## General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

### 1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

### 2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

### 3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

### 4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

### 5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

### 6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.).

### 7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

### 8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

## 处理微处理单元和微控制器的一般注意事项 单位产品

以下使用说明适用于瑞萨的所有微处理单元和微控制器单元产品。有关详细的使用说明本文档所涵盖的产品，请参阅文档的相关部分以及为产品发布的任何技术更新。

### 1. 防止静电放电(ESD)

当暴露于CMOS器件时，强电场会导致栅极氧化物的破坏并最终降低器件的运行性能。脚步必须采取措施，尽可能停止静电的产生，并在出现时迅速消散。环境控制必须足够的。干燥时，应使用加湿器。建议避免使用容易产生静电的绝缘体。

半导体器件必须在防静电电容器、静电屏蔽袋或导电材料中储存和运输。所有测试和包括工作台和地板在内的测量工具必须接地。操作员还必须使用腕带接地。半导体不得赤手触摸设备。对于安装有半导体器件的印刷电路板，必须采取类似的预防措施。

### 2. 上电处理

通电时产品的状态是不确定的。LSI内部电路的状态是不确定的，通电时寄存器设置和引脚未定义。在将复位信号施加到外部复位的成品中管脚，从通电到复位过程完成，管脚的状态不能保证。以类似的方式，引脚的状态在通过片内上电复位功能复位的产品中，从供电时间到供电达到指定重置的级别。

### 3. 断电状态下的信号输入

请勿在设备断电时输入信号或IO上拉电源。输入此类信号或IO导致的电流注入上拉电源可能会导致故障，此时通过设备的异常电流可能会导致内部退化元素。请按照产品文档中所述的电源关闭状态下的输入信号指南进行操作。

### 4. 处理未使用的引脚

按照手册中未使用引脚处理中给出的说明处理未使用的引脚。CMOS产品的输入引脚是一般处于高阻状态。在开路状态下使用未使用的引脚操作时，会在附近感应出额外的电磁噪声LSI，相关的直通电流在内部流动，并且由于将引脚状态错误识别为输入信号而发生故障成为可能。

### 5. 时钟信号

应用复位后，只有在工作时钟信号稳定后才释放复位线。在程序中切换时钟信号时执行，等待目标时钟信号稳定。当时钟信号由外部谐振器或外部振荡器产生时在复位期间，确保只有在时钟信号完全稳定后才释放复位线。此外，当切换到时钟信号时在程序执行过程中由外部谐振器或外部振荡器产生，等待目标时钟信号稳定。

### 6. 输入引脚的电压施加波形

由于输入噪声或反射波导致的波形失真可能会导致故障。如果CMOS器件的输入保持在 $V_{IL}$ 之间的区域(Max.)和 $V_{IH}$ (Min.)由于噪音，例如，设备可能发生故障。小心，以防止颤动的噪音进入设备时，输入电平是固定的，并且在输入电平通过 $V_{IL}$ (Max.)和 $V_{IH}$ (Min.)之间的区域时的过渡期间也是如此。

### 7. 禁止访问保留地址

禁止访问保留地址。保留地址是为将来可能的功能扩展提供的。不要访问这些不能保证LSI的正确操作。

### 8. 产品之间的差异

在从一种产品更改为另一种产品之前，例如更改为具有不同部件号的产品，请确认更改不会导致问题。同一组中的微处理单元或微控制器单元产品的特性，但具有不同的部件号，其特性可能会有所不同内部存储器容量，布局模式和其他因素，这些因素会影响电气特性的范围，例如特性值，工作裕度、抗噪声能力和辐射噪声量。当更改为具有不同部件号的产品时，实施系统-给定产品的评估测试。

#### (1) Function module symbol, register symbol, and address assignment

Function module symbol, register symbol, and address assignment of this register are generally expressed. Base Address and Offset Address mean DTC Module Start Register (DTCST) of Data Transfer Controller (DTC) is assigned to address 0x4020\_0C00.

#### (2) Bit number

This number indicates the bit number. This bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

#### (3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

- 0: Indicates that the value is 0 after a reset.
- 1: Indicates that the value is 1 after a reset.
- x: Indicates that the value is undefined after a reset.

#### (4) Symbol

Symbol indicates the short name of bit field. Reserved bit is expressed with a —.

#### (5) Function

Function indicates the full name of the bit field and enumerated values.

#### (6) R/W

The R/W column indicates access type whether the bit field is readable or writable.

- R/W: The bit field is readable and writable.
- R: The bit field is readable only. Writing to this bit field has no effect.
- W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

## 8. 注册说明

每个寄存器描述都包括一个显示位分配的寄存器图和一个描述每个位内容的寄存器位表。这些表中使用的符号示例将在以下部分中描述。以下是寄存器描述和相关位字段定义的示例。

### XX.XX DTCST : DTC Module Start Register

#### (1) 功能模块符号、寄存器符号、地址分配

一般表示该寄存器的功能模块符号、寄存器符号、地址分配。基地址和偏移地址意味着数据传输控制器(DTC)的DTC模块起始寄存器(DTCST)分配到地址0x4020\_0C00。

#### (2) 位号

该数字表示位数。对于32位寄存器，这些位按位31到0、16位寄存器从位15到0、8位寄存器从位7到0的顺序显示。

#### (3) 复位后的值

该符号或数字表示硬复位后每个位的值。除非另有说明，否则该值以二进制显示。

- 0: 表示复位后值为0。
- 1: 表示复位后值为1。
- x: 表示复位后该值未定义。

#### (4) Symbol

符号表示位域的简称。保留位用—表示。

#### (5) Function

函数表示位域的全称和枚举值。

#### (6) R/W

RW列指示位字段是可读还是可写的访问类型。

- RW: 位域可读可写。
- R: 位域是只读的。写入该位域无效。
- W: 位域只可写。除非另有说明，否则读取的值与复位后的值相同。

Table 1.7 Timers

| General PWM Timer (GPT)                            | The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 4 channels and a 16-bit timer with GPT16 × 4 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer. See <a href="#">section 21, General PWM Timer (GPT)</a> .   |
| Port Output Enable for GPT (POEG)                  | The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state. See <a href="#">section 20, Port Output Enable for GPT (POEG)</a> .  |
| Low power Asynchronous General Purpose Timer (AGT) | The low power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register. See <a href="#">section 22, Low Power Asynchronous General Purpose Timer (AGT)</a> .   |
| Realtime Clock (RTC)                               | The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See <a href="#">section 23, Realtime Clock (RTC)</a> .  |
| Watchdog Timer (WDT)                               | The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. See <a href="#">section 24, Watchdog Timer (WDT)</a> .  |
| Independent Watchdog Timer (IWDT)                  | The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers. See <a href="#">section 25, Independent Watchdog Timer (IWDT)</a> . |

| 独立看门狗定时器(IWDT)    | 独立看门狗定时器(IWDT)包含一个14位递减计数器,必须定期对其进行服务以防止计数器下溢。IWDT提供复位MCU或生成不可屏蔽中断或下溢中断的功能。由于定时器使用独立的专用时钟源运行,因此当系统失控时,它在将MCU作为故障安全机制返回到已知状态时特别有用。IWDT可以通过复位、下溢、刷新错误或寄存器中的计数值的刷新来自动触发。请参见第25节,独立看门狗定时器(IWDT)。 |

| Capacitive Touch Sensing Unit (CTSUS) | The Capacitive Touch Sensing Unit (CTSUS) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software that enables the CTSUS to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical conductor so that a finger does not come into direct contact with the electrode.<br>See <a href="#">section 40, Capacitive Touch Sensing Unit (CTSUS)</a> . |

| Cyclic Redundancy Check (CRC) calculator | The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available.<br>See <a href="#">section 34, Cyclic Redundancy Check (CRC) Calculator</a> . |
| Data Operation Circuit (DOC)             | The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. When a selected condition applies, 16-bit data is compared and an interrupt can be generated.<br>See <a href="#">section 41, Data Operation Circuit (DOC)</a> .   |

## 2.5 Security Attribution for Memory

In this MCU, SAU is not implemented and IDAU performs region definition for memory. IDAU divides the memory into 8 different areas as shown in Figure 2.2.

The code flash, the data flash, and the SRAM are divided into Secure (S), Non-secure (NS) and Non-secure callable (NSC) regions. These memory security attributions are set into the nonvolatile memory by the serial programming command when the device lifecycle is in SSD state. These memory security attributions are loaded into the IDAU and the memory controller before application execution. These memory security attributions cannot be updated by application but can read through the dedicated registers.

Note: When configuring, the memory regions should satisfy the setting condition of minimum address unit shown in Table 2.4.

Figure 2.2 Memory partitioning

Table 2.4 S/NS and S/NSC boundary list

| Boundary | Code flash | Data flash | SRAM |
|----------|------------|------------|------|
| S/NS     | 32 KB      | 1 KB       | 8 KB |
| S/NSC    | 1 KB       | —          | 1 KB |

Each region has its dedicated ID as follows. For more details, see section 46.2.2. Memory Security Attribution.

| Region ID | Description                    |
|-----------|--------------------------------|
| 0x0D      | Non-secure SRAM                |

## 2.6 Debug Function

### 2.6.1 Debugger connectivity

In this MCU, debug function is considered in three levels, DBG0, DBG1, DBG2. At DBG0, no debug function is available. DBG1 level is defined as non-secure debug in ARMv-8 and the debugger can only access defined non-secure debug accessible regions. DBG2 level is defined as secure debug in ARMv-8 and at this level, nonsecure and secure debug function is enabled and can be accessible from the debugger.

## 2.5 内存安全归属

在这个MCU中，没有实现SAU，而IDAU为内存执行区域定义。IDAU将内存划分为8个不同的区域，如图2.2所示。

代码闪存、数据闪存和SRAM分为安全(S)、非安全(NS)和非安全可调用(NSC)区域。当设备生命周期处于SSD状态时，这些内存安全属性由串行编程命令设置到非易失性内存中。这些内存安全属性在应用程序执行之前被加载到IDAU和内存控制器中。这些内存安全属性不能由应用程序更新，但可以通过专用寄存器读取。

Note: 配置时，内存区域应满足表2.4所示的最小地址单元设置条件。

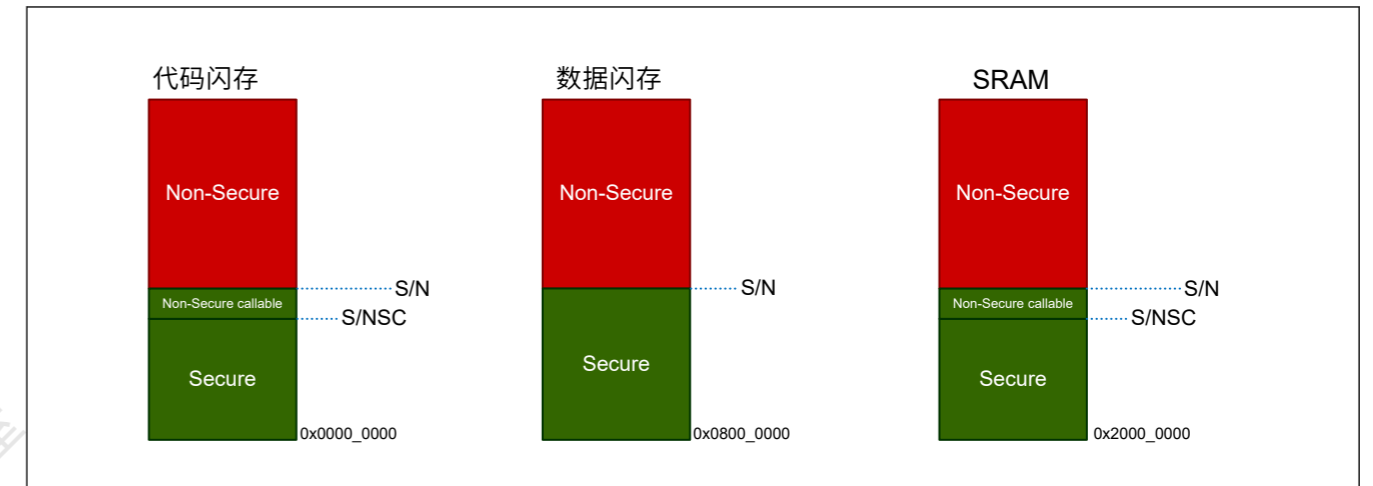

Figure 2.2 内存分区

Table 2.4 SNS和SNSC边界列表

| Boundary | 代码闪存  | 数据闪存 | SRAM |
|----------|-------|------|------|
| S/NS     | 32 KB | 1 KB | 8 KB |
| S/NSC    | 1 KB  | —    | 1 KB |

每个区域都有其专用ID，如下所示。有关详细信息，请参阅第46.2.2节。内存安全归属。

| 区域编号 | Description              |
|------|--------------------------|
| 0x0D | Non-secure SRAM          |
| 0x0E | Non-secure callable SRAM |

| 0x07 | 安全代码闪存                   |

## 2.6 调试功能

### 2.6.1 调试器连接

在本单片机中，调试功能分为三个层次，DBG0、DBG1、DBG2。在DBG0，没有调试功能可用。DBG1级别在ARMv-8中定义为非安全调试，调试器只能访问已定义的非安全调试可访问区域。DBG2级别在ARMv-8中定义为安全调试，在此级别，启用了非安全和安全调试功能，并且可以从调试器访问。

Debug level is determined by the Device Lifecycle Management (DLM) state of the product.

See Figure 2.1 for debugger accessible regions.

Table 2.5 shows the CPU debug function and conditions.

Table 2.5 CPU debug function and conditions

| Condition     |           |             | Permitted debug function                    |
|---------------|-----------|-------------|---|
| OCD connect*1 | DLM State | Debug level | Description                                 |
| Connected     | CM        | DBG2        | All debug functions are available           |
| Connected     | SSD       | DBG2        | All debug functions are available           |
| Connected     | NSECSD    | DBG1        | Only Non-secure debug function is available |
| Connected     | DPL       | DBG0        | Debugger connection is not available        |
| Connected     | LCK_DBG   | DBG0        | Debugger connection is not available        |
| Connected     | LCK_BOOT  | DBG0        | Debugger connection is not available        |
| Connected     | RMA_REQ   | DBG0        | Debugger connection is not available        |
| Connected     | RMA_ACK   | DBG2        | All debug functions are available           |

Note 1. OCD connect is determined by the CDBGPWUPREQ bit output in the SWJ-DP register. The bit can only be written by the OCD. However, the level of the bit can be confirmed by reading the DBGSTR.CDBGPWUPREQ bit.

## 2.6.2 Emulator Connection

Renesas provides the emulator which supports both debugging using SWD or JTAG communication and serial programming using SCI communication. This emulator makes it easy to switch between debug-ging and serial programming.

Table 2.6 shows the pinout of 10 pin or 20 pin socket pinouts when using this emulator. The pinout of SWD and JTAG is ARM standard, and MD, TXD, RXD pins are added for the serial programming using SCI communication.

The serial programming interface must be used to program the TrustZone IDAU boundary register settings.

It is recommended to connect P300/SWCLK/TCK and P201/MD pins using wired OR circuit on the board to use both debugging and serial programming.

调试级别由产品的设备生命周期管理(DLM)状态确定。

有关调试器可访问区域，请参见图2.1。

## 2.6.2 仿真器连接

瑞萨电子提供的仿真器支持使用SWD或JTAG通信进行调试和使用SCI通信进行串行编程。该仿真器可以轻松地在调试和串行编程之间切换。

表2.6显示了使用该仿真器时10针或20针插座的引脚排列。SWD和JTAG的管脚是ARM标准，并增加了MD、TXD、RXD引脚用于使用SCI通信的串行编程。

必须使用串行编程接口对TrustZoneIDAU边界寄存器设置进行编程。

建议使用板上的有线或电路连接P300SWCLKTCK和P201MD引脚，以同时使用调试和串行编程。

### 2.6.3 Self-Hosted Debug Function

As described in [section 2.7.6. CPUDSAR : CPU Debug Security Attribution Register](#), at the initial setting access from the CPU in non-secure state to CoreSight debug components is protected, that is, the non-secure access to Coresight debug components from the self-hosted debugger is not allowed when the debug level is DBG2 at the initial setting. Therefore, you must set CPUDSAR.CPUDSA0 to 1 to enable the full self-hosted debug function.

Note: There is no restriction for the self-hosted debug function while the CPU is in the secure state.

### 2.6.4 Effect of Debug Function

The debug function effects inside and outside of CPU.

#### 2.6.4.1 Low power mode

All CoreSight debug components can store the register settings even when the CPU enters Software Standby, Snooze or Deep Software Standby mode. However, AHB-AP cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight debug components. To request low power mode cancellation, the OCD can set the DBIRQ bit in the MCUCTRL register. For details, see [section 2.7.5.2. MCUCTRL : MCU Control Register](#).

#### 2.6.4.2 Reset

In OCD mode, some resets depend on the CPU status and the DBGSTOPPCR register setting.

**Table 2.7 Reset or interrupt and mode setting**

| Reset or interrupt name                    | Control in On-Chip Debug (OCD) mode |                               |

Note: In OCD break mode, the CPU is halted. In OCD run mode, the CPU is in OCD mode and the CPU is not halted.

Note 1. The IWDT and WDT always stop in this mode.

## 2.7 Programmers Model

### 2.7.1 Address Spaces

The MCU debug system includes two CoreSight Access Ports (AP):

- AHB-AP, which is connected to the CPU bus matrix and has the same access to the system address space as the CPU
- APB-AP, which has a dedicated address space (OCD address space) and is connected to the OCDREG registers.

[Figure 2.3](#) shows a block diagram of the AP connection and address spaces.

### 2.6.3 自托管调试功能

如第2.7.6节所述。CPUDSAR: CPUDebugSecurityAttributionRegister, 在初始设置时从对CoreSight调试组件处于非安全状态的CPU受到保护, 即当初始设置的调试级别为DBG2时, 不允许自托管调试器对Coresight调试组件的非安全访问。因此, 您必须将CPUDSAR.CPUDSA0设置为1以启用完全自托管调试功能。

Note: 当CPU处于安全状态时, 自托管调试功能没有限制。

### 2.6.4 调试功能的效果

调试功能影响CPU内部和外部。

#### 2.6.4.1 低功耗模式

即使CPU进入软件待机、贪睡或深度软件待机模式, 所有CoreSight调试组件都可以存储寄存器设置。但是, AHB-AP在这些低功耗模式下无法响应片上调试(OCD)访问。OCD必须等待取消低功耗模式才能访问CoreSight调试组件。要请求取消低功耗模式, OCD可以设置MCUCTRL寄存器中的DBIRQ位。详见2.7.5.2节。MCUCTRL: MCU控制寄存器。

#### 2.6.4.2 Reset

在OCD模式下, 一些复位取决于CPU状态和DBGSTOPPCR寄存器设置。

**Table 2.7 复位或中断和模式设置**

## 2.7 程序员模型

### 2.7.1 地址空间

MCU调试系统包括两个CoreSight访问端口(AP):

- AHB-AP, 与CPU总线矩阵相连, 与CPU具有相同的系统地址空间访问权限
- APB-AP, 具有专用的地址空间 (OCD地址空间) 并连接到OCDREG寄存器。

图2.3显示了AP连接和地址空间的框图。

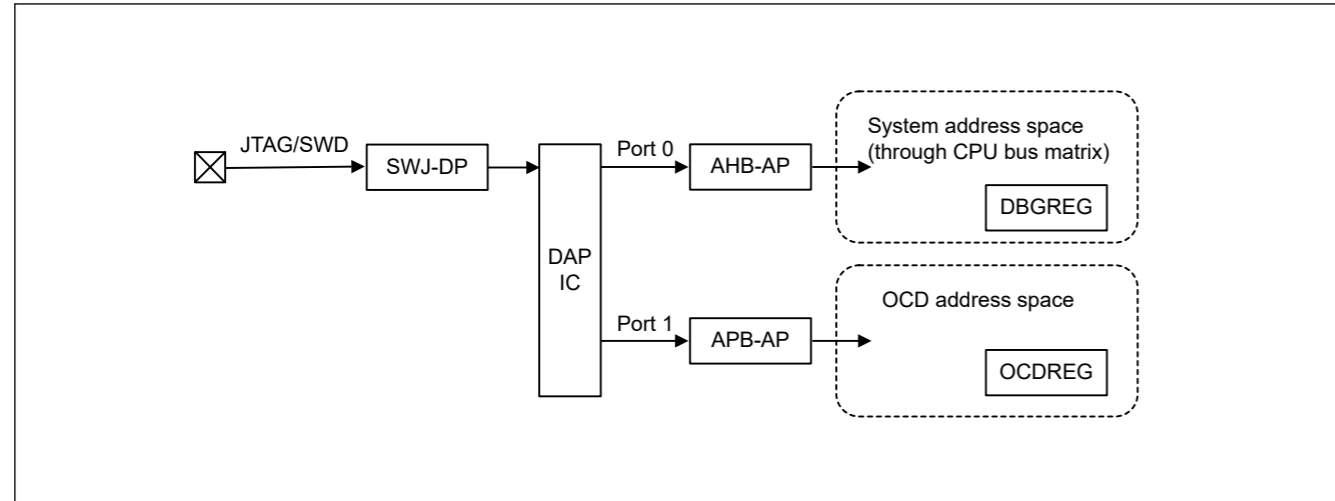

Figure 2.3 JTAG/SWD authentication block diagram

For debugging purposes, there are two register modules, DBGREG and OCDREG. DBGREG is located in the system address space and can be accessed from the OCD emulator, the CPU, and other bus masters in the MCU. OCDREG is located in the OCD address space and can only be accessed from the OCD tool. The CPU and other bus masters cannot access OCDREG.

### 2.7.2 Peripheral Address Map

In system address space, the Cortex-M33 core has a Private Peripheral Bus (PPB) which can be accessed only from CPU and OCD emulator. The PPB is expanded from the original implementation of the Cortex-M33 core for this MCU. Table 2.8 shows the address map of the MCU.

### 2.7.3 CoreSight ROM Table

The MCU contains two CoreSight ROM Tables, the processor and system ROM Tables. The Processor ROM Table contains entries which hold a list of debug components inside the processor. The System ROM Table contains entries of Processor ROM Table and others debug components outside the processor.

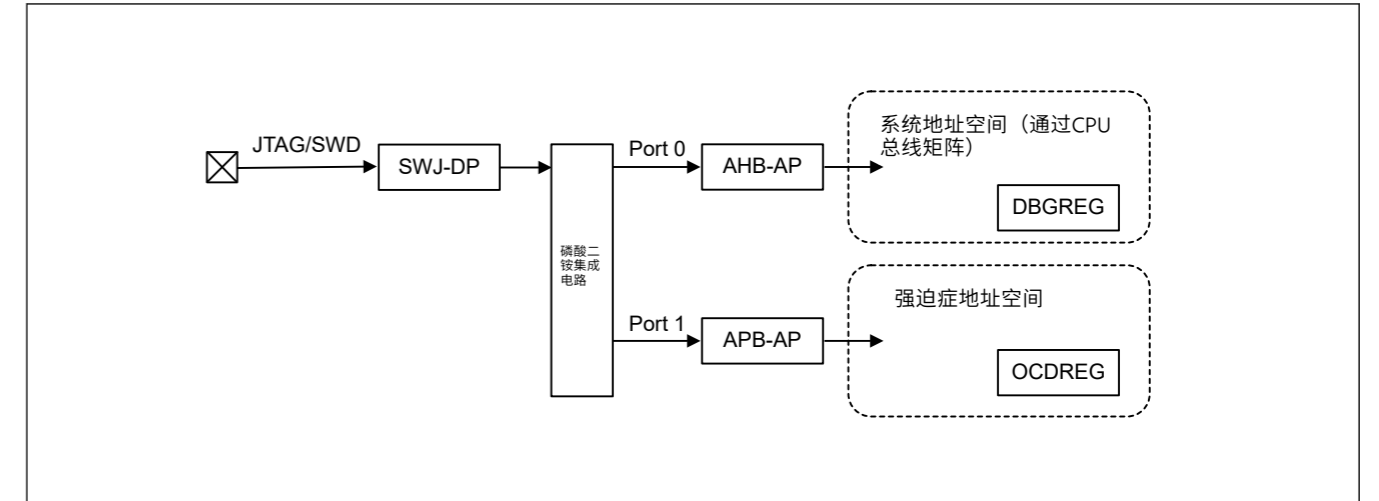

Figure 2.3 JTAG/SWD认证框图

出于调试目的，有两个寄存器模块，DBGREG和OCDREG。DBGREG位于系统地址空间中，可以从OCD仿真器、CPU和MCU中的其他总线主控器访问。OCDREG位于OCD地址空间，只能从OCD工具访问。CPU和其他总线主机无法访问OCDREG。

### 2.7.2 外设地址映射

在系统地址空间中，Cortex-M33内核有一个专用外设总线(PPB)，只能从CPU和OCD仿真器访问。PPB是从该MCU的Cortex-M33内核的原始实现扩展而来的。表2.8显示了MCU的地址映射。

### 2.7.5.3 OCDREG CoreSight component registers

The OCDREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.15 shows the registers. See reference 4. in section 2.14. References for details of each register.

### 2.7.5.3 OCDREGCoreSight组件寄存器

### 2.7.6 CPUDSAR : CPU Debug Security Attribution Register

Base address: CPSCU = 0x4000\_8000  
Offset address: 0x1B0

| Bit  | Symbol  | Function   | R/W |
|------|---------|--|-----|
| 0    | CPUDSA0 | CPU Debug Security Attribution 0<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | —       | These bits are read as 1. The write value should be 1.         | R/W |

Note: Only secure access can write to this register. Both secure access and non-secure read access are allowed. Non-secure write access is denied, and no TrustZone access error is generated.  
Note: This register is write-protected by PRCR register.

When Debug level of the MCU is DBG2, by guarding entire EPPB bus, the non-secure access from CPU to debug related components is completely controlled by the current value of the CPUDSA0 bit. Since this bit is modifiable only when CPU is in secure state, user must be aware of the CPUDSAR register before using Coresight debug components.

#### CPUDSA0 bit (CPU Debug Security Attribution 0)

Security attributes of register for accessing the debug component of the CPU.

- 0: Debug component can only be accessed with secure access.
- 1: There is no restriction on accessing the debug component.

### 2.7.7 Processing on Error response generated by CPU access

In addition to the specific-error detection specification of the Arm Cortex-M33 processor, this MCU also provides additional error information which is described in section 14, Buses.

This section describes how to handle the additional error information with no conflict to that of the Arm Cortex-M33 processor.

Table 2.16 shows error detection modules, which are also described in section 14, Buses. These error detection modules not only provide error information on the bus module, but also notify the processor to trigger the exception handler.

Table 2.16

|                              | NMI/RESET request | Interrupt                   | Bus error status register | Error address register<br>Error RW register |

Note 1. A Bus Fault can be treated as HardFault. ARM® Cortex®-M33 Device Generic User Guide in the References section 2.14. References

To prevent unexpected operation, when handling the exception, additional operation should be added into exception routing. BusFault when occurred by error detected as shown in Table 2.16:

### 2.7.6 CPUDSAR:CPU调试安全属性寄存器

Base address: CPSCU = 0x4000\_8000  
Offset address: 0x1B0

| Bit  | Symbol  | Function                                 | R/W |
|------|---------|--|-----|
| 0    | CPUDSA0 | CPU调试安全属性0<br>0: Secure<br>1: Non-secure | R/W |
| 31:1 | —       | 这些位被读取为1。写入值应为1。                         | R/W |

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问。拒绝非安全写入访问，并且不会生成TrustZone访问错误。  
Note: 该寄存器由PRCR寄存器写保护。

当MCU的Debug级别为DBG2时，通过保护整个EPPB总线，CPU对调试相关组件的非安全访问完全由CPUDSA0位的当前值控制。由于该位仅在CPU处于安全状态时才可修改，因此用户在使用Coresight调试组件之前必须了解CPUDSAR寄存器。

#### CPUDSA0位 (CPU调试安全属性0)

用于访问CPU调试组件的寄存器的安全属性。

- 0: 只能通过安全访问访问调试组件。
- 1: 对调试组件的访问没有限制。

### 2.7.7 CPU访问产生的错误响应的处理

除了ArmCortex-M33处理器的特定错误检测规范外，此MCU还提供第14节“总线”中描述的其他错误信息。

本节介绍如何处理与ArmCortex-M33处理器不冲突的附加错误信息。

表2.16显示了错误检测模块，这些模块也在第14节“总线”中进行了描述。这些错误检测模块不仅提供总线模块上的错误信息，还通知处理器触发异常处理程序。

Table 2.16

注1.总线故障可被视为硬故障。参考第2.14节中的ARM®Cortex®-M33设备通用用户指南。References

为防止意外操作，在处理异常时，应在异常路由中增加额外的操作。检测到错误发生时的BusFault，如表2.16所示：

- See section 14, Buses for the error information in the corresponding register
- Clear the data in cache for the error address
- Clear the Error Status register in the bus module
- Service exception handling with Arm-guided operation

For a Bus Fault that is not detected in the Renesas-specific error detection module (occurred inside the Arm Cortex-M33 core), see the *ARM® Cortex®-M33 Device Generic User Guide* to handle this case.

In the system bus specification, there is a specific case for Slave TrustZone Filter, that is, if an error is selected to generate an NMI, then before the processor handles the Bus Fault exception, NMI with higher priority takes the exception first. Therefore, use the BusFault handler and not NMI handler to handle this error. In other words, the NMI status should be cleared but the error status bit should not be cleared to ensure that BusFault captures all the error information.

Figure 2.4 and Figure 2.5 show the recommended flows for NMI handler and BusFault handler for the errors described in Table 2.16.

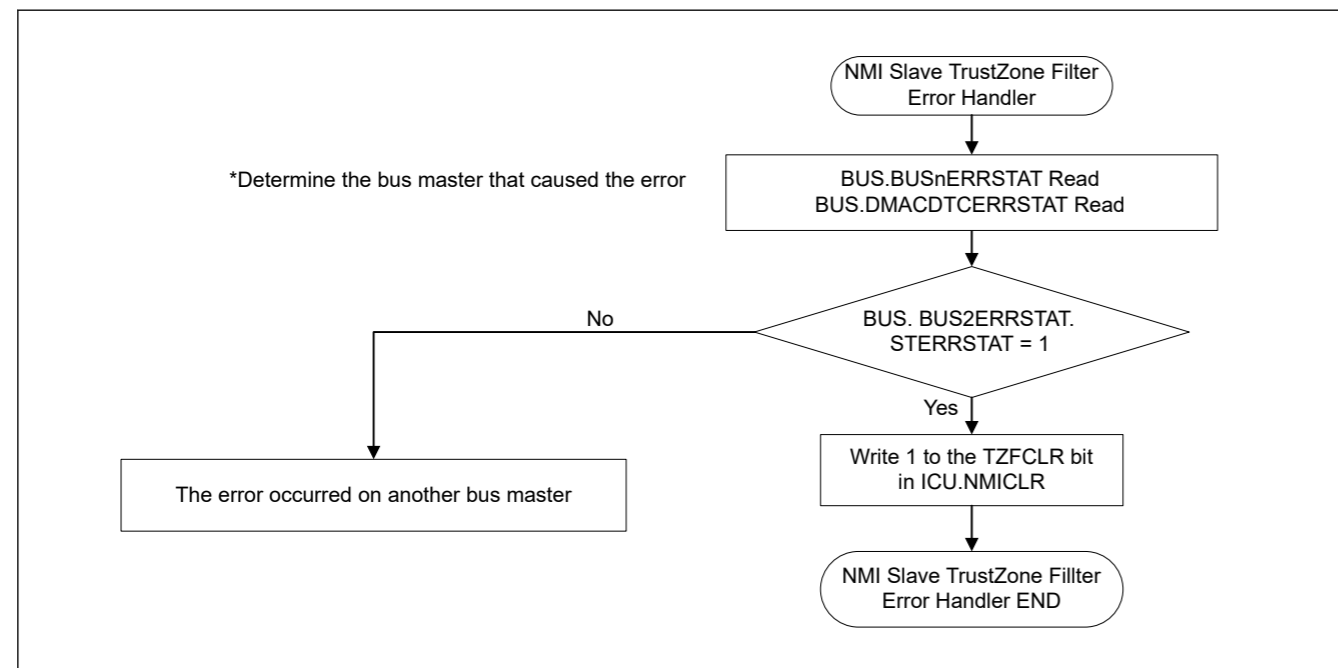

Figure 2.4 NMI handling flowchart

- 相应寄存器中的错误信息见第14节，总线
- 清除缓存中错误地址的数据
- 清除总线模块中的错误状态寄存器
- 服务异常处理，手臂引导操作

对于未在Renesas特定错误检测模块中检测到的总线故障（发生在ArmCortex-M33内核中），请参阅ARM®Cortex®-M33DeviceGenericUserGuide来处理这种情况。

在系统总线规范中，SlaveTrustZoneFilter有一个具体的案例，即如果选择了错误产生NMI，那么在处理器处理BusFault异常之前，优先级较高的NMI先处理该异常。因此，使用BusFault处理程序而不是NMI处理程序来处理此错误。换言之，应清除NMI状态但不应清除错误状态位，以确保BusFault捕获所有错误信息。

图2.4和图2.5显示了NMI处理程序和BusFault处理程序的推荐流程，用于处理中描述的错误 Table 2.16.

There is one CoreSight ATB funnel in the MCU. The funnel has two ATB slaves and one ATB master, and it selects the debug trace source from ETM and ITM to ETB. Figure 2.7 shows the CoreSight ATB connection in the MCU.

### 2.9 CoreSight ATB Funnel

MCU中有一个CoreSight ATB漏斗。漏斗有两个ATB从站和一个ATB主站，它选择从ETM和ITM到ETB的调试跟踪源。图2.7显示了MCU中的CoreSight ATB连接。

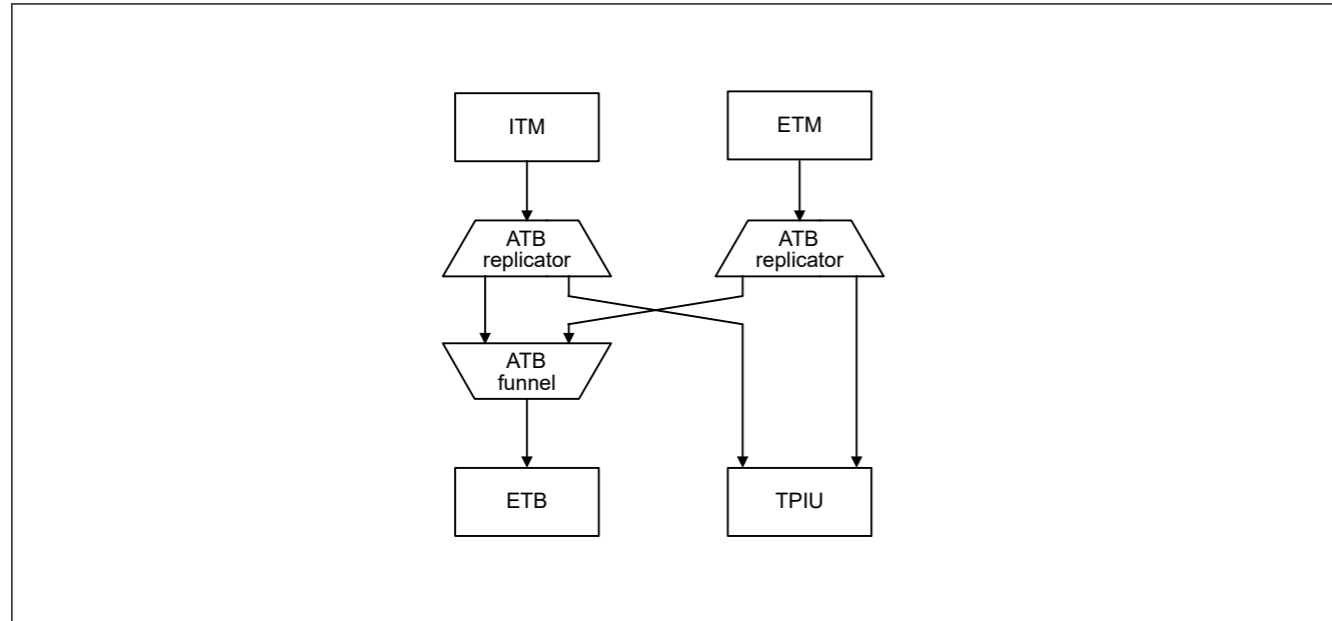

Figure 2.7 CoreSight ATB connection

Table 2.18 shows the ATB slave connection for the funnel.

Table 2.18 ATB slave connection

| ATB slave number | Connected trace source |
|------------------|------------------------|
| #0               | ITM                    |
| #1               | ETM                    |

See reference 4. in [section 2.14. References](#) for details of the ATB and funnel.

## 2.10 Break Point Unit

The MCU has Break Point Unit. See BreakPoint unit chapter of reference 1. in [section 2.14. References](#) for details about register description of this module.

## 2.11 CoreSight Time Stamp Generator

A CoreSight Time Stamp Generator provides a CPU clock-based timestamp to ITM and ETM. The timestamp is generated by a 64-bit counter. See reference 4. in [section 2.14. References](#) for details.

## 2.12 SysTick Timer

The MCU has SysTick timer that provides two 24-bit down counters, non-secure and secure counters. The timer can select SysTick timer clock (SYSTICCLK) or System clock (ICLK).

See [section 8, Clock Generation Circuit](#) and reference 1. in [section 2.14. References](#) for details.

Note: SysTick timer counter operation is enabled by signal synchronized with CPU clock. Therefore, the counter might not operate correctly if the CPU clock is slower than the SysTick timer clock. In other words, clock setting must satisfy the following: CPU clock  $\geq$  Systick clock (LOCO: 32.768 kHz).

## 2.13 OCD Emulator Connection

In this product, the MCU confirms the access permission for Non-secure debug and Non-secure chip resources by checking Debug level is DBG1 or higher. For full access permission for debug and chip resources, Secure debug level DBG2 is required.

Figure 2.8 shows a block diagram of SWD authentication mechanism.

表2.18显示了漏斗的ATB从属连接。

Table 2.18 ATB从机连接

| ATB从机号 | 连接的跟踪源 |
|--------|--------|
| #0     | ITM    |
| #1     | ETM    |

## 2.10 断点单元

MCU有断点单元。请参阅第2.14节中参考文献1的断点单元章节。关于该模块的寄存器描述的详细信息参考。

## 2.11 CoreSight时间戳生成器

CoreSight时间戳生成器为ITM和ETM提供基于CPU时钟的时间戳。时间戳由64位计数器生成。参见第2.14节中的参考4。详情参考。

## 2.12 SysTick Timer

MCU具有SysTick定时器，提供两个24位递减计数器、非安全计数器和安全计数器。定时器可以选择SysTick定时器时钟(SYSTICCLK)或系统时钟(ICLK)。

请参见第8节，时钟生成电路和第2.14节中的参考1。详情参考。

Note: SysTick定时器计数器操作由与CPU时钟同步的信号启用。因此，如果CPU时钟比SysTick定时器时钟慢，计数器可能无法正确运行。换言之，时钟设置必须满足以下条件：CPU时钟 $\geq$ Systick时钟（LOCO：32.768kHz）。

## 2.13 OCD模拟器连接

本产品中，MCU通过勾选确认非安全调试和非安全芯片资源的访问权限调试级别为DBG1或更高。对于调试和芯片资源的完全访问权限，需要安全调试级别DBG2。

图2.8显示了SWD认证机制的框图。

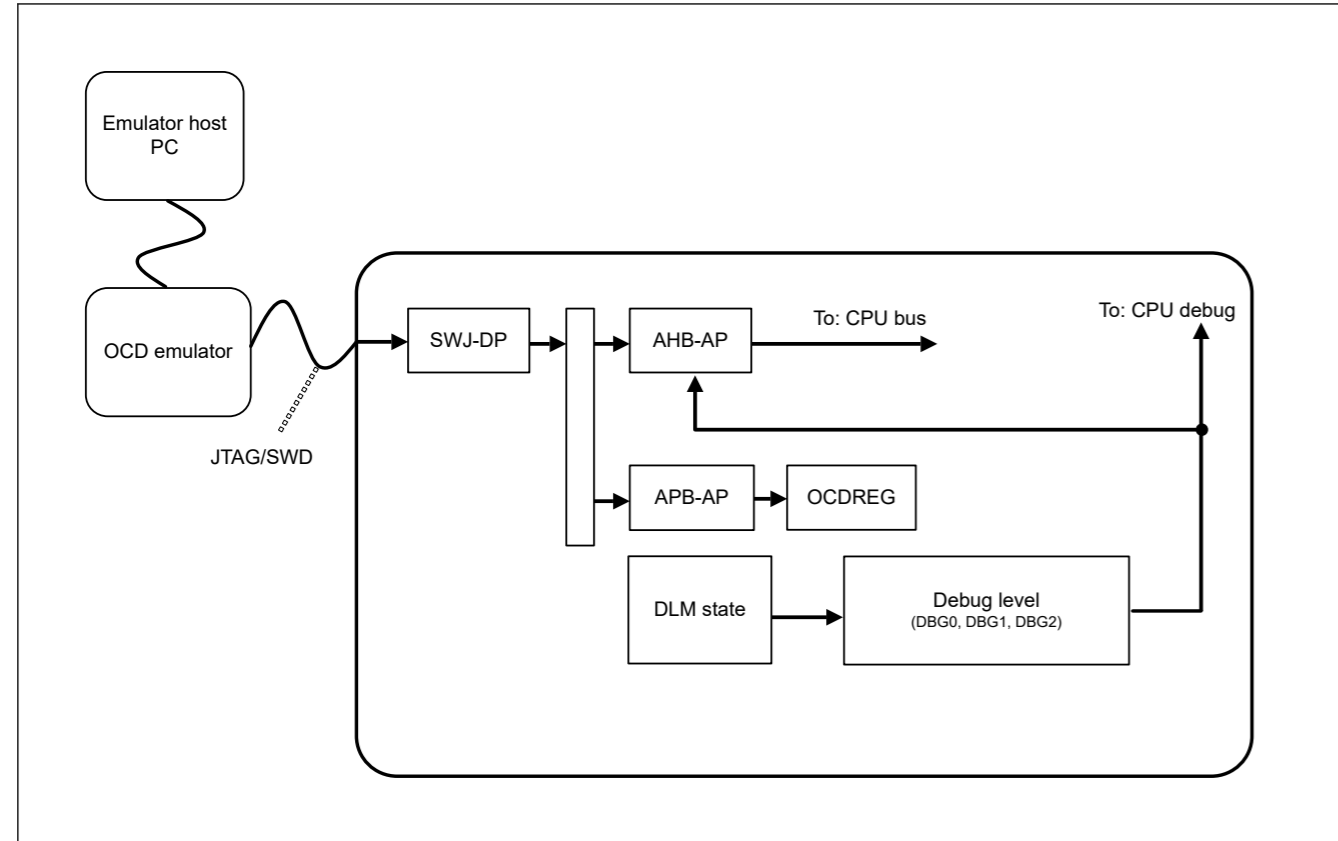

Figure 2.8 SWD Authentication mechanism block diagram

Three levels of debug capability are available, DBG0, DBG1, and DBG2, which correspond to the Device Level Management (DLM) states. When debug level is DBG0, access to debug components and system bus from OCD emulator is not permitted. When debug level is DBG1 or DBG2, the corresponding non-secure or secure debug components and system bus can be accessed from the OCD emulator. See Table 2.5 for more information about debug levels.

2.13.1 DBGEN

After the OCD emulator gets access permission, the OCD emulator must set the DBGEN bit in the System Control OCD Control Register (SYOCDRCR). In addition, the OCD emulator must clear the DBGEN bit before disconnecting it. See section 10, Low Power Modes for details.

2.13.2 Restrictions on Connecting an OCD emulator

This section describes the restrictions on emulator access.

2.13.2.1 Starting connection while in low power mode

When starting a JTAG/SWD connection from an OCD emulator, the MCU must be in Normal or Sleep mode. If the MCU is in Software Standby, Snooze, or Deep Software Standby mode, the OCD emulator can cause the MCU to hang.

2.13.2.2 Changing low power mode while in OCD mode

When the MCU is in OCD mode, the low power mode can be changed. However, system bus access from AHB-AP is prohibited in Software Standby, Snooze or Deep Software Standby mode. Only SWJ-DP, APB-AP, and OCDREG can be accessed from the OCD emulator in these modes. Table 2.19 shows the restrictions.

Table 2.19 Restrictions by mode (1 of 2)

| Active mode | Start OCD emulator connection | Change low power mode | Access AHB-AP and system bus | Access APB-AP and OCDREG |
|-------------|-------------------------------|-----------------------|------------------------------|--------------------------|
| Normal      | Yes                           | Yes                   | Yes                          | Yes                      |

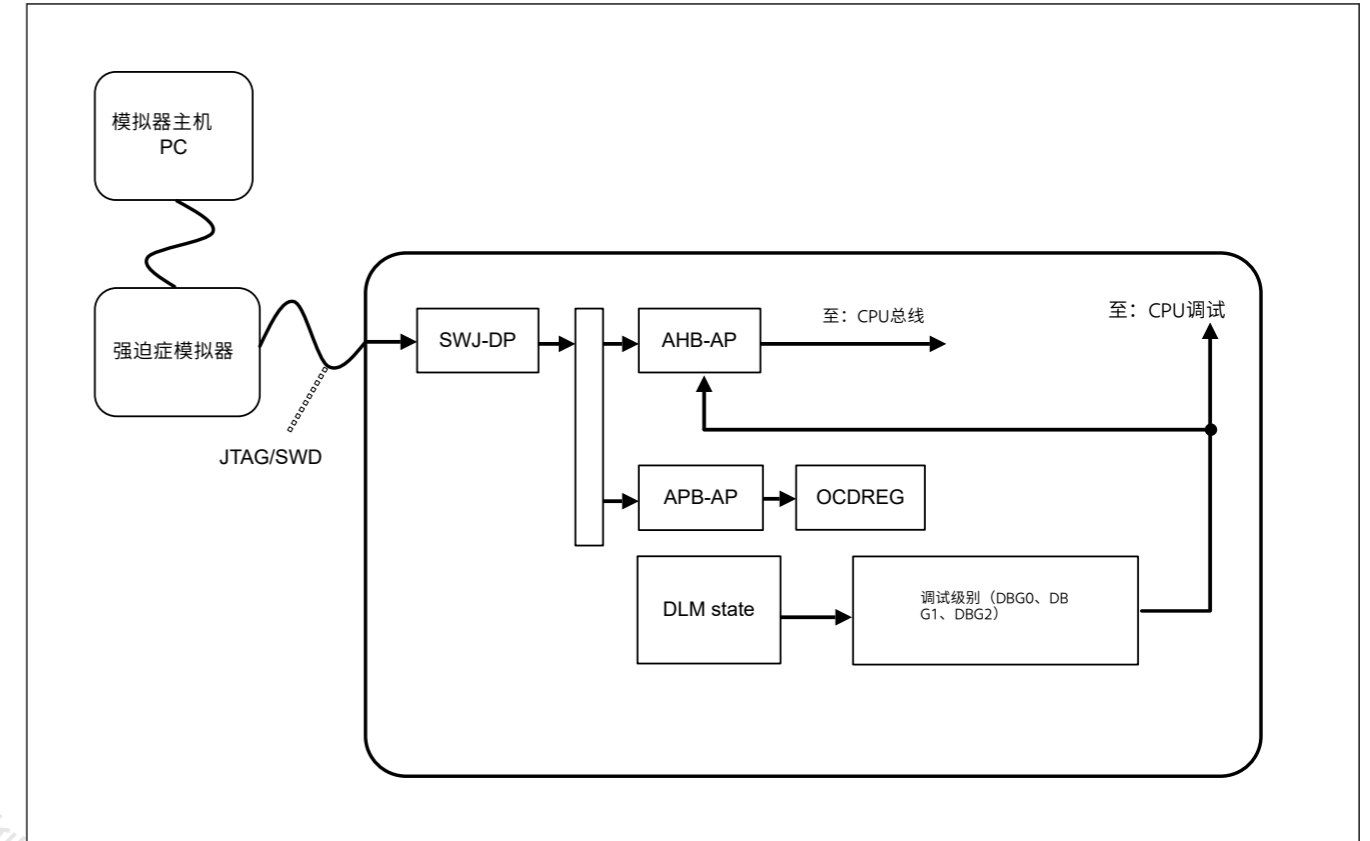

Figure 2.8 SWD认证机制框图

提供三个级别的调试能力，DBG0、DBG1和DBG2，它们对应于DeviceLevel管理(DLM)状态。当调试级别为DBG0时，不允许从OCD仿真器访问调试组件和系统总线。当调试级别为DBG1或DBG2时，可以从OCD仿真器访问相应的非安全或安全调试组件和系统总线。有关调试级别的更多信息，请参见表2.5。

2.13.1 DBGEN

OCD模拟器获得访问权限后，OCD模拟器必须设置SystemControlOCD中的DBGEN位控制寄存器(SYOCDRCR)。此外，OCD仿真器必须在断开连接之前清除DBGEN位。有关详细信息，请参见第10节，低功耗模式。

2.13.2 连接强迫症模拟器的限制

本节介绍对仿真器访问的限制。

2.13.2.1 在低功耗模式下开始连接

从OCD仿真器启动JTAGSWD连接时，MCU必须处于正常或睡眠模式。如果MCU处于软件待机、贪睡或深度软件待机模式，OCD仿真器可能会导致MCU挂起。

2.13.2.2 在OCD模式下更改低功耗模式

当MCU处于OCD模式时，可以更改低功耗模式。但是，在软件待机、贪睡或深度软件待机模式下，禁止从AHB-AP访问系统总线。在这些模式下，只能从OCD仿真器访问SWJ-DP、APB-AP和OCDREG。表2.19显示了这些限制。

Table 2.19 模式限制(1of2)

| 主动模式   | 启动强迫症模拟器连接 | 更改低功耗模式 | 访问AHB-AP和系统总线 | 访问APB-AP和OCDREG |
|--------|------------|---------|---------------|-----------------|
| Normal | Yes        | Yes     | Yes           | Yes             |

Table 2.19 Restrictions by mode (2 of 2)

| Active mode           | Start OCD emulator connection | Change low power mode | Access AHB-AP and system bus | Access APB-AP and OCDREG |
|-----------------------|-------------------------------|-----------------------|------------------------------|--------------------------|
| Sleep                 | Yes                           | Yes                   | Yes                          | Yes                      |
| Software Standby      | No                            | Yes                   | No                           | Yes                      |
| Snooze                | No                            | Yes                   | No                           | Yes                      |
| Deep Software Standby | No                            | Yes                   | No                           | Yes                      |

If system bus access is required in Software Standby, Snooze, or Deep Software Standby mode, set the MCUCTRL.DBIRQ bit in OCDREG to wake up the MCU from the low power modes. Simultaneously, by asserting the MCUCTRL.DBIRQ bit in OCDREG, the OCD emulator can wake up the MCU without starting CPU execution by using a CPU break.

### 2.13.2.3 Connecting sequence and JTAG/SWD authentication

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access DAP bus.  
In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP Control Status Register, and then wait until CSDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Set MCUCTRL.CPUWAIT = 1.
5. Confirm the debug capability of device by reading MCUSTAT:
  - If Debug function is prohibited, this device is not able to debug.
  - If Debug function is enabled and secure debug is not available, only non-secure debug is available.
  - If Debug function is enabled and secure debug is available, full debug functions are available.

If Debug function is available, set debug-related register then clear MCUCTRL.CPUWAIT = 0.

6. Set up the AHB-AP to access the system address space. The AHB-AP is connected to DAP bus port 0.
7. Set SYOCDCLR.DBGEN to 1.
8. Start accessing the CPU debug resources using the AHB-AP.

Note: Debug level is determined by the current DLM state of product.

| 主动模式   | 启动强迫模拟器连接 | 更改低功耗模式 | 访问AHB-AP和系统总线 | 访问APB-AP和OCDREG |
|--------|-----------|---------|---------------|-----------------|
| Sleep  | Yes       | Yes     | Yes           | Yes             |
| 软件待机   | No        | Yes     | No            | Yes             |
| Snooze | No        | Yes     | No            | Yes             |
| 深度软件待机 | No        | Yes     | No            | Yes             |

如果在软件待机、贪睡或深度软件待机模式下需要系统总线访问，则设置OCDREG中的MCUCTRL.DBIRQ位以将MCU从低功耗模式中唤醒。同时，通过置位OCDREG中的MCUCTRL.DBIRQ位，OCD仿真器可以在不使用CPU中断启动CPU执行的情况下唤醒MCU。

### 2.13.2.3 连接顺序和JTAG/SWD认证

- 1.通过JTAG或SWD接口将OCD调试器连接到MCU。
- 2.设置SWJ-DP访问DAP总线。  
在设置中，OCD仿真器必须在SWJDP中声明CDBGPWRUPREQ。控制状态寄存器，然后等待同一寄存器中的CSDBGPWRUPACK被断言。
- 3.将APB-AP设置为访问OCDREG。此APB-AP连接到DAP总线端口1。
4. Set MCUCTRL.CPUWAIT = 1.
- 5.通过读取MCUSTAT确认设备的调试能力：
  - 如果Debug功能被禁止，则本设备无法调试。
  - 如果启用了Debug功能且没有安全调试，则只能进行非安全调试。
  - 如果启用了Debug功能并且可以使用安全调试，则可以使用完整的调试功能。

如果Debug功能可用，设置调试相关寄存器然后清除MCUCTRL.CPUWAIT=0。

- 6.设置AHB-AP访问系统地址空间。AHB-AP连接到DAP总线端口0。
- 7.将SYOCDCLR.DBGEN设置为1。
- 8.开始使用AHB-AP访问CPU调试资源。

Note: 调试级别由产品的当前DLM状态决定。

## 3. Operating Modes

### 3.1 Overview

Table 3.1 shows the selection of operating modes by the mode-setting pin. For details, see [section 3.2. Details of Operating Modes](#). Operation starts with the on-chip flash memory enabled, regardless of the mode in which operation started.

Table 3.1 Selection of operating modes by the mode-setting pin

| Mode-setting pin (MD) | Operating mode      | On-chip Flash |
|-----------------------|---------------------|---------------|
| 1                     | Single-chip mode    | Enable        |
| 0                     | SCI / USB boot mode | Enable        |

### 3.2 Details of Operating Modes

#### 3.2.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output port, inputs or outputs for peripheral functions, or as interrupt inputs.

When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip flash is enabled.

#### 3.2.2 SCI Boot Mode

In this mode, the on-chip flash memory programming routine (SCI boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see [section 44, Flash Memory](#). The MCU starts in SCI boot mode if the MD pin is held low on release from the reset state.

#### 3.2.3 USB Boot Mode

In this mode, the on-chip flash memory programming routine (USB boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using USB. For details, see [section 44, Flash Memory](#). The MCU starts in USB boot mode if the MD pin is held low on release from the reset state.

| 0                     | SCI/USB启动模式      | Enable        |

### 3.2 操作模式的详细信息

#### 3.2.1 Single-Chip Mode

在单片机模式下，所有IO引脚都可用作输入或输出端口、外围功能的输入或输出，或用作中断输入。

当MD引脚为高电平时释放复位时，MCU以单芯片模式启动，并启用片上闪存。

#### 3.2.2 SCI启动模式

在这种模式下，使用存储在MCU引导区域中的片上闪存编程例程（SCI引导程序）。片上闪存，包括代码闪存和数据闪存，可以通过使用通用异步接收发送器(UART)SCI从MCU外部进行修改。有关详细信息，请参阅第44节，闪存。如果MD引脚在从复位状态释放时保持低电平，则MCU以SCI启动模式启动。

#### 3.2.3 USB启动模式

在这种模式下，使用存储在MCU引导区域中的片上闪存编程例程（USB引导程序）。片上闪存，包括代码闪存和数据闪存，可以通过USB从MCU外部进行修改。有关详细信息，请参阅第44节，闪存。如果MD引脚在从复位状态释放时保持低电平，则MCU在USB引导模式下启动。

Note: — : 已初始化—未初始化

注1.关于各寄存器的初始值, 请参阅第8节“时钟生成电路”。

- Note 2. The RTC has a software reset. Some control bits are not initialized by all types of resets. For details on the target bits, see [section 23, Realtime Clock \(RTC\)](#).
- Note 3. Depends on the setting of DPSBYCR.IOKEEP.
- Note 4. Some control bits are not initialized by all types of resets. For details on the target bits, see [section 14, Buses](#).
- Note 5. Reset does not occur while the debugger is connected (DBGSTR.CDBGWRUPREQ = 1) even if On-chip debugger is disabled (SYOCDRCR.DBGEN = 0).
- Note 6. Reset does not occur while On-chip debugger is enabled (SYOCDRCR.DBGEN = 1).

The RTC is not initialized by any reset source. SOSC and LOCO can be selected as the clock sources of the RTC.

[Table 5.4](#) and [Table 5.5](#) show the states of SOSC and LOCO when a reset occurs.

**Table 5.4 States of SOSC when a reset occurs**

|      |                   | Reset source  |   |
|------|-------------------|---|---|
|      |                   | POR   | Other   |
| SOSC | Enable or disable | Initialized to enable   | Continue with the state that was selected before the reset occurred |
|      | Drive capability  | Continue with the state that was selected before the reset occurred |   |

**Table 5.5 States of LOCO when a reset occurs**

|      |                        | Reset source  |   |
|------|------------------------|---|---|
|      |                        | POR, LVD0, LVD1, LVD2, Deep Software Standby (DEEPCUT[0] = 1)         | Other   |
| LOCO | Enable or disable      | Initialized to enable   |   |
|      | Oscillation accuracy*1 | Initialized to accuracy before trimming by power-on (accuracy: ± 10%) | Continue with the accuracy that was trimmed by LOCOUTCR |

Note 1. The LOCO User Trimming Control Register (LOCOUTCR) is reset by POR, LVD0, LVD1, LVD2, and Deep Software Standby (DEEPCUT[0] = 1) resets, returning the LOCO to the default oscillation accuracy. This can affect RTC accuracy if the RTC uses the LOCO (with a user trimming value in LOCOUTCR) as the RTC source clock. To restore the pre-reset LOCO oscillation accuracy, reload the required trimming value into LOCOUTCR after any of these resets.

When a reset is released, reset exception handling starts.

[Table 5.6](#) lists the pin related to the reset function.

注2.RTC具有软件复位功能。某些控制位并非由所有类型的复位初始化。有关目标位的详细信息，请参见第23节，实时时钟(RTC)。

注3.取决于DPSBYCR.IOKEEP的设置。

注4.并非所有类型的复位都会初始化一些控制位。有关目标位的详细信息，请参阅第14节，总线

注5.连接调试器(DBGSTR.CDBGWRUPREQ=1)时不会发生复位，即使禁用片上调试器(SYOCDRCR.DBGEN=0)。

注6.启用片上调试器(SYOCDRCR.DBGEN=1)时不会发生复位。

RTC不会被任何复位源初始化。可选择SOSC和LOCO作为RTC的时钟源。

表5.4和表5.5显示了复位发生时SOSC和LOCO的状态。

**Table 5.4 发生复位时SOSC的状态**

|      | 振荡精度*1 | 上电微调前初始化为精度 (精度: ±10%)                  | 继续使用被修剪的精度 LOCOUTCR |

注1.LOCO用户微调控制寄存器(LOCOUTCR)由POR、LVD0、LVD1、LVD2和深度软件待机复位 (DEEPCUT[0]=1)复位，将LOCO返回到默认振荡精度。如果RTC使用LOCO (在LOCOUTCR中具有用户修整值)作为RTC源时钟，这可能会影响RTC精度。要恢复预复位的LOCO振荡精度，请在任何这些复位后将所需的微调值重新加载到LOCOUTCR。

当一个复位被释放时，复位异常处理开始。

## 5.3 Operation

### 5.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified at power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time ( $t_{RESWT}$ ) elapses. The CPU then starts the reset exception handling.

For details, see [section 47, Electrical Characteristics](#).

### 5.3.2 Power-On Reset

The power-on reset (POR) is an internal reset generated by the power-on reset circuit. A power-on reset is generated under the following conditions.

1. If the RES pin is in a high level state when power is supplied
2. If the RES pin is in a high level state when VCC is below  $V_{POR}$

After VCC exceeds  $V_{POR}$  and the specified power-on reset time ( $t_{POR}$ ) elapses, the CPU starts the reset exception handling. The power-on reset time is a stabilization period of the external power supply and the MCU circuit.

After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset. When VCC falls below  $V_{POR}$ , a power-on reset state is occurred.

[Figure 5.1](#) shows example of operations during a power-on reset.

## 5.3 Operation

### 5.3.1 RES引脚复位

RES引脚产生此复位。当RES引脚被驱动为低电平时，所有正在进行的处理都被中止，MCU进入复位状态。要成功复位MCU，RES引脚必须在上电时指定的电源稳定时间内保持低电平。

当RES引脚从低电平驱动为高电平时，内部复位会在RES取消后等待时间( $t_{RESWT}$ )过去后取消。CPU然后开始复位异常处理。

有关详细信息，请参见第47节，电气特性。

### 5.3.2 Power-On Reset

上电复位（POR）是由上电复位电路产生的内部复位。在以下条件下会产生上电复位。

- 1.如果RES引脚在供电时处于高电平状态
- 2.如果VCC低于VPOR时RES管脚处于高电平状态

在VCC超过VPOR并且经过指定的上电复位时间( $t_{POR}$ )后，CPU开始复位异常处理。上电复位时间是外部电源和MCU电路的稳定期。

上电复位产生后，RSTSR0中的PORF标志设置为1。PORF标志由RES引脚复位初始化。当VCC低于VPOR时，会发生上电复位状态。

图5.1显示了上电复位期间的操作示例。

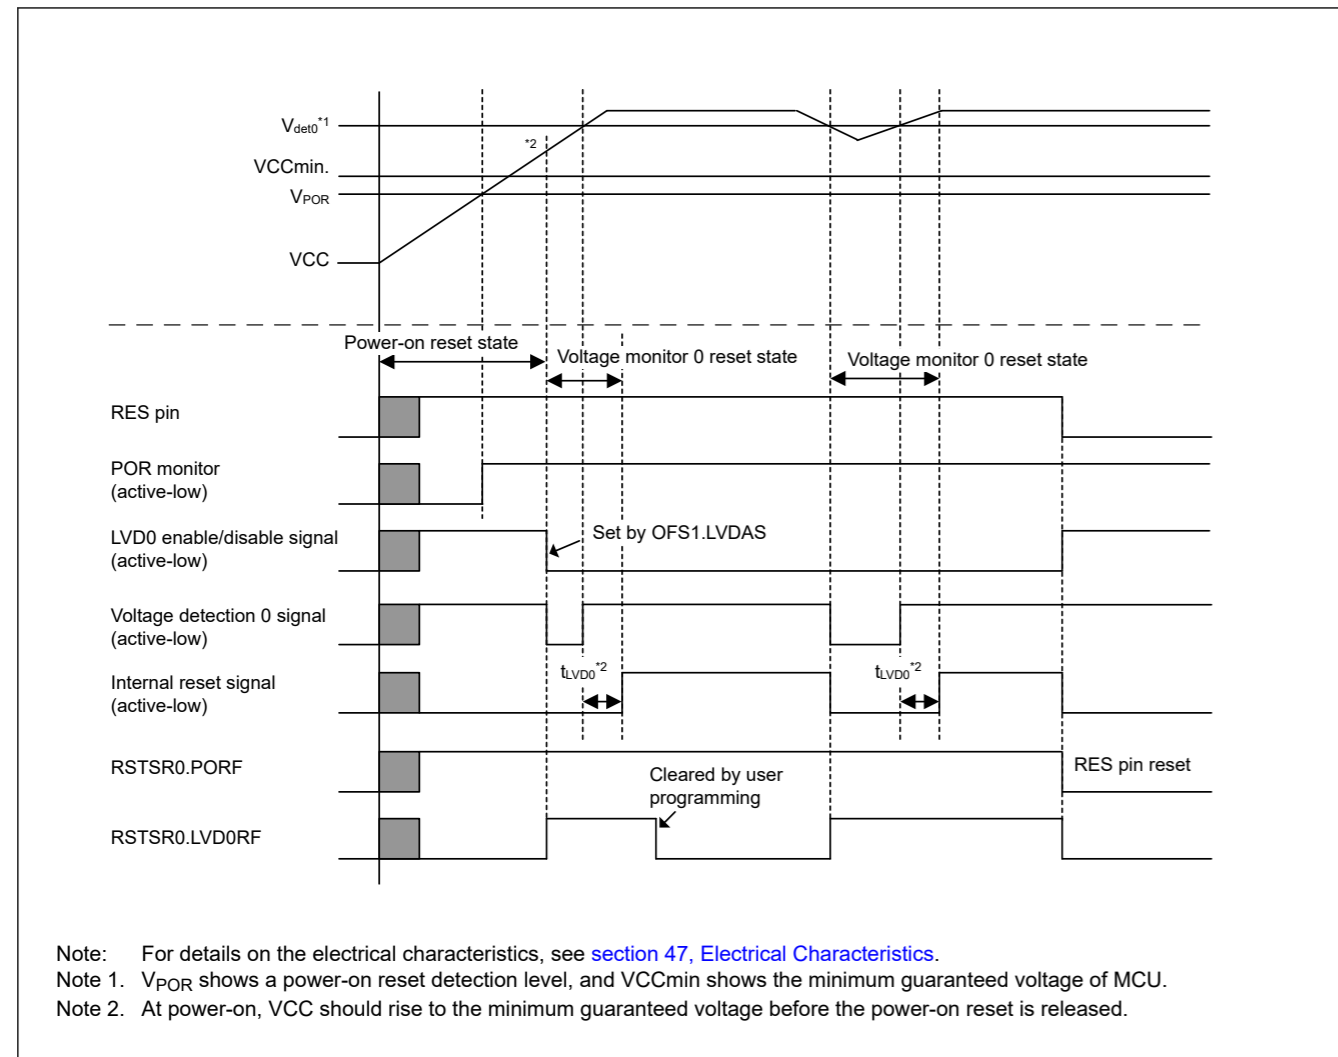

Figure 5.1 Example of operations during a power-on reset

### 5.3.3 Voltage Monitor Reset

The voltage monitor  $i$  ( $i = 0, 1, 2$ ) reset is an internal reset generated by the voltage monitor  $i$  circuit. If the Voltage Detection 0 Circuit Start (LVDAS) bit in the Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below  $V_{det0}$ , the RSTSR0.LVD0RF flag becomes 1 and the voltage detection circuit generates voltage monitor 0 reset. Clear the OFS1.LVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds  $V_{det0}$  and the voltage monitor 0 reset time ( $t_{LVD0}$ ) elapses, the internal reset is canceled and the CPU starts the reset exception handling.

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (LVD1CR0), the RSTSR0.LVD1RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 1 reset if VCC falls to or below  $V_{det1}$ .

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (LVD2CR0), the RSTSR0.LVD2RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 2 reset if VCC falls to or below  $V_{det2}$ .

Similarly, timing for release from the voltage monitor 1 reset state is selectable with the Voltage Monitor 1 Reset Negate Select bit (RN) in the LVD1CR0. When the LVD1CR0.RN bit is 0 and VCC falls to or below  $V_{det1}$ , the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time ( $t_{LVD1}$ ) elapses after VCC rises

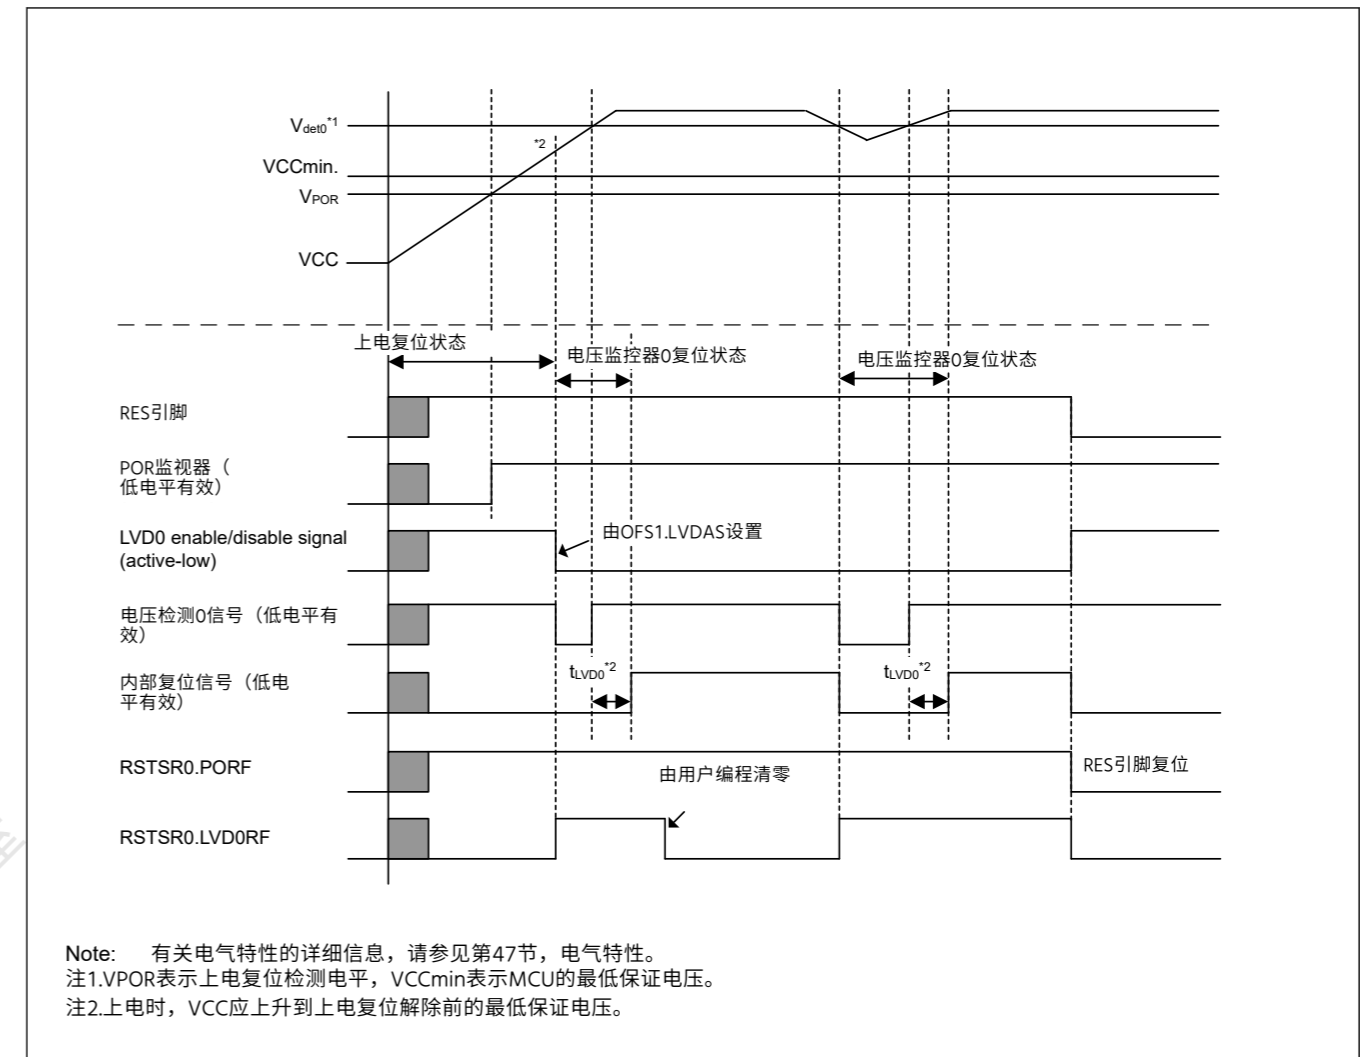

Figure 5.1 上电复位时的动作示例

### 5.3.3 电压监视器复位

电压监视器( $i=0, 1, 2$ )复位是由电压监视器 $i$ 电路产生的内部复位。如果电压选项功能选择寄存器1(OFS1)中的检测0电路启动(LVDAS)位为0(复位后使能电压监视器0复位)且VCC低于 $V_{det0}$ 时, RSTSR0.LVD0RF标志变为1, 电压检测电路生成电压监视器0复位。如果要使用电压监视器0复位, 则将OFS1.LVDAS位清零。在VCC超过 $V_{det0}$ 并且经过电压监视器0复位时间( $t_{LVD0}$ )后, 内部复位被取消, CPU开始复位异常处理。

当电压监视器1中断复位允许位(RIE)设置为1(允许电压检测电路产生复位或中断)且电压监视器1电路模式选择位(RI)设置为1(选择产生电压监视器1电路控制寄存器0(LVD1CR0)中的低电压检测复位响应), RSTSR0.LVD1RF标志设置为1, 如果VCC降至或低于 $V_{det1}$ , 电压检测电路将产生电压监视器1复位 $det1$ 。

同样, 当电压监视器2中断复位使能位(RIE)设置为1(允许电压检测电路产生复位或中断)并且电压监视器2电路模式选择位(RI)设置为1(选择在电压监视器2电路控制寄存器0(LVD2CR0)中响应检测到低电压产生复位), RSTSR0.LVD2RF标志设置为1, 如果VCC下降到或电压检测电路产生电压监视器2复位低于 $V_{det2}$ 。

类似地, 从电压监视器1复位状态释放的时间可以通过LVD1CR0中的电压监视器1复位否定选择位(RN)来选择。当LVD1CR0.RN位为0且VCC下降到或低于 $V_{det1}$ 时, CPU从内部复位状态中释放并在VCC上升后经过LVD1复位时间( $t_{LVD1}$ )时开始复位异常处理。

above  $V_{det1}$ . When the LVD1CR0.RN bit is 1 and VCC falls to or below  $V_{det1}$ , the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time ( $t_{LVD1}$ ) elapses.

Likewise, timing for release from the voltage monitor 2 reset state is selectable by setting the Voltage Monitor 2 Reset Negate Select bit (RN) in the LDV2CR0 register.

Detection levels  $V_{det1}$  and  $V_{det2}$  can be changed in the Voltage Monitoring Comparator Control Register (LVD1CMPCR/LVD2CMPCR).

Figure 5.2 shows example of operations during voltage monitor 1 and 2 resets. For details on the voltage monitor 1 reset and voltage monitor 2 reset, see [section 7, Low Voltage Detection \(LVD\)](#).

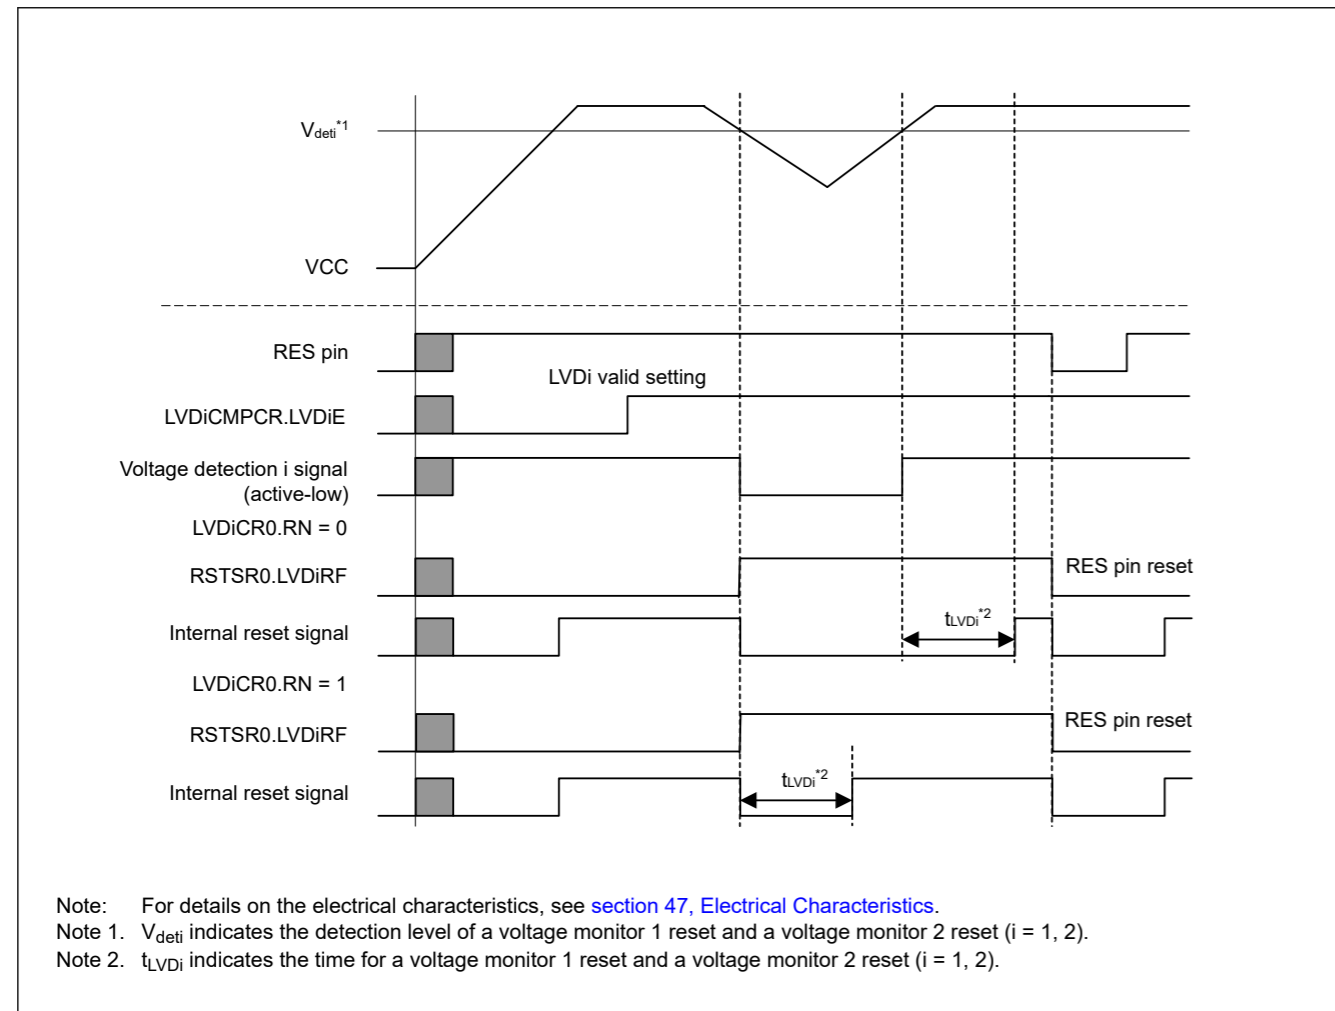

Figure 5.2 Example of operations during voltage monitor 1 and voltage monitor 2 resets

### 5.3.4 Deep Software Standby Reset

This is an internal reset generated when deep software standby mode is canceled by an interrupt.

When a deep software standby mode cancellation source is generated, a deep software standby reset is generated. The deep software standby reset is canceled after  $t_{DSBY}$  (return time after deep software standby mode cancellation) has elapsed. At the same time, deep software standby mode is also canceled.

When  $t_{DSBYWT}$  (wait time after deep software standby mode cancellation) has elapsed after deep software standby mode has been canceled, the internal reset is canceled and the CPU starts the reset exception handling.

For details of the deep software standby reset, see [section 10, Low Power Modes](#).

高于 $V_{det1}$ 。当LVD1CR0.RN位为1且VCC下降到或低于 $V_{det1}$ 时，CPU会从内部复位状态中释放，并在LVD1复位时间( $t_{LVD1}$ )过去后开始复位异常处理。

同样，从电压监视器2复位状态释放的时间可通过设置电压监视器2复位来选择LDV2CR0寄存器中的取反选择位(RN)。

检测电平 $V_{det1}$ 和 $V_{det2}$ 可以在电压监控比较器控制寄存器(LVD1CMPCR/LVD2CMPCR)。

图5.2显示了电压监视器1和2复位期间的操作示例。有关电压监视器1复位和电压监视器2复位的详细信息，请参见第7节，低电压检测(LVD)。

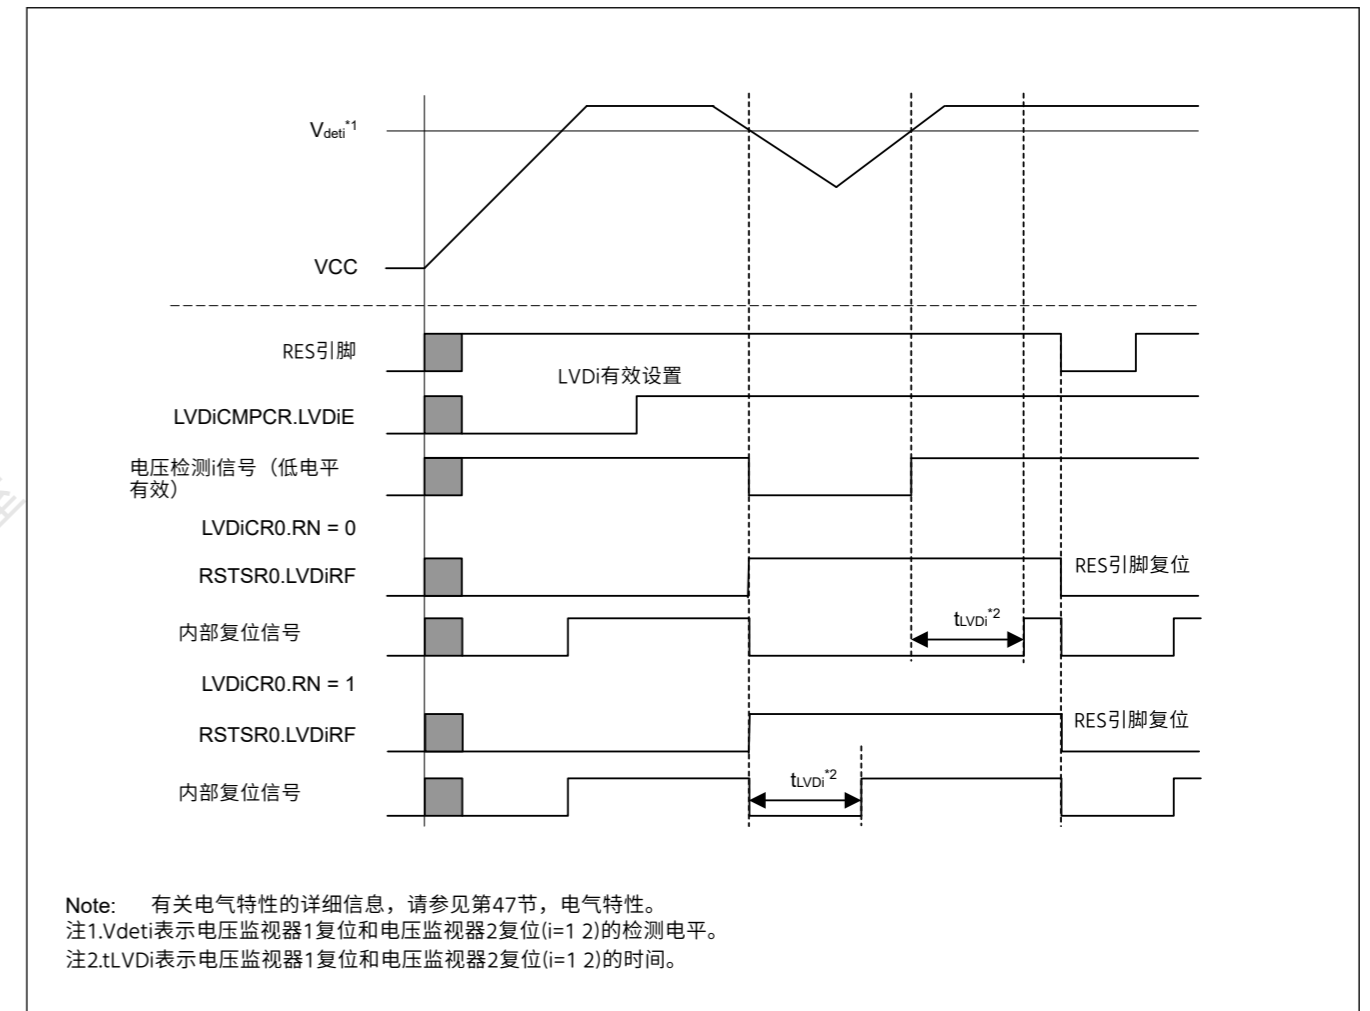

Figure 5.2 电压监视器1和电压监视器2复位期间的操作示例

### 5.3.4 深度软件待机复位

这是当深度软件待机模式被中断取消时产生的内部复位。

当产生深度软件待机模式取消源时，将产生深度软件待机复位。在经过 $t_{DSBY}$ （深度软件待机模式取消后的返回时间）后，深度软件待机复位被取消。同时，深度软件待机模式也被取消。

在深度软件待机模式取消后经过 $t_{DSBYWT}$ （深度软件待机模式取消后的等待时间）时，内部复位被取消，CPU开始复位异常处理。

有关深度软件待机复位的详细信息，请参见第10节，低功耗模式。

### 5.3.5 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated from the Independent Watchdog Timer (IWDT). Output of the reset from the IWDT can be selected in the Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time ( $t_{RESW2}$ ) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

### 5.3.6 Watchdog Timer Reset

The watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT). Output of the reset from the WDT can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select register 0 (OFS0).

When output of the watchdog timer reset is selected, a watchdog timer reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time ( $t_{RESW2}$ ) elapses after the watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the watchdog timer reset, see [section 24, Watchdog Timer \(WDT\)](#).

### 5.3.7 Software Reset

The software reset is an internal reset generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time ( $t_{RESW2}$ ) elapses after the software reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the SYSRESETREQ bit, see the *ARM® Cortex®-M33 Technical Reference Manual*.

### 5.3.8 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. This flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The CWSF flag is set to 0 when a power-on reset occurs (cold start), otherwise the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even on writing 0 to it.

[Figure 5.3](#) shows an example of cold/warm start determination operation.

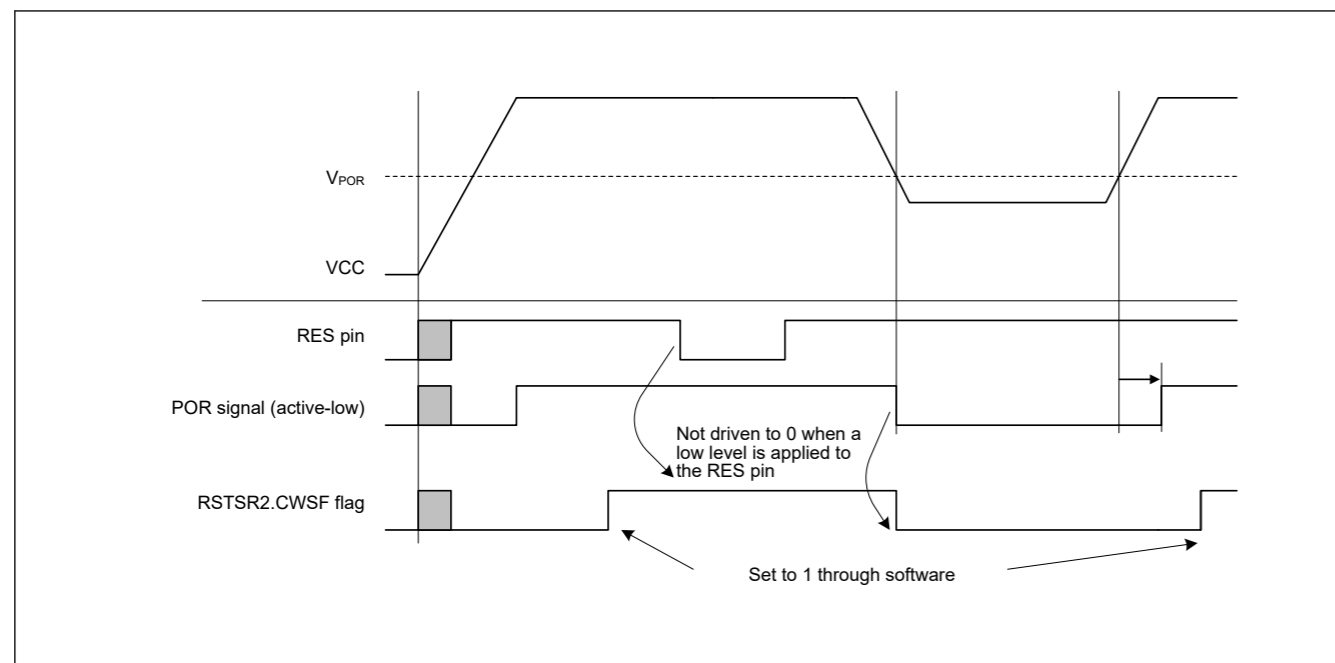

Figure 5.3 Example of cold/warm start determination operation

### 5.3.5 独立看门狗定时器复位

独立看门狗定时器复位是由独立看门狗定时器 (IWDT) 产生的内部复位。可以在选项功能选择寄存器0(OFS0)中选择IWDT的复位输出。

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows or if data is written when refresh operation is disabled. 当独立看门狗定时器复位产生后经过内部复位时间( $t_{RESW2}$ )时, 内部复位被取消, CPU开始复位异常处理。

有关独立看门狗定时器复位的详细信息, 请参见第25节, 独立看门狗定时器(IWDT)。

### 5.3.6 看门狗定时器复位

看门狗定时器复位是由看门狗定时器(WDT)产生的内部复位。WDT的复位输出可以在WDT复位控制寄存器(WDTRCR)或选项功能选择寄存器0(OFS0)中选择。

选择看门狗定时器复位输出时, 如果WDT下溢, 或者在禁止刷新操作时写入数据, 则会产生看门狗定时器复位。在产生看门狗定时器复位后经过内部复位时间( $t_{RESW2}$ )时, 内部复位被取消, CPU开始复位异常处理。

有关看门狗定时器复位的详细信息, 请参见第24节, 看门狗定时器(WDT)。

### 5.3.7 软件复位

软件复位是通过软件设置Arm内核的AIRCR寄存器中的SYSRESETREQ位产生的内部复位。当SYSRESETREQ位设置为1时, 会产生软件复位。当软件复位产生后经过内部复位时间( $t_{RESW2}$ )时, 内部复位被取消, CPU开始复位异常处理。

有关SYSRESETREQ位的详细信息, 请参阅ARM®Cortex®-M33技术参考手册。

### 5.3.8 冷暖启动的测定

读取RSTSR2中的CWSF标志以确定复位处理的原因。该标志指示是上电复位导致复位处理 (冷启动) 还是操作期间输入的复位信号导致复位处理 (热启动)。

当发生上电复位 (冷启动) 时, CWSF标志设置为0, 否则该标志不设置为0。当通过软件向其写入1时, 该标志设置为1。即使向其写入0, 它也不会设置为0。

图5.3显示了冷暖启动确定操作的示例。

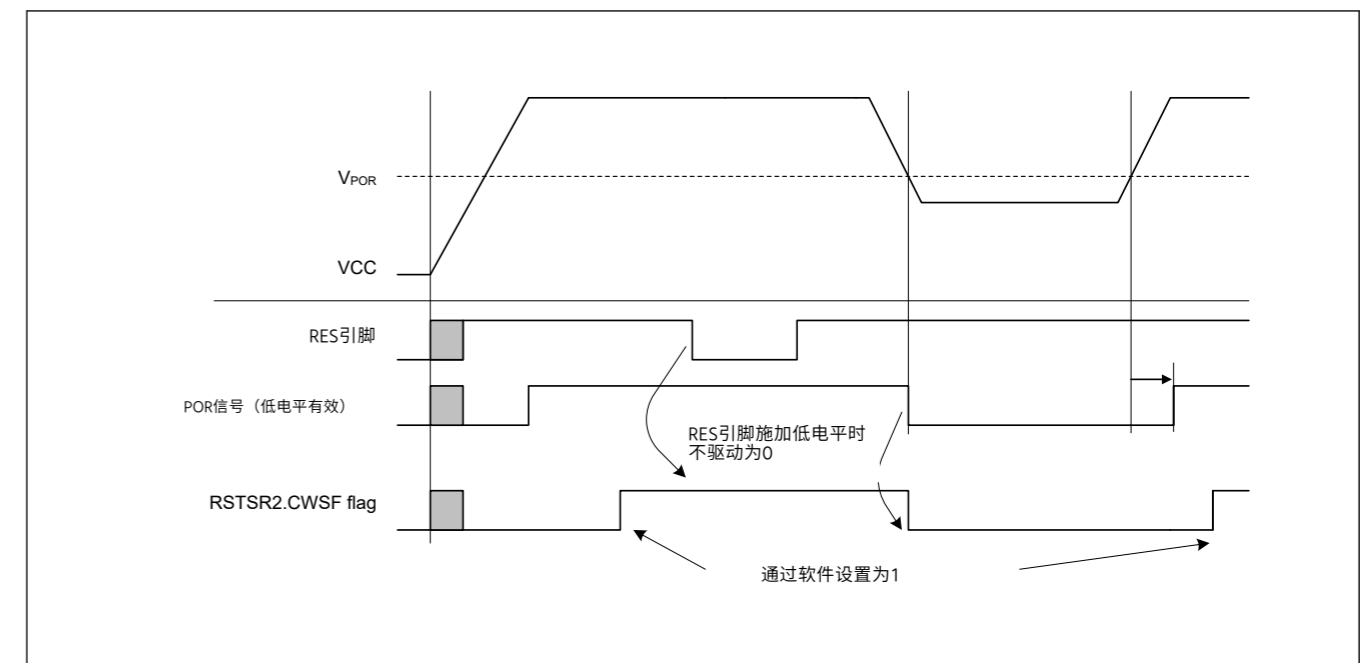

Figure 5.3 冷暖启动判定动作示例

### 5.3.9 Determination of Reset Generation Source

Read RSTSR0 and RSTSR1 to determine which reset executes the reset exception handling.

Figure 5.4 shows an example of the flow to identify a reset generation source. The reset flag must be written with 0 after it is read as 1.

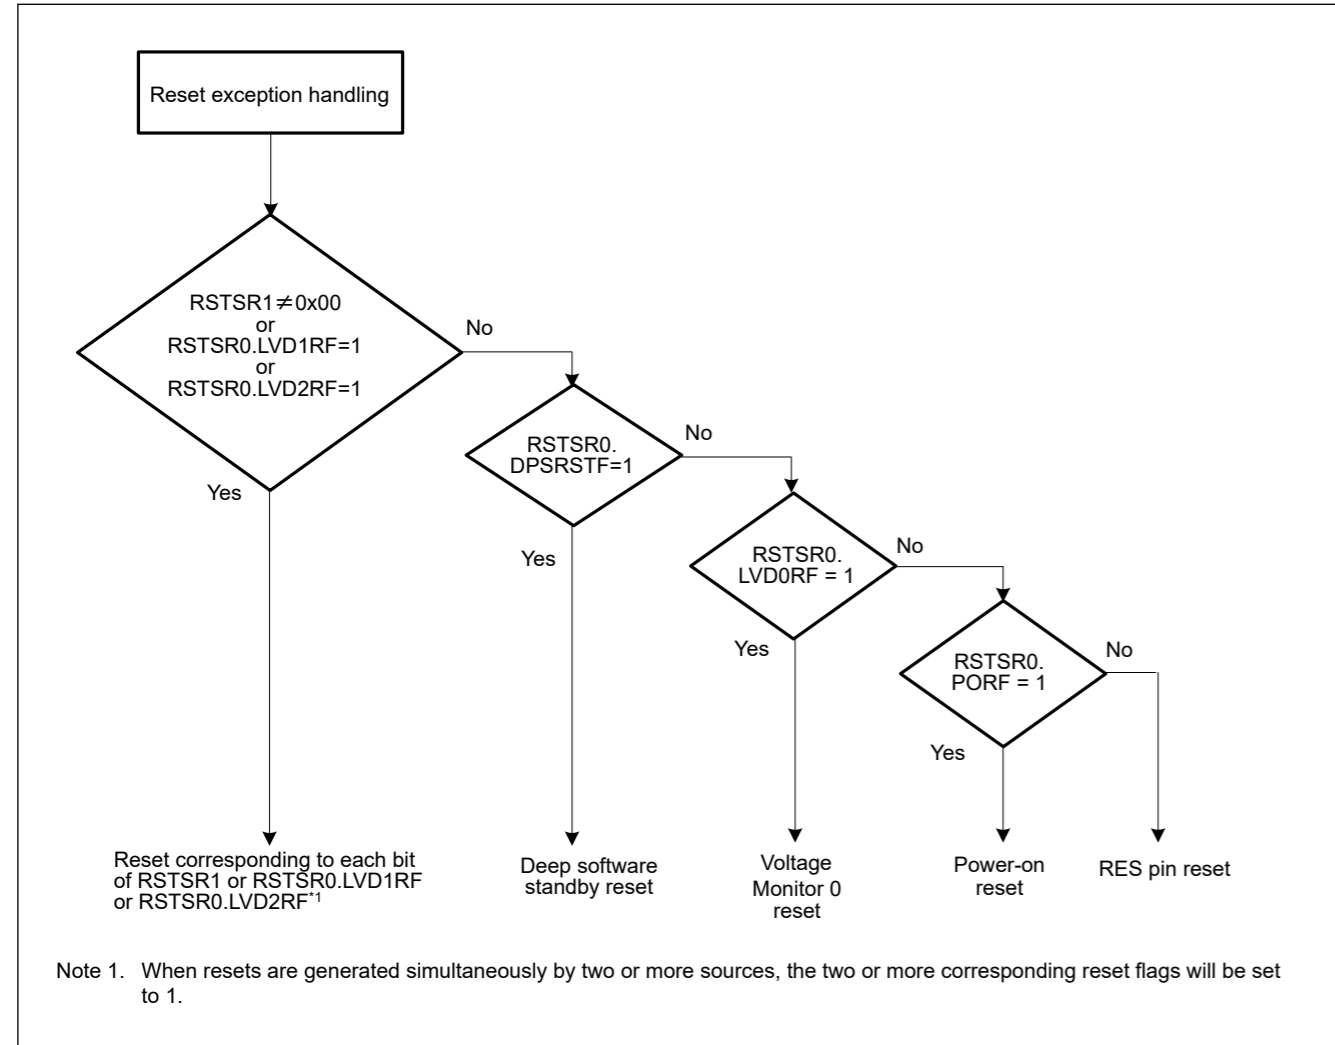

Figure 5.4 Example of reset generation source determination flow

### 5.3.9 复位产生源的确定

读取RSTSR0和RSTSR1以确定哪个复位执行复位异常处理。

图5.4显示了识别复位产生源的流程示例。复位标志读为1后必须写为0。

#### IWDTSTRT bit (IWDT Start Mode Select)

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state).

#### IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The number of clock cycles that the IWDT takes to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

#### IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, and 1/256. Using this setting combined with the IWDTTOPS[1:0] bits setting, the IWDT counting period can be set from 128 to 524288 IWDT clock cycles.

#### IWDTSTRT位 (IWDT启动模式选择)

IWDTSTRT位选择复位后激活IWDT的模式 (停止状态或激活状态)。

#### IWDTTOPS[1:0]位 (IWDT超时周期选择)

IWDTTOPS[1:0]位指定超时周期，即递减计数器下溢所需的时间，为IWDTCKS[3]中设置的分频时钟的128、512、1024或2048个周期：0]位。刷新操作后IWDT下溢所需的时钟周期数由IWDTCKS[3:0]和IWDTTOPS[1:0]位的组合决定。

有关详细信息，请参见第25节，独立看门狗定时器(IWDT)。

#### IWDTCKS[3:0]位 (IWDT专用时钟分频比选择)

IWDTCKS[3:0]位指定用于将IWDT的时钟频率分频为11、116、132、164、1128和1256的预分频器的分频比。将此设置与IWDTTOPS[1:0]位设置，IWDT计数周期可以设置为128到524288个IWDT时钟周期。

For details, see [section 25, Independent Watchdog Timer \(IWDTRPES\)](#).

#### IWDTRPES[1:0] bits (IWDTRPES Window End Position Select)

The IWDTRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the IWDTRPSS[1:0] and IWDTRPES[1:0] bits vary with the setting in the IWDTTOPS[1:0] bits.

For details, see [section 25, Independent Watchdog Timer \(IWDTRPSS\)](#).

#### IWDTRPSS[1:0] bits (IWDTRPSS Window Start Position Select)

The IWDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window starts and ends positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see [section 25, Independent Watchdog Timer \(IWDTRSTIRQS\)](#).

#### IWDTRSTIRQS bit (IWDTRSTIRQS Reset Interrupt Request Select)

The IWDTRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to an independent watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see [section 25, Independent Watchdog Timer \(IWDTRPSS\)](#).

#### IWDTRPCTL bit (IWDTRPCTL Stop Control)

The IWDTRPCTL bit specifies whether to stop counting when entering Sleep mode, Snooze mode, or Software Standby mode.

For details, see [section 25, Independent Watchdog Timer \(IWDTRPSS\)](#).

#### WDTSTRT bit (WDTSTRT Start Mode Select)

The WDTSTRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated in auto start mode). When WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

#### WDTTOPS[1:0] bits (WDTTOPS Timeout Period Select)

The WDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDTCKS[3:0] bits. The number of PCLKB cycles that takes to underflow after a refresh operation is determined by a combination of the WDTCKS[3:0] and WDTTOPS[1:0] bits.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

#### WDTCKS[3:0] bits (WDTCKS Clock Frequency Division Ratio Select)

The WDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of PCLKB as 1/4, 1/64, 1/128, 1/512, 1/2048, and 1/8192. Using this setting combined with the WDTTOPS[1:0] bits setting, the WDT counting period can be set from 4096 to 134217728 PCLKB cycles.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

#### WDRPES[1:0] bits (WDRPES Window End Position Select)

The WDRPES[1:0] bits specify the position where the window on the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the WDRPSS[1:0] and WDRPES[1:0] bits vary with the setting of the WDTTOPS[1:0] bits.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

有关详细信息，请参见第25节，独立看门狗定时器(IWDTRPES)。

#### IWDTRPES[1:0]位 (IWDTRPES窗口结束位置选择)

IWDTRPES[1:0]位指定递减计数器窗口结束的位置为计数值的0%、25%、50%或75%。窗口结束位置的值必须小于窗口开始位置的值，否则只有窗口开始位置的值有效。

与IWDTRPSS[1:0]中窗口的开始和结束位置的设置相关的计数器值和IWDTRPES[1:0]位随IWDTTOPS[1:0]位的设置而变化。

有关详细信息，请参见第25节，独立看门狗定时器(IWDTRPSS)。

#### IWDTRPSS[1:0]位 (IWDTRPSS窗口起始位置选择)

IWDTRPSS[1:0]位指定递减计数器窗口的起始位置为计数值的25%、50%、75%或100%。计数开始点为100%，下溢发生点为0%。窗口开始位置和结束位置之间的间隔成为可以刷新的时间段。在此期间之外无法刷新。

有关详细信息，请参见第25节，独立看门狗定时器(IWDTRSTIRQS)。

#### IWDTRSTIRQS位 (IWDTRSTIRQS复位中断请求选择)

IWDTRSTIRQS位选择在递减计数器下溢或产生刷新错误时的操作。该操作可选择独立看门狗定时器复位、不可屏蔽中断请求或中断请求。

有关详细信息，请参见第25节，独立看门狗定时器(IWDTRPSS)。

#### IWDTRPCTL位 (IWDTRPCTL停止控制)

IWDTRPCTL位指定在进入休眠模式、贪睡模式或软件待机模式时是否停止计数。

有关详细信息，请参见第25节，独立看门狗定时器(IWDTRPSS)。

#### WDTSTRT位 (WDTSTRT启动模式选择)

WDTSTRT位选择WDT在复位后激活的模式（停止状态或在自动启动模式下激活）。当WDT在自动启动模式下激活时，WDT的OFS0寄存器设置有效。

#### WDTTOPS[1:0]位 (WDTTOPS超时周期选择)

WDTTOPS[1:0]位指定超时周期，即在WDTCKS[3:0]中设置的分频时钟的1024、4096、8192或16384个周期时，递减计数器下溢所需的时间。刷新操作后下溢的PCLKB周期数由WDTCKS[3:0]和WDTTOPS[1:0]位的组合决定。

有关详细信息，请参见第24节，看门狗定时器(WDT)。

#### WDTCKS[3:0]位 (WDTCKS时钟分频比选择)

WDTCKS[3:0]位指定用于分频PCLKB的预分频器的分频比为14、164、1128、1512、12048和18192。将此设置与WDTTOPS[1:0]位设置，WDT计数周期可以设置为4096到134217728个PCLKB周期。

有关详细信息，请参见第24节，看门狗定时器(WDT)。

#### WDRPES[1:0]位 (WDRPES窗口结束位置选择)

WDRPES[1:0]位指定递减计数器上窗口结束的位置为计数值的0%、25%、50%或75%。窗口结束位置的值必须小于窗口开始位置的值，否则只有窗口开始位置的值有效。

与WDRPSS[1:0]中窗口的开始和结束位置设置相关的计数器值和WDRPES[1:0]位随WDTTOPS[1:0]位的设置而变化。

有关详细信息，请参见第24节，看门狗定时器(WDT)。

**WDTRPSS[1:0] bits (WDT Window Start Position Select)**

The WDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible.

Refresh is not possible outside this period.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

**WDRSTIRQS bit (WDT Reset Interrupt Request Select)**

The WDRSTIRQS bit selects the operation on an underflow of the down-counter or generation of a refresh error. The operation is selectable to a watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

**WDTSTPCTL bit (WDT Stop Control)**

The WDTSTPCTL bit specifies whether to stop counting when entering Sleep mode.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

Only secure developer can program OFS1\_SEC and OFS1\_SEL registers. OFS1\_SEC register is for secure developer, and OFS1 register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in OFS1\_SEL register. For details, see [section 6.3.3. Security attribution of option-setting memory](#).

**VDSEL[1:0] bits (Voltage Detection 0 Level Select)**

The VDSEL[1:0] bits select the voltage detection level of the voltage detection 0 circuit.

**LVDAS bits (Voltage Detection 0 Circuit Start)**

The LVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

**HOCOEN bit (HOCO Oscillation Enable)**

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the Clock Source Select bits (SCKSCR.CKSEL[2:0]). To use the HOCO clock, you must set the OFS1.HOCOFRQ0 bit to an optimum value.

**HOCOFRQ0[1:0] bits (HOCO Frequency Setting 0)**

The HOCOFRQ0[1:0] bits specify the HOCO frequency after a reset as 16, 18, or 20 MHz.

**VDSEL[1:0]位（电压检测0电平选择）**

VDSEL[1:0]位选择电压检测0电路的电压检测电平。

**LVDAS位（电压检测0电路启动）**

LVDAS位选择在复位后是启用还是禁用电压监视器0复位。

**HOCOEN位（HOCO振荡使能）**

HOCOEN位选择在复位后是启用还是禁用HOCO振荡。将此位设置为0允许在CPU开始运行之前启动HOCO振荡，减少了振荡稳定的等待时间。

Note: 当HOCOEN位设置为0时，系统时钟源不切换到HOCO。系统时钟源只能通过设置时钟源选择位(SCKSCR.CKSEL[2:0])切换到HOCO。要使用HOCO时钟，您必须将OFS1.HOCOFRQ0位设置为最佳值。

**HOCOFRQ0[1:0]位（HOCO频率设置0）**

HOCOFRQ0[1:0]位指定复位后的HOCO频率为16、18或20MHz。

 BPS\_SEC: 0x0100\_A240, 0x0100\_A244  
 BPS\_SEL: 0x0100\_A2C0, 0x0100\_A2C4

Bit field:

Value after reset:

User setting\*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program BPS\_SEC and BPS\_SEL registers. BPS\_SEC register is for secure developer, and BPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS\_SEL register. For details, see [section 6.3.3. Security attribution of option-setting memory](#).

The BPS and BPS\_SEC registers invalidate the programming and erasure to the code flash memory. When the bit of this register is set to 0, the programming and erasure to the corresponding block are invalid. [Figure 6.3](#) shows the code flash block structure of each product. [Figure 6.4](#) shows the relationship between the bit of register and the block number. Unused bits are reserved and should be set to 1.

只有安全的开发人员才能对BPS\_SEC和BPS\_SEL寄存器进行编程。BPS\_SEC寄存器用于安全开发者，BPS寄存器用于非安全开发者。应用的设置值由BPS\_SEL寄存器中相应位的设置值决定。详见6.3.3节。选项设置内存的安全属性。

### 6.3 Setting Option-Setting Memory

#### 6.3.1 Allocation of Data in Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in Figure 6.1. The allocated data is used by tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

#### 6.3.2 Setting Data for Programming Option-Setting Memory

Allocating data according to the procedure described in section 6.3.1. Allocation of Data in Option-Setting Memory, alone does not actually write the data to the option-setting memory. You must also follow one of the actions described in this section.

##### (1) Changing the option-setting memory by self-programming

Use the configuration setting command to write data to the option-setting memory in the configuration setting area.

The option-setting memory does not support background operations (BGO). When write the option-setting memory, jump to SRAM after copying writing software to SRAM.

For details of the configuration setting command, see section 44, Flash Memory.

##### (2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, see the tool manual for details.

The MCU provides two setting procedures:

- Read the data allocated as described in section 6.3.1. Allocation of Data in Option-Setting Memory, from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU
- Use the GUI interface of the tool to program the same data as allocated in section 6.3.1. Allocation of Data in Option-Setting Memory.

#### 6.3.3 Security attribution of option-setting memory

Some functionality has 3 registers for non-secure (FUNC NAME), and secure (FUNC NAME\_SEC), and security attribution (FUNC NAME\_SEL). Only secure developer can set the registers for secure and security attribution. As shown in Figure 6.5, when the bit of security attribution register is set to 0, the corresponding bit of secure register is applied. When the bit of security attribution register is set to 1, the corresponding bit of non-secure register is applied.

For example, if the secure developer wants to configure LVD of OFS1 as secure, HOCO of OFS1 as non-secure, the secure developer needs to set OFS1\_SEL as follows.

OFS1\_SEL = 0xFFFF\_FFF8

By this setting, LVDAS and VDSEL[1:0] values of OFS1\_SEC and HOCOFRQ0[1:0] and HOCOEN values of OFS1 are applied to MCU. The reserved bits of the security attribution register (FUNC NAME\_SEL) should be set to 1.

Table 6.3 PBPS、PBPS\_SEC的位与BPS、BPS\_SEC的位的关系

| 应用PBPS的位 | 应用BPS的点滴 | Content                                   |
|----------|----------|---|
| 1        | 1        | 对相应块的编程和擦除是有效的。                           |
| 1        | 0        | 对相应块的编程和擦除无效。该保护可以通过FBPROT0或FBPROT1寄存器取消。 |
| 0        | 1        | 不能设置这个条件                                  |
| 0        | 0        | 对相应块的编程和擦除永久无效                            |

### 6.3 设置选项设置内存

#### 6.3.1 选项设置内存中的数据分配

编程数据被分配到图6.1所示的选项设置存储器中的地址。分配的数据由闪存编程软件或片上调试器等工具使用。

Note: 编程格式因编译器而异。有关详细信息，请参阅编译器手册。

#### 6.3.2 编程选项设置存储器的设置数据

根据第6.3.1节中描述的程序分配数据。选项设置内存中的数据分配，单独并不实际将数据写入选项设置内存。您还必须遵循本节中描述的操作之一。

##### (1) 通过自编程更改选项设置存储器

使用配置设置命令将数据写入配置设置区的选项设置内存。

选项设置内存不支持后台操作(BGO)。写入选项设置内存时，跳转到将写入软件复制到SRAM后的SRAM。

有关配置设置命令的详细信息，请参见第44节，闪存。

##### (2) 通过OCD进行调试或通过闪存写入器进行编程

此过程取决于所使用的工具，详细信息请参见工具手册。

MCU提供两种设置程序：

- 读取第6.3.1节所述分配的数据。在选项设置内存中分配数据，从编译器生成的目标文件或摩托罗拉S格式文件，并将数据写入MCU
- 使用工具的GUI界面对6.3.1节分配的相同数据进行编程。OptionSetting内存中的数据分配。

#### 6.3.3 选项设置内存的安全属性

某些功能具有3个用于非安全(FUNCNAME)、安全(FUNCNAME\_SEC)和安全属性(FUNCNAME\_SEL)的寄存器。只有安全的开发人员才能设置安全和安全属性的寄存器。如图6.5所示，当安全属性寄存器的位设置为0时，应用安全寄存器的相应位。当安全属性寄存器的位设置为1时，应用非安全寄存器的相应位。

例如，如果安全开发者要将OFS1的LVD配置为安全，将OFS1的HOCO配置为非安全，则安全开发者需要如下设置OFS1\_SEL。

OFS1\_SEL = 0xFFFF\_FFF8

通过此设置，OFS1\_SEC和HOCOFRQ0[1:0]的LVDAS和VDSEL[1:0]值以及OFS1的HOCOEN值将应用于MCU。安全属性寄存器(FUNCNAME\_SEL)的保留位应设置为1。

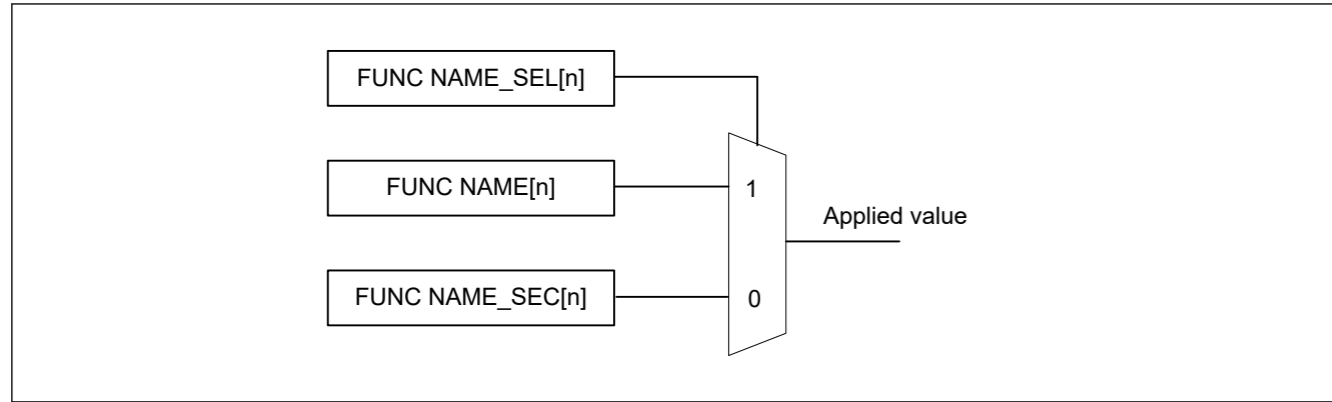

Figure 6.5 Selection of applied value

### 6.3.4 Timing of the Setting Value

For SAS, BPS, BPS\_SEC, PBPS, and PBPS\_SEC registers, the setting value of the related startup area and block protection is applied immediately after programming. For other registers, the setting value is applied after the MCU is reset.

In case the programming using the serial programming mode in customer's factory, be careful that the block protection for secure user is applied after MCU is reset. Because initial value of the security attribution registers of block protection (BPS\_SEL) is 1 (non-secure), the block protection setting for secure developer (BPS\_SEC/PBPS\_SEC) is not applied until MCU is reset even if the corresponding bit of BPS\_SEL is programmed to 0 (secure).

## 6.4 Usage Notes

### 6.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits of reserved areas and all reserved bits. If 0 is written to these bits, normal operation cannot be guaranteed.

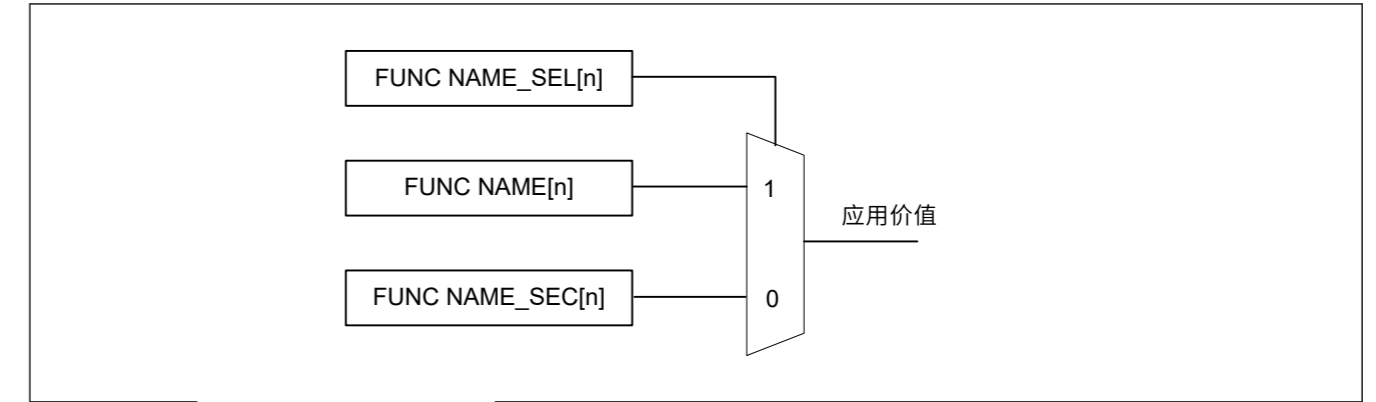

Figure 6.5 应用值的选择

### 6.3.4 设定值的时机

对于SAS、BPS、BPS\_SEC、PBPS和PBPS\_SEC寄存器，编程后立即应用相关启动区域和块保护的设置值。对于其他寄存器，设置值在MCU复位后应用。

如果在客户工厂使用串行编程模式进行编程，请注意在MCU复位后应用安全用户的块保护。由于块保护(BPS\_SEL)的安全属性寄存器的初始值为1（非安全），因此即使BPS\_SEL的相应位被编程为0（安全）。

## 6.4 使用说明

### 6.4.1 用于编程选项设置中的保留区域和保留位的数据 Memory

当期权设置内存中的保留区域和保留位在编程范围内时，将1写入保留区域和所有保留位的所有位。如果将0写入这些位，则无法保证正常操作。

## 7. Low Voltage Detection (LVD)

### 7.1 Overview

The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The LVD module consists of three separate voltage level detectors (LVD0, LVD1, LVD2). LVD0, LVD1, and LVD2 measure the voltage level input to the VCC pin. LVD registers allow your application to configure detection of VCC changes at various voltage thresholds.

Voltage monitor registers are used to configure the LVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 7.1 lists the LVD specifications. Figure 7.1 shows a block diagram of the voltage monitor 0 reset generation circuit. Figure 7.2 shows a block diagram of the voltage monitor 1 interrupt and reset circuit, and Figure 7.3 shows a block diagram of the voltage monitor 2 interrupt and reset circuit.

## 7. 低电压检测(LVD)

### 7.1 Overview

低电压检测(LVD)模块监控输入到VCC引脚的电压电平。检测等级可以通过寄存器设置来选择。LVD模块由三个独立的电压电平检测器(LVD0、LVD1、LVD2)组成。LVD0、LVD1和LVD2测量输入到VCC引脚的电压电平。LVD寄存器允许您的应用程序配置在各种电压阈值下检测VCC变化。

电压监控寄存器用于配置LVD，以在超过阈值时触发中断、事件链接输出或复位。

表7.1列出了LVD规格。图7.1显示了电压监视器0复位产生电路的框图。图7.2显示了电压监视器1中断和复位电路的框图，图7.3显示了电压监视器2中断和复位电路的框图。

#### LVD1E bit (Voltage Detection 1 Enable)

When using voltage detection 1 interrupt/reset or the LVD1SR.MON bit, set the LVD1E bit to 1. The voltage detection 1 circuit starts once td(E-A) passes after the LVD1E bit value is changed from 0 to 1. When using the voltage detection 1 circuit in deep software standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

**RIE bit (Voltage Monitor 1 Interrupt/Reset Enable)**

The RIE bit enables or disables voltage monitor 1 interrupt/reset. Ensure that neither a voltage monitor 1 interrupt nor a voltage monitor 1 reset is generated during programming or erasure of the flash memory.

**DFDIS bit (Voltage monitor 1 Digital Filter Disabled Mode Select)**

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) when this bit is 0(enabled). Set this bit to 1 (disabled) when using the voltage monitor 1 circuit in Software Standby mode or in Deep Software Standby mode.

**CMPE bit (Voltage Monitor 1 Circuit Comparison Result Output Enable)**

The CMPE bit enables or disables voltage monitor 1 circuit comparison result output. Set the CMPE bit to 1 after the voltage detection 1 circuit enables and stabilization time ( $t_{d(E-A)}$ ) elapses. When stopping the voltage detection 1 circuit, disable the voltage detection 1 circuit after setting the CMPE bit is 0.

**FSAMP[1:0] bits (Sampling Clock Select)**

The FSAMP[1:0] bits can be rewritten only when the LVD1CR0.DFDIS bit is 1 (digital filter circuit disabled). Do not rewrite these bits if the LVD1CR0.DFDIS bit is 0 (digital filter circuit enabled).

- 如果安全属性配置为非安全: ●
- 允许安全和非安全访问。

Note: 在重写该寄存器之前将PRCR.PRC3位设置为1 (允许写入)。

**RIE位 (电压监视器1中断复位使能)**

RIE位启用或禁用电压监视器1中断复位。确保在对闪存进行编程或擦除期间, 既不会产生电压监视器1中断, 也不会产生电压监视器1复位。

**DFDIS位 (电压监视器1数字滤波器禁用模式选择)**

DFDIS位禁用数字滤波器电路。当该位为0 (启用) 时, 将LOCOCR.LCSTP位设置为0 (LOCO运行)。在软件待机模式或深度软件待机模式下使用电压监视器1电路时, 将此位设置为1 (禁用)。

**CMPE位 (电压监视器1电路比较结果输出使能)**

CMPE位启用或禁用电压监视器1电路比较结果输出。在电压检测1电路使能并经过稳定时间( $t_{d(E-A)}$ )后, 将CMPE位设置为1。停止电压检测1电路时, 将CMPE位设置为0后禁用电压检测1电路。

**FSAMP[1:0]位 (采样时钟选择)**

只有当LVD1CR0.DFDIS位为1 (数字滤波器电路禁用) 时, FSAMP[1:0]位才能被重写。如果LVD1CR0.DFDIS位为0 (启用数字滤波器电路), 请勿重写这些位。

**RI bit (Voltage Monitor 1 Circuit Mode Select)**

When the RI bit is 1 (voltage monitor 1 reset selected), transition to Deep Software Standby mode cannot be made. In this case, transition to Software Standby mode is made. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 1 interrupt selected).

**RN bit (Voltage Monitor 1 Reset Negate Select)**

If the RN bit is set to 1 (negation follows a stabilization time on assertion of the LVD1 reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). In addition, for a transition to Software Standby or Deep Software Standby mode, the only possible value for the RN bit is 0 (negation follows stabilization time when  $VCC > V_{det1}$  is detected). Do not set the RN bit to 1 when this is the case.

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

**RIE bit (Voltage Monitor 2 Interrupt/Reset Enable)**

The RIE bit enables or disables the voltage monitor 2 interrupt/reset. Ensure that neither a voltage monitor 2 interrupt nor a voltage monitor 2 reset is generated during programming or erasure of the flash memory.

**RI位 (电压监视器1电路模式选择)**

当RI位为1 (选择电压监视器1复位) 时, 无法转换到深度软件待机模式。在这种情况下, 将转换到软件待机模式。要进入深度软件待机模式, 请将RI位设置为0 (选择电压监视器1中断)。

**RN位 (电压监视器1复位否定选择)**

如果RN位设置为1 (否定遵循LVD1复位信号断言的稳定时间), 设置 LOCOCR.LCSTP位为0 (LOCO运行)。此外, 为了转换到软件待机或深度软件待机模式, RN位的唯一可能值为0 (当检测到 $VCC > V_{det1}$ 时, 取反跟随稳定时间)。在这种情况下, 请勿将RN位设置为1。

- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

Note: 在重写该寄存器之前将PRCR.PRC3位设置为1 (允许写入)。

**RIE位 (电压监视器2中断复位使能)**

RIE位启用或禁用电压监视器2中断复位。确保在对闪存进行编程或擦除期间, 既不会产生电压监视器2中断, 也不会产生电压监视器2复位。

**DFDIS bit (Voltage monitor 2 Digital Filter Disabled Mode Select)**

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) when this bit is 0 (digital filter enabled). Set this bit to 1 (digital filter disabled) when using the voltage monitor 2 circuit in Software Standby mode or in Deep Software Standby mode.

**CMPE bit (Voltage Monitor 2 Circuit Comparison Result Output Enable)**

The CMPE bit enables or disables voltage monitor 2 circuit comparison result output. Set the CMPE bit to 1 after the voltage detection 2 circuit enables and stabilization time ( $t_{d(E-A)}$ ) elapses. When stopping the voltage detection 2 circuit, disable the voltage detection 2 circuit after setting the CMPE bit is 0.

**FSAMP[1:0] bits (Sampling Clock Select)**

The FSAMP[1:0] bits can be rewritten only when the LVD2CR0.DFDIS bit is 1 (digital filter circuit disabled). Do not rewrite these bits if the LVD2CR0.DFDIS bit is 0 (digital filter circuit enabled).

**RI bit (Voltage Monitor 2 Circuit Mode Select)**

When the RI bit is 1 (voltage monitor 2 reset selected), transition to Deep Software Standby mode cannot be made. In this case, transition to Software Standby mode is made. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 2 interrupt selected).

**RN bit (Voltage Monitor 2 Reset Negate Select)**

If the RN bit is set to 1 (negating LVD2 reset in a specified time after its assertion), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Additionally, for a transition to Software Standby or Deep Software Standby mode, the only possible value for the RN bit is 0 (negation follows a stabilization time when  $VCC > V_{det2}$  is detected). Do not set the RN bit to 1 (negation follows a stabilization time after assertion of the LVD2 reset signal) when this is the case.

Note 1. When enabling maskable interrupts, do not change the NMIER.LVD1EN bit value in the ICU from the reset state.

**DFDIS位 (电压监视器2数字滤波器禁用模式选择)**

DFDIS位禁用数字滤波器电路。当该位为0 (启用数字滤波器) 时, 将LOCOCR.LCSTP位设置为0 (LOCO运行)。在软件待机模式或深度软件待机模式下使用电压监视器2电路时, 将此位设置为1 (禁用数字滤波器)。

**CMPE位 (电压监视器2电路比较结果输出使能)**

CMPE位启用或禁用电压监视器2电路比较结果输出。在电压检测2电路使能且稳定时间( $t_{d(E-A)}$ )过后, 将CMPE位设置为1。停止电压检测2电路时, 将CMPE位设置为0后禁用电压检测2电路。

**FSAMP[1:0]位 (采样时钟选择)**

只有当LVD2CR0.DFDIS位为1 (数字滤波器电路禁用) 时, FSAMP[1:0]位才能被重写。如果LVD2CR0.DFDIS位为0 (启用数字滤波器电路), 请勿重写这些位。

## 7.5 Interrupt and Reset from Voltage Monitor 1

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 1 circuit.

[Table 7.4](#) shows the procedures for setting bits related to the voltage monitor 1 interrupt/reset so that voltage monitoring occurs. [Table 7.5](#) shows the procedures for setting bits related to the voltage monitor 1 interrupt/reset so that voltage monitoring stops. [Figure 7.5](#) shows an example of operations for a voltage monitor 1 interrupt. For the operation of the voltage monitor 1 reset, see [Figure 5.2](#) in [section 5, Resets](#).

When using the voltage monitor 1 circuit in Software Standby mode or Deep Software Standby mode, set up the circuit using the procedures in this section.

### (1) Setting in Software Standby mode

- Disable the digital filter ( $LVD1CR0.DFDIS = 1$ ).
- When  $VCC > V_{det1}$  is detected, negate the voltage monitor 1 reset signal ( $LVD1CR0.RN = 0$ ) following a stabilization time.

### (2) Settings in Deep Software Standby mode

- Disable the digital filter ( $LVD1CR0.DFDIS = 1$ ).

## 7.5 电压监视器1的中断和复位

响应电压监视器1电路的比较结果, 可以产生中断或复位。

[表7.4](#)显示了设置与电压监控1中断复位相关的位以进行电压监控的过程。[表7.5](#)显示了设置与电压监控1中断复位相关的位以停止电压监控的步骤。[图7.5](#)显示了电压监视器1中断的操作示例。有关电压监视器1复位的操作, 请参见第5节“复位”中的[图5.2](#)。

在软件待机模式或深度软件待机模式下使用电压监视器1电路时, 请使用本节中的步骤设置电路。

### (1) 在软件待机模式下设置

- 禁用数字滤波器 ( $LVD1CR0.DFDIS=1$ )。
- 当检测到 $VCC > V_{det1}$ 时, 在经过一段稳定时间后将电压监视器1复位信号( $LVD1CR0.RN=0$ )取反。

### (2) 深度软件待机模式中的设置

- 禁用数字滤波器 ( $LVD1CR0.DFDIS=1$ )。

- Enable the voltage monitor 1 interrupt (LVD1CR0.RI = 0). If the voltage monitor 1 reset is enabled (LVD1CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 1 circuit stops. To use the voltage monitor 1 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

Note 2. Step 11 is not required if only the ELC event signal is to be output.

Note 3. Steps 5 to 7 are not required if the digital filter is not in use.

Note 4. Steps 8 to 11 can be performed during the wait time of step 7.

**Table 7.5 Procedures for setting bits related to voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring stops**

Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least 2 LOCO clock cycles before re-enabling it.

If the voltage monitor 1 interrupt or reset setting is to be made again after it is used and stopped once, you can omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting the voltage detection 1 circuit is not required if the settings for the circuit do not change.

●启用电压监视器1中断(LVD1CR0.RI=0)。如果使能电压监视器1复位(LVD1CR0.RI=1)，则无法转换到深度软件待机模式，而是将操作转换到软件待机模式。

●当DPSBYCR.DEEPCUT[1:0]位为11b时，电压监视器1电路停止。要在深度软件待机模式下使用电压监视器1电路，请将DPSBYCR.DEEPCUT[1:0]位设置为11b以外的值。

## 7.6 Interrupt and Reset from Voltage Monitor 2

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 2 circuit.

Table 7.6 shows the procedures for setting bits related to the voltage monitor 2 interrupt/reset so that voltage monitoring occurs. Table 7.7 shows the procedures for setting bits related to the voltage monitor 2 interrupt/reset so that voltage monitoring stops. Figure 7.6 shows an example of operations for a voltage monitor 2 interrupt. For the operation of the voltage monitor 2 reset, see Figure 5.2 in section 5, Resets.

When using the voltage monitor 2 circuit in Software Standby mode or Deep Software Standby mode, set up the circuit with the following procedures.

### (1) Setting in Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1)
- When  $V_{CC} > V_{det2}$  is detected, negate the voltage monitor 2 reset signal (LVD2CR0.RN = 0) following a LVD2 stabilization time.

### (2) Settings in Deep Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1).
- Enable the voltage monitor 2 interrupt (LVD2CR0.RI = 0). If the voltage monitor 2 reset is enabled (LVD2CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 2 circuit stops. To use the voltage monitor 2 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

## 7.6 电压监视器2的中断和复位

响应电压监视器2电路的比较结果，可以产生中断或复位。

表7.6显示了设置与电压监视器2中断复位相关的位以进行电压监视的过程。表7.7显示了设置与电压监视器2中断复位相关的位以停止电压监视的步骤。图7.6显示了电压监视器2中断的操作示例。有关电压监视器2复位的操作，请参见第5节“复位”中的图5.2。

在软件待机模式或深度软件待机模式下使用电压监视器2电路时，请按照以下步骤设置电路。

### (1) 在软件待机模式下设置

- 禁用数字滤波器(LVD2CR0.DFDIS=1)
- 当检测到 $V_{CC} > V_{det2}$ 时，在LVD2稳定时间后取消电压监视器2复位信号(LVD2CR0.RN=0)。

### (2) 深度软件待机模式中的设置

- 禁用数字滤波器 (LVD2CR0.DFDIS=1)。
- 启用电压监视器2中断(LVD2CR0.RI=0)。如果启用电压监视器2复位(LVD2CR0.RI=1)，则无法转换到深度软件待机模式，而是将操作转换到软件待机模式。
- 当DPSBYCR.DEEPCUT[1:0]位为11b时，电压监视器2电路停止。要在深度软件待机模式下使用电压监视器2电路，请将DPSBYCR.DEEPCUT[1:0]位设置为11b以外的值。

如果电压监视器2的中断或复位设置在使用和停止一次后再次进行，可以根据情况省略停止和设置过程中的以下步骤：

- 如果电路的设置不变，则不需要设置电压检测2。

### 7.7 Event Link Controller (ELC) Output

The LVD can output the event signals to the Event Link Controller (ELC).

#### (1) $V_{det1}$ Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the  $V_{det1}$  voltage while both the voltage detection 1 circuit and the voltage monitor 1 circuit comparison result output are enabled.

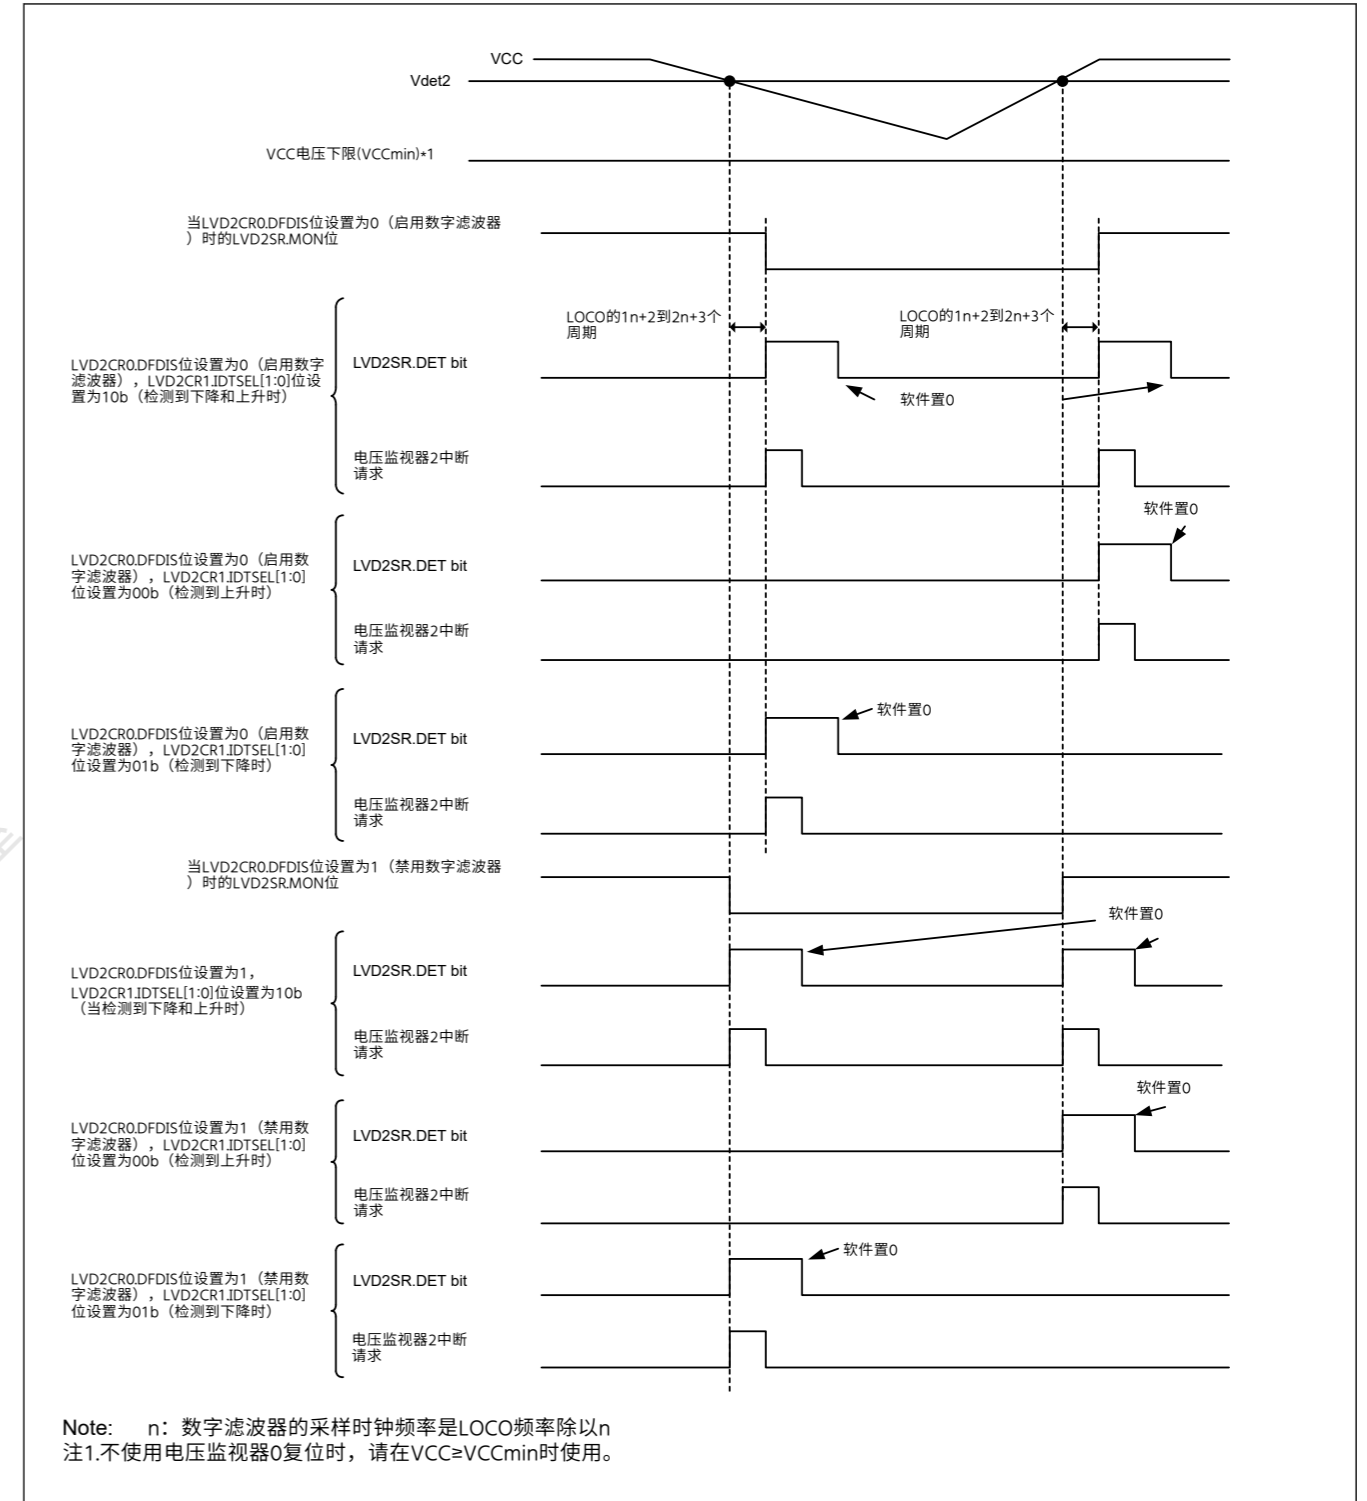

Figure 7.6 电压监视器2中断操作示例

### 7.7 事件链接控制器(ELC)输出

LVD可以将事件信号输出到事件链接控制器(ELC)。

#### (1) $V_{det1}$ 交叉检测事件

当电压检测1电路和电压监视器1电路比较结果输出都启用时, LVD检测到电压已超过 $V_{det1}$ 电压时输出事件信号。

## (2) $V_{det2}$ Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the  $V_{det2}$  voltage while both the voltage detection 2 circuit and the voltage monitor 2 circuit comparison result output are enabled.

When enabling the event link output function of the LVD, you must enable the LVD before enabling the LVD event link function of the ELC. To stop the event link output function of the LVD, you must stop the LVD before disabling the LVD event link function of the ELC.

### 7.7.1 Interrupt Handling and Event Linking

The LVD provides bits to separately enable or disable the voltage monitor 1 and 2 interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal is output to the CPU.

In contrast, as soon as an interrupt source is generated, an event link signal is output as the event signal to the other module through the ELC, regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor 1 and 2 interrupts in Software Standby and Deep Software Standby modes. The event signals for the ELC in Software Standby and Deep Software Standby modes are output as follows:

- When a  $V_{det1}$  or  $V_{det2}$  passage events is detected in Software Standby mode, event signals are not generated for the ELC because the clock is not supplied in Software Standby mode. Because the  $V_{det1}$  and  $V_{det2}$  passage detection flags are saved, when the clock supply resumes after returning from Software Standby mode, the event signals for the ELC are output based on the state of the  $V_{det1}$  and  $V_{det2}$  detection flags.
- When a  $V_{det1}$  or  $V_{det2}$  passage events are detected in Deep Software Standby mode, event signals are not generated for the ELC.

## (2) $V_{det2}$ 交叉检测事件

当电压检测2电路和电压监测器2电路比较结果输出都启用时，LVD检测到电压已超过 $V_{det2}$ 电压时输出事件信号。

使能LVD的事件链接输出功能时，必须先使能LVD，再使能ELC的LVD事件链接功能。要停止LVD的事件链接输出功能，必须先停止LVD，然后再禁用ELC的LVD事件链接功能。

### 7.7.1 中断处理和事件链接

LVD提供位来分别启用或禁用电压监视器1和2中断。当产生中断源并通过中断使能位使能中断时，将中断信号输出到CPU。

相反，一旦产生中断源，无论中断使能位的状态如何，都会通过ELC将事件链接信号作为事件信号输出到其他模块。

在软件待机和深度软件待机模式下，可以输出电压监视器1和2中断。软件待机和深度软件待机模式下ELC的事件信号输出如下：

- 当在软件待机模式下检测到 $V_{det1}$ 或 $V_{det2}$ 通过事件时，不会为ELC，因为在软件待机模式下不提供时钟。因为保存了 $V_{det1}$ 和 $V_{det2}$ 通过检测标志，所以当从软件待机模式恢复后时钟供应恢复时，ELC的事件信号将根据 $V_{det1}$ 和 $V_{det2}$ 检测标志的状态输出。
- 当在深度软件待机模式下检测到 $V_{det1}$ 或 $V_{det2}$ 通过事件时，不会为ELC生成事件信号。

Note: 设置时钟频率的限制:  $ICLK \geq PCLKA \geq PCLKB, PCLKD \geq PCLKA \geq PCLKB$   
 $ICLK \geq FCLK$   
 时钟频率比的限制: (N: 整数, 最大为64)  
 $ICLK:FCLK = N:1, ICLK:PCLKA = N:1, ICLK:PCLKB = N:1, ICLK:PCLKC = N:1$  or  $1:N, ICLK:PCLKD = N:1$  or  $1:N, ICLK:TRCLK = N:1$  or  $1:N$   
 如果启用了AD转换器, 则时钟频率比受到如下限制:  
 $PCLKA:PCLKC = 1:1$  or  $2:1$  or  $4:1$  or  $8:1$  or  $1:2$  or  $1:4$   
 Note: PE时对最小FCLK频率4MHz的限制。  
 Note: PLL和PLL2的倍频应设置在PLL和PLL2的输出频率范围内, 取频率为不使用FLL功能时考虑HOCO。  
 Note: 时钟有一个允许的频率范围 (见表8.2)。

Flash memory and SRAM also have a permissible operating frequency range in each wait cycle setting. (See [section 42, SRAM](#), [section 44, Flash Memory](#))  
Those clock frequency ranges must be satisfied even if the HOCO has its maximum or minimum frequency when not using FLL function. (See [section 47, Electrical Characteristics](#)).

闪存和SRAM在每个等待周期设置中也有一个允许的工作频率范围。（参见第42节，SRAM，第44节，闪存）即使HOCO在不使用FLL功能时具有其最大或最小频率，也必须满足这些时钟频率范围。（见第47节，电气特性）。

注1.系统时钟(ICK)和FlashIF时钟(FCLK)的频率之间需要以下关系。

$$ICK:FCLK=N:1 \text{ (N: integer)}$$

注2.系统时钟(ICK)和外围模块时钟(PCKA, PCKB)

$$ICK:PCKA = N:1, ICK:PCKB = N:1 \text{ (N: integer)}$$

Note 3. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKC, PCLKD):

$$\text{ICLK}:\text{PCLKC},\text{PCLKD} = \text{N}:1\text{or}1:\text{N} \quad (\text{N: integer})$$

Note 4. Selecting the division-by-1 to ICLK is prohibited when SCKSCR.CKSEL[2:0] bits select the system clock source faster than 100 MHz.

Note 5. The frequency of the system clock (ICLK) is limited to the flash wait cycle register (FLWT). See [section 44, Flash Memory](#).

SCKDIVCR selects the frequencies of the system clock (ICLK), peripheral module clock (PCLKA, PCLKB, PCLKC, PCLKD), FlashIF clock (FCLK).

The SCKSCR register selects the clock source for the system clock.

#### CKSEL[2:0] bits (Clock Source Select)

The CKSEL[2:0] bits select the source for the following modules:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)

- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator (MOSC)
- Sub-clock oscillator (SOSC)

The operating state of each clock source is controlled not only by the clock oscillation enable settings but also by the operating modes of the product. Some clock sources might be forcibly stopped depending on the product operating mode being used.

注3.系统时钟(ICLK)和外围模块时钟(PCLKC

PCLKD):

$$\text{ICLK}:\text{PCLKC},\text{PCLKD} = \text{N}:1\text{or}1:\text{N} \quad (\text{N: integer})$$

注4.当SCKSCR.CKSEL[2:0]位选择快于100的系统时钟源时,禁止选择对ICLK进行1分频MHz.

注5.系统时钟(ICLK)的频率仅限于闪存等待周期寄存器(FLWT)。请参见第44节,闪存。

## 8.2.5 PLLCR : PLL Control Register

Offset address: 0x02A

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | PLLSTP | PLL Stop Control<br>0: PLL is operating<br>1: PLL is stopped. | R/W |

- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLLCR register controls the operation of the PLL circuit.

**PLLSTP bit (PLL Stop Control)**

This bit runs or stops the PLL circuit.

If the main clock oscillator is to be selected as the clock source for the PLL by the PLLCCR.PLSRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLLSTP bit setting is changed to run the PLL, only use the PLL clock after confirming that the OSCSF.PLLSF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL operation. A fixed time is also required for oscillation to stop after stopping the PLL operation. Additionally, apply the following limitations when starting and stopping the PLL operation by the PLLSTP bit:

- After stopping the PLL, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL.
- Confirm that the PLL is operating and that the OSCSF.PLLSF bit is 1 before stopping the PLL.
- Regardless of whether the PLL clock is selected as the system clock, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL, confirm that the OSCSF.PLLSF bit is cleared to 0 before executing a WFI instruction.

Writing 1 to the PLLSTP bit is prohibited when SCKSCR.CKSEL[2:0] = 101 (system clock source = PLL).

Confirm the following conditions before writing 0 to PLLSTP:

- When PLL source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When PLL source clock = HOCO: HOCOCR.HCSTP = 0 (HOCO is enabled).

Note: 在重写此寄存器之前将PRCR.PRC0位设置为1 (允许写入)。

PLLCR寄存器控制PLL电路的操作。

**PLLSTP位 (PLL停止控制)**

该位运行或停止PLL电路。

如果通过PLLCCR.PLSRCSEL位选择主时钟振荡器作为PLL的时钟源, 则Main必须设置时钟振荡器等待控制寄存器(MOSCWTCR)。

更改PLLSTP位设置以运行PLL后, 只有在确认OSCSF.PLLSF位设置为1后才能使用PLL时钟。即, 启动PLL操作后需要固定的稳定时间。在停止PLL操作后, 振荡停止也需要一段固定的时间。此外, 在通过PLLSTP位启动和停止PLL操作时应用以下限制:

- 停止PLL后, 请确认OSCSF.PLLSF位为0, 然后再重新启动PLL。
- 在停止PLL之前, 确认PLL正在运行并且OSCSF.PLLSF位为1。
- 无论是否选择PLL时钟作为系统时钟, 在执行WFI指令之前, 请确认OSCSF.PLLSF设置为1, 以便在操作PLL后将MCU置于软件待机或深度软件待机模式。
- 在停止PLL后转换到软件待机或深度软件待机模式时, 请确认OSCSF.PLLSF位在执行WFI指令之前被清除为0。

当SCKSCR.CKSEL[2:0]=101 (系统时钟源=PLL) 时, 禁止向PLLSTP位写入1。

在将0写入PLLSTP之前, 请确认以下条件:

- 当PLL源时钟=MOSC时: MOSCCR.MOSTP=0 (启用MOSC)
- 当PLL源时钟=HOCO时: HOCOCR.HCSTP=0 (启用HOCO)。

The PLL2CR register controls the operation of the PLL2 circuit.

### PLL2STP bit (PLL2 Stop Control)

This bit runs or stops the PLL2 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL2 by the PLL2CCR.PL2SRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLL2STP bit setting is changed to run the PLL2, only use the PLL2 clock after confirming that the OSCSF.PLL2SF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL2 operation. A fixed time is also required for oscillation to stop after stopping the PLL2 operation. Additionally, apply the following limitations when starting and stopping the PLL2 operation by the PLL2STP bit:

- After stopping the PLL2, confirm that the OSCSF.PLL2SF bit is 0 before restarting the PLL2.
- Confirm that the PLL2 is operating and that the OSCSF.PLL2SF bit is 1 before stopping the PLL2.
- Confirm that the OSCSF.PLL2SF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL2.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL2, confirm that the OSCSF.PLL2SF bit is cleared to 0 before executing a WFI instruction.

Confirm the following conditions before writing 0 to PLL2STP:

- When the PLL2 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When the PLL2 source clock = HOCO: HOCO.CHCSTP = 0 (HOCO is enabled).

PLL2CR寄存器控制PLL2电路的操作。

### PLL2STP位 (PLL2停止控制)

该位运行或停止PLL2电路。

如果要通过PLL2CCR.PL2SRCSEL位选择主时钟振荡器作为PLL2的时钟源, 则Main必须设置时钟振荡器等待控制寄存器(MOSCWTCR)。

更改PLL2STP位设置运行PLL2后, 确认

OSCSF.PLL2SF位设置为1。也就是说, 在启动PLL2操作后需要一个固定的稳定时间。在停止PLL2操作后, 振荡停止也需要一个固定的时间。此外, 在通过PLL2STP位启动和停止PLL2操作时应用以下限制:

- 停止PLL2后, 确认OSCSF.PLL2SF位为0, 再重启PLL2。
- 在停止PLL2之前, 确认PLL2正在运行并且OSCSF.PLL2SF位为1。
- 在操作PLL2后, 在执行WFI指令以将MCU置于软件待机或深度软件待机模式之前, 确认OSCSF.PLL2SF位设置为1。
- 在停止PLL2后转换到软件待机或深度软件待机模式时, 请确认OSCSF.PLL2SF位在执行WFI指令之前被清除为0。

在将0写入PLL2STP之前, 请确认以下条件:

- 当PLL2源时钟=MOSC时: MOSCCR.MOSTP=0 (启用MOSC)
- 当PLL2源时钟=HOCO时: HOCO.CHCSTP=0 (启用HOCO)。

The MOSCCR register controls the main clock oscillator.

### MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator.

When changing the value of the MOSTP bit, execute subsequent instructions only after reading the bit to check that the value is updated.

When using the main clock, the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set before setting MOSTP to 0. After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator.

A fixed stabilization wait time is required after setting the main clock oscillator to start operation. A fixed wait time is also required for oscillation to stop after stopping the main clock oscillator.

The following restrictions apply when starting and stopping operation:

- After stopping the main clock oscillator, confirm that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator
- Confirm that the main clock oscillator operates and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is set to 0 before executing the WFI instruction.

Writing 1 to MOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).

**SOSTP bit (Sub Clock Oscillator Stop)**

The SOSTP bit starts or stops the sub-clock oscillator. When changing the value of the SOSTP bit, only execute subsequent instructions after reading the bit to check that the value is updated. Use the SOSTP bit when using the sub-clock oscillator as the source for a peripheral module, for example the RTC. When using the sub-clock oscillator, set the Sub-Clock Oscillator Mode Control Register (SOMCR) before setting SOSTP to 0.

The following restrictions apply when starting and stopping the operation:

- After stopping the sub-clock oscillator, allow a stop interval of at least 5 SOSC clock cycles before restarting it
- After setting the SOSTP bit to 0, use the sub-clock only after the sub-clock oscillation stabilization time ( $t_{SUBOSCWT}$ ) has elapsed.
- Regardless of whether the sub-clock oscillator is selected as the system clock, confirm that the sub-clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the sub-clock oscillator, wait for at least 3 SOSC clock cycles before executing the WFI instruction.

Writing 1 to SOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC).

- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the LOCO clock, wait for at least 3 LOCO cycles before executing the WFI instruction.

**SONTP位 (副时钟振荡器停止)**

SONTP位启动或停止副时钟振荡器。更改SONTP位的值时，仅在读取该位后执行后续指令以检查该值是否已更新。当使用副时钟振荡器作为外围模块（例如RTC）的源时，使用SONTP位。使用副时钟振荡器时，请先设置副时钟振荡器模式控制寄存器(SOMCR)，然后再将SOSTP设置为0。

启动和停止操作时适用以下限制：

- 子时钟振荡器停止后，在重新启动之前允许至少5个SOSC时钟周期的停止间隔
- 将SOSTP位设置为0后，仅在副时钟振荡稳定时间( $t_{SUBOSCWT}$ )过去后使用副时钟。
- 无论是否选择副时钟振荡器作为系统时钟，在执行WFI指令之前确认副时钟振荡稳定，将MCU置于软件待机或深度软件待机模式

Writing 1 to LCSTP is prohibited under the following condition:

Because the LOCO clock measures the wait time for other oscillators, it continues to oscillate while measuring this time, regardless of the setting in LOCOCR.LCSTP. As a result, the LOCO clock might be unintentionally supplied even when the LCSTP is set to stop.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The HCSTP bit value after a reset is 0 when the OFS1.HOCOEN bit is 0. It is 1 when the OFS1.HOCOEN bit is 1.

Note 2. If you are using the HOCO (HCSTP = 0), set the OFS1.HOCOFREQ[1:0] bit to an optimum value.

The HOCOCCR register controls the HOCO clock.

#### HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock.

After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOCOSF is set to 1 before using the clock. When OFS1.HOCOEN is set to 0, confirm that OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait time is required after setting the HOCO clock to start operation. A fixed wait time is also required after setting the HOCO clock to stop.

The following limitations apply when starting and stopping operation:

- After stopping the HOCO clock, confirm that the OSCSF.HOCOSF is 0 before restarting the HOCO clock.
- Confirm that the HOCO clock operates and that the OSCSF.HOCOSF is 1 before stopping the HOCO clock.
- Regardless of whether the HOCO clock is selected as the system clock, confirm that the OSCSF.HOCOSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after setting HOCO operation with the HCSTP bit.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting of the HOCO clock to stop, confirm that the OSCSF.HOCOSF is set to 0 after setting the HOCO clock and before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

在以下情况下禁止向LCSTP写入1:

- SCKSCR.CKSEL[2:0]=010b (系统时钟源=LOCO)。

因为LOCO时钟测量其他振荡器的等待时间,所以无论LOCOCR.LCSTP中的设置如何,它都会在测量该时间时继续振荡。因此,即使LCSTP设置为停止,也可能无意中提供LOCO时钟。

HOCOCCR寄存器控制HOCO时钟。

#### HCSTP bit (HOCO Stop)

HCSTP位启动或停止HOCO时钟。

将HCSTP位设置为0以启动HOCO时钟后,在使用时钟之前确认OSCSF.HOCOSF设置为1。当OFS1.HOCOEN设置为0时,请在使用HOCO时钟之前确认OSCSF.HOCOSF也设置为1。设置HOCO时钟开始运行后,需要一个固定的稳定等待时间。将HOCO时钟设置为停止后,还需要一个固定的等待时间。

- 停止HOCO时钟后,确认OSCSF.HOCOSF为0,再重新启动HOCO时钟。
- 在停止HOCO时钟之前,请确认HOCO时钟运行并且OSCSF.HOCOSF为1。
- 无论是否选择HOCO时钟作为系统时钟,确认OSCSF.HOCOSF设置为1  
在使用HCSTP位设置HOCO操作后,执行WFI指令以将MCU置于软件待机或深度软件待机模式之前。

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The MOCOCCR register controls the MOCO clock.

#### MCSTP bit (MOCO Stop)

The MCSTP bit starts or stops the MOCO clock.

After setting MCSTP to 0, use the MOCO clock only after the MOCO clock oscillation stabilization time ( $t_{MOCOWT}$ ) elapses. A fixed stabilization wait time is required after setting the MOCO clock to start operation. A fixed wait time is also required for oscillation to stop after setting the MOCO clock to stop operation.

The following restrictions apply when starting and stopping the oscillator:

- After stopping the MOCO clock, allow a stop interval of at least 5 MOCO clock cycles before restarting it
- Confirm that MOCO clock oscillation is stable before stopping the MOCO clock
- Regardless of whether the MOCO clock is selected as the system clock, confirm that MOCO clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the MOCO clock, wait for at least 3 MOCO clock cycles before executing the WFI instruction.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).

Writing 1 to the MCSTP bit (stopping the MOCO) is prohibited if oscillation stop detection is enabled in the Oscillation Stop Detection Control Register (OSTDCR.OSTDE).

#### FLLCN bit (FLL Enable)

This bit enables or disables the FLL function of the HOCO.

If FLL is enabled, the frequency accuracy is guaranteed after FLL is stabilized. The FLL stabilization can be checked by the CAC frequency measurement, but it must be executed after HOCO stabilization.

In addition, you must disable FLL by setting the FLLCN bit to 0 before transitioning to Software Standby mode.

如果启用FLL, 则在FLL稳定后, 频率精度得到保证。FLL稳定性可以通过CAC频率测量, 但必须在HOCO稳定后执行。

| 7   | —      | 这些位读为0。  | R   |

Note 1. The value after reset depends on the OFS1.HOCOEN setting.

When OFS1.HOCOEN = 1 (disable HOCO), the value after reset of HOCOSF is 0.

When OFS1.HOCOEN = 0 (enable HOCO), the HOCOSF value is set to 0 immediately after reset is released, and the HOCOSF value is set to 1 after the HOCO oscillation stabilization wait time elapses.

Note 2. This is true when an appropriate value is set in the Wait Control register for the main clock oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

This register is not controlled by CGFSAR register.

The OSCSF register contains flags to indicate the operating status of the counters in the oscillation stabilization wait circuits for the individual oscillators. After oscillation starts, these counters measure the wait time until each oscillator output clock is supplied to the internal circuits. An overflow of a counter indicates that the clock supply is stable and available for the associated circuit.

#### HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1.HOCOEN is set to 0, confirm that OSCSF.HOCOSF is set to 1 before using the HOCO clock.

[Setting condition]

- When the HOCO clock is stopped and the HOCOCCR.HCSTP bit is set to 0, and then the HOCO oscillation stabilization time is counted by the LOCO clock and supply of the HOCO clock within the MCU is started. For the HOCO oscillation stabilization time, see [section 47, Electrical Characteristics](#).

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOCCR.HCSTP bit is set to 1.

#### MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- When the main clock oscillator is stopped and the MOSCCR.MOSTP bit is set to 0, and then the number of LOCO clock cycles corresponding to the setting of the MOSCWTCR register is counted and supply of the main clock within the MCU is started.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

#### PLLSF flag (PLL Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the operating state of the counter that measures the wait time of the PLL.

[Setting condition]

- When the PLL is stopped and the PLLCR.PLLSTP bit is set to 0, and then the PLL oscillation stabilization time is counted by the LOCO clock and supply of the PLL clock within the MCU is started. If oscillation by the PLL clock source is not stable when the PLLCR.PLLSTP bit is set to 0, counting of the LOCO cycles continues even after the PLL clock source oscillation is stabilized. For the PLL oscillation stabilization time, see [section 47, Electrical Characteristics](#).

[Clearing condition]

- When the PLL is operating and then is deactivated because the PLLCR.PLLSTP bit is set to 1.

#### PLL2SF flag (PLL2 Clock Oscillation Stabilization Flag)

The PLL2SF flag indicates the operating state of the counter that measures the wait time of the PLL2.

[Setting condition]

- When the PLL2 is stopped and the PLL2CR.PLL2STP bit is set to 0, and then the PLL2 oscillation stabilization time is counted by the LOCO clock and supply of the PLL2 clock within the MCU is started. If oscillation by the PLL2 clock source is not stable when the PLL2CR.PLL2STP bit is set to 0, counting of the LOCO cycles continues even after the

注1.复位后的值取决于OFS1.HOCOEN的设置。

当OFS1.HOCOEN=1（禁用HOCO）时，HOCOSF复位后的值为0。

当OFS1.HOCOEN=0（启用HOCO）时，释放复位后立即将HOCOSF值设置为0，并在经过HOCO振荡稳定等待时间后将HOCOSF值设置为1。

注2.当主时钟振荡器的等待控制寄存器中设置了适当的值时，这是正确的。如果等待时间值不够，则将振荡稳定标志设置为1，并在振荡稳定之前开始向内部电路提供时钟信号。

该寄存器不受CGFSAR寄存器控制。

OSCSF寄存器包含用于指示各个振荡器的振荡稳定等待电路中的计数器的操作状态的标志。振荡开始后，这些计数器测量等待时间，直到每个振荡器输出时钟被提供给内部电路。计数器溢出表明时钟供应稳定并可用于相关电路。

#### HOCOSF标志（HOCO时钟振荡稳定标志）

HOCOSF标志指示测量高速时钟振荡器(HOCO)等待时间的计数器的操作状态。当OFS1.HOCOEN设置为0时，请在使用HOCO时钟之前确认OSCSF.HOCOSF设置为1。

[Setting condition]

- 当HOCO时钟停止并且HOCOCCR.HCSTP位设置为0时，然后通过LOCO时钟计算HOCO振荡稳定时间并开始提供MCU内的HOCO时钟。关于HOCO振荡稳定时间，请参见第47节，电气特性。

[Clearing condition]

- HOCO时钟正在运行，然后由于HOCOCCR.HCSTP位设置为1而被停用。

#### MOSCSF标志（主时钟振荡稳定标志）

MOSCSF标志指示测量主时钟振荡器等待时间的计数器的操作状态。

[Setting condition]

- 当主时钟振荡器停止并且MOSCCR.MOSTP位设置为0，然后LOCO的个数与MOSCWTCR寄存器的设置相对应的时钟周期被计数，并开始提供MCU内的主时钟。

[Clearing condition]

#### PLLSF标志（PLL时钟振荡稳定标志）

PLLSF标志指示测量PLL等待时间的计数器的操作状态。

[Setting condition]

- 当PLL停止并且PLLCR.PLLSTP位设置为0时，然后PLL振荡稳定时间由LOCO时钟计数并开始提供MCU内的PLL时钟。如果当PLLCR.PLLSTP位设置为0时PLL时钟源的振荡不稳定，即使PLL时钟源振荡稳定后，LOCO周期的计数也会继续。关于PLL振荡稳定时间，请参见第47节，电气特性。

[Clearing condition]

[Setting condition]

- 当PLL2停止并且PLL2CR.PLL2STP位设置为0时，然后PLL2振荡稳定时间由LOCO时钟计数并开始提供MCU内的PLL2时钟。如果在PLL2CR.PLL2STP位设置为0时PLL2时钟源的振荡不稳定，即使在

  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The OSTDCR register controls the oscillation stop detection function.

#### OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, set the OSTDIE bit to 0 before clearing OSTDF. Wait for at least 2 PCLKB cycles before setting the OSTDIE bit to 1. By reading the I/O register whose access cycle number is defined by PCLKB, it is possible to secure waiting time of 2 or more cycles of PCLKB.

#### OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function.

When the OSTDE bit is 1 (enabled), the MOCO stop bit (MOCOCR.MCSTP) is set to 0 and the MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCOCR.MCSTP bit (MOCO stopped) is invalid.

When the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

The OSTDE bit must be set to 0 before transitioning to Software Standby or Deep Software Standby mode. To transition to Software Standby or Deep Software Standby mode, first set the OSTDE bit to 0, then execute the WFI instruction.

The following restrictions apply when using the oscillation stop detection function:

In low-speed mode, selecting division by 1, 2, 4, 8 for ICLK, FCLK, PCLKA, PCLKB, PCLKC, and PCLKD is prohibited.

PLL2时钟源振荡稳定。有关PLL2振荡稳定时间，请参见第47节，电气特性。

OSTDCR寄存器控制振荡停止检测功能。

#### OSTDIE位（振荡停止检测中断使能）

OSTDIE位使能振荡停止检测功能中断。它还控制是否将振荡停止检测报告给POEG。

如果振荡停止检测状态寄存器(OSTDSR.OSTDF)中的振荡停止检测标志需要清零，则在清零OSTDF之前将OSTDIE位设置为0。在将OSTDIE位设置为1之前等待至少2个PCLKB周期。通过读取访问周期数由PCLKB定义的IO寄存器，可以确保2个或更多PCLKB周期的等待时间。

#### OSTDE位（振荡停止检测功能使能）

OSTDE位使能振荡停止检测功能。

当OSTDE位为1（使能）时，MOCO停止位（MOCOCR.MCSTP）设置为0，MOCO操作开始。MOCO时钟在振荡停止检测功能启用时不能停止。将1写入MOCOCR.MCSTP位（MOCO停止）无效。

当振荡停止检测状态寄存器(OSTDSR.OSTDF)中的振荡停止检测标志为1（检测到主时钟振荡停止）时，向OSTDE位写入0无效。

在转换到软件待机或深度软件待机模式之前，必须将OSTDE位设置为0。过渡到软件待机或深度软件待机模式，首先将OSTDE位设置为0，然后执行WFI指令。

使用振荡停止检测功能时有以下限制：

在低速模式下，禁止为ICLK、FCLK、PCLKA、PCLKB、PCLKC和PCLKD选择1、2、4、8分频。

  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note 1. This bit can only be set to 0. This bit is cleared to 0 by writing 0 after reading it as 1.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

**OSTDF flag (Oscillation Stop Detection Flag)**

The OSTDF flag indicates the main clock oscillator status. When this flag is 1, it indicates that the main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not set to 0 even when the main clock oscillation is restarted. The OSTDF bit is cleared to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading it as 0. If the OSTDF flag is set to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 then returns to 1.

The OSTDF flag cannot be set to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL)

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL.

[Setting condition]

- The main clock oscillator is stopped when OSTDCR.OSTDE = 1 (oscillation stop detection function enabled).

[Clearing condition]

- 1 is read and then 0 is written when the SCKSCR.CKSEL[2:0] bits are neither 011b (system clock is MOSC) nor 101b (system clock is PLL) and PLLCCR.PLSRCSEL bit is not 0 (PLL source clock is MOSC).

注1.该位只能设置为0。读为1后写入0清除该位为0。

OSTDSR寄存器指示主时钟振荡器的停止检测状态。

**OSTDF标志（振荡停止检测标志）**

OSTDF标志指示主时钟振荡器状态。该标志为1时，表示检测到主时钟振荡停止。检测到此停止后，即使重新启动主时钟振荡，OSTDF标志也不会设置为0。OSTDF位在读为1后写入0清零。

从向OSTDF写入0到将其读取为0之间至少需要3个ICLK周期的等待时间。如果在主时钟振荡停止时将OSTDF标志设置为0，则OSTDF标志变为0然后返回1。

在以下情况下，OSTDF标志不能设置为0:

- SCKSCR.CKSEL[2:0]=011b（系统时钟源=MOSC）。
- PLLCCR.PLSRCSEL=0（PLL源时钟=MOSC）和SCKSCR.CKSEL[2:0]=101b（系统时钟源=PLL）

将时钟源切换到主时钟振荡器和PLL以外的源后，必须将OSTDF标志设置为0。

[Setting condition]

- 当OSTDCR.OSTDE=1（振荡停止检测功能使能）时，主时钟振荡器停止。

[Clearing condition]

- 当SCKSCR.CKSEL[2:0]位既不是011b（系统时钟为MOSC）也不是101b（系统时钟为PLL）且PLLCCR.PLSRCSEL位不为0（PLL源时钟为MOSC）。

**MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)**

The MSTS[3:0] bits specify the oscillation stabilization wait time for the main clock oscillator.  
 Set the main clock oscillation stabilization time to a period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0x0 because the oscillation stabilization time is not required.  
 The wait time set in these bits is counted using: 1 cycle (μs) = 1/(fLOCO[MHz] × 8) = 1/(0.032768 × 8) = 3.81 (μs) (min.)  
 The LOCO clock automatically oscillates when necessary, regardless of the value of the LOCO.LCSTP bit. After the specified wait time elapses, supply of the main clock starts internally in the MCU, and the OSCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock starts before oscillation of the clock becomes stable.  
 Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

**MSTS[3:0]位（主时钟振荡器等待时间设置）**

MSTS[3:0]位指定主时钟振荡器的振荡稳定等待时间。  
 将主时钟振荡稳定时间设置为大于或等于振荡器制造商推荐的稳定时间。当主时钟从外部输入时, 将这些位设置为0x0, 因为不需要振荡稳定时间。  
 这些位中设置的等待时间使用以下公式计算: 1个周期(μs)=1/(fLOCO[MHz]×8)=1(0.032768×8)=3.81(μs)(min.)  
 无论LOCO.LCSTP位的值如何, LOCO时钟都会在必要时自动振荡。经过指定的等待时间后, MCU内部开始提供主时钟, 并将OSCSF.MOSCSF标志设置为1。如果指定的等待时间短, 则在时钟振荡稳定之前开始提供主时钟。  
 仅当MOSCCR.MOSTP位为1且OSCSF.MOSCSF标志为0时才重写MOSCWTCR寄存器。在任何其他情况下请勿重写此寄存器。

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The SOMCR register must be modified when SOSCCR.SOSTP is 1 (SOSC is stopped).

### SODRV bits (Sub-Clock Oscillator Drive Capability Switching)

The SODRV bits switch the drive capability of the sub-clock oscillator. SODRV is undefined at the first Power up, but value after reset of SOSCCR.SOSTP is 0 (SOSC is operated). And therefore, please set the SOSC as follows when the first Power up:

- Set the SOSCCR.SOSTP to 1 (SOSC is stopped)
- Set this bit to a value corresponding to the using capacitor.
- Clear the SOSCCR.SOSTP to 0 (SOSC is operated)

#### CKOSEL[2:0] bits (Clock Out Source Select)

The CKOSEL[2:0] bits select the source of the clock to be output from the CLKOUT pin. When changing the clock source, set the CKOEN bit to 0.

#### CKODIV[2:0] bits (Clock Output Frequency Division Ratio)

The CKODIV[2:0] bits specify the clock division ratio. Set the CKOEN bit to 0 when changing the division ratio.

#### CKOEN bit (Clock Out Enable)

The CKOEN bit enables output from the CLKOUT pin.

When this bit is set to 1, the selected clock is output. When this bit is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. Otherwise, a glitch might be generated in the output.

Clear this bit before entering Software Standby or Deep Software Standby mode if the selecting clock out source clock is stopped in that mode.

The USBCKCR register controls the USB clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of USBCKDIVCR.USBCKDIV[2:0] and USBCKSEL[2:0], use the following procedure:

- Write 1 to USBCKSREQ.
- Poll until USBCKSRDY is read as 1. While USBCKSRDY = 1, no clock is output to USBCLK.
- Write to USBCKDIVCR.USBCKDIV[2:0] and USBCKSEL[2:0].
- Write 0 to USBCKSREQ.
- Poll until USBCKSRDY is read as 0.
- When USBCKSRDY becomes 0, USBCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when USBCKSREQ = 1 and USBCKSRDY = 0, or when USBCKSREQ = 0 and USBCKSRDY = 1.

**USBCKSEL[2:0] bits (USB Clock (USBCLK) Source Select)**

These bits select the clock source of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

**USBCKSREQ bit (USB Clock (USBCLK) Switching Request)**

This bit selects the USBCLK switching request.

**USBCKSRDY flag (USB Clock (USBCLK) Switching Ready state flag)**

This flag indicates the state of switching ready for the USBCLK. When USBCKSRDY = 1, no clock is output to USBCLK.

**USBCKDIV[2:0]位 (USB时钟(USBCLK)分频选择)**

这些位选择USB时钟(USBCLK)的频率,并且必须在USBCKCR.USBCKSRDY=1时进行修改。

- 将1写入USBCKSREQ。
- 轮询直到USBCKSRDY被读取为1。当USBCKSRDY=1时,没有时钟输出到USBCLK。
- 写入USBCKDIVCR.USBCKDIV[2:0]和USBCKSEL[2:0]。
- 将0写入USBCKSREQ。
- 轮询直到USBCKSRDY被读取为0。
- 当USBCKSRDY变为0时,USBCLK开始输出。时钟切换完成。

当转换到软件待机或深度软件待机模式时,不要在执行时钟切换时执行WFI指令。即USBCKSREQ=1且USBCKSRDY=0时,或USBCKSREQ=0且USBCKSRDY=1时不执行WFI指令。

**USBCKSEL[2:0]位 (USB时钟(USBCLK)源选择)**

这些位选择USB时钟(USBCLK)的时钟源,并且必须在USBCKCR.USBCKSRDY=1时进行修改。

**USBCKSREQ位 (USB时钟(USBCLK)切换请求)**

该位选择USBCLK切换请求。

**USBCKSRDY标志 (USB时钟(USBCLK)切换就绪状态标志)**

该标志指示USBCLK的切换就绪状态。当USBCKSRDY=1时,没有时钟输出到USBCLK。

## 8.2.27 TRCKCR : Trace Clock Control Register

Base address: SYSC = 0x4001\_E000

| 7   | TRCKEN    | Trace Clock operating Enable<br>0: Stop<br>1: Operation enable  | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Trace Clock Control Register controls switching the trace clock.

TRCKCR can be written only when the debugger is connected (DBGSTR.CDBGPWRUPREQ = 1).

When the debugger is not connected, it is not necessary to change TRCK[3:0] even if the TRCLK frequency is higher than the maximum value of the specification.

Change the TRCLK frequency in the state of TRCKEN = 0.

Factor of the initialization of TRCKCR register is all resets.

## 8.3 Main Clock Oscillator

To supply the clock signal to the main clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

## 8.3.1 Connecting a Crystal Resonator

Figure 8.2 shows an example of connecting a crystal resonator. A damping resistor (Rd) can be added, if required.

Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (Rf), insert an Rf between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 8.1.

## 8.2.27 TRCKCR: 跟踪时钟控制寄存器

Base address: SYSC = 0x4001\_E000

Note: 在重写此寄存器之前将PRCR.PRC0位设置为1（允许写入）。

跟踪时钟控制寄存器控制跟踪时钟的切换。

TRCKCR只能在调试器连接时写入(DBGSTR.CDBGPWRUPREQ=1)。

未连接调试器时，即使TRCLK频率高于规范的最大值，也无需更改TRCK[3:0]。

在TRCKEN=0的状态下改变TRCLK频率。

TRCKCR寄存器初始化的因素是所有的复位。

## 8.3 主时钟振荡器

要将时钟信号提供给主时钟振荡器，请使用以下方法之一：

- 连接振荡器
- 连接外部时钟信号的输入。

## 8.3.1 连接晶体谐振器

图8.2显示了连接晶体谐振器的示例。如果需要，可以添加一个阻尼电阻器(Rd)。

由于电阻值因谐振器和振荡驱动能力而异，请使用谐振器制造商推荐的值。如果制造商建议使用外部反馈电阻器(Rf)，请按照说明在EXTAL和XTAL之间插入一个Rf。

连接谐振器以提供时钟时，谐振器的频率必须在表8.1中所述的主时钟振荡器的谐振器频率范围内。

### 8.3.2 External Clock Input

Figure 8.4 shows an example of connecting an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin becomes high impedance.

Figure 8.4 Equivalent circuit for external clock

### 8.3.3 Notes on External Clock Input

The frequency of the external clock input can only be changed when the main clock oscillator is stopped. Do not change the frequency of the external clock input when the setting of the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is 0.

### 8.4 Sub-Clock Oscillator

The only way of supplying a clock signal to the sub-clock oscillator is by connecting a crystal oscillator.

### 8.3.2 外部时钟输入

图8.4显示了连接外部时钟输入的示例。要使用外部时钟信号操作振荡器，请将MOMCR.MOSEL位设置为1。XTAL引脚变为高阻抗。

Figure 8.4 外部时钟等效电路

### 8.3.3 外部时钟输入注意事项

外部时钟输入的频率只有在主时钟振荡器停止时才能改变。当主时钟振荡器停止位(MOSCCR.MOSTP)设置为0时，请勿更改外部时钟输入的频率。

### 8.4 Sub-Clock Oscillator

向副时钟振荡器提供时钟信号的唯一方法是连接晶体振荡器。

### 8.4.1 Connecting a 32.768-kHz Crystal Resonator

To supply a clock to the sub-clock oscillator, connect a 32.768-kHz crystal resonator as shown in Figure 8.5. A damping resistor ( $R_d$ ) can be added, if necessary. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the resonator manufacturer recommends the use of an external feedback resistor ( $R_f$ ), insert an  $R_f$  between XCIN and XCOU by following the instructions. When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the sub-clock oscillator as described in Table 8.1.

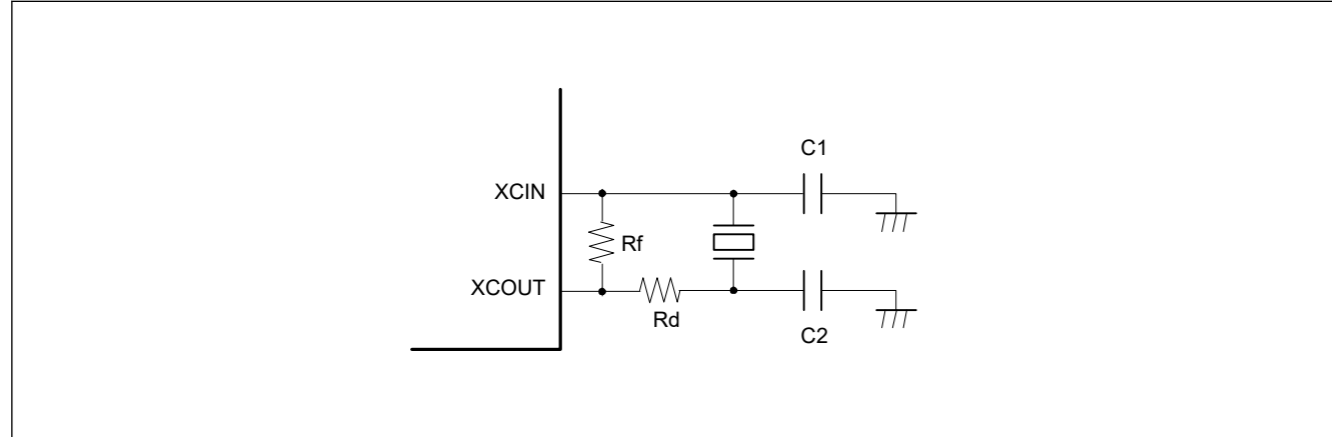

Figure 8.5 Connection example of 32.768-kHz crystal resonator

Figure 8.6 shows an equivalent circuit for the 32.768-kHz crystal resonator.

Figure 8.6 Equivalent circuit for the 32.768-kHz crystal resonator

### 8.4.2 Pin Handling When the Sub-Clock Oscillator Is Not Used

When the sub-clock oscillator is not in use, connect the XCIN pin to VSS through a resistor (to pull VSS down) and leave the XCOU pin open as shown in Figure 8.7. In addition, if an oscillator is not connected, set the Sub-Clock Oscillator Stop bit (SOSCCR.SOSTP) to 1 to stop the oscillator.

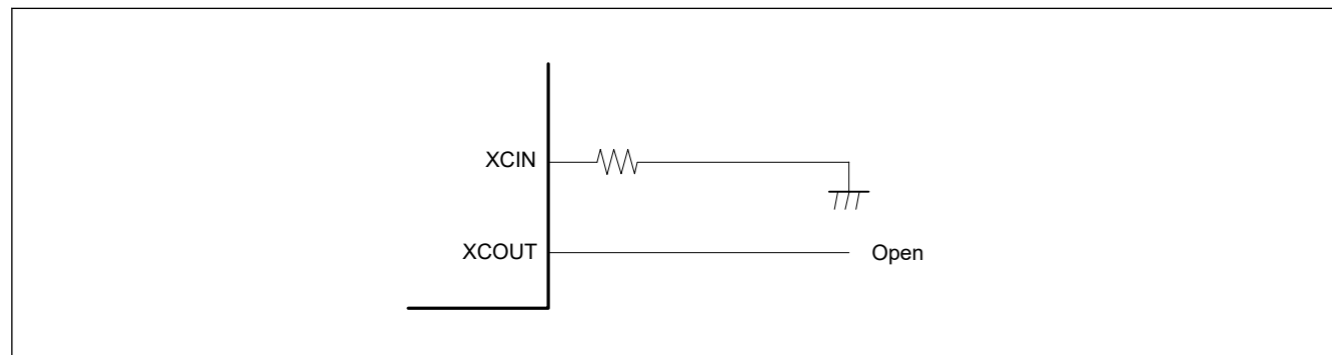

Figure 8.7 Pin handling when the sub-clock oscillator is not used

### 8.4.1 连接32.768kHz晶体谐振器

要为副时钟振荡器提供时钟，请连接一个32.768-kHz晶体谐振器，如图8.5所示。如有必要，可以添加阻尼电阻器( $R_d$ )。由于电阻值因谐振器和振荡驱动能力而异，请使用谐振器制造商推荐的值。如果谐振器制造商建议使用外部反馈电阻器( $R_f$ )，请按照说明在XCIN和XCOU之间插入一个 $R_f$ 。连接谐振器以提供时钟时，谐振器的频率必须在表8.1中所述的副时钟振荡器的谐振器频率范围内。

### 8.4.2 不使用副时钟振荡器时的引脚处理

不使用副时钟振荡器时，通过一个电阻将XCIN引脚连接到VSS（将VSS下拉），并使XCOU引脚保持开路，如图8.7所示。此外，如果未连接振荡器，请将副时钟振荡器停止位(SOSCCR.SOSTP)设置为1以停止振荡器。

## 8.5 Oscillation Stop Detection Function

### 8.5.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When oscillation stop is detected, the system clock switches as follows:

- If an oscillation stop is detected with  $SCKSCR.CKSEL[2:0] = 011b$  (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with  $PLLCCR.PLSRCSEL = 0$  (PLL source clock = MOSC) and  $SCKSCR.CKSEL[2:0] = 101b$  (system clock source = PLL), PLL clock remains the system clock source. However, the frequency becomes a free-running oscillation frequency.

An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to a high-impedance state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See [section 47, Electrical Characteristics](#).

Switching between the main clock oscillator and the MOCO clock or between the PLL clock and PLL free-running clock is controlled by the Oscillation Stop Detection Flag (OSTDSR.OSTDF).

OSTDF controls the switched clock as follows:

- When  $SCKSCR.CKSEL[2:0] = 011b$  (system clock source = MOSC):
  - When OSTDF changes from 0 to 1, the clock source switches to the MOCO clock.
  - When OSTDF changes from 1 to 0, the clock source switches back to MOSC.
- When  $PLLCCR.PLSRCSEL = 0$  (PLL source clock = MOSC) and  $SCKSCR.CKSEL[2:0] = 101b$  (System clock source = PLL):
  - When OSTDF changes 0 to 1, the clock source switches to the PLL free-running oscillation clock.
  - When OSTDF changes 1 to 0, the clock source switches back to PLL.

To switch the clock source to the main clock or PLL clock again after the oscillation stop detection, set the  $CKSEL[2:0]$  bits to a clock source other than the main clock or PLL clock and clear the OSTDF flag to 0. Also, check that the OSTDF flag is not 1, then set the  $CKSEL[2:0]$  bits to the main clock or PLL clock after the specified oscillation stabilization time elapses.

After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the oscillation stop detection function enable bit (OSTDCR.OSTDE) after a specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock is stopped by an external cause. Therefore, the oscillation stop detection function must be disabled before the main clock oscillator is stopped by software or a transition is made to Software Standby or Deep Software Standby mode.

The oscillation stop detection function switches all clocks that can be selected as the MOSC clock except CLKOUT to the MOCO (when system clock is MOSC) or PLL free-running (when system clock is PLL).

The system clock (ICKL) frequency during the MOCO (when system clock is MOSC) or PLL free-running (when system clock is PLL) operation is specified by the MOCO oscillation frequency and the division ratio set by the system clock select bits ( $SCKDIVCR.ICK[2:0]$ )

## 8.5 振荡停止检测功能

### 8.5.1 振荡停止检测和检测后操作

振荡停止检测功能检测主时钟振荡器停止。当检测到振荡停止时，系统时钟切换如下：

- 如果通过 $SCKSCR.CKSEL[2:0]=011b$ （系统时钟源=MOSC）检测到振荡停止，则系统时钟源切换到MOCO时钟。
- 如果在 $PLLCCR.PLSRCSEL=0$ （PLL源时钟=MOSC）的情况下检测到振荡停止并且 $SCKSCR.CKSEL[2:0]=101b$ （系统时钟源=PLL），PLL时钟仍然是系统时钟源。然而，该频率变为自由运行的振荡频率。

当检测到振荡停止时，可以产生一个振荡停止检测中断请求。此外，一般PWM定时器(GPT)输出可在检测时强制为高阻抗状态。

当输入时钟保持在0或1一段时间，例如，当主时钟振荡器发生故障时，检测到主时钟振荡停止。参见第47节，电气特性。

主时钟振荡器和MOCO时钟之间或PLL时钟和PLL自由运行时钟之间的切换由振荡停止检测标志(OSTDSR.OSTDF)控制。

OSTDF控制切换时钟如下：

- 当 $SCKSCR.CKSEL[2:0]=011b$ 时（系统时钟源=MOSC）：
  - 当OSTDF从0变为1时，时钟源切换到MOCO时钟。
  - 当OSTDF从1变为0时，时钟源切换回MOSC。
- 当 $PLLCCR.PLSRCSEL=0$ （PLL源时钟=MOSC）且 $SCKSCR.CKSEL[2:0]=101b$ （系统时钟源=PLL）时：
  - 当OSTDF由0变为1时，时钟源切换到PLL自由运行振荡时钟。
  - 当OSTDF由1变为0时，时钟源切换回PLL。

要在检测到振荡停止后再次将时钟源切换为主时钟或PLL时钟，请将 $CKSEL[2:0]$ 位设置为主时钟或PLL时钟以外的时钟源，并将OSTDF标志清零。此外，检查OSTDF标志不为1，然后在指定的振荡稳定时间过去后将 $CKSEL[2:0]$ 位设置为主时钟或PLL时钟。

复位释放后，主时钟振荡器停止，振荡停止检测功能被禁用。要启用振荡停止检测功能，激活主时钟振荡器并在经过指定的振荡稳定时间后将1写入振荡停止检测功能使能位(OSTDCR.OSTDE)。

振荡停止检测功能检测主时钟何时因外部原因停止。因此，必须在软件停止主时钟振荡器或转换到软件待机或深度软件待机模式之前禁用振荡停止检测功能。

振荡停止检测功能将除CLKOUT之外的所有可选择作为MOSC时钟的时钟切换到MOCO（系统时钟为MOSC时）或PLL自由运行（系统时钟为PLL时）。

MOCO（系统时钟为MOSC时）或PLL自由运行（系统时钟为PLL时）操作期间的系统时钟（ICKL）频率由MOCO振荡频率和系统时钟选择位（ $SCKDIVCR$ ）设置的分频比指定。 $ICK[2:0]$

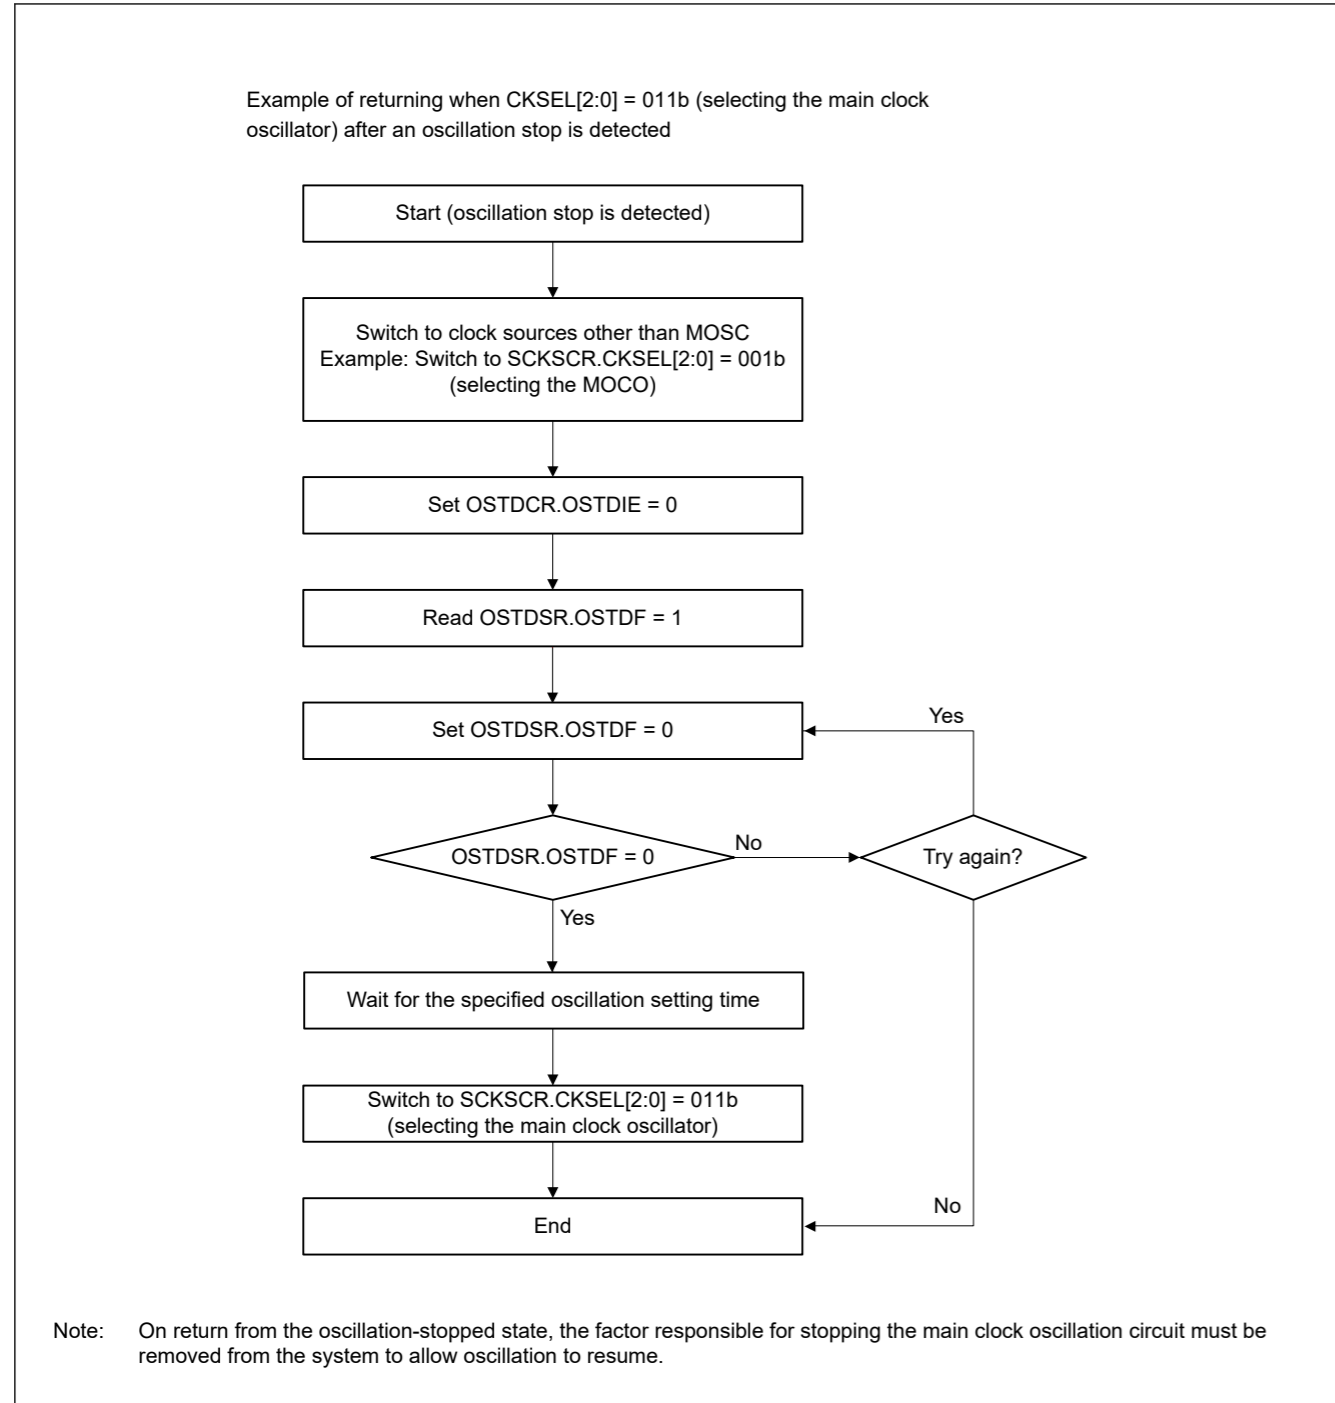

Figure 8.8 Flow of recovery on detection of oscillator stop

### 8.5.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC\_STOP) is generated when the Oscillation Stop Detection Flag (OSTDSR.OSTDF) is 1 and the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B, C, D).

After the oscillation stop is detected, wait at least 10 PCLKB clock cycles before writing to the POEGGn.OSTPF flag. When the OSTDSR.OSTDF flag requires clearing, do so after clearing the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait at least 2 PCLKB clock cycles before setting the OSTDCR.OSTDIE bit to 1 again. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

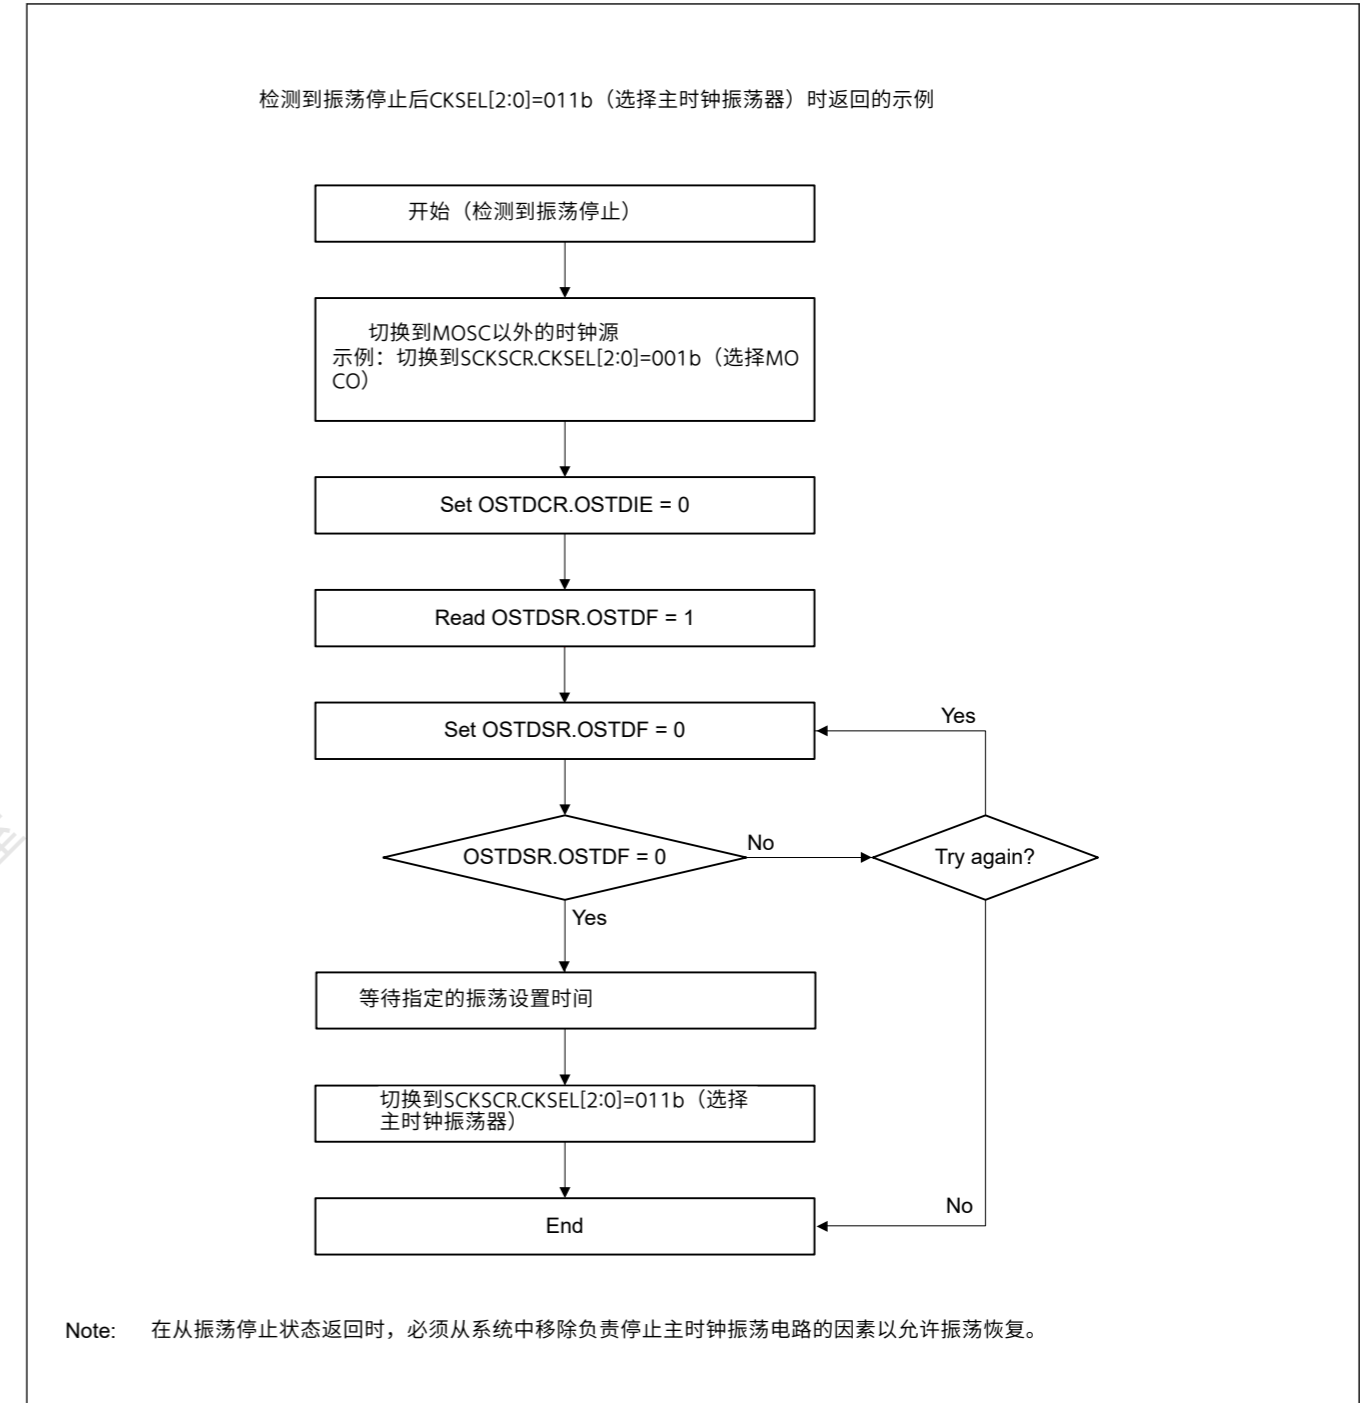

Figure 8.8 检测到振荡器停止时的恢复流程

### 8.5.2 振荡停止检测中断

当振荡停止检测标志(OSTDSR.OSTDF)为1且振荡停止检测控制寄存器(OSTDCR.OSTDIE)中的振荡停止检测中断使能位为1 (使能) 时, 将产生一个振荡停止检测中断(MOSC\_STOP)。GPT端口输出使能(POEG)被通知主时钟振荡器停止。收到通知后, POEG将POEG组n设置寄存器(POEGGn.OSTPF)中的振荡停止检测标志设置为1(n=A B C D)。

检测到振荡停止后, 至少等待10个PCLKB时钟周期, 然后再写入POEGGn.OSTPF标志。当需要清除OSTDSR.OSTDF标志时, 请在清除振荡停止检测控制寄存器(OSTDCR.OSTDIE)中的振荡停止检测中断使能位后执行此操作。至少等待2个PCLKB时钟周期, 然后再将OSTDCR.OSTDIE位设置为1。可能需要更长的PCLKB等待时间, 具体取决于读取给定IO寄存器所需的周期数。

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

AGT专用时钟 (AGTSCLK和AGTLCLK) 是AGT的工作时钟。AGTSCLK由副时钟振荡器产生，AGTLCLK由LOCO时钟产生。

#### 8.7.10 SysTick Timer-Dedicated Clock (SYSTICCLK)

SysTick定时器专用时钟SYSTICCLK是SYSTICCLK的工作时钟。SYSTICCLK由LOCO时钟生成。

#### 8.7.11 外部引脚输出时钟(CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. CLKOUT is output to the CLKOUT pin when CKOCR.CKOEN is set to 1. Only change the value in the CKODIV[2:0] or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0.

The CLKOUT clock frequency is specified in the following bits:

- CKODIV[2:0] or CKOSEL[2:0] in CKOCR
- HOCOFRQ0[1:0] bit in OFS1

### 8.7.12 JTAG Clock (JTAGTCK)

The JTAG clock (JTAGTCK) is the clock for the JTAG.

JTAGTCK is generated by the JTAG external clock (TCK).

## 8.8 Usage Notes

### 8.8.1 Notes on Clock Generation Circuit

The frequency of the following clocks supplied to each module changes according to the setting of the SCKDIVCR register:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- FlashIF clock (FCLK)

Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the operating frequency (f) specified in the AC characteristics. See [section 47, Electrical Characteristics](#).
- The system clock, peripheral module clock must be set according to [Table 8.2](#).

To ensure correct processing after the clock frequency changes, first write to the relevant Clock Control register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

### 8.8.2 Notes on Resonator

Because various resonator characteristics relate closely to your board design, adequate evaluation is required before use. See the resonator connection example in [Figure 8.5](#). The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, consult the resonator manufacturer when determining the circuit constants. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

### 8.8.3 Notes on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in [Figure 8.11](#) to prevent electromagnetic induction from interfering with correct oscillation. [Figure 8.11](#) shows the case which the main clock oscillator is used. In case of sub-clock oscillator, it is also same as [Figure 8.11](#).

CLKOUT从CLKOUT引脚外部输出，用于时钟或蜂鸣器输出。CLKOUT被输出到CKOCR.CKOEN设置为1时的CLKOUT引脚。仅更改CKODIV[2:0]或CKOSEL[2:0]位中的值CKOCR.CKOEN位为0时的CKOCR。

CLKOUT时钟频率在以下位中指定：

- CKOCR中的CKODIV[2:0]或CKOSEL[2:0]
- OFS1中的HOCOFRQ0[1:0]位

### 8.7.12 JTAG Clock (JTAGTCK)

JTAG时钟(JTAGTCK)是JTAG的时钟。

JTAGTCK由JTAG外部时钟(TCK)生成。

## 8.8 使用说明

### 8.8.1 时钟产生电路注意事项

提供给每个模块的以下时钟的频率根据SCKDIVCR寄存器的设置而变化：

- 系统时钟 (ICLK)
- 外设模块时钟 (PCLKA、PCLKB、PCLKC和PCLKD)
- FlashIF clock (FCLK)

每个频率必须满足以下条件：

- 各频率必须在交流特性规定的工作频率(f)的工作保证范围内选择。参见第47节，电气特性。
- 系统时钟、外围模块时钟必须按照表8.2设置。

为保证时钟频率变化后的正确处理，首先写入相关的ClockControl寄存器改变频率，然后从寄存器中读取值，最后进行后续处理。

### 8.8.2 谐振器注意事项

由于各种谐振器特性与您的电路板设计密切相关，因此在使用前需要进行充分评估。请参见图8.5中的谐振器连接示例。谐振器的电路常数取决于要使用的谐振器和安装电路的杂散电容。因此，在确定电路常数时，请咨询谐振器制造商。施加在谐振器引脚之间的电压必须在绝对最大额定值范围内。

### 8.8.3 电路板设计注意事项

使用晶体谐振器时，将谐振器及其负载电容尽可能靠近XTAL和EXTAL引脚。其他信号线应远离振荡电路，如图8.11所示，以防止电磁感应干扰正确的振荡。图8.11显示了使用主时钟振荡器的情况。如果是副时钟振荡器，也与图8.11相同。

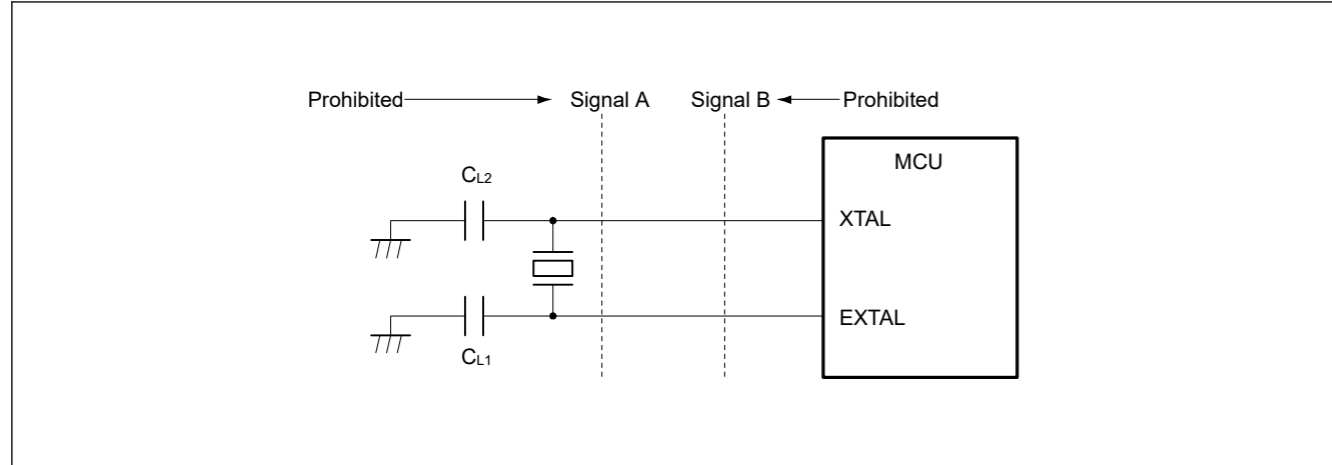

Figure 8.11 Signal routing in board design for oscillation circuit

#### 8.8.4 Notes on Resonator Connect Pin

When the main clock is not used, the EXTAL and XTAL pins can be used as general ports. When these pins are used as general ports, the main clock must be stopped (MOSCCR.MOSTP bit should be set to 1).

#### 8.8.5 Notes on Using Sub-Clock Oscillator

The output of the P212 (EXTAL), P213 (XTAL), and P705 pins may affect the oscillation by the sub-clock oscillator.

If the sub-clock oscillator is used, implement board design so as not to affect the oscillation. Renesas strongly recommends setting the DSCR[1:0] bits to 00b or 01b when using the P212 (EXTAL), P213 (XTAL), and P705 as output pins and using the sub-clock oscillator.

In addition, when using the sub-clock oscillator in middle drive capability (SOMCR.SODRV1 = 1), Renesas recommends setting the DSCR[1:0] bits to 00b when using the P212 (EXTAL), P213 (XTAL), and P705 as output pins and using the sub-clock oscillator.

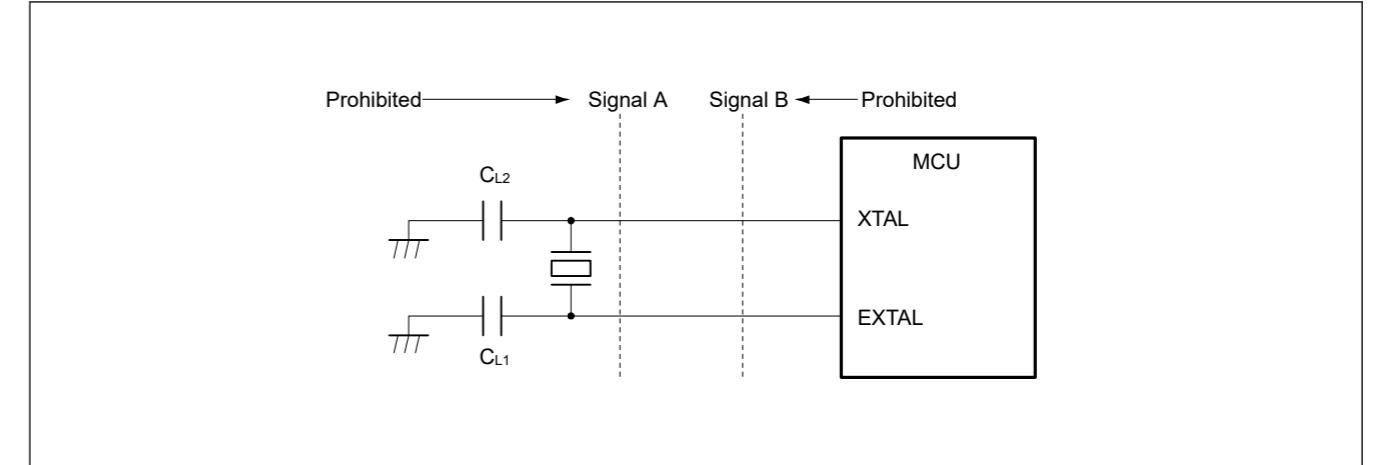

Figure 8.11 振荡电路板设计中的信号路由

#### 8.8.4 谐振器连接引脚注意事项

当不使用主时钟时，EXTAL和XTAL引脚可用作通用端口。当这些引脚用作通用端口时，必须停止主时钟（MOSCCR.MOSTP位应设置为1）。

#### 8.8.5 使用副时钟振荡器的注意事项

P212(EXTAL)、P213(XTAL)和P705引脚的输出可能会影响副时钟振荡器的振荡。

如果使用副时钟振荡器，请在不影响振荡的情况下进行板卡设计。当使用P212(EXTAL)、P213(XTAL)和P705作为输出引脚并使用副时钟振荡器时，瑞萨强烈建议将DSCR[1:0]位设置为00b或01b。

此外，当在中间驱动能力中使用副时钟振荡器(SOMCR.SODRV1=1)时，瑞萨建议在使用P212(EXTAL)、P213(XTAL)和P705时将DSCR[1:0]位设置为00b作为输出引脚并使用副时钟振荡器。

## 9. Clock Frequency Accuracy Measurement Circuit (CAC)

### 9.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.

Table 9.1 lists the CAC specifications, Figure 9.1 shows the CAC block diagram, and Table 9.2 lists the CAC I/O pin.

9.3 Operation

9.3.1 测量时钟频率

CAC使用CACREF引脚输入或内部时钟作为参考来测量时钟频率。图9.2显示了CAC的操作示例。

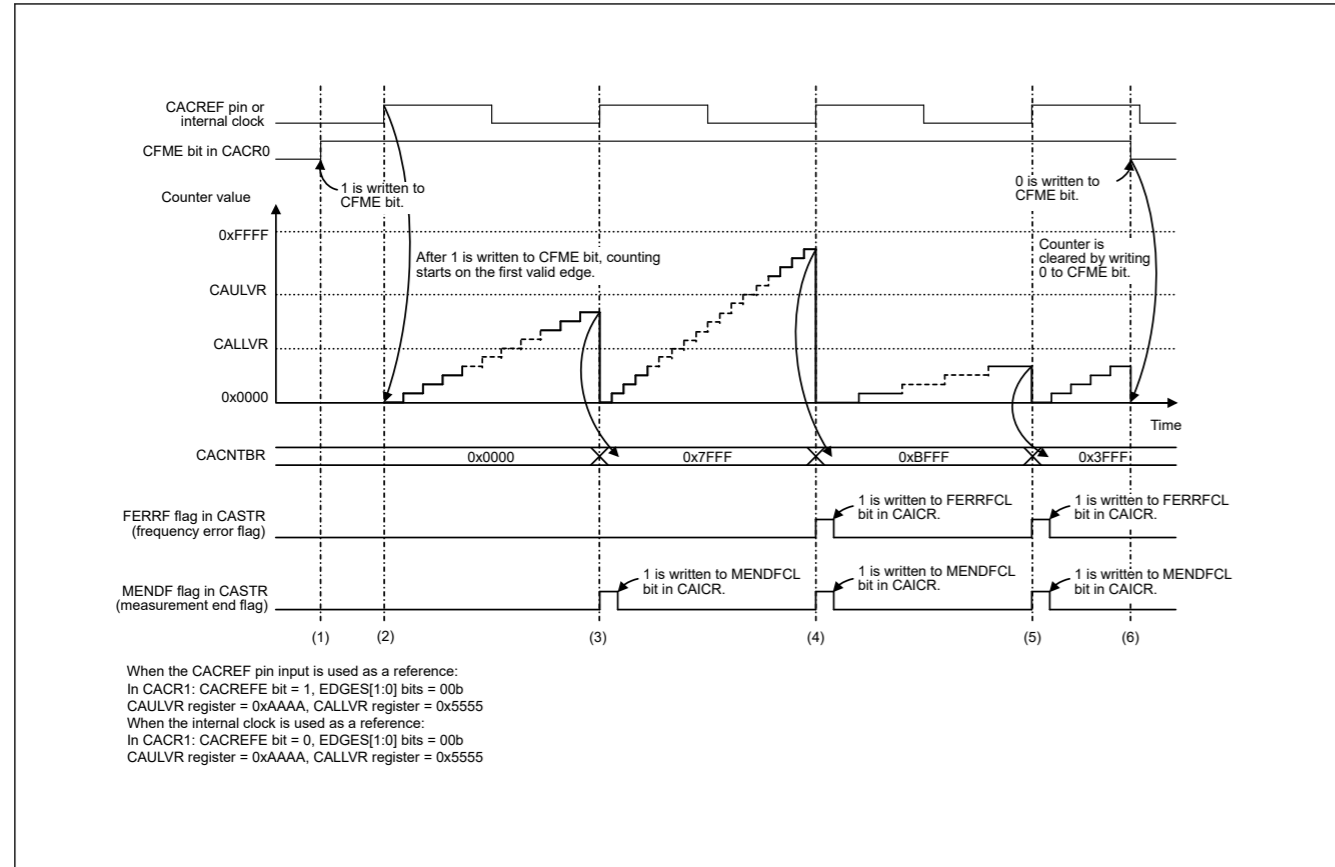

Figure 9.2 CAC operating example

The events in Figure 9.2 are:

- When the CACREF pin input is used as reference (CACR1.CACREFE = 1), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 0 and the CACR1.CACREFE bit is set to 1. When the internal clock is used as reference (CACR1.CACREFE = 0), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 1.
- When the CACREF pin input is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input from the CACREF pin. When the internal clock is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input based on the clock source selected by the CACR2.RSCS[2:0] bits.
- When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both  $CACNTBR \leq CAULVR$  and  $CACNTBR \geq CALLVR$  are true, only the MENDF flag in CASTR is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
- When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If  $CACNTBR > CAULVR$ , the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
- When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If  $CACNTBR < CALLVR$ , the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
- When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

Figure 9.2 CAC操作示例

图9.2中的事件是:

- 当CACREF引脚输入用作参考时 (CACR1.CACREFE=1), 频率测量通过以下方式启用  
将1写入CACR0.CFME位, 同时将CACR2.RPS位设置为0, 并将CACR1.CACREFE位设置为1。当内部时钟用作参考时 (CACR1.CACREFE=0), 频率测量通过以下方式启用将1写入CACR0.CFME位, 同时CACR2.RPS位设置为1。
- 当CACREF引脚输入用作参考时, 向CFME位写入1后, 如果CACR1.EDGES[1:0]位选择的有效沿 (上升沿 (CACR1.EDGES[1:0]=00b)在图9.2中)从CACREF引脚输入。当内部时钟用作参考时, CFME位写入1后, 如果CACR1.EDGES[1:0]位选择的有效沿 (上升沿 (CACR1.EDGES[1:0]=00b)在图9.2中)根据CACR2.RSCS[2:0]位选择的时钟源输入。
- 当输入下一个有效边沿时, 计数器值被传送到CACNTBR并与中的值进行比较  
CAULVR和CALLVR。如果 $CACNTBR \leq CAULVR$ 和 $CACNTBR \geq CALLVR$ 都为真, 则只有MENDF标志  
CASTR设置为1, 因为时钟频率正确。如果CAICR中的MENDIE位为1, 则产生测量结束中断。
- 当输入下一个有效边沿时, 计数器值被传送到CACNTBR并与中的值进行比较  
CAULVR和CALLVR。如果 $CACNTBR > CAULVR$ , 则CASTR中的FERRF标志设置为1, 因为时钟频率错误。如果CAICR中的FERRIE位为1, 则产生频率错误中断。CASTR中的MENDF标志在测量结束时设置为1。如果CAICR中的MENDIE位为1, 则产生测量结束中断。
- 当输入下一个有效边沿时, 计数器值被传送到CACNTBR并与中的值进行比较  
CAULVR和CALLVR。如果 $CACNTBR < CALLVR$ , 则CASTR中的FERRF标志设置为1, 因为时钟频率错误。如果CAICR中的FERRIE位为1, 则产生频率错误中断。CASTR中的MENDF标志在测量结束时设置为1。如果CAICR中的MENDIE位为1, 则产生测量结束中断。
- 当CACR0中的CFME位为1时, 每次输入有效边沿时, 计数器值被传送到CACNTBR并与CAULVR和CALLVR中的值进行比较。向CACR0中的CFME位写入0将清除计数器并停止向上计数。

### 9.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to 1 cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained using the following formula:

$$\text{Counter value error} = (1 \text{ cycle of the count source clock}) / (1 \text{ cycle of the sampling clock})$$

## 9.4 Interrupt Requests

The CAC generates three types of interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt

When an interrupt source is generated, the associated status flag is set to 1. Table 9.3 provides information on the CAC interrupt requests.

**Table 9.3 CAC interrupt requests**

| Interrupt request         | Interrupt enable bit | Status flag | Interrupt sources   |
|---------------------------|----------------------|-------------|---|
| Frequency error interrupt | CAICR.FERRIE         | CASTR.FERRF | The result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR   |
| Measurement end interrupt | CAICR.MENDIE         | CASTR.MENDF | <ul style="list-style-type: none"> <li>● Valid edge is input from the CACREF pin or internal clock</li> <li>● Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit</li> </ul> |
| Overflow interrupt        | CAICR.OVFIE          | CASTR.OVFF  | Counter overflows   |

## 9.5 Usage Notes

### 9.5.1 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable CAC operation. The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

### 9.3.2 CACREF引脚上的信号数字滤波

CACREF引脚有一个数字滤波器，CACREF引脚上的电平在选定的采样间隔内连续三个匹配后传输到内部电路。同一电平继续在内部传输，直到引脚上的电平再次连续匹配三个。可选择启用或禁用数字滤波器及其采样时钟。

由于数字滤波器的相位和输入到CACREF引脚的信号之间的差异，传输到CACNTBR的计数器值可能会出现最多1个采样时钟周期的错误。When a frequency dividing clock is selected as a count source clock the counter value error is obtained using the following formula:

$$\text{计数器值误差} = (\text{计数源时钟的1个周期}) / (\text{采样时钟的1个周期})$$

## 9.4 中断请求

CAC产生三种类型的中断请求：

- 频率错误中断
- 测量结束中断
- 溢出中断

产生中断源时，相关状态标志设置为1。表9.3提供了有关CAC中断请求的信息。

**Table 9.3 CAC中断请求**

| 中断请求   | 中断使能位        | 状态标志        | 中断源  |
|--------|--------------|-------------|--|
| 频率错误中断 | CAICR.FERRIE | CASTR.FERRF | CACNTBR与CAULVR和CALLVR比较的结果是CACNTBR>CAULVR或CACNTBR<CALLVR   |
| 测量结束中断 | CAICR.MENDIE | CASTR.MENDF | <ul style="list-style-type: none"> <li>● 有效边沿从CACREF引脚或内部时钟输入</li> <li>● 将1写入CACR0.CFME位后，在第一个有效边沿不发生测量结束中断</li> </ul> |
| 溢出中断   | CAICR.OVFIE  | CASTR.OVFF  | 计数器溢出  |

## 9.5 使用说明

## 10. Low Power Modes

### 10.1 Overview

The MCU has several functions for reducing power consumption, such as setting clock dividers, stopping modules, selecting power control mode in Normal mode, and transitioning to low power modes.

Table 10.1 lists the specifications of the low power mode functions. Table 10.2 lists the conditions to transition to low power modes, the states of the CPU and peripheral modules, and the method for canceling each mode. After a reset, the MCU enters the program execution state, but only the DTC, DMAC and SRAM operate.

## 10. 低功耗模式

### 10.1 Overview

MCU具有多种降低功耗的功能，例如设置时钟分频器、停止模块、在正常模式下选择电源控制模式以及转换到低功耗模式。

表10.1列出了低功耗模式功能的规格。表10.2列出了转换到低功耗模式的条件、CPU和外围模块的状态以及取消每种模式的方法。复位后，MCU进入程序执行状态，但只有DTC、DMAC和SRAM运行。

| I/O Ports  | Operating                | Retained  | Operating   | Retained  |

Note: Selectable means that operating or not operating can be selected by the control registers.  
 Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.  
 Operation prohibited means that the function must be stopped before entering Software Standby mode.  
 Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.  
 All modules whose module-stop bits are 0 start as soon as PCLKs are supplied after entering Snooze mode. In order to avoid increase in power consumption in Snooze mode, module-stop bit of modules which are unnecessary in Snooze mode must be set to 1 before entering Software Standby mode.

Note 1. In IWDT-dedicated on-chip oscillator and IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode. In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDTSTPCTL) in Option Function Select Register 0 (OFS0) in WDT auto start mode. Power consumption can be reduced in Normal and Sleep modes by selecting an appropriate operating power control mode according to the operating frequency.

Note: 可选择的意思是可以通过控制寄存器来选择操作或不操作。  
 停止 (Retained) 表示内部寄存器的内容被保留但操作被暂停。  
 禁止操作意味着在进入软件待机模式之前必须停止该功能。  
 停止 (未定义) 表示内部寄存器的内容未定义, 内部电路的电源被切断。  
 进入贪睡模式后, 一旦提供PCLK, 所有模块停止位为0的模块都会启动。为了避免贪睡模式下的功耗增加, 在进入软件待机模式之前, 必须将在贪睡模式下不需要的模块的模块停止位设置为1。

注1.在IWDT专用内部振荡器和IWDT中, 通过设置IWDT停止控制位来选择操作或停止 (IWDTSTPCTL)在IWDT自动启动模式下选项功能选择寄存器0(OFS0)。在WDT中, 通过在WDT自动启动模式下设置选项功能选择寄存器0(OFS0)中的WDT停止控制位(WDTSTPCTL)来选择操作或停止。通过选择适当的操作功率控制, 可以在正常和睡眠模式下降低功耗模式根据工作频率。

- Note 2. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010b (LOCO) and 100b (SOSC).
- Note 3. AGT0/AGT2 operation is possible when 100b (AGTLCLK) or 110b (AGTSCLK) is selected by the AGT0/2.AGTMR1.TCK[2:0] bits. AGT1/AGT3 operation is possible when 100b (AGTLCLK), 110b (AGTSCLK) or 101b (Underflow event signal from AGT0/AGT2) is selected by the AGT1/3.AGTMR1.TCK[2:0] bits. When 100b (AGTLCLK) is selected by AGTn.AGTMR1.TCK[2:0] bits (n = 0, 1, 2, 3), the DPSBYCR.DEEPCUT[1:0] bits must set to 00b before entering Deep Software Standby mode.
- Note 4. IIC0 wakeup interrupt is available.
- Note 5. When using SCI0 in Snooze mode, MOSCCR.MOSTP and PLLCR.PLLSTP and PLL2CR.PLL2STP bits must be 1.
- Note 6. Serial communication modes of SCI0 is only in asynchronous mode.
- Note 7. Event lists the restrictions described in [section 10.10.14. ELC Events in Snooze Mode](#).
- Note 8. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the oscillator status is the same as before entering Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the oscillator stops when the MCU enters Deep Software Standby mode.
- Note 9. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, data in the Standby SRAM is retained in Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, data in the Standby SRAM is undefined in Deep Software Standby mode.
- Note 10. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the values of the USB resume detection circuit registers are retained and detection of USB resumption is enabled, and the values of other registers are undefined in Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the values of all registers are undefined in Deep Software Standby mode.
- Note 11. When the RCR4.RCKSEL bit set to 1 (LOCO), the DPSBYCR.DEEPCUT[1:0] bits must set to 00b before entering Deep Software Standby mode.
- Note 12. When using LVD in Deep Software Standby mode, DPSBYCR.DEEPCUT[1:0] bits must be 00b or 01b before entering Deep Software Standby mode.
- Note 13. When the MCU enters Deep Software Standby mode with the DPSBYCR.DEEPCUT[1:0] bits set to 11b, the LVD circuit stops and the low-power function of the power-on reset circuit is enabled.
- Note 14. AGT4 operation is possible when 100b (AGTLCLK) or 110b (AGTSCLK) is selected by the AGT4.AGTMR1.TCK[2:0] bits. AGT5 operation is possible when 100b (AGTLCLK), 110b (AGTSCLK) or 101 (Underflow event signal from AGT4) is selected by the AGT5.AGTMR1.TCK[2:0] bits.
- Note 15. When using the 12-bit A/D Converter in Snooze mode, the ADCMPCR.CMPAE and ADCMPCR.CMPBE bits must be 1.

Table 10.3 Interrupt Source for canceling Snooze, Software Standby and Deep Software Standby Modes (2 of 2)

| Interrupt source | Name          | Software Standby Mode | Snooze Mode       | Deep Software Standby Mode |
|------------------|---------------|-----------------------|-------------------|----------------------------|
| CTSUSU           | CTSUSU_CTSUFN | No                    | Yes with SELSR0*1 | No                         |

Note 1. To use the interrupt request as a trigger for exiting the Snooze mode, the request must be selected in SELSR0. See section 13, Interrupt Controller Unit (ICU) for the setting of SELSR0. When a trigger selected in SELSR0 occurs after executing WFI instruction and during the transition from Normal mode to Software Standby mode, the request might or might not be accepted, depending on the timing of the occurrence.

Note 2. Only one of either SCIO\_AM or SCIO\_RXI\_OR\_ERI can be set.

Note 3. The event which is enabled by the SNZEDCRn must not be used.

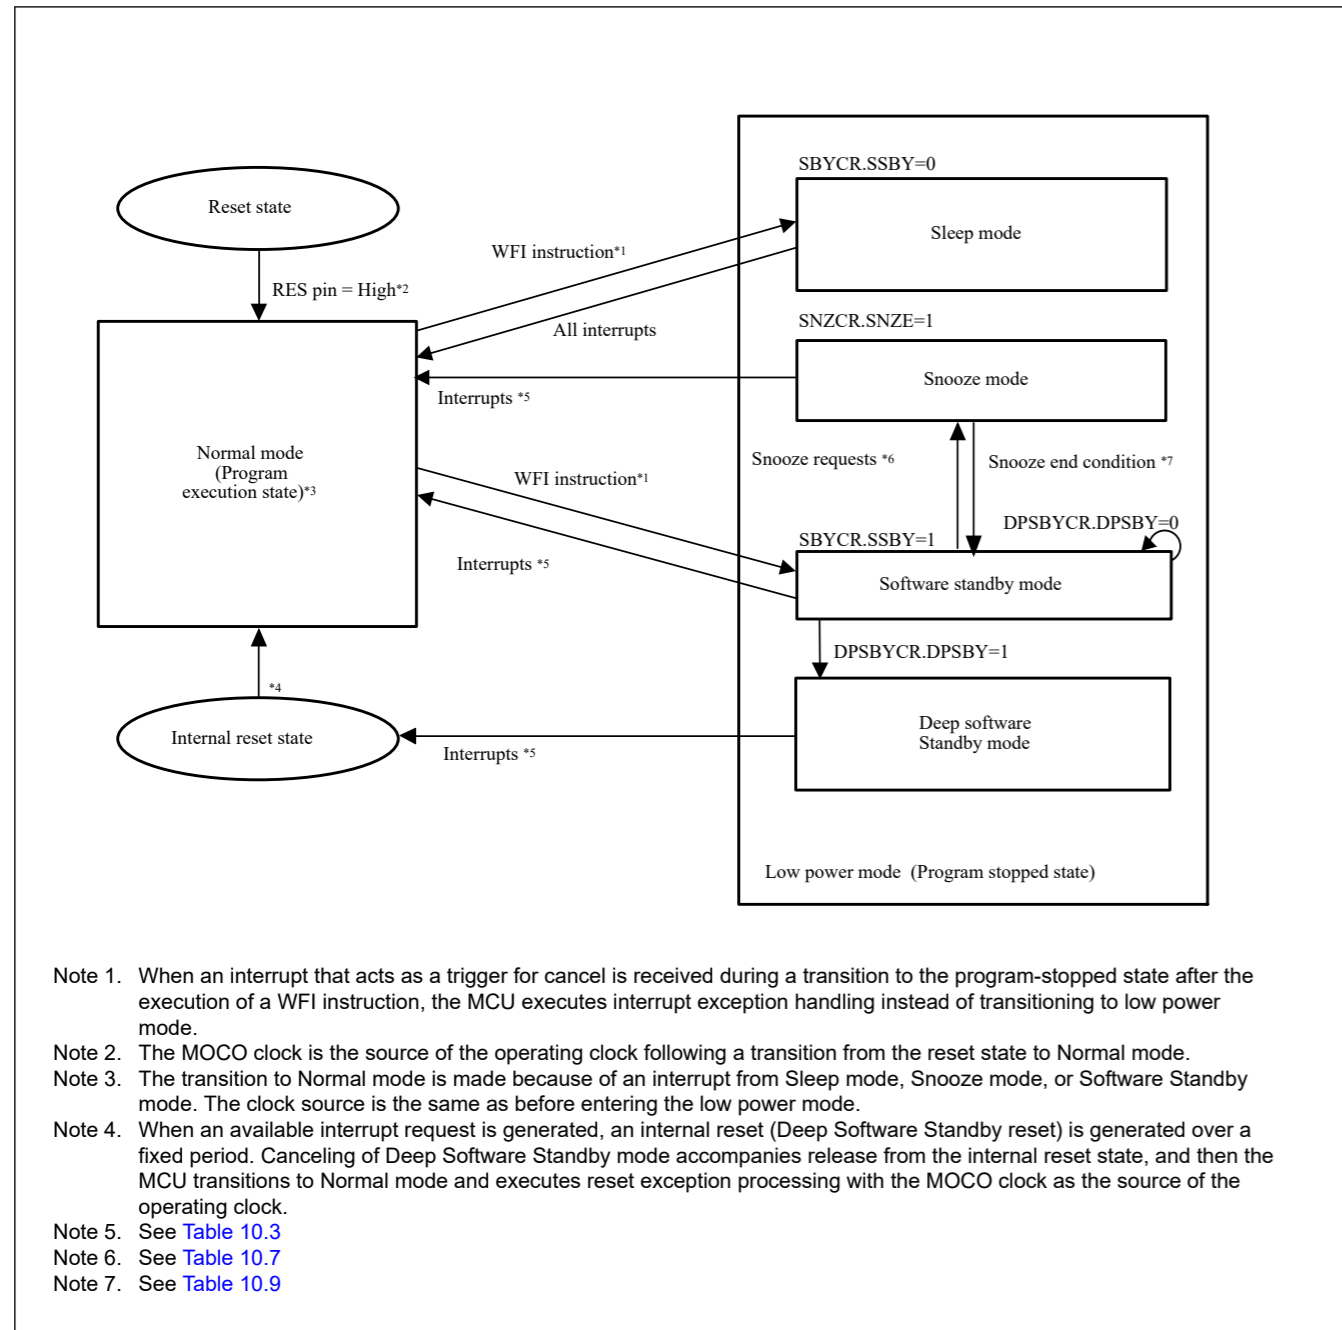

Figure 10.1 Mode Transitions

- Note 1. When an interrupt that acts as a trigger for cancel is received during a transition to the program-stopped state after the execution of a WFI instruction, the MCU executes interrupt exception handling instead of transitioning to low power mode.
- Note 2. The MOCO clock is the source of the operating clock following a transition from the reset state to Normal mode.
- Note 3. The transition to Normal mode is made because of an interrupt from Sleep mode, Snooze mode, or Software Standby mode. The clock source is the same as before entering the low power mode.
- Note 4. When an available interrupt request is generated, an internal reset (Deep Software Standby reset) is generated over a fixed period. Canceling of Deep Software Standby mode accompanies release from the internal reset state, and then the MCU transitions to Normal mode and executes reset exception processing with the MOCO clock as the source of the operating clock.

- Note 6. See Table 10.7
- Note 7. See Table 10.9

Table 10.3 用于取消贪睡、软件待机和深度软件待机模式的中断源(2of2)

| 中断源    | Name          | 软件待机模式 | 贪睡模式      | 深度软件待机模式 |
|--------|---------------|--------|-----------|----------|
| CTSUSU | CTSUSU_CTSUFN | No     | 是SELSR0*1 | No       |

注1.要将中断请求用作退出贪睡模式的触发器，必须在SELSR0中选择该请求。见第13节，用于设置SELSR0的中断控制器单元(ICU)。当SELSR0中选择的触发发生在执行WFI指令之后以及从正常模式到软件待机模式的转换期间，请求可能会或可能不会被接受，具体取决于发生的时间。

注2.只能设置SCIO\_AM或SCIO\_RXI\_OR\_ERI之一。

注3.不得使用由SNZEDCRn启用的事件。

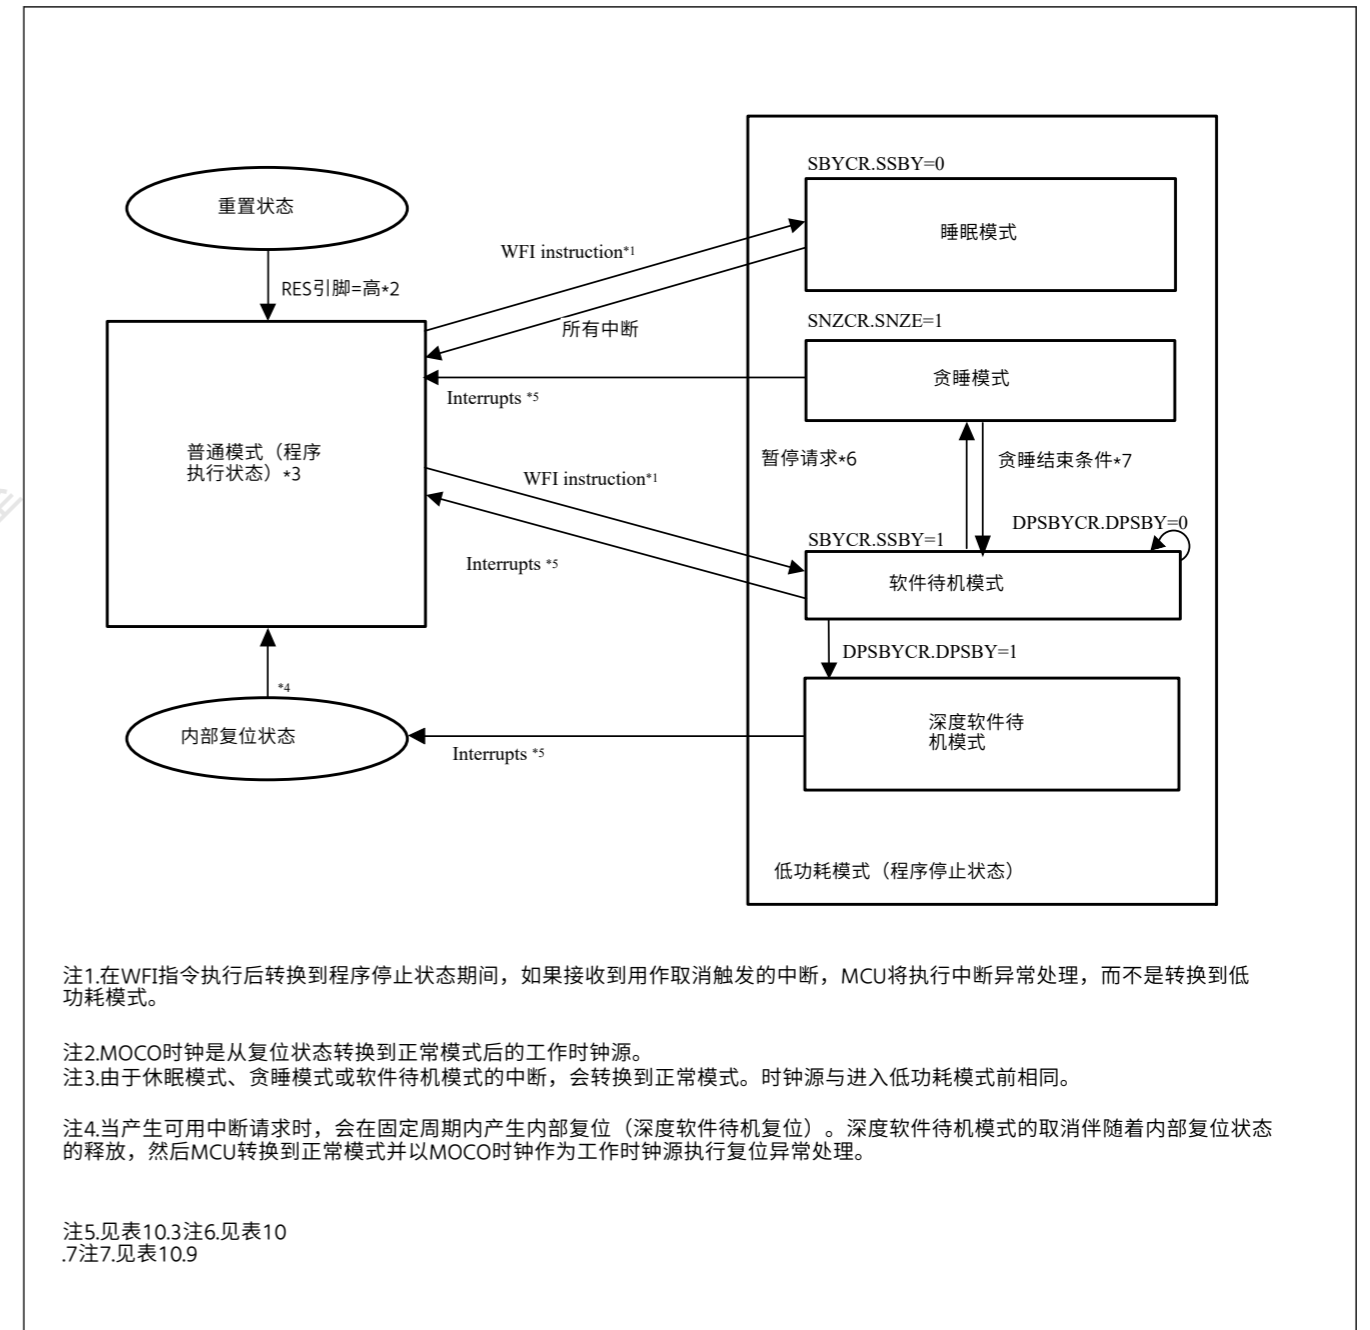

Figure 10.1 模式转换

- 注1.在WFI指令执行后转换到程序停止状态期间，如果接收到用作取消触发的中断，MCU将执行中断异常处理，而不是转换到低功耗模式。
- 注2.MOCO时钟是从复位状态转换到正常模式后的工作时钟源。
- 注3.由于休眠模式、贪睡模式或软件待机模式的中断，会转换到正常模式。时钟源与进入低功耗模式前相同。
- 注4.当产生可用中断请求时，会在固定周期内产生内部复位（深度软件待机复位）。深度软件待机模式的取消伴随着内部复位状态的释放，然后MCU转换到正常模式并以MOCO时钟作为工作时钟源执行复位异常处理。
- 注5.见表10.3注6.见表10.7注7.见表10.9

- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

**SSBY bit (Software Standby Mode Select)**

The SSBY bit specifies the transition destination after a WFI instruction is executed.

When the SSBY bit is set to 1, the MCU enters Software Standby mode after execution of a WFI instruction. When the MCU returns to Normal mode from Software Standby mode by an interrupt, the SSBY bit remains 1. The SSBY bit can be cleared by writing 0 to it.

While the OSTDCR.OSTDE bit is 1, setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

While the FENTRYR.FENTRY0 bit is 1 setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

Note: 在重写该寄存器之前将PRCR.PRC1位设置为1 (允许写入)。

**SSBY位 (软件待机模式选择)**

SSBY位指定执行WFI指令后的转移目标。

当SSBY位设置为1时, MCU在执行WFI指令后进入软件待机模式。当。。。的时候 MCU通过中断从软件待机模式返回到正常模式, SSBY位保持为1。SSBY位可以通过向其写入0来清除。

当OSTDCR.OSTDE位为1时, 忽略SSBY位的设置。即使SSBY位为1, MCU也会在执行WFI指令时进入休眠模式。

当FENTRYR.FENTRY0位为1时, SSBY位的设置被忽略。即使SSBY位为1, MCU也会在执行WFI指令时进入休眠模式。

Note 1. The MSTPBi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPBi bit, wait for two CAN clock (CANMCLK) cycles after writing, and then execute a WFI instruction (i = 1 to 2).

Note 2. The MSTPBi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPBi bit, wait for two USB clock (USBCLK) cycles after writing, and then execute a WFI instruction (i = 11).

注1.MSTPBi位必须在由该位控制的时钟振荡稳定时写入。进入软件待机模式写入MSTPBi位后, 写入后等待两个CAN时钟 (CANMCLK) 周期, 然后执行WFI指令 (i=1到2)。

- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The OPCCR register is used to reduce power consumption in Normal and Sleep modes by specifying a lower operating frequency. For the procedure to change the operating power control modes, see [section 10.5. Function for Lower Operating Power Consumption](#).

When transitioning from Software Standby mode to Normal or Snooze mode, the settings in the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits are as follows, regardless of their settings before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode).

If Software Standby mode is canceled before the transition to Software Standby completes, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits retain their settings from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

#### OPCM[1:0] bits (Operating Power Control Mode Select)

The OPCM[1:0] bits select the operating power control mode in Normal and Sleep modes. [Table 10.4](#) shows the relationship between the operating power control modes and the OPCM[1:0] and SOPCM settings.

#### OPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The OPCMTSF flag indicates the switching control state when the operating power control mode is switched. This flag becomes 1 when the OPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

Note: 在重写该寄存器之前将PRCR.PRC1位设置为1 (允许写入)。

OPCCR寄存器用于通过指定较低的工作频率来降低正常和休眠模式下的功耗。有关更改运行功率控制模式的步骤, 请参阅第10.5节。降低运行功耗的功能。

当从软件待机模式转换到正常或贪睡模式时, OPCCR.OPCM[1:0]中的设置和SOPCCR.SOPCM位如下, 无论它们在进入软件待机模式之前的设置如何:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode).

如果在转换到软件待机完成之前取消软件待机模式, 则OPCCR.OPCM[1:0]和SOPCCR.SOPCM位保留其在执行WFI指令之前的设置。如果这导致任何问题, 请设置取消软件待机模式时, MCU在异常处理过程中进入高速模式。

#### OPCM[1:0]位 (工作电源控制模式选择)

OPCM[1:0]位选择正常和休眠模式下的工作功率控制模式。表10.4显示了工作功率控制模式与OPCM[1:0]和SOPCM设置之间的关系。

#### OPCMTSF标志 (工作电源控制模式转换状态标志)

OPCMTSF标志指示切换操作功率控制模式时的切换控制状态。该标志在OPCM位被写入时变为1, 在模式转换完成时变为0。阅读此标志并确认其为0, 然后再继续。

#### 10.2.10 SOPCCR:副操作功率控制寄存器

Base address: SYSC = 0x4001\_E000

Offset address: 0x0AA

| 7:5 | —        | 这些位被读取为0。写入值应为0。                            | R/W |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问

- Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SOPCCR register is used to reduce power consumption in Normal mode and Sleep mode. Setting this register initiates entry to and exit from Subosc-speed mode. Subosc-speed mode is available only when using the sub-clock oscillator or LOCO without dividing the frequency.

For the procedure to change operating power control modes, see [section 10.5. Function for Lower Operating Power Consumption](#).

#### SOPCM bit (Sub Operating Power Control Mode Select)

The SOPCM bit selects the operating power control mode in Normal and Sleep modes. Setting this bit to 1 allows transition to Subosc-speed mode. Setting this bit to 0 allows a return to the operating mode (operating mode set by OPCCR.OPCM[1:0]) that was active before the transition to Subosc-speed mode.

When transitioning from Software Standby mode to Normal mode or Snooze mode, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM settings are as follows, regardless of their settings before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode)

If Software Standby mode is canceled before the transition to Software Standby completes, the OPCCR.OPCM[1:0] and SOPCCR.SOPCM bits retain their settings from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

[Table 10.4](#) shows the relationship between the operating power control modes, the OPCM[1:0], and SOPCM bits settings.

#### SOPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The SOPCMTSF flag indicates the switching control state when the operating power control mode is switched to or from Subosc-speed mode. This flag becomes 1 when the SOPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

[Table 10.4](#) shows each operating power control mode.

**Table 10.4 Operating power control mode**

| Operating power control mode | OPCM[1:0] bits | SOPCM bit | Power consumption |
|------------------------------|----------------|-----------|-------------------|
| High-speed mode              | 00b            | 0         | High              |
| Low-speed mode               | 11b            | 0         | ↓                 |
| Subosc-speed mode            | xxb            | 1         | Low               |

For details about the operating frequency range, see [section 47, Electrical Characteristics](#).

Each operating power control mode is described below.

- High-speed mode  
After a reset cancellation, the MCU is activated in this mode.
- Low-speed mode  
The following constraints apply in low-speed mode:
  - Programming and erasure operations for the flash memory are prohibited
  - Using the PLL or PLL2 is prohibited. See [section 10.10.1. Register Access](#)

In this mode, lower power consumption is possible than in High-speed mode when the same operation is performed under the same conditions, such as operating frequency.

- Subosc-speed mode  
The following constraints apply in Subosc-speed mode:
  - Programming and erasure operations for the flash memory are prohibited
  - Reading of the data flash is prohibited
  - Using MOSC, PLL, PLL2, MOCO, or HOCO is prohibited. See [section 10.10.1. Register Access](#)

- 忽略非安全写入访问，不会生成TrustZone访问错误。
- 如果安全属性配置为非安全：●
- 允许安全和非安全访问。

Note: 在重写该寄存器之前将PRCR.PRC1位设置为1（允许写入）。

SOPCCR寄存器用于降低正常模式和休眠模式下的功耗。设置该寄存器启动进入和退出Subosc速度模式。Subosc速度模式仅在使用副时钟振荡器或LOCO而不分频时可用。

有关更改操作功率控制模式的步骤，请参阅第10.5节。降低操作功率的功能 [Consumption](#)。

#### SOPCM位（副工作功率控制模式选择）

SOPCM位选择正常和休眠模式下的工作功率控制模式。将此位设置为1允许转换到Subosc速度模式。将此位设置为0允许返回到转换到Subosc速度模式之前处于活动状态的操作模式（由OPCCR.OPCM[1:0]设置的操作模式）。

当从软件待机模式转换到正常模式或贪睡模式时，OPCCR.OPCM[1:0]和 SOPCCR.SOPCM设置如下，无论其进入软件待机模式前的设置如何：

- OPCCR.OPCM[1:0] = 00b (High-speed mode)
- SOPCCR.SOPCM = 0b (not Subosc-speed mode)

如果在转换到软件待机完成之前取消软件待机模式，则OPCCR.OPCM[1:0]和 SOPCCR.SOPCM位保留其在执行WFI指令之前的设置。如果这导致任何问题，请设置取消软件待机模式时，MCU在异常处理过程中进入高速模式。

表10.4显示了工作功率控制模式、OPCM[1:0]和SOPCM位设置之间的关系。

#### SOPCMTSF标志（工作电源控制模式转换状态标志）

SOPCMTSF标志指示当操作功率控制模式切换到或从切换控制状态 Subosc速度模式。写入SOPCM位时该标志变为1，模式转换完成时变为0。阅读此标志并确认其为0，然后再继续。

表10.4显示了每种工作功率控制模式。

**Table 10.4 工作功率控制方式**

| 工作功率控制方式          | OPCM[1:0] bits | SOPCM bit | 能量消耗 |
|-------------------|----------------|-----------|------|
| High-speed mode   | 00b            | 0         | High |
| Low-speed mode    | 11b            | 0         | ↓    |
| Subosc-speed mode | xxb            | 1         | Low  |

有关工作频率范围的详细信息，请参阅第47节，电气特性。

下面描述每种操作功率控制模式。

- High-speed mode  
复位取消后，MCU在此模式下激活。
- Low-speed mode  
以下约束适用于低速模式：
  - 禁止对闪存进行编程和擦除操作
  - 禁止使用PLL或PLL2。请参阅第10.10.1节。注册访问

在这种模式下，如果在相同的条件下（例如工作频率）执行相同的操作，则可能比高速模式下的功耗更低。

- Subosc-speed mode  
以下约束适用于Subosc速度模式：
  - 禁止对闪存进行编程和擦除操作
  - 禁止读取数据闪存
  - 禁止使用MOSC、PLL、PLL2、MOCO或HOCO。请参阅第10.10.1节。注册访问

- Using the divided clock for ICK or FCK is prohibited. See [section 10.10.1. Register Access](#)
- Using the oscillation stop detection function of the main clock oscillator is prohibited.

In this mode, lower power consumption is possible than in low-speed mode when the same operation is performed under the same conditions, such as operating frequency.

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

#### RXDREQEN bit (RXD0 Snooze Request Enable)

The RXDREQEN bit specifies whether to detect a falling edge of the RXD0 pin in Software Standby mode. This bit can be used only when SCIO is operating in asynchronous mode. To detect a falling edge of the RXD0 pin, set this bit before entering Software Standby mode. When this bit is set to 1, a falling edge of the RXD0 pin in Software Standby mode causes the MCU to enter Snooze mode.

#### SNZDTCEN bit (DTC Enable in Snooze mode)

The SNZDTCEN bit specifies whether to use the DTC and SRAM in Snooze mode. To use the DTC and SRAM in Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, the DTC can be activated by setting IELSRn register.

#### SNZE bit (Snooze mode Enable)

The SNZE bit specifies whether to enable a transition from Software Standby mode to Snooze mode. To use Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, a trigger as shown in [Table 10.7](#) in Software Standby mode causes the MCU to enter Snooze mode. After the MCU transitions from Software Standby mode or Snooze mode to Normal operating mode, set 0 to the SNZE bit once then set it before re-entering Software Standby mode. For details, see [section 10.8. Snooze Mode](#).

禁止将分频时钟用于ICK或FCK。请参阅第10.10.1节。注册访问  
禁止使用主时钟振荡器的振荡停止检测功能。

在这种模式下，当在相同的条件下（例如工作频率）执行相同的操作时，可以比低速模式更低的功耗。

The SNZREQCR0 register controls which trigger causes the MCU to switch from Software Standby mode to Snooze mode. If a trigger is selected as a request to cancel Software Standby mode by setting the WUPENn register, see [section 13, Interrupt Controller Unit \(ICU\)](#), the MCU enters Normal mode when the trigger is generated while the associated bit of the SNZREQCR0 is 1. The setting of the WUPENn register always has higher priority than the setting of the SNZREQCR0 register. For details, see [section 10.8. Snooze Mode](#) and [section 13, Interrupt Controller Unit \(ICU\)](#).

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The DPSBYCR register controls the Deep Software Standby mode.

DPSBYCR is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

#### DEEPCUT[1:0] bit (Power-Supply Control)

The DEEPCUT[1:0] bits control the internal power supply to the standby RAM, Low-speed on-chip oscillator, AGT, and USBFS resume detecting unit in Deep Software Standby mode. In addition, these bits control the state of LVD and power-on reset circuit in Deep Software Standby mode.

When a USBFS suspend/resume interrupt is used as a Deep Software Standby mode Cancelling source, the DEEPCUT[1:0] bits must be set to 00b.

When an LVD interrupt is used in Deep Software Standby mode, the DEEPCUT[1:0] bits must be set to 00b or 01b.

For lower power consumption, set the DEEPCUT[1:0] bits to 11b so that the LVD is stopped and the low power consumption function of the power-on reset circuit is enabled.

Regardless of the DEEPCUT [1: 0] bit setting, during deep software standby mode, internal power supply to SRAM other than standby SRAM is stopped.

When a deep standby mode is used, set DPSWCR.WTSTS bits depending on the value of DEEPCUT[1] before entering Deep Software Standby mode.

#### IOKEEP bit (I/O Port Rentention)

In Deep Software Standby mode, I/O ports keep the same states as in the Software Standby mode. The IOKEEP bit specifies whether to reset the state of the I/O ports or not when the Deep Software Standby mode is canceled.

#### DPSBY bit (Deep Software Standby)

The DPSBY bit controls transitions to Deep Software Standby mode.

When the WFI instruction is executed while SBYCR.SSBY bit and DPSBYCR.DPSBY bit are both 1, the MCU enters Deep Software Standby mode through Software Standby mode.

The DPSBY bit remains 1 when Deep Software Standby mode is canceled by certain pins which are sources of external pin interrupts (NMI, IRQ0-DS to IRQ15-DS) or a peripheral interrupt (RTC alarm, RTC interval, USB suspend/resume, voltage monitor 1, or voltage monitor 2). Write 0 to this bit to clear it.

Note: 在重写该寄存器之前将PRCR.PRC1位设置为1 (允许写入)。

DPSBYCR寄存器控制深度软件待机模式。

DPSBYCR不会由作为取消深度软件待机模式的源的内部复位信号初始化。有关详细信息, 请参阅第5节, 重置。

#### DEEPCUT[1:0] bit (Power-Supply Control)

DEEPCUT[1:0]位控制待机RAM、低速片上振荡器、AGT和USBFS在深度软件待机模式下恢复检测单元。此外, 这些位控制LVD的状态和深度软件待机模式下的上电复位电路。

当USBFS挂起恢复中断用作深度软件待机模式取消源时, DEEPCUT[1:0]位必须设置为00b。

在深度软件待机模式下使用LVD中断时, DEEPCUT[1:0]位必须设置为00b或01b。

为降低功耗, 将DEEPCUT[1:0]位设置为11b, 使LVD停止并启用上电复位电路的低功耗功能。

无论DEEPCUT[1:0]位设置如何, 在深度软件待机模式下, 除待机SRAM之外的SRAM内部电源都会停止。

当使用深度待机模式时, 在进入之前根据DEEPCUT[1]的值设置DPSWCR.WTSTS位深度软件待机模式。

#### IOKEEP位 (IO端口保留)

在深度软件待机模式下, IO端口保持与软件待机模式相同的状态。IOKEEP位指定当深度软件待机模式被取消时是否复位IO端口的状态。

#### DPSBY位 (深度软件待机)

DPSBY位控制向深度软件待机模式的转换。

当SBYCR.SSBY位和DPSBYCR.DPSBY位均为1时执行WFI指令, MCU进入深度软件待机模式到软件待机模式。

当某些引脚取消深度软件待机模式时, DPSBY位保持为1, 这些引脚是外部引脚中断 (NMI、IRQ0-DS至IRQ15-D S) 或外设中断 (RTC警报、RTC间隔、USB暂停恢复、电压监控器) 的来源1, 或电压监视器2)。向该位写入0以清除它。

The DPSBY bit setting is invalid when OFS0.IWDTSTPCTL bit is 0 (counting continues) regardless of the setting in OFS0.IWDTSTRT bit. In that case, even when SBYCR.SSBY bit is 1 and the DPSBY bit is 1, the transition after the execution of a WFI instruction is to Software Standby mode.

The setting of the DPSBY bit is invalid when voltage monitor 1 reset is enabled (LVD1CR0.RI = 1) or when a voltage monitor 2 reset is enabled (LVD2CR0.RI = 1). In this case, even when the SBYCR.SSBY bit is 1 and the DPSBY bit is 1, the transition after the execution of a WFI instruction is to Software Standby mode.

The DPSWCR register sets the wait stabilization time when a Deep Software Standby mode is canceled by certain pins that are the sources of external pin interrupts or a peripheral interrupt such as RTC alarm, RTC interval, and USB suspend/resume.

During a wait stabilization period set in this register, a Deep Software Standby reset occurs, and the MCU is initialized.

The DPSWCR register is not initialized with the internal reset signal by the cancellation of the Deep Software Standby mode. For details, see [section 5, Resets](#).

When a deep standby mode is used, set DPSWCR.WTSTS bits according to the value of DPSBYCR.DEEPCUT[1] before entering Deep Software Standby mode.

When DPSBYCR.DEEPCUT[1]=0, you can set DPSWCR.WTSTS to the wait cycle for fast recovery.

When DPSBYCR.DEEPCUT[1]=1, you must set DPSWCR.WTSTS to the wait cycle for slow recovery.

DPSWCR寄存器设置当某个引脚取消深度软件待机模式时的等待稳定时间，这些引脚是外部引脚中断或外设中断（如RTC警报、RTC间隔和USB挂起恢复）的源。

在此寄存器中设置的等待稳定期间，会发生深度软件待机复位，并且初始化MCU。

通过取消深度软件待机模式，DPSWCR寄存器不会使用内部复位信号进行初始化。有关详细信息，请参阅第5节，重置。

当使用深度待机模式时，在进入深度软件待机模式之前，根据DPSBYCR.DEEPCUT[1]的值设置DPSWCR.WTSTS位。

当DPSBYCR.DEEPCUT[1]=0时，可以设置DPSWCR.WTSTS为等待周期，以便快速恢复。

当DPSBYCR.DEEPCUT[1]=1时，必须将DPSWCR.WTSTS设置为等待周期，以便缓慢恢复。

- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when a cancel request specified by DPSIEGR0 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER0 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR0 is cleared to 0x00.

To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0.

DPSIFR0 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0. For details, see [section 5, Resets](#).

#### DIRQnF flag (IRQn-DS Pin Deep Standby Cancel Flag) (n = 0 to 7)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR0 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

| 7   | DIRQ7F | IRQ7-DS引脚深度待机取消标志<br>0: 不产生取消请求1: 产生取消请求     | R/W |

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

Note: 写入0清除标志。写入1被忽略。

Note: 在重写该寄存器之前将PRCR.PRC1位设置为1 (允许写入)。

当生成由DPSIEGR0指定的取消请求时, 每个标志都设置为1。

当在任何模式下 (不仅在深度软件待机模式下) 生成取消请求或修改DPSIER0的设置时, 每个标志都可以设置为1。因此, 应在DPSIFR0清零后转换到深度软件待机模式。

要在修改DPSIER0后将DPSIFR0清为0x00, 请等待至少6个PCLKB周期, 读取DPSIFR0, 然后将0写入DPSIFR0。例如, 可以通过读取DPSIER0来确保六个或更多PCLKB周期。

DPSIFR0不被用作深度软件待机模式取消源的内部复位信号初始化。清除修改DPSIER0后DPSIFR0到0x00, 等待至少6个PCLKB周期, 读取DPSIFR0, 然后写入0到DPSIFR0。例如, 可以通过读取DPSIER0来确保六个或更多PCLKB周期。有关详细信息, 请参阅第5节, 重置。

#### DIRQnF标志 (IRQn-DS引脚深度待机取消标志) (n=0至7)

DIRQnF标志表示已生成IRQn-DS引脚的取消请求。

[Setting condition]

由DPSIEGR0指定的IRQn-DS引脚产生一个取消请求。

[Clearing condition]

读取1后将0写入每个标志。

- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when a cancel request specified by DPSIEGR1 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER1 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR1 is cleared to 0x00.

To clear DPSIFR1 to 0x00 after modifying DPSIER1, wait for at least 6 PCLKB cycles, read DPSIFR1, and then write 0 to DPSIFR1. Six or more PCLKB cycles can be secured, for example, by reading DPSIER1.

DPSIFR1 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

**DIRQnF flag (IRQn-DS Pin Deep Standby Cancel Flag) (n = 8 to 15)**

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. Writing 0 clears the flag. Writing 1 is ignored

This register is not controlled by any security attribute register (eg. LPMSAR, DPFSAR).

SYOCDCCR can be written when DBGSTR.CDBGWRUPREQ = 1 (the debugger is connected).

SYOCDCCR is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode.

**DOCDF flag (Deep Software Standby OCD flag)**

DOCDF flag indicates that a cancel request of Deep Software Standby mode by the MCUCTRL.DBIRQ bit has been generated. DOCDF flag is set to 1 when a cancel request is generated. This flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode). Therefore, a transition to Deep Software Standby mode must be made after DOCDF flag is cleared to 0.

[Setting condition]

- A cancel request by the MCUCTRL.DBIRQ is generated

[Clearing condition]

- Writing 0 to the flag after reading the bit as 1
- When DBGEN bit is 0

**DBGEN bit (Debugger Enable bit)**

The DBGEN bit enables the on-chip debug mode. This bit must be set to 1 first in the on-chip debugger mode.

[Setting condition]

- Writing 1 to the bit when the debugger is connected.

[Clearing condition]

- Power-on reset is generated
- Writing 0 to the bit.

Note: Certain restrictions apply in terms of the MCU states in which the DBGEN bit can be set to 1. For details, see [section 2.13.2. Restrictions on Connecting an OCD emulator.](#)

## 10.3 Reducing Power Consumption by Switching Clock Signals

The clock frequency changes when the SCKDIVCR register is set.

## 10.2.29 SOOCDCCR:系统控制OCD控制寄存器

Base address: SYSC = 0x4001\_E000

Offset address: 0x040E

|               |       |   |   |   |   |   |   |       |

| 7   | DBGEN  | 调试器使能位<br>在片上调试模式下首先设置为1。<br>0: 禁用片上调试器1: 启用片上调试器 | R/W              |

Note: 在重写该寄存器之前将PRCR.PRC1位设置为1（允许写入）。

注1.写入0清除标志。写1被忽略

该寄存器不受任何安全属性寄存器（例如LPMSAR、DPFSAR）的控制。

当DBGSTR.CDBGWRUPREQ=1（调试器已连接）时，可以写入SOOCDCCR。

SOOCDCCR不会由作为取消深度软件待机模式的源的内部复位信号初始化。

**DOCDF标志（深度软件待机OCD标志）**

DOCDF标志指示已通过MCUCTRL.DBIRQ位生成了深度软件待机模式的取消请求。生成取消请求时，DOCDF标志设置为1。当在任何模式下（不仅在深度软件待机模式下）生成取消请求时，此标志可能设置为1。因此，必须在DOCDF标志清零后切换到深度软件待机模式。

[Setting condition]

- MCUCTRL.DBIRQ产生取消请求

[Clearing condition]

- 读取位为1后向标志位写入0
- DBGEN位为0时

**DBGEN位（调试器启用位）**

DBGEN位使能片上调试模式。在片上调试器模式下，该位必须首先设置为1。

[Setting condition]

- 连接调试器时向该位写入1。

[Clearing condition]

- 产生上电复位
- 向该位写入0。

Note: 某些限制适用于可以将DBGEN位设置为1的MCU状态。有关详细信息，请参阅第2.13.2节。连接强迫症模拟器的限制。

## 10.3 通过切换时钟信号降低功耗

设置SCKDIVCR寄存器时，时钟频率会发生变化。

For information on module and clock associations, see [section 8.2.2. SCKDIVCR : System Clock Division Control Register](#).

## 10.4 Module-Stop Function

The module stop function can stop the clock supply set for each peripheral module.

When the MSTPmi bit (m = A to E, i = 31 to 0) in MSTPCRn (n = A to E) is set to 1, the specified module stops operating and enters the module-stop state, but the CPU continues to operate independently. Setting the MSTPmi bit to 0 cancels the module-stop state, allowing the module to resume operation at the end of the bus cycle.

After a reset is canceled, all modules other than the DMAC, DTC and SRAMn modules are placed in the module-stop state. Do not access the module while the corresponding MSTPmi bit is 1. Additionally, do not set 1 to the MSTPmi bit while the corresponding module is accessed.

## 10.5 Function for Lower Operating Power Consumption

By selecting an appropriate operating power consumption control mode according to the operating frequency, power consumption can be reduced in Normal mode and Sleep mode.

### 10.5.1 Setting Operating Power Control Mode

Ensure the operating condition such as the frequency range is always within the specified range before and after switching the operating power control modes.

This section provides example procedures for switching operating power control modes.

**Table 10.5 Available oscillators in each mode**

| Mode         | Oscillator |                               |                                 |                              |                       |                      |                                   |

#### (1) Switching from a higher power mode to a lower power mode

Example 1: From High-speed mode to Low-speed mode:

(Operation begins in High-speed mode)

1. Change the oscillator to what is used in Low-speed mode. Set the frequency of each clock lower than the maximum operating frequency in Low-speed mode.
2. Turn off the oscillator that is not required in Low-speed mode.
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Set the OPCCR.OPCM[1:0] bits to 11b (Low-speed mode).
5. Confirm that OPCCR.OPCMTSF flag is 0 (indicates transition completed).

(Operation is now in Low-speed mode)

Example 2: From High-speed mode to Subosc-speed mode

(Operation begins in High-speed mode)

1. Switch the clock source to sub-clock oscillator. Turn off PLL, PLL2, HOCO, MOCO, LOCO and main oscillator.
2. Confirm that all clock sources other than the sub-clock oscillator are stopped.
3. Confirm that the SOPCCR.SOPCMTSF flag is 0 (indicates transition completed).
4. Set the SOPCCR.SOPCM bit to 1 (Subosc-speed mode).

有关模块和时钟关联的信息，请参见第8.2.2节。SCKDIVCR:系统时钟分频控制 Register。

## 10.4 Module-Stop Function

模块停止功能可以停止为每个外围模块设置的时钟供应。

当MSTPCRn(n=AtoE)中的MSTPmi位(m=AtoE i=31to0)设置为1时，指定模块停止运行并进入module-stop状态，但CPU继续运行独立。将MSTPmi位设置为0可取消模块停止状态，允许模块在总线周期结束时恢复运行。

取消复位后，除DMAC、DTC和SRAMn模块之外的所有模块都置于模块停止状态。相应的MSTPmi位为1时不要访问模块。另外，访问相应的模块时不要将MSTPmi位设置为1。

## 10.5 降低运行功耗的功能

通过根据工作频率选择合适的工作功耗控制模式，可以降低正常模式和睡眠模式下的功耗。

### 10.5.1 设置工作电源控制模式

确保在切换工作功率控制模式前后，频率范围等工作条件始终在规定范围内。

本节提供切换操作电源控制模式的示例程序。

**Table 10.5 每种模式下可用的振荡器**

| Mode         | Oscillator |                               |                                 |                              |           |                      |                                   |

3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Turn on any required oscillator in High-speed mode.
5. Set the frequency of each clock lower than the maximum operating frequency for High-speed mode.

(Operation is now in High-speed mode)

## 10.6 Sleep Mode

### 10.6.1 Transitioning to Sleep Mode

When a WFI instruction is executed while SBYCR.SSBY bit is 0, the MCU enters Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in Sleep mode cause the MCU to cancel Sleep mode. All interrupt sources are available. If using an interrupt to cancel Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Counting by IWDT stops when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep mode, Software Standby mode or Snooze mode).

Counting by IWDT continues when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep mode, Software Standby mode or Snooze mode).

Counting by WDT stops when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 1 (WDT stops in Sleep mode). Similarly, counting by WDT stops when the MCU enters Sleep mode while the WDT is in register start mode and the WDCSTPR.SLCSTP bit is 1 (WDT stops in Sleep mode).

Counting by WDT continues when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 0 (WDT does not stop in Sleep mode). Similarly, counting by WDT continues when the MCU enters Sleep mode while the WDT is in register start mode and the WDCSTPR.SLCSTP bit is 0 (WDT does not stop in Sleep mode).

### 10.6.2 Canceling Sleep Mode

Sleep mode is canceled by:

- An interrupt
- A RES pin reset

5.确认SOPCCR.SOPCMTSF标志为0 (表示转换完成)。  
(操作现在处于Subosc速度模式)

## (2) 从低功耗模式切换到高功耗模式

- 3.确认SOPCCR.SOPCMTSF标志为0 (表示转换完成)。
- 4.在高速模式下打开所需的振荡器。

(操作现在处于高速模式)

示例2: 从低速模式到高速模式

(以低速模式开始运行)

- 4.在高速模式下打开任何需要的振荡器。
- 5.将每个时钟的频率设置为低于高速模式的最大工作频率。

(操作现在处于高速模式)

## 10.6 睡眠模式

### 10.6.1 转换到睡眠模式

当SBYCR.SSBY位为0时执行WFI指令, MCU进入休眠模式。在这种模式下, CPU停止运行, 但其内部寄存器的内容被保留。其他外围功能不会停止。休眠模式下可用的复位或中断会导致MCU取消休眠模式。所有中断源均可用。如果使用中断取消休眠模式, 则必须在执行WFI指令之前设置相关的IELSRn寄存器。有关详细信息, 请参阅第13节, 中断控制器单元(ICU)。

当MCU进入休眠模式且IWDT处于自动启动模式且OFS0.IWDTSTPCTL位为1 (IWDT在休眠模式、软件待机模式或贪睡模式下停止)。

当MCU进入休眠模式且IWDT处于自动启动模式且OFS0.IWDTSTPCTL位为0 (IWDT在休眠模式、软件待机模式或贪睡模式下不停止) 时, IWDT继续计数。

当MCU进入休眠模式且WDT处于自动启动模式且OFS0.WDTSTPCTL位为1 (WDT在休眠模式下停止)。同样, 当MCU进入休眠模式且WDT处于寄存器启动模式且WDCSTPR.SLCSTP位为1 (WDT在休眠模式下停止) 时, WDT停止计数。

当MCU进入休眠模式且WDT处于自动启动模式且OFS0.WDTSTPCTL位为0 (WDT在休眠模式下不停止)。同样, 当MCU进入休眠模式且WDT处于寄存器启动模式且WDCSTPR.SLCSTP位为0 (休眠模式下WDT不会停止) 时, WDT继续计数。

### 10.6.2 取消睡眠模式

睡眠模式通过以下方式取消:

- 中断
- ARES引脚复位

- A power-on reset
- A voltage monitor reset
- An SRAM parity error reset
- An SRAM ECC error reset
- A bus master MPU error reset
- A TrustZone error reset
- A reset caused by an IWDT or a WDT underflow

The operations are as follows:

1. Canceling by an interrupt  
When an available interrupt request is generated, Sleep mode is canceled and the MCU starts the interrupt handling.
2. Canceling by RES pin reset  
When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for the time period specified in [section 47, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by IWDT reset
  - Sleep mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in Sleep mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
    - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.
4. Canceling by WDT reset  
Sleep mode is canceled by an internal reset generated by a WDT underflow and the MCU starts the reset exception handling. However, WDT stops in Sleep mode even when counting in Normal mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
  - OFS0.WDTSTRT = 0 (auto start mode) and OFS0.WDTSTPCTL = 1
  - OFS0.WDTSTRT = 1 (register start mode) and WDTDCSTPR.SLCSTP = 1.
5. Canceling by other resets available in Sleep mode  
Sleep mode is canceled by other resets and the MCU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see [section 13, Interrupt Controller Unit \(ICU\)](#).

## 10.7 Software Standby Mode

### 10.7.1 Transitioning to Software Standby Mode

When a WFI instruction is executed while SBYCR.SSBY bit is 1 and DPSBYCR.DPSBY bit is 0, the MCU enters Software Standby mode. In this mode, the CPU, most of the on-chip peripheral functions and the oscillators stop. However, the contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions and the I/O ports are retained. Software Standby mode allows significant reduction in power consumption because most of the oscillators stops in this mode. [Table 10.2](#) shows the status of each on-chip peripheral functions and oscillators. Available resets or interrupts in Software Standby mode make the MCU to cancel Software Standby mode. See [Table 10.3](#) for available interrupt sources and [section 13.2.18. WUPEN0 : Wake Up Interrupt Enable Register 0](#), [section 13.2.19. WUPEN1 : Wake Up interrupt enable register 1](#) for information on waking up the MCU from Software Standby mode. If using an interrupt to cancel an interrupt, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction except when using DTC in Snooze mode. If DTC is required in Snooze mode, set DTCST.DTCST bit to 1 before executing a WFI instruction.

Counting by the IWDT stops if the MCU enters Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep, Software Standby or Snooze mode).

Counting by the IWDT continues if the MCU enters Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep, Software Standby or Snooze mode).

- A power-on reset
- 电压监视器复位
- SRAM奇偶校验错误复位
- SRAMECC错误复位
- 总线主控MPU错误复位
- TrustZone错误重置
- IWDT或WDT下溢引起的复位

操作如下:

- 1.中断取消  
当产生可用的中断请求时, 休眠模式被取消, MCU开始中断处理。
- 2.通过RES引脚复位取消  
当RES引脚驱动为低电平时, MCU进入复位状态。请务必在第47节“电气特性”中指定的时间段内保持RES引脚为低电平。当RES引脚在指定时间后被驱动为高电平时, CPU开始复位异常处理。
- 3.IWDT复位取消
  - 休眠模式由IWDT下溢产生的内部复位取消, MCU开始复位异常处理。但是, IWDT在休眠模式下停止, 并且在以下情况下不会产生用于取消休眠模式的内部复位:
    - OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.
- 4.WDT复位取消  
睡眠模式由WDT下溢产生的内部复位取消, MCU启动复位异常处理。但是, 即使在正常模式下计数, WDT也会在休眠模式下停止, 并且在以下情况下不会产生用于取消休眠模式的内部复位:
  - OFS0.WDTSTRT=0 (自动启动模式) 和OFS0.WDTSTPCTL=1
  - OFS0.WDTSTRT=1 (寄存器启动模式) 和WDTDCSTPR.SLCSTP=1。
- 5.通过睡眠模式下可用的其他复位取消  
休眠模式被其他复位取消, MCU开始复位异常处理。

Note: 有关正确设置中断的详细信息, 请参阅第13节, 中断控制器单元(ICU)。

## 10.7 软件待机模式

### 10.7.1 过渡到软件待机模式

当SBYCR.SSBY位为1且DPSBYCR.DPSBY位为0时执行WFI指令, MCU进入软件待机模式。在这种模式下, CPU、大部分片上外围功能和振荡器停止。但是, CPU内部寄存器和SRAM数据的内容、片上外围功能的状态和IO端口的状态会被保留。软件待机模式可显著降低功耗, 因为大多数振荡器在此模式下停止。表10.2显示了每个片上外围功能和振荡器的状态。软件待机模式下可用的复位或中断使MCU取消软件待机模式。有关可用的中断源, 请参见表10.3和第13.2.18节。WUPEN0: 唤醒中断使能寄存器0, 第13.2.19节。WUPEN1: 唤醒中断使能寄存器1, 用于将MCU从软件待机模式唤醒的信息。如果使用中断取消中断, 则必须在执行WFI指令之前设置相关的IELSRn寄存器。有关详细信息, 请参阅第13节, 中断控制器单元(ICU)。

在执行WFI指令之前将DMAST.DMST位和DTCST.DTCST位清除为0, 除非在贪睡模式下使用DTC。如果在贪睡模式下需要DTC, 请在执行WFI指令之前将DTCST.DTCST位设置为1。

如果MCU进入软件待机模式, 而IWDT处于自动启动模式并且OFS0.IWDTSTPCTL位为1 (IWDT在休眠、软件待机或贪睡模式下停止)。

如果MCU进入软件待机模式, 而IWDT处于自动启动模式并且OFS0.IWDTSTPCTL位为0 (IWDT在休眠、软件待机或贪睡模式下不停止)。

WDT stops counting when the MCU enters Software Standby mode because the PCLKB stops.

Do not enter Software Standby mode while OSTDCR.OSTDE = 1 (oscillation stop detection function is enabled). To enter Software Standby mode, execute a WFI instruction after disabling the oscillation stop detection function (OSTDCR.OSTDE = 0). In case of executing WFI instruction while OSTDCR.OSTDE = 1, the MCU enters Sleep mode even if SBYCR.SSBY = 1.

Do not enter Software Standby mode while the flash memory is programming or erasing. To enter Software Standby mode, execute a WFI instruction after programming or erasing procedure completes.

Table 10.6 shows the setting of the related control bits and the modes to enter after executing WFI instruction.

### 10.7.2 Canceling Software Standby Mode

Software Standby mode is canceled by:

- An available interrupt shown in Table 10.3
- A RES pin reset
- A power-on reset
- A voltage monitor reset
- A reset caused by an IWDTC underflow.

On exiting Software Standby mode, the oscillators that operate before the transition to the mode restart. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode. See section 13.2.18. WUPEN0 : Wake Up Interrupt Enable Register 0, section 13.2.19. WUPEN1 : Wake Up interrupt enable register 1 for information on how to wake up the MCU from Software Standby mode.

You can cancel Software Standby mode in any of the following ways:

1. Canceling by an interrupt  
When an available interrupt request (see Table 10.3) is generated, an oscillator that operates before the transition to Software Standby mode restarts. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode and starts the interrupt handling.
2. Canceling by a RES pin reset  
When the RES pin is driven low, the MCU enters the reset state, and the oscillators whose default status is operating, start the oscillation. Be sure to keep the RES pin low for the time period specified in section 47, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by a power-on reset  
Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.
4. Canceling by a voltage monitor reset

当MCU进入软件待机模式时，WDT停止计数，因为PCLKB停止。

OSTDCR.OSTDE=1时不要进入软件待机模式（振荡停止检测功能启用）。要进入软件待机模式，请在禁用振荡停止检测功能(OSTDCR.OSTDE=0)后执行WFI指令。如果在OSTDCR.OSTDE=1时执行WFI指令，即使SBYCR.SSBY=1，MCU也会进入休眠模式。

闪存正在编程或擦除时，请勿进入软件待机模式。要进入软件待机模式，请在编程或擦除过程完成后执行WFI指令。

表10.6显示了相关控制位的设置以及执行WFI指令后进入的模式。

**Table 10.6 执行WFI指令时影响模式的位设置**

### 10.7.2 取消软件待机模式

软件待机模式通过以下方式取消：

- 可用中断如表10.3所示
- ARES引脚复位
  - A power-on reset
- 电压监视器复位
- IWDTC下溢引起的复位。

在退出软件待机模式时，在转换到模式之前工作的振荡器会重新启动。在所有振荡器稳定后，MCU从软件待机模式返回到正常模式。请参阅第13.2.18节。WUPEN0：唤醒中断使能寄存器0，第13.2.19节。WUPEN1：唤醒中断使能寄存器1，用于了解如何将MCU从软件待机模式唤醒。

您可以通过以下任一方式取消软件待机模式：

- 1.中断取消  
当一个可用的中断请求（见表10.3）产生时，一个振荡器在转换到软件待机模式重新启动。在所有振荡器稳定后，MCU从软件返回到正常模式待机模式并启动中断处理。
- 2.通过RES引脚复位取消  
当RES引脚驱动为低电平时，MCU进入复位状态，默认状态为工作的振荡器开始振荡。请务必在第47节“电气特性”中指定的时间段内保持RES引脚为低电平。当RES引脚在指定时间后被驱动为高电平时，CPU开始复位异常处理。
- 3.上电复位取消  
软件待机模式通过上电复位取消，MCU启动复位异常处理。
- 4.通过电压监视器复位取消

Software Standby mode is canceled by a voltage monitor reset from the voltage detection circuit and the MCU starts the reset exception handling.

5. Canceling by IWDT reset

Software Standby mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in Software Standby mode and an internal reset for canceling Software Standby mode is not generated in the following condition:

- OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.

10.7.3 Example of Software Standby Mode Application

Figure 10.2 shows an example of entry to Software Standby mode on detection of a falling edge of the IRQn pin, and exit from Software Standby mode by a rising edge of the IRQn pin.

In this example, an IRQn pin interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 00b (falling edge) in Normal operating mode, and the IRQCRi.IRQMD[1:0] bits are set to 01b (rising edge). After that, the SBYCR.SSBY bit is set to 1 and a WFI instruction is executed. As a result, entry to Software Standby mode completes and exit from Software Standby mode is initiated by a rising edge of the IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see section 13, Interrupt Controller Unit (ICU). The oscillation stabilization time in Figure 10.2 is specified in section 47, Electrical Characteristics.

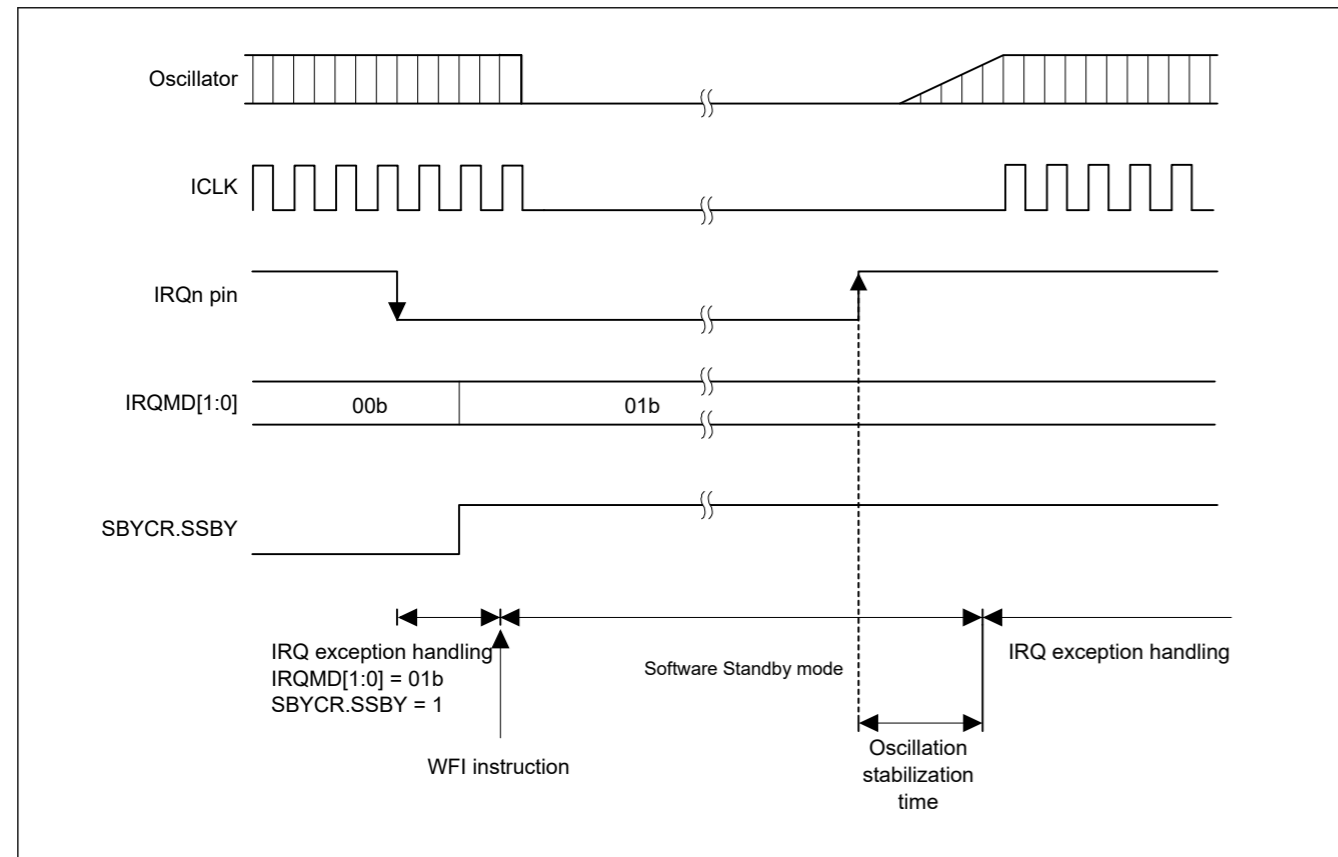

Figure 10.2 Example of Software Standby mode application

软件待机模式通过电压检测电路的电压监视器复位取消，MCU开始复位异常处理。

5.IWDT复位取消

软件待机模式由IWDT下溢产生的内部复位取消，MCU开始复位异常处理。但是，IWDT在软件待机模式下停止，并且在以下情况下不会产生用于取消软件待机模式的内部复位：

- OFS0.IWDTSTRT = 0 and OFS0.IWDTSTPCTL = 1.

10.7.3 软件待机模式应用示例

图10.2显示了在检测到IRQn引脚的下降沿进入软件待机模式并在IRQn引脚的上升沿退出软件待机模式的示例。

在此示例中，IRQn引脚中断被接受，ICU的IRQCRi.IRQMD[1:0]位在正常操作模式下设置为00b（下降沿），并且IRQCRi.IRQMD[1:0]位设置为01b（上升沿）。之后，SBYCR.SSBY位设置为1并执行WFI指令。因此，软件待机模式的进入完成，软件待机模式的退出由IRQn引脚的上升沿启动。

退出软件待机模式也需要设置ICU。有关详细信息，请参阅第13节，中断控制器单元(ICU)。图10.2中的振荡稳定时间在第47节“电气特性”中指定。

10.8 Snooze Mode

10.8.1 Transition to Snooze Mode

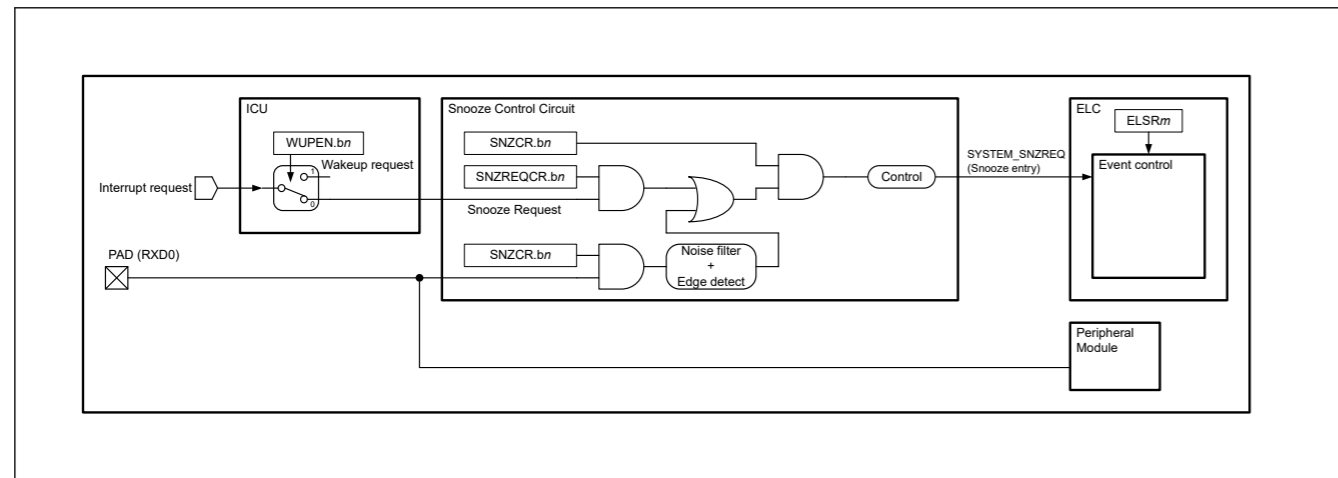

Figure 10.3 Snooze mode entry configuration

When the snooze control circuit accepts an available snooze request in Software Standby mode, the MCU transfers to Snooze mode. In this mode, some peripheral modules operate without waking the CPU. The peripheral modules that can operate in Snooze mode are shown in Table 10.2. Also, DTC operation in Snooze mode can be selected by the setting of SNZCR.SNZDTCEN bit.

Table 10.7 shows the Snooze requests that switch the MCU from Software Standby mode to Snooze mode. To use the listed Snooze requests as a trigger to switch to Snooze mode, the corresponding SNZREQENn bit of the SNZREQCRn register or RXDREQEN bit of SNZCR register must be set before entering Software Standby mode.

Table 10.7 Available snooze requests to switch to Snooze mode

- Note 3. When AGT1 is used for Snooze request factor, Snooze end factor is not allowed to set AGT3 (only AGT1).  
When AGT3 is used for Snooze request factor, Snooze end factor is not allowed to set AGT1 (only AGT3).

Clear the DMAST.DMST and DTCST.DTCST bits to 0 before executing a WFI instruction, except when using the DTC in Snooze mode. If the DTC is required in Snooze mode, set the DTCST.DTCST bit to 1 before executing a WFI instruction.

10.8.2 Canceling Snooze Mode

Snooze mode is canceled by an interrupt request that is available in Software Standby mode or a reset. Table 10.3 shows the requests that can be used to exit each mode. After canceling the Snooze mode, the MCU enters Normal operating mode and proceeds with exception processing for the given interrupt or reset. The action triggered by the interrupt requests, selected in

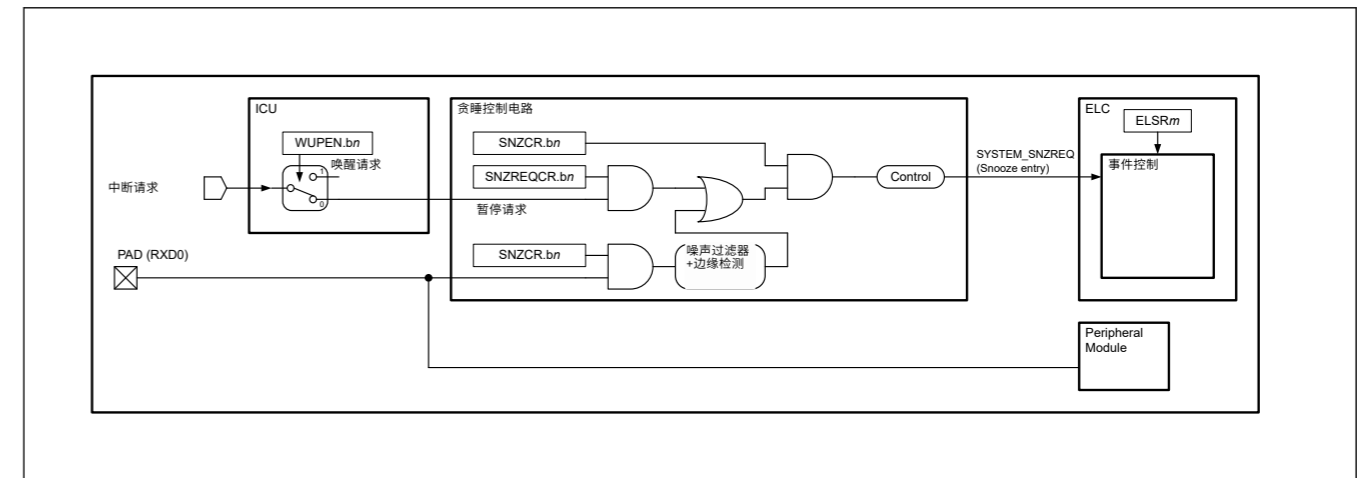

Figure 10.3 贪睡模式进入配置

当贪睡控制电路在软件待机模式下接受一个可用的贪睡请求时，MCU转移到贪睡模式。在这种模式下，一些外围模块在不唤醒CPU的情况下运行。可在贪睡模式下运行的外围模块如表10.2所示。此外，可以通过设置SNZCR.SNZDTCEN位来选择贪睡模式下的DTC操作。

表10.7显示了将MCU从软件待机模式切换到贪睡模式的贪睡请求。要将列出的贪睡请求用作切换到贪睡模式的触发器，SNZREQCRn寄存器的相应SNZREQENn位或在进入软件待机模式之前，必须设置SNZCR寄存器的RXDREQEN位。

10.8.2 取消贪睡模式

贪睡模式由软件待机模式下可用的中断请求或复位取消。表10.3显示了可用于退出每种模式的请求。取消贪睡模式后，MCU进入正常工作模式并继续对给定中断或复位进行异常处理。中断请求触发的动作，在

SELSR0, cancels Snooze mode. Interrupt canceling Snooze mode must be selected in IELSRn to link to the NVIC for the corresponding interrupt handling. See section 13, Interrupt Controller Unit (ICU) for information on SELSR0 and IELSRn registers.

### 10.8.3 Returning from Snooze Mode to Software Standby Mode

Table 10.8 shows the snooze end request that can be used as triggers to return to Software Standby mode. The snooze end requests are available only in Snooze mode. If the requests are generated when the MCU is not in Snooze mode, they are ignored. When multiple requests are selected, each of the requests invokes transition to Software Standby mode from Snooze mode.

Table 10.9 shows the snooze end conditions that consist of the snooze end requests and the conditions of the peripheral modules. The CTSU, SCIO, ADC12n (n = 0, 1), and DTC modules can keep the MCU in Snooze mode until they complete the operation. However, an AGTn (n = 1, 3) underflow as a trigger to return to Software Standby mode cancels Snooze mode without waiting for the completion of SCIO operation.

Figure 10.5 shows the timing diagram for the transition from Snooze mode to Software Standby mode. This mode transition occurs according to which snooze end requests are set in the SNZEDCR0 register. A snooze request is cleared automatically after returning to Software Standby mode.

### 10.8.3 从贪睡模式返回到软件待机模式

表10.8显示了可用作返回到软件待机模式的触发器的贪睡结束请求。贪睡结束请求仅在贪睡模式下可用。如果请求是在MCU未处于贪睡模式时生成的, 则它们将被忽略。选择多个请求时, 每个请求都会从贪睡模式转移到软件待机模式。

表10.9显示了贪睡结束条件, 包括贪睡结束请求和外围模块的条件。CTSU、SCIO、ADC12n(n=0 1)和DTC模块可以使MCU保持在贪睡模式, 直到它们完成操作。但是, AGTn(n=1 3)下溢作为返回软件待机模式的触发器会取消贪睡模式, 而无需等待SCIO操作完成。

图10.5显示了从贪睡模式转换到软件待机模式的时序图。该模式转换根据SNZEDCR0寄存器中设置的贪睡结束请求发生。返回软件待机模式后, 贪睡请求会自动清除。

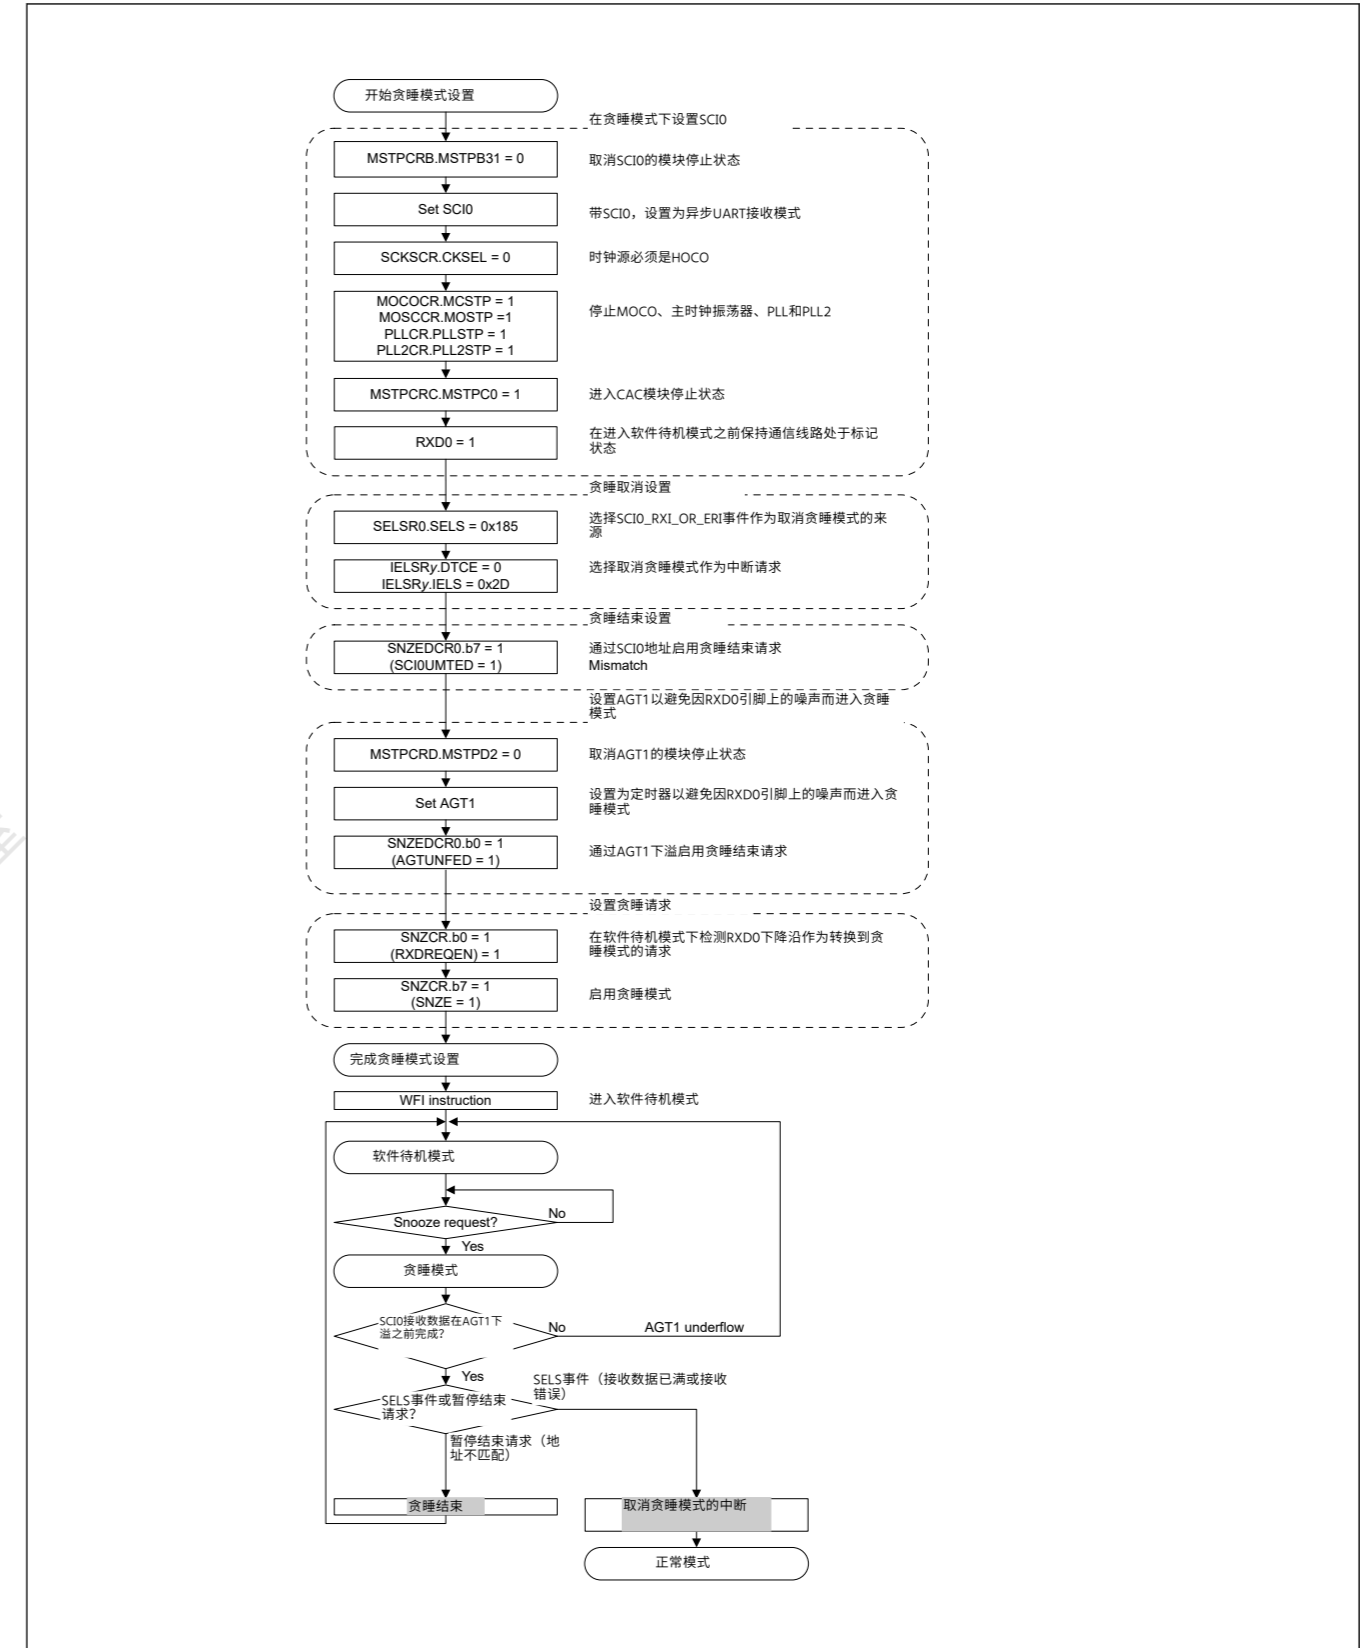

Figure 10.7 在Snooze模式进入使用SCI0的设置示例

10.9 深度软件待机模式

10.9.1 过渡到深度软件待机模式

When a WFI instruction is executed with the SBYCR.SSBY and DPSBYCR.DPSBY bits set to 1, the MCU enters Deep Software Standby mode. See [Table 10.6](#) for the setting of the related control bits. In this mode, the CPU, on-chip peripheral functions (except for RTC alarm, RTC interval, and USB suspend/resume detecting unit), SRAM (except for standby RAM), and all oscillators (except for Sub-clock oscillator and Low-speed on-chip oscillator) are stopped. Also because the internal power supply to these modules is stopped, power consumption is remarkably reduced. The contents of all CPU registers and internal peripheral modules (except for RTC alarm, RTC interval, and USB suspend/resume detecting unit) become undefined.

Data in the standby SRAM are preserved if the setting of the DEEPCUT[1:0] bits are 00b. If the setting of the DEEPCUT[1:0] bits are 01b, the internal power supply to the standby SRAM and the USB resume detecting unit is cut off, reducing power consumption. Data in the standby SRAM becomes undefined at this time. If the setting of the DEEPCUT[1:0] bits are 11b, the internal power supply to the standby SRAM, and the USB resume detecting unit is cut off, the LVD is stopped, and the low-power-consumption function of the power-on reset circuit is enabled, so power consumption is further reduced. For details, see [section 47, Electrical Characteristics](#).

When the MCU enters Deep Software Standby mode while the IWDTC is in auto start mode and the OFS0.IWDTCSTPCTL bit is 1, power supply to the IWDTC-dedicated clock and the IWDTC is cut off, and counting by the IWDTC stops.

When OFS0.IWDTCSTPCTL bit is 0, the MCU enters Software Standby mode instead of Deep Software Standby mode, regardless of the setting of OFS0.IWDTCSTRT bit or DPSBYCR.DPSBY bit. If OFS0.IWDTCSTPCTL bit is 0 while OFS0.IWDTCSTRT bit is 0 (auto start mode), IWDTC-dedicated clock and IWDTC continues the operation.

When LVD1CR0.RI = 1 (voltage monitor 1 reset selected) or LVD2CR0.RI = 1 (voltage monitor 2 reset selected), the MCU enters Software Standby mode instead of Deep Software Standby mode. The I/O port states are the same as in Software Standby mode.

Note: Conditions on the DTC, DMAC, and IWDTC for transitioning to Software Standby mode should be met before the WFI instruction is executed. For details, see [section 10.7. Software Standby Mode](#).

### 10.9.2 Cancelling Deep Software Standby Mode

Deep Software Standby mode is canceled by:

- An interrupt shown in [Table 10.3](#)
- A RES pin reset
- A power-on reset
- A voltage monitor 0 reset.

#### (1) Cancelling by an interrupt

Cancelling by interrupts is controlled by DPSIERn (n = 0 to 3) and DPSIFRn (n = 0 to 3). When a Deep Software Standby Cancelling interrupt is generated, the corresponding flag in DPSIFRn is set to 1. If the interrupt is enabled in DPSIERn, Deep Software Standby mode is canceled. Rising edge or falling edge can be selected by DPSIEGRn (n = 0 to 2). The interrupts for which an edge can be selected are the NMI, IRQn\_DS (n = 0 to 15), voltage monitor 1, and voltage monitor 2 interrupts. When a Deep Software Standby mode canceling request occurs, the internal power is supplied and MOCO starts oscillating, and an internal reset (Deep Software Standby reset) is generated for the entire MCU.

The stable MOCO clock is supplied to the entire MCU and Deep Software Standby reset is canceled. The MCU starts reset exception handling.

When Deep Software Standby mode is canceled by an external interrupt pin or internal interrupt signal, the RSTSR0.DPSRSTF flag is set to 1.

#### (2) Cancelling by RES pin reset

When the RES pin is driven low, the MCU cancels Deep Software Standby mode and enters the reset state. Keep the RES pin low for the time specified in [section 47, Electrical Characteristics](#). When RES pin is driven high after the specified time period, the CPU starts the reset exception handling.

#### (3) Cancelling by a power-on reset

Deep Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.

当在SBYCR.SSBY和DPSBYCR.DPSBY位设置为1的情况下执行WFI指令时，MCU进入Deep软件待机模式。相关控制位的设置见表10.6。在此模式下，CPU、片上外围功能（RTC闹钟、RTC间隔和USB暂停恢复检测单元除外）、SRAM（备用RAM除外）和所有振荡器（副时钟振荡器和Low-速度片上振荡器）停止。此外，由于这些模块的内部电源停止，功耗显著降低。所有CPU寄存器和内部外围模块（RTC警报、RTC间隔和USB暂停恢复检测单元除外）的内容变为未定义。

如果DEEPCUT[1:0]位的设置为00b，则保留备用SRAM中的数据。如果DEEPCUT[1:0]位设置为01b，则内部对待机SRAM和USB恢复检测单元的供电被切断，从而降低功耗。此时备用SRAM中的数据变为未定义。如果DEEPCUT[1:0]位设置为11b，则内部对待机SRAM的供电，以及USB恢复检测单元被切断，LVD停止，电源的低功耗功能-on复位电路使能，因此功耗进一步降低。有关详细信息，请参见第47节，电气特性。

当MCU在IWDTC处于自动启动模式且OFS0.IWDTCSTPCTL位为1时进入深度软件待机模式时，IWDTC专用时钟和IWDTC的电源被切断，IWDTC的计数停止。

当OFS0.IWDTCSTPCTL位为0时，MCU进入软件待机模式而不是深度软件待机模式，无论OFS0.IWDTCSTRT位或DPSBYCR.DPSBY位如何设置。如果OFS0.IWDTCSTPCTL位为0而OFS0.IWDTCSTRT位为0（自动启动模式），IWDTC专用时钟和IWDTC继续运行。

当LVD1CR0.RI=1（选择电压监视器1复位）或LVD2CR0.RI=1（选择电压监视器2复位）时，MCU进入软件待机模式而不是深度软件待机模式。IO端口状态与软件待机模式相同。

Note: 在执行WFI指令之前，应满足DTC、DMAC和IWDTC转换到软件待机模式的条件。有关详细信息，请参阅第10.7节。软件待机模式。

### 10.9.2 取消深度软件待机模式

深度软件待机模式通过以下方式取消：

- 表10.3所示的中断
- ARES引脚复位
- A power-on reset
- 电压监视器0复位。

#### (1) 通过中断取消

中断取消由DPSIERn(n=0到3)和DPSIFRn(n=0到3)控制。深度软件待机时产生取消中断时，DPSIFRn中的相应标志置1。如果在DPSIERn中使能中断，深度软件待机模式被取消。上升沿或下降沿可以通过DPSIEGRn(n=0到2)选择。可以选择边沿的中断是NMI、IRQn\_DS (n=0到15)、电压监视器1和电压监视器2中断。当产生深度软件待机模式取消请求时，内部电源被提供，MOCO开始振荡，并为整个MCU产生内部复位（深度软件待机复位）。

为整个MCU提供稳定的MOCO时钟，并取消深度软件待机复位。MCU开始复位异常处理。

当深度软件待机模式被外部中断引脚或内部中断信号取消时，RSTSR0.DPSRSTF标志设置为1。

#### (2) 通过RES引脚复位取消

当RES引脚驱动为低电平时，MCU取消深度软件待机模式并进入复位状态。在第47节“电气特性”中指定的时间内保持RES引脚为低电平。当RES引脚在指定时间段后被驱动为高电平时，CPU开始复位异常处理。

#### (3) 通过上电复位取消

深度软件待机模式通过上电复位取消，MCU启动复位异常处理。

#### (4) Cancelling by a voltage monitor 0 reset

Deep Software Standby mode is canceled by a voltage monitor 0 reset from the voltage detection circuit and the MCU starts the reset exception handling.

#### 10.9.3 Pin States when Deep Software Standby mode is Canceled

In Deep Software Standby mode, the I/O ports retain the same states from Software Standby mode. The MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, and reset exception handling starts immediately. The DPSBYCR.IOKEEP bit setting determines whether to initialize the I/O ports or to retain the I/O ports states for Software Standby mode. The following is the state of the I/O ports for each bit setting:

- When the DPSBYCR.IOKEEP bit = 0  
I/O ports are initialized by an internal reset generated when Deep Software Standby mode is canceled.
- When the DPSBYCR.IOKEEP bit = 1  
Although the MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, the I/O ports retain their states from Software Standby mode regardless of the MCU internal state. The I/O ports states remain unchanged from Software Standby mode even when settings are made to the I/O ports or peripheral modules. The retained I/O ports states are released by clearing the DPSBYCR.IOKEEP bit to 0, and the MCU operates according to the internal state. The DPSBYCR.IOKEEP bit is not initialized by any internal reset generated when Deep Software Standby mode is canceled.

#### 10.9.4 Example of Deep Software Standby Mode Application

##### (1) Entering and exiting Deep Software Standby mode

Figure 10.8 shows an example where a transition to Deep Software Standby mode is made at the falling edge of the IRQn\_DS pin, and exiting Deep Software Standby mode is made at the rising edge of the IRQn\_DS pin. In this example, an IRQn interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 00b (falling edge). After the DPSIEGRy.DIRQnEG (y = 0 or 1, n = 0 to 15) bit is set to 1 (rising edge) and the SBYCR.SSBY bit and DPSBYCR.DPSBY bit are both set to 1, the WFI instruction is executed. As a result, the MCU transitions to Deep Software Standby mode. Deep Software Standby mode is then canceled on the rising edge of the IRQn\_DS pin.

#### (4) 通过电压监视器取消0复位

深度软件待机模式通过电压检测电路的电压监视器0复位取消，MCU开始复位异常处理。

#### 10.9.3 取消深度软件待机模式时的引脚状态

在深度软件待机模式下，IO端口保持与软件待机模式相同的状态。MCU通过取消深度软件待机模式时产生的内部复位进行初始化，并立即开始复位异常处理。DPSBYCR.IOKEEP位设置确定是初始化IO端口还是保留软件待机模式下的IO端口状态。以下是每个位设置的IO端口状态：

- 当DPSBYCR.IOKEEP位=0时  
IO端口由取消深度软件待机模式时产生的内部复位进行初始化。
- 当DPSBYCR.IOKEEP位=1时  
虽然MCU由取消深度软件待机模式时产生的内部复位来初始化，但无论MCU内部状态如何，IO端口仍会保持软件待机模式下的状态。即使对IO端口或外围模块进行了设置，IO端口状态在软件待机模式下也保持不变。通过将DPSBYCR.IOKEEP位清0来释放保留的IO端口状态，MCU根据内部状态运行。DPSBYCR.IOKEEP位不会被取消深度软件待机模式时产生的任何内部复位初始化。

#### 10.9.4 深度软件待机模式应用示例

##### (1) 进入和退出深度软件待机模式

图10.8显示了一个示例，在该示例的下降沿转换到深度软件待机模式。IRQn\_DS引脚，并在IRQn\_DS引脚的上升沿退出深度软件待机模式。在这个例子中，一个将ICU的IRQCRi.IRQMD[1:0]位设置为00b（下降沿）接受IRQn中断。之后DPSIEGRy.DIRQnEG（y=0或1，n=0到15）位设置为1（上升沿）并且SBYCR.SSBY位和DPSBYCR.DPSBY位都设置为1，执行WFI指令。因此，MCU过渡到DeepSoftware待机模式。然后在IRQn\_DS引脚的上升沿取消深度软件待机模式。

### 10.9.5 Usage Flow for Deep Software Standby Mode

Figure 10.9 shows an example flow for using Deep Software Standby mode.

In this example, the RSTSR0.DPSRSTF flag of the reset function is read after the reset exception handling to determine whether a reset was generated by the RES pin or by the cancellation of Deep Software Standby mode.

For a reset by the RES pin, the MCU transitions to Deep Software Standby mode after the required register settings are made.

For a reset by cancellation of Deep Software Standby mode, the DPSBYCR.IOKEEP bit is cleared to 0 after the I/O port settings are made.

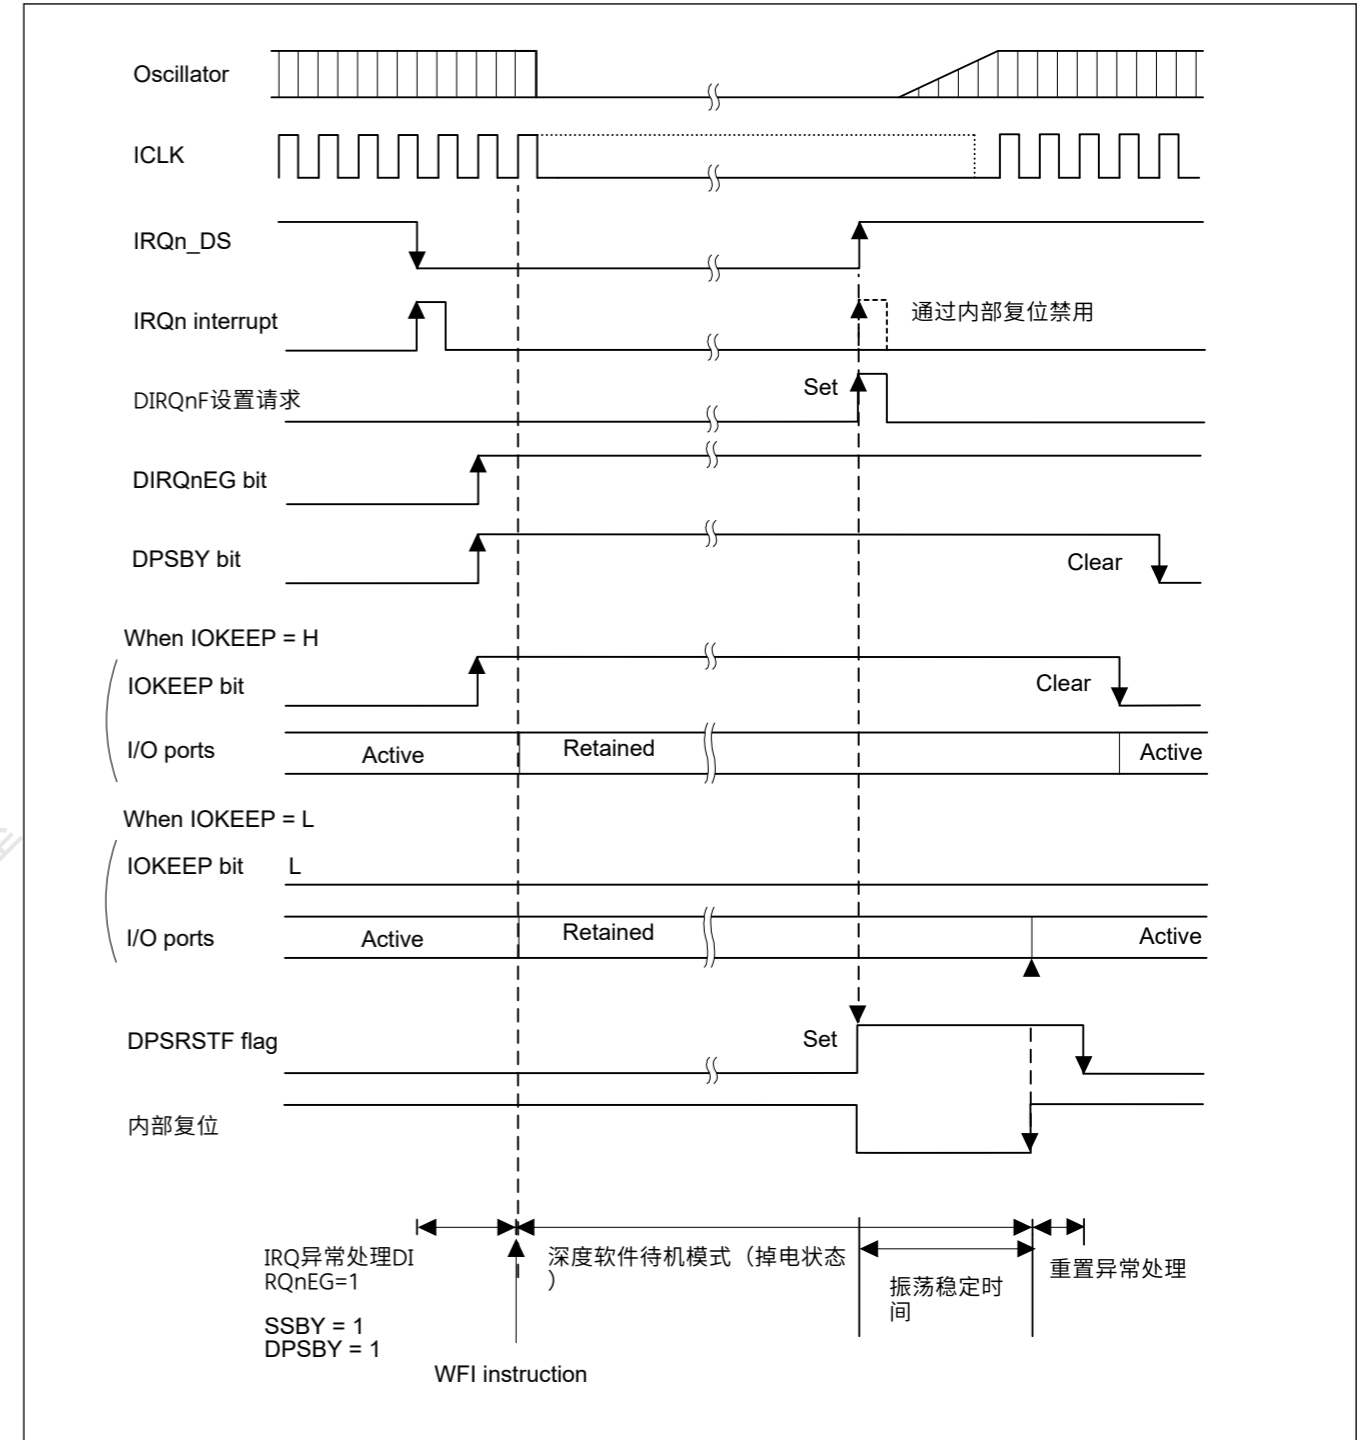

Figure 10.8 深度软件待机模式应用示例

### 10.9.5 深度软件待机模式的使用流程

图10.9显示了使用深度软件待机模式的示例流程。

在本例中，复位功能的RSTSR0.DPRSTF标志在复位异常处理后被读取，以确定复位是由RES引脚产生还是由深度软件待机模式的取消产生。

对于通过RES引脚进行的复位，在进行所需的寄存器设置后，MCU会转换到深度软件待机模式。

对于通过取消深度软件待机模式进行的复位，在IO端口设置完成后DPSBYCR.IOKEEP位被清零。

### (3) subosc-speed模式下的无效寄存器写访问

不要在本节列出的条件下写入寄存器。

[Registers]

- SCKSCR, OPCCR.

[Condition]

- SOPCCR.SOPCM = 1 (Subosc-speed mode).

### (4) DTC或DMAC的无效寄存器写访问

不要写入DTC或DMAC在本节中列出的寄存器。

[Registers]

- MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD, MSTPCRE

### (5) Invalid register write accesses in Snooze mode

Do not write to registers listed in this section in Snooze mode. They must be set before entering Software Standby mode.

[Registers]

- SNZCR, SNZEDCRn, SNZREQCRn.

### (6) Invalid write access to FLWT.FLWT[2:0]

Do not write any value other than 000b to the FLWT.FLWT[2:0] bits under the listed condition.

[Conditions]

- SOPCCR.SOPCM = 1 (Subosc-speed mode)

### (7) Invalid write access when PRCR.PRC1 is 0

Do not write to registers listed in this section when the PRCR.PRC1 bit is 0.

[Registers]

- SBYCR, SNZCR, SNZEDCRn, SNZREQCRn, OPCCR, SOPCCR, DPSBYCR, DPSWCR, DPSIERn, DPSIFRn, DPSIGRn, SYOCDRCR

### (8) Invalid write access when when PRCR.PRC4 bit is 0

Do not write to registers listed in this section when the PRCR.PRC4 bit is 0.

[Registers]

- LPMSAR, DPFSAR

## 10.10.2 I/O Port pin states

The I/O port pin states in Software Standby mode, Deep Software Standby and Snooze mode, unless modifying in Snooze mode, are the same before entering the modes. Therefore, power consumption is not reduced while the output signals are held high.

## 10.10.3 Module-Stop State of DTC, DMAC

Before writing 1 to MSTPCRA.MSTPA22, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0. For details, see [section 16, DMA Controller \(DMAC\)](#) and [section 17, Data Transfer Controller \(DTC\)](#).

## 10.10.4 Internal Interrupt Sources

Interrupts do not operate in the module-stop state. If setting the module-stop bit while an interrupt request is generated, a CPU interrupt source or a DTC or DMAC startup source cannot be cleared. Always disable the associated interrupts before setting the module-stop bits.

## 10.10.5 Input Buffer Control by DIRQnE Bit

Setting the DPSIERy.DIRQnE (y = 0 or 1, n = 0 to 15) bit to 1 enables the associated input buffer of the IRQ0-DS to IRQ15-DS pins. Although inputs to these pins are sent to the DPSIFRy.DIRQnF (y = 0 or 1, n = 0 to 15) bits, they are not sent to the interrupt controller (ICU), peripheral modules, and I/O ports.

## 10.10.6 Transitioning to Low Power Modes

Because the MCU does not support wakeup by events, do not enter the low power modes such as Sleep mode, Software Standby mode or Deep Software Standby Mode by executing a WFE instruction. Also, do not set the SLEEPDEEP bit of the System Control Register in the Cortex-M33 core because the MCU does not support low power modes by SLEEPDEEP.

## 10.10.7 Timing of WFI Instruction

It is possible for the WFI instruction to be executed before I/O register write is completed, in which case operation might not be as intended. This can happen if the WFI is placed immediately after a write to an I/O register. To avoid this problem, read back the register that was written to confirm that the write completed.

### (5) 贪睡模式下的无效寄存器写访问

不要在贪睡模式下写入本节中列出的寄存器。必须在进入软件待机模式之前设置它们。

[Registers]

### (6) 对FLWT.FLWT[2:0]的写入访问无效

在所列条件下, 请勿将000b以外的任何值写入FLWT.FLWT[2:0]位。

[Conditions]

- SOPCCR.SOPCM = 1 (Subosc-speed mode)

### (7) 当PRCR.PRC1为0时, 写入访问无效

当PRCR.PRC1位为0时, 不要写入本节中列出的寄存器。

[Registers]

- SBYCR, SNZCR, SNZEDCRn, SNZREQCRn, OPCCR, SOPCCR, DPSBYCR, DPSWCR, DPSIERn, DPSIFRn, DPSIGRn, SYOCDRCR

### (8) 当PRCR.PRC4位为0时, 写访问无效

当PRCR.PRC4位为0时, 不要写入本节中列出的寄存器。

## 10.10.2 IO端口引脚状态

软件待机模式、深度软件待机和贪睡模式下的IO端口引脚状态, 除非在贪睡模式下进行修改, 否则在进入这些模式之前是相同的。因此, 当输出信号保持为高时, 功耗不会降低。

## 10.10.3 DTC、DMAC的模块停止状态

在将1写入MSTPCRAM.MSTPA22之前, 清除DMAC的DMAST.DMST位和DTCST.DTCST位DTC为0。有关详细信息, 请参阅第16节, DMA控制器(DMAC)和第17节, 数据传输控制器(DTC)。

## 10.10.4 内部中断源

中断不会在模块停止状态下运行。如果在产生中断请求时设置模块停止位, 则无法清除CPU中断源或DTC或DMAC启动源。在设置模块停止位之前, 始终禁用相关的中断。

## 10.10.5 通过DIRQnE位控制输入缓冲器

将DPSIERy.DIRQnE (y=0或1, n=0至15) 位设置为1可使IRQ0-DS的相关输入缓冲器IRQ15-DS引脚。尽管这些引脚的输入被发送到DPSIFRy.DIRQnF (y=0或1, n=0到15) 位, 但它们不会被发送到中断控制器(ICU)、外设模块和IO端口。

## 10.10.6 过渡到低功耗模式

由于MCU不支持事件唤醒, 请勿进入睡眠模式、软件等低功耗模式待机模式或深度软件待机模式通过执行WFE指令。此外, 不要设置Cortex-M33内核中系统控制寄存器的SLEEPDEEP位, 因为MCU不支持SLEEPDEEP的低功耗模式。

## 10.10.7 WFI指令的时间安排

WFI指令可能在IO寄存器写入完成之前执行, 在这种情况下操作可能不会按预期进行。如果在写入IO寄存器后立即放置WFI, 则会发生这种情况。为避免此问题, 请回读已写入的寄存器以确认写入已完成。

### 10.10.8 Writing to the WDT/IWDT Registers by DTC or DMAC in Sleep Mode or Snooze Mode

Do not write to the WDT or IWDT registers by the DTC or DMAC while WDT or IWDT is stopped after entering Sleep mode or Snooze mode.

### 10.10.9 Oscillators in Snooze Mode

Oscillators that stop on entering Software Standby mode automatically restart when a trigger for switching to Snooze mode is generated. The MCU does not enter Snooze mode until all the oscillators stabilize. If in Snooze mode, you must disable oscillators that are not required in Snooze mode before entering Software Standby mode. Otherwise, the transition from Software Standby mode to Snooze mode takes longer.

### 10.10.10 Snooze Mode Entry by RXD0 Falling Edge

When the SNZCR.RXDREQEN bit is 1, the falling edge of RXD0 pin is used to switch MCU from Software Standby mode to Snooze mode when using UART of SCIO in Snooze mode. In this case an interrupt such as SCIO\_ERI, SCIO\_RXI or an address mismatch event is used as the source for canceling Snooze mode. However noise on the RXD0 pin might cause the MCU to transfer from Software Standby mode to Snooze mode unexpectedly. In this case if the MCU does not receive RXD0 data after the noise, an interrupt such as SCIO\_ERI or SCIO\_RXI, or an address mismatch event is not generated and the MCU stays in Snooze mode. This can be avoided by using AGTn (n = 1, 3) underflow interrupt to return to Software Standby mode or Normal mode unless otherwise UART receive data is completed before AGTn (n = 1, 3) underflow. However, do not use the AGTn (n = 1, 3) underflow as a source to return to Software Standby mode during an UART communication. This causes the UART to stop the operation in a half-finished state.

### 10.10.11 Using UART of SCIO in Snooze Mode

When using UART in Snooze mode, ensure that the snooze request (RXD0 falling edge) does not conflict with the wakeup requests set by the WUPEN register, otherwise UART cannot be guaranteed.

When using UART in Snooze mode, the following conditions must be satisfied:

- The clock source must be HOCO
- MOCO, PLL, PLL2, and the main clock oscillator must be stopped before entering Software Standby mode
- The RXD0 pin must be kept high before entering Software Standby mode
- A transition to Software Standby mode must not occur during an SCIO communication
- The MSTPCRC.MSTPC0 bit must be 1 before entering Software Standby mode.

### 10.10.12 Conditions of A/D Conversion Start in Snooze Mode

ADC120 can only be triggered by the ELC in Snooze mode. Do not use software trigger or ADTRGn (n = 0, 1) pin.

### 10.10.13 Conditions of CTSU in Snooze Mode

The CTSU can only be started by the ELC in Snooze mode.

### 10.10.14 ELC Events in Snooze Mode

This section lists available ELC events in Snooze mode. Do not use any other events. If starting peripheral modules for the first time after entering Snooze mode, the Event Link Setting Register (ELSRn) must set a Snooze mode entry event (SYSTEM\_SNZREQ) as the trigger.

- Snooze mode entry (SYSTEM\_SNZREQ)
- DTC transfer end (DTC\_DTCEND)
- ADC120 window A/B compare match (ADC120\_WCMPPM)
- ADC120 window A/B compare mismatch (ADC120\_WCMPUM)
- ADC121 window A/B compare match (ADC121\_WCMPPM)
- ADC121 window A/B compare mismatch (ADC121\_WCMPUM)

### 10.10.8 在睡眠模式或贪睡模式下通过DTC或DMAC写入WDT/IWDT寄存器 Mode

当WDT或IWDT在进入休眠模式或贪睡模式后停止时，请勿通过DTC或DMAC写入WDT或IWDT寄存器。

### 10.10.9 贪睡模式下的振荡器

进入软件待机模式时停止的振荡器会在生成切换到贪睡模式的触发器时自动重新启动。在所有振荡器稳定之前，MCU不会进入贪睡模式。如果处于贪睡模式，您必须在进入软件待机模式之前禁用贪睡模式中不需要的振荡器。否则，从软件待机模式到贪睡模式的转换需要更长的时间。

### 10.10.10 通过RXD0下降沿进入贪睡模式

当SNZCR.RXDREQEN位为1时，在贪睡模式下使用SCIO的UART时，RXD0引脚的下降沿用于将MCU从软件待机模式切换到贪睡模式。在这种情况下，中断如SCIO\_ERI、SCIO\_RXI或地址不匹配事件被用作取消贪睡模式的源。然而，RXD0引脚上的噪声可能会导致MCU意外地从软件待机模式转换到贪睡模式。在这种情况下，如果MCU没有收到

噪声后的RXD0数据，如SCIO\_ERI或SCIO\_RXI等中断，或地址不匹配事件不产生，MCU保持在贪睡模式。这可以通过使用AGTn(n=1 3)下溢中断返回到软件待机模式或正常模式来避免，除非在AGTn(n=1 3)下溢之前完成UART接收数据。但是，不要使用AGTn(n=1 3)下溢作为UART通信期间返回软件待机模式的源。这会导致UART在半完成状态下停止操作。

### 10.10.11 在贪睡模式下使用SCIO的UART

在Snooze模式下使用UART时，确保Snooze请求（RXD0下降沿）与WUPEN寄存器设置的唤醒请求不冲突，否则无法保证UART。

在Snooze模式下使用UART时，必须满足以下条件：

- 时钟源必须是HOCO
- MOCO、PLL、PLL2和主时钟振荡器必须在进入软件待机模式之前停止
- 进入软件待机模式前，RXD0引脚必须保持高电平
- 在SCIO通信期间不得转换到软件待机模式
- MSTPCRC.MSTPC0位必须为1才能进入软件待机模式。

### 10.10.12 贪睡模式下AD转换开始的条件

ADC120只能由ELC在贪睡模式下触发。不要使用软件触发或ADTRGn(n=0 1)引脚。

### 10.10.13 CTSU在贪睡模式下的情况

CTSU只能由ELC在贪睡模式下启动。

### 10.10.14 贪睡模式下的ELC事件

本节列出了贪睡模式下可用的ELC事件。不要使用任何其他事件。如果进入贪睡模式后第一次启动外围模块，事件链接设置寄存器（ELSRn）必须设置贪睡模式进入事件（SYSTEM\_SNZREQ）作为触发器。

- 贪睡模式条目(SYSTEM\_SNZREQ)
- DTC传输结束 (DTC\_DTCEND)
- ADC120窗口AB比较匹配(ADC120\_WCMPPM)
- ADC120窗口AB比较不匹配(ADC120\_WCMPUM)
- ADC121窗口AB比较匹配(ADC121\_WCMPPM)
- ADC121窗口AB比较不匹配(ADC121\_WCMPUM)

- Data operation circuit interrupt (DOC\_DOPCI).

#### 10.10.15 Module-Stop Bit Write Timing

It is possible that access to I/O register may be executed before the corresponding module-stop bit write completed. In this case, access to I/O register may not proceed as intended. To avoid this issue, before accessing I/O register, read back the module-stop bit that was written to confirm that the write completed.

- 数据操作电路中断（DOC\_DOPCI）。

#### 10.10.15 模块停止位写时序

在相应的模块停止位写入完成之前，可能会执行对IO寄存器的访问。在这种情况下，对IO寄存器的访问可能不会按预期进行。为避免此问题，在访问IO寄存器之前，请回读已写入的模块停止位以确认写入已完成。

## 11. Battery Backup Function

### 11.1 Overview

The MCU provides a battery backup function that maintains partial battery powering in the event of a power loss. Switching between VCC and VBATT, the battery-powered area includes RTC, SOSC, and backup memory.

During normal operation, the battery-powered area is powered by the main power supply, the VCC pin. When a VCC voltage drop is detected, the power source switches to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source switches back from VBATT to VCC.

#### 11.1.1 Features of Battery Backup Function

The features include:

- Battery power supply switch
- Backup registers
- Time capture pin detection

#### 11.1.2 Battery Power Supply Switch

When the voltage applied to the VCC pin drops, this feature switches the power supply from the VCC pin to the VBATT pin. When the voltage rises, it switches the power supply from the VBATT pin back to the VCC pin.

#### 11.1.3 Backup Registers

The battery-powered area provides 128-byte backup registers. These registers retain data when power is supplied from the VBATT pin even when the VCC pin is in the power-off state.

#### 11.1.4 Time Capture Pin Detection

The RTC detects input level changes on the time capture pin. For more information, see [section 23, Realtime Clock \(RTC\)](#).

**Note:** When  $VCC < V_{DET\_BATT}$  and  $> (VBATT + 0.6 V)$ , the injected current flows from the VCC to the VBATT pin through an internal diode. If the power supply battery connected to the VBATT pin cannot support this current injection, for example if the battery is not rechargeable, Renesas strongly recommends that you connect through a low-voltage threshold diode between the power supply battery and the VBATT pin.

**Note:** You must enable voltage monitor 0 reset to use the battery backup function. The voltage monitor 0 level must be higher than the VBATT switch level.

[Figure 11.1](#) shows the configuration of the battery backup function.

## 11. 电池备份功能

### 11.1 Overview

MCU提供电池备份功能，可在断电时保持部分电池供电。在VCC和VBATT之间切换，电池供电区域包括RTC、SOSC和备份存储器。

在正常工作期间，电池供电区域由主电源VCC引脚供电。当检测到VCC电压下降时，电源切换到专用电池备用电源引脚VBATT引脚。当电压再次上升时，电源从VBATT切换回VCC。

#### 11.1.1 电池备份功能的特点

特点包括：

- 电池供电开关
- 备份寄存器
- 时间捕捉引脚检测

#### 11.1.2 电池电源开关

当施加到VCC引脚的电压下降时，此功能将电源从VCC引脚切换到VBATT引脚。当电压上升时，它将电源从VBATT引脚切换回VCC引脚。

#### 11.1.3 备份寄存器

电池供电区提供128字节的备份寄存器。这些寄存器在供电时保留数据VBATT引脚即使在VCC引脚处于断电状态时。

#### 11.1.4 时间捕捉引脚检测

RTC检测时间捕捉引脚上的输入电平变化。有关详细信息，请参阅第23节，实时时钟(RTC)。

**Note:** 当 $VCC < V_{DET\_BATT}$ 且 $> (VBATT + 0.6V)$ 时，注入电流通过内部二极管从VCC流向VBATT引脚。如果连接到VBATT引脚的电源电池不能支持这种电流注入，例如，如果电池不可充电，瑞萨强烈建议您通过电源电池和VBATT引脚之间的低压阈值二极管进行连接。

**Note:** 您必须启用电压监视器0复位才能使用电池备份功能。电压监视器0电平必须高于VBATT开关电平。

该寄存器由所有复位源初始化, 包括深度软件待机复位。

### VBATTMNSEL位 (VBATT低电压检测功能选择位)

#### VBAE bit (VBATT backup register access enable bit)

You must write 1 to VBAE before accessing VBTBKR and you must write 0 to VBAE after finishing all access (write or read) to VBTBKR. If you do not write 0 to VBAE, the data of VBTBKR is not kept in VBATT mode.

To access VBTBKR, wait for at least 500 ns after writing 1 to VBAE, and then access VBTBKR.

Before entering the deep software standby mode, you must write 0 to VBAE.

To enter the deep software standby mode, wait for at least 250 ns after writing 0 to VBAE, then enter the deep software standby mode.

If you do not use VBTBKR, you should change VBAE to 0 to reduce power consumption of VBTBKR.

## 11.3 Operation

### 11.3.1 Battery Backup Function

When the voltage on the VCC pin drops, power can be supplied to the RTC and sub-clock oscillator from the VBATT pin. When a drop of power supply from VCC pin is detected, the power connection switches from VCC pin to the VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds  $V_{DET\ BATT}$ . This power supply change does not affect the RTC operation.

You must enable voltage monitor 0 reset to use the battery backup function. The RTC supports time capture detection, triggered by a change of the time capture pin input level.

The VBATT pin supplies power to the following modules:

- RTC
- Sub-clock oscillator (including XCIN and XCOU pins)
- VBATT Backup Register

Table 11.2 shows the operating states in VBATT mode.

## 11.3 Operation

### 11.3.1 电池备份功能

当VCC引脚上的电压下降时, 可以从VBATT引脚为RTC和副时钟振荡器供电。当检测到来自VCC引脚的电源下降时, 电源连接从VCC引脚切换到VBATT引脚。当VCC引脚上的电压超过 $V_{DET\ BATT}$ 时, 重新从VCC引脚供电。此电源更改不会影响RTC操作。

您必须启用电压监视器0复位才能使用电池备份功能。RTC支持时间捕捉检测, 由时间捕捉引脚输入电平的变化触发。

VBATT引脚为以下模块供电:

- RTC
- 副时钟振荡器 (包括XCIN和XCOU引脚)
- VBATT备份寄存器

表11.2显示了VBATT模式下的操作状态。

图11.2显示了电池备份功能的切换顺序。

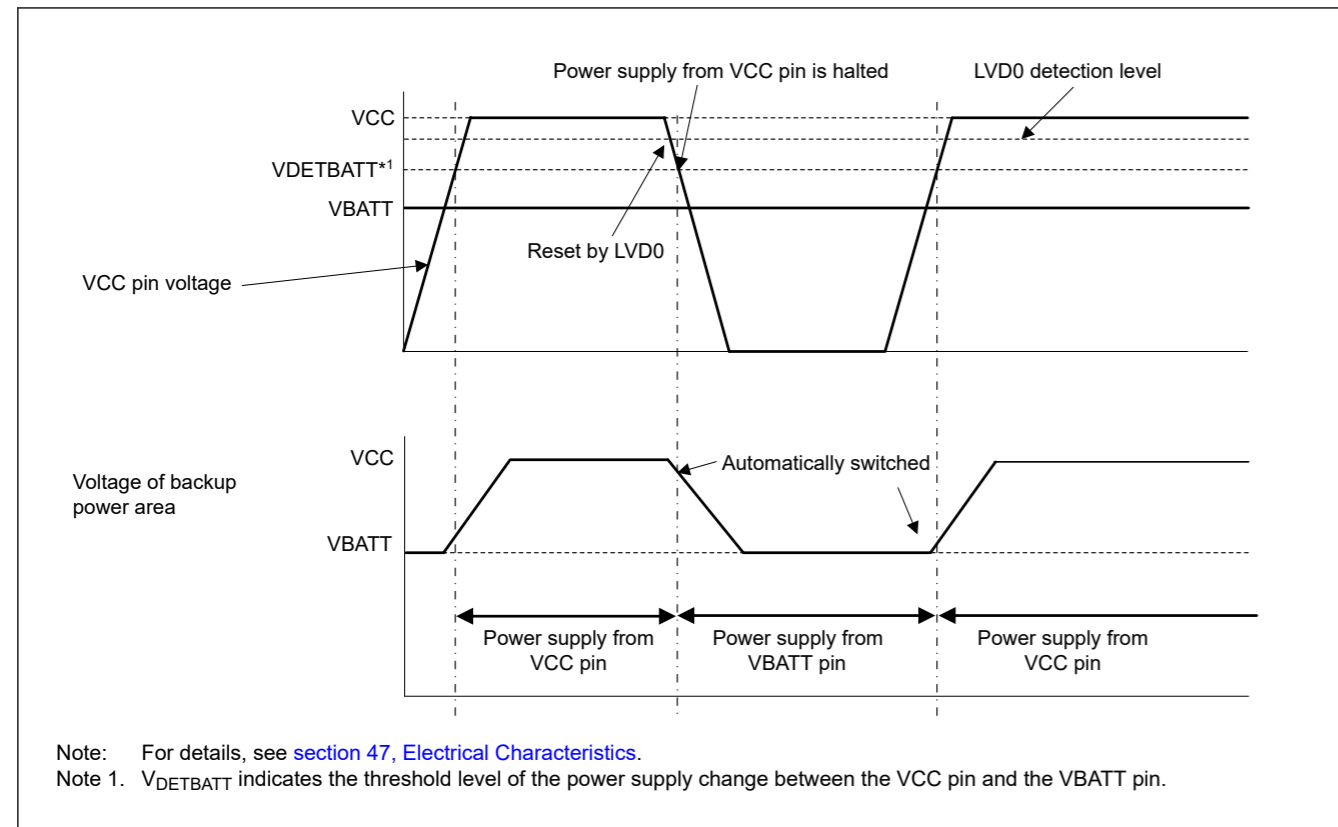

Figure 11.2 Switching sequence of Battery backup function.

### 11.3.2 VBATT Battery Power Supply Switch Usage

The battery power supply switch can switch the power supply from the VCC pin to the VBATT pin when the voltage being applied to the VCC pin drops. When the voltage rises, this switch changes the power supply from the VBATT pin to the VCC pin.

Note: The battery backup function should be used after the voltage monitor 0 reset is enabled (OFS1.LVDAS bit is 0). Voltage monitor 0 level should be higher than VBATT switch level.

### 11.3.3 VBATT Backup Register Usage

Use the VBATT backup registers VBTBKRn, where n = 0 to 127, to store or restore data with an 8-bit read or write operation.

## 11.4 Usage Notes

- Operation of the sub-clock oscillator and RTC are not guaranteed when the voltage level on VBATT is lower than the guaranteed operation range. Initialize the RTC when the VBATT pin falls below the guaranteed operating voltage and then powers up again.
- A reset generated while writing to registers described in this section might destroy the register value.
- When VCC is higher than  $V_{DET BATT}$ , the VCC pin and VBATT pin are separated. When VCC is lower than  $V_{DET BATT}$  and the switch is connected to the VBATT pin, and if the voltage on VBATT drops lower than  $(VCC - 0.6 V)$ , current might flow into the VBATT pin through the parasitic diode between the VCC and VBATT pins.
- During RTC operation using the voltage from the VBATT pin and the I/O ports within the backup, the power supply area can only be used as time capture event input pins for the RTC.

Figure 11.2 电池备份功能的切换顺序。

### 11.3.2 VBATT电池电源开关使用

当施加到VCC引脚的电压下降时，电池电源开关可以将电源从VCC引脚切换到VBATT引脚。当电压上升时，该开关将电源从VBATT引脚切换到VCC引脚。

Note: 电池备份功能应在电压监视器0复位使能（OFS1.LVDAS位为0）后使用。电压监视器0电平应高于VBATT开关电平。

### 11.3.3 VBATT备份寄存器使用

使用VBATT备份寄存器VBTBKRn，其中n=0到127，通过8位读取或写入操作来存储或恢复数据。

## 11.4 使用说明

- 当VBATT上的电压电平低于保证工作范围时，不保证副时钟振荡器和RTC的工作。当VBATT引脚低于保证工作电压时初始化RTC，然后再次上电。
- 写入本节中描述的寄存器时产生的复位可能会破坏寄存器值。
- 当VCC高于 $V_{DET BATT}$ 时，VCC管脚和VBATT管脚是分开的。当VCC低于 $V_{DET BATT}$ 且开关连接到VBATT引脚时，如果VBATT上的电压低于 $(VCC - 0.6V)$ ，电流可能会通过VCC和VBATT引脚之间的寄生二极管流入VBATT引脚。
- RTC操作期间，使用来自VBATT引脚和备份内部IO端口的电压，电源区域只能用作RTC的时间捕捉事件输入引脚。

**PRCn bits (Protect bit n) (n = 0, 1, 3, 4)**

The PRCn bits enable or disable writing to the protected registers listed in [Table 12.1](#). Setting the PRCn bits to 1 or 0 enables or disables writing, respectively.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR and its controlled registers are continuously written access. Avoid continuous write access or read the PRCR after PRC4 change, and then write access the PRC4-controlled register.

**PRCn位（保护位n）（n=0、1、3、4）**

PRCn位启用或禁用对表12.1中列出的受保护寄存器的写入。将PRCn位设置为1或0分别启用或禁用写入。

当PRCR及其受控寄存器连续写入访问时，PRC4控制的寄存器可能无法反映PRC4的变化。避免连续写访问或在PRC4更改后读取PRCR，然后再写访问PRC4控制的寄存器。

## 13. Interrupt Controller Unit (ICU)

### 13.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.

Table 13.1 lists the ICU specifications, Figure 13.1 shows a block diagram, and Table 13.2 lists the I/O pins.

Note 1. For the DMAC and DTC activation sources, see Table 13.4.

Note 2. Non-maskable interrupts can be enabled only once after a reset release.

Note 3. These non-maskable interrupts can also be used as maskable interrupts. When used as maskable interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 and voltage monitor 2 interrupts, set the LVD1CR1.IRQSEL and LVD2CR1.IRQSEL bits to 1.

注1.对于DMAC和DTC激活源，请参见表13.4。

注2.不可屏蔽中断只能在复位释放后启用一次。

注3：这些不可屏蔽中断也可以用作可屏蔽中断。当用作可屏蔽中断时，不要从复位状态更改NMIER寄存器的值。要启用电压监视器1和电压监视器2中断，请将LVD1CR1.IRQSEL和LVD2CR1.IRQSEL位设置为1。

Note 4. Low level: interrupt detection is not canceled if you do not clear it after a detection.  
 Note 5. These non-maskable interrupt sources cannot be recovered if the request source clock is stopped during low power mode.

SANMI位 (不可屏蔽中断的寄存器的安全属性)

不可屏蔽中断的寄存器的安全属性。目标寄存器如下:

- NMIER
- NMICLR
- NMICR

The value of AIRCR.BFHFNMINs bit [13] in Application Interrupt and Reset Control Register of ARM CPU should be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINs and the SANMI bits are different. AIRCR.BFHFNMINs is secure and SANMI is non-secure. Polarity has the same meaning so program these to match.

Note: Only one of Secure and Non-Secure can set security attribution for non-maskable interrupt-related registers. If you program the Secure attribute as secure, it always goes to the Secure interrupt handler. To release any of the non-maskable interrupt sources to the non-secure user, write a function to execute a nonsecure program from the interrupt handler for Secure.

#### SADMACn bits (Security attributes of registers for DMAC channel)

Security attributes of registers for DMAC channel. This register is referred to as the security attribute of the ICU and DMAC registers.

The controlled ICU register is:

- DELSRn

The controlled DMAC registers are:

- DMACn.DMSAR
- DMACn.DMSRR
- DMACn.DMDAR
- DMACn.DMDRR
- DMACn.DMCRA
- DMACn.DMCRB
- DMACn.DMTMD
- DMACn.DMINT
- DMACn.DMAMD

- NMIER
- NMICLR
- NMICR

ARMCPU的应用中断和复位控制寄存器AIRCR.BFHFNMINsbit[13]的值应与安全属性的值相同。AIRCR.BFHFNMINs和SANMI位的初始值不同。AIRCR.BFHFNMINs是安全的，而SANMI是不安全的。极性具有相同的含义，因此请对它们进行编程以匹配。

Note: 只有Secure和Non-Secure之一可以为不可屏蔽的中断相关寄存器设置安全属性。如果您将Secure属性编程为安全，则它始终会转到Secure中断处理程序。要将任何不可屏蔽的中断源释放给非安全用户，请编写一个函数以从Secure的中断处理程序执行非安全程序。

#### SAIELSRn bits (Security attributes of registers for IELSR31 to IELSR0)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn ( n = 0 to 31 ). NVIC internal registers are in NVIC\_ITNS0[31:0]. The initial values of NVIC\_ITNS0 and ICUSARG are different. NVIC\_ITNS0 is secure and ICUSARG is non-secure. Polarity has the same meaning so program these to match.

If the security attribution is configured as Non-secure:

IRQCRi register changes must satisfy the following conditions:

- For a CPU interrupt or DTC trigger:  
Change the IRQCRi register value before setting the target IELSRn register (n = 0 to 95).  
You can change the register values only when the value of the target IELSRn register is 0x0000.
- For a DMAC trigger:  
Change the IRQCRi register value before setting the target DELSRn register (n = 0 to 7).  
You can change the register values only when the value of the target DELSRn register is 0x0000.
- For a wakeup enable signal:  
Change the IRQCRi register setting before setting the target WUPEN.IRQWUPEN[n] (n = 0 to 15). You can only change the register values when the target WUPEN.IRQWUPEN[n] is 0.

#### IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For more information about the settings, see [section 13.5.6. External Pin Interrupts](#).

#### FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt request pins, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see [section 13.5.5. Digital Filter](#).

#### FLTEN bit (IRQi Digital Filter Enable)

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The digital filter is enabled when the IRQCRi.FLTEN bit is 1 and disabled when the IRQCRi.FLTEN bit is 0. The IRQi pin level is sampled at the clock cycle specified in the IRQCRi.FCLKSEL[1:0] bits. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 13.5.5. Digital Filter](#).

IRQCRi寄存器变更必须满足以下条件:

- 对于CPU中断或DTC触发:  
在设置目标IELSRn寄存器 (n=0到95) 之前更改IRQCRi寄存器值。  
仅当目标IELSRn寄存器的值为0x0000时才能更改寄存器值。
- 对于DMAC trigger:  
在设置目标DELSRn寄存器 (n=0到7) 之前更改IRQCRi寄存器值。  
只有当目标DELSRn寄存器的值为0x0000时, 才能更改寄存器值。
- 对于唤醒使能信号:  
在设置目标WUPEN.IRQWUPEN[n] (n=0到15) 之前更改IRQCRi寄存器设置。当目标WUPEN.IRQWUPEN[n]为0时, 您只能更改寄存器值。

#### IRQMD[1:0]位 (IRQi检测检测选择)

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

关于数字滤波器的详细信息, 请参阅13.5.5节。数字滤波器。

#### FLTEN位 (IRQi数字滤波器使能)

FLTEN位使能用于IRQi外部引脚中断源的数字滤波器。数字滤波器在IRQCRi.FLTEN位为1时启用, 在IRQCRi.FLTEN位为0时禁用。IRQi引脚电平在IRQCRi.FCLKSEL[1:0]位指定的时钟周期内采样。当采样电平匹配3次时, 数字滤波器的输出电平会发生变化。关于数字滤波器的详细信息, 请参阅13.5.5节。数字滤波器。

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored. The setting in the Non-Maskable Interrupt Enable Register (NMIER) does not affect the status flags in this register. Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests are generated during handler processing.

Change the NMICR register settings before enabling NMI pin interrupts, that is, before setting NMIER.NMIEN to 1.

**NMIMD bit (NMI Detection Set)**

The NMIMD bit selects the detection sensing method for the NMI pin interrupts.

**NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)**

The NFCLKSEL[1:0] bits select the digital filter sampling clock for the NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every eight cycles)

For details of the digital filter, see [section 13.5.5. Digital Filter](#).

**NFLTEN bit (NMI Digital Filter Enable)**

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN is 1, and disabled when NFLTEN is 0. The NMI pin level is sampled at the clock cycle specified in NFCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 13.5.5. Digital Filter](#).

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: This register requires halfword or word access.

Note 1. Writing 1 to the IR flag is prohibited.

The IELSRn register selects the IRQi source used by the NVIC. For details, see [xref to Table 13.3](#). IELSRn corresponds to the NVIC IRQ input source number, where n = 0 to 95.

**IELS[8:0] bits (ICU Event Link Select)**

The IELS[8:0] bits link an event signal to the associated NVIC or DTC module. Event options are classified into 8 groups (groups 0 to 7). For details, see [Table 13.3](#) and [Table 13.4](#).

**IR flag (Interrupt Status Flag)**

The IR status flag indicates an individual interrupt request from the event specified in IELS[8:0].

[Setting condition]

When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing condition]

- The IR flag is cleared to 0 by writing 0.
- At the time other than the final transfer transfer end in DTC transfer during DTCE = 1, IR flag repeat set and cleared by Hardware.

When DTC transfer except last transfer is completed (DTCE bit is changed from 1 to 0).

During DTCE = 1, write 0 to IR register is prohibited.

In the case of level detection, clear of the IR flag should follow the steps below.

Note: 该寄存器需要半字或字访问。

注1.禁止向IR标志写入1。

IELSRn寄存器选择NVIC使用的IRQi源。有关详细信息, 请参阅表13.3的外部参照。IELSRn对应于NVICIRQ输入源编号, 其中n=0到95。

**IELS[8:0]位 (ICU事件链接选择)**

IELS[8:0]位将事件信号链接到相关的NVIC或DTC模块。事件选项分为8组 (组0到7)。详见表13.3和表13.4。

**IR标志 (中断状态标志)**

IR状态标志指示来自IELS[8:0]中指定事件的单个中断请求。

[Setting condition]

当从相关外设模块或IRQi引脚接收到中断请求时。

[Clearing condition]

- IR标志通过写入0清除为0。
- 在DTCE=1期间DTC传输中最后传输传输结束以外的时间, IR标志由硬件重复设置和清除。

完成最后一次传输以外的DTC传输时 (DTCE位从1变为0)。

在DTCE=1期间, 禁止向IR寄存器写入0。

在电平检测的情况下, 清除IR标志应遵循以下步骤。

1. Negate the input interrupt signal.
2. Read access the peripheral once and wait for 2 clock cycles of the target module clock.
3. Clear the IR flag by writing 0.

**DTCE bit (DTC Activation Enable)**

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

- When 1 is written to the DTCE bit.

[Clearing condition]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete.
- When 0 is written to the DTCE bit.

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

Note: DTC transfer error in snooze mode

When an error occurs in DTC transfer in Snooze mode, ICU issues a wakeup request. However, interrupt requests are not issued automatically. See section 17, Data Transfer Controller (DTC) for how to set the interrupt when a DTC error occurs.

- 1.取反输入中断信号。
- 2.对外设进行一次读取访问，并等待目标模块时钟的2个时钟周期。
- 3.写0清除IR标志。

**DTCE位 (DTC激活使能)**

当DTCE位设置为1时，相关事件被选为DTC激活源。

[Setting condition]

- 当1写入DTCE位时。

[Clearing condition]

- 当指定数量的传输完成时。对于链式转移，当最后一次链式转移的指定转移次数完成时。
- 当0写入DTCE位时。

Note: DTC传输期间出错

如果在DTC传输期间发生错误响应，则DTC会通知ICU发生了错误。ICU清除目标IELSRn(n=0到95)的所有位。不是目标的IELSRn不会被清除。

Note: 贪睡模式下的DTC传输错误

当贪睡模式下的DTC传输发生错误时，ICU会发出唤醒请求。但是，不会自动发出中断请求。有关如何在发生DTC错误时设置中断，请参见第17节，数据传输控制器(DTC)。

注1.禁止向IR标志写入1。

**DELS[8:0] bit (DMAC Event Link Select)**

The DELS[8:0] bits link an event signal to the associated DMAC module. Do not set the same event number in multiple DELSRn registers.

**IR flag (DMAC Activation Request Status flag)**

The IR flag is the status flag of a DMAC activation request. This flag is associated with the DELS[8:0] bits of this register.

[Setting condition]

- The flag is set to 1 when a DMAC activation request is generated from the associated peripheral module or IRQi pin.

[Clearing conditions]

- When 0 is written to the flag
- At the start of a DMA transfer after the DMAC activation request is issued.

Note: The IR flag is automatically cleared after completion of DMA transfer, so do not write 0 unless an abort occurs. DMA transfer operation when 0 is written cannot be guaranteed.

Note: Error during DMAC transfer

If an error response occurs during DMAC transfer, the DMAC notifies the ICU that an error has occurred.

The ICU clears all bits of the target channel of DELSRn (n = 0 to 7). DELSRn that is not the target channel is not cleared.

**13.2.17 SELSR0 : SYS Event Link Setting Register**

Base address: ICU = 0x4000\_6000

Offset address: 0x200

| Bit  | Symbol    | Function  | R/W |

| 15:9 | —         | These bits are read as 0. The write value should be 0.  | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The SELSR0 register selects the events that wake up the CPU from Snooze mode. You can use only the events listed in Table 13.4 checked as “Canceling Snooze mode using SELSR0”. Events specified in this register are defined as ICU\_SNZCANCEL in Table 13.4. When ICU\_SNZCANCEL is selected in the IELSRn.IELS[8:0] bits, the SELSR0 event interrupt occurs.

**Caution:** For security attribution added to parts related to a series of actions, make sure to match all security attribution so that security holes cannot be created.

**About security attribution to be matched**

- Event source to be set to SELSR0.
- SELSR0
- IELSRn (n = 0 to 95) to receive event No. 45 (ICU\_SNZCANCEL).
- NVIC internal registers from the CPU of the three specified interrupts.
- Interrupt Handler.

**DELS[8:0]位 (DMAC事件链接选择)**

DELS[8:0]位将事件信号链接到相关的DMAC模块。不要在多个中设置相同的事件编号 DELSRn registers.

**IR标志 (DMAC激活请求状态标志)**

IR标志是DMAC激活请求的状态标志。该标志与该寄存器的DELS[8:0]位相关联。

[Setting condition]

- 当相关外设模块或IRQi引脚产生DMAC激活请求时，该标志设置为1。

[Clearing conditions]

- 标志写入0时
- 在发出DMAC激活请求后开始DMA传输。

Note: IR标志在DMA传输完成后自动清除，因此除非发生中止，否则不要写0。无法保证写入0时的DMA传输操作。

Note: DMAC传输期间出错

如果在DMAC传输期间发生错误响应，则DMAC会通知ICU发生了错误。

ICU清除DELSRn (n=0到7) 的目标通道的所有位。不是目标通道的DELSRn不会被清除。

**13.2.17 SELSR0: SYS事件链接设置寄存器**

Note: 如果安全属性配置为安全: ●

- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●

- 允许安全和非安全访问。

SELSR0寄存器选择将CPU从贪睡模式唤醒的事件。您只能使用中列出的事件表13.4选中“使用SELSR0取消贪睡模式”。该寄存器中指定的事件定义为ICU\_SNZCANCEL在表13.4中。在IELSRn.IELS[8:0]位中选择ICU\_SNZCANCEL时，将发生SELSR0事件中断。

**Caution:** 对于添加到与一系列动作相关的部分的安全属性，请确保匹配所有的安全属性，以免造成安全漏洞。

**关于要匹配的安全属性●**

- 事件源设置为SELSR0。
- SELSR0
- IELSRn(n=0到95)接收事件编号45(ICU\_SNZCANCEL)。
- NVIC内部寄存器来自CPU的三个指定中断。
- 中断处理程序。

## 13.3 Vector Table

The ICU detects maskable and non-maskable interrupts. Interrupt priorities are set up in the Arm NVIC. For information about these registers, see [section 13.9. Reference](#).

## 13.3.1 Interrupt Vector Table

[Table 13.3](#) describes the interrupt vector table. The interrupt vector addresses conform to the NVIC specifications.

**AGT3CBWUPEN位 (AGT3比较匹配B中断软件待机返回使能位)**

该位是控制使用AGT3比较匹配B中断作为软件待机返回因素的使能位。

Note: 该寄存器的安全属性为每个唤醒事件设置。  
为了避免安全漏洞的发生, 唤醒的目标事件和添加到该位的安全属性必须匹配。

## 13.3 向量表

ICU检测可屏蔽和不可屏蔽中断。中断优先级在ArmNVIC中设置。有关这些寄存器的信息, 请参阅第13.9节。参考。

## 13.3.1 中断向量表

[表13.3](#)描述了中断向量表。中断向量地址符合NVIC规范。

Note 1. Only the first edge detection is valid.

Note 2. Only interrupts after DTC transfer are supported.

Note 3. Using SELSR0.

## 13.4 Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation, and DMAC activation.

### 13.4.1 Detecting Interrupts

The ICU selects an event source input from a peripheral function interrupt or an external pin interrupt with IELSRn.IELS[8:0].

The accepted interrupt source sets the IELSRn.IR to 1 and sends an interrupt request to the NVIC.

External pin interrupt requests are detected by either:

- Edges (falling edge, rising edge, or rising and falling edges)
- Level (low level) of the interrupt signal.

Set the IRQCRi.IRQMD[1:0] bits to select the detection mode for the IRQi pins. For interrupt sources associated with peripheral modules, see [Table 13.3](#) and [Table 13.4](#). Events must be accepted by the NVIC before an interrupt occurs and is accepted by the CPU.

## 13.4 中断操作

ICU执行以下功能：

- 检测中断
- 启用和禁用中断
- 选择中断请求目标，例如CPU中断、DTC激活和DMAC激活。

### 13.4.1 检测中断

ICU通过IELSRn.IELS[8:0]从外围功能中断或外部引脚中断选择事件源输入。

接受的中断源将IELSRn.IR设置为1，并向NVIC发送中断请求。

外部引脚中断请求通过以下任一方式检测：

- 边沿（下降沿、上升沿或上升沿和下降沿）
- 中断信号的电平（低电平）。

设置IRQCRi.IRQMD[1:0]位以选择IRQi引脚的检测模式。对于与外围模块相关的中断源，请参见表13.3和表13.4。事件必须在中断发生之前被NVIC接受并被CPU接受。

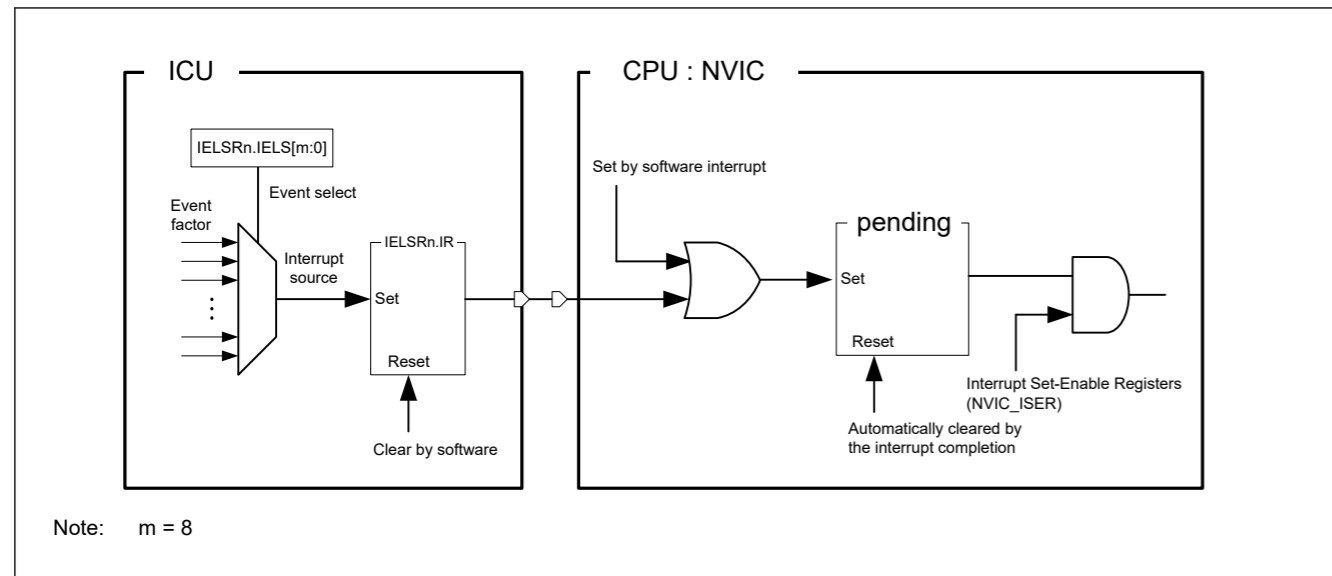

Figure 13.2 Interrupt path of the ICU and CPU (NVIC)

## 13.5 Interrupt setting procedure

### 13.5.1 Enabling Interrupt Requests

The procedure for enabling an interrupt request is as follows:

1. Set the Interrupt Set-Enable register (NVIC\_ISER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).

### 13.5.2 Disabling Interrupt Requests

The procedure to disable the interrupt request is as follows:

1. Disable the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).
2. Clear the interrupt source setting (IELSRn.IELS[8:0] = 0x00).
3. Clear the interrupt status flag (IELSRn.IR = 0).
4. Clear the interrupt Clear-Enable register (NVIC\_ICER) and interrupt Clear-Pending register (NVIC\_ICPR).

### 13.5.3 Polling for interrupts

The procedure for polling for interrupt requests is as follows:

1. Set the Interrupt Clear-Enable register (NVIC\_ICER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN register setting).
4. Poll the interrupt Set-Pending register (NVIC\_ISPR).

### 13.5.4 Selecting Interrupt Request Destinations

The available destinations are fixed for each interrupt, as described in [Table 13.3](#), [Table 13.4](#).

The interrupt output destination, CPU, DMAC, or DTC can be independently selected for each interrupt source.

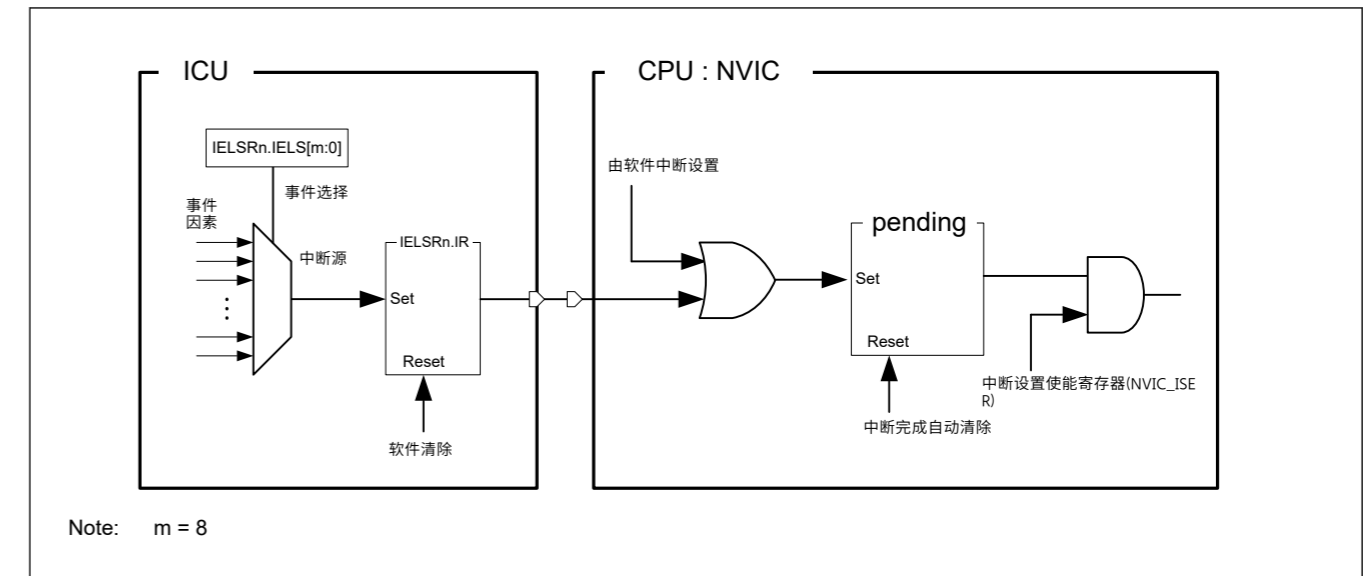

Figure 13.2 ICU和CPU(NVIC)的中断路径

## 13.5 中断设置程序

### 13.5.1 启用中断请求

使能中断请求的过程如下:

1. 设置中断设置使能寄存器(NVIC\_ISER)。
2. 将IELSRn.IELS[8:0]位设置为中断源。
3. 指定事件源的操作设置,例如DMAC激活 (DELSRn.DELS[8:0])、贪睡模式取消 (SELSR0.SELS[8:0])、软件待机模式取消 (WUPEN寄存器设置)。

### 13.5.2 禁用中断请求

禁用中断请求的过程如下:

1. 禁用事件源的操作设置,例如DMAC激活 (DELSRn.DELS[8:0])、贪睡模式取消 (SELSR0.SELS[8:0])、软件待机模式取消 (WUPEN寄存器设置)。
2. 清除中断源设置 (IELSRn.IELS[8:0]=0x00)。
3. 清除中断状态标志 (IELSRn.IR=0)。
4. 清除中断清除启用寄存器 (NVIC\_ICER) 和中断清除挂起寄存器 (NVIC\_ICPR)。

### 13.5.3 轮询中断

轮询中断请求的过程如下:

1. 设置中断清除启用寄存器(NVIC\_ICER)。
2. 将IELSRn.IELS[8:0]位设置为中断源。
3. 指定事件源的操作设置,例如DMAC激活 (DELSRn.DELS[8:0])、贪睡模式取消 (SELSR0.SELS[8:0])、软件待机模式取消 (WUPEN寄存器设置)。
4. 轮询中断设置挂起寄存器(NVIC\_ISPR)。

### 13.5.4 选择中断请求目标

每个中断的可用目的地都是固定的,如表13.3和表13.4中所述。

可以为每个中断源独立选择中断输出目标、CPU、DMAC或DTC。

Use an interrupt request destination setting that is indicated by a “✓” in the event list (see [section 13.3.2. Event Number](#)).

Note: Setting the same interrupt source for IELSRn and DELSRn is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi pin, you must set the IRQCRi.IRQMD[1:0] bits for that interrupt to select edge detection.

### 13.5.4.1 CPU interrupt request

When IELSRn.DTCE = 0, the event specified in the IELSRn register is output to the NVIC. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 0.

### 13.5.4.2 DTC activation

When IELSRn.DTCE = 1, the event specified in the IELSRn register is output to the DTC. Use the following procedure:

1. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 1.
2. Set the DTC Module Start bit (DTCST.DTCST) to 1.

Table 13.5 shows operation when the DTC is the interrupt request destination.

**Table 13.5 Operation when DTC becomes interrupt request destination**

| Interrupt request destination | DISEL*1 | Remaining transfer operations | Operation per request        | IR*2  | Interrupt request destination after transfer |
|-------------------------------|---------|-------------------------------|------------------------------|---|--|
| DTC*3                         | 1       | ≠ 0                           | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU                                | DTC  |
|                               |         | = 0                           | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU                                | CPU (IELSRn.DTCE bit is cleared)             |
|                               | 0       | ≠ 0                           | DTC transfer                 | Cleared at the start of DTC data transfer after reading DTC transfer data | DTC  |
|                               |         | = 0                           | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU                                | CPU (IELSRn.DTCE bit is cleared)             |

Note 1. DTC.MRB.DISEL bit controls the interrupt generates timing from DTC to CPU.

Note 2. When the IELSRn.IR flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.

Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. The DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR flag clear timing, and the interrupt request destination after transfer. See [Table 17.2 in section 17, Data Transfer Controller \(DTC\)](#).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

Note: DTC transfer error in snooze mode

When an error occurs in DTC transfer in Snooze mode, ICU issues a Wake Up request. However, interrupt requests are not issued automatically. See [section 17, Data Transfer Controller \(DTC\)](#) chapter for information on how to set the interrupt when a DTC error occurs.

### 13.5.4.3 DMAC Activation

Events specified in the DELSRn registers are output to the DMAC.

To set the interrupt source for DMAC, use the following procedure:

1. Set the DELSRn.DELS[8:0] bits to the event to activate the DMAC.
2. When using interrupts to CPU, set the IELSRn.IELS bit to factor of DMAC interrupt and IELSRn.DTCE bit to 0.
3. Set the activation source for the target DMAC channel (DMACm.DMTMD.DCTG[1:0]) to 01b (interrupt module detection).
4. Set the DMAC transfer enable bit for the target DMAC channel (DMACm.DMCNT.DTE) to 1.

使用事件列表中由“ ”指示的中断请求目标设置（参见第13.3.2节。事件编号）。

Note: 禁止为IELSRn和DELSRn设置相同的中断源。

如果选择DMAC或DTC作为来自IRQi引脚的请求的目标，则必须设置IRQCRi.IRQMD[1:0]位以使该中断选择边沿检测。

### 13.5.4.1 CPU中断请求

当IELSRn.DTCE=0时，将IELSRn寄存器中指定的事件输出到NVIC。将IELSRn.IELS[8:0]位设置为目标事件，并将IELSRn.DTCE位设置为0。

### 13.5.4.2 DTC activation

当IELSRn.DTCE=1时，将IELSRn寄存器中指定的事件输出到DTC。使用以下过程：

- 1.将IELSRn.IELS[8:0]位设置为目标事件，并将IELSRn.DTCE位设置为1。
- 2.将DTC模块起始位(DTCST.DTCST)设置为1。

表13.5显示了DTC是中断请求目标时的操作。

**Table 13.5 DTC成为中断请求目标时的操作**

| 中断请求目的地 | DISEL*1 | 剩余的转移操作 | 按请求操作        | IR*2                     | 传输后的中断请求目的地          |
|---------|---------|---------|--------------|--------------------------|----------------------|
| DTC*3   | 1       | ≠ 0     | DTC传输→CPU中断  | CPU接受中断时清零               | DTC                  |
|         |         | = 0     | DTC传输→CPU中断  | CPU接受中断时清零               | CPU (IELSRn.DTCE位清零) |
|         | 0       | ≠ 0     | DTC transfer | 读取DTC传输数据后，在DTC数据传输开始时清零 | DTC                  |
|         |         | = 0     | DTC传输→CPU中断  | CPU接受中断时清零               | CPU (IELSRn.DTCE位清零) |

注1.DTC.MRB.DISEL位控制从DTC到CPU的中断产生时序。

注2.IELSRn.IR标志为1时，忽略再次发生的中断请求（DTC激活请求）。

注3.对于链式传输，DTC传输将持续到最后一个链式传输结束。DISEL位状态和剩余传输计数决定是否发生CPU中断、IELSRn.IR标志清除时序以及传输后的中断请求目的地。请参见第17节“数据传输控制器(DTC)”中的表17.2。

Note: DTC传输期间出错

如果在DTC传输期间发生错误响应，则DTC会通知ICU发生了错误。ICU清除目标IELSRn(n=0到95)的所有位。不是目标的IELSRn不会被清除。

Note: 贪睡模式下的DTC传输错误

当贪睡模式下的DTC传输发生错误时，ICU会发出唤醒请求。但是，不会自动发出中断请求。有关如何在发生DTC错误时设置中断的信息，请参见第17节，数据传输控制器(DTC)章节。

### 13.5.4.3 DMAC Activation

在DELSRn寄存器中指定的事件被输出到DMAC。

要为DMAC设置中断源，请使用以下过程：

- 1.将DELSRn.DELS[8:0]位设置为事件以激活DMAC。
- 2.当对CPU使用中断时，将IELSRn.IELS位设置为DMAC中断因素，并将IELSRn.DTCE位设置为0。
- 3.将目标DMAC通道 (DMACm.DMTMD.DCTG[1:0]) 的激活源设置为01b (中断模块检测)。
- 4.将目标DMAC通道(DMACm.DMCNT.DTE)的DMAC传输使能位设置为1。

5. Set the DMAC operation enable bit (DMAST.DMST) to 1.

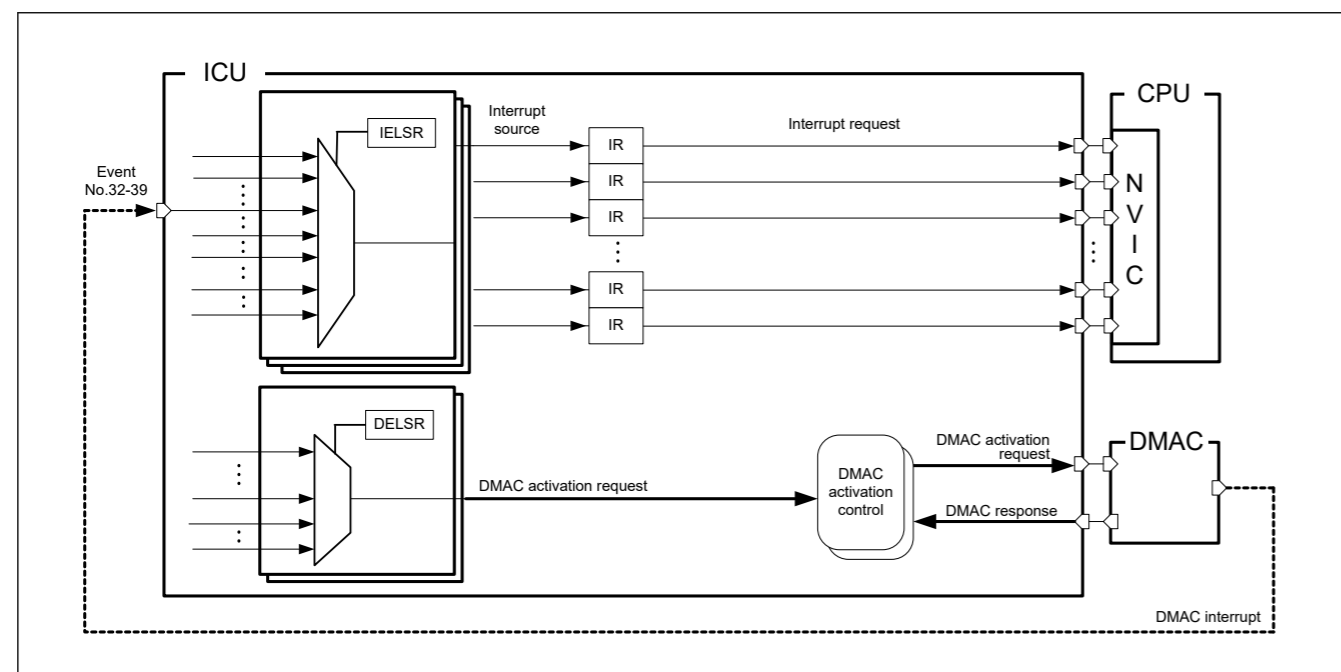

Figure 13.3 DMAC request trigger and interrupt path

Note: Error during DMAC transfer

If an error response occurs during DMAC transfer, the DMAC notifies the ICU that an error has occurred.

The ICU clears all bits of the target channel of DELSRn (n = 0 to 7). DELSRn that is not the target channel is not cleared.

### 13.5.5 Digital Filter

A digital filter function is provided for the external interrupt request pins IRQi, (i = 0 to 15) and the NMI pin interrupt. It samples input signals on the filter PCLKB sampling clock, and removes any signal with a pulse width less than 3 sampling cycles.

To use the digital filter for an IRQi pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the IRQCRi.FCLKSEL[1:0] bits (i = 0 to 15).
2. Set the IRQCRi.FLTEN bit (i = 0 to 15) to 1 (digital filter enabled).

To use the digital filter for an NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the NMICR.NFCLKSEL[1:0] bits.
2. Set the NMICR.NFLTEN bit to 1 (digital filter enabled).

Figure 13.4 shows an example of digital filter operation.

- 5.将DMAC操作使能位(DMAST.DMST)设置为1。

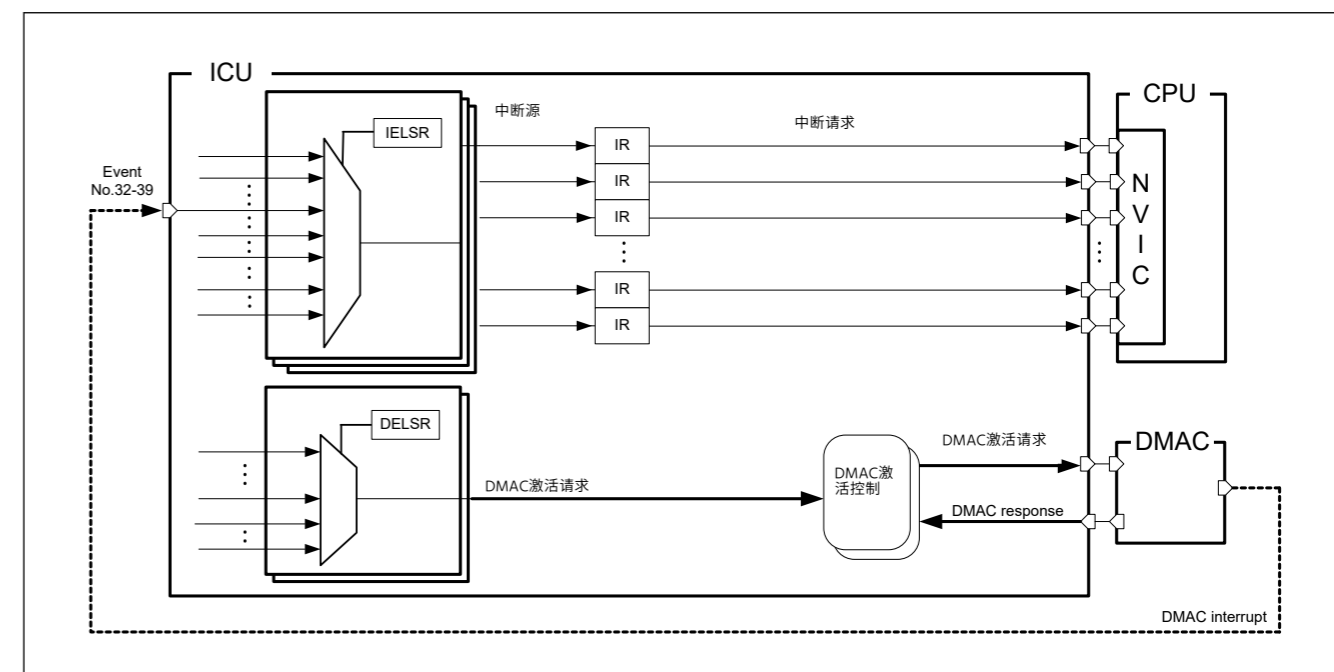

Figure 13.3 DMAC请求触发和中断路径

Note: DMAC传输期间出错

如果在DMAC传输期间发生错误响应, 则DMAC会通知ICU发生了错误。

ICU清除DELSRn (n=0到7) 的目标通道的所有位。不是目标通道的DELSRn不会被清除。

### 13.5.5 数字滤波器

为外部中断请求引脚IRQi (i=0到15) 和NMI引脚中断提供了数字过滤功能。它在滤波器PCLKB采样时钟上对输入信号进行采样, 并去除脉冲宽度小于3个采样周期的任何信号。

为IRQi引脚使用数字滤波器:

- 1.在IRQCRi.FCLKSEL[1:0]位 (i=0到15) 中将采样时钟周期设置为PCLKB、PCLKB8、PCLKB32或PCLKB64。
- 2.将IRQCRi.FLTEN位 (i=0到15) 设置为1 (启用数字滤波器)。

要将数字滤波器用于NMI引脚:

- 1.在NMICR.NFCLKSEL[1:0]位中将采样时钟周期设置为PCLKB、PCLKB8、PCLKB32或PCLKB64。
- 2.将NMICR.NFLTEN位设置为1 (启用数字滤波器)。

图13.4显示了数字滤波器操作的示例。

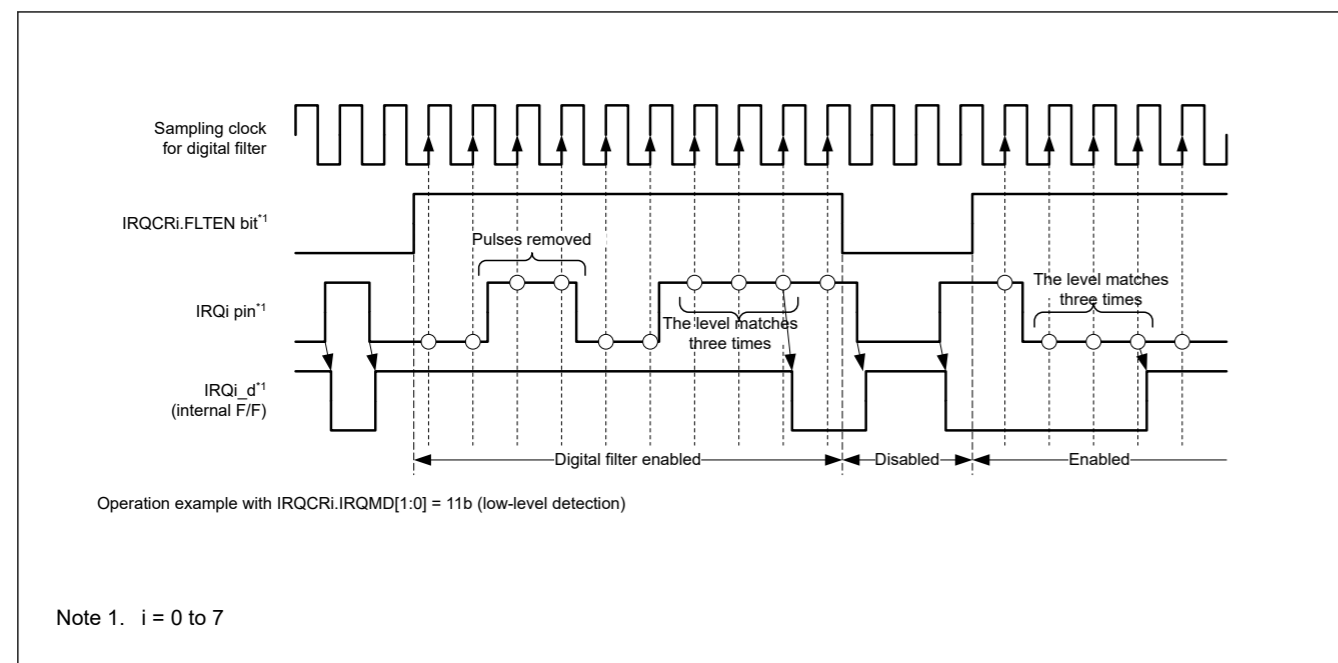

Figure 13.4 Digital filter operation example

Before entering Software Standby mode, disable the digital filters by clearing the IRQCRI.FLTEN and NMICR.NFLTEN bits. The ICU clock stops in Software Standby mode.

On exiting Software Standby, the circuit detects the edge by comparing the state before standby to the state after standby release. If the input changes during Software Standby, an incorrect edge might be detected. You can enable the digital filters again after exiting Software Standby mode.

### 13.5.6 External Pin Interrupts

To use external pin interrupts:

1. Configure I/O ports settings
2. Clear the IRQCRI.FLTEN bit ( $i = 0$  to 15) to 0 (digital filter disabled).
3. Set the IRQMD[1:0] bits of the given IRQCRI register ( $i = 0$  to 15) to select the senses of detection.
4. Set the FCLKSEL[1:0] bits, and the FLTEN bit of the IRQCRI register.
5. Select the IRQ pin as follows:
  - If the IRQ pin is to be used for CPU interrupt requests, set the IELSRn.IELS[8:0] bits and the IELSRn.DTCE bit to 0
  - If the IRQ pin is to be used for DTC activation, set the IELSRn.IELS[8:0] bits and the IELSRn.DTCE bit to 1.
  - If the IRQ pin is to be used for DMAC activation, set the DELSRn.DELS[8:0] bits.

### 13.6 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt
- Voltage monitor 2 interrupt
- SRAM parity error interrupt
- SRAM ECC error interrupt

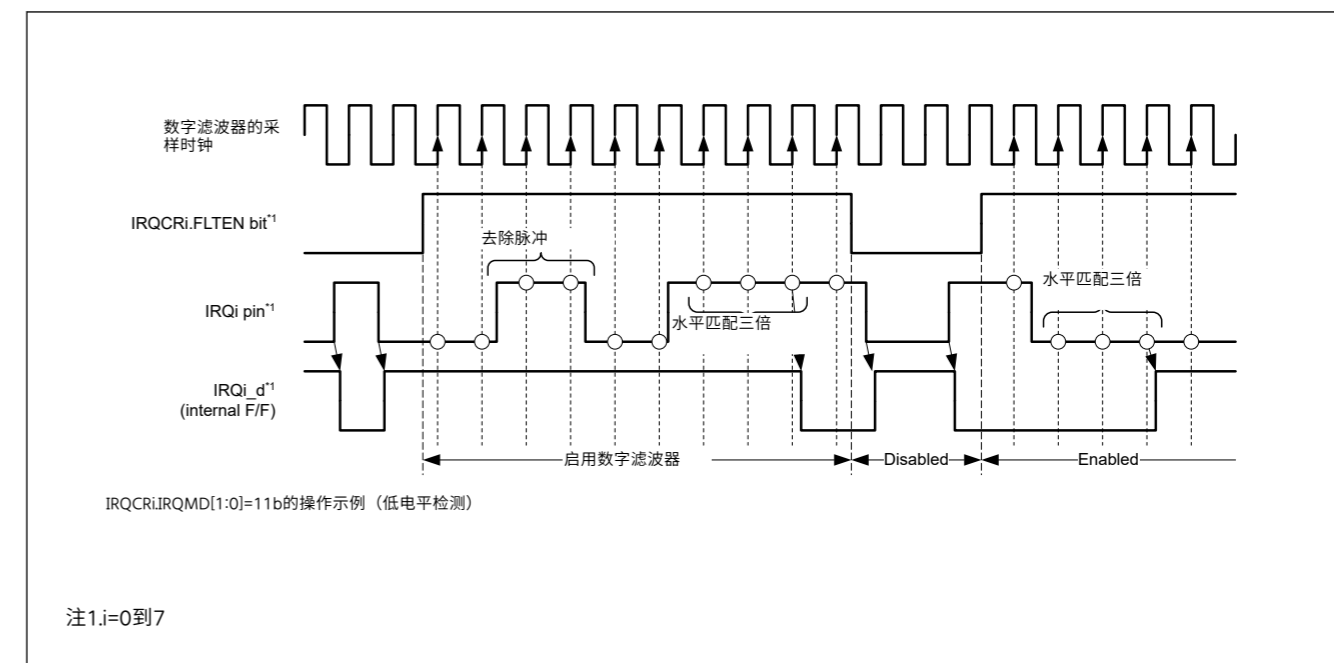

Figure 13.4 数字滤波器操作示例

在进入软件待机模式之前，通过清除IRQCRI.FLTEN和NMICR.NFLTEN位来禁用数字滤波器。ICU时钟在软件待机模式下停止。

在退出软件待机时，电路通过将待机前的状态与待机释放后的状态进行比较来检测边沿。如果在软件待机期间输入发生变化，则可能会检测到不正确的边沿。您可以在退出软件待机模式后再次启用数字滤波器。

### 13.5.6 外部引脚中断

要使用外部引脚中断：

- 1.配置IO端口设置
- 2.将IRQCRI.FLTEN位 ( $i=0$ 到15) 清零 (禁用数字滤波器)。
- 3.设置给定IRQCRI寄存器 ( $i=0$ 到15) 的IRQMD[1:0]位以选择检测的意义。
- 4.设置FCLKSEL[1:0]位和IRQCRI寄存器的FLTEN位。
- 5.选择IRQ引脚如下：
  - 如果IRQ引脚用于CPU中断请求，请将IELSRn.IELS[8:0]位和IELSRn.DTCE位设置为0
  - 如果IRQ引脚用于DTC激活，请将IELSRn.IELS[8:0]位和IELSRn.DTCE位设置为1。
  - 如果IRQ引脚用于激活DMAC，设置DELSRn.DELS[8:0]位。

### 13.6 不可屏蔽中断操作

以下源可以触发不可屏蔽中断：

- NMI引脚中断
- 振荡停止检测中断
- WDT下溢刷新错误中断
- IWDT下溢刷新错误中断
- 电压监控器1中断
- 电压监测器2中断
- SRAM奇偶校验错误中断
- SRAMECC错误中断

- MPU bus master error interrupt
- TrustZone filter error interrupt
- Cache RAM parity error interrupt.

Non-maskable interrupts can only be used with the CPU, not to activate the DTC or DMAC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts:

1. Clear the NMICR.NFLTEN bit to 0 (digital filter disabled).
2. Set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register.
3. Write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIEN bit in NMIER is ignored. An NMI interrupt cannot be disabled when enabled, except by a reset.

The secure attribution managed within the Application Interrupt and Reset Control Register (AIRCR) of the Arm CPU must match the security attribution of NMI.

The NMI secure of the CPU is changed by AIRCR.BFHFNMINs. It is managed by software developers who manage Secure program.

### 13.6.1 Correspondence to TrustZone-M by NMI

Although there is only one NMI per CPU, multiple factors can be set. This section describes the procedure for mixing Secure and NonSecure programs of NMI. When doing so, the NMI-related registers of the ICU are set to Secure.

NMI-related registers:

- NMIER
- NMICLR
- NMICR

Set "0" to ICUSARB.SANMI.

The value of AIRCR.BFHFNMINs[13] in the Application Interrupt and Reset Control Register of the ARM CPU must be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINs and ICUSARB.SANMI are different.

AIRCR.BFHFNMINs is for secure and ICUSARB.SANMI is for non-secure. Polarity has the same meaning so program these to match.

If NMI is issued, jump to the NMI handler. When mixing secure and non-secure program, the NMI handler must branch according to the TrustZone-M rule. Figure 13.5 shows the flow.

- MPU总线主机错误中断
- TrustZone过滤器错误中断
- CacheRAM奇偶校验错误中断。

不可屏蔽中断只能用于CPU，不能激活DTC或DMAC。不可屏蔽中断优先于所有其他中断。不可屏蔽中断状态可以在不可屏蔽中断状态寄存器(NMISR)中验证。在从NMI处理程序返回之前，确认NMISR中的所有位都为0。

默认情况下禁用不可屏蔽中断。要使用不可屏蔽的中断：

- 1.将NMICR.NFLTEN位清为0（禁用数字滤波器）。
- 2.设置NMICR寄存器的NMIMD位、NFCLKSEL[1:0]位和NFLTEN位。
- 3.将1写入NMICLR.NMICLR位以将NMISR.NMIST标志清零。
- 4.通过将1写入不可屏蔽中断使能寄存器(NMIER)中的相关位来启用不可屏蔽中断。

将1写入NMIER寄存器后，随后对NMIER中的NMIEN位的写访问将被忽略。启用时不能禁用NMI中断，除非通过复位。

在ArmCPU的应用程序中断和复位控制寄存器(AIRCR)中管理的安全属性必须与NMI的安全属性相匹配。

CPU的NMI安全由AIRCR.BFHFNMINs更改。它由管理的软件开发人员管理安全程序。

### 13.6.1 NMI与TrustZone-M的通信

虽然每个CPU只有一个NMI，但可以设置多个因素。本节介绍混合程序NMI的安全和非安全程序。这样做时，ICU的NMI相关寄存器设置为Secure。

NMI-related registers:

- NMIER
- NMICLR
- NMICR

将"0"设置为ICUSARB.SANMI。

ARMCPU的应用中断和复位控制寄存器AIRCR.BFHFNMINs[13]的值必须与安全属性的值相同。AIRCR.BFHFNMINs和ICUSARB.SANMI的初始值不同。

AIRCR.BFHFNMINs用于安全，ICURASB.SANMI用于非安全。极性具有相同的含义，因此请对它们进行编程以匹配。

如果发出NMI，则跳转到NMI处理程序。当混合安全和非安全程序时，NMI处理程序必须根据TrustZone-M规则进行分支。图13.5显示了流程。

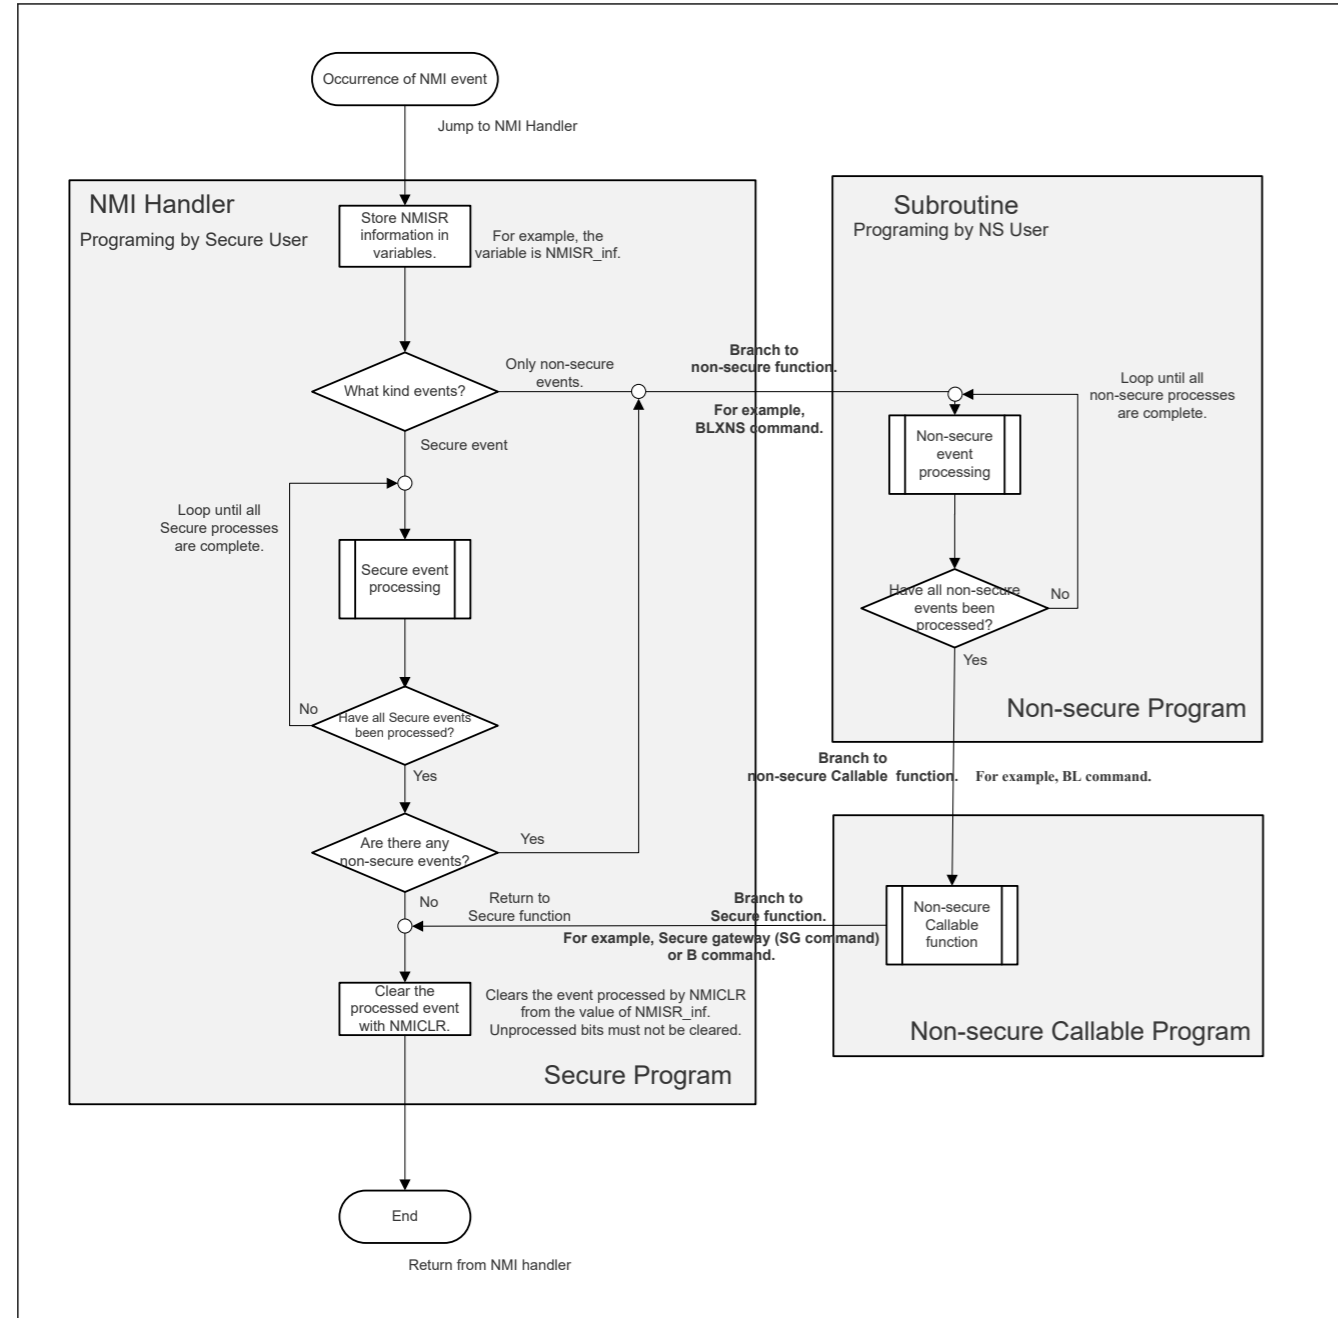

Figure 13.5 Correspondence to TrustZone-M by NMI

See the Arm documentation for details on how to move between secure and non-secure programs.

### 13.7 Return from Low Power Modes

Table 13.4 lists the interrupt sources you can use to exit Sleep, Snooze, or Software Standby mode. For more information, see section 10, Low Power Modes.

#### 13.7.1 Return from Sleep Mode

To return from Sleep mode in response to an interrupt:

##### non-maskable interrupt

- Use the NMIER register to enable the target interrupt request.

##### maskable interrupt

- Select the CPU as the interrupt request destination.

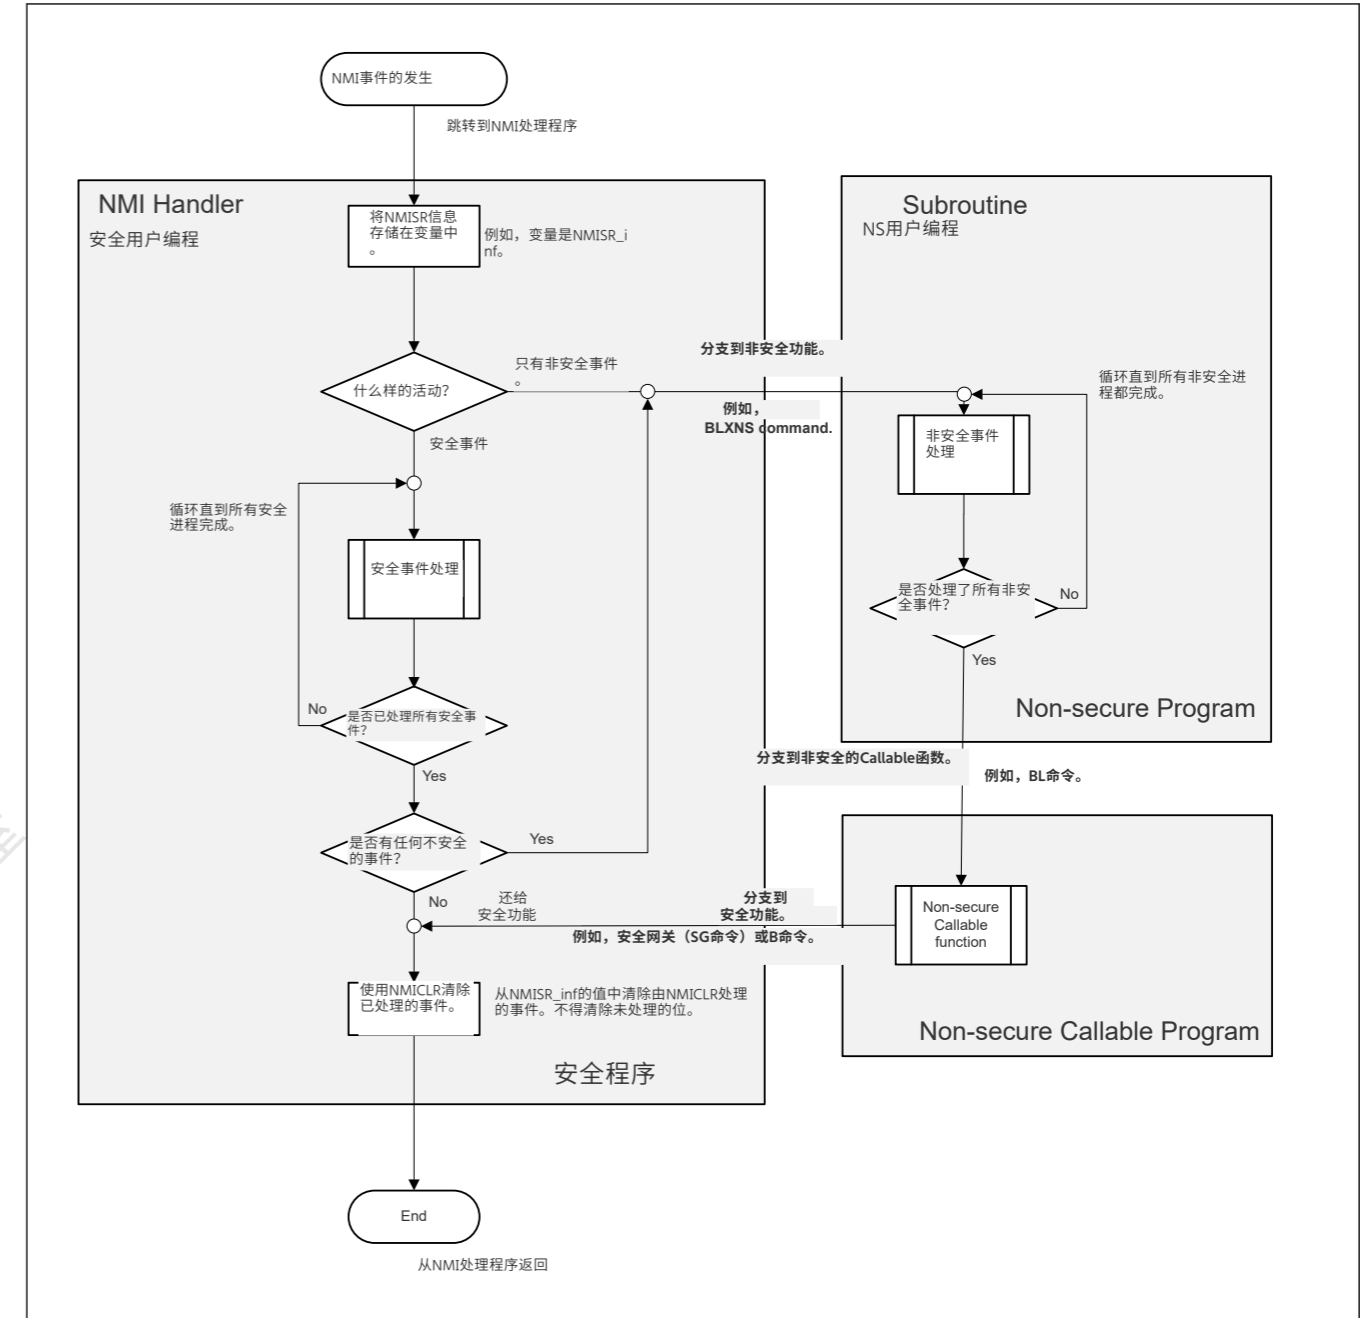

Figure 13.5 NMI与TrustZone-M的通信

有关如何在安全程序和非安全程序之间移动的信息，请参阅Arm文档。

### 13.7 从低功耗模式返回

表13.4列出了可用于退出睡眠、贪睡或软件待机模式的中断源。有关详细信息，请参阅第10节，低功耗模式。

#### 13.7.1 从睡眠模式返回

从睡眠模式返回以响应中断：

##### non-maskable interrupt

- 使用NMIER寄存器启用目标中断请求。

##### maskable interrupt

- 选择CPU作为中断请求目标。

- Enable the interrupt in the NVIC.

### 13.7.2 Return from Software Standby Mode

The ICU returns from Software Standby mode using a non-maskable interrupt or a maskable interrupt. For maskable interrupt of canceling source, see [Table 13.4](#).

To return from Software Standby mode:

1. Select the interrupt source that enables return from Software Standby:
  - For non-maskable interrupts, use the NMIER register to enable the target interrupt request
  - For maskable interrupts, use the WUPEN register to enable the target interrupt request.
2. Select the CPU as the interrupt request destination
3. Enable the interrupt in the NVIC.

Interrupt requests through the IRQn pins that do not satisfy these conditions are not detected while the clock is stopped in Software Standby mode.

Similarly, request for a non-maskable interrupt from a request source whose clock is stopped in Software Standby mode cannot be detected.

#### Transition to/from Software Standby mode

1. Before Software Standby mode is entered, disable the digital filter for the interrupt source as a return target (IRQCRI.FLTEN = 0, NMICR.NFLTEN = 0).
2. To use the digital filter again after returning from Software Standby mode, enable the digital filter (IRQCRI.FLTEN = 1, NMICR.NFLTEN = 1).

### 13.7.3 Return from Snooze Mode

The ICU can return to Normal mode from Snooze mode using the interrupts provided for this mode.

To return to Normal mode from Snooze mode:

1. Set the number of the required interrupt request in SELSR0.SELS[8:0]
2. Set the value 0x2D (ICU\_SNZCANCEL) in IELSRn.IELS[4:0] (n = 0 to 95).
3. Select the CPU as the interrupt request destination.
4. Enable the interrupt in the NVIC.

Interrupt requests through the non-maskable that do not satisfy the above conditions are not detected while the clock is stopped in snooze mode.

Note: In Snooze mode, a clock is supplied to the ICU. If an event selected in IELSRn is detected, the CPU acknowledges the interrupt after returning to Normal mode from Software Standby mode. If an event selected in DELSRn is detected, the DMAC can acknowledge the interrupt after returning to Normal mode from Software Standby mode.

### 13.8 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

### 13.9 Reference

- ARM Limited., ARM<sup>®</sup> Cortex<sup>®</sup>-M33 Processor Technical Reference Manual (ARM 100230)

- 在NVIC中启用中断。

### 13.7.2 从软件待机模式返回

ICU使用不可屏蔽中断或可屏蔽中断从软件待机模式返回。取消源的可屏蔽中断见表13.4。

从软件待机模式返回:

- 1.选择允许从软件待机返回的中断源:
  - 对于不可屏蔽的中断,使用NMIER寄存器使能目标中断请求
  - 对于可屏蔽中断,使用WUPEN寄存器启用目标中断请求。
- 2.选择CPU作为中断请求目的地
- 3.在NVIC中启用中断。

不满足这些条件的通过IRQn引脚的中断请求在时钟停止时不会被检测到软件待机模式。

同样,无法检测到来自时钟在软件待机模式下停止的请求源的不可屏蔽中断请求。

#### 从软件待机模式转换

- 1.在进入软件待机模式之前,禁用作为返回目标的中断源的数字滤波器 (IRQCRI.FLTEN=0, NMICR.NFLTEN=0)。
- 2.要在从软件待机模式返回后再次使用数字滤波器,请启用数字滤波器 (IRQCRI.FLTEN=1, NMICR.NFLTEN=1)。

### 13.7.3 从贪睡模式返回

ICU可以使用为该模式提供的中断从贪睡模式返回到正常模式。

要从贪睡模式返回正常模式:

- 1.在SELSR0.SELS[8:0]中设置所需中断请求的数量
- 2.在IELSRn.IELS[4:0] (n=0到95) 中设置值0x2D(ICU\_SNZCANCEL)。
- 3.选择CPU作为中断请求目标。
- 4.在NVIC中启用中断。

当时钟在贪睡模式下停止时,不会检测到通过不可屏蔽的不满足上述条件的中断请求。

Note: 在贪睡模式下,向ICU提供时钟。如果检测到在IELSRn中选择的事件,CPU在从软件待机模式返回到正常模式后确认中断。如果检测到在DELSRn中选择的事件,则DMAC可以在从软件待机模式返回正常模式后确认中断。

### 13.8 将WFI指令与不可屏蔽中断一起使用

每当执行WFI指令时,请确认NMISR寄存器中的所有状态标志为0。

## 14.2 Description of Buses

### 14.2.1 Arbitration

For arbitration between masters in each slave, fixed-priority and round-robin methods can be selected for each master. For details, see section 14.3.3. BUSSCNT<slave> : Slave Bus Control Register (<slave> = FHBIU, FLBIU, S0BIU, EQBIU), section 14.3.4. BUSSCNT<slave> : Slave Bus Control Register (<slave> = PSBIU, PLBIU, PHBIU).

### 14.2.2 Parallel Operation

Parallel operation is possible when different bus-master modules are requesting access to different slave modules. For example, if the CPU is fetching an instruction from Code Flash and an operand from SRAM0, the DMAC can handle transfer between a peripheral module.

Figure 14.2 shows an example of parallel operations. In this example, the CPU uses code bus and system bus for simultaneous access to FHBIU and S0BIU, respectively. Furthermore, the DMAC/DTC simultaneously accesses the peripheral bus during access to FHBIU and S0BIU by the CPU.

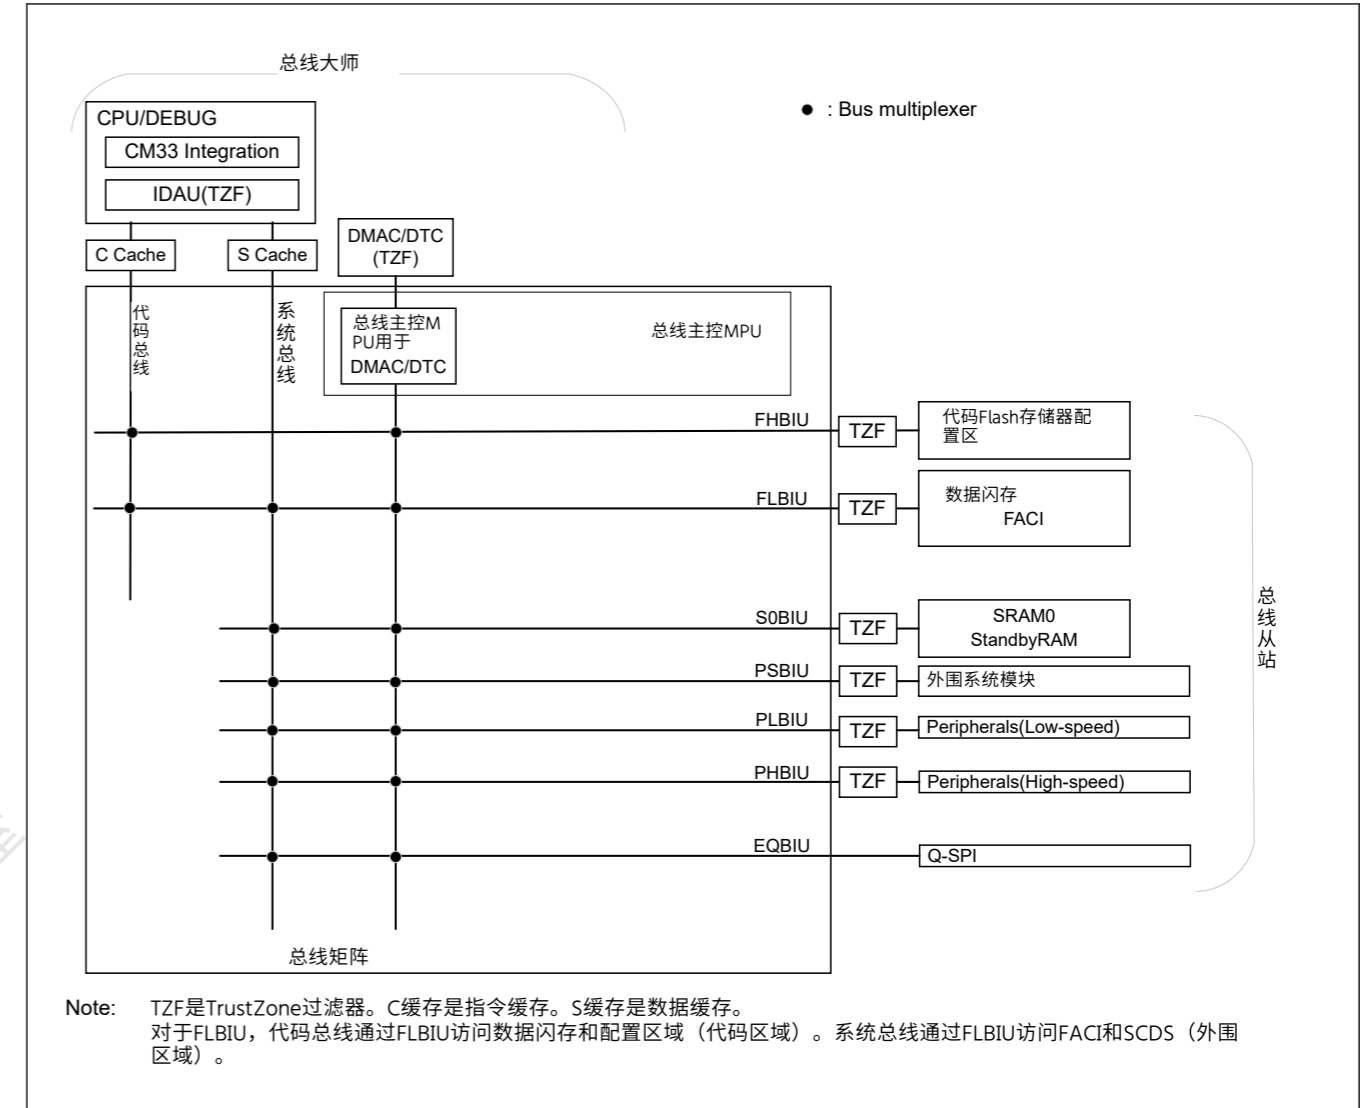

Figure 14.1 巴士连接

## 14.2 巴士的描述

### 14.2.1 Arbitration

对于每个从属设备中的主设备之间的仲裁，可以为每个主设备选择固定优先级和循环方法。详见14.3.3节。BUSSCNT<slave>：从总线控制寄存器（<slave>=FHBIU、FLBIU、S0BIU、EQBIU），第14.3.4节。BUSSCNT<slave>：从总线控制寄存器（<slave>=PSBIU、PLBIU、PHBIU）。

### 14.2.2 并行运行

当不同的总线主模块请求访问不同的从模块时，并行操作是可能的。例如，如果CPU从CodeFlash中获取指令并从SRAM0中获取操作数，则DMAC可以处理外设模块之间的传输。

图14.2显示了并行操作的示例。在本例中，CPU使用代码总线和系统总线分别同时访问FHBIU和S0BIU。此外，在CPU访问FHBIU和S0BIU期间，DMAC/DTC同时访问外围总线。

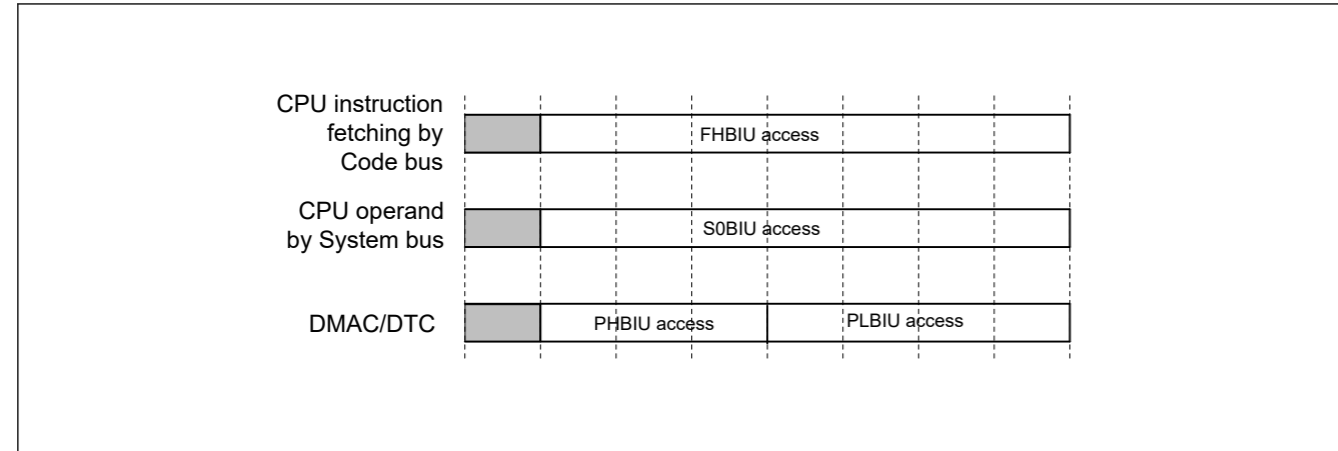

Figure 14.2 Example of Parallel Operations

### 14.2.3 Restrictions

#### (1) Restriction on Endian

Memory space must be little-endian in order to execute Cortex code.

#### (2) Bufferable write access

When CPU perform Bufferable Write access to PLBIU or PHBIU, if an STZF error occurs then the error response is invalidated. So there is no error flag will be set and no NMI / RESET request is generated.

When CPU perform Bufferable Write access to PHBIU, if a Slave BUS error occurs then the error response will become invalid and the error flag will not be set.

If error response is required, set the bus master to non-bufferable access.

#### (3) Access to reserved area of FLBIU and S0BIU

Access to the reserved area of FLBIU and S0BIU is prohibited. Operation is not guaranteed if accessed.

#### (4) Clock setting

The clock division ratio prohibits setting changes during bus access.

### 14.2.3 Restrictions

#### (1) 对字节序的限制

为了执行Cortex代码，内存空间必须是little-endian。

#### (2) 可缓冲的写访问

当CPU对PLBIU或PHBIU执行BufferableWrite访问时，如果发生STZF错误，则错误响应无效。因此不会设置错误标志，也不会生成NMIRESET请求。

当CPU对PHBIU执行BufferableWrite访问时，如果发生SlaveBUS错误，则错误响应将变为无效且错误标志不会被设置。

如果需要错误响应，请将总线主机设置为非缓冲访问。

#### (3) 访问FLBIU和S0BIU的保留区

禁止访问FLBIU和S0BIU的保留区域。如果访问，则无法保证操作。

#### (4) 时钟设置

时钟分频比禁止在总线访问期间更改设置。

每个BUS的连接见图14.1

当非法访问错误、主MPU错误和从总线错误同时发生时，STAT位仅按以下优先级顺序有效。左侧优先级更高。

MasterMPUError>Illegalaccesserror slavebuserror

Note: 非法访问错误和从总线错误不会同时发生。

一旦ILERRSTAT、MMERRSTAT或SLERRSTAT被设置，就不能被清除。

### 14.4 Bus Error Monitoring Section

The bus error monitoring system monitors each individual area, and when an error is detected, an error is returned to the requesting master IP using the AHB-Lite error response protocol.

#### 14.4.1 Bus Error Types

The following types of errors can occur on each bus:

- Illegal address access
- Bus master MPU error
- TrustZone Filter error
- Bus error transmitted from each slave IP

Table 14.2 lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU, see [section 15, Memory Protection Unit \(MPU\)](#).

#### 14.4.2 Operations When a Bus Error Occurs

When a bus error occurs, operation is not guaranteed and the error is returned to the requesting master IP.

Figure 14.3 shows operation from each error detection to user notification on the bus.

### 14.4 总线错误监控部分

总线错误监控系统监控每个单独的区域, 当检测到错误时, 使用AHB-Lite错误响应协议将错误返回给请求的主IP。

#### 14.4.1 总线错误类型

每条总线上都可能发生以下类型的错误:

- 非法地址访问
- 总线主控MPU错误
- TrustZone过滤器错误
- 从每个从IP传输的总线错误

表14.2列出了访问导致非法地址访问错误的地址范围。从机中的保留区域不会触发非法地址访问错误。有关总线主控MPU的更多信息, 请参阅第15节, 内存保护单元(MPU)。

#### 14.4.2 发生总线错误时的操作

当发生总线错误时, 无法保证操作, 错误会返回到请求的主IP。

图14.3显示了从每个错误检测到总线上的用户通知的操作。

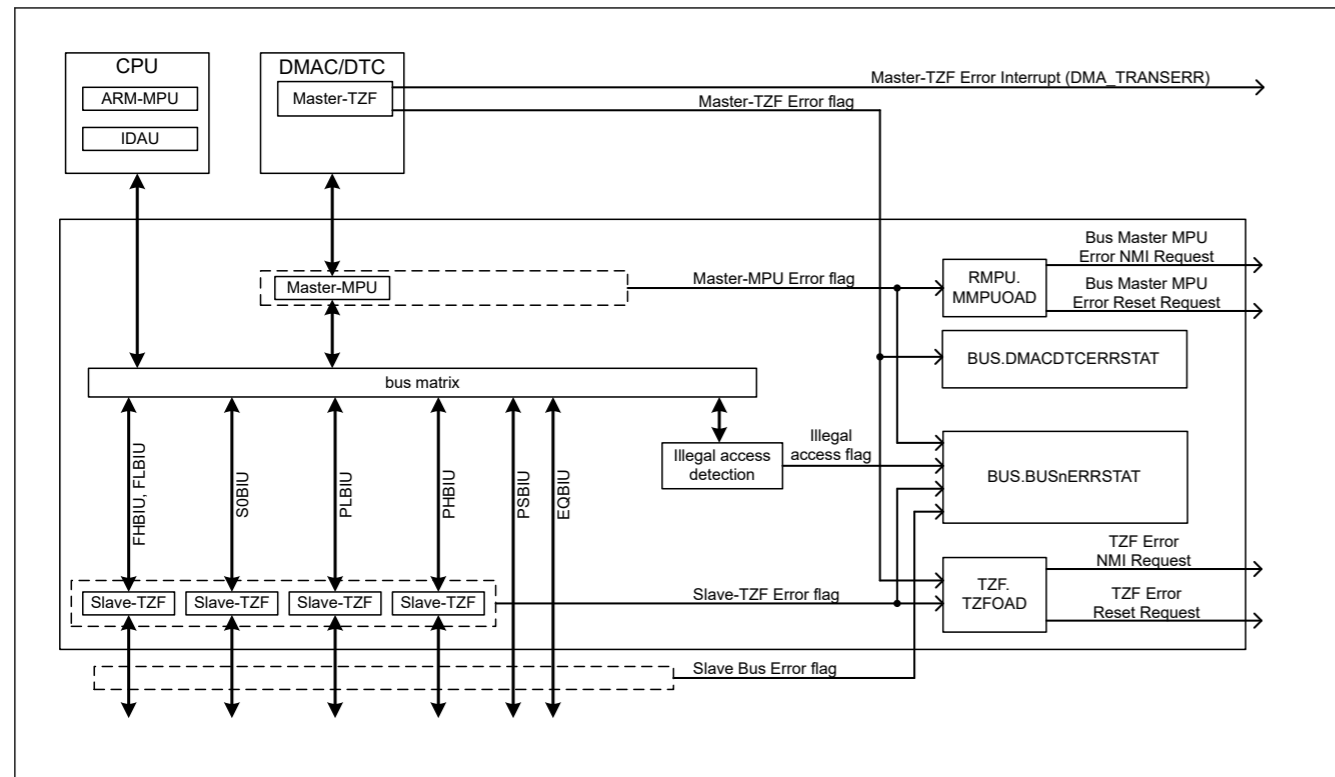

Figure 14.3 The operation from each error detection to user notification on the bus

### (1) Bus Master MPU Error

The bus master of DMAC/DTC has a master MPU for access control of the set address area. The CPU does not have a master MPU because it has an Arm MPU. When a bus master MPU error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 3).
2. Store the read/write information of the error in BUSnERRRW (n = 3).
3. Set 1 to MMERRSTAT bit of BUSnERRSTAT (n = 3).

An NMI request or a reset request is generated according to the MMPUOAD.OAD setting (see [section 15, Memory Protection Unit \(MPU\)](#)). Since BUSnERRADD (n = 3), BUSnERRRW (n = 3), and BUSnERRSTAT (n = 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 3), they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first bus master MPU error after a reset or clearing of BUSnERRSTAT.MMERRSTAT (n = 3) bit by BUSnERRCLR (n = 3).

### (2) Illegal Access Error

[section 14.4.3. Conditions Leading to Illegal Address Access Errors](#), describes illegal access errors. When an illegal access error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 1 to 3).
2. Store the read/write information of the error in BUSnERRRW (n = 1 to 3).
3. Set 1 to ILERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

NMI request and reset request are not generated. Since BUSnERRADD (n = 1 to 3), BUSnERRRW (n = 1 to 3), BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be confirmed in the Bus Fault handler or the interrupt handler.

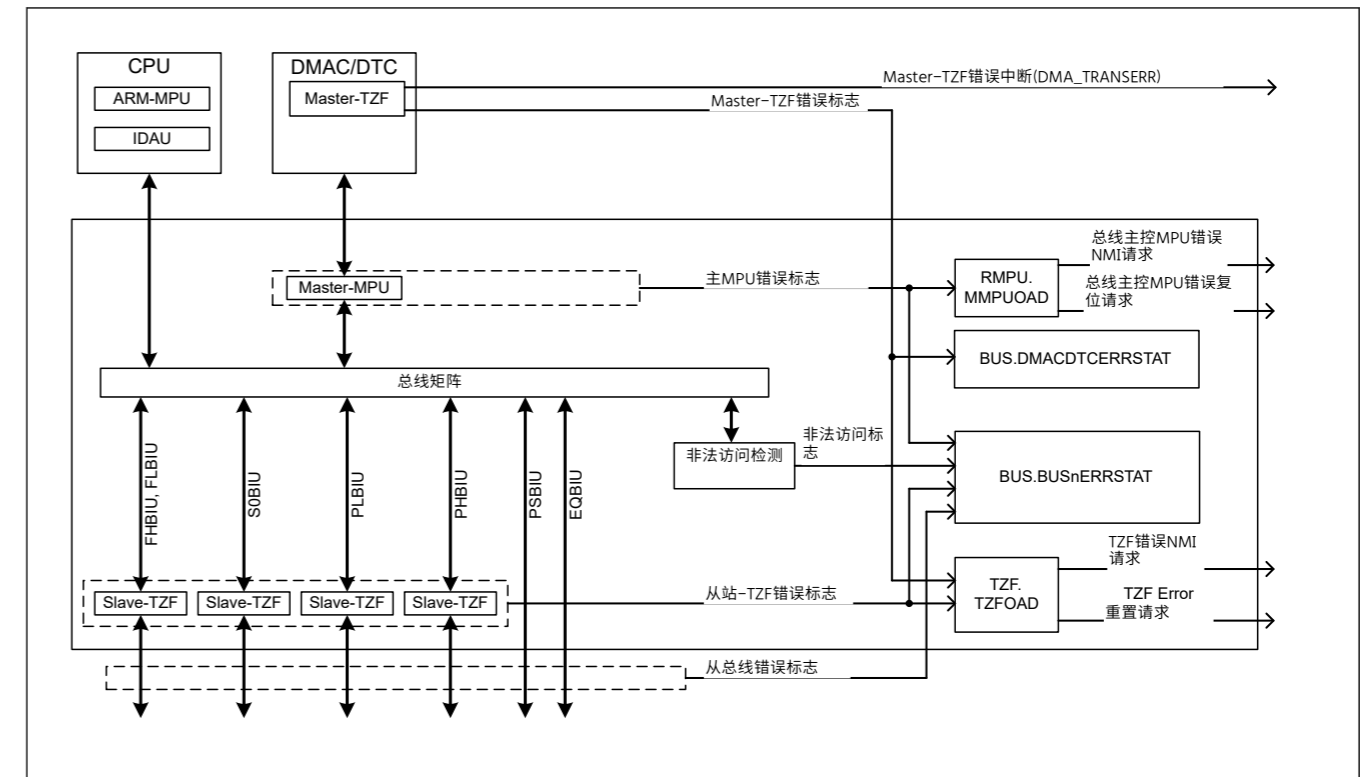

Figure 14.3 总线从每次错误检测到用户通知的操作

### (1) 总线主控MPU错误

DMACDTC的总线主控器有一个主控MPU，用于对设置的地址区域进行访问控制。CPU没有主MPU，因为它有一个ArmMPU。当检测到总线主控MPU错误时，会向主控返回错误响应。同时，执行以下步骤：

- 1.将错误地址存储在BUSnERRADD(n=3)中。
- 2.将错误的读写信息存入BUSnERRRW(n=3)。
- 3.将BUSnERRSTAT的MMERRSTAT位设置为1(n=3)。

根据MMPUOAD.OAD设置生成NMI请求或复位请求（参见第15节，内存保护单元（MPU））。由于BUSnERRADD(n=3)、BUSnERRRW(n=3)和BUSnERRSTAT(n=3)一直保持到除MPU和TZF相关复位之外的复位或被BUSnERRCLR(n=3)清除之前，它们可以在NMI中进行验证处理程序或重置后。

NMI请求仅在复位或清除后第一个总线主MPU错误时生成BUSnERRSTAT.MMERRSTAT(n=3)位由BUSnERRCLR(n=3)。

### (2) 非法访问错误

[第14.4.3节。导致非法地址访问错误的条件，描述非法访问错误。当检测到非法访问错误时，向主站返回错误响应。同时，执行以下步骤：](#)

- 1.将错误地址存储在BUSnERRADD (n=1到3) 中。
- 2.将错误的读写信息存入BUSnERRRW(n=1到3)。
- 3.将BUSnERRSTAT的ILERRSTAT位设置为1 (n=1到3) 。

不生成NMI请求和复位请求。由于BUSnERRADD (n=1到3)、BUSnERRRW (n=1到3)、BUSnERRSTAT(n=1到3)一直保持到除MPU和TZF相关的复位或被BUSnERRCLR(n=1到3)清除之前，它们可以在总线故障处理程序或中断处理程序中确认。

### (3) Master-TZF Error

As described in [section 46, Security Features](#), DMAC/DTC has Master-TZF errors. When a Master-TZF error is detected, 1 is set to MTERRSTAT bit of DMACDTCERRSTAT, and because the DMAC/DTC does not perform bus access, no bus error information is stored in BTZF3ERRADD and BTZF3ERRRW.

An NMI request or reset request is generated according to the setting of TZFOAD.OAD. See [section 16, DMA Controller \(DMAC\)](#), [section 17, Data Transfer Controller \(DTC\)](#) for details on Master-TZF errors. Because DMACDTCERRSTAT is held until reset other than MPU- and TZF-related resets or cleared by DMACDTCERRCLR, they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first Master-TZF error after reset or clearing of the DMACDTCERRSTAT.MTERRSTAT bit by DMACDTCERRCLR.

### (4) Slave-TZF Error

As described in [section 46, Security Features](#), FHBIU (code flash), FLBIU (data flash), SOBIU (SRAM), PHBIU and PLBIU have Slave-TZF errors. When a Slave-TZF error is detected, perform the following steps:

1. Store the address of the error in BTZFnERRADD (n = 1 to 3).
2. Store the read/write information of the error in BTZFnERRRW (n = 1 to 3).
3. Set 1 to STERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

NMI request or reset request is generated according to the setting in TZFOAD.OAD. Since BTZFnERRADD (n = 1 to 3), BTZFnERRRW (n = 1 to 3), and BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first Slave-TZF error after a reset or clearing of the BUSnERRSTAT.STERRSTAT (n = 1 to 3) bit by BUSnERRCLR (n = 1 to 3).

### (5) Slave Bus Error

Slave Bus Error occurs in the slave. When Slave Bus Error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 1 to 3)
2. Store the read/write information of the error in BUSnERRRW (n = 1 to 3)
3. Set 1 to SLERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

An NMI request and reset request are not generated. Since BUSnERRADD (n = 1 to 3), BUSnERRRW (n = 1 to 3), and BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be verified in the Bus Fault handler or interrupt handler. When a bus slave MPU error occurs, the error is returned to the requesting master IP and operation is not guaranteed.

## 14.4.3 Conditions Leading to Illegal Address Access Errors

[Table 14.2](#) lists the address spaces for each bus that trigger illegal address access errors.

**Table 14.2** Conditions leading to illegal address access errors (1 of 2)

| Address                    | Slave bus | Master bus |        |     |
|----------------------------|-----------|------------|--------|-----|
|                            |           | CPU        |        | DMA |
|                            |           | Code       | System |     |
| 0x0000_0000 to 0x01FF_FFFF | FHBIU     | —          |        | —   |
| 0x0200_0000 to 0x07FF_FFFF | Reserved  | E          |        | E   |
| 0x0800_0000 to 0x0803_FFFF | FLBIU     | —          |        | —   |
| 0x0804_0000 to 0x0FFF_FFFF | Reserved  | E          |        | E   |
| 0x1000_0000 to 0x100F_FFFF | Reserved  | —          |        | E   |
| 0x1010_0000 to 0x1FFF_FFFF | Reserved  | E          |        | E   |

### (3) Master-TZF Error

如第46节“安全特性”中所述，DMACDTC存在Master-TZF错误。当检测到Master-TZF错误时，将DMACDTCERRSTAT的MTERRSTAT位设置为1，并且由于DMACDTC不执行总线访问，因此BTZF3ERRADD和BTZF3ERRRW中不存储总线错误信息。

根据TZFOAD.OAD的设置生成NMI请求或复位请求。有关Master-TZF错误的详细信息，请参见第16节，DMA控制器(DMAC)，第17节，数据传输控制器(DTC)。因为除了MPU和TZF相关的复位或由DMACDTCERRCLR清除之外，DMACDTCERRSTAT一直保持到复位，所以可以在NMI处理程序中或在复位后对其进行验证。

NMI请求仅在复位或清除后第一个Master-TZF错误时生成DMACDTCERRCLR的DMACDTCERRSTAT.MTERRSTAT位。

### (4) Slave-TZF Error

如第46节所述，安全功能、FHBIU（代码闪存）、FLBIU（数据闪存）、SOBIU（SRAM）、PHBIU和PLBIU有Slave-TZF错误。当检测到Slave-TZF错误时，执行以下步骤：

- 1.将错误地址存储在BTZFnERRADD(n=1to3)中。
- 2.将错误的读写信息存入BTZFnERRRW(n=1to3)。
- 3.将BUSnERRSTAT的STERRSTAT位设置为1 (n=1至3)。

根据TZFOAD.OAD中的设置生成NMI请求或复位请求。由于BTZFnERRADD(n=1到3)、BTZFnERRRW(n=1到3)和BUSnERRSTAT(n=1到3)被保持到除MPU和TZF相关的复位或被BUSnERRCLR(n=1到3)清除之前，它们可以在NMI处理程序中或在重置后进行验证。

NMI请求仅在BUSnERRCLR (n=1至3) 复位或清除BUSnERRSTAT.STERRSTAT (n=1至3) 位后的第一个Slave-TZF错误时生成。

### (5) 从总线错误

从站总线错误发生在从站。当检测到从站总线错误时，将向主站返回错误响应。同时，执行以下步骤：

- 1.将错误的地址存储在BUSnERRADD(n=1to3)
- 2.将错误的读写信息存入BUSnERRRW(n=1to3)
- 3.将BUSnERRSTAT的SLERRSTAT位设置为1 (n=1至3)。

不会生成NMI请求和复位请求。由于BUSnERRADD(n=1到3)、BUSnERRRW(n=1到3)和BUSnERRSTAT(n=1到3)一直保持到除MPU和TZF相关复位之外的复位或被BUSnERRCLR(n=1到3)清除之前，它们可以在总线故障处理程序或中断处理程序中进行验证。当发生总线从MPU错误时，错误将返回到请求的主IP，并且无法保证操作。

## 14.4.3 导致非法地址访问错误的条件

[表14.2](#)列出了触发非法地址访问错误的每条总线的地址空间。

**Table 14.2** 导致非法地址访问错误的条件(1of2)

| Address                    | 从总线      | 主总线  |        |     |

#### 14.4.4 Time-out

For some peripheral modules, a timeout error occurs with the module-stop function. When there is no response from the slave for a certain period of time, a timeout error is detected. A timeout error is returned to the requesting master IP using the AHB-Lite error response protocol.

### 14.6 Cache

#### 14.6.1 Overview

There are two types of caches:

- C-cache on code bus
- S-cache on system bus.

Table 14.3 lists the specifications of the cache, Figure 14.4 shows a block diagram of the cache, and Figure 14.5 shows the cache structure in details.

**OAD bit (Operation after Detection)**

The OAD bit generates either a reset or a non-maskable interrupt when parity error is detected.

The protection register (CAPRCR) protects this register against writes. Modify the valid bit in the protection register (CAPRCR) to enable before writing to this bit. Do not write to CAPOAD while access to cache is in progress.

保护寄存器(CAPRCR)保护该寄存器不被写入。在写入该位之前修改保护寄存器(CAPRCR)中的有效位以使用。在访问缓存的过程中不要写入CAPOAD。

**14.6.2.9 CAPRCR:缓存保护寄存器**

Base address: CACHE = 0x4000\_7000

- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

**PRCR bit (Register Write Control)**

The PRCR bit controls the write mode of the CAPOAD register. When this bit is set to 1, writing to the CAPOAD register is enabled. When writing to this bit, write 0x78 to the KW[6:0] bits simultaneously.

**KW[6:0] bits (Write key code)**

The KW[6:0] bits enable or disable writes to the PRCR bit. When writing to the PRCR bit, write 0x78 to the KW[6:0] bits simultaneously. When a value other than 0x78 is written to KW[6:0] bits, the PRCR bit is not updated. The KW[6:0] bits are always read as 0x00.

14.6.3 Operation

14.6.3.1 S-Cache

Figure 14.6 shows the access flow from CPU to S-cache.

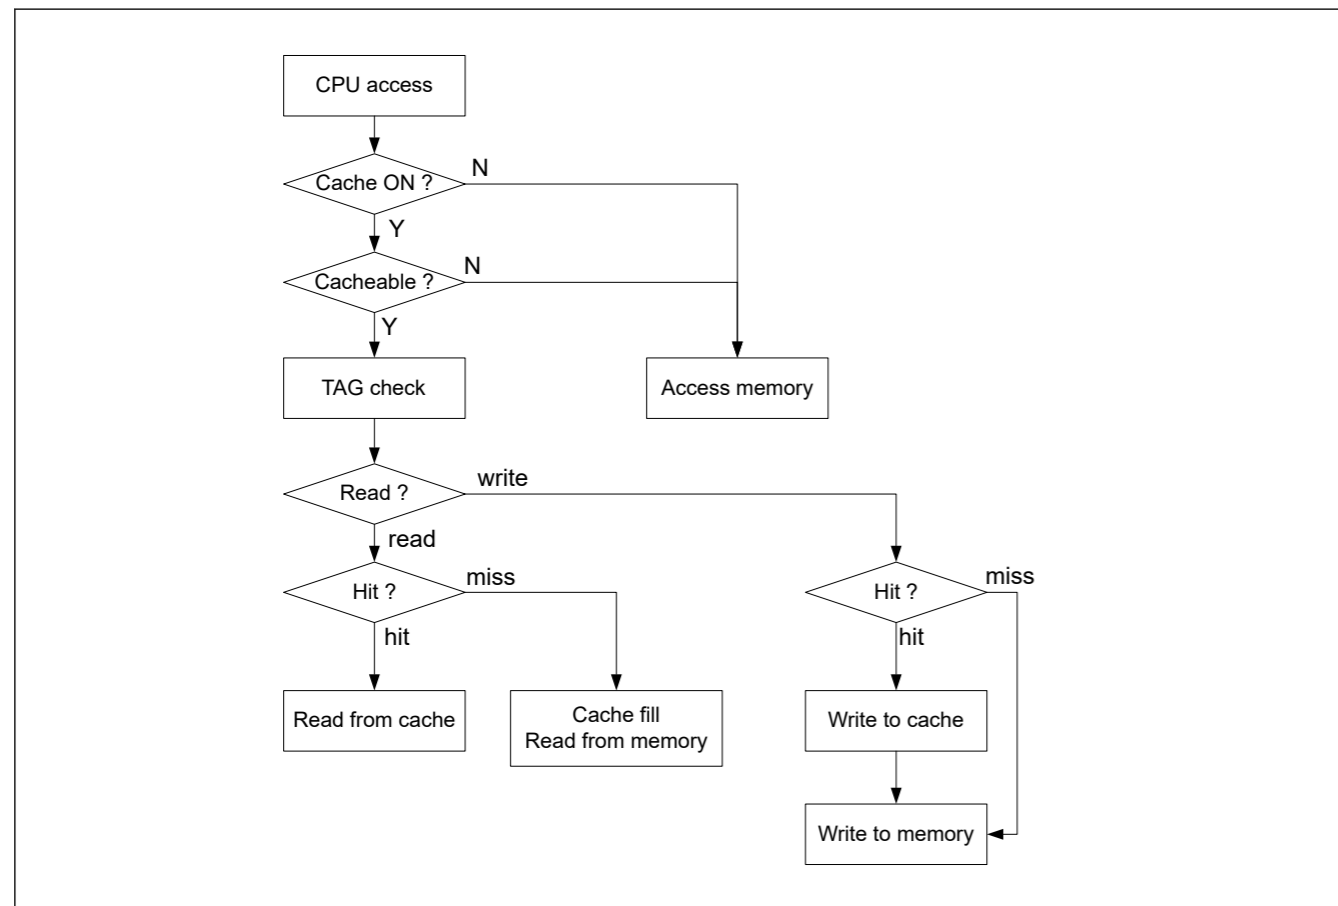

Figure 14.6 Access flow from CPU to S-cache

The cache function works when cache is enabled (CACTL.ENS = 1) and cacheable access is from CPU. The cache checks the address of CPU access request and request in cache tag, then determines whether the CPU access is a hit or a miss-hit.

| Bit  | Symbol | Function         | R/W |
|------|--------|------------------|-----|
| 31:8 | —      | 这些位被读取为0。写入值应为0。 | R/W |

Note: 如果安全属性配置为安全:

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全:

- 允许安全和非安全访问。

**PRCR位 (寄存器写控制)**

PRCR位控制CAPOAD寄存器的写模式。当该位设置为1时, 允许写入CAPOAD寄存器。写入该位时, 同时将0x78写入KW[6:0]位。

**KW[6:0]位 (写键码)**

KW[6:0]位启用或禁用对PRCR位的写入。写入PRCR位时, 同时将0x78写入KW[6:0]位。当将0x78以外的值写入KW[6:0]位时, PRCR位不会更新。KW[6:0]位总是被读取为0x00。

14.6.3 Operation

14.6.3.1 S-Cache

图14.6显示了从CPU到S-cache的访问流程。

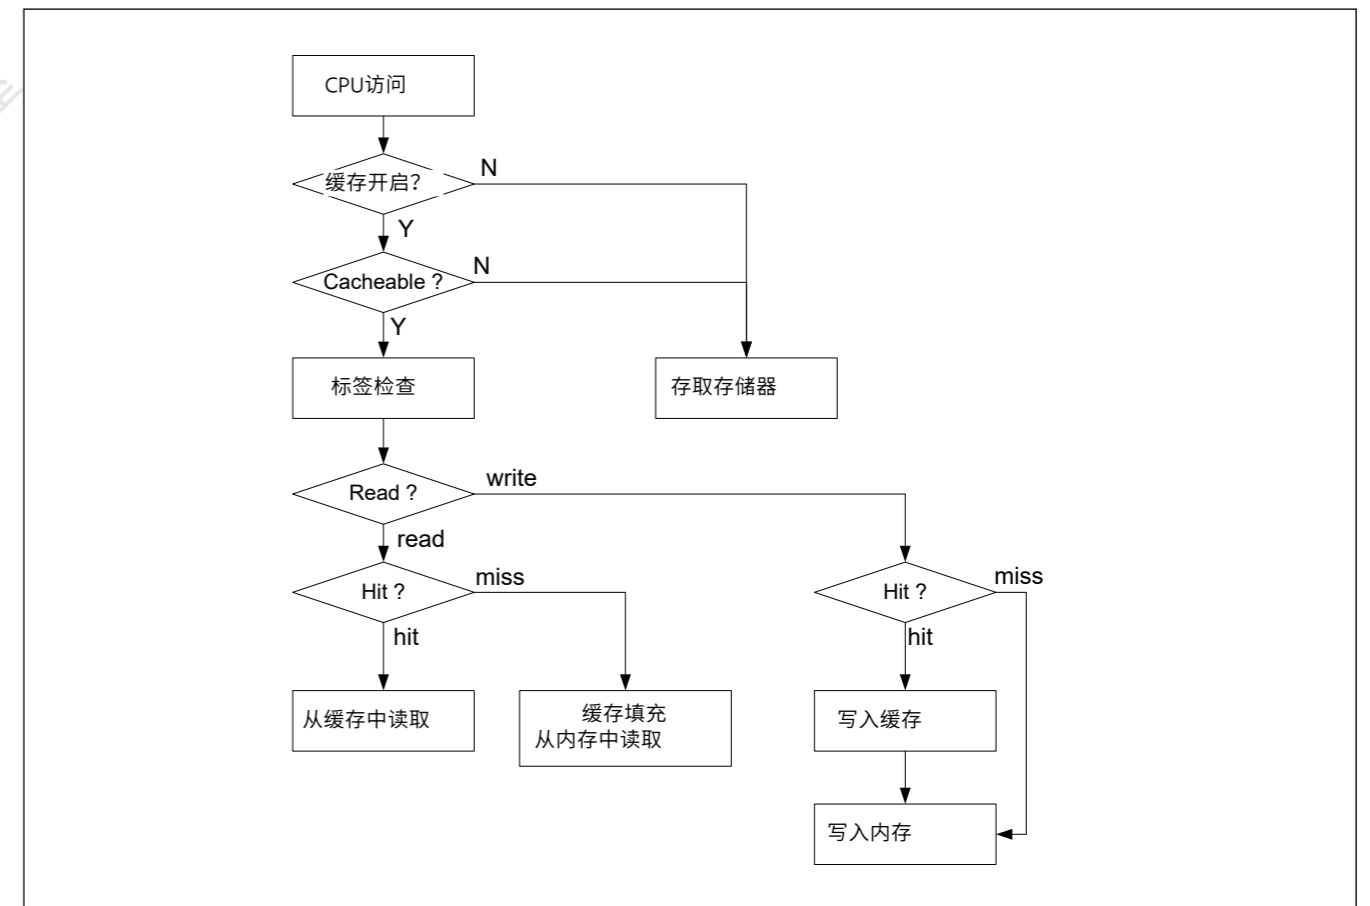

Figure 14.6 从CPU到S-cache的访问流程

缓存功能在启用缓存(CACTL.ENS=1)且可缓存访问来自CPU时起作用。缓存检查CPU访问请求的地址和缓存标签中的请求, 然后确定CPU访问是命中还是未命中。

**Read miss**

The cache reads one cache line data from memory and stores it into the cache data. The cache then returns the required data to CPU.

**Read hit**

The cache reads required data from the cache data and returns it to CPU. Access cycle then determines it is a hit because of the 0 wait cycle.

**Write miss**

The cache processes only a write cycle to memory. No affect to cache data.

**Write hit**

The cache processes both a write cycle to cache data and a write cycle to memory.

**14.6.3.2 C-Cache**

Figure 14.7 shows the access flow from CPU to C-cache.

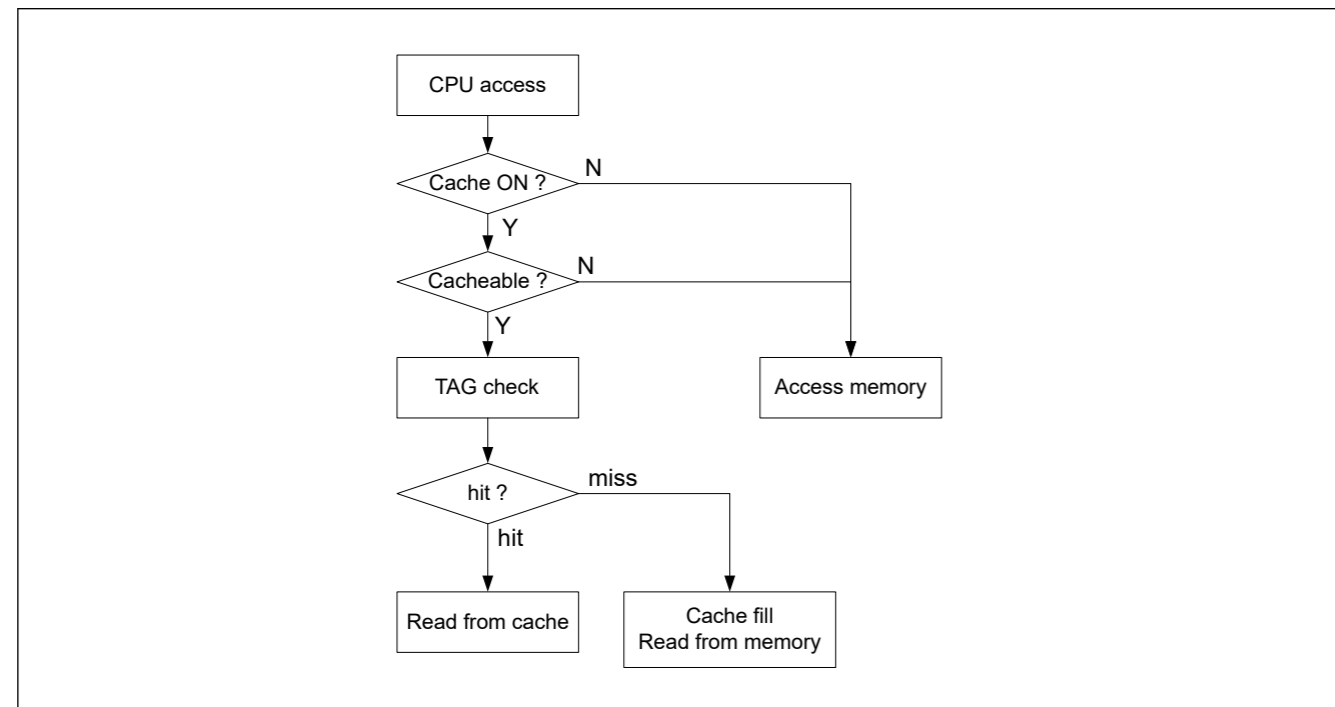

Figure 14.7 Access flow from CPU to C-cache

The cache function works when cache is enabled (CACTL.ENC = 1) and cacheable access is from CPU. The cache checks the address of CPU access request and request in cache tag, then determines whether the CPU access is a hit or a miss-hit.

**Read miss**

The cache reads one cache line data from memory and stores it into the cache data. The cache then returns the required data to CPU.

**Read hit**

The cache reads required data from the cache data and returns it to CPU. Access cycle then determines it is a hit because of the 0 wait cycle.

Because C-cache does not function in the ROM area of C-cache, therefore it operates in read-only access.

**14.6.3.3 Cache Flush**

The Valid bit is cleared with the CAFCT register. However, tag and cache data are not affected by the CAFCT register.

**读未读**

高速缓存从内存中读取一个高速缓存行数据并将其存储到高速缓存数据中。然后缓存将所需的数据返回给CPU。

**阅读命中**

缓存从缓存数据中读取需要的数据并返回给CPU。然后访问周期确定它是命中，因为等待周期为0。

**写小姐**

高速缓存仅处理对内存的写周期。不影响缓存数据。

**写命中**

高速缓存处理缓存数据的写周期和存储器的写周期。

**14.6.3.2 C-Cache**

图14.7显示了从CPU到C-cache的访问流程。

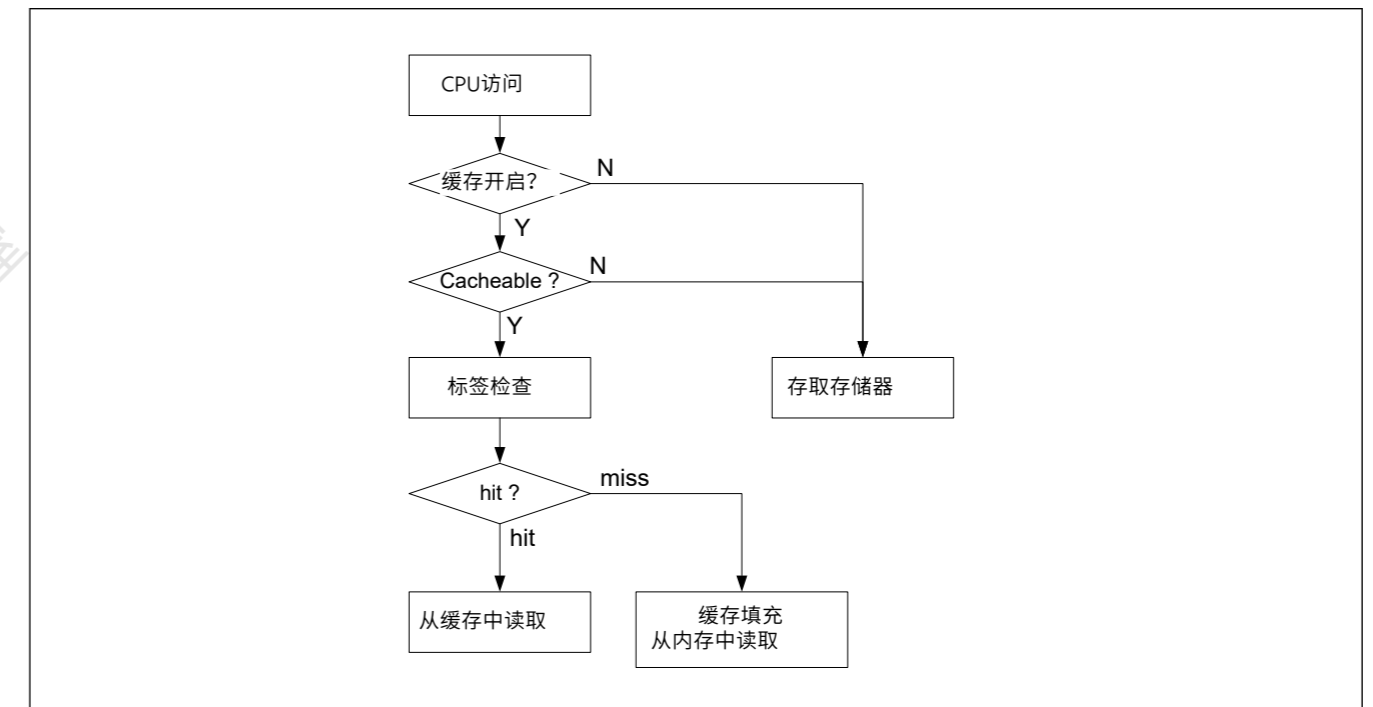

Figure 14.7 从CPU到C-cache的访问流程

缓存功能在启用缓存(CACTL.ENC=1)且可缓存访问来自CPU时起作用。缓存检查CPU访问请求的地址和缓存标签中的请求，然后确定CPU访问是命中还是未命中。

**读未读**

高速缓存从内存中读取一个高速缓存行数据并将其存储到高速缓存数据中。然后缓存将所需的数据返回给CPU。

**阅读命中**

缓存从缓存数据中读取需要的数据并返回给CPU。然后访问周期确定它是命中，因为等待周期为0。

由于C-cache在C-cache的ROM区域中不起作用，因此它以只读访问方式运行。

**14.6.3.3 缓存刷新**

有效位通过CAFCT寄存器清零。但是，标签和缓存数据不受 CAFCT寄存器的影响。

The valid bit is also cleared when CACTL is set from 0 to 1.

Note: After changing the cacheable attribute by the Arm MPU, clear the valid bit using the CAFCT register.

#### 14.6.3.4 LRU and Replace

The cache uses LRU (Least Recently Used) mechanism as the cache replacement algorithm. If a CPU access is determined as a hit or a miss-hit, the cache replaces cache data that is not the last restored. Additionally, the cache is tagged as the latest data in LRU of the cache data. Therefore even when the cache line in cache ways are full, the cache can replace cache data using LRU which shows older data.

The algorithm for a 2-way LRU shows which way, for example way 0 or way 1, is the latest stored.

#### 14.6.3.5 Parity Check

The cache has a parity check function for cache RAM that is stored as cache fill data. The cache has 4-bit parities for 32-bit data, that is when data is read, a parity bit is added to every 8-bit data of 32-bit data width. When the cache reads data with a hit status, it checks for parity errors. When a parity error occurs, a parity error notification is generated.

The cache reads 32-bit data even when the CPU requests a byte read or half-word read.

Note: A parity error might occur even though it is caused by a non validated-data byte of which the CPU does not request.

Parity error notification can be specified as a non-maskable interrupt or a reset request in the CAPOAD register. However, if the debug mode requests to suppress the parity error notification, then notification is not generated.

When a parity error occurs, the cache does not perform a cache flush and does not respond to the CPU with a bus error.

Parity errors often occur due to noise. To confirm whether the cause of the parity error is noise or corruption, see the flows for cache parity check in Figure 14.8 and Figure 14.9.

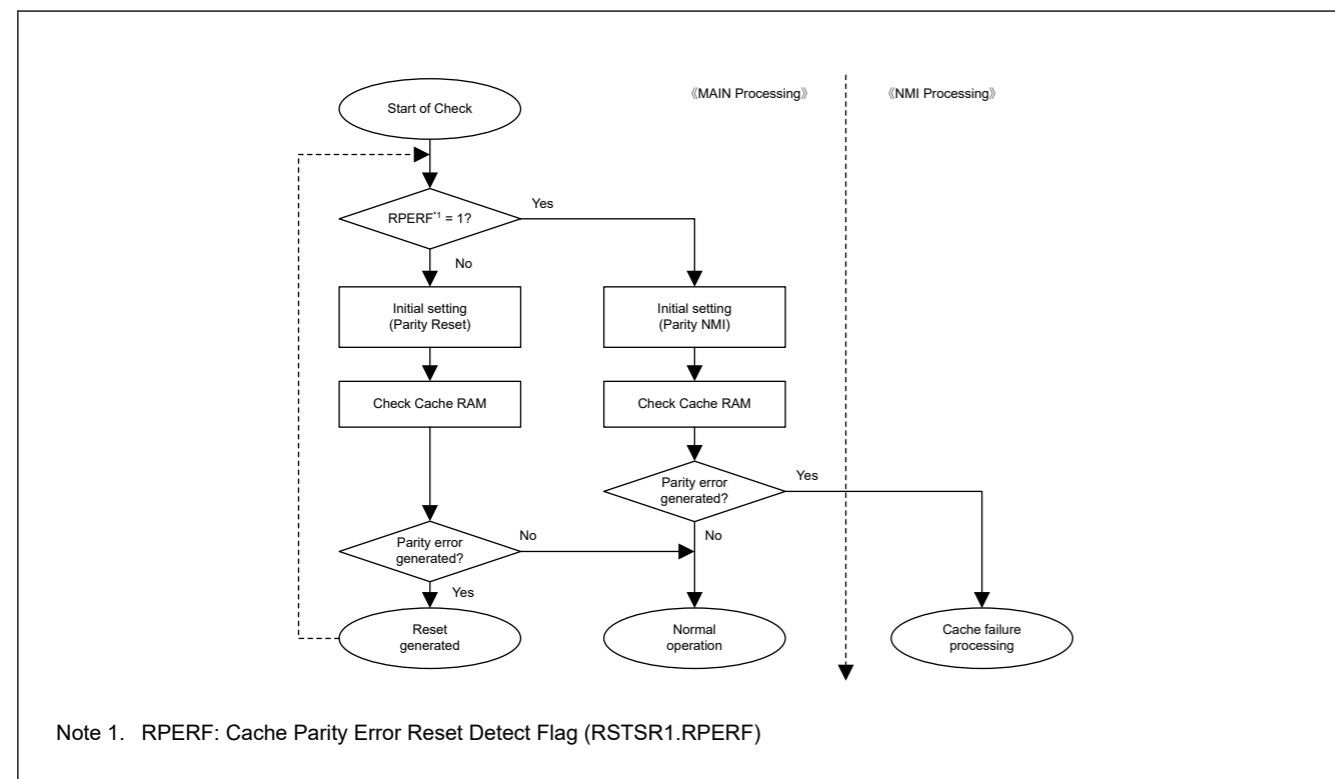

Figure 14.8 Flow of cache parity check when parity reset is enabled

当CACTL从0设置为1时，有效位也会被清除。

Note: 通过ArmMPU更改可缓存属性后，使用CAFCT寄存器清除有效位。

#### 14.6.3.4 LRU和替换

缓存使用LRU（最近最少使用）机制作为缓存替换算法。如果CPU访问被确定为命中或未命中，则缓存替换不是最后恢复的缓存数据。另外，缓存被标记为缓存数据的LRU中的最新数据。因此，即使缓存路中的缓存行已满，缓存也可以使用显示较旧数据的LRU替换缓存数据。

2路LRU的算法显示了最新存储的路，例如路0或路1。

#### 14.6.3.5 奇偶校验

高速缓存具有用于存储为高速缓存填充数据的高速缓存RAM的奇偶校验功能。高速缓存对于32位数据有4位奇偶校验，即在读取数据时，每32位数据宽度的8位数据添加一个奇偶校验位。当缓存读取具有命中状态的数据时，它会检查奇偶校验错误。当发生奇偶校验错误时，会生成奇偶校验错误通知。

即使CPU请求字节读取或半字读取，缓存也会读取32位数据。

Note: 即使奇偶校验错误是由CPU未请求的未经验证的数据字节引起的，也可能发生奇偶校验错误。

奇偶校验错误通知可以指定为不可屏蔽中断或CAPOAD寄存器中的复位请求。但是，如果调试模式请求抑制奇偶校验错误通知，则不会生成通知。

当发生奇偶校验错误时，缓存不会执行缓存刷新，也不会以总线错误响应CPU。

奇偶校验错误经常由于噪声而发生。要确认奇偶校验错误的原因是噪声还是损坏，请参见图14.8和图14.9中的缓存奇偶校验流程。

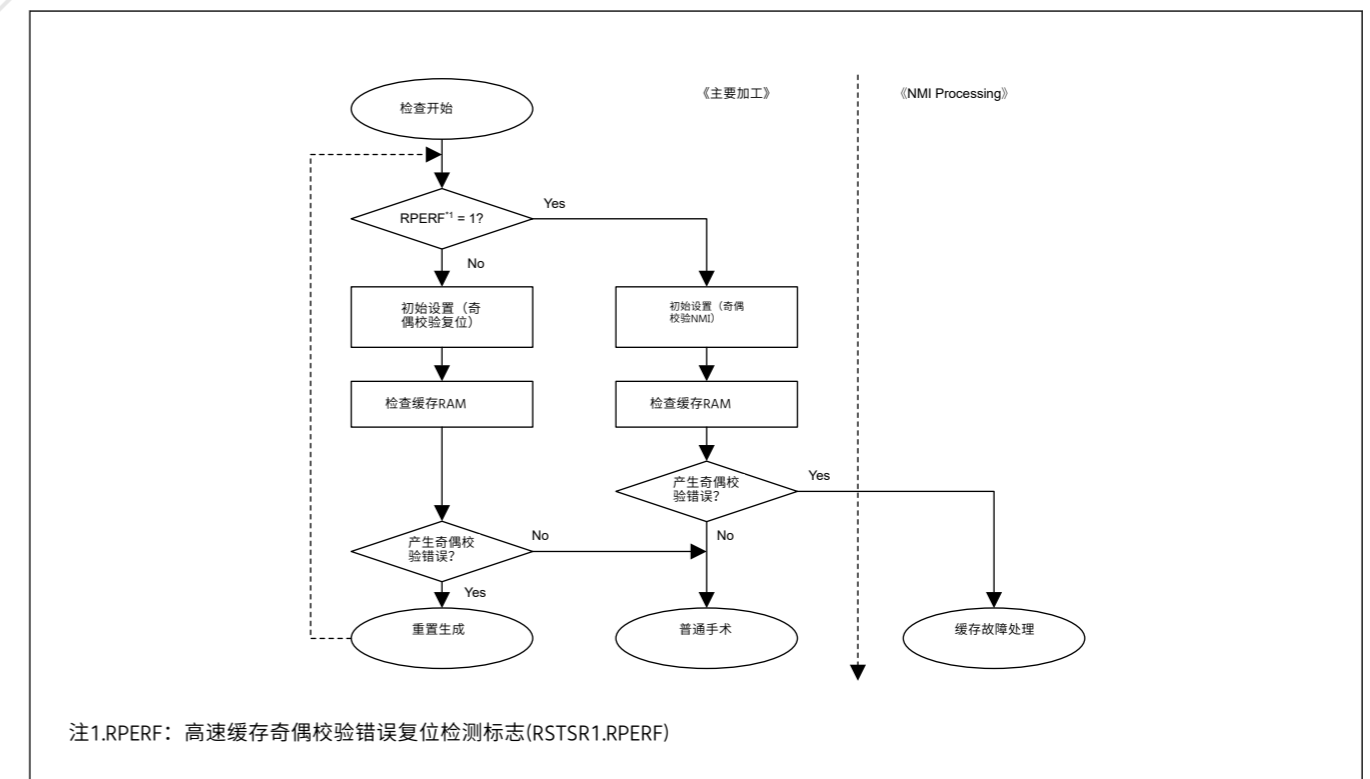

Figure 14.8 启用奇偶校验时的缓存奇偶校验流程

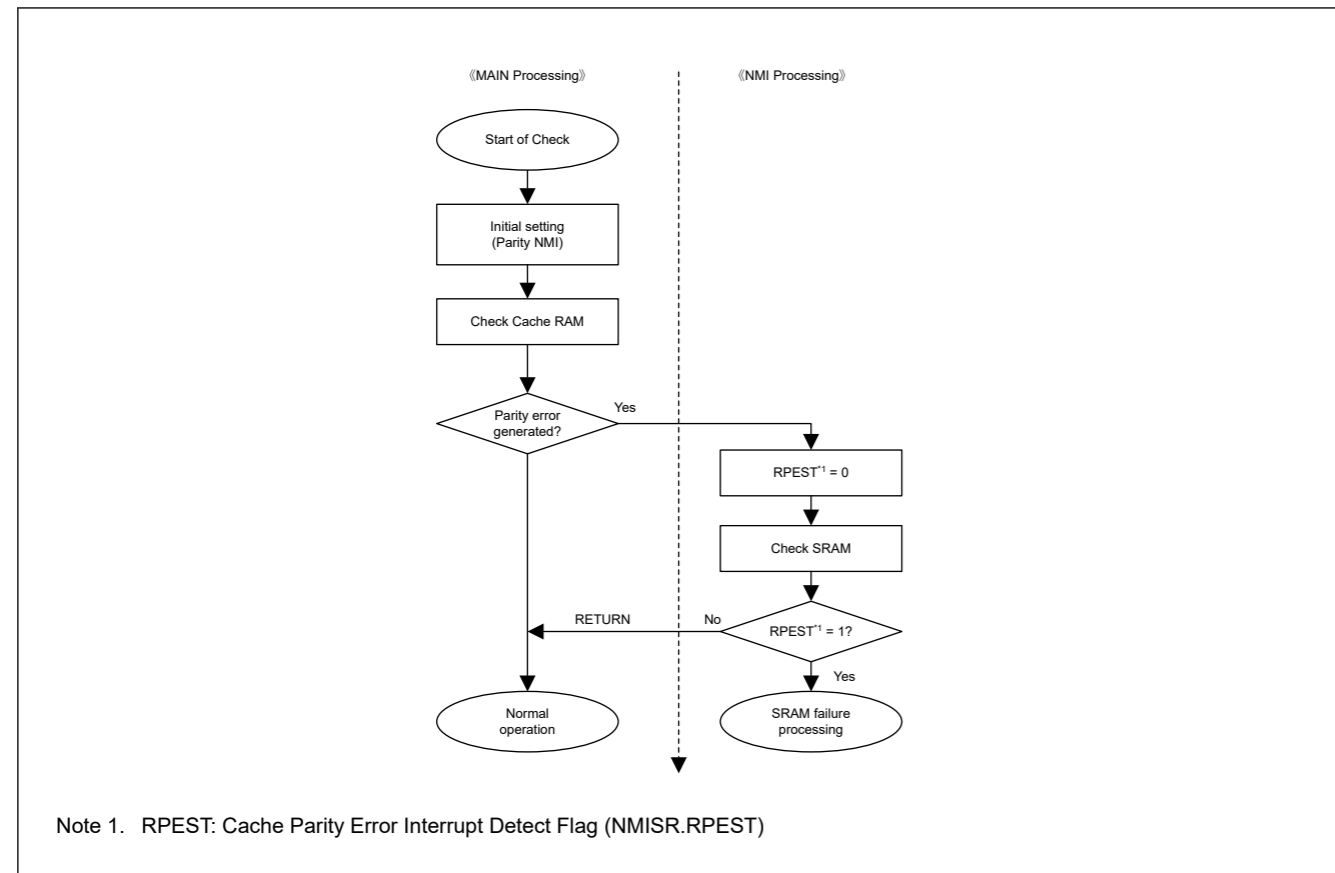

Figure 14.9 Flow of cache parity check when parity interrupt is enabled

#### 14.6.3.5.1 Cache RAM Check

Parity error of cache RAM occurs at a read access by CPU with a cache status of read-hit. With a read-hit status, some conditions are required before performing a cache RAM check. For S-cache check, execute the check program in flash memory. For C-cache check, execute the check program in SRAM or external memory.

##### (1) Cache RAM check flow

1. Flush all valid bits in cache to clear the cache enable bit.
2. Reserve a 2-KB work memory such as SRAM or external memory for S-cache. Because each cache in the MCU is a 2-way set associative with 1 KB RAM per way, a total of 2 KB is required for S-cache. The target address should not be used as reserved area.
3. Set the cache enable to 1.
4. Read data from the target word address of 2 KB using the CPU. The status of cache should be a read-miss with the result stored as cache fill data.
5. Read data in another cache way whose address is calculated by adding the address in step 4. with 1 KB address. The status of cache should be a read-miss with the result stored as cache fill data in another way. Cache RAM check for a write/read-hit status is now complete.
6. Write test data to the target word address in steps 4. and 5.. The status of cache in steps 4. and 5. should be a write-hit with the results written to the cache RAM.
7. Read from the target word address in steps 4. and 5. again. The status of cache in steps 4. and 5. should be a read-hit. Parity check for a word data is now complete.
8. Go to step 1. to continue parity check for different target addresses.

#### 14.6.3.6 Bus Error

The association from a bus slave to a bus error is described in the sections that follow.

##### In cache off

The cache returns a bus error to the CPU.

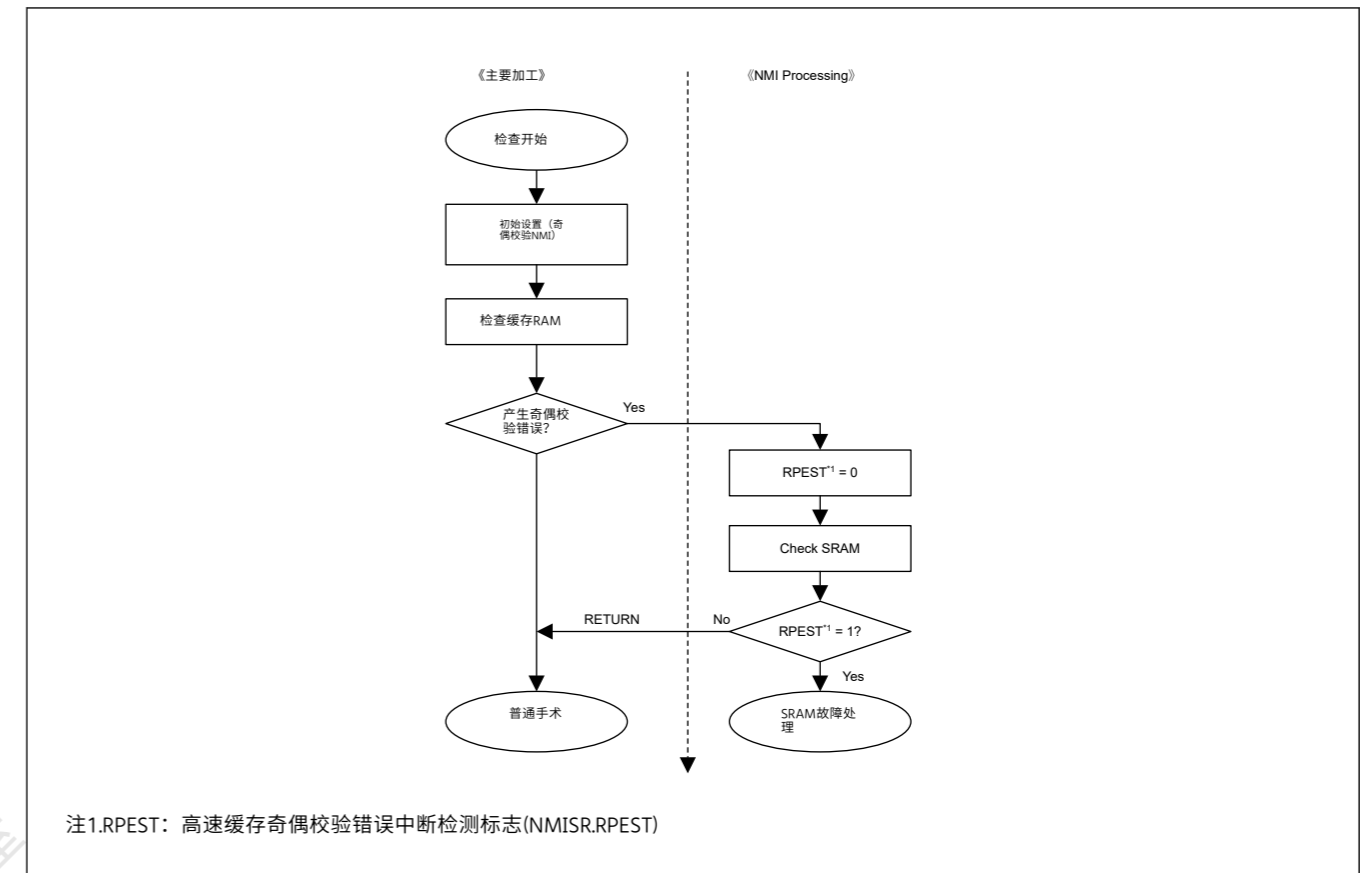

Figure 14.9 启用奇偶校验中断时的缓存奇偶校验流程

#### 14.6.3.5.1 缓存RAM检查

高速缓存RAM的奇偶校验错误发生在CPU读取访问时，高速缓存状态为read-hit。对于读取命中状态，在执行高速缓存RAM检查之前需要一些条件。对于S-cache检查，执行闪存中的检查程序。对于C-cache检查，在SRAM或外部存储器中执行检查程序。

##### (1) 缓存RAM检查流程

- 1.刷新缓存中的所有有效位以清除缓存启用位。
- 2.为S-cache预留2KB的工作存储器，例如SRAM或外部存储器。因为MCU中的每个缓存都是2way组，每路1KBRAM，所以S-cache总共需要2KB。目标地址不应用作保留区。
- 3.将缓存使能设置为1。
- 4.使用CPU从2KB的目标字地址读取数据。缓存的状态应该是读未命中，结果存储为缓存填充数据。
- 5.以另一种缓存方式读取数据，其地址是通过将步骤4中的地址与1KB地址相加计算出来的。缓存的状态应该是读未命中，结果以另一种方式存储为缓存填充数据。写读命中状态的高速缓存RAM检查现已完成。
- 6.在步骤4.和5.中将测试数据写入目标字地址。步骤4.和5.中的缓存状态应该是写入命中，结果写入缓存RAM。
- 7.再次从步骤4.和5.中的目标字地址读取。第4步和第5步中缓存的状态应该是读取命中。单词数据的奇偶校验现已完成。
- 8.转到步骤1.继续对不同的目标地址进行奇偶校验。

#### 14.6.3.6 总线错误

从总线从站到总线错误的关联将在后面的部分中描述。

##### 在缓存关闭

高速缓存将总线错误返回给CPU。

**For non-cacheable access**

The cache returns a bus error to the CPU.

**During read accesses for cache fill**

For the first data that corresponds to a CPU access request, the cache returns a bus error to the CPU. For other read data while filling the cache line, the cache cannot return a bus error to the CPU except for read data with early forwarding. The cache enable bit clears the cache line if the cache accepts a bus error response from the slave.

**For write-hit status**

The cache cannot return a bus error to the CPU because the cache enable bit does not clear the cache line.

**For write-miss status**

The cache cannot return a bus error to the CPU.

**14.6.3.7 Early Forwarding Function**

While filling data in the cache, if the address of the CPU read request and the address of the cache fill request are the same, the cache returns the data to CPU. Table 14.4 shows an example.

**Table 14.4 Example of early forwarding**

| Operation                   | Access sequence |             |             |      |             |      |      |      |   |             |
|-----------------------------|-----------------|-------------|-------------|------|-------------|------|------|------|---|-------------|
| Address of CPU read request | 0x04            | 0x08        | 0x0C        | 0x14 | →           | 0x10 | →    | →    | → |             |
| Address of cache fill       | 0x04            | 0x08        | 0x0C        | 0x10 | 0x14        | 0x18 | 0x1C | 0x00 | — |             |
| CPU access status           | Read (0x04)     | Read (0x08) | Read (0x0C) | —    | Read (0x14) | —    | —    | —    | — | Read (0x10) |

When the CPU requests read accesses and the addresses are 0x04, 0x08, 0x0C, 0x14 and 0x10 sequentially, the first read access to address 0x04 is of a miss-hit status and the cache starts to fill data into cache. The early forwarding function allows a return of read data to CPU when accesses are to addresses 0x08, 0x0C and 0x14 while the cache is filling the cache line. On the other hand, access to address 0x10 must wait for the completion of filling the cache line. The cache then returns data for address 0x10 when it finished filling the cache line.

**14.6.4 Usage Notes****14.6.4.1 Cache Line Configuration Register**

Writes to the Cache Line Configuration Register are allowed when the status is cache off (CACTL.ENS = 0 for S-cache, CACTL.ENC = 0 for C-cache).

**14.6.4.2 Coherency**

The coherency between the cache and the external memory / internal SRAM must be guaranteed by software.

When allocating shared memory between the CPU and a bus master such as DMAC in the cache support area, invalidate the cache data as necessary.

**对于不可缓存的访问**

高速缓存将总线错误返回给CPU。

**在缓存填充的读取访问期间**

对于与CPU访问请求对应的第一个数据，缓存将总线错误返回给CPU。对于其他在填充高速缓存行时读取的数据，除了提前转发的读取数据外，高速缓存不能向CPU返回总线错误。如果缓存接受来自设备的总线错误响应，缓存使能位清除缓存行。

**对于写命中状态**

高速缓存无法向CPU返回总线错误，因为高速缓存启用位不会清除高速缓存行。

**对于写未命中状态**

高速缓存不能将总线错误返回给CPU。

**14.6.3.7 提前转发功能**

在缓存中填充数据时，如果CPU读取请求的地址和缓存填充请求的地址相同，则缓存将数据返回给CPU。表14.4显示了一个示例。

**Table 14.4 提前转发示例**

| Operation | 访问顺序        |             |             |      |             |      |      |      |   |             |
|-----------|-------------|-------------|-------------|------|-------------|------|------|------|---|-------------|
| CPU读请求地址  | 0x04        | 0x08        | 0x0C        | 0x14 | →           | 0x10 | →    | →    | → |             |
| 缓存填充地址    | 0x04        | 0x08        | 0x0C        | 0x10 | 0x14        | 0x18 | 0x1C | 0x00 | — |             |
| CPU访问状态   | Read (0x04) | Read (0x08) | Read (0x0C) | —    | Read (0x14) | —    | —    | —    | — | Read (0x10) |

当CPU请求读访问，地址依次为0x04、0x08、0x0C、0x14和0x10时，对地址0x04的第一次读访问为未命中状态，缓存开始将数据填充到缓存中。早期转发功能允许在高速缓存填充高速缓存行时访问地址0x08、0x0C和0x14时将读取数据返回到CPU。另一方面，对地址0x10的访问必须等待缓存行的填充完成。然后，缓存在完成填充缓存行后返回地址0x10的数据。

**14.6.4 使用说明****14.6.4.1 高速缓存行配置寄存器**

当状态为高速缓存关闭时，允许写入高速缓存行配置寄存器（对于S-cache，CACTL.ENS=0，CACTL.ENC = 0 for C-cache）。

**14.6.4.2 Coherency**

高速缓存和外部存储器内部SRAM之间的一致性必须由软件来保证。

在高速缓存支持区域中，在CPU和DMAC等总线主控制器之间分配共享内存时，根据需要使高速缓存数据无效。

### 15.2 Arm MPU

The Arm MCU monitors the addresses accessed by the CPU across the entire address space (0x0000\_0000 to 0xFFFF\_FFFF) and provides support for:

- (8 + 8) protected regions
- When memory regions overlap, the processor generates a fault if a core access hits the overlapping regions
- Setting access permissions to protected region (Read, Write, Execution)
- Export of memory attributes to the system.

Arm MPU mismatches and permission violations invoke the programmable-priority MemManage fault (Hard Fault) handler. For details, see reference 1., 3. and 4. in section 15.4. References.

### 15.3 Bus Master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0x0000\_0000 to 0xFFFF\_FFFF). Access-control information can be set up to 8 regions in DMAC/DTC and monitor for access to each region is in accord with this information.

If access to a protected region is detected, the bus master MPU generates an internal reset or a non-maskable interrupt. For information on error access, see section 14.3. Register Descriptions and section 14.4. Bus Error Monitoring Section in section 14, Buses.

Table 15.3 lists the specifications of the bus master MPU.

## 15. 内存保护单元(MPU)

有关ArmMPU错误访问的信息，请参阅第15.4节。参考。有关其他错误访问的信息MPU，见第14.3节。寄存器说明和第14.4节。第14节，总线中的总线错误监控部分。

### 15.2 Arm MPU

ArmMCU监控整个地址空间 (0x0000\_0000到0xFFFF\_FFFF) 中CPU访问的地址，并支持：

- (8+8)个保护区
- 当内存区域重叠时，如果核心访问命中重叠区域，处理器将产生故障
- 设置对受保护区域的访问权限（读、写、执行）
- 将内存属性导出到系统。

ArmMPU不匹配和权限违规调用可编程优先级MemManage故障（硬故障）处理程序。详见15.4节中的参考1.、3和4。参考。

### 15.3 总线主控MPU

总线主控MPU监控整个地址空间 (0x0000\_0000到0xFFFF\_FFFF) 中总线主控访问的地址。DMACDTC中最多可以设置8个区域的访问控制信息，每个区域的访问监控是否与该信息一致。

如果检测到对受保护区域的访问，总线主控MPU会产生内部复位或不可屏蔽中断。有关错误访问的信息，请参阅第14.3节。寄存器说明和第14.4节。第14节，总线中的总线错误监控部分。

表15.3列出了总线主控MPU的规格。

Regions set by MMPUSDMACn (n = 0 to 7), MMPUEDMACn (n = 0 to 7) and MMPUACDMACn (n = 0 to 7) registers, can be set for a secure access or a non-secure access with the MMPUSARA register. If the corresponding MMPUSARA.MMPUASAn (n = 0 to 7) bit is set to 1, only non-secure access is permitted for that region. On the other hand, if the corresponding MMPUSARA.MMPUASAn (n = 0 to 7) bit is set to 0, only secure access is permitted for that region.

由MMPUSDMACn (n=0到7)、MMPUEDMACn (n=0到7)和MMPUACDMACn (n=0到7) 寄存器设置的区域可以通过MMPUSARA寄存器设置为安全访问或非安全访问。如果相应的MMPUSARA.MMPUASAn (n=0到7) 位设置为1，则该区域仅允许非安全访问。另一方面，如果相应的MMPUSARA.MMPUASAn(n=0到7)位设置为0，则仅允许对该区域进行安全访问。

- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Region n unit sets the ENABLE bit, the RP bit, and the WP bit each.

**ENABLE bit (Region enable)**

The ENABLE bit controls the enable or disable of DMAC/DTC region n (n = 0 to 7) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit control access permission for read and write protection to MMPUSDMACn (n = 0 to 7) and MMPUEDMACn (n = 0 to 7).

When the ENABLE bit is set to 0, access to DMAC region n (n = 0 to 7) is the outside region.

**RP bit (Read protection)**

The RP bit enables or disables read protection of DMAC/DTC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the RP bit is available.

**WP bit (Write protection)**

The WP bit enables or disables write protection of DMAC/DTC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the WP bit is available.

区域n单元分别设置ENABLE位、RP位和WP位。

**ENABLE位 (区域使能)**

ENABLE位控制DMACDTC区域n (n=0到7) 单元的启用或禁用。

当ENABLE位设置为1时, RP位和WP位控制读写保护的访问权限 MMPUSDMACn (n=0到7) 和MMPUEDMACn (n=0到7)。

当ENABLE位设置为0时, 访问DMAC区域n (n=0到7) 是外部区域。

**RP bit (Read protection)**

RP位启用或禁用DMACDTC区域n (n=0到7) 的读保护。

当ENABLE位设置为1时, RP位可用。

**WP bit (Write protection)**

WP位启用或禁用DMACDTC区域n (n=0到7) 的写保护。

当ENABLE位设置为1时, WP位可用。

A master MPU error occurs on the following conditions:

1. MMPUENDMAC.ENABLE = 1, and output of one or more Region n unit is protected region.
2. MMPUENDMAC.ENABLE = 1, and output of all Region n unit are outside region.

Other cases are handled as permitted region.

  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

#### ENABLE bit (Bus Master MPU of DMAC enable)

The ENABLE bit controls enable or disable of the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACDMACn (n = 0 to 7) is valid. When the ENABLE bit is set to 0, MMPUACDMACn (n = 0 to 7) is invalid for all regions. The bus master MPU function sets the ENABLE bit of each master group. When the ENABLE bit is set, write 0xA5 in KEY[7:0] at the same time.

#### KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the ENABLE bit. When writing to the ENABLE bit, write 0xA5 in KEY[7:0] bits at the same time. When values other than 0xA5 are written to KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

- 1.MMPUENDMAC.ENABLE=1, 一个或多个Regionn单元的输出为受保护区域。
- 2.MMPUENDMAC.ENABLE=1, 所有Regionn单元的输出都在Region外。

其他情况按许可区域处理。

禁止字节写访问。当执行字节写访问时, 不能保证操作。

#### ENABLE位 (DMAC的总线主控MPU使能)

ENABLE位控制每个主机组的总线主机MPU功能的启用或禁用。

当ENABLE位设置为1时, MMPUACDMACn (n=0至7) 有效。当ENABLE位设置为0时, MMPUACDMACn(n=0至7)对所有地区都无效。总线主控MPU功能设置每个主控组的ENABLE位。当ENABLE位置位时, 同时在KEY[7:0]中写入0xA5。

#### KEY[7:0] bits (Key Code)

KEY[7:0]位启用或禁用对ENABLE位的写入。写入ENABLE位时, 将0xA5写入KEY[7:0]位。当0xA5以外的值写入KEY[7:0]位时, ENABLE位不会更新。KEY[7:0]位总是读为0x00。

The PROTECT bit enables or disables writes to the MMPUENDMAC register.  
 When writing to the PROTECT bit, write 0xA5 in KEY[7:0] at the same time.

**KEY[7:0] bits (Key Code)**

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 in KEY[7:0] at the same time. When values other than 0xA5 are written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

**PROTECT bit (Protection of register)**

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC.PROTECT controls the following registers:

- MMPUEDMACn (n = 0 to 7) of Non-Secure program
- MMPUACDMACn (n = 0 to 7) of Non-Secure program

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

**KEY[7:0] bits (Key Code)**

### PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPUOADPT.PROTECT controls the following register:

- MMPUOAD

When the PROTECT bit is set simultaneously, write 0xA5 to the KEY[7:0] bits using half word access.

### KEY[7:0] bits (Key code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit simultaneously, write 0xA5 to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

## 15.3.2 Operation

### 15.3.2.1 Memory protection

The bus master MPU monitors memory access using control settings made individually for the access control regions. If access to a protected region is detected, the bus master MPU generates a memory protection error.

Bus Master MPU can be set for up to 8 protection regions. It is protection region when set up of permission region and protection region overlaps. It is protection region when set up of two protection region overlaps.

Bus Master MPU has master groups of DMAC/DTC.

Memory protection checks the address of the bus which the master group unified. Therefore, all the access of a master group is detected by memory protection.

The region setting registers of the Bus Master MPU for DMAC/DTC can be set for secure access and Non-Secure access using the MMPUSARA register. Make secure access and Non-Secure access settings the same for each DMAC/DTC channel and the corresponding region setting registers of the Bus Master MPU.

Bus Master MPU is permission of all regions after reset. All region is protected by setting MMPUENDMAC.ENABLE=1.

Each region sets up a permission region on the protection region. If access to the protected region is detected, Bus Master MPU will generate an error.

Figure 15.1 shows the use case of a bus master MPU.

禁止字节写访问。当执行字节写访问时, 不能保证操作。

### PROTECT位 (寄存器保护)

PROTECT位启用或禁用对要保护的相关寄存器的写入。

MMPUOADPT.PROTECT控制以下寄存器:

- MMPUOAD

当PROTECT位同时置位时, 使用半字访问将0xA5写入KEY[7:0]位。

### KEY[7:0] bits (Key code)

KEY[7:0]位启用或禁用对PROTECT位的写入。同时写入PROTECT位时, 将0xA5写入KEY[7:0]位。当其他值写入KEY[7:0]位时, PROTECT位不会更新。KEY[7:0]位总是读为0x00。

## 15.3.2 Operation

### 15.3.2.1 内存保护

总线主控MPU使用为访问控制区域单独进行的控制设置来监视内存访问。如果检测到对受保护区域的访问, 则总线主控MPU会产生内存保护错误。

总线主控MPU最多可设置8个保护区域。许可区域与保护区域的设置重叠时为保护区域。两个保护区域重叠设置时为保护区域。

总线主控MPU具有DMACDTC主控组。

内存保护检查主组统一的总线地址。因此, 一个主组的所有访问都被内存保护检测到。

可以使用MMPUSARA寄存器为DMACDTC的总线主控MPU的区域设置寄存器设置安全访问和非安全访问。使每个DMACDTC通道和总线主控MPU的相应区域设置寄存器的安全访问和非安全访问设置相同。

BusMasterMPU是复位后所有区域的权限。通过设置MMPUENDMAC.ENABLE=1来保护所有区域。

每个区域在保护区域上设置一个权限区域。如果检测到对受保护区域的访问, 则总线主控MPU会产生错误。

图15.1显示了总线主控MPU的用例。

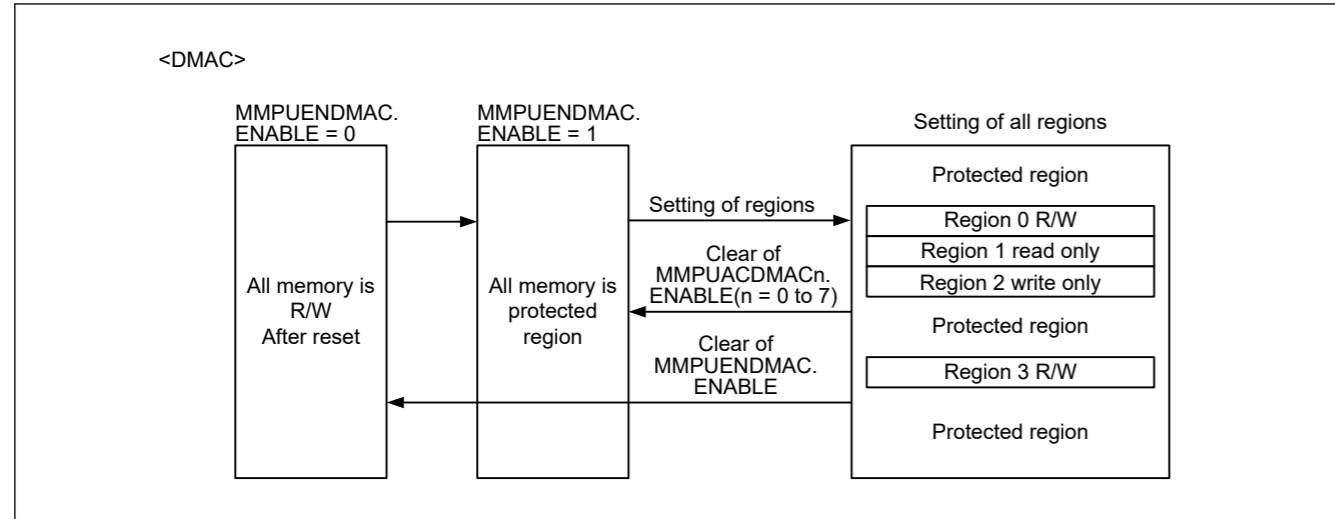

Figure 15.1 Use case of bus master MPU

Figure 15.2 shows the access permission or protection by the overlapping bus master MPU regions.

Access control for the overlapping regions is as follows:

- The region is handled as a protected region when output of one or more region units is a protected region
- The region is handled as a protected region when output of all region units is outside of the regions
- Other cases are handled as permitted regions.

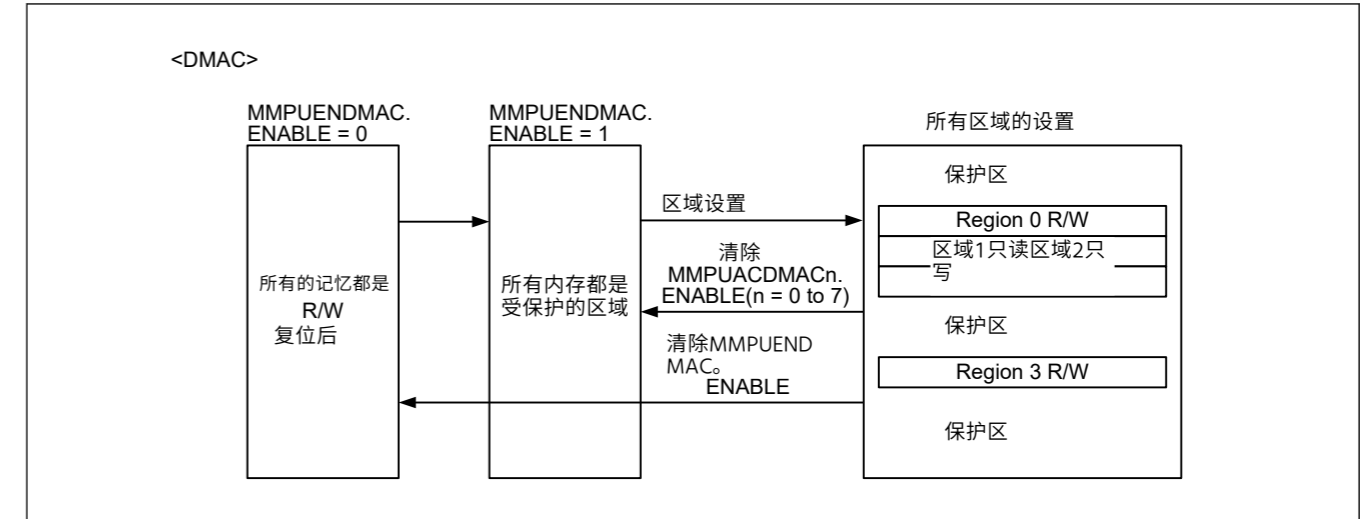

Figure 15.1 总线主控MPU用例

图15.2显示了重叠总线主控MPU区域的访问许可或保护。

重叠区域的访问控制如下：

- 当一个或多个区域单元的输出为受保护区域时，该区域被视为受保护区域
- 当所有区域单元的输出都在区域之外时，该区域被视为受保护区域
- 其他情况按许可区域处理。

### 15.3.2.2 Protecting the registers

Registers related to the Bus Master MPU can be protected with the PROTECT bit in the MMPUENPTDMA, MMPURPTDMAC, MMPURPTDMAC\_SEC and MMPUOADPT registers.

**Table 15.6 PROTECT bit and Protected target registers**

| PROTECT bit             | Protect target registers   |

| MMPUOADPT.PROTECT       | MMPUOAD  |

### 15.3.2.3 Memory protection error

If access to a protected region is detected, the bus master MPU generates an error. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or a reset.

The non-maskable interrupt status is indicated in ICU.NMISR.BUSMST. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#). The reset status is indicated in SYSTEM.RSTSR1.BUSMRF. For details, see [section 5, Resets](#).

### 15.3.2.2 保护寄存器

与总线主控MPU相关的寄存器可以通过MMPUENPTDMA中的PROTECT位进行保护，MMPURPTDMAC、MMPURPTDMAC\_SEC和MMPUOADPT寄存器。

### 15.3.2.3 内存保护错误

如果检测到对受保护区域的访问，则总线主控MPU会产生错误。设置OAD位以选择将错误报告为不可屏蔽中断还是复位。

不可屏蔽中断状态在ICU.NMISR.BUSMST中指示。有关详细信息，请参阅第13节，中断控制器单位 (ICU)。复位状态在SYSTEM.RSTSR1.BUSMRF中指示。有关详细信息，请参阅第5节，重置。

## 16. DMA Controller (DMAC)

表16.1列出了DMAC规范，图16.1显示了DMAC的框图。

|------|--------|--|-----|
| 31:0 | n/a    | Specifies the transfer source reload address 0000 0000h to FFFF FFFFh (4 Gbytes) | R/W |

Base address: DMACn = 0x4000\_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x08

| Bit   | Symbol       | Function              | R/W |

在重复传输模式和块传输模式下, 为DMCRAH和DMCRAL设置相同的值。在重复传输模式和块传输模式中, 位15到10固定为0。

(1) Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

DMCRAL functions as a 16-bit transfer counter.

The number of transfer operations is one when the setting is 0x0001, and 65,535 when it is 0xFFFF. The value is decremented by one each time data is transferred.

When the setting is 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function).

Free running function is not selected by DMTMD.TKP bit in normal transfer mode.

DMCRAH is not used in normal transfer mode. Write 0x0000 to DMCRAH.

(2) Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter.

The number of transfer operations is one when the setting is 0x001, 1,023 when it is 0x3FF, and 1,024 when it is 0x000. In repeat transfer mode, a value in the range of 0x000 to 0x3FF (1 to 1,024) can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(3) Block Transfer Mode (DMTMD.MD[1:0] = 10b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1,023 when it is 0x3FF, and 1,024 when it is 0x000. In block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(4) Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 001h, 1023 when it is 3FFh, and 1024 when it is 000h. In repeat-block transfer mode, a value in the range of 000h to 3FFh can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 000h, at which the value in DMCRAH is loaded into DMCRAL.

16.2.7 DMCRB : DMA Block Transfer Count Register

Base address: DMACn = 0x4000\_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x0C

|                    |              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| Value after reset: | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Value after reset: | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

(1) 正常传输模式 (DMTMD.MD[1:0]=00b)

DMCRAL用作16位传输计数器。

设置为0x0001时传输操作数为1，设置为0xFFFF时为65 535。每次传输数据时，该值减一。

设置为0x0000时，不设置具体的传输操作次数；在传输计数器停止的情况下执行数据传输（自由运行功能）。

在正常传输模式下，DMTMD.TKP位不选择自由运行功能。

DMCRAH不用于正常传输模式。将0x0000写入DMCRAH。

(2) 重复传输模式(DMTMD.MD[1:0]=01b)

DMCRAH指定重复大小，DMCRAL用作10位传输计数器。

设置为0x001时传输操作数为1，设置为0x3FF时为1 023，设置为0x000时为1 024。在重复传输模式下，可以为DMCRAH和DMCRAL设置0x000到0x3FF（1到1 024）范围内的值。

在DMCRAL中设置位15至10无效。将0写入这些位。

每次传输数据时，DMCRAL中的值减1，直到到达0x000，此时DMCRAL中的值DMCRAH被加载到DMCRAL中。

(3) 块传输模式 (DMTMD.MD[1:0]=10b)

DMCRAH指定块大小，DMCRAL用作10位块大小计数器。

设置为0x001时块大小为1，设置为0x3FF时为1 023，设置为0x000时为1 024。在块传输模式下，可以为DMCRAH和DMCRAL设置0x000到0x3FF范围内的值。

在DMCRAL中设置位15至10无效。将0写入这些位。

每次传输数据时，DMCRAL中的值减1，直到到达0x000，此时DMCRAL中的值DMCRAH被加载到DMCRAL中。

(4) 重复块传输模式(DMTMD.MD[1:0]=11b)

DMCRAH指定块大小，DMCRAL用作10位块大小计数器。

设置为001h时块大小为1，设置为3FFh时为1023，设置为000h时为1024。在重复块传输模式下，可以为DMCRAH和DMCRAL设置000h到3FFh范围内的值。

在DMCRAL中设置位15至10无效。将0写入这些位。

每次传输数据时，DMCRAL中的值减1，直到达到000h，此时DMCRAL中的值DMCRAH被加载到DMCRAL中。

| 31:16 | DMCRBH[15:0] | Specifies the number of block, repeat or repeat-block transfer operations. 0001h to FFFFh (1 to 65,535) 0000h (65,536) | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Set the same value for DMCRBH and DMCRBL in repeat transfer mode, block transfer mode and repeat-block transfer mode.

DMCRBH specifies the number of block, repeat and repeat-block transfer operations, and DMCRBL functions as a 16-bit the number of block counter in block, repeat, repeat-block transfer mode, respectively.

The number of transfer operations is one when the setting is 0001h, 65,535 when it is FFFFh, and 65,536 when it is 0000h.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred.

In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final data of one block size is transferred.

In normal transfer mode, DMCRB is not used. The setting is invalid.

When DMTMD.TKP is 1 and final data of one repeat size or one block size is transferred, DMCRBL reloads value of DMCRBH automatically.

在重复传输模式、块传输模式和重复块传输模式中, 将DMCRBH和DMCRBL设置为相同的值。

DMCRBH指定块、重复和重复块传输操作的数量, DMCRBL分别用作块、重复、重复块传输模式下的16位块计数器。

在重复传输模式下, 当传输一个重复大小的最终数据时, 该值减一。

在块传输模式和重复块传输模式中, 当传输一个块大小的最终数据时, 该值减一。

在正常传输模式下, 不使用DMCRB。设置无效。

当DMTMD.TKP为1并且传输一个重复大小或一个块大小的最终数据时, DMCRBL重新加载值DMCRBH automatically.

#### DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while DARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the destination address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the destination address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

#### SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while SARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the source address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

#### RPTIE bit (Repeat Size End Interrupt Enable)

When RPTIE bit is set to 1 in repeat transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-repeat size data transfer. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When this bit is set to 1 in block transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When set to repeat-block transfer mode, do not use this bit.

#### ESIE bit (Transfer Escape End Interrupt Enable)

ESIE bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that are generated during DMA transfer.

The transfer escape end interrupt is generated when the DMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by clearing this bit or the DMSTS.ESIF flag to 0.

#### DTIE bit (Transfer End Interrupt Enable)

DTIE bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers.

The transfer end interrupt is generated when the DMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by clearing this bit or the DMSTS.DTIF flag to 0.

Note: 如果安全属性配置为安全: ●

- 允许安全访问和非安全读取访问
  - 忽略非安全写入访问, 不会生成TrustZone访问错误。
- 如果安全属性配置为非安全: ●
- 允许安全和非安全访问。

#### DARIE位 (目标地址扩展重复区域溢出中断允许)

当DARIE位设置为1时目标地址发生扩展重复区域溢出时, DMCNT.DTE位清零。同时, DMSTS.ESIF标志设置为1, 表示由请求目标地址上的扩展重复区域溢出。

当块传输模式与扩展重复区域功能一起使用时, 在完成1块大小的传输后请求中断。将停止传输的通道的DMCNT.DTE位设置为1时, 将从停止传输时的状态恢复传输。

当没有为目标地址指定扩展重复区域时, 该位被忽略。

当设置为重复块传输模式时, 不要使用该位。

#### SARIE位 (源地址扩展重复区域溢出中断使能)

当SARIE位设置为1时源地址发生扩展重复区域溢出时, DMCNT.DTE位清零。同时, DMSTS.ESIF标志设置为1, 表示由请求源地址上的扩展重复区域溢出。

当块传输模式与扩展重复区域功能一起使用时, 在完成1块大小的传输后请求中断。将停止传输的通道的DMCNT.DTE位设置为1时, 将从停止传输时的状态恢复传输。

当源地址没有指定扩展重复区域时, 该位被忽略。

当设置为重复块传输模式时, 不要使用该位。

#### RPTIE位 (重复大小结束中断允许)

当RPTIE位在重复传输模式下设置为1时, DMCNT.DTE位在完成1次重复大小的数据传输后被清除为0。同时, 将DMSTS.ESIF标志设置为1, 表示已产生重复大小结束中断请求。即使DMTMD.DTS[1:0]位为10b (=未指定重复区域或块区域), 也可以生成重复大小结束中断请求。

当该位在块传输模式下设置为1时, DMCNT.DTE位在完成1块数据传输后清零, 方法与重复传输模式相同。同时, 将DMSTS.ESIF标志设置为1, 表示已产生重复大小结束中断请求。即使DMTMD.DTS[1:0]位为10b (=未指定重复区域或块区域), 也可以生成重复大小结束中断请求。

当设置为重复块传输模式时, 不要使用该位。

#### ESIE位 (传输转义结束中断使能)

ESIE位启用或禁用在DMA传输期间产生的传输转义结束中断请求 (重复大小结束中断请求和扩展重复区域溢出中断请求)。

当DMSTS.ESIF标志设置为1且该位设置为1时, 将产生传输退出结束中断。通过清除该位或DMSTS.ESIF标志为0来清除传输退出结束中断。

#### DTIE位 (传输结束中断允许)

DTIE位启用或禁用在完成指定数量的数据传输时生成的传输结束中断请求。

当DMSTS.DTIF标志设置为1且该位设置为1时, 将产生传输结束中断。通过清除该位或DMSTS.DTIF标志为0来清除传输结束中断。

**DARA[4:0] bits (Destination Address Extended Repeat Area)**

DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the DARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.DARIE bit set to 1. Table 16.2 lists the settings and the corresponding extended repeat areas.

**DADR bits (Destination Address Update Select After Reload)**

In repeat-block transfer mode, this bit specifies the behavior of DMDAR after reloading DMDRR.

When this bit is set to 1, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after reloading DMDRR.

如果安全属性配置为非安全: ●

**DARA[4:0]位 (目标地址扩展重复区)**

DARA[4:0]位指定目标地址上的扩展重复区域。扩展重复区功能是通过更新指定的低地址位来实现的，剩余的高地址位是固定的。扩展重复区域的大小可以是2字节到128MB之间的任意2次幂。

当低位地址以地址增量溢出扩展重复区域时，设置扩展重复区域的起始地址。类似地，当低位地址通过地址减量使扩展重复区域下溢时，设置扩展重复区域的结束地址。

将重复区域或块区域指定为传输目标时，请勿在目标地址上指定扩展重复区域。When repeat transfer or block transfer is selected and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area) write 00000b in the DARA[4:0] bits.

在重复块传输模式下，将00000b写入DARA[4:0]位。

当DMINT.DARIE位设置为1的扩展重复区域发生上溢或下溢时，可以请求中断。表16.2列出了设置和相应的扩展重复区域。

**DADR位 (重载后目标地址更新选择)**

在重复块传输模式下，该位指定重新加载DMDRR后DMDAR的行为。

当该位设置为1时，在重新加载DMDRR后将索引值((DMDBSH-DMDBSL)×DataSize)添加到DMDAR。

When this bit is set to 0, DMDAR only reloads DMDRR. This behavior is described in Table 16.13.

In normal, repeat or block transfer mode, this bit is ignored.

#### DM[1:0] bits (Destination Address Update Mode)

DM[1:0] bits select the mode of updating the destination address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, and 10b, the destination address is incremented by 1, 2, and 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, and 10b, the destination address is decremented by 1, 2, and 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

#### SARA[4:0] bits (Source Address Extended Repeat Area)

SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the SARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.SARIE bit set to 1. Table 16.2 lists the settings and the corresponding extended repeat areas.

#### SADR bits (Source Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMSAR after reloading DMSRR.

When this bit is set to 1, an index value  $((DMSBSH - DMSBSL) \times DataSize)$  is added to DMSAR after reloading DMSRR.

When this bit is set to 0, DMSAR only reloads DMSRR. This behavior is described in Table 16.12.

In normal, repeat or block transfer mode, this bit is ignored.

#### SM[1:0] bits (Source Address Update Mode)

SM[1:0] bits select the mode of updating the source address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, and 10b, the source address is incremented by 1, 2, and 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, and 10b, the source address is decremented by 1, 2, and 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

Table 16.2 SARA[4:0] or DARA[4:0] Settings and Corresponding Repeat Areas (1 of 2)

| SARA[4:0] or DARA[4:0] Settings and Corresponding Repeat Areas | Extended Repeat Area  |
|--|---|
| 00000b   | Not specified   |
| 00001b   | 2 bytes specified as extended repeat area by the lower 1 bit of the address   |
| 00010b   | 4 bytes specified as extended repeat area by the lower 2 bits of the address  |
| 00011b   | 8 bytes specified as extended repeat area by the lower 3 bits of the address  |
| 00100b   | 16 bytes specified as extended repeat area by the lower 4 bits of the address |
| 00101b   | 32 bytes specified as extended repeat area by the lower 5 bits of the address |
| 00110b   | 64 bytes specified as extended repeat area by the lower 6 bits of the address |

当该位设置为0时，DMDAR仅重新加载DMDRR。表16.13中描述了这种行为。

在正常、重复或块传输模式下，该位被忽略。

#### DM[1:0]位 (目标地址更新模式)

DM[1:0]位选择更新目标地址的模式。

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, and 10b, the destination address is incremented by 1, 2, and 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, and 10b, the destination address is decremented by 1, 2, and 4, respectively.

选择偏移添加后，将DMOFR寄存器指定的偏移添加到地址中。

#### SARA[4:0]位 (源地址扩展重复区)

SARA[4:0]位指定源地址上的扩展重复区域。扩展重复区功能是通过更新指定的低地址位来实现的，剩余的高地址位是固定的。扩展重复区域的大小可以是2字节到128MB之间的任意2次幂。

当低位地址以地址增量溢出扩展重复区域时，设置扩展重复区域的起始地址。类似地，当低位地址通过地址减量使扩展重复区域下溢时，设置扩展重复区域的结束地址。

当重复区域或块区域被指定为传输源时，不要在源地址上指定扩展重复区域。When repeat transfer or block transfer is selected and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area) write 00000b in the SARA[4:0] bits.

在重复块传输模式下，将00000b写入SARA[4:0]位。

当DMINT.SARIE位设置为1的扩展重复区域发生上溢或下溢时，可以请求中断。表16.2列出了设置和相应的扩展重复区域。

#### SADR位 (重载后源地址更新选择)

在重复块传输模式下，该位指定重新加载DMSRR后DMSAR的行为。

当该位设置为1时，在重新加载DMSRR后将索引值 $((DMSBSH - DMSBSL) \times DataSize)$ 添加到DMSAR。

当该位设置为0时，DMSAR仅重新加载DMSRR。这种行为在表16.12中描述。

在正常、重复或块传输模式下，该位被忽略。

#### SM[1:0]位 (源地址更新模式)

SM[1:0]位选择更新源地址的模式。

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, and 10b, the source address is incremented by 1, 2, and 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, and 10b, the source address is decremented by 1, 2, and 4, respectively.

选择偏移添加后，将DMOFR寄存器指定的偏移添加到地址中。

## 16.2.11 DMOFR : DMA Offset Register

Base address: DMACn = 0x4000\_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x18

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | n/a    | Specifies the offset when offset addition is selected as the address update mode for transfer source or destination<br>0x00000000 to 0x00FFFFFF (0 bytes to (16 M – 1) bytes)<br>0xFF000000 to 0xFFFFFFFF (–16 Mbytes to –1 byte) | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Write to this register while the DMAC operation is stopped or DMA transfer is disabled (not during data transfer).

Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR returns the extended value.

In repeat-block transfer mode, the offset is not specified by DMOFR when offset addition is selected, write 0 to DMOFR.

## 16.2.13 DMREQ:DMA软件启动寄存器

Base address: DMACn = 0x4000\_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1D

| Bit | Symbol | Function  | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
  - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

### SWREQ bit (DMA Software Start)

When 1 is written to SWREQ bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is cleared to 0 if the CLRS bit is set to 0. This bit is not cleared to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer.

Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the DMTMD.DCTG[1:0] bits are set to 00b (DMAC activation source is software).

Setting this bit is invalid when the DMTMD.DCTG[1:0] bits are set to a value other than 00b.

To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When 0 is written to this bit.

### CLRS bit (DMA Software Start Bit Auto Clear Select)

CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is cleared to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not cleared to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

### SWREQ位 (DMA软件启动)

当SWREQ位写入1时, 会产生DMA传输请求。响应请求启动DMA传输后, 如果CLRS位设置为0, 则该位清零。当CLRS位设置为1时, 该位不清零。在这种情况下, DMA传输请求转让完成后可再次发行。

但是请注意, 设置该位有效, 并且仅当DMTMD.DCTG[1:0]位设置为00b (DMAC激活源为软件) 时, 才启用软件进行的DMA传输。

当DMTMD.DCTG[1:0]位设置为00b以外的值时, 设置该位无效。

软件启动DMA传输时CLRS位为0, 确保SWREQ位为0, 然后将1写入SWREQ bit。

[Setting condition]

- 向该位写入1时。

[Clearing conditions]

- 当CLRS位设置为0 (软件启动DMA传输后SWREQ位清零) 时, 接受软件的DMA传输请求并启动DMA传输。
- 当0写入该位时。

### CLRS位 (DMA软件起始位自动清除选择)

CLRS位指定在DMA传输开始后是否将SWREQ位清除为0, 以响应通过将SWREQ位设置为1产生的DMA传输请求。当该位设置为0时, 在DMA传输完成后SWREQ位被清除为0开始了。该位设置为1时, SWREQ位不会被清除为0。在这种情况下, 可以在传输完成后再次发出DMA传输请求。

 • Non-secure write access is ignored, and TrustZone access error is not generated.  
 If the security attribution is configured as Non-secure:  
 • Secure and Non-secure access are allowed.

Set the same value for DMSBSH and DMSBSL in repeat-block transfer mode. Write 00000000h to DMSBS in normal, repeat and block transfer mode.

DMSBSH specifies buffer size and DMSBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by DMSBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMSBSH and DMSBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMSBSL reloads value of DMSBSH. When address update mode is fixed address, this register is ignored. **DMST bit (DMAC Operation Enable)**

Setting the DMAST.DMST to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all of the associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit clears to 0 during DMA transfer, DMA transfer is suspended after the current data transfer associated with a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

### 16.3 Operation

#### 16.3.1 Transfer Mode

##### 16.3.1.1 Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL register. When these bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function). Setting DMCRB register is invalid in normal transfer mode. Except in free running function, a transfer end interrupt request can be generated after completion of the specified number of transfer operations.

Table 16.5 summarizes the register update operation in normal transfer mode, and Figure 16.2 shows the operation in normal transfer mode.

Table 16.5 Register Update Operation in Normal Transfer Mode

| Register | Function                     | Update Operation after Completion of a Transfer by One Transfer Request |

##### 16.3.1.2 Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request.

A maximum of 1K data can be set as a total repeat transfer size using DMCRA register.

A maximum of 64K can be set as the number of repeat transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size.

Note: 当DMECHSAM=1时，可以在安全状态和非安全状态下清零。DMECHSAM=0，在非安全状态下不能清零。

##### 16.3.1.2 重复传输模式

在重复传输模式下，一个数据由一个传输请求传输。

使用DMCRA寄存器最多可以将1K数据设置为总重复传输大小。

使用DMCRB寄存器最多可以设置64K作为重复传输操作的次数；因此，最多可以将64M数据（1K数据×64K重复传输操作计数）设置为总数据传输大小。

Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations.

### 16.3.1.3 块传输模式

在块传输模式下，单个块数据由一个传输请求传输。

使用DMCRA寄存器最多可以将1K数据设置为总块传输大小。

使用DMCRB寄存器最多可以设置64K作为块传输操作的数量；因此，最多可以将64M数据（1K数据×64K块传输操作计数）设置为总数据传输大小。

#### 16.3.1.4 Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.

Repeat function: Added function (ring buffer) to repeat specified address area.

Offset function: Multiple areas with offset can be specified within one block transfer.

The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer.

Figure 16.5 shows an example of adding a repeat function to the transfer destination.

Figure 16.6 shows repeat-block transfer with an offset to the transfer destination.

In repeat-block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA of the DMACn.

A maximum of 64K can be set as the number of block transfer operations using DMCRB of the DMACn; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

#### 16.3.1.4 重复块传输模式

重复块传输是在块传输功能中添加了以下功能的操作模式。

重复功能：增加了重复指定地址区域的功能（环形缓冲区）。

偏移功能：在一次块传输中可以指定多个带偏移的区域。

重复块传输的传输源和传输目标都可以使用重复函数和偏移函数。

图16.5显示了向传输目的地添加重复功能的示例。

图16.6显示了到传输目标的偏移量的重复块传输。

在重复块传输模式中，单个块数据由一个传输请求传输。

使用DMACn的DMCRA可以将最大1K数据设置为总块传输大小。

使用DMACn的DMCRB最多可以设置64K作为块传输操作的数量；因此，最多可以将64M数据（1K数据×64K块传输操作计数）设置为总数据传输大小。

### 16.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR).

The extended repeat area on the source address is specified by the DMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the DMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides.

However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt by an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the DMINT.SARIE bit is set to 1, the DMSTS.ESIF flag is set to 1 and the DMCNT.DTE bit is cleared to 0 to stop DMA transfer. At this time, if the DMINT.ESIE bit is set to 1, an interrupt by an extended repeat area overflow is requested. When the DMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the interrupt handling.

Figure 16.7 shows an example of the extended repeat area operation.

### 16.3.2 扩展重复区域功能

DMAC支持在传输源地址和目标地址上指定扩展重复区域的功能。通过设置扩展重复区域，地址寄存器重复指示指定扩展重复区域的地址。

扩展重复区域可以分别指定到传输源地址寄存器(DMSAR)和传输目标地址寄存器(DMDAR)。

源地址上的扩展重复区域由DMAMD.SARA[4:0]位指定。目标地址上的扩展重复区域由DMAMD.DARA[4:0]位指定。可以为源端和目标端分别指定大小。

但是，指定为重复区域或块区域的区域（传输源或传输目的地）不应指定为扩展重复区域。

当地址寄存器值到达扩展重复区的结束地址且扩展重复区溢出时，DMA传输停止并且可以请求由扩展重复区域溢出引起的中断。当DMINT.SARIE位设置为1时传输源上的扩展重复区域发生溢出时，DMSTS.ESIF标志设置为1并且DMCNT.DTE位清零以停止DMA传输。此时，如果DMINT.ESIE位设置为1，则请求由扩展重复区域溢出引起的中断。当DMINT.DARIE位设置为1时，目标地址寄存器成为应用该功能的目标。可以通过在中断处理中向DMCNT.DTE位写入1来恢复DMA传输。

图16.7显示了扩展重复区域操作的示例。

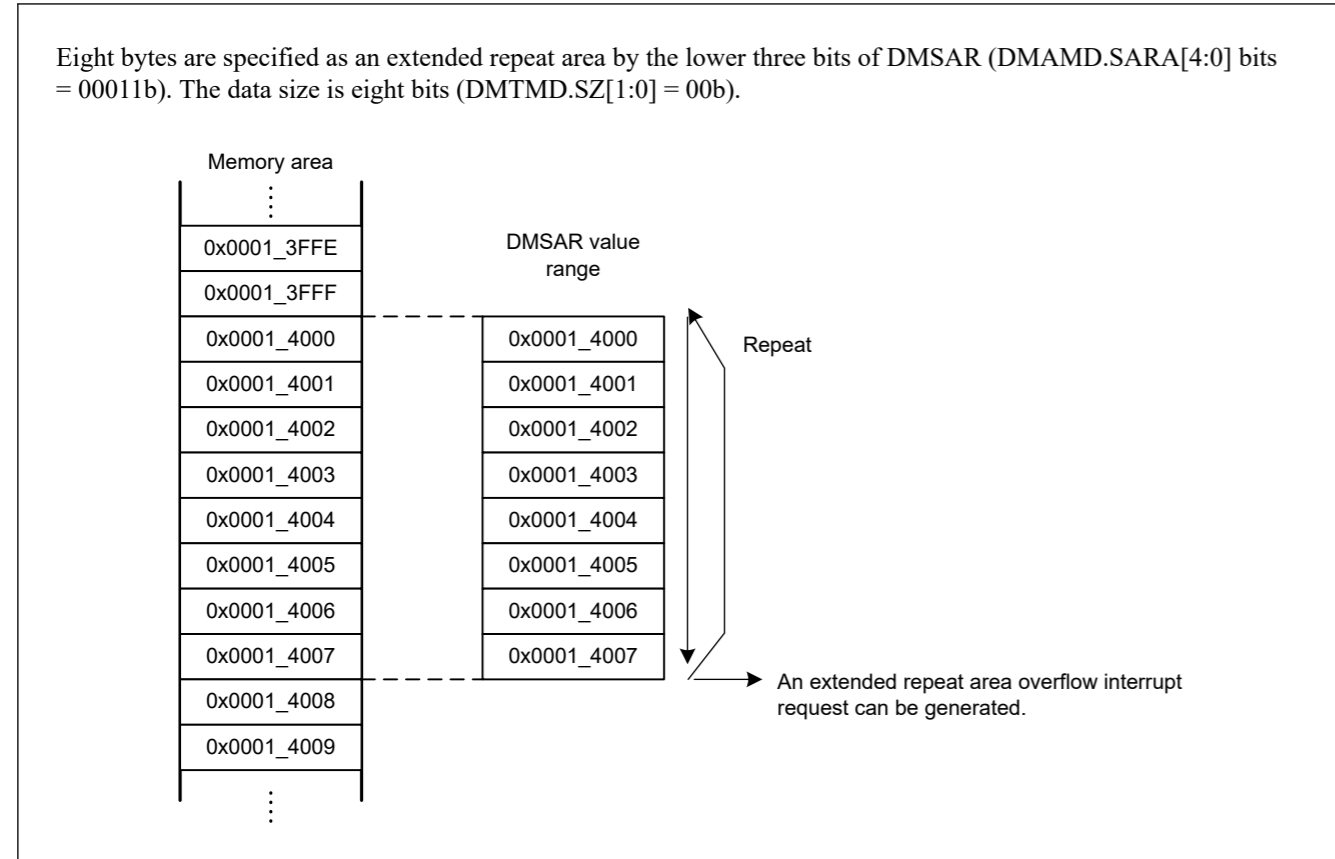

Figure 16.7 Example of Extended Repeat Area Operation

When an interrupt by an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration.

When a transfer is stopped by an interrupt by an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt by the overflow is suspended until transfer of the block is completed, and the transfer overruns.

Figure 16.8 shows an example when the extended repeat area function is used in block transfer mode.

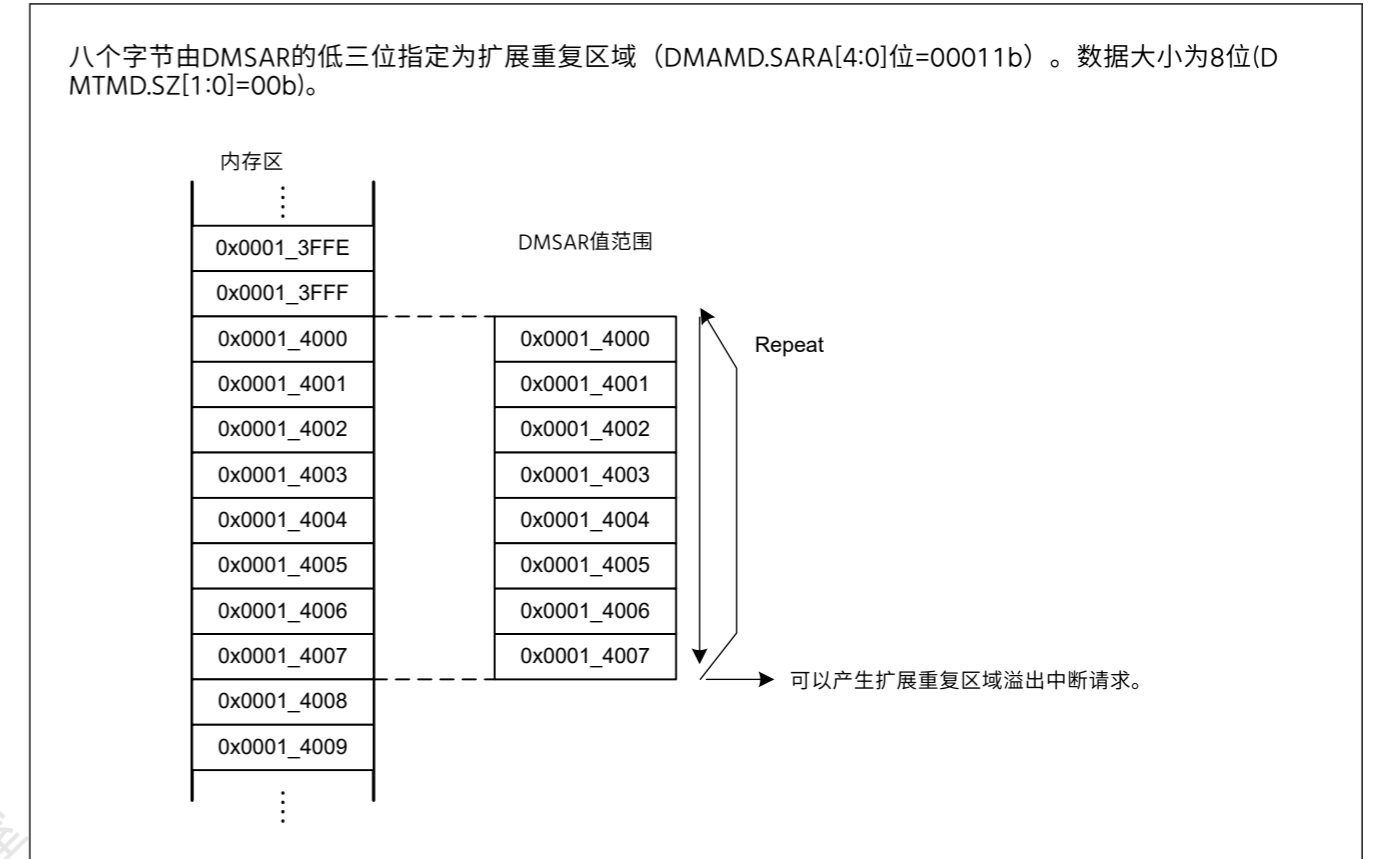

Figure 16.7 扩展重复区域操作示例

在块传输模式下使用扩展重复区域溢出中断时，应考虑以下事项。

当传输因扩展重复区域溢出中断而停止时，地址寄存器必须设置为块大小为2的幂或块大小边界与扩展重复区域边界对齐。当一个块的传输过程中扩展重复区域发生溢出时，溢出的中断被暂停，直到块的传输完成，传输溢出。

图16.8显示了在块传输模式下使用扩展重复区域功能的示例。

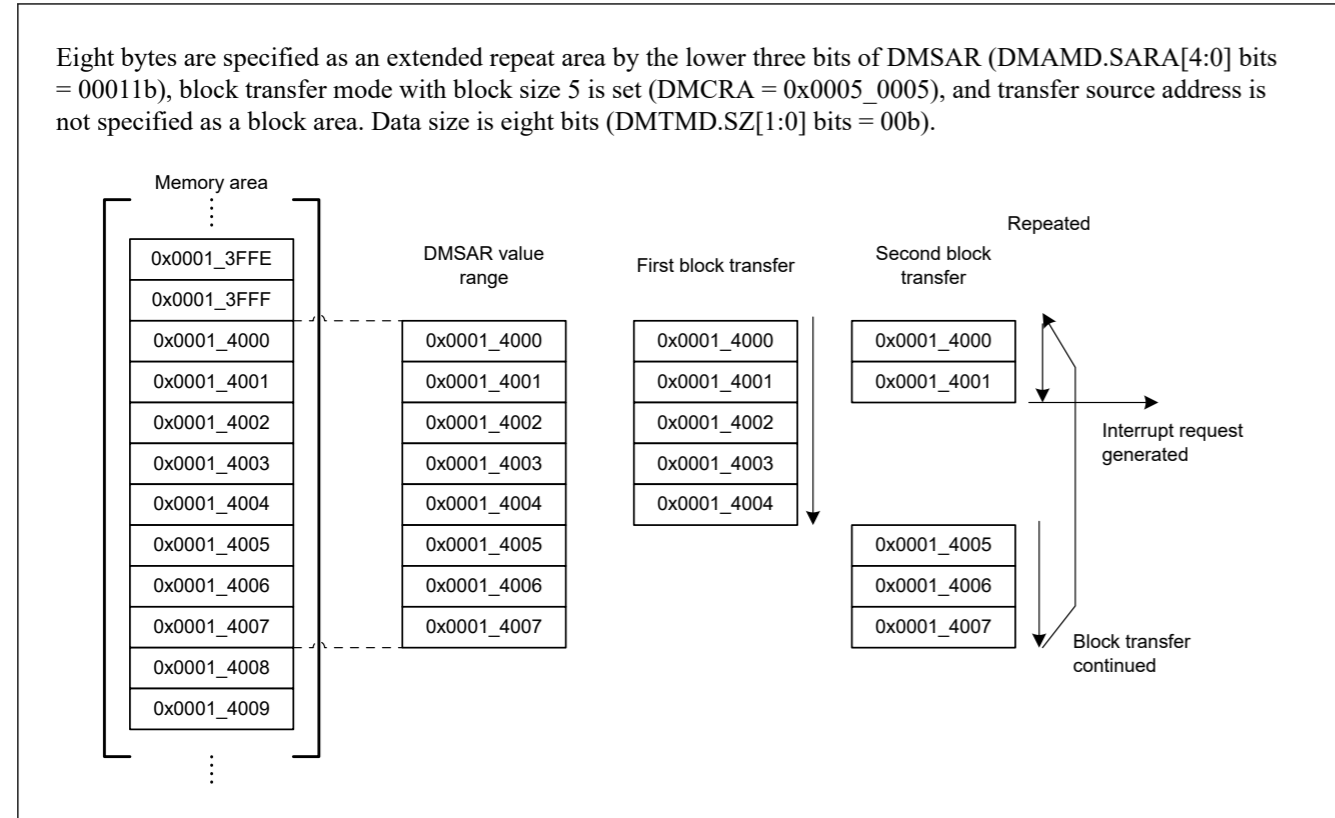

Figure 16.8 Example of Extended Repeat Area Function in Block Transfer Mode

### 16.3.3 Free-running Function

The DMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

#### 16.3.3.1 In Normal Transfer Mode

In normal transfer mode, when DMCRA.DMCRAL bits are set to 0000h, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped.

For more information, see [section 16.3.1.1. Normal Transfer Mode](#).

#### 16.3.3.2 In Other Transfer Mode

In repeat, block and repeat-block transfer mode, the DMAC supports free-running function using the DMTMD.TKP bit. If the DMTMD.TKP bit is to be set to 1, the transfer is not stopped by completion of specified total number of transfer operations and reloads DMCRBH repeatedly.

Figure 16.9 show an example of block transfer operation without free-running function.

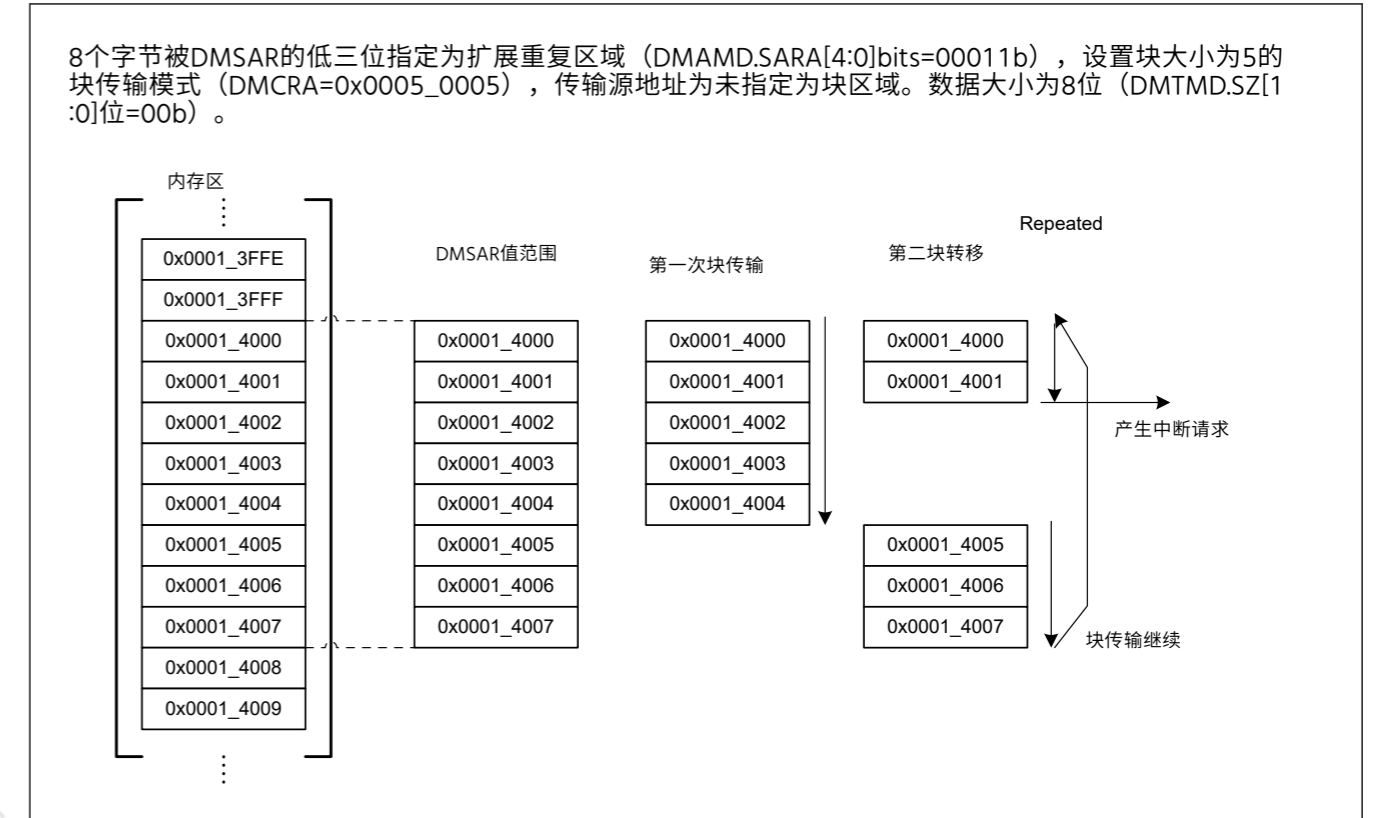

Figure 16.8 块传输模式下的扩展重复区域功能示例

### 16.3.3 Free-running Function

DMAC支持自由运行功能。此功能允许重复传输而无需在中断处理程序中重新配置。

#### 16.3.3.1 在正常传输模式下

在正常传输模式下, 当DMCRA.DMCRAL位设置为0000h时, 不设置具体的传输操作数; 在传输计数器停止的情况下执行数据传输。

有关详细信息, 请参阅第16.3.1.1节。正常传输模式。

#### 16.3.3.2 在其他传输模式下

在重复、块和重复块传输模式下, DMAC使用DMTMD.TKP位支持自由运行功能。如果要设置DMTMD.TKP位为1, 则在完成指定的传输操作总数时不会停止传输并重复重新加载DMCRBH。

图16.9显示了一个没有自由运行功能的块传输操作示例。

### 16.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (DMOFR) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas.

Offset subtraction can also be realized by setting a negative value in DMOFR. In this case, the negative value must be 2's complement.

图16.10显示了具有自由运行功能的块传输操作示例。

### 16.3.4 使用偏移的地址更新功能

可以通过固定、递增、递减或偏移添加来更新源地址和目标地址。在正常的重复和块传输模式下，选择偏移添加时，每次DMAC执行一个数据传输时，DMA偏移寄存器（DMOFR）指定的偏移量都会添加到地址。该功能实现了将地址分配到不同区域的数据传输。

偏移量减法也可以通过在DMOFR中设置一个负值来实现。在这种情况下，负值必须是2的补码。

DMSBS or DMDBS are used instead of DMOFR in repeat-block transfer mode. For more information [section 16.3.1.4. Repeat-Block Transfer Mode](#)

|---------------------|--|---|---------------|---------------|
|                     |  | SZ[1:0] = 00b   | SZ[1:0] = 01b | SZ[1:0] = 10b |
| Address fixed       | 00b  | Fixed   |               |               |
| Offset addition     | 01b  | +DMOFR*1  |               |               |
| Increment           | 10b  | +1  | +2            | +4            |
| Decrement           | 11b  | -1  | -2            | -4            |

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:  
two's complement of a negative offset value =  $\sim(\text{offset}) + 1$  ( $\sim$  = bit inversion)

### 16.3.4.1 Basic Transfer Using Offset Addition

Figure 16.11 shows an example of address updating using offset addition.

**Figure 16.11 Example of Address Updating by Offset Addition**

Figure 16.11 shows the setting of the following.

| Increment | 10b   | +1                            | +2            | +4            |
| Decrement | 11b   | -1                            | -2            | -4            |

注1.在DMA偏移寄存器中设置负值时，该值必须是二进制补码，由以下公式获得：负偏移值的二进制补码= $\sim(\text{offset})+1$ ( $\sim$ =bitinversion)

### 16.3.4.1 使用偏移加法的基本传输

图16.11显示了使用偏移量加法进行地址更新的示例。

**Figure 16.11 通过偏移加法更新地址的示例**

图16.11显示了以下设置。

- 传输数据为32位长
- 偏移量加法设置为传输源地址更新

- Increment is set as the transfer destination address update mode

The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

### 16.3.4.2 Example of XY Conversion Using Offset Addition

Figure 16.12 shows the XY conversion using offset addition in repeat transfer mode.

Settings are as follows:

- DMAMD.SM — Transfer source address update mode: Offset addition
- DMAMD.DM — Transfer destination address update mode: Destination address is incremented.
- DMTMD.SZ — Transfer data size select: 32 bits
- DMTMD.MD — Transfer mode select: Repeat transfer
- DMTMD.DTS — Repeat area select: The source is specified as the repeat area.
- DMOFR — Offset address: 0x10
- DMCRA — Repeat size: 0x4
- DMINT.RPTIE — The repeat size end interrupt is enabled.

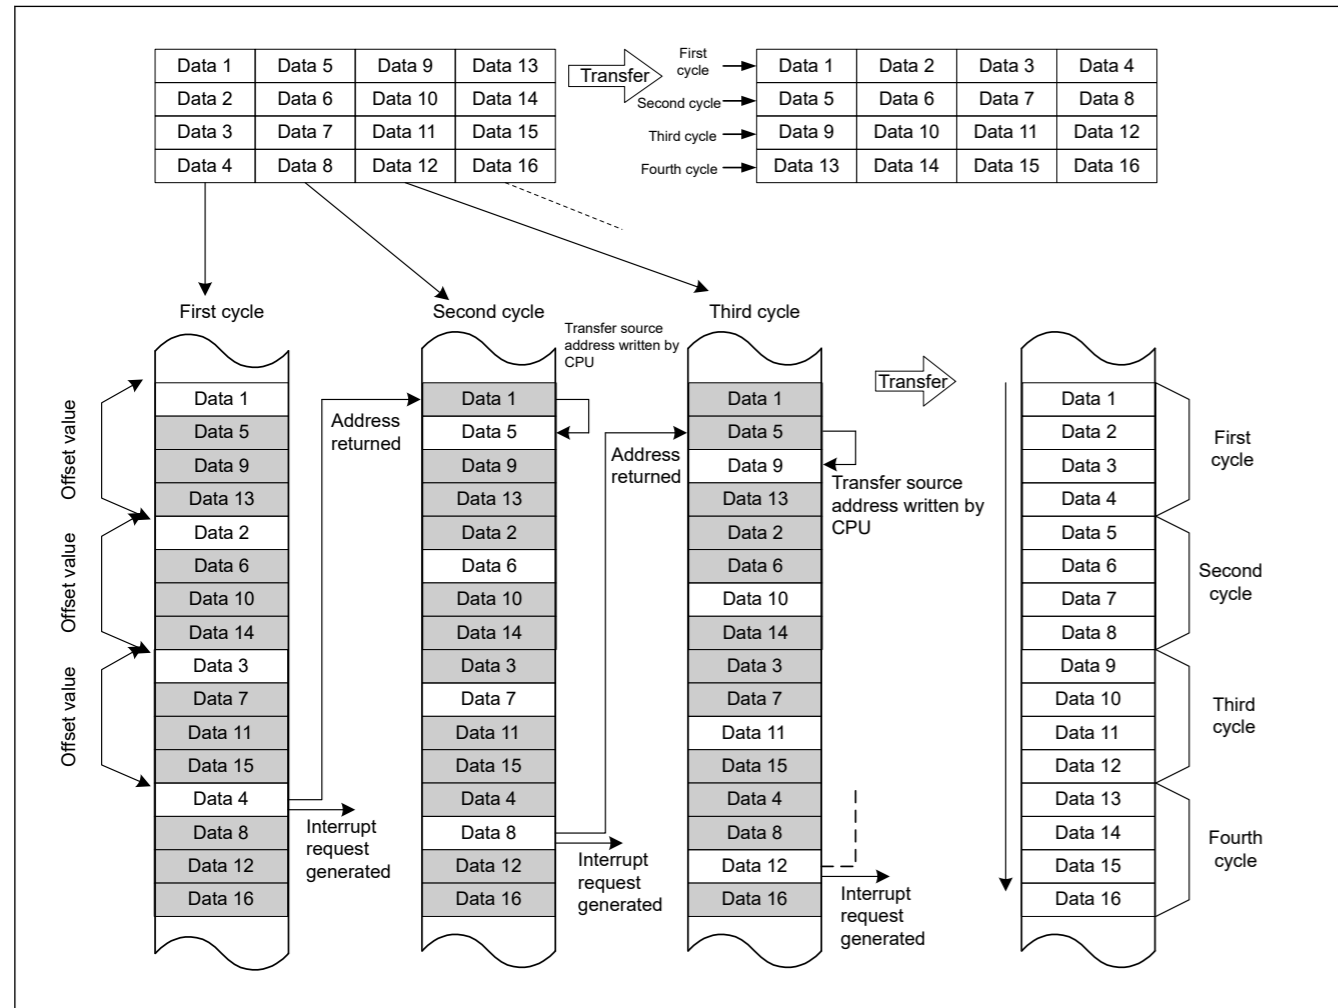

Figure 16.12 XY Conversion Operation Using Offset Addition in Repeat Transfer Mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous transfer destination addresses. When data 4 is transferred:

- The repeat size of data transfer is complete.

- 增量设置为传输目标地址更新模式

第二个和随后的数据分别从通过将偏移值与前一个地址相加而获得的传输源地址读取。以指定间隔从地址读取的数据被写入目标上的连续位置。

### 16.3.4.2 使用偏移加法的XY转换示例

图16.12显示了在重复传输模式下使用偏移添加的XY转换。

设置如下:

- DMAMD.SM—传输源地址更新模式: 偏移量加法
- DMAMD.DM—传输目标地址更新模式: 目标地址递增。
- DMTMD.SZ—传输数据大小选择: 32位
- DMTMD.MD—传输模式选择: 重复传输
- DMTMD.DTS—重复区域选择: 源被指定为重复区域。
- DMOFR — Offset address: 0x10
- DMCRA — Repeat size: 0x4
- DMINT.RPTIE—启用重复大小结束中断。

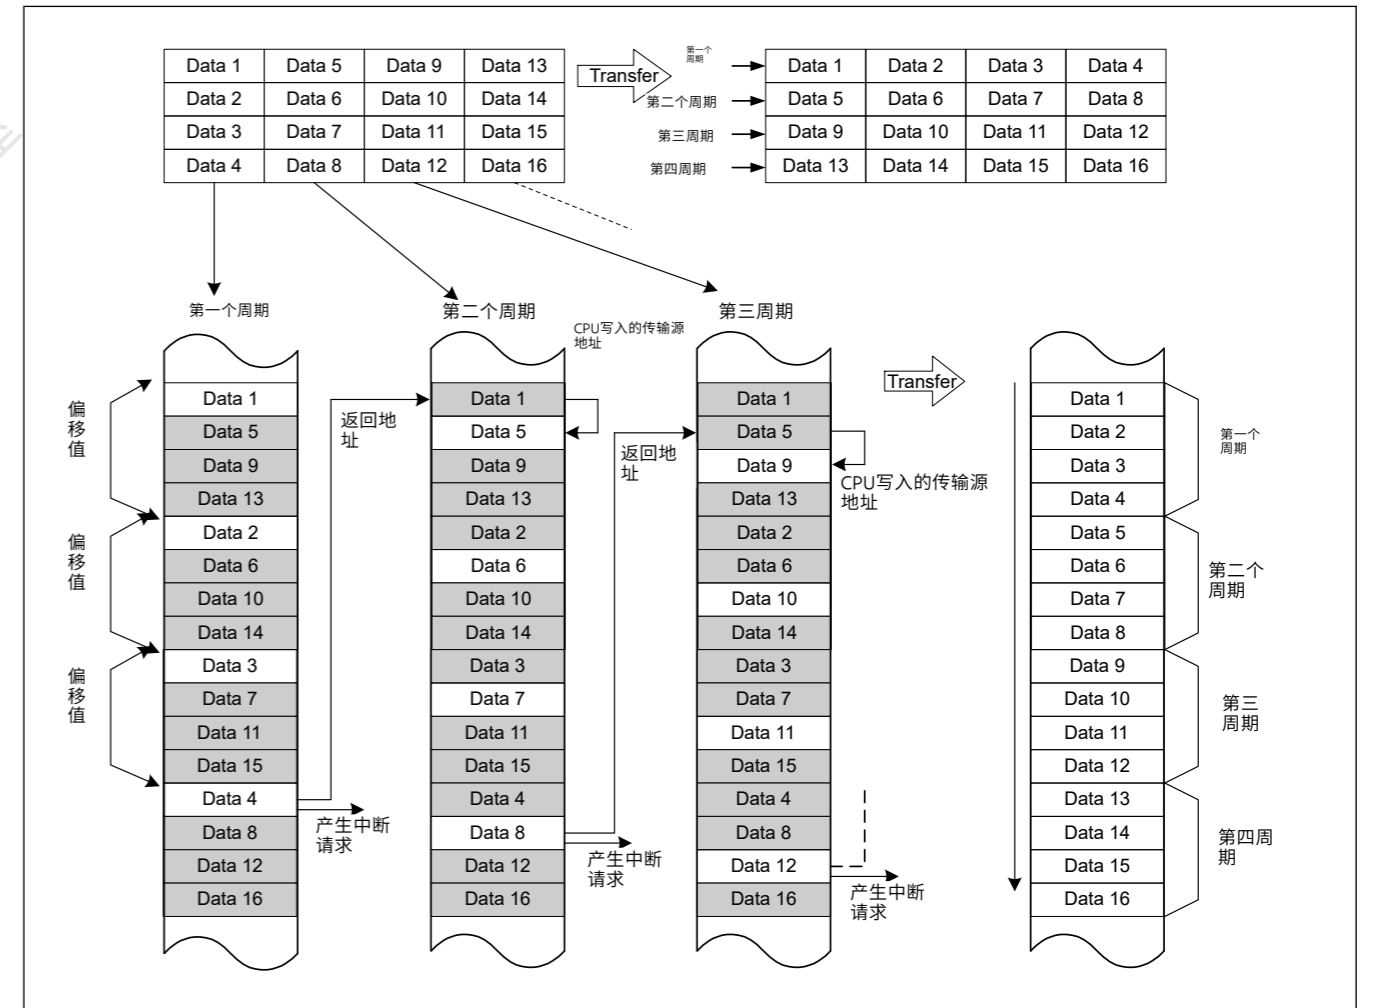

Figure 16.12 在重复传输模式下使用偏移加法的XY转换操作

传输开始时, 每次传输数据时, 都会将偏移值添加到传输源地址。传输数据被写入连续的传输目标地址。传输数据4时:

- 数据传输的重复大小已完成。

- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source).
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, the following operations are performed.

- DMSAR — Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- DMCNT — Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 16.13 shows a flowchart of the XY conversion.

- 传输源地址返回传输起始地址（传输源上数据1的地址）。
- 请求重复大小结束中断。

在此中断暂停传输期间，将执行以下操作。

- DMSAR—将DMA传输源地址重写为数据5的地址（在上面的示例中，数据1地址+4）。
- DMCNT—将DTE位设置为1。

DMA传输从DMA传输停止时的状态恢复。之后，重复上述操作，直到将传送源数据转置到目的地区域（XY转换）。

### 16.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

#### 16.3.5.1 Fixed Address Mode

When DMAMD.SM[1:0] is set to 00b, the address update mode of the source is fixed address. And when DMAMD.DM[1:0] is set to 00b, the address update mode of the destination is fixed address.

In fixed address, the address is not updated from the initial value of DMSAR and DMDAR. If the block size (DMCRA) is larger than 1, the same data will be transferred multiple times for one request.

Figure 16.14 shows address update in fixed address.

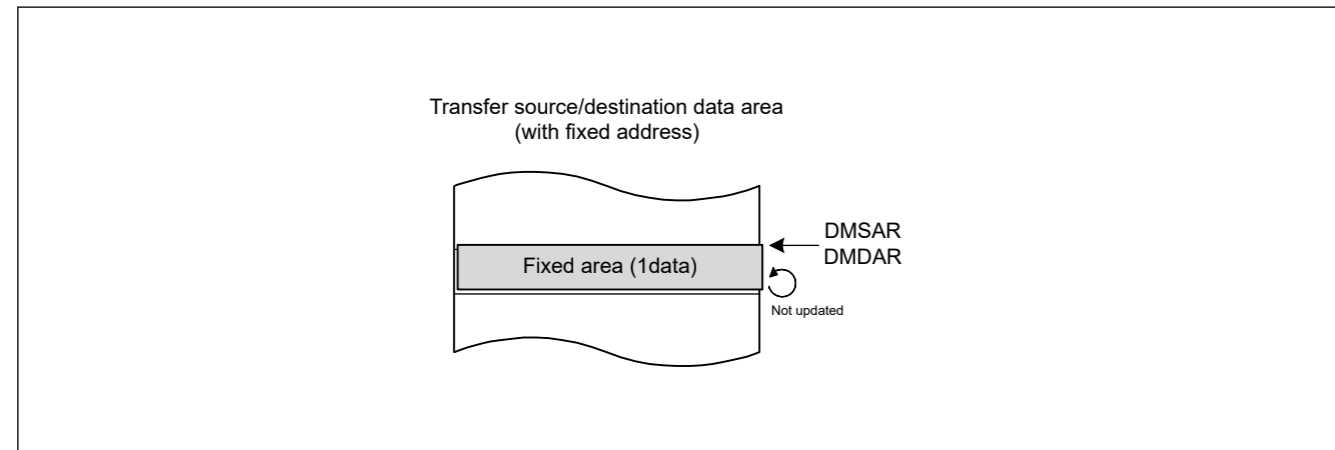

Figure 16.14 Address Update in Fixed Address

#### 16.3.5.2 Incremental and Decremental Address mode

When DMAMD.SM[1:0] is set to 10b, the address update mode of the source is incremental address. And when DMAMD.DM[1:0] is set to 10b, the address update mode of the destination is incremental address. When DMAMD.SM[1:0] is set to 11b, the address update mode of the source is decremental address. And when DMAMD.DM[1:0] is set to 11b, the address update mode of the destination is decremental address.

In these update modes, the address is incremented or decremented according to the setting of DMTMD.SZ[1:0].

In these update modes DMSBS and DMDBS indicates a reload area. The unit of DMSBS and DMDBS is "number of data". At the start of transfer, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

Figure 16.15 shows address update in incremental address.

### 16.3.5 重复块传输模式中的地址更新功能

重复块传输模式是重复传输模式和块传输模式的扩展。但是，地址更新的详细行为与这两种模式不同。以下是重复块传输模式下地址更新功能的详细信息。

#### 16.3.5.1 固定地址模式

当DMAMD.SM[1:0]设置为00b时，源的地址更新方式为固定地址。什么时候DMAMD.DM[1:0]设置为00b，目的地址更新方式为固定地址。

在固定地址中，地址不会从DMSAR和DMDAR的初始值更新。如果块大小（DMCRA）大于1，则一个请求将多次传输相同的数据。

图16.14显示了固定地址中的地址更新。

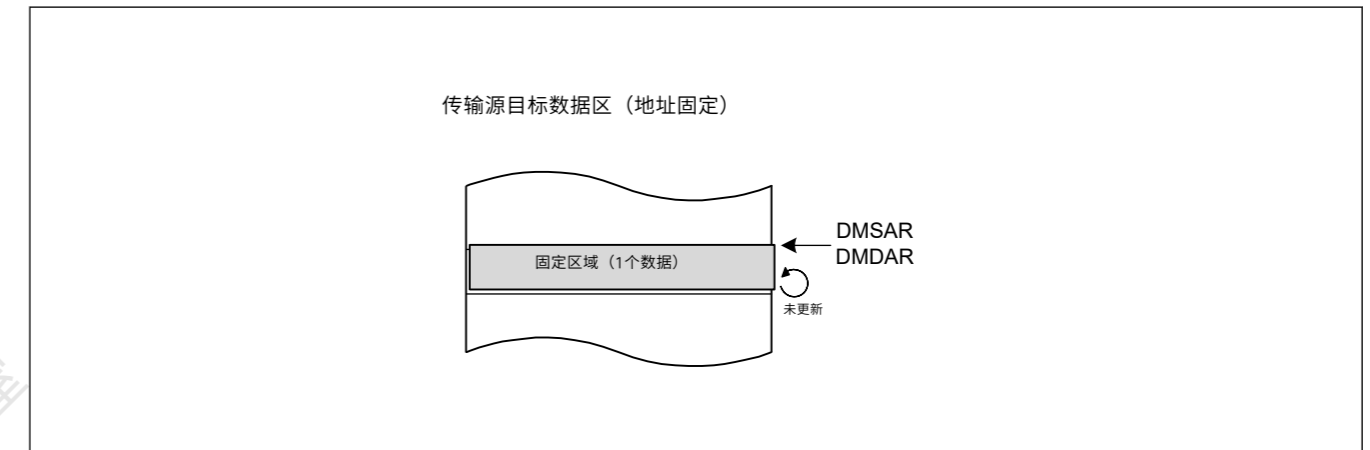

Figure 16.14 固定地址中的地址更新

#### 16.3.5.2 递增和递减地址模式

当DMAMD.SM[1:0]设置为10b时，源地址更新方式为增量地址。什么时候DMAMD.DM[1:0]设置为10b，目的地址更新方式为增量地址。当DMAMD.SM[1:0]设置为11b时，源地址更新方式为递减地址。什么时候

DMAMD.DM[1:0]设置为11b，目的地址更新方式为递减地址。

在这些更新模式中，地址根据DMTMD.SZ[1:0]的设置递增或递减。

在这些更新模式中，DMBS和DMDBS表示重新加载区域。DMSBS和DMDBS的单位是“数据数”。在传输开始时，作为DMSBS和DMDBS的低16位的DMSBSL和DMDBSL作为递减计数器运行，并在每次执行数据传输时递减。当值变为1时，DMSAR和DMDAR重新加载DMSRR和DMDRR的值。

图16.15显示了增量地址中的地址更新。

Figure 16.15 Address Update in Incremental Address

### 16.3.5.3 Offset Addition Mode

When DMAMD.SM[1:0] is set to 01b, the address update mode of the source is offset addition. And when DMAMD.DM[1:0] is set to 01b, the address update mode of the destination is offset addition.

In offset addition, DMSBS and DMDBS indicates reload area and also works as an access offset value. Unlike other transfer modes, DMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of DMSBS and DMDBS is the number of blocks. When the transfer starts, DMCRAL operates as a down counter, DMSAR and DMDAR reloads the value of DMSRR and DMDRR every time one block is transferred. In addition, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, also operates as a down counter and decrements every time one block is transferred. When the DMSBS and DMDBS value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

When DMAMD.SADR and DMAMD.DADR is set to 0, offset addition operation of the same area is repeated. DMDAR only reloads DMDRR. [section 16.3.5.3. Offset Addition Mode](#) shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=0.

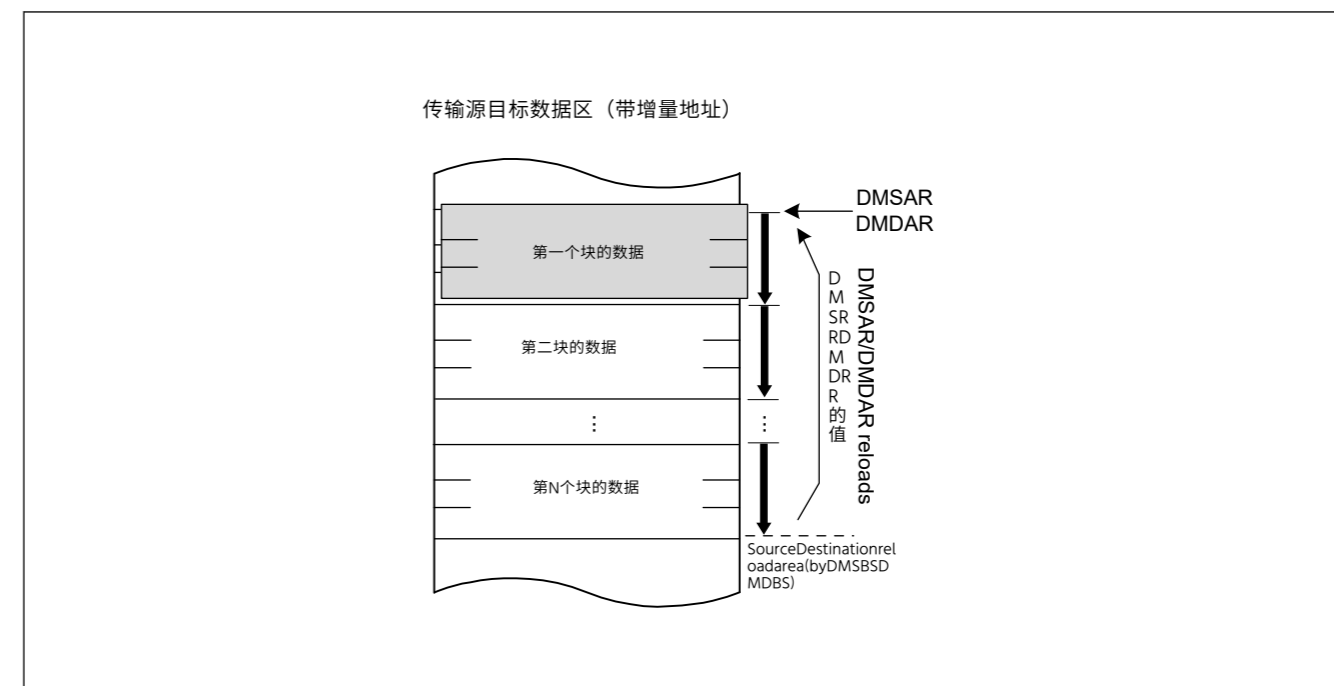

Figure 16.15 增量地址中的地址更新

### 16.3.5.3 偏移加法模式

当DMAMD.SM[1:0]设置为01b时，源地址更新方式为偏移加法。什么时候DMAMD.DM[1:0]设置为01b，目的地址更新方式为偏移加法。

除了偏移量之外，DMBS和DMDBS表示重载区域，也用作访问偏移量值。与其他传输模式不同，DMOFR寄存器不用于重复块传输模式。除了偏移量之外，DMSBS和DMDBS的单位是块数。当传输开始时，DMCRAL作为一个递减计数器运行，DMSAR和DMDAR在每次传输一个块时重新加载DMSRR和DMDRR的值。此外，作为DMSBS和DMDBS的低16位的DMSBSL和DMDBSL也用作递减计数器，并且每传输一个块就递减。当DMSBS和DMDBS的值变为1时，DMSAR和DMDAR重新加载DMSRR和DMDRR的值。

当DMAMD.SADR和DMAMD.DADR设置为0时，重复相同区域的偏移添加操作。DMDAR仅重新加载DMDRR。第16.3.5.3节。偏移加法模式显示偏移加法中的地址更新，其中DMAMD.SADR和DMAMD.DADR=0。

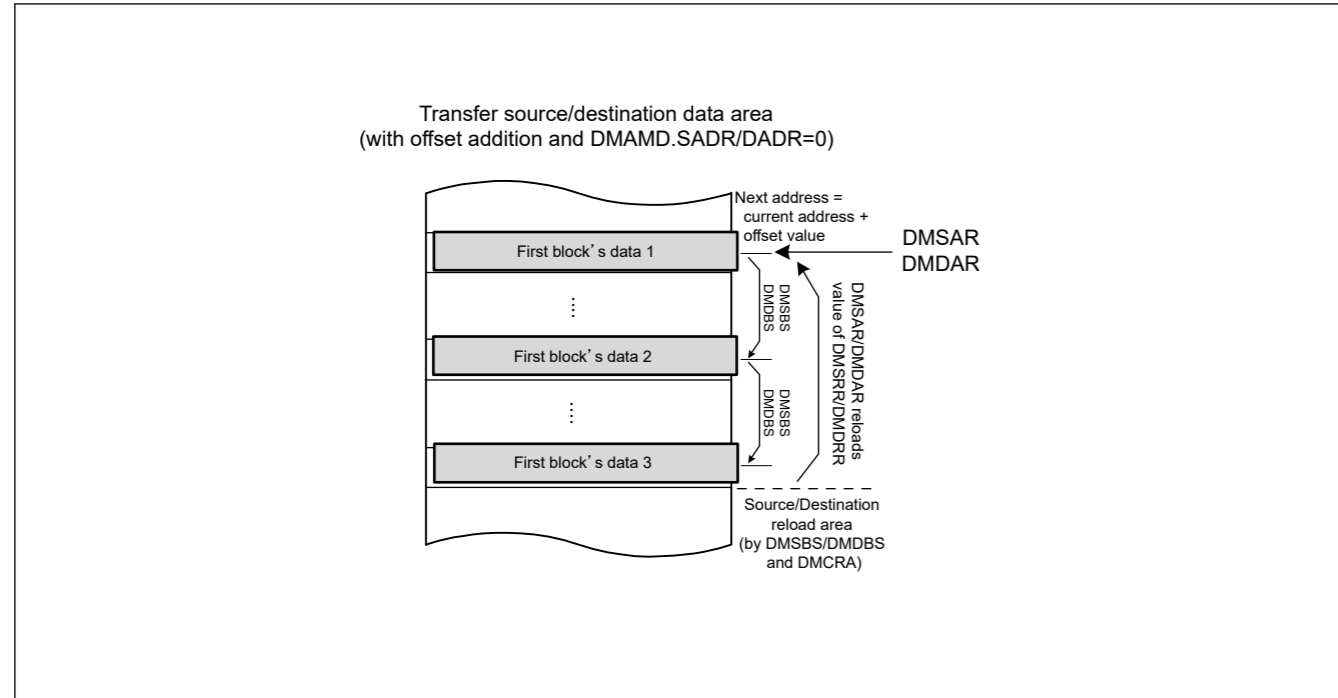

Figure 16.16 Address update in Offset Addition with DMAMD.SADR and DMAMD.DADR=0

When DMAMD.SADR and DMAMD.DADR is set to 1, the address is incremented by one data unit after DMSRR and DMDRR is reloaded by DMCRAL=1. In other words, an index value  $((DMDBSH-DMDBSL) \times DataSize)$  is added to DMDAR after DMDRR is reloaded. This behavior is used to implement multiple ring buffers. Figure 16.17 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=1.

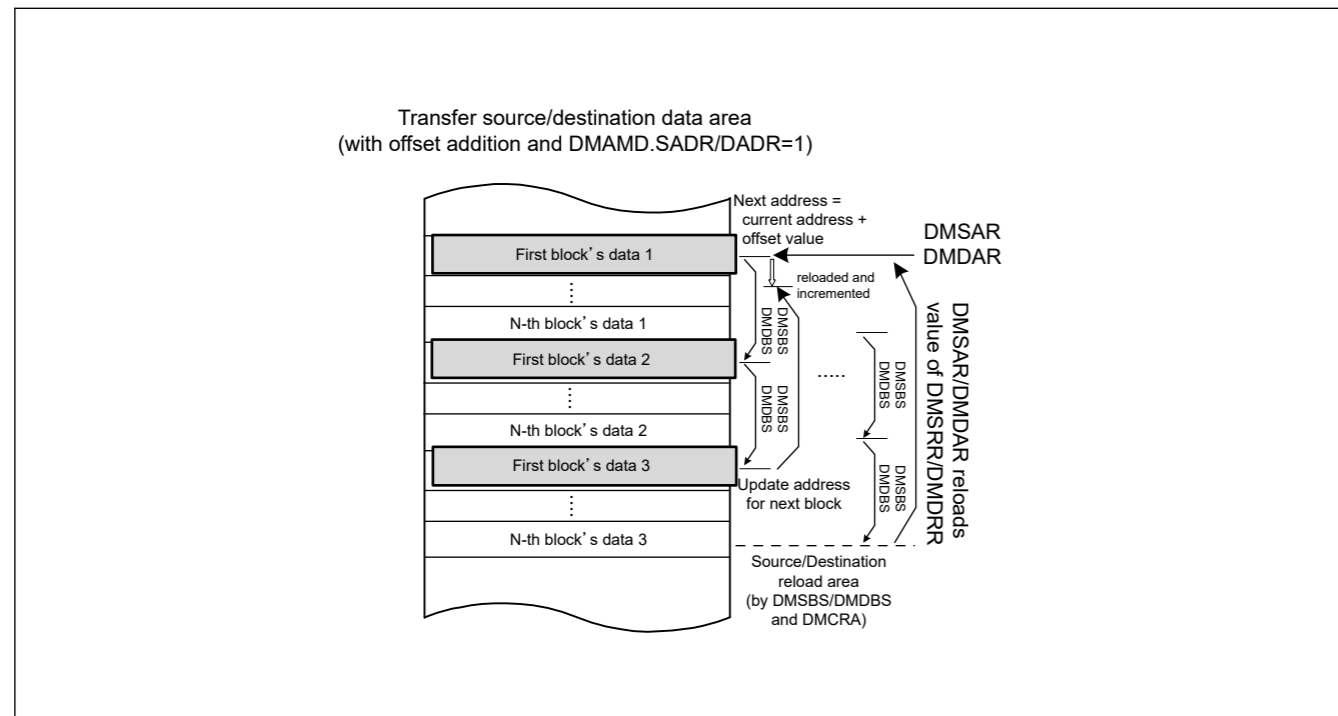

Figure 16.17 Address Update in Offset Addition with DMAMD.SADR and DMAMD.DADR=1

### 16.3.6 Example of Using Repeat-Block Transfer Mode

In repeat-block transfer mode, it is possible to realize repeated access to interval data and single or multiple ring buffers by combining the above address update modes. Following sections shows some usage examples.

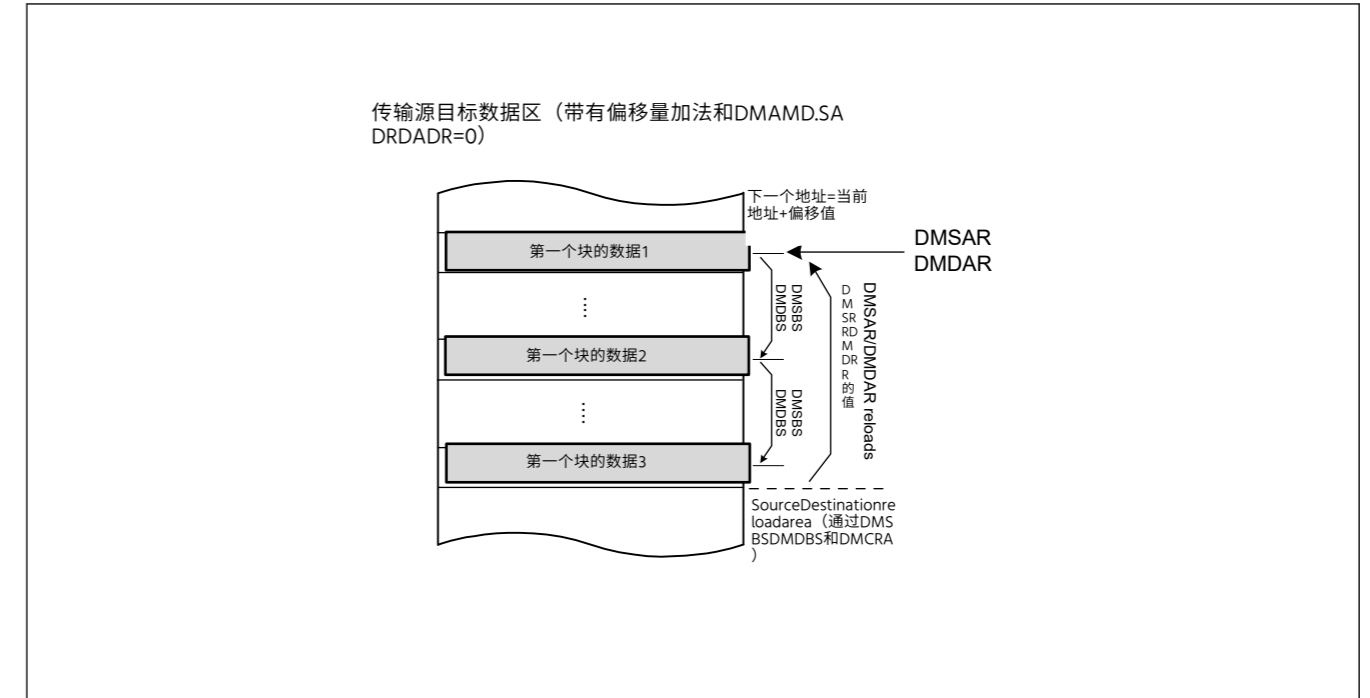

Figure 16.16 使用DMAMD.SADR和DMAMD.DADR=0进行偏移加法中的地址更新

当DMAMD.SADR和DMAMD.DADR设置为1时，在DMSRR和DMCRA=1重新加载DMDRR后，地址增加一个数据单元。换句话说，一个索引值  $((DMDBSH-DMDBSL) \times DataSize)$  被添加到重新加载DMDRR后的DMDAR。此行为用于实现多个环形缓冲区。图16.17显示了DMAMD.SADR和DMAMD.DADR=1的偏移加法中的地址更新。

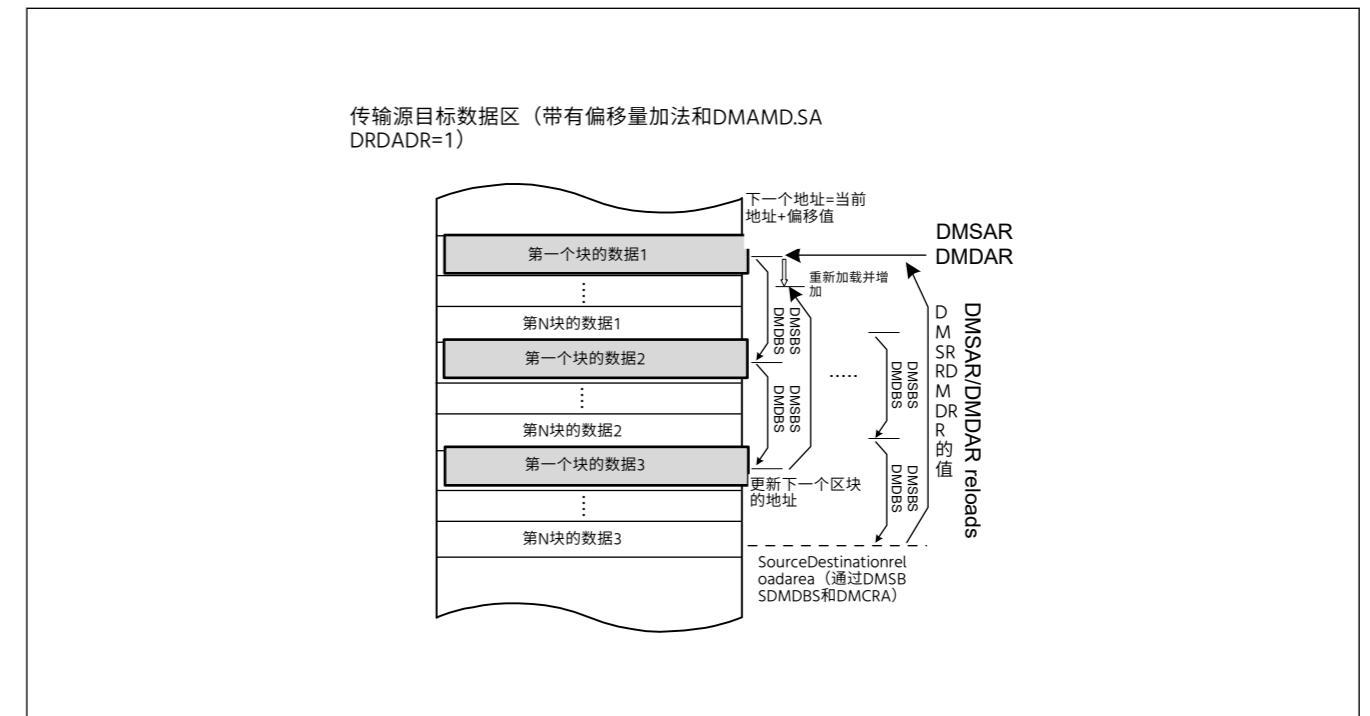

Figure 16.17 使用DMAMD.SADR和DMAMD.DADR=1进行偏移添加中的地址更新

### 16.3.6 使用重复块传输模式的示例

在重复块传输模式下，结合上述地址更新模式，可以实现对区间数据和单个或多个环形缓冲区的重复访问。以下部分显示了一些使用示例。

16.3.6.1 Interval Address to Single Ring Buffer

Figure 16.18 shows an example of reading interval ADDRn registers (data register) of ADC12 module and storing it in single ring buffer. It transfers 2 data every 4 halfwords per 1 request. DMSAR is incremented by one data every one request. This can be achieved by setting the transfer source to offset addition and DMAMD.SADR=1, the block size (DMCRA) to 2, and the transfer source offset (DMSBS) to 4. Table 16.15 shows setting of this example.

Table 16.15 Setting of use case: from interval address to single ring buffer

| Register       | Value        | Description   |
|----------------|--------------|---|
| DMSAR, DMSRR   | 0x4017_0020  | Initial source address  |

| DMTMD.SZ[1:0]  | 10b          | Data size is halfword   |

| DMAMD.DM[1:0]  | 10b          | Destination update mode is incremental address  |
| DMCRAH, DMCRAI | 2            | Transfer block size   |
| DMSBSH, DMSBSL | 4            | Source whole buffer size (unit is 'blocks') and Source access offset (unit is 'data') |

16.3.6.2

16.3.6.2.1 Unaligned Ring Buffer to Single Ring Buffer

Figure 16.19 shows an example of reading ADBUFn registers of ADC12 module (conversion result storage ring buffer) incrementally and storing it in single ring buffer. In this example, wrapping occurs because ADBUFn overflows in the fourth scan, but transfer source address of DMAC is also updated accordingly. This can be realized by setting the transfer source to incremental address and setting the DMSBS register to 16 which is the length of ADBUFn. This makes it possible to continue transfer without performing CPU processing using interrupts. Table 16.16 shows setting of this example.

16.3.6.1 单个环形缓冲区的间隔地址

图16.18显示了读取ADC12模块的间隔ADDRn寄存器（数据寄存器）并将其存储在单个环形缓冲区中的示例。它每1个请求每4个半字传输2个数据。DMSAR每请求一个数据就增加一个数据。这可以通过将传输源设置为偏移加法和DMAMD.SADR=1，将块大小(DMCRA)设置为2，将传输源偏移量(DMSBS)设置为4来实现。表16.15显示了此示例的设置。

图16.19显示了增量读取ADC12模块（转换结果存储环形缓冲区）的ADBUFn寄存器并将其存储在单个环形缓冲区中的示例。在本例中，由于ADBUFn在第四次扫描中溢出，因此发生了回绕，但DMAC的传输源地址也相应更新。这可以通过将传输源设置为增量地址并将DMSBS寄存器设置为16来实现，即ADBUFn的长度。这使得可以在不使用中断执行CPU处理的情况下继续传输。表16.16显示了此示例的设置。

16.3.6.3 Single Block to Multi Ring Buffer

Figure 16.20 shows an example of storing the continuous ADDRn registers (data register) of ADC12 module individually in multiple ring buffers. In this example, a ring buffer in which only the first element (ADDR0) in a single block is arranged in transfer order is created at the destination. Also, in the next area, create a ring buffer in which only the second element (ADDR1) is arranged in transfer order. In the following case, create a ring buffer of length N, which is defined by DMDBS. And the number of data elements in the block is 3, which is defined by DMCRA. Table 16.17 shows setting of this example.

### 16.3.7 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DMTMD.DCTG[1:0] bits to select the activation source.

#### 16.3.7.1 DMAC Activation by Software

When start DMA transfer by software, follow below procedure.

1. Set the DMTMD.DCTG[1:0] bits to 00b
2. Set the DMCNT.DTE bit to 1 (DMA transfer is enabled)
3. Set the DMAST.DMST bit set to 1 (DMAC activation enabled)
4. Set the DMREQ.SWREQ bit to 1 (DMA requested)

When the DMAC is activated by software while the DMREQ.CLRS bit is 0, the DMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request.

When the DMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

#### 16.3.7.2 DMAC Activation through Interrupt Requests from On-Chip Peripheral Modules or External Interrupt Requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation sources can be selected individually for each channel in ICU.DELSRn.DELS[8:0] (n = 0 to 7).

To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set ICU.DELSRn.DELS[8:0] (n = 0 to 7) to the event number (select the DMAC event link).
2. Set the DMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
3. Set the DMCNT.DTE bit to 1 (enable DMA transfer).
4. Set the DMAST.DMST bit set to 1 (DMAC activation enabled)

For interrupt requests specified as DMAC activation sources, see Table 13.3, in section 13, Interrupt Controller Unit (ICU).

### 16.3.8 Operation Timing

The following timing charts have indicated the number of execution cycles of the minimum.

Figure 16.21 and Figure 16.22 show DMAC operation timing examples.

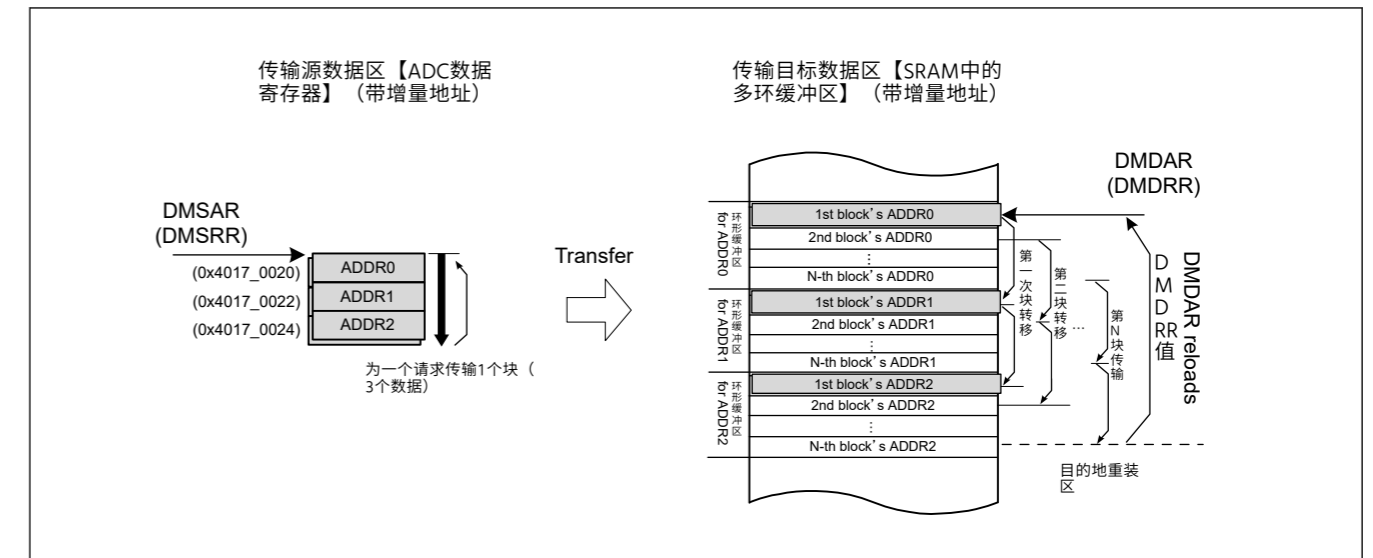

Figure 16.20 用例示例：从单块到多环缓冲区

### 16.3.7 激活源

软件、外设模块的 interrupt 请求和外部 interrupt 请求都可以指定为 DMAC 激活源。设置 DMTMD.DCTG[1:0] 位以选择激活源。

#### 16.3.7.1 软件激活 DMAC

当通过软件启动 DMA 传输时，请遵循以下步骤。

1. 将 DMTMD.DCTG[1:0] 位设置为 00b
2. 将 DMCNT.DTE 位设置为 1 (启用 DMA 传输)
3. 将 DMAST.DMST 位设置为 1 (启用 DMAC 激活)
4. 将 DMREQ.SWREQ 位设置为 1 (请求 DMA)

当 DMREQ.CLRS 位为 0 时由软件激活 DMAC 时，在响应 DMA 传输请求开始数据传输后，DMREQ.SWREQ 位清零。

当 CLRS 位为 1 时由软件激活 DMAC 时，数据传输开始后 SWREQ 位不会被清零。在这种情况下，在传输完成后再次发出 DMA 传输请求。

#### 16.3.7.2 通过来自片上外围模块或外部 interrupt 请求的 interrupt 请求激活 DMAC

您可以将来自片上外围模块的 interrupt 请求和外部 interrupt 请求指定为 DMAC 激活源。可以为 ICU.DELSRn.DELS[8:0] (n = 0 到 7) 中的每个通道单独选择激活源。

要通过来自片上外围模块的 interrupt 请求或外部 interrupt 请求启动 DMA 传输，请按照以下步骤操作。

1. 将 ICU.DELSRn.DELS[8:0] (n = 0 到 7) 设置为事件编号 (选择 DMAC 事件链接)。
2. 将 DMTMD.DCTG[1:0] 位设置为 01b (来自外围模块和外部 interrupt 引脚的 interrupt)。
3. 将 DMCNT.DTE 位设置为 1 (启用 DMA 传输)。
4. 将 DMAST.DMST 位设置为 1 (启用 DMAC 激活)

对于指定为 DMAC 激活源的 interrupt 请求，请参见第 13 节“中断控制器单元 (ICU)”中的表 13.3。

### 16.3.8 操作时间

下面的时序图已经表明了最小的执行周期数。

图 16.21 和图 16.22 显示了 DMAC 操作时序示例。

16.3.9 DMAC Execution Cycles

Table 16.18 lists execution cycles in one DMAC data transfer operation.

Table 16.18 DMAC Execution Cycles

Note: P: Block size (DMCRAH register setting)  
 Cr: Data read destination access cycle  
 Cw: Data write destination access cycle

Note 1. This is the case when the block size is 2 or more. When the block size is 1, normal transfer cycle is applied.

16.3.9 DMAC执行周期

表16.18列出了一个DMAC数据传输操作中的执行周期。

Table 16.18 DMAC执行周期

| 传输模式    | 数据传输 (读取) | 数据传输 (写入) |
|---------|-----------|-----------|
| Normal  | Cr+1      | Cw        |

| Block*1 | P × Cr    | P × Cw    |

Note: P: 块大小 (DMCRAH寄存器设置) Cr: 数据读取目标访问周期  
 Cw: 数据写入目标访问周期

注1.这是块大小为2或更大的情况。当块大小为1时，应用正常传输周期。

Cr and Cw depend on the access destination. For the number of cycles for each access destination, see [section 42, SRAM](#), [section 44, Flash Memory](#), [section 14, Buses](#). The frequency ratio of the system clock and the peripheral clock is also taken into consideration.

The unit for +1 in “Data Transfer (Read)” column is one system clock cycle (ICLK). For the operation example, see [section 16.3.8. Operation Timing](#).

Note: m: DELSRn.DELS bit number (m = 0 to 8)  
n: DMAC channel (n = 0 to 7)

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

### 16.3.11 Starting DMA Transfer

To enable the DMA transfer, set the DMCNT.DTE bit to 1 (enable the DMA transfer), and then set the DMAST.DMST bit to 1 (enable the DMAC activation).

New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the preceding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and the DMA transfer of that channel starts. When the DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

### 16.3.12 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMDBS, DMCNT, and DMSTS.

#### DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

#### DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

#### DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

#### DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

#### DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, refer to [Table 16.8](#) to [Table 16.13](#).

#### DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, refer to [Table 16.8](#) to [Table 16.13](#).

Note: m: DELSRn.DELS位号 (m=0到8) n: DMAC通道 (n=0到7)

注1.DMAST.DMST位设置不一定要遵循各个激活源的设置。

### 16.3.11 启动DMA传输

要启用DMA传输, 请将DMCNT.DTE位设置为1 (启用DMA传输), 然后将DMAST.DMST位设置为1 (启用DMAC激活)。

在传输另一个DMAC通道或DTC期间不接受新的激活请求。当前面的传输完成后, 通道仲裁选择最高优先级通道的DMA传输请求, 并开始该通道的DMA传输。当DMA传输开始时, DMSTS.ACT标志设置为1 (DMAC处于活动状态)。

### 16.3.12 DMA传输期间的寄存器

DMAC寄存器由DMA传输更新。要更新的值根据其他设置和传输状态而有所不同。要更新的寄存器是DMSAR、DMDAR、DMCRA、DMCRB、DMSBS、DMDBS、DMCNT和DMSTS。

#### DMA源地址寄存器(DMSAR)

当响应一个传输请求而传输了数据时, DMSAR的内容将更新为下一个传输请求要访问的地址。

每种传输模式下寄存器更新操作的详细信息, 请参见表16.5至表16.13。

#### DMA目标地址寄存器(DMDAR)

当响应一个传输请求传输了数据时, DMDAR的内容被更新为下一个传输请求要访问的地址。

每种传输模式下寄存器更新操作的详细信息, 请参见表16.5至表16.13。

#### DMA传输计数寄存器(DMCRA)

当响应一个传输请求传输数据时, 更新计数值。更新操作取决于选择的传输模式。

每种传输模式下寄存器更新操作的详细信息, 请参见表16.5至表16.13。

#### DMA块传输计数寄存器(DMCRB)

当响应一个传输请求传输数据时, 更新计数值。更新操作取决于选择的传输模式。

每种传输模式下寄存器更新操作的详细信息, 请参见表16.5至表16.13。

#### DMA源缓冲区大小寄存器(DMSBS)

当响应一个传输请求传输数据时, 更新计数值。更新操作取决于选择的传输模式。

有关各传输模式下的寄存器更新操作的详细信息, 请参阅表16.8至表16.13。

#### DMA目标缓冲区大小寄存器(DMDBS)

当响应一个传输请求传输数据时, 更新计数值。更新操作取决于选择的传输模式。

有关各传输模式下的寄存器更新操作的详细信息, 请参阅表16.8至表16.13。

**DMA Transfer Enable Bit (DMCNT.DTE)**

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically cleared to 0 by the DMAC according to the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt
- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for DMCNT). In this case, writing must be performed after the bit is cleared to 0.

**DMAC Active Flag (DMSTS.ACT)**

The DMSTS.ACT flag indicates whether the DMACn is in the idle or active state.

This flag is set to 1 when the DMAC starts data transfer, and is cleared to 0 when data transfer in response to one transfer request is completed.

Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

**Transfer End Interrupt Flag (DMSTS.DTIF)**

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed.

When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested.

This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

**Transfer Escape End Interrupt Flag (DMSTS.ESIF)**

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested.

This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

**16.3.13 Channel Priority**

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests.

- The channel priority is fixed as follows: Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: Highest).

When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

**16.3.14 Channel Security**

The security attribute of transfer access of DMACn, security attribute of access to register of DMACn, security attribute of access to the ICU.DELSRn register are controlled by ICUSARC.SADMACn bit. For details on the ICUSARC register, see [section 13, Interrupt Controller Unit \(ICU\)](#).

When the ICUSARC.SADMACn bit is 0, transfer of DMACn is secure access for both read and write. At the same time, the registers of channel n and the DELSRn register are protected from a non-secure access.

**DMA传输使能位(DMCNT.DTE)**

虽然DMCNT.DTE位通过寄存器写访问启用或禁用数据传输，但它会根据DMA传输状态由DMAC自动清零。

DMAC清除该位的条件如下：

- 当指定的总数据传输量完成时
- 当DMA传输因重复大小结束中断而停止时
- 当DMA传输因扩展重复区域溢出中断而停止时
- 发生DMA传输错误时

当相应的DMCNT.DTE位设置为1时，禁止写入通道的寄存器（除了DMCNT）。在这种情况下，必须在该位清0后进行写入。

**DMAC活动标志(DMSTS.ACT)**

DMSTS.ACT标志指示DMACn是处于空闲状态还是活动状态。

该标志在DMAC开始数据传输时设置为1，并在响应一个传输请求的数据传输完成时清除为0。

即使在DMA传输期间通过向DMCNT.DTE位写入0来停止DMA传输，该标志仍保持为1，直到DMA传输完成。

**传输结束中断标志(DMSTS.DTIF)**

在数据的总传输大小的DMA传输完成后，DMSTS.DTIF标志设置为1。

当该标志和DMINT.DTIE位都设置为1时，请求传输结束中断。

当DMA传输总线周期完成并且DMSTS.ACT标志被清除为0时，该标志设置为1，表示DMA传输结束。

在中断处理期间，当DMCNT.DTE位设置为1时，该标志自动清零。

**传输转义结束中断标志(DMSTS.ESIF)**

当请求重复大小结束中断或扩展重复区域溢出中断时，DMSTS.ESIF标志设置为1。当该位和DMINT.ESIE位设置为1时，请求传输转义结束中断。

当导致中断请求的DMA传输的总线周期完成并且DMSTS.ACT标志清零，表示DMA传输结束。

在中断处理期间，当DMCNT.DTE位设置为1时，该标志自动清零。

在从DMAC向CPU或DTC发送中断请求之前，必须设置中断控制寄存器。

[有关详细信息，请参阅第13节，中断控制器单元\(ICU\)。](#)

**16.3.13 频道优先级**

当存在多个DMA传输请求时，DMAC确定具有DMA传输请求的通道的优先级。

- 通道优先级固定如下：通道0>通道1>通道2>通道3...>通道7（通道0：最高）。

如果在数据传输过程中产生DMA传输请求，则在传输完最终数据后启动通道仲裁，并开始高优先级通道的DMA传输。

**16.3.14 渠道安全**

DMACn的传输访问的安全属性、DMACn的寄存器访问的安全属性、ICU.DELSRn寄存器的访问的安全属性由ICUSARC.SADMACn位控制。有关ICUSARC寄存器的详细信息，请参见第13节，中断控制器单元(ICU)。

当ICUSARC.SADMACn位为0时，DMACn的传输对于读和写都是安全访问。同时，通道n的寄存器和DELSRn寄存器受到保护，不会被非安全访问。

When the ICUSARC.SADMACn bit is 1, transfer of DMACn is non-secure access for both read and write. At the same time, the registers of channel n and the DELSRn register are non-secure attributes.

Do not write to the ICUSARC.SADMACn bit while DMA transfer of same channel is enabled or a bus master is writing to the DMA registers of same channel.

Figure 16.23 shows security attribute about each DMAC channels.

### 16.3.15 Master TrustZone Filter in DMAC

DMAC has the Master TrustZone Filter. The MasterTrustZone Filter in DMAC can detect the security areas of Flash area(code Flash and data Flash) and SRAM area(ECC / Parity RAM) defined by IDAU. When set No-secure channel

当ICUSARC.SADMACn位为1时，DMACn的传输对于读和写都是非安全访问。同时，通道n的寄存器和DELSRn寄存器是非安全属性。

当启用同一通道的DMA传输或总线主机正在写入同一通道的DMA寄存器时，请勿写入ICUSARC.SADMACn位。

图16.23显示了每个DMAC通道的安全属性。

### 16.3.15 DMAC中的主TrustZone过滤器

DMAC具有MasterTrustZone过滤器。DMAC中的MasterTrustZoneFilter可以检测IDAU定义的Flash区域（代码Flash和数据Flash）和SRAM区域（ECCParityRAM）的安全区域。设置无安全通道时

accesses those addresses, it detects the security violation. Access of violation address is not performed. Detected the error is handled as the Master TrustZone Filter error.

## 16.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

### 16.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

#### (1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of DMCRAL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

#### (2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of DMCRL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

#### (3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of DMCRL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

#### (4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of DMCRL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

### 16.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of a 1-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested to complete DMA transfer, the DMCNT.DTE bit is cleared to 0 and the DMSTS.ESIF flag is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function). If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit.

A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of a 1-block size data is completed.

Repeat size end interrupt cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

访问这些地址时，它会检测到安全违规。不执行违规地址的访问。检测到的错误作为MasterTrustZoneFilter错误处理。

## 16.4 结束DMA传输

结束DMA传输的操作取决于传输结束条件。当DMA传输结束时，DMCNT.DTE位和DMSTS.ACT标志由1变为0，表示DMA传输已经结束。

### 16.4.1 完成指定的转移操作总数后转移结束

#### (1) 在正常传输模式下 (DMTMD.MD[1:0]=00b)

当DMCRAL的值由1变为0时，相应通道上的DMA传输结束，同时DMCNT.DTE位清0，同时DMSTS.DTIF标志置1。如果此时DMINT.DTIEbit为1，则向CPU或DTC发出传输结束中断请求。

#### (2) 在重复传输模式下(DMTMD.MD[1:0]=01b)

当DMCRBL的值从1变为0时，相应通道上的DMA传输结束，同时DMCNT.DTE位清0，同时DMSTS.DTIF标志置1。如果此时DMINT.DTIE位为1，则向CPU或DTC发出中断请求。

如果DMTMD.TKP位为1（在自由运行功能中），则DMSTS.DTIF位设置为1，但DMCNT.DTE位不清除为0。

#### (3) 在块传输模式下(DMTMD.MD[1:0]=10b)

当DMCRBL的值从1变为0时，相应通道上的DMA传输结束，同时DMCNT.DTE位清0，同时DMSTS.DTIF标志置1。如果此时DMINT.DTIE位为1，则向CPU或DTC发出中断请求。

在从DMAC向CPU或DTC发送中断请求之前，必须设置中断控制寄存器。

有关详细信息，请参阅第13节，中断控制器单元(ICU)。

如果DMTMD.TKP位为1（在自由运行功能中），则DMSTS.DTIF位设置为1，但DMCNT.DTE位不清除为0。

#### (4) 在重复块传输模式下(DMTMD.MD[1:0]=11b)

当DMCRBL的值从1变为0时，相应通道上的DMA传输结束，同时DMCNT.DTE位清0，同时DMSTS.DTIF标志置1。如果此时DMINT.DTIE位为1，则向CPU或DTC发出中断请求。

在从DMAC向CPU或DTC发送中断请求之前，必须设置中断控制寄存器。有关详细信息，请参阅第13节，中断控制器单元(ICU)。

如果DMTMD.TKP位为1（在自由运行功能中），则DMSTS.DTIF位设置为1，但DMCNT.DTE位不清除为0。

### 16.4.2 按重复大小结束传输结束中断

在重复传输模式下，当DMINT.RPTIE位设置为1时完成1次重复大小的数据传输时，请求重复大小结束中断。当请求中断以完成DMA传输时，DMCNT.DTE位即使DMTMD.TKP位为1（在自由运行功能中），清除为0并且DMSTS.ESIF标志设置为1。如果此时DMINT.ESIE位为1，则向CPU或DTC发出中断请求。在这里，可以通过将1写入DMCNT.DTE位来恢复传输。

在块传输模式下也可以请求重复大小结束中断。在块传输模式中，当1块大小的数据传输完成时，以与重复传输模式相同的方式请求中断。

在重复块传输模式下不能请求重复大小结束中断。

在从DMAC向CPU或DTC发送中断请求之前，必须设置中断控制寄存器。有关详细信息，请参阅第13节，中断控制器单元(ICU)。

### 16.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the DMINT.SARIE or DMINT.DARIE bit is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function), an interrupt by an extended repeat area overflow is requested. When the interrupt is requested, the DMA transfer is terminated, the DMCNT.DTE bit is cleared to 0, and the ESIF flag in DMSTS is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Even if an interrupt by an extended repeat area overflow is requested during a read cycle, the following write cycle is performed.

In block transfer mode, even if an interrupt by an extended repeat area overflow is requested during a 1-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer.

An interrupt by an extended repeat area overflow cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

## 16.5 Processing on DMA Transfer Error

DMA transfer error occurs with the Master TrustZone Filter error in DMAC, the Slave TrustZone Filter error, the Master MPU error, the Slave Bus Error or the Illegal Access Error. If the access error occurs during the DMA transfer, the DMAC immediately stops the transfer of error occurred channel. At this time, the ICU setting of the corresponding channel is also cleared. If there is a request other than the channel which caused the error, it will be re-arbitration as it is.

When the transfer error occurs, DMCNT.DTE of the error causing channel is set to 0. Also, the error response is informed to the ICU.DELSRn of the corresponding channel is cleared. Write back to each register is not performed. Furthermore, it generates the error response detection interrupt request (DMA\_TRANSERR) to notify that an error has occurred by DMAC/DTC transfer.

When the Master TrustZone Filter error occurs, the Slave TrustZone error occurs or the Master MPU error occurs, it is possible to confirm the error information of DMAC by selecting NMI. The DMAC error channel register is cleared by selecting reset. Under the conditions where NMI is generated due to transfer error in DMAC, two interrupts(NMI and DMA\_TRANSERR) are generated. In this case, NMI always responds first.

The error response detection interrupt request (DMA\_TRANSERR) occurs when the Slave Bus error or the Illegal Access error occurs. Furthermore, it occurs after NMI when the error response detection interrupt request (DMA\_TRANSERR) is not cleared in NMI handler.

[section 16.5.1. Processing on NMI handler](#) describes how to confirm the error information of the DMAC in the NMI handler.

[section 16.5.2. Processing on Error response detection interrupt request \(DMA\\_TRANSERR\) handler](#) describes how to confirm the error information of the DMAC in the DMA\_TRANSERR handler.

Interrupts and the error information generated due to transfer errors are shown in [section 16.6.2. Transfer Error Interrupt](#).

### 16.5.1 Processing on NMI handler

The cause of NMI due to the DMA transfer error is the Master TrustZone Filter error, the Slave TrustZone Filter error or the Master MPU error. When NMI occurs due to the DMAC transfer error, the error response detection interrupt request (DMA\_TRANSERR) will occur after the end of NMI handler. It is possible to confirm the cause of the error and the DMAC channel in which the error occurred. When NMI occurs, perform the necessary processing according to the flow described in the ICU chapter.

[Figure 16.24](#) shows the flow for confirm the channel that caused the Master TrustZone Filter Error in DMAC

[Figure 16.25](#) shows the flow for confirm the channel that caused the Slave TrustZone Filter Error in DMAC

[Figure 16.26](#) shows the flow for confirm the channel and Security Attribute that caused the Master MPU error in DMAC.

If completing all processing in NMI handler, it is possible to clear the error response detection interrupt request (DMA\_TRANSERR) that occurs subsequently.

### 16.4.3 扩展重复区溢出中断传输结束

如果在指定扩展重复区域时扩展重复区域发生溢出，并且即使DMTMD.TKP位为1，DMINT.SARIE或DMINT.DARIE位也设置为1（在自由运行功能中），中断由请求扩展重复区域溢出。请求中断时，终止DMA传输，DMCNT.DTE位清0，DMSTS中的ESIF标志置1。如果此时DMINT.ESIE位为1，则发出中断请求到CPU或DTC。

即使在读取周期期间请求由扩展重复区域溢出引起的中断，也会执行下一个写入周期。

在块传输模式下，即使在1块传输期间请求扩展重复区域溢出中断，也会传输块中剩余的数据；块传输后终止传输。

在重复块传输模式下不能请求由扩展重复区域溢出引起的中断。

在从DMAC向CPU或DTC发送中断请求之前，必须设置中断控制寄存器。有关详细信息，请参阅第13节，中断控制器单元(ICU)。

## 16.5 DMA传输错误处理

DMA传输错误发生在DMAC中的MasterTrustZoneFilter错误、SlaveTrustZoneFilter错误、Master MPU错误、从总线错误或非法访问错误。如果在DMA传输过程中发生访问错误，DMAC立即停止发生错误通道的传输。此时相应通道的ICU设置也被清除。如果存在引起错误的通道以外的请求，将按原样重新仲裁。

当发生传输错误时，错误引起通道的DMCNT.DTE设置为0。同时，错误响应被通知给ICU。相应通道的DELSRn被清除。不执行回写到每个寄存器。此外，它会生成错误响应检测中断请求(DMA\_TRANSERR)，以通知DMAC/DTC传输发生错误。

当MasterTrustZoneFilter发生错误、SlaveTrustZone错误或MasterMPU错误时，可以通过选择NMI来确认DMAC的错误信息。通过选择复位来清除DMAC错误通道寄存器。在由于DMAC中的传输错误而产生NMI的情况下，会产生两个中断（NMI和DMA\_TRANSERR）。在这种情况下，NMI总是首先响应。

当发生SlaveBus错误或IllegalAccess错误时，会发生错误响应检测中断请求(DMA\_TRANSERR)。此外，当NMI处理程序中未清除错误响应检测中断请求(DMA\_TRANSERR)时，它会在NMI之后发生。

第16.5.1节。NMIhandler上的处理描述了如何在NMIhandler中确认DMAC的错误信息。

第16.5.2节。错误响应检测中断请求（DMA\_TRANSERR）处理程序的处理描述了如何在DMA\_TRANSERR处理程序中确认DMAC的错误信息。

因传输错误而产生的中断和错误信息见16.6.2节。传输错误中断。

### 16.5.1 在NMI处理程序上处理

由于DMA传输错误导致NMI的原因是MasterTrustZoneFilter错误、SlaveTrustZoneFilter错误或MasterMPU错误。当由于DMAC传输错误而发生NMI时，错误响应检测中断请求(DMA\_TRANSERR)将在NMI处理程序结束后发生。可以确认错误的原因和发生错误的DMAC通道。当发生NMI时，按照ICU章节中描述的流程进行必要的处理。

图16.25显示了在DMAC中确认导致SlaveTrustZoneFilterError的通道流程

图16.26显示了在DMAC中确认导致MasterMPU错误的通道和安全属性的流程。

如果完成NMI处理程序中的所有处理，则可以清除随后发生的错误响应检测中断请求(DMA\_TRANSERR)。

### 16.5.2 Processing on Error response detection interrupt request (DMA\_TRANSERR) handler

### 16.5.2 错误响应检测中断请求(DMA\_TRANSERR)处理程序的处理

由于DMA传输错误导致错误响应检测中断请求(DMA\_TRANSERR)的原因是从总线错误或非法访问错误。此外，它发生在NMI处理程序错误响应检测中断请求(DMA\_TRANSERR)未被NMI处理程序清除之后。

It is possible to confirm the cause of the error and the DMAC channel in which the error occurred.

## 16.6 Interrupts

### 16.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request (DMACn\_INT) to the CPU or the DTC after transfer in response to one request is completed.

In repeat-block transfer mode, do not enable escape transfer end interrupt.

Table 16.21 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 16.33 shows the schematic logic diagram of interrupt outputs (DMACn (n = 0 to 7)). Figure 16.34 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

### 16.6.1 传输结束中断

每个DMAC通道可以在响应一个请求的传输完成后向CPU或DTC输出一个中断请求 (DMACn\_INT)。

在重复块传输模式下，不要启用转义传输结束中断。

表16.21列出了中断源、中断状态标志和中断使能位之间的关系。图16.33显示了中断输出(DMACn(n=0to7))的逻辑示意图。图16.34显示了用于恢复终止DMA传输的DMAC中断处理程序。

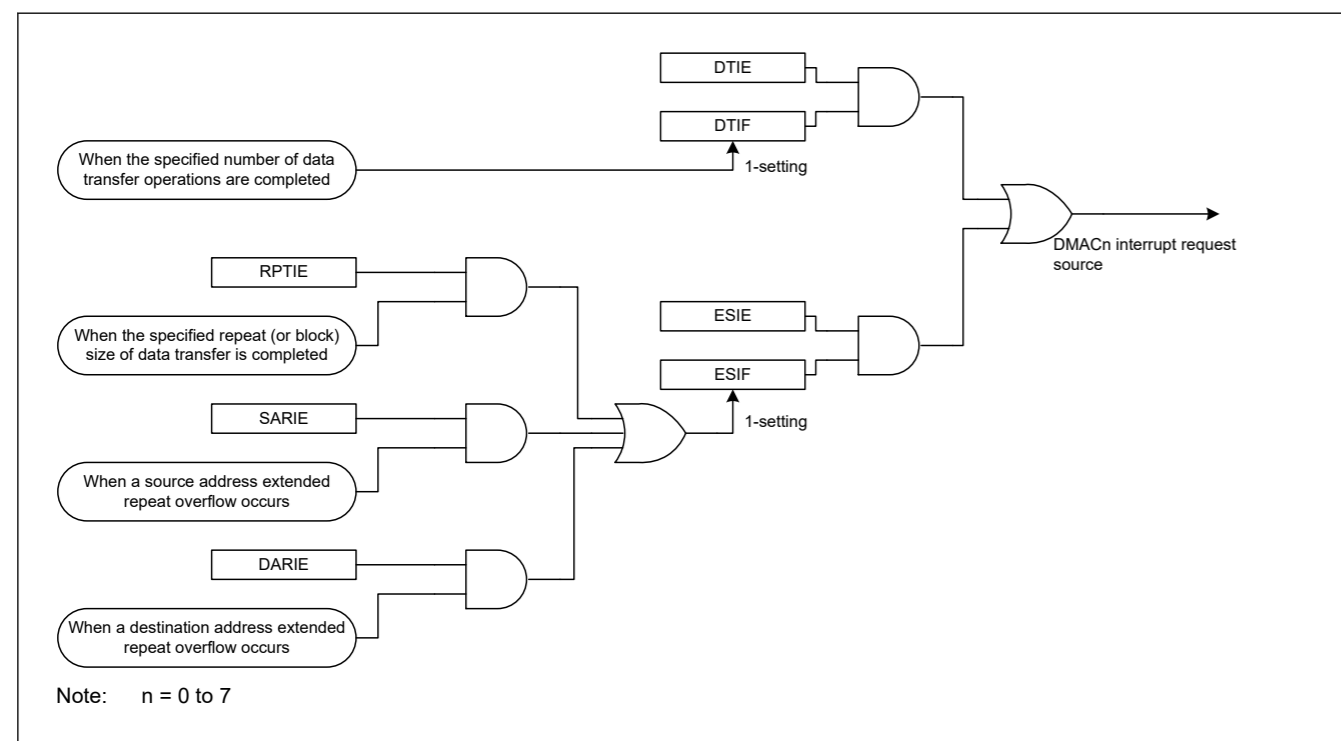

Figure 16.33 Schematic Logic Diagram of Interrupt Output Source (DMACn)

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases:

- When terminating a DMA transfer
- When continuing a DMA transfer

### 16.6.1.1 When Terminating a DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The DMACn remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

### 16.6.1.2 When Continuing a DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically cleared to 0 (interrupt source cleared), and DMA transfer is resumed.

具体来说，在以下两种情况下，不同的程序用于取消中断以重新启动DMA传输：

- 终止DMA传输时
- 继续DMA传输时

### 16.6.1.1 终止DMA传输时

将0写入DMSTS.DTIF标志以清除传输结束中断，写入DMSTS.ESIF标志以清除重复大小中断和扩展重复区域溢出中断。DMACn保持在停止状态。之后开始另一个DMA传输时，设置适当的寄存器，并将DMCNT.DTE位设置为1（启用DMA传输）。

### 16.6.1.2 继续DMA传输时

将1写入DMCNT.DTE位。DMSTS.ESIF标志自动清零（中断源清零），DMA传输恢复。

16.6.2 Transfer Error Interrupt

Error response detection interrupt request (DMA\_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DMAC transfer. The types of interrupts that occur when a DMAC transfer error occurs are listed in the Table 16.22. The Table 16.22 also shows error information stored when a transfer error occurs.

16.6.2 传输错误中断

在DMAC传输期间检测到传输错误时, 从DMACDTC生成错误响应检测中断请求(DMA\_TRANSERR)。发生DMAC传输错误时发生的中断类型在表16.22中列出。表16.22还显示了发生传输错误时存储的错误信息。

注意1.中断, 当NMI请求在检测主MPU错误和Trustzone滤波器错误后选择为操作时中断。通过确认BUS.BUS3ERRSTAT和BUS.DMACDTCERRSTAT, 判断是Master还是Slave。  
 注2.如果错误响应检测中断(DMA\_TRANSERR)发生且MasterMPU的NMI或TrustZoneFilter的NMI未发生, 则将其视为Illegaladdressaccesserror或SlaveBusError。也可以通过BUS.BUS3ERRSTAT和BUS来判断。DMACDTCERRSTAT。

Note that if the bus error occurs when writing the last data of transfer, the transfer end event and the error response detection interrupt (DMA\_TRANSERR) occurs.

## 16.7 Event Link

Each DMAC channel outputs an event link request signal (DMACn\_INT) every time it completes a data transfer, or a block transfer in block transfer mode.

For details, see [section 18, Event Link Controller \(ELC\)](#).

If a bus error occurs when writing the last data of transfer, a transfer end event and error response detection interrupt (DMA\_TRANSERR) occurs.

## 16.8 Low-Power Consumption Function

Before entering the module-stop state or Software Standby mode, or Deep Software Standby mode, you must first set the DMAST.DMST bit to 0 (the DMAC module suspended), and use the settings in the sections that follow.

### (1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DMAC. If a DMA transfer is in progress when 1 is written to the MSTPA22 bit, the transition to the module-stop state proceeds after the DMA transfer ends. Access to the DMAC registers is prohibited while the MSTPA22 bit is 1. Writing 0 to the MSTPA22 bit releases the DMAC from the module-stop state.

### (2) Software Standby mode and Deep Software Standby mode

Use the settings described in [section 10.7.1. Transitioning to Software Standby Mode](#), or in [section 10.9.1. Transitioning to Deep Software Standby Mode](#).

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode or Deep Software Standby mode.

### (3) Notes on low power consumption function

For information on the WFI instruction and register settings, see [section 10.10.7. Timing of WFI Instruction](#).

To perform a DMA transfer after returning from a low power consumption mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in [section 13.4.1. Detecting Interrupts](#), and then execute the WFI instruction.

## 16.9 Usage Notes

### 16.9.1 Access to the Registers during DMA Transfer

Do not write to the following registers while the DMSTS.ACT flag of the same channel is set to 1 (DMAC active state) or the DMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled):

- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR
- DMSBS
- DMDBS
- DMSRR

请注意，如果在写入传输的最后一个数据时发生总线错误，则会发生传输结束事件和错误响应检测中断 (DMA\_TRANSERR)。

## 16.7 活动链接

每个DMAC通道在每次完成数据传输或块传输模式下的块传输时都会输出一个事件链接请求信号(DMACn\_INT)。

有关详细信息，请参阅第18节，事件链接控制器(ELC)。

如果在写入传输的最后一个数据时发生总线错误，则会发生传输结束事件和错误响应检测中断(DMA\_TRANSERR)。

## 16.8 低功耗功能

在进入模块停止状态或软件待机模式或深度软件待机模式之前，您必须先设置DMAST.DMST位为0（DMAC模块挂起），并使用以下部分中的设置。

### (1) Module-stop function

向MSTPCRA.MSTPA22位写入1可启用DMAC的模块停止功能。如果在向MSTPA22位写入1时正在进行DMA传输，则在DMA传输结束后继续转换到模块停止状态。当MSTPA22位为1时，禁止访问DMAC寄存器。将0写入MSTPA22位可将DMAC从模块停止状态释放。

### (2) 软件待机模式和深度软件待机模式

使用第10.7.1节中描述的设置。转换到软件待机模式，或在第10.9.1节中。过渡到深度软件待机模式。

如果在执行WFI指令时DMA传输操作正在进行，则DMA传输在转换到软件待机模式或深度软件待机模式之前完成。

### (3) 低功耗功能注意事项

有关WFI指令和寄存器设置的信息，请参阅第10.10.7节。WFI指令的时间安排。

要在从低功耗模式返回后执行DMA传输，请将DMAST.DMST位再次设置为1。要将在软件待机模式下生成的请求用作对CPU的中断请求但不用作DMAC启动请求，请将CPU指定为中断请求目标，如第13.4.1节所述。检测中断，然后执行WFI指令。

## 16.9 使用说明

### 16.9.1 在DMA传输期间访问寄存器

当同一通道的DMSTS.ACT标志设置为1（DMAC活动状态）或同一通道的DMCNT.DTE位设置为1（启用DMA传输）时，请勿写入以下寄存器：

- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR
- DMSBS
- DMDBS
- DMSRR

- DMDRR
- ICUSARC
- DMACSAR

### 16.9.2 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see [section 4, Address Space](#).

### 16.9.3 Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (ICU.DELSRn n = 0 to 7)

The DMAC event link setting register (ICU.DELSRn) should be set while the DMA transfer enable bit (DMCNT.DTE) is cleared to 0 (DMA transfer is disabled). Moreover, the DTC activation enable register (ICU.IELSRn.DTCE (n = 0 to 95)) that corresponds to the same event number that has been set by the ICU.DELSRn register should not be set to 1. For details on the ICU.IELSRn.DTCE and ICU.DELSRn, see [section 13, Interrupt Controller Unit \(ICU\)](#).

### 16.9.4 Suspending or Restarting DMAC Activation

To suspend a DMAC activation request, write 0x00 to the DMAC Event Link select bits (ICU.DELSRn.DELS[8:0]). To restart the DMA transfer, write the event number to the ICU.DELSRn.DELS[8:0] bits following the settings shown in [section 16.3.10, Activating the DMAC](#).

### 16.9.5 Precautions for Resuming DMA Transfer

A DMAC activation request might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMAC activation request is held in the DMAC. To prevent this, stop the DMAC activation requests by setting the DELSRn.DELS[8:0] bits in the ICU to 0.

When a DMAC activation request occurs after the last round of the DMA transfer is generated, clear the DMAC activation request with either of the following approaches.

- Clear the DMAC activation request with a DMA dummy transfer.
- Set the DMCNT.DTE bit to 0 and then set the ICU.DELSRn.IR flag to 0.

See [Figure 16.35](#).

- DMDRR
- ICUSARC
- DMACSAR

### 16.9.2 DMA传输到保留区域

禁止对保留区域进行DMA传输。如果进行此类访问，则无法保证传输结果。有关保留区域的详细信息，请参阅第4节，地址空间。

### 16.9.3 中断控制器单元的DMAC事件链接设置寄存器的设置(ICU.DELSRn=0到7)

DMAC事件链接设置寄存器(ICU.DELSRn)应在DMA传输启用位(DMCNT.DTE)清除为0(禁用DMA传输)时设置。此外，与已由ICU.DELSRn寄存器设置的相同事件编号对应的DTC激活使能寄存器(ICU.IELSRn.DTCE(n=0至95))不应设置为1。有关ICU的详细信息.IELSRn.DTCE和ICU.DELSRn，请参见第13节，中断控制器单元(ICU)。

### 16.9.4 暂停或重新启动DMAC激活

要暂停DMAC激活请求，请将0x00写入DMAC事件链接选择位(ICU.DELSRn.DELS[8:0])。要重新启动DMA传输，请按照第16.3.10节中所示的设置将事件编号写入ICU.DELSRn.DELS[8:0]位。激活DMAC。

### 16.9.5 恢复DMA传输的注意事项

DMA传输完成后的下一个请求中可能会出现DMAC激活请求。如果发生这种情况，DMA传输开始并且DMAC激活请求被保存在DMAC中。为防止这种情况，请通过将ICU中的DELSRn.DELS[8:0]位设置为0来停止DMAC激活请求。

当最后一轮DMA传输生成后出现DMAC激活请求时，可通过以下任一方法清除DMAC激活请求。

- 使用DMA虚拟传输清除DMAC激活请求。
- 将DMCNT.DTE位设置为0，然后将ICU.DELSRn.IR标志设置为0。

请参见图16.35。

### 17.2 Register Descriptions

MRA, MRB, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

### 17.2 注册说明

MRA、MRB、SAR、DAR、CRA、CRB都是DTC内部寄存器，不能直接从CPU访问。在这些DTC内部寄存器中设置的值作为传输信息放置在SRAM区域中。当产生激活请求时，DTC从SRAM区域读取传输信息并将其设置在其内部寄存器中。数据传输结束后，内部寄存器内容作为传输信息回写到SRAM区域。

## 17.2.6 CRA : DTC Transfer Count Register A

Base address: DTCVBR

Offset address: 0x0E + 0x4 × Vector number  
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table)

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 7:0  | CRAL   | Transfer Counter A Lower Register<br>Specify the transfer count. | —   |
| 15:8 | CRAH   | Transfer Counter A Upper Register<br>Specify the transfer count. | —   |

Note: The function depends on the transfer mode.

Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

The CRA register consists of 16 bits. CRAL is the lower 8 bits and CRAH is the upper 8 bits. CRA is used in normal mode. CRAL and CRAH are used in repeat transfer mode and block transfer mode.

The CRA register cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0E) and DTC transfers it automatically to and from the CRA register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

## (1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, CRA functions as a 16-bit transfer counter. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRA value is decremented (-1) on each data transfer.

## (2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

## (3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register holds the block size and the CRAL register functions as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

## 17.2.7 CRB : DTC Transfer Count Register B

Base address: DTCVBR

Offset address: 0x0C + 0x4 × Vector number  
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table)

The CRB sets the block transfer count for block transfer mode. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used and the set value is ignored.

## 17.2.6 CRA:DTC传输计数寄存器A

Base address: DTCVBR

Offset address: 0x0E+0x4×向量编号 (无法直接从CPU访问。请参阅第17.3.1节。分配传输信息和DTC向量表)

| Bit  | Symbol | Function               | R/W |
|------|--------|------------------------|-----|
| 7:0  | CRAL   | 传送计数器A低位寄存器<br>指定传输计数。 | —   |
| 15:8 | CRAH   | 传送计数器A高位寄存器<br>指定传输计数。 | —   |

Note: 该功能取决于传输模式。

Note: 在重复传输模式和块传输模式下, 将CRAH和CRAL设置为相同的值。

CRA寄存器由16位组成。CRAL是低8位, CRAH是高8位。CRA在正常模式下使用。

CRAL和CRAH用于重复传输模式和块传输模式。

CRA寄存器不能直接从CPU访问。但是, CPU可以访问SRAM区域(传输信息(n)起始地址+0x0E), DTC会自动将其传输到CRA寄存器或从CRA寄存器传输。请参阅第17.3.1节。分配传输信息和DTC向量表。

## (1) 正常传输模式 (MRA.MD[1:0]=00b)

在正常传输模式下, CRA用作16位传输计数器。当设置值为0x0001、0xFFFF和0x0000时, 传输计数分别为1、65535和65536。CRA值在每次数据传输时递减(-1)。

## (2) 重复传输模式(MRA.MD[1:0]=01b)

在重复传输模式下, CRAH寄存器保存传输计数, CRAL寄存器用作8位传输计数器。当设置值为0x01、0xFF和0x00时, 传输计数分别为1、255和256。CRAL值在每次数据传输时递减(-1)。当它达到0x00时, CRAH值被传送到CRAL。

## (3) 块传输模式 (MRA.MD[1:0]=10b)

在块传输模式下, CRAH寄存器保存块大小, CRAL寄存器用作8位块大小计数器。当设置值为0x01、0xFF和0x00时, 传输计数分别为1、255和256。CRAL值在每次数据传输时递减(-1)。当它达到0x00时, CRAH值被传送到CRAL。

## 17.2.7 CRB:DTC传输计数寄存器B

Base address: DTCVBR

Offset address: 0x0C+0x4×向量编号 (无法直接从CPU访问。请参阅第17.3.1节。分配传输信息和DTC向量表)

CRB设置块传输模式的块传输计数。当设置值为0x0001、0xFFFF和0x0000时, 传输计数分别为1、65535和65536。当传输单个块大小的最终数据时, CRB值递减(-1)。When normal transfer mode or repeat transfer mode is selected, this register is not used and the set value is ignored.

The CRB cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0C) and DTC transfers it automatically to and from the CRB register. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#).

| 7:5 | —      | These bits are read as 0. The write value should be 0.  | R/W |

#### RRS bit (DTC Transfer Information Read Skip Enable)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

#### RRS位 (DTC传输信息读取跳过使能)

当向量编号匹配时，RRS位允许跳过传输信息读取。将DTC向量编号与之前激活过程中的向量编号进行比较。当这些向量编号匹配并且RRS位设置为1时，执行DTC数据传输而不读取传输信息。但是，当前一次传输是链式传输时，无论RRS位如何，都会读取传输信息。

如果在前一次正常传输期间传输计数器（CRA寄存器）变为0，并且在前一次块传输期间传输计数器（CRB寄存器）变为0，则无论RRS位的值如何，都将读取传输信息。

#### RRS位 (用于安全的DTC传输信息读取跳过启用)

当向量编号匹配时，RRS位允许跳过传输信息读取。将DTC向量编号与之前激活过程中的向量编号进行比较。当这些向量编号匹配且RRS位为

| Bit | Symbol | Function   | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

#### DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted. If this bit is set to 0 during a data transfer, the accepted transfer request is active until processing completes.

DTCST must be set to 0 before transitioning to one of the following state or mode:

- Module-stop state
- Software Standby mode without Snooze mode transition.
- Deep Software standby mode

For details on these transitions, see [section 17.10. Low Power Consumption Function](#) and [section 10, Low Power Modes](#).

#### VECN[7:0] bits (DTC-Activating Vector Number Monitoring)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the ACT flag is 1, indicating a DTC transfer in progress, and invalid if the ACT flag is 0, indicating no DTC transfer is in progress.

#### ACT flag (DTC Active Flag)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

| Bit | Symbol | Function         | R/W |
|-----|--------|------------------|-----|
| 7:1 | —      | 这些位被读取为0。写入值应为0。 | R/W |

Note: 如果安全属性配置为安全: ●  
允许安全访问和非安全读取访问

- 忽略非安全写入访问, 不会生成TrustZone访问错误。

如果安全属性配置为非安全: ●  
允许安全和非安全访问。

#### DTCST位 (DTC模块启动)

将DTCST位设置为1以使DTC接受传输请求。当该位设置为0时, 不再接受传输请求。如果在数据传输期间该位设置为0, 则接受的传输请求将处于活动状态, 直到处理完成。

在转换到以下状态或模式之一之前, 必须将DTCST设置为0:

- Module-stop state
- 没有贪睡模式转换的软件待机模式。
- 深度软件待机模式

有关这些转换的详细信息, 请参阅第17.10节。低功耗功能和第10节, 低功耗模式。

### 17.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit to 1 enables activation of the DTC by the associated interrupt. The selector output  $n$  number set in ICU.IELSRn is defined as the interrupt vector number, where  $n = 0$  to 95. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number  $n$  is selected in ICU.IELSRn.IELS[8:0] where  $n = 0$  to 95, as listed in [section 13.3.2. Event Number](#) in [section 13, Interrupt Controller Unit \(ICU\)](#). For activation by software, see [section 18.2.2. ELSEGRn : Event Link Software Event Generation Register n \(n = 0, 1\)](#).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepted an activation request, it does not accept another activation request until transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DTC transfer, a highest priority request is accepted on completion of the transfer. When multiple activation requests are generated while the DTC Module Start bit (DTCST.DTCST) is 0, the DTC accepts the highest priority request when DTCST.DTCST is subsequently set to 1. The smaller interrupt vector number has higher priority.

The DTC performs the following operations at the start of a single data transfer or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer
- For other transfers, the ICU.IELSRn.IR flag of the activation source is set to 0 at the start of the data transfer.

#### 17.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

DTC has two vector tables, non-secure side or secure side. Because the interrupt vector number that serves as a trigger for DTC is divided into non-secure or secure. Place the vector table of the interrupt vector number of SA = 1 in DTCVBR which is the non-secure side. Place the vector table of interrupt number SA = 0 in DTCVBR\_SEC which is the secure side.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. In the SRAM area, the start address of the transfer information  $n$  with vector number  $n$  must be  $4n$  added to the base address in the vector table.

[section 17.3.1. Allocating Transfer Information and DTC Vector Table](#) shows the relationship between the DTC vector table and transfer information. [Figure 17.3](#) shows the allocation of transfer information in the SRAM area.

将0写入DTESTA将被忽略。

当在MPU.MMPUOAD.OAD和TZF.TZFOAD.OAD中选择了复位时，由于该寄存器也被复位。请选择NMI当你想调试程序时。

[Set condition]

- 发生DMAC传输错误时。

[Clearing condition]

- 当1写入DTEVR.DTESTA时。

Note: 当DTEVSAM=1时，可以在安全状态和非安全状态下清零。DTEVSAM=0，在非安全状态下不能清零。

### 17.3 激活源

DTC由中断请求激活。将ICU.IELSRn.DTCE位设置为1可以通过相关中断激活DTC。ICU.IELSRn中设置的选择器输出 $n$ 个数被定义为中断向量号，其中 $n=0$ 到95。对于一个使能的中断，在ICU.IELSRn.IELS中选择与每个中断向量号 $n$ 相关的特定DTC中断源[8:0]其中 $n=0$ 到95，如第13.3.2节中所列。第13节，中断控制器单元(ICU)中的事件编号。关于通过软件激活，请参见第18.2.2节。ELSEGRn：事件链接软件事件生成寄存器 $n(n=0, 1)$ 。

中断向量编号相当于DTC向量表编号。在DTC接受激活请求后，它不会接受另一个激活请求，直到该单个请求的传输完成，无论请求的优先级如何。如果在DTC传输期间生成多个激活请求，则在传输完成时接受最高优先级的请求。当DTC模块起始位(DTCST.DTCST)为0时产生多个激活请求时，当DTCST.DTCST随后设置为1时，DTC接受最高优先级请求。较小的中断向量编号具有较高的优先级。

DTC在单次数据传输开始时执行以下操作，或者对于链式传输，在最后一次连续传输之后执行以下操作：

- 完成指定轮次的数据传输后，ICU.IELSRn.DTCE位设置为0，并向CPU发送中断请求
- 如果MRB.DISEL位为1，则在数据传输完成时向CPU发送中断请求
- 对于其他传输，激活源的ICU.IELSRn.IR标志在数据传输开始时设置为0。

#### 17.3.1 分配传输信息和DTC向量表

DTC从向量表中读取与每个激活源相关联的传输信息的起始地址，并读取从该地址开始的传输信息。

DTC有两个向量表，非安全端或安全端。因为作为DTC触发的中断向量号分为非安全和安全。将SA=1的中断向量号的向量表放在非安全端DTCVBR中。将中断号SA=0的向量表放在安全侧DTCVBR\_SEC中。

向量表的定位必须使基地址（起始地址）的低10位为0。使用DTC向量基址寄存器(DTCVBR)设置DTC向量表的基地址。传输信息分配在SRAM区域中。在SRAM区域中，向量编号为 $n$ 的传输信息 $n$ 的起始地址必须与向量表中的基地址相加 $4n$ 。

[第17.3.1节. 分配传输信息和DTC向量表](#)显示了DTC向量表和传输信息之间的关系。图17.3显示了SRAM区域中传输信息的分配。

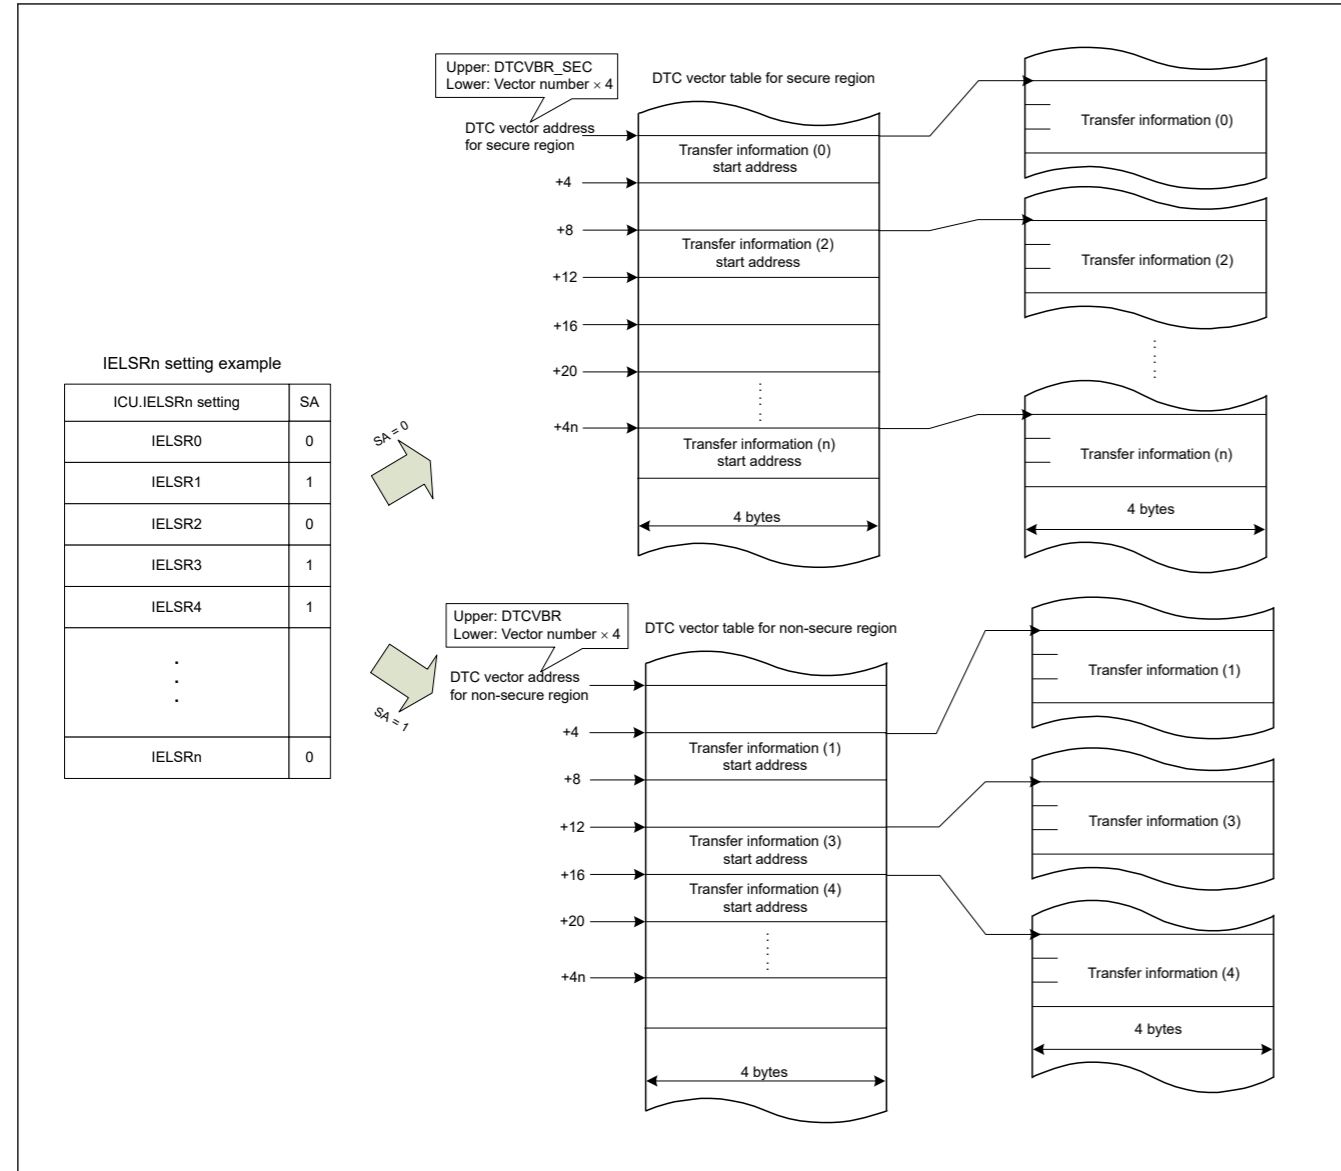

Figure 17.2 DTC vector table and transfer information

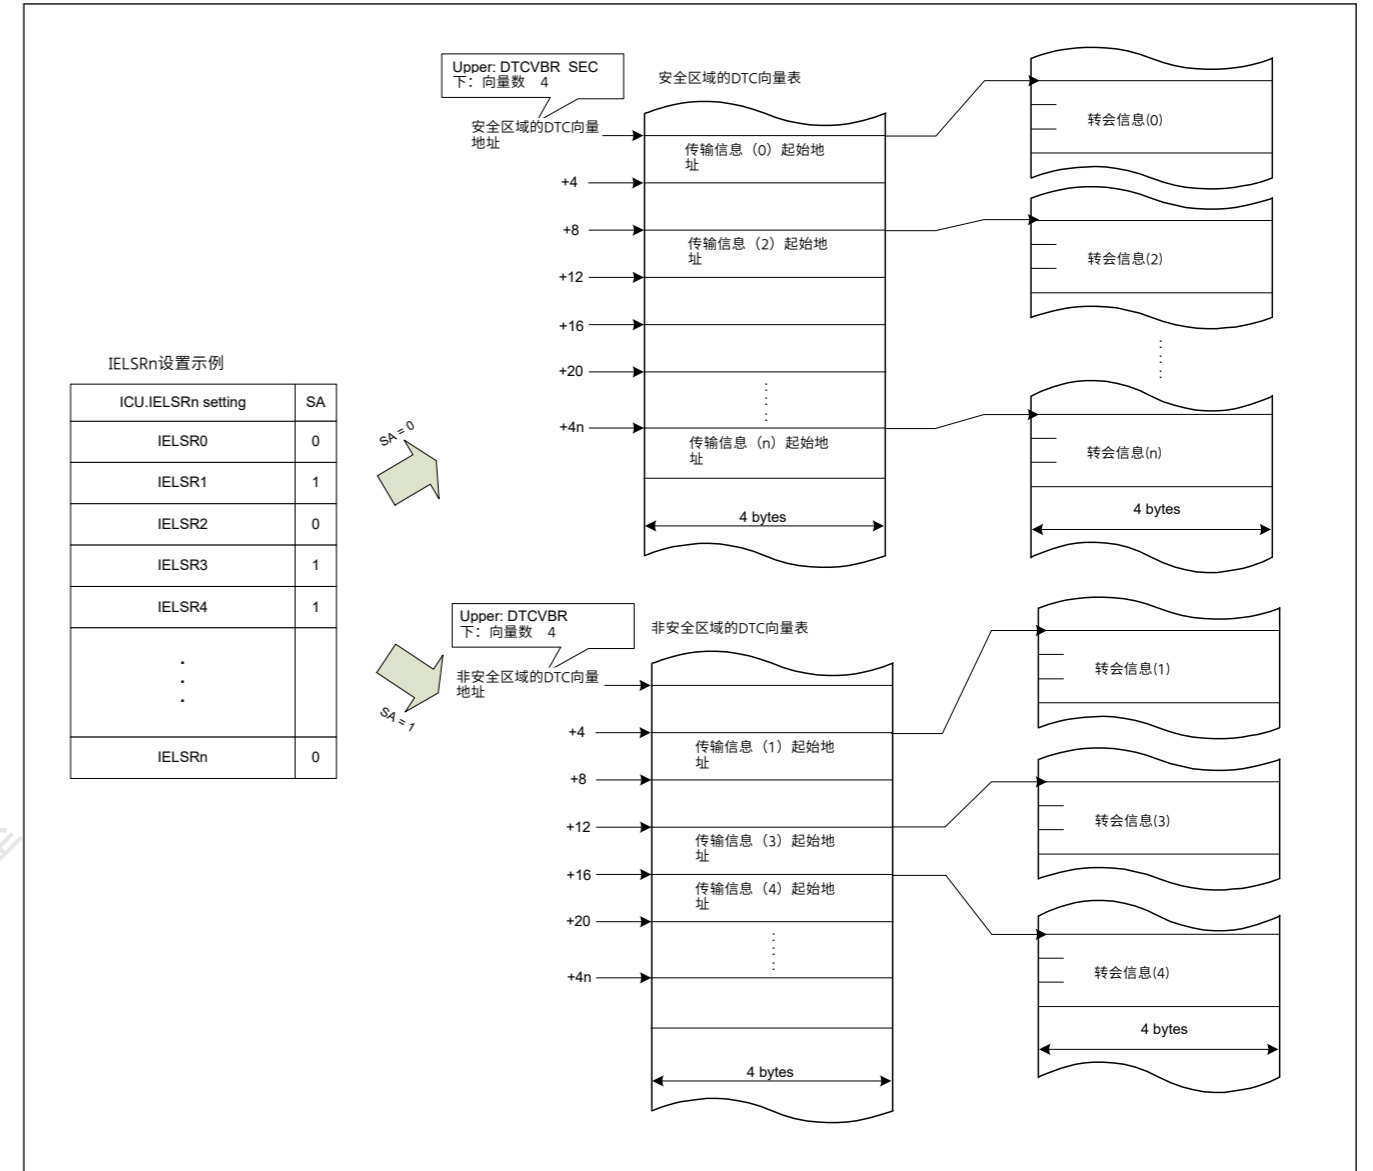

Figure 17.2 DTC向量表和传输信息

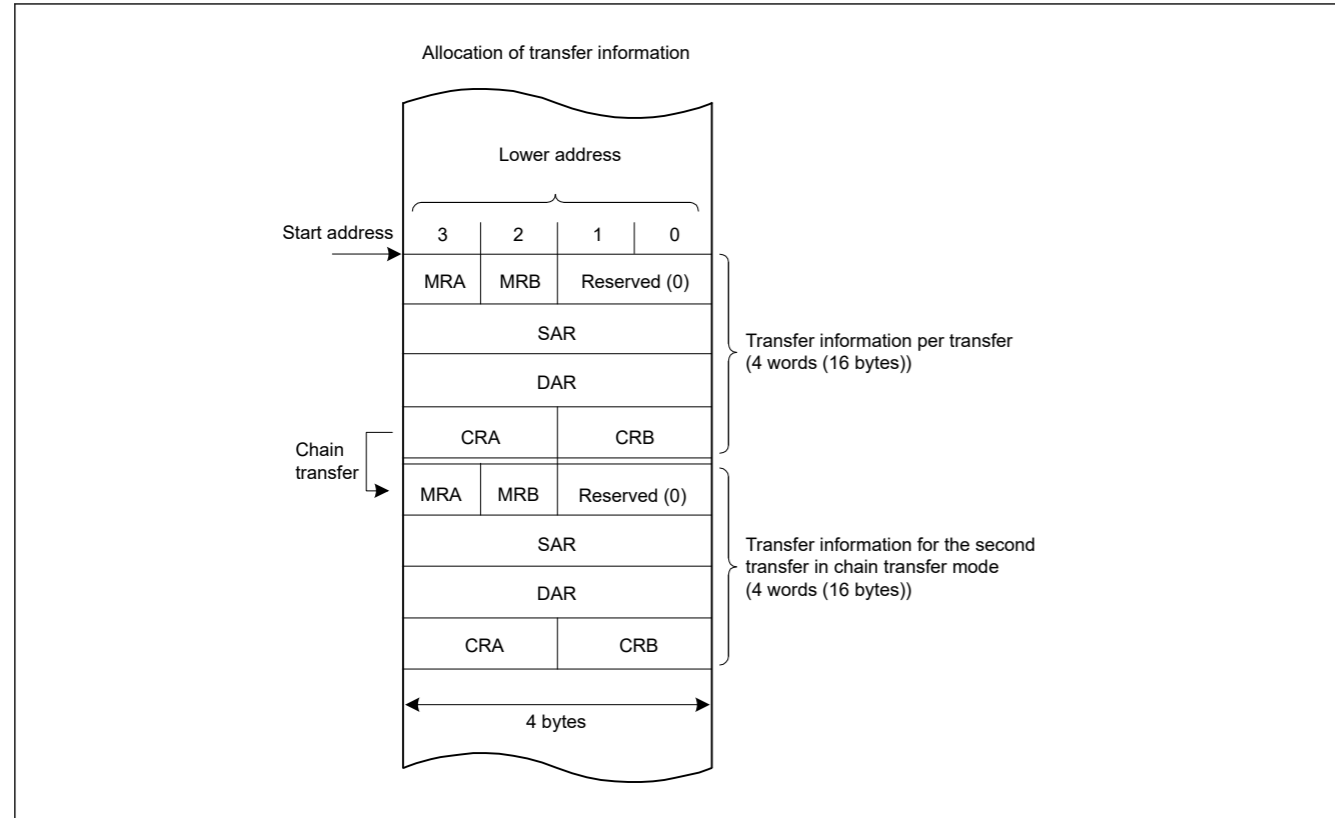

Figure 17.3 Allocation of transfer information in the SRAM area

### 17.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values of these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 17.2 describes the DTC transfer modes.

Table 17.2 DTC transfer modes

| Transfer mode          | Data size transferred on single transfer request  | Increment or decrement of memory address                  | Settable transfer count |
|------------------------|---|---|-------------------------|
| Normal transfer mode   | 1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit)  | Incremented or decremented by 1, 2, or 4 or address fixed | 1 to 65536              |
| Repeat transfer mode*1 | 1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit)  | Incremented or decremented by 1, 2, or 4 or address fixed | 1 to 256 <sup>3</sup>   |

 Note 2. Set the transfer source or transfer destination as the block area.

### 17.4 Operation

DTC根据传输信息传输数据。在进行DTC操作之前，需要在SRAM区域中存储传输信息。当DTC被激活时，它会读取与向量编号相关联的DTC向量。DTC从DTC向量引用的传输信息存储地址中读取传输信息并传输数据。数据传输后，DTC写回传输信息。将传输信息存储在SRAM区域中可以实现任意数量的通道的数据传输。

传输模式包括：

- 普通传输模式
- 重复传输模式
- 块传输模式。

DTC指定SAR寄存器中的传输源地址和DAR寄存器中的传输目标地址。这些寄存器的值在数据传输后独立地递增、递减或固定地址。

表17.2描述了DTC传输模式。

Table 17.2 DTC传输模式

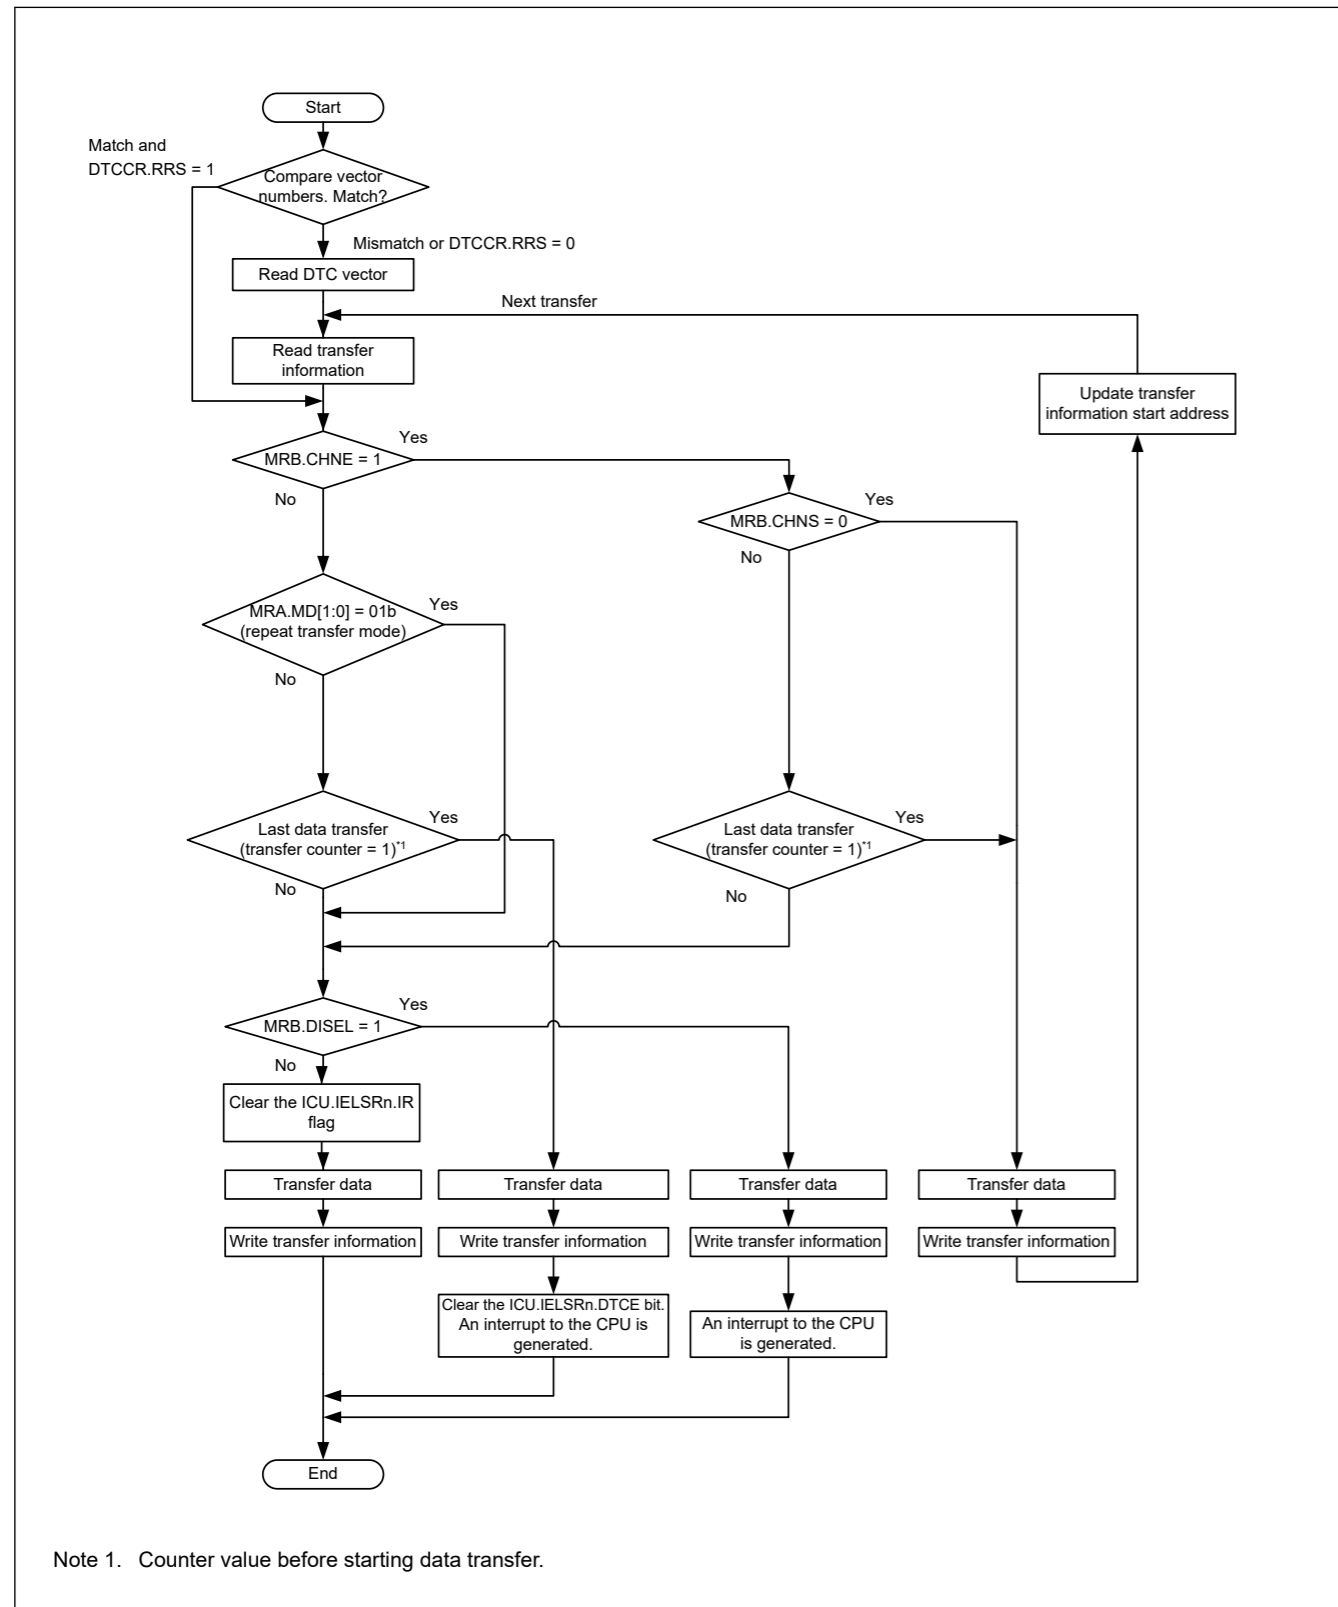

| 传输模式     | 在单个传输请求上传的数据大小  | 内存地址的递增或递减      | 可设置的传输次数              |
|----------|---|-----------------|-----------------------|
| 正常传输模式   | 1个字节 (8位)、1个半字 (16位)、1个字 (32位)                              | 递增或递减1、2或4或固定地址 | 1 to 65536            |
| 重复传输模式*1 | 1个字节 (8位)、1个半字 (16位)、1个字 (32位)                              | 递增或递减1、2或4或固定地址 | 1 to 256 <sup>3</sup> |
| 块传输模式*2  | CRAH中指定的块大小 (1到256字节、1到256个半字 (2到512字节) 或1到256字 (4到1024字节)) | 递增或递减1、2或4或固定地址 | 1 to 65536            |

注1.将传输源或传输目标设置为重复区域。注2.将传输源或传输目标设置为块区域。

Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

Figure 17.4 shows the operation flow of the DTC. Table 17.3 lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.

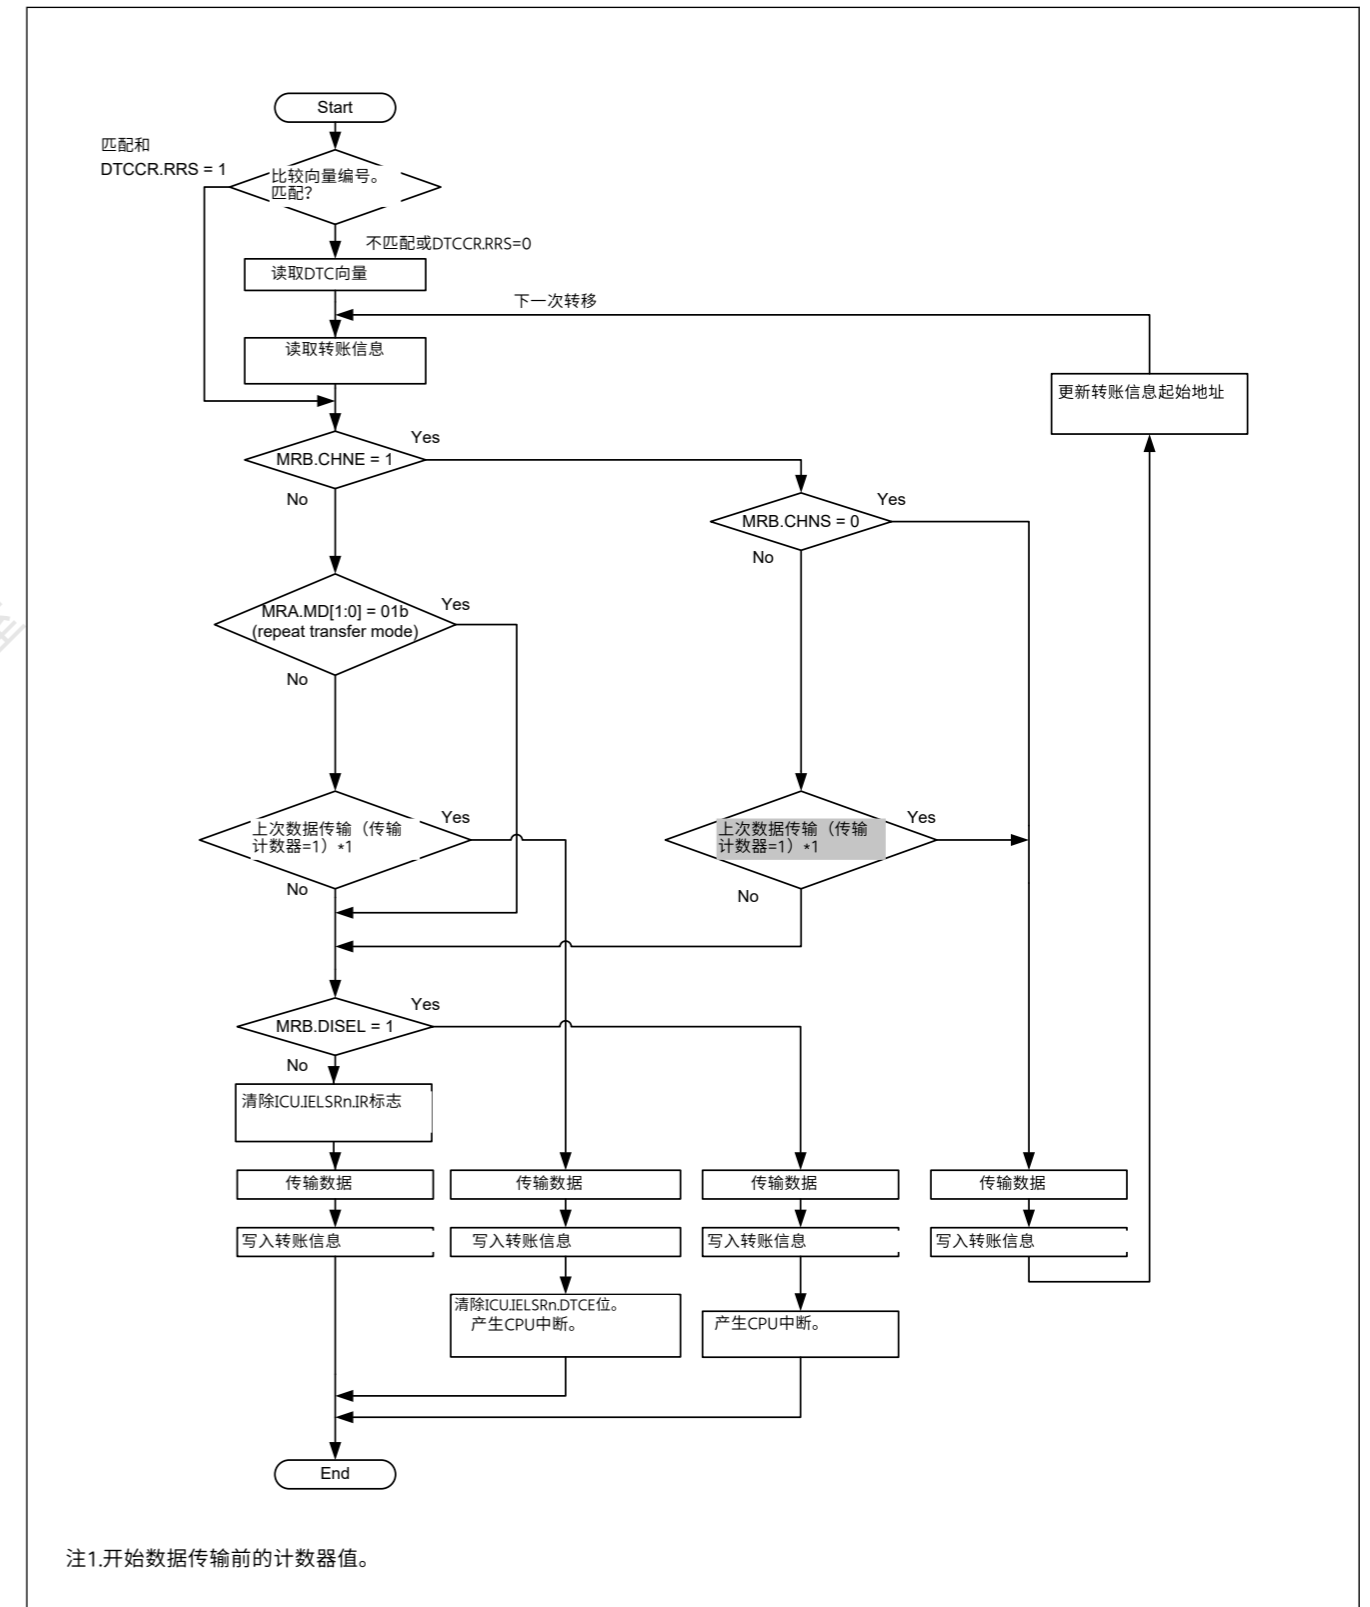

Note 1. Counter value before starting data transfer.

注3.指定计数的数据传输后，恢复初始状态并重新开始操作。

将MRB.CHNE位设置为1允许在单个激活源上进行多次传输或链式传输。当指定的数据传输完成时，它还启用链式传输。

图17.4显示了DTC的操作流程。表17.3列出了链转移条件。该表中省略了用于第二次和后续传输的控制信息的组合。

Note 1. The transfer counter used depends on the transfer modes as follows:

- Normal transfer mode — CRA register
- Repeat transfer mode — CRAL register
- Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:

- 1 → 0 in normal and block transfer modes
- 1 → CRAH in repeat transfer mode
- (1 → \*) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE = 1 is omitted.

### 17.4.1 Transfer Information Read Skip Function

Reading of vector addresses and transfer information can be skipped by setting the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared with the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, and when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the RRS bit. Figure 17.12 shows an example of a transfer information read skip.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

### 17.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to address fixed, a part of the transfer information is not written back. Table 17.4 lists the transfer information write-back skip conditions and the associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

### 17.4.1 传输信息读取跳过功能

通过设置DTCCR.RRS位可以跳过向量地址和传输信息的读取。当产生DTC激活请求时, 将当前DTC向量编号与之前激活过程中的DTC向量编号进行比较。当这些向量编号匹配且RRS位设置为1时, 执行DTC数据传输而不读取向量地址和传输信息。但是, 当上一次传输是链式传输时, 会读取向量地址和传输信息。此外, 如果在上次正常传输期间传输计数器 (CRA寄存器) 变为0, 并且在前一次块传输期间传输计数器 (CRB寄存器) 变为0, 则无论RRS位如何, 都将读取传输信息。图17.12显示了传输信息读取跳过的示例。

要更新向量表和传输信息, 请将RRS位设置为0, 更新向量表和传输信息, 然后将RRS位设置为1。通过将RRS位设置为0, 丢弃存储的向量编号。更新的DTC向量在下一个激活过程中读取表和传输信息。

### 17.4.2 传输信息回写跳过功能

当MRA.SM[1:0]位或MRB.DM[1:0]位设置为地址固定时, 部分传输信息不会被写回。表17.4列出了传输信息回写跳过条件和相关寄存器。回写CRA和CRB寄存器, 跳过回写MRA和MRB寄存器。

### 17.4.3 Normal Transfer Mode

The normal transfer mode allows a 1-byte (8 bit), 1-halfword (16 bit), 1-word (32 bit) data transfer on a single activation source. The transfer count can be set to 1 to 65536. Transfer source and destination addresses can be independently set to increment, decrement, or fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

Table 17.5 lists register functions in normal transfer mode, and Figure 17.5 shows the memory map of normal transfer mode.

### 17.4.3 正常传输模式

正常传输模式允许在单个激活源上传输1字节（8位）、1半字（16位）、1字（32位）数据。传输计数可以设置为1到65536。传输源地址和目标地址可以独立设置为递增、递减或固定。此模式允许在指定计数传输结束时向CPU生成中断请求。

表17.5列出了正常传输模式下的寄存器功能，图17.5显示了正常传输模式下的内存映射。

#### 17.4.4 Repeat Transfer Mode

The repeat transfer mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. Transfer source or transfer destination for the repeat area must be specified in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified transfer count is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 0x00 in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not clear to 0x00, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer completes.

Table 17.6 lists the register functions in repeat transfer mode, and Figure 17.6 shows the memory map of repeat transfer mode.

#### 17.4.4 重复传输模式

重复传输模式允许在单个激活源上传输1字节（8位）、1半字（16位）或1字（32位）数据。重复区域的传输源或传输目标必须在MRB.DTS位中指定。传输计数可设置为1到256。当指定的传输计数完成时，将恢复重复区域中指定的地址寄存器的初始值，恢复传输计数器的初始值，并重复传输。另一个地址寄存器连续递增或递减或保持不变。

当传输计数器CRAL在重复传输模式下递减到0x00时，CRAL值将更新为CRAH寄存器中设置的值。因此，传输计数器不会清为0x00，这会在MRB.DISEL位设置为0时禁用对CPU的中断请求。当指定的数据传输完成时，会向CPU发出中断请求。

表17.6列出了重复传输模式下的寄存器功能，图17.6显示了重复传输模式的内存映射。

### 17.4.5 Block Transfer Mode

The block transfer mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS = 1 or the DAR register when the DTS = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 17.7 lists the register functions in block transfer mode, and Figure 17.7 shows the memory map for block transfer mode.

### 17.4.5 块传输模式

块传输模式允许在单个激活源上进行单块数据传输。块区域的传输源或传输目标必须在MRB.DTS位中指定。块大小可以设置为1到256字节、1到256个半字（2到512字节）或1到256字（4到1024字节）。当指定块的传送完成时，块区域中指定的块大小计数器CRAL和地址寄存器（MRB.DTS=1时为SAR寄存器或DTS=0时为DAR寄存器）的初始值被恢复。另一个地址寄存器连续递增或递减或保持不变。

传输计数（块计数）可设置为1到65536。此模式允许在指定计数块传输结束时向CPU生成中断请求。

表17.7列出了块传输模式下的寄存器功能，图17.7显示了块传输模式下的存储器映射。

#### 17.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If the MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of rounds of transfer or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR flag of the activation source.

The SAR, DAR, CRA, CRB, MRA, and MRB registers can be set independently of each other to define the data transfer. Figure 17.8 shows a chain transfer operation.

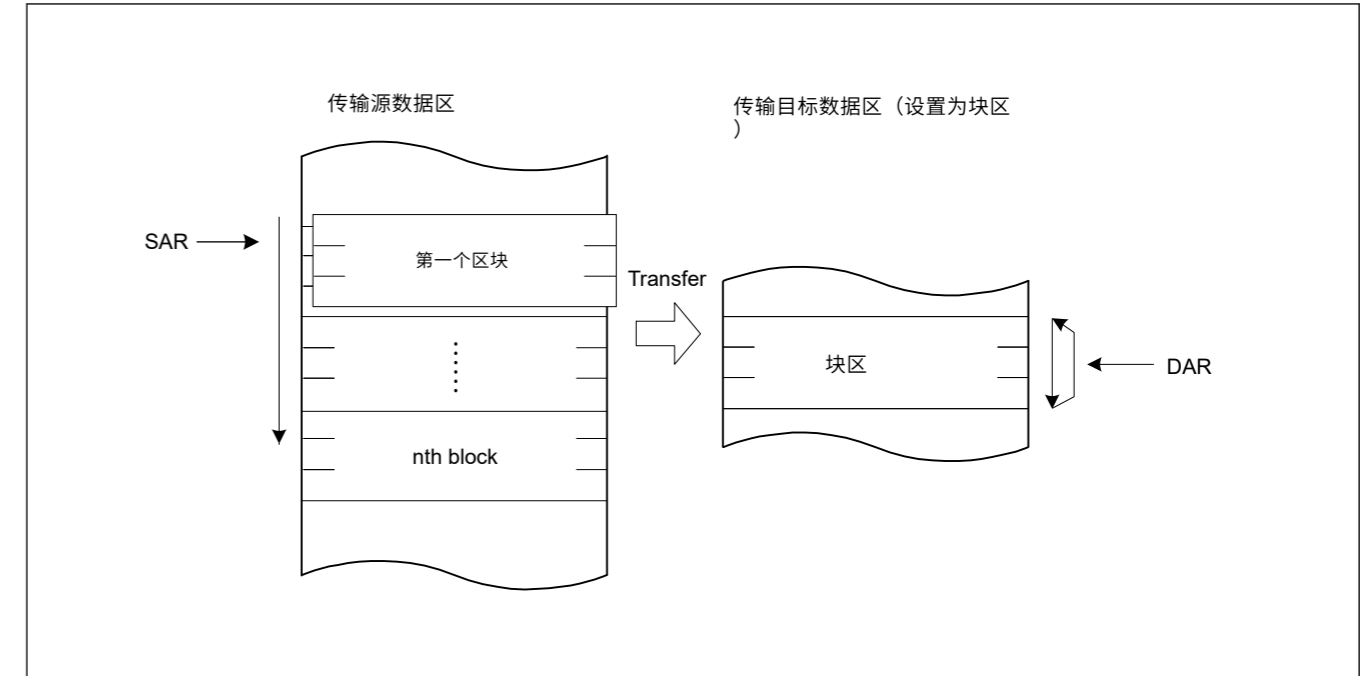

Figure 17.7 块传输模式的内存映射

#### 17.4.6 链转移

将MRB.CHNE位设置为1允许在单个激活源上连续执行链传输。如果MRB.CHNE设置为1，CHNS设置为0，则在完成指定的传输轮数或将MRB.DISEL位设置为1时不会向CPU产生中断请求。中断请求被发送到每次执行DTC数据传输时CPU。数据传输对激活源的ICU.IELSRn.IR标志没有影响。

SAR、DAR、CRA、CRB、MRA和MRB寄存器可以相互独立设置以定义数据传输。图17.8显示了链式转移操作。

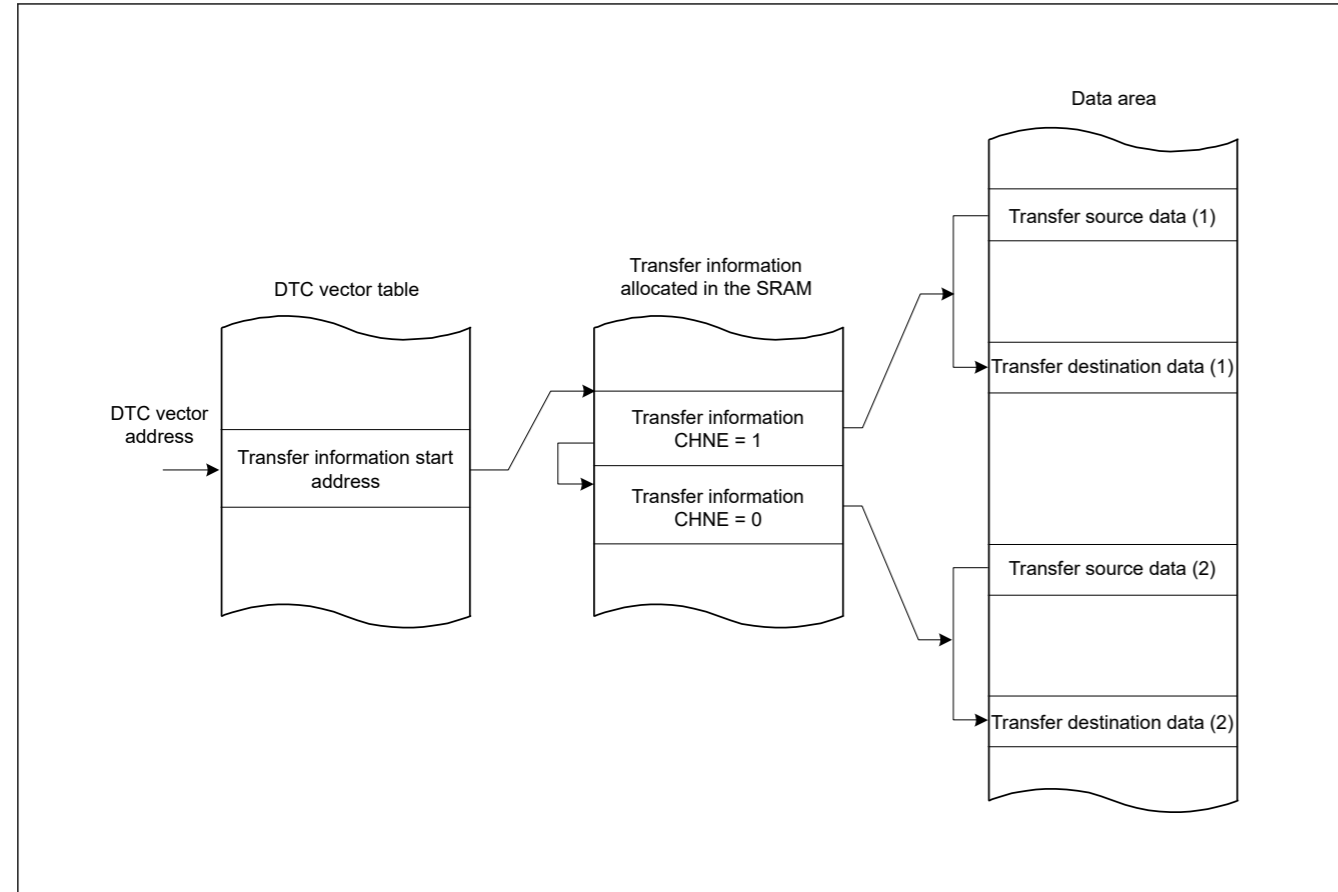

Figure 17.8 Chain transfer operation

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see Table 17.2.

17.4.7 Operation Timing

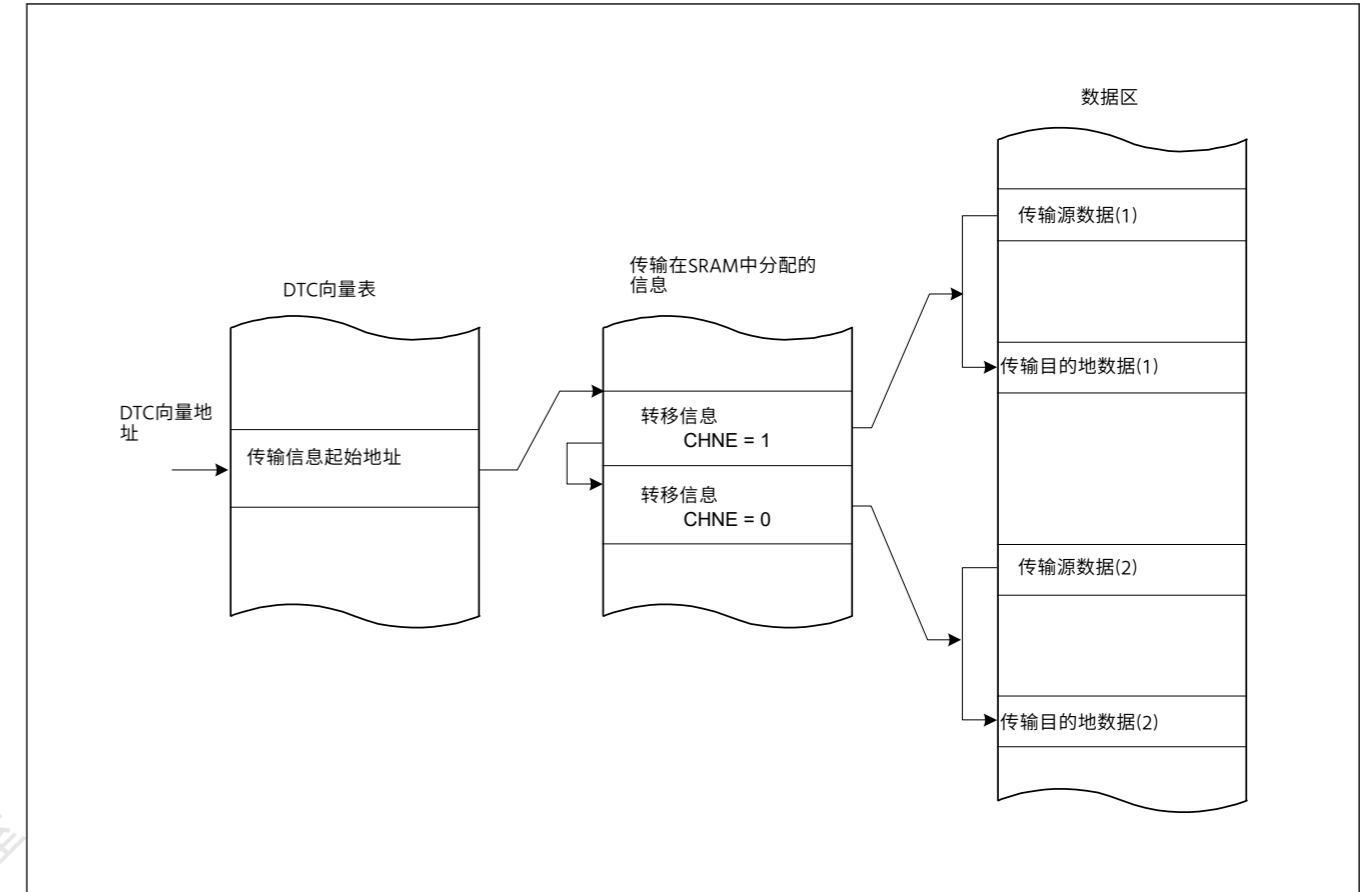

Figure 17.8 链转移操作

将1写入MRB.CHNE和CHNS位可以使链式传输仅在完成指定的数据传输后执行。在重复传输模式下，在完成指定的数据传输后执行链式传输。有关链转移条件的详细信息，请参见表17.2。

P: Block size (initial settings of CRAH and CRAL)

Cv: Cycles for access to vector transfer information storage destination

Ci: Cycles for access to transfer information storage destination address

Cr: Cycles for access to data read destination

Cw: Cycles for access to data write destination

The unit is for system clocks (ICLK) + 1 in the Vector read, Transfer information read, and Data transfer read columns and 2 in the Internal operation column.

Cv, Ci, Cr, and Cw vary depending on the corresponding access destination. For the number of cycles for respective access destinations, see [section 42, SRAM](#), [section 44, Flash Memory](#), and [section 14, Buses](#).

The frequency ratio of the system clock and peripheral clock is also taken into consideration.

The DTC response time is the time from when the DTC activation source is detected until DTC transfer starts.

[Table 17.8](#) does not include the time until DTC data transfer starts after the DTC activation source becomes active.

Note 2. When neither SAR nor DAR is set to address-fixed mode.

Note 3. When SAR or DAR is set to address-fixed mode.

Note 4. When SAR and DAR are set to address-fixed mode.

Note 5. When the block size is 2 or more. If the block size is 1, the cycle number for normal transfer applies.

#### 17.4.9 DTC Bus Mastership Release Timing

The DTC does not release the bus mastership during transfer information reads. Before the transfer information is read or written, the bus is arbitrated according to the priority determined by the bus master arbitrator. For bus arbitration, see [section 14, Buses](#).

#### 17.4.10 Vector Security

The security attribute of transfer access of DTC vector n and security attribute of access to the IELSRn(n = 0 to 95) register of ICU are controlled by SAIELSRn bit of ICUSARx(x = G, H or I) registers in CPSCU. For details on the CPSCU.ICUSARx registers, see [section 13, Interrupt Controller Unit \(ICU\)](#).

When the CPSCU.ICUSARx.SAIELSRn bit is 0, transfer of DTC vector n is secure access for both read and write. At the same time, the IELSRn register are protected from a non-secure access.

When the CPSCU.ICUSARx.SAIELSRn bit is 1, transfer of DTC vector n is non-secure access for both read and write. At the same time, the IELSRn register are non-secure attributes.

Do not write to the CPSCU.ICUSARx.SAIELSRn bit while DTC transfer is enabled or a bus master is writing to the DTC registers of same channel.

[section 17.3.1. Allocating Transfer Information and DTC Vector Table](#) shows security attribute about each DTC vectors.

#### 17.4.11 Master TrustZone Filter in DTC

DTC has the Master TrustZone Filter. The Master TrustZone Filter in DTC can detect the security areas of Flash area (code Flash and data Flash) and SRAM area (ECC / Parity RAM) defined by IDAU. When no-secure accesses those addresses, it detects the security violation. Access of violation address is not performed. Detected the error is handled as the Master TrustZone Filter error.

#### 17.5 DTC Setting Procedure

Before using the DTC, set the DTC Vector Base Register (DTCVBR). Set the ICU.IELSRn.IELS[8:0] bits to 0 to disable the interrupt in the NVIC and follow the procedure in [Table 17.9](#) to set the DTC.

**Table 17.8 DTC的执行周期**

P: 块大小 (CRAH和CRAL的初始设置)

Cv: 访问向量传输信息存储目标的周期 Ci: 访问传输信息存储目标地址的周期

Cr: 访问数据读取目标的周期 Cw: 访问数据写入目标的周期

单位为系统时钟(ICLK)+1在Vectorread、Transferinformationread和Datatransferread列中和2在内部操作列中。Cv、Ci、Cr和Cw根据相应的访问目的地而变化。有关各个访问目标的周期数,请参见第42节SRAM、第44节闪存和第14节总线。系统时钟和外设时钟的频率比也被考虑在内。

DTC响应时间是从检测到DTC激活源到DTC传输开始的时间。

表17.8不包括从DTC激活源激活到DTC数据传输开始的时间。

注3. 当SAR或DAR设置为地址固定模式时。

注4. 当SAR和DAR设置为地址固定模式时。

注5. 当块大小为2或更大时。如果块大小为1,则适用正常传输的周期数。

#### 17.4.9 DTC总线主控释放时序

在传输信息读取期间, DTC不会释放总线主控权。在读取或写入传输信息之前, 根据总线主仲裁器确定的优先级对总线进行仲裁。对于总线仲裁, 请参见第14节, 总线。

#### 17.4.10 矢量安全

DTC向量n的传输访问的安全属性和对ICU的IELSRn(n=0到95)寄存器的访问的安全属性由CPSCU中ICUSARx(x=G,H或I)寄存器的SAIELSRn位控制。有关CPSCU.ICUSARx寄存器的详细信息, 请参见第13节, 中断控制器单元(ICU)。

当CPSCU.ICUSARx.SAIELSRn位为0时, DTC向量n的传输对于读和写都是安全访问。同时, 保护IELSRn寄存器免受非安全访问。

当CPSCU.ICUSARx.SAIELSRn位为1时, DTC向量n的传输对于读取和写入都是非安全访问。同时, IELSRn寄存器是非安全属性。

当DTC传输使能或总线主机正在写入同一通道的DTC寄存器时, 请勿写入CPSCU.ICUSARx.SAIELSRn位。

[第17.3.1节. 分配传输信息和DTC向量表](#)显示每个DTC向量的安全属性。

#### 17.4.11 DTC中的主TrustZone过滤器

DTC具有MasterTrustZone过滤器。DTC中的MasterTrustZoneFilter可以检测IDAU定义的Flash区域(代码Flash和数据Flash)和SRAM区域(ECCParityRAM)的安全区域。当no-secure访问这些地址时, 它会检测到安全违规。不执行违规地址的访问。检测到的错误作为MasterTrustZoneFilter错误处理。

#### 17.5 DTC设置程序

在使用DTC之前, 请设置DTC向量基址寄存器(DTCVBR)。将ICU.IELSRn.IELS[8:0]位设置为0以禁用NVIC中的中断, 并按照表17.9中的程序设置DTC。

Table 17.9 DTC setting procedure

| No. | Step Name  | Description  |
|-----|--|--|
| 1   | Set the DTCCR <sup>*1</sup> .RRS bit to 0  | Set the DTCCR <sup>*1</sup> .RRS bit to 0 to reset the transfer information read skip flag. | 2   | Set transfer information (MRA, MRB, SAR, DAR, CRA, and CRB)  | Allocate transfer information (MRA, MRB, SAR, DAR, CRA, and CRB) in the data area. Event Number</a> in <a href="#">section 13, Interrupt Controller Unit (ICU)</a> .   |
| 6   | Set the enable bit for an activation source interrupt  | Set the enable bit for the activation source interrupts to 1. When a source interrupt is generated, the DTC is activated. To set the interrupt source enable bit, see the settings for the modules that are to be the activation sources.  |
| 7   | Set the DTCST.DTCST bit to 1   | Set the DTC Module Start bit (DTCST.DTCST) to 1.   |

Note: The DTCST.DTCST bit can be set even if the setting for each activation source is not completed.

Note: When used in non-secure state, DTCSAR.DTCSTSA = 1 or DTCST.DTCST = 1 must be set.

Note 1. When used in secure state, access DTCCR\_SEC instead of DTCCR.

## 17.6 Examples of DTC Usage

### 17.6.1 Normal Transfer

This section provides an example of DTC usage and its application when receiving 128 bytes of data from an SCI.

#### (1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0x0080) in the CRA register. The CRB register can be set to any value.

#### (2) DTC vector table settings

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

#### (3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS[8:0] as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

#### (4) SCI settings

Enable the SCIn\_RXI interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

## 17.6 DTC使用示例

### 17.6.1 正常转移

本节提供从SCI接收128字节数据时的DTC用法及其应用示例。

#### (1) 传输信息设置

在MRA寄存器中，选择固定源地址 (MRA.SM[1:0]=00b)、正常传输模式 (MRA.MD[1:0]=00b) 和字节大小传输 (MRA.SZ[1:0]=00b)。在MRB寄存器中，指定目标地址的递增 (MRB.DM[1:0]=10b) 和单个中断的单个数据传输 (MRB.CHNE=0和MRB.DISEL=0)。MRB.DTS位可以设置为任何值。在SAR寄存器中设置SCI的RDR寄存器地址，

SRAM区域用于DAR寄存器中的数据存储，以及CRA寄存器中的128(0x0080)。CRB寄存器可以设置为任何值。

#### (2) DTC向量表设置

RXI中断的传输信息的起始地址在DTC的向量表中设置。

#### (3) ICU设置和DTC模块激活

将ICU.IELSRn.DTCE位设置为1，并将ICU.IELSRn.IELS[8:0]设置为SCI中断。必须在NVIC中启用中断。将DTCST.DTCST位设置为1。

#### (4) SCI设置

通过将SCI中的SCR.RIE位设置为1来使能SCIn\_RXI中断。如果在SCI接收操作期间发生接收错误，则接收停止。要管理此问题，请使用允许CPU接受接收错误中断的设置。

### (5) DTC transfer

Each time a reception of 1 byte by the SCI is complete, an SCIn\_RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

### (6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an SCIn\_RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

## 17.6.2 Chain transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for the GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPTm.GTCCRC register (m = 320 to 323, 164 to 167). For the second transfer, normal transfer mode is specified for transfer to the GPTm.GTCCRE register (m = 320 to 323, 164 to 167). For the third transfer of the chained transfer, normal transfer mode for transfer to the GPTm.GTPBR register (m = 320 to 323, 164 to 167) is specified. This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfer while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with the GPT320.GTPR register as an activating source for the DTC.

#### (1) First transfer information setting

Set up transfer to the GPT320.GTCCRC register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRC register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

#### (2) Second transfer information setting

Set up for transfer to the GPT320.GTCCRE register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1, MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRE register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

#### (3) Third transfer information set

Set up transfer to the GPT320.GTPBR register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up single data transfer per interrupt (MRB.CHNE = 0, MRB.DISEL = 0). The MRB.DTS bit can be set to any value.

### (5) DTC transfer

每次SCI完成1个字节的接收,就会产生一个SCIn\_RXI中断来激活DTC。DTC将接收到的字节从SCI的RDR传输到SRAM,之后DAR寄存器递增,CRA寄存器递减。

### (6) 中断处理

在128轮数据传输完成且CRA寄存器中的值变为0后,向CPU产生SCIn\_RXI中断请求。完成该中断处理程序中的处理。

## 17.6.2 链式转移

本节提供了一个DTC链式转移的示例,并描述了它在General输出脉冲中的使用。您可以使用链式转移来传输PWM定时器比较数据并更改GPT的PWM定时器的周期。

对于第一个链式转移,指定正常传输模式以传输到GPTm.GTCCRC寄存器(m=320到323、164到167)。对于第二次转移,指定正常传输模式以传输到GPTm.GTCCRE寄存器(m=320到323、164到167)。对于链式转移的第三次转移,指定用于传输到GPTm.GTPBR寄存器(m=320至323、164至167)的正常传输模式。这是因为在完成指定数量的传输时清除激活源和产生中断仅限于链式转移的第三个,即在MRB.CHNE=0时传输。

以下示例显示如何使用GPT320.GTPR寄存器的计数器溢出中断作为DTC的激活源。

#### (1) 首次转账信息设置

- 2.将传输设置为正常传输模式(MRA.MD[1:0]=00b)和字长传输(MRA.SZ[1:0]=10b)。
- 3.在MRB寄存器中,选择固定的目标地址(MRB.DM[1:0]=00b)并设置链式转移(MRB.CHNE=1和MRB.CHNS=0)。
- 4.将SAR寄存器设置为数据表的首地址。
- 5.将DAR寄存器设置为GPT320.GTCCRC寄存器的地址。
- 6.将CRAH和CRAL寄存器设置为数据表的大小。CRB寄存器可以设置为任何值。

#### (2) 二转信息设置

设置传输到GPT320.GTCCRE寄存器。

- 1.在MRA寄存器中,选择源地址的递增(MRA.SM[1:0]=10b)。
- 2.将传输设置为正常传输模式(MRA.MD[1:0]=00b)和字长传输(MRA.SZ[1:0]=10b)。
- 3.在MRB寄存器中,选择固定的目标地址(MRB.DM[1:0]=00b)并设置链式转移(MRB.CHNE=1,MRB.CHNS=0)。
- 4.将SAR寄存器设置为数据表的首地址。
- 5.将DAR寄存器设置为GPT320.GTCCRE寄存器的地址。
- 6.将CRAH和CRAL寄存器设置为数据表的大小。CRB寄存器可以设置为任何值。

#### (3) 三转信息集

设置传输到GPT320.GTPBR寄存器。

- 1.在MRA寄存器中,选择源地址的递增(MRA.SM[1:0]=10b)。
- 2.将传输设置为正常传输模式(MRA.MD[1:0]=00b)和字长传输(MRA.SZ[1:0]=10b)。
- 3.在MRB寄存器中,选择固定的目标地址(MRB.DM[1:0]=00b)并设置每次中断的单次数据传输(MRB.CHNE=0,MRB.DISEL=0)。MRB.DTS位可以设置为任何值。

4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTPBR register.
6. Set the CRA register to the size of the data table. The CRB register can be set to any value.

#### (4) Transfer information assignment

Place the transfer information for use in the transfer to the GPT320.GTPBR immediately after the transfer control information for use in the GPT320.GTCCRC and GPT320.GTCCRE registers.

#### (5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT320.GTCCRC and GPT320.GTCCRE registers starts.

#### (6) ICU setting and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT320 counter overflow interrupt.
2. Set the ICU.IELSRn.IELS[8:0] bits and specify the GPT320 counter overflow.
3. Set the DTCST.DTCST bit to 1.

#### (7) GPT settings

1. Set the GPT320.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT320.GTCCRA and GPT320.GTCCRB registers and the next PWM timer compare values in the GPT320.GTCCRC and GPT320.GTCCRE registers.
3. Set the default PWM timer period values in the GPT320.GTPR register and the next PWM timer period values in the GPT320.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the Peripheral Select bits in PmnPFS.PSEL[4:0].

#### (8) GPT activation

Set the GPT320.GTSTR.CSTRT bits to 1 to start the GPT320.GTCNT counter.

#### (9) DTC transfer

Each time a GPT320 counter overflow is generated with the GPT320.GTPR register, the next PWM timer compare values are transferred to the GPT320.GTCCRC and GPT320.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT320.GTPBR register.

#### (10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT320 counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

### 17.6.3 Chain Transfer when Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 1-KB input buffer, where the input buffer is set so that its lower address starts with 0x00. [Figure 17.13](#) shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
  - (a) Transfer source address = fixed.
  - (b) CRA register = 0x0200 (512) times.
  - (c) MRB.CHNE bit = 1 (chain transfer is enabled).
  - (d) MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).

- 4.将SAR寄存器设置为数据表的首地址。
- 5.将DAR寄存器设置为GPT320.GTPBR寄存器的地址。
- 6.将CRA寄存器设置为数据表的大小。CRB寄存器可以设置为任何值。

#### (4) 转移信息分配

将用于传输到GPT320.GTPBR的传输信息放置在GPT320.GTCCRC和GPT320.GTCCRE寄存器中使用的传输控制信息之后。

#### (5) DTC向量表

在DTC向量表中，设置用于传输到GPT320.GTCCRC和GPT320.GTCCRE寄存器的传输控制信息的起始地址。

#### (6) ICU设置和DTC模块激活

- 1.设置与GPT320计数器溢出中断相关的ICU.IELSRn.DTCE位。
- 2.设置ICU.IELSRn.IELS[8:0]位并指定GPT320计数器溢出。
- 3.将DTCST.DTCST位设置为1。

#### (7) GPT settings

- 1.设置GPT320.GTIOR寄存器，使GTCCRA和GTCCRB寄存器作为输出比较寄存器运行。
- 2.在GPT320.GTCCRA和GPT320.GTCCRB寄存器中设置默认PWM定时器比较值，在GPT320.GTCCRC和GPT320.GTCCRE寄存器中设置下一个PWM定时器比较值。
- 3.在GPT320.GTPR寄存器中设置默认PWM定时器周期值，在GPT320.GTPBR寄存器中设置下一个PWM定时器周期值。
- 4.将PmnPFS.PDR中的输出位设置为1，并将PmnPFS.PSEL[4:0]中的外设选择位设置为00011b。

#### (8) GPT activation

将GPT320.GTSTR.CSTRT位设置为1以启动GPT320.GTCNT计数器。

#### (9) DTC transfer

每次使用GPT320.GTPR寄存器产生GPT320计数器溢出时，下一个PWM定时器比较值被传送到GPT320.GTCCRC和GPT320.GTCCRE寄存器。下一个PWM定时器周期的设置被传送到GPT320.GTPBR寄存器。

#### (10)中断处理

在指定轮次的数据传输完成后，例如当GPT传输的CRA寄存器中的值变为0时，会向CPU发出GPT320计数器溢出中断请求。在处理例程中完成该中断的处理。

### 17.6.3 Counter=0时的链式转移

仅当在第一次数据传输中将传输计数器设置为0时才执行第二次数据传输，并且在第二次传输中重复改变第一数据传输信息。链式转移使转移可以重复256次或更多。

以下过程显示了配置1KB输入缓冲区的示例，其中输入缓冲区设置为使其低地址从0x00开始。图17.13显示了当计数器=0时的链式传输。

- 1.将普通传输模式设置为第一次数据传输的输入数据。设置以下内容:
  - (a) 传输源地址=固定。
  - (b) CRA寄存器=0x0200(512)次。
  - (c) MRB.CHNE位=1 (启用链式传输)。
  - (d) MRB.CHNS位=1 (仅当传输计数器为0时才执行链式传输)。

- (e) MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
2. Prepare the upper 8-bit address of the start address at every 512 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 0x8000 to 0x83FF, prepare 0x82 and 0x80.
  3. For the second data transfer:
    - (a) Set the repeat transfer mode (with transfer source and destination address = fixed.) to reset the transfer counter of the first data transfer.
    - (b) Specify the CRA register in the first transfer information area for the transfer destination.
    - (c) Set the MRB.CHNE bit = 1 (chain transfer is enabled).
    - (d) Set the MRB.CHNS bit = 0 (select continuous chain transfer).
    - (e) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
    - (f) CRA register = 0x0101 (The transfer count is 1).
  4. For the third data transfer:
    - (a) Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
    - (b) Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
    - (c) Set the MRB.CHNE bit = 0 (chain transfer is disabled).
    - (d) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
    - (e) When setting the input buffer to 0x8000 to 0x83FF, also set the transfer counter to 2.
  5. The first data transfer is performed by an interrupt 512 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
  6. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x82. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
  7. In succession, the first data transfer is performed by an interrupt 512 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
  8. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x80. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
  9. Steps 5 to 8 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

- (e) MRB.DISEL位=0 (指定数据传输完成时向CPU产生中断请求)。
- 2.在flash等不同区域的第一次数据传输中, 每512次传输目标地址准备起始地址的高8位地址。比如设置输入缓冲区为0x8000到0x83FF时, 准备0x82和0x80。
  - 3.对于第二次数据传输:
    - (a) 设置重复传输模式 (传输源和目标地址=固定) 以重置第一次数据传输的传输计数器。
    - (b) 在传输目标的第一个传输信息区域中指定CRA寄存器。
    - (c) 设置MRB.CHNE位=1 (启用链式传输)。
    - (d) 设置MRB.CHNS位=0 (选择连续链传输)。
    - (e) 设置MRB.DISEL位=0 (当指定的数据传输完成时向CPU产生一个中断请求)。
    - (f) CRA寄存器=0x0101 (传输计数为1)。
  - 4.对于第三次数据传输:
    - (a) 设置重复传输模式 (以源为重复区域) 重置第一次数据传输的传输目标地址。
    - (b) 在传输目标的第一个传输信息区域中指定DAR寄存器的高8位。
    - (c) 设置MRB.CHNE位=0 (禁用链传输)。
    - (d) 设置MRB.DISEL位=0 (当指定的数据传输完成时向CPU产生一个中断请求)。
    - (e) 将输入缓冲区设置为0x8000到0x83FF时, 还要将传输计数器设置为2。
  - 5.第一次数据传输由中断执行512次。当第一次数据传输的传输计数器变为0, 第二次数据传输开始。将第一次数据传输的传输计数器设置为0x0200。第一次数据传输的传输目标地址和传输计数器的低8位变为0x0200。
  - 6.第二次数据传输由中断执行1次。当第一次数据传输的传输计数器变为0, 开始第三次数据传输。将第一次数据传输的传输目标地址的高8位设置为0x82。传送目标地址的低8位变为0x00, 第一次数据传送的传送计数器变为0x0200。
  - 7.接连地, 第一次数据传输由中断执行512次, 如为第一次数据传输指定的那样。当第一次数据传输的传输计数器变为0时, 第二次数据传输开始。将第一次数据传输的传输计数器设置为0x0200。第一次数据传输的传输目标地址和传输计数器的低8位变为0x0200。
  - 8.第二次数据传输由中断执行1次。当第一次数据传输的传输计数器变为0, 开始第三次数据传输。将第一次数据传输的传输目标地址的高8位设置为0x80。传送目标地址的低8位变为0x00, 第一次数据传送的传送计数器变为0x0200。
  - 9.步骤5到8无限重复。因为第二次数据传输是重复传输模式, 所以不会产生对CPU的中断请求。

### 17.7 Processing on DTC Transfer Error

If the access error occurs during DTC transfer, the DTC immediately stops access during transfer. To stop only the vector number that caused the error, inform the vector number that caused the error to the ICU and clear the corresponding ICU setting. After that, if there is a request other than the vector number which caused the error, it will be re-arbitration as it is. The condition under which the transfer error occurs is indicated when TrustZone Filter in DTC detects a violation.

The error response is informed to ICU when the transfer error occurs. ICU clears the ICU.IELSRn of the corresponding vector number which caused the transfer error. Furthermore, it generates an error response detection interrupt to notify that an error has occurred by DMAC/DTC transfer. (section 17.8.2. Interrupt Request of Transfer Error). Write back to SRAM is not performed.

When the Master TrustZone Filter error occurs, the Slave TrustZone error occurs or the Master MPU error occurs, it is possible to confirm the error information of DTC by selecting NMI. The DTC error vector register is cleared by selecting reset. Under the conditions where NMI is generated due to transfer error in DTC, two interrupts(NMI and DMAC\_TRANSERR) are generated. In this case, NMI always responds first.

The error response detection interrupt request (DMA\_TRANSERR) occurs when the Slave Bus error or the Illegal Access error occurs. Furthermore, it occurs after NMI when the error response detection interrupt request (DMA\_TRANSERR) is not cleared in NMI handler.

section 17.7.1. Processing on NMI handler describes how to confirm the error information of the DTC in the NMI handler. section 17.7.2. Processing on Error response detection interrupt request (DMA\_TRANSERR) handler describes how to confirm the error information of the DTC in the DMA\_TRANSERR handler.

### 17.7 DTC传输错误的处理

如果在DTC传输过程中发生访问错误，则DTC会在传输过程中立即停止访问。要仅停止导致错误的向量编号，请将导致错误的向量编号通知ICU并清除相应的ICU设置。之后，如果有引起错误的向量号以外的请求，将按原样重新仲裁。当DTC中的TrustZone过滤器检测到违规时，会指示发生传输错误的条件。

当发生传输错误时，将错误响应通知给ICU。ICU清除导致传输错误的相应向量号的ICU.IELSRn。此外，它会生成错误响应检测中断，以通知DMACDTC传输发生错误。（第17.8.2节。传输错误的中断请求）。不执行回写到SRA M。

当出现MasterTrustZoneFilter错误、SlaveTrustZone错误或MasterMPU错误时，可以通过选择NMI来确认DTC的错误信息。通过选择复位清除DTC错误向量寄存器。在由于DTC中的传输错误而产生NMI的情况下，会产生两个中断（NMI和DMAC\_TRANSERR）。在这种情况下，NMI总是首先响应。

当发生SlaveBus错误或IllegalAccess错误时，会发生错误响应检测中断请求(DMA\_TRANSERR)。此外，当NMI处理程序中未清除错误响应检测中断请求(DMA\_TRANSERR)时，它会在NMI之后发生。

第17.7.1节。NMIhandler上的处理描述了如何在NMIhandler中确认DTC的错误信息。第17.7.2节。错误响应检测中断请求(DMA\_TRANSERR)处理程序的处理描述了如何在DMA\_TRANSERR处理程序中确认DTC的错误信息。

Interrupts and the error information generated due to transfer errors are shown in [section 17.8.2. Interrupt Request of Transfer Error](#).

### 17.7.1 Processing on NMI handler

The cause of NMI due to the DMA transfer error is the Master TrustZone Filter error, the Slave TrustZone Filter error or the Master MPU error. When NMI occurs due to the DTC transfer error, the error response detection interrupt request (DMA\_TRANSERR) will occur after the end of NMI handler. It is possible to confirm the cause of the error and the DTC vector number in which the error occurred. When NMI occurs, perform the necessary processing according to the flow described in the ICU chapter.

[Figure 17.14](#) shows the flow for confirm the vector number that caused the Master TrustZone Filter Error in DTC

[Figure 17.15](#) shows the flow for confirm the vector number that caused the Slave TrustZone Filter Error in DTC

[Figure 17.16](#) shows the flow for confirm the vector number and Security Attribute that caused the Master MPU error in DTC

If completing all processing in NMI handler, it is possible to clear the error response detection interrupt request (DMA\_TRANSERR) that occurs subsequently.

因传输错误而产生的中断和错误信息见17.8.2节。中断请求传输错误。

### 17.7.1 在NMI处理程序上处理

由于DMA传输错误导致NMI的原因是MasterTrustZoneFilter错误、SlaveTrustZoneFilter错误或主控MPU错误。当由于DTC传输错误而发生NMI时，错误响应检测中断请求(DMA\_TRANSERR)将在NMI处理程序结束后发生。可以确认错误的原因和发生错误的DTC向量编号。当发生NMI时，按照ICU章节中描述的流程进行必要的处理。

如果完成NMI处理程序中的所有处理，则可以清除随后发生的错误响应检测中断请求(DMA\_TRANSERR)。

17.7.2 Processing on Error response detection interrupt request (DMA\_TRANSERR) handler

The cause of error response detection interrupt request (DMA\_TRANSERR) due to DMA transfer error is the Slave Bus Error or Illegal Access Error. Also, it occurs after the NMI handler error response detection interrupt request (DMA\_TRANSERR) is not cleared by the NMI handler.

It is possible to confirm the cause of the error and the vector number of DTC in which the error occurred.

Error cause confirmation procedure is shown Figure 17.17.

17.7.2 错误响应检测中断请求(DMA\_TRANSERR)处理程序的处理

由于DMA传输错误导致错误响应检测中断请求(DMA\_TRANSERR)的原因是从总线错误或非法访问错误。此外，它发生在NMI处理程序错误响应检测中断请求(DMA\_TRANSERR)未被NMI处理程序清除之后。

## 17.8 Interrupt

### 17.8.1 Interrupt Request of Transfer End

When the DTC completes data transfer of the specified count or when data transfer with MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Two types of interrupt are available: interrupts triggered by a DTC activation (per channel) and an interrupt triggered by the event signal DTC\_COMPLETE (common to all channels).

Interrupts to the CPU are controlled according to the settings in the NVIC and the ICU.IELSRn.IELS[8:0] bits. See [section 13, Interrupt Controller Unit \(ICU\)](#). The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

### 17.8.2 Interrupt Request of Transfer Error

The error response detection interrupt request (DMA\_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DTC transfer. The types of interrupts that occur when the DTC transfer error occurs are listed in [Table 17.10](#). The [Table 17.10](#) also shows error information stored when a transfer error occurs.

## 17.8 Interrupt

### 17.8.1 传输结束中断请求

当DTC完成指定计数的数据传输或MRB.DISEL设置为1的数据传输完成时，DTC激活源向CPU生成中断。有两种类型的中断可用：由DTC激活触发的中断（每个通道）和由事件信号DTC\_COMPLETE触发的中断（所有通道通用）。CPU的中断根据NVIC和ICU.IELSRn.IELS[8:0]位中的设置进行控制。请参阅第13节，中断控制器单元(ICU)。DTC通过授予较小的中断向量编号较高的优先级来确定激活源的优先级。CPU中断的优先级由NVIC优先级决定。

### 17.8.2 传输错误中断请求

在DTC传输期间检测到传输错误时，从DMAC/DTC生成错误响应检测中断请求(DMA\_TRANSERR)。发生DTC传输错误时发生的中断类型在表17.10中列出。表17.10还显示了发生传输错误时存储的错误信息。

Note 1. Interrupt generated, when NMI request selected as the operation after detection of the Master MPU error and The TrustZone Filter error. By confirming BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT, judge whether it is the Master or the Slave.

Note 2. If the error response detection interrupt (DMA\_TRANSERR) occurs and NMI of the Master MPU or NMI of the TrustZone Filter has not occurred, treat it as the Illegal address access error or the Slave Bus Error. It can be judged also by BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT.

Note that if the bus error occurs when writing the last data of transfer, the transfer end event and the error response detection interrupt (DMA\_TRANSERR) occurs.

## 17.9 Event Link

The DTC can produce an event link request on completion of one transfer request.

## 17.10 Low Power Consumption Function

Before transitioning to the module-stop function, Software Standby mode without Snooze mode transition, deep software standby mode, set the DTCST.DTCST bit to 0, and then perform the operations described in the following sections. The DTC is available in Snooze mode by setting the SYSTEM.SNZCR.SNZDTCEN bit to 1. See [section 10, Low Power Modes](#).

### (1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DTC. If the DTC transfer is in progress at the time, 1 is written to the MSTPCRA.MSTPA22 bit. The transition to the module-stop state proceeds after DTC transfer ends. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited. Writing 0 to the MSTPCRA.MSTPA22 bit releases the DTC from the module-stop state.

### (2) Software Standby mode, deep software standby mode

Use the settings described in [section 10.7.1. Transitioning to Software Standby Mode](#) or [section 10.9.1. Transitioning to Deep Software Standby Mode](#).

If DTC transfer operations are in progress when the WFI instruction is executed, the transition to Software Standby mode or deep software standby mode follows the completion of the DTC transfer.

### (3) Snooze Mode

When the snooze control circuit receives a snooze request in Software Standby mode, the MCU transfers to Snooze mode. See [section 10.8.1. Transition to Snooze Mode](#). DTC operation in Snooze mode can be selected in the SYSTEM.SNZCR.SNZDTCEN bit. If DTC operation is enabled in Snooze mode, before transitioning to Software Standby mode, set the DTCST.DTCST bit to 1. To return to Software Standby mode through DTC, set SYSTEM.SNZEDCR0.DTCZRED or SYSTEM.SNZEDCR0.DTCNZRED to 1. See [section 10.8.3. Returning from Snooze Mode to Software Standby Mode](#). SYSTEM.SNZEDCR0.DTCZRED enables or disables a snooze end request on completion of the last DTC transmission, detected on DTC transmission completion when CRA and CRB are 0. SYSTEM.SNZEDCR0.DTCNZRED enables or disables a snooze end request on a not last DTC transmission completion (CRA and CRB are not 0), detected on DTC transmission completion when CRA and CRB are not 0. The DTC activation request from the ICU is stopped during Software Standby mode but not stopped during Snooze mode.

注意1.中断,当NMI请求在检测主MPU错误和Trustzone滤波器错误后选择为操作时中断。通过确认BUS.BUS3ERRSTAT和BUS.DMACDTCERRSTAT,判断是Master还是Slave。

注2.如果错误响应检测中断(DMA\_TRANSERR)发生且MasterMPU的NMI或TrustZoneFilter的NMI未发生,则将其视为Illegaladdressaccesserror或SlaveBusError。也可以通过BUS.BUS3ERRSTAT和BUS来判断。DMACDTCERRSTAT。

请注意,如果在写入传输的最后一个数据时发生总线错误,则会发生传输结束事件和错误响应检测中断(DMA\_TRANSERR)。

## 17.9 活动链接

DTC可以在一个传输请求完成时产生一个事件链接请求。

## 17.10 低功耗功能

在转换到模块停止功能、没有贪睡模式转换的软件待机模式、深度软件待机模式之前,将DTCST.DTCST位设置为0,然后执行以下部分中描述的操作。通过将SYSTEM.SNZCR.SNZDTCEN位设置为1,可以在贪睡模式下使用DTC。请参阅第10节,低功耗Modes。

### (1) Module-stop function

向MSTPCRA.MSTPA22位写入1可启用DTC的模块停止功能。如果此时DTC传输正在进行,则将1写入MSTPCRA.MSTPA22位。在DTC传输结束后继续向模块停止状态的转换。当MSTPCRA.MSTPA22位为1时,禁止访问DTC寄存器。将0写入MSTPCRA.MSTPA22位可将DTC从模块停止状态释放。

### (2) 软件待机模式,深度软件待机模式

使用第10.7.1节中描述的设置。转换到软件待机模式或第10.9.1节。过渡到深度软件待机模式。

如果在执行WFI指令时DTC传输操作正在进行,则在DTC传输完成后转换到软件待机模式或深度软件待机模式。

### (3) 贪睡模式

当贪睡控制电路在软件待机模式下接收到贪睡请求时,MCU转入贪睡模式。请参阅第10.8.1节。过渡到贪睡模式。贪睡模式下的DTC操作可以在

SYSTEM.SNZCR.SNZDTCEN位。如果在贪睡模式下启用DTC操作,则在转换到软件待机模式之前,将DTCST.DTCST位设置为1。要通过DTC返回到软件待机模式,请将SYSTEM.SNZEDCR0.DTCZRED或SYSTEM.SNZEDCR0.DTCNZRED设置为1。请参阅第10.8.3节。从贪睡回来

模式到软件待机模式。SYSTEM.SNZEDCR0.DTCZRED在最后一次DTC传输完成时启用或禁用贪睡结束请求,当CRA和CRB为0时在DTC传输完成时检测到。SYSTEM.SNZEDCR0.DTCNZRED在非最后一次DTC传输时启用或禁用贪睡结束请求完成(CRA和CRB不为0),当CRA和CRB不为0时,在DTC传输完成时检测到。来自ICU的DTC激活请求在软件待机模式期间停止,但在贪睡模式期间不停止。

#### (4) Notes on Low Power Consumption Function

For the WFI instruction and the register setting procedure, see [section 10, Low Power Modes](#).

To perform a DTC transfer after returning from a low power mode without a Snooze mode transition, set the DTCST.DTCST bit to 1 again.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in [section 13.4.1. Detecting Interrupts](#), then execute the WFI instruction. If DTC operation is enabled in Snooze mode, do not use the module-stop function of the DTC.

### 17.11 Usage Notes

#### 17.11.1 Transfer Information Start Address

You must set multiples of 4 for the transfer information start addresses in the vector table. Otherwise, such addresses are accessed with their lowest 2 bits regarded as 00b.

#### (4) 低功耗功能注意事项

关于WFI指令和寄存器设置过程，请参见第10节，低功耗模式。

要在从低功耗模式返回后执行DTC传输而不进行贪睡模式转换，请将DTCST.DTCST位再次为1。

要将在软件待机模式下生成的请求用作对CPU的中断请求，而不是用作DTC激活请求，请按照第13.4.1节中的说明将CPU指定为中断请求目标。检测中断，然后执行WFI指令。如果在贪睡模式下启用DTC操作，请勿使用DTC的模块停止功能。

### 17.11 使用说明

#### 17.11.1 传输信息起始地址

您必须为向量表中的传输信息起始地址设置4的倍数。否则，这些地址的最低2位被视为00b。

## 18. Event Link Controller (ELC)

### 18.1 Overview

#### SEG bit (Software Event Generation)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

#### WE bit (SEG Bit Write Enable)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

#### WI bit (ELSEGR Register Write Disable)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

| Bit | Symbol | Function                           | R/W |

如果安全属性配置为非安全: ●

#### SEG位 (软件事件生成)

当WE位为1时向SEG位写入1时, 将产生软件事件。该位被读取为0。即使向该位写入1, 也不存储数据。在写入该位之前, WE位必须设置为1。

软件事件可以触发链接的DTC事件。

#### WE位 (SEG位写使能)

SEG位只能在WE位为1时写入。在写入该位之前将WI位清零。

[Setting condition]

- 如果在WI位为0时向该位写入1, 则该位变为1。

[Clearing condition]

- 如果在WI位为0时向该位写入0, 则该位变为0。

#### WI位 (ELSEGR寄存器写入禁止)

只有当WI位的写入值为0时, 才能写入ELSEGR寄存器。该位读为1。在设置之前WE或SEG位, WI位必须设置为0。

### 18.3 Operation

#### 18.3.1 Relation between Interrupt Handling and Event Linking

Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the explanation in the chapter for each event source module.

#### 18.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. Table 18.4 lists the operations of modules when an event occurs.

Table 18.4 Module operations when event occurs

| Module    | Operations When Event is Input   |
|-----------|--|
| GPT       | <ul style="list-style-type: none"> <li>Start counting</li> <li>Stop counting</li> <li>Clear counting</li> <li>Up counting</li> <li>Down counting</li> <li>Input capture</li> </ul>   |

| ADC12     | Start A/D conversion   |
| DTC       | Start DTC data transfer  |

#### 18.3.3 Example of Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn.ELS[8:0] bits for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.
4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 0 to the ELSRn.ELS[8:0] bit associated with the modules. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

If event link output from the RTC is to be used, set the ELC after the RTC settings, for example, for initialization and time setting. Unintended events may be generated if RTC settings are made after the ELC settings.

If event link output from the LVD is to be used, set the ELC after setting the LVD. To disable the LVD, do so after setting 0x00 to the associated ELSRn register.

Note: 该寄存器由PRCR寄存器写保护。

该寄存器指定寄存器ELSRn的安全属性 (n=16到18)

### 18.3 Operation

#### 18.3.1 中断处理和事件链接的关系

事件链接的事件编号与关联中断源的事件编号相同。有关生成事件信号的信息，请参阅每个事件源模块的章节中的说明。

#### 18.3.2 链接事件

当事件发生并且该事件已在事件链接设置寄存器(ELSRn)中设置为触发器时，将激活相关模块。模块的操作必须提前设置好。表18.4列出了事件发生时模块的操作。

Table 18.4 事件发生时的模块操作

| Module    | 输入事件时的操作   |
|-----------|--|
| GPT       | <ul style="list-style-type: none"> <li>开始计数</li> <li>停止计数</li> <li>清除计数</li> <li>向上计数</li> <li>向下计数</li> <li>输入捕捉</li> </ul>   |
| DAC12     | 开始DA转换   |
| I/O Ports | <ul style="list-style-type: none"> <li>根据EORR (复位) 或EOSR (设置) 更改引脚输出</li> <li>EIDR的锁存器引脚状态</li> <li>以下端口可用于ELC:               <ul style="list-style-type: none"> <li>PORT 1</li> <li>PORT 2</li> <li>PORT 3</li> <li>PORT 4</li> </ul> </li> </ul> |
| CTSU      | 开始测量操作   |
| ADC12     | 开始AD转换   |
| DTC       | 开始DTC数据传输  |

#### 18.3.3 链接事件的过程示例

链接事件:

- 1.设置要链接事件的模块的操作。
- 2.为要链接的模块设置适当的ELSRn.ELS[8:0]位。
- 3.将ELCR.ELCON位设置为1以启用所有事件的链接。
- 4.配置输出事件的模块并激活模块。两个模块之间的链接现在处于活动状态。
- 5.要单独停止模块的事件链接，请与模块关联的ELSRn.ELS[8:0]位设置为0。要停止所有事件的链接，请将ELCR.ELCON位设置为0。

如果要使用RTC的事件链接输出，请在RTC设置之后设置ELC，例如，用于初始化和时间设置。如果在ELC设置之后进行RTC设置，则可能会产生意外事件。

如果要使用来自LVD的事件链接输出，请在设置LVD后设置ELC。要禁用LVD，请在将0x00设置为相关的ELSRn寄存器后执行此操作。

18.4 Usage Notes

18.4.1 Linking DMAC/DTC Transfer End Signals as Events

When linking the DMAC/DTC transfer end signals as events, do not set the same peripheral module as the DMAC/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC/DTC transfer to the peripheral module is complete.

18.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in low power mode in which the module is stopped (Software Standby mode or Deep Software Standby mode).

Some modules can perform in Snooze mode. For more information, see Table 18.3 and section 10, Low Power Modes.

18.4.3 Module-Stop Function Setting

The Module Stop Control Register C (MSTPCRC) can enable or disable ELC operation. The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. The ELCON bit must be set to 0 before disabling ELC operation using the Module Stop Control Register. For more information, see Table 18.3 and section 10, Low Power Modes.

18.4.4 ELC Delay Time

In Figure 18.2, module A accesses module B through the ELC. There is a delay time in the ELC between module A and module B. Table 18.5 shows the ELC delay time.

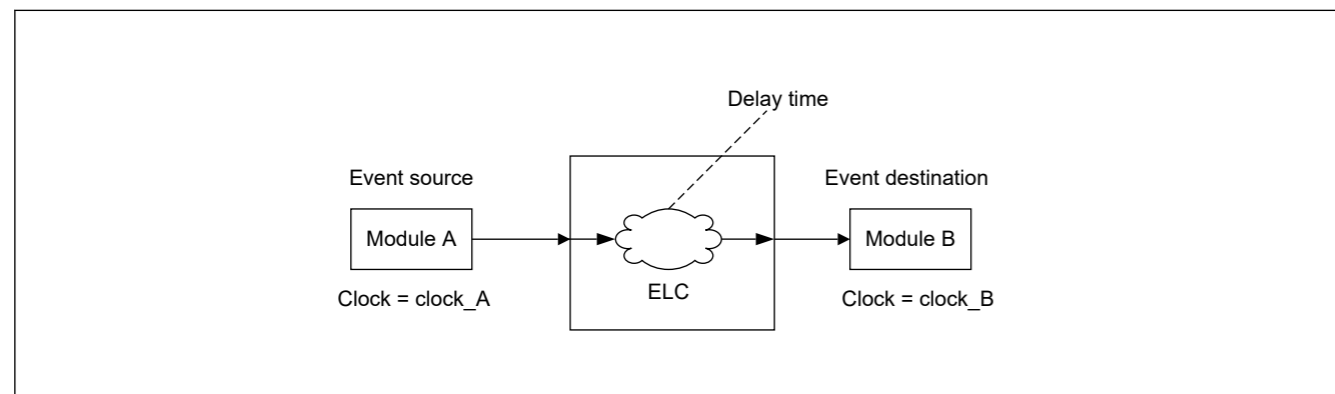

Figure 18.2 ELC delay time

Table 18.5 ELC delay time

| Clock domain      | Clock frequency   | ELC delay time                 |
|-------------------|-------------------|--------------------------------|
| clock_A = clock_B | clock_A = clock_B | 0 cycle                        |
| clock_A ≠ clock_B | clock_A = clock_B | 1 cycle to 2 cycles            |
|                   | clock_A > clock_B | 1 cycle to 2 cycles of clock_B |
|                   | clock_A < clock_B | 1 cycle to 2 cycles of clock_A |

18.4 使用说明

18.4.1 将DMACDTC传输结束信号作为事件链接

将DMACDTC传输结束信号作为事件链接时，请勿将外设模块设置为DMACDTC传输目标和事件链接目标。如果设置，则外围模块可能会在DMACDTC传输到外围模块完成之前启动。

18.4.2 设置时钟

要链接事件，您必须启用ELC和相关模块。如果相关模块处于模块停止状态或模块停止的低功耗模式（软件待机模式或深度软件待机模式），则模块无法运行。

某些模块可以在贪睡模式下执行。有关详细信息，请参阅表18.3和第10节，低功耗模式。

18.4.3 模块停止功能设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用ELC操作。ELC在复位后最初停止。释放模块停止状态可以访问寄存器。在使用模块停止控制寄存器禁用ELC操作之前，必须将ELCON位设置为0。有关详细信息，请参阅表18.3和第10节，低功耗模式。

18.4.4 ELC延迟时间

在图18.2中，模块A通过ELC访问模块B。模块A和模块B之间的ELC中有一个延迟时间。表18.5显示了ELC延迟时间。

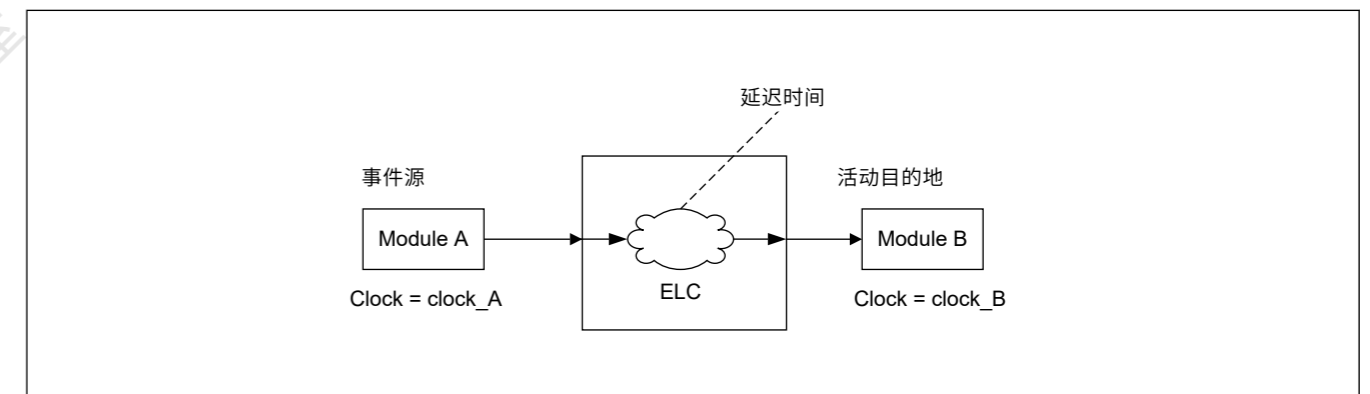

Figure 18.2 ELC延迟时间

Table 18.5 ELC延迟时间

| 时钟域               | 时钟频率              | ELC延迟时间          |
|-------------------|-------------------|------------------|
| clock_A = clock_B | clock_A = clock_B | 0 cycle          |
| clock_A ≠ clock_B | clock_A = clock_B | 1个周期到2个周期        |
|                   | clock_A > clock_B | 1个周期到2个clock_B周期 |
|                   | clock_A < clock_B | 1个周期到2个clock_A周期 |

## 19. I/O Ports

### 19.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC.

All pins except P109 ( as TDO of JTAG ports ) operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

Figure 19.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs for different packages. Table 19.1 lists the I/O port specifications by package, and Table 19.2 lists the port functions.

## 19. I/O Ports

### 19.1 Overview

IO端口引脚用作通用IO端口引脚、外围模块的IO引脚、中断输入引脚、模拟IO、ELC的端口组功能。

除P109外的所有引脚（作为JTAG端口的TDO）在复位后立即作为输入引脚工作，引脚功能通过寄存器设置切换。每个引脚的IO端口和外围模块在相关寄存器中指定。

图19.1显示了IO端口寄存器的连接图。不同封装的IO端口配置不同。表19.1按封装列出了IO端口规格，表19.2列出了端口功能。

The Port Control Register 1 (PCNTR1/PODR/PDR) is a 32-bit or 16-bit read/write register that controls port direction and port output data. The PCNTR1 specifies the port direction and output data, and is accessed in 32-bit units. The PDRn (bits [15:0] in PCNTR1) and PODRn (bits [31:16] in PCNTR1) respectively, are accessed in 16-bit units.

### PDRn bits (Pmn Direction)

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit unit. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PDRn bits are reserved. See Table 19.2. The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

### PODRn bits (Pmn Output Data)

The PODRn bits hold data to be output from the general I/O pins. Bits of non-existent port m are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PODRn bits are reserved. See Table 19.2. The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

端口控制寄存器1(PCNTR1PODRPDR)是一个32位或16位读写寄存器, 用于控制端口方向和端口输出数据。PCNTR1指定端口方向和输出数据, 并以32位为单位进行访问。PDRn (PCNTR1中的位[15:0])和PODRn (PCNTR1中的位[31:16]) 分别以16位为单位进行访问。

### PDRn bits (Pmn Direction)

当引脚配置为通用IO引脚时, PDRn位选择相关端口上各个引脚的输入或输出方向。端口m上的每个引脚都与一个PORTm.PCNTR1.PDRn位相关联。可以以1位为单位指定IO方向。与不存在的引脚相关的位被保留。保留位读取为0。写入值应为0。在仅输入端口的情况下, 保留PDRn位。见表19.2。PORTm.PCNTR1寄存器中的PDRn位与PFS.PmnPFS寄存器中的PDR位具有相同的功能。

### PODRn位 (Pmn输出数据)

PODRn位保存要从通用IO引脚输出的数据。不存在的端口m的位被保留。保留位读取为0。写入值应为0。在仅输入端口的情况下, 保留PODRn位。见表19.2。PORTm.PCNTR1寄存器中的PODRn位与PFS.PmnPFS寄存器中的PODR位具有相同的功能。

 If the security attribution is configured as Non-secure,

Note: m = 0 to 8, n = 00 to 15

Note 1. x = 1, 2, 3 or 4 for EIDR only

Note 2. Supported by ports 1, 2, 3 or 4.

The Port Control Register 2 (PCNTR2/EIDR/PIDR) allows read access to the Pmn state and the port event input data using 32-bit or 16-bit access.

The PCNTR2 specifies the Pmn state and the port event input data, and is accessed in 32-bit units.

The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

**PIDRn bits (Pmn State)**

The PIDRn bits reflect the individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when one of the following functions is enabled:

- RTC Time Capture input (RTCIC)
- Analog function (ASEL = 1)
- Capacitive Touch Sensing Unit (CTSU)

**EIDRn bits (Port Event Input Data)**

The EIDRn bits latch a pin state when an ELC\_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When the PmnPFS.ASEL bit is set to 1, the associated pin state is not reflected in EIDRn.

注1.x=1、2、3或4仅适用于EIDR

注2.端口1、2、3或4支持。

端口控制寄存器2(PCNTR2/EIDR/PIDR)允许使用32位或16位访问对Pmn状态和端口事件输入数据进行读取访问。

PCNTR2指定Pmn状态和端口事件输入数据, 并以32位为单位进行访问。

PIDRn (PCNTR2中的位[15:0]) 和EIDRn (PCNTR2中的位[31:16]) 分别以16位为单位进行访问。与不存在的引脚相关的位被保留。保留位被读取为未定义。

**PIDRn bits (Pmn State)**

PIDRn位反映端口的各个引脚状态, 与PmnPFS.PMR和PORTm.PCNTR1.PDRn。PORTm.PCNTR2寄存器中的PIDRn位与PFS.PmnPFS register。

当启用以下功能之一时, 引脚状态无法反映在PIDRn中:

- RTC时间捕捉输入(RTCIC)
- 模拟功能 (ASEL=1)
- 电容式触控感应单元(CTSU)

**EIDRn位 (端口事件输入数据)**

当ELC\_PORTx信号出现时, EIDRn位锁存引脚状态。引脚状态只能输入到EIDRn时PmnPFS.PMR和PORTm.PCNTR1.PDRn为0。当PmnPFS.ASEL位设置为1时, 相关引脚状态不会反映在EIDRn中。

The Port Control Register 3 (PCNTR3/PORR/POSR) is a 32-bit or 16-bit write register that controls the setting or resetting of the port output data.

The PCNTR3 controls the setting or resetting of the port output data, and is accessed in 32-bit units.

The POSRn (bits [15:0] in PCNTR3) and the PORRn (bits [31:16] in PCNTR3) respectively, are accessed in 16-bit units.

**POSRn bits (Pmn Output Set)**

POSR changes PODR when set by a software write. For example, for P100, when PORT1.PCNTR3.POSR00 = 1, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, POSRn bits are reserved. See Table 19.2.

**PORRn bits (Pmn Output Reset)**

PORR changes PODR when reset by a software write. For example, for P100, when PORT1.PCNTR3.PORR00 = 1, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, PORRn bits are reserved. See Table 19.2.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.  
 Note: PORRn and POSRn should not be set at the same time.

端口控制寄存器3(PCNTR3PORRPOSR)是一个32位或16位写寄存器, 用于控制端口输出数据的设置或复位。

PCNTR3控制端口输出数据的设置或复位, 并以32位为单位进行访问。

POSRn (PCNTR3中的位[15:0]) 和PORRn (PCNTR3中的位[31:16]) 分别以16位为单位进行访问。

**POSRn位 (Pmn输出设置)**

POSR在通过软件写入设置时改变PODR。例如, 对于P100, 当PORT1.PCNTR3.POSR00=1时, PORT1.PCNTR1.PODR00输出1。与不存在的引脚相关的位被保留。写入值应始终为0。在仅输入端口的情况下, 保留POSRn位。见表19.2。

**PORRn位 (Pmn输出复位)**

PORR在通过软件写入复位时改变PODR。例如, 对于P100, 当PORT1.PCNTR3.PORR00=1时, PORT1.PCNTR1.PODR00输出0。与不存在的引脚相关的位被保留。写入值应始终为0。在仅输入端口的情况下, 保留PORRn位。见表19.2。

Note: 当设置EORRn或EOSRn时, 禁止写入PODRn、PORRn和POSRn。  
 Note: PORRn和POSRn不应同时设置。

The Port Control Register 4 (PCNTR4/EORR/EOSR) is a 32-bit or 16-bit read/write register that controls the setting or resetting of the port output data by an event input from the ELC.

The PCNTR4 controls the setting or resetting of the port output data by an event input from the ELC, and is accessed in 32-bit units.

The EOSRn (bits [15:0] in PCNTR4) and EORRn (bits [31:16] in PCNTR4) respectively, are accessed in 16-bit units.

**EOSRn bits (Pmn Event Output Set)**

EOSR changes PODR when set because an ELC\_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EOSR00 is set to 1 when the ELC\_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, EOSRn bits are reserved. See Table 19.2.

**EORRn bits (Pmn Event Output Reset)**

EORR changes PODR when reset because an ELC\_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EORR00 = 1 when the ELC\_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, EORRn bits are reserved. See Table 19.2.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: EORRn and EOSRn should not be set at the same time.

端口控制寄存器4(PCNTR4/EORR/EOSR)是一个32位或16位读写寄存器，通过来自ELC的事件输入来控制端口输出数据的设置或复位。

PCNTR4通过来自ELC的事件输入来控制端口输出数据的设置或复位，并以32位为单位进行访问。

分别以16位为单位访问EOSRn (PCNTR4中的位[15:0])和EORRn (PCNTR4中的位[31:16])。

**EOSRn位 (Pmn事件输出设置)**

EOSR在设置时会更改PODR，因为发生ELC\_PORTx信号。例如，对于P100，如果在ELC\_PORTx发生时PORT1.PCNTR4.EOSR00设置为1，则PORT1.PCNTR1.PODR00输出1。与不存在的引脚相关的位被保留。写入值应始终为0。在仅输入端口的情况下，保留EOSRn位。见表19.2。

**EORRn位 (Pmn事件输出复位)**

EORR会在复位时更改PODR，因为发生ELC\_PORTx信号。例如，对于P100，如果PORT1.PCNTR4.EORR00=1当ELC\_PORTx发生时，PORT1.PCNTR1.PODR00输出0。与不存在的引脚相关的位被保留。写入值应始终为0。在仅输入端口的情况下，保留EORRn位。见表19.2。

Note: 当设置EORRn或EOSRn时，禁止写入PODRn、PORRn和POSRn。

Note: EORRn和EOSRn不应同时设置。

Port mn Pin Function Select Register (PmnPFS/PmnPFS\_HA/PmnPFS\_BY) is a 32-bit, 16-bit, or 8-bit read/write control register that selects the port mn pin function, and is accessed in 32-bit units. PmnPFS\_HA (PmnPFS [15:0] bits) is accessed in 16-bit units. PmnPFS\_BY (PmnPFS[7:0] bits) is accessed in 8-bit units.

The available Port mn pin depends on the product. For details, see [Table 19.1](#)

#### PODR bit (Port Output Data), PIDR bit (Port State), PDR bit (Port Direction)

The PDR, PIDR, and PODR bits serve the same function as the PCNTR. When these bits are read, the PCNTR value is read.

端口mn引脚功能选择寄存器（PmnPFS/PmnPFS\_HA/PmnPFS\_BY）是选择端口mn引脚功能的32位、16位或8位读写控制寄存器，以32位为单位进行访问。PmnPFS\_HA（PmnPFS[15:0]位）以16位为单位进行访问。PmnPFS\_BY（PmnPFS[7:0]位）以8位为单位进行访问。

可用的端口mn引脚取决于产品。详见表19.1

#### PODR位（端口输出数据）、PIDR位（端口状态）、PDR位（端口方向）

PDR、PIDR和PODR位的功能与PCNTR相同。读取这些位时，将读取PCNTR值。

**PCR bit (Pull-up Control)**

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PmnPFS.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

**NCODR bit (N-Channel Open-Drain Control)**

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

**DSCR[1:0] bits (Port Drive Capability)**

The DSCR[1:0] bits switches the drive capacity of the port. If the drive capacity of a pin is fixed, the associated bit is a read/write bit, but the drive capacity cannot be changed. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

**EOFR[1:0] bits (Event on Falling/Event on Rising)**

The EOFR[1:0] bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOFR[1:0] bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

**ISEL bit (IRQ Input Enable)**

The ISEL bit specifies IRQ input pins. This setting can be used in combination with the peripheral functions, although an IRQn (external pin interrupt) of the same number must only be enabled for one pin. The ISEL bit for an unspecified IRQn is reserved.

**ASEL bit (Analog Input Enable)**

The ASEL bit specifies analog pins. When a pin is set as an analog pin by this bit:

1. Specify it as a general I/O port in the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor in the Pull-up Control bit (PmnPFS.PCR).
3. Specify the input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register (PWPR). Release write-protect before modifying the register.

The ASEL bit for an unspecified analog I/O pin is reserved.

**PMR bit (Port Mode Control)**

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. The write value should be 0.

**PSEL[4:0] bits (Peripheral Select)**

The PSEL[4:0] bits assign the peripheral function.

**PCR bit (Pull-up Control)**

PCR位启用或禁用各个端口引脚上的输入上拉电阻。当引脚处于输入状态且PmnPFS.PCR中的相关位设置为1时，连接到该引脚的上拉电阻被启用。当引脚设置为通用端口输出引脚或外围功能输出引脚时，无论PCR设置如何，该引脚的上拉电阻都被禁用。上拉电阻在复位状态下也被禁用。与不存在的引脚相关的位被保留。保留位读取为0。写入值应为0。

**NCODR bit (N-Channel Open-Drain Control)**

NCODR位指定端口引脚的输出类型。与不存在的引脚相关的位被保留。保留位读取为0。写入值应为0。

**DSCR[1:0]位 (端口驱动能力)**

DSCR[1:0]位切换端口的驱动能力。如果某个管脚的驱动能力是固定的，那么相关的位就是一个读写位，但是驱动能力是不能改变的。与不存在的引脚相关的位被保留。保留位读取为0。写入值应为0。

**EOFR[1:0]位 (下降事件上升事件)**

EOFR[1:0]位选择端口组输入信号的边沿检测方法。这些位支持上升沿、下降沿或两个边沿检测。当EOFR[1:0]位设置为01b、10b或11b时，IO单元的输入使能有效。随后，事件脉冲从外部引脚输入，GPIO将事件脉冲输出到ELC。与不存在的引脚相关的位被保留。保留位读取为0。写入值应为0。

**ISEL位 (IRQ输入使能)**

ISEL位指定IRQ输入引脚。此设置可以与外围功能结合使用，尽管相同编号的IRQn (外部引脚中断) 只能为一个引脚启用。未指定的IRQn的ISEL位被保留。

**ASEL位 (模拟输入使能)**

ASEL位指定模拟引脚。当一个引脚被该位设置为模拟引脚时:

- 1.在端口模式控制位(PmnPFS.PMR)中将其指定为通用IO端口。
- 2.在上拉控制位(PmnPFS.PCR)中禁用上拉电阻。
- 3.在端口方向位(PmnPFS.PDR)中指定输入。此时无法读取引脚状态。PmnPFS寄存器受写保护寄存器(PWPR)保护。在修改寄存器之前释放写保护。

未指定的模拟IO引脚的ASEL位被保留。

**PMR位 (端口模式控制)**

PMR位指定端口引脚功能。与不存在的引脚相关的位被保留。写入值应为0。

Port Security Attribution Register is a 16-bit register that setting the Security Attribution of the each port, the registers are accessed only in 16-bit units.

### PMNSA[15:0] bits (Pmn Security Attribution)

The PmnSA bit specifies the Security Attribution of Pmn.

## 19.3 Operation

### 19.3.1 General I/O Ports

All pins except P108 to P110, and P300 operate as general I/O ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pins with the Port mn Pin Function Select register. For details on these registers, see [section 19.2. Register Descriptions](#).

Each port has the following bits:

- Port Security Attribution register (PmSAR)(m = 0 to 8), which indicates the security attribution.
- Port Direction bit (PDRn), which selects input or output direction
- Port Output Data bit (PODRn), which holds data for output
- Port Input Data bit (PIDRn), which indicates the pin states
- Event Input Data bit (EIDRn), which indicates the pin state when an ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs
- Port Output Set bit (POSRn), which indicates the output value when a software write occurs
- Port Output Reset bit (PORRn), which indicates the output value when a software write occurs
- Event Output Set bit (EOSRn), which indicates the output value when an ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs
- Event Output Reset bit (EORRn), which indicates the output value when an ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs.

### 19.3.2 Port Function Select

The following port functions are available for configuring each pin:

- Security function: Security attribution for each pins.
- I/O configuration: Complementary or open-drain output, pull-up control, and drive strength
- General I/O port: Port direction, output data setting, and read input data
- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Port mn Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes the following:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- DSCR[1:0]: Drive capacity control bit that selects the drive capacity
- EOFR[1:0]: For selecting the edge of the event that input from the port group
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin

| Bit  | Symbol      | Function                             | R/W |

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

Note: m = 0 to 8, n = 00 to 15

端口安全属性寄存器是一个16位的寄存器，用于设置每个端口的安全属性，寄存器只能以16位为单位访问。

### PMNSA[15:0]位 (Pmn安全属性)

PmnSA位指定Pmn的安全属性。

## 19.3 Operation

### 19.3.1 通用IO端口

除P108至P110和P300外的所有引脚在复位后都作为通用IO端口工作。通用IO端口组织为每个端口16位，可以通过端口控制寄存器 (PCNTRn, 其中n=1到4) 通过端口访问，或者通过端口mn引脚功能选择寄存器通过单个引脚访问。有关这些寄存器的详细信息，请参阅第19.2节。注册说明。

每个端口都有以下位:

- 端口安全属性寄存器 (PmSAR) (m=0~8)，表示安全属性。
- 端口方向位 (PDRn)，选择输入或输出方向
- 端口输出数据位 (PODRn)，用于保存输出数据
- 端口输入数据位 (PIDRn)，指示引脚状态
- 事件输入数据位 (EIDRn)，当ELC\_PORTn (n=1、2、3或4) 信号发生时指示引脚状态
- 端口输出设置位 (POSRn)，表示发生软件写时的输出值
- 端口输出复位位 (PORRn)，表示发生软件写入时的输出值
- 事件输出设置位 (EOSRn)，表示发生ELC\_PORTn (n=1、2、3或4) 信号时的输出值
- 事件输出复位位 (EORRn)，指示发生ELC\_PORTn (n=1、2、3或4) 信号时的输出值。

### 19.3.2 端口功能选择

以下端口功能可用于配置每个引脚:

- 安全功能: 每个引脚的安全属性。
- IO配置: 互补或开漏输出、上拉控制和驱动强度
- 通用IO口: 端口方向、输出数据设置、读取输入数据
- 备用功能: 配置的功能映射到引脚。

每个引脚都与一个端口mn引脚功能选择寄存器(PmnPFS)相关联，该寄存器包括相关的PODR、PIDR和PDR位。此外，PmnPFS寄存器包括以下内容:

- PCR: 上拉电阻控制位，打开或关闭输入上拉MOS
- NCODR: N沟道开漏控制位，用于选择每个引脚的输出类型
- DSCR[1:0]: 驱动容量控制位，选择驱动容量
- EOFR[1:0]: 用于选择从端口组输入的事件的边沿
- ISEL: IRQ输入使能位，用于指定IRQ输入引脚
- ASEL: 模拟输入使能位，用于指定模拟引脚

- PMR: Port mode bit to specify the pin function of each port
- PSEL[4:0]: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Port mn Pin Function Select register. For details, see [section 19.2.5. PmnPFS/PmnPFS\\_HA/PmnPFS\\_BY : Port mn Pin Function Select Register \(m = 0 to 8, n = 00 to 15\)](#).

### 19.3.3 Port Group Function for ELC

In the MCU, Port 1 to Port 4 are assigned for the ELC port group function.

#### 19.3.3.1 Behavior When ELC\_PORTn (n = 1, 2, 3 or 4) is Input from ELC

The MCU supports the two functions described in this section when an ELC\_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC.

##### (1) Input to EIDR

For the GPI function (PDR = 0 and PMR = 0 in the PmnPFS register), when an ELC\_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC, the input enable of the I/O cell is asserted, and data from the external pins are read into the EIDR bit. See [Figure 19.2](#)

For the GPO function (PDR = 1) or the peripheral mode (PMR = 1), 0 is input into the EIDR bit from the external pins.

Figure 19.2 Event ports input data

##### (2) Output from PODR by EOSR and EORR

When an ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs, the data is output from the PODR to the external pin based on the settings in the EOSR and EORR registers.

- If EOSR is set to 1, when an ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 1 to the external pin. Otherwise, when EOSR = 0, the PODR value is retained.
- If EORR is set to 1, when ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 0 to the external pin. Otherwise, when EORR = 0, the PODR value is retained.

- PMR: 端口模式位, 指定每个端口的引脚功能
- PSEL[4:0]: 端口功能选择位, 用于选择相关的外设功能。

这些配置可以通过单个寄存器访问端口mn引脚功能选择寄存器来进行。详见19.2.5节。PmnPFS/PmnPFS\_HA/PmnPFS\_BY: 端口mn引脚功能选择寄存器 (m=0到8, n=00到15)。

### 19.3.3 ELC的端口组功能

在MCU中, 端口1到端口4被分配用于ELC端口组功能。

#### 19.3.3.1 当ELC\_PORTn (n=1、2、3或4) 从ELC输入时的行为

当ELC\_PORTn (n=1、2、3或4) 信号来自ELC时, MCU支持本节中描述的两种功能。

##### (1) 输入到EIDR

对于GPI功能 (PmnPFS寄存器中的PDR=0和PMR=0), 当ELC\_PORTn (n=1、2、3或4) 信号来自ELC时, IO单元的输入使能有效, 并且数据从外部引脚读入EIDR位。见图19.2

对于GPO功能(PDR=1)或外设模式(PMR=1), 0从外部引脚输入到EIDR位。

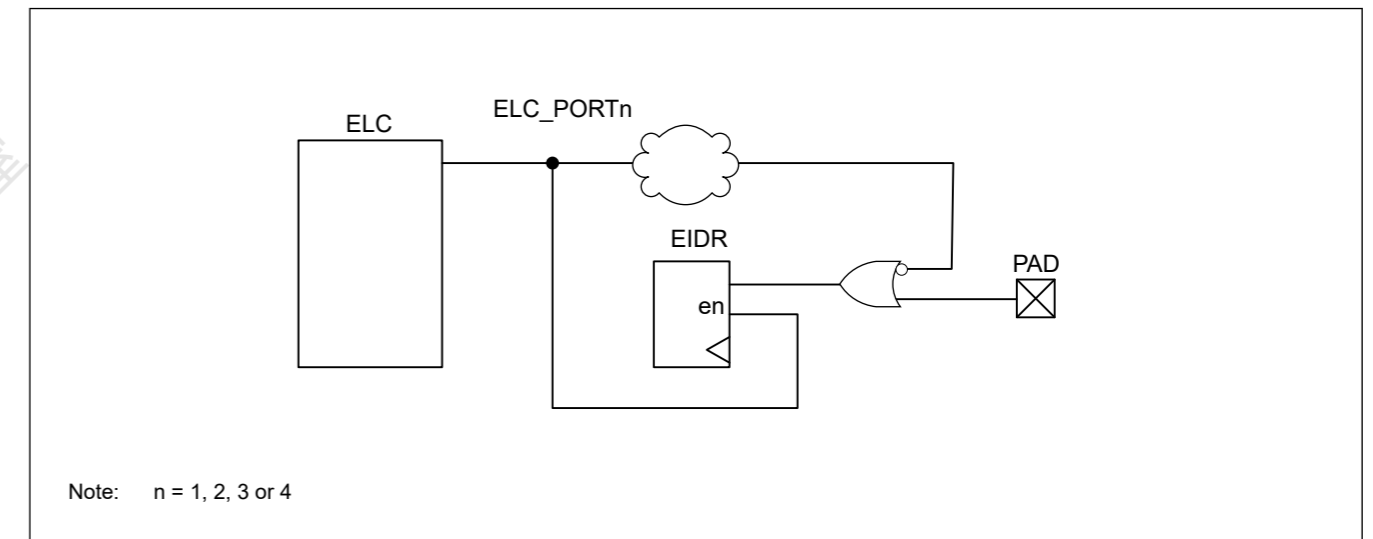

Figure 19.2 事件端口输入数据

##### (2) EOSR和EORR从PODR输出

当ELC\_PORTn (n=1、2、3或4) 信号发生时, 数据会根据EOSR和EORR寄存器中的设置从PODR输出到外部引脚。

- 如果EOSR设置为1, 当ELC\_PORTn(n=1 2 3or4)信号出现时, PODR寄存器输出1到外部引脚。否则, 当EOSR=0时, 保留PODR值。
- 如果EORR设置为1, 当ELC\_PORTn(n=1 2 3or4)信号出现时, PODR寄存器输出0到外部引脚。否则, 当EORR=0时, 保留PODR值。

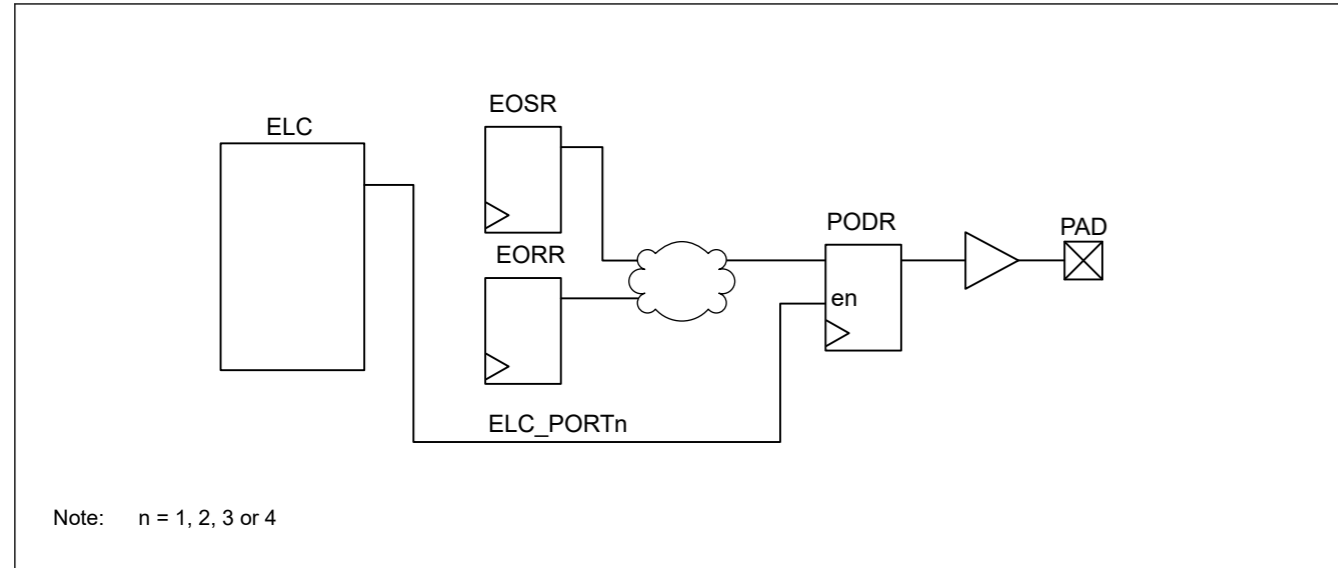

Figure 19.3 Event ports output data

### 19.3.3.2 Behavior When an Event Pulse is Output to ELC

To output the event pulse from the external pins to the ELC, set the EOFR[1:0] bits in the PmnPFS register. For details, see section 19.2.5. PmnPFS/PmnPFS\_HA/PmnPFS\_BY : Port mn Pin Function Select Register (m = 0 to 8, n = 00 to 15). When the EOFR[1:0] bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for PORT1, when the data is input from P100 to P115, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of PORTn (n = 2 to 4) is also the same as PORT1. See Figure 19.4.

## 19.4 Handling of Unused Pins

Table 19.3 shows how to handle unused pins.

Table 19.3 Handling of unused pins (1 of 2)

| Pin name | Description |
|----------|-------------|
|----------|-------------|

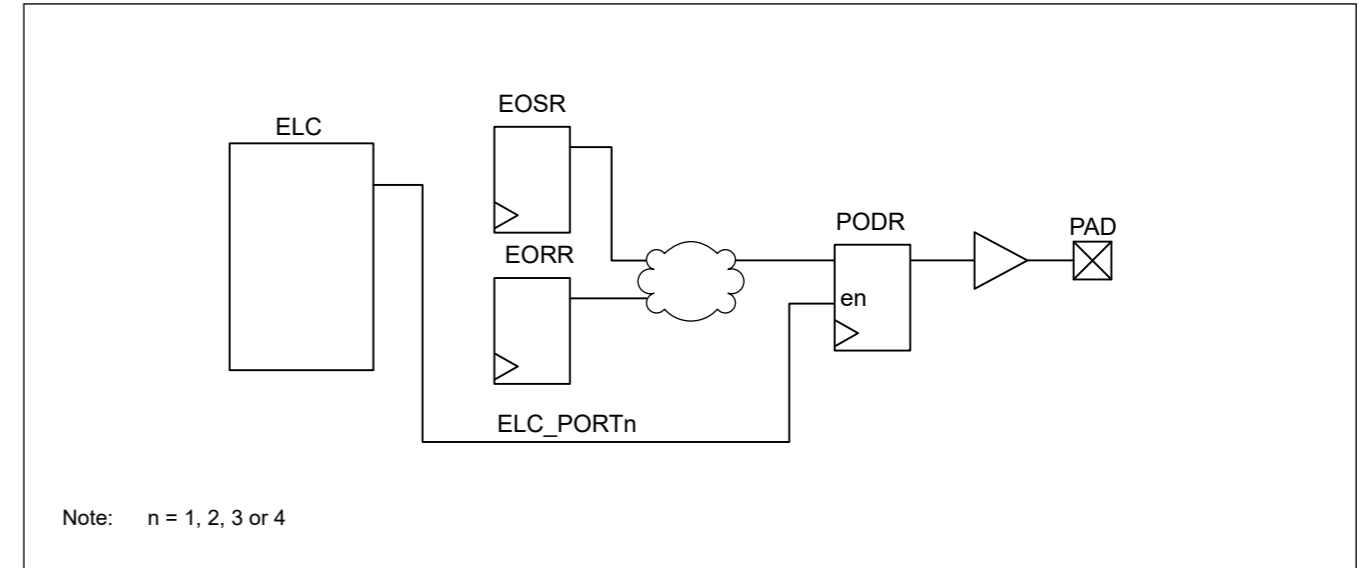

Figure 19.3 事件端口输出数据

### 19.3.3.2 事件脉冲输出到ELC时的行为

要将事件脉冲从外部引脚输出到ELC，请设置PmnPFS寄存器中的EOF[1:0]位。详见19.2.5节。PmnPFS/PmnPFS\_HA/PmnPFS\_BY：端口mn引脚功能选择寄存器（m=0到8，n=00到15）。当EOF[1:0]位被置位时，IO单元的输入使能被置位。

来自外部引脚的数据是输入。例如，对于PORT1，当数据从P100输入到P115时，这16个引脚的数据由OR逻辑组织。该数据形成一个单次脉冲，该脉冲进入ELC。PORTn（n=2至4）的操作也与PORT1相同。请参见图19.4。

Note 2. P108, P110, and P300 are recommended for pull up VCC (pulled up) through a resistor, because these pins are input pull-up enabled from the initial value (PmnPFS.PCR = 1).

Note 3. P109 is recommended for setting the direction to output (PCNTR1.PDRn = 1), because this pin is output from the initial value.

## 19.5 Usage Notes

### 19.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR register. This enables writing to the PFSWE bit in the PWPR register.\*1
2. Set 1 to the PFSWE bit in the PWPR register. This enables writing to the PmnPFS register.\*1
3. Clear the Port Mode Control bit in the PMR to 0 for the target pin to select the general I/O port.
4. Specify the I/O function for the pin through the PSEL[4:0] bits settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.
6. Clear the PFSWE bit in the PWPR register. This disables writing to the PmnPFS register.\*1
7. Set 1 to the B0WI bit in the PWPR register. This disables writing to the PFSWE bit in the PWPR register.\*1

Note 1. When the security attribution of Pmn is set to 0, should to set the PWPRS register to enable writing the PmnPFS register.

### 19.5.2 Procedure for Using Port Group Input

To use the port group input (port n (n = 1 to 4)):

1. Set the ELSRx.ELS[8:0] bits to all 0 to ignore unexpected pulses. For more information, see [section 18, Event Link Controller \(ELC\)](#).
2. Set the EOFR[1:0] bits of the PmnPFS register to specify the rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.

注2.推荐使用P108、P110和P300通过电阻上拉VCC (上拉), 因为这些引脚从初始值 (PmnPFS.PCR=1) 开始输入上拉使能。

注3.推荐使用P109设置输出方向 (PCNTR1.PDRn=1), 因为该引脚是从初始值输出的。

## 19.5 使用说明

### 19.5.1 指定引脚功能的步骤

要指定IO引脚功能:

- 1.将PWPR寄存器中的B0WI位清零。这允许写入PWPR寄存器中的PFSWE位。\*1
- 2.将PWPR寄存器中的PFSWE位设置为1。这允许写入PmnPFS寄存器。\*1
- 3.将PMR中的PortModeControl位清为0, 以便目标引脚选择通用IO端口。
- 4.通过PmnPFS寄存器中的PSEL[4:0]位设置指定引脚的IO功能。
- 5.根据需要PMR位设置为1, 以切换到为引脚选择的IO功能。
- 6.将PWPR寄存器中的PFSWE位清零。这将禁止写入PmnPFS寄存器。\*1
- 7.将PWPR寄存器中的B0WI位设置为1。这将禁止写入PWPR寄存器中的PFSWE位。\*1

注1.当Pmn的安全属性设置为0时, 应设置PWPRS寄存器以允许写入PmnPFS寄存器。

### 19.5.2 使用端口组输入的过程

要使用端口组输入 (端口n (n=1到4)):

- 1.将ELSRx.ELS[8:0]位设置为全0以忽略意外脉冲。有关详细信息, 请参阅第18节, 事件链接控制器(ELC)。
- 2.设置PmnPFS寄存器的EOFR[1:0]位以指定上升沿、下降沿或两个边沿检测。
- 3.执行虚拟读取或等待一小段时间, 例如100ns。忽略意外脉冲取决于外部引脚的初始值。

- Set the ELSRx.ELS[8:0] bits to enable the event signals.

### 19.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

- Outputs 0 if PCNTR4.EORR is set to 1 when ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs.
- Outputs 1 if PCNTR4.EOSR is set to 1 when ELC\_PORTn (n = 1, 2, 3 or 4) signal occurs.
- Outputs 0 if PCNTR3.PORR is set to 1.
- Outputs 1 if PCNTR3.POSR is set to 1.
- Outputs 0 or 1 because PCNTR1.PODRn is set.
- Outputs 0 or 1 because PmnPFS.PODRn is set.

Numbers in this list correspond to the priority for writing to the PODRn. For example, if 1. and 3. from the list occur at the same time, the higher priority event 1. is executed.

### 19.5.4 Notes on Using Analog Functions

To use an analog function, set the Port Mode Control bit (PMR) and the Port Direction bit (PDRn) to 0 so that the pin acts as a general input port. Next, set the Analog Input Enable bit (ASEL) in the Port mn Pin Function Select Register (PmnPFS.ASEL) to 1.

### 19.5.5 I/O Buffer Specification

The P402, P403, and P404 can be used as the RTC input, AGT input and other peripheral functions. Table 19.4 lists the P402, P403, P404 specifications.

Table 19.4 P402, P403, P404 specifications

| I/O port | RTC and AGT                       |        |                                      | Other peripheral                 |   |
|----------|-----------------------------------|--------|--------------------------------------|----------------------------------|---|

These RTC and AGT inputs are controlled by the VBCTICLR register. And this register is the highest priority which selecting the functions.

P402, P403, and P404 can be used as IRQn-DS(n = 4, 14, 15) whether RTC and AGT inputs are selected or not. When using these interrupts, set the interrupt procedure after setting the VBCTICLR register. (see [section 11.2.6. VBCTICLR : VBATT Input Control Register.](#))

See [Figure 19.5.](#)

The VBCTICLR register is not initialized on reset. Therefore, when not using the RTC or AGT inputs, the associated bit of VBCTICLR register must be set to 0 after reset.

- 设置ELSRx.ELS[8:0]位以启用事件信号。

### 19.5.3 端口输出数据寄存器(PODR)摘要

该寄存器输出数据如下:

- 如果PCNTR4.EORR在ELC\_PORTn (n=1、2、3或4) 信号发生时设置为1, 则输出0。
- 如果PCNTR4.EOSR在ELC\_PORTn (n=1、2、3或4) 信号发生时设置为1, 则输出1。
- 如果PCNTR3.PORR设置为1, 则输出0。
- 如果PCNTR3.POSR设置为1, 则输出1。
- 输出0或1, 因为PCNTR1.PODRn已设置。
- 输出0或1, 因为PmnPFS.PODRn已设置。

此列表中的数字对应于写入PODRn的优先级。例如, 如果列表中的1和3同时发生, 则执行优先级较高的事件1。

### 19.5.4 使用模拟功能的注意事项

要使用模拟功能, 请将端口模式控制位(PMR)和端口方向位(PDRn)设置为0, 以便引脚用作通用输入端口。接下来, 将端口mn引脚功能选择寄存器(PmnPFS.ASEL)中的模拟输入启用位(ASEL)设置为1。

### 19.5.5 IO缓冲器规格

P402、P403和P404可用作RTC输入、AGT输入和其他外围功能。表19.4列出了P402、P403、P404 specifications.

Table 19.4 P402, P403, P404 specifications

| IO端口 | RTC和AGT           |        |                                      | 其他周边                 |                                |

这些RTC和AGT输入由VBCTICLR寄存器控制。而这个寄存器是选择功能的最高优先级。

无论是否选择RTC和AGT输入, P402、P403和P404都可以用作IRQn-DS(n=4 14 15)。使用这些中断时, 请在设置VBCTICLR寄存器后设置中断程序。(参见第11.2.6节。VBCTICLR: VBATT输入控制寄存器。)

请参见图19.5。

VBCTICLR寄存器在复位时未初始化。因此, 当不使用RTC或AGT输入时, 相关的位复位后VBCTICLR寄存器必须设置为0。

### 19.6 Peripheral Select Settings for Each Product

This section describes the pin function select configuration using the PmnPFS register. Some pin names have added \_A, \_B, or \_C suffixes. When assigning IIC, SPI, SSIE, and SDHI functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

1. In Pmn pin function select register (PmnPFS), the PSEL bits have to be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, the unexpected edges may be input at the input function or the unexpected pulses may be output to the external pin at the output function.
2. Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS register. If a value which is not allowed for the register is specified, the correct operation is not guaranteed.
3. The single function should not be assigned to the multiple pins by PmnPFS register. When the GPT1, GPT5, SCI3, IIC0 or SPI0 are configured as secure and these pin function is being assigned to the pin which security attribution is set as secure by the PmSAR register, the write access to the PSEL bits for setting same function as secure pin in other pins is ignored when the security attribution of that pin is non-secure. For example, if the PSARE.PSARE30 bit is 0 (GPT1 is secure) and the P109PFS.PSEL bits is 00011b (pin function is GTIOC1A) and the P1SAR.109SA bit is 0 (P109 is secure), the write 00011b to the P405PFS.PSEL bits is ignored when the P4SAR.405SA bit is 1 (P405 is non-secure).

### 19.6 每个产品的外设选择设置

本节介绍使用PmnPFS寄存器的引脚功能选择配置。一些引脚名称添加了\_A、\_B或\_C后缀。分配IIC、SPI、SSIE和SDHI功能时，选择具有相同后缀的功能引脚。无论后缀如何，都可以选择其他引脚。禁止将相同的功能同时分配给两个或多个引脚。

- 1.在Pmn引脚功能选择寄存器（PmnPFS）中，当目标引脚的PMR位为0时，必须设置PSEL位。如果在PMR位为1时设置PSEL位，可能会在输入功能或意外脉冲可能会在输出功能处输出到外部引脚。
- 2.PmnPFS寄存器的PSEL位只能指定允许的值（功能）。如果指定了寄存器不允许的值，则不能保证正确操作。
- 3.PmnPFS寄存器不应将单一功能分配给多个引脚。当GPT1、GPT5、SCI3、IIC0或SPI0配置为安全且这些引脚功能被分配给由PmSAR寄存器设置安全属性为安全的引脚时，对PSEL位的写访问以将相同功能设置为安全当该pin的安全属性为非安全时，其他pin中的pin将被忽略。例如，如果PSARE.PSARE30位为0（GPT1是安全的）并且P109PFS.PSEL位是00011b（引脚功能是GTIOC1A）并且P1SAR.109SA位是0（P109是安全的），则将00011b写入P405PFS当P4SAR.405SA位为1（P405不安全）时，.PSEL位被忽略。

4. The PORT0 and 5 have the analog functions such as A/D converter. When these pins are used as an analog function, for avoiding the loss of resolution, the PMR bit should be set to 0 and PDR bit should be set to 0. After that, ASEL bit should be set to 1
