MST位为1，则可以根据SSIOFR.BCKASTP和SSIOFR.LRCONT位的设置来控制向外部引脚输出BCK和LR时钟帧同步信号。此功能适用于所有格式。详见表32.14。

Table 32.14 空闲状态下外部引脚的输出 (2个中的1个)

| SSICR.MST | SSIOFR.BCKASTP | SSIOFR.LRCONT | 引脚输出   |               |                  |
|-----------|----------------|---------------|--------|---------------|------------------|
|           |                |               | SSIBCK | SSILRCK/SSIFS | SSITXD0/SSIDATA0 |
| 0         | —              | —             | Stop   | Stop          | Stop             |
| 1         | 0              | 0             | Supply | Stop          | Stop             |
| 1         | 0              | 1             | Supply | Supply        | Stop             |
| 1         | 1              | 0             | Stop   | Stop          | Stop             |

Table 32.14 Output from external pins in the idle state (2 of 2)

| SSICR.MST | SSIOFR.BCKASTP | SSIOFR.LRCONT | Output from Pins |               |                  |
|-----------|----------------|---------------|------------------|---------------|------------------|
|           |                |               | SSIBCK           | SSILRCK/SSIFS | SSITXD0/SSIDATA0 |
| 1         | 1              | 1             | Stop             | Supply        | Stop             |

Figure 32.44 Example of disabling LR clock/frame synchronization continuation by SSIOFR.LRCONT

Note: To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIE is in the idle state in mastermode communication (SSICR.MST = 1), note the following: The output stops when the value of the SSIOFR.LRCONT bit is changed from 1 to 0. Make sure that the other-party device is not affected.

Table 32.14 空闲状态下外部引脚的输出 (2个中的2个)

| SSICR.MST | SSIOFR.BCKASTP | SSIOFR.LRCONT | 引脚输出   |               |                  |
|-----------|----------------|---------------|--------|---------------|------------------|
|           |                |               | SSIBCK | SSILRCK/SSIFS | SSITXD0/SSIDATA0 |
| 1         | 1              | 1             | Stop   | Supply        | Stop             |

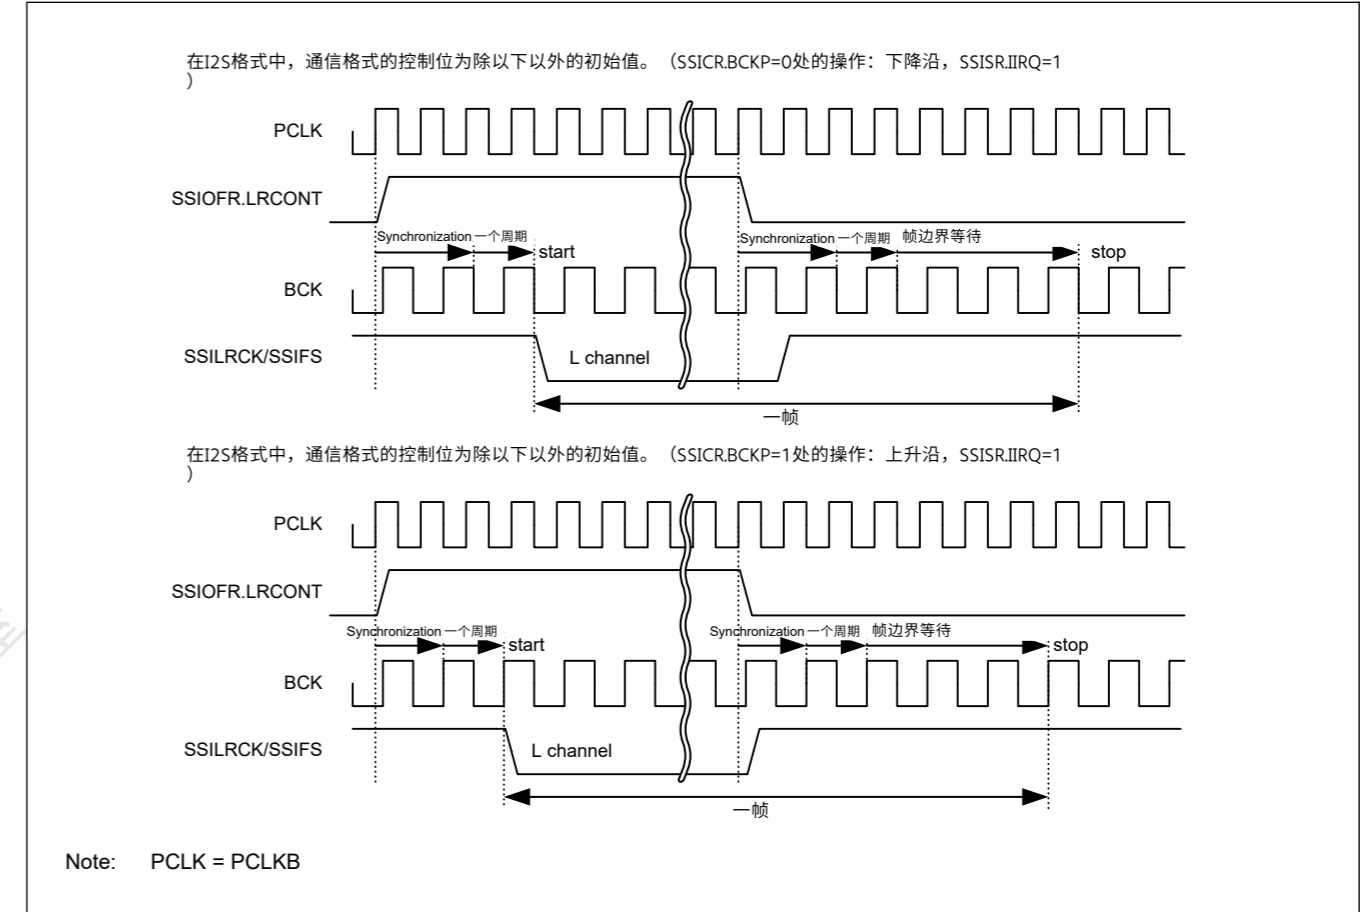

Figure 32.44 通过SSIOFR.LRCONT禁用LR时钟帧同步继续的示例

Note: 要在主模式通信 (SSICR.MST=1) 中SSIE处于空闲状态时通过SSIOFR.LRCONT停止向SSILRCKSSIFS引脚的输出，请注意以下几点：当SSIOFR.LRCONT位的值从1比0。确保对方设备不受影响。

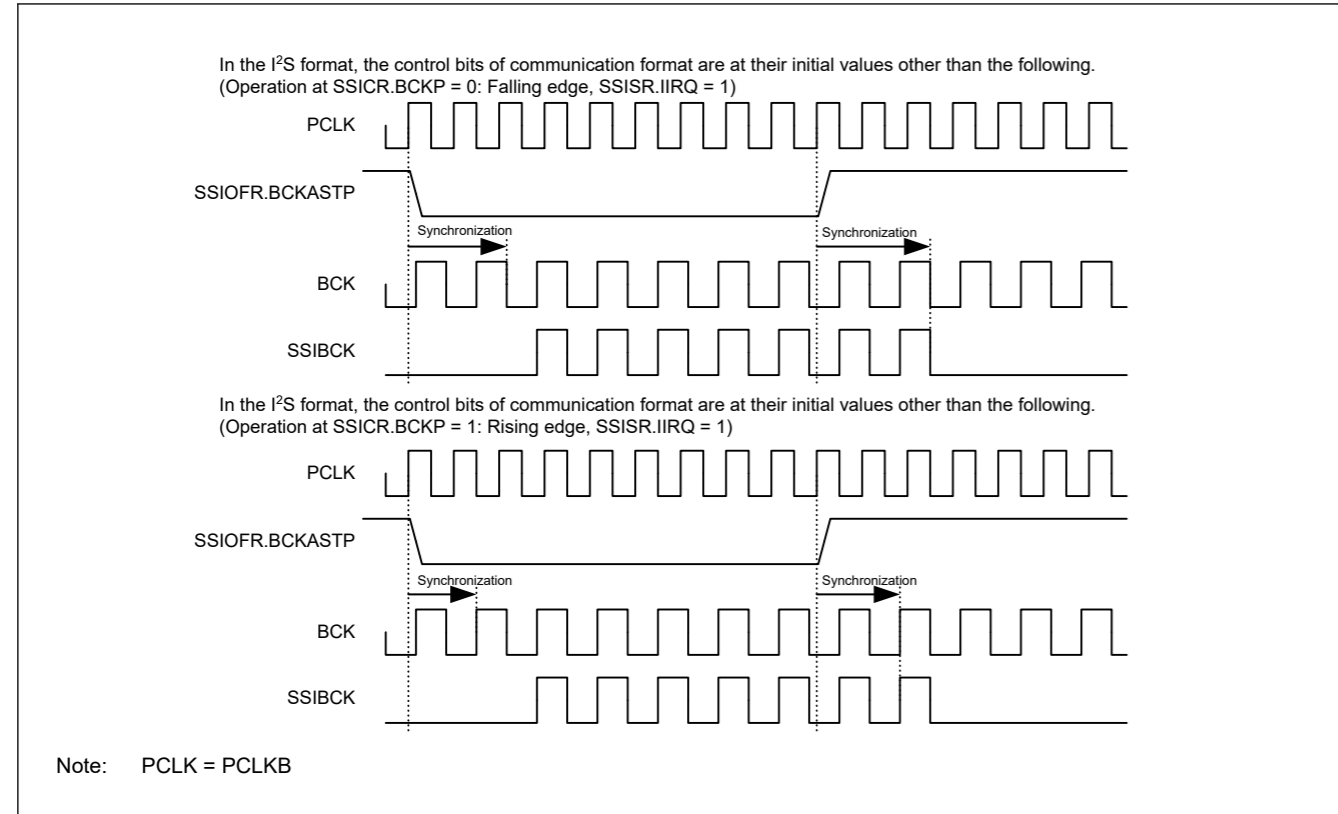

Figure 32.45 Example of stopping SSIBCK with SSIOFR.BCKASTP

Note: To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIE is in the idle state, note the following: The output stops when the value of the SSIOFR.BCKASTP bit is changed from 0 to 1. So, make sure that the other-party device is not affected.

### 32.7.2 Communication States

In this state, SSIE is during communication. Figure 32.46 shows transitions of communication states and Table 32.15 lists the conditions for transition. If the transition condition is not satisfied, the state does not transit.

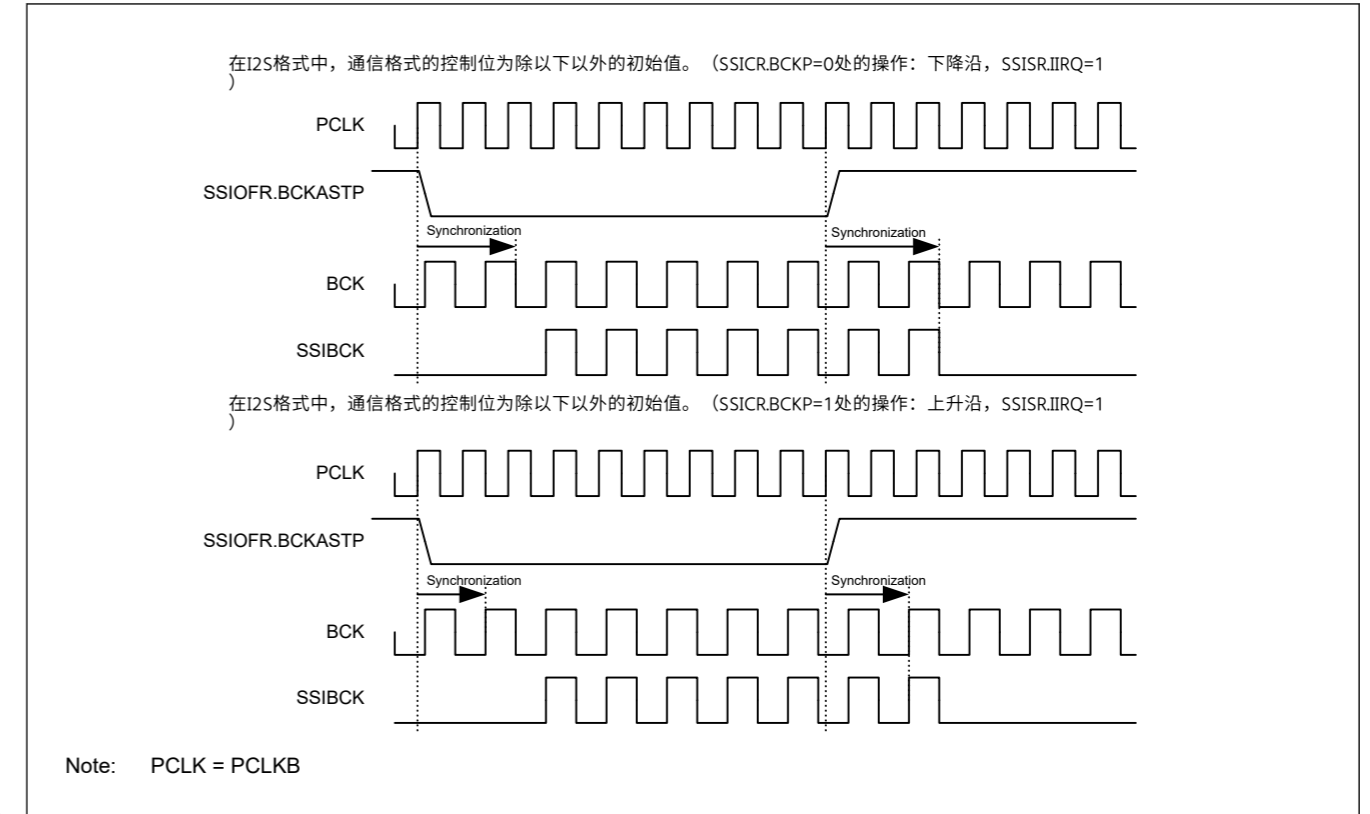

Figure 32.45 使用SSIOFR.BCKASTP停止SSIBCK的示例

Note: 要在主模式通信(SSICR.MST=1)和SSIE处于空闲状态时使用SSIOFR.BCKASTP停止向SSIBCK引脚的输出, 请注意以下几点: 当SSIOFR.BCKASTP位的值为从0变为1。因此, 请确保对方设备不受影响。

### 32.7.2 通讯状态

在此状态下, SSIE处于通信过程中。图32.46显示了通信状态的转换, 表32.15列出了转换的条件。如果不满足转移条件, 则状态不转移。

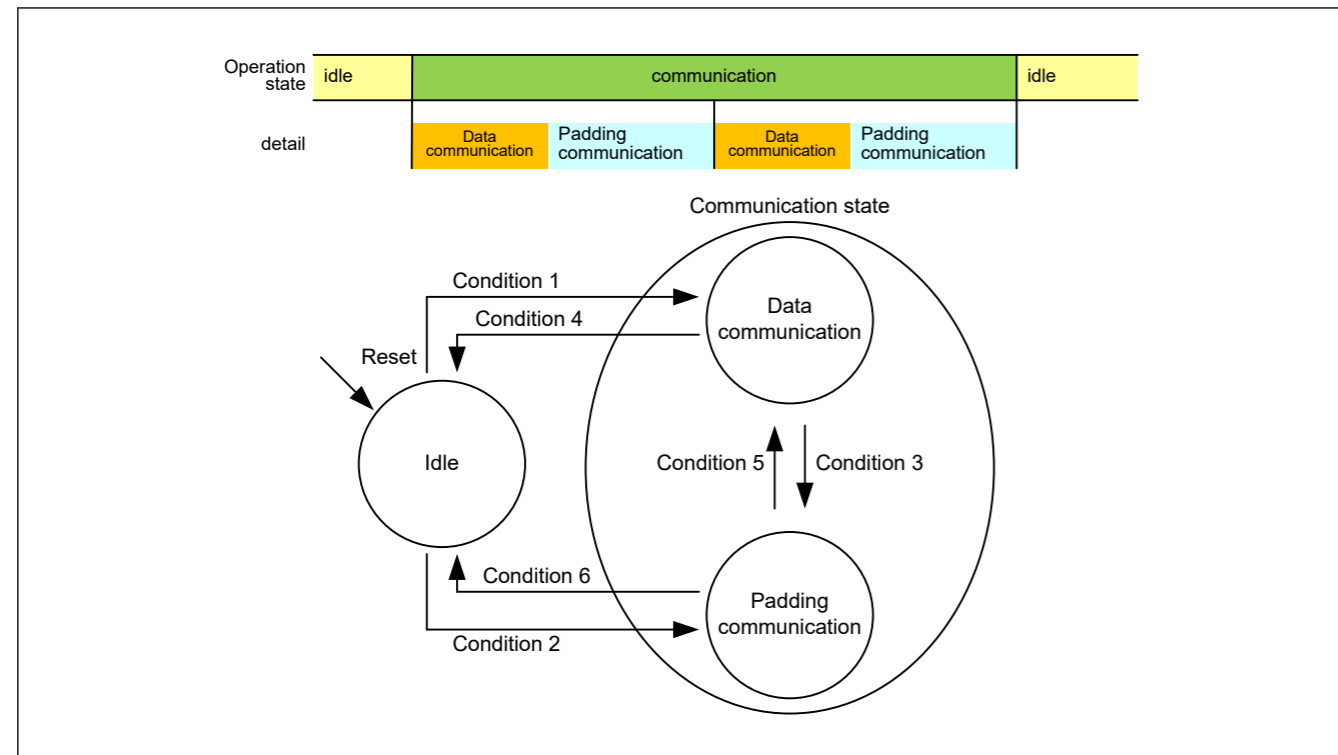

Figure 32.46 Communication state transition

Table 32.15 Condition for communication state transition

| Condition Number | Condition for Transition  |
|------------------|---|
| 1                | Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 0 or in the setting without padding bits.   |
| 2                | Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 1 and in the setting with padding bits.   |
| 3                | The following three conditions are all met: <ul style="list-style-type: none"> <li>SSICR.TEN = 1 or SSICR.REN = 1</li> <li>In the setting with padding bits</li> <li>The last bit of the data words has been transferred.</li> </ul>                |
| 4                | Both the following two conditions are met: <ul style="list-style-type: none"> <li>SSICR.SDTA = 1 or without padding bits</li> <li>While SSICR.TEN = 0 and SSICR.REN = 0, the last bit of the data words in a frame has been transferred.</li> </ul> |
| 5                | Transfer of the last padding bit is completed while SSICR.TEN = 1 or SSICR.REN = 1  |
| 6                | Both the following two conditions are met: <ul style="list-style-type: none"> <li>SSICR.SDTA = 0 and with padding bits</li> <li>While SSICR.TEN = 0 and SSICR.REN = 0, the last padding bit has been transferred.</li> </ul>                        |

See Table 32.11 for the setting with/without padding bits.

### 32.7.2.1 Data communication state

In this state, SSIE is during communication. Data of the data word length set with the SSICR.DWL[2:0] bits is transmitted, received, or transmitted and received.

- State Transition in the Setting without Padding Bits

During communication (SSISR.IIRQ = 0), SSIE is during data communication for all the time. By disabling transmission and reception (SSICR.TEN = 0, SSICR.REN = 0), SSIE transits to the idle state. For details, see Figure 32.47 and Figure 32.48.

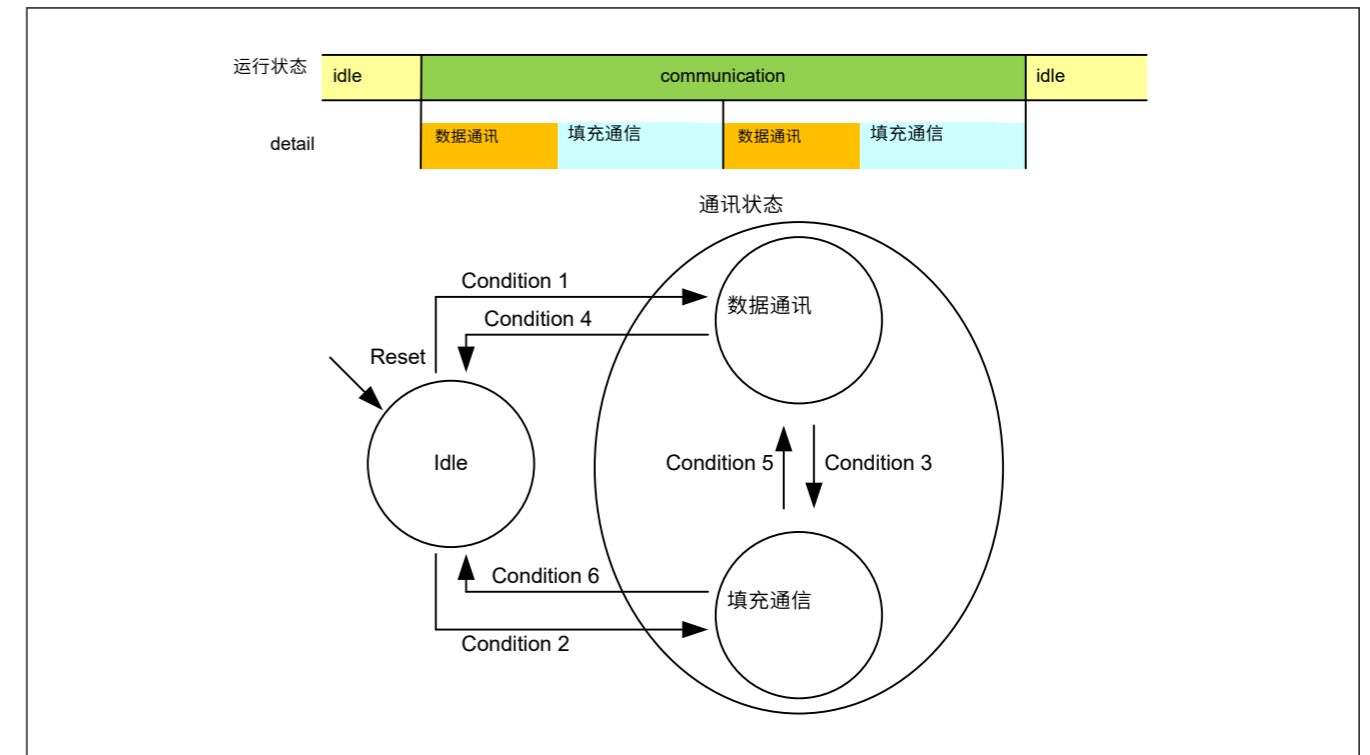

Figure 32.46 通信状态转换

Table 32.15 通信状态转移的条件

| 条件编号 | 过渡条件   |
|------|--|
| 1    | 在SSICR.SDTA=0或在没有填充位的设置中写入SSICR.TEN=1或SSICR.REN=1。   |
| 2    | 写入SSICR.TEN=1或SSICR.REN=1而SSICR.SDTA=1并在设置中使用填充位。  |
| 3    | 满足以下三个条件： <ul style="list-style-type: none"> <li>在带有填充位的设置中</li> <li>数据字的最后一位已传输。</li> </ul>                                       |
| 4    | 同时满足以下两个条件： <ul style="list-style-type: none"> <li>SSICR.SDTA=1或无填充位</li> <li>当SSICR.TEN=0和SSICR.REN=0时，帧中数据字的最后一位已被传输。</li> </ul> |
| 5    | 当SSICR.TEN=1或SSICR.REN=1时，最后一个填充位的传输完成   |
| 6    | 同时满足以下两个条件： <ul style="list-style-type: none"> <li>SSICR.SDTA=0并带有填充位</li> <li>当SSICR.TEN=0和SSICR.REN=0时，最后一个填充位已被传输。</li> </ul>   |

有关不带填充位的设置，请参见表32.11。

### 32.7.2.1 数据通讯状态

在此状态下，SSIE处于通信过程中。使用SSICR.DWL[2:0]位设置的数据字长的数据被发送、接收或发送和接收。

- 无填充位设置中的状态转换

在通信期间（SSISR.IIRQ=0），SSIE一直处于数据通信期间。通过禁用发送和接收（SSICR.TEN=0，SSICR.REN=0），SSIE转换到空闲状态。详见图32.47和图32.48。

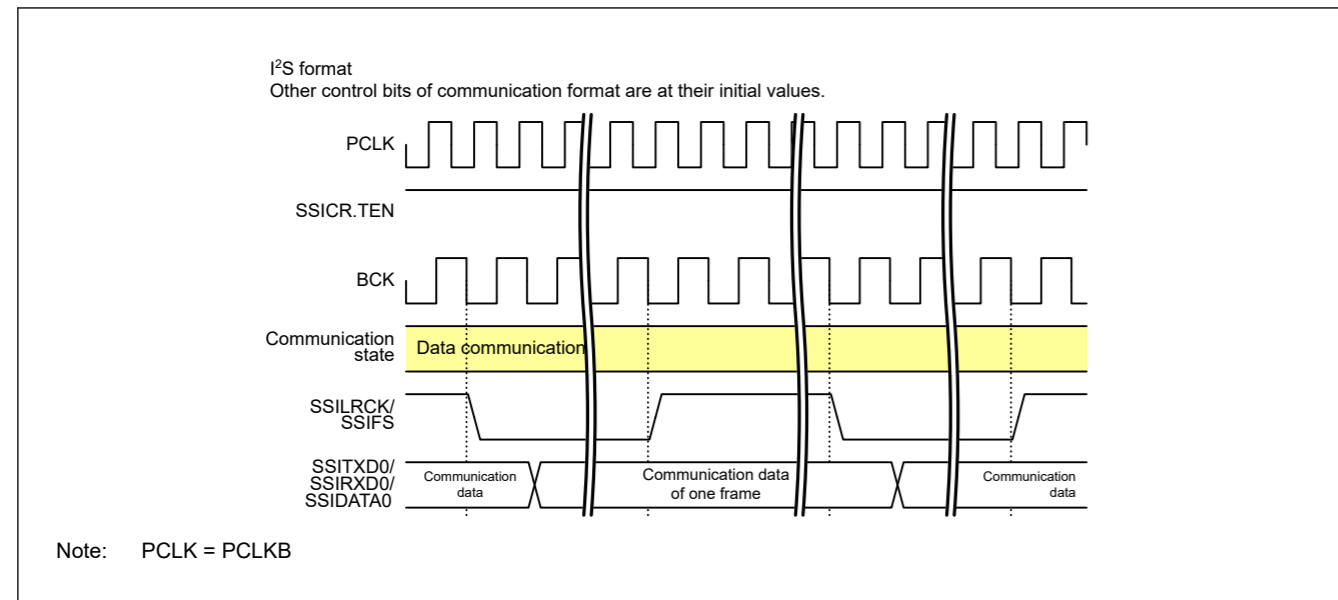

Figure 32.47 Continuation of the data communication

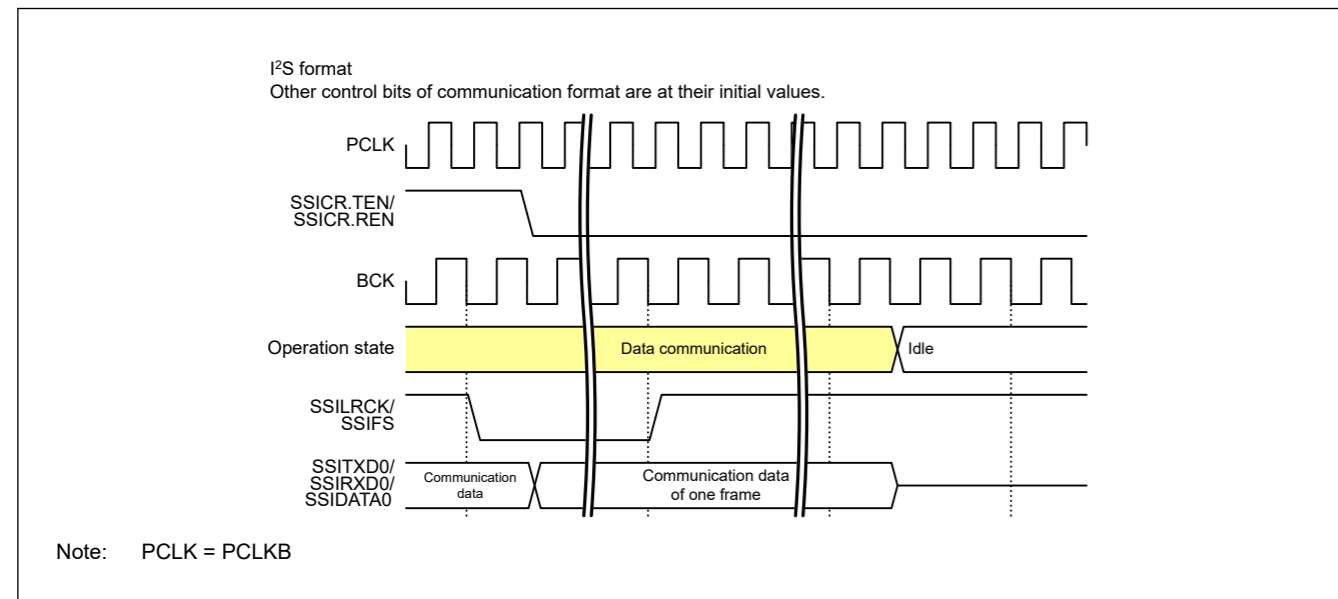

Figure 32.48 Halt from the data communication (without padding bits)

- State Transition in the Setting with Padding Bits

When SSIE ends transfer of the last bit of a data word during communication (SSISR.IIRQ = 0), SSIE transitions from the data communication state to the padding communication state in Figure 32.49. Except in the status with SSICR.SDTA = 1 and transmission and reception disabled (SSICR.TEN = 0 and SSICR.REN = 0), SSIE transitions from the data communication state to the idle state when it stops communication in Figure 32.51.

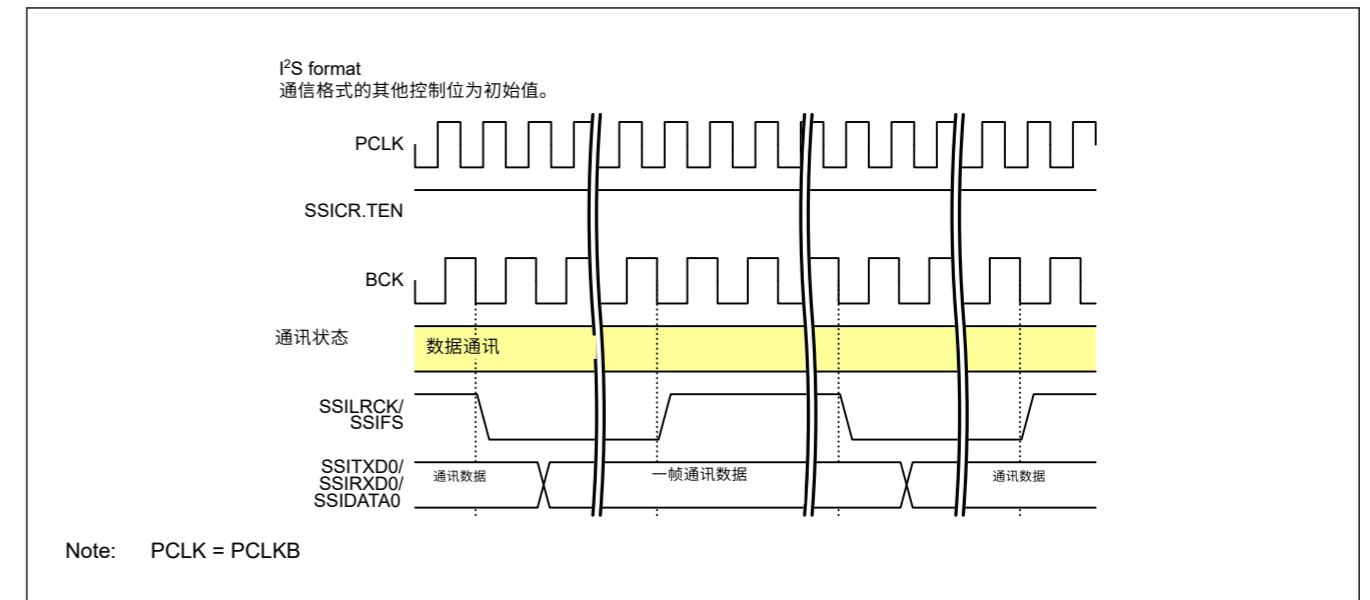

Figure 32.47 继续数据通信

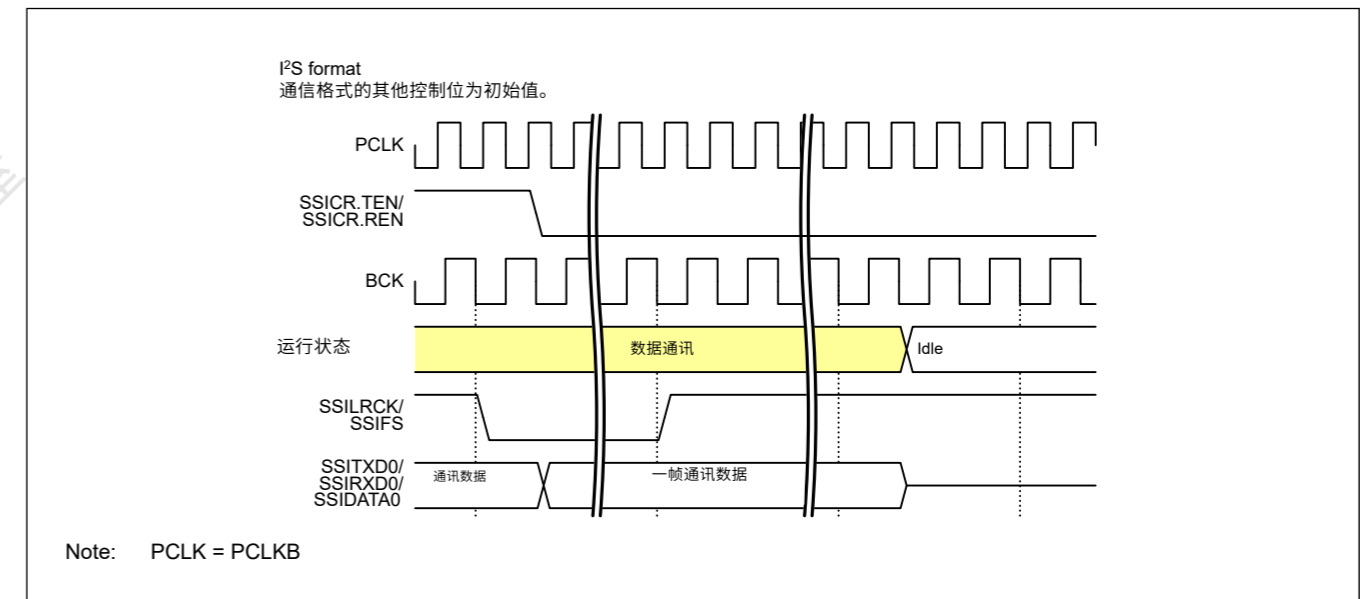

Figure 32.48 停止数据通信（无填充位）

- 具有填充位的设置中的状态转换

当SSIE在通信期间结束数据字的最后一位传输时（SSISR.IIRQ=0），SSIE从数据通信状态转换到图32.49中的填充通信状态。除了在SSICR.SDTA=1和发送和接收禁用的状态下（SSICR.TEN=0和SSICR.REN=0），SSIE在图32.51中停止通信时从数据通信状态转换到空闲状态。

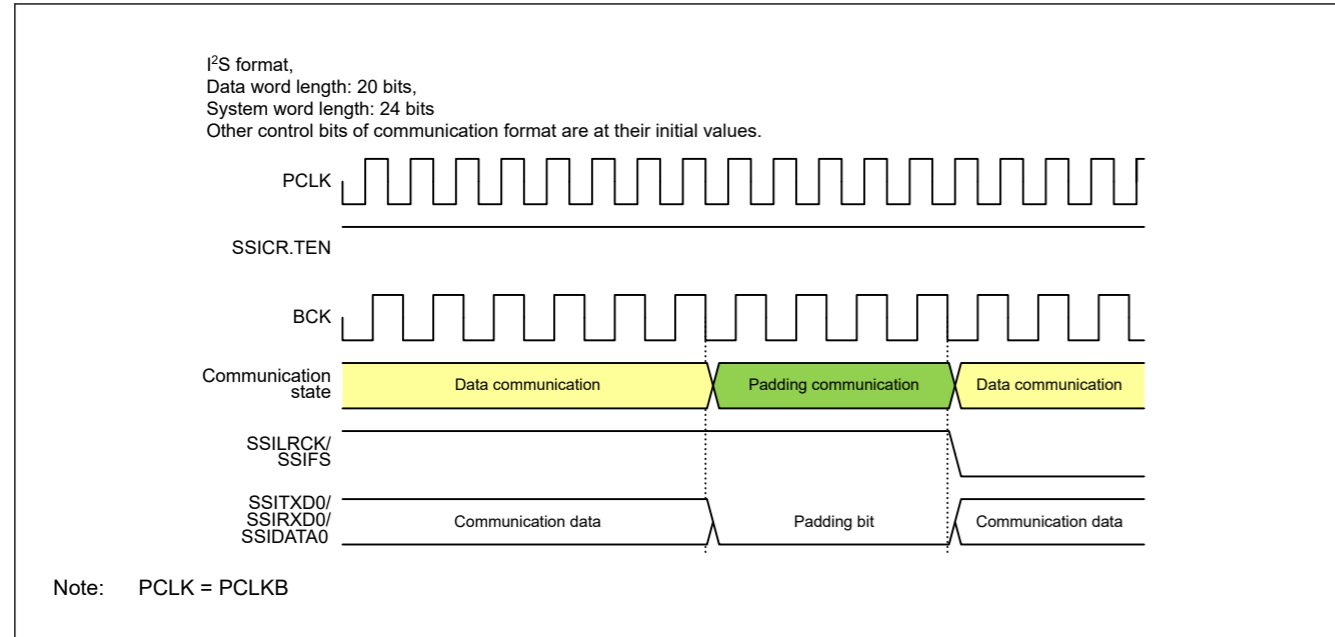

Figure 32.49 Transition from data communication to padding communication

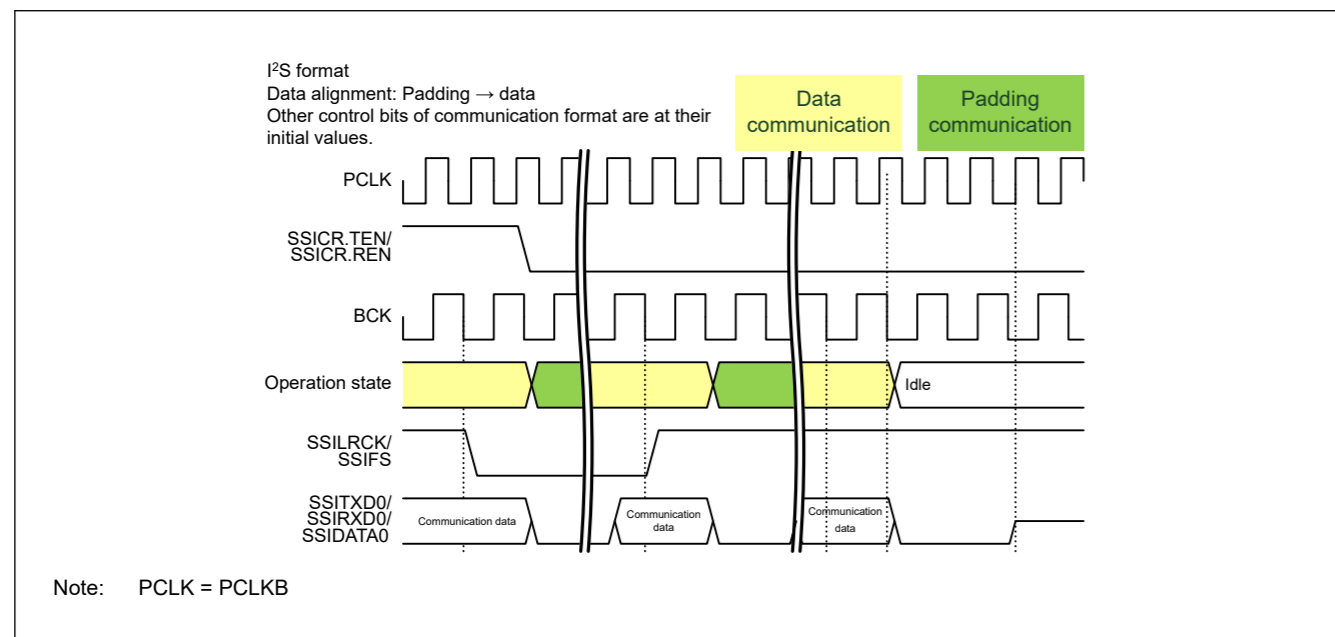

Figure 32.50 Halt from data communication (with padding bits)

### 32.7.2.2 Padding communication

In this state, SSIE is during communication. The padding bits set with the SSICR.SWL[2:0] bits and SSICR.DWL[2:0] bits are transmitted, received, or transmitted and received.

- State Transition in the Setting with Padding Bits

When SSIE ends transfer of the last padding bit during communication (SSISR.IIRQ = 0), SSIE transitions to the data communication state in Figure 32.49. If SSIE is in the status with SSICR.SDTA = 0 and transmission and reception disabled (SSICR.TEN = 0 and SSICR.REN = 0), SSIE transitions from the padding communication state to the idle state when it stops communication in Figure 32.51.

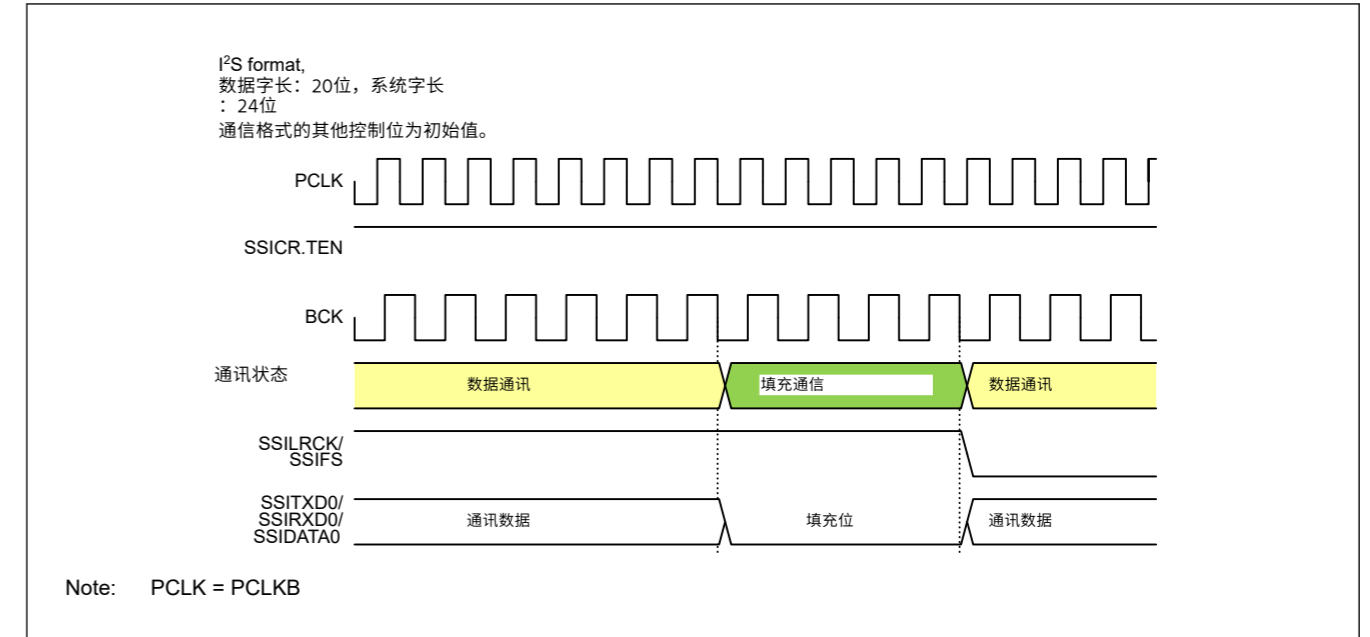

Figure 32.49 从数据通经过渡到填充通信

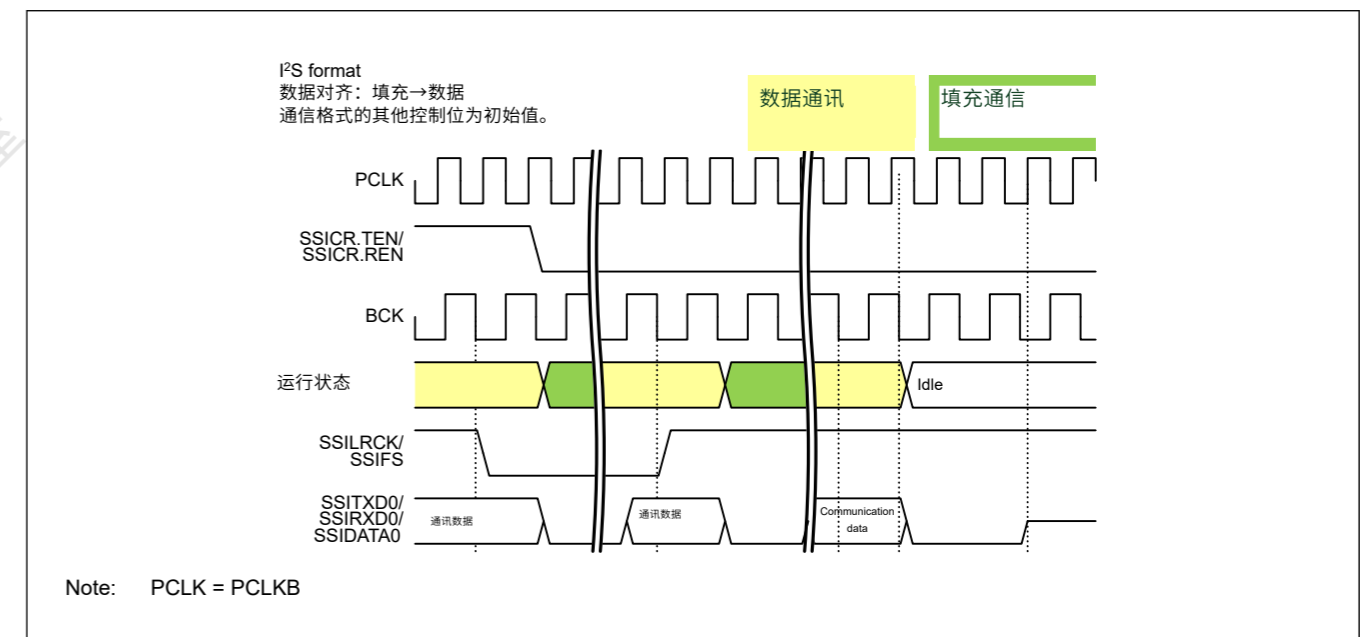

Figure 32.50 停止数据通信 (使用填充位)

### 32.7.2.2 填充通信

在此状态下, SSIE处于通信过程中。使用SSICR.SWL[2:0]位和SSICR.DWL[2:0]位设置的填充位被发送、接收或发送和接收。

- 具有填充位的设置中的状态转换

当SSIE在通信期间结束最后一个填充位的传输 (SSISR.IIRQ=0) 时, SSIE转换到图32.49中的数据通信状态。如果SSIE处于SSICR.SDTA=0且发送和接收禁用的状态 (SSICR.TEN=0和SSICR.REN=0), 则SSIE在图32.51中停止通信时从填充通信状态转换为空闲状态。

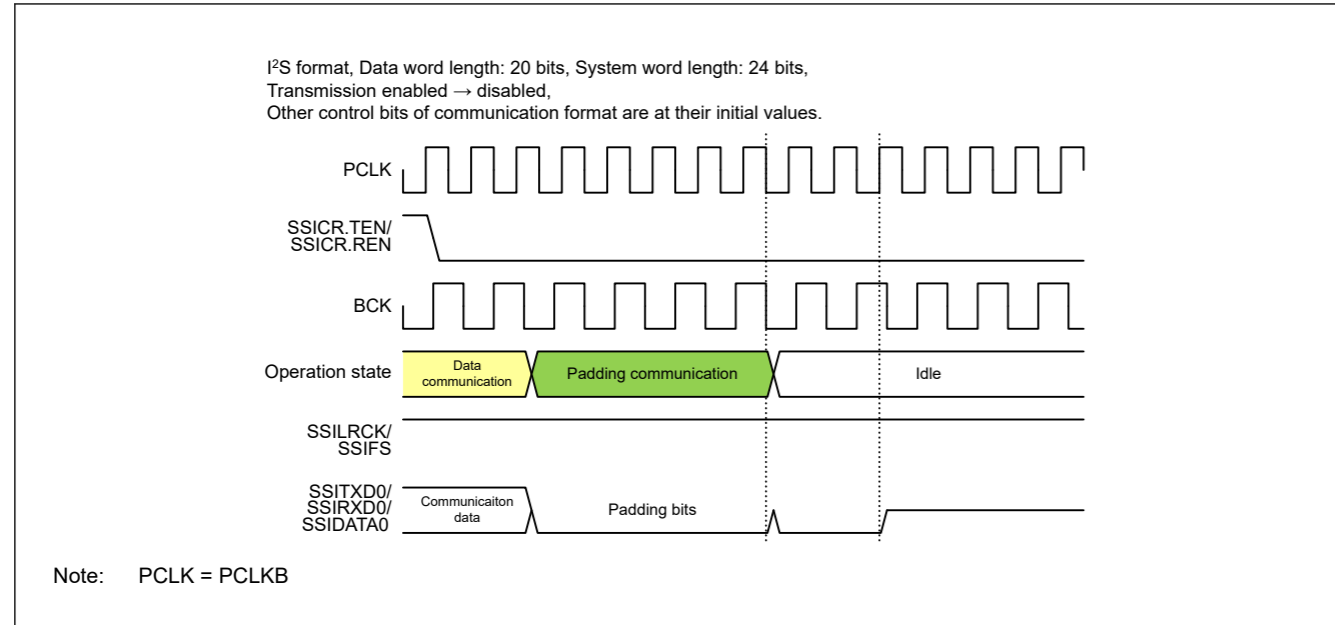

Figure 32.51 Halt from the padding communication

### 32.8 Communication Operation

Figure 32.52 shows the communication flow of SSIE.

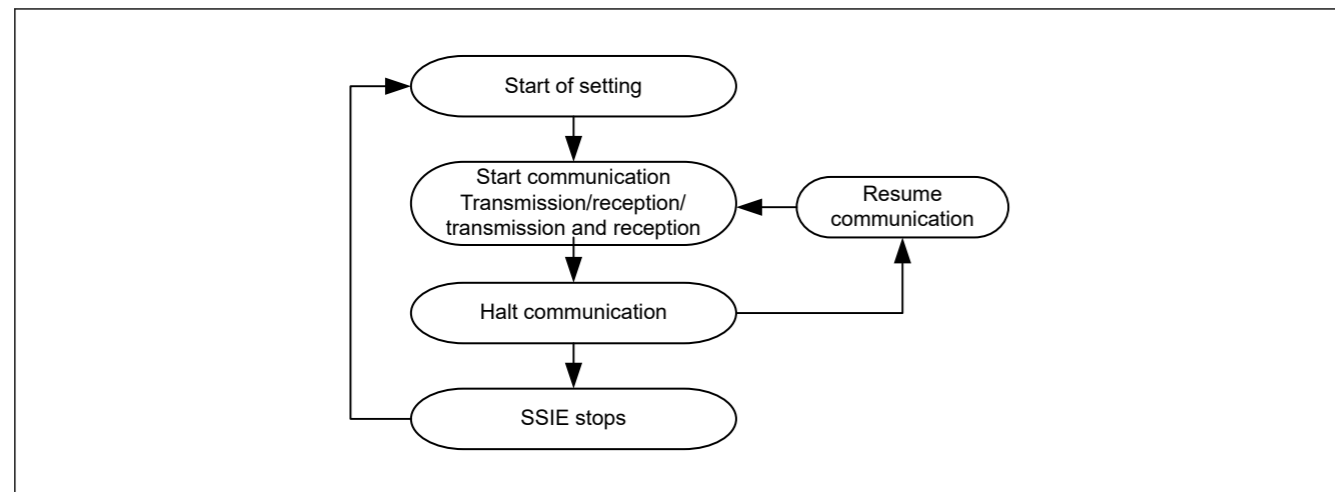

Figure 32.52 SSIE communication operation

The procedure of each operation is described from [section 32.8.1. Start Communication](#) to [section 32.8.7. Resume Communication](#).

#### 32.8.1 Start Communication

This section describes how to start communication of SSIE. [Figure 32.53](#) shows the procedure to start communication. Be sure to follow the procedure. See [section 32.8.2. Transmission](#) for transmission operation and [section 32.8.3. Reception](#) for reception operation.

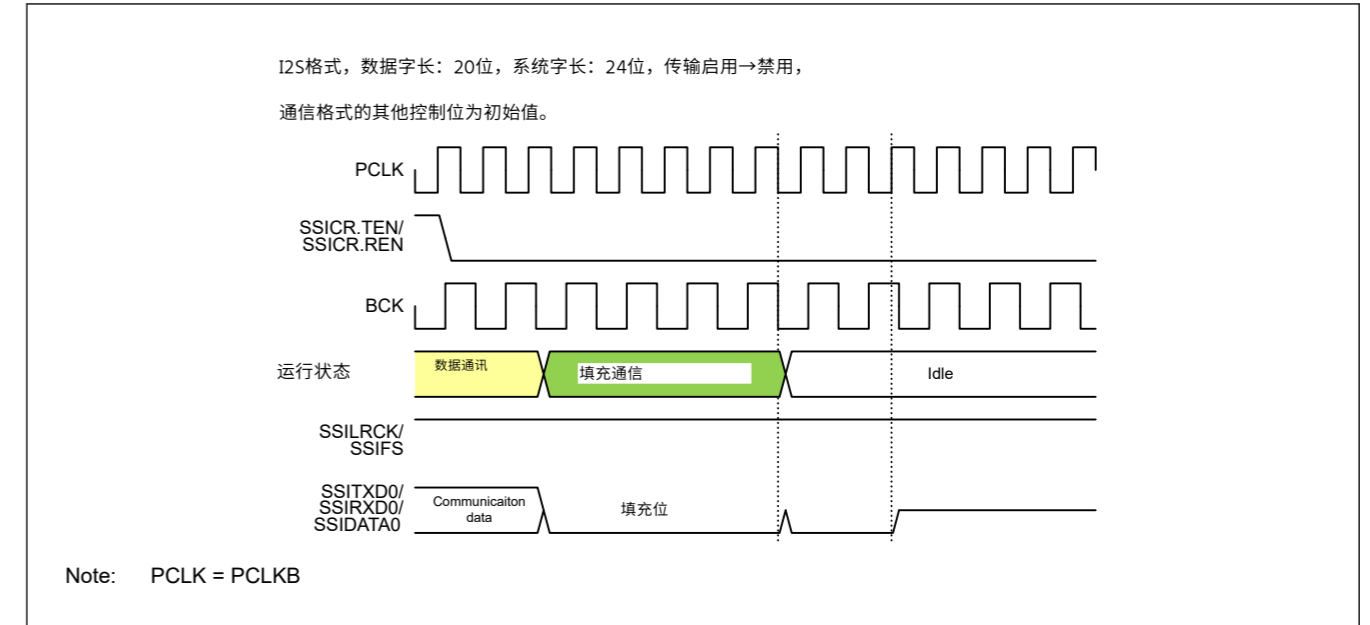

Figure 32.51 从填充通信中停止

### 32.8 通讯操作

图32.52显示了SSIE的通信流程。

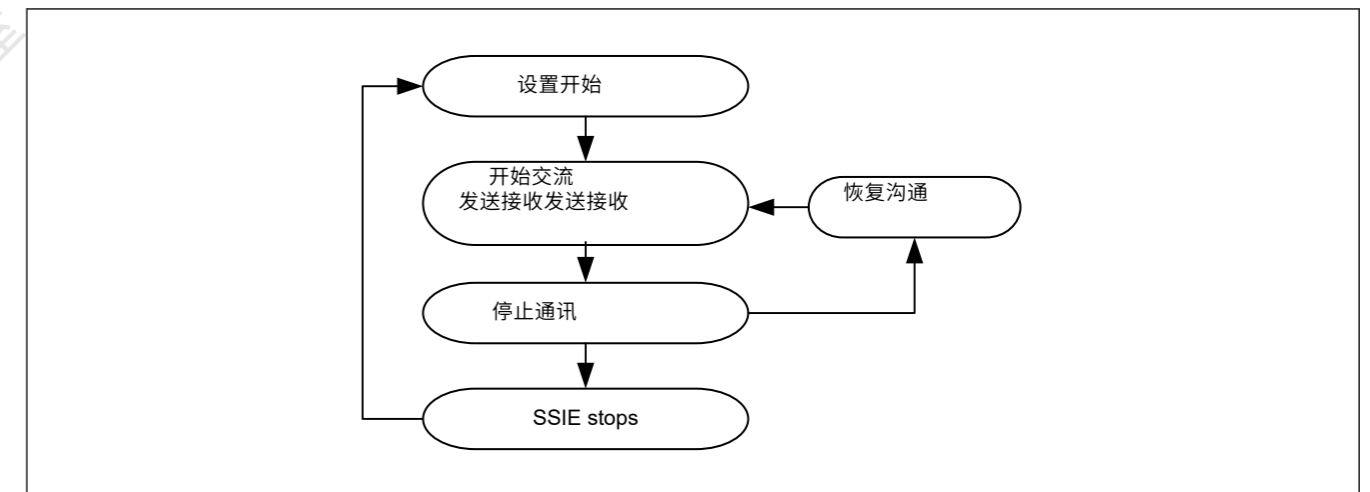

Figure 32.52 SSIE通信操作

每个操作的过程在第32.8.1节中描述。开始与第32.8.7节的通信。恢复Communication.

#### 32.8.1 开始沟通

本节介绍如何启动SSIE通信。图32.53显示了开始通信的过程。请务必遵守程序。请参阅第32.8.2节。传输操作和第32.8.3节的传输。接收操作的接收。

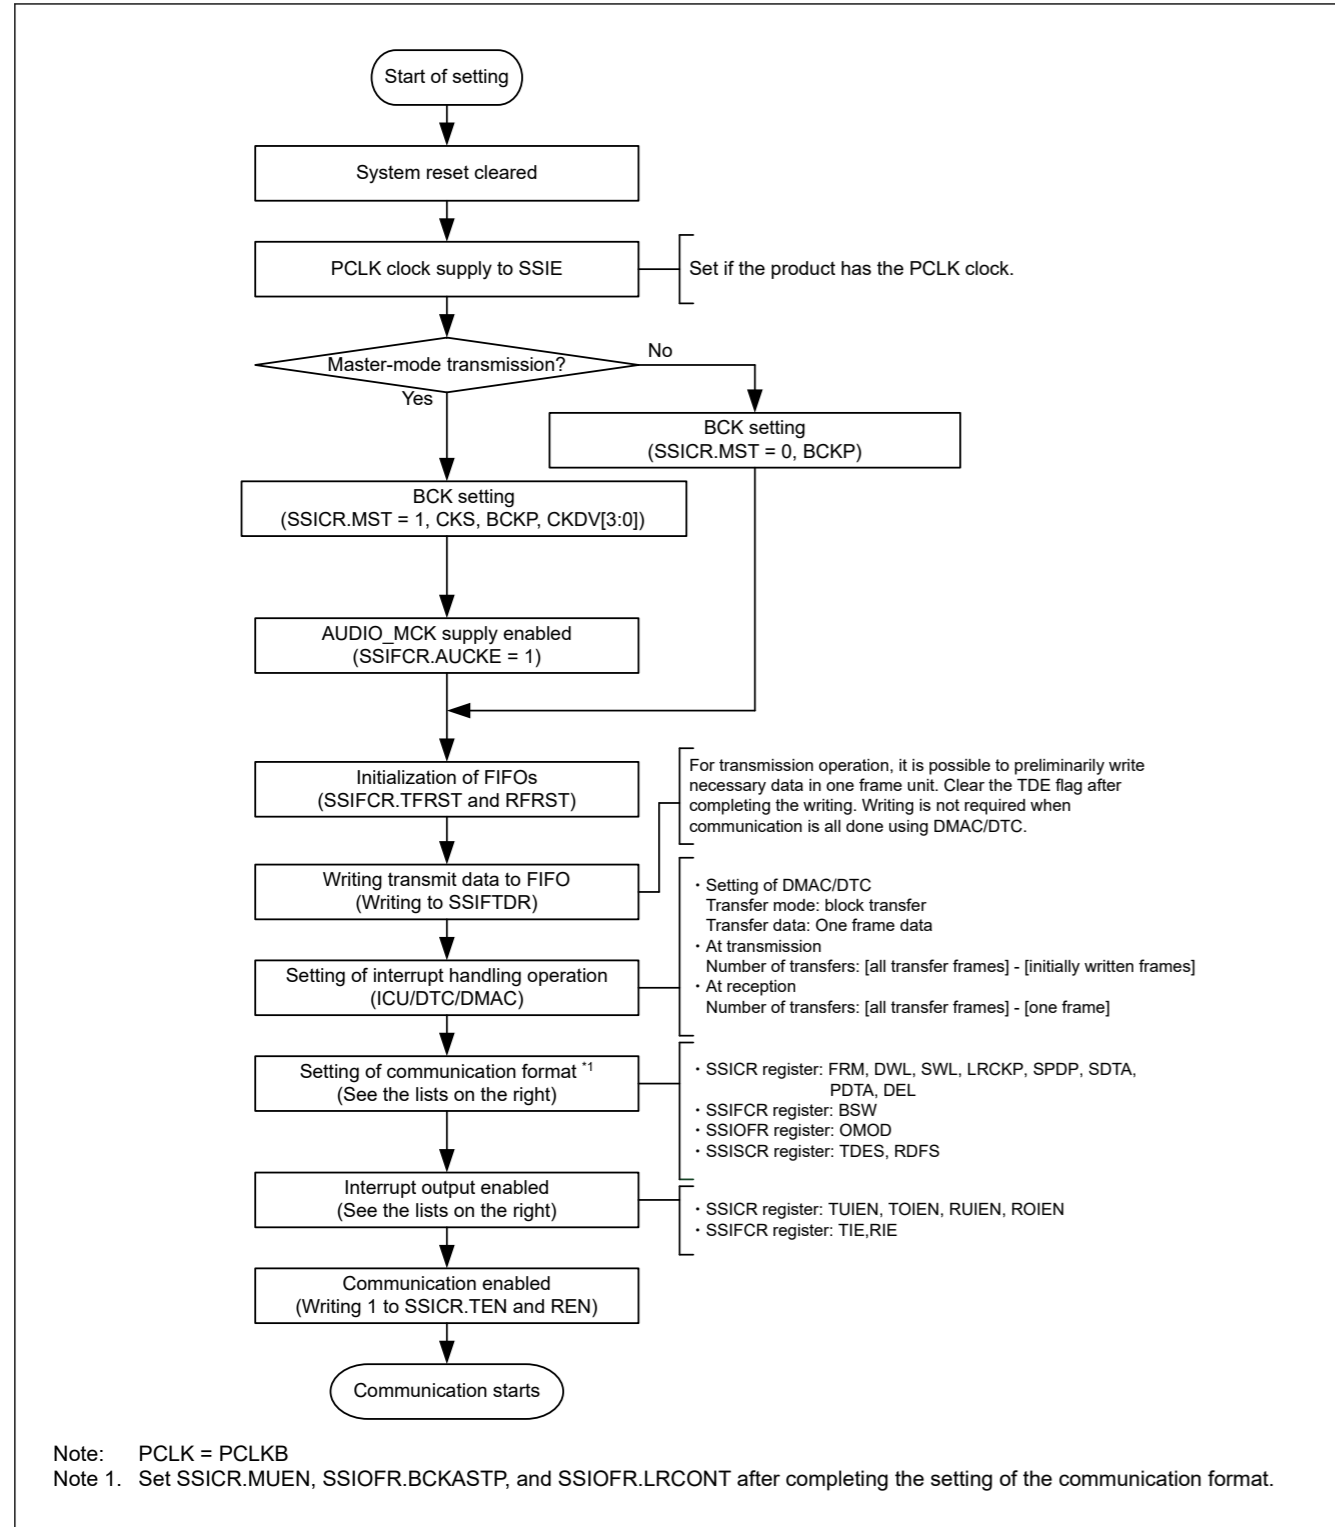

Figure 32.53 Procedure to start communication (CPU operation procedure)

SSIE can perform continuous communication based on interrupts by the DTC/DMAC. For transmission, write 1 to SSIFCR.TIE, SSICR.TUIEN, and SSICR.TOIE. For reception, write 1 to SSIFCR.RIE, SSICR.RUIEN, and SSICR.ROIEN.

### 32.8.2 Transmission

The transmission procedure in Figure 32.54 must be followed throughout a transmission operation.

After transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0), SSIE starts transmission when a start trigger is generated by SSILRCK/SSIFS with the serial data for at least a frame contained in the transmit FIFO data register

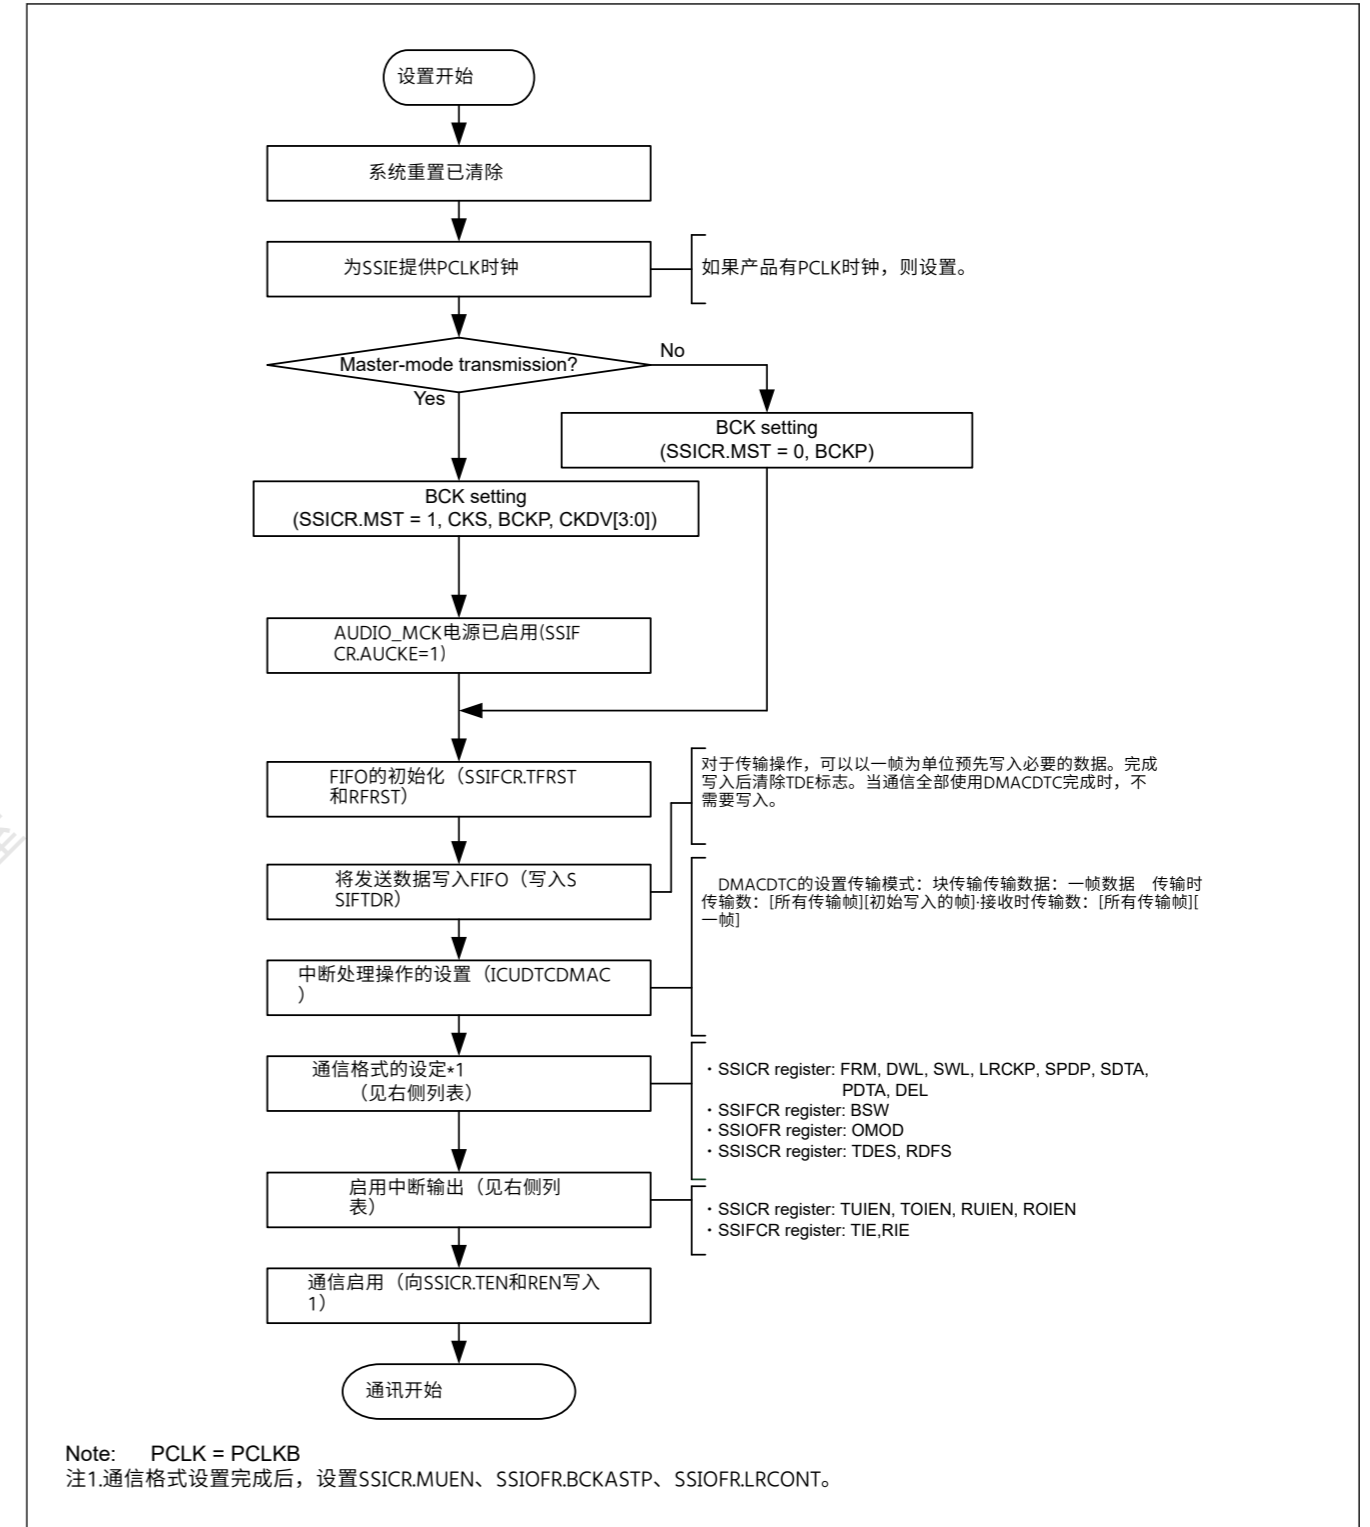

Figure 32.53 开始通信的步骤 (CPU操作步骤)

SSIE可以根据DTCDMAC的中断执行连续通信。对于传输, 写入1到SSIFCR.TIE、SSICR.TUIEN和SSICR.TOIE。对于接收, 将1写入SSIFCR.RIE、SSICR.RUIEN和SSICR.ROIEN。

### 32.8.2 Transmission

在整个传输操作中必须遵循图32.54中的传输过程。

使能传输后 (SSICR.TEN=1和SSICR.REN=0), 当SSILRCK/SSIFS使用发送FIFO数据寄存器中包含的至少一帧的串行数据生成启动触发时, SSIE开始传输

(SSIFTDR). SSIE outputs a transmit data empty interrupt to the DTC/DMAC according to the TDE setting condition (SSISCR.TDES) and the status of transmit data empty interrupt enable (SSIFCR.TIE) bit specified in the communication start procedure. This interrupt requests writing to the transmit FIFO data register (SSIFTDR). In the communication start procedure, specify writing to the transmit FIFO data register (SSIFTDR) as the DTC/DMAC operation in response to the transmit data empty interrupt. With this setting, SSIE can continuously transmit data not through the CPU. The transmit data empty interrupt is generated when the free space size of transmit FIFO data register reaches the value set in SSISCR.TDES. The number of times of writing must be specified in accordance with the free space size of the transmit FIFO data register indicated by the transmit data empty interrupt. If an error occurs, perform the error-handling procedure as instructed in the communication stop procedure.

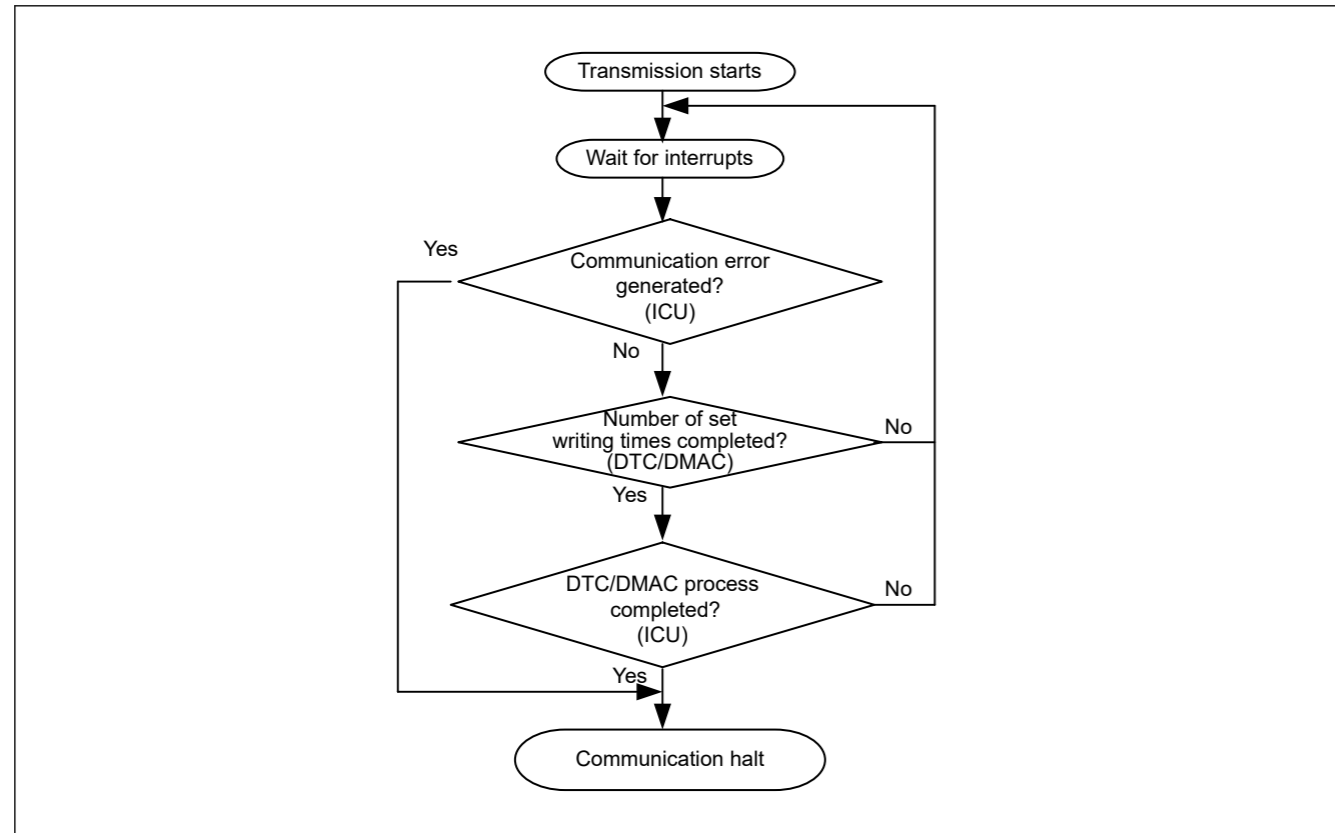

Figure 32.54 Transmission procedure

Note: The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.TDE to write data to SSIFTDR. The number of times of writing data to SSIFTDR by detecting the value 1 of SSIFSR.TDE must be in accordance with the free space size of the transmit FIFO data register specified by SSISCR.TDES. After as much transmit data as the free space size is written to SSIFTDR, the SSIFSR.TDE flag must be cleared. Continuous transmission is enabled by repeating data writing. If the SSIFSR.TDE flag is not cleared, the flag is not cleared automatically.

### 32.8.3 Reception

The reception procedure in Figure 32.55 must be followed throughout a reception operation.

After reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1), SSIE starts reception when a start trigger is generated by SSILRCK/SSIFS. SSIE outputs a receive data full interrupt to the DTC/DMAC according to the RDF setting condition (SSISCR.RDFS) and the status of receive data full interrupt enable (SSIFCR.RIE) bit specified in the communication start procedure. This interrupt requests data reading from the receive FIFO data register (SSIFRDR). In the communication start procedure, specify reading from the receive FIFO data register (SSIFRDR) as the DTC/DMAC operation in response to the receive data full interrupt. With this setting, SSIE can continuously read data not through the CPU. The receive data full interrupt is generated when data as much as the capacity of receive FIFO data register has been stored. The number of times of reading must be specified in accordance with the data size of the receive FIFO data register indicated by the receive data full interrupt. If an error occurs, perform the error-handling procedure as instructed in the communication stop procedure.

(SSIFTDR)。SSIE根据通信启动过程中指定的TDE设置条件(SSISCR.TDES)和发送数据空中断使能(SSIFCR.TIE)位的状态，向DTCDMAC输出一个发送数据空中断。该中断请求写入发送FIFO数据寄存器(SSIFTDR)。在通信开始过程中，将写入发送FIFO数据寄存器(SSIFTDR)指定为DTCDMAC操作以响应发送数据空中断。使用此设置，SSIE可以不通过CPU连续传输数据。当发送FIFO数据寄存器的可用空间大小达到SSISCR.TDES中设置的值时，将产生发送数据空中断。写入次数必须根据发送数据空中断指示的发送FIFO数据寄存器的空闲空间大小来指定。如果发生错误，请按照通信停止程序中的说明执行错误处理程序。

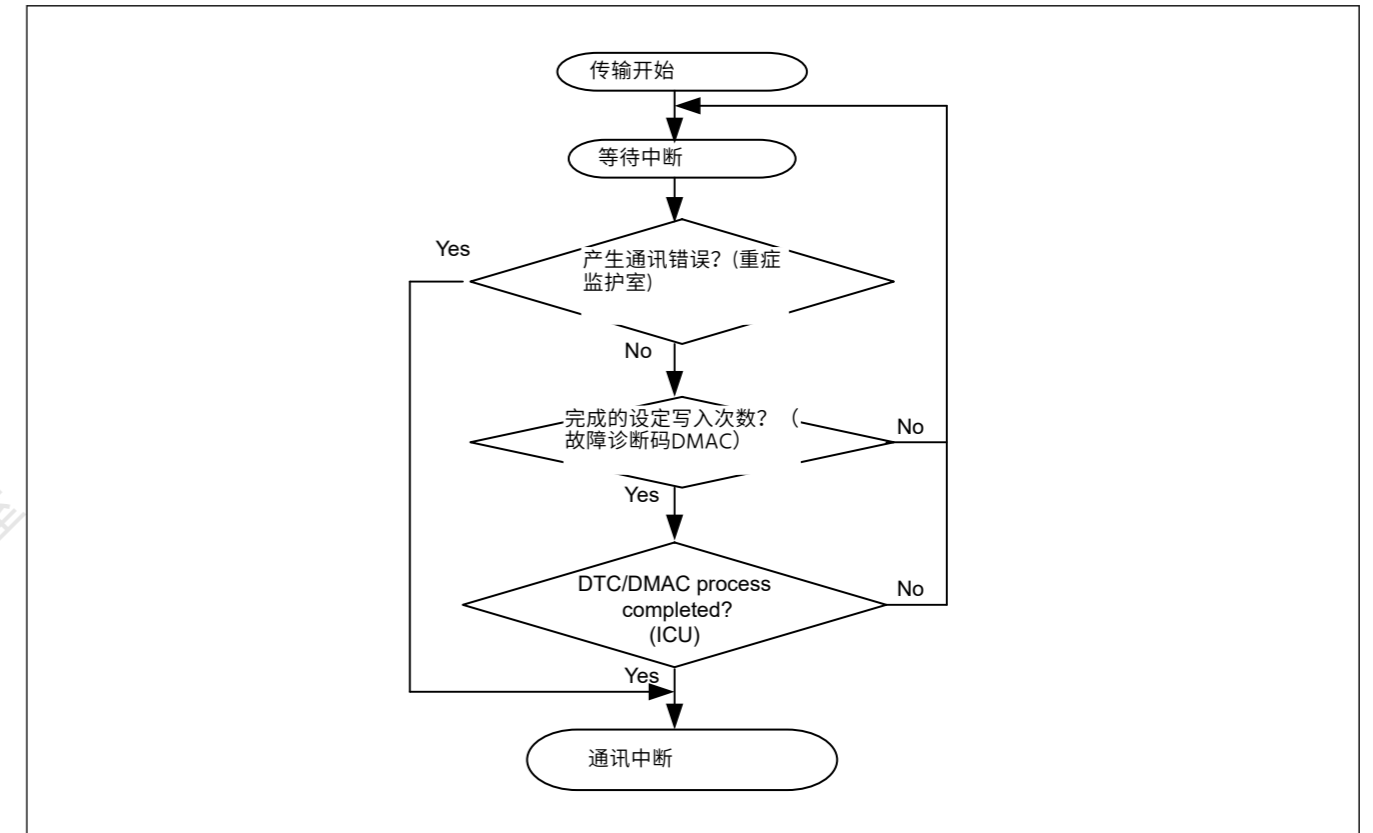

Figure 32.54 传输程序

Note: SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.TDE的值1以将数据写入SSIFTDR。通过检测SSIFSR.TDE的值为1向SSIFTDR写入数据的次数必须与SSIFSR.TDES指定的发送FIFO数据寄存器的空闲空间大小一致。在将与可用空间大小一样多的传输数据写入SSIFTDR后，必须清除SSIFSR.TDE标志。通过重复数据写入启用连续传输。如果

SSIFSR.TDE标志不清除，该标志不会自动清除。

### 32.8.3 Reception

在整个接收操作中必须遵循图32.55中的接收程序。

使能接收后 (SSICR.TEN=0和SSICR.REN=1)，SSIE会在以下条件产生开始触发时开始接收 SSILRCK/SSIFS。SSIE根据RDF设置条件(SSISCR.RDFS)和通信开始过程中指定的接收数据满中断使能(SSIFCR.RIE)位的状态向DTCDMAC输出一个接收数据满中断。该中断请求从接收FIFO数据寄存器(SSIFRDR)读取数据。在通信启动过程中，指定从接收FIFO数据寄存器(SSIFRDR)读取作为DTCDMAC操作以响应接收数据满中断。通过此设置，SSIE可以不通过CPU连续读取数据。当数据达到接收FIFO数据寄存器的容量时，产生接收数据满中断。读取次数必须根据接收数据满中断指示的接收FIFO数据寄存器的数据大小来指定。如果发生错误，请按照通信停止程序中的说明执行错误处理程序。

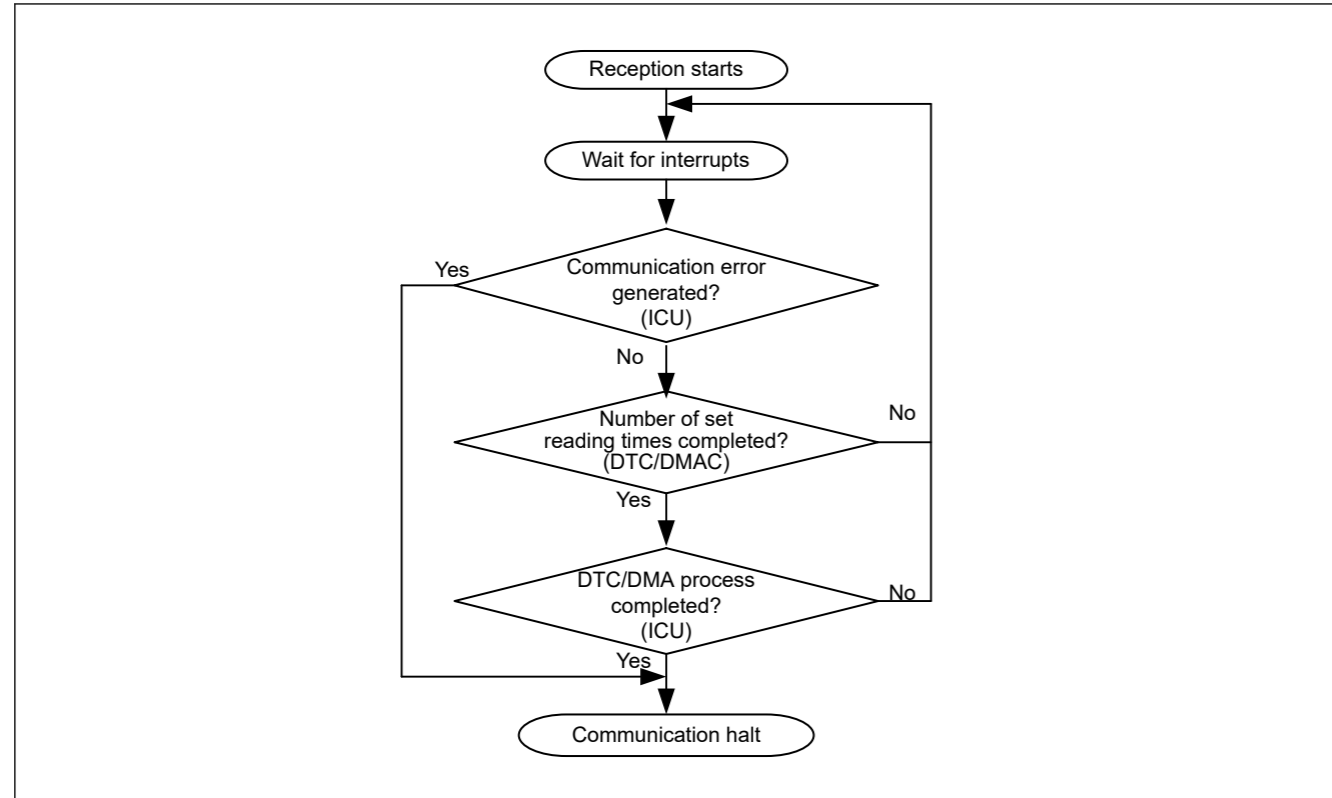

Figure 32.55 Reception procedure

Note: The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.RDF to read data from SSIFRDR. The number of times of reading data from SSIFRDR by detecting the value 1 of SSIFSR.RDF must be in accordance with the receive data storage capacity of the receive FIFO data register specified by SSISCR.RDFS. After received data is read from SSIFRDR, the SSIFSR.RDF flag must be cleared. Continuous reception is enabled by repeating data reading. If the SSIFSR.RDF flag is not cleared, the flag is not cleared automatically.

### 32.8.4 Transmission and Reception

After transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1), SSIE starts transmission and reception when a start trigger is generated by SSILRCK/SSIFS with the serial data for at least a frame contained in the transmit FIFO data register (SSIFTDR). SSIE can continuously transmit and receive data by performing the procedures described in [section 32.8.2. Transmission](#) and [section 32.8.3. Reception](#), respectively. For how to stop transmission and reception, see [section 32.8.5. Halt Communication](#).

### 32.8.5 Halt Communication

This section describes how to halt communication of SSIE. [Figure 32.56](#) shows the procedure to halt communication. Be sure to follow the procedure.

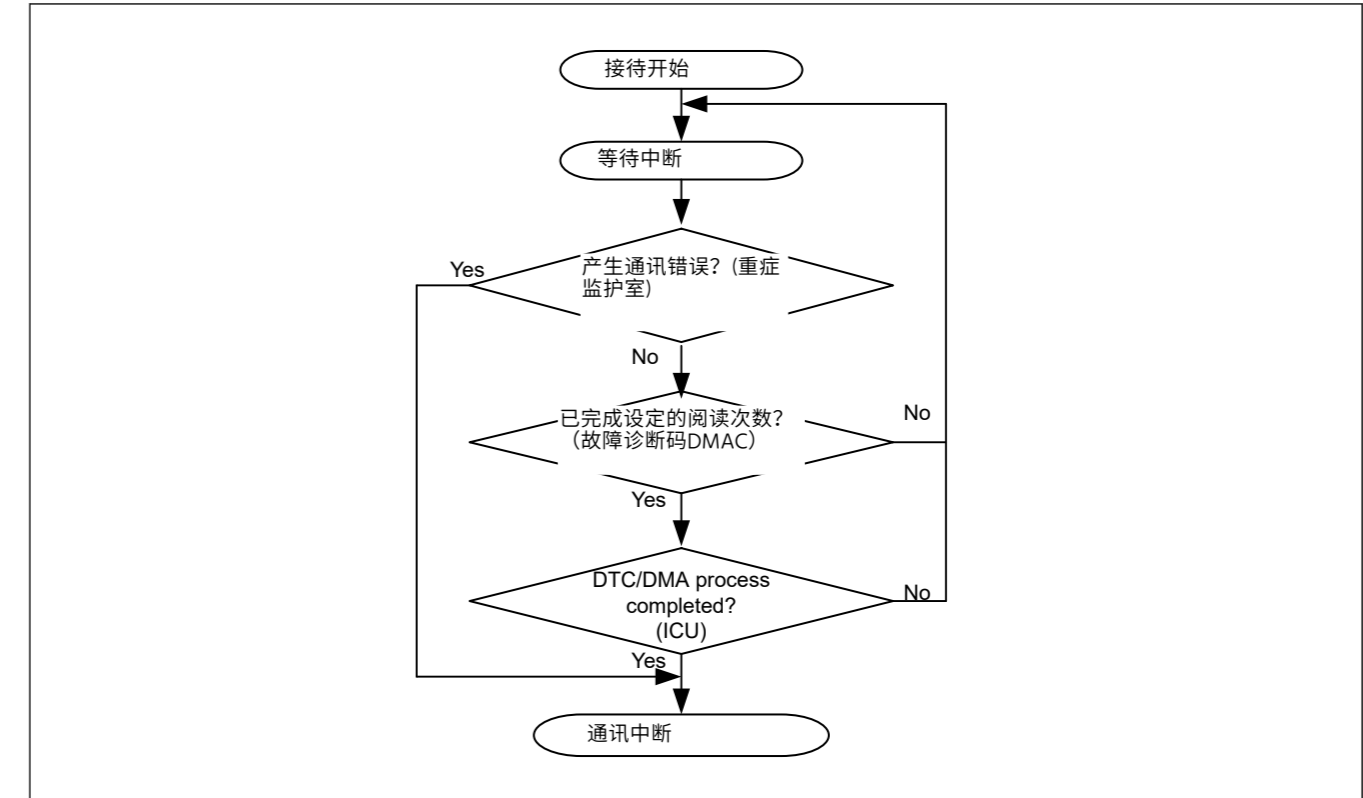

Figure 32.55 接待程序

Note: SSIE中定义的通信流使用DTC/DMAC。如果不使用DTC/DMAC，则轮询SSIFSR.RDF的值1以从SSIFRDR读取数据。检测SSIFSR.RDF的值为1从SSIFRDR读取数据的次数必须与SSISCR.RDFS指定的接收FIFO数据寄存器的接收数据存储容量一致。从SSIFRDR读取接收到的数据后，必须清除SSIFSR.RDF标志。通过重复数据读取启用连续接收。如果SSIFSR.RDF标志未清除，则该标志不会自动清除。

### 32.8.4 传输和接收

启用发送和接收后 (SSICR.TEN=1和SSICR.REN=1)，当SSILRCK/SSIFS使用发送FIFO数据寄存器中包含的至少一帧的串行数据产生开始触发时，SSIE开始发送和接收(SSIFTDR)。SSIE可以通过执行第32.8.2节中描述的过程来连续发送和接收数据。传输和接收，分别。关于如何停止发送和接收，请参见第32.8.5节。停止通讯。

### 32.8.5 停止通讯

本节介绍如何停止SSIE的通信。图32.56显示了停止通信的过程。请务必遵守程序。

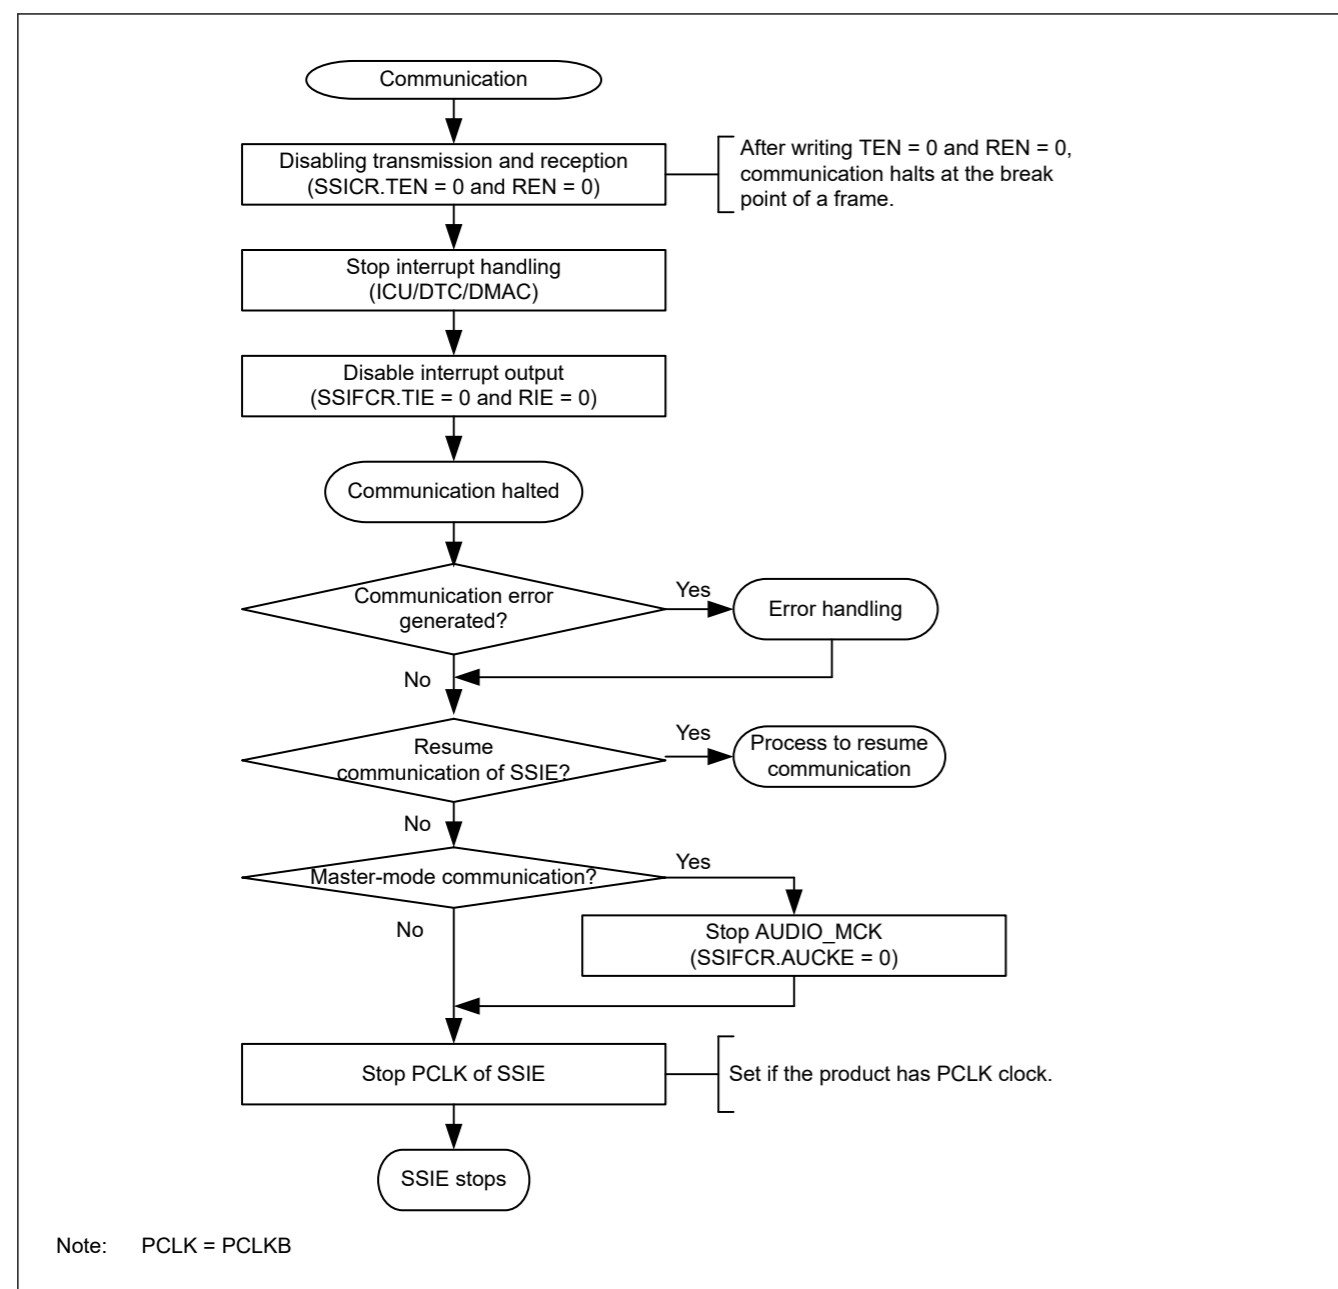

Figure 32.56 Procedure to halt communication (CPU operation procedure)

To halt the communication of SSIE, supply of the following clocks are required until the SSISR.IIRQ bit indicates an idle state.

- Input clock from the SSIBCK pin when SSICR.MST = 0
  - AUDIO\_MCK when SSICR.MST = 1
- To resume communication of SSIE in the previous setting, see [section 32.8.7. Resume Communication](#).

Note: When communication of SSIE is halted according to the procedure to halt communication in [Figure 32.56](#), resume communication according to the procedure to resume communication in [Figure 32.58](#).

### 32.8.6 Error Handling

SSIE has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error

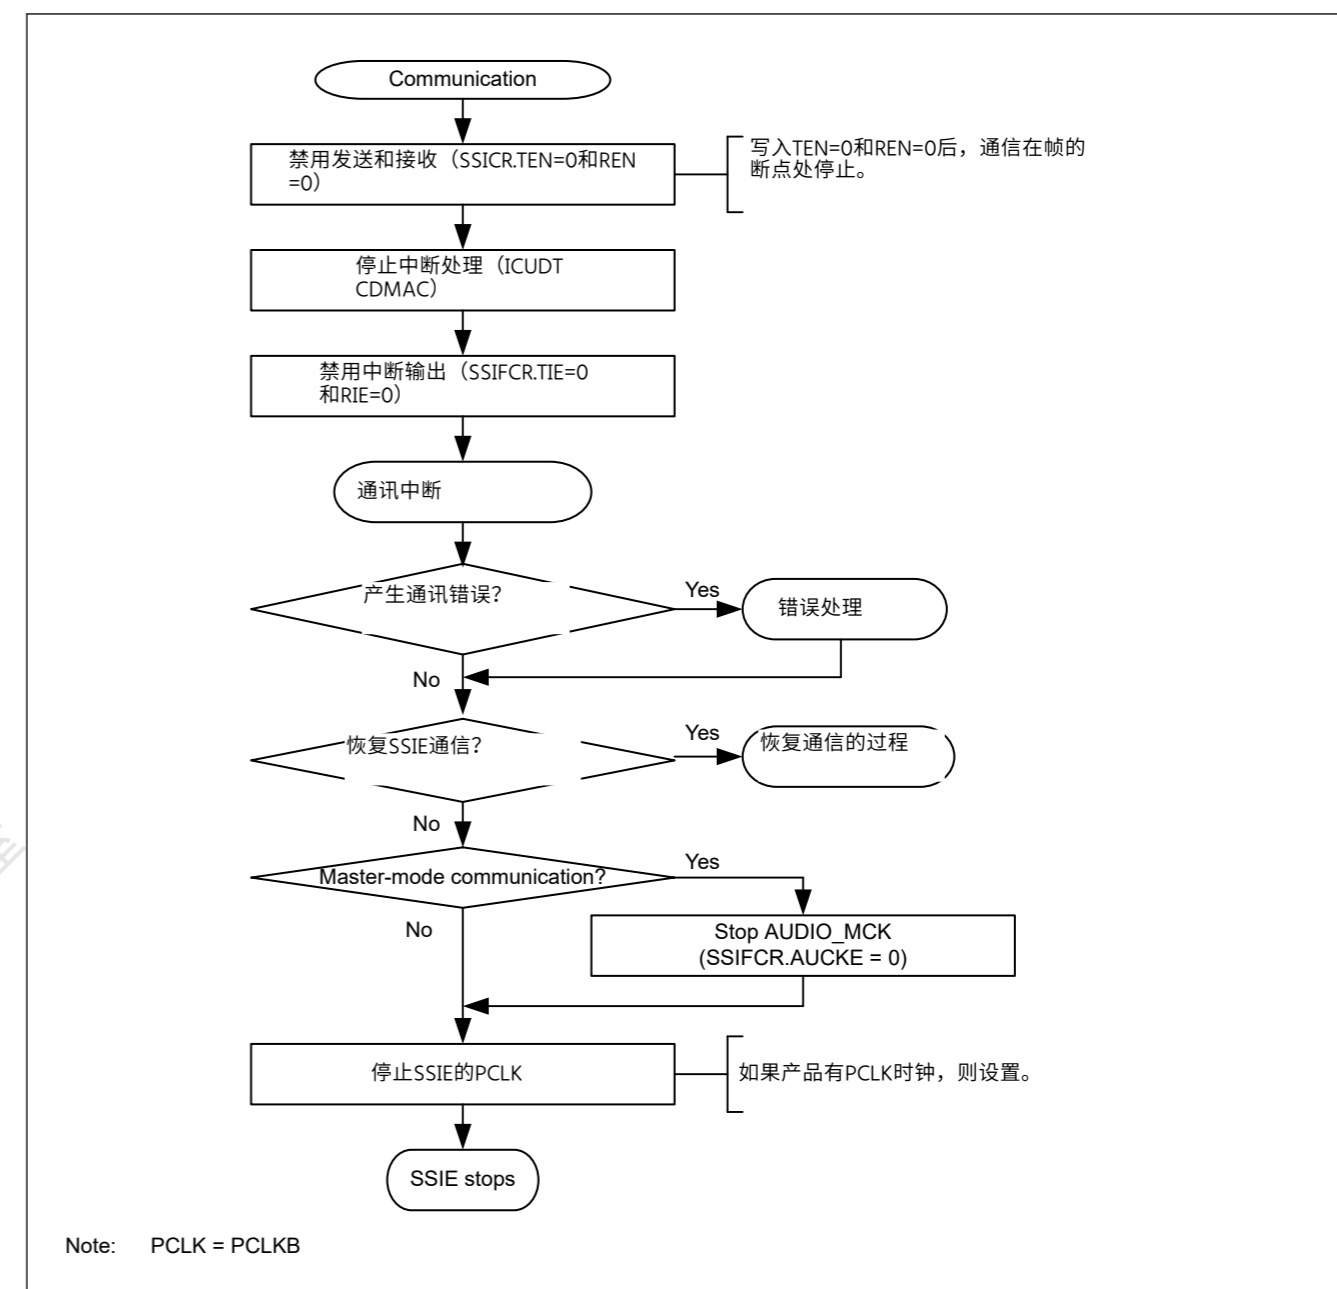

Figure 32.56 停止通信的步骤 (CPU操作步骤)

要停止SSIE的通信，需要提供以下时钟，直到SSISR.IIRQ位指示空闲状态。

- 当SSICR.MST=0时，来自SSIBCK引脚的输入时钟
  - AUDIO\_MCK when SSICR.MST = 1
- 要恢复之前设置的SSIE通信，请参阅第32.8.7节。恢复通信。

Note: 当SSIE的通信按照图32.56中的停止通信程序停止时，按照图32.58中的恢复通信程序恢复通信。

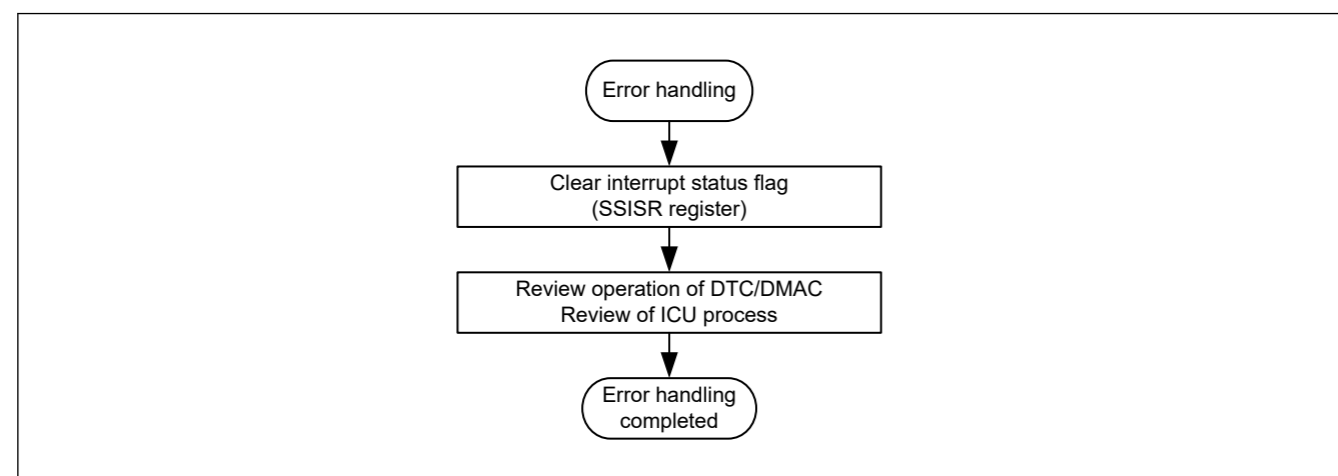

### 32.8.6 错误处理

SSIE有以下四个错误。

- 发送下溢错误
- 发送溢出错误
- 接收下溢错误

- Receive overflow error.

When an underflow error or overflow error is generated, SSIE need to be restarted. Follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#).

**Figure 32.57 Error-handling procedure**

Four error operations are described as follows. When the interrupt output enable bit of the SSICR register is enabled and error flags are set, an error interrupt is generated. See [section 32.4.2. SSISR : Status Register](#) for the setting conditions of error flags.

#### (1) Transmit Underflow Error

If a transmit underflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to a transmit data empty interrupt. After a transmit underflow error occurs, SSIE outputs 0s as data. To normally output the serial data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA0 pin, follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#). After this error occurs, serial data is consumed as usual. If you resume communication, write the serial data from the beginning.

#### (2) Transmit Overflow Error

If a transmit overflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to transmit data empty interrupts. The serial data written to the transmit FIFO data register (SSIFTDR) that caused the transmit overflow error becomes invalid. This error can occur regardless of whether a transmission operation is being done. To recover from the error, follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#). When you resume communication, deal with the invalid serial data appropriately.

#### (3) Receive Underflow Error

If a receive underflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The values read from the receive FIFO data register (SSIFRDR) that caused the receive underflow error are undefined. This error can occur regardless of whether a reception operation is being done. To recover from the error, follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#).

#### (4) Receive Overflow Error

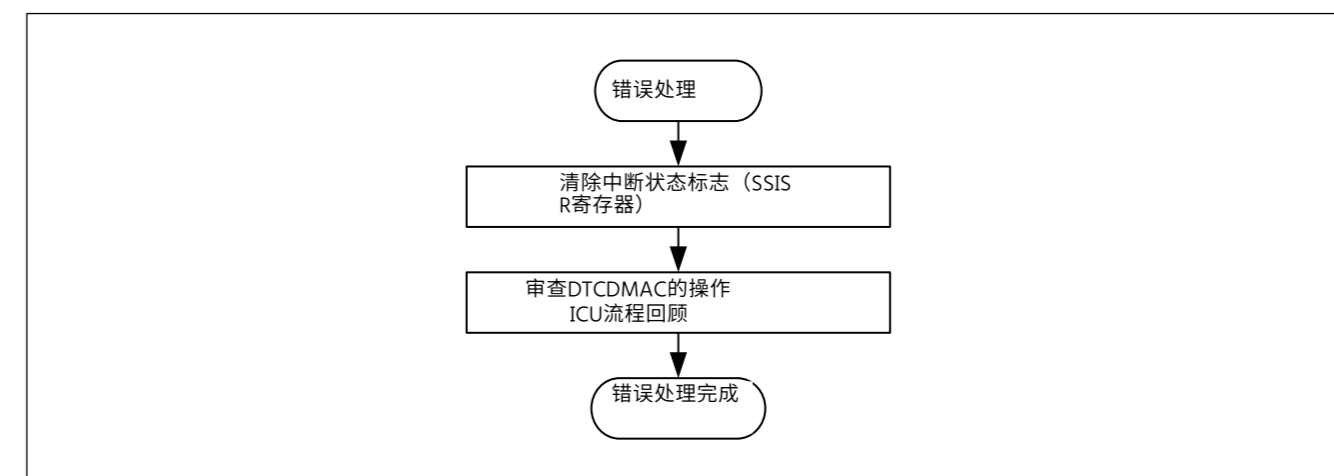

If a receive overflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The receive data that caused the receive overflow error cannot be stored in the receive FIFO data register (SSIFRDR). To recover from the error, follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#).

### 32.8.7 Resume Communication

When you resume the communication using SSIE, follow the communication resume procedure in [Figure 32.58](#). The communication resume procedure is designed on the assumption that you resume the communication stopped by the

- 接收溢出错误。

当产生下溢错误或上溢错误时，需要重启SSIE。按照图32.56中的程序停止通信和图32.57中的错误处理程序。

**Figure 32.57 Error-handling procedure**

四种错误操作描述如下。当SSICR寄存器的中断输出使能位使能且错误标志置位时，将产生错误中断。请参见第32.4.2节。SSISR：错误标志设置条件的状态寄存器。

#### (1) 发送下溢错误

如果发生发送下溢错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。发生发送下溢错误后，SSIE输出0作为数据。要将写入发送FIFO数据寄存器(SSIFTDR)的串行数据正常输出到SSITXD0/SSIDATA0引脚，请按照图32.56中的程序停止通信和图32.57中的错误处理程序。发生此错误后，串行数据将照常使用。如果您恢复通信，请从头开始写入串行数据。

#### (2) 传输溢出错误

如果发生发送溢出错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。写入导致发送溢出错误的发送FIFO数据寄存器(SSIFTDR)的串行数据变为无效。无论是否正在执行传输操作，都可能发生此错误。要从错误中恢复，请按照图32.56中的程序停止通信和图32.57中的错误处理程序。当您恢复通信时，请适当处理无效的串行数据。

#### (3) 接收下溢错误

如果发生接收下溢错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收下溢错误的接收FIFO数据寄存器(SSIFRDR)读取的值未定义。无论是否正在执行接收操作，都可能发生此错误。要从错误中恢复，请按照图32.56中的程序停止通信和图32.57中的错误处理程序。

#### (4) 接收溢出错误

如果发生接收溢出错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收溢出错误的接收数据不能存储在接收FIFO数据寄存器(SSIFRDR)中。要从错误中恢复，请按照图32.56中的程序停止通信和图32.57中的错误处理程序。

### 32.8.7 恢复沟通

当您使用SSIE恢复通信时，请遵循图32.58中的通信恢复过程。通信恢复过程的设计假设您恢复了由

communication stop procedure without changing any settings. If you want to change clock and slave/master settings, use and follow the communication start procedure in Figure 32.53. For details about the transmission operation and reception operation after starting communication, see section 32.8.2. Transmission and section 32.8.3. Reception, respectively.

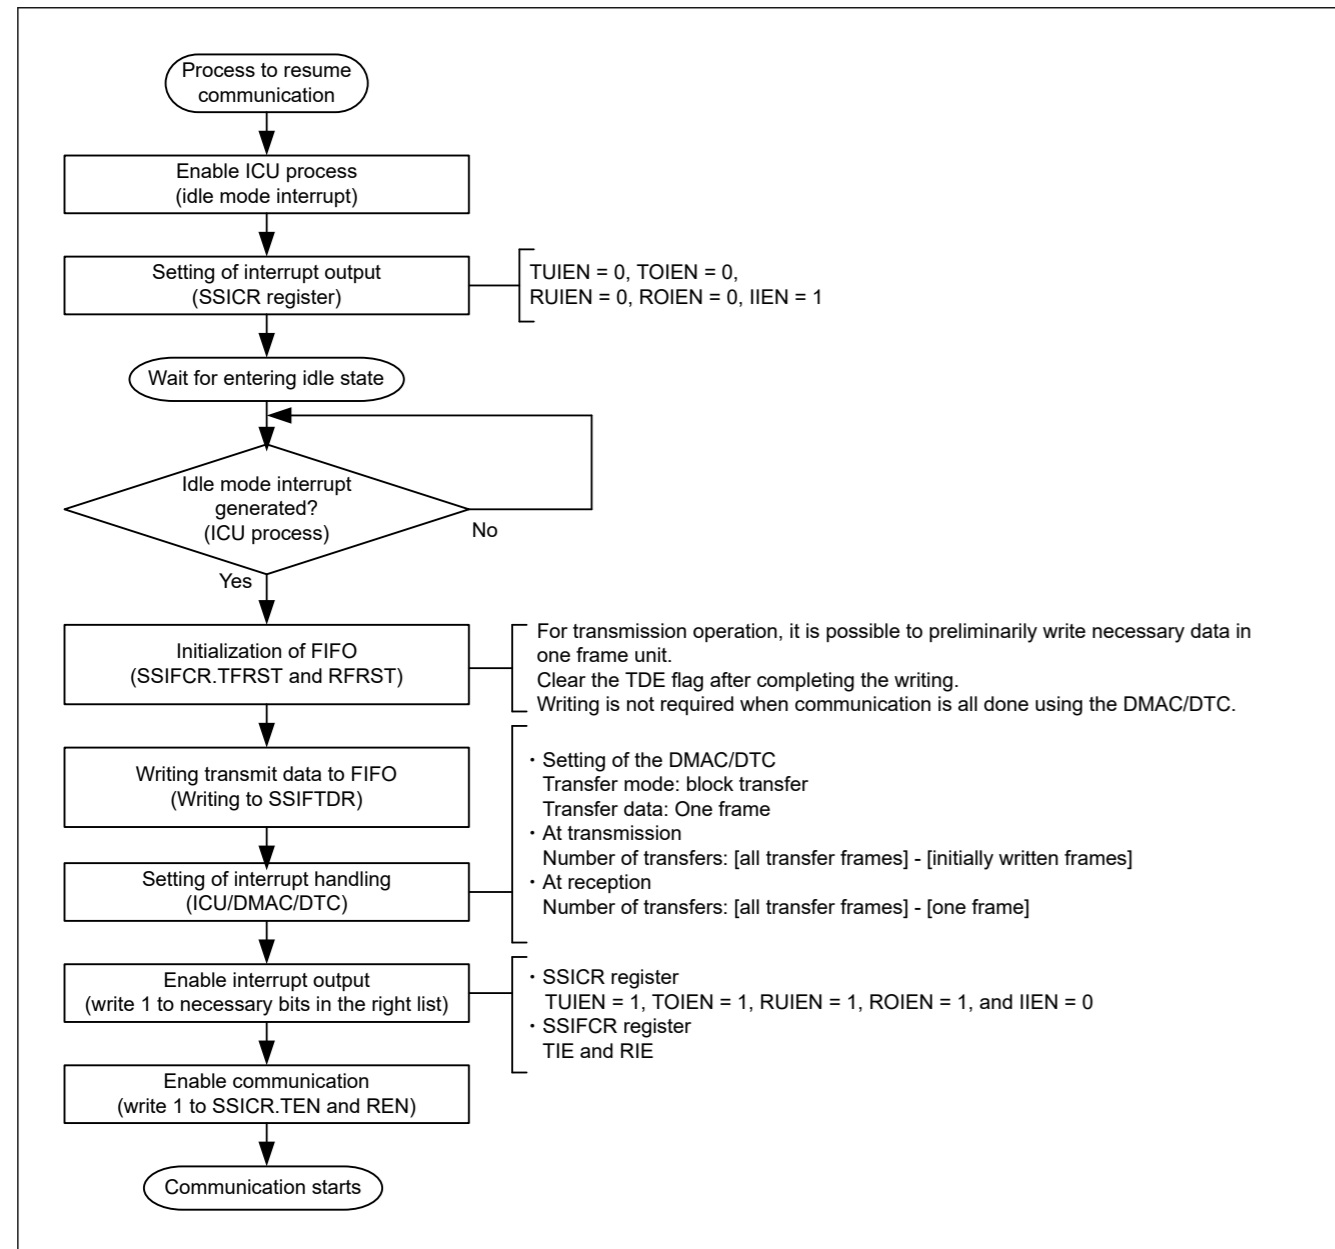

Figure 32.58 Procedure to resume communication (CPU operation procedure)

### 32.9 Interrupts

Table 32.16 lists the interrupt sources. Set enable/disable of interrupt output of each source with the TUIEN, TOIEN, RUIEN, ROIEN, and IIEN bits in the SSICR register and the TIE and RIE bits in the SSIFCR register.

通信停止程序，无需更改任何设置。如果要更改时钟和从主机设置，请使用并遵循图32.53中的通信启动程序。关于开始通信后的发送动作和接收动作的详细内容，请参阅32.8.2节。传输和32.8.3节。接待处，分别。

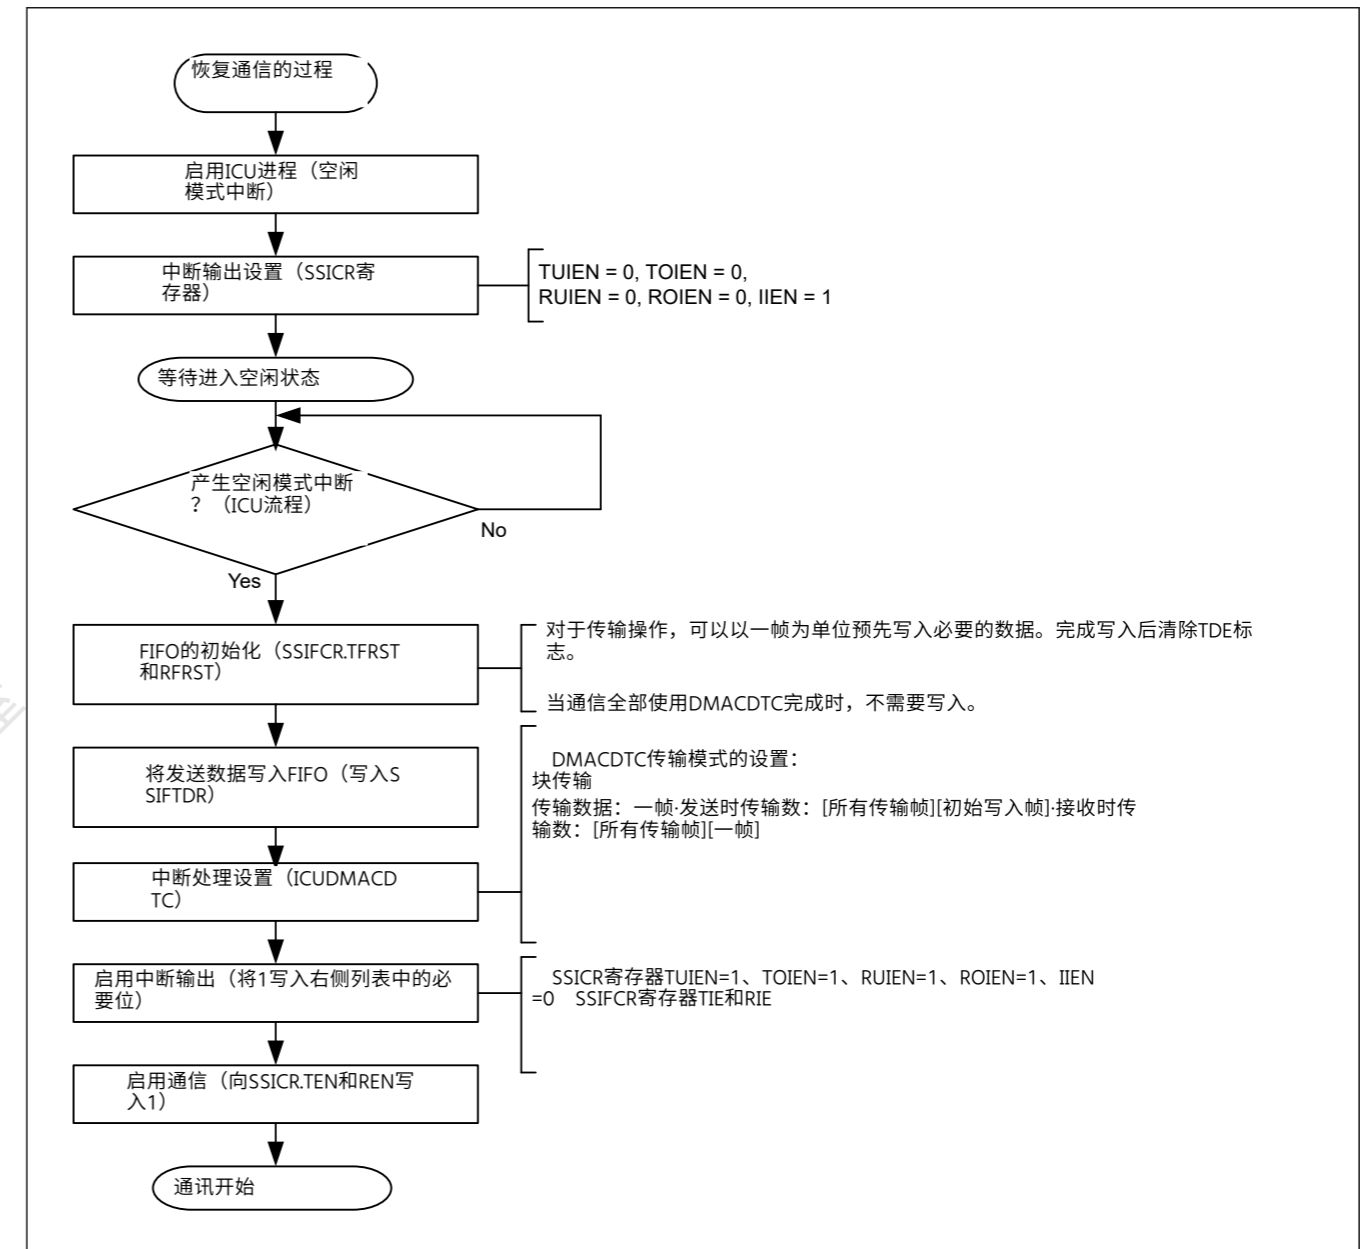

Figure 32.58 恢复通信的步骤 (CPU操作步骤)

### 32.9 Interrupts

表32.16列出了中断源。使用TUIEN、TOIEN、SSICR寄存器中的RUIEN、ROIEN和IIEN位以及SSIFCR寄存器中的TIE和RIE位。

Table 32.16 SSIE interrupt sources

| Channel | Interrupt source | Description  | Interrupt flag   | DMAC/DTC activation |
|---------|------------------|--|--|---------------------|
| SSIE0   | SSIE0_SSIF       | <ul style="list-style-type: none"> <li>Transmit underflow interrupt</li> <li>Transmit overflow interrupt</li> <li>Receive underflow interrupt</li> <li>Receive overflow interrupt</li> <li>Idle interrupt</li> </ul> | SSISR.TUIRQ<br>SSISR.TOIRQ<br>SSISR.RUIRQ<br>SSISR.ROIRQ<br>SSISR.IIRQ | Not possible        |
|         | SSIE0_SSIRXI     | Receive data full interrupt  | SSIFSR.RDF   | Possible            |
|         | SSIE0_SSITXI     | Transmit data empty interrupt  | SSIFSR.TDE   | Possible            |

### 32.9.1 SSIE0\_SSIF Interrupt

This interrupt source combines five interrupts. Enable output of necessary interrupts before using SSIE. The five interrupts are operated by using the flags assigned to individual interrupts and interrupt output enable bits. To clear an interrupt, set the interrupt enable to 0 or clear the interrupt flag to 0.

Figure 32.59 Timing Diagram of the common interrupt source, SSIE0\_SSIF

- Transmit underflow interrupt

As the transmit underflow interrupt, SSISR.TUIRQ is output while SSICR.TUIEN = 1. When you use SSIE for transmission, enable the output of this interrupt (SSICR.TUIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 32.56 and error-handling procedure in Figure 32.57.

- Transmit overflow interrupt

As the transmit overflow interrupt, SSISR.TOIRQ is output while SSICR.TOIRQ = 1. When you use SSIE for transmission, enable the output of this interrupt (SSICR.TOIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 32.56 and error-handling procedure in Figure 32.57.

- Receive underflow interrupt

As the receive underflow interrupt, SSISR.RUIRQ is output while SSICR.RUIRQ = 1. When you use SSIE for reception, enable the output of this interrupt (SSICR.RUIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 32.56 and error-handling procedure in Figure 32.57.

- Receive overflow interrupt

As the receive overflow interrupt, SSISR.ROIRQ is output while SSICR.ROIRQ = 1. When you use SSIE for reception, enable the output of this interrupt (SSICR.ROIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 32.56 and error-handling procedure in Figure 32.57.

- Idle mode interrupt

As the idle mode interrupt, SSISR.IIRQ is output while SSICR.IIEN = 1. This interrupt is used to make sure that communication has stopped fully.

Table 32.16 SSIE中断源

| Channel | 中断源          | Description  | 中断标志   | DMAC/DTC activation |
|---------|--------------|--|--|---------------------|
| SSIE0   | SSIE0_SSIF   | <ul style="list-style-type: none"> <li>发送下溢中断</li> <li>发送溢出中断</li> <li>接收下溢中断</li> <li>接收溢出中断</li> <li>空闲中断</li> </ul> | SSISR.TUIRQ<br>SSISR.TOIRQ<br>SSISR.RUIRQ<br>SSISR.ROIRQ<br>SSISR.IIRQ | 不可能                 |
|         | SSIE0_SSIRXI | 接收数据满中断  | SSIFSR.RDF   | Possible            |
|         | SSIE0_SSITXI | 发送数据空中断  | SSIFSR.TDE   | Possible            |

### 32.9.1 SSIE0\_SSIF Interrupt

该中断源结合了五个中断。在使用SSIE之前启用必要中断的输出。通过使用分配给各个中断的标志和中断输出使能位来操作五个中断。要清除中断，请将中断使能设置为0或将中断标志清除为0。

Figure 32.59 公共中断源的时序图, SSIE0\_SSIF

- 发送下溢中断

作为发送下溢中断，在SSICR.TUIEN=1时输出SSISR.TUIRQ。当使用SSIE进行发送时，使能该中断的输出（SSICR.TUIRQ=1）。如果发生此中断，请按照图32.56中的停止通信用过程和图32.57中的错误处理过程中的说明进行操作。

- 发送溢出中断

作为发送溢出中断，在SSICR.TOIRQ=1时输出SSISR.TOIRQ。当使用SSIE进行发送时，使能该中断的输出（SSICR.TOIRQ=1）。如果发生此中断，请按照图32.56中的停止通信用过程和图32.57中的错误处理过程中的说明进行操作。

- 接收下溢中断

作为接收下溢中断，在SSICR.RUIRQ=1时输出SSISR.RUIRQ。当使用SSIE进行接收时，使能该中断的输出（SSICR.RUIRQ=1）。如果发生此中断，请按照图32.56中的停止通信用过程和图32.57中的错误处理过程中的说明进行操作。

- 接收溢出中断

作为接收溢出中断，在SSICR.ROIRQ=1时输出SSISR.ROIRQ。当使用SSIE进行接收时，使能该中断的输出（SSICR.ROIRQ=1）。如果发生此中断，请按照图32.56中的停止通信用过程和图32.57中的错误处理过程中的说明进行操作。

- 空闲模式中断

作为空闲模式中断，在SSICR.IIEN=1时输出SSISR.IIRQ。此中断用于确保通信已完全停止。

### 32.9.2 SSIE0\_SSITXI Interrupt

The transmit data empty interrupt is a pulse interrupt that is output when the following condition is met:

- SSIFCR.TIE = 1 and SSIFSR.TDE = 1  
SSIE operation: When the value of SSIFSR.TDE changes from 0 to 1 while the value of SSIFCR.TIE is 1  
CPU instruction: When the value of SSIFCR.TIE changes from 0 to 1 while the value of SSIFSR.TDE is 1

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC/DMAC is busy (when the DTC/DMAC cannot accept interrupts), the interrupt suppression function holds the output of this interrupt. The held interrupt will be output after the DTC/DMAC is enabled to accept interrupts. For details, see [Figure 32.60](#).

Figure 32.60 SSIE0\_SSITXI interrupt timing diagram

### 32.9.3 SSIE0\_SSIRXI Interrupt

The receive data full interrupt is a pulse interrupt that is output when the following condition is met:

- SSIFCR.RIE = 1 and SSIFSR.RDF = 1.  
SSIE operation: When the value of SSIFSR.RDF changes from 0 to 1 while the value of SSIFCR.RIE is 1  
CPU instruction: When the value of SSIFCR.RIE changes from 0 to 1 while the value of SSIFSR.RDE is 1

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC/DMAC is busy (when the DTC/DMAC cannot accept interrupts), the interrupt suppression function holds the output of this interrupt. The held interrupt will be output after the DTC/DMAC is enabled to accept interrupts. The behavior of this interrupt is the same as the behavior shown in [Figure 32.60](#).

## 32.10 Software Resets

SSIE has three software reset bits to reset its states.

- SSIE software reset (SSIFCR.SSIRST)
- Transmit FIFO data register reset (SSIFCR.TFRST)
- Receive FIFO data register reset (SSIFCR.RFRST).

This section describes the procedures for the three types of software resets.

### 32.10.1 Software Reset Procedure

#### (1) SSIE Software Reset

For the SSIE software reset bit (SSIFCR.SSIRST), follow the procedure shown in [Figure 32.61](#). After a reset, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start

### 32.9.2 SSIE0\_SSITXI Interrupt

发送数据空中断是一个脉冲中断，当满足以下条件时输出：

- SSIFCR.TIE = 1 and SSIFSR.TDE = 1  
SSIE操作：当SSIFSR.TDE的值从0变为1且SSIFCR.TIE的值为1时CPU指令：当SSIFCR.TIE的值从0变为1且SSIFSR.TDE的值为1时

该中断受中断抑制功能影响。如果在DTC/DMAC忙时（当DTC/DMAC不能接受中断时）发生此中断的中断条件，则中断抑制功能保持此中断的输出。在DTC/DMAC使能接受中断后，将输出保持的中断。详见图32.60。

Figure 32.60 SSIE0\_SSITXI中断时序图

### 32.9.3 SSIE0\_SSIRXI Interrupt

接收数据满中断是一个脉冲中断，当满足以下条件时输出：

- SSIFCR.RIE = 1 and SSIFSR.RDF = 1.  
SSIE操作：当SSIFSR.RDF的值从0变为1且SSIFCR.RIE的值为1时CPU指令：当SSIFCR.RIE的值从0变为1且SSIFSR.RDE的值为1时

该中断受中断抑制功能影响。如果此中断的中断条件发生时，DTC/DMAC忙（当DTC/DMAC不能接受中断时），中断抑制功能保持该中断的输出。在DTC/DMAC使能接受中断后，将输出保持的中断。该中断的行为与图32.60中所示的行为相同。

## 32.10 软件复位

SSIE具有三个软件复位位来复位其状态。

- SSIE软件复位(SSIFCR.SSIRST)
- 发送FIFO数据寄存器复位(SSIFCR.TFRST)
- 接收FIFO数据寄存器复位(SSIFCR.RFRST)。

本节介绍三种软件复位的过程。

### 32.10.1 软件复位程序

#### (1) SSIE软件复位

对于SSIE软件复位位(SSIFCR.SSIRST)，请按照图32.61中所示的过程。重置后，恢复时应用相同的设置。要更改时钟和从主模式的设置，请按照以下步骤开始

communication in Figure 32.53. See section 32.8.2. Transmission and section 32.8.3. Reception respectively for transmission and reception after communication is resumed.

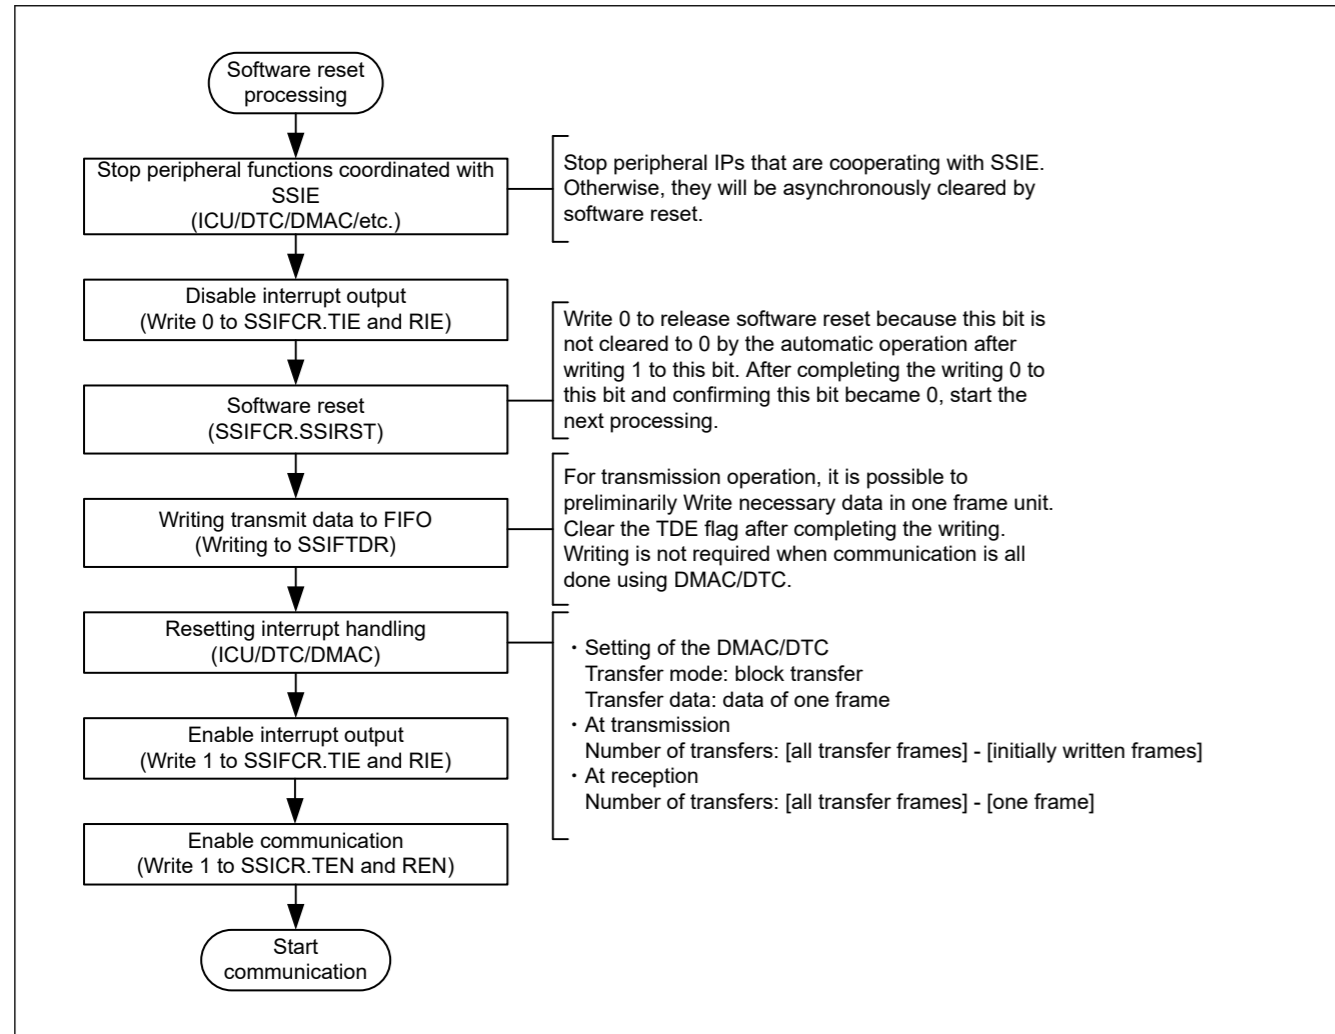

Figure 32.61 Software reset procedure (CPU operation procedure)

(2) Transmit FIFO data register reset

To perform a transmit FIFO data register reset, follow instructions in the procedure to start communication in Figure 32.53 and procedure to resume communication in Figure 32.58.

(3) Receive FIFO data register reset

To perform a receive FIFO data register reset, follow instructions in the procedure to start communication in Figure 32.53 and procedure to resume communication in Figure 32.58.

32.11 Notes

32.11.1 Notes for Slave-mode Communication

32.11.1.1 ADCKE control

In slave-mode communication (SSICR.MST = 0), SSIE needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIE is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIE becomes idle, take the procedure to start communication in Figure 32.53 or wait for an idle state by taking the procedure to resume communication in Figure 32.58.

图32.53中的通信。请参阅第32.8.2节。传输和第32.8.3节。接收分别用于通信恢复后的发送和接收。

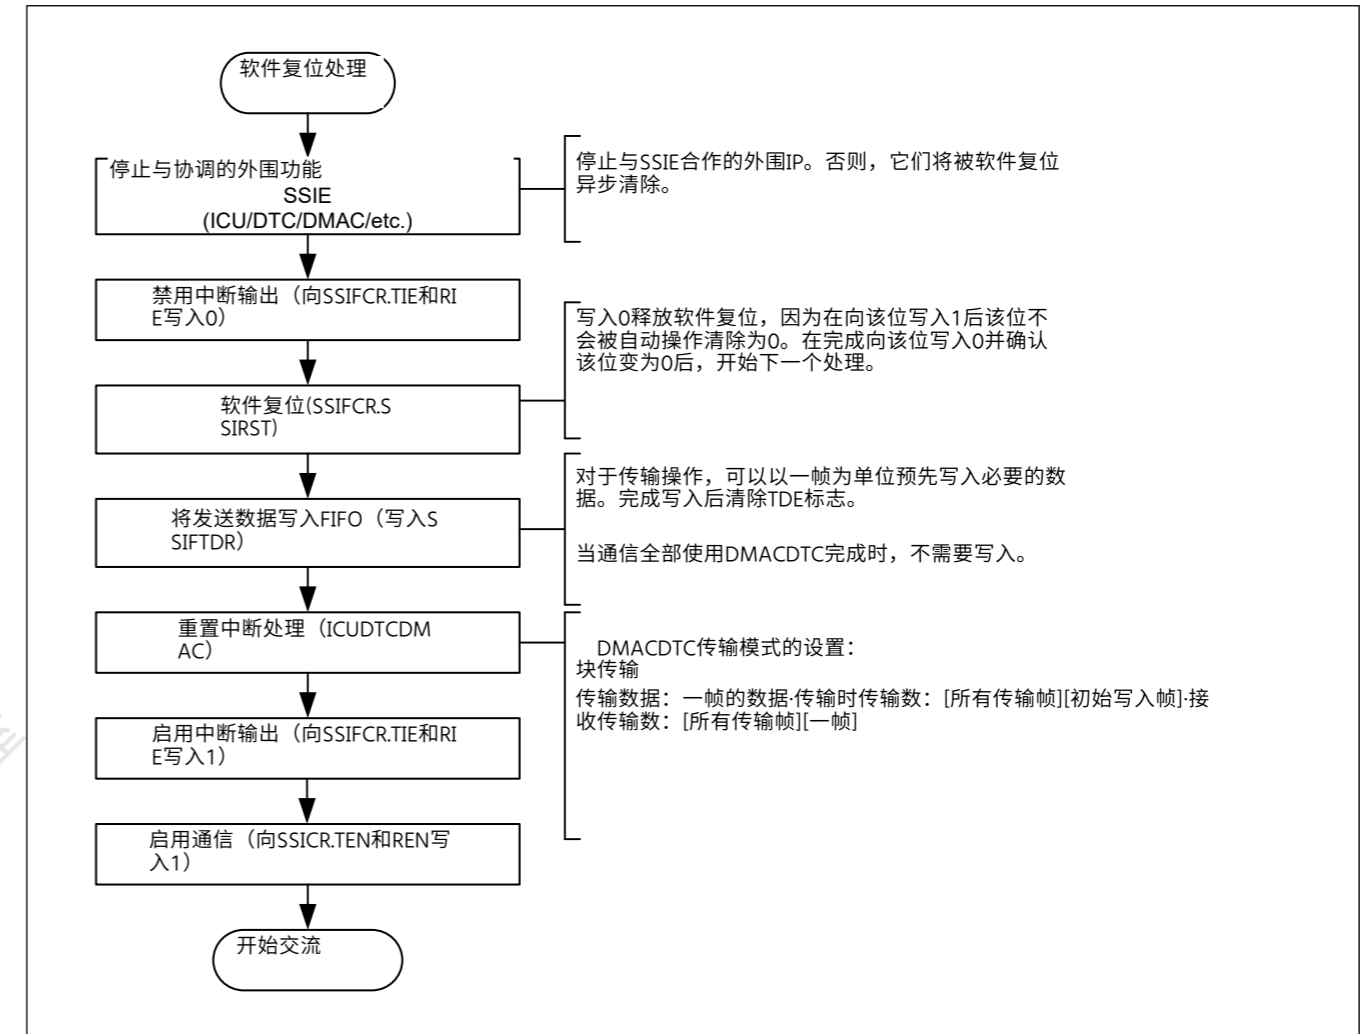

Figure 32.61 软件复位程序 (CPU操作程序)

(2) 发送FIFO数据寄存器复位

要执行发送FIFO数据寄存器复位，请按照图32.53中的开始通信过程和图32.58中恢复通信的过程中的说明进行操作。

(3) 接收FIFO数据寄存器复位

要执行接收FIFO数据寄存器复位，请按照图32.53中的开始通信过程和图32.58中恢复通信的过程中的说明进行操作。

32.11 Notes

32.11.1 从模式通信注意事项

32.11.1.1 ADCKE control

在从模式通信(SSICR.MST=0)中，SSIE需要提供SSIBCK。要在主设备端停止BCK，请确保SSIE处于空闲状态(SSISR.IIRQ=1)。如果BCK在SSIE空闲之前停止，则按照图32.53中的程序开始通信，或者按照图32.58中的程序恢复通信等待空闲状态。

### 32.11.1.2 SSILRCK/SSIFS pin

SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

## 32.11.2 Notes for Master-mode Communication

### 32.11.2.1 ADCKE control

In master-mode communication (SSICR.MST = 1), SSIE operates with the audio clock (AUDIO\_MCK). To stop SSIE completely, make sure that SSIE is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE.

### 32.11.2.2 LRCONT control

To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIE is in the idle state in master-mode communication (SSICR.MST = 1), note the following: The output stops when the value of the SSIOFR.LRCONT bit is changed from 1 to 0. Make sure that the other-party device is not affected. For details, see [Figure 32.44](#).

### 32.11.2.3 BCKASTP control

To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIE is in the idle state, note the following: The output stops when the value of the SSIOFR.BCKASTP bit is changed from 0 to 1. So, make sure that the other-party device is not affected. For details, see [Figure 32.45](#).

The BCKASTP bit cannot be used when the other-party device (which is a slave) requires the clock output from the SSIBCK pin before and during communication.

## 32.11.3 Notes for Communication Flow

### 32.11.3.1 When an error interrupt is generated

SSIE has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error

When an underflow error or overflow error is generated, SSIE need to be restarted. Follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#).

#### (1) Transmit Underflow Error

If a transmit underflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to a transmit data empty interrupt. After a transmit underflow error occurs, SSIE outputs 0s as data. To normally output the serial data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA0 pin, follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#). After this error occurs, serial data is consumed as usual. If you resume communication, write the serial data from the beginning.

#### (2) Transmit Overflow Error

If a transmit overflow error occurs, review the number of times of writing data to the Transmit FIFO Data Register (SSIFTDR) in response to transmit data empty interrupts. The serial data written to the Transmit FIFO Data Register (SSIFTDR) that caused the transmit overflow error becomes invalid. This error can occur regardless of whether a transmission operation is being done. To recover from the error, follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#). When you resume communication, deal with the invalid serial data appropriately.

### 32.11.1.2 SSILRCK/SSIFS pin

SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

## 32.11.2 主模式通信注意事项

### 32.11.2.1 ADCKE control

在主模式通信(SSICR.MST=1)中，SSIE使用音频时钟(AUDIO\_MCK)运行。要完全停止SSIE，请确保SSIE处于空闲状态(SSISR.IIRQ=1)，然后将0写入SSIFCR.ADCKE。

### 32.11.2.2 LRCONT control

当SSIE在主模式通信中处于空闲状态时（SSICR.MST=1），要使用SSIOFR.LRCONT停止向SSILRCKSSIFS引脚的输出，请注意以下几点：当SSIOFR.LRCONT位的值为从1变为0。确保对方设备不受影响。详见图32.44。

### 32.11.2.3 BCKASTP control

要在主模式通信(SSICR.MST=1)和SSIE处于空闲状态时使用SSIOFR.BCKASTP停止向SSIBCK引脚的输出，请注意以下几点：当SSIOFR.BCKASTP位的值为从0变为1。因此，请确保对方设备不受影响。详见图32.45。

当对方设备（从设备）需要时钟输出时，不能使用BCKASTP位  
SSIBCK引脚在通信之前和期间。

## 32.11.3 通信流程注意事项

### 32.11.3.1 产生错误中断时

SSIE有以下四个错误。

- 发送下溢错误
- 发送溢出错误
- 接收下溢错误
- 接收溢出错误

当产生下溢错误或上溢错误时，需要重启SSIE。按照图32.56中的程序停止通信和图32.57中的错误处理程序。

#### (1) 发送下溢错误

如果发生发送下溢错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。发生发送下溢错误后，SSIE输出0作为数据。要将写入发送FIFO数据寄存器(SSIFTDR)的串行数据正常输出到SSITXD0/SSIDATA0引脚，请按照图32.56中的程序停止通信和图32.57中的错误处理程序。发生此错误后，串行数据将照常使用。如果您恢复通信，请从头开始写入串行数据。

#### (2) 传输溢出错误

如果发生发送溢出错误，请检查向发送FIFO数据寄存器(SSIFTDR)写入数据以响应发送数据空中断的次数。导致发送溢出错误的写入发送FIFO数据寄存器(SSIFTDR)的串行数据变为无效。无论是否正在执行传输操作，都可能发生此错误。要从错误中恢复，请按照图32.56中的程序停止通信和图32.57中的错误处理程序。当您恢复通信时，请适当处理无效的串行数据。

### (3) Receive Underflow Error

If a receive underflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The values read from the receive FIFO data register (SSIFRDR) that caused the receive underflow error are undefined. This error can occur regardless of whether a reception operation is being done. To recover from the error, follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#).

### (4) Receive Overflow Error

If a receive overflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The receive data that caused the receive overflow error cannot be stored in the receive FIFO data register (SSIFRDR). To recover from the error, follow the procedure to halt communication in [Figure 32.56](#) and error-handling procedure in [Figure 32.57](#).

#### 32.11.3.2 Transmit data empty interrupt

The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.TDE to write data to SSIFTDR. The number of times of writing data to SSIFTDR by detecting the value 1 of SSIFSR.TDE must be in accordance with the free space size of the transmit FIFO data register specified by SSISCR.TDES. After as much transmit data as the free space size is written to SSIFTDR, the SSIFSR.TDE flag must be cleared. Continuous transmission is enabled by repeating data writing. If the SSIFSR.TDE flag is not cleared, the flag is not cleared automatically.

#### 32.11.3.3 Receive data full interrupt

The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.RDF to read data from SSIFRDR. The number of times of reading data from SSIFRDR by detecting the value 1 of SSIFSR.RDF must be in accordance with the receive data storage capacity of the receive FIFO data register specified by SSISCR.RDFS. After received data is read from SSIFRDR, the SSIFSR.RDF flag must be cleared. Continuous reception is enabled by repeating data reading. If the SSIFSR.RDF flag is not cleared, the flag is not cleared automatically.

#### 32.11.3.4 Switching transfer modes

1. For state transition from transmission, reception, and transmission and reception, disable transmission and reception (SSICR.TEN = 0, SSICR.REN = 0).
2. Confirm it is in the idle state (SSISR.IIRQ = 1).
3. In the idle state, set the SSICR.TEN bit and the SSICR.REN bit again and resume transfer.

#### 32.11.3.5 Resume communication after halting SSIE

When communication of SSIE is halted according to the procedure to halt communication in [Figure 32.56](#), resume communication according to the procedure to resume communication in [Figure 32.58](#).

### 32.11.4 Write Access Restriction

#### 32.11.4.1 SSICR register

If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If the value of the TEN or REN bit is changed by rewriting, subsequent operation is unpredictable. For example, when transmission or reception is enabled, check that SSISR.IIRQ is 0; when transmission or reception is disabled, check that SSISR.IIRQ is 1.

##### (1) TEN Bit and REN Bit

These bits enable/disable transmission and reception. When 1 is written to one of these bits, the corresponding communication operation starts in synchronization with a start trigger by the SSILRCK/SSIFS signal. For details, see [section 32.8.2. Transmission](#), [section 32.8.3. Reception](#), and [section 32.8.4. Transmission and Reception](#). When 0 is written to this bit, the current communication operation stops at the next frame boundary. To use SSIE for both transmission and reception, always write 1 to these bits together. When stopping the communication using SSIE, always disable both transmission and reception (write 0 to the TEN and REN bits).

### (3) 接收下溢错误

如果发生接收下溢错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收下溢错误的接收FIFO数据寄存器(SSIFRDR)读取的值未定义。无论是否正在执行接收操作，都可能发生此错误。要从错误中恢复，请按照图32.56中的程序停止通信和图32.57中的错误处理程序。

### (4) 接收溢出错误

如果发生接收溢出错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收溢出错误的接收数据不能存储在接收FIFO数据寄存器(SSIFRDR)中。要从错误中恢复，请按照图32.56中的程序停止通信和图32.57中的错误处理程序。

#### 32.11.3.2 发送数据空中断

SSIE中定义的通信流使用DTC/DMAC。如果不使用DTC/DMAC，则轮询SSIFSR.TDE的值1以将数据写入SSIFTDR。通过检测SSIFSR.TDE的值为1向SSIFTDR写入数据的次数必须与SSIFSR.TDES指定的发送FIFO数据寄存器的可用空间大小一致。在将与可用空间大小一样多的传输数据写入SSIFTDR后，必须清除SSIFSR.TDE标志。通过重复数据写入启用连续传输。如果未清除SSIFSR.TDE标志，则不会自动清除该标志。

#### 32.11.3.3 接收数据满中断

SSIE中定义的通信流使用DTC/DMAC。如果不使用DTC/DMAC，则轮询SSIFSR.RDF的值1以从SSIFRDR读取数据。通过检测SSIFSR.RDF的值为1从SSIFRDR读取数据的次数必须与SSISCR.RDFS指定的接收FIFO数据寄存器的接收数据存储容量一致。从SSIFRDR读取接收到的数据后，必须清除SSIFSR.RDF标志。通过重复数据读取启用连续接收。如果未清除SSIFSR.RDF标志，则不会自动清除该标志。

#### 32.11.3.4 切换传输模式

- 1.对于从发送、接收和发送和接收的状态转换，禁用发送和接收 (SSICR.TEN=0, SSICR.REN=0)。
- 2.确认它处于空闲状态 (SSISR.IIRQ=1)。
- 3.在空闲状态下，再次设置SSICR.TEN位和SSICR.REN位并恢复传输。

#### 32.11.3.5 停止SSIE后恢复通信

当SSIE的通信按照图32.56中的停止通信程序停止时，按照图32.58中的恢复通信程序恢复通信。

### 32.11.4 写访问限制

#### 32.11.4.1 SSICR register

如果TEN位或REN位被重写，请确保SSISR.IIRQ位处于所需状态。如果TEN的值或REN位通过改写改变，后续操作不可预知。例如，启用发送或接收时，检查SSISR.IIRQ是否为0；当发送或接收被禁用时，检查SSISR.IIRQ是否为1。

##### (1) 十位和仁位

这些位启用禁用发送和接收。当这些位之一写入1时，相应的通信操作与SSILRCK/SSIFS信号的开始触发同步开始。有关详细信息，请参阅第32.8.2节。传输，第32.8.3节。接待处和第32.8.4节。传输和接收。当向该位写入0时，当前通信操作在下一帧边界处停止。要同时使用SSIE进行发送和接收，请始终将1一起写入这些位。使用SSIE停止通信时，始终禁用发送和接收（将0写入TEN和REN位）。

32.11.4.2 SSISR register

(1) Clearing TUIRQ and TOIRQ

After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

(2) Clearing RUIRQ and ROIRQ

After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

32.11.4.3 Communication state

Writing to the bits with orange-shaded area in Table 32.17 is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Table 32.17 Bits protected from writing during communication

| Symbol  | Address (BASE+) |    | +0          |     |          |           |        |        |           |         | +1        |          |           |       |          |     |         |           |
|---------|-----------------|----|-------------|-----|----------|-----------|--------|--------|-----------|---------|-----------|----------|-----------|-------|----------|-----|---------|-----------|

|         |                 | +2 | —           | —   | RDC[5:0] |           |        |        |           | —       | —         | —        | —         | —     | —        | —   | RDF     |           |
| SSIFTDR | 0x18            | +0 | FTDR[31:16] |     |          |           |        |        |           |         |           |          |           |       |          |     |         |           |
|         |                 | +2 | FTDR[15:0]  |     |          |           |        |        |           |         |           |          |           |       |          |     |         |           |
| SSIFRDR | 0x1C            | +0 | FRDR[31:16] |     |          |           |        |        |           |         |           |          |           |       |          |     |         |           |
|         |                 | +2 | FRDR[15:0]  |     |          |           |        |        |           |         |           |          |           |       |          |     |         |           |
| SSIOFR  | 0x20            | +0 | —           | —   | —        | —         | —      | —      | —         | —       | —         | —        | —         | —     | —        | —   | —       |           |
|         |                 | +2 | —           | —   | —        | —         | —      | —      | BCK AST P | LRC ONT | —         | —        | —         | —     | —        | —   | —       | OMOD[1:0] |
| SSISCR  | 0x24            | +0 | —           | —   | —        | —         | —      | —      | —         | —       | —         | —        | —         | —     | —        | —   | —       |           |
|         |                 | +2 | —           | —   | —        | TDES[4:0] |        |        |           | —       | —         | —        | RDFS[4:0] |       |          |     |         |           |

32.11.4.2 SSISR register

(1) 清除TUIRQ和TOIRQ

启用通信后（通过将SSICR.TEN位的值从0更改为1），传输错误标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

(2) 清除RUIRQ和ROIRQ

启用通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

32.11.4.3 通讯状态

禁止写入表32.17中橙色阴影区域的位。如果写入，则不保证写入后立即执行的操作。

Table 32.17 通信期间防止写入的位

| Symbol  | Address (BASE+) |    | +0          |     |          |           |        |        |           |         | +1        |          |           |    |          |     |         |           |
|---------|-----------------|----|-------------|-----|----------|-----------|--------|--------|-----------|---------|-----------|----------|-----------|----|----------|-----|---------|-----------|
|         |                 |    | 31          | 30  | 29       | 28        | 27     | 26     | 25        | 24      | 23        | 22       | 21        | 20 | 19       | 18  | 17      | 16        |

### 33. SD/MMC Host Interface (SDHI)

#### 33.1 Overview

The Secure Digital Host Interface (SDHI) and MultiMediaCard (MMC) Interface provide the functionality required to connect a variety of external memory cards with the MCU. The SDHI supports both 1- and 4-bit buses for connecting different memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD Specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA).

The MMC interface supports 1-bit, 4-bit, and 8-bit MMC buses that provide eMMC 4.51 (JEDEC Standard JESD 84- B451) device access. This interface also provides backward compatibility and supports for high-speed SDR transfer modes.

Table 33.1 lists the SD/MMC Host Interface specifications and Figure 33.1 shows a block diagram.

Table 33.1 SD/MMC Host Interface specifications

| Interface         | Parameter                       | Specifications  |
|-------------------|---------------------------------|---|
| SD                | SD bus interface                | <ul style="list-style-type: none"> <li>Compatible with SD memory card and SDIO card</li> <li>Transfer bus mode selectable from 4-bit wide bus mode or 1-bit default bus mode</li> <li>Compatible with SD, SDHC, and SDXC formats</li> </ul> |
| SD and MMC shared | SDHI clock frequency            | The SDHI clock is generated by dividing PCLKB by 2 <sup>n</sup> (n = 0 to 9)  |
|                   | Error check functions           | CRC7 (command/response), CRC16 (transfer data)  |
|                   | Interrupt sources               | Card access interrupt (SDHI_MMC0_ACCS), SDIO access interrupt (SDHI_MMC0_SDI0), Card detection interrupt (SDHI_MMC0_CARD)   |
|                   | DMA transfer sources            | DMAC and DTC triggerable by the SBFAl interrupt<br>SD buffer is read and write accessible using the DMAC  |
|                   | Other functions                 | <ul style="list-style-type: none"> <li>Card detect function</li> <li>Write protect support</li> </ul>   |
| MMC               | MMC bus interface               | Transfer bus mode selectable from 1-bit, 4-bit, or 8-bit  |
|                   | Transfer modes                  | Backward compatible mode or high-speed SDR mode selectable  |
|                   | Other functions                 | e.MMC device access supported   |
| TrustZone Filter  | Security attribution can be set |   |

### 33. SDMMC主机接口(SDHI)

#### 33.1 Overview

安全数字主机接口(SDHI)和多媒体卡(MMC)接口提供了将各种外部存储卡与MCU连接所需的功能。SDHI支持1位和4位总线，用于连接支持SD、SDHC和SDXC格式的不同存储卡。在开发符合SD规范的主机设备时，您必须遵守SD主机辅助产品许可协议(SDHALA)。

MMC接口支持提供eMMC4.51 (JEDEC标准JESD84B451) 器件访问的1位、4位和8位MMC总线。该接口还提供向后兼容性并支持高速SDR传输模式。

表33.1列出了SDMMC主机接口规范，图33.1显示了框图。

Table 33.1 SDMMC主机接口规格

| Interface        | Parameter | Specifications   |
|------------------|-----------|--|
| SD               | SD总线接口    | <ul style="list-style-type: none"> <li>兼容SD存储卡和SDIO卡</li> <li>传输总线模式可选择4位宽总线模式或1位默认总线模式</li> <li>兼容SD、SDHC和SDXC格式</li> </ul> |
| SD和MMC共享         | SDHI时钟频率  | SDHI时钟由PCLKB除以2 <sup>n</sup> (n=0到9)生成   |
|                  | 错误检查功能    | CRC7 (command/response), CRC16 (transfer data)   |
|                  | 中断源       | 卡访问中断 (SDHI_MMC0_ACCS)、SDIO访问中断 (SDHI_MMC0_SDI0)、卡检测中断 (SDHI_MMC0_CARD)  |
|                  | DMA传输源    | SBFAI中断可触发DMAC和DTC<br>SD缓冲区可使用DMAC进行读写访问   |
|                  | 其他功能      | <ul style="list-style-type: none"> <li>卡片检测功能</li> <li>写保护支持</li> </ul>  |
| MMC              | MMC总线接口   | 传输总线模式可选择1位、4位或8位  |
|                  | 传输模式      | 向后兼容模式或高速SDR模式可选   |
|                  | 其他功能      | 支持e.MMC设备访问  |
| TrustZone Filter | 可设置安全属性   |  |

|-------|--------------|---|-----|
| 11    | CMDTP        | Data Transfer Select*2<br>0: Do not include data transfer (bc, bcr, or ac) in command<br>1: Include data transfer (adtc) in command   | R/W |
| 12    | CMDRW        | Data Transfer Direction Select*3<br>0: Write (SD/MMC Host Interface → SD card/MMC)<br>1: Read (SD/MMC Host Interface ← SD card/MMC)   | R/W |
| 13    | TRSTP        | Block Transfer Select*3<br>0: Single block transfer<br>1: Multiple blocks transfer  | R/W |
| 15:14 | CMD12AT[1:0] | CMD12 Automatic Issue Select*4<br>0 0: Automatically issue CMD12 during multiblock transfer<br>0 1: Do not automatically issue CMD12 during multiblock transfer<br>Others: Setting prohibited | R/W |
| 31:16 | —            | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. Some commands cannot be used in normal mode.  
 Note 2. The CMDTP bit is only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b.  
 Note 3. Bits CMDRW and TRSTP are only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b, and the CMDTP bit is 1.  
 Note 4. The CMD12AT[1:0] bits are only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b, and the TRSTP bit is 1.

The command type and response type are set in the SD\_CMD register. The command type and transfer mode must be set when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b. The sequence starts when a value is written to this register. See Table 33.8 and Table 33.9 for setting examples. Do not write to the SD\_CMD register when the SD\_INFO2.CBSY flag is 1.

### 33.2.2 SD\_ARG : SD Command Argument Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x008

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | —      | These bits specify command format[39:8] (argument). | R/W |

The SD\_ARG register is used for setting the argument field value. Set the SD\_ARG register before setting the SD\_CMD register. The argument field value of the automatically issued CMD12 is 0x0000\_0000 regardless of the SD\_ARG register value.

| Bit   | Symbol       | Function  | R/W |
|-------|--------------|---|-----|
| 11    | CMDTP        | 数据传输选择*2<br>0: 在命令中不包括数据传输 (bc、bcr或ac) 1: 在命令中包括数据传输 (adtc)               | R/W |
| 12    | CMDRW        | 数据传输方向选择*3<br>0: 写入 (SDMMC主机接口→SD卡MMC) 1: 读取 (SDMMC主机接口←SD卡MMC)           | R/W |
| 13    | TRSTP        | 块传输选择*3<br>0: 单块传输 1: 多块传输  | R/W |
| 15:14 | CMD12AT[1:0] | CMD12自动发行选择*4<br>00: 在多块传输过程中自动发出CMD12 01: 在多块传输过程中不自动发出CMD12<br>其他: 禁止设置 | R/W |
| 31:16 | —            | 这些位被读取为0。写入值应为0。  | R/W |

注1.某些命令不能在正常模式下使用。  
 注2.CMDTP位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b时有效。  
 注3.CMDRW和TRSTP位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b且CMDTP位为1时有效。  
 注4.CMD12AT[1:0]位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b且TRSTP位为1时有效。

命令类型和响应类型在SD\_CMD寄存器中设置。当RSPTP[2:0]位为011b、100b、101b、110b或111b时，必须设置命令类型和传输模式。当一个值被写入该寄存器时，序列开始。设置示例见表33.8和表33.9。当SD\_INFO2.CBSY标志为1时，不要写入SD\_CMD寄存器。

### 33.2.2 SD\_ARG:SD命令参数寄存器

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x008

| Bit  | Symbol | Function              | R/W |
|------|--------|-----------------------|-----|
| 31:0 | —      | 这些位指定命令格式[39:8] (参数)。 | R/W |

SD\_ARG寄存器用于设置参数字段值。在设置SD\_CMD寄存器之前设置SD\_ARG寄存器。无论SD\_ARG寄存器的值如何，自动发出的CMD12的参数字段值为0x0000\_0000。

### 33.2.3 SD\_ARG1 : SD Command Argument Register 1

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x00C

| Bit   | Symbol | Function   | R/W |
|-------|--------|--|-----|
| 15:0  | —      | These bits specify command format[39:24] (argument).   | R/W |
| 31:16 | —      | These bits are read as 0. The write value should be 0. | R/W |

The SD\_ARG1 register is used for setting the argument field value. Set the SD\_ARG1 register before setting the SD\_CMD register. The argument field value of the automatically issued CMD12 is 0x0000\_0000 regardless of the SD\_ARG1 register value.

### 33.2.4 SD\_STOP : Data Stop Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x010

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 0    | STP    | Transfer Stop<br>Data transfer stops when this bit is set to 1.   | R/W |
| 7:1  | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 8    | SEC    | Block Count Register Value Select <sup>2</sup><br>0: Disable SD_SECCNT register value<br>1: Enable SD_SECCNT register value | R/W |
| 31:9 | —      | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT\_RST.SDRST flag.

Note 2. Do not rewrite this bit when the SD\_INFO2.CBSY flag is 1.

The SD\_STOP register stops data transfer. During a multiblock transfer sequence, the SD\_SECCNT register value (number of blocks to be transferred) can be set to valid or invalid by setting the SD\_STOP register.

#### STP bit (Transfer Stop)

When the STP bit is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SDHI. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although

### 33.2.3 SD\_ARG1:SD命令参数寄存器1

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x00C

| Bit   | Symbol | Function               | R/W |
|-------|--------|------------------------|-----|
| 15:0  | —      | 这些位指定命令格式[39:24] (参数)。 | R/W |
| 31:16 | —      | 这些位被读取为0。写入值应为0。       | R/W |

SD\_ARG1寄存器用于设置参数字段值。在设置SD\_CMD寄存器之前设置SD\_ARG1寄存器。无论SD\_ARG1寄存器的值如何，自动发出的CMD12的参数字段值为0x0000\_0000。

### 33.2.4 SD\_STOP:数据停止寄存器

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x010

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 0    | STP    | 中转站<br>当该位设置为1时，数据传输停止。  | R/W |
| 7:1  | —      | 这些位被读取为0。写入值应为0。   | R/W |
| 8    | SEC    | 块计数寄存器值选择 <sup>2</sup><br>0: 禁用SD_SECCNT寄存器值<br>1: 启用SD_SECCNT寄存器值 | R/W |
| 31:9 | —      | 这些位被读取为0。写入值应为0。   | R/W |

注1.该值由复位初始化，并且在由SOFT\_RST.SDRST标志触发的复位时初始化。

注2.当SD\_INFO2.CBSY标志为1时，请勿重写该位。

SD\_STOP寄存器停止数据传输。在多块传输序列期间，可以通过设置SD\_STOP寄存器将SD\_SECCNT寄存器值（要传输的块数）设置为有效或无效。

#### STP bit (Transfer Stop)

在多块传输期间STP位设置为1时，发出CMD12以停止通过SDHI的传输。但是，如果命令序列由于通信错误或超时而停止，则不会发出CMD12。虽然

continued buffer access is possible even after STP is set to 1, the buffer access error bit (ILR or ILW) in SD\_INFO2 is set accordingly.

When STP is set to 1 during transfer for single block write, the access end flag sets when SD\_BUF becomes empty, and CMD12 is not issued. If SD\_BUF does contain data, the access end flag sets on completion of reception of the busy state without CMD12 being issued.

When STP is set to 1 during transfer for single block read, the access end flag sets immediately after the STP bit is set, and CMD12 is not issued.

When STP is set to 1 during reception of the busy state after an R1b response, the access end flag sets on completion of reception of the busy state without CMD12 being issued.

When STP is set to 1 after a command sequence is completed, CMD12 is not issued and the access end flag does not set.

Set STP to 1 after the response end flag sets.

Set STP to 0 after the access end flag sets.

#### SEC bit (Block Count Register Value Select)

When SD\_CMD is set in the following section to start the command sequence while the SEC bit is set to 1, CMD12 is automatically issued to stop multiblock transfer with the number of blocks set in SD\_SECCNT.

CMD18 or CMD25 in normal mode (SD\_CMD[10:8] = 000b)

SD\_CMD[15:13] = 001b in extended mode (CMD12 is automatically issued, multiple block transfer)

When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.

#### 33.2.5 SD\_SECCNT : Block Count Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x014

|                    |               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------------|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position:      | 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field:         | [Empty field] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Value after reset: | 0             | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit position:      | 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Bit field:         | [Empty field] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| Value after reset: | 0             | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

When performing a multiblock transfer, SD\_SECCNT is a read/write register used to set the number of blocks to be transferred. For example, when the register value is 0x0000\_0001, 1 block is transferred. When the register value is 0x0000\_FFFF, 65,535 blocks are transferred and when the register value is 0xFFFF\_FFFF, 4,294,967,295 blocks are transferred. Do not set this register to 0x0000\_0000. Do not rewrite the SD\_SECCNT register when the SD\_INFO2.CBSY flag is 1.

即使在STP设置为1后，仍可以继续访问缓冲区，相应地设置SD\_INFO2中的缓冲区访问错误位（ILR或ILW）。

在单块写入的传输过程中将STP设置为1时，当SD\_BUF为空时设置访问结束标志，并且不发出CMD12。如果SD\_BUF确实包含数据，则在发出CMD12的忙状态接收完成时设置访问结束标志。

当STP在单块读取传输期间设置为1时，在设置STP位后立即设置访问结束标志，并且未发出CMD12。

当在R1b响应后的忙状态接收期间将STP设置为1时，在发出CMD12的忙状态接收完成时设置访问结束标志。

当命令序列完成后STP设置为1时，不发出CMD12并且不设置访问结束标志。

设置响应结束标志后将STP设置为1。

设置访问结束标志后将STP设置为0。

#### SEC位（块计数寄存器值选择）

当在以下部分中设置SD\_CMD以启动命令序列而SEC位设置为1时，将自动发出CMD12以停止多块传输，其中块数在SD\_SECCNT中设置。

正常模式下的CMD18或CMD25(SD\_CMD[10:8]=000b)

SD\_CMD[15:13]=001b扩展模式（CMD12自动发出，多块传输）

当命令序列由于通信错误或超时而停止时，不会自动发出CMD12。

#### 33.2.5 SD\_SECCNT: 块计数寄存器

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x014

|               |               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|---------------|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field:    | [Empty field] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 重置后的值:        | 0             | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit position: | 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Bit field:    | [Empty field] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 重置后的值:        | 0             | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

执行多块传输时，SD\_SECCNT是一个读写寄存器，用于设置要传输的块数。例如，当寄存器值为0x0000\_0001时，传输1个块。当寄存器值为0x0000\_FFFF时，传送65 535个块，当寄存器值为0xFFFF\_FFFF时，传送4 294 967 295个块。不要将此寄存器设置为0x0000\_0000。当SD\_INFO2.CBSY标志为1时，不要重写SD\_SECCNT寄存器。

33.2.6 SD\_RSPi : SD Card Response Register i (i = 10, 32, 54)

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x018; i = 10  
 0x020; i = 32  
 0x028; i = 54

33.2.7 SD\_RSPj : SD Card Response Register j (j = 1, 3, 5)

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x01C + (0x4 × (j - 1))

| Bit   | Symbol | Function  | R/W |
|-------|--------|---|-----|
| 15:0  | —      | These bits store the response from the SD card/MMC. | R   |
| 31:16 | —      | These bits are read as 0.                           | R   |

33.2.8 SD\_RSP76 : SD Card Response Register 76

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x030

| Bit   | Symbol         | Function  | R/W |
|-------|----------------|---|-----|
| 23:0  | SD_RSP76[23:0] | These bits store the response from the SD card/MMC. | R   |
| 31:24 | —              | These bits are read as 0.                           | R   |

33.2.6 SD\_RSPi:SD卡响应寄存器i(i=10 32 54)

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x018; i = 10  
 0x020; i = 32  
 0x028; i = 54

33.2.7 SD\_RSPj:SD卡响应寄存器j(j=1 3 5)

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x01C + (0x4 × (j - 1))

| Bit   | Symbol | Function          | R/W |
|-------|--------|-------------------|-----|
| 15:0  | —      | 这些位存储来自SD卡MMC的响应。 | R   |

| 31:24 | —              | 这些位读为0。           | R   |

### 33.2.9 SD\_RSP7 : SD Card Response Register 7

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x034

| Bit  | Symbol       | Function  | R/W |
|------|--------------|---|-----|
| 7:0  | SD_RSP7[7:0] | These bits store the response from the SD card/MMC. | R   |
| 31:8 | —            | These bits are read as 0.                           | R   |

SD\_RSP10, SD\_RSP32, SD\_RSP54, SD\_RSP1, SD\_RSP3, SD\_RSP5, SD\_RSP76, and SD\_RSP7 are read-only registers that store the response from the SD card/MMC. Depending on the type of response from the SD card/MMC, the SD/MMC Host Interface divides and stores the response among the four registers.

Table 33.3 lists the correspondence between the response type and its storage destination.

Table 33.3 Correspondence between response type and storage destination

| Response type | SD_RSP10 register | SD_RSP32 register | SD_RSP54 register   | SD_RSP1 register | SD_RSP3 register | SD_RSP5 register | SD_RSP76 register | SD_RSP7 register |
|---------------|-------------------|-------------------|---------------------|------------------|------------------|------------------|-------------------|------------------|
| R1            | [39:8]            | —                 | [39:8] <sup>1</sup> | —                | —                | —                | —                 | —                |
| R1b           | [39:8]            | —                 | [39:8] <sup>1</sup> | —                | —                | —                | —                 | —                |
| R2            | [39:8]            | [71:40]           | [103:72]            | —                | —                | —                | [127:104]         | —                |
| R3            | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |
| R4            | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |
| R5            | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |
| R6            | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |
| R7            | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |

Note 1. The responses for CMD18 and CMD25 are stored in registers SD\_RSP10 and SD\_RSP54. Therefore, even if the SD\_RSP10 register is overwritten with the response for the automatically issued CMD12, the response for CMD18 or CMD25 can be confirmed by reading the SD\_RSP54 register.

### 33.2.10 SD\_INFO1 : SD Card Interrupt Flag Register 1

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x038

### 33.2.9 SD\_RSP7:SD卡响应寄存器7

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x034

| Bit  | Symbol       | Function          | R/W |
|------|--------------|-------------------|-----|
| 7:0  | SD_RSP7[7:0] | 这些位存储来自SD卡MMC的响应。 | R   |
| 31:8 | —            | 这些位读为0。           | R   |

SD\_RSP10、SD\_RSP32、SD\_RSP54、SD\_RSP1、SD\_RSP3、SD\_RSP5、SD\_RSP76和SD\_RSP7是只读寄存器，用于存储来自SD卡MMC的响应。根据SD卡MMC的响应类型，SDMMC主机接口在四个寄存器之间划分和存储响应。

表33.3列出了响应类型与其存储目的地的对应关系。

Table 33.3 响应类型与存储目的地的对应关系

| 响应类型 | SD_RSP10 register | SD_RSP32 register | SD_RSP54 register   | SD_RSP1 register | SD_RSP3 register | SD_RSP5 register | SD_RSP76 register | SD_RSP7 register |
|------|-------------------|-------------------|---------------------|------------------|------------------|------------------|-------------------|------------------|
| R1   | [39:8]            | —                 | [39:8] <sup>1</sup> | —                | —                | —                | —                 | —                |
| R1b  | [39:8]            | —                 | [39:8] <sup>1</sup> | —                | —                | —                | —                 | —                |
| R2   | [39:8]            | [71:40]           | [103:72]            | —                | —                | —                | [127:104]         | —                |
| R3   | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |
| R4   | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |
| R5   | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |
| R6   | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |
| R7   | [39:8]            | —                 | —                   | —                | —                | —                | —                 | —                |

注1.CMD18和CMD25的响应存储在寄存器SD\_RSP10和SD\_RSP54中。因此，即使SD\_RSP10寄存器被自动发出的CMD12的响应覆盖，CMD18或CMD25的响应可以通过读取SD\_RSP54寄存器来确认。

### 33.2.10 SD\_INFO1:SD卡中断标志寄存器1

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x038

| Bit   | Symbol  | Function   | R/W                |
|-------|---------|--|--------------------|
| 0     | RSPEND  | Response End Detection Flag<br>0: Response end not detected<br>1: Response end detected  | R/(W) <sup>2</sup> |
| 1     | —       | This bit is read as 0. The write value should be 0.  | R/W                |
| 2     | ACEND   | Access End Detection Flag<br>0: Access end not detected<br>1: Access end detected  | R/(W) <sup>2</sup> |
| 3     | SDCDRM  | SDnCD Removal Flag<br>0: SD card/MMC removal not detected by the SDnCD pin<br>1: SD card/MMC removal detected by the SDnCD pin             | R/(W) <sup>2</sup> |
| 4     | SDCDIN  | SDnCD Insertion Flag<br>0: SD card/MMC insertion not detected by the SDnCD pin<br>1: SD card/MMC insertion detected by the SDnCD pin       | R/(W) <sup>2</sup> |
| 5     | SDCDMON | SDnCD Pin Monitor Flag<br>0: SDnCD pin level is high <sup>3</sup><br>1: SDnCD pin level is low <sup>3</sup>                                | R                  |
| 6     | —       | This bit is read as 0. The write value should be 0.  | R/W                |
| 7     | SDWPMON | SDnWP Pin Monitor Flag<br>0: SDnWP pin level is high<br>1: SDnWP pin level is low  | R                  |
| 8     | SDD3RM  | SDnDAT3 Removal Flag<br>0: SD card/MMC removal not detected by the SDnDAT3 pin<br>1: SD card/MMC removal detected by the SDnDAT3 pin       | R/(W) <sup>2</sup> |
| 9     | SDD3IN  | SDnDAT3 Insertion Flag<br>0: SD card/MMC insertion not detected by the SDnDAT3 pin<br>1: SD card/MMC insertion detected by the SDnDAT3 pin | R/(W) <sup>2</sup> |
| 10    | SDD3MON | SDnDAT3 Pin Monitor Flag<br>0: SDnDAT3 pin level is low<br>1: SDnDAT3 pin level is high  | R                  |
| 31:11 | —       | These bits are read as 0. The write value should be 0.   | R/W                |

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT\_RST.SDRST flag.

Note 2. The flag does not change even if set to 1. Writing 0 changes the flag value to 0.

Note 3. The flag changes when the pin level continues for the period set in the SD\_OPTION.CTOP[3:0] bits or longer.

The SD\_INFO1 register indicates the detection of a response end or access end for a command sequence. The SD\_INFO1 register also indicates the detection SD card/MMC insertion/removal and the write protection status.

During a multiblock transfer sequence, if CMD12 or CMD52 (SDIO abort) is issued, the ACEND flag sets to 1, but the RSPEND flag remains set to 0.

If the command sequence is stopped because of a communication error or timeout, the ACEND flag or RSPEND flag sets to 1.

After a reset is canceled, the SDD3MON bit, SDD3IN flag, and SDD3RM flag values are changed in accordance with the status of the SDnDAT3 (n = 0) pin, and their values are changed when data is being transferred in wide bus mode. These 3 bits are used only for SD card. Set flags to be cleared to 0. Set flags that are not being cleared to 1.

#### RSPEND flag (Response End Detection Flag)

The RSPEND flag indicates that a response end was detected.

[Setting conditions]

- When reception of the response is completed
- When transmission of a command without response is completed
- When reception of the busy state after R1b response is completed
- When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed for transfer of multiple block read

| Bit   | Symbol  | Function   | R/W                |
|-------|---------|--|--------------------|
| 0     | RSPEND  | 响应结束检测标志<br>0: 未检测到响应结束1: 检测到响应结束                              | R/(W) <sup>2</sup> |
| 1     | —       | 该位读取为0。写入值应为0。   | R/W                |
| 2     | ACEND   | 访问结束检测标志<br>0: 未检测到访问结束1: 检测到访问结束                              | R/(W) <sup>2</sup> |
| 3     | SDCDRM  | SDnCD删除标志<br>0: SDnCD引脚未检测到SD卡MMC移除1: SDnCD引脚检测到SD卡MMC移除       | R/(W) <sup>2</sup> |
| 4     | SDCDIN  | SDnCD插入标志<br>0: SDnCD引脚未检测到SD卡MMC插入1: SDnCD引脚检测到SD卡MMC插入       | R/(W) <sup>2</sup> |
| 5     | SDCDMON | SDnCD引脚监控标志<br>0: SDnCD引脚电平为高*3<br>1: SDnCD引脚电平低*3             | R                  |
| 6     | —       | 该位读取为0。写入值应为0。   | R/W                |
| 7     | SDWPMON | SDnWP引脚监控标志<br>0: SDnWP引脚高电平1: SDnWP引脚低电平                      | R                  |
| 8     | SDD3RM  | SDnDAT3删除标志<br>0: SDnDAT3引脚未检测到SD卡MMC移除1: SDnDAT3引脚检测到SD卡MMC移除 | R/(W) <sup>2</sup> |
| 9     | SDD3IN  | SDnDAT3插入标志<br>0: SDnDAT3引脚未检测到SD卡MMC插入1: SDnDAT3引脚检测到SD卡MMC插入 | R/(W) <sup>2</sup> |
| 10    | SDD3MON | SDnDAT3引脚监控标志<br>0: SDnDAT3引脚低电平1: SDnDAT3引脚高电平                | R                  |
| 31:11 | —       | 这些位被读取为0。写入值应为0。   | R/W                |

注1.该值由复位初始化，并且在由SOFT\_RST.SDRST标志触发的复位时初始化。

注2.即使设置为1，标志也不会改变。写入0会将标志值更改为0。

注3.当引脚电平持续SD\_OPTION.CTOP[3:0]位中设置的周期或更长时间时，标志会发生变化。

SD\_INFO1寄存器指示对命令序列的响应结束或访问结束的检测。SD\_INFO1寄存器还指示检测SD卡MMC插入移除和写保护状态。

在多块传输序列期间，如果发出CMD12或CMD52（SDIO中止），则ACEND标志设置为1，但RSPEND标志保持设置为0。

如果命令序列由于通信错误或超时而停止，则ACEND标志或RSPEND标志设置为1。

复位取消后，SDD3MON位、SDD3IN标志和SDD3RM标志的值根据SDnDAT3(n=0)引脚的状态而改变，并且在宽总线模式下传输数据时它们的值也会改变。这3位仅用于SD卡。将要清除的标志设置为0。将未清除的标志设置为1。

#### RSPEND标志（响应结束检测标志）

RSPEND标志表示检测到响应结束。

[Setting conditions]

- 响应接收完成时
- 没有响应的命令传输完成时
- R1b响应后忙状态的接收完成时
- 多块读取传送的C52PUB位为1的CMD52响应接收完成时

- When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed for transfer of multiple block write
- This bit is set when a command sequence is halted because of a communications error or timeout.

[Clearing conditions]

- When 0 is written to RSPEND
- When a command without data is issued.

Note: When a command is issued in absence of data transfer, the RSPEND flag becomes 1 after the command sequence ends.

#### ACEND flag (Access End Detection Flag)

The ACEND flag indicates that an access end was detected.

[Setting conditions]

- When read access to the buffer is completed for transfer of single block read
- When read access to the buffer for the last block of data is completed for transfer of multiple block read
- When read access to the buffer and reception of the response to CMD12 are completed for transfer of multiple block read with automatic issuing of CMD12
- When reception of the busy state after reception of the CRC status is completed for transfer of single block write
- When reception of the busy state after reception of the CRC status of the last block of data is completed for transfer of multiple block write
- When reception of the response busy state for CMD12 is completed for transfer of multiple block write with automatic issuing of CMD12
- When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed for transfer of multiple block read
- When reception of the response busy state for CMD12 that was issued by setting the STP bit to 1 is completed for transfer of multiple block write
- When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed for transfer of multiple block read
- When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed for transfer of multiple block write
- This bit is set when a command sequence is halted because of a communications error or timeout.

[Clearing conditions]

- When 0 is written to ACEND
- When the access end bit is set to 1.

Note: The ACEND flag becomes 1 after the command sequence ends.

#### SDCDRM flag (SDnCD Removal Flag)

The SDCDRM flag indicates that SDnCD was removed.

[Setting condition]

- After a change in SDnCD from 0 to 1, Mcycle elapsed with SDnCD held at 1.

[Clearing conditions]

- When 0 is written to SDCDRM.

Note: Mcycle is set in bits [3:0] in SD\_OPTION.

#### SDCDIN flag (SDnCD Insertion Flag)

The SD CDIN flag indicates that SDnCD was inserted.

- 多块写入传送的C52PUB位为1的CMD52响应接收完成时

- 当命令序列由于通信错误或超时而停止时，该位被设置。

[Clearing conditions]

- RSPEND写入0时
- 发出无数据指令时。

Note: 当在没有数据传输的情况下发出命令时，RSPEND标志在命令序列结束后变为1。

#### ACEND标志（访问结束检测标志）

ACEND标志表示检测到访问结束。

[Setting conditions]

- 当完成对缓冲区的读取访问以传输单块读取时
- 当完成对最后一个数据块的缓冲区的读取访问以传输多块读取时
- 当对缓冲区的读取访问和对CMD12的响应的接收完成时，通过自动发出CMD12传输多块读取
- 接收CRC状态后的busy状态接收完成时，用于单块写入传输
- 当接收到最后一个数据块的CRC状态后的忙碌状态接收完成时，用于多块写入的传输
- 当CMD12的响应忙状态接收完成时，用于传输多块写入并自动发出CMD12
- 在多块读取的传送中，通过将STP位设置为1发出的对CMD12的响应的接收完成时
- 多块写入的传送，通过将STP位设置为1发出的CMD12的响应忙状态接收完成时
- 多块读取传送时，通过将IOABT位设置为1发出的对CMD52的响应的接收完成时
- 多块写入传送的IOABT位为1的CMD52响应接收完成时
- 当命令序列由于通信错误或超时而停止时，该位被设置。

[Clearing conditions]

- ACEND写入0时
- 当访问结束位设置为1时。

Note: 命令序列结束后ACEND标志变为1。

#### SDCDRM标志（SDnCD移除标志）

SDCDRM标志表明SDnCD已被删除。

[Setting condition]

- 在SDnCD从0变为1后，Mcycle过去了，而SDnCD保持在1。

[Clearing conditions]

- 当0写入SDCDRM时。

Note: Mcycle在SD\_OPTION的位[3:0]中设置。

#### SDCDIN标志（SDnCD插入标志）

SDCDIN标志表明SDnCD已插入。

[Setting condition]

- After a change in SDnCD from 1 to 0, Mcycle elapsed with SDnCD held at 0.

[Clearing conditions]

- When 0 is written to SDCDIN.

Note: Mcycle is set in bits [3:0] in SD\_OPTION.

**SDD3RM flag (SDnDAT3 Removal Flag)**

The SDD3RM flag indicates that SDnDAT3 was removed.

[Setting condition]

- After a change in SDnDAT3 from 1 to 0, two cycles of PCLKB elapsed with SDnDAT3 held at 0.

[Clearing condition]

- When 0 is written to SDD3RM.

**SDD3IN flag (SDnDAT3 Insertion Flag)**

The SDD3IN flag indicates that SDnDAT3 was inserted.

[Setting condition]

- After a change in SDnDAT3 from 0 to 1, two cycles of PCLKB elapsed with SDnDAT3 held at 1.

[Clearing condition]

- When 0 is written to SDD3IN.

33.2.11 SD\_INFO2 : SD Card Interrupt Flag Register 2

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x03C

|                    |                 |                 |                 |    |    |    |                 |                 |          |                 |                 |                 |                 |                 |                 |                 |

[Setting condition]

- SDnCD从1变为0后, Mcycle在SDnCD保持在0的情况下经过。

[Clearing conditions]

- 当0写入SDCDIN时。

Note: Mcycle在SD\_OPTION的位[3:0]中设置。

**SDD3RM标志 (SDnDAT3移除标志)**

SDD3RM标志表示SDnDAT3已被删除。

[Setting condition]

- SDnDAT3从1变为0后, 经过两个PCLKB周期, SDnDAT3保持为0。

[Clearing condition]

- 当0写入SDD3RM时。

**SDD3IN标志 (SDnDAT3插入标志)**

SDD3IN标志表示SDnDAT3已插入。

[Setting condition]

- SDnDAT3从0变为1后, 经过两个PCLKB周期, SDnDAT3保持在1。

[Clearing condition]

- 当0写入SDD3IN时。

33.2.11 SD\_INFO2:SD卡中断标志寄存器2

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x03C

|               |                 |                 |                 |    |    |    |                 |                 |          |                 |                 |                 |                 |                 |                 |                 |

| 8     | BRE            | SD_BUF0 Read Enable Flag<br>0: Disable read access to the SD_BUF0 register<br>1: Enable read access to the SD_BUF0 register  | R/W <sup>2</sup> |
| 9     | BWE            | SD_BUF0 Write Enable Flag<br>0: Disable write access to the SD_BUF0 register<br>1: Enable write access to the SD_BUF0 register   | R/W <sup>2</sup> |
| 10    | —              | This bit is read as 0. The write value should be 0.  | R/W              |
| 11    | —              | The read value is undefined. The write value should be 1.  | R/W              |
| 12    | —              | This bit is read as 0. The write value should be 0.  | R/W              |
| 13    | SD_CLK_CTRLLEN | SD_CLK_CTRL Write Enable Flag<br>0: SD/MMC bus (CMD and DAT lines) is busy, so write access to the SD_CLK_CTRL.CLKEN and CLKSEL[7:0] bits is disabled<br>1: SD/MMC bus (CMD and DAT lines) is not busy, so write access to the SD_CLK_CTRL.CLKEN and CLKSEL[7:0] bits is enabled | R                |
| 14    | CBSY           | Command Sequence Status Flag<br>0: Command sequence complete<br>1: Command sequence in progress (busy)   | R                |
| 15    | ILA            | Illegal Access Error Detection Flag<br>0: Illegal access error not detected<br>1: Illegal access error detected  | R/W <sup>2</sup> |
| 31:16 | —              | These bits are read as 0. The write value should be 0.   | R/W              |

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT\_RST.SDRST flag.

Note 2. The flag does not change even if set to 1. Writing 0 changes the flag value to 0.

The SD\_INFO2 register indicates the status of the SD buffer and the status of the SD card/MMC. Set flags to be cleared to 0. Set flags that are not being cleared to 1.

#### CMDE flag (Command Error Detection Flag)

The CMDE flag indicates that a command error was detected. The command sequence stops when a command error occurs. When the SDIO\_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section 33.3.12.

[IO\\_RW\\_EXTENDED Command \(SD: CMD53/Multiple Block Read\)](#) or [section 33.3.13. IO\\_RW\\_EXTENDED Command \(SD: CMD53/Multiple Block Write\)](#), and complete the command sequence.

[Setting conditions]

- The command index of the transmitted command differs from the command index of the received response.
- The command index of a command issued within a command sequence differs from the command index of the received response.

[Clearing condition]

- When 0 is written to CMDE.

| Bit   | Symbol         | Function  | R/W              |
|-------|----------------|---|------------------|
| 4     | ILW            | SD_BUF0非法写访问检测标志<br>0: 未检测到对SD_BUF0寄存器的非法写访问1: 检测到对SD_BUF0寄存器的非法写访问   | R/W <sup>2</sup> |
| 5     | ILR            | SD_BUF0非法读访问检测标志<br>0: 未检测到对SD_BUF0寄存器的非法读访问1: 检测到对SD_BUF0寄存器的非法读访问   | R/W <sup>2</sup> |
| 6     | RSPTO          | 响应超时检测标志<br>0: 未检测到响应超时1: 检测到响应超时   | R/W <sup>2</sup> |
| 7     | SDD0MON        | SDHI_D0引脚状态标志<br>0: SDnDAT0引脚为低电平<br>1: SDnDAT0引脚为高电平   | R                |
| 8     | BRE            | SD_BUF0读使能标志<br>0: 禁用对SD_BUF0寄存器的读访问1: 启用对SD_BUF0寄存器的读访问  | R/W <sup>2</sup> |
| 9     | BWE            | SD_BUF0写使能标志<br>0: 禁用对SD_BUF0寄存器的写访问1: 启用对SD_BUF0寄存器的写访问  | R/W <sup>2</sup> |
| 10    | —              | 该位读取为0。写入值应为0。  | R/W              |
| 11    | —              | 读取值未定义。写入值应为1。  | R/W              |
| 12    | —              | 该位读取为0。写入值应为0。  | R/W              |
| 13    | SD_CLK_CTRLLEN | SD_CLK_CTRL写使能标志<br>0: SDMMC总线 (CMD和DAT线) 忙, 因此禁止对SD_CLK_CTRL.CLKEN和CLKSEL[7:0]位的写访问<br>1: SDMMC总线 (CMD和DAT线) 不忙, 因此使能对SD_CLK_CTRL.CLKEN和CLKSEL[7:0]位的写访问 | R                |
| 14    | CBSY           | 命令序列状态标志<br>0: 命令序列完成1: 命令序列正在进行中(忙碌)   | R                |
| 15    | ILA            | 非法访问错误检测标志<br>0: 未检测到非法访问错误1: 检测到非法访问错误   | R/W <sup>2</sup> |
| 31:16 | —              | 这些位被读取为0。写入值应为0。  | R/W              |

注1.该值由复位初始化,并且在由SOFT\_RST.SDRST标志触发的复位时初始化。

注2.即使设置为1,标志也不会改变。写入0会将标志值更改为0。

SD\_INFO2寄存器指示SD缓冲区的状态和SD卡MMC的状态。将要清除的标志设置为0。将未清除的标志设置为1。

#### CMDE标志 (命令错误检测标志)

CMDE标志指示检测到命令错误。发生命令错误时命令序列停止。

当SDIO\_MODE.C52PUB位设置为1并自动发出CMD52时,如果发生通信错误或响应超时,则命令序列未完成。执行33.3.12节中所示的错误处理。IO\_RW\_EXTENDED命令 (SD: CMD53多块读取) 或第33.3.13节。IO\_RW\_EXTENDED命令 (SD: CMD53多块写入),完成命令序列。

[Setting conditions]

- 发送命令的命令索引与接收响应的命令索引不同。
- 命令序列中发出的命令的命令索引与接收到的响应的命令索引不同。

[Clearing condition]

- 当0写入CMDE时。

**CRCE flag (CRC Error Detection Flag)**

The CRCE flag indicates that a CRC error was detected. The command sequence stops when a CRC error occurs. When the SDIO\_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in [section 33.3.12](#).

[IO\\_RW\\_EXTENDED Command \(SD: CMD53/Multiple Block Read\)](#) or [section 33.3.13. IO\\_RW\\_EXTENDED Command \(SD: CMD53/Multiple Block Write\)](#), and complete the command sequence.

[Setting conditions]

- When an error occurs in the CRC status.
- When a CRC error occurs in the read data.
- When a CRC error occurs in the response.
- A CRC error in the response to a command issued within a command sequence.

[Clearing condition]

- When 0 is written to CRCE.

**ENDE flag (End Bit Error Detection Flag)**

The ENDE flag indicates that an end bit error was detected. The command sequence is stopped when an end bit error occurs. When the SDIO\_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in [section 33.3.12](#).

[IO\\_RW\\_EXTENDED Command \(SD: CMD53/Multiple Block Read\)](#) or [section 33.3.13. IO\\_RW\\_EXTENDED Command \(SD: CMD53/Multiple Block Write\)](#), and complete the command sequence.

[Setting conditions]

- When an error occurs in the response length (and the end bit is not detected).
- When an error occurs in the read data length (and the end bit is not detected among the valid bits).
- When an error occurs in the CRC status length (and the end bit is not detected).
- An error in the length of a response to a command issued within a command sequence, for example when the end bit is not detected.

[Clearing condition]

- When 0 is written to ENDE.

**DTO flag (Data Timeout Detection Flag)**

The DTO flag indicates that a data timeout was detected. The command sequence stops when a data timeout occurs.

[Setting conditions]

- After R1b response, the busy state (SDnDAT0 = 0) continues for longer than Ncycle.
- After CRC status, the busy state (SDnDAT0 = 0) continues for longer than Ncycle.
- After write data, the CRC status is not received though Ncycle has elapsed.
- After read command, read data is not received though a time longer than Ncycle has elapsed.
- After CMD12 is issued within a command sequence, the busy state (SDnDAT0 = 0) for longer than Ncycle continues.
- After the reception of read data, read data for the next block are not received though a time longer than Ncycle has elapsed.
- After release of the read wait state, read data for the next block are not received though a time longer than Ncycle has elapsed.

Note: Ncycle is set in bits [7:4] in SD\_OPTION.

[Clearing condition]

- When 0 is written to DTO.

**CRCE标志 (CRC错误检测标志)**

CRCE标志表示检测到CRC错误。当发生CRC错误时，命令序列停止。当。。。的时候SDIO\_MODE.C52PUB位设置为1并自动发出CMD52，如果发生通信错误或响应超时，则命令序列未完成。执行3.3.12节所示的错误处理。IO\_RW\_EXTENDED命令 (SD: CMD53多块读取) 或第33.3.13节。IO\_RW\_EXTENDED命令 (SD: CMD53MultipleBlockWrite)，完成命令序列。

[Setting conditions]

- CRC状态发生错误时。
- 读取数据发生CRC错误时。
- 当响应中出现CRC错误时。
- 对命令序列中发出的命令的响应中出现CRC错误。

[Clearing condition]

- CRCE写入0时。

**ENDE标志 (结束位错误检测标志)**

ENDE标志表示检测到结束位错误。当发生结束位错误时，命令序列停止。当SDIO\_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行33.3.12节所示的错误处理。IO\_RW\_EXTENDED命令 (SD: CMD53多块读取) 或第33.3.13节。IO\_RW\_EXTENDED命令 (SD: CMD53MultipleBlockWrite)，完成命令序列。

[Setting conditions]

- 响应长度发生错误 (未检测到结束位) 时。
- 读取数据长度出错时 (有效位中未检测到结束位)。
- CRC状态长度出错 (未检测到结束位) 时。
- 对命令序列中发出的命令的响应长度错误，例如未检测到结束位时。

[Clearing condition]

- 0写入ENDE时。

**DTO标志 (数据超时检测标志)**

DTO标志表示检测到数据超时。当发生数据超时时，命令序列停止。

[Setting conditions]

- R1b响应后，忙碌状态 (SDnDAT0=0) 持续时间超过Ncycle。
- CRC状态后，忙碌状态 (SDnDAT0=0) 持续时间超过Ncycle。
- 写入数据后，虽然Ncycle已过，但仍未收到CRC状态。
- 读取命令后，经过Ncycle后仍未收到读取数据。
- 在命令序列内发出CMD12后，忙碌状态 (SDnDAT0=0) 持续时间超过Ncycle。
- 读取数据接收后，虽然经过了Ncycle以上的时间，但没有接收到下一个块的读取数据。
- 读取等待状态解除后，虽然经过了Ncycle以上的时间，但没有接收到下一个块的读取数据。

Note: Ncycle在SD\_OPTION的位[7:4]中设置。

[Clearing condition]

- 当0写入DTO时。

**ILW flag (SD\_BUF0 Illegal Write Access Detection Flag)**

The ILW flag indicates that an SD\_BUF0 illegal write access was detected.

[Setting conditions]

- When data is written to SD\_BUF0 while it is not in the data read/write command state.
- When data is written to SD\_BUF0 while SD\_BUF is full.
- When data is written to SD\_BUF0 while an error occurs in the CRC status or CRC status length.
- When data is written to SD\_BUF0 while a busy state after the CRC status continues for longer than Ncycle.

Note: Ncycle is set in bits [7:4] in SD\_OPTION.

[Clearing condition]

- When 0 is written to ILW.

**ILR flag (SD\_BUF0 Illegal Read Access Detection Flag)**

The ILR flag indicates that an SD\_BUF0 illegal read access was detected.

[Setting conditions]

- When SD\_BUF is empty while SD\_BUF0 is read.
- When data with a CRC error or END error is read from SD\_BUF0.

[Clearing condition]

- When 0 is written to ILR.

**RSPTO flag (Response Timeout Detection Flag)**

The RSPTO flag indicates that a response timeout was detected. The command sequence is stopped when a response timeout occurs. When the SDIOMD.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in [section 33.3.12. IO\\_RW\\_EXTENDED Command \(SD: CMD53/Multiple Block Read\)](#) or [section 33.3.13. IO\\_RW\\_EXTENDED Command \(SD: CMD53/Multiple Block Write\)](#), and complete the command sequence.

[Setting condition]

- When a response is not received though a time longer than 640 cycles of SD/MMC clock has elapsed (including a response to a command issued within a command sequence).

[Clearing condition]

- When 0 is written to RSPTO.

**SDD0MON flag (SDHI\_D0 Pin Status Flag)**

The SDD0MON flag indicates the status of the SDHI\_D0 pin. If the data timeout (DTO) is set but the response timeout (RSPTO) is not set after the Erase command is issued, the end of the Erase sequence (SDD0MON = 1) is confirmed by polling DAT0.

If a communication error or timeout occurs during a write sequence, the DAT0 bit might retain the value 0.

While the SD/MMC clock is stopped, the DAT0 bit retains the value before the clock is stopped.

**BRE flag (SD\_BUF0 Read Enable Flag)**

The BRE flag indicates that SD\_BUF0 is enabled for reading.

[Setting conditions]

- When data set in SD\_SIZE is stored in SD\_BUF0 at single block transfer.
- When data set in SD\_SIZE is stored in either bank 1 or bank 2 of SD\_BUF0 at multiple block transfer.

[Clearing conditions]

- When 0 is written to BRE

**ILW标志 (SD\_BUF0非法写访问检测标志)**

ILW标志表示检测到SD\_BUF0非法写访问。

[Setting conditions]

- 数据写入SD\_BUF0时，SD\_BUF0不处于数据读写命令状态。
- 当SD\_BUF已满而数据写入SD\_BUF0时。
- 当数据写入SD\_BUF0且CRC状态或CRC状态长度发生错误时。
- 当数据写入SD\_BUF0时，CRC状态后的忙碌状态持续时间超过Ncycle。

Note: Ncycle在SD\_OPTION的位[7:4]中设置。

[Clearing condition]

- 当0写入ILW时。

**ILR标志 (SD\_BUF0非法读访问检测标志)**

ILR标志表示检测到SD\_BUF0非法读取访问。

[Setting conditions]

- 读取SD\_BUF0时SD\_BUF为空。
- 从SD\_BUF0读取CRC错误或END错误的的数据时。

[Clearing condition]

- 当0写入ILR时。

**RSPTO标志 (响应超时检测标志)**

RSPTO标志表示检测到响应超时。当发生响应超时时，命令序列停止。当SDIOMD.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行33.3.12节所示的错误处理。IO\_RW\_EXTENDED命令 (SD: CMD53多块读取) 或第33.3.13节。IO\_RW\_EXTENDED命令 (SD: CMD53MultipleBlockWrite)，完成命令序列。

[Setting condition]

- 超过640个SDMMC时钟周期后仍未收到响应时 (包括对命令序列内发出的命令的响应)。

[Clearing condition]

- 当0写入RSPTO时。

**SDD0MON标志 (SDHI\_D0引脚状态标志)**

SDD0MON标志指示SDHI\_D0引脚的状态。如果在发出擦除命令后设置了数据超时(DTO)但未设置响应超时(RSPTO)，则通过轮询DAT0确认擦除序列的结束(SDD0MON=1)。

如果在写入序列期间发生通信错误或超时，则DAT0位可能会保留值0。

SDMMC时钟停止时，DAT0位保持时钟停止前的值。

**BRE标志 (SD\_BUF0读取启用标志)**

BRE标志指示SD\_BUF0已启用读取。

[Setting conditions]

- 当SD\_SIZE中设置的数据在单块传输时存储在SD\_BUF0中。
- 当SD\_SIZE中设置的数据在多块传输中存储在SD\_BUF0的bank1或bank2中时。

[Clearing conditions]

- BRE写入0时

- Reading of a block of data from SD\_BUF0 by DMA transfer

When data is read from SD\_BUF0 by the CPU, clear BRE then read the amount of data specified in SD\_SIZE.

Even if a CRC error or an END error occurs while block data is read, data is stored in SD\_BUF0 and BRE is set.

**BWE flag (SD\_BUF0 Write Enable Flag)**

The BWE flag indicates that SD\_BUF0 is enabled for writing.

[Setting conditions]

- When SD\_BUF0 is empty at single block transfer.
- When either bank 1 or bank 2 of SD\_BUF0 is empty at multiple block transfer.

[Clearing conditions]

- When 0 is written to BWE.
- Writing of a block of data to SD\_BUF0 by DMA transfer.

When data is written to SD\_BUF0 by the CPU, clear BWE and then write the amount of data specified in SD\_SIZE.

**SD\_CLK\_CTRLLEN flag (SD\_CLK\_CTRL Write Enable Flag)**

When a command sequence is started by writing to SD\_CMD, the CBSY bit is set to 1 and, at the same time, the SD\_CLK\_CTRLLEN bit is set to 0. The SD\_CLK\_CTRLLEN bit is set to 1 after 8 cycles of SDCLK have elapsed after the CBSY bit clears to 0 on completion of the command sequence.

**ILA flag (Illegal Access Error Detection Flag)**

The ILA flag indicates that an illegal access error was detected.

[Setting conditions]

- Writing of data to SD\_CMD within a command sequence (CBSY = 1).
- When SD\_CMD[11] = 1 (command with data transfer) and SD\_CMD[7:0] = 0000 1100b (CMD12) are set in SD\_CMD.

[Clearing condition]

- When 0 is written to ILA.

**33.2.12 SD\_INFO1\_MASK : SD INFO1 Interrupt Mask Register**

| Bit | Symbol  | Function   | R/W |
|-----|---------|--|-----|
| 0   | RSPENDM | Response End Interrupt Request Mask<br>0: Do not mask response end interrupt request<br>1: Mask response end interrupt request | R/W |
| 1   | —       | This bit is read as 0. The write value should be 0.  | R/W |

- 通过DMA传输从SD\_BUF0读取数据块

当CPU从SD\_BUF0读取数据时,清除BRE,然后读取SD\_SIZE中指定的数据量。

即使在读取块数据时发生CRC错误或END错误,数据也会存储在SD\_BUF0中并设置BRE。

**BWE标志 (SD\_BUF0写使能标志)**

BWE标志指示SD\_BUF0已启用写入。

[Setting conditions]

- 单块传输时SD\_BUF0为空时。
- 多块传输时SD\_BUF0的bank1或bank2为空时。

[Clearing conditions]

- 当0写入BWE时。
- 通过DMA传输将数据块写入SD\_BUF0。

当CPU将数据写入SD\_BUF0时,清除BWE,然后写入SD\_SIZE中指定的数据量。

**SD\_CLK\_CTRLLEN标志 (SD\_CLK\_CTRL写使能标志)**

当通过写入SD\_CMD启动命令序列时,CBSY位设置为1,同时,SD\_CLK\_CTRLLEN位设置为0。SD\_CLK\_CTRLLEN位在SDCLK 的8个周期后设置为1。CBSY位在命令序列完成时清零。

**ILA标志 (非法访问错误检测标志)**

ILA标志表示检测到非法访问错误。

[Setting conditions]

- 在命令序列中将数据写入SD\_CMD(CBSY=1)。
- 当SD\_CMD[11]=1 (有数据传输的命令)且SD\_CMD[7:0]=00001100b(CMD12)在SD\_CMD中设置。

[Clearing condition]

- 当0写入ILA时。

| Bit   | Symbol             | Function  | R/W |
|-------|--------------------|---|-----|
| 6     | RSPTOM             | Response Timeout Interrupt Request Mask<br>0: Do not mask response timeout interrupt request<br>1: Mask response timeout interrupt request                              | R/W |
| 7     | —                  | This bit is read as 0. The write value should be 0.   | R/W |
| 8     | BREM <sup>*1</sup> | BRE Interrupt Request Mask<br>0: Do not mask read enable interrupt request for the SD buffer<br>1: Mask read enable interrupt request for the SD buffer                 | R/W |
| 9     | BWEM <sup>*1</sup> | BWE Interrupt Request Mask<br>0: Do not mask write enable interrupt request for the SD_BUF0 register<br>1: Mask write enable interrupt request for the SD_BUF0 register | R/W |
| 10    | —                  | This bit is read as 0. The write value should be 0.   | R/W |
| 11    | —                  | This bit is read as 1. The write value should be 1.   | R/W |
| 14:12 | —                  | These bits are read as 0. The write value should be 0.  | R/W |
| 15    | ILAM               | Illegal Access Error Interrupt Request Mask<br>0: Do not mask illegal access error interrupt request<br>1: Mask illegal access error interrupt request                  | R/W |
| 31:16 | —                  | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. When the SD\_INFO2\_MASK.BWEM bit is 0 or the SD\_INFO2\_MASK.BREM bit is 0, set the SD\_DMAEN.DMAEN bit to 0. When the SD\_DMAEN.DMAEN bit is 1, set the SD\_INFO2\_MASK.BWEM bit to 1 and the SD\_INFO2\_MASK.BREM bit to 1.

The SD\_INFO2\_MASK register enables or disables interrupt requests from the status flags in the SD\_INFO2 register. See Table 33.5 for details on the relationship between the status flags and the requested interrupt source.

### 33.2.14 SD\_CLK\_CTRL : SD Clock Control Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x048

|-------|------------|---|-----|
| 9     | CLKCTRLLEN | SD/MMC Clock Output Automatic Control Select<br>0: Disable automatic control of SD/MMC clock output<br>1: Enable automatic control of SD/MMC clock output | R/W |
| 31:10 | —          | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT\_RST.SDRST flag.  
 Note 2. Bits CLKSEL[7:0] and CLKEN cannot be write accessed when the SD\_INFO2.SD\_CLK\_CTRLLEN flag is 0.

The SDCLKCTRL register controls the SD/MMC clock frequency settings and output. Set the CLKEN bit to 1 before writing to the SD\_CMD register to start a command sequence. Do not write to the SDCLKCTRL register when the SD\_INFO2.SD\_CLK\_CTRLLEN flag is 0.

**CLKCTRLLEN bit (SD/MMC Clock Output Automatic Control Select)**

The CLKCTRLLEN bit enables or disables the automatic control function for SD/MMC clock output, which causes the SD/MMC clock to output only within a command sequence.

The timing with which SD/MMC clock output starts and stops is as follows:

- SD/MMC clock output starts after writing to SD\_CMD
- SD/MMC clock output stops when 8 cycles of SD/MMC clock have elapsed after the end of the command sequence.

In addition, SD/MMC clock is fixed to 0 while SCLKEN of SD\_CLK\_CTRL is 0, regardless of the value of this bit.

**33.2.15 SD\_SIZE : Transfer Data Length Register**

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x04C

| Bit   | Symbol   | Function   | R/W |
|-------|----------|--|-----|
| 9:0   | LEN[9:0] | Transfer Data Size Setting<br>These bits specify the transfer data size.*1 | R/W |
| 31:10 | —        | These bits are read as 0. The write value should be 0.                     | R/W |

Note 1. Do not rewrite these bits when the SD\_INFO2.CBSY flag is 1.

The SD\_SIZE register sets the transfer data size.

**LEN[9:0] bits (Transfer Data Size Setting)**

When using single block transfer, the transfer data size can be set in the LEN[9:0] bits from 1 byte to 512 bytes. When CMD12 is automatically issued during a multiblock transfer sequence (CMD18 and CMD25), the transfer data size can only be set to 512 bytes. When CMD12 is not automatically issued during a multiblock transfer sequence, the transfer data size can be set to 32, 64, 128, 256, or 512 bytes. However, a 32-, 64-, 128-, or 256-byte multiblock read transfer can only be performed during an SDIO multiblock transfer (CMD53). Do not set these bits to 0 when using a command that includes data transfer.

| Bit   | Symbol     | Function  | R/W |
|-------|------------|---|-----|
| 9     | CLKCTRLLEN | SDMMC时钟输出自动控制选择<br>0: 禁止SDMMC时钟输出自动控制1: 使能SDMMC时钟输出自动控制 | R/W |
| 31:10 | —          | 这些位被读取为0。写入值应为0。  | R/W |

注1.该值由复位初始化，并且在由SOFT\_RST.SDRST标志触发的复位时初始化。  
 注2.当SD\_INFO2.SD\_CLK\_CTRLLEN标志为0时，不能写访问位CLKSEL[7:0]和CLKEN。

SDCLK\_CTRL寄存器控制SDMMC时钟频率设置和输出。在写入SD\_CMD寄存器以启动命令序列之前，将CLKEN位设置为1。当SD\_INFO2.SD\_CLK\_CTRLLEN标志为0时，不要写入SDCLK\_CTRL寄存器。

**CLKCTRLLEN位 (SDMMC时钟输出自动控制选择)**

CLKCTRLLEN位启用或禁用SDMMC时钟输出的自动控制功能，这会导致SDMMC时钟仅在命令序列内输出。

SDMMC时钟输出开始和停止的时序如下：

- 写入SD\_CMD后开始SDMMC时钟输出
- 在命令序列结束后经过8个SDMMC时钟周期时，SDMMC时钟输出停止。

此外，SDMMC时钟固定为0，而SD\_CLK\_CTRL的SCLKEN为0，与该位的值无关。

**33.2.15 SD\_SIZE：传输数据长度寄存器**

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x04C

|-------|----------|----------------------------|-----|
| 9:0   | LEN[9:0] | 传输数据大小设置<br>这些位指定传输数据大小。*1 | R/W |
| 31:10 | —        | 这些位被读取为0。写入值应为0。           | R/W |

注1.当SD\_INFO2.CBSY标志为1时，不要重写这些位。

SD\_SIZE寄存器设置传输数据大小。

**LEN[9:0]位 (传输数据大小设置)**

使用单块传输时，传输数据大小可以在LEN[9:0]位中设置，从1字节到512字节。什么时候CMD12在多块传输序列 (CMD18和CMD25) 期间自动发出，传输数据大小只能设置为512字节。在多块传输序列期间未自动发出CMD12时，传输数据大小可设置为32、64、128、256或512字节。但是，只能在SDIO多块传输(CMD53)期间执行32、64、128或256字节的多块读取传输。使用包含数据传输的命令时，请勿将这些位设置为0。

| 14:12 | CRCTK[2:0] | CRC Status Token<br>These bits store the CRC status token value (normal value is 010b).   | R   |
| 15    | —          | This bit is read as 0.  | R   |
| 31:16 | —          | These bits are read as 0.   | R   |

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT\_RST.SDRST flag.  
 Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD\_CMD, CMD12 when the STP bit in SD\_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO\_MODE is set to 1.  
 Note 3. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD\_CMD, CMD12 when the STP bit in SD\_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO\_MODE is set to 1.

The SD\_ERR\_STS1 register indicates the CRC status token, CRC error, end bit error, and command error.

### 33.2.18 SD\_ERR\_STS2 : SD Error Status Register 2

| 31:7 | —        | These bits are read as 0.   | R   |

- Note 1. The value is initialized by a reset and also on reset triggered by the SOFT\_RST.SDRST flag.
- Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD\_CMD, CMD12 when the STP bit in SD\_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO\_MODE is set to 1.
- Note 3. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD\_CMD, CMD12 when the STP bit in SD\_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO\_MODE is set to 1.
- Note 4. Set the SD\_OPTION.TOP[3:0] bits to select the number of n cycles.

The SD\_ERR\_STS2 register indicates the timeout status.

### 33.2.19 SD\_BUF0 : SD Buffer Register

Base address: SDHI n 0 = 0x4009\_2000 + 0x0400 × n  
Offset address: 0x060

When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers.

If both buffers are not empty when executing multiple block read, the SD card/MMC clock is stopped to suspend receiving data. When one of the buffers is empty, the SD card/MMC clock is supplied to resume receiving data.

| Bit  | Symbol   | Function  | R/W |
|------|----------|---|-----|
| 2    | BSYTO0   | 忙超时标志0<br>0: 收到R1b响应后, SDMMC在指定时间段内从忙状态中释放*4<br>1: 收到R1b响应后, 经过指定时间*4后SDMMC处于忙碌状态   | R   |

| 5    | CRCTO    | CRC状态令牌超时标志<br>0: CRC数据写入SD卡MMC后, 在指定时间段内收到CRC状态令牌*4<br>1: 将CRC数据写入SD卡MMC后, 经过指定时间*4后未收到CRC状态令牌   | R   |
| 6    | CRCBSYTO | CRC状态令牌忙超时标志<br>0: 收到CRC状态令牌后, SDMMC在指定时间段内从忙碌状态中释放*4<br>1: 收到CRC状态令牌后, 经过指定时间*4后SDMMC处于忙碌状态  | R   |
| 31:7 | —        | 这些位读为0。   | R   |

- 注1.该值由复位初始化, 并且在由SOFT\_RST.SDRST标志触发的复位时初始化。
- 注2.通过SD\_CMD中的设置, CMD12之外的CMD SD\_STOP中的STP位设置为1, 或者当SDIO\_MODE中的C52PUB或IOABT位设置为1时为CMD52。
- 注3.通过SD\_CMD中的设置为多块传输启用自动发布时的CMD12, 当STP位中的CMD12 SD\_STOP设置为1, 或当SDIO\_MODE中的C52PUB或IOABT位设置为1时为CMD52。
- 注4.设置SD\_OPTION.TOP[3:0]位以选择n个周期数。

SD\_ERR\_STS2寄存器指示超时状态。

### 33.2.19 SD\_BUF0:SD缓冲寄存器

Base address: SDHI n 0 = 0x4009\_2000 + 0x0400 × n  
Offset address: 0x060

写入SD卡时, 写入数据写入该寄存器。从SD卡读取时, 从该寄存器读取读取的数据。该寄存器在内部连接到两个512字节的缓冲区。

如果执行多块读取时两个缓冲区都不为空, 则停止SD卡MMC时钟以暂停接收数据。当其中一个缓冲区为空时, 提供SD卡MMC时钟以恢复接收数据。

## 33.2.20 SDIO\_MODE : SDIO Mode Control Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x068

|                    |    |    |    |    |    |    |            |       |    |    |    |    |    |           |    |       |

| Bit position:      | 31 | 30 | 29 | 28 | 27 | 26 | 25         | 24    | 23 | 22 | 21 | 20 | 19 | 18        | 17 | 16    |
| Bit field:         | —  | —  | —  | —  | —  | —  | —          | —     | —  | —  | —  | —  | —  | —         | —  | —     |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0          | 0     | 0  | 0  | 0  | 0  | 0  | 0         | 0  | 0     |
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9          | 8     | 7  | 6  | 5  | 4  | 3  | 2         | 1  | 0     |
| Bit field:         | —  | —  | —  | —  | —  | —  | C52P<br>UB | IOABT | —  | —  | —  | —  | —  | RWRE<br>Q | —  | INTEN |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0          | 0     | 0  | 0  | 0  | 0  | 0  | 0         | 0  | 0     |

| Bit   | Symbol | Function   | R/W |
|-------|--------|--|-----|
| 0     | INTEN  | SDIO Interrupt Acceptance Enable*1<br>0: Disable SDIO interrupt acceptance<br>1: Enable SDIO interrupt acceptance  | R/W |
| 1     | —      | This bit is read as 0. The write value should be 0.  | R/W |
| 2     | RWREQ  | Read Wait Request<br>0: Allow SD/MMC to exit read wait state<br>1: Request for SD/MMC to enter read wait state   | R/W |
| 7:3   | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 8     | IOABT  | SDIO Abort<br>If this bit is set to 1 during multiblock transfer triggered by CMD53, CMD52 is immediately issued, and the command sequence is aborted.                                   | R/W |
| 9     | C52PUB | SDIO None Abort<br>If this bit is set to 1 during multiblock transfer triggered by CMD53, CMD52 is issued after the transfer process is complete, and the command sequence is completed. | R/W |
| 31:10 | —      | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. Do not rewrite this bit when the SD\_INFO2.CBSY flag is 1.

The SDIO\_MODE register controls reception of the SDIO interrupt, CMD52 issuance during multiblock transfer, and read wait request. Do not set bits C52PUB and IOABT to 1 at the same time.

**RWREQ bit (Read Wait Request)**

When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks.

[Read wait state releasing]

- The read wait state is released, when RWREQ is cleared to 0 in the read wait state.
- When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 is issued, and then the read wait state is released.
- When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. You must set RWREQ and C52PUB simultaneously.

When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag sets.

**IOABT bit (SDIO Abort)**

When the IOABT bit is set to 1 in a CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communication error or timeout, CMD52 is not issued.

## 33.2.20 SDIO\_MODE:SDIO模式控制寄存器

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x068

|               |    |    |    |    |    |    |            |       |    |    |    |    |    |           |    |       |
|---------------|----|----|----|----|----|----|------------|-------|----|----|----|----|----|-----------|----|-------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25         | 24    | 23 | 22 | 21 | 20 | 19 | 18        | 17 | 16    |
| Bit field:    | —  | —  | —  | —  | —  | —  | —          | —     | —  | —  | —  | —  | —  | —         | —  | —     |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0          | 0     | 0  | 0  | 0  | 0  | 0  | 0         | 0  | 0     |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9          | 8     | 7  | 6  | 5  | 4  | 3  | 2         | 1  | 0     |
| Bit field:    | —  | —  | —  | —  | —  | —  | C52P<br>UB | IOABT | —  | —  | —  | —  | —  | RWRE<br>Q | —  | INTEN |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0          | 0     | 0  | 0  | 0  | 0  | 0  | 0         | 0  | 0     |

| Bit   | Symbol | Function  | R/W |
|-------|--------|---|-----|
| 0     | INTEN  | SDIO中断接受使能*1<br>0: 禁止SDIO中断接受1: 使能SDIO中<br>断接受                    | R/W |
| 1     | —      | 该位读取为0。写入值应为0。  | R/W |
| 2     | RWREQ  | 读取等待请求<br>0: 允许SDMMC退出读取等待状态1: 请求SDM<br>MC进入读取等待状态                | R/W |
| 7:3   | —      | 这些位被读取为0。写入值应为0。  | R/W |
| 8     | IOABT  | SDIO Abort<br>如果在CMD53触发的多块传输期间该位设置为1, 则立即发出CMD52, 并中止命令序列。       | R/W |
| 9     | C52PUB | SDIO无中止<br>如果在CMD53触发的多块传输期间该位设置为1, 则在传输过程完成后发出CMD52, 命令<br>序列完成。 | R/W |
| 31:10 | —      | 这些位被读取为0。写入值应为0。  | R/W |

注1.当SD\_INFO2.CBSY标志为1时, 请勿重写该位。

SDIO\_MODE寄存器控制SDIO中断的接收、多块传输期间CMD52的发布和读取等待请求。不要同时将位C52PUB和IOABT设置为1。

**RWREQ位 (读取等待请求)**

当CMD53 (多块) 读取序列中RWREQ设置为1时, 块传输进入块之间的读取等待状态。

[读取等待状态释放]

- 在读取等待状态下, 当RWREQ被清0时, 读等待状态被释放。
- 读等待状态下IOABT置1时, 发出CMD52后RWREQ自动清0, 然后解除读等待状态。
- 当C52PUB和RWREQ在CMD53 (多块) 读序列中同时置1时, 读等待状态不会自动解除。因此, 在收到CMD52响应后, 清除RWREQ。您必须同时设置RWREQ和C52PUB。

当RWREQ设置为1时CMD53 (多块) 读取序列中的最后一个块被传输时, 不会进入读取等待状态, 并且通过设置访问结束将RWREQ自动清除为0。设置响应结束标志后将RWREQ设置为1。

**IOABT bit (SDIO Abort)**

当CMD53 (多块) 序列中的IOABT位设置为1时, CMD53序列停止并发出CMD52。但是, 如果命令序列由于通信错误或超时而停止, 则不会发出CMD52。

Although continued buffer access is possible even after IOABT is set to 1, the buffer access error bit (ILR or ILW) in SD\_INFO2 is set accordingly. Set SD\_ARG before setting IOABT to 1.

When IOABT is set to 1 during transfer for a single block write, the access end flag sets when SD\_BUF0 becomes empty, and CMD52 is not issued. If SD\_BUF0 contains data, the access end flag sets on completion of reception of the busy state without CMD52 being issued.

When IOABT is set to 1 during transfer for single block read, the access end flag sets immediately after IOABT is set, and CMD52 is not issued.

When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag sets on completion of reception of the busy state without CMD52 being issued.

When IOABT is set to 1 after a command sequence is completed, CMD52 is not issued and the access end flag does not set.

Set IOABT to 1 after the response end flag sets.

Set IOABT to 0 after the access end flag sets.

### C52PUB bit (SDIO None Abort)

When the C52PUB bit is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD\_BUF0 becomes empty. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag sets to 1.

When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag sets to 1.

If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, you must set RWREQ to 1 in addition to C52PUB.

Set SD\_ARG before setting C52PUB to 1.

Set C52PUB to 1 after the response end flag sets.

### 33.2.21 SDIO\_INFO1 : SDIO Interrupt Flag Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x06C

|                    |                 |                 |    |    |    |    |    |    |    |    |    |    |    |    |    |                 |

| Bit   | Symbol  | Function  | R/W                 |
|-------|---------|---|---------------------|
| 0     | IOIRQ   | SDIO Interrupt Status Flag<br>0: No SDIO interrupt detected<br>1: SDIO interrupt detected | R/(W) <sup>*2</sup> |
| 2:1   | —       | The read values are undefined. The write value should be 1.                               | R/W                 |
| 13:3  | —       | These bits are read as 0. The write value should be 0.                                    | R/W                 |
| 14    | EXPUB52 | EXPUB52 Status Flag<br>Indicates the status of the EXPUB52.                               | R/(W) <sup>*2</sup> |
| 15    | EXWT    | EXWT Status Flag<br>Indicates the status of the EXWT.                                     | R/(W) <sup>*2</sup> |
| 31:16 | —       | These bits are read as 0. The write value should be 0.                                    | R/W                 |

尽管即使在IOABT设置为1后仍可以继续访问缓冲区，但缓冲区访问错误位 (ILR或ILW) 在 SD\_INFO2相应设置。在将IOABT设置为1之前设置SD\_ARG。

当IOABT在单块写入传输期间设置为1时，SD\_BUF0变为空时设置访问结束标志，并且不发出CMD52。如果SD\_BUF0包含数据，则在未发出CMD52的忙状态接收完成时设置访问结束标志。

当IOABT在单块读取传输期间设置为1时，在设置IOABT后立即设置访问结束标志，并且未发出CMD52。

如果在R1b响应后接收忙碌状态期间将IOABT设置为1，则在未发出CMD52的情况下完成忙碌状态接收时设置访问结束标志。

当命令序列完成后IOABT设置为1时，不发出CMD52并且不设置访问结束标志。

设置响应结束标志后将IOABT设置为1。

设置访问结束标志后将IOABT设置为0。

### C52PUB位 (SDIO无中止)

在CMD53 (多块) 写入序列中将C52PUB位设置为1时，如果SD\_BUF0为空，则在块之间自动发出CMD52。C52PUB在接收到对CMD52的响应完成后自动清零。此外，如果在传输最后一个块时将C52PUB设置为1，则不会发出CMD52。在这种情况下，访问结束标志设置为1后，C52PUB自动清零。

当CMD53 (多块) 读序列中C52PUB和RWREQ置1时，块传输进入块间读等待状态，自动发出CMD52。C52PUB在接收到对CMD52的响应完成后自动清零。此外，如果在传输最后一个块时将C52PUB设置为1，则不会发出CMD52。在这种情况下，访问结束标志设置为1后，C52PUB自动清零。

如果在CMD53 (多块) 读取序列中将C52PUB设置为1，则除了C52PUB之外，还必须将RWREQ设置为1。

在将C52PUB设置为1之前设置SD\_ARG。

在响应结束标志设置后将C52PUB设置为1。

### 33.2.21 SDIO\_INFO1:SDIO中断标志 寄存器

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x06C

|               |                 |                 |    |    |    |    |    |    |    |    |    |    |    |    |    |       |                 |

| 15    | EXWT    | EXWT状态标志<br>指示EXWT的状态。                  | R/(W) <sup>*2</sup> |
| 31:16 | —       | 这些位被读取为0。写入值应为0。                        | R/W                 |

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT\_RST.SDRST flag.  
 Note 2. Only 0 can be written to clear the bit.

The SDIO\_INFO1 register indicates the status of the SDIO card access. Set flags to be cleared to 0. Set flags that are not being cleared to 1.

**IOIRQ flag (SDIO Interrupt Status Flag)**

The IOIRQ flag indicates that an SDIO interrupt occurred.

[Setting condition]

- When SDIO interrupt from an SDIO card is received while INTEN in SDIO\_MODE is set to 1.

[Clearing condition]

- When 0 is written to IOIRQ.\*1

Note 1. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit can be set again.

**EXPUB52 flag (EXPUB52 Status Flag)**

The EXPUB52 flag indicates the EXPUB52 status.

[Setting conditions]

- While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO\_MODE is set to 1.
- While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred.

[Clearing condition]

- When 0 is written to EXPUB52.

**EXWT flag (EXWT Status Flag)**

The EXWT flag indicates the EXWT status.

[Setting condition]

- While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO\_MODE is set to 1.

[Clearing condition]

- When 0 is written to EXWT.

**33.2.22 SDIO\_INFO1\_MASK : SDIO INFO1 Interrupt Mask Register**

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x070

|                    |           |              |    |    |    |    |    |    |    |    |    |    |    |    |    |            |
|--------------------|-----------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|
| Bit position:      | 31        | 30           | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16         |
| Bit field:         | —         | —            | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —          |
| Value after reset: | 0         | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0          |

| Bit field:         | EXWT<br>M | EXPU<br>B52M | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | IOIRQ<br>M |
| Value after reset: | 1         | 1            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 1          |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | IOIRQM | IOIRQ Interrupt Mask Control<br>0: Do not mask IOIRQ interrupts<br>1: Mask IOIRQ interrupts | R/W |
| 2:1 | —      | These bits are read as 1. The write value should be 1.                                      | R/W |

注1.该值由复位初始化，并且在由SOFT\_RST.SDRST标志触发的复位时初始化。  
 注2.只能写入0来清除该位。

SDIO\_INFO1寄存器指示SDIO卡访问的状态。将要清除的标志设置为0。将未清除的标志设置为1。

**IOIRQ标志 (SDIO中断状态标志)**

IOIRQ标志表示发生了SDIO中断。

[Setting condition]

- 当SDIO\_MODE中的INTEN设置为1时，接收到来自SDIO卡的SDIO中断。

[Clearing condition]

- 0写入IOIRQ时。\*1

注1.在清除该位之前，访问SDIO卡以否定来自SDIO卡的SDIO中断信号。如果中断信号没有被否定，这个位可以被重新设置。

**EXPUB52标志 (EXPUB52状态标志)**

EXPUB52标志指示EXPUB52状态。

[Setting conditions]

- 当CMD53 (多块) 序列中的最后一个块被传输时，SDIO\_MODE中的C52PUB设置为1。
- 在CMD53 (多块) 写入序列中，当C52PUB设置为1时，传输最后一个块。

[Clearing condition]

- 当0写入EXPUB52时。

**EXWT标志 (EXWT状态标志)**

EXWT标志指示EXWT状态。

[Setting condition]

- 当CMD53 (多块) 读取序列中的最后一个块被传输时，SDIO\_MODE中的RWREQ设置为1。

[Clearing condition]

- 当0写入EXWT时。

**33.2.22 SDIO\_INFO1\_MASK:SDIOINFO1中断屏蔽寄存器**

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x070

|               |           |              |    |    |    |    |    |    |    |    |    |    |    |    |    |            |
|---------------|-----------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|
| Bit position: | 31        | 30           | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16         |

| 重置后的值:        | 0         | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0          |
| Bit position: | 15        | 14           | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0          |
| Bit field:    | EXWT<br>M | EXPU<br>B52M | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | IOIRQ<br>M |
| 重置后的值:        | 1         | 1            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 1          |

| Bit | Symbol | Function                                 | R/W |
|-----|--------|--|-----|
| 0   | IOIRQM | IOIRQ中断屏蔽控制<br>0: 不屏蔽IOIRQ中断1: 屏蔽IOIRQ中断 | R/W |
| 2:1 | —      | 这些位被读取为1。写入值应为1。                         | R/W |

| Bit   | Symbol   | Function  | R/W |
|-------|----------|---|-----|
| 13:3  | —        | These bits are read as 0. The write value should be 0.  | R/W |
| 14    | EXPUB52M | EXPUB52 Interrupt Request Mask Control<br>0: Do not mask EXPUB52 interrupt requests<br>1: Mask EXPUB52 interrupt requests | R/W |
| 15    | EXWTM    | EXWT Interrupt Request Mask Control<br>0: Do not mask EXWT interrupt requests<br>1: Mask EXWT interrupt requests          | R/W |
| 31:16 | —        | These bits are read as 0. The write value should be 0.  | R/W |

The SDIO\_INFO1\_MASK register enables or disables interrupt requests from the status flags in the SDIO\_INFO1 register. See Table 33.5 for details on the relationship between the status flags and the requested interrupt source.

### 33.2.23 SD\_DMAEN : DMA Mode Enable Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x1B0

|                    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |       |    |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|
| Bit position:      | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17    | 16 |
| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —     | —  |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0     | 0  |
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1     | 0  |
| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | DMAEN | —  |
| Value after reset: | 0  | 0  | 0  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 0  | 0     | 0  |

| Bit   | Symbol | Function  | R/W |
|-------|--------|---|-----|
| 0     | —      | This bit is read as 0. The write value should be 0.   | R/W |
| 1     | DMAEN  | DMA Transfer Enable <sup>*1 *2</sup><br>0: Disable use of DMA transfer to access SD_BUF0 register<br>1: Enable use of DMA transfer to access SD_BUF0 register | R/W |
| 3:2   | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 4     | —      | This bit is read as 1. The write value should be 1.   | R/W |
| 11:5  | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 12    | —      | This bit is read as 1. The write value should be 1.   | R/W |
| 31:13 | —      | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. Do not rewrite this bit when the SD\_INFO2.CBSY bit is 1.

Note 2. When the SD\_INFO2\_MASK.BWEM bit is 0 or the SD\_INFO2\_MASK.BREM bit is 0, set the SD\_DMAEN.DMAEN bit to 0. When the SD\_DMAEN.DMAEN bit is 1, set the SD\_INFO2\_MASK.BWEM bit to 1 and the SD\_INFO2\_MASK.BREM bit to 1.

The SD\_DMAEN register enables or disables DMA transfers.

#### DMAEN bit (DMA Transfer Enable)

When using DMA transfer to access the SD buffer, set the DMAEN bit to 1 before setting the SD\_CMD register.

| Bit   | Symbol   | Function   | R/W |
|-------|----------|--|-----|
| 13:3  | —        | 这些位被读取为0。写入值应为0。                                     | R/W |
| 14    | EXPUB52M | EXPUB52中断请求屏蔽控制<br>0: 不屏蔽EXPUB52中断请求1: 屏蔽EXPUB52中断请求 | R/W |
| 15    | EXWTM    | EXWT中断请求屏蔽控制<br>0: 不屏蔽EXWT中断请求1: 屏蔽EXWT中断请求          | R/W |
| 31:16 | —        | 这些位被读取为0。写入值应为0。                                     | R/W |

SDIO\_INFO1\_MASK寄存器启用或禁用来自SDIO\_INFO1寄存器中状态标志的中断请求。有关状态标志和请求中断源之间关系的详细信息，请参见表33.5。

### 33.2.23 SD\_DMAEN:DMA模式使能寄存器

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x1B0

|               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |       |    |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17    | 16 |
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —     | —  |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0     | 0  |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1     | 0  |
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | DMAEN | —  |
| 重置后的值:        | 0  | 0  | 0  | 1  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 1  | 0  | 0     | 0  |

| Bit   | Symbol | Function  | R/W |
|-------|--------|---|-----|
| 0     | —      | 该位读取为0。写入值应为0。  | R/W |
| 1     | DMAEN  | DMA传输启用*1*2<br>0: 禁止使用DMA传输访问SD_BUF0寄存器1: 启用使用DMA传输访问SD_BUF0寄存器 | R/W |
| 3:2   | —      | 这些位被读取为0。写入值应为0。  | R/W |
| 4     | —      | 该位读取为1。写入值应为1。  | R/W |
| 11:5  | —      | 这些位被读取为0。写入值应为0。  | R/W |
| 12    | —      | 该位读取为1。写入值应为1。  | R/W |
| 31:13 | —      | 这些位被读取为0。写入值应为0。  | R/W |

注1.当SD\_INFO2.CBSY位为1时，请勿重写该位。

注2.当SD\_INFO2\_MASK.BWEM位为0或SD\_INFO2\_MASK.BREM位为0时，将SD\_DMAEN.DMAEN位设置为0。当SD\_DMAEN.DMAEN位为1时，将SD\_INFO2\_MASK.BWEM位设置为1和SD\_INFO2\_MASK.BREM位为1。

SD\_DMAEN寄存器启用或禁用DMA传输。

#### DMAEN位 (DMA传输使能)

使用DMA传输访问SD缓冲区时，在设置SD\_CMD寄存器之前将DMAEN位设置为1。

33.2.24 SOFT\_RST : Software Reset Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x1C0

33.2.25 SDIF\_MODE:SD接口模式设置寄存器

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n  
 Offset address: 0x1CC

|               |    |    |    |    |    |    |    |                |    |    |    |    |    |    |    |    |
|---------------|----|----|----|----|----|----|----|----------------|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24             | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —              | —  | —  | —  | —  | —  | —  | —  | —  |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8              | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | NOCHKCR        | —  | —  | —  | —  | —  | —  | —  | —  |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0 <sup>1</sup> | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit  | Symbol  | Function   | R/W |
|------|---------|--|-----|
| 7:0  | —       | These bits are read as 0. The write value should be 0.   | R/W |
| 8    | NOCHKCR | CRC Check Mask<br>CRC check mask bit for MMC test commands. Set when CRC16 or CRC status value check is not executed.<br>0: Enable CRC check<br>1: Disable CRC Check (ignore CRC16 valued when reading and ignore CRC status value when writing) | R/W |
| 31:9 | —       | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT\_RST.SDRST flag.

#### NOCHKCR bit (CRC Check Mask)

The NOCHKCR bit is used for MMC test commands. This bit is set when CRC16 or CRC status value check is not executed.

### 33.2.26 EXT\_SWAP : Swap Control Register

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x1E0

| Bit position:      | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23        | 22        | 21 | 20 | 19 | 18 | 17 | 16 |
|--------------------|----|----|----|----|----|----|----|----|-----------|-----------|----|----|----|----|----|----|
| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | —         | —         | —  | —  | —  | —  | —  | —  |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0         | 0         | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7         | 6         | 5  | 4  | 3  | 2  | 1  | 0  |
| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | BRSW<br>P | BWS<br>WP | —  | —  | —  | —  | —  | —  |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0         | 0         | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 5:0  | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 6    | BWSWP  | SD_BUF0 Swap Write*1<br>0: Normal write operation<br>1: Swap the byte endian order before writing to SD_BUF0 register | R/W |
| 7    | BRSWP  | SD_BUF0 Swap Read*1<br>0: Normal read operation<br>1: Swap the byte endian order before reading SD_BUF0 register      | R/W |
| 31:8 | —      | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. Do not rewrite this bit when the SD\_INFO2.CBSY flag is 1.

The EXT\_SWAP register selects whether or not the byte endian order is swapped when accessing the SD\_BUF0 register. See [section 33.3.1. SD/MMC Interface](#) for details on the differences in accessing the SD\_BUF0 register based on the EXT\_SWAP register value.

### 33.3 Operation

#### 33.3.1 SD/MMC Interface

When data is read from the SD card/MMC, the process is as follows:

1. The SD/MMC Host Interface receives data from the SD card/MMC through the SDnDAT signal (see [Figure 33.2](#) and [Figure 33.3](#)).
2. The received data is stored in SD\_BUF of the MMC Host Interface (see [Figure 33.4](#)).
3. The data stored in SD\_BUF is read from SD\_BUF0 (see [Figure 33.5](#)).

| Bit  | Symbol  | Function  | R/W |
|------|---------|---|-----|
| 7:0  | —       | 这些位被读取为0。写入值应为0。  | R/W |
| 8    | NOCHKCR | CRC校验掩码<br>MMC测试命令的CRC校验掩码位。不执行CRC16或CRC状态值检查时置位。<br>0: 启用CRC校验 1: 禁用CRC校验 (读取时忽略CRC16值, 写入时忽略CRC状态值) | R/W |
| 31:9 | —       | 这些位被读取为0。写入值应为0。  | R/W |

注1.该值由复位初始化,并且在由SOFT\_RST.SDRST标志触发的复位时初始化。

#### NOCHKCR位 (CRC校验掩码)

NOCHKCR位用于MMC测试命令。当不执行CRC16或CRC状态值检查时,该位置位。

### 33.2.26 EXT\_SWAP:交换控制寄存器

Base address: SDHI<sub>n</sub> 0 = 0x4009\_2000 + 0x0400 × n

Offset address: 0x1E0

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23        | 22        | 21 | 20 | 19 | 18 | 17 | 16 |
|---------------|----|----|----|----|----|----|----|----|-----------|-----------|----|----|----|----|----|----|
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —  | —         | —         | —  | —  | —  | —  | —  | —  |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0         | 0         | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7         | 6         | 5  | 4  | 3  | 2  | 1  | 0  |
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —  | BRSW<br>P | BWS<br>WP | —  | —  | —  | —  | —  | —  |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0         | 0         | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 5:0  | —      | 这些位被读取为0。写入值应为0。                                    | R/W |
| 6    | BWSWP  | SD_BUF0交换写入*1<br>0: 正常写操作 1: 在写入SD_BUF0寄存器之前交换字节顺序  | R/W |
| 7    | BRSWP  | SD_BUF0交换读取*1<br>0: 正常读取操作 1: 在读取SD_BUF0寄存器之前交换字节顺序 | R/W |
| 31:8 | —      | 这些位被读取为0。写入值应为0。                                    | R/W |

注1.当SD\_INFO2.CBSY标志为1时,请勿重写该位。

EXT\_SWAP寄存器选择在访问SD\_BUF0寄存器时是否交换字节顺序。请参阅第33.3.1节。SDMMC接口了解访问SD\_BUF0寄存器的差异的详细信息,基于EXT\_SWAP寄存器值。

### 33.3 Operation

#### 33.3.1 SD/MMC Interface

从SD卡MMC读取数据时,流程如下:

- 1.SDMMC主机接口通过SDnDAT信号从SD卡MMC接收数据(参见图33.2和[Figure 33.3](#))。
- 2.接收到的数据存储在MMC主机接口的SD\_BUF中(见图33.4)。
- 3.SD\_BUF中存储的数据从SD\_BUF0中读取(见图33.5)。

When data is written to the SD card/MMC, the specified procedure is reversed.

When accessing SD\_BUF0, pay attention to the transfer order in SDnDAT and the store order in SD\_BUF. If required, you can change the byte endian of the data read from or written to SD\_BUF0 using the SDSWAP register. See Figure 33.6.

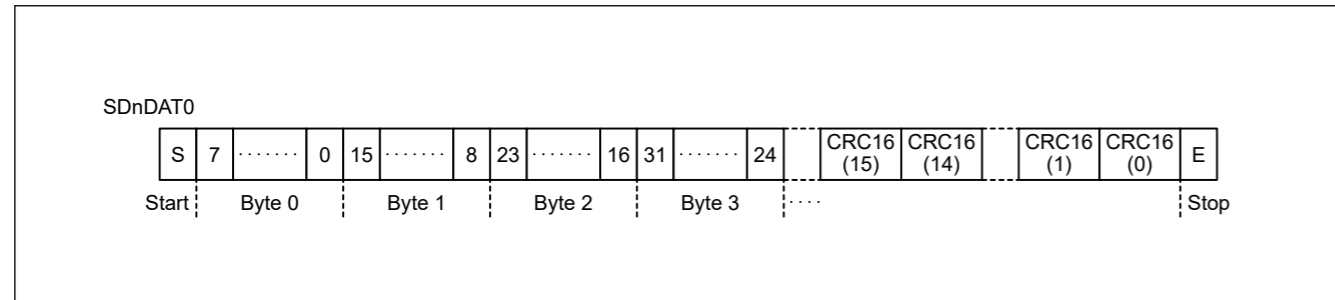

Figure 33.2 SDnDAT in 1-bit width mode

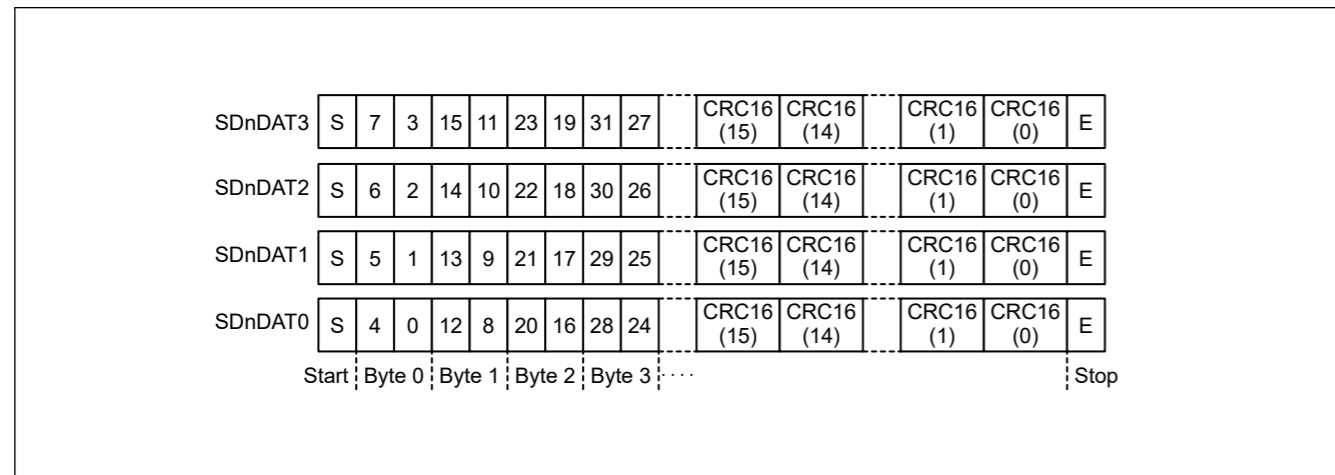

Figure 33.3 SDnDAT in 4-bit width mode

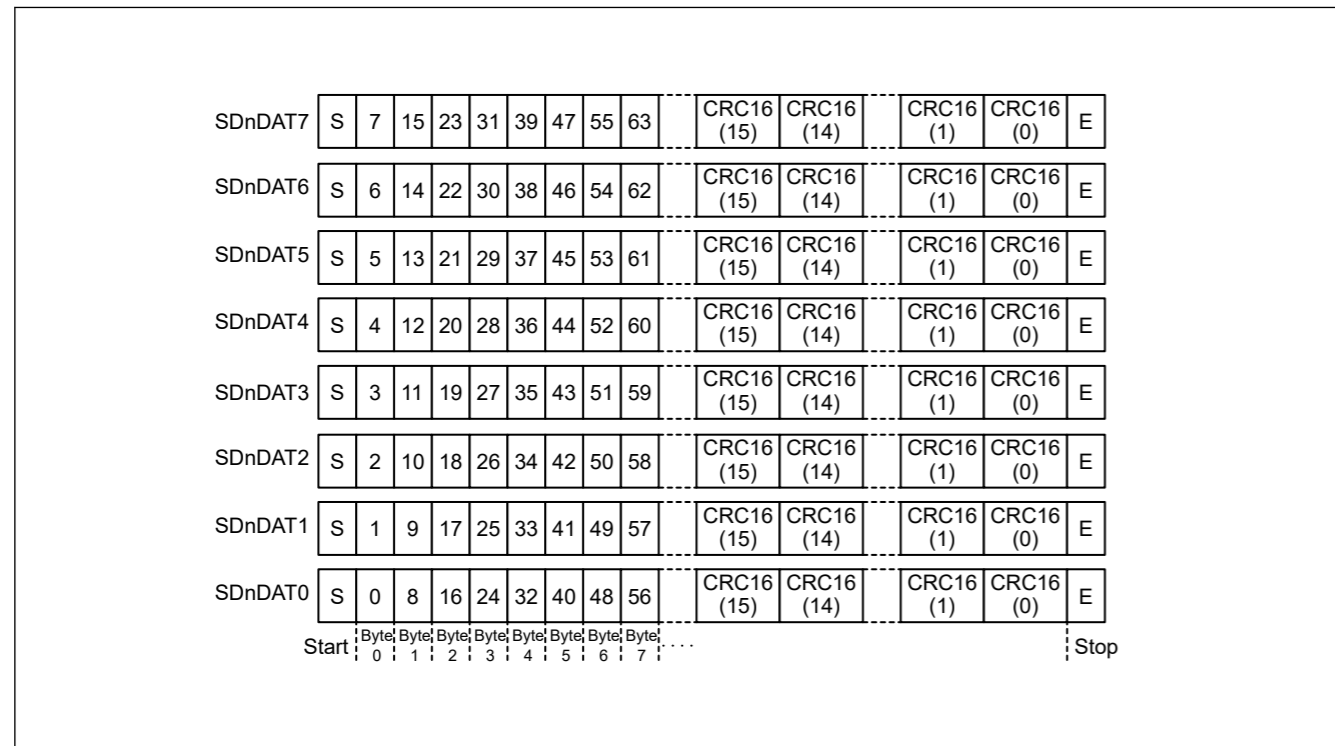

Figure 33.4 SDnDAT in 8-bit width mode

当数据写入SD卡MMC时，指定的过程相反。

访问SD\_BUF0时，注意SDnDAT中的传输顺序和SD\_BUF中的存储顺序。如果需要，您可以使用SDSWAP寄存器更改从SD\_BUF0读取或写入数据的字节字节序。请参见图33.6。

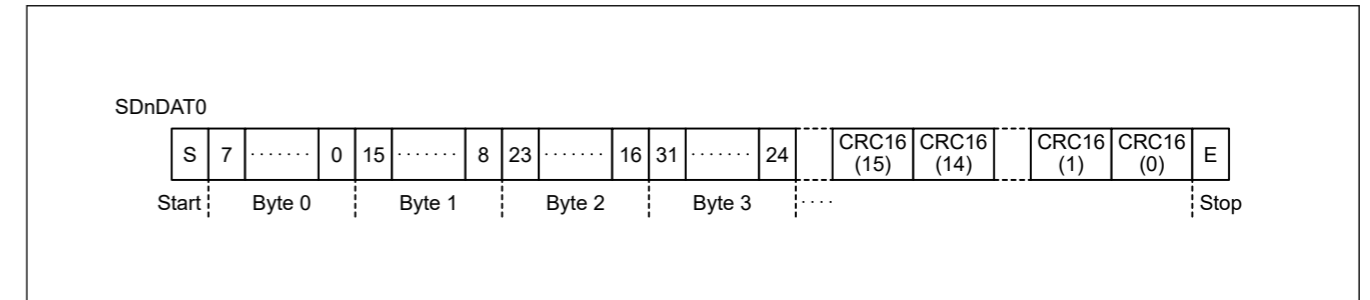

Figure 33.2 SDnDAT在1位宽模式下

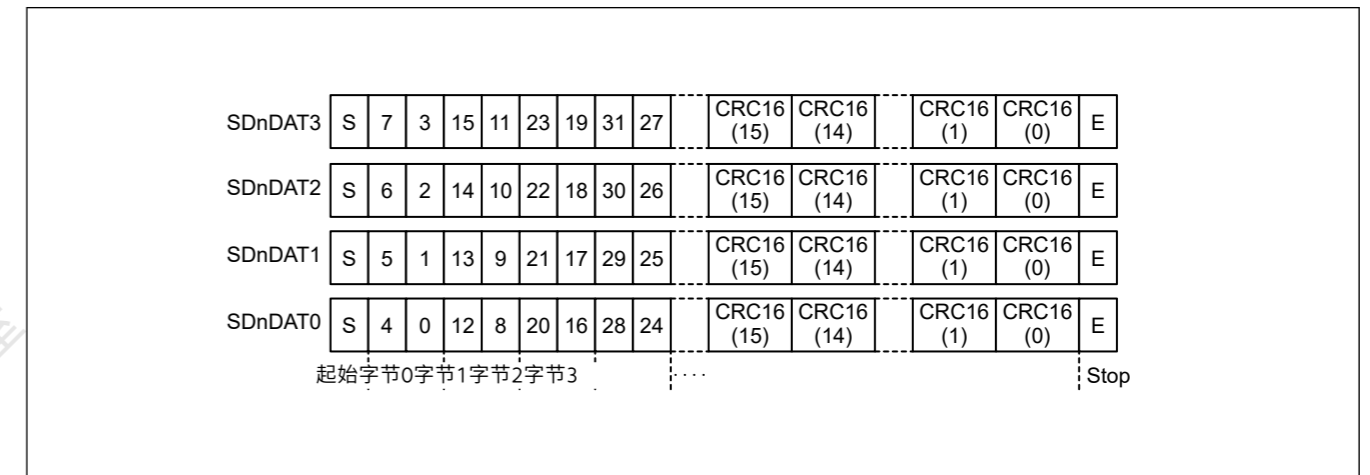

Figure 33.3 SDnDAT在4位宽模式下

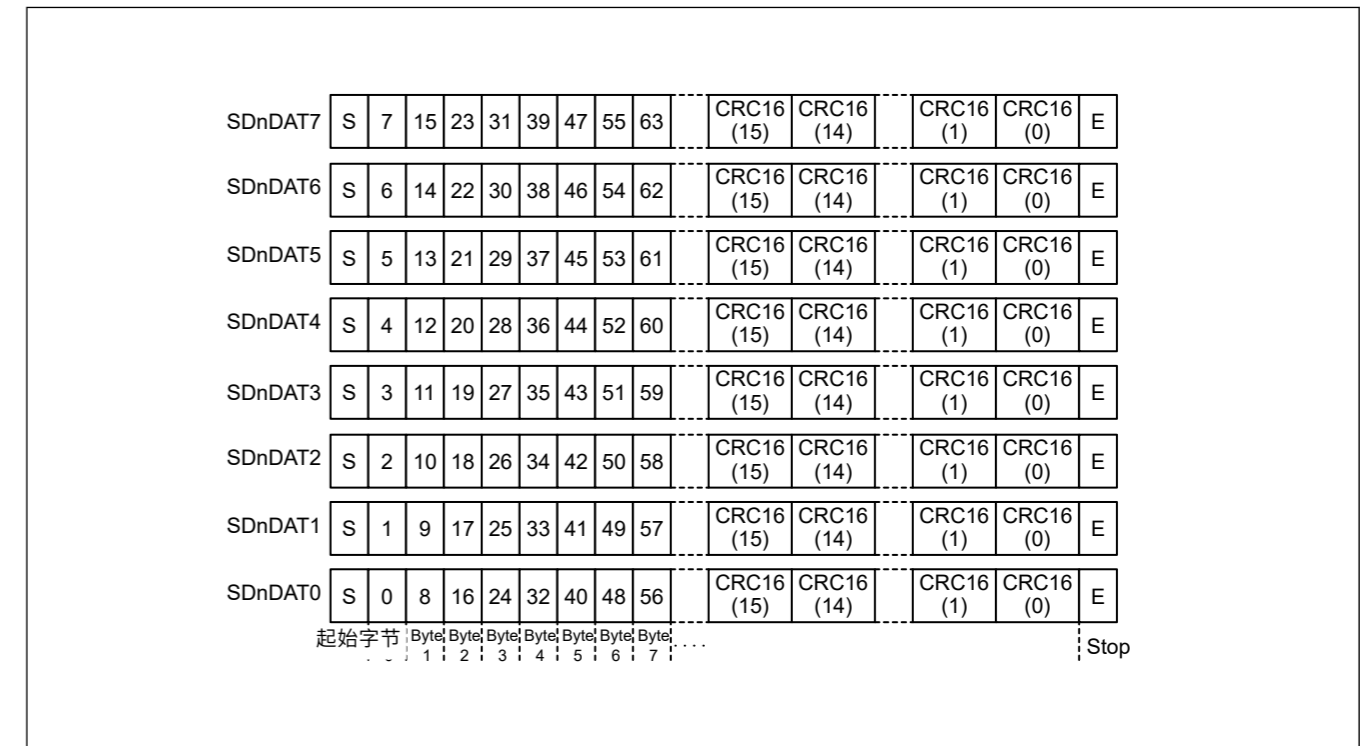

Figure 33.4 SDnDAT在8位宽度模式下

Figure 33.5 SD\_BUF store data

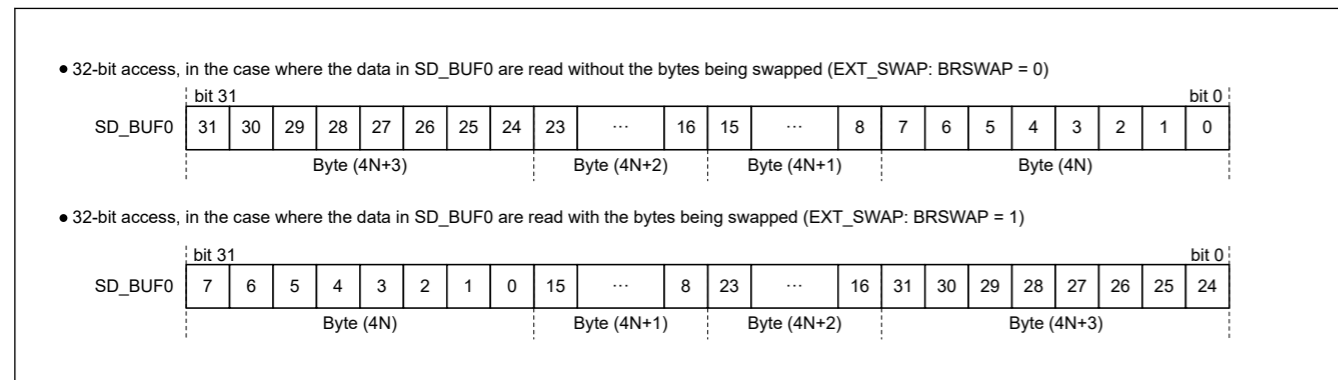

Figure 33.6 Read from SD\_BUF0

### 33.3.2 Card Detect/Write Protect

#### 33.3.2.1 Card detect

The SD/MMC Host Interface has two types of card detect functions.

##### (1) Card detect with SDnCD (n = 0)

Figure 33.7 shows the timing for card detect using SDnCD. SDnCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is determined by the specification of the SD/MMC host device.

##### (2) Card insertion

SDnCD is pulled down when a card is inserted. At this point, if SDnCD is pulled down for the Mcycle period (set in SD\_OPTION), SDCDIN in SD\_INFO1 is set to 1. It is cleared by writing 0.

##### (3) Card removal

SDnCD is pulled up when a card is removed. At this point, if SDnCD is pulled up for the Mcycle period (set in SD\_OPTION), SDCDRM in SD\_INFO1 is set to 1. It is cleared by writing 0.

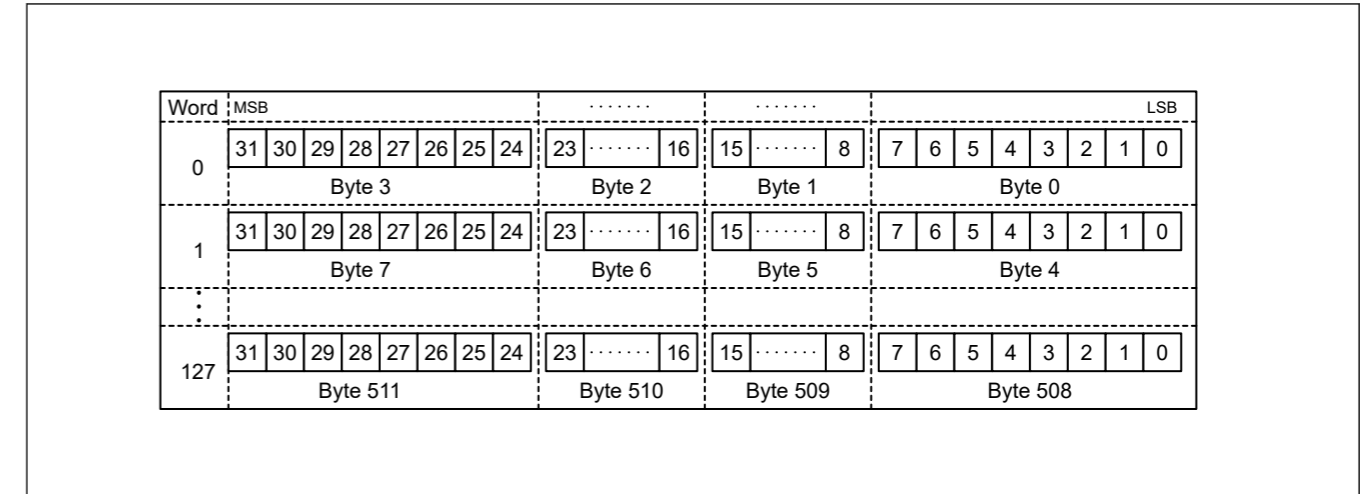

Figure 33.5 SD\_BUF存储数据

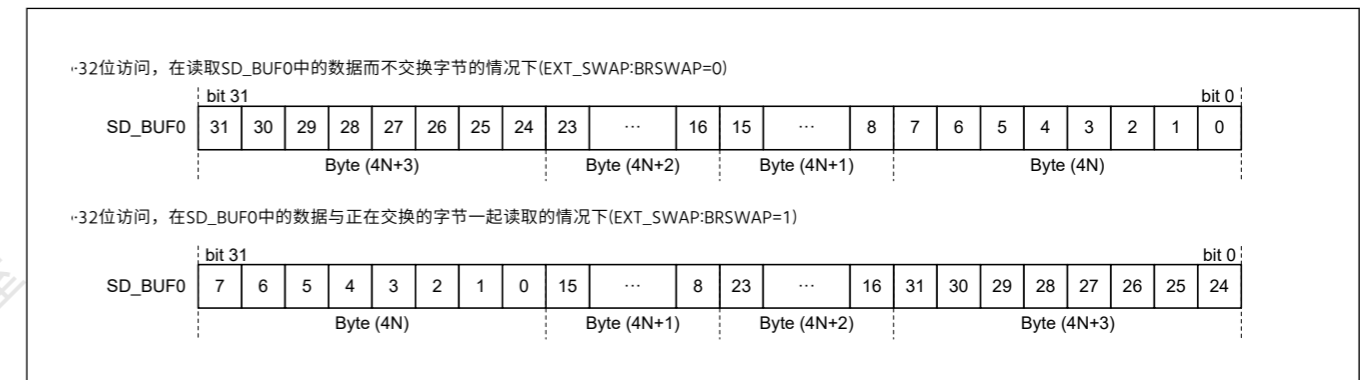

Figure 33.6 从SD\_BUF0读取

### 33.3.2 卡检测写保护

#### 33.3.2.1 卡检测

SDMMC主机接口有两种类型的卡检测功能。

##### (1) SDnCD卡检测(n=0)

图33.7显示了使用SDnCD进行卡检测的时序。SDnCD连接到卡插槽并在主机设备上拉高。上拉电阻的阻值由SDMMC主机设备的规格决定。

##### (2) 插卡

SDnCD在插入卡时被拉下。此时，如果SDnCD被下拉Mcycle周期（设置在SD\_OPTION），SD\_INFO1中的SDCDIN设置为1。写入0清除。

##### (3) 取卡

取出卡时，SDnCD被拉起。此时，如果SDnCD被拉高了Mcycle周期（设置在SD\_OPTION），SD\_INFO1中的SDCDRM设置为1，写入0清零。

Figure 33.7 Example of card detect with SDnCD

(4) SD card detect with SDnDAT3 (n = 0)

Figure 33.8 shows the timing when the SD card is detected with SDnDAT3. In addition, SDnDAT3 is pulled down by the host device, and the resistance value for pulling down is determined by the specification of the SD host device.

(5) Card insertion

When an SD card is inserted, SDnDAT3 is pulled up and SDD3IN in SD\_INFO1 is set to 1. It is cleared by writing 0.

(6) Card removal

When an SD card is removed, SDnDAT3 is pulled down and SDD3RM in SD\_INFO1 is set to 1. It is cleared by writing 0.

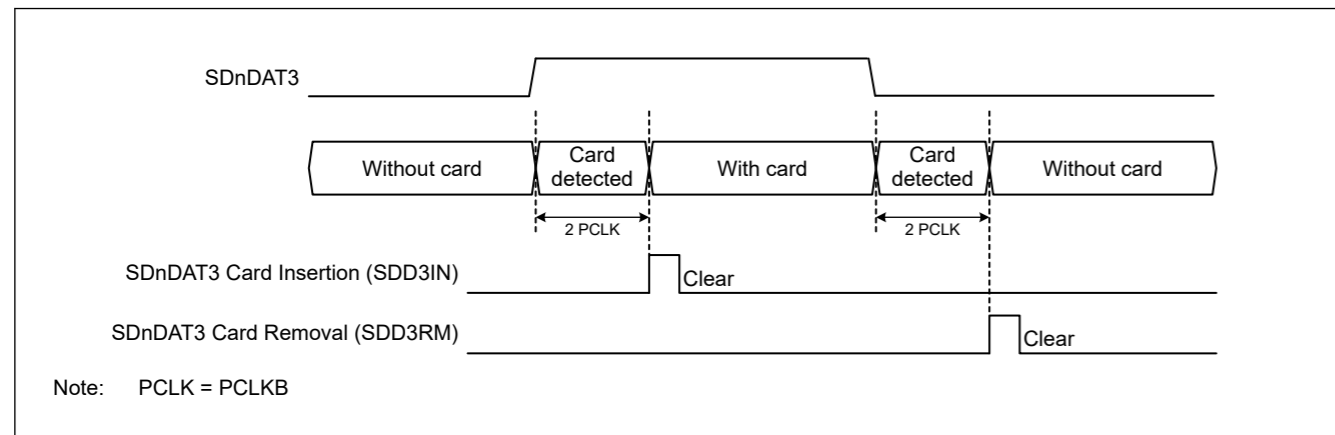

Figure 33.8 SD card detect with SDnDAT3

33.3.2.2 Write protect

The SD/MMC Host Interface has two types of write protect functions.

(1) Write protect with SDnWP (n = 0)

SDnWP is connected to the card socket and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is determined by the specification of the SD host device. When the SDnWP state is reflected to SDWPMON in SD\_INFO1, the write protect state is set after the SD card is inserted.

(2) Write protect with command

The internal write protection of the card and the lock/unlock operation of the card are realized by the command.

Figure 33.7 SDnCD卡检测示例

(4) 使用SDnDAT3(n=0)检测SD卡

图33.8显示了使用SDnDAT3检测到SD卡的时序。此外，SDnDAT3由主机设备下拉，下拉电阻值由SD主机设备的规格决定。

(5) 插卡

插入SD卡时，SDnDAT3上拉，SD\_INFO1中的SDD3IN置1，写0清零。

(6) 取卡

取出SD卡时，SDnDAT3被拉低，SD\_INFO1中的SDD3RM置1。写0清零。

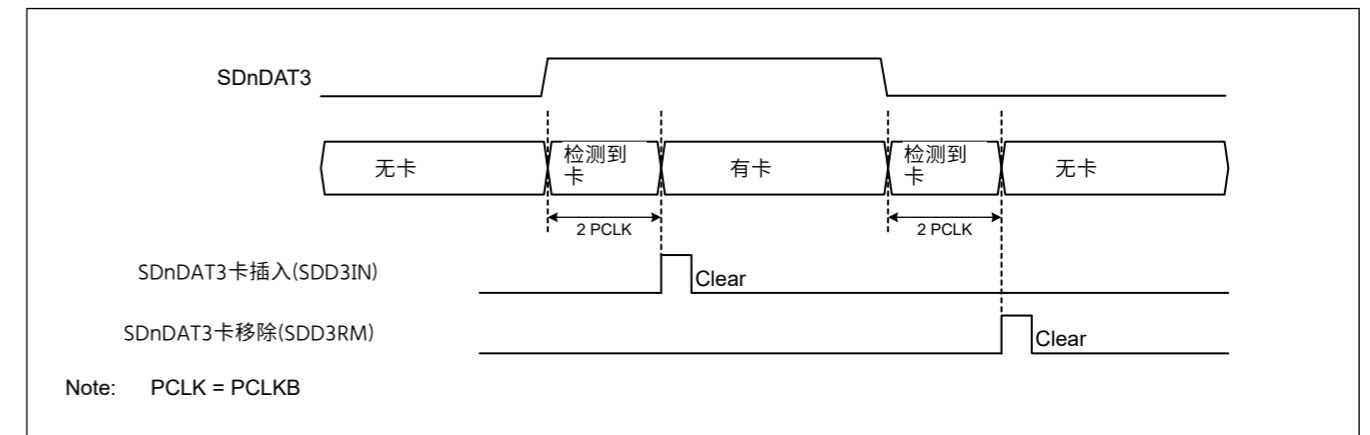

Figure 33.8 使用SDnDAT3检测SD卡

33.3.2.2 写保护

SDMMC主机接口有两种类型的写保护功能。

(1) 使用SDnWP进行写保护(n=0)

SDnWP与卡座相连，通过插卡进行上拉或下拉。上拉或下拉的选择和阻值由SD主机设备的规格决定。当SDnWP状态反映到SD\_INFO1中的SDWPMON时，插入SD卡后设置写保护状态。

(2) 用命令写保护

卡的内部写保护和卡的开锁操作都是通过命令实现的。

## 33.3.3 Interrupt Request and DMA Transfer Request

## 33.3.3.1 Interrupts

Table 33.5 lists the SDHI interrupt sources. The SDHI requests an interrupt when:

- The status flags in registers SD\_INFO1, SD\_INFO2, and SDIO\_INFO1 set to 1.
- The associated bits in the SD\_INFO1\_MASK, SD\_INFO2\_MASK, and SDIO\_INFO1\_MASK registers are 0.

When clearing the status flags in registers SD\_INFO1, SD\_INFO2, and SDIO\_INFO1, write 0 to the status flags to be cleared and write 1 to the status flags that are not being cleared.

Table 33.5 Interrupt sources

| Interrupt sources             | Status flag register |                               | Interrupt mask register |            | Interrupt name<br>Ch n (n = 0) |         |                 |          |                |
|-------------------------------|----------------------|-------------------------------|-------------------------|------------|--------------------------------|---------|-----------------|----------|----------------|
|                               | Register symbol      | Bit symbol                    | Register symbol         | Bit symbol |                                |         |                 |          |                |
| Card Access Interrupt (CACI)  | SD_INFO1             | ACEND                         | SD_INFO1_MASK           | ACENDM     | SDHI_MMCn_ACCS                 |         |                 |          |                |
|                               |                      | RSPEND                        |                         | RSPENDM    |                                |         |                 |          |                |
|                               | SD_INFO2             | ILA                           | SD_INFO2_MASK           | ILAM       |                                |         |                 |          |                |

## 33.3.3.2 DMA transfer requests (SDHI\_MMCn\_ODMSDBREQ, n = 0)

The SD/MMC Host Interface has two types of DMA transfer requests.

## (1) SD\_BUF write DMA transfer request

- When the BWE bit in SD\_INFO2 is set to 1 while the DMAEN bit in SD\_DMAEN is set to 1, the SD\_BUF write DMA transfer request is asserted.
- The SD\_BUF write DMA transfer request is negated when the last data in one block (based on the transfer data size set in SD\_SIZE) is transferred. The SD\_BUF write DMA transfer request is also negated by clearing the SDRST bit in SOFT\_RST to 0 or setting the STP bit in SD\_STOP to 1. However, if a communications error or timeout occurs at the DMA transfer, the SD\_BUF write DMA transfer request is not negated.
- The BWE bit in SD\_INFO2 is cleared after transfer of the last data in one block following a request for writing to SD\_BUF by DMA transfer.
- The number of DMA transfers must be  $n \times$  one block. (n = integer, one block = the transfer data size set in SD\_SIZE)
- When the IOABT bit in SDIO\_MODE is set to 1, the SD\_BUF write DMA transfer request is negated.

## 33.3.3 中断请求和DMA传输请求

## 33.3.3.1 Interrupts

表33.5列出了SDHI中断源。SDHI在以下情况下请求中断：

- 寄存器SD\_INFO1、SD\_INFO2和SDIO\_INFO1中的状态标志设置为1。
- SD\_INFO1\_MASK、SD\_INFO2\_MASK和SDIO\_INFO1\_MASK寄存器中的相关位为0。

清除寄存器SD\_INFO1、SD\_INFO2和SDIO\_INFO1中的状态标志时，将要清除的状态标志写入0，将未清除的状态标志写入1。

Table 33.5 中断源

| 中断源          | 状态标志寄存器  |                 | 中断屏蔽寄存器       |            | 中断名称<br>Ch n (n = 0) |         |                 |          |                |

## 33.3.3.2 DMA传输请求(SDHI\_MMCn\_ODMSDBREQ n=0)

SDMMC主机接口有两种类型的DMA传输请求。

## (1) SD\_BUF写DMA传输请求

- 当SD\_INFO2中的BWE位设置为1而SD\_DMAEN中的DMAEN位设置为1时，SD\_BUF写DMA传输请求被置位。
- 当一个块中的最后一个数据（基于SD\_SIZE中设置的传输数据大小）被传输时，SD\_BUF写DMA传输请求被否定。SD\_BUF写DMA传输请求也可以通过将SOFT\_RST中的SDRST位清0或将SD\_STOP中的STP位设置为1来取消。但是，如果通信错误或超时发生在DMA传输，SD\_BUF写DMA传输请求不被否定。
- SD\_INFO2中的BWE位在通过DMA传输向SD\_BUF写入请求后传输一个块中的最后一个数据后被清除。
- DMA传输的数量必须是 $n \times$ 1个块。（n=整数，1块=SD\_SIZE中设置的传输数据大小）
- 当SDIO\_MODE中的IOABT位设置为1时，SD\_BUF写DMA传输请求被否定。

- The DMA transfer request is also negated by clearing the DMAEN bit to 0. However, the DMA transfer request is asserted again when the DMAEN bit is set to 1 before writing to SD\_CMD.
- Because the BWE bit in SD\_INFO2 is not cleared in response to setting the STP/IOABT bit, or to a communications error or timeout, clear the bit to 0 before issuing the next command. The next request to write to SD\_BUF by DMA transfer is not issued while the BWE bit is set.

(2) SD\_BUF read DMA transfer request

- When the BRE bit in SD\_INFO2 is set to 1 while the DMAEN bit in the SD\_DMAEN register is set to 1, the SD\_BUF read DMA transfer request is asserted.
- The SD\_BUF read DMA transfer request is negated when the last data in one block (based on the transfer data size set in SD\_SIZE) is transferred. The SD\_BUF read DMA transfer request is also negated by clearing the SDRST bit in SOFT\_RST to 0 or setting the STP bit in SD\_STOP to 1. However, if a communications error or timeout occurs at the DMA transfer, the SD\_BUF read DMA transfer request is not negated.
- The BRE bit in SD\_INFO2 is cleared after transfer of the last data in one block following a request to write to SD\_BUF by DMA transfer.
- The number of DMA transfers must be n × one block. (n = integer, one block = the transfer data size set in SD\_SIZE)
- When the IOABT bit in SDIO\_MODE is set to 1, the SD\_BUF read DMA transfer request is negated.
- The DMA transfer request is also negated by clearing the DMAEN bit to 0. However, the DMA transfer request is asserted again when the DMAEN bit is set to 1 before writing to SD\_CMD.
- Because the BRE bit in SD\_INFO2 is not cleared in response to setting the STP/IOABT bit or in response to a communications error or timeout, clear the bit to 0 before issuing the next command. The next request to write to SD\_BUF by DMA transfer is not issued while the BRE bit is set.

33.3.4 Communication Errors and Timeouts

When a communication error or timeout error occurs, depending on the type of error, the associated status flag in the SD\_INFO2 register sets to 1. Also, depending on the source of the error, the associated flag in the SD\_ERR\_STS1 or SD\_ERR\_STS2 register sets to 1.

The status flags in registers SD\_ERR\_STS1 and SD\_ERR\_STS2 clear to 0 by writing to the SD\_CMD register, or by setting the SOFT\_RST.SDRST bit to 0.

Table 33.6 Communication errors

| Communication error | Interrupt flag register |            | Error status register |            | This occurs when...  |
|---------------------|-------------------------|------------|-----------------------|------------|--|
|                     | Register symbol         | Bit symbol | Register symbol       | Bit symbol |  |
| End bit error       | SD_INFO2                | ENDE       | SD_ERR_STS1           | CRCLENE    | The CRC status token length is in error  |
|                     |                         |            |                       | RDLENE     | The read data length is in error   |
|                     |                         |            |                       | RSPLNE1    | The response length is in error*1  |
|                     |                         |            |                       | RSPLNE0    | The response length is in error*2  |
| CRC error           | SD_INFO2                | CRCE       | SD_ERR_STS1           | CRCTKE     | The CRC status token is in error   |
|                     |                         |            |                       | RDCRCE     | There is a CRC error in the read data  |
|                     |                         |            |                       | RSPCRCE1   | There is a CRC error in the response*1   |
|                     |                         |            |                       | RSPCRCE0   | There is a CRC error in the response*2   |
| Command error       | SD_INFO2                | CMDE       | SD_ERR_STS1           | CMDE1      | The command index field value for the transmitted command and received response do not match*1 |
|                     |                         |            |                       | CMDE0      | The command index field value for the transmitted command and received response do not match*2 |

Note 1. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD\_CMD, CMD12 when the STP bit in SD\_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO\_MODE is set to 1.

Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD\_CMD, CMD12 when the STP bit in SD\_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO\_MODE is set to 1.

- DMA传输请求也可以通过将DMAEN位清除为0来取消。但是，当DMAEN位在写入SD\_CMD之前设置为1时，DMA传输请求会再次被断言。
- 由于SD\_INFO2中的BWE位不会因设置STPIOABT位、通信错误或超时而清除，所以在发出下一个命令之前将该位清除为0。当BWE位置位时，不会发出通过DMA传输写入SD\_BUF的下一个请求。

(2) SD\_BUF读取DMA传输请求

- 当SD\_INFO2中的BRE位设置为1且SD\_DMAEN寄存器中的DMAEN位设置为1时，SD\_BUF读取DMA传输请求被断言。
- 当一个块中的最后一个数据（基于SD\_SIZE中设置的传输数据大小）被传输时，SD\_BUF读DMA传输请求被否定。SD\_BUF读取DMA传输请求也可以通过将SOFT\_RST中的SDRST位清0或将SD\_STOP中的STP位设置为1来取消。但是，如果通信错误或超时发生在DMA传输，SD\_BUF读DMA传输请求不被否定。
- SD\_INFO2中的BRE位在通过DMA传输请求写入SD\_BUF后传输一个块中的最后一个数据后清除。
- DMA传输的数量必须是n×1个块。（n=整数，1块=SD\_SIZE中设置的传输数据大小）
- 当SDIO\_MODE中的IOABT位设置为1时，SD\_BUF读DMA传输请求被否定。
- DMA传输请求也可以通过将DMAEN位清除为0来取消。但是，当DMAEN位在写入SD\_CMD之前设置为1时，DMA传输请求会再次被断言。
- 因为SD\_INFO2中的BRE位没有被清除以响应设置STPIOABT位或响应通信错误或超时，在发出下一个命令之前将该位清零。当BRE位置位时，不会发出下一个通过DMA传输写入SD\_BUF的请求。

33.3.4 通信错误和超时

当发生通信错误或超时错误时，根据错误类型，SD\_INFO2寄存器中的相关状态标志设置为1。此外，根据错误源，SD\_ERR\_STS1或SD\_ERR\_STS2寄存器设置为1。

通过写入SD\_CMD寄存器或将SOFT\_RST.SDRST位设置为0，寄存器SD\_ERR\_STS1和SD\_ERR\_STS2中的状态标志清零。

Table 33.6 通讯错误

| 通信故障      | 中断标志寄存器  |      | 错误状态寄存器     |          | 这发生在……                 |
|-----------|----------|------|-------------|----------|------------------------|
|           | 注册符号     | 位符号  | 注册符号        | 位符号      |                        |
| 结束位错误     | SD_INFO2 | ENDE | SD_ERR_STS1 | CRCLENE  | CRC状态令牌长度错误            |
|           |          |      |             | RDLENE   | 读取数据长度错误               |
|           |          |      |             | RSPLNE1  | 响应长度错误*1               |
|           |          |      |             | RSPLNE0  | 响应长度错误*2               |
| CRC error | SD_INFO2 | CRCE | SD_ERR_STS1 | CRCTKE   | CRC状态令牌错误              |
|           |          |      |             | RDCRCE   | 读取数据有CRC错误             |
|           |          |      |             | RSPCRCE1 | 响应中有CRC错误*1            |
|           |          |      |             | RSPCRCE0 | 响应中有CRC错误*2            |
| 命令错误      | SD_INFO2 | CMDE | SD_ERR_STS1 | CMDE1    | 发送命令和接收响应的命令索引字段值不匹配*1 |
|           |          |      |             | CMDE0    | 发送命令和接收响应的命令索引字段值不匹配*2 |

注1.通过SD\_CMD中的设置为多块传输启用自动发布时的CMD12，当STP位中的CMD12 SD\_STOP设置为1，或当SDIO\_MODE中的C52PUB或IOABT位设置为1时为CMD52。

注2.通过SD\_CMD中的设置，CMD12之外的CMD SD\_STOP中的STP位设置为1，或者当SDIO\_MODE中的C52PUB或IOABT位设置为1时为CMD52。

Table 33.7 Timeouts

| Timeout                                   | Interrupt flag register   |            | Error status register |   | This occurs when...  |
|---|---|------------|-----------------------|---|--|
|   | Register symbol   | Bit symbol | Register symbol       | Bit symbol  |  |
| Response timeout                          | SD_INFO2  | RSPTO      | SD_ERR_STS2           | RSPTO1  | A response is not received even after a minimum of 640 SDHI clock cycles elapse*1                                      |
|   |   |            |                       | RSPTO0  | A response is not received even after a minimum of 640 SDHI clock cycles elapse*2                                      |
| Data timeout (excluding response timeout) | SD_INFO2  | DTO        | SD_ERR_STS2           | CRCBSYTO  | After the CRC status token is received, the SDHI is busy for at least the period set*3                                 |
|   |   |            |                       | CRCTO   | After the write data is transmitted, the CRC status token is not received even after at least the period set*3 elapses |
|   |   |            |                       | RDTO  | After the read command is issued, the read data is not received even after at least the period set*3 elapses           |
|   |   |            |                       |   | After the read data is received, the next block read data is not received even after at least the period set*3 elapses |
|   |   |            |                       | After the SDHI exits the read wait state, the next block read data is not received even after at least the period set*3 elapses |  |
| BSYTO1                                    | After CMD12 is issued during the command sequence, the SDHI is busy for at least the period set*3   |            |                       |   |  |
| BSYTO0                                    | After the R1b response is received, the SDHI is busy for at least the period set*3 (a command other than CMD12 is issued during the command sequence) |            |                       |   |  |

Note 1. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD\_CMD, CMD12 when the STP bit in SD\_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO\_MODE is set to 1.

Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD\_CMD, CMD12 when the STP bit in SD\_STOP bit is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO\_MODE is set to 1.

Note 3. The period is set in the SD\_OPTION.TOP[3:0] bits.

### 33.3.5 Command without Data Transfer (SD/MMC)

Figure 33.9 and Figure 33.10 show example flows.

Table 33.7 Timeouts

| Timeout       | 中断标志寄存器  |       | 错误状态寄存器     |  | 这发生在……                                 |
|---------------|--|-------|-------------|--|--|
|               | 注册符号   | 位符号   | 注册符号        | 位符号  |  |
| 响应超时          | SD_INFO2   | RSPTO | SD_ERR_STS2 | RSPTO1                                       | 即使经过至少640个SDHI时钟周期，也没有收到响应*1           |
|               |  |       |             | RSPTO0                                       | 即使经过至少640个SDHI时钟周期，也没有收到响应*2           |
| 数据超时（不包括响应超时） | SD_INFO2   | DTO   | SD_ERR_STS2 | CRCBSYTO                                     | 收到CRC状态令牌后，SDHI至少在设置的时间段内处于忙碌状态*3      |
|               |  |       |             | CRCTO  | 发送写入数据后，即使经过至少设置的时间段*3也不会接收到CRC状态令牌    |
|               |  |       |             | RDTO   | 发出读取命令后，即使经过至少设置的周期*3也不会接收到读取数据        |
|               |  |       |             |  | 在接收到读取数据后，即使经过至少设置的时间段*3也不会接收到下一个块读取数据 |
|               |  |       |             | 在SDHI退出读取等待状态后，即使经过至少设置的时间段*3，也不会接收到下一个块读取数据 |  |
| BSYTO1        | 在命令序列期间发出CMD12后，SDHI至少在设置的时间段内处于忙碌状态*3               |       |             |  |  |
| BSYTO0        | 收到R1b响应后，SDHI至少在设置的时间段*3内处于忙碌状态（在命令序列期间发出CMD12以外的命令） |       |             |  |  |

注1.通过SD\_CMD中的设置为多块传输启用自动发布时的CMD12，当STP位中的CMD12 SD\_STOP设置为1，或当SDIO\_MODE中的C52PUB或IOABT位设置为1时为CMD52。

注2.通过SD\_CMD中的设置，CMD12之外的CMD SD\_STOP位中的STP位设置为1，或者当SDIO\_MODE中的C52PUB或IOABT位设置为1时为CMD52。

注3.周期在SD\_OPTION.TOP[3:0]位中设置。

### 33.3.5 无数据传输的命令(SDMMC)

图33.9和图33.10显示了示例流程。

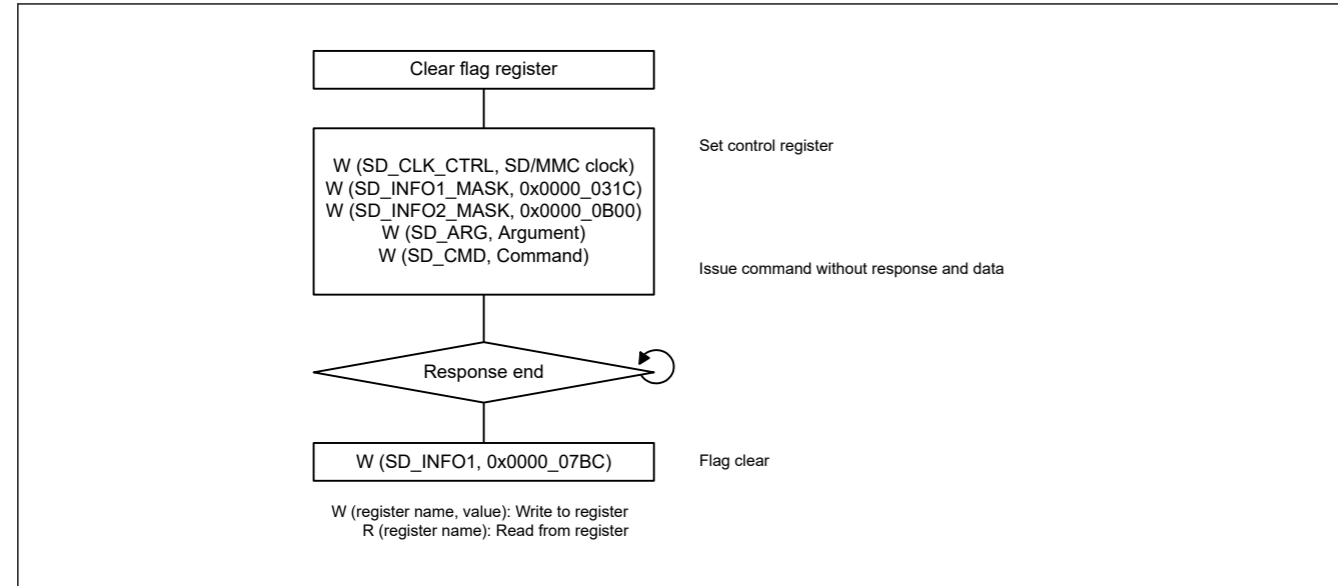

Figure 33.9 Example flow of command without response or data

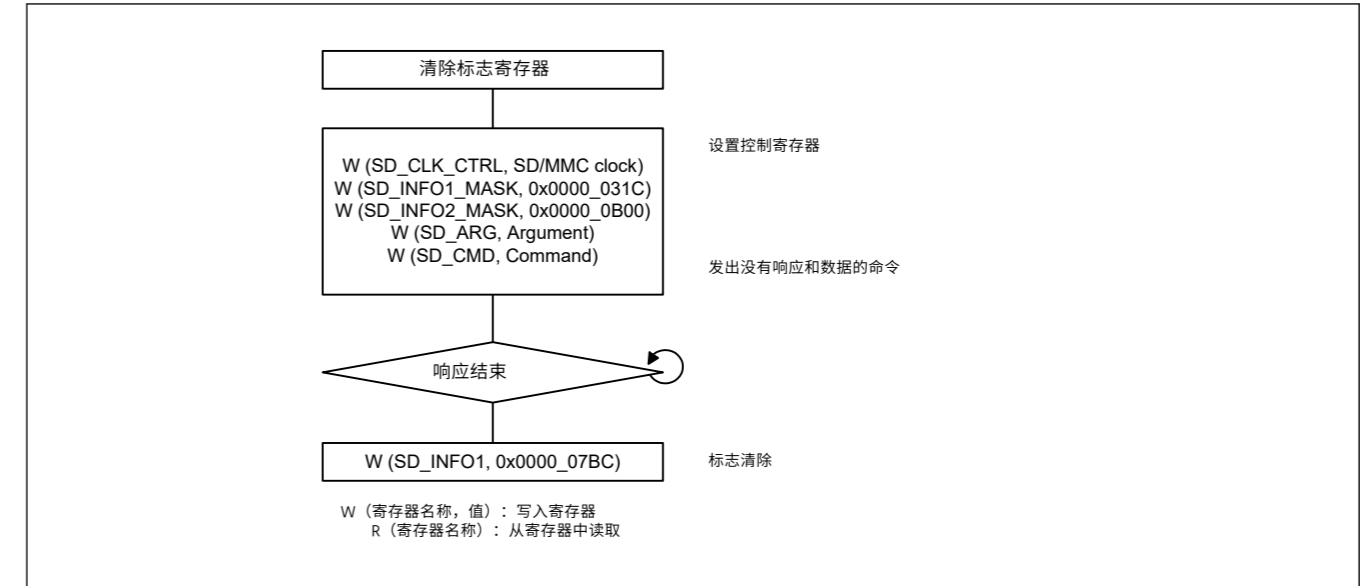

Figure 33.9 没有响应或数据的命令流示例

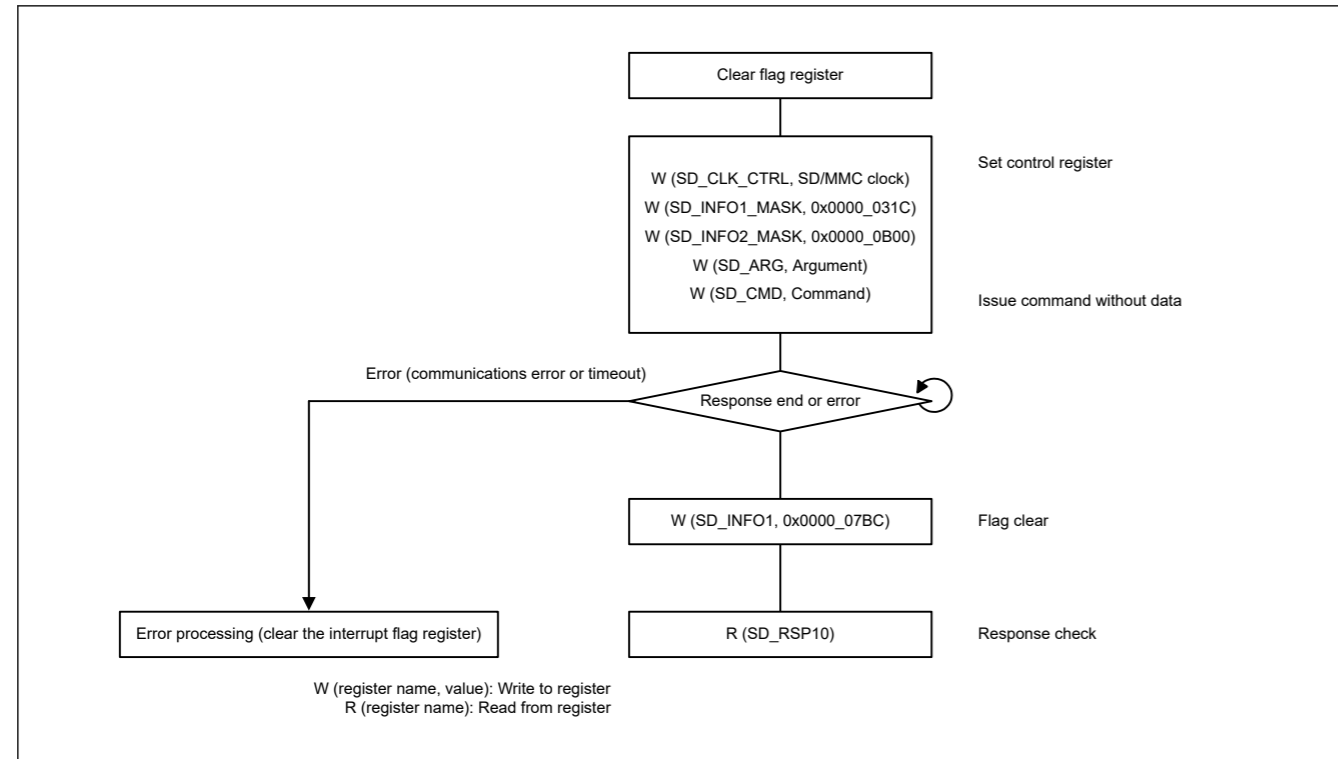

Figure 33.10 Example flow of command without data

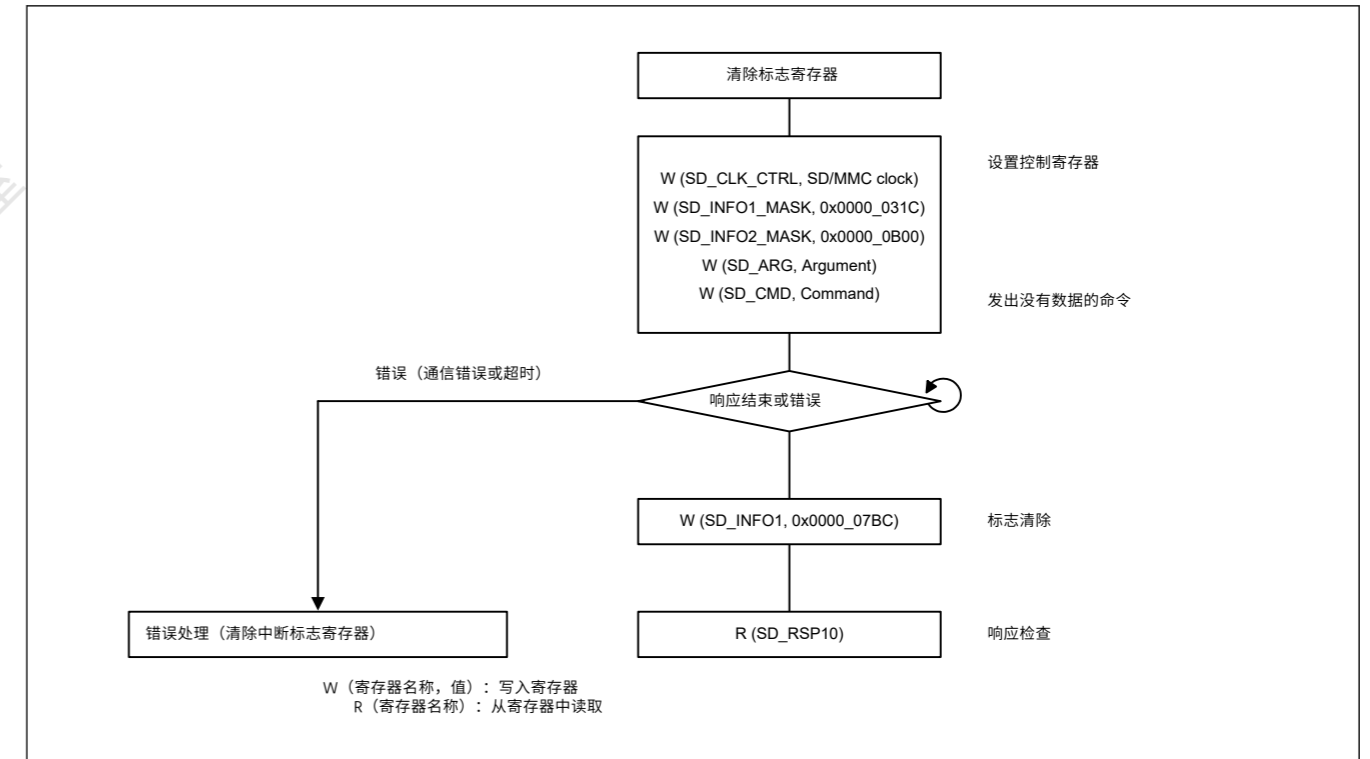

Figure 33.10 没有数据的命令流示例

33.3.5.1 Operation for command without data transfer

The following legend is used for description of register read/write.

W (register name, value): Write to register

R (register name): Read from register

The operation is described in the following section.

(1) Command without response and data

- a. Flag register clear  
First, clear the bits in the flag register. (SD\_INFO1 and SD\_INFO2)

33.3.5.1 无数据传输的命令操作

以下图例用于描述寄存器读写。

W (寄存器名称, 值): 写入寄存器

R (寄存器名称): 从寄存器中读取

该操作在下一节中描述。

(1) 没有响应和数据的命令

- a. 标志寄存器清除  
首先, 清除标志寄存器中的位。(SD\_INFO1和SD\_INFO2)

- b. Control register set  
Set the SD/MMC clock and interrupt masking. (SD\_CLK\_CTRL, SD\_INFO1\_MASK, and SD\_INFO2\_MASK)
- c. Command issue  
Set CMD argument in SD\_ARG and write to SD\_CMD.  
Accordingly, CMD is issued, and the operation is started.
- d. Flag clear  
When transmission of a command is completed, RSPEND (response end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0.

## (2) Command without data

- a. Flag register clear  
First, clear the bits in the flag register. (SD\_INFO1 and SD\_INFO2)
- b. Control register set  
Set the SD/MMC clock and interrupt masking. (SD\_CLK\_CTRL, SD\_INFO1\_MASK, and SD\_INFO2\_MASK)
- c. Command issue  
Set CMD argument in SD\_ARG and write to the SD\_CMD.  
Accordingly, CMD is issued, and the operation is started.
- d. Flag clear  
When a response is received, RSPEND (response end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0.
- e. Read a response from SD\_RSP10. Additionally, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

### 33.3.6 Single Block Read (SD/MMC)

Figure 33.11 shows an example flow of a single block read operation.

- 湾。控制寄存器组  
设置SDMMC时钟和中断屏蔽。(SD\_CLK\_CTRL、SD\_INFO1\_MASK和SD\_INFO2\_MASK)
- c. 命令问题  
在SD\_ARG中设置CMD参数并写入SD\_CMD。因此，发出CMD，并开始操作。
- d. 标志清除  
当命令传输完成时，SD\_INFO1中的RSPEND（响应结束）设置为1以产生中断。将RSPEND清除为0。

## (2) 没有数据的命令

- a. 标志寄存器清除  
首先，清除标志寄存器中的位。(SD\_INFO1和SD\_INFO2)
- 湾。控制寄存器组  
设置SDMMC时钟和中断屏蔽。(SD\_CLK\_CTRL、SD\_INFO1\_MASK和SD\_INFO2\_MASK)
- c. 命令问题  
在SD\_ARG中设置CMD参数并写入SD\_CMD。  
因此，发出CMD，并开始操作。
- d. 标志清除  
当收到响应时，SD\_INFO1中的RSPEND（响应结束）置1以产生中断。将RSPEND清除为0。
- e. 从SD\_RSP10读取响应。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

### 33.3.6 单块读取(SDMMC)

图33.11显示了单个块读取操作的示例流程。

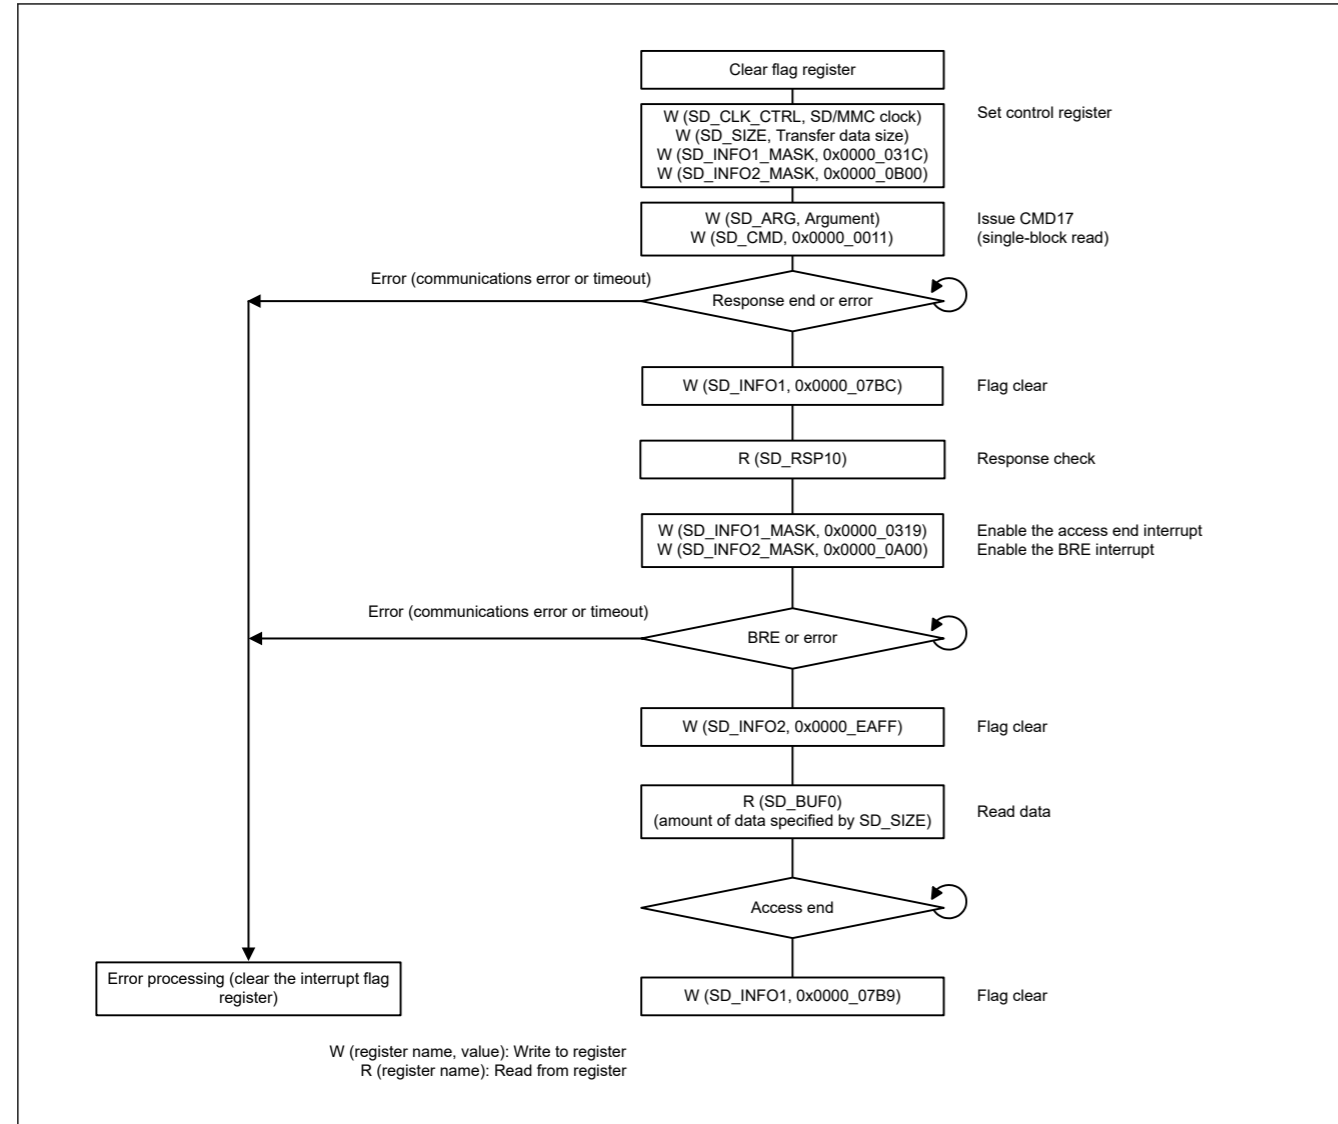

Figure 33.11 Example flow of single block read operation

### 33.3.6.1 Single block read operation

The operation of the single block read is described as follows:

- Flag register clear**  
First, clear the bits in the flag register (SD\_INFO1 and SD\_INFO2).
- Control register set**  
Set the SD/MMC clock, transfer data size, interrupt mask (SD\_CLK\_CTRL, SD\_SIZE, SD\_INFO1\_MASK, and SD\_INFO2\_MASK).
- Command issue (CMD17)**  
Set CMD17 argument in SD\_ARG and write 0x0000\_0011 to SD\_CMD. CMD17 is issued and the single block read operation is started.
- Response check**  
On receiving the response, RSPEND (response end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD\_RSP10. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD\_STP or the IOABT bit in SDIO\_MODE to 1. In addition, this causes CMD12 and CMD52 to not be issued. If the ACEND bit (access end) in SD\_INFO1 is set, halting the command sequence also leads to the generation of an interrupt.
- Data receive from SD card/MMC and data read**

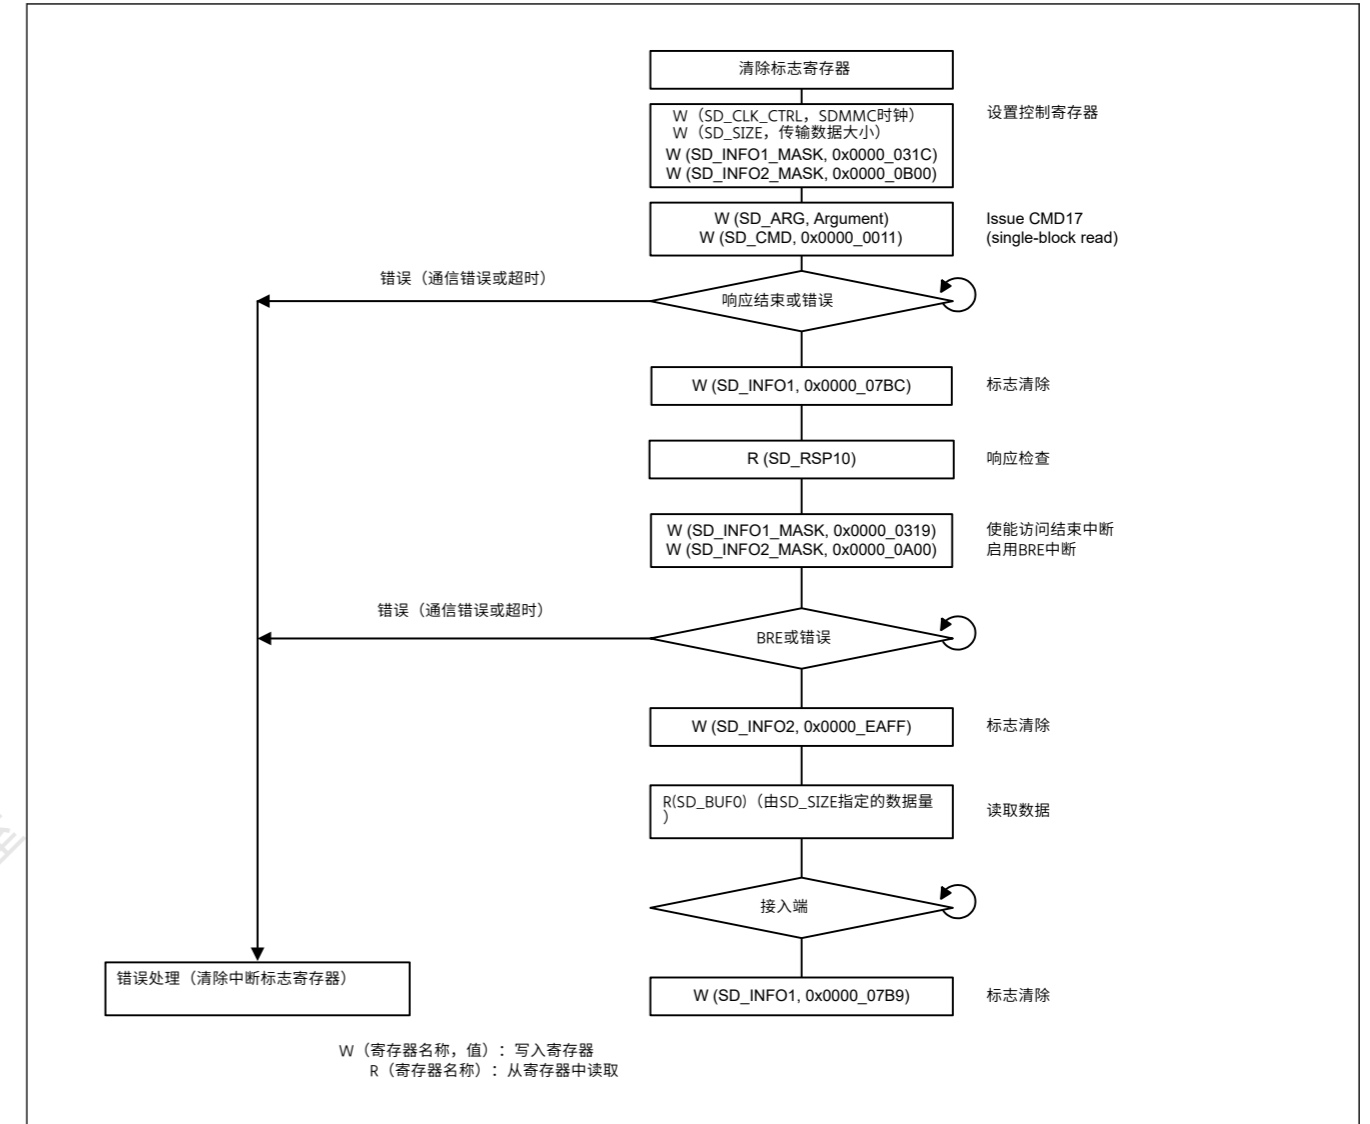

Figure 33.11 单块读操作示例流程

### 33.3.6.1 单块读操作

单块读取的操作描述如下:

- 标志寄存器清除**  
首先, 清除标志寄存器 (SD\_INFO1和SD\_INFO2) 中的位。
- 控制寄存器组**  
设置SDMMC时钟、传输数据大小、中断屏蔽 (SD\_CLK\_CTRL、SD\_SIZE、SD\_INFO1\_MASK和SD\_INFO2\_MASK)。
- 命令问题(CMD17)**  
在SD\_ARG中设置CMD17参数并将0x0000\_0011写入SD\_CMD。发出CMD17并开始单块读取操作。
- 响应检查**  
收到响应后, SD\_INFO1中的RSPEND (响应结束) 置1以产生中断。将RSPEND清零并从SD\_RSP10读取响应。如果响应解码的结果是错误的, 可以通过将SD\_STP中的STP位或SDIO\_MODE中的IOABT位设置为1来停止命令序列。此外, 这会导致CMD12和CMD52不发出。如果SD\_INFO1中的ACEND位 (访问结束) 被设置, 停止命令序列也会导致产生中断。
- 从SD卡MMC接收数据并读取数据**

Write 0x0000\_0319 to SD\_INFO1\_MASK to enable the access end interrupt. In addition, write 0x0000\_0A00 to SD\_INFO2\_MASK to enable the BRE interrupt. When the data received from the SD card/MMC is completed, the BRE bit in SD\_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD\_SIZE from SD\_BUF0.

A communication error or timeout might be generated if data is being received while reading of SD\_BUF0 is in progress.

f. Operation complete

When the data read from SD\_BUF0 is completed, ACEND (access end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear ACEND to 0 to end the single block read operation.

Additionally, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

33.3.7 Single Block Write (SD/MMC)

Figure 33.12 shows an example flow of a single block write operation.

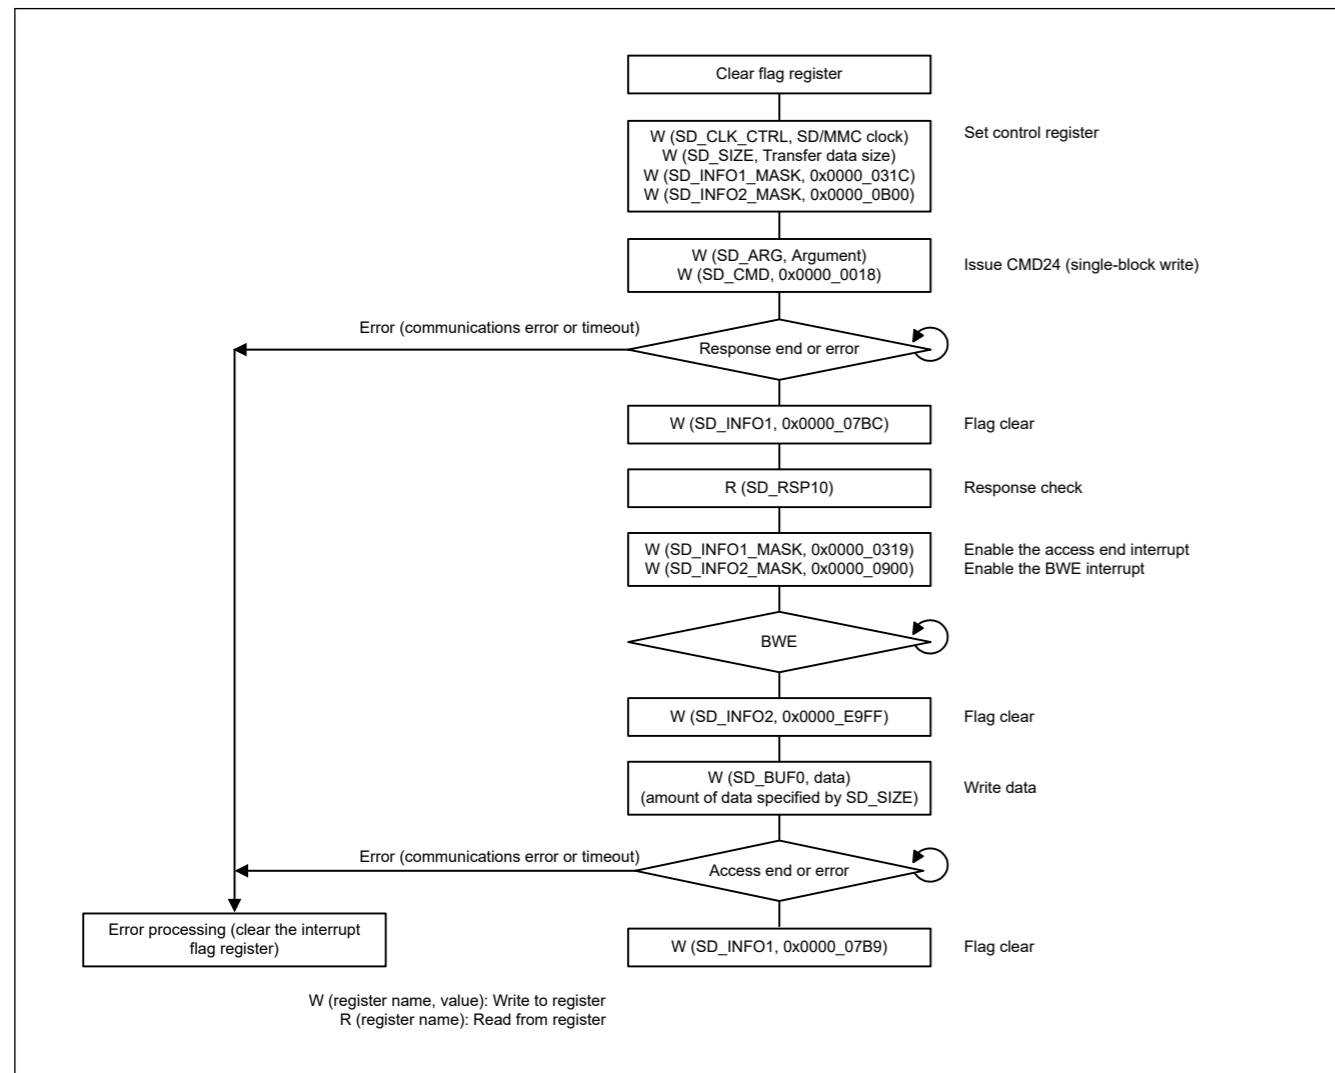

Figure 33.12 Example of single block write operation

33.3.7.1 Single block write operation

The operation of the single block write is described as follows:

- a. Flag register clear  
First, clear the bits in the flag register (SD\_INFO1 and SD\_INFO2).
- b. Control register set

将0x0000\_0319写入SD\_INFO1\_MASK以使能访问结束中断。此外，将0x0000\_0A00写入SD\_INFO2\_MASK启用BRE中断。当从SD卡MMC接收到数据完成时，SD\_INFO2中的BRE位设置为1以产生中断。将BRE位清0并从SD\_BUF0中读取SD\_SIZE中指定的数据量。

如果在读取SD\_BUF0时正在接收数据，则可能会产生通信错误或超时。

f. 操作完成

当从SD\_BUF0读取数据完成后，SD\_INFO1中的ACEND（访问结束）置1以产生中断。将ACEND清0结束单块读操作。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

33.3.7 单块写入(SDMMC)

图33.12显示了单个块写入操作的示例流程。

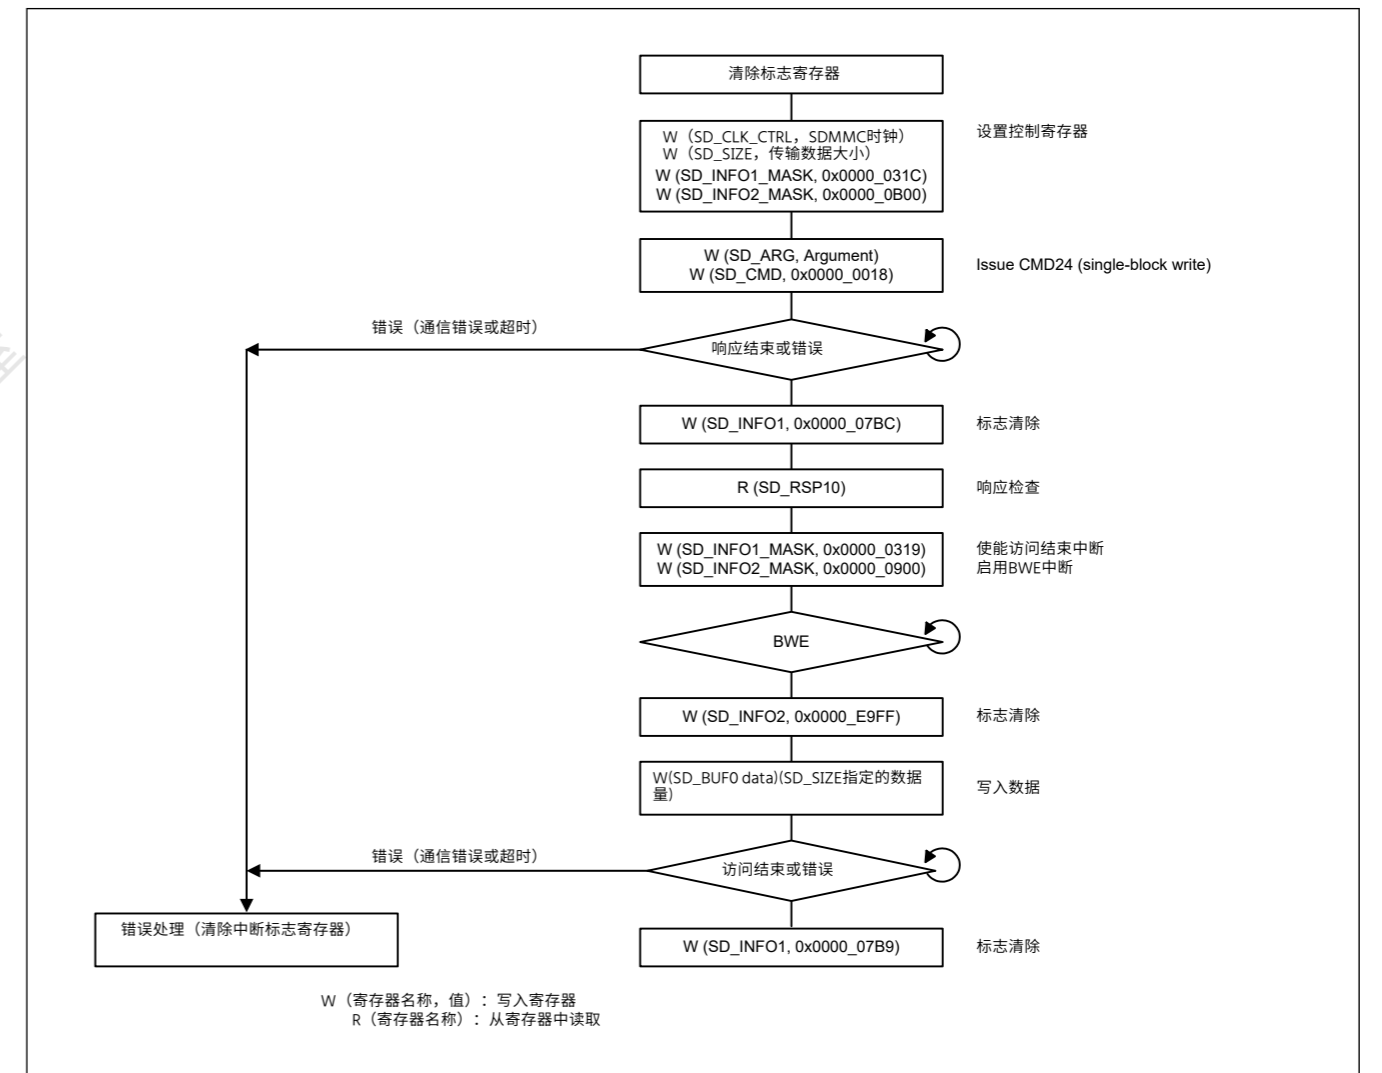

Figure 33.12 单块写操作示例

33.3.7.1 单块写操作

单块写操作描述如下：

- a. 标志寄存器清除  
首先，清除标志寄存器（SD\_INFO1和SD\_INFO2）中的位。

- Set the SD/MMC clock, transfer data size, interrupt mask (SD\_CLK\_CTRL, SD\_SIZE, SD\_INFO1\_MASK, and SD\_INFO2\_MASK).
- c. Command issue (CMD24)  
Set CMD24 argument in SD\_ARG and write 0x0000\_0018 to SD\_CMD. CMD24 is issued and the single block write operation is started.
- d. Response check  
On receiving the response, RSPEND (response end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD\_RSP10. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD\_STP or the IOABT bit in SDIO\_MODE to 1. In addition, this causes CMD12 and CMD52 to not be issued. If the ACEND bit (access end) in SD\_INFO is set, halting the command sequence also leads to the generation of an interrupt.
- e. Data write and data transmit to SD card/MMC  
Write 0x0000\_0319 to SD\_INFO1\_MASK to enable the access end interrupt. In addition, write 0x0000\_0900 to SD\_INFO2\_MASK to enable the BWE interrupt. When SD\_BUF0 is ready for the data to be written, the BWE bit in SD\_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD\_SIZE to SD\_BUF0. When the data write to SD\_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card/MMC.  
However, a communications error or timeout might be generated if data is being transmitted after writing to SD\_BUF0.
- f. Operation complete  
When the CRC status and busy state are received from the SD card/MMC, ACEND (access end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to end the single block write operation.  
In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

### 33.3.8 Multiple Block Read (SD/MMC)

Figure 33.13 shows an example flow of a multiple block read operation.

- 设置SDMMC时钟、传输数据大小、中断屏蔽 (SD\_CLK\_CTRL、SD\_SIZE、SD\_INFO1\_MASK和SD\_INFO2\_MASK)。
- c. 命令问题(CMD24)  
在SD\_ARG中设置CMD24参数并将0x0000\_0018写入SD\_CMD。发出CMD24并开始单块写入操作。
- d. 响应检查  
收到响应后，SD\_INFO1中的RSPEND（响应结束）置1以产生中断。将RSPEND清零并从SD\_RSP10读取响应。如果响应解码的结果是错误的，可以通过将SD\_STP中的STP位或SDIO\_MODE中的IOABT位设置为1来停止命令序列。此外，这会导致CMD12和CMD52不发出。如果SD\_INFO中的ACEND位（访问结束）被设置，停止命令序列也会导致中断的产生。
- e. 数据写入和数据传输到SD卡MMC  
将0x0000\_0319写入SD\_INFO1\_MASK以启用访问结束中断。此外，将0x0000\_0900写入SD\_INFO2\_MASK以启用BWE中断。当SD\_BUF0准备好写入数据时，SD\_INFO2中的BWE位设置为1以产生中断。将BWE位清0并写入指定的数据量  
SD\_SIZE到SD\_BUF0。数据写入SD\_BUF0完成后，将数据传输到SD卡。然后，从SD卡MMC接收CRC状态和忙状态。  
但是，如果在写入SD\_BUF0后正在传输数据，则可能会产生通信错误或超时。
- f. 操作完成  
当从SD卡MMC接收到CRC状态和忙状态时，SD\_INFO1中的ACEND（访问端）置1以产生中断。将ACEND位清0以结束单块写操作。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

### 33.3.8 多块读取(SDMMC)

图33.13显示了多块读取操作的示例流程。

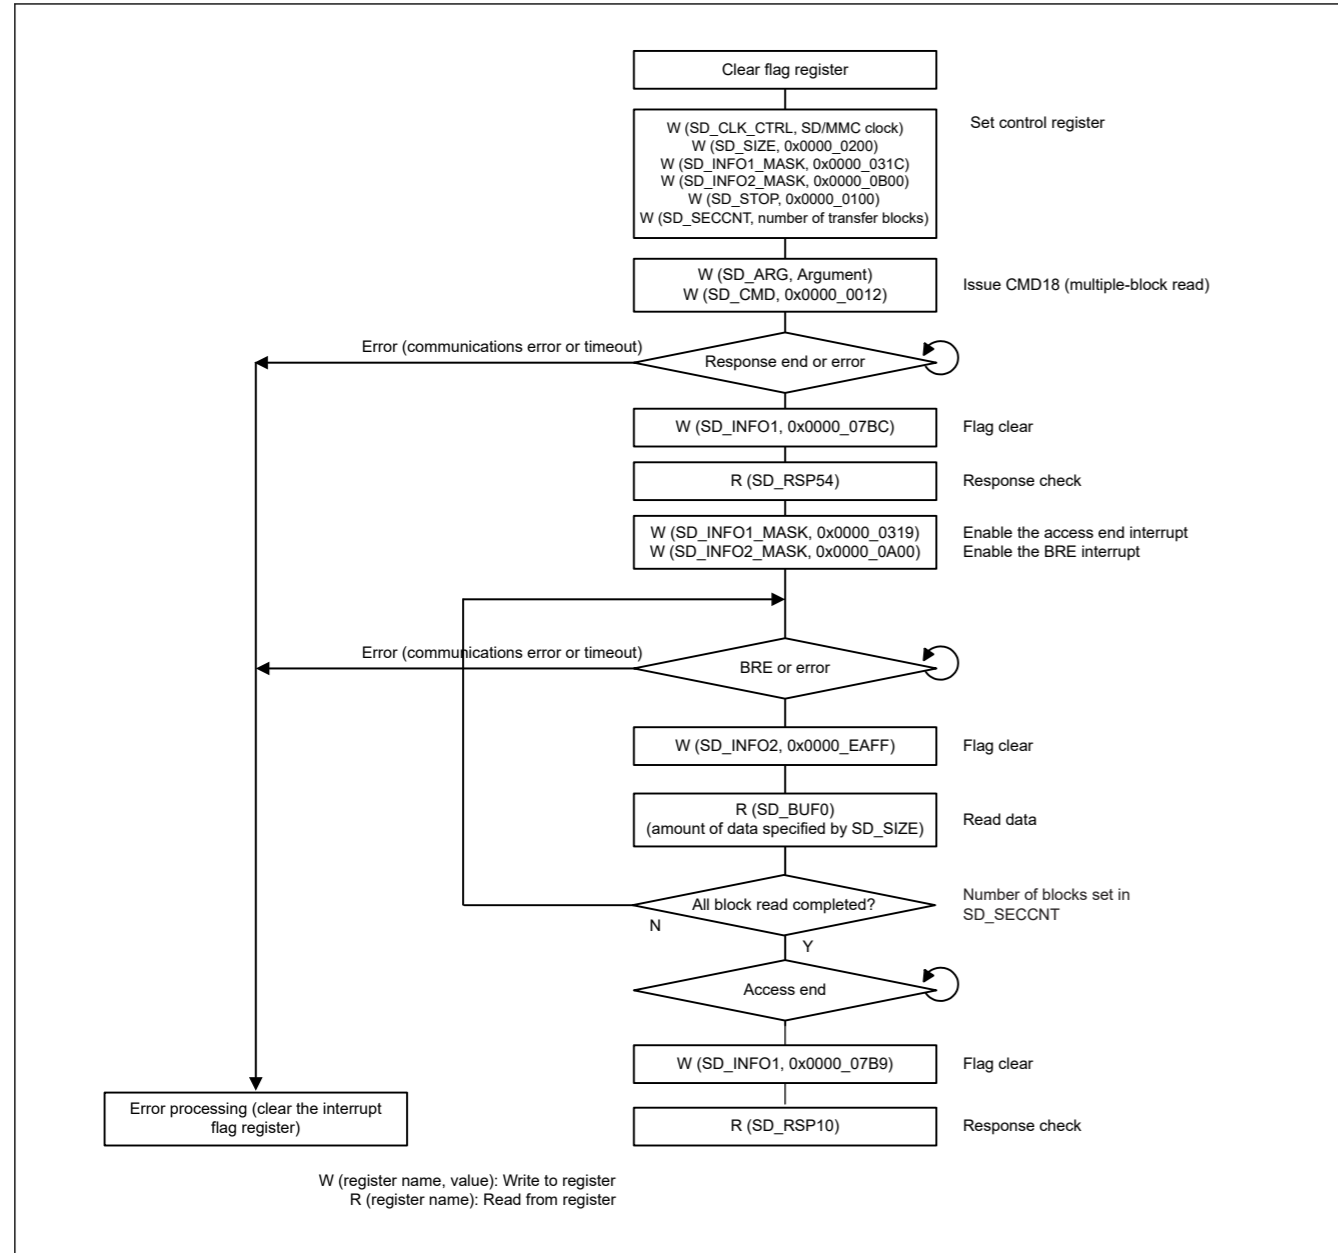

Figure 33.13 Example of multiple block read operation

### 33.3.8.1 Multiple block read operation

The operation of the multiple block read is described as follows:

- Flag register clear**  
First, clear the bits in the flag register (SD\_INFO1 and SD\_INFO2).
- Control register set**  
Set the SD/MMC clock, transfer data size, interrupt mask (SD\_CLK\_CTRL, SD\_SIZE, SD\_INFO1\_MASK, and SD\_INFO2\_MASK).  
Set SEC in SD\_STOP to 1, and set the number of transfer blocks in SD\_SECCNT.
- Command issue (CMD18)**  
Set CMD18 argument in SD\_ARG and write 0x0000\_0012 to SD\_CMD. CMD18 is issued and the multiple block read operation is started.
- Response check**  
On receiving the response, RSPEND (response end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD\_RSP54. If the result of response decoding is an error, the command sequence can be

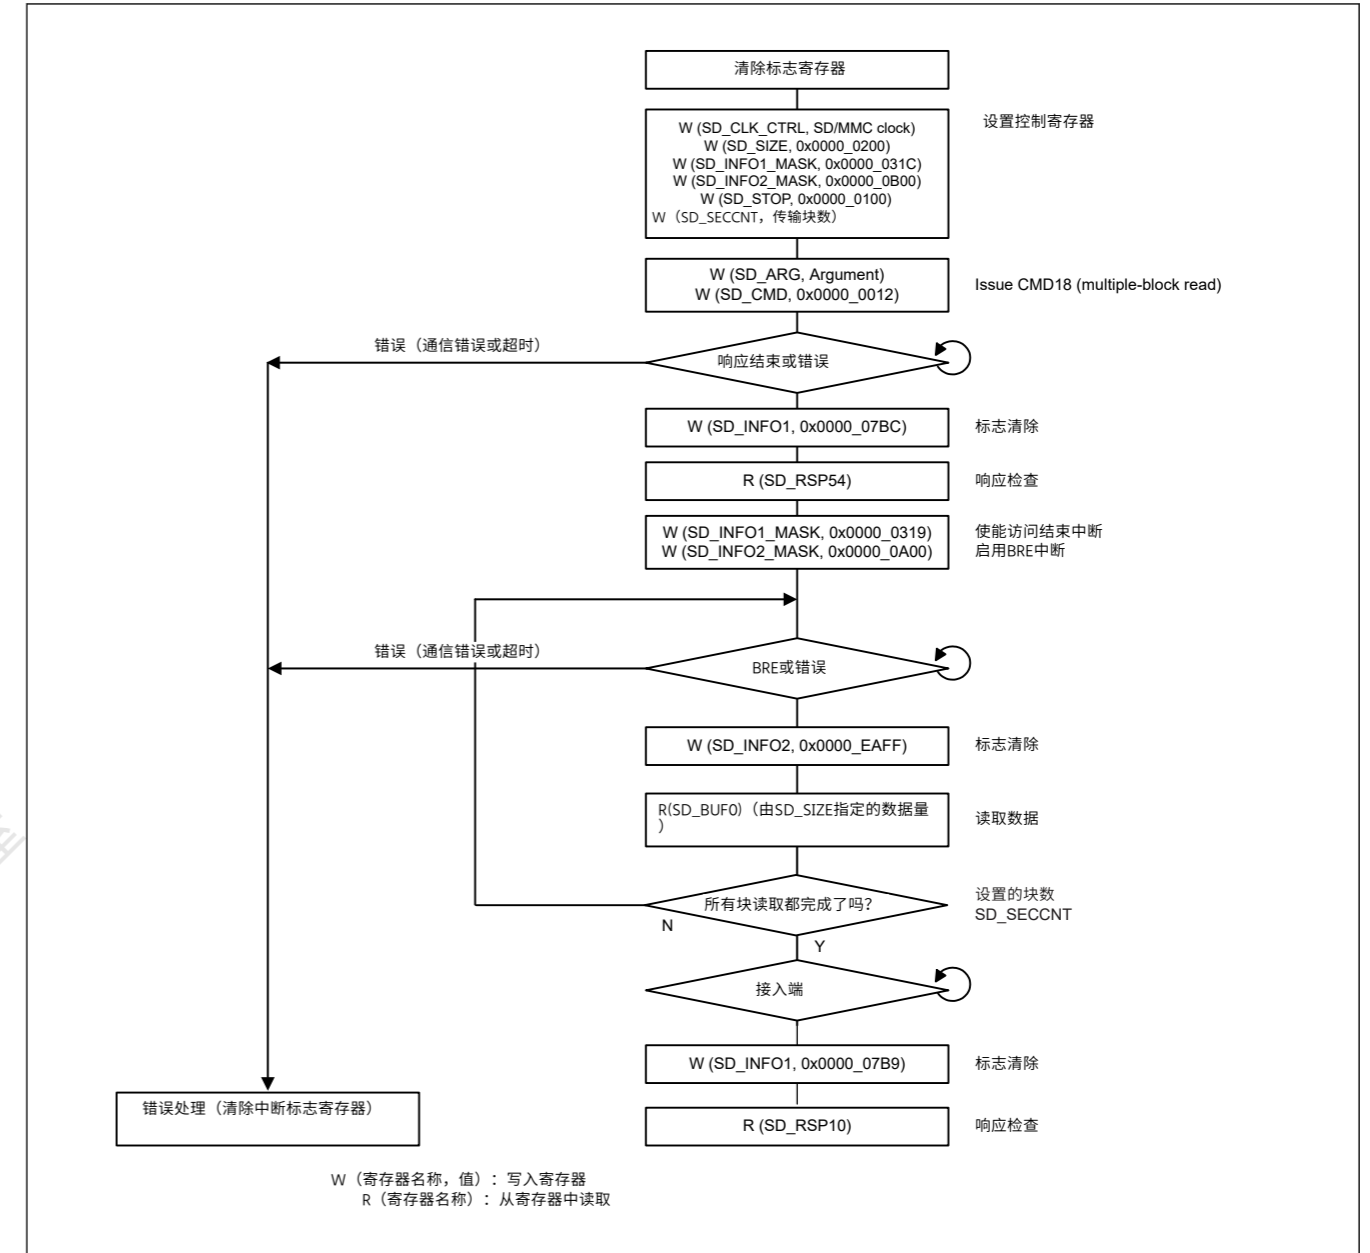

Figure 33.13 多块读取操作示例

### 33.3.8.1 多块读操作

多块读取的操作描述如下:

- 标志寄存器清除**  
首先, 清除标志寄存器 (SD\_INFO1和SD\_INFO2) 中的位。
- 控制寄存器组**  
设置SDMMC时钟、传输数据大小、中断屏蔽 (SD\_CLK\_CTRL、SD\_SIZE、SD\_INFO1\_MASK和SD\_INFO2\_MASK).  
将SD\_STOP中的SEC设置为1, 并在SD\_SECCNT中设置传输块数。
- 命令问题(CMD18)**  
在SD\_ARG中设置CMD18参数并将0x0000\_0012写入SD\_CMD。发出CMD18并开始多块读取操作。
- 响应检查**  
收到响应后, SD\_INFO1中的RSPEND (响应结束) 置1以产生中断。将RSPEND清零并从SD\_RSP54读取响应。如果响应解码的结果是错误的, 命令序列可以是

halted by setting the STP bit in SD\_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated when the ACEND bit (access end) bit in SD\_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data receive from SD card/MMC and data read

Write 0x0000\_0319 to SD\_INFO1\_MASK to enable the access end interrupt. In addition, write 0x0000\_0A00 to SD\_INFO2\_MASK to enable the BRE interrupt. When one-block data received from the SD card/MMC is completed, the BRE bit in SD\_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD\_SIZE from SD\_BUF0. Doing this repeats transfer of the number of blocks set in SD\_SECCNT. However, a communication error or timeout might be generated if data is being received while reading of SD\_BUF0 is in progress. CMD12 is automatically issued to stop multiblock transfer with the number of blocks that is set to SD\_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0x0000\_0000.

f. Operation complete

When all-block data read and the CMD12 response received are completed, ACEND (access end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear ACEND to 0 to read the response. This is the end of multiple block read operation. In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

### 33.3.9 Multiple Block Write (SD/MMC Using Internal Timer)

Figure 33.14 shows an example flow of a multiple block write using internal timer.

通过将SD\_STP中的STP位设置为1来停止。将STP位设置为1也会导致发出CMD12并接收响应。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD\_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e. 从SD卡MMC接收数据并读取数据

将0x0000\_0319写入SD\_INFO1\_MASK以使能访问结束中断。此外，将0x0000\_0A00写入SD\_INFO2\_MASK以启用BRE中断。当从SD卡MMC接收到单块数据完成时，SD\_INFO2中的BRE位被设置为1以产生中断。将BRE位清0并从SD\_BUF0中读取SD\_SIZE中指定的数据量。这样做会重复传输SD\_SECCNT中设置的块数。但是，如果在读取SD\_BUF0时正在接收数据，则可能会产生通信错误或超时。自动发出CMD12以停止多块传输，块数设置为SD\_SECCNT并接收响应。此时，CMD12参数自动设置为0x0000\_0000。

f. 操作完成

当全块数据读取和接收到的CMD12响应完成时，SD\_INFO1中的ACEND（访问结束）置1以产生中断。将ACEND清除为0以读取响应。这是多块读取操作的结束。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

### 33.3.9 多块写入（使用内部定时器的SDMMC）

图33.14显示了使用内部定时器进行多块写入的示例流程。

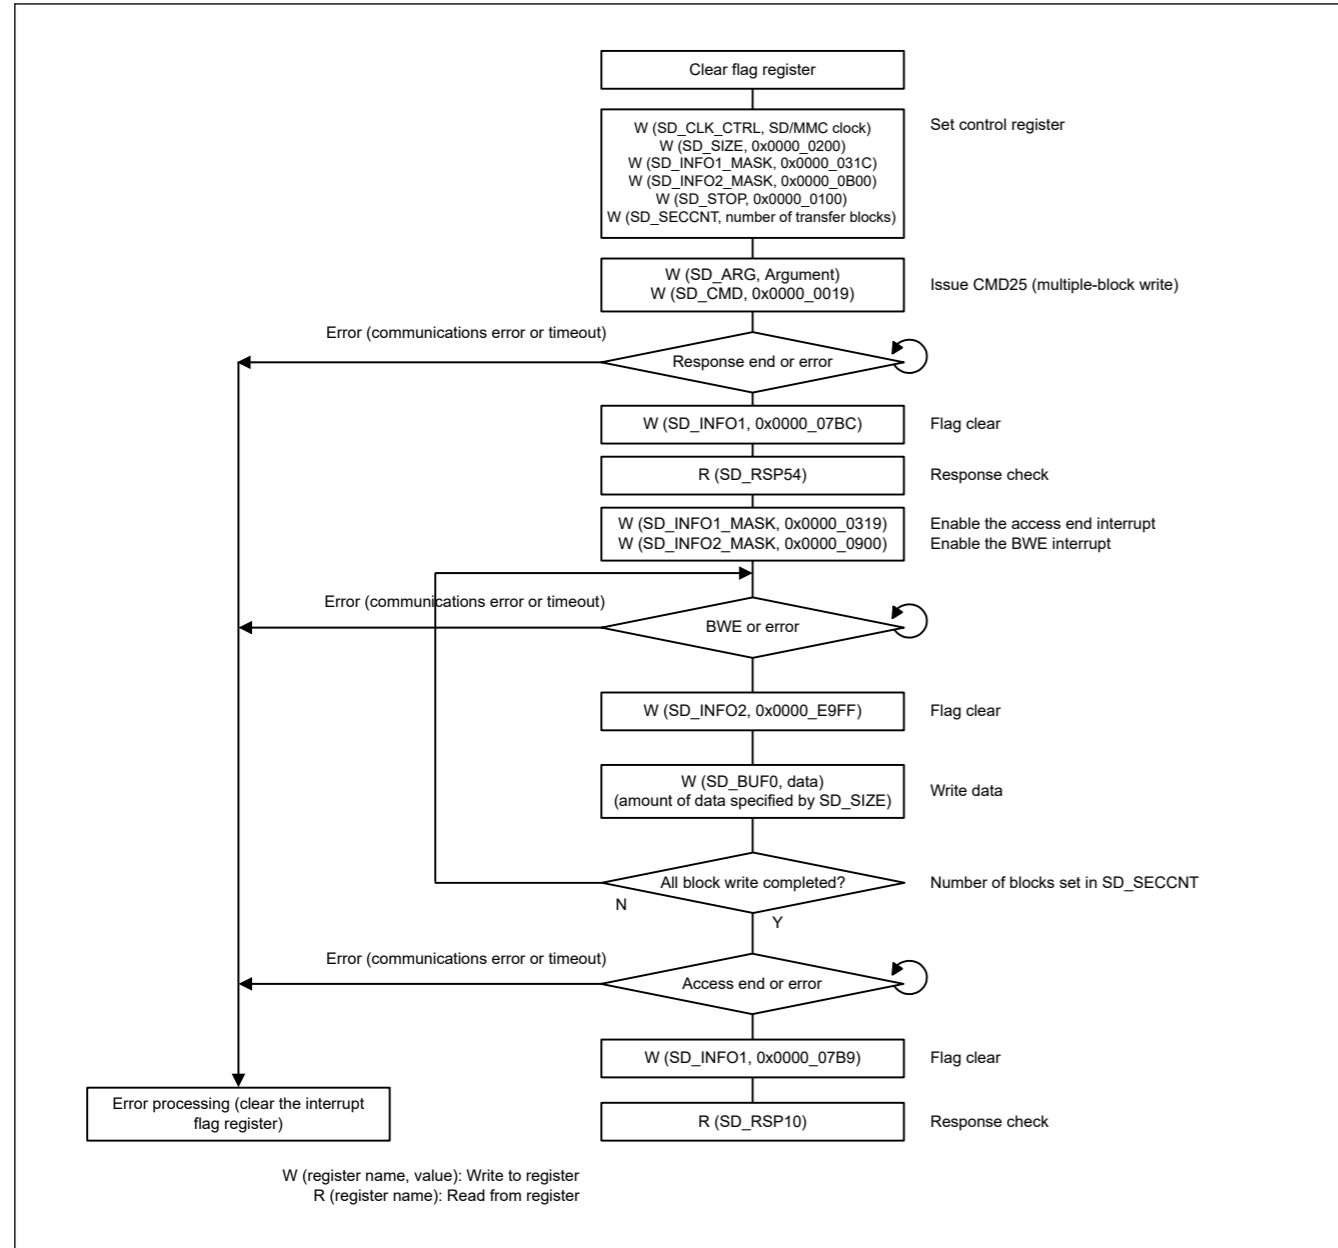

Figure 33.14 Example of multiple block write operation using internal timer

33.3.9.1 Multiple block write operation using internal timer

The operation of the multiple block write is described as follows:

- Flag register clear  
First, clear the bits in the flag register (SD\_INFO1 and SD\_INFO2).
- Control register set  
Set the SD/MMC clock, transfer data size, interrupt mask (SD\_CLK\_CTRL, SD\_SIZE, SD\_INFO1\_MASK, and SD\_INFO2\_MASK).  
Set the SEC bit in SD\_STOP to 1, and set the number of transfer blocks in SD\_SECCNT.
- Command issue (CMD25)  
Set CMD25 argument in SD\_ARG and write 0x0000\_0019 to SD\_CMD. CMD25 is issued and the multiple block write operation is started.
- Response check  
On receiving the response, the RSPEND bit (response end) in SD\_INFO1 is set to 1 to generate an interrupt.  
Clear the RSPEND bit to 0 and read the response from SD\_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD\_STP to 1. Setting the STP bit to 1 also causes CMD12 to

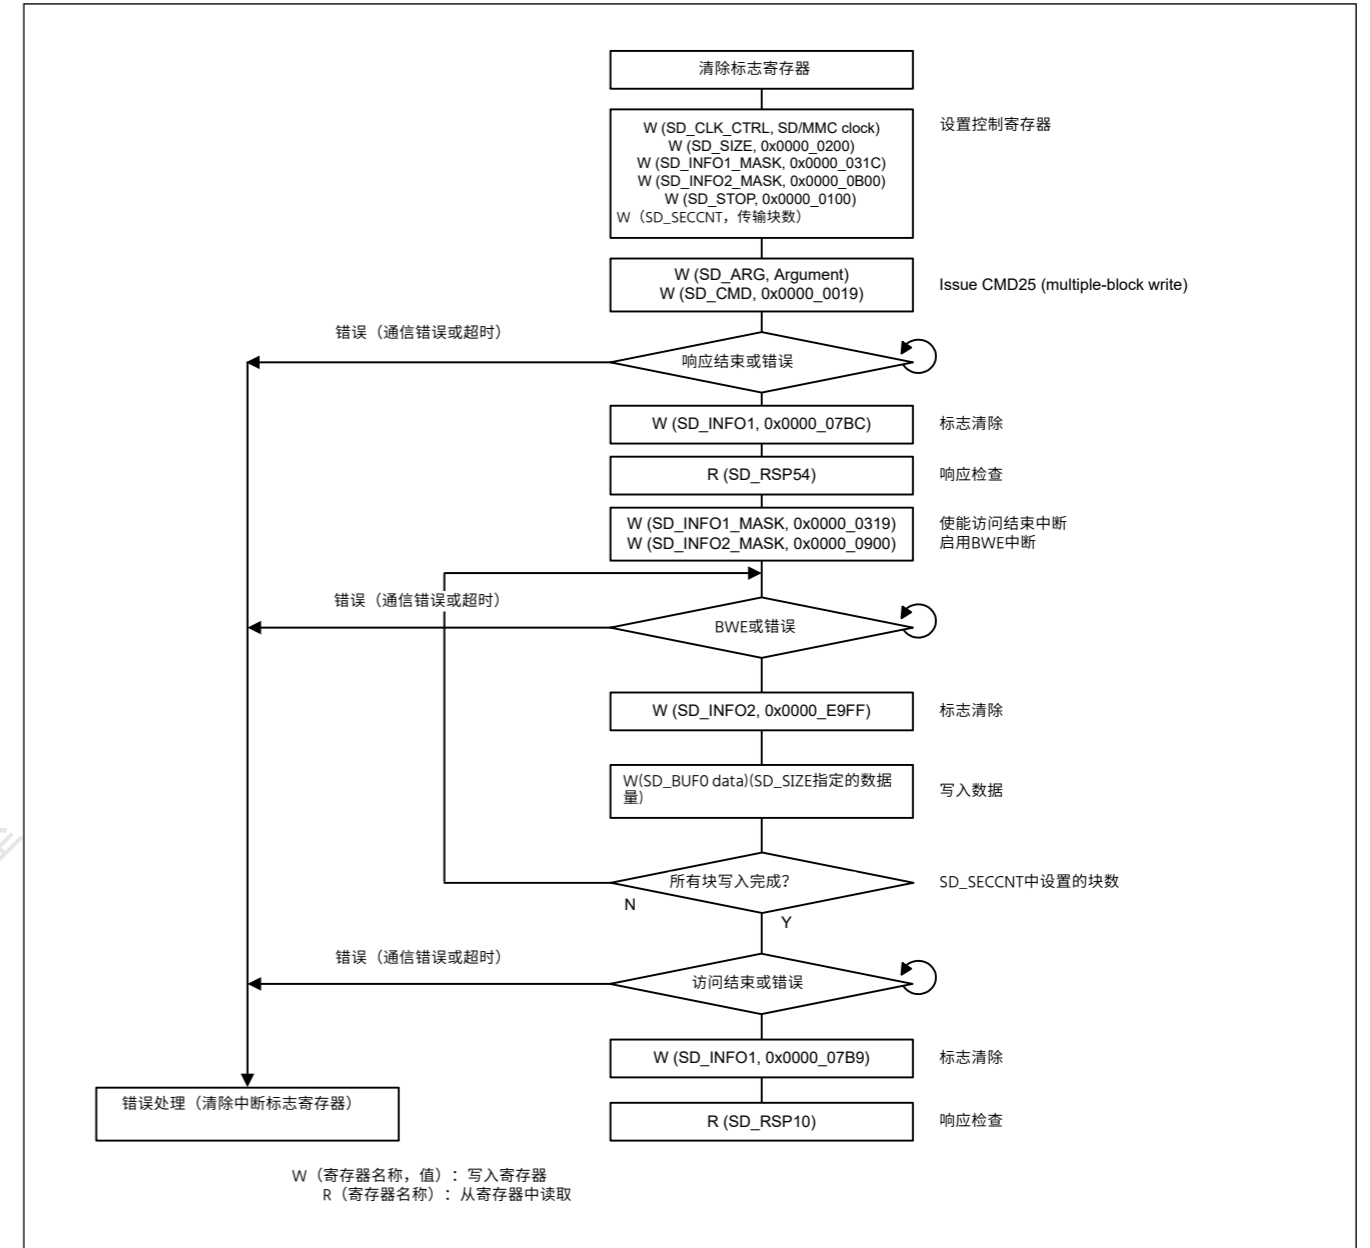

Figure 33.14 使用内部定时器的多块写入操作示例

33.3.9.1 使用内部定时器的多块写操作

多块写入的操作描述如下:

- 标志寄存器清除  
首先,清除标志寄存器(SD\_INFO1和SD\_INFO2)中的位。
- 湾. 控制寄存器组  
设置SDMMC时钟、传输数据大小、中断屏蔽(SD\_CLK\_CTRL、SD\_SIZE、SD\_INFO1\_MASK和SD\_INFO2\_MASK).  
将SD\_STOP中的SEC位设置为1,并在SD\_SECCNT中设置传输块数。
- c. 命令问题(CMD25)  
在SD\_ARG中设置CMD25参数并将0x0000\_0019写入SD\_CMD。发出CMD25并开始多块写入操作。
- d. 响应检查  
收到响应后,SD\_INFO1中的RSPEND位(响应结束)置1以产生中断。  
将RSPEND位清0并从SD\_RSP54读取响应。如果响应解码的结果是错误的,可以通过将SD\_STP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致CMD12

be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND bit (access end) bit in SD\_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data write and data transmit to SD card/MMC

Write 0x0000\_0319 to SD\_INFO1\_MASK to enable the access end interrupt. In addition, write 0x0000\_0900 to SD\_INFO2\_MASK to enable the BWE interrupt. When SD\_BUF0 is ready for the data to be written, the BWE bit in the SD\_INFO2 register is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD\_SIZE to SD\_BUF0. When the data write to SD\_BUF0 is completed, data is transmitted to the SD card/MMC. The CRC status and busy state are received from the SD card/MMC. This repeats transfer of the number of blocks set in SD\_SECCNT. However, a communication error or timeout might be generated if data is being received while writing to SD\_BUF0 is in progress. CMD12 is automatically issued to stop multiblock transfer with the number of blocks which is set to SD\_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0x0000\_0000.

f. Operation complete

When all-block data transmit and the CRC status receive are completed, the ACEND bit (access end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to read the response. This is the end of multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs.

### 33.3.10 Multiple Block Write (MMC using external timer)

Figure 33.15 shows an example flow of a multiple block write using an external timer.

发出并收到响应。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD\_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e. 数据写入和数据传输到SD卡MMC

将0x0000\_0319写入SD\_INFO1\_MASK以使能访问结束中断。此外，将0x0000\_0900写入SD\_INFO2\_MASK启用BWE中断。当SD\_BUF0准备好写入数据时，SD\_INFO2寄存器设置为1以产生中断。将BWE位清除为0，并将SD\_SIZE中指定的数据量写入SD\_BUF0。当数据写入SD\_BUF0完成后，数据被传输到SD卡MMC。这从SD卡MMC接收CRC状态和忙状态。这将重复传输设置的块数SD\_SECCNT。但是，如果在写入SD\_BUF0时正在接收数据，则可能会产生通信错误或超时。自动发出CMD12以停止多块传输，块数设置为SD\_SECCNT并接受响应。此时，CMD12参数自动设置为0x0000\_0000。

f. 操作完成

当全块数据发送和CRC状态接收完成时，SD\_INFO1中的ACEND位（访问结束）置1以产生中断。将ACEND位清0以读取响应。这是多块写操作的结束。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

### 33.3.10 多块写入（使用外部定时器的MMC）

图33.15显示了使用外部定时器进行多块写入的示例流程。

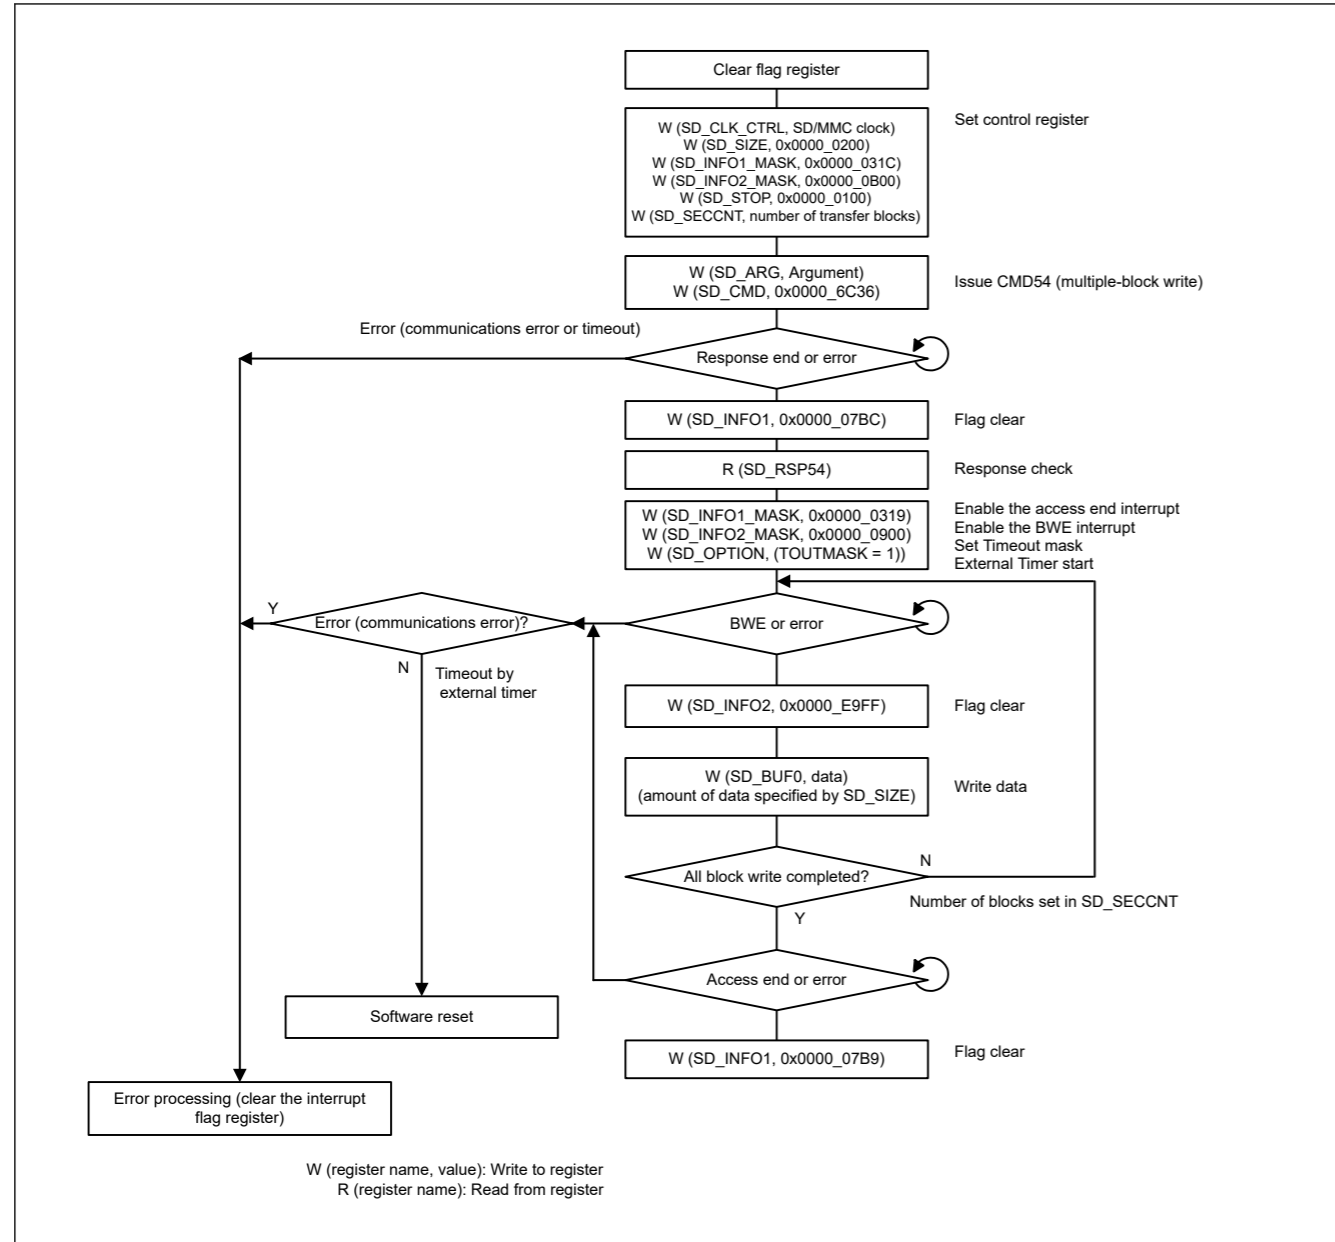

Figure 33.15 Example of multiple block write operation using external timer

### 33.3.10.1 Multiple block write operation using external timer

The operation of the multiple block write is described as follows:

- Flag register clear**  
First, clear the bits in the flag register (SD\_INFO1 and SD\_INFO2).
- Control register set**  
Set the MMC clock, transfer data size, interrupt mask (SD\_CLK\_CTRL, SD\_SIZE, SD\_INFO1\_MASK, and SD\_INFO2\_MASK).  
Set the SEC bit in SD\_STOP to 1, and set the number of transfer blocks in SD\_SECCNT.
- Command issue (CMD54)**  
Set CMD54 Argument in SD\_ARG and write 0x0000\_6C36 to SD\_CMD. CMD54 is issued and the multiple block write operation is started.
- Response check**  
On receiving the response, the RSPEND bit (response end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear the RSPEND bit to 0 and read the response from SD\_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD\_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued

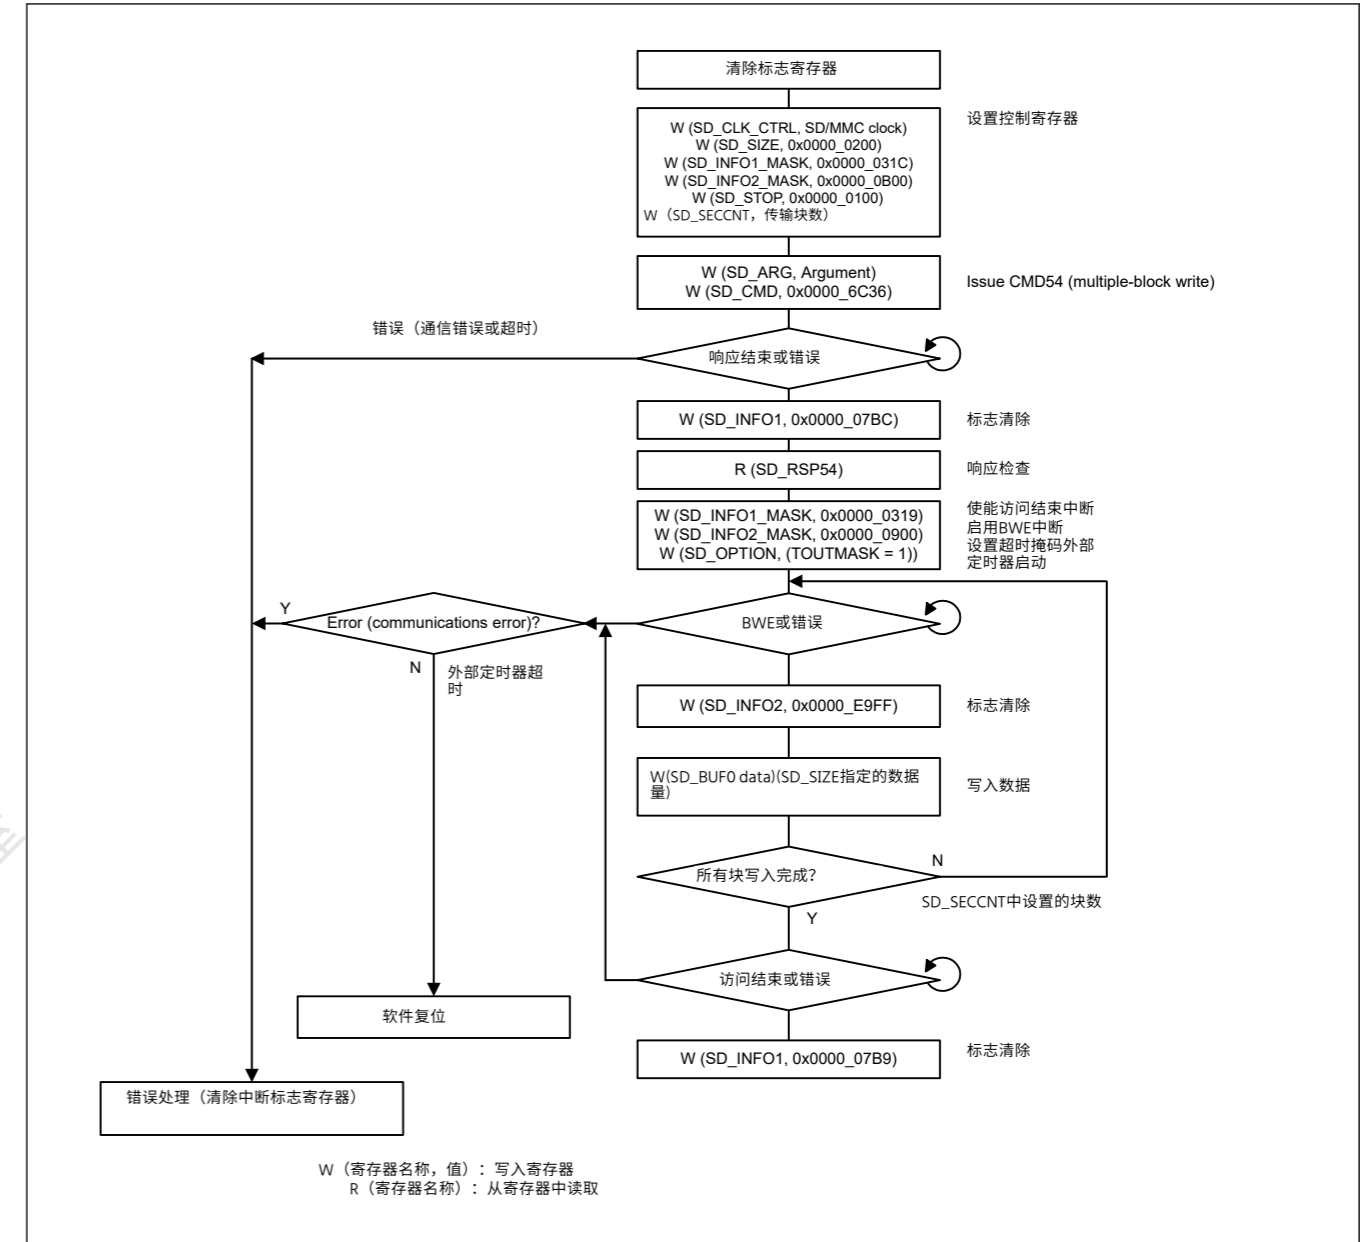

Figure 33.15 使用外部定时器的多块写入操作示例

### 33.3.10.1 使用外部定时器的多块写操作

多块写入的操作描述如下：

- 标志寄存器清除**  
首先，清除标志寄存器（SD\_INFO1和SD\_INFO2）中的位。
- 控制寄存器组**  
设置MMC时钟、传输数据大小、中断屏蔽（SD\_CLK\_CTRL、SD\_SIZE、SD\_INFO1\_MASK和SD\_INFO2\_MASK）。  
将SD\_STOP中的SEC位设置为1，并在SD\_SECCNT中设置传输块数。
- 命令问题(CMD54)**在SD\_ARG中设置CMD54参数并将0x0000\_6C36写入SD\_CMD。发出CMD54并开始多块写入操作。
- 响应检查**  
收到响应后，SD\_INFO1中的RSPEND位（响应结束）置1以产生中断。将RSPEND位清0并从SD\_RSP54读取响应。如果响应解码的结果是错误的，可以通过将SD\_STP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致发出CMD12

and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND bit (access end) bit in SD\_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data write and data transmit to MMC

Write 0x0000\_0319 to SD\_INFO1\_MASK to enable the access end interrupt, write 0x0000\_0900 to SD\_INFO2\_MASK to enable the BWE interrupt and set 1 to TOUTMASK of SD\_OPTION to inactivate timeout. In addition, start external timer. When SD\_BUF0 is ready for the data to be written, the BWE bit in the SD\_INFO2 register is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD\_SIZE to SD\_BUF0. When the data write to SD\_BUF0 is completed, data is transmitted to the MMC. The CRC status and busy state are received from the MMC. Doing this repeats transfer of the number of blocks set in SD\_SECCNT. However, a communication error or timeout might be generated if data is being received while writing to SD\_BUF0 is in progress.

f. Operation complete

When all-block data transmit and the CRC status receive are completed, the ACEND bit (access end) in SD\_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to read the response. This is the end of multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs when receiving response. Execute software reset if a timeout by external timer occurs when transmitting data.

33.3.11 IO\_RW\_DIRECT Command (SD: CMD52)

Figure 33.16 shows an example flow of an IO\_DIRECT command (CMD52) operation.

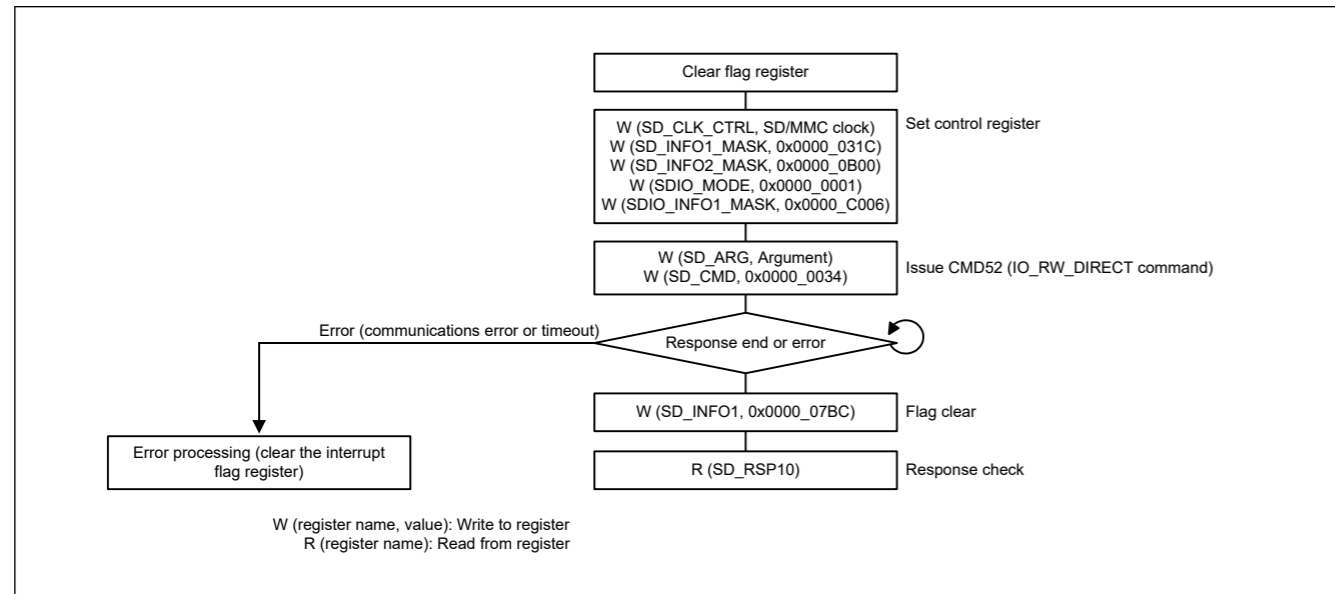

Figure 33.16 Example of IO\_RW\_DIRECT command (CMD52) operation

33.3.12 IO\_RW\_EXTENDED Command (SD: CMD53/Multiple Block Read)

Figure 33.17 shows an example flow for a CMD53 multiple block read operation.

以及收到的回复。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD\_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e. 数据写入和数据传输到MMC

向SD\_INFO1\_MASK写入0x0000\_0319使能访问结束中断，向SD\_INFO1\_MASK写入0x0000\_0900 SD\_INFO2\_MASK启用BWE中断并将SD\_OPTION的TOUTMASK设置为1以禁用超时。另外，启动外部定时器。当SD\_BUF0准备好写入数据时，SD\_INFO2寄存器中的BWE位设置为1以产生中断。将BWE位清除为0，并将SD\_SIZE中指定的数据量写入SD\_BUF0。当数据写入SD\_BUF0完成后，数据被传输到MMC。从MMC接收CRC状态和忙碌状态。这样做会重复传输SD\_SECCNT中设置的块数。但是，如果在写入SD\_BUF0时正在接收数据，则可能会产生通信错误或超时。

f. 操作完成

当全块数据发送和CRC状态接收完成时，SD\_INFO1中的ACEND位（访问结束）置1以产生中断。将ACEND位清0以读取响应。这是多块写操作的结束。此外，如果在接收响应时发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。如果在传输数据时发生外部定时器超时，则执行软件复位。

| CMD55 | 0x0000_0037 | —             |                                       |                         |
| CMD56 | 0x0000_0038 | —             |                                       |                         |

### 33.4 Usage Notes

#### 33.4.1 SD\_BUF Illegal Write Access (SD/MMC)

When writing data to SD\_BUF0 after the single block write or multi block write command is issued, the data of the size specified in SD\_SIZE must be written.

If the data exceeds the size specified in SD\_SIZE is written, the ERR4 bit in SD\_INFO2 is set to 1. In addition, the data written to SD\_BUF0 might not be transmitted and the SD\_CLK\_CTRLLEN bit in SD\_INFO2 is held at the value of 0. If this occurs, clearing the SDRST bit in SOFT\_RST to 0 and then restoring its value to 1 clears the SD\_CLK\_CTRLLEN bit to 1.

However, this does not apply to the single byte or three bytes when the SD\_SIZE setting is odd, or to the fraction of bytes when the SD\_SIZE setting is even (the 2 bytes that are not in a 4-byte unit), because the portion of dummy data writing is regarded as excess data and ignored.

#### 33.4.2 Block Number Constraint for Multiple Block Read (SD)

When performing a multiple block read of one or two blocks, depending on the timing with which the SD card response register is read, the response value might not be read properly. To prevent this, do one of the following:

1. When receiving one or two blocks of data, use single block reading.
2. Read the response to CMD18 from SD\_RSP54.

##### 33.4.2.1 Mechanism of incorrect reading

Figure 33.25 shows the processing flows of the SDHI (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation in Figure 33.25, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD\_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response might be read. This problem does not occur for multiple block reads of three or more blocks, because CMD12 is not issued until the block of data is read. The problem also does not occur for multiple block writes, because the CMD25 response is read before the block of data is sent.

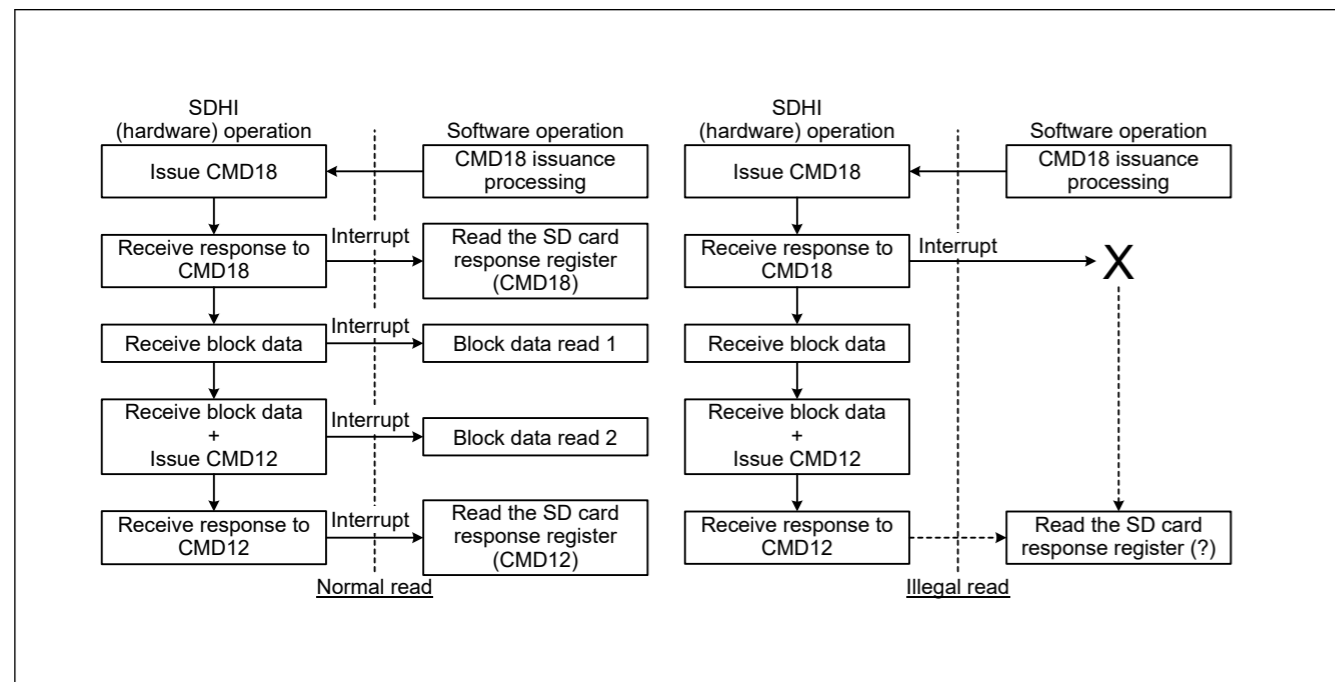

Figure 33.25 Multiple block read operation flow chart (two blocks)

#### 33.4.3 Automatic Control of SD/MMC Clock Output (SD/MMC)

In the SD Card/MMC standard, 74 cycles of SD/MMC clock must be output before initialization of the card. For this reason, use automatic control of SD/MMC clock output after 74 cycles of SD/MMC clock are output. In addition, if

### 33.4 使用说明

#### 33.4.1 SD\_BUF非法写访问(SDMMC)

在发出单块写入或多块写入命令后向SD\_BUF0写入数据时，必须写入SD\_SIZE中指定大小的数据。

如果写入的数据超过SD\_SIZE中指定的大小，则SD\_INFO2中的ERR4位设置为1。此外，写入SD\_BUF0的数据可能不会被传输，并且SD\_INFO2中的SD\_CLK\_CTRLLEN位将保持为0。如果这发生时，将SOFT\_RST中的SDRST位清除为0，然后将其值恢复为1，将SD\_CLK\_CTRLLEN位清除为1。

但是，这不适用于SD\_SIZE设置为奇数时的单个字节或三个字节，或适用于SD\_SIZE设置为偶数时的字节部分（不在4字节单元中的2个字节），因为该部分虚拟数据写入的次数被视为多余数据并被忽略。

#### 33.4.2 多块读取(SD)的块号约束

执行1个或2个块的多块读取时，根据读取SD卡响应寄存器的时序，可能无法正确读取响应值。为防止这种情况，请执行以下操作之一：

- 1、接收一两块数据时，使用单块读取。
- 2.从SD\_RSP54读取对CMD18的响应。

##### 33.4.2.1 误读机制

图33.25显示了对两个块执行多块读取时的SDHI（硬件）操作和软件操作的处理流程。如图33.25中的错误操作所示，当接收到CMD18响应时产生中断并且中断读取SD卡响应寄存器(SD\_RSP10)的时序延迟时，CMD12响应接收期间的数据或可能会读取CMD12响应。对于三个或更多块的多块读取不会出现此问题，因为在读取数据块之前不会发出CMD12。多次块写入也不会出现该问题，因为在发送数据块之前读取了CMD25响应。

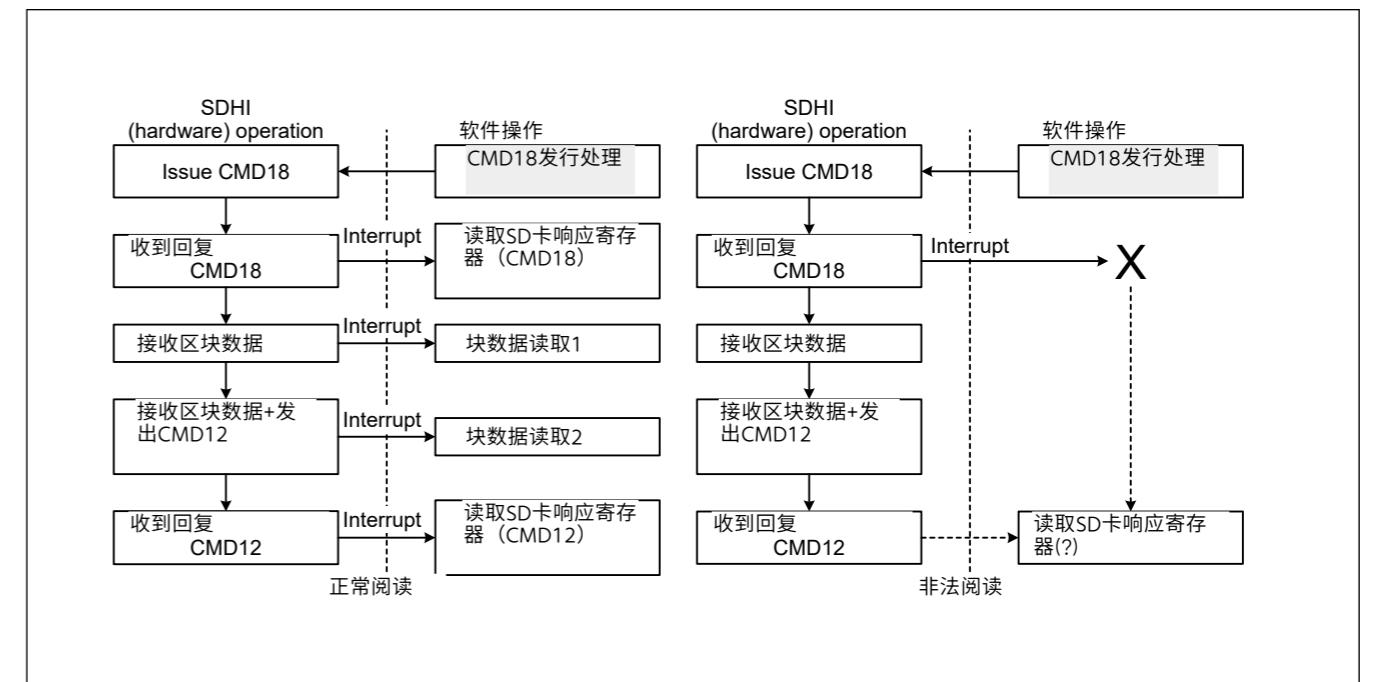

Figure 33.25 多块读取操作流程图 (两个块)

#### 33.4.3 SDMMC时钟输出(SDMMC)的自动控制

在SD卡MMC标准中，必须在卡初始化之前输出74个周期的SDMMC时钟。为此，在输出SDMMC时钟的74个周期后使用SDMMC时钟输出的自动控制。此外，如果

automatic control of SD/MMC clock output was in use, SD/MMC clock output is stopped on completion of the sequence for a communications error or timeout. When state transitions within the SD card/MMC are necessary after completion of the sequence, release automatic control of SD/MMC clock output and restart supply of the SD/MMC clock to the SD card/MMC.

#### 33.4.4 Control of the C52PUB Setting for Multiple Block Write (SD)

If the C52PUB bit in SDIO\_MODE is set to 1 during a sequence of multiple block write because of CMD53, CMD52 is not issued until SD\_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD\_BUF by using one of the following procedures, as appropriate:

##### (a) When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD\_BUF by making the setting in SD\_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO\_MODE to 1 (so that CMD52 is issued when SD\_BUF becomes empty).
3. After the RSPEND interrupt processing in SD\_INFO1 because the issuing of CMD52 is completed, restart writing to SD\_BUF by making the setting in SD\_INFO2 to enable BWE interrupts.

##### (b) When DMA transfer is in use

1. Every time DMA transfer of the value set in SD\_SIZE × n blocks (where n = 1, 2,...) proceeds, suspend writing to SD\_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO\_MODE to 1 (so that CMD52 is issued when SD\_BUF becomes empty).
3. After the RSPEND interrupt processing in SD\_INFO1 because the issuing of CMD52 is completed, restart writing to SD\_BUF by DMA transfer.

#### 33.4.5 Notes on SD\_CLK\_CTRL Register Settings (SD/MMC)

When the SD\_CLK\_CTRLLEN bit in SD\_INFO2 is 0, SD\_CLK\_CTRL cannot be written to. Before writing to SD\_CLK\_CTRL, you must check that the SD\_CLK\_CTRLLEN bit in SD\_INFO2 is 1.

#### 33.4.6 Specification Limitations

1. The Suspend/Resume operation of the SDIO is not supported.
2. The SPI bus is not supported. (SD/MMC)
3. The shared bus and 8-bit SD bus of the embedded SDIO are not supported.
4. Stream transfer of MMC is not supported.
5. High Priority Interrupt (HPI) of MMC is not supported.
6. Boot Operation/Alternative Boot Operation of MMC is not supported.
7. Open-ended multiple block transfer of MMC is not supported.

#### 33.4.7 STP Bit Setting during Multiple Block Read (SD/MMC)

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD\_STOP to 1, even if the STP bit in SD\_STOP is set to 1 to forcibly stop the execution, the command sequence might not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD\_STOP to 1 during multiple block transfer, clear the SEC bit in SD\_STOP to 0 at the same time. (Even when the SD\_CLK\_CTRLLEN bit in SD\_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence does not stop because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT\_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO\_MODE, you must leave the SEC bit in SD\_STOP as 1.

SDMMC时钟输出的自动控制正在使用中，SDMMC时钟输出在完成通信错误或超时的序列时停止。当序列完成后需要SD卡MMC内的状态转换时，解除SDMMC时钟输出的自动控制并重新开始向SD卡MMC提供SDMMC时钟。

#### 33.4.4 控制多块写入(SD)的C52PUB设置

如果SDIO\_MODE中的C52PUB位由于CMD53而在多个块写入序列期间设置为1，则在SD\_BUF变空之前不会发出CMD52。因此，在暂停写入SD\_BUF后，根据需要以下过程之一设置C52PUB位：

##### (a)不使用DMA传输时

- 1.在设置C52PUB位之前，通过在SD\_INFO2中进行设置以禁用BWE中断来暂停写入SD\_BUF。
- 2.将SDIO\_MODE中的C52PUB位设置为1（以便当SD\_BUF为空时发出CMD52）。
- 3.在SD\_INFO1中的RSPEND中断处理后，因为CMD52的发布完成，通过在SD\_INFO2中进行设置来重新开始写入SD\_BUF以启用BWE中断。

##### (b)使用DMA传输时

- 1.每次对SD\_SIZE×n块中设置的值（其中n=1 2...）进行DMA传输时，在C52PUB位置位之前暂停通过DMA传输对SD\_BUF的写入。
- 2.将SDIO\_MODE中的C52PUB位设置为1（以便当SD\_BUF为空时发出CMD52）。
- 3.SD\_INFO1中的RSPEND中断处理后，因为CMD52的下发完成，通过DMA传输重新开始写入SD\_BUF。

#### 33.4.5 SD\_CLK\_CTRL寄存器设置注意事项(SDMMC)

当SD\_INFO2中的SD\_CLK\_CTRLLEN位为0时，无法写入SD\_CLK\_CTRL。在写信之前SD\_CLK\_CTRL，必须检查SD\_INFO2中的SD\_CLK\_CTRLLEN位是否为1。

#### 33.4.6 规格限制

- 1、不支持SDIO的SuspendResume操作。
- 2.不支持SPI总线。(标清MMC)
- 3、不支持嵌入式SDIO的共享总线和8位SD总线。
- 4.不支持MMC的流传输。
- 5.不支持MMC的高优先级中断(HPI)。
- 6.BootOperationAlternativeBootOperation不支持MMC。
- 7.不支持MMC的开放式多块传输。

#### 33.4.7 多块读取(SDMMC)期间的STP位设置

在通过将SD\_STOP中的SEC位设置为1并通过自动CMD12执行执行多块读取时，即使将SD\_STOP中的STP位设置为1以强制停止执行，命令序列也可能不会停止，具体取决于设置STP位。

为避免这种情况，在多块传输期间将SD\_STOP中的STP位设置为1时，同时将SD\_STOP中的SEC位清除为0。（即使SD\_INFO2中的SD\_CLK\_CTRLLEN位为0，也将SEC位从1更改为0。）

当由于SEC位未清0而导致命令序列未停止时，可通过将SOFT\_RST中的SDRST位清0来停止命令序列。

当通过SDIO\_MODE中的IOABT位强制终止CMD53多块传输时，必须离开SD\_STOP中的SEC位为1。

### 33.4.8 Register Setting Notes

1. All registers in [section 33.2. Register Descriptions](#) are accessed in 32-bit access-only.
2. When setting registers, set them after the I/O Port Register setting.

### 33.4.8 注册设置注意事项

- 1.第33.2节中的所有寄存器。寄存器描述只能以32位访问方式访问。
- 2.设置寄存器时，请在IOPortRegister设置后进行设置。

## 34. Cyclic Redundancy Check (CRC) Calculator

### 34.1 Overview

The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available.

Table 34.1 lists the CRC calculator specifications and Figure 34.1 shows a block diagram.

Table 34.1 CRC calculator specifications

| Parameter                  | Specifications for 8-bit data   | Specifications for 32-bit data  |
|----------------------------|---|---|
| Data size                  | 8-bit   | 32-bit  |
| Data for CRC calculation*1 | CRC code generated for data in 8n-bit units (where n is a natural number)   | CRC code generated for data in 32n-bit units (where n is a natural number)  |
| CRC processor unit         | Operation executed on 8 bits in parallel  | Operation executed on 32 bits in parallel   |
| CRC generating polynomial  | One of three generating polynomials that is selectable:<br>[8-bit CRC]<br><ul style="list-style-type: none"> <li><math>X^8 + X^2 + X + 1</math> (CRC-8)</li> </ul> [16-bit CRC]<br><ul style="list-style-type: none"> <li><math>X^{16} + X^{15} + X^2 + 1</math> (CRC-16)</li> <li><math>X^{16} + X^{12} + X^5 + 1</math> (CRC-CCITT).</li> </ul> | One of two generating polynomials that is selectable:<br>[32-bit CRC]<br><ul style="list-style-type: none"> <li><math>X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1</math> (CRC-32)</li> <li><math>X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1</math> (CRC-32C).</li> </ul> |
| CRC calculation switching  | The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication   |   |
| Module-stop function       | Module-stop state can be set to reduce power consumption  |   |
| TrustZone Filter           | Security attribution can be set   |   |

Note 1. This function cannot divide data used in CRC calculations. Write data in 8-bit or 32-bit units.

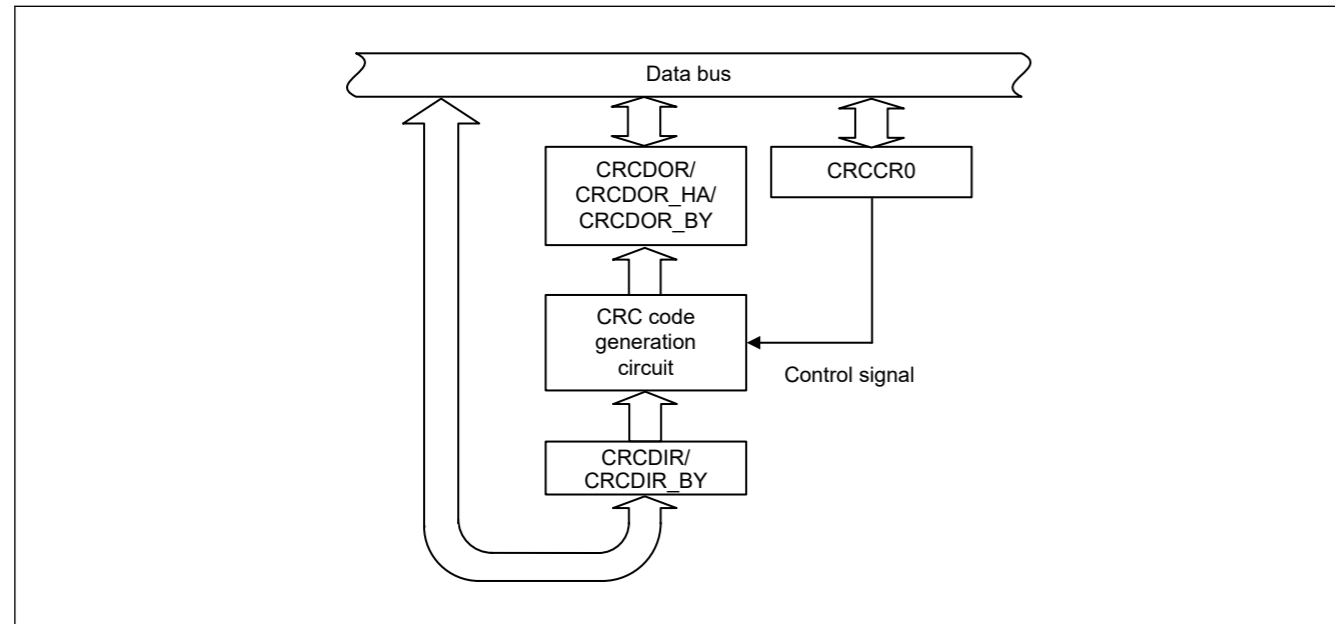

Figure 34.1 CRC calculator block diagram

### 34.2 Register Descriptions

## 34. 循环冗余校验(CRC)计算器

### 34.1 Overview

循环冗余校验(CRC)计算器生成CRC代码以检测数据中的错误。CRC计算结果的位顺序可以切换为LSB-first或MSB-first通信。此外，还可以使用各种CRC生成多项式。

表34.1列出了CRC计算器规格，图34.1显示了框图。

Table 34.1 CRC计算器规格

| Parameter            | 8位数据规格  | 32位数据规格   |
|----------------------|---|---|
| 数据大小                 | 8-bit   | 32-bit  |
| CRC计算数据*1            | 为8n位单元中的数据生成的CRC码 (其中n是自然数)   | 为32n位单元中的数据生成的CRC码 (其中n是自然数)  |
| CRC处理器单元             | 在8位上并行执行的操作   | 在32位上并行执行的操作  |
| CRC生成多项式             | 可选择的三个生成多项式之一: [8位CRC]<br><ul style="list-style-type: none"> <li><math>X^8 + X^2 + X + 1</math> (CRC-8)</li> </ul> [16-bit CRC]<br><ul style="list-style-type: none"> <li><math>X^{16} + X^{15} + X^2 + 1</math> (CRC-16)</li> <li><math>X^{16} + X^{12} + X^5 + 1</math> (CRC-CCITT).</li> </ul> | 可选择的两个生成多项式之一: [32位CRC]<br><ul style="list-style-type: none"> <li><math>X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1</math> (CRC-32)</li> <li><math>X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1</math> (CRC-32C).</li> </ul> |
| CRC计算切换              | CRC计算结果的位顺序可以切换为LSB-first或MSB-first通信   |   |
| Module-stop function | 可设置模块停止状态以降低功耗  |   |
| TrustZone Filter     | 可设置安全属性   |   |

注1.此功能不能除以CRC计算中使用的数据。以8位或32位为单位写入数据。

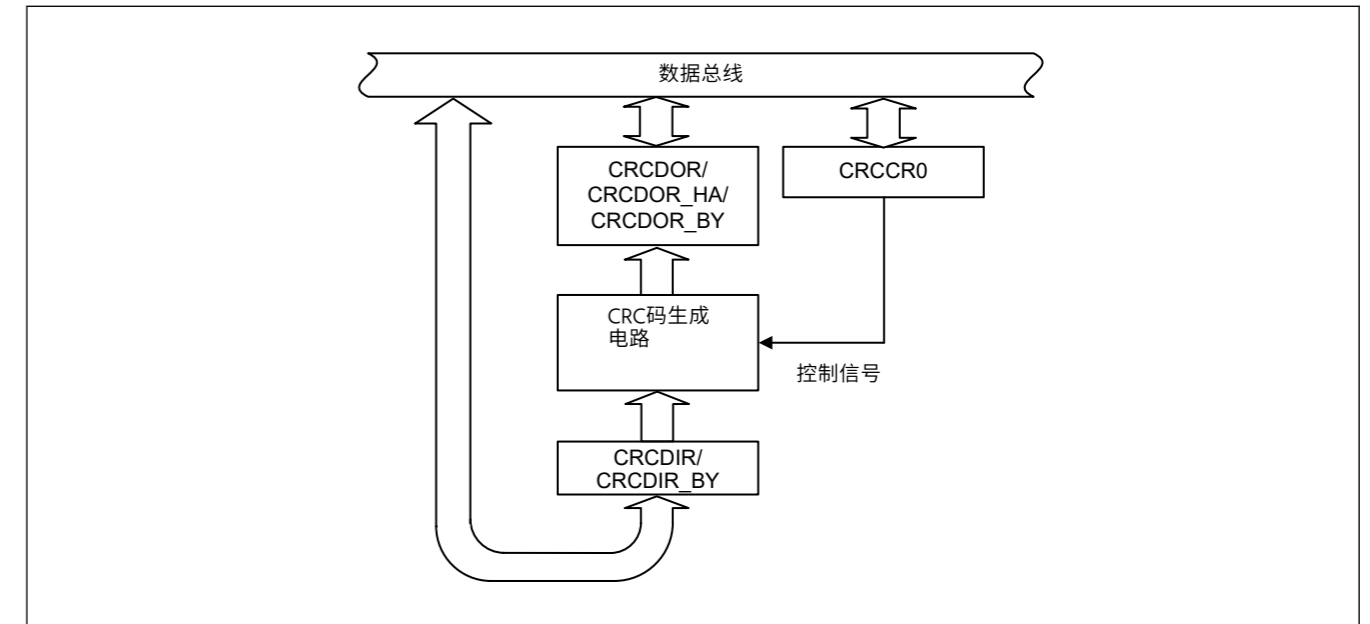

Figure 34.1 CRC计算器框图

### 34.2 注册说明

34.2.3 CRCDOR/CRCDOR\_HA/CRCDOR\_BY : CRC Data Output Register

Base address: CRC = 0x4010\_8000

Offset address: 0x08

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | n/a    | CRC output data<br>The CRCDOR register is a 32-bit read/write register for CRC-32 or CRC-32C calculation. The CRCDOR_HA (CRCDOR[31:16]) register is a 16-bit read/write register for CRC-16 or CRC-CCITT calculation. The CRCDOR_BY (CRCDOR[31:24]) register is an 8-bit read/write register for CRC-8 calculation. Because its initial value is 0x00000000, rewrite the CRCDOR/CRCDOR_HA/CRCDOR_BY register to perform the calculations using a value other than the initial value. Data written to the CRCDIR/CRCDIR_BY register is CRC calculated and the result is stored in the CRCDOR/CRCDOR_HA/CRCDOR_BY register. If the CRC code is calculated following the transferred data and the result is 0x00000000, there is no CRC error. | R/W |

34.3 Operation

34.3.1 Basic Operation

The CRC calculator generates CRC codes for use in LSB-first or MSB-first transfer.

The following examples show CRC code generation for input data (0xF0) using the 16-bit CRC-CCITT generating polynomial ( $X^{16} + X^{12} + X^5 + 1$ ). In these examples, the value of the CRC Data Output Register (CRCDOR\_HA) is cleared before CRC calculation.

When an 8-bit CRC (with the polynomial  $X^8 + X^2 + X + 1$ ) is in use, the valid bits of the CRC code are obtained in CRCDOR\_BY. When a 32-bit CRC is in use, the valid bits of the CRC code are obtained in CRCDOR.

Figure 34.2 and Figure 34.3 show the LSB-first and MSB-first data transmission examples respectively. Figure 34.4 and Figure 34.5 show the LSB-first and MSB-first data reception examples.

34.2.3 CRCDOR/CRCDOR\_HA/CRCDOR\_BY: CRC数据输出寄存器

Base address: CRC = 0x4010\_8000

Offset address: 0x08

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | n/a    | CRC输出数据<br>CRCDOR寄存器是一个32位读写寄存器，用于CRC-32或CRC-32C计算。CRCDOR_HA(CRCDOR[31:16])寄存器是用于CRC-16或CRC-CCITT计算。<br>CRCDOR_BY(CRCDOR[31:24])寄存器是一个用于CRC-8计算的8位读写寄存器。由于其初始值为0x00000000，因此重写CRCDOR/CRCDOR_HA/CRCDOR_BY寄存器以使用初始值以外的值执行计算。写入CRCDIR/CRCDIR_BY寄存器的数据经过CRC计算，结果存储在CRCDOR/CRCDOR_HA/CRCDOR_BY寄存器中。如果在传输数据之后计算CRC码，结果为0x00000000，则没有CRC错误。 | R/W |

34.3 Operation

34.3.1 基本操作

CRC计算器生成用于LSB优先或MSB优先传输的CRC代码。

以下示例显示了使用16位CRC-CCITT生成多项式( $X^{16} + X^{12} + X^5 + 1$ )为输入数据(0xF0)生成CRC码。在这些示例中，CRC数据输出寄存器(CRCDOR\_HA)的值在CRC计算之前被清除。

当使用8位CRC (多项式 $X^8 + X^2 + X + 1$ )时，CRC码的有效位在CRCDOR\_BY。使用32位CRC时，在CRCDOR中获取CRC码的有效位。

图34.2和图34.3分别显示了LSB-first和MSB-first数据传输示例。图34.4和图34.5显示了LSB优先和MSB优先的数据接收示例。

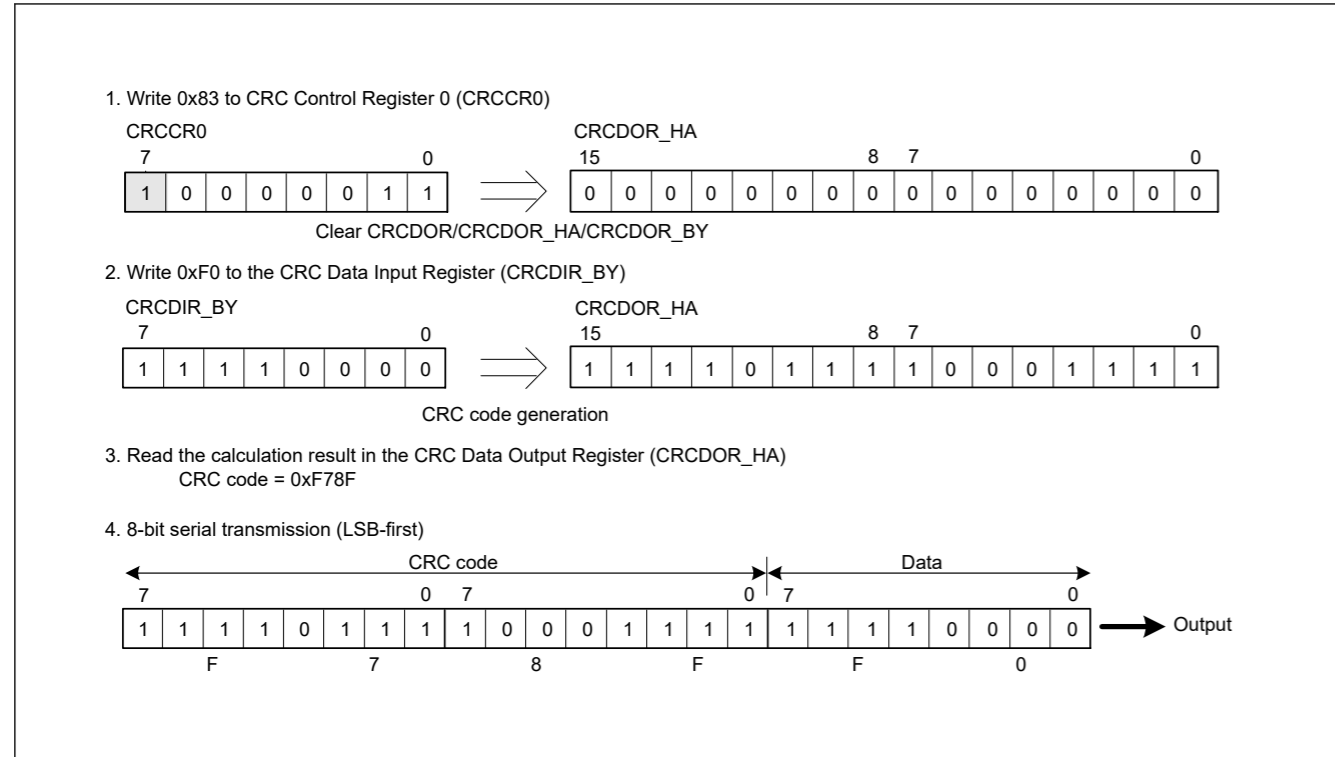

Figure 34.2 LSB-first data transmission

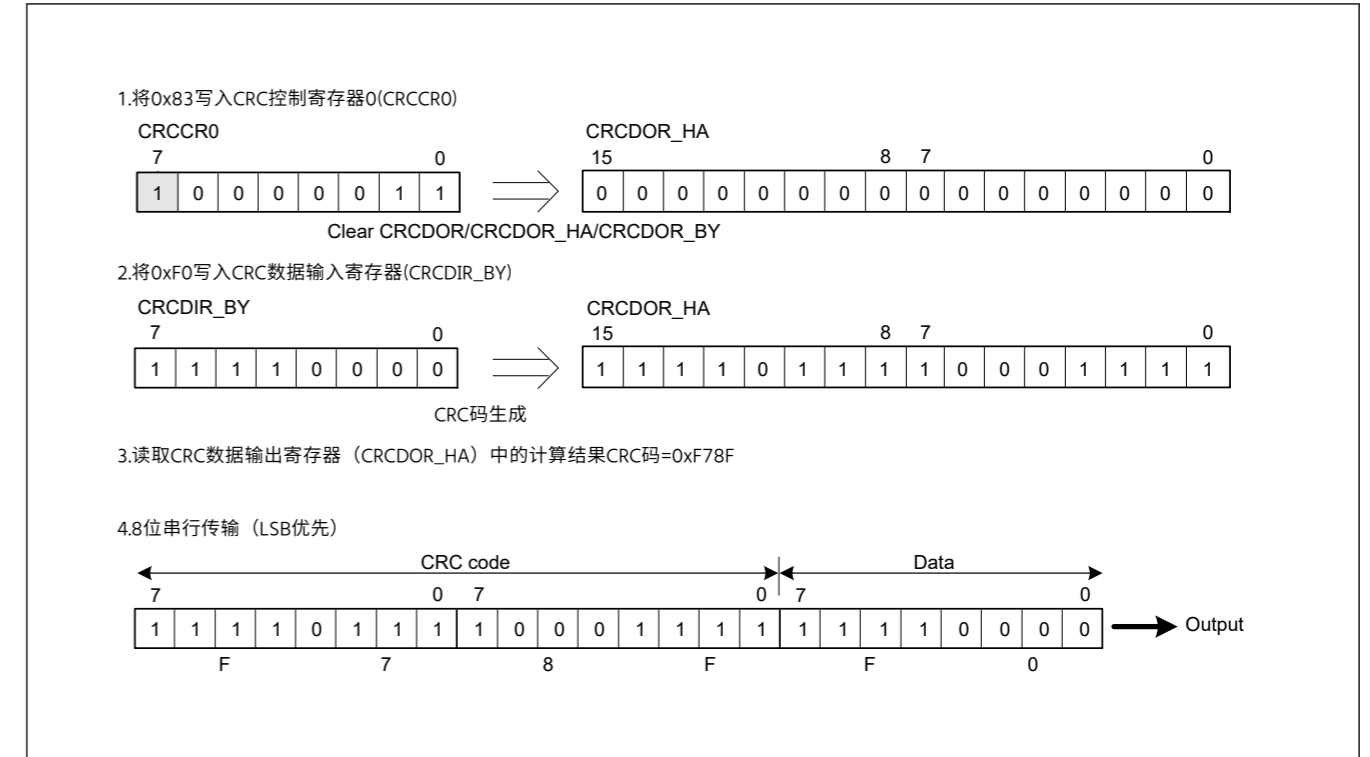

Figure 34.2 LSB-first数据传输

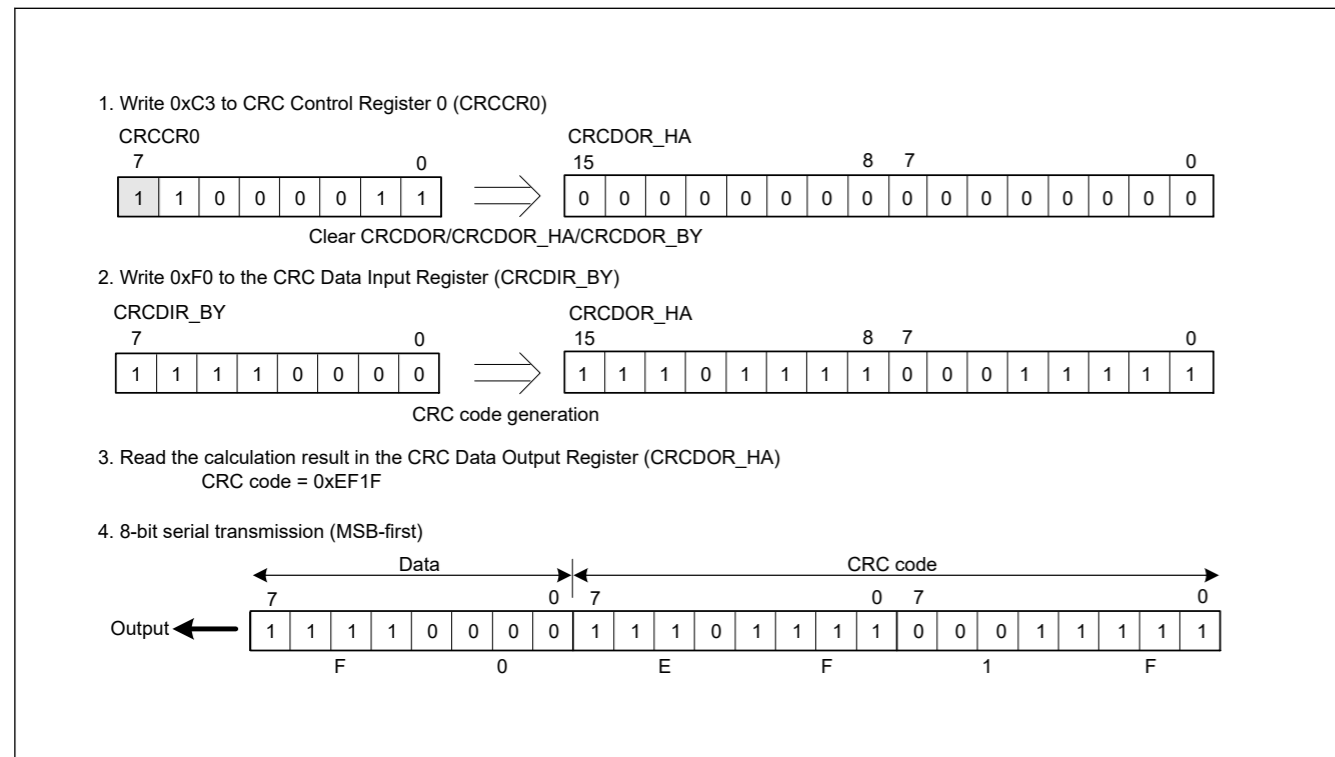

Figure 34.3 MSB-first data transmission

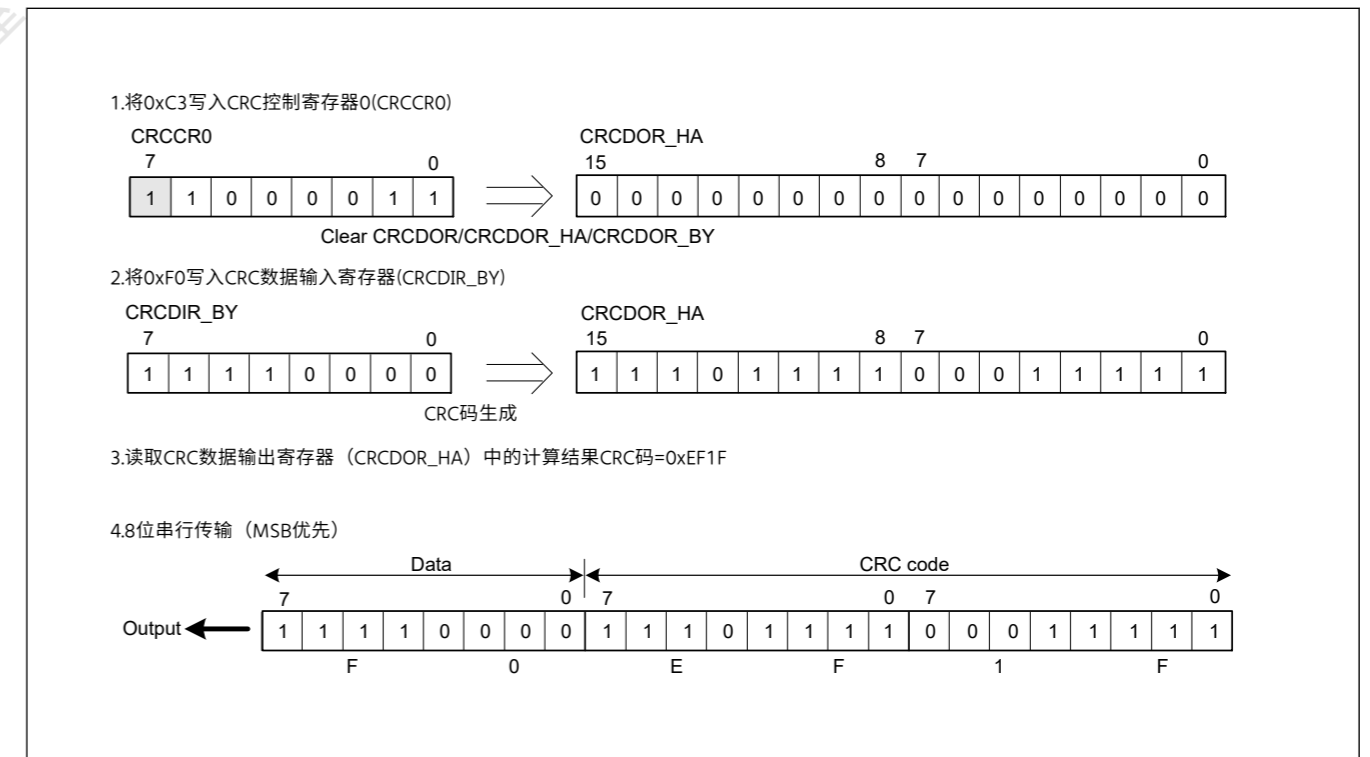

Figure 34.3 MSB优先数据传输

Figure 34.4 LSB-first data reception

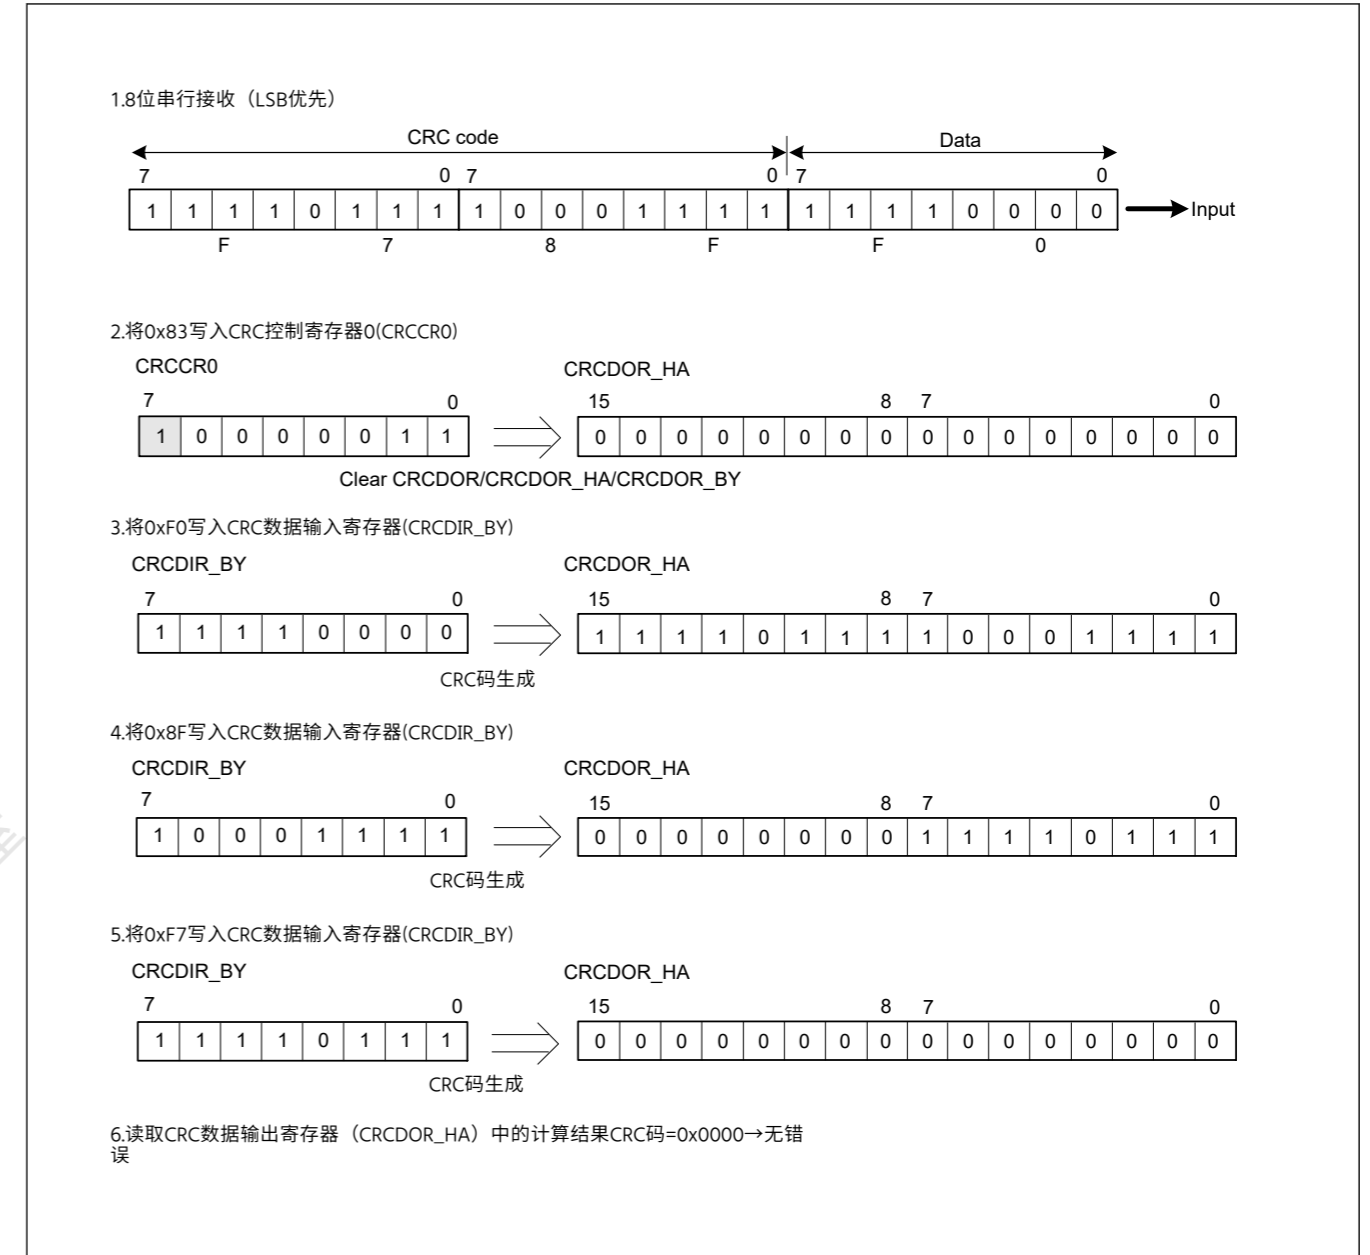

Figure 34.4 LSB-first数据接收

Figure 34.5 MSB-first data reception

34.4 Usage Notes

34.4.1 Settings for the Module-Stop State

The Module Stop Control Register C (MSTPCRC) can enable or disable CRC calculator operation. The CRC calculator is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

34.4.2 Note on Transmission

The transmission sequence for the CRC code differs based on whether the transmission is LSB-first or MSB-first. [Figure 34.6](#) shows an LSB-first and MSB-first data transmission.

Figure 34.5 MSB优先数据接收

34.4 使用说明

34.4.1 模块停止状态的设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用CRC计算器操作。CRC计算器在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

34.4.2 传输注意事项

CRC码的传输顺序根据传输是LSB在先还是MSB在先而有所不同。图34.6显示了LSB优先和MSB优先的数据传输。

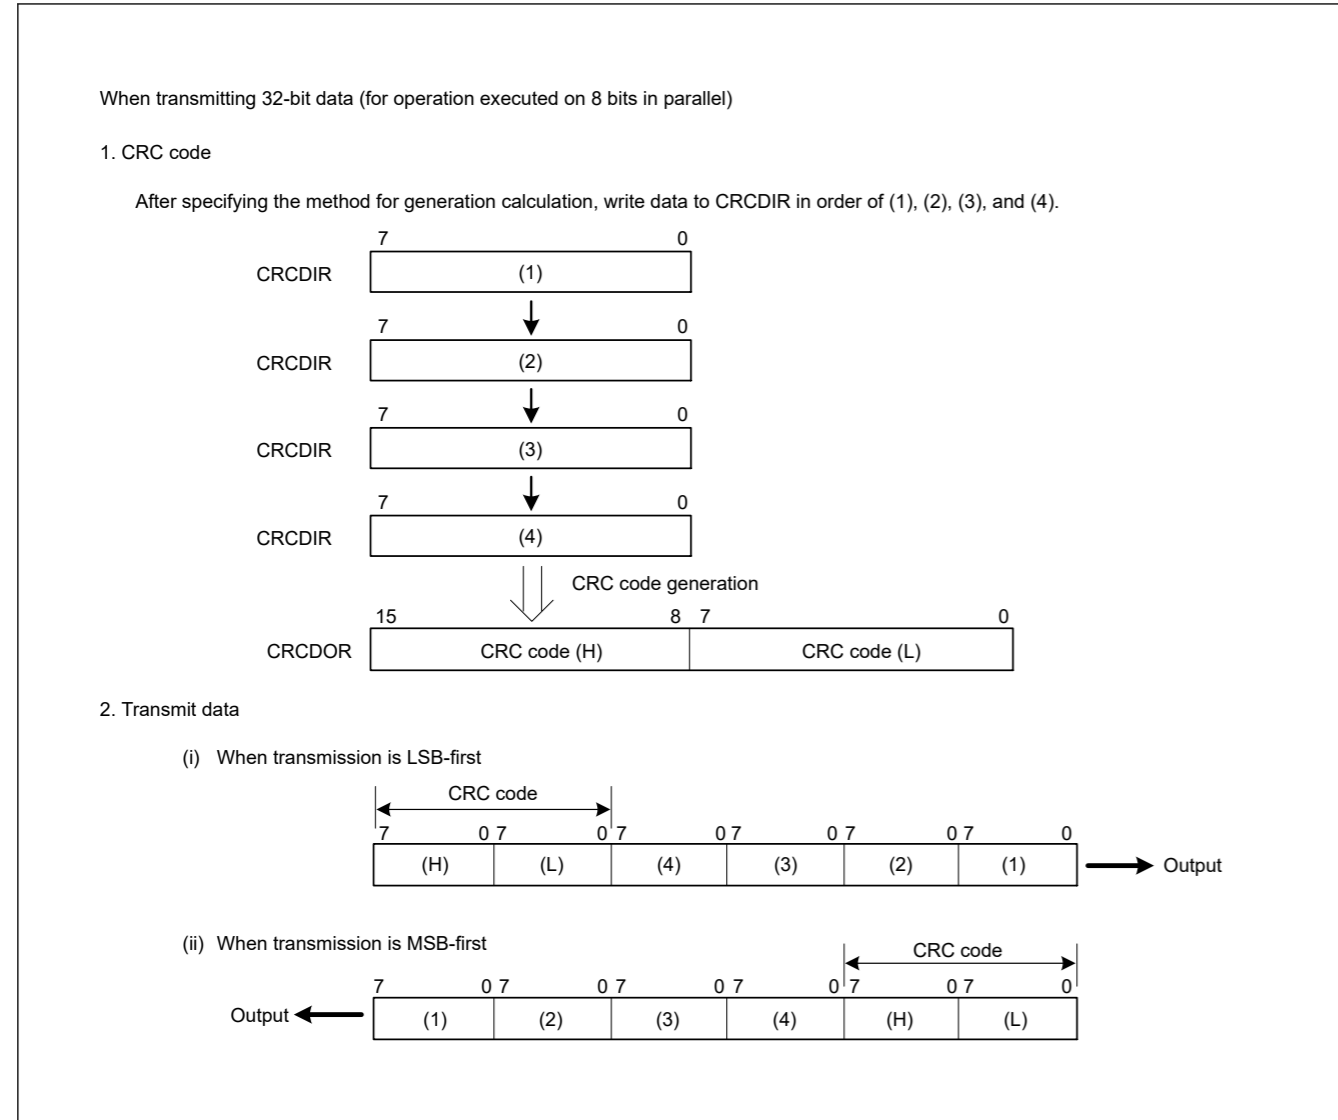

Figure 34.6 LSB-first and MSB-first data transmission

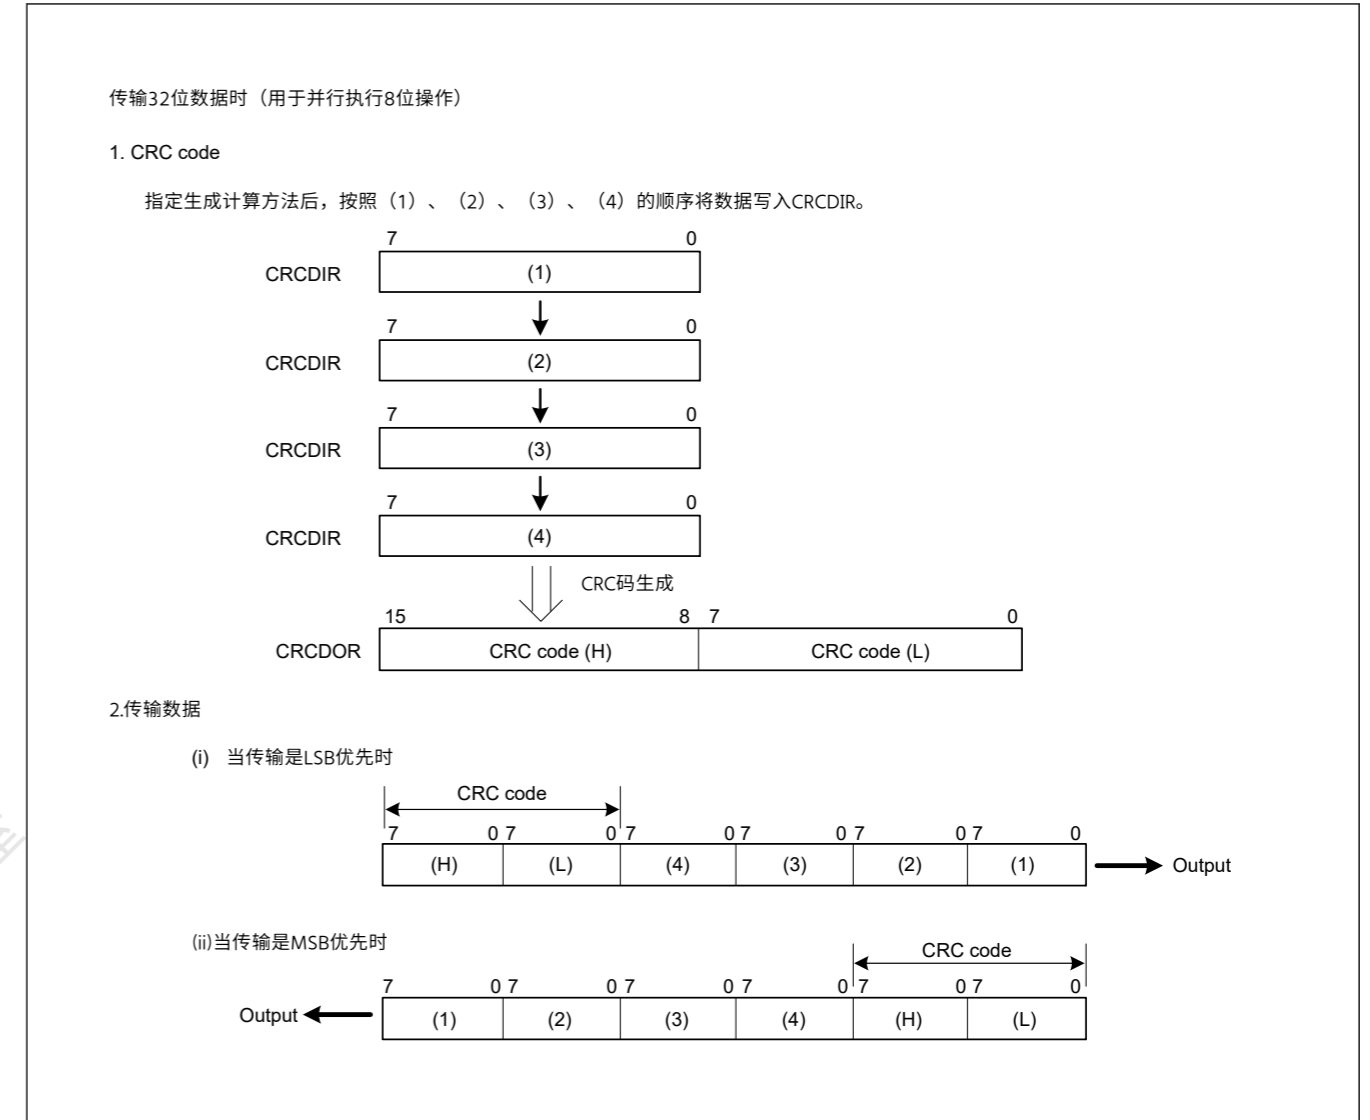

Figure 34.6 LSB-first和MSB-first数据传输

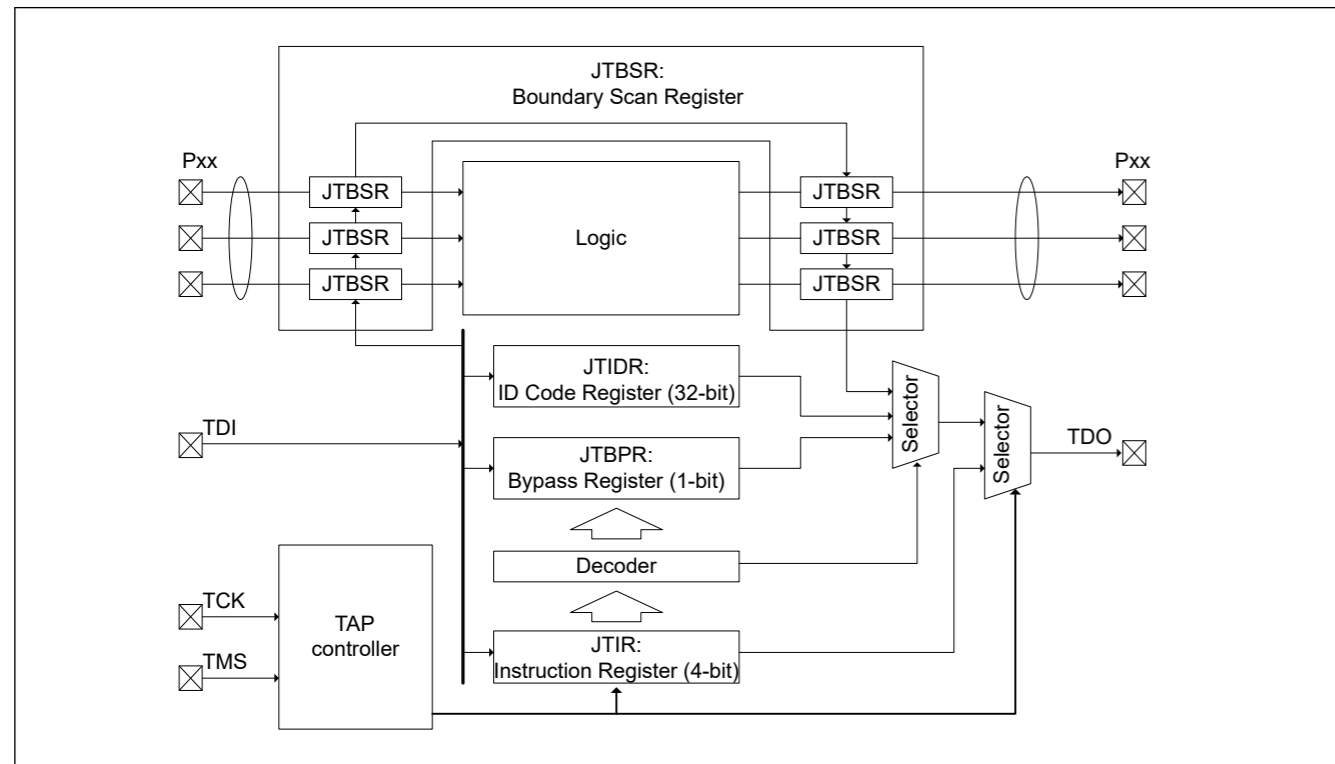

## 35. Boundary Scan

### 35.1 Overview

The boundary scan function provides a serial I/O interface based on the JTAG (Joint Test Action Group), IEEE Std.1149.1, and IEEE Standard Test Access Port and Boundary Scan Architecture. [Table 35.1](#) lists the boundary scan specifications, [Figure 35.1](#) shows a block diagram, and [Table 35.2](#) lists the I/O pins.

**Table 35.1** Boundary scan specifications

| Parameter           | Specifications   |
|---------------------|--|
| Execution condition | Boundary scan must be executed when the RES pin is driven low.   |
| Test modes          | <ul style="list-style-type: none"> <li>• BYPASS mode</li> <li>• EXTEST mode</li> <li>• SAMPLE/PRELOAD mode</li> <li>• CLAMP mode</li> <li>• HIGHZ mode</li> <li>• IDCODE mode</li> </ul> |

**Figure 35.1** Boundary scan function block diagram

**Table 35.2** Boundary scan I/O pins

| Pin name | I/O    | Description  |
|----------|--------|--|
| TCK      | Input  | Test clock input pin<br>Clock signal for boundary scan. The input clock duty cycle is 50% when the boundary scan function is used. |
| TMS      | Input  | Test mode select pin   |
| TDI      | Input  | Test data input pin  |
| TDO      | Output | Test data output pin   |

Note: This device does not support the TRST pin for the JTAG interface.

### 35.2 Register Descriptions

[Table 35.3](#) lists the boundary scan registers.

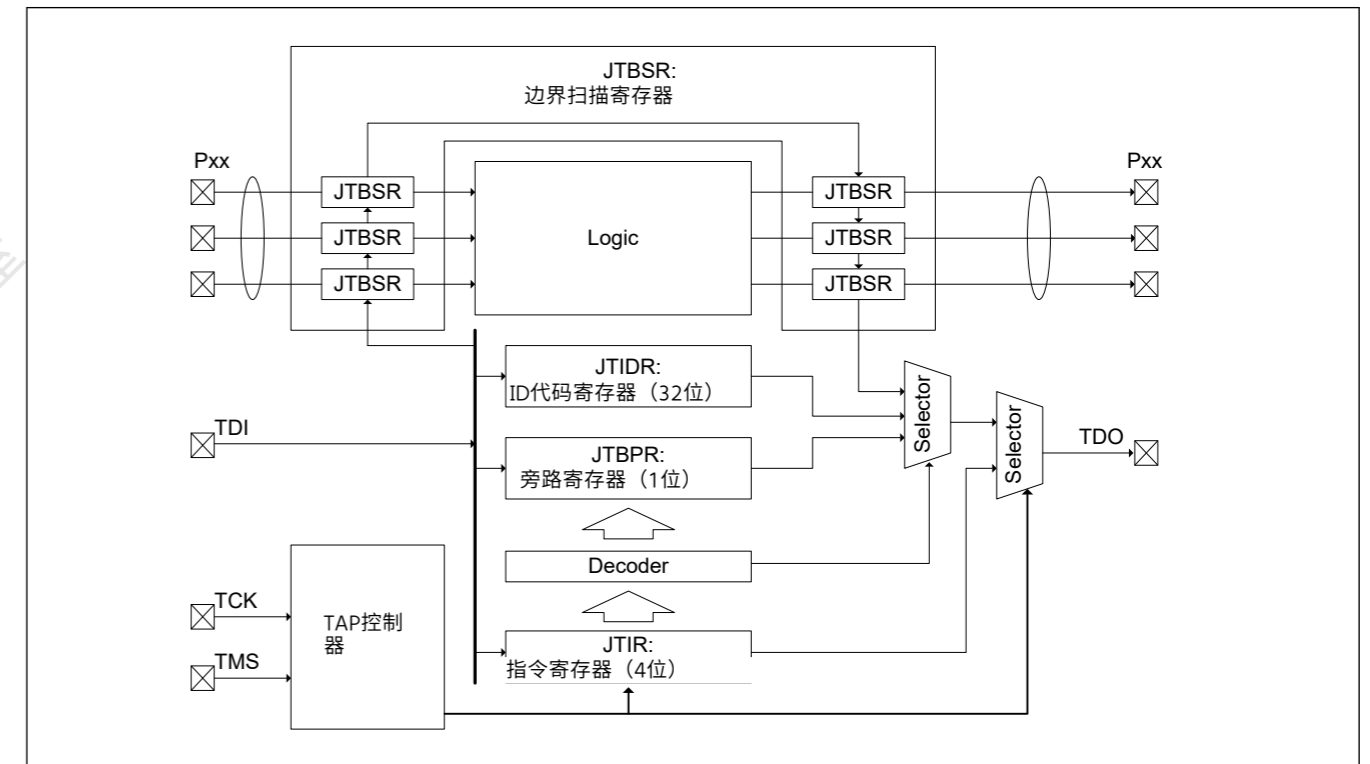

## 35. 边界扫描

### 35.1 Overview

边界扫描功能提供基于JTAG（联合测试行动组）、IEEE Std.1149.1和IEEE标准测试访问端口和边界扫描架构的串行IO接口。表35.1列出了边界扫描规范，图35.1显示了框图，表35.2列出了IO引脚。

**Table 35.1** 边界扫描规格

| Parameter | Specifications  |
|-----------|---|
| 执行条件      | 当RES引脚驱动为低电平时，必须执行边界扫描。   |
| 测试模式      | <ul style="list-style-type: none"> <li>• 旁路模式</li> <li>• EXTEST mode</li> <li>• SAMPLE/PRELOAD mode</li> <li>• 钳位模式</li> <li>• HIGHZ mode</li> <li>• IDCODE mode</li> </ul> |

**Figure 35.1** 边界扫描功能框图

**Table 35.2** 边界扫描IO引脚

| 引脚名称 | I/O    | Description                                  |
|------|--------|--|
| TCK  | Input  | 测试时钟输入引脚<br>边界扫描的时钟信号。使用边界扫描功能时，输入时钟占空比为50%。 |
| TMS  | Input  | 测试模式选择引脚                                     |
| TDI  | Input  | 测试数据输入引脚                                     |
| TDO  | Output | 测试数据输出引脚                                     |

Note: 该器件不支持JTAG接口的TRST引脚。

### 35.2 注册说明

表35.3列出了边界扫描寄存器。

Table 35.3 Boundary scan registers

| Register name          | Symbol | Value after reset |
|------------------------|--------|-------------------|
| Instruction Register   | JTIR   | 0xE               |
| ID Code Register       | JTIDR  | 0x0840_A447       |
| Bypass Register        | JTBPR  | Undefined         |
| Boundary Scan Register | JTBSR  | Undefined         |

Usage notes for the boundary scan registers:

- Instructions can be input to the Instruction Register (JTIR) through the TDI pin by serial transfer.
- The Bypass Register (JTBPR), which is a 1-bit register, is connected between the TDI and TDO pins in BYPASS mode.
- The Boundary Scan Register (JTBSR), which is configured according to the BSDL description, is connected between the TDI and TDO pins when test data is being shifted in.

Table 35.4 shows the availability of serial transfer for the registers.

Table 35.4 Serial transfer for registers

| Register name                  | Serial input | Serial output |
|--------------------------------|--------------|---------------|
| Instruction Register (JTIR)    | Available    | Available     |
| ID Code Register (JTIDR)       | Available    | Available     |
| Bypass Register (JTBPR)        | Available    | Available     |
| Boundary Scan Register (JTBSR) | Available    | Available     |

### 35.2.1 JTIR : Instruction Register

| Bit     | Symbol                | Function   | R/W     |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |

| 0x0     | EXTEST                |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x1     | SAMPLE/PRELOAD        |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x3     | IDCODE (Renesas code) |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x5     | CLAMP                 |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x6     | HIGHZ                 |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0xF     | BYPASS                |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| Others  | Reserved              |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |

JTAG instructions can be transferred to the JTIR register by serial input from the TDI pin. The JTIR register is initialized when a power-on reset occurs, or when the TAP controller is in the Test-Logic-Reset state.

### 35.2.2 JTIDR : ID Code Register

Table 35.3 边界扫描寄存器

| 注册名称    | Symbol | 重置后的值       |
|---------|--------|-------------|
| 指令寄存器   | JTIR   | 0xE         |
| ID代码寄存器 | JTIDR  | 0x0840_A447 |
| 绕过寄存器   | JTBPR  | Undefined   |
| 边界扫描寄存器 | JTBSR  | Undefined   |

边界扫描寄存器的使用说明:

- 指令可以通过串行传输的方式通过TDI引脚输入指令寄存器 (JTIR)。
- BypassRegister(JTBPR)是一个1位寄存器, 在BYPASS模式下连接在TDI和TDO引脚之间。
- 根据BSDL描述配置的边界扫描寄存器(JTBSR)在测试数据移入时连接在TDI和TDO引脚之间。

表35.4显示了寄存器串行传输的可用性。

Table 35.4 寄存器的串行传输

| 注册名称           | 串行输入      | 串行输出      |
|----------------|-----------|-----------|
| 指令寄存器(JTIR)    | Available | Available |
| ID代码寄存器(JTIDR) | Available | Available |
| 旁路寄存器(JTBPR)   | Available | Available |
| 边界扫描寄存器(JTBSR) | Available | Available |

### 35.2.1 JTIR:指令寄存器

| Bit     | Symbol                | Function   | R/W     |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
|---------|-----------------------|--|---------|-------------|-----|--------|-----|----------------|-----|-----------------------|-----|-------|-----|-------|-----|--------|--------|----------|--|

| TS[3:0] | Instruction           |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x0     | EXTEST                |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x1     | SAMPLE/PRELOAD        |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x3     | IDCODE (Renesas code) |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x5     | CLAMP                 |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0x6     | HIGHZ                 |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| 0xF     | BYPASS                |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |
| Others  | Reserved              |  |         |             |     |        |     |                |     |                       |     |       |     |       |     |        |        |          |  |

JTAG指令可以通过TDI引脚的串行输入传输到JTIR寄存器。当发生上电复位或TAP控制器处于Test-Logic-Reset状态时, JTIR寄存器被初始化。

### 35.2.2 JTIDR:ID代码寄存器

| Bit  | Symbol    | Function  | R/W |
|------|-----------|---|-----|
| 31:0 | DID[31:0] | Device ID<br>These bits store the fixed value that indicates the device IDCODE (0x0840_A447). | —   |

The JTIDR register data is output from the TDO pin when the IDCODE instruction is executed. After a reset release, the DID[31:0] of JTIDR changes into the Arm® debug code. See the *Arm® CoreSight™ SoC-400 Technical Reference Manual* (ARM DDI 0480F).

### 35.2.3 JTBPR : Bypass Register

The JTBPR register is a 1-bit register and is connected between the TDI and TDO pins when the JTIR register is set to BYPASS mode. The JTBPR register cannot be read from or written to by the CPU.

### 35.2.4 JTBSR : Boundary Scan Register

The JTBSR register is a shift register for controlling the external input and output pins of this device, and is distributed across the pads. To apply the JTBSR register in boundary-scan testing, issue the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ instructions. The BSDL file describes the associations between the JTBSR register bits and the pins of this device. The value after reset is undefined.

## 35.3 Operation

During a reset, the JTAG ports, TCK, TMS, TDI, and TDO, are assigned as default pin functions. The TCK, TMS, and TDI pins are pulled up by the pull-up resistors. Boundary scan testing can be executed after the setup time elapses when POR is negated and RES is driven low.

### 35.3.1 TAP Controller

Figure 35.2 shows the state transition diagram of the TAP controller. All transitions are controlled by the TMS signal.

| Bit  | Symbol    | Function                                  | R/W |
|------|-----------|---|-----|
| 31:0 | DID[31:0] | 设备ID<br>这些位存储指示设备IDCODE(0x0840_A447)的固定值。 | —   |

执行IDCODE指令时，从TDO引脚输出JTIDR寄存器数据。复位释放后，JTIDR的DID[31:0]更改为Arm®调试代码。请参阅Arm®CoreSight SoC-400技术参考手册(ARMDDI0480F)。

### 35.2.3 JTBPR:旁路寄存器

JTBPR寄存器是一个1位寄存器，当JTIR寄存器设置为旁路模式。CPU无法读取或写入JTBPR寄存器。

### 35.2.4 JTBSR:边界扫描寄存器

JTBSR寄存器是一个移位寄存器，用于控制该器件的外部输入和输出引脚，分布在各个焊盘上。要在边界扫描测试中应用JTBSR寄存器，请发出EXTEST、SAMPLE/PRELOAD、CLAMP和HIGHZ指令。BSDL文件描述了JTBSR寄存器位和该器件引脚之间的关联。复位后的值未定义。

## 35.3 Operation

在复位期间，JTAG端口、TCK、TMS、TDI和TDO被分配为默认引脚功能。TCK、TMS和TDI引脚由上拉电阻上拉。当POR被否定并且RES被驱动为低电平时，可以在设置时间过去后执行边界扫描测试。

### 35.3.1 水龙头控制器

图35.2显示了TAP控制器的状态转换图。所有转换都由TMS信号控制。

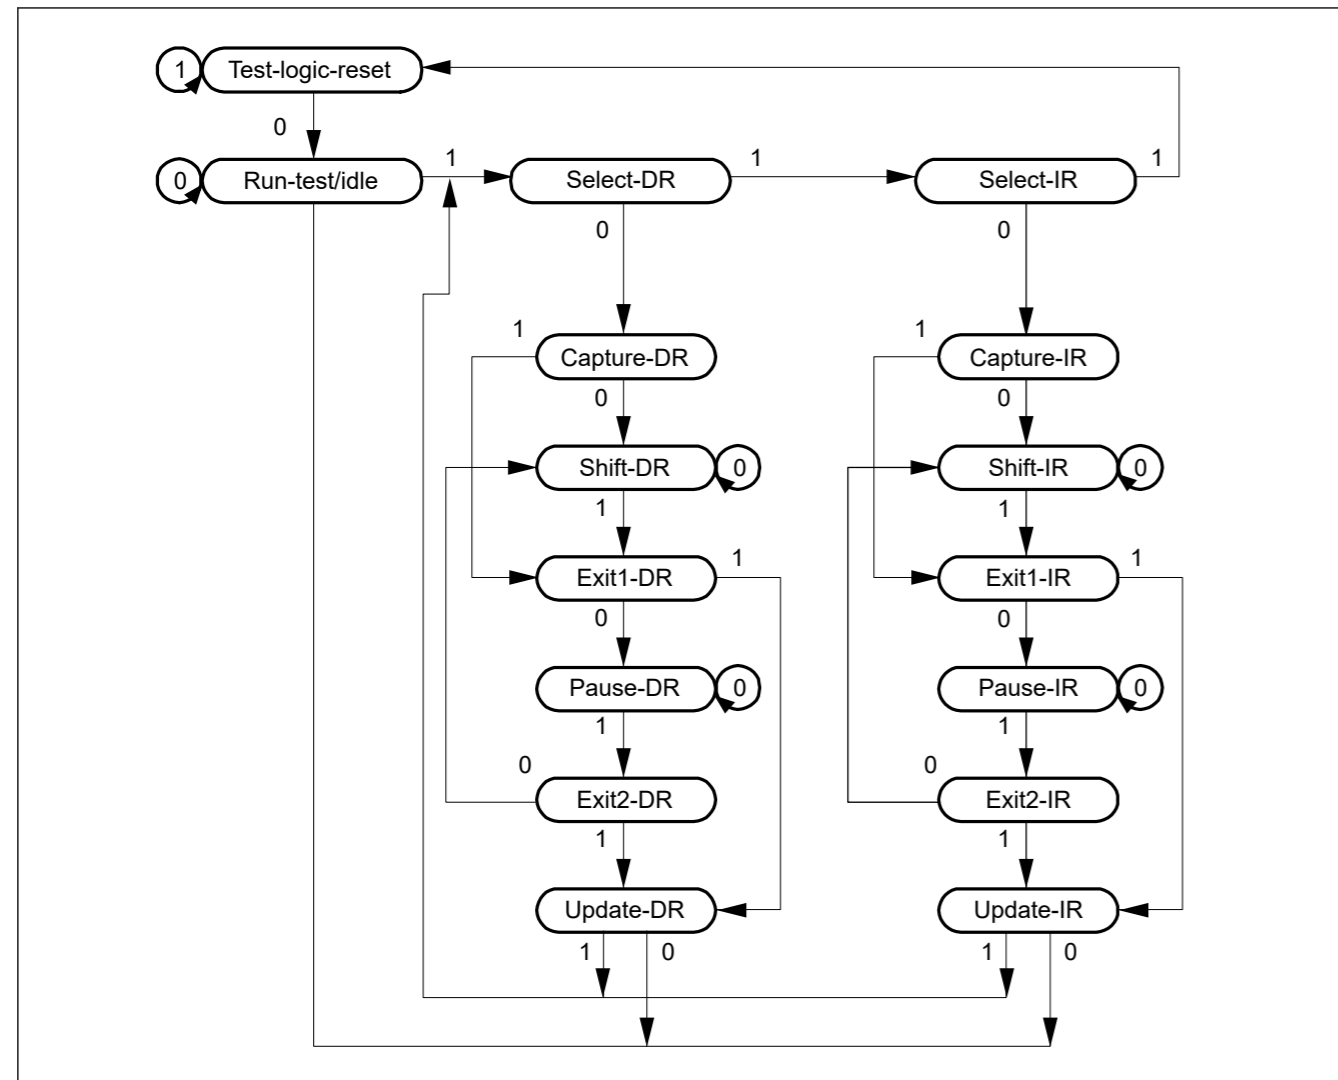

Figure 35.2 State transition diagram of TAP controller

### 35.3.2 Commands

#### (1) BYPASS

The BYPASS instruction drives the Bypass Register (JTBPR). This instruction shortens the shift path, facilitating the transfer of serial data to other LSIs on a printed circuit board at higher speeds. While this instruction is being executed, the test circuit has no effect on the system circuits.

The JTBPR register is connected between the TDI and TDO pins. Bypass operation is initiated from the Shift-DR operation. The TDO is low in the first clock cycle in the Shift-DR state. In the subsequent clock cycles, values input to the TDI pin are output from the TDO pin.

#### (2) EXTEST

The EXTEST instruction is used to test external circuits when this device is installed on the printed circuit board. If this instruction is executed, output pins are used to output test data (specified in the SAMPLE/PRELOAD instruction) from the Boundary Scan Register (JTBSR) to the other devices, and input pins are used to input the test result.

#### (3) SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input data from the internal circuits of this device to the JTBSR register, output data from the scan path, and reload the data to the scan path. While this instruction is executed, input signals are directly input to this device and output signals are also directly output to the external circuits. This device system circuit is not affected by this instruction.

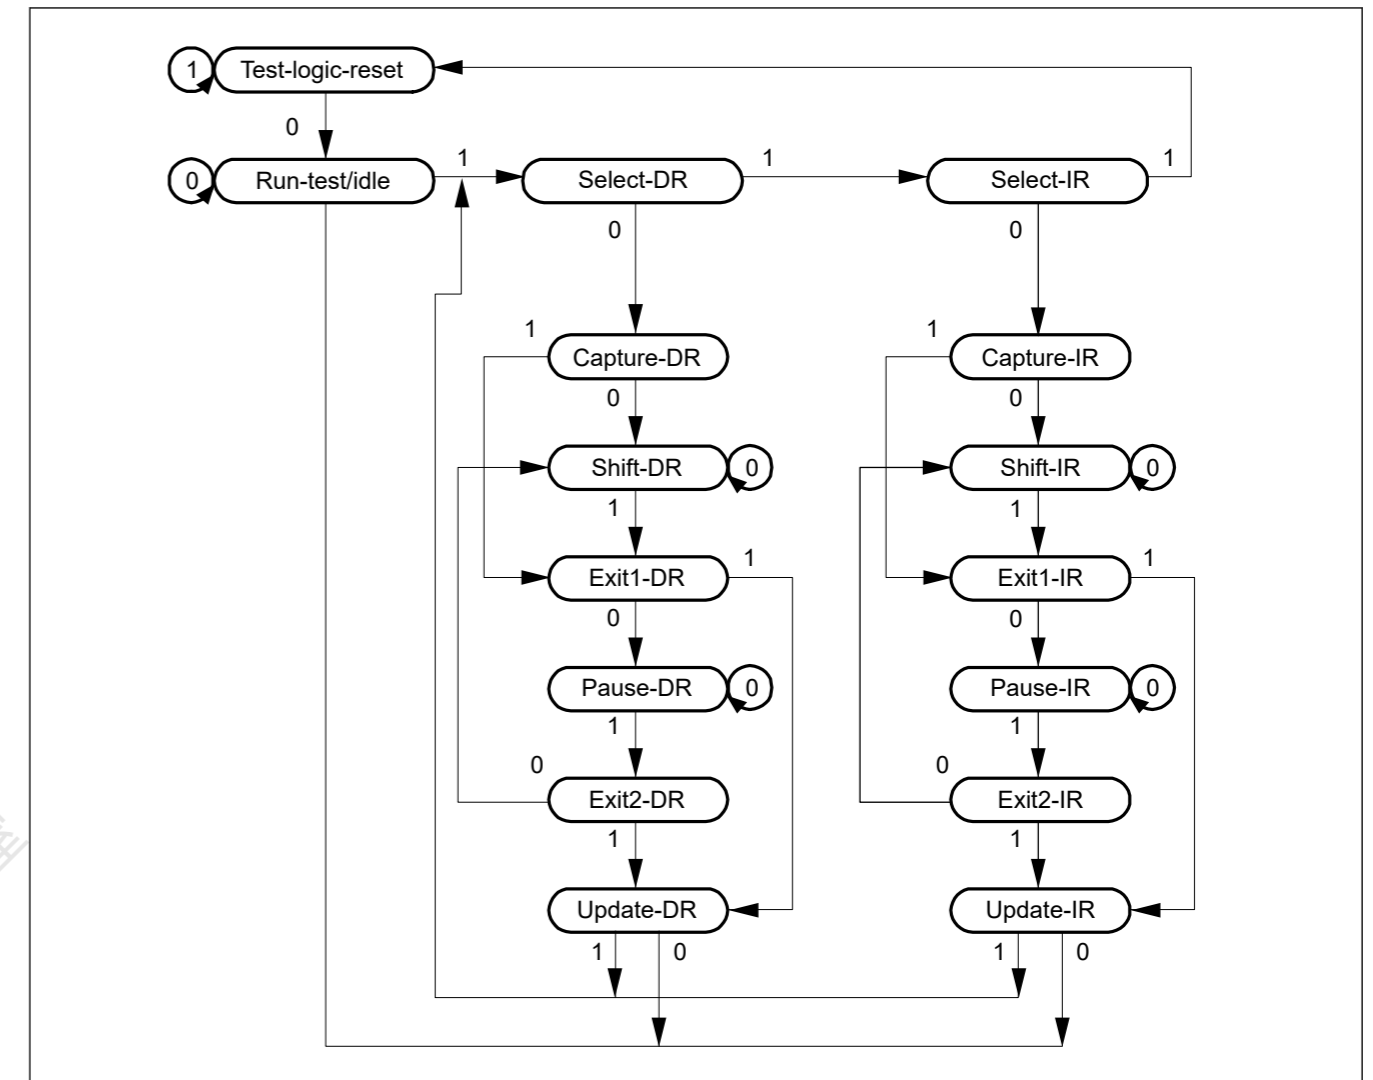

Figure 35.2 TAP控制器的状态转移图

### 35.3.2 Commands

#### (1) BYPASS

BYPASS指令驱动旁路寄存器(JTBPR)。该指令缩短了移位路径，便于将串行数据以更高的速度传输到印刷电路板上的其他LSI。在执行该指令时，测试电路对系统电路没有影响。

JTBPR寄存器连接在TDI和TDO引脚之间。旁路操作从Shift-DR操作开始。TDO在Shift-DR状态的第一个时钟周期内为低电平。在随后的时钟周期中，输入到TDI引脚的值从TDO引脚输出。

#### (2) EXTEST

当本设备安装在印刷电路板上时，EXTEST指令用于测试外部电路。如果执行该指令，输出引脚用于将测试数据（在SAMPLE/PRELOAD指令中指定）从边界扫描寄存器(JTBSR)输出到其他设备，输入引脚用于输入测试结果。

#### (3) SAMPLE/PRELOAD

SAMPLE/PRELOAD指令用于将数据从本器件内部电路输入到JTBSR寄存器，从扫描路径输出数据，并将数据重新加载到扫描路径。执行该指令时，输入信号直接输入到本设备，输出信号也直接输出到外部电路。本设备系统电路不受本指令影响。

In SAMPLE operation, the JTBSR register latches a snapshot of the data transferred from the input pins to the internal circuit or data transferred from the internal circuit to the output pins. The latched data is read from the scan path. The JTBSR register latches the data snapshot on the rising edge of the TCK pin in the Capture-DR state. The data snapshot is only transferred from the internal circuit to the output pins during a reset.

In PRELOAD operation, the initial value is written from the scan path to the parallel output latch of the JTBSR register prior to the EXTEST instruction execution. If EXTEST is executed without executing this PRELOAD operation, undefined values are output from the beginning to the end (transfer to the output latch) of the EXTEST sequence. (In the EXTEST instruction, output parallel latches are always output to the output pins.)

#### (4) IDCODE

When the IDCODE instruction is selected, the ID Code Register (JTIDR) value is output to the TDO pin in the Shift-DR state of the TAP controller. In this case, the JTIDR register value is output LSB-first. During this instruction execution, the test circuit does not affect the system circuit.

#### (5) CLAMP

When the CLAMP instruction is selected, output pins output the JTBSR register value that was specified in the SAMPLE/PRELOAD instruction in advance. While the CLAMP instruction is selected, the status of the JTBSR register is maintained regardless of the TAP controller state.

The JTBPR register is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

#### (6) HIGHZ

When the HIGHZ instruction is selected, all output pins enter high-impedance state. While the HIGHZ instruction is selected, the JTBSR register is maintained regardless of the state of the TAP controller.

The JTBPR register is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

### 35.4 Usage Notes

The boundary scan function is subject to the following constraints:

- The boundary scan must be executed when the RES pin is driven low
- Serial data input/output is in LSB order, as shown in [Figure 35.3](#)

在SAMPLE操作中，JTBSR寄存器锁存从输入引脚传输到内部电路的数据或从内部电路传输到输出引脚的数据的快照。从扫描路径读取锁存的数据。在Capture-DR状态下，JTBSR寄存器在TCK引脚的上升沿锁存数据快照。数据快照仅在复位期间从内部电路传输到输出引脚。

在PRELOAD操作中，在执行EXTEST指令之前，将初始值从扫描路径写入JTBSR寄存器的并行输出锁存器。如果不执行此PRELOAD操作的情况下执行EXTEST，则从EXTEST序列的开头到结尾（传输到输出锁存器）输出未定义的值。（在EXTEST指令中，输出并行锁存器始终输出到输出引脚。）

#### (4) IDCODE

When the IDCODE instruction is selected, the ID Code Register (JTIDR) value is output to the TDO pin in the Shift-DR state of the TAP controller. In this case, the JTIDR register value is output LSB-first. During this instruction execution, the test circuit does not affect the system circuit.

#### (5) CLAMP

选择夹具指令时，输出引脚输出样品中指定的JTBSR寄存器值  
预先PRELOAD指令。选择CLAMP指令时，无论TAP控制器状态如何，都将保持JTBSR寄存器的状态。

JTBPR寄存器连接在TDI和TDO引脚之间，导致与选择BYPASS指令时相同的操作。

#### (6) HIGHZ

选择Highz指令时，所有输出引脚都输入高阻抗状态。选择HIGHZ指令时，无论TAP控制器的状态如何，都会保持JTBSR寄存器。

JTBPR寄存器连接在TDI和TDO引脚之间，导致与选择BYPASS指令时相同的操作。

### 35.4 使用说明

边界扫描函数受以下约束：

- RES引脚拉低时必须执行边界扫描
- 串行数据输入输出按LSB顺序，如图35.3所示

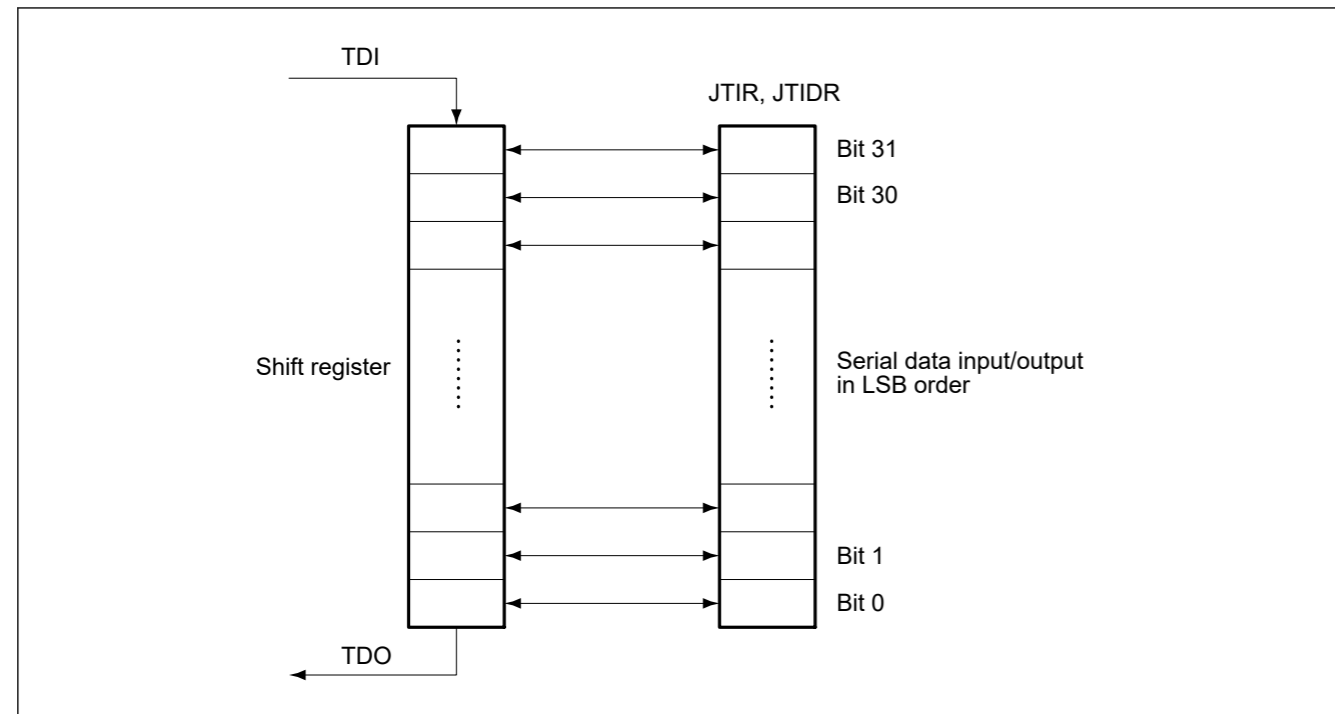

Figure 35.3 Serial data input/output

The following pins cannot be boundary-scanned:

- Power supply pins (VCC, VCL, VCL0, VSS, VBATT, AVCC0, AVSS0, VCC\_USB, and VSS\_USB)
- Analog reference pins (VREFH0, VREFL0, VREFH, VREFL)
- Clock pins (EXTAL, XTAL, XCIN, and XCOU)
- Reset pin (RES)
- USB-dedicated pins (USB\_DP, USB\_DM)
- The boundary-scan pins (TCK, TMS, TDI, and TDO).

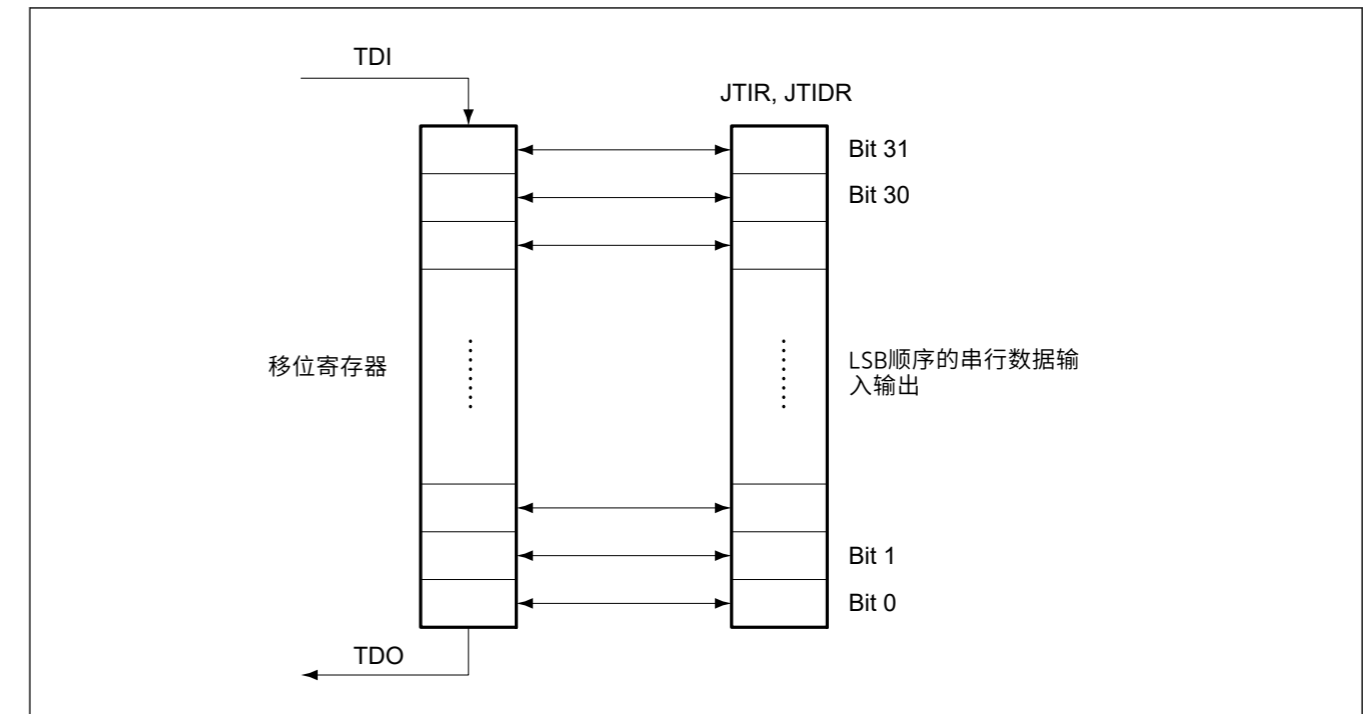

Figure 35.3 串行数据输入输出

以下引脚不能进行边界扫描：

- 电源引脚 (VCC、VCL、VCL0、VSS、VBATT、AVCC0、AVSS0、VCC\_USB和VSS\_USB)
- 模拟参考引脚 (VREFH0、VREFL0、VREFH、VREFL)
- 时钟引脚 (EXTAL、XTAL、XCIN和XCOU)
- 复位引脚 (RES)
- USB-dedicated pins (USB\_DP, USB\_DM)
- 边界扫描引脚 (TCK、TMS、TDI和TDO)。

## 36. Secure Cryptographic Engine (SCE9)

### 36.1 Overview

The Secure Cryptographic Engine (SCE9) consists of the access management circuit, encryption engine, and random number generation circuit. In combination with the SCE9 library, the SCE9 can prevent eavesdropping (to maintain confidentiality), falsification of information (to ensure integrity), and impersonation (to verify authenticity).

Because key information required for encryption and decryption is stored only in the SCE9 and all accesses from the outside can be blocked, SCE9 enables building a more robust security system.

Table 36.1 lists the SCE9 specifications. Figure 36.1 shows the SCE9 block diagram.

**Table 36.1 SCE9 specifications (1 of 2)**

| Parameter                             | Specifications   |
|---------------------------------------|--|
| Access control                        | Access management circuit <ul style="list-style-type: none"> <li>In case of irregular access to the SCE9 due to a tampered program or CPU runaway, this circuit blocks all subsequent accesses and stops data output from the SCE9</li> </ul>  |

Therefore it is protected from illicit access and copy.</li> </ul>   |

## 36. 安全加密引擎(SCE9)

### 36.1 Overview

安全密码引擎 (SCE9) 由访问管理电路、加密引擎和随机数生成电路组成。结合SCE9库, SCE9可以防止窃听 (以保持机密性)、伪造信息 (以确保完整性) 和假冒 (以验证真实性)。

由于加密和解密所需的关键信息只存储在SCE9中, 并且可以阻止来自外部的所有访问, 因此SCE9可以构建更强大的安全系统。

表36.1列出了SCE9规范。图36.1显示了SCE9框图。

**Table 36.1 SCE9规范 (2个中的1个)**

| Parameter | Specifications  |
|-----------|---|
| 访问控制      | 访问管理电路●<br>如果由于程序被篡改或CPU失控而导致对SCE9的非正常访问, 该电路将阻止所有后续访问并停止从SCE9输出数据  |

Table 36.1 SCE9 specifications (2 of 2)

| Parameter             | Specifications   |
|-----------------------|--|
| Unique ID             | <ul style="list-style-type: none"> <li>A read-only, 128-bit ID unique to an MCU (Unique ID) is accessible from the access management circuit.</li> <li>Key derivation functions (KDFs) combine the Unique ID with the key generation information. Such derived keys are used to unwrap the HUK within the SCE boundary.</li> </ul> |
| Low power consumption | Setting of the module-stop state is possible   |

Note 1. This does not include the overhead of calling SCE9 library functions.

Figure 36.1 SCE9 block diagram

## 36.2 Operation

### 36.2.1 Encryption Engine

Figure 36.2 shows conceptual diagram of the encryption engine installed in the SCE9.

The encryption engine uses the key generation information, and converts the plaintext data to ciphertext or ciphertext data to plaintext through the hardware.

The encryption/decryption process can be completed without exposing the key data and the process's intermediate data to the outside of the SCE9.

Table 36.1 SCE9规范 (2个中的2个)

| Parameter | Specifications  |
|-----------|---|
| 唯一身份      | <ul style="list-style-type: none"> <li>MCU唯一的只读128位ID (唯一ID) 可从访问管理电路访问。</li> <li>密钥派生函数(KDF)将唯一ID与密钥生成信息相结合。此类派生密钥用于在SCE边界内解开HUK。</li> </ul> |
| 低功耗       | 可以设置模块停止状态  |

注1.这不包括调用SCE9库函数的开销。

Figure 36.1 SCE9框图

## 36.2 Operation

### 36.2.1 加密引擎

图36.2显示了安装在SCE9中的加密引擎的概念图。

加密引擎使用密钥生成信息，通过硬件将明文数据转换为密文或将密文数据转换为明文。

加密解密过程可以在不将密钥数据和过程中间数据暴露在SCE9外部的情况下完成。

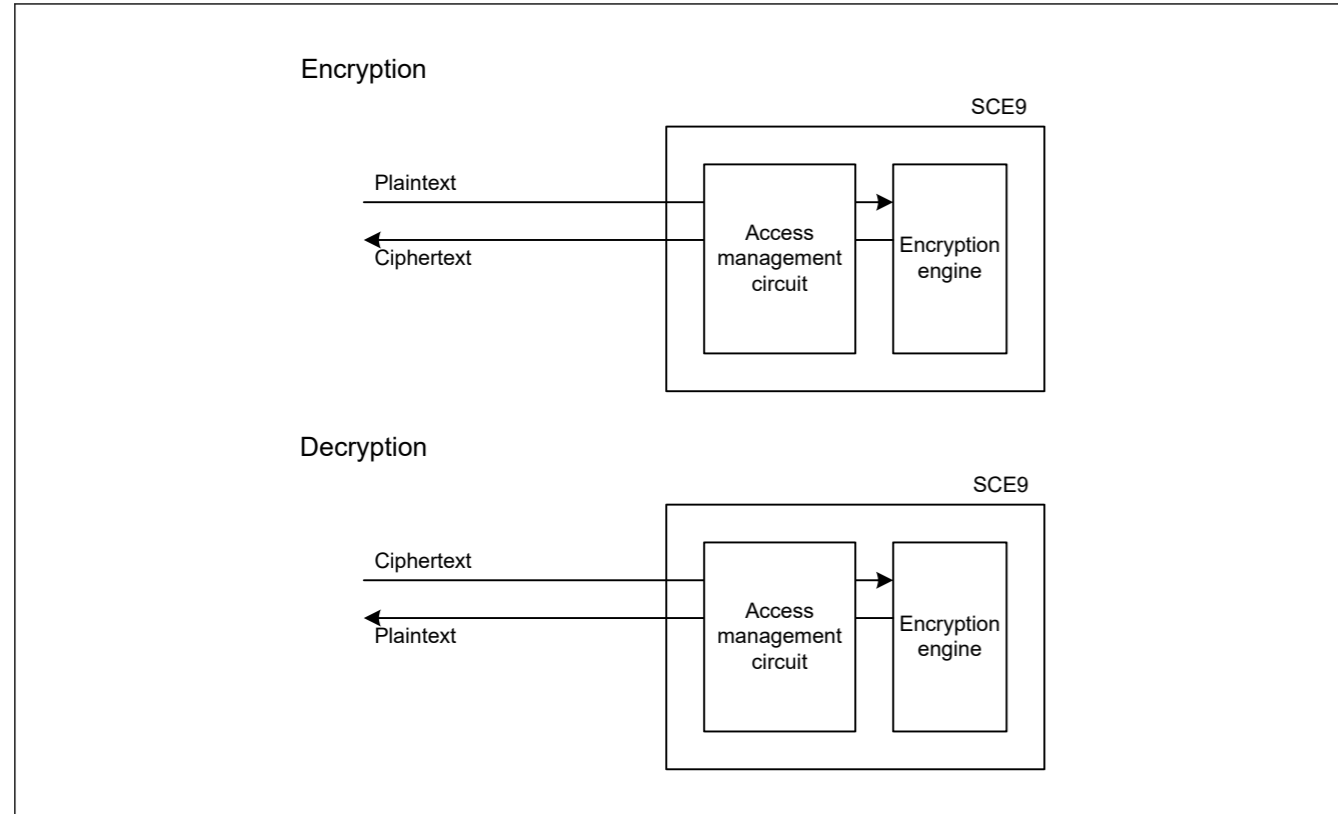

Figure 36.2 Conceptual diagram of the encryption engine

### 36.2.2 Encryption and Decryption

Follow the procedure below to encrypt and decrypt the data:

1. Enter the key generation information to the SCE9 and restore the key data.
2. Enter the target data to the SCE9. Plaintext data is converted to ciphertext and ciphertext data to plaintext.
3. Read the converted data.

The encryption engine has input and output buffers, and can perform encryption/decryption in parallel with data input/output. Figure 36.3 shows the encryption engine timing.

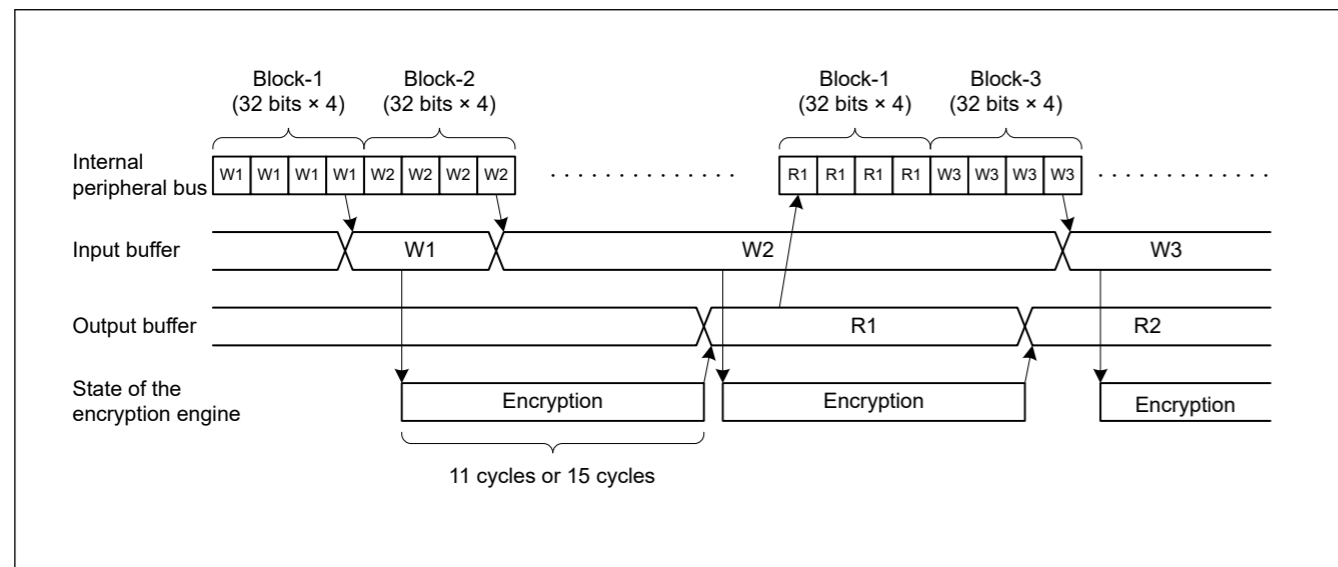

Figure 36.3 Encryption and decryption timing (AES)

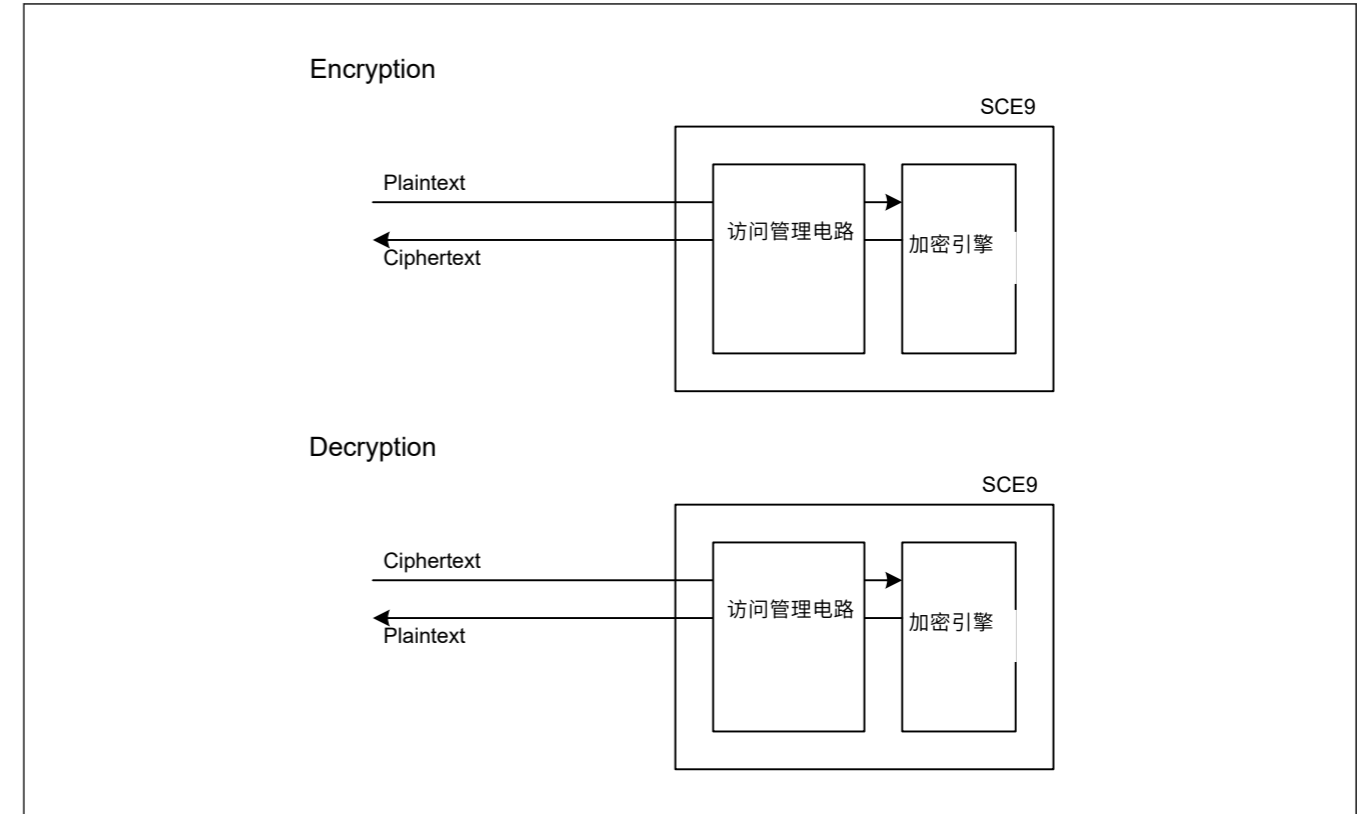

Figure 36.2 加密引擎的概念图

### 36.2.2 加密和解密

请按照以下步骤对数据进行加密和解密：

- 1.将密钥生成信息输入SCE9，恢复密钥数据。
- 2.将目标数据输入到SCE9。明文数据转换为密文，密文数据转换为明文。
- 3.读取转换后的数据。

加密引擎具有输入和输出缓冲区，可以与数据输入输出并行进行加密解密。图36.3显示了加密引擎的时序。

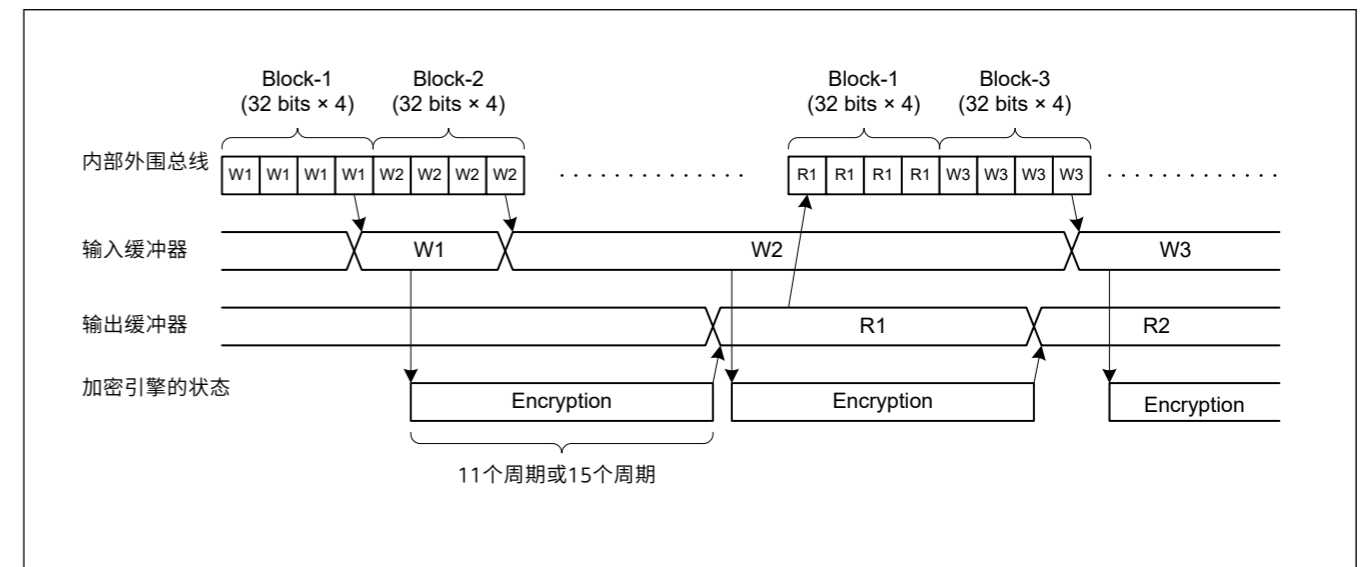

Figure 36.3 加密和解密时序 (AES)

### 36.3 Usage Notes

#### 36.3.1 Software Standby Mode

When the software standby mode is entered while the encryption engine is in process, proper processing cannot be resumed after the software standby mode is exited. The software standby mode should therefore be entered while the encryption engine is not running.

#### 36.3.2 Module-Stop Function Setting

SCE9 operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The SCE9 module is initially stopped after reset. Releasing the module-stop state enables access to the registers.

### 36.3 使用说明

#### 36.3.1 软件待机模式

当加密引擎正在运行时进入软件待机模式时，退出软件待机模式后无法恢复正常处理。因此，应在加密引擎未运行时进入软件待机模式。

#### 36.3.2 模块停止功能设置

可以使用模块停止控制寄存器C(MSTPCRC)禁用或启用SCE9操作。SCE9模块在复位后最初停止。释放模块停止状态可以访问寄存器。

## 37. 12-Bit A/D Converter (ADC12)

### 37.1 Overview

The MCU includes 12-bit successive approximation A/D converter (ADC12) units. In unit 0, up to 12 analog input channels are selectable. In unit 1, up to 10 analog input channels, temperature sensor output, internal reference voltage can be selected for conversion in respective units.

The A/D conversion accuracy is selectable from 12-bit, 10-bit, 8-bit conversion, making it possible to optimize the trade-off between speed and resolution in generating a digital value.

The ADC12 supports the following operating modes:

- Single scan mode to convert analog inputs of selected channels in ascending order of channel number
- Continuous scan mode to convert analog inputs of selected channels continuously in ascending order of channel number
- Group scan mode to divide analog inputs of channels into two groups (group A and B) and convert the analog inputs of selected channels for each group in ascending order of channel number.

In group scan mode, select two groups (group A and B). You can individually select the scan start conditions for each group (group A, B) and start scanning of each group at different times. In addition, when group A priority control operation is set, the ADC12 accepts group A scan start during group B A/D conversion, suspending group B conversion. This allows you to assign higher priority to A/D conversion start for group A.

In double trigger mode, the analog input of a selected channel is converted in single scan mode or group scan mode (group A), and data converted by the first and second A/D conversion start triggers are stored in different registers, providing duplexing of A/D converted data.

Self-diagnosis is performed once at the beginning of each scan, and one of the three reference voltage values generated in ADC12 is A/D converted.

The temperature sensor output and the internal reference voltage are selectable at the same time as the analog input of the channel. First A/D conversion is performed for the analog input of the channel, next the temperature sensor output, and then the internal reference voltage.

The ADC12 also provides a compare function (window A and window B). The compare function specifies the upper reference value for window A and lower reference value for window B, and outputs an interrupt when the A/D converted value of the selected channel meets the comparison conditions.

The A/D data storage buffer is a ring buffer consisting of 16 buffers to sequentially store A/D converted data.

Table 37.1 lists the ADC12 specifications and Table 37.2 list the functions. Figure 37.1 shows a block diagram of ADC12 and Table 37.3 lists the I/O pins.

Table 37.1 ADC12 specifications (1 of 3)

| Parameter            | Specifications  |
|----------------------|---|
| Number of units      | two units   |
| Input channels       | Up to 22 channels (AN000 to AN009, AN012, AN013, AN100 to AN102, AN116 to AN122) Extended   |
| Analog function      | Temperature sensor output, internal reference voltage   |
| Conversion method    | Successive approximation method   |
| Resolution           | 12-bit, 10-bit, 8-bit   |
| Conversion time      | 0.4 μs/channel (when 12-bit A/D conversion clock PCLKC (ADCLK) is operating at 50 MHz)  |
| A/D conversion clock | Peripheral module clock PCLKA and A/D conversion clock PCLKC (ADCLK) can be set with the following division ratios: PCLKA to PCLKC (ADCLK) frequency ratio = 1:1, 2:1, 4:1, 8:1, 1:2, 1:4 |

## 37. 12-Bit A/D Converter (ADC12)

### 37.1 Overview

MCU包括12位逐次逼近模数转换器(ADC12)单元。在单元0中,最多可选择12个模拟输入通道。在单元1中,可以选择最多10个模拟输入通道、温度传感器输出、内部参考电压进行相应单元的转换。

AD转换精度可从12位、10位、8位转换中选择,从而可以在生成数字值时优化速度和分辨率之间的权衡。

ADC12支持以下工作模式:

- 单次扫描模式,以通道号升序转换所选通道的模拟输入
- 连续扫描模式,以通道号升序连续转换所选通道的模拟输入
- 组扫描模式,将通道的模拟输入分为两组(A组和B组),并按通道编号升序对每组所选通道的模拟输入进行转换。

在组扫描模式下,选择两个组(A组和B组)。您可以单独选择每个组(A、B组)的扫描开始条件,并在不同时间开始每个组的扫描。此外,当设置A组优先控制操作时,ADC12在B组AD转换期间接受A组扫描启动,暂停B组转换。这允许您为A组的AD转换启动分配更高的优先级。

在双触发模式下,选定通道的模拟输入转换为单扫描模式或组扫描模式(组A),由第一个和第二个AD转换启动触发器转换的数据存储在不同的寄存器中,提供AD转换数据的双工。

自诊断在每次扫描开始时执行一次,并在生成的三个参考电压值之一ADC12经过AD转换。

温度传感器输出和内部参考电压可与通道的模拟输入同时选择。首先对通道的模拟输入进行AD转换,然后是温度传感器输出,然后是内部参考电压。

ADC12还提供比较功能(窗口A和窗口B)。比较函数指定窗口A的上参考值和窗口B的下参考值,当所选通道的AD转换值满足比较条件时输出中断。

AD数据存储缓冲区是由16个缓冲区组成的环形缓冲区,用于顺序存储AD转换后的数据。

表37.1列出了ADC12规格,表37.2列出了功能。图37.1显示了ADC12的框图,表37.3列出了IO引脚。

Table 37.1 ADC12规格(1of3)

| Parameter  | Specifications   |
|------------|--|
| 单位数量       | 两个单元   |
| 输入通道       | 多达22个通道(AN000至AN009、AN012、AN013、AN100至AN102、AN116至AN122)扩展                             |
| 模拟功能       | 温度传感器输出,内部参考电压   |
| 转换方法       | 逐次逼近法  |
| Resolution | 12-bit, 10-bit, 8-bit  |
| 转换时间       | 0.4μs通道(当12位AD转换时钟PCLKC(ADCLK)工作在50MHz时)   |
| AD转换时钟     | 外设模块时钟PCLKA和AD转换时钟PCLKC(ADCLK)可以设置为以下分频比:PCLKA与PCLKC(ADCLK)频率比=1:1 2:1 4:1 8:1 1:2 1:4 |

### 37.2 Register Descriptions

#### 37.2.1 ADDRn : A/D Data Registers n

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  ( $m = 0, 1$ )

Offset address:  $0x020 + 0x2 \times n$  ( $n = 0$  to 9, 12, 13,  $m = 0$ )  
 $0x020 + 0x2 \times n$  ( $n = 0$  to 2, 16 to 22,  $m = 1$ )

| Bit  | Symbol       | Function   | R/W |
|------|--------------|--|-----|
| 15:0 | ADDRn [15:0] | Converted Value 15 to 0<br>Functions vary depending on the selected mode and accuracy. See <a href="#">Table 37.5</a> and <a href="#">Table 37.6</a> . | R   |

ADDRn registers are 16-bit read-only registers to store A/D conversion results.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADRPC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

##### (1) When A/D-converted value addition/average mode is not selected

[Table 37.5](#) shows the example of bit assignment for 12-bit accuracy.

**Table 37.5 Example of bit assignment for 12-bit accuracy**

| Accuracy                                  | b15  | b14 | b13 | b12 | b11  | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3                        | b2 | b1 | b0 |
|---|--|-----|-----|-----|--|-----|----|----|----|----|----|----|---------------------------|----|----|----|
| Right-justified data with 12-bit accuracy | These bits are read as 0.                              |     |     |     | Converted Value 11 to 0:<br>12-bit A/D-converted value |     |    |    |    |    |    |    |                           |    |    |    |
| Left-justified data with 12-bit accuracy  | Converted Value 11 to 0:<br>12-bit A/D-converted value |     |     |     |  |     |    |    |    |    |    |    | These bits are read as 0. |    |    |    |

##### (2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, These registers indicate the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

##### (3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, these registers indicate the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

[Table 37.6](#) shows example of the bit assignment for 12-bit accuracy.

### 37.2 注册说明

#### 37.2.1 ADDRn:AD数据寄存器n

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  ( $m = 0, 1$ )

Offset address:  $0x020 + 0x2 \times n$  ( $n = 0$  to 9, 12, 13,  $m = 0$ )  
 $0x020 + 0x2 \times n$  ( $n = 0$  to 2, 16 to 22,  $m = 1$ )

| Bit  | Symbol       | Function                                 | R/W |
|------|--------------|--|-----|
| 15:0 | ADDRn [15:0] | 将值15转换为0<br>功能因所选模式和精度而异。请参见表37.5和表37.6。 | R   |

ADDRn寄存器是16位只读寄存器，用于存储AD转换结果。

以下条件决定了AD数据寄存器中的数据格式：

- AD数据寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）
- AD转换精度选择位(ADCER.ADRPC[1:0])中的设置（可选择12位、10位、8位。）
- 加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）
- 设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

##### (1) 未选择AD转换值加法平均模式时

表37.5显示了12位精度的位分配示例。

**Table 37.5 12位精度的位分配示例**

| Accuracy      | b15               | b14 | b13 | b12 | b11               | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3      | b2 | b1 | b0 |
|---------------|-------------------|-----|-----|-----|-------------------|-----|----|----|----|----|----|----|---------|----|----|----|
| 具有12位精度的右对齐数据 | 这些位读为0。           |     |     |     | 转换值11到0: 12位AD转换值 |     |    |    |    |    |    |    |         |    |    |    |
| 具有12位精度的左对齐数据 | 转换值11到0: 12位AD转换值 |     |     |     |                   |     |    |    |    |    |    |    | 这些位读为0。 |    |    |    |

##### (2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenADconvertedvalueaveragemodeisselected TheseregistersindicatethemeanofAD-convertedvaluesonaspecificchannel.该值根据AD数据寄存器格式选择位的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

##### (3) 选择AD转换值相加模式时

对于12位、10位、8位精度，可以在AD转换值相加模式中选择1、2、3或4次。AD转换结果作为指定转换精度的2位扩展值存储在AD数据寄存器中。

对于12位精度，在AD转换值相加模式中也可以选择16倍。在AD转换值相加模式中，这些寄存器指示通过在特定通道上添加AD转换值获得的值。AD转换结果作为指定转换精度的4位扩展值存储在AD数据寄存器中。

WhenAD-convertedvalueadditionmodeisselected thevalueisstoredintheADdataregisterbasedonthesettingsof theADDataRegisterFormatSelectbits.

表37.6显示了12位精度的位分配示例。

**Table 37.6 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected**

| Accuracy                                  |  | b15   | b14 | b13   | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1                        | b0 |

|------|----------------|--|-----|
| 15:0 | ADDBLDR [15:0] | Converted Value 15 to 0<br>Functions vary depending on the selected mode and accuracy. See <a href="#">Table 37.7</a> and <a href="#">Table 37.8</a> . | R   |

ADDBLDR register is a 16-bit read-only register to store A/D conversion results in response to a second trigger in double-trigger mode.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADPRC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

**(1) When A/D-converted value addition/average mode is not selected**

[Table 37.7](#) shows the example of bit assignment for 12-bit accuracy.

**Table 37.7 Example of bit assignment for 12-bit accuracy**

| 15:0 | ADDBLDR [15:0] | 将值15转换为0<br>功能因所选模式和精度而异。请参见表37.7和表37.8。 | R   |

ADDBLDR寄存器是一个16位只读寄存器，用于存储AD转换结果，以响应双触发模式下的第二次触发。

以下条件决定了AD数据寄存器中的数据格式：

- AD数据寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）
- AD转换精度选择位(ADCER.ADPRC[1:0])中的设置（可选择12位、10位、8位。）
- 加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）
- 设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

**(1) 未选择AD转换值加法平均模式时**

表37.7显示了12位精度的位分配示例。

**Table 37.7 12位精度的位分配示例**

| Accuracy      |                   | b15               | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---------------|-------------------|-------------------|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 具有12位精度的右对齐数据 | 这些位读为0。           | 转换值11到0: 12位AD转换值 |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |
| 具有12位精度的左对齐数据 | 转换值11到0: 12位AD转换值 | 这些位读为0。           |     |     |     |     |     |    |    |    |    |    |    |    |    |    |    |

**(2) 选择AD转换值平均模式时**

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenADconvertedvalueaveragemodeiselected ThisregisterindicatesthemeanofAD-convertedvaluesona

specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, this register indicates the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 37.8 shows example of the bit assignment for 12-bit accuracy.

Table 37.8 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected

|---|---|-----|-----|-----|---|-----|----|----|----|----|---------------------------|----|----|----|----|----|
| Right-justified data with 12-bit accuracy | These bits are read as 0.                           |     |     |     | Converted Value 11 to 0: 12-bit A/D-converted value |     |    |    |    |    |                           |    |    |    |    |    |
| Left-justified data with 12-bit accuracy  | Converted Value 11 to 0: 12-bit A/D-converted value |     |     |     |   |     |    |    |    |    | These bits are read as 0. |    |    |    |    |    |

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, These registers indicate the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, these registers indicate the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 37.10 shows example of the bit assignment for 12-bit accuracy.

Table 37.10 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected

| Accuracy                                  | b15  | b14 | b13   | b12 | b11   | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0                        |
|---|--|-----|---|-----|---|-----|----|----|----|----|----|----|----|----|----|---------------------------|
| Right-justified data with 12-bit accuracy | When 16 conversion times is specified            |     | Added Value 15 to 0: 16-bit sum of A/D conversion results |     |   |     |    |    |    |    |    |    |    |    |    |                           |
|   | When 1, 2, 3, or 4 conversion times is specified |     | These bits are read as 0.                                 |     | Added Value 13 to 0: 14-bit sum of A/D conversion results |     |    |    |    |    |    |    |    |    |    |                           |
| Left-justified data with 12-bit accuracy  | When 1, 2, 3, or 4 conversion times is specified |     | Added Value 15 to 0: 16-bit sum of A/D conversion results |     |   |     |    |    |    |    |    |    |    |    |    |                           |
|   | When 16 conversion times is specified            |     | Added Value 13 to 0: 14-bit sum of A/D conversion results |     |   |     |    |    |    |    |    |    |    |    |    | These bits are read as 0. |

37.2.4 ADTSDR : A/D Temperature Sensor Data Register

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01A

(1) 未选择AD转换值加法平均模式时

表37.9显示了12位精度的位分配示例。

Table 37.9 12位精度的位分配示例

| Accuracy      | b15               | b14 | b13 | b12 | b11               | b10 | b9 | b8 | b7 | b6 | b5      | b4 | b3 | b2 | b1 | b0 |

|               | 指定1、2、3或4转换时间时 |     | 这些位读为0。              |     | 附加值13到0: AD转换结果的14位和 |     |    |    |    |    |    |    |    |    |    |         |
| 具有12位精度的左对齐数据 | 指定1、2、3或4转换时间时 |     | 附加值15到0: AD转换结果的16位和 |     |                      |     |    |    |    |    |    |    |    |    |    |         |
|               | 指定16个转换时间时     |     | 附加值13到0: AD转换结果的14位和 |     |                      |     |    |    |    |    |    |    |    |    |    | 这些位读为0。 |

37.2.4 ATSDR:AD温度传感器数据寄存器

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01A

| Bit  | Symbol        | Function  | R/W |
|------|---------------|---|-----|
| 15:0 | ADTSDR [15:0] | Converted Value 15 to 0<br>Functions vary depending on the selected mode and accuracy. See Table 37.11 and Table 37.12. | R   |

ADTSDR register is a 16-bit read-only register to store A/D conversion result of the temperature sensor output.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADPRC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

(1) When A/D-converted value addition/average mode is not selected

Table 37.11 shows the example of bit assignment for 12-bit accuracy.

Table 37.11 Example of bit assignment for 12-bit accuracy

| Accuracy                                  | b15   | b14 | b13 | b12 | b11   | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3                        | b2 | b1 | b0 |
|---|---|-----|-----|-----|---|-----|----|----|----|----|----|----|---------------------------|----|----|----|
| Right-justified data with 12-bit accuracy | These bits are read as 0.                           |     |     |     | Converted Value 11 to 0: 12-bit A/D-converted value |     |    |    |    |    |    |    |                           |    |    |    |
| Left-justified data with 12-bit accuracy  | Converted Value 11 to 0: 12-bit A/D-converted value |     |     |     |   |     |    |    |    |    |    |    | These bits are read as 0. |    |    |    |

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, This register indicates the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, this register indicates the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 37.12 shows example of the bit assignment for 12-bit accuracy.

Table 37.12 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected (1 of 2)

| Accuracy                                  | b15  | b14 | b13   | b12 | b11   | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|--|-----|---|-----|---|-----|----|----|----|----|----|----|----|----|----|----|
| Right-justified data with 12-bit accuracy | When 16 conversion times is specified            |     | Added Value 15 to 0: 16-bit sum of A/D conversion results |     |   |     |    |    |    |    |    |    |    |    |    |    |
|   | When 1, 2, 3, or 4 conversion times is specified |     | These bits are read as 0.                                 |     | Added Value 13 to 0: 14-bit sum of A/D conversion results |     |    |    |    |    |    |    |    |    |    |    |

| Bit  | Symbol        | Function                                   | R/W |
|------|---------------|--|-----|
| 15:0 | ADTSDR [15:0] | 将值15转换为0<br>功能因所选模式和精度而异。请参见表37.11和表37.12。 | R   |

ADTSDR寄存器是一个16位只读寄存器，用于存储温度传感器输出的AD转换结果。

以下条件决定了AD数据寄存器中的数据格式：

- AD数据寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）
- AD转换精度选择位(ADCER.ADPRC[1:0])中的设置（可选择12位、10位、8位。）
- 加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）
- 设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

(1) 未选择AD转换值加法平均模式时

表37.11显示了12位精度的位分配示例。

Table 37.11 12位精度的位分配示例

| Accuracy      | b15               | b14 | b13 | b12 | b11               | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3      | b2 | b1 | b0 |
|---------------|-------------------|-----|-----|-----|-------------------|-----|----|----|----|----|----|----|---------|----|----|----|
| 具有12位精度的右对齐数据 | 这些位读为0。           |     |     |     | 转换值11到0: 12位AD转换值 |     |    |    |    |    |    |    |         |    |    |    |
| 具有12位精度的左对齐数据 | 转换值11到0: 12位AD转换值 |     |     |     |                   |     |    |    |    |    |    |    | 这些位读为0。 |    |    |    |

(2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenADconvertedvalueaveragemodeisselected ThisregisterindicatesthemeanofAD-convertedvaluesonaspecificchannel.该值根据AD数据寄存器格式选择位的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

(3) 选择AD转换值相加模式时

对于12位、10位、8位精度，可以在AD转换值相加模式中选择1、2、3或4次。AD转换结果作为指定转换精度的2位扩展值存储在AD数据寄存器中。

对于12位精度，在AD转换值相加模式中也可以选择16倍。在AD转换值相加模式下，该寄存器指示通过在特定通道上相加AD转换值获得的值。AD转换结果作为指定转换精度的4位扩展值存储在AD数据寄存器中。

WhenAD-convertedvalueadditionmodeisselected thevalueisstoredintheADdataregisterbasedonthesettings of theADDataRegisterFormatSelectbits.

表37.12显示了12位精度的位分配示例。

Table 37.12 选择AD转换值相加模式时12位精度的位分配示例 (1 of 2)

| Accuracy      | b15            | b14 | b13                  | b12 | b11                  | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |

|  | When 16 conversion times is specified            |     |     |     |     |     |    |    |    |    |    |    |    |    |    | Added Value 13 to 0:<br>14-bit sum of A/D conversion results |

### 37.2.5 ADOCDR : A/D Internal Reference Voltage Data Register

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)  
Offset address: 0x01C

| Bit  | Symbol        | Function   | R/W |
|------|---------------|--|-----|
| 15:0 | ADOCDR [15:0] | Converted Value 15 to 0<br>Functions vary depending on the selected mode and accuracy. See <a href="#">Table 37.13</a> and <a href="#">Table 37.14</a> . | R   |

ADOCDR register is a 16-bit read-only register to store A/D conversion result of the internal reference voltage.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADPRC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

#### (1) When A/D-converted value addition/average mode is not selected

[Table 37.13](#) shows the example of bit assignment for 12-bit accuracy.

**Table 37.13 Example of bit assignment for 12-bit accuracy**

| Accuracy                                  | b15  | b14 | b13 | b12 | b11 | b10  | b9 | b8 | b7 | b6 | b5 | b4 | b3                        | b2 | b1 | b0 |
|---|--|-----|-----|-----|-----|--|----|----|----|----|----|----|---------------------------|----|----|----|
| Right-justified data with 12-bit accuracy | These bits are read as 0.                              |     |     |     |     | Converted Value 11 to 0:<br>12-bit A/D-converted value |    |    |    |    |    |    |                           |    |    |    |
| Left-justified data with 12-bit accuracy  | Converted Value 11 to 0:<br>12-bit A/D-converted value |     |     |     |     |  |    |    |    |    |    |    | These bits are read as 0. |    |    |    |

#### (2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, This register indicates the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

#### (3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

**Table 37.12 选择AD转换值相加模式时12位精度的位分配示例 (2之2)**

| Accuracy      | b15            | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0                   |
|---------------|----------------|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----------------------|
| 具有12位精度的左对齐数据 | 指定1、2、3或4转换时间时 |     |     |     |     |     |    |    |    |    |    |    |    |    |    | 附加值15到0: AD转换结果的16位和 |
|               | 指定16个转换时间时     |     |     |     |     |     |    |    |    |    |    |    |    |    |    | 附加值13到0: AD转换结果的14位和 |

### 37.2.5 ADOCDR:AD内部参考电压数据寄存器

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)  
Offset address: 0x01C

| Bit  | Symbol        | Function                                   | R/W |
|------|---------------|--|-----|
| 15:0 | ADOCDR [15:0] | 将值15转换为0<br>功能因所选模式和精度而异。请参见表37.13和表37.14。 | R   |

AOCDR寄存器是一个16位只读寄存器，用于存储内部参考电压的AD转换结果。

以下条件决定了AD数据寄存器中的数据格式：

- AD数据寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）
- AD转换精度选择位(ADCER.ADPRC[1:0])中的设置（可选择12位、10位、8位。）
- 加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）
- 设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

#### (1) 未选择AD转换值加法平均模式时

表37.13显示了12位精度的位分配示例。

**Table 37.13 12位精度的位分配示例**

| Accuracy      | b15               | b14 | b13 | b12 | b11 | b10               | b9 | b8 | b7 | b6 | b5 | b4 | b3      | b2 | b1 | b0 |
|---------------|-------------------|-----|-----|-----|-----|-------------------|----|----|----|----|----|----|---------|----|----|----|
| 具有12位精度的右对齐数据 | 这些位读为0。           |     |     |     |     | 转换值11到0: 12位AD转换值 |    |    |    |    |    |    |         |    |    |    |
| 具有12位精度的左对齐数据 | 转换值11到0: 12位AD转换值 |     |     |     |     |                   |    |    |    |    |    |    | 这些位读为0。 |    |    |    |

#### (2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenADconvertedvalueaveragemodeisselected ThisregisterindicatesthemeanofAD-convertedvaluesonaspecificchannel.该值根据AD数据寄存器格式选择位的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

#### (3) 选择AD转换值相加模式时

对于12位、10位、8位精度，可以在AD转换值相加模式中选择1、2、3或4次。AD转换结果作为指定转换精度的2位扩展值存储在AD数据寄存器中。

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, this register indicates the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 37.14 shows example of the bit assignment for 12-bit accuracy.

Table 37.14 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected

| Accuracy                                  |  | b15  | b14 | b13  | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1                        | b0 |
|---|--|--|-----|--|-----|-----|-----|----|----|----|----|----|----|----|----|---------------------------|----|
| Right-justified data with 12-bit accuracy | When 16 conversion times is specified            | Added Value 15 to 0:<br>16-bit sum of A/D conversion results |     |  |     |     |     |    |    |    |    |    |    |    |    |                           |    |
|   | When 1, 2, 3, or 4 conversion times is specified | These bits are read as 0.                                    |     | Added Value 13 to 0:<br>14-bit sum of A/D conversion results |     |     |     |    |    |    |    |    |    |    |    |                           |    |
| Left-justified data with 12-bit accuracy  | When 1, 2, 3, or 4 conversion times is specified | Added Value 15 to 0:<br>16-bit sum of A/D conversion results |     |  |     |     |     |    |    |    |    |    |    |    |    |                           |    |
|   | When 16 conversion times is specified            | Added Value 13 to 0:<br>14-bit sum of A/D conversion results |     |  |     |     |     |    |    |    |    |    |    |    |    | These bits are read as 0. |    |

### 37.2.6 ADRD : A/D Self-Diagnosis Data Register

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01E

| Bit   | Symbol      | Function   | R/W |
|-------|-------------|--|-----|
| 11:0  | AD[11:0]    | Converted Value 11 to 0<br>12-bit A/D-converted value  | R   |
| 13:12 | —           | These bits are read as 0.  | R   |
| 15:14 | DIAGST[1:0] | Self-Diagnosis Status<br>0 0: Self-diagnosis not executed after power-on.<br>0 1: Self-diagnosis was executed using the 0 V voltage.<br>1 0: Self-diagnosis was executed using the reference power supply*1 voltage × 1/2.<br>1 1: Self-diagnosis was executed using the reference power supply*1 voltage.<br>For details on self-diagnosis, see section 37.2.15. ADCER : A/D Control Extended Register. | R   |

Note: The example of the bit assignment for the right-justified data with 12-bit accuracy is indicated.

Note 1. The reference voltage refers to VREFH0 for unit 0 and to VREFH for unit 1.

ADRD is a 16-bit read-only register that holds the A/D conversion results based on the self-diagnosis of the ADC12. In addition to the AD[11:0] bits indicating the A/D-converted value, it includes the Self-Diagnosis Status bit (DIAGST[1:0]).

The settings of the A/D data register format and the A/D conversion accuracy determines the formats for data in this register.

The A/D-converted value addition and average modes cannot be applied to the A/D self-diagnosis function. For details on self-diagnosis, see section 37.2.15. ADCER : A/D Control Extended Register.

This section describes the data formats for each condition. The register diagram and the register bit table shown in this section indicate example of the bit assignment for the left and right-justified data with 12-bit accuracy.

对于12位精度，在AD转换值相加模式中也可以选择16倍。在AD转换值相加模式下，该寄存器指示通过在特定通道上相加AD转换值获得的值。AD转换结果作为指定转换精度的4位扩展值存储在AD数据寄存器中。

When AD-converted value addition mode is selected the value is stored in the AD data register based on the settings of the AD Data Register Format Select bits.

表37.14显示了12位精度的位分配示例。

Table 37.14 选择AD转换值相加模式时12位精度的位分配示例

| Accuracy      |                | b15                  | b14 | b13                  | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1      | b0 |

| 15:14 | DIAGST[1:0] | Self-Diagnosis Status<br>00: 上电后不进行自诊断。01:使用0V电压执行自诊断。10: 使用基准电源+1电压×1/2执行自诊断。11: 使用基准电源+1电压执行自诊断。<br>有关自诊断的详细信息，请参阅第37.2.15节。ADCER: AD控制扩展寄存器。 | R   |

Note: 显示了具有12位精度的右对齐数据的位分配示例。

注1.参考电压是指单元0的VREFH0和单元1的VREFH。

ADRD是一个16位只读寄存器，保存基于ADC12自诊断的AD转换结果。除了指示AD转换值的AD[11:0]位外，它还包括自诊断状态位(DIAGST[1:0])。

AD数据寄存器格式和AD转换精度的设置决定了该寄存器中数据的格式。

AD转换值加法和平均模式不能应用于AD自诊断功能。有关自诊断的详细信息，请参阅第37.2.15节。ADCER: A/D控制扩展寄存器。

本节介绍每个条件的数据格式。本节所示的寄存器图和寄存器位表表示以12位精度进行左右对齐数据的位分配示例。

| 10    | —           | These bits are read as 0. The write value should be 0.  | R/W |
| 11    | —           | These bits are read as 0. The write value should be 0.  | R/W |
| 12    | —           | These bits are read as 0. The write value should be 0.  | R/W |
| 14:13 | ADCS[1:0]   | Scan Mode Select<br>00: Single scan mode<br>01: Group scan mode<br>10: Continuous scan mode<br>11: Setting prohibited   | R/W |
| 15    | ADST        | A/D Conversion Start<br>0: Stop A/D conversion process.<br>1: Start A/D conversion process.   | R/W |

Note 1. To start A/D conversion using an external pin (asynchronous trigger):  
After a high-level signal is input to the external pin (ADTRG0), write 1 to both the TRGE and EXTRG bits in the ADCSR register and drive the ADTRG0 pin low. With these settings, the scan conversion process starts on detection of the falling edge of ADTRG0. The pulse width of the low-level input must be at least PCLKA 1.5 clock cycles.

| 11    | —           | 这些位被读取为0。写入值应为0。   | R/W |
| 12    | —           | 这些位被读取为0。写入值应为0。   | R/W |
| 14:13 | ADCS[1:0]   | 扫描模式选择<br>00: 单次扫描模式<br>01: 组扫描模式<br>10: 连续扫描模式<br>11: 禁止设置  | R/W |
| 15    | ADST        | AD转换开始<br>0: 停止AD转换过程。1: 开始AD转换过程。   | R/W |

注1.使用外部引脚（异步触发）启动AD转换：  
向外部引脚(ADTRG0)输入高电平信号后，向ADCSR寄存器的TRGE和EXTRG位写入1并将ADTRG0引脚驱动为低电平。通过这些设置，扫描转换过程在检测到ADTRG0的下降沿时开始。低电平输入的脉冲宽度必须至少为PCLKA1.5个时钟周期。

The ADCSR register sets double-trigger mode and A/D conversion start trigger, enables or disables scan end interrupt, selects the scan mode, and starts or stops A/D conversion.

#### DBLANS[4:0] bits (Double Trigger Channel Select)

The DBLANS[4:0] bits select one channel for A/D conversion data duplication in double trigger mode. This can be selected by setting the binary value of the channel number to be duplicated. The A/D conversion results of the analog input of the channel selected in the DBLANS[4:0] bits are stored in A/D Data Register y when conversion is started by the first trigger, and in the A/D Data Duplexing Register when conversion is started by the second trigger.

In double trigger mode, the channels selected in the ADANSA0 and ADANSA1 registers are invalid, and the channel selected in the DBLANS[4:0] bits is A/D converted instead.

When double trigger mode is used in group scan mode, double trigger control is only applied to group A and not to group B. Therefore, multiple channel analog input can be selected for group B even in double trigger mode.

Only set the DBLANS[4:0] bits when the ADST bit is 0. Do not set the DBLANS[4:0] bits at the same time that you write 1 to the ADST bit.

To enter A/D-converted value addition/average mode when in double trigger mode, select the channel using the DBLANS[4:0] bits in the ADANSA0 and ADANSA1 registers.

A/D-converted data from the self-diagnosis function, temperature sensor output, and internal reference voltage cannot be used in double trigger mode.

#### GBADIE bit (Group B Scan End Interrupt and ELC Event Enable)

The GBADIE bit enables or disables group B scan end interrupt (ADC12i\_GBADI (i = 0, 1)) in group scan mode.

#### DBLE bit (Double Trigger Mode Select)

The DBLE bit selects or deselects double-trigger mode. Double-trigger mode can only be operated by the synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits.

Double-trigger operation is as follows:

1. The ADC12i\_ADI (i = 0, 1) interrupt is not output on completion of the first conversion but on completion of the second conversion.
2. The A/D conversion results from the duplication channel (selected in DBLANS[4:0]) started by the first trigger are stored in A/D Data Register y and those started by the second trigger are stored in the A/D Data Duplexing Register.

When the DBLE bit is set (double trigger mode is selected), the channels specified in the ADANSA0 and ADANSA1 registers are invalid. Double trigger mode is deselected by setting DBLE to 0. Setting DBLE to 1 again enables the same double-trigger operation described in 1. and 2. for first time scanning with the first trigger.

Do not select double trigger mode in continuous scan mode. Software triggering cannot be used in double trigger mode. Always set the ADST bit to 0 before setting the DBLE bit. Do not set the DBLE bit at that same time as writing 1 to the ADST bit.

#### EXTRG bit (Trigger Select)

The EXTRG bit selects the synchronous or asynchronous trigger as the trigger for starting A/D conversion.

In group-scan mode, the setting of this bit takes effect on the trigger selected for group A. For groups B, A/D conversion is started by the selected synchronous trigger regardless of this bit setting.

#### TRGE bit (Trigger Start Enable)

The TRGE bit enables or disables A/D conversion by the synchronous and asynchronous triggers. In group scan mode, set this bit to 1.

#### ADCS[1:0] bits (Scan Mode Select)

The ADCS[1:0] bits select the scan mode.

In single scan mode, A/D conversion is performed for the analog inputs of the channels selected in the ADANSA0 and ADANSA1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, the scan conversion stops.

ADCSR寄存器设置双触发模式和AD转换启动触发，使能或禁止扫描结束中断，选择扫描模式，启动或停止A/D转换。

#### DBLANS[4:0]位（双触发通道选择）

DBLANS[4:0]位选择一个通道用于双触发模式下的AD转换数据复制。这可以通过设置要复制的通道号的二进制值来选择。在DBLANS[4:0]位中选择的通道的模拟输入的AD转换结果在第一次触发开始转换时存储在AD数据寄存器y中，当转换开始时存储在AD数据双工寄存器中。第二个触发器。

双触发模式下，ADANSA0和ADANSA1寄存器选择的通道无效，DBLANS[4:0]位选择的通道改为AD转换。

在组扫描模式下使用双触发模式时，双触发控制仅适用于A组，不适用于B组。因此，即使在双触发模式下，也可以为B组选择多通道模拟输入。

仅当ADST位为0时设置DBLANS[4:0]位。不要在将1写入ADST位的同时设置DBLANS[4:0]位。

要在双触发模式下进入AD转换值加法平均模式，请使用ADANSA0和ADANSA1寄存器中的DBLANS[4:0]位。

自诊断功能、温度传感器输出和内部参考电压的D转换数据不能用于双触发模式。

#### GBADIE位（B组扫描结束中断和ELC事件使能）

GBADIE位在组扫描模式下启用或禁用组B扫描结束中断(ADC12i\_GBADI(i=0 1))。

#### DBLE位（双触发模式选择）

DBLE位选择或取消选择双触发模式。双触发模式只能由在ADSTRGR.TRSA[5:0]位中选择的同步触发(ELC)操作。

双触发操作如下：

1.ADC12i\_ADI(i=0 1)中断不是在第一次转换完成时输出，而是在第二次转换完成时输出。

2.由第一次触发启动的复制通道（在DBLANS[4:0]中选择）的AD转换结果存储在AD数据寄存器y中，由第二次触发启动的数据存储在AD数据双工寄存器中。

当设置DBLE位（选择双触发模式）时，在ADANSA0和ADANSA1寄存器中指定的通道无效。通过将DBLE设置为0来取消选择双触发模式。再次将DBLE设置为1可以启用与1和2.中描述的相同的双触发操作，以使用第一个触发进行首次扫描。

在连续扫描模式下不要选择双触发模式。双触发模式下不能使用软件触发。在设置DBLE位之前，始终将ADST位设置为0。不要在将DBLE位设置为1的同时ADST bit.

#### EXTRG bit (Trigger Select)

EXTRG位选择同步或异步触发作为启动AD转换的触发。

在组扫描模式下，该位的设置对A组选择的触发生效。对于B组，无论该位设置如何，都由选择的同步触发启动A/D转换。

#### TRGE位（触发启动使能）

TRGE位通过同步和异步触发启用或禁用AD转换。在组扫描模式下，将此位设置为1。

#### ADCS[1:0]位（扫描模式选择）

ADCS[1:0]位选择扫描模式。

在单次扫描模式下，对ADANSA0中选择的通道的模拟输入执行AD转换，并且ADANSA1寄存器，按通道号升序排列。当所有选定通道的1个AD转换周期完成时，扫描转换停止。

In continuous scan mode, when the ADCSR.ADST bit is 1, A/D conversion is performed for the analog inputs of the channels selected with the ADANSA0 and ADANSA1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion repeats from the first channel. If the ADCSR.ADST bit is set to 0 during continuous scan, A/D conversion stops even if scanning is in progress.

In group scan mode:

- Group A scanning is started by the synchronous trigger (ELC) selected in the TRSA[5:0] bits in the ADSTRGR register. A/D conversion is performed on group A analog inputs of the channels selected in the ADANSA0 and ADANSA1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion stops.
- Group B scanning is started by the synchronous trigger (ELC) selected in the ADSTRGR.TRSB[5:0] bits. A/D conversion is performed on group B analog inputs of the channels selected in the ADANSB0 and ADANSB1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion stops.

If the conversion processes in group A and B occur at the same time, those conversions cannot be controlled separately. In this case, set group A Priority Control Setting bit (ADGSPCR.PGS) in the A/D Group Scan Priority Control Register (ADGSPCR) to 1 to assign a priority to group A conversion.

In group scan mode, select different channels and triggers for group A and group B.

Only set the ADCS[1:0] bits when the ADST bit is 0. Do not set the ADCS[1:0] bits at the same time that you write 1 to the ADST bit.

Table 37.17 Selectable targets for A/D conversion depending on scan and double-trigger mode settings

| Scan mode setting | Double-trigger mode setting | Targets for A/D conversion |                        |                        |                           |                            |
|-------------------|-----------------------------|----------------------------|------------------------|------------------------|---------------------------|----------------------------|
|                   |                             | Self-diagnosis             | Analog input (group A) | Analog input (group B) | Temperature sensor output | Internal reference voltage |

Note: ✓: Selectable, —: Not selectable

#### ADST bit (A/D Conversion Start)

The ADST bit starts or stops the A/D conversion process. Before the ADST bit is set to 1, set the A/D conversion clock, the conversion mode, and the conversion target analog input.

[Setting conditions]

- 1 is written.
- The synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits is detected when ADCSR.EXTRG is 0 and ADCSR.TRGE is 1.
- The synchronous trigger (ELC) selected in the ADSTRGR.TRSB[5:0] bits is detected when ADCSR.TRGE is set to 1 in group scan mode.
- The asynchronous trigger is detected when the ADCSR.TRGE and ADCSR.EXTRG bits are set to 1 and the ADSTRGR.TRSA[5:0] bits are set to 0x00.
- When group priority operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), the ADGSPCR.GBRP bit is set to 1, and each time A/D conversion on the group with the lowest priority is started.

[Clearing conditions]

- 0 is written.

在连续扫描模式下，当ADCSR.ADST位为1时，ADANSA0和ADANSA1寄存器选择的通道的模拟输入按通道编号的升序执行AD转换。当所有选定通道的1个AD转换周期完成时，AD转换从第一个通道开始重复。如果

ADCSR.ADST位在连续扫描期间设置为0，即使在扫描过程中AD转换也会停止。

在组扫描模式下：

- A组扫描由在ADSTRGR寄存器的TRSA[5:0]位中选择的同步触发(ELC)启动。AD转换在ADANSA0和ADANSA1寄存器中选择的通道的A组模拟输入上执行，按通道编号的升序排列。当所有选定通道完成1个AD转换周期时，AD转换停止。
- B组扫描由在ADSTRGR.TRSB[5:0]位中选择的同步触发(ELC)启动。广告转换是在ADANSB0和ADANSB1寄存器中选择的通道的B组模拟输入上执行的，按通道编号的升序排列。当所有选定通道完成1个AD转换周期时，AD转换停止。

如果A组和B组中的转换过程同时发生，则不能单独控制这些转换。在这种情况下，将AD组扫描优先级控制寄存器(ADGSPCR)中的A组优先级控制设置位(ADGSPCR.PGS)设置为1，以将优先级分配给A组转换。

在组扫描模式下，为A组和B组选择不同的通道和触发。

仅当ADST位为0时才设置ADCS[1:0]位。不要在向寄存器写入1的同时设置ADCS[1:0]位ADST bit。

Table 37.17 AD转换的可选目标取决于扫描和双触发模式设置

| 扫描模式设置 | 双触发模式设置  | AD转换的目标        |               |           |         |        |
|--------|----------|----------------|---------------|-----------|---------|--------|
|        |          | Self-diagnosis | 模拟输入 (A组)     | 模拟输入 (B组) | 温度传感器输出 | 内部参考电压 |
| 单次扫描   | DBLE = 0 | ✓              | ✓             | —         | ✓       | ✓      |
|        | DBLE = 1 | —              | ✓ (1 ch only) | —         | —       | —      |
| 连续扫描   | DBLE = 0 | ✓              | ✓             | —         | ✓       | ✓      |
|        | DBLE = 1 | —              | —             | —         | —       | —      |
| 组扫描    | DBLE = 0 | ✓              | ✓             | ✓         | ✓       | ✓      |
|        | DBLE = 1 | —              | ✓ (1 ch only) | ✓         | ✓       | ✓      |

Note: :可选择 —:不可选择

#### ADST位 (AD转换开始)

ADST位启动或停止AD转换过程。在ADST位设置为1之前，设置AD转换时钟、转换模式和转换目标模拟输入。

[Setting conditions]

- 写入1。
- 当ADCSR.EXTRG为0且ADCSR.TRGE为1时，检测在ADSTRGR.TRSA[5:0]位中选择的同步触发(ELC)。
- 在组扫描模式下，当ADCSR.TRGE设置为1时，检测到在ADSTRGR.TRSB[5:0]位中选择的同步触发(ELC)。
- 当ADCSR.TRGE和ADCSR.EXTRG位设置为1且ADSTRGR.TRSA[5:0]位设置为0x00时，检测到异步触发。
- 当启用组优先操作模式时 (ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1)，ADGSPCR.GBRP位设置为1，并且每次对最低组进行AD转换优先启动。

[Clearing conditions]

- 写入0。

- The A/D conversion of all the selected channels, the temperature sensor output, the internal reference voltage completes in single scan mode.
- Group A scan completes in group scan mode.
- Group B scan completes in group scan mode.
- When group priority operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), the ADGSPCR.GBRSCN bit is set to 1, and A/D conversion on the group with the lowest priority started by trigger completes.

Note: When group priority operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), do not set the ADST bit to 1.

Note: When group priority operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), do not set the ADST bit to 0. When forcing A/D conversion to terminate, follow the procedure for clearing the ADST bit.

### 37.2.8 ADANSA0 : A/D Channel Select Register A0

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

| 15:0 | ANSAn  | A/D Conversion Channels Select<br>Bit 15 (ANSA15) is associated with ANm15 and bit 0 (ANSA00) is associated with ANm00.<br>0: Do not select associated input channel.<br>1: Select associated input channel. | R/W |

Note: n = 00 to 09, 12, 13(unit 0), 00 to 02(unit 1)

Note: Bits associated with non-existent pins are reserved. This bit is read as 0. The write value should be 0.

ADANSA0 register selects analog input channels for A/D conversion. In group scan mode, this register selects group A channels.

Only set the ADANSA0 register when the ADCSR.ADST bit is 0.

#### ANSAn bits (A/D Conversion Channels Select)

The ADANSA0 register selects any combination of analog input channels for A/D conversion. The channels and the number of channels can be arbitrarily set.

In double trigger mode, the channels selected in the ADANSA0 register are invalid, and the channel selected in the ADCSR.DBLANS[4:0] bits is selected in group A instead.

When group scan mode is selected, do not select the channels specified in A/D Channel Select Register B0 (ADANSB0) and A/D Channel Select Register B1 (ADANSB1).

### 37.2.9 ADANSA1 : A/D Channel Select Register A1

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x006

|                    |         |         |         |         |         |         |         |         |         |         |         |         |         |         |         |         |
|--------------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Bit position:      | 15      | 14      | 13      | 12      | 11      | 10      | 9       | 8       | 7       | 6       | 5       | 4       | 3       | 2       | 1       | 0       |
| Bit field:         | ANSA 31 | ANSA 30 | ANSA 29 | ANSA 28 | ANSA 27 | ANSA 26 | ANSA 25 | ANSA 24 | ANSA 23 | ANSA 22 | ANSA 21 | ANSA 20 | ANSA 19 | ANSA 18 | ANSA 17 | ANSA 16 |
| Value after reset: | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       | 0       |

- 所有选定通道的AD转换、温度传感器输出、内部参考电压均在单次扫描模式下完成。

- A组扫描在组扫描模式下完成。

- B组扫描在组扫描模式下完成。

- 当组优先操作模式使能时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），ADGSPCR.GBRSCN位设置为1，最低优先级组的AD转换开始按触发器完成。

Note: 当启用组优先操作模式时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），请勿将ADST位设置为1。

Note: 当启用组优先操作模式时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），请勿将ADST位设置为0。当强制终止AD转换时，请按照清除程序ADST位。

### 37.2.8 ADANSA0:AD通道选择寄存器A0

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Note: n = 00 to 09, 12, 13(unit 0), 00 to 02(unit 1)

Note: Bits associated with non-existent pins are reserved. This bit is read as 0. The write value should be 0.

ADANSB0 selects analog input channels for A/D conversion in group B when group scan mode is selected. The ADANSB0 register is not used in any scan mode other than group scan mode.

Only set the ADANSB0 register when the ADCSR.ADST bit is 0.

#### ANSBn bits (A/D Conversion Channels Select)

The ADANSB0 register selects any combination of analog input channels in group B for A/D conversion when group scan mode is selected. The ADANSB0 register is used for group scan mode only and not for any other modes.

Do not select channels specified in group A as selected in the ADANSA0 and ADANSA1 registers or the ADCSR.DBLANS[4:0] bits in double trigger mode.

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 15:0 | ANSAn  | AD转换通道选择<br>位15(ANSA31)与ANm31相关联, 位0(ANSA16)与ANm16相关联。<br>0: 不选择关联的输入通道。1: 选择关联的输入通道。 | R/W |

Note: n = 16 to 22(unit 1)

Note: 与不存在的引脚相关的位被保留。该位读取为0。写入值应为0。

ADANSA1寄存器选择用于AD转换的模拟输入通道。在组扫描模式下, 该寄存器选择A组通道。

仅当ADCSR.ADST位为0时设置ADANSA1寄存器。

#### ANSAn位 (AD转换通道选择)

ADANSA1寄存器为AD转换选择任意模拟输入通道组合。通道和通道数可以任意设置。

双触发模式下, ADANSA1寄存器中选择的通道无效, 在ADANSA1寄存器中选择的通道无效。改为在A组中选择ADCSR.DBLANS[4:0]位。

选择组扫描模式时, 不要选择AD通道选择寄存器B0(ADANSB0)和AD通道选择寄存器B1(ADANSB1)中指定的通道。

#### 37.2.10 ADANSB0:AD通道选择寄存器B0

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  (m = 0, 1)

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 15:0 | ADSn   | A/D-Converted Value Addition/Average Channel Select<br>Bit 15 (ADS15) is associated with ANm15 and bit 0 (ADS00) is associated with ANm00.<br>0: Do not select associated input channel.<br>1: Select associated input channel. | R/W |

Note: n = 00 to 09, 12, 13(unit 0), 00 to 02(unit 1)

Note: Bits associated with non-existent pins are reserved. This bit is read as 0. The write value should be 0.

**ADSn bits (A/D-Converted Value Addition/Average Channel Select)**

The ADSn bits determine which A/D-converted channels are subject to A/D-converted value addition/averaging. When an ADSn bit associated with a channel selected for A/D conversion is set to 1, A/D conversion of the analog input of the respective channel is performed successively 1, 2, 3, 4, or 16 times, as specified in the ADC[2:0] bits in the ADADC register.

When the ADADC.AVEE bit is 0, the value obtained by addition is stored in the A/D data register. When the ADADC.AVEE bit is 1, the mean value of the results obtained by addition is stored in the A/D data register.

The ADSn bits apply only to channels that are selected for A/D conversion in:

- The ANSAn bits in the ADANSA0 register or the DBLANS[4:0] bits in the ADCSR register

## 37.2.11 ADANSB1:AD通道选择寄存器B1

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 15:0 | ADSn   | 一个D转换的增值平均通道选择<br>位15(ADS15)与ANm15相关联, 位0(ADS00)与ANm00相关联。<br>0: 不选择关联的输入通道。1: 选择关联的输入通道。 | R/W |

Note: n = 00 to 09, 12, 13(unit 0), 00 to 02(unit 1)

Note: 与不存在的引脚相关的位被保留。该位读取为0。写入值应为0。

**ADSn位 (AD转换值加法平均通道选择)**

ADSn位确定哪些AD转换通道要进行AD转换值加法平均。当一个与选择用于AD转换的通道相关的ADSn位设置为1, 相应通道的模拟输入的AD转换按ADC[2:0]中的规定连续执行1、2、3、4或16次ADADC寄存器中的位。

当ADADC.AVEE位为0时, 相加得到的值存储在AD数据寄存器中。当ADADC.AVEE位为1时, 加法所得结果的平均值存储在AD数据寄存器中。

ADSn位仅适用于为AD转换选择的通道:

- ADANSA0寄存器中的ANSAn位或ADCSR寄存器中的DBLANS[4:0]位

- The ANSBn bits in the ADANSB0 register

For channels on which the A/D conversion is performed and for which addition/average mode is not selected, a normal 1-time conversion is executed and the conversion result is stored in the A/D data register.

Only set ADADS0 register bits when the ADCSR.ADST bit is 0.

Figure 37.3 shows a scanning operation sequence in which the ADADS0 register bits (channel c and g) are set to 1. In this figure:

- Addition mode is selected (ADADC.AVEE = 0)
- The number of conversions is set to 4 (ADADC.ADC[1:0] = 11b)
- The analog input channels (a to h) are selected by ADANSA0 register in continuous scan mode (ADCSR.ADCS[1:0] = 10b).

The conversion process begins with analog input A (channel a). The analog input C (channel c) conversion is performed successively 4 times and the added value is returned to A/D Data Register c (ADDRc). Next, the analog input D (channel d) conversion process is started. The analog input G (channel g) is performed successively 4 times and the added value is returned to A/D Data Register g (ADDRg). After conversion of analog input H (channel h), the conversion operation repeats in the same sequence starting with analog input A (channel a).

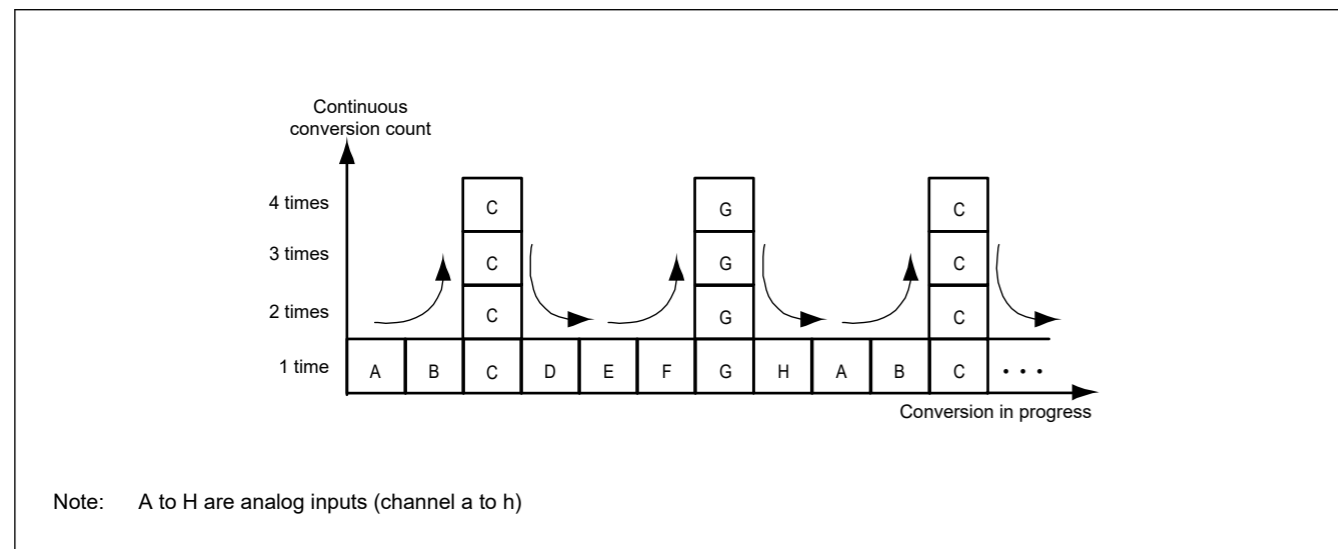

Figure 37.3 Scan conversion sequence with ADADC.ADC[2:0] = 011b, set 1 for analog inputs C and G by ADADS0/1

### 37.2.13 ADADS1 : A/D-Converted Value Addition/Average Channel Select Register 1

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00A

|                    |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |

| Bit position:      | 15    | 14    | 13    | 12    | 11    | 10    | 9     | 8     | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| Bit field:         | ADS31 | ADS30 | ADS29 | ADS28 | ADS27 | ADS26 | ADS25 | ADS24 | ADS23 | ADS22 | ADS21 | ADS20 | ADS19 | ADS18 | ADS17 | ADS16 |
| Value after reset: | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     | 0     |

| Bit  | Symbol           | Function  | R/W |
|------|------------------|---|-----|
| 15:0 | ADS <sub>n</sub> | A/D-Converted Value Addition/Average Channel Select<br>Bit 15 (ADS31) is associated with ANm31 and bit 0 (ADS16) is associated with ANm16.<br>0: Do not select associated input channel.<br>1: Select associated input channel. | R/W |

Note: n = 16 to 22(unit 1)

Note: Bits associated with non-existent pins are reserved. This bit is read as 0. The write value should be 0.

- ADANSB0寄存器中的ANSBn位

对于执行AD转换且未选择加法平均模式的通道，将执行正常的1次转换，并将转换结果存储在AD数据寄存器中。

仅当ADCSR.ADST位为0时设置ADADS0寄存器位。

图37.3显示了扫描操作序列，其中ADADS0寄存器位（通道c和g）设置为1。在该图中：

- 选择加法模式 (ADADC.AVEE=0)
- 转换次数设置为4(ADADC.ADC[1:0]=11b)
- 模拟输入通道 (a到h) 在连续扫描模式下由ADANSA0寄存器选择 (ADCSR.ADCS[1:0]=10b)。

转换过程从模拟输入A（通道a）开始。模拟输入C（通道c）转换连续执行4次，相加后的值返回到AD数据寄存器c（ADDRc）。接下来，开始模拟输入D（通道d）转换过程。模拟输入G（通道g）连续执行4次，相加后的值返回到AD数据寄存器g（ADDRg）。模拟输入H（通道h）转换后，转换操作从模拟输入A（通道a）开始以相同的顺序重复。

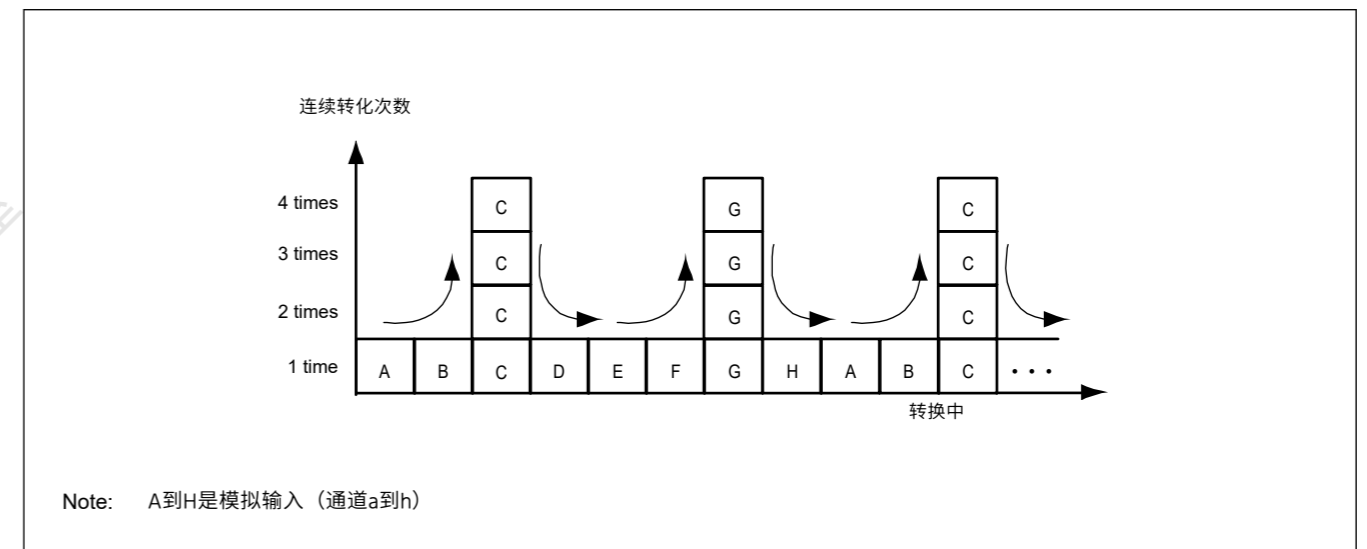

Figure 37.3 使用ADADC.ADC[2:0]=011b扫描转换序列，将模拟输入C和G设置为1 ADADS0/1

### 37.2.13 ADADS1：一个D转换值加法平均通道选择寄存器1

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00A

|               |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |

Note: n = 16 to 22(unit 1)

Note: 与不存在的引脚相关的位被保留。该位读取为0。写入值应为0。

**ADSn bits (A/D-Converted Value Addition/Average Channel Select)**

The ADSn bits determine which A/D-converted channels are subject to A/D-converted value addition/averaging. When an ADSn bit associated with a channel selected for A/D conversion is set to 1, A/D conversion of the analog input of the respective channel is performed successively 1, 2, 3, 4, or 16 times, as specified in the ADC[2:0] bits in the ADADC register.

When the ADADC.AVEE bit is 0, the value obtained by addition is stored in the A/D data register. When the ADADC.AVEE bit is 1, the mean value of the results obtained by addition is stored in the A/D data register.

The ADSn bits apply only to channels that are selected for A/D conversion in:

- The ANSAn bits in the ADANSA1 register or the DBLANS[4:0] bits in the ADCSR register
- The ANSBn bits in the ADANSB1 register.

For channels on which the A/D conversion is performed and for which addition/average mode is not selected, a normal 1-time conversion is executed and the conversion result is stored in the A/D data register.

Only set ADADS1 register when the ADCSR.ADST bit is 0.

**37.2.14 ADADC : A/D-Converted Value Addition/Average Count Select Register**

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00C

| Bit | Symbol   | Function  | R/W |

Note: ✓: Selectable, —: Not selectable

**ADSn位 (AD转换值加法平均通道选择)**

ADSn位确定哪些AD转换通道要进行AD转换值加法平均。当一个与选择用于AD转换的通道相关的ADSn位设置为1，相应通道的模拟输入的AD转换按ADC[2:0]中的规定连续执行1、2、3、4或16次ADADC寄存器中的位。

当ADADC.AVEE位为0时，相加得到的值存储在AD数据寄存器中。当ADADC.AVEE位为1时，加法所得结果的平均值存储在AD数据寄存器中。

ADSn位仅适用于为AD转换选择的通道：

- ADANSA1寄存器中的ANSAn位或ADCSR寄存器中的DBLANS[4:0]位
- ADANSB1寄存器中的ANSBn位。

对于执行AD转换且未选择加法平均模式的通道，将执行正常的1次转换，并将转换结果存储在AD数据寄存器中。

仅当ADCSR.ADST位为0时设置ADADS1寄存器。

**37.2.14 ADADC:D转换值加法平均计数选择寄存器**

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Note: ✓: 可选择 —: 不可选择

**ADC[2:0] bits (Addition/Average Count Select)**

The ADC[2:0] bits set the addition count in all channels for which A/D conversion and addition/average mode are selected, including the channel selected in double trigger mode with the ADCSR.DBLANS[4:0] bits. The count also applies to A/D conversion of the temperature sensor output and internal reference voltage.

When self-diagnosis is executed (ADCER.DIAGM = 1), do not set the ADC[2:0] bits to any value other than 000b.

**AVEE bit (Average Mode Select)**

The AVEE bit selects addition or average mode in all channels for which A/D conversion and addition/average mode are selected, including the channels selected in double-trigger mode in the ADCSR.DBLANS[4:0] bits, temperature sensor output, internal reference voltage.

**37.2.15 ADCER : A/D Control Extended Register**

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00E

|                    |        |    |    |    |       |        |              |   |   |     |   |   |            |   |   |   |

| 14:12 | —            | These bits are read as 0. The write value should be 0.   | R/W |
| 15    | ADRFMT       | A/D Data Register Format Select<br>0: Select right-justified for the A/D data register format<br>1: Select left-justified for the A/D data register format   | R/W |

Note 1. The reference voltage refers to VREFH0 for unit 0 and to VREFH for unit 1.

**ADPRC[1:0] bit (A/D Conversion Accuracy Specify)**

The ADPRC[1:0] bits set the A/D conversion accuracy. Changing the A/D conversion accuracy also changes the bit width of valid data stored in the result register and the A/D conversion time. For details, see [section 37.3.7. Analog Input Sampling and Scan Conversion Time](#) section 45.3.6, Analog Input Sampling and Scan Conversion Time. Only set the ADPRC[1:0] bits while the ADCSR.ADST bit is 0.

**ADC[2:0]位 (加法平均计数选择)**

ADC[2:0]位设置选择了AD转换和加法平均模式的所有通道的加法计数，包括使用ADCSR.DBLANS[4:0]位在双触发模式选择的通道。该计数也适用于温度传感器输出和内部参考电压的AD转换。执行自诊断时(ADCER.DIAGM=1)，请勿将ADC[2:0]位设置为000b以外的任何值。

**AVEE位 (平均模式选择)**

AVEE位在选择了AD转换和加法平均模式的所有通道中选择加法或平均模式，包括在ADCSR.DBLANS[4:0]位中选择的双触发模式的通道、温度传感器输出、内部参考电压。

**37.2.15 ADCER:AD控制扩展寄存器**

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00E

|               |        |    |    |    |       |        |              |   |   |     |   |   |            |   |   |   |

注1.参考电压是指单元0的VREFH0和单元1的VREFH。

**ADPRC[1:0]位 (AD转换精度指定)**

ADPRC[1:0]位设置AD转换精度。更改AD转换精度也会更改存储在结果寄存器中的有效数据的位宽和AD转换时间。有关详细信息，请参阅第37.3.7节。模拟输入采样和扫描转换时间第45.3.6节，模拟输入采样和扫描转换时间。只设置

ADPRC[1:0]位，而ADCSR.ADST位为0。

**ACE bit (A/D Data Register Automatic Clearing Enable)**

The ACE bit enables or disables automatic clearing (all 0) of the ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, or ADOCADR register after any of these registers is read by the CPU or DTC. Automatic clearing of the A/D data registers enables detection of failures that are not updated in the A/D data registers. For details, see [section 37.3.8. Usage Example of A/D Data Register Automatic Clearing Function.](#)

**DIAGVAL[1:0] bits (Self-Diagnosis Conversion Voltage Select)**

The DIAGVAL[1:0] bits select the voltage value used in self-diagnosis fixed voltage mode. For details, see the DIAGLD bit description.

Do not execute self-diagnosis by setting the DIAGLD bit to 1 when the DIAGVAL[1:0] bits are set to 00b.

**DIAGLD bit (Self-Diagnosis Mode Select)**

The DIAGLD bit selects whether the three voltage values are rotated or the fixed voltage is used in self-diagnosis.

Setting the DIAGLD bit to 0 selects conversion of the voltages in rotation mode, where 0 V, the reference power supply voltage  $\times 1/2$ , and the reference power supply voltage are converted, in that order. After reset and when self-diagnosis voltage rotation mode is selected, self-diagnosis is executed from 0 V. The self-diagnosis voltage value does not return to 0 V when scan conversion completes. When scan conversion is restarted, rotation starts at the voltage value following the previous value.

Setting the DIAGLD bit to 1 selects fixed voltage, in which the fixed voltage specified in the ADCER.DIAGVAL[1:0] bits is converted. If fixed mode is switched to rotation mode, rotation starts at the fixed voltage value.

Only set the DIAGLD bit when the ADCSR.ADST bit is 0.

**DIAGM bit (Self-Diagnosis Enable)**

The DIAGM bit enables or disables self-diagnosis.

Self-diagnosis is used to detect a failure of the ADC12. In self-diagnosis mode, one of the three voltage values (0 V, the reference power supply voltage  $\times 1/2$ , or the reference power supply voltage) is converted. When conversion completes, information on the converted voltage and the conversion result is stored into the A/D Self-Diagnosis Data Register (ADRD). The ADRD register can be read to determine whether the conversion result falls within the normal or abnormal range.

Self-diagnosis is executed once at the beginning of each scan, and one of the three voltages is converted. In double trigger mode (ADCSR.DBLE = 1), self-diagnosis (DIAGM = 0) is deselected. When self-diagnosis is selected in group scan mode, self-diagnosis is executed separately for group A and group B.

Only set the DIAGM bit when the ADCSR.ADST bit is 0.

**ADRFMT bit (A/D Data Register Format Select)**

The ADRFMT bit specifies flush-right or flush-left for data to be stored in the ADDRy, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, ADOCADR, ADCMPDR0/1, ADWINLLB, ADWINULB, or ADRD register.

Only set the ADRFMT bit when the ADCSR.ADST bit is 0.

**37.2.16 ADSTRGR : A/D Conversion Start Trigger Select Register**

Base address: ADC12m = 0x4017\_0000 + 0x0200  $\times$  m (m = 0, 1)

Offset address: 0x010

|                    |    |    |           |    |    |    |   |   |   |           |   |   |   |   |   |   |

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 5:0 | TRSB[5:0] | A/D Conversion Start Trigger Select for Group B<br>Select the A/D conversion start trigger for group B in group scan mode. | R/W |
| 7:6 | —         | These bits are read as 0. The write value should be 0.   | R/W |

**ACE位 (AD数据寄存器自动清除使能)**

ACE位启用或禁用ADDRy、ADRD、ADDBLDR、ADDBLDRA、ADDBLDRB、ADTSDR或ADOCADR寄存器。自动清除AD数据寄存器可以检测未在AD数据寄存器中更新的故障。有关详细信息，请参阅第37.3.8节。AD数据寄存器自动清除功能的使用示例。

**DIAGVAL[1:0]位 (自诊断转换电压选择)**

DIAGVAL[1:0]位选择用于自诊断固定电压模式的电压值。有关详细信息，请参见DIAGLD位说明。

当DIAGVAL[1:0]位设置为00b时，不要通过将DIAGLD位设置为1来执行自诊断。

**DIAGLD位 (自诊断模式选择)**

DIAGLD位选择是旋转三个电压值还是使用固定电压进行自诊断。

将DIAGLD位设置为0选择在旋转模式下转换电压，其中0V、参考电源电压 $\times 1/2$ 和参考电源电压按此顺序转换。复位后，选择自诊断电压旋转模式时，从0V开始执行自诊断。扫描转换完成时，自诊断电压值不会返回到0V。重新开始扫描转换时，从前一个值之后的电压值开始旋转。

将DIAGLD位设置为1选择固定电压，其中转换ADCER.DIAGVAL[1:0]位中指定的固定电压。如果将固定模式切换到旋转模式，则从固定电压值开始旋转。

仅当ADCSR.ADST位为0时设置DIAGLD位。

**DIAGM bit (Self-Diagnosis Enable)**

DIAGM位启用或禁用自诊断。

自诊断用于检测ADC12的故障。在自诊断模式下，转换三个电压值之一（0V、参考电源电压 $\times 1/2$ 或参考电源电压）。转换完成后，转换电压和转换结果的信息将存储到AD自诊断数据寄存器(ADRD)中。可以读取ADRD寄存器来确定转换结果是否在正常或异常范围内。

自诊断在每次扫描开始时执行一次，并转换三个电压之一。在双触发模式(ADCSR.DBLE=1)中，自诊断(DIAGM=0)被取消选择。在组扫描模式下选择自诊断时，对A组和B组分别执行自诊断。

仅当ADCSR.ADST位为0时设置DIAGM位。

**ADRFMT位 (AD数据寄存器格式选择)**

ADRFMT位指定要存储在ADDRy、ADDBLDR、ADDBLDRA、ADDBLDRB、ADTSDR、ADOCADR、ADCMPDR0/1、ADWINLLB、ADWINULB或ADRD寄存器。

仅当ADCSR.ADST位为0时才设置ADRFMT位。

**37.2.16 ADSTRGR:AD转换开始触发选择寄存器**

#### TRSB[5:0] bits (A/D Conversion Start Trigger Select for Group B)

The TRSB[5:0] bits select the trigger to start scanning of the analog input selected in group B. The TRSB[5:0] bits must only be set in group scan mode and are not used in any other scan mode. For the scan conversion start trigger for group B, setting a software trigger or an asynchronous trigger is prohibited. In group scan mode, set the TRSB[5:0] bits to a value other than 0x00 and set the ADCSR.TRGE bit to 1.

When group A is given priority in group scan mode, setting the ADGSPCR.GBRP bit to 1 allows group B to continuously operate in single scan mode. When setting the ADGSPCR.GBRP bit to 1, set the TRSB[5:0] bits to 0x3F. The issuance period for a conversion trigger must be more than or equal to the actual scan conversion time ( $t_{SCAN}$ ). If the issuance period is less than  $t_{SCAN}$ , A/D conversion by the trigger might have no effect.

When the GPT module is selected as an A/D conversion start trigger, a delay for synchronization processing occurs. For details, see [section 37.3.7. Analog Input Sampling and Scan Conversion Time](#).

Table 37.19 lists the A/D conversion startup sources selected in the TRSB[5:0] bits.

**Table 37.19 Selection of A/D conversion start sources in the TRSB[5:0] bits**

| Source   | Remarks | TRSB[5] | TRSB[4] | TRSB[3] | TRSB[2] | TRSB[1] | TRSB[0] |
|--|---------|---------|---------|---------|---------|---------|---------|
| Trigger source deselected state  | —       | 1       | 1       | 1       | 1       | 1       | 1       |

| ELC_AD00 (unit 0) and ELC_AD10 (unit 1), ELC_AD01 (unit 0) and ELC_AD11 (unit 1) | ELC     | 0       | 0       | 1       | 0       | 1       | 1       |

#### TRSA[5:0] bits (A/D Conversion Start Trigger Select)

The TRSA[5:0] bits select the trigger to start A/D conversion in single scan mode and continuous scan mode, or the trigger to start scanning of group A analog inputs in group scan mode. When scanning is executed in group scan mode or double trigger mode, software trigger or asynchronous trigger is prohibited.

- When using a synchronous trigger (ELC), set the TRGE bit in the ADCSR register to 1 and set the EXTRG bit in the ADCSR register to 0.
- When using the asynchronous trigger (ADTRG0), set the TRGE bit in the ADCSR register to 1 and set the EXTRG bit in the ADCSR register to 1.
- Software trigger (ADCSR.ADST) is enabled regardless of the settings of the ADCSR.TRGE bit, the ADCSR.EXTRG bit, or the TRSA[5:0] bits.

The issuance period for a conversion trigger must be more than or equal to the actual scan conversion time ( $t_{SCAN}$ ). If the issuance period is less than  $t_{SCAN}$ , A/D conversion by a trigger might have no effect.

Table 37.20 lists the A/D conversion start sources selected in the TRSA[5:0] bits.

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 13:8  | TRSA[5:0] | AD转换开始触发选择<br>在单次扫描模式和连续扫描模式中选择AD转换启动触发。在组扫描模式下，选择A组的AD转换启动触发。 | R/W |
| 15:14 | —         | 这些位被读取为0。写入值应为0。   | R/W |

#### TRSB[5:0]位 (B组的AD转换开始触发选择)

TRSB[5:0]位选择触发以开始扫描组B中选择的模拟输入。TRSB[5:0]位只能在组扫描模式下设置，不得用于任何其他扫描模式。对于B组的扫描转换开始触发，禁止设置软件触发或异步触发。在组扫描模式下，将TRSB[5:0]位设置为0x00以外的值，并将ADCSR.TRGE位设置为1。

当A组在组扫描模式下具有优先权时，将ADGSPCR.GBRP位设置为1允许B组在单次扫描模式下连续工作。将ADGSPCR.GBRP位设置为1时，将TRSB[5:0]位设置为0x3F。转换触发的发布周期必须大于或等于实际扫描转换时间( $t_{SCAN}$ )。如果发行周期小于 $t_{SCAN}$ ，触发器的AD转换可能无效。

When the GPT module is selected as an A/D conversion start trigger, a delay for synchronization processing occurs. For details, please refer to [section 37.3.7](#). Analog input sampling and scan conversion time.

表37.19列出了在TRSB[5:0]位中选择的AD转换启动源。

**Table 37.19 在TRSB[5:0]位中选择AD转换起始源**

| Source   | Remarks | TRSB[5] | TRSB[4] | TRSB[3] | TRSB[2] | TRSB[1] | TRSB[0] |
|--|---------|---------|---------|---------|---------|---------|---------|
| 触发源取消选择状态  | —       | 1       | 1       | 1       | 1       | 1       | 1       |
| ELC_AD00 (unit 0) and ELC_AD10 (unit 1)  | ELC     | 0       | 0       | 1       | 0       | 0       | 1       |
| ELC_AD01 (unit 0) and ELC_AD11 (unit 1)  | ELC     | 0       | 0       | 1       | 0       | 1       | 0       |
| ELC_AD00 (unit 0) and ELC_AD10 (unit 1), ELC_AD01 (unit 0) and ELC_AD11 (unit 1) | ELC     | 0       | 0       | 1       | 0       | 1       | 1       |

#### TRSA[5:0]位 (AD转换开始触发选择)

TRSA[5:0]位选择触发以在单次扫描模式和连续扫描模式下启动AD转换，或在组扫描模式下选择启动A组模拟输入扫描的触发。在组扫描模式或双触发模式下执行扫描时，禁止软件触发或异步触发。

- 使用同步触发(ELC)时，将ADCSR寄存器中的TRGE位设置为1，并将ADCSR寄存器中的EXTRG位设置为0。
- 使用异步触发(ADTRG0)时，将ADCSR寄存器的TRGE位设置为1，并将ADCSR寄存器的EXTRG位设置为1。
- 无论ADCSR.TRGE位、ADCSR.EXTRG位或TRSA[5:0]位的设置如何，都启用软件触发(ADCSR.ADST)。

转换触发的发布周期必须大于或等于实际扫描转换时间( $t_{SCAN}$ )。如果发行周期小于 $t_{SCAN}$ ，触发的AD转换可能无效。

表37.20列出了在TRSA[5:0]位中选择的AD转换起始源。

Table 37.20 Selection of A/D activation sources in the TRSA[5:0] bits

| Source   | Remarks                   | TRSA[5] | TRSA[4] | TRSA[3] | TRSA[2] | TRSA[1] | TRSA[0] |

**TSSAD bit (Temperature Sensor Output A/D-Converted Value Addition/Average Mode Select)**

When the TSSAD bit is set to 1, A/D conversion of the temperature sensor output is selected and performed successively the number of times specified in the ADC[2:0] bits in ADADC. The maximum addition count differs depending on the conversion accuracy (see section 37.2.6. [ADRD : A/D Self-Diagnosis Data Register](#)). When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is returned to the A/D Temperature sensor Data Register (ADTSDR). When the ADADC.AVEE bit is 1, the mean value is returned to ADTSDR.

Only set the TSSAD bit while the ADCSR.ADST bit is 0.

**OCSAD bit (Internal Reference Voltage A/D-Converted Value Addition/Average Mode Select)**

When the OCSAD bit is set to 1, A/D conversion of the internal reference voltage is selected and performed successively the number of times specified in the ADC[2:0] bits in ADADC. The maximum addition count differs depending on the conversion accuracy (see section 37.2.6. [ADRD : A/D Self-Diagnosis Data Register](#)). When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is returned to the A/D Internal Reference Voltage Data Register (ADOCADR). When the ADADC.AVEE bit is 1, the mean value is returned to ADOCADR.

Only set the OCSAD bit while the ADCSR.ADST bit is 0.

**TSSA bit (Temperature Sensor Output A/D Conversion Select)**

The TSSA bit selects A/D conversion of the temperature sensor output for group A in single scan mode, continuous scan mode, or group scan mode. When A/D conversion of the temperature sensor output is selected and performed, set the ADCSR.DBLE bit to 0.

Only set the TSSA bit while the ADCSR.ADST bit is 0.

**OCSA bit (Internal Reference Voltage A/D Conversion Select)**

The OCSA bit selects A/D conversion of the internal reference voltage for group A in single scan mode, continuous scan mode, or group scan mode. When A/D conversion of the internal reference voltage is selected and performed, set the ADCSR.DBLE bit to 0.

Only set the OCSA bit while the ADCSR.ADST bit is 0. In addition, wait for 400 ns or more after the OCSA bit is set to 1 before starting A/D conversion.

**TSSB bit (Temperature Sensor Output A/D Conversion Select for Group B)**

The TSSB bit selects A/D conversion of the temperature sensor output for group B in group scan mode. Only set the TSSB bit while the ADCSR.ADST bit is 0. Do not set the TSSB bit to 1 while the TSSA bit is 1.

**OCSB bit (Internal Reference Voltage A/D Conversion Select for Group B)**

The OCSB bit selects A/D conversion of the internal reference voltage for group B in group scan mode. Only set the OCSB bit while the ADCSR.ADST bit is 0. Do not set the OCSB bit to 1 while the OCSA bit is 1. Moreover, start the A/D conversion after waiting for 400 ns or more after the OCSB bit is set to 1.

**37.2.18 ADSSTRn/ADSSTRL/ADSSTRT/ADSSTRO : A/D Sampling State Register**

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  ( $m = 0, 1$ )

Offset address:  $0x0E0 + 0x1 \times n$  ( $n = 0$  to 9, 12, 13,  $m = 0$ )  
 $0x0E0 + 0x1 \times n$  ( $n = 0$  to 2,  $m = 1$ )  
 0x0DD (ADSSTRL)  
 0x0DE (ADSSTRT)  
 0x0DF (ADSSTRO)

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 7:0 | SST[7:0] | Sampling Time Setting<br>These bits set the sampling time in the range from 5 to 255 states. | R/W |

**TSSAD位 (温度传感器输出AD转换值加法平均模式选择)**

当TSSAD位设置为1时, 选择温度传感器输出的AD转换并连续执行ADADC中ADC[2:0]位指定的次数。最大加法计数因转换精度而异 (参见第37.2.6节。ADRD: AD自诊断数据寄存器)。当ADADC.AVEE位为0时, 通过加法 (积分) 获得的值返回到AD温度传感器数据寄存器(ADTSDR)。当ADADC.AVEE位为1时, 平均值返回给ADTSDR。

仅在ADCSR.ADST位为0时设置TSSAD位。

**OCSAD位 (内部参考电压AD转换值加法平均模式选择)**

当OCSAD位设置为1时, 选择内部参考电压的AD转换, 并按ADADC的ADC[2:0]位指定的次数连续执行。最大加法计数因转换精度而异 (参见第37.2.6节。ADRD: AD自诊断数据寄存器)。当ADADC.AVEE位为0时, 通过加法 (积分) 获得的值返回到AD内部参考电压数据寄存器 (ADOCADR)。当ADADC.AVEE位为1时, 平均值返回给ADOCADR。

仅在ADCSR.ADST位为0时设置OCSAD位。

**TSSA位 (温度传感器输出AD转换选择)**

TSSA位在单次扫描模式、连续扫描模式或组扫描模式下选择A组温度传感器输出的AD转换。WhenADconversionofthetemperatureoutputisselectedandperformedsettheADCSR.DBLEbitto0.

仅在ADCSR.ADST位为0时设置TSSA位。

**OCSA位 (内部参考电压AD转换选择)**

OCSA位在单次扫描模式、连续扫描模式或组扫描模式下选择A组内部参考电压的AD转换。WhenADconversionoftheinternalreferencevoltageisselectedandperformedsettheADCSR.DBLEbitto0.

仅在ADCSR.ADST位为0时设置OCSA位。此外, 在OCSA位设置为1后等待400ns或更长时间, 然后再开始AD转换。

**TSSB位 (B组的温度传感器输出AD转换选择)**

TSSB位选择组扫描模式下B组温度传感器输出的AD转换。仅在ADCSR.ADST位为0时设置TSSB位。不要在TSSA位为1时将TSSB位设置为1。

**OCSB位 (B组的内部参考电压AD转换选择)**

OCSB位选择组扫描模式下B组内部参考电压的AD转换。仅在ADCSR.ADST位为0时设置OCSB位。不要在OCSA位为1时将OCSB位设置为1。此外, 在OCSB位设置为1后等待400ns或更长时间后开始AD转换。

**37.2.18 ADSSTRnADSSTRLADSSTRTADSSTRO:AD采样状态寄存器**

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  ( $m = 0, 1$ )

Offset address:  $0x0E0 + 0x1 \times n$  ( $n = 0$  to 9, 12, 13,  $m = 0$ )  
 $0x0E0 + 0x1 \times n$  ( $n = 0$  to 2,  $m = 1$ )

 0x0DE (ADSSTRT)  
 0x0DF (ADSSTRO)

| Bit | Symbol   | Function                         | R/W |
|-----|----------|----------------------------------|-----|
| 7:0 | SST[7:0] | 采样时间设置<br>这些位在5到255个状态范围内设置采样时间。 | R/W |

The ADSSTRn register sets the sampling time for analog input.

The sampling time can be adjusted if the impedance of the analog input signal source is too high to secure sufficient sampling time, or if the ADCLK clock is slow. The set value indicates the time for one ADCLK cycle, and the required sampling time is specified by the voltage conditions. about detail, see [section 47.5. ADC12 Characteristics](#)

The lower limit of the sampling time setting depends on the frequency ratio:

- If the frequency ratio of PCLKA to PCLKC (ADCLK) = 1:1, 2:1, 4:1, or 8:1 the sampling time must be set to a value of more than 5 states
- If the frequency ratio of PCLKA to PCLKC (ADCLK) = 1:2 or 1:4, the sampling time must be set to a value of more than 6 states.

[Table 37.21](#) shows the relationship between the A/D Sampling State Register and the associated channels. For details, see [section 37.3.7. Analog Input Sampling and Scan Conversion Time](#).

Only set the SST[7:0] bits when the ADCSR.ADST bit is 0.

**Table 37.21 Relationship between A/D sampling state register and associated channels**

| Bit name   | Associated channels                          |
|--|--|
| ADSSTRn.SST[7:0] bits (n = 0 to 9, 12, 13(unit 0), 0 to 2(unit 1)) <sup>*1</sup> | AN000 to AN009, AN012, AN013, AN100 to AN102 |
| ADSSTRL.SST[7:0] bits  | AN116 to AN122                               |
| ADSSTRT.SST[7:0] bits  | Temperature sensor output                    |
| ADSSTRO.SST[7:0] bits  | Internal reference voltage                   |

Note 1. When the self-diagnosis function is selected, the sampling time set in the ADSSTRO.SST[7:0] bits is applied.

### 37.2.19 ADDISCR : A/D Disconnection Detection Control Register

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x07A

| Bit | Symbol      | Function   | R/W |
|-----|-------------|--|-----|
| 3:0 | ADNDIS[3:0] | Disconnection Detection Assist Setting<br>0x00: The disconnection detection assist function is disabled<br>0x01: Setting prohibited<br>Others: The number of states for the discharge or precharge period. | R/W |
| 4   | PCHG        | Precharge/discharge select<br>0: Discharge<br>1: Precharge   | R/W |
| 7:5 | —           | These bits are read as 0. The write value should be 0.   | R/W |

The ADDISCR register selects either precharge or discharge, and the period of precharge or discharge for the A/D disconnection detection assist function. Only set the ADDISCR register when the ADCSR.ADST bit is 0. When the temperature sensor output or internal reference voltage is converted, the A/D converter executes discharge automatically.

Disable the disconnection detection assist function if any of the following functions are used:

- The temperature sensor
- The internal reference voltage
- A/D self-diagnosis

ADSSTRn寄存器设置模拟输入的采样时间。

如果模拟输入信号源的阻抗太高而无法保证足够的采样时间，或者如果ADCLK时钟很慢，则可以调整采样时间。设定值表示一个ADCLK周期的时间，所需的采样时间由电压条件指定。有关详细信息，请参阅第47.5节。ADC12特性

采样时间设置的下限取决于频率比：

- 如果PCLKA与PCLKC(ADCLK)的频率比=1:1、2:1、4:1或8:1，则必须将采样时间设置为超过5个状态的值
- 如果PCLKA与PCLKC(ADCLK)的频率比=1:2或1:4，则必须将采样时间设置为6个以上状态的值。

表37.21显示了AD采样状态寄存器和相关通道之间的关系。有关详细信息，请参阅第37.3.7节。模拟输入采样和扫描转换时间。

仅当ADCSR.ADST位为0时设置SST[7:0]位。

**Table 37.21 AD采样状态寄存器与相关通道的关系**

| 位名称  | 关联频道   |
|--|--|
| ADSSTRn.SST[7:0]位 (n=0到9、12、13 (单元0)、0到2 (单元1)) *1 | AN000 to AN009, AN012, AN013, AN100 to AN102 |
| ADSSTRL.SST[7:0] bits                              | AN116 to AN122                               |
| ADSSTRT.SST[7:0] bits                              | 温度传感器输出                                      |
| ADSSTRO.SST[7:0] bits                              | 内部参考电压                                       |

注1.选择自诊断功能时，应用ADSSTRO.SST[7:0]位中设置的采样时间。

### 37.2.19 ADDISCR:AD断线检测控制寄存器

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x07A

| Bit | Symbol      | Function   | R/W |
|-----|-------------|--|-----|
| 3:0 | ADNDIS[3:0] | 断线检测辅助设置<br>0x00: 断线检测辅助功能禁用0x01: 设置禁止<br>其他: 放电或预充电期的状态数。 | R/W |
| 4   | PCHG        | Precharge/discharge select<br>0: Discharge<br>1: Precharge | R/W |
| 7:5 | —           | 这些位被读取为0。写入值应为0。   | R/W |

ADDISCR寄存器选择预充电或放电，以及AD断线检测辅助功能的预充电或放电周期。仅当ADCSR.ADST位为0时才设置ADDISCR寄存器。当温度传感器输出或内部参考电压转换时，AD转换器自动执行放电。

如果使用以下任何功能，请禁用断线检测辅助功能：

- 温度传感器
- 内部参考电压
- A/D self-diagnosis

**ADNDIS[3:0] bits (Disconnection Detection Assist Setting)**

The ADNDIS[3:0] bits specify the period of precharge or discharge. When ADNDIS[3:0] = 0000b, the disconnection detection assist function is disabled. Setting the ADNDIS[3:0] bits to 0001b is prohibited. Except when ADNDIS[3:0] = 0000b or 0001b, the specified value indicates the number of states for the period of precharge or discharge. When the ADNDIS[3:0] bits are set to any values other than 0000b or 0001b, the disconnection detection assistance function is enabled.

**PCHG bit (Precharge/discharge select)**

The PCHG bit selects either precharge or discharge.

**37.2.20 ADGSPCR : A/D Group Scan Priority Control Register**

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x080

|                    |      |       |    |    |    |    |   |   |   |   |   |   |   |   |        |     |
|--------------------|------|-------|----|----|----|----|---|---|---|---|---|---|---|---|--------|-----|
| Bit position:      | 15   | 14    | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1      | 0   |
| Bit field:         | GBRP | LGRRS | —  | —  | —  | —  | — | — | — | — | — | — | — | — | GBRSCN | PGS |
| Value after reset: | 0    | 0     | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0      | 0   |

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 0    | PGS    | Group Priority Operation Setting*1<br>0: Operate without group priority control.<br>1: Operate with group priority control.  | R/W |
| 1    | GBRSCN | Lower-Priority Group Restart Setting<br>(enabled only when PGS = 1 and reserved when PGS = 0.)<br>0: Disable rescanning of the group that was stopped in group priority operation<br>1: Enable rescanning of the group that was stopped in group priority operation. | R/W |
| 13:2 | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 14   | LGRRS  | Restart Channel Select<br>Enabled only when PGS = 1 and GBRSCN = 1.<br>0: Start rescanning from the first channel for scanning<br>1: Start rescanning from the channel for which A/D conversion is not completed.  | R/W |
| 15   | GBRP   | Single Scan Continuous Start*2<br>(enabled only when PGS = 1 and reserved when PGS = 0.)<br>0: Single scan is not continuously activated.<br>1: Single scan for the group with the lower-priority is continuously activated.   | R/W |

Note 1. The ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode) before setting PGS to 1. Operation is not guaranteed if these bits are set to any other value.

Note 2. When the GBRP bit is set to 1, single scan is performed continuously for the group with the lower-priority regardless of the setting in the GBRSCN bit.

**PGS bit (Group Priority Operation Setting)**

Set the PGS bit to 1 to enable group priority operation.

The ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode) before setting the PGS bit to 1. Operation is not guaranteed if the bits are set to any other value.

When the PGS bit is set to 0, a clear operation must be performed by software as described in [section 37.6.3. Constraints on Stopping A/D Conversion](#). When the PGS bit is set to 1, use the settings described in [section 37.3.4.3. Group Priority Operation](#).

**GBRSCN bit (Lower-Priority Group Restart Setting)**

The GBRSCN bit controls the restarting of scan operation in group priority operation.

When the GBRSCN bit is set to 1, if the scan operation of a lower-priority group is stopped by a trigger input of a priority group, the lower-priority group scanning is restarted on completion of the priority group scanning. If a trigger of a lower-priority group is input during scanning of the priority group, the lower-priority group scanning is started on completion of the priority group scanning.

**ADNDIS[3:0]位 (断线检测辅助设置)**

ADNDIS[3:0]位指定预充电或放电周期。当ADNDIS[3:0]=0000b时，断线检测辅助功能被禁用。禁止将ADNDIS[3:0]位设置为0001b。除了ADNDIS[3:0]=0000b或0001b时，指定值表示预充电或放电期间的状态数。当ADNDIS[3:0]位设置为0000b或0001b以外的任何值时，将启用断线检测辅助功能。

**PCHG bit (Precharge/discharge select)**

PCHG位选择预充电或放电。

**37.2.20 ADGSPCR:AD组扫描优先级控制寄存器**

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x080

|               |      |       |    |    |    |    |   |   |   |   |   |   |   |   |        |     |
|---------------|------|-------|----|----|----|----|---|---|---|---|---|---|---|---|--------|-----|
| Bit position: | 15   | 14    | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1      | 0   |
| Bit field:    | GBRP | LGRRS | —  | —  | —  | —  | — | — | — | — | — | — | — | — | GBRSCN | PGS |
| 重置后的值:        | 0    | 0     | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0      | 0   |

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 0    | PGS    | 组优先操作设置*1<br>0: 无组优先控制运行。1: 以组优先控制运行。   | R/W |
| 1    | GBRSCN | 低优先级组重启设置 (仅在PGS=1时启用, 在PGS=0时保留。)<br>0: 禁止重新扫描在组优先操作中停止的组1: 允许重新扫描在组优先操作中停止的组。 | R/W |
| 13:2 | —      | 这些位被读取为0。写入值应为0。  | R/W |
| 14   | LGRRS  | 重启频道选择<br>仅当PGS=1且GBRSCN=1时启用。<br>0: 从第一个扫描通道开始重新扫描1: 从未完成AD转换的通道开始重新扫描。        | R/W |
| 15   | GBRP   | 单次扫描连续启动*2<br>(仅在PGS=1时启用, 在PGS=0时保留。)<br>0: 单次扫描不连续激活。1: 连续激活低优先级组的单次扫描。       | R/W |

注1.ADCSR.ADCS[1:0]位必须在PGS设置为1之前设置为01b (组扫描模式)。如果这些位设置为任何其他值, 则无法保证操作。

注2.当GBRP位设置为1时, 无论GBRSCN位的设置如何, 都会对优先级较低的组连续执行单次扫描。

**PGS位 (组优先操作设置)**

将PGS位设置为1以启用组优先操作。

在将PGS位设置为1之前, 必须将ADCSR.ADCS[1:0]位设置为01b (组扫描模式)。如果这些位设置为任何其他值, 则无法保证操作。

当PGS位设置为0时, 必须通过软件执行清零操作, 如第37.6.3节所述。约束停止AD转换。当PGS位设置为1时, 使用第37.3.4.3节中描述的设置。团体优先操作。

**GBRSCN位 (低优先级组重启设置)**

GBRSCN位控制组优先操作中扫描操作的重新启动。

当GBRSCN位被设置为1时, 如果低优先级组的扫描操作被优先级组的触发输入停止, 则低优先级组扫描在优先级组扫描完成时重新开始。如果在优先级组扫描期间输入了较低优先级组的触发, 则在完成优先级组扫描时开始较低优先级组扫描。

When the GBRSCN bit is set to 0, triggers input during scanning are ignored. Set the GBRSCN bit while the ADCSR.ADST bit is 0.

**LGRRS bit (Restart Channel Select)**

This bit sets the channel from which rescanning is to be started in group priority operation. The setting of the LGRRS bit is valid when the PGS and GBRSCN bits are 1.

If the LGRRS bit is 0, scanning of a lower-priority group that was stopped in group priority operation is restarted from the first channel after scanning of the priority group completes.

If the LGRRS bit is 1, scanning of a lower-priority group that was stopped in group priority operation is restarted (upon completion of scanning of the priority group) from the channel for which A/D conversion is not complete. If A/D conversion of the addition setting channel was not completed the specified number of times when scanning stopped, A/D conversion of the addition setting channel is performed again the specified number of times when scanning restarts.

Set the LGRRS bit while the ADCSR.ADST bit is 0.

**GBRP bit (Single Scan Continuous Start)**

The GBRP bit is set when a single scan operation is to be performed continuously on the group with the lower-priority.

Setting the GBRP bit to 1 starts a single scan of the group with the lower-priority. On completion of the scan, another single scan of the group with the lower-priority is started automatically. If scanning has been stopped during group priority operation, single scan of the group with the lower-priority is automatically restarted on completion of the A/D conversion of the priority group.

Before setting the GBRP bit to 1, disable input of a trigger for the lower-priority group. If the GBRP bit is set to 1, rescanning is performed only on the group with the lower-priority even if the GBRSCN bit is set to 0.

**37.2.21 ADCMPCR : A/D Compare Function Control Register**

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x090

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 1:0 | CMPAB[1:0] | Window A/B Composite Conditions Setting<br>These bits are valid when both window A and window B are enabled (CMPAE = 1 and CMPBE = 1).<br>00: Output ADC12i_WCMPM (i = 0, 1) when window A OR window B comparison conditions are met. Otherwise, output ADC12i_WCMPUM (i = 0, 1).<br>01: Output ADC12i_WCMPM (i = 0, 1) when window A EXOR window B comparison conditions are met. Otherwise, output ADC12i_WCMPUM (i = 0, 1).<br>10: Output ADC12i_WCMPM (i = 0, 1) when window A AND window B comparison conditions are met. Otherwise, output ADC12i_WCMPUM (i = 0, 1).<br>11: Setting prohibited. | R/W |
| 8:2 | —          | These bits are read as 0. The write value should be 0.  | R/W |
| 9   | CMPBE      | Compare Window B Operation Enable<br>0: Disable compare window B operation.<br>Disable ADC12i_WCMPM (i = 0, 1) and ADC12i_WCMPUM (i = 0, 1) outputs.<br>1: Enable compare window B operation.   | R/W |
| 10  | —          | This bit is read as 0. The write value should be 0.   | R/W |
| 11  | CMPAE      | Compare Window A Operation Enable<br>0: Disable compare window A operation.<br>Disable ADC12i_WCMPM (i = 0, 1) and ADC12i_WCMPUM (i = 0, 1) outputs.<br>1: Enable compare window A operation.   | R/W |
| 12  | —          | This bit is read as 0. The write value should be 0.   | R/W |

当GBRSCN位设置为0时，扫描期间的触发输入将被忽略。设置GBRSCN位，而 ADCSR.ADST位为0。

**LGRRS位 (重启通道选择)**

该位设置在组优先操作中要从哪个通道开始重新扫描。当PGS和GBRSCN位为1时，LGRRS位的设置有效。

如果LGRRS位为0，则在优先级组扫描完成后，从第一个通道开始重新开始对在组优先级操作中停止的低优先级组的扫描。

如果LGRRS位为1，则从AD转换未完成的通道重新开始（在完成优先级组的扫描时）组优先操作中停止的低优先级组的扫描。如果在扫描停止时加法设置通道的AD转换未完成指定次数，则在扫描重新开始时再次执行加法设置通道的AD转换指定次数。

当ADCSR.ADST位为0时设置LGRRS位。

**GBRP位 (单次扫描连续启动)**

当要对优先级较低的组连续执行单次扫描操作时，设置GBRP位。

将GBRP位设置为1开始对具有较低优先级的组进行单次扫描。扫描完成后，将自动开始对具有较低优先级的组进行另一次单次扫描。如果在组优先操作期间扫描已停止，则在优先组的AD转换完成时，将自动重新开始优先级较低的组的单次扫描。

在将GBRP位设置为1之前，禁用低优先级组的触发器输入。如果GBRP位设置为1，即使GBRSCN位设置为0，也仅对具有较低优先级的组执行重新扫描。

**37.2.21 ADCMPCR:AD比较功能控制寄存器**

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x090

| Bit | Symbol     | Function  | R/W |

| 11  | CMPAE      | 比较窗口A操作启用<br>0: 禁止比较窗口A操作。<br>禁用ADC12i_WCMPM(i=0 1)和ADC12i_WCMPUM(i=0 1)输出。<br>1: 启用比较窗口A操作。  | R/W |
| 12  | —          | 该位读取为0。写入值应为0。  | R/W |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 13  | CMPBIE | Compare B Interrupt Enable<br>0: Disable ADC12i_CMPBI (i = 0, 1) interrupt when comparison conditions (window B) are met.<br>1: Enable ADC12i_CMPBI (i = 0, 1) interrupt when comparison conditions (window B) are met.   | R/W |
| 14  | WCMPE  | Window Function Setting<br>0: Disable window function<br>Window A and window B operate as a comparator to compare the single value on the lower side with the A/D conversion result.<br>1: Enable window function<br>Window A and window B operate as a comparator to compare the two values on the upper and lower sides with the A/D conversion result. | R/W |
| 15  | CMPAIE | Compare A Interrupt Enable<br>0: Disable ADC12i_CMPAI (i = 0, 1) interrupt when comparison conditions (window A) are met.<br>1: Enable ADC12i_CMPAI (i = 0, 1) interrupt when comparison conditions (window A) are met.   | R/W |

**CMPAB[1:0] bits (Window A/B Composite Conditions Setting)**

The CMPAB[1:0] bits are valid when both window A and window B are enabled (CMPAE = 1 and CMPBE = 1) in single scan mode. These bits specify the compare function match/mismatch event output conditions and monitoring conditions of ADWINMON.MONCOMB. Only set the CMPAB[1:0] bits while the ADCSR.ADST bit is 0.

**CMPBE bit (Compare Window B Operation Enable)**

The CMPBE bit enables or disables the compare window B operation. Set the CMPBE bit while the ADCSR.ADST bit is 0.

Set this bit to 0 before setting the following registers:

- A/D Channel Select Registers A0, A1, B0, B1 (ADANSA0, ADANSA1, ADANSB0, ADANSB1)
- OCSB, TSSB, OCSA, or TSSA bits in the A/D Conversion Extended Input Control Register (ADEXICR)
- CMPCHB[5:0] bits in the Window B Channel Select Register (ADCMPBNSR)

**CMPAE bit (Compare Window A Operation Enable)**

The CMPAE bit enables or disables the compare window A operation. Set the CMPAE bit while the ADCSR.ADST bit is 0.

Set this bit to 0 before setting the following registers:

- A/D Channel Select Registers A0, A1, B0, B1 (ADANSA0, ADANSA1, ADANSB0, ADANSB1)
- OCSB, TSSB, OCSA, or TSSA bits in the A/D Conversion Extended Input Control Register (ADEXICR)
- Window A Channel Select Registers 0 and 1 (ADCMPANSR0 and ADCMPANSR1)
- Window A Extended Input Select Register (ADCMPANSER)

**CMPBIE bit (Compare B Interrupt Enable)**

The CMPBIE bit enables or disables the ADC12i\_CMPBI (i = 0, 1) interrupt output when the comparison conditions (window B) are met.

**WCMPE bit (Window Function Setting)**

The WCMPE bit enables or disables the window function. Set the WCMPE bit while the ADCSR.ADST bit is 0.

**CMPAIE bit (Compare A Interrupt Enable)**

The CMPAIE bit enables or disables the ADC12i\_CMPAI (i = 0, 1) interrupt output when the comparison conditions (window A) are met.

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 13  | CMPBIE | 比较B中断使能<br>0: 当满足比较条件 (窗口B) 时, 禁用ADC12i_CMPBI(i=0 1)中断。<br>1: 当满足比较条件 (窗口B) 时, 使能ADC12i_CMPBI(i=0 1)中断。   | R/W |
| 14  | WCMPE  | 窗口功能设置<br>0: 关闭窗口功能<br>窗口A和窗口B用作比较器, 将下侧的单个值与AD转换结果进行比较。<br>1: 启用窗口功能<br>窗口A和窗口B用作比较器, 将上下两个值与AD转换结果进行比较。 | R/W |
| 15  | CMPAIE | 比较中断使能<br>0: 当满足比较条件 (窗口A) 时, 禁止ADC12i_CMPAI(i=0 1)中断。<br>1: 当满足比较条件 (窗口A) 时, 使能ADC12i_CMPAI(i=0 1)中断。    | R/W |

**CMPAB[1:0]位 (窗口AB复合条件设置)**

当窗口A和窗口B在单次扫描模式下启用 (CMPAE=1和CMPBE=1) 时, CMPAB[1:0]位有效。这些位指定比较函数匹配不匹配事件的输出条件和ADWINMON.MONCOMB的监视条件。仅在ADCSR.ADST位为0时设置CMPAB[1:0]位。

**CMPBE位 (比较窗口B操作使能)**

CMPBE位启用或禁用比较窗口B操作。当ADCSR.ADST位为0时设置CMPBE位。

在设置以下寄存器之前将此位设置为0:

- AD通道选择寄存器A0、A1、B0、B1 (ADANSA0、ADANSA1、ADANSB0、ADANSB1)
- AD转换扩展输入控制寄存器(ADEXICR)中的OCSB、TSSB、OCSA或TSSA位
- 窗口B通道选择寄存器(ADCMPBNSR)中的CMPCHB[5:0]位

**CMPAE位 (比较窗口A操作使能)**

CMPAE位启用或禁用比较窗口A操作。当ADCSR.ADST位为0时设置CMPAE位。

在设置以下寄存器之前将此位设置为0:

- AD通道选择寄存器A0、A1、B0、B1 (ADANSA0、ADANSA1、ADANSB0、ADANSB1)
- AD转换扩展输入控制寄存器(ADEXICR)中的OCSB、TSSB、OCSA或TSSA位
- 窗口A通道选择寄存器0和1 (ADCMPANSR0和ADCMPANSR1)
- 窗口A扩展输入选择寄存器(ADCMPANSER)

**CMPBIE位 (比较B中断允许)**

当满足比较条件 (窗口B) 时, CMPBIE位启用或禁用ADC12i\_CMPBI(i=0 1)中断输出。

**WCMPE位 (窗口功能设置)**

WCMPE位启用或禁用窗口功能。当ADCSR.ADST位为0时设置WCMPE位。

**CMPAIE位 (比较中断允许)**

当满足比较条件 (窗口A) 时, CMPAIE位启用或禁用ADC12i\_CMPAI(i=0 1)中断输出。

## 37.2.22 ADCMPANSR0 : A/D Compare Function Window A Channel Select Register 0

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x094

| Bit  | Symbol  | Function  | R/W |
|------|---------|---|-----|
| 15:0 | CMPCHAN | Compare Window A Channel Select<br>Bit 15 (CMPCHA15) is associated with ANm15 and bit 0 (CMPCHA00) is associated with ANm00.<br>0: Disable compare function for associated input channel<br>1: Enable compare function for associated input channel | R/W |

Note: n = 00 to 09, 12, 13(unit 0), 00 to 02(unit 1)

Note: Bits associated with non-existent pins are reserved. This bit is read as 0. The write value should be 0.

**CMPCHAN bits (Compare Window A Channel Select)**

The compare function is enabled by writing 1 to the CMPCHAN bit with the same number as the A/D conversion channel selected in the ADANSA0.ANSAn bits and the ADANSB0.ANSBn bits.

Set the CMPCHAN bits while the ADCSR.ADST bit is 0.

Note: 与不存在的引脚相关的位被保留。该位读取为0。写入值应为0。

**CMPLCHAn bits (Compare Window A Comparison Condition Select)**

The CMPLCHAn bits specify the comparison conditions for channels to which Window A comparison conditions are applied. These bits can be set for each analog input to be compared. When the comparison result of each analog input meets the set condition, the ADCMPSTR0.CMPSTCHAn flag sets to 1 and a compare interrupt (ADC12i\_CMPAI (i = 0, 1)) is generated.

|  |         |
|--|---------|
| Comparison conditions when the window function is disabled |         |

**CMPLTSA bit (Compare Window A Temperature Sensor Output Comparison Condition Select)**

The CMPLTSA bit specifies comparison conditions when the temperature sensor output is the target for the Window A comparison condition. When the temperature sensor output comparison result meets the set condition, the ADCMPSEr.CMPSTTSA flag sets to 1 and a compare interrupt (ADC12i\_CMPAI (i = 0, 1)) is generated.

**CMPLOCA bit (Compare Window A Internal Reference Voltage Comparison Condition Select)**

The CMPLOCA bit specifies comparison conditions when the internal reference voltage is the target for the Window A comparison condition. When the internal reference voltage comparison result meets the set condition, the ADCMPSEr.CMPSTOCA flag sets to 1 and a compare interrupt (ADC12i\_CMPAI (i = 0, 1)) is generated.

**37.2.28 ADCMPDRn : A/D Compare Function Window A Lower-Side/Upper-Side Level Setting Register (n = 0, 1)**

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  (m = 0, 1)

Offset address:  $0x09C + (0x2 \times n)$

| Bit position:      | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|-------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit field:         | [Empty box] |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The ADCMPDRy (y = 0, 1) register specifies the reference data when the compare window A function is used. ADCMPDR0 sets the lower reference for window A, and ADCMPDR1 sets the upper reference for window A.

ADCMPDRy are read/write registers.

ADCMPDRy are writable even during A/D conversion. The reference data can be dynamically changed by rewriting register values during A/D conversion\*1.

Set these registers so that the upper reference is not less than the lower reference ( $ADCMPDR1 \geq ADCMPDR0$  and ). ADCMPDR1 and are not used when the window function is disabled.

Note 1. The lower and the upper references are changed when each register is written. For example, when the upper reference value is changed and the lower reference value is being changed, the MCU compares the upper reference (after rewrite), and the lower reference (before rewrite) with the A/D conversion result. See Figure 37.5. If the comparison during the rewriting of these two references is erroneous, then rewrite these reference values when both ADCSR.ADST and the target Compare Window Operation Enable bit (ADCMPSEr.CMPAE or ADCMPSEr.CMPBE) are 0.

| Bit | Symbol | Function         | R/W |
|-----|--------|------------------|-----|
| 7:2 | —      | 这些位被读取为0。写入值应为0。 | R/W |

**CMPLTSA位 (比较窗口A温度传感器输出比较条件选择)**

当温度传感器输出是窗口A比较条件的目标时，CMPLTSA位指定比较条件。当温度传感器输出比较结果满足设置条件时，ADCMPSEr.CMPSTTSA标志设置为1并产生比较中断(ADC12i\_CMPAI(i=0 1))。

**CMPLOCA位 (比较窗口A内部参考电压比较条件选择)**

当内部参考电压是窗口A比较条件的目标时，CMPLOCA位指定比较条件。当内部参考电压比较结果满足设置条件时，ADCMPSEr.CMPSTOCA标志设置为1并产生比较中断(ADC12i\_CMPAI(i=0 1))。

**37.2.28 ADCMPDRn:AD比较功能窗口ALower-SideUpper-SideLevel设置寄存器(n=0 1)**

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  (m = 0, 1)

Offset address:  $0x09C + (0x2 \times n)$

| Bit position: | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|-------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit field:    | [Empty box] |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| 重置后的值:        | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

ADCMPDRy(y=0 1)寄存器指定使用比较窗口A功能时的参考数据。ADCMPDR0设置窗口A的下参考值，而ADCMPDR1设置窗口A的上参考值。

ADCMPDRy是读写寄存器。

ADCMPDRy即使在AD转换期间也是可写的。在AD转换\*1期间，可以通过重写寄存器值来动态更改参考数据。

设置这些寄存器，使参考上限不小于参考下限 ( $ADCMPDR1 \geq ADCMPDR0$ 和)。ADCMPDR1并且在窗口功能被禁用时不使用。

注1.写入每个寄存器时，低位和低位参考值会发生变化。例如，当上参考值改变和下参考值改变时，MCU将上参考(重写后)和下参考(重写前)与AD转换结果进行比较。请参见图37.5。如果在重写这两个参考时比较错误，则在ADCSR.ADST和目标比较窗口操作使能位(ADCMPSEr.CMPAE或ADCMPSEr.CMPBE)都为0时重写这些参考值。

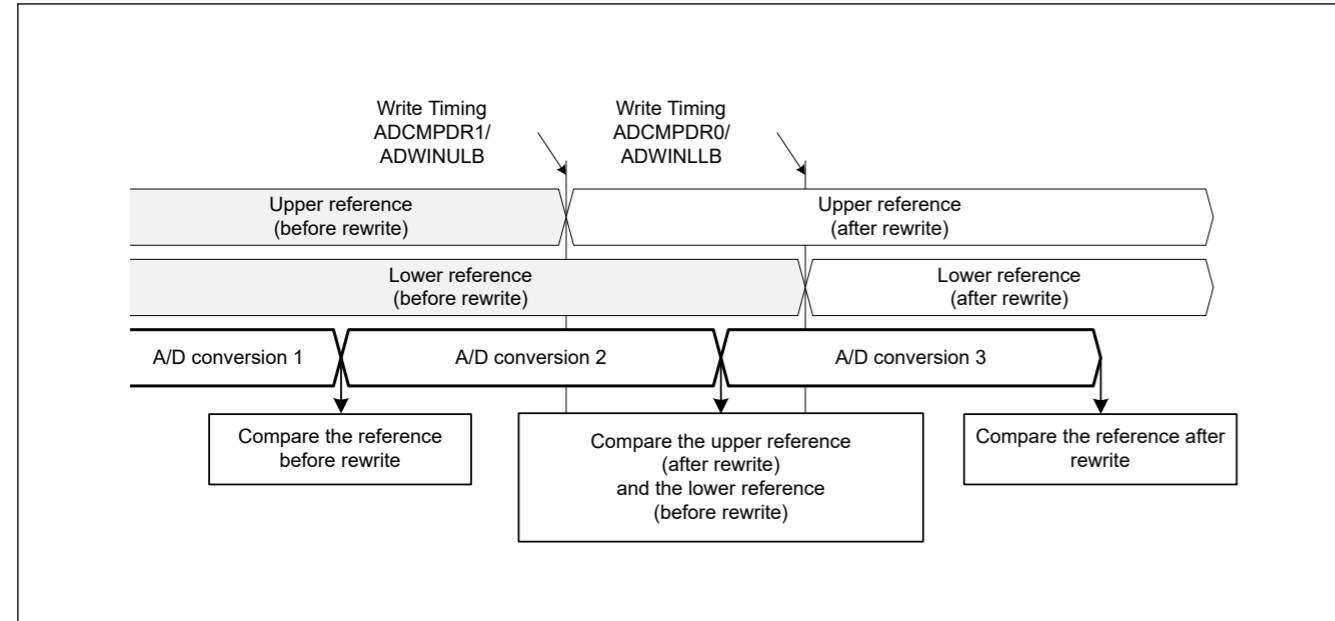

Figure 37.5 Comparison between upper and lower references before and after a rewrite

The ADCMPDRy registers use different formats depending on the following conditions:

- The value of A/D Data Register Format Select bit (flush-right or flush-left)
- The value of the A/D Conversion Accuracy Select bit (12-bit, 10-bit, 8-bit)
- The value of A/D-Converted Value Addition/Average Channel Select bits (A/D-converted value addition mode selected or not selected).

The data formats for each condition are shown as follows:

1. When A/D-converted value addition mode is not selected
  - Flush-right data with 12-bit accuracy — Lower 12 bits ([11:0]) are valid
  - Flush-right data with 10-bit accuracy — Lower 10 bits ([9:0]) are valid
  - Flush-right data with 8-bit accuracy — Lower 8 bits ([7:0]) are valid
  - Flush-left data with 12-bit accuracy — Upper 12 bits ([15:4]) are valid
  - Flush-left data with 10-bit accuracy — Upper 10 bits ([15:6]) are valid
  - Flush-left data with 8-bit accuracy — Upper 8 bits ([15:8]) are valid
2. When A/D-converted value addition mode is selected
  - Flush-right data with 12-bit accuracy — Lower 14 bits ([13:0]) are valid
  - Flush-right data with 10-bit accuracy — Lower 12 bits ([11:0]) are valid
  - Flush-right data with 8-bit accuracy — Lower 10 bits ([9:0]) are valid
  - Flush-left data with 12-bit accuracy — Upper 14 bits ([15:2]) are valid
  - Flush-left data with 10-bit accuracy — Upper 12 bits ([15:4]) are valid
  - Flush-left data with 8-bit accuracy — Upper 10 bits ([15:6]) are valid

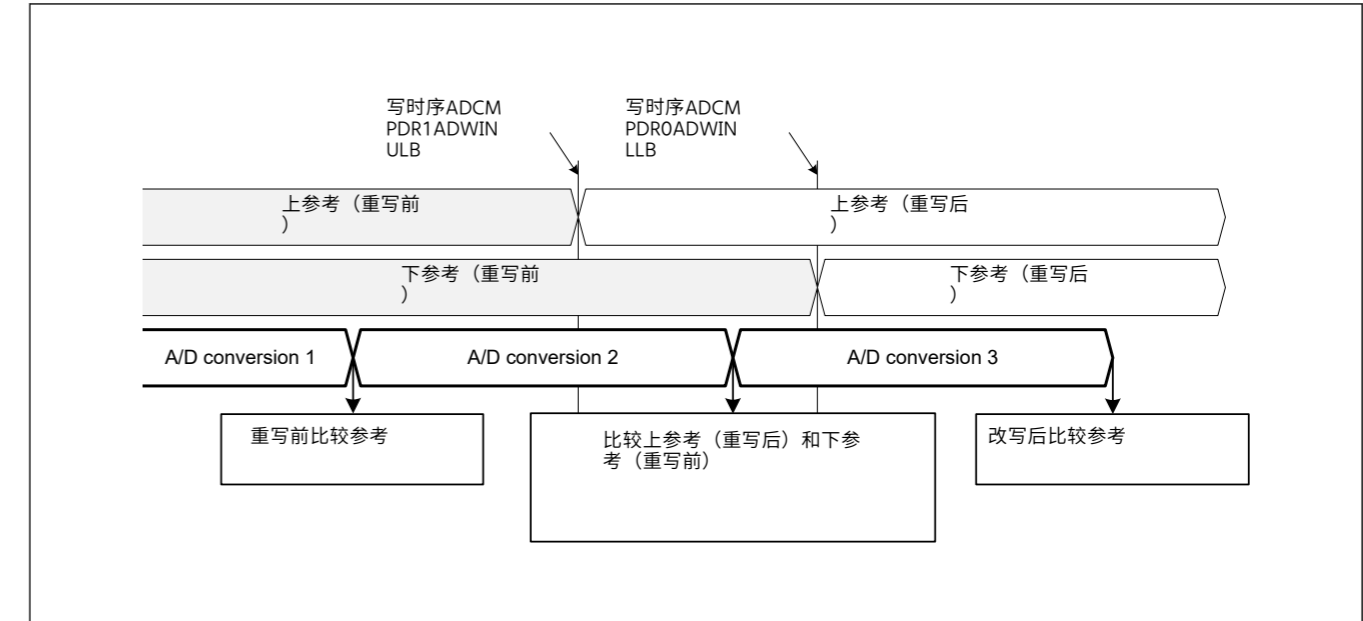

Figure 37.5 重写前后上下引用的比较

ADCMPDRy寄存器根据以下条件使用不同的格式:

- AD数据寄存器格式选择位的值 (flush-right或flush-left)
- AD转换精度选择位 (12位、10位、8位) 的值
- AD-Converted Value Addition/Average Channel Select位的值 (选择或不选择AD-converted value添加模式)。

每个条件的数据格式如下所示:

1. 未选择AD转换值加法模式时
  - 12位精度的右刷新数据—低12位([11:0])有效
  - 10位精度的右刷新数据—低10位([9:0])有效
  - 8位精度的右刷新数据—低8位([7:0])有效
  - 12位精度的左刷新数据—高12位([15:4])有效
  - 10位精度的左刷新数据—高10位([15:6])有效
  - 8位精度的左刷新数据—高8位([15:8])有效
2. 选择AD转换值加法模式时
  - 12位精度的右刷新数据—低14位([13:0])有效
  - 10位精度的右刷新数据—低12位([11:0])有效
  - 8位精度的右刷新数据—低10位([9:0])有效
  - 12位精度的左刷新数据—高14位([15:2])有效
  - 10位精度的左刷新数据—高12位([15:4])有效
  - 8位精度的左刷新数据—高10位([15:6])有效

37.2.29 ADWINnLB : A/D Compare Function Window B Lower-Side/Upper-Side Level Setting Register (n = L, U)

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  (m = 0, 1)

Offset address: 0x0A8 (n = L)  
0x0AA (n = U)

The ADWINULB and ADWINLLB registers specify the reference data when the compare window B function is used. ADWINLLB sets the lower reference for window B, and ADWINULB sets the upper reference for window B.

ADWINnLB are read/write registers.

ADWINnLB are writable even during A/D conversion. The reference data can be dynamically changed by rewriting register values during A/D conversion\*1.

Set these registers so that the upper reference is not less than the lower reference ( and  $ADWINULB \geq ADWINLLB$  ), and ADWINULB are not used when the window function is disabled.

Note 1. The lower and the upper references are changed when each register is written. For example, when the upper reference value is changed and the lower reference value is being changed, the MCU compares the upper reference (after rewrite), and the lower reference (before rewrite) with the A/D conversion result. See Figure 37.6. If the comparison during the rewriting of these two references is erroneous, then rewrite these reference values when both ADCSR.ADST and the target Compare Window Operation Enable bit (ADCMPCR.CMPAE or ADCMPCR.CMPBE) are 0.

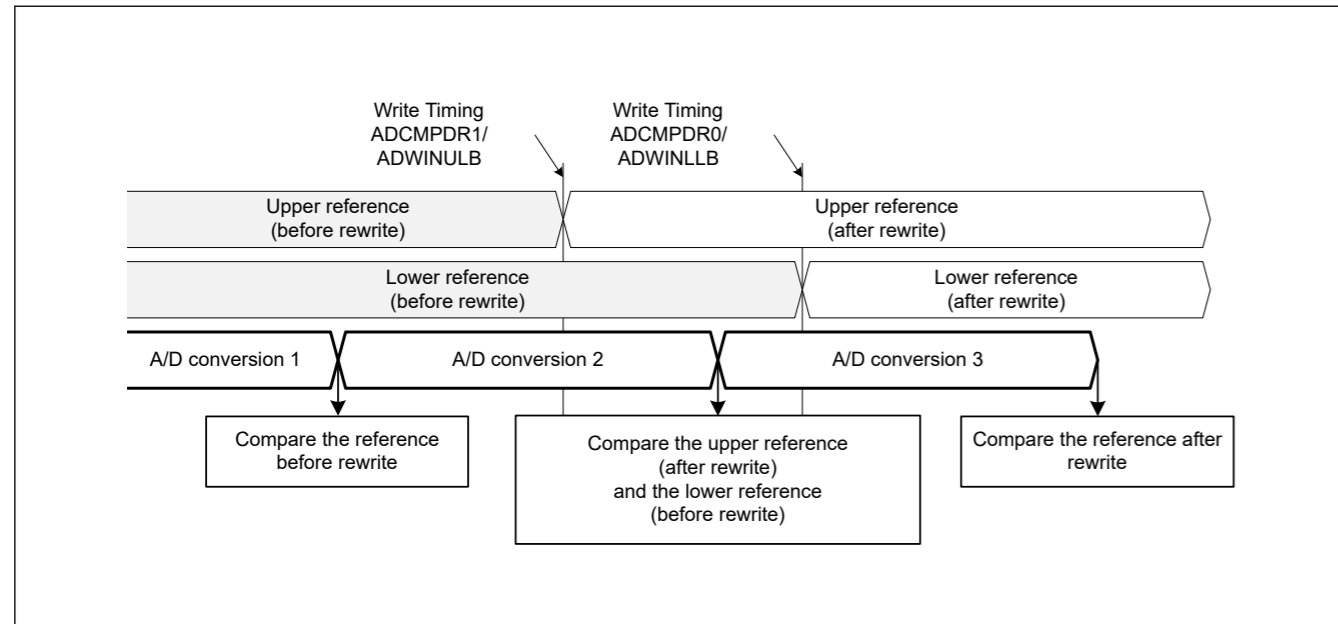

Figure 37.6 Comparison between upper and lower references before and after a rewrite

The ADWINnLB registers use different formats depending on the following conditions:

- The value of A/D Data Register Format Select bit (flush-right or flush-left)
- The value of the A/D Conversion Accuracy Select bit (12-bit, 10-bit, 8-bit)
- The value of A/D-Converted Value Addition/Average Channel Select bits (A/D-converted value addition mode selected or not selected).

The data formats for each condition are shown as follows:

1. When A/D-converted value addition mode is not selected

37.2.29 ADWINnLB:AD比较函数窗口B Lower-Side/Upper-Side Level 设置寄存器(n=L U)

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  (m = 0, 1)

Offset address: 0x0A8 (n = L)  
0x0AA (n = U)

ADWINULB和ADWINLLB寄存器指定使用比较窗口B功能时的参考数据。ADWINLLB设置窗口B的下参考，ADWINULB设置窗口B的上参考。

ADWINnLB是读写寄存器。

ADWINnLB即使在AD转换期间也是可写的。在AD转换\*1期间，可以通过重写寄存器值来动态更改参考数据。

设置这些寄存器，使上限参考值不小于下限参考值（并且 $ADWINULB \geq ADWINLLB$ ）。和禁用窗口功能时不使用ADWINULB。

注1.写入每个寄存器时，低位和高位参考值会发生变化。例如，当上参考值改变和下参考值改变时，MCU将上参考（重写后）和下参考（重写前）与AD转换结果进行比较。请参见图37.6。如果在重写这两个参考时比较错误，则在ADCSR.ADST和目标比较窗口操作使能位（ADCMPCR.CMPAE或ADCMPCR.CMPBE）都为0时重写这些参考值。

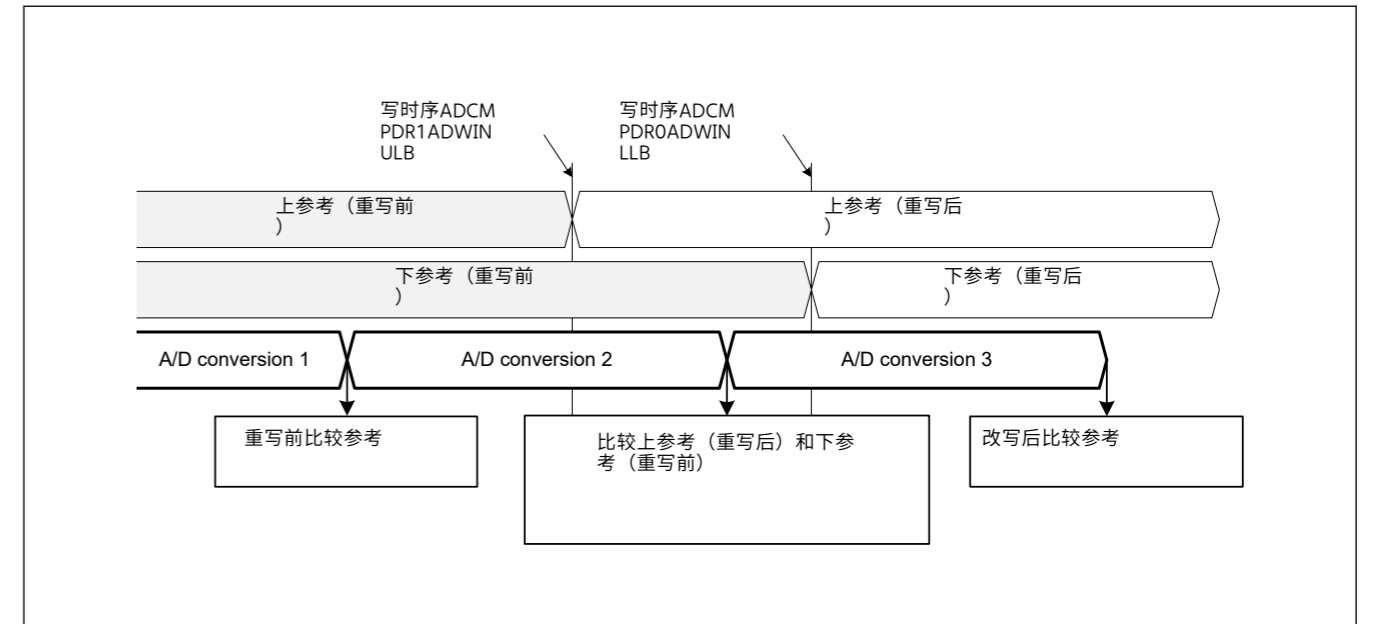

Figure 37.6 重写前后上下引用的比较

ADWINnLB寄存器根据以下条件使用不同的格式:

- AD数据寄存器格式选择位的值 (flush-right or flush-left)
- AD转换精度选择位 (12位、10位、8位) 的值
- AD-Converted Value Addition/Average Channel Select 位的值 (选择或不选择AD-converted value 添加模式)。

每个条件的数据格式如下所示:

1. 未选择AD转换值加法模式时

- Flush-right data with 12-bit accuracy — Lower 12 bits ([11:0]) are valid
- Flush-right data with 10-bit accuracy — Lower 10 bits ([9:0]) are valid
- Flush-right data with 8-bit accuracy — Lower 8 bits ([7:0]) are valid
- Flush-left data with 12-bit accuracy — Upper 12 bits ([15:4]) are valid
- Flush-left data with 10-bit accuracy — Upper 10 bits ([15:6]) are valid
- Flush-left data with 8-bit accuracy — Upper 8 bits ([15:8]) are valid

2. When A/D-converted value addition mode is selected

- Flush-right data with 12-bit accuracy — Lower 14 bits ([13:0]) are valid
- Flush-right data with 10-bit accuracy — Lower 12 bits ([11:0]) are valid
- Flush-right data with 8-bit accuracy — Lower 10 bits ([9:0]) are valid
- Flush-left data with 12-bit accuracy — Upper 14 bits ([15:2]) are valid
- Flush-left data with 10-bit accuracy — Upper 12 bits ([15:4]) are valid
- Flush-left data with 8-bit accuracy — Upper 10 bits ([15:6]) are valid

37.2.30 ADCMPSTR0 : A/D Compare Function Window A Channel Status Register 0

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

| Bit  | Symbol    | Function  | R/W |
|------|-----------|---|-----|
| 15:0 | CMPSTCHAN | Compare Window A Flag<br>When Window A operation is enabled (ADCMPSTR.CMPAE = 1b), these bits indicate the comparison result of channels to which Window A comparison conditions are applied. Bit 15 (CMPSTCHA15) is associated with ANm15 and bit 0 (CMPSTCHA00) is associated with ANm00.<br>0: Comparison conditions are not met.<br>1: Comparison conditions are met. | R/W |

Note: n = 00 to 09, 12, 13(unit 0), 00 to 02(unit 1)  
 Note: Bits associated with non-existent pins are reserved. This bit is read as 0. The write value should be 0.

**CMPSTCHAN flags (Compare Window A Flag)**

The CMPSTCHAN flags indicate the comparison results for channels to which Window A comparison conditions are applied. When a comparison condition set in ADCMPSTR0.CMPLCHAN is met at the end of A/D conversion, the associated CMPSTCHAN flag sets to 1. When the ADCMPSTR.CMPAIE bit is 1, a compare interrupt request (ADC12i\_CMPAI (i = 0, 1)) is generated when this flag sets to 1.

Writing 1 to the CMPSTCHAN flags is invalid.

[Setting condition]

- The condition set in ADCMPSTR0.CMPLCHAN is met when ADCMPSTR.CMPAE = 1.

[Clearing condition]

- Writing 0 after reading 1.

- 12位精度的右冲洗数据—低12位([11:0])有效
- 10位精度的右刷新数据—低10位([9:0])有效
- 8位精度的右冲洗数据—低8位([7:0])有效
- 12位精度的左刷新数据—高12位([15:4])有效
- 10位精度的左刷新数据—高10位([15:6])有效
- 8位精度的左刷新数据—高8位([15:8])有效

2.选择AD转换值加法模式时

- 12位精度的右刷新数据—低14位([13:0])有效
- 10位精度的右刷新数据—低12位([11:0])有效
- 8位精度的右冲洗数据—低10位([9:0])有效
- 12位精度的左刷新数据—高14位([15:2])有效
- 10位精度的左刷新数据—高12位([15:4])有效
- 8位精度的左刷新数据—高10位([15:6])有效

| 0   | CMPSTTTSA | 比较窗口A温度传感器输出比较标志<br>当窗口A操作使能 (ADCMPSTR2.CMPSTSTR2E=1) 时, 该位指示温度传感器输出比较结果。<br>0: 不满足比较条件。1: 满足比较条件。 | R/W |
| 1   | CMPSTTOCA | 比较窗口A内部参考电压比较标志<br>当窗口A操作使能时 (ADCMPSTR2.CMPSTSTR2E=1), 该位指示内部参考电压比较结果。<br>0: 不满足比较条件。1: 满足比较条件。    | R/W |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 7:2 | —      | These bits are read as 0. The write value should be 0. | R/W |

The ADCMPSEER register stores compare results of compare function window A.

#### CMPSTTSA flag (Compare Window A Temperature Sensor Output Compare Flag)

The CMPSTTSA flag indicates the temperature sensor output comparison result. When the comparison condition set in ADCMPLEER.CMPLTSA is met at the end of A/D conversion, this flag sets to 1. When the ADCMPCEER.CMPAIE bit is 1, a compare interrupt request (ADC12i\_CMPAI (i = 0, 1)) is generated when this flag sets to 1.

Writing 1 to the CMPSTTSA flag is invalid.

[Setting condition]

- The condition set in ADCMPLEER.CMPLTSA is met when ADCMPCEER.CMPAIE = 1.

[Clearing condition]

- Writing 0 after reading 1.

#### CMPSTOCA flag (Compare Window A Internal Reference Voltage Compare Flag)

The CMPSTOCA flag indicates the internal reference voltage comparison result. When the comparison condition set in ADCMPLEER.CMPLOCA is met at the end of A/D conversion, this flag sets to 1. When the ADCMPCEER.CMPAIE bit is 1, a compare interrupt request (ADC12i\_CMPAI (i = 0, 1)) is generated when this flag sets to 1.

Writing 1 to the CMPSTOCA flag is invalid.

[Setting condition]

- The condition set in ADCMPLEER.CMPLOCA is met when ADCMPCEER.CMPAIE = 1.

[Clearing condition]

- Writing 0 after reading 1.

### 37.2.33 ADCMPBNSR : A/D Compare Function Window B Channel Select Register

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0A6

| Bit position:      | 7        | 6 | 5           | 4 | 3 | 2 | 1 | 0 |
|--------------------|----------|---|-------------|---|---|---|---|---|
| Bit field:         | CMP<br>B | — | CMPCHB[5:0] |   |   |   |   |   |
| Value after reset: | 0        | 0 | 0           | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function         | R/W |
|-----|--------|------------------|-----|
| 7:2 | —      | 这些位被读取为0。写入值应为0。 | R/W |

ADCMPSEER寄存器存储比较功能窗口A的比较结果。

#### CMPSTTSA标志 (比较窗口A温度传感器输出比较标志)

CMPSTTSA标志指示温度传感器输出比较结果。当比较条件设置在ADCMPLEER.CMPLTSA在AD转换结束时满足，该标志设置为1。当ADCMPCEER.CMPAIE位为1时，当该标志设置为1时产生比较中断请求(ADC12i\_CMPAI(i=0 1))。

将1写入CMPSTTSA标志无效。

[Setting condition]

- 当ADCMPCEER.CMPAIE=1时，满足ADCMPLEER.CMPLTSA中设置的条件。

[Clearing condition]

- 读1后写0。

#### CMPSTOCA标志 (比较窗口A内部参考电压比较标志)

CMPSTOCA标志指示内部参考电压比较结果。当比较条件设置在ADCMPLEER.CMPLOCA在AD转换结束时满足，该标志设置为1。当ADCMPCEER.CMPAIE位为1时，当该标志设置为1时产生比较中断请求(ADC12i\_CMPAI(i=0 1))。

将1写入CMPSTOCA标志无效。

[Setting condition]

- 当ADCMPCEER.CMPAIE=1时，满足ADCMPLEER.CMPLOCA中设置的条件。

[Clearing condition]

- 读1后写0。

#### CMPCHB[5:0] bits (Compare Window B Channel Select)

The CMPCHB[5:0] bits specify the channels to be compared with the compare Window B conditions from AN000 to AN009, AN012, AN013, AN100 to AN102, AN116 to AN122, the temperature sensor, the internal reference voltage. The compare Window B function is enabled by specifying the hexadecimal number of the A/D conversion channel selected in the ADANSA0, ADANSA1, ADANSB0, ADANSB1 registers.

Set the CMPCHB[5:0] bits while the ADCSR.ADST bit is 0.

#### CMPLB bit (Compare Window B Comparison Condition Setting)

The CMPLB bit specifies the comparison conditions for channels for Window B. When the comparison result of an analog input meets the set condition, the associated ADCMPBSR.CMPSTB flag sets to 1 and a compare interrupt request (ADC12i\_CMPBI (i = 0, 1)) is generated.

#### CMPCHB[5:0]位 (比较窗口B通道选择)

CMPCHB[5:0]位指定要与比较窗口B条件 (从AN000到 AN009、AN012、AN013、AN100到AN102、AN116到AN122、温度传感器、内部参考电压。通过指定在ADANSA0、ADANSA1、ADANSB0、ADANSB1寄存器中选择的AD转换通道的十六进制数来启用比较窗口B功能。

当ADCSR.ADST位为0时，设置CMPCHB[5:0]位。

#### CMPLB位 (比较窗口B比较条件设置)

CMPLB位指定窗口B的通道比较条件。当模拟输入的比较结果满足设置条件时，相关的ADCMPBSR.CMPSTB标志设置为1，并发出比较中断请求(ADC12i\_CMPBI(i=0, 1))生成。

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | CMPSTB | 比较窗口B标志<br>当窗口B操作使能时 (ADCMPCR.CMPBE=1)，该位指示应用窗口B比较条件的通道的比较结果、温度传感器输出、内部参考电压。<br>0: 不满足比较条件。1: 满足比较条件。 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。  | R/W |

CMPSTB标志 (比较窗口B标志)

CMPSTB标志指示应用窗口B比较条件的通道的比较结果、温度传感器输出、内部参考电压。当ADCMPBSR.CMPLB中设置的比较条件满足时

at the end of A/D conversion, this flag sets to 1. When the ADCMPCR.CMPBIE bit is 1, a compare interrupt request (ADC12i\_CMPBI (i = 0, 1)) is generated when this flag sets to 1.

Writing 1 to the CMPSTB flag is invalid.

[Setting condition]

- The condition set in ADCMPBNSR.CMPLB is met when ADCMPCR.CMPBE = 1.

[Clearing condition]

- Writing 0 after reading 1.

### 37.2.35 ADWINMON : A/D Compare Function Window A/B Status Monitor Register

| 3:1 | —       | These bits are read as 0.  | R   |
| 4   | MONCMPA | Comparison Result Monitor A<br>0: Window A comparison conditions are not met.<br>1: Window A comparison conditions are met.  | R   |
| 5   | MONCMPB | Comparison Result Monitor B<br>0: Window B comparison conditions are not met.<br>1: Window B comparison conditions are met.  | R   |
| 7:6 | —       | These bits are read as 0.  | R   |

#### MONCOMB bit (Combination Result Monitor)

The read-only MONCOMB bit indicates the combined result of comparison condition results A and B based on the combination condition set in the ADCMPCR.CMPAB[1:0] bits.

[Setting condition]

- The combined result meets the combination condition set in the ADCMPCR.CMPAB[1:0] bits when ADCMPCR.CMPAE = 1 and ADCMPCR.CMPBE = 1.

[Clearing conditions]

- The combined result does not meet the combination condition set in the ADCMPCR.CMPAB[1:0] bits.
- ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0.

#### MONCMPA bit (Comparison Result Monitor A)

The read-only MONCMPA bit is read as 1 when the A/D-converted value of the Window A target channel meets the condition set in ADCMPLR0/ADCMPLR1 and ADCMPLER. Otherwise, it is read as 0.

[Setting condition]

- The A/D-converted value meets the condition set in the ADCMPLR0/ADCMPLR1 and ADCMPLER registers when ADCMPCR.CMPAE = 1.

[Clearing conditions]

在AD转换结束时，该标志设置为1。当ADCMPCR.CMPBIE位为1时，当该标志设置为1时产生比较中断请求(ADC12i\_CMPBI(i=0 1))。

将1写入CMPSTB标志无效。

[Setting condition]

- 当ADCMPCR.CMPBE=1时，满足ADCMPBNSR.CMPLB中设置的条件。

[Clearing condition]

- 读1后写0。

### 37.2.35 ADWINMON:AD比较功能窗口AB状态监视器寄存器

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x08C

|               |   |   |             |             |   |   |   |             |
|---------------|---|---|-------------|-------------|---|---|---|-------------|
| Bit position: | 7 | 6 | 5           | 4           | 3 | 2 | 1 | 0           |
| Bit field:    | — | — | MONC<br>MPB | MONC<br>MPA | — | — | — | MONC<br>OMB |
| 重置后的值:        | 0 | 0 | 0           | 0           | 0 | 0 | 0 | 0           |

| Bit | Symbol  | Function   | R/W |
|-----|---------|--|-----|
| 0   | MONCOMB | 组合结果监视器<br>该位指示组合结果。该位在WindowA和Window都有效B操作已启用。<br>0: 不满足窗口AB合成条件。1: 满足窗口AB复合条件。 | R   |
| 3:1 | —       | 这些位读为0。  | R   |
| 4   | MONCMPA | 比较结果监视器A<br>0: 不满足窗口A比较条件。1: 满足窗口A比较条件。  | R   |
| 5   | MONCMPB | 比较结果监视器B<br>0: 不满足窗口B比较条件。1: 满足窗口B比较条件。  | R   |
| 7:6 | —       | 这些位读为0。  | R   |

#### MONCOMB位 (组合结果监视器)

只读MONCOMB位指示比较条件结果A和B基于ADCMPCR.CMPAB[1:0]位中设置的组合条件的组合结果。

[Setting condition]

- 当ADCMPCR.CMPAE=1且ADCMPCR.CMPBE=1时，合并结果满足ADCMPCR.CMPAB[1:0]位中设置的合并条件。

[Clearing conditions]

- 合并结果不满足ADCMPCR.CMPAB[1:0]位设置的合并条件。
- ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0.

#### MONCMPA位 (比较结果监视器A)

当窗口A目标通道的AD转换值满足ADCMPLR0ADCMPLR1和ADCMPLER中设置的条件时，只读MONCMPA位被读取为1。否则，读为0。

[Setting condition]

- 当ADCMPCR.CMPAE=1时，AD转换后的值满足ADCMPLR0ADCMPLR1和ADCMPLER寄存器中设置的条件。

[Clearing conditions]

- The A/D-converted value does not meet the condition set in the ADCMPLR0/ADCMPLR1 and ADCMPLE registers when ADCMPCR.CMPAE = 1.
- ADCMPCR.CMPAE = 0 (automatically cleared when the ADCMPCR.CMPAE value changes from 1 to 0).

#### MONCMPB bit (Comparison Result Monitor B)

The read-only MONCMPB bit is read as 1 when the A/D-converted value of the Window B target channel meets the condition set in the ADCMPBNSR.CMPLB bit. Otherwise, it is read as 0.

[Setting condition]

- The A/D-converted value meets the condition set in ADCMPBNSR.CMPLB when ADCMPCR.CMPBE = 1.

[Clearing conditions]

- The A/D-converted value does not meet the condition set in ADCMPBNSR.CMPLB when ADCMPCR.CMPBE = 1.
- ADCMPCR.CMPBE = 0 (automatically cleared when the ADCMPCR.CMPBE value changes from 1 to 0).

#### 37.2.36 ADBUFEN : A/D Data Buffer Enable Register

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0D0

|                    |   |   |   |   |   |   |   |       |
|--------------------|---|---|---|---|---|---|---|-------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0     |
| Bit field:         | — | — | — | — | — | — | — | BUFEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0     |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | BUFEN  | Data Buffer Enable<br>0: The data buffer is not used.<br>1: The data buffer is used. | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.                               | R/W |

The ADBUFEN register sets whether to enable the data buffer.

#### BUFEN bit (Data Buffer Enable)

This bit enables the use of the data buffer.

When BUFEN = 1b, A/D conversion result (addition result) other than self-diagnosis result is stored in ADBUFn.

Disable the data storage operation (BUFEN = 0b) before reading ADBUFPTR.

Do not use the data buffer for data duplexing, or group scan.

#### 37.2.37 ADBUFPTR : A/D Data Buffer Pointer Register

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0D2

|                    |   |   |   |         |             |   |   |   |
|--------------------|---|---|---|---------|-------------|---|---|---|
| Bit position:      | 7 | 6 | 5 | 4       | 3           | 2 | 1 | 0 |
| Bit field:         | — | — | — | PTRO VF | BUFPTR[3:0] |   |   |   |
| Value after reset: | 0 | 0 | 0 | 0       | 0           | 0 | 0 | 0 |

| Bit | Symbol      | Function  | R/W |
|-----|-------------|---|-----|
| 3:0 | BUFPTR[3:0] | Data Buffer Pointer<br>These bits indicate the number of data buffer to which the next A/D converted data is transferred. | R/W |

- ADCMPCR.CMPAE=1时，AD转换后的值不满足ADCMPLR0ADCMPLR1和ADCMPLE寄存器中设置的条件。
- ADCMPCR.CMPAE=0（ADCMPCR.CMPAE值从1变为0时自动清零）。

#### MONCMPB位（比较结果监视器B）

当窗口B目标通道的AD转换值满足ADCMPBNSR.CMPLB位中设置的条件时，只读MONCMPB位被读取为1。否则，读为0。

[Setting condition]

- 当ADCMPCR.CMPBE=1时，AD转换后的值满足ADCMPBNSR.CMPLB中设置的条件。

[Clearing conditions]

- ADCMPCR.CMPBE=1时，AD转换后的值不满足ADCMPBNSR.CMPLB中设置的条件。
- ADCMPCR.CMPBE=0（ADCMPCR.CMPBE值从1变为0时自动清零）。

#### 37.2.36 ADBUFEN:AD数据缓冲器使能寄存器

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0D0

|               |   |   |   |   |   |   |   |       |
|---------------|---|---|---|---|---|---|---|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0     |
| Bit field:    | — | — | — | — | — | — | — | BUFEN |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0     |

| Bit | Symbol | Function                           | R/W |
|-----|--------|------------------------------------|-----|
| 0   | BUFEN  | 数据缓冲区启用<br>0: 不使用数据缓冲区。1: 使用数据缓冲区。 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。                   | R/W |

ADBUFEN寄存器设置是否启用数据缓冲区。

#### BUFEN位（数据缓冲器使能）

该位使能数据缓冲区的使用。

BUFEN=1b时，ADBUFn中存储自诊断结果以外的AD转换结果（加法结果）。

在读取ADBUFPTR之前禁用数据存储操作(BUFEN=0b)。

不要将数据缓冲区用于数据双工或组扫描。

#### 37.2.37 ADBUFPTR:AD数据缓冲区指针寄存器

Base address: ADC12m = 0x4017\_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0D2

|               |   |   |   |         |             |   |   |   |
|---------------|---|---|---|---------|-------------|---|---|---|
| Bit position: | 7 | 6 | 5 | 4       | 3           | 2 | 1 | 0 |
| Bit field:    | — | — | — | PTRO VF | BUFPTR[3:0] |   |   |   |
| 重置后的值:        | 0 | 0 | 0 | 0       | 0           | 0 | 0 | 0 |

| Bit | Symbol      | Function                               | R/W |
|-----|-------------|--|-----|
| 3:0 | BUFPTR[3:0] | 数据缓冲区指针<br>这些位指示下一个AD转换数据传输到的数据缓冲区的编号。 | R/W |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 4   | PTROVF | Pointer Overflow Flag<br>0: The data buffer pointer has not overflowed.<br>1: The data buffer pointer has overflowed. | R/W |
| 7:5 | —      | These bits are read as 0. The write value should be 0.  | R/W |

ADBUFPtr is a register that indicates the data buffer pointer and overflow status.

#### BUFPtr[3:0] bit (Data Buffer Pointer)

These bits indicate the number of data buffer to which the next A/D converted data is transferred.

When data has been transferred to data buffer 15, the pointer value becomes 0000b and the PTROVF bit is set to 1.

When the next data has been transferred, the data in data buffer 0 is overwritten.

Writing 00h to this register clears the value of these bits. Writing a value other than 00h is disabled.

#### PTROVF bit (Pointer Overflow Flag)

This bit indicates whether the data buffer pointer has overflowed. This bit is set to 1 when the pointer value becomes 0000b (overflow).

Writing 00h to this register clears this bit value. Writing a value other than 00h is disabled.

### 37.2.38 ADBUFn : A/D Data Buffer Registers n (n = 0 to 15)

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  (m = 0, 1)

Offset address:  $0x0B0 + 0x2 \times n$  (n = 0 to 15)

| Bit position:      | 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit field:         | ADBUFn |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | 0      | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 15:0 | ADBUFn | Converted Value 15 to 0<br>Functions vary depending on the selected mode and accuracy. See <a href="#">Table 37.22</a> and <a href="#">Table 37.23</a> . | R   |

ADBUFn registers are 16-bit read-only registers that sequentially store all A/D conversion results. The automatic clear function is not applied to these registers.

ADBUFn settings are the same as the A/D data register format settings. about details see section 1.2.1 ADDRn : A/D Data Registers n.

The following conditions determine the formats for data in the ADBUFn registers:

- Setting of the Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

#### (1) When A/D-converted value addition/average mode is not selected

[Table 37.22](#) shows the bit assignment for each accuracy.

**Table 37.22 Bit assignment for each accuracy (1 of 2)**

| Accuracy                                  | b15                       | b14 | b13 | b12 | b11  | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---|---------------------------|-----|-----|-----|--|-----|----|----|----|----|----|----|----|----|----|----|
| Right-justified data with 12-bit accuracy | These bits are read as 0. |     |     |     | Converted Value 11 to 0:<br>12-bit A/D-converted value |     |    |    |    |    |    |    |    |    |    |    |

| Bit | Symbol | Function                               | R/W |
|-----|--------|--|-----|
| 4   | PTROVF | 指针溢出标志<br>0: 数据缓冲区指针没有溢出。1: 数据缓冲区指针溢出。 | R/W |
| 7:5 | —      | 这些位被读取为0。写入值应为0。                       | R/W |

ADBUFPtr是指示数据缓冲区指针和溢出状态的寄存器。

#### BUFPtr[3:0]位 (数据缓冲区指针)

这些位指示下一个AD转换数据传输到的数据缓冲区的编号。

当数据已传输到数据缓冲区15时，指针值变为0000b并且PTROVF位设置为1。

当下一个数据传输完毕后，数据缓冲区0中的数据将被覆盖。

向该寄存器写入00h会清除这些位的值。禁止写入00h以外的值。

#### PTROVF位 (指针溢出标志)

该位指示数据缓冲区指针是否溢出。当指针值变为0000b (溢出) 时，该位设置为1。

向该寄存器写入00h会清除该位值。禁止写入00h以外的值。

### 37.2.38 ADBUFn:AD数据缓冲寄存器n(n=0到15)

Base address:  $ADC12m = 0x4017\_0000 + 0x0200 \times m$  (m = 0, 1)

Offset address:  $0x0B0 + 0x2 \times n$  (n = 0 to 15)

| Bit position: | 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit field:    | ADBUFn |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| 重置后的值:        | 0      | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol | Function                                   | R/W |
|------|--------|--|-----|
| 15:0 | ADBUFn | 将值15转换为0<br>功能因所选模式和精度而异。请参见表37.22和表37.23。 | R   |

ADBUFn寄存器是16位只读寄存器，顺序存储所有AD转换结果。自动清除功能不适用于这些寄存器。

ADBUFn设置与AD数据寄存器格式设置相同。有关详细信息，请参阅第1.2.1节ADDRn:ADData Registers n。

以下条件决定了ADBUFn寄存器中数据的格式：

- 寄存器格式选择位(ADCER.ADRFMT)的设置 (左对齐或右对齐)
- 加法平均计数选择位(ADADC.ADC[2:0])的设置 (1、2、3、4或16次)
- 设置平均模式启用位(ADADC.AVEE) (加法或平均)。

本节介绍不同模式下这些条件的数据格式。

#### (1) 未选择AD转换值加法平均模式时

表37.22显示了每个精度的位分配。

**Table 37.22 每个精度的位分配 (1of2)**

| Accuracy      | b15     | b14 | b13 | b12 | b11               | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |

| Left-justified data with 12-bit accuracy | Converted Value 11 to 0:<br>12-bit A/D-converted value |     |     |     |     |     |    |    |    |    |    |    | These bits are read as 0. |    |    |    |

## (2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, This register indicates These registers indicate the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

## (3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, this register indicates these registers indicate the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 37.23 shows the bit assignment for each accuracy.

Table 37.23 Bit assignment for each accuracy when A/D-converted value addition mode is selected

|   | When 1, 2, 3, or 4 conversion times is specified | These bits are read as 0.                                    |     | Added Value 13 to 0:<br>14-bit sum of A/D conversion results |     |     |    |    |    |    |    |    |    |    |                           |    |
| Left-justified data with 12-bit accuracy  | When 1, 2, 3, or 4 conversion times is specified | Added Value 15 to 0:<br>16-bit sum of A/D conversion results |     |  |     |     |    |    |    |    |    |    |    |    |                           |    |
|   | When 16 conversion times is specified            | Added Value 13 to 0:<br>14-bit sum of A/D conversion results |     |  |     |     |    |    |    |    |    |    |    |    | These bits are read as 0. |    |

## 37.3 Operation

## 37.3.1 Scanning Operation

In scanning, A/D conversion is performed sequentially on the analog inputs of the specified channels.

Scan conversion is performed in any of the three operating modes:

- Single scan mode
- Continuous scan mode
- Group scan mode

In single scan mode, one or more specified channels are scanned once. In continuous scan mode, one or more specified channels are scanned repeatedly until software sets the ADCSR.ADST bit to 0. In group scan mode, the selected channels in group A, B are scanned once after scan starts in response to the respective synchronous trigger.

In single scan mode and continuous scan mode, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n. In group scan mode, A/D conversion is performed for the ANn channels in group A selected in the ADANSA0 and ADANSA1 registers, and for the

Table 37.22 每种精度的位分配 (2个中的2个)

| Accuracy      | b15               | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3      | b2 | b1 | b0 |
|---------------|-------------------|-----|-----|-----|-----|-----|----|----|----|----|----|----|---------|----|----|----|
| 具有12位精度的左对齐数据 | 转换值11到0: 12位AD转换值 |     |     |     |     |     |    |    |    |    |    |    | 这些位读为0。 |    |    |    |

## (2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时, 可以选择D转换值平均模式。WhenADconvertedvalueaveragemodeisselected Thisregisterindicates These registers indicate the mean of AD-converted values on a specific channel. 该值根据AD的设置存储在AD数据寄存器中

数据寄存器格式选择位的方式与正常AD转换相同。

## (3) 选择AD转换值相加模式时

对于12位、10位、8位精度, 可以在AD转换值相加模式中选择1、2、3或4次。AD转换结果作为指定转换精度的2位扩展值存储在AD数据寄存器中。

对于12位精度, 在AD转换值相加模式中也可以选择16倍。在AD转换值相加模式下, 该寄存器表示这些寄存器表示通过在特定通道上添加AD转换值获得的值。AD转换结果作为指定转换精度的4位扩展值存储在AD数据寄存器中。

WhenAD-convertedvalueadditionmodeisselected thevalueisstoredintheADdataregisterbasedonthesettings of theADDataRegisterFormatSelectbits.

表37.23显示了每个精度的位分配。

Table 37.23 选择AD转换值相加模式时的每个精度的位分配

| Accuracy      | b15            | b14                  | b13 | b12                  | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1      | b0 |

|               | 指定16个转换时间时     | 附加值13到0: AD转换结果的14位和 |     |                      |     |     |    |    |    |    |    |    |    |    | 这些位读为0。 |    |

## 37.3 Operation

## 37.3.1 扫描操作

扫描时, 对指定通道的模拟输入依次进行AD转换。

扫描转换在以下三种操作模式中的任何一种中执行:

- 单次扫描模式
- 连续扫描模式
- 组扫描模式

在单次扫描模式下, 一个或多个指定通道被扫描一次。在连续扫描模式下, 重复扫描一个或多个指定通道, 直到软件将ADCSR.ADST位设置为0。在组扫描模式下, 在扫描开始后对A、B组中选定的通道进行一次扫描, 以响应相应的同步触发。

在单次扫描模式和连续扫描模式下, 对选择的ANn通道进行AD转换 ADANSA0和ADANSA1寄存器, 从编号n最小的通道开始。在组扫描模式下, 对在ADANSA0和ADANSA1寄存器中选择的A组中的ANn通道执行AD转换, 并为

ANn channels in group B selected in the ADANSB0 and ADANSB1 registers, starting from the channel with the smallest number n.

When self-diagnosis is selected, it is executed once at the beginning of each scan and one of the three reference voltages is converted.

The temperature sensor output and internal reference voltage can be selected at the same time as the analog input of the channels, and A/D conversion is performed on the analog input of channels, temperature sensor output, and internal reference voltage, in that order.

Double trigger mode can be used with single scan mode or group scan mode. With double trigger mode enabled (ADCSR.DBLE = 1), A/D conversion data of a channel selected in the ADCSR.DBLANS[4:0] bits is duplicated only if the conversion is started by the synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits. In group scan mode, only group A can use double trigger mode.

In the extended operation of double trigger mode, the A/D conversion operation is generated from the synchronous trigger combination selected in the ADSTRGR.TRSA[5:0] bits. In addition to normal double trigger mode operation, A/D conversion data with odd number trigger (ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1)) is stored in A/D Data Duplexing Register A (ADDBLDRA), and A/D conversion data with even number trigger (ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1)) is stored in A/D Data Duplexing Register B (ADDBLDRB). In the extended operation of double trigger mode, when one of the trigger combinations occurs at the same time, the data duplexing register settings for the specified triggers do not work, and A/D conversion data is stored in A/D Data Duplexing Register B (ADDBLDRB).

The ADC12 ignores a synchronous trigger that occurs during the A/D conversion started by another synchronous trigger.

### 37.3.2 Single Scan Mode

#### 37.3.2.1 Basic Operation

In basic operation of single scan mode, A/D conversion is performed once on the analog input of the specified channels as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (ELC), or an asynchronous trigger input, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register (ADDRy).
3. When A/D conversion of all the selected channels completes, an ADC12i\_ADI (i = 0, 1) interrupt request is generated.
4. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically set to 0 when A/D conversion of all the selected channels completes. The ADC12 then enters a wait state.

在ADANSB0和ADANSB1寄存器中选择的B组中的ANn通道，从具有最小编号n的通道开始。

选择自诊断时，在每次扫描开始时执行一次，并转换三个参考电压之一。

温度传感器输出和内部参考电压可以与通道的模拟输入同时选择，通道的模拟输入、温度传感器输出和内部参考电压依次进行AD转换。

双触发模式可与单扫描模式或组扫描模式一起使用。启用双触发模式(ADCSR.DBLE=1)时，仅当转换由ADSTRGR中选择的同步触发(ELC)启动时，ADCSR.DBLANS[4:0]位中选择的通道的AD转换数据才会被复制。TRSA[5:0]位。在组扫描模式下，只有A组可以使用双触发模式。

在双触发模式的扩展操作中，ADSTRGR.TRSA[5:0]位中选择的同步触发组合产生AD转换操作。除了正常的双触发模式操作外，奇数触发的AD转换数据(ELC\_AD00(单元0)和ELC\_AD10(单元1))存储在AD数据双工寄存器A(ADDBLDRA)中，偶数触发的AD转换数据(ELC\_AD01(单元0)和ELC\_AD11(单元1))存储在AD数据双工寄存器B(ADDBLDRB)中。在双触发模式的扩展操作中，当其中一种触发组合同时发生时，指定触发的数据双工寄存器设置不起作用，AD转换数据存储在AD数据双工寄存器B(ADDBLDRB)中。

ADC12忽略由另一个同步触发的AD转换期间发生的同步触发。

### 37.3.2 单次扫描模式

#### 37.3.2.1 基本操作

在单扫描模式的基本操作中，对指定通道的模拟输入进行一次AD转换，如下所示：

- 1.当通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1(AD转换开始)时，对在ADANSA0和ADANSA1中选择的ANn通道执行AD转换寄存器，从具有最小编号n的通道开始。
- 2.每次完成单个通道的AD转换，AD转换结果存储在相关的AD数据寄存器(ADDRy)中。
- 3.当所有选定通道的AD转换完成时，会产生一个ADC12i\_ADI(i=0,1)中断请求。
- 4.ADST位在AD转换期间保持1(AD转换开始)，当所有选定通道的AD转换完成时自动设置为0。ADC12然后进入等待状态。

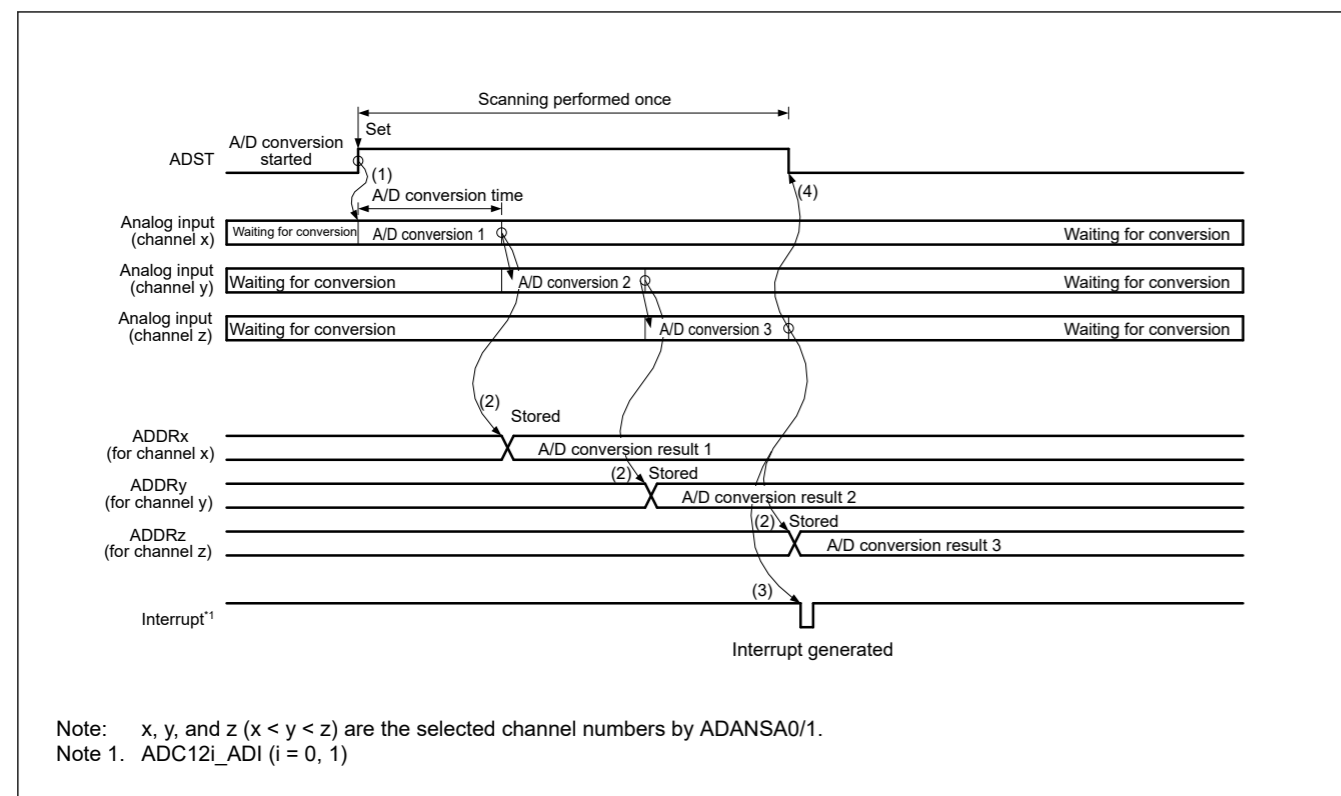

Figure 37.8 Example basic operation in single scan mode when the analog inputs (channel x to z) are selected

### 37.3.2.2 Channel Selection and Self-Diagnosis

When channels and self-diagnosis are selected, A/D conversion is first performed for the reference voltage VREFH0, VREFH ( $x0 \times 1/2$ , or  $x1$ ), then A/D conversion is performed once on the analog input of the selected channels as follows:

1. A/D conversion for self-diagnosis is first started when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (ELC), or an asynchronous trigger input.
2. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADDRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i\_ADI ( $i = 0, 1$ ) interrupt request is generated.
5. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion and is automatically set to 0 when A/D conversion of all the selected channels completes. The ADC12 then enters a wait state.

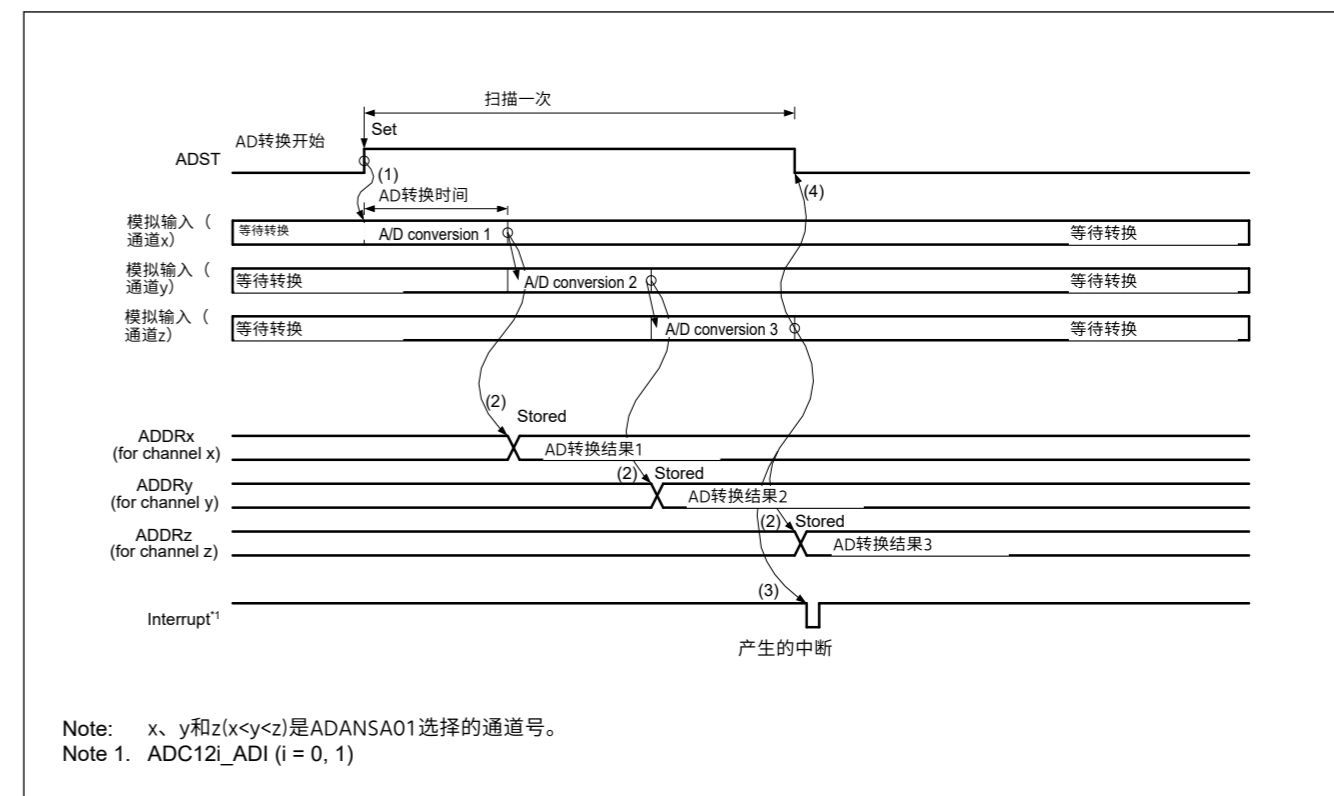

Figure 37.8 选择模拟输入（通道x至z）时单次扫描模式下的基本操作示例

### 37.3.2.2 频道选择和自诊断

选择通道和自诊断时，首先对参考电压VREFH0进行AD转换，VREFH ( $x0 \times 1/2$ 或 $x1$ )，然后在所选通道的模拟输入上执行一次AD转换，如下所示：

- 1.通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，首先启动用于自诊断的D转换。
- 2.当用于自诊断的AD转换完成时，AD转换结果存储在AD自诊断数据寄存器(ADDRD)中。然后对在ADANSA0和ADANSA1寄存器中选择的ANn通道执行D转换，从编号最小的通道开始。
- 3.每次完成单个通道的AD转换，AD转换结果存储在相关的AD数据寄存器（ADDRy）中。
- 4.当所有选定通道的AD转换完成时，会产生一个ADC12i\_ADI( $i=0, 1$ )中断请求。
- 5.ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动设置为0。ADC12然后进入等待状态。

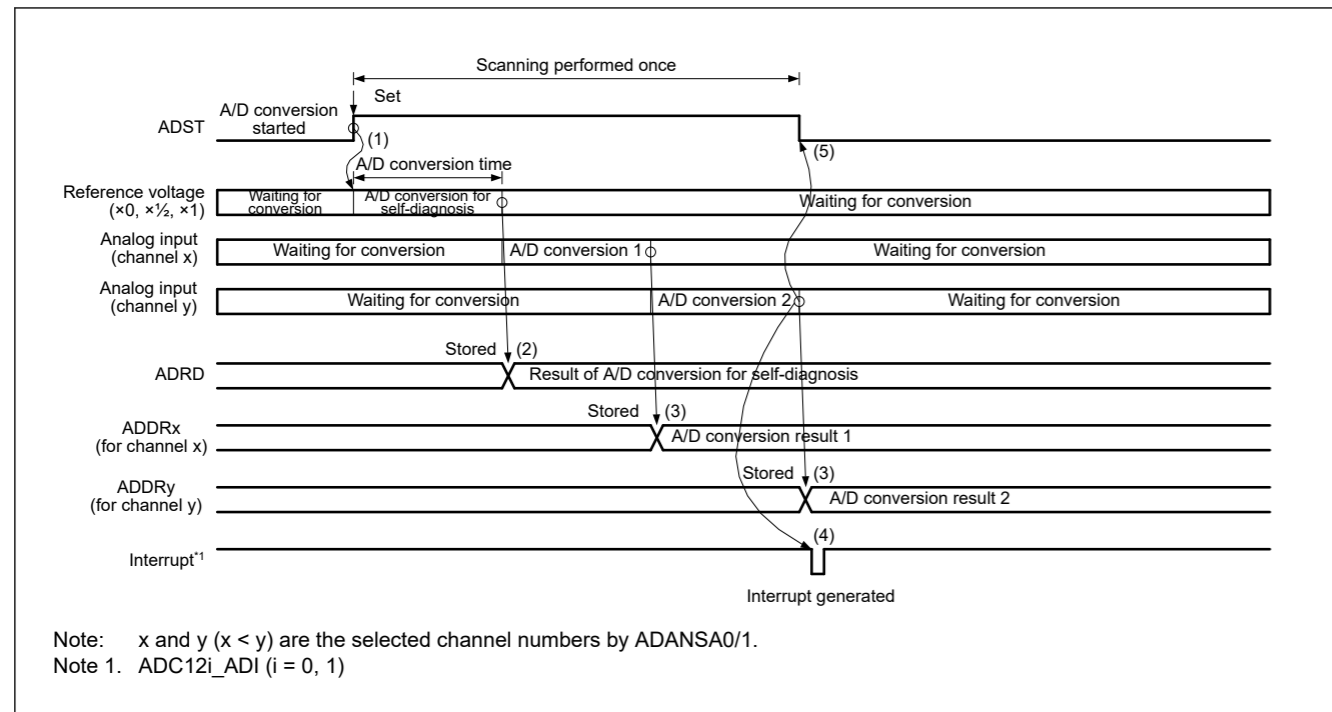

Figure 37.9 Example basic operation in single scan mode when the analog inputs (channel x and y) are selected with self-diagnosis

### 37.3.2.3 A/D conversion of temperature sensor output or internal reference voltage

When the channels and temperature sensor output or internal reference voltage are selected at the same time, A/D conversion is performed first on the analog input of the selected channels, and once on the temperature sensor output or internal reference voltage. When both temperature sensor output and internal reference voltage are selected, A/D conversion of the temperature sensor output and internal reference voltage is performed, in that order. With the channels deselected, selecting only the temperature sensor output or internal reference voltage is also possible.

The operation is as follows:

1. When a software trigger, synchronous trigger (ELC), or asynchronous trigger sets the ADCSR.ADST bit to 1 (A/D conversion start), A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. On completion of A/D conversion on the channels, the result is stored in the associated A/D Data Register y (ADDRy), and then A/D conversion of the temperature sensor output starts.
3. On completion of A/D conversion of the temperature sensor output, the result is stored in the associated A/D Temperature Sensor Data Register (ADTSDR), and then A/D conversion of the internal reference voltage starts.
4. On completion of A/D conversion of the internal reference voltage, the result is stored in the associated A/D Internal Reference Voltage Data Register (ADOCDR), and an ADC12i\_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 on completion of A/D conversion. Then, the ADC12 enters a wait state.

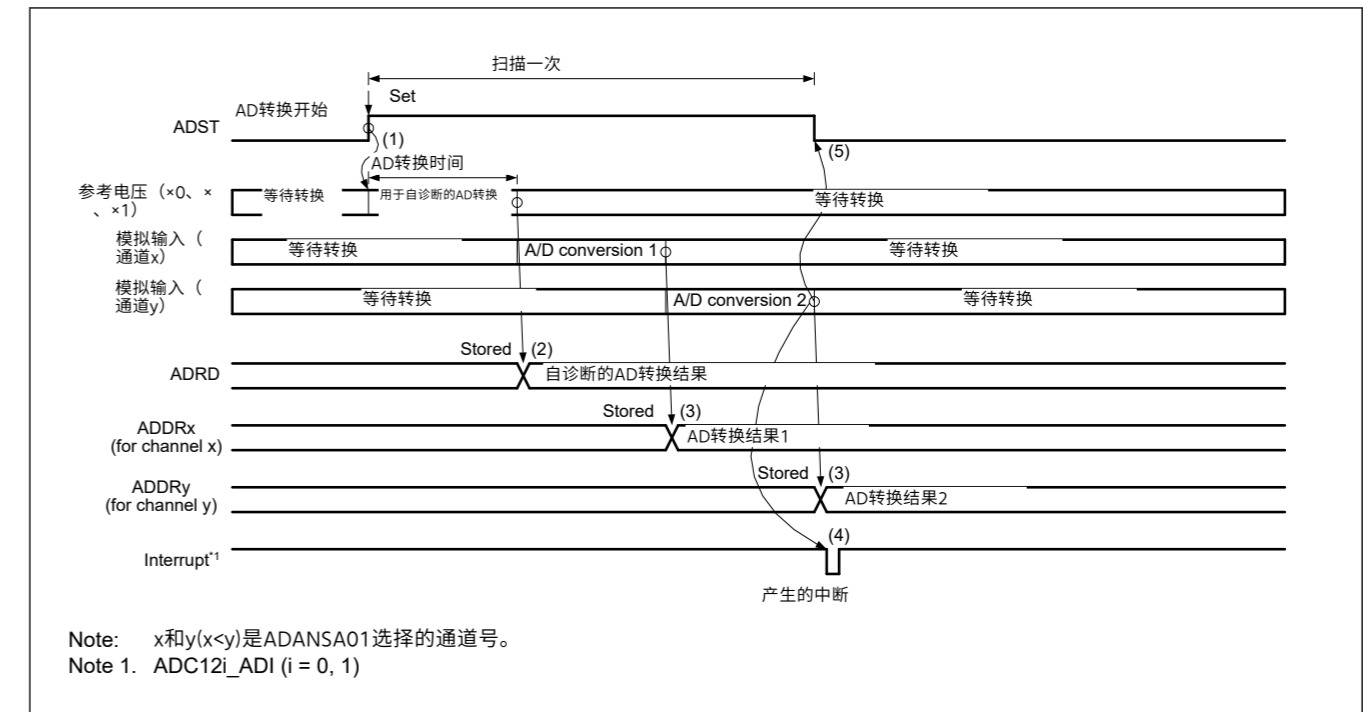

Figure 37.9 使用自诊断选择模拟输入（通道x和y）时单次扫描模式下的基本操作示例

### 37.3.2.3 温度传感器输出或内部参考电压的AD转换

当同时选择通道和温度传感器输出或内部参考电压时，首先对所选通道的模拟输入进行AD转换，再对温度传感器输出或内部参考电压进行一次AD转换。当同时选择温度传感器输出和内部参考电压时，按顺序执行温度传感器输出和内部参考电压的AD转换。取消选择通道后，也可以仅选择温度传感器输出或内部参考电压。

操作如下：

- 1.当软件触发、同步触发(ELC)或异步触发将ADCSR.ADST位设置为1（AD转换开始）时，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从通道开始用最小的数n。
- 2.在通道上完成AD转换后，结果存储在相关的AD数据寄存器y(ADDRy)中，然后温度传感器输出的AD转换开始。
- 3.温度传感器输出的AD转换完成后，结果存储在相关的AD中温度传感器数据寄存器(ADTSDR)，然后内部参考电压的AD转换开始。
- 4.内部参考电压的AD转换完成后，结果存储在相关的ADInternal参考电压数据寄存器(AOCDR)，并产生一个ADC12i\_ADI(i=0 1)中断请求（无寄存器设置）。
- 5.ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动清零。然后，ADC12进入等待状态。

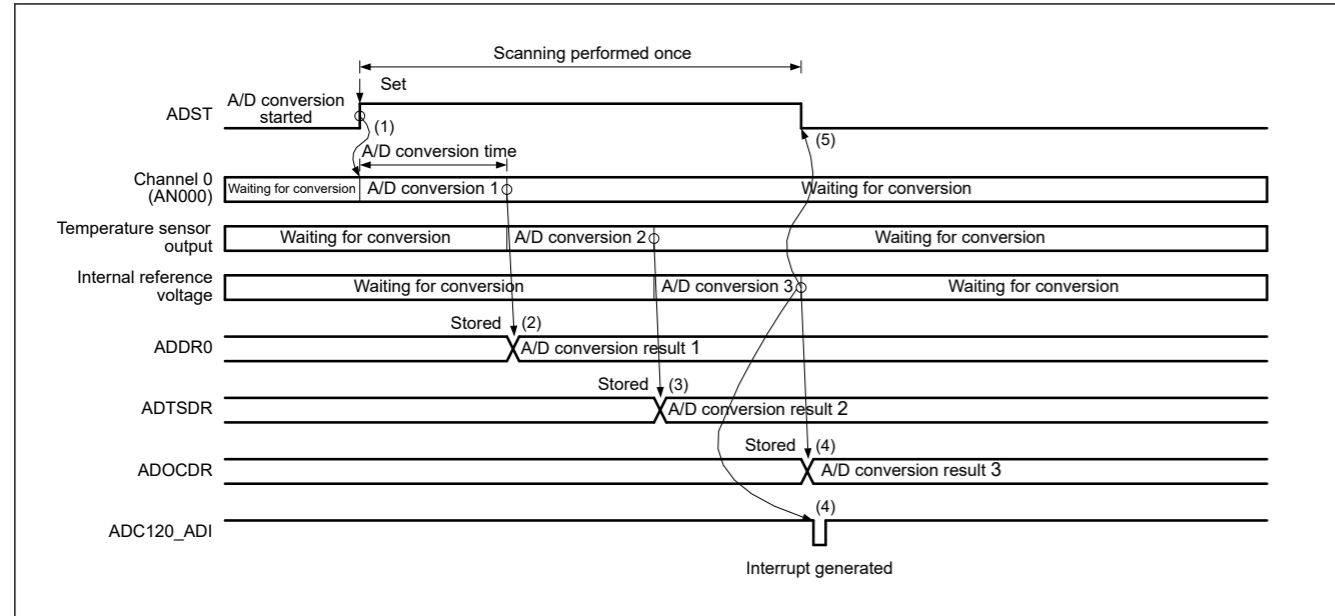

Figure 37.10 Example basic operation in single scan mode when AN000 and temperature sensor output or internal reference voltage are selected

#### 37.3.2.4 A/D conversion in double-trigger mode

When double trigger mode is selected in single scan mode, two rounds of single scan operation started by a synchronous trigger (ELC) are performed in sequence.

Deselect self-diagnosis and set the temperature sensor output A/D conversion select bit (ADEXICR.TSSA and ADEXICR.TSSB) and the internal reference voltage A/D conversion select bit (ADEXICR.OCSA and ADEXICR.OCSB) to 0.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated in the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE bit to 1. When the ADCSR.DBLE bit is set to 1, channel selection using the ADANSA0 and ADANSA1 registers is invalid.

In double trigger mode, select a synchronous trigger (ELC) with the ADSTRGR.TRSA[5:0] bits. Additionally, set the ADCSR.EXTRG bit to 0 and the ADCSR.TRGE bit to 1. Do not use a software trigger.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a synchronous trigger input (ELC), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
3. The ADCSR.ADST bit is automatically set to 0 and the ADC12 enters a wait state. An ADC12i\_ADI (i = 0, 1) interrupt request is not generated.
4. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by the second trigger input, A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
5. When A/D conversion completes, the result is stored in the A/D Data Duplexing Register (ADDBLDR), which is exclusively used in double-trigger mode.
6. An ADC12i\_ADI (i = 0, 1) interrupt request is generated if the setting of the ADCSR.ADIE bit
7. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically set to 0 when A/D conversion completes. Then the ADC12 enters a wait state.

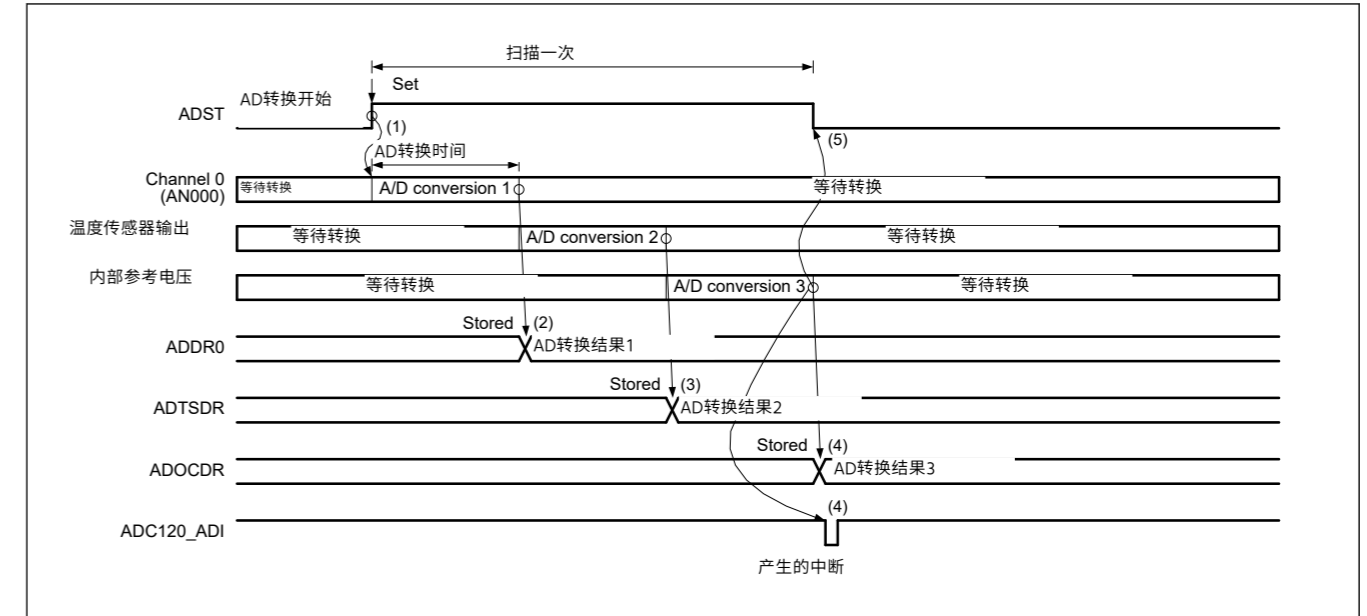

Figure 37.10 选择AN000和温度传感器输出或内部参考电压时单次扫描模式下的基本操作示例

#### 37.3.2.4 双触发模式下的AD转换

在单扫描模式下选择双触发模式时，由同步触发(ELC)启动的两轮单扫描操作将依次执行。

取消选择自诊断并设置温度传感器输出AD转换选择位(ADEXICR.TSSA和ADEXICR.TSSB)和内部参考电压AD转换选择位(ADEXICR.OCSA和ADEXICR.OCSB)为0。

AD转换数据的复制通过在ADCSR.DBLANS[4:0]位并将ADCSR.DBLE位设置为1。当ADCSR.DBLE位设置为1时，使用ADANSA0和ADANSA1寄存器的通道选择无效。

在双触发模式下，使用ADSTRGR.TRSA[5:0]位选择同步触发(ELC)。此外，设置ADCSR.EXTRG位为0，ADCSR.TRGE位为1。不要使用软件触发。

操作如下：

- 1.当同步触发输入(ELC)将ADCSR.ADST位设置为1（AD转换开始）时，ADCSR.DBLANS[4:0]位中选择的单通道开始AD转换。
- 2.每次完成单个通道的AD转换，AD转换结果存储在相关的AD数据寄存器y(ADDRy)中。
- 3.ADCSR.ADST位自动设置为0，ADC12进入等待状态。不会产生ADC12i\_ADI(i=0 1)中断请求。
- 4.当第二个触发输入将ADCSR.ADST位设置为1（AD转换开始）时，AD转换在ADCSR.DBLANS[4:0]位中选择的单通道上开始。
- 5.当AD转换完成时，结果存储在AD数据双工寄存器(ADDBLDR)中，该寄存器专用于双触发模式。
- 6.如果设置ADCSR.ADIE位，则会产生ADC12i\_ADI(i=0 1)中断请求
- 7.ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动设置为0。然后ADC12进入等待状态。

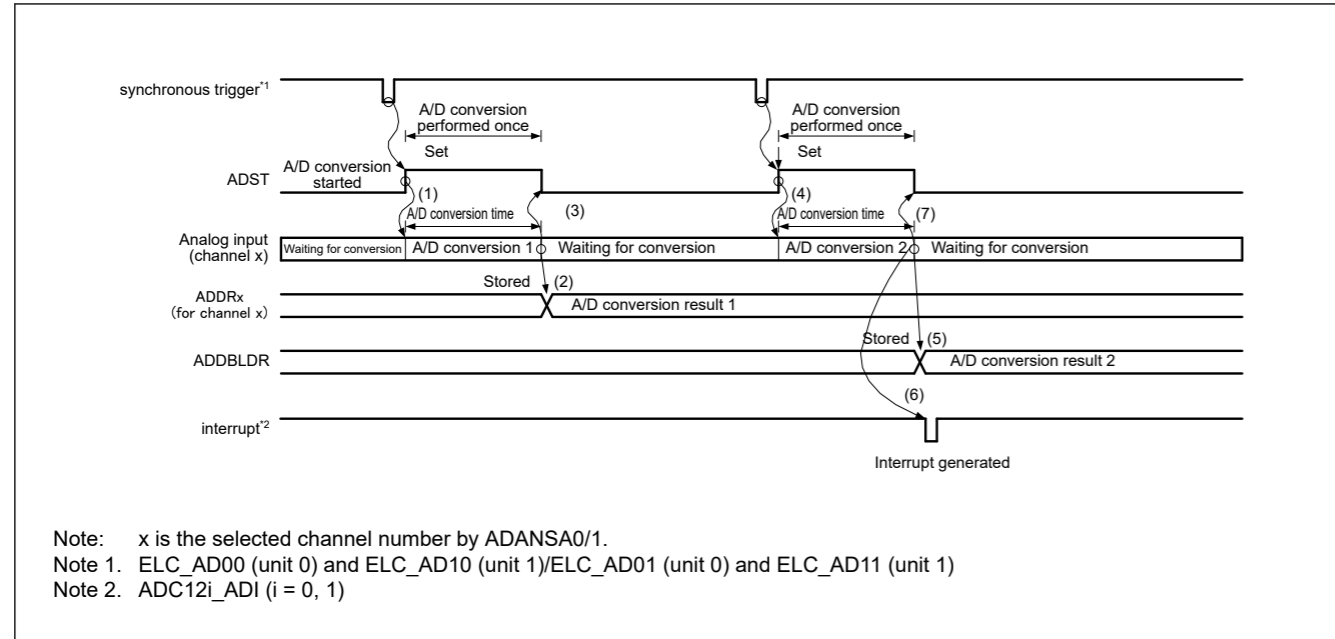

Figure 37.11 Example operation in single scan mode when double-trigger mode is selected and the analog input (channel x) is duplicated

### 37.3.2.5 Extended operations when double-trigger mode is selected

When double trigger mode is selected in single scan mode, and a synchronous trigger (ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1)/ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1)) is selected as the trigger for the start of A/D conversion, two rounds of single scan operation are performed.

Deselect self-diagnosis and set the temperature sensor output A/D conversion select bit (ADEXICR.TSSA and ADEXICR.TSSB), and the internal reference voltage A/D conversion select bit (ADEXICR.OCSA and ADEXICR.OCSB) to 0.

Duplication of A/D conversion data is enabled by setting the channel number to be duplicated to the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE bit to 1. When the ADCSR.DBLE bit is set to 1, channel selection using the ADANSA0 and ADANSA1 registers is invalid.

In extended double trigger mode, select a synchronous trigger combination ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1)/ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1) by setting the ADSTRGR.TRSA[5:0] bits to 0x0B, set the ADCSR.EXTRG bit to 0, and set the ADCSR.TRGE bit to 1. Do not use a software trigger.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a synchronous trigger input (ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1)/ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1)), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. When A/D conversion completes, the A/D conversion result is stored in the associated A/D Data Register (ADDRy) and in A/D Data Duplexing Register A (ADDBLDR A) or A/D Data Duplexing Register B (ADDBLDR B) when the ELC\_ADi0 or ELC\_ADi1 trigger is input respectively (i = 1).
3. The ADCSR.ADST bit is automatically set to 0 and the ADC12 enters a wait state. An ADC12i\_ADI (i = 0, 1) interrupt request is not generated.
4. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by the second trigger (ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1)/ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1)), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
5. When A/D conversion completes, the A/D conversion result is stored in the A/D Data Duplexing Register (ADDBLDR) and in A/D Data Duplexing Register A (ADDBLDR A) or A/D Data Duplexing Register B (ADDBLDR B) when the ELC\_ADi0 or ELC\_ADi1 trigger is input respectively (i = 1).
6. An ADC12i\_ADI (i = 0, 1) interrupt request is generated.

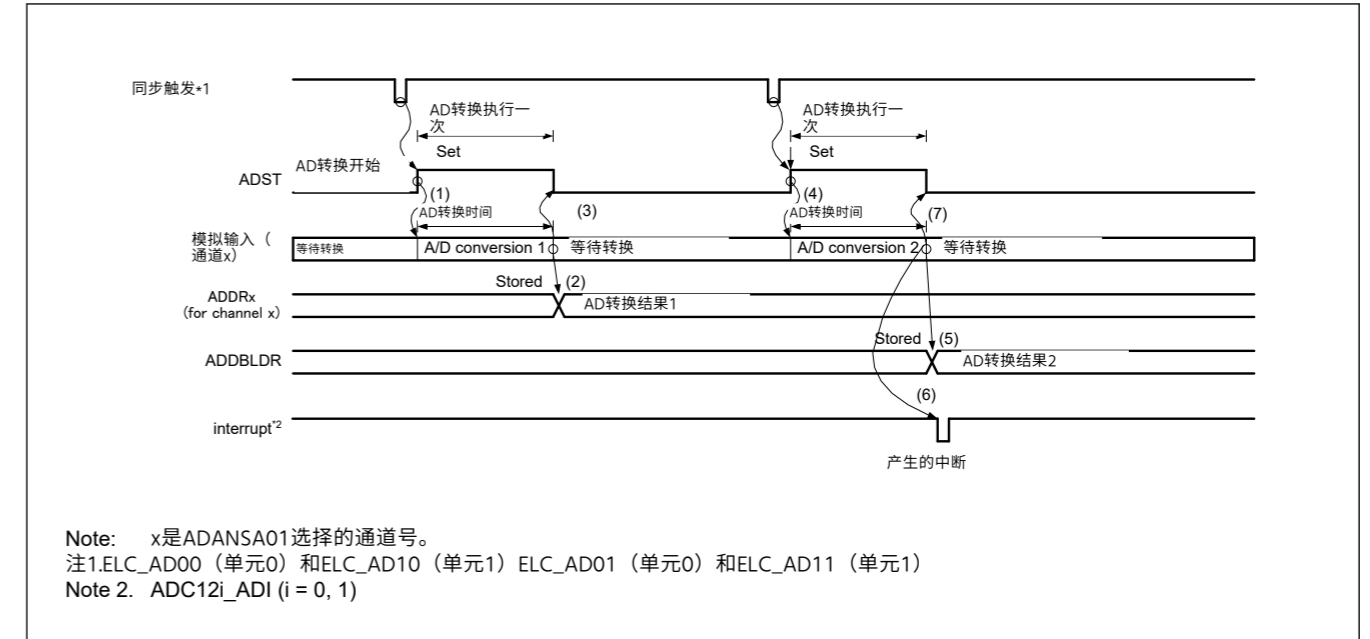

Figure 37.11 选择双触发模式并复制模拟输入 (通道x) 时的单扫描模式操作示例

### 37.3.2.5 选择双触发模式时的扩展操作

在单扫描模式下选择双触发模式时，选择同步触发 (ELC\_AD00 (单元0) 和ELC\_AD10 (单元1) ELC\_AD01 (单元0) 和ELC\_AD11 (单元1)) 作为AD转换开始的触发，执行两轮单扫描操作。

取消选择自诊断并设置温度传感器输出AD转换选择位(ADEXICR.TSSA和ADEXICR.TSSB)，内部参考电压AD转换选择位 (ADEXICR.OCSA和ADEXICR.OCSB) 为0。

通过将要复制的通道号设置为ADCSR.DBLANS[4:0]位并将ADCSR.DBLE位设置为1，启用AD转换数据的复制。当ADCSR.DBLE位设置为1时，通道选择使用ADANSA0和ADANSA1寄存器无效。

在扩展双触发模式下，通过将ADSTRGR.TRSA[5:0]位设置为0x0B，选择同步触发组合ELC\_AD00 (单元0) 和ELC\_AD10 (单元1) ELC\_AD01 (单元0) 和ELC\_AD11 (单元1)，设置ADCSR.EXTRG位为0，ADCSR.TRGE位为1。不要使用软件触发。

操作如下：

- 1.当同步触发输入 (ELC\_AD00 (单元0) 和ELC\_AD10 (单元1) ELC\_AD01 (单元0) 和ELC\_AD11 (单元1)) 将ADCSR.ADST位设置为1 (AD转换开始) 时，AD转换开始在ADCSR.DBLANS[4:0]位中选择的单个通道上。
- 2.当AD转换完成时，当ELC\_ADi0或ELC\_ADi1触发输入时，AD转换结果分别存储在相关的AD数据寄存器(ADDRy)和AD数据双工寄存器A(ADDBLDR A)或AD数据双工寄存器B(ADDBLDR B)中(i=1)。
- 3.ADCSR.ADST位自动设置为0，ADC12进入等待状态。不会产生ADC12i\_ADI(i=0 1)中断请求。
- 4.当ADCSR.ADST位被第二次触发(ELC\_AD00(unit0)和ELC\_AD10 (单元1) ELC\_AD01 (单元0) 和ELC\_AD11 (单元1))，AD转换在ADCSR.DBLANS[4:0]位中选择的单个通道上开始。
- 5.当AD转换完成时，当ELC\_ADi0或ELC\_ADi1触发输入时，AD转换结果分别存储在AD数据双工寄存器(ADDBLDR)和AD数据双工寄存器A(ADDBLDR A)或AD数据双工寄存器B(ADDBLDR B)中(i=1)。
- 6.产生一个ADC12i\_ADI(i=0 1)中断请求。

7. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion and is automatically set to 0 when A/D conversion completes. The ADC12 then enters a wait state.

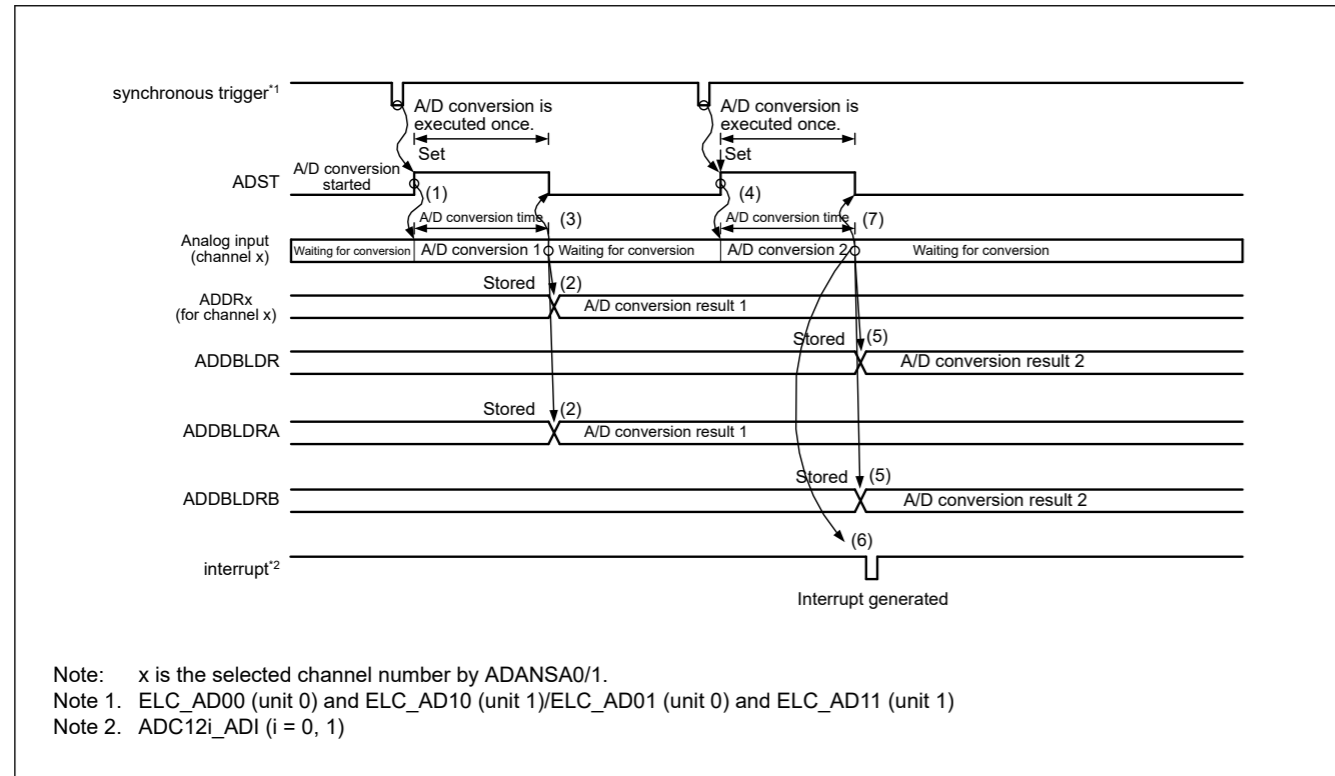

Figure 37.12 Example extended operation in double trigger mode with duplication selected for the analog input (channel x) and ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1)/ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1)

### 37.3.3 Continuous Scan Mode

#### 37.3.3.1 Basic Operation

In continuous scan mode, A/D conversion is performed repeatedly on the analog input of the specified channels.

The operation is as follows:

- When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (ELC), or an asynchronous trigger input, A/D conversion is performed for ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
- Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register (ADDRy).
- When A/D conversion of all the selected channels completes, an ADC12i\_ADI (i = 0, 1) interrupt request is generated. The ADC12 sequentially starts A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
- The ADCSR.ADST bit is not automatically cleared, and steps 2. and 3. are repeated as long as ADCSR.ADST remains 1 (A/D conversion start). When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
- When the ADCSR.ADST bit is later set to 1 (A/D conversion start), A/D conversion starts again for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.

7. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动设置为0。ADC12然后进入等待状态。

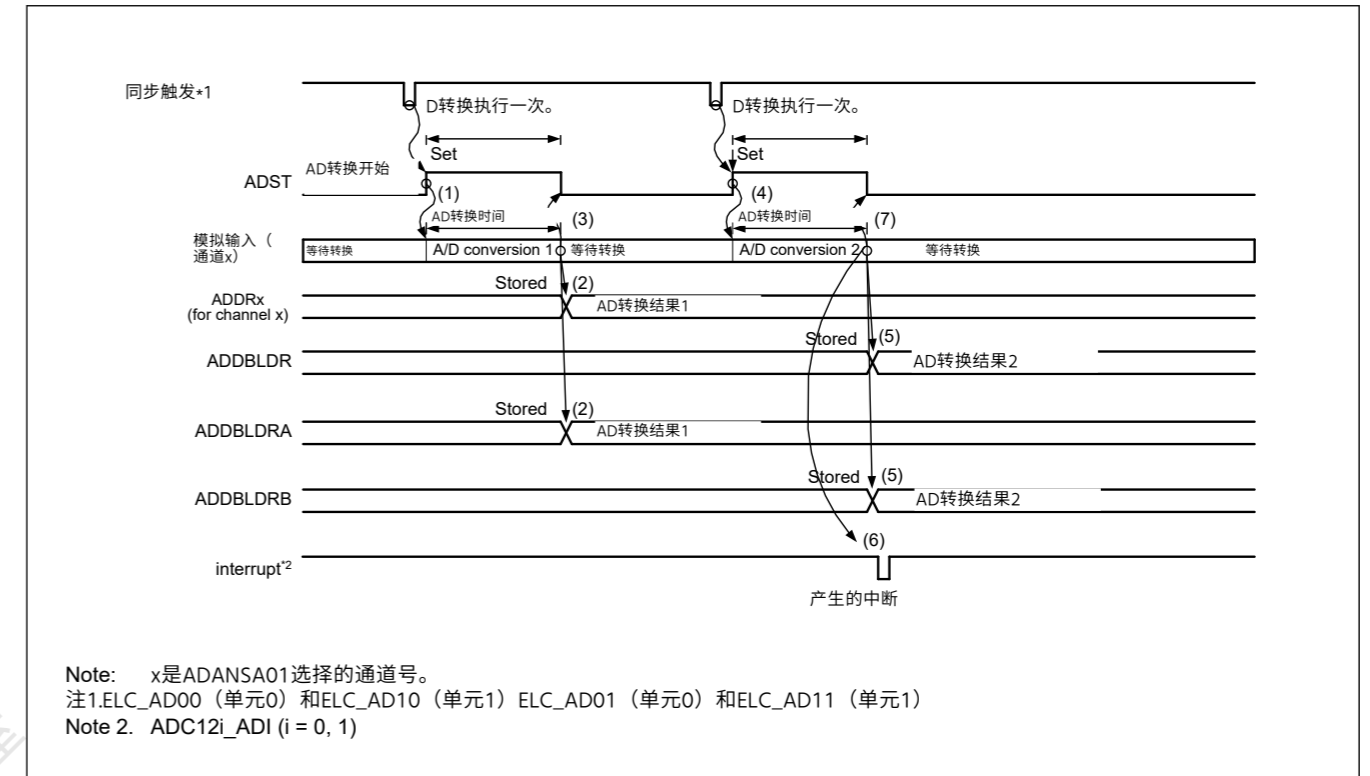

Figure 37.12 双触发模式下的扩展操作示例，为模拟输入（通道x）和ELC\_AD00（单元0）和ELC\_AD10（单元1）选择了重复ELC\_AD01（单元0）和ELC\_AD11（单元1）

### 37.3.3 连续扫描模式

#### 37.3.3.1 基本操作

在连续扫描模式下，对指定通道的模拟输入重复进行AD转换。

操作如下：

- 当软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，对在ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从编号n最小的通道开始。
- 每次完成单个通道的AD转换，AD转换结果存储在相关的AD数据寄存器(ADDRy)中。
- 当所有选定通道的AD转换完成时，会产生一个ADC12i\_ADI(i=0,1)中断请求。ADC12从编号n最小的通道开始依次启动ADANSA0和ADANSA1寄存器中选择的ANn通道的A/D转换。
- ADCSR.ADST位不会自动清零，只要ADCSR.ADST保持1（AD转换开始），就会重复步骤2和3。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
- 当ADCSR.ADST位稍后设置为1（AD转换开始）时，AD转换再次开始在ADANSA0和ADANSA1寄存器中选择的ANn通道，从具有最小编号n的通道开始。

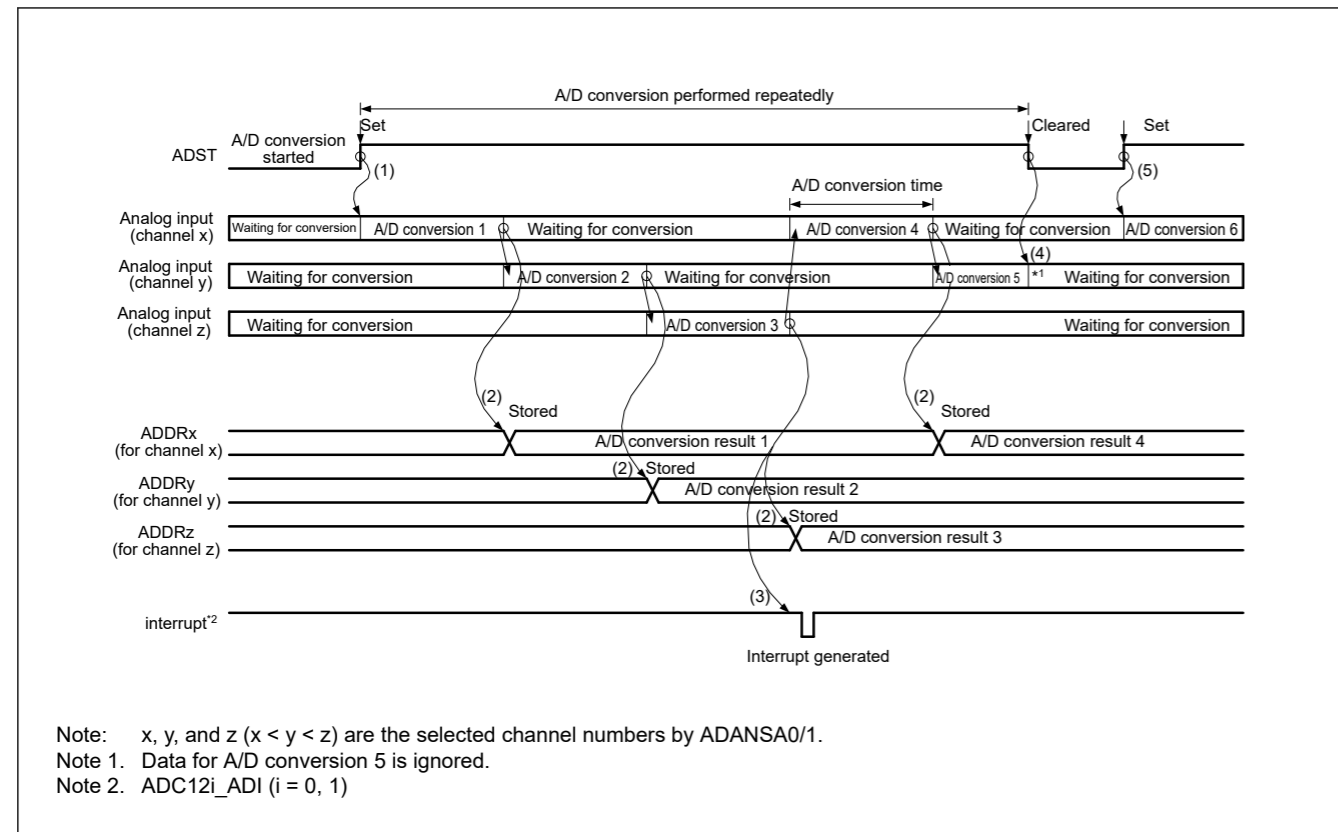

Figure 37.13 Example basic operation in continuous scan mode when the analog inputs (channel x to z) are selected

### 37.3.3.2 Channel Selection and Self-Diagnosis

When channels and self-diagnosis are selected at the same time, A/D conversion is first performed for the reference voltage VREFH0, VREFH ( $\times 0$ ,  $\times 1/2$ , or  $\times 1$ ) supplied to the ADC12, and A/D conversion is performed on the analog input of the selected channels. This sequence is repeated as described in the section that follows.

The operation is as follows:

1. A/D conversion for self-diagnosis is first started when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (ELC), or an asynchronous trigger input.
2. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the corresponding A/D Data Register (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i\_ADI ( $i = 0, 1$ ) interrupt request is generated. At the same time, the ADC12 starts A/D conversion for self-diagnosis and then on the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
5. The ADCSR.ADST bit is not automatically cleared, and steps 2. to 4. are repeated as long as the ADCSR.ADST bit remains 1. When the ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. When the ADST bit is later set to 1 (A/D conversion start), the A/D conversion for self-diagnosis is started again.

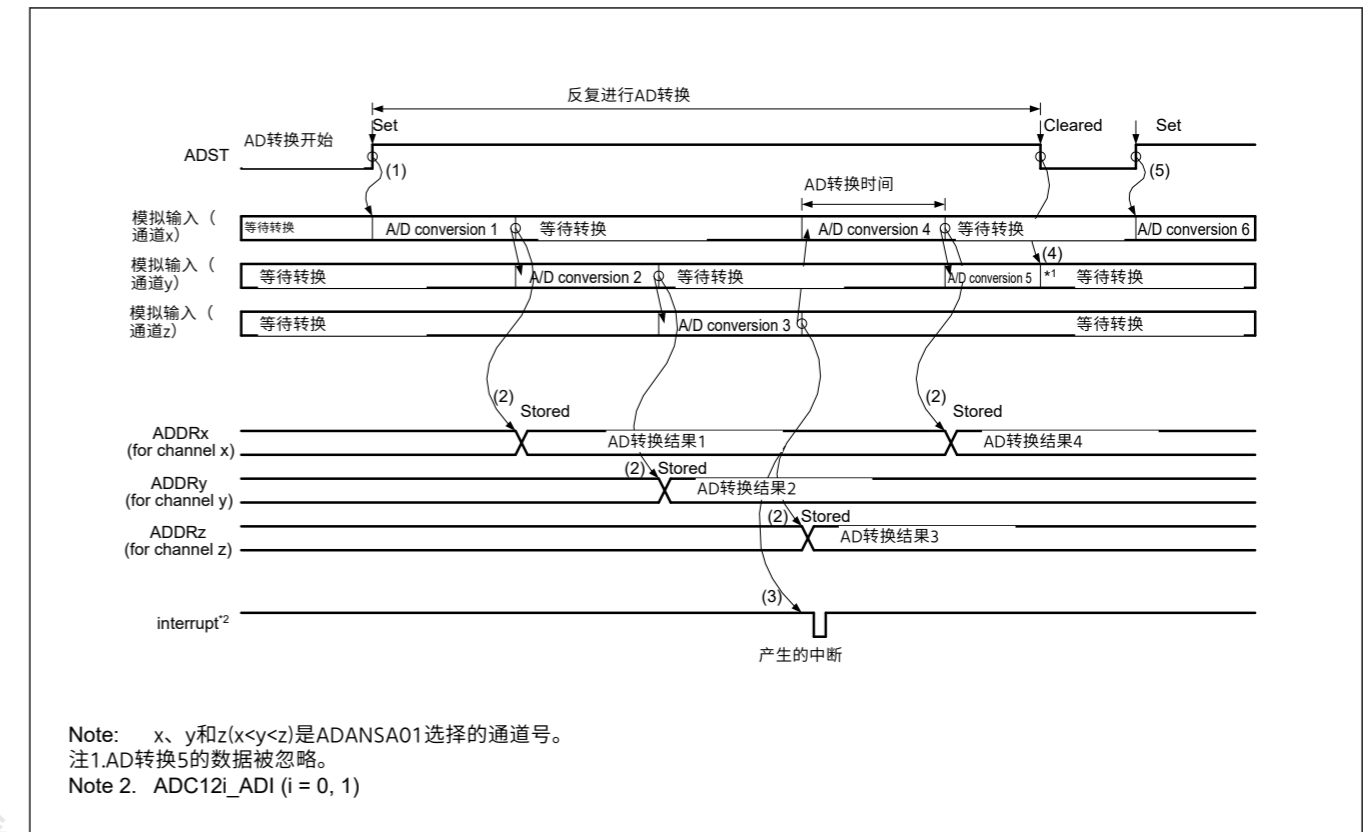

Figure 37.13 选择模拟输入（通道x至z）时连续扫描模式下的基本操作示例

### 37.3.3.2 频道选择和自诊断

同时选择通道和自诊断时，首先对参考电压进行A/D转换

提供给ADC12的VREFH0、VREFH ( $\times 0$ 、 $\times 1/2$ 或 $\times 1$ )，并对所选通道的模拟输入执行A/D转换。如以下部分所述重复此序列。

操作如下：

- 1.通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，首先启动用于自诊断的D转换。
- 2.当用于自诊断的AD转换完成时，AD转换结果存储在AD自诊断数据寄存器(ADRD)中。然后对在ADANSA0和ADANSA1寄存器中选择的ANn通道执行D转换，从编号最小的通道开始。
- 3、每完成一次单通道的AD转换，AD转换结果存入对应的AD数据寄存器（ADDRy）。
- 4.当所有选定通道的AD转换完成时，会产生一个ADC12i\_ADI( $i=0, 1$ )中断请求。同时，ADC12启动AD转换进行自诊断，然后在选择的ANn通道上进行自诊断。  
ADANSA0和ADANSA1寄存器，从编号n最小的通道开始。
- 5.ADCSR.ADST位不会自动清零，只要ADCSR.ADST位保持为1，就会重复步骤2.到4.。当ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
- 6.当ADST位稍后设置为1（AD转换开始）时，用于自诊断的AD转换再次开始。

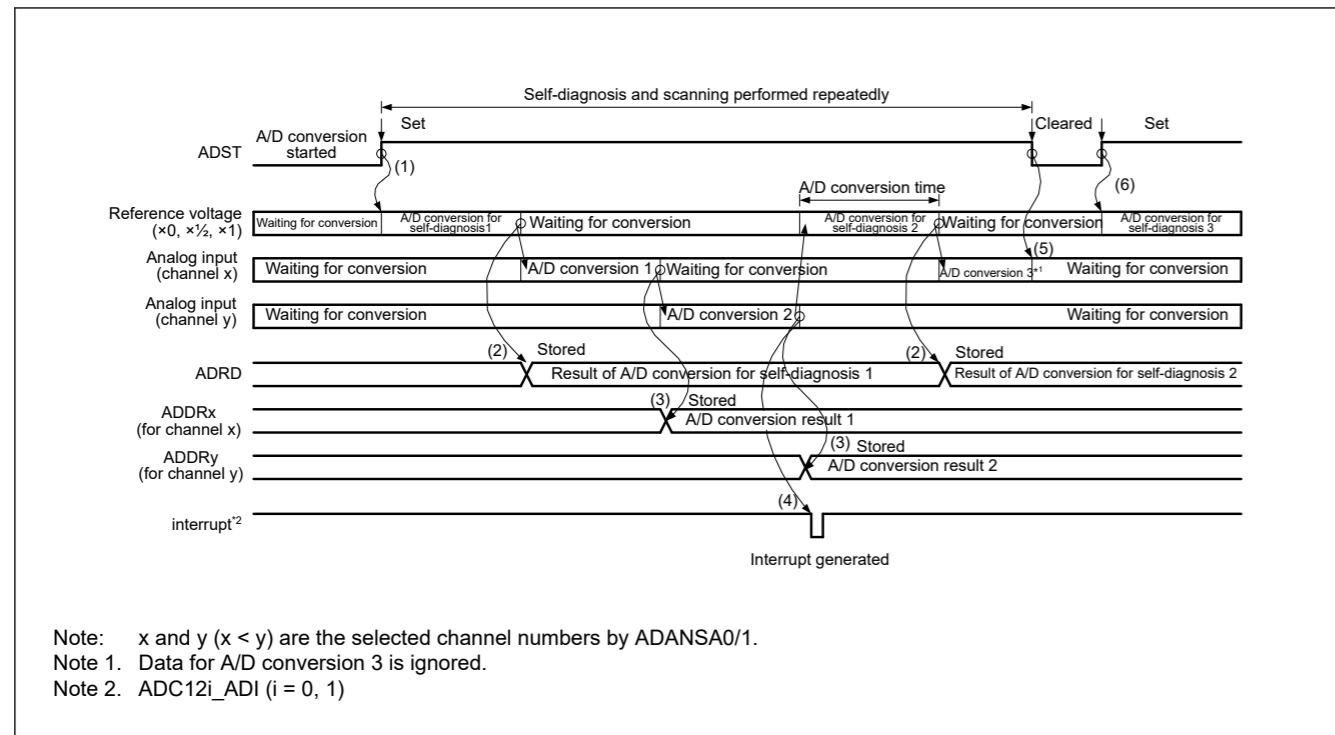

Figure 37.14 Example basic operation in continuous scan mode when the analog inputs (channel x and y) selected with self-diagnosis

### 37.3.3.3 A/D conversion of temperature sensor output or internal reference voltage

When the channels and temperature sensor output or internal reference voltage are selected at the same time, A/D conversion is first performed on the analog input of the selected channels, and then the A/D conversion of the temperature sensor output or internal reference voltage is repeated. When both the temperature sensor output and internal reference voltage are selected, A/D conversion of the temperature sensor output and internal reference voltage is performed, in that order.

With the channels deselected, selecting only the temperature sensor output or internal reference voltage is also possible.

The operation is as follows:

1. When a software trigger, synchronous trigger (ELC), or asynchronous trigger sets the ADCSR.ADST bit to 1 (A/D conversion start), A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. On completion of A/D conversion on the channels, the result is stored in the associated A/D Data Register y (ADDRy), and then A/D conversion of temperature sensor output starts.
3. On completion of A/D conversion of the temperature sensor output, the result is stored in the associated A/D Temperature Sensor Data Register (ADTSDR), and then A/D conversion of the internal reference voltage starts.
4. On completion of A/D conversion of the internal reference voltage, the result is stored in the associated A/D Internal Reference Voltage Data Register (ADOCDR), and an ADC12i\_ADI (i = 0, 1) interrupt request is generated. In addition, the ADC12 continuously starts A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the lowest number n.
5. The ADCSR.ADST bit is not cleared automatically, and steps 2 to 4 are repeated as long as this bit remains set to 1. When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. When the ADCSR.ADST bit is then set to 1 (A/D conversion start), A/D conversion starts again for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the lowest number n.

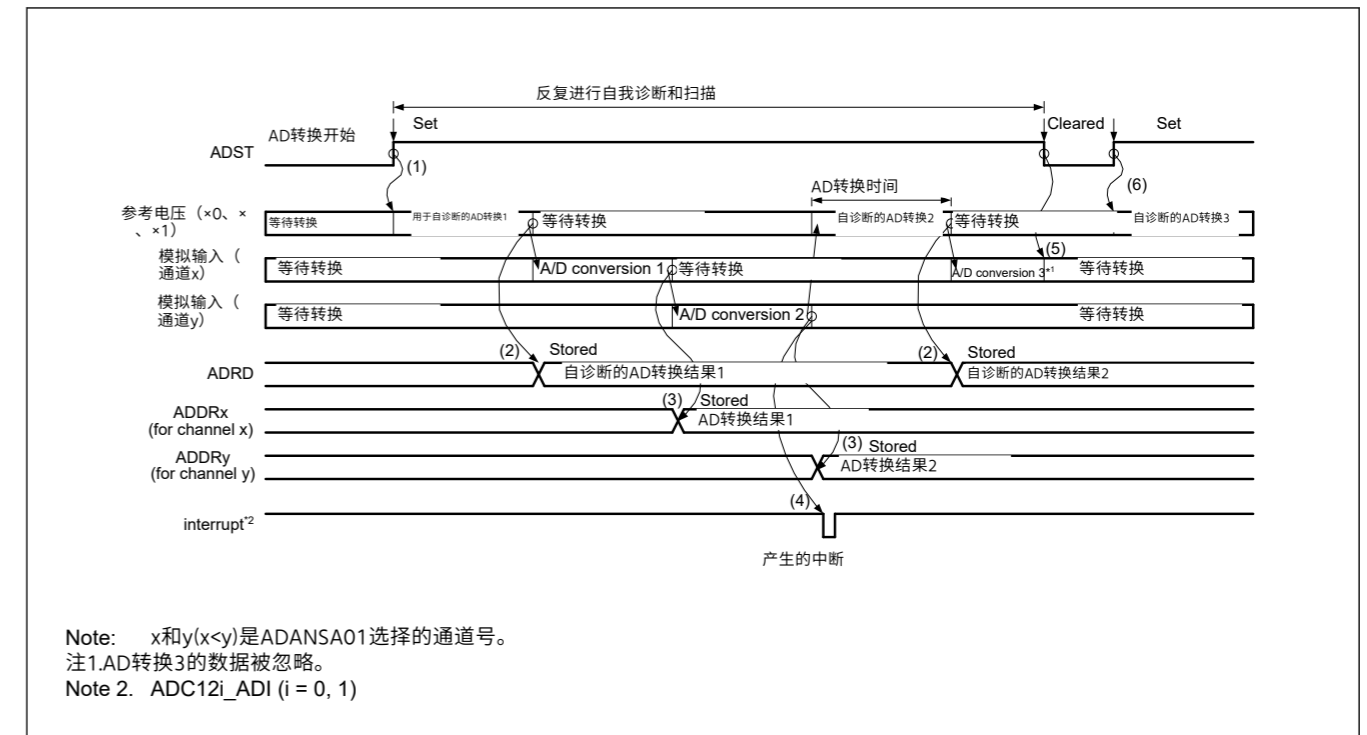

Figure 37.14 使用自诊断选择模拟输入（通道x和y）时连续扫描模式下的基本操作示例

### 37.3.3.3 温度传感器输出或内部参考电压的AD转换

当同时选择通道和温度传感器输出或内部参考电压时，首先对所选通道的模拟输入进行AD转换，然后重复温度传感器输出或内部参考电压的AD转换。当同时选择温度传感器输出和内部参考电压时，按顺序执行温度传感器输出和内部参考电压的AD转换。

取消选择通道后，也可以仅选择温度传感器输出或内部参考电压。

操作如下：

- 1.当软件触发、同步触发(ELC)或异步触发将ADCSR.ADST位设置为1（AD转换开始）时，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从通道开始用最小的数n。
- 2.通道上的AD转换完成后，结果存储在相关的AD数据寄存器y(ADDRy)中，然后温度传感器输出的AD转换开始。
- 3.温度传感器输出的AD转换完成后，结果存储在相关的AD中温度传感器数据寄存器(ADTSDR)，然后内部参考电压的AD转换开始。
- 4.内部参考电压的AD转换完成后，结果存储在相关的ADInternal参考电压数据寄存器(AOCDR)和ADC12i\_ADI(i=0 1)中断请求产生。此外，ADC12连续启动ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换，从编号最小的通道n开始。
- 5.ADCSR.ADST位不会自动清零，只要该位保持设置为1，就会重复步骤2到4。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
- 6.当ADCSR.ADST位被设置为1（AD转换开始）时，AD转换再次开始在ADANSA0和ADANSA1寄存器中选择的ANn通道，从编号最小的通道n开始。

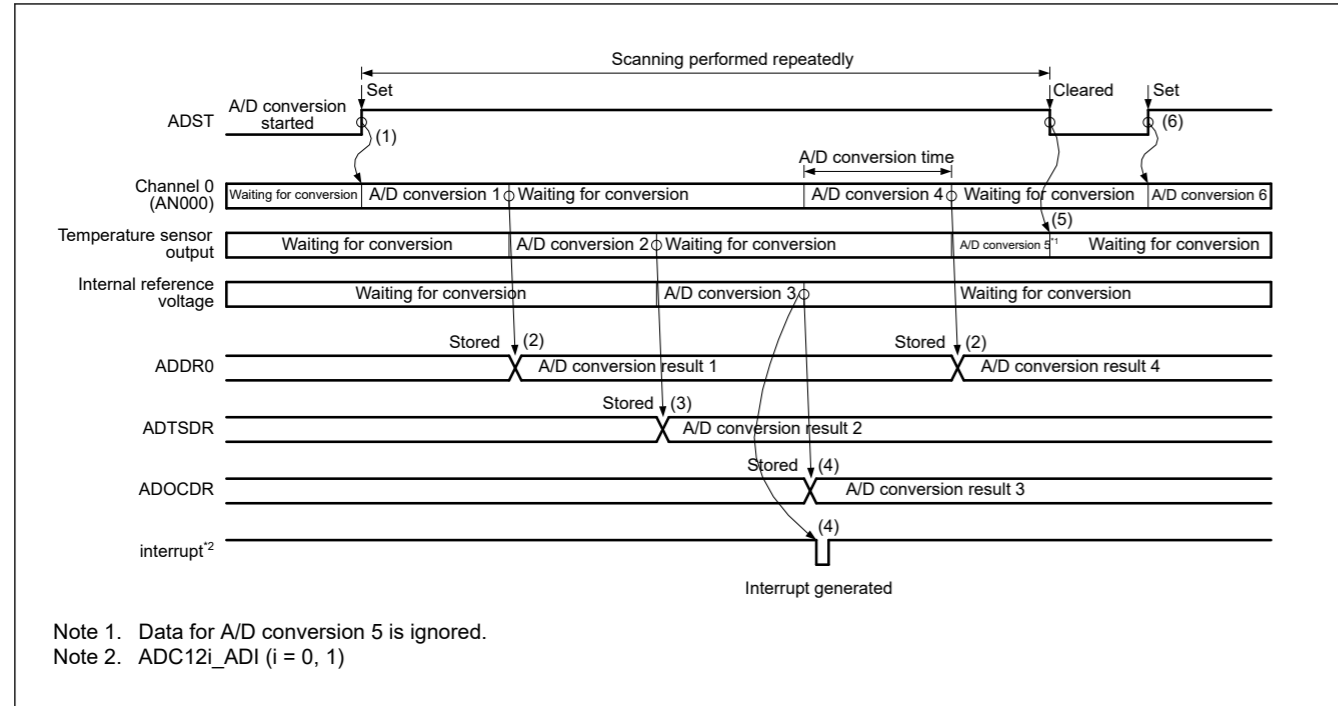

Figure 37.15 Example basic operation in continuous scan mode when AN000 and temperature sensor output or internal reference voltage are selected

### 37.3.4 Group Scan Mode

#### 37.3.4.1 Basic operation

In group scan mode, A/D conversion is performed once on the analog input of all the specified channels in group A and B after scanning is started by a synchronous trigger (ELC). The scan operation of each group is similar to the scan operation in single scan mode.

The synchronous triggers can be selected in the ADSTRGR.TRSA[5:0] bits for group A and in the ADSTRGR.TRSB[5:0] bits for group B. Use different triggers for group A and B to prevent simultaneous A/D conversion of the two groups. Do not use a software trigger.

The group A channels to be A/D-converted are selected using the ADANSA0 and ADANSA1 registers and the ADEXICR.TSSA and OCSA bits. The group B channels to be A/D-converted are selected using the ADANSB0 and ADANSB1 registers and the ADEXICR.TSSB and OCSB bits. Group A and B cannot use the same channels.

When self-diagnosis is selected in group scan mode, self-diagnosis is separately executed for Group A and B.

The following sequence describes operation in group scan mode using a synchronous trigger from the ELC. In this example, the ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1) trigger from the ELC is used to start conversion of group A and the ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1) trigger from the ELC is used to start conversion of group B. In addition, ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1) and ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1) are selected for the GPT event in the associated ELC.ELSRn registers.

The operation is as follows:

1. Scanning of group A is started by ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1).
2. When group A scanning completes, an ADC12i\_ADI (i = 0, 1) interrupt is generated (no register setting).
3. Scanning of group B is started by ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1).
4. When group B scanning completes, an ADC12i\_GBADI (i = 0, 1) interrupt is generated if the ADCSR.GBADIE bit is 1 (ADC12i\_GBADI (i = 0, 1) interrupt when scanning completion is enabled).

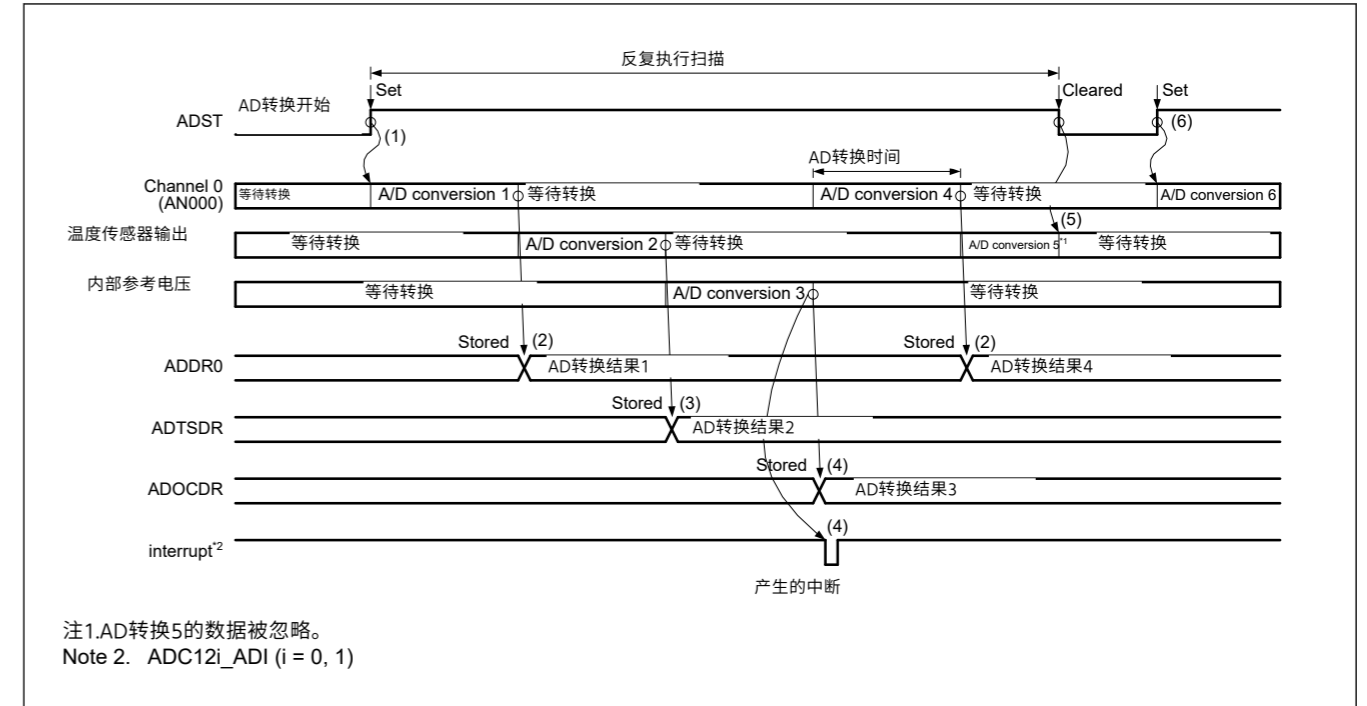

Figure 37.15 选择AN000和温度传感器输出或内部参考电压时连续扫描模式下的基本操作示例

### 37.3.4 组扫描模式

#### 37.3.4.1 基本操作

在组扫描模式下，通过同步触发（ELC）开始扫描后，对A组和B组中所有指定通道的模拟输入进行一次AD转换。每组的扫描操作类似于单次扫描模式下的扫描操作。

可以在A组的ADSTRGR.TRSA[5:0]位和B组的ADSTRGR.TRSB[5:0]位中选择同步触发。对A组和B组使用不同的触发以防止同时进行AD转换两组。不要使用软件触发。

使用ADANSA0和ADANSA1寄存器选择要进行AD转换的A组通道ADXICR.TSSA和OCSA位。要进行AD转换的B组通道使用ADANSB0和ADANSB1寄存器以及ADXICR.TSSB和OCSB位。A组和B组不能使用相同的通道。

在组扫描模式下选择自诊断时，对A组和B组分别执行自诊断。

以下序列描述了使用来自ELC的同步触发在组扫描模式下的操作。在此示例中，来自ELC的ELC\_AD00（单元0）和ELC\_AD10（单元1）触发器用于启动A组的转换，来自ELC的ELC\_AD01（单元0）和ELC\_AD11（单元1）触发器用于启动转换B组。此外，

ELC\_AD00（单元0）和ELC\_AD10（单元1）和ELC\_AD01（单元0）和ELC\_AD11（单元1）被选择用于相关ELC.ELSRn寄存器中的GPT事件。

操作如下：

- 1.A组扫描由ELC\_AD00（单元0）和ELC\_AD10（单元1）启动。
- 2.A组扫描完成后，会产生ADC12i\_ADI(i=0 1)中断（无寄存器设置）。
- 3.B组扫描由ELC\_AD01（单元0）和ELC\_AD11（单元1）启动。
- 4.B组扫描完成时，如果ADCSR.GBADIE位为1，则产生ADC12i\_GBADI(i=0 1)中断（使能扫描完成时的ADC12i\_GBADI(i=0 1)中断）。

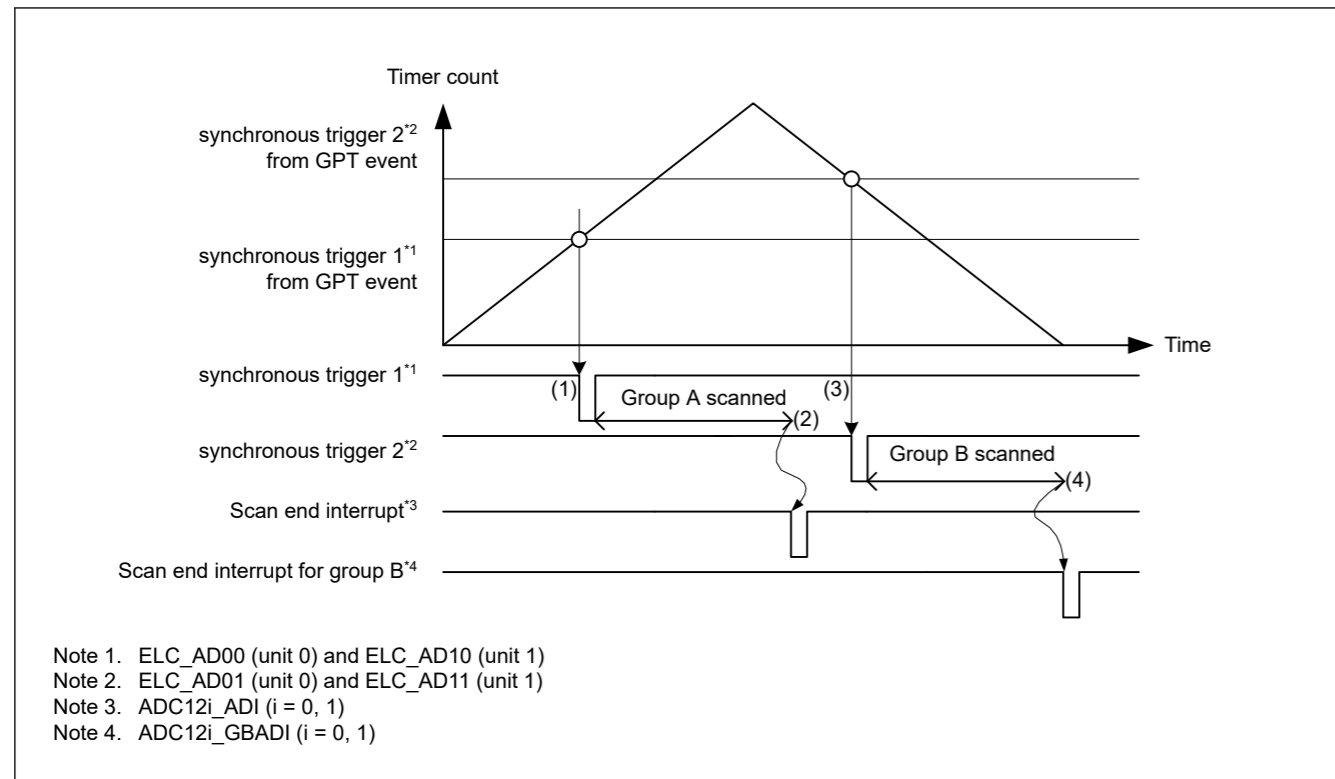

Figure 37.16 Example basic operation in group scan mode when synchronous triggers from the ELC are used

#### 37.3.4.2 A/D conversion in double-trigger mode

When double trigger mode is selected in group scan mode, two rounds of single scan operation started by a synchronous trigger (ELC) are performed as a sequence for group A. For group B, single scan operation started by a synchronous trigger (ELC) is performed once.

In group scan mode, the synchronous trigger can be selected in the ADSTRGR.TRSA[5:0] bits for group A and in the ADSTRGR.TRSB[5:0] bits for group B. Use different triggers for group A, B to prevent simultaneous A/D conversion of the two groups. Do not use a software trigger or an asynchronous trigger.

When an ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1)/ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1) is selected as group A synchronous triggers by setting the ADSTRGR.TRSA[5:0] bits to 0x0B, operation proceeds in extended double trigger mode.

The group A channel to be A/D-converted is selected using the DBLANS[4:0] bits in the ADCSR register, while the group B channels to be A/D-converted are selected using the ADANSB0 and ADANSB1 registers. Group A, B cannot use the same channels.

When double-trigger mode is selected in group scan mode, set the A/D conversion select bits for both the temperature sensor output (ADEXICR.TSSA) and the internal reference voltage (ADEXICR.OCSA) to 0 (deselected).

Self-diagnosis cannot be selected when double trigger mode is selected in group scan mode.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated in the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE bit to 1.

The following sequence describes operation in group scan mode with double trigger mode selected and using a synchronous trigger from the ELC. In this example, the ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1) trigger is used to start conversion of group A and the ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1) trigger is used to start conversion of group B. In addition, ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1) and ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1) are selected for the GPT event in the associated ELC.ELSRn registers.

The operation is as follows:

1. Scanning of group B is started by the ELC\_AD00 (unit 0) and ELC\_AD10 (unit 1) trigger from the ELC.

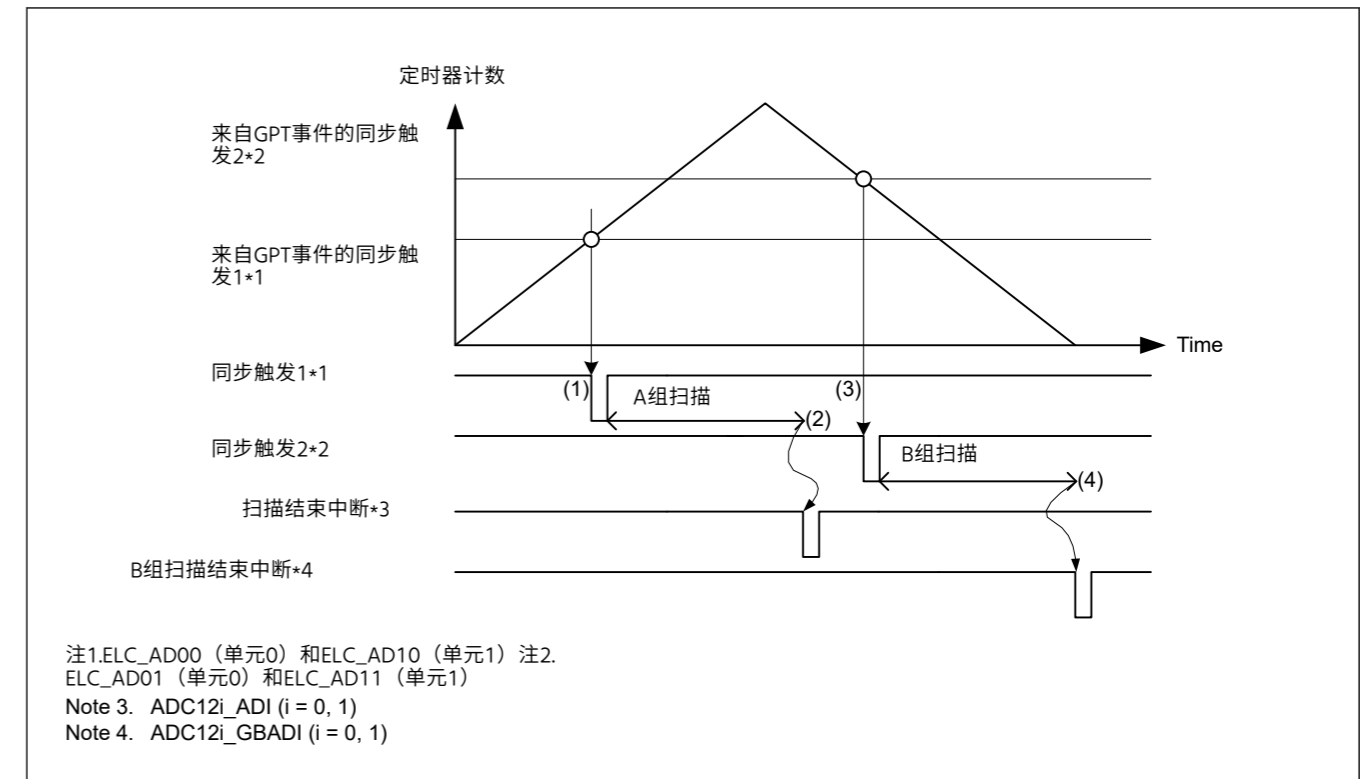

Figure 37.16 使用来自ELC的同步触发时组扫描模式下的基本操作示例

#### 37.3.4.2 双触发模式下的AD转换

在组扫描模式中选择双触发模式时，由同步触发(ELC)启动的两轮单扫描操作作为A组的顺序执行。对于B组，由同步触发(ELC)启动的单扫描操作是执行一次。

在组扫描模式下，可以在ADSTRGR.TRSA[5:0]位中为A组选择同步触发，并在组B的ADSTRGR.TRSB[5:0]位。对组A、B使用不同的触发，以防止两组同时进行AD转换。不要使用软件触发或异步触发。

当通过将ADSTRGR.TRSA[5:0]位设置为0x0B来选择ELC\_AD00 (单元0) 和 ELC\_AD10 (单元1) ELC\_AD01 (单元0) 和 ELC\_AD11 (单元1) 作为A组同步触发时，操作以扩展方式进行双触发模式。

使用ADCSR寄存器中的DBLANS[4:0]位选择要进行AD转换的A组通道，而组使用ADANSB0和ADANSB1寄存器选择要进行AD转换的B通道。A、B组不能使用相同的通道。

在组扫描模式中选择双触发模式时，将温度传感器输出(ADEXICR.TSSA)和内部参考电压(ADEXICR.OCSA)的A/D转换选择位设置为0 (取消选择)。

在组扫描模式中选择双触发模式时，不能选择自诊断。

AD转换数据的复制通过在ADCSR.DBLANS[4:0]位并将ADCSR.DBLE位设置为1。

以下序列描述了组扫描模式下的操作，其中选择了双触发模式并使用来自ELC的同步触发。在此示例中，ELC\_AD00 (单元0) 和 ELC\_AD10 (单元1) 触发器用于启动A组转换，ELC\_AD01 (单元0) 和 ELC\_AD11 (单元1) 触发器用于启动B组转换。此外，ELC\_AD00 (单元0) 和 ELC\_AD10 (单元1) 和 ELC\_AD01 (单元0) 和 ELC\_AD11 (单元1) 在关联的ELC.ELSRn寄存器中为GPT事件选择。

操作如下：

1. B组的扫描由ELC的ELC\_AD00 (单元0) 和 ELC\_AD10 (单元1) 触发开始。

- When group B scanning completes, an ADC12i\_GBADI ( $i = 0, 1$ ) interrupt is generated if the GBADIE bit in ADCSR is 1 (ADC12i\_GBADI ( $i = 0, 1$ ) interrupt when scanning completion is enabled).
- The first scan of group A is started by the first ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1) trigger.
- When the first scan of group A completes, the conversion result is stored in the associated A/D Data Register y (ADDRy); an ADC12i\_ADI ( $i = 0, 1$ ) interrupt request is not generated.
- The second scan of group A is started by the second ELC\_AD01 (unit 0) and ELC\_AD11 (unit 1) trigger.
- When the second scan of group A completes, the conversion result is stored in ADDBLDR. An ADC12i\_ADI ( $i = 0, 1$ ) interrupt is generated.

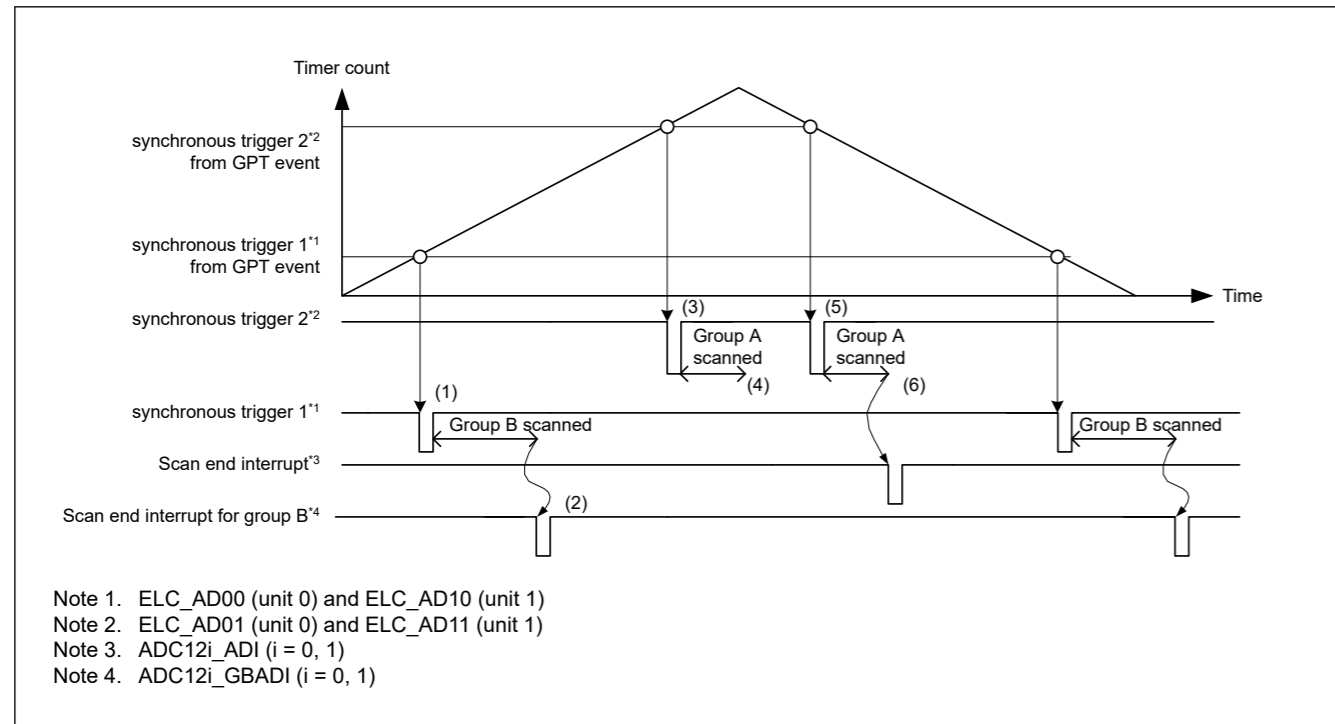

Figure 37.17 Example basic operation in group scan mode with double-trigger mode when synchronous triggers from the ELC are used

### 37.3.4.3 Group Priority Operation

Group priority operation is performed by setting the ADGSPCR.PGS bit to 1 in group-scan mode. The priority of groups is group A > group B.

When setting the PGS bit in the ADGSPCR register to 1, follow the procedure described in Figure 37.18. If the procedure is not followed, A/D conversion operation and stored data are not guaranteed.

As the basic operation in group-scan mode, a trigger input generated during A/D conversion of group A, B is ignored, and the A/D conversion operation of each group is similar to the operation in single-scan mode.

In group priority operation, if a trigger for a priority group is input during scanning of a lower-priority group, A/D conversion for the lower-priority group is stopped and A/D conversion for the priority group is performed.

If the setting of the ADGSPCR.GBRSCN bit is 0, the lower-priority group enters a wait state when A/D conversion for the priority group completes. A trigger input of the lower-priority group generated during A/D conversion is ignored.

If the setting of the ADGSPCR.GBRSCN bit is 1, A/D conversion for the lower-priority group automatically restarts upon completion of A/D conversion for the priority group. A trigger input of the lower-priority group generated during A/D conversion on the priority group takes effect, and A/D conversion for the lower-priority group is automatically performed upon completion of A/D conversion on the priority group.

If the ADGSPCR.GBRSCN bit is 1 and the ADGSPCR.LGRRS bit is 0, A/D conversion for the lower-priority group is restarted from the first channel. If the setting of the ADGSPCR.LGRRS bit is 1, A/D conversion for the lower-priority group is restarted from the channel for which the conversion stopped. However, if the self-diagnosis function is used, the A/D conversion is restarted from the channel for which the conversion stopped after self-diagnosis completed.

- B组扫描完成时，如果ADCSR中的GBADIE位为1，则产生ADC12i\_GBADI( $i=0, 1$ )中断（使能扫描完成时ADC12i\_GBADI( $i=0, 1$ )中断）。
- A组的第一次扫描由第一个ELC\_AD01（单元0）和ELC\_AD11（单元1）触发器启动。
- A组第一次扫描完成后，转换结果存入相关的AD数据寄存器y（ADDRy）；不会产生ADC12i\_ADI( $i=0, 1$ )中断请求。
- A组的第二次扫描由第二个ELC\_AD01（单元0）和ELC\_AD11（单元1）触发开始。
- A组第二次扫描完成后，转换结果存入ADDBLDR。产生一个ADC12i\_ADI( $i=0, 1$ )中断。

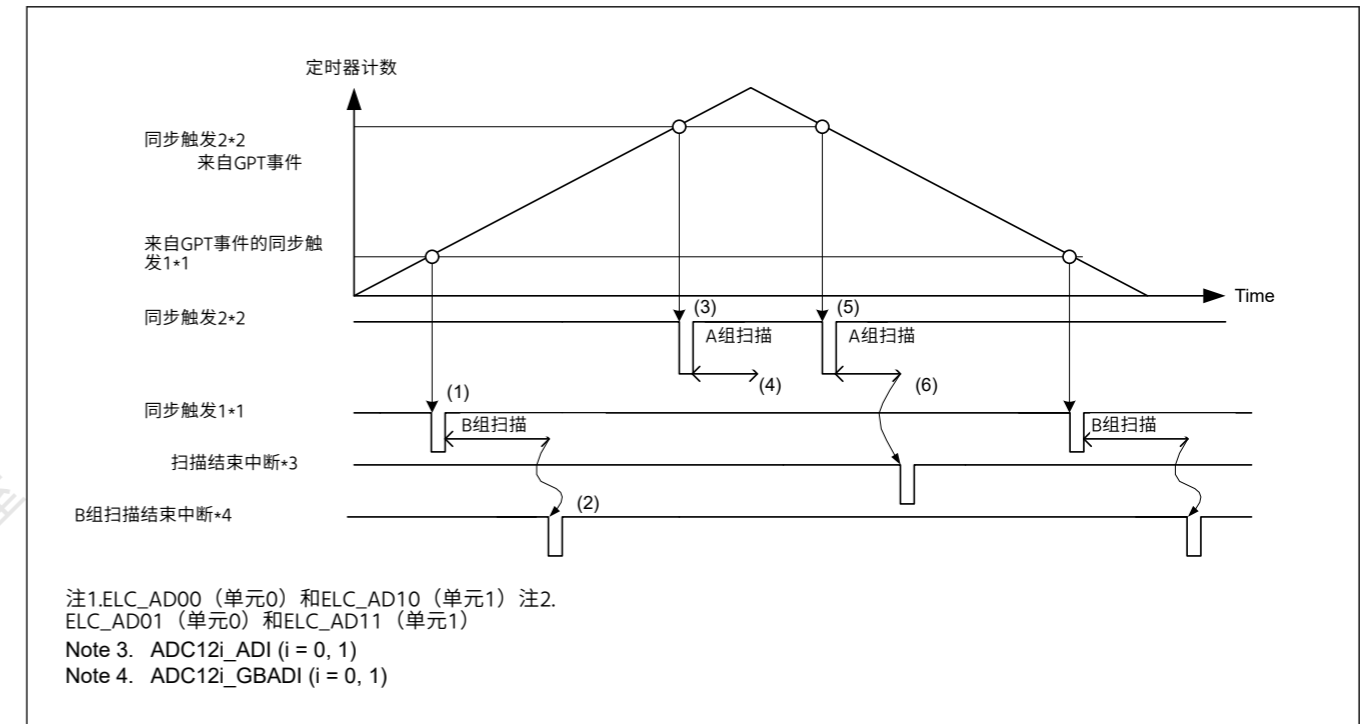

Figure 37.17 当使用来自ELC的同步触发时，具有双触发模式的组扫描模式下的基本操作示例

### 37.3.4.3 集团优先运营

在组扫描模式下，通过将ADGSPCR.PGS位设置为1来执行组优先级操作。组的优先级为A组>B组。

将ADGSPCR寄存器中的PGS位设置为1时，请遵循图37.18中描述的过程。如果不遵循该程序，则无法保证AD转换操作和存储数据。

作为组扫描模式下的基本操作，A、B组A/D转换过程中产生的触发输入被忽略，各组的A/D转换操作与单扫描模式下的操作类似。

在组优先操作中，如果在低优先级组的扫描期间输入了优先级组的触发，则停止低优先级组的AD转换并执行优先级组的AD转换。

如果ADGSPCR.GBRSCN位设置为0，则当优先级组的AD转换完成时，低优先级组进入等待状态。AD转换期间产生的低优先级组的触发输入被忽略。

如果ADGSPCR.GBRSCN位设置为1，则在优先级组的AD转换完成后，低优先级组的AD转换自动重新开始。对优先级组进行AD转换时产生的低优先级组的触发输入生效，在优先级组的AD转换完成后，自动进行低优先级组的AD转换。

如果ADGSPCR.GBRSCN位为1，ADGSPCR.LGRRS位为0，则从第一个通道重新开始低优先级组的AD转换。如果ADGSPCR.LGRRS位设置为1，则低优先级组的AD转换从转换停止的通道重新开始。但是，如果使用自诊断功能，则从自诊断完成后停止转换的通道重新开始AD转换。

Table 37.24 summarizes operations in response to the input of a trigger during A/D conversion with the settings of the ADGSPCR.GBRSCN bit.

If the setting of the ADGSPCR.GBRP bit is 1, A/D conversion operation for the lowest-priority group is to continuously perform single scans.

For the trigger settings in group-scan mode, select a synchronous trigger for group A by using the ADSTRGR.TRSA[5:0] bits, a synchronous trigger for group B by using the ADSTRGR.TRSB[5:0] bits. Each trigger must be different from each other. Set the ADSTRGR.TRSB[5:0] bits to 0x3F when setting the ADGSPCR.GBRP bit to 1.

The channels to be scanned must be selected in the registers shown in section 37.3.4. Group Scan Mode.

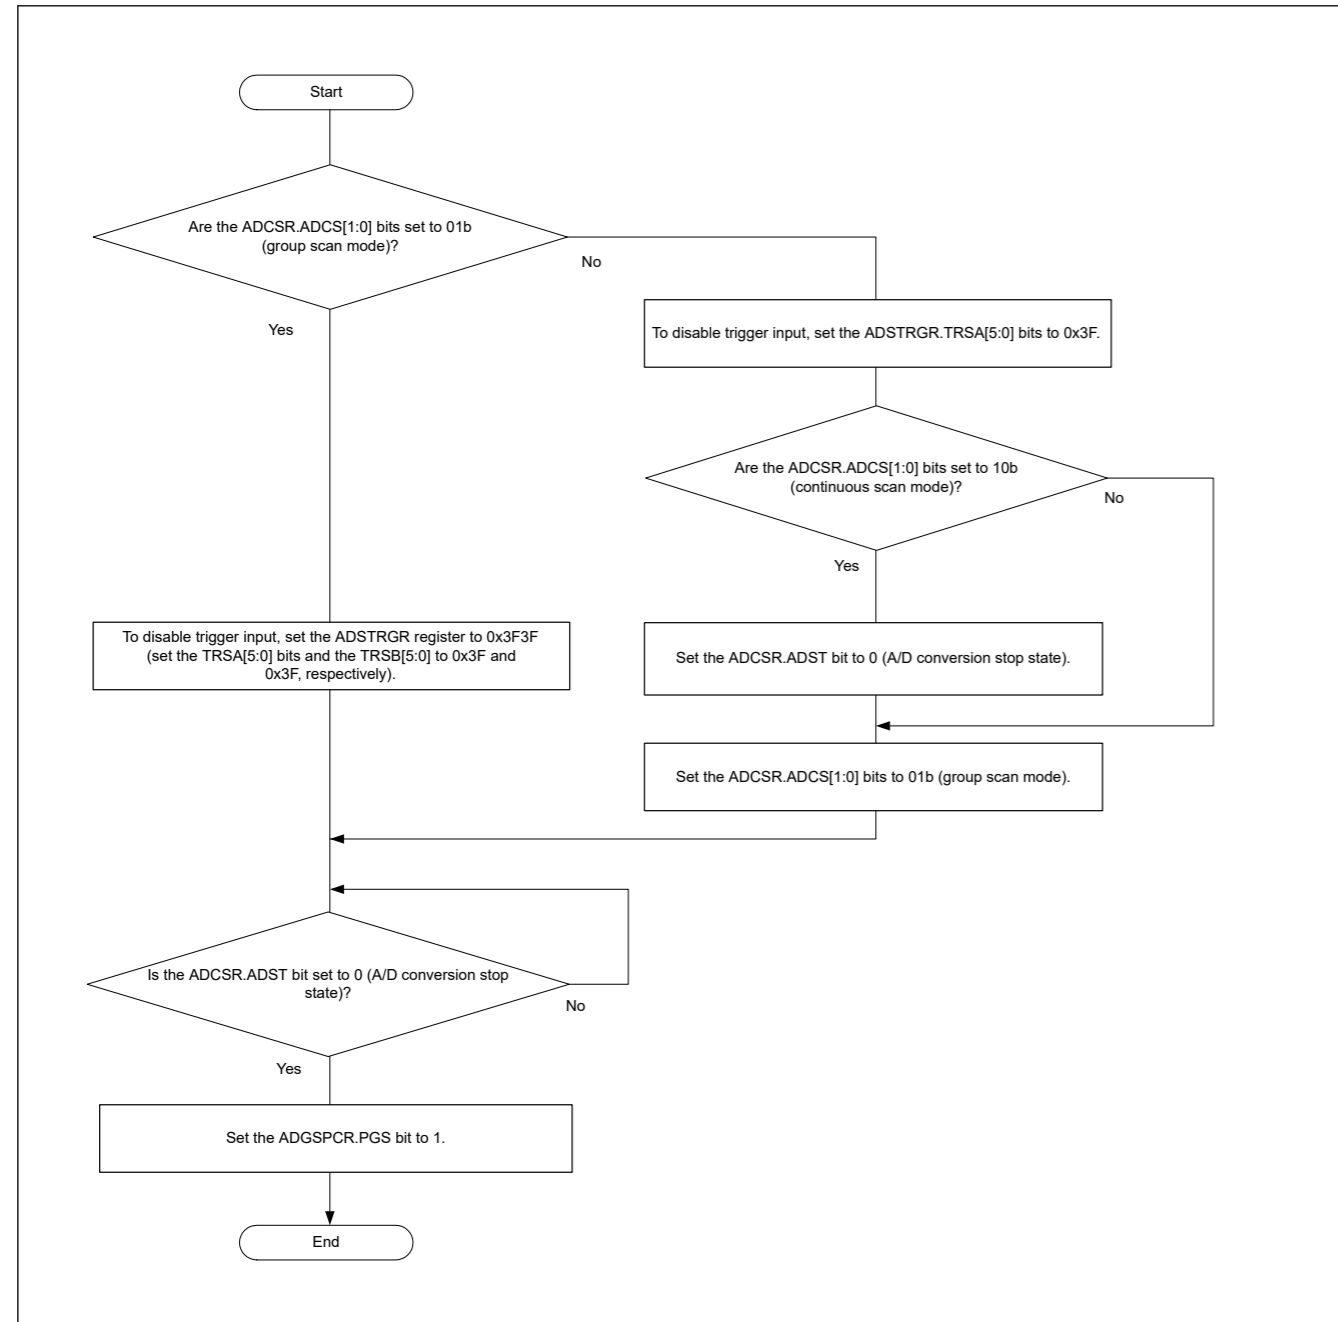

Figure 37.18 Flowchart for ADGSPCR.PGS bit setting

表37.24总结了在AD转换期间响应触发输入的操作，其中设置为ADGSPCR.GBRSCN bit。

如果ADGSPCR.GBRP位设置为1，则最低优先级组的AD转换操作是连续执行单次扫描。

对于组扫描模式下的触发设置，使用ADSTRGR.TRSA[5:0]位选择A组同步触发，使用ADSTRGR.TRSB[5:0]位选择B组同步触发。每个触发器必须彼此不同。将ADGSPCR.GBRP位设置为1时，将ADSTRGR.TRSB[5:0]位设置为0x3F。

要扫描的通道必须在第37.3.4节所示的寄存器中选择。组扫描模式。

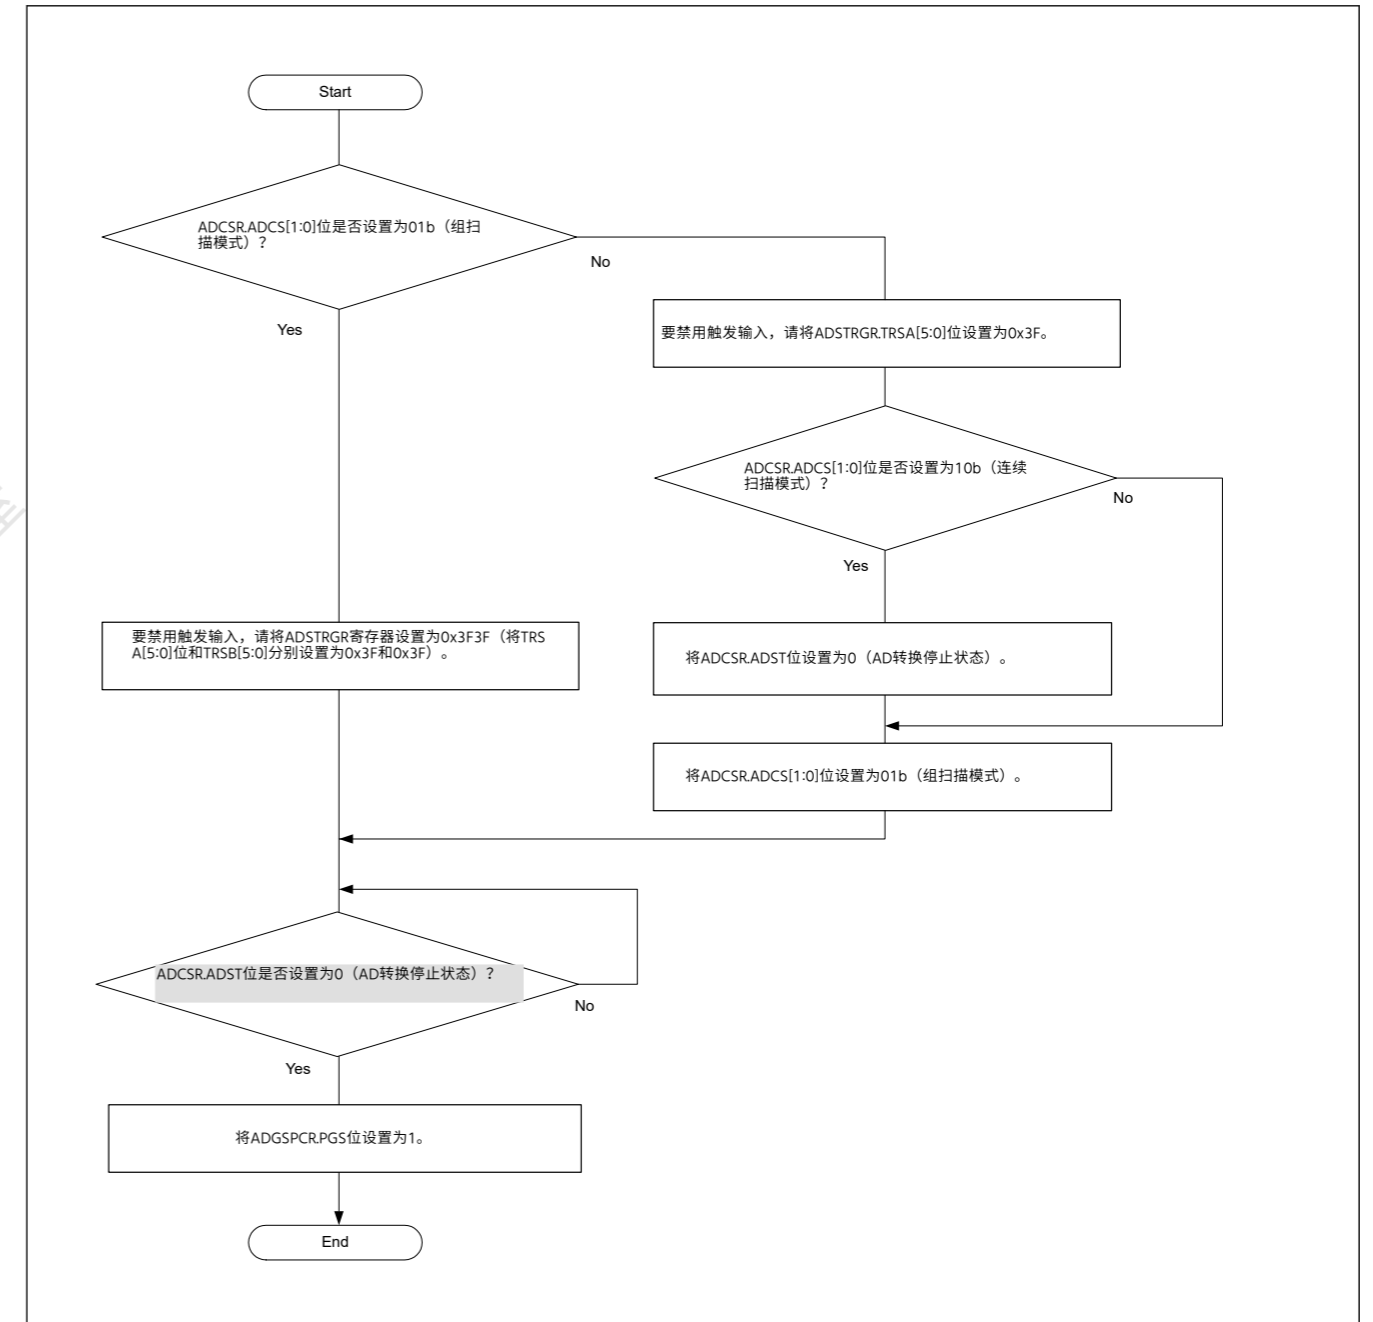

Figure 37.18 ADGSPCR.PGS位设置流程图

Table 37.24 Control of A/D conversion operations according to ADGSPCR.GBRSCN bit setting

| A/D conversion operation                       | Trigger input                | ADGSPCR.GBRSCN = 0  | ADGSPCR.GBRSCN = 1   |

| 1       | 1     | 0    | Group priority operation for two groups (groups A and B) <ul style="list-style-type: none"> <li>After A/D conversion for group B stopped, when A/D conversion for group A completes, A/D conversion for the group B channels selected in the ADANSB0/1 register restarts according to the conversion order of smaller channel number, beginning from the channel for which A/D conversion stopped.*1</li> </ul>   |
| x       | 0     | 1    | Group priority operation for two groups (groups A and B) <ul style="list-style-type: none"> <li>Single scanning for group B is continuously performed without a start trigger input. After A/D conversion for group B stopped, when A/D conversion for group A completes, single scanning for the channels selected in the ADANSB0/1 register restarts according to the conversion order of smaller channel number.</li> </ul>  |
| 1       | 1     | 1    | Group priority operation for two groups (groups A and B) <ul style="list-style-type: none"> <li>Single scanning for group B is continuously performed without a start trigger input. After A/D conversion for group B stopped, when A/D conversion for group A completes, single scanning for the channels selected in the ADANSB0/1 register restarts according to the conversion order of smaller channel number, beginning from the channel for which A/D conversion stopped.*1</li> </ul> |

Note: x: Don't care.

Note 1. When the self-diagnosis function is enabled (ADCER.DIAGM = 1), A/D conversion for the channel that has been stopped is started after self-diagnosis is performed.

(1) Group priority operation for two groups (when ADGSPCR.PGS = 1)

Operation examples 1-1 to 1-5 show group priority operations in group-scan mode (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 to 3 are selected for group B.

Operation example 1-1: "Group A trigger input during group B scan" when rescanning is enabled

- When input of a trigger for group B sets the ADCSR.ADST bit to 1 (starting A/D conversion), A/D conversion for the analog input channels selected in the ADANSB0 and ADANSB1 registers starts according to the conversion order from the channel with the smallest number n.
- On completion of A/D conversion for each channel in group B, the result is stored in the corresponding A/D Data Register y (ADDRy).

Table 37.24 根据ADGSPCR.GBRSCN位设置控制AD转换操作

| AD转换操作       | 触发输入    | ADGSPCR.GBRSCN = 0   | ADGSPCR.GBRSCN = 1  |
|--------------|---------|----------------------|---|
| 正在进行A组的AD转换时 | A组触发器输入 | 触发输入无效。              | 触发输入无效。   |
|              | B组触发器输入 | 触发输入无效。              | 在A组的AD转换完成后，执行B组的AD转换。  |
| 正在进行B组的AD转换时 | A组触发器输入 | B组的AD转换停止，A组的AD转换开始。 | <ul style="list-style-type: none"> <li>B组的AD转换停止，A组的AD转换开始。</li> <li>B组的AD转换在A组的AD转换完成后开始。</li> </ul> |
|              | B组触发器输入 | 触发输入无效。              | 触发输入无效。   |

要使用组优先操作模式，请根据下表选择要执行的操作模式并设置寄存器。

Table 37.25 两组的组优先操作设置和操作模式 (ADGSPCR.PGS=1)

| ADGSPCR |       |      | 操作类别  |
|---------|-------|------|---|
| GBRSCN  | LGRRS | GBRP |   |
| 0       | x     | 0    | 两组 (A组和B组) 的组优先操作●<br>当输入A组的触发时，B组的AD转换将终止 (并且不会重新启动)。  |

| 1       | 1     | 1    | 两组 (A组和B组) 的组优先操作●<br>B组的单次扫描在没有启动触发输入的情况下连续执行。B组AD转换停止后，当A组AD转换完成时，对ADANSB01寄存器中选择的通道的单次扫描按照通道号较小的转换顺序重新开始，从AD转换停止的通道开始。*1 |

Note: x: Don't care.

注1.自诊断功能有效时 (ADCER.DIAGM=1)，自诊断完成后，已停止通道的AD转换开始。

(1) 两个组的组优先操作 (当ADGSPCR.PGS=1时)

操作示例1-1到1-5显示了当为组A和通道1选择通道0时，组扫描模式下的组优先操作 (当ADGSPCR.GBRSCN=1、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时) 为B组选择3至3个。

操作示例1-1: 启用重新扫描时的“B组扫描期间A组触发输入”

- 当B组的触发输入将ADCSR.ADST位设置为1 (开始AD转换) 时，ADANSB0和ADANSB1寄存器中选择的模拟输入通道的AD转换按照转换顺序从最小通道开始号码n。
- B组中每个通道的AD转换完成后，将结果存储在相应的AD数据寄存器y(ADDRy)中。

- When a trigger for group A is input during A/D conversion for group B, A/D conversion for group B stops while the ADCSR.ADST bit remains 1. Then A/D conversion for the group A analog input channels selected in the ADANSA0 and ADANSA1 registers starts according to the conversion order from the channel with the smallest number n. If A/D conversion stops before it is completed, the conversion result is not stored in the A/D Data Register y (ADDRy).
- On completion of A/D conversion on the channels, the result is stored in the corresponding A/D Data Register y (ADDRy).
- If the setting of the ADCSR.ADIE bit is 1 (enabling interrupt generation upon completion of scanning), a scan end interrupt request is generated.
- If the setting of the ADGSPCR.GBRSCN bit is 1 (enabling rescanning of the group that was stopped in group priority operation), A/D conversion for the group B analog input channels selected in the ADANSB0 and ADANSB1 registers restarts according to the conversion order from the channel with the smallest number n while the ADCSR.ADST remains 1.
- On completion of A/D conversion on the channels, the result is stored in the corresponding A/D Data Register y (ADDRy).
- If the setting of the ADCSR.GBADIE bit is 1 (enabling interrupt generation on completion of group B scan), a group B scan end interrupt request is generated.
- When A/D conversion for all the channels completes, the ADCSR.ADST bit is automatically cleared and the A/D converter enters a wait state.

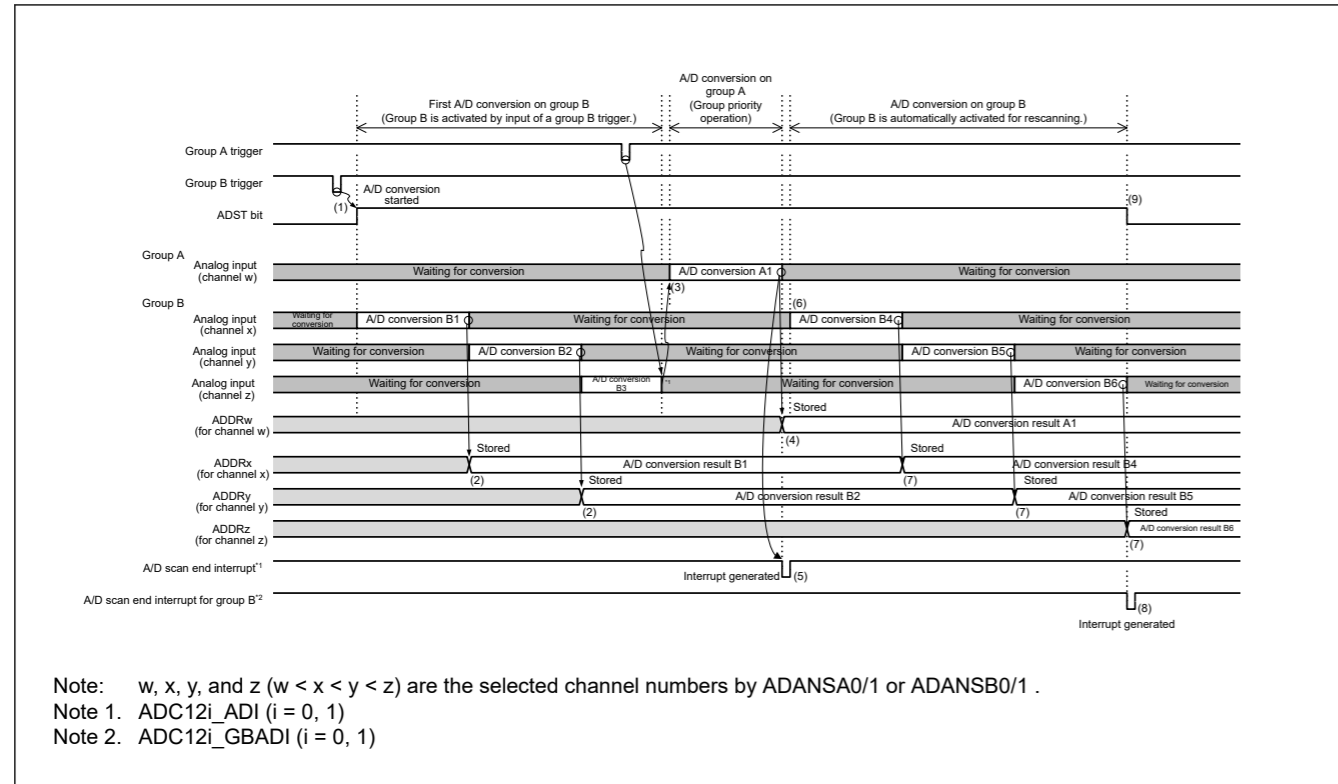

Figure 37.19 Example of group priority operation 1-1: Group A trigger input during group B scanning when rescanning is enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Operation example 1-2: “Group A trigger input during rescanning of group B” when rescanning is enabled

Figure 37.20 shows the operation when a group A trigger is input during rescanning operation for group B.

Even during rescanning operation, when a trigger for group A is input, A/D conversion on group B stops and A/D conversion for group A starts. A/D conversion for group B starts after A/D conversion for group A completes.

Operations for setting the ADCSR.ADST bit, storing the A/D conversion result in the corresponding A/D Data Register y (ADDRy), and generating interrupt requests are the same as those in operation example 1-1.

- 在B组的AD转换期间输入A组的触发信号时，B组的AD转换停止，而ADCSR.ADST位保持为1。然后在ADANSA0和ADANSA1寄存器中选择的A组模拟输入通道的AD转换开始根据编号n最小的通道的转换顺序。如果AD转换在完成之前停止，则转换结果不会存储在AD数据寄存器y(ADDRy)中。
- 在通道上完成AD转换后，结果将存储在相应的AD数据寄存器y(ADDRy)中。
- 如果ADCSR.ADIE位设置为1（扫描完成时允许产生中断），则产生扫描结束中断请求。
- 如果ADGSPCR.GBRSCN位设置为1（允许重新扫描在组优先操作中停止的组），则ADANSB0和ADANSB1寄存器中选择的B组模拟输入通道的AD转换根据转换顺序重新启动当ADCSR.ADST保持为1时，来自编号为n的最小通道。
- 在通道上完成AD转换后，结果将存储在相应的AD数据寄存器y(ADDRy)中。
- 如果ADCSR.GBADIE位设置为1（使能在B组扫描完成时产生中断），则产生B组扫描结束中断请求。
- 当所有通道的AD转换完成时，ADCSR.ADST位自动清零，AD转换器进入等待状态。

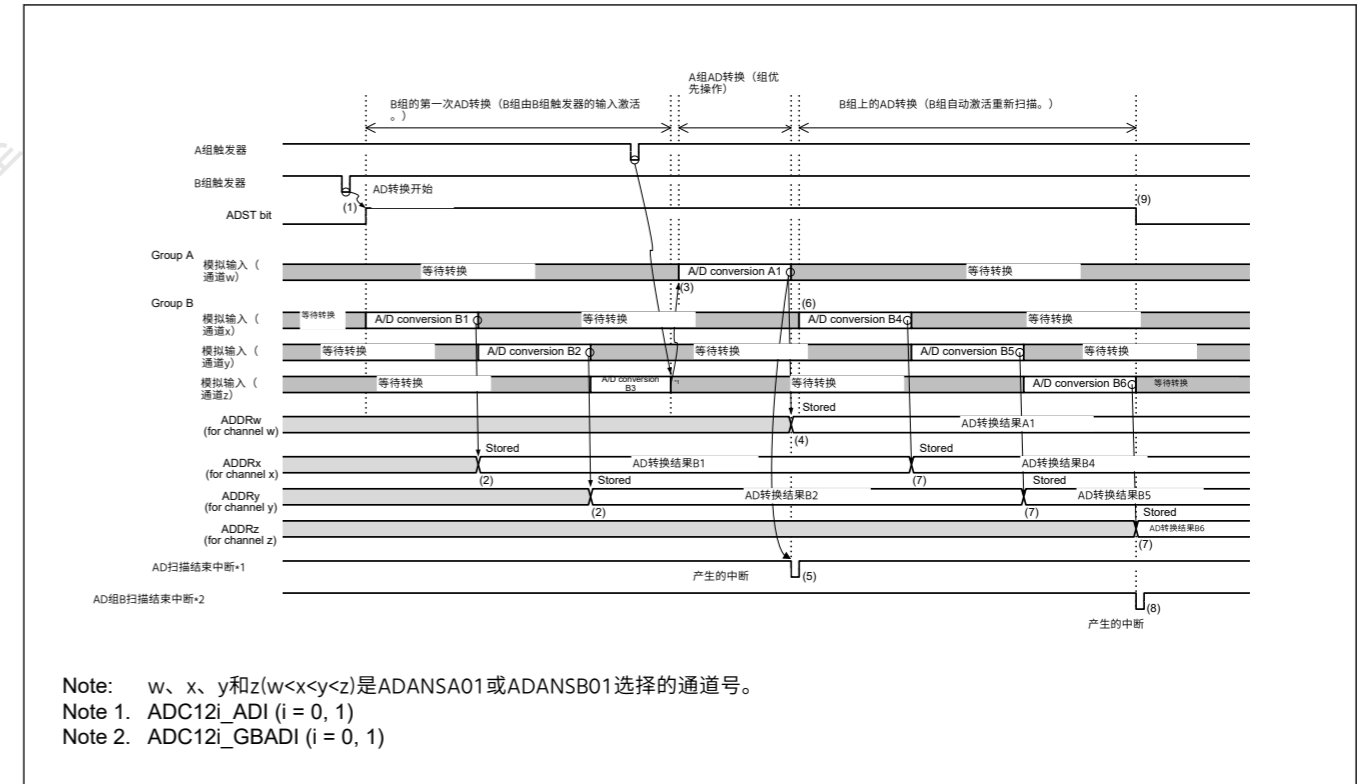

Figure 37.19 组优先操作1-1示例：启用重新扫描时，在B组扫描期间A组触发输入（当ADGSPCR.GBRSCN=1、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时）

操作示例1-2：启用重新扫描时的“B组重新扫描期间A组触发输入”

图37.20显示了在B组重新扫描操作期间输入A组触发时的操作。

即使在重新扫描操作期间，当输入A组触发时，B组的AD转换停止，A组的AD转换开始。B组的AD转换在A组的AD转换完成后开始。

设置ADCSR.ADST位、将AD转换结果存储到相应的AD数据寄存器y(ADDRy)以及产生中断请求的操作与操作示例1-1中的操作相同。

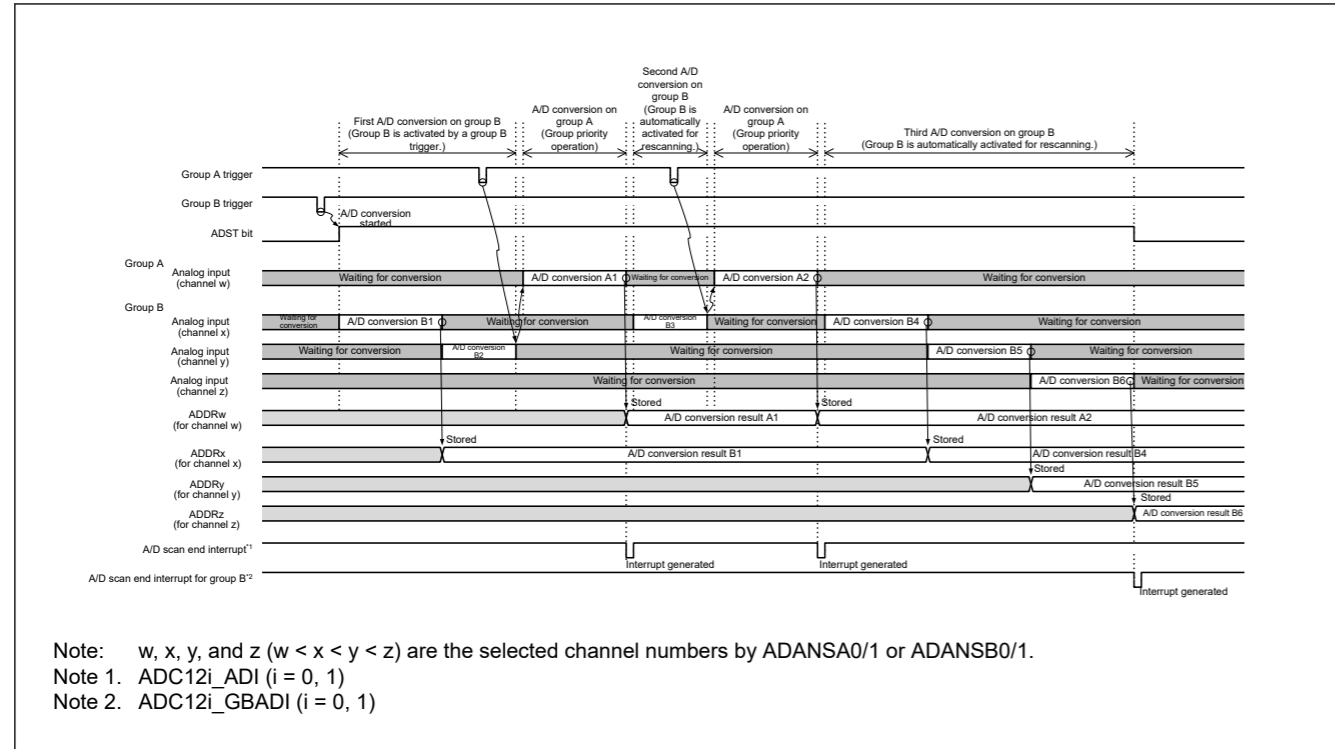

Figure 37.20 Example of group priority operation 1-2: Group A trigger input during rescanning of group B when rescanning is enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Operation example 1-3: “Group B trigger input during group A scan” when rescanning is enabled

The following describes the operation when the setting of the ADGSPCR.GBRSCN bit is 1 (enabling rescanning of the group that was stopped in group priority operation) and a trigger for group B is input during scanning operation for group A.

If the setting of the ADGSPCR.GBRSCN bit is 0, any trigger for group B that is input during scanning operation for group A is invalid.

- When input of a trigger for group A sets the ADCSR.ADST bit to 1 (starting A/D conversion), A/D conversion for the group A analog input channels selected in the ADANSA0 and ADANSA1 registers starts according to the conversion order from the channel with the smallest number n.
- When a trigger for group B is input during A/D conversion for group A, group B is ready for A/D conversion.
- On completion of A/D conversion for each channel in group A, the result is stored in the corresponding A/D Data Register y (ADDRy).
- If the setting of the ADCSR.ADIE bit is 1 (enabling interrupt generation upon completion of scanning), a scan end interrupt request is generated.
- When A/D conversion for group A completes, while the ADCSR.ADST bit remains 1, A/D conversion for the group B analog input channels selected in the ADANSB0 and ADANSB1 registers starts according to the conversion order from the channel with the smallest number n.  
(As with the case of operation example 1-1, if a trigger for group A is input during A/D conversion for group B, A/D conversion for group A starts. Then A/D conversion for group B starts upon completion of A/D conversion for group A.)
- On completion of A/D conversion of a single channel, the result is stored in the corresponding A/D Data Register y (ADDRy).
- Upon completion of A/D conversion for group B, a group B scan end interrupt request is generated if the setting of the ADCSR.GBADIE bit is 1 (enabling interrupt generation on completion of group B scan).
- When A/D conversion for all the channels completes, the ADCSR.ADST bit is automatically cleared and the A/D converter enters a wait state.

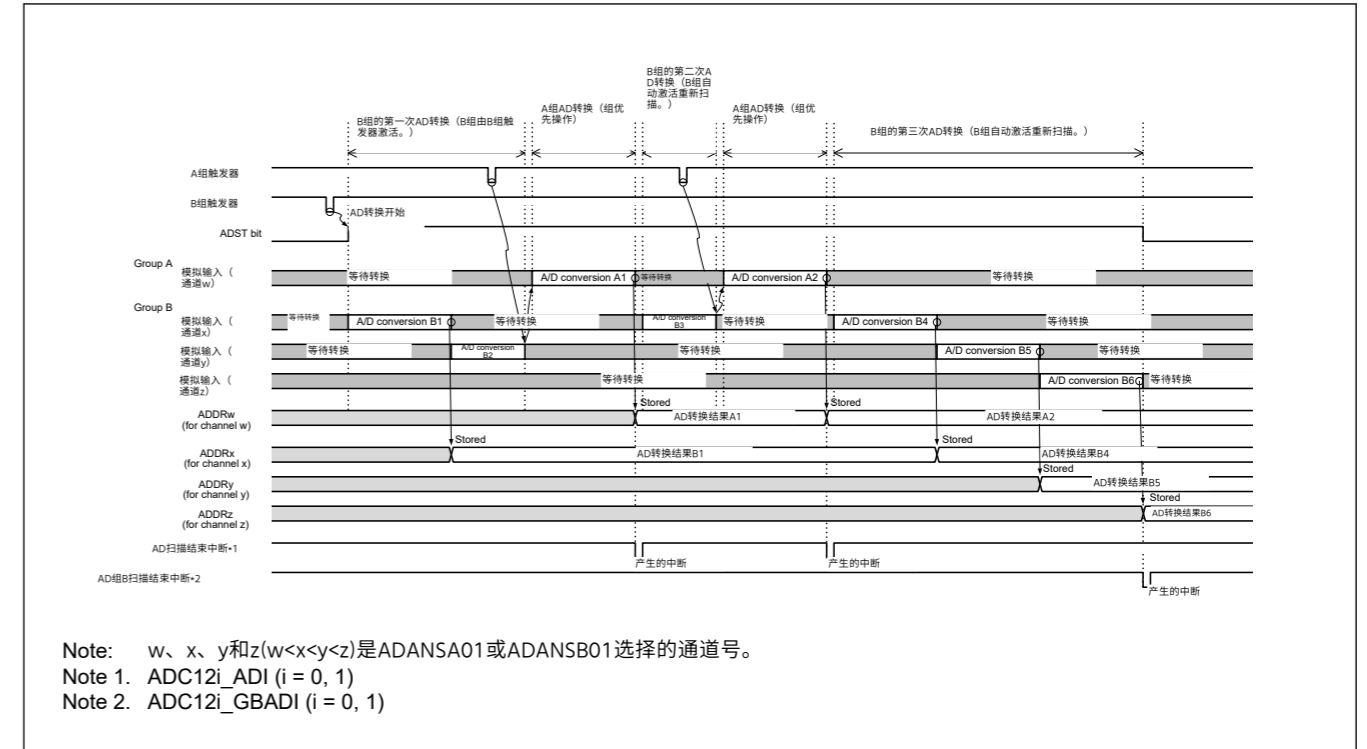

Figure 37.20 组优先操作1-2示例：启用重新扫描时（当ADGSPCR.GBRSCN=1、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时）在B组重新扫描期间A组触发输入

操作示例1-3：启用重新扫描时的“A组扫描期间B组触发输入”

下面介绍当ADGSPCR.GBRSCN位设置为1（允许重新扫描在组优先操作中停止的组）并且在A组扫描操作期间输入B组触发器时的操作。

如果ADGSPCR.GBRSCN位设置为0，则在组扫描操作期间输入的任何组B触发A无效。

- 当A组的触发输入将ADCSR.ADST位设置为1（开始AD转换）时，ADANSA0和ADANSA1寄存器中选择的A组模拟输入通道的AD转换根据通道的转换顺序开始最小的数n。
- 在A组AD转换期间输入B组触发器时，B组准备好进行AD转换。
- A组中每个通道的AD转换完成后，将结果存储在相应的AD数据寄存器y(ADDRy)中。
- 如果ADCSR.ADIE位设置为1（扫描完成时允许产生中断），则产生扫描结束中断请求。
- 当A组的AD转换完成，而ADCSR.ADST位保持为1时，ADANSB0和ADANSB1寄存器中选择的B组模拟输入通道的AD转换按照编号n最小通道的转换顺序开始。（与操作示例1-1的情况一样，如果在B组的AD转换期间输入了A组的触发信号，则A组的AD转换开始。然后，在A组的AD转换完成后，开始B组的AD转换。）
- 单通道AD转换完成后，结果存入对应的AD数据寄存器y(ADDRy)。
- B组的AD转换完成后，如果ADCSR.GBADIE位设置为1，则产生B组扫描结束中断请求（在B组扫描完成时允许产生中断）。
- 当所有通道的AD转换完成时，ADCSR.ADST位自动清零，AD转换器进入等待状态。

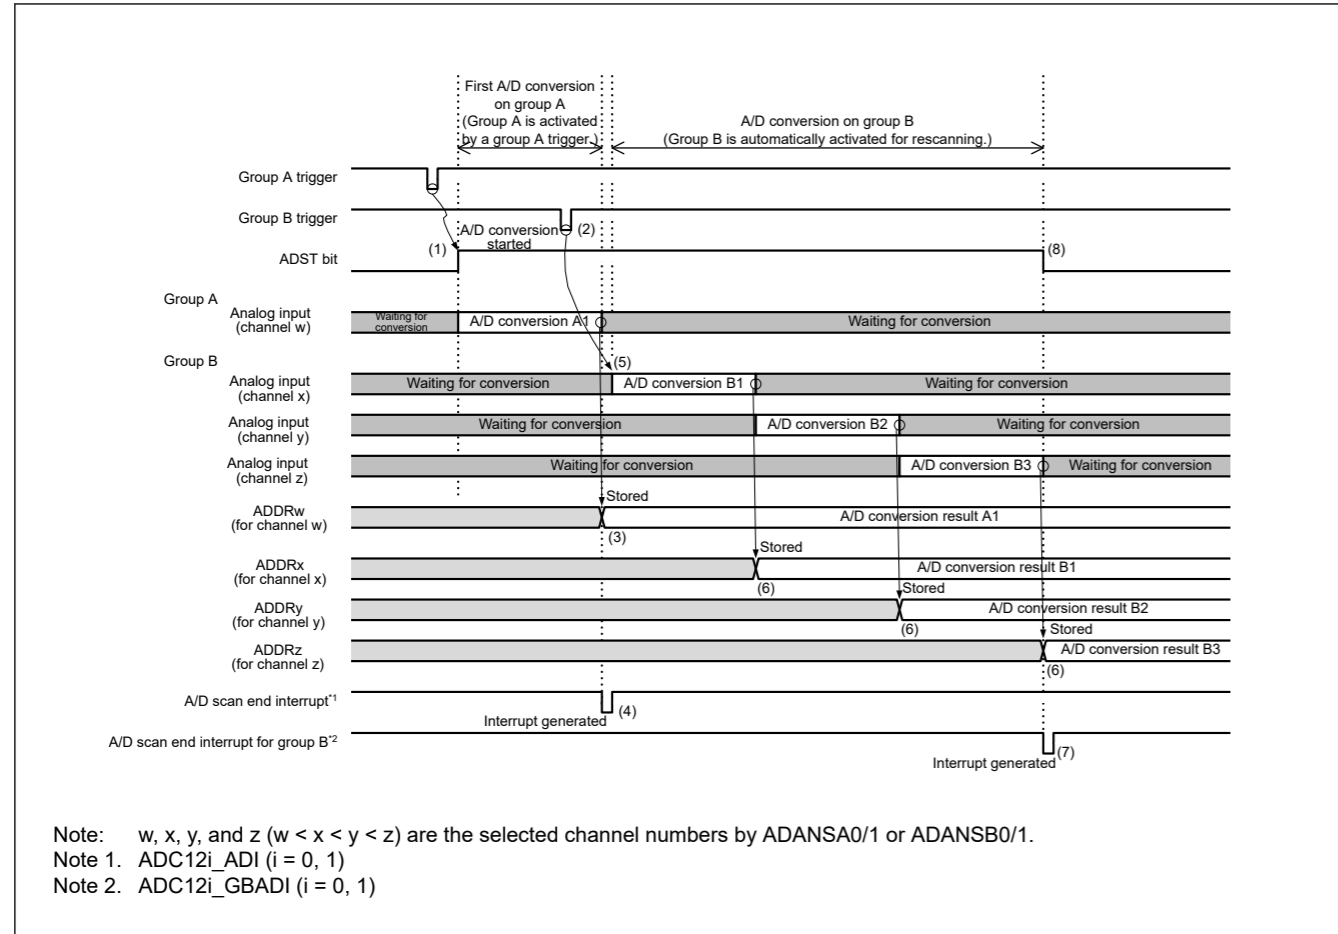

Figure 37.21 Example of group priority operation 1-3: Group B trigger input during group A scan when rescanning is enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Operation example 1-4 shows the group priority operation in group-scan mode (when ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 to 3 are selected for group B.

**Operation example 1-4: “Group A trigger input during group B scan” when rescanning is disabled**

- When input of a trigger for group B sets the ADCSR.ADST bit to 1 (starting A/D conversion), A/D conversion for the analog input channels selected in the ADANSB0 and ADANSB1 registers starts according to the conversion order from the channel with the smallest number n.
- On completion of A/D conversion for each channel in group B, the result is stored in the corresponding A/D Data Register y (ADDRy).
- When a trigger for group A is input during A/D conversion for group B, A/D conversion for group B stops while the ADCSR.ADST bit remains 1, and then A/D conversion for the group A analog input channels selected in the ADANSA0 and ADANSA1 registers starts according to the conversion order from the channel with the smallest number n. If A/D conversion stops before it is completed, the conversion result is not stored in the A/D Data Register y (ADDRy).
- On completion of A/D conversion of a single channel, the result is stored in the corresponding A/D Data Register y (ADDRy).
- On completion of A/D conversion for group A, a scan end interrupt request is generated if the setting of the ADCSR.ADIE bit is 1 (enabling interrupt generation upon completion of scanning).
- When A/D conversion for group A completes, the ADCSR.ADST bit is automatically cleared and the A/D converter enters a wait state. A/D conversion for group B is not performed until a trigger for group B is input the next time.

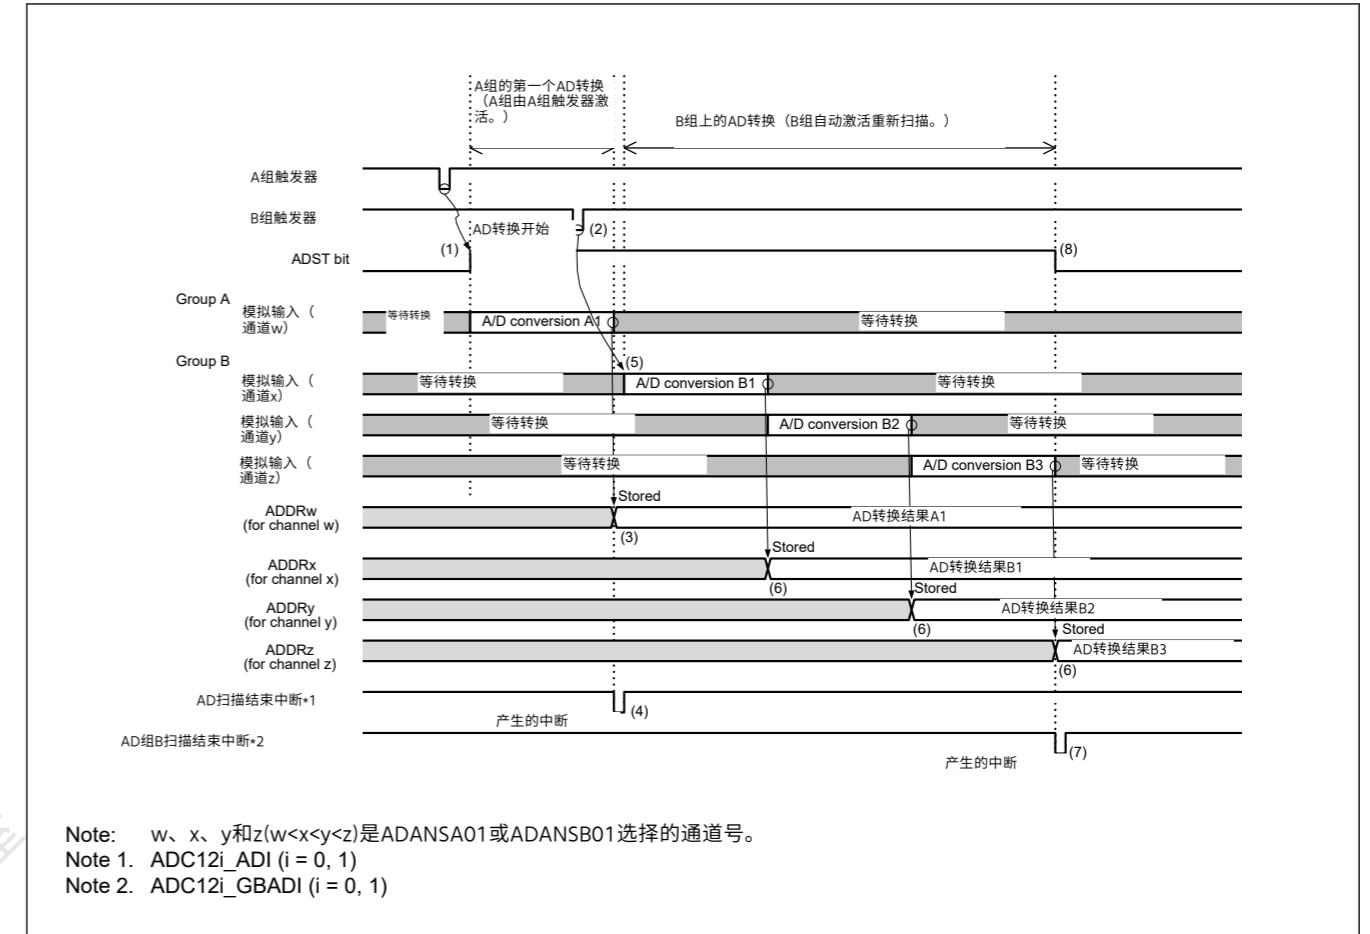

Figure 37.21 组优先操作1-3示例：启用重新扫描时A组扫描期间的B组触发输入（当ADGSPCR.GBRSCN=1、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时）

操作示例1-4显示了组扫描模式下的组优先级操作（当ADGSPCR.GBRSCN=0时，ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0）当为A组选择通道0并且为B组选择通道1至3时。

**操作示例1-4：禁用重新扫描时的“B组扫描期间A组触发输入”**

- 当B组的触发输入将ADCSR.ADST位设置为1（开始AD转换）时，ADANSB0和ADANSB1寄存器中选择的模拟输入通道的AD转换按照转换顺序从最小通道开始号码n。
- B组中每个通道的AD转换完成后，将结果存储在相应的AD数据寄存器y(ADDRy)中。
- 在B组AD转换期间输入A组触发时，在ADCSR.ADST位保持1时停止B组AD转换，然后在ADANSA0和ADANSA1寄存器按照转换顺序从编号n最小的通道开始。如果AD转换在完成之前停止，则转换结果不会存储在AD数据寄存器y(ADDRy)中。
- 单通道AD转换完成后，结果存入对应的AD数据寄存器y(ADDRy)。
- 完成A组的AD转换后，如果ADCSR.ADIE位设置为1，则产生扫描结束中断请求（扫描完成时允许产生中断）。
- 当A组的AD转换完成时，ADCSR.ADST位自动清零，AD转换器进入等待状态。直到下次输入B组的触发后，才会执行B组的AD转换。

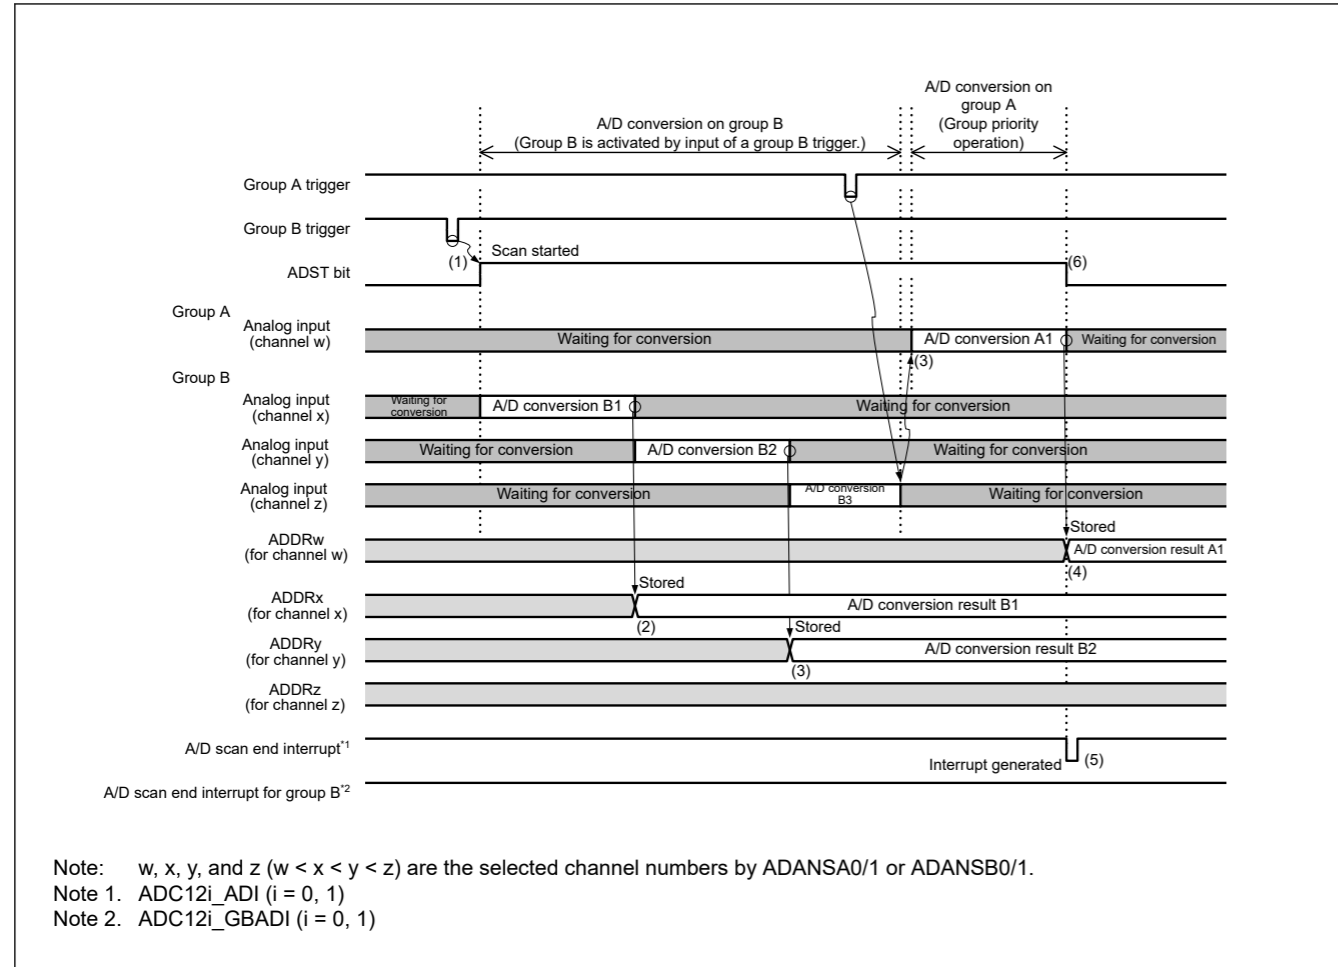

Figure 37.22 Group priority operation example 1-4: “Group A trigger is input during group B scan” when rescanning is disabled (when ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Operation example 1-5 shows the group priority operation in group-scan mode (when ADGSPCR.GBRP = 1, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 and 2 are selected for group B.

**Operation example 1-5: Continuously activating single-scan operation for group B**

- When ADGSPCR.GBRP = 1 is set, the ADCSR.ADST bit is set to 1 (starting A/D conversion) and A/D conversion for the analog input channels selected in the ADANSB0 and ADANSB1 registers starts according to the conversion order from the channel with the smallest number n.
- On completion of A/D conversion for each channel in group B, the result is stored in the corresponding A/D Data Register y (ADDRy).
- When a trigger for group A is input during A/D conversion for group B, A/D conversion for group B stops while the ADCSR.ADST bit remains 1, and then A/D conversion for group A analog input channels selected in the ADANSA0 and ADANSA1 registers starts according to the conversion order z from the channel with the smallest number n. If A/D conversion stops before it is completed, the conversion result is not stored in the A/D Data Register y (ADDRy).
- On completion of A/D conversion of a single channel, the result is stored in the corresponding A/D Data Register y (ADDRy).
- On completion of A/D conversion for group A, a scan end interrupt request is generated if the setting of the ADCSR.ADIE bit is 1 (enabling interrupt generation upon completion of scanning).
- If ADGSPCR.GBRP = 1 is set (performing single scan continuously), A/D conversion for the group B analog input channels selected in the ADANSB0 and ADANSB1 registers restarts according to the conversion order from the channel with the smallest number n while the ADCSR.ADST remains 1 (starting A/D conversion).
- On completion of A/D conversion of a single channel, the result is stored in the corresponding A/D Data Register y (ADDRy).

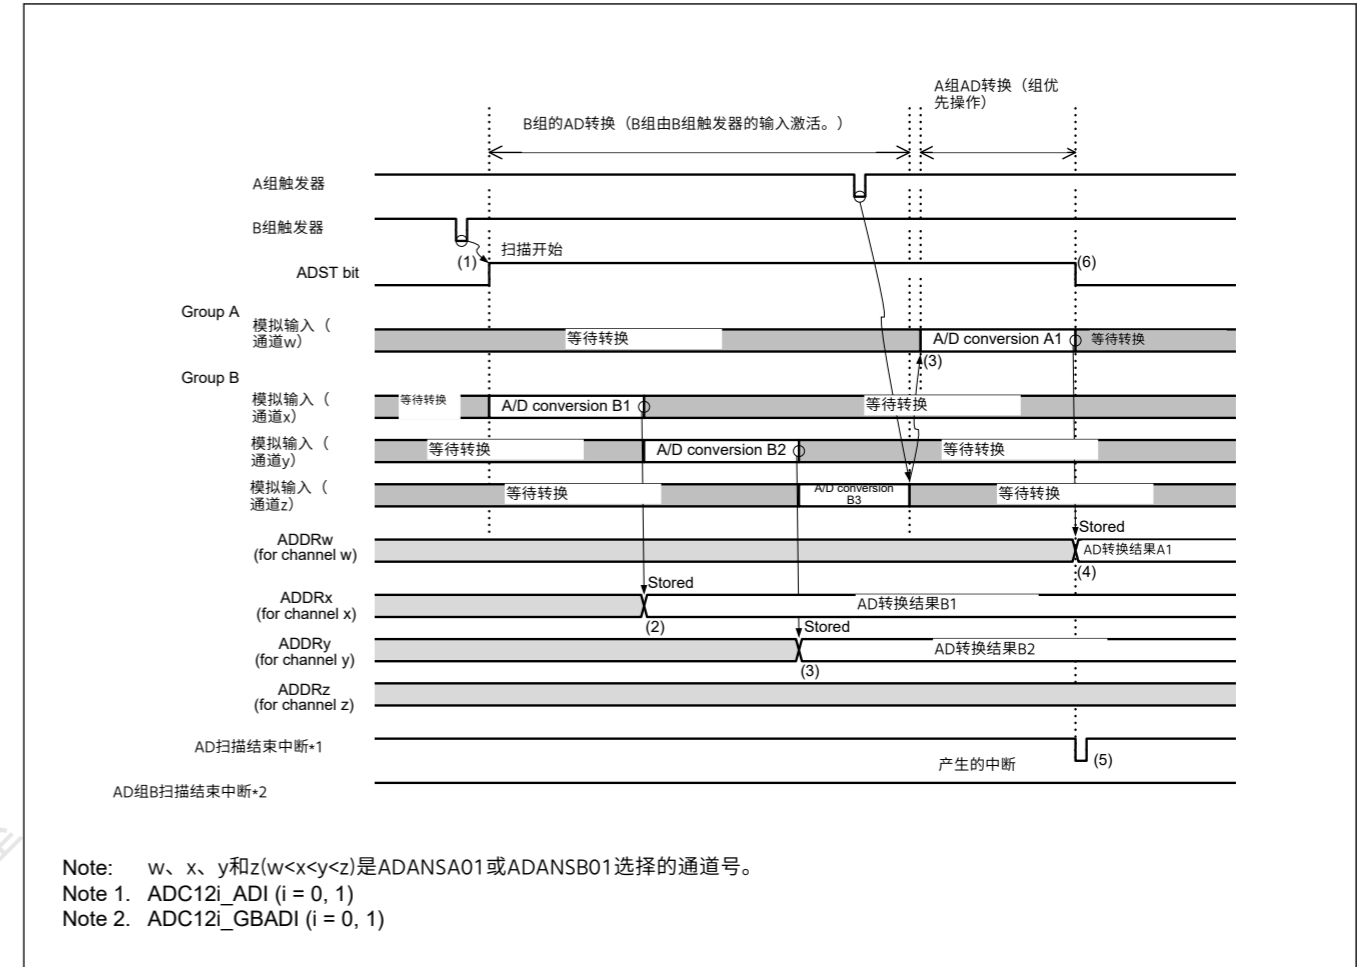

Figure 37.22 组优先操作示例1-4: “在B组扫描期间输入A组触发”当禁用重新扫描时 (当ADGSPCR.GBRSCN=0、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时)

操作示例1-5显示了组扫描模式下的组优先级操作 (当ADGSPCR.GBRP=1, 并且ADGSPCR.LGRRS=0) 当为A组选择通道0并且为B组选择通道1和2时。

**操作示例1-5: B组连续激活单扫描操作**

- 当设置ADGSPCR.GBRP=1时, ADCSR.ADST位设置为1 (开始AD转换), 并且ADANSB0和ADANSB1寄存器中选择的模拟输入通道的AD转换根据通道的转换顺序开始最小的数n。
- B组中每个通道的AD转换完成后, 将结果存储在相应的AD数据寄存器y(ADDRy)中。
- 在B组的AD转换期间输入A组的触发信号时, B组的AD转换停止, 而ADCSR.ADST位保持为1, 然后在ADANSA0和ADANSA1寄存器中选择的A组模拟输入通道的AD转换开始根据编号为n的通道的转换顺序z。如果AD转换在完成之前停止, 则转换结果不会存储在AD数据寄存器y(ADDRy)中。
- 单通道AD转换完成后, 结果存入对应的AD数据寄存器y(ADDRy)。
- 完成A组的AD转换后, 如果ADCSR.ADIE位设置为1, 则产生扫描结束中断请求 (扫描完成时允许产生中断)。
- 如果设置ADGSPCR.GBRP=1 (连续执行单次扫描), B组模拟输入的AD转换在ADANSB0和ADANSB1寄存器中选择的通道根据转换顺序从具有最小编号n的通道重新启动, 而ADCSR.ADST保持为1 (开始AD转换)。
- 单通道AD转换完成后, 结果存入对应的AD数据寄存器y(ADDRy)。

- If the setting of the ADCSR.GBADIE bit is 1 (enabling interrupt generation on completion of group B scan), a group B scan end interrupt request is generated.
- If ADGSPCR.GBRP = 1 is set (performing single scan continuously), A/D conversion for the group B analog input channels selected in the ADANSB0 and ADANSB1 registers restarts according to the conversion order from the channel with the smallest number n while the ADCSR.ADST remains 1 (starting A/D conversion).

Steps 6 to 9 are repeated as long as the ADGSPCR.GBRP bit remains 1. Do not clear the ADCSR.ADST bit as long as the ADGSPCR.GBRP bit is 1. To forcibly stop A/D conversion while ADGSPCR.GBRP = 1, follow the procedure shown in Figure 37.38.

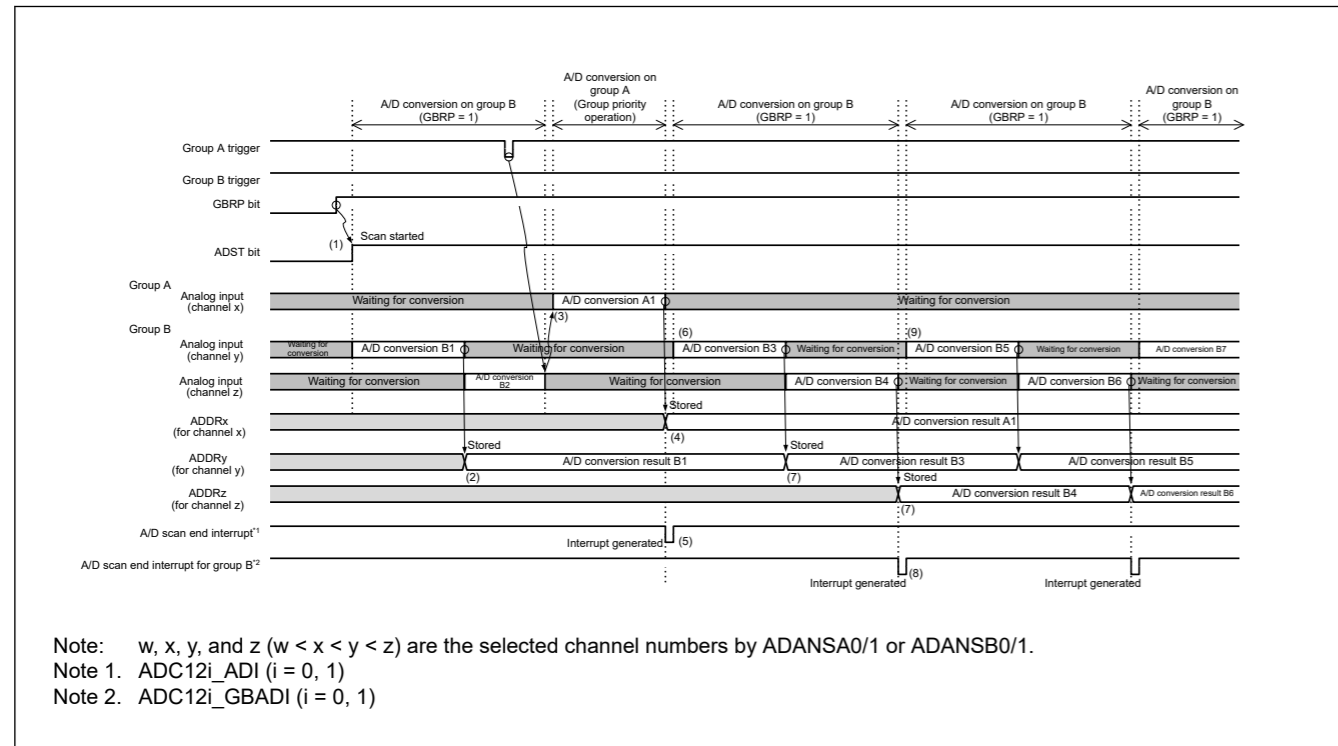

Figure 37.23 Group priority operation example 1-5: Continuously activating single scan for group B (when ADGSPCR.GBRP = 1, ADGSPCR.LGRRS = 0)

Note: To continuously activate single-scan operation for group B, disable group B trigger input.

### 37.3.5 Interleaved operation

Interleaved operation is that two ADC units convert same one pin alternately in order to obtain the data faster. This function can be used with the channel AN000/AN100, AN001/AN101 or AN002/AN102 and can be used in single scan mode and continuous scan mode. Regarding trigger, synchronous trigger and external trigger are suitable to use. It is recommended to use synchronous trigger with AGT or GPT events in order to ensure AD conversion timing.

#### 37.3.5.1 Trigger input timing

Trigger input timing for each ADC units should be controlled not to overlap each sampling period as shown in Figure 37.24 and Table 37.26. For timing parameter ( $t_{SPL}$ ,  $t_{SAM}$  and  $t_{SCAN}$ ), refer to Table 37.27.

- 如果ADCSR.GBADIE位设置为1（使能在B组扫描完成时产生中断），则产生B组扫描结束中断请求。
- 如果设置ADGSPCR.GBRP=1（连续执行单次扫描），B组模拟输入的AD转换在ADANSB0和ADANSB1寄存器中选择的通道根据转换顺序从具有最小编号n的通道重新启动，而ADCSR.ADST保持为1（开始AD转换）。

只要ADGSPCR.GBRP位保持为1，就重复步骤6到9。不要清除ADCSR.ADST位，只要ADGSPCR.GBRP位为1。要在ADGSPCR.GBRP=1时强制停止AD转换，请按照以下步骤进行操作 Figure 37.38.

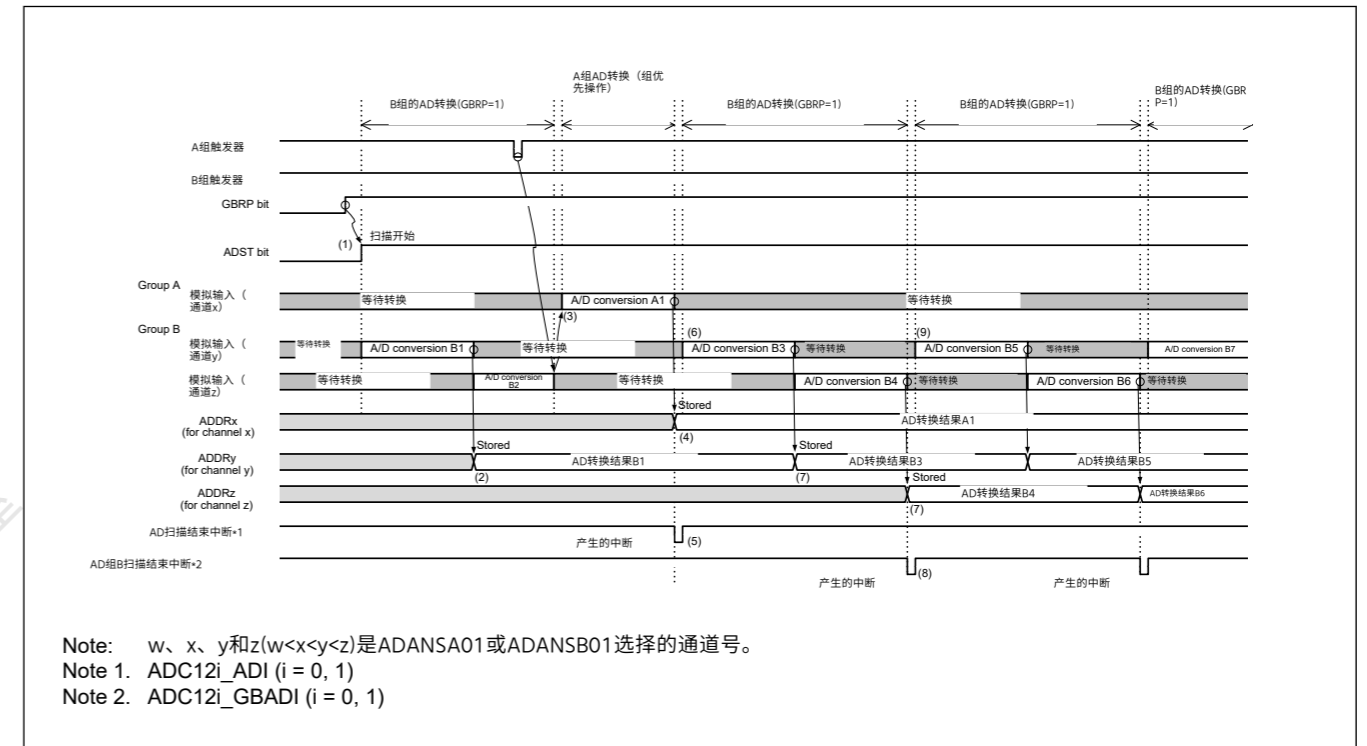

Figure 37.23 组优先操作示例1-5: B组连续激活单次扫描 (当 ADGSPCR.GBRP = 1, ADGSPCR.LGRRS = 0)

Note: 要连续激活B组的单次扫描操作，请禁用B组触发输入。

### 37.3.5 Interleaved operation

交错操作是两个ADC单元交替转换相同的一个引脚以更快地获取数据。此功能可与通道AN000AN100、AN001AN101或AN002AN102一起使用，可用于单次扫描模式和连续扫描模式。关于触发，适合使用同步触发和外触发。建议使用与AGT或GPT事件同步触发，以确保AD转换时序。

#### 37.3.5.1 触发输入时序

每个ADC单元的触发输入时序应控制为不与每个采样周期重叠，如图37.24和表37.26所示。关于时序参数 ( $t_{SPL}$ 、 $t_{SAM}$ 和 $t_{SCAN}$ )，请参见表37.27。

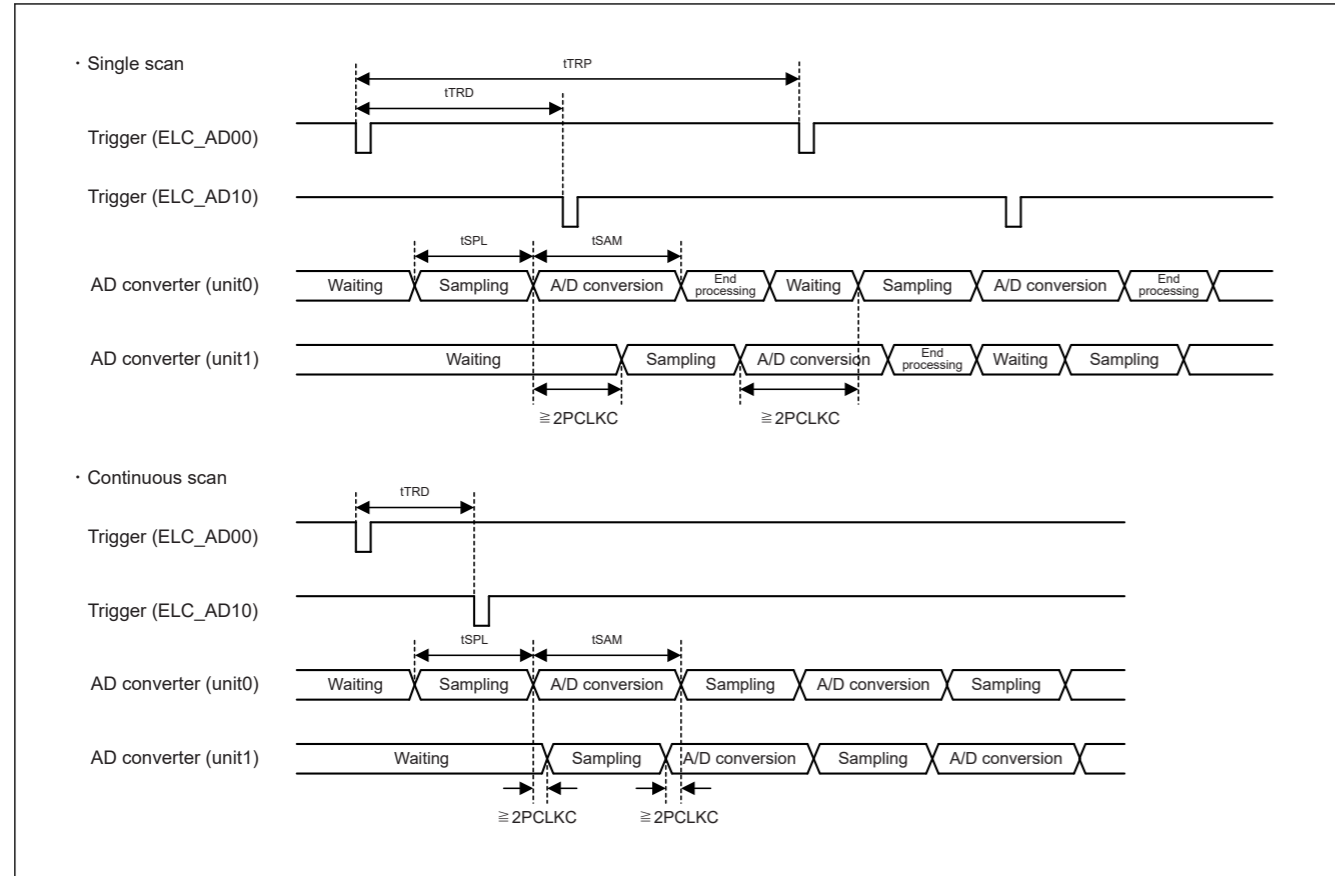

Figure 37.24 Trigger input timing in interleaved operation

Table 37.26 Setting for trigger input timing in interleaved operation

| Parameter                     | Symbol          | Min                | Max                          |
|-------------------------------|-----------------|--------------------|------------------------------|
| Trigger issuance delay period | Single scan     | $t_{SPL} + 2PCLKC$ | $t_{TRP} - t_{SPL} - 2PCLKC$ |
|                               | Continuous scan | $t_{TRD}$          | $t_{SAM} - 2PCLKC$           |
| Trigger issuance period       | $t_{TRP}$       | $t_{SCAN}$         | —                            |

### 37.3.5.2 Continuous scan mode

In this operation, assuming two ADC units are set to the same sampling period and conversion period.

The operation is as follows:

- When the ADCSR.ADST bit of ADC0 is set to 1 by a synchronous trigger input (ELC) or asynchronous trigger input, A/D conversion is performed for the selected channel.
- After certain period is elapsed after ADC0 starts (refer to [section 37.3.5.1. Trigger input timing](#)), when ADCSR.ADST bit of ADC1 is set to 1 by a synchronous trigger input (ELC) or asynchronous trigger input for the channel which is same analog input pin with ADC0.
- A/D conversion of ADC0 completes prior to completion of ADC1. Then ADC120\_ADI interrupt request is generated. ADC0 sequentially starts A/D conversion. A/D conversion is continued as long as ADCSR.ADST remains 1.
- A/D conversion of ADC1 completes after completion of ADC0. Then ADC121\_ADI interrupt request is generated. A/D conversion of ADC1 is continued as well as ADC0.

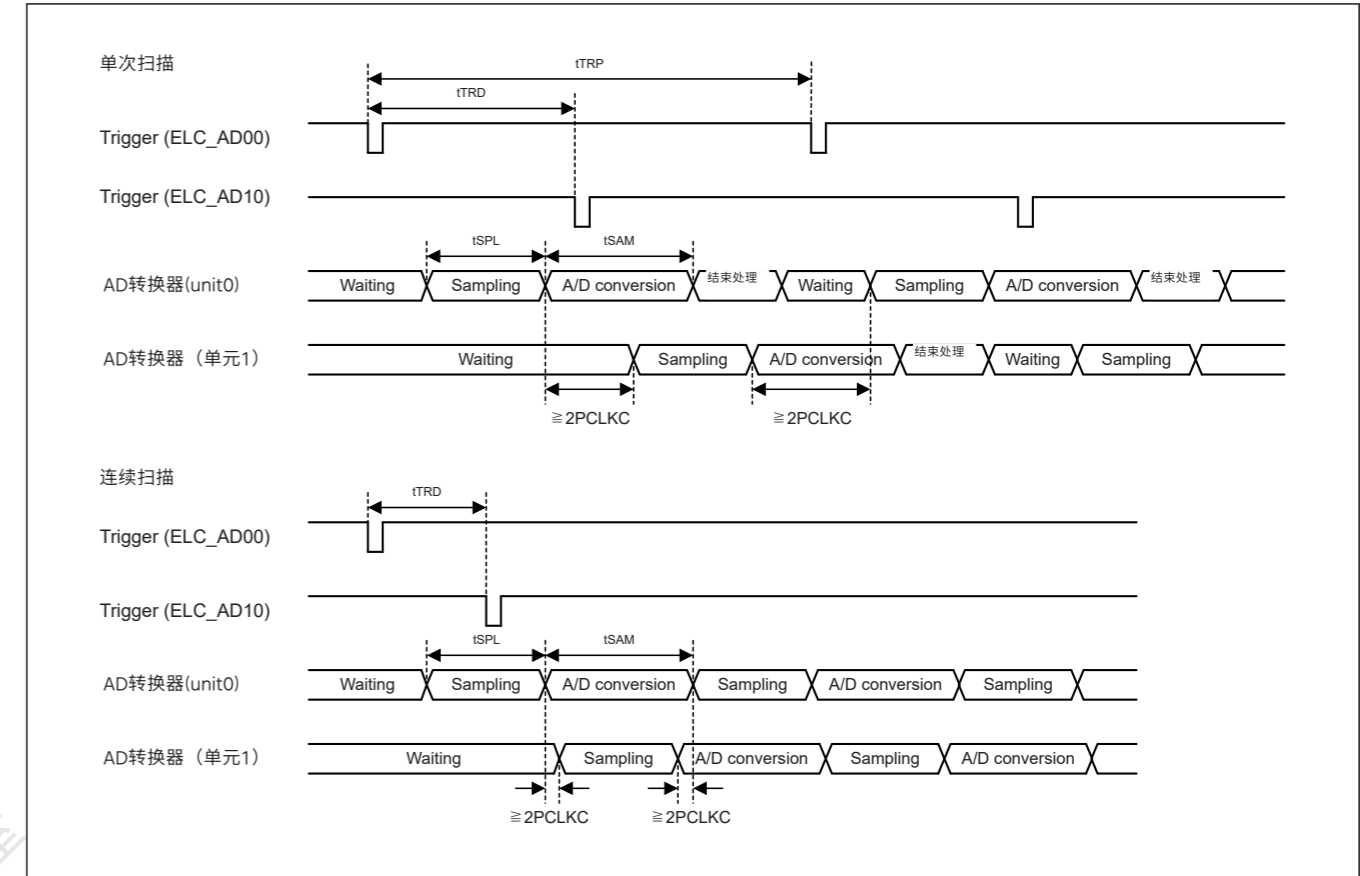

Figure 37.24 交错操作中的触发输入时序

Table 37.26 交错操作中触发输入时序的设置

| Parameter | Symbol    | Min                | Max                          |
|-----------|-----------|--------------------|------------------------------|
| 触发行延迟期    | 单次扫描      | $t_{SPL} + 2PCLKC$ | $t_{TRP} - t_{SPL} - 2PCLKC$ |
|           | 连续扫描      | $t_{TRD}$          | $t_{SAM} - 2PCLKC$           |
| 触发行期      | $t_{TRP}$ | $t_{SCAN}$         | —                            |

### 37.3.5.2 连续扫描模式

在此操作中，假设两个ADC单元设置为相同的采样周期和转换周期。

操作如下：

- 当同步触发输入(ELC)或异步触发输入将ADC0的ADCSR.ADST位设置为1时，对所选通道执行AD转换。
- ADC0启动后经过一定时间后（参见第37.3.5.1节。触发输入时序），当ADC1的ADCSR.ADST位通过同步触发输入(ELC)或异步触发输入设置为1的通道时，是与ADC0相同的模拟输入引脚。
- ADC0的AD转换在ADC1完成之前完成。然后产生ADC120\_ADI中断请求。ADC0依次启动AD转换。只要ADCSR.ADST保持1，D转换就会继续。
- ADC0完成后，ADC1的AD转换完成。然后产生ADC121\_ADI中断请求。ADC1的D转换与ADC0一样继续进行。

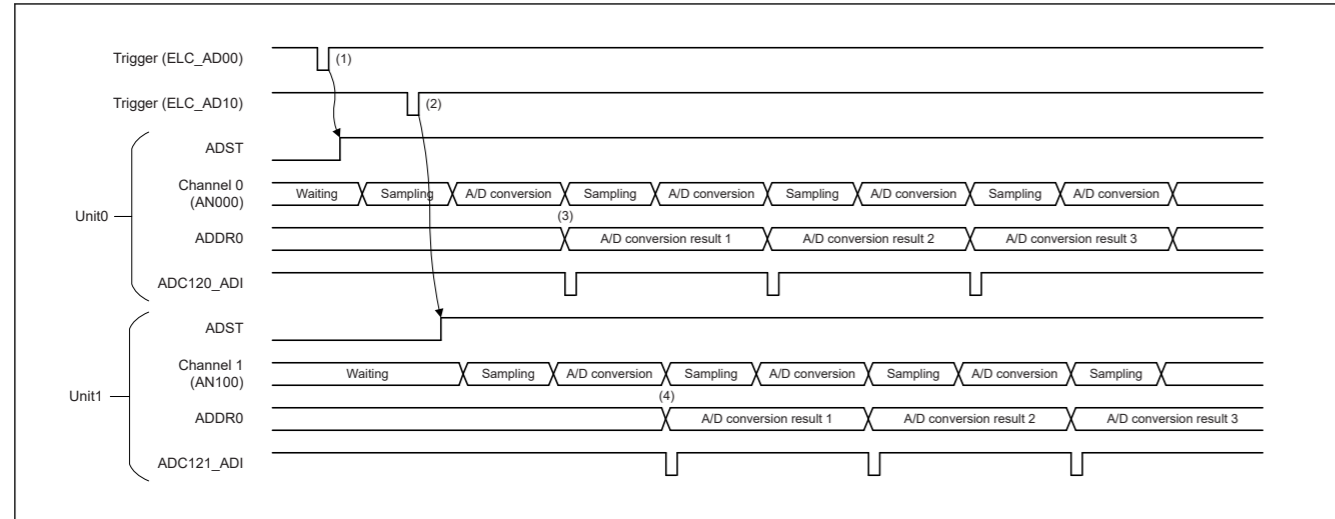

Figure 37.25 Example operation in continuous scan mode when AN000 and AN100 are selected in interleaved operation

### 37.3.5.3 Single scan mode

In this operation, assuming two ADC units are set to the same sampling period and conversion period.

The operation is as follows:

1. When the ADCSR.ADST bit of ADC0 is set to 1 by a synchronous trigger input (ELC) or asynchronous trigger input, A/D conversion is performed for the selected channel.
2. After certain period is elapsed after ADC0 starts (refer to [section 37.3.5.1. Trigger input timing](#)), when ADCSR.ADST bit of ADC1 is set to 1 by a synchronous trigger input (ELC) or asynchronous trigger input for the channel which is same analog input pin with ADC0.
3. A/D conversion of ADC0 completes prior to completion of ADC1. Then ADC120\_ADI interrupt request is generated.
4. When A/D conversion of ADC0 completes, ADCSR.ADST bit is automatically cleared to 0. Then ADC120 enters a wait state.
5. Restart A/D conversion of ADC0. Let the sampling starts during conversion period of ADC1.
6. A/D conversion of ADC1 completes after the restart of ADC0. Then ADC121\_ADI interrupt request is generated.
7. When A/D conversion of ADC1 completes, ADCSR.ADST bit is automatically cleared to 0. Then ADC121 enters a wait state.
8. Restart A/D conversion of ADC1. Let the sampling starts during conversion period of ADC0.

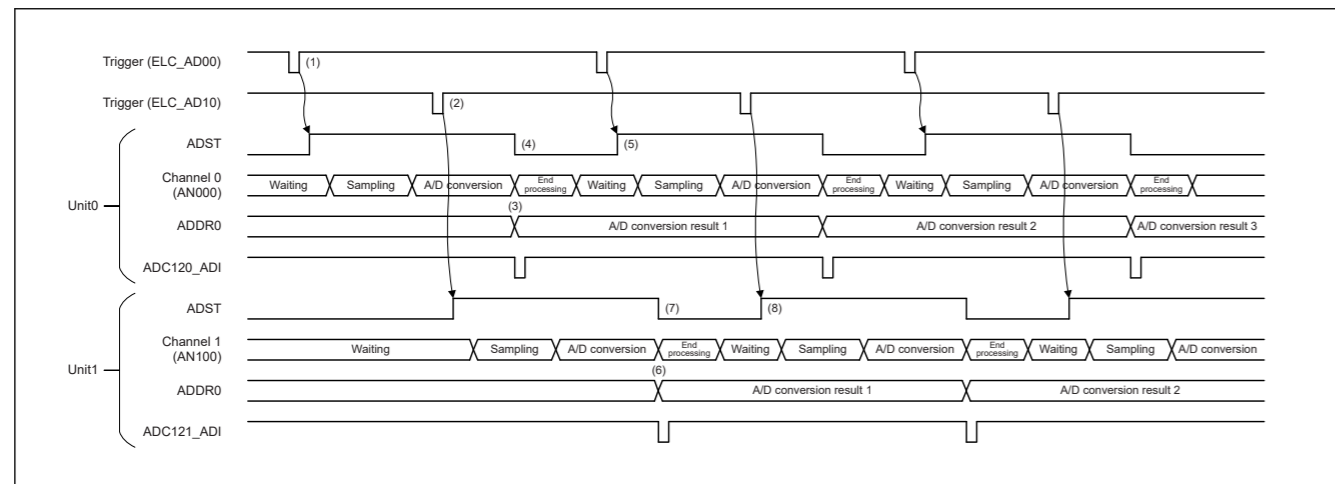

Figure 37.26 Example operation in single scan mode when AN000 and AN100 are selected in interleaved operation

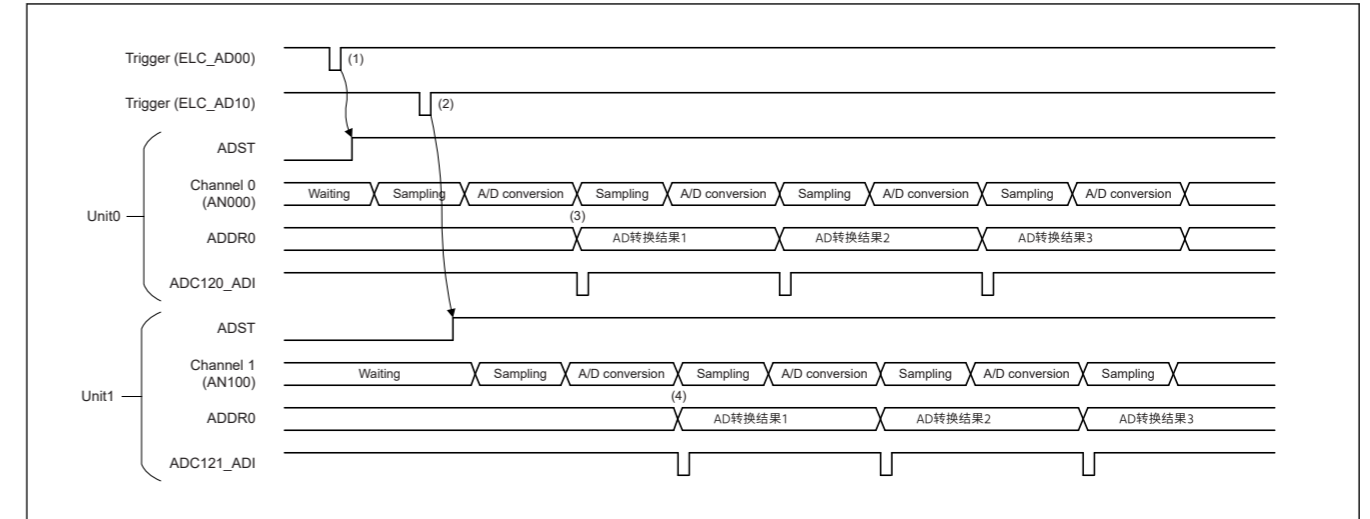

Figure 37.25 在交错操作中选择AN000和AN100时连续扫描模式下的示例操作

### 37.3.5.3 单次扫描模式

在此操作中，假设两个ADC单元设置为相同的采样周期和转换周期。

操作如下：

- 1.当同步触发输入(ELC)或异步触发输入将ADC0的ADCSR.ADST位设置为1时，对所选通道执行AD转换。
- 2.ADC0启动后经过一定时间后（参见第37.3.5.1节。触发输入时序），当ADC1的ADCSR.ADST位通过同步触发输入(ELC)或异步触发输入设置为1的通道时，是与ADC0相同的模拟输入引脚。
- 3.ADC0的AD转换在ADC1完成之前完成。然后产生ADC120\_ADI中断请求。
- 4.ADC0的AD转换完成后，ADCSR.ADST位自动清0。ADC120进入等待状态。
- 5.重启ADC0的AD转换。让采样在ADC1的转换期间开始。
- 6.ADC0重启后ADC1的AD转换完成。然后产生ADC121\_ADI中断请求。
- 7.ADC1AD转换完成后，ADCSR.ADST位自动清0。ADC121进入等待状态。
- 8.重新启动ADC1的AD转换。让采样在ADC0的转换期间开始。

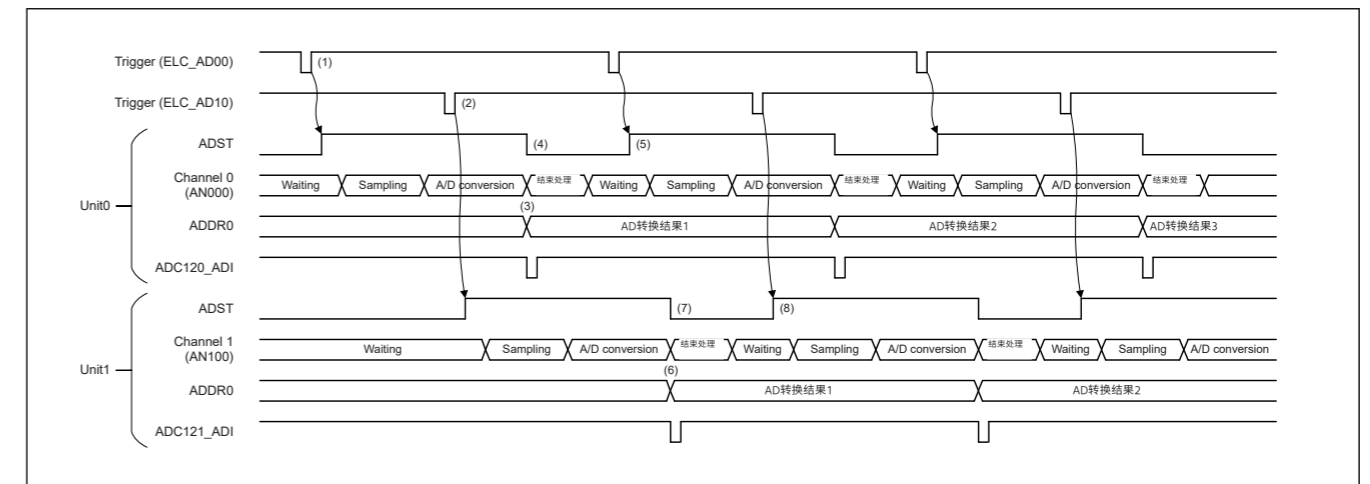

Figure 37.26 在交错操作中选择AN000和AN100时单扫描模式下的示例操作

### 37.3.5.4 Single scan mode with extended double-trigger mode

In this operation, assuming two ADC units are set to the same sampling period and conversion period.

For details of operation in extended double-trigger mode, please refer to [section 37.3.2.5. Extended operations when double-trigger mode is selected.](#)

This operation can decimate period of interrupt generation and the conversion data can be read in consecutive address with ADDBLDRA and ADDBLDRB register.

The operation is as follows:

1. When the ADCSR.ADST bit of ADC0 is set to 1 by a synchronous trigger input (ELC\_AD00), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. After certain period is elapsed after ADC0 starts (refer to [section 37.3.5.1. Trigger input timing](#)), when ADCSR.ADST bit of ADC1 is set to 1 by a synchronous trigger input (ELC\_AD10) for the channel which is same analog input pin with ADC0.
3. A/D conversion of ADC0 completes prior to completion of ADC1. The A/D conversion result is stored in the ADC0's associated A/D Data Register y (ADDRy) and in A/D Data Duplexing Register A (ADDBLDRA).
4. The ADCSR.ADST bit is automatically cleared to 0 and the ADC120 enters a wait state. An ADC120\_ADI interrupt request is not generated.
5. Restart A/D conversion of ADC0 by a synchronous trigger input (ELC\_AD01). Let the sampling starts during conversion period of ADC1.
6. A/D conversion of ADC1 completes. The A/D conversion result is stored in the ADC1's associated A/D Data Register y (ADDRy) and in A/D Data Duplexing Register A (ADDBLDRA).
7. The ADCSR.ADST bit is automatically cleared to 0 and the ADC121 enters a wait state. An ADC121\_ADI interrupt request is not generated.
8. Restart A/D conversion of ADC1 by a synchronous trigger input (ELC\_AD11). Let the sampling starts during conversion period of ADC0.
9. A/D conversion of ADC0 completes. The A/D conversion result is stored in the ADC0's A/D Data Duplexing Register (ADDBLDR) and in A/D Data Duplexing Register B (ADDBLDRB).
10. The ADCSR.ADST bit is automatically cleared to 0 and the ADC120 enters a wait state. An ADC120\_ADI interrupt request is generated.
11. Restart A/D conversion of ADC0 by a synchronous trigger input (ELC\_AD00). Let the sampling starts during conversion period of ADC1.
12. A/D conversion of ADC1 completes. The A/D conversion result is stored in the ADC1's A/D Data Duplexing Register (ADDBLDR) and in A/D Data Duplexing Register B (ADDBLDRB).
13. The ADCSR.ADST bit is automatically cleared to 0 and the ADC121 enters a wait state. An ADC121\_ADI interrupt request is generated.
14. Restart A/D conversion of ADC1 by a synchronous trigger input (ELC\_AD10). Let the sampling starts during conversion period of ADC0.

### 37.3.5.4 具有扩展双触发模式的单扫描模式

在此操作中，假设两个ADC单元设置为相同的采样周期和转换周期。

扩展双触发模式下的操作细节请参考37.3.2.5节。选择双触发模式时的扩展操作。

此操作可以抽取中断产生的周期，并且可以在连续地址中读取转换数据 ADDBLDRA和ADDBLDRB寄存器。

操作如下：

- 1.当同步触发输入(ELC\_AD00)将ADC0的ADCSR.ADST位设置为1时，ADCSR.DBLANS[4:0]位中选择的单通道开始AD转换。
- 2.ADC0启动后经过一定时间后（请参阅第37.3.5.1节。触发输入时序），当ADC1的ADCSR.ADST位被同步触发输入(ELC\_AD10)设置为1时，对于相同的模拟输入通道引脚与ADC0。
- 3.ADC0的AD转换在ADC1完成之前完成。AD转换结果存储在ADC0相关的AD数据寄存器y(ADDRy)和AD数据双工寄存器A(ADDBLDRA)中。
- 4.ADCSR.ADST位自动清零，ADC120进入等待状态。不会产生ADC120\_ADI中断请求。
- 5.通过同步触发输入(ELC\_AD01)重新启动ADC0的AD转换。让采样在ADC1的转换期间开始。
- 6.ADC1的AD转换完成。AD转换结果存储在ADC1相关的AD数据寄存器y(ADDRy)和AD数据双工寄存器A(ADDBLDRA)中。
- 7.ADCSR.ADST位自动清零，ADC121进入等待状态。不会产生ADC121\_ADI中断请求。
- 8.通过同步触发输入(ELC\_AD11)重新启动ADC1的AD转换。让采样在ADC0的转换期间开始。
- 9.ADC0的AD转换完成。AD转换结果存储在ADC0的AD数据双工寄存器(ADDBLDR)和AD数据双工寄存器B(ADDBLDRB)中。
- 10.ADCSR.ADST位自动清零，ADC120进入等待状态。产生一个ADC120\_ADI中断请求。
- 11.通过同步触发输入(ELC\_AD00)重新启动ADC0的AD转换。让采样在ADC1的转换期间开始。
- 12.ADC1的AD转换完成。AD转换结果存储在ADC1的AD数据双工寄存器(ADDBLDR)和AD数据双工寄存器B(ADDBLDRB)中。
- 13.ADCSR.ADST位自动清零，ADC121进入等待状态。产生一个ADC121\_ADI中断请求。
- 14.通过同步触发输入(ELC\_AD10)重新启动ADC1的AD转换。让采样在ADC0的转换期间开始。

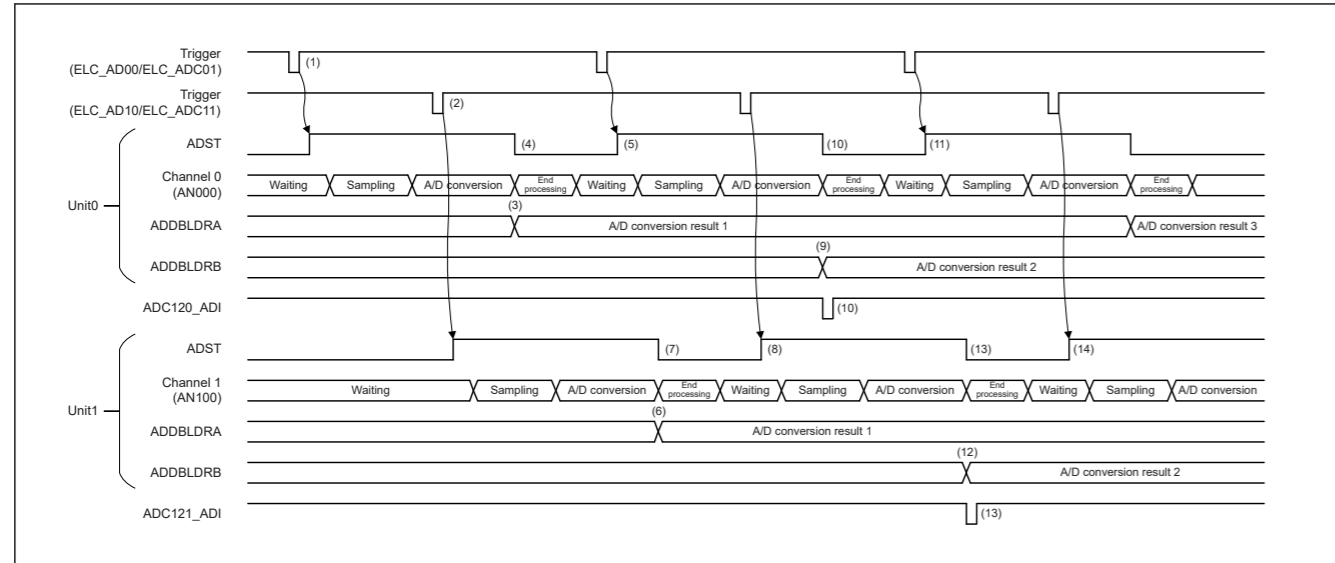

Figure 37.27 Example operation in single scan mode with extended double-trigger mode when AN000 and AN100 are selected in interleaved operation

### 37.3.6 Compare Function for Windows A and B

#### 37.3.6.1 Compare function windows A and B

The compare function compares a reference value with the A/D conversion result. The reference value can be set for Window A and Window B independently. When the compare function is in use, the self-diagnosis function and double trigger mode cannot be used. The main differences between Window A and Window B are their different interrupt output signals and the constraint on Window B of only one selectable channel.

This section provides an example operation that combines continuous scan mode and the compare function.

The operation is as follows:

- When the ADCSR.ADST bit is set to 1 (A/D conversion start) by software, a synchronous trigger (ELC) or an asynchronous trigger, A/D conversion starts in the order of the selected channels, temperature sensor, and internal reference voltage.
- On completion of A/D conversion, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy, ADTSDR, or ADOCDR). When ADCMPCR.CMPAE = 1, if bits in the ADCMPANSRy register or the ADCMPANSER register are set for Window A, the A/D conversion result is compared with the set ADCMPDR0/1 register value. When ADCMPCR.CMPBE = 1, if bits in the ADCMPBNSR register are set for Window B, the A/D conversion result is compared with the ADWINULB/ADWINLLB register setting.
- As a result of the comparison, when Window A meets the condition set in ADCMPLR0/1 or ADCMPLER, the Compare Window A Flag (ADCMPSR0.CMPSTCHAn, ADCMPSR1.CMPSTCHAn, ADCMPSESR.CMPSTTSA, or ADCMPSESR.CMPSTOCA) sets 1. At this time, if the ADCMPCR.CMPAIE bit is 1, an ADC12i\_CMPAI (i = 0, 1) interrupt request is generated. In the same way, when Window B meets the condition set in ADCMPBNSR.CMPLB, the Compare Window B Flag (ADCMPBSR.CMPSTB) sets to 1. At this time, if the ADCMPCR.CMPBIE bit is 1, an ADC12i\_CMPBI (i = 0, 1) interrupt request is generated.
- On completion of all selected A/D conversions and comparisons, scan restarts.
- After the ADC12i\_CMPAI (i = 0, 1) and ADC12i\_CMPBI (i = 0, 1) interrupts are accepted, the ADCSR.ADST bit is set to 0 (A/D conversion stop) and processing is performed for channels for which the compare flag is set to 1.
- When all compare flags of Window A are cleared, the ADC12i\_CMPAI (i = 0, 1) interrupt request is canceled. In the same way, when all compare flags of Window B are cleared, the ADC12i\_CMPBI (i = 0, 1) interrupt request is reset. To perform comparison again, restart the A/D conversion.

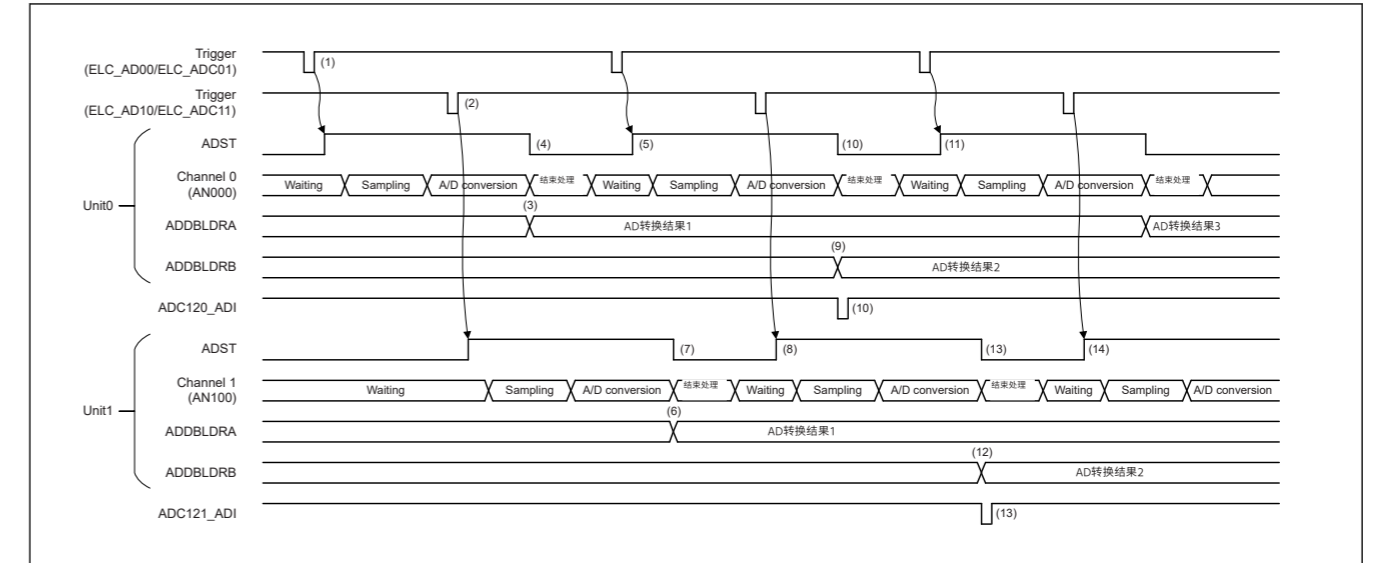

Figure 37.27 当AN000和扩展双触发模式时，单扫描模式下的示例操作 AN100在交错操作中选择

### 37.3.6 比较WindowsA和B的函数

#### 37.3.6.1 比较功能窗口A和B

比较功能将参考值与AD转换结果进行比较。参考值可设置为窗口A和窗口B独立。使用比较功能时，不能使用自诊断功能和双触发模式。WindowA和WindowB的主要区别在于它们的中断输出信号不同以及WindowB只能选择一个通道的限制。

本节提供结合连续扫描模式和比较功能的示例操作。

操作如下：

- 当ADCSR.ADST位通过软件设置为1（AD转换开始）时，同步触发(ELC)或异步触发，AD转换按所选通道、温度传感器和内部参考电压的顺序开始。
- AD转换完成后，AD转换结果存储在相关的AD数据寄存器y（ADDRy、ADTSDR或ADOCDR）中。当ADCMPCR.CMPAE=1时，如果ADCMPANSRy寄存器或ADCMPANSER寄存器中的位为窗口A设置，则AD转换结果将与设置的ADCMPDR0/1寄存器值进行比较。当ADCMPCR.CMPBE=1时，如果ADCMPBNSR寄存器中的位为窗口B设置，则将AD转换结果与ADWINULBADWINLLB寄存器设置进行比较。
- 作为比较的结果，当窗口A满足在ADCMPLR0/1或ADCMPLER中设置的条件时，比较窗口A标志（ADCMPSR0.CMPSTCHAn、ADCMPSR1.CMPSTCHAn、ADCMPSESR.CMPSTTSA或ADCMPSESR.CMPSTOCA）设置为1。此时，如果ADCMPCR.CMPAIE位为1，则产生ADC12i\_CMPAI(i=0,1)中断请求。同样，当窗口B满足ADCMPBNSR.CMPLB中设置的条件时，比较窗口B标志（ADCMPBSR.CMPSTB）设置为1。此时，如果ADCMPCR.CMPBIE位为1，则ADC12i\_CMPBI(i=0,1)中断请求产生。
- 完成所有选定的AD转换和比较后，重新开始扫描。
- 接受ADC12i\_CMPAI(i=0,1)和ADC12i\_CMPBI(i=0,1)中断后，ADCSR.ADST位设置为0（A/D转换停止）并对比较标志的通道执行处理设置为1。
- 当窗口A的所有比较标志被清除时，ADC12i\_CMPAI(i=0,1)中断请求被取消。在里面同样，当窗口B的所有比较标志都被清除时，ADC12i\_CMPBI(i=0,1)中断请求被复位。要再次进行比较，请重新开始AD转换。

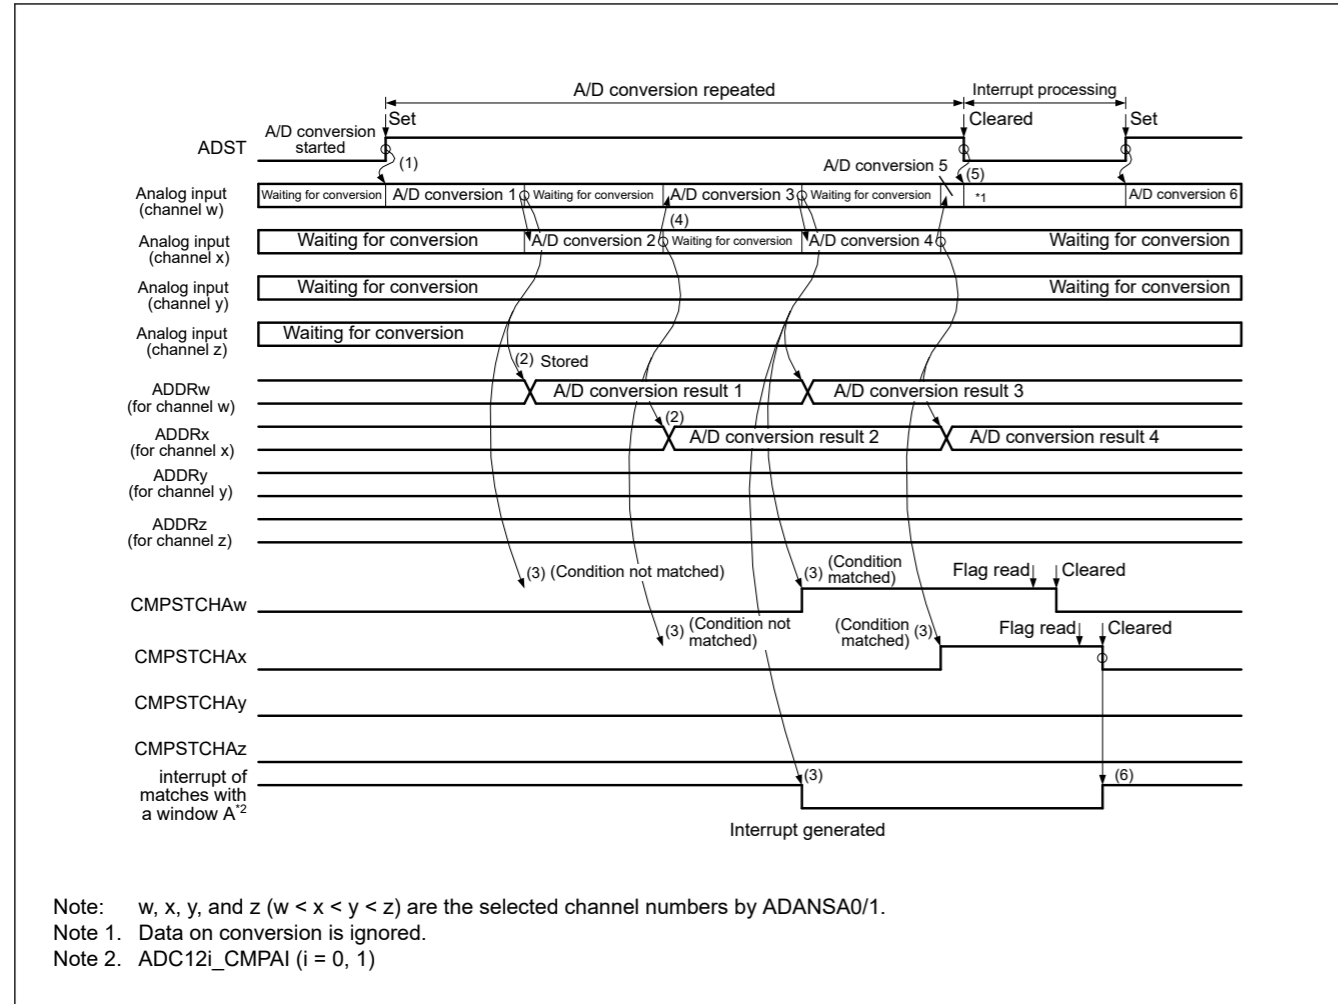

Figure 37.28 Example of compare function operation, when the analog inputs (channel w to z) are compared

### 37.3.6.2 Event output of compare function

The event output of the compare function specifies the upper-side reference voltage value and the lower-side reference voltage value for window A and window B, respectively. The output compares the A/D converted value of the selected channel with the upper and lower side reference voltage value and outputs events (ADC12i\_WCMPPM (i = 0, 1)/ADC12i\_WCMPUM (i = 0, 1)) based on event conditions (A or B, A and B, A xor B) and comparison result of window A and window B.

If more than one channel is selected for window A, and even when one channel in window A meets the comparison condition, the comparison result of window A is met. When using this function, perform A/D conversion in single scan mode.

Any channels from analog input, internal reference voltage, and temperature sensor output are selectable for window A.

One channel from analog input, internal reference voltage, and temperature sensor output is selectable for window B.

The following sequence is an example of how to set up and use the event output of the compare function:

1. Confirm that the value in the ADCSR.ADCS bits is 00b (single scan mode).
2. Select the channel for window A in the ADCMPANSR0/1 and ADCMPANSER registers. Set the window comparison conditions in the ADCMPLR0/1 and ADCMPLER registers. Set the upper-side and lower-side reference values in the ADCMPDR0/1 registers.
3. Select the channel and comparison conditions for Window B in the ADCMPBNSR register, and set the upper and lower reference values in the ADWINULB and ADWINLLB registers.
4. Set the composite conditions for window A/B, window A/B operation enable, and interrupt output enable in the ADCMPCR register.

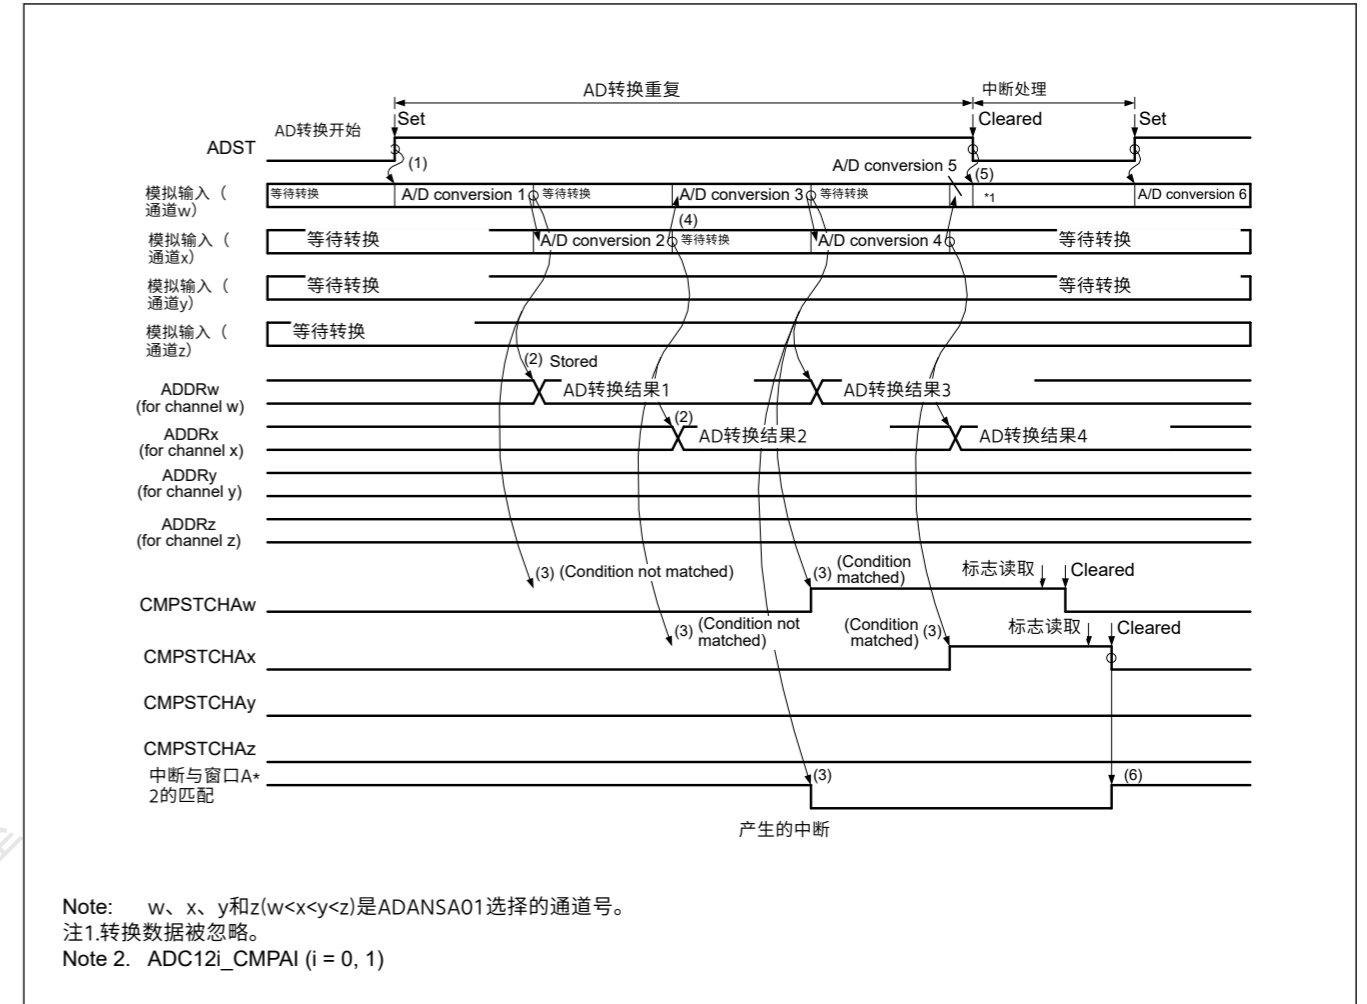

Figure 37.28 比较功能操作示例，比较模拟输入（通道w到z）时

### 37.3.6.2 比较函数的事件输出

比较函数的事件输出分别指定窗口A和窗口B的上侧参考电压值和下侧参考电压值。输出将所选通道的AD转换值与上下侧参考电压值进行比较，并根据事件条件（A或B、AandB AxorB)和窗口A和窗口B的比较结果。

如果窗口A选择了多个通道，即使窗口A中的一个通道满足比较条件，也满足窗口A的比较结果。使用此功能时，请在单次扫描模式下进行AD转换。

来自模拟输入、内部参考电压和温度传感器输出的任何通道都可选择用于窗口A。

窗口B可选择模拟输入、内部参考电压和温度传感器输出的一个通道。

以下序列是如何设置和使用比较函数的事件输出的示例：

- 1.确认ADCSR.ADCS位中的值为00b（单次扫描模式）。
- 2.在ADCMPANSR01和ADCMPANSER寄存器中选择窗口A的通道。在ADCMPLR01和ADCMPLER寄存器中设置窗口比较条件。在ADCMPDR01寄存器中设置上侧和下侧参考值。
- 3.在ADCMPBNSR寄存器中选择窗口B的通道和比较条件，并在ADWINULB和ADWINLLB寄存器中设置上下参考值。
- 4.在ADCMPCR寄存器中设置窗口AB、窗口AB操作使能和中断输出使能的复合条件。

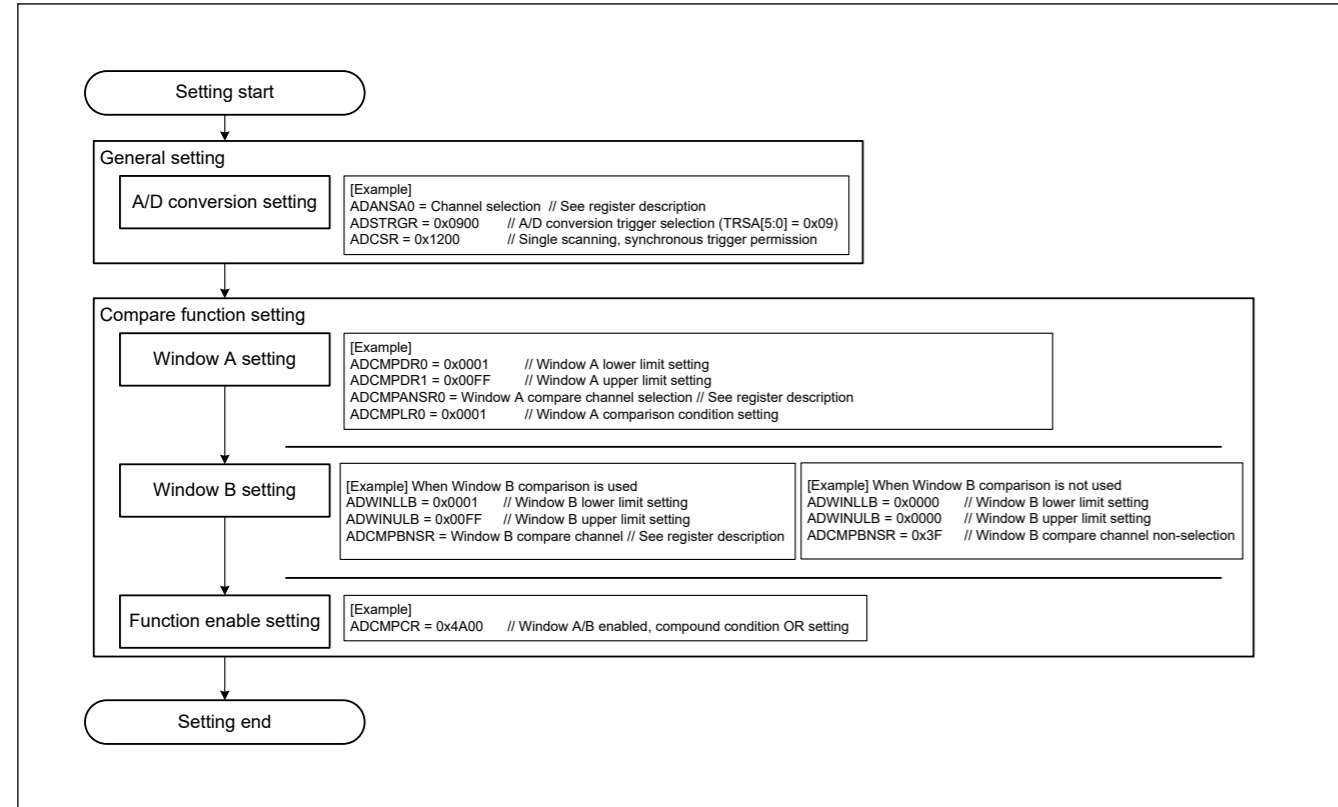

Figure 37.29 Setting example when using the event output of the compare function

For event output usage when using only window A for the compare function, note the following:

- Enable both Window A and Window B (ADCMPCR.CMPAE = 1, ADCMPCR.CMPBE = 1)
- Set the compound condition of Window A and Window B to “OR condition” (ADCMPCR.CMPAB[1:0] = 00b)
- Set the compared channel of Window B to “No selection” (ADCMBNSR.CMPCHB[5:0] = 0x3F)
- Set the compare condition of Window B to “0 < results < 0 always means mismatch”. (ADCMPCR.WCMPE = 1, ADWINLLB[15:0] = ADWINULB[15:0] = 0x0000, and ADCMPBNSR.CMPLB = 1)

Figure 37.30 shows the event output operation example of compare function.

A scan end event (ADC12i\_ADI (i = 0, 1)) is output with the same timing as single scan completion. A match or mismatch event (ADC12i\_WCMPPM (i = 0, 1)/ADC12i\_WCMPUM (i = 0, 1)) is output with 1 PCLKA cycle delay depending on the ADCMPCR.CMPAB[1:0] settings.

Note: The match and mismatch events are exclusive, so both events are never output simultaneously.

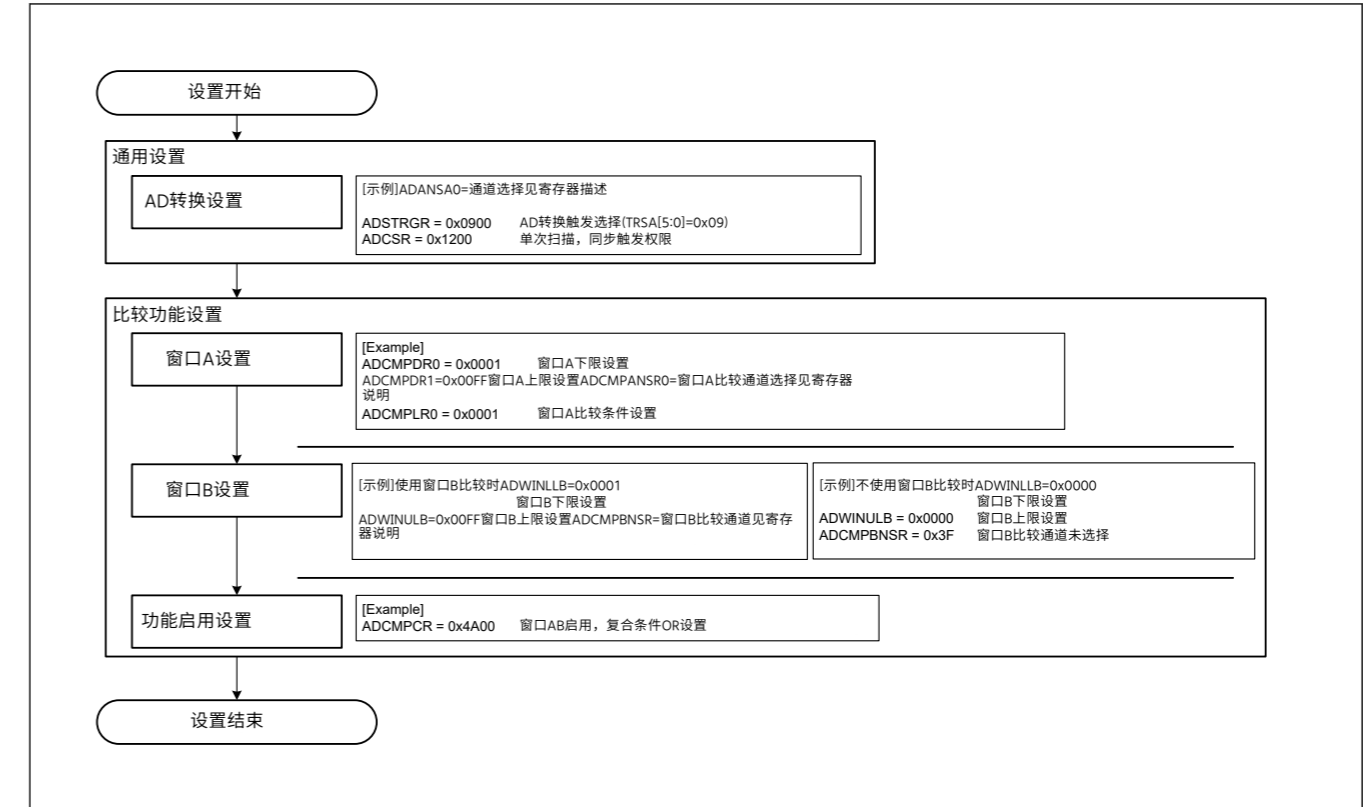

Figure 37.29 使用比较功能的事件输出时的设置示例

对于仅将窗口A用于比较功能时的事件输出用法, 请注意以下几点:

- 启用窗口A和窗口B (ADCMPCR.CMPAE=1 ADCMPCR.CMPBE=1)
- 将窗口A和窗口B的复合条件设置为“或条件” (ADCMPCR.CMPAB[1:0]=00b)
- 将窗口B的比较通道设置为“无选择” (ADCMBNSR.CMPCHB[5:0]=0x3F)
- 将窗口B的比较条件设置为“0<结果<0总是不匹配”。 (ADCMPCR.WCMPE=1, ADWINLLB[15:0]=ADWINULB[15:0]=0x0000, ADCMPBNSR.CMPLB=1)

图37.30显示了比较功能的事件输出操作示例。

以与单次扫描完成相同的时序输出扫描结束事件(ADC12i\_ADI(i=0, 1))。匹配或不匹配事件(ADC12i\_WCMPPM(i=0, 1)/ADC12i\_WCMPUM(i=0, 1))以1个PCLKA周期延迟输出, 具体取决于ADCMPCR.CMPAB[1:0]设置。

Note: match和mismatch事件是互斥的, 因此这两个事件永远不会同时输出。

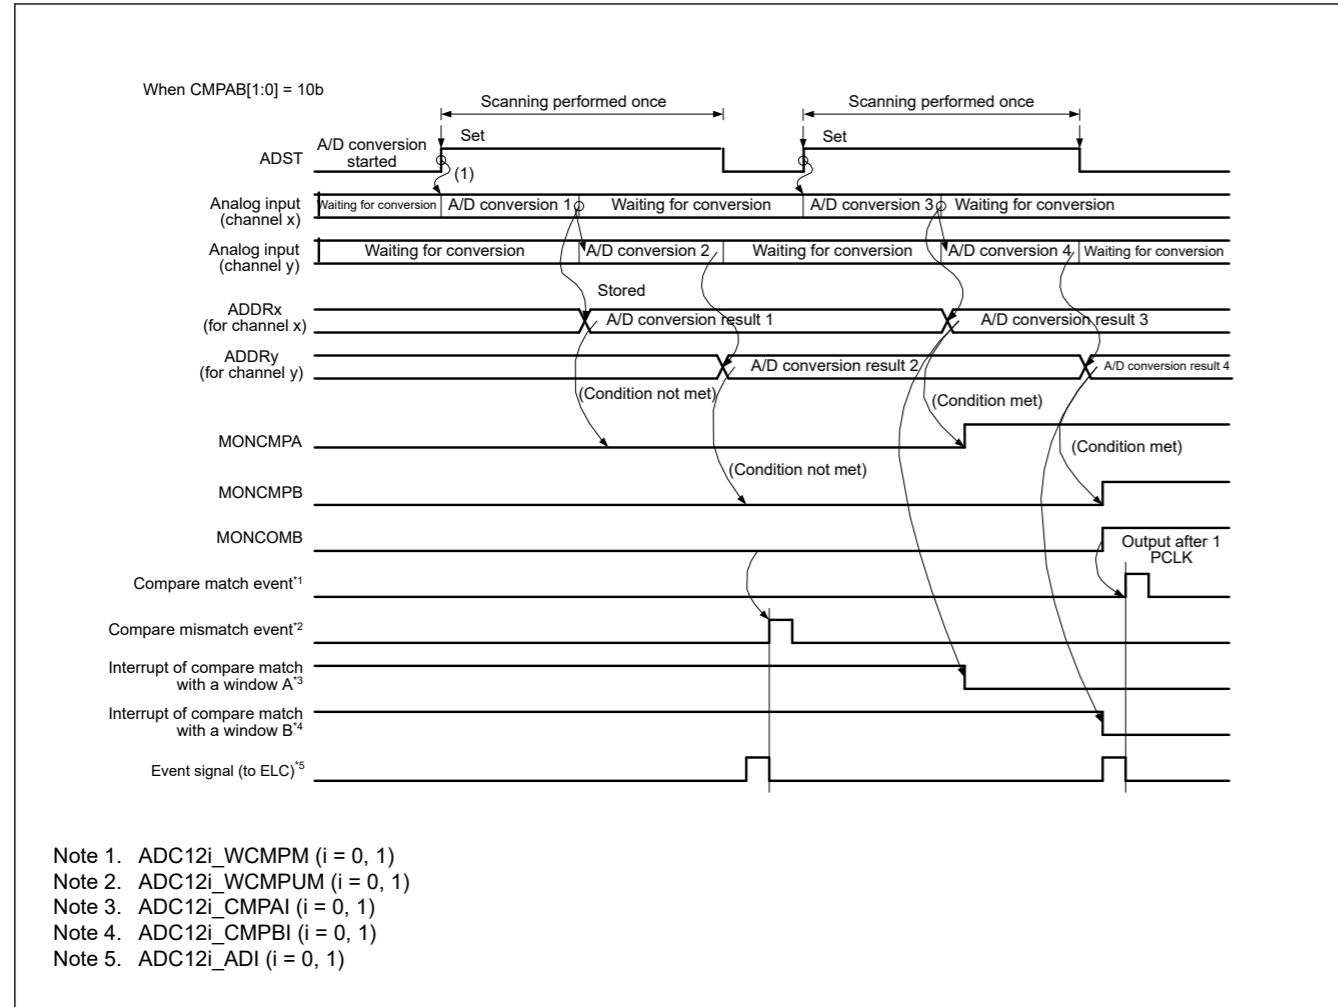

Figure 37.30 Example operation of the compare function event output, when the analog inputs (channel x and y) are compared

Note: Event output of compare function outputs match/mismatch from the comparison results of Window A and Window B, based on the ADCMPCR.CMPAB[1:0] settings.

Note: The comparison result of Window A is the logical addition of the comparison results of the comparison target channels of Window A. The comparison results of Window A and Window B are updated by each A/D conversion, and are kept even when single scan ends. Set ADCMPCR.CMPAE and ADCMPCR.CMPBE to 0 to clear the comparison results to 0.

### 37.3.6.3 Restrictions on the compare function

The following constraints apply for the compare function:

- The compare function cannot be used together with the self-diagnosis function or double-trigger mode. (The compare function is not available for ADRD, ADDBLDR, ADDBLDRA, and ADDBLDRB.)
- Specify single scan mode when using match/mismatch event outputs.
- When the temperature sensor output, internal reference voltage is selected for Window A, Window B operations are disabled.
- When the temperature sensor output, internal reference voltage is selected for Window B, Window A operations are disabled.
- Setting the same channel for Window A and Window B is prohibited.
- Set the reference voltage values so that the high-potential reference voltage value is equal to or larger than the low potential reference voltage value.

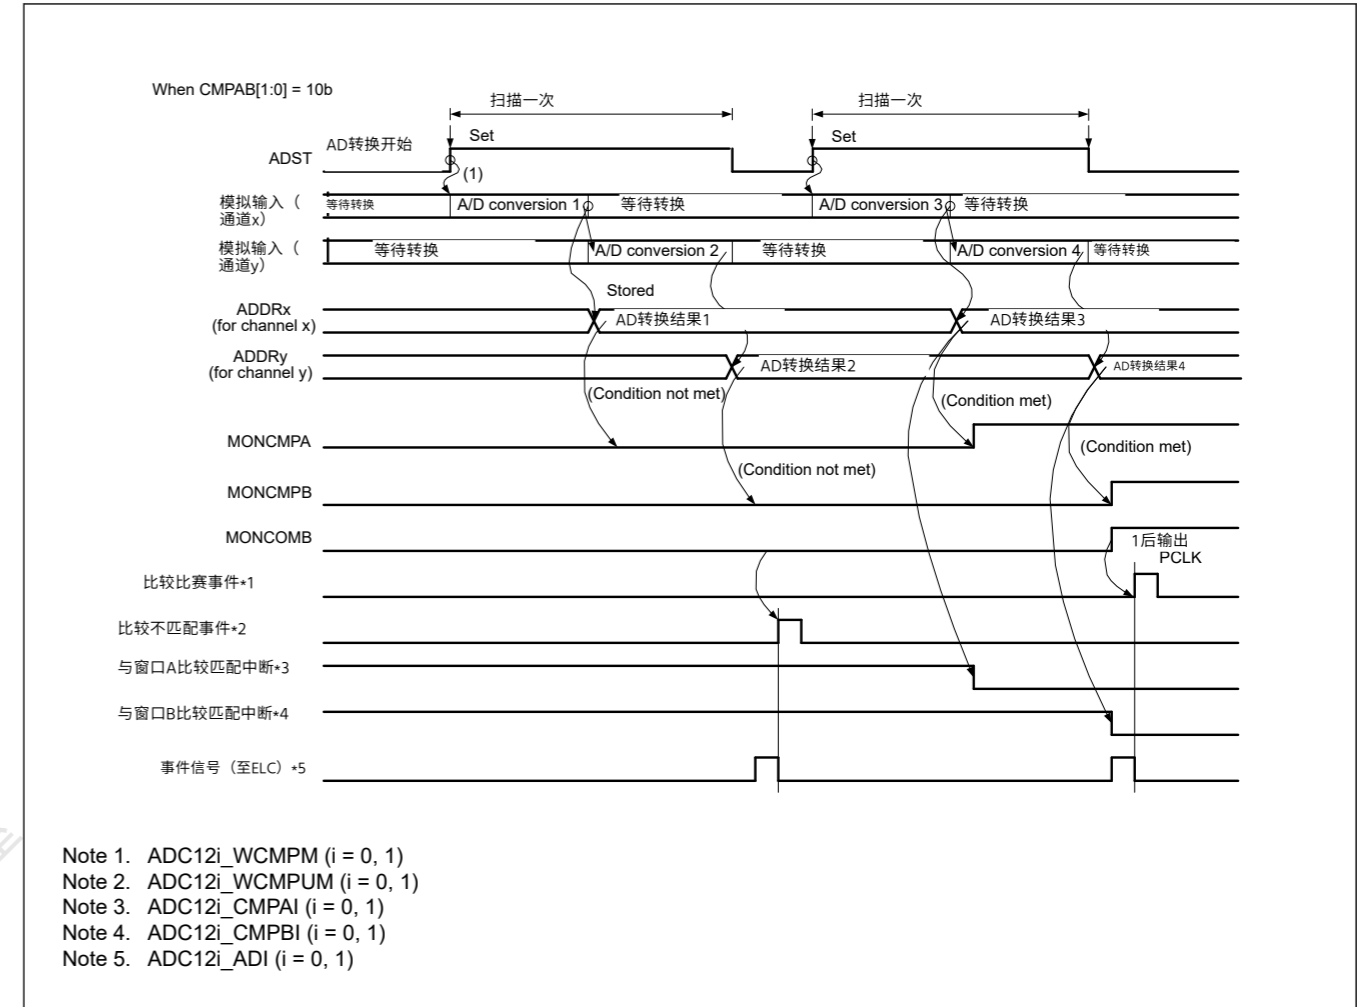

Figure 37.30 比较模拟输入（通道x和y）时比较功能事件输出的示例操作

Note: 根据ADCMPCR.CMPAB[1:0]设置，比较函数输出的事件输出与窗口A和窗口B的比较结果匹配不匹配。

Note: 窗口A的比较结果是窗口A的比较目标通道的比较结果的逻辑相加。窗口A和窗口B的比较结果在每次AD转换时更新，即使在单次扫描结束时也会保持。将ADCMPCR.CMPAE和ADCMPCR.CMPBE设置为0，将比较结果清除为0。

### 37.3.6.3 比较功能的限制

以下约束适用于比较功能：

- 比较功能不能与自诊断功能或双触发模式一起使用。（比较功能不适用于ADRD、ADDBLDR、ADDBLDRA和ADDBLDRB。）
- 使用匹配不匹配事件输出时指定单次扫描模式。
- 当温度传感器输出时，WindowA选择内部参考电压，WindowB操作被禁用。
- 当温度传感器输出时，WindowB选择内部参考电压，WindowA操作被禁用。
- 禁止窗口A和窗口B设置相同的通道。
- 设置参考电压值，使高电位参考电压值等于或大于低电位参考电压值。

### 37.3.7 Analog Input Sampling and Scan Conversion Time

Scan conversion can be activated either by a software trigger, a synchronous trigger (ELC), or an asynchronous trigger (ADTRGn (n = 0, 1)). After the start-of-scanning-delay time ( $t_D$ ) has elapsed, processing for disconnection detection assistance, and processing of conversion for self-diagnosis all proceed, followed by processing for A/D conversion.

Figure 37.31 shows the scan conversion timing, in which scan conversion is activated by a software trigger or a synchronous trigger (ELC). Figure 37.32 shows the scan conversion timing, in which scan conversion is activated by an asynchronous trigger (ADTRGn (n = 0, 1)). The scan conversion time ( $t_{SCAN}$ ) includes the start-of-scanning-delay time ( $t_D$ ), disconnection detection assistance processing time ( $t_{DIS}$ )<sup>\*1</sup>, self-diagnosis A/D conversion processing time ( $t_{DIAG}$  and  $t_{DSD}$ )<sup>\*2</sup>, A/D conversion processing time ( $t_{CONV}$ ), and end-of-scanning-delay time ( $t_{ED}$ ).

The A/D conversion processing time ( $t_{CONV}$ ) consists of input sampling time ( $t_{SPL}$ ) and time for conversion by successive approximation ( $t_{SAM}$ ). The sampling time ( $t_{SPL}$ ) is used to charge sample-and-hold circuits in the A/D converter. If there is not sufficient sampling time due to the high impedance of an analog input signal source, or if the A/D conversion clock (ADCLK) is slow, sampling time can be adjusted using the ADSSTRn register.

The time for conversion by successive approximation ( $t_{SAM}$ ) is the following

- 13 ADCLK states with 12-bit accuracy selected.
- 11 ADCLK states with 10-bit accuracy selected.
- 9 ADCLK states with 8-bit accuracy selected.

Table 37.27 shows the time for conversion by successive approximation ( $t_{SAM}$ ).

The scan conversion time ( $t_{SCAN}$ ) in single scan mode for which the number of selected channels is n can be determined as follows:

$$t_{SCAN} = t_D + (t_{DIS} \times n) + t_{DIAG} + t_{ED} + (t_{CONV} \times n)^{*3}$$

The scan conversion time for the first cycle in continuous scan mode is  $t_{SCAN}$  for single scan minus  $t_{ED}$ . The scan conversion time for the second and subsequent cycles in continuous scan mode is fixed in the following:

$$(t_{DIS} \times n) + t_{DIAG} + t_{DSD} + (t_{CONV} \times n)^{*3}$$

Note 1. When disconnection detection assistance is not selected,  $t_{DIS} = 0$ .

Only when the temperature sensor or internal reference voltage is A/D-converted, the auto-discharge period of 15 ADCLK states is inserted.

Note 2. When the self-diagnosis function is not used,  $t_{DIAG} = 0$ ,  $t_{DSD} = 0$ .

Note 3. When input sampling times ( $t_{SPL}$ ) of all selected channels are the same, this element equals  $t_{CONV} \times n$ . If each channel has a different sampling time, this element equals that of  $t_{SPL}$  and  $t_{SAM}$  set to each selected channel.

Table 37.27 shows the times for conversion during scanning.

### 37.3.7 模拟输入采样和扫描转换时间

扫描转换可以通过软件触发、同步触发(ELC)或异步触发(ADTRGn(n=0 1))来激活。在经过扫描开始延迟时间( $t_D$ )之后,断线检测辅助处理和自诊断转换处理全部进行,接着进行AD转换处理。

图37.31显示了扫描转换时序,其中扫描转换由软件触发或同步触发(ELC)激活。图37.32显示了扫描转换时序,其中扫描转换由异步触发(ADTRGn(n=0 1))激活。扫描转换时间( $t_{SCAN}$ )包括扫描开始延迟时间( $t_D$ )、断线检测辅助处理时间( $t_{DIS}$ )<sup>\*1</sup>、自诊断AD转换处理时间( $t_{DIAG}$ 和 $t_{DSD}$ )<sup>\*2</sup>如图2所示,AD转换处理时间( $t_{CONV}$ )和扫描结束延迟时间( $t_{ED}$ )。

AD转换处理时间( $t_{CONV}$ )由输入采样时间( $t_{SPL}$ )和逐次逼近转换时间( $t_{SAM}$ )组成。采样时间( $t_{SPL}$ )用于为AD转换器中的采样保持电路充电。如果由于模拟输入信号源的高阻抗而没有足够的采样时间,或者如果AD转换时钟(ADCLK)很慢,则可以使用ADSSTRn寄存器调整采样时间。

逐次逼近转换时间( $t_{SAM}$ )如下

- 13个ADCLK状态,选择12位精度。
- 11个ADCLK状态,选择精度为10位。
- 选择8位精度的9个ADCLK状态。

表37.27显示了逐次逼近转换的时间( $t_{SAM}$ )。

选择通道数为n的单次扫描模式下的扫描转换时间( $t_{SCAN}$ )可以确定如下:

$$t_{SCAN} = t_D + t_{DIS} \times n + t_{DIAG} + t_{ED} + t_{CONV} \times n \times 3$$

连续扫描模式下第一个周期的扫描转换时间是单次扫描的 $t_{SCAN}$ 减去 $t_{ED}$ 。连续扫描模式下第二个和后续周期的扫描转换时间固定如下:  $t_{DIS} \times n + t_{DIAG} + t_{DSD} + t_{CONV} \times n \times 3$

注1.未选择断线检测辅助时,  $t_{DIS} = 0$ 。

仅当温度传感器或内部参考电压为AD转换时,自动放电周期为15 ADCLK状态被插入。

注2.不使用自诊断功能时,  $t_{DIAG} = 0$ ,  $t_{DSD} = 0$ 。

注3.当所有选定通道的输入采样时间( $t_{SPL}$ )相同时,该元素等于 $t_{CONV} \times n$ 。如果每个通道具有不同的采样时间,则该元素等于为每个选定通道设置的 $t_{SPL}$ 和 $t_{SAM}$ 。

表37.27显示了扫描期间的转换时间。

Table 37.27 Conversion times during scanning (in numbers of cycles of ADCLK and PCLKA)

| Item   | Symbol   | Type/Conditions   |   |                   | Unit   |        |   |
|--|--|---|---|-------------------|--|--------|---|
|  |  | Synchronous trigger*4   | Asynchronous trigger                                | Software trigger  |  |        |   |
| Scan start processing time*1 *2  | A/D conversion on group A under group A priority control.                          | Group B is to be stopped (Group A is activated after group B is stopped by of an A/D conversion source from group A). | 3 PCLKA + 6 ADCLK<br>5 PCLKA + 3 ADCLK*5            | —                 | —  | Cycles |   |
|  |  | Group B is not to be stopped (activation by an A/D conversion source from group A).                                   | 2 PCLKA + 4 ADCLK                                   | —                 | —  |        |   |
|  | A/D conversion when self-diagnosis is enabled.                                     | A/D conversion for self-diagnosis is to be started.   | 2 PCLKA + 6 ADCLK                                   | 4 PCLKA + 6 ADCLK | 6 ADCLK  |        |   |
|  | All other  | 2 PCLKA + 4 ADCLK   | 2 PCLKA + 4 ADCLK                                   | 4 ADCLK           |  |        |   |
| Disconnection detection assistance processing time   |  | tDIS  | Setting in ADNDIS[3:0] (initial value = 0h) × ADCLK |                   |  |        |   |
| Self-diagnosis conversion processing time*1  | Sampling time  |   | tDIAG   | tSPL              | Setting in ADSSTR00 (initial value = 0Bh) × ADCLK*3  | —      | — |
|  | Time for conversion by successive approximation                                    | 12-bit conversion accuracy  | tSAM  | 15 ADCLK          | —  | —      |   |
|  |  | 10-bit conversion accuracy  |   | 13 ADCLK          | —  | —      |   |
|  |  | 8-bit conversion accuracy   |   | 11 ADCLK          | —  | —      |   |
|  | Wait time between self-diagnosis conversion end and analog channel sampling start. |   | tBED  | 2 ADCLK           |  |        |   |
| Wait time between last channel conversion end and self-diagnosis sampling start in continuous scan mode. |  | tDSD  | 2 ADCLK   |                   |  |        |   |
| A/D conversion processing time*1   | Sampling time  |   | tCONV   | tSPL              | Setting in ADSSTRn (n = 0 to 9, 12, 13(unit 0), 0 to 2(unit 1), L, T, O) (initial value = 0Bh) × ADCLK + 0.5 ADCLK | —      | — |
|  | Time for conversion by successive approximation                                    | 12-bit conversion accuracy  | tSAM  | 13 ADCLK          | —  | —      |   |
|  |  | 10-bit conversion accuracy  |   | 11 ADCLK          | —  | —      |   |
|  |  | 8-bit conversion accuracy   |   | 9 ADCLK           | —  | —      |   |
| Scan end processing time*1   |  | tED   | 1 PCLKA + 3 ADCLK<br>2 PCLKA + 3 ADCLK*5            |                   |  |        |   |

Note 1. See Figure 37.31 and Figure 37.32 for an illustration of times tD, tSPLSH, tDIAG, tCONV, and tED.  
 Note 2. This is the maximum time required from software writing or trigger input to A/D conversion start.  
 Note 3. The sampling time setting must satisfy the electrical characteristics.  
 Note 4. This does not include the time consumed in the path from timer output to trigger input.  
 Note 5. If ADCLK is faster than PCLKA (PCLKA to ADCLK frequency ratio = 1:2 or 1:4), the scan end processing time changes.

Table 37.27 扫描期间的转换时间（以ADCLK和PCLKA的周期数计）

| Item                              | Symbol                   | Type/Conditions          |  |                   | Unit   |        |   |

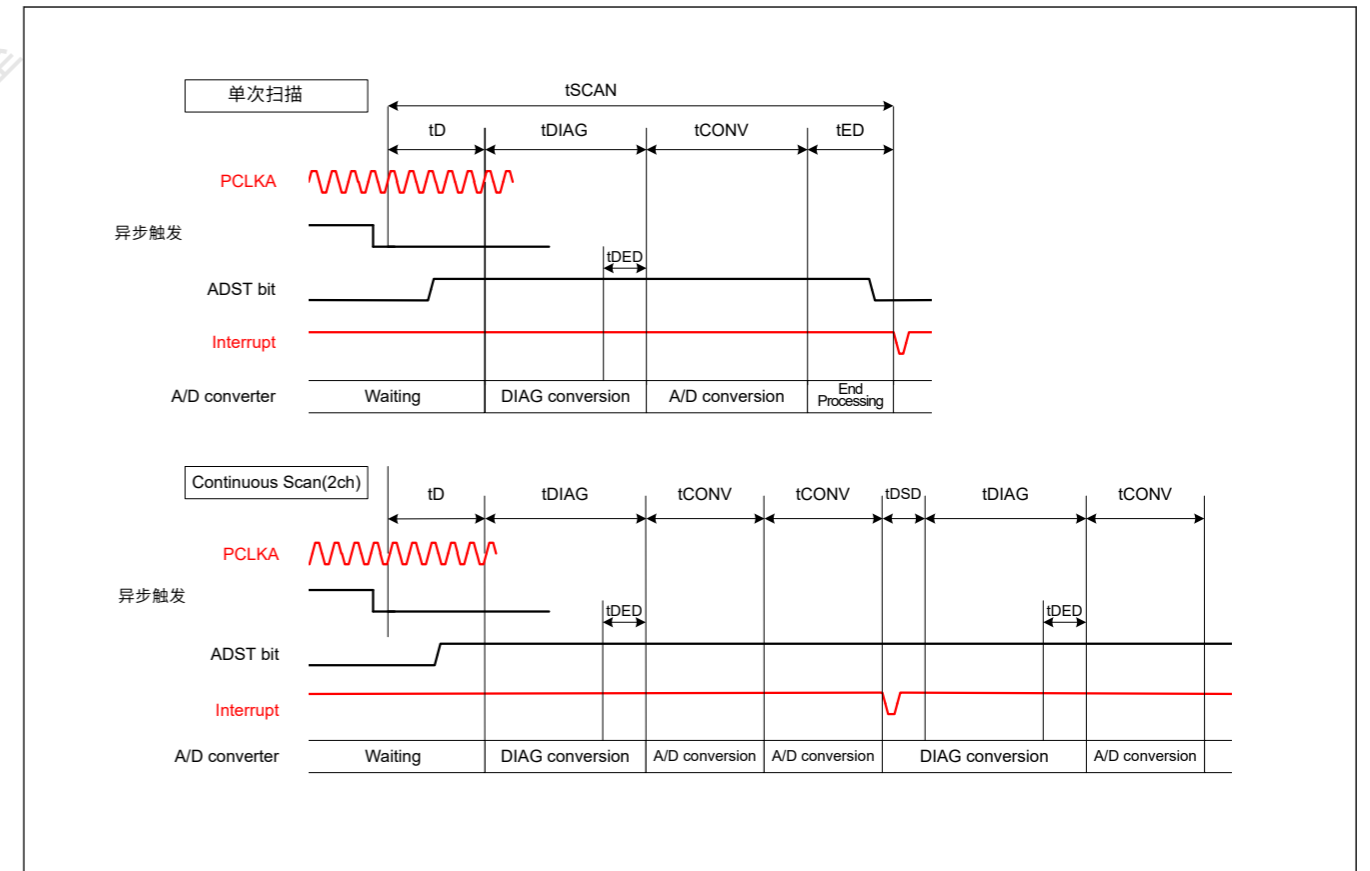

Figure 37.32 由异步触发输入(ADTRG0)激活时的扫描转换时序

### 37.3.8 Usage Example of A/D Data Register Automatic Clearing Function

Setting the ADCER.ACE bit to 1 automatically clears the A/D data registers (ADDRy, ADDR, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, ADOCDR) to 0x0000 when the A/D data registers are read by the CPU or DTC or DMAC.

### 37.3.8 AD数据寄存器自动清除功能的使用示例

将ADCER.ACE位设置为1会自动清除AD数据寄存器 (ADDRy、ADDR、ADDBLDR、ADDBLDRA、ADDBLDRB、ADTSDR、ADOCDR)为0x0000。当CPU或DTC或DMAC读取AD数据寄存器时, ADDBLDRB、ADTSDR、ADOCDR)为0x0000。

This function enables detection of update failures of the A/D data registers (ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, ADOCDR). This section describes examples in which the function to automatically clear the ADDRy register is enabled and disabled.

- If the ADCER.ACE bit is 0 (automatic clearing is disabled) and for some reason, if the A/D conversion result (0x0222) is not written to the ADDRy register, the ADDRy value retains the old data (0x0111). In addition, if this ADDRy value is read into a general-purpose register using an A/D scan end interrupt, the old data (0x0111) can be saved in the general-purpose register. When checking whether there is an update failure, it is necessary to frequently save the old data in SRAM or in a general-purpose register.
- If the ADCER.ACE bit is 1 (automatic clearing is enabled), when ADDRy = 0x0111 is read by the CPU or DTC or DMAC, ADDRy is automatically set to 0x0000. Next, if the A/D conversion result of 0x0222 cannot be transferred to ADDRy for some reason, the cleared data (0x0000) remains as the ADDRy value. If this ADDRy value is read into a general-purpose register using an A/D scan end interrupt, 0x0000 is saved in the general-purpose register. Occurrence of an ADDRy update failure can be determined by checking that the read data value is 0x0000.

### 37.3.9 A/D-Converted Value Addition/Average Mode

A/D-converted value addition/average mode can be used when A/D conversion of the analog input of the selected channels, the temperature sensor output, the internal reference voltage is selected.

In A/D-converted value addition mode, the same channel is A/D-converted 1, 2, 3, 4, or 16 consecutive times, and the sum of the converted values is stored in the data register. The conversion count of the addition function can be set to 16 only when 12-bit accuracy is selected. In A/D-converted value average mode, the same channel is A/D-converted 1, 2, or 4 consecutive times, and the mean of the converted values is stored in the data register. The use of the average of these results can improve the accuracy of A/D conversion, depending on the types of noise components that are present. This function, however, cannot always guarantee an improvement in A/D conversion accuracy.

The A/D-converted value addition/average function can be used when A/D conversion of the analog inputs of the selected channels or A/D conversion of the temperature sensor output or A/D conversion of the internal reference voltage is selected. The A/D-converted value addition/average function can also be used for channels for which the double-trigger function is selected.

The addition function for self-diagnosis is not provided.

### 37.3.10 Disconnection Detection Assist Function

The ADC12 incorporates a function to fix the charge for sampling capacitance to the specified state (VREFH0 or VREFL0 for unit 0, VREFH or VREFL for unit 1) before the start of A/D conversion. This function enables disconnection detection in wiring of analog inputs.

Figure 37.33 shows the A/D conversion operation when the disconnection detection assist function is used. Figure 37.34 shows an example of disconnection detection when precharge is selected. Figure 37.35 shows an example of disconnection detection when discharge is selected.

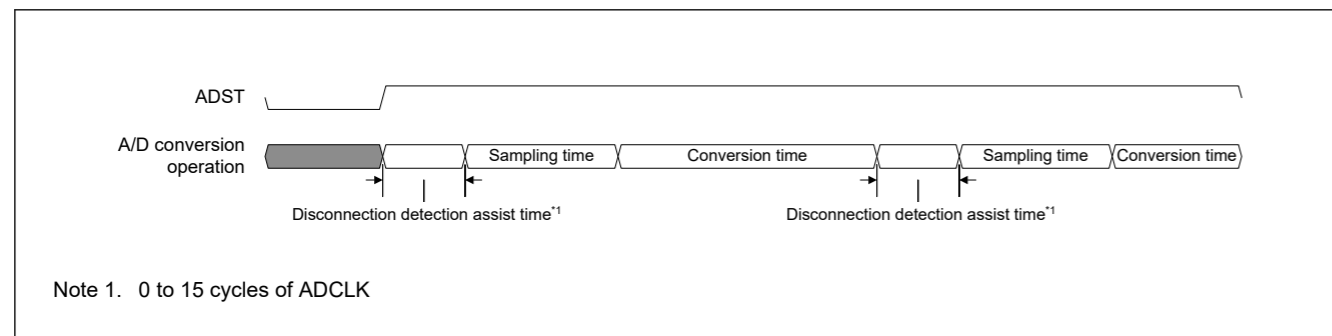

Figure 37.33 Operation of A/D conversion when disconnection detection assist function is used

此功能可以检测AD数据寄存器 (ADDRy、ADRD、ADDBLDR、ADDBLDRA、ADDBLDRB、ADTSDR、ADOCDR)。本节介绍自动清除功能的示例 ADDRy寄存器被启用和禁用。

- 如果ADCER.ACE位为0（禁止自动清零）并且由于某种原因，如果AD转换结果（0x0222）没有写入ADDRy寄存器，则ADDRy值保留旧数据（0x0111）。此外，如果使用AD扫描结束中断将该ADDRy值读入通用寄存器，则可以将旧数据（0x0111）保存在通用寄存器中。在检查是否有更新失败时，需要经常将旧数据保存在SRAM或通用寄存器中。
- 如果ADCER.ACE位为1（使能自动清除），当ADDRy=0x0111时由CPU或DTC或DMAC ADDRy自动设置为0x0000。接下来，如果0x0222的AD转换结果由于某种原因无法传送到ADDRy，则清除的数据（0x0000）仍保留为ADDRy值。如果使用AD扫描结束中断将该ADDRy值读入通用寄存器，则将0x0000保存在通用寄存器中。ADDRy更新失败的发生可以通过检查读取的数据值为0x0000来确定。

### 37.3.9 一种D转换的增值平均模式

AD-converted value addition/average mode can be used when A/D conversion of the analog input of the selected channels, the temperature sensor output, the internal reference voltage is selected.

在AD转换值加法模式下，同一通道连续1、2、3、4或16次AD转换，转换值的总和存储在数据寄存器中。只有选择12位精度时，才能将加法功能的转换计数设置为16。在AD转换值平均模式下，同一通道连续1、2或4次AD转换，转换值的平均值存储在数据寄存器中。根据存在的噪声成分的类型，使用这些结果的平均值可以提高AD转换的精度。但是，该功能不能始终保证AD转换精度的提高。

选择通道的模拟输入的AD转换或温度传感器输出的AD转换或内部参考电压的AD转换时，可以使用AD转换值加法平均功能。AD转换值加法平均功能也可用于选择了双触发功能的通道。

不提供自我诊断的附加功能。

### 37.3.10 断线检测辅助功能

ADC12具有在开始AD转换之前将采样电容的电荷固定到指定状态（单元0为VREFH0或VREFL0，单元1为VREFH或VREFL）的功能。此功能可在模拟输入接线中进行断线检测。

图37.33显示了使用断线检测辅助功能时的AD转换操作。图37.34显示了选择预充电时的断线检测示例。图37.35显示了选择放电时的断线检测示例。

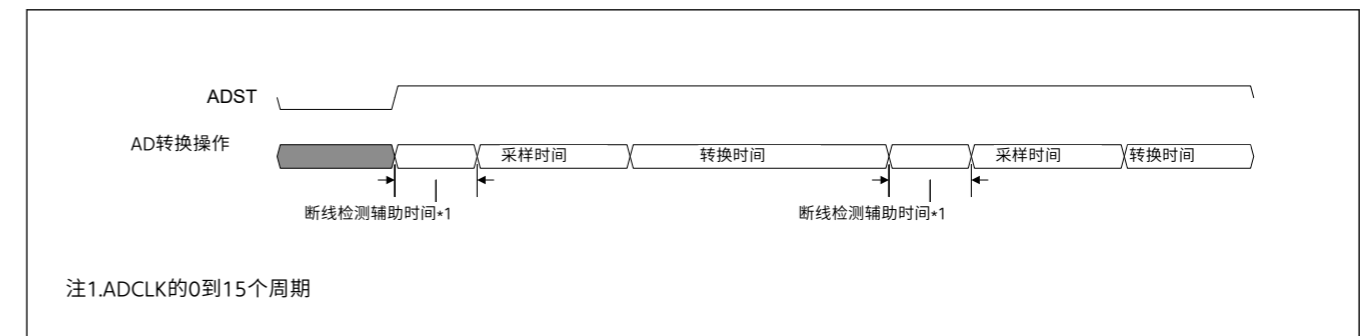

Figure 37.33 使用断线检测辅助功能时的AD转换动作

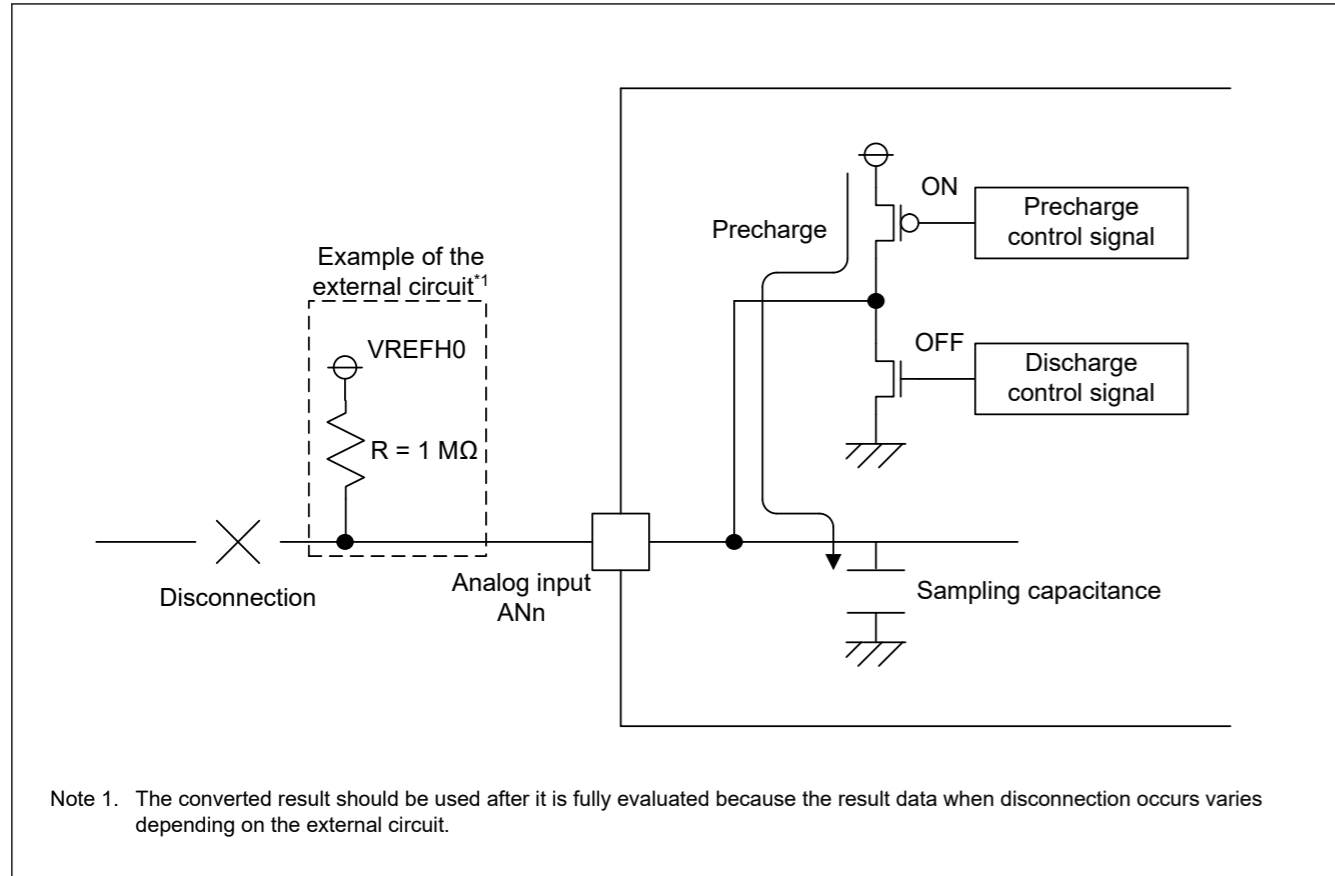

Figure 37.34 Example of disconnection detection when precharge is selected

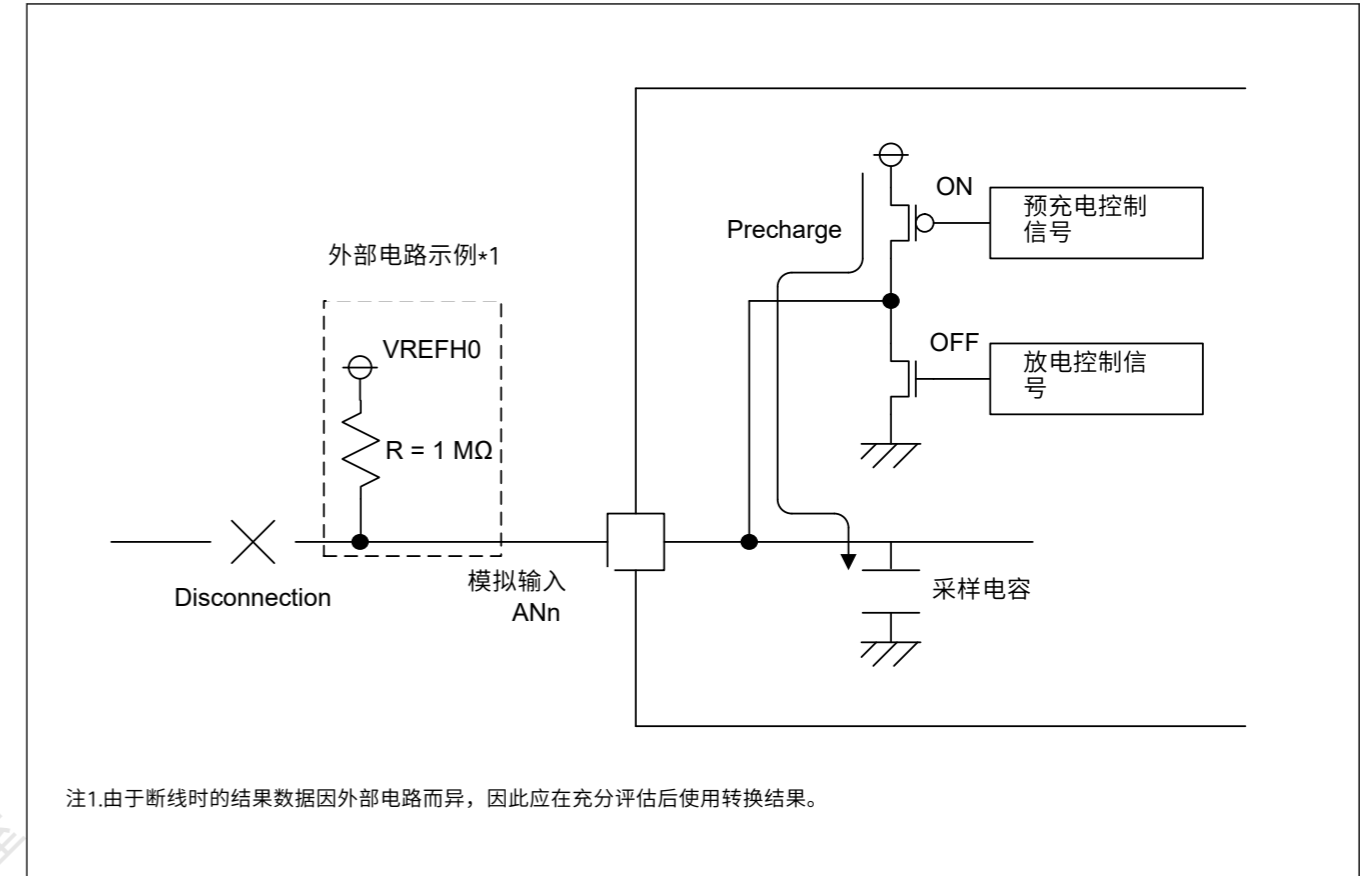

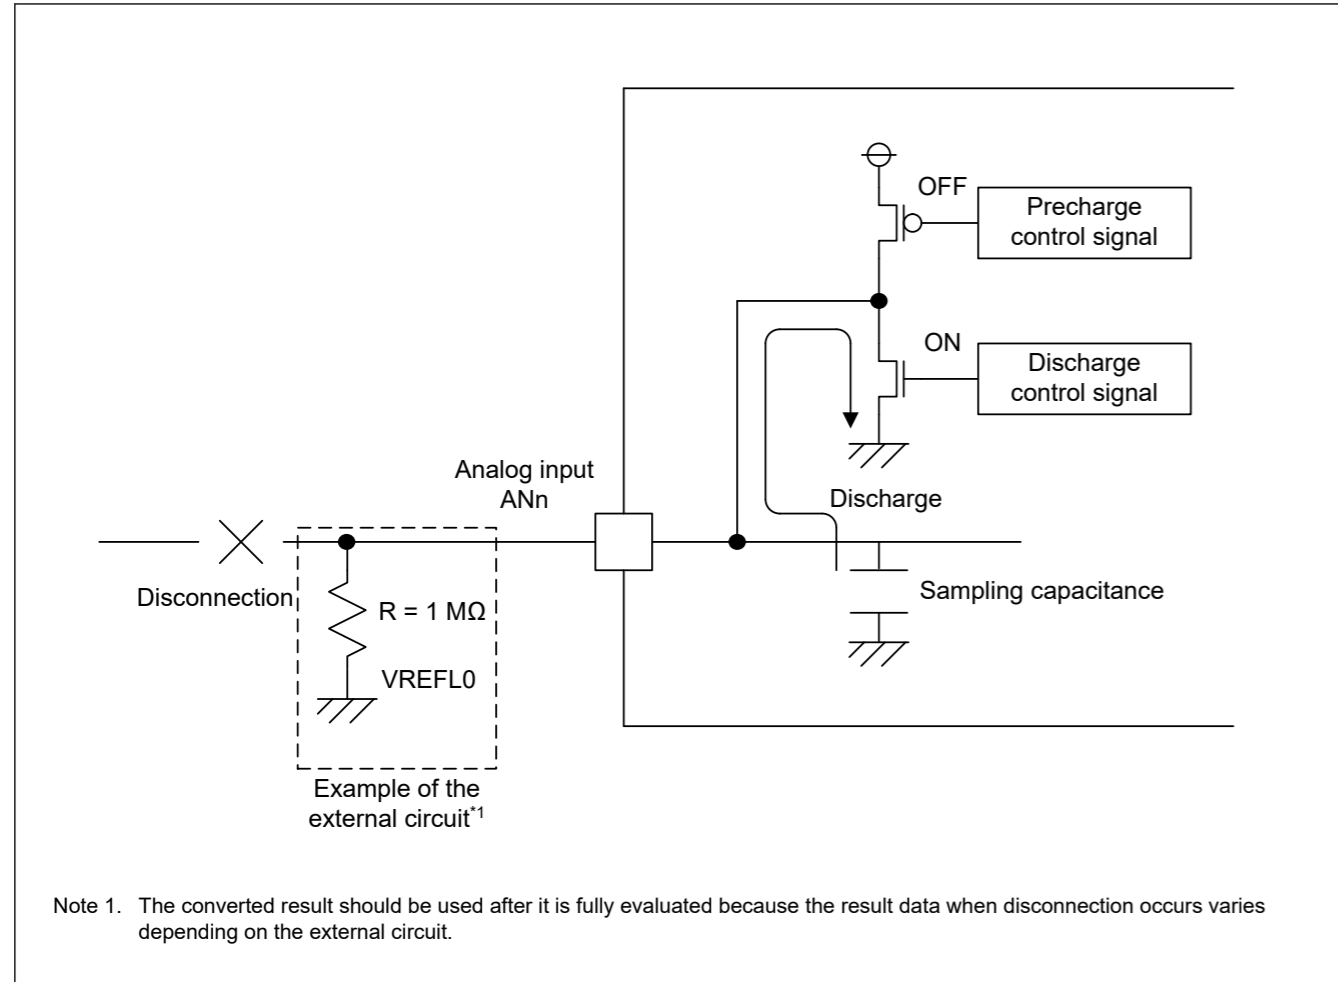

Figure 37.34 选择预充电时的断线检测示例

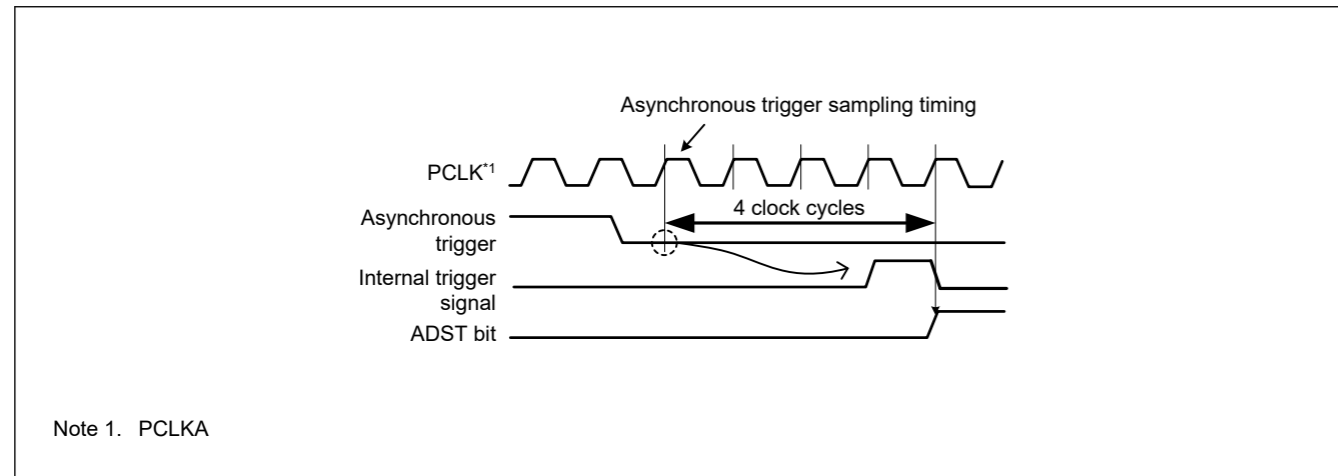

Note 1. The converted result should be used after it is fully evaluated because the result data when disconnection occurs varies depending on the external circuit.

Figure 37.35 Example of disconnection detection when discharge is selected

### 37.3.11 Starting A/D Conversion with an Asynchronous Trigger

A/D conversion can be started by the input of an asynchronous trigger. To start A/D conversion by an asynchronous trigger, set the pin function in the PmnPFS register, set the A/D Conversion Start Trigger Select bits (ADSTRGR.TRSA[5:0]) to 0x00, then input a high-level signal to the asynchronous trigger (ADTRGn (n = 0, 1) pin). Finally, set both the ADCSR.TRGE and ADCSR.EXTRG bits to 1. Figure 37.36 shows timing of the asynchronous trigger input.

An asynchronous trigger cannot be selected in the A/D conversion start trigger for group B used in group scan mode. For details on setting the pin function, see section 19, I/O Ports.

Note 1. PCLKA

Figure 37.36 Asynchronous trigger input timing

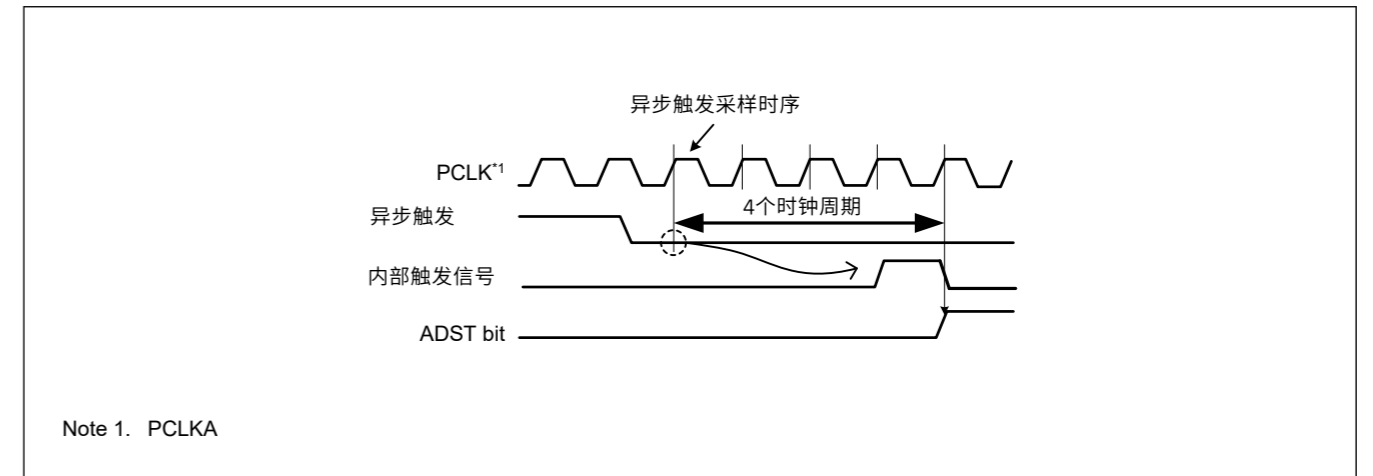

注1.由于断线时的结果数据因外部电路而异，因此应在充分评估后使用转换结果。

Figure 37.35 选择放电时的断线检测示例

### 37.3.11 使用异步触发启动AD转换

可以通过输入异步触发器来启动D转换。要通过异步触发启动AD转换，请在PmnPFS寄存器中设置引脚功能，将AD转换启动触发选择位(ADSTRGR.TRSA[5:0])设置为0x00，然后向异步触发输入高电平信号(ADTRGn(n=0,1)引脚)。最后，将ADCSR.TRGE和ADCSR.EXTRG位都设置为1。图37.36显示了异步触发输入的时序。

在组扫描模式中使用的B组的AD转换开始触发中不能选择异步触发。有关设置引脚功能的详细信息，请参见第19节，IO端口。

Note 1. PCLKA

Figure 37.36 异步触发输入时序

### 37.3.12 Starting A/D Conversion with a Synchronous Trigger from a Peripheral Module

A/D conversion can be started by a synchronous trigger (ELC). To do this, set the ADCSR.TRGE bit to 1 and the ADCSR.EXTRG bit to 0, and select the relevant sources in the ADSTRGR.TRSA[5:0] and ADSTRGR.TRSB[5:0] bits.

### 37.3.13 Using Data Buffers

This IP is provided with a ring buffer function consisting of 16 A/D data buffers. This function sequentially stores A/D conversion results other than self-diagnosis result (including addition/average results) in data buffers (ADBUF<sub>n</sub>, n = 0 to 15).

Each conversion result is stored at the timing when the A/D conversion result is stored in the data register, and most recent 16 conversion result data are retained.

The figure-below shows the schematic of data buffers, pointer, and overflow flag operations. When the BUFEN bit is set to 1, the A/D conversion result is transferred at each end of A/D conversion. The pointer indicates the number of data buffer to which the next transferred data is to be written. When data is written to up to buffer 15, the pointer is reset to 0000b and the overflow flag is set to 1. Subsequently transferred data overwrites the previously written data.

The overflow flag is reset to the initial value by writing 00h to the ADBUFPTR register.

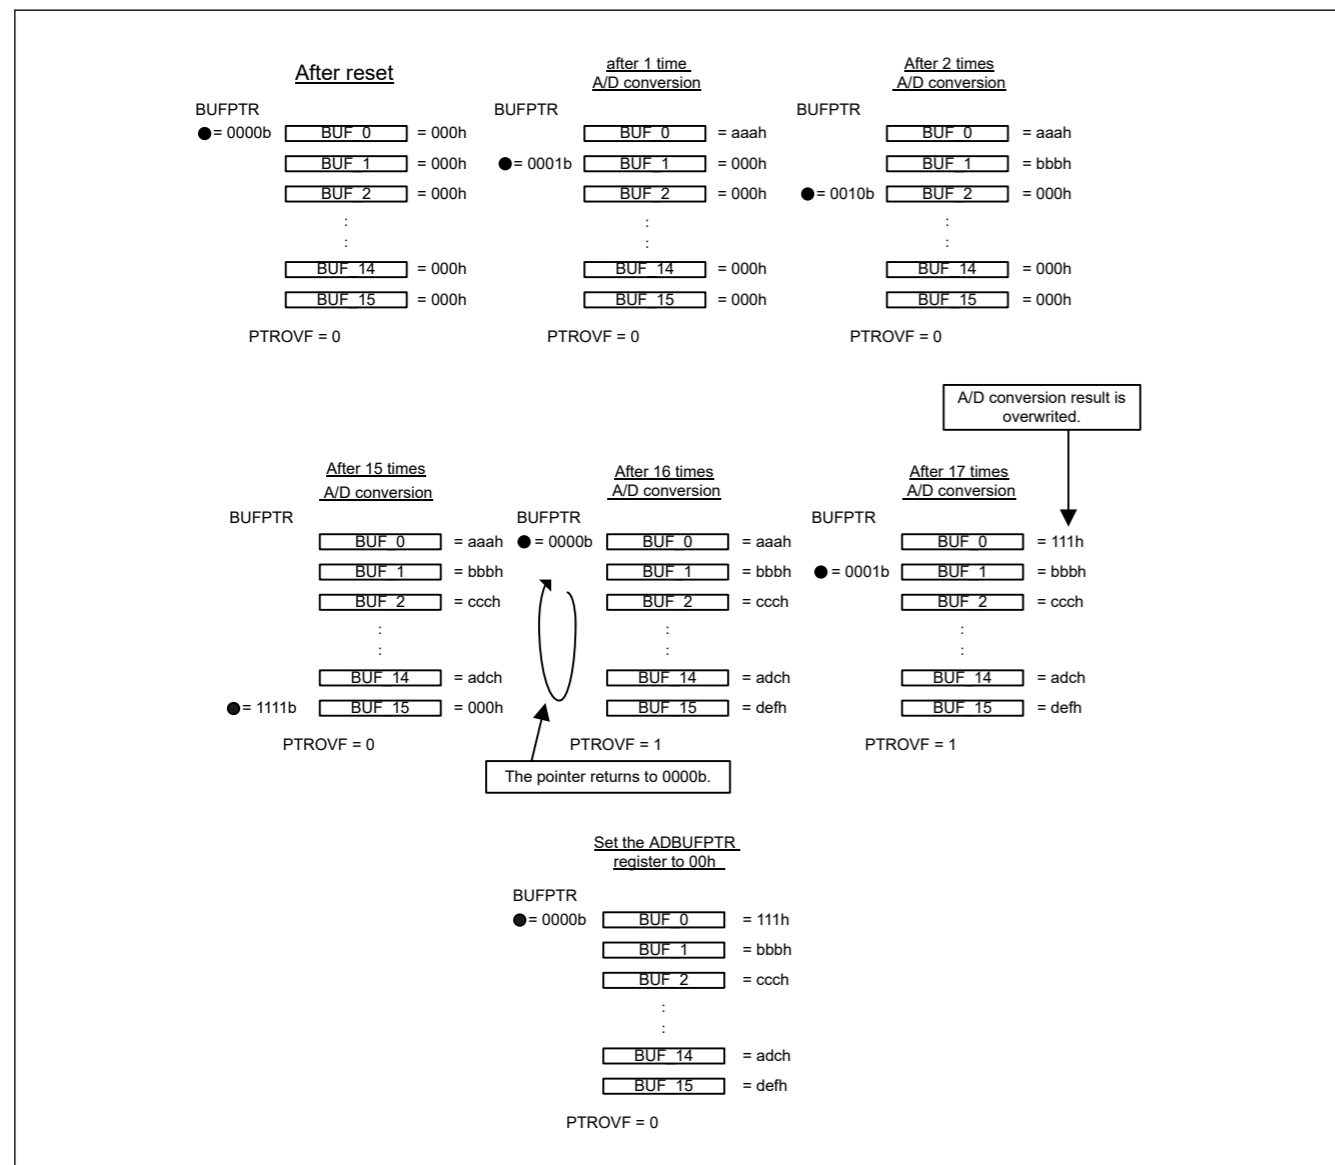

Figure 37.37 Data Buffers, Pointer, and Overflow Flag Operations

### 37.3.12 使用来自外设模块的同步触发启动AD转换

D转换可以通过同步触发器(ELC)启动。为此，将ADCSR.TRGE位设置为1，并将ADCSR.EXTRG位为0，并在ADSTRGR.TRSA[5:0]和ADSTRGR.TRSB[5:0]位中选择相关源。

### 37.3.13 使用数据缓冲区

该IP具有由16个AD数据缓冲区组成的环形缓冲区功能。该功能将除自诊断结果以外的AD转换结果（包括加法平均结果）依次存储在数据缓冲区（ADBUF<sub>n</sub>, n=0至15）中。

每个转换结果在AD转换结果存储在数据寄存器中时存储，并保留最近的16个转换结果数据。

下图显示了数据缓冲区、指针和溢出标志操作的示意图。当BUFEN位设置为1时，AD转换结果在AD转换的每一端传送。指针指示要写入下一个传输数据的数据缓冲区的编号。当数据写入缓冲区15时，指针复位为0000b，溢出标志设置为1。随后传输的数据将覆盖先前写入的数据。

通过将00h写入ADBUFPTR寄存器，溢出标志复位为初始值。

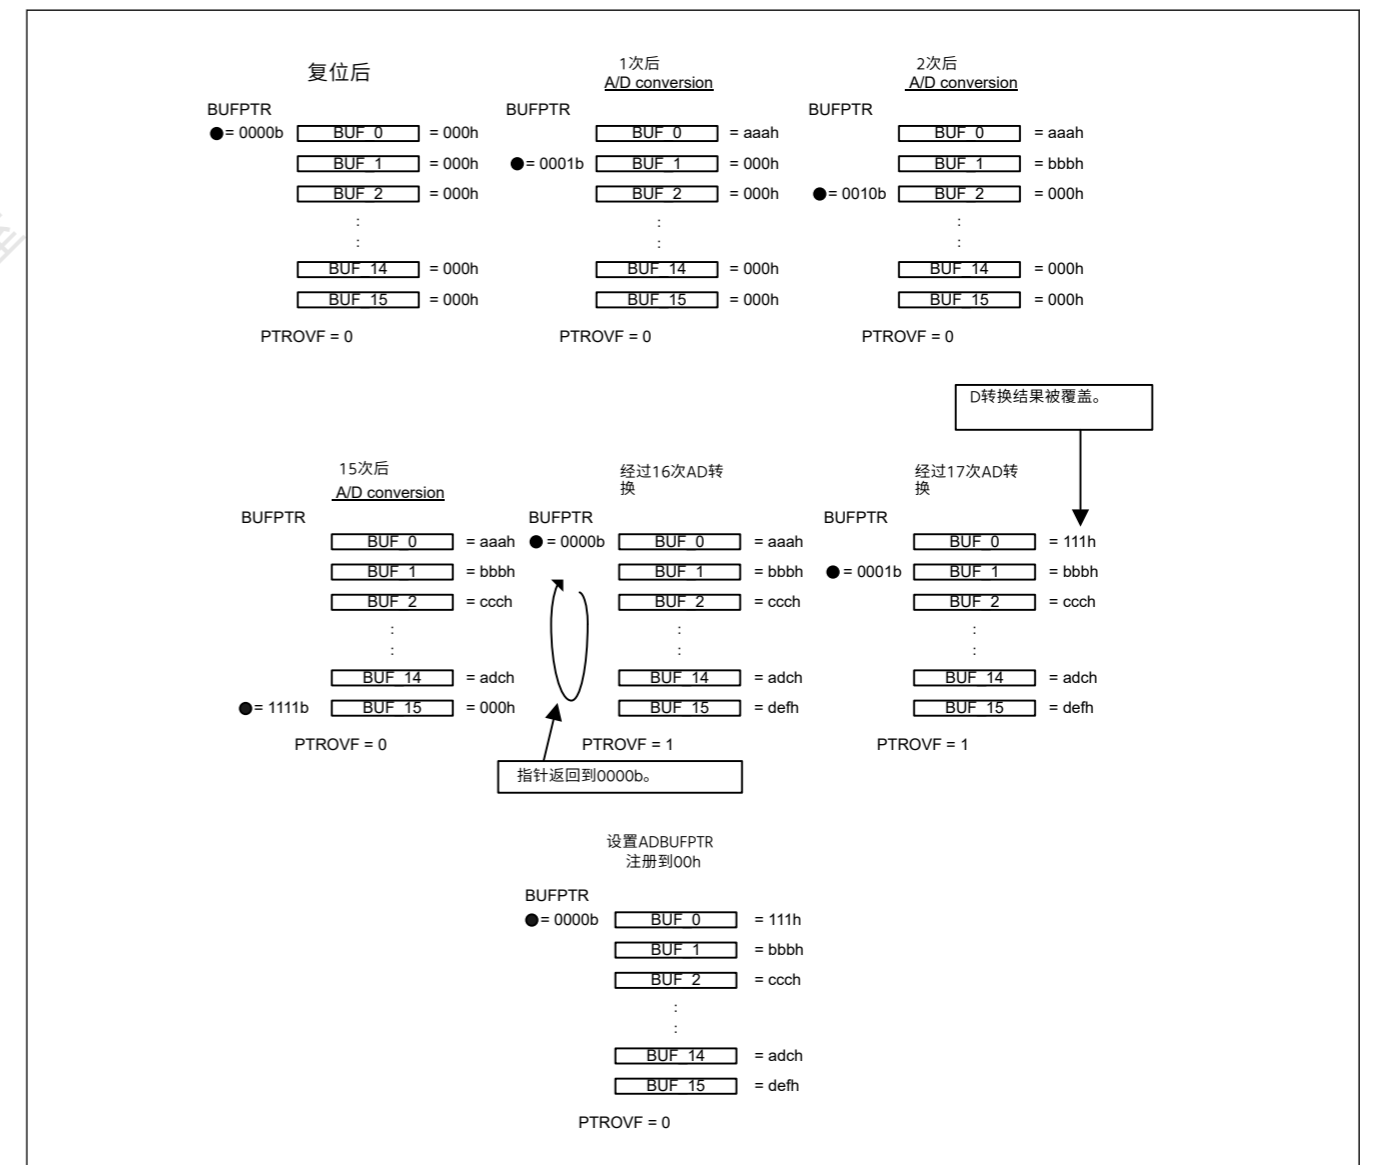

Figure 37.37 数据缓冲区、指针和溢出标志操作

37.4 Interrupt Sources and DTC, DMAC Transfer Requests

37.4.1 Interrupt Requests

The ADC12 can send scan end interrupt requests ADC12i\_ADI (i = 0, 1) and ADC12i\_GBADI (i = 0, 1) to the CPU. The ADC12 also generates the ADC12i\_CMPAI (i = 0, 1)/ADC12i\_CMPBI (i = 0, 1) interrupt for the CPU in response to matches with a condition for comparison.

An ADC12i\_ADI (i = 0, 1) interrupt is always generated. An ADC12i\_GBADI (i = 0, 1) interrupt can be generated by setting the ADCSR.GBADIE bit to 1. Similarly, ADC12i\_CMPAI (i = 0, 1) and ADC12i\_CMPBI (i = 0, 1) interrupts can be generated by setting the ADCMPCR.CMPAIE and ADCMPCR.CMPBIE bit to 1.

In addition, the DTC or DMAC can be started when an ADC12i\_ADI (i = 0, 1) or an ADC12i\_GBADI (i = 0, 1) interrupt is generated. Using an ADC12i\_ADI (i = 0, 1) or ADC12i\_GBADI (i = 0, 1) interrupt to activate the DTC or DMAC to read the converted data enables continuous conversion without a burden on software.

Table 37.28 describes the interrupt sources and ELC events available for the ADC12.

Table 37.28 The interrupt source and ELC event of ADC12 (1 of 2)

| Operation            |                     |                             | Interrupt request or ELC event | Interrupt request | DTC or DMAC activation | ELC event request   | Function   |

37.4 中断源和DTC、DMAC传输请求

37.4.1 中断请求

ADC12可以向CPU发送扫描结束中断请求ADC12i\_ADI(i=0 1)和ADC12i\_GBADI(i=0 1)。这ADC12还为CPU生成ADC12i\_CMPAI(i=0 1)ADC12i\_CMPBI(i=0 1)中断，以响应与比较条件的匹配。

始终会产生ADC12i\_ADI(i=0 1)中断。ADC12i\_GBADI(i=0 1)中断可以通过将ADCSR.GBADIE位设置为1来产生。类似地，ADC12i\_CMPAI(i=0 1)和ADC12i\_CMPBI(i=0 1)中断可以通过设置ADCMPCR来产生.CMPAIE和ADCMPCR.CMPBIE位为1。

此外，当ADC12i\_ADI(i=0 1)或ADC12i\_GBADI(i=0 1)中断产生时，可以启动DTC或DMAC。使用ADC12i\_ADI(i=0 1)或ADC12i\_GBADI(i=0 1)中断来激活DTC或DMAC以读取转换后的数据可实现连续转换，而无需软件负担。

表37.28描述了ADC12可用的中断源和ELC事件。

Table 37.28 ADC12的中断源和ELC事件 (1of2)

| Operation |            |                          | 中断请求或ELC事件               | 中断请求 | DTC或DMAC激活 | ELC事件请求                                | Function                              |
|-----------|------------|--------------------------|--------------------------|------|------------|--|---------------------------------------|
| 扫描模式      | 双触发模式      | 比较函数窗口AB                 |                          |      |            |  |                                       |
| 单次扫描模式    | Deselected | Deselected               | ADC12i_ADI (i = 0, 1)    | ✓    | ✓          | ✓                                      | ADC12i_ADI(i=0 1)在单次扫描结束时生成           |
|           |            | Selected                 | ADC12i_ADI (i = 0, 1)    | ✓    | ✓          | ✓                                      | ADC12i_ADI(i=0 1)在单次扫描结束时生成           |
|           |            |                          | ADC12i_CMPAI (i = 0, 1)  | ✓    | —          | —                                      | 在窗口A的匹配比较条件下生成的ADC12i_CMPAI(i=0 1)    |
|           |            |                          | ADC12i_CMPBI (i = 0, 1)  | ✓    | —          | —                                      | 在窗口B的匹配比较条件下生成的ADC12i_CMPBI(i=0 1)    |
|           |            |                          | ADC12i_WCMPPM (i = 0, 1) | —    | ✓          | ✓                                      | ADC12i_WCMPPM(i=0 1)在窗口AB比较功能的匹配条件下生成 |
|           |            | ADC12i_WCMPUM (i = 0, 1) | —                        | ✓    | ✓          | ADC12i_WCMPUM(i=0 1)在窗口AB比较功能的不匹配条件下生成 |                                       |

For details on DTC settings, see [section 17, Data Transfer Controller \(DTC\)](#).

## 37.5 Event Link Function

### 37.5.1 Event Output to the ELC

The ELC uses the ADC12i\_ADI (i = 0, 1) interrupt request signal as an event signal ADC12i\_ADI (i = 0, 1), enabling link operation for the preset module. The ADC12i\_GBADI (i = 0, 1) interrupt and ADC12i\_CMPAI (i = 0, 1)/ADC12i\_CMPBI (i = 0, 1) interrupts cannot be used as an event signal. For details, see [Table 37.28](#).

An event signal can be output regardless of the settings of the corresponding interrupt request enable bits. For the scan end event (ADC12i\_ADI (i = 0, 1)), a high-level pulse for one PCLKA cycle is output at the same output timing as the interrupt output (ADC12i\_ADI (i = 0, 1)) shown in [Table 37.28](#), irrespective of the setting of ADCSR.ADIE. For a compare match (ADC12i\_WCMPI (i = 0, 1)) and mismatch event (ADC12i\_WCMPUM (i = 0, 1)) to the ELC, a high-level pulse for one PCLKA cycle is output at the timing delayed by one cycle (PCLKA) from the interrupt output (ADC12i\_ADI (i = 0, 1)) shown in [Table 37.28](#).

To use compare match (ADC12i\_WCMPI (i = 0, 1)) or mismatch event (ADC12i\_WCMPUM (i = 0, 1)) to the ELC, specify single-scan mode.

### 37.5.2 ADC12 Operation through an Event from the ELC

The ADC12 can start A/D conversion by the preset event specified in the ELSRn settings for the ELC as follows:

- Select the ELC\_AD00 (unit 0) signal in the ELC.ELSR8 register

Table 37.28 ADC12的中断源和ELC事件(2of2)

| Operation |            |                         | 中断请求或ELC事件              | 中断请求 | DTC或DMAC激活 | ELC事件请求                             | Function                            |
|-----------|------------|-------------------------|-------------------------|------|------------|-------------------------------------|-------------------------------------|
| 扫描模式      | 双触发模式      | 比较函数窗口AB                |                         |      |            |                                     |                                     |
| 组扫描模式     | Deselected | Deselected              | ADC12i_ADI (i = 0, 1)   | ✓    | ✓          | ✓                                   | ADC12i_ADI(i=0 1)在A组扫描结束时生成         |
|           |            |                         | ADC12i_GBADI (i = 0, 1) | ✓    | ✓          | —                                   | ADC12i_GBADI(i=0 1)专用于在B组扫描结束时生成的B组 |

|           |            |                         | ADC12i_GBADI (i = 0, 1) | ✓    | ✓          | —                                   | ADC12i_GBADI(i=0 1)专用于在B组扫描结束时生成的B组 |
|           |            |                         | ADC12i_CMPAI (i = 0, 1) | ✓    | —          | —                                   | 在窗口A的匹配比较条件下生成的ADC12i_CMPAI(i=0 1)  |
|           |            |                         | ADC12i_CMPBI (i = 0, 1) | ✓    | —          | —                                   | 在窗口B的匹配比较条件下生成的ADC12i_CMPBI(i=0 1)  |
|           | Selected   | Deselected              | ADC12i_ADI (i = 0, 1)   | ✓    | ✓          | ✓                                   | ADC12i_ADI(i=0 1)在偶数次扫描A组结束时生成      |
|           |            | ADC12i_GBADI (i = 0, 1) | ✓                       | ✓    | —          | ADC12i_GBADI(i=0 1)专用于在B组扫描结束时生成的B组 |                                     |

Note: 可用—: 不可用

有关DTC设置的详细信息，请参阅第17节，数据传输控制器(DTC)。

## 37.5 事件链接功能

### 37.5.1 事件输出到ELC

ELC使用ADC12i\_ADI(i=0 1)中断请求信号作为事件信号ADC12i\_ADI(i=0 1)，启用预设模块的链接操作。ADC12i\_GBADI(i=0 1)中断和ADC12i\_CMPAI(i=0 1)/ADC12i\_CMPBI(i=0 1)中断不能用作事件信号。详见表37.28。

无论相应中断请求使能位的设置如何，都可以输出事件信号。对于扫描结束事件(ADC12i\_ADI(i=0 1))，在与表37.28所示的中断输出(ADC12i\_ADI(i=0 1))相同的输出时序输出一个PCLKA周期的高电平脉冲，与ADCSR.ADIE的设置无关。对于到ELC的比较匹配(ADC12i\_WCMPI(i=0 1))和失配事件(ADC12i\_WCMPUM(i=0 1))，在延迟一个周期的时序上输出一个PCLKA周期的高电平脉冲(PCLKA)来自表37.28所示的中断输出(ADC12i\_ADI(i=0 1))。

要将比较匹配(ADC12i\_WCMPI(i=0 1))或不匹配事件(ADC12i\_WCMPUM(i=0 1))用于ELC，请指定单扫描模式。

### 37.5.2 ADC12通过来自ELC的事件进行操作

ADC12可以通过ELC的ELSRn设置中指定的预设事件启动AD转换，如下所示：

- 选择ELC.ELSR8寄存器中的ELC\_AD00 (单元0) 信号

- Select the ELC\_AD01 (unit 0) signal in the ELC.ELSR9 register
- Select the ELC\_AD10 (unit 1) signal in the ELC.ELSR10 register
- Select the ELC\_AD11 (unit 1) signal in the ELC.ELSR11 register.

If an ELC event occurs during A/D conversion, the event is disabled.

## 37.6 Usage Notes

### 37.6.1 Constraints on Setting the Registers

Set each register while the ADCSR.ADST bit is 0.

### 37.6.2 Constraints on Reading the Data Registers

The following registers must be read in halfword units:

- A/D Data Registers
- A/D Data Duplexing Register
- A/D Data Duplexing Register A
- A/D Data Duplexing Register B
- A/D Temperature Sensor Data Register
- A/D Internal Reference Voltage Register
- A/D Self-Diagnosis Data Register
- A/D Data Buffer Registers n (N = 0 to 15)

If a register is read twice in byte units, that is, the upper byte and lower byte are read separately, the A/D-converted value read initially might disagree with the A/D-converted value read subsequently. To prevent this, never read the data registers in byte units.

### 37.6.3 Constraints on Stopping A/D Conversion

#### (1) A/D Conversion Stop Procedure

To stop A/D conversion when an asynchronous trigger or a synchronous trigger is selected as the condition for starting A/D conversion, follow the procedure shown in [Figure 37.38](#).

- 选择ELC.ELSR9寄存器中的ELC\_AD01（单元0）信号
- 选择ELC.ELSR10寄存器中的ELC\_AD10（单元1）信号
- 选择ELC.ELSR11寄存器中的ELC\_AD11（单元1）信号。

如果在AD转换期间发生ELC事件，则该事件被禁用。

## 37.6 使用说明

### 37.6.1 设置寄存器的限制

当ADCSR.ADST位为0时设置每个寄存器。

### 37.6.2 读取数据寄存器的限制

以下寄存器必须以半字为单位读取：

- AD数据寄存器
- AD数据双工寄存器
- AD数据双工寄存器A
- AD数据双工寄存器B
- AD温度传感器数据寄存器
- AD内部参考电压寄存器
- AD自诊断数据寄存器
- AD数据缓冲寄存器n(N=0to15)

如果以字节为单位读取寄存器两次，即分别读取高字节和低字节，则最初读取的AD转换值可能与随后读取的AD转换值不一致。为防止这种情况，切勿以字节为单位读取数据寄存器。

### 37.6.3 停止AD转换的约束

#### (1) AD转换停止程序

To stop A/D conversion when an asynchronous trigger or a synchronous trigger is selected as the condition for starting A/D conversion, follow the procedure shown in [Figure 37.38](#).

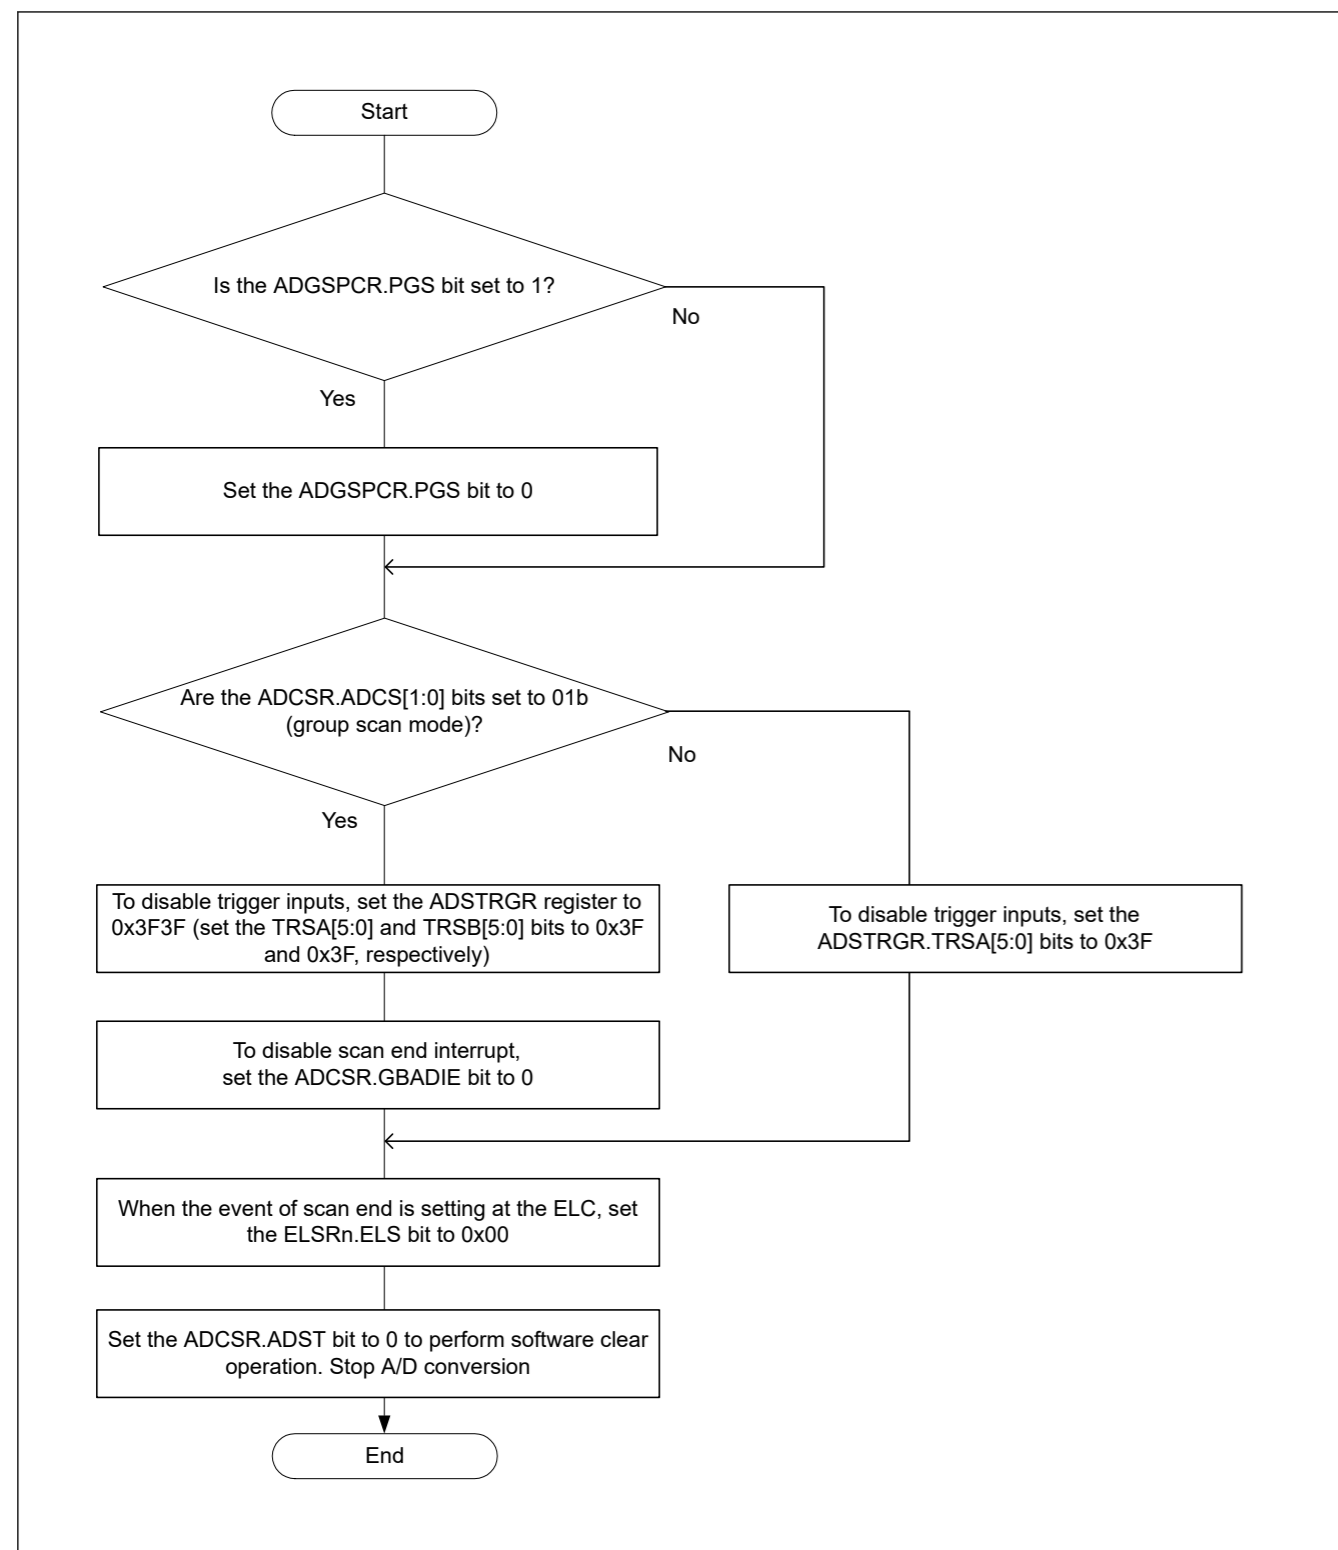

Figure 37.38 Procedures for clearing the ADCSR.ADST bit by software

To specify the following settings after performing the clear operation by software, provide a wait period for at least two ADCLK cycles.

- Enabling scan end interrupts
- Enabling scan end events for the event link controller
- Starting A/D conversion by software
- Enabling trigger input

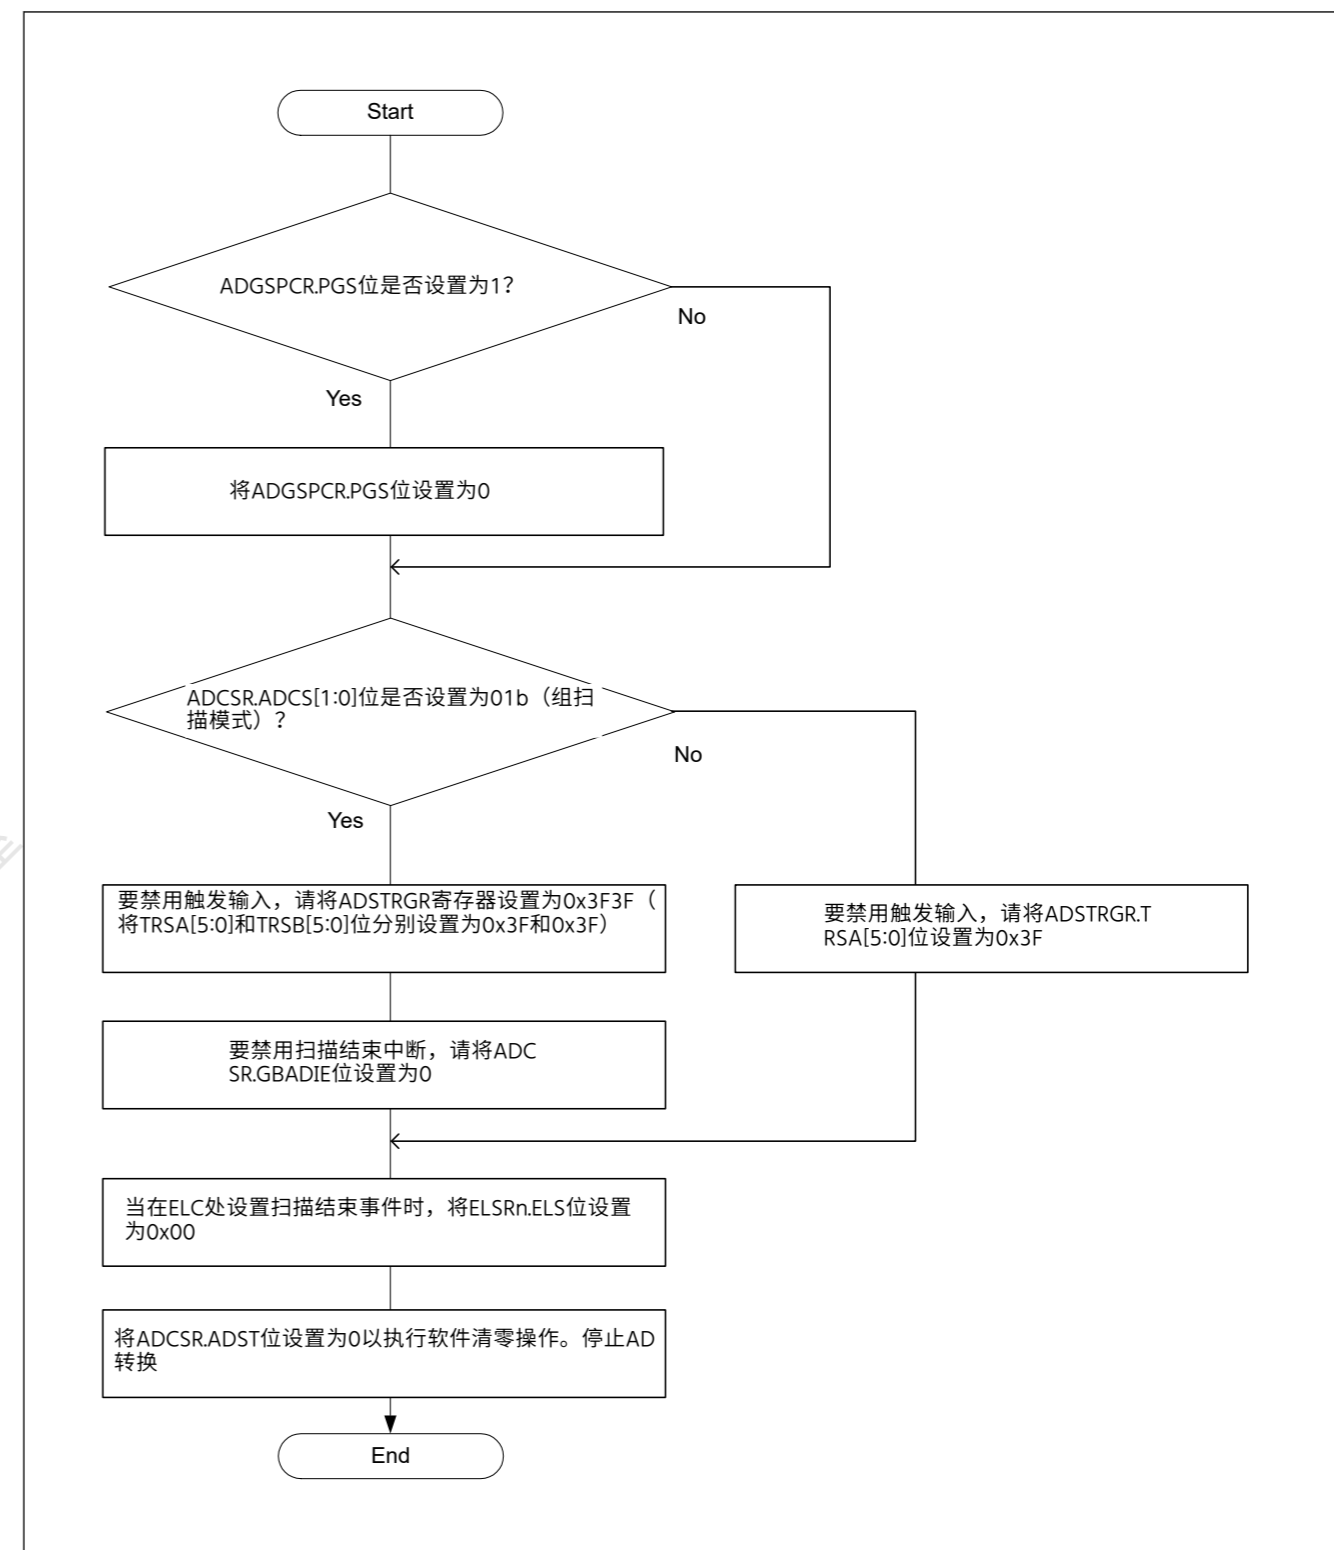

Figure 37.38 通过软件清除ADCSR.ADST位的程序

要在通过软件执行清除操作后指定以下设置, 请提供至少两个等待时间ADCLK cycles.

- 启用扫描结束中断
- 为事件链接控制器启用扫描结束事件
- 通过软件启动AD转换
- 启用触发输入

## (2) Notes on Modes and Status Bits

If necessary, individually initialize or set again the voltage status for self-diagnosis, the judgment of the even number or odd number specified for double-trigger mode, and the monitor flags of the compare function.

- To set again the voltage status for self-diagnosis, set the ADCER.DIAGLD bit to 1 and then set a desired value in the ADCER.DIAGVAL[1:0] bits.
- If the setting of the ADCSR.DBLE bit is changed from 0 to 1, the double-trigger mode operation starts from the first scanning.
- To initialize the monitor flags of the compare function (MONCMPA, MONCMPB, and MONCOMB), set the ADCMPCR.CMPAE and ADCMPCR.CMPBE bits to 0.

### 37.6.4 A/D Conversion Restart and Termination Timing

A maximum of 6 ADCLK cycles is required for the idle analog unit of the ADC12 to restart on setting the ADCSR.ADST bit to 1. A maximum of 2 ADCLK cycles is required for the operating analog unit of the ADC12 to terminate on setting the ADCSR.ADST bit to 0.

### 37.6.5 Constraints on Scan End Interrupt Handling

When scanning the same analog input twice using any trigger, the first A/D-converted data is overwritten with the second A/D-converted data. This occurs when the CPU does not complete the reading of the A/D-converted data by the time the A/D conversion of the first analog input for the second scan ends after the first scan end interrupt is generated.

### 37.6.6 Settings for the Module-Stop Function

The Module Stop Control Register can enable or disable ADC12 operation. The ADC12 is initially stopped after a reset. The registers become accessible on release from the module-stop state. After release from the module-stop state, wait for at least 1 μs before starting A/D conversion. For details, see [section 10, Low Power Modes](#).

### 37.6.7 Notes on Entering the Low-Power States

Before entering the module-stop state or Software Standby mode, be sure to stop A/D conversion. Set the ADCSR.ADST bit in ADCSR to 0 and secure a period of time until the analog unit of the ADC12 stops. Follow the procedure shown in [Figure 37.38](#) to clear the ADCSR.ADST bit with software. Then, wait for 2 clock cycles of ADCLK before entering the module-stop state or Software Standby mode.

### 37.6.8 Error in Absolute Accuracy When Disconnection Detection Assistance Is in Use

Using disconnection detection assistance leads to an error in absolute accuracy of the ADC12. This error arises because an erroneous voltage is input to the analog input pins due to the resistive voltage division between the pull-up or pull-down resistor (Rp) and the resistance of the signal source (Rs). This error in absolute accuracy is calculated from the following formula:

$$\text{Maximum error in absolute accuracy (LSB)} = (2^{\text{Resolution}} - 1) \times R_s / (R_s + R_p)$$

Only use disconnection detection assistance after thorough evaluation.

### 37.6.9 Constraints on Operating Modes and Status Bits

Initialize or set again individually, if necessary, the voltage values in self-diagnosis, the value of the first scan or second scan in double trigger mode, the data buffer pointer, and status monitor in the compare function.

- Select the voltage values in self-diagnosis (ADCER.DIAGVAL[1:0]) after setting ADCER.DIAGLD to 1.
- Double-trigger mode operates as the first scan after setting ADCSR.DBLE from 0 to 1.
- The status monitor bits (MONCMPA, MONCMPB, MONCOMB) in the compare function are initialized after setting ADCMPCR.CMPAE and ADCMPCR.CMPBE to 0.

## (2) 模式和状态位注意事项

如有必要，单独初始化或重新设置电压状态以进行自诊断、双触发模式指定的偶数或奇数判断以及比较功能的监视标志。

- 要再次设置自诊断的电压状态，请将ADCER.DIAGLD位设置为1，然后在ADCER.DIAGVAL[1:0]位中设置所需的值。
- 如果ADCSR.DBLE位的设置从0变为1，则双触发模式操作从第一次扫描开始。
- 要初始化比较函数的监控标志（MONCMPA、MONCMPB和MONCOMB），请将ADCMPCR.CMPAE和ADCMPCR.CMPBE位设置为0。

### 37.6.4 AD转换重启和终止时序

ADC12的空闲模拟单元最多需要6个ADCLK周期才能在将ADCSR.ADST位设置为1时重新启动。ADC12的操作模拟单元需要最多2个ADCLK周期才能在设置ADCSR时终止ADST位为0。

### 37.6.5 扫描结束中断处理的约束

当使用任何触发器扫描相同的模拟输入两次时，第一个AD转换数据将被第二个AD转换数据覆盖。当CPU在

在产生第一次扫描结束中断后，第二次扫描的第一个模拟输入的D转换结束。

### 37.6.6 模块停止功能的设置

模块停止控制寄存器可以启用或禁用ADC12操作。ADC12在复位后最初停止。寄存器在从模块停止状态释放时变得可访问。从模块停止状态释放后，至少等待1 μs再开始AD转换。有关详细信息，请参阅第10节，低功耗模式。

### 37.6.7 进入低功耗状态的注意事项

在进入模块停止状态或软件待机模式之前，请务必停止AD转换。将ADCSR中的ADCSR.ADST位设置为0，并确保一段时间，直到ADC12的模拟单元停止。按照图37.38所示的过程用软件清零ADCSR.ADST位。然后，在进入模块停止状态或软件待机模式之前等待ADCLK的2个时钟周期。

### 37.6.8 使用断线检测辅助时的绝对精度误差

使用断开检测辅助会导致ADC12的绝对精度出现误差。由于上拉或下拉电阻(Rp)与信号源电阻(Rs)之间的电阻分压，导致错误电压输入到模拟输入引脚，因此会出现此错误。该绝对精度误差由以下公式计算得出：

$$\text{绝对精度的最大误差(LSB)} = 2^{\text{分辨率}} \times R_s R_p / (R_s + R_p)$$

仅在全面评估后使用断线检测辅助。

### 37.6.9 操作模式和状态位的限制

必要时单独初始化或重新设置自诊断中的电压值、双触发模式下的第一次扫描或第二次扫描的值、数据缓冲区指针和比较功能中的状态监视器。

- 设置ADCER.DIAGLD为1后，选择自诊断中的电压值（ADCER.DIAGVAL[1:0]）。
- 双触发模式在将ADCSR.DBLE从0设置为1后作为第一次扫描运行。
- 比较功能中的状态监控位（MONCMPA、MONCMPB、MONCOMB）在设置ADCMPCR.CMPAE和ADCMPCR.CMPBE为0后被初始化。

### 37.6.10 Notes on Board Design

The board should be designed so that digital circuits and analog circuits are separated from each other as far as possible. In addition, digital circuit signal lines and analog circuit signal lines should not intersect or be placed near each other. If these rules are not followed, noise can occur on analog signals and A/D conversion accuracy is affected. The analog input pins, reference power supply pin (VREFH0, VREFH), reference ground pin (VREFL0, VREFL), and analog power supply (AVCC0) should be separated from digital circuits using the analog ground (AVSS0). The analog ground (AVSS0) should be connected to a stable digital ground (VSS) on the board (single-point ground plane connection).

### 37.6.11 Constraints on Noise Prevention

To prevent the analog input pins from being destroyed by abnormal voltage such as excessive surge, insert a capacitor between AVCC0 and AVSS0 and between VREFH0 and VREFL0 and between VREFH and VREFL. Additionally, connect a protection circuit to protect the analog input pins as shown in Figure 37.39.

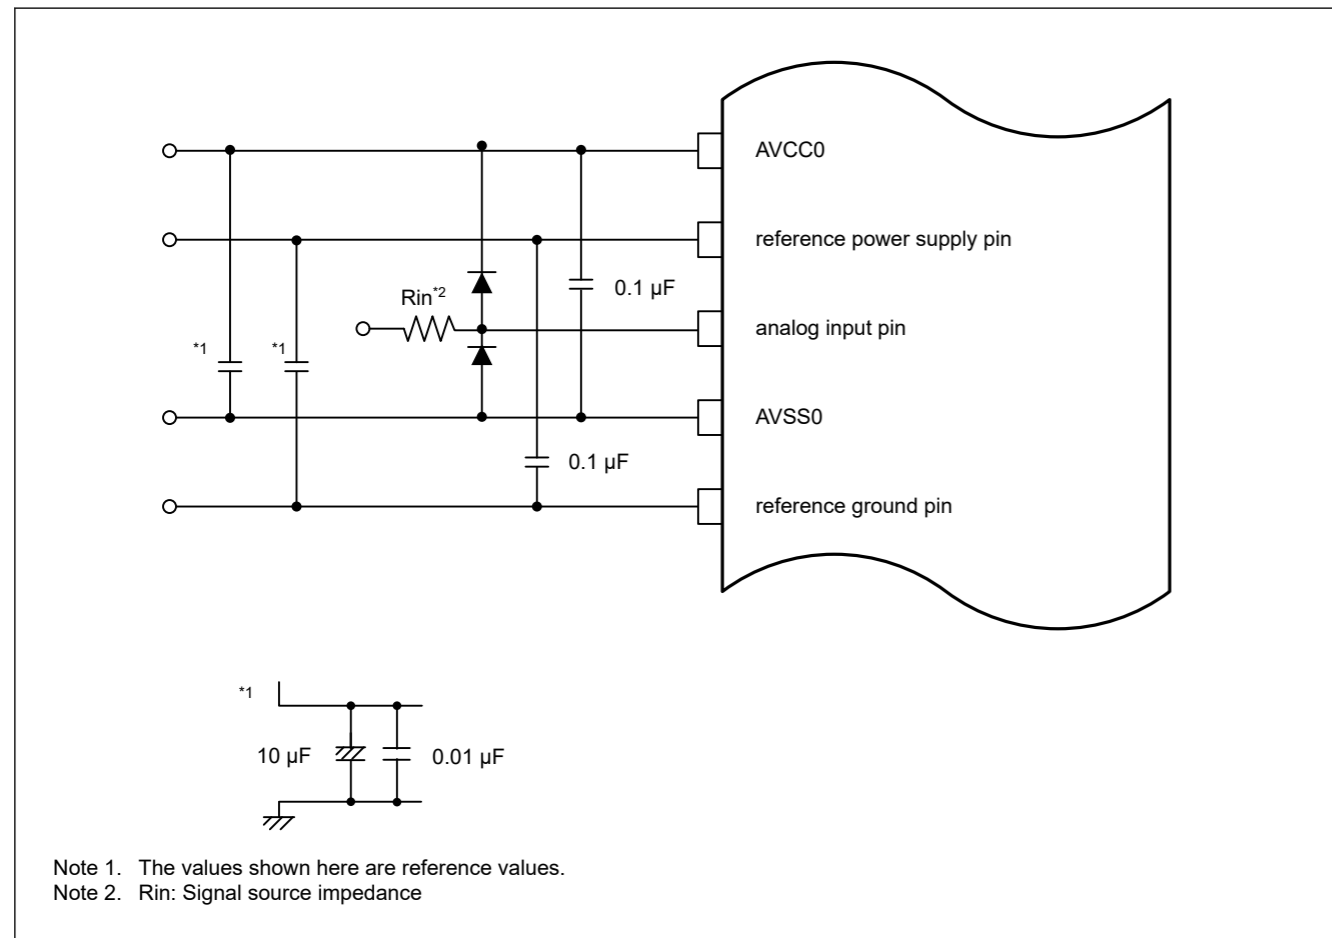

Figure 37.39 Example protection circuit for analog inputs

### 37.6.12 Port Settings When Using the ADC12 Input

When using the high-precision channels, do not use PORT0 as general I/O. Renesas recommends that you do not use the digital output that is also used as the AD analog input if normal-precision channel is used. If the digital output that is also used as the AD analog input is used for output signals, perform A/D conversion several times, eliminate the maximum and minimum values, and obtain the average of the other results.

### 37.6.13 Notes on Canceling Software Standby Mode

After software standby mode is canceled, wait at least 1 μs after the stabilization time for the oscillator elapses and before starting A/D conversion. For details, see section 10, Low Power Modes

### 37.6.10 电路板设计注意事项

电路板的设计应使数字电路和模拟电路尽可能分开。此外，数字电路信号线和模拟电路信号线不应交叉或靠近。如果不遵守这些规则，模拟信号上可能会出现噪声，影响AD转换精度。模拟输入引脚、参考电源引脚(VREFH0、VREFH)、参考接地引脚(VREFL0、VREFL)和模拟电源(AVCC0)应与使用模拟接地(AVSS0)的数字电路分开。模拟接地(AVSS0)应连接到板上的稳定数字接地(VSS) (单点接地层连接)。

### 37.6.11 防止噪音的限制

为防止模拟输入引脚被过大浪涌等异常电压损坏，请在AVCC0和AVSS0之间、VREFH0和VREFL0之间以及VREFH和VREFL之间插入一个电容器。此外，连接保护电路以保护模拟输入引脚，如图37.39所示。

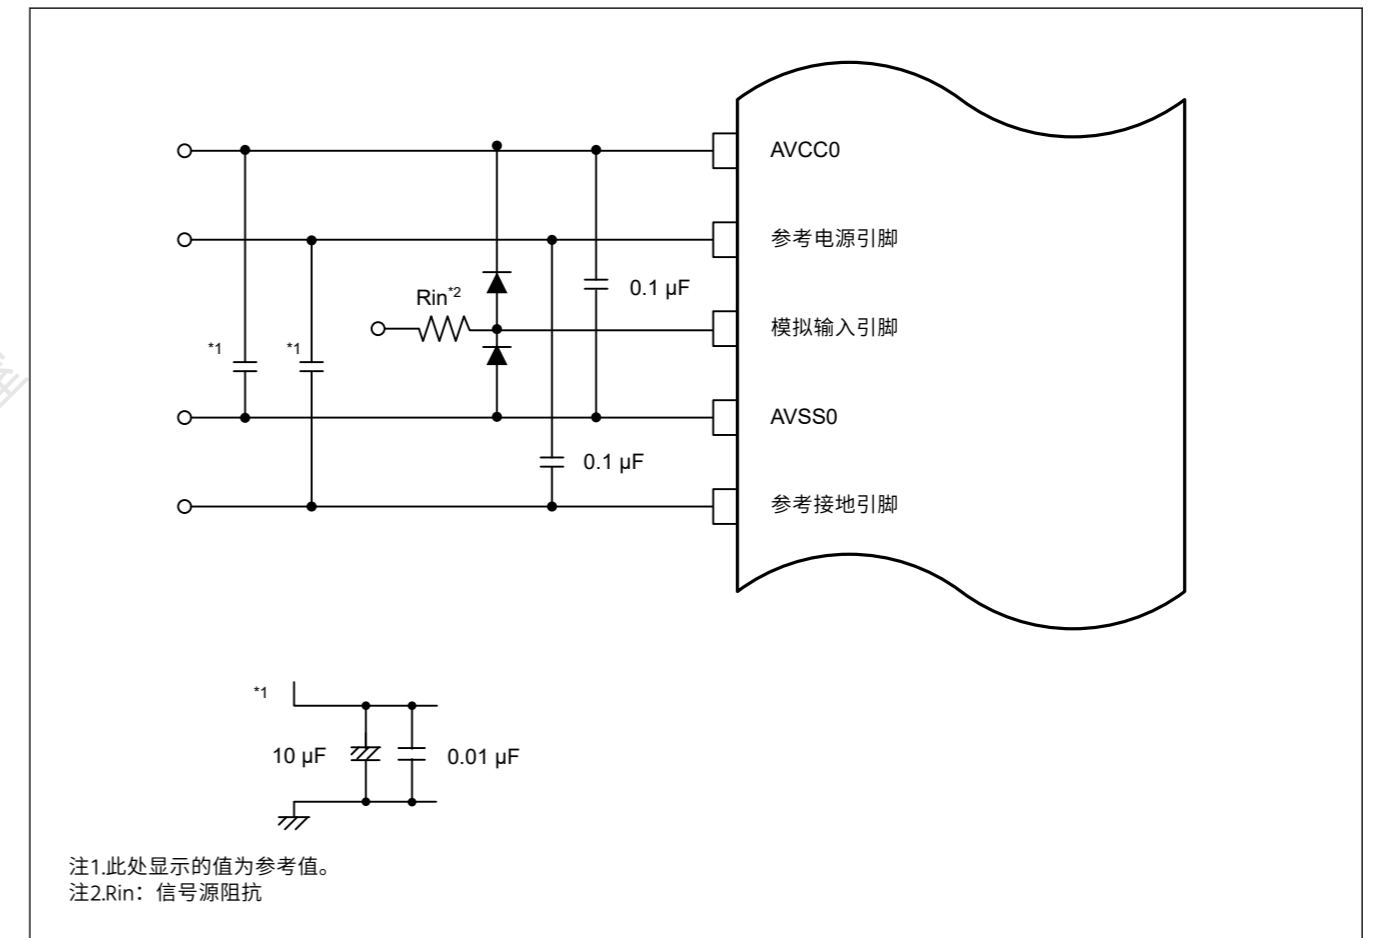

Figure 37.39 模拟输入保护电路示例

### 37.6.12 使用ADC12输入时的端口设置

使用高精度通道时，请勿将PORT0用作通用IO。如果使用普通精度通道，瑞萨建议您不要使用同时用作AD模拟输入的数字输出。如果同时用作AD模拟输入的数字输出用于输出信号，则进行数次A/D转换，消除最大值和最小值，取其他结果的平均值。

### 37.6.13 关于取消软件待机模式的注意事项

取消软件待机模式后，在振荡器的稳定时间过去后至少等待1 μs，然后再开始AD转换。有关详细信息，请参阅第10节，低功耗模式

## 37.6.14 Calculation for sampling time

The sampling time can be easily estimated by the following figure and formula. This is the time to reach the voltage within 1/4 LSB.

$$t_{SPL} = (R_{EXT} + R_{AD}) \times (C_{EXT} + C_{AD}) \times \ln(C_{AD} / (C_{EXT} + C_{AD}) \times 2^{N+2})$$

$R_{EXT}$  shows external signal source impedance

$C_{EXT}$  shows external capacitance (pin capacitance<sup>\*1</sup> + PCB parasitic capacitance)

$N = 12, 10$  or  $8$  (conversion resolution)

$C_{AD} = 5$  pF (internal capacitance)

$R_{AD} = 1.0$  k $\Omega$  (internal resistance, case of high-speed channels)

$R_{AD} = 2.0$  k $\Omega$  (internal resistance, case of normal-speed channels)

Note 1. Typical value of analog input pin is 5 pF

For example, if  $R_{EXT}$  is 1 k $\Omega$ ,  $C_{EXT}$  is 10 pF and  $N$  is 12 bits,  $t_{SPL}$  of high-speed channel is 258 ns.

This formula simplifies the general use case. This formula is not guaranteed and should be used only for estimation.

Figure 37.40 Sample and hold circuit simplified diagram

## 37.6.14 采样时间计算

采样时间可以通过下图和公式轻松估算。这是在14LSB内达到电压的时间。

$$t_{SPL} = (R_{EXT} + R_{AD}) \times (C_{EXT} + C_{AD}) \times \ln(C_{AD} / (C_{EXT} + C_{AD}) \times 2^{N+2})$$

$R_{EXT}$ 显示外部信号源阻抗

$C_{EXT}$ 表示外部电容（引脚电容+PCB寄生电容）

$N = 12, 10$  or  $8$  (conversion resolution)

$C_{AD} = 5$  pF (internal capacitance)

$R_{AD} = 1.0$  k $\Omega$  (内部电阻, 高速通道的情况)

$R_{AD} = 2.0$  k $\Omega$  (内部电阻, 正常速度通道的情况)

注1. 模拟输入引脚的典型值为5pF

例如, 如果 $R_{EXT}$ 为1k $\Omega$ ,  $C_{EXT}$ 为10pF,  $N$ 为12位, 则高速通道的 $t_{SPL}$ 为258ns。

此公式简化了一般用例。这个公式不能保证, 只能用于估计。

Figure 37.40 采样保持电路简化图

## 38. 12-Bit D/A Converter (DAC12)

### 38.1 Overview

The MCU provides a 12-bit D/A Converter (DAC12) with an output amplifier. Table 38.1 lists the DAC12 specifications, Figure 38.1 shows a block diagram, and Table 38.2 lists the I/O pins.

Table 38.1 DAC12 specifications

| Parameter                                     | Specifications   |
|---|--|
| Resolution                                    | 12 bits  |
| Output channels                               | 2 channels   |
| Interference reduction between analog modules | Methods provided to minimize interference between D/A and A/D conversion: <ul style="list-style-type: none"> <li>D/A converted data update timing is controlled by the synchronous D/A conversion enable input signal from the ADC12 (unit 1)</li> <li>Degradation of A/D conversion accuracy caused by interference is reduced by controlling the DAC12 inrush current generation timing with the enable signal.</li> </ul> |
| Module-stop function                          | Module-stop state can be set to reduce power consumption   |
| Event link function (input)                   | The DA0 and DA1 conversion can be started on input of an event signal  |
| D/A output amplifier control function         | Controls whether the output amplifier (for both amplifier-through and amplifier-bias controls) is used   |
| TrsutZone Filter                              | Security attribution can be set  |

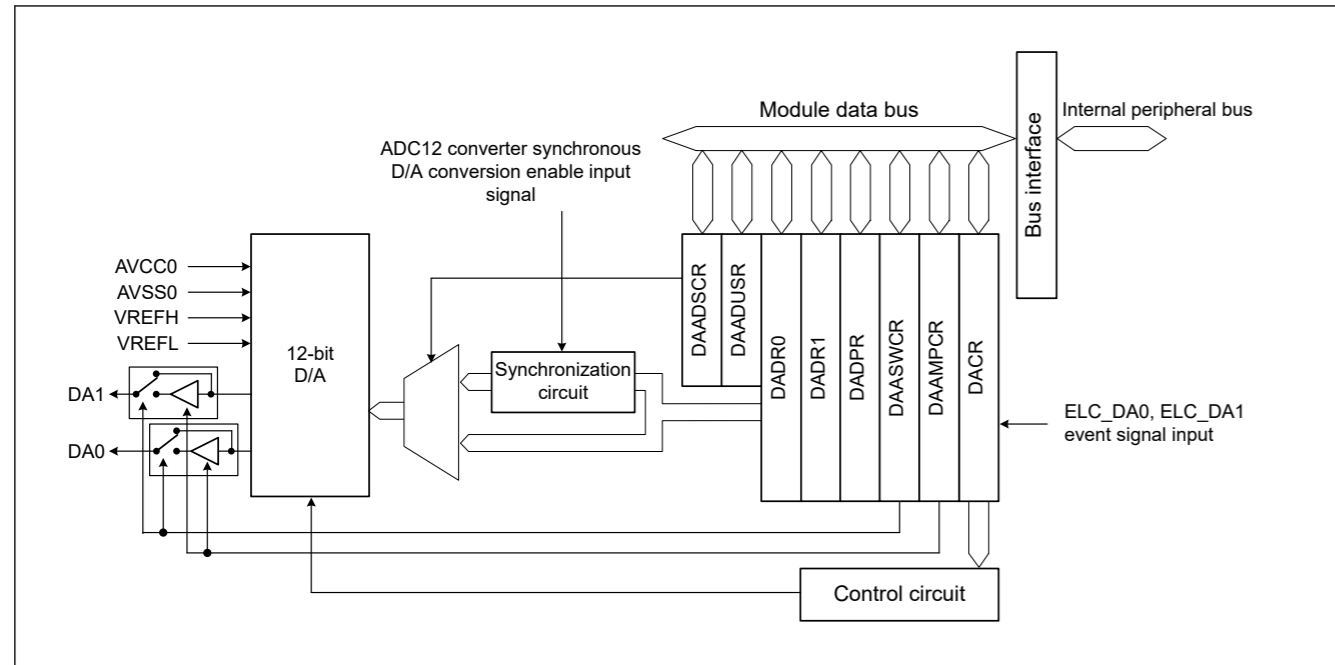

Figure 38.1 DAC12 block diagram

Table 38.2 lists the pin configuration of the DAC12.

Table 38.2 DAC12 I/O pins (1 of 2)

| Pin name | I/O   | Function   |
|----------|-------|--|
| AVCC0    | Input | <ul style="list-style-type: none"> <li>Analog power and analog reference top voltage supply pin for ADC12 and DAC12.</li> <li>Connect to VCC when these modules are not used.</li> </ul> |
| AVSS0    | Input | <ul style="list-style-type: none"> <li>Analog ground and analog reference ground supply pin for ADC12 and DAC12.</li> <li>Connect to VSS when these modules are not used.</li> </ul>     |
| VREFH    | Input | Analog reference top voltage supply pin for the ADC12 (unit 1) and the DAC12   |
| VREFL    | Input | Analog reference ground pin for the ADC12 (unit 1) and the DAC12   |

## 38. 12-Bit D/A Converter (DAC12)

### 38.1 Overview

MCU提供带输出放大器的12位DA转换器(DAC12)。表38.1列出了DAC12规格，图38.1显示了框图，表38.2列出了IO引脚。

Table 38.1 DAC12 specifications

| Parameter            | Specifications   |
|----------------------|--|
| Resolution           | 12 bits  |
| 输出通道                 | 2 channels   |
| 减少模拟模块之间的干扰          | 为尽量减少DA和AD转换之间的干扰提供的方法: <ul style="list-style-type: none"> <li>DA转换数据更新时序由来自ADC12 (单元1) 的同步DA转换使能输入信号控制</li> <li>通过使能信号控制DAC12浪涌电流的产生时序,可以减少由干扰引起的AD转换精度下降。</li> </ul> |
| Module-stop function | 可设置模块停止状态以降低功耗   |
| 事件链接功能 (输入)          | DA0和DA1转换可以在输入事件信号时启动  |
| DA输出放大器控制功能          | 控制是否使用输出放大器 (用于放大器直通和放大器偏置控制)  |
| TrsutZone Filter     | 可设置安全属性  |

Figure 38.1 DAC12框图

表38.2列出了DAC12的引脚配置。

Table 38.2 DAC12IO引脚 (2个中的1个)

| 引脚名称  | I/O   | Function  |
|-------|-------|---|
| AVCC0 | Input | <ul style="list-style-type: none"> <li>ADC12和DAC12的模拟电源和模拟参考最高电压电源引脚。</li> <li>不使用这些模块时连接到VCC。</li> </ul> |
| AVSS0 | Input | <ul style="list-style-type: none"> <li>ADC12和DAC12的模拟地和模拟参考地电源引脚。</li> <li>不使用这些模块时连接到VSS。</li> </ul>     |
| VREFH | Input | ADC12 (单元1) 和DAC12的模拟参考最高电压电源引脚   |
| VREFL | Input | ADC12 (单元1) 和DAC12的模拟参考接地引脚   |

**Table 38.2 DAC12 I/O pins (2 of 2)**

| Pin name | I/O    | Function   |
|----------|--------|--|
| DA0      | Output | Channel 0 output pin for the analog signals processed by the DAC12 |
| DA1      | Output | Channel 1 output pin for the analog signals processed by the DAC12 |

### 38.2 Register Descriptions

#### 38.2.1 DADRn : D/A Data Register n (n = 0, 1)

Base address: DAC12 = 0x4017\_1000

Offset address: 0x00 + 0x02 × n

DADRn register is 16-bit read/write registers that store data for D/A conversion. When an analog output is enabled, the values in DADRn are converted and output to the analog output pins.

12-bit data can be formatted as left- or right-justified in the DADPR.DPSEL bit setting. In right-justified format (DADPR.DPSEL = 0), the lower 12 bits, [11:0], are valid. In left-justified format (DADPR.DPSEL = 1), the upper 12 bits, [15:4], are valid.

#### 38.2.2 DACR : D/A Control Register

Base address: DAC12 = 0x4017\_1000

Offset address: 0x04

| Bit | Symbol            | Function   | R/W |
|-----|-------------------|--|-----|
| 4:0 | —                 | These bits are read as 1. The write value should be 1.   | R/W |
| 5   | DAE <sup>*1</sup> | D/A Enable<br>0: Control D/A conversion of channels 0 and 1 individually<br>1: Control D/A conversion of channels 0 and 1 collectively | R/W |
| 6   | DAOE0             | D/A Output Enable 0<br>0: Disable analog output of channel 0 (DA0)<br>1: Enable D/A conversion of channel 0 (DA0)                      | R/W |
| 7   | DAOE1             | D/A Output Enable 1<br>0: Disable analog output of channel 1 (DA1)<br>1: Enable D/A conversion of channel 1 (DA1)                      | R/W |

Note 1. This bit controls D/A conversion in combination with the DAOEi bit (i = 0, 1), which controls the output of the conversion results. For details, see Table 38.3.

**Table 38.2 DAC12 I/O引脚 (2个中的2个)**

| 引脚名称 | I/O    | Function             |
|------|--------|----------------------|
| DA0  | Output | DAC12处理的模拟信号的通道0输出引脚 |
| DA1  | Output | DAC12处理的模拟信号的通道1输出引脚 |

### 38.2 注册说明

#### 38.2.1 DADRn:DA数据寄存器n(n=0 1)

Base address: DAC12 = 0x4017\_1000

Offset address: 0x00 + 0x02 × n

DADRn寄存器是16位读写寄存器，用于存储用于DA转换的数据。当模拟输出使能时，DADRn中的值被转换并输出到模拟输出引脚。

在DADPR.DPSEL位设置中，12位数据可以被格式化为左对齐或右对齐。在右对齐格式(DADPR.DPSEL=0)中，低12位[11:0]有效。在左对齐格式(DADPR.DPSEL=1)中，高12位[15:4]有效。

#### 38.2.2 DACR:DA控制寄存器

Base address: DAC12 = 0x4017\_1000

Offset address: 0x04

| Bit | Symbol            | Function  | R/W |
|-----|-------------------|---|-----|
| 4:0 | —                 | 这些位被读取为1。写入值应为1。  | R/W |
| 5   | DAE <sup>*1</sup> | D/A Enable<br>0: 分别控制通道0和通道1的DA转换<br>1: 控制通道0和通道1的DA转换  | R/W |
| 6   | DAOE0             | DA输出使能0<br>0: 禁用通道0 (DA0) 的模拟输出<br>1: 启用通道0 (DA0) 的DA转换 | R/W |
| 7   | DAOE1             | DA输出使能1<br>0: 禁用通道1 (DA1) 的模拟输出<br>1: 启用通道1 (DA1) 的DA转换 | R/W |

注1.该位与DAOEi位(i=0 1)一起控制DA转换，DAOEi位控制转换结果的输出。详见表38.3。

Table 38.3 D/A conversion controls

| DAE | DAOE1 | DAOE0 | Description  |
|-----|-------|-------|--|
| 0   | 0     | 0     | Disable D/A conversion and analog output pins (DA0, DA1)*1   |
|     |       | 1     | <ul style="list-style-type: none"> <li>Enable D/A conversion of channel 0 and disable D/A conversion of channel 1</li> <li>Enable analog output of channel 0 (DA0) and disable analog output of channel 1 (DA1)*1</li> </ul> |
|     | 1     | 0     | <ul style="list-style-type: none"> <li>Disable D/A conversion of channel 0 and enable D/A conversion of channel 1</li> <li>Disable analog output of channel 0 (DA0)*1 and enable analog output of channel 1 (DA1)</li> </ul> |
|     |       | 1     | <ul style="list-style-type: none"> <li>Enable D/A conversion of channels 0 and 1</li> <li>Enable analog output of channels 0 and 1 (DA0, DA1)</li> </ul>   |
| 1   | x     | x     | <ul style="list-style-type: none"> <li>Enable D/A conversion of channels 0 and 1</li> <li>Collective enable analog output of channels 0 and 1 (DA0, DA1)</li> </ul>  |

Note: x: Don't care

Note 1. When analog output is disabled, the analog output signal is placed in the Hi-Z state.

Only set this register while the ADC12 is halted when the DAADSCR.DAADST bit is 1 (interference reduction between D/A and A/D conversion is enabled). Only set DACR while the ADCSR.ADST bit is 0 and after selecting the software trigger, for the ADC12 trigger to securely stop the ADC12. This MCU only supports ADC12 (unit 1).

#### DAE bit (D/A Enable)

The DAE bit controls D/A conversion, amplifier operation, and analog output in combination with the DAOEi bit (i = 0, 1) and the DAMMPCR.DAAMPi bit (i = 0, 1). See Table 38.4.

When interference reduction between D/A and A/D conversions is enabled (DAADSCR.DAADST = 1), set the ADCSR.ADST bit of the ADC12 (unit 1) to 0. Then, select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1).

#### DAOEi bit (D/A Output Enable i)

The DAOEi bit (i = 0, 1) controls D/A conversion, amplifier operation, and analog output in combination with the DAE bit and DAMMPCR.DAAMPi bit (i = 0, 1). See Table 38.4.

When both the DAOEi bit (i = 0, 1) and DAE bit are 0, D/A conversion of channel i (i = 0, 1) is not processed, and no conversion result is output.

When interference reduction between D/A and A/D conversions is enabled (DAADSCR.DAADST = 1), set the DAOEi bit while the ADCSR.ADST bit of the ADC12 (unit 1) is set to 0. Then, select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1).

The event link function can be used to set the DAOEi bit to 1. The DAOE0 bit is set to 1 when the event specified in the ELSR12 register of the ELC (ELC\_DA0 event) occurs, and output of the D/A conversion results starts. The DAOE1 bit is set to 1 when the event specified in the ELSR13 register of the ELC (ELC\_DA1 event) occurs, and output of the D/A conversion results starts.

Table 38.4 D/A conversion and analog output control

| DACR |       | DAAMPCR |   | Channel i operation | Amplifier operation of channel i | Analog output of channel i |
|------|-------|---------|---|---------------------|----------------------------------|----------------------------|
| DAE  | DAOEi | DAAMPi  |   |                     |                                  |                            |
| 0    | 0     | 0       | 0 | Stop                | Stop                             | Hi-Z                       |
|      |       | 1       | 1 | Stop                | Stop                             | Hi-Z                       |
|      | 1     | 0       | 0 | Run                 | Stop                             | Amplifier-through          |
|      |       | 1       | 1 | Run                 | Run                              | Amplifier output           |
| 1    | 0     | 0       | 0 | Run                 | Stop                             | Amplifier-through          |
|      |       | 1       | 1 | Run                 | Run                              | Amplifier output           |
|      | 1     | 0       | 0 | Run                 | Stop                             | Amplifier-through          |
|      |       | 1       | 1 | Run                 | Run                              | Amplifier output           |

Table 38.3 DA转换控制

| DAE | DAOE1 | DAOE0 | Description   |
|-----|-------|-------|---|
| 0   | 0     | 0     | 禁用DA转换和模拟输出引脚(DA0 DA1)*1  |
|     |       | 1     | <ul style="list-style-type: none"> <li>启用通道0的DA转换和禁用通道1的DA转换</li> <li>启用通道0(DA0)的模拟输出和禁用通道1(DA1)的模拟输出*1</li> </ul>  |
|     | 1     | 0     | <ul style="list-style-type: none"> <li>禁用通道0的DA转换, 启用通道1的DA转换</li> <li>禁用通道0(DA0)*1的模拟输出并启用通道1(DA1)的模拟输出</li> </ul> |
|     |       | 1     | <ul style="list-style-type: none"> <li>启用通道0和1的DA转换</li> <li>启用通道0和1 (DA0、DA1) 的模拟输出</li> </ul>                     |
| 1   | x     | x     | <ul style="list-style-type: none"> <li>启用通道0和1的DA转换</li> <li>通道0和1 (DA0、DA1) 的集体启用模拟输出</li> </ul>                   |

Note: x: Don't care

注1.当模拟输出禁用时, 模拟输出信号置于Hi-Z状态。

仅当DAADSCR.DAADST位为1时ADC12停止时才设置此寄存器(之间的干扰减少DA和AD转换已启用)。只有在ADCSR.ADST位为0且选择软件触发后设置DACR, ADC12触发才能安全停止ADC12。此MCU仅支持ADC12(单元1)。

#### DAE位 (DA启用)

DAE位与DAOEi位(i=0 1)和DAMMPCR.DAAMPi位(i=0 1)一起控制DA转换、放大器操作和模拟输出。见表38.4。

当启用DA和AD转换之间的干扰减少(DAADSCR.DAADST=1)时, 设置ADC12(单元1)的ADCSR.ADST位为0。然后, 选择ADC12(单元1)触发的软件触发以安全停止ADC12(单元1)。

#### DAOEi位 (DA输出使能i)

DAOEi位(i=0 1)与DAE位和DAMMPCR.DAAMPi位(i=0 1)一起控制DA转换、放大器操作和模拟输出。见表38.4。

当DAOEi位(i=0 1)和DAE位均为0时, 通道i(i=0 1)的DA转换不进行处理, 也不输出转换结果。

当启用DA和AD转换之间的干扰降低时(DAADSCR.DAADST=1), 设置DAOEi位, 同时将ADC12(单元1)的ADCSR.ADST位设置为0。然后, 选择ADC12的软件触发(单元1)触发以安全地停止ADC12(单元1)。

事件链接功能可用于将DAOEi位设置为1。当在发生ELC(ELC\_DA0事件)的ELSR12寄存器, 开始输出DA转换结果。当发生ELC的ELSR13寄存器中指定的事件(ELC\_DA1事件)时, DAOE1位设置为1, 并开始输出DA转换结果。

Table 38.4 DA转换和模拟输出控制

| DACR |       | DAAMPCR |   | 通道i操作 | 通道i的放大器操作 | 通道i的模拟输出          |
|------|-------|---------|---|-------|-----------|-------------------|
| DAE  | DAOEi | DAAMPi  |   |       |           |                   |
| 0    | 0     | 0       | 0 | Stop  | Stop      | Hi-Z              |
|      |       | 1       | 1 | Stop  | Stop      | Hi-Z              |
|      | 1     | 0       | 0 | Run   | Stop      | Amplifier-through |
|      |       | 1       | 1 | Run   | Run       | 放大器输出             |
| 1    | 0     | 0       | 0 | Run   | Stop      | Amplifier-through |
|      |       | 1       | 1 | Run   | Run       | 放大器输出             |
|      | 1     | 0       | 0 | Run   | Stop      | Amplifier-through |

## 38.2.4 DAADSCR : D/A A/D Synchronous Start Control Register

Base address: DAC12 = 0x4017\_1000

Offset address: 0x06

|                    |        |   |   |   |   |   |   |   |
|--------------------|--------|---|---|---|---|---|---|---|
| Bit position:      | 7      | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | DAADST | — | — | — | — | — | — | — |
| Value after reset: | 0      | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 6:0 | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 7   | DAADST | D/A A/D Synchronous Conversion<br>0: Do not synchronize DAC12 with ADC12 (unit 1) operation (disable interference reduction between D/A and A/D conversion).<br>1: Synchronize DAC12 with ADC12 (unit 1) operation (enable interference reduction between D/A and A/D conversion). | R/W |

To minimize interference between D/A and A/D conversion, the DAADSCR register enables synchronization of the start timing of D/A conversion with the ADC12 synchronous D/A conversion enable input signal.

Only set this register while the ADC12 (unit 1) is halted, that is, while the ADCSR.ADST bit is 0 after selecting the software trigger as the ADC12 (unit 1) trigger.

Select unit 1 as the target ADC12 unit before setting the DAADST bit to 1. Set DAADUSR[1] bit to 1 to select unit 1. This MCU only supports ADC12 unit 1.

**DAADST bit (D/A A/D Synchronous Conversion)**

Setting the DAADST bit to 0 allows the DADRn register value to be converted into analog data at any time. Setting the DAADST bit to 1 allows synchronization of D/A conversion with the synchronous D/A conversion enable input signal from the ADC12 (unit 1). With this bit set, D/A conversion does not start until the ADC12 (unit 1) completes A/D conversion, even when the DADRn register is changed.

Set this bit while the ADCSR.ADST bit is set to 0. Then, select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1). Set the DAADUSR.AMADSEL1 bit to 1 before setting the DAADST bit to 1.

The event link function cannot be used when the DAADST bit is set to 1. Stop the event link function by setting the ELSR12 and ELSR13 registers of the ELC. The setting of the DAADST bit is shared by channels 0 and 1 of the DAC12.

Note: i = 0, 1

## 38.2.3 DADPR:DADRn格式选择寄存器

Base address: DAC12 = 0x4017\_1000

Offset address: 0x05

|               |       |   |   |   |   |   |   |   |

## 38.2.4 DAADSCR:DAAD同步启动控制寄存器

Base address: DAC12 = 0x4017\_1000

Offset address: 0x06

|               |        |   |   |   |   |   |   |   |
|---------------|--------|---|---|---|---|---|---|---|
| Bit position: | 7      | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | DAADST | — | — | — | — | — | — | — |
| 重置后的值:        | 0      | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 6:0 | —      | 这些位被读取为0。写入值应为0。   | R/W |
| 7   | DAADST | DAAD同步转换<br>0: 不将DAC12与ADC12（单元1）操作同步（禁用DA和AD转换之间的干扰降低）。<br>1: DAC12与ADC12（单元1）操作同步（启用DA和AD转换之间的干扰降低）。 | R/W |

为了尽量减少DA和AD转换之间的干扰，DAADSCR寄存器使DA转换的开始时序与ADC12同步DA转换使能输入信号同步。

仅在ADC12（单元1）停止时设置该寄存器，即选择软件触发作为ADC12（单元1）触发后ADCSR.ADST位为0。

在将DAADST位设置为1之前选择单元1作为目标ADC12单元。将DAADUSR[1]位设置为1以选择单元1。这MCU仅支持ADC12单元1。

**DAADST位 (DAAD同步转换)**

将DAADST位设置为0可以随时将DADRn寄存器值转换为模拟数据。设置DAADST位为1允许DA转换与来自ADC12（单元1）的同步DA转换使能输入信号同步。设置该位后，在ADC12（单元1）完成AD转换之前，即使DADRn寄存器发生更改，DA转换也不会开始。

在ADCSR.ADST位设置为0时设置该位。然后，选择ADC12（单元1）触发器的软件触发器以安全地停止ADC12（单元1）。在将DAADST位设置为1之前，将DAADUSR.AMADSEL1位设置为1。

当DAADST位设置为1时，不能使用事件链接功能。通过设置ELC的ELSR12和ELSR13寄存器。DAADST位的设置由DAC12的通道0和1共享。

## 38.2.5 DAAMPCR : D/A Output Amplifier Control Register

Base address: DAC12 = 0x4017\_1000

Offset address: 0x08

|                    |        |        |   |   |   |   |   |   |
|--------------------|--------|--------|---|---|---|---|---|---|
| Bit position:      | 7      | 6      | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | DAAMP1 | DAAMP0 | — | — | — | — | — | — |
| Value after reset: | 0      | 0      | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 5:0 | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 6   | DAAMP0 | Amplifier Control 0<br>0: Do not use channel 0 output amplifier<br>1: Use channel 0 output amplifier | R/W |
| 7   | DAAMP1 | Amplifier Control 1<br>0: Do not use channel 1 output amplifier<br>1: Use channel 1 output amplifier | R/W |

The DAAMPCR register selects D/A output with or without using the amplifier.

**DAAMP0 bit (Amplifier Control 0)**

When the DAAMP0 bit is 0, analog values are output for D/A output of channel 0 without using the amplifier. When the DAAMP0 bit is 1, analog values are output for D/A output of channel 0 through the amplifier.

When both the DACR.DAE and DACR.DAOE0 bits are 0, the amplifier is not used regardless of the setting of the DAAMP0 bit. See [Table 38.4](#) for details.

**DAAMP1 bit (Amplifier Control 1)**

When the DAAMP1 bit is 0, analog values are output for D/A output of channel 1 without using the amplifier. When the DAAMP1 bit is 1, analog values are output for D/A output of channel 1 through the amplifier.

When both the DACR.DAE and DACR.DAOE1 bits are 0, the amplifier is not used regardless of the setting of the DAAMP1 bit. See [Table 38.4](#) for details.

## 38.2.6 DAASWCR : D/A Amplifier Stabilization Wait Control Register

Base address: DAC12 = 0x4017\_1000

Offset address: 0x1C

|                    |        |        |   |   |   |   |   |   |
|--------------------|--------|--------|---|---|---|---|---|---|
| Bit position:      | 7      | 6      | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | DAASW1 | DAASW0 | — | — | — | — | — | — |
| Value after reset: | 0      | 0      | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 5   | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 6   | DAASW0 | D/A Amplifier Stabilization Wait 0<br>0: Amplifier stabilization wait off (output) for channel 0<br>1: Amplifier stabilization wait on (high-Z) for channel 0 | R/W |
| 7   | DAASW1 | D/A Amplifier Stabilization Wait 1<br>0: Amplifier stabilization wait off (output) for channel 1<br>1: Amplifier stabilization wait on (high-Z) for channel 1 | R/W |

The DAASWCR register controls D/A output with the output amplifier. This register is used in the initialization procedure to wait for stabilization of the D/A output amplifier. Each bit in DAASWCR should be set to 1 when both the DACR.DAE bit and the DACR.DAOE<sub>i</sub> (i = 0, 1) bit are 0. See [section 38.6.5. Initialization Procedure with the Output Amplifier](#).

## 38.2.5 DAAMPCR:DA输出放大器控制寄存器

Base address: DAC12 = 0x4017\_1000

Offset address: 0x08

|               |        |        |   |   |   |   |   |   |
|---------------|--------|--------|---|---|---|---|---|---|
| Bit position: | 7      | 6      | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | DAAMP1 | DAAMP0 | — | — | — | — | — | — |

|-----|--------|---------------------------------------|-----|
| 5:0 | —      | 这些位被读取为0。写入值应为0。                      | R/W |
| 6   | DAAMP0 | 放大器控制0<br>0: 不使用通道0输出放大器1: 使用通道0输出放大器 | R/W |
| 7   | DAAMP1 | 放大器控制1<br>0: 不使用通道1输出放大器1: 使用通道1输出放大器 | R/W |

DAAMPCR寄存器选择使用或不使用放大器的DA输出。

**DAAMP0位 (放大器控制0)**

当DAAMP0位为0时，模拟值输出通道0的DA输出，而不使用放大器。当。。的时候DAAMP0位为1，模拟值通过放大器输出通道0的DA输出。

当DACR.DAE和DACR.DAOE0位都为0时，无论设置如何都不会使用放大器DAAMP0位。详见表38.4。

**DAAMP1位 (放大器控制1)**

当DAAMP1位为0时，模拟值输出通道1的DA输出，而不使用放大器。当。。的时候DAAMP1位为1，模拟值通过放大器输出到通道1的DA输出。

当DACR.DAE和DACR.DAOE1位都为0时，无论设置如何都不会使用放大器DAAMP1位。详见表38.4。

## 38.2.6 DAASWCR:DA放大器稳定等待控制寄存器

Base address: DAC12 = 0x4017\_1000

Offset address: 0x1C

|               |        |        |   |   |   |   |   |   |
|---------------|--------|--------|---|---|---|---|---|---|
| Bit position: | 7      | 6      | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | DAASW1 | DAASW0 | — | — | — | — | — | — |
| 重置后的值:        | 0      | 0      | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 5   | —      | 这些位被读取为0。写入值应为0。   | R/W |
| 6   | DAASW0 | DA放大器稳定等待0<br>0: 通道0的放大器稳定等待关闭 (输出) 1: 通道0的放大器稳定等待打开 (高阻态) | R/W |
| 7   | DAASW1 | DA放大器稳定等待1<br>0: 通道1的放大器稳定等待关闭 (输出) 1: 通道1的放大器稳定等待打开 (高阻态) | R/W |

DAASWCR寄存器通过输出放大器控制DA输出。该寄存器在初始化过程中用于等待DA输出放大器的稳定。当DACR.DAE位和DACR.DAOE<sub>i</sub>(i=0 1)位均为0时，DAASWCR中的每个位都应设置为1。请参见第38.6.5节。输出放大器的初始化程序。

**DAASW0 bit (D/A Amplifier Stabilization Wait 0)**

Set the DAASW0 bit to 1 in the initialization procedure to wait for the stabilization of the D/A channel 0 output amplifier. When DAASW0 is set to 1, D/A conversion operates, but the conversion result of D/A is not output from channel 0. When the DAASW0 bit is 0, the stabilization wait time stops, and the D/A conversion result of channel 0 is output through the output amplifier.

**DAASW1 bit (D/A Amplifier Stabilization Wait 1)**

Set the DAASW1 bit to 1 in the initialization procedure to wait for the stabilization of the D/A channel 1 output amplifier. When DAASW1 is set to 1, D/A conversion operates, but the conversion result of D/A is not output from channel 1. When the DAASW1 bit is 0, the stabilization wait time stops, and the D/A conversion result of channel 1 is output through the output amplifier.

**38.2.7 DAADUSR : D/A A/D Synchronous Unit Select Register**

Base address: DAC12 = 0x4017\_1000

Offset address: 0x10C0

|                    |   |   |   |   |   |   |          |   |
|--------------------|---|---|---|---|---|---|----------|---|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1        | 0 |
| Bit field:         | — | — | — | — | — | — | AMADSEL1 | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0        | 0 |

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 0   | —        | This bit is read as 0. The write value should be 0.              | R/W |
| 1   | AMADSEL1 | A/D Unit 1 Select<br>0: Do not select unit 1<br>1: Select unit 1 | R/W |
| 7:2 | —        | These bits are read as 0. The write value should be 0.           | R/W |

The DAADUSR register selects the target ADC12 unit for D/A and A/D synchronous conversions. Set the AMADSEL1 bit to 1 to select unit 1 as the target synchronous unit for the MCU. When setting the DAADSCR.DAADST bit to 1 for synchronous conversions, select the target unit in this register in advance.

Only set the DAADUSR register while the ADCSR.ADST bit of the ADC12 is set to 0 and the DAADSCR.DAADST bit is set to 0.

**38.3 Operation**

The DAC12 includes D/A conversion circuits for two channels, each of which can operate independently. When the DAOEn bit (n = 0, 1) in DACR is set to 1, DAC12 is enabled and the conversion result is output.

This following example shows D/A conversion on channel 0. Figure 38.2 shows the timing of this operation.

To process D/A conversion on channel 0:

1. Set the data for D/A conversion in the DADR0 register and the data format in the DADPR.DPSEL bit.
2. Set the DACR.DAOE0 bit to 1 to start D/A conversion. The conversion result is output from the analog output pin DA0 after the conversion time  $t_{DCONV}$  elapses. The conversion result continues to be output until DADR0 is written to again or the DAOE0 bit is set to 0. The output value (reference) is expressed by the following formula:

$$\frac{\text{Setting in DADR0}}{4096} \times VREFH$$

3. To start conversion again, write another value to DADR0. The conversion result is output after the conversion time  $t_{DCONV}$  elapses.  
When the DAADSCR.DAADST bit is 1 (interference reduction between D/A and A/D conversion is enabled), a maximum of one A/D conversion time is required for D/A conversion to start. When ADCLK is faster than the peripheral clock, a longer time might be required.
4. To disable analog output, set the DAOE0 bit to 0.

**DAASW0位 (DA放大器稳定等待0)**

在初始化过程中将DAASW0位设置为1，以等待DA通道0输出放大器稳定。当DAASW0设置为1时，DA转换进行，但DA的转换结果不从通道0输出。当DAASW0位为0时，稳定等待时间停止，通过输出输出通道0的DA转换结果放大器。

**DAASW1位 (DA放大器稳定等待1)**

在初始化过程中将DAASW1位设置为1，以等待DA通道1输出放大器稳定。当DAASW1设置为1时，DA转换进行，但DA的转换结果不从通道1输出。当DAASW1位为0时，稳定等待时间停止，通道1的DA转换结果通过输出输出放大器。

**38.2.7 DAADUSR:DAAD同步单元选择寄存器**

Base address: DAC12 = 0x4017\_1000

Offset address: 0x10C0

|               |   |   |   |   |   |   |          |   |
|---------------|---|---|---|---|---|---|----------|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1        | 0 |
| Bit field:    | — | — | — | — | — | — | AMADSEL1 | — |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0        | 0 |

| Bit | Symbol   | Function                         | R/W |
|-----|----------|----------------------------------|-----|
| 0   | —        | 该位读取为0。写入值应为0。                   | R/W |
| 1   | AMADSEL1 | AD单元1选择<br>0: 不选择单元1<br>1: 选择单元1 | R/W |
| 7:2 | —        | 这些位被读取为0。写入值应为0。                 | R/W |

DAADUSR寄存器为DA和AD同步转换选择目标ADC12单元。将AMADSEL1位设置为1以选择单元1作为MCU的目标同步单元。将DAADSCR.DAADST位设置为1以进行同步转换时，请预先在该寄存器中选择目标单位。

仅在ADC12的ADCSR.ADST位设置为0且DAADSCR.DAADST位设置为0时设置DAADUSR寄存器。

**38.3 Operation**

DAC12包含两个通道的DA转换电路，每个通道都可以独立工作。当。。。的时候DACR中的DAOEn位(n=0,1)设置为1，使能DAC12并输出转换结果。

以下示例显示了通道0上的DA转换。图38.2显示了此操作的时序。

在通道0上处理DA转换：

- 1.在DADR0寄存器中设置用于DA转换的数据，在DADPR.DPSEL位中设置数据格式。
- 2.将DACR.DAOE0位设置为1以启动DA转换。经过转换时间 $t_{DCONV}$ 后，转换结果从模拟输出引脚DA0输出。转换结果继续输出，直到再次写入DADR0或将DAOE0位设置为0。输出值（参考值）由以下公式表示：

$$\frac{\text{DADR04096中的设置}}{4096} \times VREFH$$

- 3.要再次开始转换，向DADR0写入另一个值。在经过转换时间 $t_{DCONV}$ 后输出转换结果。当DAADSCR.DAADST位为1时（启用DA和AD转换之间的干扰降低），最多需要一个AD转换时间才能启动DA转换。当ADCLK比外设时钟快时，可能需要更长的时间。

- 4.要禁用模拟输出，请将DAOE0位设置为0。

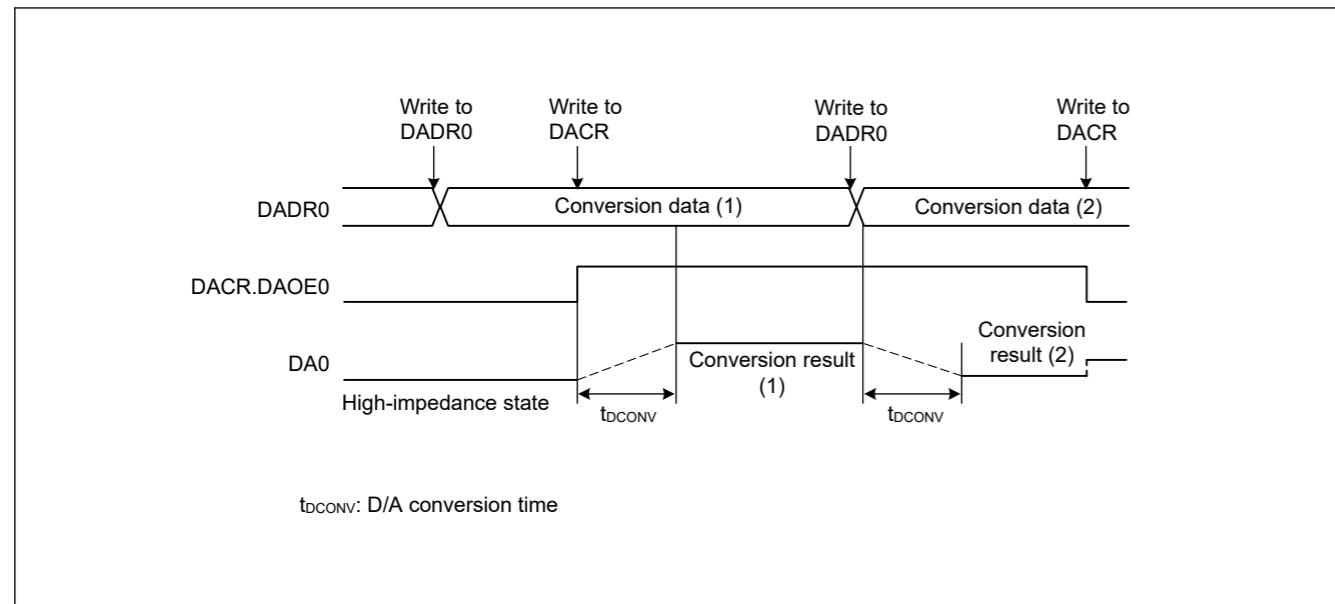

Figure 38.2 Example of DAC12 operation

### 38.3.1 Reducing Interference between D/A and A/D Conversion

When D/A conversion starts, the DAC12 generates inrush current. Because the DAC12 and ADC12 (unit 1) share the same analog power supply, the generated inrush current can interfere with ADC12 (unit 1) operation.

While the DAADSCR.DAADST bit is 1, D/A conversion does not start immediately on updating the DADRm register. Instead:

- If the DADRm register data is modified while the ADC12 is halted, D/A conversion starts in 1 PCLKA cycle.
- If the DADRm register data is modified while the ADC12 is performing a 12-bit A/D conversion, D/A conversion starts on A/D conversion completion. Therefore, it takes up to one A/D conversion time period for the DADRm register data update to be reflected as the D/A conversion circuit output. Until the D/A conversion completes, the DADRm register value does not correspond to the analog output value.

When the DAADSCR.DAADST bit is 1, it is not possible to check through software whether the DADRm register value was D/A-converted.

The following sequence provides an example of channel 0 D/A conversion, in which the DAC12 is synchronized with the ADC12 (unit 1). Figure 38.3 shows the timing of this operation.

To perform D/A conversion on channel 0 in synchronization with the ADC12 (unit 1):

1. Confirm that the ADC12 (unit 1) is halted and set the DAADUSR.AMA DSEL1 bit to 1.
2. Confirm that the ADC12 (unit 1) is halted and set the DAADSCR.DAADST bit to 1.
3. Confirm that the ADC12 (unit 1) is halted and set the DACR.DAOE0 bit to 1.
4. Set the DADR0 register. If ADCLK is faster than the peripheral clock, D/A conversion might be delayed for longer than one A/D conversion time.
  - If the ADC12 (unit 1) is halted (ADCSR.ADST = 0) when the DADR0 register is modified, D/A conversion starts in 1 PCLKA cycle.
  - If the 12-bit A/D conversion is in progress (ADCSR.ADST = 1) when the DADR0 register is modified, D/A conversion starts on A/D conversion completion. If the DADR0 register is modified twice during A/D conversion, the first update might not be converted.

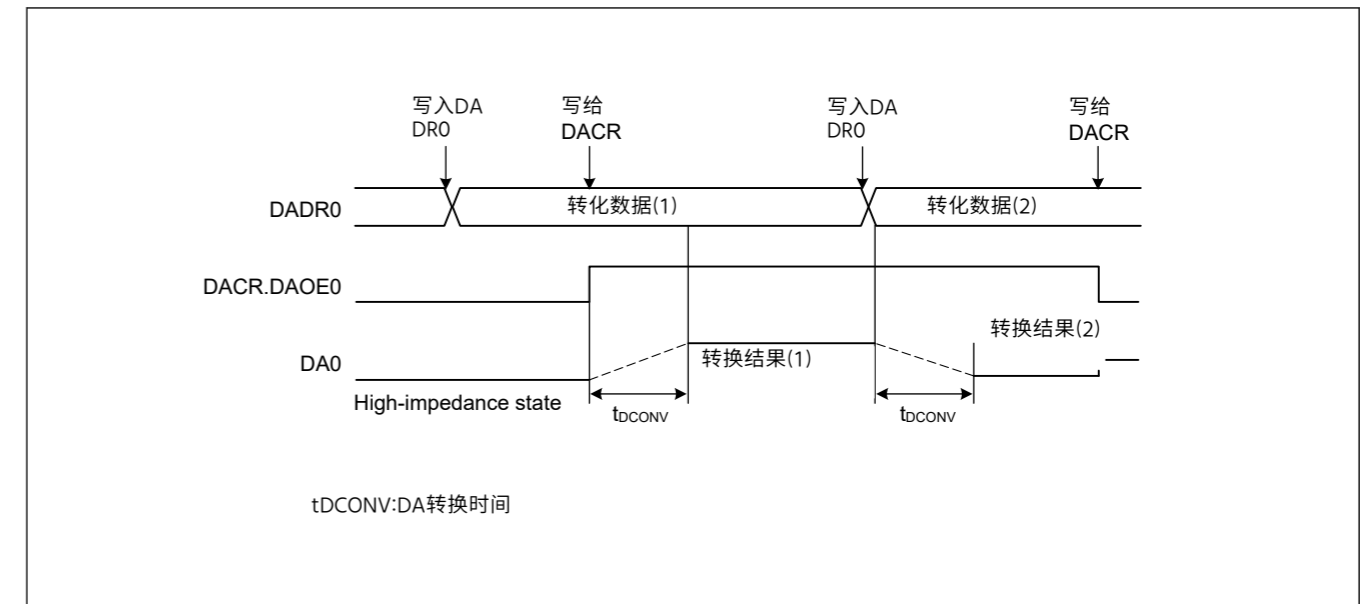

Figure 38.2 DAC12操作示例

### 38.3.1 减少DA和AD转换之间的干扰

当DA转换开始时，DAC12会产生浪涌电流。由于DAC12和ADC12（单元1）共享相同的模拟电源，所产生的浪涌电流会干扰ADC12（单元1）的运行。

当DAADSCR.DAADST位为1时，DA转换不会在更新DADRm寄存器时立即开始。Instead:

- 如果在ADC12停止时修改了DADRm寄存器数据，则DA转换在1个PCLKA周期内开始。
- 如果在ADC12执行12位AD转换时修改了DADRm寄存器数据，则DA转换在AD转换完成时开始。因此，DADRm寄存器数据更新最多需要一个AD转换时间周期才能反映为DA转换电路输出。在DA转换完成之前，DADRm寄存器的值与模拟输出值不对应。

当DAADSCR.DAADST位为1时，无法通过软件检查DADRm寄存器值是否经过DA转换。

以下序列提供了通道0DA转换的示例，其中DAC12与ADC12（单元1）。图38.3显示了该操作的时序。

与ADC12（单元1）同步在通道0上执行DA转换：

- 1.确认ADC12（单元1）已停止并将DAADUSR.AMA DSEL1位设置为1。
- 2.确认ADC12（单元1）已停止并将DAADSCR.DAADST位设置为1。
- 3.确认ADC12（单元1）已停止并将DACR.DAOE0位设置为1。
- 4.设置DADR0寄存器。如果ADCLK比外设时钟快，则DA转换可能会延迟超过一次AD转换时间。

- 如果在修改DADR0寄存器时ADC12（单元1）停止（ADCSR.ADST=0），则DA转换在1个PCLKA周期内开始。
- 如果在修改DADR0寄存器时正在进行12位AD转换（ADCSR.ADST=1），则DA转换在AD转换完成时开始。如果在AD转换期间DADR0寄存器被修改两次，第一次更新可能不会被转换。

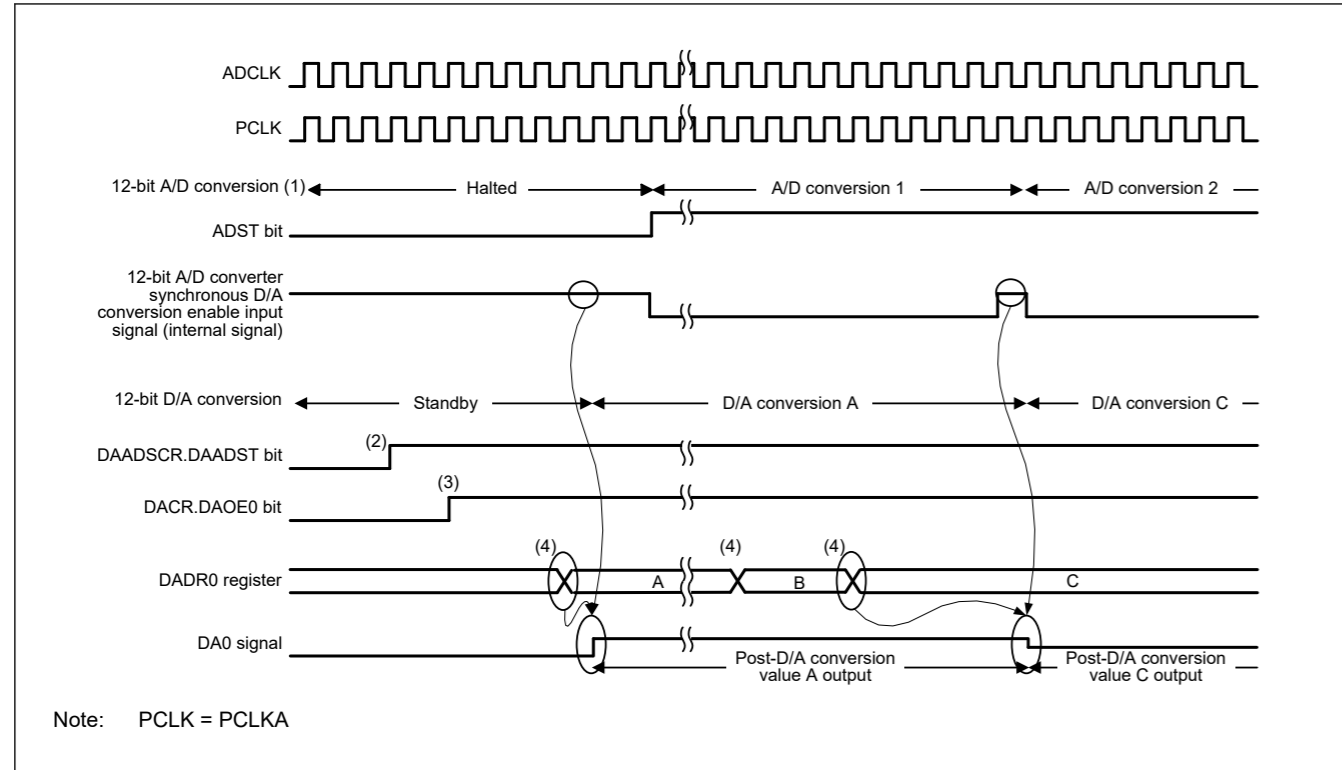

Figure 38.3 Example conversion when DAC12 is synchronized with ADC12 (unit 1)

When ADCLK is faster than PCLKA, the DAC12 might not be able to capture the synchronous D/A conversion enable input signal from the ADC12 (unit 1) during the 1 ADCLK cycle that is output between A/D conversion 1 and A/D conversion 2, as shown in Figure 38.4. In this case, post-D/A conversion value A is continuously output as the DA0 signal.

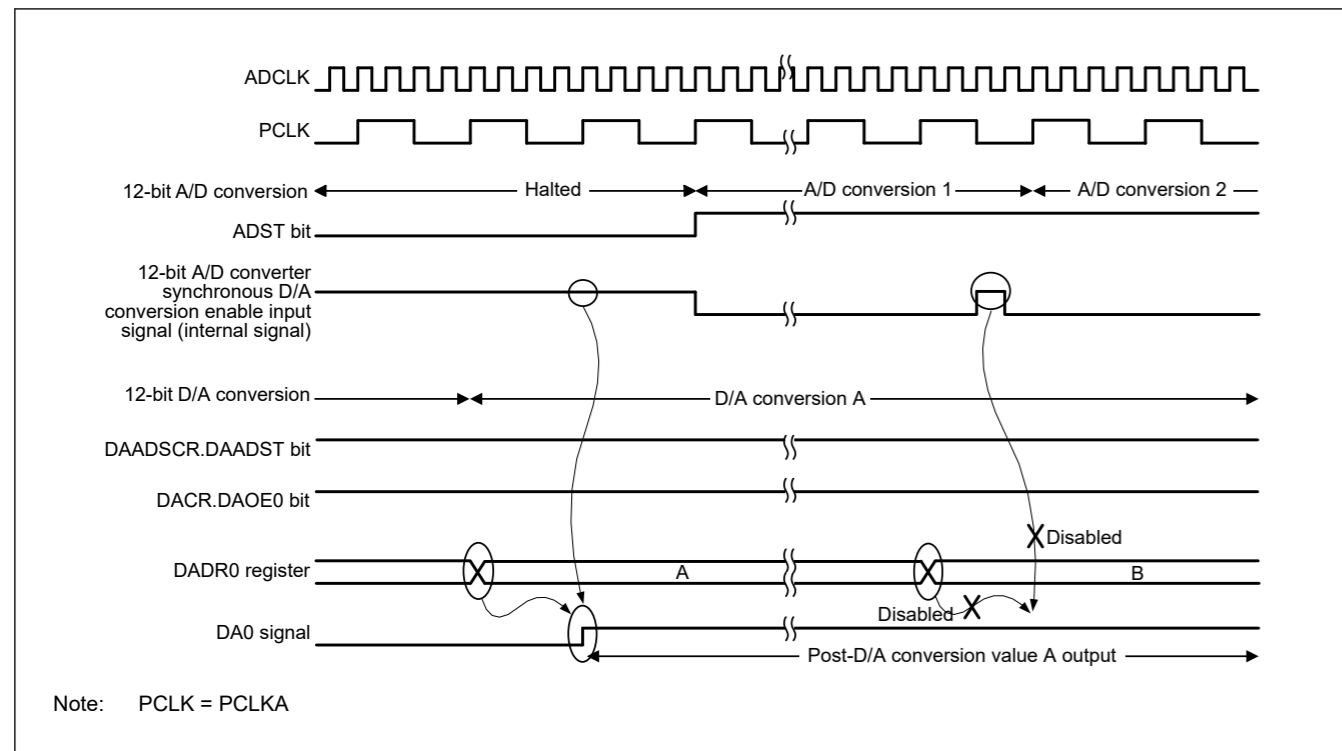

Figure 38.4 Example when the DAC12 cannot capture the synchronous D/A conversion enable input signal from the ADC12 (unit 1)

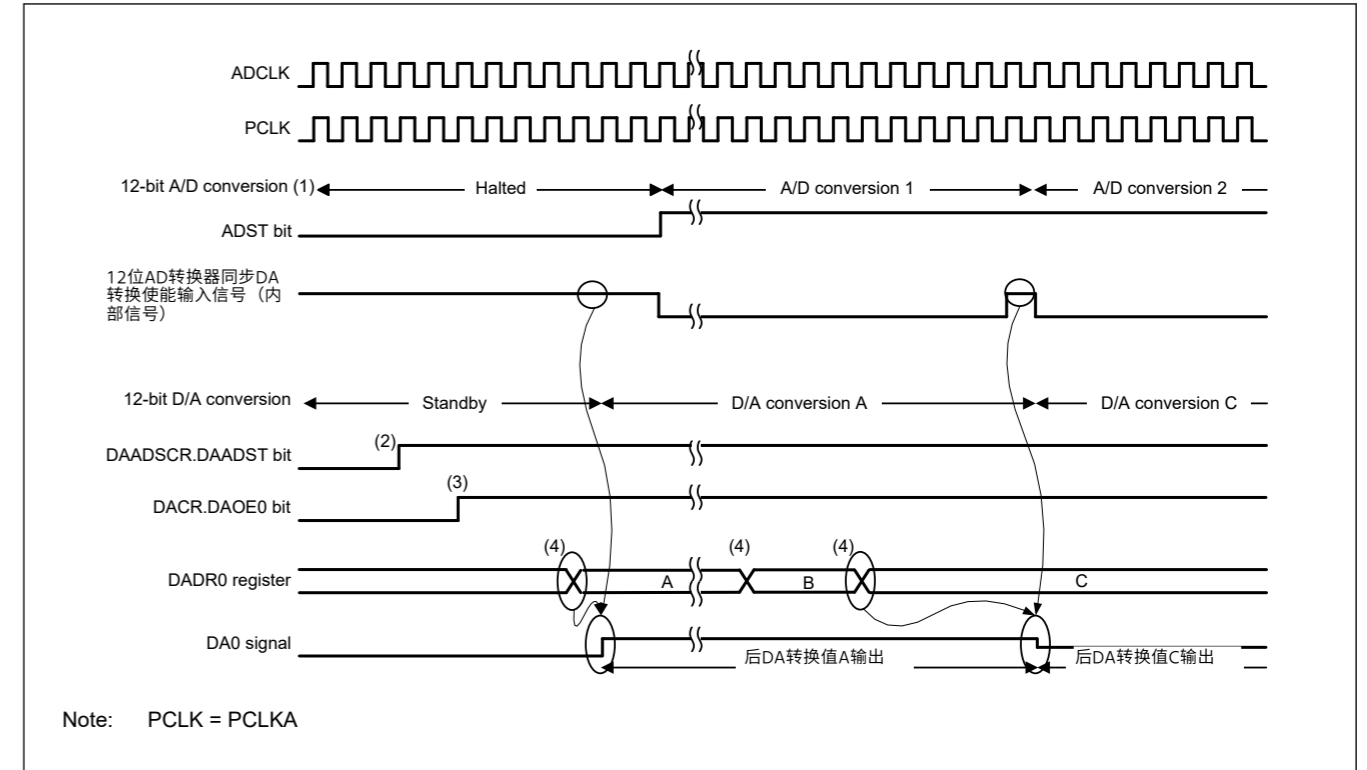

Figure 38.3 DAC12与ADC12同步时的转换示例 (单元1)

当ADCLK快于PCLKA时，DAC12可能无法在AD转换1和AD转换2之间输出的1个ADCLK周期内捕获来自ADC12 (单元1) 的同步DA转换使能输入信号，如图所示38.4。在这种情况下，后DA转换值A作为DA0信号连续输出。

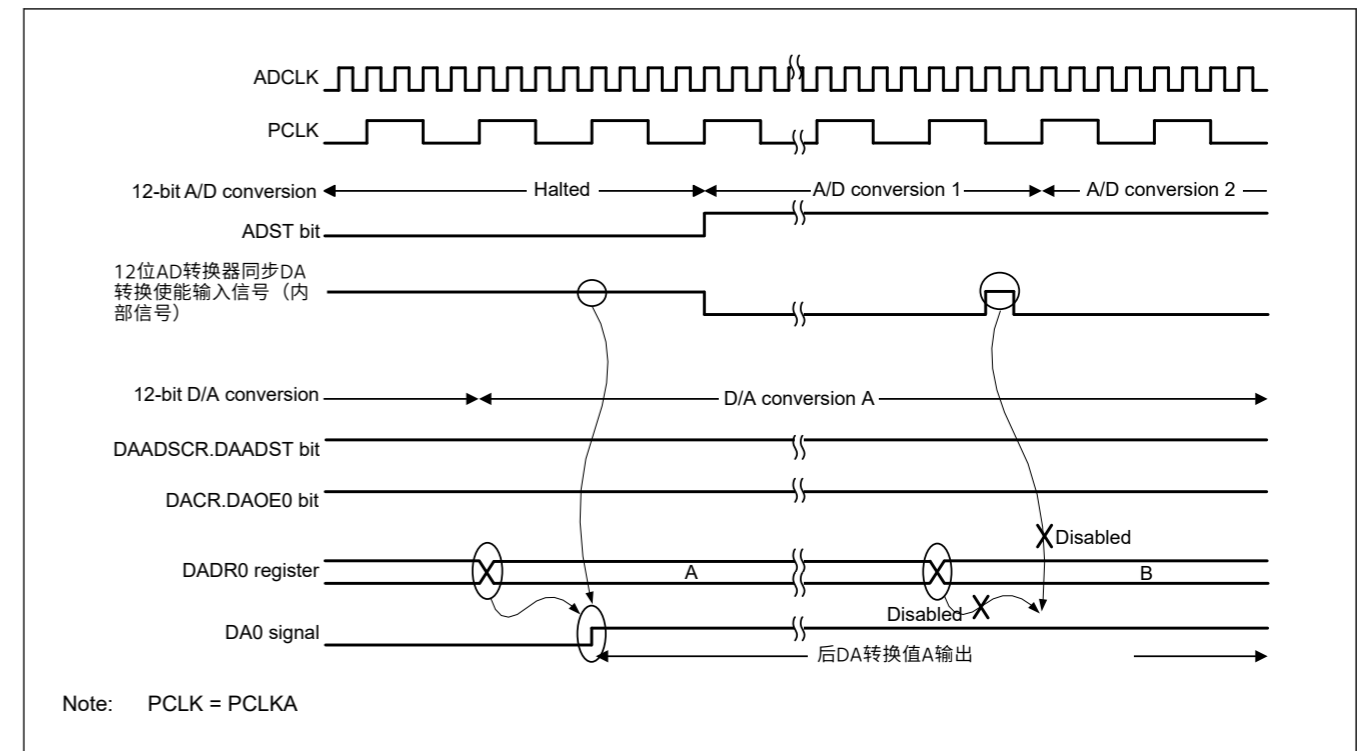

Figure 38.4 DAC12无法捕获来自ADC12 (单元1) 的同步DA转换使能输入信号时的示例

## 38.4 Event Link Operation Setting Procedure

This section describes the procedures used in event link operation.

### 38.4.1 DA0 Event Link Operation Setting Procedure

To set up DA0 event link operation:

1. Set the DADPR.DPSEL bit and the data for D/A conversion in the DADR0 register.
2. Set the ELC\_DA0 event signal to be linked to each peripheral module in the ELSR12 register.
3. Set the ELCR.ELCON bit to 1. This enables event link operation for all modules with the event link function selected.
4. Set the event output source module to activate the event link. After the event is output from the module, the DACR.DAOE0 bit becomes 1, and D/A conversion starts on channel 0.
5. Set the ELSR12 register to 0x0000 to stop event link operation of DAC12 channel 0. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

### 38.4.2 DA1 Event Link Operation Setting Procedure

To set up DA1 event link operation:

1. Set the DADPR.DPSEL bit and set the data for D/A conversion in the DADR1 register.
2. Set the ELC\_DA1 event signal to be linked to each peripheral module in the ELSR13 register.
3. Set the ELCR.ELCON bit to 1. This enables the event link operation for all modules with the event link function selected.
4. Set the event output source module to activate the event link. After the event is output from the module, the DACR.DAOE1 bit becomes 1, and D/A conversion starts on channel 1.
5. Set the ELSR13 register to 0x0000 to stop event link operation on DAC12 channel 1. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

## 38.5 Usage Notes on Event Link Operation

- When the event link function is used, do not use the amplifier output function.
- When the event link function is used, set the DACR.DAE bit to 0.
- When the event specified for the ELC\_DA0 event signal is generated while a write to the DACR.DAOE0 bit is performed, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- When the event specified for the ELC\_DA1 event signal is generated while a write to the DACR.DAOE1 bit is performed, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- Use of the event link function is prohibited when the DAADSCR.DAADST bit is set to 1 to reduce interference between D/A and A/D conversions.

## 38.6 Usage Notes

### 38.6.1 Settings for the Module-Stop Function

DAC12 operation can be disabled or enabled using the Module Stop Control Register. The DAC12 is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

### 38.6.2 DAC12 Operation in the Module-Stop State

When the MCU enters the module-stop state with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in the module-stop state, disable D/A conversion by setting the DACR.DAOE1, DAOE0, and DAE bits to 0.

## 38.4 事件链接操作设置步骤

本节介绍事件链接操作中使用的过程。

### 38.4.1 DA0事件链接操作设置步骤

设置DA0事件链接操作：

- 1.设置DADPR.DPSEL位和DADR0寄存器中用于DA转换的数据。
- 2.在ELSR12寄存器中设置ELC\_DA0事件信号链接到每个外围模块。
- 3.将ELCR.ELCON位设置为1。这将为所有选择了事件链接功能的模块启用事件链接操作。
- 4.设置事件输出源模块，激活事件链接。模块输出事件后，DACR.DAOE0位变为1，通道0开始DA转换。
- 5.将ELSR12寄存器设置为0x0000以停止DAC12通道0的事件链接操作。所有事件链接操作在ELCR.ELCON位设置为0时停止。

### 38.4.2 DA1事件链接操作设置步骤

设置DA1事件链接操作：

- 1.设置DADPR.DPSEL位并在DADR1寄存器中设置用于DA转换的数据。
- 2.在ELSR13寄存器中设置ELC\_DA1事件信号链接到每个外围模块。
- 3.将ELCR.ELCON位设置为1。这将为所有选择了事件链接功能的模块启用事件链接操作。
- 4.设置事件输出源模块，激活事件链接。模块输出事件后，DACR.DAOE1位变为1，通道1开始DA转换。
- 5.将ELSR13寄存器设置为0x0000以停止DAC12通道1上的事件链接操作。所有事件链接操作在ELCR.ELCON位设置为0时停止。

## 38.5 事件链接操作使用说明

- 使用事件链接功能时，请勿使用放大器输出功能。
- 使用事件链接功能时，将DACR.DAE位设置为0。
- 如果在执行对DACR.DAOE0位的写入时产生了为ELC\_DA0事件信号指定的事件，则写入周期停止，并且产生的事件优先将该位设置为1。
- 如果在执行对DACR.DAOE1位的写入时产生了为ELC\_DA1事件信号指定的事件，则写入周期停止，并且产生的事件优先将该位设置为1。
- DAADSCR.DAADST位设置为1时禁止使用事件链接功能，以减少DA和AD转换之间的干扰。

## 38.6 使用说明

### 38.6.1 模块停止功能的设置

可以使用模块停止控制寄存器禁用或启用DAC12操作。DAC12在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

### 38.6.2 DAC12在模块停止状态下的操作

当MCU进入模块停止状态并启用DA转换时，DA输出保持不变，模拟电源电流与DA转换时相同。如果在模块停止状态下必须降低模拟电源电流，则通过将DACR.DAOE1、DAOE0和DAE位设置为0来禁用DA转换。

### 38.6.3 DAC12 Operation in Software Standby Mode

When the MCU enters Software Standby mode with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in Software Standby mode, disable D/A conversion by setting the DACR.DAOE1, DAOE0, and DAE bits to 0.

### 38.6.4 Constraint on Entering Deep Software Standby Mode

When the MCU enters Deep Software Standby mode with D/A conversion enabled, the outputs of the DAC12 are placed in a high impedance state.

### 38.6.5 Initialization Procedure with the Output Amplifier

Use the following initialization procedures with the output amplifier. The example shows the case for channel 0.

To initialize the DAC12 with the output amplifier:

1. Write 0x0000 to the DADR0 register.
2. Set the DAASWCR.DAASW0 bit to 1.
3. Set the DAAMPCR.DAAMP0 bit to 1.
4. Set the DACR.DAE bit or the DACR.DAOE0 bit to 1 to start operation of the amplifier.
5. Clear the DAASWCR.DAASW0 bit to 0 after waiting for the duration of D/A conversion time  $t_{DCONV}$ .
6. Write the value to be converted in the DADR0 register.

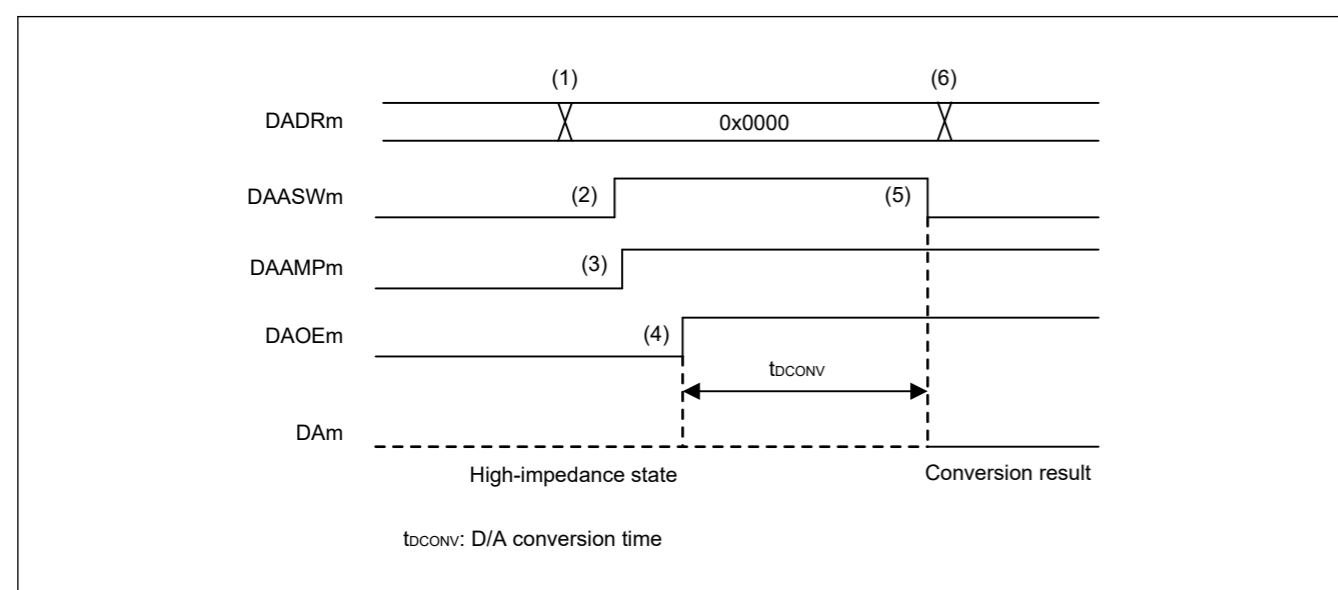

Figure 38.5 Example of the initial flow with the output amplifier in DAC12

While the amplifier is running, clearing the DACR.DAE and DACR.DAOE0 bits to 0 allows the amplifier to stop operation. To use the amplifier again, repeat steps 1 to 6.

### 38.6.6 Constraint on Usage When Interference Reduction between D/A and A/D Conversion Is Enabled

When the DAADSCR.DAADST bit is 1, enabling interference reduction between D/A and A/D conversion, do not place the ADC12 in the module-stop state. Doing so can halt D/A conversion in addition to A/D conversion.

### 38.6.3 DAC12在软件待机模式下的操作

当MCU进入软件待机模式并启用DA转换时，DA输出保持不变，模拟电源电流与DA转换期间相同。如果在软件待机模式下必须降低模拟电源电流，则通过将DACR.DAOE1、DAOE0和DAE位设置为0来禁用DA转换。

### 38.6.4 进入深度软件待机模式的限制

当MCU在启用DA转换的情况下进入深度软件待机模式时，DAC12的输出置于高阻抗状态。

### 38.6.5 输出放大器的初始化程序

对输出放大器使用以下初始化程序。该示例显示了通道0的情况。

使用输出放大器初始化DAC12：

- 1.将0x0000写入DADR0寄存器。
- 2.将DAASWCR.DAASW0位设置为1。
- 3.将DAAMPCR.DAAMP0位设置为1。
- 4.将DACR.DAE位或DACR.DAOE0位设置为1以启动放大器的操作。
- 5.等待DA转换时间 $t_{DCONV}$ 后，将DAASWCR.DAASW0位清零。
- 6.将要转换的值写入DADR0寄存器。

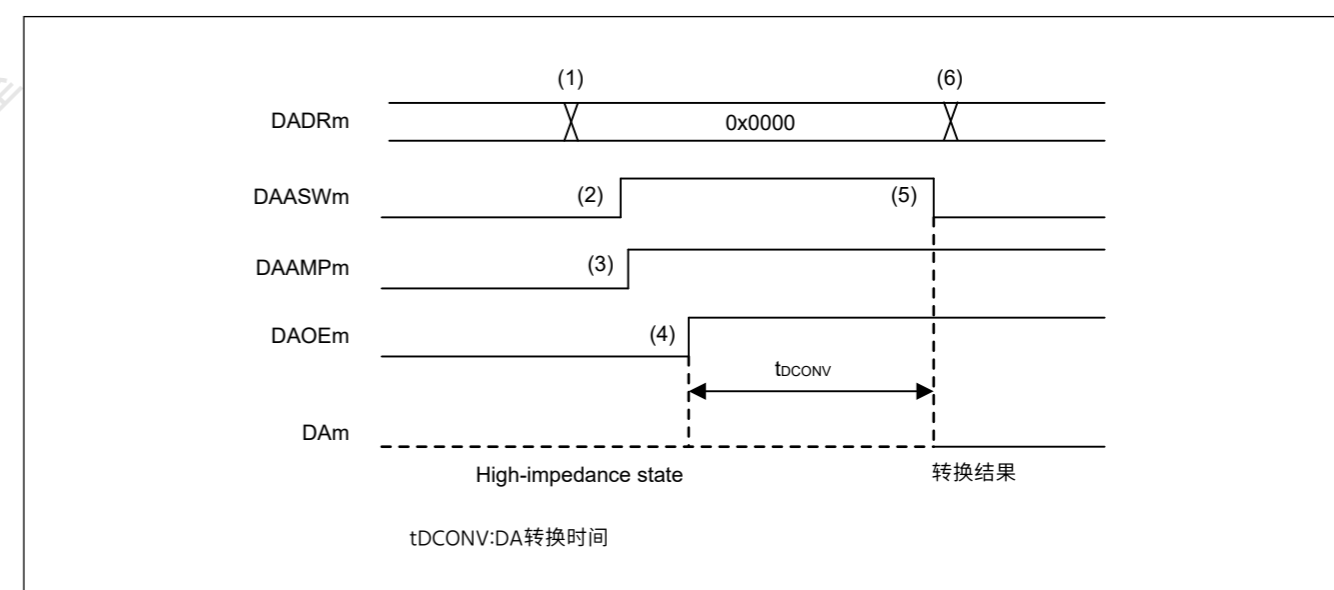

Figure 38.5 DAC12中输出放大器的初始流程示例

在放大器运行时，将DACR.DAE和DACR.DAOE0位清零可让放大器停止运行。要再次使用放大器，请重复步骤1至6。

### 38.6.6 DA和AD之间减少干扰时的使用限制 转换已启用

当DAADSCR.DAADST位为1时，启用DA和AD转换之间的干扰减少，不要放置ADC12处于模块停止状态。除了AD转换之外，这样做还可以停止DA转换。

## 39. Temperature Sensor (TSN)

### 39.1 Overview

The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC12 for conversion and can be further used by the end application.

Table 39.1 lists the TSN specifications, and Figure 39.1 shows a block diagram.

Table 39.1 TSN specifications

| Item                                | Description   |
|-------------------------------------|---|
| Temperature sensor voltage output   | Temperature sensor outputs a voltage to the 12-bit A/D converter                  |
| Module-stop function                | Module-stop state can be set to reduce power consumption                          |
| Temperature sensor calibration data | Reference data measured for each chip at factory shipment is stored in a register |
| TrustZone Filter                    | Security attribution can be set   |

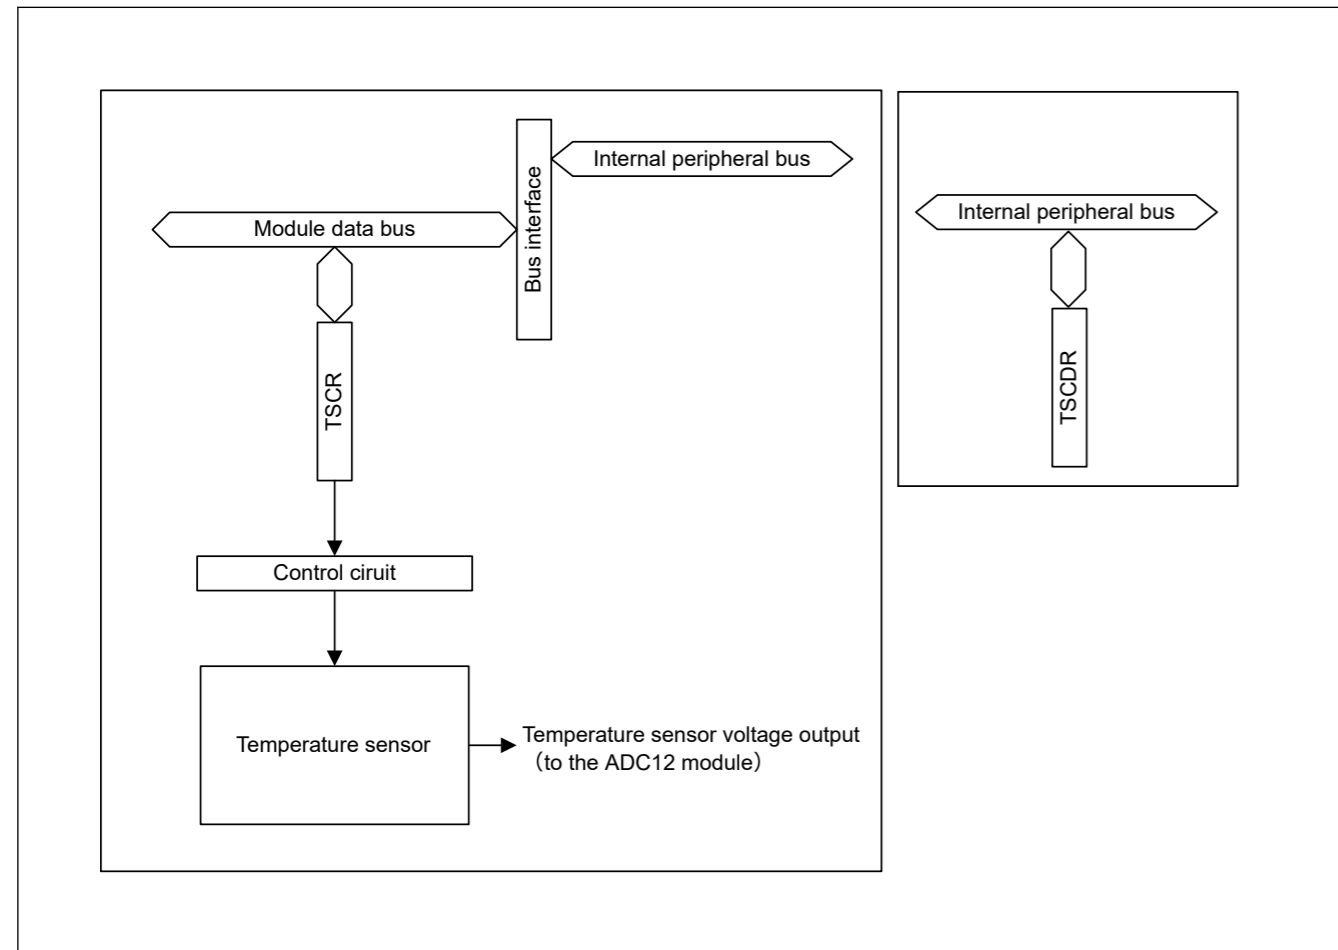

Figure 39.1 TSN block diagram

## 39. 温度传感器(TSN)

### 39.1 Overview

片上温度传感器(TSN)确定并监控芯片温度，以确保器件可靠运行。传感器输出与管芯温度成正比的电压，管芯温度与输出电压之间的关系相当线性。输出电压被提供给ADC12进行转换，并且可以被最终应用进一步使用。

表39.1列出了TSN规范，图39.1显示了框图。

Table 39.1 TSN specifications

| Item                 | Description            |
|----------------------|------------------------|
| 温度传感器电压输出            | 温度传感器向12位AD转换器输出电压     |
| Module-stop function | 可设置模块停止状态以降低功耗         |
| 温度传感器校准数据            | 出厂时为每个芯片测量的参考数据存储在寄存器中 |
| TrustZone Filter     | 可设置安全属性                |

Figure 39.1 TSN框图

### 39.2 Register Descriptions

#### 39.2.1 TSCR : Temperature Sensor Control Register

Base address: TSN = 0x400F\_3000  
Offset address: 0x00

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 3:0 | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 4   | TSOE   | Temperature Sensor Output Enable<br>0: Disable output from the temperature sensor to the ADC12<br>1: Enable output from the temperature sensor to the ADC12 | R/W |
| 6:5 | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 7   | TSEN   | Temperature Sensor Enable<br>0: Stop the temperature sensor<br>1: Start the temperature sensor.   | R/W |

The TSCR is a register which controls the temperature sensor. The timing constraints shown in Figure 39.3 apply to the settings of the TSCR register.

##### TSOE bit (Temperature Sensor Output Enable)

The TSOE bit enables or disables the temperature sensor output to ADC12.

##### TSEN bit (Temperature Sensor Enable)

The TSEN bit starts or stops the temperature sensor.

#### 39.2.2 TSCDR : Temperature Sensor Calibration Data Register

Base address: TSD = 0x407F\_B000  
Offset Address: 0x017C

| Bit   | Symbol      | Function   | R/W |
|-------|-------------|--|-----|
| 15:0  | TSCDR[15:0] | Temperature Sensor Calibration Data<br>Chip-specific value | R   |
| 31:16 | —           | These bits are read as 0.                                  | R   |

The TSCDR register stores temperature sensor calibration data measured for each chip at factory shipment.

Temperature sensor calibration data is the output voltage of the temperature sensor under the conditions  $T_j = 127^\circ\text{C}$  and  $AVCC0 = VREFH0 = 3.3\text{ V}$  converted to a digital value by the 12-bit A/D converter.

The TSCDR register is a read-only 32-bit register. Read from this register in 32-bit units.

### 39.2 注册说明

#### 39.2.1 TSCR: 温度传感器控制寄存器

Base address: TSN = 0x400F\_3000  
Offset address: 0x00

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 3:0 | —      | 这些位被读取为0。写入值应为0。  | R/W |
| 4   | TSOE   | 温度传感器输出使能<br>0: 禁用从温度传感器到ADC12的输出<br>1: 启用从温度传感器到ADC12的输出 | R/W |
| 6:5 | —      | 这些位被读取为0。写入值应为0。  | R/W |
| 7   | TSEN   | 温度传感器启用<br>0: 停止温度传感器<br>1: 启动温度传感器。                      | R/W |

TSCR是一个控制温度传感器的寄存器。图39.3所示的时序约束适用于TSCR寄存器的设置。

##### TSOE位 (温度传感器输出使能)

TSOE位启用或禁用温度传感器输出到ADC12。

##### TSEN位 (温度传感器使能)

TSEN位启动或停止温度传感器。

#### 39.2.2 TSCDR: 温度传感器校准数据寄存器

Base address: TSD = 0x407F\_B000  
Offset Address: 0x017C

| Bit   | Symbol      | Function                         | R/W |
|-------|-------------|----------------------------------|-----|
| 15:0  | TSCDR[15:0] | 温度传感器校准数据<br>Chip-specific value | R   |
| 31:16 | —           | 这些位读为0。                          | R   |

TSCDR寄存器存储在出厂时为每个芯片测量的温度传感器校准数据。

温度传感器校准数据是温度传感器在条件 $T_j = 127^\circ\text{C}$ 和 $AVCC0 = VREFH0 = 3.3\text{ V}$ 通过12位AD转换器转换为数字值。

TSCDR寄存器是一个只读的32位寄存器。以32位为单位从该寄存器中读取。

Temperature sensor calibration data is stored in the lower 12 bits of the TSCDR register.

### 39.3 Using the Temperature Sensor

The temperature sensor outputs a voltage that varies with the temperature. This voltage is converted to a digital value by the 12-bit A/D converter. To obtain the die temperature, convert this value into the temperature.

#### 39.3.1 Preparation for Using the Temperature Sensor

The ambient temperature (T) is proportional to the temperature sensor voltage output (Vs), so ambient temperature is calculated with the following formula:

$$T = (V_s - V_1) / \text{slope} + T_1$$

- T: Ambient temperature of MCU as calculation result (°C)
- Vs: Voltage output by the temperature sensor on temperature measurement (V)
- T1: Temperature experimentally measured at one point (°C)
- V1: Voltage output by the temperature sensor on measurement of T1 (V)
- T2: Temperature experimentally measured at a second point (°C)
- V2: Voltage output by the temperature sensor on measurement of T2 (V)
- Slope: Temperature gradient of the temperature sensor (V / °C), slope = (V2 - V1) / (T2 - T1)

Characteristics vary between sensors, so Renesas recommends measuring two different sample temperatures as follows:

1. Use the 12-bit A/D converter to measure the voltage V1 output by the temperature sensor at temperature T1.
2. Again use the 12-bit A/D converter to measure the voltage V2 output by the temperature sensor at a different temperature T2.
3. Obtain the temperature gradient (slope = (V2 - V1) / (T2 - T1)) from these results.
4. Subsequently, obtain temperatures by substituting the slope into the formula for the temperature characteristic (T = (Vs - V1) / slope + T1).

If you are using the temperature gradient given in [section 47, Electrical Characteristics](#), use the A/D converter to measure the voltage V1 output by the temperature sensor at temperature T1, then calculate the temperature characteristic using the following formula:

$$T = (V_s - V_1) / \text{slope} + T_1$$

Note: This method produces less accurate temperatures than measurement at two points.

In this MCU, the TSCDR register stores the temperature value (CAL127) of the temperature sensor measured under the condition Ta = Tj = 127°C and AVCC0 = VREFH0 = 3.3 V. If you use this value as the sample measurement result at the first point, you can omit the preparation before using the temperature sensor.

V1 is calculated from CAL127:

$$V_1 = 3.3 \times \text{CAL127} / 4096 \text{ [V]} \text{ (In case of 12 bit accuracy)}$$

Using this value, the measured temperature can be calculated according to the following formula:

$$T = (V_s - V_1) / \text{slope} + 127 \text{ [°C]}$$

- T: Ambient temperature of MCU as calculation result (°C)
- Vs: Voltage output by the temperature sensor when the temperature is measured (V)
- V1: Voltage output by the temperature sensor when Ta = Tj = 127°C and AVCC0 = VREFH0 = 3.3 V (V)
- Slope: Temperature gradient of the temperature sensor\*1 / 1000 (V/°C)

Note 1. See [section 47, Electrical Characteristics](#)

#### 39.3.2 Procedures for Using the Temperature Sensor

Figure 39.2 shows the procedure for using the TSN.

温度传感器校准数据存储在TSCDR寄存器的低12位中。

### 39.3 使用温度传感器

温度传感器输出随温度变化的电压。该电压由12位AD转换器转换为数字值。要获得芯片温度，请将该值转换为温度。

#### 39.3.1 使用温度传感器的准备工作

环境温度(T)与温度传感器电压输出(Vs)成正比，因此使用以下公式计算环境温度：

$$T = (V_s - V_1) / \text{slope} + T_1$$

- T: 作为计算结果的MCU的环境温度 (°C)
- Vs: 温度传感器测温时的电压输出 (V)
- T1: 在某一点实验测量的温度(°C)
- V1: 温度传感器在测量T1 (V) 时输出的电压
- T2: 在第二点实验测量的温度(°C)
- V2: 温度传感器在测量T2 (V) 时输出的电压
- 斜率: 温度传感器的温度梯度 (V/°C) , 斜率= (V2-V1) / (T2-T1)

传感器的特性各不相同，因此瑞萨电子建议测量两种不同的样品温度，如下所示：

1. 使用12位AD转换器测量温度T1时温度传感器输出的电压V1。
2. 再次使用12位AD转换器测量温度传感器在不同温度T2下输出的电压V2。
3. 从这些结果中获得温度梯度 (斜率=(V2-V1)/(T2-T1))。
4. 随后，通过将斜率代入温度特性公式(T=(Vs-V1)/斜率+T1)来获得温度。

如果您使用第47节“电气特性”中给出的温度梯度，请使用AD转换器测量温度传感器在温度T1下输出的电压V1，然后使用以下公式计算温度特性：

$$T = (V_s - V_1) / \text{slope} + T_1$$

Note: 这种方法产生的温度不如两点测量准确。

在此MCU中，TSCDR寄存器存储在Ta=Tj=127°C和AVCC0=VREFH0=3.3V条件下测量的温度传感器的温度值(CAL127)。如果您使用此值作为第一次的样本测量结果点，您可以省略使用温度传感器之前的准备工作。

V1由CAL127计算得出：

$$V_1 = 3.3 \times \text{CAL127} / 4096 \text{ [V]} \text{ (在12位精度的情况下)}$$

使用该值，可根据以下公式计算测得的温度：

$$T = (V_s - V_1) / \text{slope} + 127 \text{ [°C]}$$

- T: 作为计算结果的MCU的环境温度 (°C)
- Vs: 测温时温度传感器输出的电压 (V)
- V1: Ta=Tj=127°C且AVCC0=VREFH0=3.3V(V)时温度传感器输出的电压
- 斜率: 温度传感器的温度梯度\*11000(V/°C)

注1.见第47节，电气特性

#### 39.3.2 使用温度传感器的步骤

图39.2显示了使用TSN的过程。

For details, see [section 37, 12-Bit A/D Converter \(ADC12\)](#).

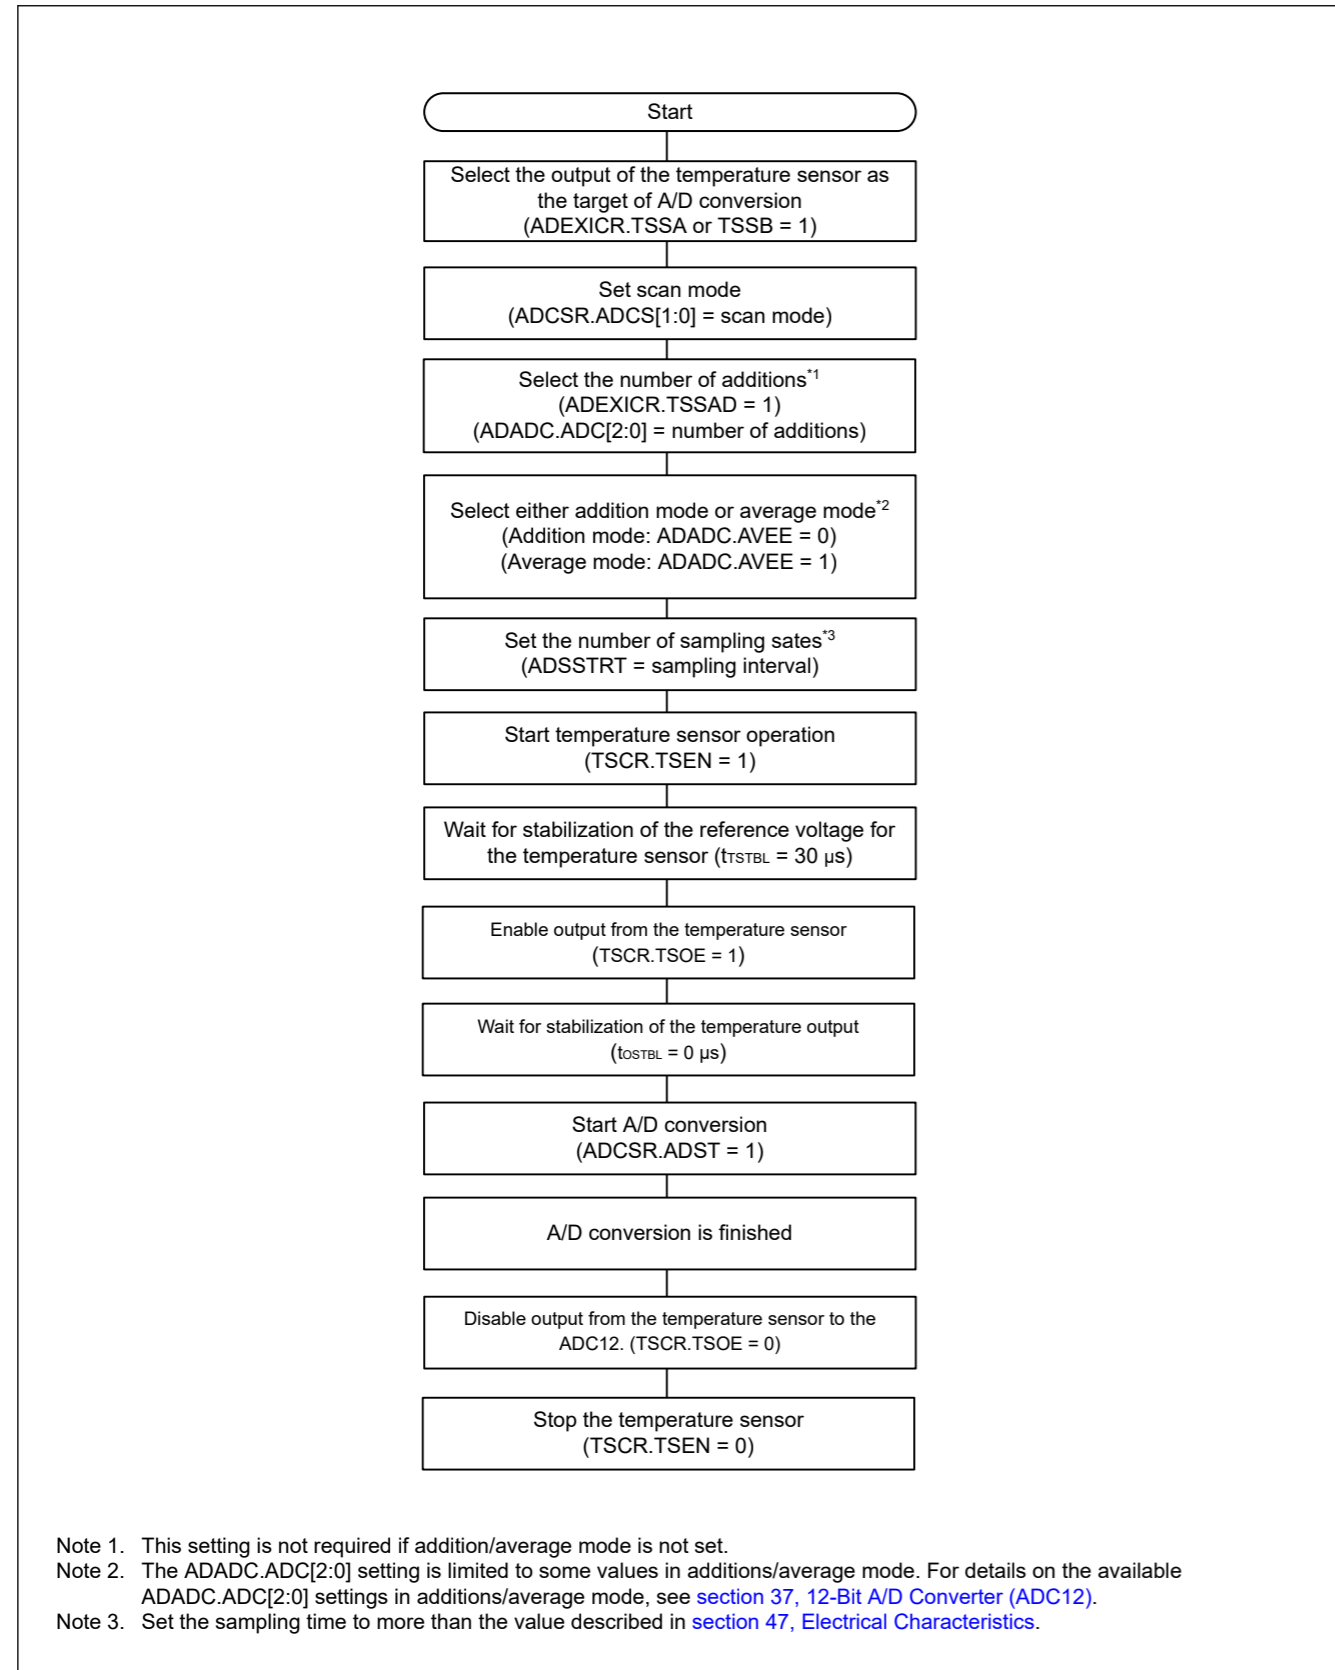

Figure 39.2 Procedure example for using the TSN

有关详细信息，请参阅第37节，12位AD转换器(ADC12)。

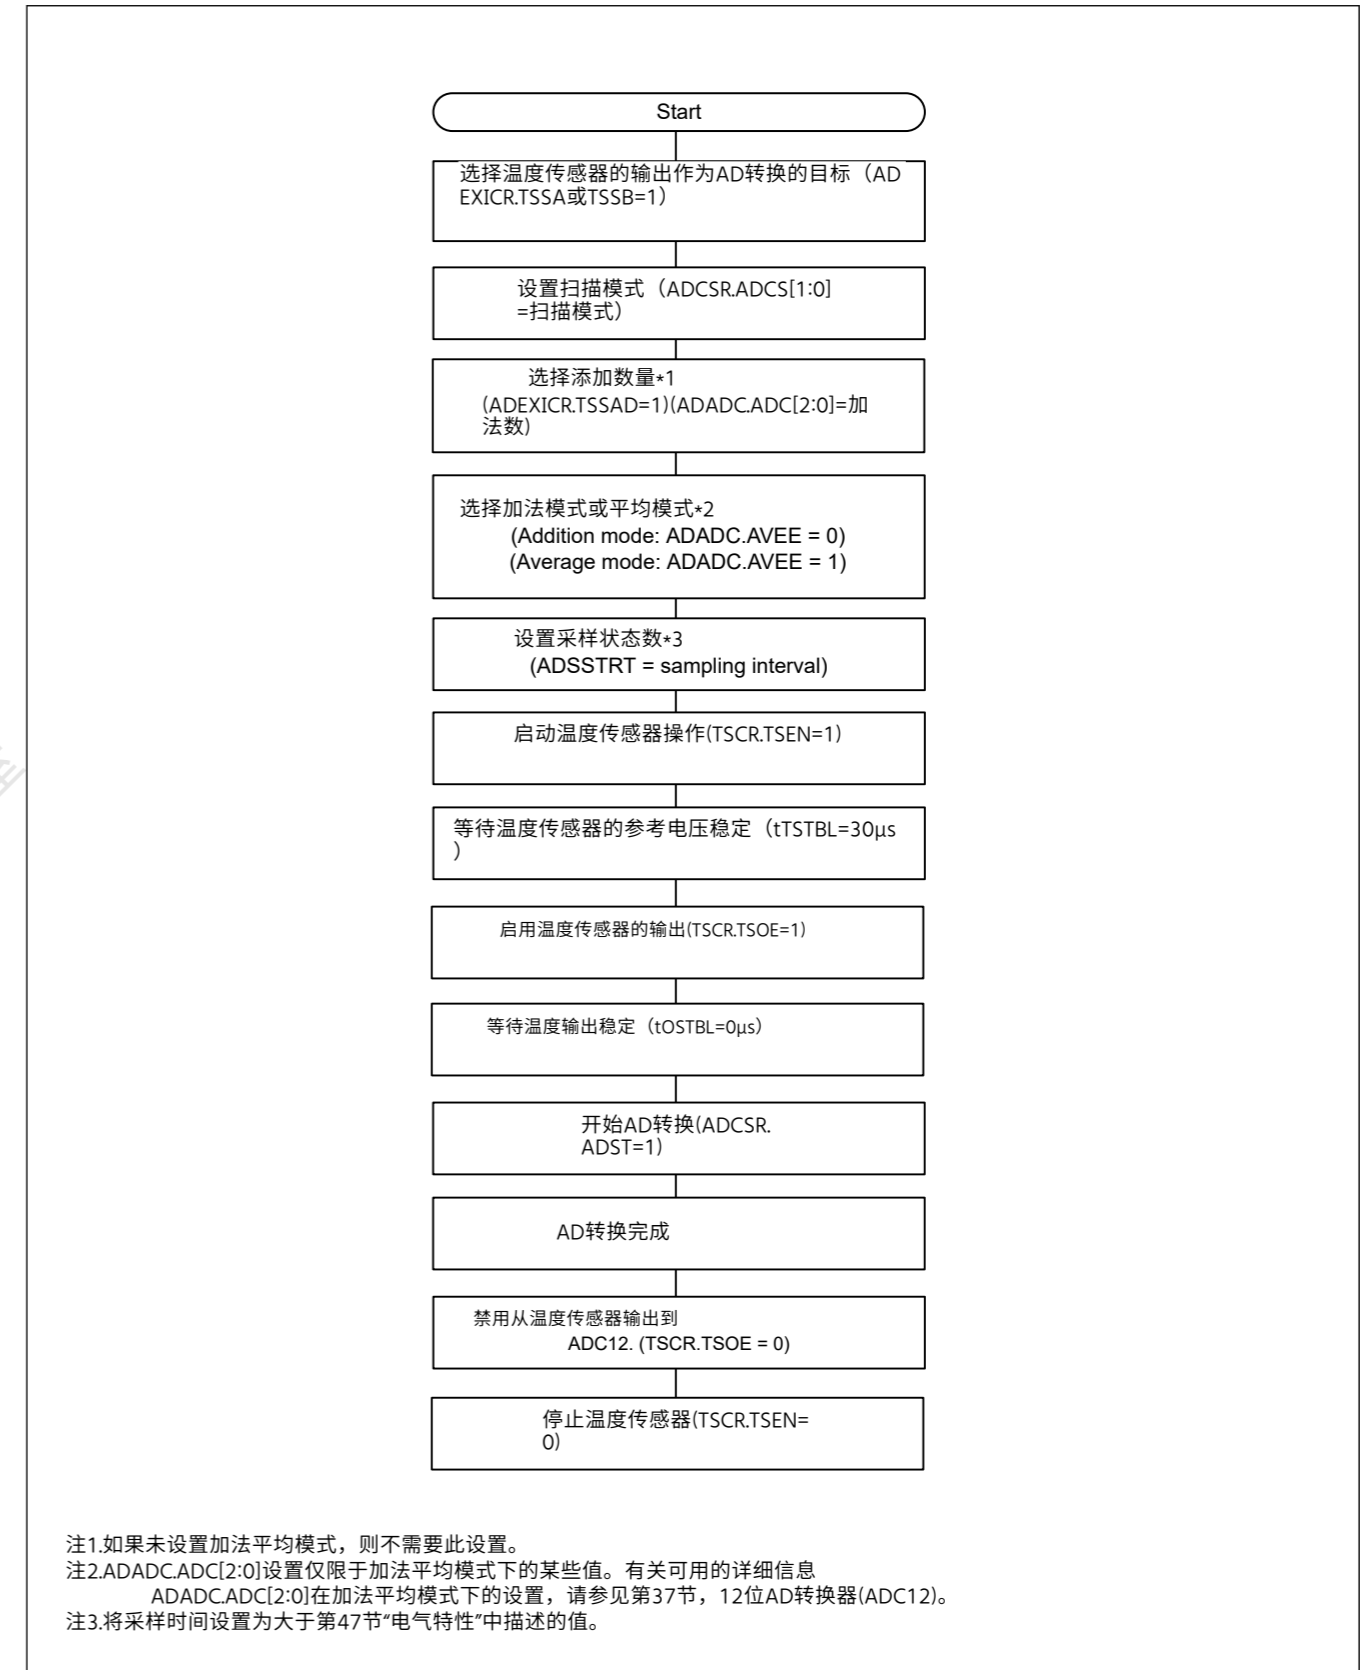

Figure 39.2 使用TSN的过程示例

Figure 39.3 shows the timing from the start of temperature sensor operation until the completion of A/D conversion when the ADC12 is in single scan mode (the conversion target is the temperature sensor output only). The times shown in the figure are described in Table 39.2

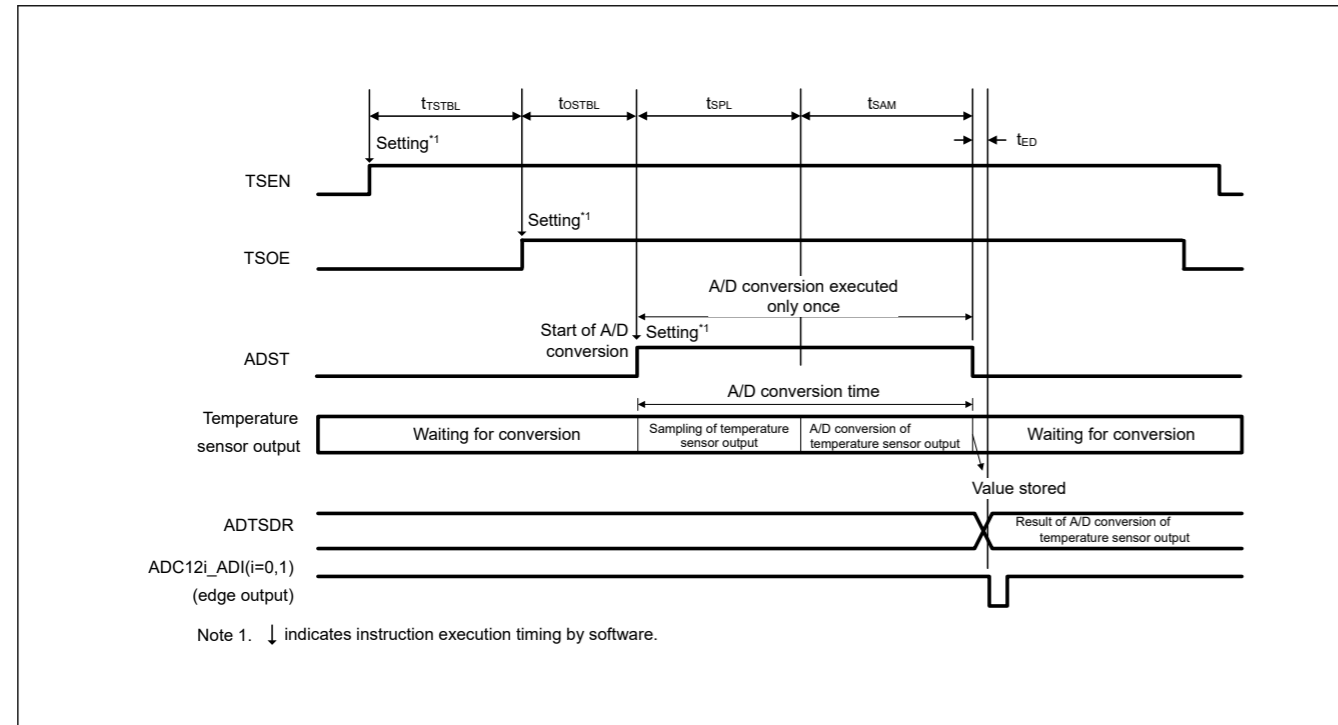

Figure 39.3 Timing from start of temperature sensor operation until completion of A/D conversion

Table 39.2 Time until completion of A/D conversion after start of temperature sensor operation

| Parameter  | Symbol      | Time   |
|--|-------------|--|
| Wait time for temperature sensor reference voltage stabilization | $t_{TSTBL}$ | 30 $\mu$ s (min)   |
| Wait time for temperature sensor output stabilization            | $t_{OSTBL}$ | 0 $\mu$ s (min)  |
| A/D converter input sampling time                                | $t_{sPL}$   | ADSSTRT setting $\times$ ADCLK cycles  |
| A/D conversion time  | $t_{sAM}$   | See the table in section 37.3.7. Analog Input Sampling and Scan Conversion Time. |
| Scan conversion end delay  | $t_{ED}$    |  |

### 39.4 Usage Notes

#### 39.4.1 Settings for the Module-Stop Function

TSN operation can be disabled or enabled using the associated bit in Module Stop Control Register D (MSTPCRD). The TSN is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

图39.3显示了当ADC12处于单次扫描模式（转换目标仅为温度传感器输出）时，从温度传感器操作开始到AD转换完成的时序。图中所示时间见表39.2

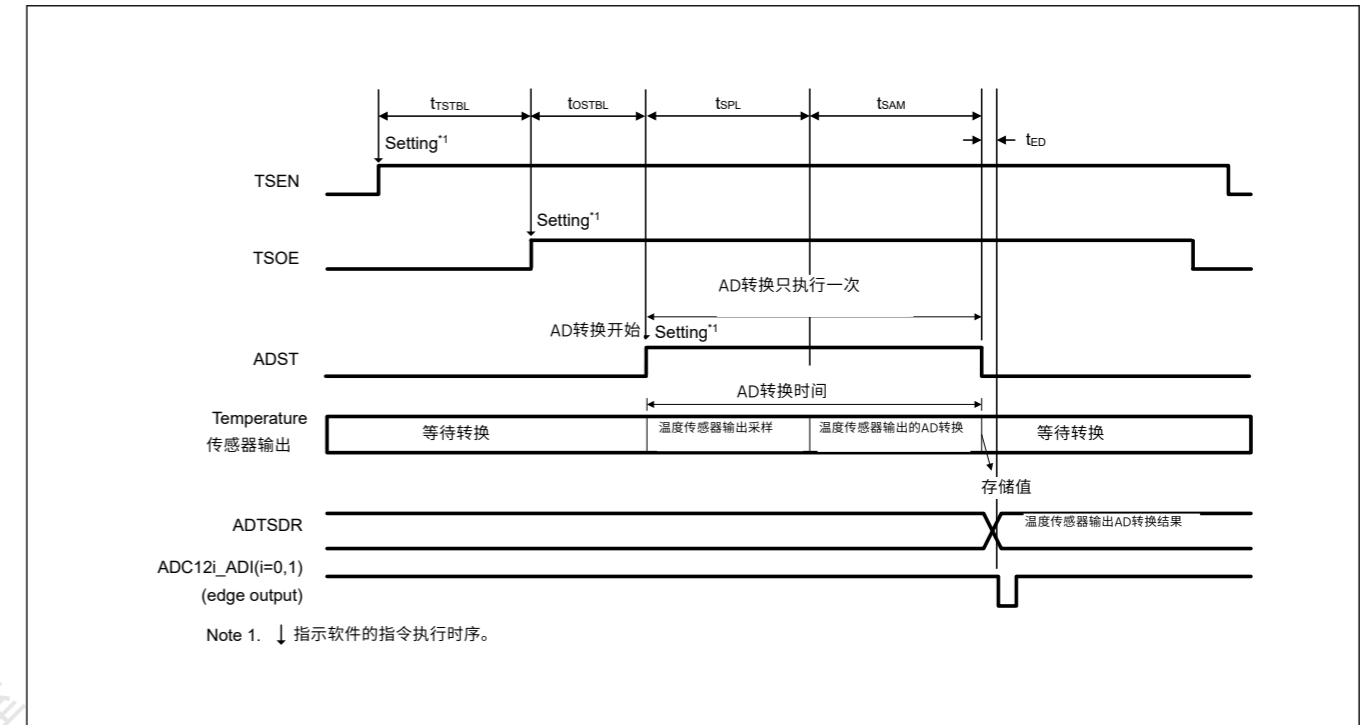

Figure 39.3 从温度传感器操作开始到AD转换完成的时间

Table 39.2 温度传感器动作开始后到AD转换完成的时间

| Parameter        | Symbol      | Time                           |
|------------------|-------------|--------------------------------|
| 温度传感器参考电压稳定的等待时间 | $t_{TSTBL}$ | 30 $\mu$ s (min)               |
| 温度传感器输出稳定的等待时间   | $t_{OSTBL}$ | 0 $\mu$ s (min)                |
| AD转换器输入采样时间      | $t_{sPL}$   | ADSTRT设置 $\times$ ADCLK周期      |
| AD转换时间           | $t_{sAM}$   | 请参见第37.3.7节中的表格。模拟输入采样和扫描转换时间。 |
| 扫描转换结束延迟         | $t_{ED}$    |                                |

### 39.4 使用说明

#### 39.4.1 模块停止功能的设置

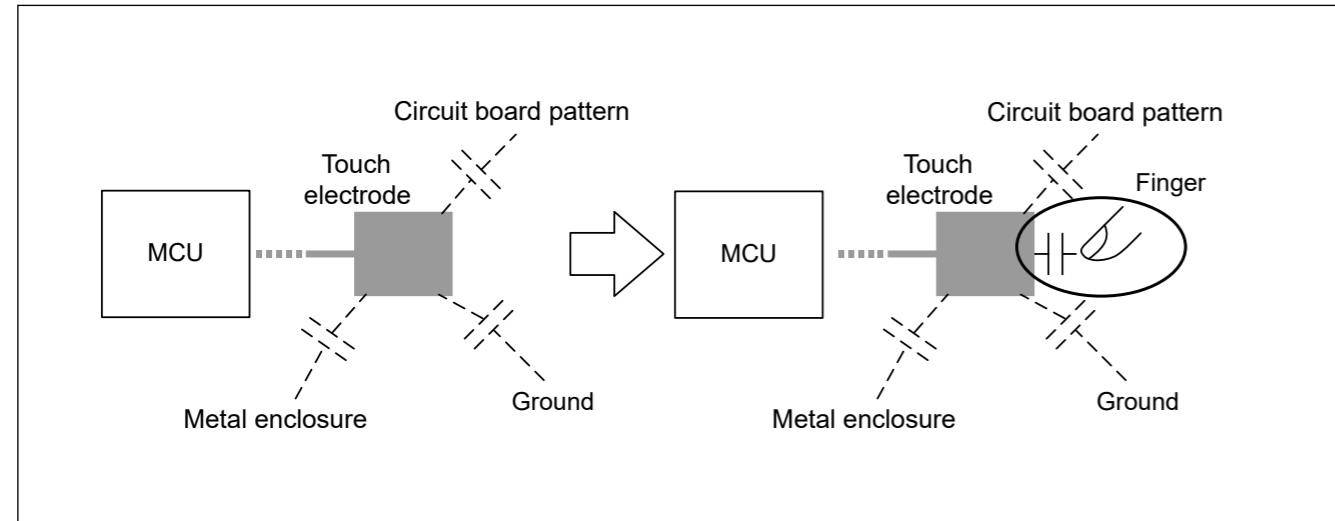

使用模块停止控制寄存器D(MSTPCRD)中的相关位可以禁用或启用TSN操作。TSN在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

## 40. Capacitive Touch Sensing Unit (CTSUS)

### 40.1 Overview

The Capacitive Touch Sensing Unit (CTSUS) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software that enables the CTSUS to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical conductor so that a finger does not come into direct contact with the electrode.

As [Figure 40.1](#) shows, electrostatic capacitance (parasitic capacitance) exists between the electrode and the surrounding conductors. Because the human body is an electrical conductor, when a finger is placed close to the electrode, the value of electrostatic capacitance increases.

**Figure 40.1** Increased electrostatic capacitance because of the presence of a finger

Electrostatic capacitance is detected by the self-capacitance and mutual capacitance methods. In the self-capacitance method, the CTSUS detects electrostatic capacitance generated between a finger and a single electrode. In the mutual capacitance method, two electrodes are used one as a transmit electrode and the other as a receive electrode, and the CTSUS detects the change in the electrostatic capacitance generated between the two when a finger is placed close to them.

**Figure 40.2** Self-capacitance and mutual capacitance methods

Electrostatic capacitance is measured by counting a clock signal whose frequency changes according to the amount of charged or discharged current, for a specified period. For details on the measurement principles of the CTSUS, see [section 40.3.1. Principles of Measurement Operation](#).

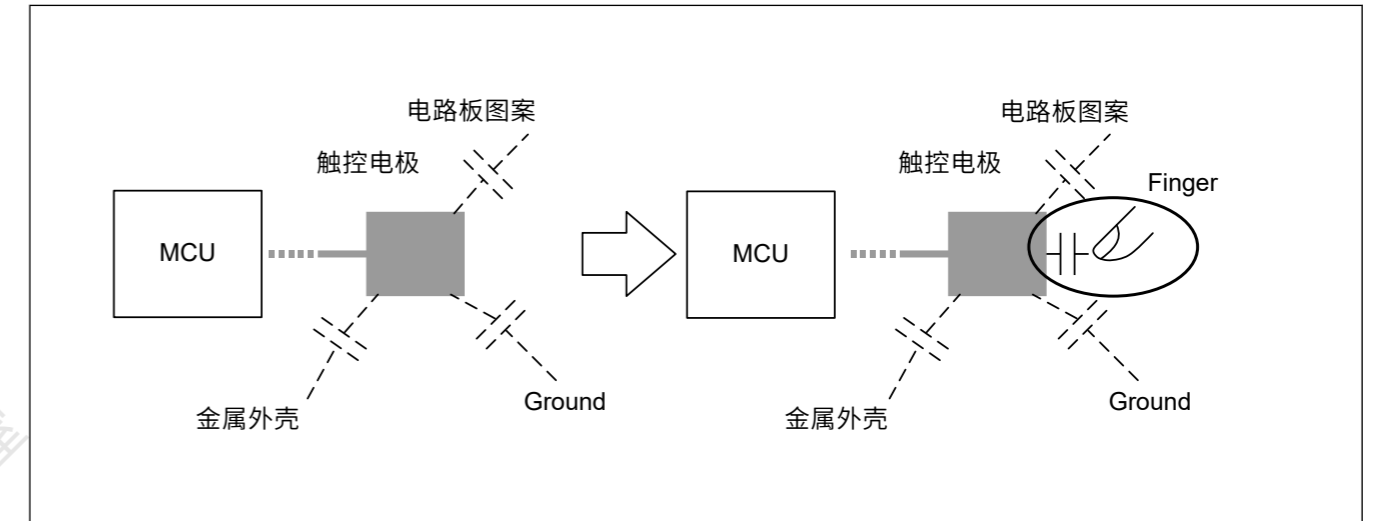

[Table 40.1](#) lists the CTSUS specifications and [Figure 40.3](#) shows a block diagram.

## 40. 电容式触控感应单元(CTSUS)

### 40.1 Overview

电容式触摸传感单元(CTSUS)测量触摸传感器的静电电容。静电电容的变化由软件确定，该软件使CTSUS能够检测手指是否与触摸传感器接触。触摸传感器的电极表面通常被电导体包围，因此手指不会直接接触电极。

如图40.1所示，静电电容（寄生电容）存在于电极和周围导体之间。因为人体是电导体，当手指靠近电极时，静电电容值会增加。

**Figure 40.1** 由于手指的存在而增加了静电电容

静电电容的检测方法有自电容法和互电容法。在自电容法中，CTSUS检测手指和单个电极之间产生的静电电容。在互电容法中，使用两个电极，一个作为发送电极，另一个作为接收电极，当手指靠近它们时，CTSUS会检测两者之间产生的静电电容的变化。

**Figure 40.2** 自电容和互电容方法

静电电容是通过时钟信号计数来测量的，该时钟信号的频率根据充电或放电电流的大小而变化，在指定的时间段内。CTSUS的测量原理详见40.3.1节。测量操作原理。

表40.1列出了CTSUS规格，图40.3显示了框图。

Table 40.1 CTSU specifications

| Parameter                    | Specifications   |  |
|------------------------------|--|--|
| Operating clock              | PCLKB, PCLKB/2, or PCLKB/4   |  |
| Pins                         | Electrostatic capacitance measurement  | 20 channels  |
|                              | TSCAP  | Low Pass Filter (LPF) connection pin   |
| Measurement modes            | Self-capacitance single scan mode  | Electrostatic capacitance is measured on one channel using the self-capacitance method.                      |
|                              | Self-capacitance multiscan mode  | Electrostatic capacitance is measured successively on multiple channels using the self-capacitance method.   |
|                              | Mutual capacitance full scan mode  | Electrostatic capacitance is measured successively on multiple channels using the mutual capacitance method. |
| Calibration mode             | Improvement of measured value accuracy by calibration of sensor ICO  |  |
| Noise prevention             | Synchronous noise prevention, high-pass noise prevention   |  |
| Measurement start conditions | <ul style="list-style-type: none"> <li>Software trigger</li> <li>External trigger (ELC_CTSU from the Event Link Controller (ELC))</li> </ul> |  |
| TrustZone Filter             | Security attribution can be set  |  |

As Figure 40.3 shows, the CTSU consists of the following components:

- Status control block
- Trigger control block
- Clock control block
- Channel control block
- Port control block
- Sensor drive pulse generator
- Measurement block
- Interrupt block
- I/O registers

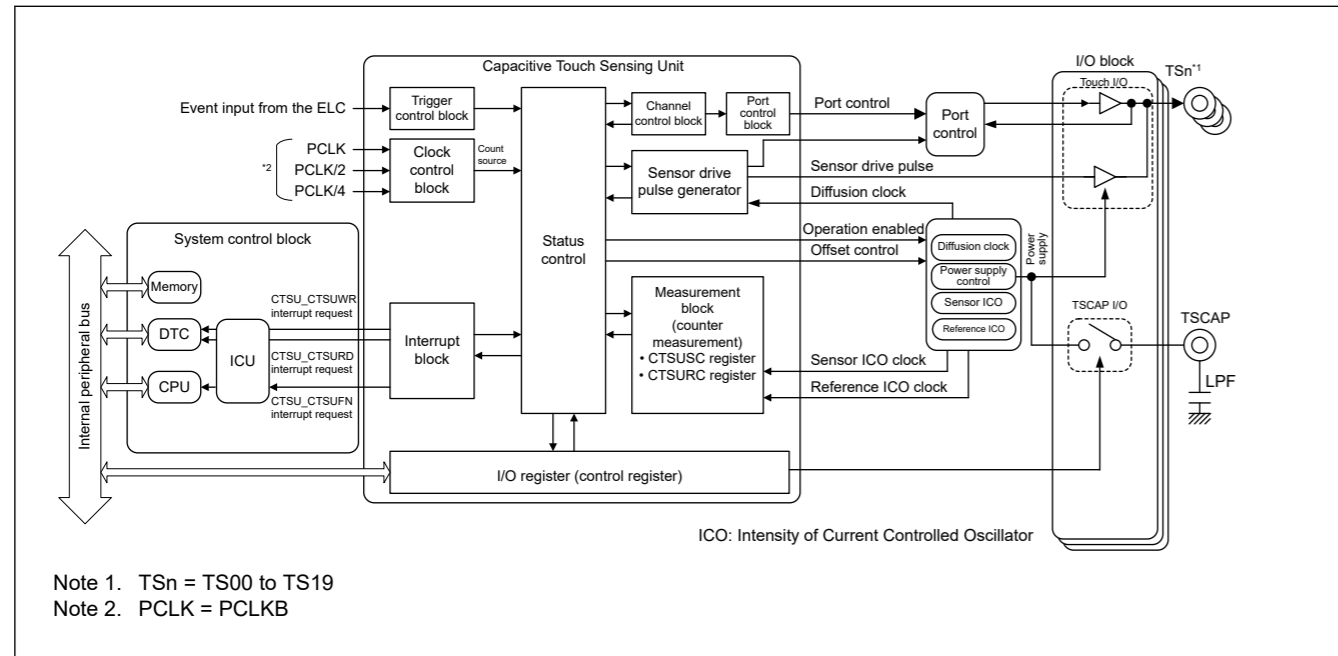

Figure 40.3 CTSU block diagram

Table 40.1 CTSU specifications

| Parameter        | Specifications  |                       |
|------------------|---|-----------------------|

| 噪音预防             | 同步防噪、防高通防噪  |                       |
| 测量开始条件           | <ul style="list-style-type: none"> <li>软件触发</li> <li>外部触发器 (来自事件链接控制器(ELC)的ELC_CTSU)</li> </ul> |                       |
| TrustZone Filter | 可设置安全属性   |                       |

如图40.3所示，CTSUS由以下组件组成：

- 状态控制块
- 触发控制块
- 时钟控制块
- 通道控制块
- 端口控制块
- 传感器驱动脉冲发生器
- 测量块
- 中断块
- I/O registers

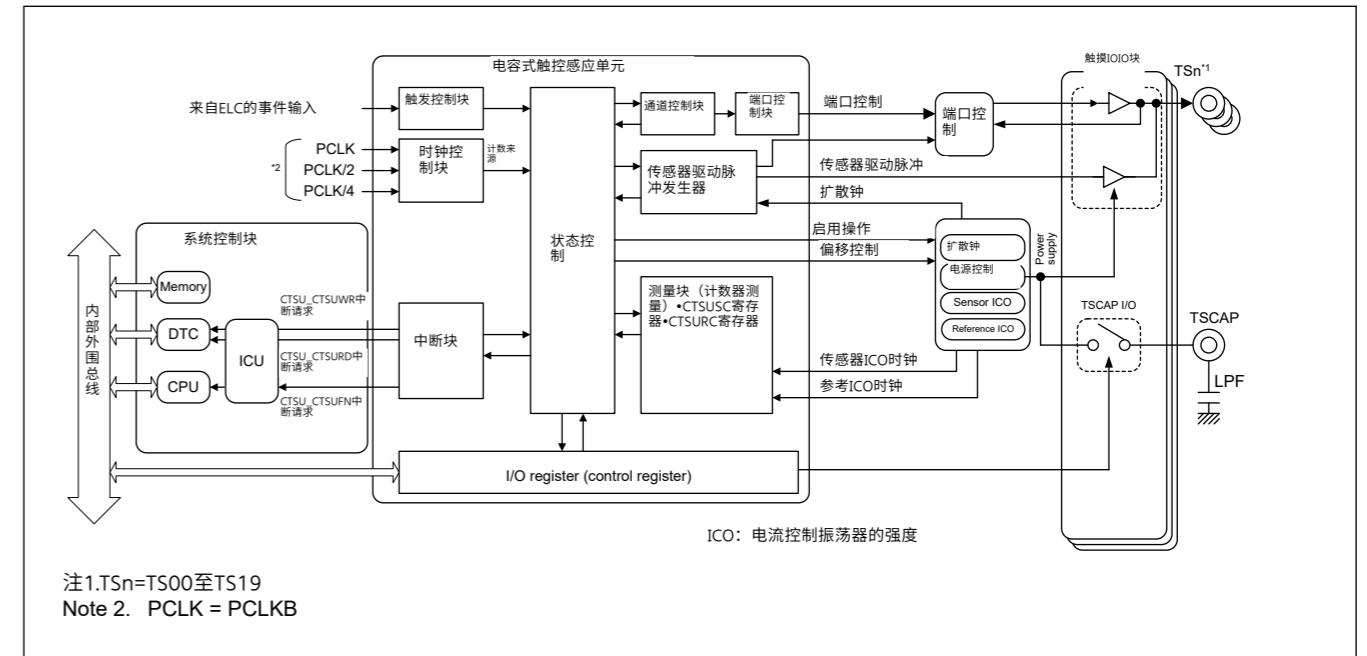

Figure 40.3 CTSU框图

Table 40.2 CTSU I/O pins

| Pin name     | I/O   | Function   |
|--------------|-------|--|
| TS00 to TS19 | Input | Electrostatic capacitive measurement pins (touch pins) |
| TSCAP        | —     | LPF connection pin                                     |

## 40.2 Register Descriptions

## 40.2.1 CTSUCR0 : CTSU Control Register 0

Base address: CTSU = 0x400D\_0000

Offset address: 0x00

| Bit position:      | 7          | 6 | 5 | 4       | 3       | 2       | 1       | 0        |
|--------------------|------------|---|---|---------|---------|---------|---------|----------|
| Bit field:         | CTSUTXVSEL | — | — | CTSUIOC | CTSUIOC | CTSUSNZ | CTSUCAP | CTSUSTRT |
| Value after reset: | 0          | 0 | 0 | 0       | 0       | 0       | 0       | 0        |

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 0   | CTSUSTRT   | CTSU Measurement Operation Start<br>0: Stop measurement operation*1<br>1: Start measurement operation   | R/W |
| 1   | CTSUCAP    | CTSU Measurement Operation Start Trigger Select<br>0: Software trigger<br>1: External trigger   | R/W |
| 2   | CTSUSNZ    | CTSU Wait State Power-Saving Enable<br>0: Disable power-saving function during wait state<br>1: Enable power-saving function during wait state  | R/W |
| 3   | CTSUIOC    | CTSU Transmit Pin Control<br>0: The TS pins are driven low<br>1: The TS pins are driven high  | R/W |
| 4   | CTSUIINIT  | CTSU Control Block Initialization<br>Writing 1 to this bit initializes the CTSU control block and CTSUSC, CTSURC, CTSUMCH0, CTSUMCH1, and CTSUST registers. This bit is read as 0.                | W   |
| 6:5 | —          | These bits are read as 0. The write value should be 0.  | R/W |
| 7   | CTSUTXVSEL | CTSU Transmission Power Supply Select<br>0: TSCAP is selected as the power-supply voltage for the transmission pins.<br>1: VCL is selected as the power-supply voltage for the transmission pins. | R/W |

Note 1. When the CTSU is not used, fix the value of this bit to 0.

Only set the CTSUCAP, CTSUSNZ, CTSUTXVSEL2 and CTSUTXVSEL bits when the CTSUSTRT bit is 0. These bits can be set at the same time that measurement operation starts.

**CTSUSTRT bit (CTSU Measurement Operation Start)**

The CTSUSTRT bit specifies whether CTSU operation starts or stops. When the CTSUSTRT bit is 0, measurement starts when the software writes 1 to the CTSUSTRT bit (software trigger) and stops when the hardware clears the CTSUSTRT bit to 0. When the CTSUSTRT bit is 1, the CTSU waits for an external trigger by writing 1 to the CTSUSTRT bit, and measurement starts on the rising edge of the external trigger. When measurement is stopped, the CTSU waits for the next external trigger and operation continues.

Table 40.3 lists the CTSU states.

Table 40.3 CTSU status (1 of 2)

| CTSUSTRT bit | CTSUCAP bit | CTSU state |
|--------------|-------------|------------|
| 0            | 0           | Stopped    |

Table 40.2 CTSU I/O pins

| 引脚名称         | I/O   | Function       |
|--------------|-------|----------------|
| TS00 to TS19 | Input | 静电电容测量引脚（触摸引脚） |
| TSCAP        | —     | LPF连接引脚        |

## 40.2 注册说明

## 40.2.1 CTSUCR0:CTSU控制寄存器0

Base address: CTSU = 0x400D\_0000

Offset address: 0x00

| Bit position: | 7          | 6 | 5 | 4       | 3       | 2       | 1       | 0        |
|---------------|------------|---|---|---------|---------|---------|---------|----------|
| Bit field:    | CTSUTXVSEL | — | — | CTSUIOC | CTSUIOC | CTSUSNZ | CTSUCAP | CTSUSTRT |
| 重置后的值:        | 0          | 0 | 0 | 0       | 0       | 0       | 0       | 0        |

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 0   | CTSUSTRT   | CTSU测量操作开始<br>0: 停止测量操作*1<br>1: 开始测量操作  | R/W |
| 1   | CTSUCAP    | CTSU测量操作开始触发选择<br>0: 软件触发1: 外部触发  | R/W |
| 2   | CTSUSNZ    | CTSU等待状态省电使能<br>0: 等待状态下关闭省电功能1: 等待状态下开启省电功能                                    | R/W |
| 3   | CTSUIOC    | CTSU发送引脚控制<br>0: TS引脚驱动为低电平1: TS引脚驱动为高电平  | R/W |
| 4   | CTSUIINIT  | CTSU控制块初始化<br>向该位写入1初始化CTSU控制模块和CTSUSC、CTSURC、CTSUMCO、CTSUMCH1和CTSUST寄存器。该位读为0。 | W   |
| 6:5 | —          | 这些位被读取为0。写入值应为0。  | R/W |
| 7   | CTSUTXVSEL | CTSU传输电源选择<br>0: 选择TSCAP作为发送引脚的电源电压。1: 选择VCL作为发送引脚的电源电压。                        | R/W |

注1.不使用CTSU时，将该位的值固定为0。

仅当CTSUSTRT位为0时设置CTSUCAP、CTSUSNZ、CTSUTXVSEL2和CTSUTXVSEL位。这些位可以在测量操作开始的同时设置。

**CTSUSTRT位 (CTSU测量操作开始)**

CTSUSTRT位指定CTSU操作是开始还是停止。当CTSUSTRT位为0时，软件将1写入CTSUSTRT位（软件触发）时开始测量，并在硬件将CTSUSTRT位清为0时停止测量。当CTSUSTRT位为1时，CTSU通过写入等待外部触发1到CTSUSTRT位，并在外部触发的上升沿开始测量。当测量停止时，CTSU等待下一个外部触发并继续操作。

表40.3列出了CTSU状态。

Table 40.3 CTSU状态(1of2)

| CTSUSTRT bit | CTSUCAP bit | CTSU state |
|--------------|-------------|------------|
| 0            | 0           | Stopped    |

Table 40.3 CTSU status (2 of 2)

| CTSUSTRT bit | CTSUCAP bit | CTSU state  |
|--------------|-------------|---|
| 0            | 1           | Stopped   |
| 1            | 0           | Measurement in progress                                       |
| 1            | 1           | Measurement in progress and waiting for an external trigger*1 |

Note 1. The state can be read from the CTSUST.CTSUSTC[2:0] flags as follows:  
 During measurement: CTSUST.CTSUSTC[2:0] flags ≠ 000b  
 While waiting for an external trigger: CTSUST.CTSUSTC[2:0] flags = 000b  
 When the CTSU is not used, fix the value of this bit to 0.

If the software sets the CTSUSTRT bit to 1 when the bit is already 1, the write is ignored and operation continues. To force operation to stop through the software when the CTSUSTRT bit is 1, set the CTSUSTRT bit to 0 and the CTSUINIT bit to 1 at the same time.

#### CTSUCAP bit (CTSU Measurement Operation Start Trigger Select)

The CTSUCAP bit specifies the measurement start condition. For details, see [CTSUSTRT bit \(CTSU Measurement Operation Start\)](#).

#### CTSUSNZ bit (CTSU Wait State Power-Saving Enable)

The CTSUSNZ bit enables or disables power-saving operation during a wait state. It can also suspend the CTSU power supply, which decreases power consumption during the wait state. In the suspended state, the CTSU power supply is turned off while the external TSCAP is still charged.

Table 40.4 shows the CTSU power supply state control.

Table 40.4 CTSU power supply state control

| CTSUCR1.CTSUPON bit | CTSUSNZ bit | CTSUCAP bit | CTSUSTRT bit | CTSU power supply state |
|---------------------|-------------|-------------|--------------|-------------------------|
| 0                   | 0           | 0           | 0            | Stopped                 |
| 1                   | 0           | —           | —            | Operating               |
| 1                   | 1           | 0           | 0            | Suspended               |

Note: Other settings are prohibited.

To start measurement from the suspended state, set the CTSUSNZ bit to 0, and then set the CTSUSTRT bit to 1. To suspend the module after measurement stops, set the CTSUSNZ bit to 1.

#### CTSUIOC bit (CTSU Transmit Pin Control)

The CTSUIOC bit selects the logic level of the TS pin when the CTSUERRS.CTSUTSOD bit is set to 1. This bit setting is ignored when the CTSUTSOD bit is 0.

#### CTSUINIT bit (CTSU Control Block Initialization)

Write 1 to the CTSUINIT bit to initialize the internal control registers. To force the current operation to stop, set the CTSUSTRT bit to 0 and the CTSUINIT bit to 1 at the same time. This stops the operation and initializes the internal control registers.

Do not write 1 to the CTSUINIT bit when the CTSUSTRT bit is 1.

#### CTSUTXVSEL bit (CTSU Transmission Power Supply Select)

The CTSUTXVSEL bit is used to switch the power supply for the transmit buffer in mutual capacitance full scan mode.

Set this bit to 0 for any other mode or when the VCC voltage is lower than 2.7 V. This bit switches the power supply for touch I/O, which is set for transmission by the CTSUCHTRCn registers. Table 40.5 lists the power supply for the TSm pin. When the VCC voltage fluctuates greatly due to switching of the output buffer, switching to the internal logic power supply can reduce the effect on the voltage fluctuation.

Table 40.3 CTSU状态 (2个中的2个)

| CTSUSTRT bit | CTSUCAP bit | CTSU state    |
|--------------|-------------|---------------|
| 0            | 1           | Stopped       |
| 1            | 0           | 测量中           |
| 1            | 1           | 测量中, 等待外部触发*1 |

注1.可以从CTSUST.CTSUSTC[2:0]标志读取状态, 如下所示:  
 测量期间: CTSUST.CTSUSTC[2:0]flags≠000b  
 等待外部触发时: CTSUST.CTSUSTC[2:0]flags=000b  
 不使用CTSU时, 将该位的值固定为0。

如果在CTSUSTRT位已经为1时软件将该位设置为1, 则忽略写入并继续操作。要在CTSUSTRT位为1时通过软件强制停止操作, 请将CTSUSTRT位设置为0, 同时将CTSUINIT位设置为1。

#### CTSUCAP位 (CTSU测量操作开始触发选择)

CTSUCAP位指定测量开始条件。有关详细信息, 请参阅CTSUSTRT位 (CTSU测量 Operation Start)。

#### CTSUSNZ位 (CTSU等待状态省电使能)

CTSUSNZ位在等待状态期间启用或禁用省电操作。它还可以暂停CTSU电源, 从而降低等待状态下的功耗。在挂起状态下, CTSU电源关闭, 而外部TSCAP仍在充电。

CTSU电源状态控制如表40.4所示。

Table 40.4 CTSU电源状态控制

| CTSUCR1.CTSUPON位 | CTSUSNZ位 | CTSUCAP位 | CTSUSTRT位 | CTSU电源状态  |
|------------------|----------|----------|-----------|-----------|
| 0                | 0        | 0        | 0         | Stopped   |
| 1                | 0        | —        | —         | Operating |
| 1                | 1        | 0        | 0         | Suspended |

Note: 禁止其他设置。

要从暂停状态开始测量, 请将CTSUSNZ位设置为0, 然后将CTSUSTRT位设置为1。要在测量停止后暂停模块, 请将CTSUSNZ位设置为1。

#### CTSUIOC位 (CTSU发送引脚控制)

CTSUERRS.CTSUTSOD位设置为1时, CTSUIOC位选择TS引脚的逻辑电平。当CTSUTSOD位为0时, 该位设置被忽略。

#### CTSUINIT位 (CTSU控制块初始化)

向CTSUINIT位写入1以初始化内部控制寄存器。要强制停止当前操作, 请将CTSUSTRT位为0, CTSUINIT位同时为1。这将停止操作并初始化内部控制寄存器。

当CTSUSTRT位为1时, 不要将1写入CTSUINIT位。

#### CTSUTXVSEL位 (CTSU发送电源选择)

CTSUTXVSEL位用于在互电容全扫描模式下切换发送缓冲器的电源。

对于任何其他模式或当VCC电压低于2.7V时, 将该位设置为0。该位切换触摸IO的电源, 由CTSUCHTRCn寄存器设置为发送。表40.5列出了TSm引脚的电源。当VCC电压因输出缓冲器的切换而大幅波动时, 切换到内部逻辑电源可以减少对电压波动的影响。

Table 40.5 Power supplied to the TSm pins

| Setting of CTSUCHTRCn Register | CTSUTXVSEL bit                  | Power supply of TSm pins    |
|--------------------------------|---------------------------------|-----------------------------|
| 0 (Reception)                  | *                               | VCC                         |
| 1 (Transmission)               | 0 (VCC)                         | Internal logic power supply |
|                                | 1 (Internal logic power supply) |                             |

## 40.2.2 CTSUCR1 : CTSU Control Register 1

Base address: CTSU = 0x400D\_0000

Offset address: 0x01

| Bit position:      | 7           | 6            | 5         | 4 | 3       | 2       | 1 | 0 |
|--------------------|-------------|--------------|-----------|---|---------|---------|---|---|
| Bit field:         | CTSUMD[1:0] | CTSUCLK[1:0] | CTSUTUNE1 | — | CTSUCSW | CTSUPON |   |   |
| Value after reset: | 0           | 0            | 0         | 0 | 0       | 0       | 0 | 0 |

| Bit | Symbol       | Function   | R/W |
|-----|--------------|--|-----|
| 0   | CTSUPON      | CTSUS Power Supply Enable<br>0: Power off the CTSUS<br>1: Power on the CTSUS   | R/W |
| 1   | CTSUCSW      | CTSUS LPF Capacitance Charging Control<br>This bit controls charging of the LPF capacitance connected to the TSCAP pin.<br>0: Turn off capacitance switch<br>1: Turn on capacitance switch | R/W |
| 2   | —            | This bit is read as 0. The write value should be 0.  | R/W |
| 3   | CTSUTUNE1    | CTSUS Power Supply Capacity Adjustment<br>0: Normal output<br>1: High-current output   | R/W |
| 5:4 | CTSUCLK[1:0] | CTSUS Operating Clock Select<br>00: PCLKB<br>01: PCLKB/2 (PCLKB divided by 2)<br>10: PCLKB/4 (PCLKB divided by 4)<br>11: Setting prohibited  | R/W |
| 7:6 | CTSUMD[1:0]  | CTSUS Measurement Mode Select<br>00: Self-capacitance single scan mode<br>01: Self-capacitance multiscan mode<br>10: Setting prohibited<br>11: Mutual capacitance full scan mode           | R/W |

Only set the CTSUCR1 register when the CTSUCR0.CTSUSTRT bit is 0.

**CTSUPON bit (CTSUS Power Supply Enable)**

The CTSUPON bit controls the power supply to the CTSUS. Set the CTSUPON and CTSUCSW bits to the same value.

**CTSUCSW bit (CTSUS LPF Capacitance Charging Control)**

The CTSUCSW bit controls charging of the LPF capacitor connected to the TSCAP pin by turning the capacitance switch on or off. After the capacitance switch is turned on, wait until the capacitance connected to the TSCAP pin is charged for the specified time before starting measurement by setting CTSUCR0.CTSUSTRT to 1. Before starting measurement, use an I/O port to output low to the TSCAP pin, and discharge the existing LPF capacitance. Set the CTSUPON and CTSUCSW bits to the same value.

**CTSUTUNE1 bit (CTSUS Power Supply Capacity Adjustment)**

The CTSUTUNE1 bit sets the capacity of the CTSUS power supply. Normally, set this bit to 0.

Table 40.5 为TSm引脚供电

| 1 (Transmission)            | 0 (VCC)           |
|                             | 1 (内部逻辑电源) 内部逻辑电源 |

## 40.2.2 CTSUCR1: CTSUS控制寄存器1

Base address: CTSUS = 0x400D\_0000

Offset address: 0x01

| Bit position: | 7           | 6            | 5         | 4 | 3       | 2       | 1 | 0 |
|---------------|-------------|--------------|-----------|---|---------|---------|---|---|
| Bit field:    | CTSUMD[1:0] | CTSUCLK[1:0] | CTSUTUNE1 | — | CTSUCSW | CTSUPON |   |   |
| 重置后的值:        | 0           | 0            | 0         | 0 | 0       | 0       | 0 | 0 |

| Bit | Symbol       | Function   | R/W |
|-----|--------------|--|-----|
| 0   | CTSUPON      | CTSUS电源使能<br>0: 关闭CTSUS1: 打开CTSUS  | R/W |
| 1   | CTSUCSW      | CTSUS LPF电容充电控制<br>该位控制连接到TSCAP引脚的LPF电容的充电。<br>0: 关闭电容开关1: 打开电容开关            | R/W |
| 2   | —            | 该位读取为0。写入值应为0。   | R/W |
| 3   | CTSUTUNE1    | CTSUS电源容量调整<br>0: 正常输出1: 大电流输出   | R/W |
| 5:4 | CTSUCLK[1:0] | CTSUS工作时钟选择<br>00: PCLKB01: PCLKB2 (PCLKB2分频) 10: PCLKB4 (PCLKB4分频) 11: 禁止设置 | R/W |
| 7:6 | CTSUMD[1:0]  | CTSUS测量模式选择<br>00: 自电容单扫描模式01: 自电容多扫描模式10: 禁止设置11: 互电容全扫描模式                  | R/W |

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCR1寄存器。

**CTSUPON位 (CTSUS电源使能)**

CTSUPON位控制CTSUS的电源。将CTSUPON和CTSUCSW位设置为相同的值。

**CTSUCSW位 (CTSUS LPF电容充电控制)**

CTSUCSW位通过打开或关闭电容开关来控制连接到TSCAP引脚的LPF电容的充电。电容开关打开后, 通过设置CTSUCR0.CTSUSTRT为1, 等到连接到TSCAP引脚的电容充电指定时间后开始测量。开始测量之前, 使用IO端口输出低电平到TSCAP引脚, 并对现有的LPF电容进行放电。将CTSUPON和CTSUCSW位设置为相同的值。

**CTSUTUNE1位 (CTSUS电源容量调整)**

CTSUTUNE1位设置CTSUS电源的容量。通常, 将此位设置为0。

**CTSUCLK[1:0] bits (CTSU Operating Clock Select)**

The CTSUCLK[1:0] bits select the operating clock.

**CTSUMD[1:0] bits (CTSU Measurement Mode Select)**

The CTSUMD[1:0] bits set the measurement mode. For details, see [section 40.3.2. Measurement Modes](#).

**40.2.3 CTSUSDPRS : CTSU Synchronous Noise Reduction Setting Register**

Base address: CTSU = 0x400D\_0000

Offset address: 0x02

|                    |   |           |                 |                  |   |   |   |   |
|--------------------|---|-----------|-----------------|------------------|---|---|---|---|
| Bit position:      | 7 | 6         | 5               | 4                | 3 | 2 | 1 | 0 |
| Bit field:         | — | CTSU SOFF | CTSUPRMODE[1:0] | CTSUPRRATIO[3:0] |   |   |   |   |
| Value after reset: | 0 | 0         | 0               | 0                | 0 | 0 | 0 | 0 |

| Bit | Symbol           | Function  | R/W |
|-----|------------------|---|-----|
| 3:0 | CTSUPRRATIO[3:0] | CTSU Measurement Time and Pulse Count Adjustment<br>These bits set the measurement time and the measurement pulse count setting.<br>Recommended setting: 3 (0011b)                        | R/W |
| 5:4 | CTSUPRMODE[1:0]  | CTSU Base Period and Pulse Count Setting<br>These bits set the base pulse count.<br>0 0: 510 pulses<br>0 1: 126 pulses<br>1 0: 62 pulses (recommended setting)<br>1 1: Setting prohibited | R/W |
| 6   | CTSUSOFF         | CTSU High-Pass Noise Reduction Function Off Setting<br>This bit turns spectrum diffusion on or off to reduce high-pass noise.<br>0: Turn on<br>1: Turn off                                | R/W |
| 7   | —                | This bit is read as 0. The write value should be 0.   | R/W |

Only set the CTSUSDPRS register when the CTSUCR0.CTSUSTRT bit is 0.

**CTSUPRRATIO[3:0] bits (CTSU Measurement Time and Pulse Count Adjustment)**

The CTSUPRRATIO[3:0] bits are used to determine the measurement time and the measurement pulse count. These values are calculated using the following formulas, where the base pulse count is determined by the CTSUPRMODE[1:0] setting:

Measurement pulse count = base pulse count × (CTSUPRRATIO[3:0] bits + 1)

Measurement time = (base pulse count × (CTSUPRRATIO[3:0] bits + 1) + (base pulse count - 2) × 0.25) × base clock cycle

Note: For details on the base clock cycle, see [section 40.2.17. CTSUSO1 : CTSU Sensor Offset Register 1](#).

**CTSUPRMODE[1:0] bits (CTSU Base Period and Pulse Count Setting)**

The CTSUPRMODE[1:0] bits select the number of base pulses that occur during measurement.

**CTSUSOFF bit (CTSU High-Pass Noise Reduction Function Off Setting)**

The CTSUSOFF bit turns on or off the function for reducing high-pass noise. Set this bit to 1 to turn the function off.

**CTSUCLK[1:0]位 (CTSU工作时钟选择)**

CTSUCLK[1:0]位选择工作时钟。

**CTSUMD[1:0]位 (CTSU测量模式选择)**

CTSUMD[1:0]位设置测量模式。有关详细信息，请参阅第40.3.2节。测量模式。

**40.2.3 CTSUSDPRS:CTSU同步降噪设置寄存器**

Base address: CTSU = 0x400D\_0000

Offset address: 0x02

|               |   |           |                 |                  |   |   |   |   |
|---------------|---|-----------|-----------------|------------------|---|---|---|---|
| Bit position: | 7 | 6         | 5               | 4                | 3 | 2 | 1 | 0 |
| Bit field:    | — | CTSU SOFF | CTSUPRMODE[1:0] | CTSUPRRATIO[3:0] |   |   |   |   |
| 重置后的值:        | 0 | 0         | 0               | 0                | 0 | 0 | 0 | 0 |

| Bit | Symbol           | Function   | R/W |
|-----|------------------|--|-----|
| 3:0 | CTSUPRRATIO[3:0] | CTSU测量时间和脉冲计数调整<br>这些位设置测量时间和测量脉冲计数设置。<br>Recommended setting: 3 (0011b)         | R/W |
| 5:4 | CTSUPRMODE[1:0]  | CTSU基本周期和脉冲计数设置<br>这些位设置基本脉冲计数。<br>00: 510脉冲01: 126脉冲10: 62脉冲<br>(推荐设置) 11: 禁止设置 | R/W |
| 6   | CTSUSOFF         | CTSU高通降噪功能关闭设置<br>该位打开或关闭频谱扩散以减少高通噪声。<br>0: 开启1<br>: 关闭                          | R/W |
| 7   | —                | 该位读取为0。写入值应为0。   | R/W |

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSDPRS寄存器。

**CTSUPRRATIO[3:0]位 (CTSU测量时间和脉冲计数调整)**

CTSUPRRATIO[3:0]位用于确定测量时间和测量脉冲计数。这些值使用以下公式计算，其中基本脉冲计数由CTSUPRMODE[1:0]设置确定：

测量脉冲计数=基本脉冲计数×CTSUPRRATIO[3:0]位+1 )

测量时间=基本脉冲计数×CTSUPRRATIO[3:0]位+1+基本脉冲计数-2×0.25×基本时钟周期 )

Note: 有关基本时钟周期的详细信息，请参阅第40.2.17节。CTSUSO1: CTSU传感器偏移寄存器1。

**CTSUPRMODE[1:0]位 (CTSU基本周期和脉冲计数设置)**

CTSUPRMODE[1:0]位选择测量期间出现的基本脉冲数。

**CTSUSOFF位 (CTSU高通降噪功能关闭设置)**

CTSUSOFF位打开或关闭降低高通噪声的功能。将此位设置为1可关闭该功能。

## 40.2.4 CTSUSST : CTSU Sensor Stabilization Wait Control Register

Base address: CTSU = 0x400D\_0000

Offset address: 0x03

| Bit | Symbol       | Function   | R/W |
|-----|--------------|--|-----|
| 7:0 | CTSUSST[7:0] | CTSUSST Sensor Stabilization Wait Control<br>Fix the value of these bits to 00010000b. | R/W |

Only set the CTSUSST register when the CTSUCR0.CTSUSTRT bit is 0.

**CTSUSST[7:0] bits (CTSUSST Sensor Stabilization Wait Control)**

The CTSUSST[7:0] bits set the stabilization wait time for the TSCAP pin voltage. Always fix these bits to 00010000b. If these bits are not set, the TSCAP voltage will be unstable at the start of measurement, and the CTSU will be unable to obtain correct touch measurement results.

## 40.2.5 CTSUMCH0 : CTSU Measurement Channel Register 0

Base address: CTSU = 0x400D\_0000

Offset address: 0x04

| Bit | Symbol        | Function   | R/W              |
|-----|---------------|--|------------------|
| 4:0 | CTSHMCH0[4:0] | CTSUSST Measurement Channel 0<br>In self-capacitance single scan mode, these bits set the channel to be measured. Other than when specified, starting measurement operation by setting CTSUCR0.CTSUSTRT to 1 is prohibited after these bits are set. In other measurement modes, these bits indicate the channel that is currently being measured.<br><br>0x00: TS00<br>0x01: TS01<br>⋮<br>0x12: TS18<br>0x13: TS19<br>0x1F: Measurement is being stopped. (Except in self-capacitance single scan mode) | R/W <sup>1</sup> |
| 7:5 | —             | These bits are read as 0. The write value should be 0.   | R/W              |

Note 1. Writing to these bits is only enabled in self-capacitance single scan mode (CTSUCR1.CTSUMD[1:0] bits = 00b).

Only set the CTSUMCH0 register when the CTSUCR0.CTSUSTRT bit is 0.

**CTSHMCH0[4:0] bits (CTSUSST Measurement Channel 0)**

In self-capacitance single scan mode, the CTSHMCH0[4:0] bits set the channel to be measured. In this mode, only specify enabled channels (TS00 to TS19). In other modes, these indicate the receive channel that is being measured, and writing to these bits has no effect.

## 40.2.4 CTSUSST:CTSUSST传感器稳定等待控制寄存器

Base address: CTSU = 0x400D\_0000

Offset address: 0x03

| Bit | Symbol       | Function                            | R/W |
|-----|--------------|-------------------------------------|-----|
| 7:0 | CTSUSST[7:0] | CTSUSST传感器稳定等待控制将这些位的值固定为00010000b。 | R/W |

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSST寄存器。

**CTSUSST[7:0]位 (CTSUSST传感器稳定等待控制)**

CTSUSST[7:0]位设置TSCAP引脚电压的稳定等待时间。始终将这些位固定为00010000b。如果未设置这些位，TSCAP电压将在测量开始时不稳定，CTSUSST将无法获得正确的触摸测量结果。

## 40.2.5 CTSUCH0:CTSUSST测量通道寄存器0

Base address: CTSU = 0x400D\_0000

Offset address: 0x04

| Bit | Symbol        | Function   | R/W              |
|-----|---------------|--|------------------|
| 4:0 | CTSHMCH0[4:0] | CTSUSST测量通道0<br>在自电容单次扫描模式下，这些位设置要测量的通道。除指定时，通过设置开始测量操作设置这些位后，禁止CTSUCR0.CTSUSTRT为1。在其他测量模式下，这些位指示当前正在测量的通道。<br><br>0x00: TS00<br>0x01: TS01<br>⋮<br>0x12: TS18<br>0x13: TS19<br>0x1F: 测量正在停止。(自电容单次扫描模式除外) | R/W <sup>1</sup> |
| 7:5 | —             | 这些位被读取为0。写入值应为0。   | R/W              |

注1.写入这些位仅在自电容单次扫描模式下启用 (CTSUCR1.CTSUMD[1:0]位=00b)。

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSST寄存器。

**CTSHMCH0[4:0]位 (CTSUSST测量通道0)**

在自电容单次扫描模式下，CTSHMCH0[4:0]位设置要测量的通道。在此模式下，仅指定启用的通道 (TS00到TS19)。在其他模式下，这些表示正在测量的接收通道，写入这些位无效。

## 40.2.6 CTSUMCH1 : CTSU Measurement Channel Register 1

Base address: CTSU = 0x400D\_0000

Offset address: 0x05

| Bit | Symbol        | Function  | R/W |
|-----|---------------|---|-----|
| 4:0 | CTSUMCH1[4:0] | CTSUS Measurement Channel 1<br>0x00: TS00<br>0x01: TS01<br>⋮<br>0x12: TS18<br>0x13: TS19<br>0x1F: Measurement is being stopped. | R   |
| 7:5 | —             | These bits are read as 0.   | R   |

**CTSUSMCH1[4:0] bits (CTSUS Measurement Channel 1)**

In full scan mode, the CTSUSMCH1[4:0] bits indicate the transmit channel that is being measured. They are always 0x1F when measurement is stopped, or in self-capacitance single scan and multi-scan modes.

## 40.2.7 CTSUCHAC0 : CTSUS Channel Enable Control Register 0

Base address: CTSU = 0x400D\_0000

Offset address: 0x06

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 7:0 | CTSUCHAC0[7:0] | CTSUS Channel Enable Control 0<br>These bits select whether the associated TS pin is measured. bit0 is associated with TS00 and bit7 with TS07.<br>0: Do not measure<br>1: Measure | R/W |

Only set the CTSUCHAC0 register when the CTSUCR0.CTUSUSTR bit is 0.

**CTSUCHAC0[7:0] bits (CTSUS Channel Enable Control 0)**

The CTSUCHAC0[7:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured.

## 40.2.6 CTSUCH1 : CTSUS测量通道寄存器1

Base address: CTSU = 0x400D\_0000

Offset address: 0x05

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 4:0 | CTSUSMCH1[4:0] | CTSUS测量通道1<br>0x00: TS00<br>0x01: TS01<br>⋮<br>0x12: TS18<br>0x13: TS19<br>0x1F: 测量正在停止。 | R   |
| 7:5 | —              | 这些位读为0。  | R   |

**CTSUSCH1[4:0]位 (CTSUS测量通道1)**

在全扫描模式下, CTSUSMCH1[4:0]位指示正在测量的发送通道。停止测量时, 或在自电容单次扫描和多次扫描模式下, 它们始终为0x1F。

## 40.2.7 CTSUCHAC0 : CTSUS通道使能控制寄存器0

Base address: CTSU = 0x400D\_0000

Offset address: 0x06

| Bit | Symbol         | Function  | R/W |
|-----|----------------|---|-----|
| 7:0 | CTSUCHAC0[7:0] | CTSUS通道使能控制0<br>这些位选择是否测量相关的TS引脚。bit0与TS00相关联, 而bit7与TS07相关联。<br>0: 不测量 1: 测量 | R/W |

仅当CTSUCR0.CTUSUSTR位为0时设置CTSUCHAC0寄存器。

**CTSUCHAC0[7:0]位 (CTSUS通道使能控制0)**

CTSUCHAC0[7:0]位选择要测量其静电电容的接收和发送引脚。

## 40.2.8 CTSUCHAC1 : CTSU Channel Enable Control Register 1

Base address: CTSU = 0x400D\_0000

Offset address: 0x07

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 7:0 | CTSUCHAC1[7:0] | CTSUS Channel Enable Control 1<br>These bits select whether the associated TS pin is measured. bit0 is associated with TS08 and bit7 with TS15.<br>0: Do not measure<br>1: Measure | R/W |

Only set the CTSUCHAC1 register when the CTSUCR0.CTSUSTRT bit is 0.

**CTSUCHAC1[7:0] bits (CTSUS Channel Enable Control 1)**

The CTSUCHAC1[7:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured.

## 40.2.9 CTSUCHAC2 : CTSUS Channel Enable Control Register 2

Base address: CTSU = 0x400D\_0000

Offset address: 0x08

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 3:0 | CTSUCHAC2[3:0] | CTSUS Channel Enable Control 2<br>These bits select whether the associated TS pin is measured. bit0 is associated with TS16 and bit3 with TS19.<br>0: Do not measure<br>1: Measure | R/W |
| 7:4 | —              | These bits are read as 0. The write value should be 0.   | R/W |

Only set the CTSUCHAC2 register when the CTSUCR0.CTSUSTRT bit = 0.

**CTSUCHAC2[3:0] bits (CTSUS Channel Enable Control 2)**

The CTSUCHAC2[3:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured.

## 40.2.10 CTSUCHTRC0 : CTSUS Channel Transmit/Receive Control Register 0

Base address: CTSU = 0x400D\_0000

Offset address: 0x0B

## 40.2.8 CTSUCHAC1: CTSUS通道使能控制寄存器1

Base address: CTSU = 0x400D\_0000

Offset address: 0x07

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 7:0 | CTSUCHAC1[7:0] | CTSUS通道使能控制1<br>这些位选择是否测量相关的TS引脚。bit0与TS08相关联，而bit7与TS15相关联。<br>0: 不测量 1: 测量 | R/W |

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHAC1寄存器。

**CTSUCHAC1[7:0]位 (CTSUS通道使能控制1)**

CTSUCHAC1[7:0]位选择要测量其静电电容的接收和发送引脚。

## 40.2.9 CTSUCHAC2: CTSUS通道使能控制寄存器2

Base address: CTSU = 0x400D\_0000

Offset address: 0x08

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 3:0 | CTSUCHAC2[3:0] | CTSUS通道启用控制2<br>这些位选择是否测量相关的TS引脚。bit0与TS16相关联，而bit3与TS19相关联。<br>0: 不测量 1: 测量 | R/W |
| 7:4 | —              | 这些位被读取为0。写入值应为0。   | R/W |

仅当CTSUCR0.CTSUSTRT位=0时设置CTSUCHAC2寄存器。

**CTSUCHAC2[3:0]位 (CTSUS通道使能控制2)**

CTSUCHAC2[3:0]位选择要测量其静电电容的接收和发送引脚。

## 40.2.10 CTSUCHTRC0: CTSUS通道发送接收控制寄存器0

Base address: CTSU = 0x400D\_0000

Offset address: 0x0B

| Bit | Symbol          | Function  | R/W |
|-----|-----------------|---|-----|
| 7:0 | CTSUCHTRC0[7:0] | CTSUS Channel Transmit/Receive Control 0<br>bit0 is associated with TS00 and bit7 with TS07.<br>0: Reception<br>1: Transmission | R/W |

Only set the CTSUCHTRC0 register when the CTSUCR0.CTSUSTRT bit is 0.

#### CTSUCHTRC0[7:0] bits (CTSUS Channel Transmit/Receive Control 0)

In full scan mode, the CTSUCHTRC0[7:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multi-scan modes.

#### 40.2.11 CTSUCHTRC1 : CTSUS Channel Transmit/Receive Control Register 1

Base address: CTSUS = 0x400D\_0000

Offset address: 0x0C

| Bit | Symbol          | Function  | R/W |
|-----|-----------------|---|-----|
| 7:0 | CTSUCHTRC1[7:0] | CTSUS Channel Transmit/Receive Control 1<br>bit0 is associated with TS08 and bit7 with TS15.<br>0: Reception<br>1: Transmission | R/W |

Only set the CTSUCHTRC1 register when the CTSUCR0.CTSUSTRT bit is 0.

#### CTSUCHTRC1[7:0] bits (CTSUS Channel Transmit/Receive Control 1)

In full scan mode, the CTSUCHTRC1[7:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multiscan modes.

#### 40.2.12 CTSUCHTRC2 : CTSUS Channel Transmit/Receive Control Register 2

Base address: CTSUS = 0x400D\_0000

Offset address: 0x0D

| Bit | Symbol          | Function  | R/W |
|-----|-----------------|---|-----|
| 3:0 | CTSUCHTRC2[3:0] | CTSUS Channel Transmit/Receive Control 2<br>bit0 is associated with TS16 and bit3 with TS19.<br>0: Reception<br>1: Transmission | R/W |
| 7:4 | —               | These bits are read as 0. The write value should be 0.  | R/W |

Only set the CTSUCHTRC2 register when the CTSUCR0.CTSUSTRT bit is 0.

#### CTSUCHTRC2[3:0] bits (CTSUS Channel Transmit/Receive Control 2)

In full scan mode, the CTSUCHTRC2[3:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multiscan modes.

| Bit | Symbol          | Function  | R/W |
|-----|-----------------|---|-----|
| 7:0 | CTSUCHTRC0[7:0] | CTSUS通道发送接收控制0位0与TS00相关联，位7与TS07相关联。<br>0: 接收 1: 发送 | R/W |

仅在CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC0寄存器。

#### CTSUCHTRC0[7:0]位 (CTSUS通道发送接收控制0)

在全扫描模式下，CTSUCHTRC0[7:0]位将接收或发送分配给相关的TS引脚。在自电容单次扫描和多次扫描模式下，该设置被忽略。

#### 40.2.11 CTSUCHTRC1: CTSUS通道发送接收控制寄存器1

Base address: CTSUS = 0x400D\_0000

Offset address: 0x0C

| Bit | Symbol          | Function  | R/W |
|-----|-----------------|---|-----|
| 7:0 | CTSUCHTRC1[7:0] | CTSUS通道发送接收控制1位0与TS08相关联，位7与TS15相关联。<br>0: 接收 1: 发送 | R/W |

仅在CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC1寄存器。

#### CTSUCHTRC1[7:0]位 (CTSUS通道发送接收控制1)

在全扫描模式下，CTSUCHTRC1[7:0]位将接收或发送分配给相关的TS引脚。在自电容单扫描和多扫描模式下，该设置被忽略。

#### 40.2.12 CTSUCHTRC2: CTSUS通道发送接收控制寄存器2

Base address: CTSUS = 0x400D\_0000

Offset address: 0x0D

| Bit | Symbol          | Function  | R/W |
|-----|-----------------|---|-----|
| 3:0 | CTSUCHTRC2[3:0] | CTSUS通道发送接收控制2位0与TS16相关联，位3与TS19相关联。<br>0: 接收 1: 发送 | R/W |
| 7:4 | —               | 这些位被读取为0。写入值应为0。                                    | R/W |

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC2寄存器。

#### CTSUCHTRC2[3:0]位 (CTSUS通道发送接收控制2)

在全扫描模式下，CTSUCHTRC2[3:0]位将接收或发送分配给相关的TS引脚。在自电容单扫描和多扫描模式下，该设置被忽略。

## 40.2.13 CTSUDCLKC : CTSU High-Pass Noise Reduction Control Register

Base address: CTSU = 0x400D\_0000

Offset address: 0x10

|                    |   |   |                |   |   |   |                |   |
|--------------------|---|---|----------------|---|---|---|----------------|---|
| Bit position:      | 7 | 6 | 5              | 4 | 3 | 2 | 1              | 0 |
| Bit field:         | — | — | CTSUSSCNT[1:0] | — | — | — | CTSUSSMOD[1:0] | — |
| Value after reset: | 0 | 0 | 0              | 0 | 0 | 0 | 0              | 0 |

| Bit | Symbol         | Function  | R/W |
|-----|----------------|---|-----|
| 1:0 | CTSUSSMOD[1:0] | CTSU Diffusion Clock Mode Select<br>Set these bits to 00b.  | R/W |
| 3:2 | —              | These bits are read as 0. The write value should be 0.      | R/W |
| 5:4 | CTSUSSCNT[1:0] | CTSU Diffusion Clock Mode Control<br>Set these bits to 11b. | R/W |
| 7:6 | —              | These bits are read as 0. The write value should be 0.      | R/W |

Only set the CTSUDCLKC register when the CTSUCR0.CTSUSTRT bit is 0.

**CTSUSSMOD[1:0] bits (CTSU Diffusion Clock Mode Select)**

The CTSUSSMOD[1:0] bits set the mode of the spectrum diffusion clock for high-pass noise reduction. When using the high-pass function, always fix these bits to 00b. If these bits are not set, the CTSU will be unable to effectively reduce high-pass noise.

**CTSUSSCNT[1:0] bits (CTSU Diffusion Clock Mode Control)**

The CTSUSSCNT[1:0] bits adjust the amount of spectrum diffusion applied to reduce high-pass noise. When using the high-pass noise reduction function, always fix these bits to 11b. If these bits are not set, touch measurement might be performed incorrectly.

## 40.2.14 CTSUST : CTSU Status Register

Base address: CTSU = 0x400D\_0000

Offset address: 0x11

|                    |         |           |           |           |   |   |              |   |
|--------------------|---------|-----------|-----------|-----------|---|---|--------------|---|

## 40.2.13 CTSUDCLKC:CTSU高通降噪控制寄存器

Base address: CTSU = 0x400D\_0000

Offset address: 0x10

|               |   |   |                |   |   |   |                |   |
|---------------|---|---|----------------|---|---|---|----------------|---|
| Bit position: | 7 | 6 | 5              | 4 | 3 | 2 | 1              | 0 |
| Bit field:    | — | — | CTSUSSCNT[1:0] | — | — | — | CTSUSSMOD[1:0] | — |
| 重置后的值:        | 0 | 0 | 0              | 0 | 0 | 0 | 0              | 0 |

| Bit | Symbol         | Function                    | R/W |
|-----|----------------|-----------------------------|-----|
| 1:0 | CTSUSSMOD[1:0] | CTSU扩散时钟模式选择<br>将这些位设置为00b。 | R/W |
| 3:2 | —              | 这些位被读取为0。写入值应为0。            | R/W |
| 5:4 | CTSUSSCNT[1:0] | CTSU扩散时钟模式控制<br>将这些位设置为11b。 | R/W |
| 7:6 | —              | 这些位被读取为0。写入值应为0。            | R/W |

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUDCLKC寄存器。

**CTSUSSMOD[1:0]位 (CTSU扩散时钟模式选择)**

CTSUSSMOD[1:0]位设置频谱扩散时钟的模式以降低高通噪声。使用高通功能时，请始终将这些位固定为00b。如果未设置这些位，CTSU将无法有效降低高通噪声。

**CTSUSSCNT[1:0]位 (CTSU扩散时钟模式控制)**

CTSUSSCNT[1:0]位调整应用的频谱扩散量以减少高通噪声。使用高通降噪功能时，请始终将这些位固定为11b。如果未设置这些位，则可能会错误地执行触摸测量。

## 40.2.14 CTSUST:CTSU状态寄存器

Base address: CTSU = 0x400D\_0000

Offset address: 0x11

|               |         |           |           |           |   |   |              |   |
|---------------|---------|-----------|-----------|-----------|---|---|--------------|---|
| Bit position: | 7       | 6         | 5         | 4         | 3 | 2 | 1            | 0 |
| Bit field:    | CTSU PS | CTSU ROVF | CTSU SOVF | CTSU DTSR | — | — | CTSUSTC[2:0] | — |

| Bit | Symbol       | Function   | R/W |
|-----|--------------|--|-----|
| 2:0 | CTSUSTC[2:0] | CTSU测量状态计数器<br>这些计数器指示当前的测量状态。<br>0 0 0: Status 0<br>0 0 1: Status 1<br>0 1 0: Status 2<br>0 1 1: Status 3<br>1 0 0: Status 4<br>1 0 1: Status 5 | R   |
| 3   | —            | 该位读取为0。写入值应为0。   | R/W |
| 4   | CTSUDTSR     | CTSU数据传输状态标志<br>该标志指示存储在传感器计数器和参考计数器中的测量结果是否被读取。<br>0: 读取1:<br>未读取   | R   |

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 5   | CTSUSOVF | CTSU Sensor Counter Overflow Flag<br>This flag indicates an overflow on the sensor counter.<br>0: No overflow occurred<br>1: Overflow occurred                           | R/W |
| 6   | CTSUROVF | CTSU Reference Counter Overflow Flag<br>This flag indicates an overflow on the reference counter.<br>0: No overflow occurred<br>1: Overflow occurred                     | R/W |
| 7   | CTSUPS   | CTSU Mutual Capacitance Status Flag<br>This flag indicates the measurement status in mutual capacitance full scan mode.<br>0: First measurement<br>1: Second measurement | R   |

When using the CTSUCR0.CTSUINIT bit to clear an overflow flag, make sure that the CTSUCR0.CTSUSTRT bit is 0.

#### CTSUSTC[2:0] flags (CTSU Measurement Status Counter)

The CTSUSTC[2:0] flags are a counter indicating the current measurement status. For details on each status, see [section 40.3.2.2. Status counter](#).

#### CTSUDTSR flag (CTSU Data Transfer Status Flag)

The CTSUDTSR flag indicates whether the measurement result stored in the sensor counter and the reference counter was read. The flag sets to 1 when measurement completes and 0 when the reference counter is read by software or the DTC. The flag can also be cleared using the CTSUCR0.CTSUINIT bit.

#### CTSUSOVF flag (CTSU Sensor Counter Overflow Flag)

The CTSUSOVF flag sets to 1 when the sensor counter, CTSUSC, overflows. On overflow, the counter value reads as 0xFFFF. Measurement processing continues for the specified period.

No interrupt occurs on an overflow. To determine the channel on which the overflow occurred, read the measurement result of each channel after measurement completes, signaled by a measurement end interrupt.

This flag is cleared when 0 is written after 1 is read by software. It can also be cleared using the CTSUCR0.CTSUINIT bit.

#### CTSUROVF flag (CTSU Reference Counter Overflow Flag)

The CTSUROVF flag sets to 1 when the reference counter, CTSURC, overflows. On overflow, the counter value reads as 0xFFFF. Measurement processing continues for the specified period.

No interrupt occurs on an overflow. To determine the channel on which the overflow occurred, read the measurement result of each channel after measurement completes, signaled by a measurement end interrupt.

This flag is cleared when 0 is written after 1 is read by software. It can also be cleared using the CTSUCR0.CTSUINIT bit.

#### CTSUPS flag (CTSU Mutual Capacitance Status Flag)

In mutual capacitance full scan mode, when CTSUCR1.CTSUMD[1:0] = 11b, the CTSUPS flag indicates whether the measurement is the first or second of two measurements for each channel. When measurement is stopped or in other measurement modes, this flag is always 0.

### 40.2.15 CTSUSSC : CTSU High-Pass Noise Reduction Spectrum Diffusion Control Register

Base address: CTSU = 0x400D\_0000

Offset address: 0x12

| Bit position:      | 15 | 14 | 13 | 12 | 11             | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|----|----|----|----|----------------|----|---|---|---|---|---|---|---|---|---|---|
| Bit field:         | —  | —  | —  | —  | CTSUSSDIV[3:0] |    |   |   | — | — | — | — | — | — | — | — |
| Value after reset: | 0  | 0  | 0  | 0  | 0              | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 5   | CTSUSOVF | CTSU传感器计数器溢出标志<br>该标志表示传感器计数器溢出。<br>0: 未发生溢出1: 发生溢出     | R/W |
| 6   | CTSUROVF | CTSU参考计数器溢出标志<br>该标志表示参考计数器溢出。<br>0: 未发生溢出1: 发生溢出       | R/W |
| 7   | CTSUPS   | CTSU互电容状态标志<br>该标志指示互电容全扫描模式下的测量状态。<br>0: 第一次测量1: 第二次测量 | R   |

使用CTSUCR0.CTSUINIT位清除溢出标志时，请确保CTSUCR0.CTSUSTRT位为0。

#### CTSUSTC[2:0]标志 (CTSU测量状态计数器)

CTSUSTC[2:0]标志是指示当前测量状态的计数器。有关每个状态的详细信息，请参阅第40.3.2.2节。状态计数器。

#### CTSUDTSR标志 (CTSU数据传输状态标志)

CTSUDTSR标志指示存储在传感器计数器和参考计数器中的测量结果是否被读取。当测量完成时，该标志设置为1，当软件或DTC读取参考计数器时，该标志设置为0。也可以使用CTSUCR0.CTSUINIT位清除该标志。

#### CTSUSOVF标志 (CTSU传感器计数器溢出标志)

当传感器计数器CTSUSC溢出时，CTSUSOVF标志设置为1。溢出时，计数器值读取为0xFFFF。测量处理持续指定的时间。

溢出时不发生中断。要确定发生溢出的通道，请在测量完成后读取每个通道的测量结果，由测量结束中断发出信号。

当软件读取1后写入0时清除该标志。它也可以使用CTSUCR0.CTSUINIT位清零。

#### CTSUROVF标志 (CTSU参考计数器溢出标志)

当参考计数器CTSURC溢出时，CTSUROVF标志设置为1。溢出时，计数器值读取为0xFFFF。测量处理持续指定的时间。

溢出时不发生中断。要确定发生溢出的通道，请在测量完成后读取每个通道的测量结果，由测量结束中断发出信号。

当软件读取1后写入0时清除该标志。它也可以使用CTSUCR0.CTSUINIT位清零。

#### CTSUPS标志 (CTSU互电容状态标志)

在互电容全扫描模式下，当CTSUCR1.CTSUMD[1:0]=11b时，CTSUPS标志指示测量是每个通道的两次测量中的第一个还是第二个。当测量停止或处于其他测量模式时，该标志始终为0。

### 40.2.15 CTSUSSC:CTSU高通降噪频谱扩散控制 Register

| 0.27 ≤ fb < 0.29 | 1110b             |
| fb < 0.27        | 1111b             |

**40.2.16 CTSUSO0: CTSU传感器偏移寄存器0**

Base address: CTSU = 0x400D\_0000

Offset address: 0x14

| Bit | Symbol      | Function  | R/W |
|-----|-------------|---|-----|
| 9:0 | CTSUSO[9:0] | CTSU传感器偏移调整<br>这些位在电极未被触摸时调整电子电容。<br>0x000: 当前偏移为0。0x001: 当前偏移为1。0x002: 当前偏移为2。<br>⋮<br>0x3FE: 当前偏移量为1022。0x3FF: 当前偏移量最大。 | R/W |

| Bit   | Symbol        | Function  | R/W |
|-------|---------------|---|-----|
| 15:10 | CTSUSNUM[5:0] | CTSUS Measurement Count Setting<br>These bits set the number of measurements. | R/W |

**CTSUSO[9:0] bits (CTSUS Sensor Offset Adjustment)**

The CTSUSO[9:0] bits offset the sensor ICO input current generated from electrostatic capacitance during touch measurement when the electrode is not being touched. This prevents the CTSUS sensor counter from overflowing. Set the TS pin that is to be measured next after a CTSUS\_CTSUWR interrupt occurs.

**CTSUSNUM[5:0] bits (CTSUS Measurement Count Setting)**

The CTSUSNUM[5:0] bits specify how many times the measurement pulse count specified in the CTSUSDPRS.CTSUPRRATIO[3:0] and CTSUSDPRS.CTSUPRMODE[1:0] bits is repeated during the measurement time. The measurement pulse count is repeated (CTSUSNUM[5:0] bits + 1) times. Set the TS pin that is to be measured next after a CTSUS\_CTSUWR interrupt is generated.

**40.2.17 CTSUSO1 : CTSUS Sensor Offset Register 1**

Base address: CTSUS = 0x400D\_0000

Offset address: 0x16

| Bit position:      | 15 | 14 | 13             | 12 | 11            | 10 | 9 | 8 | 7              | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|----|----|----------------|----|---------------|----|---|---|----------------|---|---|---|---|---|---|---|
| Bit field:         | —  |    | CTSUSICOG[1:0] |    | CTSUSDPA[4:0] |    |   |   | CTSURICOA[7:0] |   |   |   |   |   |   |   |
| Value after reset: | 0  | 0  | 0              | 0  | 0             | 0  | 0 | 0 | 0              | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol         | Function   | R/W |
|-----|----------------|--|-----|
| 7:0 | CTSURICOA[7:0] | CTSUS Reference ICO Current Adjustment<br>These bits adjust the input current of the reference ICO.<br>0x00: Current offset is 0<br>0x01: Current offset is 1<br>0x02: Current offset is 2<br>⋮<br>0xFE: Current offset is 254<br>0xFF: Current offset is maximum. | R/W |

| Bit   | Symbol        | Function                  | R/W |
|-------|---------------|---------------------------|-----|
| 15:10 | CTSUSNUM[5:0] | CTSUS测量计数设置<br>这些位设置测量次数。 | R/W |

**CTSUSO[9:0]位 (CTSUS传感器偏移调整)**

CTSUSO[9:0]位在电极未被触摸时在触摸测量期间抵消由静电电容产生的传感器ICO输入电流。这可以防止CTSUS传感器计数器溢出。在发生CTSUS\_CTSUWR中断后设置接下来要测量的TS引脚。

**CTSUSNUM[5:0]位 (CTSUS测量计数设置)**

CTSUSNUM[5:0]位指定测量脉冲计数的次数。CTSUSDPRS.CTSUPRRATIO[3:0]和CTSUSDPRS.CTSUPRMODE[1:0]位在测量期间重复。测量脉冲计数重复(CTSUSNUM[5:0]位+1)次。在产生CTSUS\_CTSUWR中断后设置接下来要测量的TS引脚。

**40.2.17 CTSUSO1: CTSUS传感器偏移寄存器1**

| 12:8  | CTSUSDPA[4:0] | CTSU Base Clock Setting<br>These bits are used to generate the base clock.<br>0x00: Operating clock divided by 2 <sup>1</sup><br>0x01: Operating clock divided by 4<br>0x02: Operating clock divided by 6<br>0x03: Operating clock divided by 8<br>0x04: Operating clock divided by 10<br>0x05: Operating clock divided by 12<br>0x06: Operating clock divided by 14<br>0x07: Operating clock divided by 16<br>0x08: Operating clock divided by 18<br>0x09: Operating clock divided by 20<br>0x0A: Operating clock divided by 22<br>0x0B: Operating clock divided by 24<br>0x0C: Operating clock divided by 26<br>0x0D: Operating clock divided by 28<br>0x0E: Operating clock divided by 30<br>0x0F: Operating clock divided by 32<br>0x10: Operating clock divided by 34<br>0x11: Operating clock divided by 36<br>0x12: Operating clock divided by 38<br>0x13: Operating clock divided by 40<br>0x14: Operating clock divided by 42<br>0x15: Operating clock divided by 44<br>0x16: Operating clock divided by 46<br>0x17: Operating clock divided by 48<br>0x18: Operating clock divided by 50<br>0x19: Operating clock divided by 52<br>0x1A: Operating clock divided by 54<br>0x1B: Operating clock divided by 56<br>0x1C: Operating clock divided by 58<br>0x1D: Operating clock divided by 60<br>0x1E: Operating clock divided by 62<br>0x1F: Operating clock divided by 64 | R/W |
| 14:13 | CTSUICOG[1:0] | CTSU ICO Gain Adjustment<br>These bits adjust the output frequency gain of the sensor ICO and the reference ICO.<br>0 0: 100% gain<br>0 1: 66% gain<br>1 0: 50% gain<br>1 1: 40% gain   | R/W |
| 15    | —             | This bit is read as 0. The write value should be 0.   | R/W |

Note 1. Do not set the CTSUSDPA[4:0] bits set to 00000b while the high-pass noise reduction function is turned off (CTSUSDPRS.CTUSOFF bit = 1) in mutual capacitance full scan mode (CTSUCR1.CTUMD[1:0] bits = 11b).

After a CTSU\_CTSUWR interrupt occurs, write first to the CTSUSSC register, next to the CTSUSO0 register, and then to the CTSUSO1 register. The write to the CTSUSO1 register causes a transition to Status 3. (See Table 40.7 and Table 40.8.) Set all of the bits in a single operation when writing to the CTSUSO1 register.

#### CTSURICOA[7:0] bits (CTSUS Reference ICO Current Adjustment)

The CTSURICOA[7:0] bits adjust the oscillation frequency using the input current of the reference ICO.

#### CTSUSDPA[4:0] bits (CTSUS Base Clock Setting)

The CTSUSDPA[4:0] bits select the base clock used as the source for the sensor drive pulse by dividing the operating clock. For details on the setting procedure, see section 40.3.2.1. Initial settings flow.

#### CTSUICOG[1:0] bits (CTSUS ICO Gain Adjustment)

The CTSUICOG[1:0] bits adjust the output frequency gain of the sensor ICO and the reference ICO. Normally, set these bits to 00b for the maximum gain. If changes in the capacitance between when the electrode is touched and when it is not touched greatly exceed the dynamic range of the sensor ICO, adjust the gain appropriately with this setting.

| Bit   | Symbol        | Function   | R/W |
|-------|---------------|--|-----|
| 12:8  | CTSUSDPA[4:0] | CTSU基本时钟设置<br>这些位用于生成基本时钟。<br>0x00: 工作时钟除以2+1<br>0x01: 工作时钟4分频0x02: 工作时钟6分频0x03: 工作时钟8分频0x04: 工作时钟10分频0x05: 工作时钟12分频0x06: 工作时钟14分频0x07: 工作时钟16分频0x08: 工作时钟除以180x09: 工作时钟除以200x0A: 工作时钟除以220x0B: 工作时钟除以240x0C: 工作时钟除以260x0D: 工作时钟除以280x0E: 工作时钟除以300x0F: 工作时钟32分频0x10: 工作时钟34分频0x11: 工作时钟36分频0x12: 工作时钟38分频0x13: 工作时钟40分频0x14: 工作时钟42分频0x15: 工作时钟44分频0x16: 工作时钟46分频0x17: 工作时钟48分频0x18: 工作时钟50分频0x19: 工作时钟52分频0x1A: 工作时钟54分频0x1B: 工作时钟56分频0x1C: 工作时钟分频by580x1D: 工作时钟除以600x1E: 工作时钟除以620x1F: 工作时钟除以64 | R/W |
| 14:13 | CTSUICOG[1:0] | CTSUICO增益调整<br>这些位调整传感器ICO和参考ICO的输出频率增益。<br>0 0: 100% gain<br>0 1: 66% gain<br>1 0: 50% gain<br>1 1: 40% gain  | R/W |
| 15    | —             | 该位读取为0。写入值应为0。   | R/W |

注1.关闭高通降噪功能时，请勿将CTSUSDPA[4:0]位设置为00000b (CTSUSDPRS.CTUSOFF位=1) 在互电容全扫描模式下 (CTSUCR1.CTUMD[1:0]位=11b)。

发生CTSUSO1寄存器中断后，先写入CTSUSSC寄存器，然后写入CTSUSO0寄存器，然后写入CTSUSO1寄存器。写入CTSUSO1寄存器会导致转换到状态3。（参见表40.7和表40.8。）在写入CTSUSO1寄存器时，在一次操作中设置所有位。

#### CTSURICOA[7:0]位 (CTSUS参考ICO电流调整)

CTSURICOA[7:0]位使用参考ICO的输入电流调整振荡频率。

#### CTSUSDPA[4:0]位 (CTSUS基本时钟设置)

CTSUSDPA[4:0]位通过对工作时钟进行分频来选择用作传感器驱动脉冲源的基本时钟。有关设置过程的详细信息，请参阅第40.3.2.1节。初始设置流程。

#### CTSUICOG[1:0]位 (CTSUSICO增益调整)

CTSUICOG[1:0]位调整传感器ICO和参考ICO的输出频率增益。通常，将这些位设置为00b以获得最大增益。如果触摸电极和未触摸电极之间的电容变化大大超过传感器ICO的动态范围，请使用此设置适当调整增益。

## 40.2.18 CTSUSC : CTSU Sensor Counter

Base address: CTSU = 0x400D\_0000

Offset address: 0x18

| Bit  | Symbol       | Function   | R/W |
|------|--------------|--|-----|
| 15:0 | CTSUSC[15:0] | CTSUSC Sensor Counter<br>These bits indicate the measurement result of the sensor ICO. They read 0xFFFF when an overflow occurs. | R   |

After a CTSU\_CTSURD interrupt occurs, read first from the CTSUSC counter and then from the CTSURC counter.

**CTSUSC[15:0] bits (CTSUSC Sensor Counter)**

The CTSUSC[15:0] bits are configured as an increment counter for the sensor ICO clock. Read these bits after a CTSU\_CTSURD interrupt occurs. After the CTSURC counter is read, these bits are cleared immediately before the CTSU measurement status counter value changes to Status 4 (the CTSUST.CTSUSTC[2:0] flags changes to 100b) in the next measurement. They can also be cleared using the CTSUCR0.CTSUINIT bit.

## 40.2.19 CTSURC : CTSU Reference Counter

Base address: CTSU = 0x400D\_0000

Offset address: 0x1A

| Bit  | Symbol       | Function  | R/W |
|------|--------------|---|-----|
| 15:0 | CTSURC[15:0] | CTSURC Reference Counter<br>These bits indicate the measurement result of the reference ICO. They read FFFFh when an overflow occurs. | R   |

After a CTSU\_CTSURD interrupt occurs, read first from the CTSUSC counter and then from the CTSURC counter.

Status 3 continues until the CTSURC counter is read, even if the stabilization time specified for Status 3 elapses.

**CTSURC[15:0] bits (CTSURC Reference Counter)**

The CTSURC[15:0] bits are configured as an increment counter for the reference ICO clock. The reference ICO optimizes touch measurement performed by the sensor ICO. There is some deviation depending on the internal sensor ICO and the reference ICO in the CTSU, but both ICOs have almost the same characteristics, including the dynamic range and the current-to-frequency characteristics. The range of current amount that can be set in the reference ICO current adjustment bits is about the same as the dynamic range of both ICOs, and the current amount input to the sensor ICO must be within this dynamic range. To ensure this, use the reference ICO to check the differences between the ICOs and measure the current-to-oscillation frequency characteristics. Because the reference ICO oscillation frequency can be obtained from the reference ICO counter, the ICO oscillation frequency (counter value/measurement time) for the input current amount can be measured by setting the value in the reference ICO current adjustment bits and measuring the reference ICO counter. The reference ICO counter value measured using the maximum value in the reference ICO current adjustment bits is the maximum value of the ICO dynamic range. The current to the sensor ICO must be offset in the offset adjustment bits so that the sensor ICO counter value does not exceed this value.

## 40.2.18 CTSUSC:CTSUSC传感器计数器

Base address: CTSU = 0x400D\_0000

Offset address: 0x18

| Bit  | Symbol       | Function  | R/W |
|------|--------------|---|-----|
| 15:0 | CTSUSC[15:0] | CTSUSC传感器计数器<br>这些位表示传感器ICO的测量结果。当发生溢出时，它们读取0xFFFF。 | R   |

发生CTSUSC\_CTSURD中断后，先从CTSUSC计数器读取，然后再从CTSURC计数器读取。

**CTSUSC[15:0]位 (CTSUSC传感器计数器)**

CTSUSC[15:0]位配置为传感器ICO时钟的增量计数器。后读取这些位 CTSU\_CTSURD中断发生。读取CTSURC计数器后，在下次测量中CTSUSC测量状态计数器值变为状态4 (CTSUST.CTSUSTC[2:0]标志变为100b) 之前，立即清除这些位。它们也可以使用CTSUCR0.CTSUINIT位清零。

## 40.2.19 CTSURC:CTSUSC参考计数器

Base address: CTSU = 0x400D\_0000

Offset address: 0x1A

| Bit  | Symbol       | Function  | R/W |
|------|--------------|---|-----|
| 15:0 | CTSURC[15:0] | CTSUSC参考计数器<br>这些位表示参考ICO的测量结果。它们在发生溢出时读取FFFFh。 | R   |

发生CTSUSC\_CTSURD中断后，先从CTSUSC计数器读取，然后再从CTSURC计数器读取。

状态3一直持续到读取CTSURC计数器为止，即使为状态3指定的稳定时间已过。

**CTSURC[15:0]位 (CTSUSC参考计数器)**

CTSURC[15:0]位配置为参考ICO时钟的增量计数器。参考ICO优化了传感器ICO执行的触摸测量。CTSUSC中的内部传感器ICO和参考ICO存在一些偏差，但两种ICO具有几乎相同的特性，包括动态范围和电流频率特性。参考ICO电流调整位可设置的电流范围与两个ICO的动态范围大致相同，输入到传感器ICO的电流必须在此动态范围内。为确保这一点，请使用参考ICO检查ICO之间的差异并测量电流-振荡频率特性。因为可以从参考ICO计数器获得参考ICO振荡频率，所以可以通过设置参考ICO电流调整位中的值并测量参考ICO计数器来测量输入电流的ICO振荡频率 (计数器值/测量时间)。使用参考ICO电流调整位中的最大值测量的参考ICO计数器值是ICO动态范围的最大值。传感器ICO的电流必须在偏移调整位中进行偏移，以使传感器ICO计数器值不超过此值。

Read the CTSURC[15:0] bits after a CTSU\_CTSURD interrupt occurs. After these bits are read, they are cleared immediately before the CTSU measurement status counter value changes to Status 4 (the CTSUST.CTSUSTC[2:0] flags changes to 100b) in the next measurement. They can also be cleared using the CTSUCR0.CTSUINIT bit.

#### 40.2.20 CTSUERRS : CTSU Error Status Register

Base address: CTSU = 0x400D\_0000

Offset address: 0x1C

|                    |               |    |    |    |    |    |   |   |               |   |   |   |              |               |               |   |
|--------------------|---------------|----|----|----|----|----|---|---|---------------|---|---|---|--------------|---------------|---------------|---|
| Bit position:      | 15            | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7             | 6 | 5 | 4 | 3            | 2             | 1             | 0 |
| Bit field:         | CTSUI<br>COMP | —  | —  | —  | —  | —  | — | — | CTSUS<br>TSOC | — | — | — | CTSUS<br>DRV | CTSUS<br>TSOD | CTSUSPMD[1:0] |   |
| Value after reset: | x             | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0             | 0 | 0 | 0 | 0            | 0             | 0             | 0 |

| Bit  | Symbol        | Function   | R/W |
|------|---------------|--|-----|
| 1:0  | CTSUSPMD[1:0] | Calibration Mode<br>0 0: Capacitance measurement mode<br>1 0: Calibration mode<br>Others: Setting prohibited | R/W |
| 2    | CTSUTSOD      | TS Pin Fixed Output<br>0: Capacitance measurement mode<br>1: TS pins are forced to be high or low            | R/W |
| 3    | CTSUDRV       | Calibration Setting 1<br>0: Capacitance measurement mode<br>1: Calibration setting 1                         | R/W |
| 6:4  | —             | These bits are read as 0. The write value should be 0.   | R/W |
| 7    | CTSUTSOC      | Calibration Setting 2<br>0: Capacitance measurement mode<br>1: Calibration setting 2                         | R/W |
| 14:8 | —             | These bits are read as 0. The write value should be 0.   | R/W |
| 15   | CTSUICOMP     | TSCAP Voltage Error Monitor<br>0: Normal TSCAP voltage<br>1: Abnormal TSCAP voltage                          | R   |

##### CTSUSPMD[1:0] bits (Calibration Mode)

The CTSUSPMD[1:0] bits are used to calibrate the CTSU. When measuring the capacitance, set these bits to 00b.

##### CTSUTSOD bit (TS Pin Fixed Output)

The CTSUTSOD bit is used to calibrate the CTSU. When setting this bit to 1, the TS pins are forced to the logic level specified by the CTSUCR0.CTSUIOC bit. When measuring the capacitance, set this bit to 0.

##### CTSUDRV bit (Calibration Setting 1)

The CTSUDRV bit is used to calibrate the CTSU. When measuring the capacitance, set this bit to 0.

##### CTSUTSOC bit (Calibration Setting 2)

The CTSUTSOC bit is used to calibrate the CTSU. When measuring capacitance, set this bit to 0.

##### CTSUICOMP bit (TSCAP Voltage Error Monitor)

If the offset current amount set in the CTSUSO1 register exceeds the sensor ICO input current during touch measurement, the TSCAP voltage becomes abnormal and touch measurement cannot be performed correctly. The CTSUICOMP bit monitors the TSCAP voltage and it sets to 1 if the voltage becomes abnormal.

If the TSCAP voltage becomes abnormal, the sensor ICO counter value becomes undefined, but touch measurement completes normally, so it is difficult to detect an abnormality by reading the sensor ICO counter value. If the CTSU reference ICO current adjustment bits (CTSURICOA[7:0]) in the CTSUSO1 register are set to any value other than 0, always check this bit when touch measurement completes.

在CTSUS\_CTSURD中断发生后读取CTSURC[15:0]位。读取这些位后，在CTSUS测量状态计数器值在下次测量中立即变为状态4（CTSUST.CTSUSTC[2:0]标志变为100b）之前将它们清零。它们也可以使用CTSUCR0.CTSUINIT位清零。

#### 40.2.20 CTSUERRS:CTSUS错误状态寄存器

Base address: CTSU = 0x400D\_0000

Offset address: 0x1C

|               |               |    |    |    |    |    |   |   |               |   |   |   |              |               |               |   |
|---------------|---------------|----|----|----|----|----|---|---|---------------|---|---|---|--------------|---------------|---------------|---|
| Bit position: | 15            | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7             | 6 | 5 | 4 | 3            | 2             | 1             | 0 |
| Bit field:    | CTSUI<br>COMP | —  | —  | —  | —  | —  | — | — | CTSUS<br>TSOC | — | — | — | CTSUS<br>DRV | CTSUS<br>TSOD | CTSUSPMD[1:0] |   |
| 重置后的值:        | x             | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0             | 0 | 0 | 0 | 0            | 0             | 0             | 0 |

| Bit  | Symbol        | Function   | R/W |
|------|---------------|--|-----|
| 1:0  | CTSUSPMD[1:0] | 校准模式<br>00: 电容测量模式10: 校准模式<br>Others: Setting prohibited | R/W |
| 2    | CTSUTSOD      | TS引脚固定输出<br>0: 电容测量模式1: TS引脚强制为高电平或低电平                   | R/W |
| 3    | CTSUDRV       | 校准设置1<br>0: 电容测量模式1: 校准设置1                               | R/W |
| 6:4  | —             | 这些位被读取为0。写入值应为0。   | R/W |
| 7    | CTSUTSOC      | 校准设置2<br>0: 电容测量模式1: 校准设置2                               | R/W |
| 14:8 | —             | 这些位被读取为0。写入值应为0。   | R/W |
| 15   | CTSUICOMP     | TSCAP电压错误监视器<br>0: 正常TSCAP电压1: 异常TSCAP电压                 | R   |

##### CTSUSPMD[1:0] bits (Calibration Mode)

CTSUSPMD[1:0]位用于校准CTSUS。测量电容时，将这些位设置为00b。

##### CTSUTSOD位 (TS引脚固定输出)

CTSUTSOD位用于校准CTSUS。将该位设置为1时，TS引脚被强制为CTSUCR0.CTSUIOC位指定的逻辑电平。测量电容时，将此位设置为0。

##### CTSUDRV位 (校准设置1)

CTSUDRV位用于校准CTSUS。测量电容时，将此位设置为0。

##### CTSUTSOC位 (校准设置2)

CTSUTSOC位用于校准CTSUS。测量电容时，将此位设置为0。

##### CTSUICOMP位 (TSCAP电压错误监视器)

如果CTSUSO1寄存器中设置的偏移电流量在触摸测量期间超过传感器ICO输入电流，则TSCAP电压会异常，无法正确执行触摸测量。CTSUICOMP位监控TSCAP电压，如果电压异常，它设置为1。

如果TSCAP电压异常，传感器ICO计数器值变得不确定，但触摸测量正常完成，因此很难通过读取传感器ICO计数器值来检测异常。如果CTSUSO1寄存器中的CTSUS参考ICO电流调整位(CTSURICOA[7:0])设置为0以外的任何值，则在触摸测量完成时始终检查该位。

This bit is cleared by writing 0 to the CTSUCR1.CTSUPON bit and turning off the power supply.

#### 40.2.21 CTSUTRMR : CTSU Reference Current Calibration Register

Base address: CTSU = 0x400D\_0000

Offset address: 0x20

The CTSUTRMR register stores a reference current value calibrated under the specified condition for each chip at factory shipment. When rewriting this register, set the CTSUERRS.CTSUSPMD[1:0] bits to 10b (calibration mode). When resetting the MCU, the values returns to the factory setting value. Do not rewrite this register when the CTSUSPMD[1:0] bits are 00b (capacitance measurement mode).

### 40.3 Operation

#### 40.3.1 Principles of Measurement Operation

Figure 40.4 shows the measurement circuit.

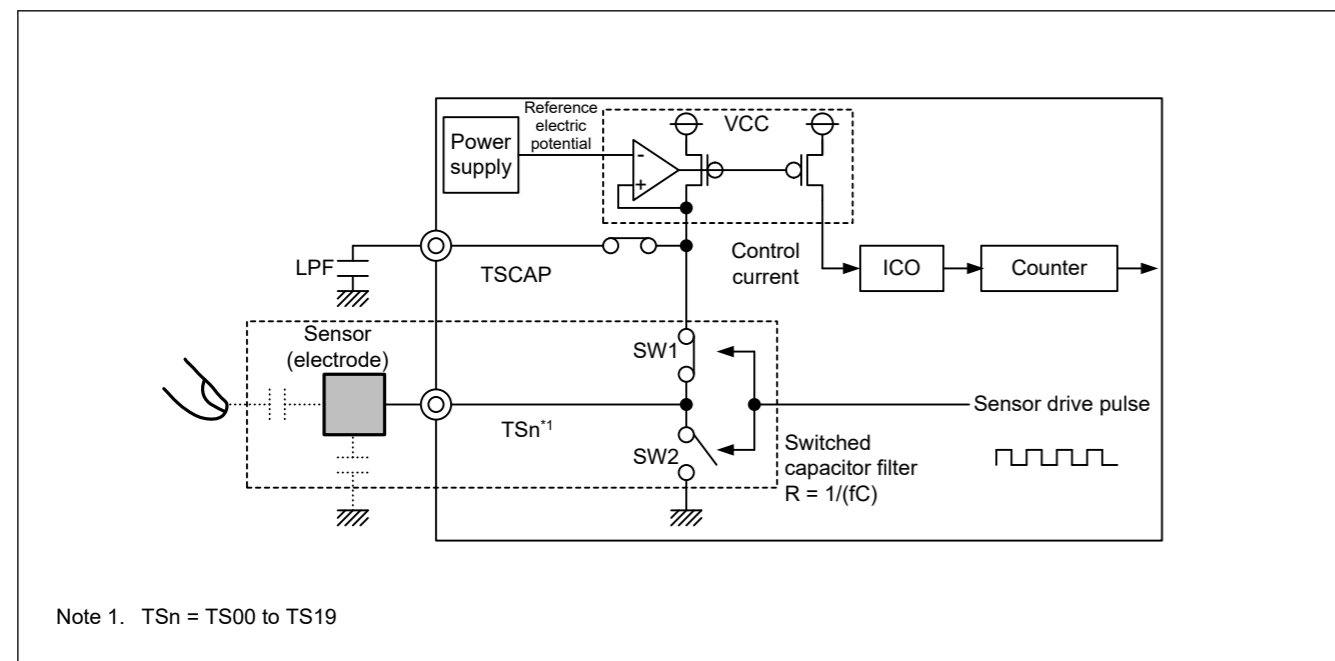

Figure 40.4 Measurement circuit

Figure 40.5 to Figure 40.7 explain the electrostatic capacitance measurement operation principles of the CTSU current frequency conversion. The operation is as follows:

1. The electrostatic capacitance of the electrode is charged by turning SW1 on and SW2 off (Figure 40.5).
2. The charged capacitance is discharged by turning SW1 off and SW2 on (Figure 40.6).
3. Current flows to the switched capacitor filter by switching between charging and discharging. At this point, if a finger is in close proximity, the capacitance and the flowing current change. A clock is generated by supplying the control current, which is proportional to the amount of current flowing through the switched capacitor filter, from the circuit that generates the TSCAP power supply to the ICO. The counter measures the clock frequency that changes depending on whether a finger is in close proximity. The software uses the value read from the counter to determine contact with a finger (Figure 40.7).

通过向CTSUCR1.CTSUPON位写入0并关闭电源来清除该位。

#### 40.2.21 CTSUTRMR:CTSUS参考电流校准寄存器

Base address: CTSU = 0x400D\_0000

Offset address: 0x20

CTSUTRMR电阻存储在出厂时为每个芯片在指定条件下校准的参考电流值。重写此寄存器时，将CTSUERRS.CTSUSPMD[1:0]位设置为10b（校准模式）。复位MCU时，数值恢复为出厂设置值。当CTSUSPMD[1:0]位为00b（电容测量模式）时，请勿重写此寄存器。

### 40.3 Operation

#### 40.3.1 测量操作原理

图40.4显示了测量电路。

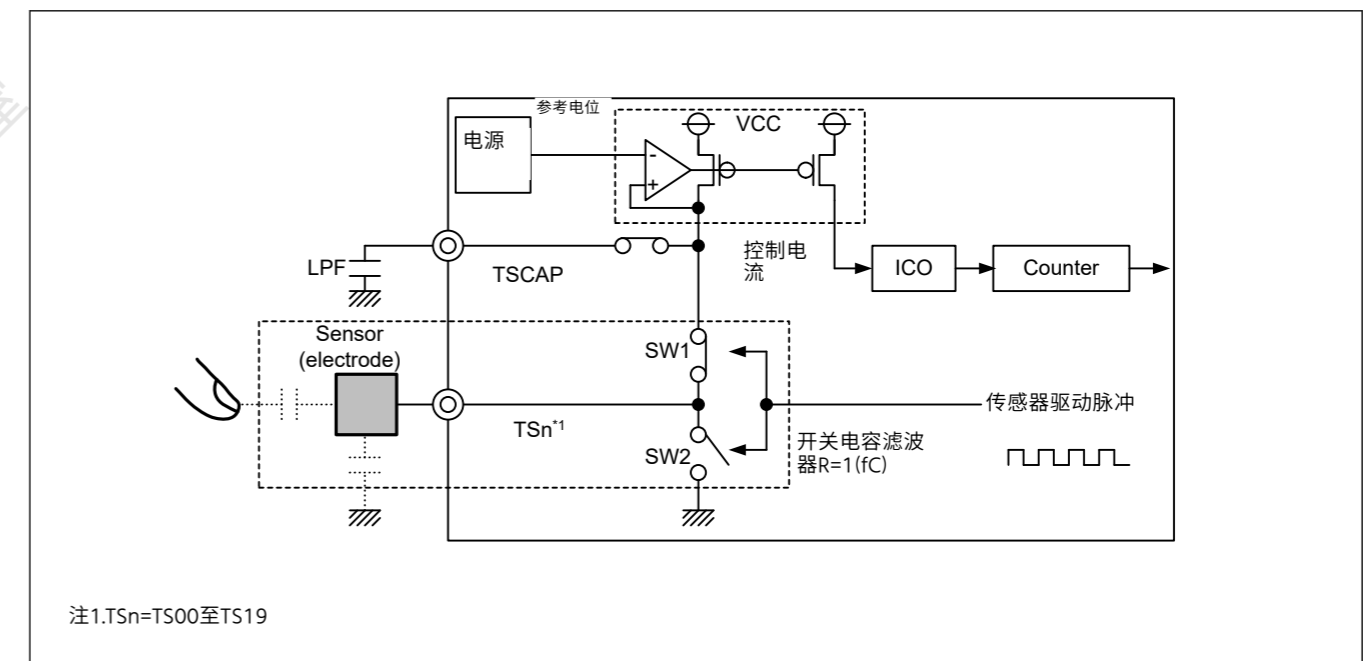

Figure 40.4 测量电路

图40.5至图40.7说明了CTSUS电流变频的静电电容测量操作原理。操作如下：

- 1.通过打开SW1和关闭SW2对电极的静电电容进行充电（图40.5）。
- 2.通过关闭SW1和打开SW2对充电的电容进行放电（图40.6）。
- 3.电流通过在充电和放电之间切换而流向开关电容滤波器。此时，如果手指靠近，则电容和流动电流会发生变化。通过从产生TSCAP电源的电路向ICO提供与流过开关电容滤波器的电流量成比例的控制电流来产生时钟。计数器测量时钟频率，该频率根据手指是否靠近而变化。软件使用从计数器读取的值来确定与手指的接触（图40.7）。

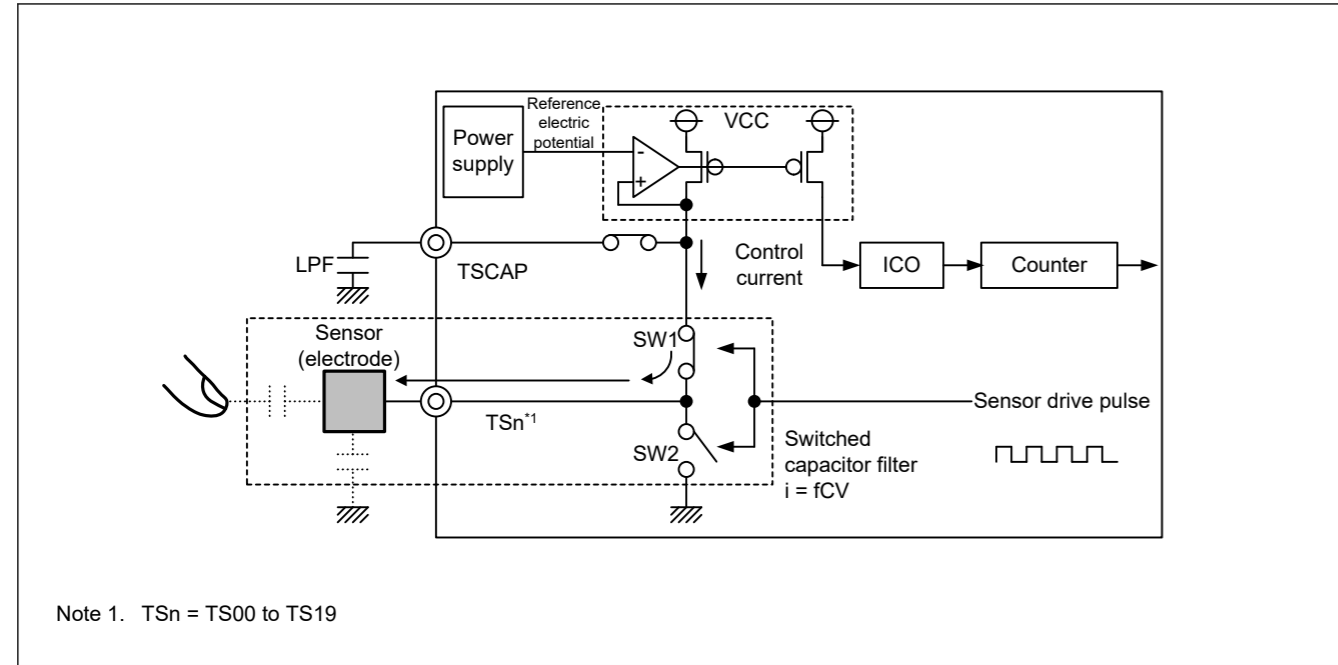

Figure 40.5 Charging operation

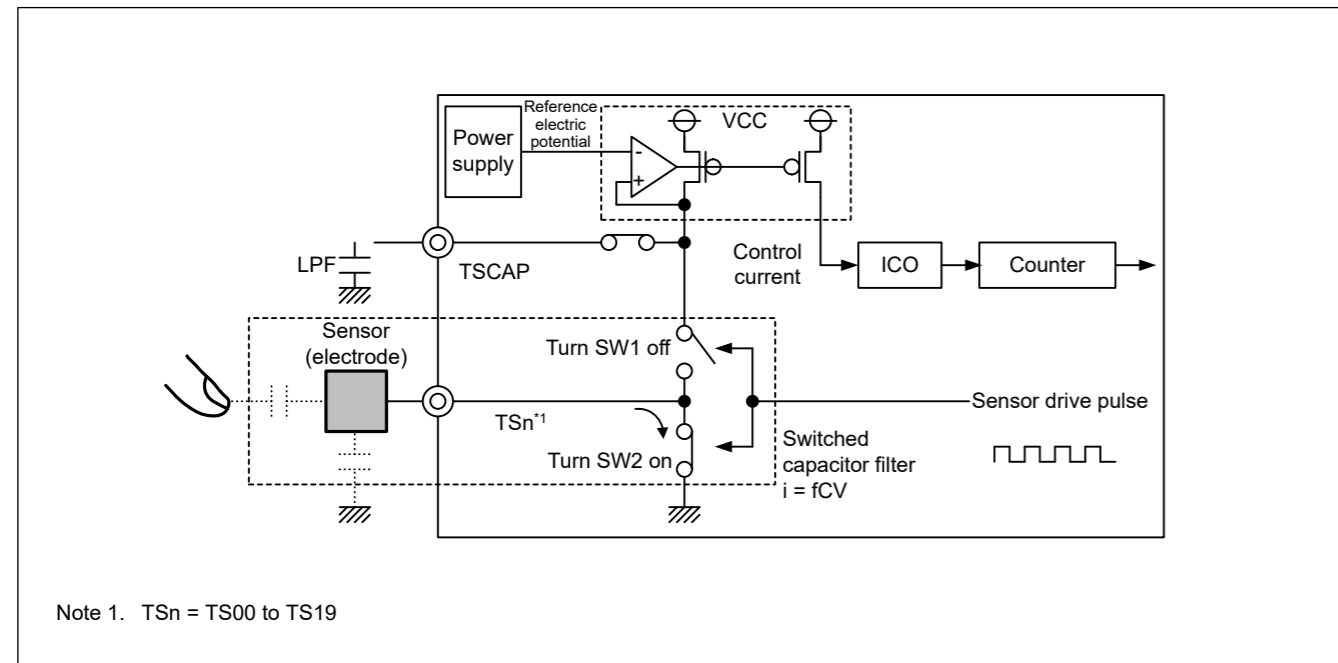

Figure 40.6 Discharging operation

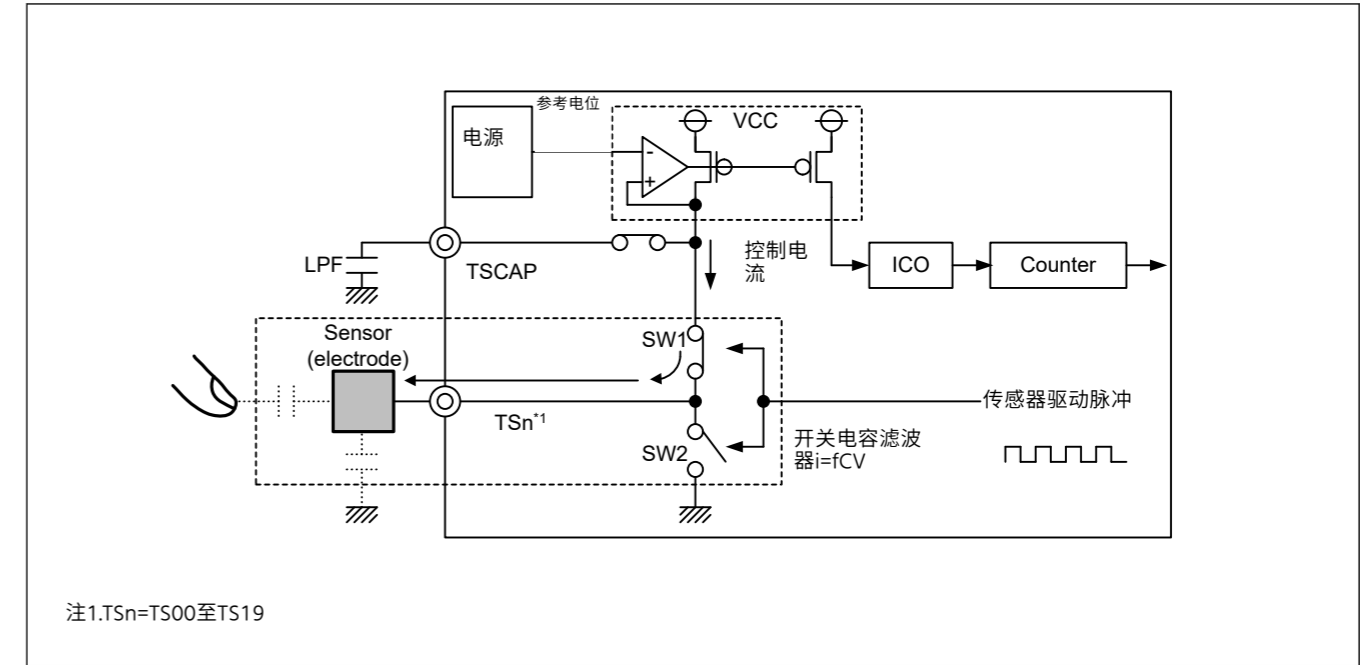

Figure 40.5 充电操作

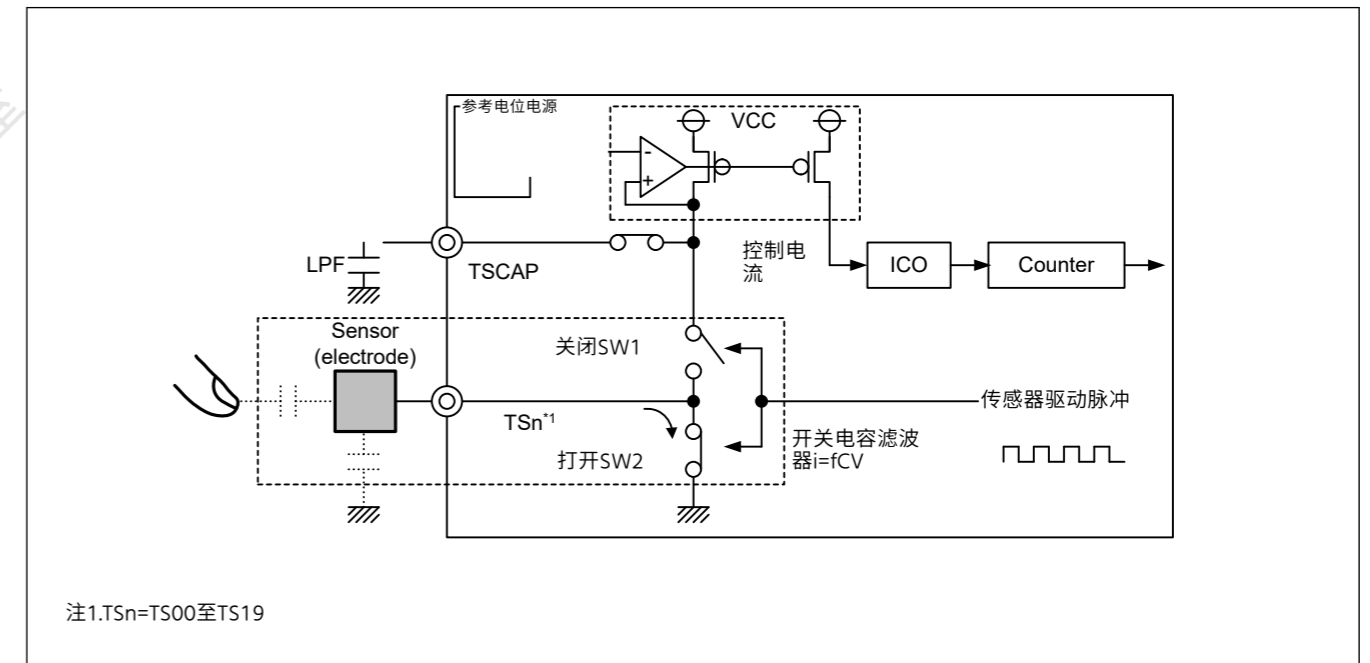

Figure 40.6 卸料作业

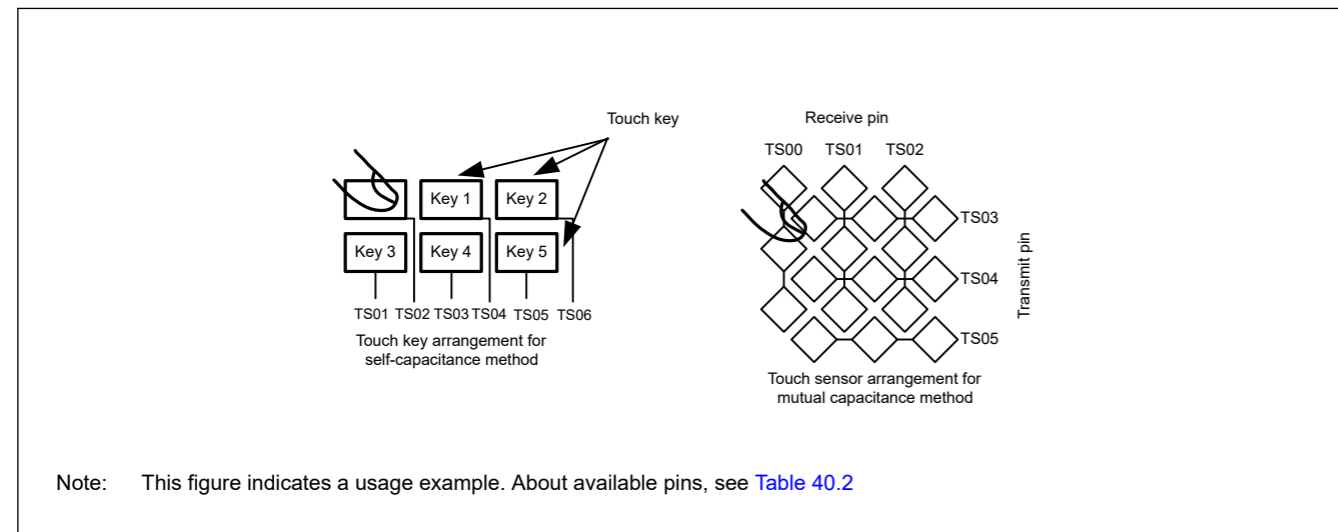

Figure 40.7 Change in measured value when finger is touching and not touching

### 40.3.2 Measurement Modes

The CTSU supports self-capacitance and mutual capacitance methods. Figure 40.8 illustrates these methods.

Note: This figure indicates a usage example. About available pins, see Table 40.2

Figure 40.8 Overview of self-capacitance method and mutual capacitance method

In the self-capacitance method, a single touch pin is allocated to a single touch key to measure individual electrostatic capacitance when a finger is in close proximity. In this method, capacitance can be measured in both single scan and multiscan modes.

In the mutual capacitance method, the capacitance between two opposing electrodes (transmit and receive pins) is measured.

#### 40.3.2.1 Initial settings flow

Figure 40.9 shows the flow for the CTSU initial settings.

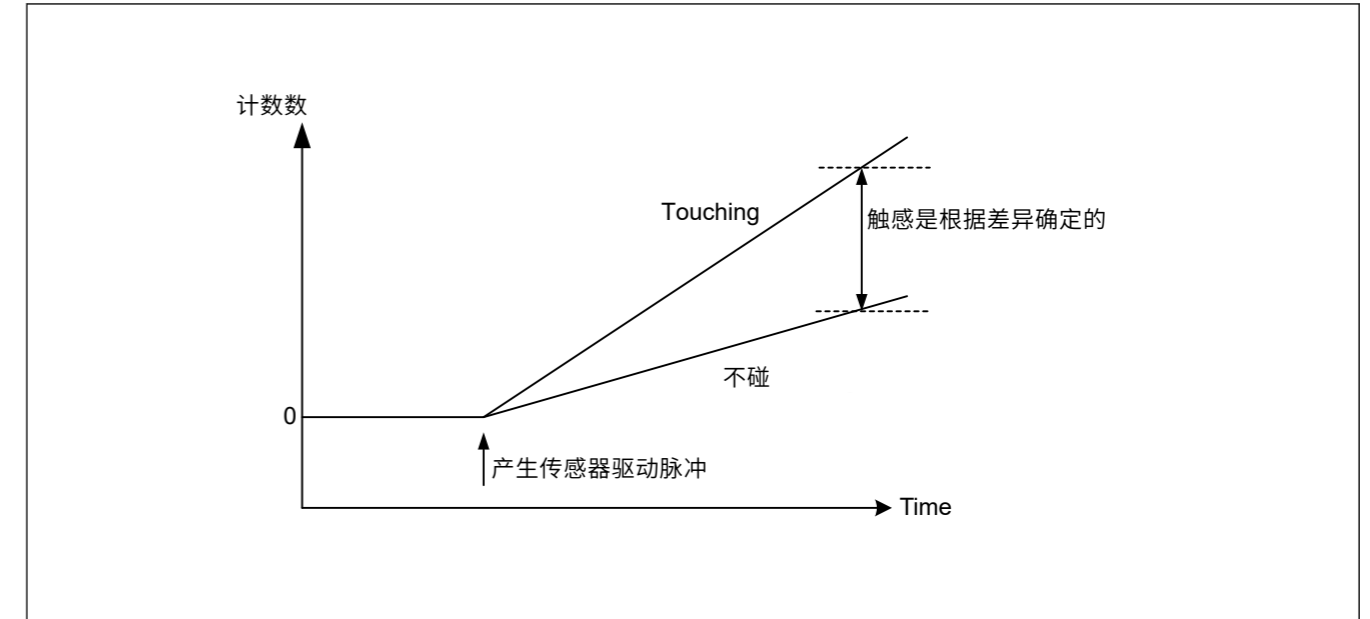

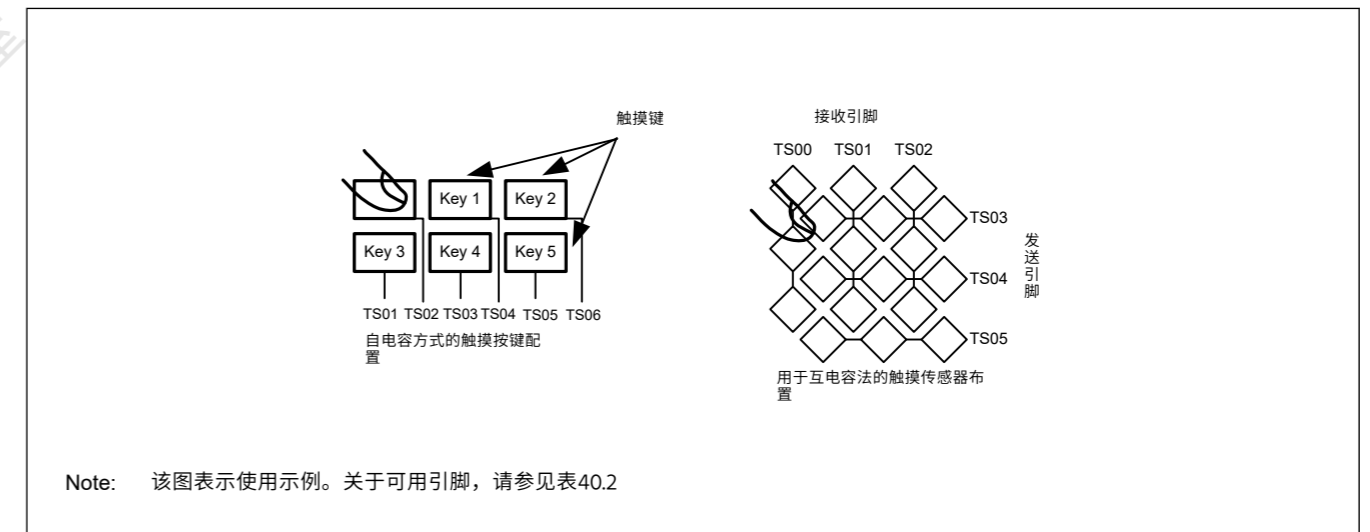

Figure 40.7 手指接触和不接触时测量值的变化

### 40.3.2 测量模式

CTSUS支持自电容和互电容方法。图40.8说明了这些方法。

Note: 该图表示使用示例。关于可用引脚，请参见表40.2

Figure 40.8 自电容法和互电容法概述

在自电容法中，将单个触摸引脚分配给单个触摸键，以在手指靠近时测量单个静电电容。在这种方法中，可以在单扫描和多扫描模式下测量电容。

在互电容法中，测量两个相对电极（发送和接收引脚）之间的电容。

#### 40.3.2.1 初始设置流程

图40.9显示了CTSUS初始设置的流程。

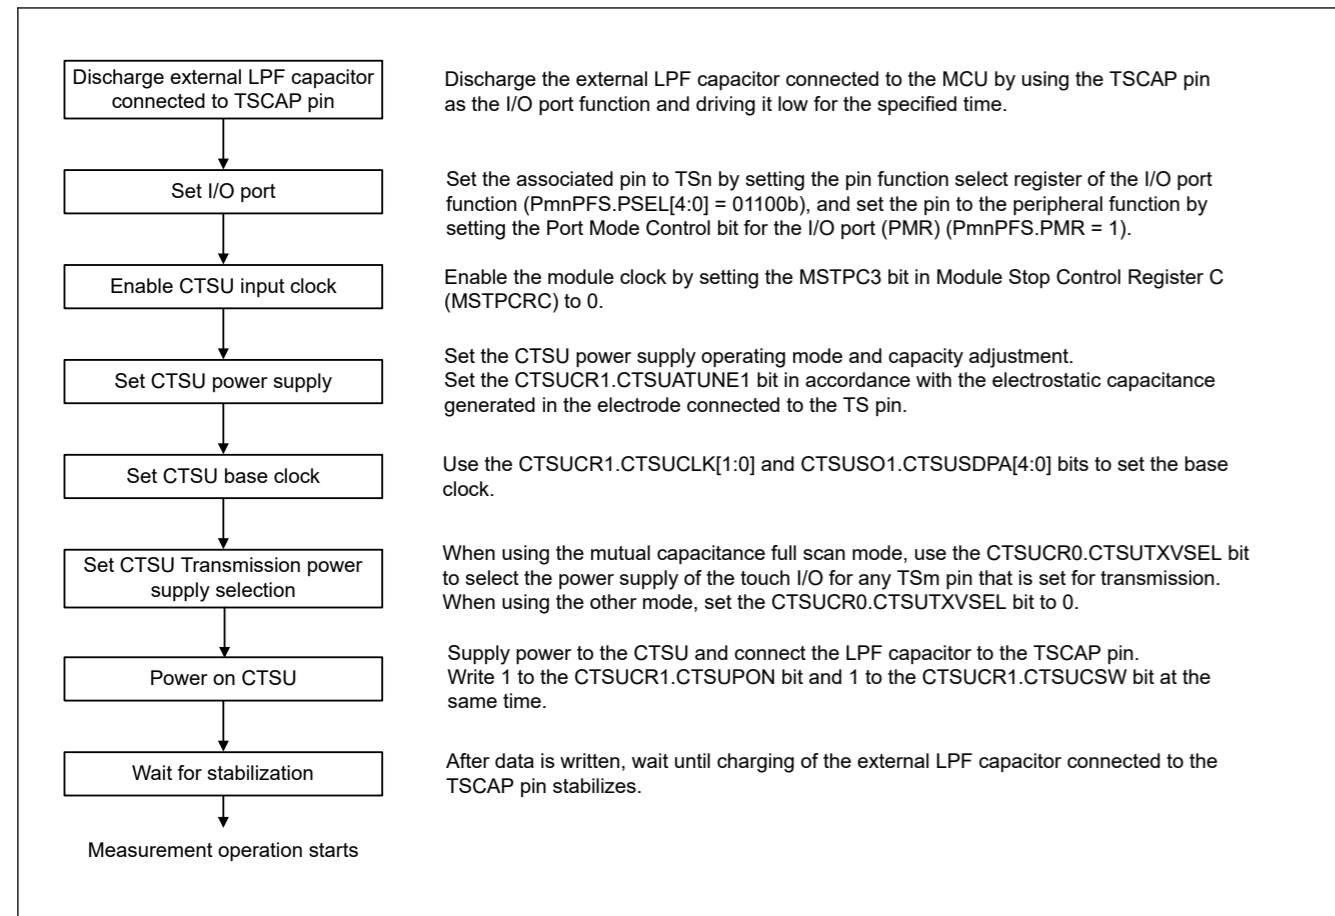

Figure 40.9 CTSU initial settings flow

Figure 40.10 shows the flow for stopping CTSU operation and invoking the standby state.

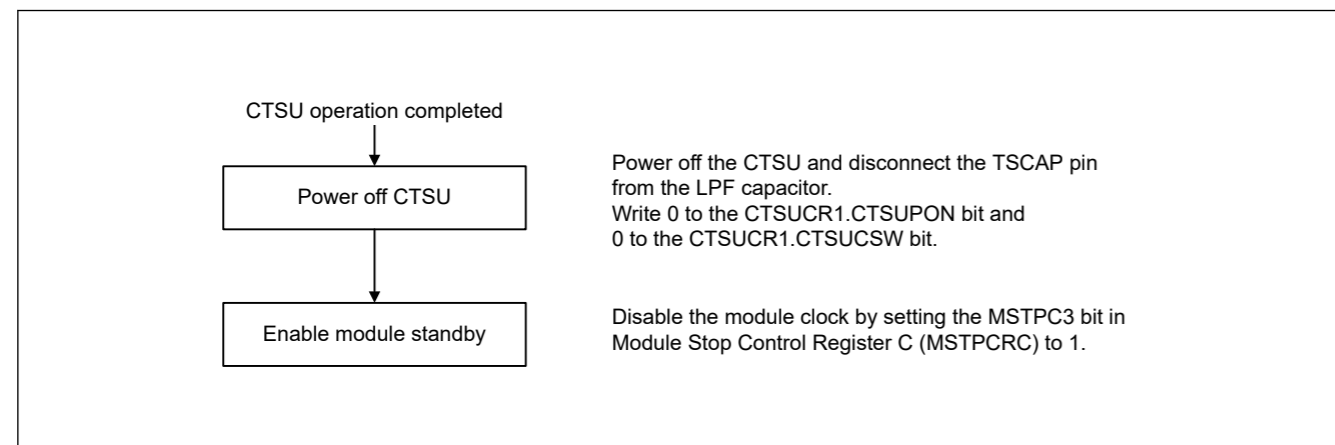

Figure 40.10 CTSU stopping flow

When restarting operation after it stops, follow the initial settings flow shown in Figure 40.9.

#### 40.3.2.2 Status counter

The measurement status counter of the CTSU Status Register (CTSUST) indicates the current measurement status. The measurement status is shared by all three modes. Figure 40.11 shows the status operation transitions.

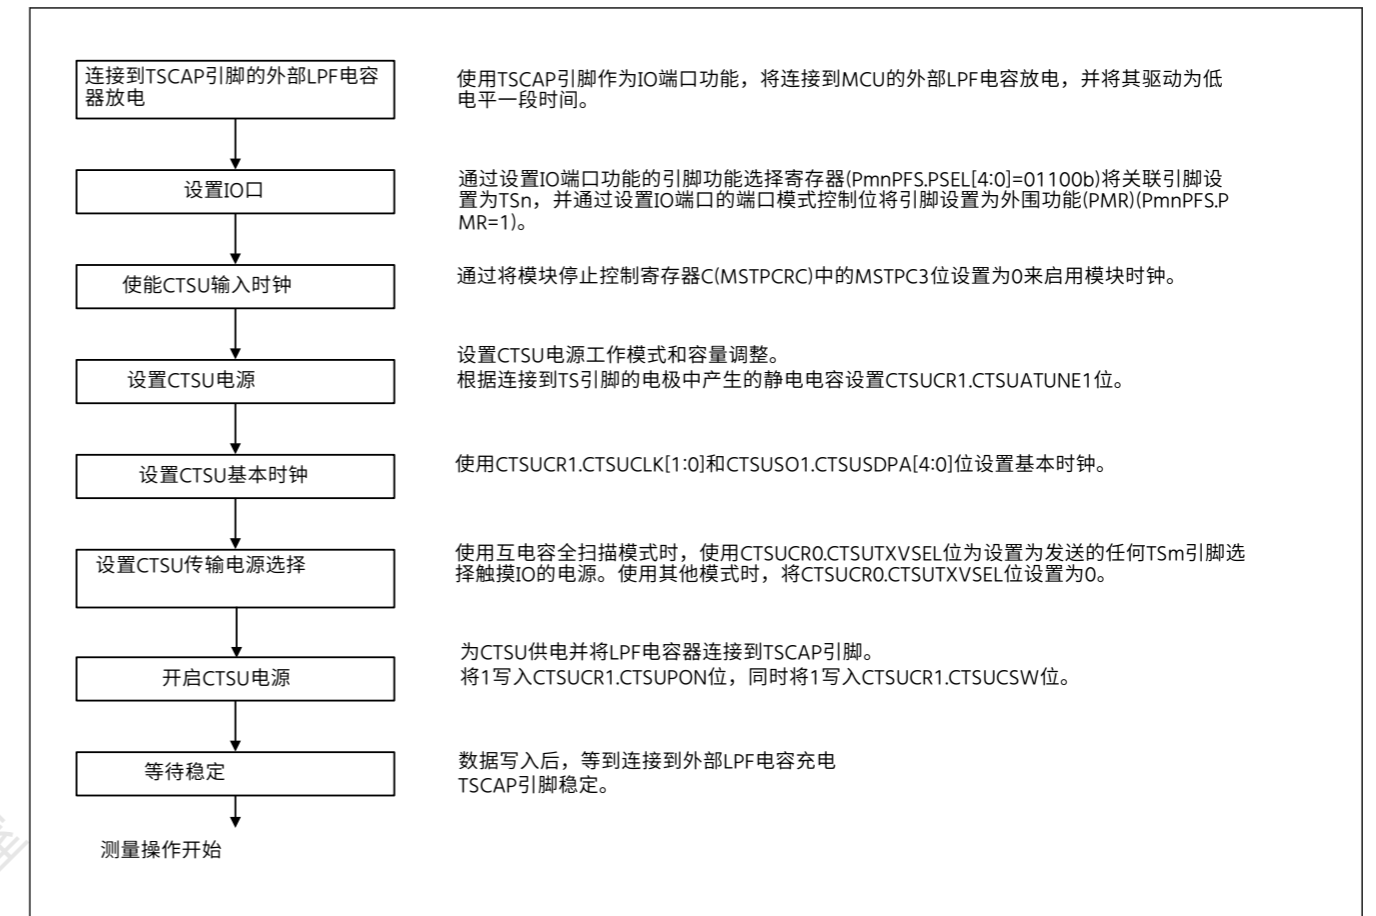

Figure 40.9 CTSU初始设置流程

图40.10显示了停止CTSUS操作并调用待机状态的流程。

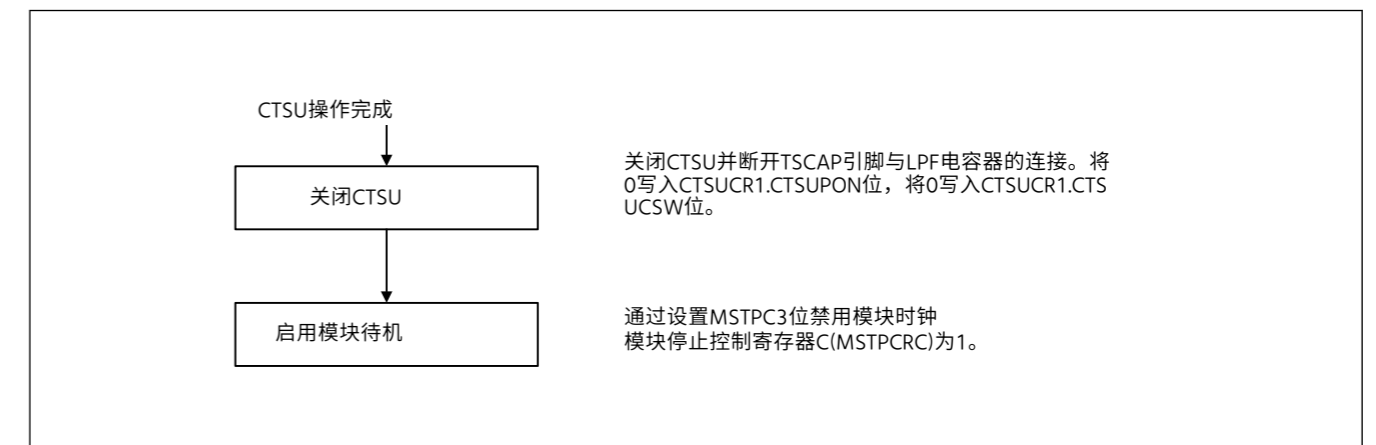

Figure 40.10 CTSUS停止流程

停止后重新运行时，请按照图40.9所示的初始设置流程进行操作。

#### 40.3.2.2 状态计数器

CTSUS状态寄存器(CTSUST)的测量状态计数器指示当前测量状态。测量状态由所有三种模式共享。图40.11显示了状态操作转换。

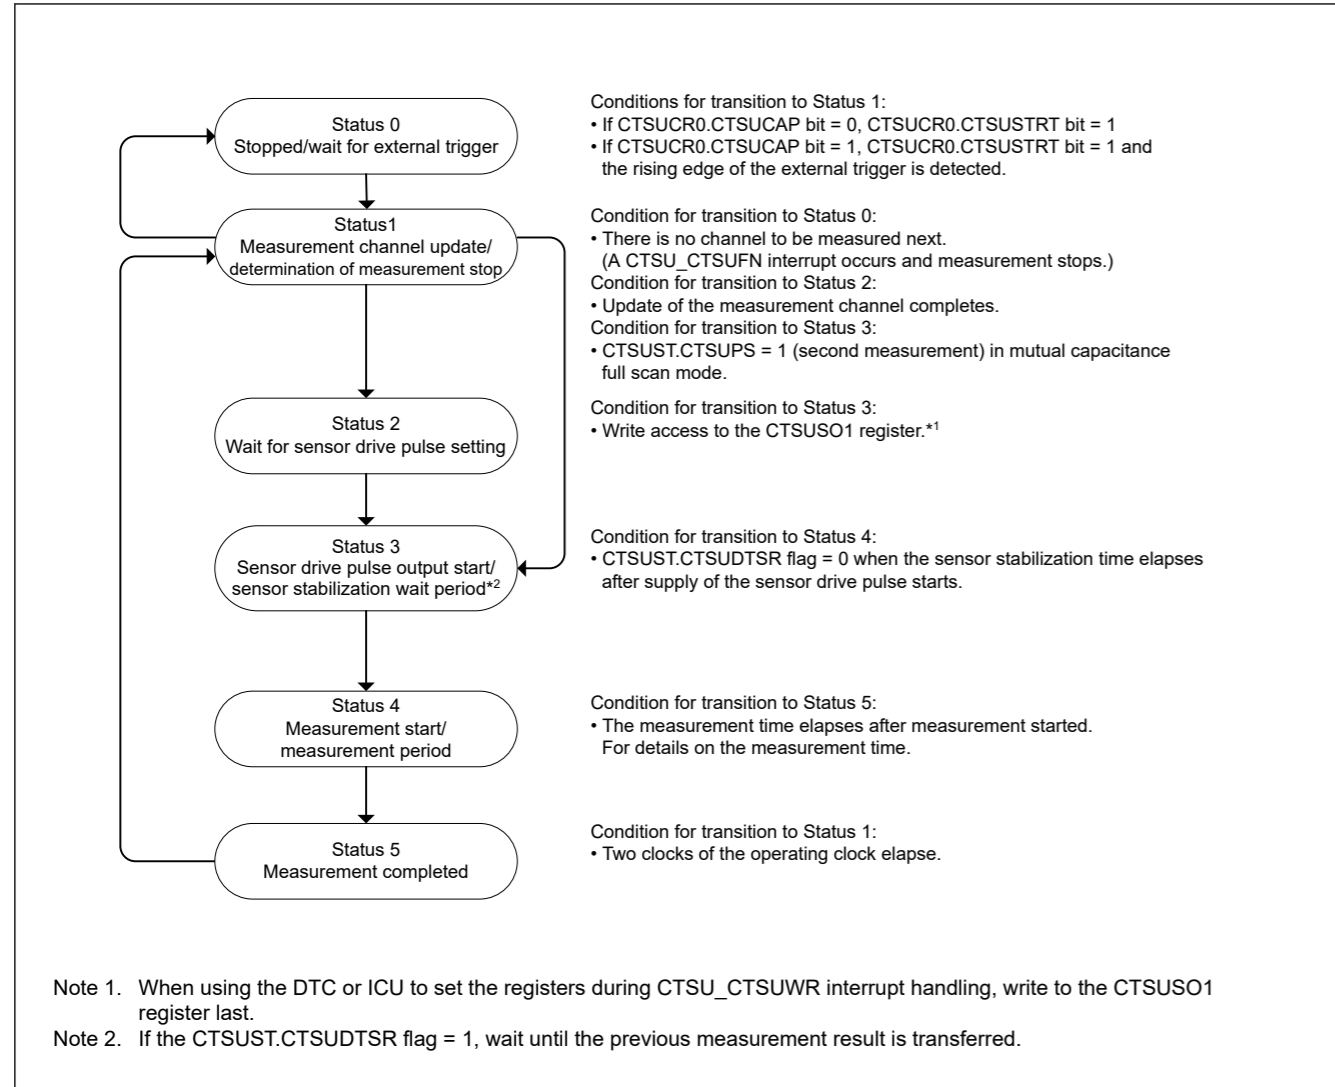

Figure 40.11 Status operation transitions

The status counter transitions to Status 0 when all of the specified measurement channels are measured.

The CTSUCR0.CTSUSTRT bit is set to 0 by hardware when a software trigger is used. When an external trigger is used, the value of 1 is retained, and the CTSU waits for the next trigger.

When operation is forced to stop during measurement or the trigger wait state, by a simultaneous 0 write to the CTSUCR0.CTSUSTRT bit and a 1 write to the CTSUCR0.CTSUINIT bit, the status transitions to Status 0 and measurement stops.

If the channel to be measured is not set in the CTSUCHAC0 to CTSUCHAC2 or CTSUCHTRC0 to CTSUCHTRC2 registers, a CTSU\_CTSUFN interrupt occurs immediately after a transition to Status 1, and then the status transitions to Status 0.

In the following situations, there is no channel to be measured:

- No measurement target channel is specified in the CTSUCHAC0 to CTSUCHAC2 registers.
- In self-capacitance single scan mode, the channel specified in the CTSUMCH0 register is not a measurement target in the CTSUCHAC0 to CTSUCHAC2 registers.
- In full scan modes, there is no transmit channel or receive channel to be measured based on the combined settings of the CTSUCHAC0 to CTSUCHAC2 and CTSUCHTRC0 to CTSUCHTRC2 registers.

If there is no channel to be measured based on these settings, a CTSU\_CTSUFN interrupt occurs immediately after a transition to Status 1, and the counter transitions to Status 0.

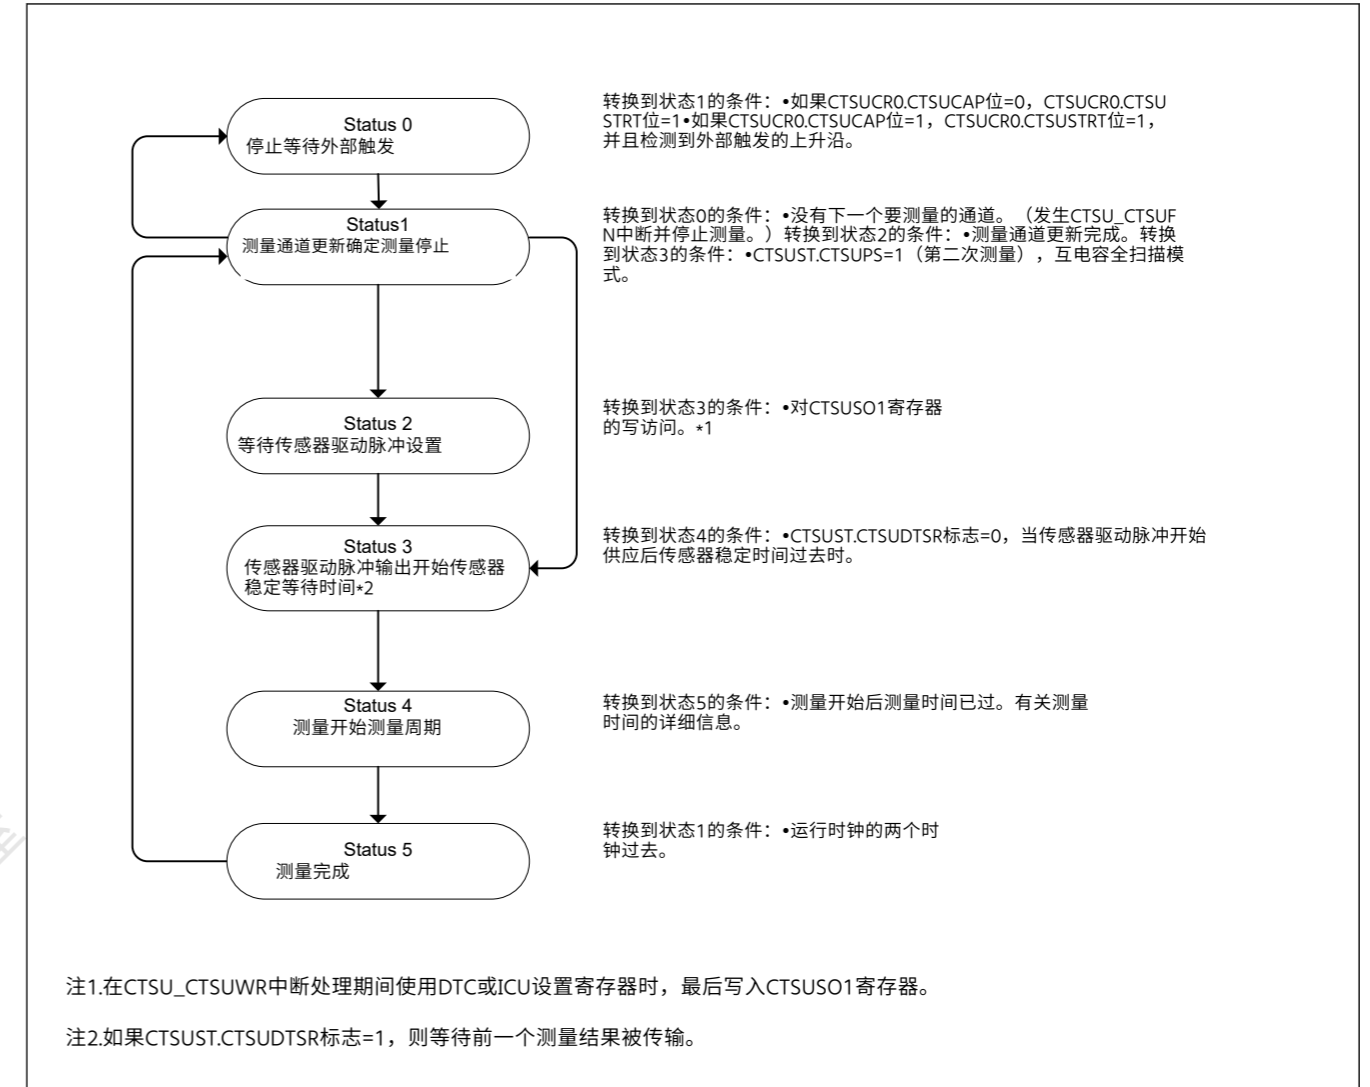

Figure 40.11 状态操作转换

当测量所有指定的测量通道时, 状态计数器转换为状态0。

当使用软件触发时, CTSUCR0.CTSUSTRT位由硬件设置为0。使用外部触发时, 保留值1, CTSU等待下一次触发。

在测量或触发等待状态期间强制停止操作时, 通过同时向CTSUCR0.CTSUSTRT位写入0和向CTSUCR0.CTSUINIT位写入1, 状态转换为状态0并停止测量。

如果要测量的通道未在CTSUCHAC0到CTSUCHAC2或CTSUCHTRC0到CTSUCHTRC2寄存器中设置, 则在转换到状态1后立即发生CTSU\_CTSUFN中断, 然后状态转换到状态0。

在以下情况下, 没有要测量的通道:

- CTSUCHAC0至CTSUCHAC2寄存器中未指定测量目标通道。
- 在自电容单次扫描模式下, CTSUCHAC0寄存器中指定的通道不是CTSUCHAC0至CTSUCHAC2寄存器中的测量目标。
- 在全扫描模式下, 根据CTSUCHAC0到CTSUCHAC2和CTSUCHTRC0到CTSUCHTRC2寄存器的组合设置, 没有要测量的发送通道或接收通道。

如果根据这些设置没有要测量的通道, 则在转换到状态1后立即发生CTSU\_CTSUFN中断, 并且计数器转换到状态0。

40.3.2.3 Self-capacitance single scan mode operation

In self-capacitance single scan mode, electrostatic capacitance on one channel is measured. Figure 40.12 shows the software flow and an operation example, and Figure 40.13 shows the timing.

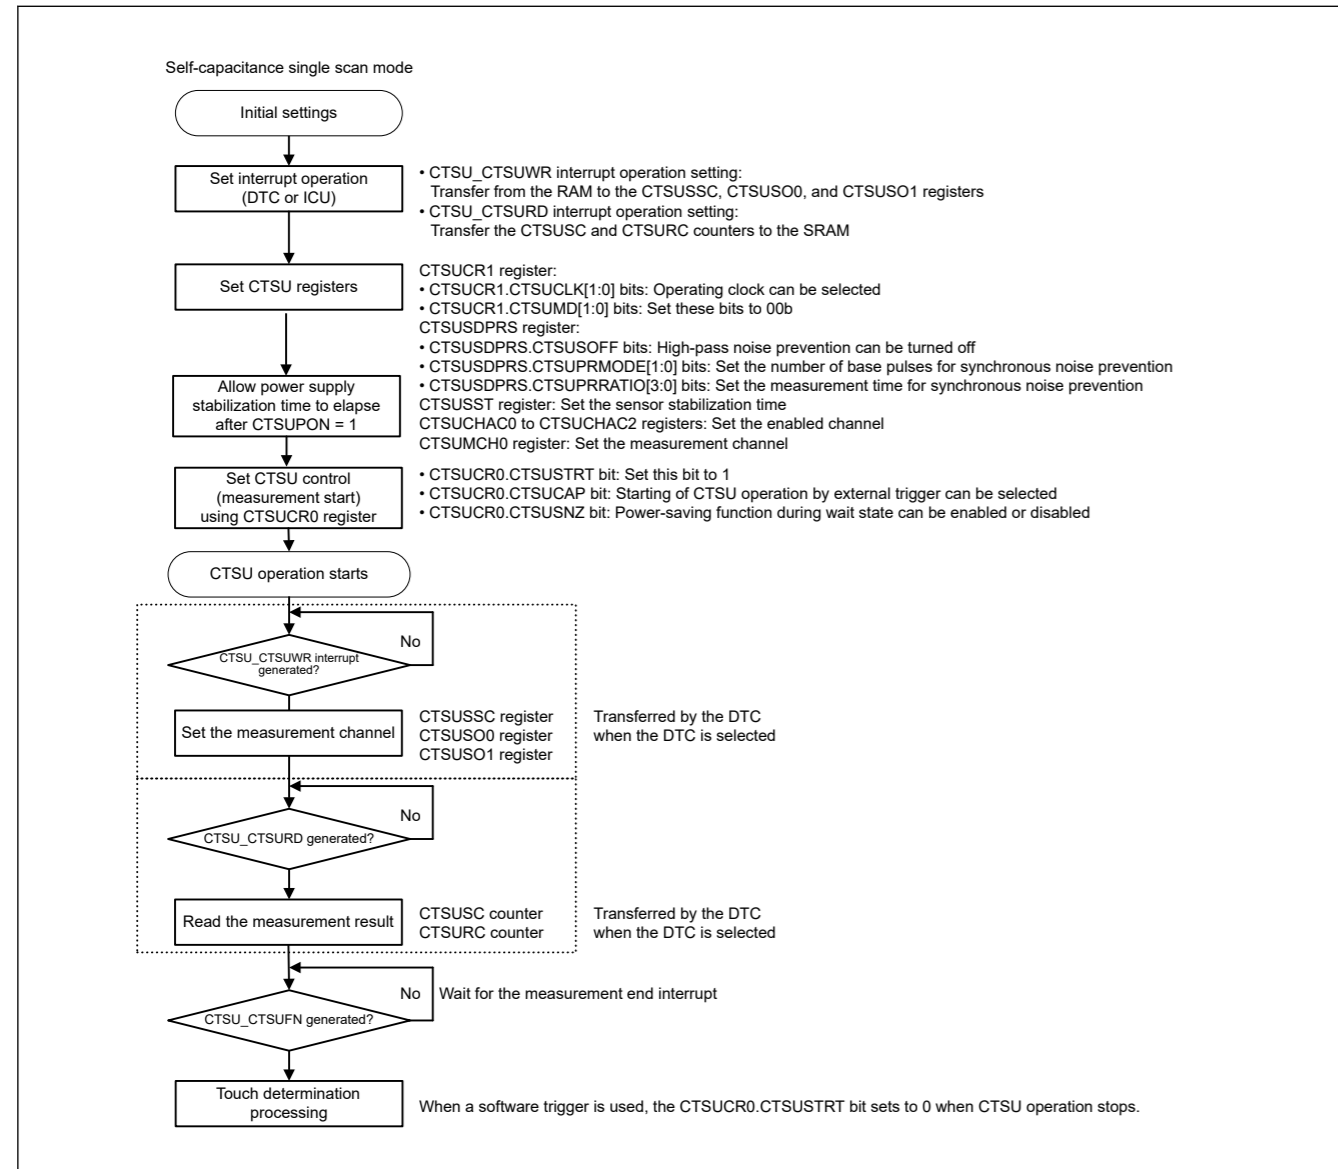

Figure 40.12 Software flow and example operation for self-capacitance single scan mode

40.3.2.3 自电容单次扫描模式操作

在自电容单次扫描模式下，测量一个通道上的静电电容。图40.12显示了软件流程和操作示例，图40.13显示了时序。

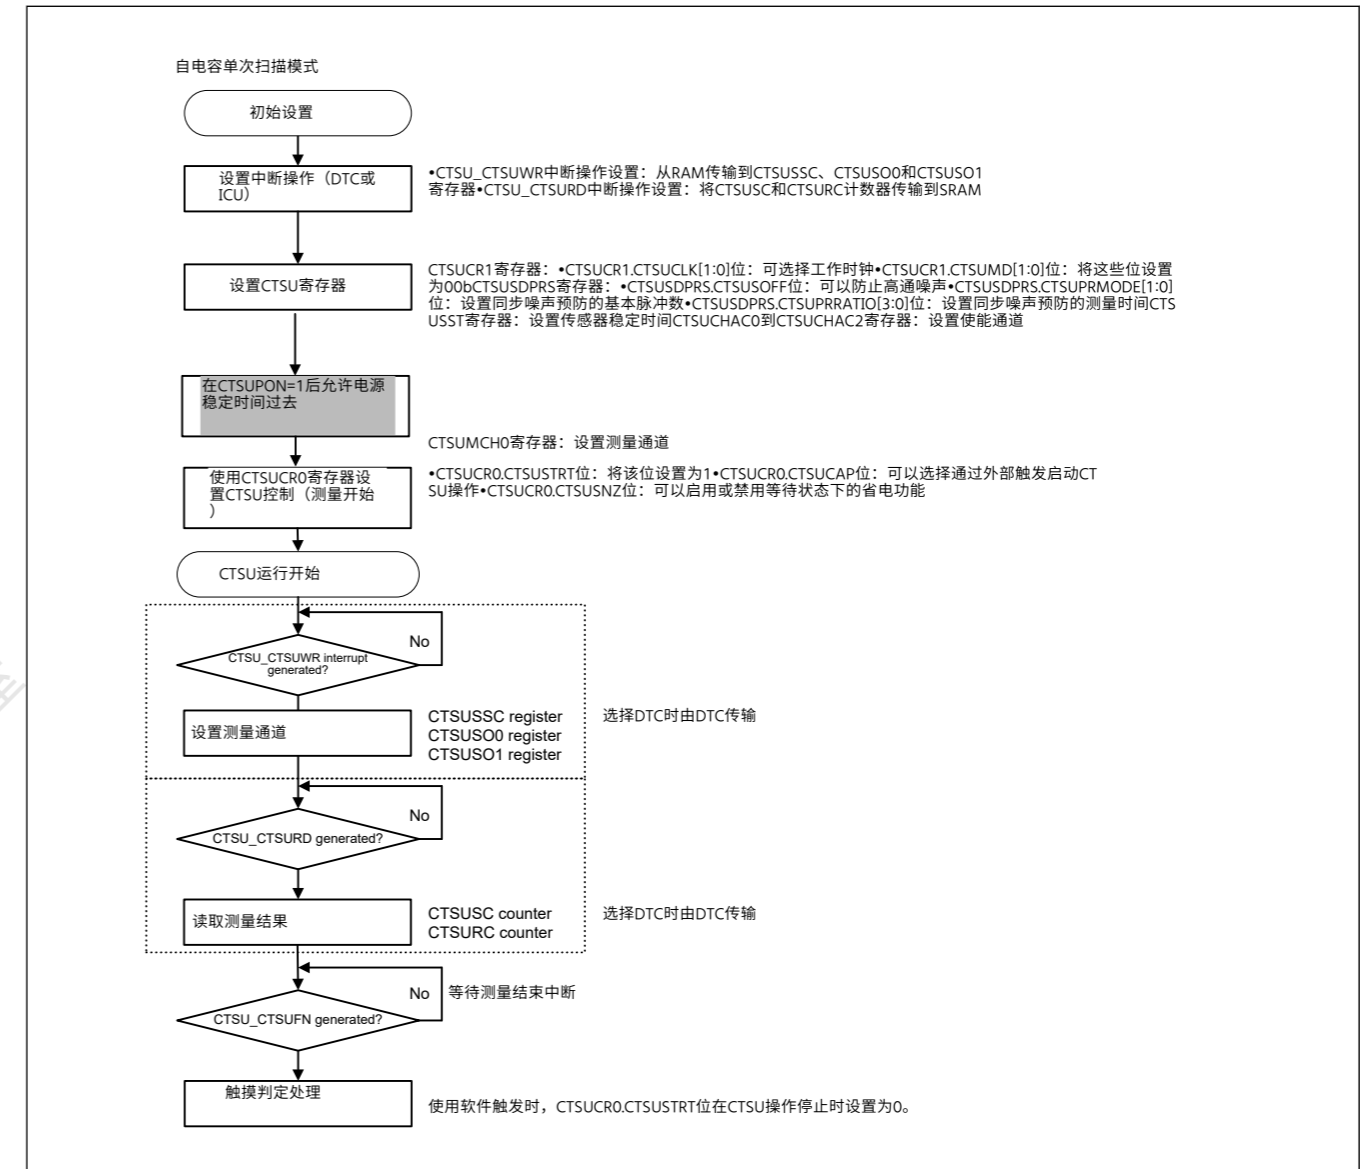

Figure 40.12 自电容单次扫描模式的软件流程和示例操作

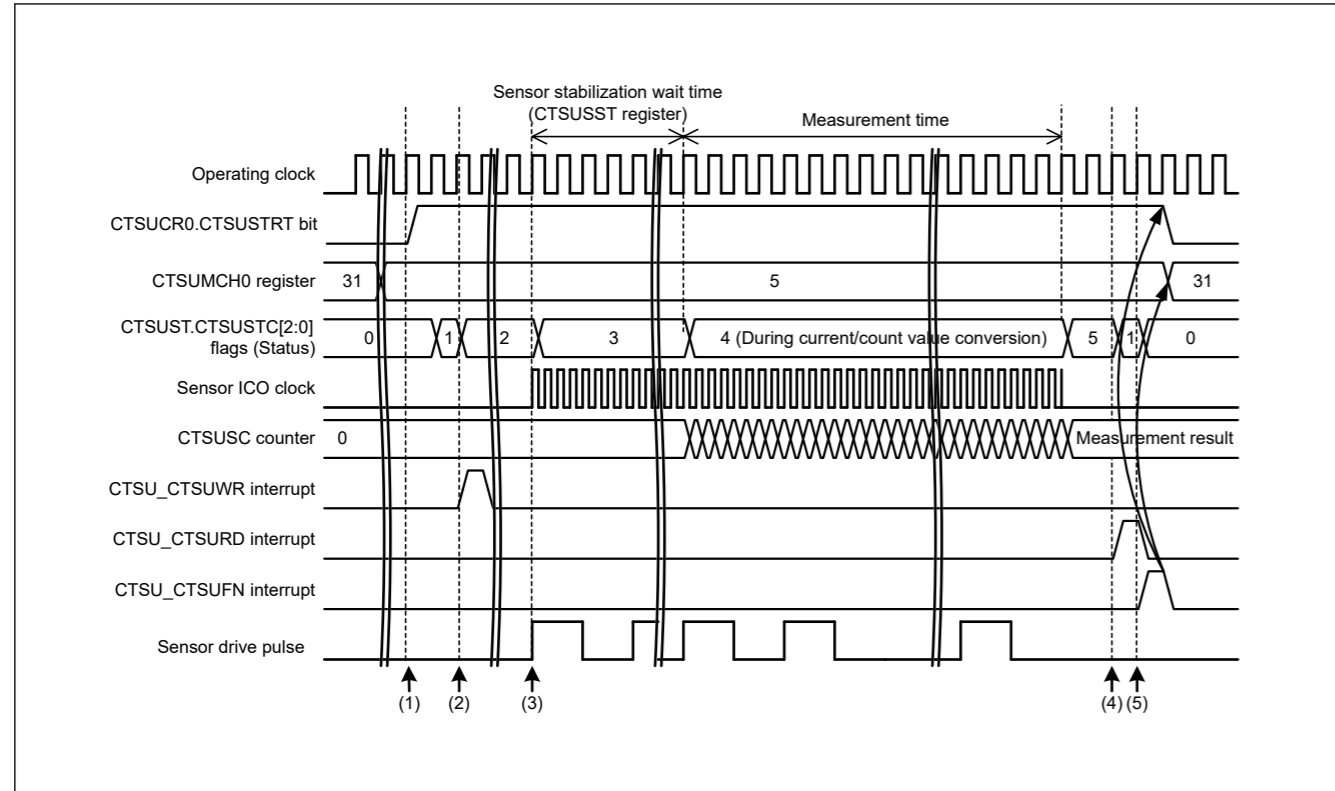

Figure 40.13 Timing of self-capacitance single scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 40.13.

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU\_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and reference ICO clock operate.
4. After the sensor stabilization wait time and the measurement time elapse, and measurement stops, a measurement result read request (CTSU\_CTSURD) is output.
5. A measurement end interrupt (CTSU\_CTSUFN) is output and measurement stops (transition to Status 0).

Table 40.7 lists the touch pin states in self-capacitance single scan mode.

Table 40.7 Touch pin states in self-capacitance single scan mode

| Status | Touch pin        |                      |
|--------|------------------|----------------------|
|        | Measured channel | Non-measured channel |
| 0      | Low              | Low                  |
| 1      | Low              | Low                  |
| 2      | Low              | Low                  |
| 3      | Pulse            | Low                  |
| 4      | Pulse            | Low                  |
| 5      | Low              | Low                  |

#### 40.3.2.4 Self-capacitance multi-scan mode operation

In self-capacitance multi-scan mode, electrostatic capacitance on all channels that are specified as measurement targets in the CTSUCHAC0 to CTSUCHAC2 registers is measured sequentially in ascending order. Figure 40.14 shows the software flow and an operation example, and Figure 40.15 shows the timing.

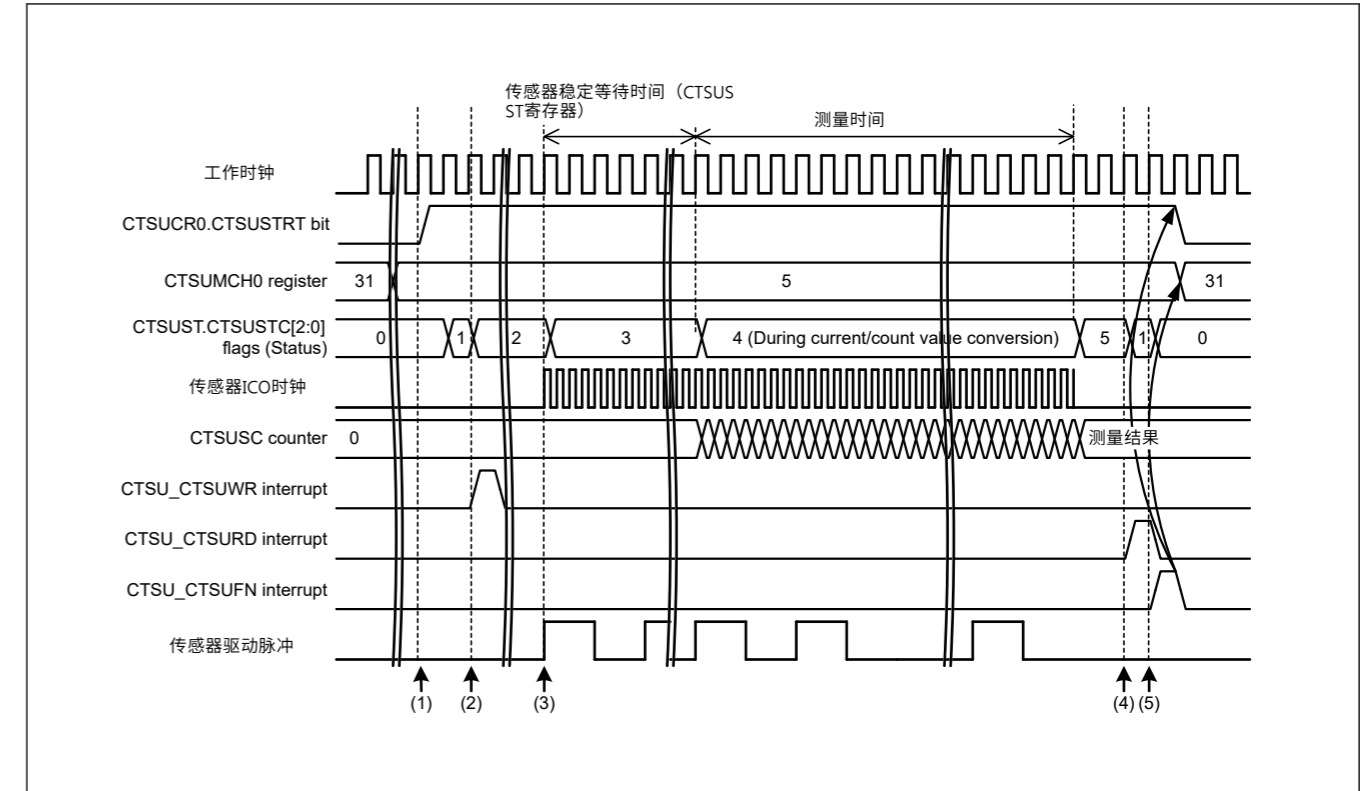

Figure 40.13 测量开始条件为软件触发时的自电容单次扫描模式时序

下面介绍图40.13所示的操作。

- 1.进行初始设置后，通过向CTSUCR0.CTSUSTRTRT位写入1开始操作。
- 2、根据预设条件确定待测通道后，输出通道设置请求（CTSU\_CTSUWR）。
- 3.写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。
- 4.经过传感器稳定等待时间和测量时间后，测量停止，输出测量结果读取请求（CTSU\_CTSURD）。
- 5.输出测量结束中断(CTSU\_CTSUFN)并停止测量（转换到状态0）。

表40.7列出了自电容单次扫描模式下的触摸引脚状态。

Table 40.7 自电容单次扫描模式下的触摸引脚状态

| Status | 触摸针   |                      |
|--------|-------|----------------------|
|        | 测量通道  | Non-measured channel |
| 0      | Low   | Low                  |
| 1      | Low   | Low                  |
| 2      | Low   | Low                  |
| 3      | Pulse | Low                  |
| 4      | Pulse | Low                  |
| 5      | Low   | Low                  |

#### 40.3.2.4 自电容多扫描模式操作

在自电容多重扫描模式下，CTSUCHAC0至CTSUCHAC2寄存器中指定为测量目标的所有通道上的静电电容按升序顺序测量。图40.14显示了软件流程和操作示例，图40.15显示了时序。

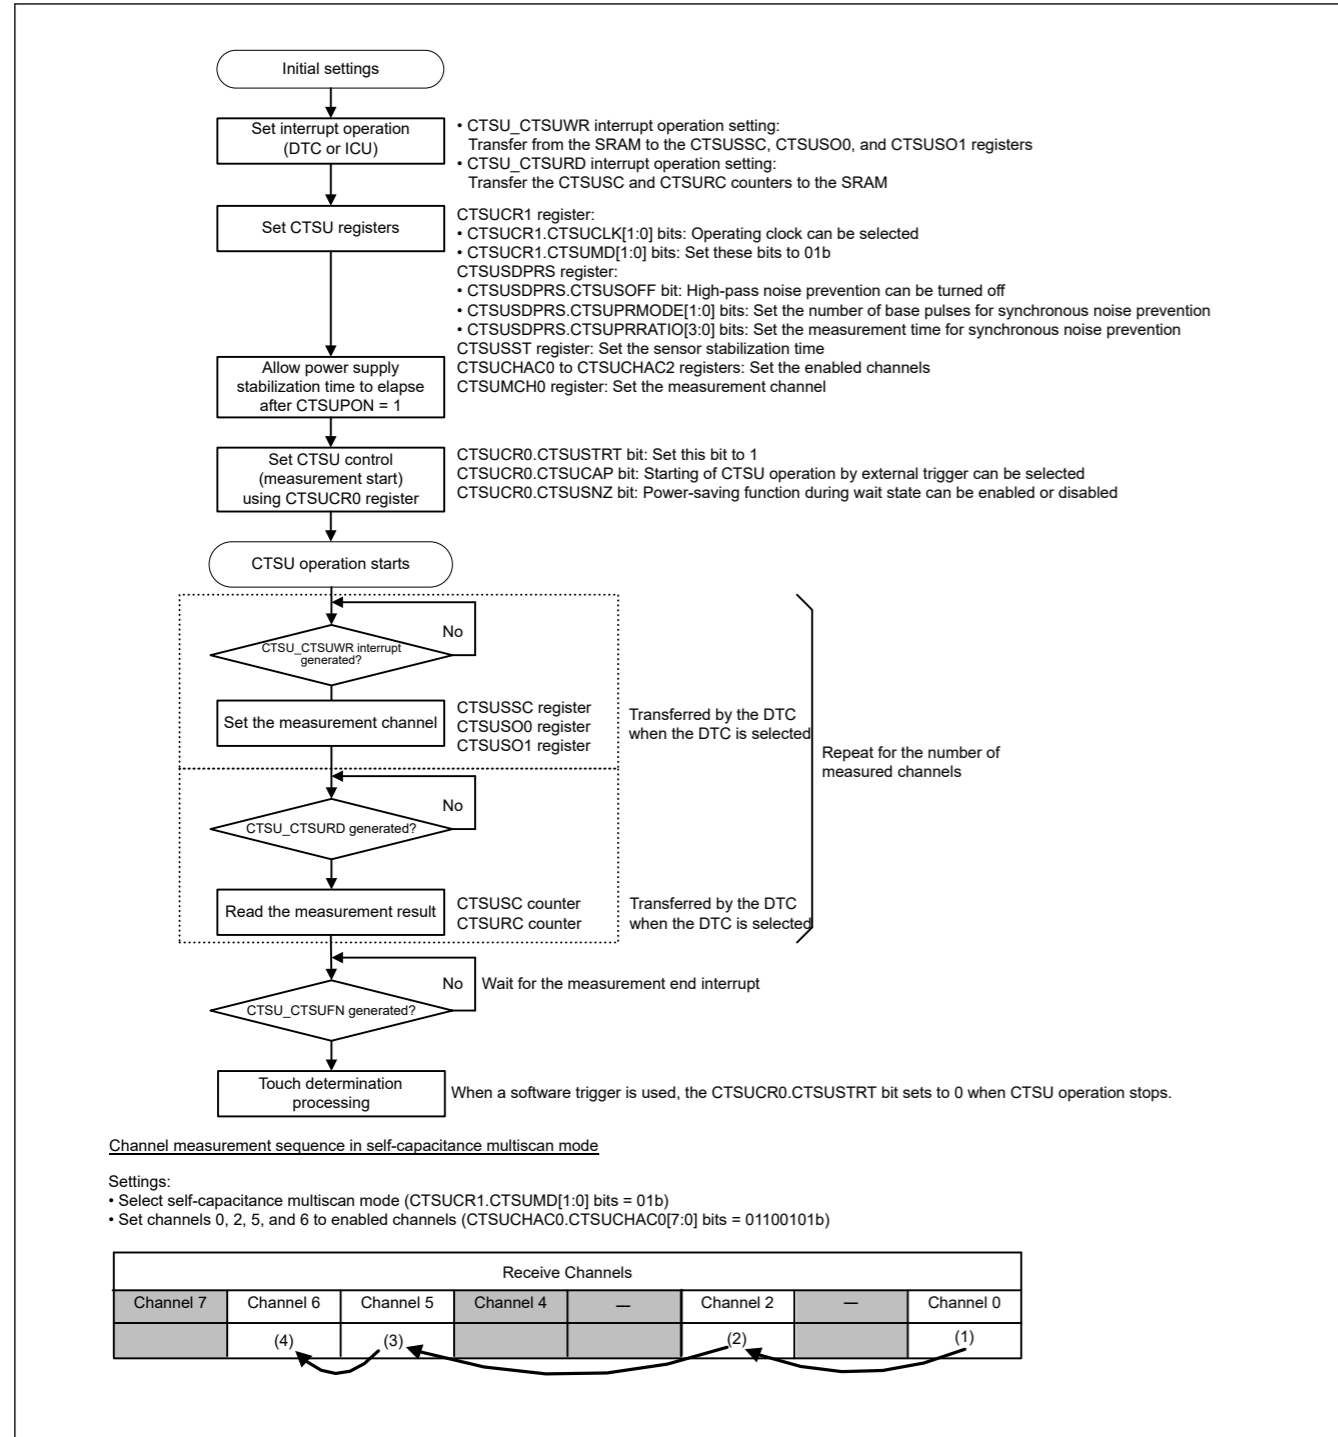

Figure 40.14 Software flow and example operation for self-capacitance multi-scan mode

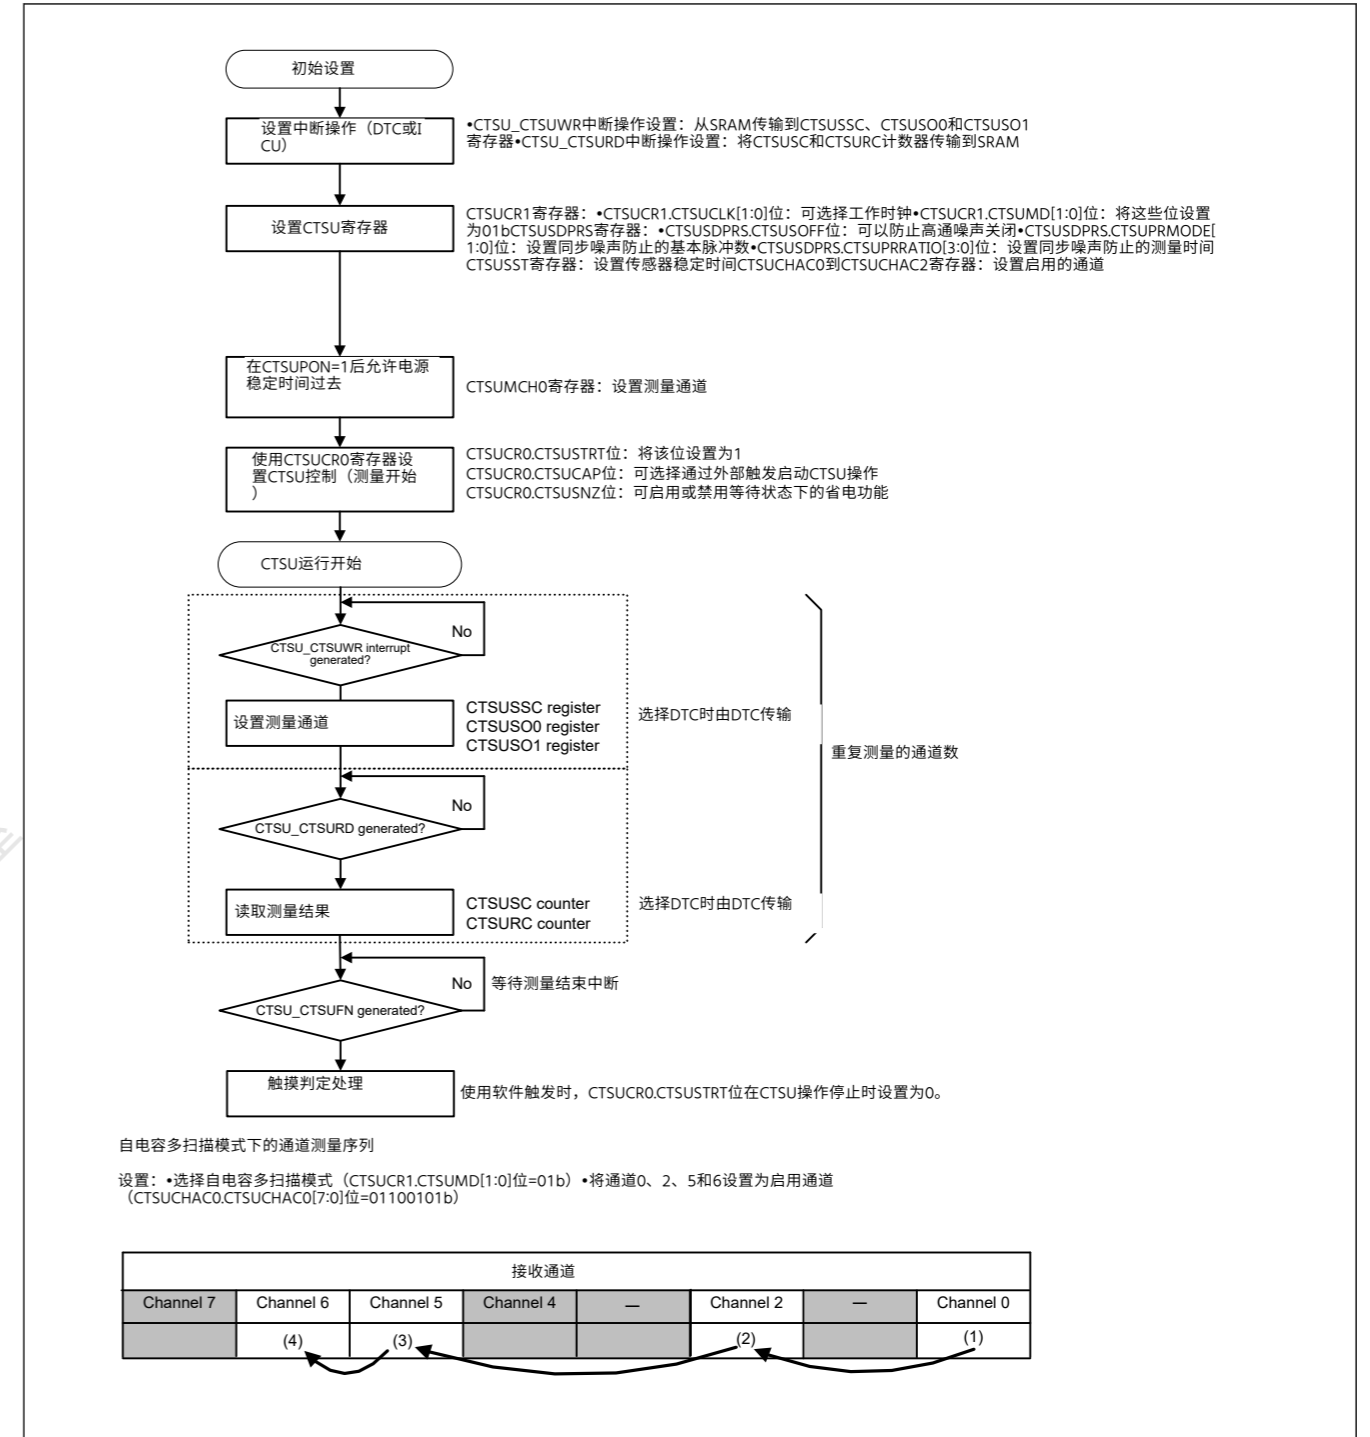

Figure 40.14 自电容多扫描模式的软件流程和示例操作

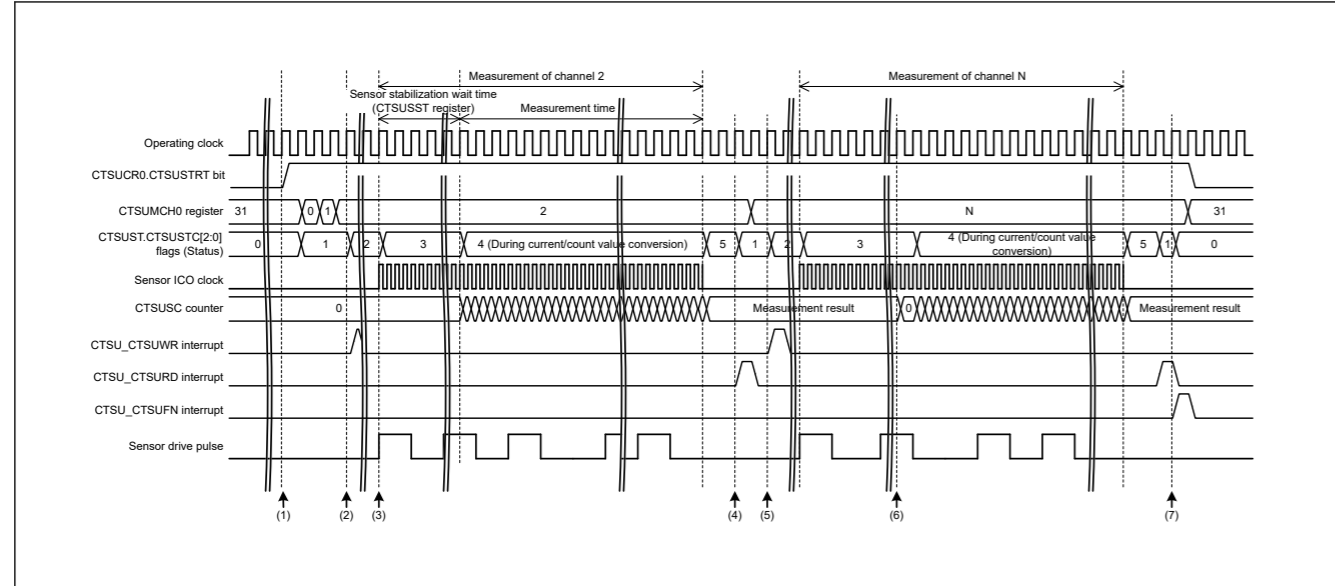

Figure 40.15 Timing of self-capacitance multi-scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 40.15:

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU\_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and the reference ICO clock operate.
4. After the sensor stabilization wait time and the measurement time elapse, and measurement stops, a measurement result read request (CTSU\_CTSURD) is output.
5. After the channel to be measured next is determined, a measurement channel setting request (CTSU\_CTSUWR) is output.
6. After the stabilization wait time elapses and when the previous measurement is read, the result is cleared and measurement starts.
7. On completion of all measurement channels, a measurement end interrupt (CTSU\_CTSUFN) is output and measurement is stopped (transition to Status 0).

Table 40.8 lists the touch pin states in self-capacitance multi-scan mode.

Table 40.8 Touch pin states in self-capacitance multi-scan mode

| Status | Touch pin        |                      |
|--------|------------------|----------------------|
|        | Measured channel | Non-measured channel |
| 0      | Low              | Low                  |
| 1      | Low              | Low                  |
| 2      | Low              | Low                  |
| 3      | Pulse            | Low                  |
| 4      | Pulse            | Low                  |
| 5      | Low              | Low                  |

### 40.3.2.5 Mutual capacitance full scan mode operation

In mutual capacitance full scan mode, measurement is performed during the high-level period of the sensor drive pulse on the receive channel by applying the edge to the target transmit channel to be measured. A single measurement target is measured twice, on the rising and falling edges. The difference between the data of these two measurements determines whether or not the electrode was touched, which results in a higher touch sensitivity.

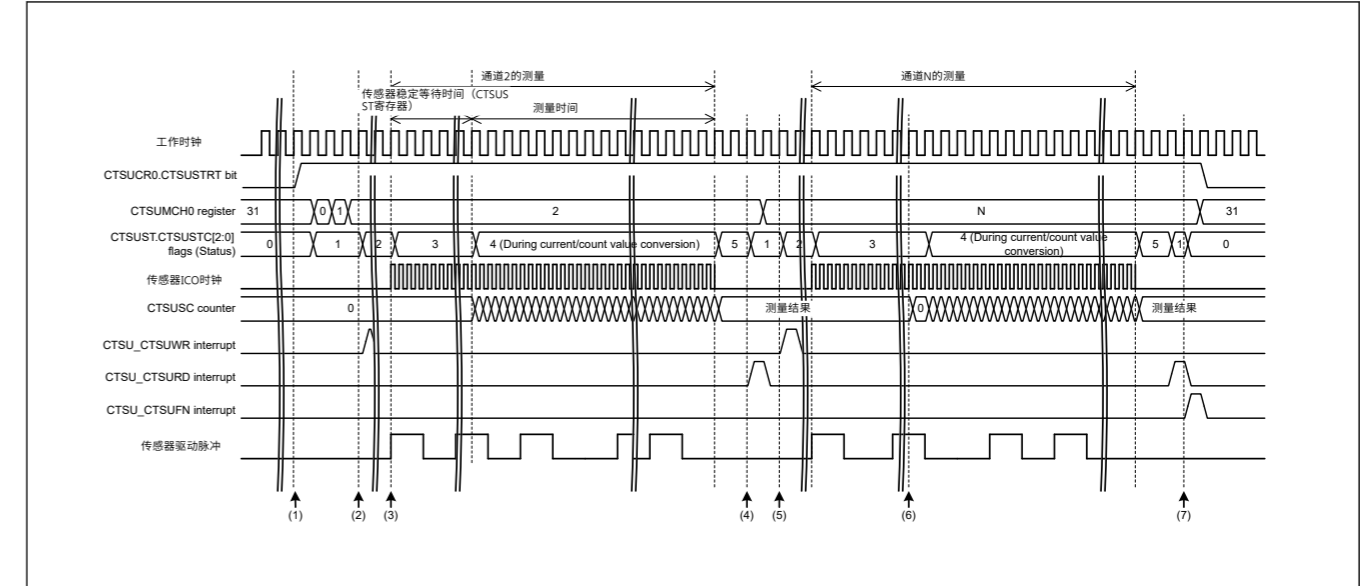

Figure 40.15 测量开始条件为软件触发时的自电容多次扫描模式时序

下面描述图40.15所示的操作：

- 1.进行初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。
- 2.根据预设条件确定待测通道后，输出通道设置请求（CTSU\_CTSUWR）。
- 3.写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。
- 4.经过传感器稳定等待时间和测量时间后，测量停止，输出测量结果读取请求（CTSU\_CTSURD）。
- 5.确定下一个要测量的通道后，输出测量通道设置请求（CTSU\_CTSUWR）。
- 6.经过稳定等待时间后，当读取前一次测量时，结果被清除并开始测量。
- 7.所有测量通道完成后，输出测量结束中断(CTSU\_CTSUFN)并停止测量（转换到状态0）。

表40.8列出了自电容多扫描模式下的触摸引脚状态。

Table 40.8 自电容多扫描模式下的触摸引脚状态

| Status | 触摸针   |                      |
|--------|-------|----------------------|
|        | 测量通道  | Non-measured channel |
| 0      | Low   | Low                  |
| 1      | Low   | Low                  |
| 2      | Low   | Low                  |
| 3      | Pulse | Low                  |
| 4      | Pulse | Low                  |
| 5      | Low   | Low                  |

### 40.3.2.5 互电容全扫描模式操作

在互电容全扫描模式下，在接收通道上的传感器驱动脉冲的高电平期间通过将边沿施加到要测量的目标发送通道来执行测量。在上升沿和下降沿对单个测量目标进行两次测量。这两次测量的数据之间的差异决定了电极是否被触摸，从而导致更高的触摸灵敏度。

Electrostatic capacitance is measured sequentially on channels set to transmission or reception in the CTSUCHTRC0 to CTSUCHTRC2 registers, and specified as measurement targets in the CTSUCHAC0 to CTSUCHAC2 registers. The capacitance is measured by combining these signals. Figure 40.16 shows the software flow and an operation example, and Figure 40.17 shows the timing.

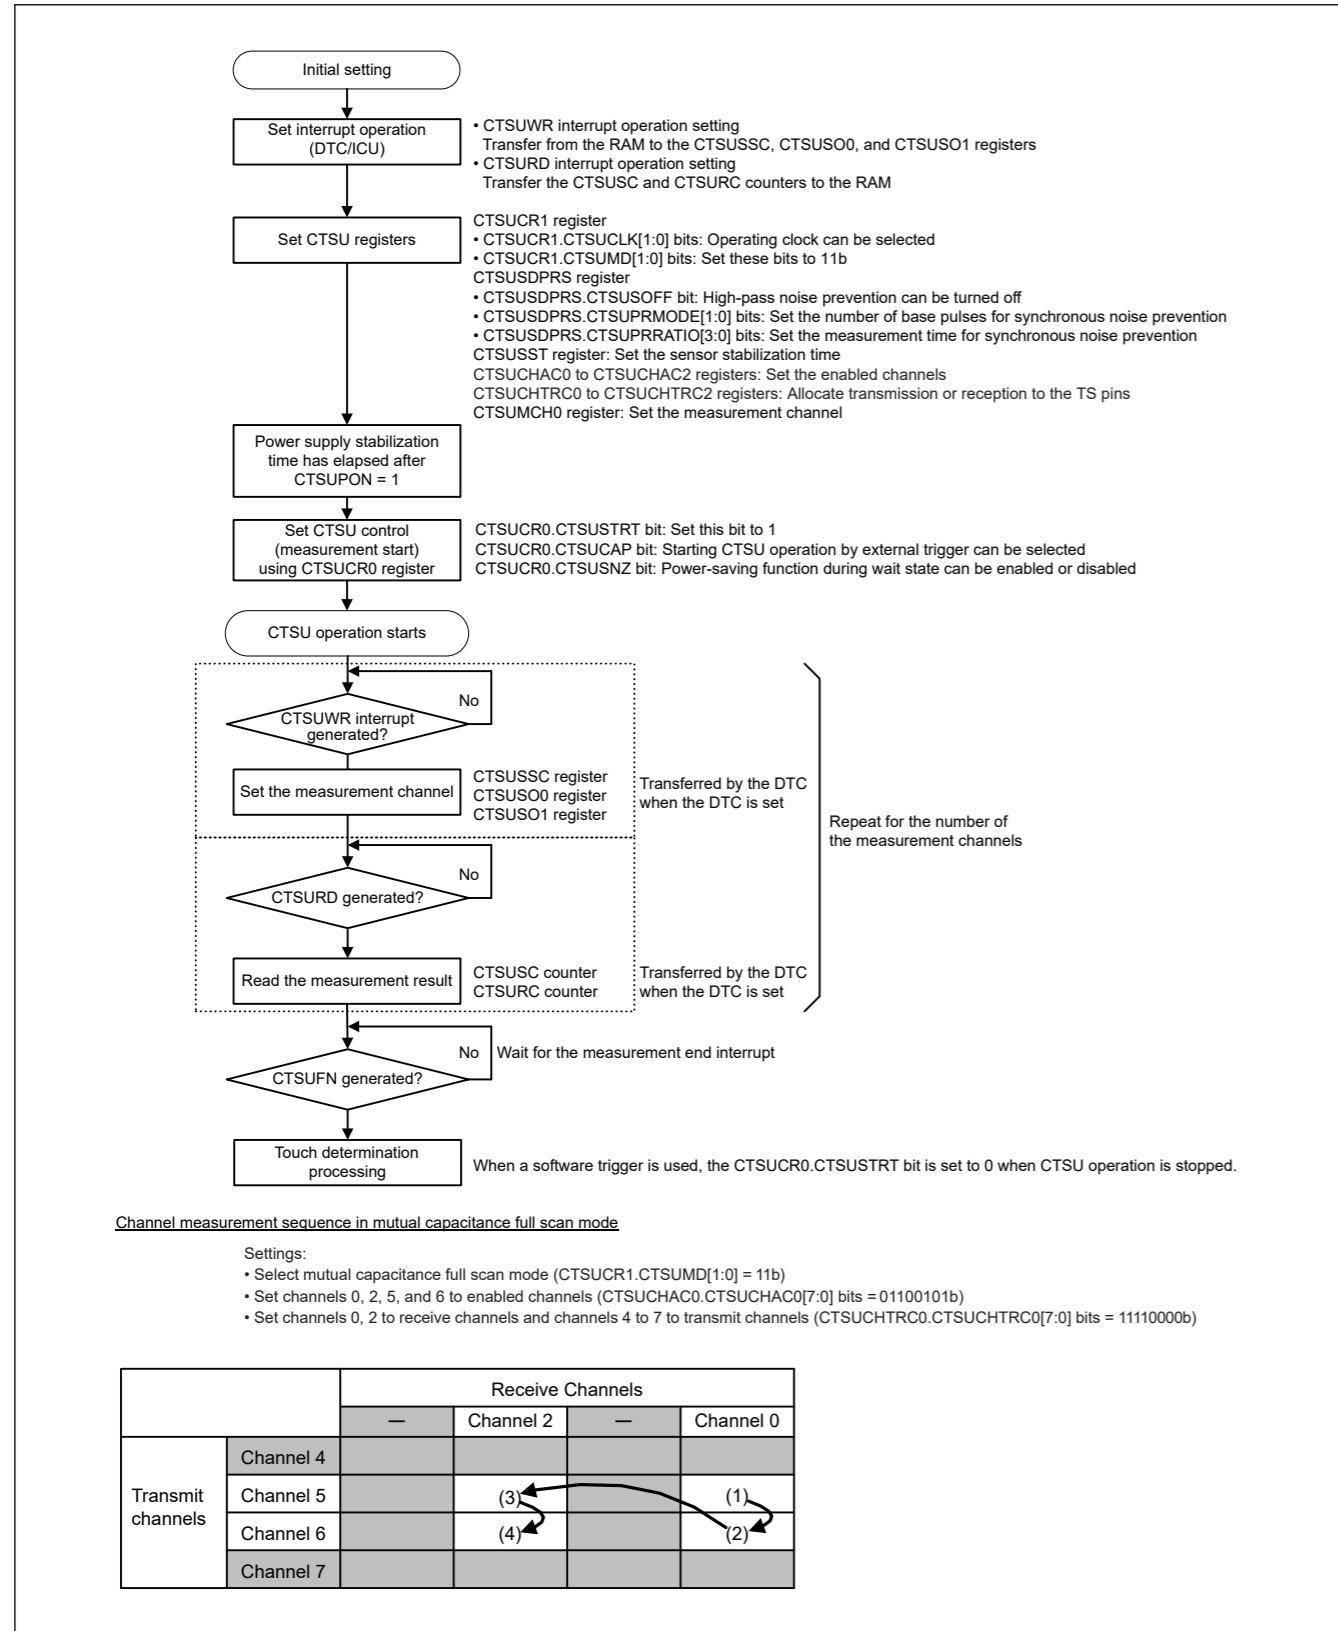

Figure 40.16 Software flow and example operation for mutual capacitance full scan mode

在CTSUCHTRC0中设置为发送或接收的通道上依次测量静电电容 CTSUCHAC2寄存器,并在CTSUCHAC0至CTSUCHAC2寄存器中指定为测量目标。通过组合这些信号来测量电容。图40.16显示了软件流程和操作示例,图40.17显示了时序。

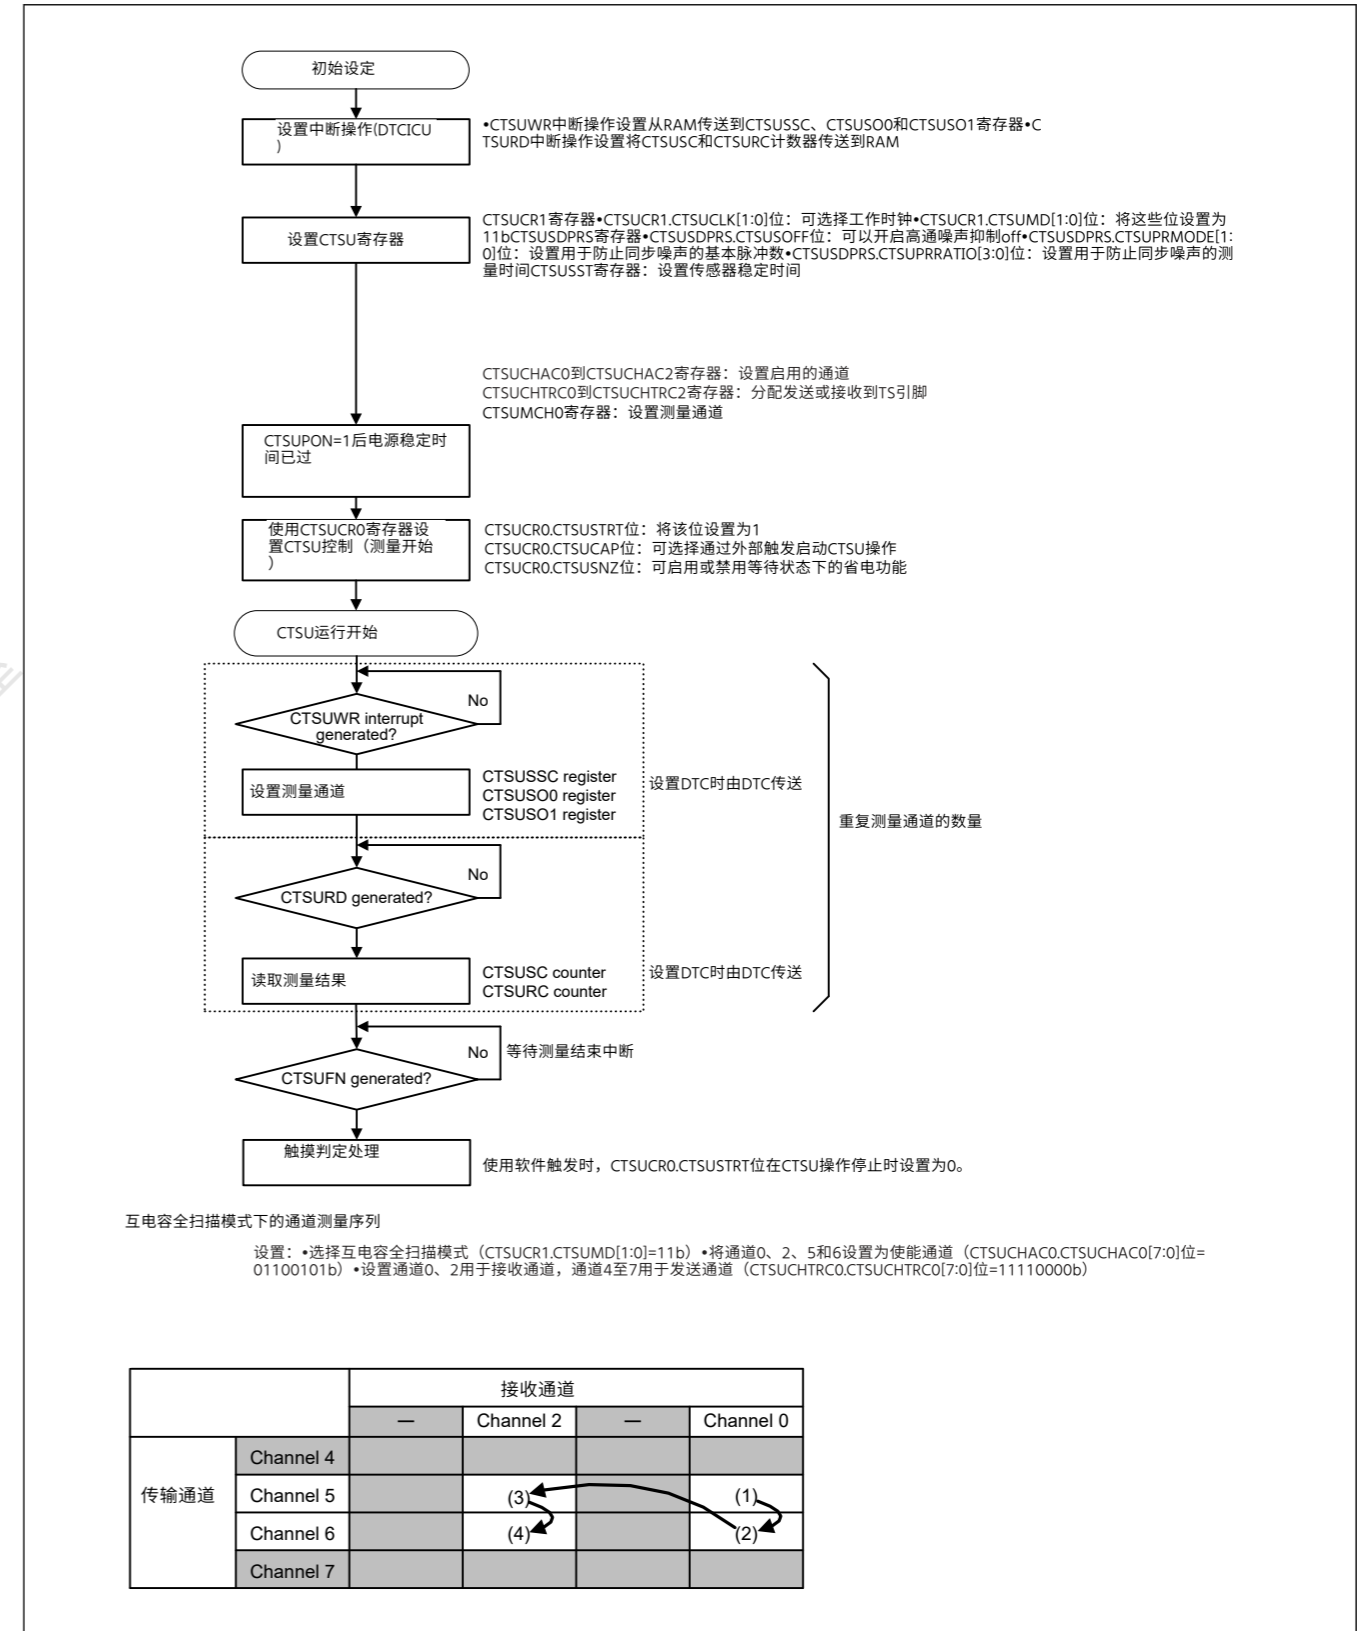

Figure 40.16 互电容全扫描模式的软件流程和示例操作

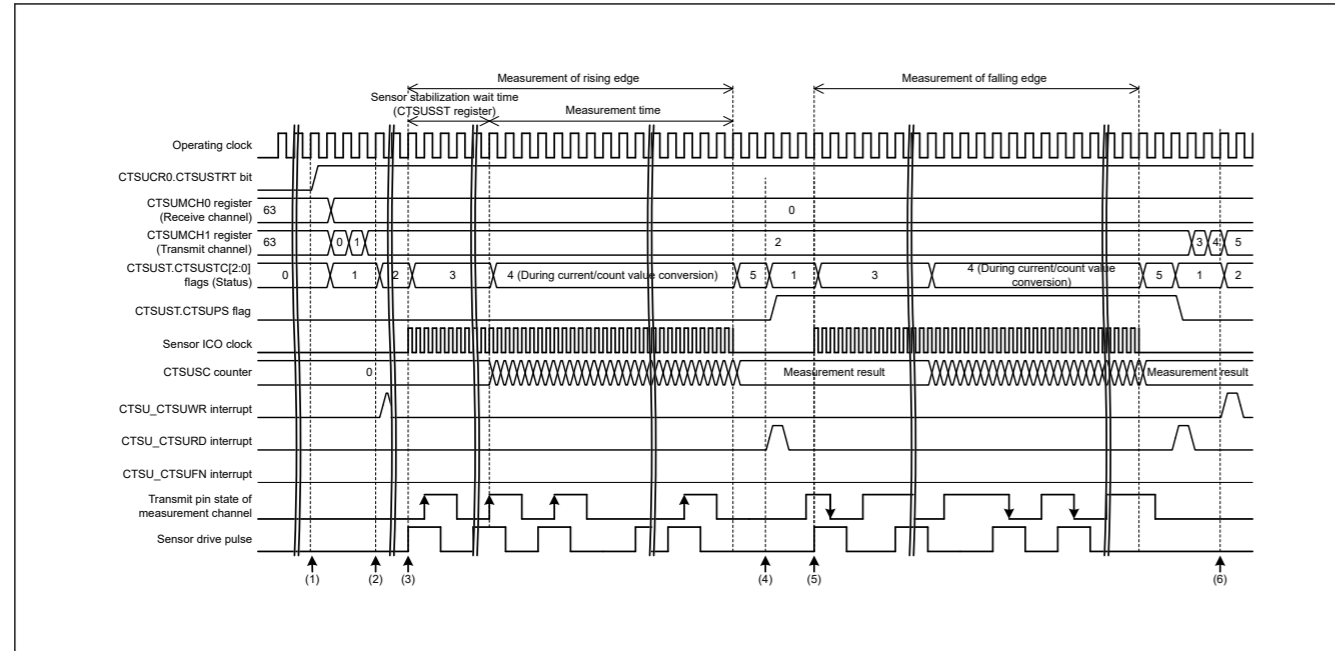

Figure 40.17 Timing of mutual capacitance full scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 40.17

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU\_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and the reference ICO clock operate. At the same time, a pulse detected on the rising edge is output to the transmit pin on the measurement channel during the high-level period of the sensor drive pulse.
4. After the sensor stabilization wait time and the measurement time elapsed and measurement stops, a measurement result read request (CTSU\_CTSURD) is output.
5. The same channel is measured by outputting a pulse detected on the falling edge during the high-level period of the sensor drive pulse.
6. After the same channel is measured twice, the channel to be measured next is determined and measured in the same way.
7. On completion of all measurement channels, a measurement end interrupt (CTSU\_CTSUFN) is output and measurement stops (transition to Status 0).

The mutual capacitance measurement status flag (CTSUST.CTSUPS bit) changes when Status 5 transitions to Status 1. Table 40.9 lists the touch pin states in mutual capacitance full scan mode.

Table 40.9 Touch pin states in mutual capacitance full scan mode (1 of 2)

| Status | Touch pins for receive channels |                      | Touch pins for transmit channels |                      | Remarks   |
|--------|---------------------------------|----------------------|----------------------------------|----------------------|---|
|        | Measured channel                | Non-measured channel | Measured channel                 | Non-measured channel |   |
| 0      | Low                             | Low                  | Low                              | Low                  | —   |
| 1      | Low                             | Low                  | Low/high                         | Low                  | —   |
| 2      | Low                             | Low                  | Low                              | Low                  | —   |
| 3      | Pulse                           | Low                  | Pulse                            | Low                  | The phase pulse is the same as that of the receive channel on the first measurement and opposite on the second measurement. |
| 4      | Pulse                           | Low                  | Pulse                            | Low                  | —   |

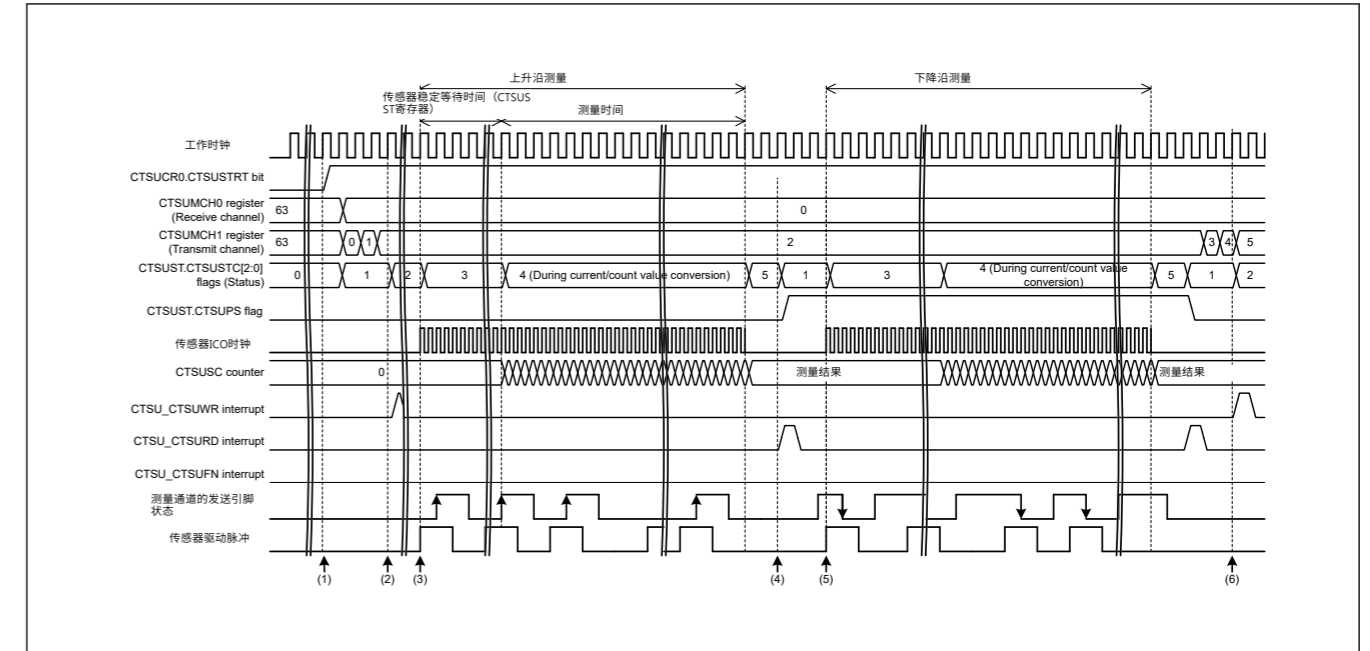

Figure 40.17 测量开始条件为软件触发时互电容全扫描模式的时序

下面介绍图40.17所示的操作

1. 进行初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。
2. 根据预设条件确定待测通道后，输出通道设置请求（CTSU\_CTSUWR）。
3. 写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。同时，在传感器驱动脉冲的高电平期间，将在上升沿检测到的脉冲输出到测量通道的发送引脚。
4. 在传感器稳定等待时间和测量时间过去并停止测量后，输出测量结果读取请求（CTSU\_CTSURD）。
5. 通过在传感器驱动脉冲的高电平期间输出下降沿检测到的脉冲来测量同一通道。
6. 同一个通道测量两次后，确定下一个要测量的通道，用同样的方法测量。
7. 所有测量通道完成后，输出测量结束中断(CTSU\_CTSUFN)并停止测量（转换到状态0）。

互电容测量状态标志（CTSUST.CTSUPS位）在状态5转换为状态1时发生变化。表40.9列出了互电容全扫描模式下的触摸引脚状态。

Table 40.9 互电容全扫描模式下的触摸引脚状态（1of2）

| Status | 接收通道的触摸引脚 |                      | 用于传输通道的触摸引脚 |                      | Remarks                              |
|--------|-----------|----------------------|-------------|----------------------|--------------------------------------|
|        | 测量通道      | Non-measured channel | 测量通道        | Non-measured channel |                                      |
| 0      | Low       | Low                  | Low         | Low                  | —                                    |
| 1      | Low       | Low                  | Low/high    | Low                  | —                                    |
| 2      | Low       | Low                  | Low         | Low                  | —                                    |
| 3      | Pulse     | Low                  | Pulse       | Low                  | 相位脉冲在第一次测量时与接收通道的相位脉冲相同，而在第二次测量时则相反。 |
| 4      | Pulse     | Low                  | Pulse       | Low                  | —                                    |

Table 40.9 Touch pin states in mutual capacitance full scan mode (2 of 2)

| Status | Touch pins for receive channels |                      | Touch pins for transmit channels |                      | Remarks |

|        | Measured channel                | Non-measured channel | Measured channel                 | Non-measured channel |         |
| 5      | Low                             | Low                  | Low                              | Low                  | —       |

## 40.3.3 Parameters Common to Multiple Modes

## 40.3.3.1 Sensor stabilization wait time and measurement time

Figure 40.18 shows the timing of the sensor stabilization wait and measurement.

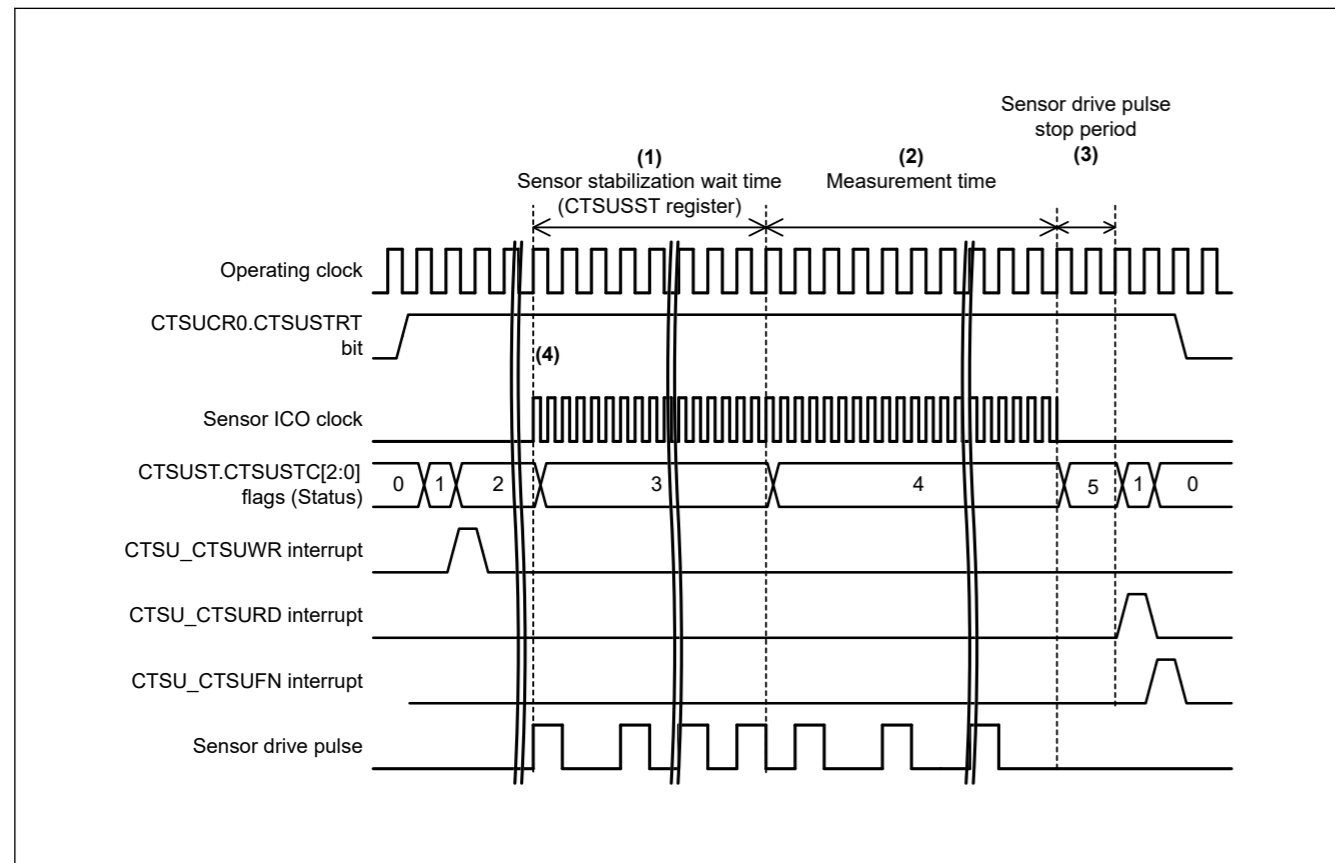

Figure 40.18 Sensor stabilization wait and measurement timing

The following describes the operation shown in Figure 40.18:

- In response to the CTSU\_CTSUWR interrupt request, output of the sensor drive pulse is started by a write access to the CTSUSO1 register. The CTSU waits for the stabilization time set in the CTSUSST register.
- When the sensor stabilization time elapses and the CTSUST.CTSUDTSR flag clears to 0, measurement starts on transition to Status 4. The measurement time is determined by the base clock cycle setting and the CTSUSDPRS.CTSUPRMODE[1:0], CTSUPRRATIO[3:0], and CTSUSO0.CTSUSNUM[5:0] bits. When the measurement time elapses, measurement of the channel stops.
- After the measurement time elapses, the status transitions to Status 1 after two operating clock cycles, and a CTSU\_CTSURD interrupt occurs. Read the data from the CTSUSC and CTSURC counters. At this time, the sensor drive pulse is output at the low level. When measurement of all specified channels is completed, the CTSUCR0.CTSUSTRT bit clears to 0.
- The sensor ICO clock oscillates while the CTSUST.CTSUSTC[2:0] flags = 011b (Status 3) or 100b (Status 4).

Table 40.9 互电容全扫描模式下的触摸引脚状态 (2个中的2个)

| Status | 接收通道的触摸引脚 |                      | 用于传输通道的触摸引脚 |                      | Remarks |
|--------|-----------|----------------------|-------------|----------------------|---------|
|        | 测量通道      | Non-measured channel | 测量通道        | Non-measured channel |         |
| 5      | Low       | Low                  | Low         | Low                  | —       |

## 40.3.3 多种模式共有的参数

## 40.3.3.1 传感器稳定等待时间和测量时间

图40.18显示了传感器稳定等待和测量的时序。

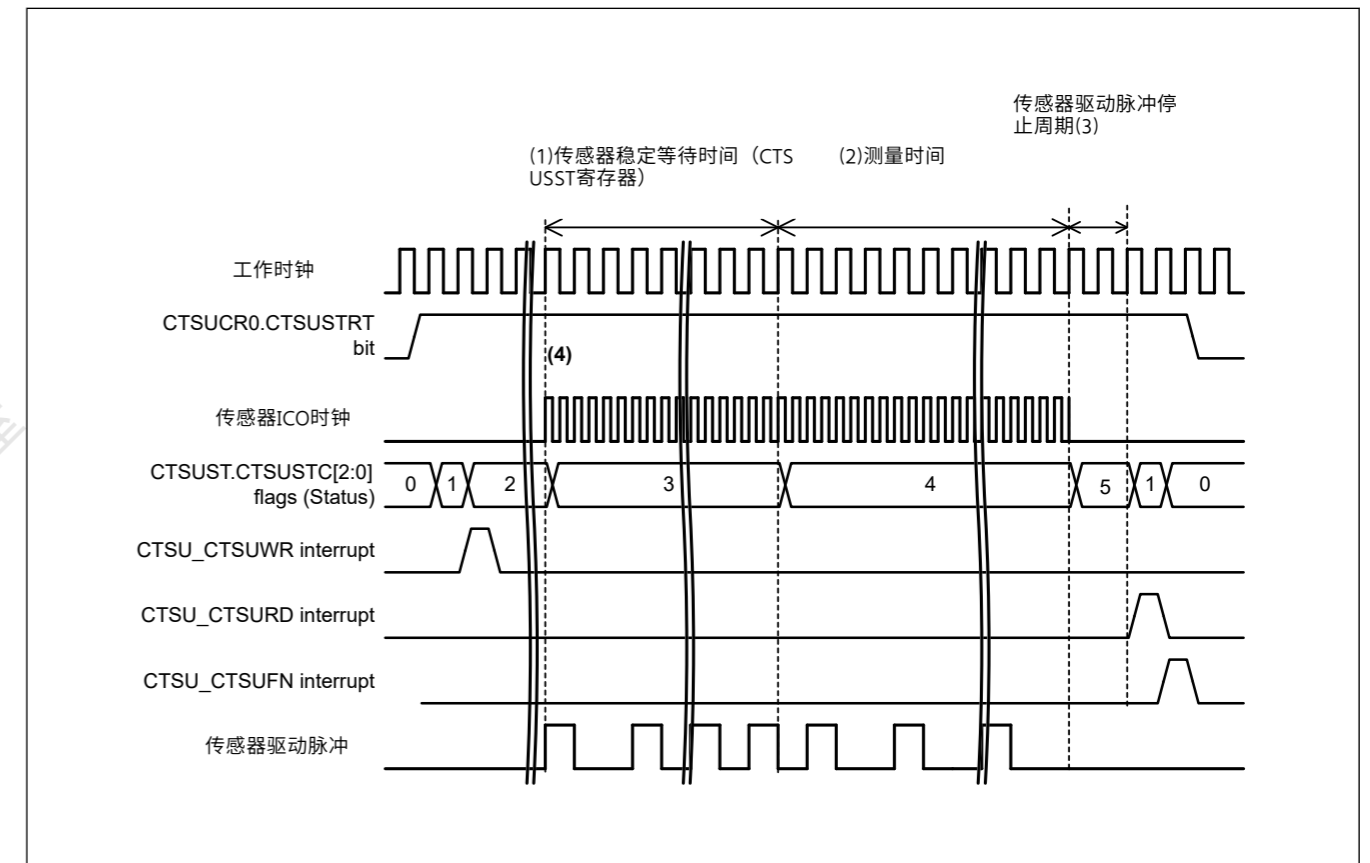

Figure 40.18 传感器稳定等待和测量定时

下面介绍图40.18所示的操作：

- 响应CTSU\_CTSUWR中断请求，通过对CTSUSO1寄存器的写访问开始输出传感器驱动脉冲。CTSUSST寄存器中设置的稳定时间。
- 当传感器稳定时间过去且CTSUST.CTSUDTSR标志清除为0时，测量开始转换到状态4。测量时间由基本时钟周期设置和CTSUSDPRS.CTSUPRMODE[1:0]、CTSUPRRATIO[3:0]和CTSUSO0.CTSUSNUM[5:0]位。当测量时间过去时，通道的测量将停止。
- 测量时间过去后，状态会在两个工作时钟周期后转换为状态1，并且 CTSU\_CTSURD中断发生。从CTSUSC和CTSURC计数器读取数据。此时，传感器驱动脉冲输出为低电平。完成所有指定通道的测量后，CTSUCR0.CTSUSTRT位清零。
- 传感器ICO时钟在CTSUST.CTSUSTC[2:0]标志=011b（状态3）或100b（状态4）时振荡。

## 40.3.3.2 Interrupts

The CTSU supports the following interrupts:

- Write request interrupt for setting registers for each channel (CTSUSUWR)
- Measurement data transfer request interrupt (CTSUSURD)
- Measurement end interrupt (CTSUSUFN)

## (1) Write request interrupt for setting registers for each channel (CTSUSUWR)

Store the settings for each measurement channel in the SRAM, and set up the DTC or ICU transfer associated with the CTSUSUWR interrupt in advance. The CTSUSUWR interrupt is output when Status 1 transitions to Status 2. Write the settings for the selected channel from the SRAM to the CTSUSSC, CTSUSO0, and CTSUSO1 registers (Figure 40.19). Because write access to the CTSUSO1 register controls the transition to the next status, you must set this register last.

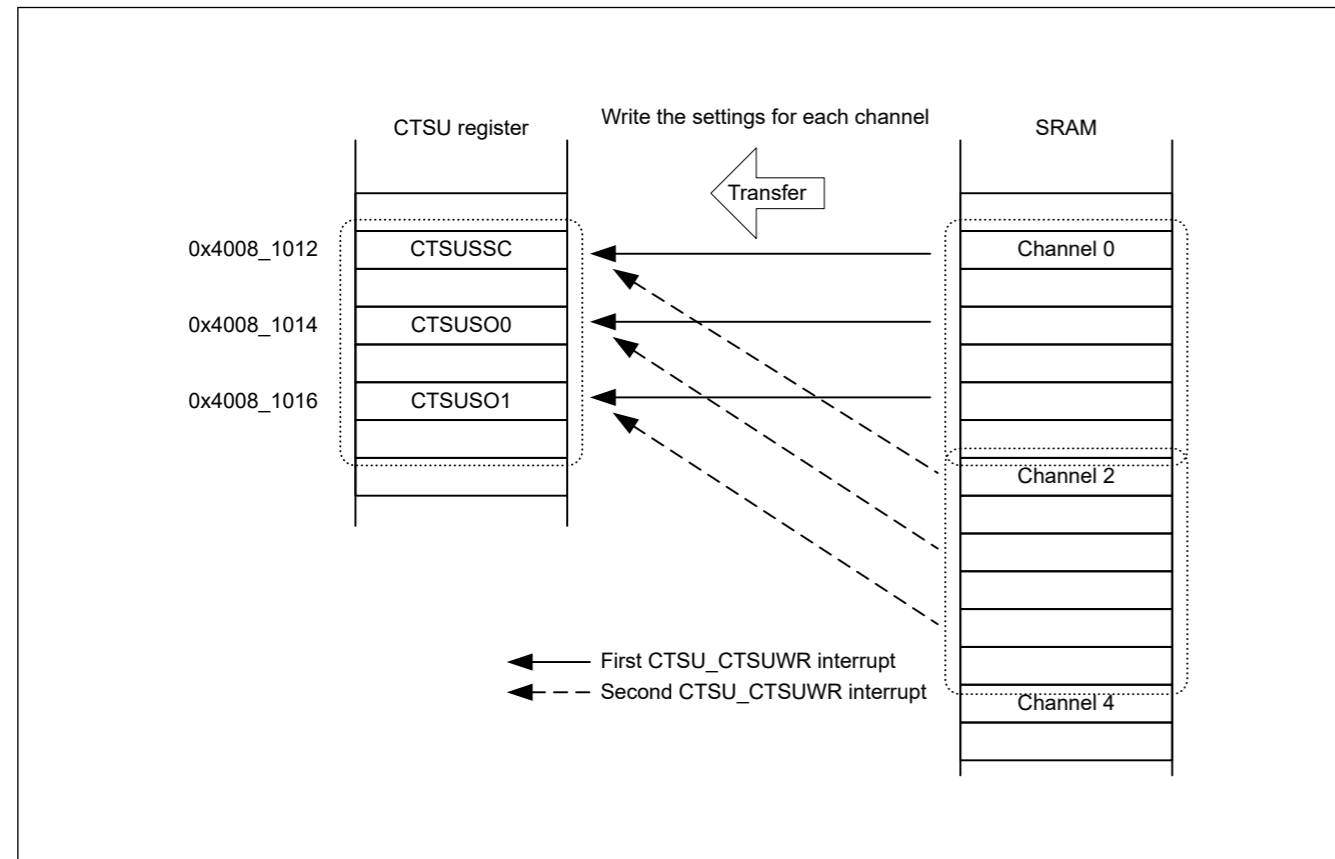

Figure 40.19 Example of DTC transfer operation using the CTSUSUWR interrupt

The registers to be set (CTSUSSC, CTSUSO0, and CTSUSO1) are allocated at sequential addresses. On CTSUSUWR interrupt generation, set up the operation as follows:

- Transfer destination address: CTSUSSC register address
- Handling at the transfer destination address: Transfer 2-byte data three times with a single interrupt. The address of the start byte is fixed.
- Transfer source address: CTSUSSC register data storage address for the lowest number channel in the settings stored in the SRAM
- Handling at the transfer source address: Transfer 2-byte data three times with a single interrupt. The address of the first byte is continued from the previous interrupt handling.
- Number of transfers per interrupt: Specify the number of measurements.

## 40.3.3.2 Interrupts

CTSUS支持以下中断:

- 各通道设置寄存器的写请求中断(CTSUSUWR)
- 测量数据传输请求中断 (CTSUSURD)
- 测量结束中断 (CTSUSUFN)

## (1) 为每个通道设置寄存器的写请求中断(CTSUSUWR)

将每个测量通道的设置存储在SRAM中，并提前设置与CTSUSUWR中断相关的DTC或ICU传输。当状态1切换到状态2时输出CTSUSUWR中断。

将所选通道的设置从SRAM写入CTSUSSC、CTSUSO0和CTSUSO1寄存器（图40.19）。因为对CTSUSO1寄存器的写访问控制到下一个状态的转换，所以您必须最后设置该寄存器。

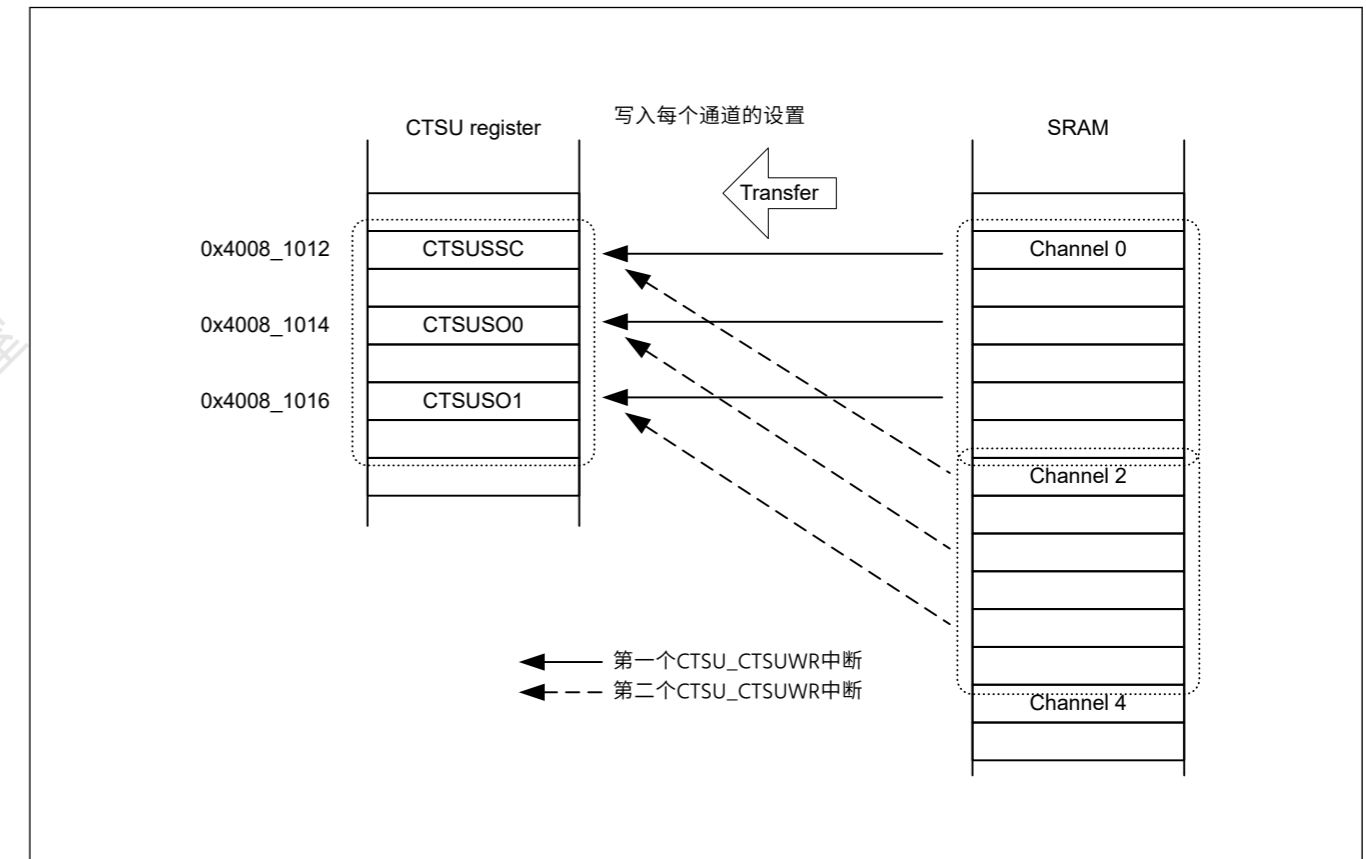

Figure 40.19 使用CTSUSUWR中断的DTC传输操作示例

要设置的寄存器（CTSUSSC、CTSUSO0和CTSUSO1）分配在顺序地址。在产生CTSUSUWR中断时，按如下方式设置操作：

- 传输目标地址：CTSUSSC寄存器地址
- 在传送目标地址处处理：一次中断传送3次2字节数据。起始字节的地址是固定的。
- 传输源地址：CTSUSSC寄存器数据存储地址，用于存储在SRAM中的设置中的最低编号通道
- 在传输源地址处处理：一次中断传输3次2字节数据。第一个字节的地址从先前的中断处理继续。
- 每个中断的传输次数：指定测量次数。

## (2) Measurement data transfer request interrupt (CTSUS\_CTSURD)

Set up the DTC or ICU transfer associated with the CTSUS\_CTSURD interrupt in advance. The CTSUS\_CTSURD interrupt is output when Status 5 transitions to Status 1. Read the measurement result from the CTSUSC and CTSURC counters (Figure 40.20).

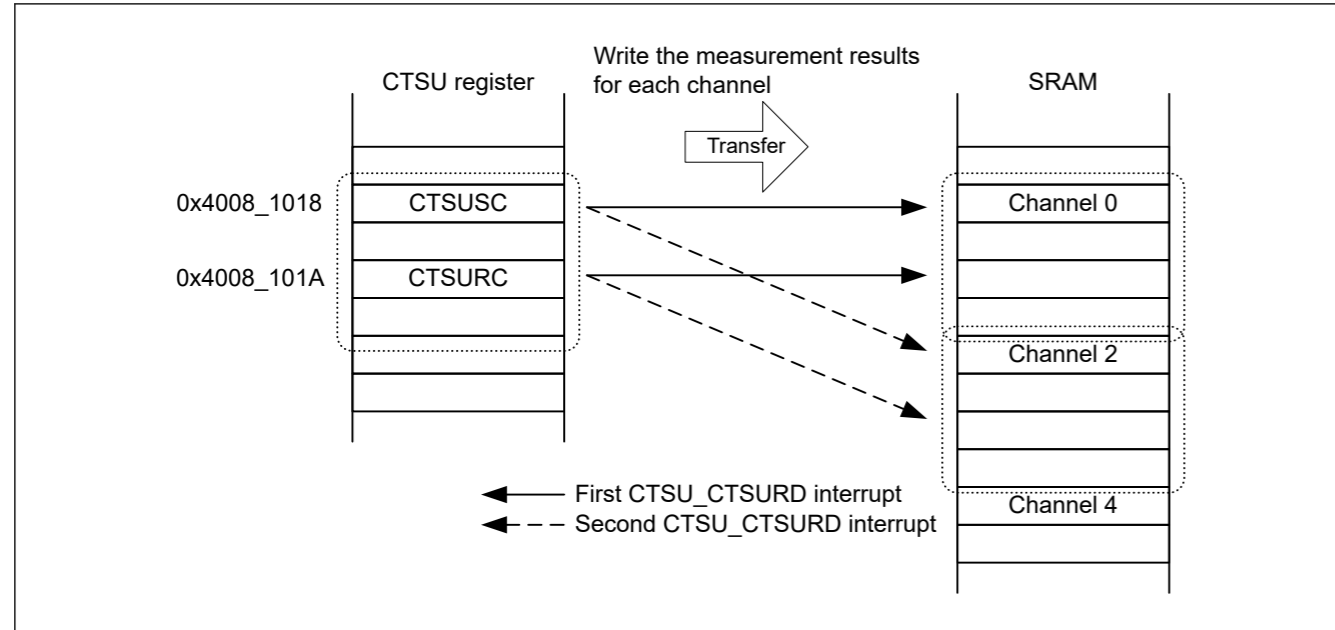

Figure 40.20 Example of DTC transfer operation using the CTSUS\_CTSURD interrupt

The measurement result registers (CTSUSC and CTSURC counters) used as transfer sources are allocated at sequential addresses. On CTSUS\_CTSURD interrupt generation, set up the operation as follows:

- Transfer source address: CTSUSC counter address
- Handling at the transfer source address: Transfer 2-byte data twice with a single interrupt. The start address is fixed.
- Transfer destination address: CTSUSC counter data storage address for the lowest number channel in the settings stored in the SRAM
- Handling at the transfer destination address: Transfer 2-byte data twice with a single interrupt. The start address is continued from the previous interrupt handling.
- Number of transfers per interrupt: Specify the number of measurements.

## (3) Measurement end interrupt (CTSUS\_CTSUFN)

When all channels are measured, an interrupt occurs when Status 1 transitions to Status 0. In the software, check the overflow flags (CTSUST.CTSUSOVF and CTSUROVF) and read the measurement results to determine whether or not the electrode was touched. Interrupt requests are accepted or disabled in the interrupt control block.

## 40.4 Usage Notes

## 40.4.1 Measurement Result Data (CTSUSC and CTSURC Counters)

Read access during measurement is prohibited. If the measurement result data is accessed, an incorrect value might be read because of asynchronous operation.

## 40.4.2 Constraint on Software Trigger

When 10b (PCLKB/4) is selected in the CTSUCR1.CTSUCLK[1:0] bits, to restart measurement by writing 1 to the CTSUR0.CTSUSTRT bit after measurement is complete, wait for at least 3 cycles to elapse after an interrupt occurs, and then write to the CTSUCR0.CTSUSTRT bit.

## (2) 测量数据传输请求中断(CTSUS\_CTSURD)

提前设置与CTSUS\_CTSURD中断相关的DTC或ICU传输。当状态5转换为状态1时输出CTSUS\_CTSURD中断。从CTSUSC和CTSURC计数器读取测量结果(图40.20)。

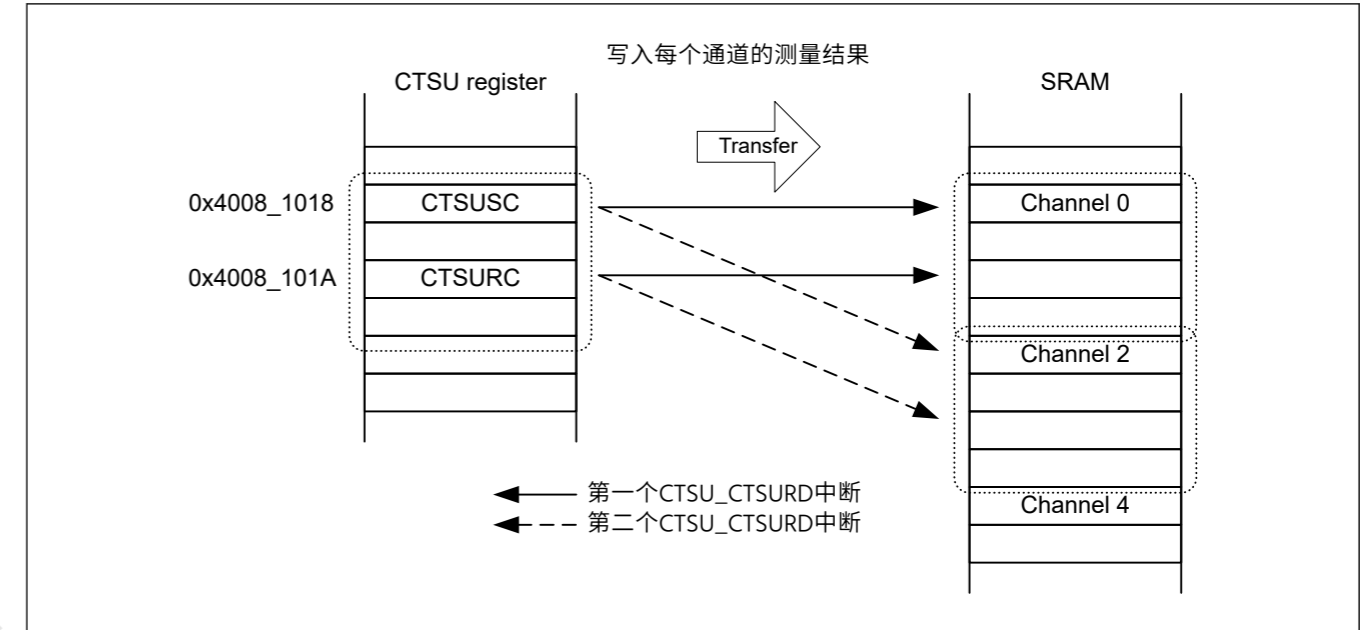

Figure 40.20 使用CTSUS\_CTSURD中断的DTC传输操作示例

用作传输源的测量结果寄存器（CTSUSC和CTSURC计数器）按顺序分配。在CTSUS\_CTSURD中断生成时，按如下方式设置操作：

- 传输源地址：CTSUSC计数器地址
- 在传输源地址处处理：一次中断传输2字节数据两次。起始地址是固定的。
- 传输目标地址：SRAM中存储的设置中编号最小的通道的CTSUSC计数器数据存储地址
- 传送目标地址处的处理：一次中断传送2字节数据两次。起始地址从先前的中断处理继续。
- 每个中断的传输次数：指定测量次数。

## (3) 测量结束中断(CTSUS\_CTSUFN)

测量所有通道时，状态1转换为状态0时发生中断。在软件中，检查溢出标志（CTSUST.CTSUSOVF和CTSUROVF）并读取测量结果以确定电极是否被触摸。在中断控制块中接受或禁用中断请求。

## 40.4 使用说明

## 40.4.1 测量结果数据（CTSUSC和CTSURC计数器）

禁止在测量期间进行读取访问。如果访问测量结果数据，可能会因为异步操作而读取到不正确的值。

## 40.4.2 软件触发约束

当在CTSUCR1.CTSUCLK[1:0]位中选择10b(PCLKB/4)时，通过将1写入测量完成后CTSUR0.CTSUSTRT位，在发生中断后至少等待3个周期，然后写入CTSUCR0.CTSUSTRT位。

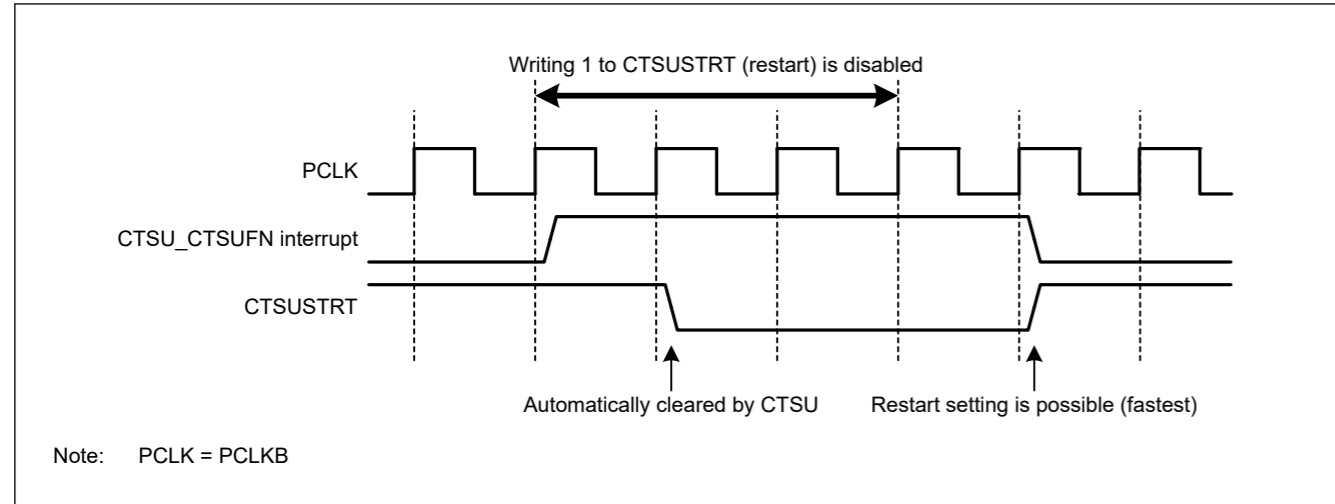

Figure 40.21 Notes on restarting measurement

#### 40.4.3 Constraints on External Triggers

- If an external trigger is input during the measurement time, measurement does not start. The next external event is enabled after 1 cycle of the operating clock when a CTSU\_CTSUFN interrupt occurs.
- To stop external trigger mode, write 0 to the CTSUCR0.CTSUSTRT bit and 0 to the CTSUCR0.CTSUINIT bit at the same time (forced stop).

#### 40.4.4 Constraints on Forced Stops

To force the current operation to stop, write 0 to the CTSUCR0.CTSUSTRT bit and 1 to the CTSUCR0.CTSUINIT bit at the same time. After this setting, the operation is stopped and the internal control registers are initialized.

When the CTSUCR0.CTSUINIT bit is used for initialization, the following registers are initialized in addition to the initialization of the internal measurement state.

- CTSUMCH0 register
- CTSUMCH1 register
- CTSUST register
- CTSUSC counter
- CTSURC counter

If operation is forced to stop, an interrupt request might be generated depending on the internal state. After a forced stop, also perform the processing for stopping and disabling the DTC or ICU. If a DTC transfer is stopped in an installed system for some reason, also perform the processing for forcing stop to and initializing the CTSU.

#### 40.4.5 TSCAP Pin

The TSCAP pin requires an external decoupling capacitor to stabilize CTSU internal voltage. The traces between the TSCAP pin and the capacitor, and the capacitor and ground should be as short and wide as physically possible.

The capacitor connected to the TSCAP pin should be fully discharged using I/O port control to output a low level, before turning on the switch (CTSUCR1.CTSUCSW bit = 1) to establish a connection.

#### 40.4.6 Constraints on Measurement Operation (CTSUCR0.CTSUSTRT Bit = 1)

During measurement (CTSUCR0.CTSUSTRT bit = 1), do not use the settings for stopping the peripheral clock or changing the port settings related to the touch pins (TSn and TSCAP pins) and Transmission power supply selection (CTSUCR0.CTSUTXVSEL) in the higher layers of the system.

If control settings non-compliant with these constraints are made, operation is forced to stop (CTSUCR0.CTSUSTRT bit = 0 and CTSUCR0.CTSUINIT bit = 1), write 0 to the CTSUCR1.CTSUPON bit and 0 to the CTSUCR1.CTSUCSW bit at the same time, and set the CTSUCR0.CTSUSNZ bit to 0. Next, restart from the initial settings flow shown in Figure 40.9.

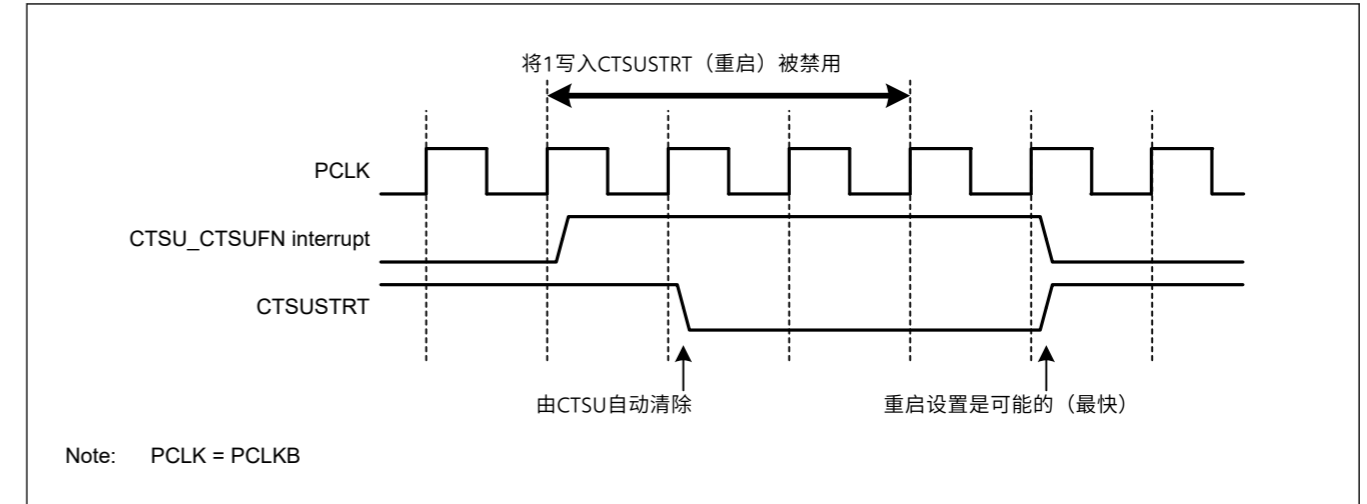

Figure 40.21 重新开始测量的注意事项

#### 40.4.3 外部触发器的约束

- 如果在测量期间输入了外部触发，则测量不会开始。当CTSUS\_CTSUFN中断发生时，下一个外部事件在工作时钟的1个周期后启用。
- 要停止外部触发模式，同时将0写入CTSUCR0.CTSUSTRT位和0写入CTSUCR0.CTSUINIT位（强制停止）。

#### 40.4.4 强制停止的约束

要强制停止当前操作，请同时向CTSUCR0.CTSUSTRT位写入0，向CTSUCR0.CTSUINIT位写入1。设置完成后，操作停止，内部控制寄存器初始化。

当CTSUCR0.CTSUINIT位用于初始化时，除了内部测量状态的初始化之外，还初始化以下寄存器。

- CTSUMCH0 register
- CTSUMCH1 register
- CTSUST register
- CTSUSC counter
- CTSURC counter

如果操作被强制停止，根据内部状态可能会产生中断请求。强制停止后，还要执行停止和禁用DTC或ICU的处理。如果由于某种原因在已安装的系统中停止了DTC传输，则还要执行强制停止和初始化CTSUS的处理。

#### 40.4.5 TSCAP Pin

TSCAP引脚需要一个外部去耦电容来稳定CTSUS内部电压。之间的痕迹TSCAP引脚和电容器，以及电容器和地线应尽可能短且宽。

在打开开关（CTSUCR1.CTSUCSW位=1）建立连接之前，应使用IO端口控制将连接到TSCAP引脚的电容器完全放电以输出低电平。

#### 40.4.6 测量操作的限制（CTSUCR0.CTSUSTRT位=1）

在测量期间（CTSUCR0.CTSUSTRT位=1），请勿使用与触摸引脚（TSn和TSCAP引脚）和发送电源选择（CTSUCR0.CTSUTXVSEL）相关的端口设置停止外围时钟或更改高位系统的层次。

如果进行了不符合这些约束的控制设置，则强制停止操作（CTSUCR0.CTSUSTRT位=0且CTSUCR0.CTSUINIT位=1），将0写入CTSUCR1.CTSUPON位并将0写入CTSUCR1.CTSUCSW位同时，将CTSUCR0.CTSUSNZ位设置为0。接下来，从图40.9所示的初始设置流程重新启动。

## 41. Data Operation Circuit (DOC)

### 41.1 Overview

The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. When a selected condition applies, 16-bit data is compared and an interrupt can be generated. Table 41.1 lists the DOC specifications and Figure 41.1 shows a block diagram.

Table 41.1 DOC specifications

| Parameter                                      | Specifications  |
|--|---|
| Data operation function                        | 16-bit data comparison, addition, and subtraction   |
| Module-stop function                           | The module-stop state can be set to reduce power consumption.   |
| Interrupts and event link function (DOC_DOPCI) | An interrupt occurs on the following conditions: <ul style="list-style-type: none"> <li>The compared values either match or mismatch</li> <li>The result of data addition is greater than 0xFFFF</li> <li>The result of data subtraction is less than 0x0000</li> </ul> |
| TrustZone Filter                               | Security attribution can be set   |

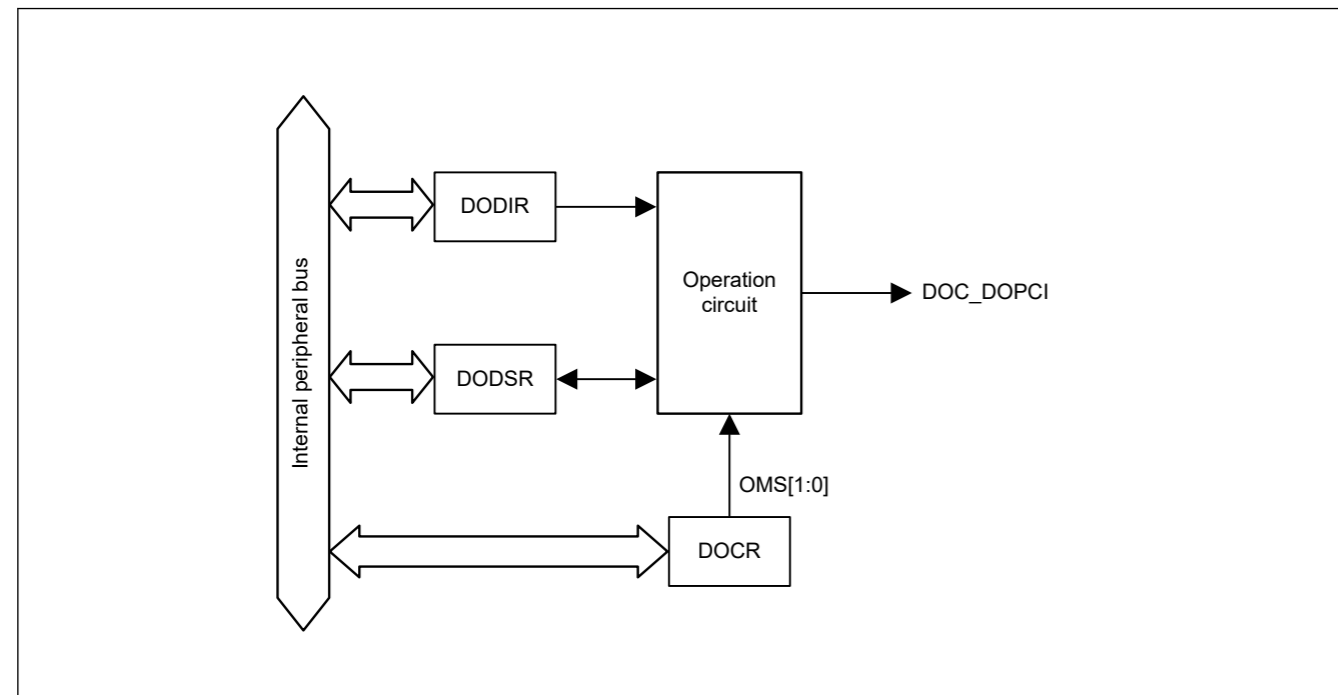

Figure 41.1 DOC block diagram

### 41.2 DOC Register Descriptions

#### 41.2.1 DOCR : DOC Control Register

Base address: DOC = 0x4010\_9000

Offset address: 0x00

|                    |   |             |           |   |   |           |          |   |

## 41. 数据运算电路(DOC)

### 41.1 Overview

数据运算电路(DOC)对16位数据进行比较、加法和减法。当适用选定条件时, 比较16位数据并可以生成中断。表4.1.1列出了DOC规范, 图4.1.1显示了框图。

Table 41.1 文档规范

| Parameter             | Specifications   |
|-----------------------|--|
| 数据运算功能                | 16位数据比较、加法和减法  |
| Module-stop function  | 可设置模块停止状态以降低功耗。  |
| 中断和事件链接功能 (DOC_DOPCI) | 在以下情况下会发生中断: ●<br>比较的值匹配或不匹配<br>● 数据相加结果大于0xFFFF<br>● 数据减法结果小于0x0000 |
| TrustZone Filter      | 可设置安全属性  |

| 1:0 | OMS[1:0] | Operating Mode Select<br>0 0: Data comparison mode<br>0 1: Data addition mode<br>1 0: Data subtraction mode<br>1 1: Setting prohibited | R/W |
| 2   | DCSEL*1  | Detection Condition Select<br>0: Set DOPCF flag when data mismatch is detected<br>1: Set DOPCF flag when data match is detected        | R/W |
| 4:3 | —        | These bits are read as 0. The write value should be 0.   | R/W |
| 5   | DOPCF    | DOC Flag<br>Indicates the result of an operation.  | R   |
| 6   | DOPCFCL  | DOPCF Clear<br>0: Retain DOPCF flag state<br>1: Clear DOPCF flag   | R/W |
| 7   | —        | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. Only valid when data comparison mode is selected.

#### OMS[1:0] bits (Operating Mode Select)

The OMS[1:0] bits select the operating mode of the DOC.

#### DCSEL bit (Detection Condition Select)

The DCSEL bit selects the detection condition in data comparison mode. This bit is only valid when data comparison mode is selected.

#### DOPCF flag (DOC Flag)

The DOPCF flag indicates the result of an operation.

[Setting conditions]

- The result of data comparison matches the condition selected in the DCSEL bit
- A data addition result is greater than 0xFFFF
- A data subtraction result is less than 0x0000

[Clearing condition]

- Writing 1 to the DOPCFCL bit

#### DOPCFCL bit (DOPCF Clear)

Setting the DOPCFCL bit to 1 clears the DOPCF flag. This bit is read as 0.

### 41.2.2 DODIR : DOC Data Input Register

Base address: DOC = 0x4010\_9000

Offset address: 0x02

|                    |             |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |

| Bit position:      | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | [Empty box] |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol | Function                                      | R/W |
|------|--------|---|-----|
| 15:0 | n/a    | It stores 16-bit data used in the operations. | R/W |

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 1:0 | OMS[1:0] | 操作模式选择<br>00: 数据比较模式<br>01: 数据加法模式<br>10: 数据减法模式<br>11: 禁止设置 | R/W |
| 2   | DCSEL*1  | 检测条件选择<br>0: 检测到数据不匹配时设置DOPCF标志<br>1: 检测到数据匹配时设置DOPCF标志      | R/W |
| 4:3 | —        | 这些位被读取为0。写入值应为0。   | R/W |
| 5   | DOPCF    | 文档标志<br>表示操作的结果。   | R   |
| 6   | DOPCFCL  | DOPCF Clear<br>0: 保持DOPCF标志状态<br>1: 清除DOPCF标志                | R/W |
| 7   | —        | 这些位被读取为0。写入值应为0。   | R/W |

注1. 仅在在选择数据比较模式时有效。

#### OMS[1:0]位 (操作模式选择)

OMS[1:0]位选择DOC的工作模式。

#### DCSEL位 (检测条件选择)

DCSEL位选择数据比较模式下的检测条件。该位仅在在选择数据比较模式时有效。

#### DOPCF flag (DOC Flag)

DOPCF标志指示操作的结果。

[Setting conditions]

- 数据比较的结果符合DCSEL位中选择的条件
- 数据相加结果大于0xFFFF
- 数据减法结果小于0x0000

[Clearing condition]

- DOPCFCL位写1

#### DOPCFCL bit (DOPCF Clear)

将DOPCFCL位设置为1会清除DOPCF标志。该位读为0。

### 41.2.2 DODIR:DOC数据输入寄存器

Base address: DOC = 0x4010\_9000

Offset address: 0x02

|               |             |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|---------------|-------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | [Empty box] |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| 重置后的值:        | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol | Function        | R/W |
|------|--------|-----------------|-----|
| 15:0 | n/a    | 它存储操作中使用的16位数据。 | R/W |

41.2.3 DODSR : DOC Data Setting Register

Base address: DOC = 0x4010\_9000

Offset address: 0x04

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 15:0 | n/a    | It stores 16-bit data used as a reference in data comparison mode. This register also stores the results of operations in data addition and subtraction modes. | R/W |

41.3 Operation

41.3.1 Data Comparison Mode

Figure 41.2 shows an example operation in data comparison mode operation by the DOC. The following sequence is an example operation when DCSEL is set to 0 (data mismatch is detected as a result of data comparison):

1. Write 00b to the DOCR.OMS[1:0] bits to select data comparison mode.
2. Set 16-bit reference data in DODSR.
3. Write the 16-bit data for comparison to DODIR.
4. Continue writing the 16-bit data until all data for comparison is written to DODIR.
5. If a value written to DODIR does not match that in DODSR, the DOCR.DOPCF flag is set to 1.

Figure 41.2 Example of operation in data comparison mode

41.3.2 Data Addition Mode

Figure 41.3 shows an example operation in data addition mode. The steps are as follows:

1. Write 01b to the DOCR.OMS[1:0] bits to select data addition mode.
2. Set 16-bit data as the initial value in the DODSR register.
3. Write the 16-bit data to be added to the DODIR register. The result of the operation is stored in the DODSR register.
4. Continue writing the 16-bit data until all data to be added is written to the DODIR.
5. If the result of an operation is greater than 0xFFFF, the DOCR.DOPCF flag is set to 1.

41.2.3 DODSR:DOC数据设置寄存器

Base address: DOC = 0x4010\_9000

Offset address: 0x04

| Bit  | Symbol | Function                                      | R/W |
|------|--------|---|-----|
| 15:0 | n/a    | 它存储在数据比较模式中用作参考的16位数据。该寄存器还存储数据加法和减法模式下的运算结果。 | R/W |

41.3 Operation

41.3.1 数据比较模式

图41.2显示了DOC在数据比较模式操作中的示例操作。以下序列是DCSEL设置为0时的示例操作（通过数据比较检测到数据不匹配）：

- 1.将00b写入DOCR.OMS[1:0]位以选择数据比较模式。
- 2.在DODSR中设置16位参考数据。
- 3.将16位数据写入DODIR进行比较。
- 4.继续写入16位数据，直到所有用于比较的数据都写入DODIR。
- 5.如果写入DODIR的值与DODSR中的值不匹配，则DOCR.DOPCF标志设置为1。

Figure 41.2 数据比较模式的操作示例

41.3.2 数据加法模式

图41.3显示了数据添加模式下的示例操作。步骤如下：

- 1.将01b写入DOCR.OMS[1:0]位以选择数据添加模式。
- 2.在DODSR寄存器中设置16位数据作为初始值。
- 3.将要添加的16位数据写入DODIR寄存器。运算结果存储在DODSR寄存器中。
- 4.继续写入16位数据，直到所有要添加的数据都写入DODIR。
- 5.如果运算结果大于0xFFFF，则DOCR.DOPCF标志设置为1。

Figure 41.3 Example of operation in data addition mode

### 41.3.3 Data Subtraction Mode

Figure 41.4 shows an example operation in data subtraction mode. The steps are as follows:

1. Write 10b to the DOCR.OMS[1:0] bits to select data subtraction mode.
2. Set 16-bit data as the initial value in the DODSR register.
3. Write the 16-bit data to be subtracted to the DODIR register. The result of the operation is stored in DODSR.
4. Continue writing the 16-bit data to the DODIR register until all data to be subtracted is written.
5. If the result of an operation is less than 0x0000, the DOCR.DOPCF flag is set to 1.

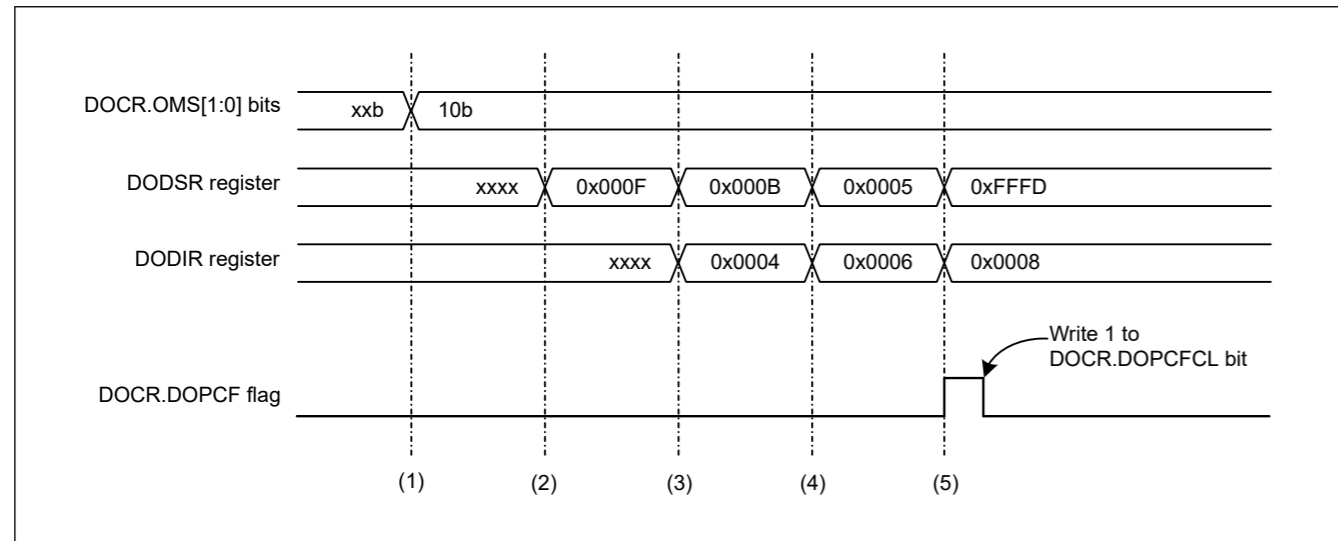

Figure 41.4 Example of operation in data subtraction mode

### 41.4 Interrupt Source

The DOC generates the DOC interrupt (DOC\_DOPCI) as an interrupt request. Table 41.2 describes the DOC interrupt request.

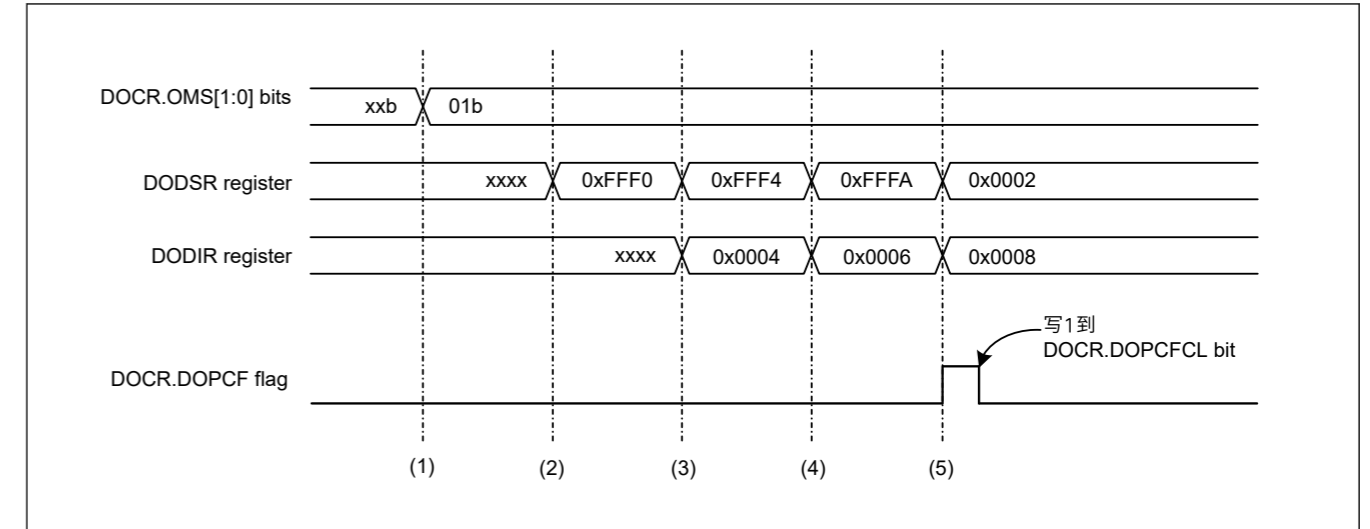

Figure 41.3 数据添加模式中的操作示例

### 41.3.3 数据减法模式

图41.4显示了数据减法模式下的示例操作。步骤如下：

- 1.将10b写入DOCR.OMS[1:0]位以选择数据减法模式。
- 2.在DODSR寄存器中设置16位数据作为初始值。
- 3.将要减去的16位数据写入DODIR寄存器。操作结果存储在DODSR中。
- 4.继续将16位数据写入DODIR寄存器，直到写入所有要减去的数据。
- 5.如果运算结果小于0x0000，则DOCR.DOPCF标志设置为1。

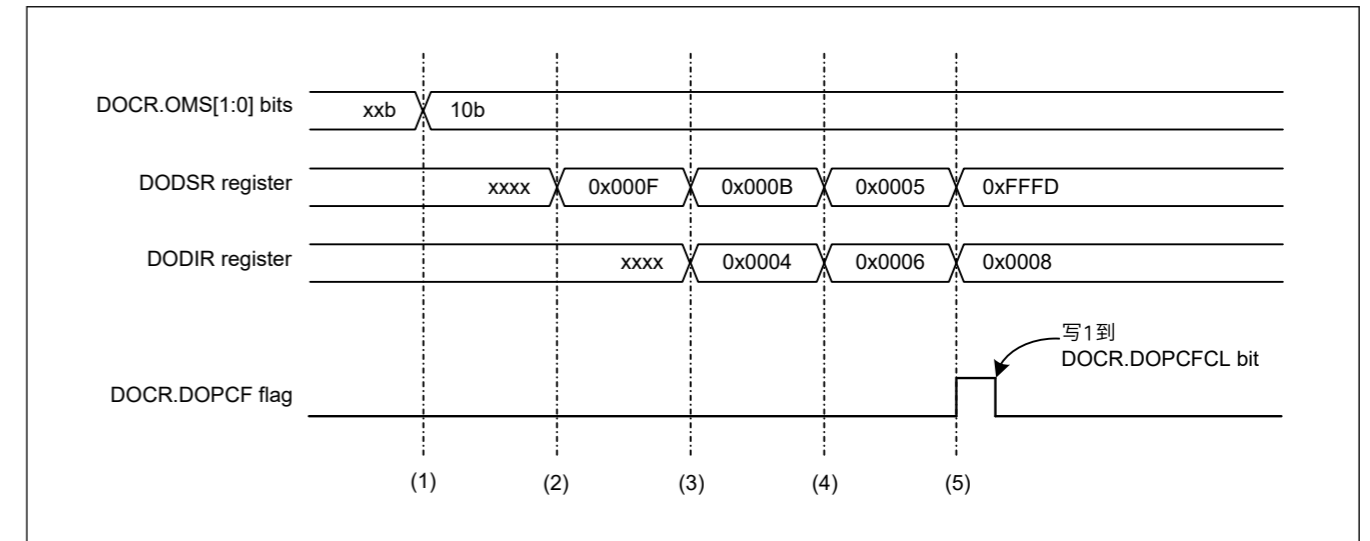

Figure 41.4 数据减法模式下的操作示例

### 41.4 中断源

DOC生成DOC中断(DOC\_DOPCI)作为中断请求。表41.2描述了DOC中断请求。

Table 41.2 Interrupt request from DOC

| Interrupt request | Status flag | Interrupt source  |
|-------------------|-------------|---|
| DOC interrupt     | DOPCF       | <ul style="list-style-type: none"> <li>The result of data comparison matches the condition selected in the DOCR.DCSEL bit.</li> <li>The result of data addition is greater than 0xFFFF.</li> <li>The result of data subtraction is less than 0x0000.</li> </ul> |

### 41.5 Output of an Event Signal to the Event Link Controller (ELC)

The DOC outputs an event signal for the ELC under the following conditions:

- The compared values either match or mismatch
- The data addition result is greater than 0xFFFF
- The data subtraction result is less than 0x0000

This signal can be used to initiate operations by other modules selected in advance and can also be used as an interrupt request. When an event signal is generated, the DOC Flag (DOCR.DOPCF) is set to 1.

### 41.6 Usage Notes

#### 41.6.1 Settings for the Module-Stop State

The module Stop Control Register C (MSTPCRC) can enable or disable DOC operation. The DOC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

Table 41.2 来自DOC的中断请求

| 中断请求 | 状态标志  | 中断源   |
|------|-------|---|
| 文档中断 | DOPCF | <ul style="list-style-type: none"> <li>数据比较的结果与DOCR.DCSEL位中选择的条件相匹配。</li> <li>数据相加的结果大于0xFFFF。</li> <li>数据减法的结果小于0x0000。</li> </ul> |

### 41.5 将事件信号输出到事件链接控制器(ELC)

DOC在以下条件下为ELC输出事件信号：

- 比较值匹配或不匹配
- 数据相加结果大于0xFFFF
- 数据减法结果小于0x0000

该信号可用于启动其他预先选择的模块的操作，也可用作中断请求。生成事件信号时，DOC标志(DOCR.DOPCF)设置为1。

### 41.6 使用说明

#### 41.6.1 模块停止状态的设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用DOC操作。DOC在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

## 42. SRAM

### 42.1 Overview

The MCU provides an on-chip, high-density SRAM module with either parity-bit checking or Error Correction Code (ECC). The first 64 KB area of the SRAM0 is the ECC. Parity check is performed on the other areas.

Table 42.1 lists the SRAM specifications.

**Table 42.1 SRAM specifications**

| Parameter               | Without ECC  | With ECC  |
|-------------------------|--|---|
| SRAM capacity           | SRAM0: 64 KB   | SRAM0: 64 KB  |
| SRAM address            | SRAM0: 0x2001_0000 to 0x2001_FFFF  | SRAM0: 0x2000_0000 to 0x2000_FFFF                                 |
| Access                  | Can access with no wait. One wait access is set at initial state. For details, see section 42.3.9. Access Cycle  |   |
| Data retention function | Not available in deep standby mode   |   |
| Module-stop function    | Module-stop state can be set to reduce power consumption   |   |
| Parity                  | Even parity with 8-bit data and 1-bit parity   | No parity   |
| Error checking          | even-parity (Data:8bit, parity:1bit)   | SEC-DED (Single-Error Correction and Double-Error Detection Code) |
| Security                | TrustZone Filter is integrated for memory access and SFR access. Access to the memory space is controlled by setting the memory Security Attribution (SA). And, access to I/O space (SFR) space is controlled by setting the register SA. See section 42.3.6. TrustZone Filter function. |   |

### 42.2 Register Descriptions

#### 42.2.1 SRAMSAR : SRAM Security Attribution Register

Base address: CPSCU = 0x4000\_8000

Offset address: 0x10

|                    |    |    |    |    |    |    |    |    |    |    |    |    |    |          |          |          |

| 1    | SRAMSA1 | Security attributes of registers for SRAM Protection 2<br>0: Secure<br>1: Non-Secure | R/W |
| 2    | SRAMSA2 | Security attributes of registers for ECC Relation<br>0: Secure<br>1: Non-Secure      | R/W |
| 31:3 | —       | These bits are read as 1. The write value should be 1.                               | R/W |

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

## 42. SRAM

### 42.1 Overview

MCU提供片上高密度SRAM模块，具有奇偶校验位检查或纠错码(ECC)。SRAM0的第一个64KB区域是ECC。对其他区域执行奇偶校验。

表42.1列出了SRAM规格。

**Table 42.1 SRAM specifications**

| Parameter            | Without ECC  | With ECC                          |
|----------------------|--|-----------------------------------|
| SRAM capacity        | SRAM0: 64 KB   | SRAM0: 64 KB                      |
| SRAM address         | SRAM0: 0x2001_0000 to 0x2001_FFFF  | SRAM0: 0x2000_0000 to 0x2000_FFFF |
| Access               | 无需等待即可访问。在初始状态设置一个等待访问。详见42.3.9节。访问周期  |                                   |
| 数据保留功能               | 在深度待机模式下不可用  |                                   |
| Module-stop function | 可设置模块停止状态以降低功耗   |                                   |
| Parity               | 8位数据和1位奇偶校验的偶校验  | 无平价                               |
| 错误检查                 | even-parity (Data:8bit, parity:1bit)   | SEC-DED (单纠错和双纠错 Detection Code)  |
| Security             | TrustZone过滤器集成用于内存访问和SFR访问。通过设置内存安全属性 (SA) 来控制对内存空间的访问。并且，通过设置寄存器SA来控制对IO空间(SFR)空间的访问。请参阅第42.3.6节。TrustZone过滤功能。 |                                   |

### 42.2 注册说明

#### 42.2.1 SRAMSAR: SRAM安全属性寄存器

Base address: CPSCU = 0x4000\_8000

Offset address: 0x10

|               |    |    |    |    |    |    |    |    |    |    |    |    |    |          |          |          |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----------|----------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18       | 17       | 16       |
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —        | —        | —        |
| 重置后的值:        | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1        | 1        | 1        |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2        | 1        | 0        |
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | SRAM SA2 | SRAM SA1 | SRAM SA0 |
| 重置后的值:        | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1        | 1        | 1        |

| Bit  | Symbol  | Function                                       | R/W |
|------|---------|--|-----|
| 0    | SRAMSA0 | SRAM保护寄存器的安全属性<br>0: Secure<br>1: Non-Secure   | R/W |
| 1    | SRAMSA1 | SRAM保护2的寄存器的安全属性<br>0: Secure<br>1: Non-Secure | R/W |
| 2    | SRAMSA2 | ECC关系寄存器的安全属性<br>0: Secure<br>1: Non-Secure    | R/W |
| 31:3 | —       | 这些位被读取为1。写入值应为1。                               | R/W |

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

**SRAMSA0 bit (Security attributes of registers for SRAM Protection)**

Security attributes of registers for SRAM Protection. The target registers are as follow.

- PARIOAD
- SRAMPRCR

**SRAMSA1 bit (Security attributes of registers for SRAM Protection 2)**

Security attributes of registers for SRAM Protection 2. The target registers are as follow.

- SRAMWTSC
- SRAMPRCR2

**SRAMSA2 bit (Security attributes of registers for ECC Relation)**

Security attributes of registers for ECC Relation. The target registers are as follow.

- ECCMODE
- ECC2STS
- ECC1STSEN
- ECC1STS
- ECCPRCR
- ECCPRCR2
- ECCETST
- ECCOAD

**42.2.2 PARIOAD : SRAM Parity Error Operation After Detection Register**

Base address: SRAM = 0x4000\_2000

Offset address: 0x00

|                    |   |   |   |   |   |   |   |     |
|--------------------|---|---|---|---|---|---|---|-----|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
| Bit field:         | — | — | — | — | — | — | — | OAD |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0   |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | OAD    | Operation After Detection<br>0: Reset<br>1: Non-maskable interrupt | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.             | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The PARIOAD register controls the operation on detection of a parity error. The SRAM Protection Register (SRAMPRCR) protects this register against writes. Always set the SRAMPRCR bit in SRAMPRCR to enabled before writing to this bit. Do not write to the PARIOAD register while accessing the SRAM.

**OAD bit (Operation After Detection)**

The OAD bit specifies either a reset or non-maskable interrupt when a parity error is detected. The OAD bit is used for SRAM0 (without ECC)/Standby SRAM.

**SRAMSA0位 (SRAM保护寄存器的安全属性)**

SRAM保护寄存器的安全属性。目标寄存器如下。

- PARIOAD
- SRAMPRCR

**SRAMSA1位 (SRAM保护2寄存器的安全属性)**

SRAM保护寄存器的安全属性2。目标寄存器如下。

- SRAMWTSC
- SRAMPRCR2

**SRAMSA2位 (ECC关系寄存器的安全属性)**

ECC关系的寄存器的安全属性。目标寄存器如下。

- ECCMODE
- ECC2STS
- ECC1STSEN
- ECC1STS
- ECCPRCR
- ECCPRCR2
- ECCETST
- ECCOAD

**42.2.2 PARIOAD: 检测寄存器后的SRAM奇偶校验错误操作**

Base address: SRAM = 0x4000\_2000

Offset address: 0x00

|               |   |   |   |   |   |   |   |     |
|---------------|---|---|---|---|---|---|---|-----|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
| Bit field:    | — | — | — | — | — | — | — | OAD |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0   |

| Bit | Symbol | Function                 | R/W |
|-----|--------|--------------------------|-----|
| 0   | OAD    | 检测后的操作<br>0: 复位1: 不可屏蔽中断 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。         | R/W |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

PARIOAD寄存器控制检测奇偶校验错误时的操作。SRAM保护寄存器(SRAMPRCR)保护该寄存器不被写入。在写入该位之前, 始终将SRAMPRCR中的SRAMPRCR位设置为启用。访问SRAM时不要写入PARIOAD寄存器。

**OAD位 (检测后操作)**

当检测到奇偶校验错误时, OAD位指定复位或不可屏蔽中断。OAD位用于SRAM0 (without ECC)/Standby SRAM。

## 42.2.3 SRAMPRCR : SRAM Protection Register

Base address: SRAM = 0x4000\_2000

Offset address: 0x04

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 0   | SRAMPRCR | Register Write Control<br>0: Disable writes to protected registers<br>1: Enable writes to protected registers | R/W |
| 7:1 | KW[6:0]  | Write Key Code<br>These bits enable or disable writes to the SRAMPRCR bit                                     | W   |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

**SRAMPRCR bit (Register Write Control)**

The SRAMPRCR bit controls the write mode of the PARIOD register. Setting the bit to 1 enables writes to the PARIOD register. When you write to this bit, always write 0x78 to KW[6:0] bits simultaneously.

**KW[6:0] bits (Write Key Code)**

The KW[6:0] bits enable or disable writes to the SRAMPRCR bit. When you write to the SRAMPRCR bit, always write 0x78 to these bits simultaneously. When a value other than 0x78 is written to KW[6:0], the SRAMPRCR bit is not updated. The KW[6:0] bits are always read as 0x00.

## 42.2.4 SRAMWTSC : SRAM Wait State Control Register

Base address: SRAM = 0x4000\_2000

Offset address: 0x08

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 0   | SRAM0WTEN | SRAM0 wait enable<br>0: No wait<br>1: Add wait state in read access cycle to SRAM0 | R/W |
| 7:1 | —         | These bits are read as 0. The write value should be 0.                             | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

This register can be rewritten only when the SRAMPRCR2 bit in the SRAMPRCR2 register is 1.

The protection register (SRAMPRCR2) protects this register against writing. Change the effective bit in the protection register (SRAMPRCR2) to write in this register.

Do not write to SRAMWTSC while access to SRAM is in progress.

## 42.2.3 SRAMPRCR:SRAM保护寄存器

Base address: SRAM = 0x4000\_2000

Offset address: 0x04

| Bit | Symbol   | Function                             | R/W |
|-----|----------|--------------------------------------|-----|
| 0   | SRAMPRCR | 寄存器写控制<br>0: 禁止写入受保护寄存器1: 允许写入受保护寄存器 | R/W |
| 7:1 | KW[6:0]  | 编写关键代码<br>这些位启用或禁用对SRAMPRCR位的写入      | W   |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
  - 忽略非安全写入访问, 不会生成TrustZone访问错误。
- 如果安全属性配置为非安全: ●
- 允许安全和非安全访问。

**SRAMPRCR位 (寄存器写控制)**

SRAMPRCR位控制PARIOD寄存器的写模式。将该位设置为1可以写入PARIOD寄存器。写入该位时, 始终同时将0x78写入KW[6:0]位。

**KW[6:0]位 (写入密钥代码)**

KW[6:0]位启用或禁用对SRAMPRCR位的写入。当您写入SRAMPRCR位时, 请始终同时将0x78写入这些位。当向KW[6:0]写入0x78以外的值时, SRAMPRCR位不会更新。KW[6:0]位总是被读取为0x00。

## 42.2.4 SRAMWTSC:SRAM等待状态控制寄存器

Base address: SRAM = 0x4000\_2000

Offset address: 0x08

| Bit | Symbol    | Function                                 | R/W |
|-----|-----------|--|-----|
| 0   | SRAM0WTEN | SRAM0等待使能<br>0: 无等待1: 在SRAM0读访问周期中添加等待状态 | R/W |
| 7:1 | —         | 这些位被读取为0。写入值应为0。                         | R/W |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
  - 忽略非安全写入访问, 不会生成TrustZone访问错误。
- 如果安全属性配置为非安全: ●
- 允许安全和非安全访问。

只有当SRAMPRCR2寄存器中的SRAMPRCR2位为1时, 才能重写该寄存器。

保护寄存器(SRAMPRCR2)保护该寄存器不被写入。更改保护寄存器(SRAMPRCR2)中的有效位以写入该寄存器。

在访问SRAM的过程中不要写入SRAMWTSC。

**SRAM0WTEN bit (SRAM0 wait enable)**

This bit sets the wait cycle to the operation region in SRAM0 (Both parity and ECC areas). When it is set 1 in the SRAM0WTEN bit, 1 wait cycle is inserted into the read cycle of operation region in SRAM0. And also 1 wait cycle is also inserted between the “write to read/write” sequential cycle in the same mat of SRAM0. When read access frequency is more than 100 MHz, it is necessary to set 1 wait cycle in SRAM0WTEN bit.

**42.2.5 SRAMPSCR2 : SRAM Protection Register 2**

Base address: SRAM = 0x4000\_2000

Offset address: 0x0C

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 0   | SRAMPSCR2 | Register Write Control<br>0: Disable writes to the protected registers<br>1: Enable writes to the protected registers | R/W |
| 7:1 | KW[6:0]   | Write Key Code<br>These bits enable or disable writes to the SRAMPSCR2 bit  | W   |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

**SRAMPSCR2 bit (Register Write Control)**

The SRAMPSCR2 bit controls the write mode of the SRAMWTSC register. Setting the bit to 1 enables writes to the SRAMWTSC register. When you write to this bit, always write 0x78 to KW[6:0] at the same time.

**KW[6:0] bits (Write Key Code)**

The KW[6:0] bits enable or disable writes to the SRAMPSCR2 bit. When you write to SRAMPSCR2 bit, always write 0x78 to these bits at the same time. When a value other than 0x78 is written to KW[6:0], the SRAMPSCR2 bit is not updated. The KW[6:0] bits are always read as 0x00.

**42.2.6 ECCMODE : ECC Operating Mode Control Register**

Base address: SRAM = 0x4000\_2000

Offset address: 0xC0

| Bit | Symbol      | Function   | R/W |
|-----|-------------|--|-----|
| 1:0 | ECCMOD[1:0] | ECC Operating Mode Select<br>0 0: Disable ECC function<br>0 1: Setting prohibited<br>1 0: Enable ECC function without error checking<br>1 1: Enable ECC function with error checking | R/W |
| 7:2 | —           | These bits are read as 0. The write value should be 0.   | R/W |

Note: If the security attribution is configured as secure:

**SRAM0WTEN位 (SRAM0等待使能)**

该位将等待周期设置为SRAM0中的操作区域（奇偶校验和ECC区域）。当它设置为1时SRAM0WTEN位，1个等待周期插入到SRAM0中操作区的读周期。并且在SRAM0的同一块中的“写到读”顺序周期之间也插入了1个等待周期。当读访问频率大于100MHz时，需要在SRAM0WTEN位中设置1个等待周期。

**42.2.5 SRAMPSCR2: SRAM保护寄存器2**

Base address: SRAM = 0x4000\_2000

Offset address: 0x0C

| Bit | Symbol    | Function                             | R/W |
|-----|-----------|--------------------------------------|-----|
| 0   | SRAMPSCR2 | 寄存器写控制<br>0: 禁止写保护寄存器<br>1: 允许写保护寄存器 | R/W |
| 7:1 | KW[6:0]   | 编写关键代码<br>这些位启用或禁用对SRAMPSCR2位的写入     | W   |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
  - 忽略非安全写入访问，不会生成TrustZone访问错误。
- 如果安全属性配置为非安全: ●
- 允许安全和非安全访问。

**SRAMPSCR2位 (寄存器写控制)**

SRAMPSCR2位控制SRAMWTSC寄存器的写模式。将该位设置为1可以写入SRAMWTSC寄存器。写入该位时，始终同时将0x78写入KW[6:0]。

**KW[6:0]位 (写入密钥代码)**

KW[6:0]位启用或禁用对SRAMPSCR2位的写入。当您写入SRAMPSCR2位时，请始终同时向这些位写入0x78。当向KW[6:0]写入0x78以外的值时，SRAMPSCR2位不会更新。KW[6:0]位总是被读取为0x00。

**42.2.6 ECCMODE: ECC操作模式控制寄存器**

Base address: SRAM = 0x4000\_2000

Offset address: 0xC0

| Bit | Symbol      | Function   | R/W |
|-----|-------------|--|-----|
| 1:0 | ECCMOD[1:0] | ECC操作模式选择<br>00: 禁用ECC功能<br>01: 设置禁止<br>10: 启用ECC功能不进行错误检查<br>11: 启用ECC功能并进行错误检查 | R/W |
| 7:2 | —           | 这些位被读取为0。写入值应为0。   | R/W |

Note: 如果安全属性配置为安全:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The ECCMODE register specifies the ECC operating mode. The ECC Protection Register (ECCPRCR) protects this register against writes. Before writing to this register, set the ECCPRCR bit in the ECCPRCR register to 1 (write protection disabled). Do not write to the ECCMODE register while accessing the SRAM.

#### ECCMOD[1:0] bits (ECC Operating Mode Select)

The ECCMOD[1:0] bits set the access mode to the ECC area in SRAM0.

#### 42.2.7 ECC2STS : ECC 2-Bit Error Status Register

Base address: SRAM = 0x4000\_2000

Offset address: 0xC1

|                    |   |   |   |   |   |   |   |         |
|--------------------|---|---|---|---|---|---|---|---------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:         | — | — | — | — | — | — | — | ECC2ERR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit | Symbol  | Function  | R/W              |
|-----|---------|---|------------------|
| 0   | ECC2ERR | ECC 2-Bit Error Status<br>0: No 2-bit ECC error occurred<br>1: 2-bit ECC error occurred | R/W <sup>1</sup> |
| 7:1 | —       | These bits are read as 0. The write value should be 0.                                  | R/W              |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. Only 0 can be written to clear the bit.

#### ECC2ERR bit (ECC 2-Bit Error Status)

The ECC2ERR bit indicates whether a 2-bit ECC error occurred in the ECC area of SRAM0. When a 2-bit error is detected while ECC operations are enabled and error checking is selected, the ECC2ERR bit is set to 1. The SRAM error signal is also asserted at this time. The 2-bit ECC error can be cleared by writing 0 to the ECC2ERR bit.

The SRAM error can be specified as a non-maskable interrupt or a reset in the ECCOAD register. Do not access the ECC area in SRAM0 while writing 0 to this register.

#### 42.2.8 ECC1STSEN : ECC 1-Bit Error Information Update Enable Register

Base address: SRAM = 0x4000\_2000

Offset address: 0xC2

|                    |   |   |   |   |   |   |   |         |
|--------------------|---|---|---|---|---|---|---|---------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:         | — | — | — | — | — | — | — | E1STSEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit | Symbol  | Function   | R/W |
|-----|---------|--|-----|
| 0   | E1STSEN | ECC 1-Bit Error Information Update Enable<br>0: Disable updating of 1-bit ECC error information<br>1: Enable updating of 1-bit ECC error information | R/W |
| 7:1 | —       | These bits are read as 0. The write value should be 0.   | R/W |

Note: If the security attribution is configured as secure:

- 允许安全访问和非安全读取访问
  - 忽略非安全写入访问，不会生成TrustZone访问错误。
- 如果安全属性配置为非安全：●
- 允许安全和非安全访问。

ECCMODE寄存器指定ECC工作模式。ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该寄存器之前，将ECCPRCR寄存器中的ECCPRCR位设置为1（禁用写保护）。访问SRAM时不要写入ECCMODE寄存器。

#### ECCMOD[1:0]位 (ECC操作模式选择)

ECCMOD[1:0]位将访问模式设置为SRAM0中的ECC区域。

#### 42.2.7 ECC2STS: ECC2位错误状态寄存器

Base address: SRAM = 0x4000\_2000

Offset address: 0xC1

|               |   |   |   |   |   |   |   |         |
|---------------|---|---|---|---|---|---|---|---------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:    | — | — | — | — | — | — | — | ECC2ERR |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit | Symbol  | Function                                   | R/W              |
|-----|---------|--|------------------|
| 0   | ECC2ERR | ECC2位错误状态<br>0: 未发生2位ECC错误<br>1: 发生2位ECC错误 | R/W <sup>1</sup> |
| 7:1 | —       | 这些位被读取为0。写入值应为0。                           | R/W              |

Note: 如果安全属性配置为安全：●

- 允许安全访问和非安全读取访问
  - 忽略非安全写入访问，不会生成TrustZone访问错误。
- 如果安全属性配置为非安全：●
- 允许安全和非安全访问。

注1.只能写入0来清除该位。

#### ECC2ERR位 (ECC2位错误状态)

ECC2ERR位指示SRAM0的ECC区域是否发生2位ECC错误。当启用ECC操作并选择错误检查时检测到2位错误时，ECC2ERR位设置为1。此时SRAM错误信号也被置位。将0写入ECC2ERR位可清除2位ECC错误。

SRAM错误可以指定为不可屏蔽中断或ECCOAD寄存器中的复位。向该寄存器写入0时不要访问SRAM0中的ECC区域。

#### 42.2.8 ECC1STSEN: ECC1位错误信息更新使能寄存器

Base address: SRAM = 0x4000\_2000

Offset address: 0xC2

|               |   |   |   |   |   |   |   |         |
|---------------|---|---|---|---|---|---|---|---------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:    | — | — | — | — | — | — | — | E1STSEN |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit | Symbol  | Function  | R/W |
|-----|---------|---|-----|
| 0   | E1STSEN | ECC1位错误信息更新启用<br>0: 禁止更新1位ECC错误信息<br>1: 允许更新1位ECC错误信息 | R/W |
| 7:1 | —       | 这些位被读取为0。写入值应为0。                                      | R/W |

Note: 如果安全属性配置为安全:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The ECC1STSEN register enables or disables updating of the ECC 1-bit Error Status Register (ECC1STS) in response to a 1-bit error ECC error in the SRAM0 (ECC area).

The ECC Protection Register (ECCPRCR) protects this register against writes. Before writing to this bit, set the ECCPRCR bit in the ECCPRCR register to 1 (write protection disabled).

**E1STSEN bit (ECC 1-Bit Error Information Update Enable)**

The E1STSEN bit enables or disables updating of the SRAM (ECC area) 1-Bit Error Status Register (ECC1STS) in response to a 1-bit error in the ECC area of SRAM0. This register also functions as an interrupt or a reset mask.

**42.2.9 ECC1STS : ECC 1-Bit Error Status Register**

Base address: SRAM = 0x4000\_2000

Offset address: 0xC3

| Bit | Symbol  | Function  | R/W                |
|-----|---------|---|--------------------|
| 0   | ECC1ERR | ECC 1-Bit Error Status<br>0: No 1-bit ECC error occurred<br>1: 1-bit ECC error occurred | R/(W) <sup>1</sup> |
| 7:1 | —       | These bits are read as 0. The write value should be 0.                                  | R/W                |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 0 can be written to clear the bit.

**ECC1ERR bit (ECC 1-Bit Error Status)**

The ECC1ERR bit indicates whether a 1-bit ECC error occurred in the ECC area of SRAM0. When a 1-bit error is detected while ECC operations are enabled and error checking is selected, the ECC1ERR bit is set to 1. The SRAM error signal is also asserted at this time. The 1-bit ECC error can be cleared by writing 0 to the ECC1ERR bit.

The SRAM error can be specified as a non-maskable interrupt or a reset in the ECCOAD register. Do not access the ECC area in SRAM0 while writing 0 to this register.

**42.2.10 ECCPRCR : ECC Protection Register**

Base address: SRAM = 0x4000\_2000

Offset address: 0xC4

| Bit | Symbol  | Function  | R/W |
|-----|---------|---|-----|
| 0   | ECCPRCR | Register Write Control<br>0: Disable writes to the protected registers<br>1: Enable writes to the protected registers | R/W |

- 允许安全访问和非安全读取访问
  - 忽略非安全写入访问，不会生成TrustZone访问错误。
- 如果安全属性配置为非安全:
- 允许安全和非安全访问。

ECC1STSEN寄存器启用或禁用ECC1位错误状态寄存器(ECC1STS)的更新，以响应SRAM0 (ECC区域) 中的1位错误ECC错误。

ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该位之前，将ECCPRCR寄存器中的ECCPRCR位设置为1 (禁用写保护)。

**E1STSEN位 (ECC1位错误信息更新使能)**

E1STSEN位启用或禁用SRAM (ECC区域) 1位错误状态寄存器(ECC1STS)的更新，以响应SRAM0的ECC区域中的1位错误。该寄存器还用作中断或复位掩码。

**42.2.9 ECC1STS:ECC1位错误状态寄存器**

Base address: SRAM = 0x4000\_2000

Offset address: 0xC3

| Bit | Symbol  | Function                                   | R/W                |
|-----|---------|--|--------------------|
| 0   | ECC1ERR | ECC1位错误状态<br>0: 未发生1位ECC错误<br>1: 发生1位ECC错误 | R/(W) <sup>1</sup> |
| 7:1 | —       | 这些位被读取为0。写入值应为0。                           | R/W                |

Note: 如果安全属性配置为安全:

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全:

- 允许安全和非安全访问。

注1.只能写入0来清除该位。

**ECC1ERR位 (ECC1位错误状态)**

ECC1ERR位指示SRAM0的ECC区域是否发生1位ECC错误。如果在启用ECC操作并选择错误检查时检测到1位错误，则ECC1ERR位设置为1。此时SRAM错误信号也被置位。将0写入ECC1ERR位可清除1位ECC错误。

SRAM错误可以指定为不可屏蔽中断或ECCOAD寄存器中的复位。向该寄存器写入0时不要访问SRAM0中的ECC区域。

**42.2.10 ECPCRR:ECC保护寄存器**

Base address: SRAM = 0x4000\_2000

Offset address: 0xC4

| Bit | Symbol  | Function                                 | R/W |
|-----|---------|--|-----|
| 0   | ECCPRCR | 寄存器写控制<br>0: 禁止写入受保护寄存器<br>1: 允许写入受保护寄存器 | R/W |

| Bit | Symbol  | Function  | R/W |
|-----|---------|---|-----|
| 7:1 | KW[6:0] | Write Key Code<br>0x78: Enable write to the ECCPRCR bit<br>Others: Disable write to the ECCPRCR bit | W   |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

#### ECCPRCR bit (Register Write Control)

The ECCPRCR bit controls the write of the ECCMODE, ECC1STSEN, and ECCOAD registers. When this bit is set to 1, writing to the ECCMODE, ECC1STSEN, and ECCOAD registers is enabled. When writing to this bit, write 0x78 to the KW[6:0] bits at the same time.

#### KW[6:0] bits (Write Key Code)

The KW[6:0] bits enable or disable writes to the ECCPRCR bit. When writing to ECCPRCR bit, write 0x78 to the KW[6:0] bits at the same time. When a value other than 0x78 is written to the KW[6:0] bits, the ECCPRCR bit is not updated. The KW[6:0] bits are always read as 0x00.

### 42.2.11 ECCPRCR2 : ECC Protection Register 2

Base address: SRAM = 0x4000\_2000

Offset address: 0xD0

| Bit position:      | 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0        |
|--------------------|----------|---|---|---|---|---|---|----------|
| Bit field:         | KW2[6:0] |   |   |   |   |   |   | ECCPRCR2 |
| Value after reset: | 0        | 0 | 0 | 0 | 0 | 0 | 0 | 0        |

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 0   | ECCPRCR2 | Register Write Control<br>0: Disable writes to the protected registers<br>1: Enable writes to the protected registers | R/W |
| 7:1 | KW2[6:0] | Write Key Code<br>0x78: Enable write to the ECCPRCR2 bit<br>Others: Disable write to the ECCPRCR2 bit                 | W   |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

#### ECCPRCR2 bit (Register Write Control)

The ECCPRCR2 bit controls the write mode of the ECCETST register. When the ECCPRCR2 bit is set to 1, writes to the ECCETST register is enabled. When writing to this bit, write 0x78 to the KW2[6:0] bits at the same time.

#### KW2[6:0] bits (Write Key Code)

The KW2[6:0] bits enable or disable writes to the ECCPRCR2 bit. When writing to ECCPRCR2 bit, write 0x78 to the KW2[6:0] bits at the same time. When a value other than 0x78 is written to the KW2[6:0] bits, the ECCPRCR2 bit is not updated. The KW2[6:0] bits are always read as 0x00.

| Bit | Symbol  | Function                                       | R/W |
|-----|---------|--|-----|
| 7:1 | KW[6:0] | 编写关键代码<br>0x78: 允许写入ECPCRR位<br>其他: 禁止写入ECPCRR位 | W   |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

#### ECPCRR位 (寄存器写控制)

ECPCRR位控制ECCMODE、ECC1STSEN和ECCOAD寄存器的写入。当该位设置为1时, 允许写入ECCMODE、ECC1STSEN和ECCOAD寄存器。写入该位时, 同时将0x78写入KW[6:0]位。

#### KW[6:0]位 (写入密钥代码)

KW[6:0]位启用或禁用对ECPCRR位的写入。写入ECCPRCR位时, 同时向KW[6:0]位写入0x78。当向KW[6:0]位写入0x78以外的值时, 不会更新ECPCRR位。KW[6:0]位总是被读取为0x00。

### 42.2.11 ECPCRR2:ECC保护寄存器2

Base address: SRAM = 0x4000\_2000

Offset address: 0xD0

| Bit position: | 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0        |
|---------------|----------|---|---|---|---|---|---|----------|
| Bit field:    | KW2[6:0] |   |   |   |   |   |   | ECCPRCR2 |
| 重置后的值:        | 0        | 0 | 0 | 0 | 0 | 0 | 0 | 0        |

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 0   | ECCPRCR2 | 寄存器写控制<br>0: 禁止写入受保护寄存器1: 允许写入受保护寄存器             | R/W |
| 7:1 | KW2[6:0] | 编写关键代码<br>0x78: 允许写入ECPCRR2位<br>其他: 禁止写入ECPCRR2位 | W   |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

#### ECPCRR2位 (寄存器写控制)

ECPCRR2位控制ECCETST寄存器的写模式。当ECPCRR2位设置为1时, 写入ECCETST寄存器使能。写入该位时, 同时向KW2[6:0]位写入0x78。

#### KW2[6:0]位 (写入密钥代码)

KW2[6:0]位启用或禁用对ECPCRR2位的写入。当写入ECPCRR2位时, 将0x78写入KW2[6:0]位。当向KW2[6:0]位写入0x78以外的值时, 不会更新ECPCRR2位。KW2[6:0]位总是读为0x00。

## 42.2.12 ECCETST : ECC Test Control Register

Base address: SRAM = 0x4000\_2000

Offset address: 0xD4

|                    |   |   |   |   |   |   |   |        |
|--------------------|---|---|---|---|---|---|---|--------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
| Bit field:         | — | — | — | — | — | — | — | TSTBYP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0      |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | TSTBYP | ECC Bypass Select<br>0: Disable ECC bypass<br>1: Enable ECC bypass | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.             | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The ECC Protection Register 2 (ECCPRCR2) protects this register against writes. Before writing to this bit, set the ECCPRCR2 bit in the ECCPRCR2 register to 1 (write protection disabled). Do not write to the ECCETST register while accessing the SRAM.

**TSTBYP bit (ECC Bypass Select)**

The TSTBYP bit enables direct access to the ECC code by bypassing the ECC function. When the ECC bypass function is used, the ECCMOD[1:0] bits in the ECCMODE register are set to 00b. The ECC must be accessed in 32 bits using the same address for 32-bit data. The ECC code is assigned to the lower 7 bits of the 32-bit data. When writing the ECC code, the upper 25 bits are ignored. When reading the ECC code, the upper 25 bits are undefined.

Note: For details of ECC test, see [section 42.3.4. ECC Decoder Testing](#).

## 42.2.13 ECCOAD : SRAM ECC Error Operation After Detection Register

Base address: SRAM = 0x4000\_2000

Offset address: 0xD8

|                    |   |   |   |   |   |   |   |     |
|--------------------|---|---|---|---|---|---|---|-----|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
| Bit field:         | — | — | — | — | — | — | — | OAD |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0   |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | OAD    | Operation After Detection<br>0: Non-maskable interrupt<br>1: Reset | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.             | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The ECC Protection Register (ECCPRCR) protects this register against writes. Before writing to this bit, set the ECCPRCR bit in the ECCPRCR register to 1 (write protection disabled). Do not write to the ECCOAD register while accessing the SRAM.

## 42.2.12 ECCETST:ECC测试控制寄存器

Base address: SRAM = 0x4000\_2000

Offset address: 0xD4

|               |   |   |   |   |   |   |   |        |
|---------------|---|---|---|---|---|---|---|--------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
| Bit field:    | — | — | — | — | — | — | — | TSTBYP |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0      |

| Bit | Symbol | Function                        | R/W |
|-----|--------|---------------------------------|-----|
| 0   | TSTBYP | ECC旁路选择<br>0: 禁用ECC旁路1: 启用ECC旁路 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。                | R/W |

Note: 如果安全属性配置为安全: ●  
允许安全访问和非安全读取访问

- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●  
允许安全和非安全访问。

ECC保护寄存器2(ECCPRCR2)保护该寄存器不被写入。在写入该位之前, 将ECCPRCR2寄存器中的ECCPRCR2位为1 (写保护禁用)。访问SRAM时不要写入ECCETST寄存器。

**TSTBYP位 (ECC旁路选择)**

TSTBYP位允许通过绕过ECC功能直接访问ECC代码。使用ECC旁路功能时, ECCMODE寄存器中的ECCMOD[1:0]位设置为00b。必须使用32位数据的相同地址以32位访问ECC。ECC代码分配给32位数据的低7位。写入ECC代码时, 忽略高25位。读取ECC码时, 高25位未定义。

Note: 有关ECC测试的详细信息, 请参见第42.3.4节。ECC解码器测试。

## 42.2.13 ECCOAD: 检测寄存器后的SRAMECC错误操作

Base address: SRAM = 0x4000\_2000

Offset address: 0xD8

|               |   |   |   |   |   |   |   |     |
|---------------|---|---|---|---|---|---|---|-----|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
| Bit field:    | — | — | — | — | — | — | — | OAD |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0   |

| Bit | Symbol | Function                 | R/W |
|-----|--------|--------------------------|-----|
| 0   | OAD    | 检测后的操作<br>0: 不可屏蔽中断1: 复位 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。         | R/W |

Note: 如果安全属性配置为安全: ●  
允许安全访问和非安全读取访问

- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●  
允许安全和非安全访问。

ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该位之前, 将ECCPRCR寄存器中的ECCPRCR位设置为1 (禁用写保护)。访问SRAM时不要写入ECCOAD寄存器。

**OAD bit (Operation After Detection)**

The OAD bit selects whether to generate a reset or a non-maskable interrupt when an ECC error is detected. The OAD bit in the ECCOAD register is used for SRAM0 (ECC area).

**42.3 Operation****42.3.1 Module Stop Function**

Power consumption can be reduced by setting module stop control register A (MSTPCRA) to stop supply of the clock signal to SRAM.

SRAM0 is controlled by SRAM0 bit in MSTPCRA register and, in the case of 1, SRAM0 becomes the clock stop state.

The SRAM is thus placed in the module-stop state by stopping supply of the clock signals. The SRAM operates after a reset.

SRAM is not accessible if it is in the module-stop state. A transition to the module-stop state should not be made while access to SRAM is in progress.

Access to the SRAM in the module-stop state is prohibited. If access is attempted, correct operation is not guaranteed.

For details on the MSTPCRA register, see [section 10, Low Power Modes](#).

**42.3.2 Correction of ECC errors**

Enabling and disabling of ECC error correction can be selected through ECCMODE register setting. In the initial state, ECC error correction is disabled. The ECC check type is SEC-DED (Single-Error Correction and Double-Error Detection Code).

When ECC function is enabled, 7-bit check bits are appended to 32-bit data for writing. For reading, 39-bit (data: 32 bits, check bits: 7 bits) data is read out from the SRAM (ECC area).

When ECC function is enabled and error checking is selected by setting ECCMOD[1:0] in the ECCMODE register to 00b, error correction is done if a 1-bit error occurs and the ECC1ERR bit in the ECC1STS register is set to 1 if the E1STSEN bit in the ECC1STSEN register is 1. If a 2-bit error occurs, error detection is done and the ECC2ERR bit in the ECC2STS register is set to 1, though error correction is not performed.

When ECC function is enabled and the error checking is disable, error correction is done if a 1-bit error occurs but ECC1ERR bit in the ECC1STS register is not updated although E1STSEN bit in the ECC1STSEN register is 1. If a 2-bit error occurs, this error is detected but the ECC2ERR bit in the ECC2STS register is not updated, and error correction is not performed.

When ECC function is disable, neither error correction nor error detection is done although 1-bit or 2-bit error occur.

So ECC1ERR bit and ECC2ERR bit are not updated.

There is no way to confirm the location where the error was found. Therefore, when after the occurrence of an error, update all the data.

When updating all the data after the occurrence of an error, the only support of 32 bit data writing.

Since the SRAM data is undefined after power on and release from deep software standby mode, accessing the SRAM when ECC function is enabled and error checking is selected causes an ECC error to occur. Therefore, before using ECC function, initial writing with 32bit data size to the area to be used in the SRAM should be done.

When a read access is executed in a row after a write access, read access is executed with priority. Therefore, during initialization, please do not perform the read access in a row after the write access.

**42.3.3 ECC Error Interrupt Function**

When ECC function is enabled and error checking is applied to the SRAM(ECC area), an ECC error occurs when either the ECC2ERR bit in the ECC2STS register or the ECC1ERR bit in the ECC1STS register becomes 1 to indicate that ECC checking revealed a 2-bit error or a 1-bit error, respectively.

An ECC error is output with a pulse width of t<sub>CLK</sub>. When the ECC 1-bit error is to be masked, set the ECC1STSEN.E1STSEN bit to 0 to disable updating of the ECC1ERR bit. An ECC error will not be generated while ECC function is disabled or when ECC function is enabled but error checking is not selected.

**OAD位 (检测后操作)**

OAD位选择在检测到ECC错误时是否产生复位或不可屏蔽中断。ECCOAD寄存器中的OAD位用于SRAM0 (ECC区域)。

**42.3 Operation****42.3.1 模块停止功能**

通过设置模块停止控制寄存器A(MSTPCRA)停止向SRAM提供时钟信号,可以降低功耗。

SRAM0由MSTPCRA寄存器中的SRAM0位控制,在为1的情况下,SRAM0变为时钟停止状态。

因此,通过停止提供时钟信号,SRAM被置于模块停止状态。SRAM在复位后运行。

如果SRAM处于模块停止状态,则无法访问。在访问SRAM的过程中,不应转换到模块停止状态。

禁止在模块停止状态下访问SRAM。如果尝试访问,则无法保证正确操作。

有关MSTPCRA寄存器的详细信息,请参见第10节,低功耗模式。

**42.3.2 纠正ECC错误**

可以通过ECCMODE寄存器设置来选择ECC纠错的启用和禁用。在初始状态下,ECC纠错被禁用。ECC校验类型为SEC-DED(单纠错双错误检测码)。

当ECC功能使能时,7位校验位被附加到32位数据中进行写入。读取时,从SRAM(ECC区域)中读取39位(数据:32位,校验位:7位)数据。

当ECC功能使能并且通过将ECCMODE寄存器中的ECCMOD[1:0]设置为00b来选择错误检查时,如果发生1位错误,则进行纠错,并且如果ECC1STS寄存器中的ECC1ERR位设置为1,则ECC1STSEN寄存器中的E1STSEN位为1。如果发生2位错误,则进行错误检测并将ECC2STS寄存器中的ECC2ERR位设置为1,但不执行错误纠正。

当启用ECC功能且禁用错误检查时,如果发生1位错误,则进行错误纠正,但尽管ECC1STSEN寄存器中的E1STSEN位为1,但ECC1STS寄存器中的ECC1ERR位不更新。如果发生2位错误,则会检测到该错误,但不会更新ECC2STS寄存器中的ECC2ERR位,也不执行纠错。

当ECC功能被禁用时,即使发生1位或2位错误,也不会进行纠错或错误检测。

因此ECC1ERR位和ECC2ERR位不会更新。

无法确认发现错误的位置。因此,当发生错误后,更新所有数据。

发生错误后更新所有数据时,仅支持32位数据写入。

由于上电并从深度软件待机模式释放后SRAM数据未定义,因此在启用ECC功能并选择错误检查时访问SRAM会导致发生ECC错误。因此,在使用ECC功能之前,应先将32位数据大小的数据写入SRAM中要使用的区域。

在写访问之后连续执行读访问时,优先执行读访问。因此,在初始化过程中,请不要在写访问之后连续进行读访问。

**42.3.3 ECC错误中断功能**

当启用ECC功能并对SRAM(ECC区域)应用错误检查时,当任一ECC2STS寄存器中的ECC2ERR位或ECC1STS寄存器中的ECC1ERR位变为1,分别表示ECC检查发现2位错误或1位错误。

以t<sub>CLK</sub>的脉冲宽度输出ECC错误。当要屏蔽ECC1位错误时,将ECC1STSEN.E1STSEN位设置为0以禁用ECC1ERR位的更新。禁用ECC功能或启用ECC功能但未选择错误检查时,不会产生ECC错误。

ECC error can choose non maskable interrupt or reset by ECCOAD register. When set 1 in the OAD bit of the ECCOAD register, ECC error is output to the Reset function. When set 0 in the OAD bit of the ECCOAD register, ECC Error interrupt is output to the ICU as non-maskable interrupt.

#### 42.3.4 ECC Decoder Testing

Figure 42.1 shows the ECC decoder testing.

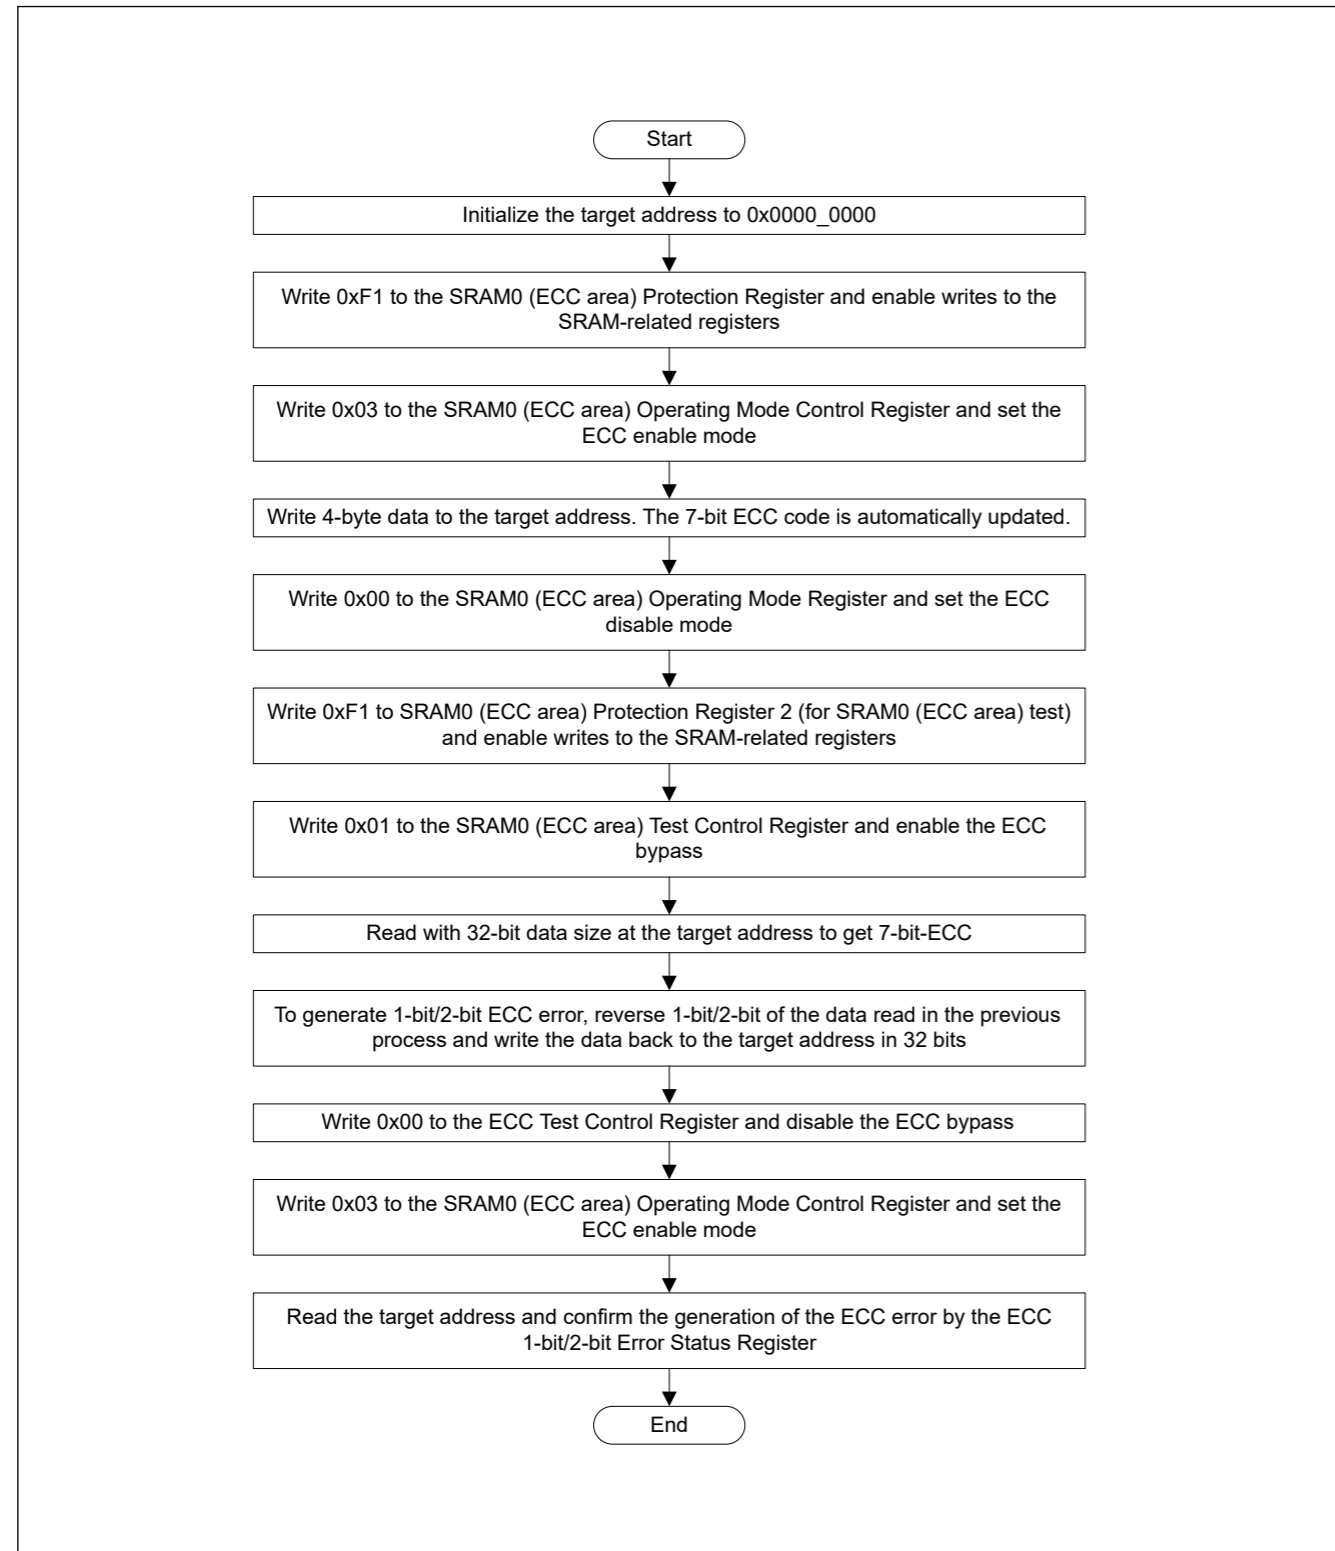

Figure 42.1 ECC decoder testing

ECC错误可以选择不可屏蔽中断或通过ECCOAD寄存器复位。当ECCOAD寄存器的OAD位设置为1时，ECC错误输出到复位功能。当ECCOAD寄存器的OAD位设置为0时，ECC错误中断作为不可屏蔽中断输出到ICU。

#### 42.3.4 ECC解码器测试

图42.1显示了ECC解码器测试。

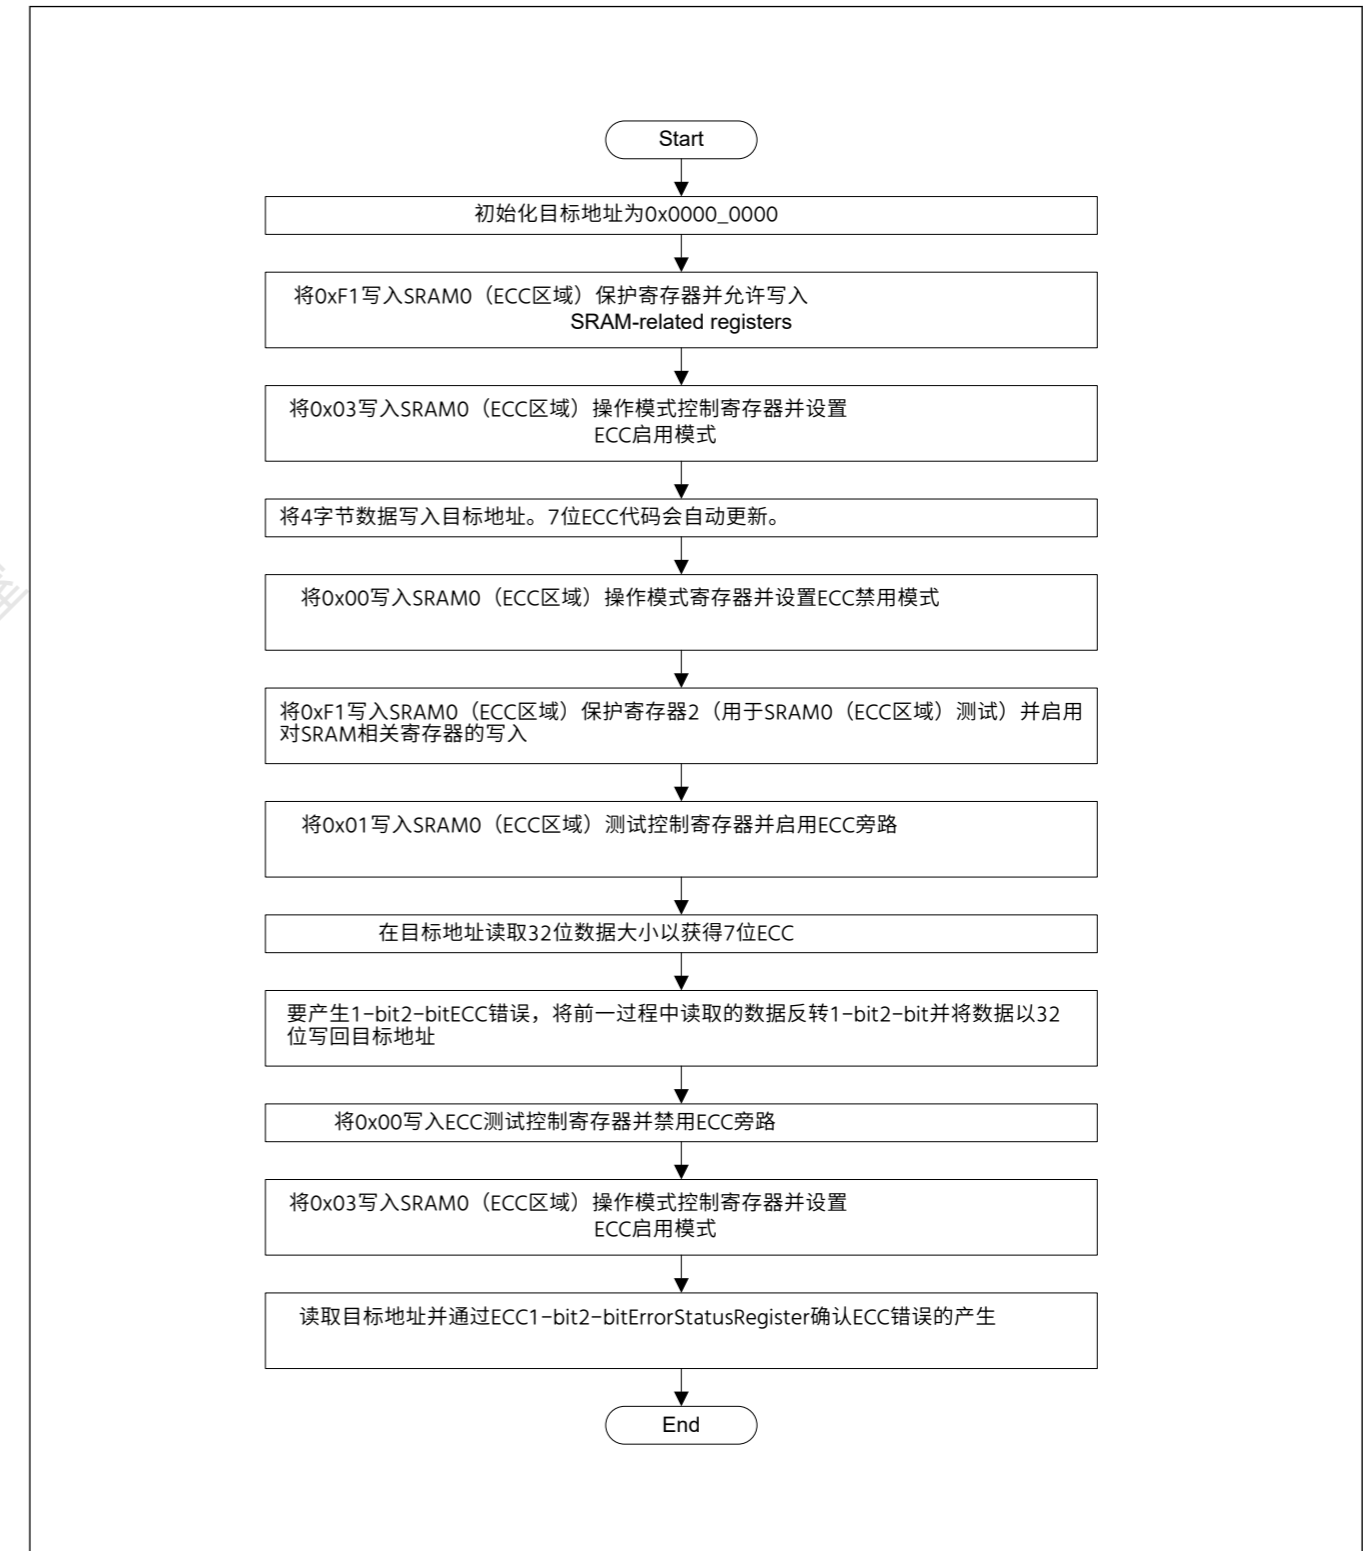

Figure 42.1 ECC解码器测试

42.3.5 Parity Calculation Function

The IEC60730 standard requires the checking of SRAM data. When data is written, a parity bit is added to every 8-bit data in the SRAM which has 32-bit data width, and when data is read, the parity is checked. When a parity error occurs, a parity-error notification is generated. This function can also be used to trigger a reset.

The parity-error notification can be specified as a non-maskable interrupt or a reset in the OAD bit of the PARIODAD register. When the OAD bit is set to 1, a parity error is output to the reset function. When the OAD bit is set to 0, a parity error is output to the ICU as a non-maskable interrupt.

Parity errors often occur because of noise. To confirm whether the cause of the parity error is noise or corruption, follow the parity check flows shown in Figure 42.2 and Figure 42.3.

When a read access is executed in a row after a write access, read access is executed with priority. Therefore, during initialization, do not perform the read access in a row after the write access.

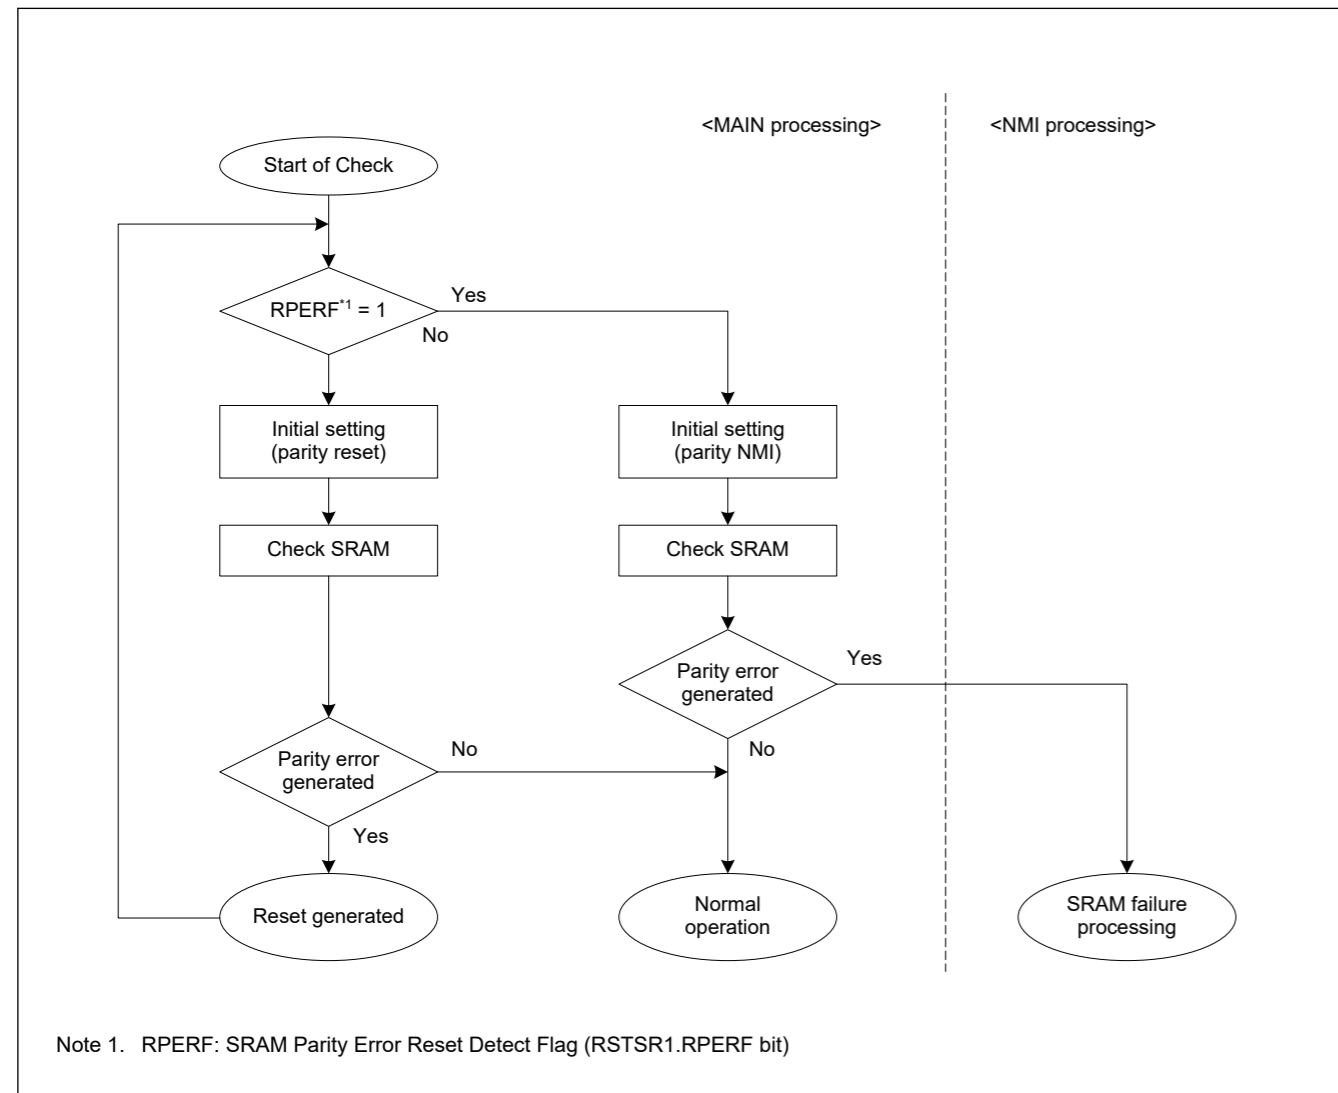

Figure 42.2 Flow of SRAM parity check when SRAM parity reset is enabled

42.3.5 奇偶校验计算功能

IEC60730标准要求检查SRAM数据。写入数据时，对32位数据宽度的SRAM中的每8位数据添加一个奇偶校验位，读取数据时检查奇偶校验位。发生奇偶校验错误时，会生成奇偶校验错误通知。此功能也可用于触发复位。

奇偶校验错误通知可以指定为不可屏蔽中断或PARIODAD寄存器的OAD位中的复位。当OAD位设置为1时，奇偶校验错误输出到复位功能。当OAD位设置为0时，奇偶校验错误作为不可屏蔽中断输出到ICU。

奇偶校验错误经常因噪声而发生。要确认奇偶校验错误的原因是噪声还是损坏，请遵循图42.2和图42.3所示的奇偶校验流程。

在写访问之后连续执行读访问时，优先执行读访问。因此，在初始化过程中，不要在写访问之后连续执行读访问。

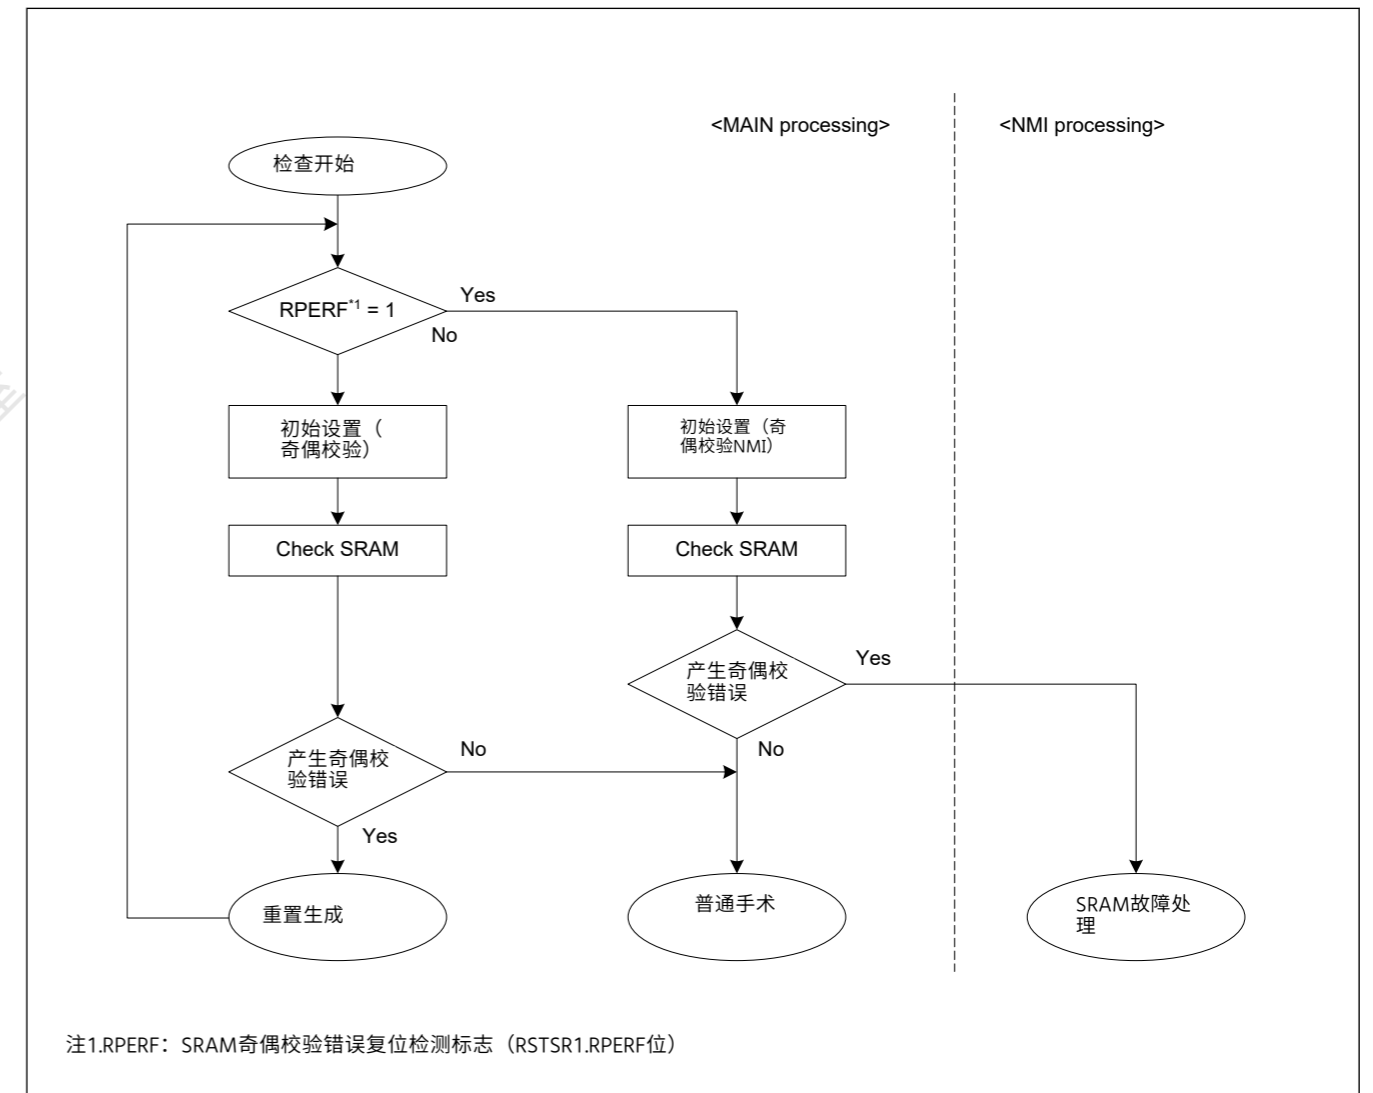

Figure 42.2 启用SRAM奇偶校验复位时的SRAM奇偶校验流程

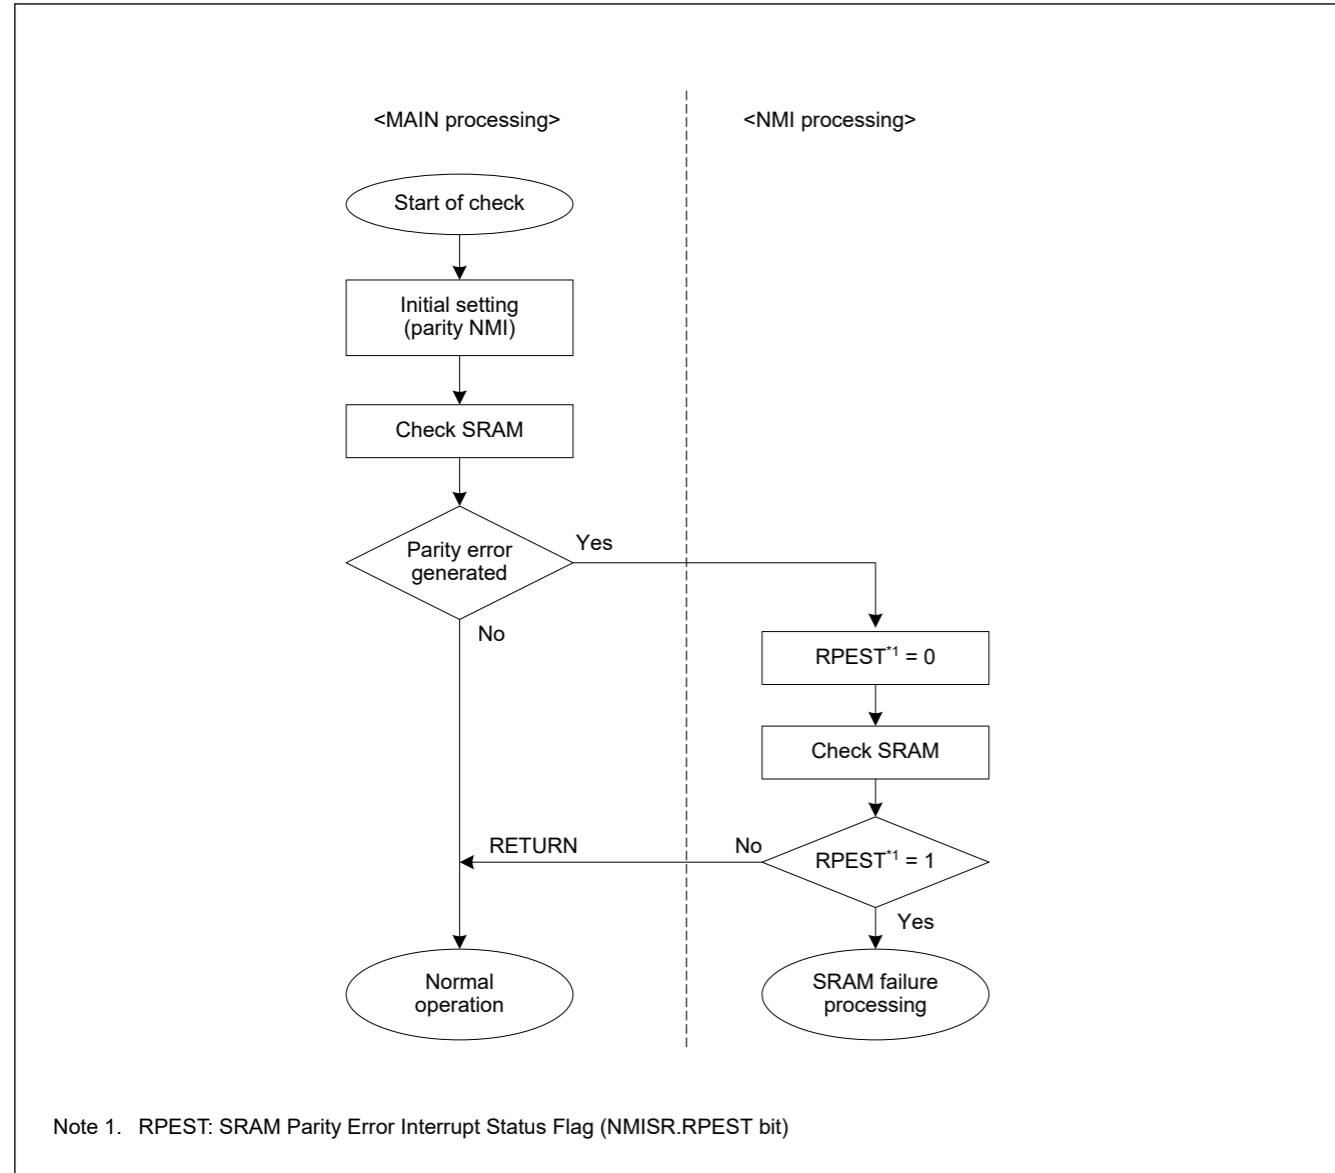

Figure 42.3 Flow of SRAM parity check when SRAM parity interrupt is enabled

### 42.3.6 TrustZone Filter function

There are two types of TrustZone Filter function for SRAM.

- TrustZone Filter for SRAM register protection
- TrustZone Filter for SRAM memory protection

#### 42.3.6.1 TrustZone Filter for SRAM register protection

SRAM registers can be protected with a Security Attribution (SA) from Non-secure access. When SA indicates that SRAM registers are secure status, non-secure access can not overwrite them because TrustZone Filter detects finds an error and protects the write access. SA for SRAM registers is just one to be used commonly among SRAM registers.

Table 42.2 Register protection (1 of 2)

| SA     | Access status | Write access                     | Read access |
|--------|---------------|----------------------------------|-------------|
| Secure | Secure        | Permit                           | Permit      |
|        | Non-secure    | TrustZone Filter error Protected | Permit      |

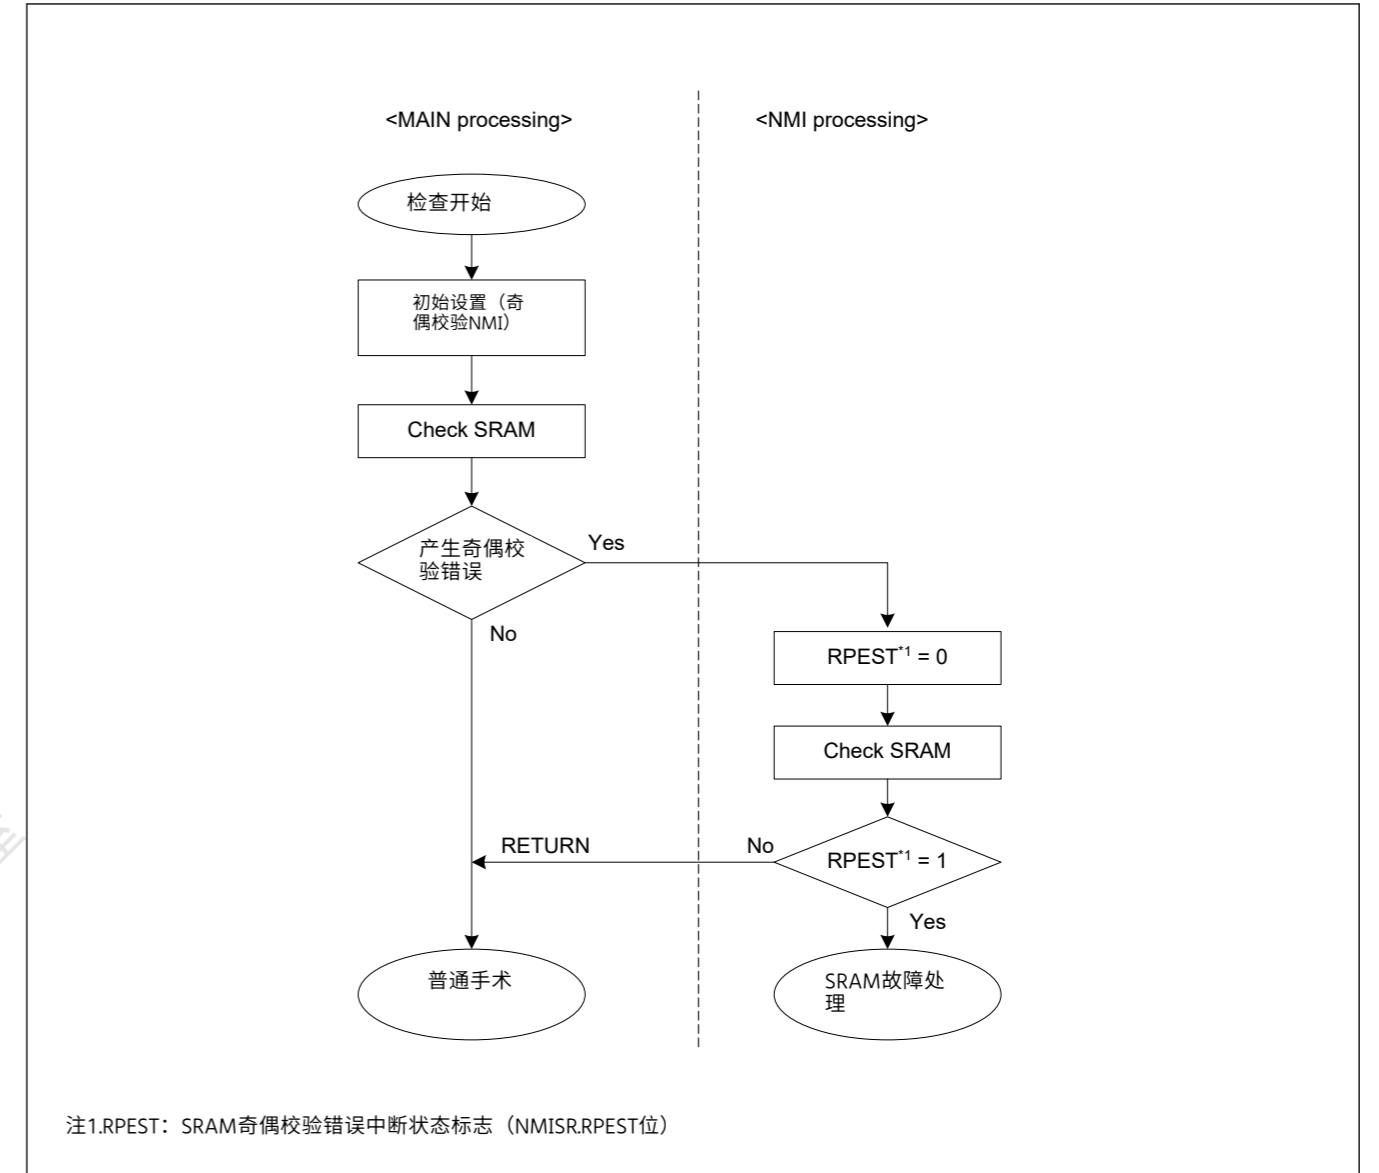

Figure 42.3 启用SRAM奇偶校验中断时的SRAM奇偶校验流程

### 42.3.6 TrustZone过滤器功能

SRAM有两种TrustZoneFilter功能。

- 用于SRAM寄存器保护的TrustZone过滤器
- 用于SRAM内存保护的TrustZone过滤器

#### 42.3.6.1 用于SRAM寄存器保护的TrustZone过滤器

可以使用安全属性(SA)保护SRAM寄存器免受非安全访问。当SA指示SRAM寄存器处于安全状态时，非安全访问无法覆盖它们，因为TrustZoneFilter检测到发现错误并保护写访问。SRAM寄存器的SA只是SRAM寄存器中常用的一种。

Table 42.2 寄存器保护(1of2)

| SA     | 访问状态       | 写访问               | 读取权限   |
|--------|------------|-------------------|--------|
| Secure | Secure     | Permit            | Permit |
|        | Non-secure | TrustZone过滤器错误受保护 | Permit |

Table 42.2 Register protection (2 of 2)

| SA         | Access status | Write access | Read access |
|------------|---------------|--------------|-------------|
| Non-secure | Secure        | Permit       | Permit      |
|            | Non-secure    | Permit       | Permit      |

When TrustZone Filter error for SRAM register access occurs, no error notification and no error response occurs.

### 42.3.6.2 TrustZone Filter for SRAM memory protection

SRAM memory, e.g. SRAM0 include ECC region and Parity can be divided into Secure/Non secure callable/Non secure status with Memory Security Attribution (MSA) and can be protected from Non-secure access. When MSA indicates that SRAM memory region are Secure or Non secure callable status, Non-secure access can't overwrite them.

Table 42.3 Memory protection

| SA                           | Access status | Write access  | Read access  |
|------------------------------|---------------|---|--|
| Secure / Non secure callable | Secure        | Permit  | Permit   |
|                              | Non-secure    | TrustZone Filter error <ul style="list-style-type: none"> <li>Protected</li> <li>Error response occurs</li> </ul> | TrustZone Filter error <ul style="list-style-type: none"> <li>Read data is 0</li> <li>Error response occurs</li> </ul> |
| Non-secure                   | Secure        | Permit  | Permit   |
|                              | Non-secure    | Permit  | Permit   |

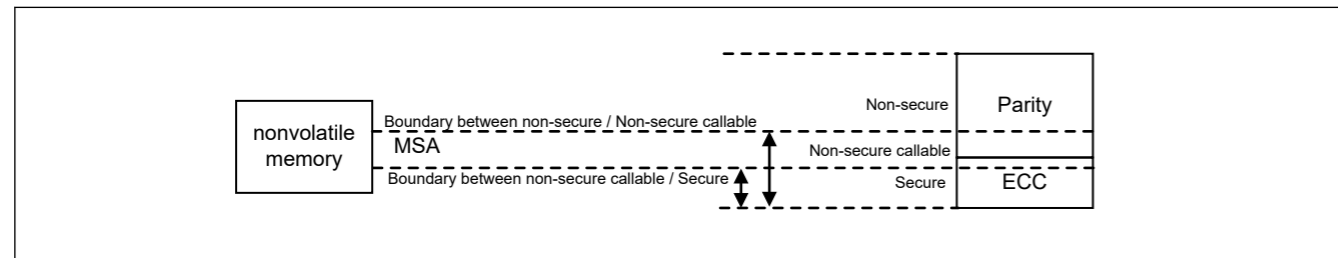

Figure 42.4 TrustZone Filter for SRAM memory

When TrustZone Filter error for SRAM memory access occurs, an error notification which become Reset request or NMI request occurs. See section 46.2. Arm TrustZone Security .

### 42.3.7 Interrupt Source

The SRAM interrupt source includes an ECC error, Parity error and TrustZone filter error. ECC error and Parity error can choose non-maskable interrupt or reset by OAD bit. When the debugger is connected, reset and non-maskable interrupt are maskable. Also, if these masks are set by the debugger, each status register is not set even if an ECC error occurs. For details on the debug mode, see section 2, CPU.

Table 42.4 SRAM Interrupt Source

| Name      | Interrupt Source                          | DTC Activation | DMAC Activation |
|-----------|---|----------------|-----------------|
| ECCERR    | ECC error (ECC operation region in SRAM0) | Not possible   | Not possible    |
| PARITYERR | Parity error                              | Not possible   | Not possible    |
| TZFLT     | TrustZone filter error                    | Not possible   | Not possible    |

### 42.3.8 Wait state

Depending on the operating frequency of ICLK, the WAIT setting for SRAM access has the following conditions.

[ICLK frequency] (SRAM0):

- 100 MHz ≥ ICLK = No-wait

Table 42.2 注册保护(2of2)

| SA         | 访问状态       | 写访问    | 读取权限   |
|------------|------------|--------|--------|
| Non-secure | Secure     | Permit | Permit |
|            | Non-secure | Permit | Permit |

当发生SRAM寄存器访问的TrustZoneFilter错误时，不会发生错误通知和错误响应。

### 42.3.6.2 用于SRAM内存保护的TrustZone过滤器

SRAM存储器，例如SRAM0包括ECC区域和Parity可分为SecureNonsecurecallableNonsecurestatuswithMemory SecurityAttribution(MSA)并可防止非安全访问。当MSA指示SRAM内存区域为安全或非安全可调用状态时，非安全访问无法覆盖它们。

Table 42.3 内存保护

| SA         | 访问状态       | 写访问   | 读取权限  |
|------------|------------|---|---|
| 安全非安全可调用   | Secure     | Permit  | Permit  |
|            | Non-secure | TrustZone过滤器错误 <ul style="list-style-type: none"> <li>发生错误响应</li> </ul> | TrustZone过滤器错误 <ul style="list-style-type: none"> <li>读取数据为0</li> <li>发生错误响应</li> </ul> |
| Non-secure | Secure     | Permit  | Permit  |
|            | Non-secure | Permit  | Permit  |

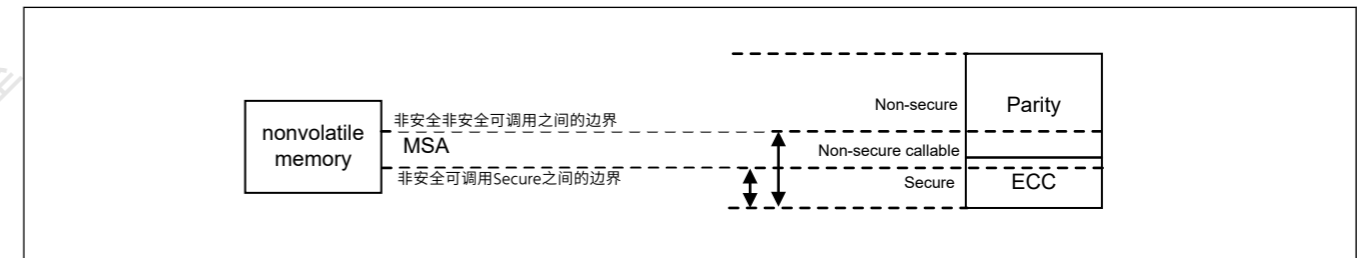

Figure 42.4 用于SRAM存储器的TrustZone过滤器

当发生SRAM内存访问的TrustZoneFilter错误时，会发生错误通知，成为Resetrequest或NMIrequest。见第46.2节。ArmTrustZone安全。

### 42.3.7 中断源

SRAM中断源包括ECC错误、奇偶校验错误和TrustZone过滤器错误。ECC错误和奇偶校验错误可以选择不可屏蔽中断或通过OAD位复位。当调试器连接时，复位和不可屏蔽中断都是可屏蔽的。此外，如果调试器设置了这些掩码，则即使发生ECC错误，也不会设置每个状态寄存器。有关调试模式的详细信息，请参见第2节CPU。

Table 42.4 SRAM中断源

| Name      | 中断源                    | DTC Activation | DMAC Activation |
|-----------|------------------------|----------------|-----------------|
| ECCERR    | ECC错误 (SRAM0中的ECC操作区域) | 不可能            | 不可能             |
| PARITYERR | 奇偶校验错误                 | 不可能            | 不可能             |
| TZFLT     | TrustZone过滤器错误         | 不可能            | 不可能             |

### 42.3.8 等待状态

根据ICLK的工作频率，SRAM访问的WAIT设置具有以下条件。

[ICLK frequency] (SRAM0):

- 100 MHz ≥ ICLK = No-wait

## 42.3.9 Access Cycle

- Number of cycles from the CPU
  - When the cache is hit, access is one cycle.
  - For cache off or non cacheable

Table 42.5 SRAM0 (ECC Area)

| Register Setting         |               | Read (cycles) |                       | Write (cycles) |                       |
|--------------------------|---------------|---------------|-----------------------|----------------|-----------------------|
|                          |               | Word access   | Half-word/Byte access | Word access    | Half-word/Byte access |
| ECC Off<br>ECCMOD[1] = 0 | SRAM0WTEN = 0 | 3             |                       | 2 <sup>1</sup> |                       |
|                          | SRAM0WTEN = 1 | 4             |                       | 2 <sup>1</sup> |                       |
| ECC On<br>ECCMOD[1] = 1  | SRAM0WTEN = 0 | 3             |                       | 2 <sup>1</sup> | 4                     |
|                          | SRAM0WTEN = 1 | 4             |                       | 2 <sup>1</sup> | 4                     |

Note 1. For efficiency of the access, when read access occurs to the same memory after write, memory write by the precedent write command delays it until for the next idle cycle or the next write access. When read continues, it is given priority to read.

Table 42.6 SRAM0 (Parity Area)

| Register Setting |  | Read (cycles) |                       | Write (cycles) |                       |
|------------------|--|---------------|-----------------------|----------------|-----------------------|
|                  |  | Word access   | Half-word/Byte access | Word access    | Half-word/Byte access |
| SRAM0WTEN = 0    |  | 3             |                       | 2 <sup>1</sup> |                       |
| SRAM0WTEN = 1    |  | 4             |                       | 2 <sup>1</sup> |                       |

Note 1. For efficiency of the access, when read access occurs to the same memory after write, memory write by the precedent write command delays it until for the next idle cycle or the next write access. When read continues, it is given priority to read.

- For cache on and cacheble (When the cache miss hit)

Table 42.7 SRAM0 (ECC Area)

| Register Setting         |               | Read (cycles) |                       | Write (cycles) |                       |
|--------------------------|---------------|---------------|-----------------------|----------------|-----------------------|
|                          |               | Word access   | Half-word/Byte access | Word access    | Half-word/Byte access |
| ECC Off<br>ECCMOD[1] = 0 | SRAM0WTEN = 0 | 3             |                       | 1 <sup>1</sup> |                       |
|                          | SRAM0WTEN = 1 | 4             |                       | 1 <sup>1</sup> |                       |
| ECC On<br>ECCMOD[1] = 1  | SRAM0WTEN = 0 | 3             |                       | 1 <sup>1</sup> |                       |
|                          | SRAM0WTEN = 1 | 4             |                       | 1 <sup>1</sup> |                       |

Note 1. For efficiency of the access, when read access occurs to the same memory after write, memory write by the precedent write command delays it until for the next idle cycle or the next write access. When read continues, it is given priority to read.

Table 42.8 SRAM0 (Parity Area)

| Register Setting |  | Read (cycles) |                       | Write (cycles) |                       |
|------------------|--|---------------|-----------------------|----------------|-----------------------|
|                  |  | Word access   | Half-word/Byte access | Word access    | Half-word/Byte access |
| SRAM0WTEN = 0    |  | 3             |                       | 1 <sup>1</sup> |                       |
| SRAM0WTEN = 1    |  | 4             |                       | 1 <sup>1</sup> |                       |

Note 1. For efficiency of the access, when read access occurs to the same memory after write, memory write by the precedent write command delays it until for the next idle cycle or the next write access. When read continues, it is given priority to read.

## 42.3.9 访问周期

- CPU的周期数
  - 当缓存命中时，访问为一个周期。
  - 对于缓存关闭或不可缓存

Table 42.5 SRAM0 (ECC Area)

| 寄存器设置                    |               | Read (cycles) |                       | Write (cycles) |                       |
|--------------------------|---------------|---------------|-----------------------|----------------|-----------------------|
|                          |               | 字访问           | Half-word/Byte access | 字访问            | Half-word/Byte access |
| ECC Off<br>ECCMOD[1] = 0 | SRAM0WTEN = 0 | 3             |                       | 2 <sup>1</sup> |                       |
|                          | SRAM0WTEN = 1 | 4             |                       | 2 <sup>1</sup> |                       |
| ECC On<br>ECCMOD[1] = 1  | SRAM0WTEN = 0 | 3             |                       | 2 <sup>1</sup> | 4                     |
|                          | SRAM0WTEN = 1 | 4             |                       | 2 <sup>1</sup> | 4                     |

注1.为提高访问效率，当写入后对同一内存进行读取访问时，先行写入命令的内存写入会将其延迟到下一个空闲周期或下一次写入访问。继续读取时，优先读取。

Table 42.6 SRAM0 (Parity Area)

| 寄存器设置         |  | Read (cycles) |                       | Write (cycles) |                       |
|---------------|--|---------------|-----------------------|----------------|-----------------------|
|               |  | 字访问           | Half-word/Byte access | 字访问            | Half-word/Byte access |

| eout[0]  | $\sim(din[31] \wedge din[29] \wedge din[28] \wedge din[26] \wedge din[23] \wedge din[22] \wedge din[20] \wedge din[17] \wedge din[13] \wedge din[12] \wedge din[10] \wedge din[7] \wedge din[3] \wedge din[0])$ |

Note: eout[6:0] = ECC code, din[31:0] = write data

## 42.3.10 ECC编码规范

下表显示了ECC编码规范。将由以下计算公式形成的ECC线 (eout[6:0]) 添加到写入数据的高7位 (din[38:32]) 中，并写入SRAM中。

Table 42.9 ECC encode

| ECC code | 计算公式  |
|----------|---|
| eout[6]  | $(din[13] \wedge din[12] \wedge din[11] \wedge din[10] \wedge din[9] \wedge din[8] \wedge din[7] \wedge din[6] \wedge din[5] \wedge din[4] \wedge din[3] \wedge din[2] \wedge din[1] \wedge din[0])$            |
| eout[5]  | $(din[23] \wedge din[22] \wedge din[21] \wedge din[20] \wedge din[19] \wedge din[18] \wedge din[17] \wedge din[16] \wedge din[15] \wedge din[14] \wedge din[3] \wedge din[2] \wedge din[1] \wedge din[0])$      |
| eout[4]  | $(din[29] \wedge din[28] \wedge din[27] \wedge din[26] \wedge din[25] \wedge din[24] \wedge din[17] \wedge din[16] \wedge din[15] \wedge din[14] \wedge din[7] \wedge din[6] \wedge din[5] \wedge din[4])$      |
| eout[3]  | $(din[31] \wedge din[30] \wedge din[26] \wedge din[25] \wedge din[24] \wedge din[20] \wedge din[19] \wedge din[18] \wedge din[14] \wedge din[10] \wedge din[9] \wedge din[8] \wedge din[4] \wedge din[0])$      |
| eout[2]  | $(din[31] \wedge din[30] \wedge din[28] \wedge din[27] \wedge din[24] \wedge din[22] \wedge din[21] \wedge din[18] \wedge din[15] \wedge din[12] \wedge din[11] \wedge din[8] \wedge din[5] \wedge din[1])$     |
| eout[1]  | $\sim(din[30] \wedge din[29] \wedge din[27] \wedge din[25] \wedge din[23] \wedge din[21] \wedge din[19] \wedge din[16] \wedge din[13] \wedge din[11] \wedge din[9] \wedge din[6] \wedge din[2] \wedge din[0])$  |
| eout[0]  | $\sim(din[31] \wedge din[29] \wedge din[28] \wedge din[26] \wedge din[23] \wedge din[22] \wedge din[20] \wedge din[17] \wedge din[13] \wedge din[12] \wedge din[10] \wedge din[7] \wedge din[3] \wedge din[0])$ |

Note: eout[6:0]=ECC代码, din[31:0]=写入数据

## 43. Standby SRAM

### 43.1 Overview

An on-chip SRAM is provided to retain data in Deep Software Standby mode. Table 43.1 lists the Standby SRAM specifications.

**Table 43.1 Standby SRAM specifications**

| Item                    | Description  |
|-------------------------|--|
| SRAM capacity           | 1 KB   |
| SRAM address            | 0x2800_0000 to 0x2800_03FF   |
| Access                  | Standby SRAM clock is the same clock as the PCLKB. See section 43.3.5. Access Cycle for details.   |
| Data retention function | Data can be retained in deep standby mode. See section 43.3.1. Data Retention for details.   |
| parity                  | Even parity (data: 8 bits, parity: 1 bit)  |
| Module-stop function    | Module-stop state can be set to reduce power consumption. See section 43.3.2. Setting for the Module-stop Function for details.                      |
| Security                | Permits the read and write operations to Standby RAM following TrustZone Filter function. See section 43.3.4. TrustZone Filter function for details. |

### 43.2 Register Descriptions

#### 43.2.1 STBRAMSAR : Standby RAM memory Security Attribution Register

Base address: CPSCU = 0x4000\_8000

Offset address: 0x014

| Bit position:      | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16           |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|
| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —            |
| Value after reset: | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1            |
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0            |
| Bit field:         | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | NSBSTBR[3:0] |
| Value after reset: | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 0  | 0  | 0            |

| Bit  | Symbol       | Function  | R/W |
|------|--------------|---|-----|
| 3:0  | NSBSTBR[3:0] | Security attributes of each region for Standby RAM<br>0x0: Region7-0 are all Secure.<br>0x1: Region7 is Non-secure. Region6-0 are Secure<br>0x2: Region7-6 are Non-secure. Region5-0 are Secure.<br>0x3: Region7-5 are Non-secure. Region4-0 are Secure.<br>0x4: Region7-4 are Non-secure. Region 3-0 are Secure.<br>0x5: Region7-3 are Non-secure. Region 2-0 are Secure.<br>0x6: Region7-2 are Non-secure. Region 1-0 are Secure.<br>0x7: Region7-1 are Non-Secure. Region0 is Secure.<br>Others: Region7-0 are all Non-Secure. | R/W |
| 31:4 | —            | This bit is read as 1.  | R   |

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

## 43. Standby SRAM

### 43.1 Overview

提供片上SRAM以在深度软件待机模式下保留数据。表43.1列出了备用SRAM规格。

**Table 43.1 备用SRAM规格**

| Item                 | Description  |
|----------------------|--|
| SRAM capacity        | 1 KB   |
| SRAM address         | 0x2800_0000 to 0x2800_03FF   |
| Access               | 备用SRAM时钟与PCLKB时钟相同。请参阅第43.3.5节。访问周期了解详情。                           |
| 数据保留功能               | 数据可以在深度待机模式下保留。请参见第43.3.1节。有关详细信息的数据保留。                            |
| parity               | 偶校验 (数据: 8位, 奇偶校验: 1位)   |
| Module-stop function | 可设置模块停止状态以降低功耗。请参见第43.3.2节。设置为模块停止功能了解详情。                          |
| Security             | 允许在TrustZone过滤器功能之后对备用RAM进行读取和写入操作。请参见第43.3.4节。TrustZone过滤器功能了解详情。 |

### 43.2 注册说明

#### 43.2.1 STBRAMSAR:备用RAM内存安全属性寄存器

Base address: CPSCU = 0x4000\_8000

Offset address: 0x014

| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16           |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —            |
| 重置后的值:        | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1            |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0            |
| Bit field:    | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | NSBSTBR[3:0] |
| 重置后的值:        | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 1  | 0  | 0  | 0            |

| Bit  | Symbol       | Function   | R/W |
|------|--------------|--|-----|
| 3:0  | NSBSTBR[3:0] | StandbyRAM各区域的安全属性<br>0x0: Region7-0都是安全的。0x1: Region7不安全。Region6-0是安全的。0x2: Region7-6是非安全的。Region5-0是安全的。0x3: Region7-5不安全。Region4-0是安全的。0x4: Region7-4不安全。区域3-0是安全的。0x5: Region7-3不安全。区域2-0是安全的。0x6: Region7-2不安全。区域1-0是安全的。0x7: Region7-1是非安全的。Region0是安全的。<br>其他: Region7-0都是非安全的。 | R/W |
| 31:4 | —            | 该位读为1。   | R   |

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问, 但不允许非安全写入访问, 并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

**NSBSTBR[3:0] bit (Security attributes of each region for Standby RAM)**

Standby RAM is divided into 8 regions. Each region can be set as Secure or Non-secure state with NSBSTBR[3:0]

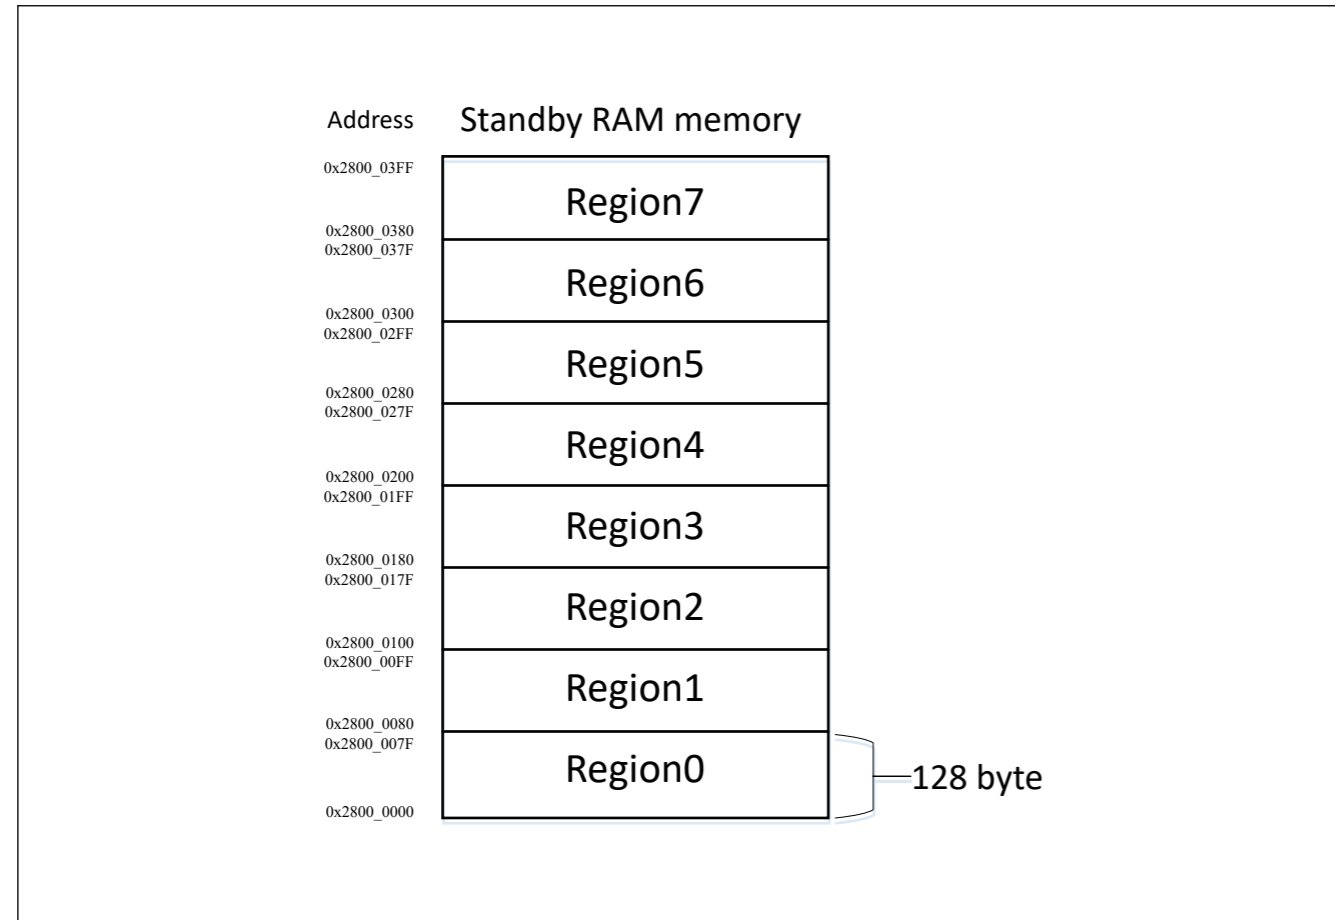

Figure 43.1 Standby RAM regions

### 43.3 Operation

#### 43.3.1 Data Retention

The power supply to the Standby SRAM in Deep Software Standby mode is enabled by the DPSBYCR.DEEPCUT[1:0] bits. If the DPSBYCR.DEEPCUT[1:0] bits are set to 00b, data in the Standby SRAM is retained in Deep Software Standby mode. See [section 10, Low Power Modes](#), for details on the DPSBYCR.DEEPCUT[1:0] bits.

#### 43.3.2 Setting for the Module-stop Function

Power consumption can be reduced by setting module stop control register A (MSTPCRA) to stop supply of the clock signal to SRAM.

If the Standby SRAM bit in MSTPCRA is set to 1, supply of the clock signal to the Standby SRAM is stopped.

The Standby SRAM is thus placed in the module-stop state by stopping supply of the clock signals. The Standby SRAM operates after a reset.

The Standby SRAM is not accessible if it is in the module-stop state. A transition to the module-stop state should not be made while access to the standby SRAM is in progress.

For details on the MSTPCRA register, see [section 10, Low Power Modes](#).

#### 43.3.3 Parity Calculation Function

The parity calculation Function for Standby SRAM is as same as SRAM without ECC.

**NSBSTBR[3:0]位 (StandbyRAM每个区域的安全属性)**

备用RAM分为8个区域。每个区域都可以通过NSBSTBR[3:0]设置为安全或非安全状态

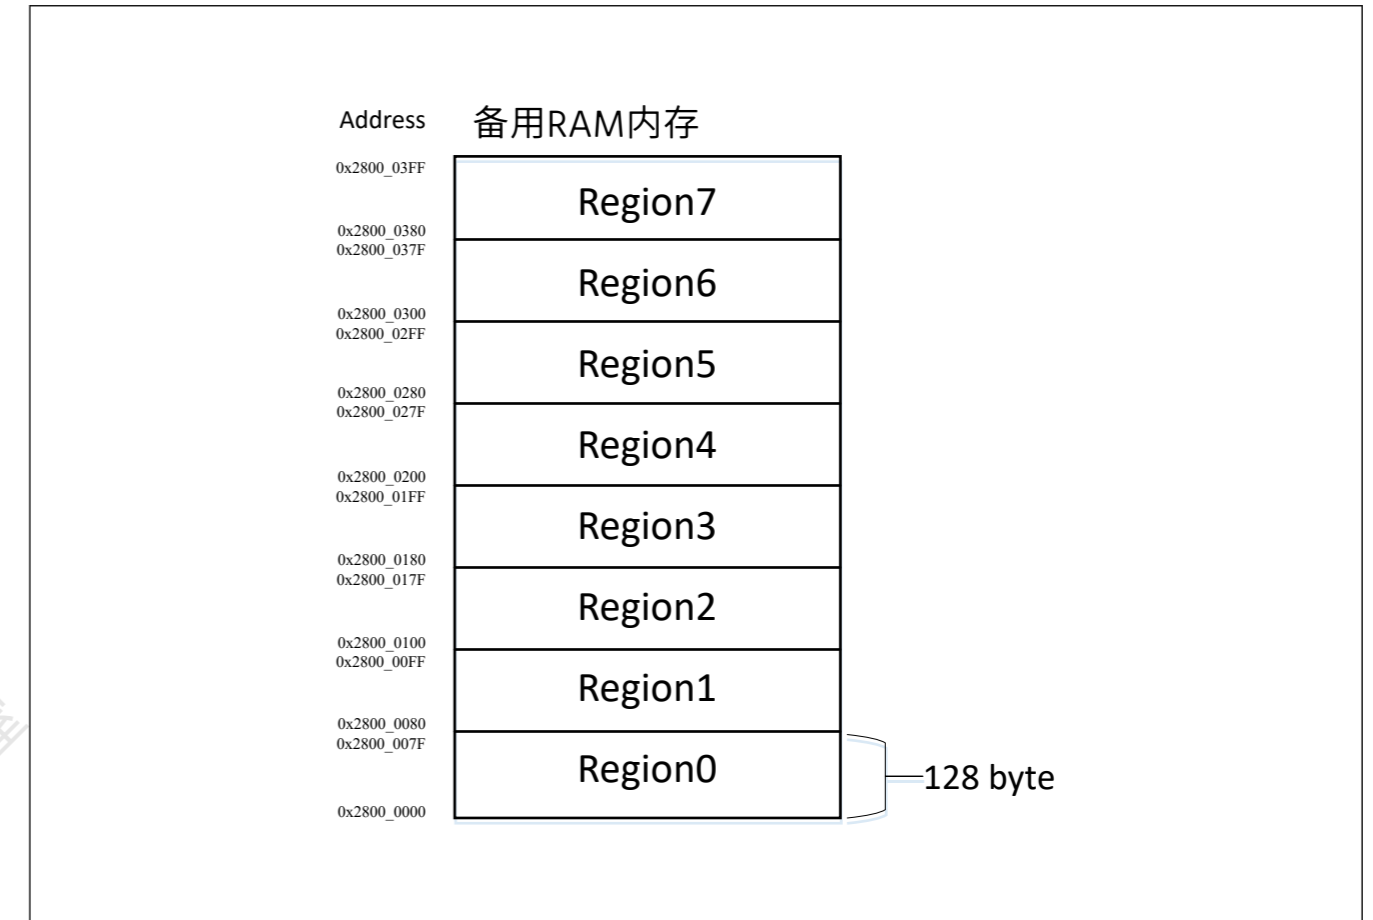

Figure 43.1 备用RAM区域

### 43.3 Operation

#### 43.3.1 数据保留

深度软件待机模式下的待机SRAM电源由DPSBYCR.DEEPCUT[1:0]位启用。如果DPSBYCR.DEEPCUT[1:0]位设置为00b，则待机SRAM中的数据将保留在深度软件待机模式中。有关DPSBYCR.DEEPCUT[1:0]位的详细信息，请参见第10节，低功耗模式。

#### 43.3.2 模块停止功能的设置

通过设置模块停止控制寄存器A(MSTPCRA)停止向SRAM提供时钟信号，可以降低功耗。

如果MSTPCRA中的StandbySRAM位设置为1，则停止向StandbySRAM提供时钟信号。

因此，通过停止提供时钟信号，备用SRAM进入模块停止状态。待机SRAM在复位后运行。

如果处于模块停止状态，则无法访问备用SRAM。在访问备用SRAM的过程中，不应转换到模块停止状态。

有关MSTPCRA寄存器的详细信息，请参见第10节，低功耗模式。

#### 43.3.3 奇偶校验计算功能

StandbySRAM的奇偶校验计算功能与无ECC的SRAM相同。

See section 42.3.5. Parity Calculation Function and section 42.3.7. Interrupt Source.

OAD bit in PARIOAD register is commonly used for SRAM0 (without ECC) / Standby SRAM.

### 43.3.4 TrustZone Filter function

There is only one type of TrustZone Filter function for Standby SRAM and that is, TrustZone Filter for SRAM memory protection

#### 43.3.4.1 TrustZone Filter for Standby SRAM Memory Protection

Standby SRAM memory can be divided into 8 regions, 128 bytes each with a Security Attribution (SA) to be protected from Non-secure access. When SA indicates that the region in Standby SRAM is secure status, non-secure access can not overwrite them because TrustZone Filter detects finds an error and protects the write access.

**Table 43.2 Security Attribution and Access status**

| SA         | Access status | Write access                       | Read access                             |
|------------|---------------|------------------------------------|---|
| Secure     | Secure        | Permit                             | Permit                                  |
|            | Non-secure    | TrustZone Filter error - Protected | TrustZone Filter error - Read data is 0 |
| Non-secure | Secure        | Permit                             | Permit                                  |
|            | Non-secure    | Permit                             | Permit                                  |

When TrustZone Filter error for Standby SRAM access occurs, no error notification and no error response occurs.

### 43.3.5 Access Cycle

Number of cycles from the CPU.

For Standby SRAM, cache always has non-cacheable access.

**Table 43.3 Standby SRAM (Parity Area 0x2800\_0000 to 0x2800\_03FF)**

|              | Read cycle   |                       | Write cycle                                      |                       |
|--------------|--|-----------------------|--|-----------------------|
|              | Word access  | Half-word/Byte access | Word access                                      | Half-word/Byte access |
| ICLK ≥ PCLKB | Min.: 2 ICLK + 2 PCLKB<br>Max.: (n + 1) ICLK + 2 PCLKB |                       | Min.: 1 ICLK + 1 PCLKB<br>Max.: n ICLK + 1 PCLKB |                       |

Note: When the frequency ratio of ICLK : PCLKB is n : 1

## 43.4 Usage Notes

### 43.4.1 Instruction Fetch from the Standby SRAM Area

When using Standby SRAM to operate a program, initialize the Standby SRAM area so that the CPU can correctly prefetch data. A parity error might occur if the CPU prefetches from an area that is not initialized. Initialize the additional 12-byte area from the end address of the program with the 4-byte boundary. Renesas recommends using the NOP instruction for data initialization.

请参见第42.3.5节。奇偶校验计算函数和第42.3.7节。中断源。

PARIOAD寄存器中的OAD位常用于SRAM0（无ECC）备用SRAM。

### 43.3.4 TrustZone过滤器功能

StandbySRAM只有一种TrustZoneFilter功能，即用于SRAM内存保护的TrustZoneFilter

#### 43.3.4.1 用于备用SRAM内存保护的TrustZone过滤器

备用SRAM存储器可分为8个区域，每个128字节具有安全属性(SA)非安全访问。当SA指示StandbySRAM中的区域为安全状态时，非安全访问无法覆盖它们，因为TrustZone Filter检测发现错误并保护写访问。

**Table 43.2 安全属性和访问状态**

| SA         | 访问状态       | 写访问               | 读取权限                 |
|------------|------------|-------------------|----------------------|
| Secure     | Secure     | Permit            | Permit               |
|            | Non-secure | TrustZone过滤器错误受保护 | TrustZone过滤器错误读取数据为0 |
| Non-secure | Secure     | Permit            | Permit               |
|            | Non-secure | Permit            | Permit               |

当StandbySRAM访问的TrustZoneFilter错误发生时，不会发生错误通知和错误响应。

### 43.3.5 访问周期

CPU的周期数。

对于备用SRAM，缓存始终具有不可缓存的访问权限。

**Table 43.3 备用SRAM（奇偶校验区0x2800\_0000至0x2800\_03FF）**

|              | 读周期  |                       | 写周期  |                       |
|--------------|--|-----------------------|--|-----------------------|
|              | 字访问  | Half-word/Byte access | 字访问  | Half-word/Byte access |
| ICLK ≥ PCLKB | Min.: 2 ICLK + 2 PCLKB<br>Max.: (n + 1) ICLK + 2 PCLKB |                       | Min.: 1 ICLK + 1 PCLKB<br>Max.: n ICLK + 1 PCLKB |                       |

Note: 当ICLK:PCLKB的频率比为n:1时

## 43.4 使用说明

### 43.4.1 从备用SRAM区域取指令

使用StandbySRAM操作程序时，初始化StandbySRAM区域，以便CPU可以正确预取数据。如果CPU从未初始化的区域预取，则可能发生奇偶校验错误。用4字节边界从程序的结束地址初始化额外的12字节区域。瑞萨推荐使用NOP指令进行数据初始化。

## 44. Flash Memory

This MCU incorporates code flash memory, data flash memory, and option-setting memory. The code flash memory stores instructions and operands, and the data flash memory stores data. For option-setting memory, see [section 6, Option-Setting Memory](#).

### 44.1 Overview

[Table 44.1](#) lists the specifications of the flash memory, and [Figure 44.1](#) is block diagrams of the flash memory related modules.

The I/O pins used in boot mode, see [Table 44.29](#).

The FCU (flash control unit) controls programming and erasure of the flash memory. The FACL (flash application command interface) controls the FCU according to the specified FACL commands.

Regarding the configuration of the code flash memory, see [Figure 44.2](#) to [section 44.2. Structure of Memory](#), and for the configuration of the data flash memory, see [Figure 44.3](#).

**Table 44.1 Specifications of flash memory (1 of 2)**

| Item                              | Code flash memory   | Data flash memory  |
|-----------------------------------|---|--|
| Memory capacity                   | User area: 1 Mbytes max   | Data area: 8 Kbytes  |
| Read cycle                        | See <a href="#">section 44.16.3. Access Cycle</a>   | See <a href="#">section 44.16.3. Access Cycle</a>  |
| Value after erasure               | 0xFF  | Undefined  |
| Programming/erasing method        | <ul style="list-style-type: none"> <li>Programming and erasing the code flash memory and data flash memory, and programming the option-setting memory are handled by the FACL commands specified in the FACL command issuing area (0x407E_0000) (self-programming).</li> <li>Programming/erasure through transfer by a serial-programmer via a serial interface (serial programming)</li> </ul>   |  |
| Protection                        | Protects against erroneous rewriting of the flash memory  |  |
| Block swap function               | The block swap structure makes a safe update for a part of non-secure application possible in case where programming is suspended.  | Not available  |
| Background operations (BGOs)      | <ul style="list-style-type: none"> <li>The data flash memory can be read while the code flash memory is being programmed or erased.</li> <li>The code flash memory can be read while the data flash memory is being programmed or erased.</li> </ul>  |  |
| Units of programming and erasure  | <ul style="list-style-type: none"> <li>Units of programming for the user area: 128 bytes</li> <li>Units of erasure for the user area: Block units</li> </ul>  | <ul style="list-style-type: none"> <li>Unit of programming for the data area: 4/8/16 bytes</li> <li>Unit of erasure for the data area: 64/128/256 bytes</li> </ul> |
| Other functions                   | Interrupts can be accepted during self-programming. In the initial settings of this MCU, an expansion area of the option-setting memory can be set.   |  |
| On-board programming (four types) | Programming/erasure in boot mode (for the SCI interface) <ul style="list-style-type: none"> <li>The asynchronous serial interface (SCI9) is used.</li> <li>The transfer rate is adjusted automatically.</li> </ul> Programming/erasure in boot mode (for the USB interface) <ul style="list-style-type: none"> <li>USBFS is used.</li> <li>Dedicated hardware is not required, so direct connection to a PC is possible.</li> </ul> Programming/erasure in On-chip debug mode <ul style="list-style-type: none"> <li>JTAG or SWD interface is used</li> </ul> Programming and erasure by self-programming <ul style="list-style-type: none"> <li>This allows code flash memory programming/erasure without resetting the system.</li> </ul> |  |

## 44. 闪存

该MCU包含代码闪存、数据闪存和选项设置存储器。代码闪存存储指令和操作数，数据闪存存储数据。有关选项设置内存，请参阅第6节，选项设置内存。

### 44.1 Overview

表44.1列出了闪存的规格，图44.1是闪存相关模块的框图。

引导模式下使用的IO引脚，请参见表44.29。

FCU（闪存控制单元）控制闪存的编程和擦除。FACL（闪存应用命令接口）根据指定的FACL命令控制FCU。

关于代码闪存的配置，请参见图44.2至44.2节。内存结构，以及数据闪存的配置，见图44.3。

**Table 44.1 闪存规格(1 of 2)**

| Item                              | 代码闪存   | 数据闪存   |
|-----------------------------------|--|--|
| 内存容量                              | 用户区：最大1MB  | Data area: 8 Kbytes  |
| 读周期                               | 请参见第44.16.3节。访问周期  | 请参见第44.16.3节。访问周期  |
| 擦除后的值                             | 0xFF   | Undefined  |
| Programming/erasing method        | <ul style="list-style-type: none"> <li>编程和擦除代码闪存和数据闪存以及编程选项设置存储器由FACL命令发出区域(0x407E_0000)中指定的FACL命令处理（自编程）。</li> <li>通过串行编程器通过串行接口传输的编程擦除（串行编程）</li> </ul>  |  |
| Protection                        | 防止闪存的错误重写  |  |
| 区块交换功能                            | 区块交换结构可以在编程暂停的情况下对部分非安全应用程序进行安全更新。   | 无法使用   |
| 后台操作(BGO)                         | <ul style="list-style-type: none"> <li>在对代码闪存进行编程或擦除时，可以读取数据闪存。</li> <li>在对数据闪存进行编程或擦除时，可以读取代码闪存。</li> </ul>   |  |
| 编程和擦除单元                           | <ul style="list-style-type: none"> <li>用户区编程单位：128字节</li> <li>用户区擦除单位：块单位</li> </ul>   | <ul style="list-style-type: none"> <li>数据区编程单位：4816字节</li> <li>数据区擦除单位：64128256字节</li> </ul> |
| 其他功能                              | 自编程期间可以接受中断。在此MCU的初始设置中，可以设置选项设置存储器的扩展区域。  |  |
| On-board programming (four types) | 引导模式下的编程擦除（用于SCI接口）● <ul style="list-style-type: none"> <li>使用异步串行接口(SCI9)。</li> <li>传输速率会自动调整。</li> </ul> 引导模式下的编程擦除（针对USB接口）● <ul style="list-style-type: none"> <li>使用USBFS。</li> <li>不需要专用硬件，因此可以直接连接到PC。</li> </ul> 片上调试模式下的编程擦除● <ul style="list-style-type: none"> <li>使用JTAG或SWD接口</li> </ul> 通过自编程进行编程和擦除● <ul style="list-style-type: none"> <li>这允许在不重置系统的情况下擦除代码闪存编程。</li> </ul> |  |
| 唯一身份                              | 为每个MCU提供一个16字节的ID代码  |  |

Table 44.1 Specifications of flash memory (2 of 2)

| Item               | Code flash memory  | Data flash memory   |
|--------------------|--|---|
| FACI command       | Program : 128 bytes<br>Block erase: 1 block (8 KB or 32 KB)<br>P/E suspend<br>P/E resume<br>Forced Stop<br>Status Clear<br>Configuration set (16 bytes)  | Program: 4/8/16 bytes<br>Block Erase: 1 block (64 bytes)<br>Multi Block Erase: 64/128/256 bytes<br>P/E suspend<br>P/E resume<br>Forced Stop<br>Blank Check: 4 bytes to data flash memory capacity<br>Status Clear |
| Security function  | Protects against illicit tampering with or reading out of data in flash memory<br>Startup area select setting protection <ul style="list-style-type: none"> <li>• BTFGL and FSUACR registers are protected by the FSPR bit.</li> </ul> Permanent block protect setting protection <ul style="list-style-type: none"> <li>• Code flash memory is permanently protected from programming/erasure operation by the permanent block protect function.</li> </ul> Flash memory protection for TrustZone <ul style="list-style-type: none"> <li>• Protection for flash memory area (P/E)</li> <li>• Protection for flash memory area (read)</li> <li>• Protection for register</li> <li>• Protection during FACI command operation.</li> <li>• Code flash P/E mode entry protection</li> </ul> |   |
| Safety function    | Software protection <ul style="list-style-type: none"> <li>• FACI command protection by FENTRYR register.</li> <li>• Flash memory is protected by FWEPROR register</li> <li>• The user area is protected by the block protect setting</li> </ul> Error protection <ul style="list-style-type: none"> <li>• Error is detected when unintended commands or prohibited settings occur. The FACI command is not accepted after an error detection.</li> </ul> Boot area protection <ul style="list-style-type: none"> <li>• The start-up area select function allows customer to safely update the boot firmware. The size of the start-up area is 8 KB.</li> </ul>  |   |
| Interrupt request  | <ul style="list-style-type: none"> <li>• FRDYI (flash sequencer ready (processing end)) : Enabled by FRDYIE bit.</li> <li>• FIFERR (flash sequencer error) : Enabled by CFAEIE/CMDLKIE/DFAEIE bits</li> </ul>  |   |
| Address conversion | <ul style="list-style-type: none"> <li>• Start-up area select function is supported</li> <li>• Block swap function is supported</li> </ul>   |   |

Note 1. Limitations apply to the combinations of the address ranges for programming/erasure process and reading process: see Table 44.31.

Figure 44.1 shows how modules related to flash memory can be configured. The flash sequencer is configured with the FCU and FACI. The FCU executes basic control for rewriting of the flash memory. The FACI receives FACI commands using peripheral bus, and controls FCU operations accordingly.

In response to a reset, the FACI transfers data from the flash memory to the option byte storage registers.

Table 44.1 闪存规格(2of2)

| Item   | 代码闪存  | 数据闪存   |
|--------|---|--|
| FACI命令 | 程序: 128字节<br>块擦除: 1个块 (8KB或32KB)<br>PE暂停PE恢复强制停止<br>状态清除<br><br>配置集 (16字节)  | Program: 4/8/16 bytes<br>Block Erase: 1 block (64 bytes)<br>多块擦除: 64/128/256字节<br>PE暂停PE恢复强制停止<br><br>空白检查: 4字节到数据闪存容量状态清除 |
| 安全功能   | 防止非法篡改或读取闪存中的数据<br>启动区选择设置保护●<br>BTFGL和FSUACR寄存器受FSPR位保护。<br>永久块保护设置保护●<br>永久块保护功能永久保护代码闪存免受编程擦除操作的影响。TrustZone的闪存保护●<br><br>闪存区保护(PE) <ul style="list-style-type: none"> <li>• 保护闪存区域 (读取)</li> <li>• 注册保护</li> <li>• FACI命令操作期间的保护。</li> <li>• CodeflashPE模式进入保护</li> </ul> |  |
| 安全功能   | 软件保护●<br>FACI命令由FENTRYR寄存器保护。 <ul style="list-style-type: none"> <li>• 闪存受FWEPROR寄存器保护</li> <li>• 用户区受块保护 设置保护</li> </ul> 错误保护●<br>发生意外命令或禁止设置时会检测到错误。错误检测后不接受FACI命令。引导区保护●<br><br>启动区域选择功能允许客户安全地更新启动固件。启动区的大小为8KB。  |  |
| 中断请求   | <ul style="list-style-type: none"> <li>• FRDYI (闪存序列器就绪 (处理结束)) : 由FRDYIE位启用。</li> <li>• FIFERR (flash sequencer error) : 由CFAEIE/CMDLKIE/DFAEIE位启用</li> </ul>  |  |
| 地址转换   | <ul style="list-style-type: none"> <li>• 支持启动区域选择功能</li> <li>• 支持区块交换功能</li> </ul>  |  |

注1.限制适用于编程擦除过程和读取过程的地址范围组合: 见表44.31。

图44.1显示了如何配置与闪存相关的模块。闪存定序器配置有FCU和FACI。FCU执行闪存重写的基本控制。FACI使用外围总线接收FACI命令, 并相应地控制FCU操作。

响应复位, FACI将数据从闪存传输到选项字节存储寄存器。

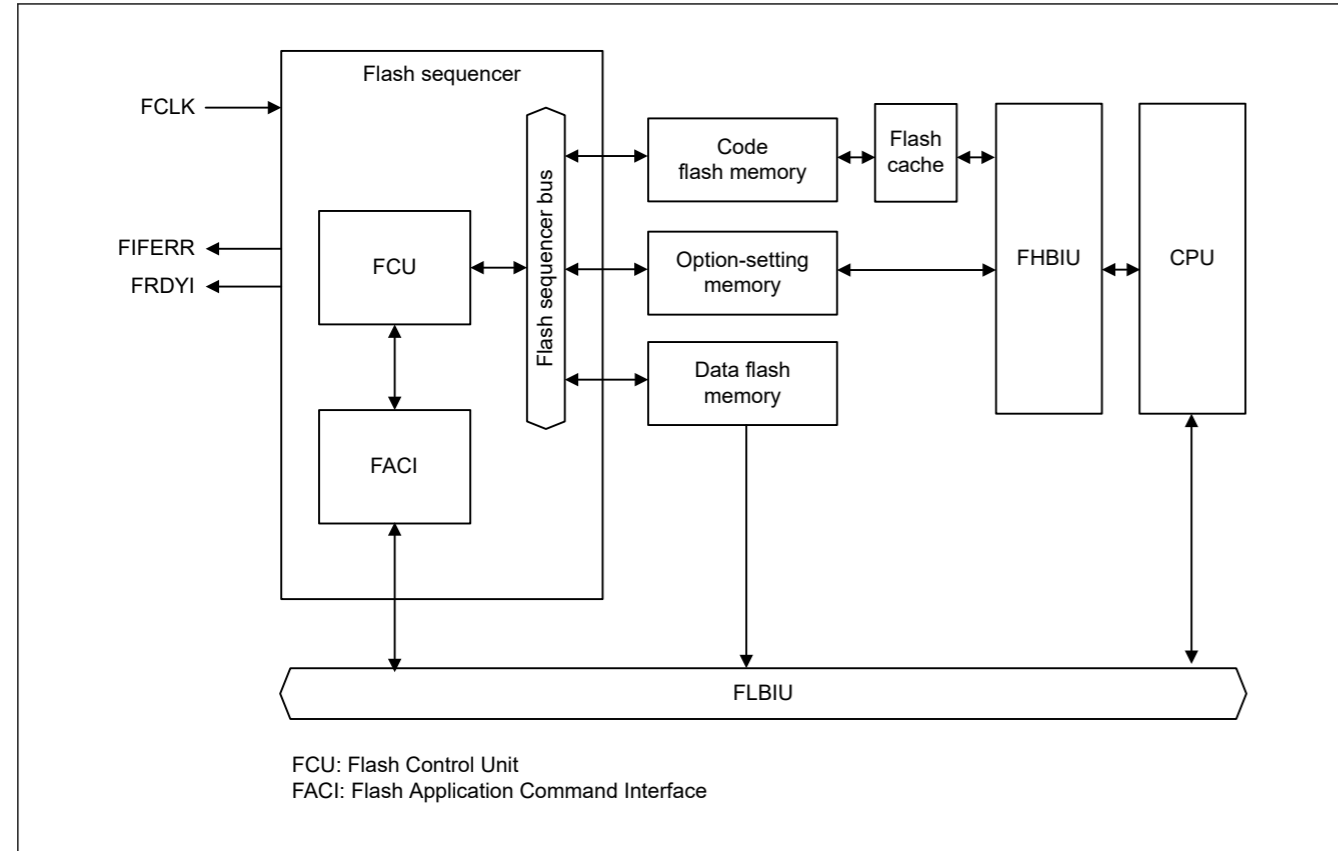

Figure 44.1 Block diagram of flash memory-related modules

#### 44.2 Structure of Memory

Figure 44.2 shows the memory map of code flash memory.

The user area of the code flash memory in this MCU is divided into 8- and 32-Kbyte blocks, which serve as the units of erasure.

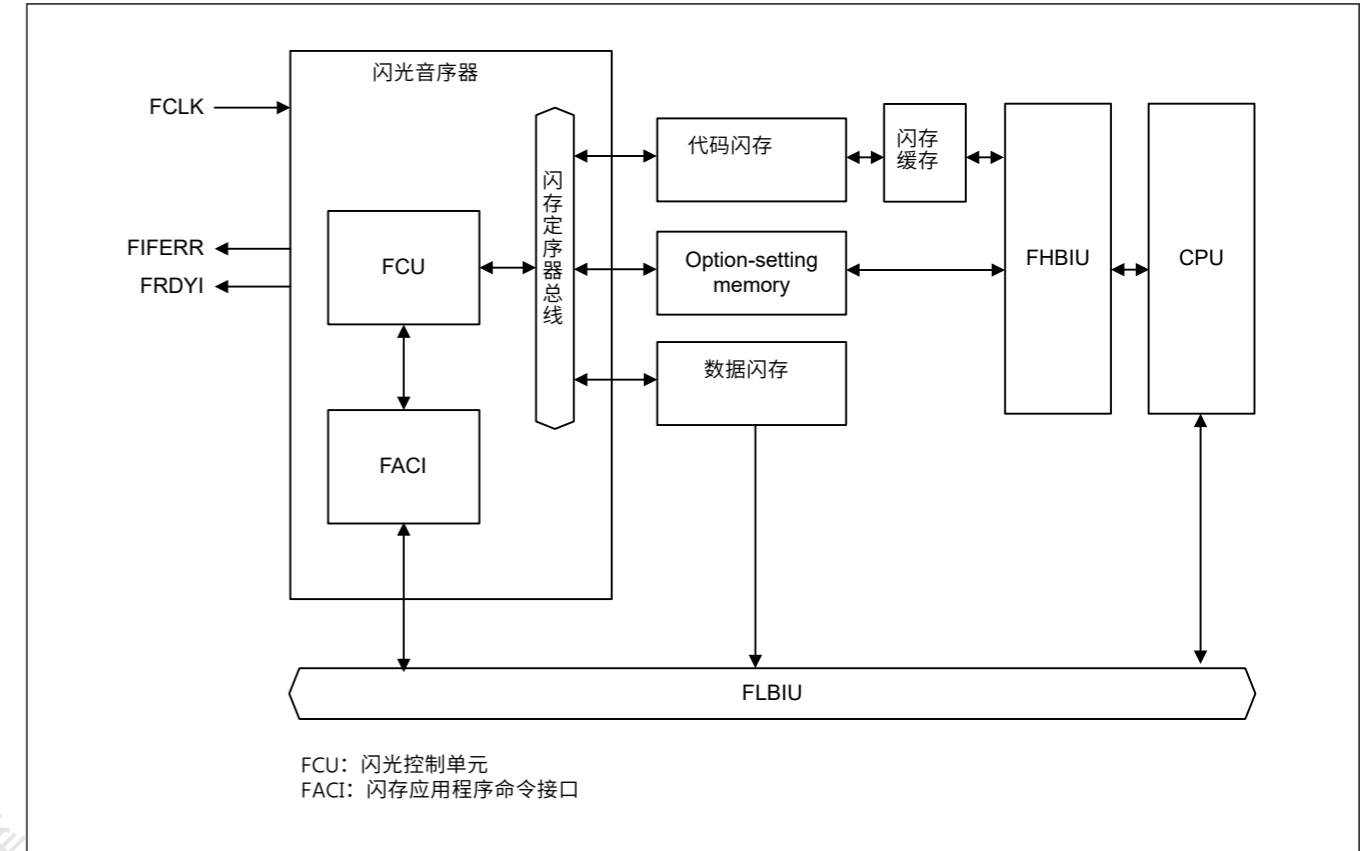

Figure 44.1 闪存相关模块框图

#### 44.2 内存结构

图44.2显示了代码闪存的内存映射。

本MCU中代码闪存的用户区分为8和32KB块，作为擦除单位。

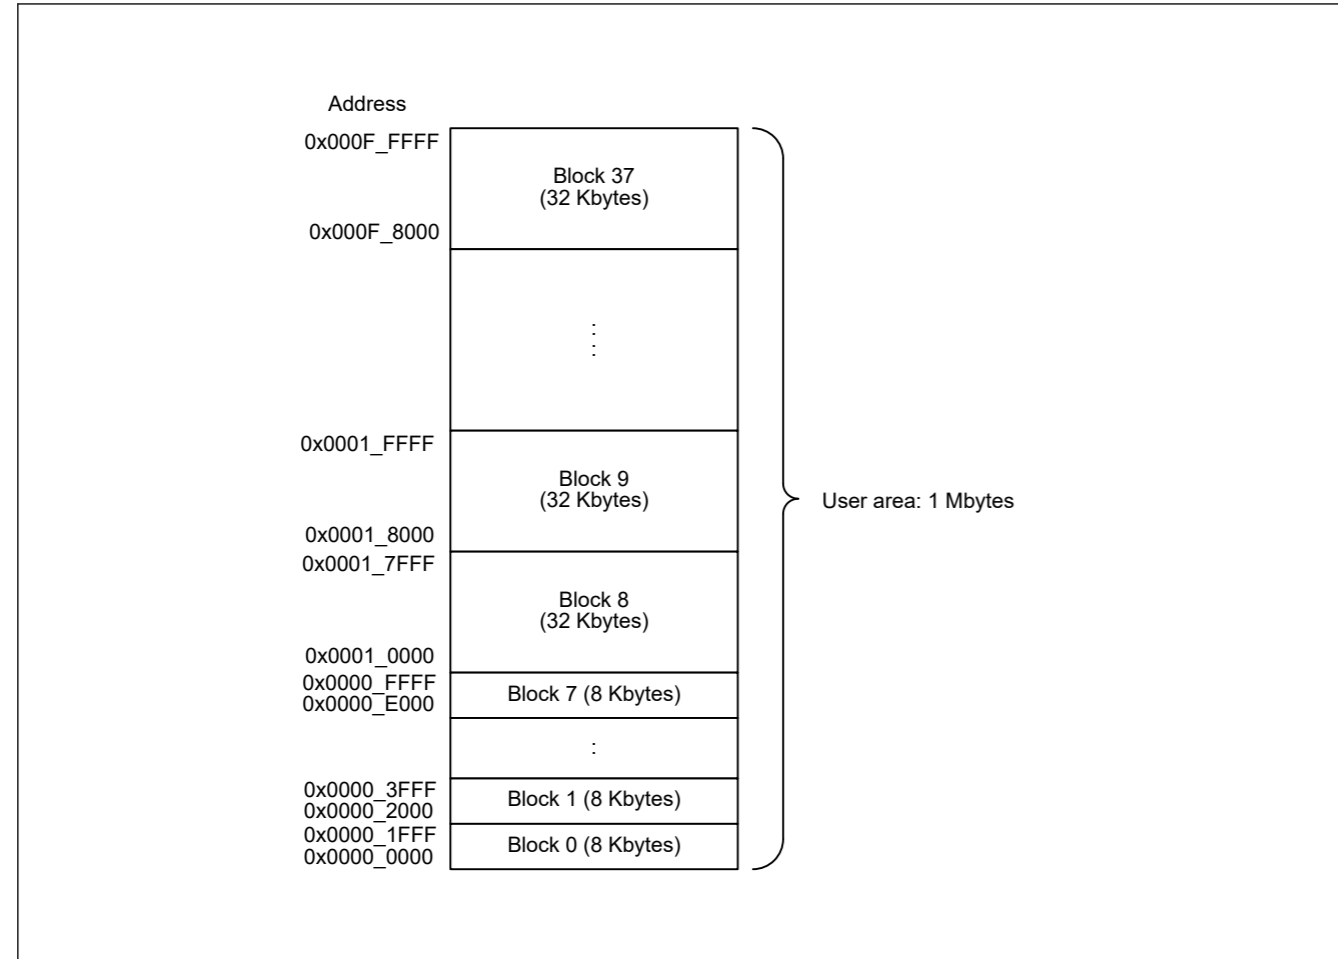

Figure 44.2 Map of the Code Flash Memory

Table 44.2 Read and programming/erasure address by product for the code flash memory

| Product            | Address                    | Number of blocks |
|--------------------|----------------------------|------------------|
| 1 Mbytes product   | 0x0000_0000 to 0x000F_FFFF | 0 to 37          |
| 768 Kbytes product | 0x0000_0000 to 0x000B_FFFF | 0 to 29          |
| 512 Kbytes product | 0x0000_0000 to 0x0007_FFFF | 0 to 21          |

The data area of the data flash memory in this MCU is divided into 64-byte blocks, with each being a unit for erasure. Figure 44.3 shows the mapping of the data flash memory.

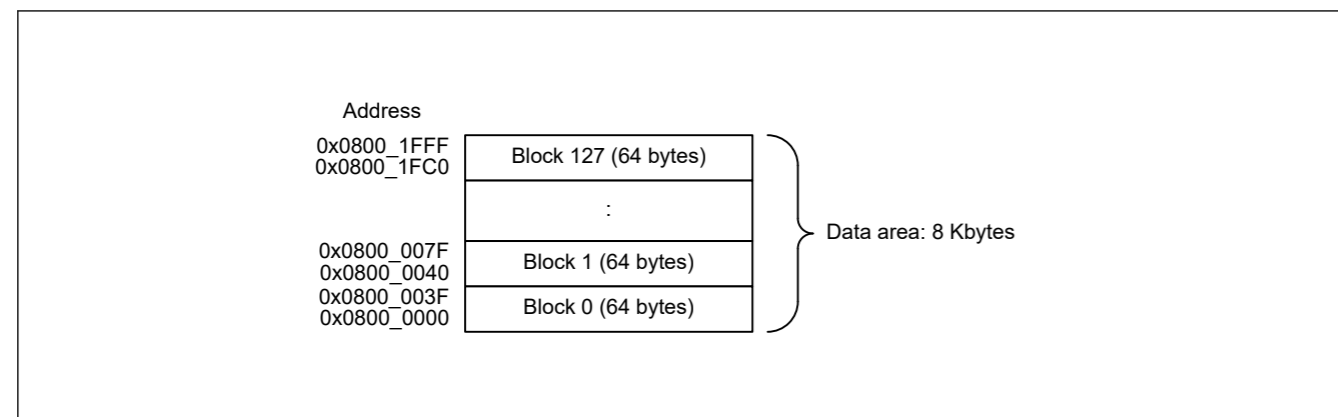

Figure 44.3 Map of the Data Flash Memory

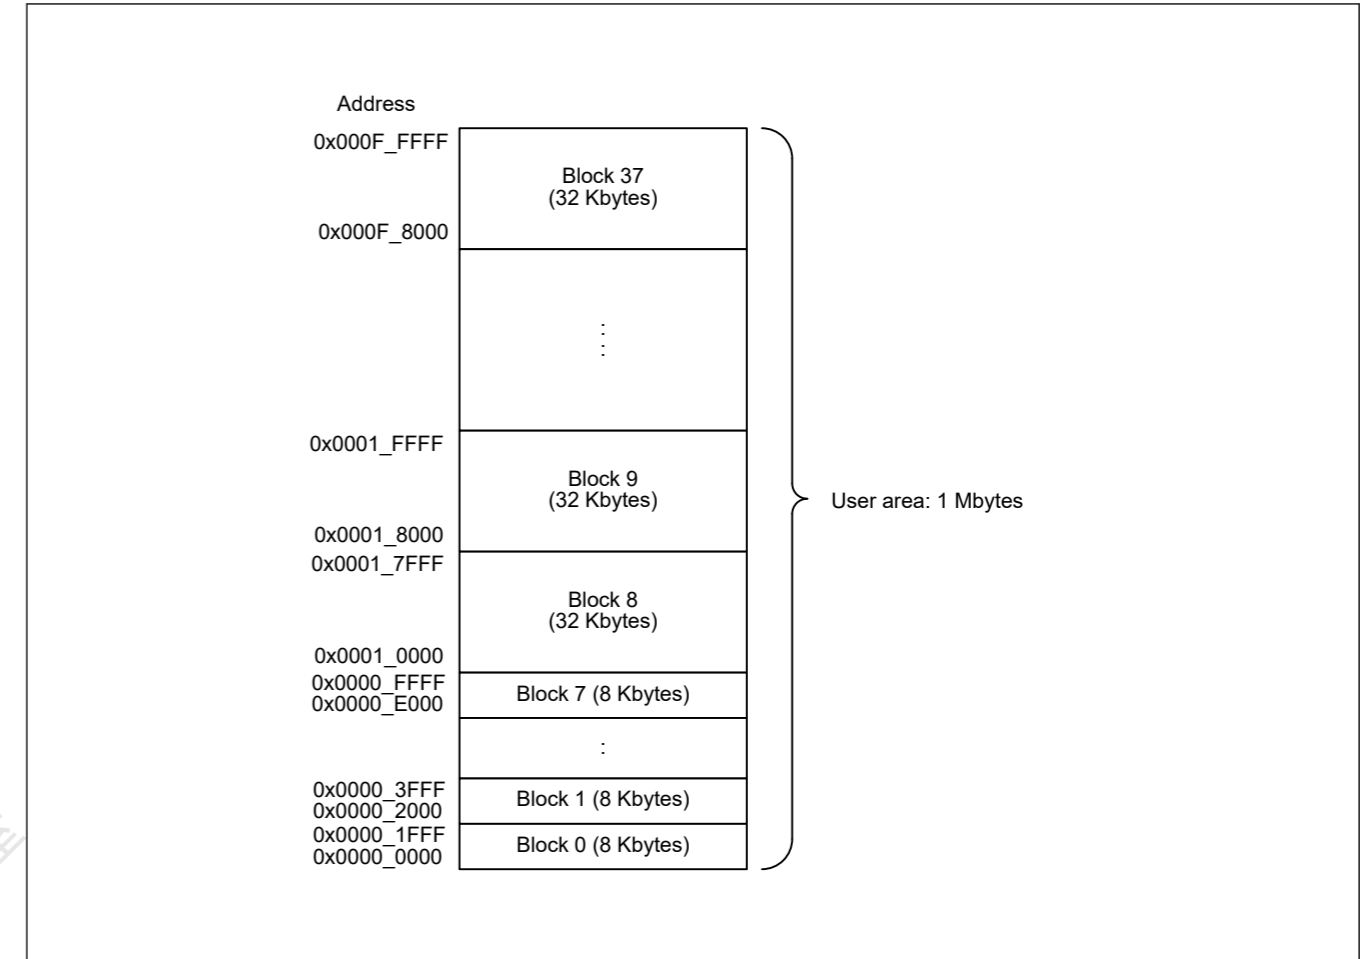

Figure 44.2 代码闪存映射

Table 44.2 按产品读取和编程代码闪存的擦除地址

| Product            | Address                    | 块数      |
|--------------------|----------------------------|---------|
| 1 Mbytes product   | 0x0000_0000 to 0x000F_FFFF | 0 to 37 |
| 768 Kbytes product | 0x0000_0000 to 0x000B_FFFF | 0 to 29 |
| 512 Kbytes product | 0x0000_0000 to 0x0007_FFFF | 0 to 21 |

本单片机中数据闪存的数据区被划分为64字节块，每个块为一个擦除单元。图44.3显示了数据闪存的映射。

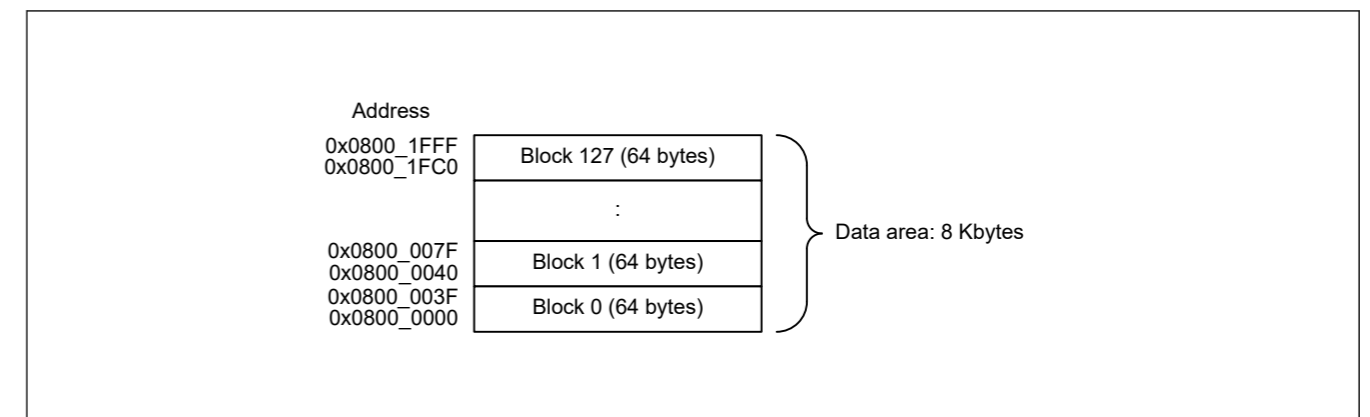

Figure 44.3 数据闪存映射

### 44.3 Address Space

Using the hardware interface with flash memory requires access to all registers of the hardware, which is for issuing FACL commands. Table 44.3 provides information about the hardware interface.

**Table 44.3 Information on the hardware interface area**

| Area  | Address                                  | Capacity                                 |
|---|--|--|
| Area containing various registers of the hardware | See section 44.4. Register Descriptions. | See section 44.4. Register Descriptions. |
| FACL command-issuing area                         | 0x407E_0000                              | 4 bytes                                  |

For the address information of the flash memory, see Figure 44.2.

### 44.4 Register Descriptions

#### 44.4.1 FCACHEE : Flash Cache Enable Register

Base address: FCACHE = 0x4001\_C100

Offset address: 0x000

| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0        |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----------|
| Bit field:         | —  | —  | —  | —  | —  | —  | — | — | — | — | — | — | — | — | — | FCACHEEN |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0        |

| Bit  | Symbol   | Function  | R/W |
|------|----------|---|-----|
| 0    | FCACHEEN | Flash Cache Enable<br>0: FCACHE is disabled<br>1: FCACHE is enabled | R/W |
| 15:1 | —        | These bits are read as 0. The write value should be 0.              | R/W |

This register is not controlled by any security attribute register.

#### FCACHEEN bit (Flash Cache Enable)

FCACHEE.FCACHEEN bit enable and disables the function of Flash Cache of FCACHE1, FCACHE2 and FLPF.

FCACHEE.FCACHEEN bit dose not influence for FCACHEIV.FCACHEIV.

When FCACHE is enabled, it works for accesses marked as cacheable.

It is prohibited to disable FCACHE after enabling.

#### 44.4.2 FCACHEIV : Flash Cache Invalidate Register

Base address: FCACHE = 0x4001\_C100

Offset address: 0x004

| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0        |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----------|
| Bit field:         | —  | —  | —  | —  | —  | —  | — | — | — | — | — | — | — | — | — | FCACHEIV |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0        |

### 44.3 地址空间

使用带有闪存的硬件接口需要访问硬件的所有寄存器，用于发出FACL命令。表44.3提供了有关硬件接口的信息。

**Table 44.3 硬件接口区信息**

| Area         | Address         | Capacity        |
|--------------|-----------------|-----------------|
| 包含各种硬件寄存器的区域 | 请参见第44.4节。注册说明。 | 请参见第44.4节。注册说明。 |
| FACL指挥区      | 0x407E_0000     | 4 bytes         |

Flash存储器的地址信息见图44.2。

### 44.4 注册说明

#### 44.4.1 FCACHEE:闪存缓存启用寄存器

Base address: FCACHE = 0x4001\_C100

Offset address: 0x000

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0        |
|---------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----------|
| Bit field:    | —  | —  | —  | —  | —  | —  | — | — | — | — | — | — | — | — | — | FCACHEEN |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0        |

| Bit  | Symbol   | Function                         | R/W |
|------|----------|----------------------------------|-----|
| 0    | FCACHEEN | 闪存缓存启用<br>0: 禁用FCACHE1: 启用FCACHE | R/W |
| 15:1 | —        | 这些位被读取为0。写入值应为0。                 | R/W |

该寄存器不受任何安全属性寄存器的控制。

#### FCACHEEN位（闪存使能）

FCACHEE.FCACHEEN位启用和禁用FCACHE1、FCACHE2和FLPF的FlashCache功能。

FCACHEE.FCACHEEN位对FCACHEIV.FCACHEIV没有影响。

启用FCACHE后，它适用于标记为可缓存的访问。

禁止启用后禁用FCACHE。

#### 44.4.2 FCACHEIV:闪存缓存无效寄存器

Base address: FCACHE = 0x4001\_C100

Offset address: 0x004

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0        |
|---------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----------|
| Bit field:    | —  | —  | —  | —  | —  | —  | — | — | — | — | — | — | — | — | — | FCACHEIV |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0        |

| Bit  | Symbol   | Function   | R/W |
|------|----------|--|-----|
| 0    | FCACHEIV | Flash Cache Invalidate<br>0: Read: Do not invalidate.<br>Write: The setting is ignored.<br>1: Invalidate<br>FCACHE is invalidated. | R/W |
| 15:1 | —        | These bits are read as 0. The write value should be 0.   | R/W |

This register is not controlled by any security attribute register.

**FCACHEIV bit (Flash Cache Invalidate)**

When 1 is written to FCACHEIV.FCACHEIV bit, the Flash cache data of FCACHE1, FCACHE2 and FLPF is invalidated.

Invalidate FCACHE with keeping FCACHE enabled after programming or erasing the code flash or the option setting memory.

**44.4.3 FLWT : Flash Wait Cycle Register**

Base address: FCACHE = 0x4001\_C100

Offset address: 0x01C

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 2:0 | FLWT[2:0] | Flash Wait Cycle<br>0 0 0: 0 wait (ICLK ≤ 50 MHz)<br>0 0 1: 1 wait (ICLK > 50 MHz)<br>0 1 0: 2 wait Not specified<br>0 1 1: 3 wait Not specified<br>Others: Setting prohibited | R/W |
| 7:3 | —         | These bits are read as 0. The write value should be 0.   | R/W |

Note: If the security attribution is configured as secure:  
 • Secure access and Non-secure read access are allowed  
 • Non-secure write access is ignored, and TrustZone access error is not generated.  
 If the security attribution is configured as Non-secure:  
 • Secure and Non-secure access are allowed.

**FLWT[2:0] bits (Flash Wait Cycle)**

The Flash Wait Cycle Register (FLWT) sets the access wait count for the flash memory.

For faster clock frequencies, set FLWT.FLWT before changing the clock frequency. For slower clock frequencies, set FLWT.FLWT after changing the clock frequency.

For information on the frequency setting, see [section 8, Clock Generation Circuit](#).

**44.4.4 FSAR : Flash Security Attribution Register**

Base address: FCACHE = 0x4001\_C100

Offset address: 0x040

| Bit  | Symbol   | Function  | R/W |
|------|----------|---|-----|
| 0    | FCACHEIV | 闪存缓存失效<br>0: 读取: 不无效。<br>写入: 忽略该设置。<br>1: Invalidate<br>FCACHE无效。 | R/W |
| 15:1 | —        | 这些位被读取为0。写入值应为0。  | R/W |

该寄存器不受任何安全属性寄存器的控制。

**FCACHEIV位 (FlashCache无效)**

当FCACHEIV.FCACHEIV位写入1时, FCACHE1、FCACHE2和FLPF的Flash缓存数据无效。

在编程或擦除代码闪存或选项设置存储器后保持FCACHE使能, 使FCACHE无效。

**44.4.3 FLWT: 闪存等待周期寄存器**

Base address: FCACHE = 0x4001\_C100

Offset address: 0x01C

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 2:0 | FLWT[2:0] | 闪存等待周期<br>0 0 0: 0 wait (ICLK ≤ 50 MHz)<br>0 0 1: 1 wait (ICLK > 50 MHz)<br>010:2等待未指定<br>011:3等待未指定<br>其他: 禁止设置 | R/W |
| 7:3 | —         | 这些位被读取为0。写入值应为0。   | R/W |

Note: 如果安全属性配置为安全: ●  
 允许安全访问和非安全读取访问  
 • 忽略非安全写入访问, 不会生成TrustZone访问错误。  
 如果安全属性配置为非安全: ●  
 允许安全和非安全访问。

**FLWT[2:0]位 (闪存等待周期)**

闪存等待周期寄存器(FLWT)设置闪存的访问等待计数。

要获得更快的时钟频率, 请在更改时钟频率之前设置FLWT.FLWT。对于较慢的时钟频率, 设置改变时钟频率后的FLWT.FLWT。

有关频率设置的信息, 请参见第8节, 时钟生成电路。

**44.4.4 FSAR:Flash安全属性寄存器**

Base address: FCACHE = 0x4001\_C100

Offset address: 0x040

| Bit  | Symbol   | Function  | R/W |
|------|----------|---|-----|
| 0    | FLWTSA   | FLWT Security Attribution<br>Target register : FLWT<br>0: Secure<br>1: Non-Secure     | R/W |
| 7:1  | —        | These bits are read as 1. The write value should be 1.                                | R/W |
| 8    | FCKMHZSA | FCKMHZ Security Attribution<br>Target register : FCKMHZ<br>0: Secure<br>1: Non-Secure | R/W |
| 15:9 | —        | These bits are read as 1. The write value should be 1.                                | R/W |

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Write access is invalid when PRCR.PRC4 bit is 0. See [section 12, Register Write Protection](#).

#### FLWTSA bit (FLWT Security Attribution)

This bit sets the security attribute of FLWT.

#### FCKMHZSA bit (FCKMHZ Security Attribution)

This bit sets the security attribute of FCKMHZ.

#### 44.4.5 UIDRn : Unique ID Registers n (n = 0 to 3)

Address: 0x0100\_8190 + n × 4

| Bit  | Symbol | Function  | R/W |
|------|--------|-----------|-----|
| 31:0 | UID    | Unique ID | R   |

The UIDRn is a read-only register that stores a 16-byte ID code (unique ID) for identifying the individual MCU. The UIDRn register should be read in 32-bit units. When reading by the signature request command of the serial programming interface, the data is read in order from the data with the large address. That is, the data in 0x0100\_819F is read first, and in 0x0100\_8190 is read last.

#### 44.4.6 PNRn : Part Numbering Register n (n = 0 to 3)

Address: 0x0100\_80F0 + n × 4

| Bit  | Symbol | Function    | R/W |
|------|--------|-------------|-----|
| 31:0 | PNR    | Part Number | R   |

The PNRn is a read-only register that stores a 16-byte part numbering. The PNRn register should be read in 32-bit units. Each byte corresponds to the ASCII code representation of the product part number as detailed in Table 1.13 Product list. The first character ("R", 0x52 in ASCII code) of the part number is stored in the byte with the smallest address

| Bit  | Symbol   | Function   | R/W |
|------|----------|--|-----|
| 0    | FLWTSA   | FLWT安全归因<br>目标寄存器: FLWT<br>0: Secure<br>1: Non-Secure      | R/W |
| 7:1  | —        | 这些位被读取为1。写入值应为1。   | R/W |
| 8    | FCKMHZSA | FCKMHZ安全归属地<br>目标寄存器: FCKMHZ<br>0: Secure<br>1: Non-Secure | R/W |
| 15:9 | —        | 这些位被读取为1。写入值应为1。   | R/W |

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

当PRCR.PRC4位为0时，写访问无效。参见第12节，寄存器写保护。

#### FLWTSA位 (FLWT安全属性)

该位设置FLWT的安全属性。

#### FCKMHZSA位 (FCKMHZ安全属性)

该位设置FCKMHZ的安全属性。

#### 44.4.5 UIDRn: 唯一ID寄存器n (n=0到3)

Address: 0x0100\_8190 + n × 4

| Bit  | Symbol | Function | R/W |
|------|--------|----------|-----|
| 31:0 | UID    | 唯一身份     | R   |

UIDRn是一个只读寄存器，它存储一个16字节的ID代码（唯一ID），用于识别单个MCU。这UIDRn寄存器应以32位为单位读取。通过串口编程接口的签名请求命令读取时，从地址大的数据开始依次读取。即先读取0x0100\_819F中的数据，最后读取0x0100\_8190中的数据。

#### 44.4.6 PNRn: 零件编号寄存器n (n=0到3)

Address: 0x0100\_80F0 + n × 4

| Bit  | Symbol | Function | R/W |
|------|--------|----------|-----|
| 31:0 | PNR    | 零件号      | R   |

PNRn是一个只读寄存器，存储一个16字节的零件编号。PNRn寄存器应以32位为单位读取。每个字节对应于表1.13产品列表中详细的产品部件号的ASCII代码表示。零件编号的第一个字符（“R”，ASCII码中的0x52）存储在地址最小的字节中

(0x0100\_80F0). When reading by the signature request command of the serial programming interface, the data is read in order from the data with the small address. That is, the data in 0x0100\_80F0 is read first, and in 0x0100\_80FF is read last.

#### 44.4.7 MCOVER : MCU Version Register

| Bit | Symbol | Function    | R/W |
|-----|--------|-------------|-----|
| 7:0 | MCUVE  | MCU Version | R   |

The MCOVER is a read-only register that stores a MCU version. The MCOVER register should be read in 8-bit units.

#### 44.4.8 FWEPROR : Flash P/E Protect Register

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 1:0 | FLWE[1:0] | Flash Programming and Erasure<br>00: Prohibits Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing.<br>01: Permits Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing.<br>10: Prohibits Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing.<br>11: Prohibits Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing. | R/W |
| 7:2 | —         | These bits are read as 0. The write value should be 0.  | R/W |

It is possible that Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing are prohibited by software.

The FWEPROR register is initialized by a reset from the following:

- All reset source
- Transition to Deep Software Standby mode
- Transition to Software Standby mode.

##### FLWE[1:0] bits (Flash Programming and Erasure)

The FLWE[1:0] bits are used to set the flash P/E protection. The value after reset is 10b.

If these bits are set to other than 01b that does not allow programming and erasure of the flash memory, the following commands cannot be executed. Issuing any of the following commands leads to setting of the FLWEERR bit in the FSTATR register to 1.

Program / Block Erase / Multi Block Erase / Blank Check / Configuration set command

(0x0100\_80F0)。通过串行编程接口的签名请求命令读取时，从地址小的数据开始依次读取。即先读取0x0100\_80F0中的数据，最后读取0x0100\_80FF中的数据。

#### 44.4.7 MCOVER:MCU版本寄存器

| Bit | Symbol | Function    | R/W |
|-----|--------|-------------|-----|
| 7:0 | MCUVE  | MCU Version | R   |

MCOVER是一个只读寄存器，用于存储MCU版本。MCOVER寄存器应以8位为单位读取。

#### 44.4.8 FWEPROR:FlashPE保护寄存器

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 1:0 | FLWE[1:0] | 闪存编程和擦除<br>00: 禁止编程、块擦除、多块擦除、空白检查和配置设置命令处理。<br>01: 允许编程、块擦除、多块擦除、空白检查和配置设置命令处理。<br>10: 禁止编程、块擦除、多块擦除、空白检查和配置设置命令处理。<br>11: 禁止Program、BlockErase、MultiBlockErase、BlankCheck和Configurationset命令处理。 | R/W |
| 7:2 | —         | 这些位被读取为0。写入值应为0。   | R/W |

程序、块擦除、多块擦除、空白检查和配置设置命令处理可能被软件禁止。

FWEPROR寄存器通过以下复位进行初始化:

- 所有复位源
- 转换到深度软件待机模式
- 转换到软件待机模式。

##### FLWE[1:0]位 (闪存编程和擦除)

FLWE[1:0]位用于设置flashPE保护。复位后的值为10b。

如果这些位设置为不允许对闪存进行编程和擦除的01b以外，则无法执行以下命令。发出以下任何命令都会将FSTATR寄存器中的FLWEERR位设置为1。

ProgramBlockEraseMultiBlockEraseBlankCheckConfigurationset命令

## 44.4.9 FASTAT : Flash Access Status Register

Base address: FACL = 0x407F\_E000

Offset address: 0x10

|                    |      |   |   |       |      |   |   |   |
|--------------------|------|---|---|-------|------|---|---|---|
| Bit position:      | 7    | 6 | 5 | 4     | 3    | 2 | 1 | 0 |
| Bit field:         | CFAE | — | — | CMDLK | DFAE | — | — | — |
| Value after reset: | 0    | 0 | 0 | 0     | 0    | 0 | 0 | 0 |

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 2:0 | —      | These bits are read as 0. The write value should be 0.  | R/W              |
| 3   | DFAE   | Data Flash Memory Access Violation Flag<br>0: No data flash memory access violation has occurred<br>1: A data flash memory access violation has occurred. | R/W <sup>1</sup> |
| 4   | CMDLK  | Command Lock Flag<br>0: The flash sequencer is not in the command-locked state<br>1: The flash sequencer is in the command-locked state.                  | R                |
| 6:5 | —      | These bits are read as 0. The write value should be 0.  | R/W              |
| 7   | CFAE   | Code Flash Memory Access Violation Flag<br>0: No code flash memory access violation has occurred<br>1: A code flash memory access violation has occurred. | R/W <sup>1</sup> |

Note 1. Only 0 can be written to clear the flag after 1 is read.

The FASTAT register indicates whether a code flash or data flash memory access violation has occurred. If any of the CFAE, CMDLK, and DFAE bits is set to 1, the flash sequencer enters the command-locked state (see [section 44.11.2. Error Protection](#)). To release it from the command-locked state, issue a status clear command or Forced Stop command to the flash sequencer.

**DFAE bit (Data Flash Memory Access Violation Flag)**

The DFAE bit indicates whether a data flash memory access violation occurred. When this bit is set to 1, the ILGLERR bit in the FSTATR register is set to 1, placing the flash sequencer in the command-locked state.

[Setting conditions]

FACL commands issued in the data flash P/E mode are as follows:

- The setting of the FSADDR or FEADDR register is the reserved portion of the data area
- FACL commands of non-secure access are issued while the setting of the FSADDR or FEADDR register is the secure region address.

[Clearing conditions]

- When this bit is written as 0 after it is set to 1
- When the flash sequencer starts to process the Status Clear or Forced Stop command.

**CMDLK bit (Command Lock Flag)**

The CMDLK bit indicates that the flash sequencer is in the command-locked state.

[Setting conditions]

- The flash sequencer detects an error and enters the command-locked state.

[Clearing conditions]

- When the flash sequencer starts to process the Status Clear or Forced Stop command.

**CFAE bit (Code Flash Memory Access Violation Flag)**

The CFAE bit indicates whether a code flash memory access violation has occurred. When this bit is set to 1, the ILGLERR bit in the FSTATR register is set to 1, placing the flash sequencer in the command-locked state.

## 44.4.9 FASTAT: 闪存访问状态寄存器

Base address: FACL = 0x407F\_E000

Offset address: 0x10

|               |      |   |   |       |      |   |   |   |
|---------------|------|---|---|-------|------|---|---|---|
| Bit position: | 7    | 6 | 5 | 4     | 3    | 2 | 1 | 0 |
| Bit field:    | CFAE | — | — | CMDLK | DFAE | — | — | — |
| 重置后的值:        | 0    | 0 | 0 | 0     | 0    | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 2:0 | —      | 这些位被读取为0。写入值应为0。                                       | R/W              |
| 3   | DFAE   | 数据闪存访问违规标志<br>0: 未发生数据闪存访问违规<br>1: 发生数据闪存访问违规。         | R/W <sup>1</sup> |
| 4   | CMDLK  | 命令锁定标志<br>0: flash定序器不处于命令锁定状态<br>1: flash定序器处于命令锁定状态。 | R                |
| 6:5 | —      | 这些位被读取为0。写入值应为0。                                       | R/W              |
| 7   | CFAE   | 代码闪存访问违规标志<br>0: 未发生代码闪存访问违规<br>1: 发生代码闪存访问违规。         | R/W <sup>1</sup> |

注1. 读取1后, 只能写入0以清除标志。

FASTAT寄存器指示是否发生了代码闪存或数据闪存访问违规。如果任何一个CFAE、CMDLK和DFAE位设置为1, 闪存定序器进入命令锁定状态(参见第44.11.2节。错误保护)。要将其从命令锁定状态释放, 请向闪存定序器发出状态清除命令或强制停止命令。

**DFAE位 (数据闪存访问违规标志)**

DFAE位指示是否发生数据闪存访问违规。当该位设置为1时, FSTATR寄存器中的ILGLERR位设置为1, 将闪存定序器置于命令锁定状态。

[Setting conditions]

数据闪存PE模式下发出的FACL命令如下:

- FSADDR或FEADDR寄存器的设置是数据区的保留部分
- FSADDR或FEADDR寄存器的设置是安全区域地址时发出非安全访问的FACL命令。

[Clearing conditions]

- 该位设置为1后写入0时
- 当flashsequencer开始处理StatusClear或ForcedStop命令时。

**CMDLK位 (命令锁定标志)**

CMDLK位指示闪存定序器处于命令锁定状态。

[Setting conditions]

- 闪存定序器检测到错误并进入命令锁定状态。

[Clearing conditions]

- 当flashsequencer开始处理StatusClear或ForcedStop命令时。

**CFAE位 (代码闪存访问违规标志)**

CFAE位指示是否发生代码闪存访问违规。当该位设置为1时, FSTATR寄存器中的ILGLERR位设置为1, 将闪存定序器置于命令锁定状态。

[Setting conditions]

FACI commands issued in the code flash P/E mode are as follows:

- The setting of the FSADDR register is the reserved portion of the user area
- The Configuration set command is issued while the setting of the FSADDR register is from 0x0000A100 to 0x0000A2F0 in self-programming mode
- FACI commands of non-secure access are issued while the setting of the FSADDR register is the secure region address.

[Clearing conditions]

- When this bit is written as 0 after it is set to 1
- When the flash sequencer starts to process the Status Clear or Forced Stop command.

#### 44.4.10 FAEINT : Flash Access Error Interrupt Enable Register

Base address: FACI = 0x407F\_E000

Offset address: 0x14

|                    |        |   |   |         |        |   |   |   |
|--------------------|--------|---|---|---------|--------|---|---|---|
| Bit position:      | 7      | 6 | 5 | 4       | 3      | 2 | 1 | 0 |
| Bit field:         | CFAEIE | — | — | CMDLKIE | DFAEIE | — | — | — |
| Value after reset: | 1      | 0 | 0 | 1       | 1      | 0 | 0 | 0 |

| Bit | Symbol  | Function  | R/W |
|-----|---------|---|-----|
| 2:0 | —       | These bits are read as 0. The write value should be 0.  | R/W |
| 3   | DFAEIE  | Data Flash Memory Access Violation Interrupt Enable<br>0: Generation of an FIFERR interrupt request is disabled when FASTAT.DFAE is set to 1<br>1: Generation of an FIFERR interrupt request is enabled when FASTAT.DFAE is set to 1. | R/W |
| 4   | CMDLKIE | Command Lock Interrupt Enable<br>0: Generation of an FIFERR interrupt request is disabled when FASTAT.CMDLK is set to 1<br>1: Generation of an FIFERR interrupt request is enabled when FASTAT.CMDLK is set to 1.                     | R/W |
| 6:5 | —       | These bits are read as 0. The write value should be 0.  | R/W |
| 7   | CFAEIE  | Code Flash Memory Access Violation Interrupt Enable<br>0: Generation of an FIFERR interrupt request is disabled when FASTAT.CFAE is set to 1<br>1: Generation of an FIFERR interrupt request is enabled when FASTAT.CFAE is set to 1. | R/W |

The FAEINT register enables or disables generation of a flash access error (FIFERR) interrupt request.

##### DFAEIE bit (Data Flash Memory Access Violation Interrupt Enable)

The DFAEIE bit enables or disables generation of an FIFERR interrupt request when a data flash memory access violation occurs, setting the DFAE bit in the FASTAT register to 1.

##### CMDLKIE bit (Command Lock Interrupt Enable)

The CMDLKIE bit enables or disables generation of an FIFERR interrupt request when the flash sequencer enters the command-locked state, setting the CMDLK bit in the FASTAT register to 1.

##### CFAEIE bit (Code Flash Memory Access Violation Interrupt Enable)

The CFAEIE bit enables or disables generation of an FIFERR interrupt request when a code flash memory access violation occur, setting the CFAE bit in the FASTAT register to 1.

[Setting conditions]

CodeflashPE模式下发出的FACI命令如下:

- FSADDR寄存器的设置是用户区的保留部分
- 自编程模式下FSADDR寄存器的设置从0x0000A100到0x0000A2F0时发出配置设置命令
- FSADDR寄存器的设置是安全区域地址时发出非安全访问的FACI命令。

[Clearing conditions]

- 该位设置为1后写入0时
- 当flashsequencer开始处理StatusClear或ForcedStop命令时。

#### 44.4.10 FAEINT: 闪存访问错误中断使能寄存器

Base address: FACI = 0x407F\_E000

Offset address: 0x14

|               |        |   |   |         |        |   |   |   |
|---------------|--------|---|---|---------|--------|---|---|---|
| Bit position: | 7      | 6 | 5 | 4       | 3      | 2 | 1 | 0 |
| Bit field:    | CFAEIE | — | — | CMDLKIE | DFAEIE | — | — | — |
| 重置后的值:        | 1      | 0 | 0 | 1       | 1      | 0 | 0 | 0 |

| Bit | Symbol  | Function   | R/W |
|-----|---------|--|-----|
| 2:0 | —       | 这些位被读取为0。写入值应为0。   | R/W |
| 3   | DFAEIE  | 数据闪存访问冲突中断使能<br>0: 当FASTAT.DFAE设置为1时, 禁止生成FIFERR中断请求<br>1: 当FASTAT.DFAE设置为1时, 使能FIFERR中断请求的生成。 | R/W |
| 4   | CMDLKIE | 命令锁定中断使能<br>0: 当FASTAT.CMDLK设置为1时, 禁止生成FIFERR中断请求<br>1: 当FASTAT.CMDLK设置为1时, 使能FIFERR中断请求的生成。   | R/W |
| 6:5 | —       | 这些位被读取为0。写入值应为0。   | R/W |
| 7   | CFAEIE  | 代码闪存访问冲突中断启用<br>0: 当FASTAT.CFAE设置为1时, 禁止生成FIFERR中断请求<br>1: 当FASTAT.CFAE设置为1时, 使能FIFERR中断请求的生成。 | R/W |

FAEINT寄存器启用或禁用闪存访问错误(FIFERR)中断请求的生成。

##### DFAEIE位 (数据闪存访问冲突中断允许)

当发生数据闪存访问违规时, DFAEIE位启用或禁用FIFERR中断请求的生成, 将FASTAT寄存器中的DFAE位设置为1。

##### CMDLKIE位 (命令锁定中断使能)

当闪存定序器进入命令锁定状态时, CMDLKIE位启用或禁用FIFERR中断请求的生成, 将FASTAT寄存器中的CMDLK位设置为1。

##### CFAEIE位 (代码闪存访问冲突中断允许)

当发生代码闪存访问违规时, CFAEIE位启用或禁用FIFERR中断请求的生成, 将FASTAT寄存器中的CFAE位设置为1。

44.4.11 FRDYIE : Flash Ready Interrupt Enable Register

Base address: FACL = 0x407F\_E000

Offset address: 0x18

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | FRDYIE | Flash Ready Interrupt Enable<br>0: Generation of an FRDY interrupt request is disabled<br>1: Generation of an FRDY interrupt request is enabled. | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.   | R/W |

The FRDYIE register enables or disables generation of a flash ready (FRDY) interrupt.

FRDYIE bit (Flash Ready Interrupt Enable)

The FRDYIE bit enables or disables generation of an FRDY interrupt request when the FRDY bit in the FSTATR register is changed from 0 to 1 on completion of processing by the flash sequencer of the Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command.

44.4.12 FSADDR : FACL Command Start Address Register

Base address: FACL = 0x407F\_E000

Offset address: 0x30

| Bit  | Symbol       | Function                                  | R/W              |
|------|--------------|---|------------------|
| 31:0 | FSADDR[31:0] | Start Address for FACL Command Processing | R/W <sup>1</sup> |

Note 1. These bits can be written when the FRDY bit in the FSTATR register is 1. Writing to these bits are ignored when the FRDY bit is 0. Note that b0 and b1 are read-only.

Table 44.4 FACL command address boundary

| Command                               | Address Boundary |
|---------------------------------------|------------------|
| Program (code flash memory)           | 128-byte         |
| Program (data flash memory)           | 4, 8, 16 -byte   |
| Block Erase (code flash memory)       | 8-KB or 32-KB    |
| Block Erase (data flash memory)       | 64-byte          |
| Multi Block Erase (data flash memory) | 64-byte          |
| Blank Check (data flash memory)       | 4-byte           |
| Configuration set                     | 16-byte          |

The FSADDR register specifies the address where the target area for command processing starts when the FACL command for Program, Block Erase, Multi Block Erase, Blank Check, or Configuration set is issued.

The FSADDR value is initialized when the SUINIT bit in the FSUINITR register is set to 1. It is also initialized by a reset.

44.4.11 FRDYIE:闪存就绪中断使能寄存器

Base address: FACL = 0x407F\_E000

Offset address: 0x18

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | FRDYIE | 闪存就绪中断使能<br>0: 禁止产生FRDY中断请求<br>1: 允许产生FRDY中断请求。 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。                                | R/W |

FRDYIE寄存器启用或禁用闪存就绪(FRDY)中断的生成。

FRDYIE位 (闪存就绪中断使能)

当FSTATR寄存器中的FRDY位在程序、块擦除、多块擦除、空白检查和配置的闪存序列器的处理完成时从0变为1时，FRDYIE位启用或禁用FRDY中断请求的产生设置命令。

44.4.12 FSADDR:FACL命令起始地址寄存器

Base address: FACL = 0x407F\_E000

Offset address: 0x30

| Bit  | Symbol       | Function      | R/W              |
|------|--------------|---------------|------------------|
| 31:0 | FSADDR[31:0] | FACL命令处理的起始地址 | R/W <sup>1</sup> |

注1.当FSTATR寄存器中的FRDY位为1时可以写入这些位。当FRDY位为0时忽略写入这些位。请注意，b0和b1是只读的。

Table 44.4 FACL命令地址边界

| Command     | 地址边界           |
|-------------|----------------|
| 程序 (代码闪存)   | 128-byte       |
| 程序 (数据闪存)   | 4, 8, 16 -byte |
| 块擦除 (代码闪存)  | 8-KB or 32-KB  |
| 块擦除 (数据闪存)  | 64-byte        |
| 多块擦除 (数据闪存) | 64-byte        |
| 空白检查 (数据闪存) | 4-byte         |
| 配置集         | 16-byte        |

FSADDR寄存器指定在发出用于编程、块擦除、多块擦除、空白检查或配置集的FACL命令时命令处理的目标区域开始的地址。

FSADDR值在FSUINITR寄存器中的SUINIT位设置为1时被初始化。它也通过复位被初始化。

**FSADDR[31:0] bits (Start Address for FACI Command Processing)**

The FSADDR[31:0] bits specify the start address for FACI command processing. Bits [31:24] are ignored in FACI command processing for the code flash memory. Bits [31:17] are ignored in FACI command processing for the data flash memory. Bits associated with the address bits of lower order than the address boundary listed in Table 44.4 are also ignored.

For information on the addresses of the code flash memory and the data flash memory, see section 44.2. Structure of Memory.

For information on the addresses of the configuration setting, see section 44.9.3.15. Configuration Set Command.

**44.4.13 FEADDR : FACI Command End Address Register**

Base address: FACL = 0x407F\_E000

Offset address: 0x34

| Bit  | Symbol       | Function                                | R/W              |
|------|--------------|---|------------------|
| 31:0 | FEADDR[31:0] | End Address for FACI Command Processing | R/W <sup>1</sup> |

Note 1. These bits can be written when the FRDY bit in the FSTATR register is 1. Writing to these bits are ignored when the FRDY bit is 0. Note that bit [0] and bit [1] are read-only.

The FEADDR register specifies the end address of the target area for Multi Block Erase and Blank Check command processing. When incremental mode is selected as the addressing mode for Blank Checking (when FBCCNT.BCDIR = 0), the address specified in the FSADDR register should be equal to or smaller than the address in the FEADDR register. Conversely, the address in the FSADDR register should be equal to or larger than the address in the FEADDR register when decremental mode is selected as the addressing mode for Blank Check (i.e. when FBCCNT.BCDIR = 1). If the BCDIR, FSADDR, and FEADDR bit settings are inconsistent with the specified rules, the flash sequencer enters the command-locked state (see section 44.11.2. Error Protection).

The FEADDR value is initialized when the SUINIT bit in the FSUINTR register is set to 1. It is also initialized by a reset.

**FEADDR[31:0] bits (End Address for FACI Command Processing)**

The FEADDR[31:0] bits specify the end address for Multi Block Erase and Blank Check command processing. In command processing, bits 31 to 17 and any bits that do not reach the address boundaries listed in the section 44.4.12. FSADDR : FACI Command Start Address Register are ignored.

For information on the addresses of the flash memory, see section 44.2. Structure of Memory.

**44.4.14 FMEPROT : Flash P/E Mode Entry Protection Register**

Base address: FACL = 0x407F\_E000

Offset address: 0x44

| Bit | Symbol | Function  | R/W                       |
|-----|--------|---|---------------------------|
| 0   | CEPROT | Code Flash P/E Mode Entry Protection<br>0: FENTRYC bit is not protected<br>1: FENTRYC bit is protected. | R/W <sup>1</sup> *2<br>*4 |
| 7:1 | —      | These bits are read as 0. The write value should be 0.  | R/W                       |

**FSADDR[31:0]位 (FACI命令处理的起始地址)**

FSADDR[31:0]位指定FACI命令处理的起始地址。在代码闪存的FACI命令处理中忽略位[31:24]。在数据闪存的FACI命令处理中忽略位[31:17]。与低于表44.4中列出的地址边界的地址位相关的位也被忽略。

有关代码闪存和数据闪存地址的信息，请参见第44.2节。结构Memory。

有关配置设置地址的信息，请参阅第44.9.3.15节。配置集命令。

**44.4.13 FEADDR:FACI命令结束地址寄存器**

Base address: FACL = 0x407F\_E000

Offset address: 0x34

| Bit  | Symbol       | Function      | R/W              |
|------|--------------|---------------|------------------|
| 31:0 | FEADDR[31:0] | FACI命令处理的结束地址 | R/W <sup>1</sup> |

注1.当FSTATR寄存器中的FRDY位为1时可以写入这些位。当FRDY位为0时忽略写入这些位。请注意，位[0]和位[1]是只读的。

FEADDR寄存器指定多块擦除和空白检查命令处理的目标区域的结束地址。When incremental mode is selected as the addressing mode for Blank Checking (when FBCCNT.BCDIR = 0) the address specified in the FSADDR registers should be equal to or smaller than the address in the FEADDR register. Conversely the address in the FSADDR registers should be equal to or larger than the address in the FEADDR register when decremental mode is selected as the addressing mode for Blank Check (i.e. when FBCCNT.BCDIR = 1).如果BCDIR、FSADDR和FEADDR位设置与指定规则不一致，则闪存定序器进入命令锁定状态（请参阅第44.11.2.错误保护部分）。

FEADDR值在FSUINTR寄存器中的SUINIT位设置为1时被初始化。它也通过复位被初始化。

**FEADDR[31:0]位 (FACI命令处理的结束地址)**

FEADDR[31:0]位指定多块擦除和空白检查命令处理的结束地址。在命令处理中，位31到17以及任何未到达44.4.12节中列出的地址边界的位。FSADDR：FACI命令起始地址寄存器被忽略。

有关闪存地址的信息，请参阅第44.2节。内存结构。

**44.4.14 FMEPROT:FlashPE模式进入保护寄存器**

Base address: FACL = 0x407F\_E000

Offset address: 0x44

| Bit | Symbol | Function  | R/W                       |
|-----|--------|---|---------------------------|
| 0   | CEPROT | CodeFlashPE模式进入保护<br>0: FENTRYC位不受保护1: FENTRYC位受保护。 | R/W <sup>1</sup> *2<br>*4 |
| 7:1 | —      | 这些位被读取为0。写入值应为0。                                    | R/W                       |

| Bit  | Symbol   | Function | R/W              |
|------|----------|----------|------------------|
| 15:8 | KEY[7:0] | Key Code | R/W <sup>3</sup> |

Note 1. Writing to this bit is only possible when the FRDY bit in the FSTATR register is 1. Writing to this bit while the FRDY bit = 0 is ignored.

Note 2. Writing to this bit is only possible when 16 bits are written and the value written to the KEY bits is D9h.

Note 3. Written values are not retained by these bits (always read as 0x00).

Note 4. Only secure access can write to this register. Both secure access and non-secure read access are allowed. Non-secure write access is denied, but TrustZone access error is not generated.

#### CEPROT bit (Code Flash P/E Mode Entry Protection)

The CEPROT bit specifies the protection setting of the FRNTRYC bit in the FENTRYR register.

[Setting condition]

- 1 being written to the CEPROT bit while writing to FMEPROT is enabled.

[Clearing condition]

- 0 being written to the CEPROT bit while writing to FMEPROT is enabled.

#### 44.4.15 FBPROT0 : Flash Block Protection Register

Base address: FACL = 0x407F\_E000

Offset address: 0x78

| Bit position:      | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0     |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-------|
| Bit field:         | KEY[7:0] |    |    |    |    |    |   |   |   |   | — | — | — | — | — | BPCN0 |
| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0     |

| Bit  | Symbol   | Function   | R/W                 |
|------|----------|--|---------------------|
| 0    | BPCN0    | Block Protection for Non-secure Cancel<br>0: Block protection is enabled<br>1: Block protection is disabled. | R/W <sup>1</sup> *2 |
| 7:1  | —        | These bits are read as 0. The write value should be 0.   | R/W                 |
| 15:8 | KEY[7:0] | Key Code   | R/W <sup>3</sup>    |

Note 1. This bit can be written when the FRDY bit in the FSTATR register is 1. Writing to this bit is ignored when the FRDY bit is 0.

Note 2. Writing to this bit is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0x78.

Note 3. Written values are not retained by these bits (always read as 0x00).

The FBPROT0 register is used to disable the block protect function for non-secure. When the block protect setting is locked by the permanent block setting, it cannot be disabled by this register.

The FBPROT0 value is initialized when the SUINIT bit in the FSUINITR is set to 1, because the FENTRYR value is initialized to 0x0000. It is also initialized by a reset.

#### BPCN0 bit (Block Protection for Non-secure Cancel)

The BPCN0 bit disables the block protect setting for non-secure function.

[Setting condition]

- When the write-enabling conditions are satisfied and the FENTRYR is not 0x0000, write 1 to this bit.

[Clearing conditions]

- 8 bits being written to FBPROT0 while the FRDY bit is 1.
- A value other than 0x78 specified in the KEY bits and 16 bits are written to FBPROT0 while the FRDY bit is 1.
- 0 being written to the BPCN0 bit while writing to FBPROT0 is enabled.
- The FENTRYR register value is 0x0000.

| Bit  | Symbol   | Function | R/W              |
|------|----------|----------|------------------|
| 15:8 | KEY[7:0] | 关键代码     | R/W <sup>3</sup> |

注1.仅当FSTATR寄存器中的FRDY位为1时才可以写入该位。当FRDY位=0时写入该位被忽略。

注2.仅当写入16位且写入KEY位的值为D9h时才能写入该位。

注3.这些位不保留写入的值（始终读取为0x00）。

注4.只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问。非安全写入访问被拒绝，但生成了TrustZone访问错误。

#### CEPROT位（代码闪存PE模式进入保护）

CEPROT位指定FENTRYR寄存器中FRNTRYC位的保护设置。

[Setting condition]

- 写入FMEPROT时将1写入CEPROT位使能。

[Clearing condition]

- 使能写入FMEPROT时将0写入CEPROT位。

#### 44.4.15 FBPROT0：闪存块保护寄存器

Base address: FACL = 0x407F\_E000

Offset address: 0x78

| Bit position: | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |       |
|---------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|-------|
| Bit field:    | KEY[7:0] |    |    |    |    |    |   |   |   |   | — | — | — | — | — | — | BPCN0 |
| 重置后的值:        | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |       |

| Bit  | Symbol   | Function                      | R/W                 |
|------|----------|-------------------------------|---------------------|
| 0    | BPCN0    | 非安全取消的块保护<br>0: 启用块保护1: 禁用块保护 | R/W <sup>1</sup> *2 |
| 7:1  | —        | 这些位被读取为0。写入值应为0。              | R/W                 |
| 15:8 | KEY[7:0] | 关键代码                          | R/W <sup>3</sup>    |

注1.当FSTATR寄存器中的FRDY位为1时可以写入该位。当FRDY位为0时忽略写入该位。

注2.仅当写入16位且写入KEY[7:0]位的值为0x78时，才能写入该位。

注3.这些位不保留写入的值（始终读取为0x00）。

FBPROT0寄存器用于禁用非安全的块保护功能。当块保护设置被永久块设置锁定时，该寄存器不能将其禁用。

FBPROT0值在FSUINITR中的SUINIT位设置为1时被初始化，因为FENTRYR值被初始化为0x0000。它由复位初始化。

#### BPCN0位（非安全取消的块保护）

BPCN0位禁用非安全功能的块保护设置。

[Setting condition]

- 当写使能条件满足且FENTRYR不为0x0000时，向该位写1。

[Clearing conditions]

- FRDY位为1时，将8位写入FBPROT0。
- 当FRDY位为1时，将KEY位中指定的0x78和16位以外的值写入FBPROT0。
- 写入FBPROT0时将0写入BPCN0位使能。
- FENTRYR寄存器值为0x0000。

44.4.16 FBPROT1 : Flash Block Protection for Secure Register

Base address: FACL = 0x407F\_E000  
Offset address: 0x7C

| Bit  | Symbol   | Function   | R/W                 |
|------|----------|--|---------------------|
| 0    | BPCN1    | Block Protection for Secure Cancel<br>0: Block protection is enabled<br>1: Block protection is disabled. | R/W <sup>1</sup> *2 |
| 7:1  | —        | These bits are read as 0. The write value should be 0.   | R/W                 |
| 15:8 | KEY[7:0] | Key Code   | R/W <sup>3</sup>    |

Note 1. Writing to this bit is only possible when the FRDY bit in the FSTATR register is 1. Writing to this bit while FRDY bit = 0 is ignored.  
Note 2. Writing to this bit is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0xB1.  
Note 3. Written values are not retained by these bits (always read as 0x00).

The FBPROT1 register is used to disable the block protect function for secure developer. When the block protect setting is locked by the permanent block setting, it cannot be disabled by this register.

The FBPROT1 value is initialized when the SUINIT bit in the FSUINITR is set to 1, because the FENTRYR value is initialized to 0x0000. It is also initialized by a reset.

**BPCN1 bit (Block Protection for Secure Cancel)**

The BPCN1 bit disables the block protect setting for secure function.

[Setting condition]

- When the write-enabling conditions are satisfied and the FENTRYR is not 0x0000, write 1 to BPCN1.

[Clearing conditions]

- 8 bits being written to FBPROT1 while the FRDY bit is 1.
- A value other than 0xB1 specified in the KEY bits and 16 bits are written to FBPROT1 while the FRDY bit is 1.
- 0 being written to the BPCN1 bit while writing to FBPROT1 is enabled.
- The FENTRYR register value is 0x0000.

44.4.17 FSTATR : Flash Status Register

Base address: FACL = 0x407F\_E000  
Offset address: 0x80

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 5:0 | —      | These bits are read as 0. The write value should be 0. | R/W |

44.4.16 FBPROT1：安全寄存器的闪存块保护

Base address: FACL = 0x407F\_E000  
Offset address: 0x7C

| Bit  | Symbol   | Function                      | R/W                 |
|------|----------|-------------------------------|---------------------|
| 0    | BPCN1    | 安全取消的块保护<br>0: 启用块保护1: 禁用块保护。 | R/W <sup>1</sup> *2 |
| 7:1  | —        | 这些位被读取为0。写入值应为0。              | R/W                 |
| 15:8 | KEY[7:0] | 关键代码                          | R/W <sup>3</sup>    |

注1.仅当FSTATR寄存器中的FRDY位为1时才可以写入该位。当FRDY位=0时写入该位被忽略。  
注2.仅当写入16位且写入KEY[7:0]位的值为0xB1时，才能写入该位。  
注3.这些位不保留写入的值（始终读取为0x00）。

FBPROT1寄存器用于禁用安全开发人员的块保护功能。当块保护设置被永久块设置锁定时，该寄存器不能将其禁用。

FBPROT1值在FSUINITR中的SUINIT位设置为1时被初始化，因为FENTRYR值被初始化为0x0000。它也由复位初始化。

**BPCN1位（安全取消的块保护）**

BPCN1位禁用安全功能的块保护设置。

[Setting condition]

- 当写使能条件满足且FENTRYR不为0x0000时，向BPCN1写1。

[Clearing conditions]

- FRDY位为1时，将8位写入FBPROT1。
- 当FRDY位为1时，将KEY位中指定的0xB1和16位以外的值写入FBPROT1。
- 写入FBPROT1时将0写入BPCN1位使能。
- FENTRYR寄存器值为0x0000。

44.4.17 FSTATR：闪存状态寄存器

Base address: FACL = 0x407F\_E000  
Offset address: 0x80

| Bit | Symbol | Function         | R/W |
|-----|--------|------------------|-----|
| 5:0 | —      | 这些位被读取为0。写入值应为0。 | R/W |

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 6     | FLWEERR   | Flash Write/Erase Protect Error Flag<br>0: An error has not occurred<br>1: An error has occurred.   | R   |
| 7     | —         | These bits are read as 0. The write value should be 0.  | R/W |
| 8     | PRGSPD    | Programming Suspend Status Flag<br>0: The flash sequencer is in a state other than those corresponding to the value 1<br>1: The flash sequencer is in the programming suspension processing state or programming suspended state. | R   |

| 13    | ERSERR    | Erase Error Flag<br>0: Erasure has completed successfully<br>1: An error has occurred during erasure.   | R   |
| 14    | ILGLERR   | Illegal Command Error Flag<br>0: The flash sequencer has not detected an illegal FACL command or illegal flash memory access<br>1: The flash sequencer has detected an illegal FACL command or illegal flash memory access.       | R   |
| 15    | FRDY      | Flash Ready Flag<br>0: Program, Block Erase, Multi Block Erase, P/E suspend, P/E resume, Forced Stop, Blank Check, or Configuration set command processing is in progress<br>1: None of the above is in progress.                 | R   |
| 19:16 | —         | These bits are read as 0. The write value should be 0.  | R/W |
| 20    | OTERR     | Other Error<br>0: A status clear or forced stop command processing is complete<br>1: An error has occurred.   | R   |
| 21    | SECERR    | Security Error<br>0: A status clear or forced stop command processing is complete<br>1: An error has occurred.  | R/W |
| 22    | FESETERR  | FENTRY Setting Error<br>0: A status clear or forced stop command processing is complete<br>1: An error has occurred.  | R   |
| 23    | ILGCOMERR | Illegal Command Error<br>0: A status clear or forced stop command processing is complete<br>1: An error has occurred.   | R   |
| 31:24 | —         | These bits are read as 0. The write value should be 0.  | R/W |

The FSTATR register indicates the state of the flash sequencer.

#### FLWEERR flag (Flash Write/Erase Protect Error Flag)

The FLWEERR flag indicates a violation of the flash memory overwrite protection setting in the FWEPROR register. When this flag is 1, the flash sequencer is in the command-locked state.

[Setting condition]

- An error has occurred.

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 6     | FLWEERR   | 闪存写擦除保护错误标志<br>0: 未发生错误1: 发生错误  | R   |
| 7     | —         | 这些位被读取为0。写入值应为0。  | R/W |
| 8     | PRGSPD    | 编程挂起状态标志<br>0: flashsequencer处于与值1对应的状态以外的状态1: flashsequencer处于编程暂停处理状态或编程暂停状态。 | R   |
| 9     | ERSSPD    | 擦除挂起状态标志<br>0: 闪存定序器处于与值1对应的状态以外的状态1: 闪存定序器处于擦除暂停处理状态或擦除暂停状态。                   | R   |
| 10    | DBFULL    | 数据缓冲区满标志<br>0: 数据缓冲区为空1: 数据缓冲区已满。   | R   |
| 11    | SUSRDY    | 挂起就绪标志<br>0: flash定序器不能接收PE挂起命令1: flash定序器可以接收PE挂起命令。                           | R   |
| 12    | PRGERR    | 编程错误标志<br>0: 烧录成功1: 烧录出错。   | R   |
| 13    | ERSERR    | 擦除错误标志<br>0: 擦除已成功完成1: 擦除过程中发生错误。   | R   |
| 14    | ILGLERR   | 非法命令错误标志<br>0: 闪存定序器未检测到非法FACL命令或非法闪存访问<br>1: 闪存定序器检测到非法FACL命令或非法闪存访问。          | R   |
| 15    | FRDY      | 闪存就绪标志<br>0: 正在处理编程、块擦除、多块擦除、PE暂停、PE恢复、强制停止、空白检查或配置设置命令处理<br>1: 以上均未进行。         | R   |
| 19:16 | —         | 这些位被读取为0。写入值应为0。  | R/W |
| 20    | OTERR     | 其他错误<br>0: 状态清除或强制停止命令处理完成1: 发生错误。  | R   |
| 21    | SECERR    | 安全错误<br>0: 状态清除或强制停止命令处理完成1: 发生错误。  | R/W |
| 22    | FESETERR  | FENTRY设置错误<br>0: 状态清除或强制停止命令处理完成1: 发生错误。  | R   |
| 23    | ILGCOMERR | 非法命令错误<br>0: 状态清除或强制停止命令处理完成1: 发生错误。  | R   |
| 31:24 | —         | 这些位被读取为0。写入值应为0。  | R/W |

FSTATR寄存器指示闪存定序器的状态。

#### FLWEERR标志 (闪存写擦除保护错误标志)

FLWEERR标志表示违反了FWEPROR寄存器中的闪存覆盖保护设置。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

- 发生错误。

[Clearing condition]

- The flash sequencer starts processing the Forced Stop command.

**PRGSPD flag (Programming Suspend Status Flag)**

The PRGSPD flag indicates that the flash sequencer is in the programming suspension processing state or programming suspended state.

[Setting condition]

- The flash sequencer starts processing in response to the programming suspend command.

[Clearing conditions]

- Reception of the P/E resume command by the flash sequencer (after write access to the FACI command-issuing area is complete)
- The flash sequencer starts processing the Forced Stop command.

**ERSSPD flag (Erasure Suspend Status Flag)**

The ERSSPD flag indicates that the flash sequencer is in the erasure suspension processing state or erasure suspended state.

[Setting condition]

- The flash sequencer starts processing in response to an erasure suspend command.

[Clearing condition]

- Reception of the P/E resume command by the flash sequencer (after write access to the FACI command-issuing area is complete)
- The flash sequencer starts processing of the Forced Stop command.

**DBFULL flag (Data Buffer Full Flag)**

The DBFULL flag indicates the state of the data buffer when the program command is issued. The flash sequencer incorporates a buffer for write data (data buffer). When data for writing to the flash memory are written to the FACI command-issuing area while the data buffer is full, the flash sequencer inserts a wait cycle in the peripheral bus.

[Setting condition]

- The data buffer becomes full while program commands are issued.

[Clearing condition]

- The data buffer becomes empty.

**SUSRDY flag (Suspend Ready Flag)**

The SUSRDY flag indicates whether the flash sequencer can receive a P/E suspend command.

[Setting condition]

- After starting programming/erasure processing, the flash sequencer enters a state in which P/E suspend commands can be received.

[Clearing conditions]

- Reception of the P/E suspend command or Forced Stop command by the flash sequencer (after write access to the FACI command-issuing area is complete)
- During programming or erasure, the flash sequencer enters the command-locked state
- Programming or erasure has completed.

**PRGERR flag (Programming Error Flag)**

The PRGERR flag indicates the result of programming of the flash memory. When this flag is 1, the flash sequencer is in the command-locked state.

[Setting condition]

[Clearing condition]

- 闪存定序器开始处理强制停止命令。

**PRGSPD标志 (编程暂停状态标志)**

PRGSPD标志指示闪存定序器处于编程暂停处理状态或编程暂停状态。

[Setting condition]

- 闪存定序器响应编程暂停命令开始处理。

[Clearing conditions]

- 闪存定序器接收到P/Eresume命令 (在对FACI命令发出区域的写访问完成后)
- 闪存定序器开始处理强制停止命令。

**ERSSPD标志 (擦除挂起状态标志)**

ERSSPD标志指示闪存定序器处于擦除暂停处理状态或擦除暂停状态。

[Setting condition]

- 闪存定序器响应擦除挂起命令开始处理。

[Clearing condition]

- 闪存定序器接收到P/Eresume命令 (在对FACI命令发出区域的写访问完成后)
- 闪存定序器开始处理强制停止命令。

**DBFULL标志 (数据缓冲区满标志)**

DBFULL标志指示发出程序命令时数据缓冲区的状态。闪存定序器包含一个用于写入数据的缓冲区 (数据缓冲区)。当用于写入闪存的数据写入到FACI命令发布区, 而数据缓冲区已满时, 闪存定序器会在外围总线中插入一个等待周期。

[Setting condition]

- 发出程序命令时数据缓冲区已满。

[Clearing condition]

- 数据缓冲区变空。

**SUSRDY标志 (挂起就绪标志)**

SUSRDY标志指示闪存定序器是否可以接收PE挂起命令。

[Setting condition]

- 开始编程擦除处理后, flash定序器进入可以接收PE挂起命令的状态。

[Clearing conditions]

- 闪存定序器接收到PE暂停命令或强制停止命令 (在对FACI命令发布区域的写访问完成后)
- 在编程或擦除期间, 闪存定序器进入命令锁定状态
- 编程或擦除已完成。

**PRGERR标志 (编程错误标志)**

PRGERR标志指示闪存的编程结果。当该标志为1时, 闪存定序器处于命令锁定状态。

[Setting condition]

- An error has occurred during programming.

[Clearing condition]

- The flash sequencer starts processing of the Status Clear or Forced Stop command.

#### ERSERR flag (Erasure Error Flag)

The ERSERR flag indicates the result of erasure of the flash memory. When this flag is 1, the flash sequencer is in the command-locked state.

[Setting condition]

- An error has occurred during erasure.

[Clearing condition]

- The flash sequencer starts processing of the Status Clear or Forced Stop command.

#### ILGLERR flag (Illegal Command Error Flag)

The ILGLERR flag indicates that the flash sequencer has detected an illegal FACI command or flash memory access. If this flag is 1, the flash sequencer is in the command-locked state.

[Setting conditions]

- See [section 44.11.2. Error Protection](#).

[Clearing condition]

- The flash sequencer starts processing of the Status Clear or Forced Stop command.

#### FRDY flag (Flash Ready Flag)

The FRDY flag indicates the command processing state of the flash sequencer.

[Setting conditions]

- The flash sequencer completes command processing
- The flash sequencer receives a P/E suspend command and suspends programming of the flash memory
- The flash sequencer received the Forced Stop command and ended command processing.

[Clearing conditions]

- The flash sequencer received an FACI command
- For Program and Configuration setting, the first write access to the FACI command-issuing area
- For other commands, the last write access to the FACI command-issuing area.

#### OTERR flag (Other Error)

See [Table 44.23](#). When this flag is 1, the flash sequencer is in the command-lock state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The status clear or forced stop command processing is complete.

#### SECERR flag (Security Error)

See [Table 44.23](#). When this flag is 1, the flash sequencer is in the command-lock state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The status clear or forced stop command processing is complete.

- 编程过程中出现错误。

[Clearing condition]

- 闪存定序器开始处理状态清除或强制停止命令。

#### ERSERR标志 (擦除错误标志)

ERSERR标志指示闪存擦除的结果。当该标志为1时, 闪存定序器处于命令锁定状态。

[Setting condition]

- 擦除过程中发生错误。

[Clearing condition]

- 闪存定序器开始处理状态清除或强制停止命令。

#### ILGLERR标志 (非法命令错误标志)

ILGLERR标志表示闪存定序器检测到非法FACI命令或闪存访问。如果该标志为1, 则闪存定序器处于命令锁定状态。

[Setting conditions]

- 请参阅第44.11.2节。错误保护。

[Clearing condition]

- 闪存定序器开始处理状态清除或强制停止命令。

#### FRDY标志 (闪存就绪标志)

FRDY标志指示闪存定序器的命令处理状态。

[Setting conditions]

- flashsequencer完成命令处理
- 闪存定序器收到PE暂停命令并暂停闪存的编程
- 闪存定序器收到强制停止命令并结束命令处理。

[Clearing conditions]

- 闪存定序器收到FACI命令
- 对于ProgramandConfiguration设置, 对FACI命令发布区的第一次写访问
- 对于其他命令, 对FACI命令发布区的最后一次写访问。

#### OTERR flag (Other Error)

见表44.23。当该标志为1时, 闪存定序器处于命令锁定状态。

[Setting condition]

- 发生错误。

[Clearing condition]

- 状态清除或强制停止命令处理完成。

#### SECERR flag (Security Error)

见表44.23。当该标志为1时, 闪存定序器处于命令锁定状态。

[Setting condition]

- 发生错误。

[Clearing condition]

- 状态清除或强制停止命令处理完成。

**FESETERR flag (FENTRY Setting Error)**

See Table 44.23. When this flag is 1, the flash sequencer is in the command-lock state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The status clear or forced stop command processing is complete.

**ILGCOMERR flag (Illegal Command Error)**

See Table 44.23. When this flag is 1, the flash sequencer is in the command-lock state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The status clear or forced stop command processing is complete.

**44.4.18 FENTRYR : Flash P/E Mode Entry Register**

Base address: FACL = 0x407F\_E000

Offset address: 0x84

|                    |          |    |    |    |    |    |   |         |   |   |   |   |   |   |   |         |
|--------------------|----------|----|----|----|----|----|---|---------|---|---|---|---|---|---|---|---------|
| Bit position:      | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8       | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:         | KEY[7:0] |    |    |    |    |    |   | FENTRYD | — | — | — | — | — | — | — | FENTRYC |
| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0       | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit  | Symbol   | Function  | R/W                |
|------|----------|---|--------------------|
| 0    | FENTRYC  | Code Flash P/E Mode Entry<br>0: Code flash is in read mode<br>1: Code flash is in P/E mode. | R/W <sup>1,2</sup> |
| 6:1  | —        | These bits are read as 0. The write value should be 0.                                      | R/W                |
| 7    | FENTRYD  | Data Flash P/E Mode Entry<br>0: Data flash is in read mode<br>1: Data flash is in P/E mode. | R/W <sup>1,2</sup> |
| 15:8 | KEY[7:0] | Key Code  | R/W <sup>3</sup>   |

Note 1. These bits can be written when the FRDY bit in the FSTATR register is 1. Writing to these bits are ignored when the FRDY bit is 0.  
Note 2. Writing to these bits is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0xAA.  
Note 3. Written values are not retained by these bits (always read 0x00).

FENTRYR is used to specify code flash P/E mode or data flash P/E mode. To specify the code flash P/E mode or data flash P/E mode so that the flash sequencer can receive FACL commands, set either the FENTRYD or FENTRYC bit to 1 to place the flash sequencer in P/E mode.

FENTRYR is initialized when the SUINIT bit in FSUINITR is set to 1. It is also initialized by a reset.

Note: Writing a value of 0XAA81 to this register causes the ILGLERR bit in the FSTATR register to be set to 1, resulting in the flash sequencer being placed in the command-locked state.

**FENTRYC bit (Code Flash P/E Mode Entry)**

The FENTRYC bit specifies P/E mode for the code flash memory.

[Setting condition]

- Write 1 to the FENTRYC bit while writing to FENTRYR is enabled and FENTRYR is 0x0000.

[Clearing conditions]

**FESETERR标志 (FENTRY设置错误)**

见表44.23。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

- 发生错误。

[Clearing condition]

- 状态清除或强制停止命令处理完成。

**ILGCOMERR标志 (非法命令错误)**

见表44.23。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

- 发生错误。

[Clearing condition]

- 状态清除或强制停止命令处理完成。

**44.4.18 FENTRYR:FlashPE模式进入寄存器**

Base address: FACL = 0x407F\_E000

Offset address: 0x84

|               |          |    |    |    |    |    |   |         |   |   |   |   |   |   |   |         |
|---------------|----------|----|----|----|----|----|---|---------|---|---|---|---|---|---|---|---------|
| Bit position: | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8       | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:    | KEY[7:0] |    |    |    |    |    |   | FENTRYD | — | — | — | — | — | — | — | FENTRYC |
| 重置后的值:        | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0       | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit  | Symbol   | Function   | R/W                |
|------|----------|--|--------------------|
| 0    | FENTRYC  | CodeFlashPE模式进入<br>0: Codeflash处于读取模式1<br>: Codeflash处于PE模式。 | R/W <sup>1,2</sup> |
| 6:1  | —        | 这些位被读取为0。写入值应为0。   | R/W                |
| 7    | FENTRYD  | 数据闪存PE模式进入<br>0: 数据闪存处于读取模式1<br>: 数据闪存处于PE模式。                | R/W <sup>1,2</sup> |
| 15:8 | KEY[7:0] | 关键代码   | R/W <sup>3</sup>   |

注1.当FSTATR寄存器中的FRDY位为1时可以写入这些位。当FRDY位为0时忽略写入这些位。  
注2.仅当写入16位且写入KEY[7:0]位的值为0xAA时，才能写入这些位。  
注3.这些位不保留写入的值（始终读取0x00）。

FENTRYR用于指定代码闪存PE模式或数据闪存PE模式。要指定代码闪存PE模式或数据闪存PE模式，以便闪存定序器可以接收FACL命令，请将FENTRYD或FENTRYC位设置为1以将闪存定序器置于PE模式。

当FSUINITR中的SUINIT位设置为1时，FENTRYR被初始化。它也被复位初始化。

Note: 将值0XAA81写入该寄存器会导致FSTATR寄存器中的ILGLERR位设置为1，从而导致闪存定序器置于命令锁定状态。

**FENTRYC位 (代码闪存PE模式进入)**

FENTRYC位指定代码闪存的PE模式。

[Setting condition]

- 写入1到FENTRYC位，同时写入FENTRYR使能并且FENTRYR为0x0000。

[Clearing conditions]

- Write 8 bits to FENTRYR while the FRDY bit is 1
- A value other than 0xAA is specified in the KEY[7:0] bits and 16 bits are written to FENTRYR while the FRDY bit is 1
- Write 0 to the FENTRYC bit while writing to FENTRYR is enabled
- Write to FENTRYR while writing is enabled and its value is other than 0x0000
- The protection of FMEPROT register is enabled.

**FENTRYD bit (Data Flash P/E Mode Entry)**

The FENTRYD bit specifies P/E mode for the data flash memory.

[Setting condition]

- Write 1 to the FENTRYD bit while writing to FENTRYR is enabled and FENTRYR is 0x0000.

[Clearing conditions]

- Write 8 bits to FENTRYR while the FRDY bit is 1
- Writing of 16 bits to FENTRYR with a value other than 0xAA specified for the KEY[7:0] bits while the FRDY bit is 1
- Write 0 to the FENTRYD bit while writing to FENTRYR is enabled
- Write to FENTRYR while writing is enabled and its value is other than 0x0000.

**KEY[7:0] bits (Key Code)**

The KEY[7:0] bits control writing permission to the FENTRYD or FENTRYC bits.

**44.4.19 FSUINTR : Flash Sequencer Setup Initialization Register**

Base address: FACL = 0x407F\_E000

Offset address: 0x8C

| Bit  | Symbol   | Function   | R/W                |
|------|----------|--|--------------------|
| 0    | SUINIT   | Set-Up Initialization<br>0: The FSADDR, FEADDR, FBPROT0, FBPROT1, FENTRYR, FBCCNT, and FCPSR flash sequencer setup registers keep their current values<br>1: The FSADDR, FEADDR, FBPROT0, FBPROT1, FENTRYR, FBCCNT, and FCPSR flash sequencer setup registers are initialized. | R/W <sup>1,2</sup> |
| 7:1  | —        | These bits are read as 0. The write value should be 0.   | R/W                |
| 15:8 | KEY[7:0] | Key Code   | R/W <sup>3</sup>   |

Note 1. This bit can be written when the FRDY bit in the FSTATR register is 1. Writing to this bit is ignored when the FRDY bit is 0.

Note 2. Writing to these bits is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0x2D.

Note 3. Written values are not retained by these bits (always read 0x00).

FSUINTR is used for initialization of the flash sequencer setup.

**SUINIT bit (Set-Up Initialization)**

The SUINIT bit initializes the following flash sequencer setup registers:

- FSADDR
- FEADDR
- FBPROT0
- FBPROT1
- FENTRYR

- FRDY位为1时向FENTRYR写入8位
- KEY[7:0]位中指定了0xAA以外的值，当FRDY位为1时，将16位写入FENTRYR
- 使能写入FENTRYR时向FENTRYC位写入0
- 启用写入时写入FENTRYR，其值不是0x0000
- FMEPROT寄存器保护使能。

**FENTRYD位 (数据闪存PE模式进入)**

FENTRYD位指定数据闪存的PE模式。

[Setting condition]

- 写入1到FENTRYD位，同时写入FENTRYR使能并且FENTRYR为0x0000。

[Clearing conditions]

- FRDY位为1时向FENTRYR写入8位
- 当FRDY位为1时，将16位写入FENTRYR，其中KEY[7:0]位指定的值不是0xAA
- 使能写入FENTRYR时向FENTRYD位写入0
- 写入启用时写入FENTRYR，其值不是0x0000。

**KEY[7:0] bits (Key Code)**

KEY[7:0]位控制对FENTRYD或FENTRYC位的写入权限。

**44.4.19 FSUINTR: 闪存定序器设置初始化寄存器**

Base address: FACL = 0x407F\_E000

Offset address: 0x8C

| Bit  | Symbol   | Function  | R/W                |
|------|----------|---|--------------------|
| 0    | SUINIT   | Set-Up Initialization<br>0: FSADDR、FEADDR、FBPROT0、FBPROT1、FENTRYR、FBCCNT和FCPSR闪存定序器设置寄存器保持其当前值<br>1: 初始化FSADDR、FEADDR、FBPROT0、FBPROT1、FENTRYR、FBCCNT和FCPSR闪存定序器设置寄存器。 | R/W <sup>1,2</sup> |
| 7:1  | —        | 这些位被读取为0。写入值应为0。  | R/W                |
| 15:8 | KEY[7:0] | 关键代码  | R/W <sup>3</sup>   |

注1.当FSTATR寄存器中的FRDY位为1时可以写入该位。当FRDY位为0时忽略写入该位。

注2.仅当写入16位且写入KEY[7:0]位的值为0x2D时才能写入这些位。

注3.这些位不保留写入的值（始终读取0x00）。

FSUINTR用于初始化闪存定序器设置。

**SUINIT bit (Set-Up Initialization)**

SUINIT位初始化以下闪存定序器设置寄存器：

- FSADDR
- FEADDR
- FBPROT0
- FBPROT1
- FENTRYR

- FBCCNT
- FCPSR.

**KEY[7:0] bits (Key Code)**

The KEY[7:0] bits control writing permission to the SUNIT bit.

**44.4.20 FCMDR : FACL Command Register**

Base address: FACL = 0x407F\_E000

Offset address: 0xA0

| Bit  | Symbol     | Function  | R/W |
|------|------------|---|-----|
| 7:0  | PCMDR[7:0] | Pre-command Flag<br>The command just before the latest command is stored. | R   |
| 15:8 | CMDR[7:0]  | Command Flag<br>The latest command is stored.                             | R   |

FCMDR records the two most recent commands accepted by the flash sequencer.

**PCMDR[7:0] bits (Pre-command Flag)**

The PCMDR[7:0] bits indicate the command received immediately before the latest command received by the flash sequencer.

**CMDR[7:0] bits (Command Flag)**

The CMDR[7:0] bits indicate the latest command received by the flash sequencer.

**Table 44.5 States of FCMDR after receiving commands**

| Command           | CMDR | PCMDR            |
|-------------------|------|------------------|
| Program           | 0xE8 | Previous command |
| Block erase       | 0xD0 | 0x20             |
| Multi block erase | 0xD0 | 0x21             |
| P/E suspend       | 0xB0 | Previous command |
| P/E resume        | 0xD0 | Previous command |
| Status Clear      | 0x50 | Previous command |
| Forced Stop       | 0xB3 | Previous command |
| Blank Check       | 0xD0 | 0x71             |
| Configuration set | 0x40 | Previous command |

**44.4.21 FBCCNT : Blank Check Control Register**

Base address: FACL = 0x407F\_E000

Offset address: 0xD0

- FBCCNT
- FCPSR.

**KEY[7:0] bits (Key Code)**

KEY[7:0]位控制对SUNIT位的写入权限。

**44.4.20 FCMDR:FACL命令寄存器**

Base address: FACL = 0x407F\_E000

Offset address: 0xA0

| Bit  | Symbol     | Function                         | R/W |
|------|------------|----------------------------------|-----|
| 7:0  | PCMDR[7:0] | Pre-command Flag<br>存储最新命令之前的命令。 | R   |
| 15:8 | CMDR[7:0]  | 命令标志<br>存储最新的命令。                 | R   |

FCMDR记录闪存定序器最近接受的两个命令。

**PCMDR[7:0] bits (Pre-command Flag)**

PCMDR[7:0]位指示在闪存定序器接收到的最新命令之前收到的命令。

**CMDR[7:0] bits (Command Flag)**

CMDR[7:0]位指示闪存定序器接收到的最新命令。

**Table 44.5 FCMDR收到指令后的状态**

| Command     | CMDR | PCMDR |
|-------------|------|-------|
| Program     | 0xE8 | 上一条命令 |
| 块擦除         | 0xD0 | 0x20  |
| 多块擦除        | 0xD0 | 0x21  |
| P/E suspend | 0xB0 | 上一条命令 |
| P/E resume  | 0xD0 | 上一条命令 |
| 状态清除        | 0x50 | 上一条命令 |
| 强制停止        | 0xB3 | 上一条命令 |
| 空白支票        | 0xD0 | 0x71  |
| 配置集         | 0x40 | 上一条命令 |

**44.4.21 FBCCNT:空白检查控制寄存器**

Base address: FACL = 0x407F\_E000

Offset address: 0xD0

BCST bit in the FBCSTAT register is 1 and while the FRDY bit in the FSTATR register is 1. When the BCST bit in the FBCSTAT register is 0, the PSADR[16:0] bits hold the address produced by the previous check.

44.4.24 FSUASMON : Flash Startup Area Select Monitor Register

Base address: FACL = 0x407F\_E000  
Offset address: 0xDC

|                    |       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------------|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position:      | 31    | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field:         | BTFLG | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  |
| Value after reset: | 0/1   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit position:      | 15    | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Bit field:         | FSPR  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  | —  |
| Value after reset: | 0/1   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit   | Symbol | Function   | R/W |
|-------|--------|--|-----|
| 14:0  | —      | These bits are read as 0. The write value should be 0.   | R   |
| 15    | FSPR   | Protection Programming Flag to set Boot Flag and Startup Area Control<br>0: Protected state<br>1: Non-protected state.                                   | R   |
| 30:16 | —      | These bits are read as 0. The write value should be 0.   | R   |
| 31    | BTFLG  | Flag of Startup Area Select for Boot Swap<br>0: The startup area is the alternate block (block 1)<br>1: The startup area is the default block (block 0). | R   |

**FSPR bit (Protection Programming Flag to set Boot Flag and Startup Area Control)**

The FSPR bit indicates the protection state against the configuration set command for the BTFLG bit, and FSUACR Register.

In response to a reset or configuration set command, the FACL transfers data from flash memory to this register.

**BTFLG bit (Flag of Startup Area Select for Boot Swap)**

The BTFLG bit indicates whether the address of the startup area is exchanged for the boot swap function or not.

In response to a reset or configuration set command, the FACL transfers data from flash memory to this register.

44.4.25 FCPSR : Flash Sequencer Processing Switching Register

Base address: FACL = 0x407F\_E000  
Offset address: 0xE0

|                    |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |         |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------|
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:         | —  | —  | —  | —  | —  | —  | — | — | — | — | — | — | — | — | — | ESUSPMD |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit  | Symbol  | Function   | R/W |
|------|---------|--|-----|
| 0    | ESUSPMD | Erase Suspend Mode<br>0: Suspension priority mode<br>1: Erasure priority mode. | R/W |
| 15:1 | —       | These bits are read as 0. The write value should be 0.                         | R/W |

FCPSR selects the erasure suspension mode. FCPSR is initialized when the SUINIT bit in FSUINTR is set to 1. It is also initialized by a reset.

FBCSTAT寄存器中的BCST位为1，而FSTATR寄存器中的FRDY位为1。当FBCSTAT寄存器为0，PSADR[16:0]位保存上一次检查产生的地址。

44.4.24 FSUASMON:闪存启动区选择监控寄存器

Base address: FACL = 0x407F\_E000  
Offset address: 0xDC

|               |       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| 重置后的值:        | 0/1   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit   | Symbol | Function  | R/W |
|-------|--------|---|-----|
| 14:0  | —      | 这些位被读取为0。写入值应为0。  | R   |
| 15    | FSPR   | 保护编程标志设置引导标志和启动区控制<br>0: 保护状态1: 非保护状态。  | R   |
| 30:16 | —      | 这些位被读取为0。写入值应为0。  | R   |
| 31    | BTFLG  | 引导交换的启动区域选择标志<br>0: 启动区为alternateblock (block1) 1: 启动区为defaultblock (block0)。 | R   |

**FSPR位 (用于设置引导标志和启动区域控制的保护编程标志)**

FSPR位指示针对BTFLG位的配置设置命令的保护状态，而FSUACR Register。

响应复位或配置设置命令，FACL将数据从闪存传输到该寄存器。

**BTFLG位 (用于引导交换的启动区域选择标志)**

BTFLG位指示启动区域的地址是否被交换为引导交换功能。

响应复位或配置设置命令，FACL将数据从闪存传输到该寄存器。

44.4.25 FCPSR:闪存定序器处理切换寄存器

Base address: FACL = 0x407F\_E000  
Offset address: 0xE0

|               |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |         |
|---------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:    | —  | —  | —  | —  | —  | —  | — | — | — | — | — | — | — | — | — | ESUSPMD |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       |

| Bit  | Symbol  | Function                      | R/W |
|------|---------|-------------------------------|-----|
| 0    | ESUSPMD | 擦除挂起模式<br>0: 暂停优先模式1: 擦除优先模式。 | R/W |
| 15:1 | —       | 这些位被读取为0。写入值应为0。              | R/W |

FCPSR选择擦除暂停模式。当FSUINTR中的SUINIT位设置为1时，FCPSR被初始化。它也被复位初始化。

**ESUSPMD bit (Erasure Suspend Mode)**

The ESUSPMD bit selects the erasure suspension mode when a P/E suspend command is issued while the flash sequencer is executing erasure processing (see [section 44.9.3.10. P/E Suspend Command](#)). This bit should be set before issuing Block Erase or Multi Block Erase command.

**44.4.26 FPCKAR : Flash Sequencer Processing Clock Notification Register**

Base address: FACL = 0x407F\_E000

Offset address: 0xE4

| Bit  | Symbol    | Function  | R/W                |
|------|-----------|---|--------------------|
| 7:0  | PCKA[7:0] | Flash Sequencer Operating Clock Notification<br>These bits are used to set the operating frequency of the flash sequencer while processing FACL commands. | R/W <sup>1,2</sup> |
| 15:8 | KEY[7:0]  | Key Code  | R/W <sup>3</sup>   |

Note 1. This bit can be written when the FRDY bit in the FSTATR register is 1. Writing to this bit is ignored when the FRDY bit is 0.

Note 2. Writing to these bits is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0x1E.

Note 3. Written values are not retained by these bits (always read 0x00).

FPCKAR specifies the operating frequency of the flash sequencer while processing FACL commands. The highest operating frequency for the given product is set as the initial value.

**PCKA[7:0] bits (Flash Sequencer Operating Clock Notification)**

The PCKA[7:0] bits specify the operating frequency of the flash sequencer while processing FACL commands. Set the desired frequency for these bits before issuing an FACL command. Specifically, convert the frequency in MHz to a binary number and set it for these bits.

Example:

Frequency is 35.9 MHz (PCKA = 0x24)

Round up the first decimal place of 35.9 MHz to a whole number (= 36) and convert it into a binary number.

If the value set in these bits is smaller than the actual operating frequency of the flash sequencer, the flash memory programming/erasure characteristics cannot be guaranteed. If the value set in these bits is greater than the actual operating frequency of the flash sequencer, the flash memory programming/erasure characteristics can be guaranteed but the FACL command processing time such as the time programming/erasure takes will increase. The minimum FACL command processing time is obtained when the operating frequency of the flash sequencer is the same as the PCKA value.

**KEY[7:0] bits (Key Code)**

The KEY[7:0] bits control writing permission to the PCKA bit.

**44.4.27 FSUACR : Flash Startup Area Control Register**

Base address: FACL = 0x407F\_E000

Offset address: 0xE8

**ESUSPMD位 (擦除挂起模式)**

当闪存定序器正在执行擦除处理时发出PE暂停命令时，ESUSPMD位选择擦除暂停模式（请参阅第44.9.3.10节。PE暂停命令）。该位应在发出块擦除或多块擦除命令之前设置。

**44.4.26 FPCKAR:闪存定序器处理时钟通知寄存器**

Base address: FACL = 0x407F\_E000

Offset address: 0xE4

| Bit  | Symbol    | Function                                     | R/W                |
|------|-----------|--|--------------------|
| 7:0  | PCKA[7:0] | 闪存定序器工作时钟通知<br>这些位用于在处理时设置闪存定序器的工作频率 FACL命令。 | R/W <sup>1,2</sup> |
| 15:8 | KEY[7:0]  | 关键代码   | R/W <sup>3</sup>   |

注1.当FSTATR寄存器中的FRDY位为1时可以写入该位。当FRDY位为0时忽略写入该位。

注2.仅当写入16位且写入KEY[7:0]位的值为0x1E时，才能写入这些位。

注3.这些位不保留写入的值（始终读取0x00）。

FPCKAR在处理FACL命令时指定闪存定序器的工作频率。将给定产品的最高工作频率设置为初始值。

**PCKA[7:0]位 (闪存定序器工作时钟通知)**

PCKA[7:0]位指定闪存定序器在处理FACL命令时的工作频率。在发出FACL命令之前为这些位设置所需的频率。具体来说，将以MHz为单位的频率转换为二进制数并为这些位设置它。

Example:

频率为35.9MHz(PCKA=0x24)

将35.9MHz的第一个小数位四舍五入为整数(=36)并将其转换为二进制数。

如果这些位中设置的值小于闪存定序器的实际工作频率，则无法保证闪存编程擦除特性。如果这些位中设置的值大于闪存定序器的实际工作频率，则可以保证闪存编程擦除特性，但FACL命令处理时间（例如编程擦除所花费的时间）会增加。当闪存定序器的工作频率与PCKA值相同时，得到最小FACL命令处理时间。

**KEY[7:0] bits (Key Code)**

KEY[7:0]位控制对PCKA位的写入权限。

**44.4.27 FSUACR: 闪存启动区控制寄存器**

Base address: FACL = 0x407F\_E000

Offset address: 0xE8

| Bit  | Symbol   | Function   | R/W                 |
|------|----------|--|---------------------|
| 1:0  | SAS[1:0] | Startup Area Select<br>0 0: Startup area is selected by BTFGL bit<br>0 1: Startup area is selected by BTFGL bit<br>1 0: Startup area is temporarily switched to the default area (block 0)<br>1 1: Startup area is temporarily switched to the alternate area (block 1). | R/W <sup>1</sup> *3 |
| 7:2  | —        | These bits are read as 0. The write value should be 0.   | R/W                 |
| 15:8 | KEY[7:0] | Key Code   | R/W <sup>2</sup>    |

Note 1. Following described the write condition of these bits (these conditions are required at the same time).

1. Access size to this register is 16 bits
2. The value of KEY[7:0] is 0x66
3. The FSPR bit is 1.

Note 2. Written values are not retained by these bits (always read 0x00).

Note 3. Only secure access can write to this register. Both secure access and non-secure read access are allowed. Non-secure write access is denied, but TrustZone access error is not generated.

FSUACR sets the startup area for the boot swap function.

#### SAS[1:0] bits (Startup Area Select)

The SAS[1:0] bits select the startup area. Three methods are available for changing the startup area.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits control writing permission to the SAS [1:0] bits.

### 44.4.28 FCKMHZ : Data Flash Access Frequency Register

Base address: FLAD = 0x407F\_C000

Offset address: 0x40

|                    |             |   |   |   |   |   |   |   |
|--------------------|-------------|---|---|---|---|---|---|---|
| Bit position:      | 7           | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | FCKMHZ[7:0] |   |   |   |   |   |   |   |
| Value after reset: | 0           | 0 | 1 | 1 | 1 | 1 | 0 | 0 |

| Bit | Symbol      | Function  | R/W |
|-----|-------------|---|-----|
| 7:0 | FCKMHZ[7:0] | Data Flash Access Frequency Register<br>These bits optimize the speed of reading the data flash memory. | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

This register optimizes the speed of reading the data flash memory.

Set the frequency of the peripheral module clock (FCLK) of internal peripheral bus which is the clock for access to the data flash memory, in MHz units. For example, 35.9 MHz should be rounded up and set the frequency to 36. Number of cycles required for access to the data flash memory are inserted according to the frequency. When changing the frequency of the FCLK, follow the procedure below to modify the value of the data flash access frequency register (FCKMHZ) in either of the following ways according to whether operation is at a lower frequency before or after the change.

- When changing the speed from low to high: Modify FCKMHZ. After confirming the change by reading FCKMHZ, change the frequency.
- When changing the speed from high to low: Change the frequency. After the frequency is changed, modify FCKMHZ.

## 44.5 Flash Cache

### 44.5.1 Feature of flash cache

| Bit  | Symbol   | Function   | R/W                 |
|------|----------|--|---------------------|
| 1:0  | SAS[1:0] | 启动区域选择<br>00: 启动区域由BTFGL位选择01: 启动区域由BTFGL位选择10: 启动区域暂时切换到默认区域 (块0) 11: 启动区域暂时切换到备用区域 (块1)。 | R/W <sup>1</sup> *3 |
| 7:2  | —        | 这些位被读取为0。写入值应为0。   | R/W                 |
| 15:8 | KEY[7:0] | 关键代码   | R/W <sup>2</sup>    |

注1.下面描述了这些位的写入条件 (这些条件是同时需要的)。1.对该寄存器的访问大小为16位2.KEY[7:0]的值为0x663.FSPR位为1。

注2.这些位不保留写入的值 (始终读取0x00)。

注3.只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问。非安全写入访问被拒绝,但生成了TrustZone访问错误。

FSUACR设置引导交换功能的启动区域。

#### SAS[1:0]位 (启动区域选择)

SAS[1:0]位选择启动区域。三种方法可用于更改启动区域。

#### KEY[7:0] bits (Key Code)

KEY[7:0]位控制对SAS[1:0]位的写入权限。

### 44.4.28 FCKMHZ:数据闪存访问频率寄存器

Base address: FLAD = 0x407F\_C000

Offset address: 0x40

|               |             |   |   |   |   |   |   |   |
|---------------|-------------|---|---|---|---|---|---|---|
| Bit position: | 7           | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | FCKMHZ[7:0] |   |   |   |   |   |   |   |
| 重置后的值:        | 0           | 0 | 1 | 1 | 1 | 1 | 0 | 0 |

| Bit | Symbol      | Function                        | R/W |
|-----|-------------|---------------------------------|-----|
| 7:0 | FCKMHZ[7:0] | 数据闪存访问频率寄存器<br>这些位优化了数据闪存的读取速度。 | R/W |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
  - 忽略非安全写入访问,不会生成TrustZone访问错误。
- 如果安全属性配置为非安全: ●
- 允许安全和非安全访问。

该寄存器优化了数据闪存的读取速度。

设置内部外围总线的外围模块时钟(FCLK)的频率,它是访问数据闪存的时钟,以MHz为单位。例如,35.9MHz应向上取整,并将频率设置为36。根据频率插入访问数据闪存所需的周期数。当改变FCLK的频率时,根据改变之前或之后是在较低频率下操作,按照以下步骤,通过以下任一方式修改数据闪存访问频率寄存器(FCKMHZ)的值。

- 转速由低变高时: 修改FCKMHZ。通过读取FCKMHZ确认更改后,更改频率。
- 速度由高变低时: 改变频率。频率改变后,修改FCKMHZ。

## 44.5 闪存缓存

### 44.5.1 闪存缓存的特点

The FCACHE (Flash Cache) speeds up read access from bus master to the flash memory. The FCACHE includes:

- FCACHE1, for CPU instruction fetches
- FCACHE2, for CPU operand access
- FLPF, for the prefetch access in CPU instruction fetches

**Table 44.6 Flash Cache 1 (FCACHE1) overview**

|                     |  |
|---------------------|--|
| Cache Target Region | 0x0000_0000 - 0x007F_FFFF  |
| Target Bus Master   | CPU instruction Fetch  |
| Capacity            | 256 Bytes  |
| Associativity       | 8WAY set associative<br>128 bits/entry (128 bit aligned data), 2 entries/way |
| Access Cycle        | Cache Hit : 0 wait<br>Cache Miss : wait number of Flash Wait Cycle Register  |

**Table 44.7 Flash Cache 2 (FCACHE2) overview**

|                     |   |
|---------------------|---|
| Cache Target Region | 0x0000_0000 - 0x007F_FFFF   |
| Target Bus Master   | CPU Operand Access  |
| Capacity            | 16 Bytes  |
| Associativity       | Full Associative<br>128 bits/entry (128 bit aligned data), 1 entry          |
| Access Cycle        | Cache Hit : 0 wait<br>Cache Miss : wait number of Flash Wait Cycle Register |

**Table 44.8 Prefetch Buffer (FLPF) overview**

|                     |   |
|---------------------|---|
| Cache Target Region | 0x0000_0000 - 0x007F_FFFF   |
| Capacity            | 32 Bytes  |
| Associativity       | Full Associative<br>128 bits/entry (128 bit aligned data), 2 entries        |
| Request Address     | Next address of previous CPU Instruction                                    |
| Access Cycle        | Cache Hit : 0 wait<br>Cache Miss : wait number of Flash Wait Cycle Register |

FCACHE(FlashCache)加快了从总线主机到闪存的读取访问。FCACHE包括:

- FCACHE1, 用于CPU取指
- FCACHE2, 用于CPU操作数访问
- FLPF, 用于CPU取指中的预取访问

**Table 44.6 闪存1(FCACHE1)概述**

| Boot program at a reset         | User area program  | Embedded program for serial programming  | Depends on debug command   |

## 44.7 Overview of Functions

By using a dedicated flash-memory programmer to program the flash memory through a serial interface (serial programming) or JTAG/SWD interface (on-chip debug mode), the device can be rewritten regardless of whether this is before or after it is mounted on the target system.

Furthermore, security functions to prohibit rewriting or reading of the user program written to the flash memory are incorporated, and this can prevent falsification and illicit reading of the programs by third parties.

Programming by the user program (self-programming) is available to suit applications where the application on the target system may require updating after manufacturing or shipment. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as processing for external communications, etc., and this is the case in various situations. Table 44.10 lists the overview of the methods of programming and the corresponding operating modes.

Table 44.10 Programming methods

| Programming method      | Functional overview  | Operating mode          |
|-------------------------|--|-------------------------|
| Serial programming      | <p>A dedicated flash-memory programmer through the SCI or USBFS interface enables on-board programming of the flash memory after the device is mounted on the target system.</p> <p>A dedicated flash-memory programmer through the SCI or USBFS interface and a dedicated programming adapter board allow off-board programming of the flash memory, for example, programming of the device before it is mounted on the target system.</p>  | Serial programming mode |
| Self-programming        | <p>A user program written to memory in advance of serial programming execution can also program the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data from the code flash memory while the data flash memory is programmed. As a result, a program resident in the code flash memory is able to program the data flash memory.</p> <p>For background operations that are not possible, instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being programmed by self-programming. In such cases, a program for programming from the internal SRAM or external memory must be transferred in advance and executed.</p> | Normal operating mode   |
| JTAG or SWD programming | <p>A dedicated flash-memory programmer or an on-chip debugger through JTAG or SWD enables on-board programming of the flash memory after the device is mounted on the target system.</p> <p>A dedicated flash-memory programmer or an on-chip debugger through JTAG or SWD and a dedicated programming adapter board allow off-board programming of the flash memory, for example, programming of the device before it is mounted on the target system.</p>  | On-chip debug mode      |

Table 44.11 lists the functions of the flash memory. Serial programmer commands realize each function of serial programming, while reading of the flash memory by an FACI command or the user program realizes each function of self-programming.

允许编程和擦除的闪存区域和复位后的引导程序根据每种模式而不同。模式之间的差异在表44.9中列出。

Table 44.9 模式之间的差异

| Parameter | 正常运行模式   | 串行编程模式 (SCI或USB启动模式)   | 片上调试模式 (JTAG或SWD引导模式)  |
|-----------|--|--|--|
| 可编程和可擦除区域 | <ul style="list-style-type: none"> <li>代码闪存</li> <li>数据闪存</li> <li>选项设置内存 (仅编程)</li> </ul> | <ul style="list-style-type: none"> <li>代码闪存</li> <li>数据闪存</li> <li>Option-setting memory (programming only)</li> </ul> | <ul style="list-style-type: none"> <li>代码闪存</li> <li>数据闪存</li> <li>选项设置内存 (仅编程)</li> </ul> |

## 44.7 功能概述

通过使用专用闪存编程器通过串行接口 (串行编程) 或JTAG/SWD接口 (片上调试模式) 对闪存进行编程, 无论是在安装之前还是之后, 都可以重写设备目标系统。

此外, 内置了禁止重写或读取写入闪存的用户程序的安全功能, 这可以防止第三方篡改和非法读取程序。

用户程序编程 (自编程) 适用于目标系统上的应用程序在制造或发货后可能需要更新的应用程序。还集成了用于安全重写闪存的保护功能。此外, 支持自编程期间的中断处理, 因此可以与外部通信处理等同时进行编程, 这在各种情况下都是如此。表44.10列出了编程方法和相应操作模式的概述。

Table 44.10 编程方法

| 编程方法             | 功能概览   | 操作模式   |
|------------------|--|--------|
| 串行编程             | <p>通过SCI或USBFS接口的专用闪存编程器可在器件安装到目标系统后对闪存进行板载编程。</p> <p>通过SCI或USBFS接口的专用闪存编程器和专用编程适配器板允许对闪存进行板外编程, 例如, 在将设备安装到目标系统之前对其进行编程。</p>  | 串行编程模式 |
| Self-programming | <p>在串行编程执行之前写入存储器的用户程序也可以对闪存进行编程。后台操作能力使得在对数据闪存进行编程时, 可以从代码闪存中获取指令或以其他方式读取数据。结果, 驻留在代码闪存中的程序能够对数据闪存进行编程。对于无法进行的后台操作, 在自编程对代码闪存进行编程时, 无法获取代码闪存中的指令并且无法访问数据。在这种情况下, 必须预先传输并执行从内部SRAM或外部存储器进行编程的程序。</p> | 正常运行模式 |
| JTAG或SWD编程       | <p>专用闪存编程器或通过JTAG或SWD的片上调试器可在器件安装到目标系统后对闪存进行板载编程。专用闪存编程器或片上调试器通过</p> <p>JTAG或SWD和专用编程适配器板允许对闪存进行板外编程, 例如, 在将器件安装到目标系统之前对其进行编程。</p>   | 片上调试模式 |

表44.11列出了闪存的功能。串行编程器命令实现串行编程的各个功能, 而通过FACI命令或用户程序读取闪存实现自编程的各个功能。

Table 44.11 Basic Functions

| Function                              | Functional overview   | Availability       |   |
|---------------------------------------|---|--------------------|---|
|                                       |   | Serial programming | Self-programming  |
| Blank check                           | Checks a specified block to ensure that writing to it has not already proceeded. Results of reading from data flash memory to which nothing is written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure. | Not supported      | Supported (data flash programming only)                           |
| Block erasure                         | Erases the memory contents in the specified block   | Supported          | Supported   |
| Programming                           | Writes to the specified address   | Supported          | Supported   |
| CRC                                   | Calculates the CRC in the specified range of the flash memory and transfers it to the flash programmer  | Supported          | Non supported   |
| Read                                  | Reads data programmed in the flash memory   | Supported          | Not supported (read by user program is possible)                  |
| Start-up program protection functions | Configures the start-up program protection functions  | Supported          | Supported   |
| Option function selection             | Selects the option function, and modifies the initial setting of this MCU   | Supported          | Supported   |
| Block swap function                   | Setting block swap functions  | Supported          | Supported   |
| Block protection                      | Setting block protection  | Supported          | Supported   |
| Device lifecycle transition           | Transitions the device lifecycle  | Supported          | Not supported   |
| Memory security attribution           | Setting the memory security attribution   | Supported          | Not supported   |
| Key                                   | Injects key   | Supported          | Supported (except the key related to device lifecycle transition) |
| All erasure                           | Erase the flash memory to the state after shipment  | Supported          | Not supported   |

The flash memory supports various security functions.

Table 44.12 lists the security functions supported by the flash memory.

Table 44.12 Lists of Security Functions

| Function                               | Description  |
|--|--|
| Security flag for Start-up area select | Start-up area selection can be protected by setting of security flag (FSPR).   |
| Permanently block protection           | Programming or erasure of each block of code flash memory can be protected permanently.  |
| Protection for TrustZone               | Programming or erasure area, readable area, register access, and FACI command operation are protected by ARM TrustZone security. |
| Programming or erasure mode protection | Only secure developer can enter the programming or erasure mode for code flash.  |

## 44.8 Operating Modes of the Flash Sequencer

The flash sequencer has three operating modes as shown in Figure 44.6. Transitions between modes are initiated by changing the value of the FENTRYR register.

When the value of the FENTRYR register is 0x0000, the flash sequencer is in read mode. In this mode, it does not receive FACI commands. The code flash memory and data flash memory are both readable.

When the value of the FENTRYR register is 0x0001, the flash sequencer is in code flash P/E mode where the code flash memory can be programmed or erased by FACI commands. In this mode, the data flash memory is readable.

When the value of the FENTRYR register is 0x0080, the flash sequencer is in data flash P/E mode where the data flash memory can be programmed or erased by FACI commands. In this mode, the data flash memory is not readable. However, the code flash memory is readable.

Table 44.11 基本功能

| Function    | 功能概述  | Availability |                      |
|-------------|---|--------------|----------------------|
|             |   | 串行编程         | 自编程                  |
| 空白支票        | 检查指定的块以确保尚未对其进行写入。无法保证从擦除后没有写入任何内容的数据闪存中读取的结果，因此使用空白检查来确认擦除后没有继续写入内存。 | 不支持          | 支持（仅数据闪存编程）          |
| 块擦除         | 擦除指定块中的内存内容   | Supported    | Supported            |
| Programming | 写入指定地址  | Supported    | Supported            |
| CRC         | 计算flash存储器指定范围内的CRC，并传送给flash编程器                                      | Supported    | 不支持                  |
| Read        | 读取闪存中编程的数据  | Supported    | 不支持（可由用户程序读取）        |
| 启动程序保护功能    | 配置启动程序保护功能  | Supported    | Supported            |
| 选项功能选择      | 选择选项功能，修改本MCU的初始设置  | Supported    | Supported            |
| 区块交换功能      | 设置块交换功能   | Supported    | Supported            |
| 块保护         | 设置块保护   | Supported    | Supported            |
| 设备生命周期过渡    | 过渡设备生命周期  | Supported    | 不支持                  |
| 内存安全归属      | 设置内存安全属性  | Supported    | 不支持                  |
| Key         | 注入密钥  | Supported    | 支持（设备生命周期转换相关的key除外） |
| 全部擦除        | 擦除闪存到出货后的状态   | Supported    | 不支持                  |

闪存支持各种安全功能。

表44.12列出了闪存支持的安全功能。

Table 44.12 安全功能列表

| Function    | Description                                   |
|-------------|---|
| 启动区域选择的安全标志 | 启动区域选择可以通过设置安全标志(FSPR)来保护。                    |
| 永久阻止保护      | 可以永久保护每个代码闪存块的编程或擦除。                          |
| 保护TrustZone | 编程或擦除区域、可读区域、寄存器访问和FACI命令操作受ARMTrustZone安全保护。 |
| 编程或擦除模式保护   | 只有安全的开发人员才能进入代码闪存的编程或擦除模式。                    |

## 44.8 FlashSequencer的操作模式

闪存定序器具有三种操作模式，如图44.6所示。通过更改FENTRYR寄存器的值来启动模式之间的转换。

当FENTRYR寄存器的值为0x0000时，闪存定序器处于读取模式。在这种模式下，它不接收FACI命令。代码闪存和数据闪存都是可读的。

当FENTRYR寄存器的值为0x0001时，闪存定序器处于代码闪存PE模式，代码闪存可以通过FACI命令进行编程或擦除。在这种模式下，数据闪存是可读的。

当FENTRYR寄存器的值为0x0080时，闪存定序器处于数据闪存PE模式，可以通过FACI命令对数据闪存进行编程或擦除。在这种模式下，数据闪存是不可读的。但是，代码闪存是可读的。

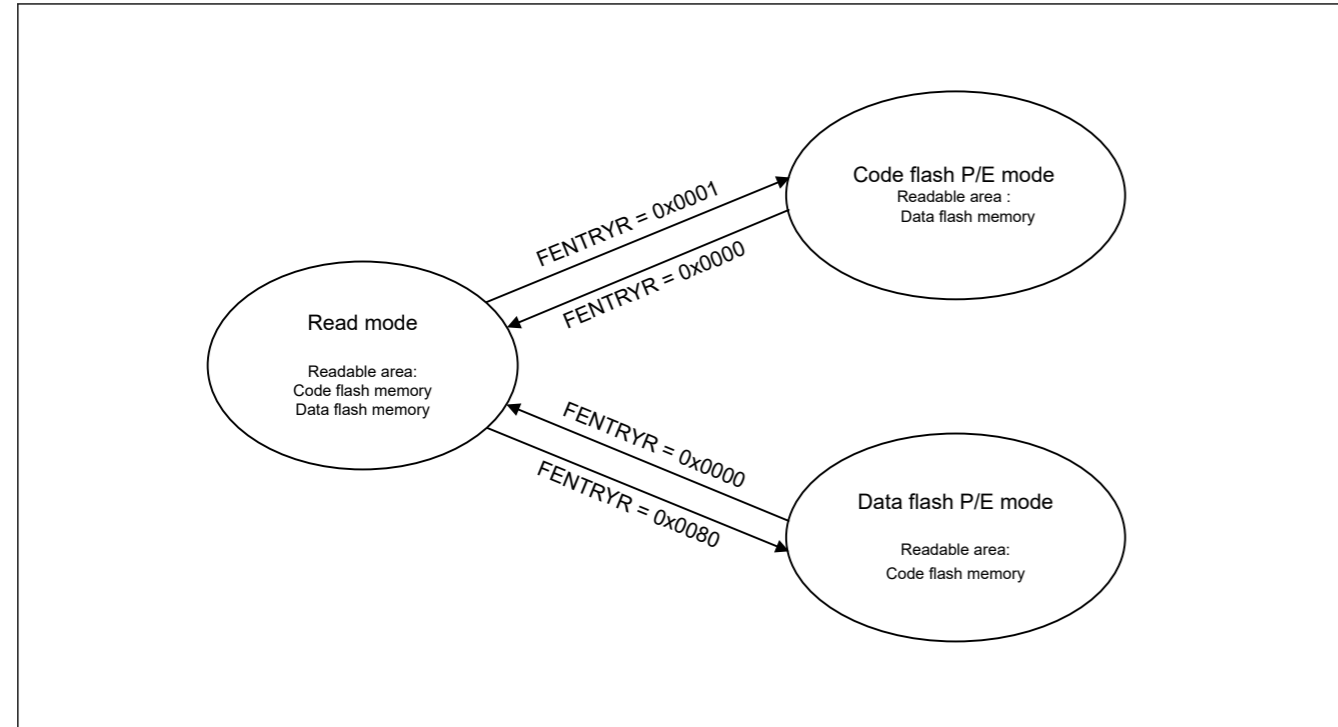

Figure 44.6 Modes of the flash sequencer

## 44.9 FACI Commands

### 44.9.1 List of FACI Commands

The FACI controls the FCU according to the specified FACI commands.

This section describes information about the FACI commands and Table 44.13 lists the FACI commands.

Table 44.13 FACI commands

| FACI command      | Function   |
|-------------------|--|
| Program           | Programs the user area and data area. Units of programming are 128 bytes for the user area and 4, 8, or 16 bytes for the data area.  |
| Block erase       | Erases user area and data area. The erase unit is 8 KB or 32 KB for user area, and 64 bytes for data flash.  |
| Multi block erase | Erases data area. The erase unit is 64, 128, 256 bytes for data flash.   |
| P/E suspend       | Suspends programming or erasure processing.  |
| P/E resume        | Resumes suspended programming or erasure processing.   |
| Status clear      | Initializes the ILGLERR, ERSERR, PRGERR, ILGCOMERR, FESETERR, SECERR, and OTERR bits in the FSTATR register and the CMDLK, CFAE, and DFAE bits in the FASTAT register, and the flash sequencer released from command-locked state. |
| Forced stop       | Forcibly stops processing of FACI commands and initializes the FSTATR and FASTAT registers.  |
| Blank check       | Checks if data areas are blank. Units of Blank Check: 4 bytes to data flash memory capacity (specified in 4-byte units).   |
| Configuration set | Sets the option-setting memory. Units of setting: 16 bytes.  |

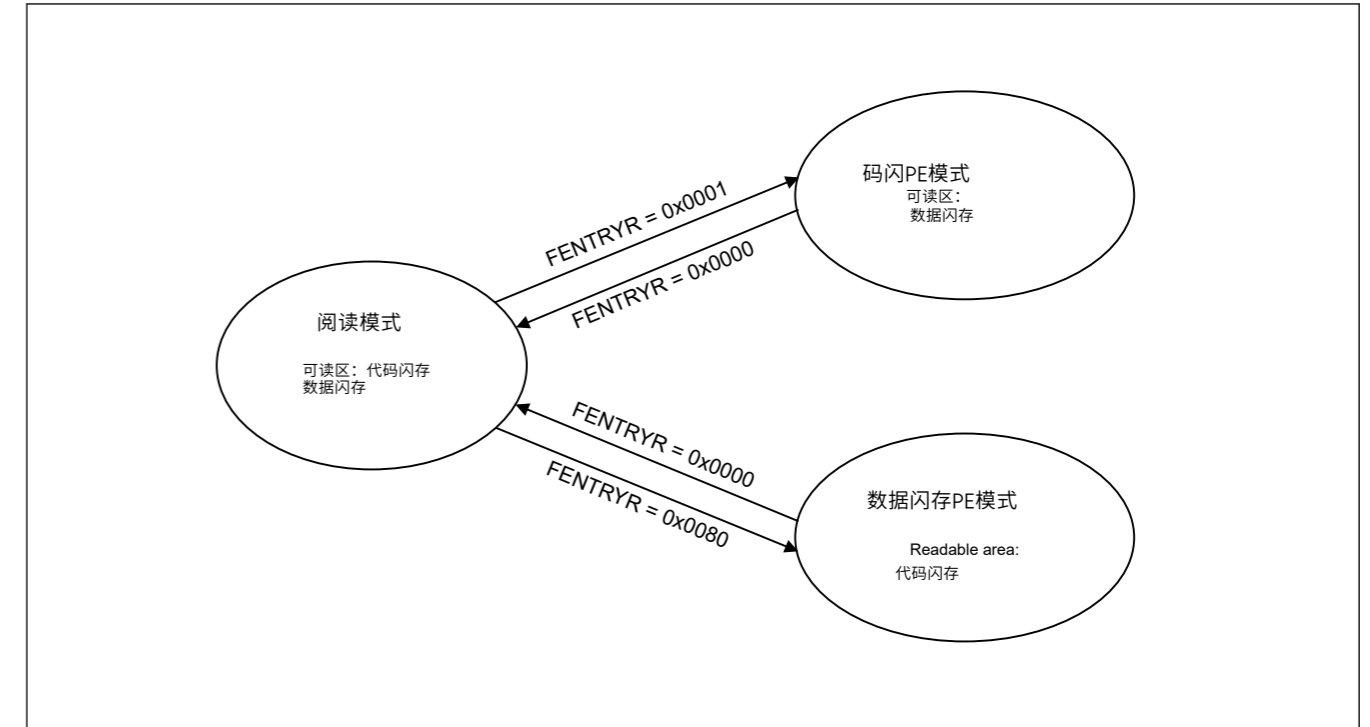

Figure 44.6 闪存音序器的模式

## 44.9 FACI命令

### 44.9.1 FACI命令列表

FACI根据指定的FACI命令控制FCU。

本节介绍有关FACI命令的信息，表44.13列出了FACI命令。

Table 44.13 FACI命令

| FACI命令      | Function   |
|-------------|--|
| Program     | 对用户区和数据区进行编程。用户区的编程单元为128字节，数据区为4、8或16字节。  |
| 块擦除         | 擦除用户区和数据区。用户区的擦除单元为8KB或32KB，数据闪存为64字节。   |
| 多块擦除        | 擦除数据区。数据闪存的擦除单元为64、128、256字节。  |
| P/E suspend | 暂停编程或擦除处理。   |
| P/E resume  | 恢复暂停的编程或擦除处理。  |
| 状态清除        | Initializes the ILGLERR, ERSERR, PRGERR, ILGCOMERR, FSTATR寄存器中的FESETERR、SECERR和OTERR位以及FASTAT寄存器中的CMDLK、CFAE和DFAE位，并且闪存定序器从命令锁定状态释放。 |
| 强制停止        | 强制停止处理FACI命令并初始化FSTATR和FASTAT寄存器。  |
| 空白支票        | 检查数据区域是否为空白。空白检查单位：4字节到数据闪存容量（以4字节为单位指定）。  |
| 配置集         | 设置选项设置内存。设置单位：16字节。  |

The FACI commands are issued by writing to the FACI command-issuing area (see Table 44.3). When write access as shown in Table 44.14 proceeds in the specified state, the flash sequencer executes the processing associated with the given command (see section 44.9.2. Relationship between the Flash Sequencer State and FACI Commands).

Table 44.14 FACI command formats

| FACI commands   | Number of write access | Write data to the FACI command-issuing area |                                     |                       |                |
|---|------------------------|---|-------------------------------------|-----------------------|----------------|
|   |                        | 1st access                                  | 2nd access                          | 3rd to (N+2)th access | (N+3)th access |
| Program (user area)<br>N = 64   | 67                     | 0xE8  | 0x40 (=N)                           | WD1 to WD64           | 0xD0           |
| Program (data area)<br>4-byte programming: N = 2<br>8-byte programming: N = 4<br>16-byte programming: N = 8 | N+3                    | 0xE8  | 0x02 (=N)<br>0x04 (=N)<br>0x08 (=N) | WD1 to WDN            | 0xD0           |
| Block Erase<br>(user area 8K/32K Bytes)   | 2                      | 0x20  | 0xD0                                | —                     | —              |
| Block Erase<br>(data area 64 bytes)   | 2                      | 0x20  | 0xD0                                | —                     | —              |
| Multi block erase<br>(data area 64/128/256 bytes)   | 2                      | 0x21  | 0xD0                                | —                     | —              |
| P/E suspend   | 1                      | 0xB0  | —                                   | —                     | —              |
| P/E resume  | 1                      | 0xD0  | —                                   | —                     | —              |
| Status Clear  | 1                      | 0x50  | —                                   | —                     | —              |
| Forced Stop   | 1                      | 0xB3  | —                                   | —                     | —              |
| Blank Check   | 2                      | 0x71  | 0xD0                                | —                     | —              |
| Configuration set<br>N = 8  | 11                     | 0x40  | 0x08 (=N)                           | WD1 to WD8            | 0xD0           |

Note: WDN (N = 1, 2, ...): Nth 16-bit data to be programmed.

The flash sequencer clears the FSTATR.FRDY bit to 0 at the start of a command processing other than the Status Clear command, and sets this bit to 1 on completion.

If the FRDYIE.FRDYIE bit setting is 1, a flash ready (FRDY) interrupt is generated when the FSTATR.FRDY bit is set to 1.

#### 44.9.2 Relationship between the Flash Sequencer State and FACI Commands

The FACI commands are accepted according to the mode/state of the flash sequencer. FACI commands should be issued after transitioning of the flash sequencer to the code flash P/E mode or data flash P/E mode and after checking the state of the flash sequencer.

Use the FSTATR and FASTAT registers to check the state of the flash sequencer. In addition, the occurrence of errors in general can be checked by reading the CMDLK bit in the FASTAT register. The value of the CMDLK bit is the logical OR of the following bits in the FSTATR register:

- ILGLERR
- ILGCOMERR
- FESETERR
- SECERR
- OTERR
- ERSERR
- PRGERR
- FLWEERR.

Table 44.15 lists the available FACI commands in each operating mode.

FACI命令通过写入FACI命令发布区域来发布（参见表44.3）。当表44.14所示的写访问在指定状态下进行时，闪存定序器执行与给定命令相关的处理（请参阅第44.9.2节。闪存定序器状态和FACI命令之间的关系）。

Table 44.14 FACI命令格式

| FACI命令  | 写访问次数 | 将数据写入FACI命令发布区 |                                     |               |                |
|---|-------|----------------|-------------------------------------|---------------|----------------|
|   |       | 1st access     | 2nd access                          | 第3次到第(N+2)次访问 | (N+3)th access |
| Program (user area)<br>N = 64   | 67    | 0xE8           | 0x40 (=N)                           | WD1 to WD64   | 0xD0           |
| Program (data area)<br>4-byte programming: N = 2<br>8-byte programming: N = 4<br>16-byte programming: N = 8 | N+3   | 0xE8           | 0x02 (=N)<br>0x04 (=N)<br>0x08 (=N) | WD1 to WDN    | 0xD0           |
| 块擦除（用户区8K/32K字节）  | 2     | 0x20           | 0xD0                                | —             | —              |
| 块擦除（数据区64字节）  | 2     | 0x20           | 0xD0                                | —             | —              |
| 多块擦除（数据区64/128/256字节）   | 2     | 0x21           | 0xD0                                | —             | —              |
| P/E suspend   | 1     | 0xB0           | —                                   | —             | —              |
| P/E resume  | 1     | 0xD0           | —                                   | —             | —              |
| 状态清除  | 1     | 0x50           | —                                   | —             | —              |
| 强制停止  | 1     | 0xB3           | —                                   | —             | —              |
| 空白支票  | 2     | 0x71           | 0xD0                                | —             | —              |
| 配置集<br>N = 8  | 11    | 0x40           | 0x08 (=N)                           | WD1 to WD8    | 0xD0           |

Note: WDN(N=1 2...): 要编程的第N个16位数据。

闪存定序器在除状态清除命令之外的命令处理开始时将FSTATR.FRDY位清除为0，并在完成时将此位设置为1。

如果FRDYIE.FRDYIE位设置为1，则当FSTATR.FRDY位设置为1时会产生闪存就绪(FRDY)中断。

#### 44.9.2 FlashSequencerState和FACI命令之间的关系

根据闪存定序器的模式状态接受FACI命令。FACI命令应在闪存定序器转换到代码闪存PE模式或数据闪存PE模式并检查闪存定序器的状态之后发出。

使用FSTATR和FASTAT寄存器检查闪存定序器的状态。此外，一般可以通过读取FASTAT寄存器中的CMDLK位来检查错误的发生。CMDLK位的值是FSTATR寄存器中以下位的逻辑或：

- ILGLERR
- ILGCOMERR
- FESETERR
- SECERR
- OTERR
- ERSERR
- PRGERR
- FLWEERR.

表44.15列出了每种操作模式下可用的FACI命令。

Table 44.15 Operating mode and available FACL commands

| Operating mode      | FENTRYR | Available FACL commands  |
|---------------------|---------|--|
| Read mode           | 0x0000  | None   |
| Code flash P/E mode | 0x0001  | Program<br>Block erase<br>P/E suspend<br>P/E resume<br>Status Clear<br>Forced Stop<br>Configuration set                |
| Data flash P/E mode | 0x0080  | Program<br>Block erase<br>Multi block erase<br>P/E suspend<br>P/E resume<br>Status Clear<br>Forced Stop<br>Blank Check |

Table 44.16 shows the state of the flash sequencer and acceptable FACL commands. An appropriate mode is assumed to have been set before the commands are executed.

Table 44.16 Acceptable FACL commands and state of the flash sequencer

|                                  | Program, block erase or multi block erase command processing | Configuration set command processing | Program, block erase or multi block erase command suspension processing | Blank check command processing | Programming suspended | Erase suspended | Programming while erasure is suspended | Command-locked state (FRDY = 1) | Command-locked state (FRDY = 0) | Processing of forced stop command | Other state    |
|----------------------------------|--|--------------------------------------|---|--------------------------------|-----------------------|-----------------|--|---------------------------------|---------------------------------|-----------------------------------|----------------|
| FRDY bit                         | 0  | 0                                    | 0   | 0                              | 1                     | 1               | 0                                      | 1                               | 0                               | 0                                 | 1              |

Note: O: Acceptable

X: Not acceptable (places the sequencer in the command-locked state)  
 —: Ignored

- Note 1. Only acceptable in data flash P/E mode.
- Note 2. Only acceptable in code flash P/E mode
- Note 3. Acceptable when programming area is other than erase suspending block.
- Note 4. When configuration set is processing and when FSTATR.DBFULL bit is 1, do not issue this command.

### 44.9.3 Usage of FACI Commands

#### 44.9.3.1 Overview of Command Usage in Code Flash P/E Mode

Figure 44.7 show an overview of FACI command usage in code flash P/E mode. For the available commands in code flash P/E mode, see Table 44.15.

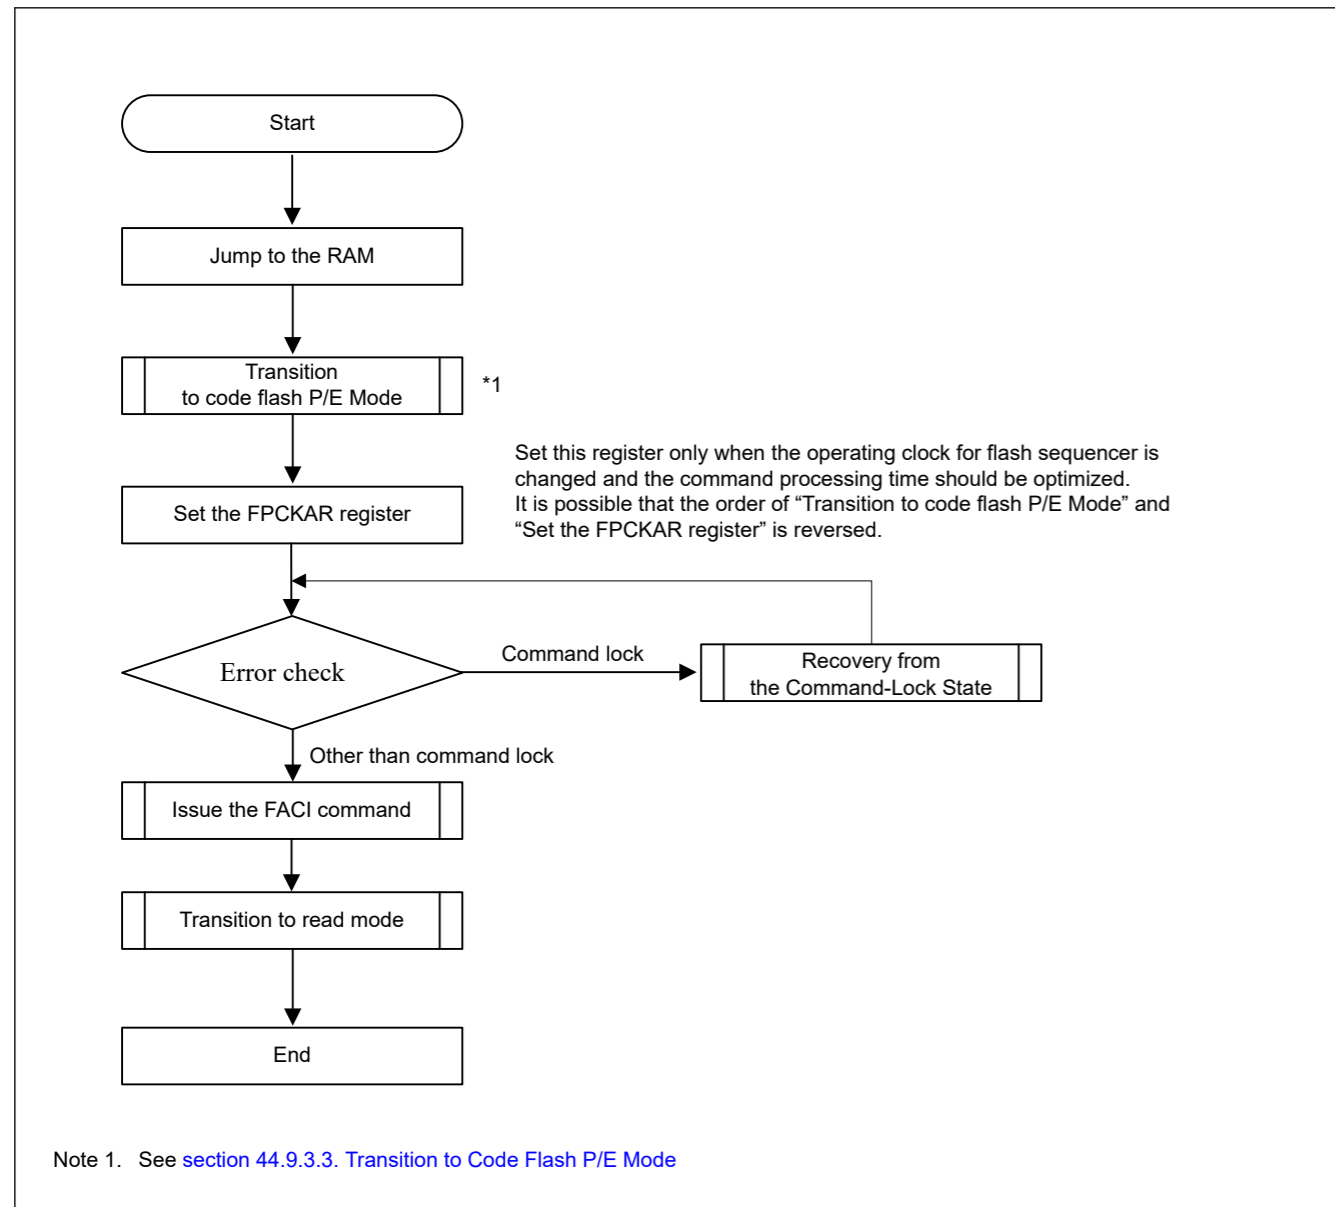

Figure 44.7 Overview of command usage in code flash P/E mode

#### 44.9.3.2 Overview of Command Usage in Data Flash P/E Mode

Figure 44.8 shows an overview of FACI command usage in data flash P/E and Table 44.15 lists the available commands in data flash P/E mode.

X: 不可接受 (将定序器置于命令锁定状态) —: 忽略

- 注1.仅在数据闪存PE模式下可接受。注2.仅在代码闪存PE模式下可接受
- 注3.当编程区域不是擦除暂停块时可接受。
- 注4.当配置集正在处理并且FSTATR.DBFULL位为1时, 不要发出此命令。

### 44.9.3 FACI命令的使用

#### 44.9.3.1 CodeFlashPE模式中的命令使用概述

图44.7显示了代码闪存PE模式下的FACI命令使用概览。对于代码闪存中的可用命令PE模式, 见表44.15。

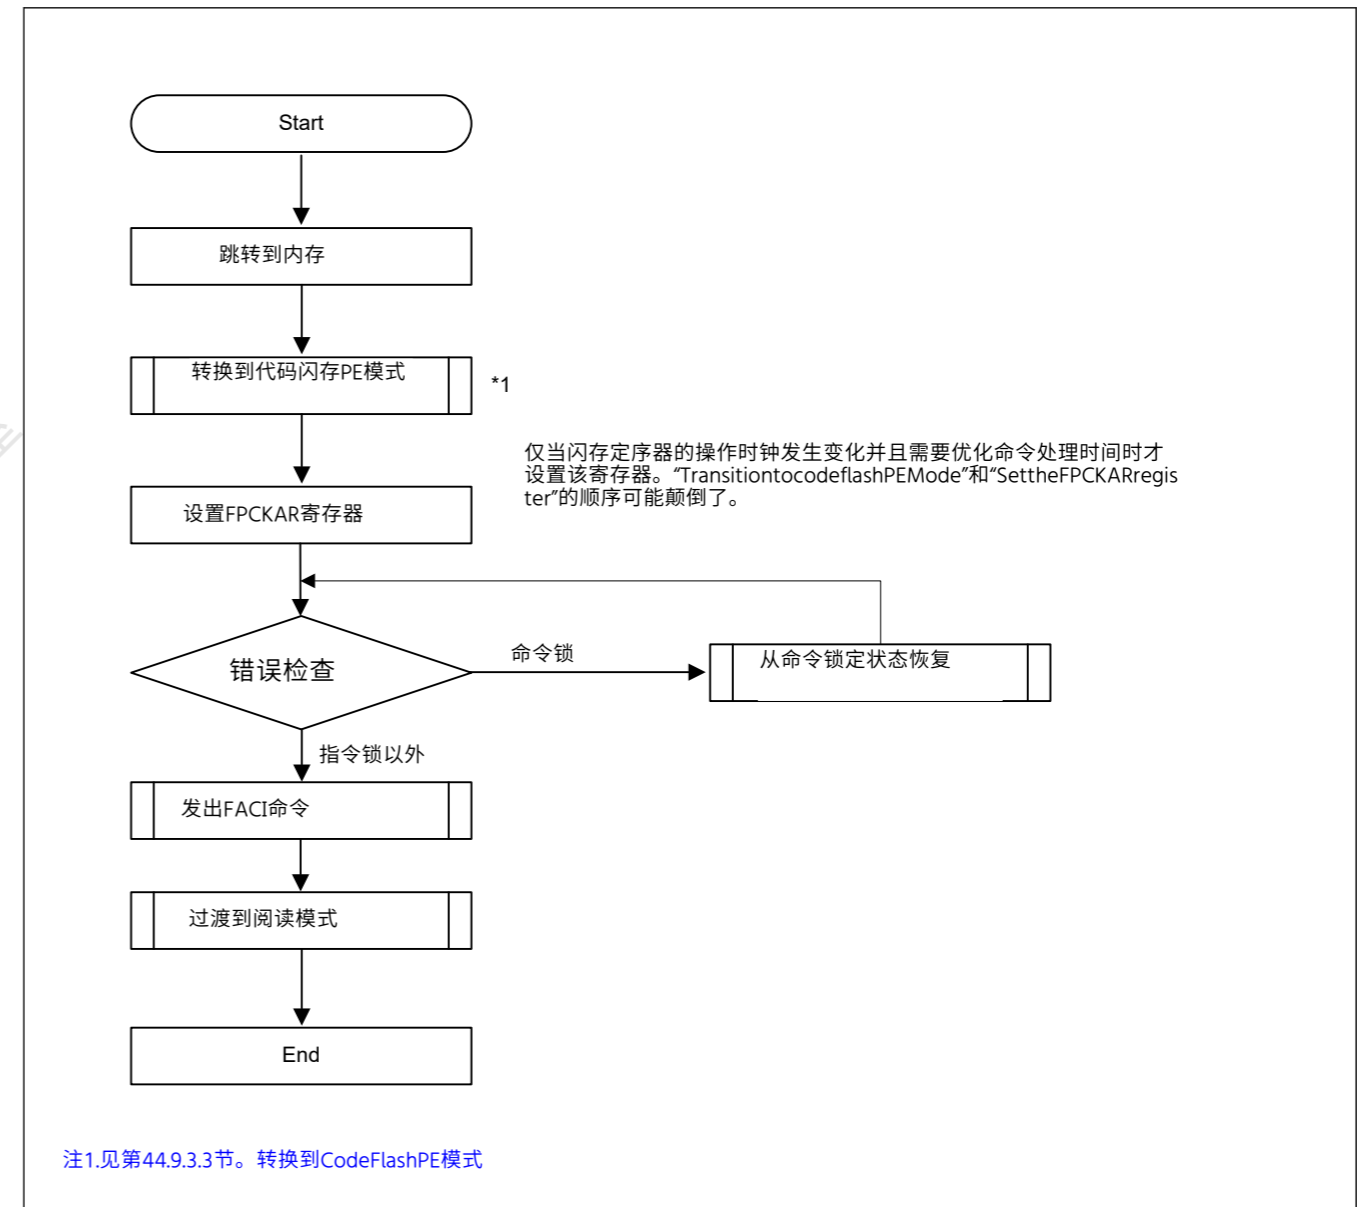

Figure 44.7 CodeflashPE模式下的命令使用概述

#### 44.9.3.2 DataFlashPE模式下的命令使用概述

图44.8显示了数据闪存PE中FACI命令使用的概述, 表44.15列出了数据闪存PE模式下的可用命令。

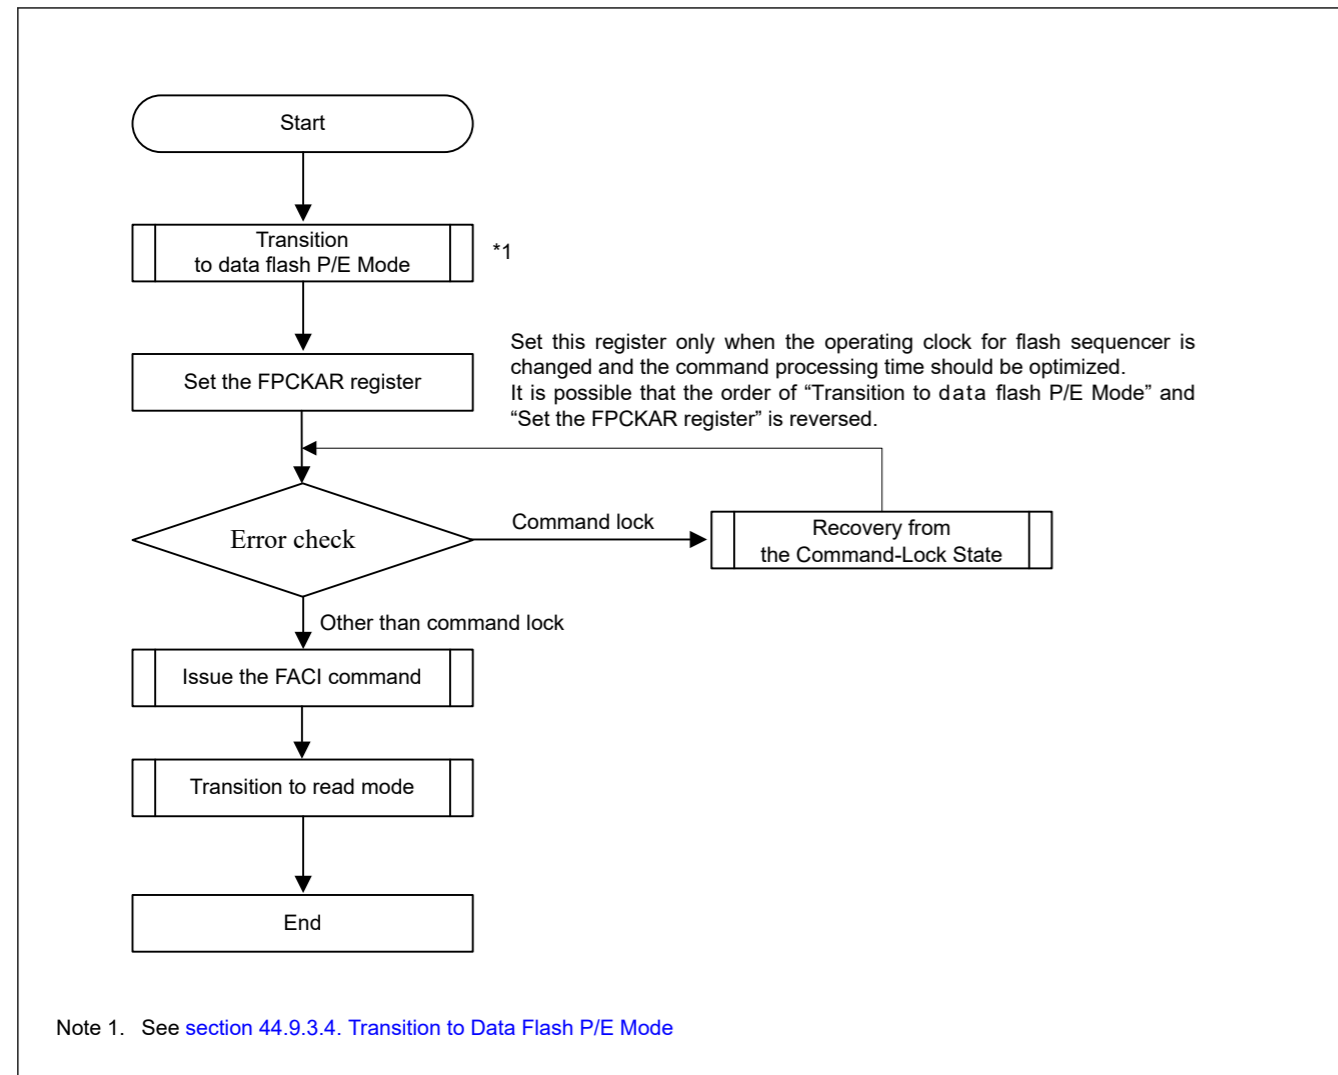

Figure 44.8 Overview of command usage in data flash P/E mode

### 44.9.3.3 Transition to Code Flash P/E Mode

To issue FACL commands for the code flash memory, a transition to code flash P/E mode is required by setting the FENTRYC bit in the FENTRYR register to 1.

Figure 44.9 shows the procedure to transition to code flash P/E mode.

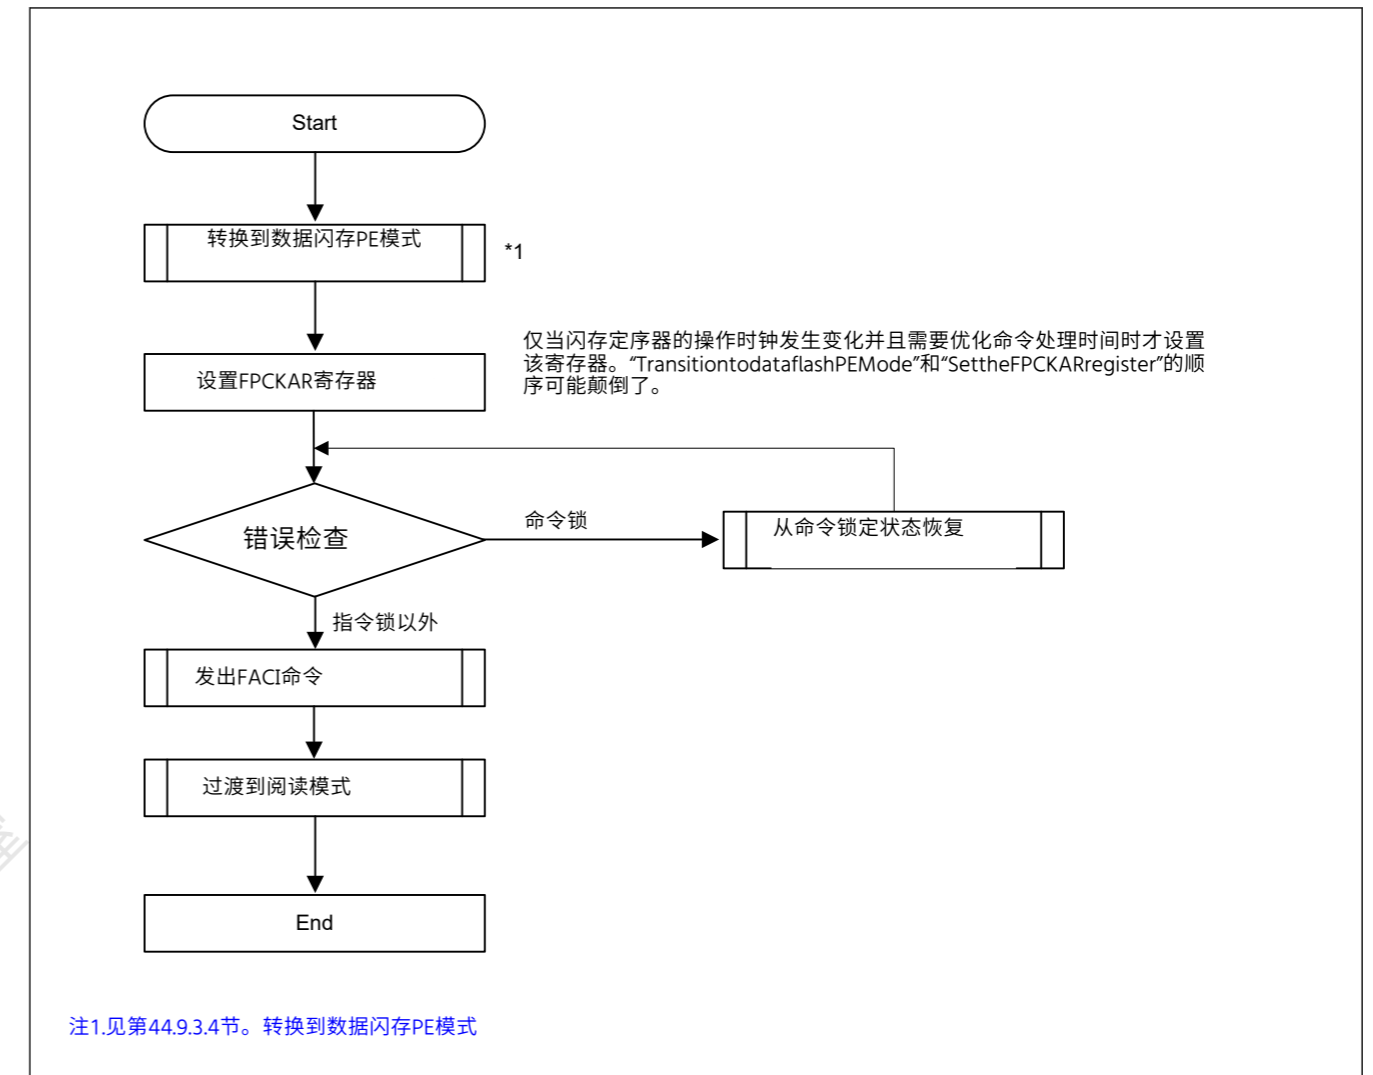

Figure 44.8 数据闪存PE模式下的命令使用概述

### 44.9.3.3 转换到CodeFlashPE模式

要为代码闪存发出FACL命令，需要通过设置FENTRYR寄存器中的FENTRYC位为1。

图44.9显示了转换到代码闪存PE模式的过程。

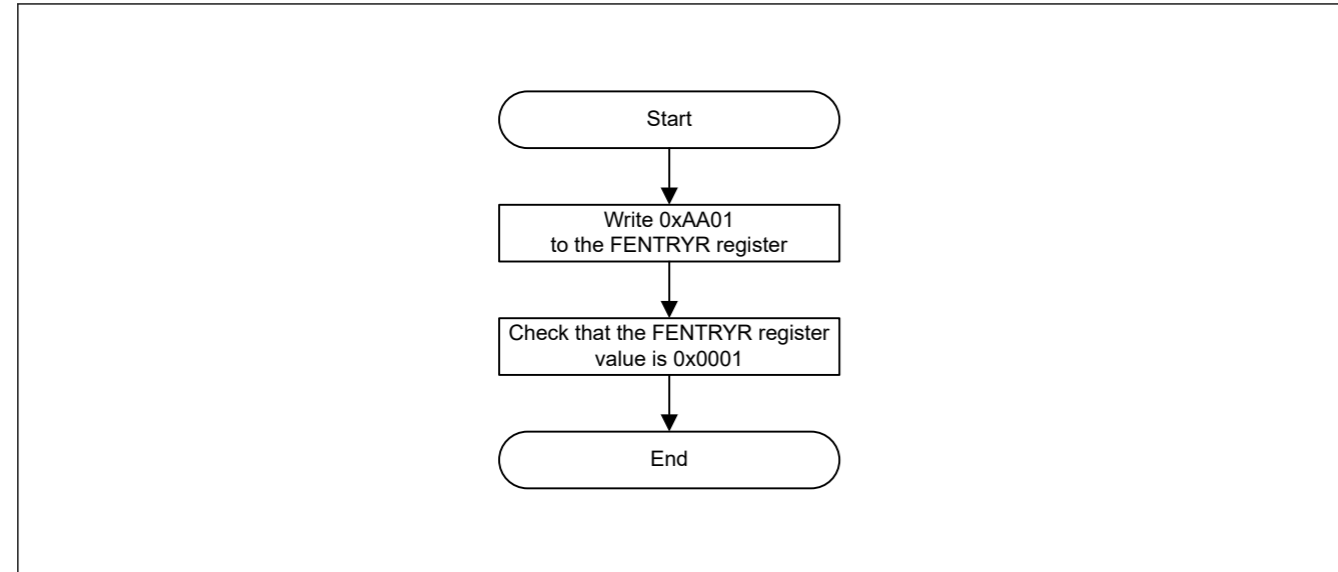

Figure 44.9 Procedure to transition to code flash P/E mode

#### 44.9.3.4 Transition to Data Flash P/E Mode

To issue FACL commands for the data flash memory, a transition to data flash P/E mode is required by setting the FENTRYD bit in the FENTRYR register to 1.

Figure 44.10 shows the procedure to transition to data flash P/E mode.

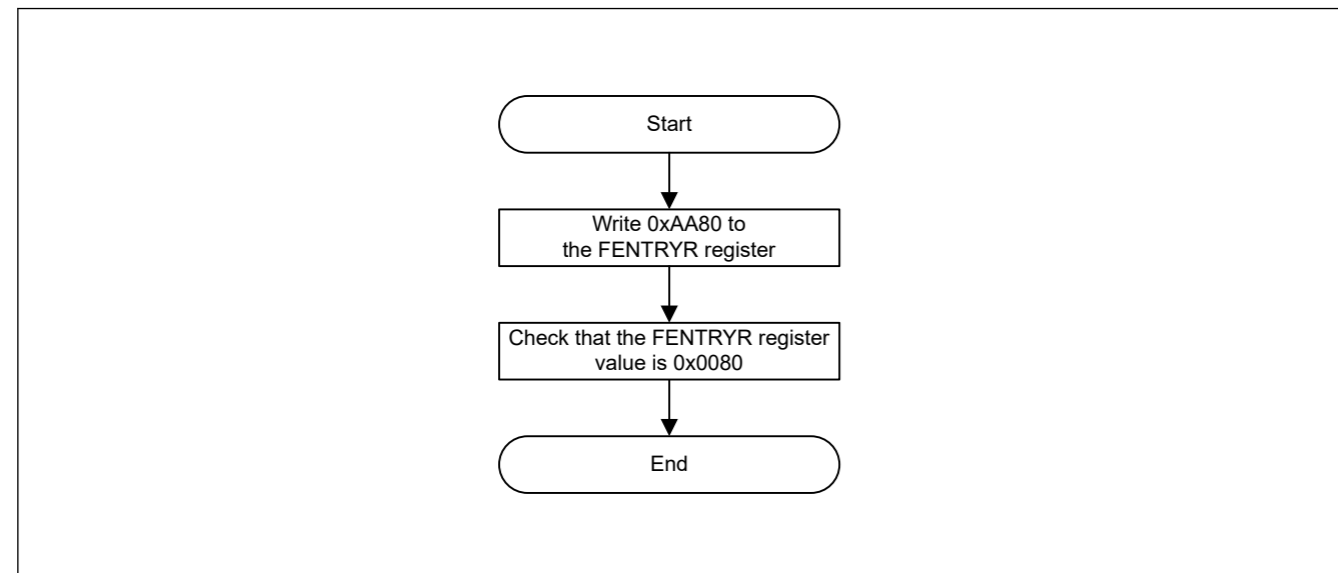

Figure 44.10 Procedure to transition to data flash P/E mode

#### 44.9.3.5 Transition to Read Mode

To read the flash memory, a transition to read mode is required by setting the FENTRYR register to 0x0000. The transition to read mode should be made after the flash sequencer completes the processing and while operation is not in the command-locked state.

Figure 44.11 shows the procedure to transition to read mode.

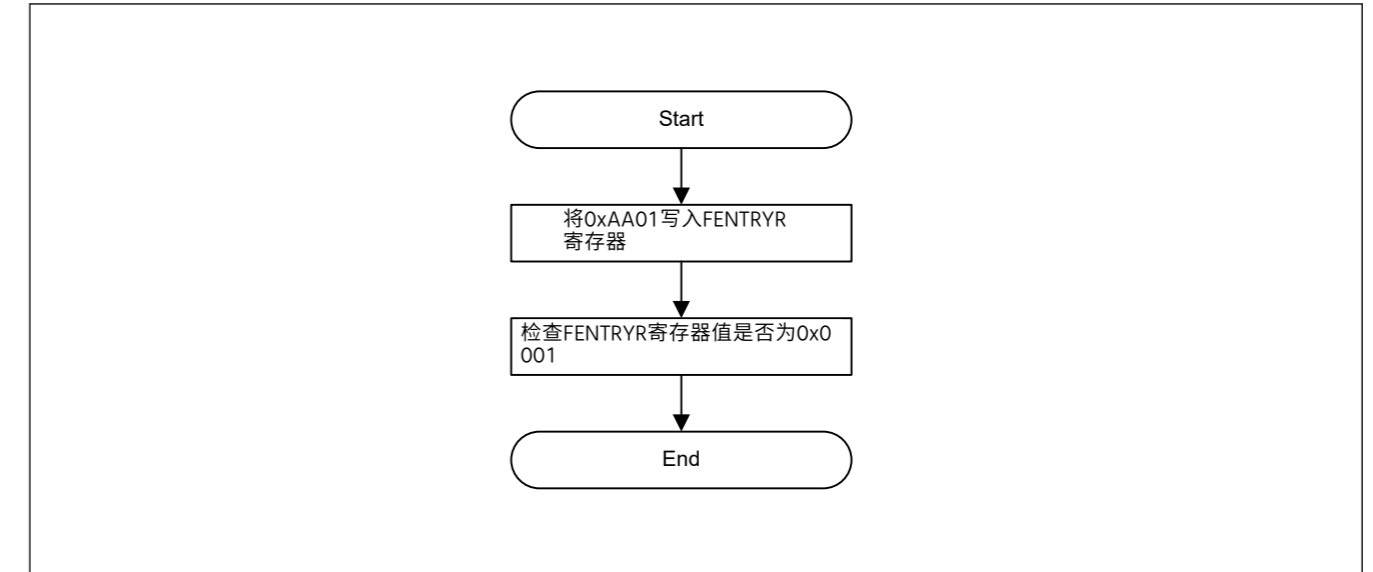

Figure 44.9 转换到代码闪存PE模式的程序

#### 44.9.3.4 转换到数据闪存PE模式

要为数据闪存发出FACL命令，需要通过设置FENTRYR寄存器中的FENTRYD位为1。

图44.10显示了转换到数据闪存PE模式的过程。

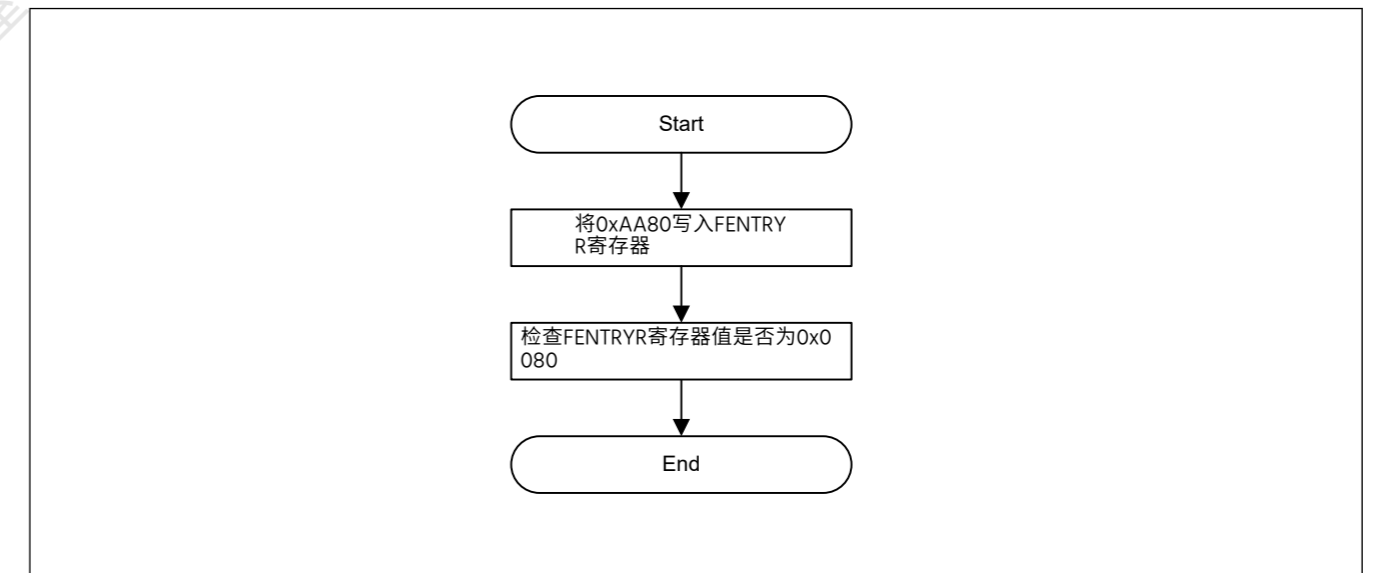

Figure 44.10 转换到数据闪存PE模式的步骤

#### 44.9.3.5 过渡到阅读模式

要读取闪存，需要通过将FENTRYR寄存器设置为0x0000转换到读取模式。闪存定序器完成处理后且操作未处于命令锁定状态时，应转换到读取模式。

图44.11显示了转换到读取模式的过程。

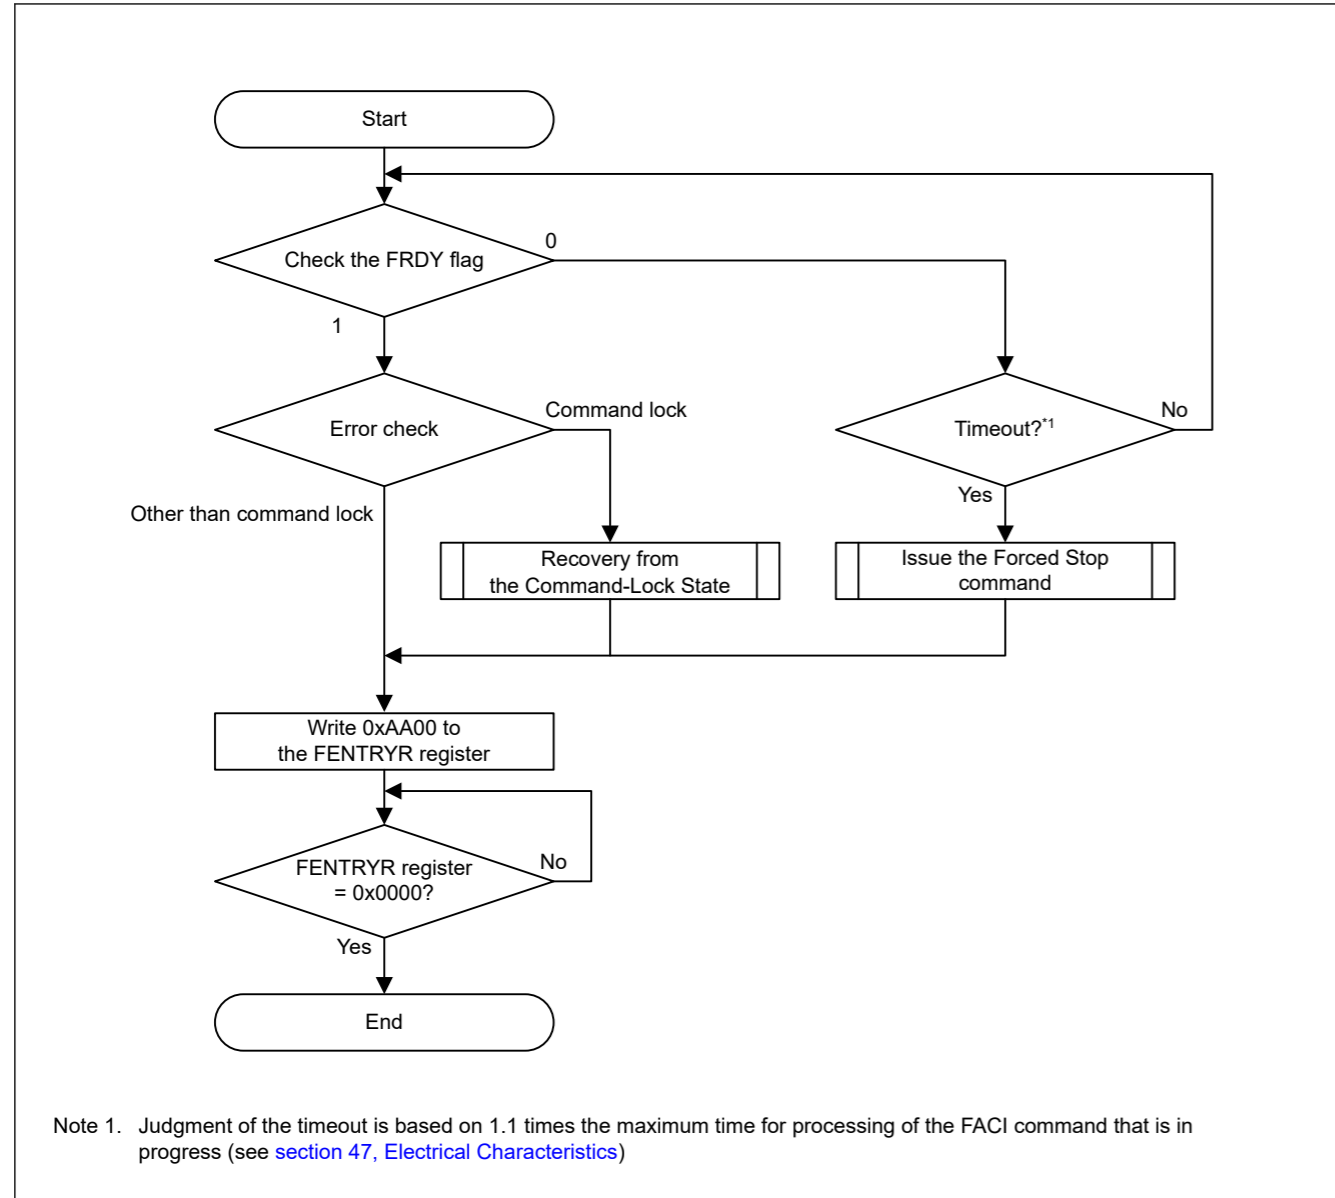

Figure 44.11 Procedure to transition to read mode

#### 44.9.3.6 Recovery from the Command-Locked State

When the flash sequencer enters the command-locked state, FACY commands cannot be accepted. To release the sequencer from the command-locked state, use the status clear command, forced stop command, or FASTAT register.

When the command-locked state is detected by checking for an error before issuing the P/E suspend command, the FRDY bit in the FSTATR register might be 0 even though command processing has not completed. If processing is not complete by the maximum programming/erasure time specified in the electrical characteristics, this is a timeout and the flash sequencer must be stopped with the forced stop command.

The FLWEERR bit in the FSTATR register does not change from 1 to 0 with the status clear command. When these bits are set to 1, use the forced stop command to release from the command-locked state. Bits other than FRDY and FLWEERR in FSTATR register that indicate the command-locked state can be changed from 1 to 0 with the status clear or forced stop command.

Figure 44.12 shows the recovery flow from the command-locked state.

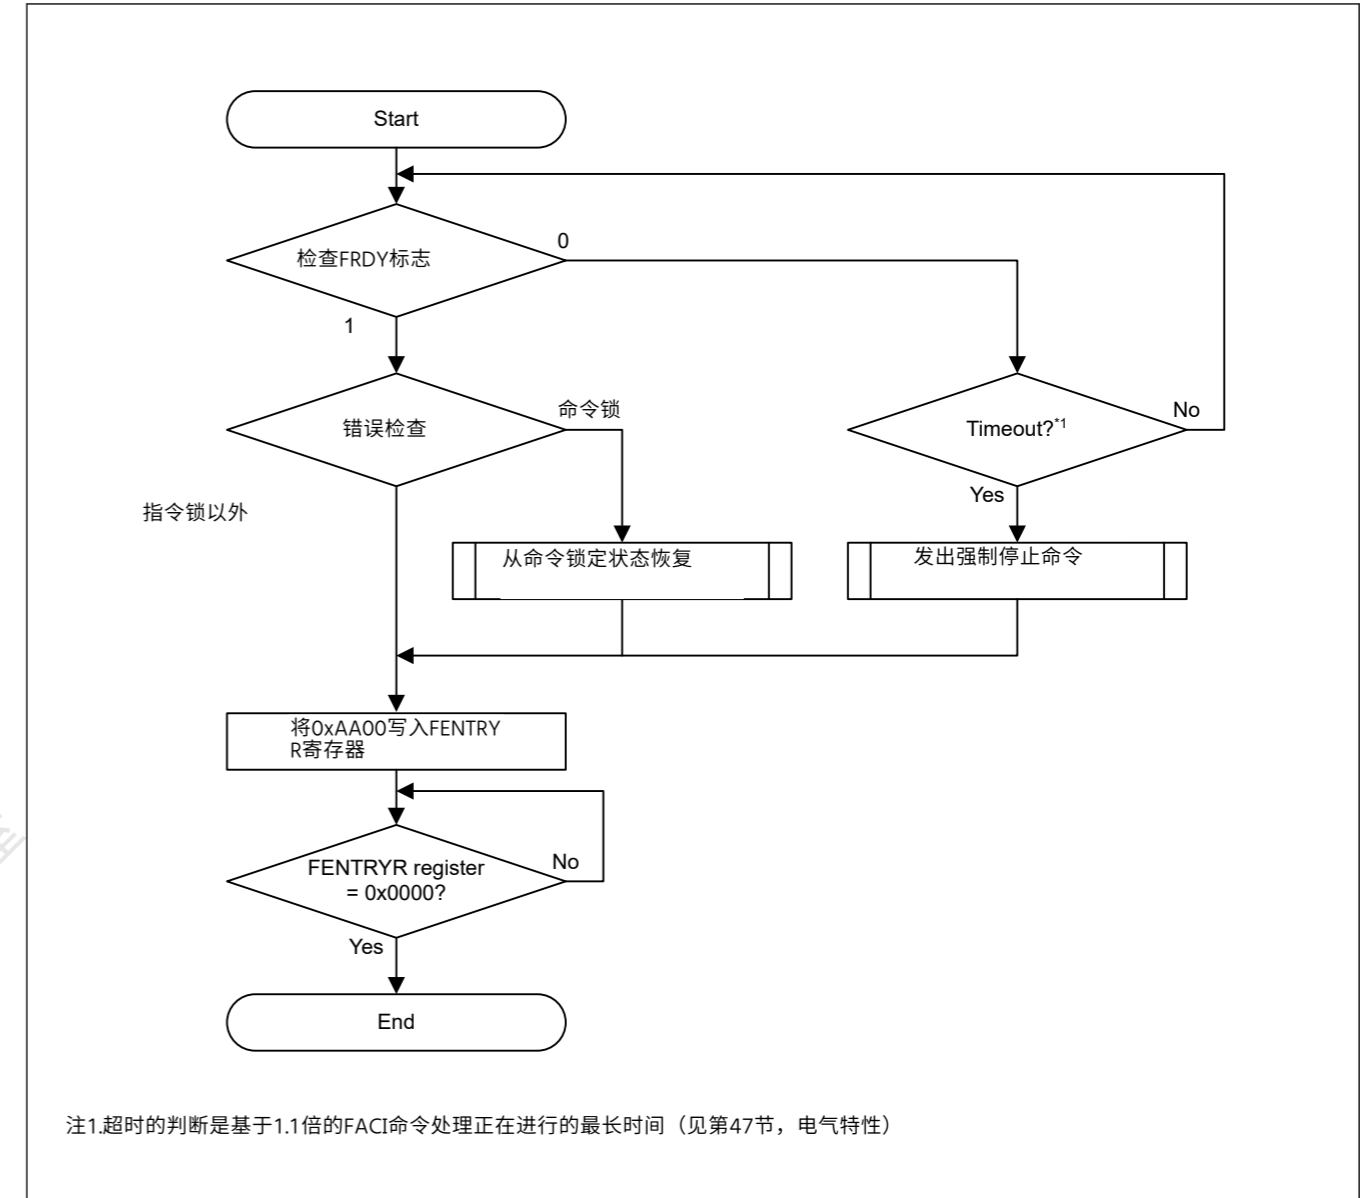

Figure 44.11 转换到阅读模式的过程

#### 44.9.3.6 从命令锁定状态恢复

当闪存定序器进入命令锁定状态时，无法接受FACY命令。要从命令锁定状态释放定序器，请使用状态清除命令、强制停止命令或FASTAT寄存器。

当通过在发出PE挂起命令之前检查错误来检测命令锁定状态时，即使命令处理尚未完成，FSTATR寄存器中的FRDY位也可能为0。如果在电气特性中指定的最大编程擦除时间未完成处理，则这是一个超时，并且必须使用强制停止命令停止闪存定序器。

FSTATR寄存器中的FLWEERR位不会随着状态清除命令从1变为0。当这些位设置为1时，使用强制停止命令从命令锁定状态中释放。FSTATR寄存器中除FRDY和FLWEERR以外的位指示命令锁定状态可以通过状态清除或强制停止命令从1更改为0。

图44.12显示了从命令锁定状态的恢复流程。

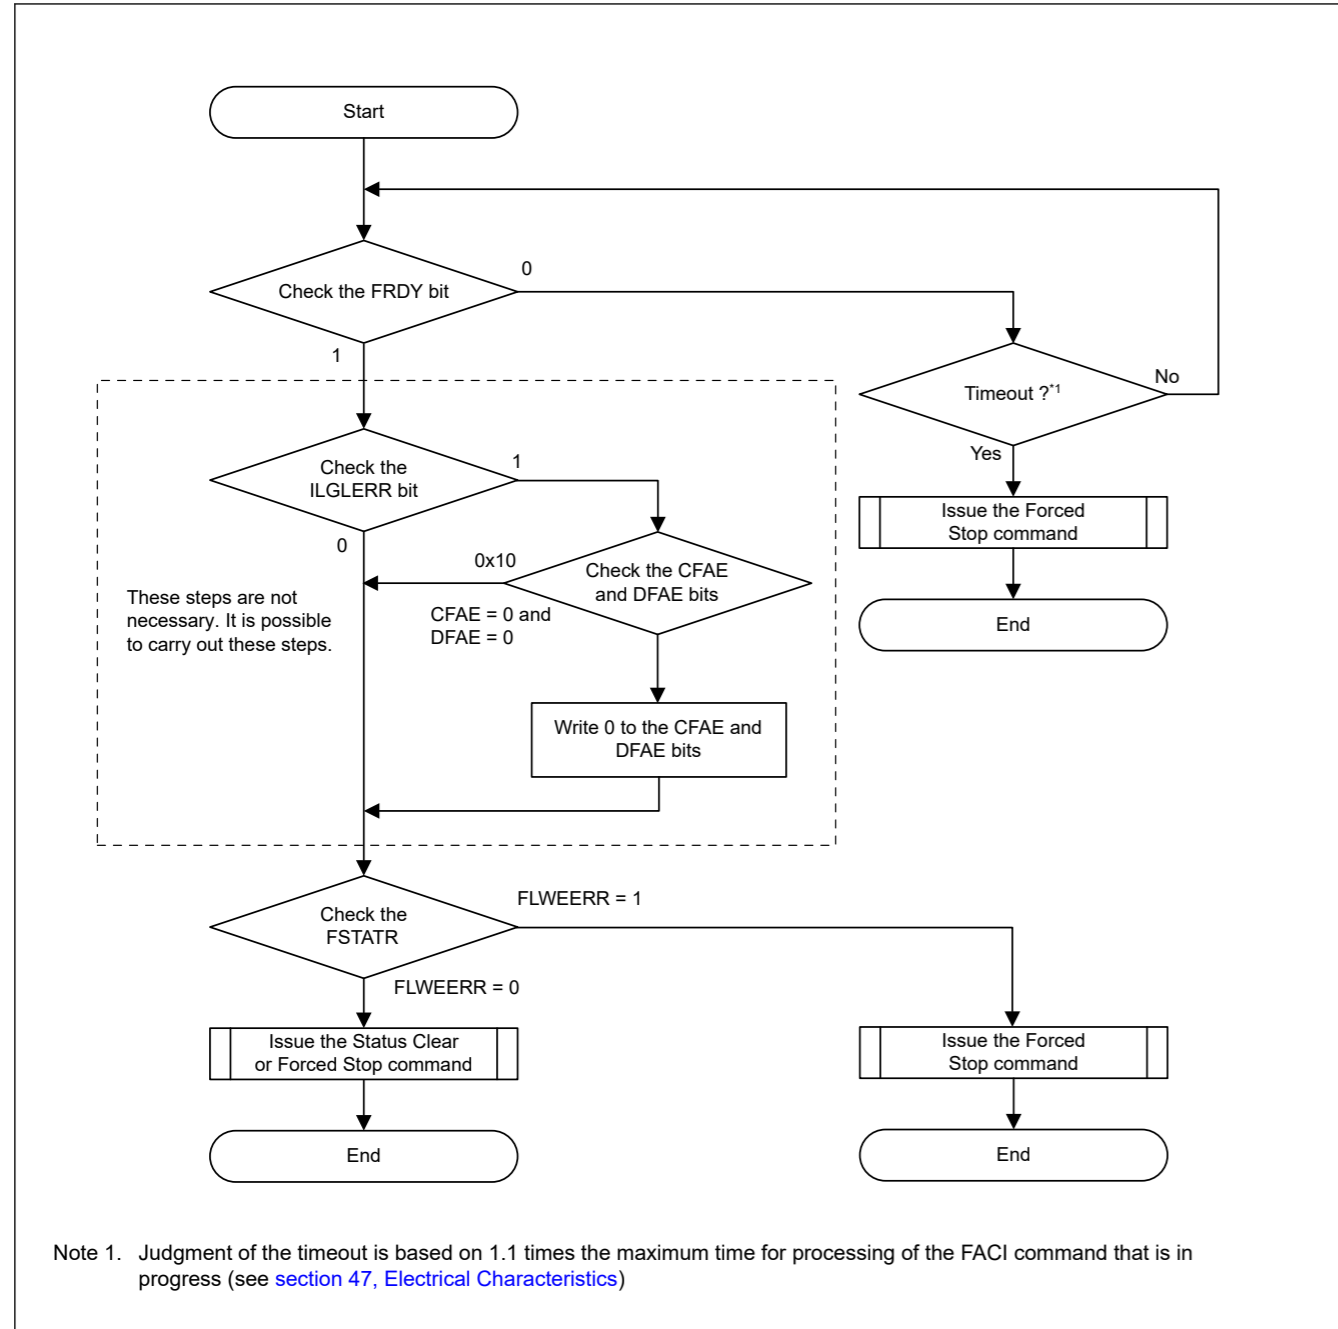

Figure 44.12 Recovery flow from the command-locked state

### 44.9.3.7 Program Command

The program command is used for writing to the user area and data area. Before issuing the FACL program command, set the first address of the target block in the FSADDR register. Writing 0xD0 at the final access of the FACL command-issuing area starts the program command processing. If the target area of program command processing contains area that are not for writing, write 0xFFFF to the corresponding area.

Issuing the program command while the FACL internal data buffer is full leads to a wait on the peripheral bus that might affect communications performance of other peripheral modules. To avoid a wait, set the DBFULL bit in the FSTATR register to 0 when issuing the FACL command. Writing to the data area does not lead to the data buffer becoming full.

Figure 44.13 shows the usage of the program command.

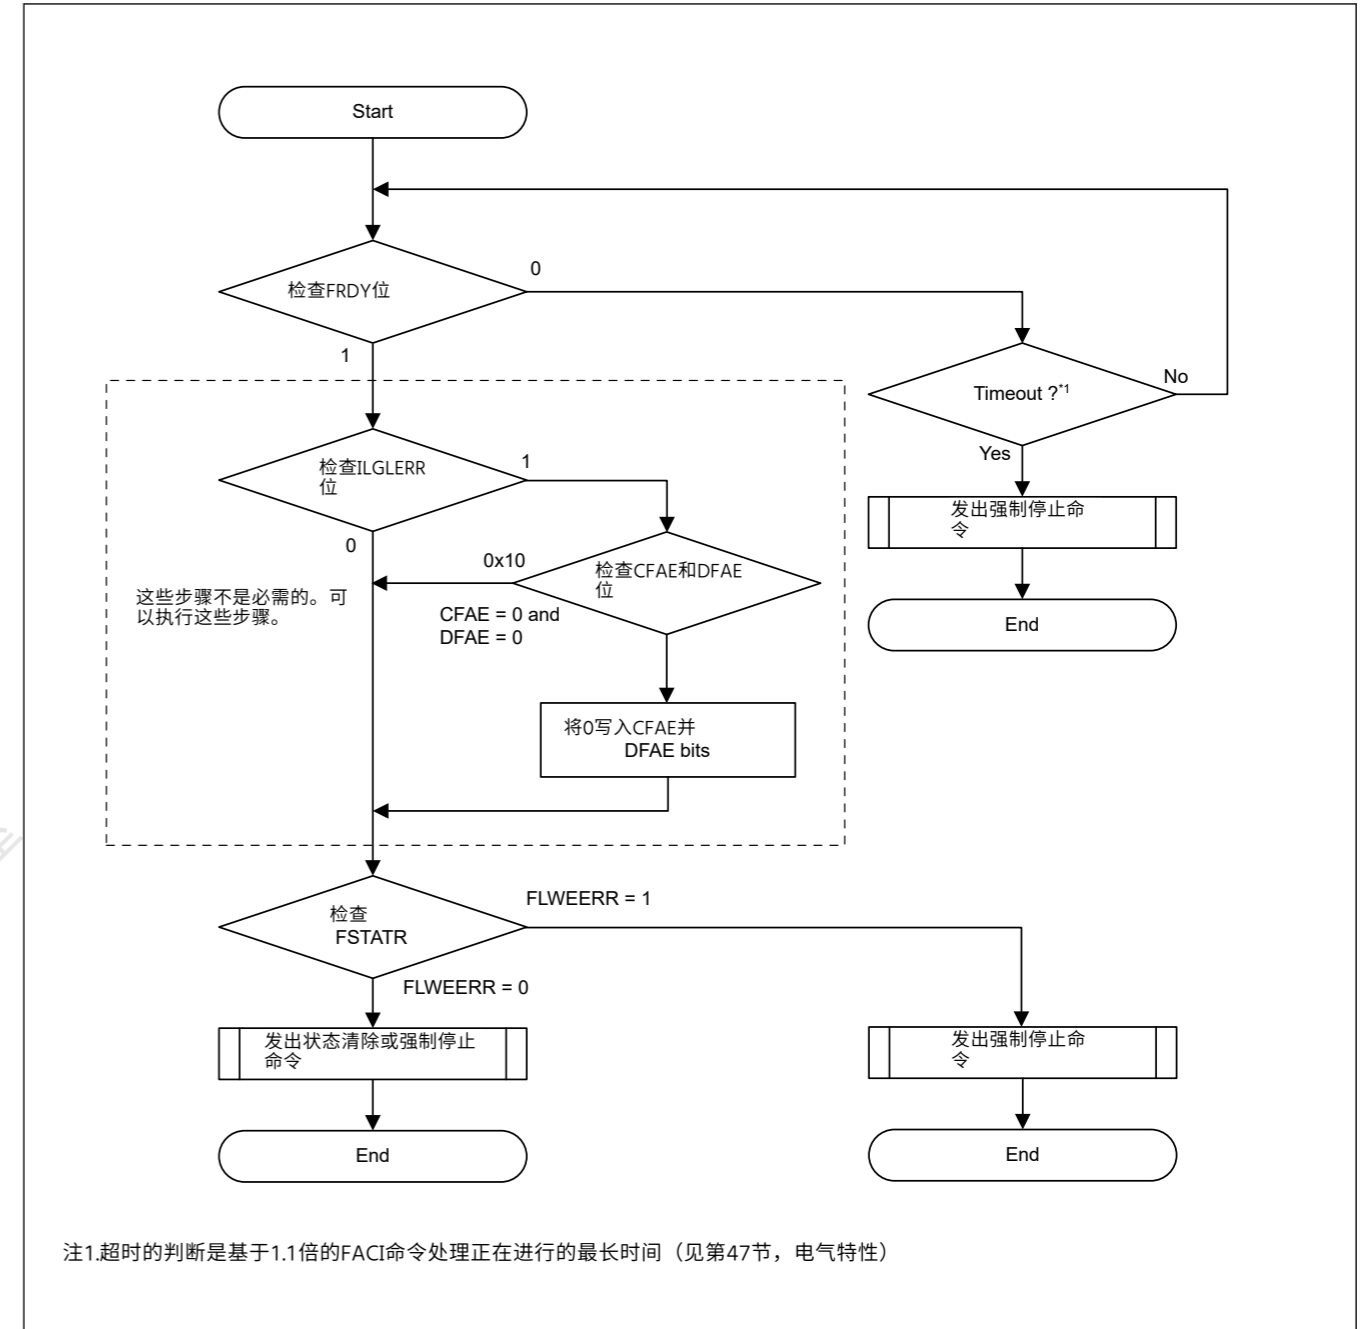

Figure 44.12 从命令锁定状态恢复流程

### 44.9.3.7 程序命令

程序命令用于写入用户区和数据区。在发出FACL程序命令之前，在FSADDR寄存器中设置目标块的首地址。在最终访问FACL命令发布区域时写入0xD0开始程序命令处理。如果程序命令处理的目标区域包含非写入区域，则将0xFFFF写入相应区域。

在FACL内部数据缓冲区已满时发出程序命令会导致外围总线等待，这可能会影响其他外围模块的通信性能。为避免等待，请在发出FACL命令时将FSTATR寄存器中的DBFULL位设置为0。写入数据区不会导致数据缓冲区变满。

图44.13显示了程序命令的用法。

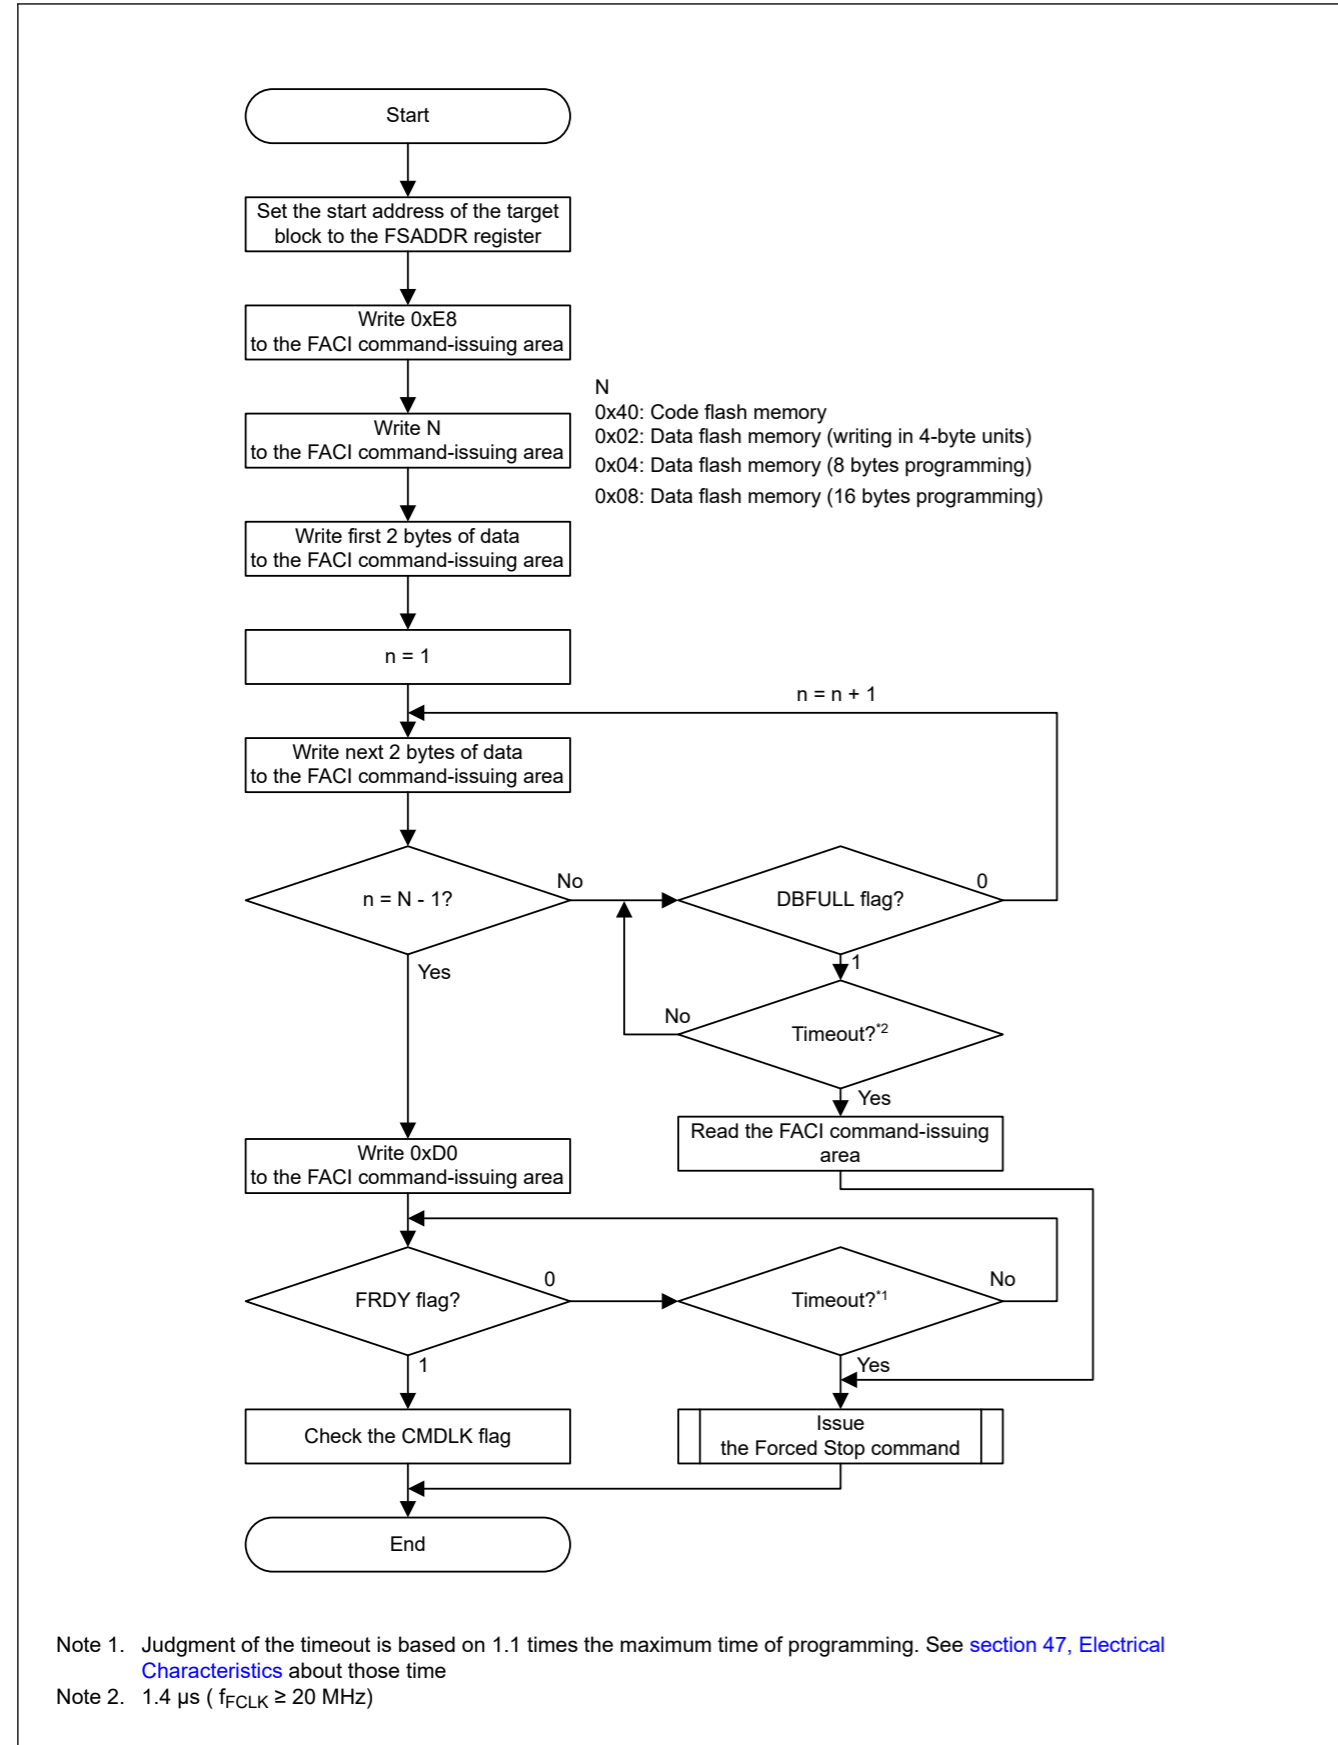

Figure 44.13 Usage flow of the program command

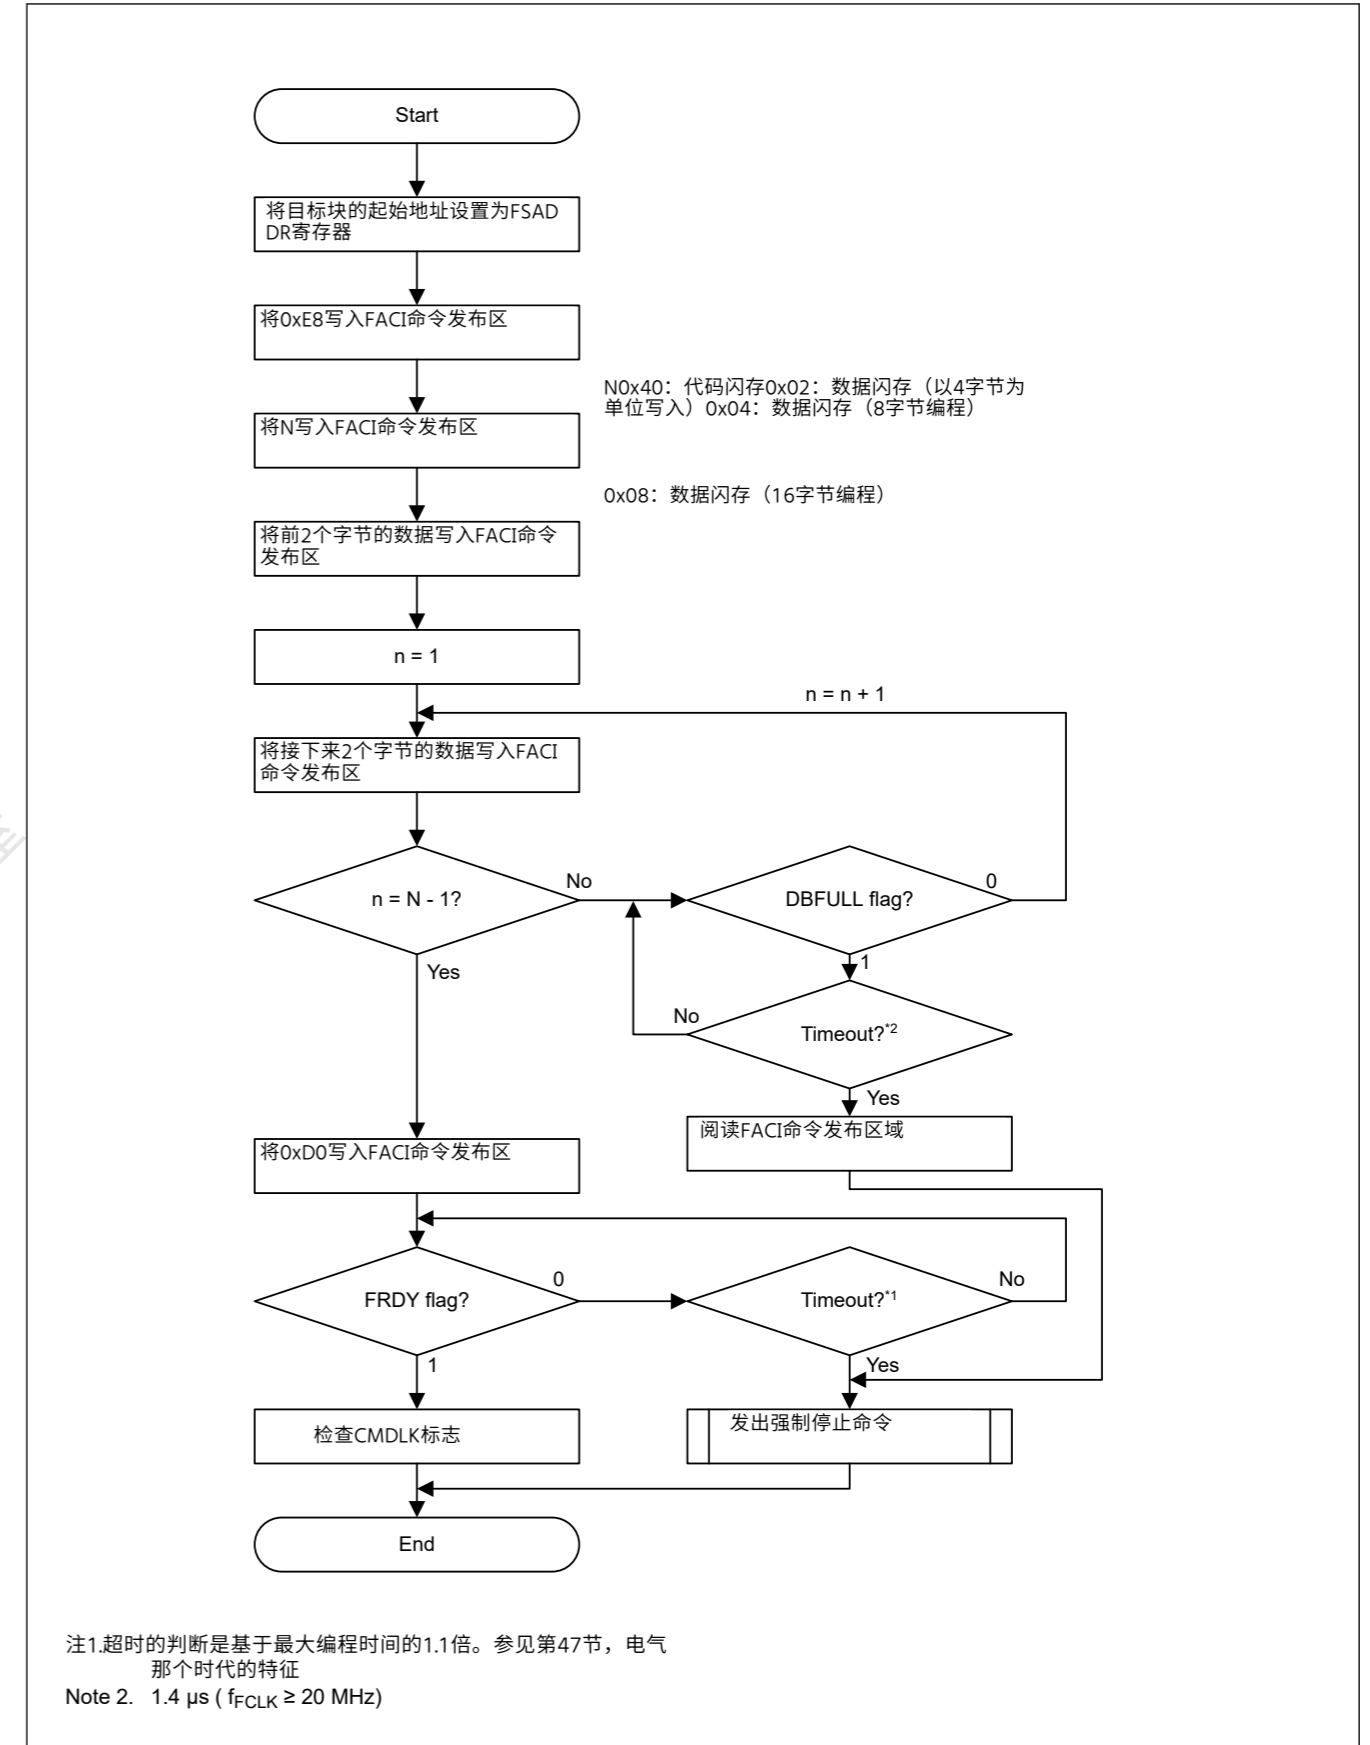

Figure 44.13 程序指令的使用流程

### 44.9.3.8 Block Erase Command

The block erase command is used for erasing user area or data area. The erase unit is one block. Before issuing a block erase command, set the first address of the target block to FSADRR register. Writing 0xD0 at the second write access of the FACI command triggers the FACI to start the block erase command processing. Completion of command processing can be confirmed with the FRDY bit of FSTATR register.

Set the FCPSR registers before issuing the block erase command. Additionally, FCPSR must be set when the erasure-suspended mode is to be switched.

Figure 44.14 shows the usage of the block erase command.

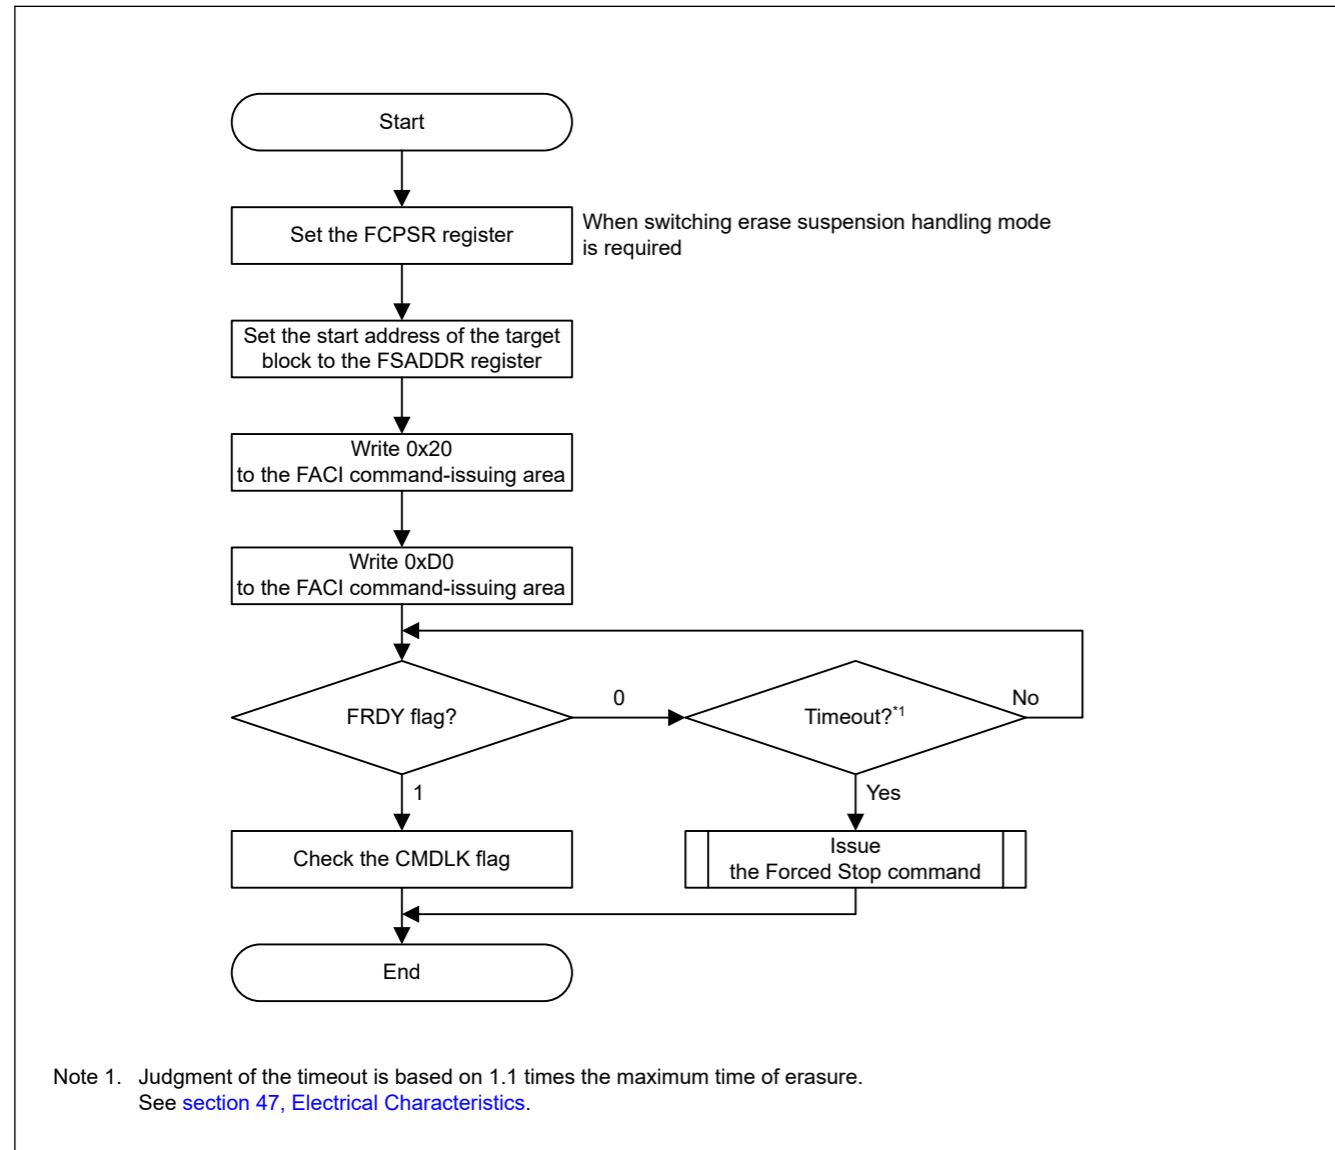

Figure 44.14 Usage flow of the block erase command

### 44.9.3.9 Multi Block Erase Command

The multi block erase command is used for erasing data area. The erase unit is 64, 128, or 256 bytes. Before issuing the multi block erase command, set the start address to FSADRR register and the end address to FEADDR register. Writing 0xD0 at the second write access of the FACI command triggers FACI to start the multi block erase command processing. Completion of command processing can be confirmed with the FRDY bit of FSTATR register.

Set the FCPSR registers before issuing the multi block erase command. Additionally, FCPSR must be set when the erasure-suspended mode is to be switched.

### 44.9.3.8 块擦除命令

块擦除命令用于擦除用户区或数据区。擦除单位是一个块。在发出块擦除命令之前，将目标块的首地址设置为FSA DRR寄存器。在FACI命令的第二次写访问时写入0xD0会触发FACI开始块擦除命令处理。命令处理的完成可以通过F STATR寄存器的FRDY位来确认。

在发出块擦除命令之前设置FCPSR寄存器。此外，当要切换擦除暂停模式时，必须设置FCPSR。

图44.14显示了块擦除命令的用法。

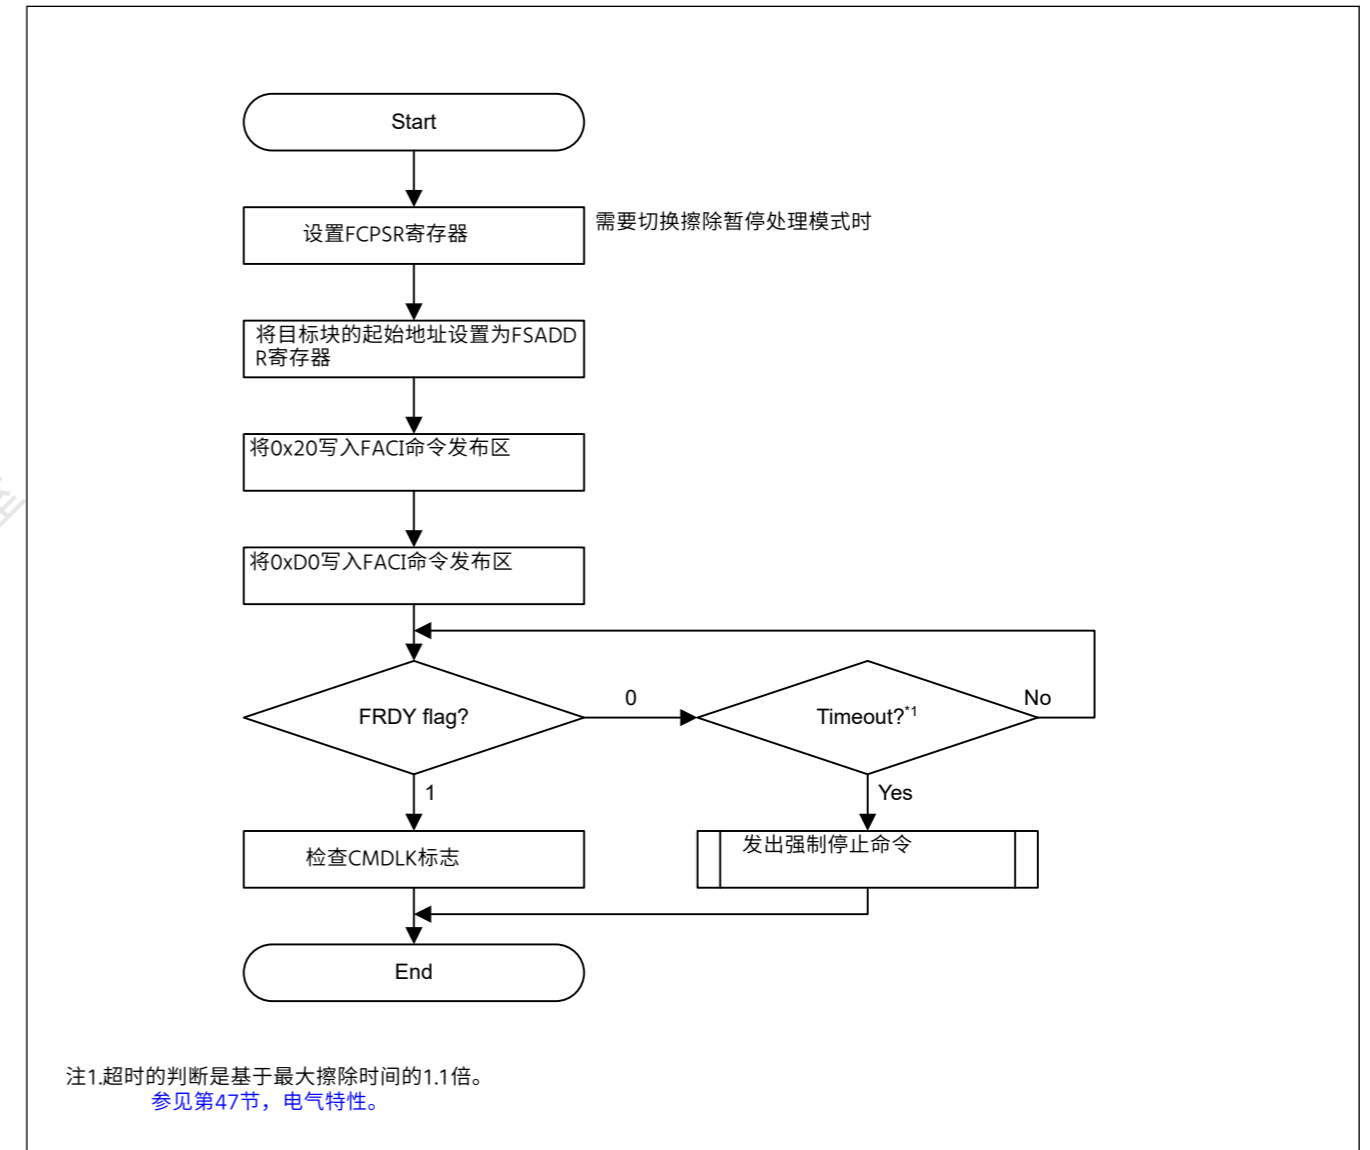

Figure 44.14 块擦除命令的使用流程

### 44.9.3.9 多块擦除命令

多块擦除命令用于擦除数据区域。擦除单元为64、128或256字节。在发出多块擦除命令之前，将起始地址设置为FSADRR寄存器，将结束地址设置为FEADDR寄存器。在FACI命令的第二次写访问时写入0xD0会触发FACI开始多块擦除命令处理。命令处理的完成可以通过FSTATR寄存器的FRDY位来确认。

在发出多块擦除命令之前设置FCPSR寄存器。此外，当要切换擦除暂停模式时，必须设置FCPSR。

The erase size is specified by both the FSADDR and FEADDR settings. Table 44.17 describes how to set the FSADDR and FEADDR.

Table 44.17 Settings for the erase size

| Erase size | FSADDR                               | FEADDR        |
|------------|--------------------------------------|---------------|
| 64 bytes   | FSA0 to FSA5 = 0 (64 byte-boundary)  | FSADDR + 0x3C |
| 128 bytes  | FSA0 to FSA6 = 0 (128 byte-boundary) | FSADDR + 0x7C |
| 256 bytes  | FSA0 to FSA7 = 0 (256 byte-boundary) | FSADDR + 0xFC |

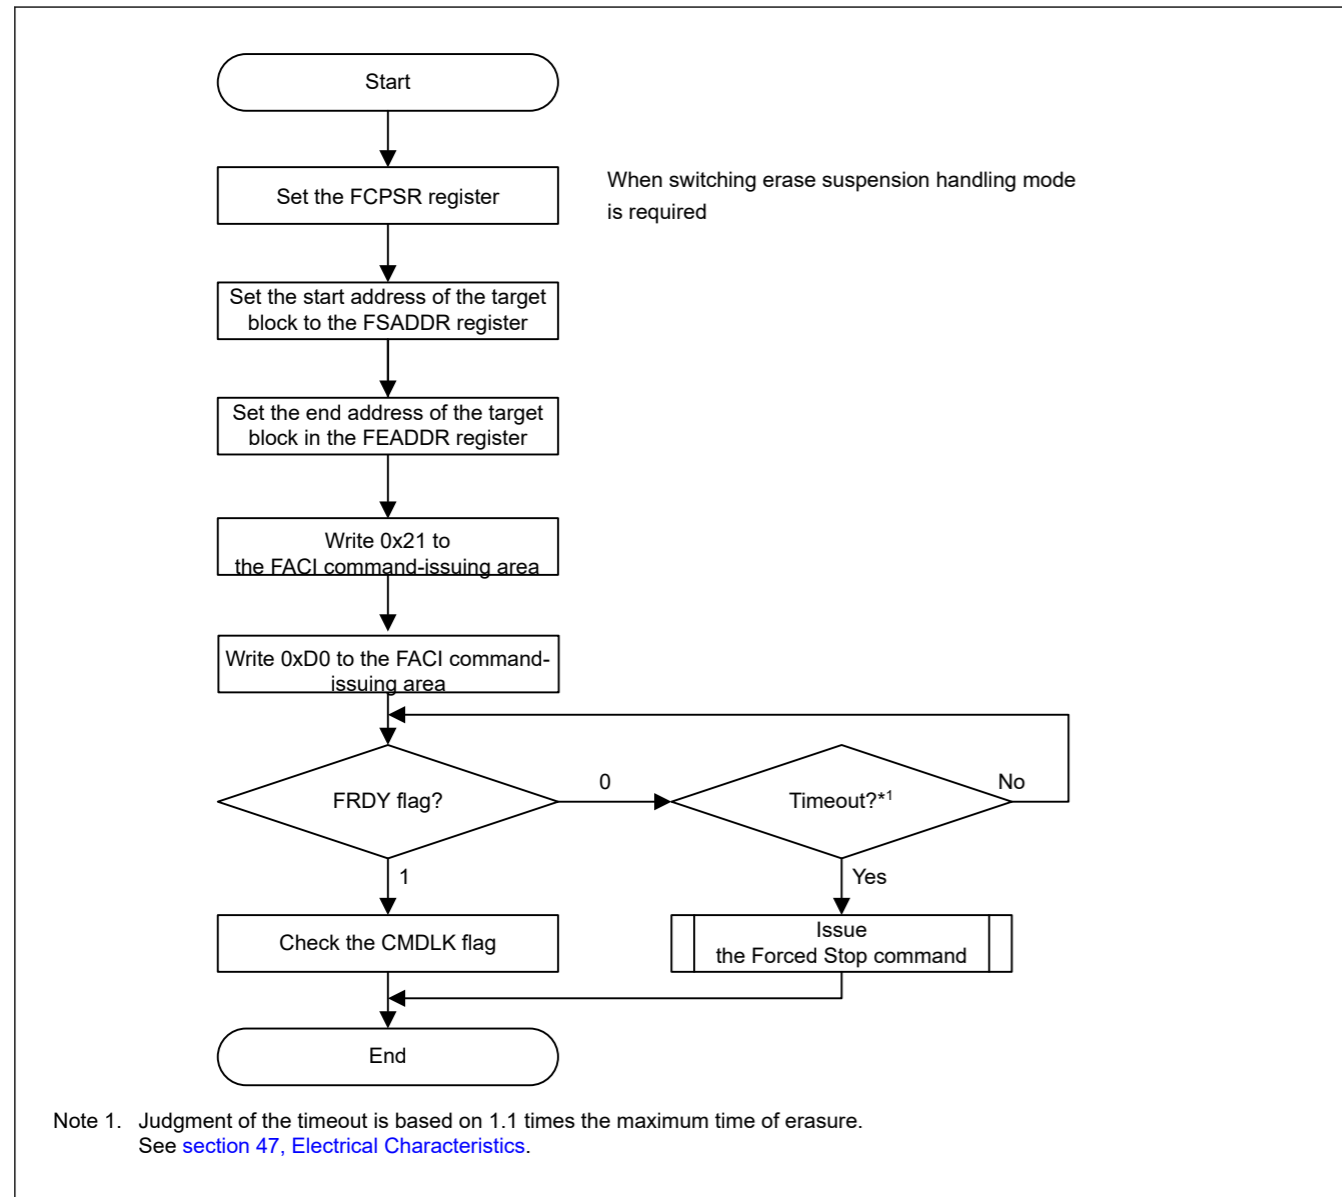

Figure 44.15 Usage flow of the multi block command

44.9.3.10 P/E Suspend Command

The P/E suspend command is used to suspend programming/erasure. Before issuing a P/E suspend command, check that the CMDLK bit in the FASTAT register is 0, and that the execution of programming/erasure is performed normally. To confirm that the P/E suspend command can be received, check that the SUSRDY bit in the FSTATR register is 1. After issuing a P/E suspend command, read the CMDLK bit to confirm that no error occurs.

If an error occurs during programming/erasure, the CMDLK bit is set to 1. When programming/erasure processing has finished from the time when the SUSRDY bit is 1 to when the P/E suspend command is received, no error occurs and the

擦除大小由FSADDR和FEADDR设置指定。表44.17描述了如何设置FSADDR和FEADDR。

Table 44.17 擦除大小的设置

| 擦除大小      | FSADDR                               | FEADDR        |
|-----------|--------------------------------------|---------------|
| 64 bytes  | FSA0 to FSA5 = 0 (64 byte-boundary)  | FSADDR + 0x3C |
| 128 bytes | FSA0 to FSA6 = 0 (128 byte-boundary) | FSADDR + 0x7C |
| 256 bytes | FSA0 to FSA7 = 0 (256 byte-boundary) | FSADDR + 0xFC |

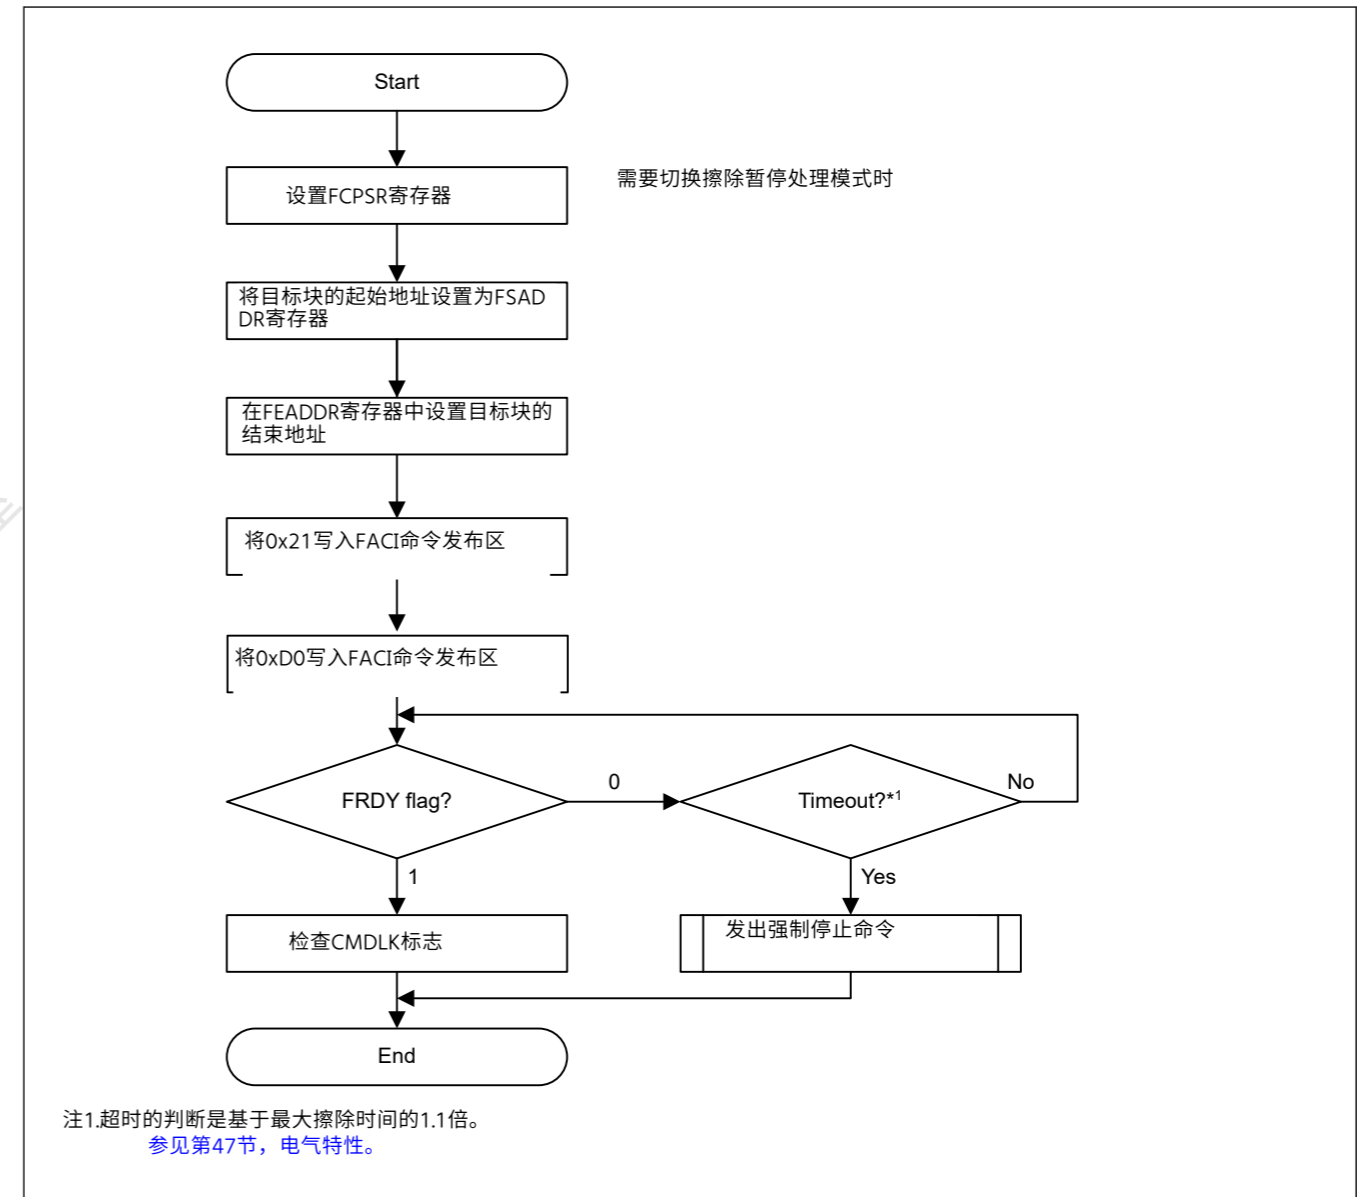

Figure 44.15 多块命令的使用流程

44.9.3.10 PE挂起命令

PE暂停命令用于暂停编程擦除。在发出PE挂起命令之前，请检查FASTAT寄存器中的CMDLK位是否为0，并且编程擦除的执行是否正常执行。要确认可以接收到PE挂起命令，请检查FSTATR寄存器中的SUSRDY位是否为1。发出PE挂起命令后，读取CMDLK位以确认没有错误发生。

如果在编程擦除过程中发生错误，则将CMDLK位设置为1。从SUSRDY位为1到接收到PE暂停命令时，当编程擦除处理完成时，不会发生错误，并且

suspended state is not entered (the FRDY bit in the FSTATR register is 1 and the ERSSPD and PRGSPD bits in FSTATR are 0).

When a P/E suspend command is received and the programming/erasure suspend processing finishes normally, the flash sequencer enters the suspended state, the FRDY bit is set to 1, and the ERSSPD or PRGSPD bit is 1. After issuing a P/E suspend command, check that the ERSSPD or PRGSPD bit is 1 and the suspended state is entered, then proceed with the subsequent flow. If a P/E resume command is issued in the subsequent flow even when the suspended state is not entered, an illegal command error occurs and the flash sequencer shifts to the command-locked state (see [section 44.11.2. Error Protection](#)).

If the erasure suspended state is entered, programming to blocks other than an erasure target block can be performed. Additionally, the programming and erasure suspended states can shift to read mode by clearing the FENTRYR register.

[Figure 44.16](#) shows the usage of the P/E suspend command.

未进入挂起状态（FSTATR寄存器中的FRDY位为1，FSTATR中的ERSSPD和PRGSPD位为0）。

当接收到PE挂起命令并且编程擦除挂起处理正常完成时，闪存定序器进入挂起状态，FRDY位设置为1，ERSPD或PRGSPD位为1。发出PE挂起命令后，检查是否ERSPD或PRGSPD位为1，进入挂起状态，然后进行后续流程。如果在后续流程中发出PEresume命令，即使未进入挂起状态，也会发生非法命令错误，并且闪存定序器会切换到命令锁定状态（参见第44.11.2节。错误保护）。

如果进入擦除暂停状态，则可以执行对擦除目标块以外的块的编程。此外，通过清除FENTRYR寄存器，编程和擦除暂停状态可以转换为读取模式。

图44.16显示了PE挂起命令的用法。

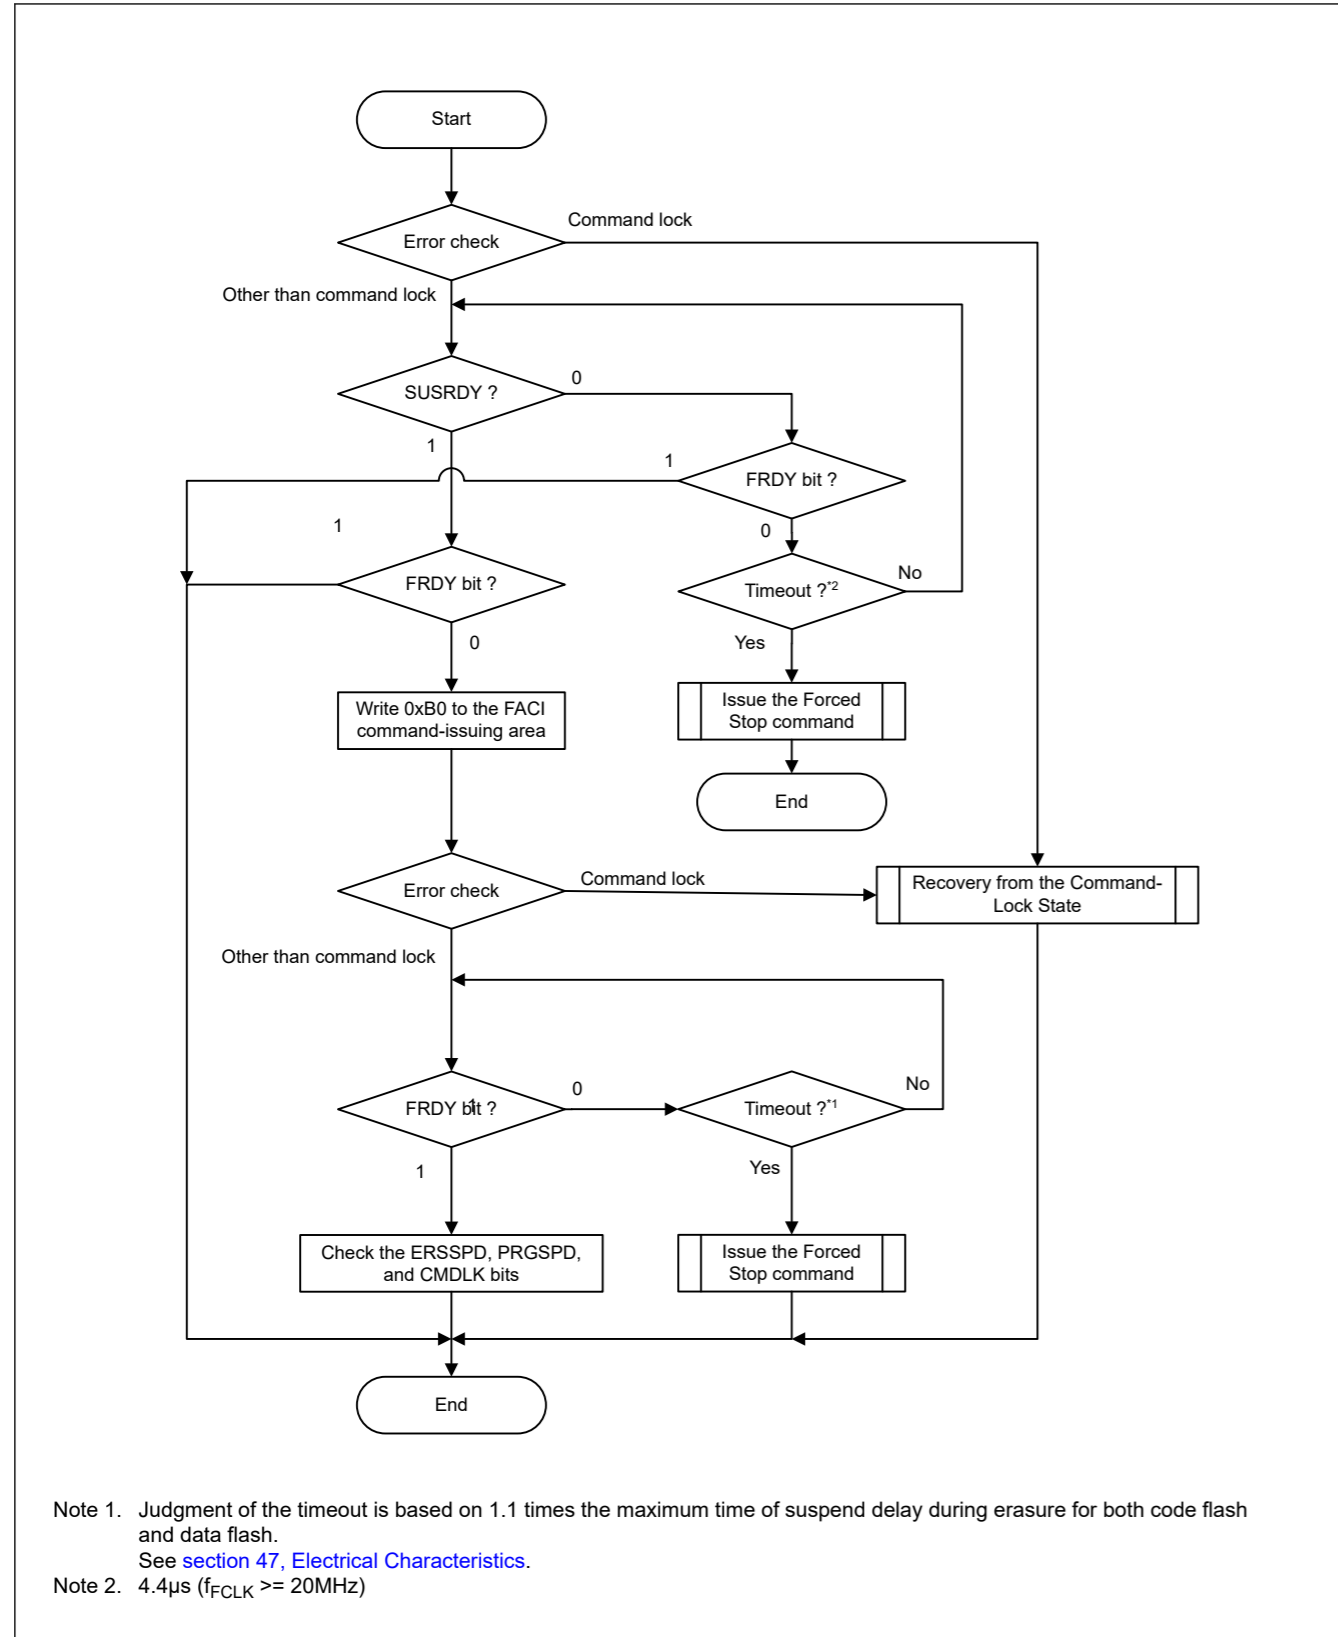

Figure 44.16 Usage flow of the P/E suspend command

(1) Suspension during Programming

When issuing a P/E suspend command during flash memory programming, the flash sequencer suspends programming processing. Figure 44.17 shows the suspend programming operation. When receiving programming-related command, the flash sequencer clears the FRDY bit in the FSTATR register to 0 to start programming. If the flash sequencer enters the state

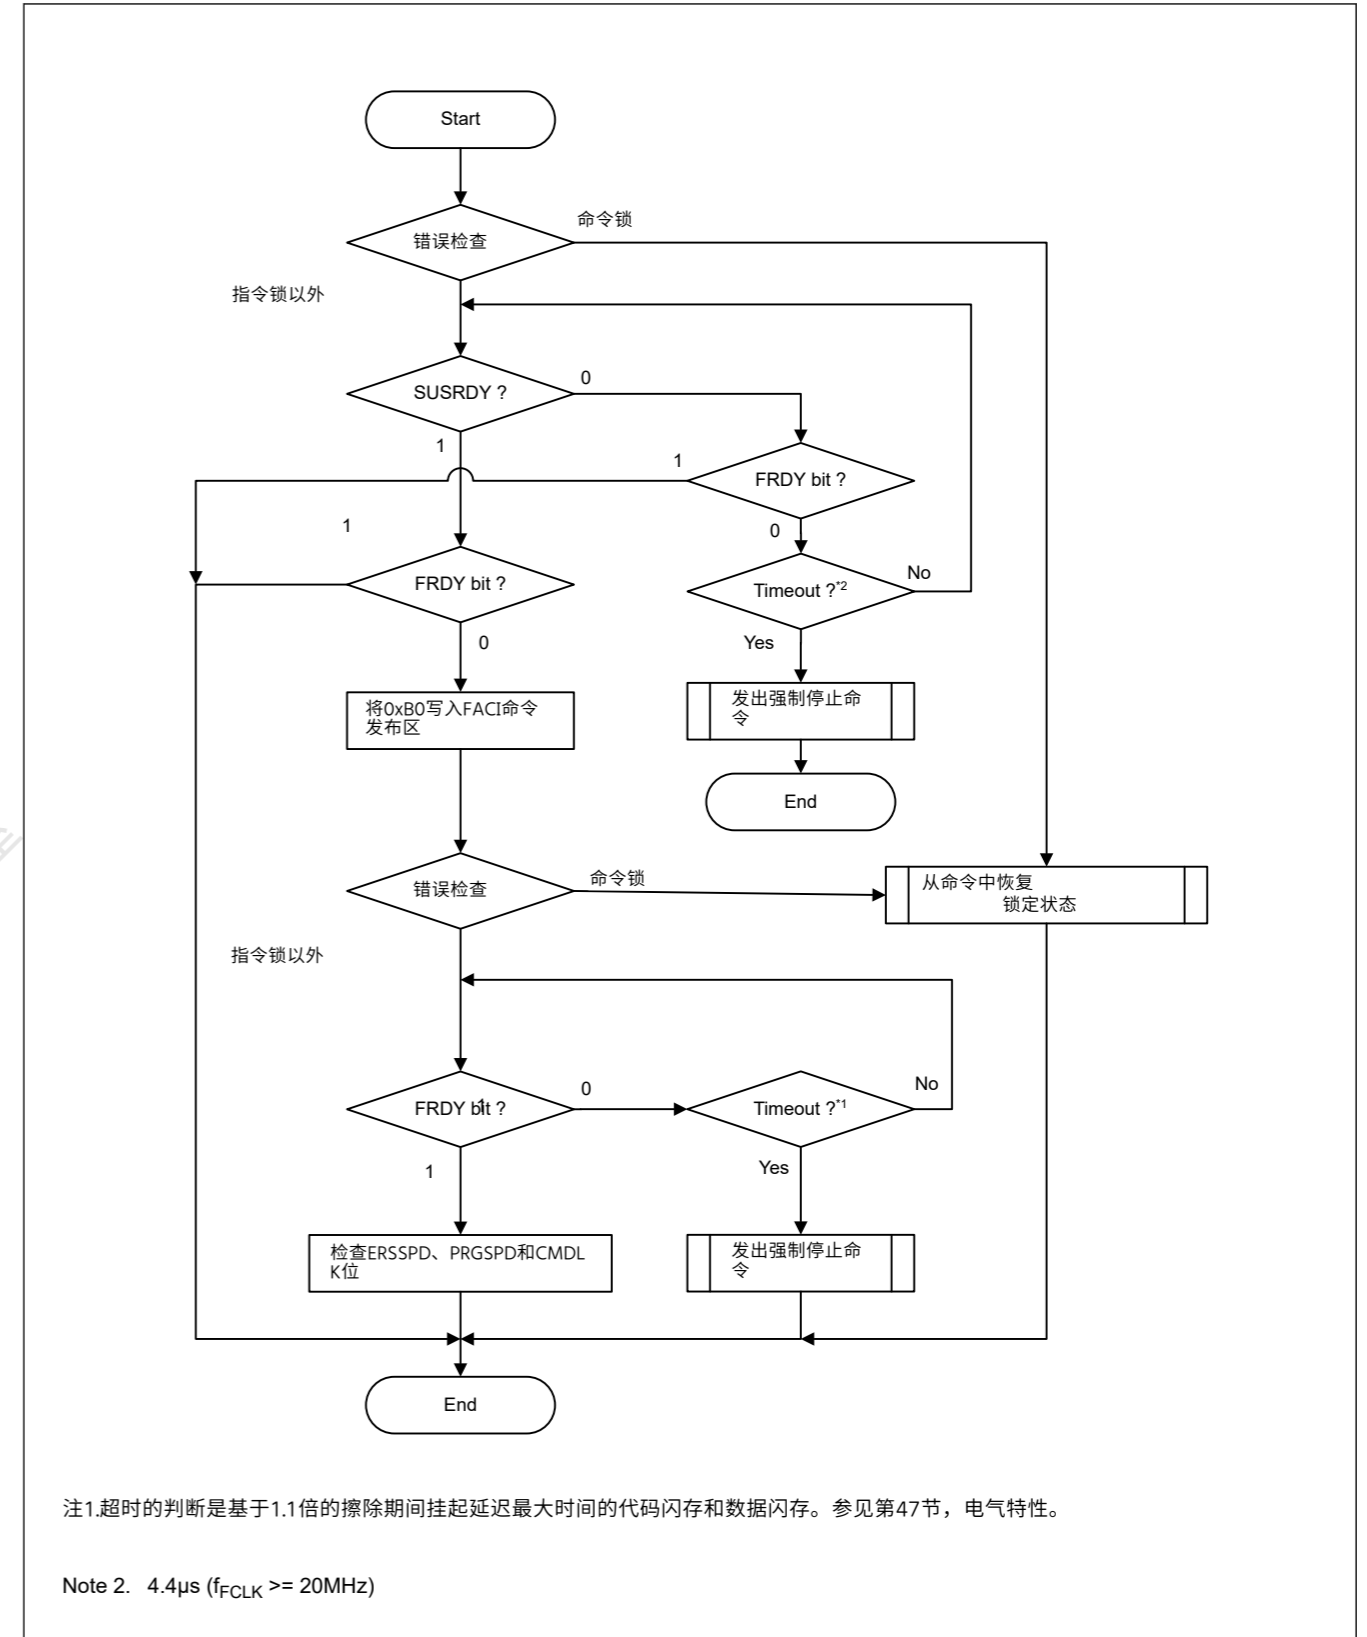

Figure 44.16 PE挂起命令的使用流程

(1) 编程期间暂停

在闪存编程期间发出PE暂停命令时，闪存定序器暂停编程处理。图44.17显示了挂起编程操作。当接收到编程相关命令时，flashsequencer将FSTATR寄存器中的FRDY位清0以开始编程。如果闪存定序器进入状态

in which the P/E suspend command can be received after programming starts, it sets the SUSRDY bit in the FSTATR register to 1.

When a P/E suspend command is issued, the flash sequencer receives the command and clears the SUSRDY bit to 0. If the flash sequencer receives a P/E suspend command while a programming pulse is applied, the flash sequencer continues with the pulse. After the specified pulse application time, the flash sequencer finishes pulse application, starts the programming suspend processing, and sets the PRGSPD bit in the FSTATR register to 1.

When a suspended processing finishes, the flash sequencer sets the FRDY bit to 1 to enter the programming suspended state. When receiving a P/E resume command in the programming suspended state, the flash sequencer clears the FRDY and PRGSPD bits to 0 and resumes programming.

Figure 44.17 shows the timing for suspension during programming.

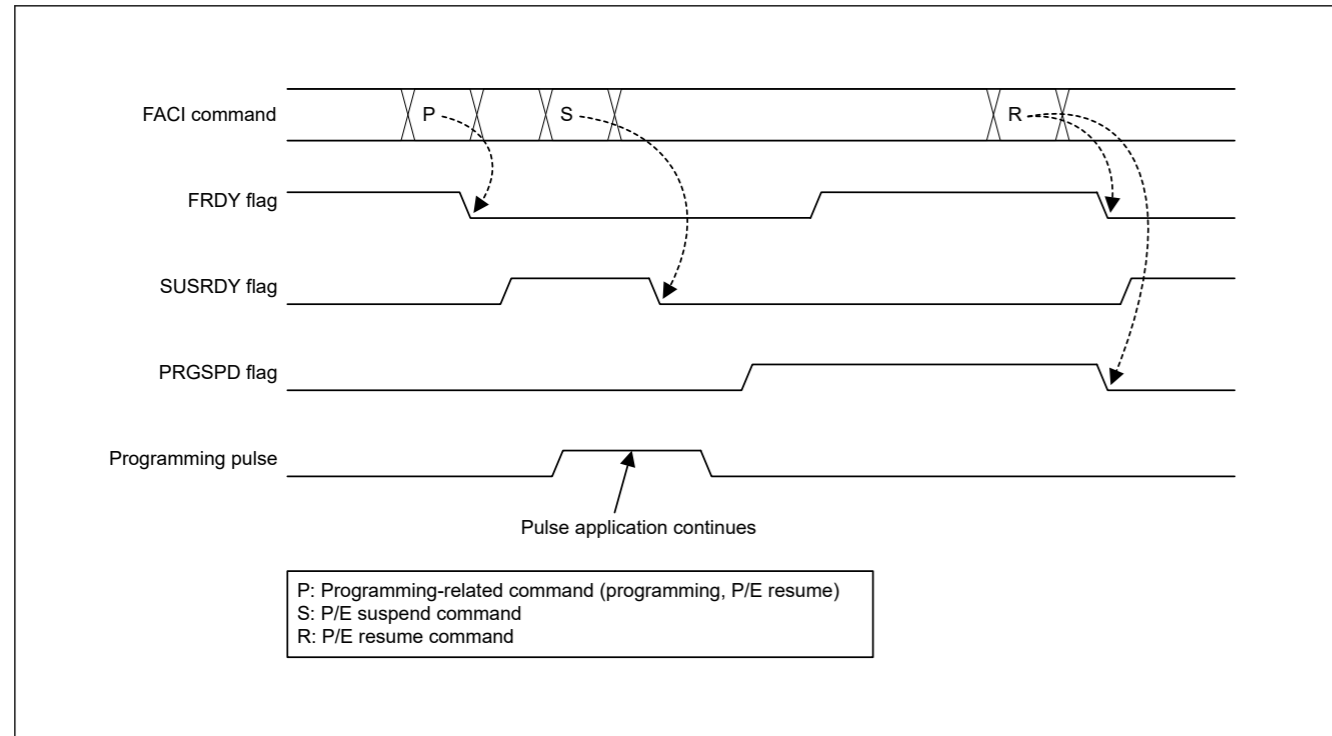

Figure 44.17 Suspension during programming

## (2) Suspension during Erasure (Suspension Priority Mode)

The flash sequencer has a suspension priority mode for the suspension of erasure. Figure 44.18 shows the suspend operation of erasure when the erasure suspend mode is set to the suspension priority mode (the ESUSPMD bit in the FCPSR register is 0).

When receiving an erasure-related command, the flash sequencer clears the FRDY bit in the FSTATR register to 0 to start erasure. If the flash sequencer enters the state in which the P/E suspend command can be received after erasure starts, it sets the SUSRDY bit in the FSTATR register to 1.

When a P/E suspend command is issued, the flash sequencer receives the command and clears the SUSRDY bit to 0.

When receiving a suspend command during erasure, the flash sequencer starts the suspend processing and sets the ERSSPD bit in the FSTATR register to 1 even when it is applying an erasure pulse. When the suspended processing finishes, the flash sequencer sets the FRDY bit to 1 to enter the erasure suspended state. When receiving a P/E resume command in the erasure suspended state, the flash sequencer clears the FRDY and ERSSPD bits to 0 and resumes erasure. Operations of the FRDY, SUSRDY, and ERSSPD bits at the suspension and resumption of erasure are the same, regardless of the erasure suspend mode.

The setting of the erasure suspend mode affects the control method of erasure pulses. In suspension priority mode, when receiving a P/E suspend command while erasure pulse A that has not been previously suspended is being applied, the flash sequencer suspends the application of erasure pulse A and enters the erasure suspended state. When receiving a P/E suspend command while reapplying erasure pulse A after erasure is resumed with a P/E resume command, the flash sequencer

在编程开始后接收PE挂起命令的情况下，它将FSTATR寄存器中的SUSRDY位设置为1。

当发出PE暂停命令时，闪存定序器接收该命令并将SUSRDY位清除为0。如果在施加编程脉冲时闪存定序器接收到PE暂停命令，则闪存定序器继续执行该脉冲。在指定的脉冲施加时间之后，闪存定序器完成脉冲施加，开始编程暂停处理，并将FSTATR寄存器中的PRGSPD位设置为1。

当暂停处理完成时，闪存定序器将FRDY位设置为1以进入编程暂停状态。当在编程暂停状态下接收到PEresume命令时，闪存定序器将FRDY和PRGSPD位清除为0并恢复编程。

图44.17显示了编程期间暂停的时序。

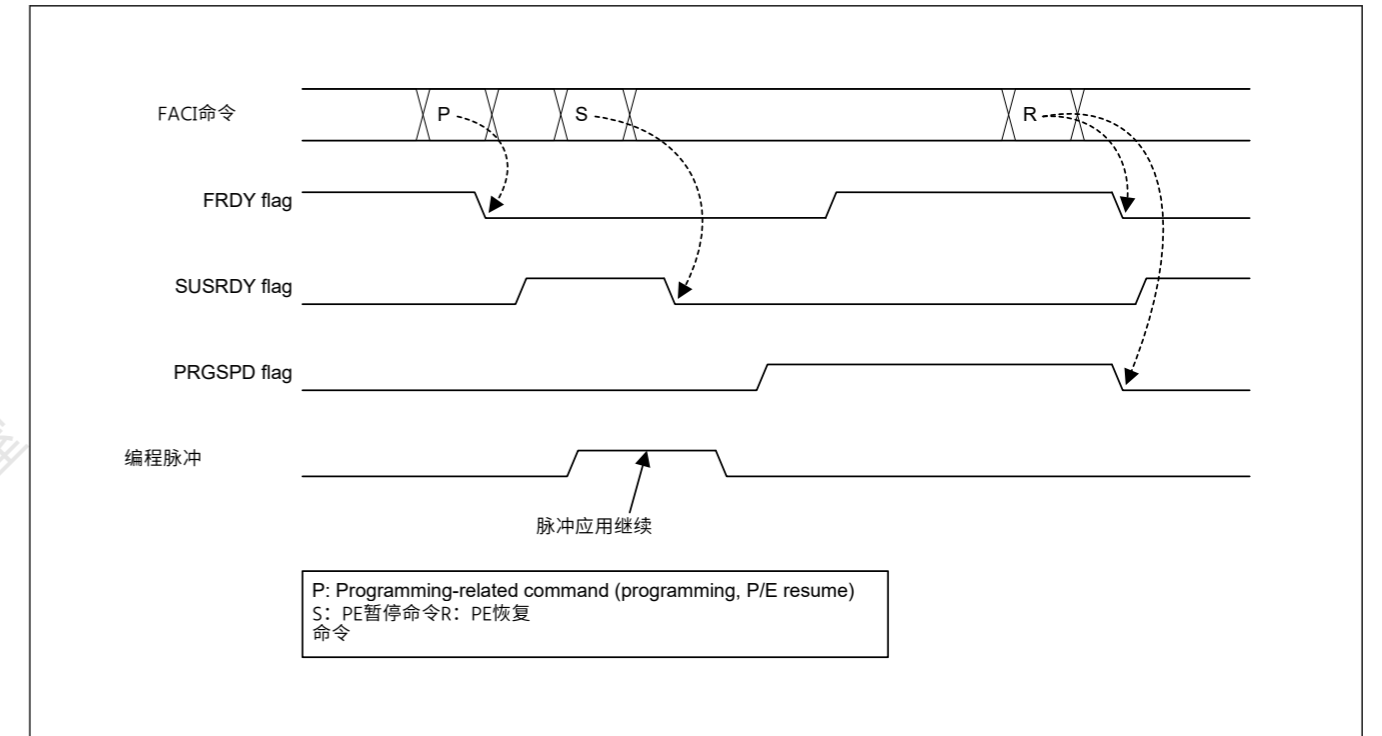

Figure 44.17 编程期间暂停

## (2) 擦除期间暂停（暂停优先模式）

闪存定序器具有用于暂停擦除的暂停优先模式。图44.18显示了擦除挂起模式设置为挂起优先模式时的擦除挂起操作（FCPSR寄存器中的ESUSPMD位为0）。

当接收到擦除相关命令时，闪存定序器将FSTATR寄存器中的FRDY位清零以开始擦除。如果闪存定序器在擦除开始后进入可以接收PE挂起命令的状态，它会将FSTATR寄存器中的SUSRDY位设置为1。

当发出PE挂起命令时，闪存定序器接收该命令并将SUSRDY位清除为0。

在擦除期间接收到挂起命令时，闪存定序器启动挂起处理并将FSTATR寄存器中的ERSSPD位设置为1，即使它正在施加擦除脉冲。当挂起处理完成时，闪存定序器将FRDY位设置为1以进入擦除挂起状态。当在擦除暂停状态下接收到PE恢复命令时，闪存定序器将FRDY和ERSSPD位清除为0并恢复擦除。无论擦除暂停模式如何，FRDY、SUSRDY和ERSSPD位在擦除暂停和恢复时的操作都是相同的。

擦除暂停模式的设置会影响擦除脉冲的控制方法。在挂起优先模式下，当在施加先前未被挂起的擦除脉冲A的同时接收到PE挂起命令时，闪存定序器挂起擦除脉冲A的施加并进入擦除挂起状态。在使用PE恢复命令恢复擦除后，在重新应用擦除脉冲A的同时接收到PE暂停命令时，闪存定序器

continues to apply erasure pulse A. After the specified pulse application time, the flash sequencer finishes erasure pulse application and enters the erasure suspended state.

When the flash sequencer receives a P/E resume command next and erasure pulse B is being applied, the flash sequencer receives a P/E suspend command again, and the application of erasure pulse B is then suspended. In suspension priority mode, delays due to suspension can be minimized because the application of an erasure pulse is suspended once per pulse, and priority is given to the suspend processing.

If the interval of suspension after resume is longer than  $t_{REST1}$  (Resume time: priority on suspension, resume after the 1st suspend for the same pulse), suspend delay will be always  $t_{SESD1}$  (Suspend delay: priority on suspension, the 1st suspend for the same pulse).

If the interval of suspension after resume is shorter than  $t_{REST1}$ , suspend delay becomes either  $t_{SESD1}$  or  $t_{SESD2}$  (Suspend delay: priority on suspension, the 2nd suspend for the same pulse).

(The value of  $t_{REST1}$  /  $t_{SESD1}$  /  $t_{SESD2}$ , see [section 47, Electrical Characteristics](#).)

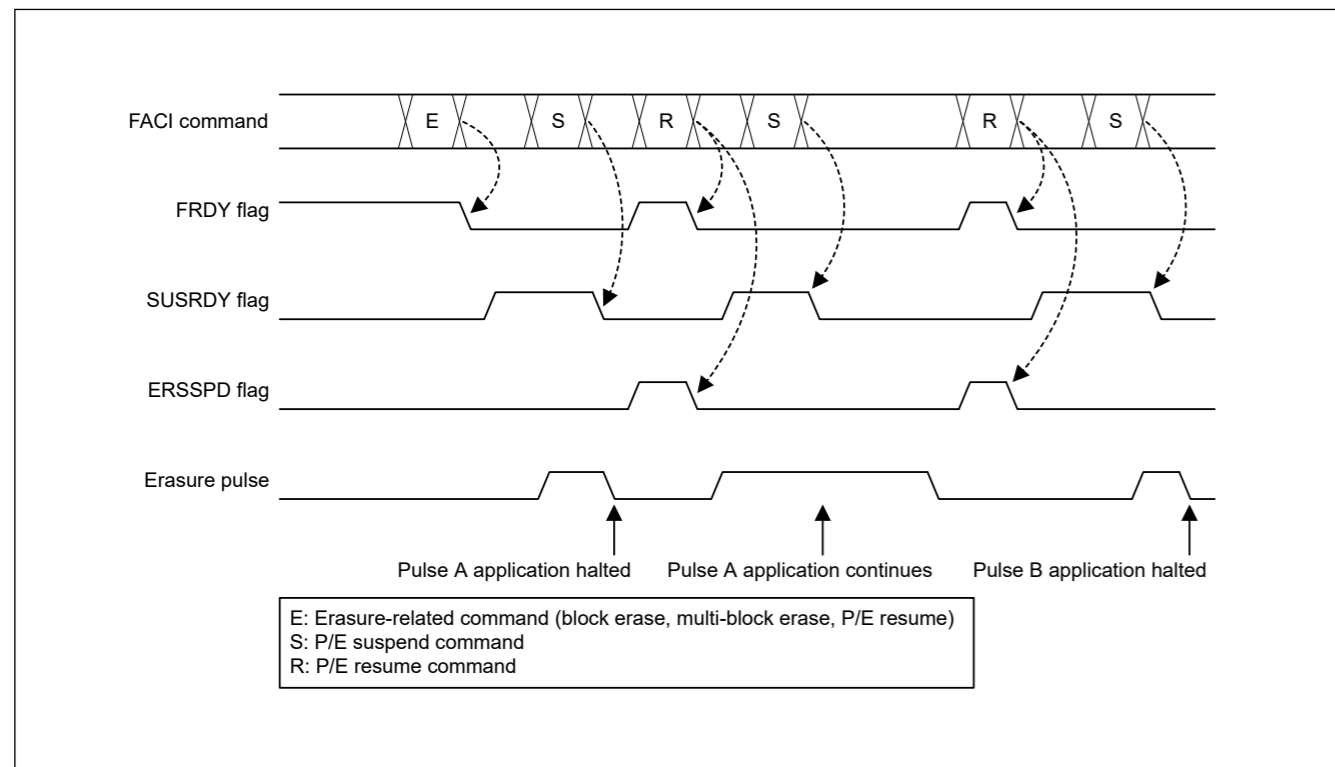

Figure 44.18 Suspension during erasure (suspension priority mode)

### (3) Suspension during Erasure (Erasure Priority Mode)

The flash sequencer has an erasure priority mode for the suspension of erasure. [Figure 44.19](#) shows the suspend operation of erasure when the erasure suspend mode is set to the erasure priority mode (the ESUSPMD bit in the FCPSR register is 1). The control method of erasure pulses in erasure priority mode is the same as that of programming pulses for the programming suspend processing.

If the flash sequencer receives a P/E suspend command while an erasure pulse is applied, the flash sequencer continues to apply the pulse. In this mode, the required time for the erasure processing can be reduced compared to the suspension priority mode because the re-application of erasure pulses does not occur when a P/E resume command is issued.

继续施加擦除脉冲A。在指定的脉冲施加时间之后，闪存定序器完成擦除脉冲施加并进入擦除暂停状态。

当闪存定序器接下来接收到PE恢复命令并且正在施加擦除脉冲B时，闪存定序器再次接收到PE暂停命令，然后暂停擦除脉冲B的施加。在挂起优先模式中，由于擦除脉冲的施加在每个脉冲中挂起一次，因此挂起引起的延迟可以被最小化，并且挂起处理具有优先权。

如果恢复后挂起的时间间隔大于 $t_{REST1}$ （恢复时间：挂起优先，相同脉冲第一次挂起后恢复），挂起延迟将始终为 $t_{SESD1}$ （挂起延迟：挂起优先，第一次挂起相同的脉冲）。

如果恢复后的暂停间隔小于 $t_{REST1}$ ，则暂停延迟变为 $t_{SESD1}$ 或 $t_{SESD2}$ （暂停延迟：暂停优先，相同脉冲的第2次暂停）。

( $t_{REST1}$  $t_{SESD1}$  $t_{SESD2}$ 的值，请参见第47节，电气特性。)

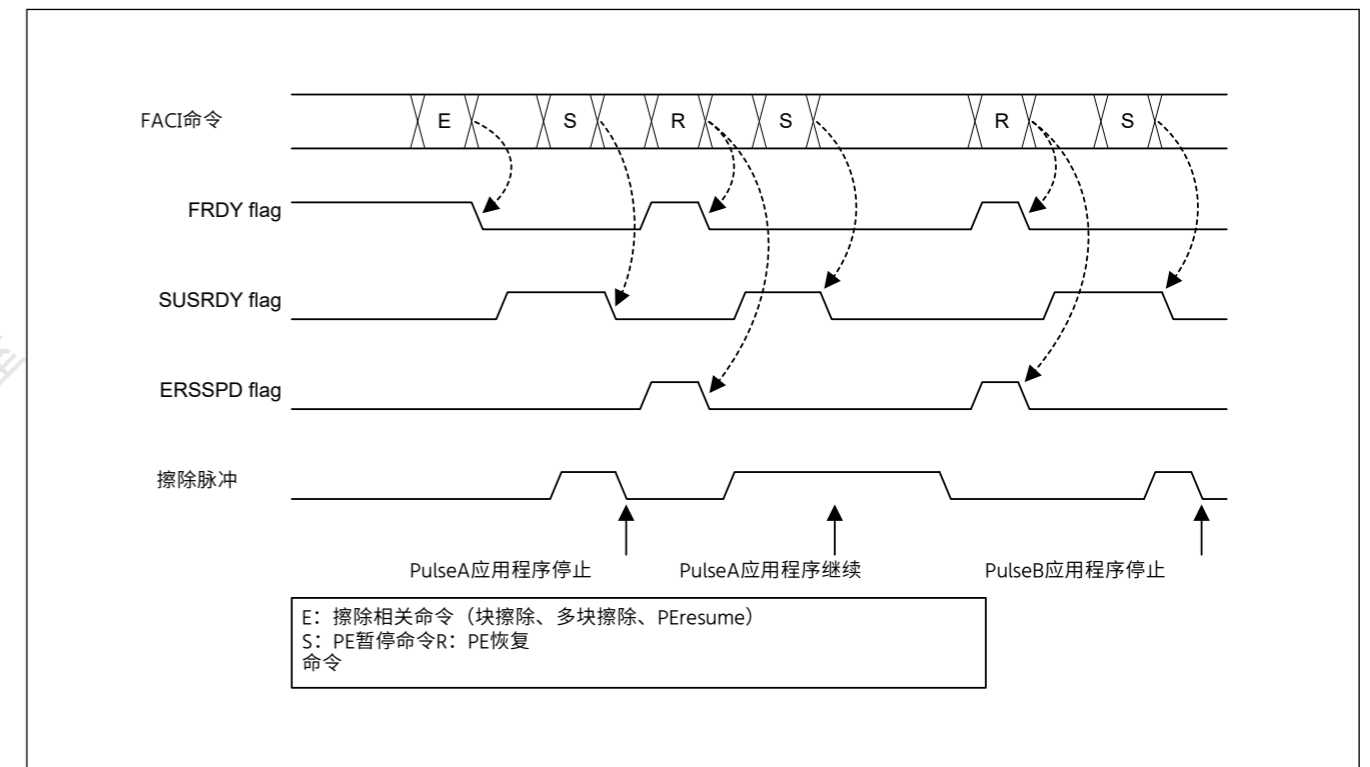

Figure 44.18 擦除期间暂停（暂停优先模式）

### (3) 擦除期间暂停（擦除优先模式）

闪存定序器具有用于暂停擦除的擦除优先模式。图44.19显示了擦除挂起模式设置为擦除优先模式时的擦除挂起操作（FCPSR寄存器中的ESUSPMD位为1）。擦除优先模式中擦除脉冲的控制方法与用于编程暂停处理的编程脉冲的控制方法相同。

如果在施加擦除脉冲时闪存定序器接收到PE暂停命令，则闪存定序器继续施加脉冲。在这种模式下，与暂停优先模式相比，擦除处理所需的时间可以减少，因为当发出PE恢复命令时不会发生擦除脉冲的重新施加。

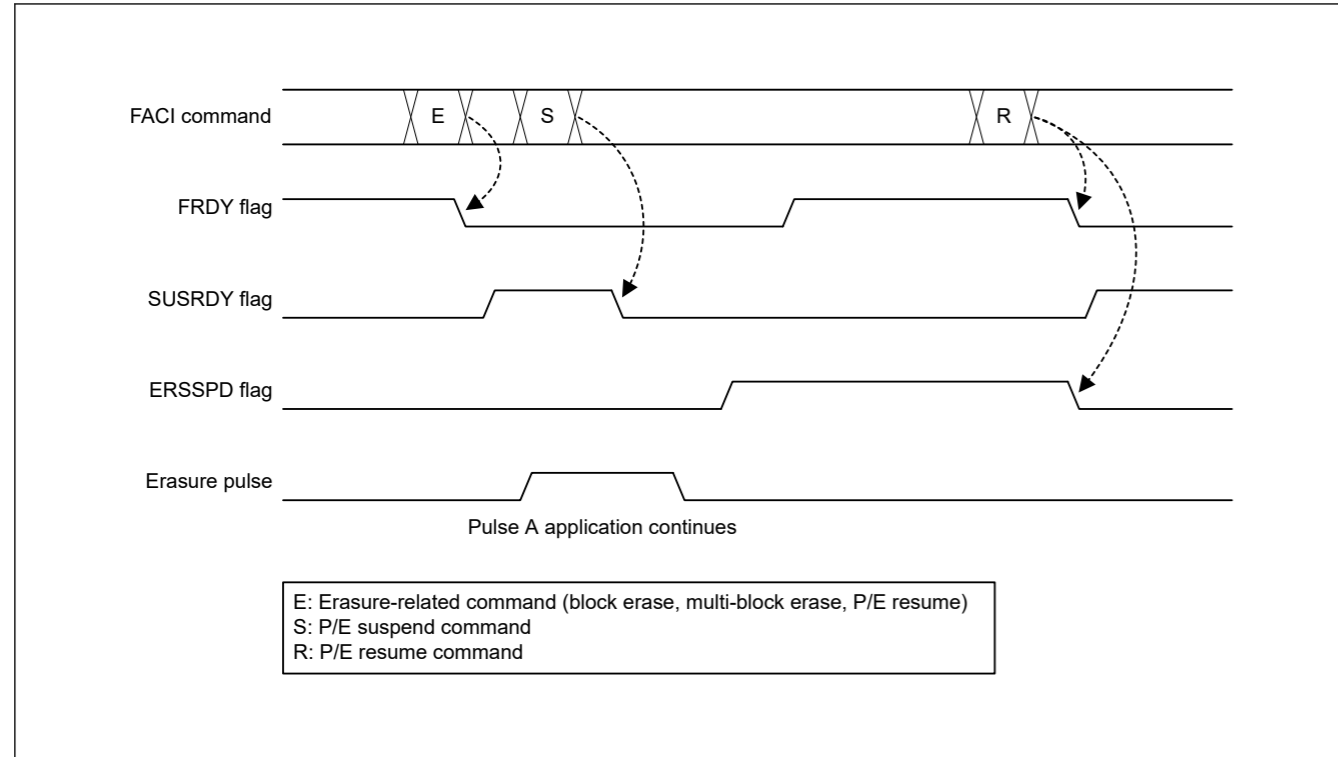

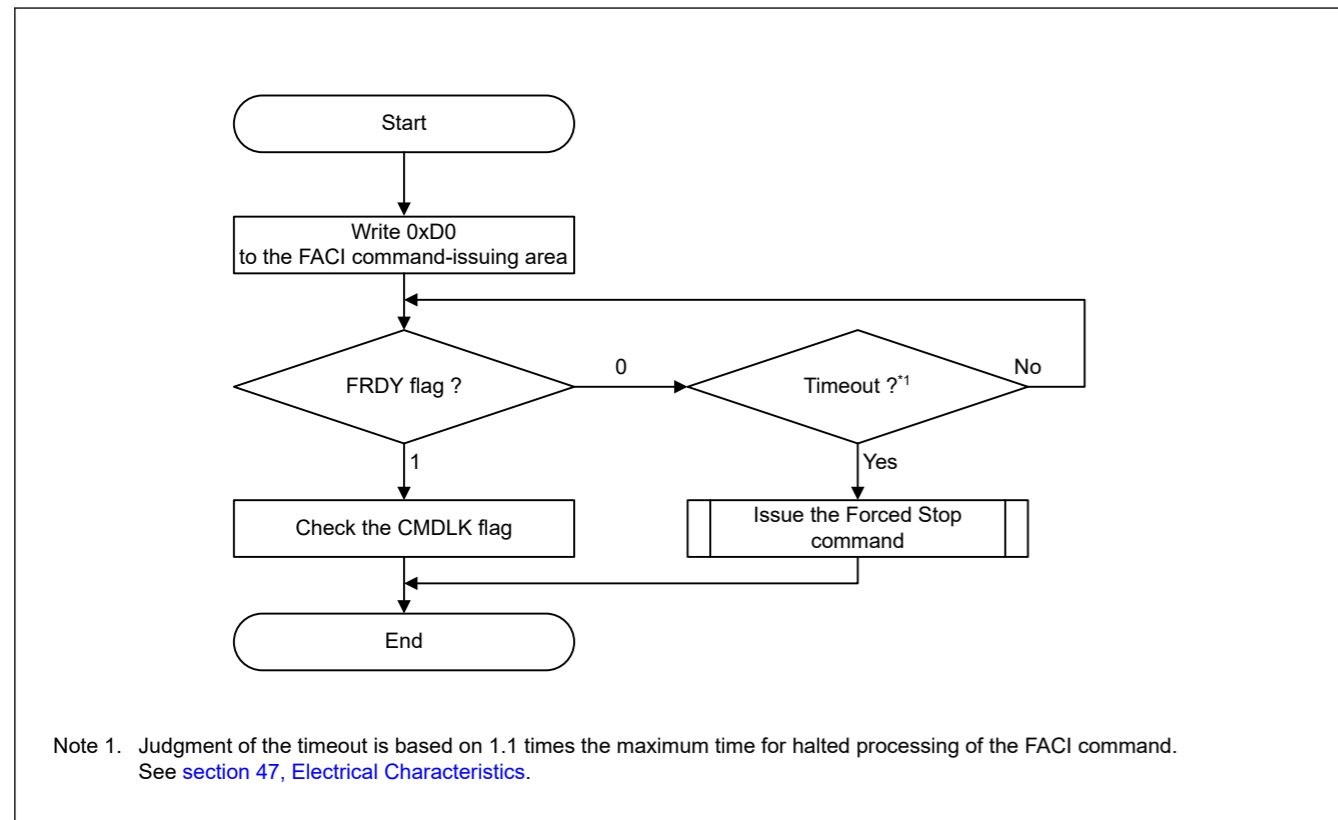

Figure 44.19 Suspension during erasure (erasure priority mode)

44.9.3.11 P/E Resume Command

The P/E resume command is used to resume suspended programming or erasure. If the FENTRYR setting has been modified during suspension, issue a P/E resume command only after resetting FENTRYR to the previous value that was held before the P/E suspend command. Figure 44.20 shows usage of the P/E resume command.

Note 1. Judgment of the timeout is based on 1.1 times the maximum time for halted processing of the FACL command. See section 47, Electrical Characteristics.

Figure 44.20 Usage flow of the P/E resume command

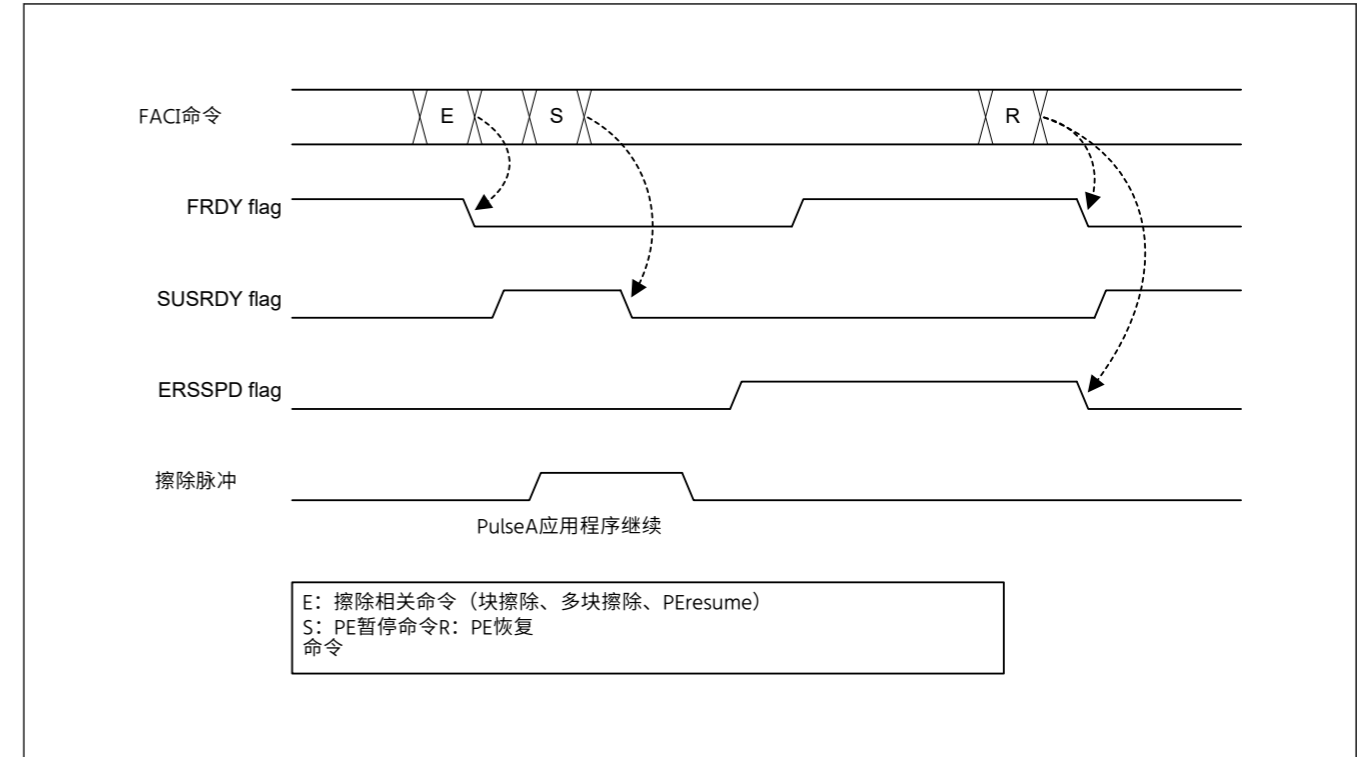

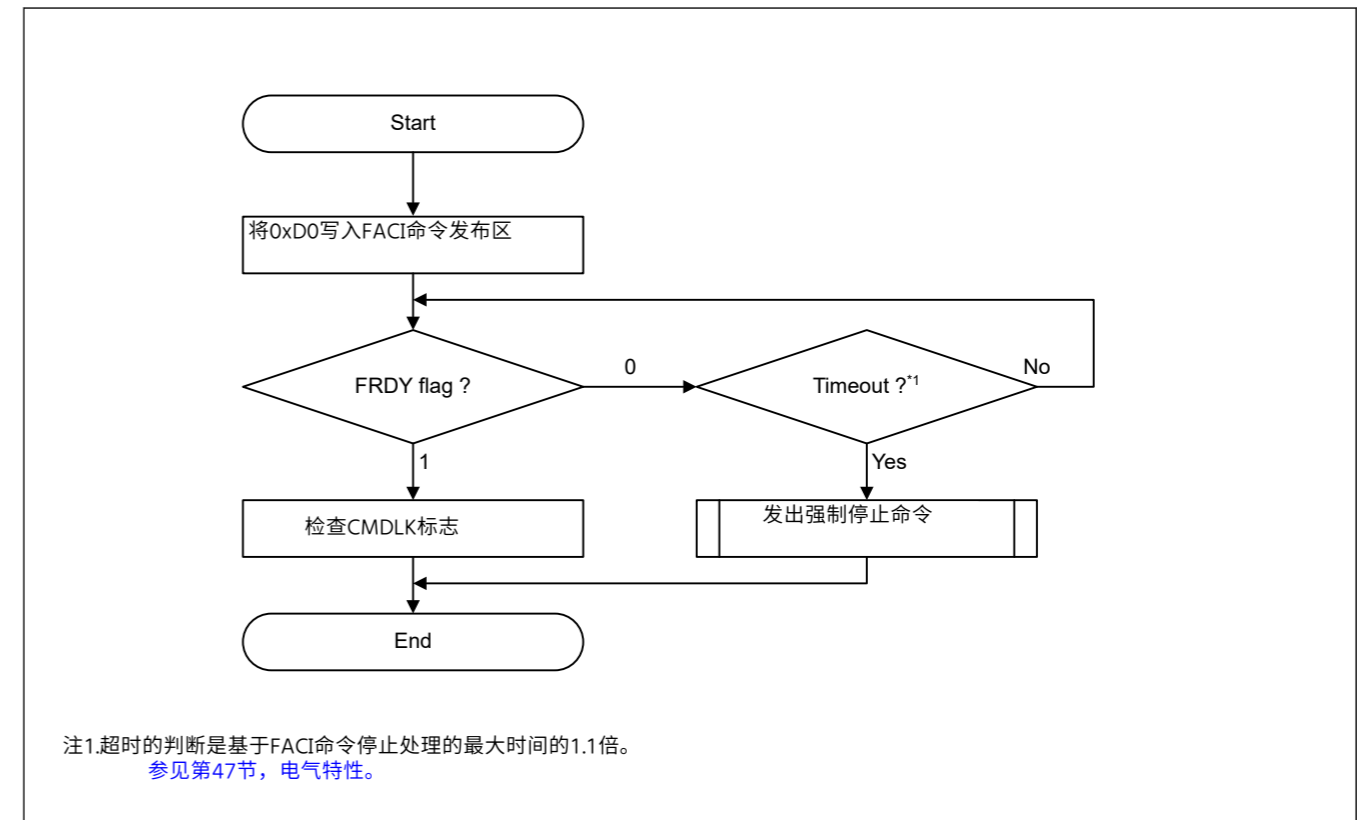

Figure 44.19 擦除期间暂停 (擦除优先模式)

44.9.3.11 PE恢复命令

PEresume命令用于恢复暂停的编程或擦除。如果在挂起期间修改了FENTRYR设置，则仅在将FENTRYR重置为发出PE挂起命令之前保持的先前值之后才发出PEresume命令。图44.20显示了PEresume命令的用法。

注1.超时的判断是基于FACL命令停止处理的最大时间的1.1倍。参见第47节，电气特性。

Figure 44.20 PEresume命令的使用流程

### 44.9.3.12 Status Clear Command

The status clear command is used to clear the command-locked state (see [section 44.9.3.6. Recovery from the Command-Locked State](#)).

You can use the status clear command to clear the following bits in the FSTATR register in the command-locked state:

- ILGLERR
- ILGCOMERR
- FESETERR
- SECERR
- OTERR
- ERSERR
- PRGERR

Figure 44.21 shows usage of the status clear command.

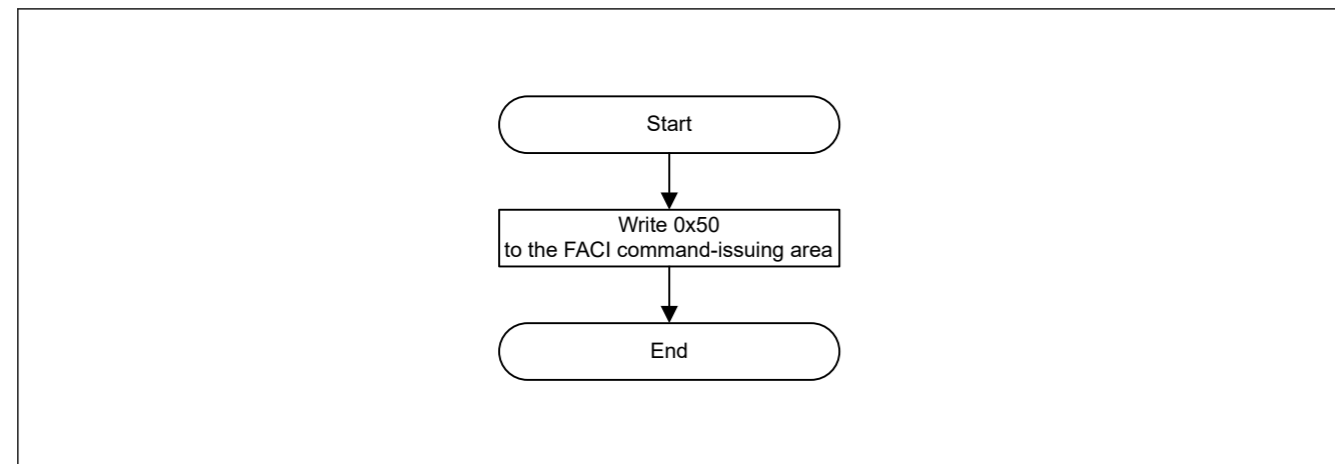

Figure 44.21 Usage flow of the status clear command

### 44.9.3.13 Forced Stop Command

The forced stop command is used to forcibly end command processing by the flash sequencer. Although this command halts command processing more quickly than the P/E suspension command, values from the programming or erasure that are in progress are not guaranteed. Additionally, resumption of processing is not possible. Processing of programming or erasure that is halted by the forced stop command is also defined as one programming round.

Executing the forced stop command also initializes part of the FACL, the whole FCU, the FSTATR and FASTAT registers. This command can be used in the procedure for recovery from the command-locked state and for processing in response to a timeout of the flash sequencer (see [section 44.9.3.6. Recovery from the Command-Locked State](#)).

Figure 44.22 shows usage of the forced stop command.

### 44.9.3.12 状态清除命令

statusclear命令用于清除命令锁定状态（参见第44.9.3.6节。从命令中恢复锁定状态）。

在命令锁定状态下，您可以使用statusclear命令清除FSTATR寄存器中的以下位：

- ILGLERR
- ILGCOMERR
- FESETERR
- SECERR
- OTERR
- ERSERR
- PRGERR

图44.21显示了statusclear命令的用法。

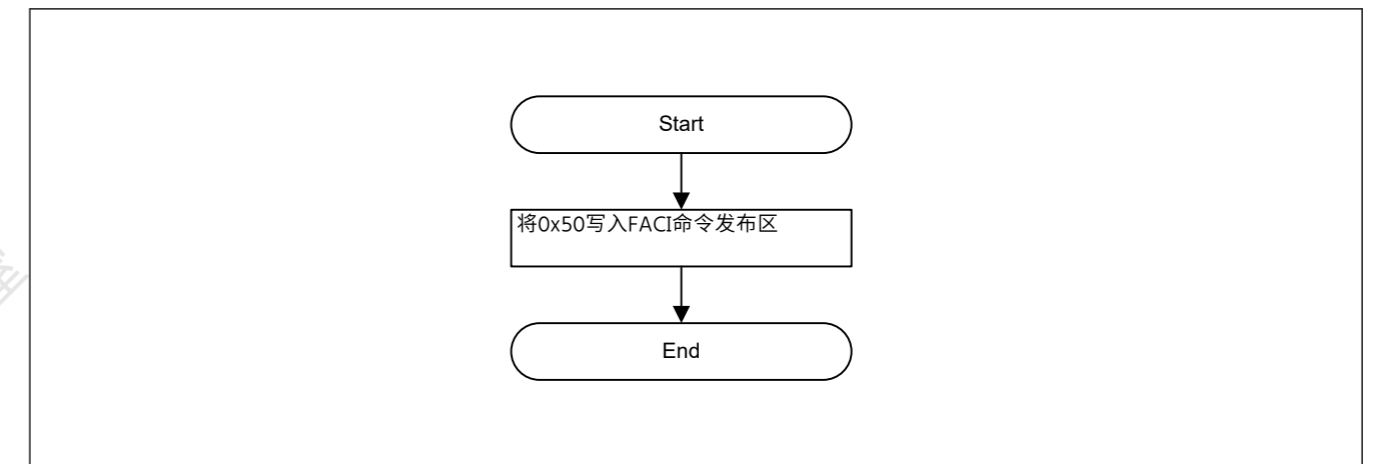

Figure 44.21 statusclear命令的使用流程

### 44.9.3.13 强制停止命令

强制停止命令用于强制结束闪存定序器的命令处理。尽管此命令比PE暂停命令更快地停止命令处理，但不能保证正在进行的编程或擦除的值。此外，无法恢复处理。由强制停止命令停止的编程或擦除的处理也被定义为一轮编程。

执行强制停止命令还会初始化部分FACL、整个FCU、FSTATR和FASTAT寄存器。此命令可用于从命令锁定状态恢复的过程以及用于响应闪存定序器超时的处理（请参阅第44.9.3.6节。从命令锁定状态恢复）。

图44.22显示了强制停止命令的用法。

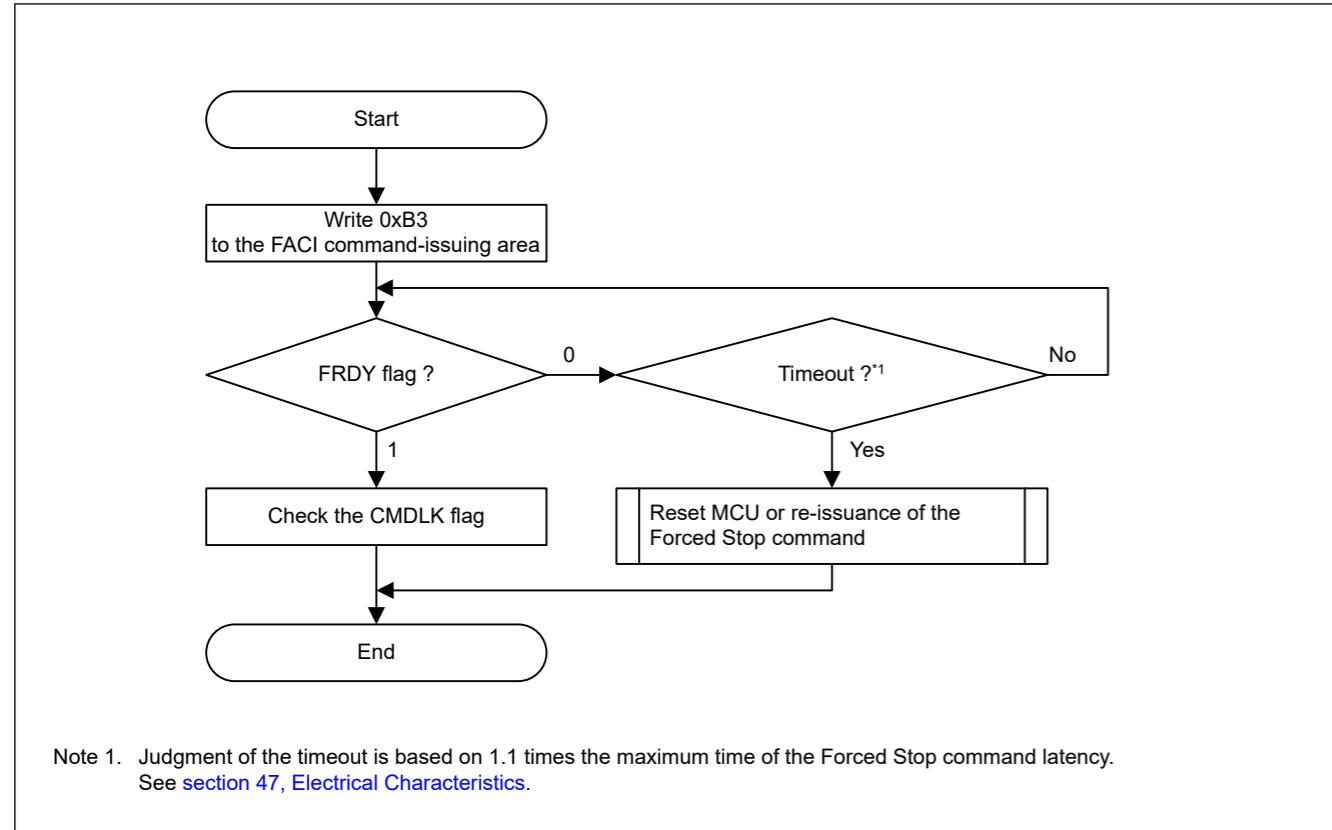

Figure 44.22 Usage flow of the forced stop command

## (1) Notes on Using the Forced Stop Command during Command Issue

When using the forced stop command at the timeout occurrence by DBFULL bit of the program command, writing in the FACI command-issuing area is sometimes processed as writing in data of the program command. See Table 44.3 in section 44.3. Address Space for information on the FACI command-issuing area to force a command lock. Then issue a forced stop command with return method from the command lock status (see Figure 44.13). Locking commands is possible in any case where the unit for reading the FACI command issuing area is 8, 16, or 32 bits.

## 44.9.3.14 Blank Check Command

The blank check command is used to confirm that an area is in the non-programmed state. Values read from the data flash memory that have been erased but not yet programmed again that is in the non-programmed state, are undefined.

Before issuing the Blank Check command, set addressing mode, start address, and end address of the target area for Blank Check to the FBCCNT, FSADDR, and FEADDR registers. When Blank Check addressing mode is set to decremental mode (i.e. FBCCNT.BCDIR = 1), address specified in FSADDR should be equal to or larger than address in FEADDR.

On the other hand, the address in FSADDR should be equal to or smaller than address in FEADDR when Blank Check addressing mode is set to incremental mode (i.e. FBCCNT.BCDIR = 0).

If the settings of the BCDIR bit, FSADDR, and FEADDR are inconsistent, the flash sequencer enters the command-locked state. The size of the target area for Blank Check is in the range from 4 bytes to the data flash memory capacity and is set in units of 4 bytes.

Write 0x71 and 0xD0 to the FACI command-issuing area to start Blank Check. Completion of processing can be confirmed by the FRDY bit of the FSTATR register. At the end of processing, the result of Blank Check is stored in the BCST bit in the FBCSTAT register. If non-programmed data exists within the target area for Blank Check, flash sequencer stops Blank Check command operation. In this case, address of non-programmed data is indicated to FPSADDR register.

Figure 44.23 shows usage of the blank check command.

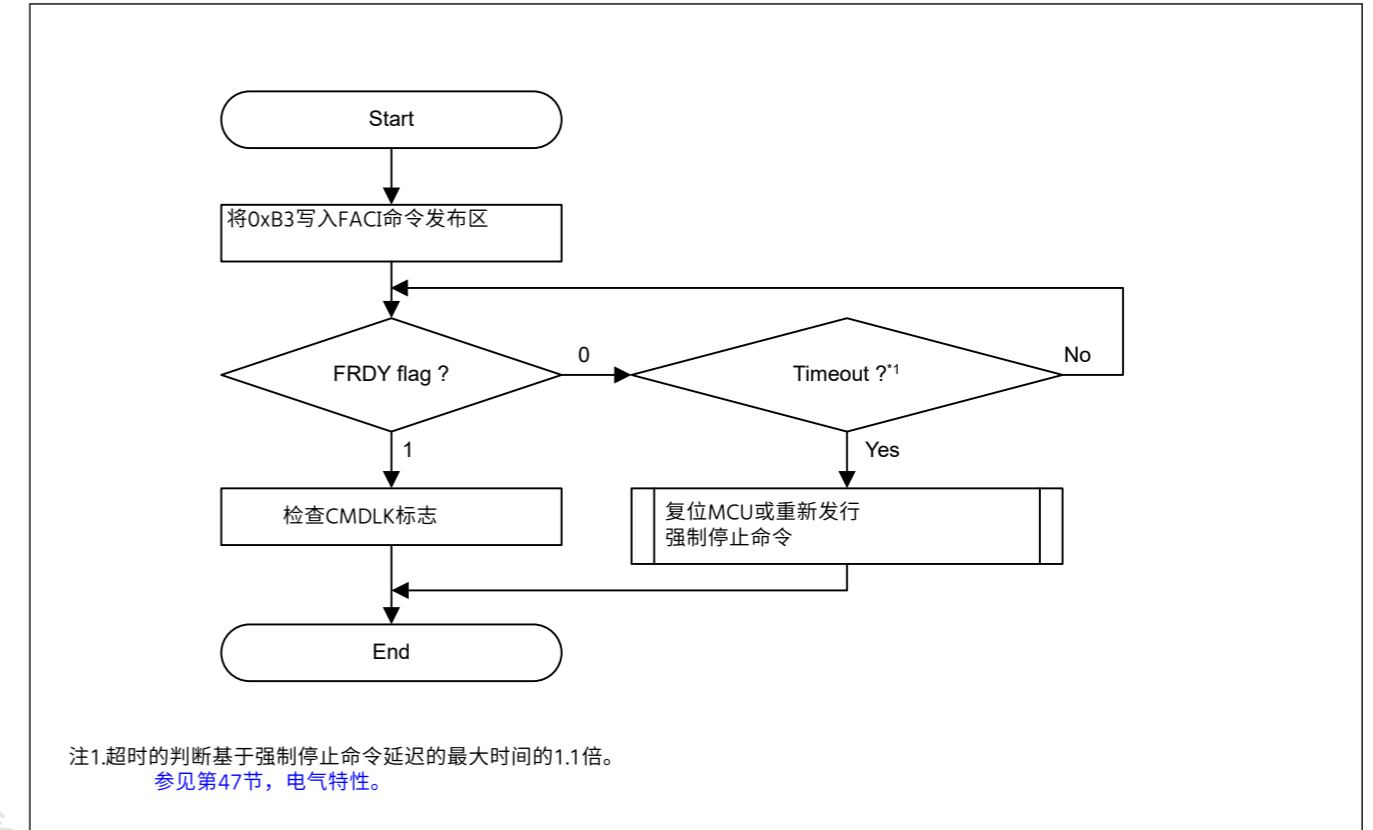

Figure 44.22 强制停止命令的使用流程

## (1) 命令发出期间使用强制停止命令的注意事项

通过程序命令的DBFULL位在超时发生时使用强制停止命令时，写入FACI命令发布区域有时被处理为写入程序命令的数据。请参见第44.3节中的表44.3。FACI命令发布区域信息的地址空间以强制命令锁定。然后从命令锁定状态发出带返回方法的强制停止命令（见图44.13）。在读取FACI命令发布区域的单位为8、16或32位的任何情况下，锁定命令都是可能的。

## 44.9.3.14 空白检查命令

空白检查命令用于确认某个区域处于非编程状态。从处于未编程状态的已擦除但尚未再次编程的数据闪存读取的值未定义。

在发出空白检查命令之前，设置空白目标区域的寻址方式、起始地址和结束地址检查FBCCNT、FSADDR和FEADDR寄存器。当空白检查寻址模式设置为递减模式（即FBCCNT.BCDIR=1）时，FSADDR中指定的地址应等于或大于FEADDR中的地址。

另一方面，当空白检查寻址模式设置为增量模式（即FBCCNT.BCDIR=0）时，FSADDR中的地址应等于或小于FEADDR中的地址。

如果BCDIR位、FSADDR和FEADDR的设置不一致，则flashsequencer进入command-locked状态。BlankCheck的目标区域大小在4字节到数据闪存容量的范围内，以4字节为单位设置。

将0x71和0xD0写入FACI命令发出区域以启动空白检查。可通过FSTATR寄存器的FRDY位确认处理完成。处理结束时，空白检查的结果存储在FBCSTAT寄存器的BCST位中。如果空白检查的目标区域内存在未编程的数据，闪存定序器将停止空白

检查命令操作。在这种情况下，非编程数据的地址被指示到FPSADDR寄存器。

图44.23显示了空白检查命令的用法。

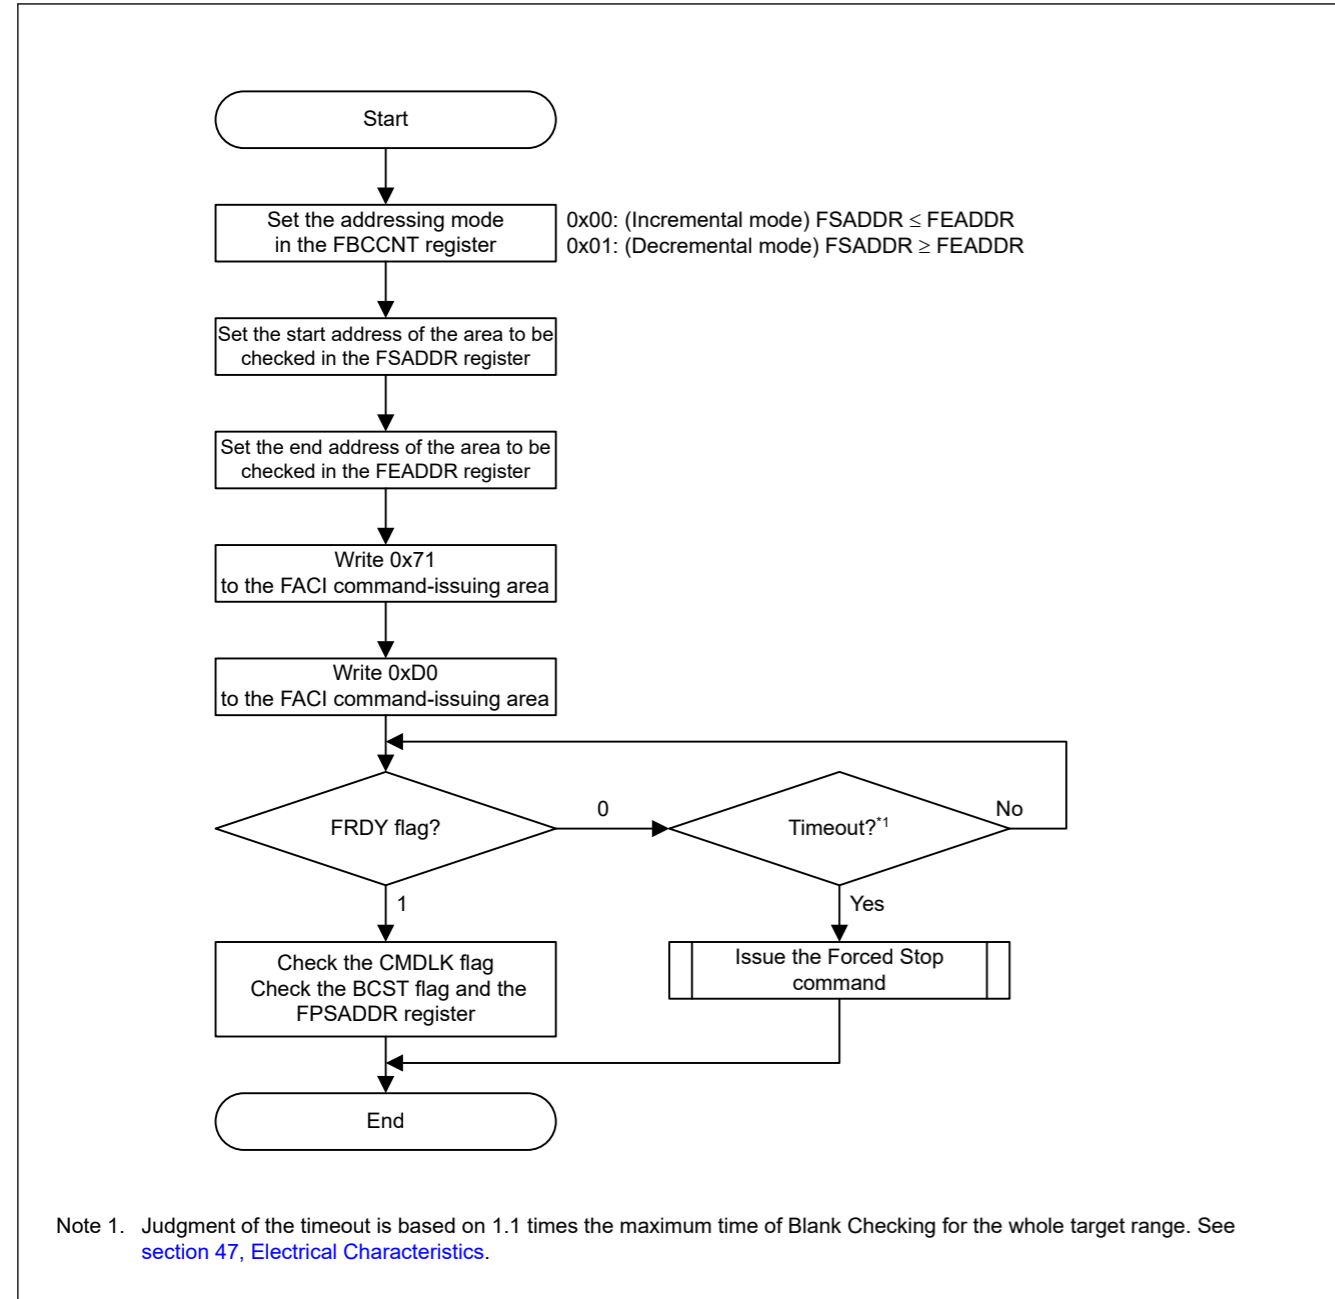

Figure 44.23 Usage flow of the blank check command

### 44.9.3.15 Configuration Set Command

The Configuration set command is used to set option-setting memory. Before issuing the Configuration set command, set the specified address (shown in Table 44.18) in the FSADDR register. Writing 0xD0 to the FACL command-issuing area in the final access for issuing the FACL command starts FACL processing of the Configuration set command.

Figure 44.24 shows usage of the configuration set command.

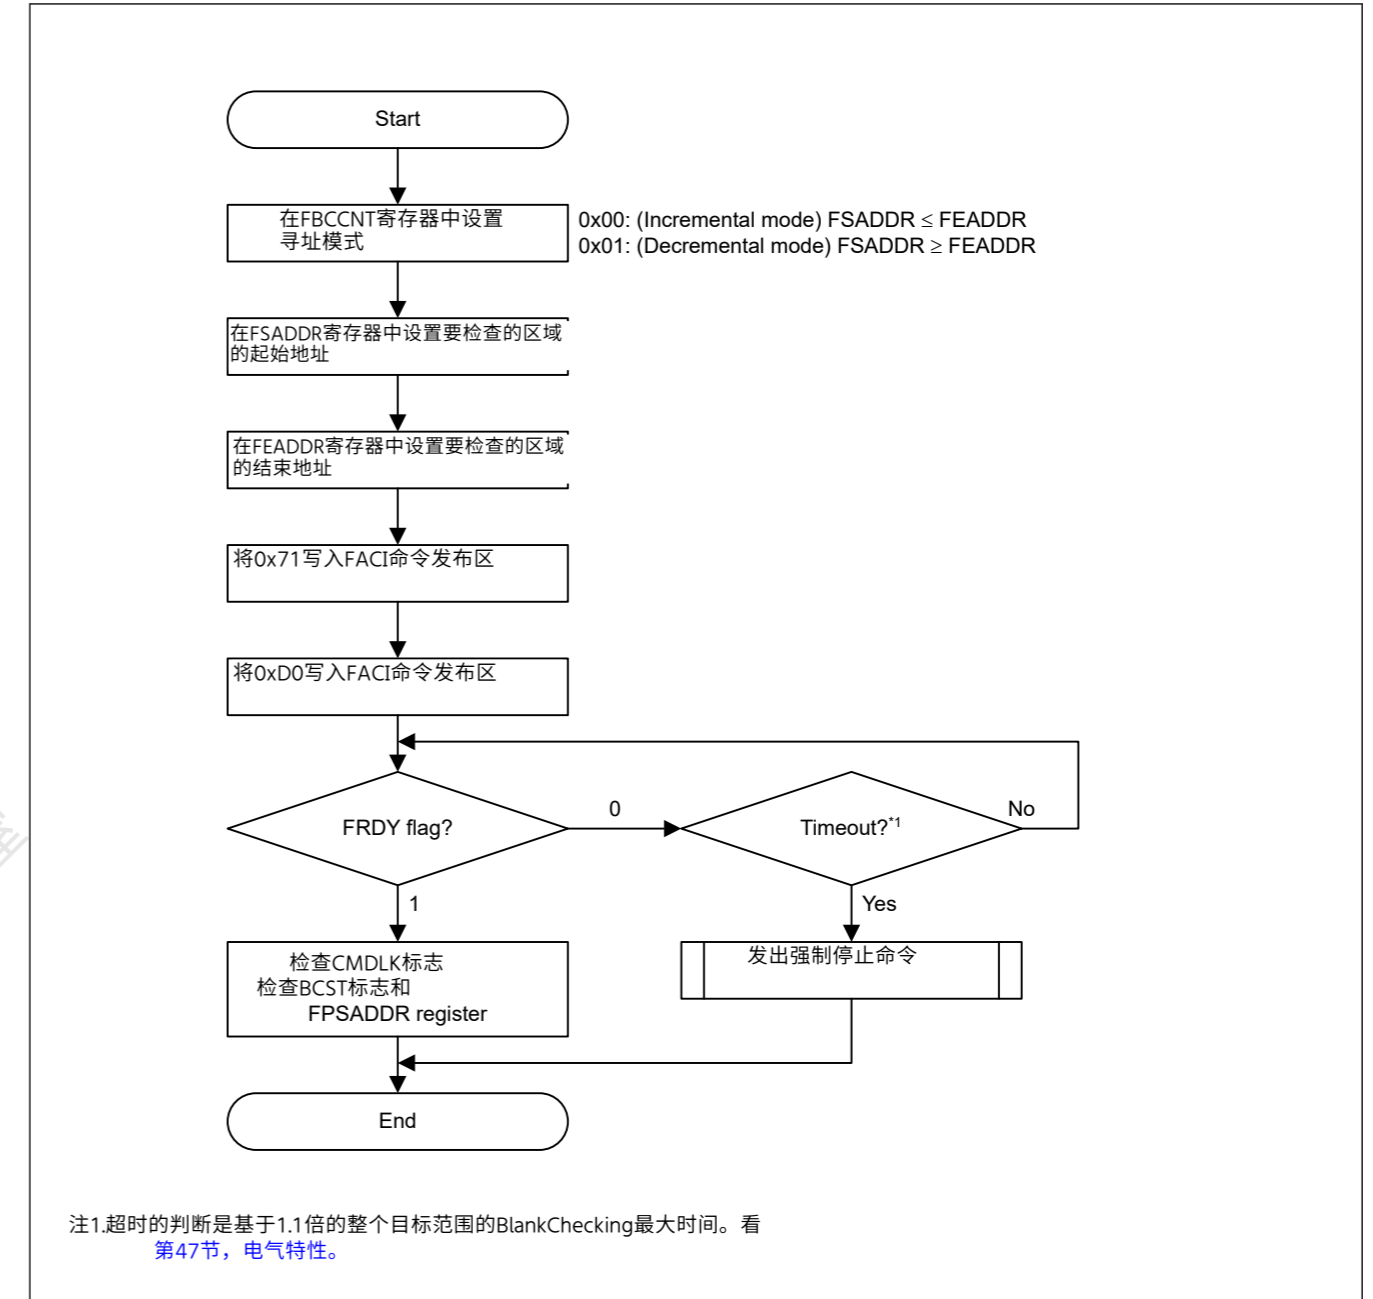

Figure 44.23 空白检查命令的使用流程

### 44.9.3.15 配置集命令

Configurationset命令用于设置选项设置内存。在发出配置设置命令之前，在FSADDR寄存器中设置指定的地址（如表44.18所示）。在发出FACL命令的最终访问中将0xD0写入FACL命令发出区域，开始配置设置命令的FACL处理。

图44.24显示了配置集命令的用法。

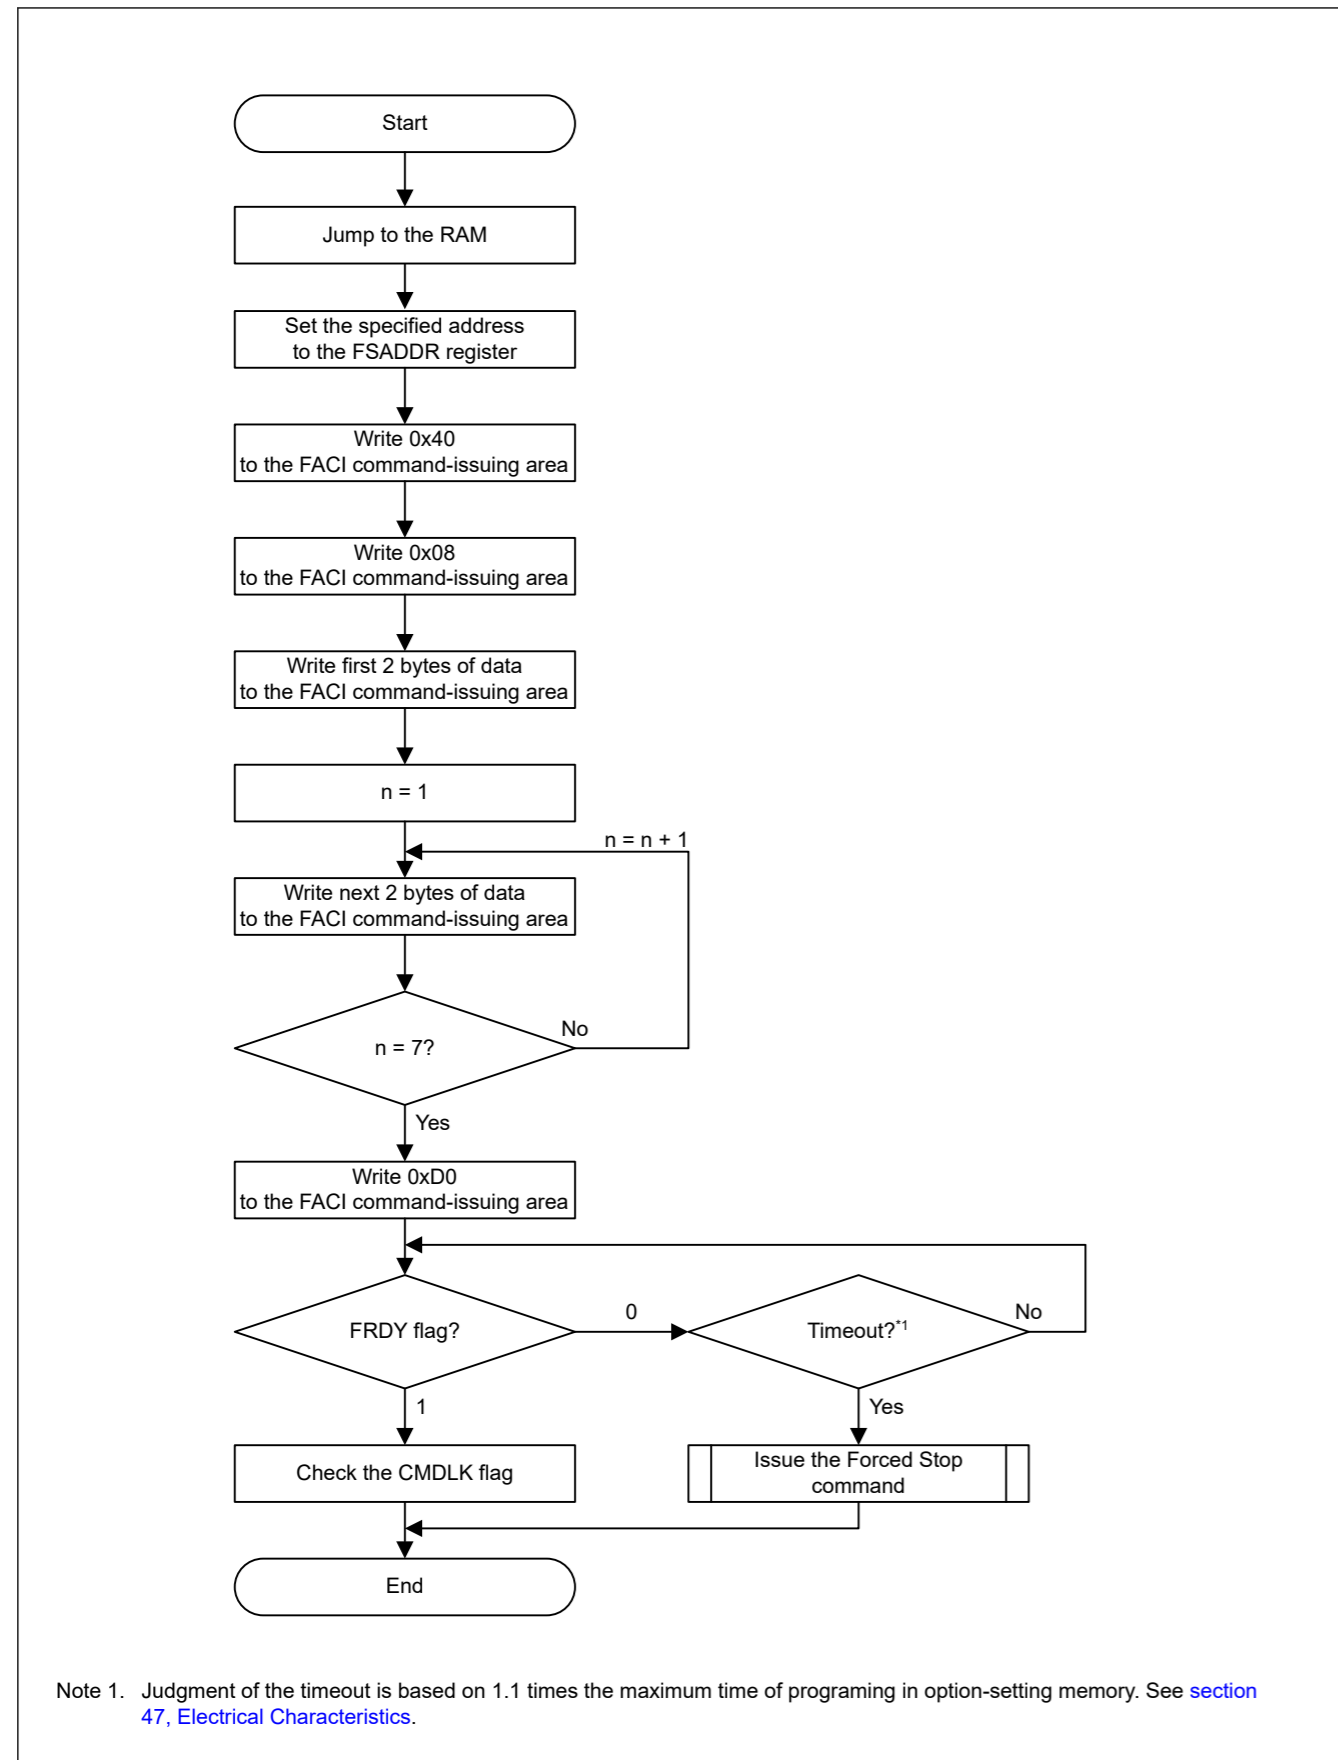

Figure 44.24 Usage flow of the configuration set command

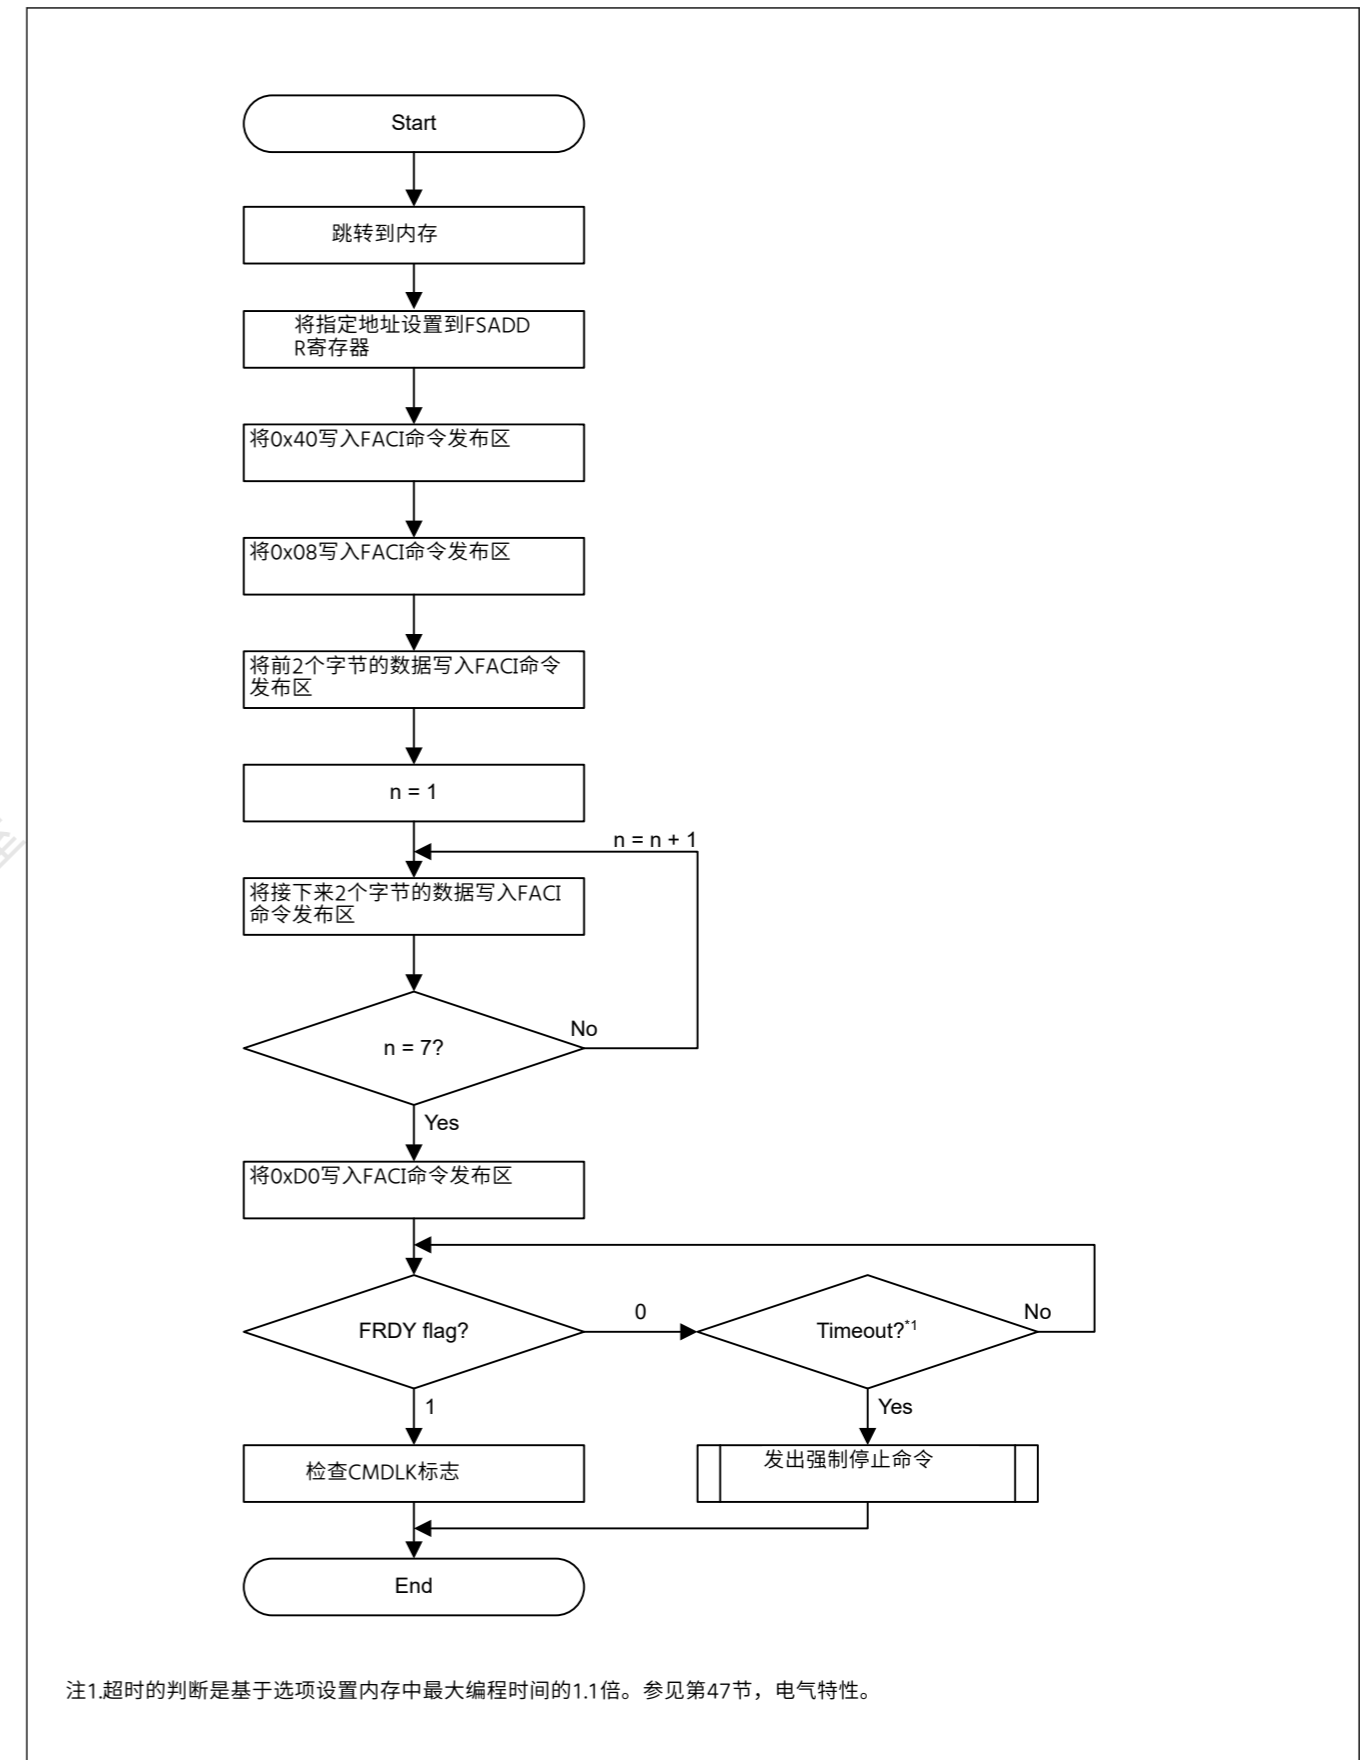

Figure 44.24 配置集命令使用流程

The correspondence between the possible target data for configuration setting and the address value set in the FSADDR register is shown in Table 44.18. For details, see section 44.4.12. FSADDR : FACI Command Start Address Register.

Table 44.18 Address Used by Configuration Set Command

| Address     | FSADDR Register Value | Setting Data   | Operation of additional writing              |  | Timing when the Setting is Enabled  |
|-------------|-----------------------|--|--|--|-------------------------------------|
|             |                       |  | SAS.FSPR bit is 1                            | SAS.FSPR bit is 0                            |                                     |
| 0x0100_A100 | 0x0100_A100           | Option Function Select Register 0 (OFS0)                   | Writable                                     | Writable                                     | At a reset                          |
| 0x0100_A134 | 0x0100_A134           | Start-up Area Setting Register (SAS)                       | Writable                                     | Not writable <sup>*1</sup>                   | When a reset or command is executed |
| 0x0100_A180 | 0x0100_A180           | Option Function Select Register 1 (OFS1)                   | Writable                                     | Writable                                     | At a reset                          |

| 0x0100_A280 | 0x0100_A280           | Option Function Select Register 1 Select (OFS1_SEL)        | Writable                                     | Writable                                     | At a reset                          |
| 0x0100_A290 | 0x0100_A290           | Bank Select Register Select (BANKSEL_SEL)                  | Writable                                     | Writable                                     | At a reset                          |
| 0x0100_A2C0 | 0x0100_A2C0           | Block Protect Setting Register Select (BPS_SEL)            | Writable                                     | Writable                                     | At a reset                          |

Note 1. The SAS.FSPR bit cannot be restored to 1 by using the Configuration set command once it is set to 0. Therefore, setting the start-up area select flags again becomes impossible. (when the Configuration set command is issued to the address of 0x0100A134, the command is locked.) Exercise extra caution when handling the SAS.FSPRbit.

Note 2. Once PBPS[n] bit is set to 0, the BPS[n] bit cannot be restored to 1 by using the Configuration set command.

Note 3. Once these bits are set to 0, the bits cannot be restored to 1 by using the Configuration set command. The PBPS[n] bit can not be set to 0 by using the Configuration set command when the BPS[n] bit is 1.

Note 4. Once PBPS\_SEC[n] bit is set to 0, the BPS\_SEC[n] bit cannot be restored to 1 by using the Configuration set command.

Note 5. Once these bits are set to 0, the bits cannot be restored to 1 by using the Configuration set command. The PBPS\_SEC[n] bit cannot be set to 0 by using the Configuration set command when the BPS\_SEC[n] bit is 1.

#### 44.10 Suspend Operation

Reading from the flash memory is not possible during programming or erasure if the conditions for background operation given in Table 44.31 are not satisfied. When a P/E suspend command is issued to suspend the programming or erasure of the flash memory, reading from the flash memory is enabled. Regarding P/E suspend commands, there are one suspend command mode for programming and two suspend command modes for erasure (suspension priority mode and erasure priority mode). To resume suspended programming or erasure, the P/E resume command is available. See details on the suspend operation, refer to Figure 44.16.

配置设置的可能目标数据与FSADDR寄存器中设置的地址值的对应关系如表44.18所示。有关详细信息，请参阅第44.4.12节。FSADDR：FACI命令起始地址寄存器。

Table 44.18 配置设置命令使用的地址

| Address     | FSADDR 寄存器值设置数据 |                              | 追加写入的操作                                      |  | 启用设置的时间  |
|-------------|-----------------|------------------------------|--|--|----------|
|             |                 |                              | SAS.FSPR位为1                                  | SAS.FSPR位为0                                  |          |
| 0x0100_A100 | 0x0100_A100     | 选项功能选择寄存器0(OFS0)             | Writable                                     | Writable                                     | 复位时      |

| 0x0100_A1E0 | 0x0100_A1E0     | 永久块保护设置 Register (PBPS)      | Writable <sup>*3</sup><br>(from 1 to 0 only) | Writable <sup>*3</sup><br>(from 1 to 0 only) | 执行复位或命令时 |
| 0x0100_A200 | 0x0100_A200     | 选项功能选择寄存器1 Secure (OFS1_SEC) | Writable                                     | Writable                                     | 复位时      |
| 0x0100_A210 | 0x0100_A210     | 银行选择寄存器安全(BANKSEL_SEC)       | Writable                                     | Writable                                     | 复位时      |
| 0x0100_A240 | 0x0100_A240     | 块保护设置寄存器 Secure (BPS_SEC)    | Writable <sup>*4</sup>                       | Writable <sup>*4</sup>                       | 执行复位或命令时 |
| 0x0100_A260 | 0x0100_A260     | 永久块保护设置 注册安全(PBPS_SEC)       | Writable <sup>*5</sup><br>(from 1 to 0 only) | Writable <sup>*5</sup><br>(from 1 to 0 only) | 执行复位或命令时 |
| 0x0100_A280 | 0x0100_A280     | 选项功能选择寄存器1 Select (OFS1_SEL) | Writable                                     | Writable                                     | 复位时      |
| 0x0100_A290 | 0x0100_A290     | 银行选择寄存器选择 (BANKSEL_SEL)      | Writable                                     | Writable                                     | 复位时      |
| 0x0100_A2C0 | 0x0100_A2C0     | 块保护设置寄存器 Select (BPS_SEL)    | Writable                                     | Writable                                     | 复位时      |

注1.SAS.FSPR位一旦设置为0，就无法通过Configurationset命令恢复为1。因此，再次设置启动区域选择标志变得不可能。（当向0x0100A134地址发出Configurationset命令时，该命令被锁定。）处理SAS.FSPRbit时要格外小心。

注2.一旦PBPS[n]位设置为0，BPS[n]位不能通过使用配置设置命令恢复为1。

注3.一旦这些位设置为0，就不能使用配置设置命令将这些位恢复为1。当BPS[n]位为1时，不能使用配置设置命令将PBPS[n]位设置为0。

注4.一旦PBPS\_SEC[n]位设置为0，则BPS\_SEC[n]位无法通过使用配置设置命令恢复为1。

注5.一旦这些位设置为0，就不能使用配置设置命令将这些位恢复为1。当BPS\_SEC[n]位为1时，无法使用配置设置命令将PBPS\_SEC[n]位设置为0。

#### 44.10 暂停操作

如果不满足表44.31中给出的后台操作条件，则在编程或擦除期间无法从闪存读取。当发出PE暂停命令以暂停闪存的编程或擦除时，将启用从闪存读取。关于PE挂起命令，有一种用于编程的挂起命令模式和两种用于擦除的挂起命令模式（挂起优先模式和擦除优先模式）。要恢复暂停的编程或擦除，可以使用PEresume命令。详见挂起操作，参见图44.16。

## 44.11 Protection Function

### 44.11.1 Software Protection

Software protection disables programming and erasure of the code flash memory through the settings of control registers and block protect setting in the user area. If an attempt is made to issue an FACI command against software protection, the flash sequencer enters the command-locked state.

#### 44.11.1.1 Protection through FWEPROR

Unless the FWEPROR.FLWE[1:0] bits are set to 01b, programming cannot proceed in any mode.

#### 44.11.1.2 Protection by FENTRYR

When the FENTRYR register is set to 0x0000, the flash sequencer enters read mode. In read mode, FACI commands cannot be accepted. If an attempt is made to issue an FACI command in read mode, the flash sequencer enters the command-locked state.

#### 44.11.1.3 Protection by Block Protect Setting

Each block in user area has the block protect setting (BPS or BPS\_SEC). When the FBPROT0 or FBPROT1 register is 0x0000 and the block protect bit is 0, issuing the Program or Block Erase command to user area of the code flash causes the command-locked state. To program or erase the block whose block protect bit is 0, set the FBPROT0 or FBPROT1 register to 0x0001.

The block protect setting can be locked by the permanent block protect setting (PBPS or PBPS\_SEC). When the permanent block protect setting and the block protect setting are 0, issuing a Program or Block erase command to user area of the code flash causes the flash sequencer to enter the command-locked state regardless of the FBPROT0 and FBPROT1 register settings.

Valid block protect setting (BPS or BPS\_SEC) depends on the Block Protect Select bit (BPS\_SEL).

See [section 44.12.2. Permanent Block Protect Setting](#) for details of the block protect setting and permanent block protect setting. See [section 44.4.15. FBPROT0 : Flash Block Protection Register](#) and [section 44.4.16. FBPROT1 : Flash Block Protection for Secure Register](#) for more information.

For details of block protect setting (BPS or BPS\_SEC) and block protect select (BPS\_SEL), see [section 6, Option-Setting Memory](#).

The protected area by the block protect setting is always determined by the address of the FSADDR register setting regardless of the address swapping function setting (the startup area select, and the block swap). [Table 44.19](#) to [section 44.11.1.3. Protection by Block Protect Setting](#) show the relation of user area and the block protect setting in each function setting.

- BPS[0] to BPS[n] or BPS\_SEC[0] to BPS\_SEC[n] are assigned to the block of user area (for example, address is 0x00\_0000 to the last block address).
- BPS[0]/BPS\_SEC[0] and BPS[1]/BPS\_SEC[1] are assigned to the block of user area depending on the startup area select setting (SAS.BTFLG bit). (See [section 44.11.3. Start-Up Program Protection](#)).
- The second half of FLI user area is assigned to block protect setting depending on the block swap select setting (BANKSEL.BLCKSWP[2:0] bits). See [section 44.11.4. Block Swap Function](#).

[Table 44.19](#) shows the block protect setting when the startup area select is disabled (not swapping).

[Table 44.19](#) and later show example of the block protect setting when the address conversion function is used.

**Table 44.19 Example of Block Protect setting when SAS.BTFLG is 1 (1 of 2)**

| FSADDR[23:0]           | Block size | Block protect setting | User area block number | Notes |
|------------------------|------------|-----------------------|------------------------|-------|
| The last block address | 32 KB      | BPS[n] or BPS_SEC[n]  | Block n                | —     |
| ⋮                      | ⋮          | ⋮                     | ⋮                      | —     |
| 0x01_8000 to 0x01_FFFF | 32 KB      | BPS[9] or BPS_SEC[9]  | Block 9                | —     |

## 44.11 保护功能

### 44.11.1 软件保护

软件保护通过控制寄存器的设置和用户区的块保护设置禁用代码闪存的编程和擦除。如果尝试针对软件保护发出FACI命令，则闪存定序器进入命令锁定状态。

#### 44.11.1.1 通过FWEPROR进行保护

除非FWEPROR.FLWE[1:0]位设置为01b，否则无法在任何模式下进行编程。

#### 44.11.1.2 FENTRYR的保护

当FENTRYR寄存器设置为0x0000时，闪存定序器进入读取模式。在读取模式下，无法接受FACI命令。如果尝试在读取模式下发出FACI命令，则闪存定序器进入命令锁定状态。

#### 44.11.1.3 通过块保护设置进行保护

用户区的每个块都有块保护设置（BPS或BPS\_SEC）。当FBPROT0或FBPROT1寄存器为0x0000且块保护位为0时，向代码闪存的用户区发出Program或BlockErase命令会导致命令锁定状态。要编程或擦除块保护位为0的块，请将FBPROT0或FBPROT1寄存器设置为0x0001。

块保护设置可以通过永久块保护设置（PBPS或PBPS\_SEC）锁定。当永久块保护设置和块保护设置为0时，无论FBPROT0和FBPROT1寄存器设置如何，向代码闪存的用户区发出程序或块擦除命令都会使闪存定序器进入命令锁定状态。

有效的块保护设置（BPS或BPS\_SEC）取决于块保护选择位（BPS\_SEL）。

请参见[第44.12.2节。永久块保护设置有关块保护设置和永久块保护设置的详细信息。请参见第44.4.15节。FBPROT0：闪存块保护寄存器和第44.4.16节。FBPROT1：安全寄存器的闪存块保护了解更多信息。](#)

有关块保护设置（BPS或BPS\_SEC）和块保护选择（BPS\_SEL）的详细信息，请参阅[第6节，选项设置Memory](#)。

块保护设置的保护区始终由FSADDR寄存器设置的地址确定，与地址交换功能设置（启动区域选择和块交换）无关。[表44.19至第44.11.1.3节](#)。块保护设置的保护显示了用户区域和每个功能设置中的块保护设置的关系。

- BPS[0]到BPS[n]或BPS\_SEC[0]到BPS\_SEC[n]分配给用户区的块（例如，地址是0x00\_0000到最后一个块地址）。
- BPS[0]/BPS\_SEC[0]和BPS[1]/BPS\_SEC[1]根据启动区选择设置（SAS.BTFLG位）分配给用户区块。（参见[第4.11.3节。启动程序保护](#)）。
- FLI用户区的后半部分根据块交换选择设置（BANKSEL.BLCKSWP[2:0]位）分配给块保护设置。请参见[第44.11.4节。块交换功能](#)。

[表44.19](#)显示了禁用启动区域选择（不交换）时的块保护设置。

[表44.19](#)及以后显示了使用地址转换功能时的块保护设置示例。

**Table 44.19 SAS.BTFLG为1时的块保护设置示例（1 of 2）**

| FSADDR[23:0]           | 块大小   | 块保护设置                | 用户区块号   | Notes |
|------------------------|-------|----------------------|---------|-------|
| 最后一个区块地址               | 32 KB | BPS[n] or BPS_SEC[n] | Block n | —     |
| ⋮                      | ⋮     | ⋮                    | ⋮       | —     |
| 0x01_8000 to 0x01_FFFF | 32 KB | BPS[9] or BPS_SEC[9] | Block 9 | —     |

Table 44.19 Example of Block Protect setting when SAS.BTFLG is 1 (2 of 2)

| FSADDR[23:0]           | Block size | Block protect setting | User area block number | Notes  |
|------------------------|------------|-----------------------|------------------------|--|
| 0x01_0000 to 0x01_7FFF | 32 KB      | BPS[8] or BPS_SEC[8]  | Block 8                | —  |
| 0x00_E000 to 0x00_FFFF | 8 KB       | BPS[7] or BPS_SEC[7]  | Block 7                | —  |
| 0x00_C000 to 0x00_DFFF | 8 KB       | BPS[6] or BPS_SEC[6]  | Block 6                | —  |
| ⋮                      | ⋮          | ⋮                     | ⋮                      | —  |
| 0x00_2000 to 0x00_3FFF | 8 KB       | BPS[1] or BPS_SEC[1]  | Block 1                | Not swap block 0 and block 1 in this startup area select setting |
| 0x00_0000 to 0x00_1FFF | 8 KB       | BPS[0] or BPS_SEC[0]  | Block 0                | Not swap block 0 and block 1 in this startup area select setting |

Table 44.20 Example of Block Protect setting when SAS.BTFLG is 0

| FSADDR[23:0]           | Block size | Block protect setting | User area block number | Notes  |
|------------------------|------------|-----------------------|------------------------|--|

#### 44.11.2 Error Protection

Error protection detects the issuing of illegal FACL commands, illegal access, and flash sequencer malfunction. FACL command acceptance is disabled (command-locked state) in response to the detection of these errors. The flash memory cannot be programmed or erased while the flash sequencer is in the command-locked state. For release from the command-locked state, issue the Status Clear or Forced Stop command. The Status Clear command can only be used while the FRDY bit in the FSTATR register is 1. The Forced Stop command can be used regardless of the value of the FRDY bit. While the CMDLKIE bit in the FAEINT register is 1, a flash access error (FIFERR) interrupt is generated if the flash sequencer enters the command-locked state (the CMDLK bit in the FASTAT register is set to 1).

If the flash sequencer enters the command-locked state in response to a command other than the P/E suspend command during programming or erasure processing, the flash sequencer continues the processing for programming or erasure. In this state, the P/E suspend command cannot be used to suspend the processing for programming or erasure. If a command is issued in the command-locked state, the IGLERR bit becomes 1 and the other bits retain the values set from previous error detection.

Table 44.23 shows the error protection types and status bit values after error detections.

Table 44.23 Error protection type (1 of 3)

| Error type            | Description  | ILGOMERR | FESERR | SECERR | OTERR | ILGLERR | ERSERR | PRGERR | FLWEERR | CFAE | DFAE |
|-----------------------|--|----------|--------|--------|-------|---------|--------|--------|---------|------|------|
| FENTRYR setting error | The value set in FENTRYR is not 0x0000, 0x0001, or 0x0080              | 0        | 1      | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0    |
|                       | The FENTRYR setting at suspension is different from that at resumption | 0        | 1      | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0    |

#### 44.11.2 错误保护

错误保护检测非法FACL命令的发出、非法访问和闪存定序器故障。FACL命令接受被禁用（命令锁定状态）以响应检测到这些错误。闪存定序器处于命令锁定状态时，无法对闪存进行编程或擦除。要从命令锁定状态释放，请发出状态清除或强制停止命令。状态清除命令只能在FSTATR寄存器中的FRDY位为1时使用。无论FRDY位的值如何，都可以使用强制停止命令。当FAEINT寄存器中的CMDLKIE位为1时，如果闪存定序器进入命令锁定状态（FASTAT寄存器中的CMDLK位设置为1），则会产生闪存访问错误(FIFERR)中断。

如果闪存定序器在编程或擦除处理期间响应于除了PE暂停命令之外的命令而进入命令锁定状态，则闪存定序器继续进行编程或擦除处理。在这种状态下，PE挂起命令不能用于挂起编程或擦除处理。如果在命令锁定状态下发出命令，则IGLERR位变为1，其他位保留先前错误检测设置的值。

表44.23显示了错误检测后的错误保护类型和状态位值。

Table 44.23 错误保护类型(1of3)

| 错误类型        | Description                        | ILGOMERR | FESERR | SECERR | OTERR | ILGLERR | ERSERR | PRGERR | FLWEERR | CFAE | DFAE |
|-------------|------------------------------------|----------|--------|--------|-------|---------|--------|--------|---------|------|------|
| FENTRYR设置错误 | FENTRYR中设置的值不是0x0000、0x0001或0x0080 | 0        | 1      | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0    |
|             | 暂停时的FENTRYR设置与恢复时的设置不同             | 0        | 1      | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0    |

Table 44.23 Error protection type (2 of 3)

| Error type  | Description   | ILGOMERR | FESETERR | SECERR | OTERR | ILGLERR | ERSERR | PRGERR | FLWEERR | CFAE | DFAE      |
|---|---|----------|----------|--------|-------|---------|--------|--------|---------|------|-----------|
| Illegal command error   | An undefined size is specified in the first cycle of the command. (not byte-write)  | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0         |
|   | An undefined code is written in the first access of the FACL command  | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0         |
|   | The value specified in the last access of the multiple-access FACL command is not 0xD0  | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0         |
|   | The value (N) specified in the second write access of the FACL command in the program or configuration set command is wrong                                     | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0         |
|   | Blank Check command is issued with inconsistent BCDIR, FSADDR, and FEADDR settings (see section 44.4.13. FEADDR : FACL Command End Address Register)            | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0/1<br>*1 |
|   | A multi block erase command is issued with inconsistent FSADDR and FEADDR settings.<br>• FSADDR > FEADDR<br>• FEADDR is set to reserved area.                   | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0/1<br>*1 |
|   | An FACL command not acceptable in each mode is issued (see Table 44.15)   | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 0         |

Table 44.23 Error protection type (3 of 3)

| Error type                         | Description   | ILGOMERR | FESETERR | SECERR | OTERR | ILGLERR | ERSERR | PRGERR | FLWEERR | CFAE | DFAE |
|------------------------------------|---|----------|----------|--------|-------|---------|--------|--------|---------|------|------|
| Data flash memory access violation | A program or block erase command is issued to the reserved data area in data flash P/E mode   | 0        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 1    |
|                                    | A multi block erase command is issued to the reserved data area in data flash P/E mode. (FSADDR is set to reserved data area).                  | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 1    |
|                                    | Blank Check command is issued to reserved data area in data flash P/E mode. (FSADDR is set to reserved data area ).                             | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 1    |
|                                    | A program, block erase, multi block erase, or blank check command of non-secure access is issued to the secure region of data area.             | 0        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 1    |
| Security error                     | Configuration set command for the SAS.BTFLG bit setting is issued when the SAS.FSPR bit is 0 (see section 44.9.3.15. Configuration Set Command) | 0        | 0        | 1      | 0     | 1       | 0      | 0      | 0       | 0    | 0    |
| Others                             | An FACL command-issuing area is accessed in read mode   | 0        | 0        | 0      | 1     | 1       | 0      | 0      | 0       | 0    | 0    |
|                                    | An FACL command-issuing area is read in code flash P/E mode or data flash P/E mode  | 0        | 0        | 0      | 1     | 1       | 0      | 0      | 0       | 0    | 0    |
| Flash write erase protection error | A flash memory write protection error is detected by the FWEPROR register setting*2 during command processing by the flash sequencer            | 0        | 0        | 0      | 0     | 0       | 0/1    | 0/1    | 1       | 0    | 0    |

Note 1. DFAE value depends on the FSADDR setting.

Note 2. For details on the FWEPROR register, see section 44.4.8. FWEPROR : Flash P/E Protect Register.

### 44.11.3 Start-Up Program Protection

Protection of the startup program is for protection of the program to be started after a reset (the startup program). This function provides a way to safely update the startup program when rewriting is suspended during a reset.

The startup area is 8 Kbytes in size and is assigned to the user area in the code flash memory. This function uses the values of the SAS.BTFLG bit and the FSUACR.SAS[1:0] bits to change the area where the startup program is stored in block units (see Figure 44.25 to Figure 44.28).

In protection of the startup program, the state of the selection of the startup area can be fixed by the FSPR bit. However, the SAS.FSPR bit never be restored to 1 once the flag is set to 0. Exercise extra caution when handling the SAS.FSPR bit.

Table 44.23 错误保护类型 (3之3)

| 错误类型         | Description  | ILGOMERR | FESETERR | SECERR | OTERR | ILGLERR | ERSERR | PRGERR | FLWEERR | CFAE | DFAE |
|--------------|--|----------|----------|--------|-------|---------|--------|--------|---------|------|------|
| 数据闪存访问违规     | 在数据闪存PE模式下，向保留数据区域发出程序或块擦除命令                               | 0        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 1    |
|              | 在数据闪存PE模式下，向保留数据区域发出多块擦除命令。(FSADDR设置为保留数据区)。               | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 1    |
|              | 在数据闪存PE模式下，向保留数据区域发出空白检查命令。(FSADDR设置为保留数据区)。               | 1        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 1    |
|              | 向数据区域的安全区域发出非安全访问的编程、块擦除、多块擦除或空白检查命令。                      | 0        | 0        | 0      | 0     | 1       | 0      | 0      | 0       | 0    | 1    |
| 安全错误         | 当SAS.FSPR位为0时，发出SAS.BTFLG位设置的配置设置命令(请参阅第44.9.3.15节。配置设置命令) | 0        | 0        | 1      | 0     | 1       | 0      | 0      | 0       | 0    | 0    |
| Others       | 以读取模式访问FACL命令发布区域  | 0        | 0        | 0      | 1     | 1       | 0      | 0      | 0       | 0    | 0    |
|              | 在代码闪存PE模式或数据闪存PE模式下读取FACL命令发布区域                            | 0        | 0        | 0      | 1     | 1       | 0      | 0      | 0       | 0    | 0    |
| Flash写擦除保护错误 | 在闪存定序器的命令处理期间，通过FWEPROR寄存器设置*2检测到闪存写保护错误                   | 0        | 0        | 0      | 0     | 0       | 0/1    | 0/1    | 1       | 0    | 0    |

注1.DFAE值取决于FSADDR设置。

注2.关于FWEPROR寄存器的详细信息，请参阅44.4.8节。FWEPROR：闪存PE保护寄存器。

### 44.11.3 启动程序保护

启动程序的保护是为了保护复位后要启动的程序(启动程序)。此功能提供了一种在复位期间暂停重写时安全更新启动程序的方法。

启动区大小为8KB，分配给代码闪存中的用户区。该函数使用SAS.BTFLG位和FSUACR.SAS[1:0]位的值来改变以块为单位存储启动程序的区域(见图44.25至图44.28)。

在启动程序的保护中，启动区域的选择状态可以通过FSPR位来固定。但是，那一旦标志设置为0，SAS.FSPR位永远不会恢复为1。处理SAS.FSPR位时要格外小心。

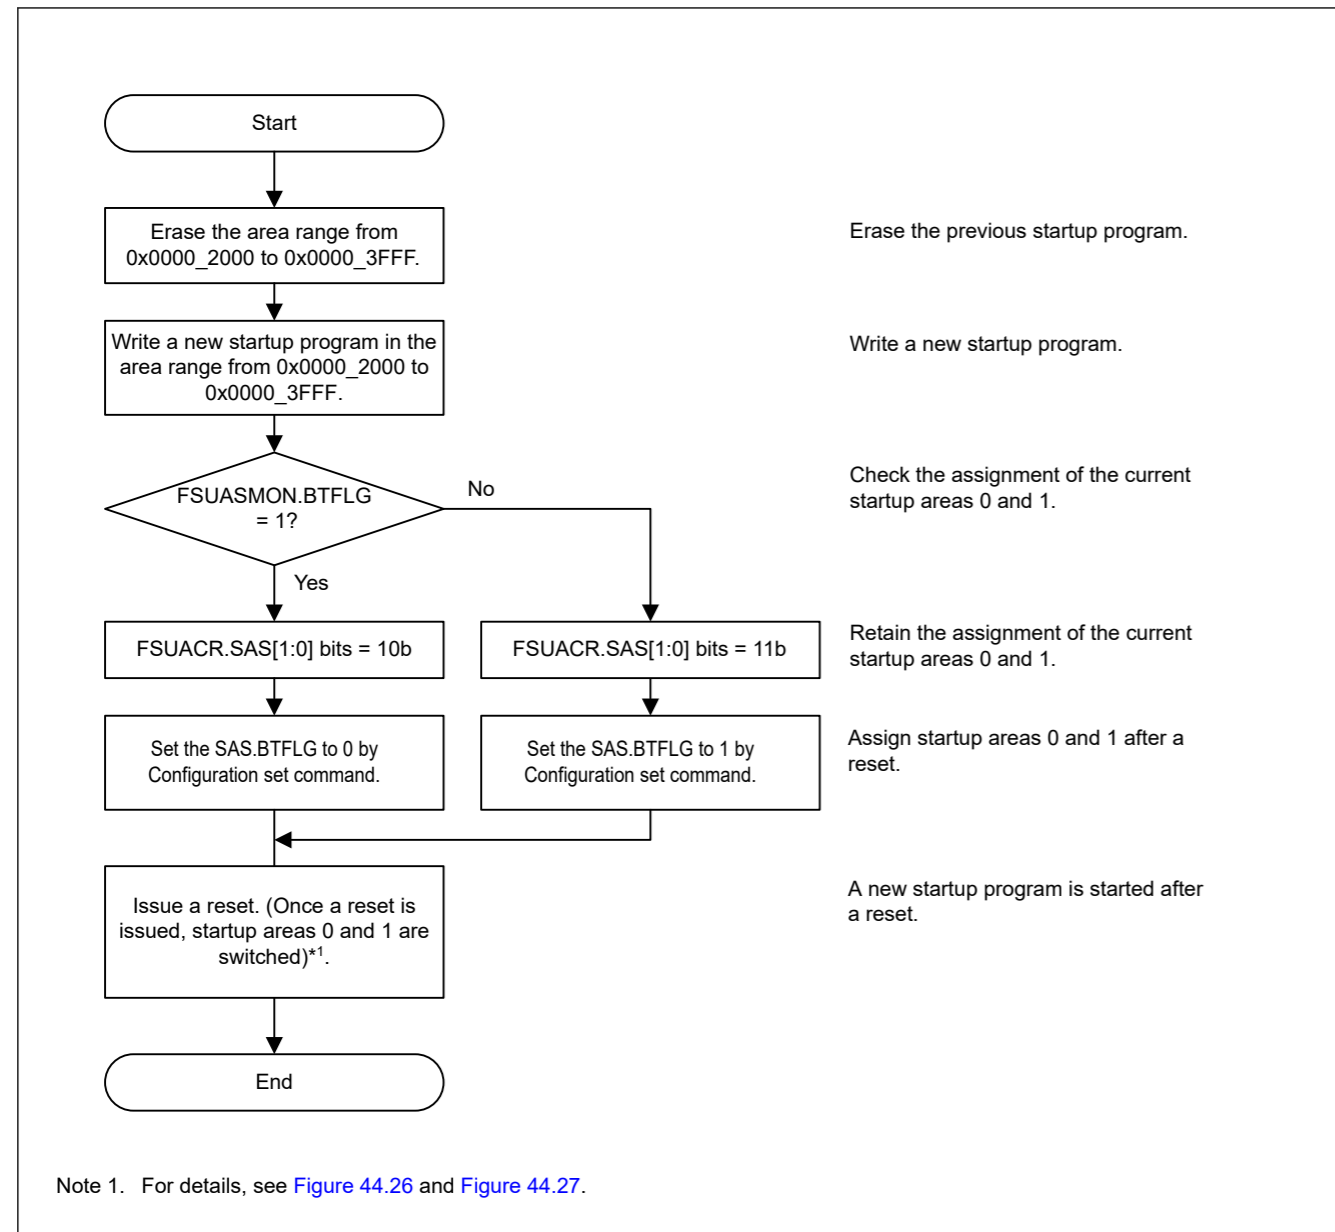

Figure 44.28 Concept of Protection of the Startup Program

#### 44.11.4 Block Swap Function

This protection uses the functions of block swap selection to update a program while a user program is running and to provide a safe method of updating in cases where programming is suspended during a reset.

##### 44.11.4.1 Selecting the Block Swap

Block swap selection provides a way to safely update the program when programming is suspended during a reset. [Figure 44.29](#) is a schematic view of block swap selection and [Figure 44.30](#) shows an example of the flow of block swap selection. A reset after setting the value of the BANKSEL.BLCKSWP bit in the option-setting memory changes the addresses of block A and B. When the address is switched, the Programming/erasure target for the FACL commands is also switched.

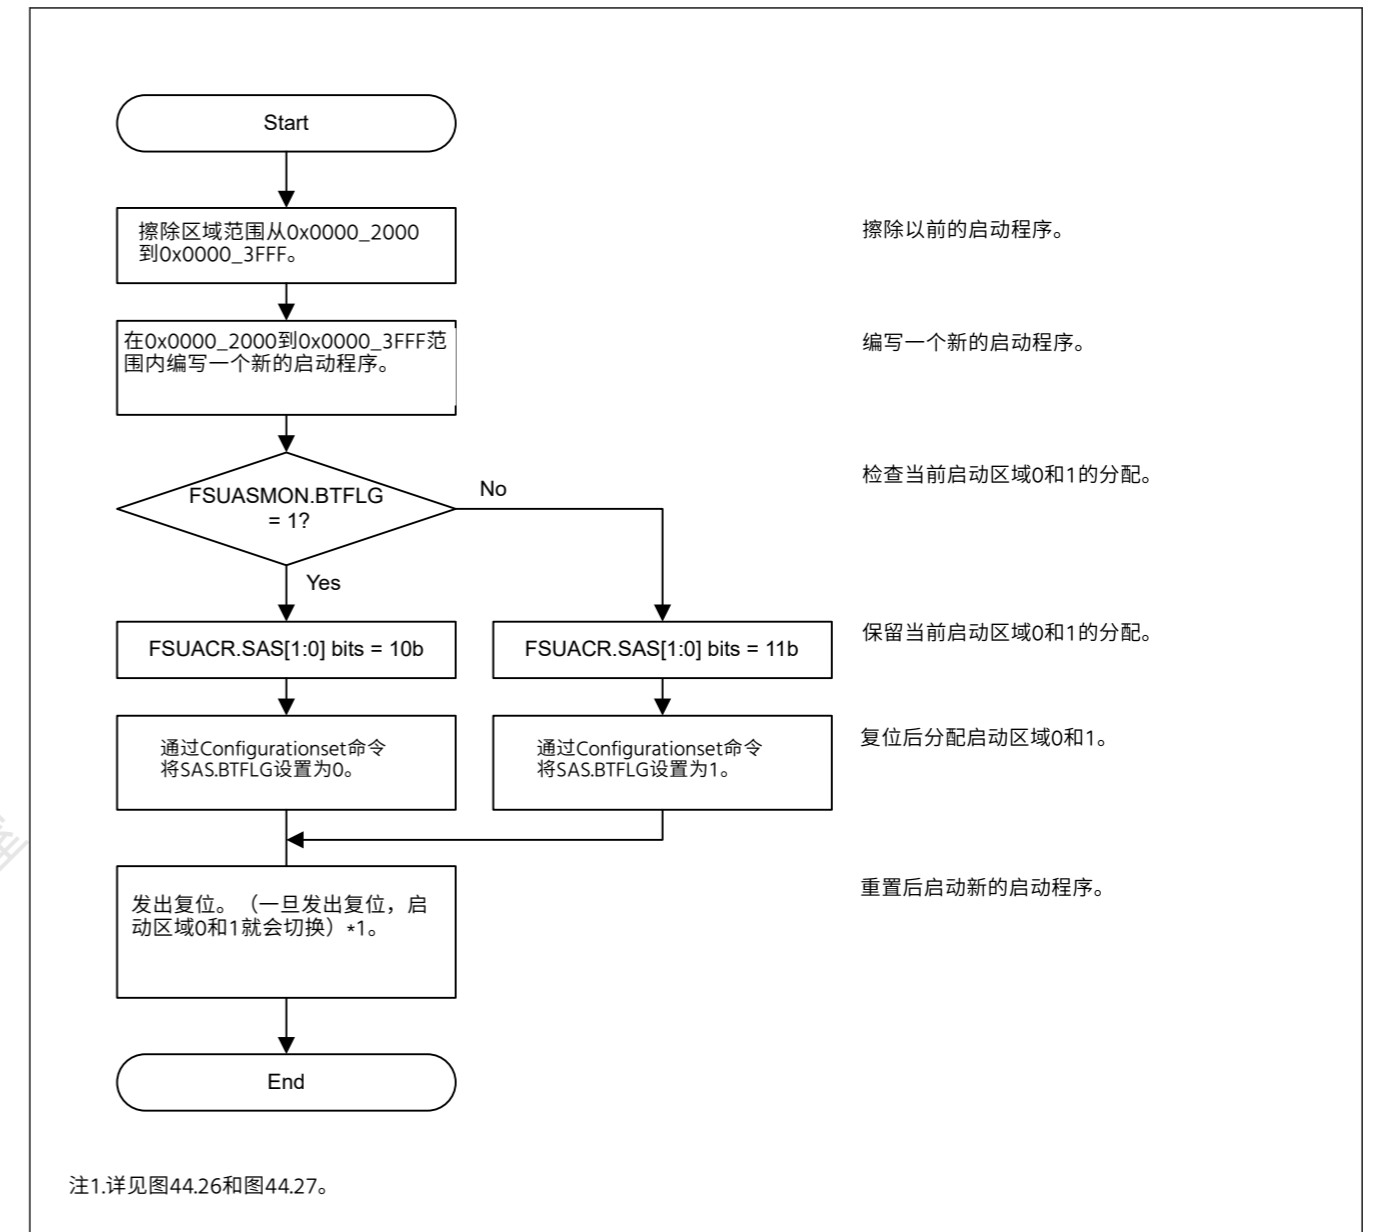

Figure 44.28 保护启动程序的概念

#### 44.11.4 区块交换功能

此保护使用块交换选择功能在用户程序运行时更新程序，并在复位期间暂停编程的情况下提供安全的更新方法。

##### 44.11.4.1 选择块交换

块交换选择提供了一种在复位期间编程暂停时安全更新程序的方法。图44.29是块交换选择的示意图，图44.30显示了块交换选择流程的示例。设置选项设置存储器中的BANKSEL.BLCKSWP位的值后的复位会改变块A和B的地址。当地址切换时，FACL命令的编程擦除目标也会切换。

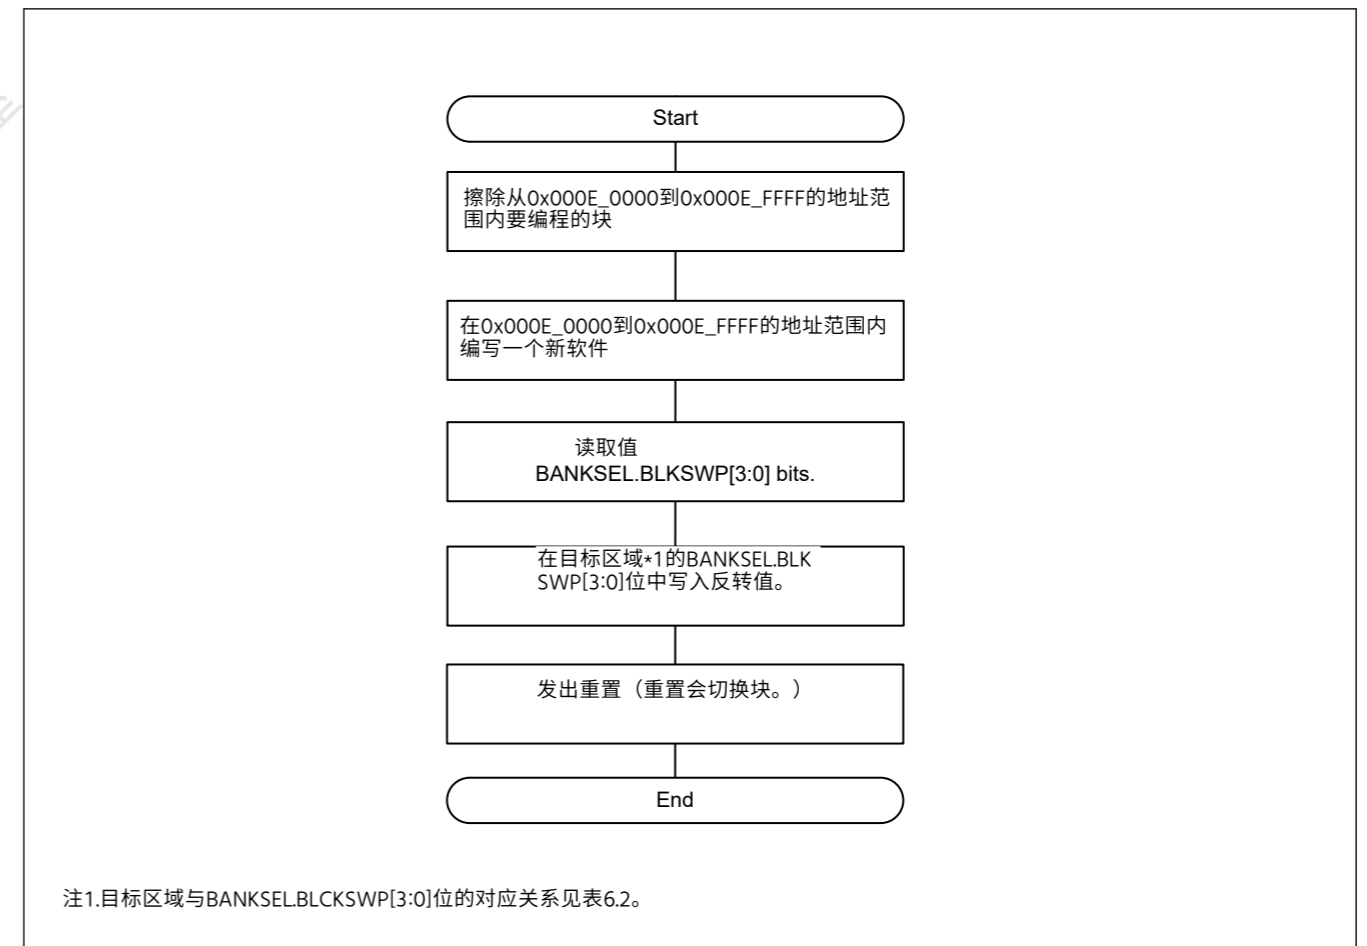

Figure 44.30 块交换选择流程示例 (适用于具有1MB代码闪存的产品)

44.12 Security Function

The flash sequencer supports the following security functions:

44.12 安全功能

闪存定序器支持以下安全功能：

- Security flag for startup area
- Permanent block protect setting
- Flash memory protection for TrustZone

### 44.12.1 Security Flag for Startup Area Select

The security flag (SAS.FSPR) for the startup area is located in the option-setting memory.

When the SAS.FSPR bit is 0, issuing the configuration set command to change the SAS.BTFLG bit causes the flash sequencer to be in the command-locked state. Also, when the SAS.FSPR bit is 0, it is invalid to write to the Startup Area Select bits SAS[1:0] in the FSUACR register. The SAS.FSPR bit enables protection.

### 44.12.2 Permanent Block Protect Setting

The permanent block protect setting is the clear protection for the block protection setting. User area cannot be permanently updated by the FACL command when the permanent block protect setting is enabled. See [section 44.11.1.3. Protection by Block Protect Setting](#) for more details.

The block protect setting and the permanent block protect setting have the write/clear protection against the configuration set command. The flash sequencer does not detect an error when the configuration set command is issued to the write/clear protected settings.

Figure 44.31 and Table 44.24 show the write/clear protection against the block protect setting (BPS[n]) and the permanent protect setting (PBPS[n]). Figure 44.32 and Table 44.25 show the write/clear protection against the block protect setting for secure (BPS\_SEC[n]) and permanent protect setting for secure (PBPS\_SEC[n]).

Effective permanent block protect setting (PBPS or PBPS\_SEC) depends on block protect select (BPS\_SEL). For details of permanent block protect setting (PBPS or PBPS\_SEC) and block protect select (BPS\_SEL), see [section 6, Option-Setting Memory](#).

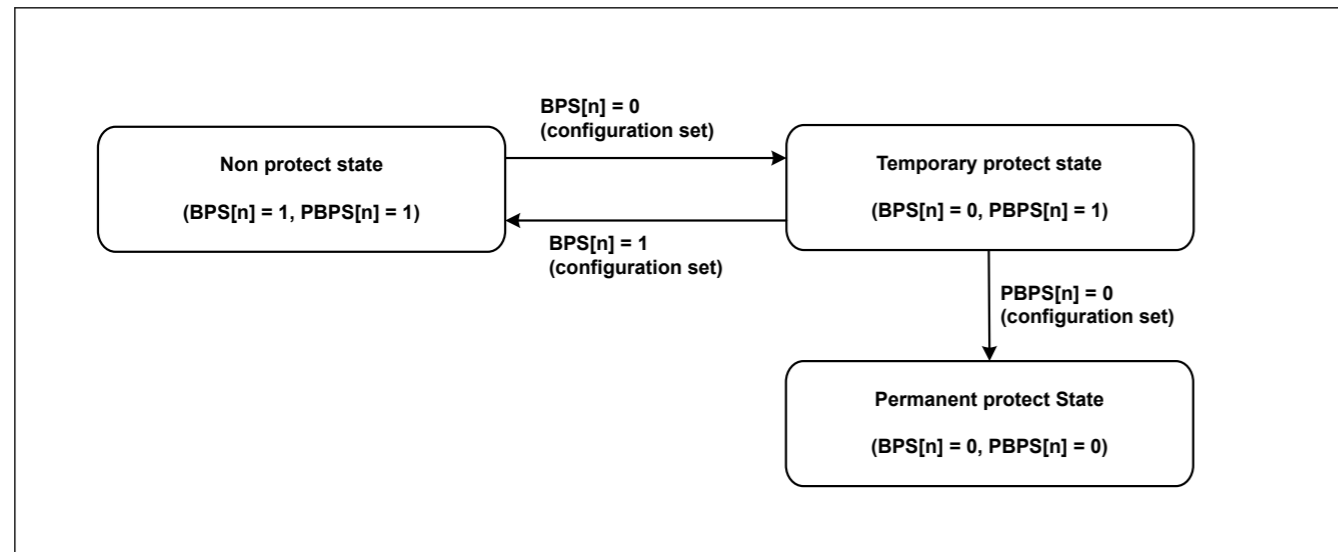

Figure 44.31 Status transition of flash sequencer by BPS[n] and PBPS[n]

Table 44.24 Write/clear protection of BPS[n] and PBPS[n]

| Current state |         | Updatable state by configuration set command |            |             |             |
|---------------|---------|--|------------|-------------|-------------|
| BPS[n]        | PBPS[n] | BPS[n] = 1                                   | BPS[n] = 0 | PBPS[n] = 1 | PBPS[n] = 0 |
| 1             | 1       | ✓  | ✓          | ✓           | X           |
| 1             | 0       | —  | —          | —           | —           |
| 0             | 1       | ✓  | ✓          | ✓           | ✓           |
| 0             | 0       | X  | ✓          | X           | ✓           |

Note:   
 • ✓ indicates updatable by configuration set command.   
 • X indicates not updatable by configuration set command (error does not occur).

- 启动区安全标志
- 永久封锁保护设置
- TrustZone的闪存保护

### 44.12.1 启动区域选择的安全标志

启动区域的安全标志(SAS.FSPR)位于选项设置内存中。

当SAS.FSPR位为0时，发出配置设置命令来更改SAS.BTFLG位会导致闪存定序器处于命令锁定状态。此外，当SAS.FSPR位为0时，写入FSUACR寄存器中的启动区域选择位SAS[1:0]无效。SAS.FSPR位启用保护。

### 44.12.2 永久块保护设置

永久块保护设置是对块保护设置的明确保护。启用永久块保护设置后，FACL命令无法永久更新用户区域。请参阅第44.11.1.3节。通过块保护设置进行保护以获取更多详细信息。

块保护设置和永久块保护设置具有针对配置集命令的写清除保护。向写清除保护设置发出配置设置命令时，闪存定序器不会检测到错误。

图44.31和表44.24显示了针对块保护设置(BPS[n])和永久保护设置(PBPS[n])的写清除保护。图44.32和表44.25显示了针对安全的块保护设置(BPS\_SEC[n])和安全的永久保护设置(PBPS\_SEC[n])的写清除保护。

有效的永久块保护设置 (PBPS或PBPS\_SEC) 取决于块保护选择 (BPS\_SEL)。有关永久块保护设置 (PBPS或PBPS\_SEC) 和块保护选择 (BPS\_SEL) 的详细信息，请参见第6节，选项设置存储器。

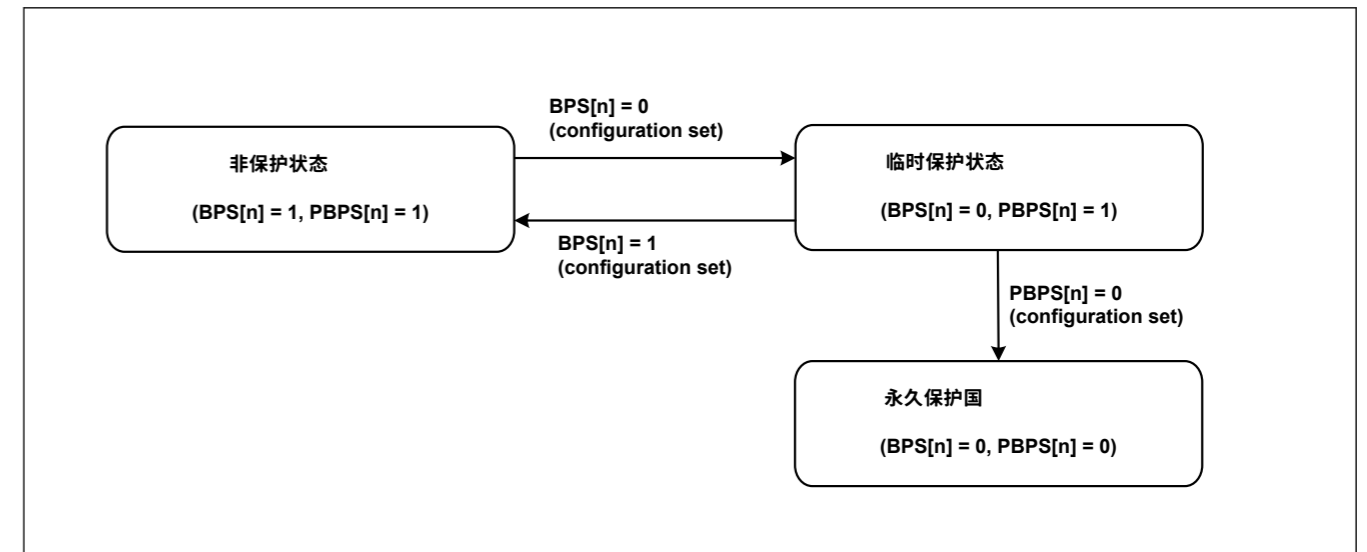

Figure 44.31 通过BPS[n]和PBPS[n]进行闪存定序器的状态转换

Table 44.24 BPS[n]和PBPS[n]的写清除保护

| 当前状态   |         | 可通过配置设置命令更新状态 |            |             |             |
|--------|---------|---------------|------------|-------------|-------------|
| BPS[n] | PBPS[n] | BPS[n] = 1    | BPS[n] = 0 | PBPS[n] = 1 | PBPS[n] = 0 |
| 1      | 1       | ✓             | ✓          | ✓           | X           |
| 1      | 0       | —             | —          | —           | —           |
| 0      | 1       | ✓             | ✓          | ✓           | ✓           |
| 0      | 0       | X             | ✓          | X           | ✓           |

Note:   
 • 表示可通过配置设置命令更新。   
 • X表示不能通过配置设置命令更新（不发生错误）。

• — indicates not reaching to this state.

Note:   
 • ✓ indicates updatable by configuration set command.   
 • X indicates not updatable by configuration set command (error does not occur).   
 • — indicates not reaching to this state.

### 44.12.3 Flash Memory Protection for TrustZone

Information in this section focuses on the flash sequencer operation.

The flash memory provides the following types of protect function against non-secure access:

- Protection for flash memory area (P/E)
- Protection for flash memory area (read)
- Protection for registers
- Protection during FACI command operation
- Code flash P/E mode entry protection

#### 44.12.3.1 Protection for Flash Memory Area (P/E)

This function protects the secure region of the code flash and data flash from FACI commands of non-secure access. The condition of protection depends on the FACI command, the access attribution, and the memory boundary setting.

For details of secure region, see [section 46, Security Features](#).

See [Table 44.26](#) for information on protection of the flash memory area (P/E).

 • —表示未达到此状态。

### 44.12.3 TrustZone的闪存保护

本节中的信息侧重于闪存定序器的操作。

闪存提供以下类型的保护功能以防止非安全访问:

- 保护闪存区 (PE)
- 保护闪存区域 (读取)
- 寄存器保护
- FACI命令操作期间的保护
- CodeflashPE模式进入保护

#### 44.12.3.1 对闪存区域(PE)的保护

此功能保护代码闪存和数据闪存的安全区域免受非安全访问的FACI命令的影响。保护条件取决于FACI命令、访问属性和内存边界设置。

有关安全区域的详细信息，请参阅第46节，安全功能。

有关保护闪存区域(PE)的信息，请参见表44.26。

Table 44.26 Protection for the flash memory area (P/E)

| FACI command                  | Target area       |   | Issuing of FACI command by non-secure access | Issuing of FACI command by secure access |
|-------------------------------|-------------------|---|--|--|
| Program Block erase           | Code flash memory | User area (non-secure area)             | ✓  | ✓  |
|                               |                   | User area (secure area)                 | X  | ✓  |
|                               | Data flash memory | Data area (non-secure area)             | ✓  | ✓  |
|                               |                   | Data area (secure area)                 | X  | ✓  |
| Multi block erase Blank check | Data flash memory | Data area (non-secure area)             | ✓  | ✓  |
|                               |                   | Data area (secure area)                 | X  | ✓  |
| Configuration set             | Code flash memory | option-setting memory (non-secure area) | ✓  | ✓  |
|                               |                   | option-setting memory (secure area)     | X  | ✓  |

Note:   
 • ✓ indicates FACI command operation is not prohibited.   
 • X indicates FACI command operation is prohibited. Error occurs when the area is selected, and the FACI command is executed.

When the target area of FACI command is the user area of code flash, the flash sequencer compares the FSADDR register setting with the memory boundary setting of the code flash and determines whether the target area is in the secure region.

The memory boundary can be set to 0x0000\_0000 to 0x00FF\_8000 in 32 KB unit.

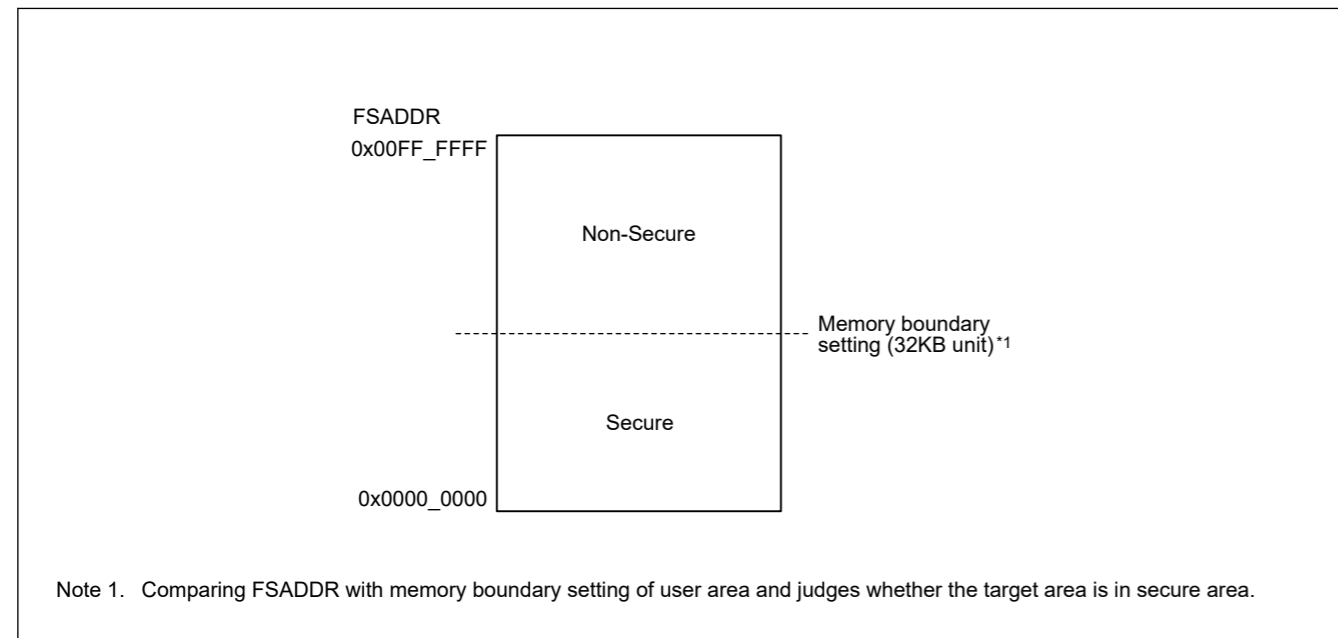

Figure 44.33 Secure/non-secure region in user area

When the target area of the issuing FACI command is the data area of data flash, the flash sequencer compares the FSADDR/FEADDR register setting with the memory boundary setting of the data flash and determines whether the target area is in secure region. The memory boundary can be set to 0x0800\_0000 to 0x0800\_FC00 in 1 KB unit. Figure 44.34 shows details of the non-secure/secure attribute of data area in the data flash.

Table 44.26 对闪存区域(PE)的保护

| FACI命令      | 目标区域 |   | 通过非安全访问发出FACI命令 | 通过安全访问发出FACI命令 |
|-------------|------|---|-----------------|----------------|
| Program 块擦除 | 代码闪存 | 用户区 (非安全区)                              | ✓               | ✓              |
|             |      | 用户区 (安全区)                               | X               | ✓              |
|             | 数据闪存 | 数据区 (非安全区)                              | ✓               | ✓              |
|             |      | 数据区 (安全区)                               | X               | ✓              |
| 多块擦除 空白支票   | 数据闪存 | 数据区 (非安全区)                              | ✓               | ✓              |
|             |      | 数据区 (安全区)                               | X               | ✓              |
| 配置集         | 代码闪存 | option-setting memory (non-secure area) | ✓               | ✓              |
|             |      | option-setting memory (secure area)     | X               | ✓              |

Note:   
 • 表示不禁止FACI命令操作。   
 • X表示禁止FACI命令操作。选择区域时发生错误，执行FACI命令。

当FACI命令的目标区域是代码闪存的用户区域时，闪存定序器将FSADDR寄存器设置与代码闪存的内存边界设置进行比较，并确定目标区域是否在安全区域中。

内存边界可以以32KB为单位设置为0x0000\_0000到0x00FF\_8000。

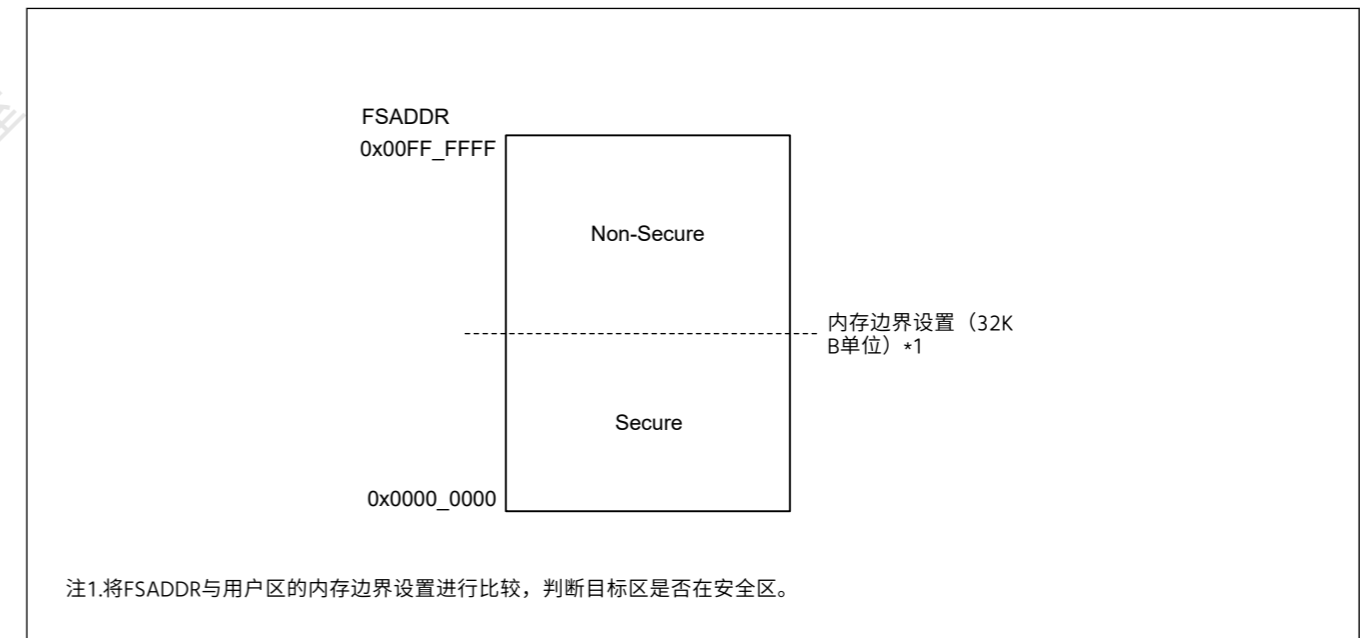

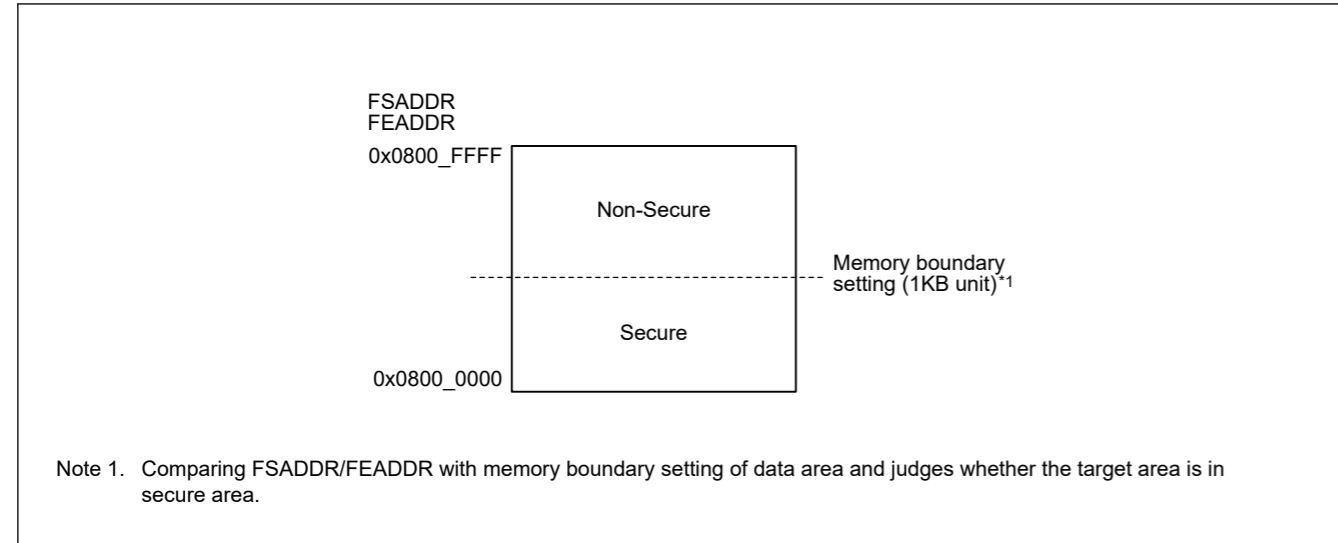

Figure 44.33 用户区域中的安全非安全区域

当发出FACI命令的目标区域是数据flash的数据区域时，flashsequencer比较FSADDR/FEADDR寄存器设置与数据闪存的内存边界设置并确定目标区域是否在安全区域中。内存边界可以以1KB为单位设置为0x0800\_0000到0x0800\_FC00。图44.34显示了数据闪存中数据区域的非安全安全属性的详细信息。

Note 1. Comparing FSADDR/FEADDR with memory boundary setting of data area and judges whether the target area is in secure area.

Figure 44.34 Secure/non-secure region in data area

See Figure 44.35 in the details of non-secure/secure region of option-setting memory. The flash sequencer judges that target area is secure region from the FSADDR register setting.

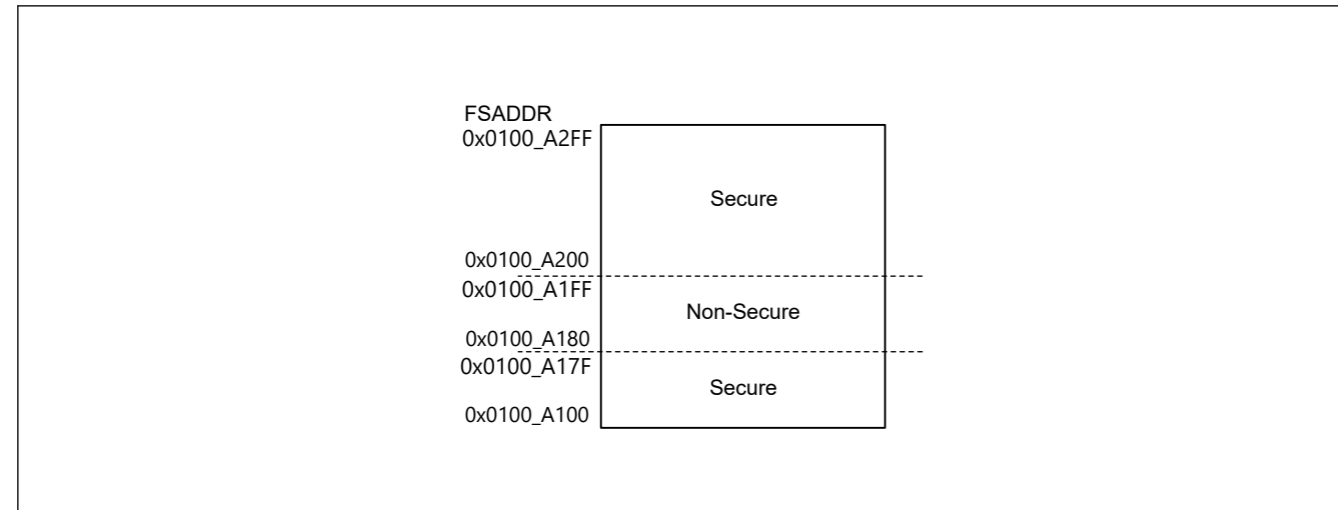

Figure 44.35 Secure/non-secure region in option-setting memory

### 44.12.3.2 Protection for Flash Memory Area (Read)

This function protects the secure region of code flash and data flash from non-secure bus access.

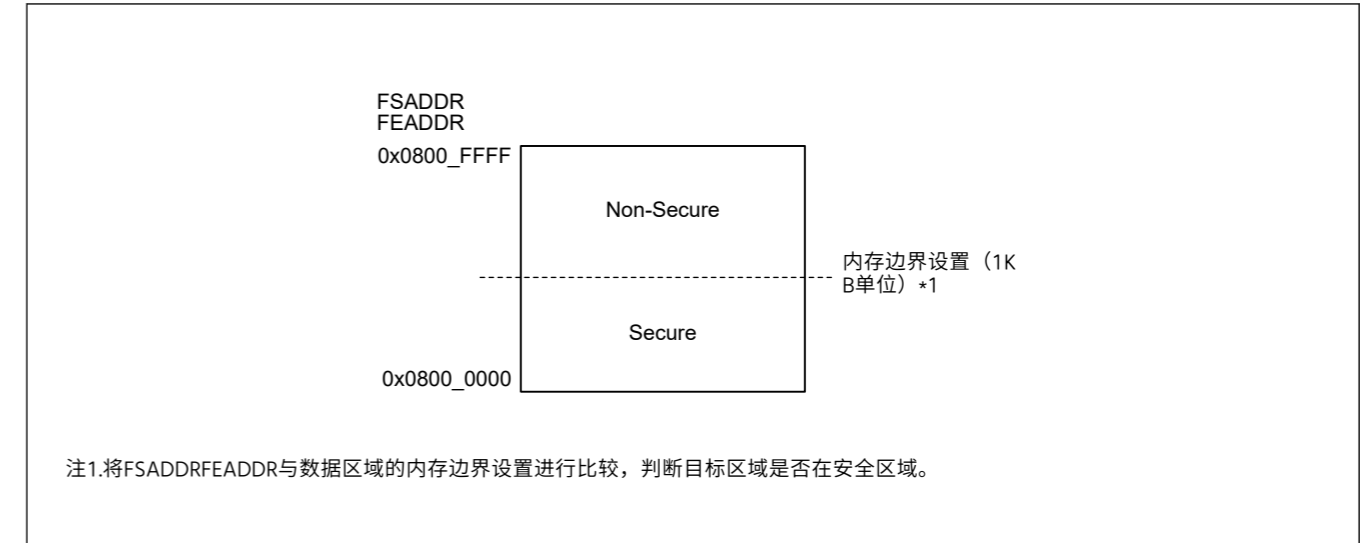

For details of secure region, see section 46, Security Features .

### 44.12.3.3 Protection for Register

The flash sequencer registers have write-access protection against non-secure access. Table 44.27 shows details of the protected registers of the flash sequencer.

Table 44.27 Protected registers of the flash sequencer for TrustZone (1 of 2)

| Protection target register | Security attribute setting                            | Notes   |
|----------------------------|---|---|
| FCKMHZ                     | Security attribution register setting (FSAR.FCKMHZSA) | See section 44.4.4. FSAR : Flash Security Attribution Register          |
| FMEPROT                    | Always secure   | See section 44.4.14. FMEPROT : Flash P/E Mode Entry Protection Register |

注1.将FSADDR/FEADDR与数据区域的内存边界设置进行比较,判断目标区域是否在安全区域。

Figure 44.34 数据区域中的安全非安全区域

有关选项设置内存的非安全安全区域的详细信息,请参见图44.35。闪存定序器根据FSADDR寄存器设置判断目标区域是安全区域。

Figure 44.35 选项设置内存中的安全非安全区域

### 44.12.3.2 保护闪存区域 (读取)

该功能保护代码闪存和数据闪存的安全区域免受非安全总线访问。

有关安全区域的详细信息,请参阅第46节,安全功能。

### 44.12.3.3 注册保护

闪存定序器寄存器具有针对非安全访问的写访问保护。表44.27显示了闪存定序器的受保护寄存器的详细信息。

Table 44.27 TrustZone的闪存定序器的受保护寄存器 (1of2)

| 保护对象寄存器 | 安全属性设置                   | Notes                              |

| FMEPROT | 始终安全                     | 请参见第44.4.14节。FMEPROT:闪存PE模式进入保护寄存器 |

Table 44.27 Protected registers of the flash sequencer for TrustZone (2 of 2)

| Protection target register  | Security attribute setting                      | Notes   |
|---|---|---|
| FBPROT1   | Always secure                                   | See section 44.4.16. FBPROT1 : Flash Block Protection for Secure Register |
| FSUACR  | Always secure                                   | See section 44.4.27. FSUACR : Flash Startup Area Control Register         |
| FACI command-issuing area and all registers of FACI (Base address is FACI) and FWEPROR register | During FACI command processing by secure access | See section 44.12.3.4. Protection during FACI Command Operation           |

44.12.3.4 Protection during FACI Command Operation

This function protects read/write access to the FACI command-issuing area, including all registers of FACI (Base address is FACI) and FWEPROR register by the non-secure access during the FACI command processing of the secure access. The protect condition includes the suspending period of the program, block erase, or multi block erase command by the P/E suspend command of the secure access. See Figure 44.36 and Table 44.28 for details of the protection during the FACI command operation.

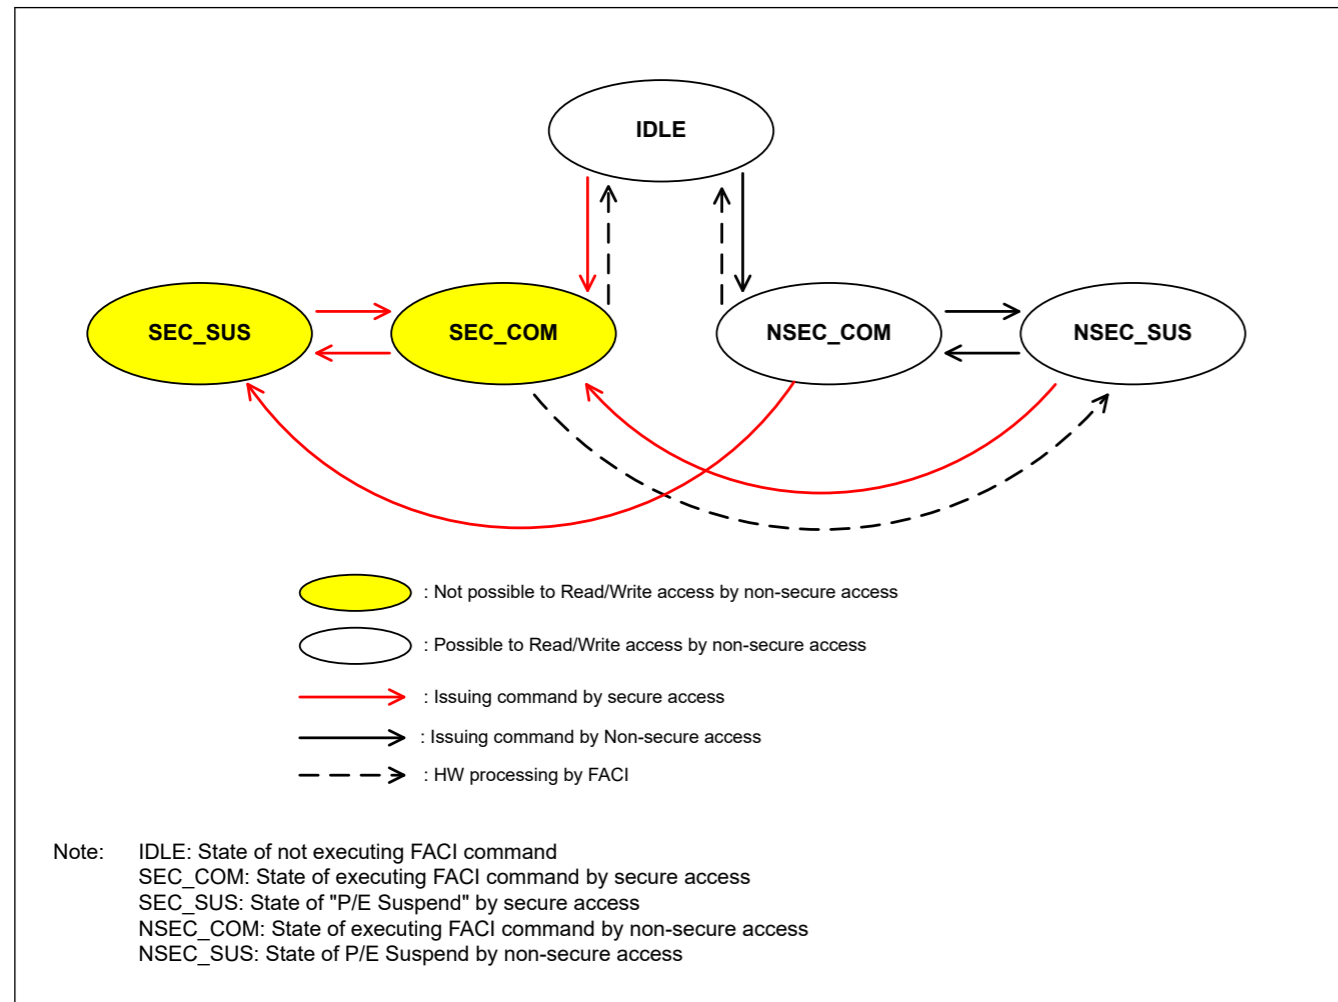

Figure 44.36 State of protection during FACI command operation

Table 44.27 TrustZone的闪存定序器的受保护寄存器 (2个中的2个)

| 保护对象寄存器                                     | 安全属性设置           | Notes                             |

| FRDY bit               | 1                                | 0 | 0   | 1 | 1                  | 0   | 0                              | 1   | 1  | 0 | 0  | 0 | 0  | 1 | 1   | 0 | 0   |  |
| PRGSPD or ERSSPD bit   | 0                                | 0 | 0   | 0 | 0                  | 0   | 0                              | 1   | 1  | 1 | 1  | 1 | 1  | 0 | 0   | 0 | 0   |  |
| CMDLK bit              | 0                                | 0 | 0   | 1 | 1                  | 1/0 | 1/0                            | 1/0 | 1/0  | 0 | 0  | 0 | 0  | 0 | 0   | 0 | 0   |  |
| Non-secure access      | ✓                                | X | ✓   | ✓ | ✓                  | X   | ✓                              | X   | ✓  | X | ✓  | X | ✓  | X | ✓   | X | ✓   |  |

Note:

- S indicates the FACL command by the secure access.
- NS indicates the FACL command by the non-secure access.
- ✓ indicates read/write access is possible by the non-secure access.
- X indicates read/write access is not possible by the non-secure access. Write data is ignored and read data is always 0.

Note 1. The FACL command issued by the non-secure access is not allowed.

Code flash programming/erasure can be protected by the FMEPROT register of secure function. Therefore, it does not assume that secure function issues P/E suspend command during code flash programming/erasure of non-secure function.

Data flash programming/erasure of non-secure can be suspended by secure function. If secure function issues P/E suspend command during data flash programming/erasure of non-secure function, secure function should issue P/E resume command. When secure function issues P/E resume command, secure function should notify non-secure function that data flash programming/erasure is complete and return to non-secure function. See Figure 44.37 and Figure 44.38 in example of issuing P/E suspend of secure function during programming/erasure of non-secure function.

Table 44.28 FACL命令操作期间的保护

Note:

- S表示通过安全访问的FACL命令。
- NS通过非安全访问指示FACL命令。
- 表示非安全访问可以进行读写访问。
- X表示非安全访问无法进行读写访问。写入数据被忽略，读取数据始终为0。

注1.非安全访问发出的FACL命令是不允许的。

代码闪存编程擦除可以通过安全功能的FMEPROT寄存器进行保护。因此，不假设安全功能在非安全功能的代码闪存编程擦除期间发出PE挂起命令。

非安全的数据闪存编程擦除可以通过安全功能暂停。如果在非安全功能的数据闪存编程擦除期间安全功能发出PE暂停命令，安全功能应发出PE恢复命令。当安全功能发出PEresume命令时，安全功能应通知非安全功能数据闪存编程擦除完成并返回到非安全功能。在对非安全功能进行编程擦除时发出PE安全功能挂起的示例参见图44.37和图44.38。

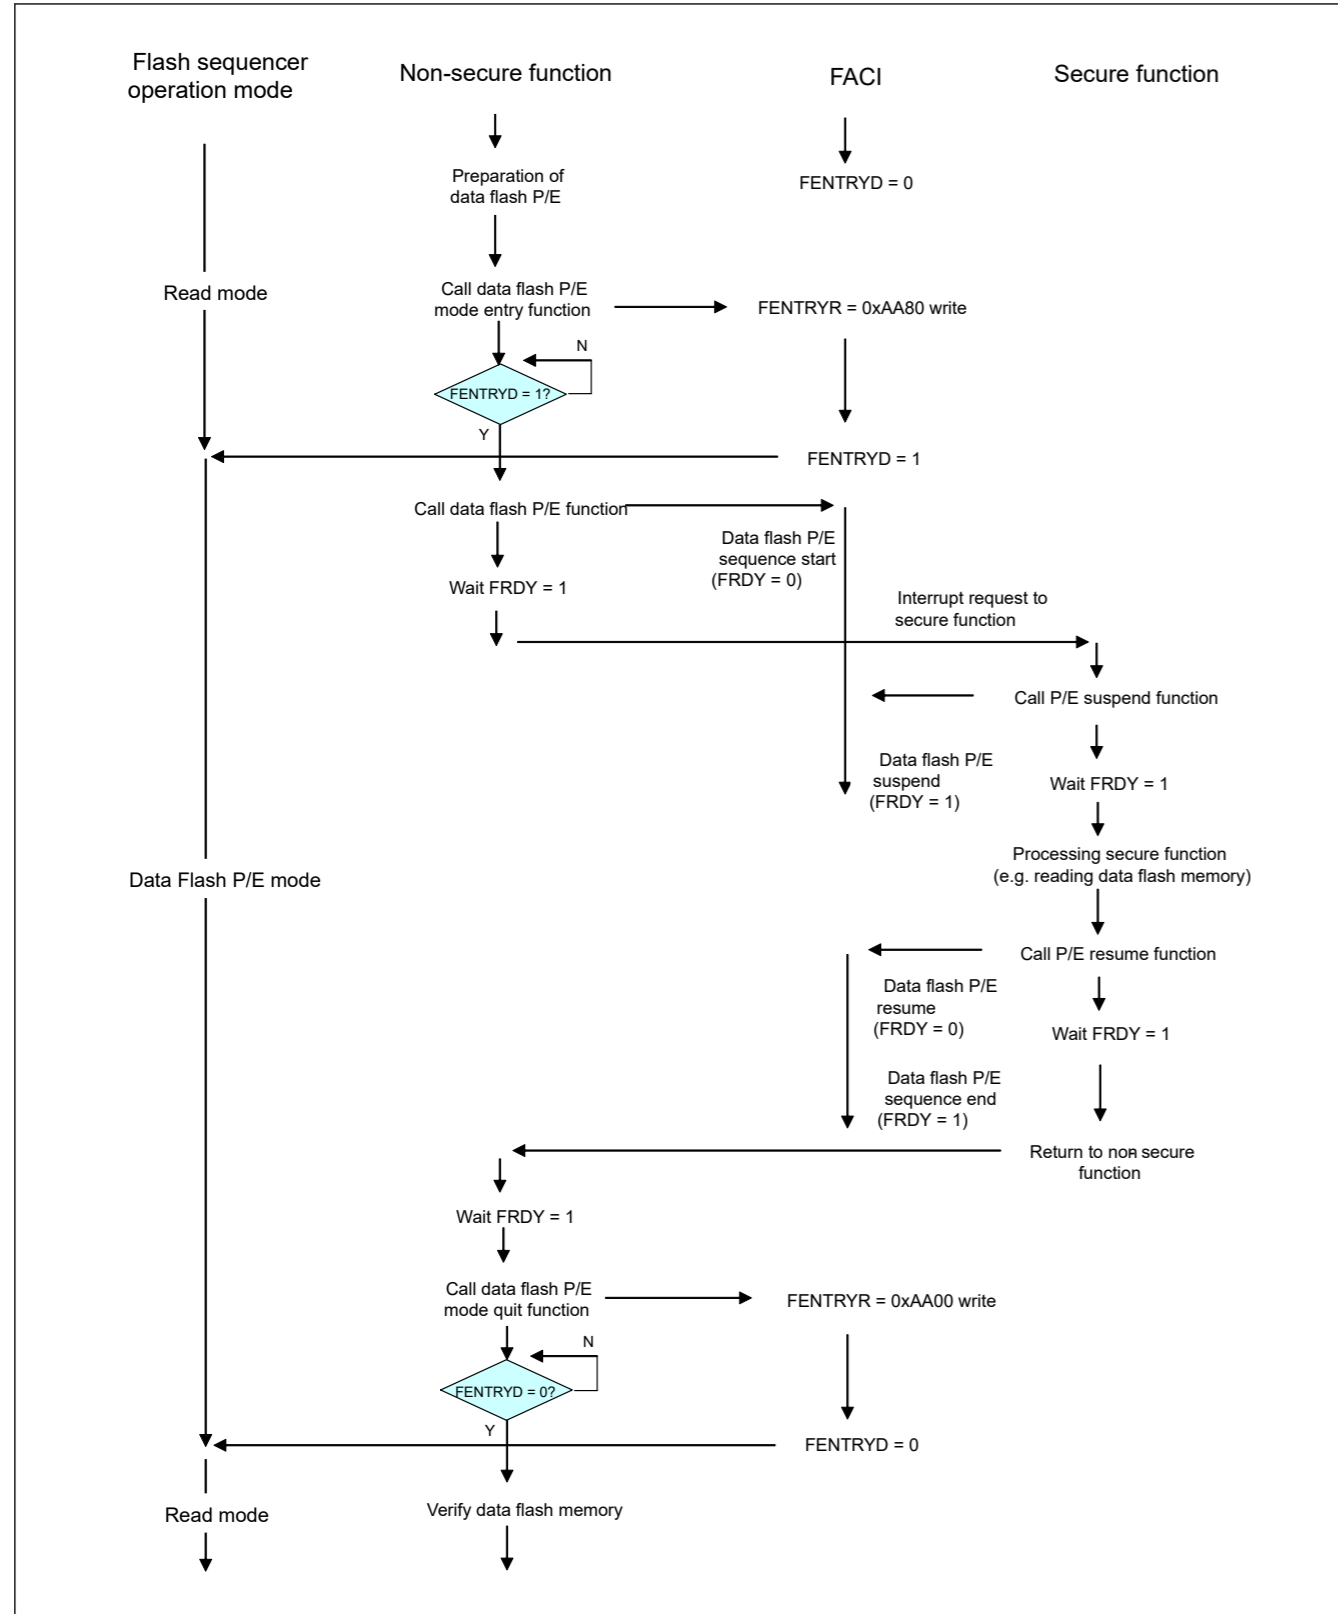

Figure 44.37 Data Flash P/E suspend of secure function Example (Check FRDY bit to detect P/E end)

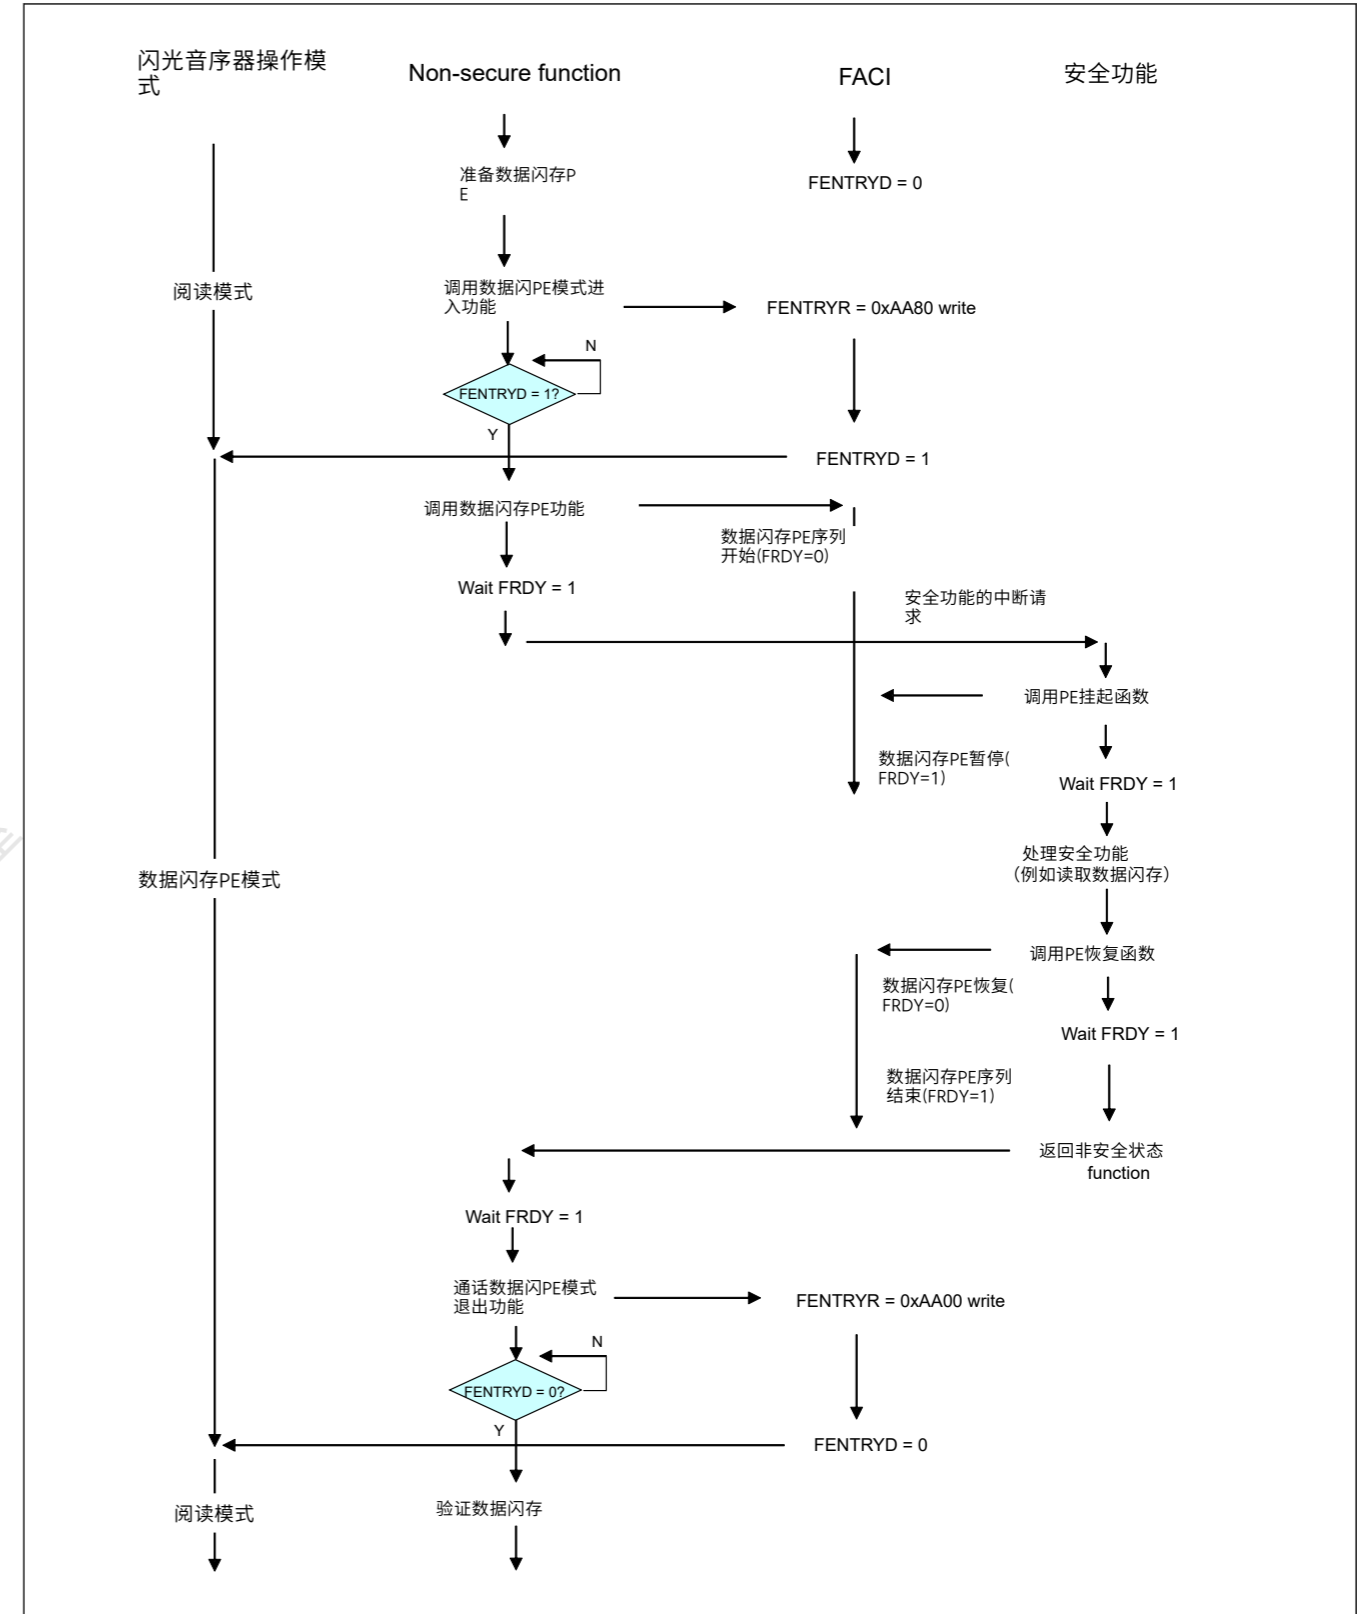

Figure 44.37 数据闪存PE安全功能暂停示例 (检查FRDY位以检测PE结束)

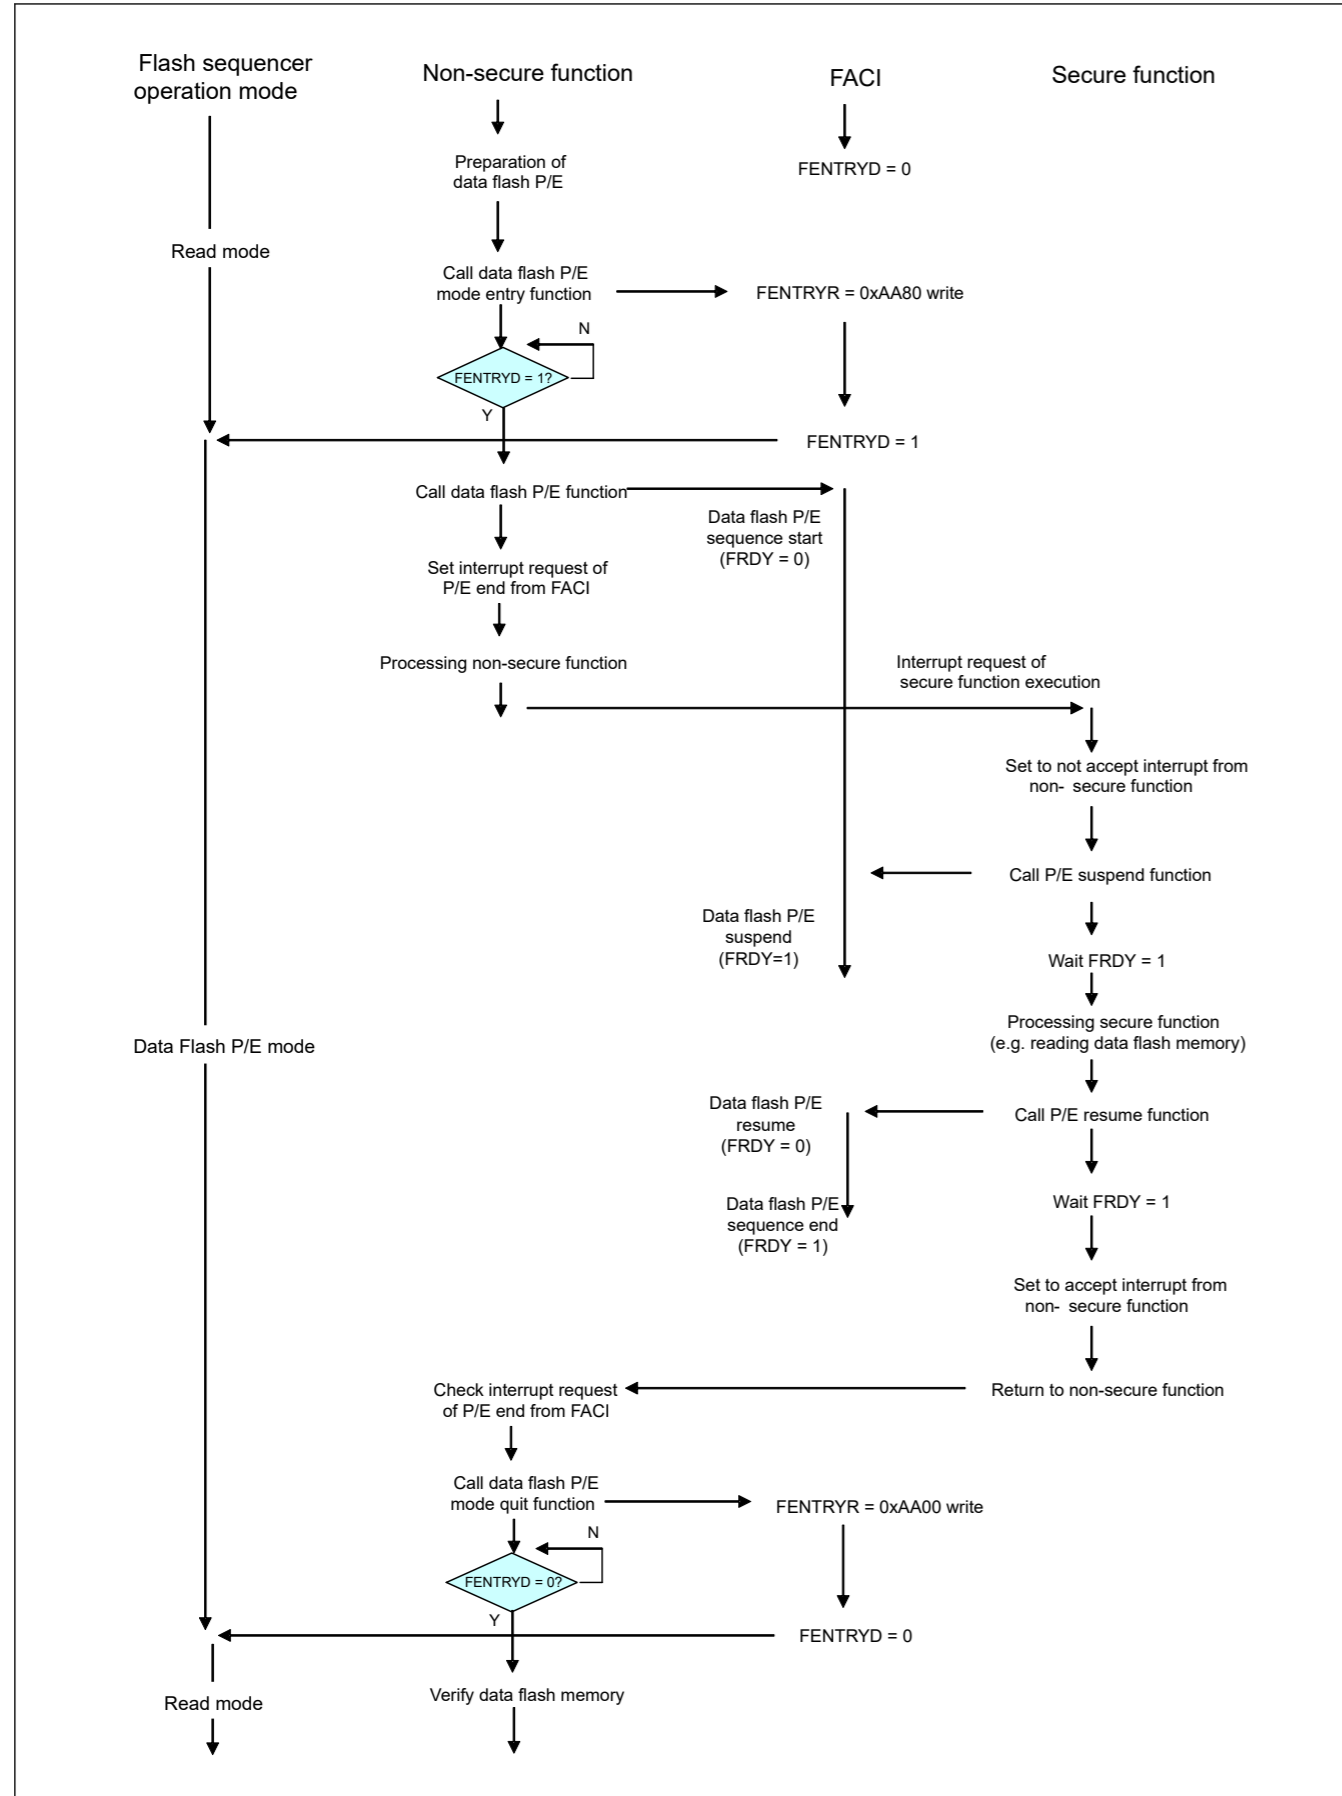

Figure 44.38 Data Flash P/E suspend of secure function Example (Check interrupt request to detect P/E end)

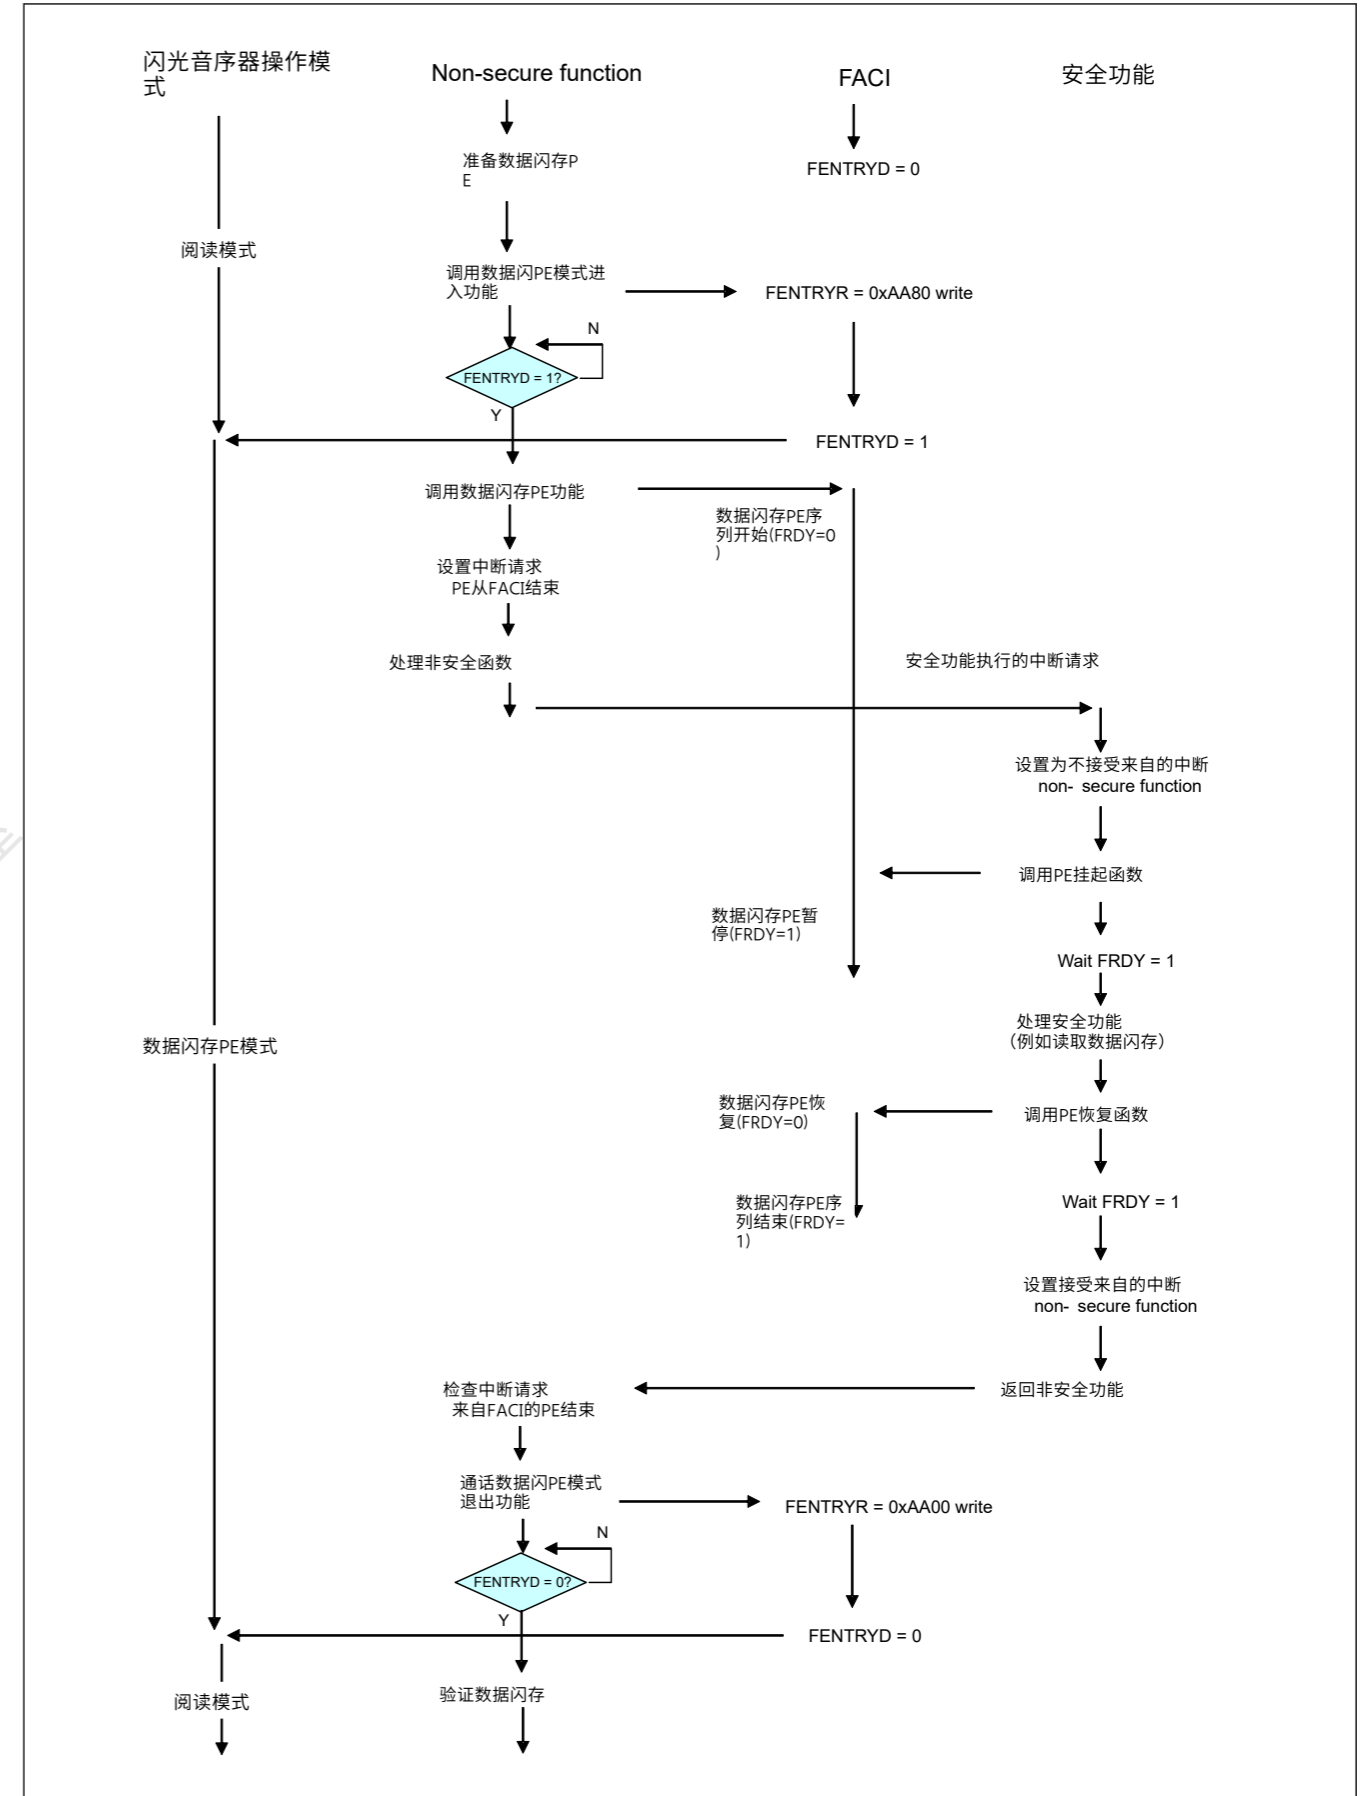

Figure 44.38 数据闪存PE安全功能暂停示例（检查中断请求以检测PE结束）

#### 44.12.3.5 Code Flash P/E Mode Entry Protection

The flash sequencer has protection function of code flash P/E by the FMEPROT register for the secure developer. Secure function can prevent disturbance of reading code flash memory by this protection function. See [section 44.4.14](#).

[FMEPROT : Flash P/E Mode Entry Protection Register](#).

For applications that do not require non-secure region programming/erasure other than from secure function, it is recommended to always disable non-secure function of code flash programming/erasure by enabling the protection function of FMEPROT register.

See [Figure 44.39](#) in details of the code flash P/E sequence example by non-secure function.

#### 44.12.3.5 CodeFlashPE模式进入保护

闪存定序器通过FMEPROT寄存器为安全开发人员提供代码闪存PE的保护功能。安全功能可以通过此保护功能防止读取代码闪存的干扰。请参阅第44.4.14节。FMEPROT：FlashPE模式进入保护寄存器。

对于除安全功能外不需要非安全区域编程擦除的应用，建议始终通过启用FMEPROT寄存器的保护功能来禁用代码闪存编程擦除的非安全功能。

有关非安全功能的代码闪存PE序列示例的详细信息，请参见图44.39。

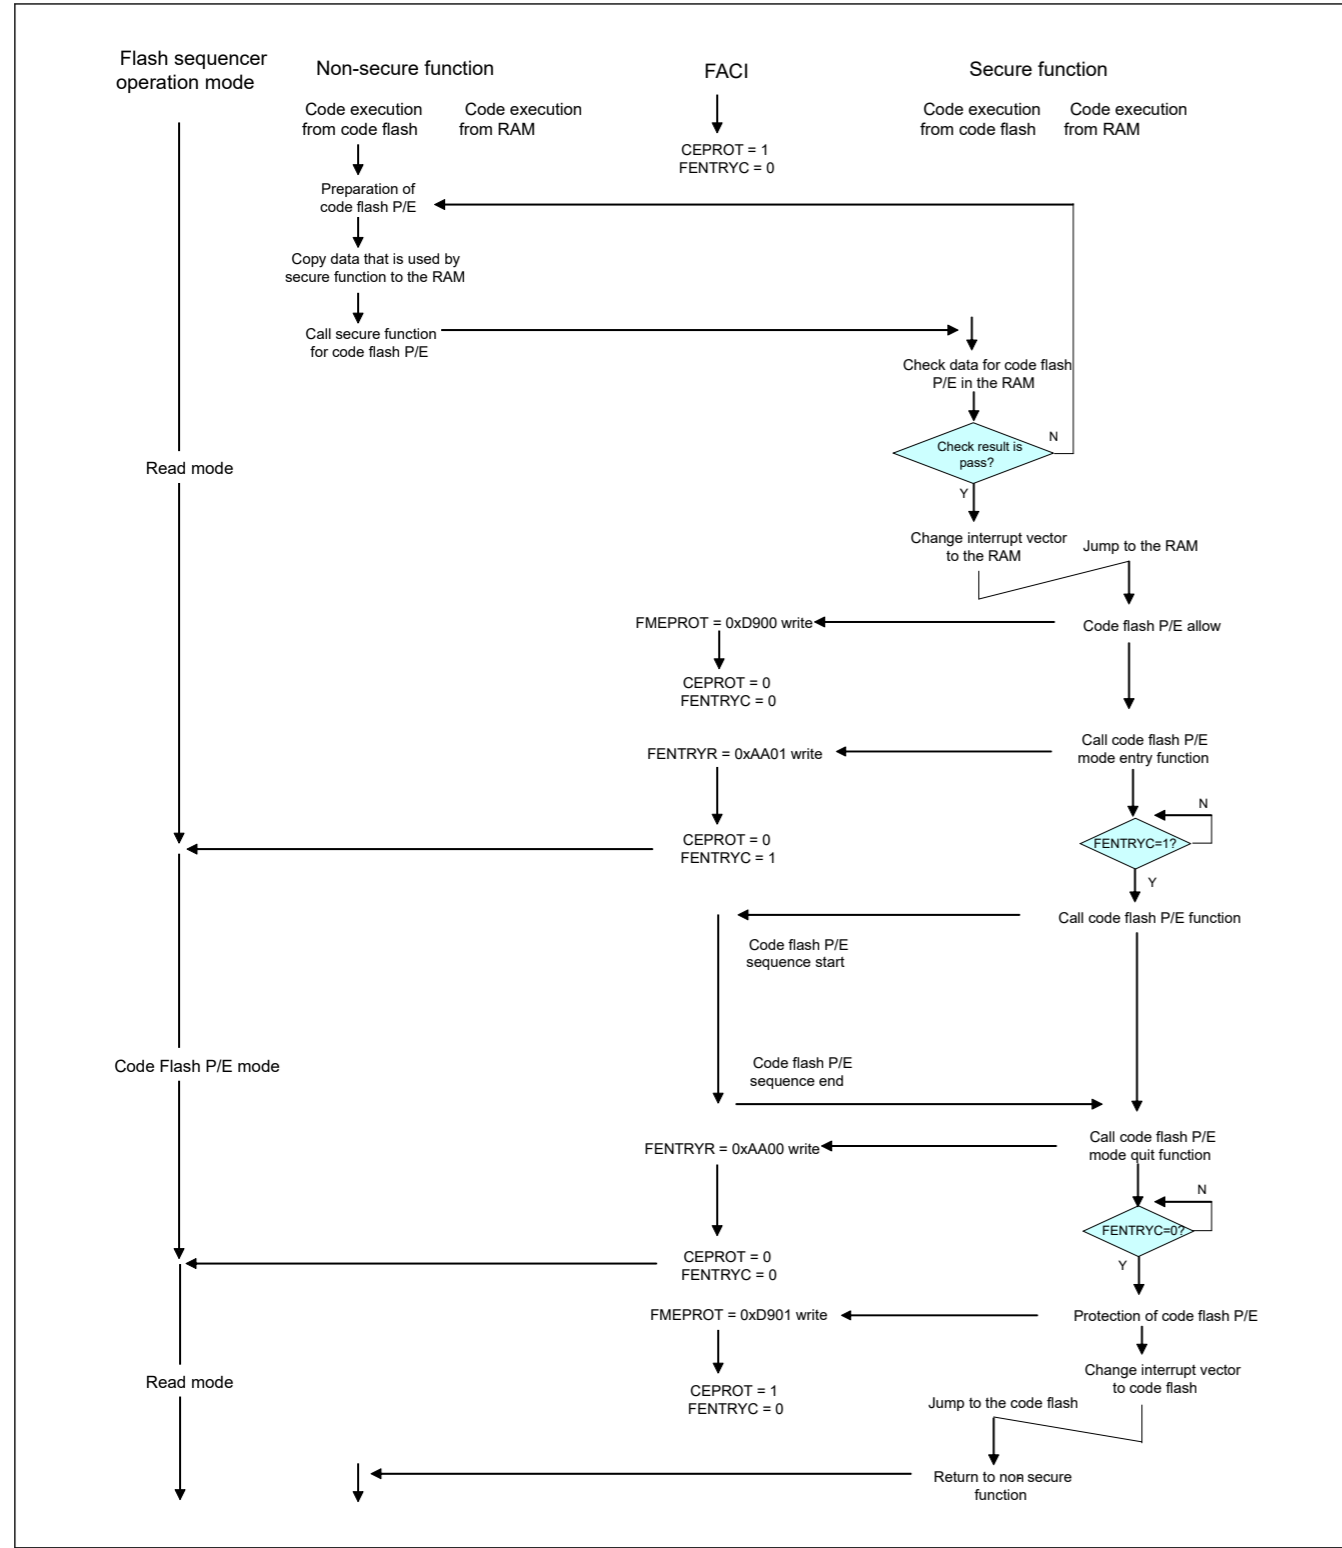

Figure 44.39 Code Flash P/E Sequence Example by non-secure function (Using secure function for code flash P/E)

44.13 Boot Mode

There are two serial programming modes; the boot mode (for the SCI interface) with SCI9 and the boot mode (for the USB interface) with USBFS. Table 44.29 lists the I/O pins used in boot mode. Table 44.30 lists the available communication interface used in the boot mode.

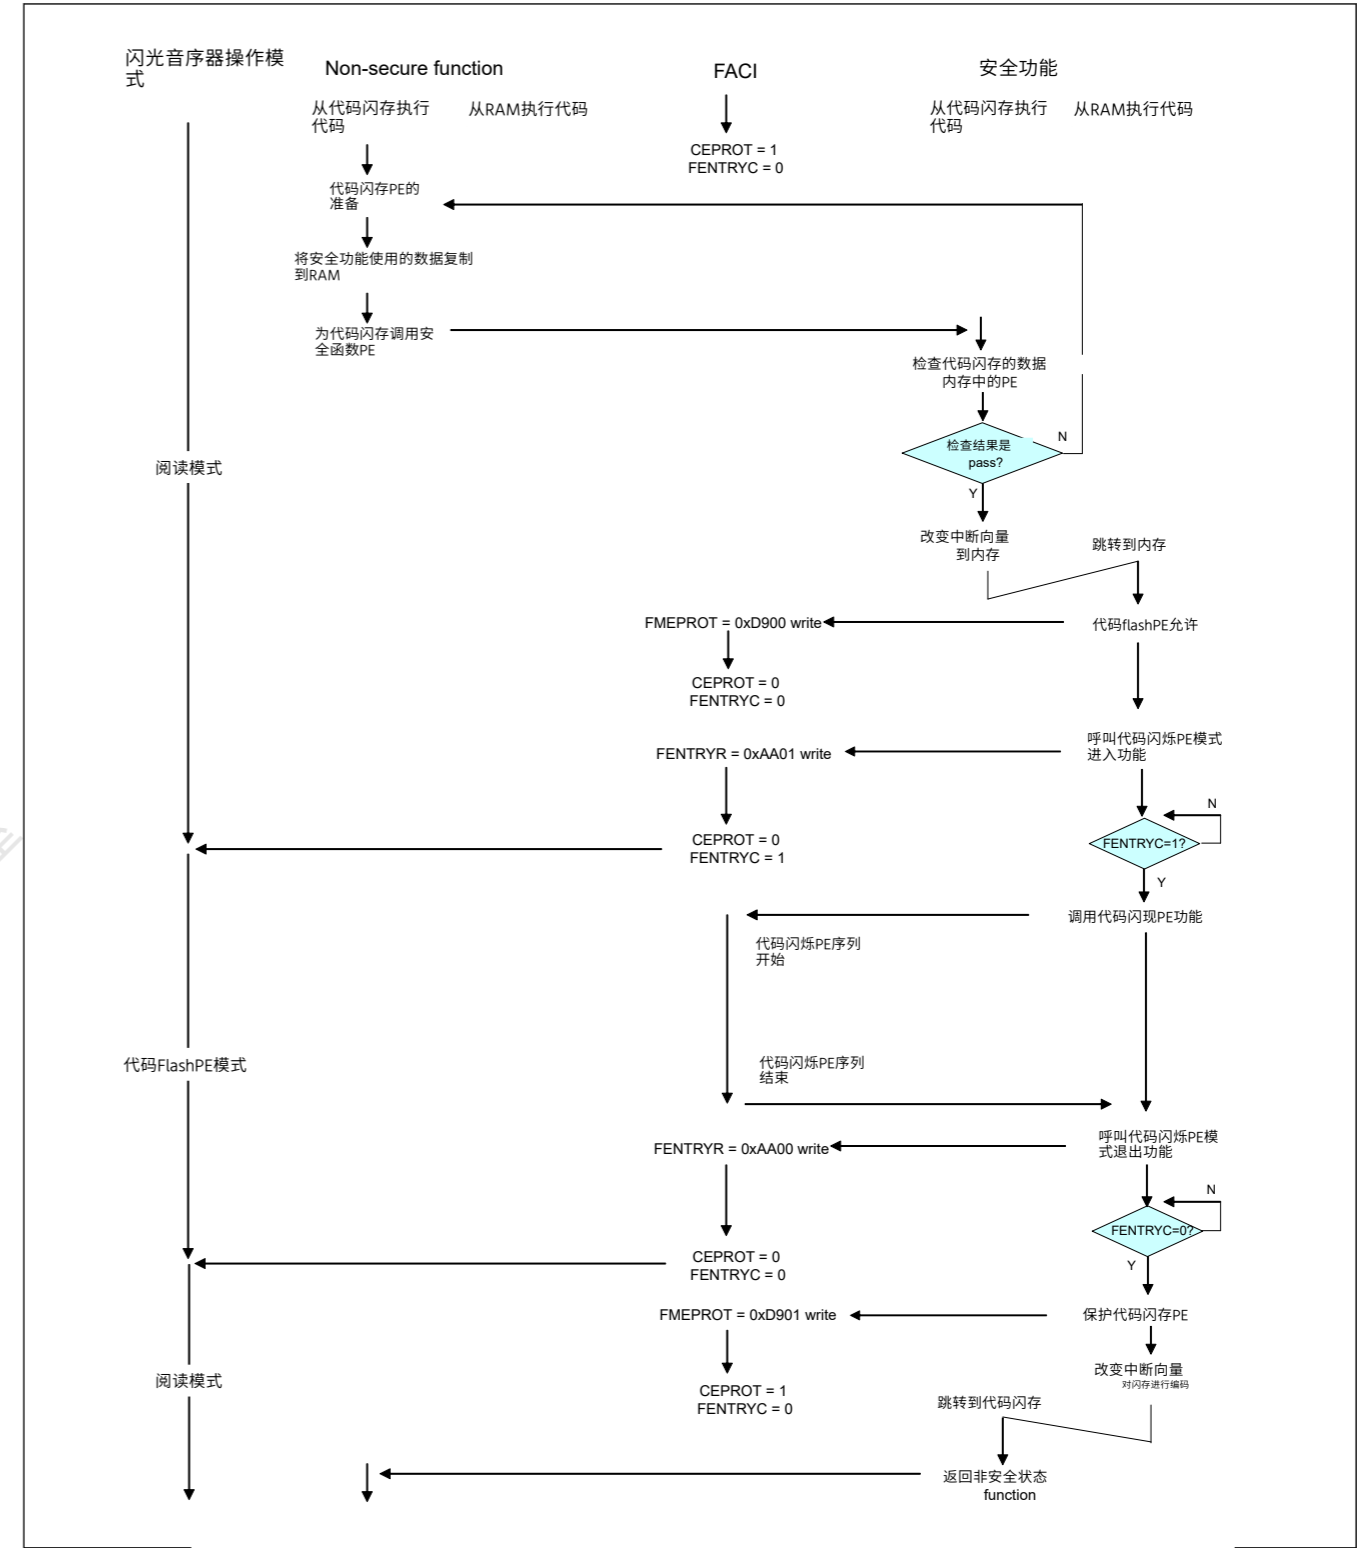

Figure 44.39 CodeFlashPESequenceExamplebynon-securefunction(UsingsecurefunctionforcodeflashPE)

44.13 引导模式

有两种串行编程模式；SCI9的引导模式（SCI接口）和USBFS的引导模式（USB接口）。表44.29列出了引导模式中使用的IO引脚。表44.30列出了启动模式中使用的可用通信接口。

Table 44.29 I/O Pins Used in Boot Mode

| Pin Name       | I/O    | Mode to be Used  | Use   |
|----------------|--------|--|---|
| MD             | Input  | Boot mode (for the SCI interface)<br>Boot mode (for the USB interface) | Selection of operating mode                             |
| P110/RXD9      | Input  | Boot mode (for the SCI interface)                                      | For host communication (to receive data through SCI)    |
| P109/TXD9      | Output |  | For host communication (to transmit data through SCI)   |
| USB_DP, USB_DM | I/O    | Boot mode (for the USB interface)                                      | Data input/output of USB                                |
| USB_VBUS       | Input  |  | Detection of connection and disconnection of USB cables |

Table 44.30 Available Communication Interface Used in Boot Mode

|  |                |                 |                 |
|--|----------------|-----------------|-----------------|
| Main clock oscillator or external clock is connected | Yes            | No              | No              |
| Sub clock oscillator is connected*1                  | Yes or No      | Yes             | No              |
| Available interface                                  | SCI or USB     | SCI or USB      | SCI             |
| Tool connection time*2                               | Up to 1 second | Up to 2 seconds | Up to 3 seconds |

Note 1. The drive capability of the sub clock oscillator is set to standard by SOMCR.SODRV bit. Note that if you use the crystal corresponding the low drive capability on your board, the crystal may not oscillate in the boot mode.

Note 2. See the boot firmware manual for the detail connection time.

#### 44.13.1 Boot Mode (for the SCI Interface)

In boot mode (for the SCI interface), the host sends control commands and data for programming, and the flash memory is programmed or erased accordingly. An on-chip SCI handles transfer between the host and this MCU in asynchronous mode. Tools for transmission of control commands and the data for programming must be prepared in the host.

When this MCU is activated in boot mode (for the SCI interface), the program on the dedicated area the MCU is executed. The boot program automatically adjusts the bit rate of the SCI and controls programming/erasure by receiving control commands from the host.

Figure 44.40 shows the system configuration for operations in boot mode (for the SCI interface).

Table 44.29 引导模式下使用的IO引脚

| 引脚名称           | I/O    | 使用模式                               | Use               |
|----------------|--------|------------------------------------|-------------------|
| MD             | Input  | Boot模式（用于SCI接口）<br>Boot模式（用于USB接口） | 操作模式的选择           |
| P110/RXD9      | Input  | 引导模式（用于SCI接口）                      | 用于主机通信（通过SCI接收数据） |
| P109/TXD9      | Output |                                    | 用于主机通信（通过SCI传输数据） |
| USB_DP, USB_DM | I/O    | 引导模式（用于USB接口）                      | USB数据输入输出         |
| USB_VBUS       | Input  |                                    | 检测USB电缆的连接和断开     |

Table 44.30 引导模式中使用的可用通信接口

|               |         |         |      |
|---------------|---------|---------|------|
| 连接主时钟振荡器或外部时钟 | Yes     | No      | No   |
| 副时钟振荡器已连接*1   | 是还是不是   | Yes     | No   |
| 可用接口          | SCI或USB | SCI或USB | SCI  |
| 工具连接时间*2      | 最多1秒    | 最多2秒    | 最多3秒 |

注1.副时钟振荡器的驱动能力由SOMCR.SODRV位设置为标准。请注意，如果您使用与板上低驱动能力相对应的晶体，则晶体可能不会在引导模式下振荡。

注2.详细连接时间请参见启动固件手册。

#### 44.13.1 引导模式（用于SCI接口）

在引导模式下（针对SCI接口），主机发送控制命令和数据进行编程，相应地对闪存进行编程或擦除。片上SCI以异步模式处理主机和该MCU之间的传输。主机中必须准备好用于传输控制命令和编程数据的工具。

当这个MCU在启动模式下被激活时（对于SCI接口），在MCU的专用区域上的程序被执行。引导程序通过接收来自主机的控制命令自动调整SCI的比特率并控制编程擦除。

图44.40显示了引导模式下操作的系统配置（对于SCI接口）。

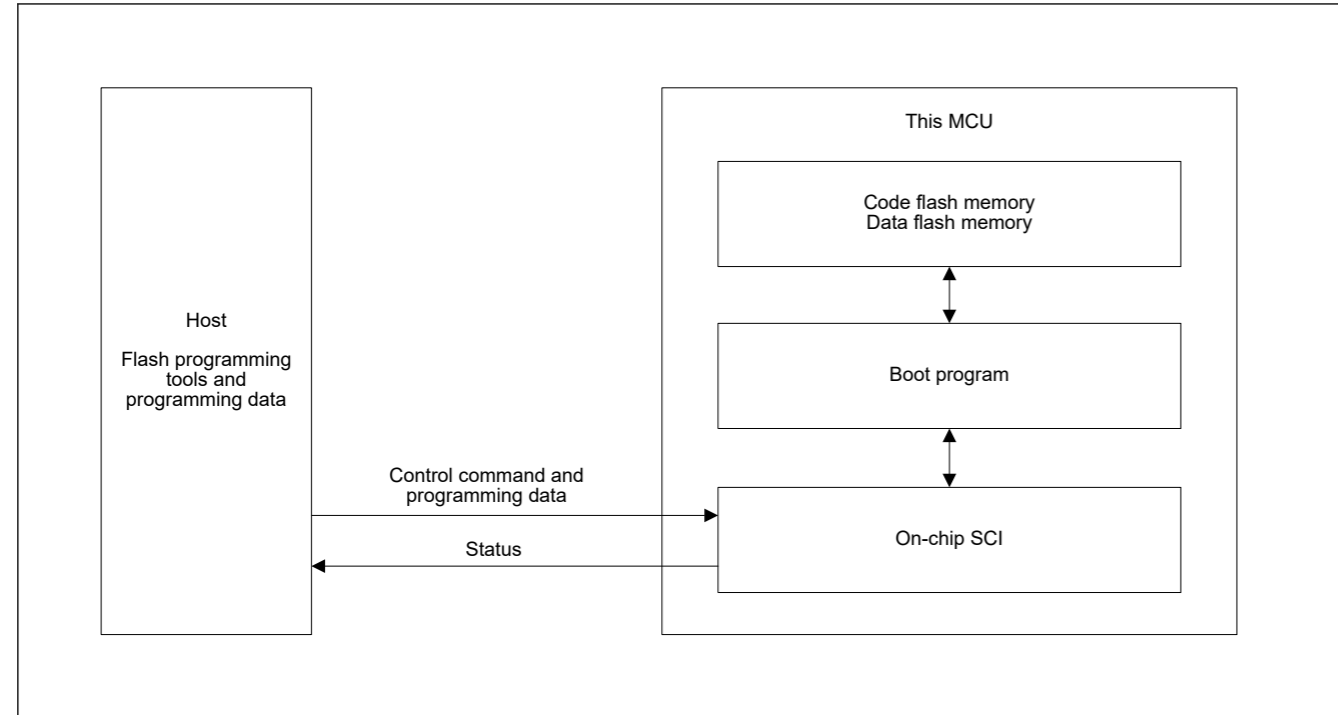

Figure 44.40 System Configuration for Operations in Boot Mode (for the SCI Interface)

44.13.2 Boot Mode (for the USB Interface)

In boot mode (with the USB interface), the flash memory can be programmed or erased by sending control commands and program data from the host. An on-chip USB is used for communications between the host and this MCU. The host requires tools for sending control commands and data for programming. Figure 44.41 shows the configuration of a system for use in boot mode (for the USB interface). The USB cable must be connected on reset release.

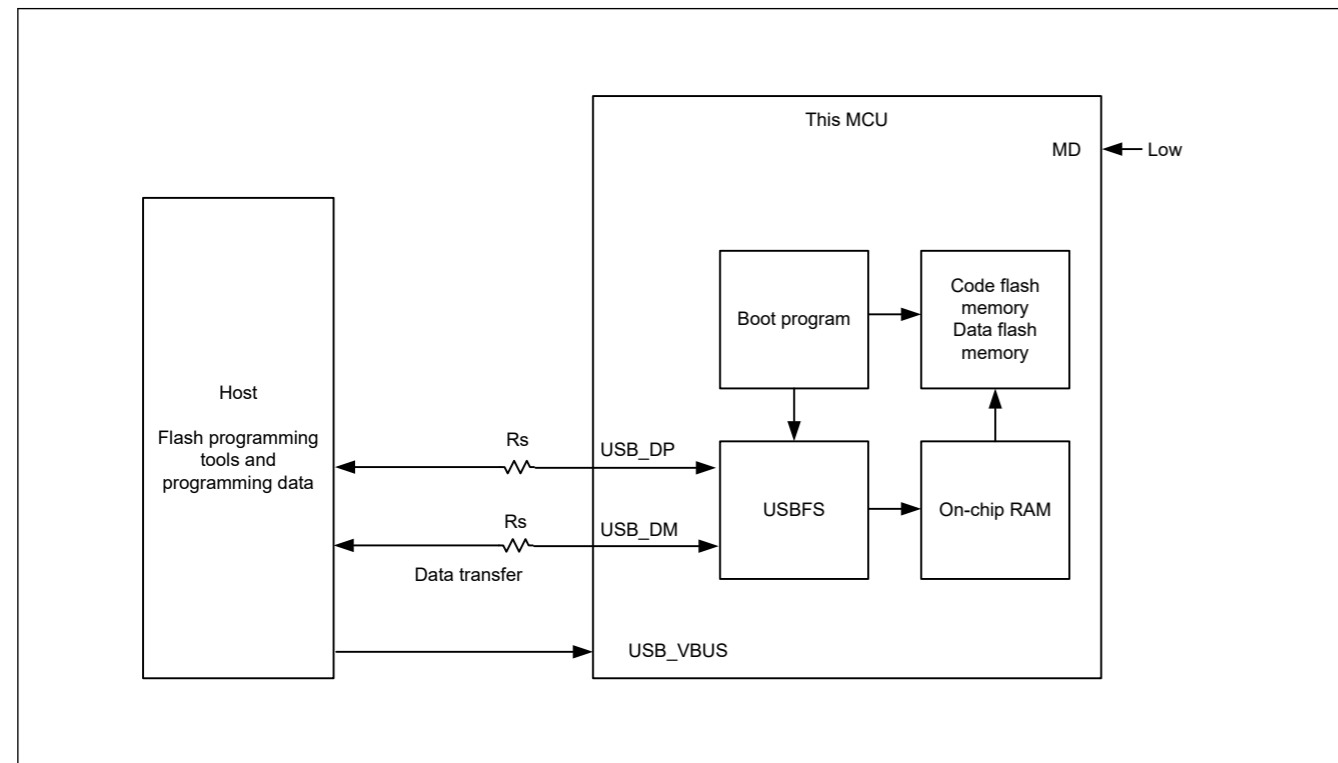

Figure 44.41 System Configuration in Boot Mode (for the USB Interface)

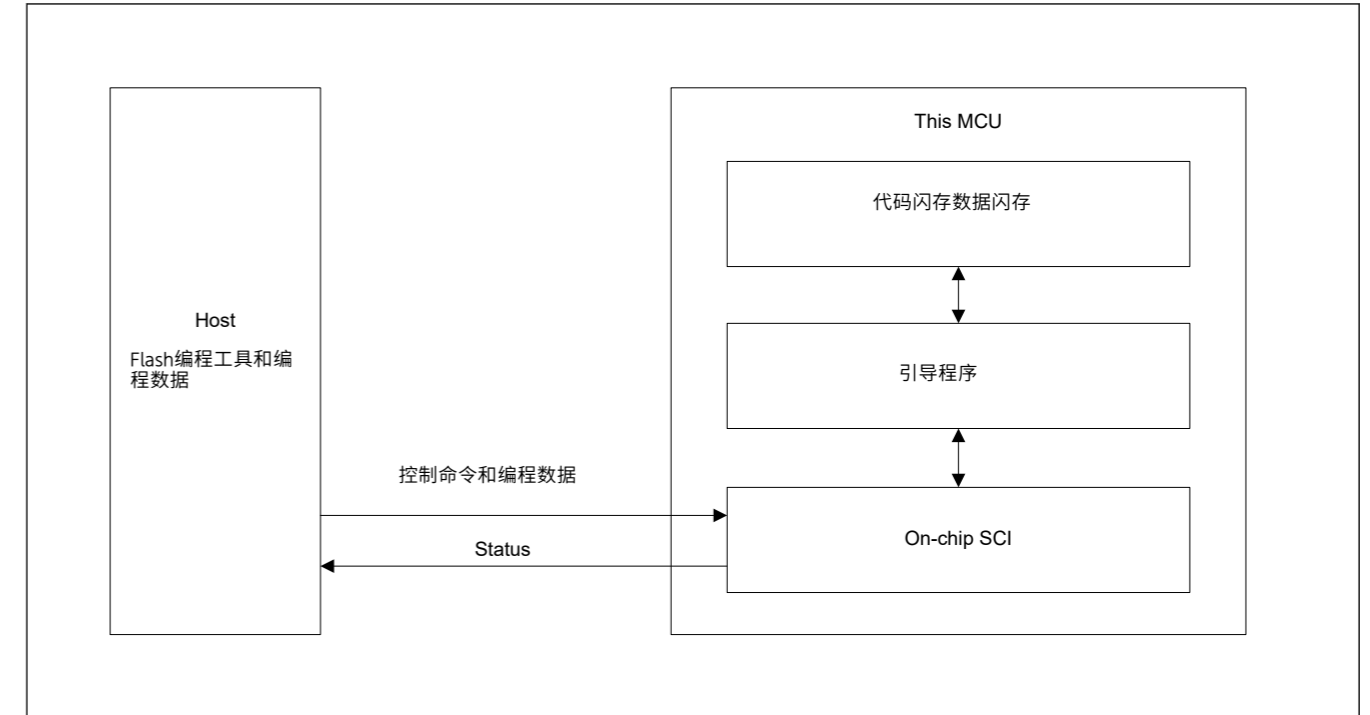

Figure 44.40 引导模式下操作的系统配置（用于SCI接口）

44.13.2 引导模式（用于USB接口）

在引导模式下（使用USB接口），可以通过从主机发送控制命令和编程数据来对闪存进行编程或擦除。片上USB用于主机和该MCU之间的通信。主机需要用于发送控制命令和编程数据的工具。图44.41显示了在引导模式下使用的系统配置（用于USB接口）。USB电缆必须在复位释放时连接。

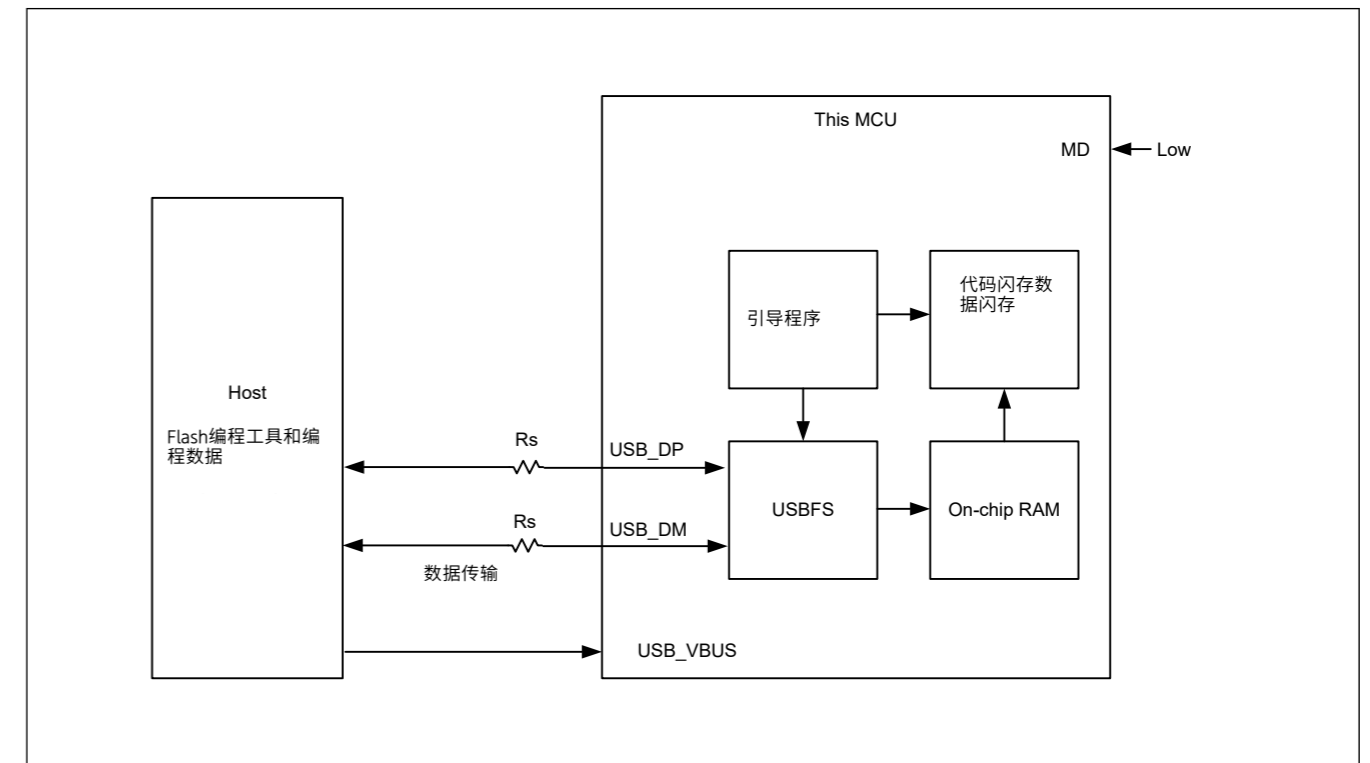

Figure 44.41 引导模式下的系统配置（用于USB接口）

### 44.14 Using the Serial Programmer for Rewriting

A serial programmer can be used to rewrite flash memory in boot mode.

#### (1) Serial Programming

This MCU is mounted on the system board at the time of serial programming. Providing a connector to the board enables rewriting of this MCU by the serial programmer to proceed.

#### 44.14.1 Environments for Serial Programming

The recommended environments for rewriting the flash memory of the MCU with data are described below.

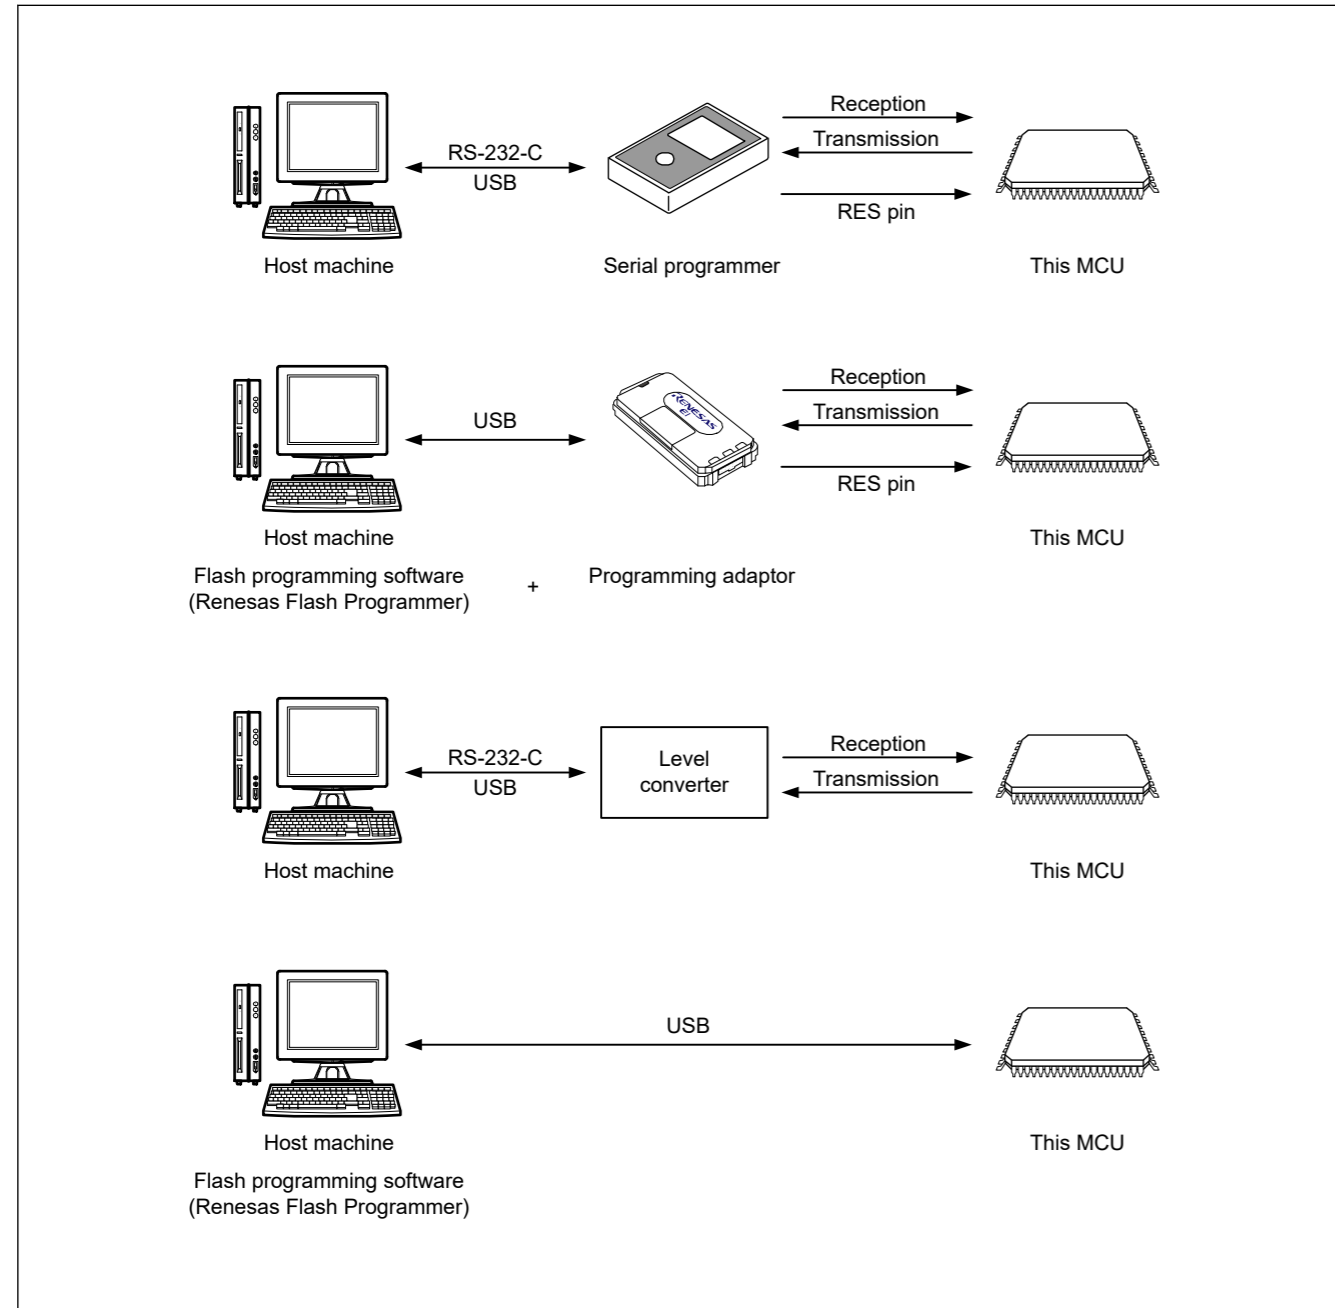

Figure 44.42 Environments for Rewriting the Flash Memory

### 44.14 使用串行编程器进行重写

串行编程器可用于在引导模式下重写闪存。

#### (1) 串行编程

该MCU在串行编程时安装在系统板上。为电路板提供连接器可以让串行编程器重写该MCU以继续进行。

#### 44.14.1 串行编程环境

使用数据重写MCU的闪存的推荐环境如下所述。

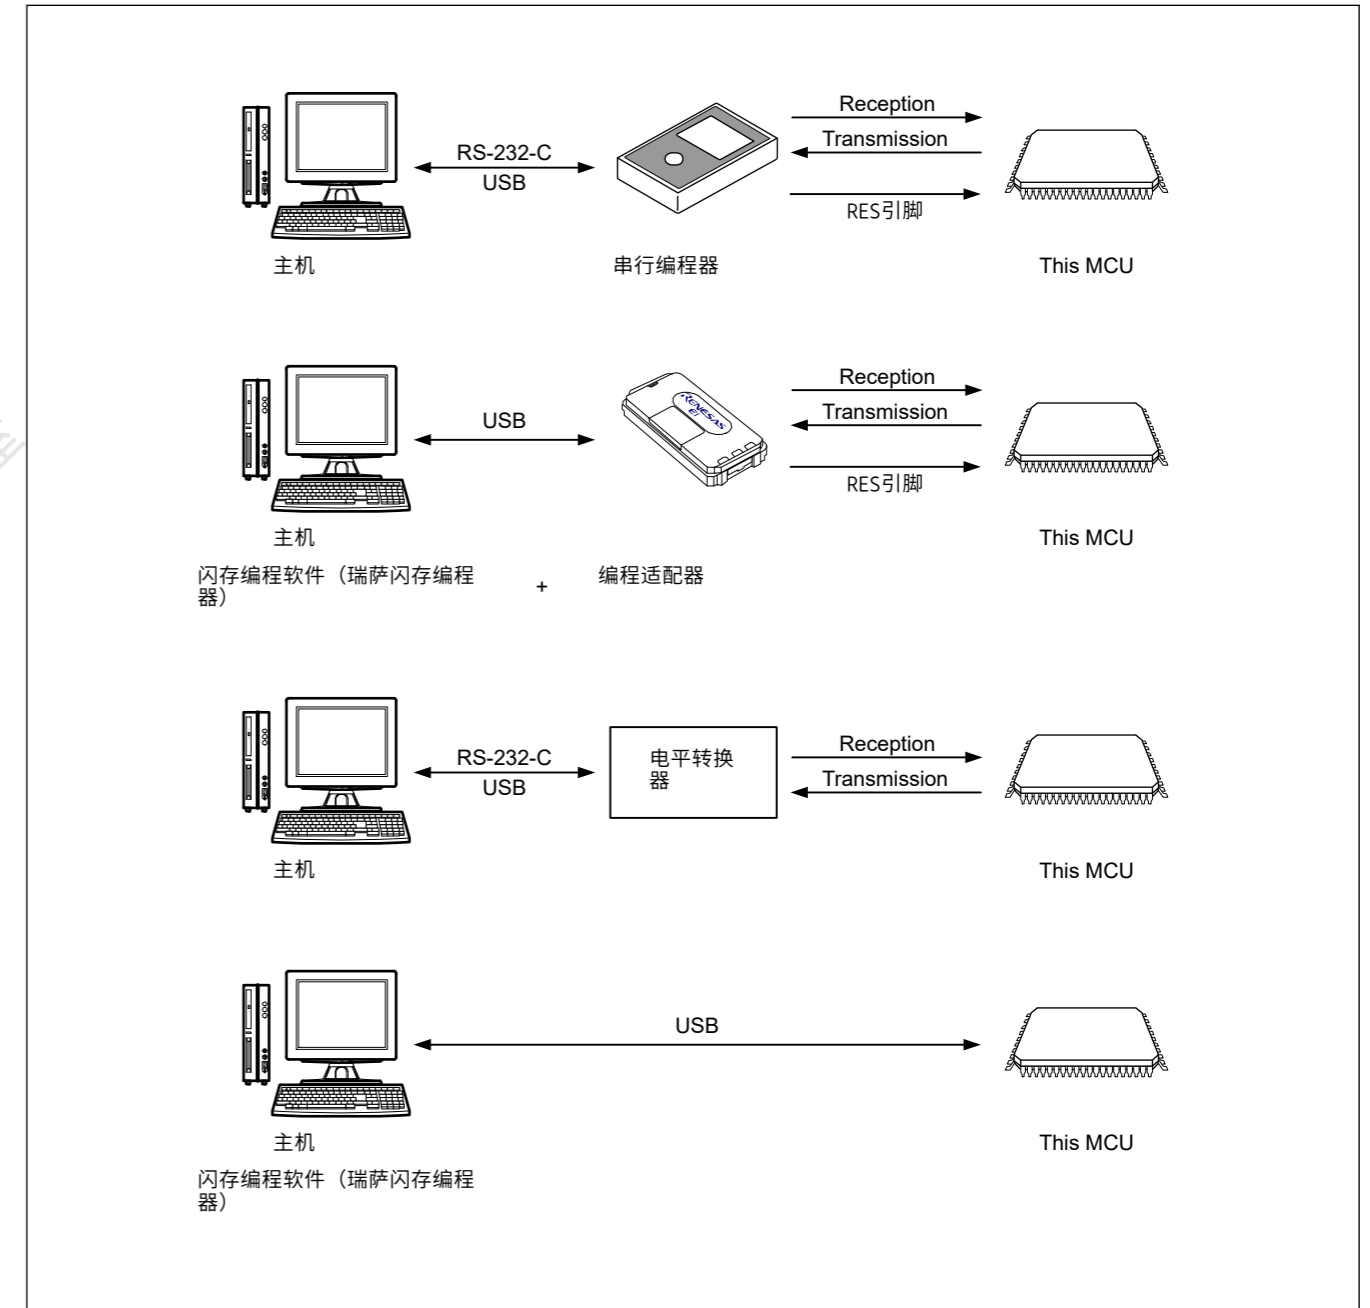

Figure 44.42 重写闪存的环境

## 44.15 Programming through Self-Programming

### 44.15.1 Overview

This MCU supports programming of the flash memory by the user program itself. The FACI commands can be used with user programs for writing to the flash memory. This allows upgrading of user programs and rewriting of constant data fields.

The program for rewriting must be transferred to the internal RAM or external memory in advance when the BGO is not available or when rewriting the option-setting memory.

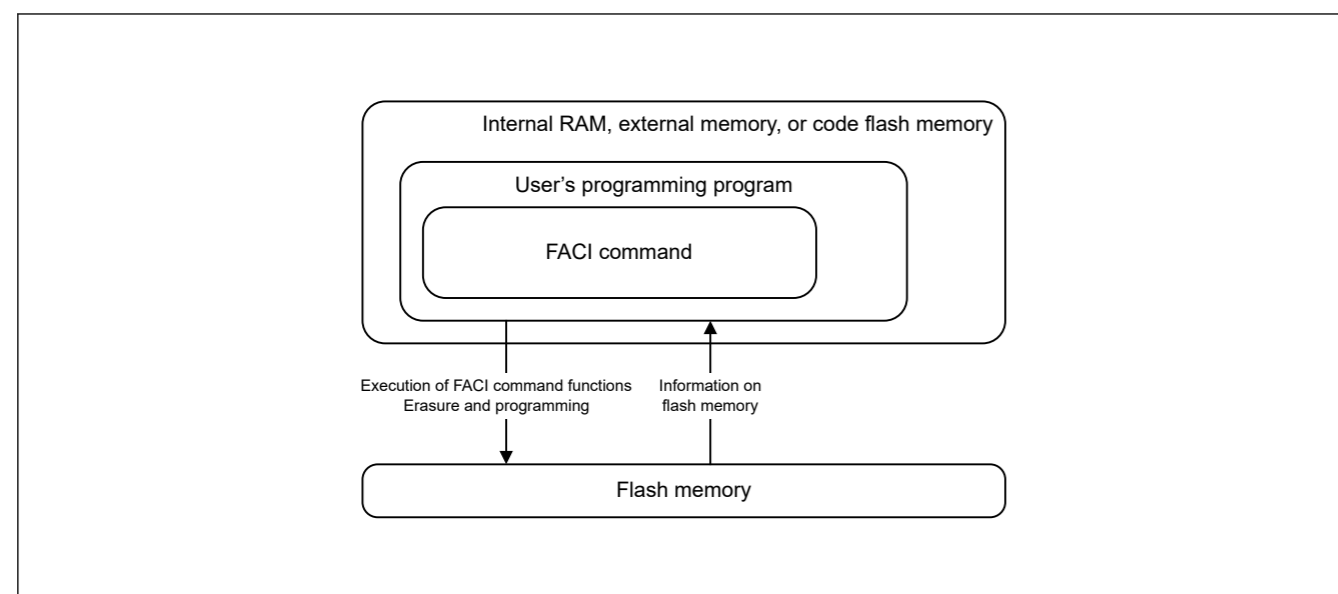

Figure 44.43 Schematic View of Self-Programming

For comprehensive information on the self-programming, refer to [section 44.9. FACI Commands](#)

### 44.15.2 Background Operation

The background operation (BGO) can be used to execute the flash rewrite routine on the code flash memory when the data flash memory.

Background operations can be used when the combination of the flash memory for rewriting and the flash memory for reading is any of those listed below.

Table 44.31 Conditions under which Background Operation is Usable

|        | Range for rewriting | Range for reading |
|--------|---------------------|-------------------|
| Common | Code flash memory   | Data flash memory |
|        | Data flash memory   | Code flash memory |

## 44.16 Reading Flash Memory

### 44.16.1 Reading Code Flash Memory

Special settings are not required to read code flash memory after release from the reset state. Data can simply be read out through access to addresses in the code flash memory.

When reading code flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state), all bits are read as 1.

### 44.16.2 Reading Data Flash Memory

## 44.15 通过自编程进行编程

### 44.15.1 Overview

该MCU支持用户程序本身对闪存进行编程。FACI命令可与用户程序一起用于写入闪存。这允许升级用户程序和重写常量数据字段。

当BGO不可用或重写选项设置存储器时，必须将重写程序提前传送到内部RAM或外部存储器。

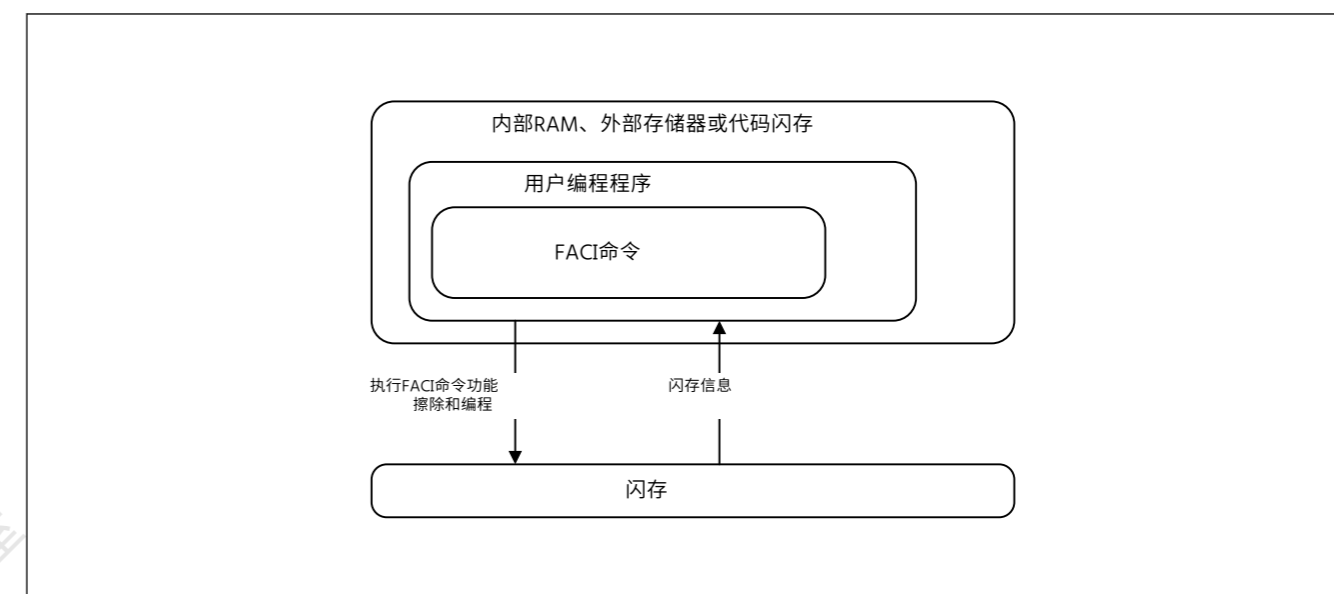

Figure 44.43 自编程示意图

有关自编程的全面信息，请参阅第44.9节。FACI命令

### 44.15.2 后台操作

后台操作（BGO）可用于在数据闪存时对代码闪存执行闪存重写程序。

当用于重写的闪存和用于读取的闪存的组合为下列任何一种时，可以使用后台操作。

Table 44.31 后台操作可用的条件

|        | 重写范围 | 读取范围 |
|--------|------|------|
| Common | 代码闪存 | 数据闪存 |
|        | 数据闪存 | 代码闪存 |

## 44.16 读取闪存

### 44.16.1 读码闪存

从复位状态释放后，读取代码闪存不需要特殊设置。可以通过访问代码闪存中的地址来简单地读取数据。

当读取已擦除但尚未再次编程的代码闪存时（即处于未编程状态），所有位都被读取为1。

### 44.16.2 读取数据闪存

Special settings are not required to read data flash memory after release from the reset state. Data can simply be read out through access to addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state) are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

### 44.16.3 Access Cycle

When the CPU cache is hit, access is one cycle.

For the CPU cache is missed while CPU cache operation is enabled, or CPU cache is disabled. (This operation only guarantees the first read access of a wrapping burst in AHB protocol. Otherwise, access wait occurs until the CPU cache is filled.)

**Table 44.32 Code Flash Memory**

| Flash Cache Operation | FLWT Register Setting | Read cycle (ICLK) |
|-----------------------|-----------------------|-------------------|
| enable and hit        | —                     | 3                 |
| disable or miss       | 0x00                  | 3                 |
|                       | 0x01                  | 4                 |
|                       | 0x02                  | 5                 |
|                       | 0x03                  | 6                 |

**Table 44.33 Data Flash Memory**

| FCKMHZ Register Setting | Read (cycle)                                       |
|-------------------------|--|
| 0x00 to 0x09            | Min: 2 ICLK + 3 FCLK<br>Max: (n + 1) ICLK + 3 FCLK |
| 0x0A to 0x13            | Min: 2 ICLK + 4 FCLK<br>Max: (n + 1) ICLK + 4 FCLK |
| 0x14 to 0x1D            | Min: 2 ICLK + 5 FCLK<br>Max: (n + 1) ICLK + 5 FCLK |
| 0x1E to 0x27            | Min: 2 ICLK + 6 FCLK<br>Max: (n + 1) ICLK + 6 FCLK |
| 0x28 to 0x31            | Min: 2 ICLK + 7 FCLK<br>Max: (n + 1) ICLK + 7 FCLK |
| 0x32                    | Min: 2 ICLK + 8 FCLK<br>Max: (n + 1) ICLK + 8 FCLK |

Note: When the frequency ratio of ICLK : FCLK is n : 1

### 44.17 Usage Notes

#### (1) Reading Area Where Programming/Erase was Interrupted and Area Targeted for Suspension

The data stored in the area where programming or erasure has been suspended or the area where programming or erasure has been suspended by using the suspend command are undefined. To avoid faulty operation caused by reading undefined data, take care not to fetch instructions or read data from areas where programming or erasure was suspended and where programming or erasure was suspended by using the suspend command.

#### (2) Suspension During Programming/Erase

When processing of programming/erasure is stopped by issuing the P/E suspend command, the programming/erasure processing can be resumed by issuing the P/E resume command. If the flash sequencer enters the command-locked state for any reason and issues the forced stop command after the suspended processing is normally completed and the ERSSPD flag or PRGSPD flag is set to 1, the suspended processing cannot be resumed. In addition, the values in the area where the processing was suspended are not guaranteed. Erase that area

从复位状态释放后读取数据闪存不需要特殊设置。通过访问数据闪存中的地址可以简单地读取数据。

从已擦除但尚未再次编程（即处于未编程状态）的数据闪存中读取的值未定义。当您需确认某个区域处于非编程状态时，请使用空白检查。

### 44.16.3 访问周期

当CPU缓存被命中时，访问为一个周期。

启用CPU缓存操作或禁用CPU缓存时CPU缓存丢失。（此操作仅保证AHB协议中包装突发的第一次读取访问。否则，将等待访问，直到CPU缓存被填满。）

**Table 44.32 代码闪存**

| 闪存缓存操作 | FLWT寄存器设置 | 读周期(ICLK) |
|--------|-----------|-----------|
| 启用并点击  | —         | 3         |
| 禁用或错过  | 0x00      | 3         |
|        | 0x01      | 4         |
|        | 0x02      | 5         |
|        | 0x03      | 6         |

**Table 44.33 数据闪存**

| FCKMHZ寄存器设置  | Read (cycle)                                       |
|--------------|--|
| 0x00 to 0x09 | Min: 2 ICLK + 3 FCLK<br>Max: (n + 1) ICLK + 3 FCLK |
| 0x0A to 0x13 | Min: 2 ICLK + 4 FCLK<br>Max: (n + 1) ICLK + 4 FCLK |
| 0x14 to 0x1D | Min: 2 ICLK + 5 FCLK<br>Max: (n + 1) ICLK + 5 FCLK |
| 0x1E to 0x27 | Min: 2 ICLK + 6 FCLK<br>Max: (n + 1) ICLK + 6 FCLK |
| 0x28 to 0x31 | Min: 2 ICLK + 7 FCLK<br>Max: (n + 1) ICLK + 7 FCLK |
| 0x32         | Min: 2 ICLK + 8 FCLK<br>Max: (n + 1) ICLK + 8 FCLK |

Note: 当ICLK:FCLK的频率比为n:1时

### 44.17 使用说明

#### (1) 编程擦除被中断的阅读区域和暂停的目标区域

存储在已暂停编程或擦除的区域或已使用suspend命令暂停编程或擦除的区域中的数据是未定义的。为避免因读取未定义数据而导致错误操作，请注意不要从暂停编程或擦除的区域以及使用暂停命令暂停编程或擦除的区域获取指令或读取数据。

#### (2) 编程擦除期间的暂停

当通过发出PE暂停命令停止编程擦除处理时，可以通过发出PE恢复命令来恢复编程擦除处理。如果闪存定序器由于任何原因进入命令锁定状态并在挂起处理正常完成并且ERSSPD标志或PRGSPD标志设置为1后发出强制停止命令，则无法恢复挂起的处理。此外，不能保证处理暂停的区域中的值。擦除该区域

### (3) Prohibition of Additional Programming

Programming a given area of the code flash memory or data flash memory twice is not possible. To program the code flash memory or data flash memory where has been programmed, erase the target area. Programming can be added to the option-setting memory.

### (4) Resets During Programming/Erase, or Blank Checking

In the case of a reset due to the signal on the RES pin during programming/erase, or blank checking of the flash memory, wait for at least  $t_{RESW}$  (see section 47, Electrical Characteristics) of the reset input period once the operating voltage is within the range stipulated in the electrical characteristics, then release the device from the reset state.

### (5) Allocation of Vectors for Interrupts and Other Exceptions During Programming/Erase

Generation of an interrupt or other exception during programming/erase may lead to fetching of the vector from the code flash memory. Under conditions where BGO cannot be used, set the address of the vector to an address that is not in the code flash memory. Alternatively, make sure that no handling of interrupts or exceptions proceeds during programming/erase.

### (6) Items Prohibited During Programming/Erase, or Blank Checking

High voltage is applied to the flash memory during programming/erase, or blank checking. To prevent damage to the flash memory, do not perform the following operations.

- Have the operating voltage from the power supply go beyond the permitted range.
- Change the FWEPROR.FLWE[1:0]bits.
- Change the OPCCR.OPCM[2:0] and SOPCCR.SOPCM bits.
- Change the SCKDIVCR.FCK[2:0]bits.
- Change the SCKSCR.CKSEL[2:0]bits.
- Transition to the software standby mode, or deep software standby mode.

### (7) Programming/Erase in Low-Speed Modes and Subosc-Speed Mode

Do not programming/erase the flash memory when low-speed mode or subosc-speed mode is selected with the operating power control register (OPCCR or SOPCCR).

### (8) Emulator Connection

Renesas provides the emulator which supports both debugging using SWD or JTAG communication and serial programming using SCI communication. This emulator makes it easy to switch between debugging and serial programming.

Table 44.34 shows the pinout of 10 pin or 20 pin socket pinouts when using this emulator. The pinout of SWD and JTAG is ARM standard, and MD, TXD, RXD pins are added for the serial programming using SCI communication.

The serial programming interface must be used to program the TrustZone IDAU boundary register settings.

It is recommended to connect P300/SWCLK/TCK and P201/MD pins using wired OR circuit on the board to use both debugging and serial programming

Table 44.34 Pin assign for emulator (1 of 2)

| Pin No. | SWD                                 | JTAG                              | Serial Programming using SCI |
|---------|-------------------------------------|-----------------------------------|------------------------------|
| 1       | VCC                                 | VCC                               | VCC                          |
| 2       | P108/SWDIO                          | P108/TMS                          | NC                           |
| 4       | P300/SWCLK<br>Wired OR with P201/MD | P300/TCK<br>Wired OR with P201/MD | P201/MD                      |
| 6       | P109/SWO/TXD9                       | P109/TDO/TXD9                     | P109/TXD9                    |
| 8       | P110/RXD9                           | P110/TDI/RXD9                     | P110/RXD9                    |
| 9       | GNDdetect                           | GNDdetect                         | GNDdetect                    |
| 10      | nRESET                              | nRESET                            | nRESET                       |

### (3) 禁止额外编程

不能对代码闪存或数据闪存的给定区域进行两次编程。要对已编程的代码闪存或数据闪存进行编程，请擦除目标区域。可以将编程添加到选项设置存储器中。

### (4) 在编程擦除或空白检查期间复位

如果在编程擦除期间由于RES引脚上的信号而导致复位，或者闪存的空白检查，一旦工作电压达到在电气特性规定的范围内，然后将设备从复位状态释放。

### (5) 在编程擦除期间为中断和其他异常分配向量

在编程擦除期间产生中断或其他异常可能会导致从代码闪存中获取向量。在无法使用BGO的情况下，将向量的地址设置为不在代码闪存中的地址。或者，确保在编程擦除期间不处理中断或异常。

### (6) 编程擦除或空白检查期间禁止的项目

在编程擦除或空白检查期间向闪存施加高电压。为防止损坏闪存，请勿执行以下操作。

- 电源的工作电压是否超出允许范围。
- 改变FWEPROR.FLWE[1:0]位。
- 更改OPCCR.OPCM[2:0]和SOPCCR.SOPCM位。
- 更改SCKDIVCR.FCK[2:0]位。
- 更改SCKSCR.CKSEL[2:0]位。
- 转换到软件待机模式或深度软件待机模式。

### (7) 低速模式和Subosc-Speed模式下的编程擦除

当使用工作电源控制寄存器（OPCCR或SOPCCR）选择低速模式或subosc-speed模式时，不要对闪存进行编程擦除。

### (8) 仿真器连接

瑞萨电子提供的仿真器支持使用SWD或JTAG通信进行调试和使用SCI通信进行串行编程。该仿真器可以轻松地在调试和串行编程之间切换。

表44.34显示了使用该仿真器时10针或20针插座的引脚排列。SWD和JTAG的管脚是ARM标准，并增加了MD、TXD、RXD引脚用于使用SCI通信的串行编程。

必须使用串行编程接口对TrustZone IDAU边界寄存器设置进行编程。

建议使用板上的有线OR电路连接P300/SWCLK/TCK和P201/MD引脚，以同时使用调试和串行编程

Table 44.34 模拟器的引脚分配（2个中的1个）

| 针号 | SWD                      | JTAG                   | 使用SCI进行串行编程 |
|----|--------------------------|------------------------|-------------|
| 1  | VCC                      | VCC                    | VCC         |
| 2  | P108/SWDIO               | P108/TMS               | NC          |

## 45. Internal Voltage Regulator

### 45.1 Overview

The MCU includes one internal voltage regulator:

- Linear regulator (LDO)

This regulator supplies voltage to all internal circuits and memory except for I/O, analog, USB, and battery backup power domains.

### 45.2 Operation

Table 45.1 lists the LDO mode pin settings, and Figure 45.1 shows the LDO mode settings. In LDO mode, the internal voltage is generated from VCC.

Table 45.1 LDO mode pin

| Pins      | Setting descriptions  |
|-----------|---|
| All VCC   | <ul style="list-style-type: none"> <li>• Connect each pin to the system power supply.</li> <li>• Connect each pin to VSS through a 0.1-<math>\mu</math>F multilayer ceramic capacitor. Place the capacitor close to the pin.</li> </ul> |
| VCL, VCL0 | Connect the each pin to VSS through a 0.1- $\mu$ F multilayer ceramic capacitor. Place the capacitor close to the pin.  |

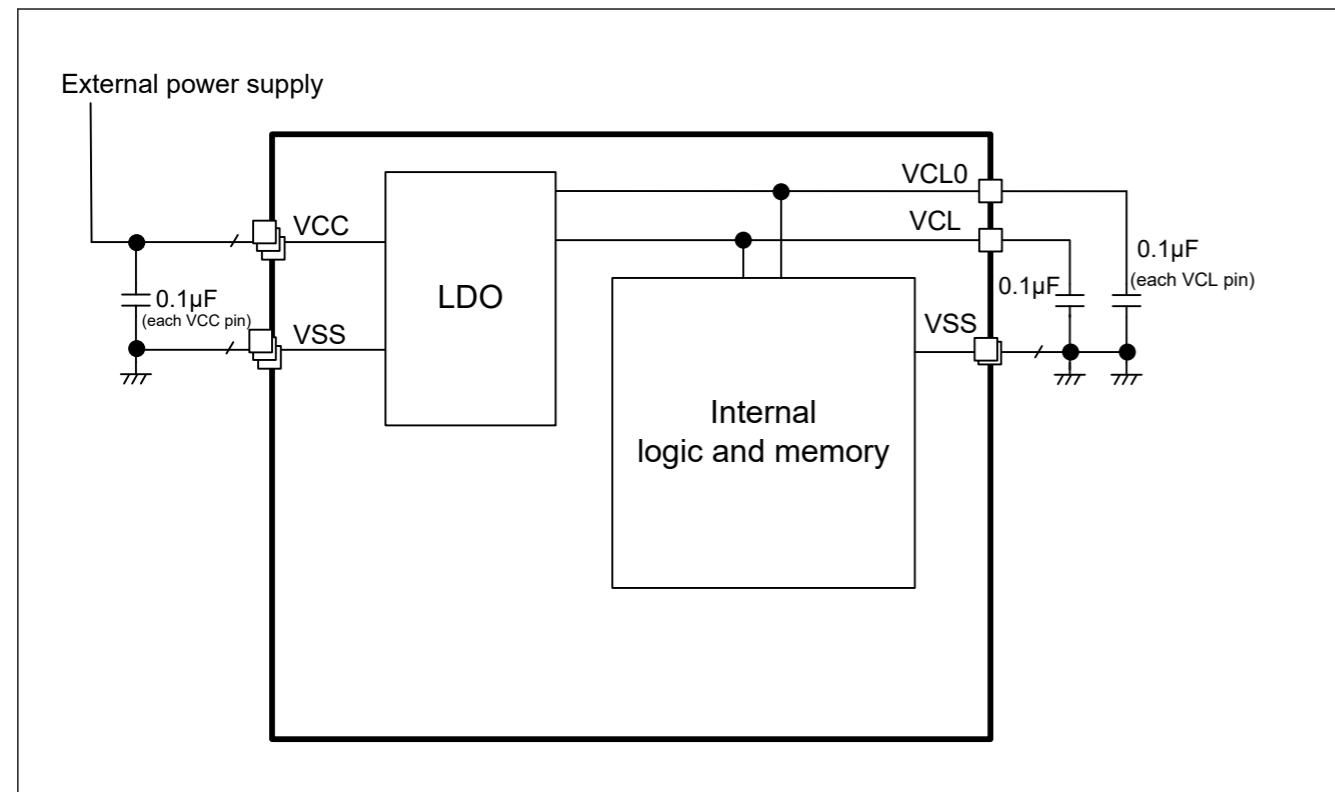

Figure 45.1 LDO mode settings

## 45. 内部稳压器

### 45.1 Overview

MCU包含一个内部稳压器：

- 线性稳压器 (LDO)

该稳压器为除IO、模拟、USB和电池备用电源域之外的所有内部电路和存储器提供电压。

### 45.2 Operation

表45.1列出了LDO模式引脚设置，图45.1显示了LDO模式设置。在LDO模式下，内部电压由VCC产生。

Table 45.1 LDO模式引脚

| Pins      | 设置说明  |
|-----------|---|
| All VCC   | <ul style="list-style-type: none"> <li>• 将每个引脚连接到系统电源。</li> <li>• 通过一个0.1<math>\mu</math>F多层陶瓷电容器将每个引脚连接到VSS。将电容器靠近引脚放置。</li> </ul> |
| VCL, VCL0 | 通过一个0.1 $\mu$ F多层陶瓷电容器将每个引脚连接到VSS。将电容器靠近引脚放置。   |

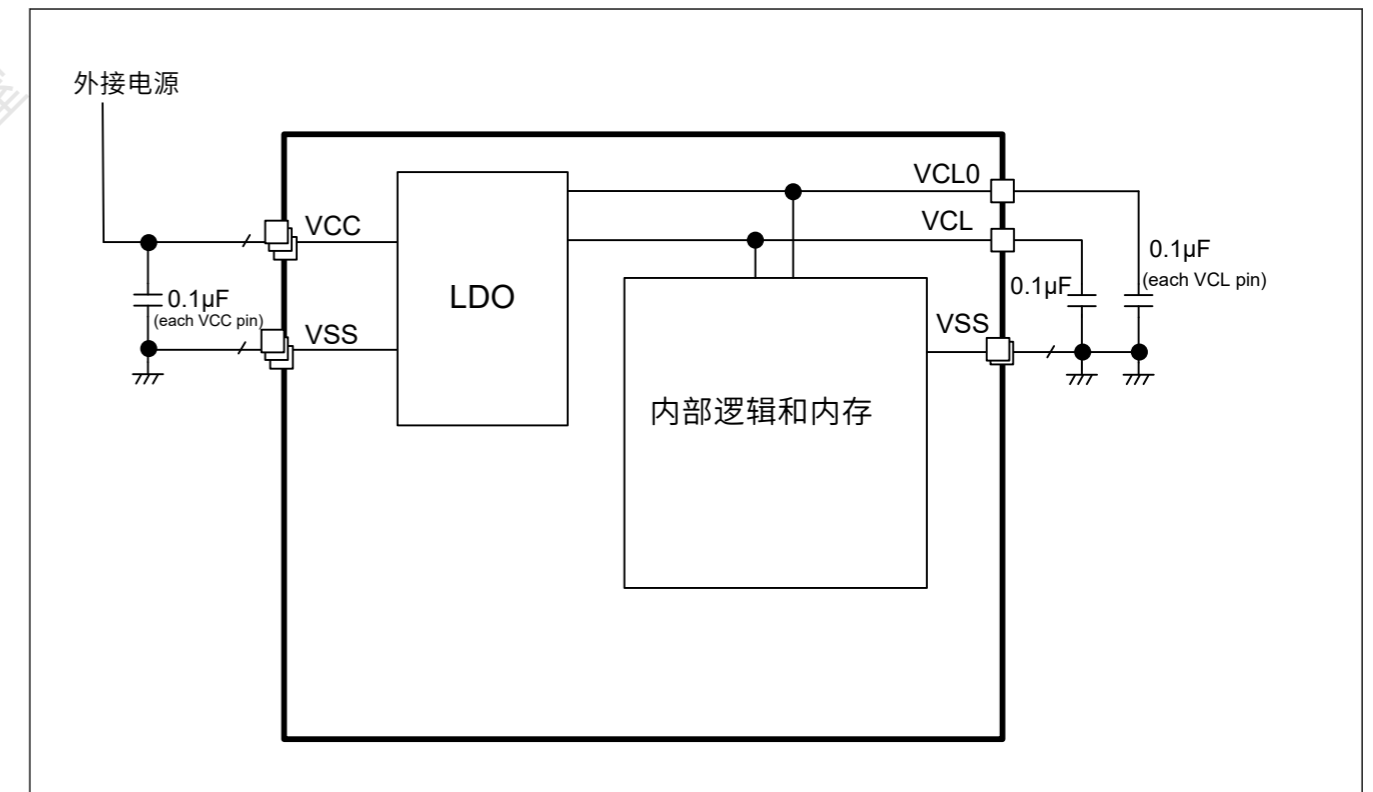

Figure 45.1 LDO模式设置

## 46. Security Features

### 46.1 Features

- ARMv8-M TrustZone security
  - Eight regions IDAU for memory space
    - Up to three regions for the code flash
    - Up to two regions for the data flash
    - Up to three regions for the SRAM
    - IDAU setting is common for the CPU, DMAC, and DTC
  - SAU is not implemented
  - Secure or Non-secure region for the Standby SRAM
  - Secure or Non-secure region for the VBATT backup registers
  - Individual Secure or Non-secure security attribution for each peripheral
  - Some peripherals support both Secure and Non-secure security attributions
- Device lifecycle management
- Three debug access levels
  - DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals
  - DBG1: The debugger connection is allowed, and restricted to access only non-secure memory regions and peripherals
  - DBG0: The debugger connection is not allowed
- Key injection
- Cryptographic accelerator
  - See [section 36, Secure Cryptographic Engine \(SCE9\)](#)
- Secure pin multiplexing
  - All I/O port pins can be configured individually as secure or non-secure
  - Pin functions of SCI3, SPI0, IIC0, GPT321 and GPT165 can be configured as secure pin
  - See [section 19, I/O Ports](#)

### 46.2 Arm TrustZone Security

#### 46.2.1 Arm TrustZone Technology

Arm TrustZone technology divides the system and the application into Secure and Non-secure domains. Secure application can access both Secure and Non-secure memory and resources. Non-secure application can only access Non-secure memory and resources.

The system starts up in Secure state by default. The security state of CPU can be either Secure or Non-secure.

#### 46.2.2 Memory Security Attribution

The code flash, the data flash, and the SRAM are divided into Secure (S), Non-secure (NS) and Non-secure callable (NSC) regions. These memory security attributions are set into the nonvolatile memory by the serial programming command when the device lifecycle is SSD state. These memory security attributions are loaded into the IDAU and the memory controller before application execution. These memory security attributions cannot be updated by application but can be through the dedicated registers.

The code flash can be divided in up to three regions. The data flash can be divided in up to two regions. The SRAM can be divided in up to three regions. [Figure 46.1](#) shows the memory mapping. [Table 46.1](#) shows the size of memory region.

## 46. 安全功能

### 46.1 Features

- ARMv8-M TrustZone security
  - 八个区域IDAU用于存储空间
    - 代码闪存最多三个区域
    - 最多两个区域用于数据闪存
    - SRAM最多三个区域
    - IDAU设置对于CPU、DMAC和DTC是通用的
  - SAU未实施
  - 备用SRAM的安全或非安全区域
  - VBATT备份寄存器的安全或非安全区域
  - 每个外围设备的单独安全或非安全安全属性
  - 一些外围设备同时支持安全和非安全安全属性
- 设备生命周期管理
- 三个调试访问级别
  - DBG2: 允许调试器连接, 并且对访问内存和外设没有限制
  - DBG1: 允许调试器连接, 但仅限于访问非安全内存区域和外围设备
  - DBG0: 不允许调试器连接
- 密钥注入
- 密码加速器
  - 参见[第36节, 安全加密引擎\(SCE9\)](#)
- 安全引脚复用
  - 所有IO端口引脚都可以单独配置为安全或非安全
  - SCI3、SPI0、IIC0、GPT321和GPT165的引脚功能可配置为安全引脚
  - 参见[第19节, IO端口](#)

### 46.2 ArmTrustZone安全

#### 46.2.1 ArmTrustZone技术

ArmTrustZone技术将系统和应用程序划分为安全和非安全域。安全应用程序可以访问安全和非安全内存和资源。非安全应用程序只能访问非安全内存和资源。

系统默认以安全状态启动。CPU的安全状态可以是Secure或非-secure。

#### 46.2.2 内存安全归属

代码闪存、数据闪存和SRAM分为安全(S)、非安全(NS)和非安全可调用(NSC)区域。当设备生命周期为SSD状态时, 这些内存安全属性由串行编程命令设置到非易失性内存中。这些内存安全属性在应用程序执行之前被加载到IDAU和内存控制器中。这些内存安全属性不能由应用程序更新, 但可以通过专用寄存器来更新。

代码闪存最多可分为三个区域。数据闪存最多可分为两个区域。SRAM最多可分为三个区域。图46.1显示了内存映射。表46.1显示了内存区域的大小。

Note: It is prohibited to place Secure or Non-secure callable regions in a block swappable area because the secure application will be placed in the non-secure region after block swapping.

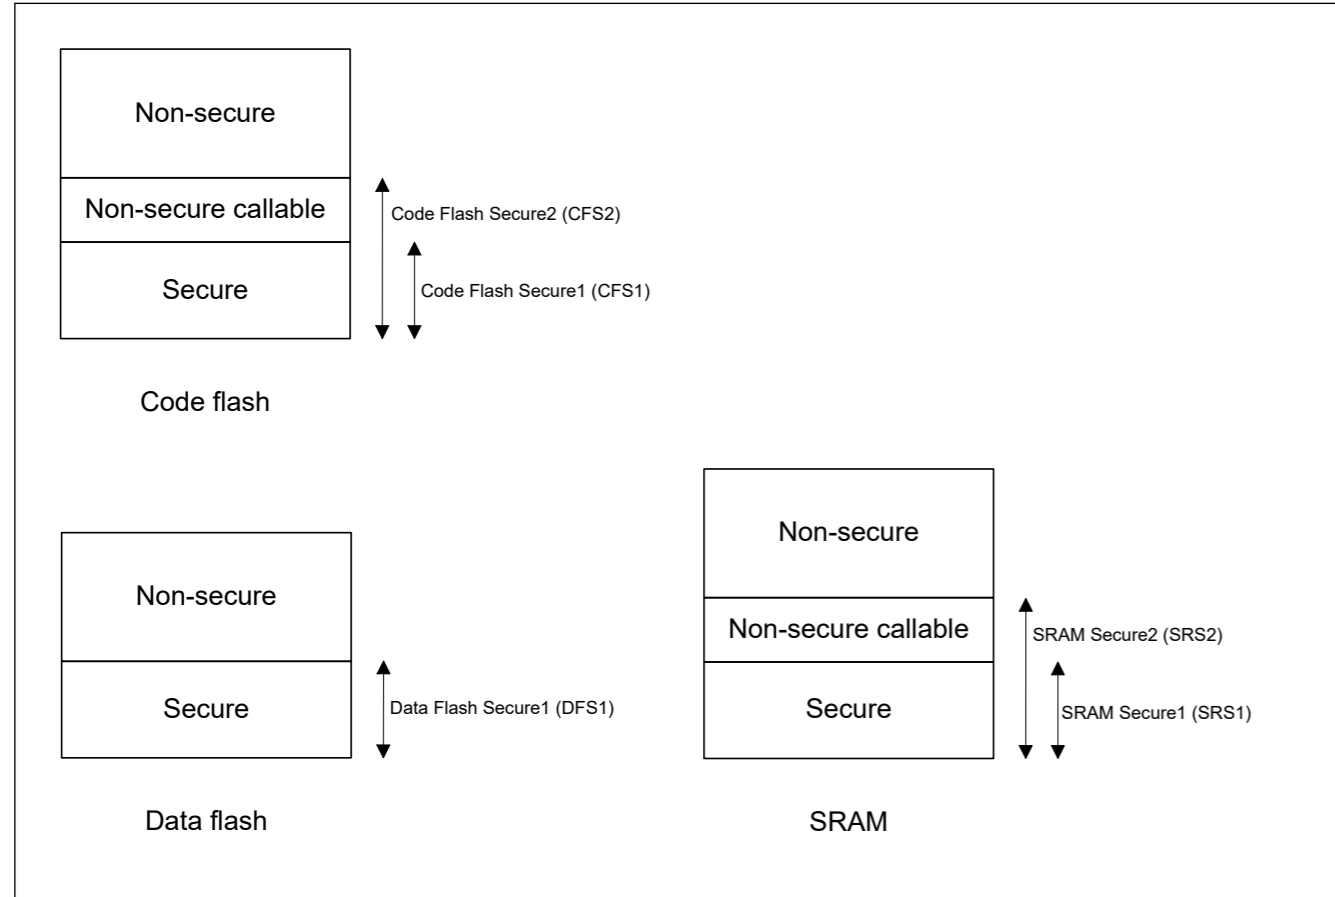

Figure 46.1 Memory mapping

Table 46.1 Memory Region Size

| Memory Region                  | Start Address             | Size                           |
|--------------------------------|---------------------------|--------------------------------|
| Code flash secure              | 0x0000_0000               | CFS1 × 1 KB                    |
| Code flash non-secure callable | CFS1 × 1 KB               | CFS2 × 32 KB - CFS1 × 1 KB     |
| Code flash non-secure          | CFS2 × 32 KB              | Code flash size - CFS2 × 32 KB |
| Data flash secure              | 0x0800_0000               | DFS1 × 1 KB                    |
| Data flash non-secure          | 0x0800_0000 + DFS1 × 1 KB | Data flash size - DFS1 × 1 KB  |
| SRAM secure                    | 0x2000_0000               | SRS1 × 1 KB                    |
| SRAM non-secure callable       | 0x2000_0000 + SRS1 × 1 KB | SRS2 × 8 KB - SRS1 × 1 KB      |
| SRAM non-secure                | 0x2000_0000 + SRS2 × 8 KB | SRAM size - SRS2 × 8 KB        |

The Standby SRAM is divided 8 regions. Security attribution can be set for each region, but both secure region and non-secure region must be contiguous. In other words, the Standby SRAM can have one contiguous secure region and one contiguous non-secure region. The Standby SRAM security attribution is set to the dedicated register by the secure application. See [section 43, Standby SRAM](#) for the details.

The VBATT backup register is divided 8 regions. Security attribution can be set for each region, but both secure region and non-secure region must be contiguous. In other words, the VBATT backup register can have one contiguous Secure region and one contiguous Non-secure region. The VBATT backup register security attribution is set to the dedicated register by the secure application. See [section 11, Battery Backup Function](#) for the details.

Table 46.2 shows the access permission of the memory.

Note: 禁止将安全或非安全可调用区域放置在块可交换区域中，因为安全应用程序将在块交换后放置在非安全区域中。

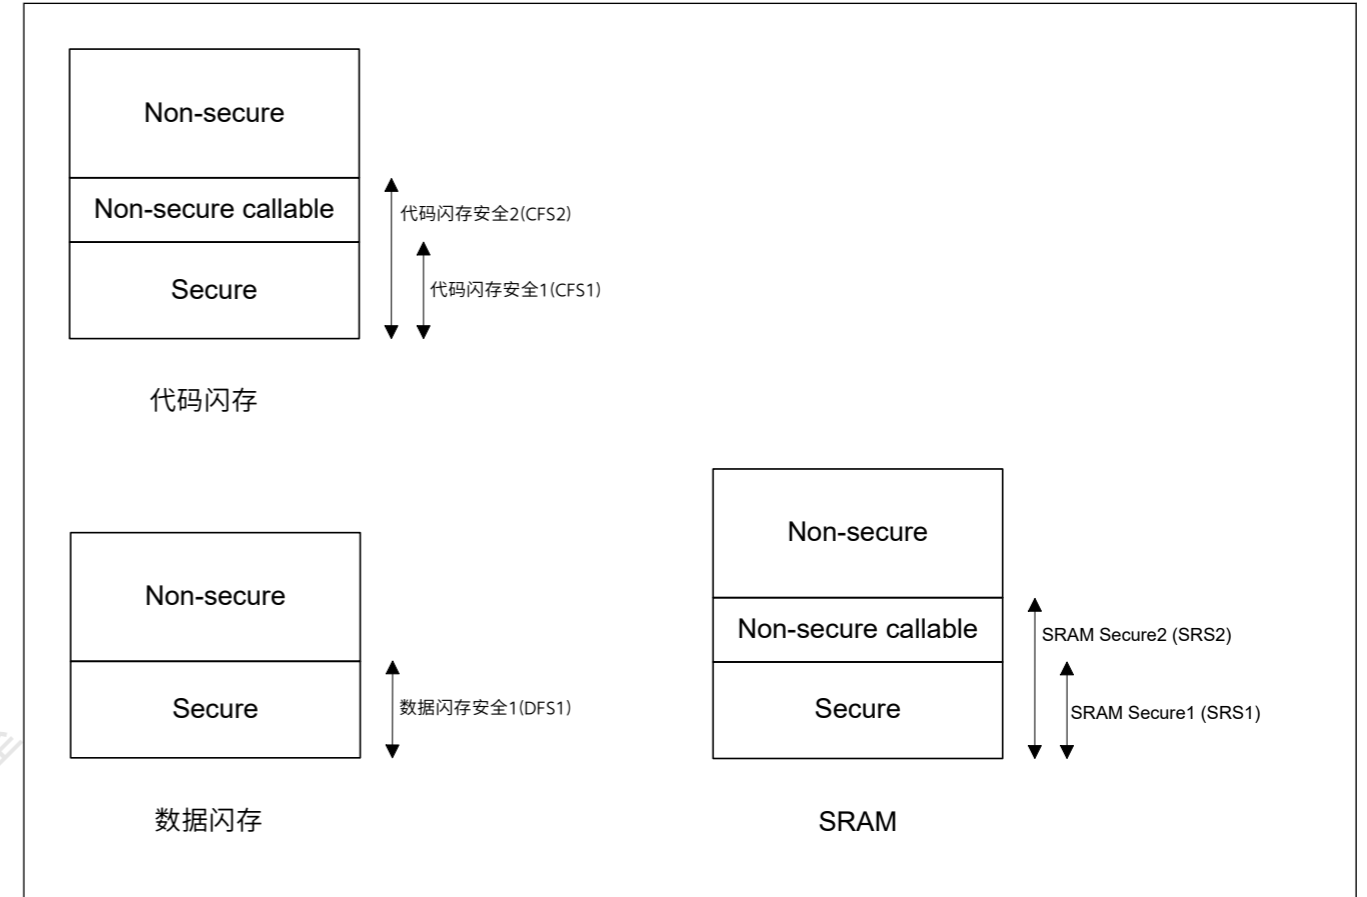

Figure 46.1 内存映射

Table 46.1 内存区域大小

| 记忆区        | 起始地址                      | Size                       |
|------------|---------------------------|----------------------------|
| 代码闪存安全     | 0x0000_0000               | CFS1 × 1 KB                |
| 代码闪存非安全可调用 | CFS1 × 1 KB               | CFS2 × 32 KB - CFS1 × 1 KB |
| 代码闪存不安全    | CFS2 × 32 KB              | 代码闪存大小 - CFS2 × 32 KB      |
| 数据闪存安全     | 0x0800_0000               | DFS1 × 1 KB                |
| 数据闪存不安全    | 0x0800_0000 + DFS1 × 1 KB | 数据闪存大小 - DFS1 × 1 KB       |
| SRAM安全     | 0x2000_0000               | SRS1 × 1 KB                |
| SRAM非安全可调用 | 0x2000_0000 + SRS1 × 1 KB | SRS2 × 8 KB - SRS1 × 1 KB  |
| SRAM非安全    | 0x2000_0000 + SRS2 × 8 KB | SRAM大小 - SRS2 × 8 KB       |

备用SRAM分为8个区域。可以为每个区域设置安全属性，但安全区域和非安全区域必须是连续的。换言之，Standby SRAM可以有一个连续的安全区域和一个连续的非安全区域。备用SRAM安全属性由安全应用程序设置到专用寄存器。有关详细信息，请参阅第43节，备用SRAM。

VBATT备份寄存器分为8个区域。可以为每个区域设置安全属性，但安全区域和非安全区域必须是连续的。换句话说，VBATT备份寄存器可以有一个连续的安全区域和一个连续的非安全区域。VBATT备份寄存器安全属性由安全应用程序设置为专用寄存器。有关详细信息，请参阅第11节，电池备份功能。

表46.2显示了内存的访问权限。

**Table 46.2 Access Permission of Memory**

| Memory   | Secure access | Non-secure access  |
|--|---------------|--|
| Code flash, Data flash, SRAM configured as Secure or Non-secure callable | allowed       | Write ignored / Read ignored<br>TrustZone Access error is generated  |
| Code flash, Data flash, SRAM configured as non-secure                    | allowed       | allowed  |
| Standby SRAM, VBATT backup register configured as Secure                 | allowed       | Write ignored / Read 0x00<br>TrustZone Access error is not generated |
| Standby SRAM, VBATT backup register configured as Non-secure             | allowed       | allowed  |

### 46.2.3 Peripheral Security Attribution

Each peripheral can be configured to be Secure or Non-secure.

Peripherals are divided into two types.

Type-1 peripherals has the one security attribution. Access to all registers is controlled by one security attribution. Type-1 peripheral security attribution is set to the PSARx (x = B to E) register by the secure application.

Type-2 peripherals has the security attribution for each register or for each bit. Access to each register or bit field is controlled according to these security attributions. Type-2 peripheral security attribution is set to the Security Attribution register in each module by the secure application. For the Security Attribution register, see sections in the user manual for each peripheral.

Table 46.3 shows the classification of peripheral type.

**Table 46.3 Peripheral Type Classification**

| Type              | Peripheral  |
|-------------------|---|
| Type-1            | SCI, SPI, USBFS, CAN, IIC, SCE9, DOC, SDHI, SSIE, CTSU, CRC, CAC, TSN, ADC12, DAC12, POEG, AGT, GPT, RTC, IWD, WDT  |
| Type-2            | System control (Resets, LVD, Clock Generation Circuit, Low Power Modes, Battery Backup Function), FLASH CACHE, SRAM controller, CPU CACHE, DMAC, DTC, ICU, MPU, BUS, Security setting, ELC, I/O ports |
| Always Non-secure | QSPI  |

Table 46.4 shows the access permission of type-1 peripherals. The access permission of type-2 peripherals is different by peripherals. See section Register Description of each peripherals.

**Table 46.4 The access permission of type-1 peripherals**

| Permission                          | Secure access | Non-secure access   |
|-------------------------------------|---------------|---|
| Peripheral configured as secure     | allowed       | Write ignored / Read ignored<br>TrustZone Access error is generated |
| Peripheral configured as non-secure | allowed       | allowed   |

### 46.2.4 Flash Sequencer Security Attribution

The flash sequencer is used to program or erase the flash.

The flash sequencer has the special security attribution. Table 46.5 shows the access permission of flash sequencer.

**Table 46.2 内存访问权限**

| Memory                     | 安全访问    | Non-secure access              |
|----------------------------|---------|--------------------------------|
| 代码闪存、数据闪存、SRAM配置为安全或非安全可调用 | allowed | 写被忽略读被忽略<br>生成TrustZone访问错误    |
| 代码闪存、数据闪存、配置为非安全的SRAM      | allowed | allowed                        |
| 备用SRAM、VBATT备份寄存器配置为安全     | allowed | 写入忽略读取0x00<br>未生成TrustZone访问错误 |
| 备用SRAM、VBATT备份寄存器配置为非安全    | allowed | allowed                        |

### 46.2.3 外围安全属性

每个外围设备都可以配置为安全或非安全。

外设分为两种。

Type-1外围设备具有唯一的安全属性。对所有寄存器的访问由一个安全属性控制。类型1外设安全属性由安全应用程序设置到PSARx (x=B到E) 寄存器。

Type-2外设对每个寄存器或每个位都有安全属性。根据这些安全属性控制对每个寄存器或位字段的访问。类型2外围安全属性由安全应用程序设置到每个模块中的安全属性寄存器。对于安全属性寄存器，请参阅每个外设的用户手册中的部分。

表46.3显示了外围类型的分类。

**Table 46.3 外设类型分类**

| Type              | Peripheral   |
|-------------------|--|
| Type-1            | SCI, SPI, USBFS, CAN, IIC, SCE9, DOC, SDHI, SSIE, CTSU, CRC, CAC, TSN, ADC12, DAC12, POEG, AGT, GPT, RTC, IWD, WDT |
| Type-2            | 系统控制 (复位、LVD、时钟生成电路、低功耗模式、电池备份功能)、FLASH CACHE、SRAM控制器、CPU CACHE、DMAC、DTC、ICU、MPU、BUS、安全设置、ELC、IO端口                 |
| Always Non-secure | QSPI   |

表46.4显示了type-1外设的访问权限。type-2外设的访问权限因外设而异。请参阅每个外设的寄存器描述部分。

**Table 46.4 type-1外设的访问权限**

| Permission | 安全访问    | Non-secure access           |
|------------|---------|-----------------------------|
| 外设配置为安全    | allowed | 写被忽略读被忽略<br>生成TrustZone访问错误 |
| 外设配置为非安全   | allowed | allowed                     |

### 46.2.4 FlashSequencer安全属性

闪存定序器用于对闪存进行编程或擦除。

闪存定序器具有特殊的安全属性。表46.5显示了flashsequencer的访问权限。

Table 46.5 Access Permissions of Flash Sequencer

|                                    | Secure access | Non-secure access   |
|------------------------------------|---------------|---|
| FACI command issuing area          | allowed       | When the FACI command is issued to the secure region of code flash, data flash and option-setting memory <ul style="list-style-type: none"> <li>Issued FACI command is invalid</li> <li>Flash sequencer error is generated</li> </ul> When the FACI command is issued to the non-secure region of code flash, data flash and option-setting memory <ul style="list-style-type: none"> <li>Issued FACI command is valid</li> </ul> |
| FBPROT1, FSUACR, FMEPROT registers | allowed       | Write ignored / Readable<br>TrustZone Access error is not generated   |
| FCKMHZ register                    | allowed       | Configured by Flash Security Attribution register<br>When configured as Secure, <ul style="list-style-type: none"> <li>Write ignored / Readable</li> <li>TrustZone Access error is not generated.</li> </ul> When configured as Non-secure <ul style="list-style-type: none"> <li>allowed</li> </ul>  |
| Other registers                    | allowed       | During programming/erasure or during suspend programming/erasure by secure application <ul style="list-style-type: none"> <li>Write ignored / Read 0x00</li> <li>TrustZone Access error is not generated</li> </ul> In other state <ul style="list-style-type: none"> <li>allowed</li> </ul>  |

### 46.2.5 Address Space Security Attribution

Table 46.6 shows the security attribution of the address space.

Table 46.6 Address Space Security Attribution

| Region                         | Attribution         |
|--------------------------------|---------------------|
| Code flash secure              | Secure              |
| Code flash non-secure callable | Non-secure callable |
| Code flash non-secure          | Non-secure          |
| Data flash secure              | Secure              |
| Data flash non-secure          | Non-Secure          |
| SRAM secure                    | Secure              |
| SRAM non-secure callable       | Non-secure callable |
| SRAM non-secure                | Non-secure          |
| Peripherals                    | Exempt              |
| External address space         | Exempt              |
| Other area                     | Exempt              |

Note: Exempt: No check will be done. All bus transactions are propagated.

### 46.2.6 TrustZone Access Error

Table 46.7 shows the behavior when TrustZone access error. The behavior varies depending on the master or slave area to be accessed.

Table 46.7 The Behavior When TrustZone Access Error (1 of 2)

| Area                         | CPU                            | DMAC/DTC  |
|------------------------------|--------------------------------|---|
| Code flash, Data flash, SRAM | Detect SecureFault exception*2 | <ul style="list-style-type: none"> <li>transfer does not start</li> <li>occur NMI or reset*1</li> <li>occur interrupt (DMA_TRANSERR)</li> </ul> |

Table 46.5 FlashSequencer的访问权限

|                                    | 安全访问    | Non-secure access   |
|------------------------------------|---------|---|
| FACI指令发布区                          | allowed | 当FACI命令被发送到代码闪存、数据闪存和选项设置存储器的安全区域时● <ul style="list-style-type: none"> <li>发出的FACI命令无效</li> <li>产生闪存定序器错误</li> </ul> 当FACI命令被发送到代码闪存、数据闪存和选项设置存储器的非安全区域时● <ul style="list-style-type: none"> <li>发出的FACI命令有效</li> </ul> |
| FBPROT1, FSUACR, FMEPROT registers | allowed | 写忽略可读<br>未生成TrustZone访问错误   |

| 其他寄存器                              | allowed | 在编程擦除期间或在安全应用程序的暂停编程擦除期间● <ul style="list-style-type: none"> <li>写入忽略读取0x00</li> <li>未生成TrustZone访问错误</li> </ul> 在其他状态●   |

### 46.2.5 地址空间安全属性

表46.6显示了地址空间的安全属性。

Table 46.6 地址空间安全属性

| Region                   | Attribution         |
|--------------------------|---------------------|
| 代码闪存安全                   | Secure              |
| 代码闪存非安全可调用               | Non-secure callable |
| 代码闪存不安全                  | Non-secure          |
| 数据闪存安全                   | Secure              |
| 数据闪存不安全                  | Non-Secure          |
| SRAM secure              | Secure              |
| SRAM non-secure callable | Non-secure callable |
| SRAM non-secure          | Non-secure          |
| Peripherals              | Exempt              |
| 外部地址空间                   | Exempt              |
| 其他区域                     | Exempt              |

Note: 豁免: 不会进行任何检查。传播所有总线事务。

### 46.2.6 TrustZone访问错误

表46.7显示了TrustZone访问错误时的行为。行为因要访问的主区域或从区域而异。

Table 46.7 TrustZone访问错误时的行为(1of2)

| Area           | CPU               | DMAC/DTC  |
|----------------|-------------------|---|
| 代码闪存、数据闪存、SRAM | 检测SecureFault异常*2 | <ul style="list-style-type: none"> <li>传输未开始</li> <li>发生NMI或复位*1</li> <li>发生中断(DMA_TRANSERR)</li> </ul> |

Table 46.7 The Behavior When TrustZone Access Error (2 of 2)

| Area       | CPU   | DMAC/DTC  |
|------------|---|---|
| Other area | <ul style="list-style-type: none"> <li>• Detect BusFault exception*2 *3</li> <li>• Occur NMI or reset*1*2 *3</li> </ul> | <ul style="list-style-type: none"> <li>• Stop transfer*4</li> <li>• Occur NMI or reset *1 *4</li> <li>• Occur interrupt (DMA_TRANSERR)*4</li> </ul> |

Note 1. NMI or reset is selected with TZFOAD.OAD bit.  
 Note 2. When TrustZone access error occurs by the debugger access, exception, NMI, or reset does not occurs.Only the error response is returned.  
 Note 3. These error behaviors does not occur for write access to the PHBIU or PLBIU address space which memory attribute is set to "Early Write Acknowledgment" by the ARM MPU.  
 Note 4. These error behaviors does not occur for write access from DMAC to the PHBIU or PLBIU address space when the bufferable write is enabled by DMBWR.BWE.

### 46.3 Device Lifecycle Management

Device lifecycle identifies the current phase of the device and controls the capabilities of the debug interface, the serial programming interface and Renesas test mode. Figure 46.2 is the illustration of the device lifecycle. Table 46.8 shows the lifecycle definition and capability in each lifecycle.

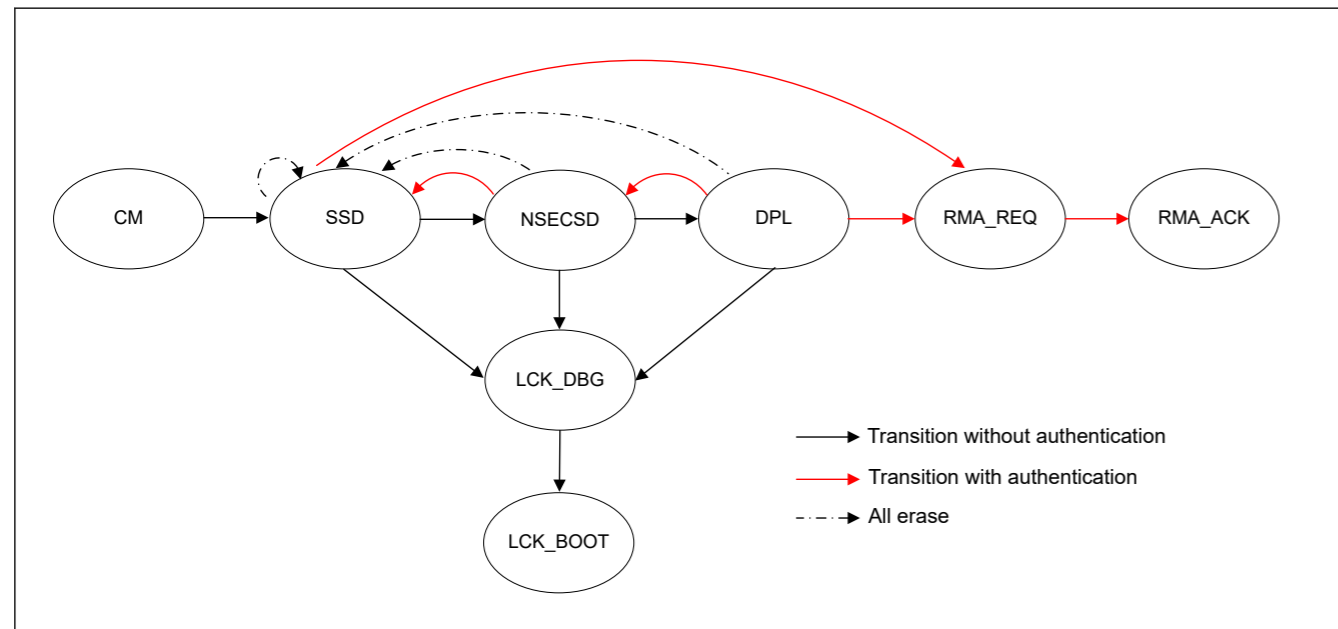

Figure 46.2 The illustration of the device lifecycle

Table 46.8 The lifecycle definition and the capability can be used in each lifecycle (1 of 2)

| Lifecycle | Definition   | Debug level | Serial programming   | Renesas test mode |
|-----------|--|-------------|--|-------------------|
| CM        | "Chip Manufacturing"<br>The device is in Renesas factory. The state when the customer received the device. | DBG2        | Available<br>cannot access code/data flash area                          | Not available     |
| SSD       | "Secure Software Development"<br>The secure part of application is being developed.                        | DBG2        | Available<br>can program/erase/read all code/data flash area             | Not available     |
| NSECSD    | "Non-SECure Software Development"<br>The non-secure part of application is being developed.                | DBG1        | Available<br>can program/erase/read only non-secure code/data flash area | Not available     |
| DPL       | "DePLoyed"<br>The device is in-field.  | DBG0        | Available<br>cannot access code/data flash area                          | Not available     |

Table 46.7 TrustZone访问错误时的行为(2of2)

| Area | CPU  | DMAC/DTC   |
|------|--|--|
| 其他区域 | <ul style="list-style-type: none"> <li>• 检测BusFault异常*2*3</li> <li>• 发生NMI或复位*1*2*3</li> </ul> | <ul style="list-style-type: none"> <li>• 停止传输*4</li> <li>• 发生NMI或复位*1*4</li> <li>• 发生中断(DMA_TRANSERR)*4</li> </ul> |

注1.通过TZFOAD.OAD位选择NMI或复位。  
 注2.当调试器访问发生TrustZone访问错误时，不会发生异常、NMI或复位。仅返回错误响应。  
 注3.对内存属性设置为“Early”的PHBIU或PLBIU地址空间的写访问不会发生这些错误行为ARMMPU的“写确认”。  
 注4.当DMBWR.BWE启用可缓冲写时，这些错误行为不会发生在从DMAC到PHBIU或PLBIU地址空间的写访问中。

### 46.3 设备生命周期管理

设备生命周期识别设备的当前阶段并控制调试接口、串行编程接口和瑞萨测试模式的功能。图46.2是设备生命周期的图示。表46.8显示了每个生命周期中的生命周期定义和能力。

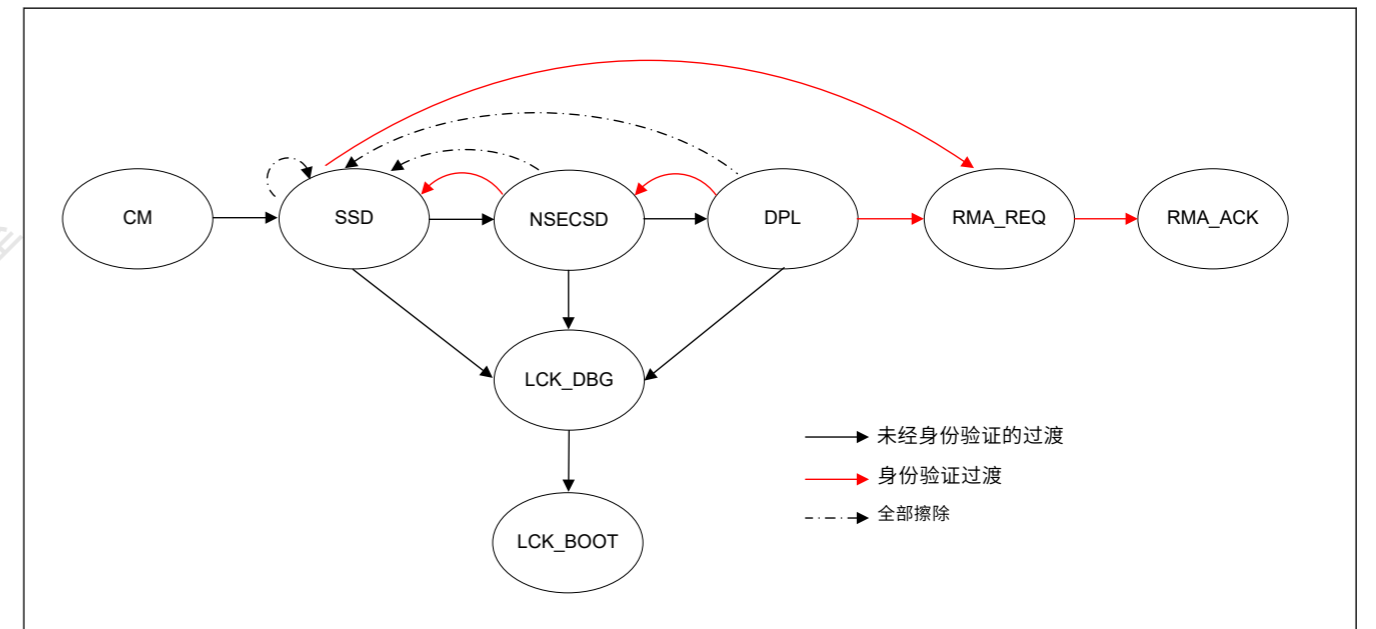

Figure 46.2 设备生命周期示意图

Table 46.8 生命周期定义和能力可以在每个生命周期中使用 (1of2)

| Lifecycle | Definition  | 调试级别 | 串行编程                             | 瑞萨测试模式 |
|-----------|---|------|----------------------------------|--------|
| CM        | "Chip Manufacturing"<br>该设备在瑞萨电子工厂。客户收到设备时的状态。        | DBG2 | Available<br>无法访问代码数据闪存区         | 无法使用   |
| SSD       | "Secure Software Development"<br>应用程序的安全部分正在开发中。      | DBG2 | Available<br>可以编程擦除读取所有代码数据闪存区域  | 无法使用   |
| NSECSD    | "Non-SECure Software Development"<br>应用程序的非安全部分正在开发中。 | DBG1 | Available<br>可以编程擦除只读非安全代码数据闪存区域 | 无法使用   |
| DPL       | "DePLoyed"<br>该设备在现场。                                 | DBG0 | Available<br>无法访问代码数据闪存区         | 无法使用   |

**Table 46.8 The lifecycle definition and the capability can be used in each lifecycle (2 of 2)**

| Lifecycle | Definition  | Debug level | Serial programming                              | Renesas test mode |
|-----------|---|-------------|---|-------------------|
| LCK_DBG   | "LoCKed DeBuG"<br>The debug interface is permanently disabled.  | DBG0        | Available<br>cannot access code/data flash area | Not available     |
| LCK_BOOT  | "LoCKed BOOT interface"<br>The debug interface and the serial programming interface are permanently disabled.           | DBG0        | Not available                                   | Not available     |
| RMA_REQ   | "Return Material Authorization REQuest"<br>Request for RMA. The customer must send the device to Renesas in this state. | DBG0        | Available<br>cannot access code/data flash area | Not available     |
| RMA_ACK   | "Return Material Authorization ACKnowledged"<br>Failure analysis in Renesas   | DBG2        | Available<br>cannot access code/data flash area | Available         |

### 46.3.1 Changing the Lifecycle State

Use the serial programming commands to change the device lifecycle state. See the boot firmware application note for the detail of command. The lifecycle cannot be updated by application but can read through the dedicated registers.

As shown in [Figure 46.2](#), there are three types lifecycle transition.

The first one is to change to lower debug access level or restrict the serial programming mode. This change can be done with no restriction.

**Note:** The debug interface is permanently disabled in LCK\_DBG. After changed to LCK\_DBG, the debug interface cannot be used forever.

**Note:** The debug interface and serial programming interface are permanently disabled in LCK\_BOOT. After changed to LCK\_BOOT, the debug interface and the serial programming interface cannot be used forever.

The second one is to change to higher debug access level or request for RMA. This change needs key authentication. The key length is 128 bits. The secure developer needs to inject two keys when the lifecycle is SSD state. One is "SECDBG\_KEY" which is used to authentication to change the lifecycle from NSECSD to SSD. Other one is "RMA\_KEY" which is used to authentication to change the lifecycle from SSD or DPL to RMA\_REQ. The non-secure developer needs to inject one key when the lifecycle is NSECSD state. This is "NONSECDBG\_KEY" which is used to authentication to change the lifecycle from DPL to NSECSD. See [section 46.4. Key Injection](#) for the detail of how to inject the key. The key authentication uses a challenge and response authentication or authentication using the unique ID. The authentication using the unique ID is available only transition to RMA\_REQ. The following is the process of how to calculate the response, challenge and response authentication, or the authentication code using unique ID.

Response = HMAC-SHA256 (KEY, 128bits challenge || fixed value (256bits))

Authentication code = HMAC-SHA256 (KEY, 128bits unique ID || fixed value (256 bits))

fixed value = 9e56dc41 cf0c9648 1b811141 f8f9ba1e 4dd77746 6d403593 17f46d64 fe64fdf6

**Note:** In case the key is not injected, these lifecycle changes cannot be done.

**Note:** In the lifecycle transition from NSECSD to SSD or from DPL to NSECSD, the contents on the flash memory are not erased.

**Note:** MCU does not respond after changing to higher debug access level or RMA\_REQ. If you continue to use the serial programming commands, need to re-enter the boot mode after a reset. See the boot firmware application note for the detail.

**Note:** In the lifecycle transition to RMA\_REQ, the contents on the flash memory except permanently locked block or setting or BPS\_SEL register are erased. The contents in the permanently locked block or register can be read by Renesas at failure analysis. Permanently locked block means the block which programming and erasure is disabled permanently by PBPS, PBPS\_SEC and BPS\_SEL register. Permanently locked register means SAS register which programming and erasure is disabled permanently by FSPR bit.

**Table 46.8 可以在每个生命周期中使用生命周期定义和能力 (2个中的2个)**

| Lifecycle | Definition                                   | 调试级别 | 串行编程                     | 瑞萨测试模式    |
|-----------|--|------|--------------------------|-----------|
| LCK_DBG   | "LoCKed DeBuG"<br>调试接口被永久禁用。                 | DBG0 | Available<br>无法访问代码数据闪存区 | 无法使用      |
| LCK_BOOT  | "LoCKed BOOT interface"<br>调试接口和串行编程接口被永久禁用。 | DBG0 | 无法使用                     | 无法使用      |
| RMA_REQ   | "退货授权请求"<br>请求RMA。客户必须在此状态下将设备发送给瑞萨电子。       | DBG0 | Available<br>无法访问代码数据闪存区 | 无法使用      |
| RMA_ACK   | "已确认退货授权"<br>瑞萨电子的故障分析                       | DBG2 | Available<br>无法访问代码数据闪存区 | Available |

### 46.3.1 更改生命周期状态

使用串行编程命令更改设备生命周期状态。有关命令的详细信息，请参见启动固件应用说明。生命周期不能由应用程序更新，但可以通过专用寄存器读取。

如图46.2所示，生命周期转换分为三种。

第一个是更改为降低调试访问级别或限制串行编程模式。这种改变可以不受限制地进行。

**Note:** 调试接口在LCK\_DBG中被永久禁用。改成LCK\_DBG后，调试接口就不能一直使用了。

**Note:** 调试接口和串行编程接口在LCK\_BOOT中永久禁用。改成之后LCK\_BOOT、调试接口和串行编程接口不能永远使用。

第二个是更改为更高的调试访问级别或请求RMA。此更改需要密钥身份验证。密钥长度为128位。当生命周期为SSD状态时，安全开发人员需要注入两个密钥。一种是"SECDBG\_KEY"，用于身份验证以将生命周期从NSECSD更改为SSD。另一种是"RMA\_KEY"，用于身份验证以将生命周期从SSD或DPL更改为RMA\_REQ。当生命周期为NSECSD状态时，非安全开发人员需要注入一个密钥。这是"NONSECDBG\_KEY"，用于身份验证以将生命周期从DPL更改为NSECSD。见第46.4节。KeyInjection有关如何注入密钥的详细信息。密钥身份验证使用质询和响应身份验证或使用唯一ID的身份验证。使用唯一ID的身份验证只能转换到RMA\_REQ。以下是如何计算响应、挑战和响应身份验证或使用唯一ID的身份验证码的过程。

响应=HMAC-SHA256(KEY 128bitschallengeFixedvalue(256bits))

认证码=HMAC-SHA256 (KEY, 128bits唯一ID固定值 (256bits) )

固定值=9e56dc41cf0c96481b811141f8f9ba1e4dd777466d40359317f46d64fe64fdf6

**Note:** 如果未注入密钥，则无法完成这些生命周期更改。

**Note:** 在从NSECSD到SSD或从DPL到NSECSD的生命周期转换中，闪存上的内容不会被擦除。

**Note:** 更改为更高的调试访问级别或RMA\_REQ后，MCU没有响应。如果继续使用串口编程命令，需要复位后重新进入开机模式。有关详细信息，请参阅启动固件应用说明。

**Note:** 在到RMA\_REQ的生命周期转换中，闪存上的内容除了永久锁定的块或设置或BPS\_SEL寄存器外被擦除。瑞萨在故障分析时可以读取永久锁定的块或寄存器中的内容。永久锁定块是指被PBPS、PBPS\_SEC和BPS\_SEL寄存器永久禁用编程和擦除的块。永久锁定寄存器是指通过FSPR位永久禁用编程和擦除的SAS寄存器。

The third one is all erase. This is done by an initialize command unless an initialize command itself is disabled. The lifecycle is back to SSD and the contents on the flash memory is erased. If there is permanently locked block or register, an initialize command does not execute. In case of the all bits of PBPS and PBPS\_SEC register are 1 and FSPR bit is 1, an initialize command is executable.

**Note:** The initialize command can be issued by everyone, so contents on the flash memory are easily erased. Developers who do not want this can invalidate the initialize command permanently by parameter setting command.

**Note:** MCU does not respond after executing the initialize command. If you continue to use the serial programming commands, need to re-enter the boot mode after a reset. See the boot firmware application note for the detail.

### 46.3.2 Debug access level

There are three debug access levels, and the debug access level changes according to the lifecycle state.

- DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals
- DBG1: The debugger connection is allowed, and restricted to access only non-secure memory regions and peripherals
- DBG0: The debugger connection is not allowed

### 46.3.3 Serial Programming

Whether a serial programmer can be connected and the range of flash memory that can be accessed depends on the lifecycle state as shown in [Table 46.8](#). And the accepted serial programming command differs depending on the lifecycle state. See the boot firmware application note for the detail of command.

### 46.3.4 Lifecycle changing example

The following is a typical lifecycle changing example.

#### Secure developer

- Change the lifecycle from CM to SSD by using the serial programming command.
- Set the memory security attribution of the code flash, data flash and SRAM by using the serial programming command.
- Program the secure application by using the serial programming interface and debug the secure application. Debug is possible if the lifecycle is CM, but it is impossible to set the memory security attribution in CM state. If the memory security attribution is not set, all area of the code flash, data flash and SRAM is Secure.

**Note:** Need to configure the registers listed in [Table 46.10](#) as Non-secure only in NSECSD state. See [section 46.6.1. Restrictions on setting the security attribution](#) for details.

- Inject "SECDBG\_KEY" and "RMA\_KEY" by using the serial programming command (if need).
- Inject AES, RSA, ECC, HMAC keys listed in [Table 46.9](#) (if need).
- Disable the all erase by using the serial programming command (if need).
- Change the lifecycle from SSD to NSECSD by using the serial programming command.

#### Non-secure developer

- Program the Non-secure application by using the serial programming interface and debug the Non-secure application.
- Inject "NONSECDBG\_KEY" by using the serial programming command (if need).
- Inject AES, RSA, ECC, HMAC keys listed in [Table 46.9](#) (if need).
- Disable the all erase by using the serial programming command (if need).
- Change the lifecycle to DPL by using the serial programming command.

### 46.3.5 Failure analysis

If the customer requests the failure analysis to Renesas, it is necessary to send the device after changing the lifecycle to RMA\_REQ. If the lifecycle is not RMA\_REQ, Renesas can not do the failure analysis. Because RMA\_REQ is permanent state, it can not back to the another state after changing to RMA\_REQ. It is assumed to change to SSD or NSECSD and analyze before changing to RMA\_REQ.

第三个是全部擦除。这由初始化命令完成，除非初始化命令本身被禁用。生命周期回到SSD，闪存上的内容被擦除。如果存在永久锁定的块或寄存器，则不会执行初始化命令。如果PBPS和PBPS\_SEC寄存器的所有位为1，FSPR位为1，则可执行初始化命令。

**Note:** 每个人都可以发出初始化命令，因此闪存上的内容很容易被擦除。不希望这样的开发者可以通过参数设置命令使初始化命令永久无效。

**Note:** 执行初始化命令后MCU没有响应。如果继续使用串口编程命令，需要复位后重新进入开机模式。有关详细信息，请参阅启动固件应用说明。

### 46.3.2 调试访问级别

共有三个调试访问级别，调试访问级别根据生命周期状态而变化。

- DBG2: 允许调试器连接，不限制访问内存和外设
- DBG1: 允许调试器连接，但仅限于访问非安全内存区域和外围设备
- DBG0: 不允许调试器连接

### 46.3.3 串行编程

是否可以连接串行编程器以及可以访问的闪存范围取决于生命周期状态，如表46.8所示。并且接受的串行编程命令根据生命周期状态而有所不同。有关命令的详细信息，请参见启动固件应用说明。

### 46.3.4 生命周期更改示例

以下是一个典型的生命周期更改示例。

#### 安全开发人员

- 使用串行编程命令将生命周期从CM更改为SSD。
- 使用串行编程命令设置codeflash、dataflash和SRAM的内存安全属性。
- 使用串行编程接口对安全应用程序进行编程并调试安全应用程序。如果生命周期是CM，则可以调试，但无法在CM状态下设置内存安全属性。如果未设置内存安全属性，则代码闪存、数据闪存和SRAM的所有区域都是安全的。

**Note:** 仅在NSECSD状态下需要将表46.10中列出的寄存器配置为非安全。请参见第46.6.1节。[设置安全属性的限制以获取详细信息。](#)

- 使用串行编程命令（如果需要）注入"SECDBG\_KEY"和"RMA\_KEY"。
- 注入表46.9中列出的AES、RSA、ECC、HMAC密钥（如果需要）。
- 使用串行编程命令禁用全部擦除（如果需要）。
- 使用串行编程命令将生命周期从SSD更改为NSECSD。

#### Non-secure developer

- 使用串行编程接口对非安全应用程序进行编程并调试非安全应用程序。
- 使用串行编程命令（如果需要）注入"NONSECDBG\_KEY"。
- 注入表46.9中列出的AES、RSA、ECC、HMAC密钥（如果需要）。
- 使用串行编程命令禁用全部擦除（如果需要）。
- 使用串行编程命令将生命周期更改为DPL。

### 46.3.5 故障分析

如果客户要求对瑞萨进行故障分析，则需要将生命周期更改为RMA\_REQ后发送设备。如果生命周期不是RMA\_REQ，瑞萨将无法进行故障分析。因为RMA\_REQ是永久状态，所以在更改为RMA\_REQ后不能回到另一个状态。假设更改为SSD或NSECSD并在更改为RMA\_REQ之前进行分析。

Devices sent to Renesas will not be returned to customers. The device will be discarded.

Note: As described in the [section 46.3.1. Changing the Lifecycle State](#), RMA\_KEY is needed to change the lifecycle to RMA\_REQ. If the customer forgets the RMA\_KEY, Renesas can not do the failure analysis.

#### 46.4 Key Injection

There are three steps required to inject a user key into the MCU.

First, the customer needs to create the 128 bits installation key. This key is called User Factory Programming Key (UFPK) and used to encrypt a user key. The customer gets the key of the wrapped version (W-UFPK) through the Renesas Key Wrapping Service.

Second the customer encrypts the user key using UFPK as the AES key.

Last the customer sends W-UFPK and the encrypted user key to the MCU by using serial programming interface. The sent user key is decrypted, wrapped with the hardware unique key, and then stored in the nonvolatile memory.

[Figure 46.3](#) is the illustration of key injection. [Table 46.9](#) shows the keys that can be injected by serial programming interface.

User Key is also used for authentication during the life cycle transition.

发送给瑞萨的设备将不会退还给客户。该设备将被丢弃。

Note: 如第46.3.1节所述。更改LifecycleState，需要RMA\_KEY才能将生命周期更改为RMA\_REQ。如果客户忘记了RMA\_KEY，瑞萨将无法进行故障分析。

#### 46.4 密钥注入

将用户密钥注入MCU需要三个步骤。

首先，客户需要创建128位安装密钥。此密钥称为用户工厂编程密钥(UFPK)，用于加密用户密钥。客户通过RenesasKeyWrappingService获得打包版本(W-UFPK)的密钥。

其次，客户使用UFPK作为AES密钥对用户密钥进行加密。

最后客户通过串行编程接口将W-UFPK和加密的用户密钥发送给MCU。发送的用户密钥被解密，用硬件唯一密钥包装，然后存储在非易失性存储器中。

图46.3是密钥注入的示意图。表46.9显示了串行编程接口可以注入的密钥。

用户密钥还用于生命周期转换期间的身份验证。

**Table 46.9 The keys that can be injected by serial programming (2 of 2)**

|      |   |
|------|---|
| ECC  | ECC P192, ECC P224, ECC P256, ECC P384, ECC P512 (Public and Private) |
| HMAC | HMAC-SHA224, HMAC-SHA256  |

46.5 Register Description

46.5.1 PSARB : Peripheral Security Attribution Register B

Base address: PSCU = 0x400E\_0000  
Offset address: 0x04

| 31    | PSARB31 | SCI0 and the MSTPCRB.MSTPB31 bit security attribution<br>0: Secure<br>1: Non-secure | R/W |

Note: A bit undefined in this table is reserved bit. The reserved bit should be kept the initial value.

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

The PSARB specifies the security attribution for each module and the corresponding bit in Module Stop Control Register.

| 29    | PSARE29 | GPT2和MSTPCRE.MSTPE29位安全属性<br>0: Secure<br>1: Non-secure         | R/W |
| 30    | PSARE30 | GPT1和MSTPCRE.MSTPE30位安全属性<br>0: Secure<br>1: Non-secure         | R/W |
| 31    | PSARE31 | GPT0、GPT_OPS和MSTPCRE.MSTPE31位安全属性<br>0: Secure<br>1: Non-secure | R/W |

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

PSARE指定每个模块的安全属性以及模块停止控制寄存器中的相应位。

### 46.5.5 MSSAR : Module Stop Security Attribution Register

Base address: PSCU = 0x400E\_0000  
Offset address: 0x14

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 0    | MSSAR0 | The MSTPCRC.MSTPC14 bit security attribution<br>0: Secure<br>1: Non-secure | R/W |
| 1    | MSSAR1 | The MSTPCRA.MSTPA22 bit security attribution<br>0: Secure<br>1: Non-secure | R/W |
| 2    | MSSAR2 | The MSTPCRA.MSTPA7 bit security attribution<br>0: Secure<br>1: Non-secure  | R/W |
| 3    | MSSAR3 | The MSTPCRA.MSTPA0 bit security attribution<br>0: Secure<br>1: Non-secure  | R/W |
| 31:4 | —      | These bits are read as 1. The write value should be 1.                     | R/W |

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.  
Note: This register is write-protected by PRCR register.

The MSSAR specifies the security attribution for the corresponding bit in Module Stop Control Register.

### 46.5.6 CFSAMONA : Code Flash Security Attribution Monitor Register A

Base address: PSCU = 0x400E\_0000  
Offset address: 0x18

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 14:0  | —         | These bits are read as 0.   | R   |
| 23:15 | CFS2[8:0] | Code Flash Secure area 2<br>Indicate the total area of secure region and non-secure callable region for code flash. | R   |
| 31:24 | —         | These bits are read as 0.   | R   |

Note: The CFSAMONA does not have security attribution.

### 46.5.5 MSSAR: 模块停止安全属性寄存器

Base address: PSCU = 0x400E\_0000  
Offset address: 0x14

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 0    | MSSAR0 | MSTPCRC.MSTPC14位安全属性<br>0: Secure<br>1: Non-secure | R/W |
| 1    | MSSAR1 | MSTPCRA.MSTPA22位安全属性<br>0: Secure<br>1: Non-secure | R/W |
| 2    | MSSAR2 | MSTPCRA.MSTPA7位安全属性<br>0: Secure<br>1: Non-secure  | R/W |
| 3    | MSSAR3 | MSTPCRA.MSTPA0位安全属性<br>0: Secure<br>1: Non-secure  | R/W |
| 31:4 | —      | 这些位被读取为1。写入值应为1。                                   | R/W |

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。  
Note: 该寄存器由PRCR寄存器写保护。

MSSAR指定模块停止控制寄存器中相应位的安全属性。

### 46.5.6 CFSAMONA: 代码闪存安全属性监控寄存器A

Base address: PSCU = 0x400E\_0000  
Offset address: 0x18

| Bit   | Symbol    | Function                                   | R/W |
|-------|-----------|--|-----|
| 14:0  | —         | 这些位读为0。                                    | R   |
| 23:15 | CFS2[8:0] | CodeFlash安全区2<br>指示代码闪存的安全区域和非安全可调用区域的总面积。 | R   |
| 31:24 | —         | 这些位读为0。                                    | R   |

Note: CFSAMONA没有安全属性。

### 46.5.7 CFSAMONB : Code Flash Security Attribution Monitor Register B

Base address: PSCU = 0x400E\_0000  
Offset address: 0x1C

| Bit   | Symbol     | Function   | R/W |
|-------|------------|--|-----|
| 9:0   | —          | These bits are read as 0.  | R   |
| 23:10 | CFS1[13:0] | Code Flash Secure area 1<br>Indicate the area of secure region for code flash. | R   |
| 31:24 | —          | These bits are read as 0.  | R   |

Note: The CFSAMONB does not have security attribution.

### 46.5.8 DFSAMON : Data Flash Security Attribution Monitor Register

Base address: PSCU = 0x400E\_0000  
Offset address: 0x20

| Bit   | Symbol   | Function   | R/W |
|-------|----------|--|-----|
| 9:0   | —        | These bits are read as 0.  | R   |
| 15:10 | DFS[5:0] | Data flash Secure area<br>Indicate the area of Secure region for data flash. | R   |
| 31:16 | —        | These bits are read as 0.  | R   |

Note: The DFSAMON does not have security attribution.

### 46.5.9 SSAMONA : SRAM Security Attribution Monitor Register A

Base address: PSCU = 0x400E\_0000  
Offset address: 0x24

| Bit   | Symbol   | Function  | R/W |
|-------|----------|---|-----|
| 12:0  | —        | These bits are read as 0.   | R   |
| 20:13 | SS2[7:0] | SRAM Secure area 2<br>Indicate the total area of Secure region and non-secure callable region for SRAM. | R   |
| 31:21 | —        | These bits are read as 0.   | R   |

Note: The SSAMONA does not have security attribution.

### 46.5.7 CFSAMONB:代码闪存安全属性监控寄存器B

Base address: PSCU = 0x400E\_0000  
Offset address: 0x1C

| Bit   | Symbol     | Function                        | R/W |
|-------|------------|---------------------------------|-----|
| 9:0   | —          | 这些位读为0。                         | R   |
| 23:10 | CFS1[13:0] | CodeFlash安全区1<br>指示代码闪存的安全区域区域。 | R   |
| 31:24 | —          | 这些位读为0。                         | R   |

Note: CFSAMONB没有安全属性。

### 46.5.8 DFSAMON:数据闪存安全属性监控寄存器

Base address: PSCU = 0x400E\_0000  
Offset address: 0x20

| Bit   | Symbol   | Function                  | R/W |
|-------|----------|---------------------------|-----|
| 9:0   | —        | 这些位读为0。                   | R   |
| 15:10 | DFS[5:0] | 数据闪存安全区<br>指示数据闪存的安全区域区域。 | R   |
| 31:16 | —        | 这些位读为0。                   | R   |

Note: DFSAMON没有安全属性。

### 46.5.9 SSAMONA:SRAM安全属性监控寄存器A

Base address: PSCU = 0x400E\_0000  
Offset address: 0x24

| Bit   | Symbol   | Function                               | R/W |
|-------|----------|--|-----|
| 12:0  | —        | 这些位读为0。                                | R   |
| 20:13 | SS2[7:0] | SRAM安全区域2<br>指示SRAM的安全区域和非安全可调用区域的总面积。 | R   |
| 31:21 | —        | 这些位读为0。                                | R   |

Note: SSAMONA没有安全属性。

46.5.10 SSAMONB : SRAM Security Attribution Monitor Register B

Base address: PSCU = 0x400E\_0000  
Offset address: 0x28

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 9:0   | —         | These bits are read as 0.  | R   |
| 20:10 | SS1[10:0] | SRAM secure area 1<br>Indicate the area of secure region for SRAM. | R   |
| 31:21 | —         | These bits are read as 0.  | R   |

Note: The SSAMONB does not have security attribution.

46.5.11 DLMMON : Device Lifecycle Management State Monitor Register

Base address: PSCU = 0x400E\_0000  
Offset address: 0x2C

| Bit  | Symbol      | Function   | R/W |
|------|-------------|--|-----|
| 3:0  | DLMMON[3:0] | Device Lifecycle Management State Monitor<br>0x1: CM<br>0x2: SSD<br>0x3: NSECSD<br>0x4: DPL<br>0x5: LCK_DBG<br>0x6: LCK_BOOT<br>0x7: RMA_REQ<br>0x8: RMA_ACK<br>Others: Reserved | R   |
| 31:4 | —           | These bits are read as 0. The write value should be 0.   | R   |

Note: The DLMMON does not have security attribution.

46.5.10 SSAMONB:SRAM安全属性监控寄存器B

Base address: PSCU = 0x400E\_0000  
Offset address: 0x28

| Bit   | Symbol    | Function                   | R/W |
|-------|-----------|----------------------------|-----|
| 9:0   | —         | 这些位读为0。                    | R   |
| 20:10 | SS1[10:0] | SRAM安全区1<br>指示SRAM的安全区域区域。 | R   |
| 31:21 | —         | 这些位读为0。                    | R   |

Note: SSAMONB没有安全属性。

46.5.11 DLMMON:设备生命周期管理状态监视器寄存器

Base address: PSCU = 0x400E\_0000  
Offset address: 0x2C

| Bit  | Symbol      | Function   | R/W |
|------|-------------|--|-----|
| 3:0  | DLMMON[3:0] | 设备生命周期管理状态监视器<br>0x1: CM<br>0x2: SSD<br>0x3: NSECSD<br>0x4: DPL<br>0x5: LCK_DBG<br>0x6: LCK_BOOT<br>0x7: RMA_REQ<br>0x8: RMA_ACK<br>Others: Reserved | R   |
| 31:4 | —           | 这些位被读取为0。写入值应为0。   | R   |

Note: DLMMON没有安全属性。

## 46.5.12 TZFSAR : TrustZone Filter Security Attribution Register

Base address: CPSCU = 0x4000\_8000

Offset address: 0x180

|                    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |            |

| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |   |   |   |     |

| Bit  | Symbol   | Function   | R/W |
|------|----------|--|-----|
| 0    | OAD      | Operation after detection<br>0: Non-maskable interrupt<br>1: Reset       | R/W |
| 7:1  | —        | These bits are read as 0. The write value should be 0.                   | R/W |
| 15:8 | KEY[7:0] | KeyCode<br>This bit is used to enable or disable writing of the OAD bit. | W   |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

**OAD bit (Operation after detection)**

The OAD bit is specified to generate either reset or non-maskable interrupt when the access to the protect region is detected by the TrustZone Filter.

When the OAD bit is set, write 0xA5 in the KEY[7:0] bits at the same time.

## 46.5.12 TZFSAR:TrustZone过滤器安全属性寄存器

Base address: CPSCU = 0x4000\_8000

Offset address: 0x180

|               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |            |

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

**TZFSA0位 (TrustZone过滤器寄存器的安全属性)**

TZFOAD和TZFPT寄存器的寄存器安全属性。

## 46.5.13 TZFOAD: 检测寄存器后的TrustZone过滤器操作

Base address: TZF = 0x4000\_0E00

Offset address: 0x00

|               |          |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |   |   |     |
|---------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|
| Bit position: | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |   |   |     |
| Bit field:    | KEY[7:0] |    |    |    |    |    |   |   |   |   |   | — | — | — | — | — | — | — | — | OAD |
| 重置后的值:        | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |   |   |   |     |

| Bit  | Symbol   | Function                     | R/W |
|------|----------|------------------------------|-----|
| 0    | OAD      | 检测后操作<br>0: 不可屏蔽中断1: 复位      | R/W |
| 7:1  | —        | 这些位被读取为0。写入值应为0。             | R/W |
| 15:8 | KEY[7:0] | KeyCode<br>该位用于启用或禁用OAD位的写入。 | W   |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

**OAD位 (检测后的操作)**

当TrustZone过滤器检测到对保护区域的访问时，OAD位被指定为产生复位或不可屏蔽中断。

当OAD位置位时，同时向KEY[7:0]位写入0xA5。

**KEY[7:0] bits (KeyCode)**

The KEY[7:0] bits are used to enable or disable writing of the OAD bit. When writing the OAD bit, write 0xA5 in the KEY[7:0] bits at the same time.

When the KEY[7:0] bits value except 0xA5 is written in, the OAD bit is not updated.

The KEY[7:0] bits are read always as 0x00.

**46.5.14 TZFPT : TrustZone Filter Protect Register**

Base address: TZF = 0x4000\_0E00

Offset address: 0x04

|                    |          |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |   |   |         |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|---|---|---------|
| Bit position:      | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |   |   |         |
| Bit field:         | KEY[7:0] |    |    |    |    |    |   |   |   |   |   | — | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |   |   |         |

| Bit  | Symbol   | Function  | R/W |
|------|----------|---|-----|
| 0    | PROTECT  | Protection of register<br>0: All Bus TrustZone Filter register writing is protected. Read is possible.<br>1: All Bus TrustZone Filter register writing is possible. | R/W |
| 7:1  | —        | These bits are read as 0. The write value should be 0.  | R/W |
| 15:8 | KEY[7:0] | KeyCode<br>This bit is used to enable or disable writing of the PROTECT bit.  | W   |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

**PROTECT bit (Protection of register)**

The PROTECT bit controls enable or disable writing to the corresponding registers to be protected. TZFOAD register is protected by PROTECT.

When the PROTECT bit is set, write 0xA5 in the KEY[7:0] bits at the same time.

**KEY[7:0] bits (KeyCode)**

The KEY[7:0] bits are used to enable or disable writing of the PROTECT bit. When writing the PROTECT bit, write 0xA5 in the KEY[7:0] bits at the same time.

When the KEY[7:0] bits value except 0xA5 is written in, the PROTECT bit is not updated.

The KEY[7:0] bits are read always as 0x00.

**46.6 Usage Notes****46.6.1 Restrictions on setting the security attribution**

To set the software breakpoint, the debugger need to re-program the flash. Table 46.10 shows the registers that the debugger sets to re-program the flash. If the security attribution of the register listed in Table 46.10 is configured as secure, the debugger can not set the software breakpoint in NSECSD state because the debugger can not change the register setting. Secure developer need to configure the registers listed in Table 46.10 as non-secure only in NSECSD state.

**Table 46.10 The registers that the debugger sets to re-program the flash**

| Function name            | Register name                                  |
|--------------------------|--|
| Clock Generation Circuit | SCKDIVCR, SCKCR, PLLCCR, PLLCR, HOCOCR, MOCOCR |
| Low-Power modes          | OPCCR, SOPCCR                                  |

**KEY[7:0] bits (KeyCode)**

KEY[7:0]位用于启用或禁用OAD位的写入。写入OAD位时，将0xA5写入KEY[7:0]位。

当KEY[7:0]位值除0xA5被写入时，OAD位不会更新。

KEY[7:0]位总是被读取为0x00。

**46.5.14 TZFPT:TrustZone过滤器保护寄存器**

Base address: TZF = 0x4000\_0E00

Offset address: 0x04

|               |          |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |   |   |    |
|---------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|---|---|----|
| Bit position: | 15       | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |   |   |   |    |
| Bit field:    | KEY[7:0] |    |    |    |    |    |   |   |   |   |   | — | — | — | — | — | — | — | — | 保护 |
| 重置后的值:        | 0        | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |   |   |   |    |

| Bit  | Symbol   | Function   | R/W |
|------|----------|--|-----|
| 0    | PROTECT  | 注册保护<br>0: 所有总线TrustZone过滤器寄存器写入受到保护。读取是可能的。1: 所有总线TrustZone过滤器寄存器写入都是可能的。 | R/W |
| 7:1  | —        | 这些位被读取为0。写入值应为0。   | R/W |
| 15:8 | KEY[7:0] | KeyCode<br>该位用于启用或禁用PROTECT位的写入。   | W   |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

**PROTECT位 (寄存器保护)**

PROTECT位控制启用或禁用对受保护的相应寄存器的写入。TZFOAD寄存器受PROTECT保护。

当PROTECT位置位时，同时向KEY[7:0]位写入0xA5。

**KEY[7:0] bits (KeyCode)**

KEY[7:0]位用于启用或禁用PROTECT位的写入。写入PROTECT位时，同时向KEY[7:0]位写入0xA5。

写入除0xA5以外的KEY[7:0]位值时，PROTECT位不更新。

KEY[7:0]位总是被读取为0x00。

**46.6 使用说明****46.6.1 设置安全属性的限制**

要设置软件断点，调试器需要重新编程闪存。表46.10显示了调试器为重新编程闪存而设置的寄存器。如果表46.10中列出的寄存器的安全属性配置为安全，则调试器无法在NSECSD状态下设置软件断点，因为调试器无法更改寄存器设置。仅在NSECSD状态下，安全开发人员需要将表46.10中列出的寄存器配置为非安全。

**Table 46.10 调试器设置的用于重新编程闪存的寄存器**

| 函数名称            | 注册名称   |
|-----------------|--|
| 时钟产生电路          | SCKDIVCR, SCKCR, PLLCCR, PLLCR, HOCOCR, MOCOCR |
| Low-Power modes | OPCCR, SOPCCR                                  |

### 46.6.2 SAU setting

After reset, all of address space is marked as Secure by SAU default setting. SAU\_CTRL register should be set to 0x2 to enable the IDAU security attribution. That is, after setting SAU\_CTRL register to 0x2, the address space security attribution becomes as shown in Table 46.6.

### 46.6.3 Non-secure exception during the setting of FACI registers

As shown in Table 46.5, the registers related to FACI are protected from non-secure access only during programming/erasure or during suspend programming/erasure. Outside of this state, the access from non-secure region is not protected. For example, when programming by the secure user, the non-secure user can rewrite the FSADDR if a non-secure exception occurs immediately after “Set the start address of the target block to the FSADDR register” flow in Figure 44.13. If the FACI command is issued after the non-secure exception processing is completed and the CPU state returns to the secure state, data will be programmed to an address not intended by the secure user.

To prevent such a things, secure user needs to set not to accept the non-secure exception during the following period.

- Set not to accept the non-secure exception before setting FWEPROR to 01h or setting FENTRYR to other than 0000h, that is before releasing the protection of FWEPROR or FENTRYR.
- Set to accept the non-secure exception after all write access to the FACI command-issuing area is completed.

### 46.6.4 FCU interrupt usage

It is recommended that secure users do not use the FCU interrupts, but rather use the register polling. Because non-secure users can program/erase the data flash without calling the secure gateway, if secure user uses FCU interrupts, the unintentional exception handling may be executed when data flash is programmed/erased by a non-secure user.

### 46.6.2 SAU设置

复位后，SAU默认设置将所有地址空间标记为安全。SAU\_CTRL寄存器应设置为0x2以启用IDAU安全属性。即设置SAU\_CTRL寄存器为0x2后，地址空间安全属性变为如表46.6所示。

### 46.6.3 FACI寄存器设置期间的非安全异常

如表46.5所示，与FACI相关的寄存器仅在编程擦除或挂起编程擦除期间受到保护，不会受到非安全访问。在此状态之外，来自非安全区域的访问不受保护。例如，当由安全用户编程时，如果在图44.13中的“将目标块的起始地址设置为FSADDR寄存器”流程之后立即发生非安全异常，则非安全用户可以重写FSADDR。如果在非安全异常处理完成后发出FACI命令并且CPU状态返回到安全状态，则数据将被编程到安全用户不打算使用的地址。

为了防止这样的事情发生，安全用户需要在接下来的时间段内设置不接受非安全异常。

- 在将FWEPROR设置为01h或将FENTRYR设置为0000h以外的值之前，即在解除对FWEPROR或FENTRYR的保护之前，设置不接受非安全例外。
- 设置为在对FACI命令发布区域的所有写访问完成后接受非安全异常。

### 46.6.4 FCU中断使用

建议安全用户不要使用FCU中断，而是使用寄存器轮询。由于非安全用户可以在不调用安全网关的情况下对数据闪存进行编程擦除，因此如果安全用户使用FCU中断，则在数据闪存被非安全用户编程擦除时可能会执行意外异常处理。

## 47. Electrical Characteristics

Supported peripheral functions and pins differ from one product name to another.

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

- $VCC = AVCC0 = VCC\_USB = VBATT = 2.7$  to  $3.6$  V
- $2.7 \leq VREFH0/VREFH \leq AVCC0$
- $VSS = AVSS0 = VREFL0/VREFL = VSS\_USB = 0$  V
- $T_a = T_{opr}$

Figure 47.1 shows the timing conditions.

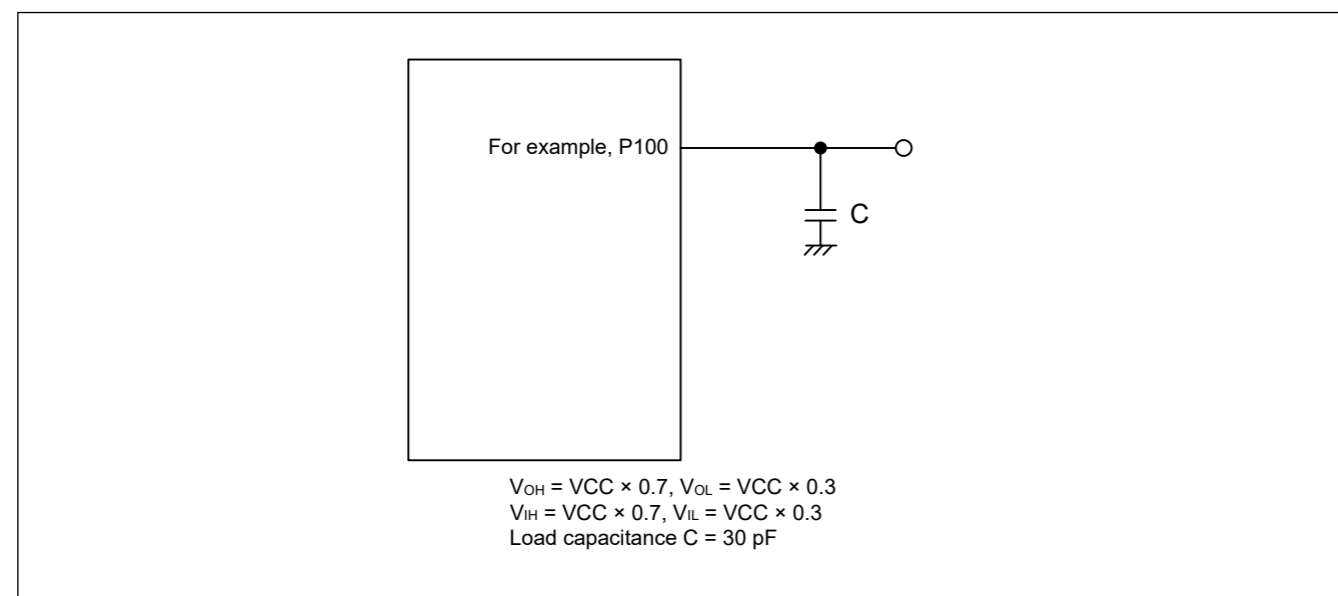

Figure 47.1 Input or output timing measurement conditions

The recommended measurement conditions for the timing specification of each peripheral provided are for the best peripheral operation. Make sure to adjust the driving abilities of each pin to meet your conditions.

### 47.1 Absolute Maximum Ratings

Table 47.1 Absolute maximum ratings

| Parameter  | Symbol                    | Value                          | Unit |
|--|---------------------------|--------------------------------|------|
| Power supply voltage   | VCC, VCC_USB <sup>2</sup> | -0.3 to +4.0                   | V    |
| VBATT power supply voltage                                   | VBATT                     | -0.3 to +4.0                   | V    |
| Input voltage (except for 5 V-tolerant ports <sup>*1</sup> ) | V <sub>in</sub>           | -0.3 to VCC + 0.3              | V    |
| Input voltage (5 V-tolerant ports <sup>*1</sup> )            | V <sub>in</sub>           | -0.3 to + VCC + 4.0 (max. 5.8) | V    |
| Reference power supply voltage                               | VREFH/VREFH0              | -0.3 to VCC + 0.3              | V    |
| Analog power supply voltage                                  | AVCC0 <sup>*2</sup>       | -0.3 to +4.0                   | V    |
| Analog input voltage   | V <sub>AN</sub>           | -0.3 to AVCC0 + 0.3            | V    |
| Operating temperature <sup>*3 *4</sup>                       | T <sub>opr</sub>          | -40 to +105                    | °C   |
| Storage temperature  | T <sub>stg</sub>          | -55 to +125                    | °C   |

Note 1. Ports P205, P206, P400, P401, P407 to P415, and P708 to P713 are 5 V tolerant.

Note 2. Connect AVCC0 and VCC\_USB to VCC.

Note 3. See section 47.2.1. Tj/Ta Definition.

Note 4. Contact a Renesas Electronics sales office for information on derating operation when Ta = +85°C to +105°C. Derating is the systematic reduction of load for improved reliability.

## 47. 电气特性

支持的外围功能和引脚因产品名称而异。

除非另有规定，MCU的电气特性在以下条件下定义：

- $VCC = AVCC0 = VCC\_USB = VBATT = 2.7$  to  $3.6$  V
- $2.7 \leq VREFH0/VREFH \leq AVCC0$
- $VSS = AVSS0 = VREFL0/VREFL = VSS\_USB = 0$  V
- $T_a = T_{opr}$

图47.1显示了时序条件。

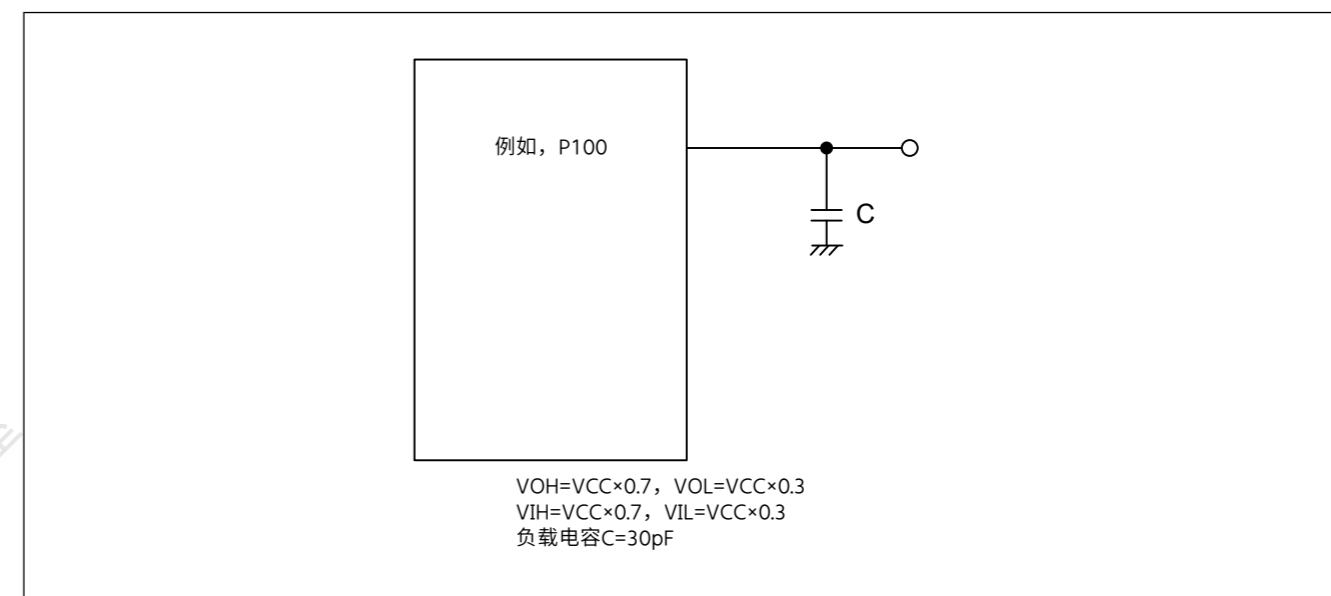

Figure 47.1 输入或输出定时测量条件

所提供的每个外设时序规范的推荐测量条件是为了实现最佳外设操作。确保调整每个引脚的驱动能力以满足您的条件。

### 47.1 绝对最大额定值

Table 47.1 绝对最大额定值

| Parameter         | Symbol                    | Value                          | Unit |
|-------------------|---------------------------|--------------------------------|------|
| 电源电压              | VCC, VCC_USB <sup>2</sup> | -0.3 to +4.0                   | V    |
| VBATT电源电压         | VBATT                     | -0.3 to +4.0                   | V    |
| 输入电压 (5V容限端口*1除外) | V <sub>in</sub>           | -0.3 to VCC + 0.3              | V    |
| 输入电压 (5V耐压端口*1)   | V <sub>in</sub>           | -0.3 to + VCC + 4.0 (max. 5.8) | V    |
| 参考电源电压            | VREFH/VREFH0              | -0.3 to VCC + 0.3              | V    |
| 模拟电源电压            | AVCC0 <sup>*2</sup>       | -0.3 to +4.0                   | V    |
| 模拟输入电压            | V <sub>AN</sub>           | -0.3 to AVCC0 + 0.3            | V    |
| 工作温度*3*4          | T <sub>opr</sub>          | -40 to +105                    | °C   |
| 贮存温度              | T <sub>stg</sub>          | -55 to +125                    | °C   |

注1. 端口P205、P206、P400、P401、P407至P415和P708至P713可承受5V电压。

注2. 将AVCC0和VCC\_USB连接到VCC。

注3: 见第47.2.1节。Tj/Ta定义。

注4. 有关在Ta=+85°C至+105°C时降额运行的信息，请联系瑞萨电子销售办事处。降额是系统地减少负载以提高可靠性。

**Caution:** Permanent damage to the MCU might result if absolute maximum ratings are exceeded.

**Table 47.2 Recommended operating conditions**

| Parameter                    | Symbol              | Value                | Min | Typ | Max | Unit |
|------------------------------|---------------------|----------------------|-----|-----|-----|------|
| Power supply voltages        | VCC                 | When USB is not used | 2.7 | —   | 3.6 | V    |
|                              |                     | When USB is used     | 3.0 | —   | 3.6 | V    |
|                              | VSS                 | —                    | 0   | —   | V   |      |
| USB power supply voltages    | VCC_USB             | —                    | VCC | —   | V   |      |
|                              | VSS_USB             | —                    | 0   | —   | V   |      |
| VBATT power supply voltage   | VBATT               | 1.8                  | —   | 3.6 | V   |      |
| Analog power supply voltages | AVCC0 <sup>*1</sup> | —                    | VCC | —   | V   |      |
|                              | AVSS0               | —                    | 0   | —   | V   |      |

Note 1. Connect AVCC0 to VCC. When the A/D converter and the D/A converter are not in use, do not leave the AVCC0, VREFH/VREFH0, AVSS0, and VREFL/VREFL0 pins open. Connect the AVCC0 and VREFH/VREFH0 pins to VCC, and the AVSS0 and VREFL/VREFL0 pins to VSS, respectively.

## 47.2 DC Characteristics

### 47.2.1 Tj/Ta Definition

**Table 47.3 DC characteristics**

Conditions: Products with operating temperature (T<sub>a</sub>) -40 to +105°C

| Parameter                        | Symbol         | Typ | Max | Unit | Test conditions  |
|----------------------------------|----------------|-----|-----|------|--|
| Permissible junction temperature | T <sub>j</sub> | —   | 125 | °C   | High-speed mode<br>Low-speed mode<br>Subosc-speed mode |

Note: Make sure that  $T_j = T_a + \theta_{ja} \times \text{total power consumption (W)}$ , where total power consumption =  $(VCC - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + I_{CCmax} \times VCC$ .

### 47.2.2 I/O V<sub>IH</sub>, V<sub>IL</sub>

**Table 47.4 I/O V<sub>IH</sub>, V<sub>IL</sub> (1 of 2)**

| Parameter   | Symbol                  | Min  | Typ             | Max       | Unit                |           |
|---|-------------------------|--|-----------------|-----------|---------------------|-----------|
| Input voltage (except for Schmitt trigger input pins) | Peripheral function pin | EXTAL (external clock input), SPI (except RSPCK) | V <sub>IH</sub> | VCC × 0.8 | —                   | V         |
|   |                         |  | V <sub>IL</sub> | —         | —                   | VCC × 0.2 |
|   | IIC (SMBus)             | V <sub>IH</sub>                                  | 2.1             | —         | VCC + 3.6 (max 5.8) |           |
|   |                         | V <sub>IL</sub>                                  | —               | —         | 0.8                 |           |

**Caution:** 如果超过绝对最大额定值，可能会对MCU造成永久性损坏。

**Table 47.2 推荐工作条件**

| Parameter | Symbol              | Value   | Min | Typ | Max | Unit |
|-----------|---------------------|---------|-----|-----|-----|------|
| 电源电压      | VCC                 | 不使用USB时 | 2.7 | —   | 3.6 | V    |
|           |                     | 使用USB时  | 3.0 | —   | 3.6 | V    |
|           | VSS                 | —       | 0   | —   | V   |      |
| USB电源电压   | VCC_USB             | —       | VCC | —   | V   |      |
|           | VSS_USB             | —       | 0   | —   | V   |      |
| VBATT电源电压 | VBATT               | 1.8     | —   | 3.6 | V   |      |
| 模拟电源电压    | AVCC0 <sup>*1</sup> | —       | VCC | —   | V   |      |
|           | AVSS0               | —       | 0   | —   | V   |      |

注1.将AVCC0连接到VCC。不使用AD转换器和DA转换器时，不要离开AVCC0、VREFH/VREFH0、AVSS0和VREFL/VREFL0引脚打开。将AVCC0和VREFH/VREFH0引脚连接到VCC，以及AVSS0和VREFL/VREFL0引脚分别连接到VSS。

## 47.2 DC Characteristics

### 47.2.1 Tj/Ta Definition

**Table 47.3 DC characteristics**

条件：工作温度(T<sub>a</sub>)-40至+105°C的产品

| Parameter | Symbol         | Typ | Max | Unit | 测试条件   |
|-----------|----------------|-----|-----|------|--|
| 允许结温      | T <sub>j</sub> | —   | 125 | °C   | High-speed mode<br>Low-speed mode<br>Subosc-speed mode |

Note: 确保 $T_j = T_a + \theta_{ja} \times \text{总功耗(W)}$ ，其中总功耗= $(VCC - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + I_{CCmax} \times VCC$ 。

### 47.2.2 I/O V<sub>IH</sub>, V<sub>IL</sub>

**Table 47.4 IOVIH VIL(1of2)**

| Parameter           | 符号最小值       | Typ                           | Max             | Unit      |                     |           |
|---------------------|-------------|-------------------------------|-----------------|-----------|---------------------|-----------|
| 输入电压 (施密特触发器输入引脚除外) | 外设功能引脚      | EXTAL (外部时钟输入), SPI (RSPCK除外) | V <sub>IH</sub> | VCC × 0.8 | —                   | V         |
|                     |             |                               | V <sub>IL</sub> | —         | —                   | VCC × 0.2 |
|                     | IIC (SMBus) | V <sub>IH</sub>               | 2.1             | —         | VCC + 3.6 (max 5.8) |           |
|                     |             | V <sub>IL</sub>               | —               | —         | 0.8                 |           |

Table 47.4 I/O V<sub>IH</sub>, V<sub>IL</sub> (2 of 2)

| Parameter                     |  |                         |  | Symbol                              | Min             | Typ                      | Max  | Unit |                         |
|-------------------------------|--|-------------------------|--|-------------------------------------|-----------------|--------------------------|--|------|-------------------------|

Note 1. RES and peripheral function pins associated with Ports P205, P206, P400, P401, P407 to P415, and P708 to P713 (total 22 pins).  
 Note 2. All input pins except for the peripheral function pins already described in the table.  
 Note 3. Ports P205, P206, P400, P401, P407 to P415, and P708 to P713 (total 21 pins).  
 Note 4. All input pins except for the ports already described in the table.  
 Note 5. When VCC is less than 2.7 V, the input voltage of 5 V-tolerant ports should be less than 3.6 V, otherwise breakdown may occur because 5 V-tolerant ports are electrically controlled so as not to violate the break down voltage.

注1.与端口P205、P206、P400、P401、P407至P415和P708至P713相关的RES和外围功能引脚（共22个引脚）。  
 注2.除表中已描述的外围功能引脚外的所有输入引脚。  
 注3.端口P205、P206、P400、P401、P407~P415、P708~P713（共21针）。  
 注4.除表中已描述的端口外的所有输入引脚。  
 注5.当VCC小于2.7V时，5V容限端口的输入电压应小于3.6V，否则可能发生击穿，因为5V容限端口是电气控制的，以免违反击穿电压。

|  |  | High drive*3          | $I_{OH}$ | —   | —    | -40  | mA |
|  |  |                       | $I_{OL}$ | —   | —    | 40   | mA |
|  | Other output pins*4  | Low drive*1           | $I_{OH}$ | —   | —    | -4.0 | mA |
|  |  |                       | $I_{OL}$ | —   | —    | 4.0  | mA |
|  |  | Middle drive*2        | $I_{OH}$ | —   | —    | -8.0 | mA |
|  |  |                       | $I_{OL}$ | —   | —    | 8.0  | mA |
| High drive*3   |  | $I_{OH}$              | —        | —   | -32  | mA   |    |
|  |  | $I_{OL}$              | —        | —   | 32   | mA   |    |
| Permissible output current (maxvalue of total of all pins) | Maximum of all output pins                                   | $\Sigma I_{OH} (max)$ | —        | —   | -80  | mA   |    |
|  |  | $\Sigma I_{OL} (max)$ | —        | —   | 80   | mA   |    |

Note 1. This is the value when low driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.

Note 2. This is the value when middle driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.

Note 3. This is the value when high driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.

Note 4. Except for P200, which is an input port.

**Caution:** To protect the reliability of the MCU, the output current values should not exceed the values in this table. The average output current indicates the average value of current measured during 100  $\mu$ s.

| Input capacitance                       | USB_DP, USB_DM, and ports P014, P015, P400, P401, P511, P512      | $C_{in}$   | —              | —   | 16  | pF            | $V_{bias} = 0 \text{ V}$<br>$V_{amp} = 20 \text{ mV}$<br>$f = 1 \text{ MHz}$<br>$T_a = 25^\circ\text{C}$ |
|   | Other input pins  |            | —              | —   | 8   |               |  |

Note 1. SCL0\_A, SDA0\_A (total 2 pins).

Note 2. This is the value when high driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.

## 47.2.4 IOVOH VOL和其他特性

Table 47.6 IOVOH、VOL和其他特性

| Parameter    |  | 符号         | 最小值            | 典型值 | 最大单元测试条件          |  |
|--------------|--|------------|----------------|-----|-------------------|--|
| 输出电压         | IIC  | $V_{OL}$   | —              | —   | 0.4 V             |  |
|              |  | $V_{OL}$   | —              | —   | 0.6               |  |
|              | IIC*1  | $V_{OL}$   | —              | —   | 0.4               |  |
|              |  | $V_{OL}$   | —              | 0.4 | —                 |  |
|              | 端口P205、P206、P407至P415、P708至P713 (共17针) *2          | $V_{OH}$   | $V_{CC} - 1.0$ | —   | —                 | $I_{OH} = 20 \text{ mA}$<br>$V_{CC} = 3.3 \text{ V}$ |
|              |  | $V_{OL}$   | —              | —   | 1.0               | $I_{OL} = 20 \text{ mA}$<br>$V_{CC} = 3.3 \text{ V}$ |
|              | 其他输出引脚   | $V_{OH}$   | $V_{CC} - 0.5$ | —   | —                 | $I_{OH} = 1.0 \text{ mA}$                            |
|              |  | $V_{OL}$   | —              | —   | 0.5               | $I_{OL} = 1.0 \text{ mA}$                            |
| 输入漏电流        | RES  | $I_{in}$   | —              | —   | 5.0 $\mu\text{A}$ |  |
|              | Port P200  |            | —              | —   | 1.0               |  |
| 三态漏电流 (关闭状态) | 5 V-tolerant ports                                 | $I_{TSIL}$ | —              | —   | 5.0 $\mu\text{A}$ |  |
|              | 其他端口 (端口P200除外)                                    |            | —              | —   | 1.0               |  |
| 输入上拉MOS电流    | 端口P0至P8  | $I_p$      | -300           | —   | -10 $\mu\text{A}$ |  |
| 输入电容         | USB_DP、USB_DM和端口P014, P015, P400, P401, P511, P512 | $C_{in}$   | —              | —   | 16 pF             |  |
|              | 其他输入引脚   |            | —              | —   | 8                 |  |

Note 1. SCL0\_A, SDA0\_A (total 2 pins).

注2.这是在PmnPFS寄存器的端口驱动能力位中选择高驱动能力时的值。在深度软件待机模式下会保留所选的驱动能力。

- Note 1. Supply current values are with all output pins unloaded and all input pull-up MOSs in the off state.  
 Note 2. Measured with clocks supplied to the peripheral functions. This does not include the BGO operation.  
 Note 3. I<sub>CC</sub> depends on f (ICLK) as follows.  
 I<sub>CC</sub> Max. = 0.53 × f + 42 (max. operation in high-speed mode)  
 I<sub>CC</sub> Typ. = 0.09 × f + 3.6 (normal operation in high-speed mode, all peripheral clocks disabled)  
 I<sub>CC</sub> Typ. = 0.2 × f + 1.7 (low-speed mode)  
 I<sub>CC</sub> Max. = 0.05 × f + 42 (sleep mode)  
 Note 4. This does not include the BGO operation.  
 Note 5. Supply of the clock signal to peripherals is stopped in this state. This does not include the BGO operation.  
 Note 6. FCLK, PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (1.563 MHz).  
 Note 7. FCLK, PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (3.125 MHz).  
 Note 8. Reference value  
 Note 9. When the MCU is in Software Standby mode or the MSTPCRD.MSTPD16 (12-Bit A/D Converter 0 Module Stop bit) and MSTPCRD.MSTPD15 (12-bit A/D converter 1 module stop bit) are in the module-stop state.  
 Note 10. FCLK, PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (15.6 kHz).  
 Note 11. PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (512 Hz). FCLK is the same frequency as that of ICLK.  
 Note 12. PLL output frequency = 100MHz.  
 Note 13. PLL output frequency = 200MHz.

Table 47.8 Coremark and normal mode current

| Parameter                   | Symbol  | Typ         | Unit   | Test conditions  |  |
|-----------------------------|---|-------------|--------|--|--|
| Supply Current <sup>1</sup> | Coremark <sup>2 3</sup>   | 119         | μA/MHz | ICLK = 100MHz<br>PCLKA = PCLKB = PCLKC = PCLKD = FCLK = 1.56 MHz |  |
|                             |   | Normal mode |        |  | 115  |
|                             |   |             |        |  | All peripheral clocks disabled, cache on, while (1) code executing from flash <sup>2 3</sup> |
|                             | All peripheral clocks disabled, cache off, while (1) code executing from flash <sup>2 3</sup> | 117         |        |  |  |

- Note 1. Supply current values are with all output pins unloaded and all input pull-up MOSs in the off state.  
 Note 2. Supply of the clock signal to peripherals is stopped in this state. This does not include the BGO operation.

Table 47.7 工作和待机电流(2of2)

| Parameter      | Symbol                     | Min | Typ                         | Max  | 单元 | 测试条件    |        |     |        |   |

### 47.2.6 VCC Rise and Fall Gradient and Ripple Frequency

**Table 47.9 Rise and fall gradient characteristics**

| Parameter              | Symbol                                      | Min    | Typ    | Max | Unit | Test conditions |   |
|------------------------|---|--------|--------|-----|------|-----------------|---|
| VCC rising gradient    | Voltage monitor 0 reset disabled at startup | SrVCC  | 0.0084 | —   | 20   | ms/V            | — |
|                        | Voltage monitor 0 reset enabled at startup  |        | 0.0084 | —   | —    |                 | — |
|                        | SCI/USB boot mode*1                         |        | 0.0084 | —   | 20   |                 | — |
| VCC falling gradient*2 | SfVCC                                       | 0.0084 | —      | —   | ms/V | —               |   |

Note 1. At boot mode, the reset from voltage monitor 0 is disabled regardless of the value of the OFS1.LVDAS bit.  
 Note 2. This applies when VBATT is used.

**Table 47.10 Rising and falling gradient and ripple frequency characteristics**

The ripple voltage must meet the allowable ripple frequency  $f_r(VCC)$  within the range between the VCC upper limit (3.6 V) and lower limit (2.7 V). When the VCC change exceeds  $VCC \pm 10\%$ , the allowable voltage change rising and falling gradient  $dt/dVCC$  must be met.

| Parameter  | Symbol     | Min | Typ | Max | Unit | Test conditions                                |
|--|------------|-----|-----|-----|------|--|
| Allowable ripple frequency                           | $f_r(VCC)$ | —   | —   | 10  | kHz  | Figure 47.6<br>$V_r(VCC) \leq VCC \times 0.2$  |
|  |            | —   | —   | 1   | MHz  | Figure 47.6<br>$V_r(VCC) \leq VCC \times 0.08$ |
|  |            | —   | —   | 10  | MHz  | Figure 47.6<br>$V_r(VCC) \leq VCC \times 0.06$ |
| Allowable voltage change rising and falling gradient | $dt/dVCC$  | 1.0 | —   | —   | ms/V | When VCC change exceeds $VCC \pm 10\%$         |

Figure 47.6 Ripple waveform

### 47.2.7 Thermal Characteristics

Maximum value of junction temperature ( $T_j$ ) must not exceed the value of “section 47.2.1.  $T_j/T_a$  Definition”.

$T_j$  is calculated by either of the following equations.

- $T_j = T_a + \theta_{ja} \times \text{Total power consumption}$
- $T_j = T_t + \Psi_{jt} \times \text{Total power consumption}$ 
  - $T_j$ : Junction Temperature (°C)
  - $T_a$ : Ambient Temperature (°C)
  - $T_t$ : Top Center Case Temperature (°C)
  - $\theta_{ja}$ : Thermal Resistance of “Junction”-to-“Ambient” (°C/W)

### 47.2.6 VCC上升和下降梯度和纹波频率

**Table 47.9 上升和下降梯度特性**

| Parameter | Symbol        | Min    | Typ    | Max | Unit | 测试条件 |   |
|-----------|---------------|--------|--------|-----|------|------|---|
| VCC上升梯度   | 启动时禁用电压监视器0复位 | SrVCC  | 0.0084 | —   | 20   | ms/V | — |
|           | 启动时启用电压监视器0复位 |        | 0.0084 | —   | —    |      | — |
|           | SCI/USB启动模式*1 |        | 0.0084 | —   | 20   |      | — |
| VCC下降梯度*2 | SfVCC         | 0.0084 | —      | —   | ms/V | —    |   |

注1.在引导模式下，无论OFS1.LVDAS位的值如何，都禁止从电压监视器0进行的复位。  
 注2.这适用于使用VBATT时。

**Table 47.10 上升下降梯度和纹波频率特性**

纹波电压必须在VCC上限(3.6V)和下限(2.7V)之间。当VCC变化超过 $VCC \pm 10\%$ 时，必须满足允许的电压变化上升和下降梯度 $dt/dVCC$ 。

| Parameter    | Symbol     | Min | Typ | Max | Unit | 测试条件   |
|--------------|------------|-----|-----|-----|------|--|
| 允许纹波频率       | $f_r(VCC)$ | —   | —   | 10  | kHz  | Figure 47.6<br>$V_r(VCC) \leq VCC \times 0.2$  |
|              |            | —   | —   | 1   | MHz  | Figure 47.6<br>$V_r(VCC) \leq VCC \times 0.08$ |
|              |            | —   | —   | 10  | MHz  | Figure 47.6<br>$V_r(VCC) \leq VCC \times 0.06$ |
| 允许电压变化上升下降梯度 | $dt/dVCC$  | 1.0 | —   | —   | ms/V | 当VCC变化超过 $VCC \pm 10\%$                        |

Figure 47.6 纹波波形

### 47.2.7 热特性

结温 ( $T_j$ ) 的最大值不得超过“第47.2.1节的值。 $T_j/T_a$ 定义”。

$T_j$ 通过以下任一公式计算。

- $T_j = T_a + \theta_{ja} \times \text{总功耗}$
- $T_j = T_t + \Psi_{jt} \times \text{总功耗}$ 
  - $T_j$ : 结温(°C)
  - $T_a$ : 环境温度 (°C)
  - $T_t$ : 顶部中心外壳温度(°C)
  - $\theta_{ja}$ : “结”到“环境”的热阻(°C/W)

- $\Psi_{jt}$ : Thermal Resistance of “Junction”-to-“Top Center Case” (°C/W)
- Total power consumption = Voltage × (Leakage current + Dynamic current)
- Leakage current of IO =  $\Sigma (I_{OL} \times V_{OL}) / \text{Voltage} + \Sigma (|I_{OH}| \times |V_{CC} - V_{OH}|) / \text{Voltage}$
- Dynamic current of IO =  $\Sigma IO (C_{in} + C_{load}) \times \text{IO switching frequency} \times \text{Voltage}$ 
  - $C_{in}$ : Input capacitance
  - $C_{load}$ : Output capacitance

Regarding  $\theta_{ja}$  and  $\Psi_{jt}$ , refer to Table 47.11.

**Table 47.11 Thermal Resistance**

| Parameter          | Package                     | Symbol        | Value*1 | Unit | Test conditions              |      |                              |
|--------------------|-----------------------------|---------------|---------|------|------------------------------|------|------------------------------|
| Thermal Resistance | 64-pin LQFP (PLQP0064KB-C)  | $\theta_{ja}$ | 38.0    | °C/W | JESD 51-2 and 51-7 compliant |      |                              |
|                    | 100-pin LQFP (PLQP0100KB-B) |               | 35.0    |      |                              |      |                              |
|                    | 144-pin LQFP (PLQP0144KA-B) |               | 33.0    |      |                              |      |                              |
|                    | 64-pin LQFP (PLQP0064KB-C)  | $\Psi_{jt}$   | 0.80    |      |                              | °C/W | JESD 51-2 and 51-7 compliant |
|                    | 100-pin LQFP (PLQP0100KB-B) |               | 0.76    |      |                              |      |                              |
|                    | 144-pin LQFP (PLQP0144KA-B) |               | 0.63    |      |                              |      |                              |

Note 1. The values are reference values when the 4-layer board is used. Thermal resistance depends on the number of layers or size of the board. For details, refer to the JEDEC standards.

#### 47.2.7.1 Calculation guide of $I_{CCmax}$

Table 47.12 shows the power consumption of each unit.

**Table 47.12 Power consumption of each unit (1 of 2)**

| Dynamic current/ Leakage current | MCU Domain | Category       | Item          | Frequency [MHz] | Current [uA/MHz] | Current*1 [mA] |
|----------------------------------|------------|----------------|---------------|-----------------|------------------|----------------|
| Leakage current                  | Analog     | LDO and Leak*2 | Ta = 75 °C*3  | —               | —                | 21.22          |
|                                  |            |                | Ta = 85 °C*3  | —               | —                | 25.22          |
|                                  |            |                | Ta = 95 °C*3  | —               | —                | 30.22          |
|                                  |            |                | Ta = 105 °C*3 | —               | —                | 37.42          |

- $\Psi_{jt}$ : “结”到“顶部中心外壳”的热阻(°CW)
- 总功耗=电压×(漏电流+动态电流)
- IO漏电流= $\Sigma(I_{OL} \times V_{OL})$ 电压+ $\Sigma(I_{OH} \times V_{CC} - V_{OH})$ 电压
- IO的动态电流= $\Sigma IO(C_{in} + C_{load}) \times \text{IO开关频率} \times \text{电压}$ 
  - Cin:输入电容
  - C负载:输出电容

关于 $\theta_{ja}$ 和 $\Psi_{jt}$ , 请参阅表47.11。

**Table 47.11 热阻**

| Parameter          | Package                     | Symbol        | Value*1 | Unit | 测试条件            |      |                 |
|--------------------|-----------------------------|---------------|---------|------|-----------------|------|-----------------|
| Thermal Resistance | 64-pin LQFP (PLQP0064KB-C)  | $\theta_{ja}$ | 38.0    | °C/W | 符合JESD51-2和51-7 |      |                 |
|                    | 100-pin LQFP (PLQP0100KB-B) |               | 35.0    |      |                 |      |                 |
|                    | 144-pin LQFP (PLQP0144KA-B) |               | 33.0    |      |                 |      |                 |
|                    | 64-pin LQFP (PLQP0064KB-C)  | $\Psi_{jt}$   | 0.80    |      |                 | °C/W | 符合JESD51-2和51-7 |
|                    | 100-pin LQFP (PLQP0100KB-B) |               | 0.76    |      |                 |      |                 |
|                    | 144-pin LQFP (PLQP0144KA-B) |               | 0.63    |      |                 |      |                 |

注1.数值为使用4层板时的参考值。热阻取决于板的层数或尺寸。有关详细信息, 请参阅JEDEC标准。

#### 47.2.7.1 ICCmax的计算指南

表47.12显示了每个单元的功耗。

**Table 47.12 每个单元的功耗 (2个中的1个)**

| 动态电流漏电流 | MCU Domain | Category | Item          | Frequency [MHz] | Current [uA/MHz] | Current*1 [mA] |
|---------|------------|----------|---------------|-----------------|------------------|----------------|
| 漏电流     | Analog     | LDO和泄漏*2 | Ta = 75 °C*3  | —               | —                | 21.22          |
|         |            |          | Ta = 85 °C*3  | —               | —                | 25.22          |
|         |            |          | Ta = 95 °C*3  | —               | —                | 30.22          |
|         |            |          | Ta = 105 °C*3 | —               | —                | 37.42          |

Table 47.12 Power consumption of each unit (2 of 2)

| Dynamic current/<br>Leakage current | MCU<br>Domain | Category                         | Item                        | Frequency<br>[MHz] | Current<br>[uA/MHz] | Current*1<br>[mA] |       |
|-------------------------------------|---------------|----------------------------------|-----------------------------|--------------------|---------------------|-------------------|-------|
| Dynamic current                     | CPU           | Operation with<br>Flash and SRAM | Coremark                    | 100                | 86.493              | 8.65              |       |
|                                     |               |                                  | Peripheral Unit             | Timer              | GPT16 (4ch)*4       | 100               | 3.548 |
|                                     |               |                                  |                             | GPT32 (4ch)*4      | 100                 | 3.946             | 0.39  |

|                                     |               |                                  |                             | DTC                | 100                 | 3.792             | 0.38  |

Note 1. The values are guaranteed by design.

Note 2. LDO and Leak are internal voltage regulator's current and MCU's leakage current.

It is selected according to the temperature of Ta.

Note 3.  $\Delta(T_j - T_a) = 20^\circ\text{C}$  is considered to measure the current.

Note 4. To determine the current consumption per channel, group or unit, divide Current [mA] by the number of channels, groups or units.

Table 47.13 shows the outline of operation for each unit.

Table 47.13 Outline of operation for each unit (1 of 2)

| Peripheral | Outline of operation   |
|------------|--|
| GPT        | Operating modes is set to saw-wave PWM mode.<br>GPT is operating with PCLKD. |
| POEG       | Only clear module stop bit.  |
| AGT        | AGT is operating with PCLKB.   |
| RTC        | RTC is operating with LOCO.  |

Table 47.12 每个单元的功耗 (2个中的2个)

| 动态电流/漏电流 | MCU<br>Domain | Category       | Item     | Frequency<br>[MHz] | Current<br>[uA/MHz] | Current*1<br>[mA] |       |
|----------|---------------|----------------|----------|--------------------|---------------------|-------------------|-------|
| 动态电流     | CPU           | 操作与<br>闪存和SRAM | Coremark | 100                | 86.493              | 8.65              |       |
|          |               |                | 外围单元     | Timer              | GPT16 (4ch)*4       | 100               | 3.548 |

注1.数值由设计保证。

注2.LDO和Leak是内部稳压器的电流和MCU的漏电流。

根据Ta的温度选择。

注3.测量电流时考虑 $\Delta(T_j - T_a) = 20^\circ\text{C}$ 。

注4.要确定每个通道、组或单元的电流消耗，请将电流[mA]除以通道、组或单元的数量。

表47.13显示了每个单元的操作概要。

Table 47.13 每个单元的操作概要 (2个中的1个)

| Peripheral | 操作概要                              |
|------------|-----------------------------------|
| GPT        | 操作模式设置为锯齿波PWM模式。<br>GPT使用PCLKD运行。 |
| POEG       | 只清除模块停止位。                         |
| AGT        | AGT使用PCLKB运行。                     |
| RTC        | RTC与LOCO一起运行。                     |

Table 47.13 Outline of operation for each unit (2 of 2)

| Peripheral | Outline of operation  |
|------------|---|
| WDT        | WDT is operating with PCLKB.  |
| IWDT       | IWDT is operating with IWDTCLK.   |
| USBFS      | Transfer types is set to bulk transfer.<br>USBFS is operating using Full-speed transfer (12 Mbps).  |
| SCI        | SCI is transmitting data in clock synchronous mode.   |
| IIC        | Communication format is set to I2C-bus format.<br>IIC is transmitting data in master mode.  |
| CAN        | CAN is transmitting and receiving data in self-test mode 1.   |
| SPI        | SPI mode is set to SPI operation (4-wire method).<br>SPI master/slave mode is set to master mode.<br>SPI is transmitting 8-bit width data.                            |
| QSPI       | QSPI is issuing Fast Read Quad I/O Instruction.   |
| SSIE       | Communication mode is set to Master.<br>System word length is set to 32 bits.<br>Data word length is set to 20 bits.<br>SSIE is transmitting data using I2S format.   |
| SDHI       | Transfer bus mode is set to 4-bit wide bus mode.<br>SDHI is issuing CMD24 (single-block write).   |
| ADC12      | Resolution is set to 12-bit accuracy.<br>Data registers is set to A/D-converted value addition mode.<br>ADC12 is converting the analog input in continuous scan mode. |
| DAC12      | DAC12 is outputting the conversion result while updating the value of data register.  |
| TSN        | TSN is operating.   |
| CTSU       | CTSU is operating in self-capacitance single scan mode.   |
| ELC        | Only clear module stop bit.   |
| SCE9       | SCE9 is executing built-in self test.   |
| CRC        | CRC is generating CRC code using 32-bit CRC32-C polynomial.   |
| DOC        | DOC is operating in data addition mode.   |
| CAC        | Measurement target clocks is set to PCLKB.<br>Measurement reference clocks is set to PCLKB.<br>CAC is measuring the clock frequency accuracy.                         |
| DMAC       | Bit length of transfer data is set to 32 bits.<br>Transfer mode is set to block transfer mode.<br>DMAC is transferring data from SRAM0 to SRAM0.                      |
| DTC        | Bit length of transfer data is set to 32 bits.<br>Transfer mode is set to block transfer mode.<br>DTC is transferring data from SRAM0 to SRAM0.                       |

47.2.7.2 Example of  $T_j$  calculation

Assumption :

- Package 144-pin LQFP :  $\theta_{ja} = 33.0 \text{ } ^\circ\text{C/W}$
- $T_a = 100 \text{ } ^\circ\text{C}$
- $I_{CCmax} = 70 \text{ mA}$
- $V_{CC} = 3.5 \text{ V}$  ( $V_{CC} = AV_{CC} = V_{CC\_USB}$ )
- $I_{OH} = 1 \text{ mA}$ ,  $V_{OH} = V_{CC} - 0.5 \text{ V}$ , 12 Outputs
- $I_{OL} = 20 \text{ mA}$ ,  $V_{OL} = 1.0 \text{ V}$ , 8 Outputs
- $I_{OL} = 1 \text{ mA}$ ,  $V_{OL} = 0.5 \text{ V}$ , 12 Outputs

Table 47.13 每个单元的操作概要 (2个中的2个)

| Peripheral | 操作概要  |
|------------|---|
| WDT        | WDT使用PCLKB运行。   |
| IWDT       | IWDT使用IWDTCLK运行。  |
| USBFS      | 传输类型设置为批量传输。<br>USBFS使用全速传输(12Mbps)运行。                      |
| SCI        | SCI在时钟同步模式下传输数据。  |
| IIC        | 通信格式设置为I2C总线格式。<br>IIC在主机模式下传输数据。                           |
| CAN        | CAN在自检模式1中发送和接收数据。  |
| SPI        | SPI模式设置为SPI操作(4线方法)。<br>SPI主从模式设置为主模式。<br>SPI正在传输8位宽度的数据。   |
| QSPI       | QSPI正在发出快速读取四线IO指令。   |
| SSIE       | 通信模式设置为主。<br>系统字长设置为32位。<br>数据字长设置为20位。<br>SSIE使用I2S格式传输数据。 |
| SDHI       | 传输总线模式设置为4位宽总线模式。<br>SDHI正在发布CMD24(单块写入)。                   |
| ADC12      | 分辨率设置为12位精度。<br>数据寄存器设置为AD转换值加法模式。<br>ADC12在连续扫描模式下转换模拟输入。  |
| DAC12      | DAC12在更新数据寄存器值的同时输出转换结果。                                    |
| TSN        | TSN正在运行。  |
| CTSU       | CTSU在自电容单次扫描模式下运行。  |
| ELC        | 只清除模块停止位。   |
| SCE9       | SCE9正在执行内置自检。   |
| CRC        | CRC使用32位CRC32-C多项式生成CRC码。                                   |

| CAC        | 测量目标时钟设置为PCLKB。<br>测量参考时钟设置为PCLKB。CAC正在测量时钟频率精度。            |
| DMAC       | 传输数据的位长设置为32位。<br>传输模式设置为块传输模式。<br>DMAC正在将数据从SRAM0传输到SRAM0。 |
| DTC        | 传输数据的位长设置为32位。<br>传输模式设置为块传输模式。<br>DTC正在将数据从SRAM0传输到SRAM0。  |

47.2.7.2  $T_j$ 计算示例

Assumption :

- Package 144-pin LQFP :  $\theta_{ja} = 33.0 \text{ } ^\circ\text{C/W}$
- $T_a = 100 \text{ } ^\circ\text{C}$
- ICC最大值=70mA
- $V_{CC} = 3.5 \text{ V}$  ( $V_{CC} = AV_{CC} = V_{CC\_USB}$ )
- $I_{OH}=1\text{mA}$ ,  $V_{OH}=V_{CC} - 0.5\text{V}$ , 12个输出
- $I_{OL}=20\text{mA}$ ,  $V_{OL}=1.0\text{V}$ , 8个输出
- $I_{OL}=1\text{mA}$ ,  $V_{OL}=0.5\text{V}$ , 12路输出

- $C_{in} = 8 \text{ pF}$ , 32 pins, Input frequency = 10 MHz
- $C_{load} = 30 \text{ pF}$ , 32 pins, Output frequency = 10 MHz

$$\begin{aligned} \text{Leakage current of IO} &= \Sigma (V_{OL} \times I_{OL}) / \text{Voltage} + \Sigma ((V_{CC} - V_{OH}) \times I_{OH}) / \text{Voltage} \\ &= (20 \text{ mA} \times 1 \text{ V}) \times 8 / 3.5 \text{ V} + (1 \text{ mA} \times 0.5 \text{ V}) \times 12 / 3.5 \text{ V} + ((V_{CC} - (V_{CC} - 0.5 \text{ V})) \times 1 \text{ mA}) \times 12 / 3.5 \text{ V} \\ &= 45.7 \text{ mA} + 1.71 \text{ mA} + 1.71 \text{ mA} \\ &= 49.1 \text{ mA} \end{aligned}$$

$$\begin{aligned} \text{Dynamic current of IO} &= \Sigma IO (C_{in} + C_{load}) \times \text{IO switching frequency} \times \text{Voltage} \\ &= ((8 \text{ pF} \times 32) \times 10 \text{ MHz} + (30 \text{ pF} \times 32) \times 10 \text{ MHz}) \times 3.5 \text{ V} \\ &= 42.6 \text{ mA} \end{aligned}$$

$$\begin{aligned} \text{Total power consumption} &= \text{Voltage} \times (\text{Leakage current} + \text{Dynamic current}) \\ &= (70 \text{ mA} \times 3.5 \text{ V}) + (49.1 \text{ mA} + 42.6 \text{ mA}) \times 3.5 \text{ V} \\ &= 566 \text{ mW} (0.566 \text{ W}) \end{aligned}$$

$$\begin{aligned} T_j &= T_a + \theta_{ja} \times \text{Total power consumption} \\ &= 100 \text{ }^\circ\text{C} + 33.0 \text{ }^\circ\text{C/W} \times 0.566 \text{ W} \\ &= 118.7 \text{ }^\circ\text{C} \end{aligned}$$

### 47.3 AC Characteristics

#### 47.3.1 Frequency

Table 47.14 Operation frequency value in high-speed mode

| Parameter           | Symbol  | Min             | Typ | Max | Unit |
|---------------------|---|-----------------|-----|-----|------|
| Operation frequency | System clock (ICLK) <sup>*2</sup>             | —               | —   | 100 | MHz  |
|                     | Peripheral module clock (PCLKA) <sup>*2</sup> | —               | —   | 100 |      |
|                     | Peripheral module clock (PCLKB) <sup>*2</sup> | —               | —   | 50  |      |
|                     | Peripheral module clock (PCLKC) <sup>*2</sup> | — <sup>*3</sup> | —   | 50  |      |
|                     | Peripheral module clock (PCLKD) <sup>*2</sup> | —               | —   | 100 |      |
|                     | Flash interface clock (FCLK) <sup>*2</sup>    | — <sup>*1</sup> | —   | 50  |      |

- Note 1. FCLK must run at a frequency of at least 4 MHz when programming or erasing the flash memory.  
 Note 2. See section 8, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, and FCLK frequencies.  
 Note 3. When the ADC12 is used, the PCLKC frequency must be at least 1 MHz.

Table 47.15 Operation frequency value in low-speed mode

| Parameter           | Symbol   | Min             | Typ | Max | Unit |
|---------------------|--|-----------------|-----|-----|------|
| Operation frequency | System clock (ICLK) <sup>*2</sup>                | —               | —   | 1   | MHz  |
|                     | Peripheral module clock (PCLKA) <sup>*2</sup>    | —               | —   | 1   |      |
|                     | Peripheral module clock (PCLKB) <sup>*2</sup>    | —               | —   | 1   |      |
|                     | Peripheral module clock (PCLKC) <sup>*2 *3</sup> | — <sup>*3</sup> | —   | 1   |      |
|                     | Peripheral module clock (PCLKD) <sup>*2</sup>    | —               | —   | 1   |      |
|                     | Flash interface clock (FCLK) <sup>*1 *2</sup>    | —               | —   | 1   |      |

- Note 1. Programming or erasing the flash memory is disabled in low-speed mode.  
 Note 2. See section 8, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, and FCLK frequencies.

- $C_{in}=8\text{pF}$ , 32引脚, 输入频率=10MHz
- $C_{\text{负载}}=30\text{pF}$ , 32引脚, 输出频率=10MHz

$$\begin{aligned} \text{IO的漏电流} &= \Sigma (\text{VOL} \times \text{IOL}) / \text{电压} + \Sigma ((\text{VCCVOH}) \times \text{IOH}) / \text{电压} \\ &= (20 \text{ mA} \times 1 \text{ V}) \times 8 / 3.5 \text{ V} + (1 \text{ mA} \times 0.5 \text{ V}) \times 12 / 3.5 \text{ V} + ((\text{VCC} - (\text{VCC} - 0.5 \text{ V})) \times 1 \text{ mA}) \times 12 / 3.5 \text{ V} \\ &= 45.7 \text{ mA} + 1.71 \text{ mA} + 1.71 \text{ mA} \\ &= 49.1 \text{ mA} \end{aligned}$$

$$\begin{aligned} \text{IO的动态电流} &= \Sigma \text{IO} (\text{Cin} + \text{Cload}) \times \text{IO开关频率} \times \text{电压} \\ &= ((8 \text{ pF} \times 32) \times 10 \text{ MHz} + (30 \text{ pF} \times 32) \times 10 \text{ MHz}) \times 3.5 \text{ V} \\ &= 42.6 \text{ mA} \end{aligned}$$

$$\begin{aligned} \text{总功耗} &= \text{电压} \times (\text{漏电流} + \text{动态电流}) \\ &= (70 \text{ mA} \times 3.5 \text{ V}) + (49.1 \text{ mA} + 42.6 \text{ mA}) \times 3.5 \text{ V} \\ &= 566 \text{ mW} (0.566 \text{ W}) \end{aligned}$$

$$\begin{aligned} T_j &= T_a + \theta_{ja} \times \text{总功耗} \\ &= 100 \text{ }^\circ\text{C} + 33.0 \text{ }^\circ\text{C/W} \times 0.566 \text{ W} \\ &= 118.7 \text{ }^\circ\text{C} \end{aligned}$$

### 47.3 交流特性

#### 47.3.1 Frequency

Table 47.14 高速模式下的运行频率值

| Parameter | Symbol          | Min             | Typ | Max | Unit |
|-----------|-----------------|-----------------|-----|-----|------|
| 运行频率      | 系统时钟 (ICLK)*2   | —               | —   | 100 | MHz  |
|           | 外围模块时钟(PCLKA)*2 | —               | —   | 100 |      |
|           | 外围模块时钟(PCLKB)*2 | —               | —   | 50  |      |
|           | 外围模块时钟(PCLKC)*2 | — <sup>*3</sup> | —   | 50  |      |
|           | 外围模块时钟(PCLKD)*2 | —               | —   | 100 |      |
|           | 闪存接口时钟(FCLK)*2  | — <sup>*1</sup> | —   | 50  |      |

- 注1.在对闪存进行编程或擦除时, FCLK必须以至少4MHz的频率运行。  
 注2.有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD和FCLK频率之间的关系, 请参见第8节, 时钟生成电路。  
 注3.使用ADC12时, PCLKC频率必须至少为1MHz。

Table 47.15 低速模式下的运行频率值

| Parameter | Symbol              | Min             | Typ | Max | Unit |
|-----------|---------------------|-----------------|-----|-----|------|
| 运行频率      | 系统时钟(ICLK)*2        | —               | —   | 1   | MHz  |
|           | 外围模块时钟(PCLKA)*2     | —               | —   | 1   |      |
|           | 外围模块时钟(PCLKB)*2     | —               | —   | 1   |      |
|           | 外围模块时钟(PCLKC)*2*3   | — <sup>*3</sup> | —   | 1   |      |
|           | 外围模块时钟(PCLKD)*2     | —               | —   | 1   |      |
|           | Flash接口时钟(FCLK)*1*2 | —               | —   | 1   |      |

- 注1.在低速模式下禁止对闪存进行编程或擦除。  
 注2.有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD和FCLK频率之间的关系, 请参见第8节, 时钟生成电路。

Note 3. When the ADC12 is used, the PCLKC frequency must be set to at least 1 MHz.

Table 47.16 Operation frequency value in Subosc-speed mode

| Parameter           | Symbol   | Min  | Typ  | Max  | Unit |     |
|---------------------|--|------|------|------|------|-----|
| Operation frequency | System clock (ICLK) <sup>*2</sup>                | f    | 29.4 | —    | 36.1 | kHz |
|                     | Peripheral module clock (PCLKA) <sup>*2</sup>    | —    | —    | 36.1 |      |     |
|                     | Peripheral module clock (PCLKB) <sup>*2</sup>    | —    | —    | 36.1 |      |     |
|                     | Peripheral module clock (PCLKC) <sup>*2 *3</sup> | —    | —    | 36.1 |      |     |
|                     | Peripheral module clock (PCLKD) <sup>*2</sup>    | —    | —    | 36.1 |      |     |
|                     | Flash interface clock (FCLK) <sup>*1 *2</sup>    | 29.4 | —    | 36.1 |      |     |

Note 1. Programming or erasing the flash memory is disabled in Subosc-speed mode.  
 Note 2. See section 8, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, and FCLK frequencies.  
 Note 3. The ADC12 cannot be used.

47.3.2 Clock Timing

Table 47.17 Clock timing except for sub-clock oscillator (1 of 2)

| Parameter  | Symbol                 | Min                 | Typ    | Max             | Unit   | Test conditions |  |
|--|------------------------|---------------------|--------|-----------------|--------|-----------------|--|
| EXTAL external clock input cycle time                                  | t <sub>EXcyc</sub>     | 41.66               | —      | —               | ns     | Figure 47.7     |  |
| EXTAL external clock input high pulse width                            | t <sub>EXH</sub>       | 15.83               | —      | —               | ns     |                 |  |
| EXTAL external clock input low pulse width                             | t <sub>EXL</sub>       | 15.83               | —      | —               | ns     |                 |  |
| EXTAL external clock rise time   | t <sub>EXr</sub>       | —                   | —      | 5.0             | ns     |                 |  |
| EXTAL external clock fall time   | t <sub>EXf</sub>       | —                   | —      | 5.0             | ns     |                 |  |
| Main clock oscillator frequency  | f <sub>MAIN</sub>      | 8                   | —      | 24              | MHz    | —               |  |
| Main clock oscillation stabilization wait time (crystal) <sup>*1</sup> | t <sub>MAINOSCWT</sub> | —                   | —      | — <sup>*1</sup> | ms     | Figure 47.8     |  |
| LOCO clock oscillation frequency                                       | f <sub>LOCO</sub>      | 29.4912             | 32.768 | 36.0448         | kHz    | —               |  |
| LOCO clock oscillation stabilization wait time                         | t <sub>LOCOWT</sub>    | —                   | —      | 60.4            | μs     | Figure 47.9     |  |
| ILOCO clock oscillation frequency                                      | f <sub>ILOCO</sub>     | 13.5                | 15     | 16.5            | kHz    | —               |  |
| MOCO clock oscillation frequency                                       | F <sub>MOCO</sub>      | 6.8                 | 8      | 9.2             | MHz    | —               |  |
| MOCO clock oscillation stabilization wait time                         | t <sub>MOCOWT</sub>    | —                   | —      | 15.0            | μs     | —               |  |
| HOCO clock oscillator oscillation frequency                            | Without FLL            | f <sub>HOCO16</sub> | 15.78  | 16              | 16.22  | MHz             | -20 ≤ Ta ≤ 105°C   |
|  |                        | f <sub>HOCO18</sub> | 17.75  | 18              | 18.25  |                 |  |
|  |                        | f <sub>HOCO20</sub> | 19.72  | 20              | 20.28  |                 |  |
|  |                        | f <sub>HOCO16</sub> | 15.71  | 16              | 16.29  |                 | -40 ≤ Ta ≤ -20°C   |
|  |                        | f <sub>HOCO18</sub> | 17.68  | 18              | 18.32  |                 |  |
|  |                        | f <sub>HOCO20</sub> | 19.64  | 20              | 20.36  |                 |  |
|  | With FLL               | f <sub>HOCO16</sub> | 15.960 | 16              | 16.040 | MHz             | -40 ≤ Ta ≤ 105°C<br>Sub-clock frequency accuracy is ±50 ppm. |
|  |                        | f <sub>HOCO18</sub> | 17.955 | 18              | 18.045 |                 |  |
|  |                        | f <sub>HOCO20</sub> | 19.950 | 20              | 20.050 |                 |  |
| HOCO clock oscillation stabilization wait time <sup>*2</sup>           | t <sub>HOCOWT</sub>    | —                   | —      | 64.7            | μs     | —               |  |
| HOCO period jitter   | —                      | —                   | ±85    | —               | ps     | —               |  |
| FLL stabilization wait time  | t <sub>FLLWT</sub>     | —                   | —      | 1.8             | ms     | —               |  |
| PLL clock frequency  | f <sub>PLL</sub>       | 100                 | —      | 200             | MHz    | —               |  |

注3.使用ADC12时，PCLKC频率必须设置为至少1MHz。

Table 47.16 Subosc-speed模式下的运行频率值

| Parameter | Symbol              | Min  | Typ  | Max  | Unit |     |
|-----------|---------------------|------|------|------|------|-----|
| 运行频率      | 系统时钟(ICLK)*2        | f    | 29.4 | —    | 36.1 | kHz |
|           | 外围模块时钟(PCLKA)*2     | —    | —    | 36.1 |      |     |
|           | 外围模块时钟(PCLKB)*2     | —    | —    | 36.1 |      |     |
|           | 外围模块时钟(PCLKC)*2*3   | —    | —    | 36.1 |      |     |
|           | 外围模块时钟(PCLKD)*2     | —    | —    | 36.1 |      |     |
|           | Flash接口时钟(FCLK)*1*2 | 29.4 | —    | 36.1 |      |     |

注1.在Subosc速度模式下，编程或擦除闪存被禁用。  
 注2.有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD和FCLK频率之间的关系，请参见第8节，时钟生成电路。  
 注3.ADC12不能使用。

47.3.2 时钟时序

Table 47.17 除副时钟振荡器外的时钟时序 (2个中的1个)

| Parameter           | Symbol                 | Min                 | Typ    | Max             | Unit   | 测试条件        |                                     |
|---------------------|------------------------|---------------------|--------|-----------------|--------|-------------|-------------------------------------|
| EXTAL外部时钟输入周期时间     | t <sub>EXcyc</sub>     | 41.66               | —      | —               | ns     | Figure 47.7 |                                     |

Table 47.17 Clock timing except for sub-clock oscillator (2 of 2)

| Parameter  | Symbol                          | Min | Typ       | Max       | Unit    | Test conditions              |
|--|---------------------------------|-----|-----------|-----------|---------|------------------------------|
| PLL2 clock frequency                               | $f_{PLL2}$                      | 120 | —         | 240       | MHz     | —                            |
| PLL/PLL2 clock oscillation stabilization wait time | $t_{PLLWT}$                     | —   | —         | 174.9     | $\mu s$ | Figure 47.10                 |
| PLL/PLL2 period jitter                             | $f_{PLL}, f_{PLL2} \geq 120MHz$ | —   | —         | $\pm 100$ | ps      | —                            |
|  | $f_{PLL}, f_{PLL2} < 120MHz$    | —   | —         | $\pm 120$ | ps      | —                            |
| PLL/PLL2 long term jitter                          | —                               | —   | $\pm 300$ | —         | ps      | Term: 1 $\mu s$ , 10 $\mu s$ |

Note 1. When setting up the main clock oscillator, ask the oscillator manufacturer for an oscillation evaluation, and use the results as the recommended oscillation stabilization time. Set the MOSCWTCR register to a value equal to or greater than the recommended value. After changing the setting in the MOSCCR.MOSTP bit to start main clock operation, read the OSCSF.MOSCSF flag to confirm that it is 1, and then start using the main clock oscillator.

Note 2. This is the time from release from reset state until the HOCO oscillation frequency ( $f_{HOCO}$ ) reaches the range for guaranteed operation.

Table 47.18 Clock timing for the sub-clock oscillator

| Parameter                                     | Symbol         | Min | Typ    | Max | Unit | Test conditions |
|---|----------------|-----|--------|-----|------|-----------------|
| Sub-clock frequency                           | $f_{SUB}$      | —   | 32.768 | —   | kHz  | —               |
| Sub-clock oscillation stabilization wait time | $t_{SUBOSCWT}$ | —   | —      | —*1 | s    | Figure 47.11    |

Note 1. When setting up the sub-clock oscillator, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time. After changing the setting in the SOSCCR.SOSTP bit to start sub-clock operation, only start using the sub-clock oscillator after the sub-clock oscillation stabilization time elapses with an adequate margin. A value that is two times the value shown is recommended.

Table 47.17 除副时钟振荡器外的时钟时序 (2of2)

| Parameter         | Symbol                          | Min | Typ       | Max       | Unit    | 测试条件                         |
|-------------------|---------------------------------|-----|-----------|-----------|---------|------------------------------|
| PLL2时钟频率          | $f_{PLL2}$                      | 120 | —         | 240       | MHz     | —                            |
| PLLPLL2时钟振荡稳定等待时间 | $t_{PLLWT}$                     | —   | —         | 174.9     | $\mu s$ | Figure 47.10                 |
| PLLPLL2周期抖动       | $f_{PLL}, f_{PLL2} \geq 120MHz$ | —   | —         | $\pm 100$ | ps      | —                            |
|                   | $f_{PLL}, f_{PLL2} < 120MHz$    | —   | —         | $\pm 120$ | ps      | —                            |
| PLLPLL2长期抖动       | —                               | —   | $\pm 300$ | —         | ps      | Term: 1 $\mu s$ , 10 $\mu s$ |

注1.设置主时钟振荡器时，请咨询振荡器制造商索取振荡评估，并将结果作为推荐的振荡稳定时间。将MOSCWTCR寄存器设置为等于或大于推荐值的值。更改MOSCCR.MOSTP位的设置以启动主时钟操作后，读取OSCSF.MOSCSF标志以确认其为1，然后开始使用主时钟振荡器。

注2.这是从复位状态释放到HOCO振荡频率( $f_{HOCO}$ )达到保证工作范围的时间。

Table 47.18 副时钟振荡器的时钟时序

| Parameter           | Symbol         | Min | Typ    | Max | Unit | 测试条件         |
|---------------------|----------------|-----|--------|-----|------|--------------|
| Sub-clock frequency | $f_{SUB}$      | —   | 32.768 | —   | kHz  | —            |
| 副时钟振荡稳定等待时间         | $t_{SUBOSCWT}$ | —   | —      | —*1 | s    | Figure 47.11 |

注1.设置副时钟振荡器时，请咨询振荡器制造商进行振荡评估，并将结果作为推荐的振荡稳定时间。更改SOSCCR.SOSTP位的设置以启动副时钟操作后，只有在副时钟振荡稳定时间过去并留有足够余量后才开始使用副时钟振荡器。建议使用两倍于显示值的值。

Table 47.20 Timing of recovery from low power modes (2 of 2)

| Parameter  | Symbol  | Min               | Typ | Max               | Unit              | Test conditions |              |
|--|---|-------------------|-----|-------------------|-------------------|-----------------|--------------|
| Recovery time from Deep Software Standby mode              | DPSBYCR.DEEPCUT[1] = 0 and DPSWCR.WTSTS[5:0] = 0x0E       | t <sub>DSBY</sub> | —   | 0.38              | 0.54              | ms              | Figure 47.15 |
|  | DPSBYCR.DEEPCUT[1] = 1 and DPSWCR.WTSTS[5:0] = 0x19       | t <sub>DSBY</sub> | —   | 0.55              | 0.73              | ms              |              |
| Wait time after cancellation of Deep Software Standby mode | t <sub>DSBYWT</sub>                                       | 56                | —   | 57                | t <sub>cyc</sub>  |                 |              |
| Recovery time from Software Standby mode to Snooze mode    | High-speed mode when system clock source is HOCO (20 MHz) | t <sub>SNZ</sub>  | —   | 35 <sup>*12</sup> | 70 <sup>*12</sup> | μs              | Figure 47.16 |
|  | High-speed mode when system clock source is MOCO (8 MHz)  | t <sub>SNZ</sub>  | —   | 11 <sup>*12</sup> | 14 <sup>*12</sup> | μs              |              |

- Note 1. The recovery time is determined by the system clock source. When multiple oscillators are active, the recovery time can be determined with the following equation:  
Total recovery time = recovery time for an oscillator as the system clock source + the longest t<sub>SBYOSCWT</sub> in the active oscillators - t<sub>SBYOSCWT</sub> for the system clock + 2 LOCO cycles (when LOCO is operating) + Subosc is oscillating and MSTPC0 = 0 (CAC module stop)
- Note 2. When the frequency of the crystal is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x05) and the greatest value of the internal clock division setting is 1.
- Note 3. When the frequency of PLL is 200 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x05) and the greatest value of the internal clock division setting is 4.
- Note 4. When the frequency of the external clock is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x00) and the greatest value of the internal clock division setting is 1.
- Note 5. When the frequency of PLL is 200 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x00) and the greatest value of the internal clock division setting is 4.
- Note 6. The Sub-clock oscillator frequency is 32.768 KHz and the greatest value of the internal clock division setting is 1.
- Note 7. The LOCO frequency is 32.768 KHz and the greatest value of the internal clock division setting is 1.
- Note 8. The HOCO frequency is 20 MHz and the greatest value of the internal clock division setting is 1.
- Note 9. The PLL frequency is 200 MHz and the greatest value of the internal clock division setting is 4.
- Note 10. The MOCO frequency is 8 MHz and the greatest value of the internal clock division setting is 1.
- Note 11. In Subosc-speed mode, the sub-clock oscillator or LOCO continues oscillating in Software Standby mode.
- Note 12. When the SNZCR.RXDREQEN bit is set to 0, the following time is added as the power supply recovery time: 16 μs (typical), 48 μs (maximum).
- Note 13. The recovery time can be calculated with the equation of t<sub>SBYOSCWT</sub> + t<sub>SBYSEQ</sub>. And they can be determined with the following value and equation. For n, the greatest value is selected from among the internal clock division settings.

| Wakeup time        | TYP                         |   | MAX                         |   | Unit |
|--------------------|-----------------------------|---|-----------------------------|---|------|
|                    | t <sub>SBYOSCWT</sub>       | t <sub>SBYSEQ</sub>                                   | t <sub>SBYOSCWT</sub>       | t <sub>SBYSEQ</sub>                                   |      |
| t <sub>SBYMC</sub> | (MSTS[7:0]*32 + 3) / 0.262  | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>MAIN</sub>   | (MSTS[7:0]*32 + 14) / 0.236 | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>MAIN</sub>   | μs   |
| t <sub>SBYPC</sub> | (MSTS[7:0]*32 + 34) / 0.262 | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>PLL</sub>    | (MSTS[7:0]*32 + 45) / 0.236 | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>PLL</sub>    | μs   |
| t <sub>SBYEX</sub> | 10                          | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>EXMAIN</sub> | 62                          | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>EXMAIN</sub> | μs   |
| t <sub>SBYPE</sub> | 135                         | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>PLL</sub>    | 192                         | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>PLL</sub>    | μs   |
| t <sub>SBYSC</sub> | 0                           | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>SUB</sub>    | 0                           | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>SUB</sub>    | μs   |
| t <sub>SBYLO</sub> | 0                           | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>LOCO</sub>   | 0                           | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>LOCO</sub>   | μs   |
| t <sub>SBYHO</sub> | 20                          | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>HOCO</sub>   | 67                          | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>HOCO</sub>   | μs   |
| t <sub>SBYPH</sub> | 140                         | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>PLL</sub>    | 202                         | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>PLL</sub>    | μs   |
| t <sub>SBYMO</sub> | 0                           | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>MOCO</sub>   | 0                           | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>MOCO</sub>   | μs   |

Table 47.20 从低功耗模式恢复的时间 (2个中的2个)

| Parameter        | Symbol  | Min               | Typ | Max               | 单元测试条件            |    |              |
|------------------|---|-------------------|-----|-------------------|-------------------|----|--------------|
| 恢复时间从深度软件待机模式    | DPSBYCR.DEEPCUT[1] = 0 and DPSWCR.WTSTS[5:0] = 0x0E | t <sub>DSBY</sub> | —   | 0.38              | 0.54              | ms | Figure 47.15 |
|                  | DPSBYCR.DEEPCUT[1] = 1 and DPSWCR.WTSTS[5:0] = 0x19 | t <sub>DSBY</sub> | —   | 0.55              | 0.73              | ms |              |
| 取消深度软件待机模式后的等待时间 | t <sub>DSBYWT</sub>                                 | 56                | —   | 57                | t <sub>cyc</sub>  |    |              |
| 恢复时间从软件待机模式到贪睡模式 | 系统时钟源为高速模式 HOCO (20 MHz)                            | t <sub>SNZ</sub>  | —   | 35 <sup>*12</sup> | 70 <sup>*12</sup> | μs | Figure 47.16 |
|                  | 系统时钟源为高速模式 MOCO (8 MHz)                             | t <sub>SNZ</sub>  | —   | 11 <sup>*12</sup> | 14 <sup>*12</sup> | μs |              |

- 注1.恢复时间由系统时钟源决定。当多个振荡器处于活动状态时，恢复时间可以通过以下公式确定：总恢复时间=一个振荡器作为系统时钟源的恢复时间+系统时钟有效振荡器中的最长t<sub>SBYOSCWT</sub>t<sub>SBYOSCWT</sub>+2个LOCO周期（当LOCO正在运行）+Subosc正在振荡且MSTPC0=0（CAC模块停止）
- 注2.当晶振频率为24MHz（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为0x05）且内部时钟分频设置的最大值为1时。
- 注3.当PLL的频率为200MHz（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为0x05）且内部时钟分频设置的最大值为4时。
- 注4.当外部时钟频率为24MHz（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为0x00）且内部时钟分频设置的最大值为1时。
- 注5.当PLL的频率为200MHz（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为0x00）且内部时钟分频设置的最大值为4时。
- 注6.副时钟振荡器频率为32.768KHz，内部时钟分频设置的最大值为1。
- 注7.LOCO频率为32.768KHz，内部时钟分频设置的最大值为1。
- 注8.HOCO频率为20MHz，内部时钟分频设置最大值为1。注9.PLL频率为200MHz，内部时钟分频设置最大值为4。注10.MOCO频率为8MHz，内部时钟分频设置的最大值为1。
- 注11.在Subosc速度模式下，副时钟振荡器或LOCO在软件待机模式下继续振荡。
- 注12.当SNZCR.RXDREQEN位设置为0时，添加以下时间作为电源恢复时间：16μs（典型值）、48μs（最大值）。
- 注13.恢复时间可以用t<sub>SBYOSCWT</sub>+t<sub>SBYSEQ</sub>等式计算。它们可以用下面的值和方程来确定。对于n，从内部时钟分频设置中选择最大值。

| 唤醒时间典型值            | TYP                         |   | MAX                         |   | Unit |
|--------------------|-----------------------------|---|-----------------------------|---|------|
|                    | t <sub>SBYOSCWT</sub>       | t <sub>SBYSEQ</sub>                                   | t <sub>SBYOSCWT</sub>       | t <sub>SBYSEQ</sub>                                   |      |
| t <sub>SBYMC</sub> | (MSTS[7:0]*32 + 3) / 0.262  | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>MAIN</sub>   | (MSTS[7:0]*32 + 14) / 0.236 | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>MAIN</sub>   | μs   |
| t <sub>SBYPC</sub> | (MSTS[7:0]*32 + 34) / 0.262 | 35 + 18 / f <sub>CLK</sub> + 4n / f <sub>PLL</sub>    | (MSTS[7:0]*32 + 45) / 0.236 | 62 + 18 / f <sub>CLK</sub> + 4n / f <sub>PLL</sub>    | μs   |

|  |  | High drive buffer      | —    | 4    |                          |              |
|  | GTIOCxY output skew (x = 4 to 7, Y = A or B) | Middle drive buffer    | —    | 4    |                          |              |
|  |  | High drive buffer      | —    | 4    |                          |              |
| GTIOCxY output skew (x = 0 to 7, Y = A or B)                         | Middle drive buffer                          | —                      | 6    |      |                          |              |
|  | High drive buffer                            | —                      | 6    |      |                          |              |
| OPS output skew<br>GTOUUP, GTOULO, GTOVUP,<br>GTOVLO, GTOWUP, GTOWLO | $t_{GTOSK}$                                  | —                      | 5    | ns   | Figure 47.23             |              |
| AGT  | AGTIO, AGTEE input cycle                     | $t_{ACYC}^{*2}$        | 100  | —    | ns                       | Figure 47.24 |
|  | AGTIO, AGTEE input high width, low width     | $t_{ACKWH}, t_{ACKWL}$ | 40   | —    |                          |              |
|  | AGTIO, AGTO, AGTOA, AGTOB output cycle       | $t_{ACYC2}$            | 62.5 | —    |                          |              |
| ADC12  | ADC12 trigger input pulse width              | $t_{TRGW}$             | 1.5  | —    | $t_{Pcyc}$ Figure 47.25  |              |

Note:  $t_{Pcyc}$ : PCLKB cycle,  $t_{PDcyc}$ : PCLKD cycle.  
 Note 1. This skew applies when the same driver I/O is used. If the I/O of the middle and high drivers is mixed, operation is not guaranteed.  
 Note 2. Constraints on input cycle:

Note: 软件待机模式下最少200ns。  
 Note: 如果时钟源切换, 则增加切换源的4个时钟周期。  
 注1.  $t_{Pcyc}$ 表示PCLKB周期。  
 注2.  $t_{NMICK}$ 表示NMI数字滤波器采样时钟的周期。注3.  $t_{IRQCK}$ 表示IRQi数字滤波器采样时钟的周期。

|  | AGTIO、AGTO、AGTOA、AGTOB输出周期 | $t_{ACYC2}$            | 62.5 | —    |                          |              |
| ADC12  | ADC12触发输入脉冲宽度              | $t_{TRGW}$             | 1.5  | —    | $t_{Pcyc}$ Figure 47.25  |              |

Note:  $t_{Pcyc}$ : PCLKB cycle,  $t_{PDcyc}$ : PCLKD cycle.  
 注1. 当使用相同的驱动器IO时, 此偏差适用。如果中高驱动器的IO混合使用, 则无法保证运行。  
 注2. 输入周期的限制:

When not switching the source clock:  $t_{Pcyc} \times 2 < t_{ACYC}$  should be satisfied.  
 When switching the source clock:  $t_{Pcyc} \times 6 < t_{ACYC}$  should be satisfied.

Figure 47.19 I/O ports input timing

Figure 47.20 POEG input trigger timing

Figure 47.21 GPT input capture timing

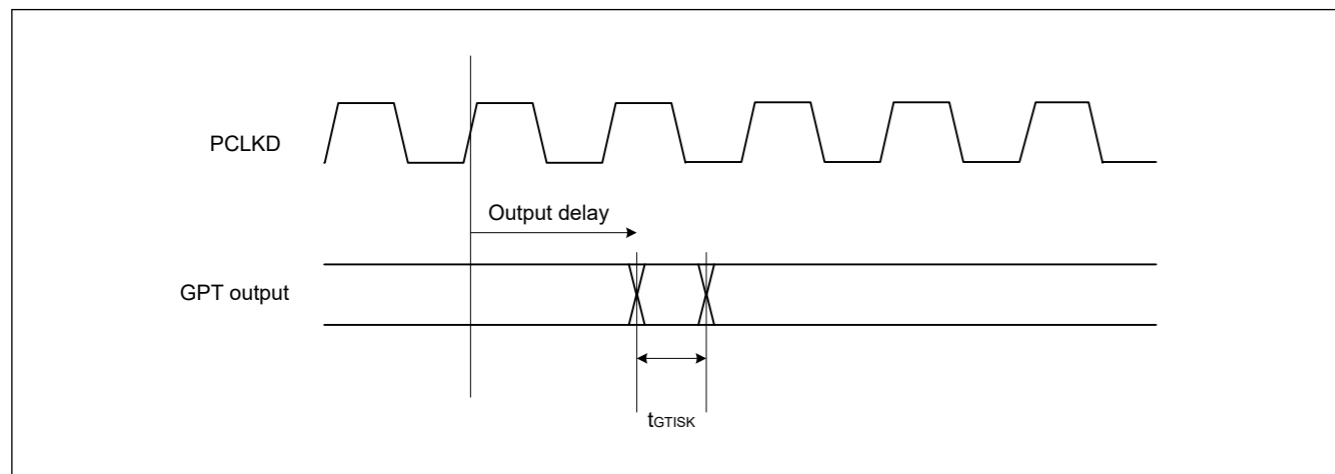

Figure 47.22 GPT output delay skew

不切换源时钟时:  $t_{Pcyc} \times 2 < t_{ACYC}$  应满足。  
 切换源时钟时:  $t_{Pcyc} \times 6 < t_{ACYC}$  应满足。

Note:  $t_{Pcyc}$ : PCLKA cycle.

Note: Must use pins that have a letter appended to their name, for instance “\_A”, “\_B”, to indicate group membership. For the SPI interface, the AC portion of the electrical characteristics is measured for each group.

Note 1. N is set to an integer from 1 to 8 by the SPCKD register.

Note 2. N is set to an integer from 1 to 8 by the SSLND register.

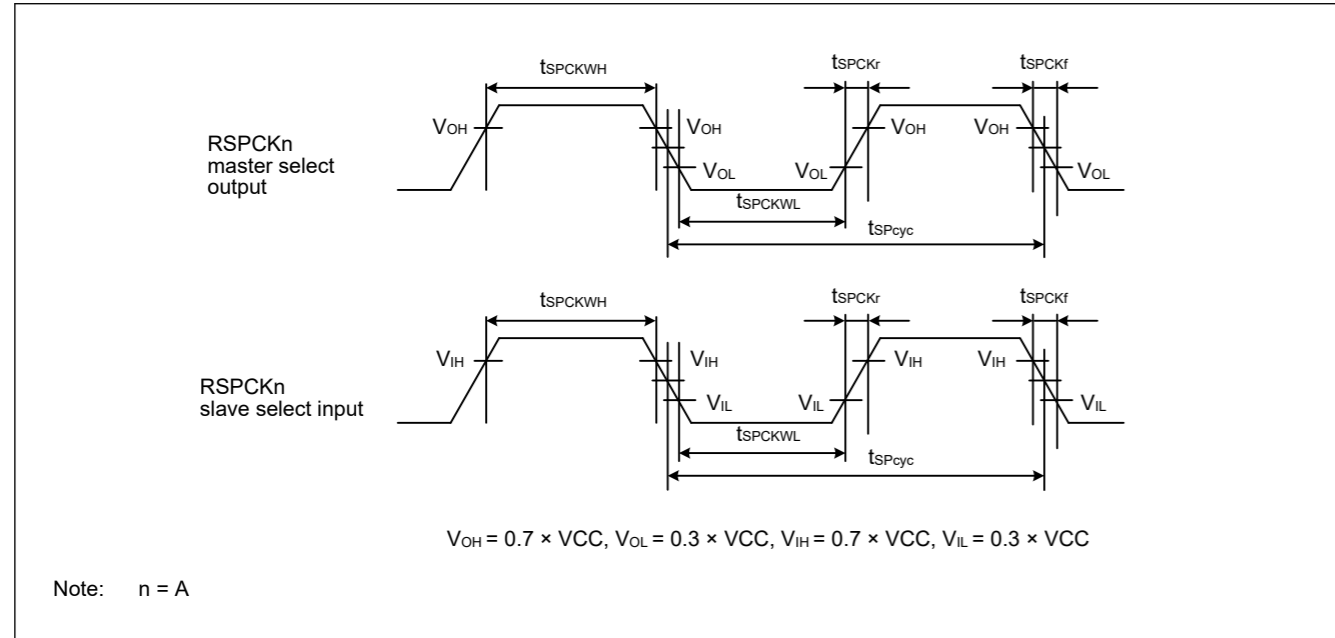

Figure 47.34 SPI clock timing

Note:  $t_{Pcyc}$ : PCLKA cycle.

Note: 必须使用名称后附有字母的引脚，例如“\_A”、“\_B”，以表示组成员身份。对于SPI接口，测量每组的电气特性的交流部分。

注1.N由SPCKD寄存器设置为1到8的整数。注2.N由SSLND寄存器

设置为1到8的整数。

## 47.3.11 IIC Timing

Table 47.29 IIC timing (1) (1 of 2)

(1) Conditions: Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register for the following pins: SDA0\_B, SCL0\_B, SDA1\_B, SCL1\_B.

(2) The following pins do not require setting: SCL0\_A, SDA0\_A, SCL1\_A, SDA1\_A.

(3) Use pins that have a letter appended to their names, for instance "\_A" or "\_B", to indicate group membership. For the IIC interface, the AC portion of the electrical characteristics is measured for each group.

| Parameter  | Symbol   | Min        | Max   | Unit                      | Test conditions |              |
|--|--|------------|---|---------------------------|-----------------|--------------|
| IIC<br>(Standard mode,<br>SMBus)<br>ICFER.FMPE = 0 | SCL input cycle time   | $t_{SCL}$  | $6 (12) \times t_{IICcyc} + 1300$                   | —                         | ns              | Figure 47.43 |

|                          | Data input setup time  | $t_{SDAS}$ | $t_{IICcyc} + 50$                                       | —                         | ns              |              |
|                          | Data input hold time   | $t_{SDAH}$ | 0   | —                         | ns              |              |
| SCL, SDA capacitive load | $C_b$  | —          | 400   | pF                        |                 |              |

Note:  $t_{IICcyc}$ : IIC internal reference clock (IIC $\phi$ ) cycle,  $t_{Pcyc}$ : PCLKB cycle.

Note: Values in parentheses apply when ICMR3.NF[1:0] is set to 11b while the digital filter is enabled with ICFER.NFE set to 1.

Note: Must use pins that have a letter appended to their name, for instance "\_A", "\_B", to indicate group membership. For the IIC interface, the AC portion of the electrical characteristics is measured for each group.

Note 1. Only supported for SCL0\_A, SDA0\_A, SCL1\_A, and SDA1\_A.

**Table 47.29 IIC时序(1)(2of2)**

(1)条件: 在PmnPFS寄存器的端口驱动能力位中为以下引脚选择中间驱动输出: SDA0\_B、SCL0\_B、SDA1\_B、SCL1\_B。(2)以下引脚不需要设置: SCL0\_A、SDA0\_A、SCL1\_A、SDA1\_A。(3)使用名称后附有字母的图钉, 例如"\_A"或"\_B", 表示组成员身份。对于IIC接口, 测量每组的电气特性的交流部分。

Note 1. For slave-mode transmission, SSIE has a path, through which the signal input from the SSILRCK0/SSIFS0 pin is used to generate transmit data, and the transmit data is logically output to the SSITXD0 or SSIDATA0 pin.

Figure 47.44 SSIE clock input/output timing

Figure 47.45 Clock input timing

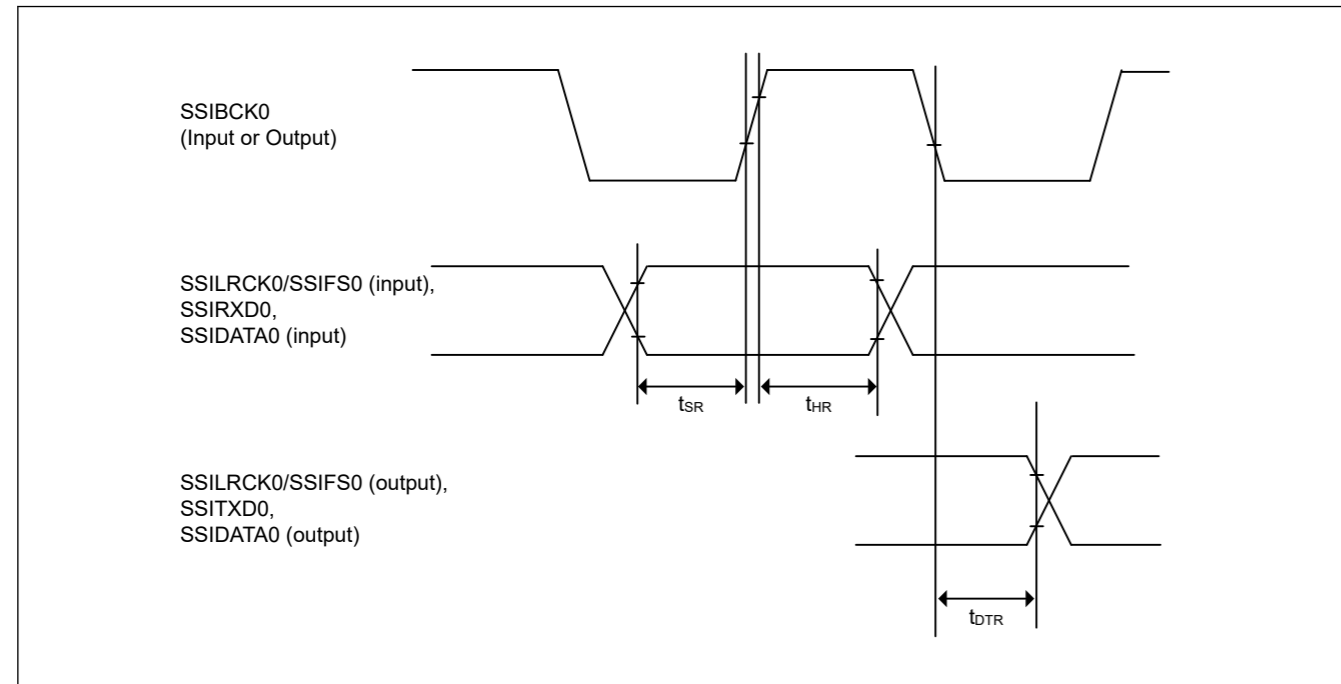

Figure 47.46 SSIE data transmit and receive timing when SSICR.BCKP = 0

注1.对于从模式传输, SSIE有一个路径, 通过该路径, 从SSILRCK0/SSIFS0引脚输入的信号用于生成发送数据, 发送数据逻辑输出到SSITXD0或SSIDATA0引脚。

**Table 47.36 A/D conversion characteristics for unit 0 (2 of 2)**

Conditions: PCLKC = 1 to 50 MHz

| Parameter   | Min                       | Typ  | Max  | Unit | Test conditions                                 |
|---|---------------------------|------|------|------|---|
| High-precision normal-speed channels (AN006 to AN009, AN012, AN013) | 0.92 (0.66) <sup>*2</sup> | —    | —    | μs   | Sampling in 33 states                           |
| Conversion time <sup>*1</sup> (Operation at PCLKC = 50 MHz)         |                           |      |      |      | Permissible signal source impedance Max. = 1 kΩ |
| Offset error  | —                         | ±1.0 | ±2.5 | LSB  | —   |
| Full-scale error  | —                         | ±1.0 | ±2.5 | LSB  | —   |
| Absolute accuracy   | —                         | ±2.0 | ±4.5 | LSB  | —   |
| DNL differential nonlinearity error                                 | —                         | ±0.5 | ±1.5 | LSB  | —   |
| INL integral nonlinearity error                                     | —                         | ±1.0 | ±2.5 | LSB  | —   |

Note: These specification values apply when there is no access to the external memory during A/D conversion. If access occurs during A/D conversion, values might not fall within the indicated ranges.  
The use of PORT0 as digital outputs is not allowed when the 12-Bit A/D converter is used.  
The characteristics apply when AVCC0, AVSS0, VREFH0/VREFH, VREFL0, VREFL, and 12-bit A/D converter input voltage are stable.

Note: When both unit0 and unit1 are used, do not select the following analog input combinations at the same time except the interleave function. If selected, values might not fall within the indicated ranges.

- AN100 and AN000 or AN001 or AN002
- AN101 and AN000 or AN001 or AN002 or AN003
- AN102 and AN000 or AN001 or AN002 or AN003 or AN004

Note 1. The conversion time includes the sampling and comparison times. The number of sampling states is indicated for the test conditions.

Note 2. Values in parentheses indicate the sampling time.

**Table 47.37 A/D conversion characteristics for unit 1**

Conditions: PCLKC = 1 to 50 MHz

| Parameter   | Min   | Typ   | Max                       | Unit | Test conditions |     |   |

| 高精度常速通道 (AN006至AN009、AN012、AN013)    | 0.92 (0.66) <sup>*2</sup> | —    | —    | μs 在33个州进行抽样       |
| 转换时间*1 (Operation at PCLKC = 50 MHz) |                           |      |      | 允许的的信号源阻抗 Max.=1kΩ |
| 偏移误差                                 | —                         | ±1.0 | ±2.5 | LSB                |
| Full-scale error                     | —                         | ±1.0 | ±2.5 | LSB                |
| 绝对精度                                 | —                         | ±2.0 | ±4.5 | LSB                |
| DNL微分非线性误差                           | —                         | ±0.5 | ±1.5 | LSB                |
| INL积分非线性误差                           | —                         | ±1.0 | ±2.5 | LSB                |

Note: 这些规格值适用于在AD转换期间无法访问外部存储器的情况。如果访问发生在D转换, 值可能不在指定范围内。  
使用12位AD转换器时, 不允许将PORT0用作数字输出。  
这些特性适用于AVCC0、AVSS0、VREFH0、VREFH、VREFL0、VREFL和12位AD转换器输入电压稳定时。

Note: 当同时使用unit0和unit1时, 除了交错功能外, 不要同时选择以下模拟输入组合。如果选中, 值可能不在指定范围内。●

- AN100和AN000或AN001或AN002
- AN101和AN000或AN001或AN002或AN003
- AN102和AN000或AN001或AN002或AN003或AN004

注1. 转换时间包括采样时间和比较时间。针对测试条件指示采样状态的数量。

注2: 括号内的数值表示采样时间。

| Parameter                      | Min  | Typ  | Max  | Unit | Test conditions |
|--------------------------------|------|------|------|------|-----------------|
| A/D internal reference voltage | 1.13 | 1.18 | 1.23 | V    | —               |
| Sampling time                  | 4.15 | —    | —    | µs   | —               |

Note: 这些规格值适用于在AD转换期间无法访问外部存储器的情况。如果访问发生在D转换，值可能不在指定范围内。  
使用12位AD转换器时，不允许将PORT0用作数字输出。  
这些特性适用于AVCC0、AVSS0、VREFH0、VREFH、VREFL0、VREFL和12位AD转换器输入电压稳定时。

Note: 当同时使用unit0和unit1时，除了交错功能外，不要同时选择以下模拟输入组合。如果选中，值可能不在指定范围内。●

- AN100和AN000或AN001或AN002
- AN101和AN000或AN001或AN002或AN003
- AN102和AN000或AN001或AN002或AN003或AN004

注1. 转换时间包括采样时间和比较时间。针对测试条件指示采样状态的数量。

注2: 括号内的数值表示采样时间。

| 采样时间      | 4.15 | —    | —    | µs   | —    |

Figure 47.54 Illustration of ADC12 characteristic terms

#### Absolute accuracy

Absolute accuracy is the difference between output code based on the theoretical A/D conversion characteristics, and the actual A/D conversion result. When measuring absolute accuracy, the voltage at the midpoint of the width of the analog input voltage (1-LSB width), which can meet the expectation of outputting an equal code based on the theoretical A/D conversion characteristics, is used as an analog input voltage. For example, if 12-bit resolution is used and the reference voltage  $V_{REFH0} = 3.072\text{ V}$ , then the 1-LSB width becomes  $0.75\text{ mV}$ , and  $0\text{ mV}$ ,  $0.75\text{ mV}$ , and  $1.5\text{ mV}$  are used as the analog input voltages. If the analog input voltage is  $6\text{ mV}$ , an absolute accuracy of  $\pm 5\text{ LSB}$  means that the actual A/D conversion result is in the range of  $0x003$  to  $0x00D$ , though an output code of  $0x008$  can be expected from the theoretical A/D conversion characteristics.

#### Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal line when the measured offset and full-scale errors are zeroed, and the actual output code.

#### Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between the 1-LSB width based on the ideal A/D conversion characteristics and the width of the actual output code.

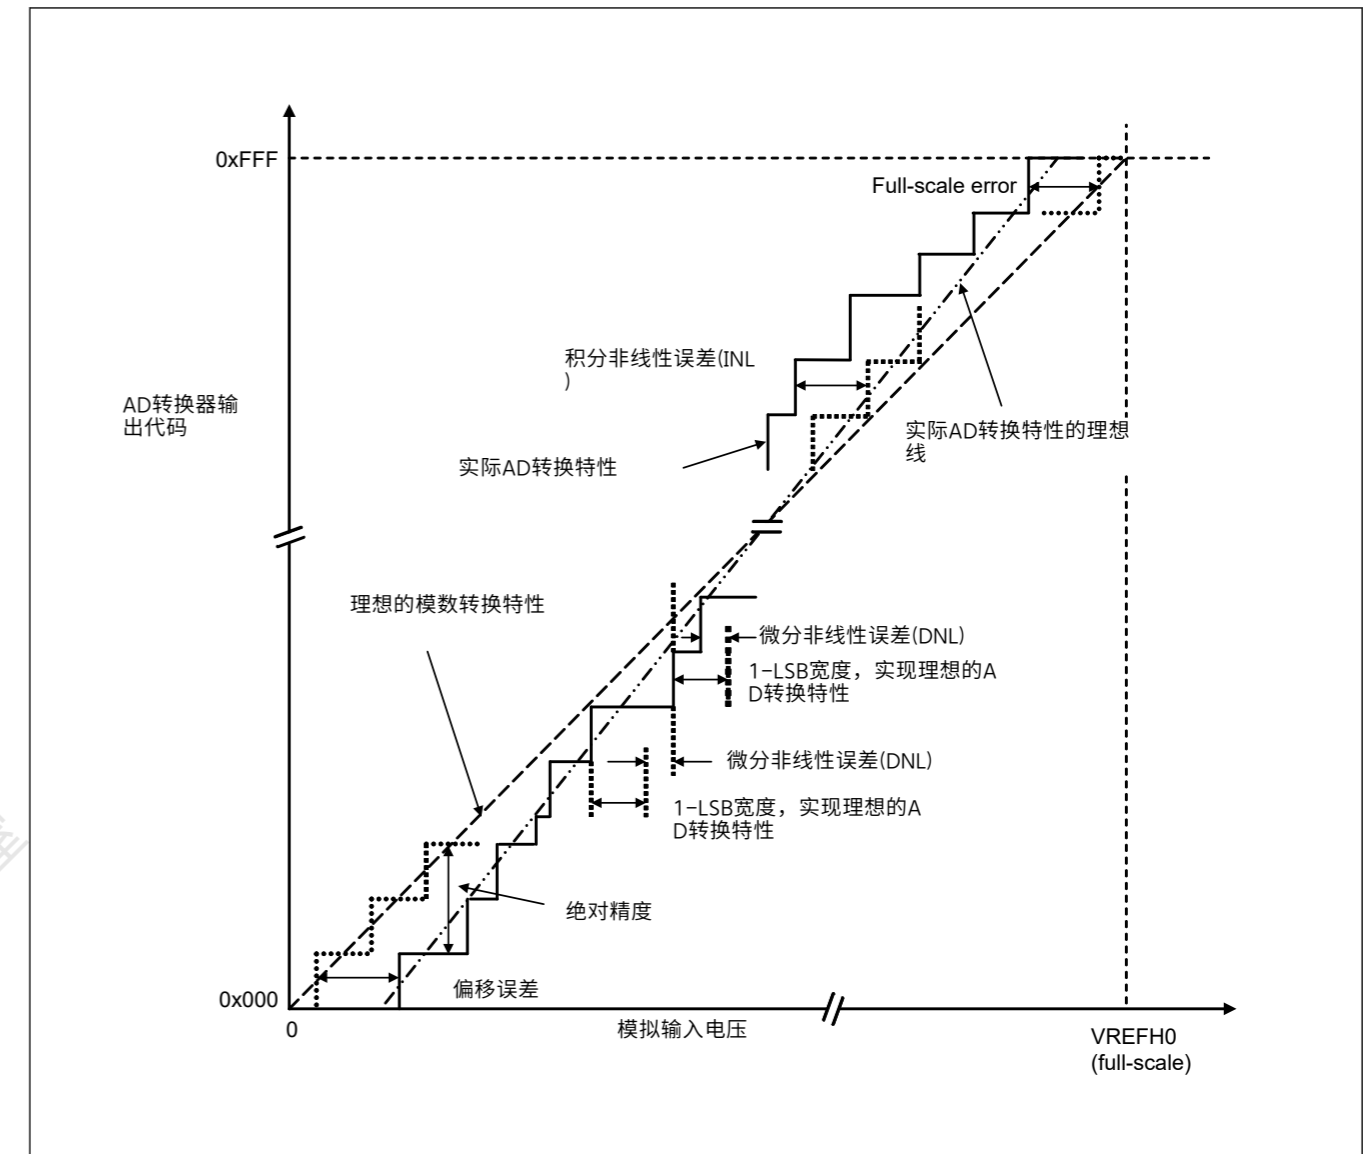

Figure 47.54 ADC12特征项说明

#### 绝对精度

绝对精度是基于理论AD转换特性的输出代码与实际AD转换结果之间的差异。测量绝对精度时，将模拟输入电压宽度（1-LSB宽度）的中点电压作为模拟输入电压，该电压可以满足基于理论模数转换特性输出等码的预期。例如，如果使用12位分辨率且参考电压 $V_{REFH0}=3.072\text{V}$ ，则1-LSB宽度变为 $0.75\text{mV}$ ，并且使用 $0\text{mV}$ 、 $0.75\text{mV}$ 和 $1.5\text{mV}$ 作为模拟输入电压。如果模拟输入电压为 $6\text{mV}$ ， $\pm 5\text{LSB}$ 的绝对精度意味着实际的AD转换结果在 $0x003$ 到 $0x00D$ 的范围内，尽管从理论上的AD转换特性可以预期输出代码为 $0x008$ 。

#### 积分非线性误差(INL)

积分非线性误差是测量的偏移和满量程误差为零时的理想线与实际输出代码之间的最大偏差。

#### 微分非线性误差(DNL)

微分非线性误差是基于理想AD转换特性的1-LSB宽度与实际输出码的宽度之差。

**Offset error**

Offset error is the difference between the transition point of the ideal first output code and the actual first output code.

**Full-scale error**

Full-scale error is the difference between the transition point of the ideal last output code and the actual last output code.

Note 1. This is the minimum number of times to guarantee all the characteristics after reprogramming. The guaranteed range is from 1 to the minimum value.

Note 2. This indicates the minimum value of the characteristic when reprogramming is performed within the specified range.

Note 3. This result is obtained from reliability testing.

Note 4. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 10,000), erasing can be performed n times for each block. For example, when 128-byte programming is performed 64 times for different addresses in 8-KB blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address several times as one erasure is not enabled. Overwriting is prohibited.

Note 5. Time for resumption includes time for reapplying the erasing pulse (up to one full pulse) that was cut off at the time of suspension.

Note 6. The reference value at VCC = 3.3V and room temperature.

注1.这是重新编程后保证所有特性的最少次数。保证范围是从1到最小值。

注2.这表示在指定范围内执行重新编程时特性的最小值。

注3: 此结果来自可靠性测试。

注4.重新编程擦除周期是每个块的擦除次数。当重新编程擦除周期为n次 (n=10 000) 时, 可以对每个块执行n次擦除。例如, 当对8KB块中的不同地址执行64次128字节编程, 然后擦除整个块时, 重新编程擦除周期计为1。但是, 不能将同一地址多次编程为一次擦除。禁止覆盖。

注5.恢复时间包括重新应用暂停时切断的擦除脉冲 (最多1个完整脉冲) 的时间。

注6.VCC=3.3V和室温下的参考值。

| First erasing resume time during erasure in suspend priority mode*5 | t <sub>DREST1</sub> | —                   | —     | 300 | —                      | —     | 300 | μs   |                 |
| Second erasing resume time during erasure in suspend priority mode  | t <sub>DREST2</sub> | —                   | —     | 126 | —                      | —     | 70  | μs   |                 |
| Erasing resume time during erasure in erasure priority mode         | t <sub>DREET</sub>  | —                   | —     | 126 | —                      | —     | 70  | μs   |                 |
| Forced stop command   | t <sub>FD</sub>     | —                   | —     | 32  | —                      | —     | 20  | μs   |                 |
| Data hold time*3  | t <sub>DRP</sub>    | 10*3*4              | —     | —   | 10*3*4                 | —     | —   | Year |                 |

Note 1. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 125,000), erasing can be performed n times for each block. For example, when 4-byte programming is performed 16 times for different addresses in 64-byte blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address several times as one erasure is not enabled. Overwriting is prohibited.

Note 2. This is the minimum number of times to guarantee all the characteristics after reprogramming. The guaranteed range is from 1 to the minimum value.

Note 3. This indicates the minimum value of the characteristic when reprogramming is performed within the specified range.

Note 4. This result is obtained from reliability testing.

Note 5. Time for resumption includes time for reapplying the erasing pulse (up to one full pulse) that was cut off at the time of suspension.

Note 6. The reference value at VCC = 3.3 V and room temperature.

### 47.12.3 Option Setting Memory Characteristics

**Table 47.48 Option setting memory characteristics**

Conditions: Program: FCLK = 4 to 50 MHz  
Read: FCLK ≤ 50 MHz

| Parameter  | Symbol           | FCLK = 4 MHz |       |     | 20 MHz ≤ FCLK ≤ 50 MHz |       |     | Unit  | Test conditions |
|--|------------------|--------------|-------|-----|------------------------|-------|-----|-------|-----------------|

| 在擦除优先模式下擦除期间暂停延迟       | 64-byte             | t <sub>DSEED</sub>  | —          | —   | 300                    | —     | —   | 300  | μs   |
|                        | 128-byte            |                     | —          | —   | 390                    | —     | —   | 390  |      |
|                        | 256-byte            |                     | —          | —   | 570                    | —     | —   | 570  |      |
| 挂起优先模式擦除期间的第一次擦除恢复时间*5 | t <sub>DREST1</sub> | —                   | —          | 300 | —                      | —     | 300 | μs   |      |
| 挂起优先模式下擦除期间的第二次擦除恢复时间  | t <sub>DREST2</sub> | —                   | —          | 126 | —                      | —     | 70  | μs   |      |
| 在擦除优先模式下擦除期间擦除恢复时间     | t <sub>DREET</sub>  | —                   | —          | 126 | —                      | —     | 70  | μs   |      |
| 强制停止命令                 | t <sub>FD</sub>     | —                   | —          | 32  | —                      | —     | 20  | μs   |      |
| 数据保持时间*3               | t <sub>DRP</sub>    | 10*3*4              | —          | —   | 10*3*4                 | —     | —   | Year |      |

注1.重新编程擦除周期是每个块的擦除次数。当重新编程擦除周期为n次 (n=125 000) 时, 可以对每个块执行n次擦除。例如, 当对64字节块中的不同地址执行16次4字节编程, 然后擦除整个块时, 重新编程擦除周期计为1。但是, 不能将同一地址多次编程为一次擦除。禁止覆盖。

注2.这是重新编程后保证所有特性的最少次数。保证范围是从1到最小值。

注3.这表示在指定范围内执行重新编程时特性的最小值。

注4: 此结果来自可靠性测试。

注5.恢复时间包括重新应用暂停时切断的擦除脉冲 (最多1个完整脉冲) 的时间。

注6.VCC=3.3V和室温下的参考值。

### 47.12.3 选项设置内存特性

| CLKOUT   | CLKOUT                      | Hi-Z    | [CLKOUT selected] CLKOUT output | Keep              | Hi-Z                 | Keep                    |
| DAC      | DAn                         | Hi-Z    | [DAn输出(DAOE=1)]DA输出保留           | Keep              | Hi-Z                 | Keep                    |
| Others   | —                           | Hi-Z    | Keep-O                          | Keep              | Hi-Z                 | Keep                    |

Note: H: High-level  
L: Low-level  
Hi-Z: High-impedance  
Keep-O: 输出引脚保留其先前的值。输入引脚变为高阻抗。  
保持: 在软件待机模式期间保持引脚状态。

注1. 保持IO端口状态直到DPSBYCR.IOKEEP位被清除为0。

注2. 如果引脚被指定为软件待机取消源, 同时它被用作外部中断引脚, 则输入被启用。

注3. 如果引脚被指定为深度软件待机取消源, 则启用输入。

注4. 当引脚用作输入引脚时, 输入被启用。

### Appendix 2. Package Dimensions

Information on the latest version of the package dimensions or mountings is displayed in "Packages" on the Renesas Electronics Corporation website.

Figure 2.1 LQFP 144-pin

### Appendix 2. 包装尺寸

最新版本的封装尺寸或安装信息显示在瑞萨电子的“封装”中电子公司网站。

Figure 2.1 LQFP 144-pin

## Appendix 3. I/O Registers

This appendix describes I/O register address and access cycles by function.

### 3.1 Peripheral Base Addresses

This section provides the base addresses for peripherals described in this manual. Table 3.1 shows the name, description, and the base address of each peripheral.

**Table 3.1 Peripheral base address (1 of 3)**

| Name   | Description                                  | Base address |
|--------|--|--------------|
| RMPU   | Renesas Memory Protection Unit               | 0x4000_0000  |
| TZF    | TrustZone Filter                             | 0x4000_0E00  |
| SRAM   | SRAM Control                                 | 0x4000_2000  |
| BUS    | BUS Control                                  | 0x4000_3000  |
| DMAC0  | Direct memory access controller 0            | 0x4000_5000  |
| DMAC1  | Direct memory access controller 1            | 0x4000_5040  |
| DMAC2  | Direct memory access controller 2            | 0x4000_5080  |
| DMAC3  | Direct memory access controller 3            | 0x4000_50C0  |
| DMAC4  | Direct memory access controller 4            | 0x4000_5100  |
| DMAC5  | Direct memory access controller 5            | 0x4000_5140  |
| DMAC6  | Direct memory access controller 6            | 0x4000_5180  |
| DMAC7  | Direct memory access controller 7            | 0x4000_51C0  |
| DMA    | DMAC Module Activation                       | 0x4000_5200  |
| DTC    | Data Transfer Controller                     | 0x4000_5400  |
| ICU    | Interrupt Controller                         | 0x4000_6000  |
| CACHE  | CACHE  | 0x4000_7000  |
| CPSCU  | CPU System Security Control Unit             | 0x4000_8000  |
| DBG    | Debug Function                               | 0x400_1B000  |
| FCACHE | Flash Cache                                  | 0x400_1C100  |
| SYSC   | System Control                               | 0x4001_E000  |
| PORT0  | Port 0 Control Registers                     | 0x4008_0000  |
| PORT1  | Port 1 Control Registers                     | 0x4008_0020  |
| PORT2  | Port 2 Control Registers                     | 0x4008_0040  |
| PORT3  | Port 3 Control Registers                     | 0x4008_0060  |
| PORT4  | Port 4 Control Registers                     | 0x4008_0080  |
| PORT5  | Port 5 Control Registers                     | 0x4008_00A0  |
| PORT6  | Port 6 Control Registers                     | 0x4008_00C0  |
| PORT7  | Port 7 Control Registers                     | 0x4008_00E0  |
| PORT8  | Port 8 Control Registers                     | 0x4008_0100  |
| PFS    | Pmn Pin Function Control Register            | 0x4008_0800  |
| ELC    | Event Link Controller                        | 0x4008_2000  |
| RTC    | Realtime Clock                               | 0x4008_3000  |
| IWDT   | Independent Watchdog Timer                   | 0x4008_3200  |
| WDT    | Watchdog Timer                               | 0x4008_3400  |
| CAC    | Clock Frequency Accuracy Measurement Circuit | 0x4008_3600  |

## Appendix 3. I/O Registers

本附录按功能描述了IO寄存器地址和访问周期。

### 3.1 外设基地址

本节提供本手册中描述的外设的基地址。表3.1显示了每个外设的名称、描述和基地址。

**Table 3.1 外设基地址(1 of 3)**

| Name   | Description      | 基址          |
|--------|------------------|-------------|
| RMPU   | 瑞萨内存保护单元         | 0x4000_0000 |
| TZF    | TrustZone Filter | 0x4000_0E00 |
| SRAM   | SRAM Control     | 0x4000_2000 |
| BUS    | 总线控制             | 0x4000_3000 |
| DMAC0  | 直接内存访问控制器0       | 0x4000_5000 |
| DMAC1  | 直接内存访问控制器1       | 0x4000_5040 |
| DMAC2  | 直接内存访问控制器2       | 0x4000_5080 |
| DMAC3  | 直接内存访问控制器3       | 0x4000_50C0 |
| DMAC4  | 直接内存访问控制器4       | 0x4000_5100 |
| DMAC5  | 直接内存访问控制器5       | 0x4000_5140 |
| DMAC6  | 直接内存访问控制器6       | 0x4000_5180 |
| DMAC7  | 直接内存访问控制器7       | 0x4000_51C0 |
| DMA    | DMAC模块激活         | 0x4000_5200 |
| DTC    | 数据传输控制器          | 0x4000_5400 |
| ICU    | 中断控制器            | 0x4000_6000 |
| CACHE  | CACHE            | 0x4000_7000 |
| CPSCU  | CPU系统安全控制单元      | 0x4000_8000 |
| DBG    | 调试功能             | 0x400_1B000 |
| FCACHE | 闪存缓存             | 0x400_1C100 |
| SYSC   | 系统控制             | 0x4001_E000 |
| PORT0  | 端口0控制寄存器         | 0x4008_0000 |
| PORT1  | 端口1控制寄存器         | 0x4008_0020 |
| PORT2  | 端口2控制寄存器         | 0x4008_0040 |
| PORT3  | 端口3控制寄存器         | 0x4008_0060 |
| PORT4  | 端口4控制寄存器         | 0x4008_0080 |
| PORT5  | 端口5控制寄存器         | 0x4008_00A0 |
| PORT6  | 端口6控制寄存器         | 0x4008_00C0 |
| PORT7  | 端口7控制寄存器         | 0x4008_00E0 |
| PORT8  | 端口8控制寄存器         | 0x4008_0100 |
| PFS    | Pmn引脚功能控制寄存器     | 0x4008_0800 |
| ELC    | 事件链接控制器          | 0x4008_2000 |
| RTC    | 实时时钟             | 0x4008_3000 |
| IWDT   | 独立看门狗定时器         | 0x4008_3200 |
| WDT    | 看门狗定时器           | 0x4008_3400 |
| CAC    | 时钟频率精度测量电路       | 0x4008_3600 |

Table 3.1 Peripheral base address (2 of 3)

| Name    | Description                                    | Base address |
|---------|--|--------------|
| MSTP    | Module Stop Control A, B, C, D                 | 0x4008_4000  |

| DAC12   | 12-bit D/A converter       | 0x4017_1000 |

Table 3.1 Peripheral base address (3 of 3)

| Name | Description                         | Base address |
|------|-------------------------------------|--------------|
| FLAD | Data Flash                          | 0x407F_C000  |
| FACI | Flash Application Command Interface | 0x407F_E000  |
| QSPI | Quad-SPI                            | 0x6400_0000  |

Note: Name = Peripheral name  
 Description = Peripheral functionality  
 Base address = Lowest reserved address or address used by the peripheral

### 3.2 Access Cycles

This section provides access cycle information for the I/O registers described in this manual.

- Registers are grouped by associated module.
- The number of access cycles indicates the number of cycles based on the specified reference clock.
- In the internal I/O area, reserved addresses that are not allocated to registers must not be accessed, otherwise operations cannot be guaranteed.
- The number of I/O access cycles depends on bus cycles of the internal peripheral bus, divided clock synchronization cycles, and wait cycles of each module. Divided clock synchronization cycles differ depending on the frequency ratio between ICLK and PCLK.
- When the frequency of ICLK is equal to that of PCLK, the number of divided clock synchronization cycles is always constant.
- When the frequency of ICLK is greater than that of PCLK, at least 1 PCLK cycle is added to the number of divided clock synchronization cycles.
- The number of write access cycles indicates the number of cycles obtained by non-bufferable write access.

Note: This applies to the number of cycles when access from the CPU does not conflict with the instruction fetching to the external memory or bus access from other bus masters such as DTC or DMAC.

Table 3.2 Access cycles (1 of 3)

| Peripherals                                | Address     |             | Number of access cycles |       |                          |        | Cycle Unit | Related function   |
|--|-------------|-------------|-------------------------|-------|--------------------------|--------|------------|--|
|  |             |             | ICLK = PCLK             |       | ICLK > PCLK <sup>1</sup> |        |            |  |
|  |             |             | Read                    | Write | Read                     | Write  |            |  |
| RMPU, TZF, SRAM, BUS, DMACn, DMA, DTC, ICU | 0x4000_0000 | 0x4000_6FFF | 4                       | 3     | 4                        | 3      | ICLK       | Renesas Memory Protection Unit, TrustZone Filter, SRAM Control, BUS Control, Direct memory access controller n, DMAC Module Activation, DTC Control Register, Interrupt Controller |

Table 3.1 外设基地址(3of3)

| Name | Description | 基址          |
|------|-------------|-------------|
| FLAD | 数据闪存        | 0x407F_C000 |
| FACI | Flash应用命令接口 | 0x407F_E000 |
| QSPI | Quad-SPI    | 0x6400_0000 |

Note: 名称=外设名称  
 描述=外围功能  
 基址=外设使用的最低保留地址或地址

### 3.2 访问周期

本节提供本手册中描述的IO寄存器的访问周期信息。

- 寄存器按相关模块分组。
- 访问周期数是指基于指定参考时钟的周期数。
- 在内部IO区，不能访问未分配给寄存器的保留地址，否则无法保证操作。
- IO访问周期数取决于内部外设总线的总线周期、分频时钟同步周期和每个模块的等待周期。分频时钟同步周期取决于ICLK和PCLK之间的频率比。
- 当ICLK的频率等于PCLK的频率时，分频的时钟同步周期数始终是恒定的。
- 当ICLK频率大于PCLK频率时，分频时钟同步周期数至少增加1个PCLK周期。
- 写访问周期数是指非缓冲写访问所获得的周期数。

Note: 这适用于当来自CPU的访问与从外部存储器获取指令或来自其他总线主控器（例如DTC或DMAC）的总线访问不冲突时的周期数。

Table 3.2 访问周期(1of3)

| Peripherals                                | Address     |             | 访问周期数       |       |                          |        | Cycle Unit | 相关功能   |
|--|-------------|-------------|-------------|-------|--------------------------|--------|------------|--|
|  |             |             | ICLK = PCLK |       | ICLK > PCLK <sup>1</sup> |        |            |  |
|  |             |             | Read        | Write | Read                     | Write  |            |  |

Table 3.2 Access cycles (3 of 3)

| Peripherals | Address<br>From To |             | Number of access cycles |       |               |        | Cycle Unit | Related function                                |
|-------------|--------------------|-------------|-------------------------|-------|---------------|--------|------------|---|
|             |                    |             | ICLK = FCLK             |       | ICLK > FCLK*1 |        |            |   |
|             |                    |             | Read                    | Write | Read          | Write  |            |   |
| FLAD, FACI  | 0x407F_C000        | 0x407F_EFFF | 5                       | 4     | 2 to 5        | 2 to 4 | FCLK       | Data Flash, Flash Application Command Interface |

- Note 1. If the number of PCLK or FCLK cycles is non-integer (for example 1.5), the minimum value is without the decimal point, and the maximum value is rounded up to the decimal point. For example, 1.5 to 2. 5 is 1 to 3.
- Note 2. When accessing a 16-bit register (FTDRHL, FRDRHL, FCR, FDR, LSR, and CDR), access is 2 cycles more than the value shown in Table 3.2. When accessing an 8-bit register (including FTDRH, FTDRL, FRDRH, and FRDRL), the access cycles are as shown in Table 3.2.
- Note 3. When accessing the 32-bit register (SPDR), access is 2 cycles more than the value in Table 3.2. When accessing an 8-bit or 16-bit register (SPDR\_HA), the access cycles are as shown in Table 3.2.
- Note 4. The access cycles depend on the QSPI bus cycles.

Table 3.2 访问周期 (3个, 共3个)

| Peripherals | Address<br>From To |             | 访问周期数       |       |               |        | Cycle Unit | 相关功能          |
|-------------|--------------------|-------------|-------------|-------|---------------|--------|------------|---------------|
|             |                    |             | ICLK = FCLK |       | ICLK > FCLK*1 |        |            |               |
|             |                    |             | Read        | Write | Read          | Write  |            |               |
| FLAD, FACI  | 0x407F_C000        | 0x407F_EFFF | 5           | 4     | 2 to 5        | 2 to 4 | FCLK       | 数据闪存、闪存应用命令接口 |

- 注1.若PCLK或FCLK周期数为非整数（例如1.5），则最小值不带小数点，最大值四舍五入到小数点。例如，1.5到2。5是1到3。
- 注2.访问16位寄存器（FTDRHL、FRDRHL、FCR、FDR、LSR和CDR）时，访问时间比中所示的值多2个周期。访问8位寄存器（包括FTDRH、FTDRL、FRDRH和FRDRL）时，访问周期如下图所示：  
Table 3.2.
- 注3.访问32位寄存器(SPDR)时，访问比表3.2中的值多2个周期。访问8位或16位寄存器（SPDR\_HA）时，访问周期如表3.2所示。
- 注4.访问周期取决于QSPI总线周期。
