✓: Available  
—: Setting prohibited

Note 1. Recommend using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (tGTISK)

Table 19.7 Register settings for input/output pin function (PORT2)

:可用—禁止设置

注1.建议使用名称后附有字母的引脚，例如“\_A”或“\_B”，以表示组成员身份。对于接口，测量每组电气特性的交流部分。

注2.输出缓冲器中有中驱动和高驱动两种。推荐使用相同的驱动缓冲器输出歪斜规格(tGTISK)

✓: Available  
 —: Setting prohibited

- Note 1. Recommend using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.
- Note 2. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (t<sub>GTISK</sub>)
- Note 3. The driver strength of this port can not be controlled by PmnPFS.DSCR[1:0] bits.
- Note 4. When using NMI pin interrupt, Port related registers setting are not required.

Table 19.8 Register settings for input/output pin function (PORT3)

| PSEL[4:0] settings        | Function               | Pin       |                      |                            |         |         |        |        |        |        |                 |                 |        |               |           |

✓: Available  
 —: Setting prohibited

- Note 1. Recommend using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.
- Note 2. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (t<sub>GTISK</sub>)

:可用—:禁止设置

- 注1.建议使用名称后附有字母的引脚，例如“\_A”或“\_B”，以表示组成员身份。对于接口，测量每组电气特性的交流部分。
- 注2.输出缓冲器中有中驱动和高驱动两种。推荐使用相同的驱动缓冲器输出歪斜规格(t<sub>GTISK</sub>)
- 注3.此端口的驱动强度不能由PmnPFS.DSCR[1:0]位控制。
- 注4.当使用NMI引脚中断时，不需要设置端口相关的寄存器。

✓: Available  
—: Setting prohibited

- Note 1. To use this pin function, set the associated pin as a general input (set the PmnPFS.PDR and PmnPFS.PMR bits to 0).
- Note 2. Recommend using pins that have a letter appended to their names, for instance “\_A” or “\_B”, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.
- Note 3. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (tGTISK)

:可用-禁止设置

- 注1.要使用此引脚功能，请将相关引脚设置为通用输入（将PmnPFS.PDR和PmnPFS.PMR位设置为0）。
- 注2.建议使用名称后附有字母的引脚，例如“\_A”或“\_B”，以表示组成员身份。对于接口，测量每组电气特性的交流部分。
- 注3.输出缓冲器中有中驱动和高驱动两种。推荐使用相同的驱动缓冲器输出歪斜规格(tGTISK)

## 20. Port Output Enable for GPT (POEG)

### 20.1 Overview

The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state in one of the following ways:

- Input level detection of the GTETRn (n = A to D) pins
- Output-disable request from the GPT
- Oscillation stop detection of the clock generation circuit
- Register settings

The GTETRn (n = A to D) pins can be used as GPT external trigger input pins.

Table 20.1 lists the POEG specifications, Figure 20.1 shows a block diagram, and Table 20.2 lists the input pins.

**Table 20.1 POEG specifications**

| Parameter   | Specifications   |
|---|--|
| Output-disable control through input level detection      | <ul style="list-style-type: none"> <li>● The GPT output pins can be disabled when a GTETRn rising edge or high level is sampled after polarity and filter selection.</li> </ul>  |
| Output-disable request from the GPT                       | <ul style="list-style-type: none"> <li>● When the GTIOCxA pin and the GTIOCxB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCxA and GTIOCxB pins are output-disabled.</li> </ul>  |
| Output-disable control through oscillation stop detection | <ul style="list-style-type: none"> <li>● The GPT output pins can be disabled when oscillation of the clock generation circuit stops.</li> </ul>  |
| Output-disable control by software (registers)            | <ul style="list-style-type: none"> <li>● The GPT output pins can be disabled by modifying the register settings.</li> </ul>  |
| Interrupt   | <ul style="list-style-type: none"> <li>● Interrupts can be generated by detecting the input level of external trigger input pins (GTETRn pins).</li> <li>● Interrupts can be generated when all GPT output pins are driven to an active level simultaneously.</li> </ul>   |
| External trigger output to the GPT                        | <ul style="list-style-type: none"> <li>● The GTETRn signals can be output to the GPT after polarity and filter selection. (count start, count stop, count clear, up-count, down-count, or input capture function)</li> </ul>   |
| Noise filtering   | <ul style="list-style-type: none"> <li>● For input from the GTETRn pins, PCLKB/1, PCLKB/8, PCLKB/32, or PCLKB/128 can be selected as the noise filtering clock. (Filtering is performed by sampling the input signals three times using the selected clock.)</li> <li>● Positive or negative polarity can be selected for any of the GTETRn input pins.</li> <li>● Signal state after polarity and filter selection can be monitored.</li> </ul> |
| TrustZone Filter  | <ul style="list-style-type: none"> <li>● Security attribution can be set for each groups.</li> </ul>   |

Note: n = A to D, x = 0 to 7

## 20. GPT(POEG)的端口输出使能

### 20.1 Overview

端口输出使能(POEG)功能可以通过以下方式之一将通用PWM定时器(GPT)输出引脚置于输出禁用状态:

- GTETRn(n=AtoD)引脚的输入电平检测
- 来自GPT的输出禁用请求
- 时钟发生电路的振荡停止检测
- 注册设置

GTETRn(n=AtoD)引脚可用作GPT外部触发输入引脚。

表20.1列出了POEG规范, 图20.1显示了框图, 表20.2列出了输入引脚。

**Table 20.1 POEG specifications**

| Parameter         | Specifications  |
|-------------------|---|
| 通过输入电平检测进行输出禁用控制  | <ul style="list-style-type: none"> <li>● 在极性和滤波器选择后采样GTETRn上升沿或高电平时, 可以禁用GPT输出引脚。</li> </ul>  |
| 来自GPT的输出禁用请求      | <ul style="list-style-type: none"> <li>● 当GTIOCxA引脚和GTIOCxB引脚同时被驱动为有效电平时, GPT向POEG生成一个输出禁用请求。通过接收这些请求, POEG可以控制GTIOCxA和GTIOCxB引脚是否输出禁用。</li> </ul>  |
| 通过振荡停止检测进行输出禁用控制  | <ul style="list-style-type: none"> <li>● 当时钟生成电路的振荡停止时, 可以禁用GPT输出引脚。</li> </ul>   |
| 通过软件(寄存器)进行输出禁用控制 | <ul style="list-style-type: none"> <li>● 通过修改寄存器设置可以禁用GPT输出引脚。</li> </ul>   |
| Interrupt         | <ul style="list-style-type: none"> <li>● 可以通过检测外部触发输入引脚(GTETRn引脚)的输入电平来产生中断。</li> <li>● 当所有GPT输出引脚同时驱动到有效电平时, 可能会产生中断。</li> </ul>   |
| 到GPT的外部触发输出       | <ul style="list-style-type: none"> <li>● GTETRn信号可以在极性和滤波器选择后输出到GPT。(计数开始、计数停止、计数清除、递增计数、递减计数或输入捕捉功能)</li> </ul>  |
| 噪声过滤              | <ul style="list-style-type: none"> <li>● 对于来自GTETRn引脚的输入, 可以选择PCLKB1、PCLKB8、PCLKB32或PCLKB128作为噪声过滤时钟。(通过使用所选时钟对输入信号进行3次采样来执行滤波。)</li> <li>● 可以为任何GTETRn输入引脚选择正极性或负极性。</li> <li>● 可以监控极性和滤波器选择后的信号状态。</li> </ul> |
| TrustZone Filter  | <ul style="list-style-type: none"> <li>● 可以为每个组设置安全属性。</li> </ul>   |

Note: n = A to D, x = 0 to 7

Note 1. Only 0 can be written to clear the flag.

Note 2. Can be modified only once after a reset.

The POEGn (n = A to D) registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT.

In the descriptions, POEGn represents the POEGn (n = A to D) registers.

### 20.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOCxA, GTIOCxB, and the 3-phase PWM output for BLDC motor control pins can be set to output-disable:

- Input level or edge detection of the GTETRn pins  
When POEGn.PIDE is 1, the POEGn.PIDF flag is set to 1.
- Output-disable request from the GPT  
When POEGn.IOCE is 1, the POEGn.IOCF flag is set to 1 if the disable request is enabled by GTINTAD. The GTINTAD.GRPABH and GTINTAD.GRPABL settings apply to the group selected by the GPT register GTINTAD.GRP[1:0] or OPSCR.GRP[1:0].
- Oscillation stop detection for the clock generation circuit  
While POEGn.OSTPE is 1, the halt status of the main clock oscillator is detected and the POEGn.OSTPF flag is set to 1.
- SSF bit setting  
When POEGn.SSF is set to 1, the PWM output is disabled.

The output-disable state is controlled in the GPT module. The output-disable of the GTIOCxA and GTIOCxB pins is set in the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits in GPTx. The output-disable of the 3-phase PWM output for BLDC motor control pins is set in the OPSCR.GRP[1:0] bits and OPSCR.GODF bit in GPT OPS.

#### 20.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGn.PIDE, POEGn.NFCS[1:0], POEGn.NFEN, and POEGn.INV occur on the GTETRn pins, the GPT output pins are output-disabled.

##### 20.3.1.1 Digital Filter

Figure 20.2 shows high-level detection by the digital filter. When a high level associated with the POEGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGn.NFCS[1:0] and POEGn.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not output, changes of the levels on the GTETRn pins are ignored.

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 31:30 | NFCS[1:0] | 噪声滤波器时钟选择<br>00: 每PCLKB采样GTETRn引脚输入电平3次<br>01: 每PCLKB采样GTETRn引脚输入电平3次/8<br>10: 每PCLKB采样GTETRn引脚输入电平3次/32<br>11: 每PCLKB采样GTETRn引脚输入电平3次/128 | R/W |

注1.只能写入0来清除标志。

注2.复位后只能修改一次。

POEGn(n=AtoD)寄存器控制GPT引脚的输出禁用状态、中断和GPT的外部触发输入。

在描述中, POEGn代表POEGn (n=A到D) 寄存器。

### 20.3 输出禁用控制操作

如果满足以下任一条件, 则GTIOCxA、GTIOCxB和BLDC电机控制引脚的3相PWM输出可设置为输出禁用:

- GTETRn引脚的输入电平或边沿检测  
当POEGn.PIDE为1时, POEGn.PIDF标志设置为1。
- 来自GPT的输出禁用请求  
当POEGn.IOCE为1时, 如果禁用请求由GTINTAD启用, 则POEGn.IOCF标志设置为1。这GTINTAD.GRPABH和GTINTAD.GRPABL设置适用于GPT寄存器选择的组GTINTAD.GRP[1:0] or OPSCR.GRP[1:0].
- 时钟产生电路的振荡停止检测  
当POEGn.OSTPE为1时, 检测到主时钟振荡器的停止状态和POEGn.OSTPF标志设置为1。
- SSF位设置  
当POEGn.SSF设置为1时, PWM输出被禁用。

输出禁用状态由GPT模块控制。GTIOCxA和GTIOCxB引脚的输出禁用在GPTx中的GTINTAD.GRP[1:0]、GTIOR.OADF[1:0]和GTIOR.OBDF[1:0]位中设置。BLDC电机控制引脚的3相PWM输出的输出禁用在GPT OPS中的OPSCR.GRP[1:0]位和OPSCR.GODF位中设置。

#### 20.3.1 引脚输入电平检测操作

如果在POEGn.PIDE、POEGn.NFCS[1:0]、POEGn.NFEN和POEGn.INV中设置的输入条件发生在GTETRn引脚, GPT输出引脚输出禁用。

##### 20.3.1.1 数字滤波器

图20.2显示了数字滤波器的高电平检测。当在POEGn.NFCS[1:0]和POEGn.NFEN中选择的采样时钟连续3次检测到与POEGn.INV极性设置相关的高电平时, 检测到的电平被识别为高电平, 并且GPT输出引脚为输出禁用。如果在此间隔期间甚至检测到一个低电平, 则检测到的电平不会被识别为高电平。此外, 在不输出采样时钟的时间间隔内, GTETRn引脚的电平变化被忽略。

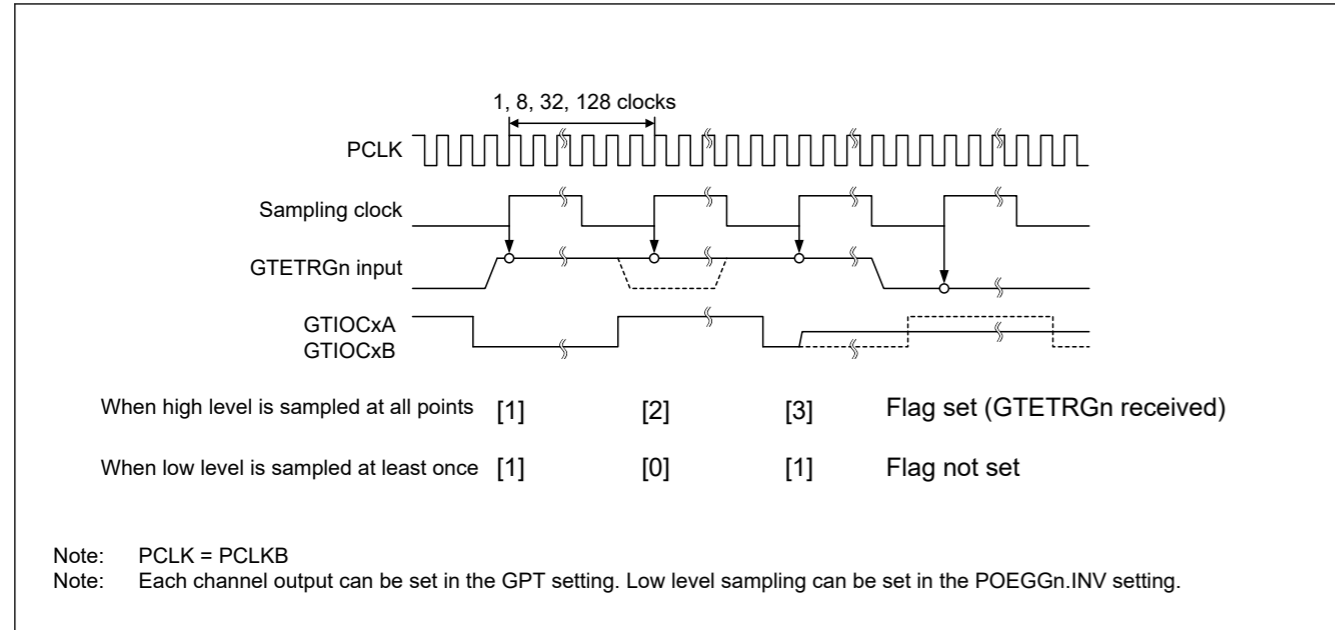

Figure 20.2 Example of digital filter operation

### 20.3.2 Output-Disable Requests from the GPT

For details on the operation, see the description for GTIOC Pin Output Negate Control in [section 21, General PWM Timer \(GPT\)](#).

### 20.3.3 Output-Disable Control Using Detection of Stopped Oscillation

When the oscillation stop detection function in the clock generation circuit detects stopped oscillation while POEGn.OSTPE is 1, the GPT output pins are output-disabled for each group.

### 20.3.4 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing 1 to the Software Stop flag, POEGn.SSF.

### 20.3.5 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following flags:

- POEGn.PIDF
- POEGn.IOCF
- POEGn.OSTPF
- POEGn.SSF

Writing 0 to the POEGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRn are not disabled and the POEGn.ST bit is not set to 0.

Writing 0 to the POEGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.OABHF and GTST.OABLF flags in the GPT are set to 0.

Writing 0 to the POEGn.OSTPF flag is ignored (the flag is not cleared) if the OSTDSR.OSTDF flag in the clock generation circuit is not set to 0. In addition, when the flag set and release occur at the same time, the flag set takes precedence.

Figure 20.3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

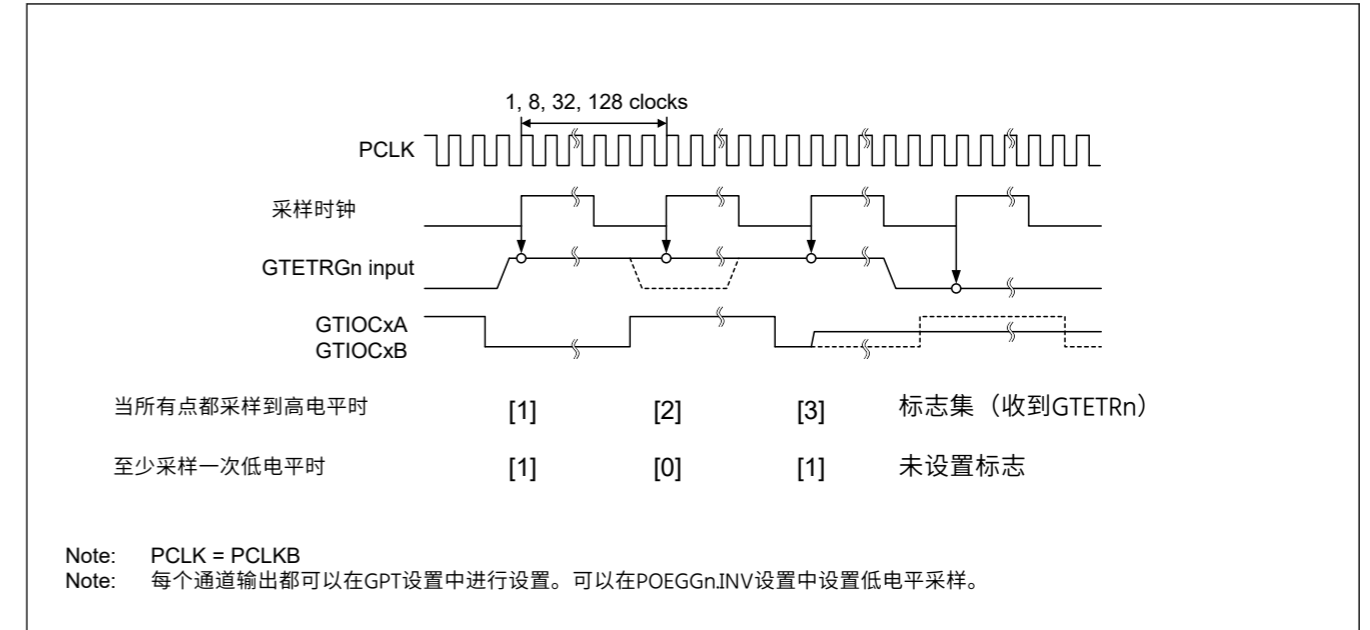

Figure 20.2 数字滤波器操作示例

### 20.3.2 来自GPT的输出禁用请求

有关操作的详细信息，请参见第21节通用PWM定时器(GPT)中对GTIOC引脚输出取反控制的描述。

### 20.3.3 使用停止振荡检测的输出禁用控制

当时钟发生电路中的振荡停止检测功能检测到停止振荡时 POEGn.OSTPE为1，每组的GPT输出引脚输出禁用。

### 20.3.4 使用寄存器的输出禁用控制

GPT输出引脚可以通过将1写入软件停止标志POEGn.SSF来直接控制。

### 20.3.5 从输出禁用释放

要释放处于输出禁用状态的GPT输出引脚，可以通过复位将它们返回到初始状态，或者清除以下所有标志：

- POEGn.PIDF
- POEGn.IOCF
- POEGn.OSTPF
- POEGn.SSF

如果外部输入引脚GTETRn未被禁用且POEGn.ST位未设置为0，则忽略向POEGn.PIDF标志写入0（该标志不被清除）。

仅当GPT中的所有GTST.OABHF和GTST.OABLF标志都设置为0时，向POEGn.IOCF标志写入0才有效（该标志被清除）。

如果时钟生成电路中的OSTDSR.OSTDF标志未设置为0，则忽略向POEGn.OSTPF标志写入0（该标志不被清除）。此外，当标志设置和释放同时发生时，标志集优先。

图20.3显示了输出禁用的释放时序。标志清零后，在GPT的下一个计数周期开始时，输出禁用被释放。

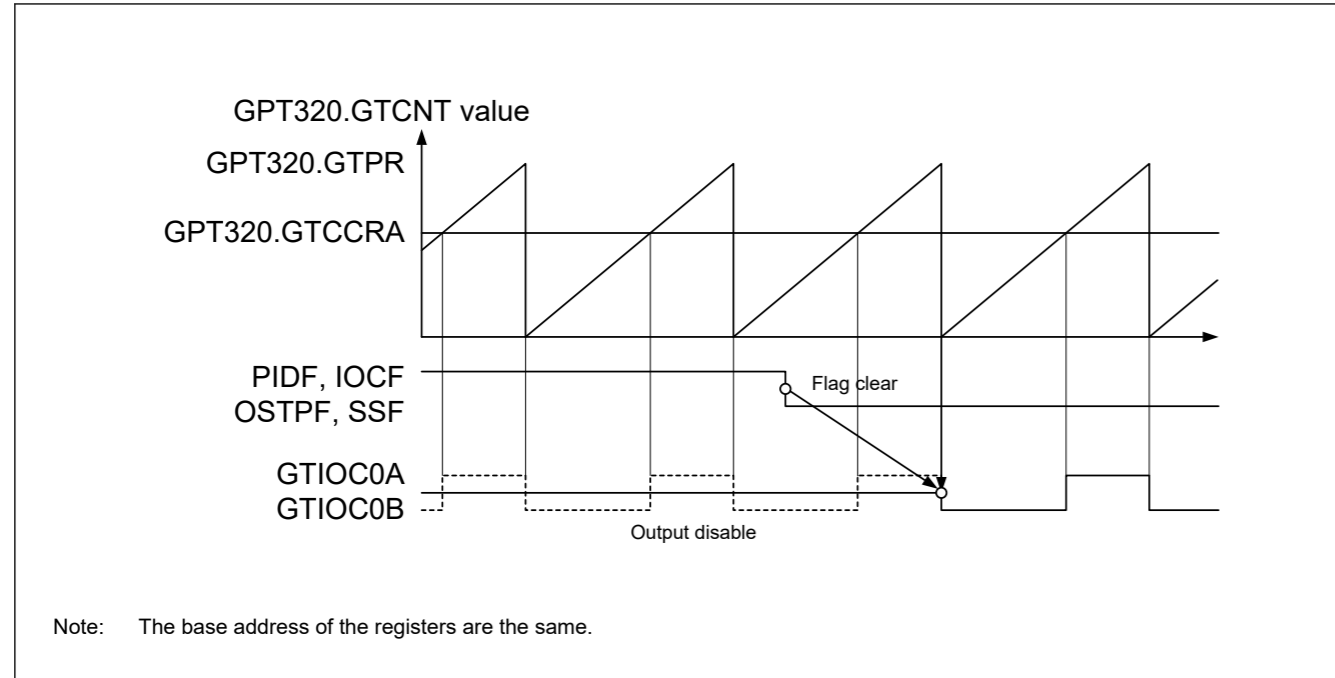

Figure 20.3 Output-disable release timing for GPT pin outputs

### 20.4 Interrupt Sources

The POEG generates an interrupt request when triggered by these sources:

- Output-disable control by the input level detection
- Output-disable request from the GPT

Table 20.3 lists the conditions for interrupt requests.

Table 20.3 Interrupt sources and conditions

| Interrupt source       | Symbol      | Associated flag | Trigger conditions  |
|------------------------|-------------|-----------------|---|
| POEG group A interrupt | POEG_GROUPA | POEGGA.IOCF     | An output-disable request from a GPT disable request occurred |
|                        |             | POEGGA.PIDF     | An output-disable request from the GTETRGA pin occurred       |
| POEG group B interrupt | POEG_GROUPB | POEGGB.IOCF     | An output-disable request from a GPT disable request occurred |
|                        |             | POEGGB.PIDF     | An output-disable request from the GTETRGB pin occurred       |
| POEG group C interrupt | POEG_GROUPC | POEGGC.IOCF     | An output-disable request from a GPT disable request occurred |
|                        |             | POEGGC.PIDF     | An output-disable request from the GTETRGC pin occurred       |
| POEG group D interrupt | POEG_GROUPD | POEGGD.IOCF     | An output-disable request from a GPT disable request occurred |
|                        |             | POEGGD.PIDF     | An output-disable request from the GTETRGD pin occurred       |

### 20.5 External Trigger Output to the GPT

The POEG outputs signals generated by filtering and level detection of GTETRn pins input signals as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear
- Up-count
- Down-count
- Input capture

Figure 20.3 GPT引脚输出的输出禁用释放时序

### 20.4 中断源

当这些源触发时，POEG会产生一个中断请求：

- 通过输入电平检测进行输出禁止控制
- 来自GPT的输出禁用请求

表20.3列出了中断请求的条件。

Table 20.3 中断源和条件

| 中断源      | Symbol      | 相关标志        | 触发条件                  |
|----------|-------------|-------------|-----------------------|
| POEGA组中断 | POEG_GROUPA | POEGGA.IOCF | 发生了来自GPT禁用请求的输出禁用请求   |
|          |             | POEGGA.PIDF | 发生了来自GTETRGA引脚的输出禁用请求 |
| POEGB组中断 | POEG_GROUPB | POEGGB.IOCF | 发生了来自GPT禁用请求的输出禁用请求   |
|          |             | POEGGB.PIDF | 发生来自GTETRGB引脚的输出禁用请求  |
| POEGC组中断 | POEG_GROUPC | POEGGC.IOCF | 发生了来自GPT禁用请求的输出禁用请求   |
|          |             | POEGGC.PIDF | 发生了来自GTETRGC引脚的输出禁用请求 |
| POEGD组中断 | POEG_GROUPD | POEGGD.IOCF | 发生了来自GPT禁用请求的输出禁用请求   |
|          |             | POEGGD.PIDF | 发生来自GTETRGD引脚的输出禁用请求  |

### 20.5 到GPT的外部触发输出

POEG输出GTETRn管脚输入信号滤波和电平检测产生的信号作为GPT操作触发信号，用于以下用途：

- 计数开始
- 计数停止
- 清点
- Up-count
- Down-count
- 输入捕捉

For the POEGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGn.NFCS[1:0] and POEGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in section 20.3.1. Pin Input Level Detection Operation. The state after filtering can be monitored in POEGn.ST.

Figure 20.4 shows the output timing of an external trigger to the GPT.

Figure 20.4 Output timing of external trigger to the GPT

## 20.6 Usage Notes

### 20.6.1 Transition to Software Standby Mode

When using the POEG, do not invoke Software Standby mode. In this mode, the POEG stops and therefore output disable of the pins cannot be controlled.

### 20.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PmnPFS.PMR and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

对于POEGn.INV极性设置信号，当在POEGn.NFCS[1:0]和POEGn.NFEN中选择的采样时钟连续输入相同电平3次时，输出该值。控制寄存器的设置与20.3.1节中描述的输入电平检测操作相同。引脚输入电平检测操作滤波后的状态可以在POEGn.ST中监控。

图20.4显示了外部触发到GPT的输出时序。

Figure 20.4 外部触发到GPT的输出时序

## 20.6 使用说明

### 20.6.1 过渡到软件待机模式

使用POEG时，请勿调用软件待机模式。在此模式下，POEG停止，因此无法控制引脚的输出禁用。

### 20.6.2 指定与GPT关联的引脚

仅当引脚与PmnPFS.PMR和PmnPFS.PSEL设置中的GPT关联时，POEG才控制输出禁用。当引脚指定为通用IO引脚时，POEG不执行输出禁用控制。

## 21. General PWM Timer (GPT)

### 21.1 Overview

The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 4 channels and a 16-bit timer with GPT16 × 4 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer.

Table 21.1 lists the GPT specifications, Table 21.2 shows the GPT functions, and Figure 21.1 shows a block diagram.

Table 21.1 GPT specifications

| Parameter | Description  |
|-----------|--|
| Functions | <ul style="list-style-type: none"> <li>32 bits × 4 channels (GPT32n (n = 0 to 3))</li> <li>16 bits × 4 channels (GPT16m (m = 4 to 7))</li> <li>Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter</li> <li>Clock sources independently selectable for each channel</li> <li>Two input/output pins per channel</li> <li>Two output compare/input capture registers per channel</li> <li>For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use</li> <li>In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms</li> <li>Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow</li> <li>Generation of dead times in PWM operation</li> <li>Synchronous starting, stopping and clearing counters for arbitrary channels</li> <li>Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 8 ELC events</li> <li>Count start, count stop, count clear, up-count, down-count, or input capture operation in response to the status of two input pins</li> <li>Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 4 external triggers</li> <li>Period count function</li> <li>Output pin disable function by detected short-circuits between output pins</li> <li>PWM waveform for controlling brushless DC motors can be generated</li> <li>Compare match A to F event, overflow/underflow event, and input UVW edge event can be output to the ELC</li> <li>Enables the noise filter for input capture and input UVW.</li> <li>Logical operation between the channel output</li> <li>Bus clock: PCLKA, Core clock: PCLKD</li> <li>Frequency ratio: PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64)</li> </ul> |

## 21. 通用PWM定时器(GPT)

### 21.1 Overview

通用PWM定时器(GPT)是一个具有GPT32×4通道的32位定时器和一个具有GPT16×4通道的16位定时器。PWM波形可以通过控制加计数器、减计数器或加减计数器来产生。此外，可以生成PWM波形来控制无刷直流电机。GPT也可以用作通用定时器。

表21.1列出了GPT规范，表21.2显示了GPT功能，图21.1显示了框图。

Table 21.1 GPT specifications

| Parameter | Description   |
|-----------|---|
| Functions | <ul style="list-style-type: none"> <li>32位×4通道(GPT32n(n=0到3))</li> <li>16位×4通道(GPT16m(m=4到7))</li> <li>每个计数器的递增计数或递减计数(锯齿波)或递增递减计数(三角波)</li> <li>每个通道可独立选择时钟源</li> <li>每个通道两个输入输出引脚</li> <li>每个通道两个输出比较输入捕捉寄存器</li> <li>每个通道的两个输出比较输入捕捉寄存器，提供四个寄存器作为缓冲寄存器，在不使用缓冲时可以作为比较寄存器工作</li> <li>在输出比较操作中，缓冲器切换可以处于波峰或波谷，从而能够生成横向不对称的PWM波形</li> <li>用于在每个通道中设置帧周期的寄存器，能够在上溢或下溢时产生中断</li> <li>在PWM操作中产生死区</li> <li>任意通道的同步启动、停止和清除计数器</li> <li>响应最多8个ELC事件的计数开始、计数停止、计数清除、递增计数、递减计数或输入捕获操作</li> <li>计数开始、计数停止、计数清除、递增计数、递减计数或输入捕获操作以响应两个输入引脚的状态</li> <li>计数开始、计数停止、计数清除、递增计数、递减计数或输入捕获操作，以响应最多4个外部触发</li> <li>周期计数功能</li> <li>通过检测到输出引脚之间的短路禁用输出引脚功能</li> <li>可生成控制无刷直流电机的PWM波形</li> <li>比较匹配A到F事件、上溢下溢事件和输入UVW边缘事件可以输出到ELC</li> <li>为输入捕获和输入UVW启用噪声滤波器。</li> <li>通道输出之间的逻辑运算</li> <li>总线时钟: PCLKA, 核心时钟: PCLKD</li> <li>Frequency ratio: PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64)</li> </ul> |

GTWP enables or disables writing to registers to prevent accidental modification. Protection by the GTWP register is only for the writes by the CPU. GTWP does not protect registers from updates that occur in association with CPU writes.

#### WP bit (Register Write Disable)

The following is a list of write enabled or disabled registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTDTCR, GTDVU, GTICLF, GTPC.

#### STRWP bit (GTSTR.CSTRT Bit Write Disable)

The STRWP bit enables or disables starting the updating of counter values by writing to the CSTRTn bit (n = 0 to 7) corresponding to a channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR register is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1 (disabling writing), the CSTRT bit for the given channel will not be updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GTWP.STRWP bit of GPT channel 0 is 0 (enabling writing), writing 1 to the GTSTR.CSTRT0 bit of GPT channel 1 when its current setting is 0 will lead to updating of the value, and the GPT320.GTCNT counter starts running. When the setting of the GTWP.STRWP bit of GPT channel 0 is 1 (disabling writing), writing 1 to the GTSTR.CSTRT0 bit of GPT channel 1 when its current setting is 0 will leave the bit with the value 0, and the GPT320.GTCNT counter will not start running.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

#### STPWP bit (GTSTP.CSTOP Bit Write Disable)

The STPWP bit enables or disables starting the updating of counter values by writing to the CSTOPn bit (n = 0 to 7) corresponding to a channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and the writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1 (disabling writing), the CSTOP bit for the given channel will not be updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GTWP.STPWP bit of GPT channel 0 is 0 (enabling writing), writing 1 to the GTSTP.CSTOP0 bit of GPT channel 1 when its current setting is 0 will lead to updating of the value, and the GPT320.GTCNT counter is stopped. When the setting of the GTWP.STPWP bit of GPT channel 0 is 1 (disabling writing), writing 1 to the GTSTP.CSTOP0 bit of GPT channel 1 when its current setting is 0 will leave the bit with the value 0, and the GPT320.GTCNT counter will not be stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

#### CLRWP bit (GTCLR.CCLR Bit Write Disable)

CLRWP bit enables or disables starting the updating of counter values by writing to the CCLRn bit (n = 0 to 7) corresponding to a channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and the writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel in the case of simultaneous writing to all channels.

Thus, in the case of writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1 (disabling writing), the CCLR bit for the given channel will not be updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0 (enabling writing) will be updated. For example, when the setting of the GTWP.CLRWP bit of GPT channel 0 is 0 (enabling writing), writing 1 to the GTCLR.CCLR0 bit of GPT channel 1 when its current setting is 0 will lead to updating of the value, and the GPT320.GTCNT counter is cleared. When the setting of the GTWP.CLRWP bit of

GTWP启用或禁用写入寄存器以防止意外修改。GTWP寄存器的保护只针对CPU的写操作。GTWP不保护寄存器免受与CPU写入相关的更新。

#### WP位 (寄存器写禁止)

以下是写启用或禁用寄存器的列表：

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTDTCR, GTDVU, GTICLF, GTPC.

#### STRWP位 (GTSTR.CSTRT位写入禁止)

STRWP位通过写入与GTSTR寄存器中的通道号对应的CSTRTn位 (n=0至7) 来启用或禁用开始更新计数器值。

GTSTR寄存器中每个CSTRTn位的位位置分配给对应编号的通道，对任何通道写入GTSTR寄存器都会导致写入所有通道的寄存器。每个通道的STRWP位不控制写入，而仅控制在同时写入所有通道的情况下相应通道的CSTRT位的更新。

因此，在写入STRWP位设置为1的通道的CSTRT位（禁止写入）的情况下，给定通道的CSTRT位将不会被更新，但对应于通道的CSTRT位将被更新。STRWP位的设置为0（允许写入）将被更新。例如，当GPT通道0的GTWP.STRWP位设置为0（允许写入）时，当前设置为0时向GPT通道1的GTSTR.CSTRT0位写入1将导致值更新，并且GPT320.GTCNT计数器开始运行。当GPT通道0的GTWP.STRWP位设置为1时（禁止写入），当前设置为0时，向GPT通道1的GTSTR.CSTRT0位写入1将保留该位的值0，而GPT320.GTCNT计数器不会开始运行。

如果要保护GTSTR寄存器中的所有位不被更新，请将所有通道的STRWP位设置为1。

#### STPWP位 (GTSTP.CSTOP位写入禁用)

STPWP位通过写入与GTSTP寄存器中的通道号对应的CSTOPn位 (n=0到7) 来启用或禁用开始更新计数器值。

GTSTP寄存器中每个CSTOPn位的位位置分配给对应编号的通道，对任何通道写入GTSTP寄存器都会导致写入所有通道的寄存器。每个通道的STPWP位不控制写入，而仅控制在同时写入所有通道的情况下相应通道的CSTOP位的更新。

因此，在写入STPWP位设置为1的通道的CSTOP位（禁止写入）的情况下，给定通道的CSTOP位将不会被更新，但对应于其通道的CSTOP位STPWP位的设置为0（允许写入）将被更新。例如，当GPT通道0的GTWP.STPWP位设置为0（允许写入）时，当前设置为0时向GPT通道1的GTSTP.CSTOP0位写入1将导致值更新，并且GPT320.GTCNT计数器停止。当GPT通道0的GTWP.STPWP位设置为1时（禁止写入），当前设置为0时向GPT通道1的GTSTP.CSTOP0位写入1将保留该位的值0，而GPT320.GTCNT计数器不会停止。

如果要保护GTSTP寄存器中的所有位不被更新，请将所有通道的STPWP位设置为1。

#### CLRWP位 (GTCLR.CCLR位写入禁止)

CLRWP位通过写入与GTCLR寄存器中的通道号对应的CCLRn位 (n=0至7) 来启用或禁用开始更新计数器值。

GTCLR寄存器中每个CCLRn位的位位置分配给对应编号的通道，对任何通道写入GTCLR寄存器都会导致写入所有通道的寄存器。每个通道的CLRWP位不控制写入，而仅控制在同时写入所有通道的情况下相应通道的CCLR位的更新。

因此，在写入CLRWP位设置为1（禁止写入）的通道CCLR位的情况下，给定通道的CCLR位将不会被更新，但对应于通道的CCLR位将被更新。CLRWP位的设置为0（允许写入）将被更新。例如，当GPT通道0的GTWP.CLRWP位设置为0（允许写入）时，当前设置为0时向GPT通道1的GTCLR.CCLR0位写入1将导致值更新，并且GPT320.GTCNT计数器清零。当设置GTWP.CLRWP位

non-secure access in the same security configuratin as the previous example, the GTCNT counter operation status of GPT channel 0 (CSTRT0 bit) can be read.

For the association between GTSTR bit number and a channel number, see [Figure 21.2](#).

**CSTRTn bits (Channel n GTCNT Count Start (n = 0 to 7))**

The CSTRTn bits start channel n of the GTCNT counter operation. Writing to the GTSTR.CSTRTn bit (n = 0 to 7) has no effect unless the GTSSR.CSTRT bit is set to 1.

The read data shows the counter status of each channel (GTCR.CST bit). Zero means the counter is stopped and 1 means the counter is running.

**21.2.3 GTSTP : General PWM Timer Software Stop Register**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)  
Offset address: 0x08

| Bit  | Symbol              | Function  | R/W |
|------|---------------------|---|-----|
| 31:0 | CSTOP0 to CSTOP31*1 | Channel n GTCNT Count Stop (n : the same as bit position value)<br>0: GTCNT counter not stop<br>1: GTCNT counter stop | R/W |

Note 1. The bits that can be used vary depending on the product. The n of CSTOPn is the same as the GPT channel number. For this product, n is 0 to 7.

The GTSTP stops the GTCNT counter operation for each channel n, where n = 0 to 7.

The GTSTP bit number represents the channel number. The GTSTP register of each channel is shared by all the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTP register.

The bit corresponding to channel which security attribution is configured as secure can be read by non-secure access but can not be written by non-secure access. For example, if GPT channel 0 is configured as secure and other GPTs are configured as non-secure, the CSTOP0 bit can not be written by non-secure access to GTSTP register in GPT channel 1, and the GTCNT counter operation status of GPT channel 0 is not changed. When the GTSTP register in GPT 1 is read by non-secure access in the same security configuratin as the previous example, the GTCNT counter operation status of GPT channel 0 (CSTOP0 bit) can be read.

For the association between GTSTP bit number and a channel number, see [Figure 21.2](#).

**CSTOPn bits (Channel n GTCNT Count Stop (n = 0 to 7))**

The CSTOPn bits stop channel n of the GTCNT counter operation. Writing to the GTSTP.CSTOPn bit (n = 0 to 7) has no effect unless the GTPSR.CSTOPn bit is set to 1. The read data shows the counter status of each channel (invert of GTCR.CST bit). Zero means the counter is running and 1 means the counter is stopped.

**21.2.4 GTCLR : General PWM Timer Software Clear Register**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)  
Offset address: 0x0C

non-secureaccess在与上一个示例相同的安全配置中，可以读取GPT通道0 (CSTRT0位) 的GTCNT计数器操作状态。

GTSTR位号与通道号的关系见图21.2。

**CSTRTn位 (通道nGTCNT计数开始 (n=0到7) )**

CSTRTn位启动GTCNT计数器操作的通道n。除非GTSSR.CSTRT位设置为1，否则写入GTSTR.CSTRTn位 (n=0到7) 无效。

读取的数据显示每个通道的计数器状态 (GTCR.CST位)。零表示计数器停止，1表示计数器正在运行。

**21.2.3 GTSTP:通用PWM定时器软件停止寄存器**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)  
Offset address: 0x08

| Bit  | Symbol              | Function  | R/W |
|------|---------------------|---|-----|
| 31:0 | CSTOP0 to CSTOP31*1 | 通道nGTCNT计数停止 (n: 与位位置值相同)<br>0: GTCNT计数器不停止1:<br>GTCNT计数器停止 | R/W |

注1.可使用的钻头因产品而异。CSTOPn的n与GPT通道号相同。对于本产品，n为0到7。

GTSTP停止每个通道n的GTCNT计数器操作，其中n=0到7。

GTSTP位号代表通道号。每个通道的GTSTP寄存器由所有通道共享。对于与写入1的GTSTP位号相关的通道，GTCNT计数器停止。写0对GTCNT计数器的状态和GTSTP寄存器的值没有影响。

安全属性配置为安全的通道对应的位可以被非安全访问读取，但不能被非安全访问写入。例如，如果GPT通道0配置为安全，其他GPT配置为非安全，则不能通过非安全访问GPT通道1中的GTSTP寄存器来写入CSTOP0位，以及GPT通道的GTCNT计数器操作状态0不变。当GPT1中的GTSTP寄存器通过与上例相同的安全配置中的非安全访问读取时，可以读取GPT通道0 (CSTOP0位) 的GTCNT计数器操作状态。

GTSTP位号与通道号的关系见图21.2。

**CSTOPn位 (通道nGTCNT计数停止 (n=0到7) )**

CSTOPn位停止GTCNT计数器操作的通道n。除非GTPSR.CSTOPn位设置为1，否则写入GTSTP.CSTOPn位 (n=0至7) 无效。读取的数据显示每个通道的计数器状态 (反转GTCR.CST位)。零表示计数器正在运行，1表示计数器停止。

**21.2.4 GTCLR:通用PWM定时器软件清零寄存器**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)  
Offset address: 0x0C

| Bit  | Symbol            | Function   | R/W |
|------|-------------------|--|-----|
| 31:0 | CCLR0 to CCLR31*1 | Channel n GTCNT Count Clear (n : the same as bit position value)<br>0: GTCNT counter is not cleared<br>1: GTCNT counter is cleared | W   |

Note 1. The bits that can be used vary depending on the product. The n of CCLRn is the same as the GPT channel number. For this product, n is 0 to 7.

The GTCLR is a write-only register that clears the GTCNT counter operation for each channel n, where n = 0 to 7.

The GTCLR bit number represents the channel number. The GTCLR register of each channel is shared by all the channels. The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter.

The bit corresponding to channel which security attribution is configured as secure can not be written by non-secure access. For example, if GPT channel 0 is configured as secure and other GPTs are configured as non-secure, the CCLR0 bit can not be written by non-secure access to GTCLR register in GPT channel 1, and the GTCNT counter of GPT channel 0 is not cleared.

For the association between GTCLR bit number and a channel number, see Figure 21.2.

### CCLRn bits (Channel n GTCNT Count Clear (n = 0 to 7))

Channel n of the GTCNT counter value is cleared on writing 1 to this bit. This bit is read as 0.

### 21.2.5 GTSSR : General PWM Timer Start Source Select Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x10

|                    |             |             |             |             |             |             |             |             |              |              |              |              |              |              |              |              |

The GTSSR sets the source to start the GTCNT counter.

#### SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGA pin input.

#### SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGA pin input.

#### SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGB pin input.

#### SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGB pin input.

#### SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGC pin input.

#### SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGC pin input.

#### SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGD pin input.

#### SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGD pin input.

#### SSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

#### SSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

#### SSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

GTSSR设置启动GTCNT计数器的源。

#### SSGTRGAR位 (GTETRGA引脚上升沿输入源计数器启动使能)

SSGTRGAR位启用或禁用GTCNT计数器在GTETRGA引脚输入的上升沿启动。

#### SSGTRGAF位 (GTETRGA引脚下降沿输入源计数器启动使能)

SSGTRGAF位启用或禁用GTCNT计数器在GTETRGA引脚输入的下降沿启动。

#### SSGTRGBR位 (GTETRGB引脚上升沿输入源计数器启动使能)

SSGTRGBR位在GTETRGB引脚输入的上升沿启用或禁用GTCNT计数器启动。

#### SSGTRGBF位 (GTETRGB引脚下降沿输入源计数器启动使能)

SSGTRGBF位在GTETRGB引脚输入的下降沿启用或禁用GTCNT计数器启动。

#### SSGTRGCR位 (GTETRGC引脚上升沿输入源计数器启动使能)

SSGTRGCR位启用或禁用GTCNT计数器在GTETRGC引脚输入的上升沿启动。

#### SSGTRGCF位 (GTETRGC引脚下降沿输入源计数器启动使能)

SSGTRGCF位启用或禁用GTCNT计数器在GTETRGC引脚输入的下降沿启动。

#### SSGTRGDR位 (GTETRGD引脚上升沿输入源计数器启动使能)

SSGTRGDR位启用或禁用GTCNT计数器在GTETRGD引脚输入的上升沿启动。

#### SSGTRGDF位 (GTETRGD引脚下降沿输入源计数器启动使能)

SSGTRGDF位启用或禁用GTCNT计数器在GTETRGD引脚输入的下降沿启动。

#### SSCARBL位 (GTIOCnB值低电平期间的GTIOCnA引脚上升沿输入源计数器启动使能)

SSCARBL位启用或禁用GTCNT计数器在GTIOCnA引脚输入的上升沿启动，当GTIOCnB输入为0。

#### SSCARBH位 (GTIOCnB值高电平期间的GTIOCnA引脚上升沿输入源计数器启动使能)

SSCARBH位启用或禁用GTCNT计数器在GTIOCnA引脚输入的上升沿启动，当GTIOCnB输入为1。

#### SSCAFBL位 (在GTIOCnB值低电平源计数器启动使能期间GTIOCnA引脚下降输入)

SSCAFBL位启用或禁用GTCNT计数器在GTIOCnA引脚输入的下降沿启动，当GTIOCnB输入为0。

**SSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Start Enable)**

The SSCAFBH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**SSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Start Enable)**

The SSCBRAL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**SSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Start Enable)**

The SSCBRAH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**SSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Start Enable)**

The SSCBFAL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**SSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Start Enable)**

The SSCBFAH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**SSELCm bit (ELC\_GPTm Event Source Counter Start Enable) (m = A to H)**

The SSELCm bit enables or disables the GTCNT counter start at the ELC\_GPTm event input.

**CSTRT bit (Software Source Counter Start Enable)**

The CSTRT bit enables or disables the GTCNT counter start by GTSTR register.

**21.2.6 GTPSR : General PWM Timer Stop Source Select Register**

**SSCAFBH位 (GTIOCnB值高电平期间GTIOCnA引脚下降输入源计数器启动使能)**

SSCAFBH位启用或禁用GTCNT计数器在GTIOCnA引脚输入的下降沿启动，当GTIOCnB输入为1。

**SSCBRAL位 (GTIOCnA值低电平期间的GTIOCnB引脚上升沿输入源计数器启动使能)**

SSCBRAL位启用或禁用GTCNT计数器在GTIOCnB引脚输入的上升沿启动，当GTIOCnA输入为0。

**SSCBRAH位 (GTIOCnA值高电平期间的GTIOCnB引脚上升沿输入源计数器启动使能)**

SSCBRAH位使能或禁止GTCNT计数器在GTIOCnB引脚输入的上升沿启动，当GTIOCnA输入为1。

**SSCBFAL位 (GTIOCnA值低电平源计数器启动使能期间GTIOCnB引脚下降输入)**

SSCBFAL位使能或禁止GTCNT计数器在GTIOCnB引脚输入的下降沿启动，当GTIOCnA输入为0。

**SSCBFAH位 (GTIOCnA值高电平源计数器启动使能期间的GTIOCnB引脚下降输入)**

SSCBFAH位启用或禁用GTCNT计数器在GTIOCnB引脚输入的下降沿启动，当GTIOCnA输入为1。

**SSELCm位 (ELC\_GPTm事件源计数器启动启用) (m=A到H)**

SSELCm位启用或禁用在ELC\_GPTm事件输入时启动的GTCNT计数器。

**CSTRT位 (软件源计数器启动使能)**

CSTRT位启用或禁用由GTSTR寄存器启动的GTCNT计数器。

**21.2.6 GTPSR: 通用PWM定时器停止源选择寄存器**

The GTPSR sets the source to stop the GTCNT counter.

#### PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGA pin input.

#### PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGA pin input.

#### PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

PSGTRGBR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGB pin input.

#### PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGB pin input.

#### PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

PSGTRGCR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGC pin input.

#### PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGC pin input.

#### PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

PSGTRGDR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGD pin input.

#### PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGD pin input.

#### PSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

| Bit   | Symbol | Function   | R/W |
|-------|--------|--|-----|

GTPSR设置源以停止GTCNT计数器。

#### PSGTRGAR位 (GTETRGA引脚上升沿输入源计数器停止使能)

PSGTRGAR位在GTETRGA引脚输入的上升沿启用或禁用GTCNT计数器停止。

#### PSGTRGAF位 (GTETRGA引脚下降沿输入源计数器停止使能)

PSGTRGAF位在GTETRGA引脚输入的下降沿启用或禁用GTCNT计数器停止。

#### PSGTRGBR位 (GTETRGB引脚上升沿输入源计数器停止使能)

PSGTRGBR位在GTETRGB引脚输入的上升沿启用或禁用GTCNT计数器停止。

#### PSGTRGBF位 (GTETRGB引脚下降沿输入源计数器停止使能)

PSGTRGBF位在GTETRGB引脚输入的下降沿启用或禁用GTCNT计数器停止。

#### PSGTRGCR位 (GTETRGC引脚上升沿输入源计数器停止使能)

PSGTRGCR位使能或禁止GTCNT计数器在GTETRGC引脚输入的上升沿停止。

#### PSGTRGCF位 (GTETRGC引脚下降沿输入源计数器停止使能)

PSGTRGCF位在GTETRGC引脚输入的下降沿启用或禁用GTCNT计数器停止。

#### PSGTRGDR位 (GTETRGD引脚上升沿输入源计数器停止使能)

PSGTRGDR位启用或禁用GTCNT计数器在GTETRGD引脚输入的上升沿停止。

#### PSGTRGDF位 (GTETRGD引脚下降沿输入源计数器停止使能)

PSGTRGDF位在GTETRGD引脚输入的下降沿启用或禁用GTCNT计数器停止。

#### PSCARBL位 (GTIOCnB值低电平期间的GTIOCnA引脚上升沿输入源计数器停止使能)

PSCARBL位在GTIOCnA引脚输入的上升沿启用或禁用GTCNT计数器停止，当GTIOCnB输入为0。

**PSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Stop Enable)**

This bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**PSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Stop Enable)**

The PSCAFBL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**PSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Stop Enable)**

The PSCAFBH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**PSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Stop Enable)**

The PSCBRAL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**PSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Stop Enable)**

The PSCBRAH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**PSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Stop Enable)**

The PSCBFAL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**PSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Stop Enable)**

The PSCBFAH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**PSELCm bit (ELCm Event Source Counter Stop Enable) (m = A to H)**

The PSELCm bit enables or disables the GTCNT counter stop at the ELC\_GPTm event input.

**CSTOP bit (Software Source Counter Stop Enable)**

The CSTOP bit enables or disables the GTCNT counter stop by the GTSTP register.

**21.2.7 GTCSR : General PWM Timer Clear Source Select Register**

**PSCARBH位 (GTIOCnB值高电平期间的GTIOCnA引脚上升沿输入源计数器停止使能)**

当GTIOCnB输入为1时, 该位在GTIOCnA引脚输入的上升沿启用或禁用GTCNT计数器停止。

**PSCAFBL位 (GTIOCnB值低电平源计数器停止使能期间GTIOCnA引脚下降输入)**

PSCAFBL位在GTIOCnA引脚输入的下降沿启用或禁用GTCNT计数器停止, 当GTIOCnB输入为0。

**PSCAFBH位 (GTIOCnB值高电平期间的GTIOCnA引脚下降输入源计数器停止使能)**

PSCAFBH位在GTIOCnA引脚输入的下降沿启用或禁用GTCNT计数器停止, 当GTIOCnB输入为1。

**PSCBRAL位 (GTIOCnA值低电平期间的GTIOCnB引脚上升沿输入源计数器停止使能)**

PSCBRAL位在GTIOCnB引脚输入的上升沿启用或禁用GTCNT计数器停止, 当GTIOCnA输入为0。

**PSCBRAH位 (GTIOCnA值高电平期间的GTIOCnB引脚上升沿输入源计数器停止使能)**

PSCBRAH位使能或禁止GTCNT计数器在GTIOCnB引脚输入的上升沿停止, 当GTIOCnA输入为1。

**PSCBFAL位 (GTIOCnA值低源计数器停止使能期间GTIOCnB引脚下降输入)**

PSCBFAL位在GTIOCnB引脚输入的下降沿启用或禁用GTCNT计数器停止, 当GTIOCnA输入为0。

**PSCBFAH位 (GTIOCnA值高电平源计数器停止使能期间的GTIOCnB引脚下降输入)**

PSCBFAH位使能或禁止GTCNT计数器在GTIOCnB引脚输入的下降沿停止, 当GTIOCnA输入为1。

**PSELCm位 (ELCm事件源计数器停止使能) (m=A到H)**

PSELCm位启用或禁用GTCNT计数器在ELC\_GPTm事件输入处停止。

**CSTOP位 (软件源计数器停止使能)**

CSTOP位通过GTSTP寄存器启用或禁用GTCNT计数器停止。

**21.2.7 GTCSR: 通用PWM定时器清零源选择寄存器**

The GTCSR sets the source to clear the GTCNT counter.

#### CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGA pin input.

#### CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGA pin input.

#### CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGB pin input.

#### CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGB pin input.

#### CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGC pin input.

#### CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGC pin input.

#### CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGD pin input.

GTCSR设置源以清除GTCNT计数器。

#### CSGTRGAR位 (GTETRGA引脚上升沿输入源计数器清零使能)

CSGTRGAR位在GTETRGA引脚输入的上升沿启用或禁用GTCNT计数器清零。

#### CSGTRGAF位 (GTETRGA引脚下降输入源计数器清零使能)

CSGTRGAF位在GTETRGA引脚输入的下沿启用或禁用GTCNT计数器清零。

#### CSGTRGBR位 (GTETRGB引脚上升沿输入源计数器清零使能)

CSGTRGBR位在GTETRGB引脚输入的上升沿启用或禁用GTCNT计数器清零。

#### CSGTRGBF位 (GTETRGB引脚下降输入源计数器清零使能)

CSGTRGBF位在GTETRGB引脚输入的下沿启用或禁用GTCNT计数器清零。

#### CSGTRGCR位 (GTETRGC引脚上升沿输入源计数器清零使能)

CSGTRGCR位在GTETRGC引脚输入的上升沿启用或禁用GTCNT计数器清零。

#### CSGTRGCF位 (GTETRGC引脚下降输入源计数器清零使能)

CSGTRGCF位在GTETRGC引脚输入的下沿启用或禁用GTCNT计数器清零。

#### CSGTRGDR位 (GTETRGD引脚上升沿输入源计数器清零使能)

CSGTRGDR位在GTETRGD引脚输入的上升沿启用或禁用GTCNT计数器清零。

**CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)**

The CSGTRGDF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGD pin input.

**CSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Clear Enable)**

The CSCARBL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**CSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Clear Enable)**

The CSCARBH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**CSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Clear Enable)**

The CSCAFBL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**CSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Clear Enable)**

The CSCAFBH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**CSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Clear Enable)**

The CSCBRAL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**CSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Clear Enable)**

The CSCBRAH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**CSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Clear Enable)**

The CSCBFAL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**CSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Clear Enable)**

The CSCBFAH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**CSELCm bit (ELCm Event Source Counter Clear Enable) (m = A to H)**

The CSELCm bit enables or disables the GTCNT counter clear at the ELC\_GPTm event input.

**CCLR bit (Software Source Counter Clear Enable)**

The CCLR bit enables or disables the GTCNT counter clear by the GTCLR register.

**21.2.8 GTUPSR : General PWM Timer Up Count Source Select Register**

**CSGTRGDF位 (GTETRGD引脚下降输入源计数器清零使能)**

CSGTRGDF位在GTETRGD引脚输入的下降沿启用或禁用GTCNT计数器清零。

**CSCARBL位 (GTIOCnB值低电平期间的GTIOCnA引脚上升沿输入源计数器清零使能)**

CSCARBL位在GTIOCnA引脚输入的上升沿启用或禁用GTCNT计数器清零，当GTIOCnB输入为0。

**CSCARBH位 (GTIOCnB值高电平期间GTIOCnA引脚上升沿输入源计数器清零使能)**

CSCARBH位在GTIOCnA引脚输入的上升沿启用或禁用GTCNT计数器清零，当GTIOCnB输入为1。

**CSCAFBL位 (GTIOCnB值低电平源计数器清除使能期间GTIOCnA引脚下降输入)**

CSCAFBL位在GTIOCnA引脚输入的下降沿启用或禁用GTCNT计数器清零，当GTIOCnB输入为0。

**CSCAFBH位 (GTIOCnB值高电平源计数器清零使能期间GTIOCnA引脚下降输入)**

CSCAFBH位在GTIOCnA引脚输入的下降沿启用或禁用GTCNT计数器清零，当GTIOCnB输入为1。

**CSCBRAL位 (GTIOCnA值低电平期间的GTIOCnB引脚上升沿输入源计数器清零使能)**

CSCBRAL位在GTIOCnB引脚输入的上升沿启用或禁用GTCNT计数器清零，当GTIOCnA输入为0。

**CSCBRAH位 (GTIOCnA值高电平期间GTIOCnB引脚上升沿输入源计数器清零使能)**

CSCBRAH位在GTIOCnB引脚输入的上升沿启用或禁用GTCNT计数器清零，当GTIOCnA输入为1。

**CSCBFAL位 (GTIOCnA值低电平源计数器清零使能期间GTIOCnB引脚下降输入)**

CSCBFAL位在GTIOCnB引脚输入的下降沿启用或禁用GTCNT计数器清零，当GTIOCnA输入为0。

**CSCBFAH位 (GTIOCnA值高电平期间GTIOCnB引脚下降输入源计数器清零使能)**

CSCBFAH位在GTIOCnB引脚输入的下降沿启用或禁用GTCNT计数器清零，当GTIOCnA输入为1。

**CSELCm位 (ELCm事件源计数器清除启用) (m=A到H)**

CSELCm位在ELC\_GPTm事件输入处启用或禁用GTCNT计数器清零。

**CCLR位 (软件源计数器清除启用)**

CCLR位启用或禁用由GTCLR寄存器清除的GTCNT计数器。

**21.2.8 GTUPSR: 通用PWM定时器向上计数源选择寄存器**

| 31:24 | —       | These bits are read as 0. The write value should be 0.  | R/W |

The GTUPSR sets the source to count up the GTCNT counter.

When at least one bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

#### USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGA pin input.

#### USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGA pin input.

#### USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGB pin input.

#### USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGB pin input.

#### USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGC pin input.

| 31:24 | —       | 这些位被读取为0。写入值应为0。  | R/W |

GTUPSR将源设置为对GTCNT计数器进行计数。

当GTUPSR寄存器中的至少一位设置为1时, GTCNT计数器由该寄存器中设置为1的源进行计数。在这种情况下, GTCR.TPCS无效。

#### USGTRGAR位 (GTETRGA引脚上升沿输入源计数器向上计数使能)

USGTRGAR位在GTETRGA引脚输入的上升沿启用或禁用GTCNT计数器向上计数。

#### USGTRGAF位 (GTETRGA引脚下降沿输入源计数器向上计数使能)

USGTRGAF位在GTETRGA引脚输入的下沿启用或禁用GTCNT计数器向上计数。

#### USGTRGBR位 (GTETRGB引脚上升沿输入源计数器向上计数使能)

USGTRGBR位在GTETRGB引脚输入的上升沿启用或禁用GTCNT计数器向上计数。

#### USGTRGBF位 (GTETRGB引脚下降沿输入源计数器向上计数使能)

USGTRGBF位在GTETRGB引脚输入的下沿启用或禁用GTCNT计数器向上计数。

#### USGTRGCR位 (GTETRGC引脚上升沿输入源计数器向上计数使能)

USGTRGCR位在GTETRGC引脚输入的上升沿启用或禁用GTCNT计数器向上计数。

**USGTRGCF bit (GTETRG C Pin Falling Input Source Counter Count Up Enable)**

The USGTRGCF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRG C pin input.

**USGTRGDR bit (GTETRG D Pin Rising Input Source Counter Count Up Enable)**

The USGTRGDR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRG D pin input.

**USGTRGDF bit (GTETRG D Pin Falling Input Source Counter Count Up Enable)**

The USGTRGDF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRG D pin input.

**USCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Up Enable)**

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCnA pin input, when GTIOCnB input is 0.

**USCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Up Enable)**

The USCARBH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**USCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Up Enable)**

The USCAFBL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**USCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Up Enable)**

The USCAFBL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**USCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Up Enable)**

The USCBRAL bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**USCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Up Enable)**

The USCBRAH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

**USCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Up Enable)**

The USCBFAL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

**USCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Up Enable)**

The USCBFAH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

**USELCm bit (ELC\_GPTm Event Source Counter Count Up Enable) (m = A to H)**

The USELCm bit enables or disables the GTCNT counter count up at the ELC\_GPTm event input.

**21.2.9 GTDNSR : General PWM Timer Down Count Source Select Register**

**USGTRGCF位 (GTETRG C引脚下降输入源计数器向上计数使能)**

USGTRGCF位在GTETRG C引脚输入的下降沿启用或禁用GTCNT计数器向上计数。

**USGTRGDR位 (GTETRG D引脚上升沿输入源计数器向上计数使能)**

USGTRGDR位在GTETRG D引脚输入的上升沿启用或禁用GTCNT计数器向上计数。

**USGTRGDF位 (GTETRG D引脚下降输入源计数器向上计数使能)**

USGTRGDF位在GTETRG D引脚输入的下降沿启用或禁用GTCNT计数器向上计数。

**USCARBL位 (GTIOCnB值低电平期间的GTIOCnA引脚上升沿输入源计数器向上计数使能)**

USCARBL位在GTIOCnA引脚输入的上升沿启用或禁用GTCNT计数器向上计数，当GTIOCnB输入为0。

**USCARBH位 (GTIOCnB值高电平期间的GTIOCnA引脚上升沿输入源计数器向上计数使能)**

USCARBH位在GTIOCnA引脚输入的上升沿启用或禁用GTCNT计数器向上计数，当GTIOCnB输入为1。

**USCAFBL位 (GTIOCnB值低电平源计数器向上计数启用期间的GTIOCnA引脚下降输入)**

USCAFBL位在GTIOCnA引脚输入的下降沿启用或禁用GTCNT计数器向上计数，当GTIOCnB输入为0。

**USCAFBL位 (GTIOCnB值高电平期间GTIOCnA引脚下降输入源计数器向上计数使能)**

USCAFBL位在GTIOCnA引脚输入的下降沿启用或禁用GTCNT计数器向上计数，当GTIOCnB输入为1。

**USCBRAL位 (GTIOCnA值低电平源计数器向上计数启用期间的GTIOCnB引脚上升沿输入)**

USCBRAL位在GTIOCnB引脚输入的上升沿启用或禁用GTCNT计数器向上计数，当GTIOCnA输入为0。

**USCBRAH位 (GTIOCnA值高电平期间GTIOCnB引脚上升沿输入源计数器向上计数使能)**

当GTIOCnA输入为1时，USCBRAH位在GTIOCnB引脚输入的上升沿启用或禁用GTCNT计数器向上计数。

**USCBFAL位 (GTIOCnA值低电平源计数器向上计数启用期间的GTIOCnB引脚下降输入)**

当GTIOCnA输入为0时，USCBFAL位在GTIOCnB引脚输入的下降沿启用或禁用GTCNT计数器向上计数。

**USCBFAH位 (GTIOCnA值高电平期间的GTIOCnB引脚下降输入源计数器向上计数使能)**

当GTIOCnA输入为1时，USCBFAH位在GTIOCnB引脚输入的下降沿启用或禁用GTCNT计数器向上计数。

**USELCm位 (ELC\_GPTm事件源计数器向上计数启用) (m=A到H)**

USELCm位在ELC\_GPTm事件输入处启用或禁用GTCNT计数器向上计数。

**21.2.9 GTDNSR: 通用PWM定时器递减计数源选择寄存器**

The GTDNSR sets the source to count down the GTCNT counter.

When at least one bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

#### DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGA pin input.

#### DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGA pin input.

#### DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGB pin input.

GTDNSR将源设置为对GTCNT计数器进行倒计时。

当GTDNSR寄存器中的至少一位设置为1时, GTCNT计数器由该寄存器中设置为1的源进行倒数计数。在这种情况下, GTCR.TPCS无效。

#### DSGTRGAR位 (GTETRGA引脚上升沿输入源计数器倒计使能)

DSGTRGAR位在GTETRGA引脚输入的上升沿启用或禁用GTCNT计数器倒计。

#### DSGTRGAF位 (GTETRGA引脚下降输入源计数器倒计使能)

DSGTRGAF位在GTETRGA引脚输入的下沿启用或禁用GTCNT计数器倒计。

#### DSGTRGBR位 (GTETRGB引脚上升输入源计数器倒计使能)

DSGTRGBR位在GTETRGB引脚输入的上升沿启用或禁用GTCNT计数器倒计。

**DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGBF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGB pin input.

**DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGCR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGC pin input.

**DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGCF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGC pin input.

**DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)**

The DSGTRGDR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGD pin input.

**DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)**

The DSGTRGDF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGD pin input.

**DSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Down Enable)**

The DSCARBL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

**DSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Down Enable)**

The DSCARBH bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**DSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Down Enable)**

The DSCAFBL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**DSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Down Enable)**

The DSCAFBH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**DSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Down Enable)**

The DSCBRAL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**DSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Down Enable)**

The DSCBRAH bit enables or disables the GTCNT counter count down on the rising edge of GTIOCnB pin input, when GTIOCnA input is 1.

**DSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Down Enable)**

The DSCBFAL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**DSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Down Enable)**

The DSCBFAH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**DSGTRGBF位 (GTETRGB引脚下降输入源计数器倒计时使能)**

DSGTRGBF位在GTETRGB引脚输入的下降沿启用或禁用GTCNT计数器倒计时。

**DSGTRGCR位 (GTETRGC引脚上升沿输入源计数器向下计数使能)**

DSGTRGCR位在GTETRGC引脚输入的上升沿启用或禁用GTCNT计数器倒计时。

**DSGTRGCF位 (GTETRGC引脚下降输入源计数器倒计时使能)**

DSGTRGCF位在GTETRGC引脚输入的下降沿启用或禁用GTCNT计数器倒计时。

**DSGTRGDR位 (GTETRGD引脚上升沿输入源计数器倒计时使能)**

DSGTRGDR位在GTETRGD引脚输入的上升沿启用或禁用GTCNT计数器倒计时。

**DSGTRGDF位 (GTETRGD引脚下降输入源计数器倒计时使能)**

DSGTRGDF位在GTETRGD引脚输入的下降沿启用或禁用GTCNT计数器倒计时。

**DSCARBL位 (GTIOCnB值低电平期间GTIOCnA引脚上升沿输入源计数器向下计数使能)**

当GTIOCnB输入为0时，DSCARBL位在GTIOCnA引脚输入的上升沿启用或禁用GTCNT计数器倒计时。

**DSCARBH位 (GTIOCnB值高电平期间GTIOCnA引脚上升沿输入源计数器向下计数使能)**

DSCARBH位在GTIOCnA引脚输入的上升沿启用或禁用GTCNT计数器倒计时，当GTIOCnB输入为1。

**DSCAFBL位 (GTIOCnB值低电平期间GTIOCnA引脚下降输入源计数器倒计时使能)**

当GTIOCnB输入为0时，DSCAFBL位在GTIOCnA引脚输入的下降沿启用或禁用GTCNT计数器倒计时。

**DSCAFBH位 (GTIOCnB值高电平期间GTIOCnA引脚下降输入源计数器向下计数使能)**

当GTIOCnB输入为1时，DSCAFBH位在GTIOCnA引脚输入的下降沿启用或禁用GTCNT计数器倒计时。

**DSCBRAL位 (GTIOCnA值低电平期间的GTIOCnB引脚上升沿输入源计数器向下计数使能)**

DSCBRAL位在GTIOCnB引脚输入的上升沿启用或禁用GTCNT计数器倒计时，当GTIOCnA输入为0。

**DSCBRAH位 (GTIOCnA值高电平期间GTIOCnB引脚上升沿输入源计数器向下计数使能)**

DSCBRAH位在GTIOCnB引脚输入的上升沿启用或禁用GTCNT计数器倒计时，当GTIOCnA输入为1。

**DSCBFAL位 (GTIOCnA值低电平期间GTIOCnB引脚下降输入源计数器向下计数使能)**

DSCBFAL位在GTIOCnB引脚输入的下降沿启用或禁用GTCNT计数器倒计时，当GTIOCnA输入为0。

**DSCBFAH位 (GTIOCnA值高电平期间GTIOCnB引脚下降输入源计数器倒计时使能)**

当GTIOCnA输入为1时，DSCBFAH位在GTIOCnB引脚输入的下降沿启用或禁用GTCNT计数器倒计时。

**DSELCm bit (ELC\_GPTm Event Source Counter Count Down Enable) (m = A to H)**

The DSELCm bit enables or disables the GTCNT counter count down at the ELC\_GPTm event input.

**21.2.10 GTICASR : General PWM Timer Input Capture Source Select Register A**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x24

| 31:24 | —      | These bits are read as 0. The write value should be 0.   | R/W |

The GTICASR sets the source of input capture for GTCCRA.

#### ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGA pin input.

#### ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGA pin input.

#### ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGB pin input.

#### ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGB pin input.

#### ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGC pin input.

#### ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGC pin input.

#### ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGD pin input.

#### ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGD pin input.

#### ASCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

#### ASCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

#### ASCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

#### ASCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when the GTIOCnB input is 1.

#### ASCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

| Bit   | Symbol | Function  | R/W |
|-------|--------|---|-----|
| 23    | ASELCH | ELC_GPTH事件源GTCCRA输入捕获启用<br>0: 在ELC_GPTH输入处禁用GTCCRA输入捕捉1: 在ELC_GPTH输入处启用GTCCRA输入捕捉 | R/W |
| 31:24 | —      | 这些位被读取为0。写入值应为0。  | R/W |

GTICASR设置GTCCRA的输入捕获源。

#### ASGTRGAR位 (GTETRGA引脚上升沿输入源GTCCRA输入捕捉使能)

ASGTRGAR位在GTETRGA引脚输入的上升沿启用或禁用GTCCRA的输入捕捉。

#### ASGTRGAF位 (GTETRGA引脚下降输入源GTCCRA输入捕捉使能)

ASGTRGAF位在GTETRGA引脚输入的下降沿启用或禁用GTCCRA的输入捕捉。

#### ASGTRGBR位 (GTETRGB引脚上升沿输入源GTCCRA输入捕捉使能)

ASGTRGBR位在GTETRGB引脚输入的上升沿启用或禁用GTCCRA的输入捕捉。

#### ASGTRGBF位 (GTETRGB引脚下降输入源GTCCRA输入捕捉使能)

ASGTRGBF位在GTETRGB引脚输入的下降沿启用或禁用GTCCRA的输入捕捉。

#### ASGTRGCR位 (GTETRGC引脚上升沿输入源GTCCRA输入捕捉使能)

ASGTRGCR位在GTETRGC引脚输入的上升沿启用或禁用GTCCRA的输入捕捉。

#### ASGTRGCF位 (GTETRGC引脚下降输入源GTCCRA输入捕捉使能)

ASGTRGCF位在GTETRGC引脚输入的下降沿启用或禁用GTCCRA的输入捕捉。

#### ASGTRGDR位 (GTETRGD引脚上升沿输入源GTCCRA输入捕捉使能)

ASGTRGDR位在GTETRGD引脚输入的上升沿启用或禁用GTCCRA的输入捕捉。

#### ASGTRGDF位 (GTETRGD引脚下降输入源GTCCRA输入捕捉使能)

ASGTRGDF位在GTETRGD引脚输入的下降沿启用或禁用GTCCRA的输入捕捉。

#### ASCARBL位 (GTIOCnB值低电平期间的GTIOCnA引脚上升沿输入源GTCCRA输入捕捉使能)

当GTIOCnB输入为0时，ASCARBL位在GTIOCnA引脚输入的上升沿启用或禁用GTCCRA的输入捕捉。

#### ASCARBH位 (GTIOCnB值高电平期间的GTIOCnA引脚上升沿输入源GTCCRA输入捕捉使能)

ASCARBH位在GTIOCnA引脚输入的上升沿启用或禁用GTCCRA的输入捕捉，当GTIOCnB输入为1。

#### ASCAFBL位 (GTIOCnB值低电平期间GTIOCnA引脚下降输入源GTCCRA输入捕捉使能)

ASCAFBL位在GTIOCnA引脚输入的下降沿启用或禁用GTCCRA的输入捕捉，当GTIOCnB输入为0。

#### ASCAFBH位 (GTIOCnB值高电平期间GTIOCnA引脚下降输入源GTCCRA输入捕捉使能)

当GTIOCnB输入为1时，ASCAFBH位在GTIOCnA引脚输入的下降沿启用或禁用GTCCRA的输入捕捉。

#### ASCBRAL位 (GTIOCnA值低电平期间的GTIOCnB引脚上升沿输入源GTCCRA输入捕捉使能)

当GTIOCnA输入为0时，ASCBRAL位在GTIOCnB引脚输入的上升沿启用或禁用GTCCRA的输入捕捉。

**ASCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)**

The ASCBRAH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**ASCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)**

The ASCBFAL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**ASCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)**

The ASCBFAH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**ASELCm bit (ELC\_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)**

The ASELCm bit enables or disables the input capture for GTCCRA at the ELC\_GPTm event input.

**21.2.11 GTICBSR : General PWM Timer Input Capture Source Select Register B**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x28

The GTICBSR sets the source of input capture for GTCCRB.

#### **BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGAR bit enables or disables the input capture for GTCCRB on the rising edge of the GTETRGA pin input.

#### **BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGAF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGA pin input.

#### **BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGBR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGB pin input.

#### **BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGBF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGB pin input.

#### **BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGCR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGC pin input.

#### **BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGCF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGC pin input.

#### **BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)**

The BSGTRGDR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGD pin input.

#### **BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)**

The BSGTRGDF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGD pin input.

#### **BSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)**

The BSCARBL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

#### **BSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)**

The BSCARBH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

| Bit   | Symbol | Function  | R/W |

| 31:24 | —      | 这些位被读取为0。写入值应为0。  | R/W |

GTICBSR设置GTCCRB的输入捕获源。

#### **BSGTRGAR位 (GTETRGA引脚上升沿输入源GTCCRB输入捕捉使能)**

BSGTRGAR位在GTETRGA引脚输入的上升沿启用或禁用GTCCRB的输入捕捉。

#### **BSGTRGAF位 (GTETRGA引脚下降输入源GTCCRB输入捕捉使能)**

BSGTRGAF位在GTETRGA引脚输入的下降沿启用或禁用GTCCRB的输入捕捉。

#### **BSGTRGBR位 (GTETRGB引脚上升沿输入源GTCCRB输入捕捉使能)**

BSGTRGBR位在GTETRGB引脚输入的上升沿启用或禁用GTCCRB的输入捕捉。

#### **BSGTRGBF位 (GTETRGB引脚下降输入源GTCCRB输入捕捉使能)**

BSGTRGBF位在GTETRGB引脚输入的下降沿启用或禁用GTCCRB的输入捕捉。

#### **BSGTRGCR位 (GTETRGC引脚上升沿输入源GTCCRB输入捕捉使能)**

BSGTRGCR位在GTETRGC引脚输入的上升沿启用或禁用GTCCRB的输入捕捉。

#### **BSGTRGCF位 (GTETRGC引脚下降输入源GTCCRB输入捕捉使能)**

BSGTRGCF位在GTETRGC引脚输入的下降沿启用或禁用GTCCRB的输入捕捉。

#### **BSGTRGDR位 (GTETRGD引脚上升沿输入源GTCCRB输入捕捉使能)**

BSGTRGDR位在GTETRGD引脚输入的上升沿启用或禁用GTCCRB的输入捕捉。

#### **BSGTRGDF位 (GTETRGD引脚下降输入源GTCCRB输入捕捉使能)**

BSGTRGDF位在GTETRGD引脚输入的下降沿启用或禁用GTCCRB的输入捕捉。

#### **BSCARBL位 (GTIOCnB值低电平期间GTIOCnA引脚上升沿输入源GTCCRB输入捕捉使能)**

当GTIOCnB输入为0时，BSCARBL位在GTIOCnA引脚输入的上升沿启用或禁用GTCCRB的输入捕捉。

#### **BSCARBH位 (GTIOCnB值高电平期间GTIOCnA引脚的上升沿输入源GTCCRB输入捕捉使能)**

BSCARBH位在GTIOCnA引脚输入的上升沿启用或禁用GTCCRB的输入捕捉，当GTIOCnB输入为1。

**BSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)**

The BSCAFBL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

**BSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)**

The BSCAFBH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

**BSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)**

The BSCBRAL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**BSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)**

The BSCBRAH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**BSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)**

The BSCBFAL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

**BSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)**

The BSCBFAH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

**BSELCm bit (ELC\_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)**

The BSELCm bit enables or disables the input capture for GTCCRB at the ELC\_GPTm event input.

21.2.12 GTCR : General PWM Timer Control Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)

**BSCAFBL位 (GTIOCnB值低电平期间GTIOCnA引脚下降输入源GTCCRB输入捕捉 Enable)**

当GTIOCnB输入为0时, BSCAFBL位在GTIOCnA引脚输入的下降沿启用或禁用GTCCRB的输入捕捉。

**BSCAFBH位 (GTIOCnB值高电平期间GTIOCnA引脚下降输入源GTCCRB输入捕捉 Enable)**

BSCAFBH位在GTIOCnA引脚输入的下降沿启用或禁用GTCCRB的输入捕捉, 当GTIOCnB输入为1。

**BSCBRAL位 (GTIOCnA值低电平期间GTIOCnB引脚上升沿输入源GTCCRB输入捕捉 Enable)**

BSCBRAL位在GTIOCnB引脚输入的上升沿启用或禁用GTCCRB的输入捕捉, 当GTIOCnA输入为0。

**BSCBRAH位 (GTIOCnA值高电平期间的GTIOCnB引脚上升沿输入源GTCCRB输入捕捉 Enable)**

BSCBRAH位在GTIOCnB引脚输入的上升沿启用或禁用GTCCRB的输入捕捉, 当GTIOCnA输入为1。

**BSCBFAL位 (GTIOCnA值低电平期间GTIOCnB引脚下降输入源GTCCRB输入捕捉 Enable)**

BSCBFAL位在GTIOCnB引脚输入的下降沿启用或禁用GTCCRB的输入捕捉, 当GTIOCnA输入为0。

**BSCBFAH位 (GTIOCnA值高电平期间GTIOCnB引脚下降输入源GTCCRB输入捕捉 Enable)**

BSCBFAH位在GTIOCnB引脚输入的下降沿启用或禁用GTCCRB的输入捕捉, 当GTIOCnA输入为1。

**BSELCm位 (ELC\_GPTm事件源计数器GTCCRB输入捕捉使能) (m=A到H)**

BSELCm位在ELC\_GPTm事件输入处启用或禁用GTCCRB的输入捕捉。

The GTCR controls GTCNT.

#### CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- The GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input that are enabled by GTSSR for the starting counter source, occurs (n = 0 to 7)
- 1 is written by software directly.

[Clearing conditions]

- The GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input enabled by GTSSR as the counter stop source, occurs (n = 0 to 7)
- 0 is written by software directly.

When the period count function is finished while the GTPC.ASTP bit is 1.

#### MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode. The MD[2:0] bits must be set while the GTCNT operation is stopped.

#### TPCS[3:0] bits (Timer Prescaler Select)

The TPCS[3:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[3:0] bits must be set while the GTCNT operation is stopped.

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 18:16 | MD[2:0]   | 模式选择<br>000: Saw-wave PWM模式 (单缓存或双缓存均可) 001: Saw-wave One-shot脉冲模式 (固定缓存操作) 010: 禁止设置 011: 禁止设置 100: 三角波 PWM 模式1 (波谷32位传输) (单缓冲器或双缓冲器均可)<br><br>101: 三角波 PWM 模式2 (波峰和波谷32位传输) (单缓冲器或双缓冲器均可)<br><br>110: 三角波 PWM 模式3 (谷底64位传输) (固定缓冲操作) 111: 禁止设置                  | R/W |
| 22:19 | —         | 这些位被读取为0。写入值应为0。  | R/W |
| 26:23 | TPCS[3:0] | 定时器预分频器选择<br>0000: PCLKD10001: PCLKD20010<br>: PCLKD40011: PCLKD80100: PCLKD160101: PCLKD320110: PCLKD640111: 禁止设置 1000: PCLKD2561001: 禁止设置 1010: PCLKD10241011: 禁止设置 1100: GTETRGA (通过POEG) 1101: GTETRGB (通过POEG) 1110: GTETRGC (通过POEG) 1111: GTETRGD (通过POEG) | R/W |
| 31:27 | —         | 这些位被读取为0。写入值应为0。  | R/W |

GTCR控制GTCNT。

#### CST bit (Count Start)

CST位控制GTCNT计数器的启动和停止。

[Setting conditions]

- GTSTR值，其中与位号关联的通道号设置为1，GTSSR.CSTRT位为1
- 发生由GTSSR为启动计数器源启用的ELC事件输入、外部触发或GTIOCnAGTIOCnB输入 (n=0到7)
- 1由软件直接写入。

[Clearing conditions]

- GTSTP值，其中与位号关联的通道号设置为1，且GTPSR.CSTOP位为1
- 发生ELC事件输入、外部触发或GTSSR作为计数器停止源启用的GTIOCnAGTIOCnB输入 (n=0至7)
- 0由软件直接写入。

当GTPC.ASTP位为1时完成周期计数功能。

#### MD[2:0] bits (Mode Select)

MD[2:0]位选择GPT操作模式。当GTCNT操作停止时，必须设置MD[2:0]位。

#### TPCS[3:0] bits (Timer Prescaler Select)

TPCS[3:0]位选择GTCNT的时钟。可为每个通道独立选择时钟预分频器。这当GTCNT操作停止时，必须设置TPCS[3:0]位。

| 31:28 | —          | 这些位被读取为0。写入值应为0。   | R/W |

GTUDDTYC设置GTCNT计数的方向（向上计数或向下计数），并设置GTIOCnAGTIOCnB引脚输出。

Count Direction:

- 在锯齿波模式下。

When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting stops, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).

When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.

- In triangle-wave mode.

When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.

When the UDF bit is set to 1 while counting is stopped, the UD value is reflected in the count direction when counting starts.

### UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting) for GTCNT.

### UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only 0 should be written to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

### Output duty

- In saw-wave mode.

When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR). When the OADTY/OBDTY value is changed during down-counting, the duty is reflected at an underflow (GTCNT = 0).

When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting stops the output duty is not reflected at the starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0).

When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

- In triangle-wave mode.

When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow.

When the OADTY/OBDTY value changes to 1 with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. The output duty is reflected at an underflow.

When the OADTY/OBDTY value changes to 0 with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

### OmDTY[1:0] bits (GTIOCm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCm pin.

### OmDTYF bit (Forcible GTIOCm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation. When OmDTYF bit is set to 1 while counting stops, return this bit to 0 until the first period ends after the counter starts.

### OmDTYR bit (GTIOCm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmDTYR bit selects the value that is the object of output retained or toggled at cycle end, when the control changes from 0% or 100% duty setting to compare match for the GTIOCm pin and GTIOR. The GTIOM[3:2] bits are set to 00b (output retained at cycle end) or the GTIOR.GTIOM[3:2] bits are set to 11b (output toggled at cycle end).

The GPT internally continues to perform compare match operation while 0% or 100% duty operation is running. When the OmDTYR bit is set to 1, the value of the compare match at cycle end is applied to the GTIOR.GTIOM [3:2] bits.

如果在向上计数期间将UD值设置为0, 则计数方向会在溢出时发生变化 (GTCNT值变为GTPR值后与计数时钟同步的时序)。在递减计数期间将UD值设置为1时, 计数方向会在下溢 (GTCNT值变为0后与计数时钟同步的时序) 下发生变化。当UDF位为0时UD值从1变为0并且在计数停止时, 计数器开始向上计数并且计数方向在溢出时改变 (在GTCNT值变为GTPR值之后与计数时钟同步的时序)。当UDF位为0且UD值从0变为1且计数停止时, 计数器开始递减计数并且计数方向在下溢时改变 (GTCNT值变为0后与计数时钟同步的时序)。当计数停止时UDF位设置为1时, UD位值在计数开始时反映在计数方向上。

- 三角波模式。

计数过程中UD值变化时, 计数方向不变。当UDF位为0时UD值发生变化并且计数停止时, 该变化不会反映在计数开始时的计数方向上。当计数停止时UDF位设置为1时, UD值在计数开始时反映在计数方向上。

### UD位 (计数方向设置)

UD位设置GTCNT的计数方向 (向上计数或向下计数)。

### UDF位 (强制计数方向设置)

当GTCNT开始操作时, UDF位将计数方向强制设置为UD值。在计数器操作期间, 只能将0写入该位。当计数停止时向该位写入1时, 在计数开始前将该位返回0。

### 输出占空比

- 在锯齿波模式下。

当OADTYOBDTY值在递增计数期间发生变化时, 占空比反映在溢出处(GTCNT=GTPR)。

在递减计数期间更改OADTYOBDTY值时, 占空比反映为下溢(GTCNT=0)。当OADTYOBDTY值变为1且OADTYF/OBDTYF位为0并且在计数停止时, 输出占空比不会反映在开始计数器操作中。当计数方向向上时, 输出占空比反映在溢出处(GTCNT=GTPR)。当计数方向向下时, 输出占空比反映为下溢(GTCNT=0)。当OADTYOBDTY值变为0且OADTYFOBDTYF位为1且计数停止时, 输出占空比反映在开始计数器操作时。

- 三角波模式。

当计数期间OADTYOBDTY值发生变化时, 占空比反映为下溢。

当OADTYFOBDTYF位为0且OADTYOBDTY值变为1且计数停止时, 输出占空比不会反映在开始计数器操作中。输出占空比反映在下溢处。当OADTYOBDTY值变为0且OADTYFOBDTYF位为1且计数停止时, 输出占空比反映在开始计数器操作时。

### OmDTY[1:0]位 (GTIOCm输出占空比设置) (m=A, B)

OmDTY[1:0]位设置GTIOCm引脚的输出占空比 (0%、100%或比较匹配控制)。

### OmDTYF位 (强制GTIOCm输出占空比设置) (m=A, B)

OmDTYF位强制将输出占空比设置为OmDTY设置。在计数器操作期间将此位设置为0。什么时候OmDTYF位在计数停止时设置为1, 在计数器开始后第一个周期结束之前将该位返回0。

### OmDTYR位 (释放0%100%占空比设置后选择GTIOCm输出值) (m=A, B)

当控制从0%或100%占空比设置更改为GTIOCm引脚和GTIOR比较匹配时, OmDTYR位选择作为输出对象在周期结束时保留或切换的值。GTIOM[3:2]位设置为00b (输出在循环结束时保留) 或GTIOR.GTIOM[3:2]位设置为11b (输出在循环结束时切换)。

GPT在内部继续执行比较匹配操作, 而0%或100%占空比操作正在运行。当。。。的时候OmDTYR位设置为1, 循环结束时比较匹配的值应用于GTIOR.GTIOM[3:2]位。

The GTIOR sets the functions of the GTIOCnA and GTIOCnB pins.

#### GTIOA[4:0] bits (GTIOCnA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCnA pin function. For details, see [Table 21.4](#).

#### OADFLT bit (GTIOCnA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCnA pin outputs high or low when counting stops.

#### OAHLDBit (GTIOCnA Pin Output Setting at the Start/Stop Count)

The OAHLDBit specifies whether the GTIOCnA pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OAHLDBit is set to 0:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLDBit is set to 1:

- The output is retained when counting starts or stops.

#### OAE bit (GTIOCnA Pin Output Enable)

The OAE bit disables or enables the GTIOCnA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit value.

#### OADF[1:0] bits (GTIOCnA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of the GTIOCnA pin when an output disable request occurs.

#### NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCnA pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

#### NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCnA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

#### GTIOB[4:0] bits (GTIOCnB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCnB pin function. For details, see [Table 21.4](#).

| Bit   | Symbol     | Function   | R/W |
|-------|------------|--|-----|
| 26:25 | OBDF[1:0]  | GTIOCnB引脚禁用值设置<br>00: 禁止输出01: GTIOCnB引脚在输出禁止时设置为Hi-Z10: GTIOCnB引脚在输出禁止时设置为0<br>11: GTIOCnB引脚在输出禁止时设置为1 | R/W |
| 28:27 | —          | 这些位被读取为0。写入值应为0。   | R/W |
| 29    | NFBEN      | 噪声滤波器B启用<br>0: GTIOCnB引脚的噪声滤波器禁用1: GTIOCnB引脚的噪声滤波器启用   | R/W |
| 31:30 | NFCSB[1:0] | 噪声滤波器B采样时钟选择<br>0 0: PCLKD/1<br>0 1: PCLKD/4<br>1 0: PCLKD/16<br>1 1: PCLKD/64                         | R/W |

GTIOR设置GTIOCnA和GTIOCnB引脚的功能。

#### GTIOA[4:0]位 (GTIOCnA引脚功能选择)

GTIOA[4:0]位选择GTIOCnA引脚功能。详见表21.4。

#### OADFLT位 (计数停止时的GTIOCnA引脚输出值设置)

OADFLT位设置当计数停止时GTIOCnA引脚输出高电平还是低电平。

#### OAHLDB位 (开始停止计数时的GTIOCnA引脚输出设置)

OAHLDB位指定是保留GTIOCnA引脚输出电平还是计数开始或停止时的电平取决于寄存器设置。

当OAHLDB位设置为0时:

- GTIOA[4:0]位的位[4]中指定的值在计数开始时输出
- 计数停止时输出OADFLT位中指定的值
- 如果在计数停止时修改OADFLT位，则新值会立即反映在输出中。

当OAHLDB位设置为1时:

- 计数开始或停止时保持输出。

#### OAE位 (GTIOCnA引脚输出使能)

OAE位禁用或启用GTIOCnA引脚输出。

当GTCCRA寄存器用作输入捕捉寄存器时 (GTICASR寄存器中至少有一位设置为1)，无论OAE位值如何，GTIOCnA引脚都不输出。

#### OADF[1:0]位 (GTIOCnA引脚禁用值设置)

当出现输出禁用请求时，OADF[1:0]位选择GTIOCnA引脚的输出值。

#### NFAEN位 (噪声滤波器A使能)

NFAEN位禁用或启用来自GTIOCnA引脚的输入的噪声滤波器。因为更改位的值可能会导致内部产生意外边沿，所以在此之前选择GTIOR寄存器中相关引脚的输出比较功能。

#### NFCSA[1:0]位 (噪声滤波器A采样时钟选择)

NFCSA[1:0]位设置GTIOCnA引脚噪声滤波器的采样间隔。设置这些位时，请等待所选采样间隔的2个周期，然后再设置输入捕捉功能。

#### GTIOB[4:0]位 (GTIOCnB引脚功能选择)

GTIOB[4:0]位选择GTIOCnB引脚功能。详见表21.4。

**OBDFLT bit (GTIOCnB Pin Output Value Setting at the Count Stop)**

The OBDFLT bit sets whether the GTIOCnB pin outputs high or low when counting stops.

**OBHLD bit (GTIOCnB Pin Output Setting at the Start/Stop Count)**

The OBHLD bit specifies whether the GTIOCnB pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OBHLD bit is set to 0:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1:

- The output is retained when counting starts or stops.

**OBE bit (GTIOCnB Pin Output Enable)**

The OBE bit disables or enables the GTIOCnB pin output.

When GTCCRB register is used as the input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit value.

**OBDF[1:0] bits (GTIOCnB Pin Disable Value Setting)**

The OBDF[1:0] bits select the output value of the GTIOCnB pin, when an output disable request occurs.

**NFBEN bit (Noise Filter B Enable)**

The NFBEN bit disables or enables the noise filter for input from the GTIOCnB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

**NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)**

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCnB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

**OBDFLT位 (计数停止时GTIOCnB引脚输出值设置)**

OBDFLT位设置当计数停止时GTIOCnB引脚输出高电平还是低电平。

**OBHLD位 (GTIOCnB引脚输出设置在开始停止计数)**

OBHLD位指定是保留GTIOCnB引脚输出电平还是计数开始或停止时的电平取决于寄存器设置。

当OBHLD位设置为0时:

- GTIOB[4:0]位的位[4]中指定的值在计数开始时输出
- 计数停止时输出OBDFLT位中指定的值
- 如果在计数停止时修改了OBDFLT位, 则新值会立即反映在输出中。

当OBHLD位设置为1时:

- 计数开始或停止时保持输出。

**OBE位 (GTIOCnB引脚输出使能)**

OBE位禁用或启用GTIOCnB引脚输出。

当GTCCRB寄存器用作输入捕捉寄存器时 (GTICBSR寄存器中至少有一位设置为1), 无论OBE位值如何, GTIOCnB引脚都不输出。

**OBDF[1:0]位 (GTIOCnB引脚禁用值设置)**

当输出禁用请求发生时, OBDF[1:0]位选择GTIOCnB引脚的输出值。

**NFBEN位 (噪声滤波器B启用)**

NFBEN位禁用或启用来自GTIOCnB引脚的输入的噪声滤波器。因为更改位的值可能会导致内部产生意外边沿, 所以在此之前选择GTIOR寄存器中相关引脚的输出比较功能。

**NFCSB[1:0]位 (噪声滤波器B采样时钟选择)**

NFCSB[1:0]位设置GTIOCnB引脚噪声滤波器的采样间隔。设置这些位时, 请等待所选采样间隔的2个周期, 然后再设置输入捕捉功能。

Table 21.4 Settings of GTIOA[4:0] and GTIOB[4:0] bits

| GTIOA/GTIOB[4:0] bits |    |    |    |    | Function               |                              |  |
|-----------------------|----|----|----|----|------------------------|------------------------------|--|
| b4                    | b3 | b2 | b1 | b0 | b4                     | b3, b2 <sup>*1</sup> *2 *3   | b1, b0 <sup>*2</sup>                           |
| 0                     | 0  | 0  | 0  | 0  | Initial output is low  | Output retained at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 0                     | 0  | 0  | 0  | 1  |                        |                              | Low output at GTCCRA/GTCCRB compare match      |
| 0                     | 0  | 0  | 1  | 0  |                        |                              | High output at GTCCRA/GTCCRB compare match     |
| 0                     | 0  | 0  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |
| 0                     | 0  | 1  | 0  | 0  |                        | Low output at cycle end      | Output retained at GTCCRA/GTCCRB compare match |
| 0                     | 0  | 1  | 0  | 1  |                        |                              | Low output at GTCCRA/GTCCRB compare match      |
| 0                     | 0  | 1  | 1  | 0  |                        |                              | High output at GTCCRA/GTCCRB compare match     |
| 0                     | 0  | 1  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |
| 0                     | 1  | 0  | 0  | 0  |                        | High output at cycle end     | Output retained at GTCCRA/GTCCRB compare match |
| 0                     | 1  | 0  | 0  | 1  |                        |                              | Low output at GTCCRA/GTCCRB compare match      |
| 0                     | 1  | 0  | 1  | 0  |                        |                              | High output at GTCCRA/GTCCRB compare match     |
| 0                     | 1  | 0  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |
| 0                     | 1  | 1  | 0  | 0  |                        | Output toggled at cycle end  | Output retained at GTCCRA/GTCCRB compare match |
| 0                     | 1  | 1  | 0  | 1  |                        |                              | Low output at GTCCRA/GTCCRB compare match      |
| 0                     | 1  | 1  | 1  | 0  |                        |                              | High output at GTCCRA/GTCCRB compare match     |
| 0                     | 1  | 1  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |
| 1                     | 0  | 0  | 0  | 0  | Initial output is high | Output retained at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 1                     | 0  | 0  | 0  | 1  |                        |                              | Low output at GTCCRA/GTCCRB compare match      |
| 1                     | 0  | 0  | 1  | 0  |                        |                              | High output at GTCCRA/GTCCRB compare match     |
| 1                     | 0  | 0  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |
| 1                     | 0  | 1  | 0  | 0  |                        | Low output at cycle end      | Output retained at GTCCRA/GTCCRB compare match |
| 1                     | 0  | 1  | 0  | 1  |                        |                              | Low output at GTCCRA/GTCCRB compare match      |
| 1                     | 0  | 1  | 1  | 0  |                        |                              | High output at GTCCRA/GTCCRB compare match     |
| 1                     | 0  | 1  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |
| 1                     | 1  | 0  | 0  | 0  |                        | High output at cycle end     | Output retained at GTCCRA/GTCCRB compare match |
| 1                     | 1  | 0  | 0  | 1  |                        |                              | Low output at GTCCRA/GTCCRB compare match      |
| 1                     | 1  | 0  | 1  | 0  |                        |                              | High output at GTCCRA/GTCCRB compare match     |
| 1                     | 1  | 0  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |
| 1                     | 1  | 1  | 0  | 0  |                        | Output toggled at cycle end  | Output retained at GTCCRA/GTCCRB compare match |
| 1                     | 1  | 1  | 0  | 1  |                        |                              | Low output at GTCCRA/GTCCRB compare match      |
| 1                     | 1  | 1  | 1  | 0  |                        |                              | High output at GTCCRA/GTCCRB compare match     |
| 1                     | 1  | 1  | 1  | 1  |                        |                              | Output toggled at GTCCRA/GTCCRB compare match  |

Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting) or underflow (GTCNT changes from 0 to GTPR in down-counting). The GTCNT counter is cleared for saw waves and for the trough (GTCNT changes from 0 to 1) for triangle waves.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

Table 21.4 GTIOA[4:0]和GTIOB[4:0]位的设置

| GTIOA/GTIOB[4:0] bits |    |    |    |    | Function |                            |                        |
|-----------------------|----|----|----|----|----------|----------------------------|------------------------|
| b4                    | b3 | b2 | b1 | b0 | b4       | b3, b2 <sup>*1</sup> *2 *3 | b1, b0 <sup>*2</sup>   |
| 0                     | 0  | 0  | 0  | 0  | 初始输出低    | 输出在循环结束时保留                 | GTCCRAGTCCRB比较匹配时保留的输出 |
| 0                     | 0  | 0  | 0  | 1  |          |                            | GTCCRAGTCCRB比较匹配时的低输出  |
| 0                     | 0  | 0  | 1  | 0  |          |                            | GTCCRAGTCCRB比较匹配时的高输出  |
| 0                     | 0  | 0  | 1  | 1  |          |                            | 在GTCCRAGTCCRB比较匹配时切换输出 |
| 0                     | 0  | 1  | 0  | 0  |          | 循环结束时输出低                   | GTCCRAGTCCRB比较匹配时保留的输出 |
| 0                     | 0  | 1  | 0  | 1  |          |                            | GTCCRAGTCCRB比较匹配时的低输出  |
| 0                     | 0  | 1  | 1  | 0  |          |                            | GTCCRAGTCCRB比较匹配时的高输出  |
| 0                     | 0  | 1  | 1  | 1  |          |                            | 在GTCCRAGTCCRB比较匹配时切换输出 |
| 0                     | 1  | 0  | 0  | 0  |          | 循环结束时的高输出                  | GTCCRAGTCCRB比较匹配时保留的输出 |
| 0                     | 1  | 0  | 0  | 1  |          |                            | GTCCRAGTCCRB比较匹配时的低输出  |
| 0                     | 1  | 0  | 1  | 0  |          |                            | GTCCRAGTCCRB比较匹配时的高输出  |
| 0                     | 1  | 0  | 1  | 1  |          |                            | 在GTCCRAGTCCRB比较匹配时切换输出 |
| 0                     | 1  | 1  | 0  | 0  |          | 输出在循环结束时切换                 | GTCCRAGTCCRB比较匹配时保留的输出 |
| 0                     | 1  | 1  | 0  | 1  |          |                            | GTCCRAGTCCRB比较匹配时的低输出  |
| 0                     | 1  | 1  | 1  | 0  |          |                            | GTCCRAGTCCRB比较匹配时的高输出  |
| 0                     | 1  | 1  | 1  | 1  |          |                            | 在GTCCRAGTCCRB比较匹配时切换输出 |
| 1                     | 0  | 0  | 0  | 0  | 初始输出高    | 输出在循环结束时保留                 | GTCCRAGTCCRB比较匹配时保留的输出 |
| 1                     | 0  | 0  | 0  | 1  |          |                            | GTCCRAGTCCRB比较匹配时的低输出  |
| 1                     | 0  | 0  | 1  | 0  |          |                            | GTCCRAGTCCRB比较匹配时的高输出  |
| 1                     | 0  | 0  | 1  | 1  |          |                            | 在GTCCRAGTCCRB比较匹配时切换输出 |
| 1                     | 0  | 1  | 0  | 0  |          | 循环结束时输出低                   | GTCCRAGTCCRB比较匹配时保留的输出 |
| 1                     | 0  | 1  | 0  | 1  |          |                            | GTCCRAGTCCRB比较匹配时的低输出  |
| 1                     | 0  | 1  | 1  | 0  |          |                            | GTCCRAGTCCRB比较匹配时的高输出  |
| 1                     | 0  | 1  | 1  | 1  |          |                            | 在GTCCRAGTCCRB比较匹配时切换输出 |
| 1                     | 1  | 0  | 0  | 0  |          | 循环结束时的高输出                  | GTCCRAGTCCRB比较匹配时保留的输出 |
| 1                     | 1  | 0  | 0  | 1  |          |                            | GTCCRAGTCCRB比较匹配时的低输出  |
| 1                     | 1  | 0  | 1  | 0  |          |                            | GTCCRAGTCCRB比较匹配时的高输出  |
| 1                     | 1  | 0  | 1  | 1  |          |                            | 在GTCCRAGTCCRB比较匹配时切换输出 |
| 1                     | 1  | 1  | 0  | 0  |          | 输出在循环结束时切换                 | GTCCRAGTCCRB比较匹配时保留的输出 |
| 1                     | 1  | 1  | 0  | 1  |          |                            | GTCCRAGTCCRB比较匹配时的低输出  |
| 1                     | 1  | 1  | 1  | 0  |          |                            | GTCCRAGTCCRB比较匹配时的高输出  |
| 1                     | 1  | 1  | 1  | 1  |          |                            | 在GTCCRAGTCCRB比较匹配时切换输出 |

注1.循环结束是指上溢（递增计数时GTCNT从GTPR变为0）或下溢（递减计数时GTCNT从0变为GTPR）。锯齿波和波谷（GTCNT从0变为1）的三角波清除GTCNT计数器。

注2.在比较匹配操作中，当一个周期结束的时序和GTCCRAGTCCRB比较匹配的时序相同时，在锯齿波PWM模式下，b3和b2设置优先，b1和b0设置优先在任何其他模式下都具有优先权。

注3.在GTUPSR或GTDNSR中至少一位设置为1的事件计数操作中，忽略b3和b2的设置。

## 21.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

The GTINTAD enables or disables interrupt requests and output disable requests.

**GRP[1:0] bits (Output Disable Source Select)**

The GRP[1:0] bits select the GTIOCnA pin and GTIOCnB pin output disable sources.

GTST.ODF shows the request of the output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE bits are 0.

**GRPABH bit (Same Time Output Level High Disable Request Enable)**

The GRPABH bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

**GRPABL bit (Same Time Output Level Low Disable Request Enable)**

The GRPABL bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 0 at the same time.

## 21.2.15 GTINTAD:通用PWM定时器中断输出设置寄存器

| 31    | —        | 该位读取为0。写入值应为0。  | R/W |

GTINTAD启用或禁用中断请求和输出禁用请求。

**GRP[1:0]位 (输出禁用源选择)**

GRP[1:0]位选择GTIOCnA引脚和GTIOCnB引脚输出禁用源。

GTST.ODF显示了使用GRP[1:0]位选择的输出禁用源组的请求。当GTIOR.OAE和GTIOR.OBE位均为0时，设置GRP[1:0]位。

**GRPABH位 (同时输出电平高禁用请求启用)**

GRPABH位允许或禁止GTIOCnA引脚和GTIOCnB引脚同时输出1时的输出禁止请求。

**GRPABL位 (同时输出电平低禁用请求启用)**

当GTIOCnA引脚和GTIOCnB引脚同时输出0时，GRPABL位允许或禁止输出禁止请求。

Note 1. Only 0 can be written to this bit. Do not write 1.

The GTST indicates the status of the GPT.

#### TCFA flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

#### TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

#### TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

[Setting condition]

- GTCNT = GTCCRC.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

#### TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)

| Bit | Symbol | Function                                       | R/W     |
|-----|--------|--|---------|
| 31  | PCF    | 周期计数功能完成标志<br>0: 未发生周期计数功能完成<br>1: 已发生周期计数功能完成 | R/(W)*1 |

注1.该位只能写入0。不要写1。

GTST指示GPT的状态。

#### TCFA标志 (输入捕捉比较匹配标志A)

TCFA标志指示GTCCRA的输入捕获或比较匹配的状态。

[Setting conditions]

- GTCNT=GTCCRA，当GTCCRA寄存器用作比较匹配寄存器时
- 当GTCCRA寄存器用作输入捕捉寄存器时，GTCNT计数器值通过输入捕捉信号传送到GTCCRA。

[Clearing condition]

- 0写入此标志。

#### TCFB标志 (输入捕捉比较匹配标志B)

TCFB标志指示GTCCRB的输入捕获或比较匹配的状态。

[Setting conditions]

- GTCNT=GTCCRB，当GTCCRB寄存器用作比较匹配寄存器时
- 当GTCCRB寄存器用作输入捕捉寄存器时，GTCNT计数器值通过输入捕捉信号传送到GTCCRB。

[Clearing condition]

- 0写入此标志。

#### TCFC标志 (输入比较匹配标志C)

TCFC标志指示GTCCRC比较匹配的状态。

[Setting condition]

- GTCNT = GTCCRC.

[Clearing condition]

- 0写入此标志。

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0]=01b 10b 11b (GTCCRC执行缓冲操作)。

#### TCFD标志 (输入比较匹配标志D)

TCFD标志指示GTCCRD比较匹配的状态。

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0写入此标志。

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)

- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

**TCFE flag (Input Compare Match Flag E)**

The TCFE flag indicates the status for the compare match of GTCCRE.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

**TCFF flag (Input Compare Match Flag F)**

The TCFF flag indicates the status for the compare match of GTCCRF.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

**TCFPO flag (Overflow Flag)**

The TCFPO flag indicates when an overflow or crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR - 1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

**TCFPU flag (Underflow Flag)**

The TCFPU flag indicates when an underflow or trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this bit.

- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0]=10b 11b (GTCCRD执行缓冲操作)。

**TCFE标志 (输入比较匹配标志E)**

TCFE标志指示GTCCRE比较匹配的状态。

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0写入此标志。

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0]=01b 10b 11b (GTCCRE执行缓冲操作)。

**TCFF标志 (输入比较匹配标志F)**

TCFF标志表示GTCCRF比较匹配的状态。

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0写入此标志。

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0]=10b 11b (GTCCRF执行缓冲操作)。

**TCFPO flag (Overflow Flag)**

TCFPO标志指示何时发生溢出或波峰。

[Setting conditions]

- 在锯齿波模式下，发生溢出 (GTCNT在递增计数中从GTPR变为0)
- 在三角波模式中，出现波峰 (GTCNT从GTPR变为GTPR1)
- 在硬件源的计数中，发生了溢出 (GTCNT在递增计数中从GTPR变为0)。

[Clearing condition]

- 0写入此标志。

**TCFPU flag (Underflow Flag)**

TCFPU标志指示何时发生下溢或波谷。

[Setting conditions]

- 在锯齿波模式下，发生下溢 (GTCNT在向下计数中从0变为GTPR)
- 在三角波模式下，出现波峰 (GTCNT从0变为1)
- 在硬件源计数中，发生了下溢 (向下计数时GTCNT从0变为GTPR)。

[Clearing condition]

- 0写入该位。

**TUCF flag (Count Direction Flag)**

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and to 0 in down-counting.

**ODF flag (Output Disable Flag)**

The ODF flag shows the request of the output disable source group that is selected in the GRP[1:0] bits.

When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

**OABHF flag (Same Time Output Level High Flag)**

The OABHF flag indicates that the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

When the GTIOCnA or GTIOCnB pin outputs 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When an interrupt by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

**OABLF flag (Same Time Output Level Low Flag)**

The OABLF flag indicates that the GTIOCnA and GTIOCnB pins output 0 at the same time.

When the GTIOCnA pin or GTIOCnB pin outputs 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When an interrupt by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or the OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. When the output disable state is active, a compare match is performed continuously in the GPT and the OABHF/OABLF flag is updated in association with the result of the compared value.

**PCF flag (Period Count Function Finish Flag)**

This bit is status flag of period count function finish.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing condition]

**TUCF标志 (计数方向标志)**

TUCF标志表示GTCNT的计数方向。在事件计数操作中, 该标志在递增计数时设置为1, 在递减计数时设置为0。

**ODF标志 (输出禁用标志)**

ODF标志显示在GRP[1:0]位中选择的输出禁用源组的请求。

当输出禁用时, 输出禁用控制不会在输出禁用请求被否定的同一周期内释放。它在下一个周期中发布。

**OABHF标志 (同时输出电平高标志)**

OABHF标志表示GTIOCnA引脚和GTIOCnB引脚同时输出1。

当GTIOCnA或GTIOCnB引脚输出0时, 该标志返回0。该标志为只读。禁止写入0清除标志。

当通过OABHF标志启用中断时(GTINTAD.GRPABH=1), OABHF标志作为输出禁用请求输出到POEG。

[Setting condition]

- 当OAE和OBE位都设置为1时, GTIOCnA和GTIOCnB引脚同时输出1。

[Clearing conditions]

- 当OAE和OBE位都设置为1时, GTIOCnA引脚输出值与GTIOCnB引脚输出值不同
- 当OAE和OBE位都设置为1时, GTIOCnA和GTIOCnB引脚同时输出0
- OAE位或OBE位设置为0。

**OABLF标志 (同时输出电平低标志)**

OABLF标志表示GTIOCnA和GTIOCnB管脚同时输出0。

当GTIOCnA引脚或GTIOCnB引脚输出1时, 该标志返回0。该标志为只读。禁止写入0清除标志。

当启用OABLF标志的中断时(GTINTAD.GRPABL=1), OABLF标志作为输出禁用请求输出到POEG。

[Setting condition]

- 当OAE和OBE位都设置为1时, GTIOCnA和GTIOCnB引脚同时输出0。

[Clearing conditions]

- 当OAE和OBE位都设置为1时, GTIOCnA引脚输出值与GTIOCnB引脚输出值不同
- 当OAE和OBE位都设置为1时, GTIOCnA和GTIOCnB管脚同时输出1
- OAE位或OBE位都设置为0。

生成OABHF/OABLF标志的比较目标信号是比较匹配输出 (PWM输出) 信号, 在它们被输出禁用功能屏蔽之前。当输出禁用状态激活时, 在GPT中连续执行比较匹配, 并根据比较值的结果更新OABHF/OABLF标志。

**PCF标志 (周期计数功能完成标志)**

该位是周期计数功能完成的状态标志。

[Setting condition]

- GTPC.PCEN位为1, GTPC.PCNT计数器在周期结束时为1。
- GTPC.PCEN位为1, GTPC.PCNT计数器在计数时钟为0。

[Clearing condition]

- 0 is written to this bit.

### 21.2.17 GTBER : General PWM Timer Buffer Enable Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)

| 22    | CCRSWT    | GTCCRA and GTCCRB Forcible Buffer Operation<br>Writing 1 to this bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after 1 is written. This bit is read as 0. | W   |
| 31:23 | —         | These bits are read as 0. The write value should be 0.   | R/W |

The GTBER register provides settings for the buffer operation and must be set while the GTCNT operation stops.

#### BD0 bit (GTCCR Buffer Operation Disable)

The BD0 bit disables the buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF combined.

When GTDTCR.TDE is 1 and when BD0 is set to 0, GTCCRB does not perform buffer operation. The GTCCRB register is automatically set to a compare match value for negative-phase waveform with dead time.

A value for the BD0 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDCE or GTSECR.SBDCE.

#### BD1 bit (GTPR Buffer Operation Disable)

The BD1 bit disables the buffer operation using GTPR and GTPBR combined.

A value for the BD1 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDPE or GTSECR.SBDPE.

- 0写入该位。

### 21.2.17 GTBER:通用PWM定时器缓冲器使能寄存器

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

| 22    | CCRSWT    | GTCCRA和GTCCRB强制缓冲区操作向该位写入1会强制GTCCRA和GTCCRB进行缓冲区传输。该位在写入1后自动返回0。该位读为0。                       | W   |
| 31:23 | —         | 这些位被读取为0。写入值应为0。  | R/W |

GTBER寄存器为缓冲区操作提供设置，并且必须在GTCNT操作停止时设置。

#### BD0位 (GTCCR缓冲区操作禁用)

BD0位使用GTCCRA、GTCCRB、GTCCRC、GTCCRD、GTCCRE和GTCCRF组合禁用缓冲区操作。

当GTDTCR.TDE为1且BD0设置为0时，GTCCRB不执行缓冲操作。GTCCRB寄存器自动设置为带有死区时间的负相位波形的比较匹配值。

当向GTSECR.SBDCE或GTSECR.SBDCE写入1时，可以设置与由GTSECSR寄存器写入1的位的位置相关的通道中的BD0位的值。

#### BD1位 (GTPR缓冲区操作禁用)

BD1位禁用使用GTPR和GTPBR组合的缓冲区操作。

当向GTSECR.SBDPE或GTSECR.SBDPE写入1时，可以设置与由GTSECSR寄存器写入1的位的位置相关的通道中的BD1位的值。

**CCRA[1:0] bits (GTCCRA Buffer Operation)**

The CCRA[1:0] bits set the buffer operation with GTCCRA, GTCCRC, and GTCCRD combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

**CCRB[1:0] bits (GTCCRB Buffer Operation)**

The CCRB[1:0] bits set the buffer operation using GTCCRB, GTCCRE, and GTCCRF combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

**PR[1:0] bits (GTPR Buffer Operation)**

The PR[1:0] bits set the buffer operation with GTPR and GTPBR combined.

**CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)**

Writing 1 to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after the 1 is written. This bit is read as 0, and is valid only when counting is stopped with a compare match operation specified.

**21.2.18 GTCNT : General PWM Timer Counter**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x48

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | n/a    | GTCNT is a 32-bit read/write counter for GPT32n (n = 0 to 3). For GPT16m (m = 4 to 7), GTCNT is a 16-bit register. GTCNT can only be written to after counting stops. For GPT16m (m = 4 to 7), the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. GTCNT must be set within the range of 0 ≤ GTCNT ≤ GTPR. | R/W |

**21.2.19 GTCCRn : General PWM Timer Compare Capture Register n (n = A to F)**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x4C (GTCCRA)  
0x50 (GTCCRB)  
0x54 (GTCCRC)  
0x58 (GTCCRE)  
0x5C (GTCCRD)  
0x60 (GTCCRF)

**CCRA[1:0]位 (GTCCRA缓冲区操作)**

CCRA[1:0]位设置与GTCCRA、GTCCRC和GTCCRD组合的缓冲区操作。当缓冲操作受到GTCR中设置的操作模式限制时，GTCR设置优先。

缓冲器操作模式固定为锯齿波单次脉冲模式或三角波PWM模式3（波谷64位传输）。

**CCRB[1:0]位 (GTCCRB缓冲区操作)**

CCRB[1:0]位使用GTCCRB、GTCCRE和GTCCRF组合设置缓冲区操作。当缓冲操作受到GTCR中设置的操作模式限制时，GTCR设置优先。

缓冲器操作模式固定为锯齿波单次脉冲模式或三角波PWM模式3（波谷64位传输）。

**PR[1:0]位 (GTPR缓冲区操作)**

PR[1:0]位设置结合GTPR和GTPBR的缓冲区操作。

**CCRSWT位 (GTCCRA和GTCCRB强制缓冲操作)**

向CCRSWT位写入1会强制GTCCRA和GTCCRB进行缓冲区传输。该位在写入1后自动返回0。该位读为0，仅当计数停止并指定比较匹配操作时才有效。

**21.2.18 GTCNT:通用PWM定时器计数器**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x48

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | n/a    | GTCNT是GPT32n (n=0到3)的32位读写计数器。对于GPT16m (m=4到7)，GTCNT是一个16位寄存器。GTCNT只能在计数停止后写入。对于GPT16m (m=4到7)，用于访问32位单元的高16位始终读为0x0000，并且忽略写入这些位。GTCNT必须设置在0≤GTCNT≤GTPR的范围内。 | R/W |

**21.2.19 GTCCRn:通用PWM定时器比较捕捉寄存器n(n=AtoF)**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x4C (GTCCRA)  
0x50 (GTCCRB)  
0x54 (GTCCRC)  
0x58 (GTCCRE)  
0x5C (GTCCRD)  
0x60 (GTCCRF)

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 31:0 | n/a    | GTCCRn registers are read/write registers. The effective size of GTCCRn is the same as GTCNT (16- or 32-bit). If the effective size of GTCCRn is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. GTCCRA and GTCCRB are registers used for both output compare and input capture. GTCCRC and GTCCRE are compare match registers that can also function as buffer registers for GTCCRA and GTCCRB. GTCCRD and GTCCRF are compare match registers that can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB). | R/W |

Note 1. For GPT16m (m = 4 to 7), the value of the upper 16 bits after reset is 0x0000.

### 21.2.20 GTPR : General PWM Timer Cycle Setting Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x64

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 31:0 | n/a    | GTPR is a read/write register that sets the maximum count value of GTCNT. The effective size of GTPR is the same as GTCNT (16- or 32-bit). If the effective size of GTPR is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. For saw waves, the value of (GTPR + 1) is the cycle. For triangle waves, the value of (GTPR value × 2) is the cycle. | R/W |

Note 1. For GPT16m (m = 4 to 7), the value of the upper 16 bits after reset is 0x0000.

### 21.2.21 GTPBR : General PWM Timer Cycle Setting Buffer Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x68

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 31:0 | n/a    | GTPBR is a read/write register that functions as a buffer register for GTPR. The effective size of GTPBR is the same as GTCNT (16- or 32-bit). If the effective size of GTPBR is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. | R/W |

Note 1. For GPT16m (m = 4 to 7), the value of the upper 16 bits after reset is 0x0000.

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | n/a    | GTCCRn寄存器是读写寄存器。GTCCRn的有效大小与GTCNT（16位或32位）。如果GTCCRn的有效大小为16位，则在32位单元中访问的高16位始终被读取为0x0000，并且忽略写入这些位。GTCCRA和GTCCRB是用于输出比较和输入捕捉的寄存器。GTCCRC和GTCCRE是比较匹配寄存器，也可以用作GTCCRA和GTCCRB的缓冲寄存器。GTCCRD和GTCCRF是比较匹配寄存器，也可以用作GTCCRC和GTCCRE的缓冲寄存器（GTCCRA和GTCCRB的双缓冲寄存器）。 | R/W |

注1.对于GPT16m (m=4到7)，复位后高16位的值为0x0000。

### 21.2.20 GTPR：通用PWM定时器周期设置寄存器

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x64

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | n/a    | GTPR是一个读写寄存器，设置GTCNT的最大计数值。GTPR的有效大小与GTCNT（16位或32位）相同。如果GTPR的有效大小为16位，则在32位单元中访问的高16位始终被读取为0x0000，并且忽略写入这些位。对于锯齿波，(GTPR+1)的值就是周期。对于三角波，(GTPR值×2)的值就是周期。 | R/W |

注1.对于GPT16m (m=4到7)，复位后高16位的值为0x0000。

### 21.2.21 GTPBR:通用PWM定时器周期设置缓冲寄存器

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x68

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 31:0 | n/a    | GTPBR是一个读写寄存器，用作GTPR的缓冲寄存器。GTPBR的有效大小与GTCNT（16位或32位）相同。如果GTPBR的有效大小为16位，则在32位单元中访问的高16位始终被读取为0x0000，并且忽略写入这些位。 | R/W |

注1.对于GPT16m (m=4到7)，复位后高16位的值为0x0000。

21.2.22 GTDTCR : General PWM Timer Dead Time Control Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x88

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 0    | TDE    | Negative-Phase Waveform Setting<br>0: GTCCRB is set without using GTDVU<br>1: GTDVU sets the compare match value for negative-phase waveform with automatic dead time in GTCCRB | R/W |
| 31:1 | —      | These bits are read as 0. The write value should be 0.  | R/W |

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time. GPT has a dead time control function and the GTDVU register is used for setting dead time value.

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU. When GTDVU is used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU) is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and automatic setting does not take place.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB:

- Triangle waves:  
Upper limit value: GTPR - 1  
Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode:  
Upper limit value: GTPR  
Lower limit value: 0.

21.2.23 GTDVU : General PWM Timer Dead Time Value Register U

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x8C

21.2.22 GTDTCR:通用PWM定时器死区时间控制寄存器

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x88

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 0    | TDE    | 负相位波形设置<br>0: 不使用GTDVU设置GTCCRB1: GTDVU在GTCCRB中设置带自动死区时间的反相波形比较匹配值 | R/W |
| 31:1 | —      | 这些位被读取为0。写入值应为0。  | R/W |

GTDTCR可以自动设置带死区时间的负相位波形的比较匹配值。GPT具有死区时间控制功能，GTDVU寄存器用于设置死区时间值。

TDE位 (负相位波形设置)

TDE位指定是否使用GTDVU。使用GTDVU时，通过正相波形的比较匹配值(GTCCRA)和死区时间值(GTDVU)获得的带死区时间的负相波形的比较匹配值自动设置在GTCCRB中。

TDE位设置在锯齿波PWM模式下被忽略，并且不会进行自动设置。

GTCCRB值是自动设置的，具有以下上下限值。如果得到的GTCCRB值不在上限或下限范围内，则在GTCCRB中设置以下限制值：

- Triangle waves:  
上限值: GTPR-1  
下限值: 加1, 减0
- 锯齿波单发脉冲模式: 上限值: GTPR  
下限值: 0。

21.2.23 GTDVU:通用PWM定时器死区值寄存器U

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Offset address: 0x8C

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 31:0 | n/a    | GTDVU is a read/write register that sets the dead time for generating PWM waveforms with dead time. The effective size of GTDVU is the same as GTCNT (16 or 32 bits). If the effective size of GTDVU is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored.<br>Setting a GTDVU value greater than or equal to GTPR is prohibited. When using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The set value can be confirmed by reading from GTCCRB. When GTDVU is used, writing to GTCCRB is prohibited. When this register is set to 0, waveforms without dead time are output.<br>While GPT is running, changing the GTDVU values is prohibited. To change GTDVU to a new value, stop the GPT with the CST bit in the GTCR register. | R/W |

Note 1. For GPT16m (m = 4 to 7), the value of the upper 16 bits after reset is 0x0000.

### 21.2.24 GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)  
GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 7)

Note 1. The signal before performing output disable control is selected.  
 Note 2. When channel's own GTIOCnA is selected, C is treated as "1".  
 Note 3. When channel's own GTIOCnB is selected, D is treated as "1".

The GTICLF register sets the logical operation function between compare match outputs. The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control. (The output disable control is performed with the signal after logical operation.)

Access in 8-bit units to GTICLF is prohibited.

**ICLFm[2:0] bit (GTIOCm Output Logical Operation Function Select) (m = A, B)**

These bits select the logical operation function between signals before performing output disable control for GTIOCm. To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed. When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as "1".

**ICLFSELk[5:0] bit (Inter Channel Signal k Select) (k = C, D)**

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

**21.2.25 GTPC : General PWM Timer Period Count Register**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0, 1)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 6)

Offset address: 0xBC

注1.选择执行输出禁用控制之前的信号。注意2.选择频道自己的GTIOCNA时，C将其视为“1”。注意3.选择频道自己的GTIOCnB时，D将视为“1”。

GTICLF寄存器设置比较匹配输出之间的逻辑运算功能。通过比较匹配控制后执行占空比0%100%控制的信号执行逻辑运算。（输出禁止控制是通过逻辑运算后的信号进行的。）

禁止以8位为单位访问GTICLF。

**ICLFm[2:0]位 (GTIOCm输出逻辑运算功能选择) (m=A B)**

这些位在执行GTIOCm的输出禁用控制之前选择信号之间的逻辑运算功能。为防止对GPT输出造成危害，逻辑运算后的信号由PCLKD锁存。锁存后，执行输出禁用控制。When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

当相同的信号运行逻辑函数，或者选择exorand也没有选择时，一个信号被视为“1”。

**ICLFSELk[5:0]位 (通道间信号k选择) (k=C D)**

这些位选择在执行GTIOCnm的输出禁用控制之前的信号执行逻辑运算的信号k。

**21.2.25 GTPC: 通用PWM定时器周期计数寄存器**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0, 1)  
 GPT16m = 0x4016\_9000 + 0x0100 × m (m = 4 to 6)

Offset address: 0xBC

| Bit   | Symbol     | Function  | R/W |
|-------|------------|---|-----|
| 0     | PCEN       | Period Count Function Enable<br>0: Period count function is disabled<br>1: Period count function is enabled       | R/W |
| 7:1   | —          | These bits are read as 0. The write value should be 0.  | R/W |
| 8     | ASTP       | Automatic Stop Function Enable<br>0: Automatic stop function is disabled<br>1: Automatic stop function is enabled | R/W |
| 15:9  | —          | These bits are read as 0. The write value should be 0.  | R/W |
| 27:16 | PCNT[11:0] | Period Counter<br>Counter for the number of period  | R/W |
| 31:28 | —          | These bits are read as 0. The write value should be 0.  | R/W |

The GTPC register counts the number of period.

#### PCEN bit (Period Count Function Enable)

This bit enables or disables period count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCD bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

#### ASTP bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bit is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at PCNT = 0, the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

#### PCNT[11:0] bit (Period Counter)

This counter counts the number of period.

When the PCEN bit is 0, writing the number of period is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of period. In sawtooth-wave mode, the end of period refers to overflow, underflow, or counter clearing. In triangle-wave mode, it refers to trough.

When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

GTPC寄存器计算周期数。

#### PCEN位 (周期计数功能使能)

该位启用或禁用周期计数功能。

当计数正在进行和停止时，可以写入。

当向GTSECR.SPCE位或GTSECR.SPCD位写入1时，该值同时设置到由GTSECSR寄存器设置为1的通道中的PCEN位。

#### ASTP位 (自动停止功能使能)

该位使能或禁止GTCNT计数器在完成周期数计数后自动停止。

当PCENbit为0时，可以写入。

当PCEN位为1时，禁止写入。

当PCEN位为1，ASTP位为1，PCNT计数器在PCNT=0时停止，GTCNT计数器也停止。当ASTP位为0时，GTCNT计数器继续计数。

#### PCNT[11:0] bit (Period Counter)

该计数器计算周期数。

当PCENbit为0时，可写入周期数。

当PCEN位为1时，写入被禁止，并且在周期结束时执行递减计数。在锯齿波模式中，周期结束是指上溢、下溢或计数器清零。在三角波模式中，它指的是波谷。

当PCNT计数器在周期结束时为1时，它变为0并停止计数。

当GTCNT计数器停止而周期计数功能使能时，PCNT计数器保持其值。当。。。的时候GTCNT计数器重新开始计数且PCEN位为1，PCNT计数器重新从保持值开始向下计数。

当PCNT计数器为0且ASTP位为1时PCEN位从0变为1时，GTCNT计数器立即停止在计数时钟处。

The GTSECSR register selects an intended channel for updating an operation enable bit by the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

The bit corresponding to channel which security attribution is configured as secure can be read by non-secure access but can not be written by non-secure access. For example, if GPT0 is configured as secure and other GPTs are configured as non-secure, the SECSEL0 bit can not be written by non-secure access to GPT1.GTSECSR register, and the simultaneous control status of GPT0 is not changed. When the GPT1.GTSECSR register is read by non-secure access in the same security configuratin as the previous example, the simultaneous control status of GPT0 (SECSEL0 bit) can be read.

Access in 8-bit or 16-bit units to GTSECSR is prohibited, and it should be accessed in 32-bit units.

GTSECSR寄存器通过GTSECR寄存器选择用于更新操作使能位的预期通道。GTSECSR寄存器的位位置表示通道号。每个通道的GTSECSR寄存器是一个公共寄存器，在任何通道的GTSECSR寄存器中写入1并更新它会改变一个通道，与GTSECSR寄存器写入1的位的位置有关，同时被控制GTSECR寄存器的操作使能位。

安全属性配置为安全的通道对应的位可以被非安全访问读取，但不能被非安全访问写入。例如，如果GPT0配置为安全，而其他GPT配置为非安全，则SECSEL0位不能通过对GPT1.GTSECSR寄存器的非安全访问来写入，并且GPT0的同时控制状态不会改变。当GPT1.GTSECSR寄存器通过与上例相同的安全配置中的非安全访问读取时，可以读取GPT0 (SECSEL0位) 的同时控制状态。

禁止以8位或16位为单位访问GTSECSR，应以32位为单位进行访问。

**SECSELn bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 7)**

This bit enables or disables the simultaneous control of operation enable in channel n.

When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

**21.2.27 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register**

Base address: GPT32n = 0x4016\_9000 + 0x0100 × n (n = 0 to 3)

| 31:25 | —      | These bits are read as 0. The write value should be 0.  | R/W |

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers.

The GTSECR register of channel which security attribution is configured as secure can not be written by non-secure access. For example, if GPT0 is configured as secure and other GPTs are configured as non-secure, the GPT0.GTSECR register can not be written by non-secure access to GPT1.GTSECR register even if the simultaneous control of GPT0 is enabled, and the simultaneous control status of GPT0 is not changed.

Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

**SECSELn位 (操作使能位同时控制通道选择) (n=0至7)**

该位启用或禁用通道n中操作启用的同时控制。

该位设置为1时启用同步控制，该位设置为0时禁用同步控制。

GTSECR寄存器同时更新由GTSECSR寄存器设置的通道的操作使能位的值。

将1写入任何通道的GTSECR寄存器中的位并更新它会更新所有通道的操作使能位，这与所有GTSECSR寄存器写入1的位的位置有关。

安全属性配置为安全的通道的GTSECR寄存器不能被非安全访问写入。例如，如果GPT0配置为安全，而其他GPT配置为非安全，则即使GPT0的同时控制使能，也不能通过非安全访问GPT1.GTSECR寄存器来写入GPT0.GTSECR寄存器，并且GPT0的同时控制状态不变。

禁止在GTSECR中将同一操作使能位的使能位和禁用位设置为1。

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

**SBDCE bit (GTCCR Register Buffer Operation Simultaneous Enable)**

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

**SBDPE bit (GTPR Register Buffer Operation Simultaneous Enable)**

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPBR, registers are enabled.

Simultaneous setting of SBDPE and SBDCD bits to 1 is prohibited.

**SBDCD bit (GTCCR Register Buffer Operation Simultaneous Disable)**

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

**SBDPD bit (GTPR Register Buffer Operation Simultaneous Disable)**

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPBR, registers are disabled.

Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

**SPCE bit (Period Count Function Simultaneous Enable)**

When 1 is written to this bit, 1 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is enabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

**SPCD bit (Period Count Function Simultaneous Disable)**

When 1 is written to this bit, 0 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is disabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

| 0   | UF     | Input Phase Soft Setting  | R/W |
| 1   | VF     | These bits set the input phase from software settings. Setting these bits is valid when OPSCR.FB = 1. | R/W |
| 2   | WF     |   | R/W |

写入1的位会自动清除。读取GTSECR时，读取0。

禁止以8位或16位为单位访问GTSECR寄存器，应以32位为单位进行访问。

**SBDCE位 (GTCCR寄存器缓冲区操作同时使能)**

向该位写入1时，通过GTSECSR寄存器设置为1的通道中的GTBER.BD[0]位同时设置为0，并且使用GTCCRA、GTCRC和GTCCRD寄存器以及使用GTCCRB、GTCCRE进行缓冲操作和GTCCRF寄存器被启用。

禁止将SBDCE和SBDCD位同时设置为1。

**SBDPE位 (GTPR寄存器缓冲区操作同时使能)**

向该位写入1时，同时将GTSECSR寄存器设置为1的通道中的GTBER.BD[1]位设置为0，并启用使用GTPR、GTPBR寄存器的缓冲操作。

禁止将SBDPE和SBDCD位同时设置为1。

**SBDCD位 (GTCCR寄存器缓冲区操作同时禁用)**

当向该位写入1时，同时将1设置为由GTSECSR寄存器设置为1的通道中的GTBER.BD[0]位，并使用GTCCRA、GTCRC和GTCCRD寄存器以及使用GTCCRB、GTCCRE进行缓冲操作和GTCCRF寄存器被禁用。

禁止将SBDCE和SBDCD位同时设置为1。

**SBDPD位 (GTPR寄存器缓冲区操作同时禁用)**

当向该位写入1时，同时将1设置到由GTSECSR寄存器设置为1的通道中的GTBER.BD[1]位，并且使用GTPR、GTPBR寄存器的缓冲操作被禁用。

禁止将SBDPE和SBDCD位同时设置为1。

**SPCE位 (周期计数功能同时使能)**

向该位写入1时，通过GTSECSR寄存器设置为1的通道中的GTPC.PCEN位同时设置为1，并启用周期计数功能。

禁止将SPCE和SPCD位同时设置为1。

**SPCD位 (周期计数功能同时禁用)**

向该位写入1时，通过GTSECSR寄存器设置为1的通道中的GTPC.PCEN位同时设置为0，并且禁用周期计数功能。

禁止将SPCE和SPCD位同时设置为1。

**21.2.28 OPSCR: 输出相位切换控制寄存器**

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 31:30 | NFCS[1:0] | External Input Noise Filter Clock Selection<br>Noise filter sampling clock setting of the external input.<br>0 0: PCLKD/1<br>0 1: PCLKD/4<br>1 0: PCLKD/16<br>1 1: PCLKD/64 | R/W |

Note 1. When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

#### UF , VF , WF bits (Input Phase Soft Setting)

The UF , VF , WF bits set the input phase from the software settings. When OPSCR.FB bit is 1, these bits are valid. The set value of the UF /VF /WF takes the place of the U/V/W external input.

#### U, V, W bits (Input Phase Monitor)

When the OPSCR.FB bit is 0, external inputs that are synchronized by PCLKD are monitored by these bits. When the OPSCR.FB bit is 1, the OPSCR.U, OPSCR.V, and OPSCR.W bits can read the OPSCR.UF , OPSCR.VF , and OPSCR.WF bits.

#### EN bit (Enable-Phase Output Control)

The EN bit controls the output enable signal output phase (positive phase/reverse phase).

When the OPSCR.EN bit is 1, the signal waveform is output.

When the OPSCR.EN bit is 0, first set OPSCR.FB, OPSCR.UF /VF /WF (software setting is selected), OPSCR.P/N, OPSCR.INV, OPSCR.RV, OPSCR.ALIGN, OPSCR.GRP[1:0], OPSCR.GODF, OPSCR.NFEN, OPSCR.NFCS. Then, set the bit to 1. Also when OPSCR.GODF is 1 and the signal value selected in the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

#### FB bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (OPSCR.UF, VF, WF) and external input such as a Hall element.

#### P bit (Positive-Phase Output (P) Control)

The P bit selects one of the level signal output (PWM of GPT320) or PWM signal output for the positive-phase output (GTOUUP pin, GTOVUP pin, GTOWUP pin).

#### N bit (Negative-Phase Output (N) Control)

The N bit selects one of the level signal output (PWM of GPT320) or PWM signal output for the negative-phase output (GTOULO pin, GTOVLO pin, GTOWLO pin).

#### INV bit (Invert-Phase Output Control)

The INV bit selects one of the positive logic (active-high) output or negative logic (active-low) output for the output phase.

#### RV bit (Output Phase Rotation Direction Reversal Control)

The RV bit reverses the direction of rotation of the motor by inverting the input phase.

#### ALIGN bit (Input Phase Alignment)

The ALIGN bit selects the PCLKD or PWM for the sampling of the input phase (input phase is specified in the OPSCR.FB bit). When OPSCR.ALIGN bit is 0, input phase is aligned to PCLKD.

Note: When PWM output is selected (OPSCR.P/N is 1) and the PCLKD input phase is aligned, the PWM pulse can be short-pulsed.

Note: When OPSCR.ALIGN bit is 1, input phase is aligned with PWM output.

#### GRP[1:0] bit (Output Disabled Source Selection)

The GRP[1:0] bit selects the output disable source.

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 31:30 | NFCS[1:0] | 外部输入噪声滤波器时钟选择<br>外部输入的噪声滤波器采样时钟设置。<br>0 0: PCLKD/1<br>0 1: PCLKD/4<br>1 0: PCLKD/16<br>1 1: PCLKD/64 | R/W |

注1.当OPSCR.GODF=1且OPSCR.GRP[1:0]位选择的信号值为高时，OPSCR.EN位设置为0。

OPSCR寄存器设置无刷直流电机控制所需的信号波形输出。

#### UF VF WF位 (输入相位软设置)

UF、VF、WF位从软件设置中设置输入相位。当OPSCR.FB位为1时，这些位有效。UFVFWF的设定值代替了UVW外部输入。

#### U、V、W位 (输入相位监视器)

当OPSCR.FB位为0时，由PCLKD同步的外部输入由这些位监控。当。。。的时候OPSCR.FB位为1，OPSCR.U、OPSCR.V和OPSCR.W位可以读取OPSCR.UF、OPSCR.VF和OPSCR.WF位。

#### EN位 (使能阶段输出控制)

EN位控制输出使能信号的输出相位 (正相反相)。

当OPSCR.EN位为1时，输出信号波形。

当OPSCR.EN位为0时，先设置OPSCR.FB、OPSCR.UFVFWF (选择软件设置)、OPSCR.PN、OPSCR.INV、OPSCR.RV、OPSCR.ALIGN、OPSCR.GRP[1:0]、OPSCR.GODF、OPSCR.NFEN、OPSCR.NFCS。然后，将该位设置为1。同样，当OPSCR.GODF为1且在OPSCR.GRP[1:0]位中选择的信号值为高时，OPSCR.EN位设置为0。

#### FB位 (外部反馈信号使能)

FB位从软件设置 (OPSCR.UF、VF、WF) 和霍尔元件等外部输入中选择输入相位。

#### P位 (正相输出(P)控制)

P位选择电平信号输出 (GPT320的PWM) 或正相输出 (GTOUUP引脚、GTOVUP引脚、GTOWUP引脚) 的PWM信号输出之一。

#### N位 (负相输出(N)控制)

N位选择电平信号输出 (GPT320的PWM) 或负相输出 (GTOULO引脚、GTOVLO引脚、GTOWLO引脚) 的PWM信号输出之一。

#### INV位 (反相输出控制)

INV位选择输出相位的正逻辑 (高电平有效) 输出或负逻辑 (低电平有效) 输出之一。

#### RV位 (输出相位旋转方向反转控制)

RV位通过反转输入相位来反转电机的旋转方向。

#### ALIGN位 (输入相位对齐)

ALIGN位选择PCLKD或PWM对输入相位进行采样 (输入相位在OPSCR.FB位中指定)。当OPSCR.ALIGN位为0时，输入相位与PCLKD对齐。

Note: When PWM output is selected (OPSCR.P/N is 1) and the PCLKD input phase is aligned, the PWM pulse can be short-pulsed.

Note: 当OPSCR.ALIGN位为1时，输入相位与PWM输出对齐。

#### GRP[1:0]位 (输出禁用源选择)

GRP[1:0]位选择输出禁用源。

**GODF bit (Group Output Disable Function)**

When OPSCR.GODF is 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

When OPSCR.GODF bit is 0, this bit is ignored.

**NFEN bit (External Input Noise Filter Enable)**

The NFEN bit selects the noise filter for external input. When OPSCR.NFEN bit is 0, a noise filter for the external input is not used.

Note: When this bit is switched because of an unintentional internal edge, set the OPSCR.EN bit to 0.

**NFCS[1:0] bits (External Input Noise Filter Clock Selection)**

The NFCS[1:0] bits select the clock for the external input noise filter. When the OPSCR.NFEN bit is 1, noise filter sampling clock setting of the external input is enabled.

1. Set the NFCS[1:0].
2. Wait for 2 cycles.
3. Set the OPSCR.EN bit to 1.

**21.3 Operation****21.3.1 Basic Operation**

Each channel has a 32-bit and 16-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle.

When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated GTIOCnA or GTIOCnB can be changed (n = 0 to 7). GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

**21.3.1.1 Counter operation****(1) Counter start and stop**

The counter of each channel starts the count operation when GTCR.CST is set to 1. The GTCR.CST bit value is changed by the following sources:

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register.
- Completion of the period count function while the GTPC.ASTP bit is 1.

**(2) Periodic count operation in up-counting by count clock**

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 0x00000000. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1. After GTCNT overflows, up-counting resumes from 0x00000000.

Figure 21.3 shows an example of a periodic count operation in up-counting by the count clock.

**GODF位 (组输出禁用功能)**

当OPSCR.GODF为1且OPSCR.GRP[1:0]位选择的信号值为高时，OPSCR.EN位设置为0。

当OPSCR.GODF位为0时，该位被忽略。

**NFEN位 (外部输入噪声滤波器使能)**

NFEN位选择外部输入的噪声滤波器。当OPSCR.NFEN位为0时，不使用外部输入的噪声滤波器。

Note: 由于无意的内部边沿而切换该位时，将OPSCR.EN位设置为0。

**NFCS[1:0]位 (外部输入噪声滤波器时钟选择)**

NFCS[1:0]位选择外部输入噪声滤波器的时钟。当OPSCR.NFEN位为1时，使能外部输入的噪声滤波器采样时钟设置。

- 1.设置NFCS[1:0]。
- 2.等待2个周期。
- 3.将OPSCR.EN位设置为1。

**21.3 Operation****21.3.1 基本操作**

每个通道都有一个32位和16位定时器，它们使用计数时钟和硬件源执行周期性计数操作。计数功能提供向上计数和向下计数。GTPR控制计数周期。

当GTCNT计数器值与GTCCRA或GTCCRB中的值匹配时，相关GTIOCnA或GTIOCnB可以更改（n=0到7）。GTCCRA或GTCCRB可用作具有硬件资源的输入捕捉寄存器。

GTCCRC和GTCCRD可以作为GTCCRA的缓冲寄存器。GTCCRE和GTCCRF可以作为GTCCRB的缓冲寄存器。

**21.3.1.1 计数器操作****(1) 计数器启动和停止**

当GTCR.CST设置为1时，每个通道的计数器开始计数操作。GTCR.CST位值由以下来源更改：

- 写入GTCR寄存器
- 当GTSSR.CSTRT位设置为1时，将1写入GTSTR中与GPT通道号相关的位
- 当GTPSR.CSTOP位设置为1时，将1写入GTSTP中与GPT通道号相关的位
- GTSSR寄存器中选择的硬件源
- GTPSR寄存器中选择的硬件源。
- GTPC.ASTP位为1时完成周期计数功能。

**(2) 计数时钟递增计数中的周期计数操作**

当相关的GTCR.CST位通过GTUPSR和GTDNSR寄存器设置为0x00000000。当GTCNT值从GTPR值变为0（溢出）时，GTST.TCFPO标志设置为1。GTCNT溢出后，向上计数从0x00000000恢复。

图21.3显示了计数时钟递增计数中的周期性计数操作的示例。

Figure 21.3 Example of periodic count operation in up-counting by the count clock

Table 21.5 shows an example for setting periodic count operation in up-counting.

Table 21.5 Example for setting a periodic count operation in up-counting by the count clock

| No. | Step Name                     | Description  |
|-----|-------------------------------|--|
| 1   | Set operating mode            | Set the operating mode with GTCR.MD[2:0]. In Figure 21.3, 000b (saw-wave PWM mode) is set.   |
| 2   | Set count direction           | Select the count direction with the GTUDDTYC register. In Figure 21.3, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting). |
| 3   | Select count clock            | Select the count clock with GTCR.TPCS[3:0].  |
| 4   | Set cycle                     | Set the cycle in GTPR.   |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.3, 0x00000000 is set.   |
| 6   | Start count operation         | Set GTCR.CST to 1 to start count operation.  |

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 0x00000000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1. After the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 21.4 shows an example of periodic count operation in down-counting by the count clock.

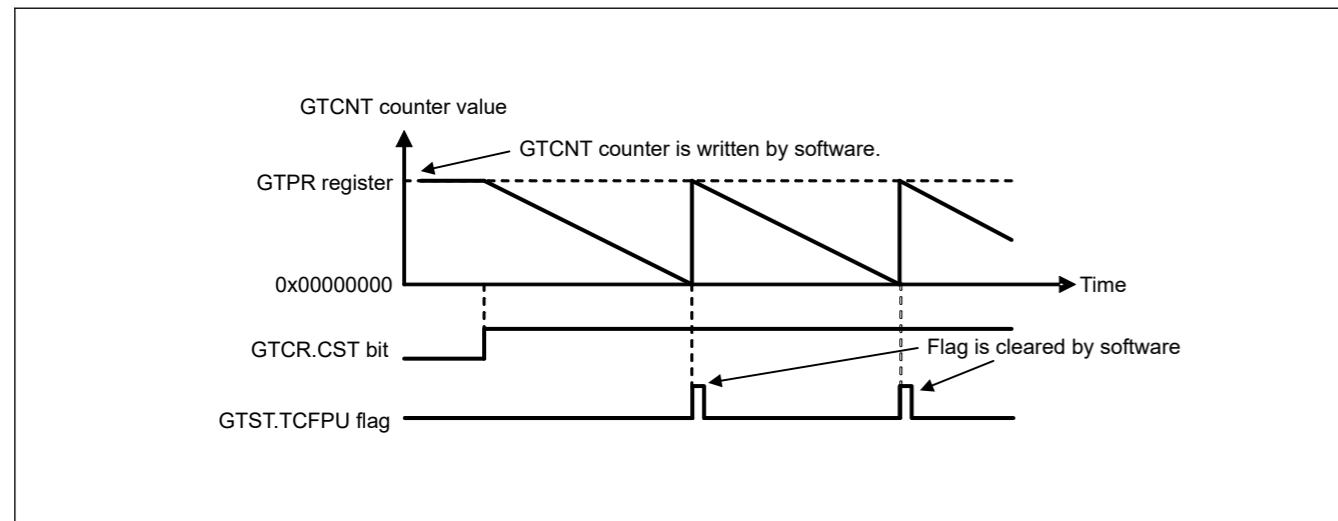

Figure 21.4 Example of periodic count operation in down-counting by the count clock

Table 21.6 shows an example for setting periodic count operation in down-counting by the count clock.

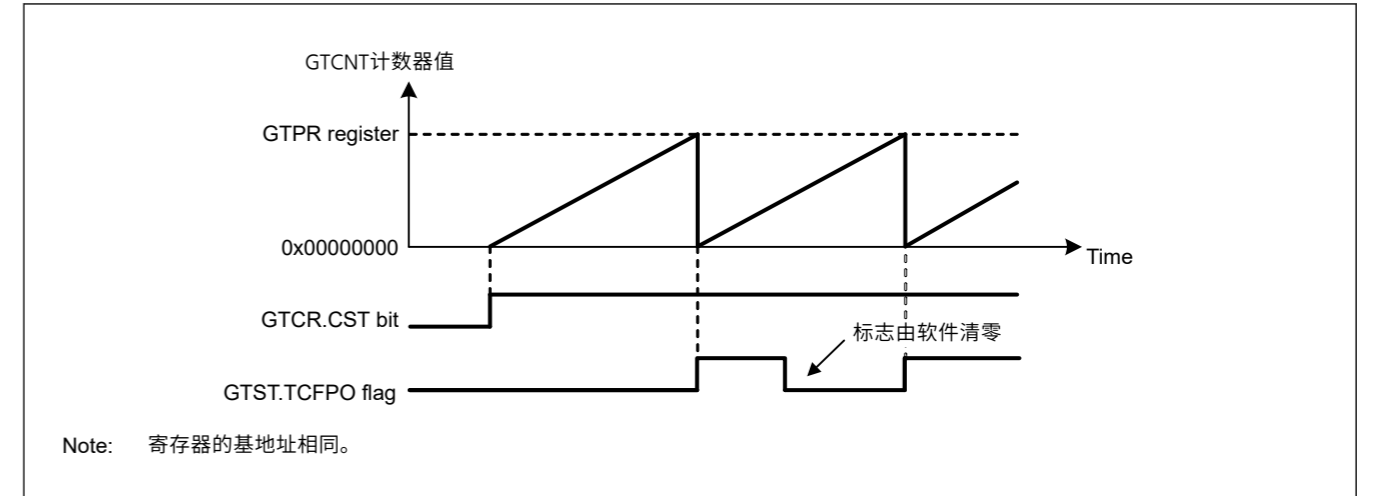

Figure 21.3 计数时钟递增计数中的周期计数操作示例

表21.5显示了在递增计数中设置周期性计数操作的示例。

Table 21.5 使用计数时钟在递增计数中设置周期性计数操作的示例

| No. | 步骤名称      | Description  |
|-----|-----------|--|
| 1   | 设置操作模式    | 使用GTCR.MD[2:0]设置操作模式。在图21.3中，设置了000b（锯齿波PWM模式）。                                  |
| 2   | 设置计数方向    | 使用GTUDDTYC寄存器选择计数方向。在图21.3中，在GTUDDTYC[1:0]中设置了11b之后，在GTUDDTYC[1:0]中设置了01b（向上计数）。 |
| 3   | 选择计数时钟    | 使用GTCR.TPCS[3:0]选择计数时钟。  |
| 4   | 设置周期      | 在GTPR中设置循环。  |
| 5   | 设置计数器的初始值 | 在GTCNT计数器中设置初始值。在图21.3中，设置了0x00000000。   |
| 6   | 开始计数操作    | 将GTCR.CST设置为1以启动计数操作。  |

(3) 计数时钟递减计数中的周期计数操作

每个通道中的GTCNT计数器可以通过使用GTUPSR设置GTUDDTYC.UD和GTDNSR寄存器设置为0x00000000。当GTCNT从0变为GTPR值（下溢）时，GTST.TCFPU设置为1。在GTCNT计数器下溢后，从GTPR值开始向下计数。

图21.4显示了计数时钟递减计数中周期性计数操作的示例。

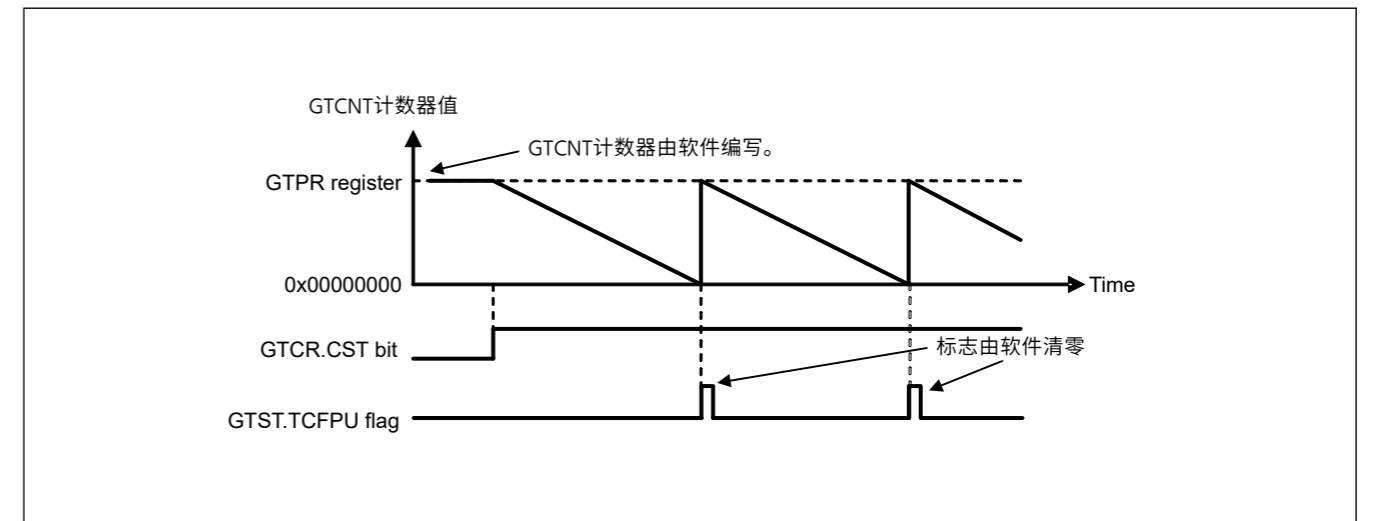

Figure 21.4 计数时钟递减计数中的周期计数操作示例

表21.6显示了在计数时钟的递减计数中设置周期性计数操作的示例。

Table 21.6 Example for setting periodic count operation in down-counting by count clock

| No. | Step Name                     | Description   |
|-----|-------------------------------|---|
| 1   | Set operating mode            | Set the operating mode with GTCR.MD[2:0].<br>In Figure 21.4, 000b (saw-wave PWM mode) is set.   |
| 2   | Set count direction           | Select the count direction with the GTUDDTYC register.<br>In Figure 21.4, after 10b is set in GTUDDTYC[1:0], 00b is set in GTUDDTYC[1:0] (down-counting). |
| 3   | Select count clock            | Select the count clock with GTCR.TPCS[3:0].   |
| 4   | Set cycle                     | Set the cycle in GTPR.  |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 21.4, the GTPR value is set.   |
| 6   | Start count operation         | Set GTCR.CST to 1 to start count operation.   |

#### (4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior when up-counting using hardware sources is the same as when up-counting by the count clock.

When GTCR.CST bit is set to 1 to count up using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized by the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count up with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 21.5 shows an example of an event count operation in up-counting by a hardware resource (rising edge of GTETRGA pin).

Figure 21.5 Example of event count operation in up-counting using hardware sources

Table 21.7 shows an example for setting event count operation in up-counting by the count clock.

Table 21.6 计数时钟递减计数中设置周期计数操作的示例

| No. | 步骤名称      | Description  |
|-----|-----------|--|
| 1   | 设置操作模式    | 使用GTCR.MD[2:0]设置操作模式。<br>在图21.4中, 设置了000b (锯齿波PWM模式)。                                |

| 5   | 设置计数器的初始值 | 在GTCNT计数器中设置初始值。<br>在图21.4中, 设置了GTPR值。   |
| 6   | 开始计数操作    | 将GTCR.CST设置为1以启动计数操作。  |

#### (4) 使用硬件源的递增计数中的事件计数操作

每个通道中的GTCNT计数器可以使用GTUPSR中设置的硬件源执行递增计数。

当GTUPSR设置为使能时, 在GTCR.TPCS[3:0]中选择的计数时钟和在GTUDDTYC.UD被忽略。如果同时使用硬件源进行向上计数和向下计数, 则GTCNT计数器值不会改变。使用硬件源递增计数时的溢出行为与使用计数时钟递增计数时的溢出行为相同。

当GTCR.CST位设置为1以使用硬件源进行计数时, 计数操作被启用。GTCR.CST设置为1后, 计数器无法按GTCR.TPCS[3:0]中指定的1个时钟周期向上计数, 因为计数操作与GTCR.TPCS[3:0]中选择的计数时钟同步。将GTCR.TPCS[3:0]设置为000b以在GTCR.CST设置为1后以1个PCLKD延迟向上计数。

图21.5显示了一个硬件资源递增计数中的事件计数操作示例 (上升沿GTETRGA pin)。

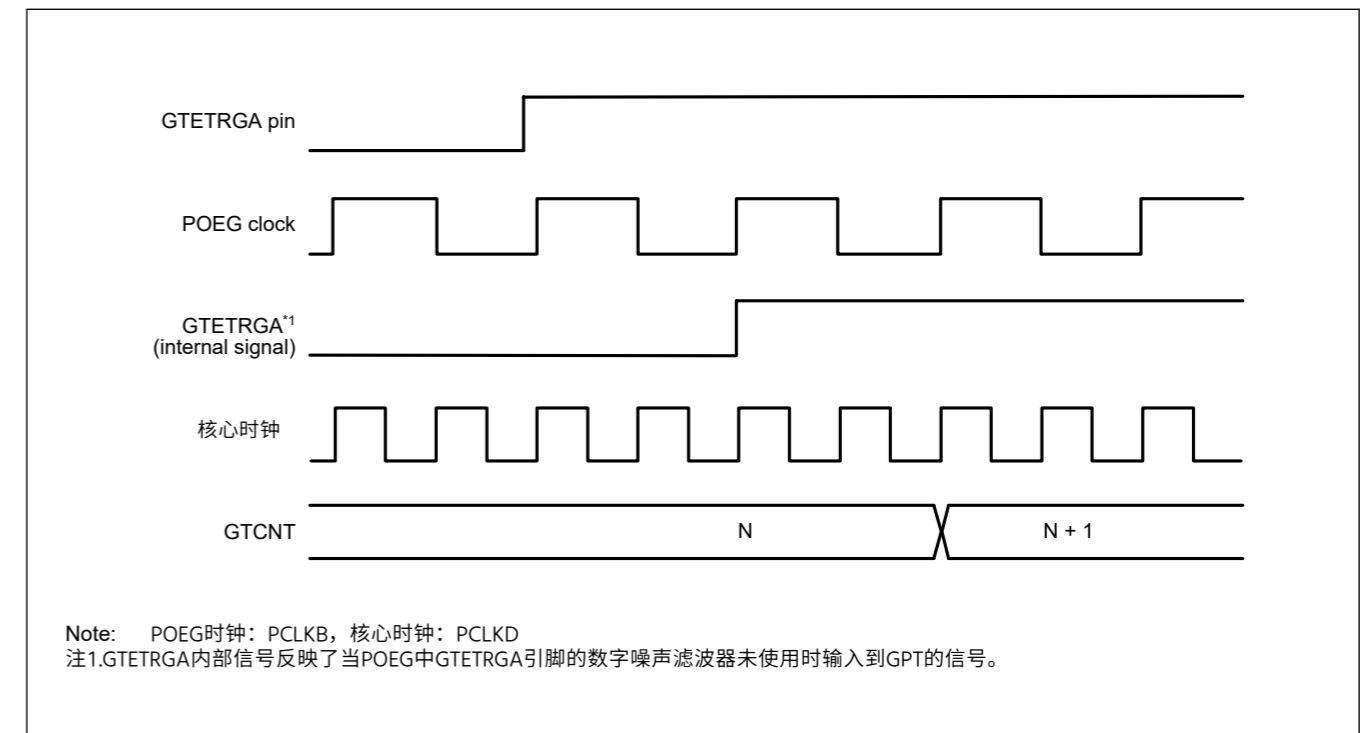

Figure 21.5 使用硬件源进行递增计数的事件计数操作示例

表21.7显示了在计数时钟递增计数中设置事件计数操作的示例。

Table 21.7 Example for setting an event count operation in up-counting using hardware sources

| No. | Step Name                     | Description   |
|-----|-------------------------------|---|
| 1   | Set count source              | Select the counting-up source with the GTUPSR register. |
| 2   | Set cycle                     | Set the cycle in GTPR.                                  |
| 3   | Set initial value for counter | Set the initial value in the GTCNT counter.             |
| 4   | Start count operation         | Set GTCR.CST to 1 to start count operation.             |

(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The underflow behavior when down-counting using hardware sources is the same as when down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized with the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count down with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 21.6 shows an example of a event count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

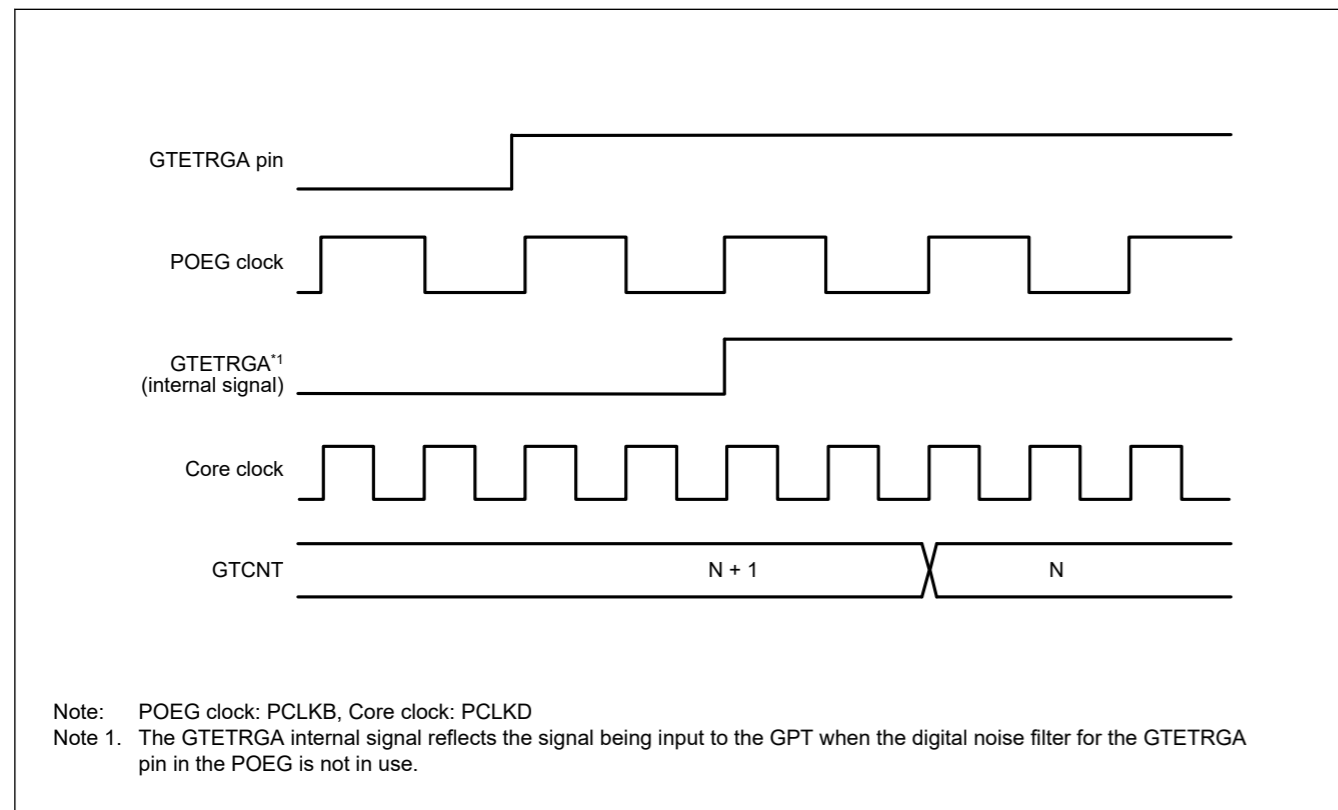

Figure 21.6 Example of event count operation in down-counting using hardware sources

Table 21.8 shows an example for setting a periodic count operation in down-counting using a hardware resource.

Table 21.8 Example for setting an event count operation in down-counting using hardware sources (1 of 2)

| No. | Step Name        | Description   |
|-----|------------------|---|
| 1   | Set count source | Select the counting-down source with the GTDNSR register. |
| 2   | Set cycle        | Set the cycle in GTPR.                                    |

Table 21.7 使用硬件源在递增计数中设置事件计数操作的示例

| No. | 步骤名称      | Description           |
|-----|-----------|-----------------------|
| 1   | 设置计数源     | 使用GTUPSR寄存器选择递增计数源。   |
| 2   | 设置周期      | 在GTPR中设置循环。           |
| 3   | 设置计数器的初始值 | 在GTCNT计数器中设置初始值。      |
| 4   | 开始计数操作    | 将GTCR.CST设置为1以启动计数操作。 |

(5) 使用硬件源的递减计数中的事件计数操作

每个通道中的GTCNT计数器可以使用GTDNSR中设置的硬件源进行递减计数。

当GTDNSR设置为使能时，在GTCR.TPCS[3:0]中选择的计数时钟和在GTUDDTYC.UD被忽略。如果同时使用硬件源进行向上计数和向下计数，则GTCNT计数器值不会改变。使用硬件源向下计数时的下溢行为与使用计数时钟向下计数时相同。

当GTCR.CST位设置为1以使用硬件源进行递减计数时，启用计数操作。在GTCR.CST设置为1后，计数器无法按照GTCR.TPCS[3:0]中的规定向下计数1个时钟周期，因为计数操作与GTCR.TPCS[3:0]中选择的计数时钟同步。将GTCR.TPCS[3:0]设置为000b以在GTCR.CST设置为1后以1个PCLKD延迟递减计数。

图21.6显示了一个事件计数操作的例子，通过硬件资源进行递减计数（上升沿GTETRGA pin）。

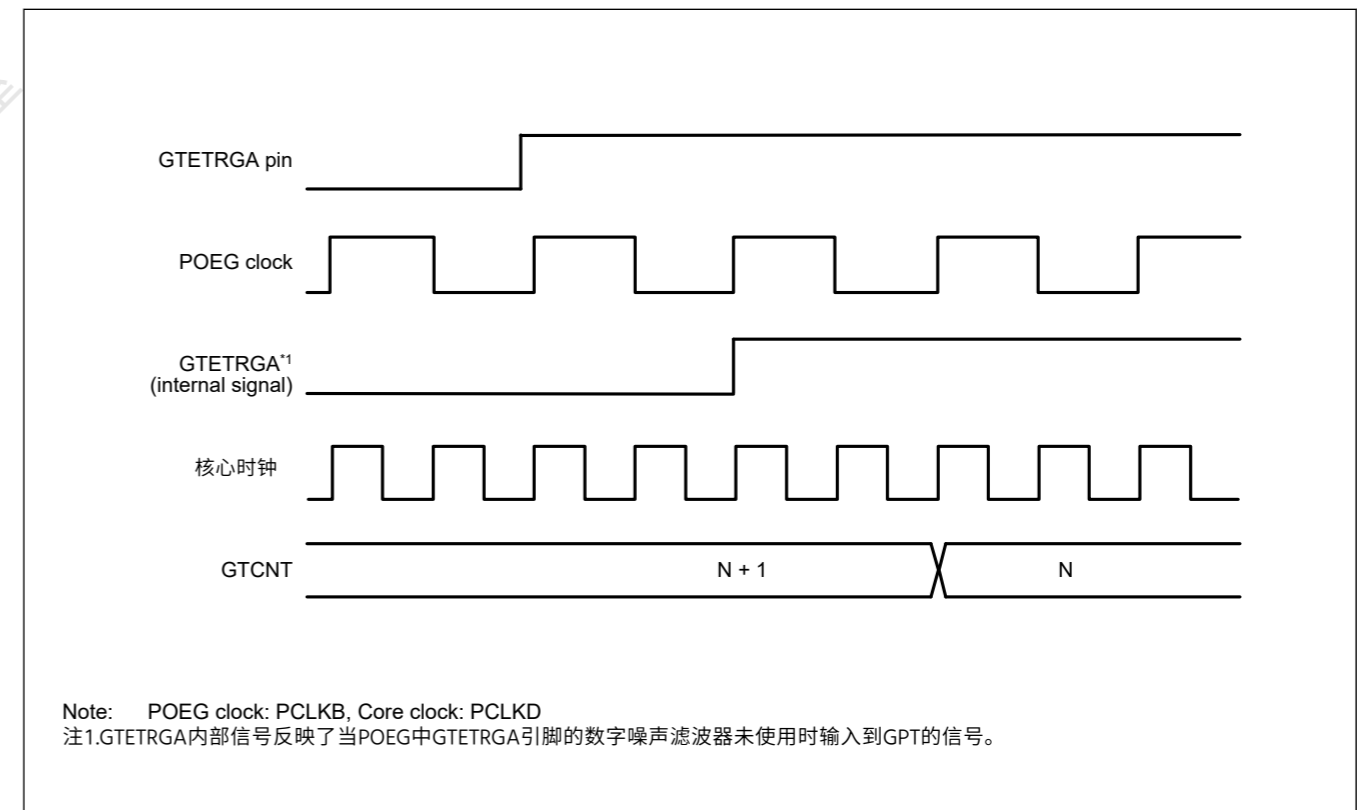

Figure 21.6 使用硬件源递减计数中的事件计数操作示例

表21.8显示了使用硬件资源在递减计数中设置周期性计数操作的示例。

| No. | Step Name                     | Description                                 |
|-----|-------------------------------|---|
| 3   | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 4   | Start count operation         | Set GTCR.CST to 1 to start count operation. |

### (6) Counter clear operation

The counter of each channel is cleared by following sources:

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST is 1) or not (GTCR.CST is 0).

For saw waves selected by setting GTCR.MD[2:0] and the count direction flag showing down-counting (GTST.TUCF is 0), the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

When not in saw waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in the GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with PCLKD. If other settings are used, clear is synchronized with the counter clock selected in GTCR.TPCS[3:0].

### 21.3.1.2 Waveform output by compare match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock, including the event count. At the same time, the GPT can output low, high, or toggled output from the associated GTIOCnA or GTIOCnB output pin (n = 0 to 7). In addition, the GTIOCnA or GTIOCnB pin output can be low, high, or toggled at the cycle end which is determined by GTPR (n = 0 to 7).

The cycle end is:

- For saw waves in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves – when the GTCNT counter is cleared
- For triangle waves – when the GTCNT changes from 0 to 1 (trough).

#### (1) Low output and high output

Figure 21.7 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOCnA pin by a GTCCRA compare match, and low is output from the GTIOCnB pin by a GTCCRB compare match. The pin level does not change when the specified level and pin level match.

Table 21.8 使用硬件源在递减计数中设置事件计数操作的示例(2of2)

| No. | 步骤名称      | Description           |
|-----|-----------|-----------------------|
| 3   | 设置计数器的初始值 | 在GTCNT计数器中设置初始值。      |
| 4   | 开始计数操作    | 将GTCR.CST设置为1以启动计数操作。 |

### (6) 计数器清零操作

每个通道的计数器由以下来源清零:

- 将0写入GTCNT寄存器
- 当GTCSR.CCLR位设置为1时, 将1写入GTCLR中与GPT通道号相关的位
- GTCSR寄存器中选择的硬件源。

计数操作期间禁止写入GTCNT寄存器。GTCNT计数器可以通过向GTCLR写入1和硬件源的清除请求来清除, 无论GTCNT正在计数 (GTCR.CST为1) 还是不计数 (GTCR.CST为0)。

对于通过设置GTCR.MD[2:0]和显示递减计数的计数方向标志 (GTST.TUCF为0) 选择的锯齿波, 当向GTCLR寄存器写入1时, GTCNT寄存器设置为GTPR寄存器的值并在执行硬件源清除时。

当不处于锯齿波模式和递减计数时, 当向GTCLR寄存器写入1和执行硬件源清零时, GTCNT寄存器设置为0。

在GTUPSR或GTDNSR中至少有1位设置为1的事件计数操作中, 清除源发生后, 立即执行写入GTCLR寄存器和通过硬件源清除以与PCLKD同步。如果使用其他设置, 则清除与GTCR.TPCS[3:0]中选择的计数器时钟同步。

### 21.3.1.2 比较匹配的波形输出

比较匹配意味着GTCNT计数器值与GTCCRA或GTCCRB的值匹配。当比较匹配发生时, 比较匹配标志与计数时钟同步生成, 包括事件计数。同时, GPT可以从相关的GTIOCnA或GTIOCnB输出引脚 (n=0到7) 输出低电平、高电平或翻转输出。此外, GTIOCnA或GTIOCnB引脚输出可以是低电平、高电平或在周期结束时切换, 由下式确定

GTPR (n = 0 to 7).

循环结束为:

- 对于递增计数中的锯齿波 当GTCNT从GTPR值变为0时 (溢出)
- 对于向下计数中的锯齿波 当GTCNT从0变为GTPR值时 (下溢)
- 对于锯齿波 当GTCNT计数器清零时
- 对于三角波——当GTCNT从0变为1 (波谷) 时。

#### (1) 低输出和高输出

图21.7显示了通过GTCCRA和GTCCRB比较匹配的低输出和高输出操作示例。

在本例中, GTCNT计数器进行递增计数, 设定为通过GTCCRA比较匹配从GTIOCnA引脚输出高电平, 通过GTCCRB比较匹配从GTIOCnB引脚输出低电平。当指定电平和引脚电平匹配时, 引脚电平不会改变。

Figure 21.7 Example of low output and high output operation

Table 21.9 shows an example for setting low output and high output operation.

Table 21.9 Example for setting low output and high output operation

| No. | Step Name                     | Description   |
|-----|-------------------------------|---|
| 1   | Set operating mode            | Set the operating mode with GTCR.MD[2:0]. In Figure 21.7, 000b (saw-wave PWM mode) is set.  |

| 6   | Set GTIOCnm pin function      | Set the GTIOCnm pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. In Figure 21.7, GTIOA[4:0] = 00010b, GTIOB[4:0] = 10001b.                                   |
| 7   | Enable GTIOCnm pin output     | Set to enable the GTIOCnm pin output with OAE and OBE in GTIOR.   |
| 8   | Set compare match value       | Set compare match values in the GTCCRA and GTCCRB registers.  |
| 9   | Start count operation         | Set GTCR.CST to 1 to start count operation.   |

Note: n: 0 to 7  
m: A, B

(2) Toggled output

Figure 21.8 and Figure 21.9 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB.

In Figure 21.8, the GTCNT counter performs up-counting, and settings are made so that the GTIOCnA pin output by a GTCCRA compare match and GTIOCnB pin output by a GTCCRB compare match are toggled.

In Figure 21.9, the GTCNT counter performs up-counting, and settings are made so that a GTCCRA compare match toggles the GTIOCnA pin output level and a cycle end toggles the GTIOCnB pin output level.

Figure 21.7 低输出和高输出操作示例

表21.9显示了设置低输出和高输出操作的示例。

Table 21.9 设置低输出和高输出操作的示例

| No. | 步骤名称          | Description  |
|-----|---------------|--|
| 1   | 设置操作模式        | 使用GTCR.MD[2:0]设置操作模式。在图21.7中, 设置了000b (锯齿波PWM模式)。  |

| 8   | 设置比较匹配值       | 在GTCCRA和GTCCRB寄存器中设置比较匹配值。   |
| 9   | 开始计数操作        | 将GTCR.CST设置为1以启动计数操作。  |

Note: n: 0 to 7  
m: A, B

(2) Toggled output

图21.8和图21.9通过GTCCRA和GTCCRB的比较匹配显示了切换输出操作的示例。

在图21.8中, GTCNT计数器进行递增计数, 并进行设置以使GTIOCnA引脚输出GTCCRA比较匹配和GTCCRB比较匹配的GTIOCnB引脚输出被切换。

在图21.9中, GTCNT计数器执行递增计数, 并进行设置, 以便GTCCRA比较匹配切换GTIOCnA引脚输出电平, 循环结束切换GTIOCnB引脚输出电平。

### 21.3.1.3 Input capture function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 21.10 shows an example of the input capture function.

In this example, the GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTCCRA at both edges of the GTIOCnA input pin and to GTCCRB on the rising edge of the GTIOCnB input pin.

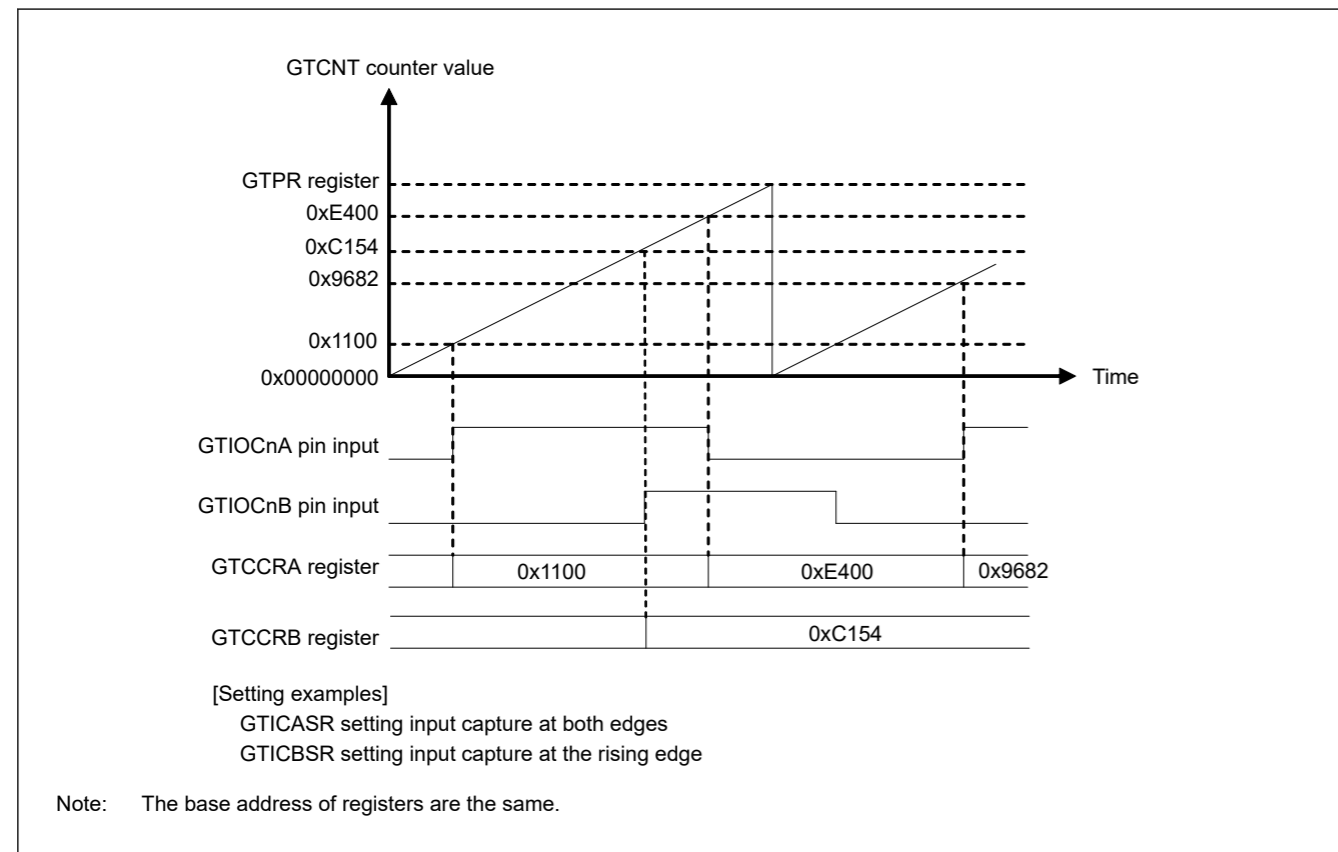

Figure 21.10 Example of input capture operation

Table 21.11 shows an example for setting an input capture operation with count operation by the count clock.

### 21.3.1.3 输入捕捉功能

在检测到在GTICASR和GTICBSR中设置的硬件源时，可以将GTCNT计数器值传输到GTCCRA或GTCCRB。

图21.10显示了输入捕捉函数的示例。

在本例中，GTCNT计数器通过计数时钟进行递增计数，并设置为在GTIOCnA输入引脚的两个边沿对GTCCRA执行输入捕捉，在GTIOCnB输入引脚的上升沿对GTCCRB执行输入捕捉。

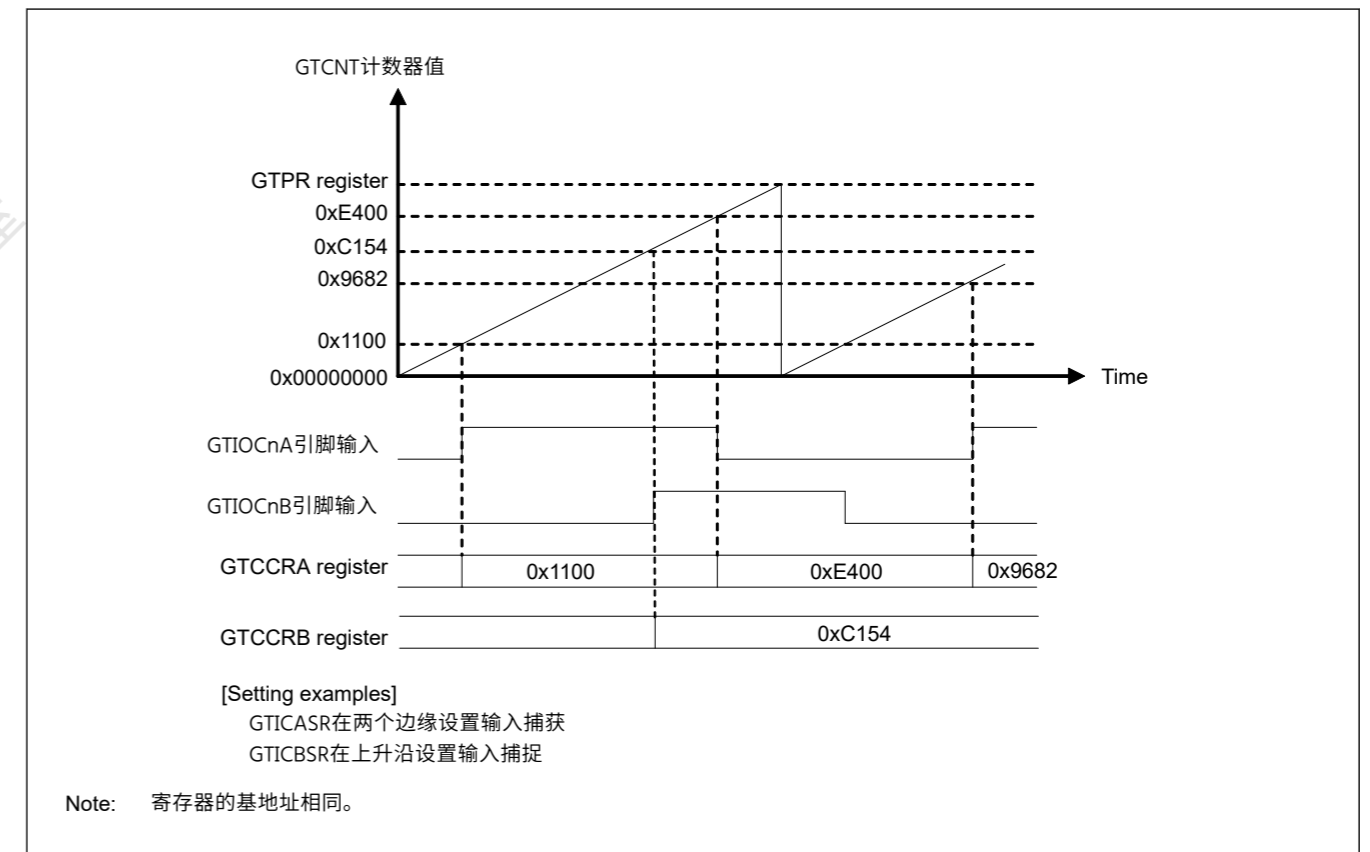

Figure 21.10 输入捕捉操作示例

| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.   |
| 6   | Select input capture source   | Select the input capture source in GTICASR and GTICBSR.<br>In Figure 21.10, GTICASR = 0x00000F00, GTICBSR = 0x00003000. |
| 7   | Start count operation         | Set GTCR.CST to 1 to start count operation.   |

### 21.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR and GTPBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF.

#### 21.3.2.1 GTPR register buffer operation

GTPBR can function as a buffer register for GTPR. The buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in CTCSR register)
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR.CCLRn bit is set to 1, n = 0 to 7).

To set GTPR to function as a buffer, set the GTBER.PR bit to 1. To set GTPR not to function as a buffer, set the GTBER.PR bit to 0.

Figure 21.11 to Figure 21.13 show examples of GTPR buffer operation and Table 21.12 shows an example for setting GTPR buffer operation.

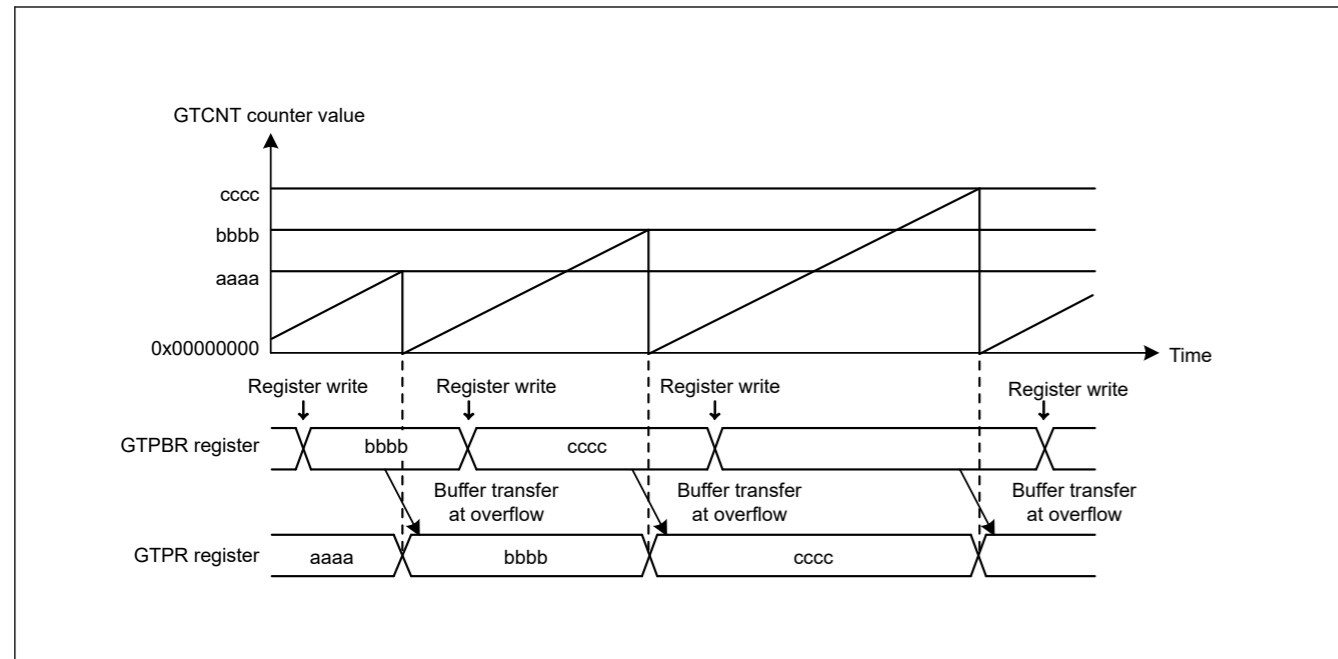

Figure 21.11 Example of GTPR buffer operation with saw waves in up-counting

| 5   | 设置计数器的初始值 | 在GTCNT计数器中设置初始值。   |
| 6   | 选择输入捕捉源   | 在GTICASR和GTICBSR中选择输入捕获源。<br>在图21.10中, GTICASR=0x00000F00, GTICBSR=0x00003000。 |
| 7   | 开始计数操作    | 将GTCR.CST设置为1以启动计数操作。  |

### 21.3.2 缓冲操作

可以使用GTBER设置以下缓冲区操作:

- GTPR and GTPBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF.

#### 21.3.2.1 GTPR寄存器缓冲操作

GTPBR可以作为GTPR的缓冲寄存器。缓冲区传输在锯齿波模式或事件计数中的上溢(向上计数期间)或下溢(向下计数期间)以及三角波模式的波谷处执行。

在锯齿波模式或事件计数中,当计数期间发生以下计数器清零操作时,将执行缓冲区传输:

- 通过硬件源清除(清除源在CTCSR寄存器中选择)
- 软件清零(当GTCSR.CCLR位为1且GTCLR.CCLRn位设置为1时,n=0至7)。

要将GTPR设置为缓冲区,请将GTBER.PR位设置为1。要将GTPR设置为不作为缓冲区,请将GTBER.PR位设置为0。

图21.11至图21.13显示了GTPR缓冲区操作的示例,表21.12显示了设置GTPR缓冲区操作的示例。

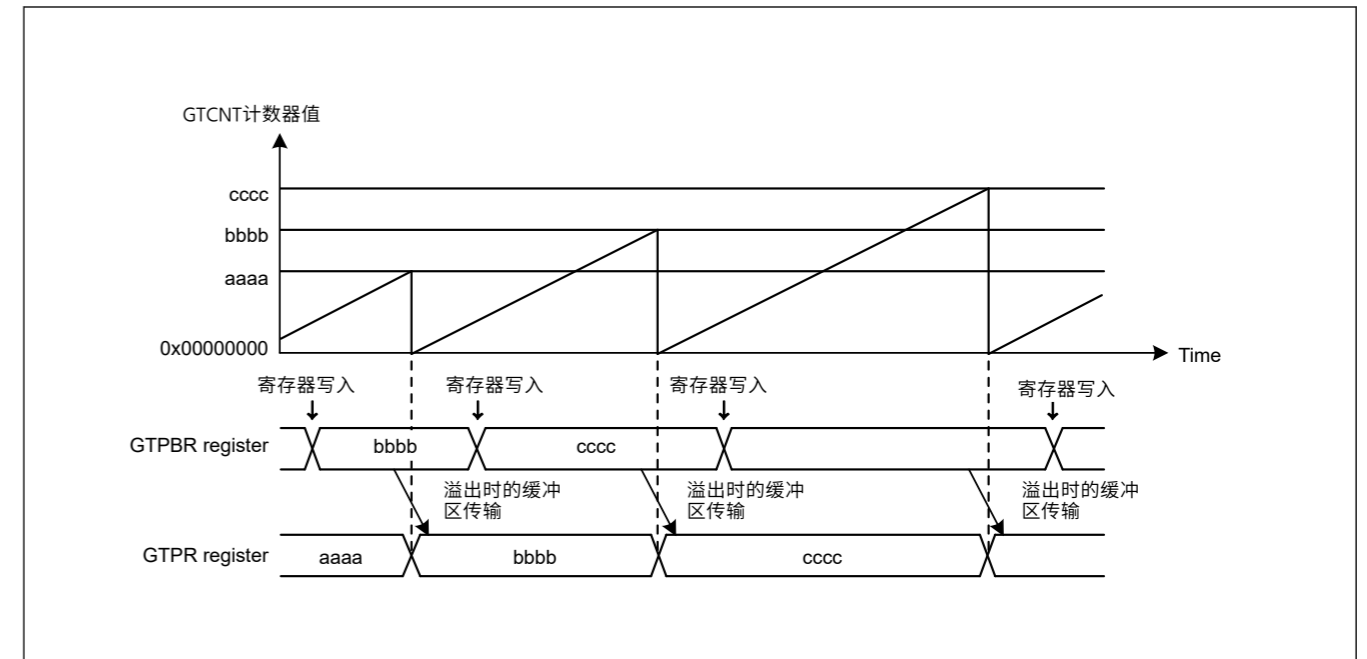

Figure 21.11 GTPR缓冲区操作示例,在向上计数中使用锯齿波

|-----|---------------------------------|--|
| 7   | Set buffer value                | For buffer operation, set a value in one cycle after the current cycle in GTPBR. |
| 8   | Start count operation           | Set GTCR.CST to 1 to start count operation.                                      |
| 9   | Set buffer value for each cycle | For buffer operation, set a value in one cycle after the current cycle in GTPBR. |

### 21.3.2.2 Buffer operation for GTCCRA and GTCCRB

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. To set GTCCRA or GTCCRB to not function as a buffer, set 00b.

#### (1) When GTCCRA or GTCCRB functions as an output compare register

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow  
Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear  
In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources similar to the case shown in [section 21.3.2.1. GTPR register buffer operation](#).  
In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer  
When GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave 1 shot pulse mode or triangle-wave PWM mode 3.

[Figure 21.14](#) to [Figure 21.16](#) show examples of GTCCRA and GTCCRB buffer operation and [Table 21.13](#) shows an example for setting GTCCRA and GTCCRB buffer operation.

Table 21.12 设置GTPR缓冲区操作的示例(2of2)

| 7   | 设置缓冲区值      | 对于缓冲操作, 在GTPBR中的当前周期之后的一个周期内设置一个值。 |
| 8   | 开始计数操作      | 将GTCR.CST设置为1以启动计数操作。              |
| 9   | 为每个周期设置缓冲区值 | 对于缓冲操作, 在GTPBR中的当前周期之后的一个周期内设置一个值。 |

### 21.3.2.2 GTCCRA和GTCCRB的缓冲操作

GTCCRC可以作为GTCCRA缓冲寄存器, GTCCRD可以作为GTCCRC缓冲寄存器 (GTCCRA的双缓冲寄存器)。同样, GTCCRE可以作为GTCCRB缓冲寄存器, GTCCRF可以作为GTCCRE缓冲寄存器 (GTCCRB的双缓冲寄存器)。

要将GTCCRA或GTCCRB设置为双缓冲区, 请将GTBER.CCRA[1:0]或GTBER.CCRB[1:0]设置为10b或11b。对于单缓冲操作, 设置01b。要将GTCCRA或GTCCRB设置为不用作缓冲区, 请设置00b。

#### (1) 当GTCCRA或GTCCRB用作输出比较寄存器时

缓冲区传输发生在以下情况:

- 上溢或下溢的缓冲区传输  
在锯齿波模式或事件计数操作中, 在溢出 (向上计数期间) 或下溢 (向下计数期间) 时执行缓冲区传输。在三角波模式中, 缓冲区传输在波谷 (三角波PWM模式1) 或波峰和波谷 (三角波PWM模式2) 处执行。
- 通过计数器清除缓冲区传输  
在锯齿波模式或事件计数操作中, 在计数期间, 缓冲区传输 (与向上计数期间的溢出或向下计数期间的下溢相同) 由计数器清零源执行, 类似于章节中所示的情况21.3.2.1。GTPR寄存器缓冲操作。在三角波模式下, 计数器清零不执行缓冲区传输。
- 强制缓冲转移  
当GTBER.CCRSWT位在计数操作停止时设置为1时, 在锯齿波模式、事件计数操作和三角波模式下强制执行GTCCRA和GTCCRB寄存器缓冲传输。此外, 从GTCCRD寄存器到临时寄存器A以及从GTCCRF寄存器到临时寄存器B的缓冲区传输在锯齿波1发射脉冲模式或三角波PWM模式3中执行。

图21.14至图21.16显示了GTCCRA和GTCCRB缓冲操作的示例, 表21.13显示了设置GTCCRA和GTCCRB缓冲操作的示例。

|-----|---------------------------------|--|
| 12  | Set buffer value for each cycle | For buffer operation, set the GTIOCnA pin and GTIOCnB pin transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTCCRC and GTCCRE, respectively.<br>For double buffer operation, also set the GTIOCnA pin and GTIOCnB pin transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in GTCCRD and GTCCRF, respectively. |

Note: n: 0 to 7  
m: A, B

(2) When GTCCRA or GTCCRB functions as an input capture register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 21.17 and Figure 21.18 show examples of GTCCRA and GTCCRB buffer operation and Table 21.14 shows an example for setting GTCCRA and GTCCRB buffer operation.

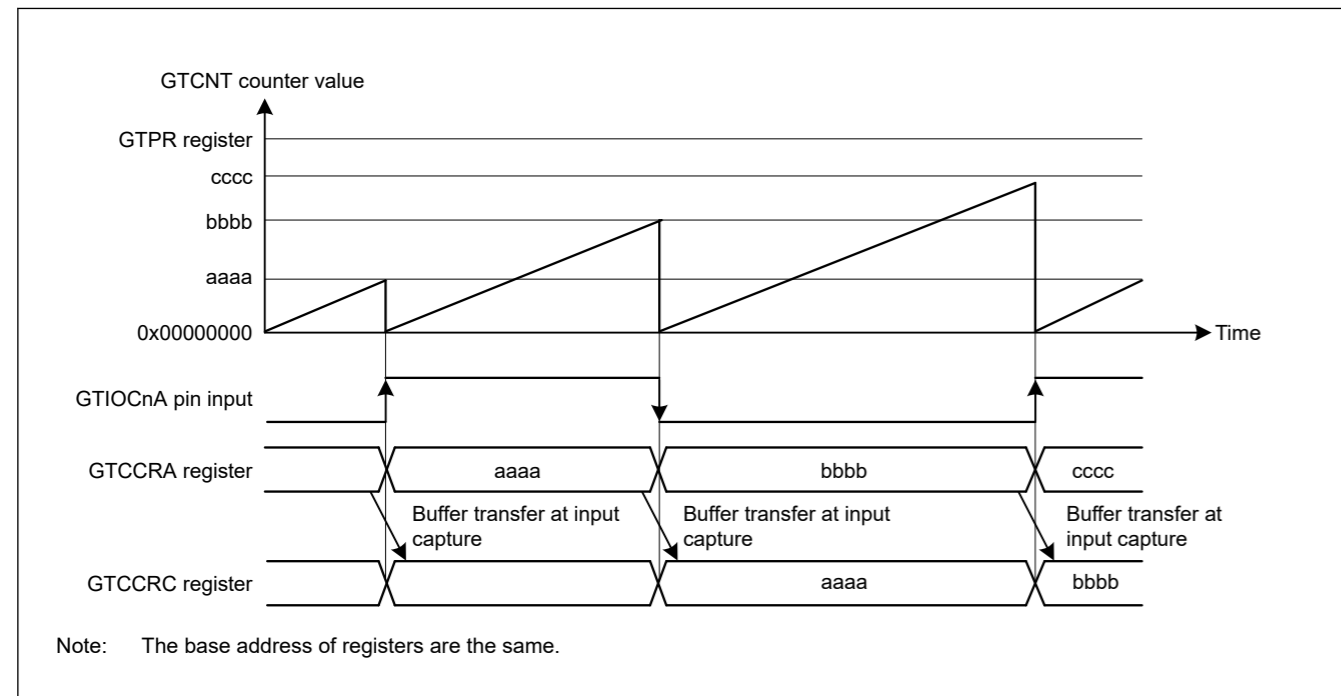

Figure 21.17 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOCnA input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnA input

| No. | 步骤名称        | Description   |
|-----|-------------|---|
| 12  | 为每个周期设置缓冲区值 | 对于缓冲操作，设置GTIOCnA引脚和GTIOCnB引脚在当前周期后的1个周期（在锯齿波模式或在波谷或波峰处缓冲传输的三角波模式）或当前周期后的半个周期（在三角波在GTCCRC和GTCCRE中分别在波谷和波峰进行缓冲传输的模式）。<br>对于双缓冲器操作，也将GTIOCnA引脚和GTIOCnB引脚转换设置在当前周期之后的2个周期（在锯齿波模式或在波谷或波峰处缓冲传输的三角波模式）或当前周期之后的1个周期（在三角形波模式，在波谷和波峰都有缓冲转移）分别在GTCCRD和GTCCRF中。 |

Note: n: 0 to 7  
m: A, B

(2) 当GTCCRA或GTCCRB用作输入捕捉寄存器时

当产生输入捕捉时，GTCNT计数器值被传送到GTCCRA和GTCCRB并存储。GTCCRA和GTCCRB寄存器值被传送到缓冲寄存器。在输入捕捉操作中，缓冲区传输不是由计数器清零来执行的。

图21.17和图21.18显示了GTCCRA和GTCCRB缓冲操作的示例，表21.14显示了设置GTCCRA和GTCCRB缓冲操作的示例。

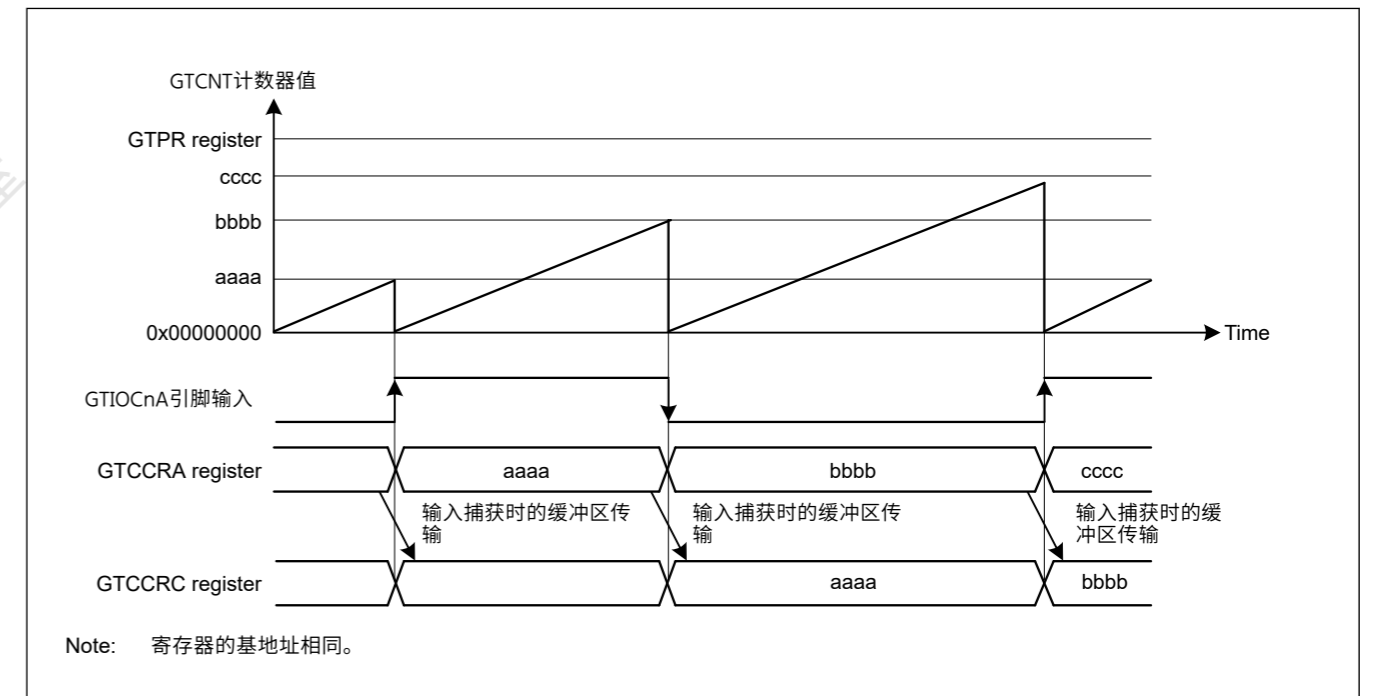

Figure 21.17 GTCCRA和GTCCRB缓冲区操作的示例，在两个边沿都有输入捕捉GTIOCnA输入，递增计数中的锯齿波，并且GTCNT计数器在GTIOCnA输入

| 4   | Set cycle                     | Set the cycle in GTPR.   |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.  |
| 6   | Select input capture source   | Select input capture source in the GTICASR register and GTICBSR register. In Figure 21.17, GTICASR = 0x00000F00, and in Figure 21.18, GTICBSR = 0x0000F000.  |
| 7   | Set buffer operation          | Set buffer operation with CCRA and CCRB in GTBER. In Figure 21.17, CCRA[1:0] = 01b, and in Figure 21.18, CCRB = 1xb.   |
| 8   | Start count operation         | Set GTCR.CST to 1 to start count operation.  |

### 21.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOcNA pin or GTIOcNB pin (n = 0 to 7) by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR and GTDVU, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

#### 21.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIOcNA pin or GTIOcNB pin (n = 0 to 7) when a GTCCRA or GTCCRB compare match

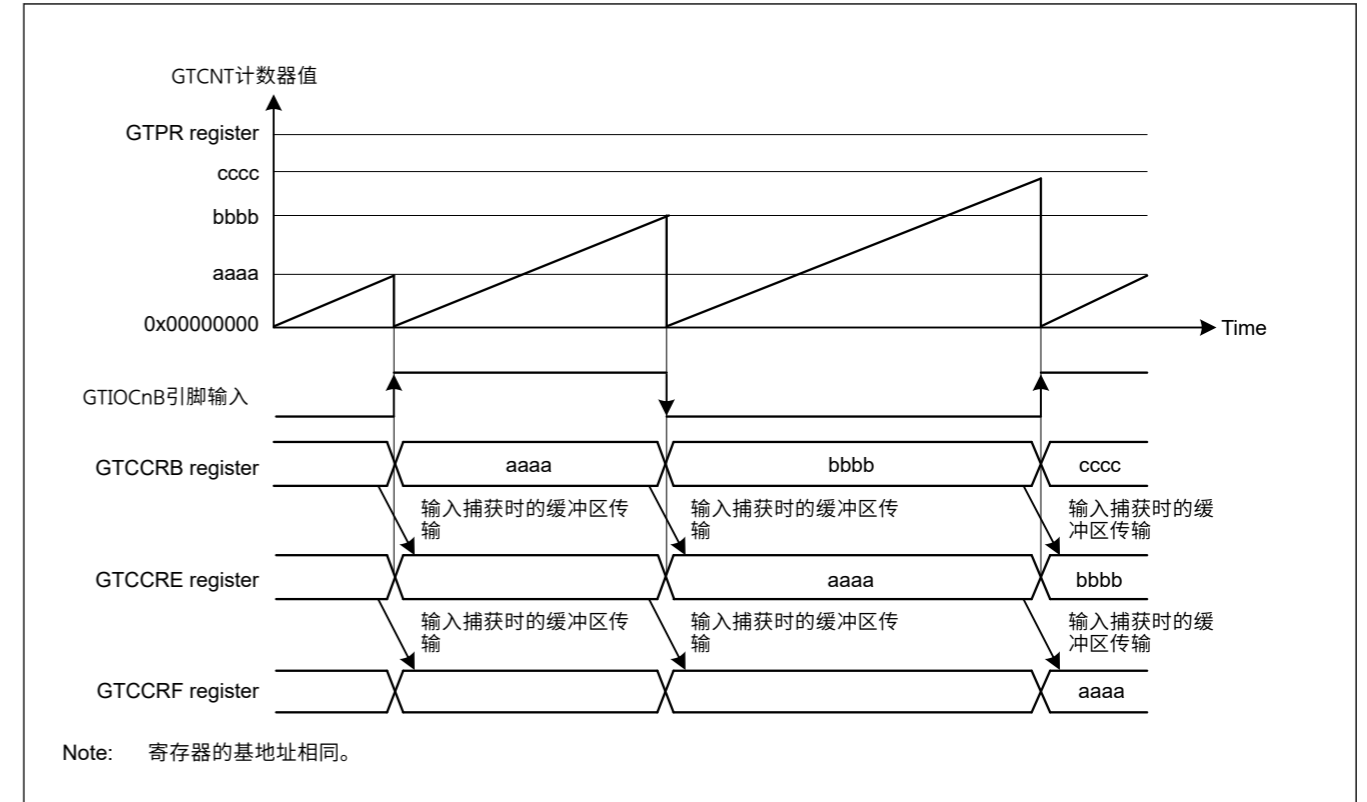

Figure 21.18 GTCCRA和GTCCRB双缓冲操作示例，在两个边沿进行输入捕获 GTIOcNB输入，递增计数中的锯齿波，GTCNT计数器在两个边缘清零 GTIOcNB input

| No. | 步骤名称      | Description  |
|-----|-----------|--|
| 1   | 设置操作模式    | 用GTCR.MD[2:0]设置工作模式，用GTCSCR计数清零。在图21.17中，MD[2:0]=000b（锯齿波PWM模式）和GTCSCR=0x00000F00，并且在图21.18中，MD[2:0]=000b（锯齿波PWM模式）和GTCSCR=0x0000F000。 |
| 2   | 设置计数方向    | 使用GTUDDTYC寄存器选择计数方向（向上或向下）。在图21.17中，在GTUDDTYC[1:0]中设置了11b后，在GTUDDTYC[1:0]中设置了01b（向上计数）。  |
| 3   | 选择计数时钟    | 使用GTCR.TPCS[3:0]选择计数时钟。  |
| 4   | 设置周期      | 在GTPR中设置循环。  |
| 5   | 设置计数器的初始值 | 在GTCNT计数器中设置初始值。   |
| 6   | 选择输入捕捉源   | 在GTICASR寄存器和GTICBSR寄存器中选择输入捕捉源。在图21.17中，GTICASR=0x00000F00，在图21.18中，GTICBSR=0x0000F000。  |
| 7   | 设置缓冲操作    | 在GTBER中使用CCRA和CCRB设置缓冲区操作。在图21.17中，CCRA[1:0]=01b，在图21.18中，CCRB=1xb。  |
| 8   | 开始计数操作    | 将GTCR.CST设置为1以启动计数操作。  |

### 21.3.3 PWM输出工作模式

GPT可以通过两者之间的比较匹配将PWM波形输出到GTIOcNA引脚或GTIOcNB引脚（n=0到7）。GTCNT计数器和GTCCRA或GTCCRB。

通过设置GTDTCR和GTDVU，可以自动将带死区时间的反相波形的比较匹配值设置为GTCCRB。

#### 21.3.3.1 Saw-Wave PWM Mode

在锯齿波PWM模式下，GTCNT通过设置GTPR的周期执行锯齿波（半波）操作，当GTCCRA或GTCCRB比较时，PWM波形输出到GTIOcNA引脚或GTIOcNB引脚（n=0至7）匹配

occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

Figure 21.19 shows an example of saw-wave PWM mode operation, and Table 21.15 shows an example for setting saw-wave PWM mode.

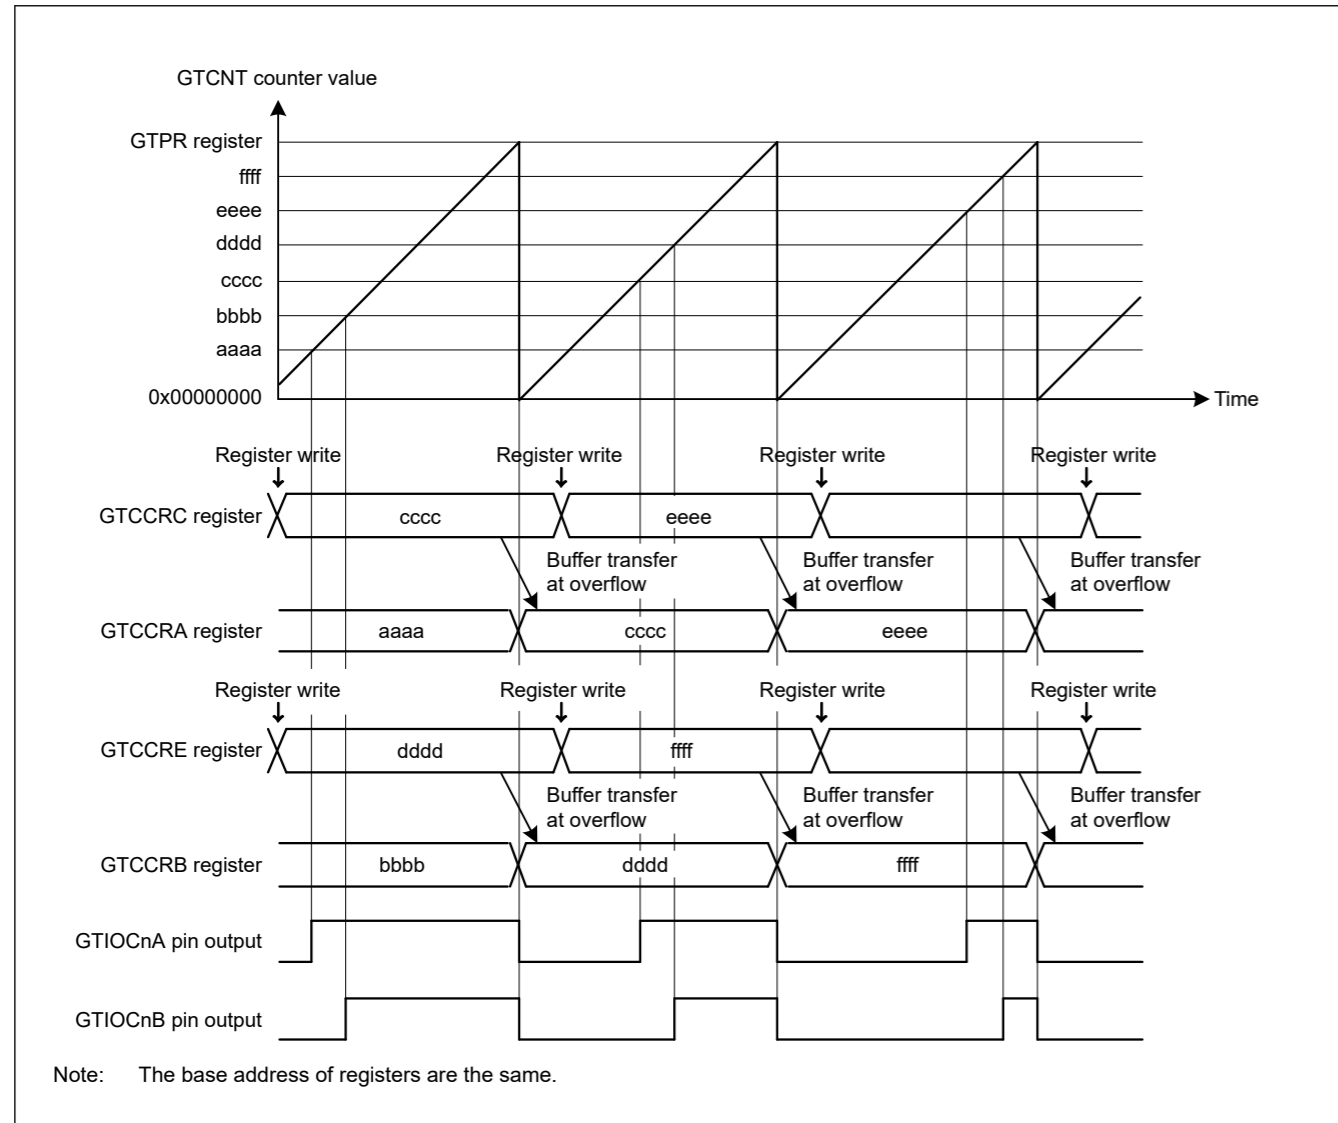

Figure 21.19 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

Table 21.15 Example for setting saw-wave PWM mode (1 of 2)

| No. | Step Name                     | Description  |
|-----|-------------------------------|--|
| 1   | Set operating mode            | Set the operating mode with GTCR.MD[2:0]. In Figure 21.19, 000b (saw-wave PWM mode) is set.  |
| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.19, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting). |
| 3   | Select count clock            | Select the count clock with GTCR.TPCS[3:0].  |
| 4   | Set cycle                     | Set the cycle in GTPR.   |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.  |
| 6   | Set GTIOCnm pin function      | Set the GTIOCnm pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. In Figure 21.19, GTIOA[4:0] = 00110b and GTIOB[4:0] = 00110b.                                |
| 7   | Enable GTIOCnm pin output     | Set to enable the GTIOCnm pin output with OAE and OBE in GTIOR.  |

发生。引脚输出值可以根据GTIOR设置分别从低输出、高输出或切换输出中选择，用于比较匹配和循环结束。

图21.19显示了锯齿PWM模式操作的示例，表21.15显示了设置锯齿PWM模式的示例。

m: A, B

### 21.3.3.2 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR, the GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA pin or GTIOCnB pin (n = 0 to 7) at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while count operation is stopped, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR and GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.20 shows an example of saw-wave one-shot pulse mode operation, and Table 21.16 shows an example for setting saw-wave one-shot pulse mode.

Table 21.15 设置锯齿波PWM模式的示例(2of2)

| No. | 步骤名称        | Description   |
|-----|-------------|---|
| 8   | 设置缓冲操作      | 在GTBER中使用CCRA和CCRB设置缓冲区操作。在图21.19中，CCRA[1:0]=01b和CCRB[1:0]=01b。   |
| 9   | 设置比较匹配值     | 在GTCCRA中设置GTIOCnA引脚转换，在GTCCRB中设置GTIOCnB引脚转换。  |
| 10  | 设置缓冲区值      | 对于缓冲操作，分别在GTCCRC和GTCCRE中的当前周期之后的1个周期内设置GTIOCnA引脚和GTIOCnB引脚转换。对于双缓冲器操作，还分别在GTCCRD和GTCCRF中的当前周期之后的2个周期内设置GTIOCnA引脚和GTIOCnB引脚转换。 |
| 11  | 开始计数操作      | 将GTCR.CST设置为1以启动计数操作。   |
| 12  | 为每个周期设置缓冲区值 | 对于缓冲操作，分别在GTCCRC和GTCCRE中的当前周期之后的1个周期内设置GTIOCnA引脚和GTIOCnB引脚转换。对于双缓冲器操作，还分别在GTCCRD和GTCCRF中的当前周期之后的2个周期内设置GTIOCnA引脚和GTIOCnB引脚转换。 |

Note: n: 0 to 7  
m: A, B

### 21.3.3.2 锯齿波单发脉冲模式

锯齿波单次脉冲模式是在GTPR中设置周期，GTCNT计数器执行锯齿波（半波）操作并将PWM波形输出到GTIOCnA引脚或GTIOCnB引脚（n=0到7）在GTCCRA或GTCCRB的比较匹配中，缓冲区操作固定。

锯齿波单次脉冲模式中的缓冲操作不同于通常的缓冲操作。缓冲区传输从以下位置执行：

- GTCCRC到GTCCRA在循环结束
- 循环结束时GTCCRE到GTCCRB
- GTCCRD在循环结束时到临时寄存器A
- GTCCRF在循环结束时到临时寄存器B
- GTCCRA比较匹配时到GTCCRA的临时寄存器A
- GTCCRB比较匹配时的临时寄存器B到GTCCRB。

引脚输出值可以根据GTIOR设置分别从低输出、高输出或切换输出中选择，以进行比较匹配和循环结束。当GTBER.CCRSWT位在计数操作停止时设置为1时，缓冲区被强制从GTCCRD寄存器传送到临时寄存器A，并从GTCCRF寄存器传送到临时寄存器B。通过设置GTDTCR和GTDVU，比较匹配值带有死区时间的负相位波形可以自动设置为GTCCRB。

图21.20显示了锯齿波单次脉冲模式操作的示例，表21.16显示了设置锯齿波单次脉冲模式的示例。

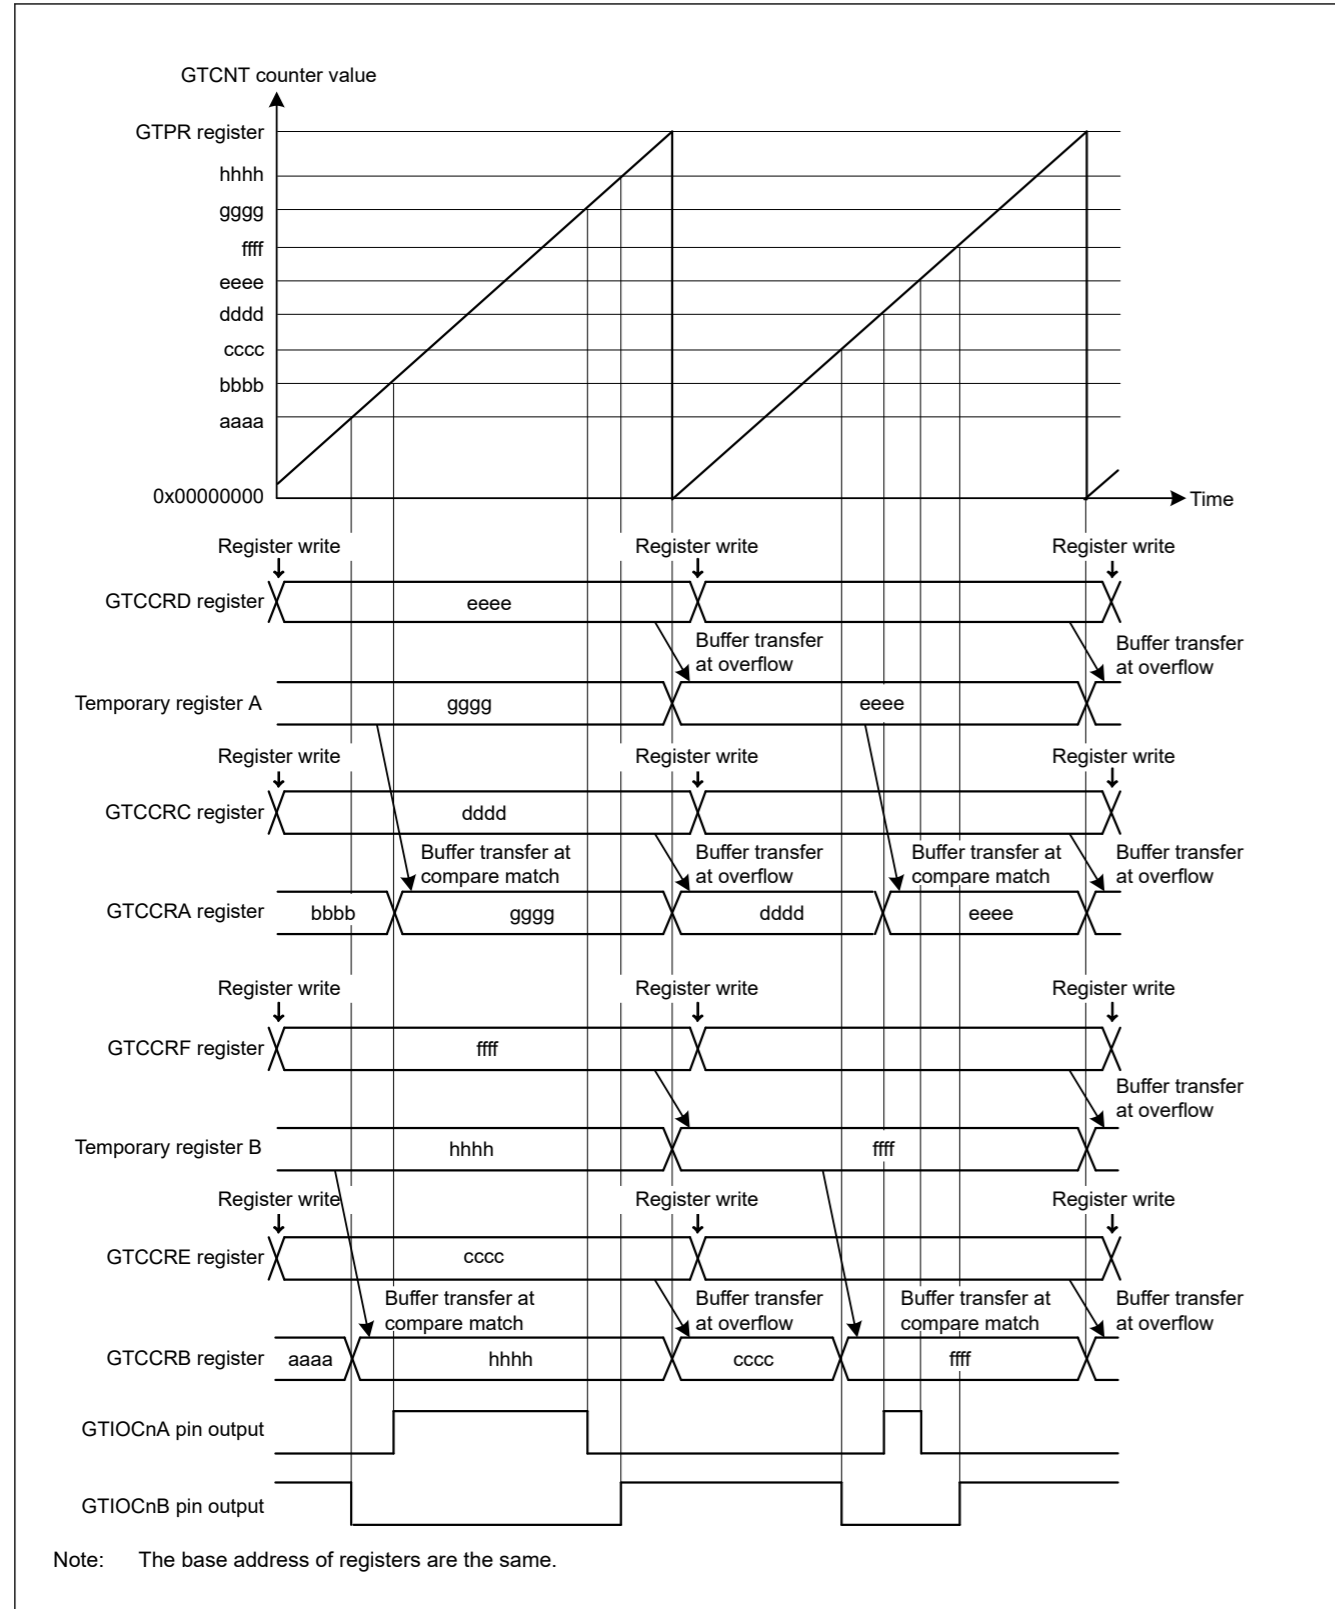

Figure 21.20 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

| 11  | Start count operation           | Set GTCR.CST to 1 to start count operation.   |
| 12  | Set buffer value for each cycle | Set the GTIOcnA pin transition in one cycle after the current cycle in GTCCRC and GTCCRD and the GTIOcnB pin transition in GTCCRE and GTCCRF.                         |

Note: n: 0 to 7  
m: A, B

### 21.3.3.3 Triangle-wave PWM mode 1 (32-bit transfer at trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOcnA pin or GTIOcnB pin (n = 0 to 7) when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR and GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.21 shows an example of a triangle-wave PWM mode 1 operation, and Table 21.17 shows an example for setting a triangle-wave PWM mode 1.

Note: n: 0 to 7  
m: A, B

### 21.3.3.3 三角波PWM模式1（波谷32位传输）

三角波PWM模式1是在GTPR中设定周期的模式。GTCNT计数器执行三角波（全波）操作，当发生GTCCRA或GTCCRB比较匹配时，PWM波形输出到GTIOcnA引脚或GTIOcnB引脚（n=0至7）。在槽中进行缓冲转移。引脚输出值可以根据GTIOR设置分别从低输出、高输出或切换输出中选择，用于比较匹配和循环结束。

通过设置GTDTCR和GTDVU，可以自动将带死区时间的反相波形的比较匹配值设置为GTCCRB。

图21.21显示了三角波PWM模式1操作的示例，表21.17显示了设置三角波PWM模式1的示例。

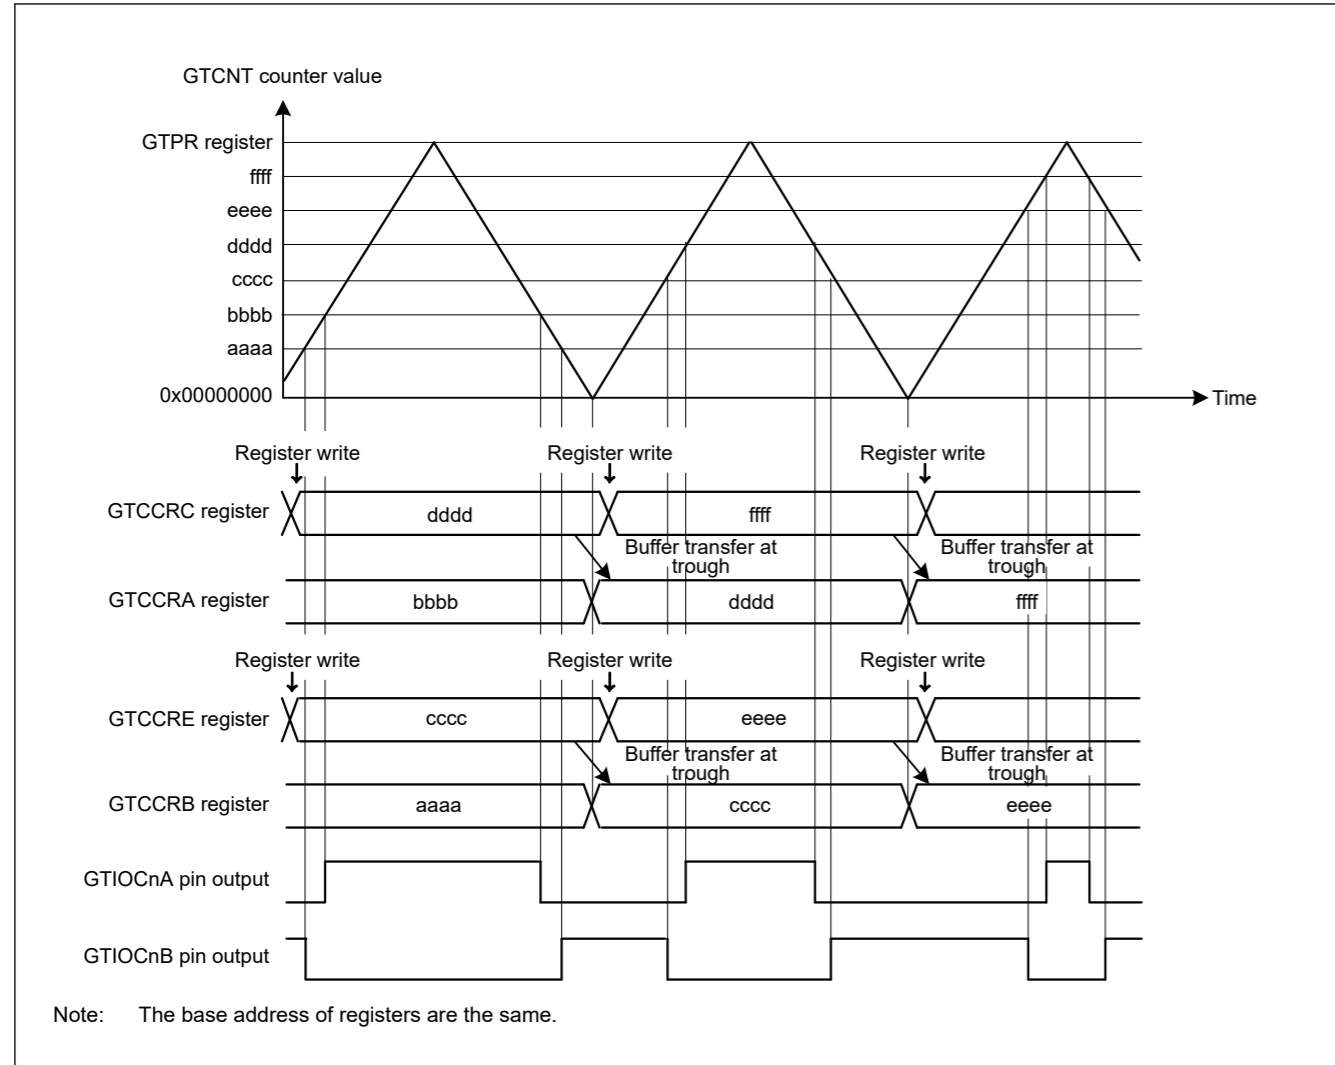

Figure 21.21 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/GTCCRB register compare match, and output retained at cycle end

Note: n: 0 to 7  
m: A, B

#### 21.3.3.4 Triangle-wave PWM mode 2 (32-bit transfer at crest and trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA pin or GTIOCnB pin (n = 0 to 7) when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR and GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.22 shows an example of triangle-wave PWM mode 2 operation, and Table 21.18 shows an example for setting triangle-wave PWM mode 2.

Note: n: 0 to 7  
m: A, B

#### 21.3.3.4 三角波PWM模式2 (波峰和波谷32位传输)

与三角波PWM模式1类似，在三角波PWM模式2中，周期在GTPR中设置。GTCNT计数器执行三角波（全波）操作，当发生GTCCRA或GTCCRB比较匹配时，PWM波形输出到GTIOCnA引脚或GTIOCnB引脚（n=0至7）。缓冲转移在波峰和波谷进行。引脚输出值可以根据GTIOR设置分别从低输出、高输出或切换输出中选择，用于比较匹配和循环结束。

通过设置GTDTCR和GTDVU，可以自动将带死区时间的反相波形的比较匹配值设置为GTCCRB。

图21.22显示了三角波PWM模式2操作的示例，表21.18显示了设置三角波PWM模式2的示例。

### 21.3.3.5 Triangle-wave PWM mode 3 (64-bit transfer at trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOcNA pin or GTIOcNB pin ( $n = 0$  to 7) at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR and GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.23 shows an example of triangle-wave PWM mode 3 operation, and Table 21.19 shows an example for setting triangle-wave PWM mode 3.

m: A, B

### 21.3.3.5 三角波PWM模式3 (波谷64位传输)

三角波PWM模式3是在GTPR中设定周期的模式。GTCNT计数器执行三角波（全波）操作，并且在GTCCRA或GTCCRB的比较匹配（缓冲器操作固定）时，PWM波形输出到GTIOcNA引脚或GTIOcNB引脚（ $n=0$ 至7）。三角波PWM模式3中的缓冲操作与通常的缓冲操作不同。缓冲区传输从以下位置执行：

- GTCCRC到GTCCRA处于低谷
- GTCCRE至GTCCRB处于低谷
- GTCCRD到谷底临时寄存器A
- GTCCRF到波谷的临时寄存器B
- 顶部为GTCCRA的临时寄存器A
- 在顶部的GTCCRB临时寄存器B。

引脚输出值可以根据GTIOR设置分别从低输出、高输出或切换输出中选择，用于比较匹配和循环结束。

通过设置GTDTCR和GTDVU，可以自动将带死区时间的反相波形的比较匹配值设置为GTCCRB。

图21.23显示了三角波PWM模式3操作的示例，表21.19显示了设置三角波PWM模式3的示例。

### 21.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time value (GTDVU value) can automatically be set to GTCCRB. The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Writing to GTCCRB is prohibited when the automatic dead time setting function is used. Dead time setting beyond the cycle is also prohibited. Values for automatic dead time setting can be read from GTCCRB. In triangle-wave mode, when the dead time is beyond the cycle by setting the value  $GTCCRA = 0$  or  $GTCCRA \geq GTPR$  for GTCCRA, the output protection function keeps the level of output. For details, see section 21.7.3. **GTIOCnm Pin Output Negate Control (n = 0 to 7, m = A, B)**. The automatic dead time value setting to GTCCRB is performed at the next clock cycle count when registers that are used for calculating the automatic dead time value are updated.

When a dead time error occurs, the compare match values for positive and negative waveforms are adjusted to generate the waveforms with the dead time as shown in Table 21.20.

The adjusted value for the negative waveform is set for GTCCRB automatically.

The adjusted value for the positive waveform is used as internal signal and not set for GTCCRA.

Table 21.20 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs

| Mode                              | Count Direction | Period        | Condition for Dead Time Error | Change Point of the Positive-Phase Waveform after Adjustment | Change Point of the Negative-Phase Waveform after Adjustment |
|-----------------------------------|-----------------|---------------|-------------------------------|--|--|
| Sawtooth-wave one-shot pulse mode | Up-counting     | First half    | $GTCCRA - GTDVU < 0$          | GTDVU  | 0  |
|                                   |                 | Second half   | $GTCCRA + GTDVU > GTPR$       | $GTPR - GTDVU$   | GTPR   |
|                                   | Down-counting   | First half    | $GTCCRA + GTDVU > GTPR$       | $GTPR - GTDVU$   | GTPR   |
|                                   |                 | Second half   | $GTCCRA - GTDVU < 0$          | GTDVU  | 0  |
| Triangle-wave PWM mode 1/2/3      | Up-counting     | (First half)  | $GTCCRA - GTDVU \leq 0$       | $GTDVU + 1$  | 1  |

### 21.3.4 自动死区时间设置功能

通过设置GTDTCR, 可以自动将正波形的比较匹配值 (GTCCRA值) 和指定死区时间值 (GTDVU值) 得到的负波形与死区时间的比较匹配值设置为GTCCRB。自动死区时间设置功能可用于锯齿单次脉冲模式和所有三角形

PWM modes.

使用自动死区时间设置功能时, 禁止写入GTCCRB。超出周期的死区时间设置也被禁止。自动死区时间设置的值可以从GTCCRB中读取。在三角波模式下, 当设置 $GTCCRA=0$ 或 $GTCCRA \geq GTPR$ 时, 死区时间超出周期时, 输出保护功能保持输出电平。详见21.7.3节。GTIOCnm引脚输出否定控制 (n=0到7, m=A, B)。当用于计算自动死区时间值的寄存器被更新时, 在下一个时钟周期计数时执行GTCCRB的自动死区时间值设置。

当出现死区时间错误时, 调整正负波形的比较匹配值以生成具有死区时间的波形, 如表21.20所示。

负波形的调整值自动为GTCCRB设置。

正波形的调整值用作内部信号, 而不是为GTCCRA设置的。

Table 21.20 发生死区错误时波形变化点的调整

| Mode                         | Count Direction | Period        | 死区时间错误的条件               | 变化点正相波形后 Adjustment | 变化点后的负相位波形 Adjustment |

| 13  | Set buffer value for each cycle | When the compare match register is used for buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRC. |

Note: n: 0 to 7  
m: A, B

### 21.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected in the count cycle during up-counting and the GTPR value before the start of down-counting is reflected during down-counting.

Figure 21.28 shows an example of count direction changing function operation.

Figure 21.28 Example of a count direction changing function operation during buffer operation

### 21.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCnA pin and the GTIOCnB pin (n = 0 to 7) are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

Table 21.22 三角波PWM模式1或2(2of2)中自动死区时间设置功能的设置示例

| No. | 步骤名称        | Description   |
|-----|-------------|---|
| 13  | 为每个周期设置缓冲区值 | 当比较匹配寄存器用于缓冲操作时，在GTCCRC中设置GTIOCnA引脚在当前周期后1个周期（三角波PWM模式1）或当前周期后半周期（三角波PWM模式2）。 |

Note: n: 0 to 7  
m: A, B

### 21.3.5 计数方向改变功能

GTCNT计数器的计数方向可以通过修改GTUDDTYC中的UD位来改变。

在锯齿波模式下，如果在计数操作期间修改GTUDDTYC中的UD位，则计数方向会在溢出（在向上计数期间修改时）或下溢（在向下计数期间修改时）改变。如果在计数操作停止时修改GTUDDTYC.UD位且GTUDDTYC.UDF位为0，则GTUDDTYC.UD位的修改不会反映在计数开始时，并且计数方向会在上溢或下溢时改变。如果在计数操作停止时UDF位设置为1，则此时的GTUDDTYC.UD位值将反映在计数开始时。

在三角波模式下，即使在计数操作期间修改GTUDDTYC中的UD位，计数方向也不会改变。同样，即使在计数操作停止且GTUDDTYC.UDF位为0时修改GTUDDTYC.UD位，GTUDDTYC.UD位的值也不会反映到计数操作中。如果在计数操作停止时将GTUDDTYC.UDF位设置为1，则此时的GTUDDTYC.UD位值将反映在计数开始时。

如果在锯齿波计数操作期间计数方向发生变化，则加计数开始后的GTPR值反映在加计数期间的计数周期中，而减计数开始之前的GTPR值反映在减计数期间。

图21.28显示了计数方向改变功能操作的示例。

Figure 21.28 缓冲操作期间的计数方向改变功能操作示例

### 21.3.6 输出占空比0%和100%的功能

GTIOCnA引脚和GTIOCnB引脚（n=0至7）的输出占空比通过更改GTUDDTYC.OADTY位或GTUDDTYC.OBDTY位。

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is set to 1 while the count operation is stopped, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0% or 100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCnA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCnB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). Table 21.23 shows the values of GTIOCnA and GTIOCnB pin output at cycle end.

Table 21.23 Output values after releasing 0% or 100% duty setting (m = A, B)

| GTIOR.GTIOm[3:2]                     | Compare match value at cycle end masked by 0% or 100% duty setting | GTUDDTYC.OmDTYR in duty 0% setting |   | GTUDDTYC.OmDTYR in duty 100% setting |   |
|--------------------------------------|--|------------------------------------|---|--------------------------------------|---|
|                                      |  | 0                                  | 1 | 0                                    | 1 |
| 00<br>(output retained at cycle end) | 0  | 0                                  | 0 | 1                                    | 0 |
|                                      | 1  | 0                                  | 1 | 1                                    | 1 |
| 01<br>(low output at cycle end)      | —  | 0                                  | 0 | 0                                    | 0 |
| 10<br>(high output at cycle end)     | —  | 1                                  | 1 | 1                                    | 1 |
| 11<br>(output toggled at cycle end)  | 0  | 1                                  | 1 | 0                                    | 1 |
|                                      | 1  | 1                                  | 0 | 0                                    | 0 |

Figure 21.29 shows an example of output duty 0% and 100% function.

在锯齿波模式下，如果在计数操作期间修改GTUDDTYC.OADTY位或GTUDDTYC.OBDTY位，则输出占空比设置反映在溢出（在向上计数期间修改时）或下溢（在向下期间修改时-数数）。如果在计数操作停止且GTUDDTYC.OADTYF或GTUDDTYC.OBDTYF位为0时修改GTUDDTYC.OADTY位或GTUDDTYC.OBDTY位，则在计数开始时不反映输出占空比修改。输出占空比在上溢或下溢时发生变化。如果在计数操作停止时GTUDDTYC.OADTYF或GTUDDTYC.OBDTYF位设置为1，则

GTUDDTYC.OADTY位或当时的GTUDDTYC.OBDTY位值反映在计数开始时。

在三角波模式下，如果在计数操作期间修改GTUDDTYC.OADTY位或GTUDDTYC.OBDTY位，则输出占空比设置反映为下溢。

如果在计数操作停止且GTUDDTYC.OADTYF或GTUDDTYC.OBDTYF位为0时修改GTUDDTYC.OADTY位或GTUDDTYC.OBDTY位，则在计数开始时不反映输出占空比修改。输出占空比在下溢时发生变化。如果在计数操作停止且GTUDDTYC.OADTYF或GTUDDTYC.OBDTYF位为1时修改了GTUDDTYC.OADTY位或GTUDDTYC.OBDTY位，则输出占空比修改将反映在计数开始时。

在执行0%或100%占空比操作时，GPT在内部继续：

- 执行比较匹配操作
- 设置比较匹配标志
- 输出中断
- 执行缓冲操作。

当控制从0%或100%占空比设置更改为比较匹配时，周期结束时GTIOCnA引脚的输出值由GTIOR.GTIOA[3:2]和GTUDDTYC.OADTYR决定。周期结束时GTIOCnB引脚的输出值由GTIOR.GTIOB[3:2]和GTUDDTYC.OBDTYR决定。

当GTIOR.GTIOA[3:2]和GTIOR.GTIOB[3:2]设置为01b时，输出引脚在周期结束时输出低电平。什么时候GTIOR.GTIOA[3:2]和GTIOR.GTIOB[3:2]设置为10b，输出引脚在周期结束时输出高电平。

GTUDDTYC.OADTYR当GTIOR.GTIOm[3:2]设置为00b（在循环结束时保持输出）或GTIOR.GTIOm[3:2]设置为11b（选择作为在循环结束时切换的输出保留对象的值到11b（输出在循环结束时切换））。表21.23显示了循环结束时GTIOCnA和GTIOCnB引脚输出的值。

Table 21.23 释放0%或100%占空比设置后的输出值(m=A B)

| GTIOR.GTIOm[3:2] | 比较被0%或100%占空比设置屏蔽的循环结束时的匹配值 | GTUDDTYC.OmDTYR在占空比0%设置 |   | GTUDDTYC.OmDTYR占空比100%设置 |   |
|------------------|-----------------------------|-------------------------|---|--------------------------|---|
|                  |                             | 0                       | 1 | 0                        | 1 |
| 00（循环结束时保留输出）    | 0                           | 0                       | 0 | 1                        | 0 |
|                  | 1                           | 0                       | 1 | 1                        | 1 |
| 01（循环结束时输出低）     | —                           | 0                       | 0 | 0                        | 0 |
| 10（循环结束时的高输出）    | —                           | 1                       | 1 | 1                        | 1 |
| 11（循环结束时切换输出）    | 0                           | 1                       | 1 | 0                        | 1 |

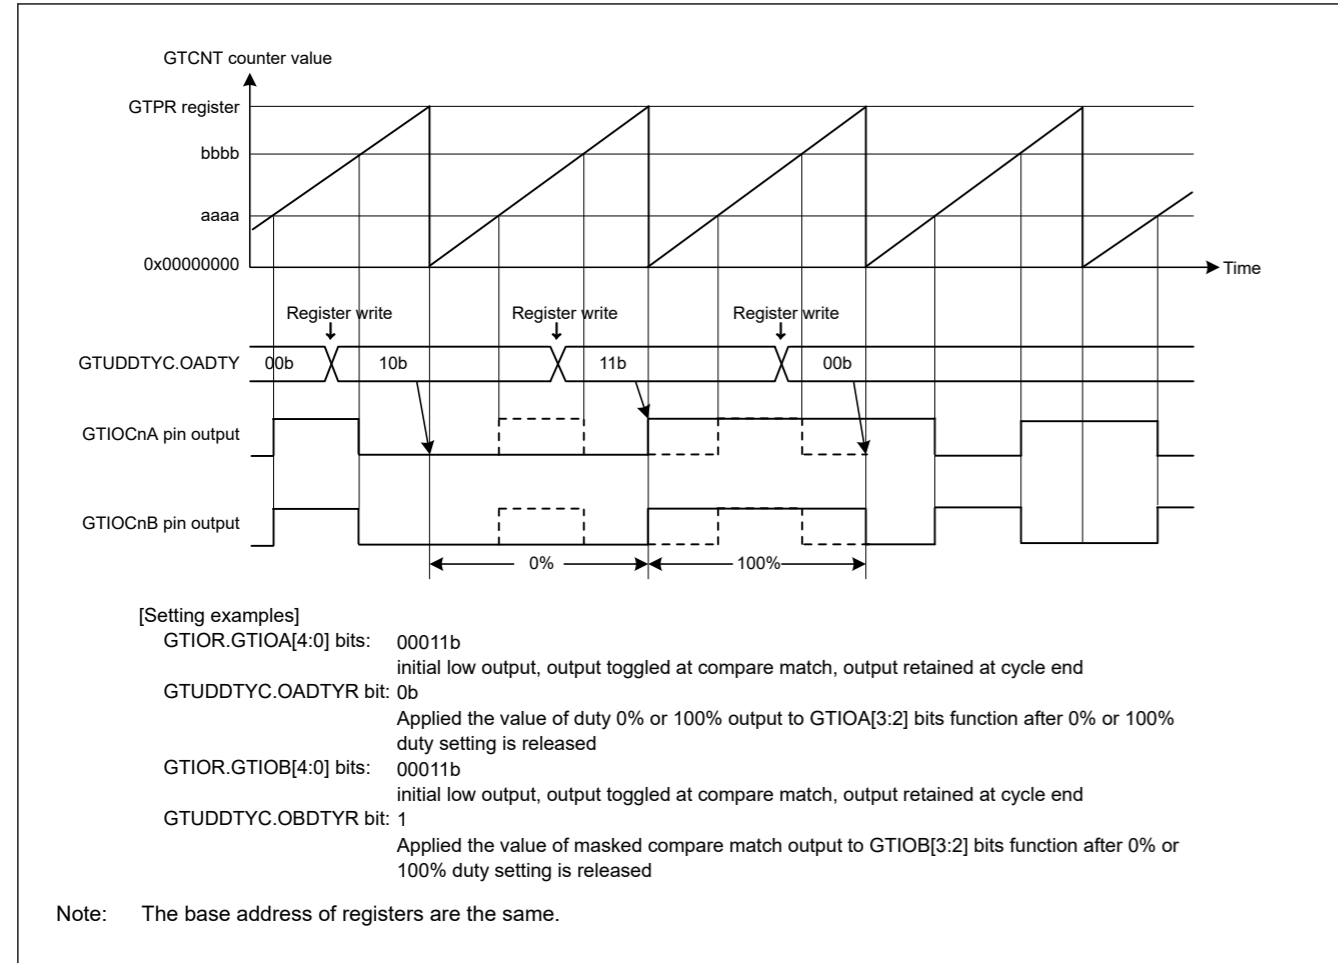

Figure 21.29 Example of output duty 0% and 100% function

### 21.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- ELC event input
- GTIOCnA and GTIOCnB pin input (n = 0 to 7).

#### 21.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 21.30 shows an example of a count start operation by a hardware source. Table 21.24 shows the setting example.

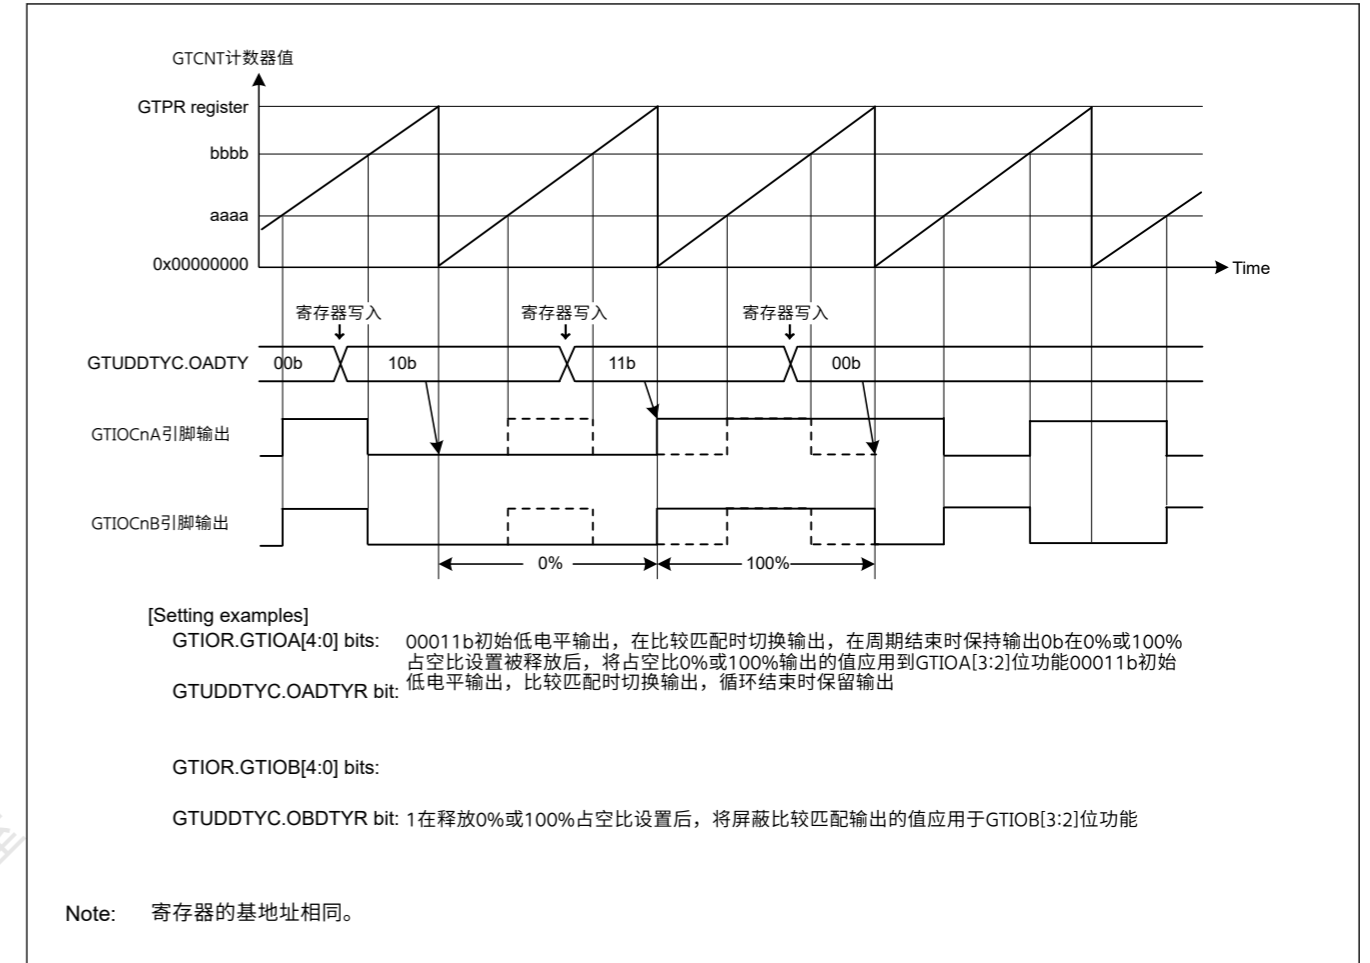

Figure 21.29 输出占空比0%和100%功能示例

### 21.3.7 硬件计数开始计数停止和清除操作

GTCNT计数器可以由以下硬件源启动、停止或清除：

- 外部触发输入
- ELC事件输入
- GTIOCnA和GTIOCnB引脚输入 (n=0至7)。

#### 21.3.7.1 硬件启动操作

GTCNT计数器可以通过使用GTSSR选择硬件源来启动。

图21.30显示了一个硬件源的计数开始操作示例。表21.24显示了设置示例。

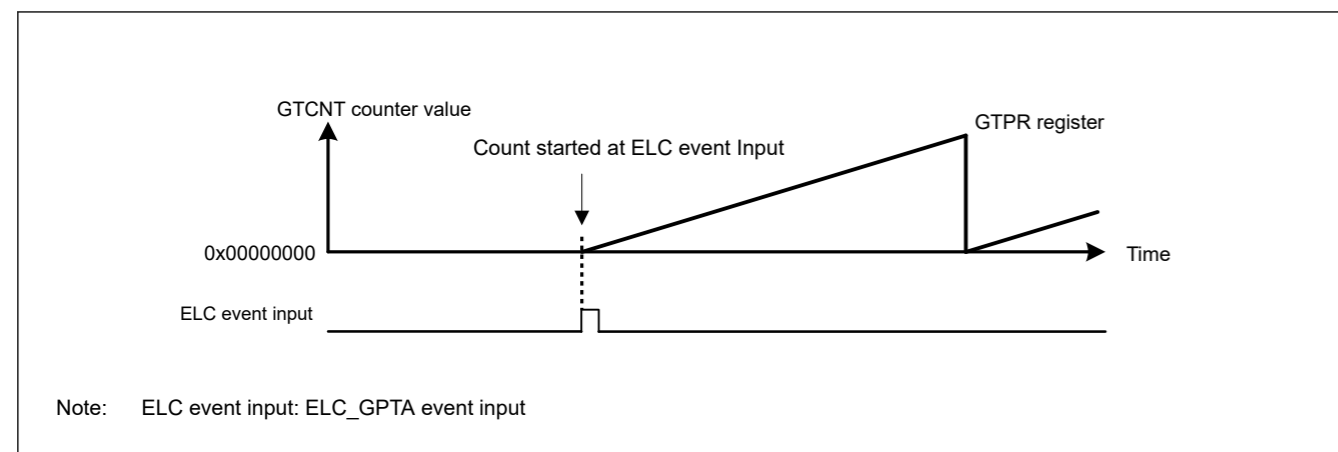

Figure 21.30 Example of count start operation by a hardware source started at the input of the signal from the ELC\_GPTA event

### 21.3.7.2 Hardware stop operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR.

Figure 21.31 shows an example of a count stop operation by a hardware source. Table 21.25 shows the setting example. In this example, the count operation stops at the edge of the ELC\_GPTA event input and restarts at the edges of the ELC\_GPTB event input.

### 21.3.7.2 硬件停止操作

GTCNT计数器可以通过使用GTPSR选择硬件源来停止。

图21.31显示了一个硬件源的计数停止操作示例。表21.25显示了设置示例。在此示例中, 计数操作在ELC\_GPTA事件输入的边沿停止, 并在ELC\_GPTB事件输入的边沿重新开始。

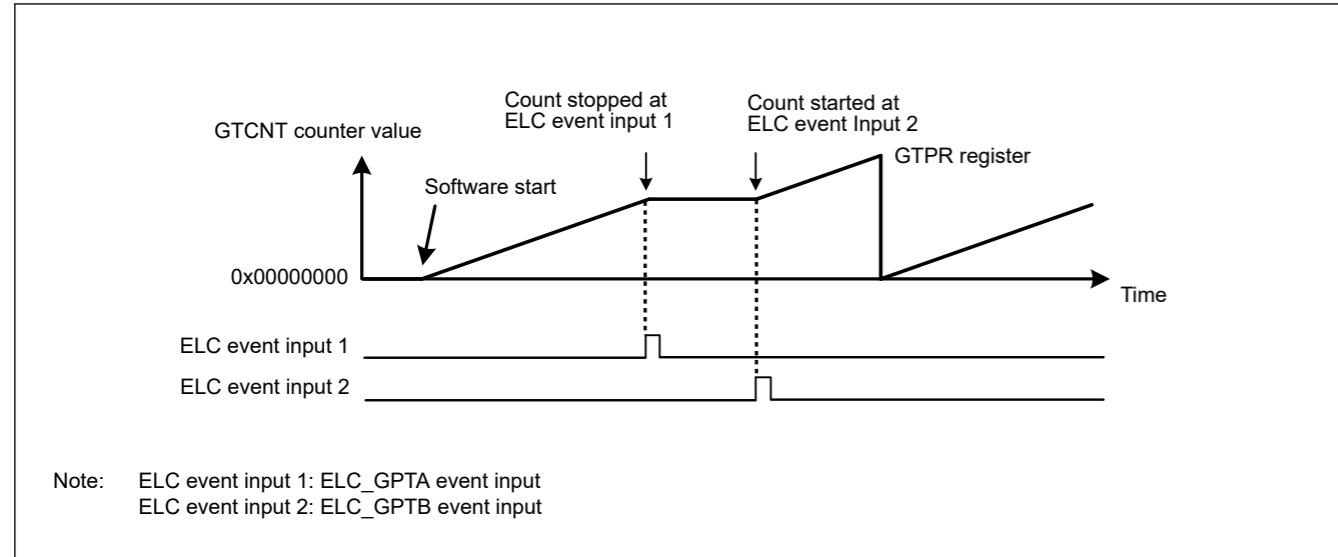

Figure 21.31 Example of count stop operation by hardware source started by software, stopped at ELC\_GPTA input, and restarted at ELC\_GPTB input

Table 21.25 Example setting for count stop operation by a hardware source

| No. | Step Name                     | Description  |
|-----|-------------------------------|--|
| 1   | Set operating mode            | Set the operating mode with GTCR.MD[2:0]. In Figure 21.31, 000b (saw-wave PWM mode) is set.  |
| 2   | Set count direction           | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.31, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).                             |
| 3   | Select count clock            | Select the count clock with GTCR.TPCS[3:0].  |
| 4   | Set cycle                     | Set the cycle in GTPR.   |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.31, 0x00000000 is set.  |
| 6   | Set hardware count start      | Select a hardware source for starting count operation in GTSSR register, and wait for count start by the hardware source. In Figure 21.31, GTSSR.SSELCB = 1.                                   |
| 7   | Set hardware count stop       | Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. In Figure 21.31, GTPSR.PSELCA = 1.                                     |
| 8   | Set hardware source operation | Set operation of the hardware source selected in GTSSR register or GTPSR register, and start or stop counting. In Figure 21.31, ELC_GPTA input operation and ELC_GPTB input operation are set. |

Figure 21.32 shows an example of a count start/stop operation by a hardware source. Table 21.26 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

| 5   | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.32, 0x00000000 is set.  |
| 6   | Set hardware count start      | Select a hardware source for starting count operation with GTSSR register and wait for count start by the hardware source. In Figure 21.32, GTSSR.SSGTRGAR = 1.    |
| 7   | Set hardware count stop       | Select a hardware source for stopping count operation with GTPSR register and wait for count stop by the hardware source. In Figure 21.32, GTPSR.PSGTRGAF = 1.     |
| 8   | Set hardware source operation | Set operation of the hardware source selected in GTSSR or GTPSR and start or stop counting. In Figure 21.32, the GTETRGA pin operation is set.                     |

### 21.3.7.3 Hardware clear operation

The GTCNT counter can be cleared by selecting a hardware source using GTCR. The GPTn\_OVF/GPTn\_UDF (n = 0 to 7) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 21.33 and Figure 21.34 show examples of the GTCNT counter clearing operation by a hardware source. Table 21.27 shows the setting example. In this example, the GTCNT counter starts at the edge of the ELC\_GPTA input, and the counter stops and clears at the edge of the ELC\_GPTB input.

| 7   | 设置硬件计数停止  | 使用GTPSR寄存器选择停止计数操作的硬件源，并等待硬件源停止计数。在图21.32中，GTPSR.PSGTRGAF=1。                             |
| 8   | 设置硬件源操作   | 设置在GTSSR或GTPSR中选择的硬件源的操作并开始或停止计数。在图21.32中，设置了GTETRGA引脚操作。                                |

### 21.3.7.3 硬件清除操作

GTCNT计数器可以通过使用GTCR选择硬件源来清除。当GTCNT计数器被硬件或软件清零时，不会产生GPTn\_OVF/GPTn\_UDF (n=0到7) 中断（上溢下溢中断）。

图21.33和图21.34显示了通过硬件源清除GTCNT计数器操作的示例。表21.27显示了设置示例。在本例中，GTCNT计数器在ELC\_GPTA输入的边沿开始，计数器在ELC\_GPTB输入的边沿停止并清零。

| 4   | Set cycle                     | Set the cycle in the GTPR register.  |
| 5   | Set initial value for counter | Set the initial value in the GTCNT counter.<br>In Figure 21.33, 0x00000000 is set. In Figure 21.34, the GTPR value is set.   |
| 6   | Set hardware count start      | Select a hardware source for starting count operation in GTSSR register and wait for count start by the hardware source. In Figure 21.33 and Figure 21.34, GTSSR.SSELCA = 1.   |
| 7   | Set hardware count stop       | Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. In Figure 21.33 and Figure 21.34, GTPSR.PSELCA = 1.  |
| 8   | Set hardware count clear      | Select a hardware source for clearing count operation in GTCSR register and wait for count clear by the hardware source. In Figure 21.33 and Figure 21.34, GTCSR.CSELCA = 1.   |
| 9   | Set hardware source operation | Set operation of the hardware source selected in GTSSR register, GTPSR Register or GTCSR register and start, stop or clear counting.<br>In Figure 21.33 and Figure 21.34, the ELC_GPTA input and ELC_GPTB input are set. |

The GPTn\_OVF/GPTn\_UDF (n = 0 to 7) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 21.35 shows the relationship between the counter clearing by a hardware source and the GPTn\_OVF (n = 0 to 7) interrupt.

Figure 21.35 Relationship between counter clearing by hardware source and GPTn\_OVF (n = 0 to 7) interrupt

### 21.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop, and clear operation can be performed.

#### 21.3.8.1 Synchronized operation by software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP, or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

Figure 21.36 shows an example of a simultaneous start, stop, and clear by software. Figure 21.37 shows an example of phase start operation by software.

Table 21.27 通过硬件源进行计数清除操作的示例设置(2of2)

| No. | 步骤名称      | Description  |
|-----|-----------|--|
| 4   | 设置周期      | 在GTPR寄存器中设置周期。   |
| 5   | 设置计数器的初始值 | 在GTCNT计数器中设置初始值。<br>在图21.33中, 设置了0x00000000。在图21.34中, 设置了GTPR值。                                |
| 6   | 设置硬件计数开始  | 在GTSSR寄存器中选择一个开始计数操作的硬件源, 等待硬件源开始计数。在图21.33和图21.34中, GTSSR.SSELCA=1。                           |
| 7   | 设置硬件计数停止  | 在GTPSR寄存器中选择一个停止计数操作的硬件源, 等待硬件源停止计数。在图21.33和图21.34中, GTPSR.PSELCA=1。                           |
| 8   | 设置硬件计数清除  | 在GTCSR寄存器中选择一个清除计数操作的硬件源, 等待硬件源清除计数。在图21.33和图21.34中, GTCSR.CSELCA=1。                           |
| 9   | 设置硬件源操作   | 设置在GTSSR寄存器、GTPSR寄存器或GTCSR寄存器中选择的硬件源的操作以及开始、停止或清除计数。在图21.33和图21.34中, 设置了ELC_GPTA输入和ELC_GPTB输入。 |

GPTn\_OVFGPTn\_UDF (n=0到7) 中断 (溢出下溢中断) 不会在计数器被硬件源或软件清零时产生。

图21.35显示了通过硬件源清除计数器和GPTn\_OVF (n=0到7) 中断之间的关系。

Figure 21.35 硬件源计数器清零与GPTn\_OVF(n=0to7)中断的关系

### 21.3.8 同步操作

可以对通道进行同步操作, 例如同步启动、停止和清除操作。

#### 21.3.8.1 软件同步操作

通过将相关的GTSTR、GTSTP或GTCLR位同时设置为1, 可以在多个通道上启动、停止和清除GTCNT计数器。

通过在GTCNT计数器中设置初始值并设置相关的GTSTR位同时为1。

图21.36显示了通过软件同时启动、停止和清除的示例。图21.37显示了通过软件进行相位启动操作的示例。

Figure 21.36 Example of a simultaneous start, stop, and clear by software with the same count cycle (GTPR register value)

Figure 21.36 使用相同计数周期 (GTPR寄存器值) 的软件同时启动、停止和清除的示例

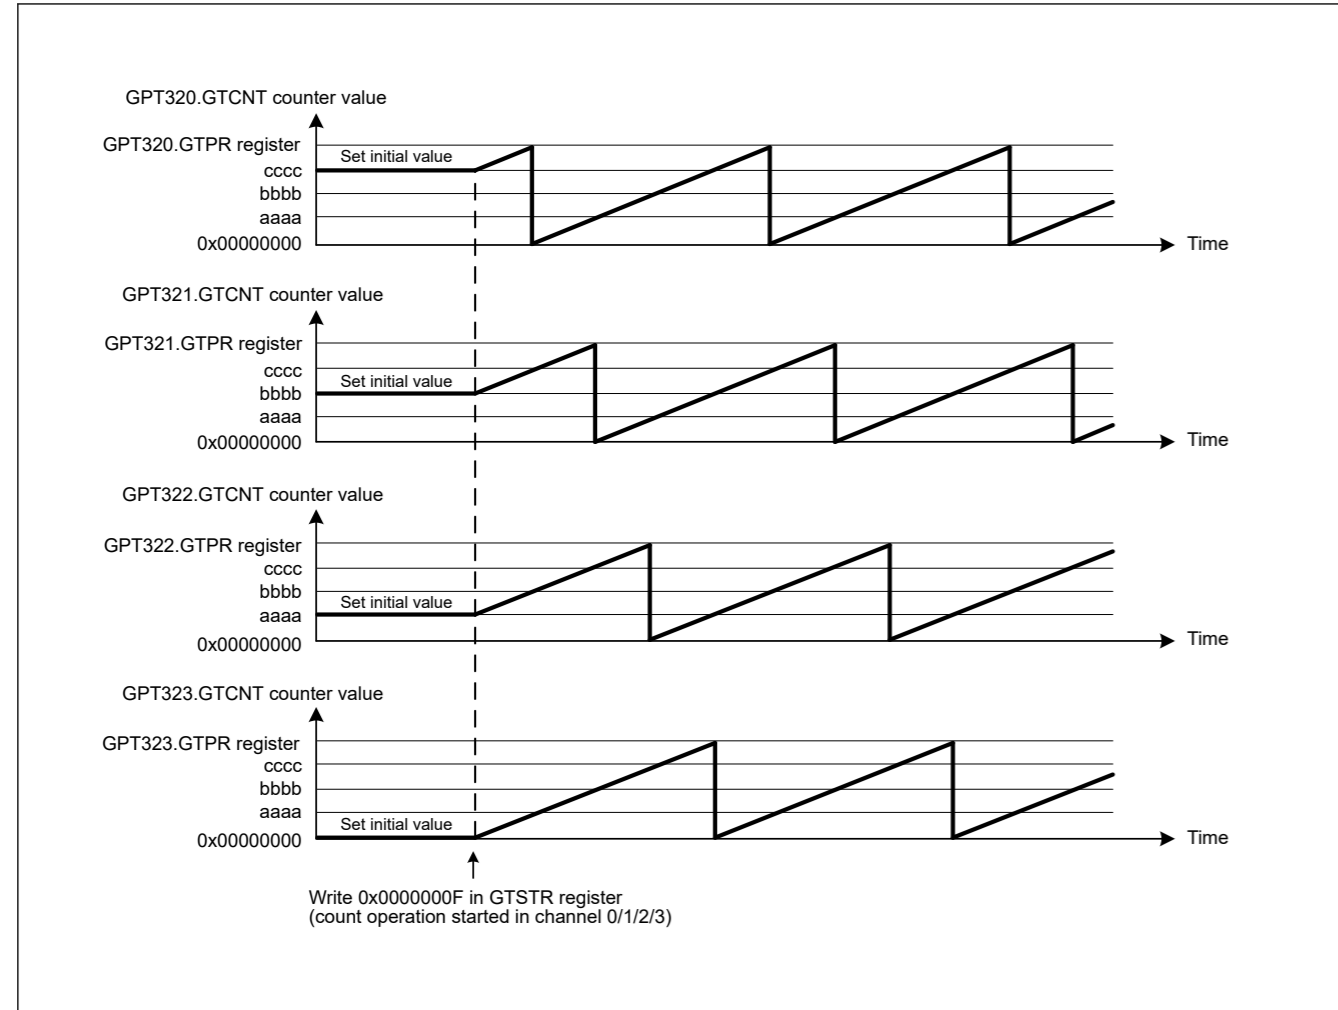

Figure 21.37 Example of software phase start with the same count cycle (GTPR register value)

### 21.3.8.2 Synchronized operation by hardware

The counters for multiple channels can be started, stopped, and cleared simultaneously by the following hardware sources. Hardware sources that can cause a synchronized operation are external trigger input and ELC event input. Synchronized operations through GTIOCnA and GTIOCnB pin input are possible by setting an ELC event due to input capture as a hardware source (n = 0 to 7).

Figure 21.38 shows an example of a simultaneous start, stop, and clear operation by a hardware source. Table 21.28 shows the setting example.

Figure 21.37 以相同计数周期开始的软件阶段示例 (GTPR寄存器值)

### 21.3.8.2 硬件同步操作

多个通道的计数器可以通过以下硬件源同时启动、停止和清除。可以导致同步操作的硬件源是外部触发输入和ELC事件输入。通过将输入捕获导致的ELC事件设置为硬件源 (n = 0到7)，可以通过GTIOCnA和GTIOCnB引脚输入进行同步操作。

图21.38显示了一个硬件源同时启动、停止和清除操作的示例。表21.28显示了设置示例。

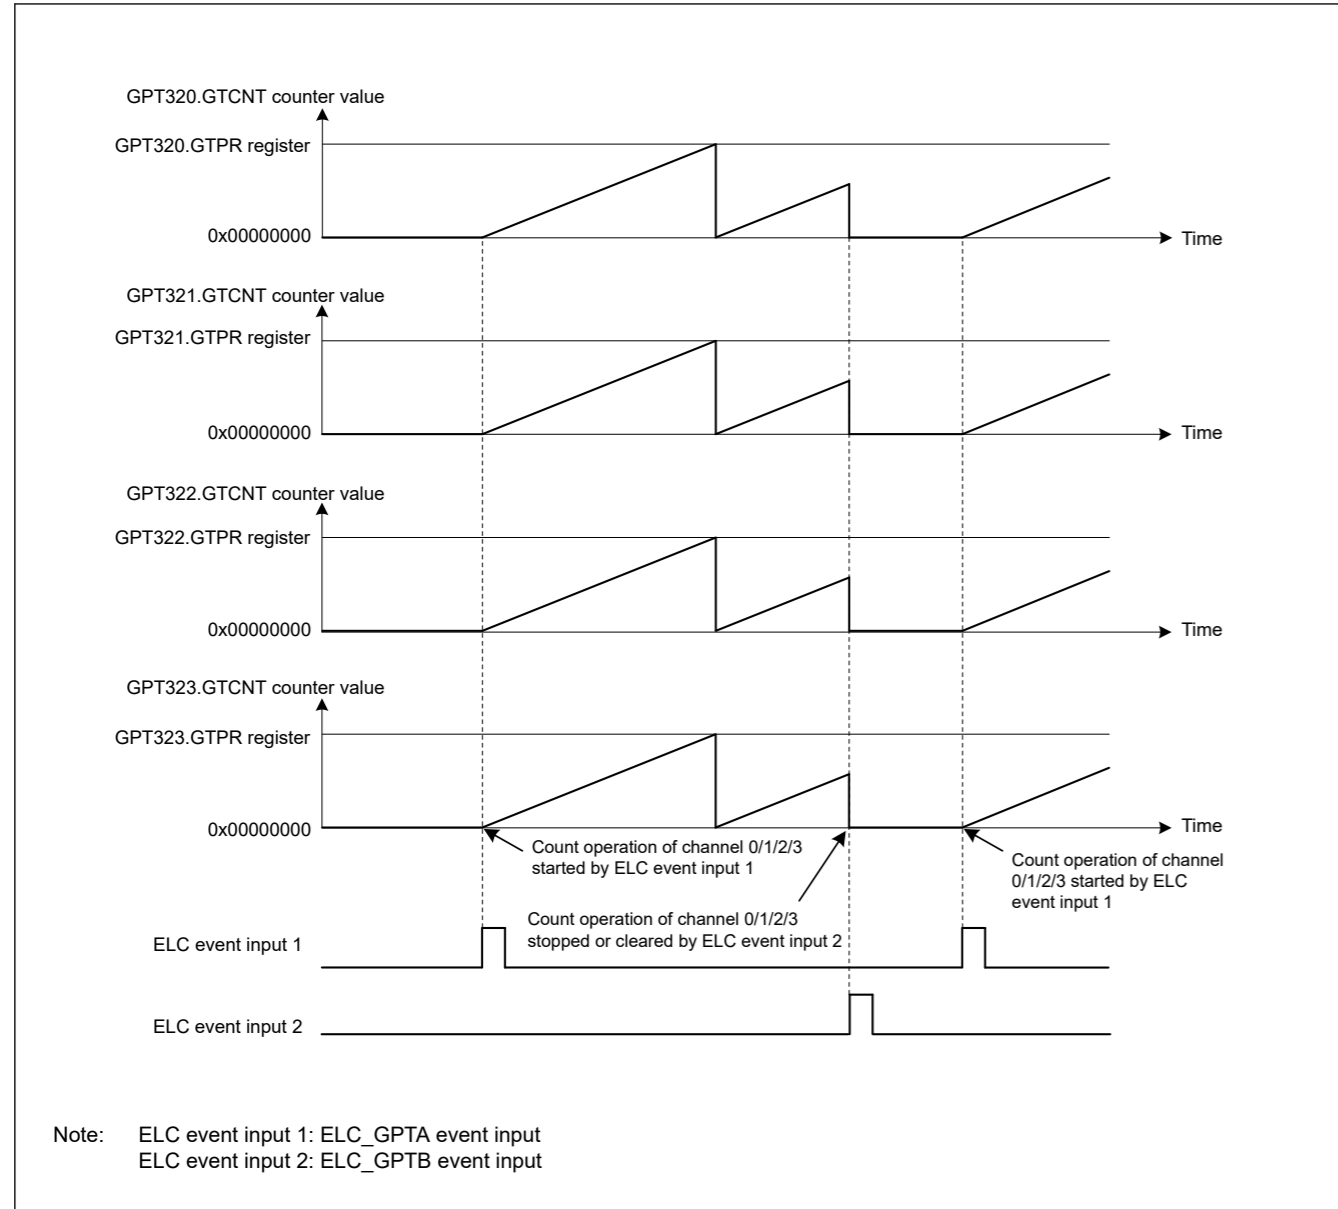

Figure 21.38 Example of a simultaneous start, stop, and clear by a hardware source with the same count cycle (GTPR register value)

### 21.3.9 PWM Output Operation Examples

#### (1) Synchronized PWM output

The GPT outputs  $8 \times 2$  phases of linked PWM waveforms for a maximum of  $GPT \times 8$  channels.

Figure 21.39 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOcNA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOcNB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

Table 21.28 通过硬件源同时启动的示例设置(2of2)

| No. | 步骤名称     | Description   |
|-----|----------|---|
| 7   | 设置硬件计数停止 | 使用GTPSR寄存器选择停止计数操作的硬件源并等待硬件源停止计数在图21.38中, GTPSR.PSEL CB=1。                    |
| 8   | 设置硬件计数清除 | 使用GTCSR寄存器选择清除计数操作的硬件源, 等待硬件源清除计数在图21.38中, GTCSR.CSEL LCB=1。                  |

### 21.3.9 PWM输出操作示例

#### (1) 同步PWM输出

GPT为最多 $GPT \times 8$ 通道输出 $8 \times 2$ 相链接的PWM波形。

图21.39显示了一个示例, 其中4个通道在锯齿波PWM模式下执行同步操作并输出8相PWM波形。GTIOcNA设置为输出低作为初始值, 在GTCCRA比较匹配时输出高, 在循环结束时输出低。GTIOcNB设置为输出低作为初始值, 在GTCCRB比较匹配时输出高, 在循环结束时输出低。

Figure 21.39 Example of synchronized PWM output

(2) 3-phase saw-wave complementary PWM output

Figure 21.40 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

Figure 21.39 同步PWM输出示例

(2) 三相锯齿波互补PWM输出

图21.40显示了一个示例，其中三个通道在锯齿波PWM模式下执行同步操作并输出三相互补PWM波形。GTIOCnA引脚设置为输出低作为初始值，在GTCCRA比较匹配时输出高，在周期结束时输出低。GTIOCnB引脚设置为输出高作为初始值，在GTCCRB比较匹配时输出低，在周期结束时输出高。

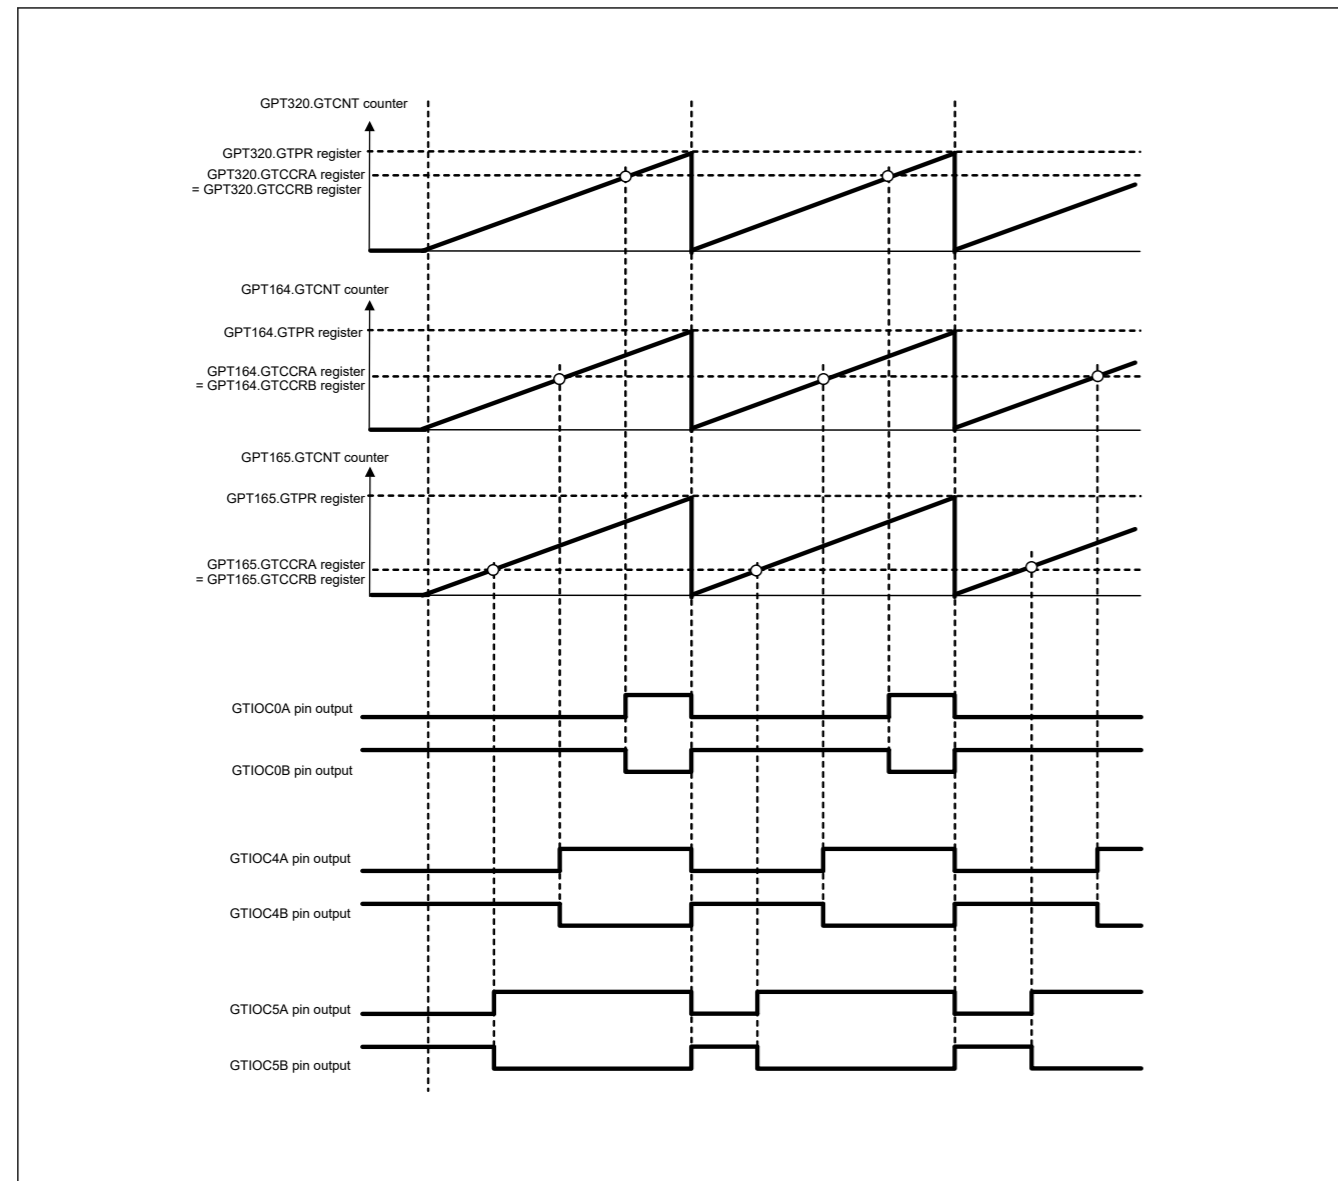

Figure 21.40 Example of 3-phase saw-wave complementary PWM output

(3) 3-phase saw-wave complementary PWM output with automatic dead time setting

Figure 21.41 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTIOCnB compare match, and retains the output at the cycle end.

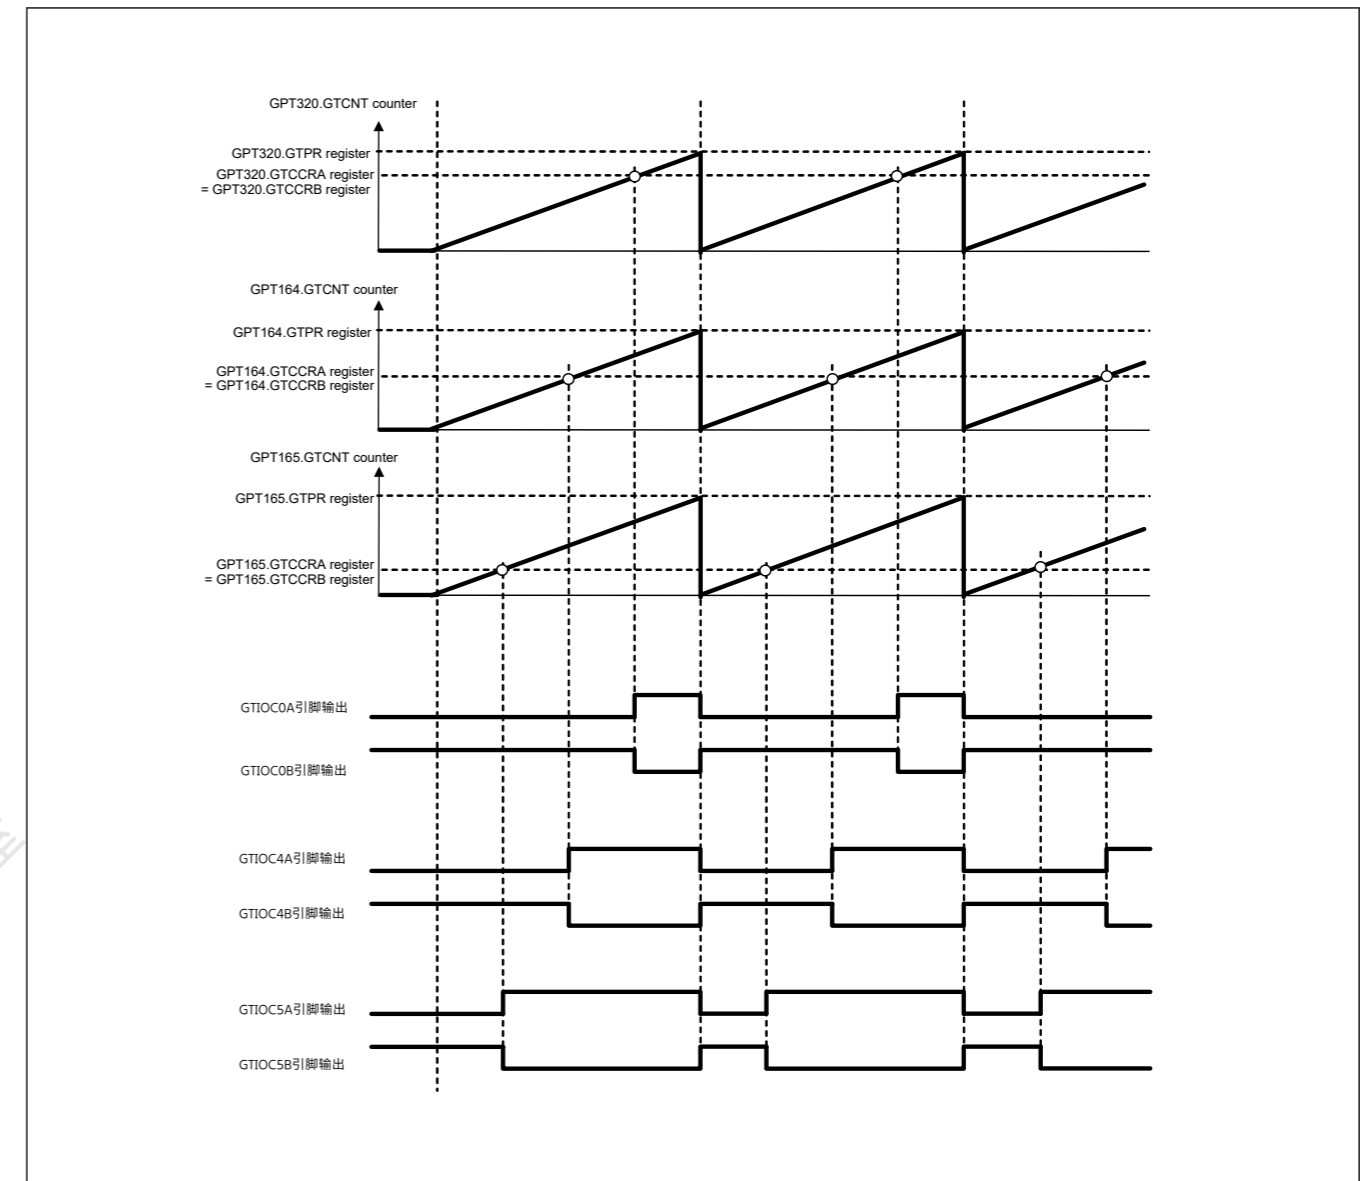

Figure 21.40 三相锯齿波互补PWM输出示例

(3) 具有自动死区时间设置的三相锯齿波互补PWM输出

图21.41显示了一个示例，其中三个通道在具有自动死区时间设置的锯齿波一次性脉冲模式下执行同步操作并输出三相互补PWM波形。GTIOCnA引脚设置为输出低电平作为初始值，在GTCCRA比较匹配时切换输出，并在周期结束时保持输出。GTIOCnB引脚设置为输出高电平作为初始值，在GTIOCnB比较匹配时切换输出，并在周期结束时保持输出。

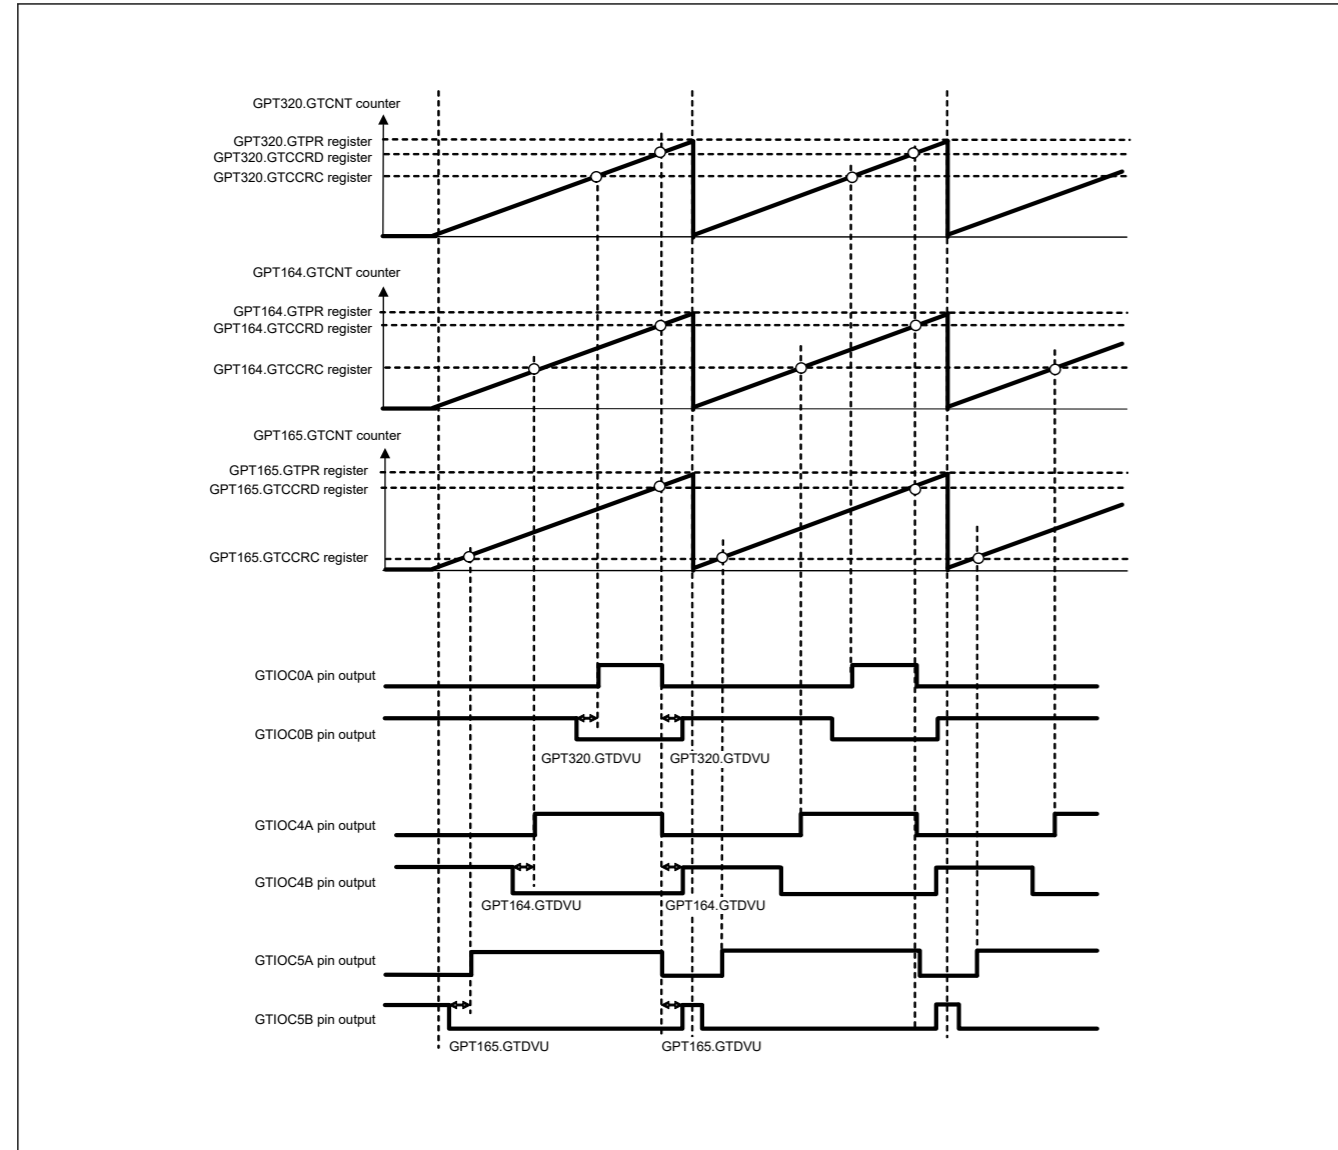

Figure 21.41 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

(4) 3-phase triangle-wave complementary PWM output

Figure 21.42 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

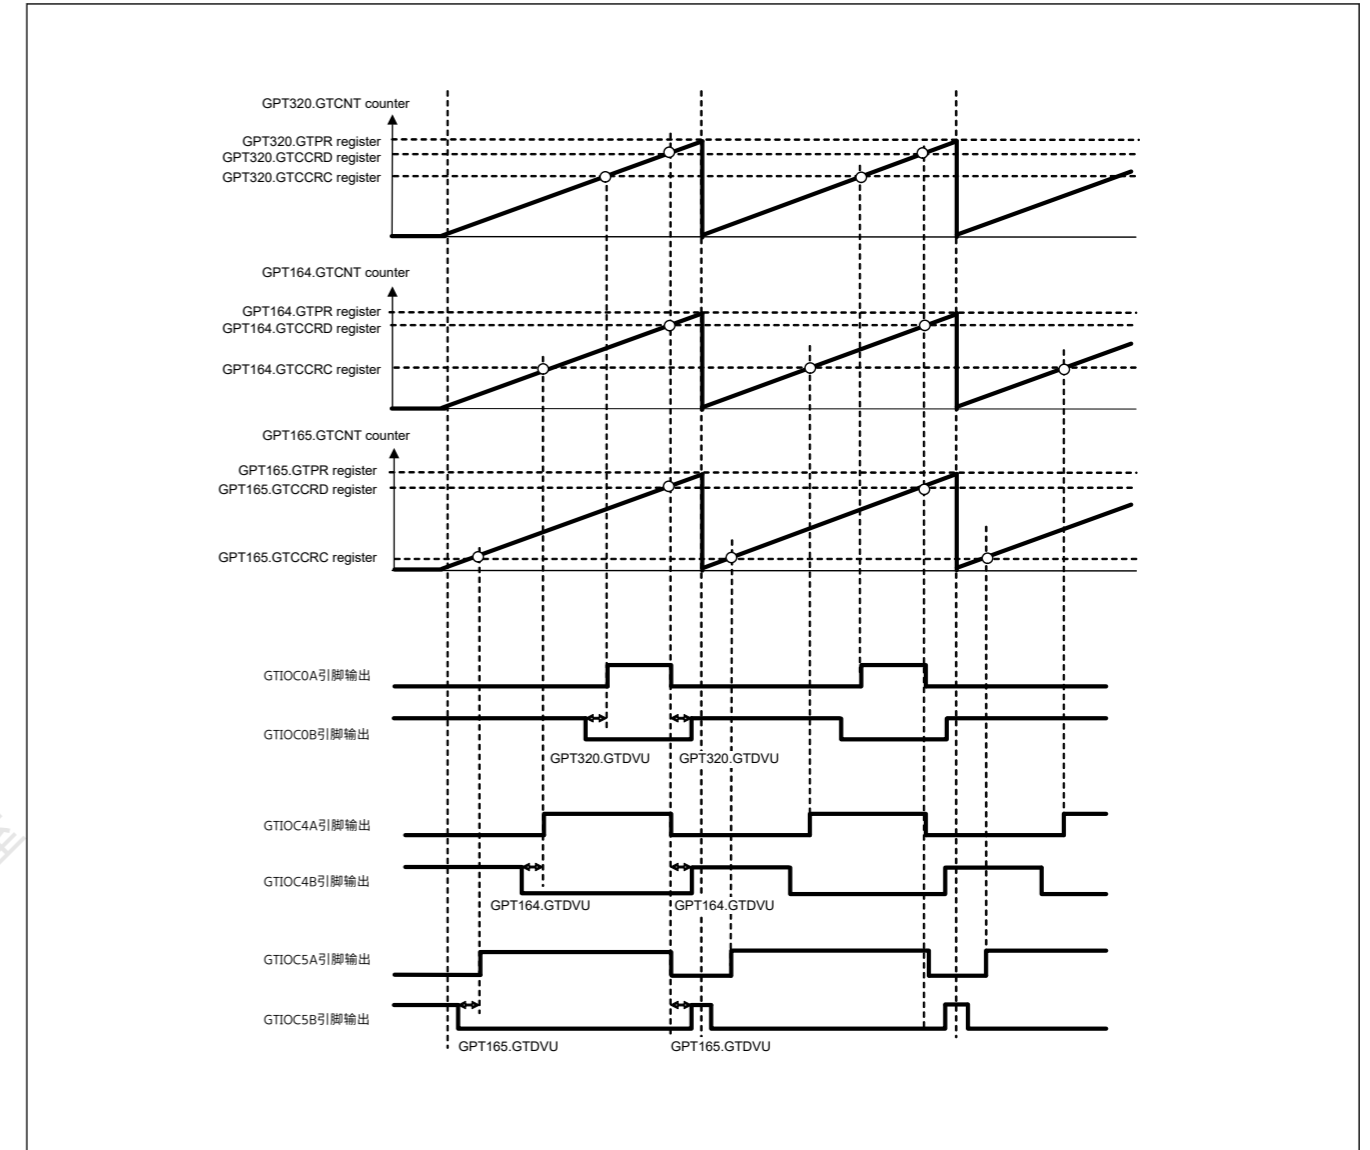

Figure 21.41 具有自动死区时间设置的三相锯齿波互补PWM输出示例

(4) 三相三角波互补PWM输出

图21.42显示了一个示例，其中三个通道在三角波PWM模式1中执行同步操作并输出三相互补PWM波形。GTIOCnA引脚设置为输出低电平作为初始值，在GTCCRA比较匹配时切换输出，并在周期结束时保持输出。GTIOCnB引脚设置为输出高电平作为初始值，在GTCCRB比较匹配时切换输出，并在周期结束时保持输出。

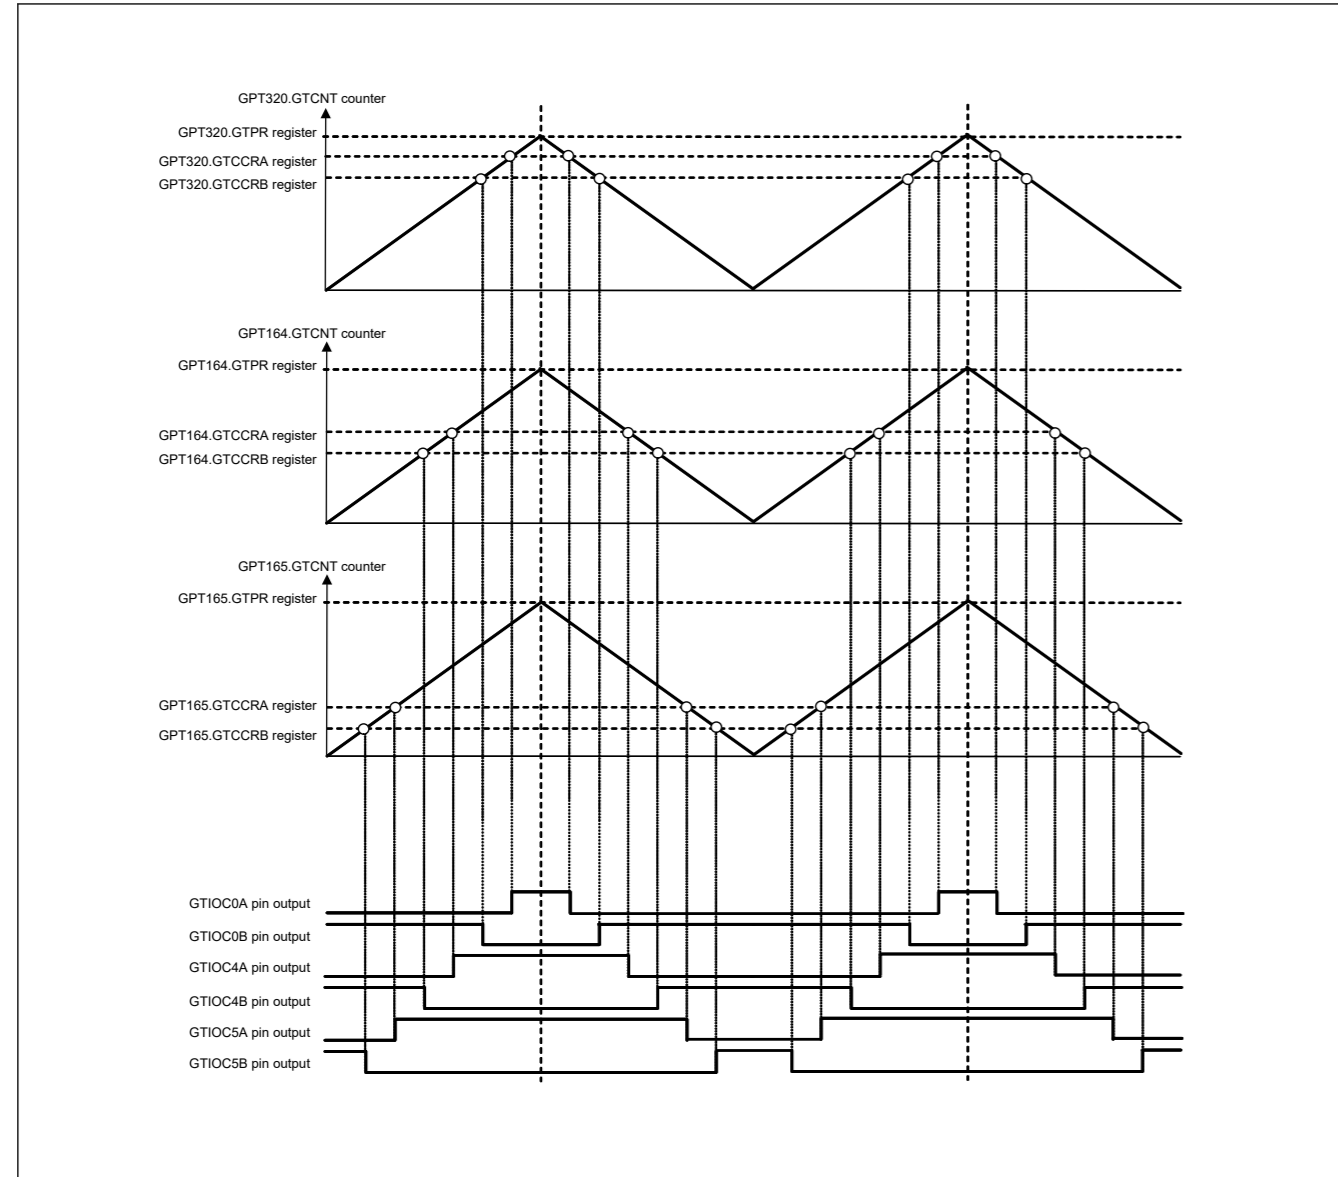

Figure 21.42 Example of 3-phase triangle-wave complementary PWM output

(5) 3-phase triangle-wave complementary PWM output with automatic dead time setting

Figure 21.43 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

Figure 21.42 三相三角波互补PWM输出示例

(5) 具有自动死区时间设置的三相三角波互补PWM输出

图21.43显示了一个示例，其中三个通道在三角波PWM模式1下执行同步操作，自动设置死区时间并输出三相互补PWM波形。GTIOCnA引脚设置为输出低电平作为初始值，在GTCCRA比较匹配时切换输出，并在周期结束时保持输出。GTIOCnB引脚设置为输出高电平作为初始值，在GTCCRB比较匹配时切换输出，并在周期结束时保持输出。

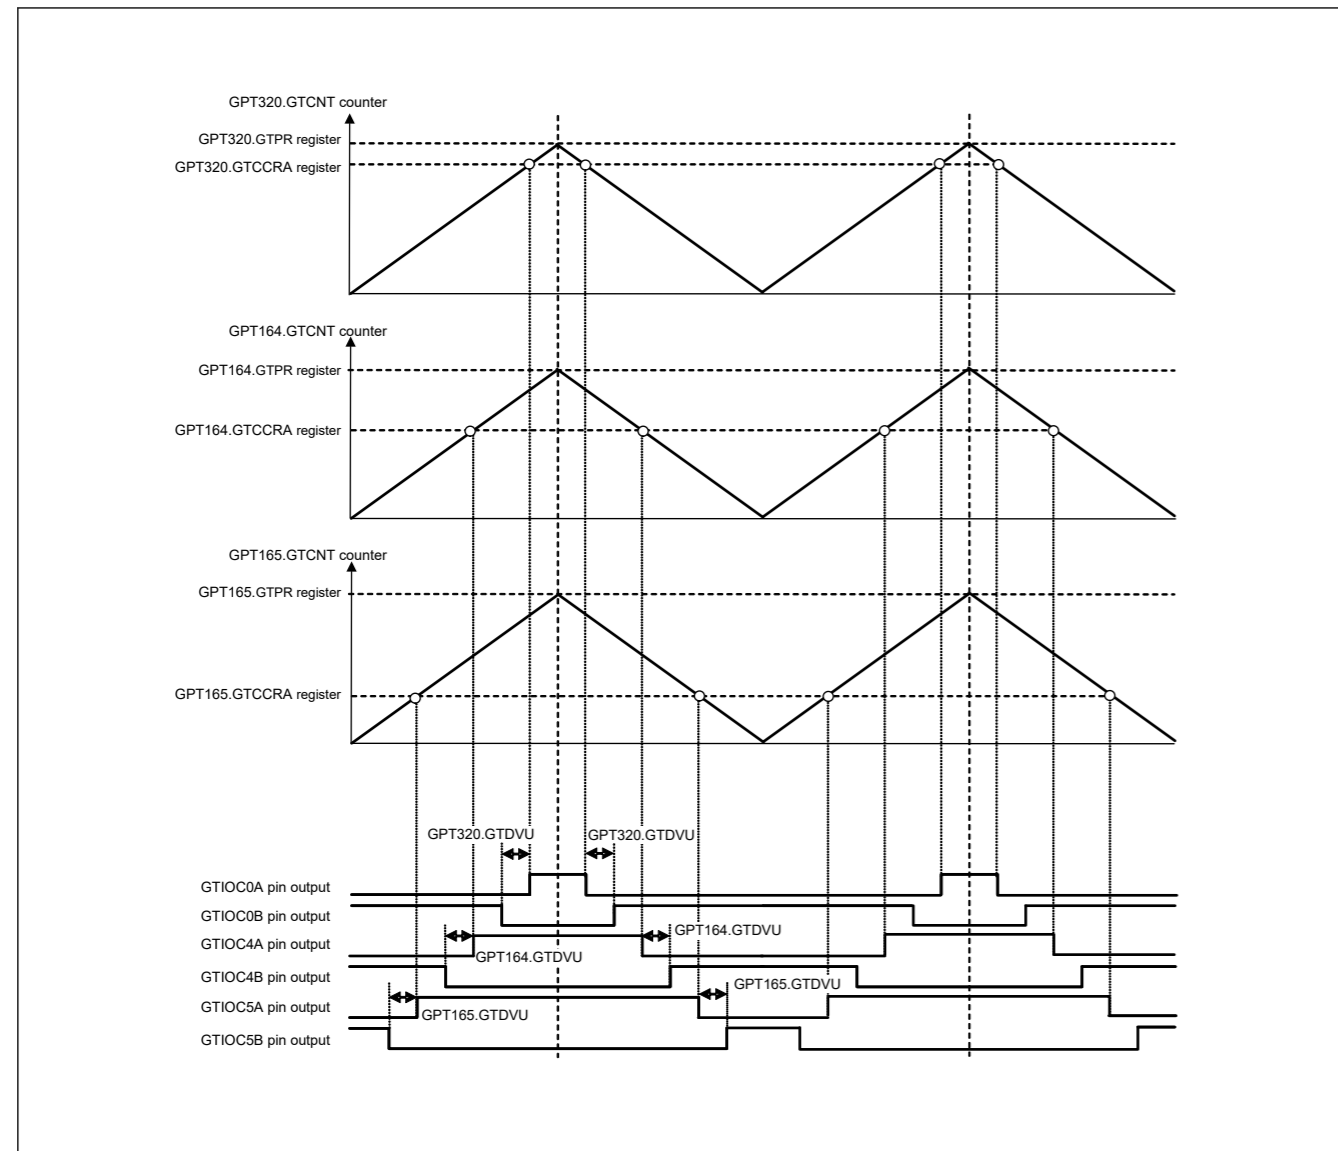

Figure 21.43 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

(6) 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

Figure 21.44 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

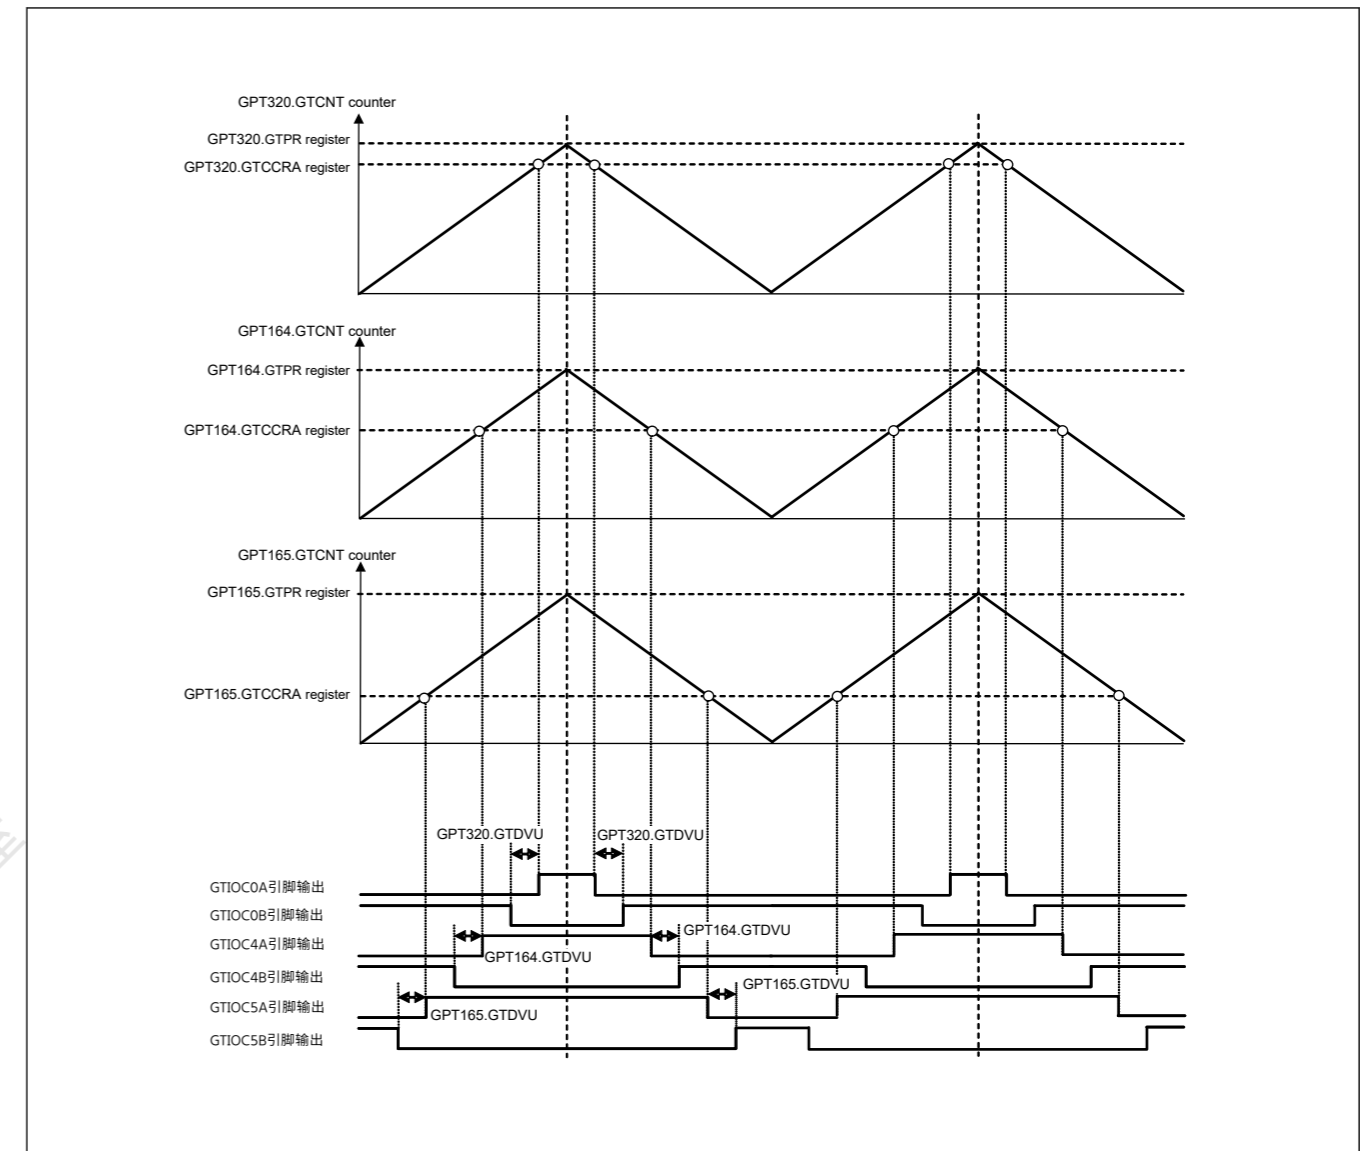

Figure 21.43 具有自动死区时间设置的三相三角波互补PWM输出示例

(6) 具有自动死区时间设置的三相不对称三角波互补PWM输出

图21.44显示了一个示例，其中三个通道在三角波PWM模式3下执行同步操作，自动设置死区时间并输出三相互补PWM波形。GTIOCnA设置为输出低电平作为初始值，在GTCCRA比较匹配时切换输出，并在循环结束时保留输出。GTIOCnB设置为输出高电平作为初始值，在GTCCRB比较匹配时切换输出，并在循环结束时保留输出。

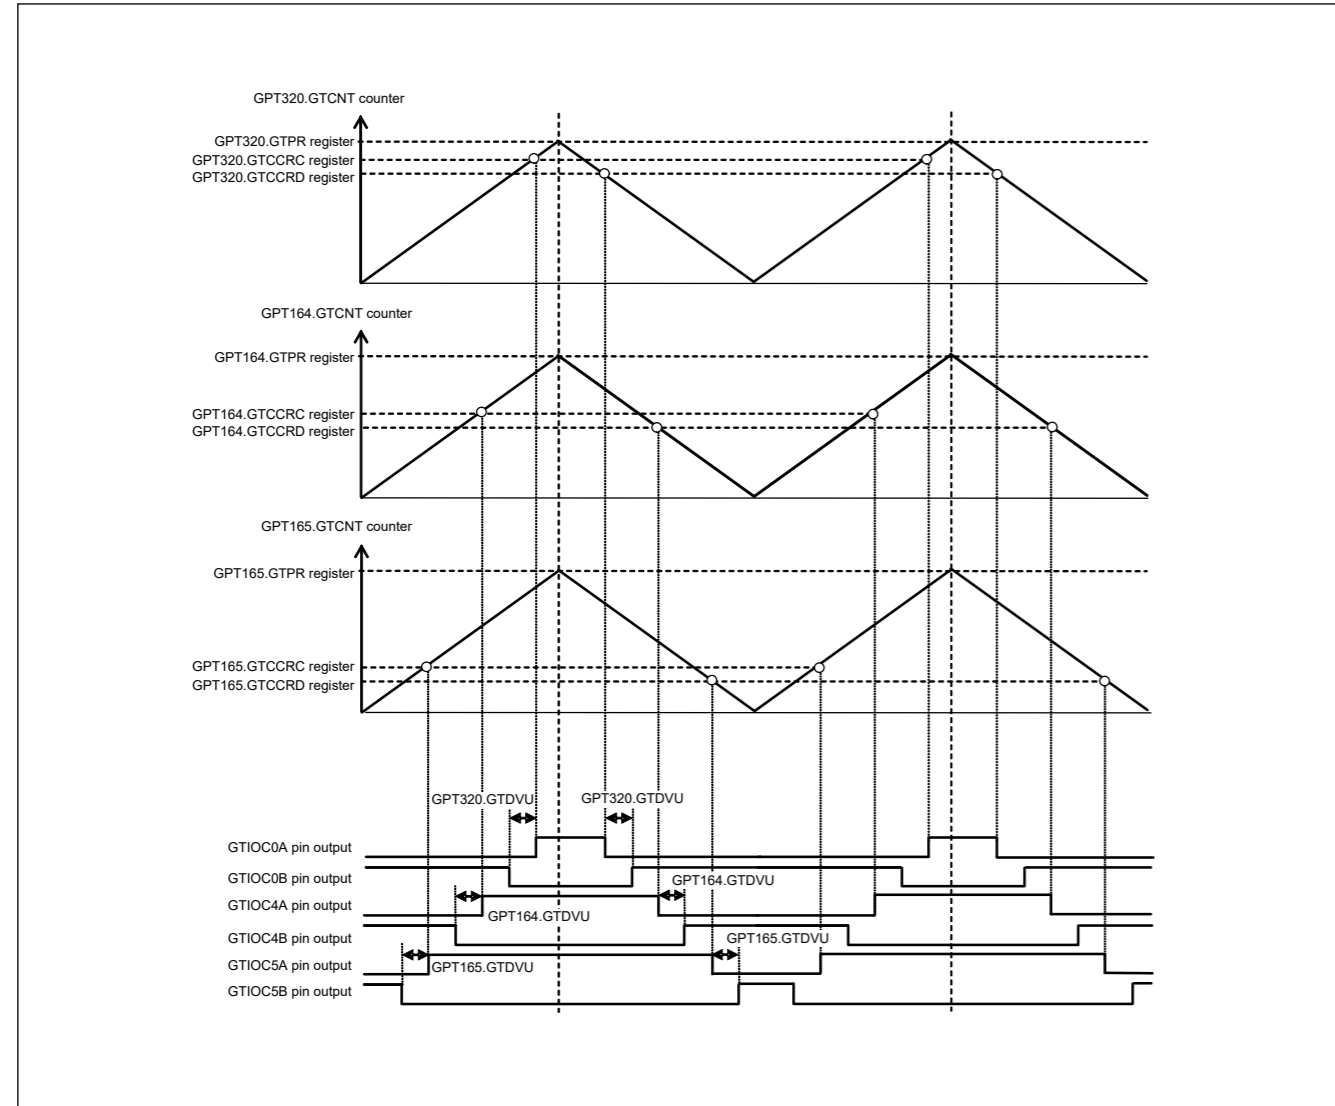

Figure 21.44 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

### 21.3.10 Period Count Function

By setting the GTPC register, the end of period can be counted.

The number of period to be counted should be set into the GTPC.PCNT counter when the GTPC.PCEN bit is 0. When the PCEN bit is 1, the PCNT counter can be read, but writing is disabled. When the PCEN bit is 1, down-counting is performed at the end of period. When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped to finish the period count function. At that time, the GTST.PCF flag is set. When the GTPC.ASTP bit is 1, the GTCNT counter is also stopped at the same time that the period count function is finished.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

When either GTSECR.SPCE bit or GTSECR.SPCD bit is set to 1, the PCEN bit in the channels set to 1 by the GTSECSR register is simultaneously set the value to enable or disable the period count function for multiple channels.

Figure 21.45 and Figure 21.46 show examples of PWM cycle count function.

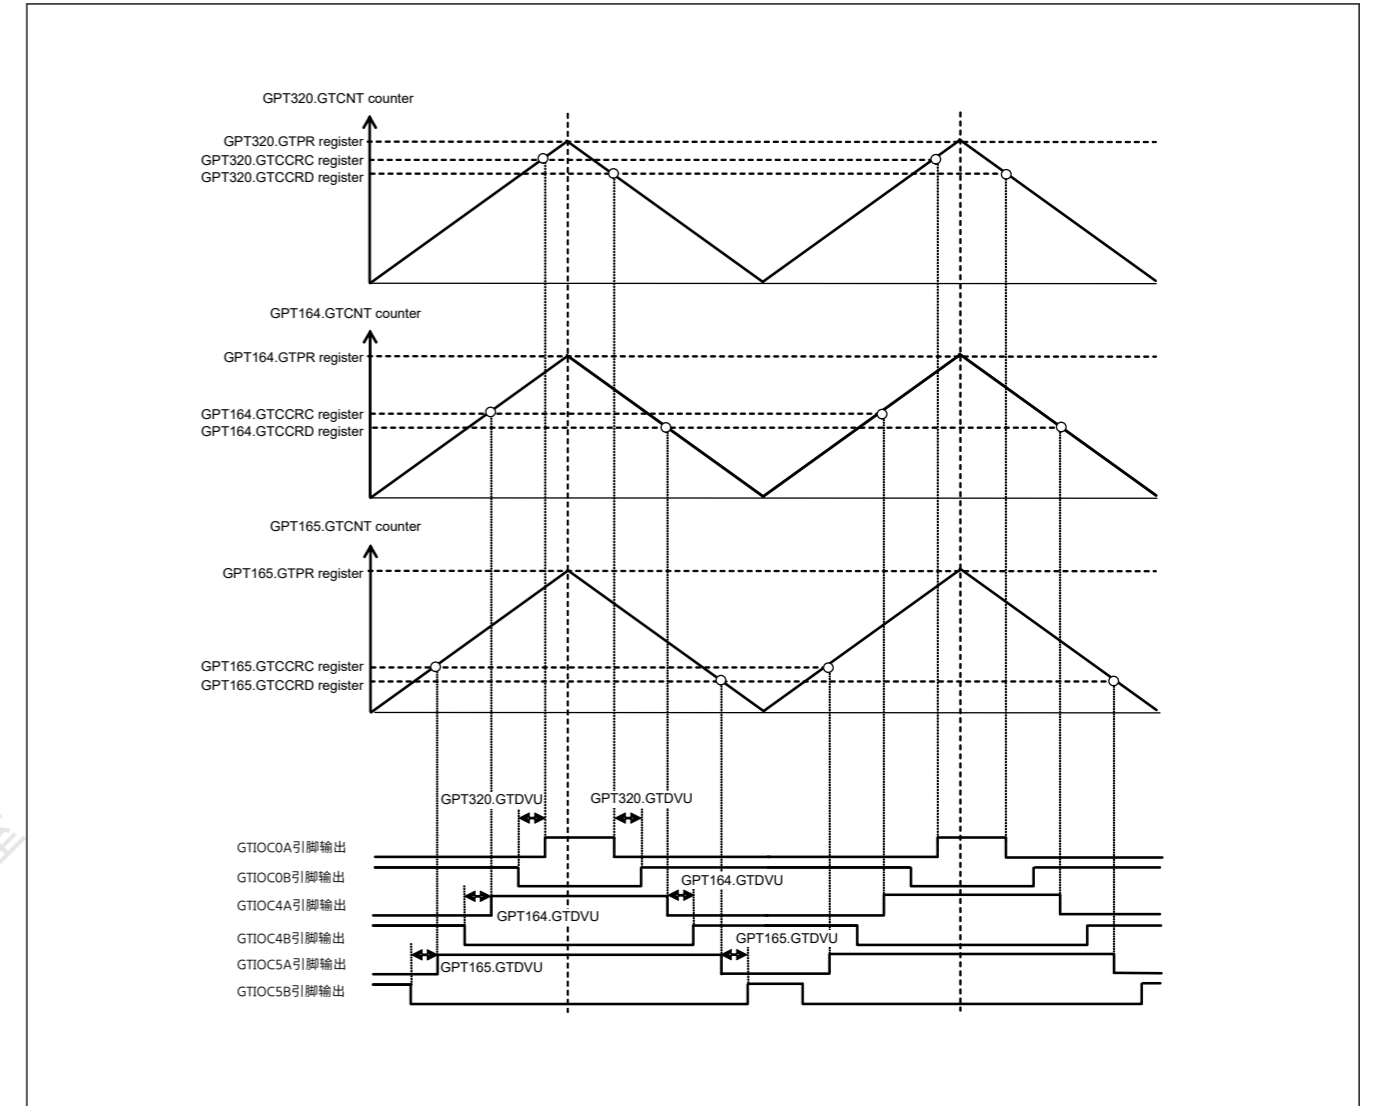

Figure 21.44 具有自动死区时间设置的三相不对称三角波互补PWM输出示例

### 21.3.10 周期计数功能

通过设置GTPC寄存器，可以计算周期结束。

当GTPC.PCEN位为0时，要计数的周期数应设置到GTPC.PCNT计数器中。当PCEN位为1，可以读取PCNT计数器，但禁止写入。当PCEN位为1时，在周期结束时进行递减计数。当PCNT计数器在周期结束时为1时，它变为0并停止计数以完成周期计数功能。此时，设置了GTST.PCF标志。当GTPC.ASTP位为1时，GTCNT计数器也在周期计数功能完成的同时停止。

当GTCNT计数器停止而周期计数功能使能时，PCNT计数器保持其值。当。。。的时候GTCNT计数器重新开始计数且PCEN位为1，PCNT计数器重新从保持值开始向下计数。

当PCNT计数器为0且ASTP位为1时PCEN位从0变为1时，GTCNT计数器立即停止在计数时钟处。

当GTSECR.SPCE位或GTSECR.SPCD位设置为1时，通过GTSECSR寄存器设置为1的通道中的PCEN位同时设置该值以启用或禁用多个通道的周期计数功能。

图21.45和图21.46显示了PWM周期计数功能的示例。

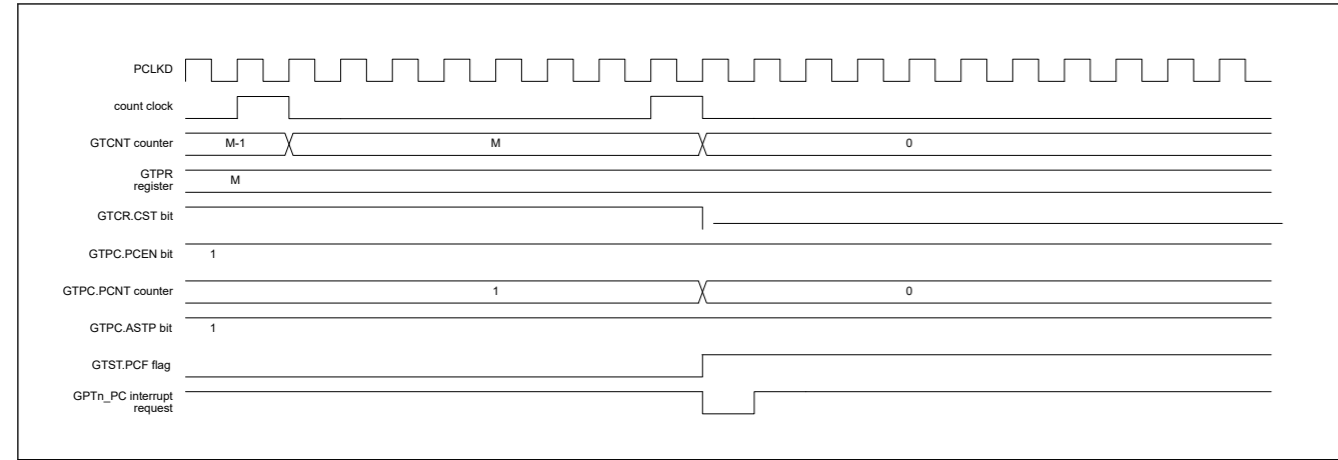

Figure 21.45 Example of PWM Cycle Count Function (Saw-Wave One-Shot Pulse Mode)

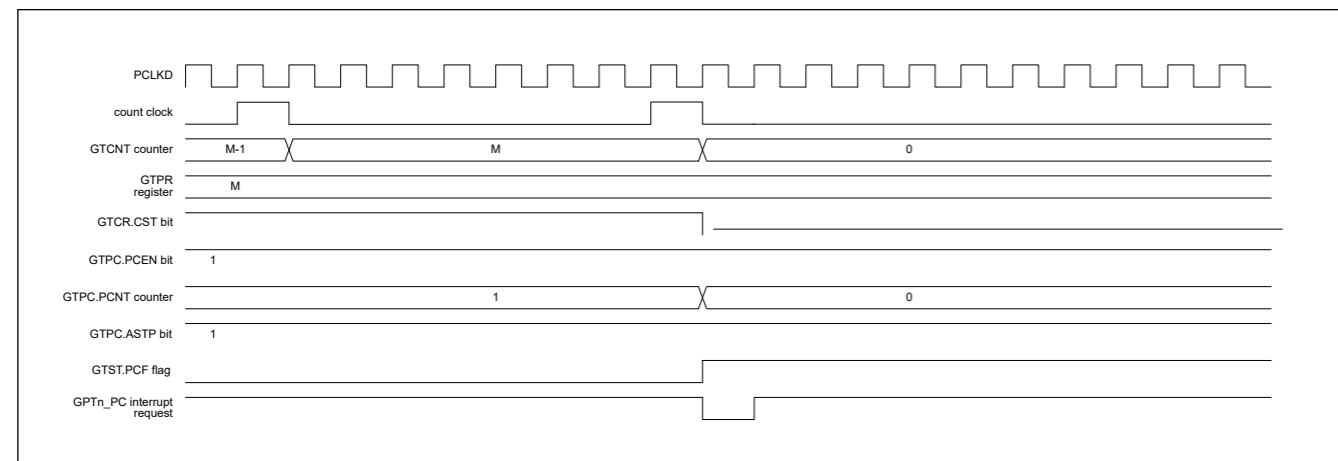

Figure 21.46 Example of the Timig of Operations for PWM Cycle Count Function (Saw-Wave One-Shot Pulse mode, Up-Counting)

### 21.3.11 Phase Counting Function

The phase difference between the GTIOCnA and GTIOCnB pin (n = 0 to 7) inputs is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCnA and GTIOCnB pin inputs being set in the GTUPSR and GTDNSR registers. For details on count operation, see [section 21.3.1.1. Counter operation](#).

Figure 21.47 to Figure 21.56 show an example of phase counting modes 1 to 5 operation when the GTIOCnA, GTIOCnB pins are used. Table 21.29 to Table 21.38 show conditions of up-counting or down-counting and list settings for the GTUPSR and GTDNSR registers which is corresponding to Figure 21.47 to Figure 21.56.

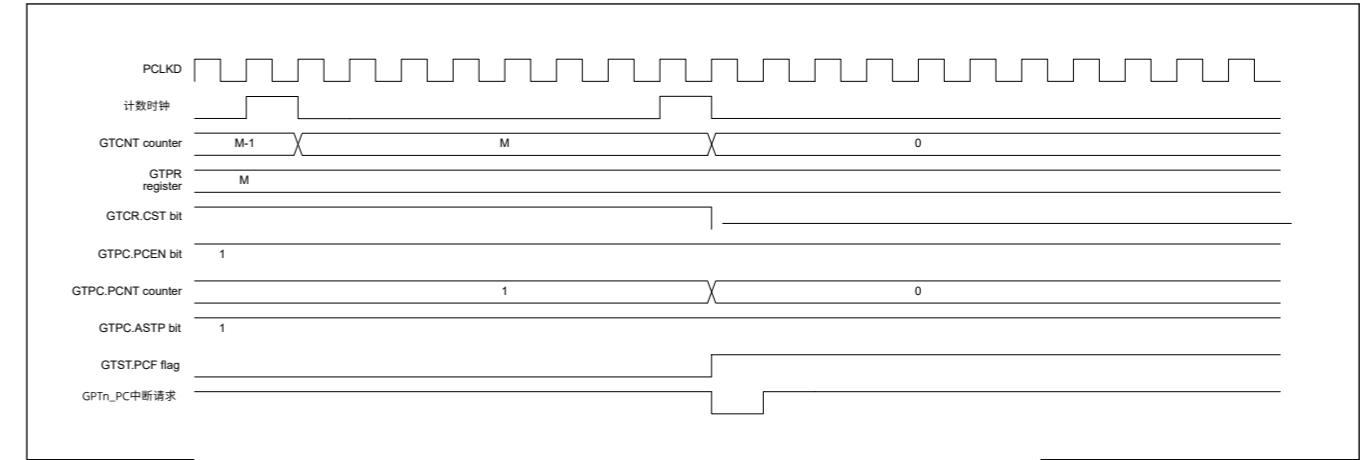

Figure 21.45 PWM周期计数功能示例 (Saw-WaveOne-Shot脉冲模式)

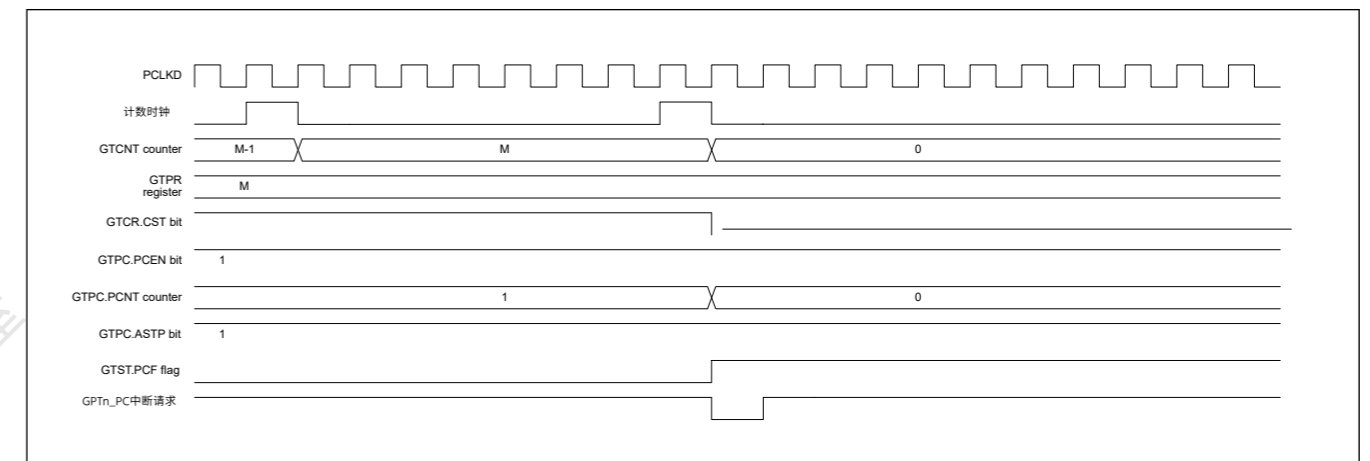

Figure 21.46 PWM周期计数功能的操作时序示例 (Saw-WaveOne-Shot脉冲模式, 递增计数)

### 21.3.11 相位计数功能

检测到GTIOCnA和GTIOCnB引脚 (n=0到7) 输入之间的相位差, 并且相关的GTCNT向上计数或向下计数。可检测的相位差可与在GTUPSR和GTDNSR寄存器中设置的GTIOCnA和GTIOCnB引脚输入的边沿和电平之间的关系进行任何组合。有关计数操作的详细信息, 请参阅第21.3.1.1节。柜台操作。

图21.47至图21.56显示了使用GTIOCnA、GTIOCnB引脚时相位计数模式1至5操作的示例。表21.29至表21.38显示了向上计数或向下计数的条件, 并列出了GTUPSR和GTDNSR寄存器的设置, 对应于图21.47至图21.56。

### 21.3.12 Output Phase Switching (GPT\_OPS)

GPT\_OPS provides a function for easy control of brushless DC motor operation using the Output Phase Switching Control Register (OPSCR).

GPT\_OPS outputs a PWM signal to be used for chopper control or level signal for each phase (U-positive phase/negative phase, V-positive phase/negative phase, W-positive phase/negative phase) of the 6-phase motor control. This function uses a soft setting value (OPSCR.UF, VF, WF) set by software or external signals detected by the Hall element, a PWM waveform of GPT320.GTIOC0A.

Figure 21.57 shows the conceptual diagram of GPT\_OPS control flow.

### 21.3.12 输出相位切换(GPT\_OPS)

GPT\_OPS提供使用输出相位切换控制轻松控制无刷直流电机运行的功能 Register (OPSCR).

GPT\_OPS输出用于斩波控制的PWM信号或6相电机控制的每一相 (U正相负相、V正相负相、W正相负相) 的电平信号。该功能使用软件设置的软设置值 (OPSCR.UF、VF、WF) 或霍尔元件检测到的外部信号, GPT320.GTIOC0A的PWM波形。

图21.57显示了GPT\_OPS控制流程的概念图。

21.3.12.1 Input selection and synchronization of external input signal

In the GPT\_ OPS control flow conceptual diagram shown in Figure 21.57, (1) is a selection of input phase from the software settings and external input by the OPSCR.FB bit.

When OPSCR.FB bit is 0, select the external input. Enable the input signal after synchronization with the GPT core clock (PCLKD). After carrying out noise filtering (optional), set the external input to the input phase of PWM (PWM of GPT320.GTIOC0A) using falling edge sampling with OPSCR.ALIGN bit set to 1.

When OPSCR.FB bit is 1, select the soft setting (OPSCR.UF, VF, WF) with the value of the input phase of PWM (PWM of GPT320.GTIOC0A) using falling edge sampling with OPSCR.ALIGN bit set to 1.

When OPSCR.ALIGN bit is 0, GPT\_ OPS operates with the input phase of PCLKD synchronization with either OPSCR.FB bit set to 0 or OPSCR.FB bit set to 1. However, there are cases where the PWM pulse width of the output U/V/W phases (PWM output mode) of switch timing (just before/just after) is shortened.

Table 21.39 shows the input selection process and setting of associated OPSCR bits.

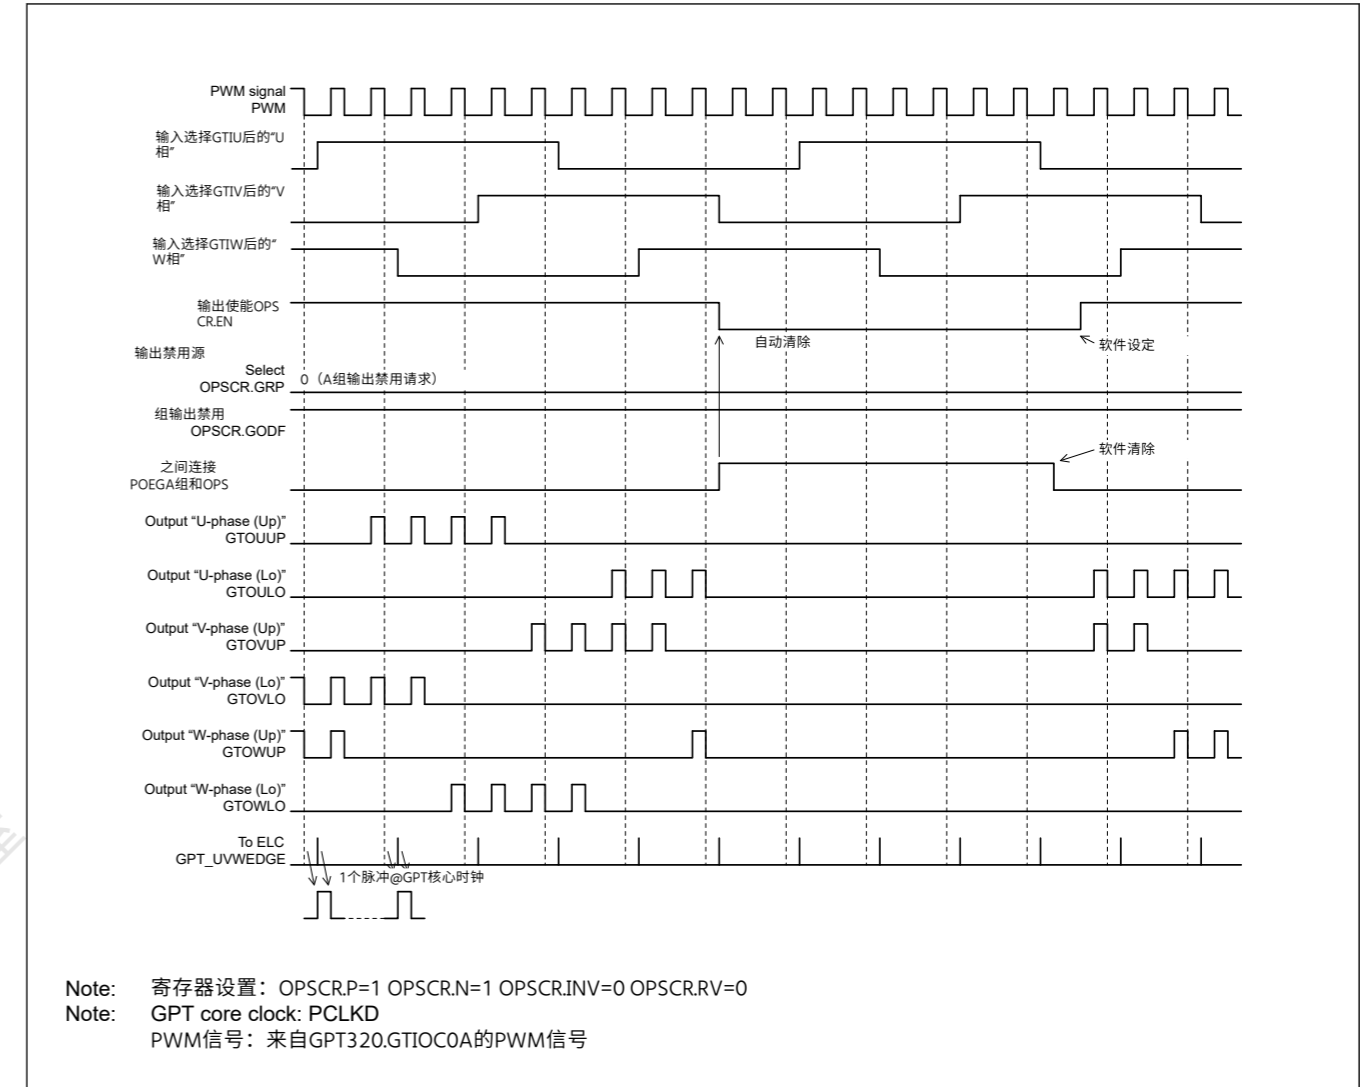

Figure 21.60 组输出禁用控制操作示例

21.3.12.1 外部输入信号的输入选择和同步

在图21.57所示的GPT\_ OPS控制流程概念图中, (1)是通过OPSCR.FB位从软件设置和外部输入中选择输入相位。

当OPSCR.FB位为0时, 选择外部输入。与GPT内核时钟(PCLKD)同步后启用输入信号。执行噪声过滤(可选)后, 使用下降沿采样将外部输入设置为PWM的输入相位 (GPT320.GTIOC0A的PWM), 并将OPSCR.ALIGN位设置为1。

当OPSCR.FB位为1时, 选择软设置 (OPSCR.UF、VF、WF) 与PWM的输入相位值 (PWM的GPT320.GTIOC0A)使用下降沿采样, 并将OPSCR.ALIGN位设置为1。

当OPSCR.ALIGN位为0时, GPT\_ OPS以PCLKD同步的输入相位运行, 其中OPSCR.FB位设置为0或OPSCR.FB位设置为1。但是, 输出UVW相位的PWM脉冲宽度存在某些情况 (PWM输出模式) 的开关时间 (就在之前) 被缩短了。

表21.39显示了输入选择过程和相关OPSCR位的设置。

Table 21.39 Input selection processing method

| Register OPSCR |           | Selection of input phase sampling method (U/V/W-phase)                                    | Synchronization input/output selection process (GPT_OPS internal node name)                     |
|----------------|-----------|---|---|
| FB bit         | ALIGN bit |   |   |
| 0              | 1         | External Input at PWM Falling Edge Sampling (PCLKD synchronization + falling edge sample) | Input Phase<br>Input U-Phase (gtu_sync)<br>Input V-Phase (gtv_sync)<br>Input W-Phase (gtw_sync) |
|                | 0         | External Input at PCLKD Synchronization Output (PCLKD synchronization + through mode)     |   |
| 1              | 1         | Software Settings at PWM Falling Edge Sampling (OPSCR.UF, VF, WF of falling edge sample)  |   |
|                | 0         | Software Setting Value Selection (= OPSCR.UF/VF/WF value) (= PCLKD synchronization)       |   |

21.3.12.2 Input sampling

The OPSCR.U, V, W bits indicate the PCLKD sampling results of the input selected in the OPSCR.FB bit. When OPSCR.FB bit is 0 and after synchronization with the GPT core clock (PCLKD) and noise filtering (optional), OPSCR.U, V, W bits indicate the sampling results of the external input. When OPSCR.FB bit is 1, OPSCR.U, V, W bits are the value (OPSCR.UF, VF, WF) of the soft setting.

21.3.12.3 Input phase decode

In the GPT\_OPS control flow conceptual diagram shown in Figure 21.57, (3) enables the 6-phase signals by decoding the input phase selected in the OPSCR.FB bit.

Table 21.40 shows the decode table of input phase when OPSCR.RV bit is 0.

Table 21.40 Decode table of input phase (OPSCR.RV = 0)

| Input phase (U/V/W) (GPT_OPS internal node name) |               |               | 6-phase enable {U/V/W (Up/Lo)} by decoding input phase (GPT_OPS internal node name) |              |              |              |              |              |

21.3.12.4 Rotation Direction Control

In the GPT\_OPS control flow conceptual diagram shown in Figure 21.57, (2) controls the direction of rotation of a 3-phase motor using the OPSCR.RV bit.

When the rotation direction is reverse (RV bit = 1), the input phase is inverted.

Table 21.42 shows the assigned output phases based on the OPSCR.RV bit setting (before and after rotation direction control).

Table 21.42 Rotation Direction Control Method

| Reversal of Direction of Rotation Using Output Phases as Specified in OPSCR Register | Output of Rotation Direction Control [U/V/W (Positive/Negative)]<br>(GPT_OPS Internal Node Name after Control) |                            |                            |                            |                            |                            |
|--|--|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|

| 0  | U-phase (Up)<br>(gtuup_en)   | U-phase (Lo)<br>(gtulo_en) | V-phase (Up)<br>(gtvup_en) | V-phase (Lo)<br>(gtvlo_en) | W-phase (Up)<br>(gtwup_en) | W-phase (Lo)<br>(gtwlo_en) |
| 1  | U-phase (Up)<br>(gtuup_en)   | U-phase (Lo)<br>(gtulo_en) | W-phase (Up)<br>(gtwup_en) | W-phase (Lo)<br>(gtwlo_en) | V-phase (Up)<br>(gtvup_en) | V-phase (Lo)<br>(gtvlo_en) |

21.3.12.5 Output selection control

In the GPT\_OPS control flow conceptual diagram in Figure 21.57, (4) represents the selection of the output waveform by setting the OPSCR register bit.

For output selection, the following bits are relevant:

- The OPSCR.EN bit controls whether to output the 6-phase output, or to stop
- The OPSCR.P and OPSCR.N bits can select from the level signal or PWM signal (chopper output) for the output phase
- The polarity of the output phase can be set to a positive logic or negative logic by the OPSCR.INV bit.

Table 21.43 and Table 21.44 show the output selection control method using the OPSCR register bit.

Table 21.43 Output selection control method (positive phase) (1 of 2)

| Enable-phase output control | Positive-phase output (P) control | Invert-phase output control | Output port name (positive phase = up)<br>(output selection internal node allocation) |   |
|-----------------------------|-----------------------------------|-----------------------------|---|---|
| OPSCR.EN                    | OPSCR.P                           | OPSCR.INV                   | GTOUUP<br>GTOVUP<br>GTOWUP  | Mode  |
| 0                           | x                                 | x                           | 0   | Output Stop<br>(External pin: Hi-Z)<br>GPT_OPS → 0 output |

21.3.12.4 旋转方向控制

在图21.57所示的GPT\_OPS控制流程概念图中，(2)使用OPSCR.RV位控制三相电机的旋转方向。

当旋转方向为反向时 (RV位=1)，输入相位反转。

表21.42显示了基于OPSCR.RV位设置 (旋转方向控制之前和之后) 分配的输出相位。

Table 21.42 旋转方向控制方式

| 使用输出相位反转旋转方向<br>在OPSCR中指定Register | 旋转方向控制输出[UVW (正负)]<br>(GPT_OPS控制后的内部节点名称) |                            |                            |                            |                            |                            |
|-----------------------------------|---|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|
|                                   | OPSCR.RV bit                              | (gtuup_ren)                | (gtulo_ren)                | (gtvup_ren)                | (gtvlo_ren)                | (gtwup_ren)                |
| 0                                 | U-phase (Up)<br>(gtuup_en)                | U-phase (Lo)<br>(gtulo_en) | V-phase (Up)<br>(gtvup_en) | V-phase (Lo)<br>(gtvlo_en) | W-phase (Up)<br>(gtwup_en) | W-phase (Lo)<br>(gtwlo_en) |
| 1                                 | U-phase (Up)<br>(gtuup_en)                | U-phase (Lo)<br>(gtulo_en) | W-phase (Up)<br>(gtwup_en) | W-phase (Lo)<br>(gtwlo_en) | V-phase (Up)<br>(gtvup_en) | V-phase (Lo)<br>(gtvlo_en) |

21.3.12.5 输出选择控制

在图21.57的GPT\_OPS控制流程概念图中，(4)表示通过设置OPSCR寄存器位来选择输出波形。

对于输出选择，以下是相关的：

- OPSCR.EN位控制是输出6相输出，还是停止
- OPSCR.P和OPSCR.N位可以选择输出相位的电平信号或PWM信号 (斩波器输出)
- 输出相的极性可以通过OPSCR设置为正逻辑或负逻辑。INV位。

表21.43和表21.44显示了使用OPSCR寄存器位的输出选择控制方法。

Table 21.43 输出选择控制方式 (正相) (1of2)

| 使能相位输出控制 | 正相输出(P)控制 | 反相输出控制    | 输出端口名称 (正相=向上) (输出选择内部节点分配) |                                |

21.3.12.6 Output selection control (group output disable function)

When OPSCR.GODF is 1 and the signal value selected by the OPSCR.GRP bit is high (output disable request), the group output-disable function asynchronously sets the output to Hi-Z. When an output-disable request is generated, the OPSCR.EN bit is cleared to 0. For the return, set the OPSCR.EN bit to 1 after clearing the output disable request by software.

To ensure output-disable control, use the POEG\_GROUPn (n = A to D) interrupt to clear the flag in the POE or check that the OPSCR.EN bit is 0 and then clear the flag. For an example of the operation of group output disable control, see Figure 21.60.

Table 21.43 输出选择控制方式 (正相) (2of2)

| 使能相位输出控制 | 正相输出(P)控制 | 反相输出控制    | 输出端口名称 (正相=向上) (输出选择内部节点分配)   |                    |

21.3.12.6 输出选择控制 (组输出禁用功能)

当OPSCR.GODF为1且OPSCR.GRP位选择的信号值为高电平 (输出禁用请求) 时, 组输出禁用功能异步将输出设置为Hi-Z。产生输出禁止请求时, OPSCR.EN位清零。返回时, 请在软件清除输出禁止请求后将OPSCR.EN位设置为1。

为确保输出禁用控制, 请使用POEG\_GROUPn (n=A到D) 中断清除POE中的标志或检查OPSCR.EN位是否为0, 然后清除标志。组输出禁用控制的操作示例见图21.60。

### 21.3.12.7 Event Link Controller (ELC) output

In the GPT\_OPS control flow conceptual diagram shown in [Figure 21.57](#), (5) outputs the Hall sensor input signal edge to the ELC.

The Hall sensor input edge signal is the logical OR of the rising and falling edge signals of each U-phase/V-phase/W-phase input sampled at PCLKD. That is, if the high period of each of the U-phase/V-phase/W-phase of the input phase is short in duration, the Hall sensor edge input signal is not output at that time.

When the OPSCR.FB bit is 0, the Hall sensor input edge signal is the logical OR of the edge signals of the external input phase sampled at PCLKD.

When OPSCR.FB bit is 1, the Hall sensor input edge signal is the logical OR of the edge of the soft setting (OPSCR.UF, VF, WF) sampled at PCLKD.

See [Figure 21.58](#) to [Figure 21.60](#) for examples of the output signal to the ELC.

### 21.3.12.8 GPT\_OPS start operation setting flow

**Table 21.45 Example setting of GPT\_OPS start operation**

| No. | Step Name   | Description   |
|-----|---|---|
| 1   | GPT320 operation mode setting   | GPT320.GTIOC0A set the PWM output operation mode of the saw-wave or triangle-wave. For details, see <a href="#">section 21.3.3. PWM Output Operating Mode</a> .   |
| 2   | Counting of GPT320  | Start the count operation of GPT320, and outputs a PWM waveform.  |
| 3   | GPT_OPS input data set (only software setting is selected)                        | Set software setting to OPSCR.UF, VF, and WF bits.  |
| 4   | Noise filter settings of GPT_OPS external input (only external input is selected) | When using a noise filter, set the sampling clock of the noise filter by OPSCR.NFCS[1:0] bits. Then the noise filter is enabled if OPSCR.NFEN = 1.  |
| 5   | GPT_OPS input phase selection setting/input phase alignment setting               | Select the input phase from the external input or software setting by OPSCR.FB bit. Select the alignment of the input phase by OPSCR.ALIGN bit.   |
| 6   | Setting the GPT_OPS output phase  | Set the level output/PWM output of the positive/negative phase output by OPSCR.P/OPSCR.N bit. Set the positive logic/negative logic of the output phase by OPSCR.INV bit. Set the rotation direction by OPSCR.RV bit. |
| 7   | GPT_OPS setting the group output disable function                                 | Set the selection of output disable source by OPSCR.GRP bit. Perform the setting of on/off of the group output disable function by OPSCR.GODF bit.  |
| 8   | GPT_OPS Working   | Setting the OPSCR.EN = 1 outputs the 6-phase output to drive the brushless DC motor from the GPT_OPS.   |

### 21.3.13 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed.

[Figure 21.61](#) shows the block diagram of inter channel logical operation.

To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed.

When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal (C = A or D = B) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as "1". In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is "A", the result of OR is "1", the result of EXOR is "NOT A", and the result of NOR is "0".

### 21.3.12.7 事件链接控制器(ELC)输出

在图21.57所示的GPT\_OPS控制流程概念图中，(5)将霍尔传感器输入信号沿输出到ELC。

霍尔传感器输入边沿信号是在PCLKD采样的每个U相V相W相输入的上升沿和下降沿信号的逻辑或。也就是说，如果输入相的U相V相W相中的每一个的高电平时段持续时间短，则此时不输出霍尔传感器边沿输入信号。

当OPSCR.FB位为0时，霍尔传感器输入边沿信号为在PCLKD采样的外部输入相位边沿信号的逻辑或。

当OPSCR.FB位为1时，霍尔传感器输入边沿信号为软设置边沿的逻辑或（OPSCR.UF, VF, WF）在PCLKD采样。

有关ELC的输出信号示例，请参见图21.58至图21.60。

### 21.3.12.8 GPT\_OPS启动操作设置流程

**Table 21.45 GPT\_OPS启动操作的示例设置**

| No. | 步骤名称                            | Description  |
|-----|---------------------------------|--|
| 1   | GPT320操作模式设置                    | GPT320.GTIOC0A设置PWM输出工作模式为锯齿波或三角波。详见21.3.3节。PWM输出工作模式。                         |
| 2   | GPT320的计数                       | 启动GPT320的计数操作，并输出一个PWM波形。  |
| 3   | GPT_OPS输入数据集（仅选择软件设置）           | 将软件设置设置为OPSCR.UF、VF和WF位。   |
| 4   | 噪声滤波器设置<br>GPT_OPS外部输入（仅选择外部输入） | 使用噪声滤波器时，通过OPSCR.NFCS[1:0]位设置噪声滤波器的采样时钟。如果OPSCR.NFEN=1，则启用噪声滤波器。               |
| 5   | GPT_OPS输入相位选择设置<br>输入相位对齐设置     | 通过OPSCR.FB位从外部输入或软件设置中选择输入相位。通过OPSCR.ALIGN位选择输入相位的对齐方式。                        |
| 6   | 设置GPT_OPS输出阶段                   | 通过OPSCR.POPSCR.N位设置正负相输出的电平输出PWM输出。通过OPSCR.INV位设置输出相位的正逻辑负逻辑。通过OPSCR.RV位设置旋转方向 |
| 7   | GPT_OPS设置组输出禁用功能                | 通过OPSCR.GRP位设置输出禁用源的选择。通过OPSCR.GODF位执行组输出禁用功能的开关设置。                            |
| 8   | GPT_OPS Working                 | 设置OPSCR.EN=1输出6相输出驱动直流无刷电机GPT_OPS。   |

### 21.3.13 通道间逻辑运算功能

可以执行比较匹配输出之间的逻辑运算功能。

图21.61显示了通道间逻辑操作的框图。

为防止对GPT输出造成危害，逻辑运算后的信号由PCLKD锁存。锁存后，执行输出禁用控制。

When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

当相同的信号 (c=a或d=b) 操作逻辑函数，或者，或者选择也没有选择，C或D也被视为“1”。在GTIOCnA引脚输出的情况下，当C选择相同通道的A时，AND的结果为“A”，OR的结果为“1”，EXOR的结果为“NOT A”，NOR为“0”。

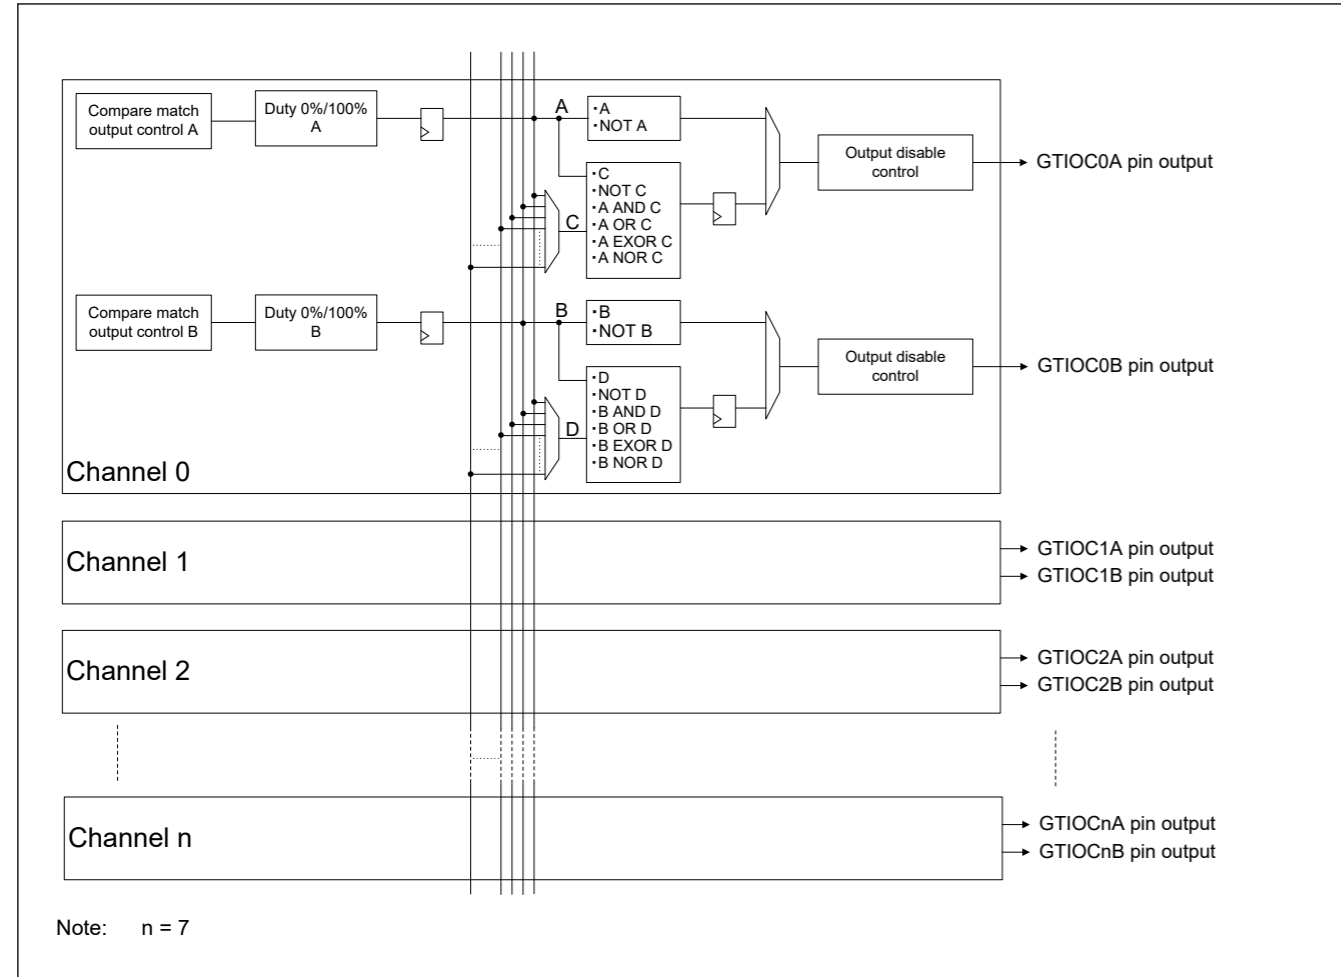

Figure 21.61 Block Diagram of Inter Channel Logical Operation

Figure 21.62 shows an example of inter channel logical operation.

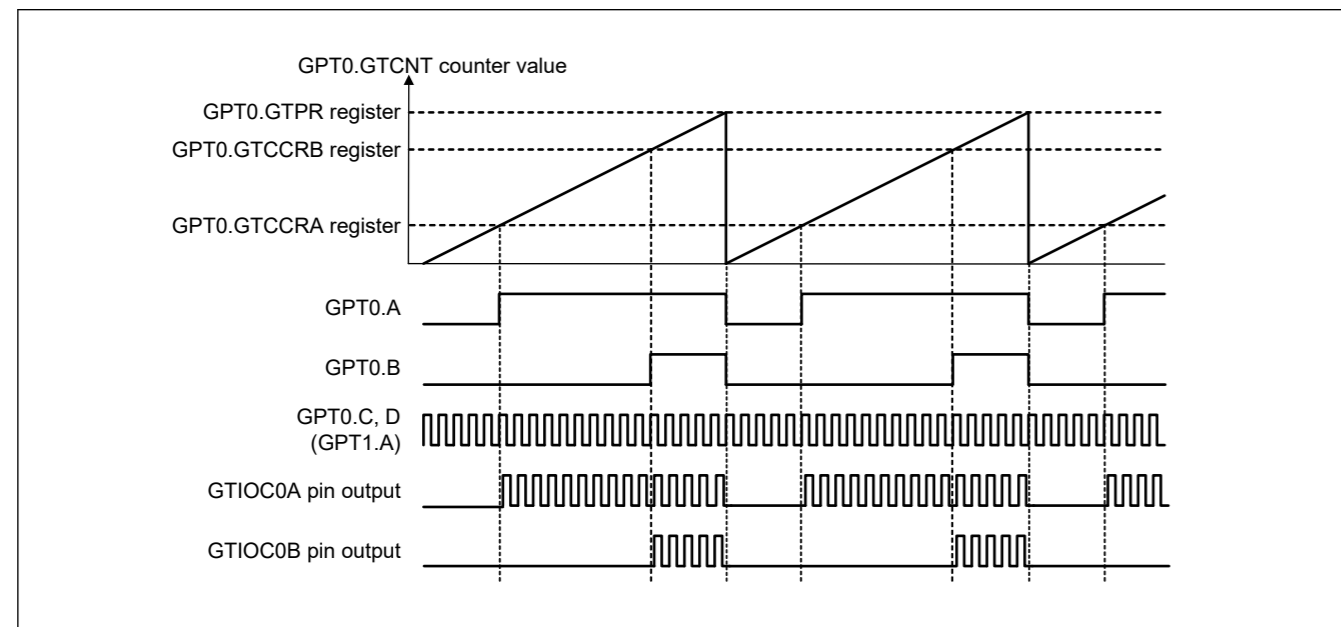

Figure 21.62 Example of Inter Channel Logical Operation

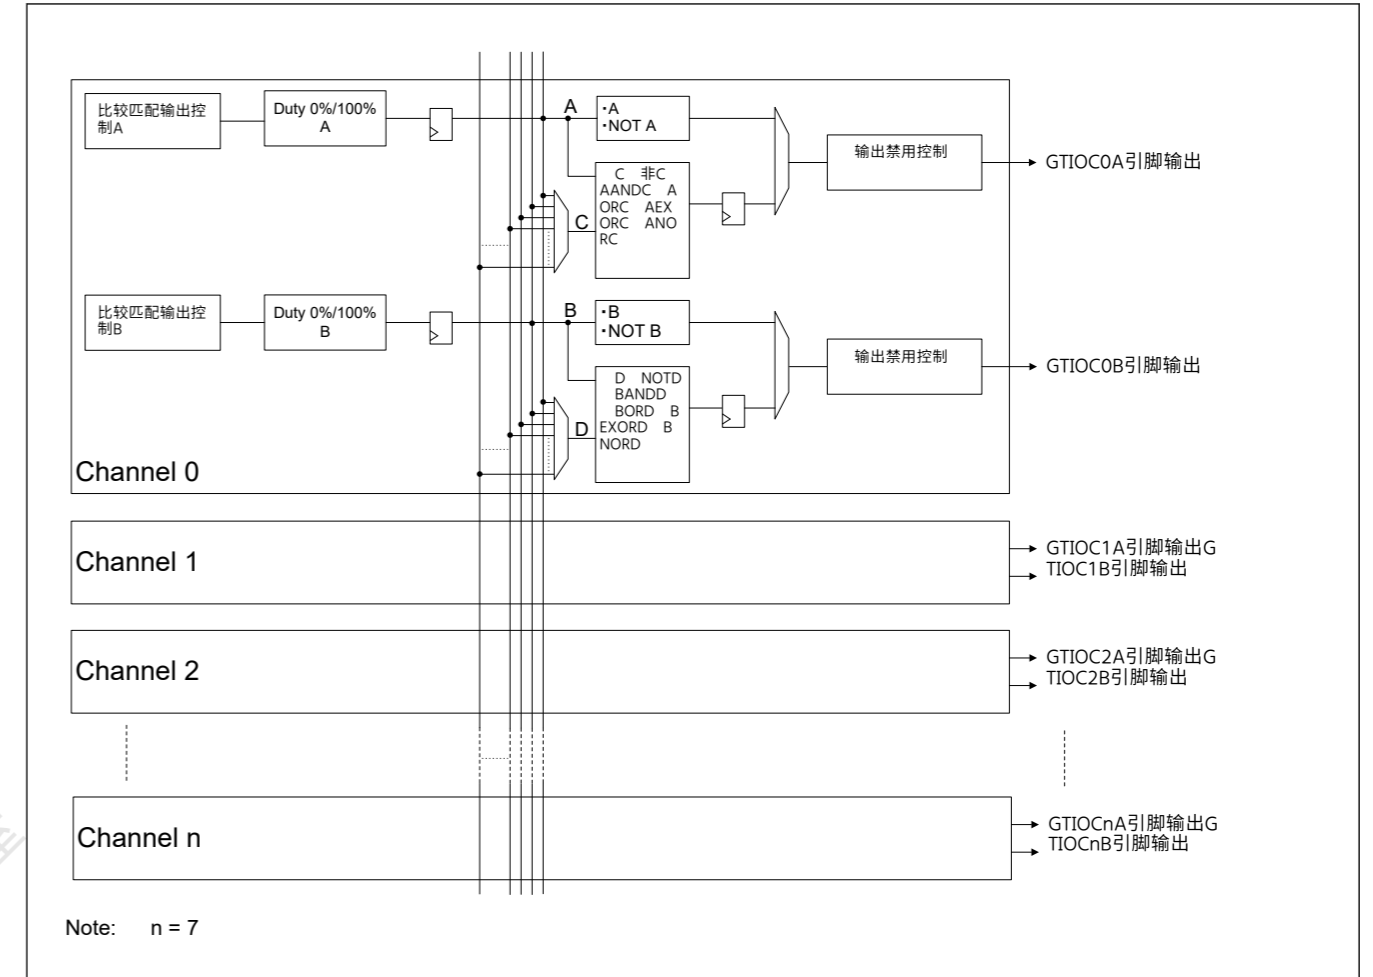

Figure 21.61 通道间逻辑操作框图

图21.62显示了通道间逻辑操作的示例。

Figure 21.62 通道间逻辑运算示例

## 21.4 Interrupt Sources

### 21.4.1 Interrupt Sources

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTCNT counter overflow (GTPR compare match)/underflow.
- period count function finish

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear occur at the same time, flag clear takes priority over flag set. These flags are automatically updated by the internal state. The Interrupt Controller Unit can change the relative channel priorities. However, the priority within a channel is fixed. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Table 21.46 lists the GPT interrupt sources.

**Table 21.46 Interrupt sources**

| Channel    | Name       | Interrupt source                                  | Interrupt flag  | DTC activation |
|------------|------------|---|-----------------|----------------|
| n = 0 to 3 | GPTn_CCMPA | GPT32n.GTCCRA input capture/compare match         | GTST[0] (TCFA)  | Possible       |
|            | GPTn_CCMPB | GPT32n.GTCCRB input capture/compare match         | GTST[1] (TCFB)  | Possible       |
|            | GPTn_CMPC  | GPT32n.GTCCRC compare match                       | GTST[2] (TCFC)  | Possible       |
|            | GPTn_CMPD  | GPT32n.GTCCRD compare match                       | GTST[3] (TCFD)  | Possible       |
|            | GPTn_CMPE  | GPT32n.GTCCRE compare match                       | GTST[4] (TCFE)  | Possible       |
|            | GPTn_CMPF  | GPT32n.GTCCRF compare match                       | GTST[5] (TCFF)  | Possible       |
|            | GPTn_OVF   | GPT32n.GTCNT overflow (GPT32m.GTPR compare match) | GTST[6] (TCFPO) | Possible       |
|            | GPTn_UDF   | GPT32n.GTCNT underflow                            | GTST[7] (TCFPU) | Possible       |
|            | GPTn_PC    | Period count function finish (n = 0, 1)           | GTST[31] (PCF)  | Possible       |
| n = 4 to 7 | GPTn_CCMPA | GPT16n.GTCCRA input capture/compare match         | GTST[0] (TCFA)  | Possible       |
|            | GPTn_CCMPB | GPT16n.GTCCRB input capture/compare match         | GTST[1] (TCFB)  | Possible       |
|            | GPTn_CMPC  | GPT16n.GTCCRC compare match                       | GTST[2] (TCFC)  | Possible       |
|            | GPTn_CMPD  | GPT16n.GTCCRD compare match                       | GTST[3] (TCFD)  | Possible       |
|            | GPTn_CMPE  | GPT16n.GTCCRE compare match                       | GTST[4] (TCFE)  | Possible       |
|            | GPTn_CMPF  | GPT16n.GTCCRF compare match                       | GTST[5] (TCFF)  | Possible       |
|            | GPTn_OVF   | GPT16n.GTCNT overflow (GPT320.GTPR compare match) | GTST[6] (TCFPO) | Possible       |
|            | GPTn_UDF   | GPT16n.GTCNT underflow                            | GTST[7] (TCFPU) | Possible       |
|            | GPTn_PC    | Period count function finish (n = 4 to 6)         | GTST[31] (PCF)  | Possible       |

#### (1) GPTn\_CCMPA interrupt (n = 0 to 7)

An interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register.

#### (2) GPTn\_CCMPB interrupt (n = 0 to 7)

An interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register

## 21.4 中断源

### 21.4.1 中断源

GPT提供以下中断源:

- GTCCR输入捕捉比较匹配
- GTCNT计数器上溢 (GTPR比较匹配) 下溢。
- 周期计数功能完成

每个中断源都有自己的状态标志。当一个中断源信号产生时, 相关的状态标志在GTST设置为1。GTST中相关的状态标志可以通过写入0来清除。如果标志设置和标志清除同时发生, 标志清除优先于标志设置。这些标志由内部状态自动更新。中断控制器单元可以改变相关的通道优先级。但是, 通道内的优先级是固定的。有关详细信息, 请参阅第13节, 中断控制器单元(ICU)。

表21.46列出了GPT中断源。

**Table 21.46 中断源**

| Channel    | Name       | 中断源                              | 中断标志            | DTC activation |
|------------|------------|----------------------------------|-----------------|----------------|
| n = 0 to 3 | GPTn_CCMPA | GPT32n.GTCCRA输入捕捉比较匹配            | GTST[0] (TCFA)  | Possible       |
|            | GPTn_CCMPB | GPT32n.GTCCRB输入捕捉比较匹配            | GTST[1] (TCFB)  | Possible       |
|            | GPTn_CMPC  | GPT32n.GTCCRC比较匹配                | GTST[2] (TCFC)  | Possible       |
|            | GPTn_CMPD  | GPT32n.GTCCRD比较匹配                | GTST[3] (TCFD)  | Possible       |
|            | GPTn_CMPE  | GPT32n.GTCCRE比较匹配                | GTST[4] (TCFE)  | Possible       |
|            | GPTn_CMPF  | GPT32n.GTCCRF比较匹配                | GTST[5] (TCFF)  | Possible       |
|            | GPTn_OVF   | GPT32n.GTCNT溢出 (GPT32m.GTPR比较匹配) | GTST[6] (TCFPO) | Possible       |
|            | GPTn_UDF   | GPT32n.GTCNT underflow           | GTST[7] (TCFPU) | Possible       |
|            | GPTn_PC    | 周期计数功能完成(n=0 1)                  | GTST[31] (PCF)  | Possible       |
| n = 4 to 7 | GPTn_CCMPA | GPT16n.GTCCRA输入捕捉比较匹配            | GTST[0] (TCFA)  | Possible       |
|            | GPTn_CCMPB | GPT16n.GTCCRB输入捕捉比较匹配            | GTST[1] (TCFB)  | Possible       |
|            | GPTn_CMPC  | GPT16n.GTCCRC比较匹配                | GTST[2] (TCFC)  | Possible       |
|            | GPTn_CMPD  | GPT16n.GTCCRD比较匹配                | GTST[3] (TCFD)  | Possible       |
|            | GPTn_CMPE  | GPT16n.GTCCRE比较匹配                | GTST[4] (TCFE)  | Possible       |
|            | GPTn_CMPF  | GPT16n.GTCCRF比较匹配                | GTST[5] (TCFF)  | Possible       |
|            | GPTn_OVF   | GPT16n.GTCNT溢出 (GPT320.GTPR比较匹配) | GTST[6] (TCFPO) | Possible       |
|            | GPTn_UDF   | GPT16n.GTCNT underflow           | GTST[7] (TCFPU) | Possible       |
|            | GPTn_PC    | 周期计数功能完成 (n=4到6)                 | GTST[31] (PCF)  | Possible       |

#### (1) GPTn\_CCMPA中断 (n=0到7)

在以下情况下会产生中断请求:

- 当GTCCRA寄存器用作比较匹配寄存器时, GTCNT计数器值与GTCCRA寄存器匹配
- 当GTCCRA寄存器用作输入捕捉寄存器时, 输入捕捉信号导致GTCNT计数器值传送到GTCCRA寄存器。

#### (2) GPTn\_CCMPB中断 (n=0到7)

在以下情况下会产生中断请求:

- 当GTCCRB寄存器用作比较匹配寄存器时, GTCNT计数器值与GTCCRB寄存器匹配

- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register.

### (3) GPTn\_CMPC interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

### (4) GPTn\_CMPD interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

### (5) GPTn\_CMPE interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register).

### (6) GPTn\_CMPF interrupt (n = 0 to 7)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

### (7) GPTn\_OVF interrupt (n = 0 to 7)

An interrupt request is generated in the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT changes from GTPR to GTPR-1)

- 当GTCCRB寄存器用作输入捕捉寄存器时，输入捕捉信号导致GTCNT计数器值传送到GTCCRB寄存器。

### (3) GPTn\_CMPC中断 (n=0到7)

在以下情况下会产生中断请求：

- GTCCRC寄存器用作比较匹配寄存器时，GTCNT计数器值与GTCCRC寄存器匹配。

不执行比较匹配，因此在以下情况下不请求中断：

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0]=01b 10b 11b（使用GTCCRC寄存器进行缓冲操作）。

### (4) GPTn\_CMPD中断 (n=0到7)

在以下情况下会产生中断请求：

- 当GTCCRD寄存器用作比较匹配寄存器时，GTCNT计数器值与GTCCRD寄存器匹配。

不执行比较匹配，因此在以下情况下不请求中断：

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0]=10b 11b（使用GTCCRD寄存器进行缓冲操作）。

### (5) GPTn\_CMPE中断 (n=0到7)

在以下情况下会产生中断请求：

- 当GTCCRE寄存器用作比较匹配寄存器时，GTCNT计数器值与GTCCRE寄存器匹配。

不执行比较匹配，因此在以下情况下不请求中断：

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0]=01b 10b 11b（使用GTCCRE寄存器进行缓冲操作）。

### (6) GPTn\_CMPF中断 (n=0到7)

在以下情况下会产生中断请求：

- 当GTCCRF寄存器用作比较匹配寄存器时，GTCNT计数器值与GTCCRF寄存器匹配。

不执行比较匹配，因此在以下情况下不请求中断：

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0]=10b 11b（使用GTCCRF寄存器进行缓冲操作）。

### (7) GPTn\_OVF中断 (n=0到7)

在以下情况下会产生中断请求：

- 在锯齿波模式下，溢出时允许中断请求（在向上计数期间，当GTCNT计数器值从GTPR变为0时）
- 在三角波模式下，在波峰处启用中断请求（GTCNT从GTPR变为GTPR-1）

- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

#### (8) GPTn\_UDF interrupt (n = 0 to 7)

An interrupt request is generated in the following conditions.

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT changes from 0 to 1)
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

About Interrupt signals and interrupt status flags, see [section 21.2.16. GTST : General PWM Timer Status Register](#).

#### (9) GPTn\_PC Interrupt (n = 0, 1, 4 to 6)

When the GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1, an interrupt request is generated at the end of cycle.

### 21.4.2 DMAC and DTC Activation

The DMAC and DTC can be activated by the interrupt in each channel. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#), [section 16, DMA Controller \(DMAC\)](#), and [section 17, Data Transfer Controller \(DTC\)](#).

## 21.5 Operations Linked by ELC

### 21.5.1 Event Signal Output to ELC

The GPT can perform operation linked with another module set in advance when its interrupt request signal is used as an event signal by the Event Link Controller (ELC).

The GPT has the following ELC event signals:

- Generation of compare match and input capture A interrupt (GPTn\_CCMPA)
- Generation of compare match and input capture B interrupt (GPTn\_CCMPB)
- Generation of compare match C interrupt (GPTn\_CMPC)
- Generation of compare match D interrupt (GPTn\_CMPD)
- Generation of compare match E interrupt (GPTn\_CMPE)
- Generation of compare match F interrupt (GPTn\_CMPF)
- Generation of overflow interrupt (GPTn\_OVF)
- Generation of underflow interrupt (GPTn\_UDF)
- Finish of period count function (GPTm\_PC)

Note: n = 0 to 7  
m = 0, 1, 4 to 6

### 21.5.2 Event Signal Inputs from ELC

The GPT can perform the following operations in response to a maximum of 8 events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down-counting
- Input capture.

See [section 18, Event Link Controller \(ELC\)](#) for the connection between the ELC and the event signal input.

## 21.6 Noise Filter Function

Each pin for use in input capture and Hall sensor input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than 3 sampling cycles.

- 在硬件源的计数中, 发生了溢出 (GTCNT在向上计数中从GTPR变为0)。

#### (8) GPTn\_UDF中断 (n=0到7)

在以下情况下会产生中断请求。

- 在锯齿波模式下, 下溢时允许中断请求 (在向下计数期间, 当GTCNT计数器值从0变为GTPR时)
- 在三角波模式下, 在波谷处启用中断请求 (GTCNT由0变为1)
- 在硬件源的计数中, 发生了下溢 (向下计数时GTCNT从0变为GTPR)。

关于中断信号和中断状态标志, 请参见第21.2.16节。GTST: 通用PWM定时器状态寄存器。

#### (9) GPTn\_PC中断 (n=0、1、4到6)

当GTPC.PCEN位为1且GTPC.PCNT计数器为1时, 在周期结束时产生中断请求。

### 21.4.2 DMAC和DTC激活

DMAC和DTC可以通过每个通道中的中断来激活。有关详细信息, 请参见第13节, 中断控制器单元(ICU), 第16节, DMA控制器(DMAC), 和第17节, 数据传输控制器(DTC)。

## 21.5 由ELC链接的操作

### 21.5.1 事件信号输出到ELC

当GPT的中断请求信号被事件链接控制器(ELC)用作事件信号时, GPT可以执行与预先设置的另一个模块链接的操作。

GPT具有以下ELC事件信号:

- 产生比较匹配和输入捕捉A中断(GPTn\_CCMPA)
- 产生比较匹配和输入捕捉B中断(GPTn\_CCMPB)
- 产生比较匹配C中断(GPTn\_CMPC)
- 产生比较匹配D中断(GPTn\_CMPD)
- 产生比较匹配E中断(GPTn\_CMPE)
- 产生比较匹配F中断(GPTn\_CMPF)
- 产生溢出中断 (GPTn\_OVF)
- 产生下溢中断 (GPTn\_UDF)
- 周期计数功能完成 (GPTm\_PC)

Note: n = 0 to 7  
m = 0, 1, 4 to 6

### 21.5.2 来自ELC的事件信号输入

GPT可以执行以下操作以响应来自ELC的最多8个事件:

- 开始计数、停止计数、清计数
  - Up-counting, down-counting
- 输入捕捉。

有关ELC和事件信号输入之间的连接, 请参见第18节, 事件链接控制器(ELC)。

## 21.6 噪音过滤功能

用于GPT的输入捕捉和霍尔传感器输入的每个引脚都配备了噪声滤波器。噪声滤波器以采样时钟对输入信号进行采样, 并去除长度小于3个采样周期的脉冲。

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

Figure 21.63 shows the timing of noise filtering.

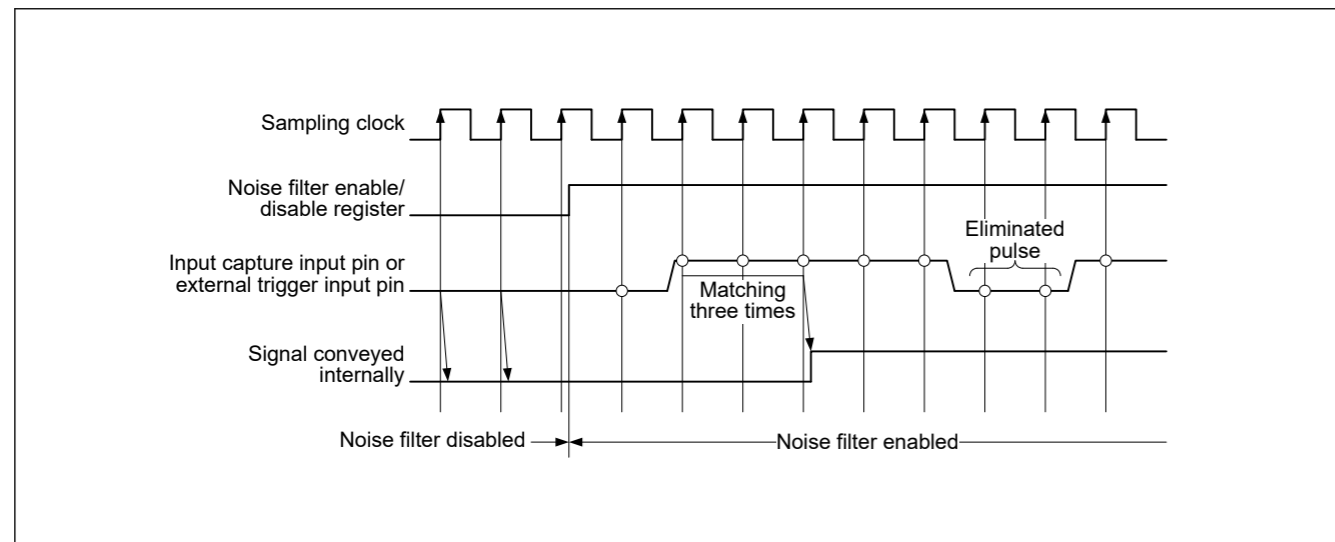

Figure 21.63 Timing of noise filtering

If noise filtering is enabled, the input capture operation or external trigger operation is performed on the edges of the noise filtered signal after a delay of a sampling interval  $\times 2 + \text{PCLKD}$ . This is due to the noise filtering for the input capture input or external trigger operation.

## 21.7 Protection Function

### 21.7.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTDTCR, GTDVU, GTICLF, GTPC.

Every bit in registers GTSTR, GTSTP and GTCLR which can update the corresponding registers in other channels and can be updated by any of the corresponding registers in other channels conversely, can be protected by setting the GTWP.STRWP, STPWP, and CLRWP bits, respectively, per channel.

Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels by writing to the GTSECSR and GTSECR registers of a given channel, can be enabled or disabled by the setting of the GTWP.CMNWP bit.

Protection using the GTWP register is only for write operations by the CPU. This protection does not cover updates to registers that occur in association with CPU writes.

### 21.7.2 Disabling of Buffer Operation

If the timing of the buffer register write is delayed relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD[1] and BD[0] bit settings. Specifically, buffer transfer can be temporarily disabled even though a buffer transfer condition is generated during buffer register write.

0 can be set simultaneously by setting the GTSECR register for multiple channels which were set by the GTSECSR register.

Figure 21.64 shows an example of operation for disabling buffer operation.

噪声过滤器功能包括为每个引脚启用和禁用噪声过滤器以及为每个通道设置采样时钟。

图21.63显示了噪声过滤的时序。

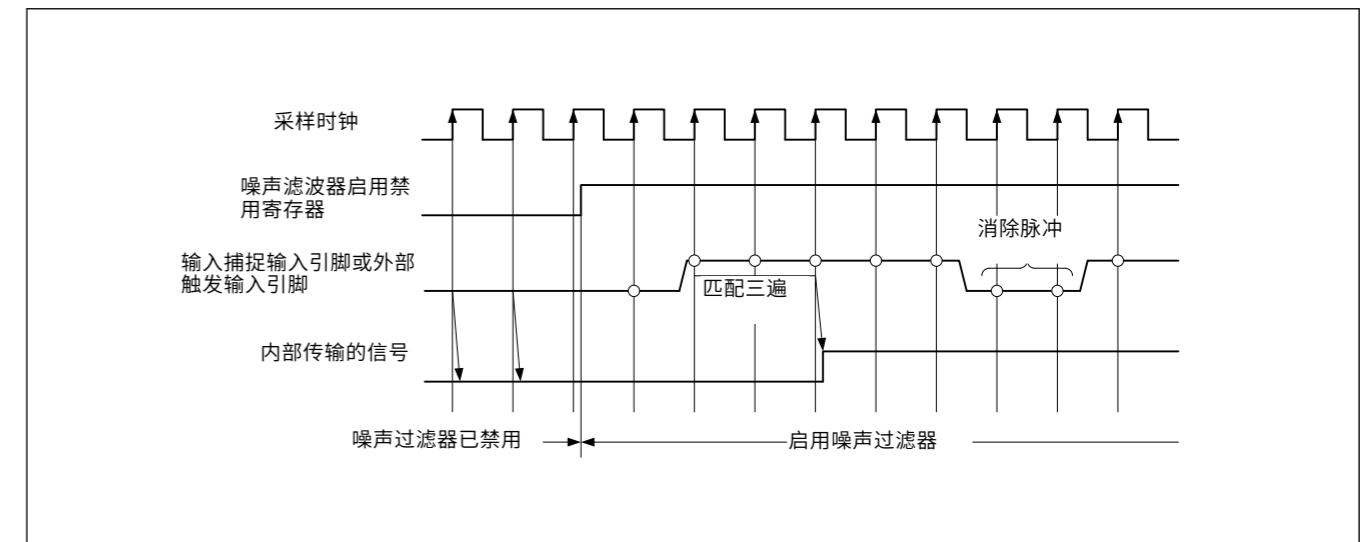

Figure 21.63 噪声过滤的时序

如果噪声过滤使能，输入捕捉操作或外部触发操作在经过一个采样间隔 $\times 2 + \text{PCLKD}$ 的延迟后在噪声过滤信号的边沿上执行。这是由于输入捕捉输入或外部触发操作的噪声过滤。

## 21.7 保护功能

### 21.7.1 寄存器的写保护

为了防止寄存器被意外修改，可以通过设置以通道为单位对寄存器进行写保护 GTWP.WP。可以为以下寄存器设置写保护：

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTDTCR, GTDVU, GTICLF, GTPC.

寄存器GTSTR、GTSTP和GTCLR中的每个位可以更新其他通道中的相应寄存器，反之也可以由其他通道中的任何相应寄存器更新，可以分别通过设置GTWP.STRWP、STPWP和CLRWP位来保护每个频道。

同样，写入GTSECSR和GTSECR寄存器，它们可以通过写入GTSECSR和给定通道的GTSECR寄存器可以通过设置GTWP.CMNWP位来启用或禁用。

使用GTWP寄存器的保护仅适用于CPU的写操作。此保护不涵盖与CPU写入相关的寄存器更新。

### 21.7.2 禁用缓冲区操作

如果缓冲寄存器写入的时序相对于缓冲传输的时序延迟，则可以通过GTBER.BD[1]和BD[0]位设置暂停缓冲操作。具体来说，即使在缓冲寄存器写入期间产生了缓冲传送条件，也可以暂时禁用缓冲传送。

0可以通过设置GTSECSR寄存器为由GTSECSR寄存器设置的多个通道同时设置。

图21.64显示了禁用缓冲区操作的操作示例。

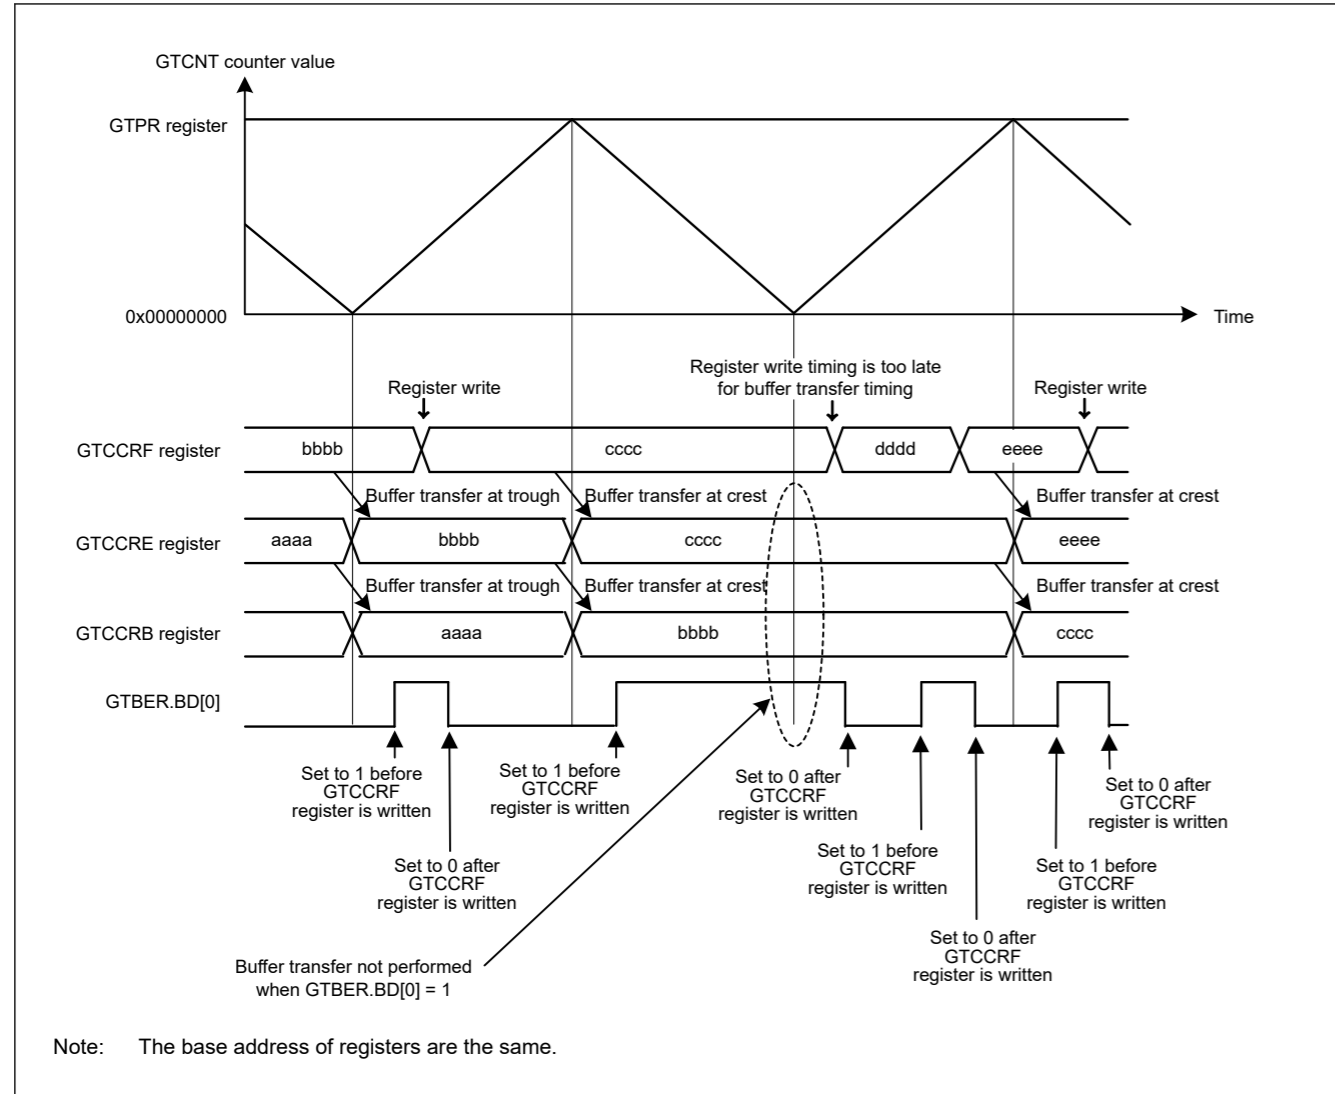

Figure 21.64 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

### 21.7.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.

Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

1. Select the channels for simultaneously setting of the GTSECSR register  
Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.
2. Simultaneously set the GTBER.BD bits by updating the GTSECR register  
In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register.

Figure 21.65 show examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

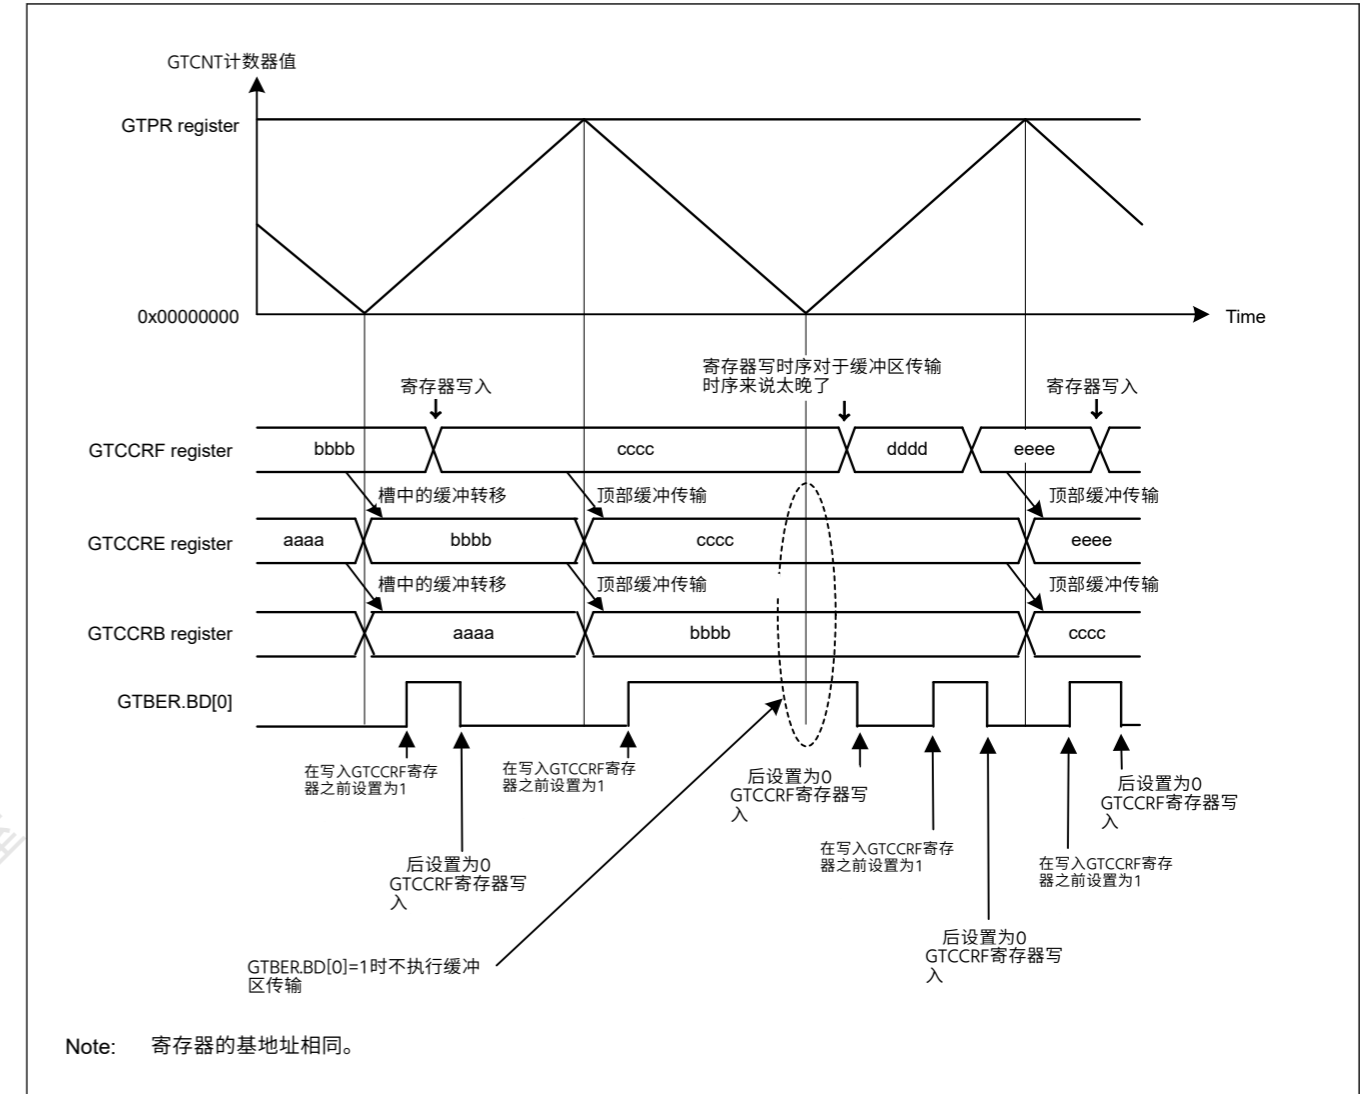

Figure 21.64 三角波缓冲操作、双缓冲操作、波谷和波峰缓冲转移的禁用操作示例

### 21.7.2.1 多通道缓冲操作的同时控制

GTBER.BD位可以通过直接写入每个通道的GTBER寄存器或通过已在GTSECSR寄存器中设置的多个通道进行设置来设置。

按照以下步骤同时设置多个通道的GTBER.BD位。

- 1.选择同时设置GTSECSR寄存器的通道  
设置GTSECSR寄存器，使用于同时设置GTBER.BD位的相应通道的位位置的值变为1。通过写入任何通道的GTSECSR寄存器，可以更新所有GTSECSR寄存器。
- 2.通过更新GTSECR寄存器同时设置GTBER.BD位  
在GTSECR寄存器中，设置要同时设置的GTBER.BD位的操作（启用或禁用缓冲区操作）。根据GTSECR寄存器的值，从任何通道写入GTSECR寄存器会更新与GTSECSR寄存器中设置为1的位相对应的所有通道中的GTBER.BD位。

图21.65显示了同时控制多个通道的缓冲区操作的启用或禁用的示例。

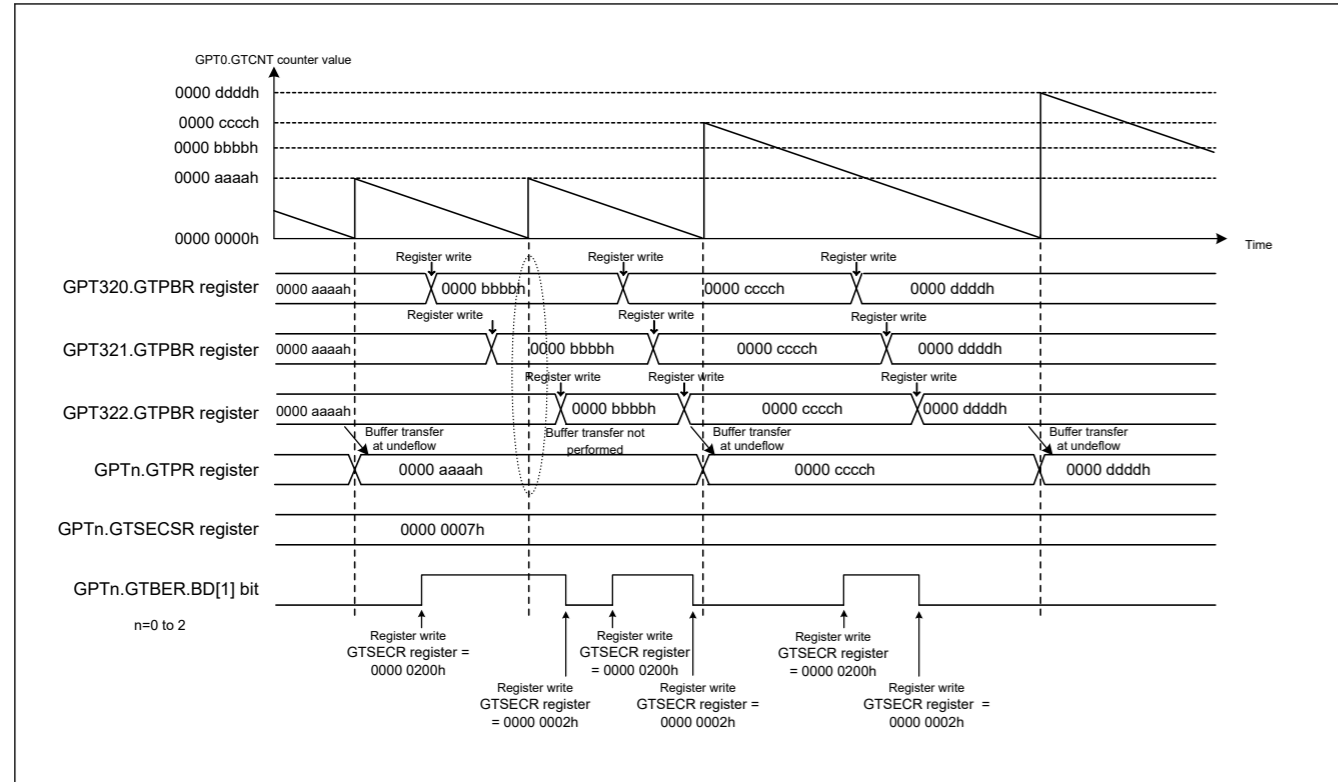

Figure 21.65 Example of Multiple Channel Operation for Disabling Buffer Operation (Sawtooth Waves, Single Buffer Operation)

21.7.3 GTIOCnm Pin Output Negate Control (n = 0 to 7, m = A, B)

For protection from system failure, the output disable control that changes the GTIOCnm pin output value forcibly is provided for GTIOCnm pin output by the request of output disable from POEG. When the GTIOCnA pin output value is the same as the GTIOCnB pin output value, output protection is required. GPT detects this condition and generates output disable requests to POEG according to the setting of the output disable request permission bits, such as GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG receives output disable requests from each channel and calculates external input using an OR operation, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCnA pin and the GTIOCnB pin) out of 4 output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is set based on the GTIOR.OADF[1:0] bits for the GTIOCnA pin and the GTIOR.OBDF[1:0] setting for the GTIOCnB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request.

When event count is performed or when the output disable state should be released immediately without waiting for end of cycle, GTIOR.OADF[1:0] should be set to 00b (for GTIOCnA pin) or GTIOR.OBDF[1:0] should be set to 00b (for the GTIOCnB pin).

Figure 21.66 shows an example of the GTIOCnm pin output disable control operation. (n = 0 to 7, m = A, B)

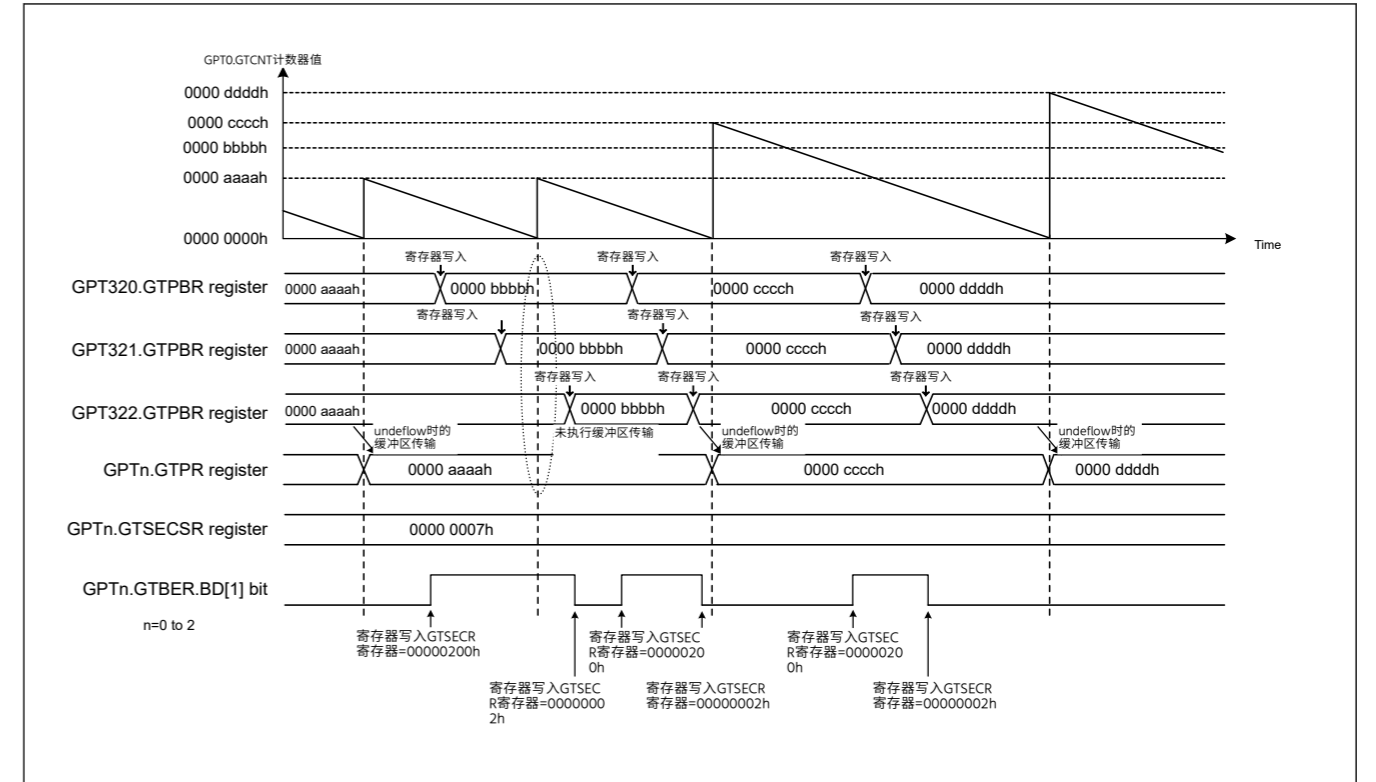

Figure 21.65 禁用缓冲区操作的多通道操作示例 (锯齿波, 单缓冲操作)

21.7.3 GTIOCnm引脚输出负控制 (n=0至7, m=A, B)

为防止系统故障, 根据POEG的输出禁用请求, 为GTIOCnm引脚输出提供强制改变GTIOCnm引脚输出值的输出禁用控制。当GTIOCnA引脚输出值与GTIOCnB引脚输出值相同时, 需要输出保护。GPT检测到这种情况并根据输出禁用请求许可位的设置, 如GTINTAD.GRPABH、GTINTAD.GRPABL向POEG生成输出禁用请求。在POEG接收到来自每个通道的输出禁用请求并使用OR运算计算外部输入后, POEG向GPT生成输出禁用请求。

通过设置GTINTAD.GRP[1:0], 在POEG产生的4个输出禁止请求中选择一个输出禁止信号 (代表GTIOCnA引脚和GTIOCnB引脚的共享输出禁止请求信号)。通过读取GTST.ODF位来监控所选禁用输出请求的状态。输出禁用期间的输出电平根据GTIOCnA引脚的GTIOR.OADF[1:0]位和GTIOCnB引脚的GTIOR.OBDF[1:0]设置来设置。

通过从POEG生成输出禁用请求异步执行对输出禁用状态的更改。通过终止输出禁用请求, 在循环结束时执行输出禁用状态的释放。

当执行事件计数或应立即释放输出禁用状态而不等待周期结束时, 应将GTIOR.OADF[1:0]设置为00b (对于GTIOCnA引脚) 或GTIOR.OBDF[1:0]应设置为设置为00b (对于GTIOCnB引脚)。

图21.66显示了GTIOCnm引脚输出禁用控制操作的示例。 (n=0到7, m=A, B)

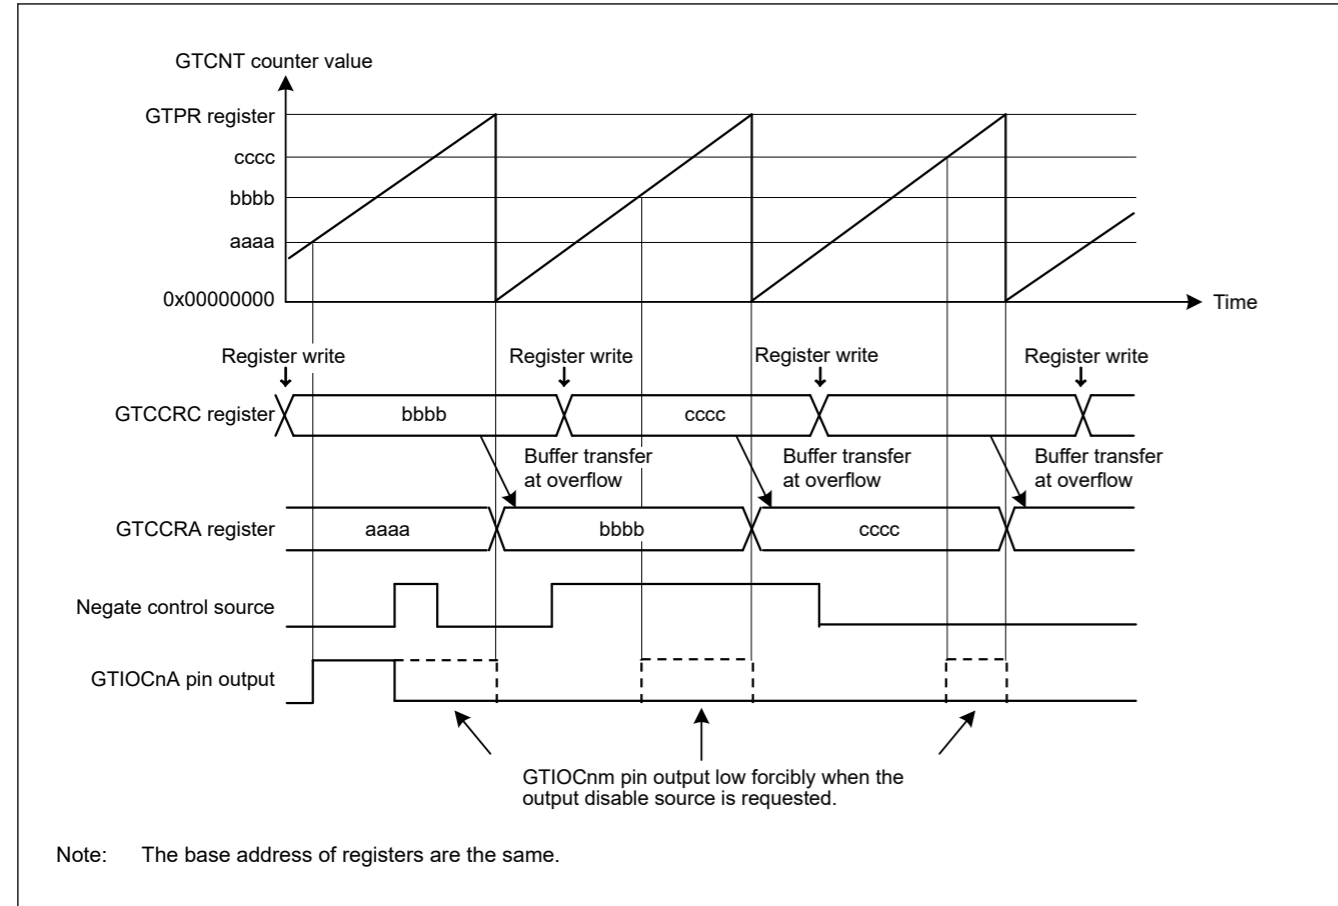

Figure 21.66 Example of GTIOcNm pin output disable control operation in saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable (n = 0 to 7, m = A, B)

## 21.8 Initialization Method of Output Pins

### 21.8.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function with the PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

Figure 21.66 GTIOcNm引脚输出禁用控制操作示例在锯齿波递增计数、缓冲器操作、有效电平1、GTCCRA比较匹配时的高输出、周期结束时的低输出和输出禁用时的低输出 (n=0到7, m=A, B)

## 21.8 输出管脚的初始化方法

### 21.8.1 复位后的引脚设置

GPT寄存器在复位时被初始化。通过PmnPFS寄存器选择端口引脚功能，设置GTIOR.OAE和GTIOR.OBE位，并将GPT功能输出到外部引脚后开始计数。

Figure 21.67 Example of pin settings after reset

### 21.8.2 Pin Initialization Due to Error during Operation

If an error occurs during GPT operation, the following four types of pin processing can be performed before pin initialization:

- Set the OAHL and OBHL bits in GTIOR to 1 and retain the outputs at count stop
- Set the OAHL and OBHL bits in GTIOR to 0, specify arbitrary output values at OADFLT and OBDFLT in GTIOR, and output the arbitrary values at count stop
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR registers and PmnPFS.PMR bit of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0, and the control bit associated with the pin in the PMR to 0 to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

After the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting is resumed, operation continues from where it stopped. If counting is stopped, the registers must be initialized before counting starts.

## 21.9 Usage Notes

### 21.9.1 Module-Stop Function Setting

The Module Stop Control Register can enable or disable GPT operation. The GPT is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

### 21.9.2 GTCCRn Settings during Compare Match Operation (n = A to F)

#### (1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy both of the following conditions:

- $GTDVU < GTCCRA$
- $0 < GTCCRA < GTPR$

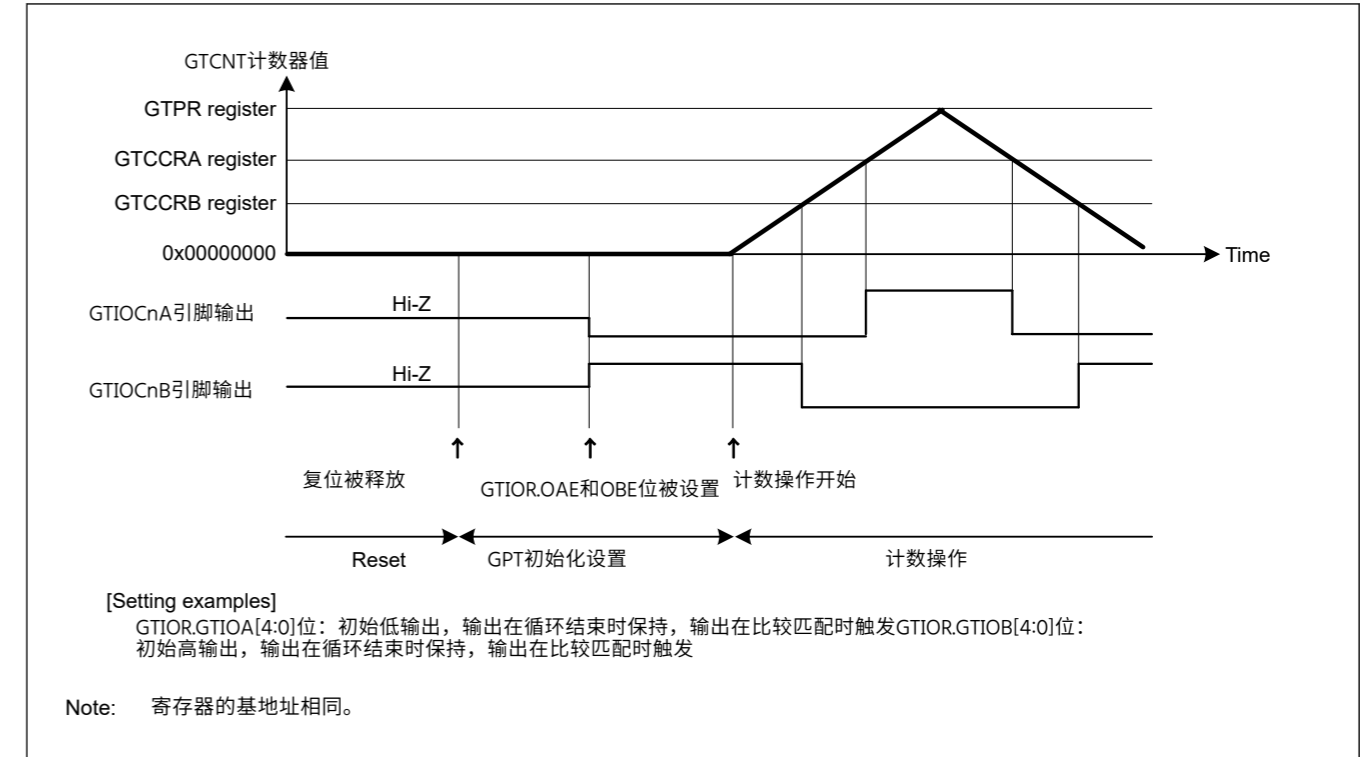

Figure 21.67 复位后的引脚设置示例

### 21.8.2 由于操作过程中的错误而导致的引脚初始化

如果在GPT操作过程中发生错误，可以在引脚初始化之前进行以下四种引脚处理：

- 将GTIOR中的OAHL和OBHL位设置为1，并在计数停止时保留输出
- 将GTIOR中的OAHL和OBHL位设置为0，在GTIOR中的OADFLT和OBDFLT指定任意输出值，并在计数停止时输出任意值
- 通过预先设置IO端口的PDR、PODR寄存器和PmnPFS.PMR位，将引脚设置为输出任意值作为通用输出端口。将GTIOR中的OAE和OBE位设置为0，并将与PMR中的引脚相关的控制位设置为0，以允许在发生错误时从设置为通用输出端口的引脚输出任意值。
- 使用POEG功能将输出驱动为高阻抗状态。

进行自动死区时间设置后，计数停止后将GTDTCR.TDE位清零。当计数停止时，只有被GPT外部源改变的寄存器的值会改变。如果重新开始计数，则从停止处继续操作。如果停止计数，则必须在计数开始前初始化寄存器。

## 21.9 使用说明

### 21.9.1 模块停止功能设置

模块停止控制寄存器可以启用或禁用GPT操作。GPT在重置后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

### 21.9.2 比较匹配操作期间的GTCCRn设置 (n=A到F)

#### (1) 在三角波PWM模式下进行自动死区时间设置时

GTCCRA寄存器必须满足以下两个条件：

- $GTDVU < GTCCRA$
- $0 < GTCCRA < GTPR$

When the setting of  $GTCCRA = 0$  or  $GTCCRA \geq GTPR$  is made for the  $GTCCRA$  register during count operation, the output protection function is activated. However, if the following condition is not satisfied, the output protection function does not work normally:

- The value of the  $GTCCRA$  register at the start of counting is larger than 0 and less than  $GTPR$ .

For details, see [section 21.7.3. GTIOCNm Pin Output Negate Control \(n = 0 to 7, m = A, B\)](#)

### (2) When automatic dead time setting is not made in triangle-wave PWM mode

The  $GTCCRA$  register must be set within the range of  $0 < GTCCRA < GTPR$ . If  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is satisfied. When  $GTCCRA > GTPR$ , no compare match occurs.

Similarly,  $GTCCRB$  must be set within the range of  $0 < GTCCRB < GTPR$ . If  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is satisfied. When  $GTCCRB > GTPR$ , no compare match occurs.

### (3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The  $GTCCRC$  and  $GTCCRD$  registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, the correct output waveforms with secured dead time may not be obtained.

- In up-counting:  $GTCCRC < GTCCRD$ ,  $GTCCRC > GTDVU$ ,  $GTCCRD < GTPR - GTDVU$
- In down-counting:  $GTCCRC > GTCCRD$ ,  $GTCCRC < GTPR - GTDVU$ ,  $GTCCRD > GTDVU$

Similarly, the  $GTCCRE$  and  $GTCCRF$  registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time might not be obtained:

- In up-counting:  $GTCCRE < GTCCRF$ ,  $GTCCRE > GTDVU$ ,  $GTCCRF < GTPR - GTDVU$
- In down-counting:  $GTCCRE > GTCCRF$ ,  $GTCCRE < GTPR - GTDVU$ ,  $GTCCRF > GTDVU$

### (4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The  $GTCCRC$  and  $GTCCRD$  registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting:  $0 < GTCCRC < GTCCRD < GTPR$
- In down-counting:  $GTPR > GTCCRC > GTCCRD > 0$

Similarly,  $GTCCRE$  and  $GTCCRF$  must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting:  $0 < GTCCRE < GTCCRF < GTPR$
- In down-counting:  $GTPR > GTCCRE > GTCCRF > 0$ .

### (5) In saw-wave PWM mode

The  $GTCCRA$  register must be set with the range of  $0 < GTCCRA < GTPR$ . If  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRA = 0$  or  $GTCCRA = GTPR$  is satisfied. If  $GTCCRA > GTPR$  is set, no compare match occurs.

Similarly,  $GTCCRB$  must be set with the range of  $0 < GTCCRB < GTPR$ . If  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is set, a compare match occurs within the cycle only when  $GTCCRB = 0$  or  $GTCCRB = GTPR$  is satisfied. If  $GTCCRB > GTPR$  is set, no compare match occurs.

## 21.9.3 Setting Range for GTCNT Counter

The  $GTCNT$  counter register must be set with the range of  $0 \leq GTCNT \leq GTPR$ .

## 21.9.4 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the  $GTCNT$  counter by the  $GTCR.CST$  bit synchronizes the count clock that is selected in  $GTCR.TPCS[3:0]$ . When  $GTCR.CST$  is updated, the  $GTCNT$  counter starts/stops after a count clock that is

当在计数操作期间对 $GTCCRA$ 寄存器设置 $GTCCRA=0$ 或 $GTCCRA \geq GTPR$ 时, 输出保护功能被激活。但是, 如果不满足以下条件, 则输出保护功能不能正常工作:

- 计数开始时 $GTCCRA$ 寄存器的值大于0小于 $GTPR$ 。

详见21.7.3节。GTIOCNm引脚输出负控制 (n=0至7, m=A, B)

### (2) 在三角波PWM模式下未进行自动死区时间设置时

$GTCCRA$ 寄存器必须设置在 $0 < GTCCRA < GTPR$ 的范围内。如果设置了 $GTCCRA=0$ 或 $GTCCRA=GTPR$ , 则仅当满足 $GTCCRA=0$ 或 $GTCCRA=GTPR$ 时, 才会在周期内发生比较匹配。当 $GTCCRA > GTPR$ 时, 不发生比较匹配。

同样,  $GTCCRB$ 必须设置在 $0 < GTCCRB < GTPR$ 的范围内。如果设置了 $GTCCRB=0$ 或 $GTCCRB=GTPR$ , 则仅当 $GTCCRB=0$ 或 $GTCCRB=GTPR$ 满足时, 才会在周期内发生比较匹配。当 $GTCCRB > GTPR$ 时, 不发生比较匹配。

### (3) 在锯齿单发脉冲模式下进行自动死区时间设置时

$GTCCRC$ 和 $GTCCRD$ 寄存器必须设置为满足以下限制。如果不满足这些限制, 则可能无法获得具有安全死区时间的正确输出波形。

- In up-counting:  $GTCCRC < GTCCRD$ ,  $GTCCRC > GTDVU$ ,  $GTCCRD < GTPR - GTDVU$
- In down-counting:  $GTCCRC > GTCCRD$ ,  $GTCCRC < GTPR - GTDVU$ ,  $GTCCRD > GTDVU$

同样, 必须设置 $GTCCRE$ 和 $GTCCRF$ 寄存器以满足以下限制。如果不满足限制条件, 则可能无法获得具有安全死区时间的正确输出波形:

- In up-counting:  $GTCCRE < GTCCRF$ ,  $GTCCRE > GTDVU$ ,  $GTCCRF < GTPR - GTDVU$
- In down-counting:  $GTCCRE > GTCCRF$ ,  $GTCCRE < GTPR - GTDVU$ ,  $GTCCRF > GTDVU$

### (4) 在锯齿单发脉冲模式下未进行自动死区时间设置时

$GTCCRC$ 和 $GTCCRD$ 寄存器必须设置为满足以下限制。如果不满足限制, 则不会发生两个比较匹配, 并且无法执行脉冲输出。

- In up-counting:  $0 < GTCCRC < GTCCRD < GTPR$
- In down-counting:  $GTPR > GTCCRC > GTCCRD > 0$

同样, 必须设置 $GTCCRE$ 和 $GTCCRF$ 以满足以下限制。如果不满足限制, 则不会发生两个比较匹配, 并且无法执行脉冲输出。

- In up-counting:  $0 < GTCCRE < GTCCRF < GTPR$
- In down-counting:  $GTPR > GTCCRE > GTCCRF > 0$ .

### (5) 在锯齿波PWM模式下

$GTCCRA$ 寄存器必须设置为 $0 < GTCCRA < GTPR$ 。如果设置了 $GTCCRA=0$ 或 $GTCCRA=GTPR$ , 则仅当满足 $GTCCRA=0$ 或 $GTCCRA=GTPR$ 时, 才会在周期内发生比较匹配。如果设置了 $GTCCRA > GTPR$ , 则不会发生比较匹配。

类似地,  $GTCCRB$ 必须设置在 $0 < GTCCRB < GTPR$ 的范围内。如果设置了 $GTCCRB=0$ 或 $GTCCRB=GTPR$ , 则仅当满足 $GTCCRB=0$ 或 $GTCCRB=GTPR$ 时, 才会在周期内发生比较匹配。如果设置了 $GTCCRB > GTPR$ , 则不会发生比较匹配。

## 21.9.3 GTCNT计数器的设置范围

$GTCNT$ 计数器寄存器的设置范围必须为 $0 \leq GTCNT \leq GTPR$ 。

## 21.9.4 启动和停止GTCNT计数器

通过 $GTCR.CST$ 位启动和停止 $GTCNT$ 计数器的控制时序与在 $GTCR.TPCS[3:0]$ 中选择的计数时钟同步。当 $GTCR.CST$ 被更新时,  $GTCNT$ 计数器开始在一个计数时钟后停止

selected in GTCR.TPCS[3:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored, resulting in situations in which an event is accepted or an interrupt occurs after GTCR.CST is set to 0.

### 21.9.5 Priority Order of Each Event

#### (1) GTCNT register

Table 21.47 shows a priority order of events updating the GTCNT register.

**Table 21.47 Priority order of sources updating GTCNT**

| Source updating GTCNT                                     | Priority order |
|---|----------------|
| Writing by CPU (writing to GTCNT/GTCLR)                   | High           |
| Clear by hardware sources set in GTCR                     | ↑              |
| Count up or down by hardware sources set in GTUPSR/GTDNSR | ↑              |
| Count operation   | Low            |

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

#### (2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), the writing by CPU has priority over the starting/stopping by hardware sources.

In case that stop by the period count function conflicts with start by the CPU writing (GTCR register writing/GTSTR register writing), the period count function is finished with setting the GTST.PCF flag. The CST bit is not changed and the GTCNT continues to count.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. When there is a conflict between updating the GTCR.CST bit and reading by the CPU, pre-update data is read.

#### (3) GTCCRm registers (m = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to the GTCCRm registers, the writing to GTCCRm registers has priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. When there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

#### (4) GTPR registers

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

在GTCR.TPCS[3:0]中选择。因此，在GTCNT计数器实际启动之前产生的事件将被忽略，从而导致在GTCR.CST设置为0之后接受事件或发生中断的情况。

### 21.9.5 每个事件的优先顺序

#### (1) GTCNT register

表21.47显示了更新GTCNT寄存器的事件的优先顺序。

**Table 21.47 更新GTCNT的源的优先顺序**

| 源更新GTCNT                        | 优先顺序 |
|---------------------------------|------|
| CPU写入 (写入GTCNT/GTCLR)           | High |
| 由GTCR中设置的硬件源清除                  | ↑    |
| 通过GTUPSR/GTDNSR中设置的硬件源进行向上或向下计数 | ↑    |
| 计数操作                            | Low  |

如果硬件源的递增计数和递减计数同时发生，GTCNT计数器值不会改变。当更新GTCNT寄存器和CPU读取之间存在冲突时，会读取更新前的数据。

#### (2) GTCR.CST bit

当GTSSR/GTPSR寄存器中设置的硬件源启动停止与CPU写入 (写入GTCR/GTSTR/GTSTP寄存器) 发生冲突时，CPU写入优先于硬件源启动停止。

如果周期计数功能停止与CPU写入启动 (GTCR寄存器写入/GTSTR寄存器写入) 发生冲突，则周期计数功能通过设置GTST.PCF标志结束。CST位不变，GTCNT继续计数。

当GTSSR寄存器中设置的硬件源启动和GTPSR寄存器中设置的硬件源停止之间存在冲突时，GTCR.CST位的值不会改变。当更新GTCR.CST位与CPU读取之间存在冲突时，会读取更新前的数据。

#### (3) GTCCRm寄存器 (m=A到F)

当输入捕捉缓冲区传输操作与写入GTCCRm寄存器之间存在冲突时，写入GTCCRm寄存器优先于输入捕捉缓冲区传输操作。当输入捕捉与CPU写入计数器寄存器或硬件源更新计数器寄存器之间存在冲突时，将捕获更新前的计数器值。当更新GTCCRm寄存器和CPU读取之间存在冲突时，会读取更新前的数据。

#### (4) GTPR registers

当缓冲区传输操作与写入GTPR寄存器之间存在冲突时，写入GTPR寄存器优先于缓冲区传输操作。当更新GTPR寄存器与CPU读取发生冲突时，读取更新前的数据。

## 22. Low Power Asynchronous General Purpose Timer (AGT)

### 22.1 Overview

The low power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register.

Table 22.1 lists the AGT specifications, Figure 22.1 shows a block diagram, and Table 22.2 lists the I/O pins.

**Table 22.1 AGT specifications**

| Parameter                                       | Description   |   |
|---|---|---|
| Operating modes                                 | Timer mode  | The count source is counted   |
|   | Pulse output mode   | The count source is counted and the output is inverted at each timer underflow  |
|   | Event counter mode  | An external event is counted  |
|   | Pulse width measurement mode  | An external pulse width is measured   |
|   | Pulse period measurement mode   | An external pulse period is measured  |
| Number of Channels                              | 16 bits × 6 channels (AGTn (n = 0 to 5))  |   |
| Count source (operating clock) <sup>*2</sup>    | Timer mode  | PCLKB, PCLKB/2, PCLKB/8, AGTLCLK/d, AGTSCLK/d (d = 1, 2, 4, 8, 16, 32, 64, or 128), or underflow signal of AGTn (n = 0, 2, 4) selectable. <sup>*1</sup> |
|   | Pulse output mode   |   |
|   | Pulse width measurement mode  |   |
|   | Pulse period measurement mode   |   |
|   | Event counting mode   | External event input  |
| Interrupt and Event Link function <sup>*3</sup> | <ul style="list-style-type: none"> <li>Underflow event signal or measurement complete event signal           <ul style="list-style-type: none"> <li>When the counter underflows</li> <li>When the measurement of the active width of the external input pin (AGTIOn) completes in pulse width measurement mode</li> <li>When the set edge of the external input pin (AGTIOn) is input in pulse period measurement mode.</li> </ul> </li> <li>Compare match A event signal           <ul style="list-style-type: none"> <li>When the values of AGT register and AGTCMA register matched (compare match A function enabled).</li> </ul> </li> <li>Compare match B event signal           <ul style="list-style-type: none"> <li>When the values of AGT register and AGTCMB register matched (compare match B function enabled).</li> </ul> </li> <li>Return from Snooze mode or Software Standby mode can be performed with AGTn_AGTI, AGTn_AGTCMAI, or AGTn_AGTCMBI (n = 1, 3)<sup>*4</sup></li> </ul> |   |
| Selectable functions                            | <ul style="list-style-type: none"> <li>Compare match function</li> </ul> One or two of the AGT Compare Match A register and AGT Compare Match B register is selectable.   |   |
| TrustZone Filter                                | Security attribution can be set for each channels   |   |

Note 1. AGTn (n = 0, 2, 4) cannot use underflow signal. AGTn (n = 1, 3, 5) connects directly with the underflow event signal from the AGTn (n = 0, 2, 4) timer.

Note 2. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.

Note 3. The AGT1 cannot use the Event Link function. AGT0 event signals can be used.

Note 4. In details, see section 10, Low Power Modes.

## 22. 低功耗异步通用定时器(AGT)

### 22.1 Overview

低功耗异步通用定时器(AGT)是一个16位定时器，可用于脉冲输出、外部脉冲宽度或周期测量以及外部事件计数。该定时器由一个重载寄存器和一个递减计数器组成。重载寄存器和递减计数器分配到同一个地址，可以通过AGT寄存器访问。

表22.1列出了AGT规格，图22.1显示了框图，表22.2列出了IO引脚。

**Table 22.1 AGT specifications**

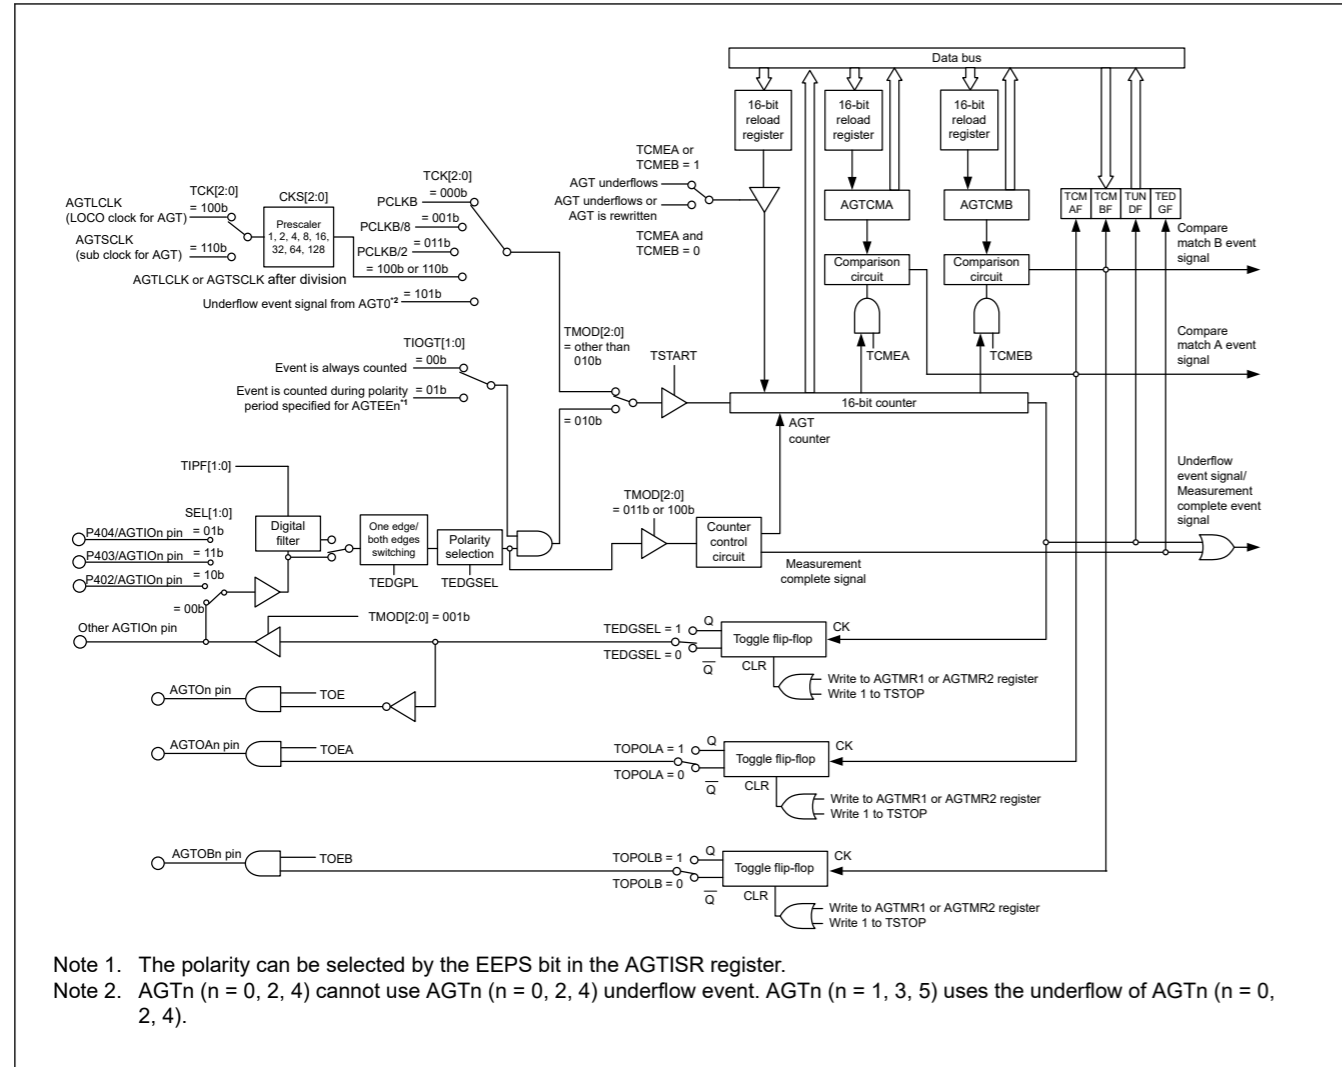

| Parameter        | Description   |   |
|------------------|---|---|
| 操作模式             | 定时器模式   | 计数源被计数  |
|                  | 脉冲输出方式  | 计数源被计数并在每次定时器下溢时反转输出  |
|                  | 事件计数器模式   | 计算外部事件  |
|                  | 脉宽测量模式  | 测量外部脉冲宽度  |
|                  | 脉冲周期测量模式  | 测量外部脉冲周期  |
| 通道数              | 16位×6通道(AGTn(n=0到5))  |   |
| 计数源 (工作时钟) *2    | 定时器模式   | PCLKB、PCLKB2、PCLKB8、AGTLCLKd、AGTSCLKd (d=1、2、4、8、16、32、64或128) 或AGTn的下溢信号 (n=0、2、4) 可选。*1 |
|                  | 脉冲输出方式  |   |
|                  | 脉宽测量模式  |   |
|                  | 脉冲周期测量模式  |   |
|                  | 事件计数模式  | 外部事件输入  |
| 中断和事件链接功能*3      | <ul style="list-style-type: none"> <li>下溢事件信号或测量完成事件信号           <ul style="list-style-type: none"> <li>当计数器下溢时</li> <li>在脉冲宽度测量模式下，外部输入引脚(AGTIOn)的有效宽度测量完成时</li> <li>在脉冲周期测量模式下输入外部输入引脚(AGTIOn)的设置边沿时。</li> </ul> </li> <li>比较匹配A事件信号           <ul style="list-style-type: none"> <li>当AGT寄存器和AGTCMA寄存器的值匹配时 (比较匹配A功能启用)。</li> </ul> </li> <li>比较匹配B事件信号           <ul style="list-style-type: none"> <li>当AGT寄存器和AGTCMB寄存器的值匹配时 (比较匹配B功能启用)。</li> </ul> </li> <li>从贪睡模式或软件待机模式返回可以通过 AGTn_AGTI, AGTn_AGTCMAI, or AGTn_AGTCMBI (n = 1, 3)<sup>*4</sup></li> </ul> |   |
| 可选择的功能           | <ul style="list-style-type: none"> <li>比较匹配功能AGT比较匹配A寄存器和AGT比较匹配中的一个或两个B寄存器是可选的。</li> </ul>   |   |
| TrustZone Filter | 可以为每个通道设置安全属性   |   |

注1.AGTn(n=0 2 4)不能使用下溢信号。AGTn(n=1 3 5)直接连接来自AGTn(n=0 2 4)定时器的下溢事件信号。

注2.满足外设模块时钟 (PCLKB) 的频率≥计数源时钟的频率。

注3.AGT1 不能使用EventLink功能。可以使用AGT0事件信号。

注4.详细信息请参见第10节，低功耗模式。

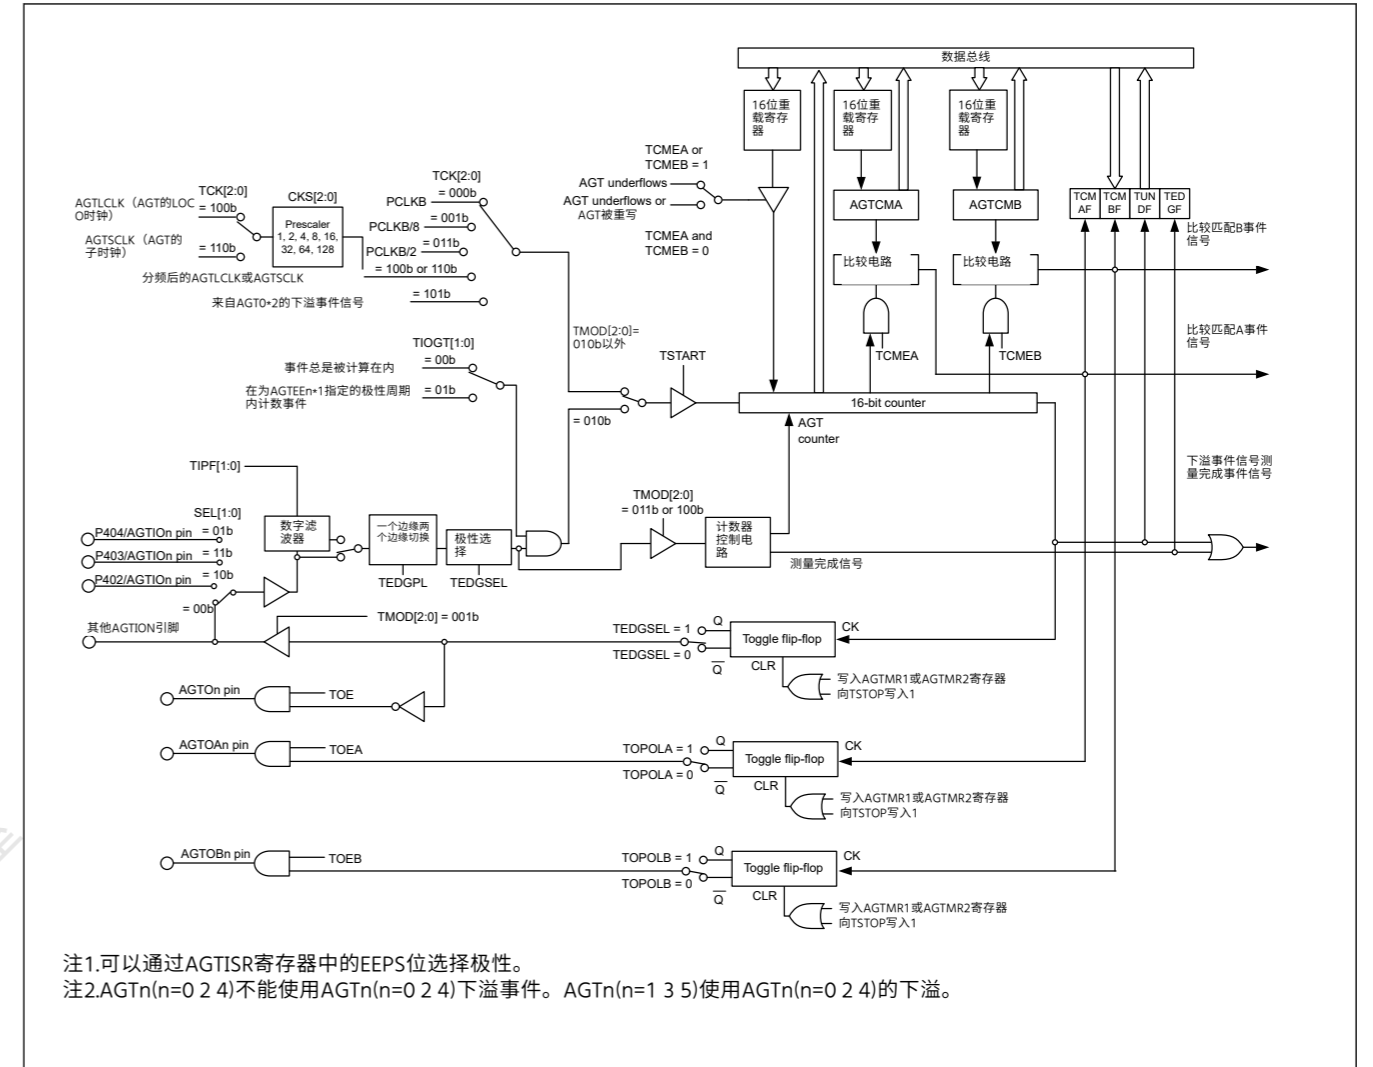

Note 1. The polarity can be selected by the EEPS bit in the AGTISR register.  
 Note 2. AGTn (n = 0, 2, 4) cannot use AGTn (n = 0, 2, 4) underflow event. AGTn (n = 1, 3, 5) uses the underflow of AGTn (n = 0, 2, 4).

Figure 22.1 AGT block diagram

Table 22.2 AGT I/O pins

| Pin name | I/O          | Function                                      |
|----------|--------------|---|
| AGTEEn   | Input        | External event input enable for AGT           |
| AGTIOn   | Input/output | External event input and pulse output for AGT |
| AGTOn    | Output       | Pulse output for AGT                          |
| AGTOAn   | Output       | Compare match A output for AGT                |
| AGTOBn   | Output       | Compare match B output for AGT                |

Note: Channel number: n = 0 to 5  
 Note: P402, P403, P404 can only be used as input.

注1.可以通过AGTISR寄存器中的EEPS位选择极性。  
 注2.AGTn(n=0 2 4)不能使用AGTn(n=0 2 4)下溢事件。AGTn(n=1 3 5)使用AGTn(n=0 2 4)的下溢。

Figure 22.1 AGT框图

Table 22.2 AGT I/O pins

| 引脚名称   | I/O          | Function        |
|--------|--------------|-----------------|
| AGTEEn | Input        | AGT的外部事件输入使能    |
| AGTIOn | Input/output | AGT的外部事件输入和脉冲输出 |
| AGTOn  | Output       | AGT的脉冲输出        |
| AGTOAn | Output       | 比较AGT的匹配A输出     |
| AGTOBn | Output       | 比较AGT的匹配B输出     |

Note: 通道号: n=0到5  
 Note: P402、P403、P404只能用作输入。

## 22.2 Register Descriptions

## 22.2.1 AGT : AGT Counter Register

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  (n = 0 to 5)

Offset address: 0x00

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 15:0 | n/a    | 16-bit counter and reload register<br>Setting range : 0x0000 to 0xFFFF | R/W |

AGTn.AGT is a 16-bit register. The write value is written to the reload register and the read value is read from the counter.

The states of the reload register and the counter change according to the TSTART bit in the AGTCR register and TCMEA/TCMEB bit in the AGTCMSR register. For details, see [section 22.3.1. Reload Register and Counter Rewrite Operation](#).

When 1 is written to the TSTOP bit in the AGTCR register, AGT counter is forcibly stopped and set to 0xFFFF.

When the TCK[2:0] bits setting in the AGTMR1 register are a value other than 001b (PCLKB/8) or 011b (PCLKB/2), if the AGT register is set to 0x0000, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts. The AGTOn, AGTIO pin output are toggled.

When the AGT register is set to 0x0000 in event counter mode, regardless of the value of TCK[2:0] bits, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts.

In addition, the AGTOn pin output is toggled even during a period other than the specified count period. When the AGT register is set to 0x0001 or more, a request signal is generated each time AGT underflows.

## 22.2.2 AGTCMA : AGT Compare Match A Register

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  (n = 0 to 5)

Offset address: 0x02

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 15:0 | n/a    | 16-bit compare match A data is stored.*1<br>Setting range : 0x0000 to 0xFFFF | R/W |

Note 1. Set the AGTCMA register to 0xFFFF when compare match A is not used.

The AGTCMA register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register A change according to the TSTART bit in the AGTCR register. For details, see [section 22.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation](#).

## 22.2 注册说明

## 22.2.1 AGT:AGT计数器寄存器

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  (n = 0 to 5)

Offset address: 0x00

| Bit  | Symbol | Function                        | R/W |
|------|--------|---------------------------------|-----|
| 15:0 | n/a    | 16位计数器和重载寄存器设置范围: 0x0000到0xFFFF | R/W |

AGTn.AGT是一个16位寄存器。写入值写入重载寄存器，读取值从计数器中读取。

重载寄存器和计数器的状态根据AGTCR寄存器和TCMEA中的TSTART位改变AGTCMSR寄存器中的TCMEB位。详见22.3.1节。重载寄存器和计数器重写操作。

当AGTCR寄存器的TSTOP位写入1时，AGT计数器被强制停止并设置为0xFFFF。

当AGTMR1寄存器中的TCK[2:0]位设置为001b(PCLKB8)或011b(PCLKB2)以外的值时，如果AGT寄存器设置为0x0000，在计数开始后立即生成一次对ICU、DTC、DMAC和ELC的请求信号。AGTOn、AGTIO引脚输出被切换。

当AGT寄存器在事件计数器模式下设置为0x0000时，无论TCK[2:0]位的值如何，都会在计数开始后立即生成一次对ICU、DTC、DMAC和ELC的请求信号。

此外，即使在指定计数周期以外的周期内，AGTOn引脚输出也会切换。当AGT寄存器设置为0x0001或更大时，每次AGT下溢时都会产生一个请求信号。

## 22.2.2 AGTCMA:AGT比较匹配A寄存器

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  (n = 0 to 5)

Offset address: 0x02

| Bit  | Symbol | Function                                | R/W |
|------|--------|---|-----|
| 15:0 | n/a    | 16位比较匹配A数据被存储。*1<br>设置范围: 0x0000到0xFFFF | R/W |

注1.不使用比较匹配A时，将AGTCMA寄存器设置为0xFFFF。

AGTCMA寄存器是一个读写寄存器，用于设置与AGT计数器比较匹配的值。重载寄存器和比较寄存器A的状态根据AGTCR寄存器中的TSTART位而改变。详见22.3.2节。重载寄存器和AGT比较匹配AB寄存器重写操作。

## 22.2.3 AGTCMB : AGT Compare Match B Register

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to 5)

Offset address: 0x04

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 15:0 | n/a    | 16-bit compare match B data is stored.*1<br>Setting range : 0x0000 to 0xFFFF | R/W |

Note 1. Set the AGTCMB register to 0xFFFF when compare match B is not used.

The AGTCMB register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register B change according to the TSTART bit in the AGTCR register. For details, see [section 22.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation](#).

## 22.2.4 AGTCR : AGT Control Register

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to 5)

Offset address: 0x08

| Bit | Symbol | Function   | R/W     |
|-----|--------|--|---------|
| 0   | TSTART | AGT Count Start*2<br>0: Count stops<br>1: Count starts                               | R/W     |
| 1   | TCSTF  | AGT Count Status Flag*2<br>0: Count stopped<br>1: Count in progress                  | R       |
| 2   | TSTOP  | AGT Count Forced Stop*1<br>0: Writing is invalid<br>1: The count is forcibly stopped | W       |
| 3   | —      | This bit is read as 0. The write value should be 0.                                  | R/W     |
| 4   | TEDGF  | Active Edge Judgment Flag<br>0: No active edge received<br>1: Active edge received   | R/(W)*3 |
| 5   | TUNDF  | Underflow Flag<br>0: No underflow<br>1: Underflow                                    | R/(W)*3 |
| 6   | TCMAF  | Compare Match A Flag<br>0: No match<br>1: Match                                      | R/(W)*3 |
| 7   | TCMBF  | Compare Match B Flag<br>0: No match<br>1: Match                                      | R/(W)*3 |

Note 1. When 1 (count is forcibly stopped) is written to the TSTOP bit, the TSTART bit and TCSTF flag are initialized at the same time. The pulse output level is also initialized. The read value is 0.

Note 2. For information on using the TSTART bit and TCSTF flag, see [section 22.4.1. Count Operation Start and Stop Control](#).

Note 3. Only 0 can be written to clear the flag.

## 22.2.3 AGTCMB:AGT比较匹配B寄存器

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to 5)

Offset address: 0x04

| Bit  | Symbol | Function                               | R/W |
|------|--------|--|-----|
| 15:0 | n/a    | 存储16位比较匹配B数据。*1<br>设置范围: 0x0000到0xFFFF | R/W |

注1.不使用比较匹配B时, 将AGTCMB寄存器设置为0xFFFF。

AGTCMB寄存器是一个读写寄存器, 用于设置与AGT计数器比较匹配的值。重载寄存器和比较寄存器B的状态根据AGTCR寄存器中的TSTART位而改变。详见22.3.2节。重载寄存器和AGT比较匹配AB寄存器重写操作。

## 22.2.4 AGTCR:AGT控制寄存器

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  ( $n = 0$  to 5)

Offset address: 0x08

| Bit | Symbol | Function  | R/W     |
|-----|--------|---|---------|
| 0   | TSTART | AGT计数开始*2<br>0: 计数停止1<br>: 计数开始                   | R/W     |
| 1   | TCSTF  | AGT计数状态标志*2<br>0: 计数停止1: 计数中                      | R       |
| 2   | TSTOP  | AGTCount强制停止*1<br>0: 写入无效1: 强制停止计数                | W       |
| 3   | —      | 该位读取为0。写入值应为0。                                    | R/W     |
| 4   | TEDGF  | 主动边缘判断标志<br>0: 未收到有效边沿1: 收到有效边沿                   | R/(W)*3 |
| 5   | TUNDF  | Underflow Flag<br>0: No underflow<br>1: Underflow | R/(W)*3 |
| 6   | TCMAF  | 比较匹配标志<br>0: 不匹配1<br>: 匹配                         | R/(W)*3 |
| 7   | TCMBF  | 比较匹配B标志<br>0: 不匹配1<br>: 匹配                        | R/(W)*3 |

注1.当1 (强制停止计数) 写入TSTOP位时, TSTART位和TCSTF标志同时初始化。脉冲输出电平也被初始化。读取值为0。

注2.有关使用TSTART位和TCSTF标志的信息, 请参阅第22.4.1节。计数操作启动和停止控制。

注3.只能写入0来清除标志。

**TSTART bit (AGT Count Start)**

The count operation is started by writing 1 to the TSTART bit and stopped by writing 0. When the TSTART bit is set to 1 (count starts), the TCSTF flag is set to 1 (count in progress) in synchronization with the count source. Also, after 0 is written to the TSTART bit, the TCSTF flag is set to 0 (count stops) in synchronization with the count source. For details, see [section 22.4.1. Count Operation Start and Stop Control](#).

**TCSTF flag (AGT Count Status Flag)**

The TCSTF flag indicates the AGT count status.

[Setting condition]

- When 1 is written to the TSTART bit (the TCSTF flag is set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (the TCSTF flag is set to 0 in synchronization with the count source)
- When 1 is written to the TSTOP bit.

**TSTOP bit (AGT Count Forced Stop)**

When 1 is written to the TSTOP bit, the count is forcibly stopped. The read value is 0.

**TEDGF flag (Active Edge Judgment Flag)**

The TEDGF flag indicates that an active edge was detected.

[Setting condition]

- When the measurement of the active width of the external input pin (AGTIO<sub>n</sub>) is complete in pulse width measurement mode
- When the set edge of the external input pin (AGTIO<sub>n</sub>) is input in pulse period measurement mode.

[Clearing condition]

- When 0 is written to this flag by software.

**TUNDF flag (Underflow Flag)**

The TUNDF flag indicates that the counter underflowed.

[Setting condition]

- When the counter underflows.

[Clearing condition]

- When 0 is written to this flag by software.

**TCMAF flag (Compare Match A Flag)**

The TCMAF flag indicates that compare match A was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMA register.

[Clearing condition]

- When 0 is written to this flag by software.

**TCMBF flag (Compare Match B Flag)**

The TCMBF flag indicates that compare match B was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMB register.

[Clearing condition]

- When 0 is written to this flag by software.

**TSTART位 (AGT计数开始)**

通过向TSTART位写入1开始计数操作，通过写入0停止计数操作。当TSTART位设置为1（计数开始）时，TCSTF标志设置为1（计数进行中）与计数源同步。此外，在TSTART位写入0后，TCSTF标志与计数源同步设置为0（计数停止）。详见22.4.1节。计数操作启动和停止控制。

**TCSTF标志 (AGT计数状态标志)**

TCSTF标志指示AGT计数状态。

[Setting condition]

- 当TSTART位写入1时（TCSTF标志设置为1，与计数源同步）。

[Clearing conditions]

- TSTART位写入0时（TCSTF标志设置为0与计数源同步）
- TSTOP位写入1时。

**TSTOP位 (AGT计数强制停止)**

向TSTOP位写入1时，强制停止计数。读取值为0。

**TEDGF标志 (活动边缘判断标志)**

TEDGF标志表示检测到有效边沿。

[Setting condition]

- 在脉冲宽度测量模式下，外部输入引脚(AGTIO<sub>n</sub>)的有效宽度测量完成时
- 在脉冲周期测量模式下输入外部输入引脚(AGTIO<sub>n</sub>)的设置边沿时。

[Clearing condition]

- 当软件向该标志写入0时。

**TUNDF flag (Underflow Flag)**

TUNDF标志指示计数器下溢。

[Setting condition]

- 当计数器下溢时。

[Clearing condition]

- 当软件向该标志写入0时。

**TCMAF标志 (比较匹配A标志)**

TCMAF标志表示检测到比较匹配A。

[Setting condition]

- 当AGT寄存器中的值与AGTCMA寄存器中的值匹配时。

[Clearing condition]

- 当软件向该标志写入0时。

**TCMBF标志 (比较匹配B标志)**

TCMBF标志表示检测到比较匹配B。

[Setting condition]

- 当AGT寄存器中的值与AGTCMB寄存器中的值匹配时。

[Clearing condition]

- 当软件向该标志写入0时。

22.2.5 AGTMR1 : AGT Mode Register 1

Base address: AGTn = 0x400E\_8000 + 0x0100 × n (n = 0 to 5)

Offset address: 0x09

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 2:0 | TMOD[2:0] | Operating Mode*3<br>0 0 0: Timer mode<br>0 0 1: Pulse output mode<br>0 1 0: Event counter mode<br>0 1 1: Pulse width measurement mode<br>1 0 0: Pulse period measurement mode<br>Others: Setting prohibited  | R/W |
| 3   | TEDGPL    | Edge Polarity*4<br>0: Single-edge<br>1: Both-edge  | R/W |
| 6:4 | TCK[2:0]  | Count Source*1 *2 *5 *7<br>0 0 0: PCLKB<br>0 0 1: PCLKB/8<br>0 1 1: PCLKB/2<br>1 0 0: Divided clock AGTLCLK specified by CKS[2:0] bits in the AGTMR2 register<br>1 0 1: Underflow event signal from AGTn (n = 0, 2, 4)*6<br>1 1 0: Divided clock AGTSCLK specified by CKS[2:0] bits in the AGTMR2 register<br>Others: Setting prohibited | R/W |
| 7   | —         | This bit is read as 0. The write value should be 0.  | R/W |

Note: Write access to the AGTMR1 register initializes the output from the AGTOn, AGTIO n, AGTOAn, AGTOBn pins of the AGT (n = 0 to 5). For details on the output level at initialization, see section 22.2.7. AGTIOC : AGT I/O Control Register.

Note 1. When event counter mode is selected, the external input pin (AGTIO n) is selected as the count source regardless of the setting of TCK[2:0] bits.

Note 2. Do not switch count sources during count operation. Only switch count sources when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 3. The operating mode can only be changed when the count is stopped while both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count is stopped). Do not change the operating mode during count operation.

Note 4. The TEDGPL bit is enabled only in event counter mode.

Note 5. To run AGT in Software Standby and Deep Software Standby mode, select AGTLCLK or AGTSCLK (TCK[2:0] = 100b, 110b).

Note 6. AGTn (n = 0, 2, 4) cannot use AGTn (n = 0, 2, 4) underflow (setting prohibited). AGTn (n = 1, 3, 5) uses the AGTn (n = 0, 2, 4) underflow.

Note 7. Do not change the TCK[2:0] bits when the CKS[2:0] bits in the AGTMR2 register is not 000b. First, change the CKS[2:0] bits in the AGTMR2 register to 000b. Then change the TCK[2:0] bits and wait for one cycle of the count source.

22.2.6 AGTMR2 : AGT Mode Register 2

Base address: AGTn = 0x400E\_8000 + 0x0100 × n (n = 0 to 5)

Offset address: 0x0A

22.2.5 AGTMR1 : AGT模式寄存器1

Base address: AGTn = 0x400E\_8000 + 0x0100 × n (n = 0 to 5)

Offset address: 0x09

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 2:0 | TMOD[2:0] | 操作模式*3<br>000: 定时器模式001: 脉冲输出模式010: 事件计数器模式011: 脉冲宽度测量模式100: 脉冲周期测量模式<br>其他: 禁止设置  | R/W |
| 3   | TEDGPL    | 边缘极性*4<br>0: Single-edge<br>1: Both-edge   | R/W |
| 6:4 | TCK[2:0]  | 计数源*1*2*5*7<br>000:PCLKB001:PCLKB8011:PCLKB2100:分频时钟AGTLCLK由AGTMR2寄存器中的CKS[2:0]位指定101:来自AGTn(n=0)的下溢事件信号2 4)*6<br>110: 由AGTMR2寄存器中的CKS[2:0]位指定的分频时钟AGTSCLK<br>其他: 禁止设置 | R/W |
| 7   | —         | 该位读取为0。写入值应为0。   | R/W |

Note: 对AGTMR1寄存器的写访问会初始化AGT (n=0到5) 的AGTOn、AGTIO n、AGTOAn、AGTOBn引脚的输出。有关初始化时的输出电平的信息，请参阅第22.2.7节。AGTIOC: AGTIO控制寄存器。

注意1.选择事件计数器模式时，无论设置如何

TCK[2:0] bits.

注2.在计数操作期间不要切换计数源。只有当TSTART位和TCSTF标志都在AGTCR寄存器设置为0 (计数停止)。

注3.只有在AGTCR寄存器中的TSTART位和TCSTF标志都设置为0 (计数停止) 时停止计数才能更改操作模式。请勿在计数操作期间更改操作模式。

注4.TEDGPL位仅在事件计数器模式下启用。

注5.要在软件待机和深度软件待机模式下运行AGT，请选择AGTLCLK或AGTSCLK(TCK[2:0]=100b 110b)。注6.AGTn(n=0 2 4)不能使用AGTn(n=0 2 4)下溢 (禁止设置)。AGTn(n=1 3 5)使用AGTn(n=0 2 4)下溢。

注7.当AGTMR2寄存器中的CKS[2:0]位不是000b时，不要更改TCK[2:0]位。首先，更改CKS[2:0]位AGTMR2寄存器到000b。然后改变TCK[2:0]位并等待计数源的一个周期。

22.2.6 AGTMR2:AGT模式寄存器2

Base address: AGTn = 0x400E\_8000 + 0x0100 × n (n = 0 to 5)

Offset address: 0x0A

| Bit | Symbol   | Function  | R/W |
|-----|----------|---|-----|
| 2:0 | CKS[2:0] | AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio*1*2*3<br>0 0 0: 1/1<br>0 0 1: 1/2<br>0 1 0: 1/4<br>0 1 1: 1/8<br>1 0 0: 1/16<br>1 0 1: 1/32<br>1 1 0: 1/64<br>1 1 1: 1/128 | R/W |
| 6:3 | —        | These bits are read as 0. The write value should be 0.  | R/W |
| 7   | LPM      | Low Power Mode<br>0: Normal mode<br>1: Low power mode   | R/W |

Note 1. Do not rewrite the CKS[2:0] bits during count operation. Only rewrite the CKS[2:0] bits when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 2. When count source is AGTLCLK or AGTSCLK, the switch of CKS[2:0] bits is valid.

Note 3. Do not switch the TCK[2:0] bits in the AGTMR1 register when CKS[2:0] bits are not 000b. Switch the TCK[2:0] bits in the AGTMR1 register after CKS[2:0] bits are set to 000b, and wait for 1 cycle of the count source.

#### CKS[2:0] bit (AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio)

CKS[2:0] bits select the Count Source Clock Frequency Division Ratio for AGTLCLK or AGTSCLK.

#### LPM bit (Low Power Mode)

The LPM bit sets the low power operation, which impacts access to certain AGT registers. Set this bit to 1 to operate in low power.

When this bit is 1, access to the following registers is prohibited:

- AGT/AGTCMA/AGTCMB/AGTCR.

After this bit is switched from 1 to 0, the first access to the register is constrained as follows:

- When reading from the AGT register, read AGT register twice. Only the second reading of data is valid.
- When writing to the AGT, AGTCMA, AGTCMB, and AGTCR register, allow at least 2 cycles of the count source clock when writing to the register.
- When confirm the value written to the AGT, AGTCMA, AGTCMB, and AGTCR registers.
  - When the count operation is stopped; after writing data, it can be read in the next cycle.
  - When the count operation is operating; after writing data, it can be written 4 cycles after the count source clock.

Figure 22.2 shows the flow of how to write LPM bit

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 2:0 | CKS[2:0] | AGTLCLK或AGTSCLK计数源时钟分频比*1*2*3<br>0 0 0: 1/1<br>0 0 1: 1/2<br>0 1 0: 1/4<br>0 1 1: 1/8<br>1 0 0: 1/16<br>1 0 1: 1/32<br>1 1 0: 1/64<br>1 1 1: 1/128 | R/W |
| 6:3 | —        | 这些位被读取为0。写入值应为0。   | R/W |
| 7   | LPM      | 低功耗模式<br>0: 正常模式1: 低功耗模式   | R/W |

注1.在计数操作期间不要重写CKS[2:0]位。仅当AGTCR寄存器中的TSTART位和TCSTF标志都设置为0（计数停止）时才重写CKS[2:0]位。

注2.当计数源为AGTLCLK或AGTSCLK时，CKS[2:0]位的切换有效。

注3.当CKS[2:0]位不是000b时，不要切换AGTMR1寄存器中的TCK[2:0]位。在CKS[2:0]位设置为000b后，切换AGTMR1寄存器中的TCK[2:0]位，并等待计数源的1个周期。

#### CKS[2:0]位 (AGTLCLK或AGTSCLK计数源时钟分频比)

CKS[2:0]位选择AGTLCLK或AGTSCLK的计数源时钟分频比。

#### LPM位 (低功耗模式)

LPM位设置低功耗操作，这会影响对某些AGT寄存器的访问。将此位设置为1以在低功耗下工作。

该位为1时，禁止访问以下寄存器：

- AGT/AGTCMA/AGTCMB/AGTCR.

该位由1变为0后，对寄存器的第一次访问受到如下约束：

- 读取AGT寄存器时，读取AGT寄存器两次。只有第二次读取数据是有效的。
- 写入AGT、AGTCMA、AGTCMB和AGTCR寄存器时，写入寄存器时至少允许计数源时钟的2个周期。
- 确认写入AGT、AGTCMA、AGTCMB、AGTCR寄存器的值时。
  - 当计数操作停止时；写入数据后，可以在下一个周期读取。
  - 当计数操作正在运行时；写入数据后，可在计数源时钟后4个周期写入。

图22.2显示如何写入LPM位的流程

Figure 22.2 LPM how to write flow chart

### 22.2.7 AGTIOC : AGT I/O Control Register

Base address: AGTn = 0x400E\_8000 + 0x0100 × n (n = 0 to 5)

Offset address: 0x0C

|                    |            |           |   |     |   |         |   |   |

| 2   | TOE        | AGTOn pin Output Enable<br>0: AGTOn pin output disabled<br>1: AGTOn pin output enabled   | R/W |
| 3   | —          | This bit is read as 0. The write value should be 0.  | R/W |
| 5:4 | TIPF[1:0]  | Input Filter*3<br>These bits specifies the sampling frequency of the filter for the AGTIO pin. If the input to the AGTIO pin is sampled and the value matches three successive times, that value is taken as the input value.<br>0 0: No filter<br>0 1: Filter sampled at PCLKB<br>1 0: Filter sampled at PCLKB/8<br>1 1: Filter sampled at PCLKB/32 | R/W |
| 7:6 | TIOGT[1:0] | Count Control*1 *2<br>0 0: Event is always counted<br>0 1: Event is counted during polarity period specified for AGTEEn pin<br>Others: Setting prohibited  | R/W |

Note 1. When AGTEEn pin is used, the polarity to count an event can be selected with the EEPS bit in the AGTISR register.

Note 2. TIOGT[1:0] bits are enabled only in event counter mode.

Note 3. When event counter mode operation is performed during Software Standby and Deep Software Standby mode, the digital filter function cannot be used.

#### TEDGSEL bit (I/O Polarity Switch)

The TEDGSEL bit switches the AGTOn pin output polarity and the AGTIO pin input/output edge and polarity.

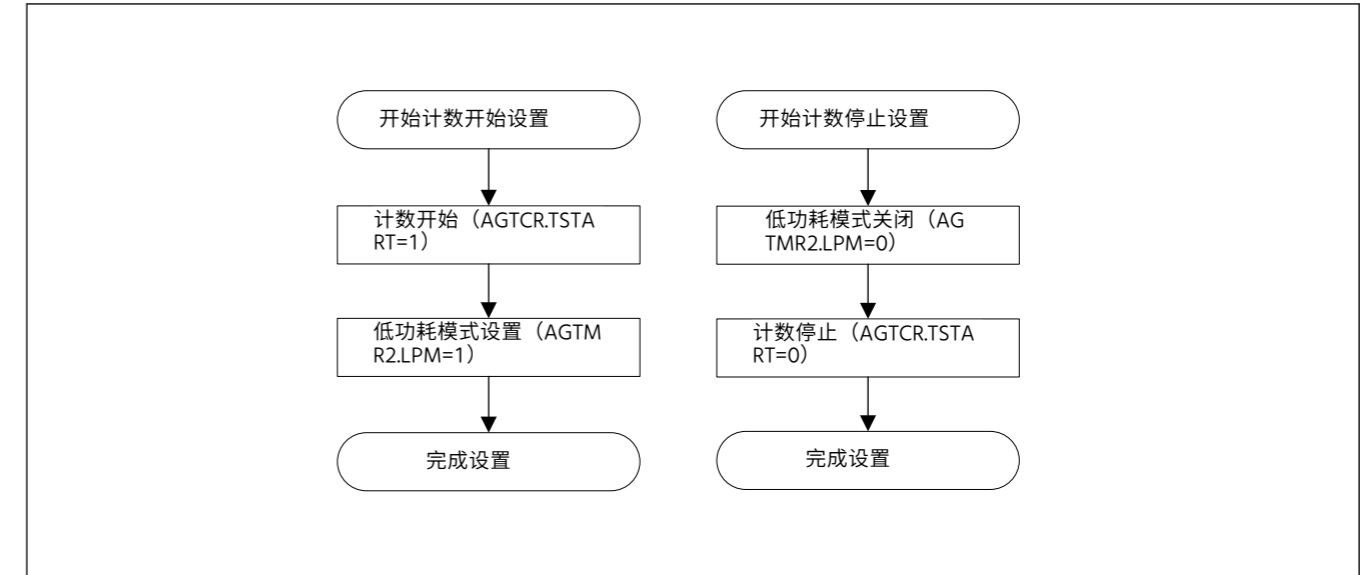

Figure 22.2 LPM如何写流程图

### 22.2.7 AGTIOC:AGTIO控制寄存器

Base address: AGTn = 0x400E\_8000 + 0x0100 × n (n = 0 to 5)

Offset address: 0x0C

|               |            |           |   |     |   |         |   |   |

| 3   | —          | 该位读取为0。写入值应为0。   | R/W |
| 5:4 | TIPF[1:0]  | 输入滤波器*3<br>这些位指定AGTIO pin输入的滤波器采样频率。如果对AGTIO pin的输入进行采样并且值连续匹配3次, 则将该值作为输入值。<br>00: 无滤波器01: 滤波器在PCLKB1采样0: 滤波器在PCLKB8采样<br>11: 滤波器在PCLKB32采样 | R/W |
| 7:6 | TIOGT[1:0] | 计数控制*1*2<br>00: 始终计数事件01: 在为AGTEEn引脚指定的极性周期内计数事件<br>其他: 禁止设置   | R/W |

注1.使用AGTEEn引脚时, 可以通过AGTISR寄存器中的EEPS位选择计数事件的极性。

注2.TIOGT[1:0]位仅在事件计数器模式下启用。

注3.在软件待机和深度软件待机模式期间执行事件计数器模式操作时, 不能使用数字滤波器功能。

#### TEDGSEL位 (IO极性开关)

TEDGSEL位切换AGTOn引脚输出极性和AGTIO pin输入输出边沿和极性。

In pulse output mode, it only controls polarity of the AGTOn pin output and AGTIO pin output. AGTOn pin output and AGTIO pin output are initialized when the AGTMR1 register is written or the TSTOP bit in the AGTCR register is written with 1.

#### TOE bit (AGTOn pin Output Enable)

The TOE bit selects whether the AGTOn pin output is disabled or enabled.

#### TIPF[1:0] bits (Input Filter)

The TIPF[1:0] bits specify the sampling frequency of the AGTIO pin input filter. When the input to the AGTIO pin is sampled and the values match three times in succession, the value is regarded as the input value.

#### TIOGT[1:0] bits (Count Control)

The TIOGT[1:0] bits control the event count.

Table 22.3 AGTIO pin I/O edge and polarity switching

| Operating mode                | Function  |
|-------------------------------|---|
| Timer mode                    | Not used  |
| Pulse output mode             | 0: Output is started at high (initialization level: high) i.e. inverted output<br>1: Output is started at low (initialization level: low). i.e. normal output |
| Event counter mode            | 0: Count on rising edge<br>1: Count on falling edge.  |
| Pulse width measurement mode  | 0: Low-level width is measured<br>1: High-level width is measured.  |
| Pulse period measurement mode | 0: Measure from one rising edge to the next rising edge<br>1: Measure from one falling edge to the next falling edge.   |

Note: When the TOE bit is 0, the pin state is Hi-Z.

Table 22.4 AGTOn pin output polarity switching

| Operating mode | Function   |
|----------------|--|
| All modes      | 0: Output is started at low (initial level: low): Normal output<br>1: Output is started at high (initial level: high): Inverted output |

Note: When the TOE bit is 0, a value according to the set value of the TEDGSEL bit in the pulse output mode is output.

### 22.2.8 AGTISR : AGT Event Pin Select Register

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  (n = 0 to 5)

Offset address: 0x0D

| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2    | 1 | 0 |
|--------------------|---|---|---|---|---|------|---|---|
| Bit field:         | — | — | — | — | — | EEPS | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0    | 0 | 0 |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 1:0 | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 2   | EEPS   | AGTEEn Polarity Selection<br>0: An event is counted during the low-level period<br>1: An event is counted during the high-level period | R/W |
| 7:3 | —      | These bits are read as 0. The write value should be 0.   | R/W |

#### EEPS bit (AGTEEn Polarity Selection)

The EEPS bit selects the polarity of events to be counted.

在脉冲输出模式下，它只控制AGTOn引脚输出和AGTIO引脚输出的极性。AGTOn引脚输出和AGTIO引脚输出被初始化。当AGTMR1寄存器被写入或AGTCR寄存器中的TSTOP位被写入1时，AGTIO引脚输出被初始化。

#### TOE位 (AGTOn引脚输出使能)

TOE位选择是禁用还是启用AGTOn引脚输出。

#### TIPF[1:0] bits (Input Filter)

TIPF[1:0]位指定AGTIO引脚输入滤波器的采样频率。当AGTIO引脚的输入被采样并且值连续匹配3次时，该值被认为是输入值。

#### TIOGT[1:0] bits (Count Control)

TIOGT[1:0]位控制事件计数。

Table 22.3 AGTIO引脚IO边沿和极性切换

| 操作模式     | Function  |
|----------|---|
| 定时器模式    | 不曾用过  |
| 脉冲输出方式   | 0: 输出从高开始 (初始化电平: 高), 即反相输出<br>1: 输出从低开始 (初始化电平: 低)。即正常输出 |
| 事件计数器模式  | 0: 上升沿计数<br>1: 下降沿计数。                                     |
| 脉宽测量模式   | 0: 测量低电平宽度<br>1: 测量高电平宽度。                                 |
| 脉冲周期测量模式 | 0: 从一个上升沿测量到下一个上升沿<br>1: 从一个下降沿测量到下一个下降沿。                 |

Note: 当TOE位为0时，引脚状态为Hi-Z。

Table 22.4 AGTOn引脚输出极性切换

| 操作模式 | Function   |
|------|--|
| 所有模式 | 0: 低电平开始输出 (初始电平: 低电平): 正常输出<br>1: 高电平开始输出 (初始电平: 高电平): 反相输出 |

Note: TOE位为0时，输出与脉冲输出模式下的TEDGSEL位的设定值对应的值。

### 22.2.8 AGTISR:AGT事件引脚选择寄存器

Base address:  $AGTn = 0x400E\_8000 + 0x0100 \times n$  (n = 0 to 5)

Offset address: 0x0D

| Bit position: | 7 | 6 | 5 | 4 | 3 | 2    | 1 | 0 |
|---------------|---|---|---|---|---|------|---|---|
| Bit field:    | — | — | — | — | — | EEPS | — | — |

Note 1. You must set the Pin Function Select Register. See [section 19, I/O Ports](#).

The AGTIOSEL register sets the AGTIO pin when using the AGTIO pin in Deep Software Standby mode and Software Standby mode.

#### SEL[1:0] bits (AGTIO pin Select)

The SEL[1:0] bits select the AGTIO pin function.

#### TIES bit (AGTIO pin Input Enable)

The TIES bit enables or disables an external event input.

## 22.3 Operation

### 22.3.1 Reload Register and Counter Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and the counter differs depending on the value of the TSTART bit in the AGTCR register and of the TCMEA or TCMEB bit in the AGTCMSR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and the counter. When the TSTART bit is 1 (count starts) and the TCMEA bit and TCMEB bit are 0 (AGT compare match A/B register are invalid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the next count source. When the TSTART bit is 1 (count starts) and the TCMEA bit or the TCMEB bit is 1 (AGT compare match A register or compare match B register is valid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the underflow of the counter.

[Figure 22.3](#) and [Figure 22.4](#) show the timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value.

| 4   | TIES     | AGTIO引脚输入使能<br>0: 在软件待机模式下禁用外部事件输入<br>1: 在软件待机模式下启用外部事件输入   | R/W |
| 7:5 | —        | 这些位被读取为0。写入值应为0。  | R/W |

注1.您必须设置引脚功能选择寄存器。请参阅第19节，IO端口。

当在深度软件待机模式和软件中使用AGTIO引脚时，AGTIOSEL寄存器设置AGTIO引脚待机模式。

#### SEL[1:0]位 (AGTIO引脚选择)

SEL[1:0]位选择AGTIO引脚功能。

#### TIES位 (AGTIO引脚输入使能)

TIES位启用或禁用外部事件输入。

## 22.3 Operation

### 22.3.1 重载寄存器和计数器重写操作

无论操作模式如何，对重载寄存器和计数器的重写操作的时序根据AGTCR寄存器中的TSTART位和AGTCMSR寄存器中的TCMEA或TCMEB位的值而有所不同。当TSTART位为0（计数停止）时，计数值直接写入重载寄存器和计数器。当TSTART位为1（计数开始）且TCMEA位和TCMEB位为0（AGT比较匹配A/B寄存器无效）时，将值与计数源同步写入重载寄存器，然后写入计数器与下一个计数源同步。当TSTART位为1（计数开始）且TCMEA位或TCMEB位为1（AGT比较匹配A寄存器或比较匹配B寄存器有效）时，值与计数源同步写入重载寄存器，然后与计数器的下溢同步到计数器。

图22.3和图22.4显示了使用TSTART位值和TCMEA/TCMEB位值进行重写操作的时序。

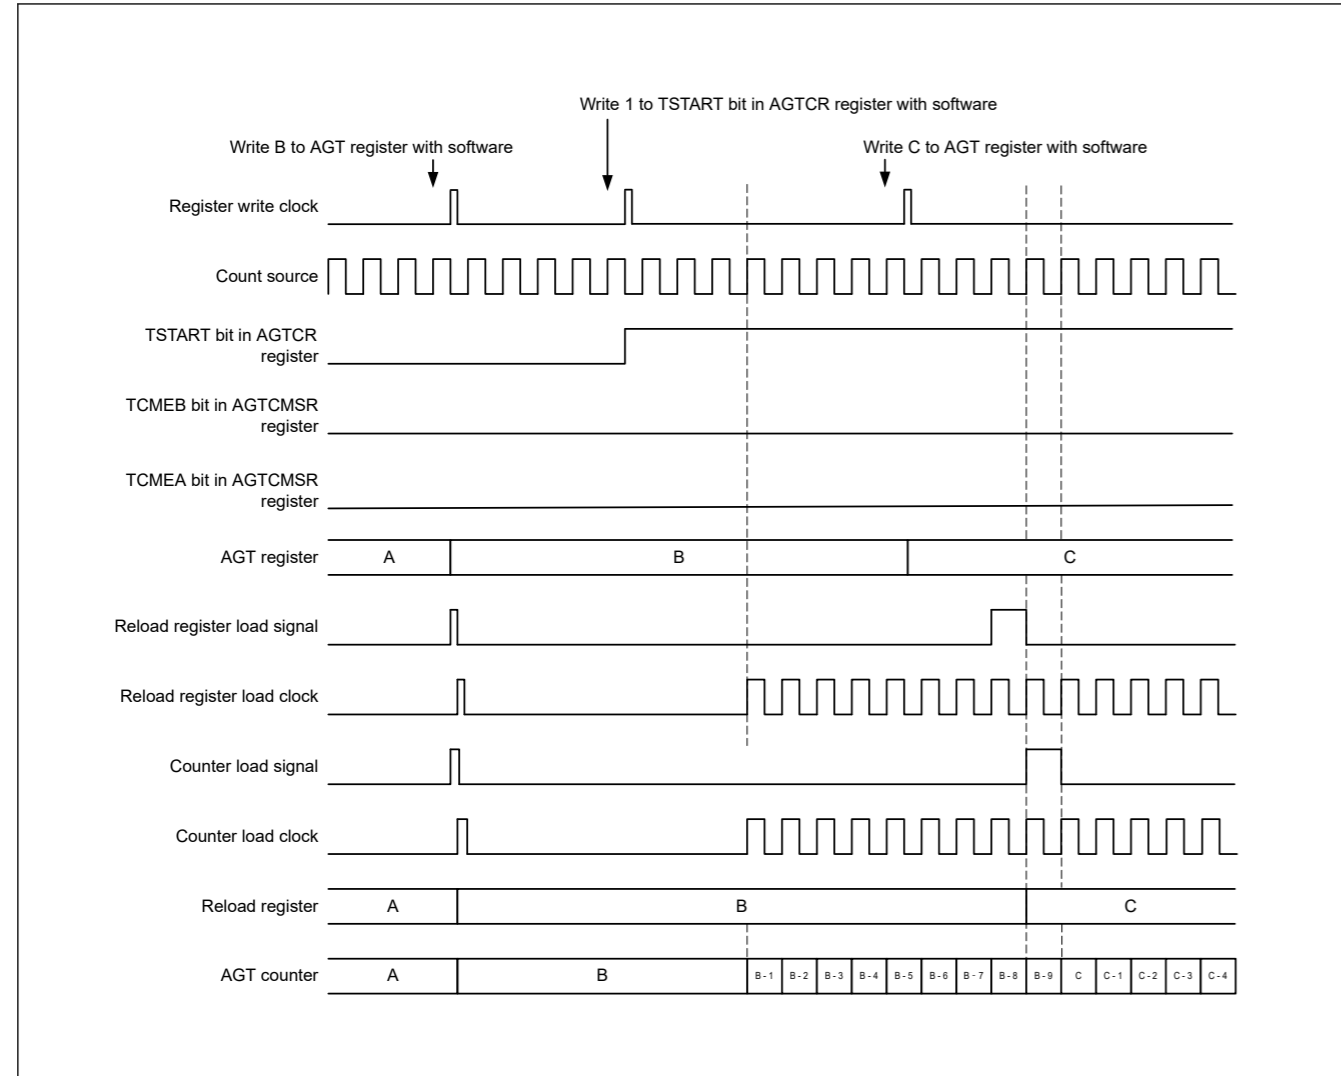

Figure 22.3 Timing of rewrite operation with TSTART bit value and TCMEA or TCMEB bit value when AGT compare match A register or AGT compare match B register is invalid

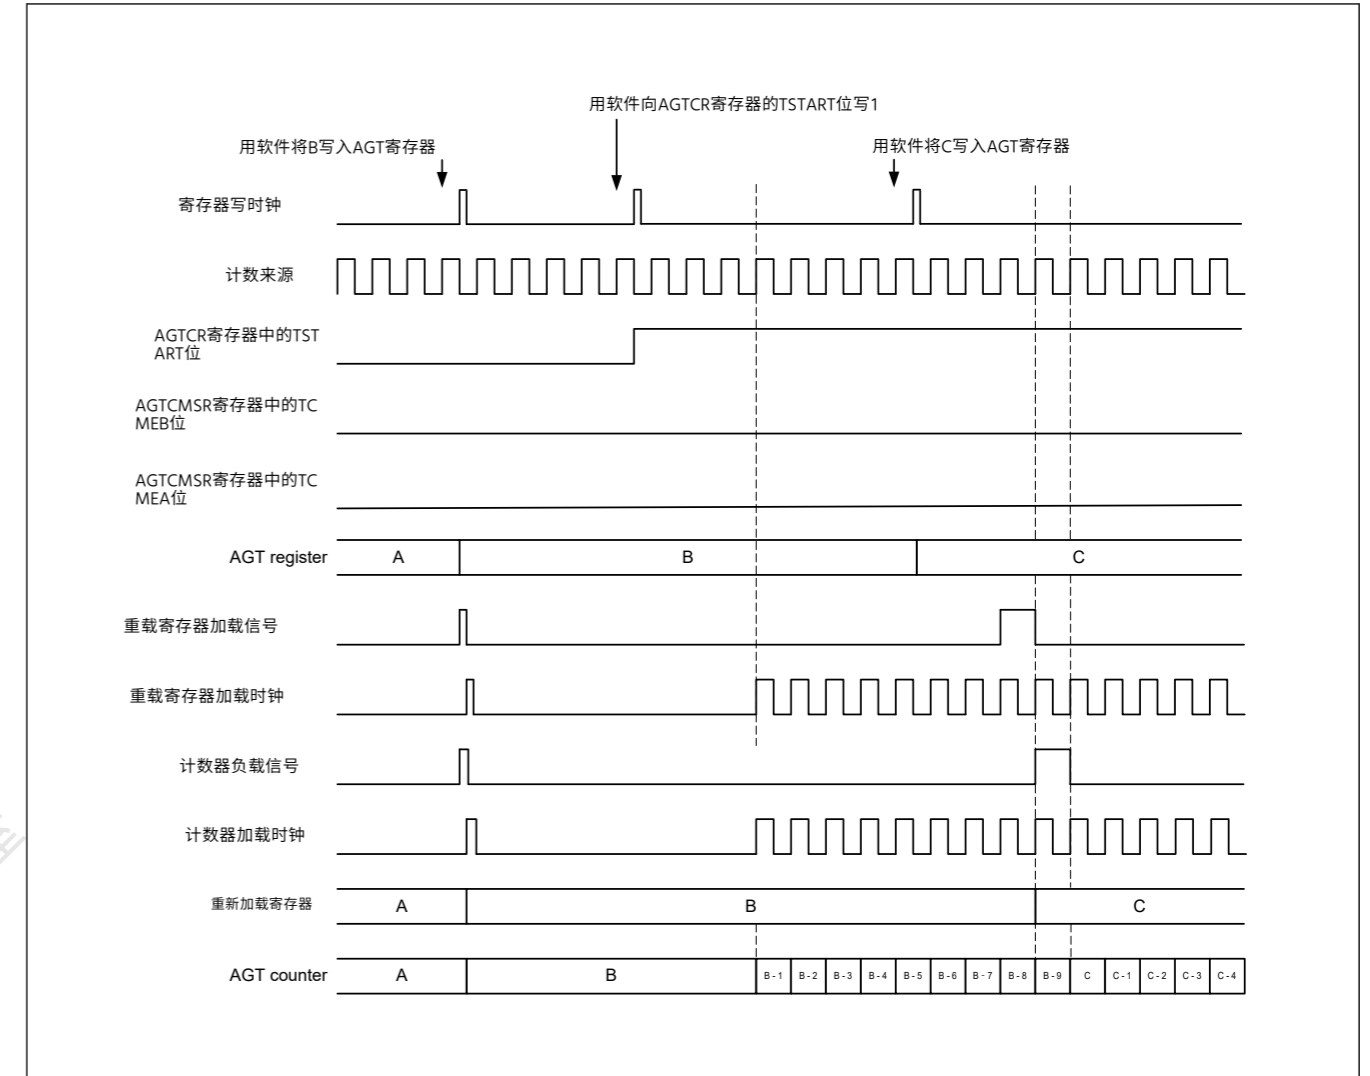

Figure 22.3 当AGT比较匹配A寄存器或AGT比较匹配B寄存器无效时，使用TSTART位值和TCMEA或TCMEB位值进行重写操作的时序

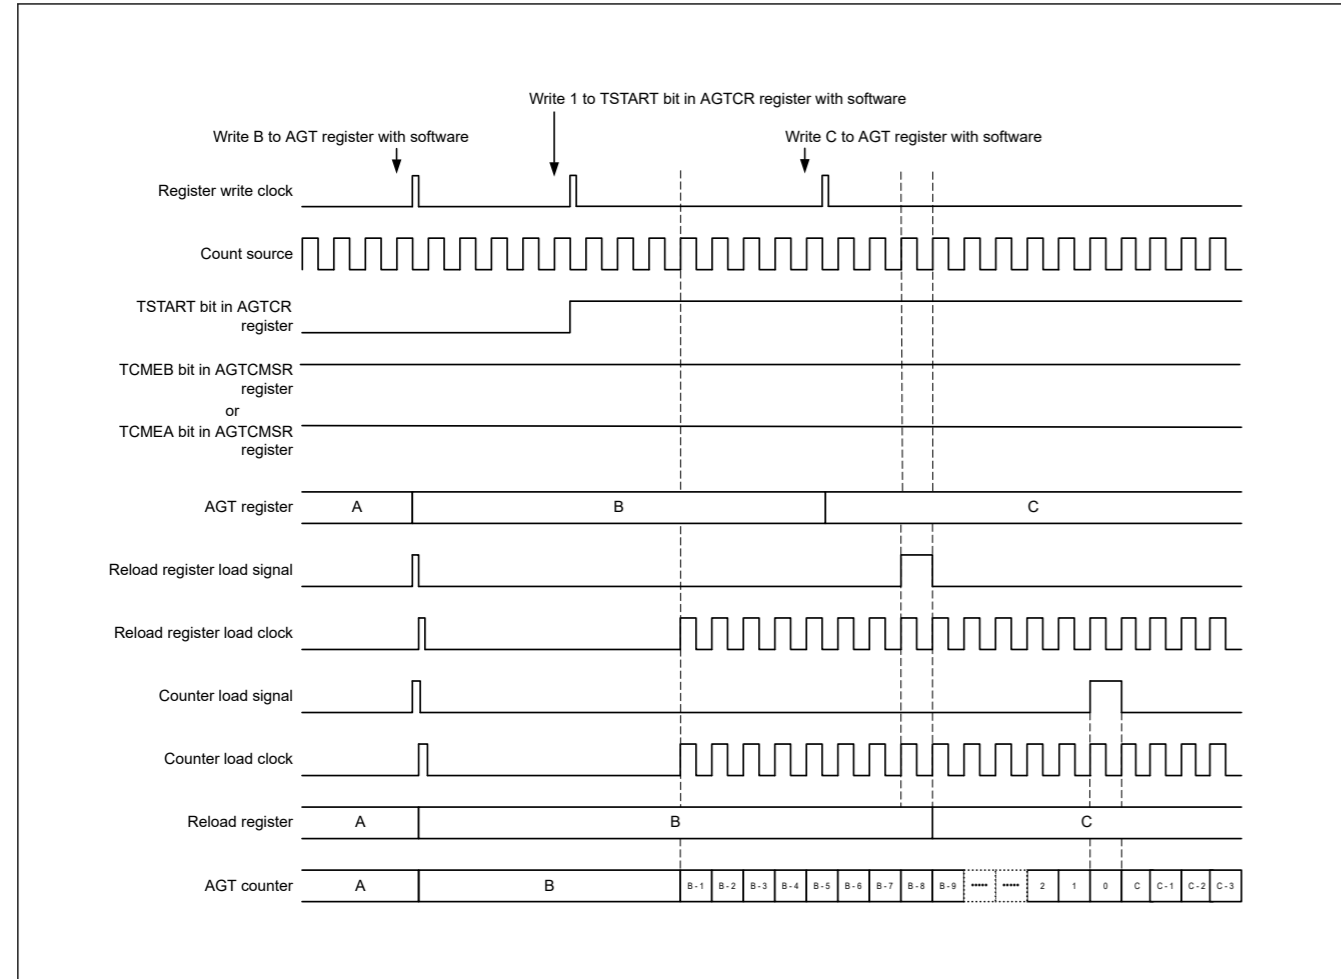

Figure 22.4 Timing of rewrite operation with TSTART bit value and TCMEA or TCMEB bit value when AGT compare match A register or AGT compare match B register is valid

### 22.3.2 Reload Register and AGT Compare Match A/B Register Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and AGT compare register A/B depends on the value of the TSTART bit in the AGTCR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and AGT compare register A/B. When the TSTART bit is 1 (count starts), the value is written to the reload register in synchronization with the count source, and then to the compare register in synchronization with the underflow of the counter.

Figure 22.5 shows the timing of rewrite operation with TSTART bit value for compare register A. AGT Compare register B is of the same timing as AGT compare register A.

Figure 22.4 当AGT比较匹配A寄存器或AGT比较匹配B寄存器有效时，使用TSTART位值和TCMEA或TCMEB位值进行重写操作的时序

### 22.3.2 重载寄存器和AGT比较匹配AB寄存器重写操作

不管操作模式如何，对重载寄存器和AGT比较寄存器AB的重写操作的时序取决于AGTCR寄存器中TSTART位的值。当TSTART位为0（计数停止）时，计数值直接写入重载寄存器和AGT比较寄存器AB。当TSTART位为1（计数开始）时，该值同步写入重载寄存器计数源，然后与计数器的下溢同步到比较寄存器。

图22.5显示了比较寄存器A的TSTART位值的重写操作时序。AGT比较寄存器B与AGT比较寄存器A的时序相同。

Figure 22.5 Timing of rewrite operation with the TSTART bit value for AGT compare register A

### 22.3.3 Timer Mode

In this mode, the AGT counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register. In timer mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x0000 and the next count source is input, an underflow occurs and an interrupt request is generated.

Figure 22.6 shows the operation example in timer mode.

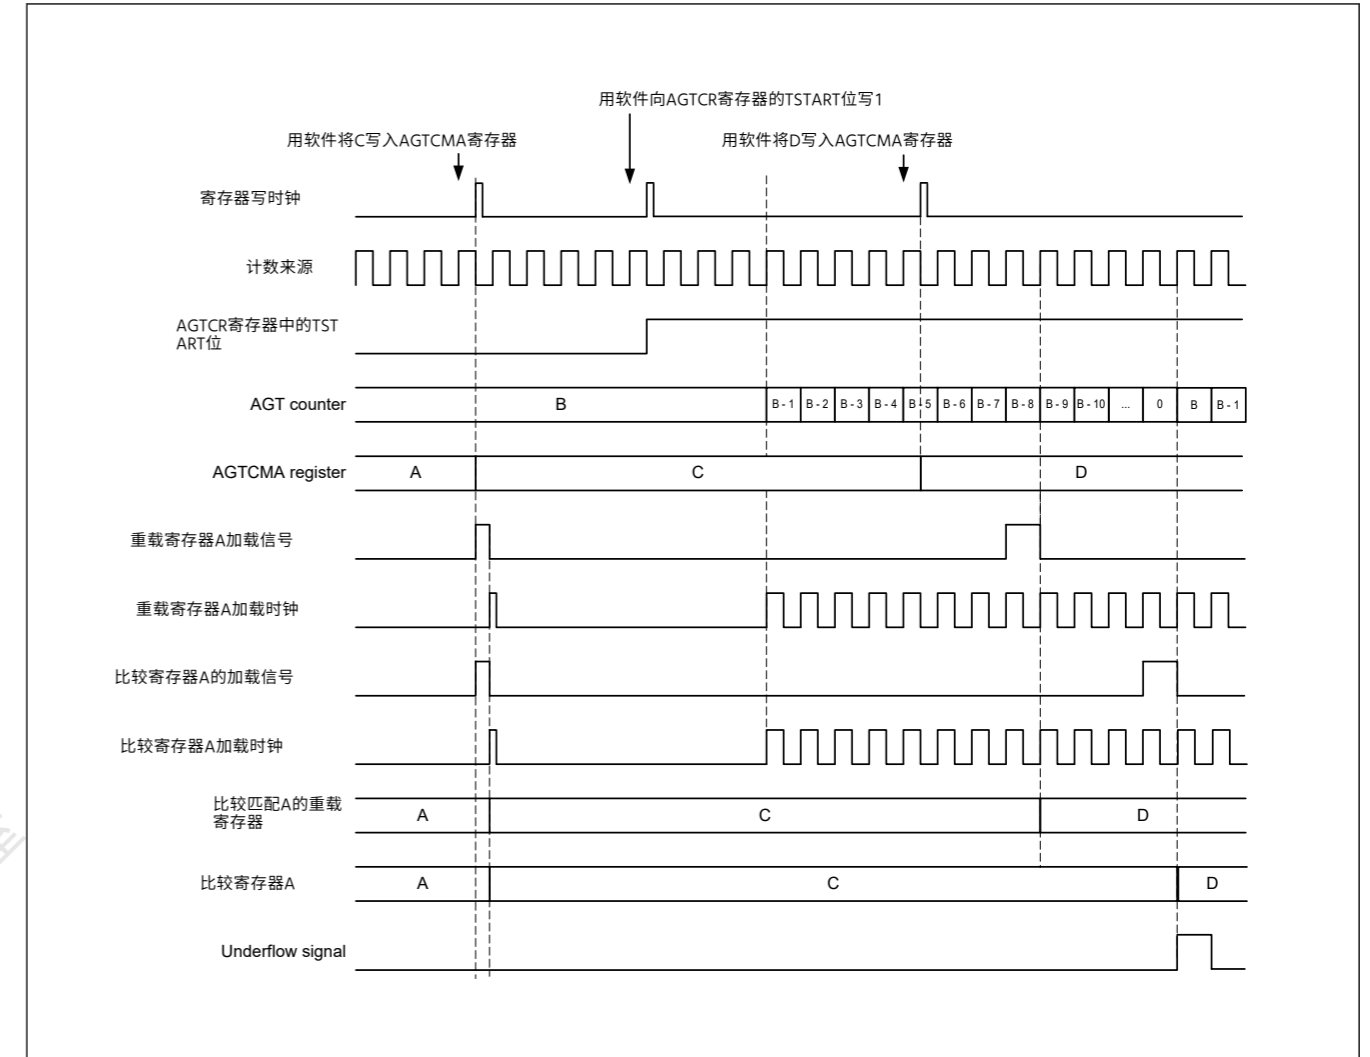

Figure 22.5 AGT比较寄存器A的TSTART位值的重写操作时序

### 22.3.3 定时器模式

在此模式下，AGT计数器按AGTMR1寄存器中的TCK[2:0]位选择的计数源递减。在定时器模式下，计数值在计数源的每个上升沿减1。当计数值达到0x0000并输入下一个计数源时，发生下溢并产生中断请求。

图22.6显示了定时器模式下的操作示例。

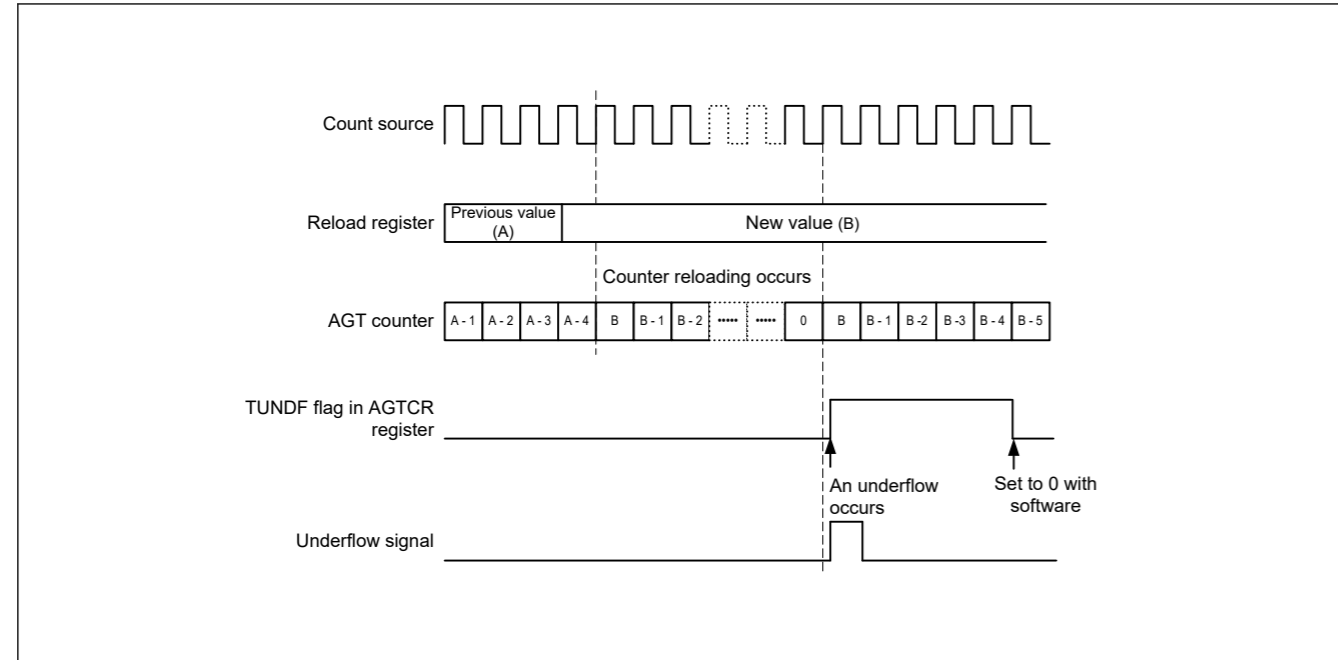

Figure 22.6 Operation example in timer mode

### 22.3.4 Pulse Output Mode

In pulse output mode, the counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and the output level of the AGTIO<sub>n</sub> and AGTOn pins inverted each time an underflow occurs.

In pulse output mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x0000 and the next count source is input, an underflow occurs and an interrupt request is generated. In addition, a pulse can be output from the AGTIO<sub>n</sub> and AGTOn pins. The output level is inverted each time an underflow occurs. The pulse output from the AGTOn pin can be stopped with the TOE bit in the AGTIOC register. The output level can be selected with the TEDGSEL bit in the AGTIOC register.

Figure 22.7 shows the operation example in pulse output mode.

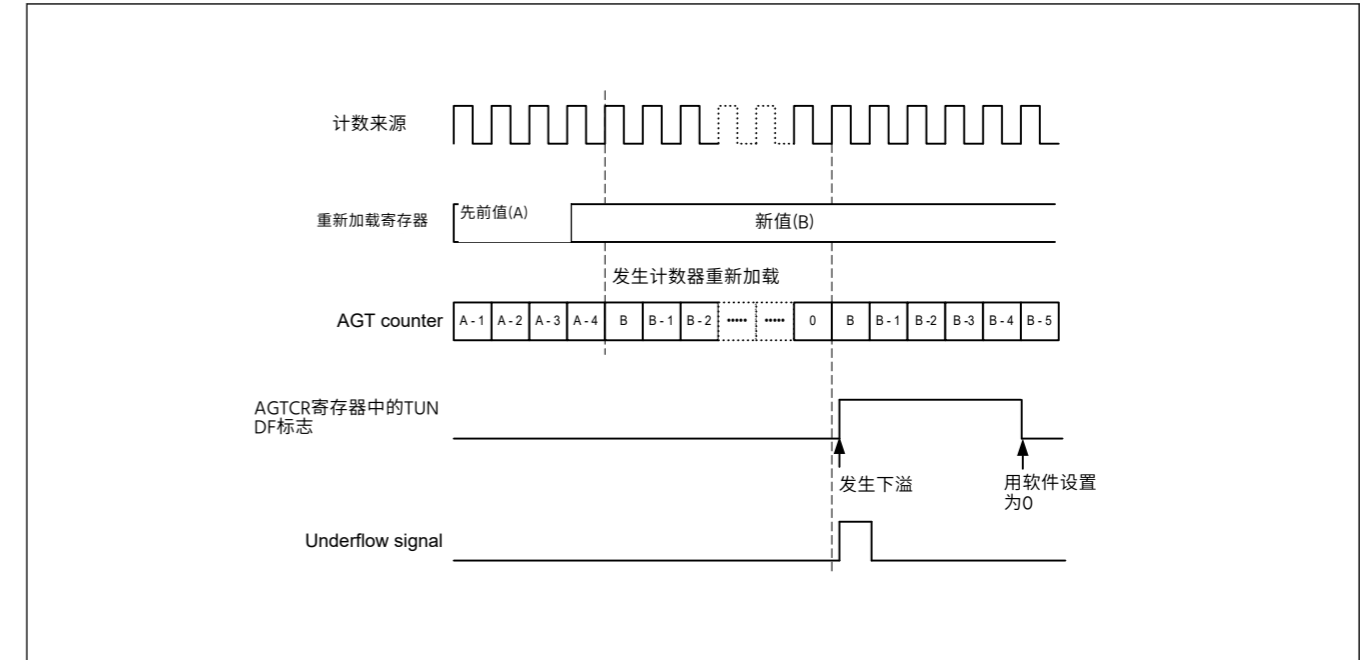

Figure 22.6 定时器模式下的操作示例

### 22.3.4 脉冲输出方式

在脉冲输出模式下，计数器由AGTMR1寄存器中的TCK[2:0]位选择的计数源递减，并且每次发生下溢时反转AGTIO<sub>n</sub>和AGTOn引脚的输出电平。

在脉冲输出模式下，计数值在计数源的每个上升沿减1。当计数值达到0x0000并输入下一个计数源时，发生下溢并产生中断请求。此外，可以从AGTIO<sub>n</sub>和AGTOn引脚输出脉冲。每次发生下溢时，输出电平都会反转。AGTOn引脚的脉冲输出可通过AGTIOC寄存器中的TOE位停止。可以通过AGTIOC寄存器中的TEDGSEL位选择输出电平。

图22.7显示了脉冲输出模式下的操作示例。

Figure 22.7 Operation example in pulse output mode

### 22.3.5 Event Counter Mode

In event counter mode, the counter is decremented by an external event signal (count source) input to the AGTIO pin. Various periods for counting events can be set with the TIOGT[1:0] bits in the AGTIOC register and AGTISR registers. In addition, the filter function for the AGTIO pin input can be specified with bits TIPF[1:0] in the AGTIOC register. The output from the AGTOn pin can be toggled even in event counter mode.

Figure 22.8 shows the operation example in event counter mode.

Figure 22.7 脉冲输出模式的动作示例

### 22.3.5 事件计数器模式

在事件计数器模式下，计数器由输入到AGTIO pin的外部事件信号（计数源）递减。可以使用AGTIOC寄存器和AGTISR寄存器中的TIOGT[1:0]位设置计数事件的各种周期。此外，AGTIO pin输入的过滤功能可通过AGTIOC寄存器中的位TIPF[1:0]指定。即使在事件计数器模式下，也可以切换AGTOn pin的输出。

图22.8显示了事件计数器模式下的操作示例。

Figure 22.8 Operation example 1 in event counter mode

Figure 22.9 shows an operation example for counting during the specified period in event counter mode (TIOGT[1:0] bits in the AGTIOC register are set to 01b).

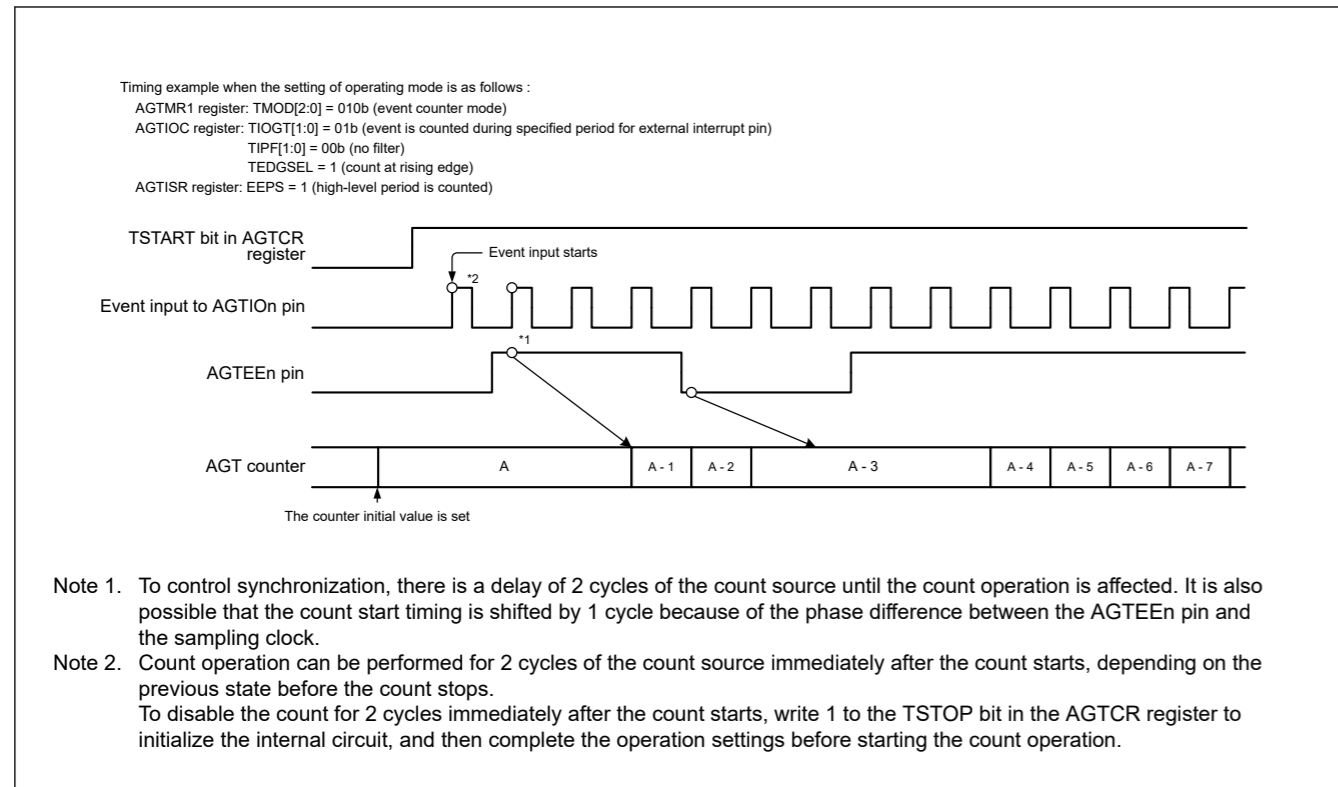

Figure 22.9 Operation example 2 in event counter mode

### 22.3.6 Pulse Width Measurement Mode

In pulse width measurement mode, the pulse width of an external signal input to the AGTIO pin is measured. When the level specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIO pin, the counter is decremented by the

Figure 22.8 事件计数器模式下的操作示例1

图22.9显示了在事件计数器模式下在指定周期内进行计数的操作示例 (AGTIOC寄存器中的TIOGT[1:0]位设置为01b)。

Figure 22.9 事件计数器模式下的操作示例2

### 22.3.6 脉冲宽度测量模式

在脉冲宽度测量模式下，测量输入到AGTIO引脚的外部信号的脉冲宽度。当AGTIOC寄存器中的TEDGSEL位指定的电平输入到AGTIO引脚时，计数器递减

count source selected with the TCK[2:0] bits in the AGTMR1 register. When the specified level on the AGTIO pin ends, the counter is stopped, the TEDGF bit in the AGTCR register is set to 1 (active edge received), and an interrupt request is generated. The measurement of pulse width data is performed by reading the count value while the counter is stopped. Also, when the counter underflows during measurement, the TUNDF bit in the AGTCR register is set to 1 and an interrupt request is generated.

Figure 22.10 shows the operation example in pulse width measurement mode.

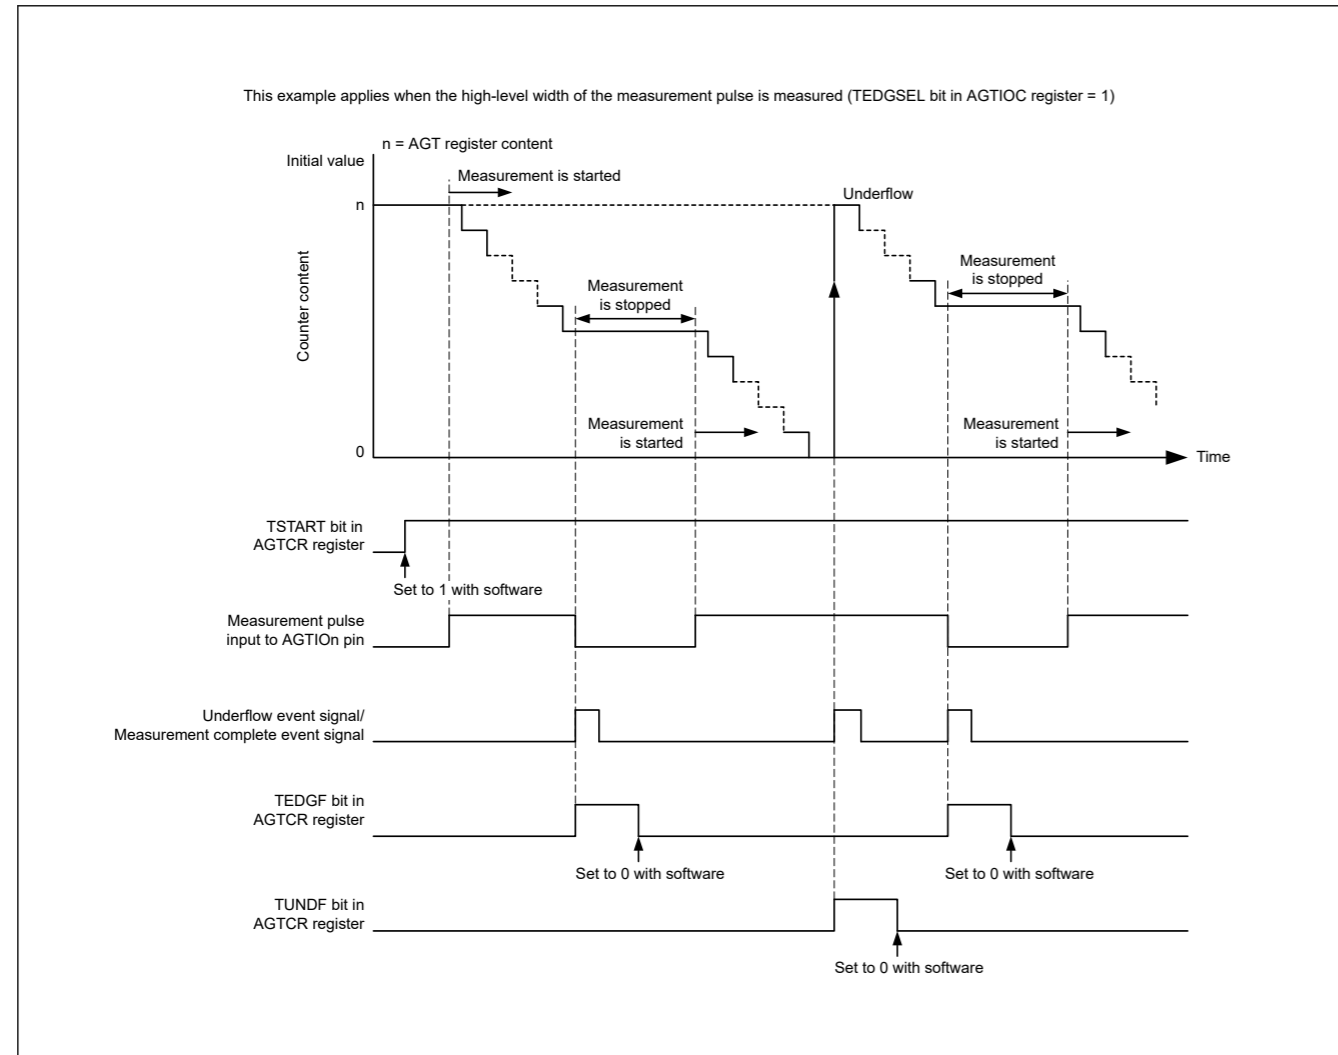

Figure 22.10 Operation example in pulse width measurement mode

### 22.3.7 Pulse Period Measurement Mode

In pulse period measurement mode, the pulse period of an external signal input to the AGTIO pin is measured. The counter is decremented by the count source selected with TCK[2:0] bits in the AGTMR1 register. When a pulse with the period specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIO pin, the count value is transferred to the read-out buffer on the rising edge of the count source. The value in the reload register is loaded to the counter at the next rising edge. Simultaneously, the TEDGF flag in the AGTCR register is set to 1 (active edge received) and an interrupt request is generated. The read-out buffer (AGT register) is read at this time and the difference from the reload value (see section 22.4.6. How to Calculate Event Number, Pulse Width, and Pulse Period) is the period data of the input pulse. The period data is retained until the read-out buffer is read. When the counter underflows, the TUNDF flag in the AGTCR register is set to 1 (underflow) and an interrupt request is generated.

Figure 22.11 shows the operation example in pulse period measurement mode.

Only input pulses with a period longer than twice the period of the count source are measured. Also, the low-level and high-level widths must both be longer than the period of the count source. If a pulse period shorter than these conditions is input, the input might be ignored.

通过AGTMR1寄存器中的TCK[2:0]位选择计数源。当AGTIO引脚上的指定电平结束时，计数器停止，AGTCR寄存器中的TEDGF位设置为1（接收到有效沿），并产生中断请求。通过在计数器停止时读取计数值来执行脉冲宽度数据的测量。此外，当测量期间计数器下溢时，AGTCR寄存器中的TUNDF位设置为1，并产生中断请求。

图22.10显示了脉宽测量模式下的操作示例。

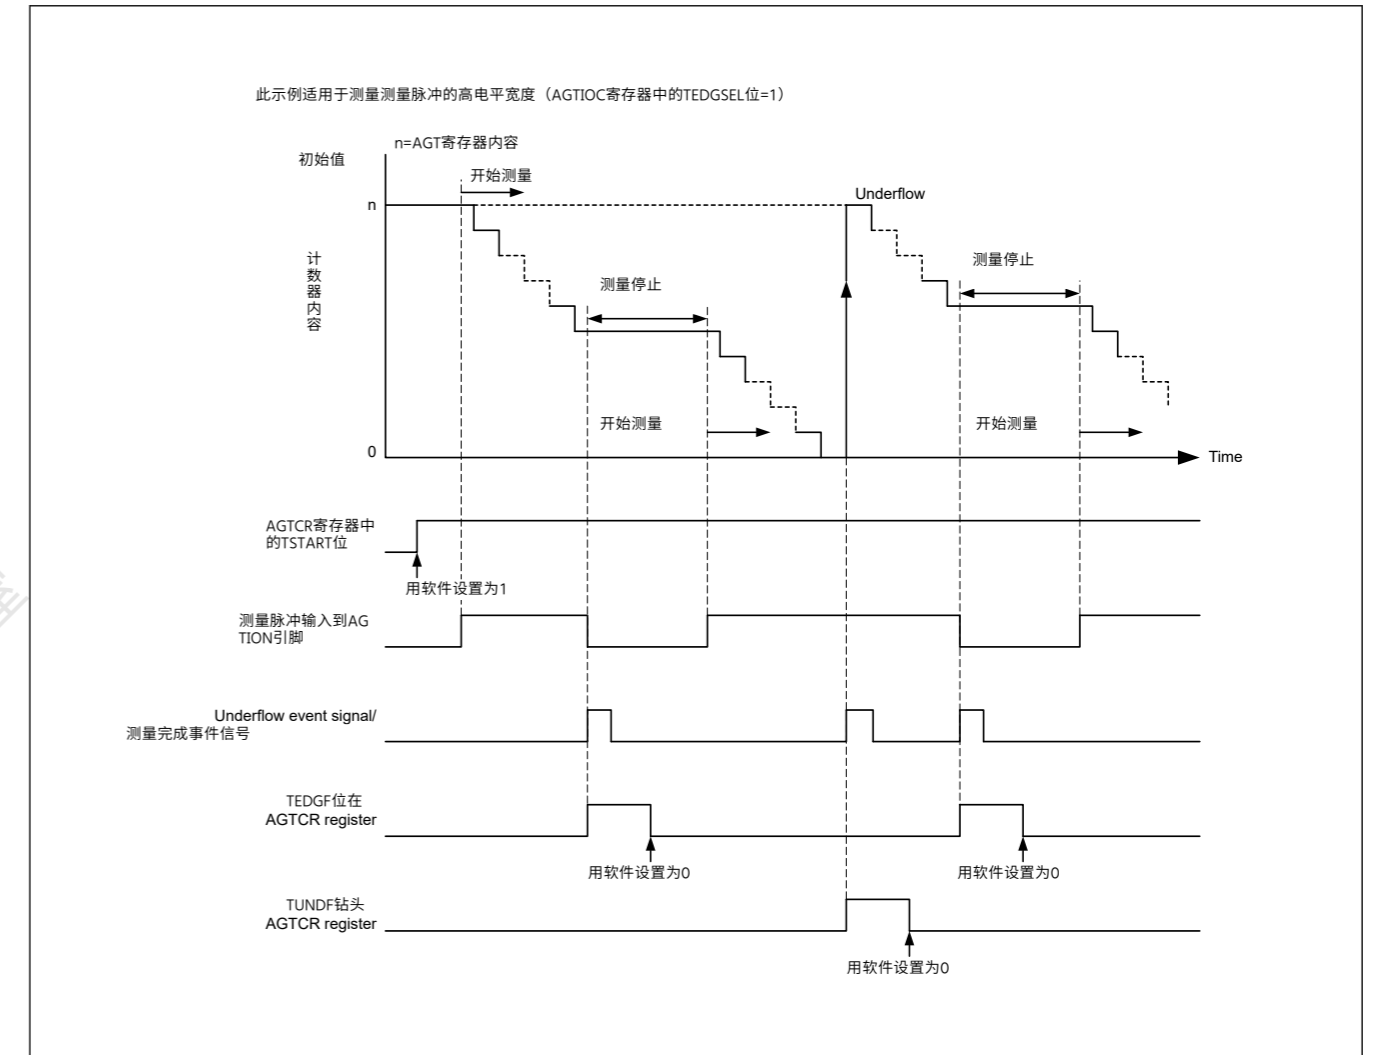

Figure 22.10 脉宽测量模式下的操作示例

### 22.3.7 脉冲周期测量模式

在脉冲周期测量模式下，测量输入到AGTIO引脚的外部信号的脉冲周期。计数器由AGTMR1寄存器中的TCK[2:0]位选择的计数源递减。当AGTIOC寄存器中TEDGSEL位指定周期的脉冲输入到AGTIO引脚时，计数值在计数源的上升沿传送到读出缓冲器。重载寄存器中的值在下一个上升沿加载到计数器。同时，AGTCR寄存器中的TEDGF标志设置为1（接收到有效沿）并产生中断请求。此时读取读出缓冲器（AGT寄存器），与重载值的差值（见22.4.6.如何计算事件数、脉冲宽度和脉冲周期）是输入脉冲的周期数据。周期数据被保留，直到读出缓冲器被读取。当计数器下溢时，AGTCR寄存器中的TUNDF标志设置为1（下溢）并产生中断请求。

图22.11显示了脉冲周期测量模式下的操作示例。

仅测量周期长于计数源周期两倍的输入脉冲。此外，低电平和高电平宽度都必须长于计数源的周期。如果输入比这些条件短的脉冲周期，输入可能会被忽略。

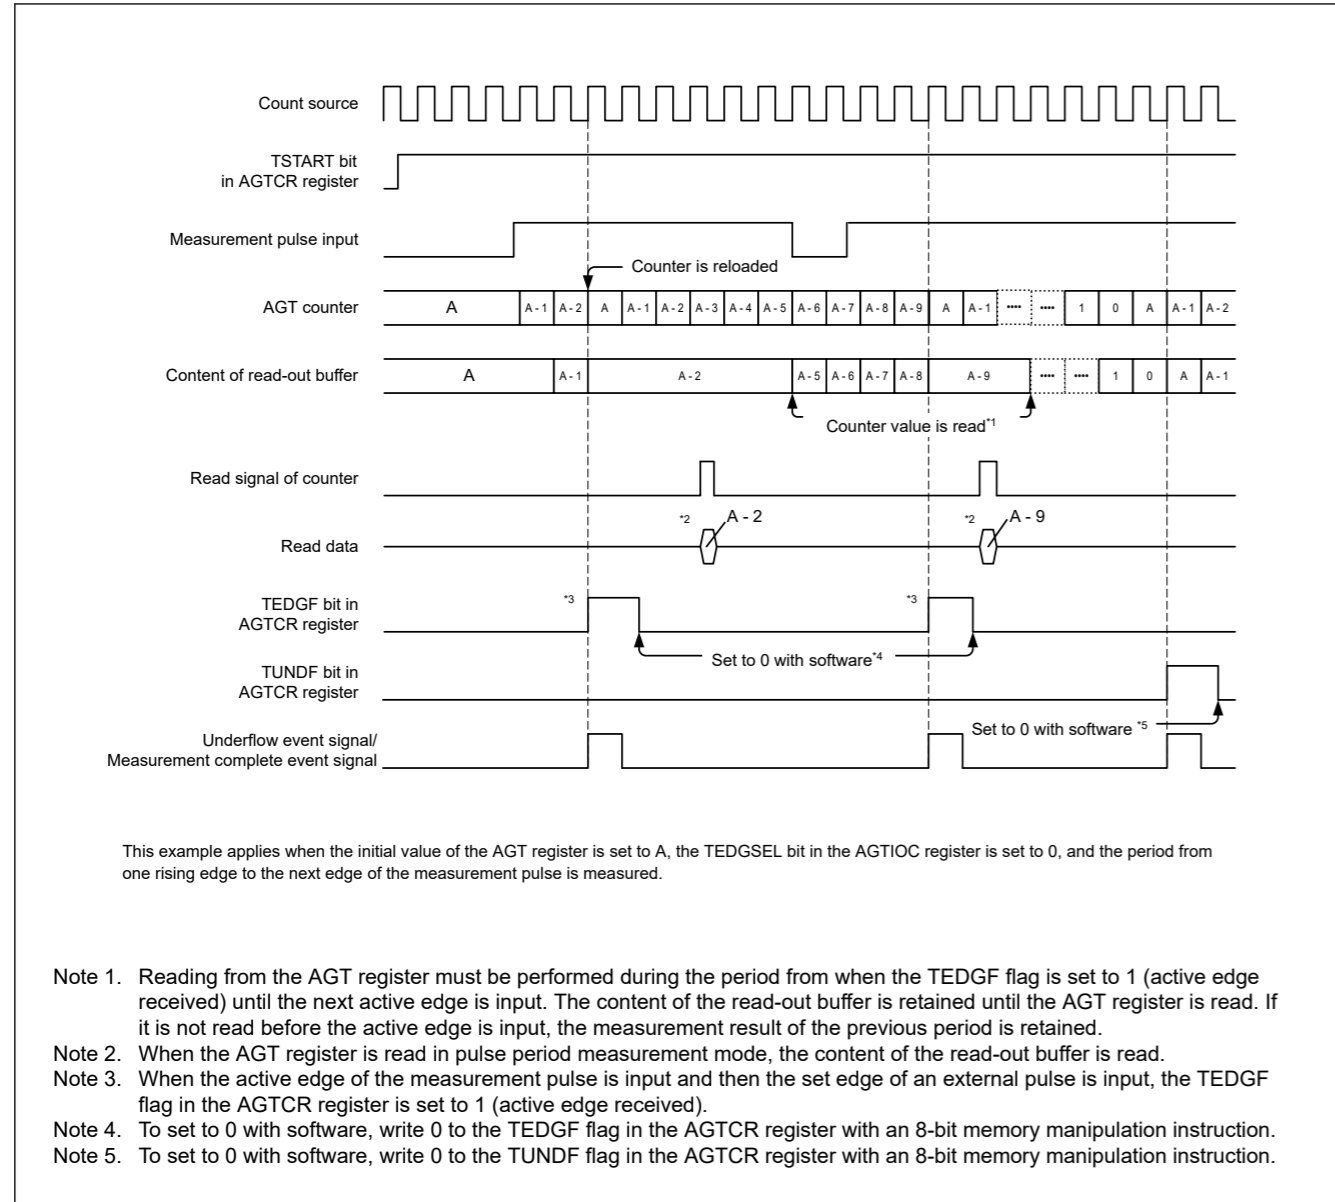

Figure 22.11 Operation example in pulse period measurement mode

### 22.3.8 Compare Match function

The compare match function detects matches (compare match) between the content of the AGTCMA or AGTCMB register and the content of the AGT register. This function is enabled when the TCMEA or TCMEB bit in the AGTCMSR register is 1 (compare match A register or compare match B register is valid). The counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and when the values of AGT and AGTCMA or AGTCMB match, the TCMAF/TCMBF flag in the AGTCR register is set to 1 (match), and an interrupt request is generated.

When the compare match function is enabled, the timing of the rewrite operation to the reload register and the counter differs. See section 22.3.1. [Reload Register and Counter Rewrite Operation](#) for details. In addition, the output level of the AGTOAn, AGTOBn pins is inverted by the match and by the underflow. The output level can be selected with the TOPOLA or TOPOLB bit in the AGTCMSR register.

Figure 22.12 shows the operation example in compare match mode.

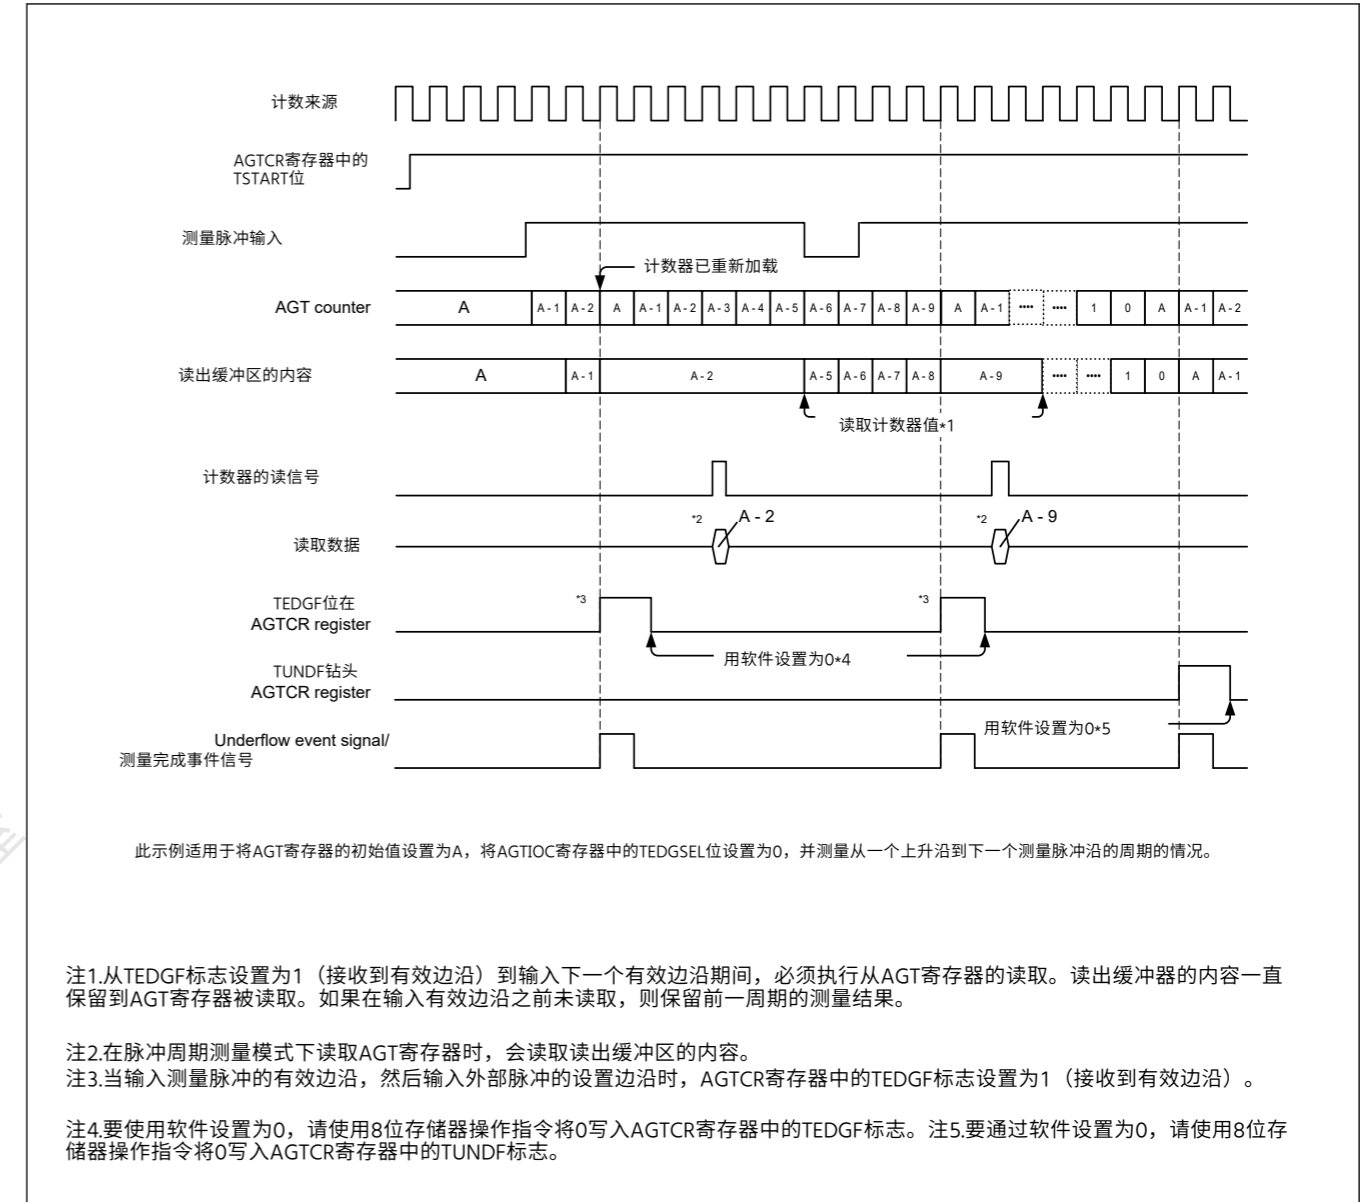

Figure 22.11 脉冲周期测量模式下的操作示例

### 22.3.8 比较匹配功能

比较匹配功能检测AGTCMA或AGTCMB寄存器的内容与AGT寄存器的内容之间的匹配（比较匹配）。该功能在AGTCMSR寄存器中的TCMEA或TCMEB位为1时使能（比较匹配A寄存器或比较匹配B寄存器有效）。计数器按AGTMR1寄存器中TCK[2:0]位选择的计数源递减，当AGT和AGTCMA或AGTCMB的值匹配时，AGTCR寄存器中的TCMAFTCMBF标志设置为1（匹配），并产生中断请求。

当比较匹配功能启用时，对重载寄存器和计数器的重写操作的时序不同。请参阅第22.3.1节。重载寄存器和计数器重写操作了解详情。此外，AGTOAn、AGTOBn引脚的输出电平通过匹配和下溢反转。输出电平可以选择与

AGTCMSR寄存器中的TOPOLA或TOPOLB位。

图22.12显示了比较匹配模式下的操作示例。

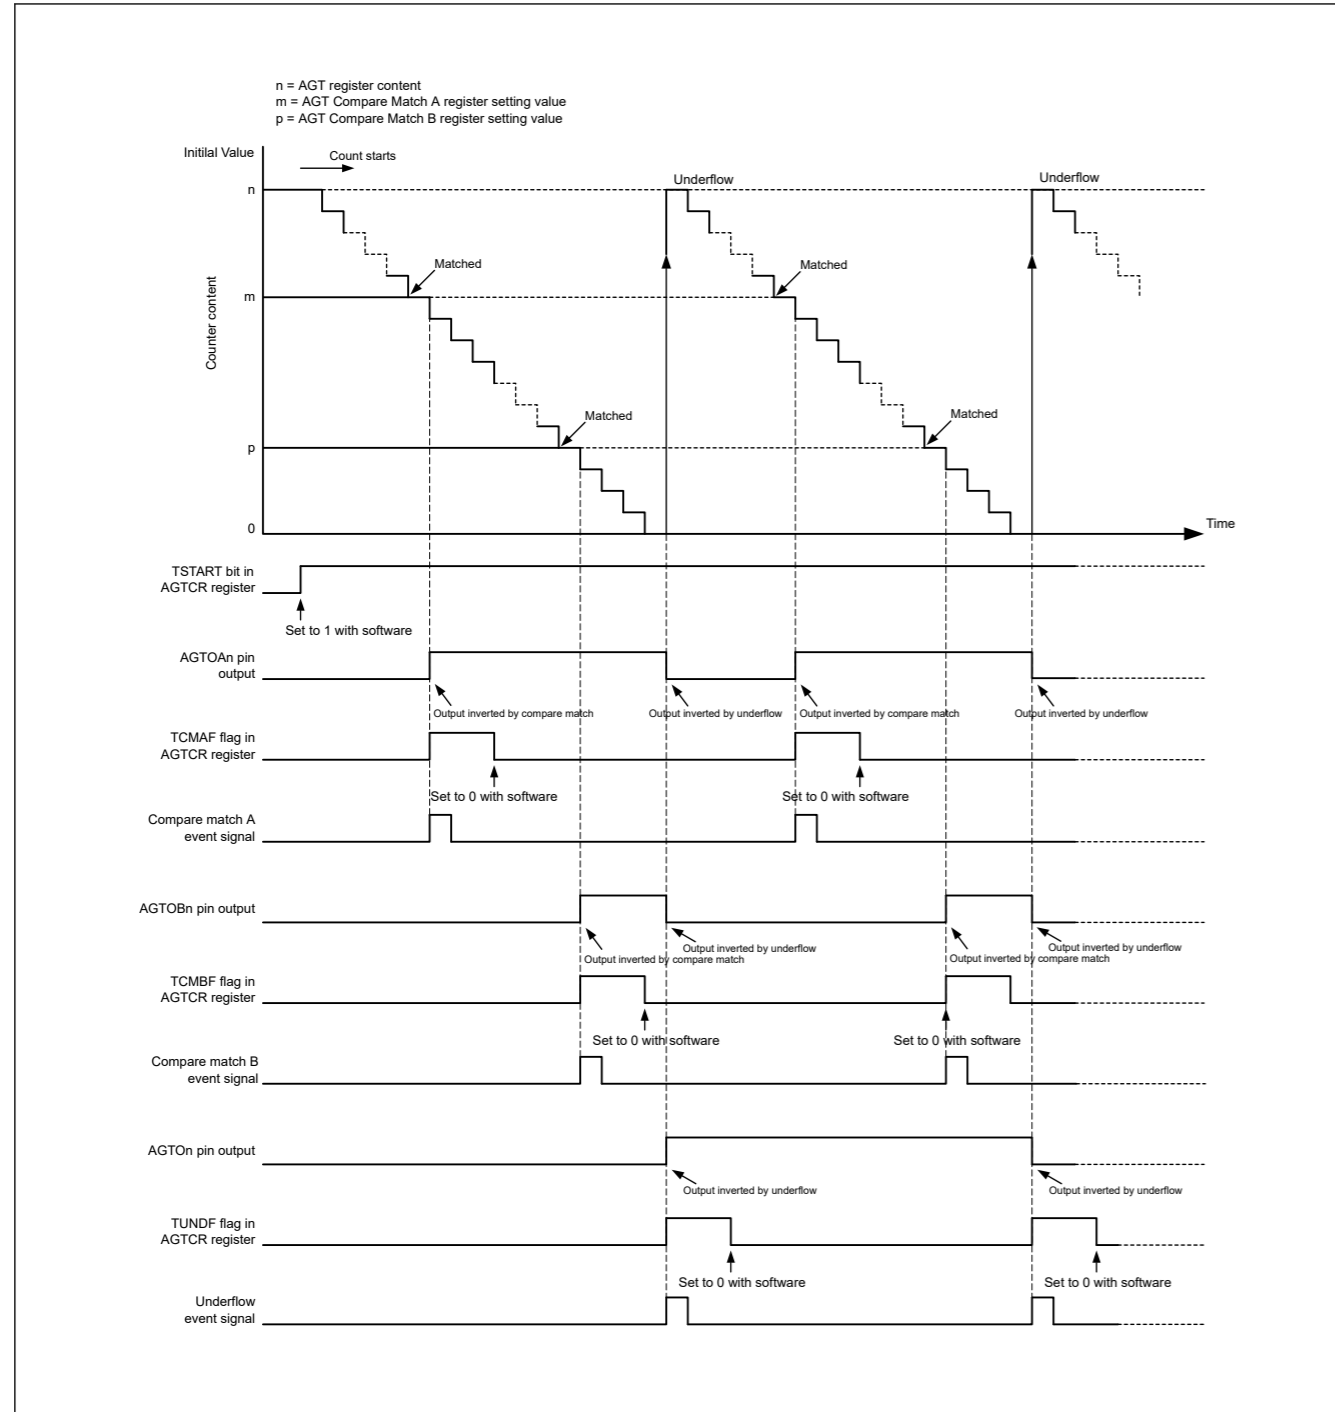

Figure 22.12 Operation example in compare match mode (TOPOLA = 0, TOPOLB = 0)

22.3.9 Output Settings for Each Mode

Table 22.5 to Table 22.8 list the states of pins AGTON, AGTIO, AGTOAn, and AGTOBn pins in each mode.

Table 22.5 AGTON pin setting

| Operating mode | AGTIOC register |             | AGTON pin output |
|----------------|-----------------|-------------|------------------|
|                | TOE bit         | TEDGSEL bit |                  |
| All modes      | 1               | 1           | Inverted output  |
|                |                 | 0           | Normal output    |

|                               | 0                | 0 or 1     | Output disabled (not used) |
| Pulse width measurement mode  | 0                | 0          | Prohibited                 |
| Pulse period measurement mode |                  |            |                            |

Table 22.8 AGTOB pin setting

| Operating mode                | AGTCMSR register |            | AGTOB pin output           |
|-------------------------------|------------------|------------|----------------------------|
|                               | TOEB bit         | TOPOLB bit |                            |
| Timer mode                    | 1                | 1          | Inverted output            |
|                               |                  | 0          | Normal output              |
|                               | 0                | 0 or 1     | Output disabled (not used) |
| Pulse output mode             | 1                | 1          | Inverted output            |
|                               |                  | 0          | Normal output              |
|                               | 0                | 0 or 1     | Output disabled (not used) |
| Event counter mode            | 1                | 1          | Inverted output            |
|                               |                  | 0          | Normal output              |
|                               | 0                | 0 or 1     | Output disabled (not used) |
| Pulse width measurement mode  | 0                | 0          | Prohibited                 |
| Pulse period measurement mode |                  |            |                            |

### 22.3.10 Standby Mode

The AGT can operate in Software Standby and Deep Software Standby mode. Set it to Software Standby or Deep Software Standby mode with count operation start (TSTART = 1, TCSTF = 1).

Table 22.9 and Table 22.10 show the setting that can be used in Software Standby and Deep Software Standby mode.

Table 22.6 AGTIO引脚设置

| 操作模式     | AGTIOC register |                  |
|----------|-----------------|------------------|
|          | TEDGSEL bit     | AGTIO pin I/O    |
| 定时器模式    | 0 or 1          | Input (not used) |
| 脉冲输出方式   | 1               | 正常输出             |
|          | 0               | 反相输出             |
| 事件计数器模式  | 0 or 1          | Input            |
| 脉宽测量模式   |                 |                  |
| 脉冲周期测量模式 |                 |                  |

Table 22.7 AGTO引脚设置

| 操作模式     | AGTCMSR register |            | AGTO引脚输出   |
|----------|------------------|------------|------------|
|          | TOEA bit         | TOPOLA bit |            |
| 定时器模式    | 1                | 1          | 反相输出       |
|          |                  | 0          | 正常输出       |
|          | 0                | 0 or 1     | 输出禁用 (未使用) |
| 脉冲输出方式   | 1                | 1          | 反相输出       |
|          |                  | 0          | 正常输出       |
|          | 0                | 0 or 1     | 输出禁用 (未使用) |
| 事件计数器模式  | 1                | 1          | 反相输出       |
|          |                  | 0          | 正常输出       |
|          | 0                | 0 or 1     | 输出禁用 (未使用) |
| 脉宽测量模式   | 0                | 0          | Prohibited |
| 脉冲周期测量模式 |                  |            |            |

Table 22.8 AGTOB引脚设置

|----------|------------------|------------|------------|
|          | TOEB bit         | TOPOLB bit |            |
| 定时器模式    | 1                | 1          | 反相输出       |
|          |                  | 0          | 正常输出       |
|          | 0                | 0 or 1     | 输出禁用 (未使用) |
| 脉冲输出方式   | 1                | 1          | 反相输出       |
|          |                  | 0          | 正常输出       |
|          | 0                | 0 or 1     | 输出禁用 (未使用) |
| 事件计数器模式  | 1                | 1          | 反相输出       |
|          |                  | 0          | 正常输出       |
|          | 0                | 0 or 1     | 输出禁用 (未使用) |
| 脉宽测量模式   | 0                | 0          | Prohibited |
| 脉冲周期测量模式 |                  |            |            |

### 22.3.10 待机模式

AGT可以在软件待机和深度软件待机模式下运行。将其设置为软件待机或深度软件计数操作开始的待机模式 (TSTART=1, TCSTF=1)。

表22.9和表22.10显示了可在软件待机和深度软件待机模式下使用的设置。

**Table 22.9 Usable settings in Software Standby and Deep Software Standby mode (AGTn (n = 0, 2, 4)<sup>\*2</sup>)**

| Operating mode                | AGTMR1.TCK[2:0] | Operating clock      | Resurgence factor of CPU |
|-------------------------------|-----------------|----------------------|--------------------------|
| Timer mode                    | 100b or 110b    | AGTLCLK or AGTSCLK   | —                        |
| Pulse output mode             | 100b or 110b    | AGTLCLK or AGTSCLK   | —                        |
| Event counter mode            | —               | AGTIO <sup>n</sup> 1 | —                        |
| Pulse width measurement mode  | 100b or 110b    | AGTLCLK or AGTSCLK   | —                        |
| Pulse period measurement mode | 100b or 110b    | AGTLCLK or AGTSCLK   | —                        |

Note: —: invalid

Note 1. When using the AGTIO<sup>n</sup> pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.

Note 2. AGT4 cannot operate in Deep Software Standby mode.

**Table 22.10 Usable settings in Software Standby and Deep Software Standby mode (AGTn (n = 1, 3, 5)<sup>\*3</sup>)**

| Operating mode                | AGTMR1.TCK[2:0]                    | Operating clock                                    | Resurgence factor of CPU   |
|-------------------------------|------------------------------------|--|--|
| Timer mode                    | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGTn (n = 0, 2, 4) underflow | <ul style="list-style-type: none"> <li>Underflow</li> <li>Compare match A/B</li> </ul> |
| Pulse output mode             | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGTn (n = 0, 2, 4) underflow | <ul style="list-style-type: none"> <li>Underflow</li> <li>Compare match A/B</li> </ul> |
| Event counter mode            | —                                  | AGTIO <sup>n</sup> 2                               | <ul style="list-style-type: none"> <li>Underflow</li> <li>Compare match A/B</li> </ul> |
| Pulse width measurement mode  | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGTn (n = 0, 2, 4) underflow | <ul style="list-style-type: none"> <li>Underflow</li> <li>Active edge</li> </ul>       |
| Pulse period measurement mode | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGTn (n = 0, 2, 4) underflow | <ul style="list-style-type: none"> <li>Underflow</li> <li>Active edge</li> </ul>       |

Note: —: invalid

Note: Release of Software Standby or Deep Software Standby mode is only AGT1.

Note: Compare match A/B is resurgence factor of CPU from Software Standby mode.

Note 1. Only when AGTn (n = 0, 2, 4) operates in Table 22.9

Note 2. When using the AGTIO<sup>n</sup> pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.

Note 3. AGT5 cannot operate in Deep Software Standby mode.

### 22.3.11 Interrupt Sources

The AGTn has three interrupt sources for channels n (n = 0 to 5) as listed in Table 22.11.

**Table 22.11 AGT interrupt sources**

| Name         | Interrupt source  | DMAC/DTC activation |
|--------------|---|---------------------|
| AGTn_AGTI    | <ul style="list-style-type: none"> <li>When the counter underflows</li> <li>When measurement of the active width of the external input pin (AGTIO<sup>n</sup>) is complete in pulse width measurement mode</li> <li>When the set edge of the external input pin (AGTIO<sup>n</sup>) is input in pulse period measurement mode.</li> </ul> | Possible            |
| AGTn_AGTCMAI | <ul style="list-style-type: none"> <li>When the values of AGT register and AGTCMA register match</li> </ul>   | Possible            |
| AGTn_AGTCMBI | <ul style="list-style-type: none"> <li>When the values of AGT register and AGTCMB register match</li> </ul>   | Possible            |

Note: Channel number (n = 0 to 5)

### 22.3.12 Event Signal Output to ELC

The AGT0 uses the Event Link Controller (ELC) to perform a link operation to a specified module using the interrupt request signal as the event signal. The AGT0 outputs compare match A, compare match B, and underflow/measurement complete signals as event signals. For details, see section 18, Event Link Controller (ELC).

**Table 22.9 软件待机和深度软件待机模式下的可用设置(AGTn(n=0 2 4)\*2)**

| 操作模式     | AGTMR1.TCK[2:0] | 工作时钟                 | CPU的中兴系数 |
|----------|-----------------|----------------------|----------|
| 定时器模式    | 100b or 110b    | AGTLCLK or AGTSCLK   | —        |
| 脉冲输出方式   | 100b or 110b    | AGTLCLK or AGTSCLK   | —        |
| 事件计数器模式  | —               | AGTIO <sup>n</sup> 1 | —        |
| 脉宽测量模式   | 100b or 110b    | AGTLCLK or AGTSCLK   | —        |
| 脉冲周期测量模式 | 100b or 110b    | AGTLCLK or AGTSCLK   | —        |

Note: —: invalid

注1.在软件待机模式下将AGTIO<sup>n</sup>引脚用于外部事件输入时, 设置AGTIOSEL.TIES=1。

注2.AGT4不能在深度软件待机模式下运行。

**Table 22.10 软件待机和深度软件待机模式下的可用设置(AGTn(n=1 3 5)\*3)**

| 操作模式     | AGTMR1.TCK[2:0]                    | 工作时钟   | CPU的中兴系数  |
|----------|------------------------------------|--|---|
| 定时器模式    | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGTn (n = 0, 2, 4) underflow | <ul style="list-style-type: none"> <li>Underflow</li> <li>比较匹配AB</li> </ul> |
| 脉冲输出方式   | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGTn (n = 0, 2, 4) underflow | <ul style="list-style-type: none"> <li>Underflow</li> <li>比较匹配AB</li> </ul> |
| 事件计数器模式  | —                                  | AGTIO <sup>n</sup> 2                               | <ul style="list-style-type: none"> <li>Underflow</li> <li>比较匹配AB</li> </ul> |
| 脉宽测量模式   | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGTn (n = 0, 2, 4) underflow | <ul style="list-style-type: none"> <li>Underflow</li> <li>主动边缘</li> </ul>   |
| 脉冲周期测量模式 | 100b or 110b or 101b <sup>*1</sup> | AGTLCLK or AGTSCLK or AGTn (n = 0, 2, 4) underflow | <ul style="list-style-type: none"> <li>Underflow</li> <li>主动边缘</li> </ul>   |

Note: —: invalid

Note: 软件待机或深度软件待机模式的释放只有AGT1。

Note: 比较匹配AB是CPU从软件待机模式中恢复的因素。

注1.仅当AGTn(n=0 2 4)在表22.9中运行时

注2.在软件待机模式下将AGTIO<sup>n</sup>引脚用于外部事件输入时, 设置AGTIOSEL.TIES=1。

注3.AGT5不能在深度软件待机模式下运行。

### 22.3.11 中断源

AGTn具有三个用于通道n (n=0到5) 的中断源, 如表22.11中所列。

**Table 22.11 AGT中断源**

| Name         | 中断源  | DMAC/DTC activation |
|--------------|--|---------------------|
| AGTn_AGTI    | <ul style="list-style-type: none"> <li>当计数器下溢时</li> <li>在脉冲宽度测量模式下完成外部输入引脚(AGTIO<sup>n</sup>)的有效宽度测量时</li> <li>在脉冲周期测量模式下输入外部输入引脚(AGTIO<sup>n</sup>)的设置边沿时。</li> </ul> | Possible            |
| AGTn_AGTCMAI | <ul style="list-style-type: none"> <li>当AGT寄存器和AGTCMA寄存器的值匹配时</li> </ul>   | Possible            |
| AGTn_AGTCMBI | <ul style="list-style-type: none"> <li>当AGT寄存器和AGTCMB寄存器的值匹配时</li> </ul>   | Possible            |

Note: 通道号 (n=0到5)

### 22.3.12 事件信号输出到ELC

AGT0使用事件链接控制器(ELC)使用中断请求信号作为事件信号对指定模块执行链接操作。AGT0输出比较匹配A、比较匹配B和下溢测量完成信号作为事件信号。有关详细信息, 请参阅第18节, 事件链接控制器(ELC)。

## 22.4 Usage Notes

### 22.4.1 Count Operation Start and Stop Control

- When the operating mode (see Table 22.1) is set to other than the event counter mode, or the count source is set to other than AGTn underflow event signal (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 3 cycles of the count source. Do not access the registers associated with AGT other than the TCSTF flag until this bit is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 3 cycles of the count source. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT. Other than the TCSTF flag until this bit is set to 0.
- When the operating mode (see Table 22.1) is set to event counter mode, or the count source is set to AGT1 underflow event signal (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 2 PCLKB cycles. Do not access the registers associated with AGT other than the TCSTF flag until this bit is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 2 PCLKB cycles. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this bit is set to 0.

### 22.4.2 Access to Counter Register

When the TSTART bit and TCSTF flag in the AGTCR register are both 1 (count starts), allow at least 3 cycles of the count source clock between writes when writing to the AGT register successively.

### 22.4.3 When Changing Mode

The registers associated with AGT operating mode (AGTMR1, AGTMR2, AGTIOC, AGTISR, AGTCMSR and AGTIOCR) can be changed only when the count is stopped with both the TSTART bit and TCSTF flag set to 0 (count stops). Do not change these registers during count operation.

When the registers associated with AGT operating mode are changed, the values of TEDGF, TUNDF, TCMAF, and TCMBF flags are undefined. Before starting the count, write 0 to the following flags:

- TEDGF (no active edge received)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

### 22.4.4 Output pin setting

When using the AGTOn, AGTIOOn, AGTOAn, or AGTOBn as an output pin, set up the Operation and determine the initial output values. Then set an output mode in the port register.

When using the AGTIOOn as an input pin in pulse width measurement mode or pulse period measurement mode, set up the Operation and start count operation. Then start to enter external events from the AGTIOOn pin. Invalidate the first measurement and validate the second and later completed measurements.

### 22.4.5 Digital Filter

When using the digital filter, do not start the timer operation for 5 cycles of the digital filter clock after setting TIPF[1:0] bits and when the TEDGSEL bit in the AGTIOC register changes.

### 22.4.6 How to Calculate Event Number, Pulse Width, and Pulse Period

- In event counter mode, event number is expressed mathematically as follows:  
Event number = initial value of counter [AGT register] - counter value of active event end

## 22.4 使用说明

### 22.4.1 计数操作启动和停止控制

- 当操作模式 (见表22.1) 设置为非事件计数器模式, 或计数源设置为非AGTn下溢事件信号 (TCK[2:0]=101b) 时:

在计数停止期间将1 (计数开始) 写入AGTCR寄存器中的TSTART位后, AGTCR寄存器中的TCSTF标志在计数源的3个周期内保持为0 (计数停止)。在此位设置为1 (正在进行计数) 之前, 不要访问与AGT相关的寄存器, 而不是TCSTF标志。

在计数操作期间将0 (计数停止) 写入TSTART位后, TCSTF标志在计数源的3个周期内保持为1。当TCSTF标志设置为0时, 停止计数。不要访问与AGT关联的寄存器。除TCSTF标志外, 直到该位设置为0。

- 当工作模式 (见表22.1) 设置为事件计数器模式, 或计数源设置为AGT1下溢事件信号 (TCK[2:0]=101b) 时:

在停止计数时将1 (计数开始) 写入AGTCR寄存器中的TSTART位后, AGTCR寄存器中的TCSTF标志在2个PCLKB周期内保持为0 (计数停止)。在此位设置为1 (正在进行计数) 之前, 不要访问与AGT相关的寄存器, 而不是TCSTF标志。

在计数操作期间将0 (计数停止) 写入TSTART位后, TCSTF标志保持1持续2 PCLKB周期。当TCSTF标志设置为0时, 停止计数。不要访问与相关的寄存器 AGT不是TCSTF标志, 直到该位设置为0。

### 22.4.2 访问计数器寄存器

当AGTCR寄存器中的TSTART位和TCSTF标志都为1 (计数开始) 时, 连续写入AGT寄存器时, 在两次写入之间至少允许计数源时钟的3个周期。

### 22.4.3 更改模式时

与AGT操作模式相关的寄存器 (AGTMR1、AGTMR2、AGTIOC、AGTISR、AGTCMSR和AGTIOCR) 只有在TSTART位和TCSTF标志都设置为0 (计数停止) 时停止计数时才能更改。在计数操作期间不要更改这些寄存器。

当与AGT工作模式相关的寄存器发生变化时, TEDGF、TUNDF、TCMAF和TCMBF标志未定义。在开始计数之前, 将0写入以下标志:

- TEDGF (未收到有效边沿)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

### 22.4.4 输出引脚设置

当使用AGTOn、AGTIOOn、AGTOAn或AGTOBn作为输出引脚时, 设置操作并确定初始输出值。然后在端口寄存器中设置一个输出模式。

在脉冲宽度测量模式或脉冲周期测量模式下使用AGTIOOn作为输入引脚时, 设置操作并开始计数操作。然后开始从AGTIOOn引脚输入外部事件。使第一次测量无效并验证第二次和以后完成的测量。

### 22.4.5 数字滤波器

使用数字滤波器时, 在设置TIPF[1:0]位后以及AGTIOC寄存器中的TEDGSEL位发生变化时, 在数字滤波器时钟的5个周期内不要启动定时器操作。

### 22.4.6 如何计算事件编号、脉冲宽度和脉冲周期

- 在事件计数器模式下, 事件编号以数学方式表示如下:  
事件编号=计数器的初始值[AGT寄存器]活动事件结束的计数器值

- In pulse width measurement mode, pulse width is expressed mathematically as follows:  
Pulse width = counter value of stopping measurement - counter value of next stopping measurement
- In pulse period measurement mode, input pulse period is expressed mathematically as follows:  
Period of input pulse = (initial value of counter [AGT register] - reading value of the read-out buffer) + 1.

#### 22.4.7 When Count is Forcibly Stopped by TSTOP Bit

After the counter is forcibly stopped by the TSTOP bit in the AGTCR register, do not access the following I/O registers for 1 cycle of the count source:

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

#### 22.4.8 When Selecting AGTn (n = 0, 2, 4) Underflow as the Count Source

Operate according to the following procedures described in this section when selecting the underflow event signal as the count source.

##### (1) Procedure for starting operation

1. Set AGT.
2. Start the count operation of AGTn (n = 1, 3, 5).
3. Start the count operation of AGTn (n = 0, 2, 4).

##### (2) Procedure for stopping operation

1. Stop the count operation of AGTn (n = 0, 2, 4).
2. Stop the count operation of AGTn (n = 1, 3, 5).
3. Stop the count source clock of AGTn (n = 1, 3, 5) (write 000b in the AGTMR1.TCK[2:0] bits).

#### 22.4.9 Module-stop function

AGT operation can be disabled or enabled using Module Stop Control Register D (MSTPCRD) and Module Stop Control Register E (MSTPCRE). The AGT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#)

#### 22.4.10 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. Therefore, when using the AGTIO, AGTEE, or both input as external event input, the clock source should not be switched. If switching the clock source while using the external event input, extend the input pulse width by 4 clock cycles of the switched source clock cycles.

- 在脉冲宽度测量模式下，脉冲宽度以数学方式表示如下：  
脉冲宽度=停止测量的计数器值下一个停止测量的计数器值
- 在脉冲周期测量模式下，输入脉冲周期的数学表达式如下：  
输入脉冲周期=（计数器初始值[AGT寄存器]读出缓冲器的读取值）+1。

#### 22.4.7 当计数被TSTOP位强制停止时

计数器被AGTCR寄存器中的TSTOP位强制停止后，在计数源的1个周期内不要访问以下IO寄存器：

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

#### 22.4.8 选择AGTn(n=0 2 4)下溢作为计数源时

选择下溢事件信号作为计数源时，请按照本节所述的以下步骤进行操作。

##### (1) 开始运行的步骤

1. Set AGT.
- 2.启动AGTn(n=1 3 5)的计数操作。
- 3.启动AGTn(n=0 2 4)的计数操作。

##### (2) 停止运行的步骤

- 1.停止AGTn(n=0 2 4)的计数操作。
- 2.停止AGTn(n=1 3 5)的计数操作。
- 3.停止AGTn(n=1 3 5)的计数源时钟（将000b写入AGTMR1.TCK[2:0]位）。

#### 22.4.9 Module-stop function

可以使用模块停止控制寄存器D(MSTPCRD)和模块停止控制来禁用或启用AGT操作寄存器E(MSTPCRE)。AGT模块在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式

#### 22.4.10 切换源时钟时

当通过改变SCKSCR.CKSEL[2:0]来切换时钟源时，选择器的时钟输出在切换时钟的4个周期内停止。因此，当使用AGTIO、AGTEE或两者输入作为外部事件输入时，不应切换时钟源。如果在使用外部事件输入时切换时钟源，请将输入脉冲宽度延长4个切换源时钟周期的时钟周期。

## 23. Realtime Clock (RTC)

### 23.1 Overview

The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.

The sub-clock oscillator or LOCO can be selected as the count source of the time counters. The RTC uses a 128-Hz clock acquired by dividing the count source by a prescaler. Year, month, date, day-of-week, a.m. /p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted by 1/128 second.

Table 23.1 lists the RTC specifications, Figure 23.1 shows a block diagram, and Table 23.2 lists the I/O pins.

**Table 23.1 RTC specifications**

| Parameter                    | Specifications   |
|------------------------------|--|
| Count mode                   | Calendar count mode/binary count mode  |

Note 1. The frequency of the peripheral module clock (PCLKB)  $\geq$  the frequency of the count source should be satisfied.

## 23. 实时时钟(RTC)

### 23.1 Overview

实时时钟(RTC)有两种计数模式，日历计数模式和二进制计数模式，通过切换寄存器设置使用。对于日历计数模式，RTC有一个从2000年到2099年的100年日历，并自动调整闰年的日期。对于二进制计数模式，RTC会计算秒数并将信息保留为序列值。二进制计数模式可用于公历（西方）以外的日历。

可以选择子时钟振荡器或LOCO作为时间计数器的计数源。RTC使用一个128-Hz时钟，通过预分频器将计数源分频获得。年、月、日、星期、上午、下午（在12小时模式下）时、分、秒或32位二进制按1/128秒计数。

表23.1列出了RTC规格，图23.1显示了框图，表23.2列出了IO引脚。

**Table 23.1 RTC specifications**

| Parameter        | Specifications  |
|------------------|---|
| 计数模式             | 日历计数模式二进制计数模式   |
| 计数来源*1           | 副时钟(XCIN)或LOCO  |
| 时钟和日历功能          | <ul style="list-style-type: none"> <li>日历计数模式               <ul style="list-style-type: none"> <li>年、月、日、星期、时、分、秒计数，BCD显示</li> <li>12小时24小时模式切换功能</li> <li>30秒调整功能（小于30的数字向下取整为00秒，大于等于30秒向上取整为1分钟）</li> <li>闰年自动调整功能</li> </ul> </li> <li>二进制计数模式               <ul style="list-style-type: none"> <li>以32位计算秒数，二进制显示</li> </ul> </li> <li>两种模式共享               <ul style="list-style-type: none"> <li>Start/stop function</li> <li>亚秒数字以二进制单位显示（1Hz、2Hz、4Hz、8Hz、16Hz、32Hz或64Hz）</li> <li>时钟纠错功能</li> <li>时钟(1-Hz/64-Hz)输出</li> </ul> </li> </ul>  |

| 事件链接功能           | 周期性事件输出(RTC_PRD)  |
| TrustZone filter | 可设置安全属性   |

注1.外围模块时钟（PCLKB）的频率 $\geq$ 计数源的频率应满足。

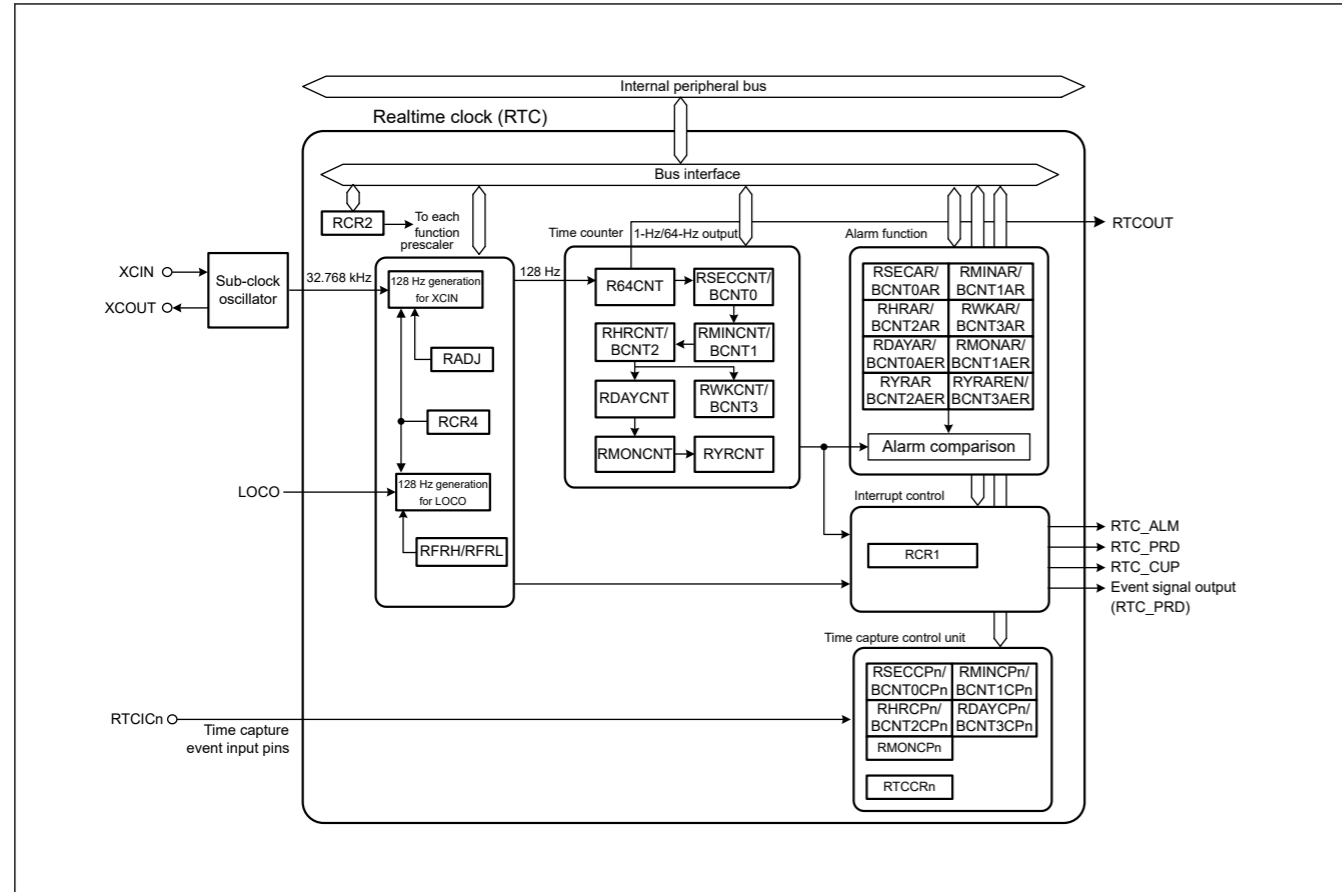

Figure 23.1 RTC block diagram

Table 23.2 RTC I/O pins

| Pin name            | I/O    | Description   |
|---------------------|--------|---|
| XCIN                | Input  | Connect a 32.768-kHz crystal to these pins  |
| XCOU                | Output |   |
| RTCOUT              | Output | This pin is used to output a 1-Hz/64-Hz waveform, but not in Deep Software Standby mode   |
| RTCICn (n = 0 to 2) | Input  | Time capture event input pins<br>RTCICn can be controlled by the VBTICTLR register. For more information, see <a href="#">section 11, Battery Backup Function</a> and <a href="#">section 19, I/O Ports</a> . |

### 23.2 Register Descriptions

Write or read from the RTC registers as described in [section 23.6.5. Notes on Writing to and Reading from Registers](#).

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power state during counting operations, for example, while the RCR2.START bit is 1, the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate.

Note: A reset generated while writing to a register might destroy the register value. In addition, do not allow the MCU to enter Software Standby or Deep Software Standby mode immediately after setting any of these registers. For details, see [section 23.6.4. Transitions to Low Power Modes after Setting Registers](#).

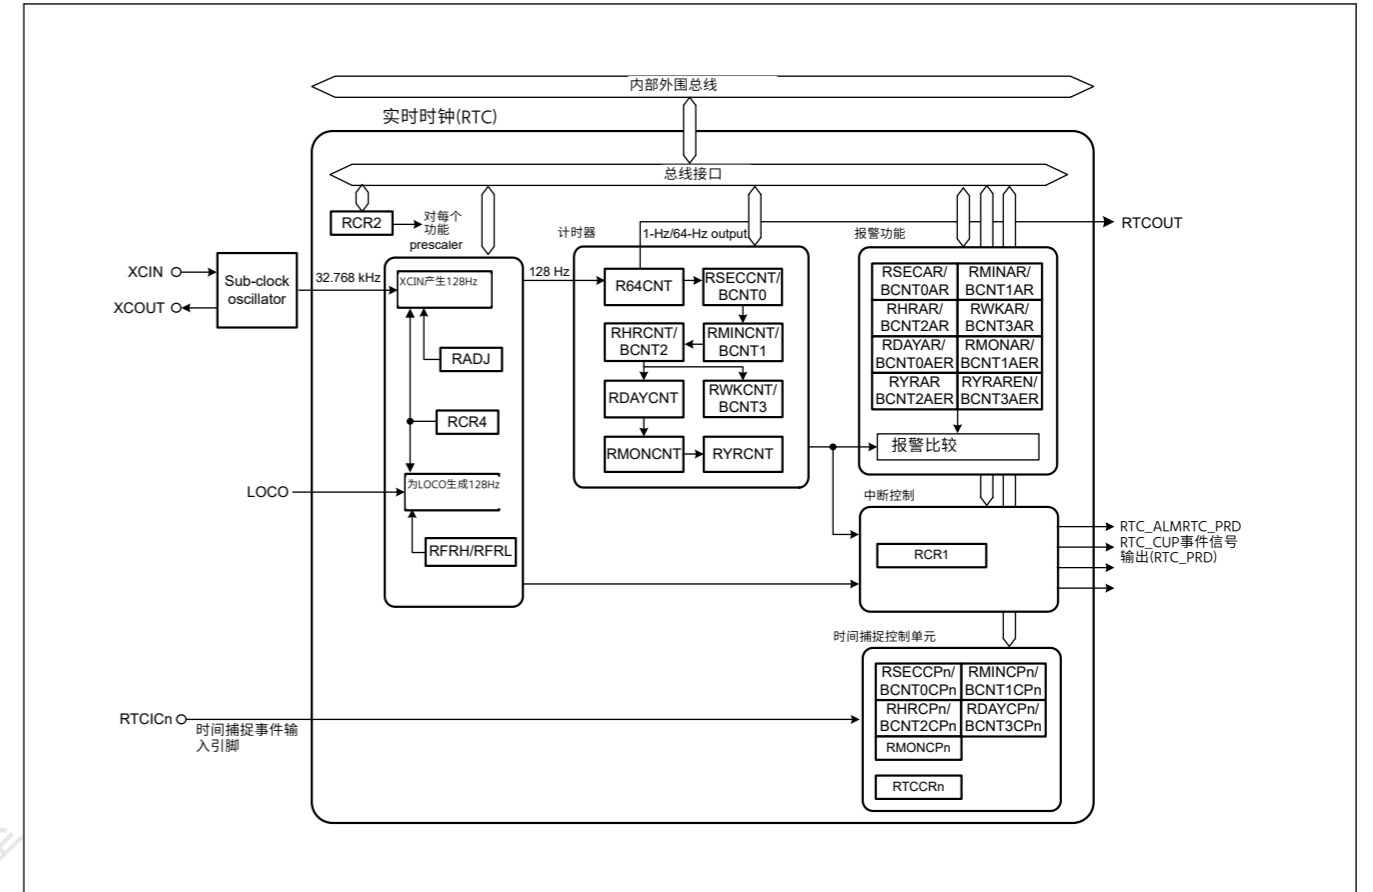

Figure 23.1 实时时钟框图

Table 23.2 RTC I/O pins

| 引脚名称                | I/O    | Description  |
|---------------------|--------|--|
| XCIN                | Input  | 将32.768kHz晶振连接到这些引脚  |
| XCOU                | Output |  |
| RTCOUT              | Output | 此引脚用于输出1-Hz/64-Hz波形，但在DeepSoftware中不使用待机模式                           |
| RTCICn (n = 0 to 2) | Input  | 时间捕捉事件输入引脚<br>RTCICn可由VBTICTLR寄存器控制。有关详细信息，请参阅第11节，电池备份功能和第19节，IO端口。 |

### 23.2 注册说明

如第23.6.5节所述，从RTC寄存器写入或读取。关于写入和读取寄存器的注意事项。

如果复位后RTC寄存器中的值在列表中以x（未定义位）的形式给出，则它不会被复位初始化。当RTC在计数操作期间进入复位状态或低功耗状态时，例如，当RCR2.START位为1时，年、月、星期、日期、小时、分钟、秒和64-Hz计数器继续经营。

Note: 写入寄存器时产生的复位可能会破坏寄存器值。此外，不要让MCU在设置任何这些寄存器后立即进入软件待机或深度软件待机模式。详见23.6.4节。设置寄存器后转换到低功耗模式。

## 23.2.1 R64CNT : 64-Hz Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x00

|                    |   |      |      |      |      |       |       |       |
|--------------------|---|------|------|------|------|-------|-------|-------|
| Bit position:      | 7 | 6    | 5    | 4    | 3    | 2     | 1     | 0     |
| Bit field:         | — | F1HZ | F2HZ | F4HZ | F8HZ | F16HZ | F32HZ | F64HZ |
| Value after reset: | 0 | x    | x    | x    | x    | x     | x     | x     |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | F64HZ  | 64-Hz Flag<br>This bit indicates the 64-Hz state of the sub-second digit. | R   |
| 1   | F32HZ  | 32-Hz Flag<br>This bit indicates the 32-Hz state of the sub-second digit. | R   |
| 2   | F16HZ  | 16-Hz Flag<br>This bit indicates the 16-Hz state of the sub-second digit. | R   |
| 3   | F8HZ   | 8-Hz Flag<br>This bit indicates the 8-Hz state of the sub-second digit.   | R   |
| 4   | F4HZ   | 4-Hz Flag<br>This bit indicates the 4-Hz state of the sub-second digit.   | R   |
| 5   | F2HZ   | 2-Hz Flag<br>This bit indicates the 2-Hz state of the sub-second digit.   | R   |
| 6   | F1HZ   | 1-Hz Flag<br>This bit indicates the 1-Hz state of the sub-second digit.   | R   |
| 7   | —      | This bit is read as 0.  | R   |

The R64CNT counter is used in both calendar count mode and binary count mode. The 64-Hz counter (R64CNT) generates the period for a second by counting up periods of the 128-Hz clock. The state in the sub-second range can be confirmed by reading this counter.

This counter is set to 0x00 by an RTC software reset or an execution of a 30-second adjustment. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

## 23.2.2 RSECCNT : Second Counter (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x02

|                    |   |            |   |   |           |   |   |   |
|--------------------|---|------------|---|---|-----------|---|---|---|
| Bit position:      | 7 | 6          | 5 | 4 | 3         | 2 | 1 | 0 |
| Bit field:         | — | SEC10[2:0] |   |   | SEC1[3:0] |   |   |   |
| Value after reset: | x | x          | x | x | x         | x | x | x |

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 3:0 | SEC1[3:0]  | 1-Second Count<br>Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place. | R/W |
| 6:4 | SEC10[2:0] | 10-Second Count<br>Counts from 0 to 5 for 60-second counting.   | R/W |
| 7   | —          | The read value is undefined. The write value should be 0.   | R/W |

The RSECCNT counter sets and counts the BCD-coded second value. It counts the carries generated once per second in the 64-Hz counter.

The setting range is decimal 00 to 59. The RTC does not operate normally if any other value is set. Before writing to this register, you must stop the count operation using the START bit in RCR2.

## 23.2.1 R64CNT : 64-Hz Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x00

|               |   |      |      |      |      |       |       |       |
|---------------|---|------|------|------|------|-------|-------|-------|
| Bit position: | 7 | 6    | 5    | 4    | 3    | 2     | 1     | 0     |
| Bit field:    | — | F1HZ | F2HZ | F4HZ | F8HZ | F16HZ | F32HZ | F64HZ |
| 重置后的值:        | 0 | x    | x    | x    | x    | x     | x     | x     |

| Bit | Symbol | Function                 | R/W |
|-----|--------|--------------------------|-----|
| 0   | F64HZ  | 64-Hz标志该位指示亚秒数字的64-Hz状态。 | R   |
| 1   | F32HZ  | 32-Hz标志该位指示亚秒数字的32-Hz状态。 | R   |
| 2   | F16HZ  | 16-Hz标志该位指示亚秒数字的16-Hz状态。 | R   |
| 3   | F8HZ   | 8-Hz标志该位指示亚秒数字的8-Hz状态。   | R   |
| 4   | F4HZ   | 4-Hz标志该位指示亚秒数字的4-Hz状态。   | R   |
| 5   | F2HZ   | 2-Hz标志该位指示亚秒数字的2-Hz状态。   | R   |
| 6   | F1HZ   | 1-Hz标志该位指示亚秒数字的1-Hz状态。   | R   |
| 7   | —      | 该位读为0。                   | R   |

R64CNT计数器用于日历计数模式和二进制计数模式。64-Hz计数器(R64CNT)通过向上计数128-Hz时钟的周期来产生一秒的周期。亚秒范围内的状态可以通过读取该计数器来确认。

该计数器通过RTC软件复位或执行30秒调整设置为0x00。要读取此计数器，请按照第23.3.5节中的程序进行。读取64-Hz计数器和时间。

## 23.2.2 RSECCNT:第二个计数器 (在日历计数模式下)

Base address: RTC = 0x4008\_3000

Offset address: 0x02

|               |   |            |   |   |           |   |   |   |
|---------------|---|------------|---|---|-----------|---|---|---|
| Bit position: | 7 | 6          | 5 | 4 | 3         | 2 | 1 | 0 |
| Bit field:    | — | SEC10[2:0] |   |   | SEC1[3:0] |   |   |   |
| 重置后的值:        | x | x          | x | x | x         | x | x | x |

| Bit | Symbol     | Function                          | R/W |
|-----|------------|-----------------------------------|-----|
| 3:0 | SEC1[3:0]  | 1-SecondCount每秒从0计数到9。产生进位时，十位加1。 | R/W |
| 6:4 | SEC10[2:0] | 10秒计数从0计数到5以进行60秒计数。              | R/W |
| 7   | —          | 读取值未定义。写入值应为0。                    | R/W |

RSECCNT计数器设置并计算BCD编码的第二个值。它对64-Hz计数器中每秒生成一次的进位进行计数。

设置范围为十进制00到59。如果设置任何其他值，RTC将无法正常工作。在写入该寄存器之前，您必须使用RCR2中的START位停止计数操作。

To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.3 RMINCNT : Minute Counter (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x04

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 3:0 | MIN1[3:0]  | 1-Minute Count<br>Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place. | R/W |
| 6:4 | MIN10[2:0] | 10-Minute Count<br>Counts from 0 to 5 for 60-minute counting.   | R/W |
| 7   | —          | The read value is undefined. The write value should be 0.   | R/W |

The RMINCNT counter sets and counts the BCD-coded minute value. It counts the carries generated once every minute in the second counter.

A value from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.4 RHRCNT : Hour Counter (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x06

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 3:0 | HR1[3:0]  | 1-Hour Count<br>Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place. | R/W |
| 5:4 | HR10[1:0] | 10-Hour Count<br>Counts from 0 to 2 once per carry from the ones place.                                    | R/W |
| 6   | PM        | AM/PM select for time counter setting.<br>0: AM<br>1: PM   | R/W |
| 7   | —         | The read value is undefined. The write value should be 0.  | R/W |

The RHRCNT counter sets and counts the BCD-coded hour value. It counts the carries generated once per hour in the minute counter. The specifiable time differs based on the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – from 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – from 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. The PM bit is only enabled when the RCR2.HR24 bit is 0.

Otherwise, the setting in the PM bit has no effect. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

要读取此计数器，请按照第23.3.5节中的程序进行。读取64-Hz计数器和时间。

### 23.2.3 RMINCNT：分钟计数器（在日历计数模式下）

Base address: RTC = 0x4008\_3000

Offset address: 0x04

| Bit | Symbol     | Function                   | R/W |
|-----|------------|----------------------------|-----|
| 3:0 | MIN1[3:0]  | 1分钟计数每分钟从0计数到9。产生进位时，十位加1。 | R/W |
| 6:4 | MIN10[2:0] | 10分钟计数从0到5计数60分钟。          | R/W |
| 7   | —          | 读取值未定义。写入值应为0。             | R/W |

RMINCNT计数器设置并计算BCD编码的分钟值。它对第二个计数器中每分钟产生一次的进位进行计数。

可以指定从00到59的值（以BCD表示）。如果指定的值超出此范围，则RTC将无法正确运行。在写入该寄存器之前，您必须使用RCR2中的START位停止计数操作。要读取此计数器，请按照第23.3.5节中的程序进行。读取64-Hz计数器和时间。

### 23.2.4 RHRCNT：小时计数器（在日历计数模式下）

Base address: RTC = 0x4008\_3000

Offset address: 0x06

| Bit | Symbol    | Function                          | R/W |
|-----|-----------|-----------------------------------|-----|
| 3:0 | HR1[3:0]  | 1小时计数每小时从0计数到9次。产生进位时，十位加1。       | R/W |
| 5:4 | HR10[1:0] | 10小时计数从0到2计数一次，每次从一个位置进行。         | R/W |
| 6   | PM        | AM/PM选择时间计数器设置。<br>0: AM<br>1: PM | R/W |
| 7   | —         | 读取值未定义。写入值应为0。                    | R/W |

RHRCNT计数器设置并计算BCD编码的小时值。它在分钟计数器中计算每小时生成一次的进位。可指定的时间因小时模式位(RCR2.HR24)中的设置而异：

- 当RCR2.HR24位为0时——从00到11（以BCD表示）。
- 当RCR2.HR24位为1时 从00到23（以BCD表示）。

如果指定的值超出此范围，则RTC将无法正确运行。在写入该寄存器之前，您必须使用RCR2中的START位停止计数操作。PM位仅在RCR2.HR24位为0时启用。

否则，PM位中的设置无效。要读取此计数器，请按照第23.3.5节中的程序进行。阅读64-Hz计数器和时间。

## 23.2.5 RWKCNT : Day-of-Week Counter (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x08

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 2:0 | DAYW[2:0] | Day-of-Week Counting<br>0 0 0: Sunday<br>0 0 1: Monday<br>0 1 0: Tuesday<br>0 1 1: Wednesday<br>1 0 0: Thursday<br>1 0 1: Friday<br>1 1 0: Saturday<br>1 1 1: Setting prohibited | R/W |
| 7:3 | —         | The read values are undefined. The write value should be 0.  | R/W |

The RWKCNT counter sets and counts in the coded day-of-week value. It counts the carries generated once per day in the hour counter. A value from 0 through 6 can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

## 23.2.6 BCNTn : Binary Counter n (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x02 + 0x02 × n

| Bit | Symbol    | Function       | R/W |
|-----|-----------|----------------|-----|
| 7:0 | BCNT[7:0] | Binary Counter | R/W |

BCNTn is a read/write 8-bit register to access BCNT[31:0] that is a 32-bit binary counter. BCNT3 is assigned to the BCNT[31:24] bits, BCNT2 is assigned to the BCNT[23:16] bits, BCNT1 is assigned to the BCNT[15:8] bits, and BCNT0 is assigned to the BCNT[7:0] bits. BCNTn performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

## 23.2.7 RDAYCNT : Day Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x0A

## 23.2.5 RWKCNT: 星期计数器 (在日历计数模式下)

Base address: RTC = 0x4008\_3000

Offset address: 0x08

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 2:0 | DAYW[2:0] | Day-of-Week Counting<br>000: 星期日001: 星期一<br>010: 星期二011: 星期三<br>100: 星期四101: 星期五<br>110: 星期六111: 禁止设置 | R/W |
| 7:3 | —         | 读取的值未定义。写入值应为0。   | R/W |

RWKCNT计数器在编码的星期值中设置和计数。它计算小时计数器中每天生成一次的进位。可以指定从0到6的值。如果指定的值超出此范围，则RTC将无法正确运行。在写入该寄存器之前，您必须使用RCR2中的START位停止计数操作。要读取此计数器，请按照第23.3.5节中的程序进行。读取64-Hz计数器和时间。

## 23.2.6 BCNTn: 二进制计数器n (n=0到3) (在二进制计数模式下)

Base address: RTC = 0x4008\_3000

Offset address: 0x02 + 0x02 × n

| Bit | Symbol    | Function | R/W |
|-----|-----------|----------|-----|
| 7:0 | BCNT[7:0] | 二进制计数器   | R/W |

BCNTn是一个读写8位寄存器，用于访问BCNT[31:0]，它是一个32位二进制计数器。BCNT3分配给BCNT[31:24]位，BCNT2分配给BCNT[23:16]位，BCNT1分配给BCNT[15:8]位，BCNT0分配给BCNT[7:0]位。BCNTn通过64-Hz计数器每秒生成的进位执行计数操作。在写入该寄存器之前，您必须使用RCR2中的START位停止计数操作。要读取此计数器，请按照第23.3.5节中的程序进行。读取64-Hz计数器和时间。

## 23.2.7 RDAYCNT: 日计数器

Base address: RTC = 0x4008\_3000

Offset address: 0x0A

| Bit | Symbol      | Function   | R/W |
|-----|-------------|--|-----|
| 3:0 | DATE1[3:0]  | 1-Day Count<br>Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place. | R/W |
| 5:4 | DATE10[1:0] | 10-Day Count<br>Counts from 0 to 3 once per carry from the ones place.                                   | R/W |
| 7:6 | —           | These bits are read as 0. The write value should be 0.   | R/W |

The RDAYCNT counter is used in calendar count mode to set and count the BCD-coded date value. It counts the carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year. Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. When specifying a value, the range of specifiable days depends on the month and whether the year is a leap year. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.8 RMONCNT : Month Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x0C

|                    |   |   |   |           |           |   |   |   |
|--------------------|---|---|---|-----------|-----------|---|---|---|
| Bit position:      | 7 | 6 | 5 | 4         | 3         | 2 | 1 | 0 |
| Bit field:         | — | — | — | MON1<br>0 | MON1[3:0] |   |   |   |
| Value after reset: | 0 | 0 | 0 | x         | x         | x | x | x |

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 3:0 | MON1[3:0] | 1-Month Count<br>Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place. | R/W |
| 4   | MON10     | 10-Month Count<br>Counts from 0 to 1 once per carry from the ones place.                                     | R/W |
| 7:5 | —         | These bits are read as 0. The write value should be 0.   | R/W |

The RMONCNT counter is used in calendar count mode to set and count the BCD-coded month value. It counts the carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.9 RYRCNT : Year Counter

Base address: RTC = 0x4008\_3000

Offset address: 0x0E

|                    |    |    |    |    |    |    |   |   |           |   |   |   |          |   |   |   |
|--------------------|----|----|----|----|----|----|---|---|-----------|---|---|---|----------|---|---|---|
| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7         | 6 | 5 | 4 | 3        | 2 | 1 | 0 |
| Bit field:         | —  | —  | —  | —  | —  | —  | — | — | YR10[3:0] |   |   |   | YR1[3:0] |   |   |   |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | x         | x | x | x | x        | x | x | x |

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 3:0 | YR1[3:0] | 1-Year Count<br>Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place. | R/W |

| Bit | Symbol      | Function                  | R/W |
|-----|-------------|---------------------------|-----|
| 3:0 | DATE1[3:0]  | 1天计数每天从0计数到9次。产生进位时，十位加1。 | R/W |
| 5:4 | DATE10[1:0] | 10天计数从0到3计数一次，每次从一个位置进行。  | R/W |
| 7:6 | —           | 这些位被读取为0。写入值应为0。          | R/W |

RDAYCNT计数器用于日历计数模式以设置和计数BCD编码的日期值。它计算小时计数器中每天生成一次的进位。计数操作取决于月份以及年份是否为闰年。闰年根据年份计数器(RYRCNT)值是否可被400、100和4整除来确定。

可以指定从01到31的值（以BCD表示）。如果指定的值超出此范围，则RTC将无法正确运行。指定值时，可指定天数的范围取决于月份以及年份是否为闰年。在写入该寄存器之前，您必须使用RCR2中的START位停止计数操作。要读取此计数器，请按照第23.3.5节中的程序进行。读取64-Hz计数器和时间。

### 23.2.8 RMONCNT:月计数器

Base address: RTC = 0x4008\_3000

Offset address: 0x0C

|               |   |   |   |           |           |   |   |   |
|---------------|---|---|---|-----------|-----------|---|---|---|
| Bit position: | 7 | 6 | 5 | 4         | 3         | 2 | 1 | 0 |
| Bit field:    | — | — | — | MON1<br>0 | MON1[3:0] |   |   |   |
| 重置后的值:        | 0 | 0 | 0 | x         | x         | x | x | x |

| Bit | Symbol    | Function                    | R/W |
|-----|-----------|-----------------------------|-----|
| 3:0 | MON1[3:0] | 1个月计数每月一次从0计数到9。产生进位时，十位加1。 | R/W |
| 4   | MON10     | 10-MonthCount从0到1计数一次，每次进位。 | R/W |
| 7:5 | —         | 这些位被读取为0。写入值应为0。            | R/W |

RMONCNT计数器用于日历计数模式以设置和计数BCD编码的月份值。它在日期计数器中计算每月生成一次的进位。

可以指定从01到12的值（以BCD表示）。如果指定的值超出此范围，则RTC将无法正确运行。在写入该寄存器之前，您必须使用RCR2中的START位停止计数操作。要读取此计数器，请按照第23.3.5节中的程序进行。读取64-Hz计数器和时间。

### 23.2.9 RYRCNT:年计数器

Base address: RTC = 0x4008\_3000

Offset address: 0x0E

|               |    |    |    |    |    |    |   |   |           |   |   |   |          |   |   |   |
|---------------|----|----|----|----|----|----|---|---|-----------|---|---|---|----------|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7         | 6 | 5 | 4 | 3        | 2 | 1 | 0 |
| Bit field:    | —  | —  | —  | —  | —  | —  | — | — | YR10[3:0] |   |   |   | YR1[3:0] |   |   |   |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | x         | x | x | x | x        | x | x | x |

| Bit | Symbol   | Function                  | R/W |
|-----|----------|---------------------------|-----|
| 3:0 | YR1[3:0] | 1年计数每年从0计数到9次。产生进位时，十位加1。 | R/W |

| Bit  | Symbol    | Function   | R/W |
|------|-----------|--|-----|
| 7:4  | YR10[3:0] | 10-Year Count<br>Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place. | R/W |
| 15:8 | —         | These bits are read as 0. The write value should be 0.   | R/W |

The RYRCNT counter is used in calendar count mode to set and count the BCD-coded year value. It counts the carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).

### 23.2.10 RSECAR : Second Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x10

|                    |     |            |   |           |   |   |   |   |
|--------------------|-----|------------|---|-----------|---|---|---|---|
| Bit position:      | 7   | 6          | 5 | 4         | 3 | 2 | 1 | 0 |
| Bit field:         | ENB | SEC10[2:0] |   | SEC1[3:0] |   |   |   |   |
| Value after reset: | x   | x          | x | x         | x | x | x | x |

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 3:0 | SEC1[3:0]  | 1 Second<br>Value for the ones place of seconds.   | R/W |
| 6:4 | SEC10[2:0] | 10 Seconds<br>Value for the tens place of seconds.   | R/W |
| 7   | ENB        | ENB<br>0: Do not compare register value with RSECCNT counter value<br>1: Compare register value with RSECCNT counter value | R/W |

RSECAR is an alarm register associated with the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. RSECAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

| Bit  | Symbol    | Function                                      | R/W |
|------|-----------|---|-----|
| 7:4  | YR10[3:0] | 10-YearCount从0到9计数一次，每次从一个位置进位。当十位产生进位时，百位加1。 | R/W |
| 15:8 | —         | 这些位被读取为0。写入值应为0。                              | R/W |

RYRCNT计数器在日历计数模式下用于设置和计数BCD编码的年份值。它计算月份计数器中每年生成一次的进位。

可以指定从00到99（BCD格式）的值。如果指定的值超出此范围，则RTC将无法正确运行。在写入该寄存器之前，您必须使用RCR2中的START位停止计数操作。要读取此计数器，请按照第23.3.5节中的程序进行。读取64-Hz计数器和时间。

### 23.2.10 RSCAR: 第二个警报寄存器（在日历计数模式下）

Base address: RTC = 0x4008\_3000

Offset address: 0x10

|               |     |            |   |           |   |   |   |   |
|---------------|-----|------------|---|-----------|---|---|---|---|
| Bit position: | 7   | 6          | 5 | 4         | 3 | 2 | 1 | 0 |
| Bit field:    | ENB | SEC10[2:0] |   | SEC1[3:0] |   |   |   |   |
| 重置后的值:        | x   | x          | x | x         | x | x | x | x |

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 3:0 | SEC1[3:0]  | 1秒个位的秒值。   | R/W |
| 6:4 | SEC10[2:0] | 10秒十位秒的值。  | R/W |
| 7   | ENB        | ENB<br>0: 不将寄存器值与RSECCNT计数器值进行比较<br>1: 将寄存器值与RSECCNT计数器值进行比较 | R/W |

RSCAR是与BCD编码的第二个计数器RSECCNT相关的警报寄存器。当ENB位设置为1时，RSCAR值与RSECCNT值进行比较。从下面的报警寄存器中，只有那些选择与设置为1的ENB位与相关计数器进行比较：

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

当所有各自的值都匹配时，与RTC\_ALM中断相关的IR标志设置为1。可以指定从00到59（以BCD表示）的RSCAR值。如果指定的值超出此范围，则RTC将无法正确运行。该寄存器通过RTC软件复位设置为0x00。

## 23.2.11 RMINAR : Minute Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x12

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 3:0 | MIN1[3:0]  | 1 Minute<br>Value for the ones place of minutes.   | R/W |
| 6:4 | MIN10[2:0] | 10 Minutes<br>Value for the tens place of minutes.   | R/W |
| 7   | ENB        | ENB<br>0: Do not compare register value with RMINCNT counter value<br>1: Compare register value with RMINCNT counter value | R/W |

RMINAR is an alarm register associated with the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. RMINAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

## 23.2.12 RHRAR : Hour Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x14

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 3:0 | HR1[3:0]  | 1 Hour<br>Value for the ones place of hours.      | R/W |
| 5:4 | HR10[1:0] | 10 Hours<br>Value for the tens place of hours.    | R/W |
| 6   | PM        | AM/PM select for alarm setting.<br>0: AM<br>1: PM | R/W |

## 23.2.11 RMINAR: 分钟报警寄存器 (日历计数模式)

Base address: RTC = 0x4008\_3000

Offset address: 0x12

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 3:0 | MIN1[3:0]  | 分钟的个位的1分钟值。  | R/W |
| 6:4 | MIN10[2:0] | 十位分钟的10分钟值。  | R/W |
| 7   | ENB        | ENB<br>0: 不将寄存器值与RMINCNT计数器值进行比较<br>1: 将寄存器值与RMINCNT计数器值进行比较 | R/W |

RMINAR是一个与BCD编码的分钟计数器RMINCNT相关的报警寄存器。当ENB位设置为1时，RMINAR值与RMINCNT值进行比较。从下面的报警寄存器中，只有那些选择与设置为1的ENB位与相关计数器进行比较：

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

当所有各自的值都匹配时，与RTC\_ALM中断相关的IR标志设置为1。可以指定从00到59（以BCD表示）的RMINAR值。如果指定的值超出此范围，则RTC将无法正常运行。该寄存器通过RTC软件复位设置为0x00。

## 23.2.12 RHRAR: 小时报警寄存器 (日历计数模式)

Base address: RTC = 0x4008\_3000

Offset address: 0x14

| Bit | Symbol    | Function                      | R/W |
|-----|-----------|-------------------------------|-----|
| 3:0 | HR1[3:0]  | 1小时值的个数。                      | R/W |
| 5:4 | HR10[1:0] | 十位小时的10小时值。                   | R/W |
| 6   | PM        | AMPM选择闹钟设置。<br>0: AM<br>1: PM | R/W |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 7   | ENB    | ENB<br>0: Do not compare register value with RHCNT counter value<br>1: Compare register value with RHCNT counter value | R/W |

RHRAR is an alarm register associated with the BCD-coded hour counter RHCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – From 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – From 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. When the RCR2.HR24 bit is 0, you must set the PM bit. When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect. This register is set to 0x00 by an RTC software reset.

### 23.2.13 RWKAR : Day-of-Week Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x16

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 2:0 | DAYW[2:0] | Day-of-Week Setting<br>0 0 0: Sunday<br>0 0 1: Monday<br>0 1 0: Tuesday<br>0 1 1: Wednesday<br>1 0 0: Thursday<br>1 0 1: Friday<br>1 1 0: Saturday<br>1 1 1: Setting prohibited | R/W |
| 6:3 | —         | The read values are undefined. The write value should be 0.   | R/W |
| 7   | ENB       | ENB<br>0: Do not compare register value with RWKCNT counter value<br>1: Compare register value with RWKCNT counter value  | R/W |

RWKAR is an alarm register associated with the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 7   | ENB    | ENB<br>0: 不将寄存器值与RHCNT计数器值进行比较<br>1: 将寄存器值与RHCNT计数器值进行比较 | R/W |

RHRAR是一个与BCD编码的小时计数器RHCNT相关的报警寄存器。当ENB位设置为1时，RHRAR值与RHCNT值进行比较。从以下报警寄存器中，只有选择ENB位设置为1的报警寄存器与相关计数器进行比较：

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

当所有各自的值都匹配时，与RTC\_ALM中断相关的IR标志设置为1。可指定的时间根据小时模式位(RCR2.HR24)中的设置而有所不同：

- 当RCR2.HR24位为0时 从00到11（以BCD表示）。
- 当RCR2.HR24位为1时 从00到23（BCD格式）。

如果指定的值超出此范围，则RTC将无法正确运行。当RCR2.HR24位为0时，必须设置PM位。当RCR2.HR24位为1时，PM位中的设置无效。该寄存器通过RTC软件复位设置为0x00。

### 23.2.13 RWKAR：星期报警寄存器（日历计数模式）

Base address: RTC = 0x4008\_3000

Offset address: 0x16

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 2:0 | DAYW[2:0] | Day-of-Week Setting<br>000: 星期日001: 星期一<br>010: 星期二011: 星期三<br>100: 星期四101: 星期五<br>110: 星期六111: 禁止设置 | R/W |
| 6:3 | —         | 读取的值未定义。写入值应为0。  | R/W |
| 7   | ENB       | ENB<br>0: 不将寄存器值与RWKCNT计数器值进行比较<br>1: 将寄存器值与RWKCNT计数器值进行比较   | R/W |

RWKAR是与编码的星期计数器RWKCNT相关的报警寄存器。当ENB位设置为1时，RWKAR值与RWKCNT值进行比较。从下面的报警寄存器中，只有那些选择与设置为1的ENB位与相关计数器进行比较：

- RSECAR

- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. RWKAR values from 0 through 6 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

23.2.14 BCNTnAR : Binary Counter n Alarm Register (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x10 + 0x02 × n

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 7:0 | BCNTAR | Alarm register associated with the 32-bit binary counter | R/W |

BCNTnAR is a read/write alarm register associated with the 32-bit binary counter. BCNT3AR is assigned to the BCNTAR[31:24] bits, BCNT2AR is assigned to the BCNTAR[23:16] bits, BCNT1AR is assigned to the BCNTAR[15:8] bits, and BCNT0AR is assigned to the BCNTAR[7:0]. This register is set to 0x00 by an RTC software reset.

23.2.15 RDAYAR : Date Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x18

| Bit | Symbol      | Function   | R/W |
|-----|-------------|--|-----|
| 3:0 | DATE1[3:0]  | 1 Day<br>Value for the ones place of days.   | R/W |
| 5:4 | DATE10[1:0] | 10 Days<br>Value for the tens place of days.   | R/W |
| 6   | —           | The read value is undefined. The write value should be 0.  | R/W |
| 7   | ENB         | ENB<br>0: Do not compare register value with RDAYCNT counter value<br>1: Compare register value with RDAYCNT counter value | R/W |

RDAYAR is an alarm register associated with the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR

- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

当所有各自的值都匹配时，与RTC\_ALM中断相关的IR标志设置为1。可以指定从0到6（以BCD表示）的RWKAR值。如果指定的值超出此范围，则RTC将无法正确运行。该寄存器通过RTC软件复位设置为0x00。

23.2.14 BCNTnAR: 二进制计数器n报警寄存器 (n=0到3) (在二进制计数模式下)

Base address: RTC = 0x4008\_3000

Offset address: 0x10 + 0x02 × n

| Bit | Symbol | Function           | R/W |
|-----|--------|--------------------|-----|
| 7:0 | BCNTAR | 与32位二进制计数器关联的报警寄存器 | R/W |

BCNTnAR是一个与32位二进制计数器相关的读写报警寄存器。BCNT3AR分配给BCNTAR[31:24]位，BCNT2AR分配给BCNTAR[23:16]位，BCNT1AR分配给BCNTAR[15:8]位，BCNT0AR分配给BCNTAR[7:0]。该寄存器通过RTC软件复位设置为0x00。

23.2.15 RDAYAR:日期报警寄存器 (日历计数模式)

Base address: RTC = 0x4008\_3000

Offset address: 0x18

| Bit | Symbol      | Function   | R/W |
|-----|-------------|--|-----|
| 3:0 | DATE1[3:0]  | 1天的个位数的值。  | R/W |
| 5:4 | DATE10[1:0] | 10天十位天的价值。   | R/W |
| 6   | —           | 读取值未定义。写入值应为0。   | R/W |
| 7   | ENB         | ENB<br>0: 不将寄存器值与RDAYCNT计数器值进行比较1: 将寄存器值与RDAYCNT计数器值进行比较 | R/W |

RDAYAR是一个与BCD编码日期计数器RDAYCNT相关的报警寄存器。当ENB位设置为1时，将RDAYAR值与RDAYCNT值进行比较。从下面的报警寄存器中，只有那些选择与设置为1的ENB位与相关计数器进行比较：

- RSECAR
- RMINAR
- RHRAR

- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. The RDAYAR values from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

### 23.2.16 RMONAR : Month Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1A

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 3:0 | MON1[3:0] | 1 Month<br>Value for the ones place of months.   | R/W |
| 4   | MON10     | 10 Months<br>Value for the tens place of months.   | R/W |
| 6:5 | —         | The read values are undefined. The write value should be 0.  | R/W |
| 7   | ENB       | ENB<br>0: Do not compare register value with RMONCNT counter value<br>1: Compare register value with RMONCNT counter value | R/W |

RMONAR is an alarm register associated with the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. The RMONAR values from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

### 23.2.17 RYRAR : Year Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1C

- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

当所有各自的值都匹配时，与RTC\_ALM中断相关的IR标志设置为1。可以指定从01到31（以BCD表示）的RDAYA R值。如果指定的值超出此范围，则RTC将无法正确运行。该寄存器通过RTC软件复位设置为0x00。

### 23.2.16 RMONAR: 月报警寄存器（日历计数模式）

Base address: RTC = 0x4008\_3000

Offset address: 0x1A

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 3:0 | MON1[3:0] | 1月份的个位数的月份值。   | R/W |
| 4   | MON10     | 10个月十位月份的值。  | R/W |
| 6:5 | —         | 读取的值未定义。写入值应为0。  | R/W |
| 7   | ENB       | ENB<br>0: 不将寄存器值与RMONCNT计数器值进行比较1: 将寄存器值与RMONCNT计数器值进行比较 | R/W |

RMONAR是一个与BCD编码月份计数器RMONCNT相关的报警寄存器。当ENB位设置为1时，RMONAR值与RMONCNT值进行比较。从以下报警寄存器中，只有选择ENB位设置为1的报警寄存器与相关计数器进行比较：

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

当所有各自的值都匹配时，与RTC\_ALM中断相关的IR标志设置为1。可以指定从01到12（以BCD表示）的RMONAR值。如果指定的值超出此范围，则RTC将无法正确运行。该寄存器通过RTC软件复位设置为0x00。

### 23.2.17 RYRAR: 年报警寄存器（在日历计数模式下）

Base address: RTC = 0x4008\_3000

Offset address: 0x1C

| Bit  | Symbol    | Function   | R/W |
|------|-----------|--|-----|
| 3:0  | YR1[3:0]  | 1 Year<br>Value for the ones place of years.           | R/W |
| 7:4  | YR10[3:0] | 10 Years<br>Value for the tens place of years.         | R/W |
| 15:8 | —         | These bits are read as 0. The write value should be 0. | R/W |

RYRAR is an alarm register associated with the BCD-coded year counter RYRCNT. The RYRAR values from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x0000 by an RTC software reset.

### 23.2.18 RYRAREN : Year Alarm Enable Register (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1E

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 6:0 | —      | The read values are undefined. The write value should be 0.  | R/W |
| 7   | ENB    | ENB<br>0: Do not compare register value with the RYRCNT counter value<br>1: Compare register value with the RYRCNT counter value | R/W |

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC\_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

### 23.2.19 BCNTnAER : Binary Counter n Alarm Enable Register (n = 0, 1) (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x18 + 0x02 × n

| Bit  | Symbol    | Function         | R/W |
|------|-----------|------------------|-----|
| 3:0  | YR1[3:0]  | 年的个位的1年值。        | R/W |
| 7:4  | YR10[3:0] | 10年十位年份的值。       | R/W |
| 15:8 | —         | 这些位被读取为0。写入值应为0。 | R/W |

RYRAR是一个与BCD编码年份计数器RYRCNT相关联的警报寄存器。可以指定从00到99（BCD格式）的RYRAR值。如果指定的值超出此范围，则RTC将无法正确运行。该寄存器通过RTC软件复位设置为0x0000。

### 23.2.18 RYRAREN:年警报启用寄存器（在日历计数模式下）

Base address: RTC = 0x4008\_3000

Offset address: 0x1E

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 6:0 | —      | 读取的值未定义。写入值应为0。  | R/W |
| 7   | ENB    | ENB<br>0: 不将寄存器值与RYRCNT计数器值进行比较<br>1: 将寄存器值与RYRCNT计数器值进行比较 | R/W |

当RYRAREN寄存器中的ENB位设置为1时，RYRAR值与RYRCNT值进行比较。从以下报警寄存器中，只有选择ENB位设置为1的报警寄存器与相关计数器进行比较：

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

当所有各自的值都匹配时，与RTC\_ALM中断相关的IR标志设置为1。该寄存器通过RTC软件复位设置为0x00。

### 23.2.19 BCNTnAER:二进制计数器n报警使能寄存器(n=0 1)(以二进制计数 Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x18 + 0x02 × n

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 7:0 | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |

BCNTnAER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC\_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

### 23.2.20 BCNT2AER : Binary Counter 2 Alarm Enable Register (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1C

| Bit position:      | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| Bit field:         | —  |    |    |    |    |    |   |   | ENB[7:0] |   |   |   |   |   |   |   |
| Value after reset: | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | x        | x | x | x | x | x | x | x |

| Bit  | Symbol   | Function   | R/W |
|------|----------|--|-----|
| 7:0  | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |
| 15:8 | —        | These bits are read as 0. The write value should be 0.             | R/W |

BCNT2AER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC\_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

### 23.2.21 BCNT3AER : Binary Counter 3 Alarm Enable Register (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x1E

| Bit position:      | 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|----------|---|---|---|---|---|---|---|
| Bit field:         | ENB[7:0] |   |   |   |   |   |   |   |
| Value after reset: | x        | x | x | x | x | x | x | x |

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 7:0 | ENB[7:0] | Setting the alarm enable associated with the 32-bit binary counter | R/W |

BCNT3AER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC\_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

| Bit | Symbol   | Function            | R/W |
|-----|----------|---------------------|-----|
| 7:0 | ENB[7:0] | 设置与32位二进制计数器关联的报警启用 | R/W |

BCNTnAER是一个读写寄存器，用于设置与32位二进制计数器相关的报警使能(BCNTAER)。BCNT3AER分配给BCNTAER.ENB[31:24]位，BCNT2AER寄存器分配给BCNTAER.ENB[23:16]位，BCNT1AER分配给BCNTAER.ENB[15:8]位，BCNT0AER分配给BCNTAER.ENB[7:0]位。与设置为1的BCNTAER.ENB[31:0]位相关的二进制计数器(BCNT[31:0])与二进制报警寄存器(BCNTAR)进行比较，当全部匹配时，与RTC\_ALM中断设置为1。该寄存器通过RTC软件复位设置为0x00。

### 23.2.20 BCNT2AER：二进制计数器2报警使能寄存器（在二进制计数模式下）

Base address: RTC = 0x4008\_3000

Offset address: 0x1C

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| Bit field:    | —  |    |    |    |    |    |   |   | ENB[7:0] |   |   |   |   |   |   |   |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | x        | x | x | x | x | x | x | x |

| Bit  | Symbol   | Function            | R/W |
|------|----------|---------------------|-----|
| 7:0  | ENB[7:0] | 设置与32位二进制计数器关联的报警启用 | R/W |
| 15:8 | —        | 这些位被读取为0。写入值应为0。    | R/W |

BCNT2AER是一个读写寄存器，用于设置与32位二进制计数器相关的报警使能(BCNTAER)。BCNT3AER分配给BCNTAER.ENB[31:24]位，BCNT2AER寄存器分配给BCNTAER.ENB[23:16]位，BCNT1AER分配给BCNTAER.ENB[15:8]位，BCNT0AER分配给BCNTAER.ENB[7:0]位。与设置为1的BCNTAER.ENB[31:0]位相关的二进制计数器(BCNT[31:0])与二进制报警寄存器(BCNTAR)进行比较，当全部匹配时，与RTC\_ALM中断设置为1。该寄存器通过RTC软件复位设置为0x00。

### 23.2.21 BCNT3AER：二进制计数器3报警使能寄存器（在二进制计数模式下）

Base address: RTC = 0x4008\_3000

Offset address: 0x1E

| Bit position: | 7        | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|----------|---|---|---|---|---|---|---|
| Bit field:    | ENB[7:0] |   |   |   |   |   |   |   |
| 重置后的值:        | x        | x | x | x | x | x | x | x |

| Bit | Symbol   | Function            | R/W |
|-----|----------|---------------------|-----|
| 7:0 | ENB[7:0] | 设置与32位二进制计数器关联的报警启用 | R/W |

BCNT3AER是一个读写寄存器，用于设置与32位二进制计数器相关的报警使能(BCNTAER)。BCNT3AER分配给BCNTAER.ENB[31:24]位，BCNT2AER寄存器分配给BCNTAER.ENB[23:16]位，BCNT1AER分配给BCNTAER.ENB[15:8]位，BCNT0AER分配给BCNTAER.ENB[7:0]位。与设置为1的BCNTAER.ENB[31:0]位相关的二进制计数器(BCNT[31:0])与二进制报警寄存器(BCNTAR)进行比较，当全部匹配时，与RTC\_ALM中断设置为1。该寄存器通过RTC软件复位设置为0x00。

## 23.2.22 RCR1 : RTC Control Register 1

Base address: RTC = 0x4008\_3000

Offset address: 0x22

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 0   | AIE      | Alarm Interrupt Enable<br>0: Disable alarm interrupt requests<br>1: Enable alarm interrupt requests  | R/W |
| 1   | CIE      | Carry Interrupt Enable<br>0: Disable carry interrupt requests<br>1: Enable carry interrupt requests  | R/W |
| 2   | PIE      | Periodic Interrupt Enable<br>0: Disable periodic interrupt requests<br>1: Enable periodic interrupt requests   | R/W |
| 3   | RTCOS    | RTCOUT Output Select<br>0: Outputs 1 Hz on RTCOUT<br>1: Outputs 64 Hz RTCOUT   | R/W |
| 7:4 | PES[3:0] | Periodic Interrupt Select<br>0x6: Generate periodic interrupt every 1/256 second*1<br>0x7: Generate periodic interrupt every 1/128 second<br>0x8: Generate periodic interrupt every 1/64 second<br>0x9: Generate periodic interrupt every 1/32 second<br>0xA: Generate periodic interrupt every 1/16 second<br>0xB: Generate periodic interrupt every 1/8 second<br>0xC: Generate periodic interrupt every 1/4 second<br>0xD: Generate periodic interrupt every 1/2 second<br>0xE: Generate periodic interrupt every 1 second<br>0xF: Generate periodic interrupt every 2 seconds<br>Others: Do not generate periodic interrupts | R/W |

Note 1. When LOCO is selected (RCR4.RCKSEL = 1) while PES[3:0] = 0x6, a periodic interrupt is generated every 1/128 second.

The RCR1 register is used in both calendar count mode and binary count mode. Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits are updated before proceeding.

**AIE bit (Alarm Interrupt Enable)**

The AIE bit enables or disables alarm interrupt requests.

If the times indicated in the counters and alarm settings match in Deep Software Standby mode, the MCU returns from the regardless of the AIE bit value.

**CIE bit (Carry Interrupt Enable)**

The CIE bit enables or disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

**PIE bit (Periodic Interrupt Enable)**

The PIE bit enables or disabled a periodic interrupt.

If the periods indicated in the counters and PES[3:0] settings match in Deep Software Standby mode, the MCU returns from the regardless of the PIE bit value.

## 23.2.22 RCR1:RTC控制寄存器1

Base address: RTC = 0x4008\_3000

Offset address: 0x22

| Bit | Symbol   | Function   | R/W |
|-----|----------|--|-----|
| 0   | AIE      | 报警中断使能<br>0: 禁用报警中断请求<br>1: 启用报警中断请求   | R/W |
| 1   | CIE      | 进位中断使能<br>0: 禁止进位中断请求<br>1: 使能进位中断请求   | R/W |
| 2   | PIE      | 周期性中断使能<br>0: 禁用周期性中断请求<br>1: 启用周期性中断请求  | R/W |
| 3   | RTCOS    | RTCOUT输出选择<br>0: 在RTCOUT上输出1Hz<br>1: 输出64HzRTCOUT  | R/W |
| 7:4 | PES[3:0] | 周期性中断选择<br>0x6: 每1256秒产生周期性中断*1<br>0x7: 每1128秒产生周期中断<br>0x8: 每164秒产生周期中断<br>0x9: 每132秒产生周期中断<br>0xA: 每116秒产生周期中断<br>0xB: 每18秒产生周期中断<br>0xC: 产生周期中断每14秒<br>0xD: 每12秒产生周期性中断<br>0xE: 每1秒产生周期性中断<br>0xF: 每2秒产生周期性中断<br>其他: 不产生周期性中断 | R/W |

注意1.选择LOCO (RCR4.RCKSEL=1) 时, PES[3:0]=0x6时, 每1128秒都会生成周期性中断。

RCR1寄存器用于日历计数模式和二进制计数模式。AIE、PIE和PES[3:0]位与计数源同步更新。修改RCR1寄存器时, 在继续之前检查所有位是否都已更新。

**AIE位 (报警中断允许)**

AIE位启用或禁用报警中断请求。

如果计数器和警报设置中指示的时间在深度软件待机模式下匹配, 则MCU从不考虑AIE位值返回。

**CIE位 (进位中断使能)**

当发生对RSECCNT/BCNT0寄存器的进位, 或在读取64-Hz计数器时发生对64-Hz计数器(R64CNT)的进位时, CIE位启用或禁用中断请求。

**PIE位 (周期性中断使能)**

PIE位启用或禁用周期性中断。

如果计数器中指示的周期和PES[3:0]设置在深度软件待机模式下匹配, 则MCU将从无论PIE位值如何返回。

**RTCOS bit (RTCOUT Output Select)**

The RTCOS bit selects the RTCOUT output period. The RTCOS bit must be rewritten while the count operation is stopped (RCR2.START = 0) and the RTCOUT output is disabled (RCR2.RTCOE = 0). When RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled.

**PES[3:0] bits (Periodic Interrupt Select)**

The PES[3:0] bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified in these bits.

**23.2.23 RCR2 : RTC Control Register 2 (in Calendar Count Mode)**

Base address: RTC = 0x4008\_3000

Offset address: 0x24

|                    |           |      |           |           |           |       |           |       |
|--------------------|-----------|------|-----------|-----------|-----------|-------|-----------|-------|
| Bit position:      | 7         | 6    | 5         | 4         | 3         | 2     | 1         | 0     |

| 2   | ADJ30  | 30-Second Adjustment<br>0: In writing: Invalid (writing 0 has no effect).<br>In reading: Normal time operation in progress, or 30-second adjustment has completed.<br>1: In writing: Execute 30-second adjustment.<br>In reading: 30-second adjustment in progress.  | R/W |
| 3   | RTCOE  | RTCOUT Output Enable<br>0: Disable RTCOUT output<br>1: Enable RTCOUT output  | R/W |
| 4   | AADJE  | Automatic Adjustment Enable*2*3<br>0: Disable automatic adjustment<br>1: Enable automatic adjustment   | R/W |
| 5   | AADJP  | Automatic Adjustment Period Select*2*3<br>0: The RADJ.ADJ[5:0] setting from the count value of the prescaler every minute.<br>1: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every 10 seconds.   | R/W |
| 6   | HR24   | Hours Mode*3<br>0: Operate RTC in 12-hour mode<br>1: Operate RTC in 24-hour mode   | R/W |
| 7   | CNTMD  | Count Mode Select*4<br>0: Calendar count mode<br>1: Binary count mode  | R/W |

Note 1. R64CNT, RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAR, RYRAREN, RADJ, RTCCRn, RSECCPn, RMINCPn, RHRCPn, RDAYCPn, RMONCPn, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

Note 3. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See [section 23.6.5. Notes on Writing to and Reading from Registers](#) for notes on register writing/reading.

Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

**RTCOS位 (RTCOUT输出选择)**

RTCOS位选择RTCOUT输出周期。当计数操作停止(RCR2.START=0)并且RTCOUT输出被禁用(RCR2.RTCOE=0)时，必须重写RTCOS位。当RTCOUT输出到外部引脚时，必须使能RCR2.RTCOE位。

**PES[3:0]位 (周期性中断选择)**

PES[3:0]位指定周期性中断的周期。以这些位中指定的周期生成周期性中断。

**23.2.23 RCR2: RTC控制寄存器2 (日历计数模式)**

Base address: RTC = 0x4008\_3000

Offset address: 0x24

|               |           |      |           |           |           |       |           |       |
|---------------|-----------|------|-----------|-----------|-----------|-------|-----------|-------|
| Bit position: | 7         | 6    | 5         | 4         | 3         | 2     | 1         | 0     |

Note 1. R64CNT, RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAR, RYRAREN, RADJ, RTCCRn, RSECCPn, RMINCPn, RHRCPn, RDAYCPn, RMONCPn, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

注意2.选择机车时, 该位的设置被禁用。

注3.改写该位时, 请确认该值已被改写, 然后再进行以下处理。请参阅第23.6.5节。  
[Notes on Writing to and Reading from Registers](#)有关寄存器写入读取的说明。

注4.改写该位时, 请确认该值已被改写, 然后再进行以下处理。

The RCR2 register is related to hours mode, automatic adjustment function, enabling RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

#### START bit (Start)

The START bit stops or restarts the prescaler or time counter operation. This bit is updated in synchronization with the next cycle of the count source. When the START bit is modified, check that the bit is updated before proceeding.

#### RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. Check that this bit is 0 before proceeding.

#### ADJ30 bit (30-Second Adjustment)

The ADJ30 bit is for 30-second adjustment.

When 1 is written to the ADJ30 bit, the RSECCNT value of 30 seconds or less is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.

The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment completes. If 1 is written to the ADJ30 bit, check that the bit is 0 before proceeding. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is set to 0 by an RTC software reset.

#### RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.

When RTCOUT is to be output from an external pin, enable the RTCOE bit and set up the port control for the pin.

#### AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.

The AADJE bit is set to 0 by an RTC software reset.

#### AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.

The AADJP bit is set to 0 by an RTC software reset.

#### HR24 bit (Hours Mode)

The HR24 bit specifies whether the RTC operates in 12- or 24-hour mode.

Use the START bit to stop counting before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

#### CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see [section 23.3.1. Outline of Initial Settings of Registers after Power On.](#)

RCR2寄存器与小时模式、自动调整功能、启用RTCOUT输出、30秒调整、RTC软件复位和控制计数操作有关。

#### 开始位 (开始)

START位停止或重新启动预分频器或时间计数器操作。该位与计数源的下一个周期同步更新。修改START位后，请在继续之前检查该位是否已更新。

#### RESET位 (RTC软件复位)

RESET位初始化预分频器和寄存器以由RTC软件复位。当向该位写入1时，初始化与计数源同步开始。初始化完成后，RESET位自动设置为0。在继续之前检查该位是否为0。

#### ADJ30位 (30-Second Adjustment)

ADJ30位用于30秒调整。

向ADJ30位写入1时，30秒以下的RSECCNT值向下舍入为00秒，30秒以上的值向上舍入为1分钟。

30秒调整与计数源同步进行。向该位写入1时，30秒调整完成后ADJ30位自动设置为0。如果将1写入ADJ30位，请在继续之前检查该位是否为0。当执行30秒调整时，预分频器和R64CNT也被复位。RTC软件复位将ADJ30位设置为0。

#### RTCOE位 (RTCOUT输出使能)

RTCOE位使能从RTCOUT引脚输出1-Hz/64-Hz时钟信号。

在更改RTCOE位的值之前，使用START位停止计数。不要停止计数（将0写入START位）并同时更改RTCOE位的值。

当RTCOUT要从外部引脚输出时，使能RTCOE位并设置引脚的端口控制。

#### ADJE位 (自动调整使能)

AADJE位控制（启用或禁用）自动调整。

在更改ADJE位的值之前，将正负位(RADJ.PMADJ[1:0])设置为00b（不执行调整）。

RTC软件复位将ADJE位设置为0。

#### AADJP位 (自动调整周期选择)

AADJP位选择自动调整周期。

在更改AADJP位的值之前，将正负位(RADJ.PMADJ[1:0])设置为00b（不执行调整）。

AADJP位通过RTC软件复位设置为0。

#### HR24位 (Hours Mode)

HR24位指定RTC是在12小时还是24小时模式下运行。

在更改HR24位的值之前，使用START位停止计数。不要停止计数（将0写入START位）并同时更改HR24位的值。

#### CNTMD位 (计数模式选择)

CNTMD位指定RTC计数模式是在日历计数模式还是二进制计数模式下运行。

设置计数模式时，执行RTC软件复位并从初始设置重新开始。该位与计数源同步更新。但是，计数模式仅在RTC软件复位后切换。（RTC复位前位切换，RTC复位后模式切换。）

有关初始设置的详细信息，请参阅第23.3.1节。上电后寄存器的初始设置概要。

## 23.2.24 RCR2 : RTC Control Register 2 (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x24

|                    |           |   |           |           |           |   |           |       |

| 6   | —      | The read value is undefined. The write value should be 0.  | R/W |
| 7   | CNTMD  | Count Mode Select*4<br>0: Calendar count mode<br>1: Binary count mode  | R/W |

Note 1. R64CNT, BCNTnAR, BCNTnAER, RADJ, RTCCRn, BCNTnCPm, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

Note 3. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See [section 23.6.5. Notes on Writing to and Reading from Registers](#) for notes on register writing/reading.

Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

RCR2 in the binary count mode is a register related to the automatic correction function, RTCOUT output enable, RTC software reset, and count mode control.

**START bit (Start)**

The START bit stops or restarts the prescaler or counter (clock) operation. This bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding.

**RESET bit (RTC Software Reset)**

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is 0 before proceeding.

**RTCOE bit (RTCOUT Output Enable)**

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time. When an RTCOUT signal is to be output from an external pin, enable the port control in addition to setting this bit.

## 23.2.24 RCR2: RTC控制寄存器2 (二进制计数模式)

Base address: RTC = 0x4008\_3000

Offset address: 0x24

|               |           |   |           |           |           |   |           |       |

Note 1. R64CNT, BCNTnAR, BCNTnAER, RADJ, RTCCRn, BCNTnCPm, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

注意2.选择机车时, 该位的设置被禁用。

注3.改写该位时, 请确认该值已被改写, 然后再进行以下处理。请参阅第23.6.5节。

[NotesonWritetoandReadingfromRegisters](#)有关寄存器写入读取的说明。

注4.改写该位时, 请确认该值已被改写, 然后再进行以下处理。

二进制计数模式下的RCR2是与自动校正功能、RTCOUT输出使能、RTC软件复位和计数模式控制相关的寄存器。

**开始位 (开始)**

START位停止或重新启动预分频器或计数器(时钟)操作。该位与计数源同步更新。修改START位后, 请在继续之前检查该位是否已更新。

**RESET位 (RTC软件复位)**

RESET位初始化预分频器和寄存器以由RTC软件复位。当向该位写入1时, 初始化与计数源同步开始。初始化完成后, RESET位自动设置为0。当向RESET位写入1时, 在继续之前检查该位是否为0。

**RTCOE位 (RTCOUT输出使能)**

RTCOE位使能从RTCOUT引脚输出1-Hz/64-Hz时钟信号。

在更改RTCOE位的值之前, 使用START位停止计数。不要停止计数(将0写入START位)并同时更改RTCOE位的值。当要从外部引脚输出RTCOUT信号时, 除了设置该位外, 还启用端口控制。

**AADJE bit (Automatic Adjustment Enable)**

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is set to 0 by an RTC software reset.

**AADJP bit (Automatic Adjustment Period Select)**

The AADJP bit selects the automatic-adjustment period.

Correction period can be selected from 32 second units or 8 second units in binary count mode.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is set to 0 by an RTC software reset.

**CNTMD bit (Count Mode Select)**

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see [section 23.3.1. Outline of Initial Settings of Registers after Power On](#).

**23.2.25 RCR4 : RTC Control Register 4**

Base address: RTC = 0x4008\_3000

Offset address: 0x28

|                    |   |   |   |   |   |   |   |        |
|--------------------|---|---|---|---|---|---|---|--------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
| Bit field:         | — | — | — | — | — | — | — | RCKSEL |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x      |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | RCKSEL | Count Source Select<br>0: Sub-clock oscillator is selected<br>1: LOCO is selected | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.                            | R/W |

The RCR4 register is used in both calendar count mode and binary count mode.

**RCKSEL bit (Count Source Select)**

The RCKSEL bit selects the count source from the sub-clock oscillator and LOCO.

The RCKSEL bit is only used in normal operation mode. When the RCKSEL bit is set to 0, the time is counted with the sub-clock oscillator. When the bit is set to 1, the time is counted with LOCO.

For details on count source setting, see [section 23.3.1. Outline of Initial Settings of Registers after Power On](#) and [section 23.3.2. Clock and Count Mode Setting Procedure](#). The count source must be selected only once before specifying the initial settings of the RTC registers at power on.

**23.2.26 RFRL : Frequency Register L**

Base address: RTC = 0x4008\_3000

Offset address: 0x2C

|                    |           |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------------------|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position:      | 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | RFC[15:0] |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | x         | x  | x  | x  | x  | x  | x | x | x | x | x | x | x | x | x | x |

**ADJE位 (自动调整使能)**

AADJE位控制 (启用或禁用) 自动调整。

在更改ADJE位的值之前, 将正负位(RADJ.PMADJ[1:0])设置为00b (不执行调整)。RTC软件复位将ADJE位设置为0。

**AADJP位 (自动调整周期选择)**

AADJP位选择自动调整周期。

在二进制计数模式下, 校正周期可以从32秒单位或8秒单位中选择。

在更改AADJP位的值之前, 将正负位(RADJ.PMADJ[1:0])设置为00b (不执行调整)。AADJP位通过RTC软件复位设置为0。

**CNTMD位 (计数模式选择)**

CNTMD位指定RTC计数模式是在日历计数模式还是二进制计数模式下运行。

设置计数模式时, 执行RTC软件复位并从初始设置重新开始。该位与计数源同步更新。但是, 计数模式仅在RTC软件复位后切换。(RTC复位前位切换, RTC复位后模式切换。)

有关初始设置的详细信息, 请参阅第23.3.1节。上电后寄存器的初始设置概要。

**23.2.25 RCR4:RTC控制寄存器4**

Base address: RTC = 0x4008\_3000

Offset address: 0x28

|               |   |   |   |   |   |   |   |        |
|---------------|---|---|---|---|---|---|---|--------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
| Bit field:    | — | — | — | — | — | — | — | RCKSEL |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x      |

| Bit | Symbol | Function                          | R/W |
|-----|--------|-----------------------------------|-----|
| 0   | RCKSEL | 计数源选择<br>0: 选择副时钟振荡器1: 选择LOC<br>0 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。                  | R/W |

RCR4寄存器用于日历计数模式和二进制计数模式。

**RCKSEL位 (计数源选择)**

RCKSEL位从副时钟振荡器和LOCO中选择计数源。

RCKSEL位仅用于正常操作模式。当RCKSEL位设置为0时, 时间由副时钟振荡器计数。当该位设置为1时, 时间以LOCO计数。

有关计数源设置的详细信息, 请参阅第23.3.1节。上电后寄存器的初始设置概要和第23.3.2节。时钟和计数模式设置程序。在上电时指定RTC寄存器的初始设置之前, 必须只选择一次计数源。

**23.2.26 RFRL:频率寄存器L**

Base address: RTC = 0x4008\_3000

Offset address: 0x2C

|               |           |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|---------------|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | RFC[15:0] |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| 重置后的值:        | x         | x  | x  | x  | x  | x  | x | x | x | x | x | x | x | x | x | x |

| Bit  | Symbol    | Function   | R/W |
|------|-----------|--|-----|
| 15:0 | RFC[15:0] | Frequency Comparison Value<br>Write 0x00FF to this register when using the LOCO. | R/W |

RFRL is a register for controlling the prescaler when LOCO is selected.

The RTC time counter operates on a 128-Hz clock signal as the base clock. Therefore, when LOCO is selected, LOCO is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency comparison value in the RFC[15:0] bits to generate a 128-Hz clock from the LOCO frequency. Before writing to RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

A value from 0x0007 through 0x01FF can be specified as the frequency comparison value. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. The operating frequency of the peripheral module clock and the LOCO should be such that the peripheral module clock is ≥ LOCO.

Calculation method of frequency comparison value:

$$RFC[15:0] = (\text{LOCO clock frequency}) / 128 - 1$$

When the LOCO frequency is 32.768 kHz, the RFRL register should be set to 0x00FF.

### 23.2.27 RFRH : Frequency Register H

Base address: RTC = 0x4008\_3000

Offset address: 0x2A

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|
| 0    | RFC16  | Write 0 before writing to the RFRL register after a cold start. | R/W |
| 15:1 | —      | These bits are read as 0. The write value should be 0.          | R/W |

Before writing to RFRHL.RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

### 23.2.28 RADJ : Time Error Adjustment Register

Base address: RTC = 0x4008\_3000

Offset address: 0x2E

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 5:0 | ADJ[5:0]   | Adjustment Value<br>These bits specify the adjustment value from the prescaler.  | R/W |
| 7:6 | PMADJ[1:0] | Plus-Minus<br>0 0: Do not perform adjustment.<br>0 1: Adjustment is performed by the addition to the prescaler<br>1 0: Adjustment is performed by the subtraction from the prescaler<br>1 1: Setting prohibited. | R/W |

The RADJ register is used in both calendar count mode and binary count mode. Adjustment is performed by the addition to or subtraction from the prescaler or 64-Hz counter. If the Automatic Adjustment Enable (RCR2.AADJE) bit is 0, adjustment

| Bit  | Symbol    | Function                       | R/W |
|------|-----------|--------------------------------|-----|
| 15:0 | RFC[15:0] | 频率比较值<br>使用LOCO时将0x00FF写入该寄存器。 | R/W |

RFRL是一个寄存器，用于在选择LOCO时控制预分频器。

RTC时间计数器以128-Hz时钟信号作为基本时钟运行。Therefore when LOCO is selected LOCO is divided by the prescaler to generate a 128-Hz clock signal. 设置RFC[15:0]位中的频率比较值以从LOCO频率生成128-Hz时钟。在冷启动后写入RFC[15:0]之前，将0x0000写入RFRH寄存器。

从0x0007到0x01FF的值可以指定为频率比较值。如果指定的值超出此范围，则RTC将无法正确运行。在写入该寄存器之前，请务必通过设置RCR2中的START位来停止计数操作。外围模块时钟和LOCO的工作频率应使外围模块时钟 ≥ LOCO。

频率比较值的计算方法：

$$RFC[15:0] = (\text{LOCO clock frequency}) / 128 - 1$$

当LOCO频率为32.768kHz时，RFRL寄存器应设置为0x00FF。

### 23.2.27 RFRH:频率寄存器H

Base address: RTC = 0x4008\_3000

Offset address: 0x2A

| Bit  | Symbol | Function             | R/W |
|------|--------|----------------------|-----|
| 0    | RFC16  | 在冷启动后写入RFRL寄存器之前写入0。 | R/W |
| 15:1 | —      | 这些位被读取为0。写入值应为0。     | R/W |

在冷启动后写入RFRHL.RFC[15:0]之前，将0x0000写入RFRH寄存器。

### 23.2.28 RADJ:时间误差调整寄存器

Base address: RTC = 0x4008\_3000

Offset address: 0x2E

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 5:0 | ADJ[5:0]   | 调整值<br>这些位指定来自预分频器的调整值。   | R/W |
| 7:6 | PMADJ[1:0] | Plus-Minus<br>00: 不进行调整。01: 通过预分频器1的加法进行调整<br>0: 通过预分频器1的减法进行调整<br>1: 禁止设置。 | R/W |

RADJ寄存器用于日历计数模式和二进制计数模式。通过对预分频器或64-Hz计数器进行加法或减法来执行调整。如果自动调整启用(RCR2.AADJE)位为0，则调整

is performed when writing to the RADJ. If the RCR2.AADJE bit is 1, adjustment is performed in the interval specified in the Automatic Adjustment Period Select (RCR2.AADJP) bit.

The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting, then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits are updated before continuing with more processing. This register is set to 0x00 by an RTC software reset. The setting of this register is enabled only when the sub-clock oscillator is selected. When LOCO is selected, adjustment is not performed.

#### ADJ[5:0] bits (Adjustment Value)

The ADJ[5:0] bits specify the adjustment value (number of sub-clock cycles) from the prescaler.

#### PMADJ[1:0] bits (Plus-Minus)

The PMADJ[1:0] bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

### 23.2.29 RTCCRn : Time Capture Control Register n (n = 0 to 2)

Base address: RTC = 0x4008\_3000

Offset address: 0x40 + 0x02 × n

|                    |      |   |           |   |      |           |   |   |
|--------------------|------|---|-----------|---|------|-----------|---|---|
| Bit position:      | 7    | 6 | 5         | 4 | 3    | 2         | 1 | 0 |
| Bit field:         | TCEN | — | TCNF[1:0] | — | TCST | TCCT[1:0] |   |   |
| Value after reset: | x    | 0 | x         | x | 0    | x         | x | x |

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 1:0 | TCCT[1:0] | Time Capture Control<br>0 0: Do not detect events<br>0 1: Detect rising edge<br>1 0: Detect falling edge<br>1 1: Detect both edges  | R/W |
| 2   | TCST      | Time Capture Status<br>0: No event detected<br>1: Event detected*1  | R/W |
| 3   | —         | This bit is read as 0. The write value should be 0.   | R/W |
| 5:4 | TCNF[1:0] | Time Capture Noise Filter Control<br>0 0: Turn noise filter off<br>0 1: Setting prohibited<br>1 0: Turn noise filter on (count source)<br>1 1: Turn noise filter on (count source by divided by 32) | R/W |
| 6   | —         | These bits are read as 0. The write value should be 0.  | R/W |
| 7   | TCEN      | Time Capture Event Input Pin Enable<br>0: Disable the RTCICn pin as the time capture event input pin<br>1: Enable the RTCICn pin as the time capture event input pin                                | R/W |

Note 1. Indicates that an event is detected. Writing 1 to this bit has no effect. Writing 0 sets this bit to 0.

The RTCCRn register is used both in calendar count mode and in binary count mode. RTCCR0, RTCCR1, and RTCCR2 control the RTCIC0, RTCIC1, and RTCIC2 pins, respectively.

RTCCRn is updated in synchronization with the count source. When RTCCRn is modified, check that all the bits except the TCST bit are updated before continuing with additional processing. This register is cleared to 0x00 by an RTC software reset. When RTCICm is used as the time capture pin, VBTICTLR.VCHnIEN (n = 0 to 2) must be set to 1.

#### TCCT[1:0] bits (Time Capture Control)

The TCCT[1:0] bits control the edge detection of the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2. The detection edge is selectable. The TCCT[1:0] bits must be set while the VBTICTLR.VCHnIEN bit is 1.

在写入RADJ时执行。如果RCR2.AADJE位为1，则在自动调整周期选择(RCR2.AADJP)位指定的间隔内执行调整。

如果在寄存器设置后的计数源的320个周期内指定了以下调整值，则通过软件进行的当前调整（禁用自动调整）可能无效。要连续执行调整，请在寄存器设置后等待计数源的320个或更多周期，然后指定下一个调整值。

RADJ与计数源同步更新。修改RADJ后，在继续进行更多处理之前检查所有位是否已更新。该寄存器通过RTC软件复位设置为0x00。该寄存器的设置仅在选择了副时钟振荡器时启用。选择LOCO时，不进行调整。

#### ADJ[5:0] bits (Adjustment Value)

ADJ[5:0]位指定来自预分频器的调整值（子时钟周期数）。

#### PMADJ[1:0] bits (Plus-Minus)

PMADJ[1:0]位根据在ADJ[5:0] bits。

### 23.2.29 RTCCRn:时间捕捉控制寄存器n(n=0to2)

Base address: RTC = 0x4008\_3000

Offset address: 0x40 + 0x02 × n

|               |      |   |           |   |      |           |   |   |
|---------------|------|---|-----------|---|------|-----------|---|---|
| Bit position: | 7    | 6 | 5         | 4 | 3    | 2         | 1 | 0 |
| Bit field:    | TCEN | — | TCNF[1:0] | — | TCST | TCCT[1:0] |   |   |
| 重置后的值:        | x    | 0 | x         | x | 0    | x         | x | x |

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 1:0 | TCCT[1:0] | 时间捕捉控制<br>00: 不检测事件01: 检测上升沿10: 检测下降沿11: 检测两个沿                          | R/W |
| 2   | TCST      | 时间捕捉状态<br>0: 未检测到事件1: 检测到事件*1   | R/W |
| 3   | —         | 该位读取为0。写入值应为0。  | R/W |
| 5:4 | TCNF[1:0] | 时间捕捉噪声滤波器控制<br>00: 关闭噪声过滤器01: 设置禁止10: 打开噪声过滤器(计数源) 11: 打开噪声过滤器(计数源除以32) | R/W |
| 6   | —         | 这些位被读取为0。写入值应为0。  | R/W |
| 7   | TCEN      | 时间捕捉事件输入引脚使能<br>0: 禁止RTCICn引脚作为时间捕捉事件输入引脚1: 使能RTCICn引脚作为时间捕捉事件输入引脚      | R/W |

注1.表示检测到事件。向该位写入1无效。写入0将该位设置为0。

RTCCRn寄存器用于日历计数模式和二进制计数模式。RTCCR0、RTCCR1和RTCCR2分别控制RTCIC0、RTCIC1和RTCIC2引脚。

RTCCRn与计数源同步更新。当RTCCRn被修改时，检查除TCST位在继续进行附加处理之前被更新。RTC软件复位将该寄存器清零为0x00。当RTCICm用作时间捕捉引脚时，VBTICTLR.VCHnIEN(n=0to2)必须设置为1。

#### TCCT[1:0]位(时间捕捉控制)

TCCT[1:0]位控制时间捕捉事件输入引脚RTCIC0、RTCIC1和RTCIC2的边沿检测。检测边缘是可选的。当VBTICTLR.VCHnIEN位为1时，必须设置TCCT[1:0]位。

**TCST bit (Time Capture Status)**

The TCST bit indicates that an event on the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2, was detected. When the TCST bit is 0, no event is detected. When the TCST bit is 1, this bit indicates that an event was detected on the associated pin and the capture register is valid. When multiple events are detected, the capture time for the first event is retained.

The event is detected only during count operation (RCR2.START bit = 1). Before reading the capture register, make sure that this bit is set to 1.

Set the TCST bit while the TCCT[1:0] bits are 00b (no event is detected). The TCST bit is set to 0 in synchronization with the count source. When the TCST bit is set to 0, check that the bit is updated before continuing with additional processing.

**TCNF[1:0] bits (Time Capture Noise Filter Control)**

The TCNF[1:0] bits control the noise filter of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).

When the noise filter is on, the count source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.

Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCNF[1:0] bits, wait for 3 cycles of the specified sampling period, then set the TCCT[1:0] bits. Set the TCNF[1:0] bits when the VBTICTLR.VCHnIEN bit is 1.

**TCEN bit (Time Capture Event Input Pin Enable)**

The TCEN bit enables or disables the time capture event input pins RTCIC0, RTCIC1, and RTCIC2. When the functions of the time capture event input pins are multiplexed, set VBTICTLR first. If the TCEN bit is set to 0, also set the TCCT[1:0] bits to 00b.

section 23.2.29. RTCCRN: Time Capture Control Register n (n = 0 to 2) lists the conditions for enabling the RTCICn pin. Before setting this bit to 1, be sure to set the count source setting bit (RCR4.RCKSEL), RTC time capture event enable bit (RCPE.RTCEN), port control setting bits (PmnPFS.PDR, and PmnPFS.PMR). For details on the port control setting bits (PmnPFS.PDR and PmnPFS.PMR), see section 19, I/O Ports.

**23.2.30 RSECCPn : Second Capture Register n (n = 0 to 2) (in Calendar Count Mode)**

Base address: RTC = 0x4008\_3000

Offset address: 0x52 + 0x10 × n

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 3:0 | SEC1[3:0]  | 1-Second Capture<br>Capture value for the ones place of seconds.  | R   |
| 6:4 | SEC10[2:0] | 10-Second Capture<br>Capture value for the tens place of seconds. | R   |
| 7   | —          | The read value is undefined.                                      | R   |

RSECCPn is a read-only register that captures the RSECCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RSECCP0, RSECCP1, and RSECCP2 registers, respectively. This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRN.TCCT[1:0] bits.

**TCST位 (时间捕捉状态)**

TCST位指示检测到时间捕捉事件输入引脚RTCIC0、RTCIC1和RTCIC2上的事件。当TCST位为0时，未检测到任何事件。当TCST位为1时，该位表示在相关引脚上检测到事件并且捕捉寄存器有效。当检测到多个事件时，将保留第一个事件的捕获时间。

仅在计数操作期间检测到事件 (RCR2.START位=1)。在读取捕获寄存器之前，请确保该位设置为1。

当TCCT[1:0]位为00b (未检测到事件) 时，设置TCST位。TCST位与计数源同步设置为0。当TCST位设置为0时，在继续进行其他处理之前检查该位是否已更新。

**TCNF[1:0]位 (时间捕捉噪声滤波器控制)**

TCNF[1:0]位控制时间捕捉事件输入引脚 (RTCIC0、RTCIC1和RTCIC2) 的噪声滤波器。

当噪声滤波器打开时，计数源除以1或除以32是可选的。在这种情况下，当时间捕捉事件输入引脚上的输入电平在设置的采样周期内连续匹配3次时，确定输入电平。

当TCCT[1:0]位为00b (未检测到事件) 时，设置TCNF[1:0]位。使用噪声滤波器时，设置TCNF[1:0]位，等待指定采样周期的3个周期，然后设置TCCT[1:0]位。当VBTICTLR.VCHnIEN位为1时，设置TCNF[1:0]位。

**TCEN位 (时间捕捉事件输入引脚使能)**

TCEN位启用或禁用时间捕捉事件输入引脚RTCIC0、RTCIC1和RTCIC2。当时间捕捉事件输入引脚的功能复用时，首先设置VBTICTLR。如果TCEN位设置为0，也将TCCT[1:0]位设置为00b。

第23.2.29节。RTCCRN: 时间捕捉控制寄存器n (n=0到2) 列出了启用RTCICn引脚的条件。在将此位设置为1之前，请务必设置计数源设置位(RCR4.RCKSEL)、RTC时间捕捉事件使能位(RCPE.RTCEN)、端口控制设置位(PmnPFS.PDR和PmnPFS.PMR)。有关端口控制设置位 (PmnPFS.PDR和PmnPFS.PMR) 的详细信息，请参阅第19节，IO端口。

**23.2.30 RSCCPn: 第二个捕捉寄存器n (n=0到2) (在日历计数模式下)**

Base address: RTC = 0x4008\_3000

Offset address: 0x52 + 0x10 × n

| Bit | Symbol     | Function      | R/W |
|-----|------------|---------------|-----|
| 3:0 | SEC1[3:0]  | 1秒捕获捕获秒的个位的值。 | R   |
| 6:4 | SEC10[2:0] | 10秒捕获十位秒的捕获值。 | R   |
| 7   | —          | 读取值未定义。       | R   |

RSCCPn是一个只读寄存器，当检测到时间捕捉事件时，它会捕捉RSECCNT值。

RTCIC0、RTCIC1和RTCIC2引脚检测到的事件检测时间存储在RSCCP0、RSCCP1和RSCCP2寄存器，分别。RTC软件复位将该寄存器清零为0x00。在读取该寄存器之前，应使用RTCCRN.TCCT[1:0]位停止时间捕捉事件检测。

## 23.2.31 RMINCPn : Minute Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x54 + 0x10 × n

| Bit | Symbol     | Function  | R/W |
|-----|------------|---|-----|
| 3:0 | MIN1[3:0]  | 1-Minute Capture<br>Capture value for the ones place of minutes.  | R   |
| 6:4 | MIN10[2:0] | 10-Minute Capture<br>Capture value for the tens place of minutes. | R   |
| 7   | —          | The read value is undefined.                                      | R   |

RMINCPn is a read-only register that captures the RMINCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMINCP0, RMINCP1, and RMINCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

## 23.2.32 RHRCpN : Hour Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x56 + 0x10 × n

| Bit | Symbol    | Function   | R/W |
|-----|-----------|--|-----|
| 3:0 | HR1[3:0]  | 1-Hour Capture<br>Capture value for the ones place of hours  | R   |
| 5:4 | HR10[1:0] | 10-Hour Capture<br>Capture value for the tens place of hours | R   |
| 6   | PM        | PM<br>0: AM<br>1: PM   | R   |
| 7   | —         | The read value is undefined.                                 | R   |

RHRCpN is a read-only register that captures the RHRCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RHRCp0, RHRCp1, and RHRCp2 registers, respectively.

The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

## 23.2.31 RMINCPn: 分钟捕捉寄存器n (n=0到2) (在日历计数模式下)

Base address: RTC = 0x4008\_3000

Offset address: 0x54 + 0x10 × n

| Bit | Symbol     | Function                   | R/W |
|-----|------------|----------------------------|-----|
| 3:0 | MIN1[3:0]  | 1-MinuteCapture以分钟为单位的捕获值。 | R   |
| 6:4 | MIN10[2:0] | 10分钟捕获十位分钟的捕获值。            | R   |
| 7   | —          | 读取值未定义。                    | R   |

RMINCPn是一个只读寄存器，它在检测到时间捕捉事件时捕捉RMINCNT值。

RTCIC0、RTCIC1和RTCIC2引脚检测到的事件检测时间存储在RMINCP0、RMINCP1和RMINCP2寄存器，分别。

RTC软件复位将该寄存器清零为0x00。在读取该寄存器之前，应使用RTCCRn.TCCT[1:0]位停止时间捕捉事件检测。

## 23.2.32 RHRCpN: 小时捕捉寄存器n (n=0到2) (在日历计数模式下)

Base address: RTC = 0x4008\_3000

Offset address: 0x56 + 0x10 × n

| Bit | Symbol    | Function                | R/W |
|-----|-----------|-------------------------|-----|
| 3:0 | HR1[3:0]  | 1-HourCapture以小时为单位的捕获值 | R   |
| 5:4 | HR10[1:0] | 10-HourCapture十位小时的捕获值  | R   |
| 6   | PM        | PM<br>0: AM<br>1: PM    | R   |
| 7   | —         | 读取值未定义。                 | R   |

RHRCpN是一个只读寄存器，它在检测到时间捕捉事件时捕捉RHRCNT值。

RTCIC0、RTCIC1和RTCIC2引脚检测到的事件检测时间存储在RHRCp0、RHRCp1和RHRCp2寄存器，分别。

PM位仅在RCR2.HR24位为0时启用（在12小时模式下）。

RTC软件复位将该寄存器清零为0x00。在读取该寄存器之前，您必须使用RTCCRn.TCCT[1:0]位停止时间捕捉事件检测。

## 23.2.33 RDAYCPn : Date Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x5A + 0x10 × n

| Bit | Symbol      | Function  | R/W |
|-----|-------------|---|-----|
| 3:0 | DATE1[3:0]  | 1-Day Capture<br>Capture value for the ones place of days.  | R   |
| 5:4 | DATE10[1:0] | 10-Day Capture<br>Capture value for the tens place of days. | R   |
| 7:6 | —           | The read value is undefined.                                | R   |

RDAYCPn is a read-only register that captures the RDAYCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RDAYCP0, RDAYCP1, and RDAYCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

## 23.2.34 RMONCPn : Month Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x5C + 0x10 × n

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 3:0 | MON1[3:0] | 1-Month Capture<br>Capture value for the ones place of months.  | R   |
| 4   | MON10     | 10-Month Capture<br>Capture value for the tens place of months. | R   |
| 7:5 | —         | These bits are read as 0.                                       | R   |

RMONCPn is a read-only register that captures the RMONCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMONCP0, RMONCP1, and RMONCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

## 23.2.33 RDAYCPn: 日期捕捉寄存器n (n=0到2) (在日历计数模式下)

Base address: RTC = 0x4008\_3000

Offset address: 0x5A + 0x10 × n

| Bit | Symbol      | Function      | R/W |
|-----|-------------|---------------|-----|
| 3:0 | DATE1[3:0]  | 1天捕获捕获天数的值。   | R   |
| 5:4 | DATE10[1:0] | 10天捕获十位天的捕获值。 | R   |
| 7:6 | —           | 读取值未定义。       | R   |

RDAYCPn是一个只读寄存器，它在检测到时间捕捉事件时捕捉RDAYCNT值。

RTCIC0、RTCIC1和RTCIC2引脚检测到的事件检测时间分别存储在RDAYCP0、RDAYCP1和RDAYCP2寄存器中。

RTC软件复位将该寄存器清零为0x00。在读取该寄存器之前，应使用RTCCRn.TCCT[1:0]位停止时间捕捉事件检测。

## 23.2.34 RMONCPn: 月份捕捉寄存器n (n=0到2) (在日历计数模式下)

Base address: RTC = 0x4008\_3000

Offset address: 0x5C + 0x10 × n

| Bit | Symbol    | Function                 | R/W |
|-----|-----------|--------------------------|-----|
| 3:0 | MON1[3:0] | 1-MonthCapture捕获月份个位数的值。 | R   |
| 4   | MON10     | 10个月捕获捕获十个月份的值。          | R   |
| 7:5 | —         | 这些位读为0。                  | R   |

RMONCPn是一个只读寄存器，它在检测到时间捕捉事件时捕捉RMONCNT值。

RTCIC0、RTCIC1和RTCIC2引脚检测到的事件检测时间分别存储在RMONCP0、RMONCP1和RMONCP2寄存器中。

RTC软件复位将该寄存器清零为0x00。在读取该寄存器之前，应使用RTCCRn.TCCT[1:0]位停止时间捕捉事件检测。

### 23.2.35 BCNTnCPm : BCNTn Capture Register m (n= 0 to 3, m = 0 to 2) (in Binary Count Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x52 + 0x10 × m (BCNT0CPm)  
 0x54 + 0x10 × m (BCNT1CPm)  
 0x56 + 0x10 × m (BCNT2CPm)  
 0x5A + 0x10 × m (BCNT3CPm)

BCNTnCPm is a read-only register that captures the BCNTn value when a time capture event is detected. BCNT3CPm is assigned to the BCNTCPm[31:24] bits, BCNT2CPm is assigned to the BCNTCPm[23:16] bits, BCNT1CPm is assigned to the BCNTCPm[15:8] bits and BCNT0CPm is assigned to the BCNTCPm[7:0] bits. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNTnCP0, BCNTnCP1, and BCNTnCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

### 23.3 Operation

#### 23.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, perform the initial settings for the clock, count mode, time error adjustment, time, alarm, interrupts, and time capture.

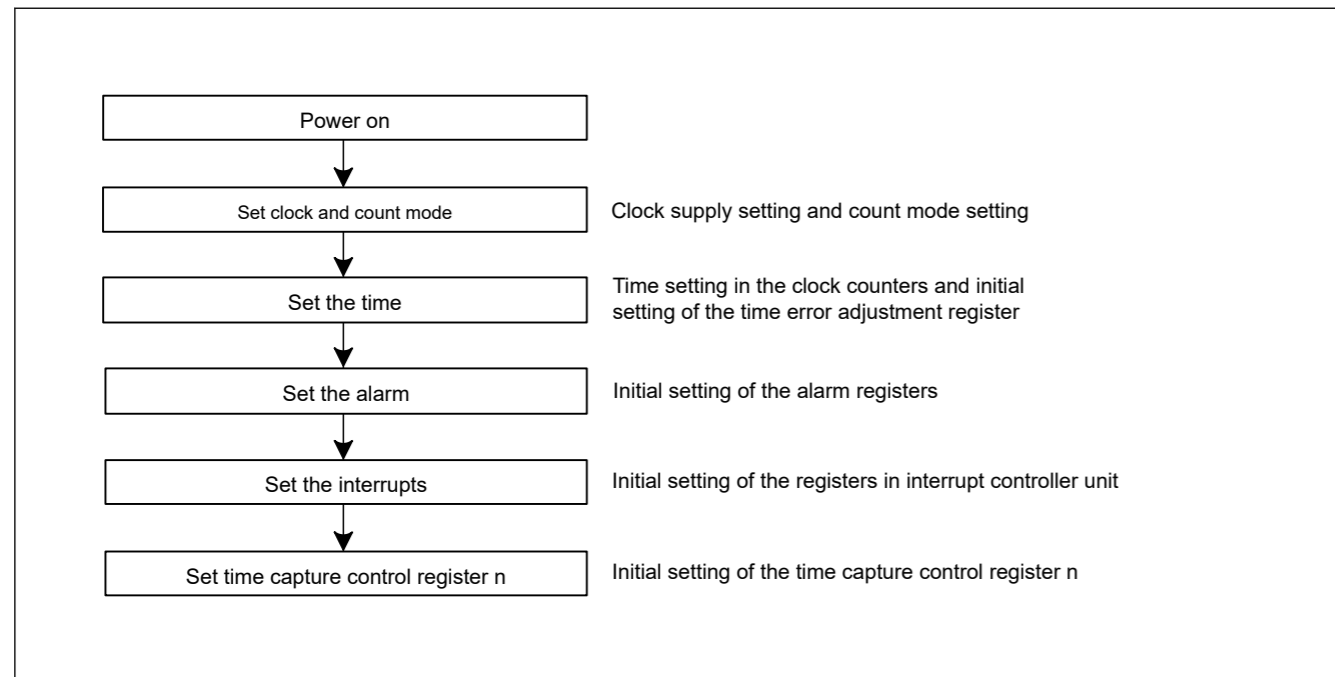

Figure 23.2 Outline of initial settings after a power on

#### 23.3.2 Clock and Count Mode Setting Procedure

Figure 23.3 shows how to set the clock and the count mode.

### 23.2.35 BCNTnCPm:BCNTn捕捉寄存器m(n=0to3 m=0to2)(以二进制计数 Mode)

Base address: RTC = 0x4008\_3000

Offset address: 0x52 + 0x10 × m (BCNT0CPm)  
 0x54 + 0x10 × m (BCNT1CPm)  
 0x56 + 0x10 × m (BCNT2CPm)  
 0x5A + 0x10 × m (BCNT3CPm)

BCNTnCPm是一个只读寄存器，它在检测到时间捕捉事件时捕捉BCNTn值。BCNT3CPm分配给BCNTCPm[31:24]位，BCNT2CPm分配给BCNTCPm[23:16]位，BCNT1CPm分配给BCNTCPm[15:8]位，BCNT0CPm分配给BCNTCPm[7:0]位。RTCIC0、RTCIC1和RTCIC2引脚检测到的事件检测时间分别存储在BCNTnCP0、BCNTnCP1和BCNTnCP2寄存器中。

RTC软件复位将该寄存器清零为0x00。在读取该寄存器之前，您必须使用RTCCRn.TCCT[1:0]位停止时间捕捉事件检测。

### 23.3 Operation

#### 23.3.1 上电后寄存器的初始设置概要

上电后，对时钟、计数方式、时间误差调整、时间、闹钟、中断、时间捕捉进行初始设置。

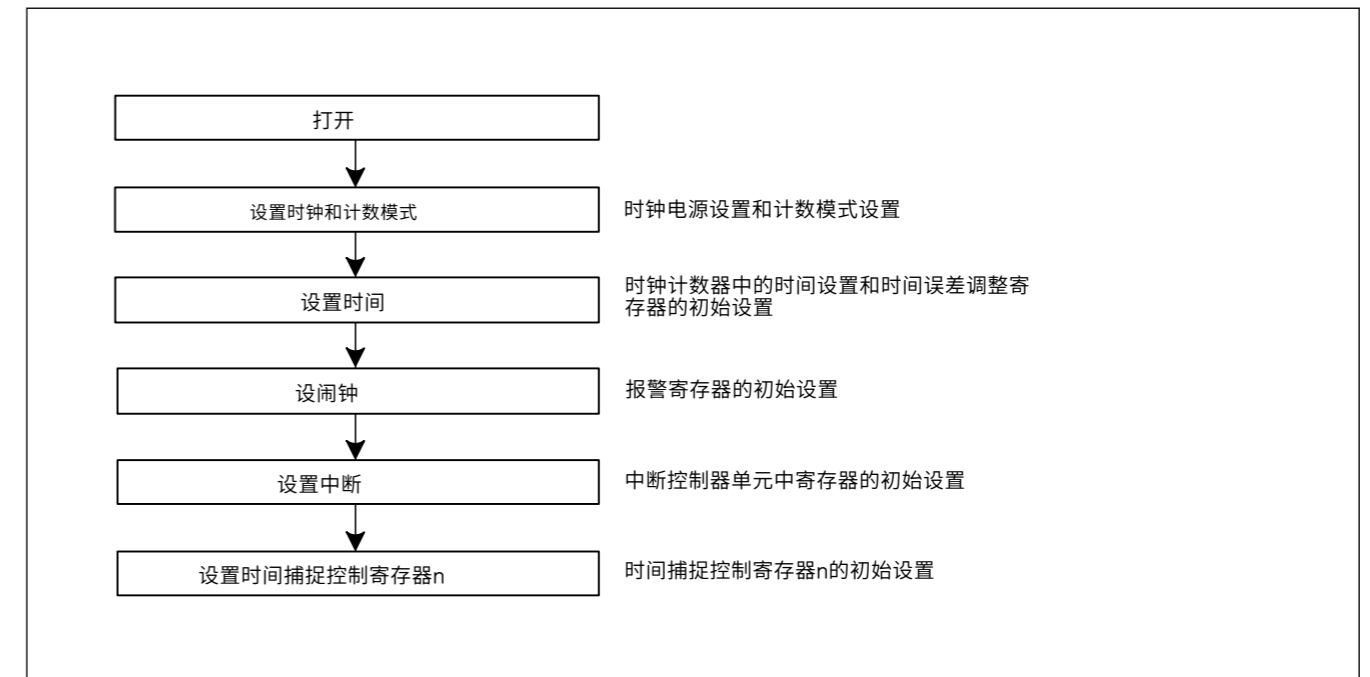

Figure 23.2 通电后的初始设定概要

### 23.3.5 读取64-Hz计数器和时间

图23.6显示了如何读取64-Hz计数器和时间。

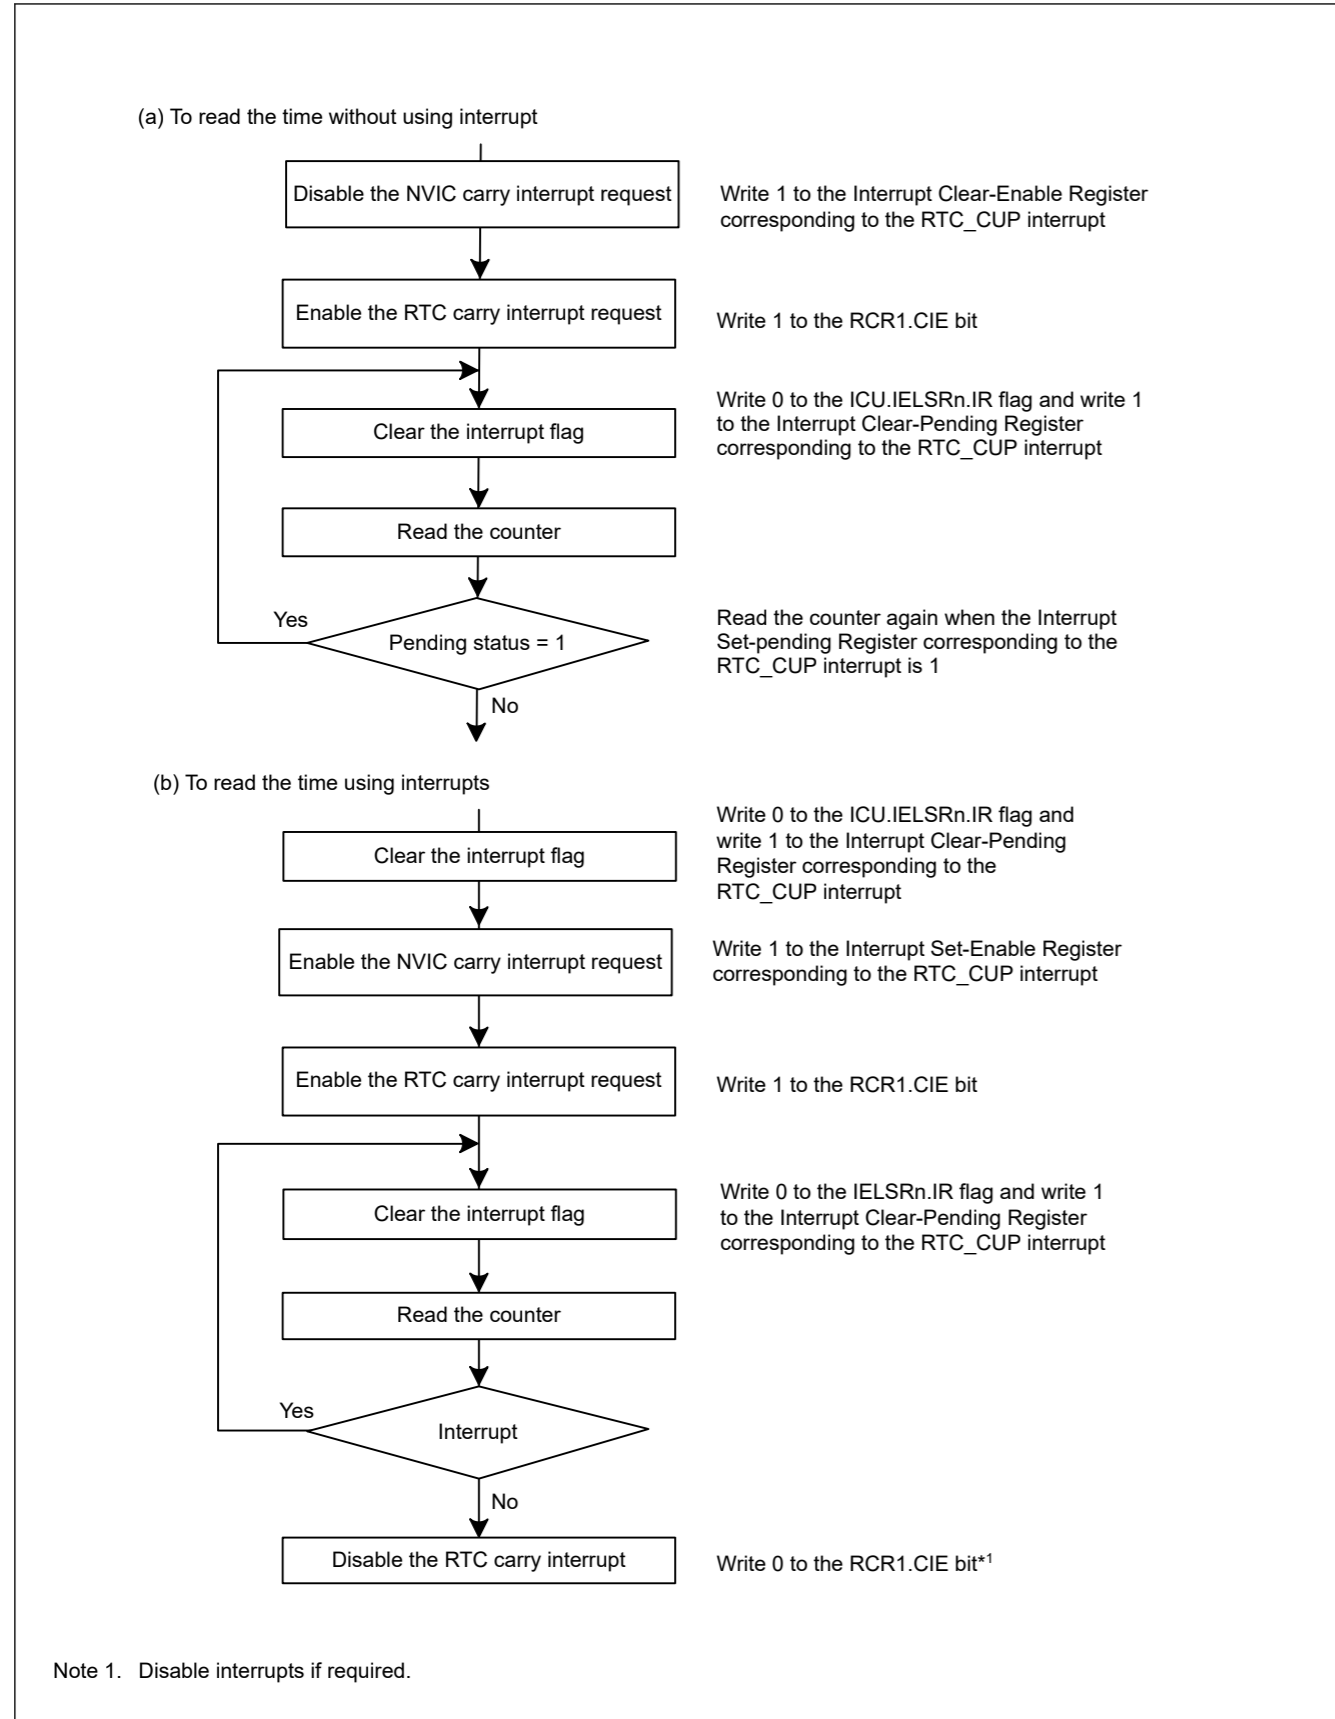

Figure 23.6 Reading time

If a carry occurs while the 64-Hz counter and time are read, the correct time is not obtained, therefore they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 23.6, and the procedure using carry interrupts is shown in (b). To keep the program simple, method (a) should be used in most cases.

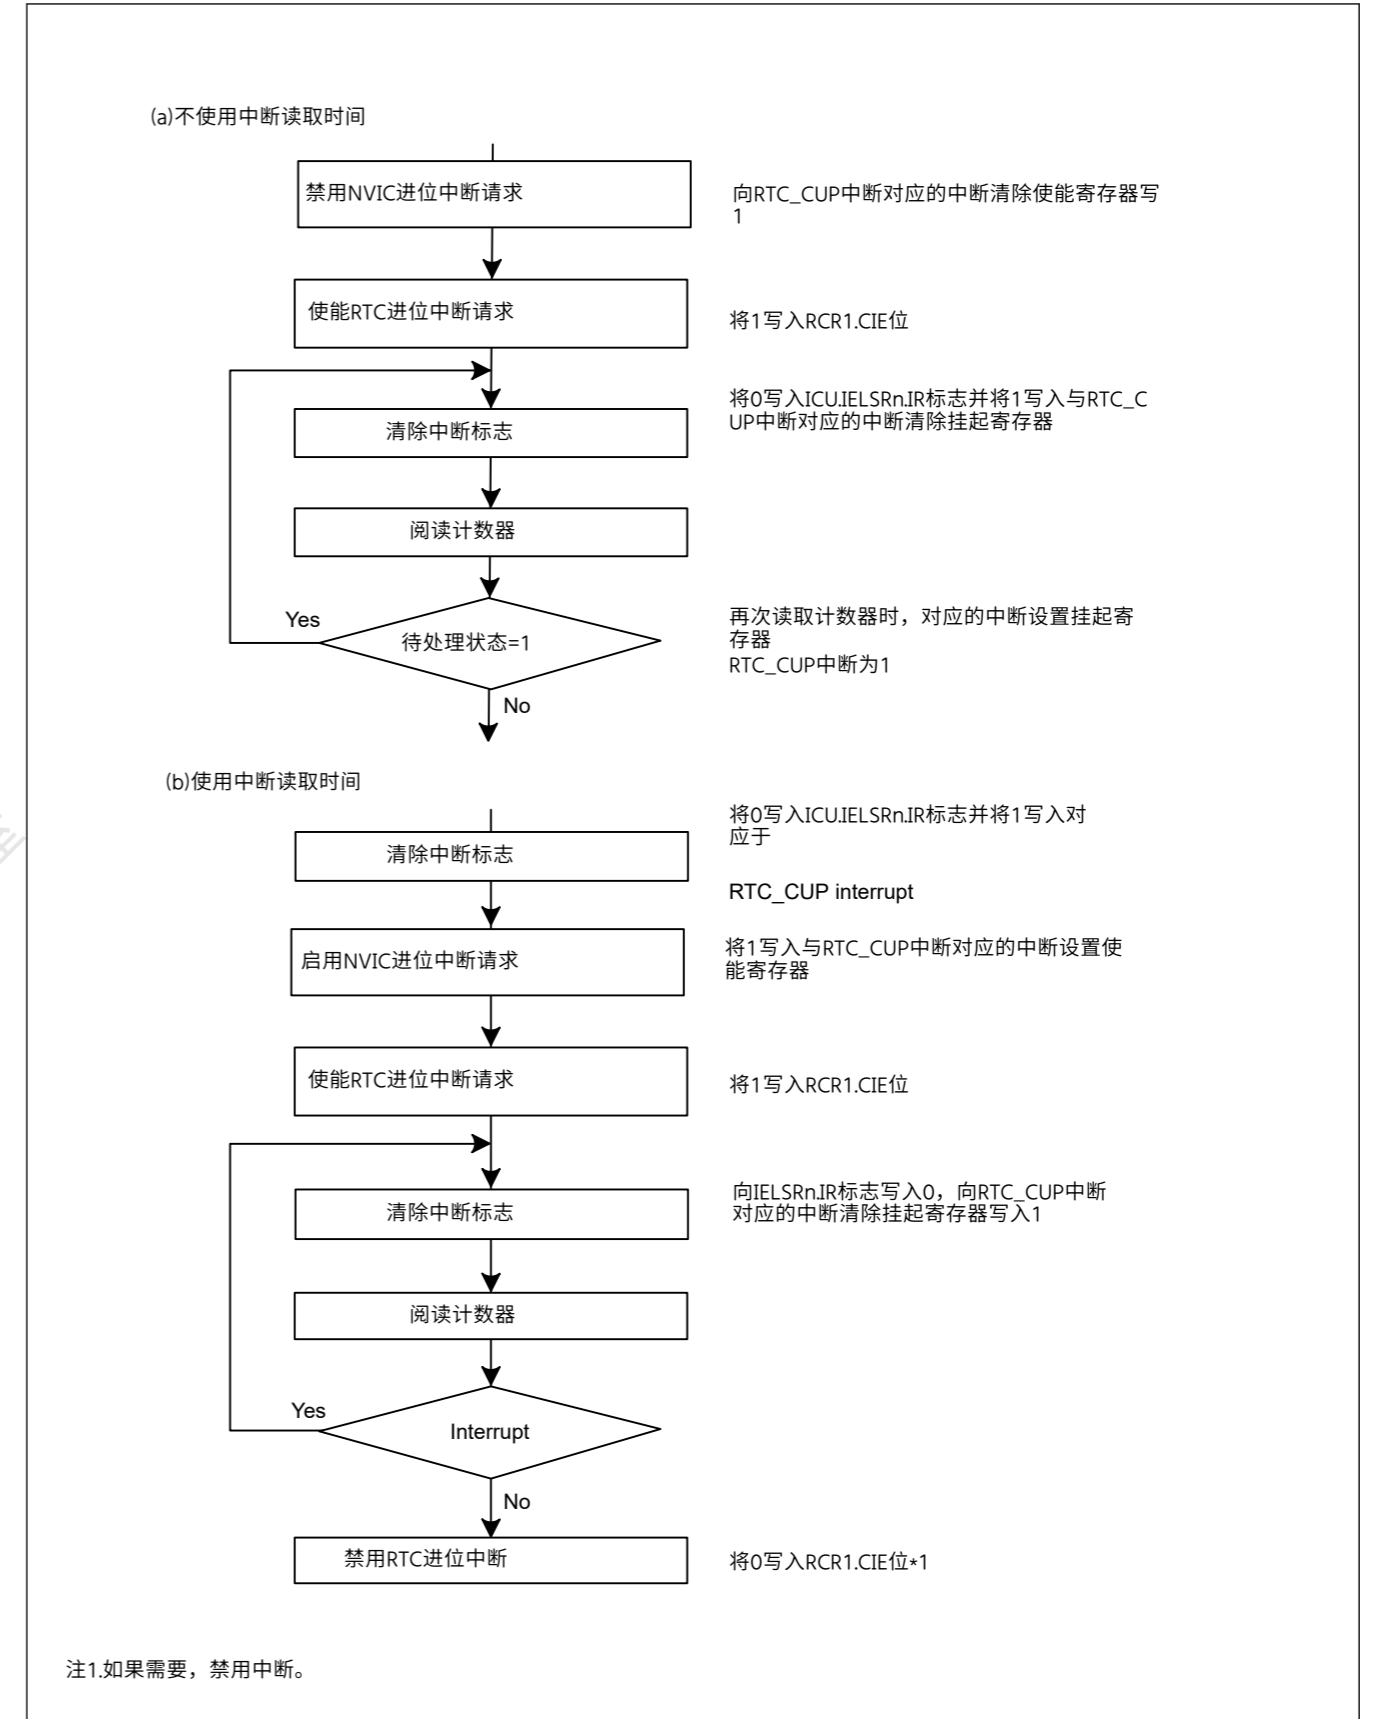

Figure 23.6 阅读时间

如果在读取64-Hz计数器和时间时发生进位, 则无法获得正确的时间, 因此必须再次读取它们。不使用中断读取时间的过程如图23.6(a)所示, 使用进位中断的过程如图23.6(b)所示。为保持程序简单, 在大多数情况下应使用方法(a)。

## 23.3.6 Alarm Function

Figure 23.7 shows how to use the alarm function.

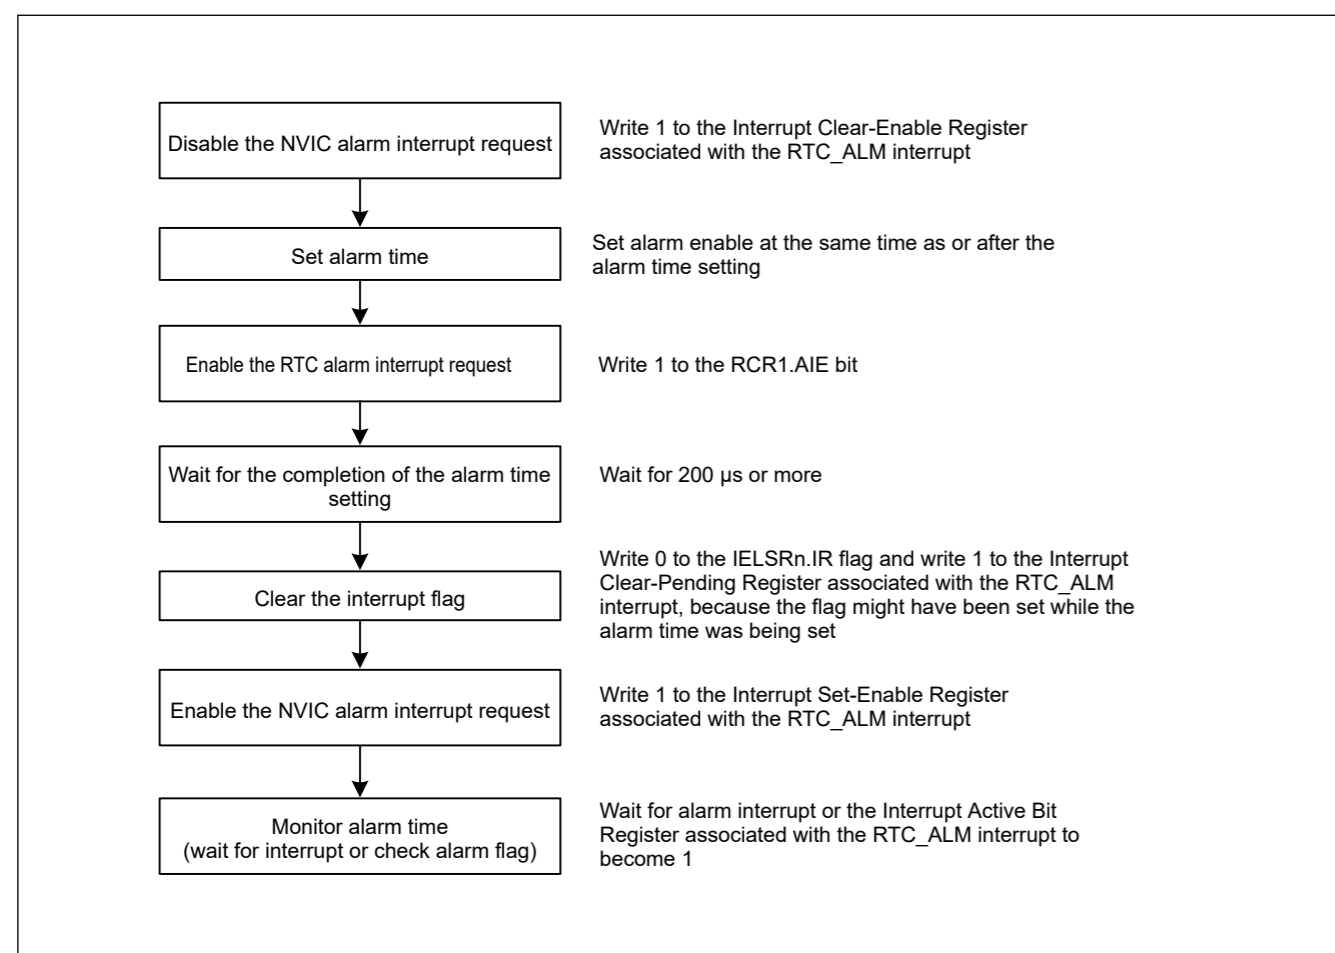

Figure 23.7 Using the alarm function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the Alarm Enable register associated with the target bit of the alarm, and set the alarm time in the alarm register. For bits that are not the target of the alarm, write 0 to the ENB bit of the Alarm Enable register.\*1

For any of the ENB[31:0] bits that are set to 1, the bits in the corresponding positions in the binary counter (BCNT[31:0]) are compared with the values of the corresponding bits in the binary alarm registers\*1. When all such bits match, the IR flag associated with the RTC\_ALM interrupt is set to 1 and the corresponding bits in the Interrupt Set-Pending/Clear-Pending Registers are set to 1. Alarm detection can be confirmed by reading the Interrupt Set-Pending Register associated with the RTC\_ALM interrupt, but an interrupt should be used in most cases. If 1 is set in the Interrupt Set-Enable Register associated with the RTC\_ALM interrupt, an alarm interrupt is generated in the event of the alarm, enabling the alarm to be detected.

Writing 0 sets the IELSRn.IR flag associated with the RTC\_ALM interrupt to 0. If interrupt is enabled, the Interrupt Set-Pending/Clear-Pending Register associated with the RTC\_ALM interrupt is cleared automatically after exiting the interrupt handler. Otherwise, write 1 to the Interrupt Clear-Pending Register associated with the RTC\_ALM interrupt to clear it.

When the counter and the alarm time match in a low power state, the MCU returns from the low power state.

Note 1. For any bits in the ENB bits that are set to 1, the values in the corresponding positions in the alarm registers from the following registers are compared with the corresponding bits of the counted values.

Counter registers: RSECCNT, RMINCNT, RHRCNT, RWKCNT, RDAYCNT, RMONCNT, RYRCNT

Alarm registers: RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAREN

## 23.3.6 报警功能

图23.7显示了如何使用报警功能。

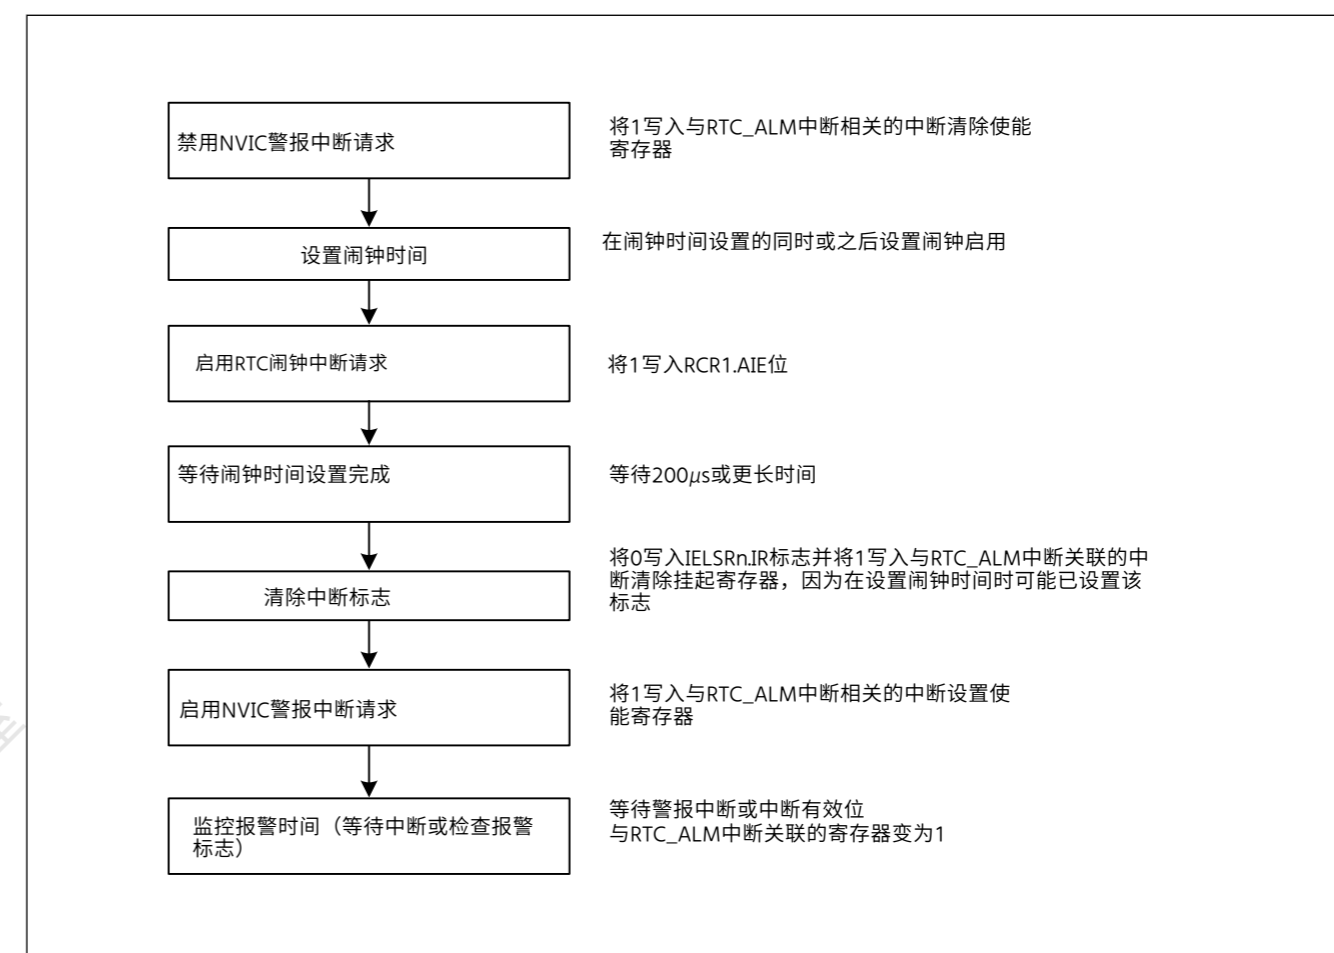

Figure 23.7 使用报警功能

在日历计数模式下，可以通过年、月、日、星期、小时、分钟或秒中的任何一个或它们的任意组合来生成警报。将1写入涉及闹钟设置的闹钟寄存器的ENB位，并在低位设置闹钟时间。将0写入与报警设置无关的寄存器中的ENB位。

在二进制计数模式下，可以以32位的任意位组合产生报警。将1写入闹钟的ENB位与报警的目标位相关联的使能寄存器，并在报警寄存器中设置报警时间。对于不是报警目标的位，将0写入报警启用寄存器的ENB位。\*1

对于任何设置为1的ENB[31:0]位，二进制计数器(BCNT[31:0])中相应位置的位与二进制报警寄存器中相应位的值进行比较\*1。当所有这些位匹配时，与RTC\_ALM中断相关的IR标志设置为1，并且中断设置挂起清除挂起寄存器中的相应位设置为1。可以通过读取中断设置挂起寄存器来确认警报检测与RTC\_ALM中断相关联，但在大多数情况下应使用中断。如果在与RTC\_ALM中断相关的中断设置使能寄存器中设置为1，则在发生警报时会产生警报中断，从而能够检测到警报。

写入0将与RTC\_ALM中断关联的IELSRn.IR标志设置为0。如果启用中断，则中断设置与RTC\_ALM中断关联的PendingClear-Pending寄存器在退出中断处理程序后自动清除。否则，将1写入与RTC\_ALM中断相关的中断清除挂起寄存器以将其清除。

当计数器和闹钟时间在低功耗状态下匹配时，MCU从低功耗状态返回。

注1.对于设置为1的ENB位中的任何位，将以下寄存器中报警寄存器中相应位置的位与计数值的相应位进行比较。

Counter registers: RSECCNT, RMINCNT, RHRCNT, RWKCNT, RDAYCNT, RMONCNT, RYRCNT

Alarm registers: RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAREN

### 23.3.7 Procedure for Disabling Alarm Interrupt

Figure 23.8 shows the procedure for disabling the enabled alarm interrupt request.

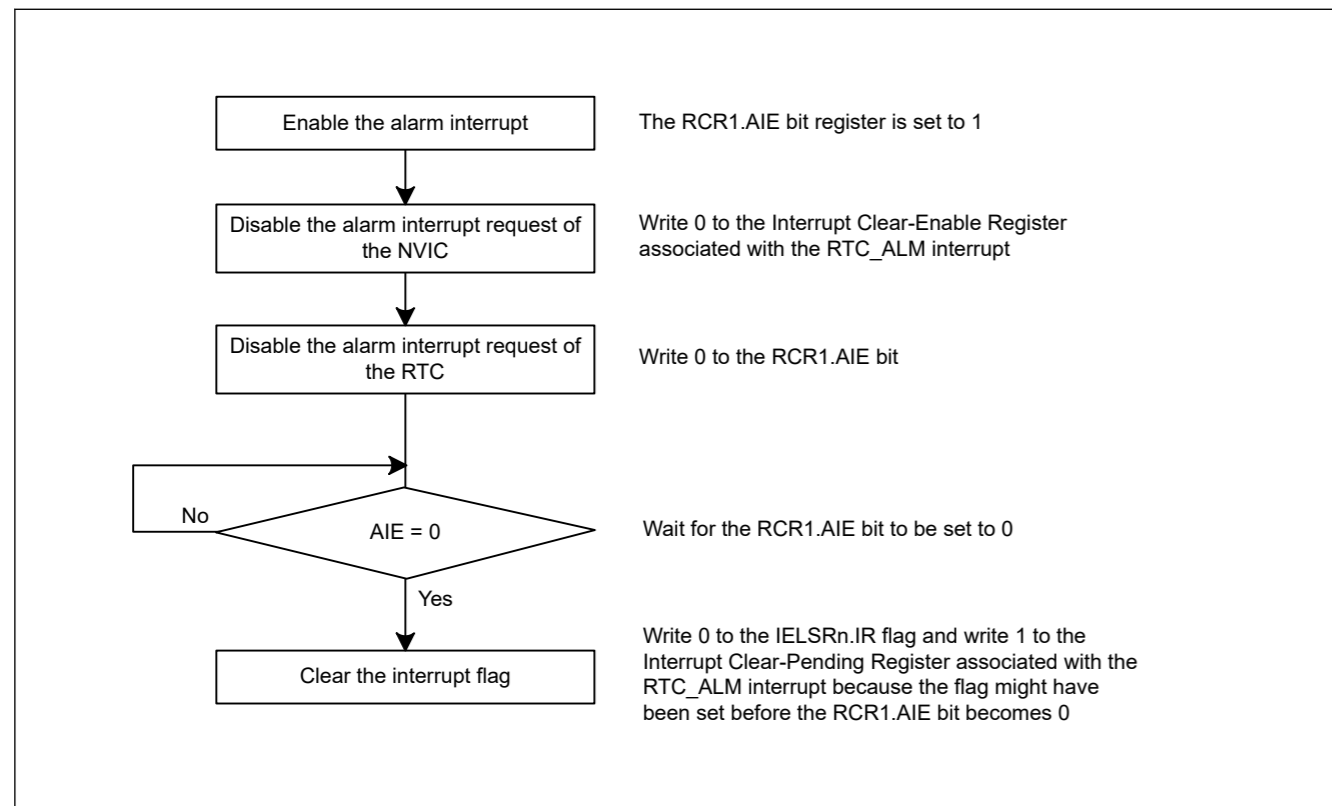

Figure 23.8 Procedure for disabling alarm interrupt request

### 23.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low.

The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

#### 23.3.8.1 Automatic adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.

Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJP bit elapses.

##### (1) Example 1: Sub-clock oscillator running at 32.769 kHz

#### Adjustment procedure

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

### 23.3.7 禁用警报中断的步骤

图23.8显示了禁用启用的警报中断请求的过程。

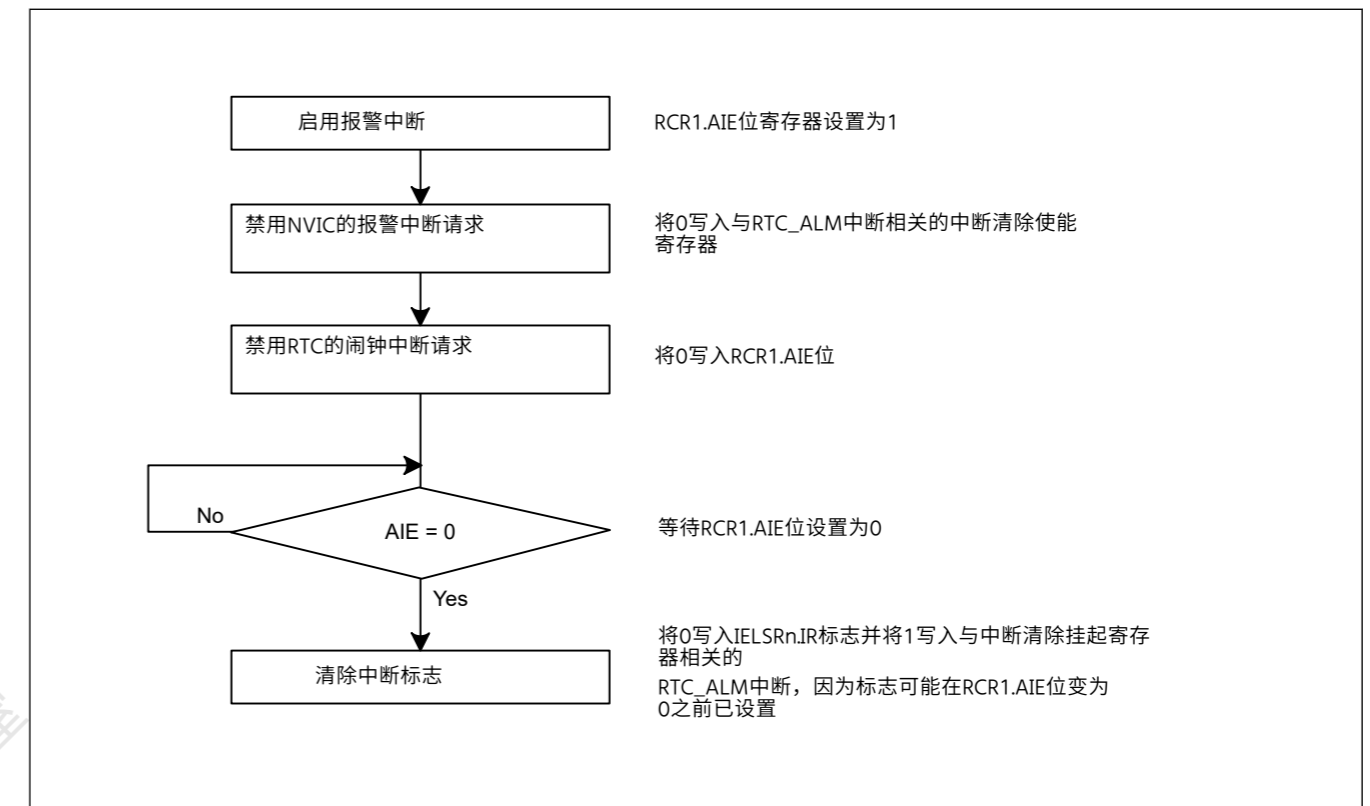

Figure 23.8 禁用报警中断请求的步骤

### 23.3.8 时间误差调整功能

时间误差调整功能用于校正子时钟振荡器振荡精度变化引起的时间误差, 运行速度快或慢。由于在选择子时钟振荡器时, 子时钟振荡器的32768个周期构成1秒的操作, 因此如果子时钟频率高, 则时钟运行快, 如果子时钟频率低, 则时钟运行慢。

时间误差调整功能包括:

- 自动调整
- 软件调整

使用RCR2.AADJE位选择自动调整或软件调整。

#### 23.3.8.1 自动调整

通过将RCR2.AADJE位设置为1来启用自动调整。

自动调整是每次经过RCR2.AADJP位选择的调整周期后, 将预分频器计数的值与RADJ寄存器中的值相加或相减。

##### (1) 示例1: 运行在32.769kHz的子时钟振荡器

#### 调整程序

当副时钟振荡器以32.769kHz运行时, 每32769个时钟周期经过1秒。RTC旨在以32768个时钟周期运行, 因此时钟以每秒1个时钟周期的速度运行。时钟上的时间每分钟快60个时钟周期, 因此调整可以采取将时钟每分钟调回60个周期的形式。

**Register settings when RCR2.CNTMD = 0:**

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 60 (0x3C)

(2) Example 2: Sub-clock oscillator running at 32.766 kHz

**Adjustment procedure**

When the sub-clock oscillator is running at 32.766 kHz, 1 second elapses every 32766 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs slow by 2 clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

**Register settings when RCR2.CNTMD = 0:**

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 20 (0x14)

(3) Example 3: Sub-clock oscillator running at 32.764 kHz

**Adjustment procedure**

When the sub-clock oscillator is running at 32.764 kHz, 1 second elapses on 32764 clock cycles. Because the RTC operates for 32768 clock cycles as 1 second, the clock is delayed for 4 clock cycles per second. In 8 seconds, the delay is 32 clock cycles, therefore correction can be made by advancing the clock 32 clock cycles every 8 seconds.

**Register settings when RCR2.CNTMD = 1:**

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 32 (0x20)

**23.3.8.2 Adjustment by software**

Enable adjustment by software by setting the RCR2.AADJE bit to 0. Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register on execution of a write instruction to the RADJ register.

(1) Example 1: Sub-clock oscillator running at 32.769 kHz

**Adjustment procedure**

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 1 clock cycle per second, so adjustment can take the form of setting the clock back by 1 cycle every second.

**Register settings**

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 1 (0x10)  
This is written to the RADJ register once per 1-second interrupt.

**23.3.8.3 Procedure to change the mode of adjustment**

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

To change adjustment by software to automatic adjustment:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).

**RCR2.CNTMD=0时的寄存器设置:**

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0]=10b (通过预分频器的减法进行调整)
- RADJ.ADJ[5:0] = 60 (0x3C)

(2) 示例2: 以32.766kHz运行的子时钟振荡器

**调整程序**

当子时钟振荡器以32.766kHz运行时, 每32766个时钟周期经过1秒。RTC旨在以32768个时钟周期运行, 因此时钟每秒运行2个时钟周期。时钟上的时间每10秒慢20个时钟周期, 因此调整可以采取将时钟每10秒向前设置20个周期的形式。

**RCR2.CNTMD=0时的寄存器设置:**

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0]=01b (通过加到预分频器进行调整)
- RADJ.ADJ[5:0] = 20 (0x14)

(3) 示例3: 以32.764kHz运行的子时钟振荡器

**调整程序**

当副时钟振荡器以32.764kHz运行时, 32764个时钟周期经过1秒。由于RTC以1秒为单位运行32768个时钟周期, 因此时钟每秒延迟4个时钟周期。在8秒内, 延迟为32个时钟周期, 因此可以通过每8秒将时钟提前32个时钟周期来进行校正。

**RCR2.CNTMD=1时的寄存器设置:**

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0]=01b (通过加到预分频器进行调整)
- RADJ.ADJ[5:0] = 32 (0x20)

**23.3.8.2 软件调整**

通过将RCR2.AADJE位设置为0来启用软件调整。软件调整是在对RADJ寄存器执行写指令时, 将预分频器计数的值与RADJ寄存器中的值相加或相减。

(1) 示例1: 运行在32.769kHz的子时钟振荡器

**调整程序**

当副时钟振荡器以32.769kHz运行时, 每32769个时钟周期经过1秒。RTC旨在以32768个时钟周期运行, 因此时钟以每秒1个时钟周期的速度运行。时钟上的时间每秒快1个时钟周期, 因此调整可以采取将时钟每秒调回1个周期的形式。

**注册设置**

- RADJ.PMADJ[1:0]=10b (通过预分频器的减法进行调整)
- RADJ.ADJ[5:0] = 1 (0x10)  
每1秒中断一次将其写入RADJ寄存器。

**23.3.8.3 更改调整模式的程序**

改变调整模式时, 将RADJ.PMADJ[1:0]位设置为00b后改变RCR2中的AADJE位的值 (不进行调整)。

将软件调整改为自动调整:

- 1.将RADJ.PMADJ[1:0]位设置为00b (不进行调整)。
- 2.将RCR2.AADJE位设置为1 (启用自动调整)。

- Use the RCR2.AADJP bit to select the period of adjustment.
- In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

To change automatic adjustment to adjustment by software:

- Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
- Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
- Proceed with the adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the wanted time. After that, the time is adjusted every time a value is written to the RADJ register.

#### 23.3.8.4 Procedure to stop adjustment

Stop the adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

#### 23.3.9 Capturing the time

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin in calendar count mode or binary count mode.

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the RTCCRn.TCST bit is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins. Set VBTICTLR.VCHnIEN (n = 0 to 2) to 1 to enable the RTCICn input. Operation when the noise filter is off is shown in Figure 23.9 and operation when the noise filter is on is shown in Figure 23.10.

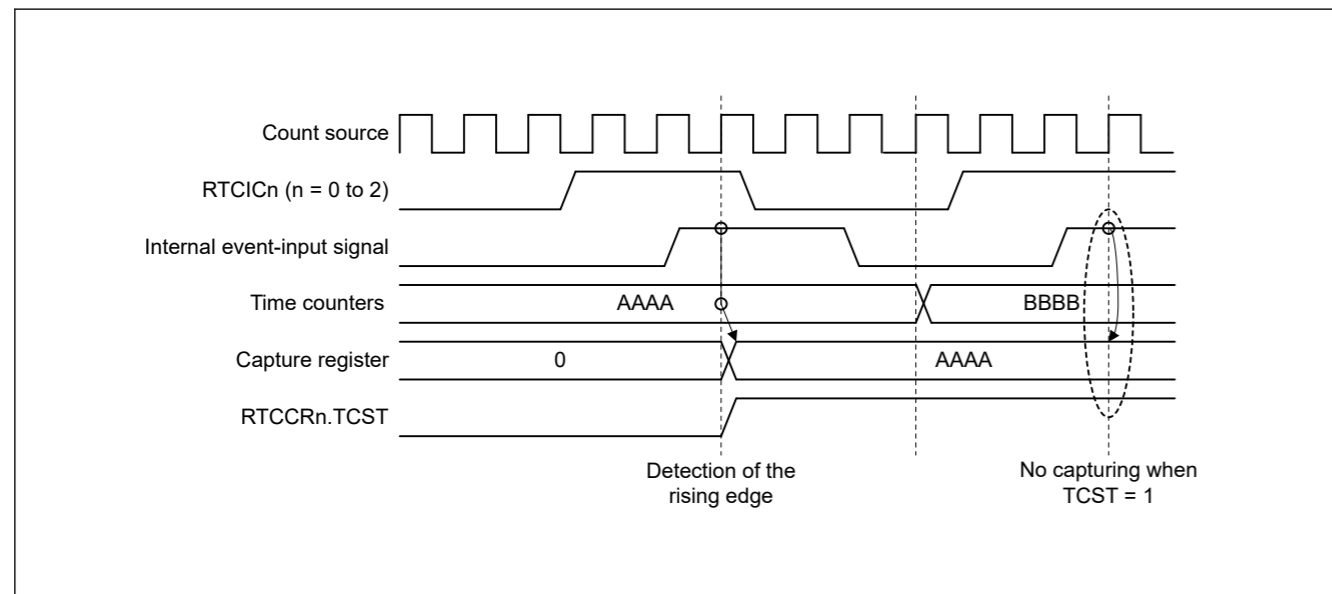

Figure 23.9 Timing of a time capture operation with the noise filter off

- 使用RCR2.AADJP位选择调整周期。
- 在RADJ中，将PMADJ[1:0]位设置为加法或减法，并将ADJ[5:0]位设置为用于时间误差调整的值。

将自动调整更改为软件调整：

- 将RADJ.PMADJ[1:0]位设置为00b（不进行调整）。
- 将RCR2.AADJE位设置为0（启用软件调整）。
- 通过将RADJ.PMADJ[1:0]位设置为加法或减法并将RADJ.ADJ[5:0]位设置为在所需时间用于时间误差调整的值，继续进行调整。之后，每次将值写入RADJ寄存器时都会调整时间。

#### 23.3.8.4 停止调整的程序

通过将RADJ.PMADJ[1:0]位设置为00b来停止调整（不执行调整）。

#### 23.3.9 捕捉时间

通过在日历计数模式或二进制计数模式下检测时间捕捉事件输入引脚上的信号沿，RTC能够存储月、日、小时、分钟和秒二进制计数器3到0。

噪声滤波器也可用于时间捕捉事件输入引脚。如果启用噪声滤波器，则当引脚上的输入电平匹配3次时，RTCCRn.TCST位设置为1。

可以为每个时间捕捉事件输入引脚打开或关闭噪声滤波器。将VBTICTLR.VCHnIEN（n=0到2）设置为1以启用RTCICn输入。噪声滤波器关闭时的操作如图23.9所示，噪声滤波器打开时的操作如图23.10所示。

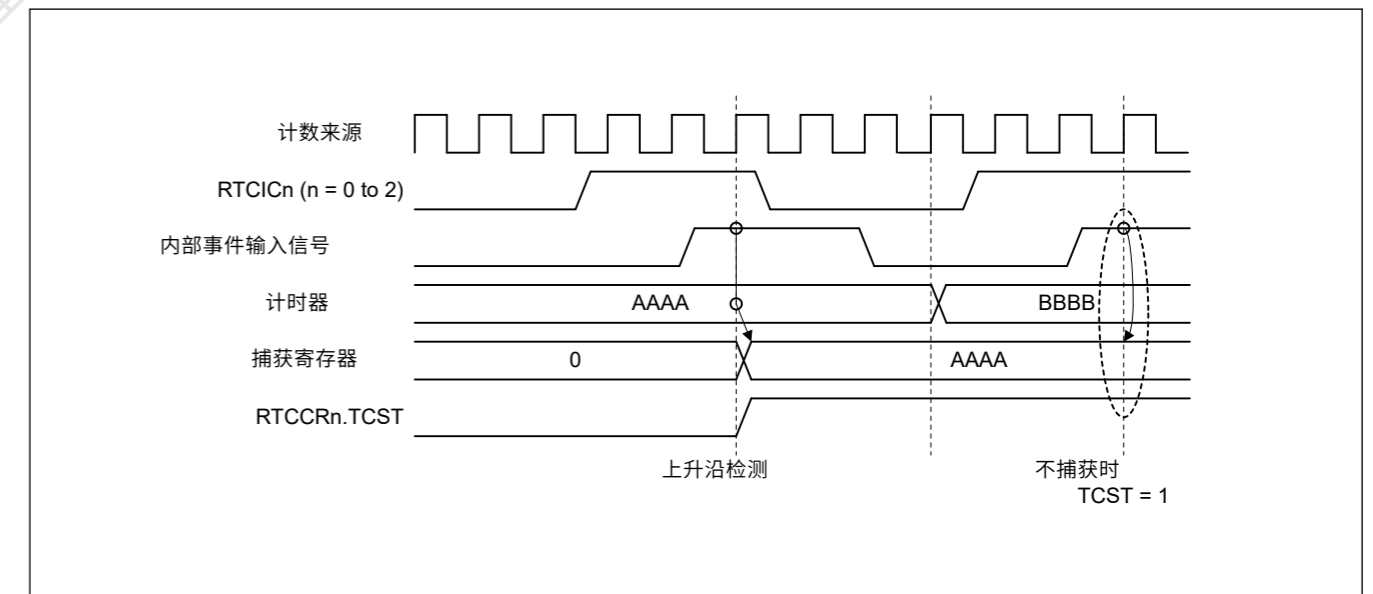

Figure 23.9 关闭噪声过滤器的时间捕捉操作的时序

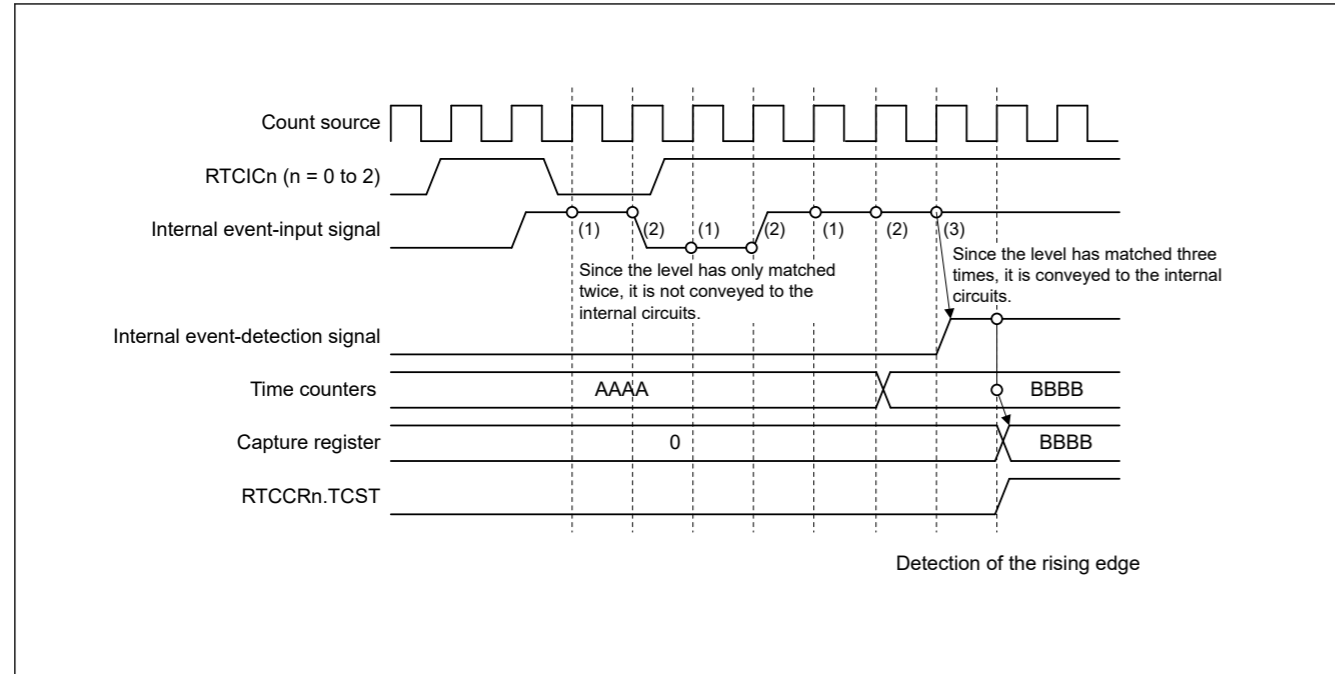

Figure 23.10 Timing of a time capture operation with the noise filter on

### 23.4 Interrupt Sources

The RTC has three interrupt sources, as listed in Table 23.3.

Table 23.3 RTC interrupt sources

| Name    | Interrupt source   |
|---------|--------------------|
| RTC_ALM | Alarm interrupt    |
| RTC_PRD | Periodic interrupt |
| RTC_CUP | Carry interrupt    |

#### (1) Alarm interrupt (RTC\_ALM)

This interrupt is generated based on the comparison result between the alarm registers and RTC counters. For details, see section 23.3.6. Alarm Function.

Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the IELSRn.IR flag and the interrupt Set-Pending Register associated with the RTC\_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to mismatching of the alarm registers and clock counters, the flag is not 1 again until there is another match or the values of the alarm registers are modified again.

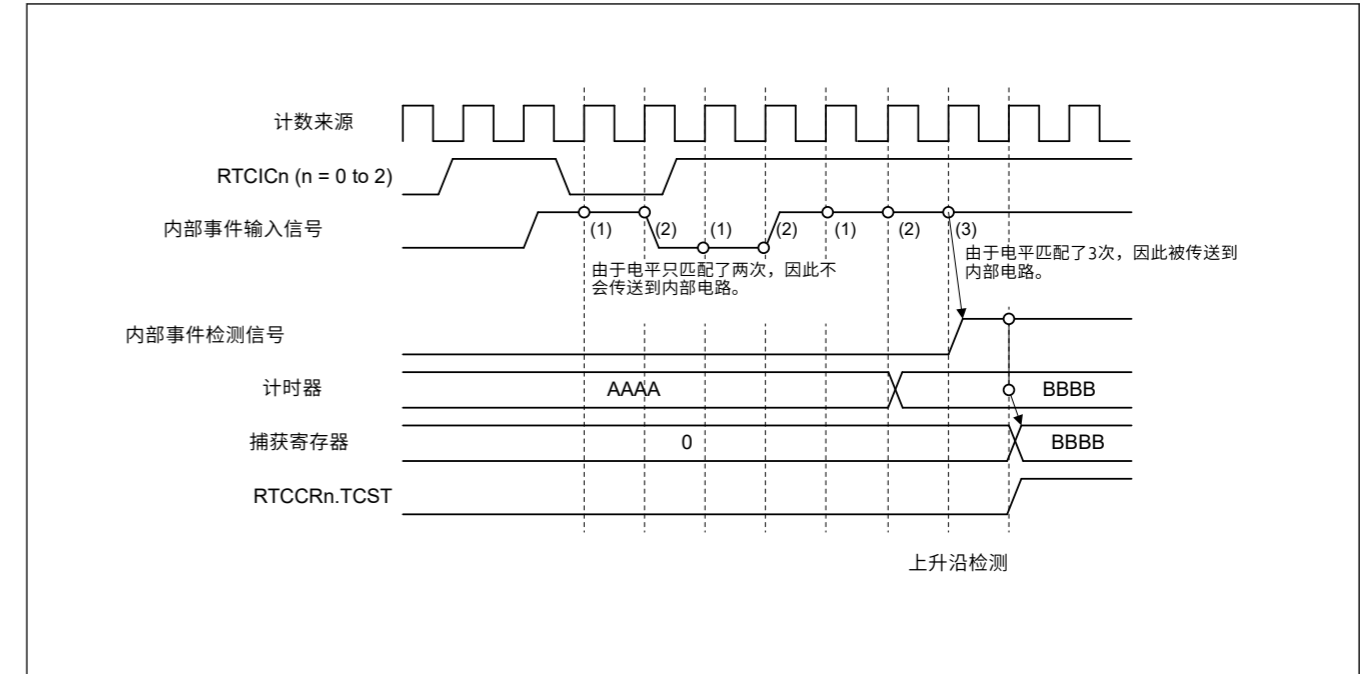

Figure 23.10 开启噪声滤波器的时间捕获操作的时序

### 23.4 中断源

RTC具有三个中断源，如表23.3中所列。

Table 23.3 RTC中断源

| Name    | 中断源   |
|---------|-------|
| RTC_ALM | 报警中断  |
| RTC_PRD | 周期性中断 |
| RTC_CUP | 进位中断  |

#### (1) 闹钟中断(RTC\_ALM)

该中断是根据闹钟寄存器和RTC计数器之间的比较结果产生的。详见23.3.6节。报警功能。

因为当闹钟寄存器的设置与时钟计数器匹配时中断标志可能被设置为1，请等待闹钟时间设置被确认并清除IELSRn.IR标志和相关的中断设置挂起寄存器修改闹钟寄存器的值后，RTC\_ALM中断再次为0。报警中断的中断标志置1并返回报警寄存器和时钟计数器不匹配状态后，该标志不再为1，直到再次匹配或再次修改报警寄存器的值。

Figure 23.11 Timing for the alarm interrupt (RTC\_ALM)

(2) Periodic interrupt (RTC\_PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected in the RCR1.PES[3:0] bits.

(3) Carry interrupt (RTC\_CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

Figure 23.12 shows the timing of the carry interrupt (RTC\_CPU).

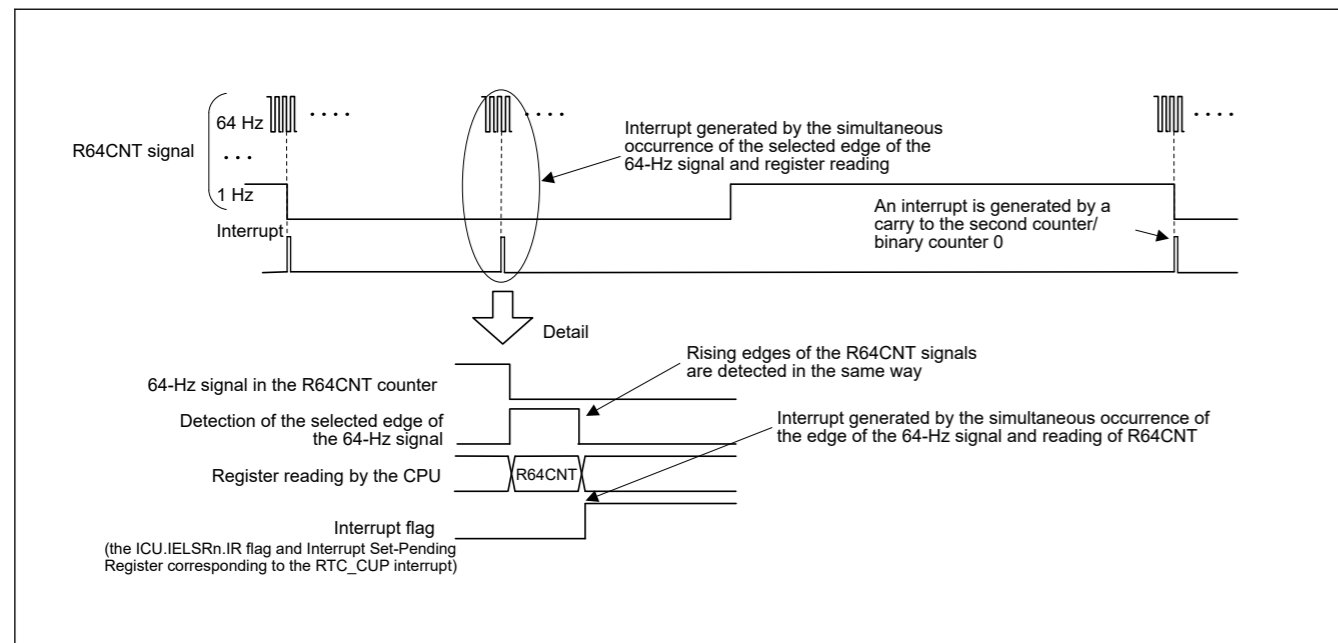

Figure 23.12 Timing for the carry interrupt (RTC\_CUP)

23.5 Event Link Output

The RTC generates periodic event output (RTC\_PRD) event signal for the ELC that can be used to initiate operations by other modules selected in advance.

Figure 23.11 闹钟中断的时序(RTC\_ALM)

(2) 周期性中断(RTC\_PRD)

此中断以2秒、1秒、1/2秒、1/4秒、1/8秒、1/16秒、1/32秒、1/64秒、1/128秒或1/256秒的间隔生成。可以在RCR1.PES[3:0]位中选择中断间隔。

(3) 进位中断(RTC\_CUP)

当第二个计数器二进制计数器0的进位发生或在对64-Hz计数器的读访问期间发生对R64CNT计数器的进位时, 将产生此中断。

图23.12显示了进位中断(RTC\_CPU)的时序。

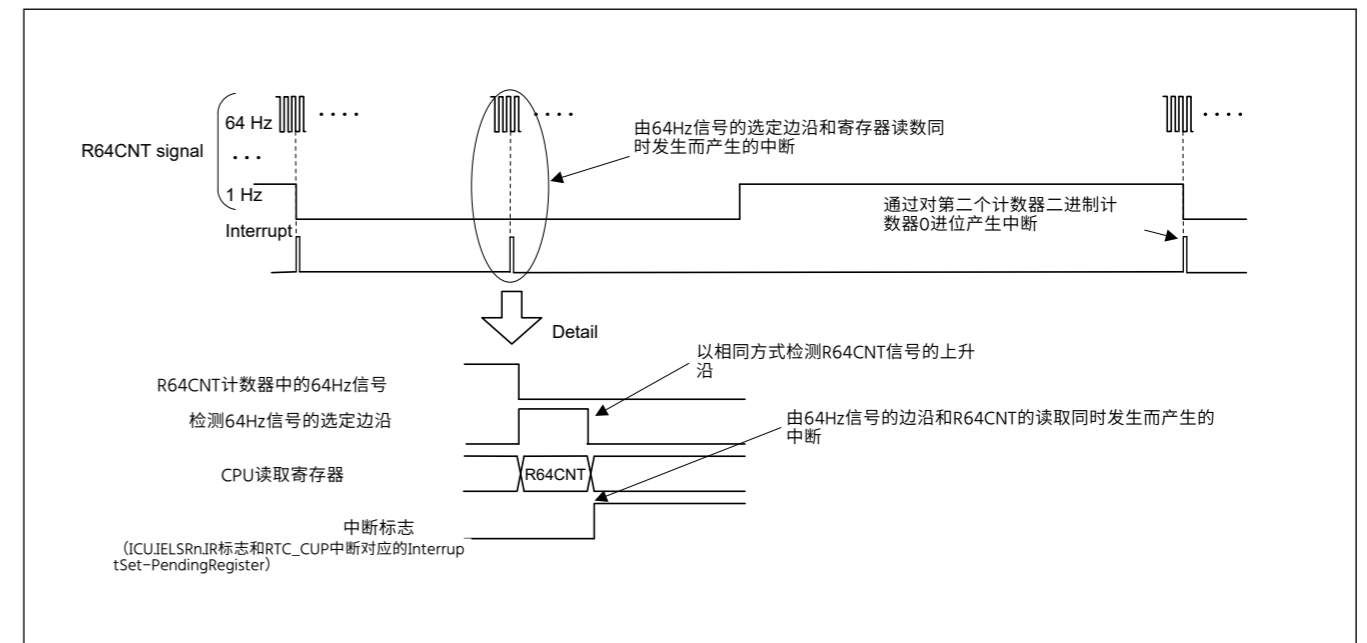

Figure 23.12 进位中断(RTC\_CUP)的时序

23.5 事件链接输出

RTC为ELC生成周期性事件输出(RTC\_PRD)事件信号, 该信号可用于启动预先选择的其他模块的操作。

The periodic event signal is output at the interval selected from 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by setting the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

**Note:** If event linking from the RTC is used, only set the ELC after setting the RTC, for example initialization and time settings. Setting the RTC after the ELC can lead to output of unexpected event signals.

### 23.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output to the CPU when an interrupt source is generated while the associated enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal through the ELC when an interrupt source is generated, regardless of the setting of the associated interrupt enable bit.

**Note:** Although alarm and periodic interrupts can still be output during Software Standby or Deep Software Standby mode, the periodic event signals for the ELC are not output.

## 23.6 Usage Notes

### 23.6.1 Register Writing during Counting

The following registers should not be written to during counting, that is, while the RCR2.START bit is 1:

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS
- RCR2.RTCOE
- RCR2.HR24
- RFRL

The counter should be stopped before writing to any of these registers.

### 23.6.2 Use of Periodic Interrupts

**Figure 23.13** shows the procedure for using periodic interrupts.

The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits.

In addition, any of the following operation can affect the interrupt period:

- Stopping/restarting or resetting counter operation
- Reset by RTC software
- 30-second adjustment by changing the RCR2 value

When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted based on the adjustment value.

通过设置RCR1.PES[3:0]，以从1256、1128、164、132、116、18、14、12、1和2秒中选择的间隔输出周期性事件信号)位。

不保证选择事件生成后的事件生成周期。

**Note:** 如果使用来自RTC的事件链接，请仅在设置RTC后设置ELC，例如初始化和时间设置。在ELC之后设置RTC会导致意外事件信号的输出。

### 23.5.1 中断处理和事件链接

RTC有一个位来启用或禁用周期性中断。当相关使能位使能时产生中断源时，将向CPU输出中断请求信号。

相反，当产生中断源时，事件链接输出信号作为事件信号通过ELC发送到其他模块，而不管相关中断使能位的设置如何。

**Note:** 尽管在软件待机或深度软件待机模式下仍可输出警报和周期性中断，但不会输出ELC的周期性事件信号。

## 23.6 使用说明

### 23.6.1 计数期间的寄存器写入

计数期间不应写入以下寄存器，即RCR2.START位为1时：

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS
- RCR2.RTCOE
- RCR2.HR24
- RFRL

在写入任何这些寄存器之前，应停止计数器。

### 23.6.2 使用周期性中断

图23.13显示了使用周期性中断的过程。

可以通过设置RCR1.PES[3:0]位来更改周期性中断的产生和周期。但是，因为预分频器R64CNT和RSECCNT/BCNT0用于产生中断，所以在设置RCR1.PES[3:0]位后不能立即保证中断周期。

此外，以下任何操作都会影响中断周期：

- 停止重新启动或重置计数器操作
- RTC软件复位
- 通过改变RCR2值进行30秒调整

使用时间误差调整功能时，根据调整值加减调整后的中断产生周期。

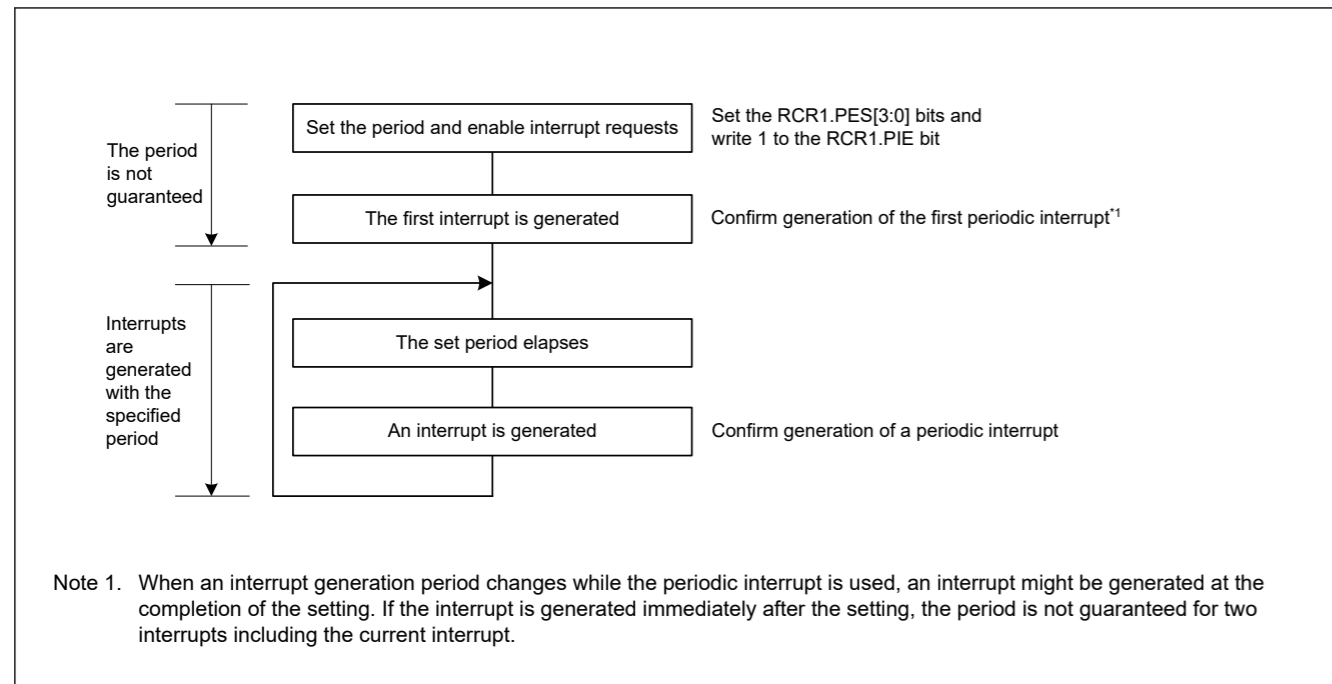

Figure 23.13 Using the periodic interrupt function

### 23.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted based on the adjustment value.

### 23.6.4 Transitions to Low Power Modes after Setting Registers

A transition to a low power state (Software Standby mode, Deep Software Standby mode, or battery backup state) during a write to an RTC register might corrupt the value of the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power state.

### 23.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after writing to the counter register, follow the procedure in [section 23.3.5. Reading 64-Hz Counter and Time](#).
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4 register, or frequency register is reflected when fourth read operations are performed after writing.
- The values written to the RCR1.CIE, RCR1.RTCOS, and RCR2.RTCOE bits can be read immediately after writing.
- To read the value from the timer counter after returning from a reset or a period in Software Standby mode, Deep Software Standby mode, or battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit = 1).
- After a reset is generated, write to the RTC register after 6 cycles of the count source clock have elapsed.

### 23.6.6 Changing the Count Mode

When changing the count mode (calendar count mode/binary count mode), set the RCR2.START bit to 0, stop the counting operation, then start it again from the initial setting. For details on the initial setting, see [section 23.3.1. Outline of Initial Settings of Registers after Power On](#).

### 23.6.7 Initialization Procedure When the RTC Is Not to Be Used

Registers in the RTC are not initialized by a reset. Depending on the initial state, the generation of an unintentional interrupt request or operation of the counter might lead to increased power consumption.

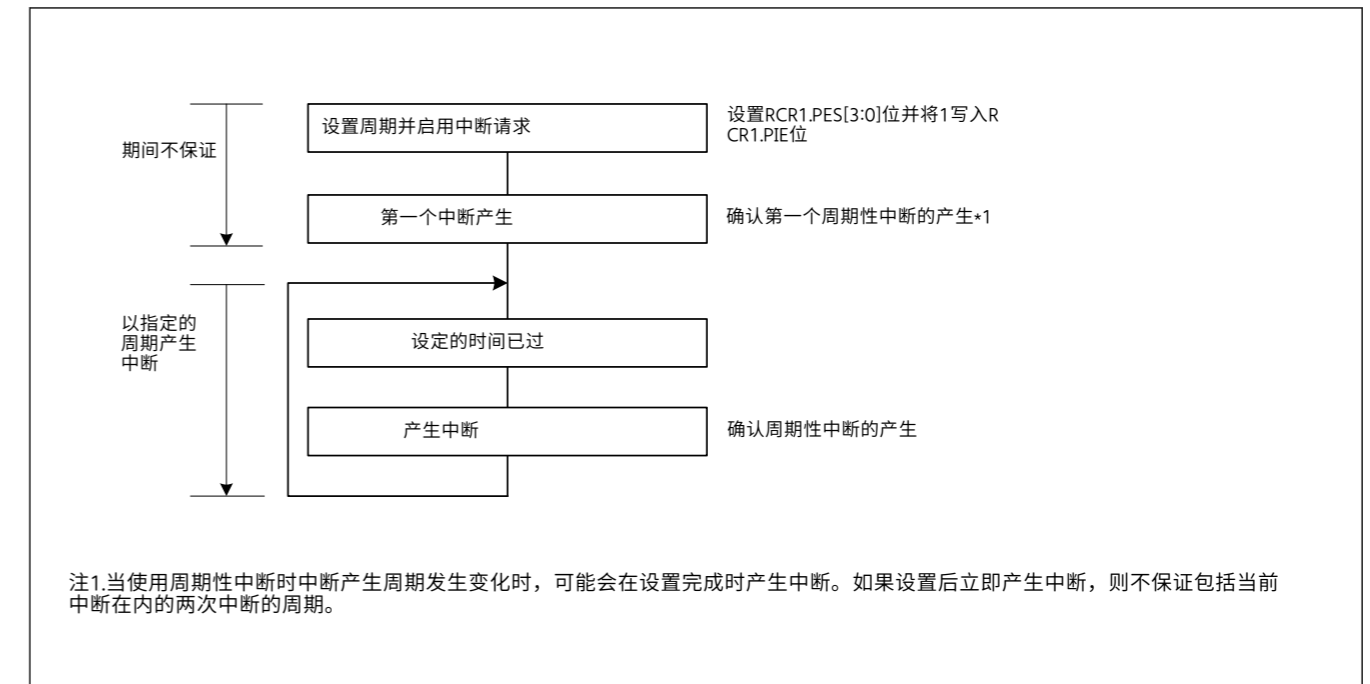

Figure 23.13 使用周期性中断功能

### 23.6.3 RTCOUT(1-Hz/64-Hz)时钟输出

停止重新启动或重置计数器操作,通过RTC软件重置,并通过更改30秒调整RCR2值影响RTCOUT(1-Hz/64-Hz)输出的周期。使用时间误差调整功能时,调整后的RTCOUT(1-Hz/64-Hz)输出的周期根据调整值加减。

### 23.6.4 设置寄存器后转换到低功耗模式

在写入RTC寄存器期间转换到低功耗状态(软件待机模式、深度软件待机模式或电池备份状态)可能会损坏寄存器的值。设置寄存器后,在开始转换到低功耗状态之前确认设置到位。

### 23.6.5 关于写入和读取寄存器的注意事项

- 在写入计数器寄存器后读取第二个计数器寄存器时,请按照[第23.3.5节.读取64-Hz计数器和时间](#)。
- 写入计数寄存器、报警寄存器、年报警使能寄存器、RCR2.AADJE、AADJP位和HR24、RCR4寄存器或频率寄存器的值在写入后执行第四次读操作时反映。
- 写入RCR1.CIE、RCR1.RTCOS和RCR2.RTCOE位的值可在写入后立即读取。
- 要在软件待机模式下从复位或一段时间返回后从定时器计数器读取值,Deep软件待机模式或电池备份状态在时钟运行时等待1/128秒(RCR2.START位=1)。
- 产生复位后,经过6个计数源时钟周期后写入RTC寄存器。

### 23.6.6 更改计数模式

当改变计数模式(日历计数模式/二进制计数模式)时,将RCR2.START位设置为0,停止计数操作,然后从初始设置重新开始。有关初始设置的详细信息,请参阅[第23.3.1节.上电后寄存器的初始设置概要](#)。

### 23.6.7 不使用RTC时的初始化程序

RTC中的寄存器不会因复位而初始化。根据初始状态,意外中断请求的生成或计数器的操作可能会导致功耗增加。

For applications that do not require a realtime clock, initialize the registers by following the initialization procedure shown in Figure 23.14.

Alternatively, when the sub-clock oscillator is not used as the system clock or realtime clock, the counter can be stopped by writing 0 (sub-clock oscillator is selected) to the RCR4.RCKSEL bit and stopping the sub-clock oscillator. To stop the sub-clock oscillator, write 1 to the SOSCCR.SOSTP bit.

For details on the setting of the SOSCCR.SOSTP bit, see section 8, Clock Generation Circuit.

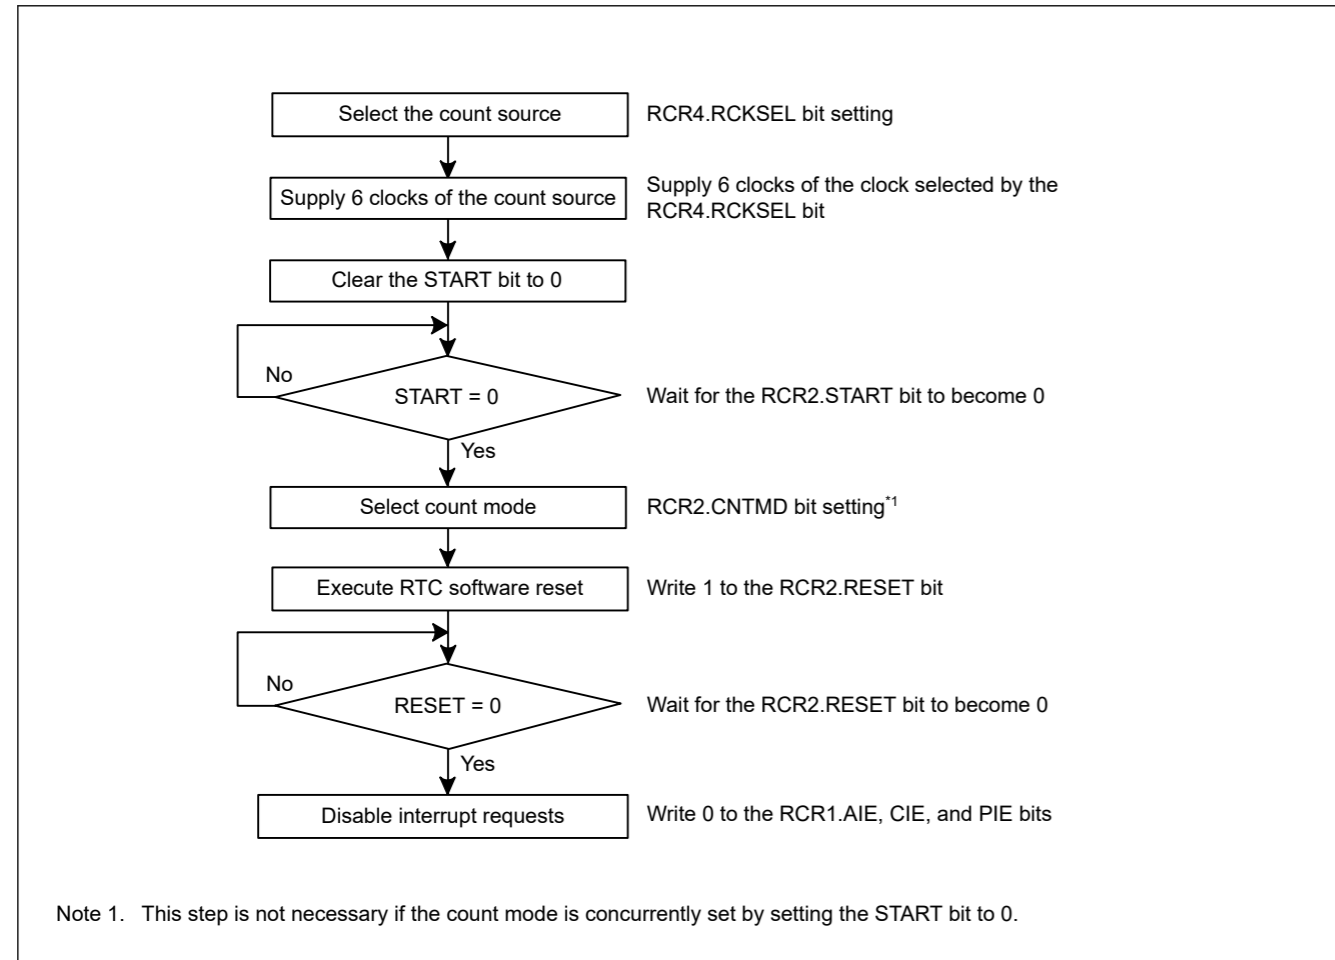

Figure 23.14 Initialization procedure

### 23.6.8 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. If the RTC periodical interrupt or RTC periodical event output was generated at this time, the interrupt or event is invalid.

对于不需要实时时钟的应用程序，按照图23.14所示的初始化过程初始化寄存器。

或者，当副时钟振荡器不用作系统时钟或实时时钟时，可以通过向RCR4.RCKSEL位写入0（选择副时钟振荡器）并停止副时钟振荡器来停止计数器。要停止副时钟振荡器，向SOSCCR.SOSTP位写入1。

有关SOSCCR.SOSTP位设置的详细信息，请参见第8节，时钟生成电路。

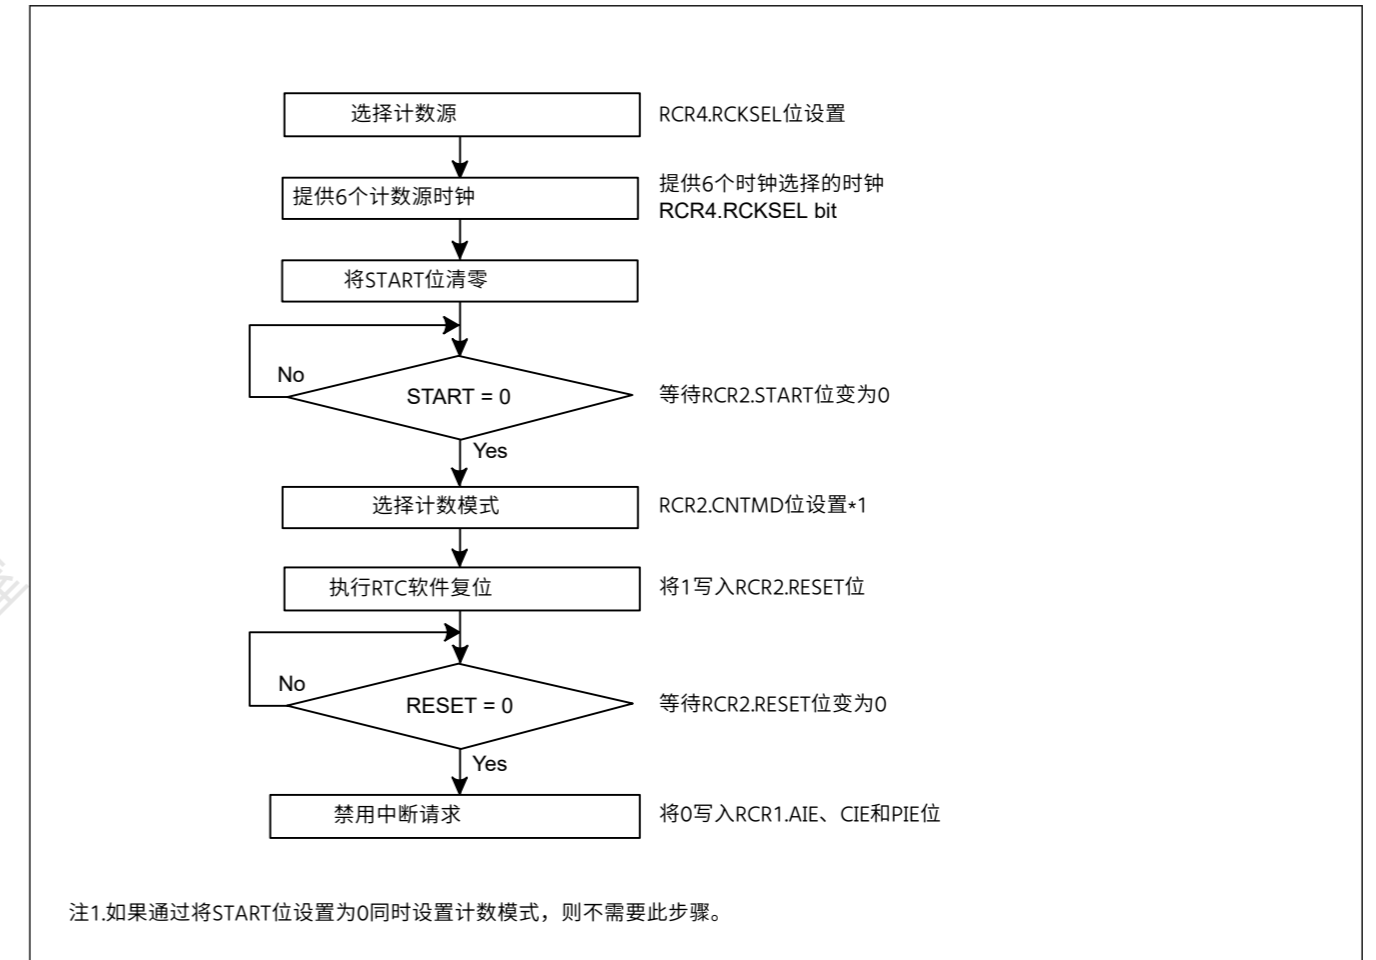

Figure 23.14 初始化程序

### 23.6.8 切换源时钟时

当通过改变SCKSCR.CKSEL[2:0]来切换时钟源时，选择器的时钟输出在切换时钟的4个周期内停止。如果此时产生了RTC周期性中断或RTC周期性事件输出，则该中断或事件无效。

## 24. Watchdog Timer (WDT)

### 24.1 Overview

The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.

Table 24.1 lists the WDT specifications and Figure 24.1 shows a block diagram.

**Table 24.1 WDT specifications**

| Parameter                                | Specifications  |
|--|---|
| Count source*1                           | Peripheral clock (PCLKB)  |
| Clock division ratio                     | Division by 4, 64, 128, 512, 2048, or 8192  |
| Counter operation                        | Counting down using a 14-bit down-counter   |
| Condition for starting the counter       | <ul style="list-style-type: none"> <li>Auto start mode: Counting automatically starts after a reset or after an underflow or refresh error occurs</li> <li>Register start mode: Counting is started with a refresh by writing to the WDTRR register</li> <li>Only secure developer can select Auto-start mode or Register-start mode</li> </ul> |
| Conditions for stopping the counter      | <ul style="list-style-type: none"> <li>Reset (the down-counter and other registers return to their initial values)</li> <li>A counter underflows or a refresh error is generated</li> </ul>   |
| Window function                          | Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)  |
| Watchdog timer reset sources             | <ul style="list-style-type: none"> <li>Down-counter underflows</li> <li>Refreshing outside the refresh-permitted period (refresh error)</li> </ul>  |
| Non-maskable interrupt/interrupt sources | <ul style="list-style-type: none"> <li>Down-counter underflows</li> <li>Refreshing outside the refresh-permitted period (refresh error)</li> </ul>  |
| Reading of the counter value             | The down-counter value can be read by the WDTSR register  |
| Event link function (output)             | <ul style="list-style-type: none"> <li>Down-counter underflow event output</li> <li>Refresh error event output</li> </ul>   |
| Output signal (internal signal)          | <ul style="list-style-type: none"> <li>Reset output</li> <li>Interrupt request output</li> <li>Sleep-mode count stop control output</li> </ul>  |
| TrustZone Filter                         | Security attribution can be set   |

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB)  $\geq 4 \times$  (the frequency of the count clock source after division).

## 24. 看门狗定时器(WDT)

### 24.1 Overview

看门狗定时器(WDT)是一个14位递减计数器，可用于在计数器下溢时复位MCU，因为系统已失控且无法刷新WDT。此外，WDT可用于产生不可屏蔽中断或下溢中断。

表24.1列出了WDT规范，图24.1显示了框图。

**Table 24.1 WDT specifications**

| Parameter                                | Specifications   |
|--|--|
| 计数来源*1                                   | 外设时钟(PCLKB)  |
| 时钟分频比                                    | 除以4、64、128、512、2048或8192   |
| 计数器操作                                    | 使用14位递减计数器进行递减计数   |
| 启动计数器的条件                                 | <ul style="list-style-type: none"> <li>自动启动模式：复位后或发生下溢或刷新错误后自动开始计数</li> <li>寄存器启动模式：通过写入WDTRR寄存器以刷新开始计数</li> <li>只有安全的开发人员可以选择自动启动模式或注册启动模式</li> </ul> |
| 停止计数器的条件                                 | <ul style="list-style-type: none"> <li>复位（递减计数器和其他寄存器恢复初始值）</li> <li>计数器下溢或产生刷新错误</li> </ul>   |
| 窗口功能                                     | 可以指定窗口开始和结束位置（允许刷新和禁止刷新期间）   |
| 看门狗定时器复位源                                | <ul style="list-style-type: none"> <li>Down-counter underflows</li> <li>刷新允许时间之外的刷新（刷新错误）</li> </ul>   |
| Non-maskable interrupt/interrupt sources | <ul style="list-style-type: none"> <li>Down-counter underflows</li> <li>刷新允许时间之外的刷新（刷新错误）</li> </ul>   |
| 读取计数器值                                   | 递减计数器的值可以通过WDTSR寄存器读取  |
| 事件链接功能（输出）                               | <ul style="list-style-type: none"> <li>递减计数器下溢事件输出</li> <li>刷新错误事件输出</li> </ul>  |
| 输出信号（内部信号）                               | <ul style="list-style-type: none"> <li>复位输出</li> <li>中断请求输出</li> <li>休眠模式计数停止控制输出</li> </ul>   |
| TrustZone Filter                         | 可设置安全属性  |

注1.满足外设模块时钟（PCLKB）的频率 $\geq 4 \times$ （分频后的计数时钟源的频率）。

Figure 24.1 WDT block diagram

24.2 Register Descriptions

24.2.1 WDTRR : WDT Refresh Register

Base address: WDT = 0x4008\_3400

Offset address: 0x00

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 7:0 | n/a    | The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register. | R/W |

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 0x00 and then writing 0xFF to WDTRR register (refresh operation) within the refresh-permitted period.

After the down-counter is refreshed, it starts counting down from the value selected by setting the WDT Timeout Period Select bits (OFS0.WDTTOPS[1:0]) in the Option Function Select Register 0 in auto start mode. In register start mode, counting down starts from the value selected by setting the Timeout Period Select bits (WDTTCR.TOPS[1:0]) in the WDT Control Register.

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see section 24.3.3. Refresh Operation.

Figure 24.1 看门狗框图

24.2 注册说明

24.2.1 WDTRR:WDT刷新寄存器

Base address: WDT = 0x4008\_3400

Offset address: 0x00

| Bit | Symbol | Function                       | R/W |
|-----|--------|--------------------------------|-----|
| 7:0 | n/a    | 通过写入0x00然后将0xFF写入该寄存器来刷新递减计数器。 | R/W |

WDTRR寄存器刷新WDT的递减计数器。

WDT的递减计数器通过在允许刷新期间内写入0x00然后将0xFF写入WDTRR寄存器（刷新操作）来刷新。

递减计数器刷新后，在自动启动模式下，它从通过设置选项功能选择寄存器0中的WDT超时周期选择位(OFS0.WDTTOPS[1:0])选择的值开始递减计数。在寄存器启动模式下，倒计时从通过设置WDT控制寄存器中的超时周期选择位(WDTTCR.TOPS[1:0])选择的值开始。

写入0x00时，读取值为0x00。写入0x00以外的值时，读取的值为0xFF。有关刷新操作的详细信息，请参阅第24.3.3节。刷新操作。

## 24.2.2 WDTCR : WDT Control Register

Base address: WDT = 0x4008\_3400

Offset address: 0x02

|                    |    |    |           |    |    |           |          |   |   |   |   |           |   |   |   |   |
|--------------------|----|----|-----------|----|----|-----------|----------|---|---|---|---|-----------|---|---|---|---|
| Bit position:      | 15 | 14 | 13        | 12 | 11 | 10        | 9        | 8 | 7 | 6 | 5 | 4         | 3 | 2 | 1 | 0 |
| Bit field:         | —  | —  | RPSS[1:0] | —  | —  | RPES[1:0] | CKS[3:0] |   |   | — | — | TOPS[1:0] |   |   |   |   |

The WDTCR register is used to set the clock division ratio, and window start and end positions for refresh, and the timeout period until the down-counter underflows in register start mode.

Some constraints apply to writes to the WDTCR register. For details, see [section 24.3.2. Controlling Writes to the WDTCR, WDTCR, and WDTCSR Registers](#).

In auto start mode, the settings in the WDTCR register are disabled, and the settings in the Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made in the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

**TOPS[1:0] bits (Timeout Period Select)**

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

[Table 24.2](#) lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

## 24.2.2 WDTCR:WDT控制寄存器

WDTCR寄存器用于设置时钟分频比、刷新的窗口开始和结束位置，以及在寄存器开始模式下直到递减计数器下溢的超时时间。

一些限制适用于写入WDTCR寄存器。详见24.3.2节。控制对WDTCR的写入，[WDTCSR和WDTCSR寄存器](#)。

在自动启动模式下，禁用WDTCR寄存器中的设置，启用选项功能选择寄存器0(OFS0)中的设置。WDTCR寄存器的设置也可以在OFS0寄存器中进行。详见24.3.8节。选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联。

**TOPS[1:0]位 (超时周期选择)**

TOPS[1:0]位从1024、4096、8192和16384个周期中选择超时周期，直到递减计数器下溢的周期，以CKS[3:0]位中指定的分频时钟为1个周期。向下计数器刷新后，CKS[3:0]和TOPS[1:0]位的组合决定了PCLKB周期数，直到计数器下溢。

表24.2列出了CKS[3:0]和TOPS[1:0]位设置、超时时间和PCLKB cycles。

Table 24.2 Timeout period settings

| CKS[3:0] bits | TOPS[1:0] bits | Clock division ratio | Timeout period (number of cycles) | PCLKB clock cycles |
|---------------|----------------|----------------------|-----------------------------------|--------------------|
| 0x1           | 00b            | PCLKB/4              | 1024                              | 4096               |
|               | 01b            |                      | 4096                              | 16384              |
|               | 10b            |                      | 8192                              | 32768              |

|               | 10b            |                      | 8192                              | 1048576            |
|               | 11b            |                      | 16384                             | 2097152            |
| 0x6           | 00b            | PCLKB/512            | 1024                              | 524288             |
|               | 01b            |                      | 4096                              | 2097152            |
|               | 10b            |                      | 8192                              | 4194304            |
|               | 11b            |                      | 16384                             | 8388608            |
| 0x7           | 00b            | PCLKB/2048           | 1024                              | 2097152            |
|               | 01b            |                      | 4096                              | 8388608            |
|               | 10b            |                      | 8192                              | 16777216           |
|               | 11b            |                      | 16384                             | 33554432           |
| 0x8           | 00b            | PCLKB/8192           | 1024                              | 8388608            |
|               | 01b            |                      | 4096                              | 33554432           |
|               | 10b            |                      | 8192                              | 67108864           |
|               | 11b            |                      | 16384                             | 134217728          |

**CKS[3:0] bits (Clock Division Ratio Select)**

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the PCLKB divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 4096 and 134217728 PCLKB clock cycles.

**RPES[1:0] bits (Window End Position Select)**

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

**RPSS[1:0] bits (Window Start Position Select)**

The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window end position is set to 0%.

Table 24.3 lists the counter values for the window start and end positions, and Figure 24.2 shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 24.2 超时时间设置

| CKS[3:0] bits | TOPS[1:0] bits | 时钟分频比      | 超时时间 (周期数) | PCLKB时钟周期 |
|---------------|----------------|------------|------------|-----------|
| 0x1           | 00b            | PCLKB/4    | 1024       | 4096      |
|               | 01b            |            | 4096       | 16384     |
|               | 10b            |            | 8192       | 32768     |
|               | 11b            |            | 16384      | 65536     |
| 0x4           | 00b            | PCLKB/64   | 1024       | 65536     |
|               | 01b            |            | 4096       | 262144    |
|               | 10b            |            | 8192       | 524288    |
|               | 11b            |            | 16384      | 1048576   |
| 0xF           | 00b            | PCLKB/128  | 1024       | 131072    |
|               | 01b            |            | 4096       | 524288    |
|               | 10b            |            | 8192       | 1048576   |
|               | 11b            |            | 16384      | 2097152   |
| 0x6           | 00b            | PCLKB/512  | 1024       | 524288    |
|               | 01b            |            | 4096       | 2097152   |
|               | 10b            |            | 8192       | 4194304   |
|               | 11b            |            | 16384      | 8388608   |
| 0x7           | 00b            | PCLKB/2048 | 1024       | 2097152   |
|               | 01b            |            | 4096       | 8388608   |
|               | 10b            |            | 8192       | 16777216  |
|               | 11b            |            | 16384      | 33554432  |
| 0x8           | 00b            | PCLKB/8192 | 1024       | 8388608   |
|               | 01b            |            | 4096       | 33554432  |
|               | 10b            |            | 8192       | 67108864  |
|               | 11b            |            | 16384      | 134217728 |

**CKS[3:0]位 (时钟分频比选择)**

CKS[3:0]位指定用于递减计数器的时钟的分频比。分频比可以从PCLKB除以4、64、128、512、2048和8192中选择。结合TOPS[1:0]位设置，这允许将WDT配置为4096和134217728个PCLKB时钟周期。

**RPES[1:0]位 (窗口结束位置选择)**

RPES[1:0]位指定指示刷新允许周期的窗口结束位置。可以为窗口结束位置选择75%、50%、25%或0%的超时时间。将窗口结束位置设置为小于窗口起始位置的值 (窗口起始位置 > 窗口结束位置)。如果窗口结束位置大于窗口起始位置，则仅启用窗口起始位置设置。

**RPSS[1:0]位 (窗口起始位置选择)**

RPSS[1:0]位指定指示允许刷新周期的窗口起始位置。可以为窗口起始位置选择100%、75%、50%或25%的超时时间。将窗口起始位置设置为大于窗口结束位置的值。如果窗口起始位置设置为小于或等于窗口结束位置的值，则窗口结束位置设置为0%。

表24.3列出了窗口开始和结束位置的计数器值，图24.2显示了在RPSS[1:0]、RPES[1:0]和TOPS[1:0]位中设置的允许刷新周期。

Table 24.3 Relationship between the timeout period and window start and end counter values

| TOPS[1:0] | Timeout period |               | Window start and end counter value |        |        |        |
|-----------|----------------|---------------|------------------------------------|--------|--------|--------|
|           | Cycles         | Counter value | 100%                               | 75%    | 50%    | 25%    |
| 00b       | 1024           | 0x03FF        | 0x03FF                             | 0x02FF | 0x01FF | 0x00FF |
| 01b       | 4096           | 0x0FFF        | 0x0FFF                             | 0x0BFF | 0x07FF | 0x03FF |
| 10b       | 8192           | 0x1FFF        | 0x1FFF                             | 0x17FF | 0x0FFF | 0x07FF |
| 11b       | 16384          | 0x3FFF        | 0x3FFF                             | 0x2FFF | 0x1FFF | 0x0FFF |

### 24.2.3 WDTSR:WDT状态寄存器

Base address: WDT = 0x4008\_3400

Offset address: 0x04

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field: REFE F UNDF F CNTVAL[13:0]

重置后的值: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit  | Symbol       | Function                              | R/W              |
|------|--------------|---------------------------------------|------------------|
| 13:0 | CNTVAL[13:0] | Down-Counter Value<br>递减计数器计数的值       | R                |
| 14   | UNDF         | Underflow Flag<br>0: 未发生下溢<br>1: 发生下溢 | R/W <sup>1</sup> |

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 15  | REFEF  | Refresh Error Flag<br>0: No refresh error occurred<br>1: Refresh error occurred | R/W <sup>1</sup> |

Note 1. Only 0 can be written to clear the flag.

The WDTSR register indicates the counter value of the down-counter and the status of whether an underflow or refresh error occurred in the down-counter.

#### CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

#### UNDF flag (Underflow Flag)

Read the UNDF flag to confirm whether an underflow occurred in the counter. A value of 1 indicates that the down counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

#### REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

#### 24.2.4 WDTRCR : WDT Reset Control Register

Base address: WDT = 0x4008\_3400

Offset address: 0x06

| Bit position:      | 7           | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|-------------|---|---|---|---|---|---|---|
| Bit field:         | RSTIR<br>QS | — | — | — | — | — | — | — |
| Value after reset: | 1           | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 6:0 | —      | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function                          | R/W              |
|-----|--------|-----------------------------------|------------------|
| 15  | REFEF  | 刷新错误标志<br>0: 未发生刷新错误<br>1: 发生刷新错误 | R/W <sup>1</sup> |

注1.只能写入0来清除标志。

WDTSR寄存器指示递减计数器的计数值以及递减计数器是否发生下溢或刷新错误的状态。

#### CNTVAL[13:0] bits (Down-Counter Value)

读取CNTVAL[13:0]位以确认递减计数器的值。读取的值可能与实际计数相差1。

#### UNDF flag (Underflow Flag)

读取UNDF标志以确认计数器是否发生下溢。值1表示递减计数器下溢。将0写入标志以将值设置为0。写入1无效。

清除UNDF标志需要(N+1)个PCLKB周期。此外，在下溢后的(N+1)个PCLKB周期内忽略标志的清除。N在WDTCR.CKS[3:0]位中指定如下：

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

#### REFEF标志 (刷新错误标志)

读取REFEF标志，确认是否发生刷新错误，表示在禁止期间进行了刷新操作。值1表示发生了刷新错误。将0写入标志以将值设置为0。写入1无效。

清除REFEF标志需要(N+1)个PCLKB周期。此外，在刷新错误后的(N+1)个PCLKB周期内，标志的清除将被忽略。N在WDTCR.CKS[3:0]位中指定如下：

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

#### 24.2.4 WDTRCR:WDT复位控制寄存器

Base address: WDT = 0x4008\_3400

Offset address: 0x06

| Bit position: | 7           | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|-------------|---|---|---|---|---|---|---|
| Bit field:    | RSTIR<br>QS | — | — | — | — | — | — | — |
| 重置后的值:        | 1           | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function         | R/W |
|-----|--------|------------------|-----|
| 6:0 | —      | 这些位被读取为0。写入值应为0。 | R/W |

| Bit | Symbol  | Function   | R/W |
|-----|---------|--|-----|
| 7   | RSTIRQS | Reset Interrupt Request Select<br>0: Enable non-maskable interrupt request or interrupt request output<br>1: Enable reset output | R/W |

The WDTRCR register controls reset output by a WDT down-counter underflow or interrupt request output.

Some constraints apply to writes to the WDTRCR register. For details, see [section 24.3.2. Controlling Writes to the WDTCSR, WDTRCR, and WDTCSNPR Registers](#).

In auto start mode, the WDTRCR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTRCR register can also be made for the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

### 24.2.5 WDTCSNPR : WDT Count Stop Control Register

Base address: WDT = 0x4008\_3400

Offset address: 0x08

| Bit position:      | 7          | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|------------|---|---|---|---|---|---|---|
| Bit field:         | SLCS<br>TP | — | — | — | — | — | — | — |
| Value after reset: | 1          | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 6:0 | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 7   | SLCSTP | WDT Count Stop Control Register<br>0: Disable count stop<br>1: Stop count on transition to Sleep mode | R/W |

The WDTCSNPR register controls whether to stop the WDT counter in a low power mode. Some constraints apply to writes to the WDTCSNPR register. For details, see [section 24.3.2. Controlling Writes to the WDTCSR, WDTRCR, and WDTCSNPR Registers](#).

In auto start mode, the WDTCSNPR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSNPR register can also be made for the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

#### SLCSTP bit (WDT Count Stop Control Register)

The SLCSTP bit selects whether to stop counting on transition to Sleep mode, Snooze, or Software Standby mode.

### 24.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

## 24.3 Operation

### 24.3.1 Count Operation in each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting starts with a refresh by writing to the register.

In auto start mode, counting automatically starts after a release from the reset state according to the settings in the Option Function Select register 0 (OFS0) in the flash.

In register start mode, counting starts with a refresh by writing to the WDTRR register after the respective registers are set after a release from the reset state.

| Bit | Symbol  | Function                                  | R/W |
|-----|---------|---|-----|
| 7   | RSTIRQS | 复位中断请求选择<br>0: 使能不可屏蔽中断请求或中断请求输出1: 使能复位输出 | R/W |

WDTRCR寄存器通过WDT递减计数器下溢或中断请求输出控制复位输出。

一些限制适用于写入WDTRCR寄存器。详见24.3.2节。控制写入WDTCSR、WDTRCR和WDTCSNPR寄存器。

在自动启动模式下，WDTRCR寄存器设置被禁用，而选项功能选择寄存器0(OFS0)中的设置被启用。WDTRCR寄存器的设置也可以对OFS0寄存器进行。详见24.3.8节。选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联。

### 24.2.5 WDTCSNPR:WDT计数停止控制寄存器

Base address: WDT = 0x4008\_3400

Offset address: 0x08

| Bit position: | 7          | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|------------|---|---|---|---|---|---|---|
| Bit field:    | SLCS<br>TP | — | — | — | — | — | — | — |
| 重置后的值:        | 1          | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function                                 | R/W |
|-----|--------|--|-----|
| 6:0 | —      | 这些位被读取为0。写入值应为0。                         | R/W |
| 7   | SLCSTP | WDT计数停止控制寄存器<br>0: 禁用计数停止1: 转换到睡眠模式时停止计数 | R/W |

WDTCSNPR寄存器控制是否在低功耗模式下停止WDT计数器。一些限制适用于写入WDTCSNPR寄存器。详见24.3.2节。控制对WDTCSR、WDTRCR和WDTCSNPR寄存器的写入。

在自动启动模式下，WDTCSNPR寄存器设置被禁用，而选项功能选择寄存器0(OFS0)中的设置被启用。也可以对OFS0寄存器进行WDTCSNPR寄存器的设置。详见24.3.8节。选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联。

#### SLCSTP位 (WDT计数停止控制寄存器)

SLCSTP位选择在转换到休眠模式、贪睡或软件待机模式时是否停止计数。

### 24.2.6 选项功能选择寄存器0(OFS0)

有关OFS0寄存器的信息，请参见第24.3.8节。选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联。

## 24.3 Operation

### 24.3.1 每种启动模式下的计数操作

WDT有两种启动模式:

- 自动启动模式，从复位状态释放后自动开始计数
- 寄存器启动模式，通过写入寄存器，从刷新开始计数。

在自动启动模式下，根据选项中的设置从复位状态释放后自动开始计数功能选择闪存中的寄存器0(OFS0)。

在寄存器启动模式下，在从复位状态释放后，在设置各个寄存器后，通过写入WDTRR寄存器，从刷新开始计数。

Select auto start mode or register start mode by setting the WDT Start Mode Select bit (OFS0.WDTSTRT) in the OFS0 register.

When the auto start mode is selected, the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are disabled while the settings in the OFS0 register are enabled.

When the register start mode is selected, the setting for the OFS0 register is disabled while the settings for the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are enabled.

### 24.3.1.1 Register start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) is 1, register start mode is selected and the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are enabled.

After the reset state is released, set the following to Sleep mode in the WDTCSSTPR register:

- Clock division ratio
- Window start and end positions
- Timeout period in the WDTCR register
- Reset output or interrupt request output in the WDTRCR register
- Counter stop control during transitions to Sleep mode in the WDTCSSTPR register

Refresh the down-counter to start counting down from the value set in the Timeout Period Selection bits (WDTCR.TOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal as long as counting continues. However, if the down-counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs the reset signal or a non-maskable interrupt request/interrupt request (WDT\_NMIUNDF). Reset output or interrupt request output can be selected in the WDT Reset Interrupt Request Select bit (WDTRCR.RSTIRQS). Non-maskable interrupt requests or interrupt requests can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 24.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.WDTSTRT = 1)
- Reset output is enabled (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)

通过设置OFS0寄存器中的WDT启动模式选择位(OFS0.WDTSTRT)来选择自动启动模式或寄存器启动模式。

选择自动启动模式后，WDT控制寄存器 (WDTCR) 中的设置，WDTRESET控制寄存器 (WDTRCR) 和WDT计数停止控制寄存器 (WDTCSSTPR) 在启用OFS0寄存器中的设置时被禁用。

选择寄存器启动模式时，在WDT控件的设置时禁用OFS0寄存器的设置使能寄存器(WDTCR)、WDT复位控制寄存器(WDTRCR)和WDT计数停止控制寄存器(WDTCSSTPR)。

### 24.3.1.1 注册启动模式

当WDT启动模式选择位(OFS0.WDTSTRT)为1时，选择寄存器启动模式并启用WDT控制寄存器(WDTCR)、WDT复位控制寄存器(WDTRCR)和WDT计数停止控制寄存器(WDTCSSTPR)。

释放复位状态后，在WDTCSSTPR寄存器中将以下内容设置为休眠模式：

- 时钟分频比
- 窗口开始和结束位置
- WDTCR寄存器中的超时时间
- WDTRCR寄存器中的复位输出或中断请求输出
- WDTCSSTPR寄存器中转换到休眠模式期间的计数器停止控制

刷新递减计数器以从超时周期选择位(WDTCR.TOPS[1:0])中设置的值开始递减计数。

此后，只要在可刷新期间刷新了计数器，则每次刷新计数器时都会重置计数器中的值，并继续递减计数。只要继续计数，WDT就不会输出复位信号。但是，如果由于程序失控导致递减计数器无法刷新而导致递减计数器下溢，或者由于计数器在刷新允许时间之外刷新而发生刷新错误，则WDT输出复位信号或非可屏蔽中断请求中断请求(WDT\_NMIUNDF)。可以在WDT复位中断请求选择位(WDTRCR.RSTIRQS)中选择复位输出或中断请求输出。可以在WDT下溢刷新错误中断允许位(NMIER.WDTEN)中选择不可屏蔽的中断请求或中断请求。

图24.3显示了以下条件下的操作示例：

- 寄存器启动模式 (OFS0.WDTSTRT=1)
- 启用复位输出(WDTRCR.RSTIRQS=1)
- 窗口起始位置为75%(WDTCR.RPSS[1:0]=10b)
- 窗口结束位置为25%(WDTCR.RPES[1:0]=10b)

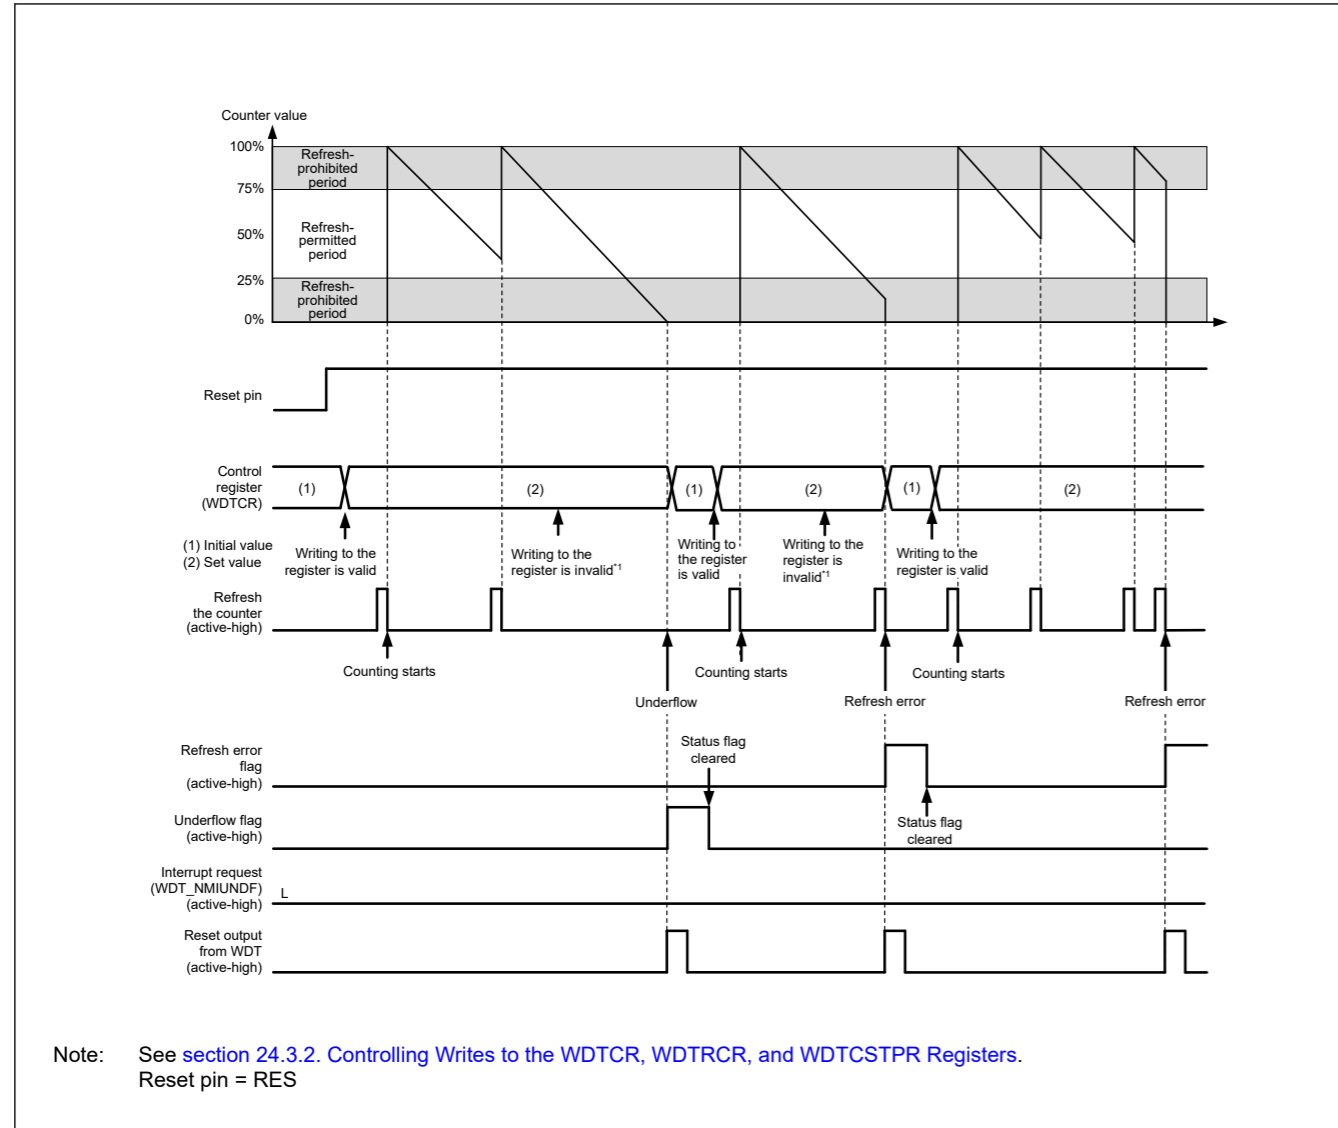

Figure 24.3 Operation example in register start mode

### 24.3.1.2 Auto start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) in the Option Function Select Register 0 (OFS0) is 0, auto start mode is selected, the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSPTPR) are disabled, and the settings in the OFS0 register are enabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the WDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control during transition to Sleep mode

When the reset state is released, the down-counter automatically starts counting down from the value set in the WDT Timeout Period Select bits (OFS0.WDTPOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal as long as the counting continues. However, if the down-counter underflows because refreshing of the down-counter is not possible due to a

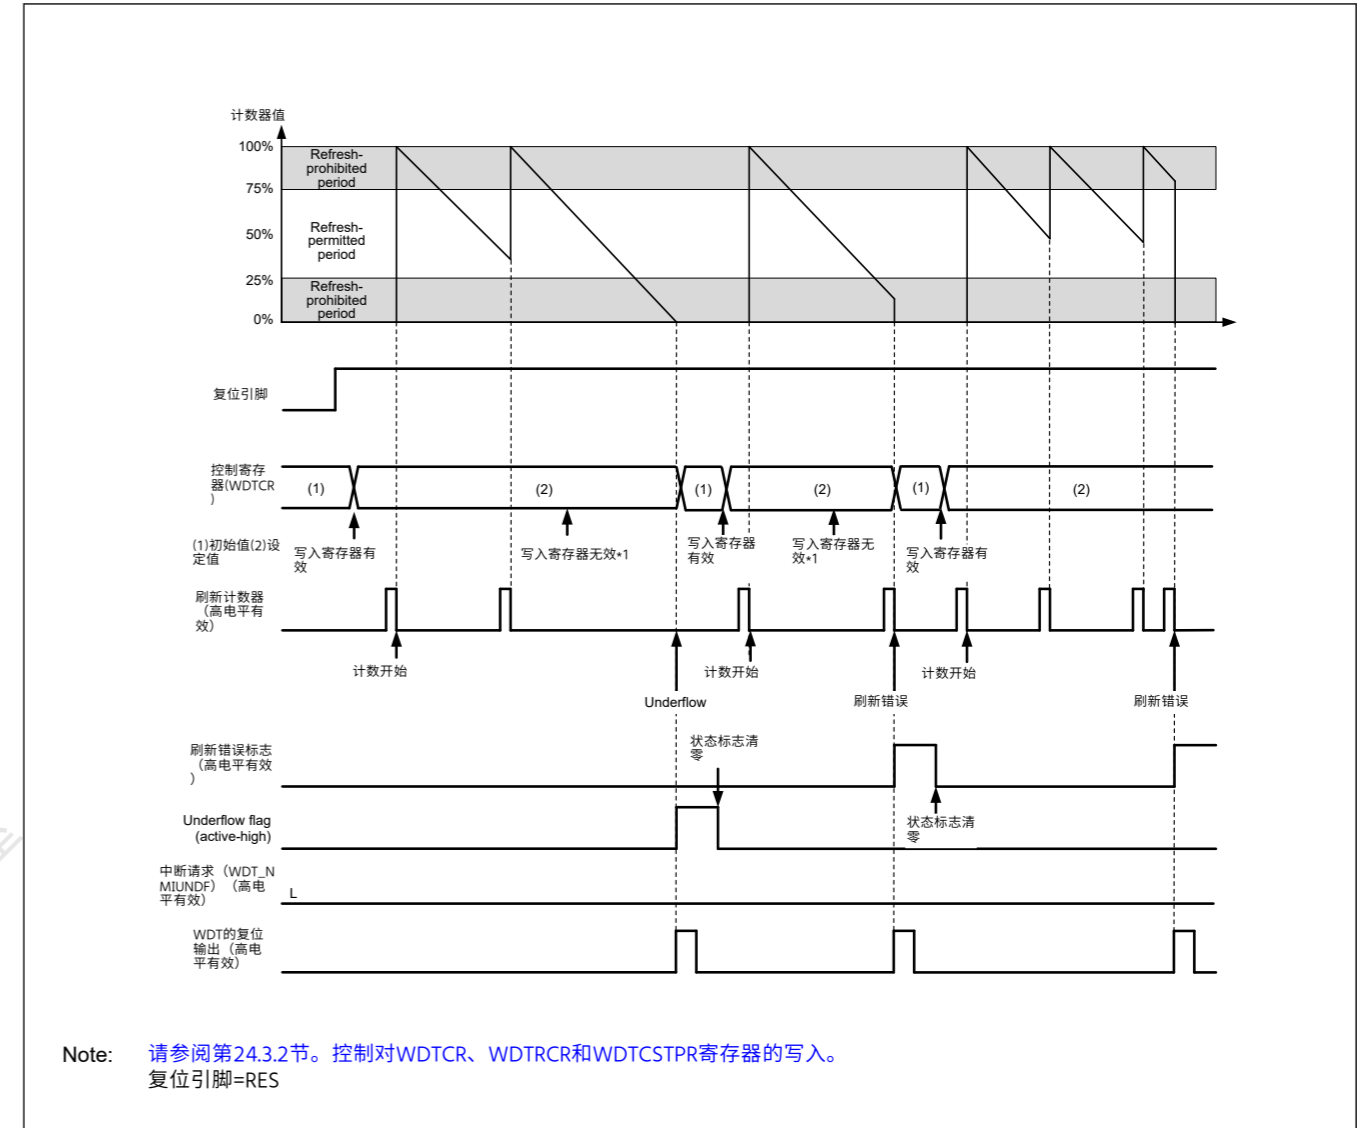

Figure 24.3 寄存器启动模式下的操作示例

### 24.3.1.2 自动启动模式

当WDT启动模式选择位置 (OFS0.WDTSTRT) 中的选项功能选择寄存器0 (OFS0) 为0时, 选择了自动启动模式, WDT控制寄存器 (WDTCR) (WDTCR), WDTRESETRESETCONTROMCONTROL寄存器 (WDTRCR) 和WDTCountCountCountCountCount停止控制寄存器(WDTCSPTPR)被禁用, 而OFS0寄存器中的设置被启用。

在复位状态下, 选项功能选择寄存器0(OFS0)中的以下设置值在WDT registers:

- 时钟分频比
- 窗口开始和结束位置
- 超时时间
- 复位输出或中断请求
- 转换到睡眠模式期间的计数器停止控制

当复位状态解除时, 递减计数器自动从WDT中设置的值开始递减计数超时周期选择位(OFS0.WDTPOPS[1:0])。

此后, 只要在可刷新期间刷新了计数器, 则每次刷新计数器时都会重置计数器中的值, 并继续递减计数。只要继续计数, WDT就不会输出复位信号。但是, 如果递减计数器下溢, 因为递减计数器的刷新是不可能的, 因为

runaway program or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the reset signal or non-maskable interrupt request/interrupt request (WDT\_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle. The value of the timeout period is set in the down-counter and counting restarts.

Reset output or interrupt request output can be selected by setting the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 24.4 shows an example of operation (non-maskable interrupt) under the following conditions:

- Auto start mode (OFS0.WDTSTRT = 0)
- Non-maskable interrupt request output is enabled (OFS0.WDTRSTIRQS = 0)
- The window start position is 75% (OFS0.WDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.WDTRPES[1:0] = 10b)

Figure 24.4 Operation example in auto start mode

### 24.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSSTPR Registers

Writing to the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), or WDT Count Stop Control Register (WDTCSSTPR) is possible once between the release from the reset state and the first refresh operation.

如果程序失控或由于刷新允许刷新周期之外的刷新而发生刷新错误，则WDT输出复位信号或不可屏蔽中断请求中断请求(WDT\_NMIUNDF)。

复位信号或不可屏蔽中断请求中断请求产生后，计数器在计数1个周期后重新加载超时周期。超时时间的值在递减计数器中设置并重新开始计数。

通过设置WDT复位中断请求选择位(OFS0.WDTRSTIRQS)可以选择复位输出或中断请求输出。可以在WDT下溢刷新错误中断允许位(NMIER.WDTEN)中选择不可屏蔽的中断请求或中断请求。

图24.4显示了以下条件下的操作示例（不可屏蔽中断）：

- 自动启动模式 (OFS0.WDTSTRT=0)
- 使能不可屏蔽中断请求输出 (OFS0.WDTRSTIRQS=0)
- 窗口起始位置为75%(OFS0.WDTRPSS[1:0]=10b)
- 窗口结束位置为25%(OFS0.WDTRPES[1:0]=10b)

Figure 24.4 自动启动模式下的操作示例

### 24.3.2 控制对WDTCR、WDTRCR和WDTCSSTPR寄存器的写入

写入WDT控制寄存器(WDTCR)、WDT复位控制寄存器(WDTRCR)或WDT计数停止控制在从复位状态释放到第一次刷新操作之间，寄存器(WDTCSSTPR)是可能的。

After a refresh (counting starts) or a write to WDTCR, WDTRCR or WDTCSSTPR register, the protection signal in the WDT becomes 1 to protect WDTCR, WDTRCR and WDTCSSTPR register against subsequent write attempts. This protection is released by the reset source of the WDT. With other reset sources, the protection is not released.

Figure 24.5 shows control waveforms produced in response to writing to the WDTCR.

Figure 24.5 Control waveforms produced in response to writes to the WDTCR register

### 24.3.3 Refresh Operation

The down-counter is refreshed and starts counting operation on a write of the values 0x00 and 0xFF to the WDT Refresh Register (WDTRR). If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, correct refreshing resumes on a write of 0x00 and 0xFF to the WDTRR register.

Correct refreshing is also performed when a register other than WDTRR is accessed or WDTRR is read between writing 0x00 and writing 0xFF to WDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the 0xFF write. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]

- 0x00 → 0xFF
- 0x00 ((n-1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from WDTRR → 0xFF

[Example write sequences that are invalid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF

After 0xFF is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 cycles of the signal for counting. To meet this requirement, complete writing 0xFF to WDTRR 4 count cycles before the down-counter underflows.

Figure 24.6 shows the WDT refresh-operation waveforms when the clock division ratio is PCLKB/64.

在刷新（计数开始）或写入WDTCR、WDTRCR或WDTCSSTPR寄存器后，WDT变为1以保护WDTCR、WDTRCR和WDTCSSTPR寄存器免受后续写入尝试。该保护由WDT的复位源解除。使用其他复位源时，不会解除保护。

图24.5显示了响应写入WDTCR产生的控制波形。

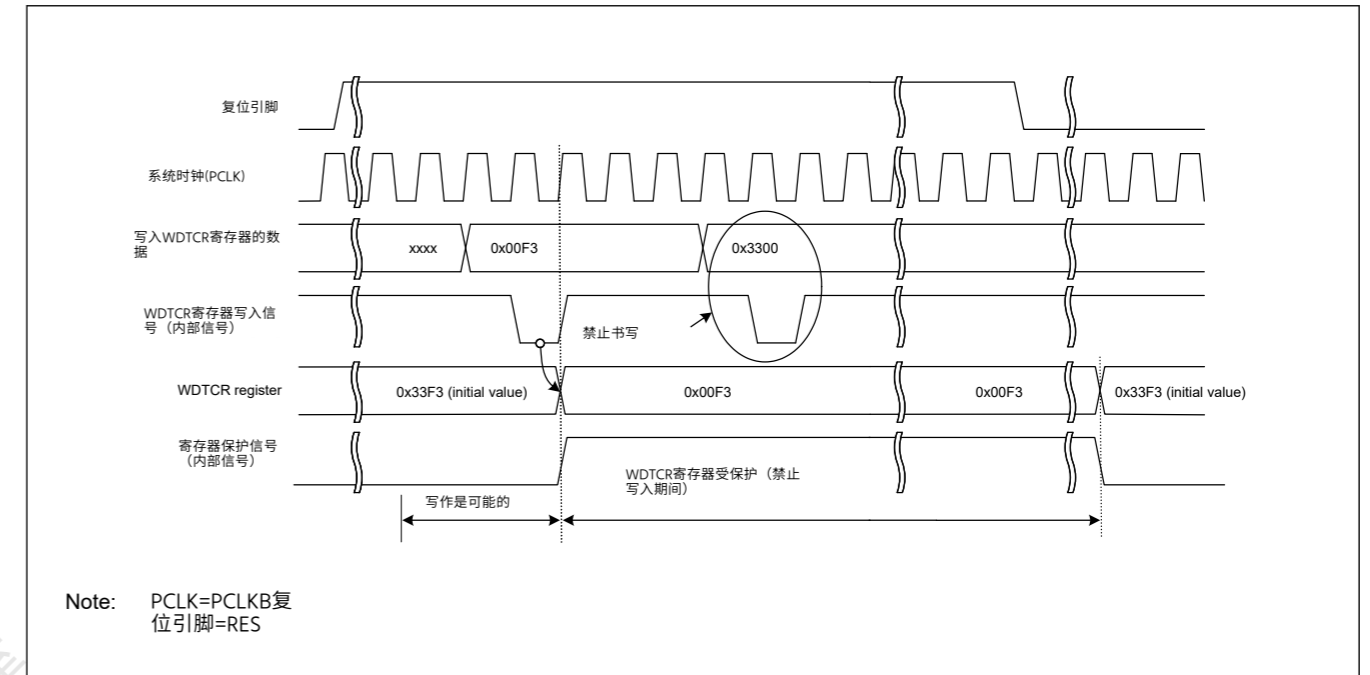

Figure 24.5 响应写入WDTCR寄存器而产生的控制波形

### 24.3.3 刷新操作

向下计数器刷新并在将值0x00和0xFF写入WDT刷新寄存器(WDTRR)时开始计数操作。如果在0x00之后写入0xFF以外的值，则不刷新递减计数器。如果写入无效值，则在向WDTRR寄存器写入0x00和0xFF时会恢复正确刷新。

在写入0x00和写入0xFF到WDTRR之间访问WDTRR以外的寄存器或读取WDTRR时，也会执行正确刷新。刷新计数器的写入必须在允许刷新的周期内进行，这由0xFF写入决定。因此，即使在可刷新期间外写入0x00，也会执行正确的刷新。

[对刷新计数器有效的示例写入序列]

- 0x00 → 0xFF
- 0x00 ((n-1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → 访问另一个寄存器或从WDTRR读取 → 0xFF

[对刷新计数器无效的示例写入序列]

- 0x23 (0x00以外的值) → 0xFF
- 0x00 → 0x54 (0xFF以外的值)
- 0x00 → 0xAA (0x00和0xFF以外的值) → 0xFF

将0xFF写入WDT刷新寄存器(WDTRR)后，刷新递减计数器最多需要4个信号周期进行计数。为满足此要求，请在递减计数器下溢之前的4个计数周期内将0xFF写入WDTRR。

图24.6显示了时钟分频比为PCLKB/64时的WDT刷新操作波形。

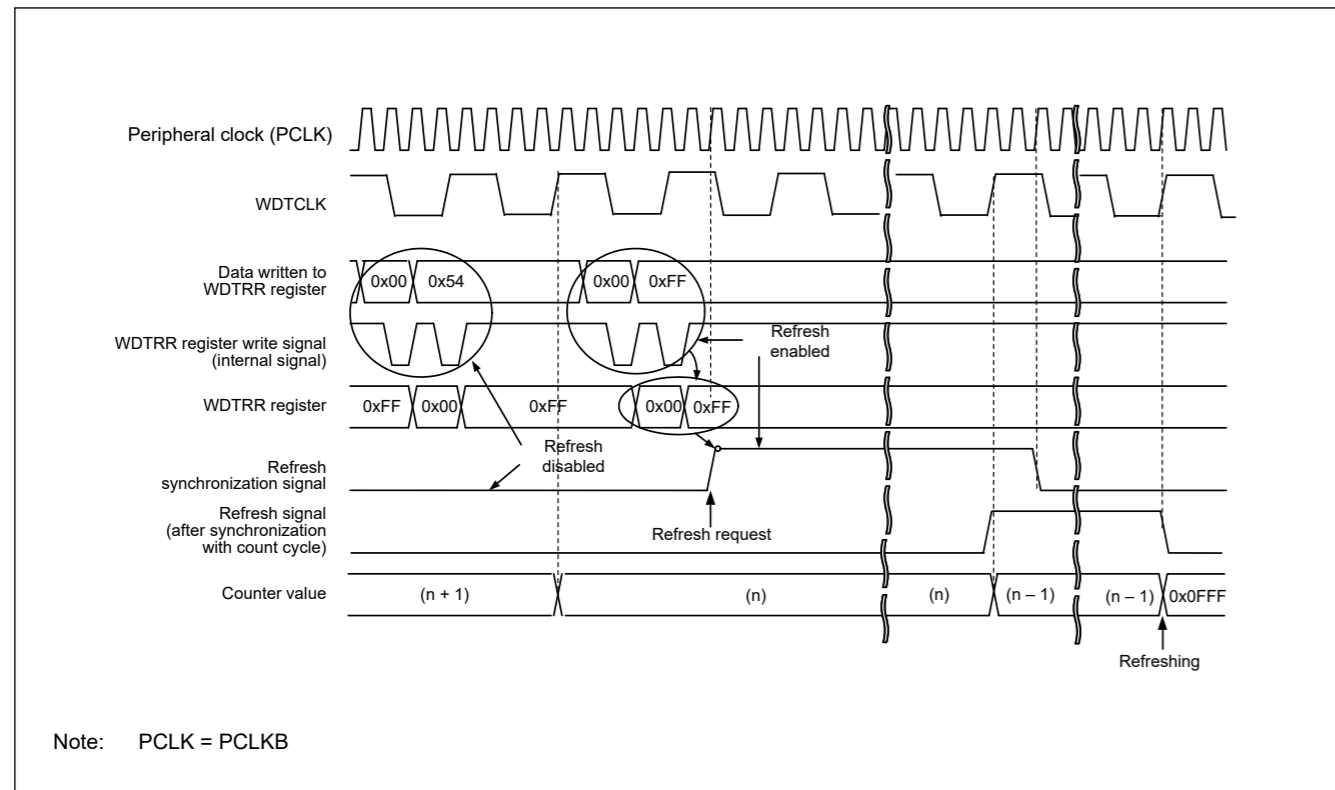

Figure 24.6 WDT refresh operation waveforms when WDTCSR.CKS[3:0] = 0x4 and WDTCSR.TOPS[1:0] = 01b

Note: When setting the refresh time, consider the oscillation accuracy of the clock sources of the PCLKB and WDTCLK. Set values which ensure that refreshing is possible even when the frequency varies in the range of error of the oscillation accuracy.

#### 24.3.4 Status Flags

The refresh error (WDTSR.REFEF) and underflow (WDTSR.UNDF) flags retain the source of the interrupt request from the WDT. After a release from the interrupt request generation, read the WDTSR.REFEF and WDTSR.UNDF flags to check for the interrupt source. For each flag, writing 0 clears the bit. Writing 1 has no effect. Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the next interrupt request from the WDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see [section 24.2.3. WDTSR : WDT Status Register](#).

#### 24.3.5 Reset Output

When the Reset Interrupt Select bit (WDTRCR.RSTIRQS) is set to 1 in register start mode, or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1 in auto start mode, a reset signal is output for 1 cycle count when an underflow in the down-counter or a refresh error occurs.

In register start mode, the down-counter is initialized (all bits set to 0) and stopped in that state after output of a reset signal. After the reset state is released and the program is restarted, the counter is set up again and counting down starts again with a refresh. In auto start mode, counting down starts automatically after the reset state is released.

#### 24.3.6 Interrupt Sources

When the Reset Interrupt Select bit (WDTRCR.RSTIRQS) is set to 0 in register start mode or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0 in auto start mode, an interrupt (WDT\_NMIUNDF) signal is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

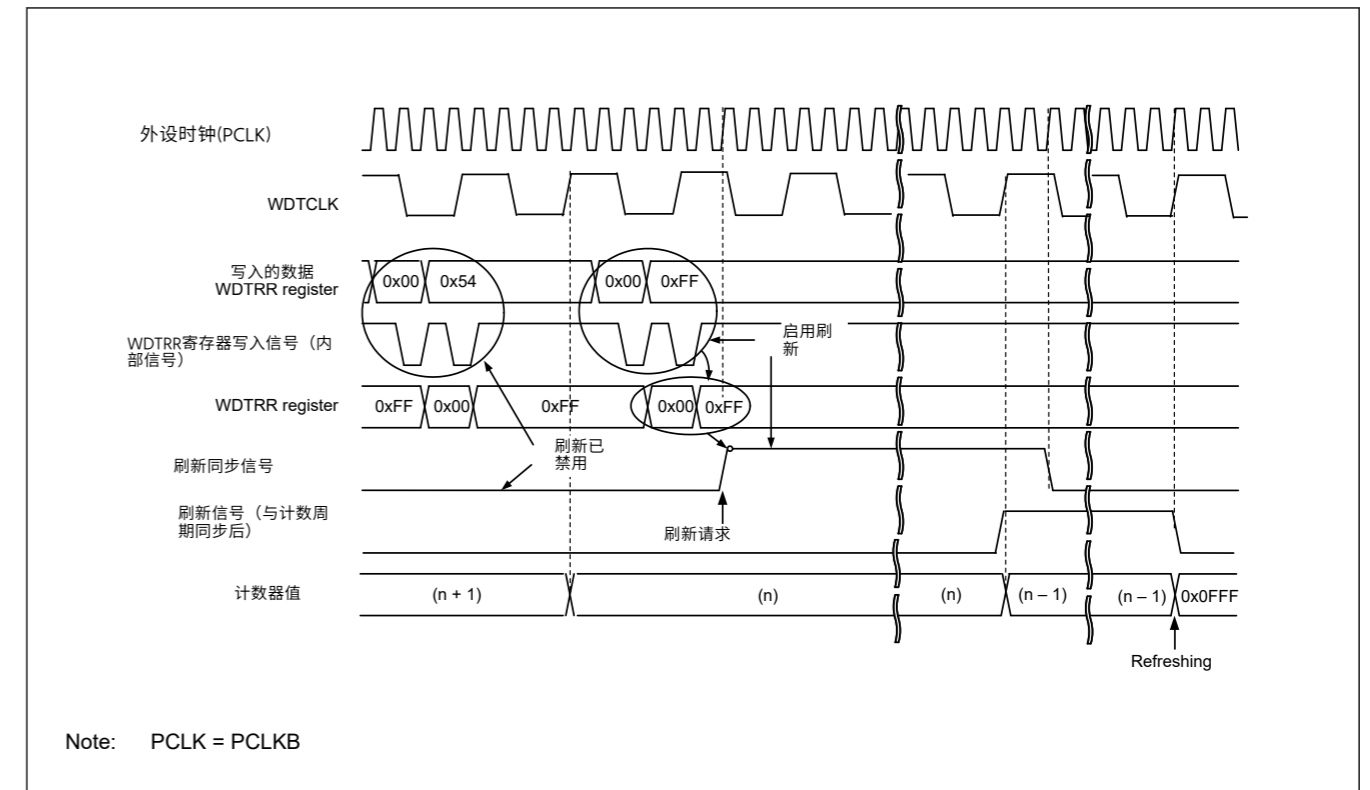

Figure 24.6 WDTCSR.CKS[3:0]=0x4和WDTCSR.TOPS[1:0]=01b时的WDT刷新操作波形

Note: 设置刷新时间时, 要考虑PCLKB和WDTCLK时钟源的振荡精度。设定即使频率在振荡精度的误差范围内变化也能进行刷新的值。

#### 24.3.4 状态标志

刷新错误(WDTSR.REFEF)和下溢(WDTSR.UNDF)标志保留来自WDT的 interrupt 请求源。释放 interrupt 请求生成后, 读取 WDTSR.REFEF和WDTSR.UNDF标志以检查中断源。对于每个标志, 写入0会清除该位。写1无效。保持状态标志不变不会影响操作。如果在WDT发出下一个中断请求时未清除标志, 则清除较早的中断源并写入新的中断源。关于从各标志写入0到反映其值的时间段, 请参阅第24.2.3节。WDTSR: WDT状态寄存器。

#### 24.3.5 复位输出

当复位中断选择位(WDTRCR.RSTIRQS)在寄存器启动模式下设置为1时, 或当WDT复位时在自动启动模式下, 选项功能选择寄存器0(OFS0)中的中断请求选择位(OFS0.WDTRSTIRQS)设置为1, 当递减计数器中的下溢或刷新错误发生时, 在1个周期计数内输出复位信号。

在寄存器启动模式下, 递减计数器被初始化(所有位设置为0)并在输出复位信号后停止在该状态。复位状态解除并重新启动程序后, 再次设置计数器, 并通过刷新再次开始倒计时。在自动启动模式下, 复位状态解除后自动开始倒计时。

#### 24.3.6 中断源

当在寄存器启动模式下复位中断选择位(WDTRCR.RSTIRQS)设置为0或WDT复位时在自动启动模式下, 选项功能选择寄存器0(OFS0)中的中断请求选择位(OFS0.WDTRSTIRQS)设置为0, 当计数器下溢或发生刷新错误时, 将产生中断(WDT\_NMIUNDF)信号。此中断可用作不可屏蔽中断或中断。有关详细信息, 请参阅第13节, 中断控制器单元(ICU)。

Table 24.4 WDT interrupt source

| Name        | Interrupt source  | Interrupt to CPU | Start DMAC or DTC |
|-------------|---|------------------|-------------------|
| WDT_NMIUNDF | <ul style="list-style-type: none"> <li>Down-counter underflow</li> <li>Refresh error</li> </ul> | Possible         | Not possible      |

### 24.3.7 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) of the WDT Status Register. Check these bits to obtain the counter value. The read value of the down-counter might differ from the actual count by one.

Figure 24.7 shows the processing for reading the WDT down-counter value when the clock division ratio is PCLKB/64.

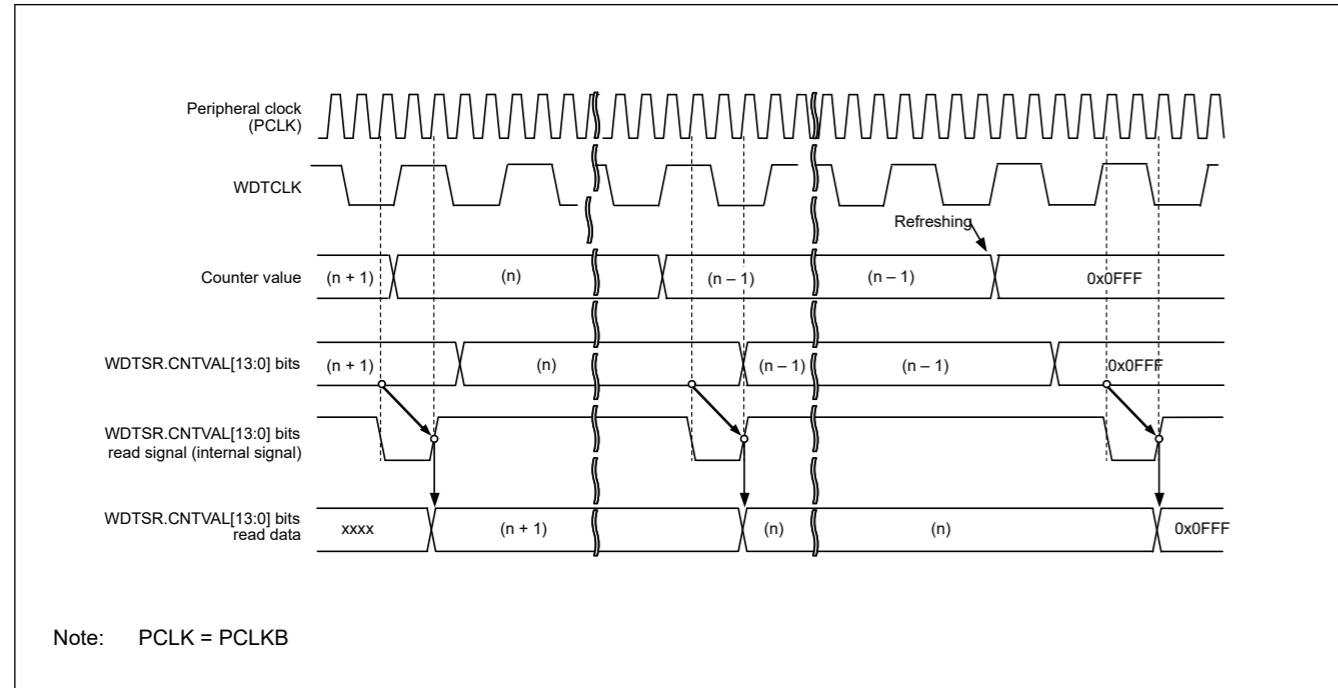

Figure 24.7 Processing for reading WDT down-counter value when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b

### 24.3.8 Association between Option Function Select Register 0 (OFS0) and WDT Registers

Table 24.5 lists the association between the Option Function Select Register 0 (OFS0) used in auto start mode, and the registers used in register start mode. For details on the Option Function Select Register 0 (OFS0), see section 6.2.1. [OFS0: Option Function Select Register 0](#).

Table 24.5 Association between Option Function Select Register 0 (OFS0) and the WDT registers

| Control target                           | Function   | OFS0 register (enabled in auto start mode) OFS0.WDTSTRT = 0 | WDT registers (enabled in register start mode) OFS0.WDTSTRT = 1 |
|--|--|---|---|
| Down-counter                             | Timeout period selection                           | OFS0.WDTTOPS[1:0]   | WDTCR.TOPS[1:0]   |
|  | Clock division ratio selection                     | OFS0.WDTCKS[3:0]  | WDTCR.CKS[3:0]  |
|  | Window start position selection                    | OFS0.WDTRPSS[1:0]   | WDTCR.RPSS[1:0]   |
|  | Window end position selection                      | OFS0.WDTRPES[1:0]   | WDTCR.RPES[1:0]   |
| Reset output or interrupt request output | Reset output or interrupt request output selection | OFS0.WDTRSTIRQS   | WDTCCR.RSTIRQS  |
| Count stop                               | Sleep or Snooze mode count stop control            | OFS0.WDTSTPCTL  | WDTGSTPR.SLCSTP   |

Table 24.4 WDT中断源

| Name        | 中断源  | 对CPU的中断  | 启动DMAC或DTC |
|-------------|--|----------|------------|
| WDT_NMIUNDF | <ul style="list-style-type: none"> <li>Down-counter underflow</li> <li>刷新错误</li> </ul> | Possible | 不可能        |

### 24.3.7 读取递减计数器值

WDT将计数器值存储在WDT状态寄存器的递减计数器值位(WDTSR.CNTVAL[13:0])中。检查这些位以获得计数器值。递减计数器的读取值可能与实际计数相差1。

图24.7显示了在时钟分频比为PCLKB/64时读取WDT递减计数器值的处理。

Figure 24.7 当WDTCR.CKS[3:0]=0x4和WDTCR.TOPS[1:0] = 01b

### 24.3.8 选项功能选择寄存器0(OFS0)和WDT之间的关联 Registers

表24.5列出了用于自动启动模式的选项功能选择寄存器0(OFS0)和用于寄存器启动模式的寄存器之间的关联。有关选项功能选择寄存器0(OFS0)的详细信息，请参见第6.2.1节。OFS0: 选项功能选择寄存器0。

Table 24.5 选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联

| 控制目标         | Function      | OFS0寄存器 (在自动启动模式下启用) OFS0.WDTSTRT=0 | WDT寄存器 (在寄存器启动模式下启用) OFS0.WDTSTRT=1 |
|--------------|---------------|-------------------------------------|-------------------------------------|
| Down-counter | 超时时间选择        | OFS0.WDTTOPS[1:0]                   | WDTCR.TOPS[1:0]                     |
|              | 时钟分频比选择       | OFS0.WDTCKS[3:0]                    | WDTCR.CKS[3:0]                      |
|              | 窗口起始位置选择      | OFS0.WDTRPSS[1:0]                   | WDTCR.RPSS[1:0]                     |
|              | 窗口结束位置选择      | OFS0.WDTRPES[1:0]                   | WDTCR.RPES[1:0]                     |
| 复位输出或中断请求输出  | 复位输出或中断请求输出选择 | OFS0.WDTRSTIRQS                     | WDTCCR.RSTIRQS                      |
| 计数停止         | 睡眠或贪睡模式计数停止控制 | OFS0.WDTSTPCTL                      | WDTGSTPR.SLCSTP                     |

## 24.4 Output to the Event Link Controller (ELC)

The WDT is capable of a link operation for the previously specified module when interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow and refresh error. An event signal is output regardless of the setting of the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) in register start mode or auto start mode. An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (WDTSR.REFEF) or Underflow flag (WDTSR.UNDF) is 1. For details, see [section 18, Event Link Controller \(ELC\)](#).

## 24.5 Usage Notes

### 24.5.1 ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x53 to ICU Event Link Setting Register n (ICU.IELSRn) is prohibited when enabling the WDT reset assertion (OFS0.WDTRSTIRQS = 0 or WDTRCR.RSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x53).

## 24.4 输出到事件链接控制器(ELC)

当ELC将中断请求信号用作事件信号时，WDT能够对先前指定的模块进行链接操作。事件信号由计数器下溢和刷新错误输出。在寄存器启动模式或自动启动模式下，无论复位中断请求选择位(WDTRCR.RSTIRQS)的设置如何，都会输出事件信号。当刷新错误标志(WDTSR.REFEF)或下溢标志(WDTSR.UNDF)为1时，也可以在产生下一个中断源时输出事件信号。有关详细信息，请参阅第18节，事件链接控制器(ELC)。

## 24.5 使用说明

### 24.5.1 ICU事件链接设置寄存器n(IELSRn)设置

当启用WDT复位断言(OFS0.WDTRSTIRQS=0或WDTRCR.RSTIRQS=0)或启用事件链接操作(ELSRn.ELS[8:0])时，禁止将0x53设置为ICU事件链接设置寄存器n(ICU.IELSRn)=0x53)。

## 25. Independent Watchdog Timer (IWDT)

### 25.1 Overview

The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.

The IWDT functions differ from those of the WDT in the following respects:

- The divided IWDT-dedicated clock (IWDTCLK) is used as the count source (not affected by PCLKB)
- IWDT does not support register start mode

Table 25.1 lists the IWDT specifications and Figure 25.1 shows a block diagram.

**Table 25.1 IWDT specifications**

| Parameter                                | Description   |
|--|---|
| Count source*1                           | IWDT-dedicated clock (IWDTCLK)  |
| Clock division ratio                     | Division by 1, 16, 32, 64, 128, or 256  |
| Counter operation                        | Counting down using a 14-bit down-counter   |
| Condition for starting the counter       | <ul style="list-style-type: none"> <li>● Counting automatically starts after a reset</li> <li>● Only secure developer can start the IWDT</li> </ul>   |
| Conditions for stopping the counter      | <ul style="list-style-type: none"> <li>● Reset (the down-counter and other registers return to their initial values)</li> <li>● A counter underflows or a refresh error is generated (counting restarts automatically).</li> </ul>  |
| Window function                          | Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)  |
| Reset output sources                     | <ul style="list-style-type: none"> <li>● Down-counter underflows</li> <li>● Refreshing outside the refresh-permitted period (refresh error).</li> </ul>   |
| Non-maskable interrupt/interrupt sources | <ul style="list-style-type: none"> <li>● Down-counter underflows</li> <li>● Refreshing outside the refresh-permitted period (refresh error).</li> </ul>   |
| Reading the counter value                | The down-counter value can be read by the IWDTSR register   |
| Event link function                      | <ul style="list-style-type: none"> <li>● Down-counter underflow event output</li> <li>● Refresh error event output.</li> </ul>  |
| Output signal (internal signal)          | <ul style="list-style-type: none"> <li>● Reset output</li> <li>● Interrupt request output</li> <li>● Sleep-mode count stop control output.</li> </ul>   |
| Auto start mode                          | Configurable to the following triggers: <ul style="list-style-type: none"> <li>● Clock frequency division ratio after a reset (OFS0.IWDTCKS[3:0] bits)</li> <li>● Timeout period of the Independent Watchdog Timer (OFS0.IWDTTOPS[1:0] bits)</li> <li>● Window start position in the Independent Watchdog Timer (OFS0.IWDRPSS[1:0] bits)</li> <li>● Window end position in the Independent Watchdog Timer (OFS0.IWDRPES[1:0] bits)</li> <li>● Reset output or interrupt request output (OFS0.IWDRSTIRQS bit)</li> <li>● Down-count stop function at transition to Sleep mode, Software Standby mode, or Snooze mode (OFS0.IWDTSTPCTL bit).</li> </ul> |
| TrustZone Filter                         | Security attribution can be set   |

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB)  $\geq 4 \times$  (the frequency of the count clock source after division).

The bus interface and registers operate with PCLKB, and the 14-bit counter and control circuits operate with IWDTCLK.

## 25. 独立看门狗定时器(IWDT)

### 25.1 Overview

独立看门狗定时器(IWDT)包含一个14位递减计数器, 必须定期对其进行服务以防止计数器下溢。IWDT提供复位MCU或生成不可屏蔽中断或下溢中断的功能。由于定时器使用独立的专用时钟源运行, 因此当系统失控时, 它在将MCU作为故障安全机制返回到已知状态时特别有用。IWDT可以通过复位、下溢、刷新错误或寄存器中的计数值的刷新来自动触发。

IWDT的功能与WDT的功能有以下不同:

- 分频IWDT专用时钟 (IWDTCLK) 用作计数源 (不受PCLKB影响)
- IWDT不支持寄存器启动方式

表25.1列出了IWDT规范, 图25.1显示了框图。

**Table 25.1 IWDT specifications**

| Parameter                                | Description  |
|--|--|
| 计数来源*1                                   | IWDT-dedicated clock (IWDTCLK)   |
| 时钟分频比                                    | 除以1、16、32、64、128或256   |
| 计数器操作                                    | 使用14位递减计数器进行递减计数   |
| 启动计数器的条件                                 | <ul style="list-style-type: none"> <li>● 复位后自动开始计数</li> <li>● 只有安全的开发人员才能启动IWDT</li> </ul>   |
| 停止计数器的条件                                 | <ul style="list-style-type: none"> <li>● 复位 (递减计数器和其他寄存器恢复初始值)</li> <li>● 计数器下溢或产生刷新错误 (计数自动重新开始)。</li> </ul>  |
| 窗口功能                                     | 可以指定窗口开始和结束位置 (允许刷新和禁止刷新期间)  |
| 重置输出源                                    | <ul style="list-style-type: none"> <li>● Down-counter underflows</li> <li>● 在允许刷新的期限之外刷新 (刷新错误)。</li> </ul>  |
| Non-maskable interrupt/interrupt sources | <ul style="list-style-type: none"> <li>● Down-counter underflows</li> <li>● 在允许刷新的期限之外刷新 (刷新错误)。</li> </ul>  |
| 读取计数器值                                   | 递减计数器的值可以通过IWDTSR寄存器读取   |
| 事件链接功能                                   | <ul style="list-style-type: none"> <li>● 递减计数器下溢事件输出</li> <li>● 刷新错误事件输出。</li> </ul>   |
| 输出信号 (内部信号)                              | <ul style="list-style-type: none"> <li>● 复位输出</li> <li>● 中断请求输出</li> <li>● 休眠模式计数停止控制输出。</li> </ul>  |
| 自动启动模式                                   | 可配置为以下触发器: ● <ul style="list-style-type: none"> <li>● 复位后的时钟分频比 (OFS0.IWDTCKS[3:0]位)</li> <li>● 独立看门狗定时器的超时周期 (OFS0.IWDTTOPS[1:0]位)</li> <li>● 独立看门狗定时器中的窗口起始位置 (OFS0.IWDRPSS[1:0]位)</li> <li>● 独立看门狗定时器中的窗口结束位置 (OFS0.IWDRPES[1:0]位)</li> <li>● 复位输出或中断请求输出 (OFS0.IWDRSTIRQS位)</li> <li>● 转换到休眠模式、软件待机模式或贪睡模式时的减计数停止功能 (OFS0.IWDTSTPCTL位)。</li> </ul> |
| TrustZone Filter                         | 可设置安全属性  |

注1.满足外设模块时钟 (PCLKB) 的频率 $\geq 4 \times$  (分频后的计数时钟源的频率)。

总线接口和寄存器使用PCLKB运行, 14位计数器和控制电路使用IWDTCLK运行。

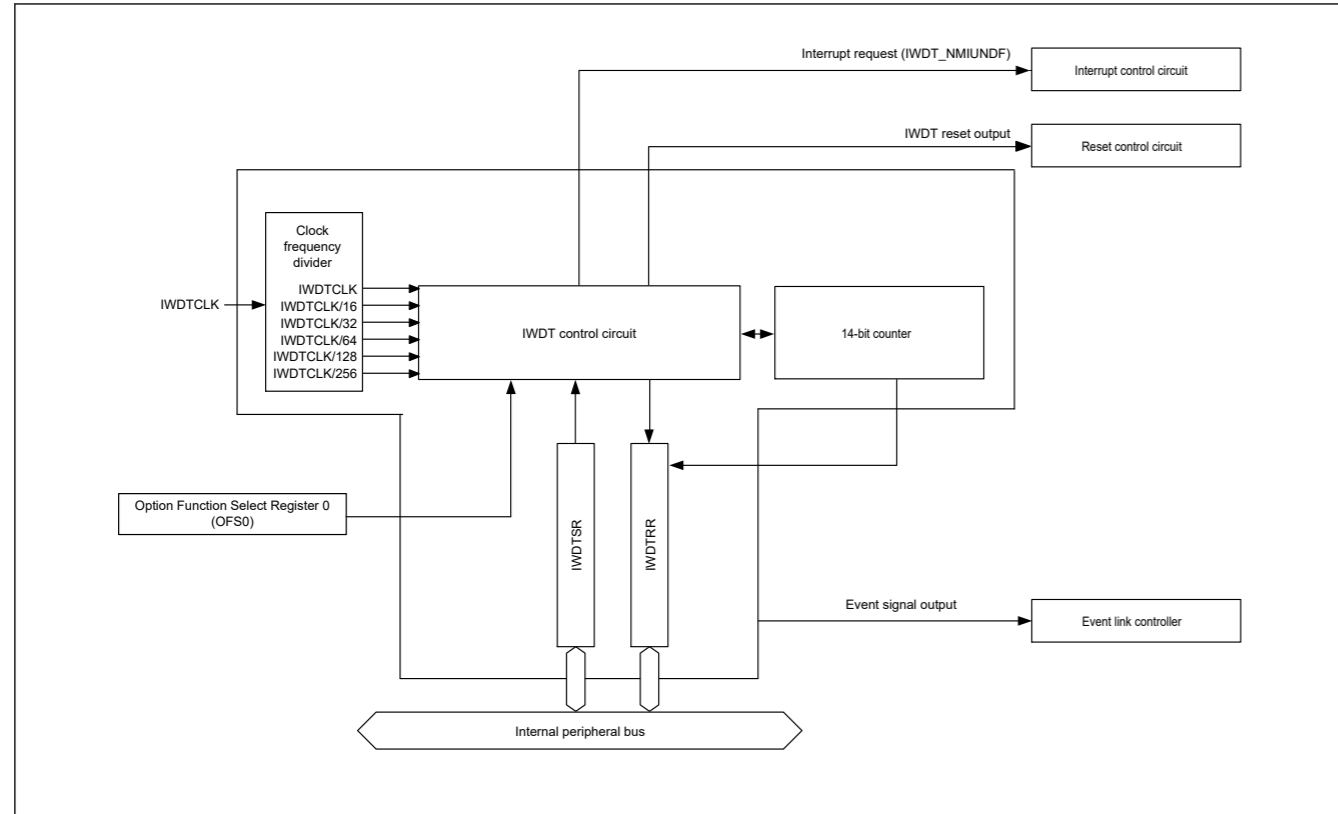

Figure 25.1 IWDT block diagram

## 25.2 Register Descriptions

### 25.2.1 IWDTRR : IWDT Refresh Register

Base address: IWDT = 0x4008\_3200

Offset address: 0x00

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 7:0 | n/a    | The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register | R/W |

The IWDTRR register refreshes the down-counter of the IWDT. The down-counter of the IWDT is refreshed by writing 0x00 and then writing 0xFF to IWDTRR (refresh operation) within the refresh-permitted period. After the down-counter is refreshed, it starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]) in the Option Function Select Register 0 (OFS0).

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see [section 25.3.2. Refresh Operation](#).

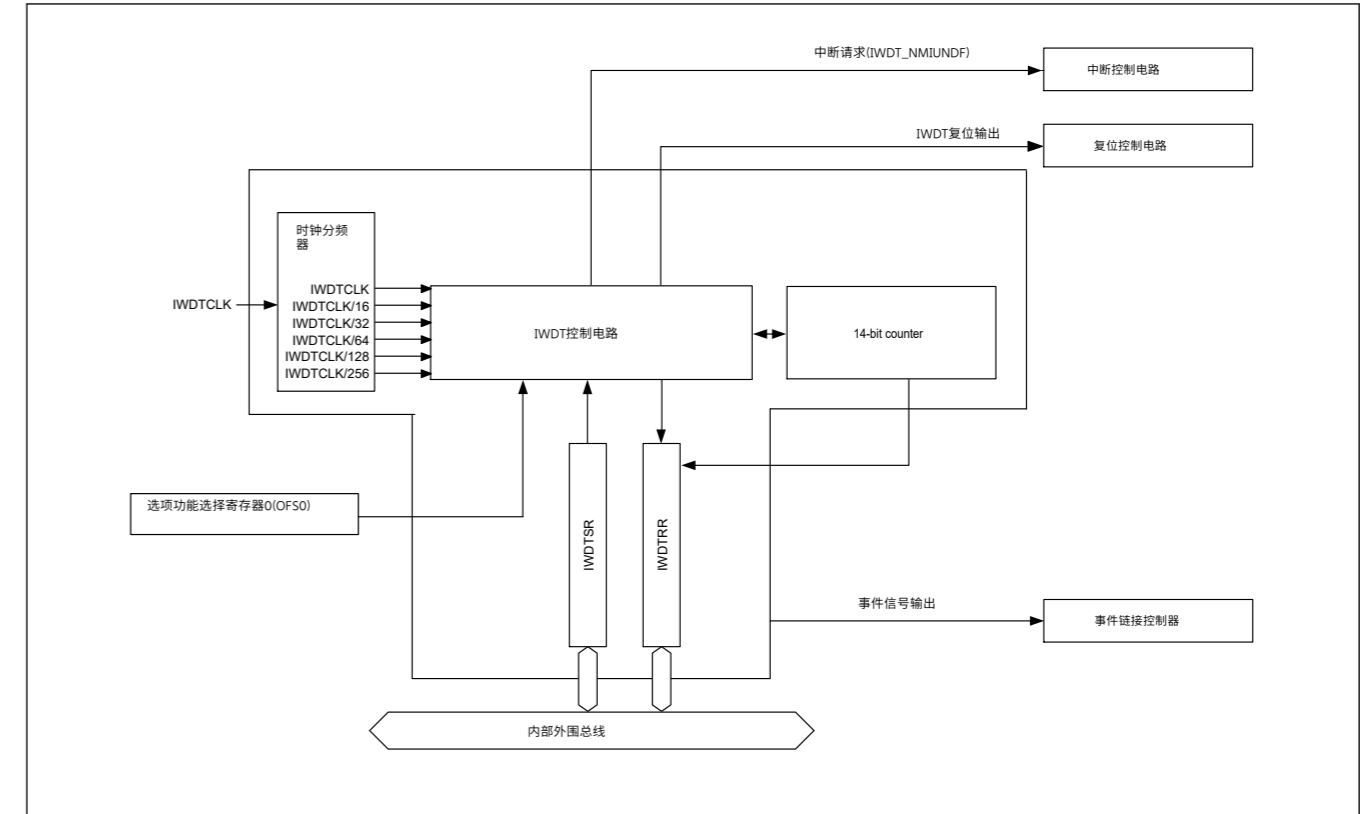

Figure 25.1 IWDT框图

## 25.2 注册说明

### 25.2.1 IWDTRR: IWDT刷新寄存器

Base address: IWDT = 0x4008\_3200

Offset address: 0x00

| Bit | Symbol | Function                      | R/W |
|-----|--------|-------------------------------|-----|
| 7:0 | n/a    | 通过写入0x00然后将0xFF写入该寄存器来刷新递减计数器 | R/W |

IWDTRR寄存器刷新IWDT的递减计数器。IWDT的递减计数器通过在允许刷新的周期内写入0x00然后将0xFF写入IWDTRR (刷新操作) 来刷新。递减计数器刷新后, 它从选项功能选择寄存器0(OFS0)的IWDT超时周期选择位(OFS0.IWDTTOPS[1:0])中选择的值开始递减计数。

写入0x00时, 读取值为0x00。写入0x00以外的值时, 读取的值为0xFF。有关刷新操作的详细信息, 请参阅第25.3.2节。刷新操作。

## 25.2.2 IWDTSR : IWDT Status Register

Base address: IWDT = 0x4008\_3200

Offset address: 0x04

| Bit  | Symbol       | Function  | R/W              |
|------|--------------|---|------------------|
| 13:0 | CNTVAL[13:0] | Down-counter Value<br>Value counted by the down-counter                         | R                |
| 14   | UNDF         | Underflow Flag<br>0: No underflow occurred<br>1: Underflow occurred             | R/W <sup>1</sup> |
| 15   | REFEF        | Refresh Error Flag<br>0: No refresh error occurred<br>1: Refresh error occurred | R/W <sup>1</sup> |

Note 1. Only 0 can be written to clear the flag.

The IWDTSR register indicates the counter value of the down-counter and whether an underflow or refresh error occurred in the down-counter.

**CNTVAL[13:0] bits (Down-counter Value)**

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

**UNDF flag (Underflow Flag)**

Read the UNDF flag to confirm whether an underflow occurred in the down-counter. The value 1 indicates that the down-counter underflowed. Write 0 to the UNDF flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDF flag takes (N + 2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of this flag is ignored for (N + 2) IWDTCLK cycles after an underflow. N is specified in the IWDTCKS[3:0] bits as follows:

- When OFS0.IWDTCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCKS[3:0] = 0xF, N = 128
- When OFS0.IWDTCKS[3:0] = 0x5, N = 256.

**REFEF flag (Refresh Error Flag)**

Read the REFEF flag to confirm whether a refresh error occurred. This indicates that a refresh operation was performed during a prohibited period. The value 1 indicates that a refresh error occurred. Write 0 to the REFEF flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N + 2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of this flag is ignored for (N + 2) IWDTCLK cycles following a refresh error. N is specified in the IWDTCKS[3:0] bits as follows:

- When OFS0.IWDTCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCKS[3:0] = 0xF, N = 128

## 25.2.2 IWDTSR:IWDT状态寄存器

Base address: IWDT = 0x4008\_3200

Offset address: 0x04

| Bit  | Symbol       | Function                              | R/W              |
|------|--------------|---------------------------------------|------------------|
| 13:0 | CNTVAL[13:0] | Down-counter Value<br>递减计数器计数的值       | R                |
| 14   | UNDF         | Underflow Flag<br>0: 未发生下溢<br>1: 发生下溢 | R/W <sup>1</sup> |
| 15   | REFEF        | 刷新错误标志<br>0: 未发生刷新错误<br>1: 发生刷新错误     | R/W <sup>1</sup> |

注1.只能写入0来清除标志。

IWDTSR寄存器指示递减计数器的计数值以及递减计数器是否发生下溢或刷新错误。

**CNTVAL[13:0] bits (Down-counter Value)**

读取CNTVAL[13:0]位以确认递减计数器的值。读取的值可能与实际计数相差1。

**UNDF flag (Underflow Flag)**

读取UNDF标志以确认递减计数器中是否发生下溢。值1表示递减计数器下溢。将0写入UNDF标志以将值设置为0。写入1无效。

清除UNDF标志需要(N+2)个IWDTCLK周期和2个PCLKB周期。此外，在下溢后的(N+2)个IWDTCLK周期内，该标志的清除将被忽略。N在IWDTCKS[3:0]位中指定如下：

- When OFS0.IWDTCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCKS[3:0] = 0xF, N = 128
- When OFS0.IWDTCKS[3:0] = 0x5, N = 256.

**REFEF标志 (刷新错误标志)**

读取REFEF标志以确认是否发生刷新错误。这表示在禁止期间执行了刷新操作。值1表示发生了刷新错误。将0写入REFEF标志以将值设置为0。写入1无效。

清除REFEF标志需要(N+2)个IWDTCLK周期和2个PCLKB周期。此外，在刷新错误后的(N+2)个IWDTCLK周期内，该标志的清除将被忽略。N在IWDTCKS[3:0]位中指定如下：

- When OFS0.IWDTCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCKS[3:0] = 0xF, N = 128

- When  $OFS0.IWDTCKS[3:0] = 0x5$ ,  $N = 256$ .

### 25.2.3 OFS0 : Option Function Select Register 0

For information on the Option Function Select Register 0 (OFS0), see [section 6.2.1. OFS0 : Option Function Select Register 0](#).

#### IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits select the timeout period, that is, the period until the down-counter underflows, from 128, 512, 1024, or 2048 cycles, taking the divided clock specified in the IWDTCKS[3:0] bits as 1 cycle.

After the down-counter is refreshed, the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits determines the number of IWDTCLK cycles until the counter underflows.

[Table 25.2](#) lists the relationship between the IWDTCKS[3:0] and IWDTTOPS[1:0] bit settings, the timeout period, and the number of IWDTCLK cycles.

**Table 25.2 Timeout period settings**

| IWDTCKS[3:0] bits |    |    |    | IWDTTOPS[1:0] bits |    | Clock division ratio | Timeout period (number of cycles) | IWDTCLK cycles |
|-------------------|----|----|----|--------------------|----|----------------------|-----------------------------------|----------------|
| b7                | b6 | b5 | b4 | b1                 | b0 |                      |                                   |                |
| 0                 | 0  | 0  | 0  | 0                  | 0  | IWDTCLK              | 128                               | 128            |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 512            |
|                   |    |    |    | 1                  | 0  |                      | 1024                              | 1024           |
|                   |    |    |    | 1                  | 1  |                      | 2048                              | 2048           |
| 0                 | 0  | 1  | 0  | 0                  | 0  | IWDTCLK/16           | 128                               | 2048           |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 8192           |
|                   |    |    |    | 1                  | 0  |                      | 1024                              | 16384          |
|                   |    |    |    | 1                  | 1  |                      | 2048                              | 32768          |
| 0                 | 0  | 1  | 1  | 0                  | 0  | IWDTCLK/32           | 128                               | 4096           |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 16384          |
|                   |    |    |    | 1                  | 0  |                      | 1024                              | 32768          |
|                   |    |    |    | 1                  | 1  |                      | 2048                              | 65536          |
| 0                 | 1  | 0  | 0  | 0                  | 0  | IWDTCLK/64           | 128                               | 8192           |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 32768          |
|                   |    |    |    | 1                  | 0  |                      | 1024                              | 65536          |
|                   |    |    |    | 1                  | 1  |                      | 2048                              | 131072         |
| 1                 | 1  | 1  | 1  | 0                  | 0  | IWDTCLK/128          | 128                               | 16384          |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 65536          |
|                   |    |    |    | 1                  | 0  |                      | 1024                              | 131072         |
|                   |    |    |    | 1                  | 1  |                      | 2048                              | 262144         |
| 0                 | 1  | 0  | 1  | 0                  | 0  | IWDTCLK/256          | 128                               | 32768          |
|                   |    |    |    | 0                  | 1  |                      | 512                               | 131072         |
|                   |    |    |    | 1                  | 0  |                      | 1024                              | 262144         |
|                   |    |    |    | 1                  | 1  |                      | 2048                              | 524288         |

#### IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the IWDT-dedicated clock (IWDTCLK) divided by 1, 16, 32, 64, 128, and 256. Combined with the IWDTTOPS[1:0] bit setting, the IWDT can be configured to a count period between 128 and 524,288 IWDTCLK cycles.

- When  $OFS0.IWDTCKS[3:0] = 0x5$ ,  $N = 256$ .

### 25.2.3 OFS0: 选项功能选择寄存器0

有关选项功能选择寄存器0(OFS0)的信息, 请参见第6.2.1节。OFS0: 选项功能选择寄存器0。

#### IWDTTOPS[1:0]位 (IWDT超时周期选择)

IWDTTOPS[1:0]位选择超时周期, 即从128、512、1024或2048个周期到递减计数器下溢的周期, 采用IWDTCKS[3:0]位中指定的分频时钟作为1个周期。

向下计数器刷新后, IWDTCKS[3:0]和IWDTTOPS[1:0]位的组合决定了在计数器下溢之前的IWDTCLK周期数。

表25.2列出了IWDTCKS[3:0]和IWDTTOPS[1:0]位设置、超时周期和IWDTCLK周期数之间的关系。

**Table 25.2 超时时间设置**

| IWDTCKS[3:0] bits |    |    |    | IWDTTOPS[1:0] bits |    | 时钟分频比       | 超时时间 (周期数) | IWDTCLK cycles |
|-------------------|----|----|----|--------------------|----|-------------|------------|----------------|
| b7                | b6 | b5 | b4 | b1                 | b0 |             |            |                |
| 0                 | 0  | 0  | 0  | 0                  | 0  | IWDTCLK     | 128        | 128            |
|                   |    |    |    | 0                  | 1  |             | 512        | 512            |
|                   |    |    |    | 1                  | 0  |             | 1024       | 1024           |
|                   |    |    |    | 1                  | 1  |             | 2048       | 2048           |
| 0                 | 0  | 1  | 0  | 0                  | 0  | IWDTCLK/16  | 128        | 2048           |
|                   |    |    |    | 0                  | 1  |             | 512        | 8192           |
|                   |    |    |    | 1                  | 0  |             | 1024       | 16384          |
|                   |    |    |    | 1                  | 1  |             | 2048       | 32768          |
| 0                 | 0  | 1  | 1  | 0                  | 0  | IWDTCLK/32  | 128        | 4096           |
|                   |    |    |    | 0                  | 1  |             | 512        | 16384          |
|                   |    |    |    | 1                  | 0  |             | 1024       | 32768          |
|                   |    |    |    | 1                  | 1  |             | 2048       | 65536          |
| 0                 | 1  | 0  | 0  | 0                  | 0  | IWDTCLK/64  | 128        | 8192           |
|                   |    |    |    | 0                  | 1  |             | 512        | 32768          |
|                   |    |    |    | 1                  | 0  |             | 1024       | 65536          |
|                   |    |    |    | 1                  | 1  |             | 2048       | 131072         |
| 1                 | 1  | 1  | 1  | 0                  | 0  | IWDTCLK/128 | 128        | 16384          |
|                   |    |    |    | 0                  | 1  |             | 512        | 65536          |
|                   |    |    |    | 1                  | 0  |             | 1024       | 131072         |
|                   |    |    |    | 1                  | 1  |             | 2048       | 262144         |
| 0                 | 1  | 0  | 1  | 0                  | 0  | IWDTCLK/256 | 128        | 32768          |
|                   |    |    |    | 0                  | 1  |             | 512        | 131072         |
|                   |    |    |    | 1                  | 0  |             | 1024       | 262144         |
|                   |    |    |    | 1                  | 1  |             | 2048       | 524288         |

#### IWDTCKS[3:0]位 (IWDT专用时钟分频比选择)

IWDTCKS[3:0]位指定用于递减计数器的时钟分频比。分频比可以从IWDT专用时钟(IWDTCLK)除以1、16、32、64、128和256中选择。结合IWDTTOPS[1:0]位设置, 可以将IWDT配置为计数128到524 288个IWDTCLK周期之间的周期。

**IWDTRPES[1:0] bits (IWDT Window End Position Select)**

The IWDTRPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

**IWDTRPSS[1:0] bits (IWDT Window Start Position Select)**

The IWDTRPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the window end position. If the window start position is less than or equal to the window end position, the window end position is set to 0%.

Table 25.3 lists the counter values for the window start and end positions, and Figure 25.2 shows the refresh-permitted period set in the IWDTRPSS[1:0], IWDTRPES[1:0], and IWDTTOPS[1:0] bits.

**Table 25.3 Relationship between the timeout period and window start and end counter values**

| IWDTTOPS[1:0] bits |    | Timeout period |               | Window start and end counter value |        |        |        |
|--------------------|----|----------------|---------------|------------------------------------|--------|--------|--------|
| b1                 | b0 | Cycles         | Counter value | 100%                               | 75%    | 50%    | 25%    |
| 0                  | 0  | 128            | 0x007F        | 0x007F                             | 0x005F | 0x003F | 0x001F |
| 0                  | 1  | 512            | 0x01FF        | 0x01FF                             | 0x017F | 0x00FF | 0x007F |
| 1                  | 0  | 1024           | 0x03FF        | 0x03FF                             | 0x02FF | 0x01FF | 0x00FF |
| 1                  | 1  | 2048           | 0x07FF        | 0x07FF                             | 0x05FF | 0x03FF | 0x01FF |

**Figure 25.2 IWDTRPSS[1:0] and IWDTRPES[1:0] bit settings and refresh-permitted period**

**IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)**

The IWDTRSTIRQS bit specifies the behavior when an underflow or a refresh error occurs. Setting 1 selects reset output. Setting 0 selects non-maskable interrupt or interrupt.

**IWDTRPES[1:0]位 (IWDT窗口结束位置选择)**

IWDTRPES[1:0]位指定指示刷新允许周期的窗口结束位置。可以为窗口结束位置选择75%、50%、25%或0%的超时时间。将窗口结束位置设置为小于窗口开始位置的值（窗口开始位置>窗口结束位置）。如果窗口结束位置大于窗口起始位置，则仅启用窗口起始位置设置。

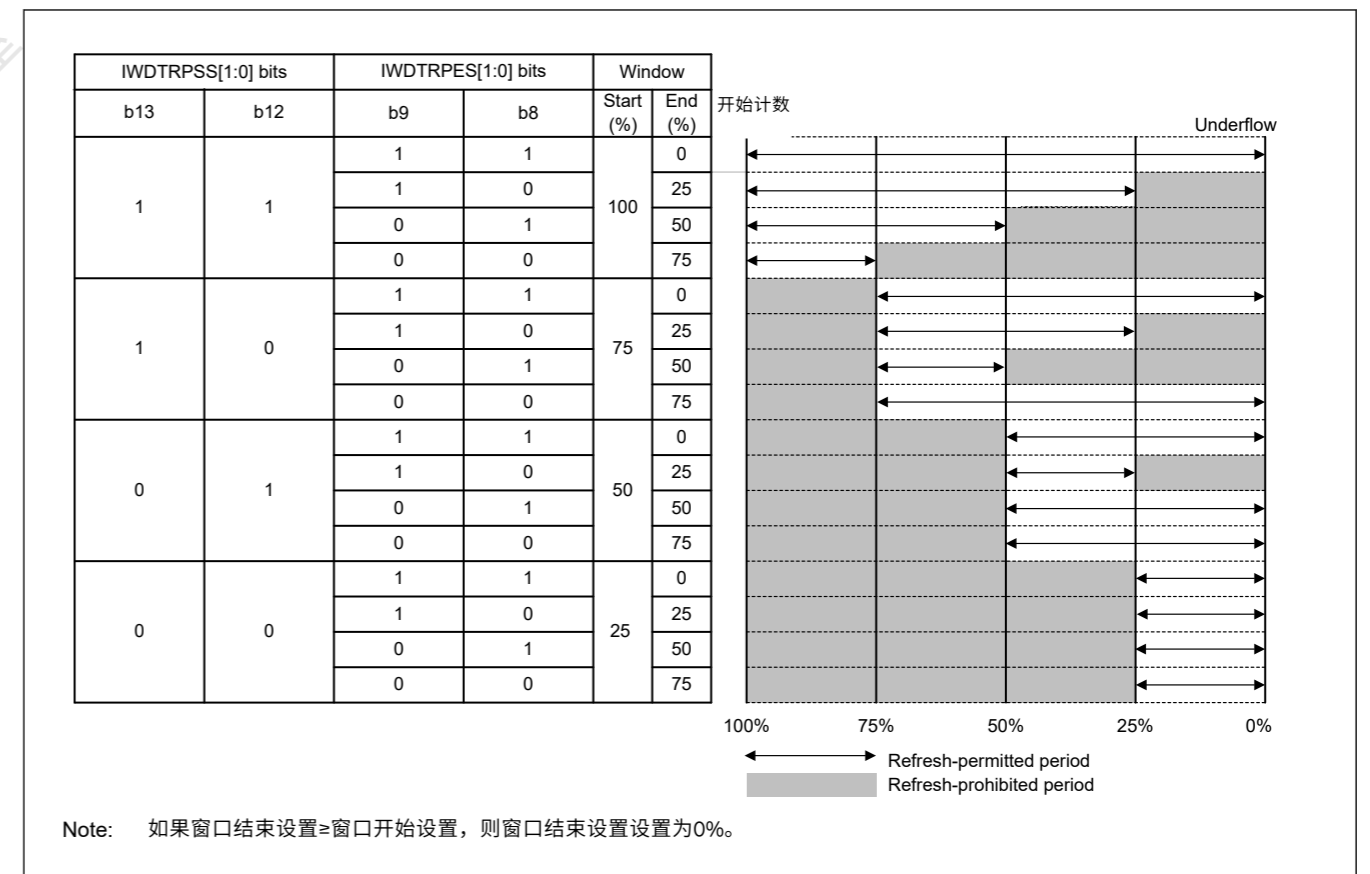

**IWDTRPSS[1:0]位 (IWDT窗口起始位置选择)**

IWDTRPSS[1:0]位指定指示刷新允许周期的窗口起始位置。可以为窗口起始位置选择100%、75%、50%或25%的超时时间。将窗口起始位置设置为大于窗口结束位置的值。如果窗口起始位置小于或等于窗口结束位置，则窗口结束位置设置为0%。

表25.3列出了窗口开始和结束位置的计数器值，图25.2显示了在IWDTRPSS[1:0]、IWDTRPES[1:0]和IWDTTOPS[1:0]位中设置的允许刷新周期。

**Table 25.3 超时时间与窗口开始和结束计数器值之间的关系**

| IWDTTOPS[1:0] bits |    | 超时时间   |        | 窗口开始和结束计数器值 |        |        |        |
|--------------------|----|--------|--------|-------------|--------|--------|--------|
| b1                 | b0 | Cycles | 计数器值   | 100%        | 75%    | 50%    | 25%    |
| 0                  | 0  | 128    | 0x007F | 0x007F      | 0x005F | 0x003F | 0x001F |
| 0                  | 1  | 512    | 0x01FF | 0x01FF      | 0x017F | 0x00FF | 0x007F |
| 1                  | 0  | 1024   | 0x03FF | 0x03FF      | 0x02FF | 0x01FF | 0x00FF |
| 1                  | 1  | 2048   | 0x07FF | 0x07FF      | 0x05FF | 0x03FF | 0x01FF |

**Figure 25.2 IWDTRPSS[1:0]和IWDTRPES[1:0]位设置和允许刷新周期**

**IWDTRSTIRQS位 (IWDT复位中断请求选择)**

IWDTRSTIRQS位指定发生下溢或刷新错误时的行为。设置1选择复位输出。设置0选择不可屏蔽中断或中断。

**IWDTSTPCTL bit (IWDT Stop Control)**

The IWDTSTPCTL bit selects whether to stop counting on transition to Sleep, Snooze, or Software Standby mode.

**25.3 Operation****25.3.1 Auto Start Mode**

When the IWDT Start Mode Select bit (OFS0.IWDTSTRT) in the Option Function Select Register 0 is 0, auto start mode is selected, otherwise the IWDT is disabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the IWDT registers:

- Clock division ratio (OFS0.IWDTCKS[3:0])
- Window start and end positions (OFS0.IWDRPSS[1:0], OFS0.IWDRPES[1:0])
- Timeout period (OFS0.IWDTTOPS[1:0])
- Reset output or interrupt request (OFS0.IWDRSTIRQS)

When the reset state is released, the counter automatically starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]).

After that, as long as the program continues normal operation and the counter is refreshed within the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The IWDT does not output the reset signal as long as this procedure continues. However, if the counter underflows because the program crashed or because a refresh error occurred when an attempt is made to refresh outside the refresh-permitted period, the IWDT asserts the reset signal or non-maskable interrupt request/interrupt request (IWDT\_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle, the value of the timeout period is set in the down-counter and counting starts. The reset output or interrupt request output can be selected with the IWDT Reset Interrupt Request Select bit (OFS0.IWDRSTIRQS). Non-maskable interrupt request or interrupt request can be selected with the IWDT Underflow/Refresh Error Interrupt Enable bit (NMIER.IWDTEN).

Figure 25.3 shows an example of operation under the following conditions:

- Auto start mode (OFS0.IWDTSTRT = 0)
- Non-maskable interrupt request output is enabled (OFS0.IWDRSTIRQS = 0)
- The window start position is 75% (OFS0.IWDRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDRPES[1:0] = 10b).

**IWDTSTPCTL位 (IWDT停止控制)**

IWDTSTPCTL位选择在转换到休眠、贪睡或软件待机模式时是否停止计数。

**25.3 Operation****25.3.1 自动启动模式**

当IWDT启动模式选择位置 (OFS0.IWDTSTRT) 中的选项函数选择寄存器0为0时, 选择了自动启动模式, 否则IWDT将被禁用。

在复位状态下, 选项功能选择寄存器0(OFS0)中的以下设置值在IWDT registers:

- 时钟分频比 (OFS0.IWDTCKS[3:0])
- 窗口开始和结束位置 (OFS0.IWDRPSS[1:0]、OFS0.IWDRPES[1:0])
- 超时周期 (OFS0.IWDTTOPS[1:0])
- 复位输出或中断请求 (OFS0.IWDRSTIRQS)

解除复位状态后, 计数器自动从IWDT中选择的值开始倒计时  
超时周期选择位(OFS0.IWDTTOPS[1:0])。

之后, 只要程序继续正常运行, 并且在允许刷新的时间内刷新计数器, 每次刷新计数器并继续递减计数时, 计数器中的值都会被复位。只要此过程继续, IWDT就不会输出复位信号。但是, 如果由于程序崩溃或在刷新允许周期之外尝试刷新时发生刷新错误而导致计数器下溢, 则IWDT将置位复位信号或不可屏蔽中断请求中断请求(IWDT\_NMIUNDF)。

在产生复位信号或不可屏蔽中断请求中断请求后, 计数器在计数1个周期后重新加载超时周期, 超时周期的值设置在递减计数器中并开始计数。可以通过IWDT复位中断请求选择位(OFS0.IWDRSTIRQS)选择复位输出或中断请求输出。可以使用IWDT下溢刷新错误中断 允许位(NMIER.IWDTEN)选择不可屏蔽的中断请求或中断请求。

图25.3显示了以下条件下的操作示例:

- 自动启动模式 (OFS0.IWDTSTRT=0)
- 使能不可屏蔽中断请求输出 (OFS0.IWDRSTIRQS=0)
- 窗口起始位置为75%(OFS0.IWDRPSS[1:0]=10b)
- 窗口结束位置为25%(OFS0.IWDRPES[1:0]=10b)。

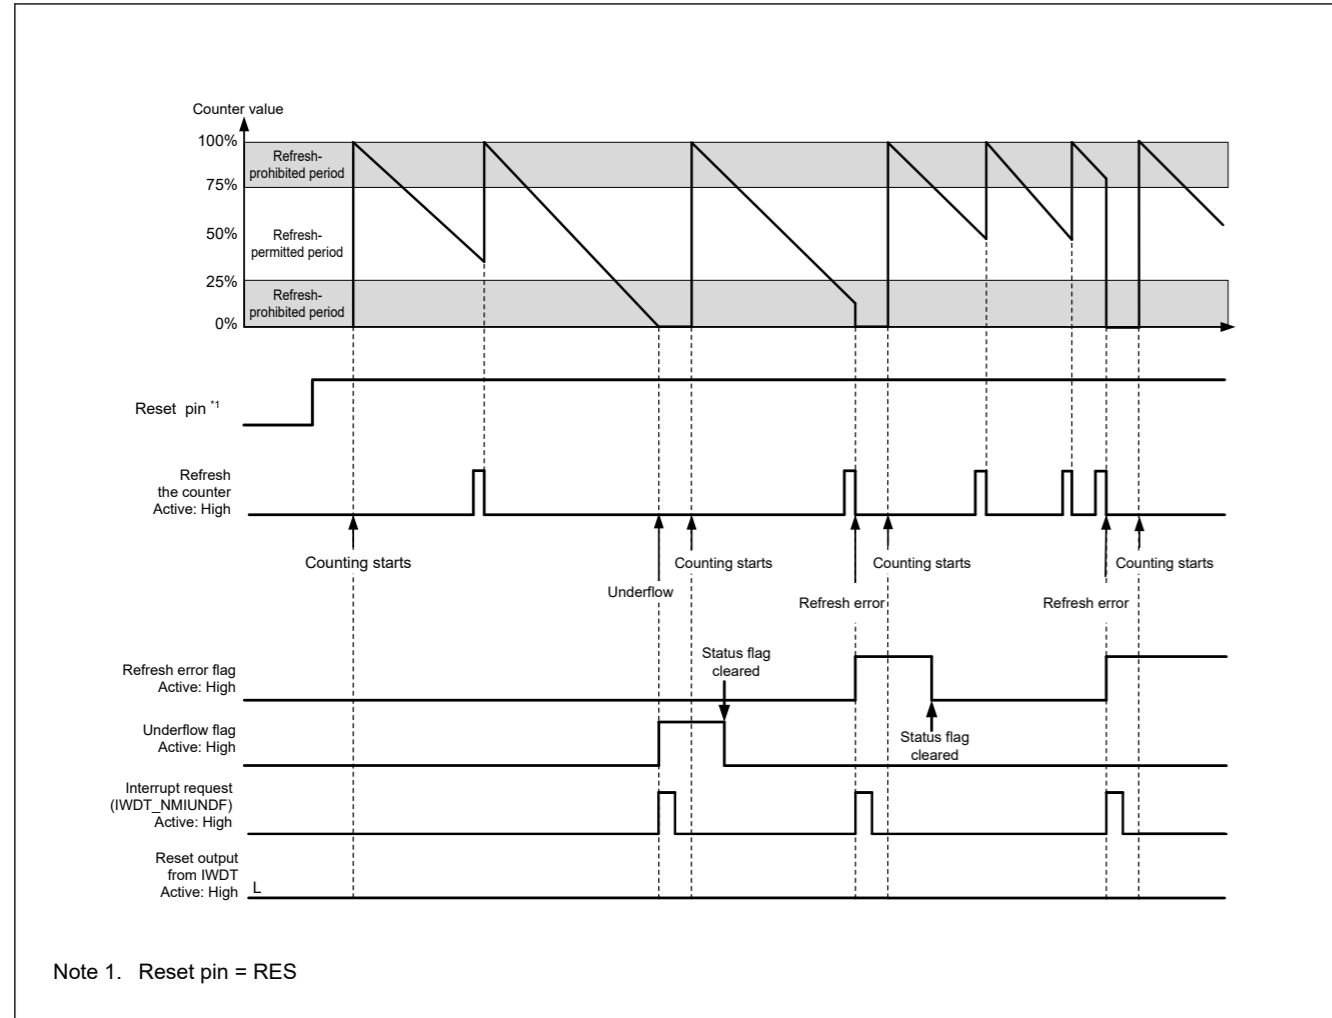

Figure 25.3 Operation example in auto start mode

### 25.3.2 Refresh Operation

The down-counter is refreshed and operation starts (counting is started by refreshing) by writing the values 0x00 and 0xFF to the IWDT Refresh Register (IWDTRR). If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, correct refreshing resumes on a write of 0x00 and 0xFF to the IWDTRR.

When writes are made in the order of 0x00 (first time) → 0x00 (second time), and if 0xFF is written after that, the writing order 0x00 → 0xFF is satisfied. Writing 0x00 ((n - 1)th time) → 0x00 (nth time) → 0xFF is valid, and the refresh is performed correctly. Even when the first value written before 0x00 is not 0x00, correct refreshing is performed as long as the operation contains the write sequence of 0x00 → 0xFF.

Correct refreshing is also performed regardless of whether a register other than IWDTRR is accessed or IWDTRR is read between writing 0x00 and writing 0xFF to IWDTRR. Writes to refresh the counter must be made within the refresh-permitted period. Whether writing is done within the refresh-permitted period is determined when 0xFF is written. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid to refresh the counter]

- 0x00 → 0xFF
- 0x00 ((n - 1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from IWDTRR → 0xFF.

[Example write sequences that are not valid to refresh the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)

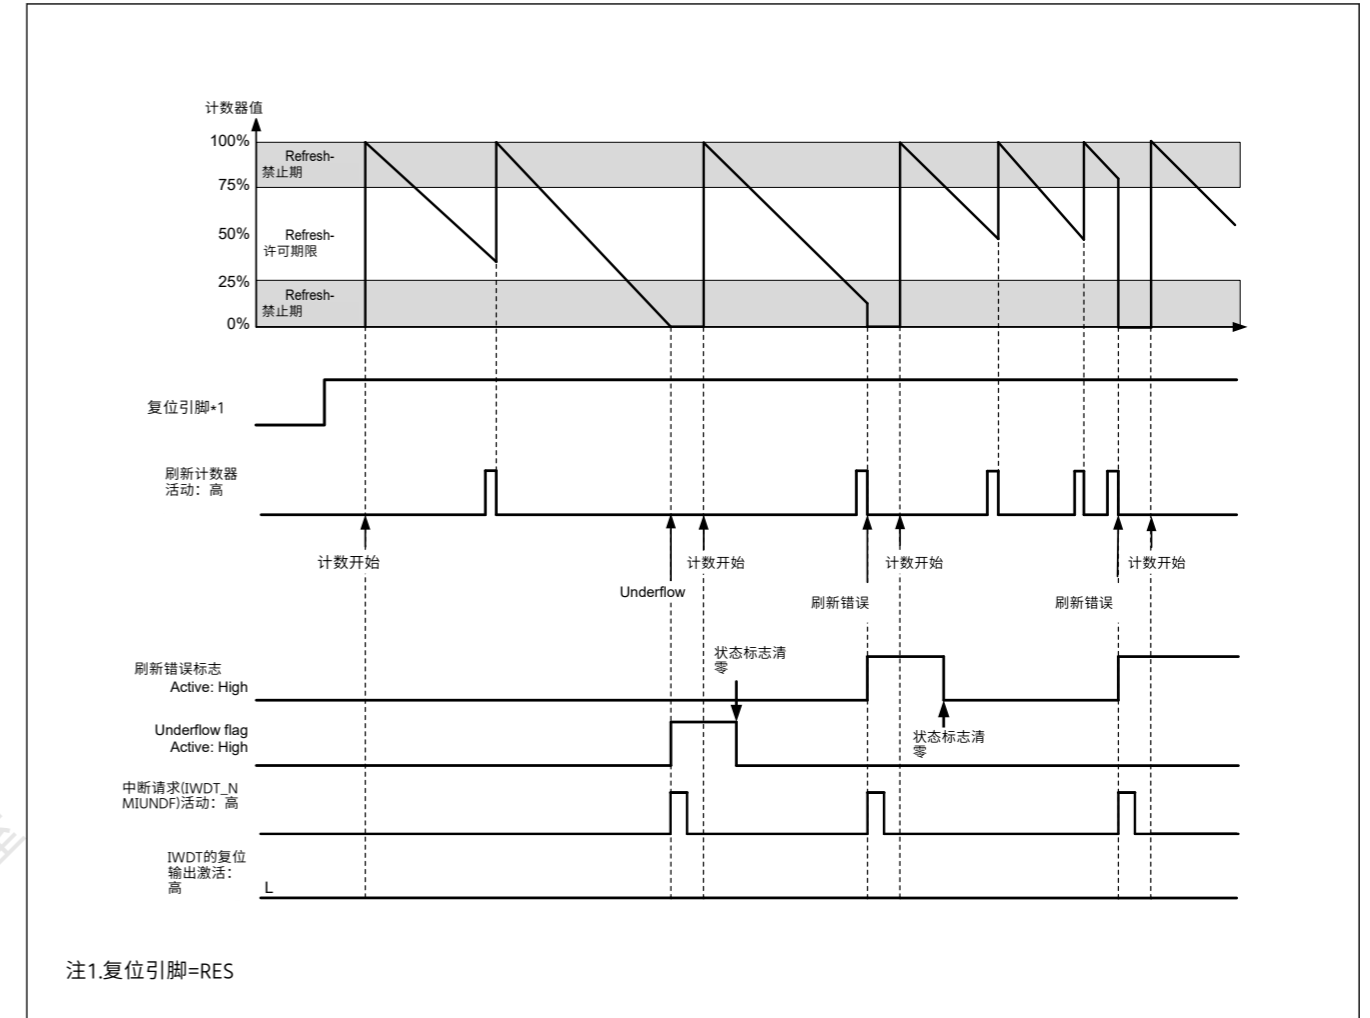

Figure 25.3 自动启动模式下的操作示例

### 25.3.2 刷新操作

通过将值0x00和0xFF写入IWDT刷新寄存器(IWDTRR)来刷新递减计数器并开始操作(通过刷新开始计数)。如果在0x00之后写入0xFF以外的值,则不刷新递减计数器。如果写入无效值,则在向IWDTRR写入0x00和0xFF时会恢复正确刷新。

当以0x00(第一次)→0x00(第二次)的顺序进行写入时,如果在此之后写入0xFF,则满足写入顺序0x00→0xFF。写入0x00((n-1)次)→0x00(n次)→0xFF有效,刷新正确。即使在0x00之前写入的第一个值不是0x00时,只要操作包含0x00→0xFF的写入序列,就会执行正确的刷新。

无论在写入0x00和写入0xFF到IWDTRR之间是否访问IWDTRR以外的寄存器或读取IWDTRR,也会执行正确刷新。刷新计数器的写入必须在允许刷新的期限内进行。在写入0xFF时确定是否在可刷新周期内完成写入。因此,即使在可刷新期间外写入0x00,也会执行正确的刷新。

[对刷新计数器有效的示例写入序列]

- 0x00 → 0xFF
- 0x00 ((n - 1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → 访问另一个寄存器或从IWDTRR读取 → 0xFF。

[对刷新计数器无效的示例写入序列]

- 0x23 (0x00以外的值) → 0xFF
- 0x00 → 0x54 (0xFF以外的值)

### 25.3.4 Reset Output

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1, a reset signal is output when an underflow in the counter or a refresh error occurs. Counting down automatically starts after the reset output.

### 25.3.5 Interrupt Sources

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0, an interrupt (IWDT\_NMIUNDF) signal occurs when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Table 25.4 IWDT interrupt source

| Name         | Interrupt source  | Interrupt to CPU | Start DMAC or DTC |
|--------------|---|------------------|-------------------|
| IWDT_NMIUNDF | <ul style="list-style-type: none"> <li>Down-counter underflow</li> <li>Refresh error</li> </ul> | Possible         | Not possible      |

### 25.3.6 Reading the Down-Counter Value

As the counter is a IWDT-dedicated clock (IWDTCLK), the counter value cannot be read directly. The IWDT synchronizes the counter value with the peripheral clock (PCLKB) and stores it in the down-counter value bits (IWDTSR.CNTVAL[13:0]) of the IWDT Status Register. Check these bits to obtain the counter value indirectly.

Reading the counter value requires multiple PCLKB clock cycles (up to 4 clock cycles), and the read counter value might differ from the actual counter value by a value of one count.

Figure 25.5 shows the processing for reading the IWDT counter value when PCLKB > IWDTCLK and the clock division ratio is IWDTCLK.

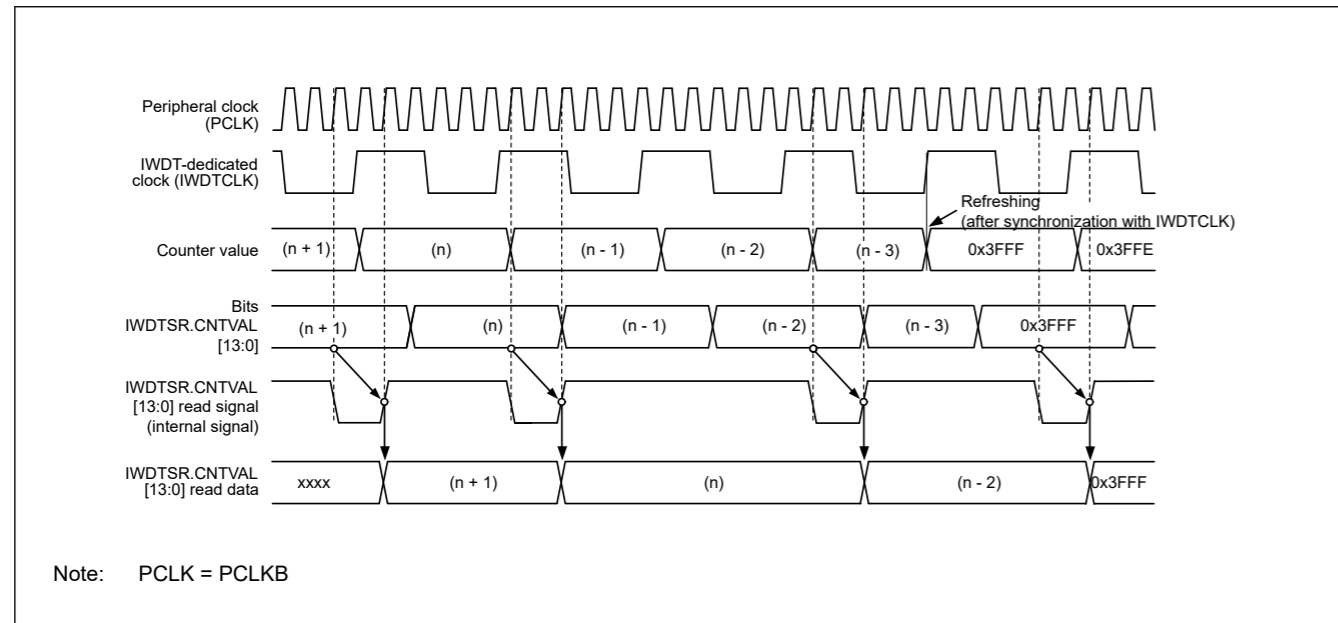

Figure 25.5 Processing for reading IWDT counter value when OFS0.IWDTCCKS[3:0] = 0000b, OFS0.IWDTTOPS[1:0] = 11b

## 25.4 Output to the Event Link Controller (ELC)

The IWDT is capable of link operation for a specified module when the interrupt request signal is used as an event signal by the event link controller (ELC). The event signal is output by the counter underflow or refresh error.

An event signal is output regardless of the setting of the OFS0.IWDTRSTIRQS bit. An event signal can also be output at generation of the next interrupt source while the Refresh Error flag (IWDTSR.REFEF) or Underflow flag (IWDTSR.UNDF) is 1. For details, see [section 18, Event Link Controller \(ELC\)](#).

### 25.3.4 复位输出

当IWDT重置中断请求选择位置 (OFS0.IWDTRSTIRQS) 中的选项函数选择寄存器0 (OFS0) 的位置为1时, 当计数器中的下流或刷新错误发生时, 将输出重置信号。复位输出后自动开始倒计时。

### 25.3.5 中断源

当IWDT重置中断请求选择位置 (OFS0.IWDTRSTIRQS) 中的选项函数选择寄存器0 (OFS0) 设置为0时, 当计数器中的下流或刷新错误发生时, 会发生中断 (IWDT\_NMIUNDF) 信号。此中断可用作不可屏蔽中断或中断。有关详细信息, 请参阅第13节, 中断控制器单元(ICU)。

Table 25.4 IWDT中断源

| Name         | 中断源  | 对CPU的中断  | 启动DMAC或DTC |
|--------------|--|----------|------------|
| IWDT_NMIUNDF | <ul style="list-style-type: none"> <li>Down-counter underflow</li> <li>刷新错误</li> </ul> | Possible | 不可能        |

### 25.3.6 读取递减计数器值

由于计数器是IWDT专用时钟(IWDTCLK), 因此无法直接读取计数器值。IWDT将计数器值与外设时钟(PCLKB)同步, 并将其存储在IWDT状态寄存器的递减计数器值位(IWDTSR.CNTVAL[13:0])中。检查这些位以间接获得计数器值。

读取计数器值需要多个PCLKB时钟周期 (最多4个时钟周期), 读取的计数器值可能与实际计数器值相差一个计数值。

图25.5显示了当PCLKB>IWDTCLK且时钟分频比为IWDTCLK时读取IWDT计数器值的处理。

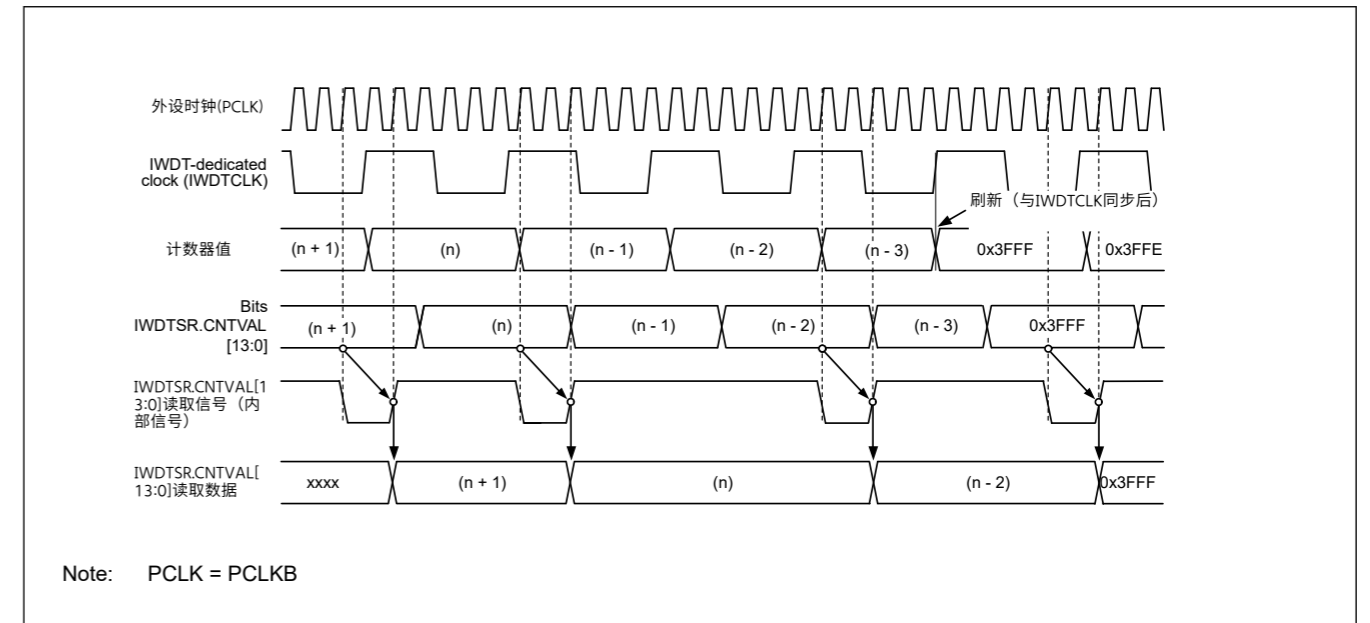

Figure 25.5 OFS0.IWDTCCKS[3:0]=0000b时读取IWDT计数器值的处理, OFS0.IWDTTOPS[1:0] = 11b

## 25.4 输出到事件链接控制器(ELC)

当中断请求信号被事件链接控制器(ELC)用作事件信号时, IWDT能够对指定模块进行链接操作。事件信号由计数器下溢或刷新错误输出。

无论OFS0.IWDTRSTIRQS位的设置如何, 都会输出事件信号。当刷新错误标志(IWDTSR.REFEF)或下溢标志(IWDTSR.UNDF)为1时, 也可以在生成下一个中断源时输出事件信号。有关详细信息, 请参阅第18节, 事件链接控制器(ELC)。

## 25.5 Usage Notes

### 25.5.1 Refresh Operations

While configuring the refresh time, consider variations in the range of errors given the accuracy of PCLKB and IWDTCLK. Set values that ensure refreshing is possible.

### 25.5.2 Clock Division Ratio Setting

Satisfy the frequency of the peripheral module clock (PCLKB)  $\geq 4 \times$  (the frequency of the count clock source after division).

### 25.5.3 Constraints on the ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x52 to ICU Event Link Setting Register n (IELSRn.IELS[8:0]) is prohibited when enabling the IWDT reset assertion (OFS0.IWDRSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x52).

## 25.5 使用说明

### 25.5.1 刷新操作

在配置刷新时间时，请考虑给定PCLKB和IWDTCLK精度的误差范围的变化。设置确保可以刷新的值。

### 25.5.2 时钟分频比设置

满足外设模块时钟 (PCLKB) 的频率 $\geq 4 \times$  (分频后的计数时钟源的频率)。

### 25.5.3 ICU事件链接设置寄存器n(IELSRn)设置的约束

当启用IWDT复位断言(OFS0.IWDRSTIRQS=0)或启用事件链接操作(ELSRn.ELS[8:0]=0x52)。

## 26. USB 2.0 Full-Speed Module (USBFS)

### 26.1 Overview

The USB 2.0 Full-Speed module (USBFS) operates as a host or device controller compliant with the Universal Serial Bus (USB) specification revision 2.0. The host controller supports USB 2.0 full-speed and low-speed transfers, and the device controller supports USB 2.0 full-speed transfers. The USBFS has an internal USB transceiver and supports all of the transfer types defined in the USB 2.0 specification

The USBFS has FIFO buffer for data transfers, providing a maximum of 10 pipes. Any endpoint number can be assigned to pipes 1 to 9, based on the peripheral devices or the communication requirements for your system.

Table 26.1 lists the USBFS specifications, Figure 26.1 shows a block diagram, and Table 26.2 lists the I/O pins.

**Table 26.1 USBFS specifications**

| Parameter                | Specifications  |
|--------------------------|---|
| Features                 | <ul style="list-style-type: none"> <li>USB Device Controller (UDC) and USB 2.0 transceiver supporting host controller, device controller, and On-The-Go (OTG) functions (one channel)</li> <li>Host and device controller can be switched by software</li> <li>Self-power or bus power mode selectable</li> <li>Revision 1.2 of battery charging specification is supported</li> </ul> <p>Host controller features:</p> <ul style="list-style-type: none"> <li>Full-speed transfer (12 Mbps) and low-speed transfer (1.5 Mbps)</li> <li>Automatic scheduling for SOF and packet transmissions</li> <li>Programmable intervals for isochronous and interrupt transfers</li> <li>Communications with multiple peripheral devices connected through a single hub</li> </ul> <p>Device controller features:</p> <ul style="list-style-type: none"> <li>Full-speed transfer (12 Mbps)<sup>*1</sup></li> <li>Control transfer stage control function</li> <li>Device state control function</li> <li>Auto response function for SET_ADDRESS request</li> <li>SOF interpolation</li> </ul> |

| TrustZone Filter         | Security attribution can be set   |

Note 1. Low-speed transfer (1.5 Mbps) is not supported.

## 26. USB2.0全速模块(USBFS)

### 26.1 Overview

USB2.0全速模块(USBFS)作为主机或设备控制器运行，符合通用串行总线(USB)规范修订版2.0。主机控制器支持USB 2.0全速和低速传输，设备控制器支持USB2.0全速传输。USBFS具有内部USB收发器并支持USB2.0规范中定义的所有传输类型

USBFS具有用于数据传输的FIFO缓冲区，最多提供10个管道。根据外围设备或系统的通信要求，可以将任何端点编号分配给管道1到9。

表26.1列出了USBFS规范，图26.1显示了框图，表26.2列出了IO引脚。

**Table 26.1 USBFS specifications**

| Parameter            | Specifications  |
|----------------------|---|
| Features             | <ul style="list-style-type: none"> <li>USB设备控制器(UDC)和USB2.0收发器，支持主机控制器、设备控制器和On-The-Go(OTG)功能（一个通道）</li> <li>主机和设备控制器可通过软件切换</li> <li>自供电或总线供电模式可选</li> <li>支持电池充电规范1.2版</li> </ul> <p>主机控制器特点：●</p> <ul style="list-style-type: none"> <li>全速传输(12Mbps)和低速传输(1.5Mbps)</li> <li>SOF和数据包传输的自动调度</li> <li>同步和中断传输的可编程间隔</li> <li>与通过单个集线器连接的多个外围设备进行通信</li> </ul> <p>设备控制器特点：●</p> <ul style="list-style-type: none"> <li>控制转移级控制功能</li> <li>设备状态控制功能</li> <li>SET_ADDRESS请求的自动响应功能</li> <li>SOF插值</li> </ul> |

| Function | Pin name                 | I/O    | Description   |
|----------|--------------------------|--------|---|
| USBFS    | USB_DP                   | I/O    | D+ I/O pin of the USB on-chip transceiver. This pin should be connected to the D+ pin of the USB bus.   |
|          | USB_DM                   | I/O    | D- I/O pin of the USB on-chip transceiver. This pin should be connected to the D- pin of the USB bus.   |
|          | USB_VBUS                 | Input  | USB cable connection monitor pin. This pin should be connected to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller. |
|          | USB_EXICEN               | Output | Low-power control signal for external power supply (OTG) chip.  |
|          | USB_VBUSEN               | Output | VBUS (5 V) supply enable signal for external power supply chip.   |
|          | USB_OVRCURA, USB_OVRCURB | Input  | External overcurrent detection signals should be connected to these pins. VBUS comparator signals should be connected to these pins when the OTG power supply chip is connected.                                  |
|          | USB_ID                   | Input  | MicroAB connector ID input signal should be connected to this pin during operation in OTG mode.   |
|          | VCC_USB                  | Input  | Power supply pins.  |
|          | VSS_USB                  | Input  | Ground pins.  |

26.2 Register Descriptions

26.2.1 SYSCFG : System Configuration Control Register

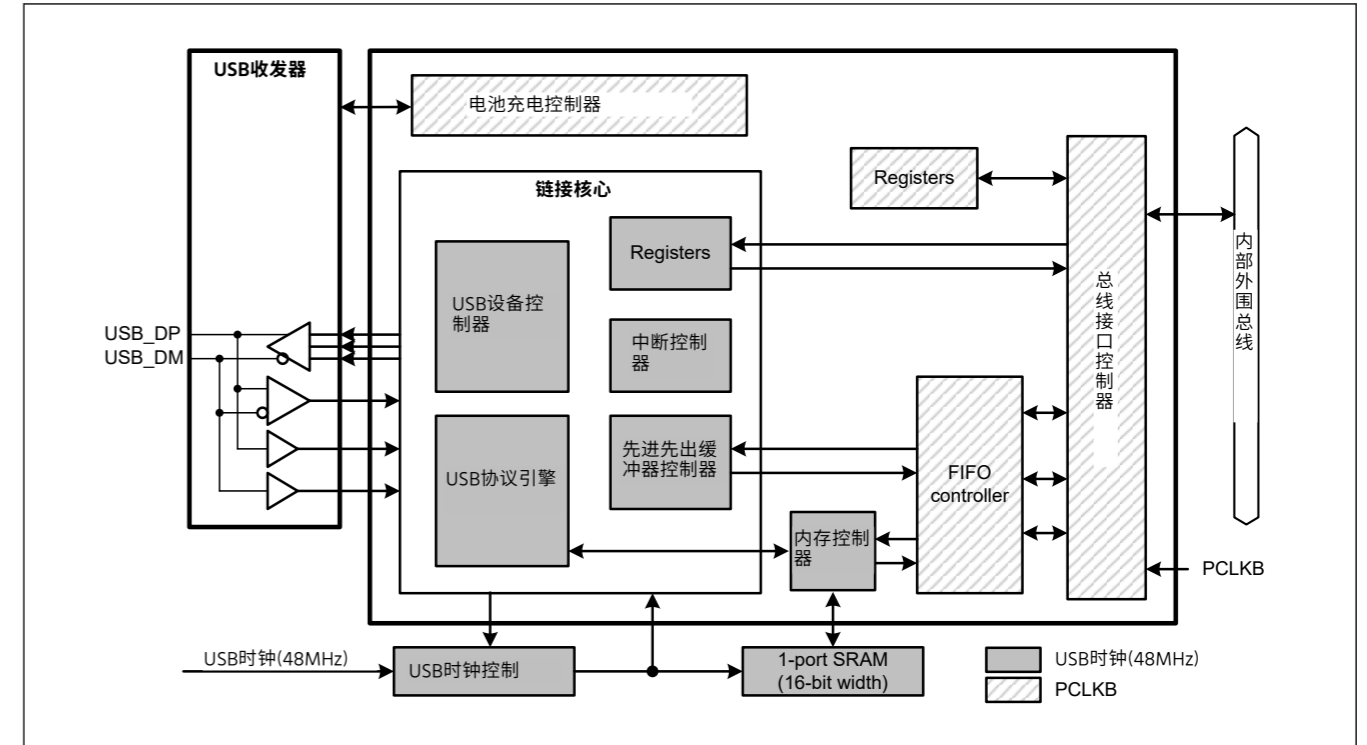

Figure 26.1 USBFS框图

Table 26.2 USBFS引脚配置

| Function | 引脚名称                     | I/O    | Description  |
|----------|--------------------------|--------|--|
| USBFS    | USB_DP                   | I/O    | USB片上收发器的D+IO引脚。该引脚应连接到USB总线的D+引脚。                                   |
|          | USB_DM                   | I/O    | D USB片上收发器的IO引脚。该引脚应连接到USB总线的D 引脚。                                   |
|          | USB_VBUS                 | Input  | USB电缆连接监视器引脚。该引脚应连接到USB总线的VBUS。当USB模块作为功能控制器运行时，可以检测VBUS引脚状态（连接或断开）。 |
|          | USB_EXICEN               | Output | 用于外部电源(OTG)芯片的低功耗控制信号。   |
|          | USB_VBUSEN               | Output | VBUS(5V)为外部供电芯片供电使能信号。   |
|          | USB_OVRCURA, USB_OVRCURB | Input  | 外部过流检测信号应连接到这些引脚。连接OTG电源芯片时，应将VBUS比较器信号连接到这些引脚。                      |
|          | USB_ID                   | Input  | MicroAB连接器ID输入信号应在操作期间连接到此引脚 OTG mode.                               |
|          | VCC_USB                  | Input  | 电源引脚。  |
|          | VSS_USB                  | Input  | 接地引脚。  |

26.2 注册说明

26.2.1 SYSCFG: 系统配置控制寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x000

|               |    |    |    |    |      |    |   |   |      |      |        |   |   |   |   |      |
|---------------|----|----|----|----|------|----|---|---|------|------|--------|---|---|---|---|------|
| Bit position: | 15 | 14 | 13 | 12 | 11   | 10 | 9 | 8 | 7    | 6    | 5      | 4 | 3 | 2 | 1 | 0    |
| Bit field:    | —  | —  | —  | —  | SCKE | —  | — | — | DCFM | DRPD | DPRP U | — | — | — | — | USBE |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0    | 0  | 0 | 0 | 0    | 0    | 0      | 0 | 0 | 0 | 0 | 0    |

| Bit   | Symbol | Function   | R/W |
|-------|--------|--|-----|
| 0     | USBE   | USBFS Operation Enable<br>0: Disable<br>1: Enable  | R/W |
| 2:1   | —      | These bits are read as 0. The write value should be 0.                                       | R/W |
| 3     | —      | This bit is read as 0. The write value should be 0.  | R/W |
| 4     | DPRPU  | D+ Line Resistor Control<br>0: Disable line pull-up<br>1: Enable line pull-up                | R/W |
| 5     | DRPD   | D+/D- Line Resistor Control<br>0: Disable line pull-down<br>1: Enable line pull-down         | R/W |
| 6     | DCFM   | Controller Function Select<br>0: Select device controller<br>1: Select host controller       | R/W |
| 7     | —      | This bit is read as 0. The write value should be 0.  | R/W |
| 9:8   | —      | These bits are read as 0. The write value should be 0.                                       | R/W |
| 10    | SCKE   | USB Clock Enable<br>0: Stop clock supply to the USBFS<br>1: Enable clock supply to the USBFS | R/W |
| 15:11 | —      | These bits are read as 0. The write value should be 0.                                       | R/W |

Note: After writing 1 to the SCKE bit, read it to confirm that it is set to 1.

#### USBE bit (USBFS Operation Enable)

The USBE bit enables or disables operation of the USBFS.

Changing the USBE bit from 1 to 0 initializes the bits listed in Table 26.3. Only change this bit while the SCKE bit is 1. In host controller mode, this bit must be set to 1 after setting the DRPD bit to 1, eliminating SYSSTS0.LNST[1:0] flags chattering, and confirming that the USB bus state is stable.

Table 26.3 Registers initialized by writing 0 to the SYSCFG.USBE bit

| Selected function | Register | Bit                                  | Remarks                                  |
|-------------------|----------|--------------------------------------|--|
| Device controller | SYSSTS0  | LNST[1:0]                            | Value is saved in host controller mode   |
|                   | DVSTCTR0 | RHST[2:0]                            | —  |
|                   | INTSTS0  | DVSQ[2:0]                            | Value is saved in host controller mode   |
|                   | USBADDR  | USBADDR[6:0]                         | Value is saved in host controller mode   |
|                   | USBREQ   | BREQUEST[7:0],<br>BMREQUESTTYPE[7:0] | Value is saved in host controller mode   |
|                   | USBVAL   | WVALUE[15:0]                         | Value is saved in host controller mode   |
|                   | USBINDX  | WINDEX[15:0]                         | Value is saved in host controller mode   |
|                   | USBLENG  | WLENTUH[15:0]                        | Value is saved in host controller mode   |
| Host controller   | DVSTCTR0 | RHST[2:0]                            | —  |
|                   | FRMNUM   | FRNM[10:0]                           | Value is saved in device controller mode |

#### DPRPU bit (D+ Line Resistor Control)

The DPRPU bit enables or disables pulling up the D+ line in device controller mode.

When the DPRPU bit is set to 1 in device controller mode, the USBFS pulls up the D+ line to notify the USB host that it attached. Changing the DPRPU bit from 1 to 0 releases the pull-up, thereby notifying the USB host that it detached.

Set this bit to 1 in device controller mode and to 0 in host controller mode.

| Bit   | Symbol | Function                                      | R/W |
|-------|--------|---|-----|
| 0     | USBE   | USBFS操作启用<br>0: 禁用<br>1: 启用                   | R/W |
| 2:1   | —      | 这些位被读取为0。写入值应为0。                              | R/W |
| 3     | —      | 该位读取为0。写入值应为0。                                | R/W |
| 4     | DPRPU  | D+线路电阻控制<br>0: 禁用线路上拉<br>1: 启用线路上拉            | R/W |
| 5     | DRPD   | D+D- 线路电阻控制<br>0: 禁用线下拉<br>1: 启用线下拉           | R/W |
| 6     | DCFM   | 控制器功能选择<br>0: 选择设备控制器<br>1: 选择主机控制器           | R/W |
| 7     | —      | 该位读取为0。写入值应为0。                                | R/W |
| 9:8   | —      | 这些位被读取为0。写入值应为0。                              | R/W |
| 10    | SCKE   | USB时钟使能<br>0: 停止向USBFS提供时钟<br>1: 使能向USBFS提供时钟 | R/W |
| 15:11 | —      | 这些位被读取为0。写入值应为0。                              | R/W |

Note: 将1写入SCKE位后，读取它以确认其设置为1。

#### USBE位 (USBFS操作使能)

USBE位启用或禁用USBFS的操作。

将USBE位从1更改为0会初始化表26.3中列出的位。仅在SCKE位为1时更改该位。在主机控制器模式下，必须在将DRPD位设置为1后将该位设置为1，消除SYSSTS0.LNST[1:0]标志抖动，并确认USB总线状态是稳定的。

Table 26.3 通过向SYSCFG.USBE位写入0来初始化寄存器

| 所选功能  | Register | Bit                                  | Remarks      |
|-------|----------|--------------------------------------|--------------|
| 设备控制器 | SYSSTS0  | LNST[1:0]                            | 值以主机控制器模式保存  |
|       | DVSTCTR0 | RHST[2:0]                            | —            |
|       | INTSTS0  | DVSQ[2:0]                            | 值以主机控制器模式保存  |
|       | USBADDR  | USBADDR[6:0]                         | 值以主机控制器模式保存  |
|       | USBREQ   | BREQUEST[7:0],<br>BMREQUESTTYPE[7:0] | 值以主机控制器模式保存  |
|       | USBVAL   | WVALUE[15:0]                         | 值以主机控制器模式保存  |
|       | USBINDX  | WINDEX[15:0]                         | 值以主机控制器模式保存  |
|       | USBLENG  | WLENTUH[15:0]                        | 值以主机控制器模式保存  |
| 主机控制器 | DVSTCTR0 | RHST[2:0]                            | —            |
|       | FRMNUM   | FRNM[10:0]                           | 值保存在设备控制器模式中 |

#### DPRPU位 (D+线路电阻控制)

DPRPU位启用或禁用设备控制器模式下上拉D+线。

当DPRPU位在设备控制器模式下设置为1时，USBFS拉高D+线以通知USB主机它已连接。将DPRPU位从1更改为0会释放上拉电阻，从而通知USB主机它已分离。

在设备控制器模式下将此位设置为1，在主机控制器模式下设置为0。

**DRPD bit (D+/D- Line Resistor Control)**

TheDRPD bit enables or disables pulling down D+ and D- lines in host controller mode. Set this bit to 1 in host controller mode and to 0 in device controller mode.

**DCFM bit (Controller Function Select)**

The DCFM bit selects the host or device function of the USBFS. Only change this bit when the DPRPU and DRPD bits are both 0.

**SCKE bit (USB Clock Enable)**

The SCKE bit stops or enables the 48-MHz clock supply to the USBFS. When this bit is 0, only SYSCFG is permitted to be read from and written to; the other registers related to the USB should not be read from or written to.

**26.2.2 SYSSTS0 : System Configuration Status Register 0**

Base address: USBFS = 0x4009\_0000  
Offset address: 0x004

| Bit   | Symbol      | Function   | R/W |
|-------|-------------|--|-----|
| 1:0   | LNST[1:0]   | USB Data Line Status Monitor<br>Indicates the status of the USB data lines, see Table 26.4   | R   |
| 2     | IDMON       | External ID0 Input Pin Monitor<br>0: USB_ID pin is low<br>1: USB_ID pin is high  | R   |
| 4:3   | —           | These bits are read as 0.  | R   |
| 5     | SOFEA       | Active Monitor When the Host Controller Is Selected<br>0: SOF output stopped<br>1: SOF output operating  | R   |
| 6     | HTACT       | USB Host Sequencer Status Monitor<br>0: Host sequencer completely stopped<br>1: Host sequencer not completely stopped                                  | R   |
| 13:7  | —           | These bits are read as 0.  | R   |
| 15:14 | OVCMON[1:0] | External USB_OVRCURA/ USB_OVRCURB Input Pin Monitor<br>OVCMON[1] indicates the USB_OVRCURA pin status. OVCMON[0] indicates the USB_OVRCURB pin status. | R   |

Note: The values of the OVCMON[1:0] and IDMON bits depend on the status of the USB\_OVRCURA, USB\_OVRCURB, and USB\_ID pins.

**LNST[1:0] bits (USB Data Line Status Monitor)**

The LNST[1:0] bits indicate the state of the USB data lines, D+ and D-. For details, see Table 26.4. In device controller mode, read the LNST[1:0] bits after connection processing (SYSCFG.DPRPU bit = 1). In host controller mode, read them after enabling pull-down of the lines (SYSCFG.DRPD bit = 1).

**Table 26.4 Status of the USB data bus lines (D+ and D-) (1 of 2)**

| LNST[1:0] bits | During full-speed operation | During low-speed operation |
|----------------|-----------------------------|----------------------------|
| 00b            | SE0                         | SE0                        |
| 01b            | J-State                     | K-State                    |

**DRPD位 (D+D- 线路电阻控制)**

DRPD位启用或禁用在主机控制器模式下下拉D+和D- 线。在主机控制器模式下将此位设置为1，在设备控制器模式下设置为0。

**DCFM位 (控制器功能选择)**

DCFM位选择USBFS的主机或设备功能。仅当DPRPU和DRPD位都为0时更改该位。

**SCKE位 (USB时钟使能)**

SCKE位停止或启用向USBFS提供48MHz时钟。该位为0时，只允许读写SYSCFG；不应读取或写入与USB相关的其他寄存器。

**26.2.2 SYSSTS0: 系统配置状态寄存器0**

Base address: USBFS = 0x4009\_0000  
Offset address: 0x004

| Bit   | Symbol      | Function   | R/W |
|-------|-------------|--|-----|
| 1:0   | LNST[1:0]   | USB数据线状态监视器<br>指示USB数据线的状态，见表26.4  | R   |
| 2     | IDMON       | 外部ID0输入引脚监视器<br>0: USB_ID引脚为低电平<br>1: USB_ID引脚为高电平   | R   |
| 4:3   | —           | 这些位读为0。  | R   |
| 5     | SOFEA       | 选择主机控制器时的活动监视器<br>0: SOF输出停止1: SOF输出工作   | R   |
| 6     | HTACT       | USB主机定序器状态监视器<br>0: 主机定序器完全停止1: 主机定序器未完全停止   | R   |
| 13:7  | —           | 这些位读为0。  | R   |
| 15:14 | OVCMON[1:0] | 外部USB_OVRCURA/USB_OVRCURB输入引脚监视器<br>OVCMON[1]指示USB_OVRCURA引脚状态。OVCMON[0]表示USB_OVRCURB引脚状态。 | R   |

Note: OVCMON[1:0]和IDMON位的值取决于USB\_OVRCURA、USB\_OVRCURB和USB\_ID引脚的状态。

**LNST[1:0]位 (USB数据线状态监视器)**

LNST[1:0]位指示USB数据线D+和D-的状态。详见表26.4。在设备控制器模式下，在连接处理后读取LNST[1:0]位 (SYSCFG.DPRPU=1)。在主机控制器模式下，在启用线路下拉后读取它们 (SYSCFG.DRPD=1)。

**Table 26.4 USB数据总线的状态 (D+和D-) (1of2)**

| LNST[1:0] bits | 全速运行期间  | 低速运转时   |
|----------------|---------|---------|
| 00b            | SE0     | SE0     |
| 01b            | J-State | K-State |

Table 26.4 Status of the USB data bus lines (D+ and D-) (2 of 2)

| LNST[1:0] bits | During full-speed operation | During low-speed operation |
|----------------|-----------------------------|----------------------------|
| 10b            | K-State                     | J-State                    |
| 11b            | SE1                         | SE1                        |

**SOFEA bit (Active Monitor When the Host Controller Is Selected)**

The SOFEA bit is used in host controller mode to check whether the output of the last SOF is complete when the USBFS is suspended because of a 0 setting to the DVSTCTR0.UACT bit.

In host controller mode, check that both the HTACT and SOFEA bits are 0 before setting the SYSCFG.USBE bit to 0 to stop the USBFS or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

**HTACT bit (USB Host Sequencer Status Monitor)**

The HTACT bit is set to 0 when the host sequencer of the USBFS is completely stopped.

In host controller mode, check that the HTACT bit is 0 before setting the DVSTCTR0.UACT bit to 0 to place the USBFS in the suspended state or setting the SCKE bit to 0 to stop the clock signal supply during communication.

**OVCMON[1:0] bits (External USB\_OVRCURA/ USB\_OVRCURB Input Pin Monitor)**

The OVCMON[1:0] bits indicate the status of the overcurrent signals from an external power supply IC.

26.2.3 DVSTCTR0 : Device State Control Register 0

Base address: USBFS = 0x4009\_0000

Offset address: 0x008

**SOFEA位 (选择主机控制器时的主动监视器)**

SOFEA位在主机控制器模式下用于检查当USBFS由于DVSTCTR0.UACT位设置为0而暂停时最后一个SOF的输出是否完成。

在主机控制器模式下，在将SYSCFG.USBE位设置为0以停止USBFS或将SYSCFG.SCKE位设置为0以在通信期间停止时钟信号供应之前，请检查HTACT和SOFEA位是否都为0。

**HTACT位 (USB主机定序器状态监视器)**

当USBFS的主机定序器完全停止时，HTACT位设置为0。

在主机控制器模式下，在将DVSTCTR0.UACT位设置为0以将USBFS置于挂起状态或将SCKE位设置为0以在通信期间停止时钟信号供应之前，请检查HTACT位是否为0。

**OVCMON[1:0]位 (外部USB\_OVRCURA/USB\_OVRCURB输入引脚监视器)**

OVCMON[1:0]位指示来自外部电源IC的过流信号的状态。

26.2.3 DVSTCTR0: 设备状态控制寄存器0

Base address: USBFS = 0x4009\_0000

Offset address: 0x008

| 15:12 | —       | These bits are read as 0. The write value should be 0.   | R/W |

The USBFS controller does not support low-speed connections in device controller mode. When this value is read, abnormal connection processing must be executed in higher level application software.

#### RHST[2:0] bits (USB Bus Reset Status)

RHST[2:0] bits indicate the status of the USB bus reset.

In host controller mode, writing 1 to the USBRST bit causes the RHST[2:0] bits to set to 100b. When 0 is written to the USBRST bit and the USBFS ends the SE0 state, the RHST[2:0] bits update to a new value.

In device controller mode, if the USBFS detects a USB bus reset, the RHST[2:0] bits indicate 010b if the DPRPU bit is 1, and a DVST interrupt is generated.

#### UACT bit (USB Bus Enable)

When set to 1 in host controller mode, the UACT bit enables USB bus operation by controlling SOF packet transmission to the USB bus in addition to data and reception. The USBFS starts SOF packet output within one frame period after the UACT bit is set to 1. When UACT is set to 0, the USBFS enters the idle state after the SOF packet output.

The USBFS sets the UACT bit to 0 on any of the following conditions:

- A DTCH interrupt is detected during communication (when UACT = 1)
- An EOFERR interrupt is detected during communication (when UACT = 1)

Always write 1 to the UACT bit at the end of the USB bus reset processing (writing 0 to the USBRST bit) or at the end of resume processing from the suspended state (writing 0 to the RESUME bit).

In device controller mode, always set this bit to 0.

#### RESUME bit (Resume Output)

The RESUME bit controls the resume signal output in host controller mode.

When this bit is set to 1, the USBFS drives the USB port to the K-state and outputs the resume signal. The USBFS sets the bit to 1 on detection of a remote wakeup signal while the RWUPE bit is 1 and in the USB Suspend state.

The USBFS continues outputting the K-state while the RESUME bit is 1, until the bit is cleared to 0 by software. The RESUME bit must be 1 (resume period) for the time defined in the USB 2.0 specification. Only set this bit to 1 while the interface is in the Suspend state. Write 1 to the UACT bit simultaneously with the end of the resume processing (writing 0 to the RESUME bit).

Always set this bit to 0 in device controller mode.

#### USBRST bit (USB Bus Reset Output)

The USBRST bit controls the output of the USB bus signal in host controller mode. When this bit set to 1, the USBFS drives the USB port to the SE0 state to reset the USB bus. The USBFS continues outputting SE0 while the USBRST bit is 1, until the bit is cleared to 0 by software. The USBRST bit must be 1 (USB bus reset period) for the time defined in the USB 2.0 specification. Writing 1 to the USBRST bit during communication (UACT = 1) or during resume processing (RESUME

| Bit   | Symbol  | Function  | R/W |
|-------|---------|---|-----|

| 11    | HNPBTOA | 主机协商协议(HNP)控制<br>在OTG模式下从设备B切换到设备A时使用该位。如果HNPBTOA位为1, 即使SYSCFG.DPRPU=0或SYSCFG.DCFM=1, 内部功能控制仍保持暂停状态直到HNP处理结束。 | R/W |
| 15:12 | —       | 这些位被读取为0。写入值应为0。  | R/W |

USBFS控制器不支持设备控制器模式下的低速连接。当读取此值时, 必须在更高级别的应用软件中执行异常连接处理。

#### RHST[2:0]位 (USB总线复位状态)

RHST[2:0]位指示USB总线复位的状态。

在主机控制器模式下, 将1写入USBRST位会导致RHST[2:0]位设置为100b。当0被写入USBRST位和USBFS结束SE0状态, RHST[2:0]位更新为新值。

在设备控制器模式下, 如果USBFS检测到USB总线复位, 如果DPRPU位为1, 则RHST[2:0]位指示010b, 并产生DVST中断。

#### UACT位 (USB总线使能)

在主机控制器模式下设置为1时, UACT位通过控制向USB总线发送SOF数据包以及数据和接收来启用USB总线操作。USBFS在UACT位设置为1后的一帧周期内开始SOF数据包输出。当UACT设置为0时, USBFS在SOF数据包输出后进入空闲状态。

USBFS在以下任何条件下将UACT位设置为0:

- 通信期间检测到DTCH中断 (当UACT=1时)
- 通信期间检测到EOFERR中断 (当UACT=1时)

在USB总线复位处理结束 (将0写入USBRST位) 或从挂起状态恢复处理结束 (将0写入RESUME位) 时, 始终向UACT位写入1。

在设备控制器模式下, 始终将此位设置为0。

#### RESUME位 (恢复输出)

RESUME位控制主机控制器模式下的恢复信号输出。

当该位设置为1时, USBFS将USB端口驱动到K状态并输出恢复信号。当RWUPE位为1且处于USB挂起状态时, USBFS在检测到远程唤醒信号时将该位设置为1。

当RESUME位为1时, USBFS继续输出K状态, 直到该位被软件清除为0。这在USB2.0规范中定义的时间内, RESUME位必须为1 (恢复周期)。仅当接口处于挂起状态时将此位设置为1。在恢复处理结束的同时向UACT位写入1 (向RESUME位写入0)。

在设备控制器模式下始终将此位设置为0。

#### USBRST位 (USB总线复位输出)

USBRST位控制主机控制器模式下USB总线信号的输出。当该位设置为1时, USBFS将USB端口驱动到SE0状态以复位USB总线。当USBRST位为1时, USBFS继续输出SE0, 直到该位被软件清零。在USB2.0规范中定义的时间内, USBRST位必须为1 (USB总线复位周期)。通信期间(UACT=1)或恢复处理期间(RESUME)向USBRST位写入1

= 1) prevents the USBFS from starting USB bus reset processing until both the UACT and RESUME bits become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset processing (writing 0 to the USBRST bit).

Always set this bit to 0 in device controller mode.

#### RWUPE bit (Wakeup Detection Enable)

The RWUPE bit enables or disables remote wakeup signals (resume signals) from downstream peripheral devices in host controller mode. When this bit is set to 1, the USBFS detects a remote wakeup signal (K-state for 2.5 μs) from a downstream peripheral device, and performs resume processing, driving the K-state. When the RWUPE bit is set to 0, the USBFS ignores remote wakeup signals (K-states) from peripheral devices connected to the USB port.

Do not stop the internal clock when the RWUPE bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in device controller mode.

#### WKUP bit (Wakeup Output)

The WKUP bit enables or disables remote wakeup signals (resume signals) to the USB bus in device controller mode.

The USBFS controls the output timing of the remote wakeup signals. When this bit is set to 1, the USBFS clears it to 0 after outputting the K-state for 10 ms. The USB 2.0 specification specifies that the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is sent. If the USBFS writes 1 to the WKUP bit immediately after detecting the Suspend state, the K-state is output after 2 ms.

Only write 1 to the WKUP bit when the device is in the Suspend state (INTSTS0.DVSSQ[2:0] = 1xxb) and the USB host enables the remote wakeup signal (RWUPE = 1). Do not stop the internal clock while this bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in host controller mode.

#### HNPBTOA bit (Host Negotiation Protocol (HNP) Control)

The HNPBTOA bit is used when switching from device B to device A while in OTG mode.

If the HNPBTOA bit is 1, the internal function control maintains the Suspend state until HNP processing ends, even if the SYSCFG.DPRPU bit is set to 0 or the SYSCFG.DCFM bit is set to 1. Resume interrupts (RESM) are not generated even if a falling edge of D+ is detected.

The HNP processing ends when a host attach event is detected, because of a pull-up by the initiating party, or the HNPBTOA bit is cleared to 0 by software because the HNP processing times out.

### 26.2.4 CFIFO/CFIFOL : CFIFO Port Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x014

| Bit  | Symbol                      | Function  | R/W |
|------|-----------------------------|---|-----|
| 15:0 | FIFOPORT[15:0] <sup>1</sup> | FIFO Port<br>Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits | R/W |

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND) in the associated port selection register. See Table 26.5 and Table 26.6.

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

=1)防止USBFS开始USB总线复位处理，直到UACT和RESUME位都变为0。在USB总线复位处理结束的同时向UACT位写入1（向USBRST位写入0）。

在设备控制器模式下始终将此位设置为0。

#### RHUPE位（唤醒检测使能）

在主机控制器模式下，RWUPE位启用或禁用来自下游外围设备的远程唤醒信号（恢复信号）。当该位设置为1时，USBFS检测到来自下游外围设备的远程唤醒信号（K状态持续2.5μs），并执行恢复处理，驱动K状态。当RHUPE位设置为0时，USBFS忽略来自连接到USB端口的的外围设备的远程唤醒信号（K状态）。

当RHUPE位为1时不要停止内部时钟，即使处于挂起状态（SYSCFG.SCKE位必须设置为1）。

在设备控制器模式下始终将此位设置为0。

#### WKUP bit (Wakeup Output)

WKUP位在设备控制器模式下启用或禁用到USB总线的远程唤醒信号（恢复信号）。

USBFS控制远程唤醒信号的输出时序。当该位设置为1时，USBFS在输出K状态10ms后将其清除为0。USB2.0规范规定，在发送远程唤醒信号之前，USB总线空闲状态必须保持5ms或更长时间。如果USBFS在检测到Suspend状态后立即向WKUP位写入1，则在2ms后输出K-state。

仅当设备处于挂起状态（INTSTS0.DVSSQ[2:0]=1xxb）且USB主机使能远程唤醒信号（RWUPE=1）时向WKUP位写入1。当该位为1时不要停止内部时钟，即使处于挂起状态（SYSCFG.SCKE位必须设置为1）。

在主机控制器模式下始终将此位设置为0。

#### HNPBTOA位（主机协商协议(HNP)控制)

在OTG模式下从设备B切换到设备A时使用HNPBTOA位。

如果HNPBTOA位为1，内部功能控制保持暂停状态直到HNP处理结束，即使SYSCFG.DPRPU位设置为0或SYSCFG.DCFM位设置为1。不产生恢复中断(RESM)即使检测到D+的下降沿。

当检测到主机连接事件时，HNP处理结束，因为发起方的上拉，或者由于HNP处理超时，HNPBTOA位由软件清零。

### 26.2.4 CFIFOCFIFOL:CFIFO端口寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x014

| Bit  | Symbol                      | Function  | R/W |
|------|-----------------------------|---|-----|
| 15:0 | FIFOPORT[15:0] <sup>1</sup> | FIFO Port<br>通过访问这些位从FIFO缓冲区读取接收数据或将发送数据写入FIFO缓冲区 | R/W |

注1.有效位取决于相关端口选择寄存器中的MBW设置(CFIFOSEL.MBW)和BIGEND设置(CFIFOSEL.BIGEND)。请参见表26.5和表26.6。

三个FIFO端口可用：

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIFO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

**FIFOPORT[15:0] bits (FIFO Port)**

When the FIFOPORT[15:0] bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See Table 26.5 and Table 26.6.

**Table 26.5 Endian operation in 16-bit access**

| CFIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---------------------|-------------|------------|
| 0                   | N + 1 data  | N + 0 data |
| 1                   | N + 0 data  | N + 1 data |

**Table 26.6 Endian operation in 8-bit access**

| CFIFOSEL.BIGEND bit | Bits [15:8]         | Bits [7:0] |
|---------------------|---------------------|------------|
| 0                   | Access prohibited*1 | N + 0 data |
| 1                   | Access prohibited*1 | N + 0 data |

Note 1. Writing to or reading from these areas is not allowed.

**26.2.5 DnFIFO/DnFIFOL : DnFIFO Port Register (n = 0, 1)**

Base address: USBFS = 0x4009\_0000

Offset address: 0x018 + 0x4 × n

| Bit  | Symbol                       | Function  | R/W |
|------|------------------------------|---|-----|
| 15:0 | FIFOPORT[15:0] <sup>*1</sup> | FIFO Port<br>Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits | R/W |

每个FIFO端口配置有:

- 一个端口寄存器 (CFIFO、D0FIFO或D1FIFO)，用于处理从FIFO缓冲区读取数据并将数据写入FIFO缓冲区
- 端口选择寄存器 (CFIFOSEL、D0FIFOSEL或D1FIFOSEL)，用于选择分配给FIFO端口的管道
- 一个端口控制寄存器 (CFIFOCTR、D0FIFOCTR或D1FIFOCTR)

每个FIFO端口具有以下约束:

- 通过CFIFO端口访问DCP控制传输的FIFO缓冲区
- 通过D0FIFO或D1FIFO端口访问DMA或DTC传输的FIFO缓冲区
- D0FIFO和D1FIFO端口也可以被CPU访问
- 当使用特定于FIFO端口的功能时，例如DMA或DTC传输功能，您不能更改在端口选择寄存器的CURPIPE[3:0]位中选择的管道号
- 配置FIFO端口的寄存器不会影响其他FIFO端口
- 不能将同一管道分配给两个或多个FIFO端口
- 有两种FIFO缓冲区状态，一种授予CPU访问权限，另一种授予串行接口引擎(SIE)。当SIE有访问权限时，CPU不能访问FIFO缓冲区

**FIFOPORT[15:0] bits (FIFO Port)**

当访问FIFOPORT[15:0]位时，USBFS从FIFO缓冲区读取接收数据或将发送数据写入FIFO缓冲区。只有当相关端口控制寄存器 (CFIFOCTR、D0FIFOCTR或D1FIFOCTR) 中的FRDY位为1时，才能访问FIFO端口寄存器。

FIFO端口寄存器中的有效位取决于端口选择寄存器 (CFIFOSEL、D0FIFOSEL或D1FIFOSEL) 中的MBW和BIGEND设置。请参见表26.5和表26.6。

**Table 26.5 16位访问中的字节序操作**

| CFIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---------------------|-------------|------------|
| 0                   | N + 1 data  | N + 0 data |
| 1                   | N + 0 data  | N + 1 data |

**Table 26.6 8位访问中的字节序操作**

| CFIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---------------------|-------------|------------|
| 0                   | 禁止访问*1      | N + 0 data |
| 1                   | 禁止访问*1      | N + 0 data |

注1.不允许对这些区域进行写入或读取。

**26.2.5 DnFIFODnFIFOL:DnFIFO端口寄存器(n=0 1)**

Base address: USBFS = 0x4009\_0000

Offset address: 0x018 + 0x4 × n

| Bit  | Symbol                       | Function  | R/W |
|------|------------------------------|---|-----|
| 15:0 | FIFOPORT[15:0] <sup>*1</sup> | FIFO Port<br>通过访问这些位从FIFO缓冲区读取接收数据或将发送数据写入FIFO缓冲区 | R/W |

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW, D0FIFOSEL.MBW, and D1FIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND, D0FIFOSEL.BIGEND, and D1FIFOSEL.BIGEND) in the associated port selection register. See Table 26.7 and Table 26.8.

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIFO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

#### FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See Table 26.7 and Table 26.8.

Table 26.7 Endian operation in 16-bit access

| CFIFOSEL.BIGEND bit<br>D0FIFOSEL.BIGEND bit<br>D1FIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---|-------------|------------|
| 0   | N + 1 data  | N + 0 data |
| 1   | N + 0 data  | N + 1 data |

Table 26.8 Endian operation in 8-bit access

| CFIFOSEL.BIGEND bit<br>D0FIFOSEL.BIGEND bit<br>D1FIFOSEL.BIGEND bit | Bits [15:8]         | Bits [7:0] |
|---|---------------------|------------|
| 0   | Access prohibited*1 | N + 0 data |
| 1   | Access prohibited*1 | N + 0 data |

Note 1. Writing to or reading from these areas is not allowed.

注1.有效位取决于相关端口选择寄存器中的MBW设置 (CFIFOSEL.MBW、D0FIFOSEL.MBW和D1FIFOSEL.MBW) 和BIGEND设置 (CFIFOSEL.BIGEND、D0FIFOSEL.BIGEND和D1FIFOSEL.BIGEND)。请参见表26.7和表26.8。

三个FIFO端口可用:

- CFIFO
- D0FIFO
- D1FIFO

每个FIFO端口配置有:

- 一个端口寄存器 (CFIFO、D0FIFO或D1FIFO)，用于处理从FIFO缓冲区读取数据并将数据写入FIFO缓冲区
- 端口选择寄存器 (CFIFOSEL、D0FIFOSEL或D1FIFOSEL)，用于选择分配给FIFO端口的管道
- 一个端口控制寄存器 (CFIFOCTR、D0FIFOCTR或D1FIFOCTR)

每个FIFO端口具有以下约束:

- 通过CFIFO端口访问DCP控制传输的FIFO缓冲区
- 通过D0FIFO或D1FIFO端口访问DMA或DTC传输的FIFO缓冲区
- D0FIFO和D1FIFO端口也可以被CPU访问
- 当使用特定于FIFO端口的功能时，例如DMA或DTC传输功能，您不能更改在端口选择寄存器的CURPIPE[3:0]位中选择的管道号
- 配置FIFO端口的寄存器不会影响其他FIFO端口
- 不能将同一管道分配给两个或多个FIFO端口
- 有两种FIFO缓冲区状态，一种授予CPU访问权限，另一种授予串行接口引擎(SIE)。当SIE有访问权限时，CPU不能访问FIFO缓冲区

#### FIFOPORT[15:0] bits (FIFO Port)

当访问FIFOPORT位时，USBFS从FIFO缓冲区读取接收数据或将发送数据写入FIFO缓冲区。只有当相关端口控制寄存器 (CFIFOCTR、D0FIFOCTR或D1FIFOCTR) 中的FRDY位为1时，才能访问FIFO端口寄存器。

FIFO端口寄存器中的有效位取决于端口选择寄存器 (CFIFOSEL、D0FIFOSEL或D1FIFOSEL) 中的MBW和BIGEND设置。请参见表26.7和表26.8。

Table 26.7 16位访问中的字节序操作

| CFIFOSEL.BIGEND bit<br>D0FIFOSEL.BIGEND bit<br>D1FIFOSEL.BIGEND bit | Bits [15:8] | Bits [7:0] |
|---|-------------|------------|
| 0   | N + 1 data  | N + 0 data |

| 15    | RCNT         | Read Count Mode<br>0: The DTLN[8:0] bits (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) are cleared when all receive data is read from the CFIFO. In double buffer mode, the DTLN[8:0] value is cleared when all data is read from only a single plane.<br>1: The DTLN[8:0] bits are decremented each time the receive data is read from the CFIFO. | R/W            |

Note 1. Only 0 can be read.

Do not specify the same pipe number in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected.

Do not change the pipe number while DMA or DTC transfer is enabled.

**CURPIPE[3:0] bits (CFIFO Port Access Pipe Specification)**

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the CFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

## 26.2.6 CFIFOSEL:CFIFO端口选择寄存器

Base address: USBFS = 0x4009\_0000

| 9     | —            | 该位读取为0。写入值应为0。  | R/W            |
| 10    | MBW          | CFIFO端口访问位宽<br>0: 8-bit width<br>1: 16-bit width  | R/W            |
| 13:11 | —            | 这些位被读取为0。写入值应为0。  | R/W            |
| 14    | REW          | 缓冲区指针倒带<br>0: 不倒回缓冲区指针1: 倒回缓冲区指针  | W <sup>1</sup> |
| 15    | RCNT         | 读取计数模式<br>0: DTLN[8:0]位 (CFIFOCTR.DTLN[8:0]、D0FIFOCTR.DTLN[8:0]、D1FIFOCTR.DTLN[8:0]) 在所有接收数据从先进先出。在双缓冲模式下, 当仅从单个平面读取所有数据时, 清除DTLN[8:0]值。<br>1: 每次从CFIFO读取接收数据时, DTLN[8:0]位递减。 | R/W            |

注1.只能读取0。

不要在CFIFOSEL、D0FIFOSEL和D1FIFOSEL寄存器的CURPIPE[3:0]位中指定相同的管道编号。当D0FIFOSEL和D1FIFOSEL寄存器中的CURPIPE[3:0]位设置为0000b时, 不选择管道。

启用DMA或DTC传输时不要更改管道编号。

**CURPIPE[3:0]位 (CFIFO端口访问管道规范)**

CURPIPE[3:0]位指定用于通过CFIFO端口读取或写入数据的管道编号。写入这些位后, 读取它们以检查写入的值是否与读取的值一致, 然后再进行下一个过程。不要为CFIFOSEL、D0FIFOSEL和D1FIFOSEL中的CURPIPE[3:0]位设置相同的管道编号。

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

**ISEL bit (CFIFO Port Access Direction When DCP Is Selected)**

After writing a new value to the ISEL bit with the DCP as the selected pipe, read the ISEL bit to check that the written value agrees with the read value before proceeding to the next process. Set the ISEL and CURPIPE[3:0] bits simultaneously.

**MBW bit (CFIFO Port Access Bit Width)**

The MBW bit specifies the bit width for accessing the CFIFO port.

When the selected pipe is receiving, set the CURPIPE[3:0] and MBW bits simultaneously. After a write to these bits starts a data read from the FIFO buffer, do not change the bits until all of the data is read.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

**REW bit (Buffer Pointer Rewind)**

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the REW bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

**26.2.7 DnFIFOSEL : DnFIFO Port Select Register (n = 0, 1)**

Base address: USBFS = 0x4009\_0000

Offset address: 0x028 + 0x4 × n

| Bit | Symbol       | Function  | R/W |
|-----|--------------|---|-----|
| 3:0 | CURPIPE[3:0] | FIFO Port Access Pipe Specification<br>0x0: Default Control Pipe<br>0x1: Pipe 1<br>0x2: Pipe 2<br>0x3: Pipe 3<br>0x4: Pipe 4<br>0x5: Pipe 5<br>0x6: Pipe 6<br>0x7: Pipe 7<br>0x8: Pipe 8<br>0x9: Pipe 9<br>Others: Setting prohibited | R/W |
| 7:4 | —            | These bits are read as 0. The write value should be 0.  | R/W |
| 8   | BIGEND       | FIFO Port Endian Control<br>0: Little endian<br>1: Big endian   | R/W |
| 9   | —            | This bit is read as 0. The write value should be 0.   | R/W |
| 10  | MBW          | FIFO Port Access Bit Width<br>0: 8-bit width<br>1: 16-bit width   | R/W |

在FIFO缓冲区访问期间，即使尝试更改CURPIPE[3:0]设置，当前访问设置也会保留，直到访问完成。

**ISEL位 (选择DCP时的CFIFO端口访问方向)**

在以DCP作为选定管道的情况下将新值写入ISEL位后，读取ISEL位以检查写入的值是否与读取的值一致，然后再进行下一个过程。同时设置ISEL和CURPIPE[3:0]位。

**MBW位 (CFIFO端口访问位宽度)**

MBW位指定访问CFIFO端口的位宽。

当所选管道正在接收时，同时设置CURPIPE[3:0]和MBW位。在写入这些位开始从FIFO缓冲区读取数据后，在读取所有数据之前不要更改这些位。

当所选管道正在传输时，位宽不能从8位更改为16位，同时数据正在写入FIFO缓冲区。

即使选择了16位宽度，也可以通过字节访问控制写入奇数个字节。

**REW位 (缓冲区指针倒带)**

REW位指定是否倒回缓冲区指针。

当所选管道正在接收时，在读取FIFO缓冲区时将此位设置为1允许从第一个数据重新读取FIFO缓冲区。在双缓冲中，此设置允许从第一个条目重新读取当前读取的FIFO缓冲区平面。

请勿在同时更改CURPIPE[3:0]位时将此位设置为1。在将REW位设置为1之前，请务必检查FRDY位是否为1。

要从传输管道的第一个数据重写FIFO缓冲区，请使用BCLR位。

**26.2.7 DnFIFOSEL:DnFIFO端口选择寄存器(n=0 1)**

Base address: USBFS = 0x4009\_0000

Offset address: 0x028 + 0x4 × n

| Bit | Symbol       | Function   | R/W |
|-----|--------------|--|-----|
| 3:0 | CURPIPE[3:0] | FIFO端口访问管道规范<br>0x0: 默认控制管道0x1:<br>管道10x2: 管道20x3: 管<br>道30x4: 管道40x5: 管道<br>50x6: 管道60x7: 管道7<br>0x8: 管道80x9: 管道9<br><br>其他: 禁止设置 | R/W |
| 7:4 | —            | 这些位被读取为0。写入值应为0。   | R/W |
| 8   | BIGEND       | FIFO端口字节序控制<br>0: 小端1: 大<br>端  | R/W |
| 9   | —            | 该位读取为0。写入值应为0。   | R/W |
| 10  | MBW          | FIFO端口访问位宽<br>0: 8-bit width<br>1: 16-bit width  | R/W |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 11  | —      | This bit is read as 0. The write value should be 0.   | R/W |
| 12  | DREQE  | DMA/DTC Transfer Request Enable<br>0: Disable DMA/DTC transfer request<br>1: Enable DMA/DTC transfer request  | R/W |
| 13  | DCLRM  | Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read<br>0: Disable auto buffer clear mode<br>1: Enable auto buffer clear mode   | R/W |
| 14  | REW    | Buffer Pointer Rewind<br>0: Do not rewind buffer pointer<br>1: Rewind buffer pointer  | W   |
| 15  | RCNT   | Read Count Mode<br>0: Clear DTLN[8:0] bits in (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) when all receive data is read from DnFIFO (after read of a single plane in double buffer mode)<br>1: Decrement DTLN[8:0] bits each time receive data is read from DnFIFO | R/W |

The same pipe must not be specified in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected. The pipe number must not be changed while DMA or DTC transfer is enabled.

#### CURPIPE[3:0] bits (FIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the DnFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

#### MBW bit (FIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the DnFIFO port.

When the selected pipe is receiving, after a write to these bits starts a data read from the FIFO buffer, do not change the bits until all of the data is read. Set the CURPIPE[3:0] and MBW bits simultaneously.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

#### DREQE bit (DMA/DTC Transfer Request Enable)

The DREQE bit enables or disables issuing of DMA or DTC transfer requests. To enable DMA or DTC transfer requests, set this bit to 1 after setting the CURPIPE[3:0] bits. To change the CURPIPE[3:0] setting, first set this bit to 0.

#### DCLRM bit (Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read)

The DCLRM bit enables or disables automatic FIFO buffer clearing after data in the selected pipe is read.

When this bit is set to 1, on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or when reading of a received short packet is complete while the PIPECFG.BFRE bit is 1, the USBFS sets the BCLR bit in the FIFO port control register to 1.

When using the USBFS with the SOFCFG.BRDYM bit set to 1, set this bit to 0.

#### REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the bit to 1, be sure to check that the FRDY bit is 1.

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 11  | —      | 该位读取为0。写入值应为0。   | R/W |
| 12  | DREQE  | DMADTC传输请求启用<br>0: 禁用DMADTC传输请求1: 启用DMADTC传输请求   | R/W |
| 13  | DCLRM  | 读取指定管道数据后访问的自动缓冲存储器清除模式<br>0: 禁用自动缓冲区清除模式1: 启用自动缓冲区清除模式  | R/W |
| 14  | REW    | 缓冲区指针倒带<br>0: 不倒回缓冲区指针1: 倒回缓冲区指针   | W   |
| 15  | RCNT   | 读取计数模式<br>0: 清除 (CFIFOCTR.DTLN[8:0]、D0FIFOCTR.DTLN[8:0]、D1FIFOCTR.DTLN[8:0])当从DnFIFO中读取所有接收数据时 (在双缓冲模式下读取单个平面后)<br>1: 每次从DnFIFO读取接收数据时, 递减DTLN[8:0]位 | R/W |

不能在CFIFOSEL、D0FIFOSEL和D1FIFOSEL寄存器的CURPIPE[3:0]位中指定相同的管道。当D0FIFOSEL和D1FIFOSEL寄存器中的CURPIPE[3:0]位设置为0000b时, 不选择管道。启用DMA或DTC传输时, 不得更改管道编号。

#### CURPIPE[3:0]位 (FIFO端口访问管道规范)

CURPIPE[3:0]位指定用于通过DnFIFO端口读取或写入数据的管道编号。写入这些位后, 读取它们以检查写入的值是否与读取的值一致, 然后再进行下一个过程。不要为CFIFOSEL、D0FIFOSEL和D1FIFOSEL中的CURPIPE[3:0]位设置相同的管道编号。

在FIFO缓冲区访问期间, 即使尝试更改CURPIPE[3:0]设置, 当前访问设置也会保留, 直到访问完成。

#### MBW位 (FIFO端口访问位宽度)

MBW位指定访问DnFIFO端口的位宽。

当所选管道正在接收时, 在写入这些位后开始从FIFO缓冲区读取数据, 在读取所有数据之前不要更改这些位。同时设置CURPIPE[3:0]和MBW位。

当所选管道正在传输时, 位宽不能从8位更改为16位, 同时数据正在写入FIFO缓冲区。

即使选择了16位宽度, 也可以通过字节访问控制写入奇数个字节。

#### DREQE位 (DMADTC传输请求使能)

DREQE位启用或禁用DMA或DTC传输请求的发出。要启用DMA或DTC传输请求, 请在设置CURPIPE[3:0]位后将此位设置为1。要更改CURPIPE[3:0]设置, 首先将该位设置为0。

#### DCLRM位 (读取指定管道数据后访问的自动缓冲存储器清除模式)

在读取所选管道中的数据后, DCLRM位启用或禁用自动FIFO缓冲区清除。

当该位设置为1时, 在分配给所选管道的FIFO缓冲区为空时接收到零长度数据包, 或在PIPECFG.BFRE位为1时完成读取接收到的短数据包时, USBFS设置FIFO端口控制寄存器中的BCLR位为1。

当使用SOFCFG.BRDYM位设置为1的USBFS时, 将此位设置为0。

#### REW位 (缓冲区指针倒带)

REW位指定是否倒回缓冲区指针。

当所选管道正在接收时, 在读取FIFO缓冲区时将此位设置为1允许从第一个数据重新读取FIFO缓冲区。在双缓冲中, 此设置允许从第一个条目重新读取当前读取的FIFO缓冲区平面。

请勿在同时更改CURPIPE[3:0]位时将此位设置为1。在将该位设置为1之前, 请务必检查FRDY位是否为1。

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

### RCNT bit (Read Count Mode)

The RCNT bit specifies the read mode for the value in the CFIFOCTR.DTLN bit. When accessing DnFIFO with the PIPECFG.BFRE bit set to 1, set the RCNT bit to 0.

## 26.2.8 CFIFOCTR : CFIFO Port Control Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x022

|                    |      |      |      |    |    |    |   |           |   |   |   |   |   |   |   |   |

| Bit  | Symbol    | Function  | R/W |
|------|-----------|---|-----|
| 8:0  | DTLN[8:0] | Receive Data Length<br>Indicates the receive data length.<br>The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits. | R   |
| 12:9 | —         | These bits are read as 0. The write value should be 0.  | R/W |
| 13   | FRDY      | FIFO Port Ready<br>0: FIFO port access disabled<br>1: FIFO port access enabled  | R   |
| 14   | BCLR      | CPU Buffer Clear<br>0: No operation<br>1: Clear FIFO buffer on the CPU side   | W   |
| 15   | BVAL      | Buffer Memory Valid Flag<br>0: Invalid (writing 0 has no effect)<br>1: Writing ended  | R/W |

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

### DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0

The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.

While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

### FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

要从传输管道的第一个数据重写FIFO缓冲区, 请使用BCLR位。

### RCNT位 (读取计数模式)

RCNT位指定CFIFOCTR.DTLN位中值的读取模式。当使用DnFIFO访问PIPECFG.BFRE位设置为1, 将RCNT位设置为0。

## 26.2.8 CFIFOCTR:CFIFO端口控制寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x022

|               |      |      |      |    |    |    |   |           |   |   |   |   |   |   |   |   |

| 15   | BVAL      | 缓冲存储器有效标志<br>0: 无效 (写入0无效) 1: 写入结束   | R/W |

CFIFOCTR、D0FIFOCTR和D1FIFOCTR寄存器对应于CFIFO、D0FIFO和D1FIFO缓冲区。

### DTLN[8:0]位 (接收数据长度)

DTLN[8:0]位指示接收数据的长度。

在读取FIFO缓冲区时, DTLN[8:0]位指示不同的值, 具体取决于DnFIFOSEL.RCNT位(n=0 1), 如下所示:

- RCNT = 0

USBFS设置DTLN[8:0]位以指示接收数据的长度, 直到CPU或DMADTC从单个FIFO缓冲区平面读取所有接收数据。

当PIPECFG.BFRE位=1时, USBFS将保留接收数据的长度, 直到BCLR位设置为1, 即使在读取所有数据之后也是如此。

- RCNT = 1

每次从FIFO缓冲区读取数据时, USBFS都会递减DTLN[8:0]位中指示的值。当MBW=0时该值减1, 当MBW=1时该值减2。

当从一个FIFO缓冲平面读取所有数据时, USBFS将这些位设置为0。在双缓冲模式下, 如果在一个FIFO缓冲平面中的数据在从另一个平面读取所有数据之前接收到数据, 则USBFS设置这些位以指示在读取所有数据时在前一个平面中接收数据的长度从后一个平面。

### FRDY位 (FIFO端口就绪)

FRDY位指示FIFO端口是否可以被CPU或DMADTC访问。

在以下情况下, USBFS将FRDY位设置为1, 但由于没有数据可读取, 因此无法通过FIFO端口读取数据:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

**BCLR bit (CPU Buffer Clear)**

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

**BVAL flag (Buffer Memory Valid Flag)**

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

**26.2.9 DnFIFOCTR : DnFIFO Port Control Register (n = 0, 1)**

Base address: USBFS = 0x4009\_0000

Offset address: 0x02A + 0x4 × n

| Bit  | Symbol    | Function  | R/W              |
|------|-----------|---|------------------|
| 8:0  | DTLN[8:0] | Receive Data Length<br>Indicates the receive data length.<br>The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits. | R                |
| 12:9 | —         | These bits are read as 0. The write value should be 0.  | R/W              |
| 13   | FRDY      | FIFO Port Ready<br>0: FIFO port access disabled<br>1: FIFO port access enabled  | R                |
| 14   | BCLR      | CPU Buffer Clear<br>0: No operation<br>1: Clear FIFO buffer on the CPU side   | R/W <sup>1</sup> |

- 当分配给所选管道的FIFO缓冲区为空时，接收到一个长度为零的数据包
- PIPECFG.BFRE位=1时接收到一个短数据包并完全读取数据

在这些情况下，将BCLR位设置为1以清除FIFO缓冲区，并启用下一个数据的发送和接收。

**BCLR位 (CPU缓冲区清除)**

将BCLR位设置为1以清除所选管道的CPU端的FIFO缓冲区。

当分配给所选管道的FIFO缓冲区设置为双缓冲区模式时，USBFS仅清除即使两个平面都已启用读取，也有FIFO缓冲区。

当DCP为选定管道时，将BCLR位设置为1允许USBFS清除FIFO缓冲区，而不管CPU或SIE是否具有访问权限。要在SIE具有访问权限时清除缓冲区，请将DCPCTR.PID[1:0]位设置为00b (NAK响应)，然后再将BCLR位设置为1。

当所选管道正在传输时，如果同时向BVAL标志和BCLR位写入1，则USBFS会清除已写入的数据，从而可以传输零长度数据包。

当所选管道不是DCP时，仅在FIFO端口控制寄存器中的frdy位为1 (由USBFS设置) 时，仅将1个写入BCLR位。

**BVAL标志 (缓冲存储器有效标志)**

当数据完全写入CPU端的FIFO缓冲区时，将BVAL标志设置为1，用于在CURPIPE[3:0].

当所选管道正在传输时，在以下情况下将此标志设置为1:

- 要发送一个短包，在数据写入后将此标志设置为1
- 要发送零长度数据包，请在数据写入FIFO缓冲区之前将此标志设置为1

然后USBFS将FIFO缓冲区从CPU端切换到SIE端，从而启用传输。

当在连续传输模式下为管道写入最大数据包大小的数据时，USBFS将BVAL标志设置为1，并将FIFO缓冲区从CPU侧切换到SIE侧，从而启用传输。

仅在FRDY位为1 (由USBFS设置) 时将1写入BVAL标志。当所选管道正在接收时，不要将BVAL标志设置为1。

**26.2.9 DnFIFOCTR:DnFIFO端口控制寄存器(n=0 1)**

Base address: USBFS = 0x4009\_0000

Offset address: 0x02A + 0x4 × n

| Bit  | Symbol    | Function  | R/W              |
|------|-----------|---|------------------|
| 8:0  | DTLN[8:0] | 接收数据长度<br>表示接收数据长度。<br>这些值的含义因端口选择寄存器中的RCNT位设置而异。有关详细信息，请参见DTLN[8:0]位的说明。 | R                |
| 12:9 | —         | 这些位被读取为0。写入值应为0。  | R/W              |
| 13   | FRDY      | FIFO端口就绪<br>0: 禁止FIFO端口访问<br>1: 使能FIFO端口访问                                | R                |
| 14   | BCLR      | CPU缓冲区清除<br>0: 无操作<br>1: 清除CPU端的FIFO缓冲区                                   | R/W <sup>1</sup> |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 15  | BVAL   | Buffer Memory Valid Flag<br>0: Invalid (writing 0 has no effect)<br>1: Writing ended | R/W |

Note 1. Only 0 can be read.

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

#### DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0

The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.

While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

#### FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

#### BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

#### BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written

| Bit | Symbol | Function                           | R/W |
|-----|--------|------------------------------------|-----|
| 15  | BVAL   | 缓冲存储器有效标志<br>0: 无效 (写入0无效) 1: 写入结束 | R/W |

注1.只能读取0。

CFIFOCTR、D0FIFOCTR和D1FIFOCTR寄存器对应于CFIFO、D0FIFO和D1FIFO缓冲区。

#### DTLN[8:0]位 (接收数据长度)

DTLN[8:0]位指示接收数据的长度。

在读取FIFO缓冲区时, DTLN[8:0]位指示不同的值, 具体取决于DnFIFOSEL.RCNT位(n=0 1), 如下所示:

- RCNT = 0

USBFS设置DTLN[8:0]位以指示接收数据的长度, 直到CPU或DMADTC从单个FIFO缓冲区平面读取所有接收数据。

当PIPECFG.BFRE位=1时, USBFS将保留接收数据的长度, 直到BCLR位设置为1, 即使在读取所有数据之后也是如此。

- RCNT = 1

每次从FIFO缓冲区读取数据时, USBFS都会递减DTLN[8:0]位中指示的值。当MBW=0时该值减1, 当MBW=1时该值减2。

当从一个FIFO缓冲平面读取所有数据时, USBFS将这些位设置为0。在双缓冲模式下, 如果在一个FIFO缓冲平面中的数据在从另一个平面读取所有数据之前接收到数据, 则USBFS设置这些位以指示在读取所有数据时在前一个平面中接收数据的长度从后一个平面。

#### FRDY位 (FIFO端口就绪)

FRDY位指示FIFO端口是否可以被CPU或DMADTC访问。

在以下情况下, USBFS将FRDY位设置为1, 但由于没有数据可读取, 因此无法通过FIFO端口读取数据:

- 当分配给所选管道的FIFO缓冲区为空时, 接收到一个长度为零的数据包
- PIPECFG.BFRE位=1时接收到一个短数据包并完全读取数据

在这些情况下, 将BCLR位设置为1以清除FIFO缓冲区, 并启用下一个数据的发送和接收。

#### BCLR位 (CPU缓冲区清除)

将BCLR位设置为1以清除所选管道的CPU端的FIFO缓冲区。

当分配给所选管道的FIFO缓冲区设置为双缓冲区模式时, USBFS仅清除即使两个平面都已启用读取, 也有FIFO缓冲区。

当DCP为选定管道时, 将BCLR位设置为1允许USBFS清除FIFO缓冲区, 而不管CPU或SIE是否具有访问权限。要在SIE具有访问权限时清除缓冲区, 请将DCPCTR.PID[1:0]位设置为00b (NAK响应), 然后再将BCLR位设置为1。

当所选管道正在传输时, 如果同时向BVAL标志和BCLR位写入1, 则USBFS会清除已写入的数据, 从而可以传输零长度数据包。

当所选管道不是DCP时, 仅在FIFO端口控制寄存器中的frdy位为1 (由USBFS设置) 时, 仅将1写入BCLR位。

#### BVAL标志 (缓冲存储器有效标志)

当数据完全写入CPU端的FIFO缓冲区时, 将BVAL标志设置为1, 用于在CURPIPE[3:0].

当所选管道正在传输时, 在以下情况下将此标志设置为1:

- 要发送一个短包, 在数据写入后将此标志设置为1

- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

### 26.2.10 INTENB0 : Interrupt Enable Register 0

Base address: USBFS = 0x4009\_0000

Offset address: 0x030

|                    |      |      |      |      |      |       |       |       |   |   |   |   |   |   |   |   |

|-----|--------|--|-----|
| 7:0 | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 8   | BRDYE  | Buffer Ready Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request                         | R/W |
| 9   | NRDYE  | Buffer Not Ready Response Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request            | R/W |
| 10  | BEMPE  | Buffer Empty Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request                         | R/W |
| 11  | CTRE   | Control Transfer Stage Transition Interrupt Enable *1<br>0: Disable interrupt request<br>1: Enable interrupt request | R/W |
| 12  | DVSE   | Device State Transition Interrupt Enable *1<br>0: Disable interrupt request<br>1: Enable interrupt request           | R/W |
| 13  | SOFE   | Frame Number Update Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request                  | R/W |
| 14  | RSME   | Resume Interrupt Enable*1<br>0: Disable interrupt request<br>1: Enable interrupt request                             | R/W |
| 15  | VBSE   | VBUS Interrupt Enable<br>0: Disable interrupt request<br>1: Enable interrupt request                                 | R/W |

Note 1. The RSME, DVSE, and CTRE bits can only be set to 1 in device controller mode. Do not set these bits to 1 in host controller mode.

When a status flag in the INTSTS0 register sets to 1 and the associated interrupt request enable bit setting in theINTENB0 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB0 register setting, the status flag in the INTSTS0 register sets to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB0 register is switched from 0 to 1 while the associated status flag in the INTSTS0 register is set to 1, a USBFS interrupt is requested.

- 要发送零长度数据包，请在数据写入FIFO缓冲区之前将此标志设置为1

然后USBFS将FIFO缓冲区从CPU端切换到SIE端，从而启用传输。

当在连续传输模式下为管道写入最大数据包大小的数据时，USBFS将BVAL标志设置为1，并将FIFO缓冲区从CPU侧切换到SIE侧，从而启用传输。

仅在FRDY位为1（由USBFS设置）时将1写入BVAL标志。当所选管道正在接收时，不要将BVAL标志设置为1。

### 26.2.10 INTENB0:中断使能寄存器0

Base address: USBFS = 0x4009\_0000

Offset address: 0x030

|               |      |      |      |      |      |       |       |       |   |   |   |   |   |   |   |   |

Note: The bits in INTENB1 can only be set to 1 in host controller mode. Do not set these bits to 1 in device controller mode.

INTENB1 specifies the interrupt masks in host controller mode and for the setup transaction.

When a status flag in the INTSTS1 register sets to 1 and the associated interrupt request enable bit setting in the INTENB1 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB1 register setting, the status flag in the INTSTS1 register sets to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB1 register is switched from 0 to 1 while the associated status flag in the INTSTS1 register is set to 1, a USBFS interrupt is requested.

Do not enable interrupts in device controller mode.

Note: INTENB1中的位只能在主机控制器模式下设置为1。不要在设备控制器模式下将这些位设置为1。

INTENB1指定主机控制器模式和设置事务的中断掩码。

当INTSTS1寄存器中的状态标志设置为1并且INTENB1寄存器中相关的中断请求使能位设置为1时，USBFS发出USBFS中断请求。

无论INTENB1寄存器设置如何，INTSTS1寄存器中的状态标志都会设置为1，以响应满足相关条件的状态更改。

当INTENB1寄存器中的中断请求使能位从0切换到1时，而相关的状态标志在INTSTS1寄存器设置为1，请求USBFS中断。

不要在设备控制器模式下启用中断。

| 15:10 | —          | This bit is read as 0. The write value should be 0.   | R/W |

The BRDYENB register enables or disables the INTSTS0.BRDY bit to be set to 1 when a BRDY interrupt is detected for each pipe.

When a status flag in the BRDYSTS register sets to 1 and the associated PIPE<sub>n</sub>BRDYE bit (n = 0 to 9) setting in the BRDYENB register is 1, the INTSTS0.BRDY flag sets to 1. In this case, if the BRDYE bit in INTENB0 is 1, the USBFS generates a BRDY interrupt request. While at least one PIPE<sub>n</sub>BRDYE bit indicates 1, the USB generates the BRDY interrupt request when the associated interrupt request enable bit in the BRDYENB register is changed from 0 to 1 by software.

| 15:10 | —          | 该位读取为0。写入值应为0。                         | R/W |

当检测到每个管道的BRDY中断时，BRDYENB寄存器启用或禁用INTSTS0.BRDY位以设置为1。

当BRDYSTS寄存器中的状态标志设置为1并且BRDYENB寄存器中相关的PIPE<sub>n</sub>BRDYE位 (n=0到9) 设置为1时，INTSTS0.BRDY标志设置为1。在这种情况下，如果INTENB0中的BRDYE位为1，USBFS产生一个BRDY中断请求。当至少一个PIPE<sub>n</sub>BRDYE位指示1时，当BRDYENB寄存器中相关的中断请求使能位由软件从0变为1时，USB产生BRDY中断请求。

| 15:10 | —          | This bit is read as 0. The write value should be 0.   | R/W |

The NRDYENB register enables or disables the INTSTS0.NRDY bit to be set to 1 when a NRDY interrupt is detected for each pipe.

When a status flag in the NRDYSTS register sets to 1 and the associated PIPE<sub>n</sub>NRDYE (n = 0 to 9) bit setting in the NRDYENB register is 1, the INTSTS0.NRDY flag sets to 1. In this case, if the NRDYE bit in INTENB0 is 1, the USBFS generates a NRDY interrupt request. While at least one PIPE<sub>n</sub>NRDYE bit indicates 1, the USBFS generates the NRDY interrupt request when the associated interrupt request enable bit in the NRDYENB register is changed from 0 to 1 by software.

| 15:10 | —          | 该位读取为0。写入值应为0。                         | R/W |

当检测到每个管道的NRDY中断时，NRDYENB寄存器启用或禁用INTSTS0.NRDY位设置为1。

当NRDYSTS寄存器中的状态标志设置为1并且NRDYENB寄存器中相关的PIPE<sub>n</sub>NRDYE (n=0到9) 位设置为1时，INTSTS0.NRDY标志设置为1。在这种情况下，如果INTENB0中的NRDYE位为1、USBFS产生一个NRDY中断请求。当至少一个PIPE<sub>n</sub>NRDYE位指示1时，USBFS生成

当NRDYENB寄存器中的相关中断请求使能位由软件从0变为1时，发出NRDY中断请求。

| 15:10 | —          | This bit is read as 0. The write value should be 0.   | R/W |

The BEMPENB register enables or disables the INTSTS0.BEMP bit to be set to 1 when a BEMP interrupt is detected for each pipe.

When a status flag in the BEMPSTS register sets to 1 and the associated PIPE<sub>n</sub>BEMPE (n = 0 to 9) bit setting in the BEMPENB register is 1, the INTSTS0.BEMP flag sets to 1. In this case, if the BEMPE bit in INTENB0 is 1, the USBFS generates a BEMP interrupt request. While at least one PIPE<sub>n</sub>BEMPE bit indicates 1, the USBFS generates the BEMP interrupt request when the associated interrupt request enable bit in the BEMPENB register is changed from 0 to 1 by software.

| 3:0  | —        | These bits are read as 0. The write value should be 0.  | R/W |
| 4    | EDGESTS  | Edge Interrupt Output Status Monitor*1<br>Indicates 1 during the edge processing of an edge interrupt output signal.  | R   |
| 5    | —        | This bit is read as 0. The write value should be 0.   | R/W |
| 6    | BRDYM    | BRDY Interrupt Status Clear Timing<br>0: Clear BRDY flag by software<br>1: Clear BRDY flag by the USBFS through a data read from the FIFO buffer or data write to the FIFO buffer | R/W |
| 7    | —        | This bit is read as 0. The write value should be 0.   | R/W |
| 8    | TRNENSEL | Transaction-Enabled Time Select*1<br>0: Not low-speed communication<br>1: Low-speed communication   | R/W |
| 15:9 | —        | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. Confirm that the EDGESTS flag is 0 before stopping the clock supply to the USBFS.

**EDGESTS bit (Edge Interrupt Output Status Monitor)**

The EDGESTS bit indicates 1 during the edge processing of an edge interrupt output signal. Confirm that this bit is 0 before stopping the clock supply to the USBFS.

**BRDYM bit (BRDY Interrupt Status Clear Timing)**

The BRDYM bit specifies how the BRDY interrupt status flags for the pipes are cleared.

**TRNENSEL bit (Transaction-Enabled Time Select)**

When the USB port is in use for full- or low-speed communications, the TRNENSEL bit specifies the timing with which the USBFS issues tokens in a frame (transaction-enabled time).

Set this bit to 1 when a low-speed device is connected. The bit is only valid in host controller mode. Set this bit to 0 in device controller mode.

| Bit  | Symbol   | Function   | R/W |
|------|----------|--|-----|
| 3:0  | —        | 这些位被读取为0。写入值应为0。   | R/W |
| 4    | EDGESTS  | 边沿中断输出状态监视器*1<br>在边沿中断输出信号的边沿处理期间表示1。                                    | R   |
| 5    | —        | 该位读取为0。写入值应为0。   | R/W |
| 6    | BRDYM    | BRDY中断状态清除时序<br>0: 软件清除BRDY标志1: USBFS通过从FIFO缓冲区读取数据或向FIFO缓冲区写入数据清除BRDY标志 | R/W |
| 7    | —        | 该位读取为0。写入值应为0。   | R/W |
| 8    | TRNENSEL | 事务启用时间选择*1<br>0: 非低速通讯1: 低速通讯  | R/W |
| 15:9 | —        | 这些位被读取为0。写入值应为0。   | R/W |

注1.在停止向USBFS提供时钟之前，请确认EDGESTS标志为0。

**EDGESTS位 (边缘中断输出状态监视器)**

在边沿中断输出信号的边沿处理期间，EDGESTS位指示1。在停止向USBFS提供时钟之前，请确认该位为0。

**BRDYM位 (BRDY中断状态清除时序)**

BRDYM位指定如何清除管道的BRDY中断状态标志。

**TRNENSEL位 (事务使能时间选择)**

当USB端口用于全速或低速通信时，TRNENSEL位指定USBFS在一个帧中发布令牌 (事务启用时间)。

当连接了低速设备时，将此位设置为1。该位仅在主机控制器模式下有效。在设备控制器模式下将此位设置为0。

## 26.2.16 INTSTS0: 中断状态寄存器0

| 8   | BRDY      | Buffer Ready Interrupt Status<br>0: No BRDY interrupt occurred<br>1: BRDY interrupt occurred  | R     |
| 9   | NRDY      | Buffer Not Ready Interrupt Status<br>0: No NRDY interrupt occurred<br>1: NRDY interrupt occurred  | R     |
| 10  | BEMP      | Buffer Empty Interrupt Status<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred  | R     |
| 11  | CTRT      | Control Transfer Stage Transition Interrupt Status*2<br>0: No control transfer stage transition interrupt occurred<br>1: Control transfer stage transition interrupt occurred   | R/W*1 |
| 12  | DVST      | Device State Transition Interrupt Status*2<br>0: No device state transition interrupt occurred<br>1: Device state transition interrupt occurred   | R/W*1 |
| 13  | SOFR      | Frame Number Refresh Interrupt Status<br>0: No SOF interrupt occurred<br>1: SOF interrupt occurred  | R/W*1 |
| 14  | RESM      | Resume Interrupt Status*2 *3<br>0: No resume interrupt occurred<br>1: Resume interrupt occurred   | R/W*1 |
| 15  | VBINT     | VBUS Interrupt Status*3<br>0: No VBUS interrupt occurred<br>1: VBUS interrupt occurred  | R/W*1 |

Note: The value of the DVST bit is 0 when the MCU is reset and 1 after a USB bus reset.

Note: The value of the VBSTS bit is 1 when the USB\_VBUS pin is high and 0 when the USB\_VBUS pin is low.

Note: The value of the DVSQ[2:0] bits is 000b when the MCU is reset and 001b after a USB bus reset.

Note 1. To clear the VBINT, RESM, SOFR, DVST, CTRT, or VALID bits, write 0 only to the bits to be cleared. Write 1 to the other bits. Do not write 0 to the status bits indicating 0.

Note 2. The status of the RESM, DVST, and CTRT bits are changed only in device controller mode. Set the associated interrupt enable bits to 0 (disabled) in host controller mode.

Note 3. The USBFS detects a change in the status indicated in the VBINT and RESM bits even while the clock supply is stopped (SCKE bit = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply before clearing the status by software.

### CTSQ[2:0] bits (Control Transfer Stage)

In host controller mode, the read value of the CTSQ[2:0] bits is invalid.

| Bit | Symbol    | Function  | R/W   |

| 11  | CTRT      | 控制传输阶段转换中断状态*2<br>0: 未发生控制转移阶段转换中断1: 发生控制转移阶段转换中断   | R/W*1 |
| 12  | DVST      | 设备状态转换中断状态*2<br>0: 未发生设备状态转换中断1: 发生设备状态转换中断   | R/W*1 |
| 13  | SOFR      | 帧号刷新中断状态<br>0: 未发生SOF中断1: 发生SOF中断   | R/W*1 |
| 14  | RESM      | 恢复中断状态*2*3<br>0: 未发生恢复中断1: 发生恢复中断   | R/W*1 |
| 15  | VBINT     | VBUS中断状态*3<br>0: 未发生VBUS中断1: 发生VBUS中断   | R/W*1 |

Note: DVST位的值在MCU复位时为0, 在USB总线复位后为1。

Note: 当USB\_VBUS引脚为高电平时VBSTS位的值为1, 当USB\_VBUS引脚为低电平时为0。

Note: DVSQ[2:0]位的值在MCU复位时为000b, 在USB总线复位后为001b。

注1.要清除VBINT、RESM、SOFR、DVST、CTRT或VALID位, 只需将0写入要清除的位。将1写入其他位。不要将0写入指示0的状态位。

注2.RESM、DVST和CTRT位的状态仅在设备控制器模式下更改。在主机控制器模式下, 将相关的中断使能位设置为0(禁用)。

注3.即使在时钟供应停止(SCKE位=0)时, USBFS也会检测到VBINT和RESM位指示的状态变化, 并在相关中断请求位为1时请求中断。在之前启用时钟供应通过软件清除状态。

### CTSQ[2:0]位 (控制传输级)

在主机控制器模式下, CTSQ[2:0]位的读取值无效。

**VALID bit (USB Request Reception)**

In host controller mode, the read value of the VALID bit is invalid.

**DVSQ[2:0] bits (Device State)**

The DVSQ[2:0] bits are initialized by a USB bus reset. In host controller mode, the read value is invalid.

**BRDY flag (Buffer Ready Interrupt Status)**

The BRDY flag indicates the BRDY interrupt status.

The USBFS sets the BRDY bit to 1 when it detects a BRDY interrupt status (PIPE<sub>n</sub>BRDY = 1, n = 0 to 9) on at least one pipe for which BRDY interrupts are enabled (BRDYENB.PIPE<sub>n</sub>BRDYE = 1).

For the conditions that cause the PIPE<sub>n</sub>BRDY status to be asserted, see [section 26.3.3.1. BRDY interrupt](#).

The USBFS sets the BRDY bit to 0 when the software writes 0 to all of the PIPE<sub>n</sub>BRDY bits associated with the PIPE<sub>n</sub>BRDYE bits that are set to 1. Writing 0 to the BRDY flag in the software does not clear the flag.

**NRDY flag (Buffer Not Ready Interrupt Status)**

The NRDY flag indicates the NRDY interrupt status.

The USBFS sets the NRDY bit to 1 when it detects a NRDY interrupt status (PIPE<sub>n</sub>NRDY = 1, n = 0 to 9) on at least one pipe for which NRDY interrupts are enabled (NRDYENB.PIPE<sub>n</sub>NRDYE = 1).

For the conditions that cause the PIPE<sub>n</sub>NRDY status to be asserted, see [section 26.3.3.2. NRDY interrupt](#).

The USBFS sets the NRDY bit to 0 when the software writes 0 to all of the PIPE<sub>n</sub>NRDY bits associated with the PIPE<sub>n</sub>NRDYE bits that are set to 1. Writing 0 to the NRDY flag in the software does not clear the flag.

**NRDY flag (Buffer Empty Interrupt Status)**

The NRDY flag indicates the NRDY interrupt status.

The USBFS sets the NRDY bit to 1 when it detects a NRDY interrupt status (PIPE<sub>n</sub>BEMP = 1, n = 0 to 9) on at least one pipe for which NRDY interrupts are enabled (BEMPENB.PIPE<sub>n</sub>BEMPE = 1).

For the conditions that cause the PIPE<sub>n</sub>BEMP status to be asserted, see [section 26.3.3.3. BEMP interrupt](#).

The USBFS sets the NRDY bit to 0 when the software writes 0 to all of the PIPE<sub>n</sub>BEMP bits associated with the PIPE<sub>n</sub>BEMPE bits that are set to 1. Writing 0 to the NRDY flag in the software does not clear the flag.

**CTRT flag (Control Transfer Stage Transition Interrupt Status)**

In device controller mode, the USBFS updates the value of the CTSQ[2:0] bits and sets the CTRT flag to 1 on detecting a transition in the control transfer stage. When a control transfer stage transition interrupt occurs, clear the CTRT flag before the USBFS detects the next control transfer stage transition.

Values read from the CTRT flag in host controller mode are invalid.

**DVST flag (Device State Transition Interrupt Status)**

In device controller mode, the USBFS updates the value of the DVSQ[2:0] bits and sets the DVST flag to 1 on detecting a change in the device state. When a device state transition interrupt occurs, clear the DVST flag before the USBFS detects the next device state transition.

Values read from the DVST flag in host controller mode are invalid.

**SOFR flag (Frame Number Refresh Interrupt Status)**

In host controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number when the DVSTCTR0.UACT bit is set to 1 by software. A SOFR interrupt is detected every 1 ms.

In device controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number. A frame number refresh interrupt is detected every 1 ms.

The USBFS can detect an SOFR interrupt through the internal interpolation function even when a corrupted SOF packet is received from the USB host.

**有效位 (USB请求接收)**

在主机控制器模式下，VALID位的读取值无效。

**DVSQ[2:0] bits (Device State)**

DVSQ[2:0]位由USB总线复位初始化。在主机控制器模式下，读取的值无效。

**BRDY标志 (缓冲区就绪中断状态)**

BRDY标志指示BRDY中断状态。

当USBFS在至少一个启用了BRDY中断(BRDYENB.PIPE<sub>n</sub>BRDYE=1)的管道上检测到BRDY中断状态(PIPE<sub>n</sub>BRDY=1 n=0到9)时，将BRDY位设置为1。

有关导致PIPE<sub>n</sub>BRDY状态被断言的条件，请参见第26.3.3.1节。BRDY中断。

当软件将0写入与设置为1的PIPE<sub>n</sub>BRDYE位。在软件中将0写入BRDY标志不会清除该标志。

**NRDY标志 (缓冲区未就绪中断状态)**

NRDY标志指示NRDY中断状态。

当USBFS在至少一个启用了NRDY中断(NRDYENB.PIPE<sub>n</sub>NRDYE=1)的管道上检测到NRDY中断状态(PIPE<sub>n</sub>NRDY=1 n=0到9)时，将NRDY位设置为1。

有关导致PIPE<sub>n</sub>NRDY状态被断言的条件，请参见第26.3.3.2节。NRDY中断。

USBFS将NRDY位设置为0，当软件将0写入与设置为1的PIPE<sub>n</sub>NRDYE位。在软件中将0写入NRDY标志不会清除该标志。

**NRDY标志 (缓冲区空中断状态)**

NRDY标志指示NRDY中断状态。

当USBFS在至少一个启用了NRDY中断(BEMPENB.PIPE<sub>n</sub>BEMPE=1)的管道上检测到NRDY中断状态(PIPE<sub>n</sub>BEMP=1 n=0到9)时，将NRDY位设置为1。

有关导致PIPE<sub>n</sub>BEMP状态被断言的条件，请参见第26.3.3.3节。BEMP中断。

当软件将0写入与设置为1的PIPE<sub>n</sub>BEMPE位。在软件中将0写入NRDY标志不会清除该标志。

**CTRT标志 (控制传输阶段转换中断状态)**

在设备控制器模式下，USBFS更新CTSQ[2:0]位的值，并在检测到控制传输阶段的转换时将CTRT标志设置为1。当控制传输阶段转换中断发生时，在USBFS检测到下一个控制传输阶段转换之前清除CTRT标志。

在主机控制器模式下从CTRT标志读取的值无效。

**DVST标志 (设备状态转换中断状态)**

在设备控制器模式下，USBFS更新DVSQ[2:0]位的值，并在检测到设备状态发生变化时将DVST标志设置为1。当设备状态转换中断发生时，在USBFS检测到下一个设备状态转换之前清除DVST标志。

在主机控制器模式下从DVST标志读取的值无效。

**SOFR标志 (帧号刷新中断状态)**

在主机控制器模式下，当软件将DVSTCTR0.UACT位设置为1时，USBFS在更新帧号时将SOFR标志设置为1。每1ms检测一次SOFR中断。

在设备控制器模式下，USBFS在更新帧号时将SOFR标志设置为1。每1ms检测一次帧号刷新中断。

即使从USB主机接收到损坏的SOF数据包，USBFS也可以通过内部插值功能检测SOFR中断。

**RESM flag (Resume Interrupt Status)**

In device controller mode, the USBFS sets the RESM flag to 1 on detecting the falling edge of the signal on the USB\_DP pin in the Suspend state (DVSQ[2:0] = 1xxb). Values read from the RESM flag in host controller mode are invalid.

**VBINT flag (VBUS Interrupt Status)**

The USBFS sets the VBINT flag to 1 on detecting a level change (high to low or low to high) in the USB\_VBUS pin input value. The USBFS sets the VBSTS flag to indicate the USB\_VBUS pin input value. When a VBUS interrupt occurs, eliminate transient elements by reading the VBSTS flag at least three times through software processing and check that the values read are the same.

**26.2.17 INTSTS1 : Interrupt Status Register 1**

Base address: USBFS = 0x4009\_0000

Offset address: 0x042

Note 1. The USBFS detects a change in the status in the PDDETINT, OVRRCR or BCHG bit even when the clock supply is stopped (SYSCFG.SCKE = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply (SYSCFG.SCKE = 1) before clearing the status through software. No other interrupts can be detected while the clock supply is stopped (SYSCFG.SCKE bit = 0).

Note 2. To clear the bits in the INTSTS1 register, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 3. To clear the bits in INTSTS1, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 4. The USBFS detects a change in the status in the OVRRCR or BCHG bit even when the clock supply is stopped (SYSCFG.SCKE = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply (SYSCFG.SCKE = 1) before

**RESM标志 (恢复中断状态)**

在设备控制器模式下，USBFS在检测到处于挂起状态(DVSQ[2:0]=1xxb)的USB\_DP引脚上的信号下降沿时将RESM标志设置为1。在主机控制器模式下从RESM标志读取的值无效。

**VBINT标志 (VBUS中断状态)**

USBFS在检测到USB\_VBUS引脚输入值的电平变化 (从高到低或从低到高) 时将VBINT标志设置为1。USBFS设置VBSTS标志以指示USB\_VBUS引脚输入值。当发生VBUS中断时，通过软件处理至少3次读取VBSTS标志来消除瞬态元素，并检查读取的值是否相同。

**26.2.17 INTSTS1: 中断状态寄存器1**

Base address: USBFS = 0x4009\_0000

Offset address: 0x042

|               |           |      |    |      |           |    |   |   |   |            |      |      |   |   |   |              |

注1.即使停止时钟供应(SYSCFG.SCKE=0)，USBFS也会检测到PDDETINT、OVRRCR或BCHG位的状态变化，并在相关中断请求位为1时请求中断。使能在通过软件清除状态之前提供时钟 (SYSCFG.SCKE=1)。停止提供时钟 (SYSCFG.SCKE位=0) 时，不会检测到其他中断。

注2.要清除INTSTS1寄存器中的位，只需将0写入要清除的位。将1写入其他位。

注3.要清除INTSTS1中的位，只需将0写入要清除的位。将1写入其他位。

注4.即使停止时钟供应(SYSCFG.SCKE=0)，USBFS也会检测到OVRRCR或BCHG位的状态变化，并在相关中断请求位为1时请求中断。使能时钟供应(SYSCFG.SCKE=1)之前

clearing the status through the software. No other interrupts can be detected while the clock supply is stopped (SYSCFG.SCKE bit = 0).

INTSTS1 is used to confirm the status of each interrupt in host controller mode. Only enable the status change interrupts indicated in the bits in INTSTS1 in host controller mode.

#### PDETECTINT flag (PDETECTINT Detection Interrupt Status Flag)

The USBFS sets the PDETECTINT flag to 1 on detecting a level change (high to low or low to high) in the PDETECT pin input value. When the PDETECTINT interrupt is generated, perform debouncing by reading the BCCTRL1.PDETECTSTS flag at least three times through software processing and checking that the values read are the same.

#### SACK flag (Setup Transaction Normal Response Interrupt Status)

The SACK flag indicates the status of the setup transaction normal response interrupt in host controller mode.

The USBFS detects the SACK interrupt and sets this flag to 1 when an ACK response is returned from a peripheral device during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

Values read from the SACK flag in device controller mode are invalid.

#### SIGN flag (Setup Transaction Error Interrupt Status)

The SIGN flag indicates the status of setup transaction error interrupts in host controller mode.

The USBFS detects the SIGN interrupt and sets this flag to 1 when an ACK response is not returned from a peripheral device three consecutive times during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions:

- Timeout is detected by the USBFS when the peripheral device has returned no response
- A corrupted ACK packet is received
- A handshake other than ACK (NAK, NYET, or STALL) is received

Values read from the SIGN flag in device controller mode are invalid.

#### EOFERR flag (EOF Error Detection Interrupt Status)

The EOFERR flag indicates the status of EOF error detection interrupts in host controller mode.

The USBFS detects the EOFERR interrupt and sets this flag to 1 on detecting that communication did not complete at the EOF2 timing defined in the USB 2.0 specification. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

After detecting the EOFERR interrupt, the USBFS controls the hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt was detected to 0
- Puts the port in which the EOFERR interrupt occurred into the idle state

The software must terminate all pipes in which communications are being carried out and re-enumerate the USB port.

Values read from the EOFERR flag in device controller mode are invalid.

#### ATTCH flag (ATTCH Interrupt Status)

The ATTCH flag indicates the status of USB attach detection interrupts in host controller mode.

The USBFS detects the ATTCH interrupt and sets this flag to 1 on detecting a J- or K-state on the full- or low-speed signal level for 2.5  $\mu$ s. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the ATTCH interrupt on any of the following conditions.

- K-state, SE0, or SE1 changes to J-state, and J-state continues for 2.5  $\mu$ s
- J-state, SE0, or SE1 changes to K-state, and K-state continues for 2.5  $\mu$ s

Values read from the ATTCH flag in device controller mode are invalid.

通过软件清除状态。停止提供时钟 (SYSCFG.SCKE位=0) 时, 不会检测到其他中断。

INTSTS1用于确认主机控制器模式下每个中断的状态。仅在主机控制器模式下启用INTSTS1位中指示的状态更改中断。

#### PDETECTINT标志 (PDETECTINT检测中断状态标志)

USBFS在检测到PDETECT引脚输入值的电平变化 (从高到低或从低到高) 时将PDETECTINT标志设置为1。当产生PDETECTINT中断时, 通过软件处理至少3次读取BCCTRL1.PDETECTSTS标志并检查读取的值是否相同来执行去抖动。

#### SACK标志 (设置事务正常响应中断状态)

SACK标志指示主机控制器模式下设置事务正常响应中断的状态。

在USBFS发出的设置事务期间, 当外围设备返回ACK响应时, USBFS检测到SACK中断并将该标志设置为1。如果相关的中断使能位由软件设置为1, 则USBFS产生中断。

在设备控制器模式下从SACK标志读取的值无效。

#### SIGN标志 (设置事务错误中断状态)

SIGN标志指示主机控制器模式下设置事务错误中断的状态。

在USBFS发出的设置事务期间, 如果外围设备连续3次没有返回ACK响应, 则USBFS检测到SIGN中断并将该标志设置为1。如果相关的中断使能位由软件设置为1, 则USBFS产生中断。

当三个连续的设置事务发生以下任何响应条件时, USBFS检测到SIGN中断:

- 当外围设备没有返回响应时, USBFS检测到超时
- 收到损坏的ACK数据包
- 收到ACK (NAK、NYET或STALL) 以外的握手

在设备控制器模式下从SIGN标志读取的值无效。

#### EOFERR标志 (EOF错误检测中断状态)

EOFERR标志指示主机控制器模式下EOF错误检测中断的状态。

USBFS检测到EOFERR中断, 并在检测到通信未在USB2.0规范中定义的EOF2时序完成时将该标志设置为1。如果相关的中断使能位由软件设置为1, 则USBFS产生中断。

检测到EOFERR中断后, USBFS对硬件进行如下控制, 而不考虑相关的中断使能位设置:

- 将检测到EOFERR中断的端口的DVSTCTR0.UACT位设置为0
- 将发生EOFERR中断的端口置于空闲状态

软件必须终止正在执行通信的所有管道并重新枚举USB端口。

在设备控制器模式下从EOFERR标志读取的值无效。

#### ATTCH标志 (ATTCH中断状态)

ATTCH标志指示主机控制器模式下USB连接检测中断的状态。

USBFS检测到ATTCH中断, 并在检测到全速或低速信号电平上的JorK状态持续2.5 $\mu$ s时将此标志设置为1。如果相关的中断使能位由软件设置为1, 则USBFS产生中断。

USBFS在以下任何条件下检测ATTCH中断。

- K-state、SE0或SE1变为J-state, J-state持续2.5 $\mu$ s
- J-state、SE0或SE1变为K-state, K-state持续2.5 $\mu$ s

在设备控制器模式下从ATTCH标志读取的值无效。

**DTCH flag (USB Disconnection Detection Interrupt Status)**

The DTCH flag indicates the status of USB disconnection detection interrupts in host controller mode.

The USBFS detects the DTCH interrupt and sets this flag to 1 on detecting a USB bus detach event. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects bus detach events based on the USB 2.0 specification.

After detecting the DTCH interrupt, the USBFS controls hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt was detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state

The software must terminate all pipes in which communications are being carried out and invoke the wait state for attaching to the USB port (waiting for ATTCH interrupt generation).

Values read from the DTCH flag in device controller mode are invalid.

**BCHG flag (USB Bus Change Interrupt Status)**

The BCHG flag indicates the status of USB bus change interrupts in host controller mode.

The USBFS detects the BCHG interrupt and sets this flag to 1 when a change in the full- or low-speed signal level occurs on the USB port. This includes any change from J-state, K-state, or SE0 to J-state, K-state, or SE0. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS sets the LNST[1:0] flags to indicate the input state of the USB port. When a BCHG interrupt occurs, eliminate transient elements by repeat reading the LNST[1:0] flags by software until the same value is read at least three times.

Change in the USB bus state can be detected while the internal clock is stopped.

Values read from the BCHG flag in device controller mode are invalid.

**OVRCCR flag (Overcurrent Input Change Interrupt Status)**

The OVRCCR flag indicates the status of USB\_OVRCURA and USB\_OVRCURB input pin change interrupts.

The USBFS detects the OVRCCR interrupt and sets this flag to 1 when a change (high to low or low to high) occurs in at least one of the input values to the USB\_OVRCURA and USB\_OVRCURB pins. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

**26.2.18 BRDYSTS : BRDY Interrupt Status Register**

Base address: USBFS = 0x4009\_0000

Offset address: 0x046

**DTCH标志 (USB断线检测中断状态)**

DTCH标志指示主机控制器模式下USB断开检测中断的状态。

USBFS检测到DTCH中断并在检测到USB总线分离事件时将此标志设置为1。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

USBFS根据USB2.0规范检测总线分离事件。

检测到DTCH中断后，USBFS对硬件进行如下控制，而不管相关的中断使能位设置如何：

- 将检测到DTCH中断的端口的DVSTCTR0.UACT位设置为0
- 将发生DTCH中断的端口置于空闲状态

软件必须终止正在执行通信的所有管道并调用等待状态以连接到USB端口（等待ATTCH中断生成）。

在设备控制器模式下从DTCH标志读取的值无效。

**BCHG标志 (USB总线更改中断状态)**

BCHG标志指示主机控制器模式下USB总线更改中断的状态。

当USB端口上发生全速或低速信号电平变化时，USBFS检测到BCHG中断并将该标志设置为1。这包括从J-state、K-state或SE0到J-state、K-state或SE0的任何更改。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

USBFS设置LNST[1:0]标志以指示USB端口的输入状态。当发生BCHG中断时，通过软件重复读取LNST[1:0]标志来消除瞬态元素，直到至少读取相同的值3次。

当内部时钟停止时，可以检测到USB总线状态的变化。

在设备控制器模式下从BCHG标志读取的值无效。

**OVRCCR标志 (过流输入变化中断状态)**

OVRCCR标志指示USB\_OVRCURA和USB\_OVRCURB输入引脚变化中断的状态。

当USB\_OVRCURA和USB\_OVRCURB引脚的至少一个输入值发生变化（从高到低或从低到高）时，USBFS检测到OVRCCR中断并将该标志设置为1。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

| Bit   | Symbol    | Function  | R/W              |
|-------|-----------|---|------------------|
| 8     | PIPE8BEMP | BEMP Interrupt Status for Pipe 8<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W <sup>1</sup> |
| 9     | PIPE9BEMP | BEMP Interrupt Status for Pipe 9<br>0: No BEMP interrupt occurred<br>1: BEMP interrupt occurred | R/W <sup>1</sup> |
| 15:10 | —         | These bits are read as 0. The write value should be 0.  | R/W              |

Note 1. To clear the status indicated in the bits in BEMPSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

### 26.2.21 FRMNUM : Frame Number Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x04C

| Bit position:      | 15   | 14   | 13 | 12 | 11 | 10         | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|------|------|----|----|----|------------|---|---|---|---|---|---|---|---|---|---|
| Bit field:         | OVRN | CRCE | —  | —  | —  | FRNM[10:0] |   |   |   |   |   |   |   |   |   |   |
| Value after reset: | 0    | 0    | 0  | 0  | 0  | 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol     | Function   | R/W              |
|-------|------------|--|------------------|
| 10:0  | FRNM[10:0] | Frame Number<br>Latest frame number.   | R                |
| 13:11 | —          | These bits are read as 0. The write value should be 0.                         | R/W              |
| 14    | CRCE       | Receive Data Error<br>0: No error occurred<br>1: Error occurred                | R/W <sup>1</sup> |
| 15    | OVRN       | Overrun/Underrun Detection Status<br>0: No error occurred<br>1: Error occurred | R/W <sup>1</sup> |

Note 1. To clear the status, write 0 only to the bits to be cleared. Write 1 to the other bits.

#### FRNM[10:0] flags (Frame Number)

The USBFS sets the FRNM[10:0] flags to indicate the latest frame number, which is updated every 1 ms, when an SOF packet is issued or received.

#### CRCE flag (Receive Data Error)

The CRCE flag sets to 1 when a CRC error or bit stuffing error occurs during isochronous transfer. On detecting a CRC error in host controller mode, the USBFS generates an internal NRDY interrupt.

To clear the CRCE flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

#### OVRN flag (Overrun/Underrun Detection Status)

The OVRN flag sets to 1 when an overrun or underrun error occurs during isochronous transfer. To clear the flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

In host controller mode, the OVRN flag sets to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the time to issue an OUT token comes before all of the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the time to issue an IN token comes when no FIFO buffer planes are empty

In device controller mode, the OVRN flag sets to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the IN token is received before all of the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the OUT token is received when no FIFO buffer planes are empty

| Bit   | Symbol    | Function                                | R/W              |
|-------|-----------|---|------------------|
| 8     | PIPE8BEMP | 管道8的BEMP中断状态<br>0: 未发生BEMP中断1: 发生BEMP中断 | R/W <sup>1</sup> |
| 9     | PIPE9BEMP | 管道9的BEMP中断状态<br>0: 未发生BEMP中断1: 发生BEMP中断 | R/W <sup>1</sup> |
| 15:10 | —         | 这些位被读取为0。写入值应为0。                        | R/W              |

注1.要清除BEMPSTS中位指示的状态, 请仅将0写入要清除的位。将1写入其他位。

### 26.2.21 FRMNUM:帧号寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x04C

| Bit position: | 15   | 14   | 13 | 12 | 11 | 10         | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|------|------|----|----|----|------------|---|---|---|---|---|---|---|---|---|---|
| Bit field:    | OVRN | CRCE | —  | —  | —  | FRNM[10:0] |   |   |   |   |   |   |   |   |   |   |
| 重置后的值:        | 0    | 0    | 0  | 0  | 0  | 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol     | Function                               | R/W              |
|-------|------------|--|------------------|
| 10:0  | FRNM[10:0] | 帧号<br>最新帧号。                            | R                |
| 13:11 | —          | 这些位被读取为0。写入值应为0。                       | R/W              |
| 14    | CRCE       | 接收数据错误<br>0: 未发生错误1: 发生错误              | R/W <sup>1</sup> |
| 15    | OVRN       | OverrunUnderrun检测状态<br>0: 未发生错误1: 发生错误 | R/W <sup>1</sup> |

注1.要清除状态, 只需将0写入要清除的位。将1写入其他位。

#### FRNM[10:0] flags (Frame Number)

USBFS设置FRNM[10:0]标志以指示最新的帧号, 该帧号每1ms更新一次, 当发出或接收SOF数据包时。

#### CRCE标志 (接收数据错误)

当同步传输期间发生CRC错误或位填充错误时, CRCE标志设置为1。在主机控制器模式下检测到CRC错误时, USBFS会生成内部NRDY中断。

要清除CRCE标志, 向其写入0, 同时向FRMNUM寄存器中的其他位写入1。

#### OVRN标志 (溢出/欠载检测状态)

当同步传输期间发生溢出或欠载错误时, OVRN标志设置为1。要清除该标志, 请向其写入0, 同时向FRMNUM寄存器中的其他位写入1。

在主机控制器模式下, OVRN标志在以下任何条件下设置为1:

- 对于传输同步管道, 发出OUT令牌的时间是在所有传输数据写入FIFO缓冲区之前
- 对于接收同步管道, 在没有FIFO缓冲平面为空时发出IN令牌

在设备控制器模式下, OVRN标志在以下任何条件下设置为1:

- 对于传输同步管道, 在所有传输数据写入FIFO缓冲区之前接收到IN令牌
- 对于接收同步管道, 当没有FIFO缓冲平面为空时接收OUT令牌

## 26.2.22 DVCHGR : Device State Change Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x04E

|                    |       |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|--------------------|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position:      | 15    | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | DVCHG | —  | —  | —  | —  | —  | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0     | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 14:0 | —      | These bits are read as 0. The write value should be 0.   | R/W |

For details, see [section 26.3.1.5. Release from deep software standby mode because of USB suspend/resume interrupts.](#)

## 26.2.23 USBADDR : USB Address Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x050

|                    |    |    |    |    |               |    |   |   |              |   |   |   |   |   |   |   |
|--------------------|----|----|----|----|---------------|----|---|---|--------------|---|---|---|---|---|---|---|
| Bit position:      | 15 | 14 | 13 | 12 | 11            | 10 | 9 | 8 | 7            | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | —  | —  | —  | —  | STSRECOV[3:0] |    |   | — | USBADDR[6:0] |   |   |   |   |   |   |   |
| Value after reset: | 0  | 0  | 0  | 0  | 0             | 0  | 0 | 0 | 0            | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol        | Function  | R/W |
|-------|---------------|---|-----|
| 6:0   | USBADDR[6:0]  | USB Address<br>In device controller mode, these bits indicate the USB address assigned by the host when the USBFS processed the SET_ADDRESS request successfully.   | R/W |
| 7     | —             | This bit is read as 0. The write value should be 0.   | R/W |
| 11:8  | STSRECOV[3:0] | Status Recovery<br>0x4: Recovery in device controller mode: Setting prohibited<br>Recovery in host controller mode:<br>Return to the low-speed state (bits DVSTCTR0.RHST[2:0] = 001b)<br>0x8: Recovery in device controller mode: Setting prohibited<br>Recovery in host controller mode:<br>Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b)<br>0x9: Recovery in device controller mode:<br>Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 001b (default state)<br>Recovery in host controller mode: Setting prohibited<br>0xA: Recovery in device controller mode:<br>Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 010b (address state)<br>Recovery in host controller mode: Setting prohibited<br>0xB: Recovery in device controller mode:<br>Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 011b (configured state)<br>Recovery in host controller mode: Setting prohibited<br>Others: Setting prohibited | R/W |
| 15:12 | —             | These bits are read as 0. The write value should be 0.  | R/W |

**USBADDR[6:0] bits (USB Address)**

In device controller mode, the USBADDR[6:0] flags indicate the USB address received when the USBFS processed a SetAddress request successfully. The USBFS sets the USBADDR[6:0] bits to 0x00 on detecting a USB bus reset.

## 26.2.22 DVCHGR:设备状态改变寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x04E

|               |       |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
|---------------|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15    | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 14:0 | —      | 这些位被读取为0。写入值应为0。   | R/W |
| 15   | DVCHG  | 设备状态更改<br>0: 禁止写入USBADDR.STSRECOV[3:0]和USBADDR.USBADDR[6:0]位<br>1: 允许写入USBADDR.STSRECOV[3:0]和USBADDR.USBADDR[6:0]位 | R/W |

有关详细信息，请参阅第26.3.1.5节。由于USB挂起恢复中断而从深度软件待机模式中释放。

## 26.2.23 USBADDR:USB地址寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x050

|               |    |    |    |    |               |    |   |   |              |   |   |   |   |   |   |   |
|---------------|----|----|----|----|---------------|----|---|---|--------------|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11            | 10 | 9 | 8 | 7            | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | —  | —  | —  | —  | STSRECOV[3:0] |    |   | — | USBADDR[6:0] |   |   |   |   |   |   |   |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0             | 0  | 0 | 0 | 0            | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol        | Function  | R/W |
|-------|---------------|---|-----|
| 6:0   | USBADDR[6:0]  | USB地址<br>在设备控制器模式下，这些位指示USBFS成功处理SET_ADDRESS请求时主机分配的USB地址。  | R/W |
| 7     | —             | 该位读取为0。写入值应为0。  | R/W |
| 11:8  | STSRECOV[3:0] | 状态恢复<br>0x4: 设备控制器模式下的恢复：在主机控制器模式下设置禁止恢复：<br>返回低速状态（位DVSTCTR0.RHST[2:0]=001b）<br>0x8: 设备控制器模式下的恢复：在主机控制器模式下设置禁止恢复：<br>返回全速状态（位DVSTCTR0.RHST[2:0]=010b）<br>0x9: 设备控制器模式下的恢复：<br>返回全速状态（位DVSTCTR0.RHST[2:0]=010b），位INTSTS0.DVSQ[2:0] = 001b (default state)<br>主机控制器模式下的恢复：禁止设置<br>0xA: 设备控制器模式下的恢复：<br>返回全速状态（位DVSTCTR0.RHST[2:0]=010b），位INTSTS0.DVSQ[2:0] = 010b (address state)<br>主机控制器模式下的恢复：禁止设置<br>0xB: 设备控制器模式下的恢复：<br>返回全速状态（位DVSTCTR0.RHST[2:0]=010b），位INTSTS0.DVSQ[2:0] = 011b (configured state)<br>主机控制器模式下的恢复：禁止设置<br>其他：禁止设置 | R/W |
| 15:12 | —             | 这些位被读取为0。写入值应为0。  | R/W |

**USBADDR[6:0] bits (USB Address)**

在设备控制器模式下，USBADDR[6:0]标志指示当USBFS处理一个SetAddress请求成功。USBFS在检测到USB总线复位时将USBADDR[6:0]位设置为0x00。

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1. On recovering from a USB power shut-off, the operation can resume from the USB address set before the software shut-off.

In host controller mode, the USBADDR[6:0] bits are invalid.

### STSRECOV[3:0] bits (Status Recovery)

Use the STSRECOV[3:0] bits to resume the state of the internal sequencer on recovering from USB power shut-off. For details, see [section 26.3.1.5. Release from deep software standby mode because of USB suspend/resume interrupts.](#)

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1.

## 26.2.24 USBREQ : USB Request Type Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x054

| Bit  | Symbol             | Function  | R/W              |
|------|--------------------|---|------------------|
| 7:0  | BMREQUESTTYPE[7:0] | Request Type<br>USB request bmRequestType value | R/W <sup>1</sup> |
| 15:8 | BREQUEST[7:0]      | Request<br>USB request bRequest value           | R/W <sup>1</sup> |

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBREQ stores setup requests for control transfers.

In device controller mode, the USBREQ stores the received bRequest and bmRequestType values. In host controller mode, it sets to the bRequest and bmRequestType values to be transmitted.

USBREQ is initialized by a USB bus reset.

### BMREQUESTTYPE[7:0] bits (Request Type)

The BMREQUESTTYPE[7:0] bits hold the bmRequestType value of USB requests.

- In host controller mode:  
Set these bits to the value of the USB request data in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:  
These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

### BREQUEST[7:0] bits (Request)

The BREQUEST[7:0] bits store bRequest value of the USB request.

- In host controller mode:  
Set these bits to the value of the USB request data in setup transmission transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:  
These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

当DVCHGR.DVCHG位设置为1时，允许写入这些位。从USB电源关闭恢复后，操作可以从软件关闭前设置的USB地址恢复。

在主机控制器模式下，USBADDR[6:0]位无效。

### STSRECOV[3:0] bits (Status Recovery)

使用STSRECOV[3:0]位在从USB电源关闭恢复时恢复内部定序器的状态。有关详细信息，请参阅第26.3.1.5节。由于USB挂起恢复中断而从深度软件待机模式中释放。

当DVCHGR.DVCHG位设置为1时，可以写入这些位。

## 26.2.24 USBREQ:USB请求类型寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x054

| Bit  | Symbol             | Function                    | R/W              |
|------|--------------------|-----------------------------|------------------|
| 7:0  | BMREQUESTTYPE[7:0] | 请求类型<br>USB请求bmRequestType值 | R/W <sup>1</sup> |
| 15:8 | BREQUEST[7:0]      | Request<br>USB请求bRequest值   | R/W <sup>1</sup> |

注1.在设备控制器模式下，可以读取这些位，但写入它们无效。在主机控制器模式下，这些位都是读写位。

USBREQ存储控制传输的设置请求。

在设备控制器模式下，USBREQ存储接收到的bRequest和bmRequestType值。在主机控制器模式下，它设置为要传输的bRequest和bmRequestType值。

USBREQ由USB总线复位初始化。

### BMREQUESTTYPE[7:0] bits (Request Type)

BMREQUESTTYPE[7:0]位保存USB请求的bmRequestType值。

- 在主机控制器模式下:  
在传输设置事务中将这些位设置为USB请求数据的值。当DCPCTR.SUREQ位为1时，不要更改位的值。
- 在设备控制器模式下:  
这些位指示接收设置事务中USB请求数据的值。写入位无效。

### BREQUEST[7:0] bits (Request)

BREQUEST[7:0]位存储USB请求的bRequest值。

- 在主机控制器模式下:  
在设置传输事务中将这些位设置为USB请求数据的值。当DCPCTR.SUREQ位为1时，不要更改位的值。
- 在设备控制器模式下:  
这些位指示接收设置事务中USB请求数据的值。写入位无效。

## 26.2.25 USBVAL : USB Request Value Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x056

| Bit  | Symbol       | Function                          | R/W              |
|------|--------------|-----------------------------------|------------------|
| 15:0 | WVALUE[15:0] | Value<br>USB request wValue value | R/W <sup>1</sup> |

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

In device controller mode, USBVAL stores the received wValue value. In host controller mode, it sets to the wValue value to be transmitted is set.

USBVAL is initialized by a USB bus reset.

**WVALUE[15:0] bits (Value)**

The WVALUE[15:0] bits store wValue value of the USB request.

- In host controller mode:  
Set these bits to the value of the wValue field in USB requests of transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:  
These bits indicate the wValue value of USB requests in reception setup transactions. Writing to the bits has no effect.

## 26.2.26 USBINDX : USB Request Index Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x058

| Bit  | Symbol       | Function                          | R/W              |
|------|--------------|-----------------------------------|------------------|
| 15:0 | WINDEX[15:0] | Index<br>USB request wIndex value | R/W <sup>1</sup> |

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBINDX stores setup requests for control transfers.

In device controller mode, it stores the received wIndex value. In host controller mode, it sets to the wIndex value to be transmitted.

USBINDX is initialized by a USB bus reset.

**WINDEX[15:0] bits (Index)**

The WINDEX[15:0] bits hold the wIndex value of a USB request.

- In host controller mode:

## 26.2.25 USBVAL:USB请求值寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x056

| Bit  | Symbol       | Function              | R/W              |
|------|--------------|-----------------------|------------------|
| 15:0 | WVALUE[15:0] | Value<br>USB请求wValue值 | R/W <sup>1</sup> |

注1.在设备控制器模式下，可以读取这些位，但写入它们无效。在主机控制器模式下，这些位都是读写位。

在设备控制器模式下，USBVAL存储接收到的wValue值。在主机控制器模式下，它设置为要传输的wValue值。

USBVAL由USB总线复位初始化。

**WVALUE[15:0] bits (Value)**

WVALUE[15:0]位存储USB请求的wValue值。

- 在主机控制器模式下:  
将这些位设置为USB传输设置事务请求中wValue字段的值。当DCPCTR.SUREQ位为1时，不要更改位的值。
- 在设备控制器模式下:  
这些位指示接收设置事务中USB请求的wValue值。写入位无效。

## 26.2.26 USBINDX:USB请求索引寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x058

| Bit  | Symbol       | Function              | R/W              |
|------|--------------|-----------------------|------------------|
| 15:0 | WINDEX[15:0] | Index<br>USB请求wIndex值 | R/W <sup>1</sup> |

注1.在设备控制器模式下，可以读取这些位，但写入它们无效。在主机控制器模式下，这些位都是读写位。

USBINDX存储控制传输的设置请求。

在设备控制器模式下，它存储接收到的wIndex值。在主机控制器模式下，它设置为要传输的wIndex值。

USBINDX由USB总线复位初始化。

**WINDEX[15:0] bits (Index)**

WINDEX[15:0]位保存USB请求的wIndex值。

- 在主机控制器模式下:

Set these bits to the wIndex value in USB requests in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:

These bits indicate the wIndex value in USB requests received in reception setup transactions. Writing to the bits has no effect.

### 26.2.27 USBLENG : USB Request Length Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x05A

| Bit  | Symbol        | Function                            | R/W              |
|------|---------------|-------------------------------------|------------------|
| 15:0 | WLENTUH[15:0] | Length<br>USB request wLength value | R/W <sup>1</sup> |

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBLENG stores setup requests for control transfers.

In device controller mode, the value of wLength that is received is stored. In host controller mode, the value of wLength to be transmitted is set.

USBLENG is initialized by a USB bus reset.

#### WLENTUH[15:0] bits (Length)

The WLENTUH[15:0]bits hold the wLength value of a USB request.

- In host controller mode:

Set these bits to the wLength value in USB requests in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.

- In device controller mode:

These bits indicate the wLength value in USB requests received in reception setup transactions. Writing to the bits has no effect.

### 26.2.28 DCPCFG : DCP Configuration Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x05C

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 3:0 | —      | These bits are read as 0. The write value should be 0.                                | R/W |
| 4   | DIR    | Transfer Direction*1<br>0: Data receiving direction<br>1: Data transmitting direction | R/W |

在传输设置事务中将这些位设置为USB请求中的wIndex值。当DCPCTR.SUREQ位为1时，不要更改位的值。

- 在设备控制器模式下:

这些位指示在接收设置事务中收到的USB请求中的wIndex值。写入位无效。

### 26.2.27 USBLENG:USB请求长度寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x05A

| Bit  | Symbol        | Function                | R/W              |
|------|---------------|-------------------------|------------------|
| 15:0 | WLENTUH[15:0] | Length<br>USB请求wLength值 | R/W <sup>1</sup> |

注1.在设备控制器模式下，可以读取这些位，但写入它们无效。在主机控制器模式下，这些位都是读写位。

USBLENG存储控制传输的设置请求。

在设备控制器模式下，存储接收到的wLength的值。在主机控制器模式下，设置要传输的wLength的值。

USBLENG由USB总线复位初始化。

#### WLENTUH[15:0] bits (Length)

WLENTUH[15:0]位保存USB请求的wLength值。

- 在主机控制器模式下:

在传输设置事务中将这些位设置为USB请求中的wLength值。当DCPCTR.SUREQ位为1时，不要更改位的值。

- 在设备控制器模式下:

这些位指示在接收设置事务中收到的USB请求中的wLength值。写入位无效。

### 26.2.28 DCPCFG:DCP配置寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x05C

| Bit | Symbol | Function                         | R/W |
|-----|--------|----------------------------------|-----|
| 3:0 | —      | 这些位被读取为0。写入值应为0。                 | R/W |
| 4   | DIR    | 传输方向*1<br>0: 数据接收方向<br>1: 数据发送方向 | R/W |

| Bit  | Symbol | Function   | R/W |
|------|--------|--|-----|
| 6:5  | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 7    | SHTNAK | Pipe Disabled at End of Transfer*1<br>0: Keep pipe open after transfer ends<br>1: Disable pipe after transfer ends | R/W |
| 15:8 | —      | These bits are read as 0. The write value should be 0.   | R/W |

Note 1. Only set this bit while the PID is NAK. Before setting this bit, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

#### DIR bit (Transfer Direction)

In host controller mode, the DIR bit sets the transfer direction of the data stage and status stage for control transfers. In device controller mode, set the DIR bit to 0.

#### SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change PID to NAK on transfer end when the selected pipe is receiving. It is only valid when the selected pipe is receiving.

When the SHTNAK bit is 1, the USBFS changes the DCPCTR.PID[1:0] bits for the DCP to NAK on determining that a transfer has ended. The USBFS determines transfer end on the following condition:

- A short packet, including a zero-length packet, is successfully received.

### 26.2.29 DCPMAXP : DCP Maximum Packet Size Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x05E

| Bit position:      | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6         | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|-------------|----|----|----|----|----|---|---|---|-----------|---|---|---|---|---|---|
| Bit field:         | DEVSEL[3:0] |    |    | —  | —  | —  | — | — | — | MXPS[6:0] |   |   |   |   |   |   |
| Value after reset: | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 1         | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol      | Function  | R/W |
|-------|-------------|---|-----|
| 6:0   | MXPS[6:0]   | Maximum Packet Size*1<br>Maximum data payload specification (maximum packet size) for the DCP   | R/W |
| 11:7  | —           | These bits are read as 0. The write value should be 0.  | R/W |
| 15:12 | DEVSEL[3:0] | Device Select*2<br>0x0: Address 0000b<br>0x1: Address 0001b<br>0x2: Address 0010b<br>0x3: Address 0011b<br>0x4: Address 0100b<br>0x5: Address 0101b<br>Others: Setting prohibited | R/W |

Note 1. Only set the MXPS[6:0] bits while PID is NAK. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary. After the MXPS[6:0] bits are set and the DCP is set to the CURPIPE[3:0] bits in a port select register, clear the buffer by setting the BCLR bit in the port control register to 1.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK and the DCPCTR.SUREQ bit is 0. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

#### MXPS[6:0] bits (Maximum Packet Size)

The MXPS[6:0] bits specify the maximum data payload (maximum packet size) for the DCP. The initial value is 0x40 (64 bytes). Set the bits to a USB 2.0-compliant value. Do not write to the FIFO buffer or set PID = BUF while MXPS[6:0] is set to 0.

| Bit  | Symbol | Function                                  | R/W |
|------|--------|---|-----|
| 6:5  | —      | 这些位被读取为0。写入值应为0。                          | R/W |
| 7    | SHTNAK | 传输结束时管道禁用*1<br>0: 传输结束后保持管道打开1: 传输结束后禁用管道 | R/W |
| 15:8 | —      | 这些位被读取为0。写入值应为0。                          | R/W |

注1.仅当PID为NAK时设置该位。在设置该位之前,请检查DCPCTR.PBUSY位是否为0,然后更改DCPCTR.PID[1:0]位用于DCP从BUF到NAK。如果PID[1:0]位被USBFS更改为NAK,则无需通过软件检查PBUSY位。

#### DIR位 (传输方向)

在主机控制器模式下, DIR位设置控制传输的数据阶段和状态阶段的传输方向。在设备控制器模式下, 将DIR位设置为0。

#### SHTNAK位 (传输结束时禁用管道)

SHTNAK位指定当所选管道正在接收时, 是否在传输结束时将PID更改为NAK。仅在所选管道正在接收时有效。

当SHTNAK位为1时, USBFS在确定传输已结束时将DCPCR.PID[1:0]位更改为DCP为NAK。USBFS在以下条件下确定传输结束:

- 成功接收到短报文, 包括零长度报文。

### 26.2.29 DCPMAXP:DCP最大数据包大小寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x05E

| Bit position: | 15          | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6         | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|-------------|----|----|----|----|----|---|---|---|-----------|---|---|---|---|---|---|
| Bit field:    | DEVSEL[3:0] |    |    | —  | —  | —  | — | — | — | MXPS[6:0] |   |   |   |   |   |   |
| 重置后的值:        | 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 1         | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol      | Function   | R/W |
|-------|-------------|--|-----|
| 6:0   | MXPS[6:0]   | 最大数据包大小*1<br>DCP的最大数据有效负载规范 (最大数据包大小)  | R/W |
| 11:7  | —           | 这些位被读取为0。写入值应为0。   | R/W |
| 15:12 | DEVSEL[3:0] | 设备选择*2<br>0x0: Address 0000b<br>0x1: Address 0001b<br>0x2: Address 0010b<br>0x3: Address 0011b<br>0x4: Address 0100b<br>0x5: Address 0101b<br>其他: 禁止设置 | R/W |

注1.仅在PID为NAK时设置MXPS[6:0]位。在设置这些位之前,请检查DCPCTR.PBUSY位是否为0,然后将DCP的DCPCTR.PID[1:0]位从BUF更改为NAK。如果PID[1:0]位被USBFS更改为NAK,则无需通过软件检查PBUSY位。在设置MXPS[6:0]位并将DCP设置为端口选择寄存器中的CURPIPE[3:0]位后,通过将端口控制寄存器中的BCLR位设置为1来清除缓冲区。

注2.仅在PID为NAK且DCPCTR.SUREQ位为0时设置DEVSEL[3:0]位。在设置这些位之前,请检查DCPCTR.PBUSY位为0,然后将DCPCR.PID[1:0]位从BUF更改为NAK。如果PID[1:0]位被USBFS更改为NAK,则无需通过软件检查PBUSY位。

#### MXPS[6:0]位 (最大数据包大小)

MXPS[6:0]位指定DCP的最大数据有效载荷 (最大数据包大小)。初始值为0x40 (64字节)。将这些位设置为符合USB2.0的值。当MXPS[6:0]设置为0时,不要写入FIFO缓冲区或设置PID=BUF。

**DEVSEL[3:0] bits (Device Select)**

In host controller mode, the DEVSEL[3:0] bits specify the address of the target peripheral device for a control transfer. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0010b, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0000b.

**26.2.30 DCPCTR : DCP Control Register**

Base address: USBFS = 0x4009\_0000

Offset address: 0x060

|                    |      |       |    |    |          |    |   |       |       |       |       |   |   |      |          |   |

| 13:12 | —        | These bits are read as 0. The write value should be 0.   | R/W   |
| 14    | SUREQ    | Setup Token Transmission<br>Sets up token transmission in host controller mode.<br>0: Invalid (writing 0 has no effect)<br>1: Transmit setup packet  | R/W   |
| 15    | BSTS     | Buffer Status<br>0: Buffer access disabled<br>1: Buffer access enabled   | R     |

**DEVSEL[3:0] bits (Device Select)**

在主机控制器模式下，DEVSEL[3:0]位指定目标外围设备的地址以进行控制传输。首先在相关的DEVADDn (n=0到5)寄存器中设置设备地址，然后将这些位设置为相应的值。例如，要将DEVSEL[3:0]位设置为0010b，首先要设置DEVADD2寄存器中的地址。

在设备控制器模式下，将这些位设置为0000b。

**26.2.30 DCPCTR:DCP控制寄存器**

Base address: USBFS = 0x4009\_0000

Offset address: 0x060

|               |      |       |    |    |          |    |   |       |       |       |       |   |   |      |          |   |

Note 1. This bit is read as 0.

Note 2. Only set the SQSET and SQCLR bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

### PID[1:0] bits (Response PID)

The PID[1:0] bits control the USB response type during control transfers.

In host controller mode, to change the PID[1:0] setting from NAK to BUF:

- When the transmitting direction is set:
  - a. Write all of the transmit data to the FIFO buffer while the DVSTCTR0.UACT bit is 1 and PID is NAK.
  - b. Set PID[1:0] bits to 01b (BUF).  
The USBFS then executes the OUT transaction.
- When the receiving direction is set:
  - a. Check that the FIFO buffer is empty (or empty the buffer) while the DVSTCTR0.UACT bit is 1 and PID is NAK.
  - b. Set PID[1:0] bits to 01b (BUF).  
The USBFS then executes the IN transaction.

The USBFS changes the PID[1:0] setting as follows:

- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets the PID[1:0] to STALL (11b)
- When a reception error, such as a CRC error, is detected three times consecutively, the USBFS sets the PID[1:0] bits to NAK (00b)
- On receiving the STALL handshake, the USBFS sets PID[1:0] to STALL (11b)

In device controller mode, the USBFS changes the PID[1:0] setting as follows:

- On receiving a setup packet, the USBFS sets PID[1:0] to NAK (00b). The USBFS then sets the INTSTS0.VALID flag to 1, and the PID[1:0] setting cannot be changed until the software clears the VALID flag to 0.
- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets PID[1:0] to STALL (11b)
- On detecting a control transfer sequence error, the USBFS sets PID[1:0] to STALL (1xb)
- On detecting a USB bus reset, the USBFS sets PID[1:0] to NAK

The USBFS does not check the PID[1:0] setting while processing a SET\_ADDRESS request.

The PID[1:0] bits are initialized by a USB bus reset.

### CCPL bit (Control Transfer End Enable)

In device controller mode, setting the CCPL bit to 1 enables the status stage of the control transfer to be completed. When the bit is set to 1 by software while the associated PID[1:0] bits are set to BUF, the USBFS completes the control transfer status stage.

During control read transfers, the USBFS transmits the ACK handshake in response to the OUT transaction from the USB host. During control write or no-data control transfers, it transmits the zero-length packet in response to the IN transaction from the USB host. On detecting a SET\_ADDRESS request, the USBFS operates in auto response mode from the setup stage up to status stage completion regardless of the CCPL bit setting.

The USBFS changes the CCPL bit from 1 to 0 on receiving a new setup packet. The software cannot write 1 to the bit while the INTSTS0.VALID bit is 1. The bit is initialized by a USB bus reset.

In host controller mode, always write 0 to the CCPL bit.

### PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether DCP is used for the transaction when USBFS changes the PID[1:0] bits from BUF to NAK. The USBFS changes the PBUSY bit from 0 to 1 on start of a USB transaction for the selected pipe. It changes the PBUSY bit from 1 to 0 on completion of one transaction.

注1.该位读为0。

注2.仅在PID为NAK时设置SQSET和SQCLR位。在设置这些位之前，请检查PBUSY位是否为0，然后将DCP的PID[1:0]位从BUF更改为NAK。如果PID[1:0]位被USBFS更改为NAK，则无需通过软件检查PBUSY位。

### PID[1:0] bits (Response PID)

PID[1:0]位在控制传输期间控制USB响应类型。

在主机控制器模式下，要将PID[1:0]设置从NAK更改为BUF：

- 设置传输方向时：
  - a. 当DVSTCTR0.UACT位为1且PID为NAK时，将所有发送数据写入FIFO缓冲区。  
将PID[1:0]位设置为01b(BUF)。  
然后USBFS执行OUT事务。
- 设置接收方向时：
  - a. 在DVSTCTR0.UACT位为1且PID为NAK时检查FIFO缓冲区是否为空（或清空缓冲区）。  
将PID[1:0]位设置为01b(BUF)。  
然后USBFS执行IN事务。

USBFS更改PID[1:0]设置如下：

- 当PID[1:0]位被软件设置为BUF(01b)并且USBFS接收到超过MaxPacketSize的数据时，USBFS将PID[1:0]设置为STALL(11b)
- 当连续3次检测到接收错误（例如CRC错误）时，USBFS将PID[1:0]位设置为NAK(00b)
- 在接收到STALL握手时，USBFS将PID[1:0]设置为STALL(11b)

在设备控制器模式下，USBFS将PID[1:0]设置更改如下：

- 在接收到设置数据包时，USBFS将PID[1:0]设置为NAK(00b)。然后USBFS将INTSTS0.VALID标志设置为1，并且在软件将VALID标志清除为0之前无法更改PID[1:0]设置。
- 当PID[1:0]位被软件设置为BUF(01b)并且USBFS接收到超过MaxPacketSize的数据时，USBFS将PID[1:0]设置为STALL(11b)
- 在检测到控制传输序列错误时，USBFS将PID[1:0]设置为STALL(1xb)
- 在检测到USB总线复位时，USBFS将PID[1:0]设置为NAK

USBFS在处理SET\_ADDRESS请求时不检查PID[1:0]设置。

PID[1:0]位由USB总线复位初始化。

### CCPL位 (控制传输结束使能)

在设备控制器模式下，将CCPL位设置为1可以完成控制传输的状态阶段。当该位由软件设置为1且相关的PID[1:0]位设置为BUF时，USBFS完成控制传输状态阶段。

在控制读取传输期间，USBFS发送ACK握手以响应来自USB主机的OUT事务。在控制写入或无数据控制传输期间，它传输零长度数据包以响应来自USB主机的IN事务。在检测到SET\_ADDRESS请求时，USBFS从设置阶段到状态阶段完成以自动响应模式运行，无论CCPL位设置如何。

USBFS在接收到新的设置数据包时将CCPL位从1更改为0。当INTSTS0.VALID位为1时，软件无法向该位写入1。该位由USB总线复位初始化。

在主机控制器模式下，始终将0写入CCPL位。

### PBUSY bit (Pipe Busy)

PBUSY位指示当USBFS将PID[1:0]位从BUF更改为NAK时是否使用DCP进行事务处理。USBFS在所选管道的USB事务开始时将PBUSY位从0更改为1。它改变了

PBUSY位在一个事务完成时从1变为0。

After PID is set to NAK by software, the value in the PBUSY bit indicates whether changes to pipe settings can proceed.

For details, see [section 26.3.4.1. Pipe control register switching procedures](#).

#### SQMON bit (Sequence Toggle Bit Monitor)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

The USBFS toggles the bit on normal completion of the transaction. It does not toggle the bit, however, when a DATAPID mismatch occurs during a transfer in the receiving direction.

In device controller mode, the USBFS sets the SQMON bit to 1 (specifies DATA1 as the expected value) on successful reception of the setup packet.

In device controller mode, the USBFS does not reference this bit during IN or OUT transactions at the status stage, and it does not toggle the bit on normal completion.

#### SQSET bit (Sequence Toggle Bit Set)

The SQSET bit specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

#### SQCLR bit (Sequence Toggle Bit Clear)

The SQCLR bit specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer. It is read as 0.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

#### SUREQCLR bit (SUREQ Bit Clear)

In host controller mode, setting the SUREQCLR bit to 1 clears the SUREQ bit to 0. The bit is read as 0.

If transfer stops while the SUREQ bit is set to 1 in a setup transaction, set the SUREQCLR bit to 1 by software. This is not necessary at the end of a normal setup transaction, because the USBFS automatically clears the SUREQ bit to 0.

Only control the SUREQ bit through the SUREQCLR bit while the DVSTCTR0.UACT bit is 0. When UACT is 0, communication is halted or no transfer is occurring because a bus disconnection was detected.

In device controller mode, always write 0 to this bit.

#### SUREQ bit (Setup Token Transmission)

In host controller mode, setting the SUREQ bit to 1 triggers the USBFS to transmit the setup packet. After completing the setup transaction process, the USBFS generates either the SACK or SIGN interrupt and clears the SUREQ bit to 0. The USBFS also clears the SUREQ bit to 0 when the software sets the SUREQCLR bit to 1.

Before setting the SUREQ bit to 1, set the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, and USBLENG appropriately to transmit the target USB request in the setup transaction. Also check that the PID[1:0] bits for the DCP are set to NAK. After setting the SUREQ bit to 1, do not change the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, or USBLENG until the setup transaction is complete (SUREQ bit = 1). Write 1 to the SUREQ bit only when transmitting the setup token. Otherwise, write 0.

In device controller mode, always write 0 to this bit.

#### BSTS flag (Buffer Status)

The BSTS flag indicates the status of access to the DCP FIFO buffer. The meaning of this flag varies as follows depending on the CFIFOSEL.ISEL setting:

- When ISEL = 0, the bit indicates whether receive data can be read from the buffer
- When ISEL = 1, the bit indicates whether transmit data can be written to the buffer

在软件将PID设置为NAK后，PBUSY位中的值指示是否可以继续对管道设置进行更改。

详见26.3.4.1节。管道控制寄存器切换程序。

#### SQMON位 (序列切换位监视器)

SQMON位指示DCP传输期间下一个事务的序列切换位的预期值。

USBFS在事务正常完成时切换该位。但是，当在接收方向的传输过程中发生DATAPID不匹配时，它不会切换该位。

在设备控制器模式下，USBFS在成功接收到设置数据包时将SQMON位设置为1（指定DATA1作为预期值）。

在设备控制器模式下，USBFS在状态阶段的IN或OUT事务期间不引用该位，并且它不会在正常完成时切换该位。

#### SQSET位 (序列切换位设置)

SQSET位将DATA1指定为DCP传输期间下一个事务的序列切换位的预期值。

不要同时将SQCLR和SQSET位设置为1。

#### SQCLR位 (序列翻转位清除)

SQCLR位将DATA0指定为DCP传输期间下一个事务的序列切换位的预期值。读为0。

不要同时将SQCLR和SQSET位设置为1。

#### SUREQCLR bit (SUREQ Bit Clear)

在主机控制器模式下，将SUREQCLR位设置为1会将SUREQ位清除为0。该位被读取为0。

如果在设置事务中将SUREQ位设置为1时传输停止，则通过软件将SUREQCLR位设置为1。这在正常设置事务结束时不是必需的，因为USBFS会自动将SUREQ位清除为0。

当DVSTCTR0.UACT位为0时，仅通过SUREQCLR位控制SUREQ位。当UACT为0时，由于检测到总线断开，通信停止或没有传输发生。

在设备控制器模式下，始终向该位写入0。

#### SUREQ位 (设置令牌传输)

在主机控制器模式下，将SUREQ位设置为1会触发USBFS发送设置数据包。完成设置事务处理后，USBFS产生SACK或SIGN中断并将SUREQ位清零。当软件将SUREQCLR位设置为1时，USBFS也将SUREQ位清零。

在将SUREQ位设置为1之前，将DCPMAXP.DEVSEL[3:0]位、USBREQ、USBVAL、USBINDX和USBLENG适当地在设置事务中传输目标USB请求。还要检查DCP的PID[1:0]位是否设置为NAK。将SUREQ位设置为1后，在设置事务完成（SUREQ位=1）之前，不要更改DCPMAXP.DEVSEL[3:0]位、USBREQ、USBVAL、USBINDX或USBLENG。仅在发送设置令牌时向SUREQ位写入1。否则，写0。

在设备控制器模式下，始终向该位写入0。

#### BSTS flag (Buffer Status)

BSTS标志指示访问DCPFIFO缓冲区的状态。根据CFIFOSEL.ISEL设置，该标志的含义如下：

- ISEL=0时，该位指示是否可以从缓冲区读取接收数据
- ISEL=1时，该位指示发送数据是否可以写入缓冲区

## 26.2.31 PIPESEL : Pipe Window Select Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x064

| Bit  | Symbol       | Function   | R/W |
|------|--------------|--|-----|
| 3:0  | PIPESEL[3:0] | Pipe Window Select<br>0x0: No pipe selected<br>0x1: Pipe 1<br>0x2: Pipe 2<br>0x3: Pipe 3<br>0x4: Pipe 4<br>0x5: Pipe 5<br>0x6: Pipe 6<br>0x7: Pipe 7<br>0x8: Pipe 8<br>0x9: Pipe 9<br>Others: Setting prohibited | R/W |
| 15:4 | —            | These bits are read as 0. The write value should be 0.   | R/W |

Set pipes 1 to 9 using the PIPESEL, PIPECFG, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN registers (n = 0 to 9).

After selecting the pipe in the PIPESEL register, pipe functions must be set in the associated PIPECFG, PIPEMAXP, and PIPEPERI registers. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set independently of the pipe selection in this register.

**PIPESEL[3:0] bits (Pipe Window Select)**

The PIPESEL[3:0] bits select the pipe number associated with the PIPECFG, PIPEMAXP, and PIPEPERI registers used for data writing and reading. Selecting a pipe number in the PIPESEL[3:0] bits allows writing to and reading from PIPECFG, PIPEMAXP, and PIPEPERI associated with the selected pipe number.

When PIPESEL[3:0] = 0000b, 0 is read from all of the bits in PIPECFG, PIPEMAXP, and PIPEPERI. Writing to these bits has no effect.

## 26.2.32 PIPECFG : Pipe Configuration Register

Base address: USBFS = 0x4009\_0000

Offset address: 0x068

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 3:0 | EPNUM[3:0] | Endpoint Number*1<br>Specifies the endpoint number for the selected pipe. Setting 0000b indicates that the pipe is not used. | R/W |
| 4   | DIR        | Transfer Direction*2 *3<br>0: Receiving direction<br>1: Transmitting direction   | R/W |
| 6:5 | —          | These bits are read as 0. The write value should be 0.   | R/W |

## 26.2.31 PIPESEL:管道窗口选择寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x064

| Bit  | Symbol       | Function   | R/W |
|------|--------------|--|-----|
| 3:0  | PIPESEL[3:0] | 管道窗口选择<br>0x0: 未选择管道0x1<br>: 管道10x2: 管道20x<br>3: 管道30x4: 管道40<br>x5: 管道50x6: 管道6<br>0x7: 管道70x8: 管道<br>80x9: 管道9<br><br>其他: 禁止设置 | R/W |
| 15:4 | —            | 这些位被读取为0。写入值应为0。   | R/W |

使用PIPESEL、PIPECFG、PIPEMAXP、PIPEPERI、PIPEnCTR、PIPEnTRE和PIPEnTRN寄存器 (n=0到9) 设置管道1到9。

在PIPESEL寄存器中选择管道后, 必须在相关的PIPECFG、PIPEMAXP和PIPEPERI寄存器。PIPEnCTR、PIPEnTRE和PIPEnTRN可以独立于该寄存器中的管道选择进行设置。

**PIPESEL[3:0]位 (管道窗口选择)**

PIPESEL[3:0]位选择与用于数据写入和读取的PIPECFG、PIPEMAXP和PIPEPERI寄存器相关的管道编号。在PIPESEL[3:0]位中选择一个管道编号允许写入和读取与所选管道编号相关的PIPECFG、PIPEMAXP和PIPEPERI。

当PIPESEL[3:0]=0000b时, 从PIPECFG、PIPEMAXP和PIPEPERI中的所有位读取0。写入这些位无效。

## 26.2.32 PIPECFG:管道配置寄存器

Base address: USBFS = 0x4009\_0000

Offset address: 0x068

| Bit | Symbol     | Function                              | R/W |
|-----|------------|---------------------------------------|-----|
| 3:0 | EPNUM[3:0] | 端点编号*1<br>指定选定管道的端点编号。设置0000b表示不使用管道。 | R/W |

| 6:5 | —          | 这些位被读取为0。写入值应为0。                      | R/W |

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 7     | SHTNAK    | Pipe Disabled at End of Transfer*1<br>0: Continue pipe operation after transfer ends<br>1: Disable pipe after transfer ends   | R/W |
| 8     | —         | This bit is read as 0. The write value should be 0.   | R/W |
| 9     | DBLB      | Double Buffer Mode*2 *3<br>0: Single buffer<br>1: Double buffer   | R/W |
| 10    | BFRE      | BRDY Interrupt Operation Specification*2 *3<br>0: Generate BRDY interrupt on transmitting or receiving data<br>1: Generate BRDY interrupt on completion of reading data   | R/W |
| 13:11 | —         | These bits are read as 0. The write value should be 0.  | R/W |
| 15:14 | TYPE[1:0] | Transfer Type*1<br>0 0: Pipe not used<br>0 1: Pipes 1 and 2: Bulk transfer<br>Pipes 3 to 5: Bulk transfer<br>Pipes 6 to 9: Setting prohibited<br>1 0: Pipes 1 and 2: Setting prohibited<br>Pipes 3 to 5: Setting prohibited<br>Pipes 6 to 9: Interrupt transfer<br>1 1: Pipes 1 and 2: Isochronous transfer<br>Pipes 3 to 5: Setting prohibited<br>Pipes 6 to 9: Setting prohibited | R/W |

Note 1. Only set the TYPE[1:0], SHTNAK, and EPNUM[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the BFRE, DBLB, and DIR bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 3. To change the BFRE, DBLB, or DIR bits after completing USB communication on the selected pipe, in addition to the constraints described in Note 2, write 1 and 0 to the PIPEnCTR.ACLRM bit continuously through the software and clear the FIFO buffer assigned to the pipe.

PIPECFG specifies the transfer type, FIFO buffer access direction, and endpoint numbers for pipes 1 to 9. It also selects single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

#### EPNUM[3:0] bits (Endpoint Number)

The EPNUM[3:0] bits specify the endpoint number for the selected pipe. Setting 0000b indicates the pipe not used.

Set these bits so that the combination of the DIR and EPNUM[3:0] settings is different from those for other pipes. The EPNUM[3:0] bits can be set to 0000b for all pipes.

#### DIR bit (Transfer Direction)

The DIR bit specifies the transfer direction for the selected pipe.

When the software sets this bit to 0, the USBFS uses the selected pipe for receiving. When the software sets this bit to 1, the USBFS uses the selected pipe for transmitting.

#### SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change the PIPEnCTR.PID[1:0] bits to 00b (NAK) at the end of transfer when the selected pipe is set in the receiving direction. The bit is valid for pipes 1 to 5 in the receiving direction.

When the software sets this bit to 1 for a receiving pipe, the USBFS changes the associated PIPEnCTR.PID[1:0] bits to 00b (NAK) on determining the transfer end. The USBFS determines that the transfer has ended on the following conditions:

- A short packet data (including a zero-length packet) was successfully received
- The transaction counter is used and the number of packets specified for the transaction counter are successfully received

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 7     | SHTNAK    | 传输结束时管道禁用*1<br>0: 传输结束后继续管道操作1: 传输结束后禁用管道  | R/W |
| 8     | —         | 该位读取为0。写入值应为0。   | R/W |
| 9     | DBLB      | 双缓冲模式*2*3<br>0: 单缓冲区1:<br>双缓冲区   | R/W |
| 10    | BFRE      | BRDY中断操作规范*2*3<br>0: 发送或接收数据时产生BRDY中断1: 读取数据完成时产生BRDY中断  | R/W |
| 13:11 | —         | 这些位被读取为0。写入值应为0。   | R/W |
| 15:14 | TYPE[1:0] | 传输类型*1<br>00: 未使用管道01: 管道1和2:<br>批量传输管道3到5: 批量传输<br><br>管道6至9: 禁止设置<br>10: 管道1和2: 设置禁止管道3至5:<br>设置禁止管道6至9: 中断传输<br><br>11: 管道1和2: 同步传输管道3至5: 禁止设置管道6至9: 禁止设置 | R/W |

注1.PID为NAK时，仅设置TYPE[1:0]、SHTNAK和EPNUM[3:0]位。在设置这些位之前，请检查PIPEnCTR.PBUSY位为0，然后将PIPEnCTR.PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00(NAK)，则无需通过软件检查PBUSY位。

注2.仅在PID为NAK且在端口选择寄存器的CURPIPE[3:0]位中选择管道之前设置BFRE、DBLB和DIR位。在设置这些位之前，请检查PIPEnCTR.PBUSY位是否为0，然后将PIPEnCTR.PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00(NAK)，则无需通过软件检查PBUSY位。

注3.要在选定管道上完成USB通信后更改BFRE、DBLB或DIR位，除了注2中描述的约束外，通过软件连续向PIPEnCTR.ACLRM位写入1和0并清除FIFO分配给管道的缓冲区。

PIPECFG指定管道1到9的传输类型、FIFO缓冲区访问方向和端点编号。它还选择单缓冲区或双缓冲区模式，以及在传输结束时是继续还是禁用管道操作。

#### EPNUM[3:0] bits (Endpoint Number)

EPNUM[3:0]位指定所选管道的端点号。设置0000b表示管道未使用。

设置这些位，以便DIR和EPNUM[3:0]设置的组合不同于其他管道的设置。这对于所有管道，EPNUM[3:0]位可以设置为0000b。

#### DIR位 (传输方向)

DIR位指定所选管道的传输方向。

当软件将此位设置为0时，USBFS使用所选管道进行接收。当软件将该位设置为1时，USBFS使用选定的管道进行传输。

#### SHTNAK位 (传输结束时禁用管道)

SHTNAK位指定当所选管道设置为接收方向时，是否在传输结束时将PIPEnCTR.PID[1:0]位更改为00b(NAK)。该位对接收方向的管道1到5有效。

当软件将该位设置为1用于接收管道时，USBFS在确定传输结束时将相关的PIPEnCTR.PID[1:0]位更改为00b(NAK)。USBFS在以下条件下确定传输已结束:

- 成功接收短包数据 (包括零长度包)
- 使用事务计数器，成功接收事务计数器指定的包数

**DBLB bit (Double Buffer Mode)**

The DBLB bit selects either single or double buffer mode for the FIFO buffer used by the selected pipe. The bit is valid for pipes 1 to 5.

**BFRE bit (BRDY Interrupt Operation Specification)**

The BFRE bit specifies the BRDY interrupt generation timing from the USBFS to the CPU for the selected pipe.

When the software sets the BFRE bit to 1 and the selected pipe is in the receiving direction, the USBFS detects the transfer completion and generates the BRDY interrupt on reading the packet.

When a BRDY interrupt is generated with this setting, the software must write 1 to the BCLR bit in the port control register. The FIFO buffer assigned to the selected pipe is not enabled for reception until 1 is written to the BCLR bit.

When the BFRE bit is set to 1 by software and the selected pipe is in the transmitting direction, the USBFS does not generate the BRDY interrupt. For details, see [section 26.3.3.1. BRDY interrupt](#).

**TYPE[1:0] bits (Transfer Type)**

The TYPE[1:0] bits specify the transfer type for the pipe selected in the PIPESEL.PIPESEL[3:0] bits. Before setting PID to BUF and starting USB communication on the selected pipe, set the TYPE[1:0] bits to a value other than 00b.

**26.2.33 PIPEMAXP : Pipe Maximum Packet Size Register**

Base address: USBFS = 0x4009\_0000

Offset address: 0x06C

|                    |             |    |    |    |    |    |           |   |   |   |   |   |   |   |   |   |
|--------------------|-------------|----|----|----|----|----|-----------|---|---|---|---|---|---|---|---|---|
| Bit position:      | 15          | 14 | 13 | 12 | 11 | 10 | 9         | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | DEVSEL[3:0] |    |    | —  | —  | —  | MXPS[8:0] |   |   |   |   |   |   |   |   |   |
| Value after reset: | 0           | 0  | 0  | 0  | 0  | 0  | 0         | 0 | 0 | x | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol      | Function   | R/W |
|-------|-------------|--|-----|
| 8:0   | MXPS[8:0]   | Maximum Packet Size*1<br><ul style="list-style-type: none"> <li>Pipes 1 and 2<br/>1 byte (0x001) to 256 bytes (0x100) (Bit [9] not supported.)</li> <li>Pipes 3 to 5<br/>8 bytes (0x008), 16 bytes (0x010), 32 bytes (0x020), 64 bytes (0x040) (Bits [9:7] and [2:0] not supported.)</li> <li>Pipes 6 to 9<br/>1 byte (0x001) to 64 bytes (0x040) (Bits [9:7] not supported.)</li> </ul> | R/W |
| 11:9  | —           | These bits are read as 0. The write value should be 0.   | R/W |
| 15:12 | DEVSEL[3:0] | Device Select*2<br>0x0: Address 0000b<br>0x1: Address 0001b<br>0x2: Address 0010b<br>0x3: Address 0011b<br>0x4: Address 0100b<br>0x5: Address 0101b<br>Others: Setting prohibited  | R/W |

Note: The value of the MXPS[8:0] bits is 0x000 when no pipe is selected in the PIPESEL.PIPESEL[3:0] bits and 0x040 when a pipe is selected.

Note 1. Only set the MXPS[8:0] bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEMAXP specifies the maximum packet size for pipes 1 to 9.

**DBLB位 (双缓冲模式)**

DBLB位为所选管道使用的FIFO缓冲区选择单缓冲区模式或双缓冲区模式。该位对管道1到5有效。

**BFRE位 (BRDY中断操作规范)**

BFRE位为所选管道指定从USBFS到CPU的BRDY中断生成时序。

当软件将BFRE位设置为1且所选管道处于接收方向时，USBFS检测到传输完成并在读取数据包时产生BRDY中断。

当使用该设置产生BRDY中断时，软件必须将1写入端口控制寄存器中的BCLR位。在将1写入BCLR位之前，分配给所选管道的FIFO缓冲区不会用于接收。

当BFRE位由软件设置为1且所选管道处于发送方向时，USBFS不会产生BRDY中断。详见26.3.3.1节。BRDY中断。

**TYPE[1:0] bits (Transfer Type)**

TYPE[1:0]位指定在PIPESEL.PIPESEL[3:0]位中选择的管道的传输类型。设置PID之前BUF并在所选管道上启动USB通信，将TYPE[1:0]位设置为00b以外的值。

**26.2.33 PIPEMAXP:管道最大数据包大小寄存器**

Base address: USBFS = 0x4009\_0000

Offset address: 0x06C

|               |             |    |    |    |    |    |           |   |   |   |   |   |   |   |   |   |

| 8:0   | MXPS[8:0]   | 最大数据包大小*1<br><ul style="list-style-type: none"> <li>管道1和2<br/>1字节(0x001)到256字节(0x100) (不支持位[9]。)</li> <li>管道3至5<br/>8字节(0x008)、16字节(0x010)、32字节(0x020)、64字节(0x040) (不支持位[9:7]和[2:0]。)</li> <li>管道6至9<br/>1字节(0x001)到64字节(0x040) (不支持位[9:7]。)</li> </ul> | R/W |
| 11:9  | —           | 这些位被读取为0。写入值应为0。  | R/W |
| 15:12 | DEVSEL[3:0] | 设备选择*2<br>0x0: Address 0000b<br>0x1: Address 0001b<br>0x2: Address 0010b<br>0x3: Address 0011b<br>0x4: Address 0100b<br>0x5: Address 0101b<br>其他: 禁止设置  | R/W |

Note: The value of the MXPS[8:0] bits is 0x000 when no pipe is selected in the PIPESEL.PIPESEL[3:0] bits and 0x040 when a pipe is selected.

注1.仅在PID为NAK且在端口选择寄存器的CURPIPE[3:0]位中选择管道之前设置MXPS[8:0]位。在设置这些位之前，请检查PIPEnCTR.PBUSY位是否为0，然后将PIPEnCTR.PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00(NAK)，则无需通过软件检查PBUSY位。

注2.仅在PID为NAK时设置DEVSEL[3:0]位。在设置这些位之前，请检查PIPEnCTR.PBUSY位是否为0，然后将PIPEnCTR.PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00b(NAK)，则无需通过软件检查PBUSY位。

PIPEMAXP指定管道1到9的最大数据包大小。

**MXPS[8:0] bits (Maximum Packet Size)**

The MXPS[8:0] bits specify the maximum data payload (maximum packet size) for the selected pipe.

Set these bits to the appropriate value for each transfer type based on the USB 2.0 specification. When MXPS[8:0] = 0, do not write to the FIFO buffer or set PID to BUF. These writes have no effect.

**DEVSEL[3:0] bits (Device Select)**

In host controller mode, the DEVSEL[3:0] bits specify the address of the target device for USB communication. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0x2, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0x0.

**26.2.34 PIPEPERI : Pipe Cycle Control Register**

Base address: USBFS = 0x4009\_0000

Offset address: 0x06E

|                    |    |    |    |      |    |    |   |   |   |   |   |   |   |           |   |   |
|--------------------|----|----|----|------|----|----|---|---|---|---|---|---|---|-----------|---|---|
| Bit position:      | 15 | 14 | 13 | 12   | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2         | 1 | 0 |
| Bit field:         | —  | —  | —  | IFIS | —  | —  | — | — | — | — | — | — | — | IITV[2:0] |   |   |
| Value after reset: | 0  | 0  | 0  | 0    | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0         | 0 | 0 |

| Bit   | Symbol                 | Function  | R/W |
|-------|------------------------|---|-----|
| 2:0   | IITV[2:0] <sup>1</sup> | Interval Error Detection Interval<br>Specifies the interval error detection timing for the selected pipe as the n-th power of 2 of the frame timing | R/W |
| 11:3  | —                      | These bits are read as 0. The write value should be 0.  | R/W |
| 12    | IFIS                   | Isochronous IN Buffer Flush<br>0: Do not flush buffer<br>1: Flush buffer  | R/W |
| 15:13 | —                      | These bits are read as 0. The write value should be 0.  | R/W |

Note 1. Only set the IITV[2:0] bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEPERI selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfers, and sets the interval error detection interval for pipes 1 to 9.

**IITV[2:0] bits (Interval Error Detection Interval)**

To change the IITV[2:0] bits to another value after they are set and USB communication is performed, set the PIPEnCTR.PID[1:0] bits to 00b (NAK) and then set the PIPEnCTR.ACLRM bit to 1 to initialize the interval timer.

The IITV[2:0] bits are not provided for pipes 3 to 5. Write 000b to bit positions of the IITV[2:0] bits associated with pipes 3 to 5.

**IFIS bit (Isochronous IN Buffer Flush)**

The IFIS bit specifies whether to flush the buffer when the pipe selected in the PIPESEL.PIPESEL[3:0] bits is used for isochronous IN transfers.

In device controller mode when the selected pipe is for isochronous IN transfers, the USBFS automatically clears the FIFO buffer if the USBFS fails to receive the IN token from the USB host within the interval set in the IITV[2:0] bits in terms of frames.

When double buffering is specified (PIPECFG.DBLEB = 1), the USBFS only clears the data in the previously used plane.

The USBFS clears the FIFO buffer on receiving the SOF packet immediately after the frame in which the USBFS expected to receive the IN token. Even if the SOF packet is corrupted, the FIFO buffer is cleared at the time the SOF packet is expected to be received by using the internal interpolation function.

In host controller mode, set the IITV[2:0] bits to 000b.

**MXPS[8:0]位 (最大数据包大小)**

MXPS[8:0]位指定所选管道的最大数据有效负载 (最大数据包大小)。

根据USB2.0规范将这些位设置为每种传输类型的适当值。当MXPS[8:0]=0时, 不要写入FIFO缓冲区或将PID设置为BUF。这些写入没有效果。

**DEVSEL[3:0] bits (Device Select)**

在主机控制器模式下, DEVSEL[3:0]位指定USB通信的目标设备的地址。首先在相关的DEVADDn (n=0到5) 寄存器中设置设备地址, 然后将这些位设置为相应的值。例如, 要将DEVSEL[3:0]位设置为0x2, 首先设置DEVADD2寄存器中的地址。

在设备控制器模式下, 将这些位设置为0x0。

**26.2.34 PIPEPERI:管道循环控制寄存器**

Base address: USBFS = 0x4009\_0000

Offset address: 0x06E

|               |    |    |    |      |    |    |   |   |   |   |   |   |   |           |   |   |
|---------------|----|----|----|------|----|----|---|---|---|---|---|---|---|-----------|---|---|
| Bit position: | 15 | 14 | 13 | 12   | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2         | 1 | 0 |
| Bit field:    | —  | —  | —  | IFIS | —  | —  | — | — | — | — | — | — | — | IITV[2:0] |   |   |
| 重置后的值:        | 0  | 0  | 0  | 0    | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0         | 0 | 0 |

| Bit   | Symbol                 | Function                               | R/W |
|-------|------------------------|--|-----|
| 2:0   | IITV[2:0] <sup>1</sup> | 间隔错误检测间隔<br>将所选管道的间隔错误检测时间指定为帧时间的2的n次方 | R/W |
| 11:3  | —                      | 这些位被读取为0。写入值应为0。                       | R/W |
| 12    | IFIS                   | 同步IN缓冲区刷新<br>0: 不刷新缓冲区1:<br>刷新缓冲区      | R/W |
| 15:13 | —                      | 这些位被读取为0。写入值应为0。                       | R/W |

注1.仅在PID为NAK时设置IITV[2:0]位。在设置这些位之前, 请检查PBUSY位是否为0, 然后将PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00(NAK), 则无需通过软件检查PBUSY位。

PIPEPERI选择在同步IN传输期间发生间隔错误时是否刷新缓冲区, 并设置管道1到9的间隔错误检测间隔。

**IITV[2:0]位 (间隔错误检测间隔)**

要在设置IITV[2:0]位并在执行USB通信后将其更改为另一个值, 请设置PIPEnCTR.PID[1:0]位为00b(NAK), 然后将PIPEnCTR.ACLRM位设置为1以初始化间隔定时器。

不为管道3到5提供IITV[2:0]位。将000b写入与管道3到5相关联的IITV[2:0]位的位位置。

**IFIS位 (同步IN缓冲区刷新)**

IFIS位指定当在PIPESEL.PIPESEL[3:0]位中选择的管道用于同步IN传输时是否刷新缓冲区。

在设备控制器模式下, 当所选管道用于同步IN传输时, 如果USBFS未能在IITV[2:0]位 (以帧为单位) 设置的间隔内从USB主机接收IN令牌, 则USBFS自动清除FIFO缓冲区。

当指定双缓冲时 (PIPECFG.DBLEB=1), USBFS只清除先前使用的平面中的数据。

在USBFS预期接收IN令牌的帧之后, USBFS在接收到SOF数据包后立即清除FIFO缓冲区。即使SOF数据包损坏, FIFO缓冲区也会在预期接收SOF数据包时使用内部插值功能清除。

在主机控制器模式下, 将IITV[2:0]位设置为000b。

Set the IITV[2:0] bits to 000b when the selected pipe is not used for isochronous transfers.

### 26.2.35 PIPEnCTR : PIPEn Control Registers (n = 1 to 5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x070 + 0x2 × (n - 1)

|                    |      |        |    |    |    |        |       |       |       |       |       |   |   |   |          |   |
|--------------------|------|--------|----|----|----|--------|-------|-------|-------|-------|-------|---|---|---|----------|---|
| Bit position:      | 15   | 14     | 13 | 12 | 11 | 10     | 9     | 8     | 7     | 6     | 5     | 4 | 3 | 2 | 1        | 0 |

| 8     | SQCLR    | Sequence Toggle Bit Clear*2<br>Clears the sequence toggle bit for pipe n.<br>This bit is read as 0.<br>0: Invalid (writing 0 has no effect)<br>1: Clear the expected value for the next transaction to DATA0 | R/W*1 |
| 9     | ACLRM    | Auto Buffer Clear Mode*3<br>0: Disable<br>1: Enable (initialize all buffers)   | R/W   |
| 10    | ATREPM   | Auto Response Mode*2<br>0: Disable auto response mode<br>1: Enable auto response mode  | R/W   |
| 13:11 | —        | These bits are read as 0. The write value should be 0.   | R/W   |
| 14    | INBUFM   | Transmit Buffer Monitor<br>0: No data to be transmitted is in the FIFO buffer<br>1: Data to be transmitted is in the FIFO buffer   | R     |
| 15    | BSTS     | Buffer Status<br>0: Buffer access by the CPU disabled<br>1: Buffer access by the CPU enabled   | R     |

Note 1. Only 0 can be read.

Note 2. Only set the ATREPM bit or write 1 to the SQCLR or SQSET bit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 3. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bit, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEnCTR can be set for any pipe selection in the PIPESEL register.

当所选管道不用于同步传输时，将IITV[2:0]位设置为000b。

### 26.2.35 PIPEnCTR:PIPEn控制寄存器(n=1到5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x070 + 0x2 × (n - 1)

|               |      |        |    |    |    |        |       |       |       |       |       |   |   |   |          |   |

注1.只能读取0。

注2.PID为NAK时，仅设置ATREPM位或向SQCLR或SQSET位写入1。在设置这些位之前，请检查PBUSY位是否为0，然后将PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00(NAK)，则无需通过软件检查PBUSY位。

注3.仅在PID为NAK且在端口选择寄存器的CURPIPE[3:0]位中选择管道之前设置ACLRM位。在设置该位之前，请检查PBUSY位是否为0，然后将PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00(NAK)，则无需通过软件检查PBUSY位。

PIPEnCTR可以为PIPESEL寄存器中的任何管道选择设置。

**PID[1:0] bits (Response PID)**

The PID[1:0]bits specify the response type for the next transaction on the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. Table 26.9 and Table 26.10 show the basic operations of the USBFS (when there are no errors in the communication packets) based on the PID[1:0] bit setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to NAK on recognizing completion of the transfer when the selected pipe is in the receiving direction and the PIPECFG.SHTNAK bit for the selected pipe is set to 1 by software
- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode

To specify the response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF)

**Table 26.9 Operation of the USBFS based on the PID[1:0] setting in host controller mode**

| PID[1:0] value             | Transfer type                  | Transfer direction (DIR bit)   | USBFS operation  |
|----------------------------|--------------------------------|--------------------------------|--|
| 00b (NAK)                  | Does not depend on the setting | Does not depend on the setting | Does not issue tokens  |
| 01b (BUF)                  | Bulk or interrupt              | Does not depend on the setting | Issues tokens when the DVSTCTR0.UACT bit is 1 and the FIFO buffer associated with the selected pipe is ready for transmission and reception.<br>Does not issue tokens when the DVSTCTR0.UACT bit is 0 or the FIFO buffer associated with the selected pipe is not ready for transmission or reception. |
|                            | Isochronous                    | Does not depend on the setting | Issues tokens regardless of the status of the FIFO buffer associated with the selected pipe.   |
| 10b (STALL) or 11b (STALL) | Does not depend on the setting | Does not depend on the setting | Does not issue tokens.   |

**Table 26.10 Operation of the USBFS based on the PID[1:0] setting in device controller mode (1 of 2)**

| PID[1:0] value | Transfer type     | Transfer direction (DIR bit)   | USBFS operation  |
|----------------|-------------------|--------------------------------|--|
| 00b (NAK)      | Bulk or interrupt | Does not depend on the setting | Returns NAK in response to the token from the USB host     |
|                | Isochronous       | Does not depend on the setting | Returns nothing in response to the token from the USB host |

**PID[1:0] bits (Response PID)**

PID[1:0]位指定所选管道上下一个事务的响应类型。

默认PID[1:0]设置为NAK。将PID[1:0]设置更改为BUF以使用关联的管道进行USB传输。表26.9和表26.10显示了基于PID[1:0]位设置的USBFS的基本操作（当通信数据包中没有错误时）。

在选定管道上进行USB通信期间，通过软件将PID[1:0]设置从BUF更改为NAK后，检查PBUSY位是否为1，以查看管道上的USB传输是否真正进入了NAK状态。如果USBFS将PID[1:0]位更改为NAK，则无需通过软件检查PBUSY位。

USBFS在以下情况下更改PIPEnCTR.PID[1:0]设置：

- 当所选管道处于接收方向并且所选管道的PIPECFG.SHTNAK位由软件设置为1时，USBFS在识别到传输完成时将PID设置为NAK
- USBFS在接收到负载超过所选管道的最大数据包大小的数据包时将PID设置为STALL(11b)
- USBFS在设备控制器模式下检测到USB总线复位时将PID设置为NAK
- USBFS在主机控制器模式下连续3次检测到接收错误（例如CRC错误）时将PID设置为NAK
- USBFS在主机控制器模式下接收到STALL握手时将PID设置为STALL(11b)

要指定响应类型，请按如下方式设置PID[1:0]位：

- 要从NAK(00b)转换到STALL，设置10b
- 要从BUF(01b)转换到STALL，设置11b
- 要从STALL(11b)转换为NAK，请设置10b，然后设置00b
- 要从STALL转换到BUF，请设置00b(NAK)，然后设置01b(BUF)

**Table 26.9 USBFS在主机控制器模式下基于PID[1:0]设置的操作**

| PID[1:0] value             | 传输类型        | 传输方向 (DIR位) | USBFS operation  |
|----------------------------|-------------|-------------|--|
| 00b (NAK)                  | 不依赖于设置      | 不依赖于设置      | 不发行代币  |
| 01b (BUF)                  | 批量或中断       | 不依赖于设置      | 当DVSTCTR0.UACT位为1并且与所选管道关联的FIFO缓冲区已准备好进行发送和接收时，发出令牌。当DVSTCTR0.UACT位为0或与所选管道关联的FIFO缓冲区尚未准备好进行发送或接收。 |
|                            | Isochronous | 不依赖于设置      | 无论与所选管道关联的FIFO缓冲区的状态如何，都会发出令牌。   |
| 10b (STALL) or 11b (STALL) | 不依赖于设置      | 不依赖于设置      | 不发行代币。   |

**Table 26.10 基于设备控制器模式下的PID[1:0]设置的USBFS操作 (1of2)**

| PID[1:0] value | 传输类型        | 传输方向 (DIR位) | USBFS operation      |
|----------------|-------------|-------------|----------------------|
| 00b (NAK)      | 批量或中断       | 不依赖于设置      | 返回NAK以响应来自USB主机的令牌   |
|                | Isochronous | 不依赖于设置      | 响应来自USB主机的令牌，不返回任何内容 |

Table 26.10 Operation of the USBFS based on the PID[1:0] setting in device controller mode (2 of 2)

| PID[1:0] value             | Transfer type     | Transfer direction (DIR bit)     | USBFS operation   |
|----------------------------|-------------------|----------------------------------|---|
| 01b (BUF)                  | Bulk              | Receiving direction (DIR = 0)    | Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception                |
|                            | Interrupt         | Receiving direction (DIR = 0)    | Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception                |
|                            | Bulk or interrupt | Transmitting direction (DIR = 1) | Transmits data in response to the token from the USB host if the FIFO buffer associated with the selected pipe is ready for transmission. Otherwise, returns NAK.       |
|                            | Isochronous       | Receiving direction (DIR = 0)    | Receives data in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception. Otherwise, discards the data. |
|                            | Isochronous       | Transmitting direction (DIR = 1) | Transmits data in response to the token from the USB host if the associated FIFO buffer is ready for transmission. Otherwise, transmits a zero-length packet.           |
| 10b (STALL) or 11b (STALL) | Bulk or interrupt | Does not depend on the setting   | Returns STALL in response to the token from the USB host  |
|                            | Isochronous       | Does not depend on the setting   | Returns nothing in response to the token from the USB host  |

**PBUSY bit (Pipe Busy)**

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by software after PID is set to NAK allows you to check whether changing the pipe setting is possible. For details, see [section 26.3.4.1. Pipe control register switching procedures](#).

**SQMON bit (Sequence Toggle Bit Confirmation)**

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

When the selected pipe is not the isochronous transfer type, the USBFS toggles the SQMON flag on successful completion of the transaction. However, the USBFS does not toggle the SQMON flag when a DATA-PID mismatch occurs during transfer in the receiving direction.

**SQSET bit (Sequence Toggle Bit Set)**

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS clears the SQSET bit to 0.

**SQCLR bit (Sequence Toggle Bit Clear)**

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS clears the SQCLR bit to 0.

**ACLRM bit (Auto Buffer Clear Mode)**

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 26.11 shows the data cleared by writing 1 and 0 to the ACLRM bit continuously and the cases in which this processing is required.

Table 26.11 Data cleared by the USBFS when ACLRM = 1 (1 of 2)

| Number | Data cleared by setting the ACLRM bit   | Situations requiring data clear     |
|--------|---|-------------------------------------|
| 1      | All data in the FIFO buffer allocated to the selected pipe (two FIFO buffers in double buffer mode) | When initializing the selected pipe |

Table 26.10 基于设备控制器模式下的PID[1:0]设置的USBFS操作 (2之2)

| PID[1:0] value             | 传输类型        | 传输方向 (DIR位) | USBFS operation  |
|----------------------------|-------------|-------------|--|
| 01b (BUF)                  | Bulk        | 接收方向(DIR=0) | 如果与所选管道关联的FIFO缓冲区已准备好接收, 则接收数据并返回ACK以响应来自USB主机的OUT令牌     |
|                            | Interrupt   | 接收方向(DIR=0) | 如果与所选管道关联的FIFO缓冲区已准备好接收, 则接收数据并返回ACK以响应来自USB主机的OUT令牌     |
|                            | 批量或中断       | 发射方向(DIR=1) | 传输数据以响应来自USB主机的令牌, 如果与所选管道关联的FIFO缓冲区已准备好进行传输。否则, 返回NAK。  |
|                            | Isochronous | 接收方向(DIR=0) | 如果与所选管道关联的FIFO缓冲区已准备好接收, 则接收数据以响应来自USB主机的OUT令牌。否则, 丢弃数据。 |
|                            | Isochronous | 发射方向(DIR=1) | 如果关联的FIFO缓冲区已准备好传输, 则传输数据以响应来自USB主机的令牌。否则, 发送零长度数据包。     |
| 10b (STALL) or 11b (STALL) | 批量或中断       | 不依赖于设置      | 返回STALL以响应来自USB主机的令牌                                     |
|                            | Isochronous | 不依赖于设置      | 响应来自USB主机的令牌, 不返回任何内容                                    |

**PBUSY bit (Pipe Busy)**

PBUSY位指示所选管道是否正在用于当前事务。

USBFS在所选管道的USB事务开始时将PBUSY位从0更改为1, 并更改PBUSY位在一个事务完成时从1变为0。

在PID设置为NAK后, 通过软件读取PBUSY位可以检查是否可以更改管道设置。详见26.3.4.1节。管道控制寄存器切换程序。

**SQMON位 (序列切换位确认)**

SQMON位指示所选管道的下一个事务的序列切换位的预期值。

当所选管道不是同步传输类型时, USBFS在事务成功完成时切换SQMON标志。但是, 当在接收方向的传输过程中发生DATA-PID不匹配时, USBFS不会切换SQMON标志。

**SQSET位 (序列切换位设置)**

通过软件将SQSET位设置为1会导致USBFS将DATA1设置为所选管道上下一个事务的序列切换位的预期值。USBFS将SQSET位清0。

**SQCLR位 (序列翻转位清除)**

通过软件将SQCLR位设置为1会导致USBFS将所选管道上下一个事务的序列切换位的预期值清除为DATA0。USBFS将SQCLR位清0。

**ACLRM位 (自动缓冲区清除模式)**

ACLRM位启用或禁用所选管道的自动缓冲区清除模式。要完全清除分配给所选管道的FIFO缓冲区中的数据, 请向ACLRM位连续写入1和0。

表26.11显示了通过向ACLRM位连续写入1和0来清除的数据以及需要进行此处理的情况。

Table 26.11 当ACLRM=1(1of2)时USBFS清除的数据

| Number | 通过设置ACLRM位清除数据                          | 需要数据清楚的情况 |
|--------|---|-----------|
| 1      | FIFO缓冲区中的所有数据分配给选定的管道 (两个双缓冲模式下的FIFO缓冲) | 初始化选定管道时  |

Table 26.11 Data cleared by the USBFS when ACLRM = 1 (2 of 2)

| Number | Data cleared by setting the ACLRM bit  | Situations requiring data clear                          |
|--------|--|--|
| 2      | Interval count value when the selected pipe is the isochronous transfer type | When resetting the interval count value                  |
| 3      | Internal flags related to the PIPECFG.BFRE bit                               | When changing the PIPECFG.BFRE setting                   |
| 4      | FIFO buffer toggle control   | When changing the PIPECFG.DBLB setting                   |
| 5      | Internal flags related to the transaction count                              | When forcing the transaction count function to terminate |

**ATREPM bit (Auto Response Mode)**

The ATREPM bit enables or disables auto response mode for the selected pipe.

This bit can be set to 1 in device controller mode when the selected pipe is the bulk transfer type. When the bit is set to 1, the USBFS responds to the token from the USB host as follows:

- When the selected pipe is set for bulk IN transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 1):
  - When the ATREPM bit = 1 and PID = BUF, the USBFS transmits a zero-length packet in response to the IN token.
  - The USBFS updates (allows toggling of) the sequence toggle bit (DATA-PID) each time the USBFS receives ACK from the USB host. In a single transaction, the IN token is received, a zero-length packet is transmitted, and then ACK is received. The USBFS does not generate the BRDY or BEMP interrupt.
- When the selected pipe is set for bulk OUT transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 0):
 

When the ATREPM bit = 1 and PID = BUF, the USBFS returns NAK in response to the OUT token and generates an NRDY interrupt.

For USB communication in auto response mode, set the ATREPM bit to 1 while the FIFO buffer is empty. Do not write to the FIFO buffer during USB communication in auto response mode. When the selected pipe uses isochronous transfer, always set this bit to 0.

In host controller mode, always set the ATREPM bit to 0.

**INBUFM bit (Transmit Buffer Monitor)**

The INBUFM bit indicates the FIFO buffer status for the selected pipe in the transmitting direction.

When the selected pipe is set in the transmitting direction (PIPECFG.DIR = 1), the USBFS sets this bit to 1 when the CPU or DMA/DTC completes writing data to at least one FIFO buffer plane.

The USBFS sets this bit to 0 when the USBFS completes transmission of the data from the FIFO buffer plane to which all the data is written. In double buffer mode (PIPECFG.DBLB = 1), the USBFS sets the INBUFM bit to 0 when the USBFS completes transmission of the data from the two FIFO buffer planes before the CPU or DMA/DTC completes writing data to one FIFO buffer plane.

The INBUFM bit indicates the same value as the BSTS bit when the selected pipe is in the receiving direction (PIPECFG.DIR = 0).

**BSTS bit (Buffer Status)**

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 26.12.

Table 26.11 当ACLRM=1(2of2)时USBFS清除的数据

| Number | 通过设置ACLRM位清除数据        | 需要数据清楚的情况         |
|--------|-----------------------|-------------------|
| 2      | 选择管道为等时传输类型时的间隔计数值    | 重置间隔计数值时          |
| 3      | 与PIPECFG.BFRE位相关的内部标志 | 更改PIPECFG.BFRE设置时 |
| 4      | FIFO缓冲区切换控制           | 更改PIPECFG.DBLB设置时 |
| 5      | 与事务计数相关的内部标志          | 强制事务计数函数终止时       |

**ATREPM位 (自动响应模式)**

ATREPM位启用或禁用所选管道的自动响应模式。

当所选管道为批量传输类型时，该位可以在设备控制器模式下设置为1。当该位设置为1时，USBFS响应来自USB主机的令牌，如下所示：

- 当所选管道设置为批量IN传输时 (PIPECFG.TYPE[1:0]=01b和PIPECFG.DIR=1):
  - 当ATREPM位=1且PID=BUF时，USBFS发送一个长度为零的数据包以响应IN令牌。  
湾。每次USBFS从USB主机接收到ACK时，USBFS都会更新（允许切换）序列切换位(DATA-PID)。在单个事务中，收到IN令牌，发送零长度数据包，然后收到ACK。USBFS不会产生BRDY或BEMP中断。
- 当所选管道设置为批量OUT传输时 (PIPECFG.TYPE[1:0]=01b和PIPECFG.DIR=0) :
 

当ATREPM位=1且PID=BUF时，USBFS返回NAK以响应OUT令牌并生成一个NRDY interrupt。

对于自动响应模式下的USB通信，当FIFO缓冲区为空时，将ATREPM位设置为1。在自动响应模式下的USB通信期间不要写入FIFO缓冲区。当所选管道使用同步传输时，始终将此位设置为0。

在主机控制器模式下，始终将ATREPM位设置为0。

**INBUFM位 (发送缓冲区监视器)**

INBUFM位指示发送方向上所选管道的FIFO缓冲区状态。

当所选管道设置为发送方向(PIPECFG.DIR=1)时，当CPU或DMADTC完成将数据写入至少一个FIFO缓冲区平面时，USBFS将该位设置为1。

当USBFS完成从写入所有数据的FIFO缓冲区平面传输数据时，USBFS将该位设置为0。在双缓冲模式(PIPECFG.DBLB=1)下，当USBFS在CPU或DMADTC完成将数据写入一个FIFO缓冲层之前完成从两个FIFO缓冲层的数据传输时，USBFS将INBUFM位设置为0。

当所选管道处于接收方向时 (PIPECFG.DIR=0)，INBUFM位指示与BSTS位相同的值。

**BSTS bit (Buffer Status)**

BSTS位指示所选管道的FIFO缓冲区状态。

BSTS位的含义取决于PIPECFG.DIR、PIPECFG.BFRE和DnFIFOSEL.DCLRM设置，如表26.12所示。

Table 26.12 BSTS bit operation

| DIR value | BFRE value | DCLRM value | BSTS bit function   |
|-----------|------------|-------------|---|
| 0         | 0          | 0           | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 on completion of data read  |
|           |            | 1           | Setting prohibited  |
|           | 1          | 0           | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 when the software sets the BCLR bit in the port control register to 1 after the data read is complete |
|           |            | 1           | Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 on completion of data read  |
| 1         | 0          | 0           | Sets to 1 when transmit data can be written to the FIFO buffer, and clears to 0 on completion of data write   |
|           |            | 1           | Setting prohibited  |
|           | 1          | 0           | Setting prohibited  |
|           |            | 1           | Setting prohibited  |

- Note 1. Only write 1 to the SQCLR or SQSET bit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.
- Note 2. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

### PID[1:0] bits (Response PID)

The PID[1:0]bits specify the response type for the next transaction of the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. Table 26.9 and Table 26.10 show the basic operation (when there are no errors in the transmitted and received packets) of the USBFS depending on the PID[1:0] setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the selected pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode

To specify each response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF)

### PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by software after PID is set to NAK allows you to check whether changing the pipe setting is possible.

### SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

The USBFS toggles the SQMON bit on successful completion of the transaction. However, the USBFS does not toggle the SQMON bit when a DATA-PID mismatch occurs during transfer in the receiving direction.

### SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS sets the SQSET bit to 0.

### SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS sets the SQCLR bit to 0.

### ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

注1.PID为NAK时, 仅向SQCLR或SQSET位写入1。在设置这些位之前, 请检查PBUSY位是否为0, 然后将PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00b(NAK), 则无需通过软件检查PBUSY位。

注2.仅在PID为NAK时和在端口选择寄存器的CURPIPE[3:0]位中选择管道之前设置ACLRM位。在设置该位之前, 请检查PIPEnCTR.PBUSY位是否为0, 然后将PIPEnCTR.PID[1:0]位从01b(BUF)更改为00b(NAK)。如果PID[1:0]位被USBFS更改为00b(NAK), 则无需通过软件检查PBUSY位。

### PID[1:0] bits (Response PID)

PID[1:0]位指定所选管道的下一个事务的响应类型。

默认PID[1:0]设置为NAK。将PID[1:0]设置更改为BUF以使用关联的管道进行USB传输。表26.9和表26.10显示了取决于PID[1:0]设置的USBFS的基本操作 (在发送和接收的数据包中没有错误时)。

在选定管道上进行USB通信期间, 通过软件将PID[1:0]设置从BUF更改为NAK后, 检查PBUSY位是否为1, 以查看选定管道上的USB传输是否真正进入了NAK状态。如果USBFS将PID[1:0]位更改为NAK, 则无需通过软件检查PBUSY位。

USBFS在以下情况下更改PIPEnCTR.PID[1:0]设置:

- USBFS在接收到负载超过所选管道的最大数据包大小的数据包时将PID设置为STALL(11b)
- USBFS在设备控制器模式下检测到USB总线复位时将PID设置为NAK
- USBFS在主机控制器模式下连续3次检测到接收错误 (例如CRC错误) 时将PID设置为NAK
- USBFS在主机控制器模式下接收到STALL握手时将PID设置为STALL(11b)

要指定每种响应类型, 请按如下方式设置PID[1:0]位:

- 要从NAK(00b)转换到STALL, 设置10b
- 要从BUF(01b)转换到STALL, 设置11b
- 要从STALL(11b)转换为NAK, 请设置10b, 然后设置00b
- 要从STALL转换到BUF, 请设置00b(NAK), 然后设置01b(BUF)

### PBUSY bit (Pipe Busy)

PBUSY位指示所选管道是否正在用于当前事务。

USBFS在所选管道的USB事务开始时将PBUSY位从0更改为1, 并更改PBUSY位在一个事务完成时从1变为0。

在PID设置为NAK后, 通过软件读取PBUSY位可以检查是否可以更改管道设置。

### SQMON位 (序列切换位确认)

SQMON位指示所选管道的下一个事务的序列切换位的预期值。

USBFS在事务成功完成时切换SQMON位。但是, USBFS不会切换SQMON位, 当在接收方向的传输过程中发生DATA-PID不匹配时。

### SQSET位 (序列切换位设置)

通过软件将SQSET位设置为1会导致USBFS将DATA1设置为所选管道上下一个事务的序列切换位的预期值。USBFS将SQSET位设置为0。

### SQCLR位 (序列翻转位清除)

通过软件将SQCLR位设置为1会导致USBFS将所选管道上下一个事务的序列切换位的预期值清除为DATA0。USBFS将SQCLR位设置为0。

### ACLRM位 (自动缓冲区清除模式)

ACLRM位启用或禁用所选管道的自动缓冲区清除模式。要完全清除分配给所选管道的FIFO缓冲区中的数据, 请向ACLRM位连续写入1和0。

Table 26.13 shows the data cleared by writing 1 and 0 continuously to the ACLRM bit and the cases in which this processing is required.

Table 26.13 Data cleared by the USBFS when ACLRM = 1

| Number | Data cleared by setting the ACLRM bit  | Situations requiring data clear                          |
|--------|--|--|
| 1      | All data in the FIFO buffer allocated to the selected pipe                   | When initializing the selected pipe                      |
| 2      | Interval count value when the selected pipe is the isochronous transfer type | When resetting the interval count value                  |
| 3      | Internal flags related to the PIPECFG.BFRE bit                               | When changing the PIPECFG.BFRE setting                   |
| 4      | Internal flags related to the transaction count                              | When forcing the transaction count function to terminate |

**BSTS bit (Buffer Status)**

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 26.12.

26.2.37 PIPEnTRE : PIPEn Transaction Counter Enable Register (n = 1 to 5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x090 + 0x4 × (n - 1)

| Bit   | Symbol | Function  | R/W |
|-------|--------|---|-----|
| 7:0   | —      | These bits are read as 0. The write value should be 0.  | R/W |
| 8     | TRCLR  | Transaction Counter Clear<br>0: Invalid (writing 0 has no effect)<br>1: Clear counter value   | R/W |
| 9     | TRENB  | Transaction Counter Enable<br>0: Disable transaction counter<br>1: Enable transaction counter | R/W |
| 15:10 | —      | These bits are read as 0. The write value should be 0.  | R/W |

Note: Set each bit in PIPEnTRE while PID is NAK. Before setting these bits after changing the PIPEnCTR.PID[1:0] bits for the selected pipe from BUF to NAK, check that the PIPEnCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

**TRCLR bit (Transaction Counter Clear)**

When the TRCLR bit sets to 1, the USBFS clears the value of the transaction counter associated with the selected pipe and then sets the TRCLR bit to 0.

**TRENB bit (Transaction Counter Enable)**

The TRENB bit enables or disables the transaction counter.

For receiving pipes, setting the TRENB bit to 1 after setting the total number of the packets to be received in the PIPEnTRN.TRNCNT[15:0] bits through the software allows the USBFS to control hardware on having received the number of packets equal to the TRNCNT[15:0] setting, as follows:

- When the PIPECFG.SHTNAK bit is 1, the USBFS changes the PID bits to NAK for the associated pipe on having received the number of packets equal to the TRNCNT[15:0] setting
- When the PIPECFG.BFRE bit is 1, the USBFS asserts the BRDY interrupt on having received the number of packets equal to the TRNCNT[15:0] setting and then reading the last received data

表26.13显示了通过向ACLRM位连续写入1和0来清除的数据以及需要进行此处理的情况。

Table 26.13 ACLRM=1时USBFS清除的数据

| Number | 通过设置ACLRM位清除数据        | 需要数据清楚的情况         |
|--------|-----------------------|-------------------|
| 1      | 分配给所选管道的FIFO缓冲区中的所有数据 | 初始化选定管道时          |
| 2      | 选择管道为等时传输类型时的间隔计数值    | 重置间隔计数值时          |
| 3      | 与PIPECFG.BFRE位相关的内部标志 | 更改PIPECFG.BFRE设置时 |
| 4      | 与事务计数相关的内部标志          | 强制事务计数函数终止时       |

**BSTS bit (Buffer Status)**

BSTS位指示所选管道的FIFO缓冲区状态。

BSTS位的含义取决于PIPECFG.DIR、PIPECFG.BFRE和DnFIFOSEL.DCLRM设置，如表26.12所示。

26.2.37 PIPEnTRE:PIPEn事务计数器使能寄存器(n=1到5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x090 + 0x4 × (n - 1)

| Bit   | Symbol | Function                          | R/W |
|-------|--------|-----------------------------------|-----|
| 7:0   | —      | 这些位被读取为0。写入值应为0。                  | R/W |
| 8     | TRCLR  | 交易计数器清除<br>0: 无效 (写0无效) 1: 清除计数器值 | R/W |
| 9     | TRENB  | 事务计数器启用<br>0: 禁用事务计数器1: 启用事务计数器   | R/W |
| 15:10 | —      | 这些位被读取为0。写入值应为0。                  | R/W |

Note: 当PID为NAK时，设置PIPEnTRE中的每个位。在将所选管道的PIPEnCTR.PID[1:0]位从BUF更改为NAK之后设置这些位之前，请检查PIPEnCTR.PBUSY位是否为0。但是，如果PID[1:0]位更改为NAK通过USBFS，无需通过软件检查PBUSY位。

**TRCLR位 (事务计数器清零)**

当TRCLR位设置为1时，USBFS清除与所选管道关联的事务计数器的值，然后将TRCLR位设置为0。

**TRENB位 (事务计数器使能)**

TRENB位启用或禁用事务计数器。

对于接收管道，在设置接收管道的总包数后，将TRENB位设置为1 PIPEnTRN.TRNCNT[15:0]位通过软件允许USBFS在接收到等于TRNCNT[15:0]设置的数据包数量时控制硬件，如下所示：

- 当PIPECFG.SHTNAK位为1时，USBFS在接收到等于TRNCNT[15:0]设置的数据包数时将关联管道的PID位更改为NAK
- 当PIPECFG.BFRE位为1时，USBFS在接收到等于TRNCNT[15:0]设置的数据包数量并读取最后接收到的数据时断言BRDY中断

For transmitting pipes, set the TRENB bit to 0.

When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT[15:0] bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.

### 26.2.38 PIPEnTRN : PIPEn Transaction Counter Register (n = 1 to 5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x092 + 0x4 × (n - 1)

| Bit  | Symbol       | Function  | R/W |
|------|--------------|---|-----|
| 15:0 | TRNCNT[15:0] | Transaction Counter<br>When written to, this bit specifies the total packets (number of transactions) to be received by the selected pipe.<br>When read from, when PIPEnTRE.TRENB is 0, this bit indicates the specified number of transactions.<br>When PIPEnTRE.TRENB is 1, this bit indicates the current transaction count. | R/W |

The PIPEnTRN registers retain their settings during a USB bus reset.

#### TRNCNT[15:0] bits (Transaction Counter)

The USBFS increments the value of the TRNCNT[15:0] bits by 1 when all of the following conditions are satisfied on receiving the packet:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value ≠ current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[9:0] setting

The USBFS clears the value of the TRNCNT[15:0] bits to 0 when any of the following conditions are satisfied:

All of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value = current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[9:0] setting

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The USBFS received a short packet

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The PIPEnTRE.TRCLR bit was set to 1 by software

For transmitting pipes, set the TRNCNT[15:0] bits to 0. When the transaction counter is not used, set the TRNCNT[15:0] bits to 0.

Setting the number of transactions to be transferred to the TRNCNT[15:0] bits is only enabled when the PIPEnTRE.TRENB bit is 0. To set the number of transactions to be transferred, set the TRCLR bit to 1 to clear the current counter value before setting the PIPEnTRE.TRENB bit to 1.

对于传输管道，将TRENB位设置为0。

当不使用事务计数器时，将该位设置为0。当使用事务计数器时，将该位设置为1之前设置TRNCNT[15:0]位。在接收第一个要计数的数据包之前将该位设置为1由交易柜台。

### 26.2.38 PIPEnTRN:PIPEn事务计数器寄存器(n=1到5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x092 + 0x4 × (n - 1)

| Bit  | Symbol       | Function  | R/W |
|------|--------------|---|-----|
| 15:0 | TRNCNT[15:0] | 事务计数器写入时，该位指定所选管道要接收的总数据包（事务数）。读取时，当PIPEnTRE.TRENB为0时，该位指示指定的事务数。当PIPEnTRE.TRENB为1时，该位指示当前事务计数。 | R/W |

PIPEnTRN寄存器在USB总线复位期间保留其设置。

#### TRNCNT[15:0] bits (Transaction Counter)

当接收到数据包时满足以下所有条件时，USBFS将TRNCNT[15:0]位的值加1：

- PIPEnTRE.TRENB位=1
- (TRNCNT[15:0]设定值≠当前计数器值+1)收到数据包
- 接收数据包的有效载荷与PIPEMAXP.MXPS[9:0]设置一致

当满足以下任一条件时，USBFS将TRNCNT[15:0]位的值清零：

满足以下所有条件：

- PIPEnTRE.TRENB位=1
- (TRNCNT[15:0]setvalue=currentcountervalue+1)收到数据包
- 接收数据包的有效载荷与PIPEMAXP.MXPS[9:0]设置一致

满足以下两个条件：

- PIPEnTRE.TRENB位=1
- USBFS收到一个短数据包

满足以下两个条件：

- PIPEnTRE.TRENB位=1
- PIPEnTRE.TRCLR位由软件设置为1

对于传输管道，将TRNCNT[15:0]位设置为0。当不使用事务计数器时，将TRNCNT[15:0]位设置为0。

仅当PIPEnTRE.TRENB位为0时才使能将要传输的事务数设置到TRNCNT[15:0]位。要设置要传输的事务数，请将TRCLR位设置为1以清除当前计数器将PIPEnTRE.TRENB位设置为1之前的值。

## 26.2.39 BCCTRL1 : Battery Charging Control Register 1

Base address: USBFS = 0x4009\_0000

Offset address: 0x0B0

|                    |    |    |    |    |    |    |               |              |    |    |             |            |             |             |             |           |

**RPDME bit (D- Line Pull-down Control)**

In device controller operation, set this bit to 1 to perform Data Contact Detect. In the Battery Charging Specification Revision 1.2, there are two methods to handle Data Contact Detect; the method realized by software wait and the method to contact the data line by hardware. The RPDME bit adopts the latter method. When RPDME = 1, the USBFS controls D- line pull-down.

**IDPSRCE bit (D+ Line IDPSRC Output Control)**

In device controller operation, set this bit to 1 to perform Data Contact Detect. In the Battery Charging Specification Revision 1.2, there are two methods to handle Data Contact Detect; the method realized by software wait and the method to contact the data line by hardware. The IDPSRCE bit adopts the latter method. When IDPSRCE = 1, the USBFS enables the IDP\_SRC circuit

## 26.2.39 BCCTRL1: 电池充电控制寄存器1

Base address: USBFS = 0x4009\_0000

Offset address: 0x0B0

|               |    |    |    |    |    |    |               |              |    |    |             |            |             |             |             |           |

**RPDME bit (D- Line Pull-down Control)**

在设备控制器操作中，将此位设置为1以执行数据接触检测。在电池充电规范中修订版1.2，有两种方法来处理DataContactDetect；软件等待实现的方法和硬件连接数据线的方法。RPDME比特采用后一种方法。当RPDME=1时，USBFS控制Dline下拉。

**IDPSRCE位 (D+线IDPSRC输出控制)**

在设备控制器操作中，将此位设置为1以执行数据接触检测。在电池充电规范中修订版1.2，有两种方法来处理DataContactDetect；软件等待实现的方法和硬件连接数据线的方法。IDPSRCE位采用后一种方法。当IDPSRCE=1时，USBFS使能IDP\_SRC电路

**VDMSRCE bit (D- Line VDMSRC (0.6 V) Output Control)**

In host controller operation, during Primary Detection, this bit controls VDMSRC (0.6 V) output from the USB\_DM pin.

In device controller operation, during Secondary Detection, this bit controls VDMSRC (0.6 V) output from the USB\_DM pin.

**VDPSRCE bit (D+ Line VDPSRC (0.6 V) Output Control)**

In device controller operation, if Primary Detection is executed, this bit controls VDPSRC (0.6 V) output from the USB\_DP pin.

**PDDETE bit (D+ Line 0.6 V Input Detection Control)**

When the PDDETE bit is set to 1, the following states can be detected.

In host controller operation, during Primary Detection, VDPSRC (0.6 V) is input to the USB\_DP pin from a peripheral device.

In device controller operation, during Secondary Detection, VDPSRC (0.6 V) output from the USBFS to the USB\_DM pin is input to the USB\_DP pin via the host.

**CHGDETE bit (D- Line 0.6 V Input Detection Control)**

In device controller operation, the following can be detected when the CHGDETE bit is set to 1.

During Primary Detection, VDMSRC (0.6 V) is input to the USB\_DM pin from the host.

During Primary Detection, VDPSRC (0.6 V) output from the USBFS to the USB\_DP pin is input to the USB\_DM pin via the USB host.

**PDDETSTS flag (D+ Line 0.6 V Input Detection Status Flag)**

The PDDETSTS flag is enabled when the PDDETE bit is 1. The PDDETSTS flag becomes 1 under the following conditions.

In host controller operation, during Primary Detection, VDPSRC (0.6V) is input to the USB\_DP pin from a peripheral device.

In device controller operation, during Secondary Detection, the VDMSRC (0.6V) output from the USBFS to the USB\_DM pin is input to the USB\_DP pin via the host.

**CHGDETSTS flag (D- Line 0.6 V Input Detection Status Flag)**

In device controller operation, this flag is enabled when the CHGDETE bit is 1. The CHGDETSTS flag becomes 1 under the following conditions.

During Primary Detection, VDMSRC (0.6V) is input to the USB\_DM pin from the USB host.

During Primary Detection, the VDPSRC (0.6V) output from the USBFS to the USB\_DP pin is input to the USB\_DM pin via the USB host.

**26.2.40 BCCTRL2 : Battery Charging Control Register 2**

**VDMSRCE位 (DLineVDMSRC(0.6V)输出控制)**

在主机控制器操作中, 在主检测期间, 该位控制USB\_DM引脚的VDMSRC(0.6V)输出。

在设备控制器操作中, 在辅助检测期间, 该位控制USB\_DM引脚的VDMSRC(0.6V)输出。

**VDPSRCE位 (D+线VDPSRC(0.6V)输出控制)**

在设备控制器操作中, 如果执行PrimaryDetection, 该位控制USB\_DP引脚的VDPSRC(0.6V)输出。

**PDDETE位 (D+线0.6V输入检测控制)**

当PDDETE位设置为1时, 可以检测到以下状态。

在主机控制器操作中, 在初级检测期间, VDPSRC(0.6V)从外围设备输入到USB\_DP引脚。

在设备控制器操作中, 在二次检测期间, 从USBFS到USB\_DM引脚的VDPSRC(0.6V)输出通过主机输入到USB\_DP引脚。

**CHGDETE位 (DLine0.6V输入检测控制)**

在设备控制器操作中, 当CHGDETE位设置为1时, 可以检测到以下情况。

在主要检测期间, VDMSRC(0.6V)从主机输入到USB\_DM引脚。

在初级检测期间, 从USBFS到USB\_DP引脚的VDPSRC(0.6V)输出通过USB主机输入到USB\_DM引脚。

**PDDETSTS标志 (D+线0.6V输入检测状态标志)**

当PDDETE位为1时, 使能PDDETSTS标志。在以下条件下, PDDETSTS标志变为1。

在主机控制器操作中, 在初级检测期间, VDPSRC(0.6V)从外围设备输入到USB\_DP引脚。

在设备控制器操作中, 在二次检测期间, 从USBFS到USB\_DM引脚的VDMSRC(0.6V)输出通过主机输入到USB\_DP引脚。

**CHGDETSTS标志 (DLine0.6V输入检测状态标志)**

在设备控制器操作中, 当CHGDETE位为1时启用该标志。在以下条件下, CHGDETSTS标志变为1。

在初级检测期间, VDMSRC(0.6V)从USB主机输入到USB\_DM引脚。

在初级检测期间, 从USBFS到USB\_DP引脚的VDPSRC(0.6V)输出通过USB主机输入到USB\_DM引脚。

| Bit  | Symbol      | Function   | R/W |
|------|-------------|--|-----|
| 5:0  | —           | These bits are read as 0. The write value should be 0.   | R/W |
| 7:6  | USBSPD[1:0] | Transfer Speed of Communication Target Device<br>0 0: Do not use DEVADDn<br>0 1: Low-speed<br>1 0: Full-speed<br>1 1: Setting prohibited | R/W |
| 15:8 | —           | These bits are read as 0. The write value should be 0.   | R/W |

The DEVADDn register specifies the transfer speed of the peripheral device that is the communication target for pipes 0 to 9.

In host controller mode, set all DEVADDn bits before starting communication to any pipes. Only change the bits in DEVADDn when no valid pipes are using the bit settings. A valid pipe is defined as one that satisfies both of the following conditions:

- DEVADDn is selected in the DEVSEL[3:0] bits
- The PID[1:0] bits are set to BUF for the selected pipe, or the selected pipe is the DCP with the DCPCTR.SUREQ bit set to 1

In device controller mode, set all bits in this register to 0.

#### USBSPD[1:0] bits (Transfer Speed of Communication Target Device)

The USBSPD[1:0] bits specify the USB transfer speed of the target peripheral device. Set these bits to 10b when a full-speed device is connected through the hub. In host controller mode, the USBFS generates packets based on the USBSPD[1:0] setting. In device controller mode, set these bits to 00b.

| Bit   | Symbol      | Function   | R/W |

### 26.2.41 DEVADDn: 器件地址n配置寄存器 (n=0到5)

Base address: USBFS = 0x4009\_0000

Offset address: 0x0D0 + 0x2 × n

| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7           | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|----|----|----|----|----|----|---|---|-------------|---|---|---|---|---|---|---|
| Bit field:    | —  | —  | —  | —  | —  | —  | — | — | USBSPD[1:0] | — | — | — | — | — | — | — |
| 重置后的值:        | 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0           | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit  | Symbol      | Function   | R/W |
|------|-------------|--|-----|
| 5:0  | —           | 这些位被读取为0。写入值应为0。   | R/W |
| 7:6  | USBSPD[1:0] | 通信目标设备的传输速度<br>00: 不使用DEVADDn01:<br>低速10: 全速11: 禁止设<br>置 | R/W |
| 15:8 | —           | 这些位被读取为0。写入值应为0。   | R/W |

DEVADDn寄存器指定作为管道0到9的通信目标的外围设备的传输速度。

在主机控制器模式下, 在开始与任何管道通信之前设置所有DEVADDn位。仅更改中的位DEVADDn当没有有效管道使用位设置时。有效管道被定义为同时满足以下两个条件的管道:

- DEVADDn在DEVSEL[3:0]位中选择
- 所选管道的PID[1:0]位设置为BUF, 或者所选管道是DCPCTR.SUREQ位设置为1的DCP

在设备控制器模式下, 将此寄存器中的所有位设置为0。

#### USBSPD[1:0]位 (通信目标设备的传输速度)

USBSPD[1:0]位指定目标外围设备的USB传输速度。当通过集线器连接全速设备时, 将这些位设置为10b。在主机控制器模式下, USBFS根据USBSPD[1:0]设置生成数据包。在设备控制器模式下, 将这些位设置为00b。

26.2.42 PHYSECTRL : PHY Single-ended Receiver Control Register

Base address: USBFS = 0x4009\_0000  
Offset address: 0x0F4

| Bit  | Symbol | Function  | R/W |
|------|--------|---|-----|

| 31:24 | —      | These bits are read as 0. The write value should be 0.                | R/W |

Note 1. Use this bit during operation in Deep Software Standby mode. For details, see [section 26.3.1.5. Release from deep software standby mode because of USB suspend/resume interrupts.](#)

### SRPC0 bit (USB Single-ended Receiver Control)

The SRPC0 bit controls the D+ and D- inputs of the USB transceiver. In host controller mode, set this bit to 1. In device controller mode, set this bit to 0 when disconnected, set to 1 when suspended. This bit is only valid when the FIXPHY0 bit is 1.

### FIXPHY0 bit (USB Transceiver Output Fix)

The FIXPHY0 bit keeps the outputs of the USB transceiver disabled.

注1.在深度软件待机模式下操作期间使用该位。有关详细信息，请参阅第26.3.1.5节。由于USB挂起恢复中断而从深度软件待机模式中释放。

### SRPC0位 (USB单端接收器控制)

SRPC0位控制USB收发器的D+和D输入。在主机控制器模式下，将此位设置为1。在设备控制器模式下，断开连接时将此位设置为0，暂停时设置为1。该位仅在FIXPHY0位为1时有效。

### FIXPHY0位 (USB收发器输出修复)

FIXPHY0位保持禁用USB收发器的输出。

## 26.2.44 DPUSR1R:深度软件待机USB暂停恢复中断寄存器

| 19:18 | —        | This bit is read as 0. The write value should be 0.  | R/W |
| 20    | DOVRCRA0 | USB OVRCURA Interrupt Source Recovery<br>0: System has not recovered from Deep Software Standby mode<br>1: System recovered from Deep Software Standby mode because of OVRCURA input | R   |
| 21    | DOVRCRB0 | USB OVRCURB Interrupt Source Recovery<br>0: System has not recovered from Deep Software Standby mode<br>1: System recovered from Deep Software Standby mode because of OVRCURB input | R   |
| 22    | —        | This bit is read as 0. The write value should be 0.  | R/W |
| 23    | DVBINT0  | USB VBUS Interrupt Source Recovery<br>0: System has not recovered from Deep Software Standby mode<br>1: System recovered from Deep Software Standby mode because of VBUS input       | R   |
| 31:24 | —        | These bits are read as 0. The write value should be 0.   | R/W |

**DPINTE0 bit (USB DP Interrupt Enable/Clear)**

The DPINTE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the DP input of the USBFS. Writing 0 to this bit while the DPINT0 bit is 1 sets the DPINT0 bit to 0.

**DMINTE0 bit (USB DM Interrupt Enable/Clear)**

The DMINTE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the DM input of the USBFS. Writing 0 to this bit while the DMINT0 bit is 1 clears the DMINT0 bit to 0.

**DOVRCRAE0 bit (USB OVRCURA Interrupt Enable/Clear)**

The DOVRCRAE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the OVRCURA input of the USBFS. Writing 0 to this bit while the DOVRCRA0 bit is 1 clears the DOVRCRA0 bit to 0.

**DOVRCRBE0 bit (USB OVRCURB Interrupt Enable/Clear)**

The DOVRCRBE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the OVRCURB input of the USBFS. Writing 0 to this bit while the DOVRCRB0 bit is 1 clears the DOVRCRB0 bit to 0.

**DVBSE0 bit (USB VBUS Interrupt Enable/Clear)**

The DVBSE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the VBUS input of the USBFS. Writing 0 to this bit while the DVBINT0 bit is 1 clears the DVBINT0 bit to 0.

**DPINT0 bit (USB DP Interrupt Source Recovery)**

The DPINT0 bit indicates that the system has returned from Deep Software Standby mode because of the DP input of the USBFS. This recovery is only enabled when the DPINTE0 bit is 1. Writing 0 to the DPINTE0 bit while this bit is 1 clears this bit to 0.

**DMINT0 bit (USB DM Interrupt Source Recovery)**

The DMINT0 bit indicates that the system has returned from Deep Software Standby mode because of the DM input of the USBFS. This recovery is only enabled when the DMINTE0 bit is 1. Writing 0 to the DMINTE0 bit while this bit is 1 clears this bit to 0.

| Bit   | Symbol   | Function  | R/W |
|-------|----------|---|-----|
| 7     | DVBSE0   | USBVBUS中断使能清除<br>0: 禁止通过VBUS输入从深度软件待机模式恢复1: 使能通过VBUS输入从深度软件待机模式恢复   | R/W |
| 15:8  | —        | T这些位被读取为0。写入值应为0。   | R/W |
| 16    | DPINT0   | USBDP中断源恢复<br>0: 系统尚未从深度软件待机模式中恢复1: 系统由于DP从深度软件待机模式中恢复              | R   |
| 17    | DMINT0   | USBDM中断源恢复<br>0: 系统尚未从深度软件待机模式中恢复1: 系统由于DM输入而从深度软件待机模式中恢复           | R   |
| 19:18 | —        | 该位读取为0。写入值应为0。  | R/W |
| 20    | DOVRCRA0 | USBOVRCURA中断源恢复<br>0: 系统尚未从深度软件待机模式中恢复1: 系统由于OVRCURA输入而从深度软件待机模式中恢复 | R   |
| 21    | DOVRCRB0 | USBOVRCURB中断源恢复<br>0: 系统尚未从深度软件待机模式中恢复1: 系统由于OVRCURB输入而从深度软件待机模式中恢复 | R   |
| 22    | —        | 该位读取为0。写入值应为0。  | R/W |
| 23    | DVBINT0  | USBVBUS中断源恢复<br>0: 系统尚未从深度软件待机模式中恢复1: 系统由于VBUS输入而从深度软件待机模式中恢复       | R   |
| 31:24 | —        | 这些位被读取为0。写入值应为0。  | R/W |

**DPINTE0位 (USBDP中断使能清除)**

DPINTE0位启用或禁用触发从深度软件待机模式恢复由DP输入USBFS。当DPINT0位为1时向该位写入0会将DPINT0位设置为0。

**DMINTE0位 (USBDM中断使能清除)**

DMINTE0位启用或禁用触发从深度软件待机模式恢复由DM输入USBFS。当DMINT0位为1时向该位写入0会将DMINT0位清除为0。

**DOVRCRAE0位 (USBOVRCURA中断使能清除)**

DOVRCRAE0位通过USBFS的OVRCURA输入启用或禁用从深度软件待机模式恢复的触发。当DOVRCRA0位为1时向该位写入0会将DOVRCRA0位清除为0。

**DOVRCRBE0位 (USBOVRCURB中断使能清除)**

DOVRCRBE0位通过USBFS的OVRCURB输入启用或禁用从深度软件待机模式恢复的触发。当DOVRCRB0位为1时向该位写入0会将DOVRCRB0位清除为0。

**DVBSE0位 (USBVBUS中断使能清除)**

DVBSE0位通过VBUS输入启用或禁用从深度软件待机模式恢复的触发USBFS。当DVBINT0位为1时向该位写入0会将DVBINT0位清除为0。

**DPINT0位 (USBDP中断源恢复)**

由于USBFS的DP输入，DPINT0位指示系统已从深度软件待机模式返回。此恢复仅在DPINTE0位为1时启用。当该位为1时向DPINTE0位写入0将该位清除为0。

**DMINT0位 (USBDM中断源恢复)**

由于USBFS的DM输入，DMINT0位指示系统已从深度软件待机模式返回。此恢复仅在DMINTE0位为1时启用。当该位为1时向DMINTE0位写入0会将该位清除为0。

**DOVRCRA0 bit (USB OVRCURA Interrupt Source Recovery)**

The DOVRCRA0 bit indicates that the system has returned from Deep Software Standby mode because of the OVRCURA input of the USBFS. This recovery is only enabled when the DOVRCRAE0 bit is 1. Writing 0 to the DOVRCRAE0 bit while this bit is 1 clears this bit to 0.

**DOVRCRB0 bit (USB OVRCURB Interrupt Source Recovery)**

The DOVRCRB0 bit indicates that the system has returned from Deep Software Standby mode because of the OVRCURB input of the USBFS. This recovery is only enabled when the DOVRCRBE0 bit is 1. Writing 0 to the DOVRCRBE0 bit while this bit is 1 clears this bit to 0.

**DVBINT0 bit (USB VBUS Interrupt Source Recovery)**

The DVBINT0 bit indicates that the system has returned from Deep Software Standby mode because of the VBUS input of the USBFS. This recovery is only enabled when the DVBSE0 bit is 1. Writing 0 to the DVBSE0 bit while this bit is 1 clears this bit to 0.

**26.3 Operation****26.3.1 System Control**

This section describes register settings required for initializing the USBFS and controlling power consumption.

**26.3.1.1 Setting data to the USBFS registers**

Setting the SYSCFG.USBE bit to 1 after starting the clock supply (SYSCFG.SCKE bit = 1) enables and starts USBFS operation.

**26.3.1.2 Selecting the controller function**

The USBFS can operate as either a host or device controller.

Use the SYSCFG.DCFM bit to select one of these USBFS functions. The DCFM bit must be changed in the initial settings immediately after a reset or in the D+ pull-up-disabled state (SYSCFG.DPRPU bit = 0) and D+ and D- pull-down-disabled state (SYSCFG.DRPD bit = 0).

**26.3.1.3 Controlling the USB data bus using resistors**

The USBFS provides pull-up and pull-down resistors for the D+ and D- lines. Pull these lines up or down by setting the SYSCFG.DPRPU and DRPD bits.

In device controller mode, confirm that connection to the USB host is made, and then set the SYSCFG.DPRPU bit to 1 and pull up the D+ line (in full-speed communication).

When the SYSCFG.DPRPU bit is set to 0 during communication with a PC, the USBFS disables the pull-up resistor of the USB data line, thereby notifying the USB host of disconnection.

In host controller mode, set the SYSCFG.DRPD bit to 1 to pull down the D+ and D- lines.

**Table 26.14 USB data bus resistor control**

| SYSCFG register settings |           | USB data bus control |           | Function  |
|--------------------------|-----------|----------------------|-----------|---|
| DRPD bit                 | DPRPU bit | D-                   | D+        |   |
| 0                        | 0         | Open                 | Open      | When resistors not used                             |
| 0                        | 1         | Open                 | Pull-up   | When operating as a device controller at full-speed |
| 1                        | 0         | Pull-down            | Pull-down | When operating as a host controller                 |
| 1                        | 1         | —                    | —         | Setting prohibited                                  |

**26.3.1.4 Example external connection circuits**

Figure 26.2 shows an example OTG connection in the self-powered system. The USBFS controls the pull-up resistor of the D+ line and the pull-down resistor of D+ and D- lines. Select pull-up and pull-down for the lines in the SYSCFG.DPRPU

**DOVRCRA0位 (USBOVRCURA中断源恢复)**

由于USBFS的OVRCURA输入，DOVRCRA0位指示系统已从深度软件待机模式返回。此恢复仅在DOVRCRAE0位为1时启用。当此位为1时向DOVRCRAE0位写入0会将该位清除为0。

**DOVRCRB0位 (USBOVRCURB中断源恢复)**

DOVRCRB0位指示由于USBFS的OVRCURB输入，系统已从深度软件待机模式返回。此恢复仅在DOVRCRBE0位为1时启用。当此位为1时向DOVRCRBE0位写入0会将该位清除为0。

**DVBINT0位 (USBVBUS中断源恢复)**

由于USBFS的VBUS输入，DVBINT0位指示系统已从深度软件待机模式返回。此恢复仅在DVBSE0位为1时启用。当该位为1时将0写入DVBSE0位可将该位清除为0。

**26.3 Operation****26.3.1 系统控制**

本节介绍初始化USBFS和控制功耗所需的寄存器设置。

**26.3.1.1 将数据设置到USBFS寄存器**

启动时钟供应 (SYSCFG.SCKE位=1) 后将SYSCFG.USBE位设置为1启用并启动USBFS操作。

**26.3.1.2 选择控制器功能**

USBFS可以作为主机或设备控制器运行。

使用SYSCFG.DCFM位选择这些USBFS功能之一。DCFm位必须在复位后立即更改为初始设置或在D+上拉禁用状态 (SYSCFG.DPRPU位=0) 和D+和D- 下拉禁用状态 (SYSCFG.DRPD位=0) 。

**26.3.1.3 使用电阻控制USB数据总线**

USBFS为D+和D-线提供上拉和下拉电阻。通过设置SYSCFG.DPRPU和DRPD位。

在设备控制器模式下，确认与USB主机的连接已建立，然后将SYSCFG.DPRPU位设置为1并拉高D+线 (全速通信)。

当SYSCFG.DPRPU位在与PC通信期间设置为0时，USBFS禁用上拉电阻USB数据线，从而通知USB主机断开。

在主机控制器模式下，将SYSCFG.DRPD位设置为1以拉低D+和D-线。

**Table 26.14 USB数据总线电阻控制**

| SYSCFG寄存器设置 |           | USB数据总线控制 |           | Function     |
|-------------|-----------|-----------|-----------|--------------|
| DRPD bit    | DPRPU bit | D-        | D+        |              |
| 0           | 0         | Open      | Open      | 不使用电阻时       |
| 0           | 1         | Open      | Pull-up   | 作为设备控制器全速运行时 |
| 1           | 0         | Pull-down | Pull-down | 作为主机控制器运行时   |
| 1           | 1         | —         | —         | 禁止设定         |

**26.3.1.4 外部连接电路示例**

图26.2显示了自供电系统中的示例OTG连接。USBFS控制的上拉电阻D+线和D+和D-线的下拉电阻。为SYSCFG.DPRPU中的行选择上拉和下拉

and SYSCFG.DRPD bits. In device controller mode, the pull-up resistor of USB data line is disabled if SYSCFG.DPRPU bit is set to 0 while communicating with the USB host. The USBFS can use this to notify the USB host of a device disconnect.

和SYSCFG.DRPD位。在设备控制器模式下，如果在与USB主机通信时将SYSCFG.DPRPU位设置为0，则禁用USB数据线的上拉电阻。USBFS可以使用它来通知USB主机设备断开连接。

The examples of external circuits given in this section are simplified circuits, and their operation in every system is not guaranteed.

### 26.3.1.5 Release from deep software standby mode because of USB suspend/resume interrupts

Deep Software Standby mode can be canceled by a USB suspend/resume interrupt. USB suspend/resume interrupts are detected by the USB resume detecting unit, which controls and monitors the USB I/O pins to detect the interrupts.

Figure 26.7 shows a schematic diagram of the connection between the USB resume detecting unit and the USB I/O pins.

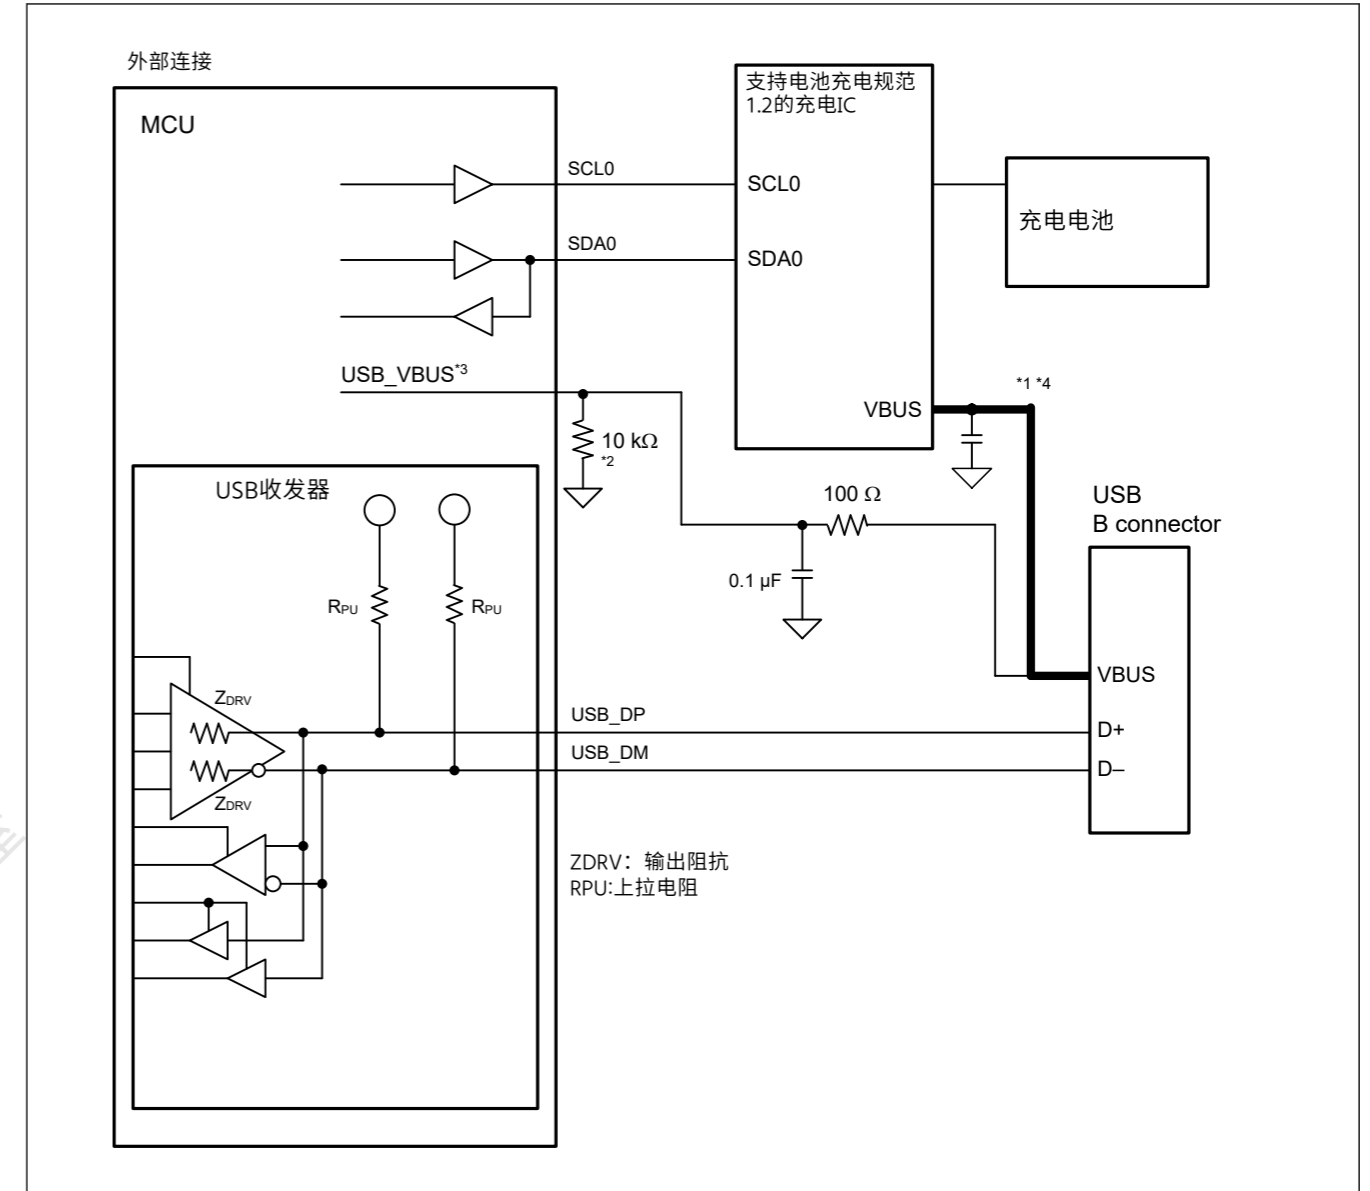

Figure 26.6 支持电池充电版本1.2的功能连接示例

本节中给出的外部电路示例是简化电路，不保证它们在每个系统中的操作。

### 26.3.1.5 由于USB挂起恢复中断而从深度软件待机模式中释放

深度软件待机模式可以通过USB挂起恢复中断来取消。USB暂停恢复中断由USB恢复检测单元检测，该单元控制和监视USBIO引脚以检测中断。

图26.7显示了USB恢复检测单元与USBIO引脚之间的连接示意图。

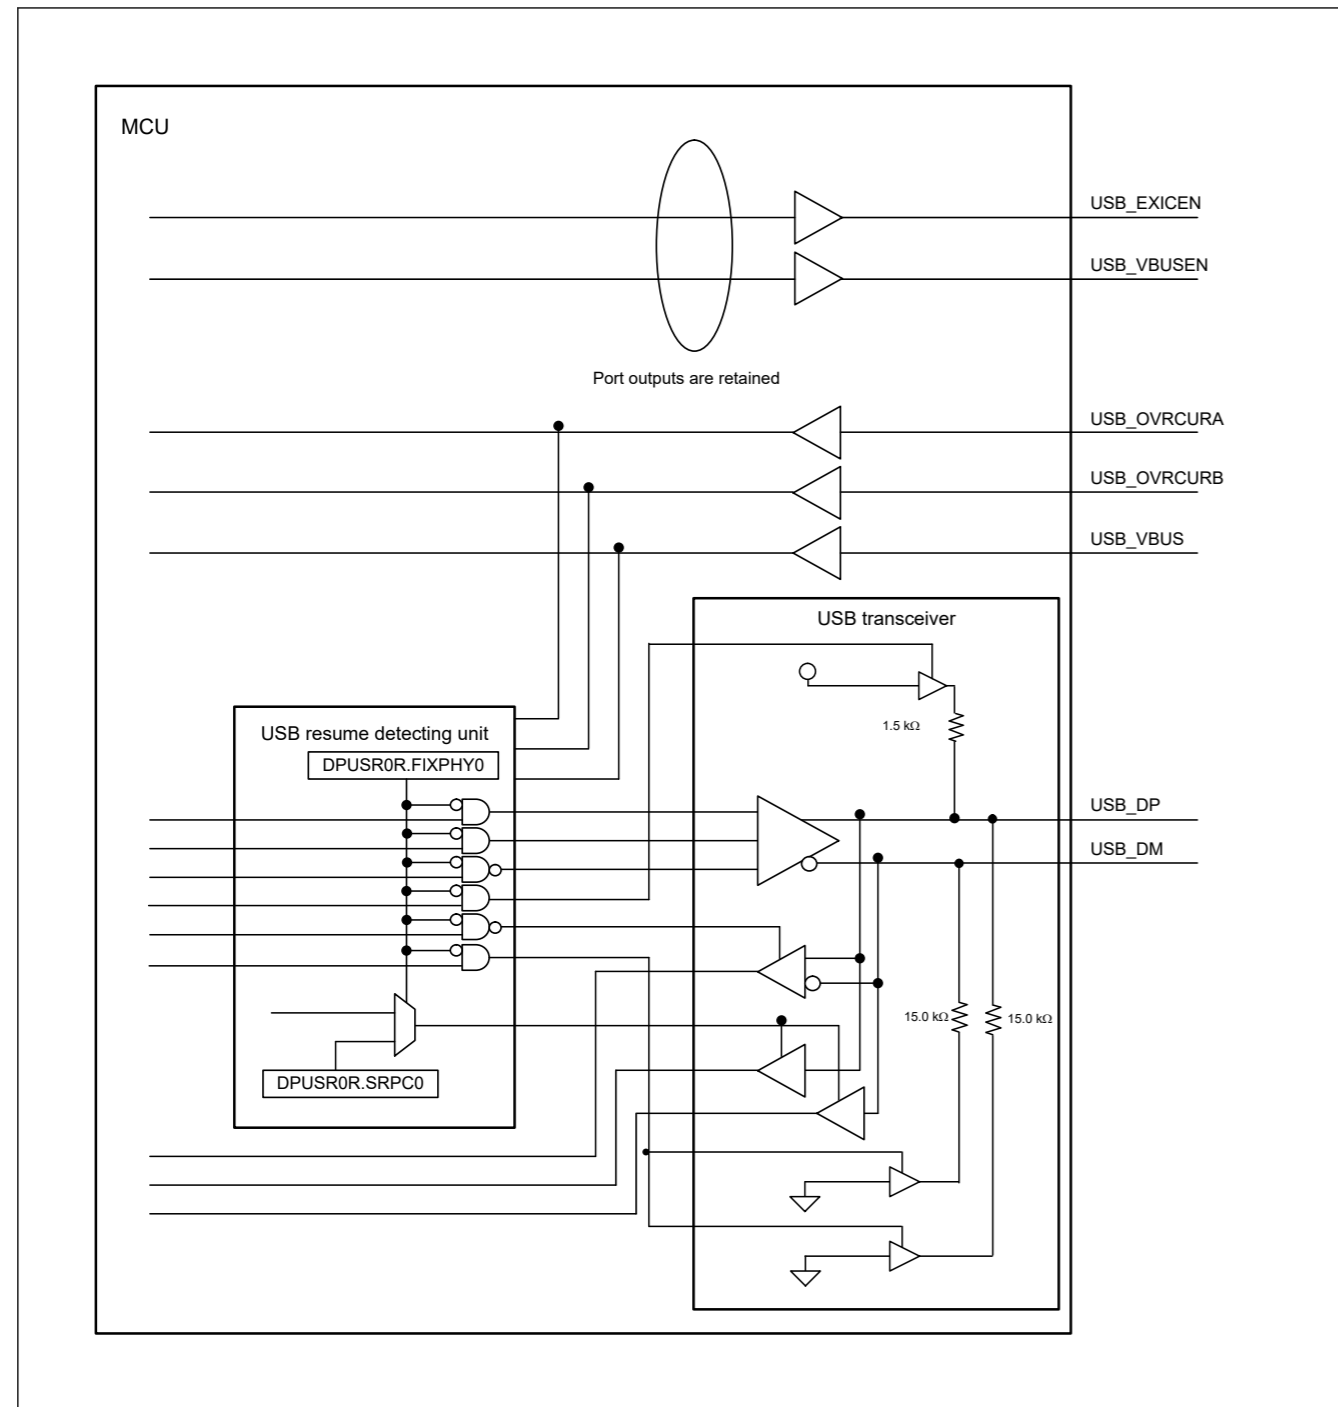

Figure 26.7 Connection between the USB resume detecting unit and the USB I/O pins

Table 26.15 shows the USB suspend and resume interrupt sources and their associated I/O pins.

Table 26.15 USB suspend and resume interrupt sources and their associated I/O pins

| USB operating mode | Source                | Pin name                 |
|--------------------|-----------------------|--------------------------|
| Device, OTG        | Resume                | USB_DP                   |

26.3.2 Interrupts

Table 26.16 lists the interrupt sources in the USBFS. When an interrupt generation condition is satisfied and the interrupt output is enabled using the associated interrupt enable register, a USBFS interrupt request is issued to the Interrupt Controller Unit (ICU) and an USBFS interrupt is generated.

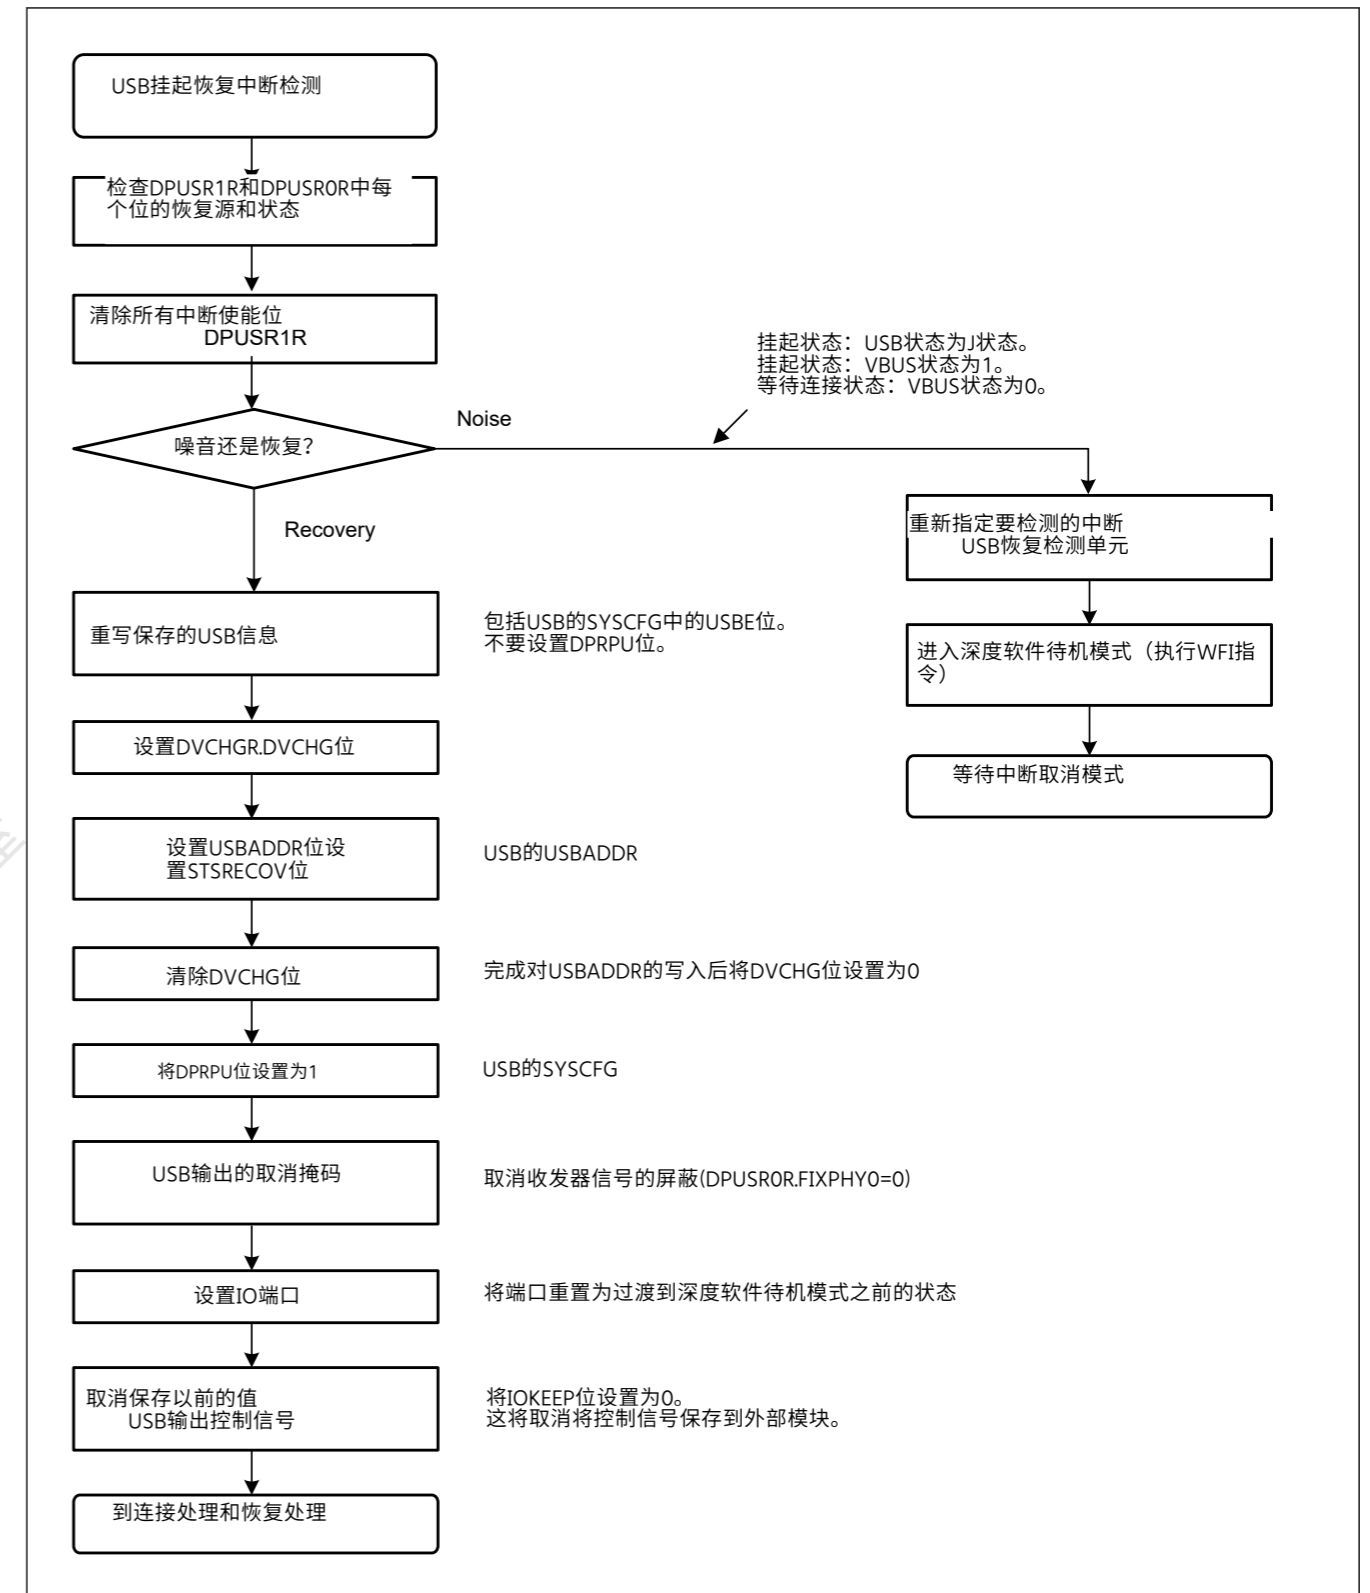

Figure 26.10 用于取消作为设备控制器的深度软件待机模式的USBFS设置流程

26.3.2 Interrupts

表26.16列出了USBFS中的中断源。当满足中断生成条件并使用相关的中断使能寄存器启用中断输出时，将向中断控制器单元(ICU)发出USBFS中断请求并生成USBFS中断。

Table 26.16 Interrupt sources (1 of 2)

| Bit to be set to 1 | Name   | Interrupt source  | Applicable controller function | Status flag        |
|--------------------|--|---|--------------------------------|--------------------|
| VBINT              | VBUS interrupt                                   | <ul style="list-style-type: none"> <li>A change in the state of the USB_VBUS input pin was detected (low to high or high to low)</li> </ul>   | Host or device*1               | INTSTS0.VBSTS      |
| RESM               | Resume interrupt                                 | <ul style="list-style-type: none"> <li>A change in the state of the USB bus was detected in the Suspend state (J-state to K-state or J-state to SE0)</li> </ul>   | Device                         | —                  |
| SOFR               | Frame number update interrupt                    | <p>In host controller mode:</p> <ul style="list-style-type: none"> <li>An SOF packet with a different frame number was transmitted</li> </ul> <p>In device controller mode:</p> <ul style="list-style-type: none"> <li>An SOF packet with a different frame number was received</li> </ul>  | Host or device                 | —                  |
| DVST               | Device state transition interrupt                | <ul style="list-style-type: none"> <li>One of the following device state transitions was detected: <ul style="list-style-type: none"> <li>USB bus reset was detected</li> <li>Suspend state was detected</li> <li>SET_ADDRESS request was received</li> <li>SET_CONFIGURATION request was received</li> </ul> </li> </ul>   | Device                         | INTSTS0.DVSQ[2:0]  |
| CTRT               | Control transfer stage transition interrupt      | <ul style="list-style-type: none"> <li>A control transfer stage transition was detected because of one of the following: <ul style="list-style-type: none"> <li>Setup stage completed</li> <li>Control write transfer status stage transition occurred</li> <li>Control read transfer status stage transition occurred</li> <li>Control transfer completed</li> <li>Control transfer sequence error occurred</li> </ul> </li> </ul>   | Device                         | INTSTS0.CTSQ[2:0]  |
| BEMP               | Buffer empty interrupt                           | <ul style="list-style-type: none"> <li>The buffer is empty after all FIFO buffer data was transmitted</li> <li>A packet larger than the maximum packet size was received</li> </ul>   | Host or device                 | BEMPSTS.PIPEnBEMP  |
| NRDY               | Buffer not ready interrupt                       | <p>In host controller mode</p> <ul style="list-style-type: none"> <li>A STALL response was received from the peripheral device in response to the issued token</li> <li>The response from the peripheral device in response to the issued token was not received successfully (no response three times consecutively or packet reception error three times consecutively)</li> <li>An overrun or underrun error occurred during isochronous transfer</li> </ul> <p>In device controller mode</p> <ul style="list-style-type: none"> <li>NAK was returned for an IN or OUT token while the PID[1:0] bits were set to 01b (BUF)</li> <li>A CRC error or bit stuffing error occurred during data reception in isochronous transfer</li> <li>An overrun or underrun occurred during data reception in isochronous transfer</li> </ul> | Host or device                 | NRDYSTS.PIPEnNRDY  |

### 26.3.3 Interrupt Descriptions

#### 26.3.3.1 BRDY interrupt

The BRDY interrupt is generated in both host and device controller modes. This section describes the conditions in which the USBFS sets the associated bit in BRDYSTS to 1. Under these conditions, the USBFS generates a BRDY interrupt if the software has set the bit in BRDYENB associated with the given pipe to 1 and the INTENB0.BRDYE bit to 1.

The conditions for generating and clearing the BRDY interrupt depend on the SOFCFG.BRDYM and PIPECFG.BFRE settings for each pipe as follows:

##### (1) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, the USBFS generates an internal BRDY interrupt request trigger and sets the BRDYSTS.PIPEnBRDY bit associated with the selected pipe to 1.

##### For transmitting pipes

- When the DIR bit is changed from 0 to 1 by software
- When packet transmission is complete for a pipe while write-access from the CPU to the FIFO buffer for the pipe is disabled (when the BSTS bit is read as 0)
- When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode
- No request trigger is generated until completion of writing data to the currently-written FIFO buffer even if transmission to the other FIFO buffer is complete
- When the hardware flushes the buffer of the pipe for isochronous transfers
- When 1 is written to the PIPECTR.ACLRM bit, which causes the FIFO buffer to transition from the write-disabled to write-enabled state

No request trigger is generated for the DCP, that is, during data transmission for control transfers.

##### For receiving pipes

- When packet reception is successfully complete, enabling the FIFO buffer to be read while read-access from the CPU to the FIFO buffer for the given pipe is disabled (when the BSTS bit is read as 0). No request trigger is generated for transactions in which a DATA-PID mismatch has occurred.
- When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode. No request trigger is generated until completion of reading data from the currently-read FIFO buffer, even if reception by the other FIFO buffer is complete.

In device controller mode, the BRDY interrupt is not generated in the status stage of control transfers. The PIPEBRDY interrupt status of the selected pipe can be set to 0 by writing 0 to the associated PIPEnBRDY bit through software. In this case, the other PIPEBRDY bit should be set to 1.

Clear the BRDY status before accessing the FIFO buffer.

Table 26.17 USBFS中断 (2个中的2个)

### 26.3.3 中断说明

#### 26.3.3.1 BRDY interrupt

在主机和设备控制器模式下都会产生BRDY中断。本节描述USBFS将BRDYSTS中的相关位设置为1的条件。在这些条件下，如果软件将BRDYENB中与给定管道相关的位设置为1并且INTENB0.BRDYE位，USBFS将生成BRDY中断为1。

产生和清除BRDY中断的条件取决于每个管道的SOFCFG.BRDYM和PIPECFG.BFRE设置，如下所示：

##### (1) 当SOFCFG.BRDYM=0且PIPECFG.BFRE=0时

通过这些设置，BRDY中断指示FIFO端口可访问。

在以下任何一种情况下，USBFS都会产生一个内部BRDY中断请求触发器并设置BRDYSTS.PIPEnBRDY位与所选管道相关联为1。

##### 用于传输管道

- DIR位由软件从0变为1时
- 当一个管道的数据包传输完成而从CPU到该管道的FIFO缓冲区的写访问被禁用时（当BSTS位被读取为0时）
- 双缓冲模式下，当一个FIFO缓冲区完成向另一个FIFO缓冲区写入数据时为空闲
- 直到向当前写入的FIFO缓冲区写入数据完成，才会产生请求触发，即使传输到另一个FIFO缓冲区已完成
- 当硬件刷新管道缓冲区以进行同步传输时
- 当PIPECTR.ACLRM位写入1时，导致FIFO缓冲区从写禁止状态转变为写使能状态

没有为DCP生成请求触发，即在控制传输的数据传输期间。

##### 用于接收管道

- 当数据包接收成功完成时，允许读取FIFO缓冲区，同时禁止CPU对给定管道的FIFO缓冲区的读取访问（当BSTS位被读取为0时）。对于发生DATA-PID不匹配的事务，不会生成请求触发器。
- 当一个FIFO缓冲区在双缓冲模式下从另一个FIFO缓冲区读取数据完成后使能读取。在从当前读取的FIFO缓冲区读取数据完成之前，不会生成请求触发，即使其他FIFO缓冲区的接收已完成。

在设备控制器模式下，在控制传输的状态阶段不会产生BRDY中断。通过软件将0写入相关的PIPEnBRDY位，可以将所选管道的PIPEBRDY中断状态设置为0。在这种情况下，另一个PIPEBRDY位应设置为1。

在访问FIFO缓冲区之前清除BRDY状态。

**(2) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 1**

With these settings, the USBFS generates a BRDY interrupt on completion of reading all data for a single transfer using the receiving pipe, and sets the bit in BRDYSTS associated with the pipe to 1.

On any of the following conditions, the USBFS determines that the last data for a single transfer was received.

- When a short packet including a zero-length packet is received
- When the PIPEn transaction counter register (PIPEnTRN) is used and the number of packets specified in the PIPEnTRN.TRCNT[15:0] bits are completely received

When the data is completely read after any of these conditions is satisfied, the USBFS determines that all data for a single transfer is completely read.

When a zero-length packet is received while the FIFO buffer is empty, the USBFS determines that all data for a single transfer is completely read when the FRDY bit in the FIFO port control register is 1 and the DTLN[8:0] bits are 0. In this case, to start the next transfer, write 1 to the BCLR bit in the associated port control register through the software. With these settings, the USBFS does not detect a BRDY interrupt for the transmitting pipe.

The PIPEBRDY interrupt status of a pipe can be set to 0 by writing 0 to the associated BRDYSTS.PIPEnBRDY bit through the software. In this case, 1s must be written to the PIPEBRDY bits for the other pipes.

In this mode, do not change the PIPECFG.BFRE bit setting until all data for a single transfer is processed. When it is necessary to change the PIPECFG.BFRE bit before completion of processing, all FIFO buffers for the pipe must be cleared using the PIPEnCTR.ACLRM bit.

**(3) When SOFCFG.BRDYM = 1 and PIPECFG.BFRE = 0**

With these settings, the BRDYSTS.PIPEnBRDY values are linked to the BSTS bit setting for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by the USB depending on the FIFO buffer status.

**For transmitting pipes**

The BRDY interrupt status bits are set to 1 when the FIFO buffer is ready for write access, and are set to 0 when it is not ready. The BRDY interrupt is not generated for the DCP in the transmitting direction even when it is ready for write access.

**For receiving pipes**

The BRDY interrupt status bits set to 1 when the FIFO buffer is ready for read access, and set to 0 when all data is read (not ready for read access).

When a zero-length packet is received while the FIFO buffer is empty, the associated bit is set to 1 and the BRDY interrupt is continuously generated until the software writes 1 to BCLR. With this setting, the PIPEnBRDY bit cannot be set to 0 by software.

When the SOFCFG.BRDYM bit is set to 1, set the PIPECFG.BFRE bit for all pipes to 0.

Figure 26.12 shows the timing of BRDY interrupt generation.

**(2) 当SOFCFG.BRDYM=0且PIPECFG.BFRE=1时**

使用这些设置，USBFS在完成使用接收管道读取单次传输的所有数据时生成BRDY中断，并将BRDYSTS中与管道关联的位设置为1。

在以下任何一种情况下，USBFS都会确定已接收到单次传输的最后一个数据。

- 收到包含零长度包的短包时
- 当使用PIPEn事务计数器寄存器(PIPEnTRN)并且完全接收到PIPEnTRN.TRCNT[15:0]位中指定的数据包数量时

当满足其中任何一个条件后数据被完全读取时，USBFS确定单次传输的所有数据都被完全读取。

当FIFO缓冲区为空时接收到零长度数据包时，当FIFO端口控制寄存器中的FRDY位为1且DTLN[8:0]位为0.在这种情况下，要开始下一次传输，通过软件向相关端口控制寄存器中的BCLR位写入1。使用这些设置，USBFS不会检测到传输管道的BRDY中断。

通过软件将0写入相关的BRDYSTS.PIPEnBRDY位，可以将管道的PIPEBRDY中断状态设置为0。在这种情况下，必须将1写入其他管道的PIPEBRDY位。

在此模式下，在处理完单次传输的所有数据之前，不要更改PIPECFG.BFRE位设置。当需要在处理完成之前更改PIPECFG.BFRE位时，必须使用PIPEnCTR.ACLRM位清除管道的所有FIFO缓冲区。

**(3) 当SOFCFG.BRDYM=1且PIPECFG.BFRE=0时**

通过这些设置，BRDYSTS.PIPEnBRDY值链接到每个管道的BSTS位设置。换句话说，BRDY中断状态位(PIPEBRDY)由USB设置为1或0，具体取决于FIFO缓冲区状态。

**用于传输管道**

当FIFO缓冲区准备好进行写访问时，BRDY中断状态位设置为1，当它未准备好时设置为0。发送方向上的DCP不会产生BRDY中断，即使它已准备好进行写访问。

**用于接收管道**

当FIFO缓冲区准备好进行读取访问时，BRDY中断状态位设置为1，并在读取所有数据（未准备好进行读取访问）时设置为0。

当FIFO缓冲区为空时接收到零长度数据包时，相关位设置为1，并且持续产生BRDY中断，直到软件将1写入BCLR。使用此设置，PIPEnBRDY位不能通过软件设置为0。

当SOFCFG.BRDYM位设置为1时，将所有管道的PIPECFG.BFRE位设置为0。

图26.12显示了BRDY中断产生的时序。

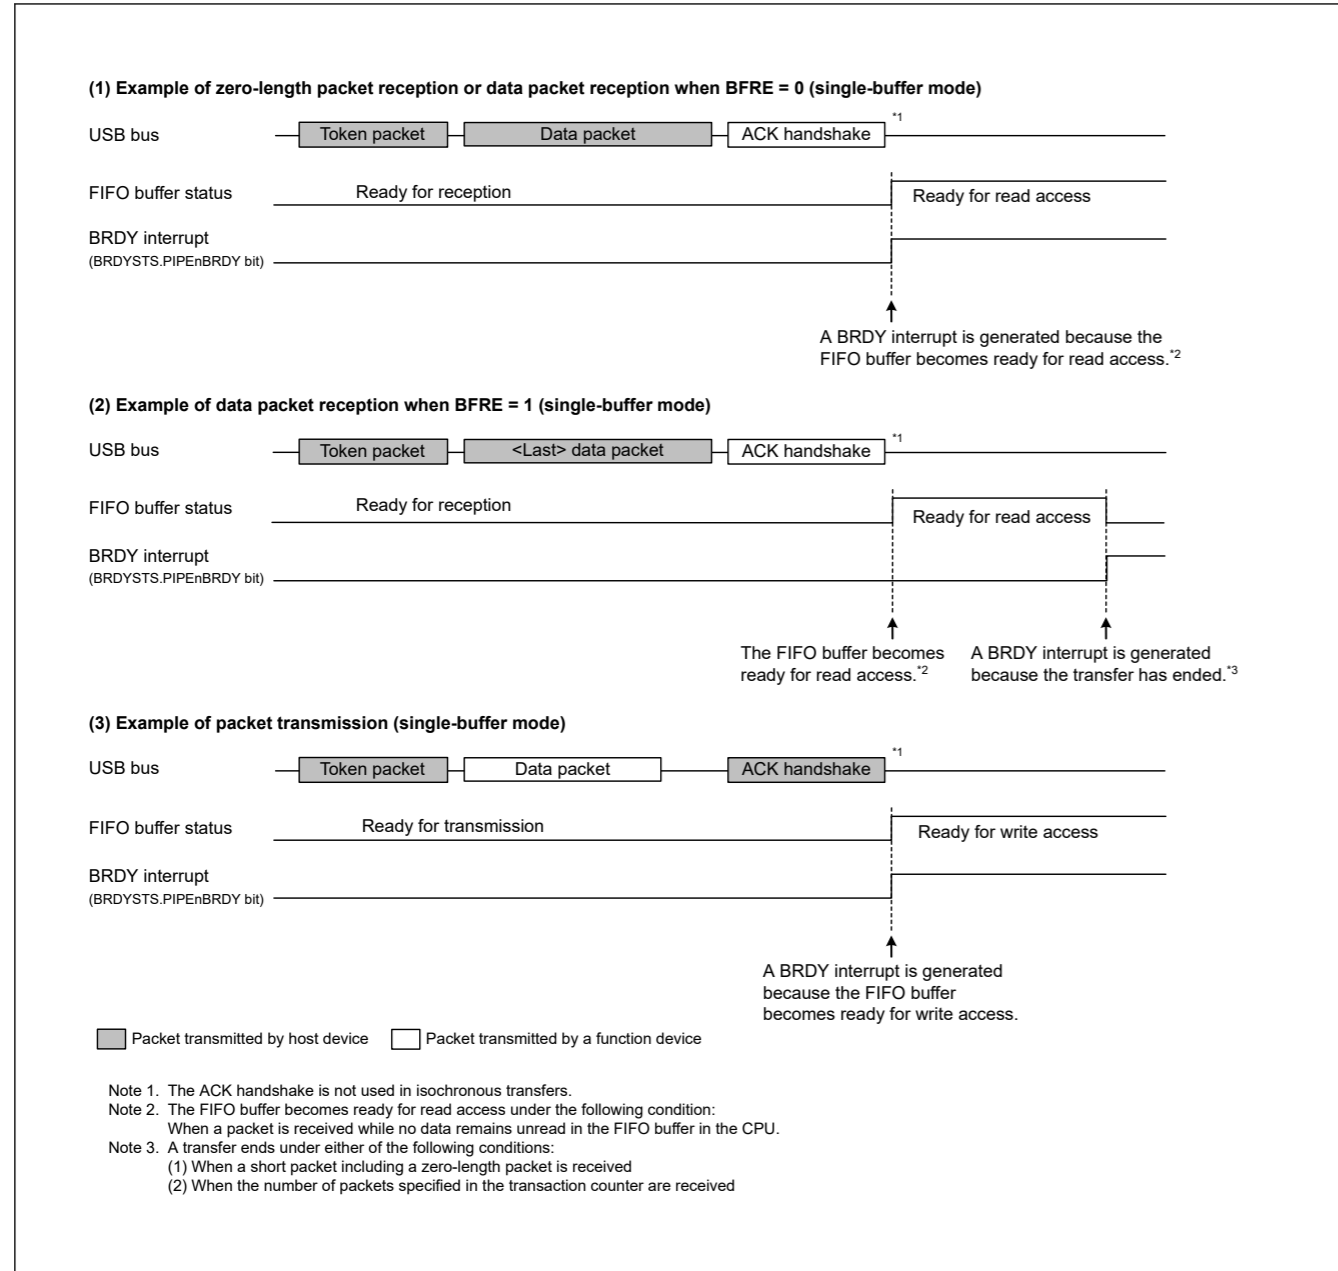

Figure 26.12 Timing of BRDY interrupt generation

The condition for clearing the INTSTS0.BRDY bit depends on the SOFCFG.BRDYM bit setting, as shown in Table 26.18.

Table 26.18 Conditions for clearing the BRDY bit

| BRDYM bit | Condition for clearing BRDY bit  |
|-----------|--|
| 0         | The USBFS clears the BRDY bit to 0 when all bits in BRDYSTS are set to 0 by software.  |
| 1         | The USBFS clears the BRDY bit to 0 when the BSTS bits for all pipes have cleared to 0. |

### 26.3.3.2 NRDY interrupt

On generating an internal NRDY interrupt request for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated PIPEnNRDY bit in NRDYSTS to 1. If the associated bit in NRDYENB is set to 1 by software, the USBFS sets the INTSTS0.NRDY bit to 1 and generates a USBFS interrupt.

This section describes the conditions in which the USBFS generates the internal NRDY interrupt request for a given pipe.

The internal NRDY interrupt request is not generated during setup transaction execution in host controller mode. During setup transactions in host controller mode, the SACK or SIGN interrupt is detected.

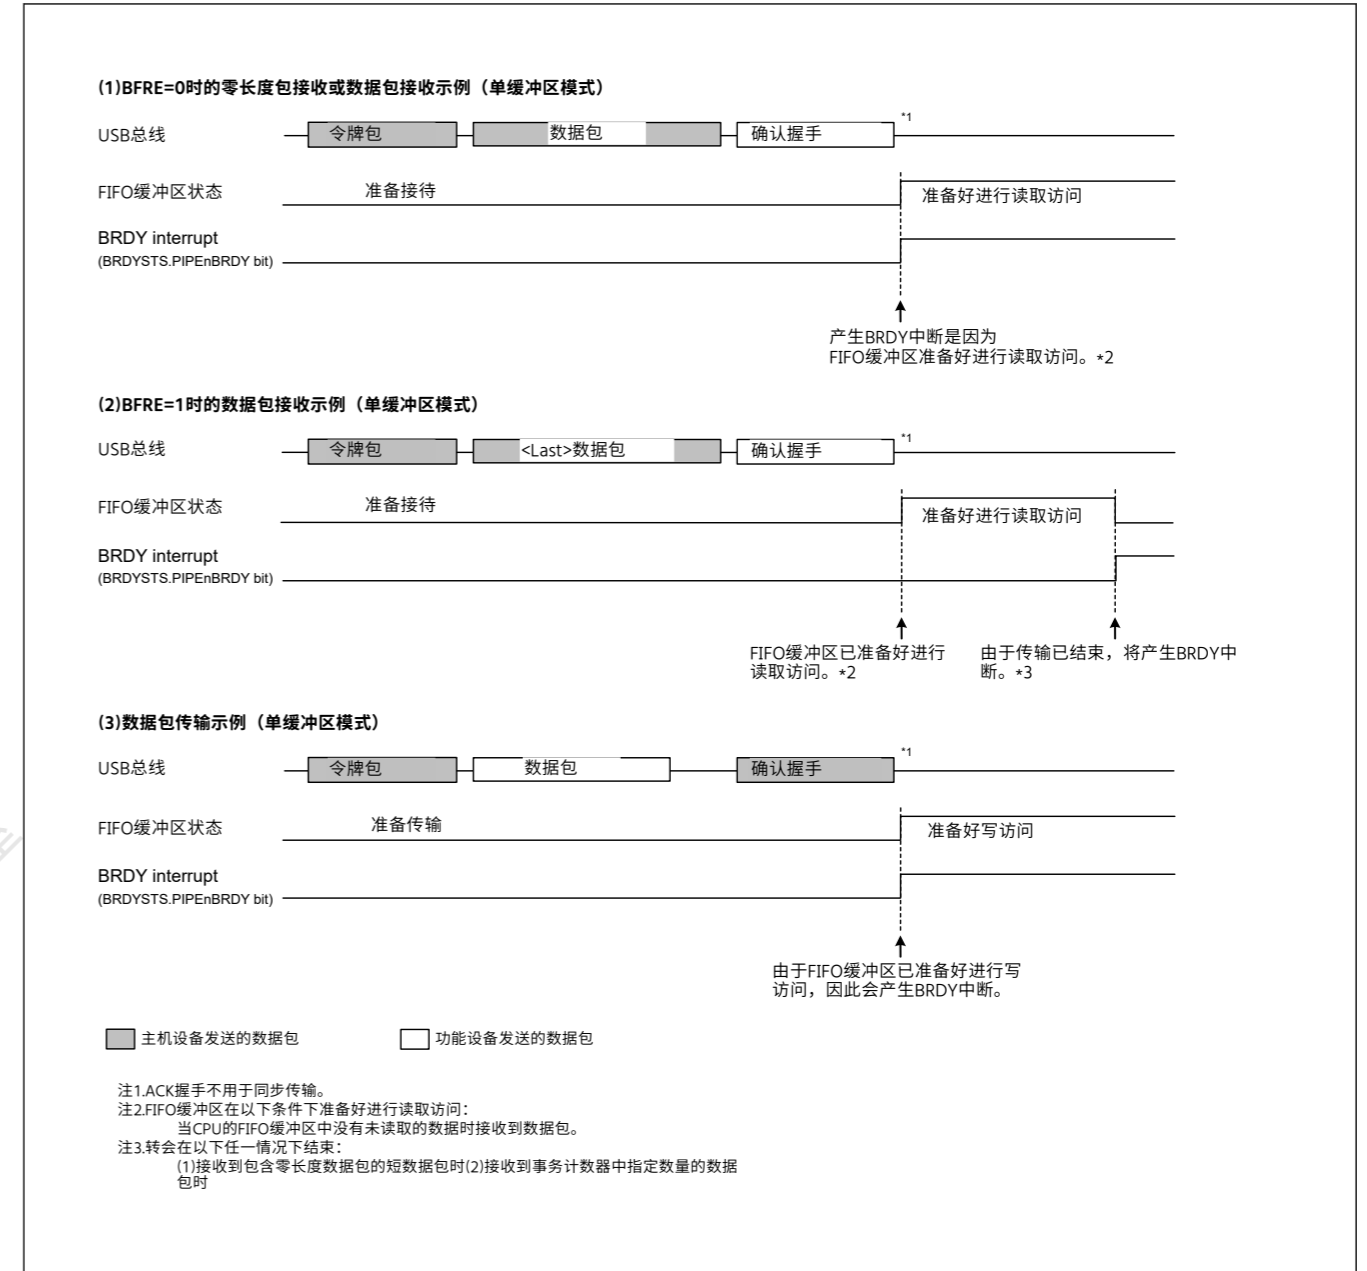

Figure 26.12 BRDY中断产生的时序

清除INTSTS0.BRDY位的条件取决于SOFCFG.BRDYM位设置, 如表26.18所示。

Table 26.18 清除BRDY位的条件

| BRDYM bit | 清除BRDY位的条件                            |
|-----------|---------------------------------------|
| 0         | 当BRDYSTS中的所有位被软件设置为0时, USBFS将BRDY位清零。 |
| 1         | 当所有管道的BSTS位已清零时, USBFS将BRDY位清零。       |

### 26.3.3.2 NRDY interrupt

在为PID位由软件设置为BUF的管道生成内部NRDY中断请求时, USBFS将NRDYSTS中的相关PIPEnNRDY位设置为1。如果NRDYENB中的相关位由软件设置为1, 则USBFS设置INTSTS0.NRDY位为1并产生USBFS中断。

本节描述USBFS为给定管道生成内部NRDY中断请求的条件。

内部NRDY中断请求在主控制器模式下的设置事务执行期间不会产生。在主控制器模式下的设置事务期间, 检测到SACK或SIGN中断。

The internal NRDY interrupt request is not generated during status stage execution of the control transfer in device controller mode.

### (1) In host controller mode

#### For transmitting pipes

On any of the following conditions, the USBFS detects an NRDY interrupt:

- For isochronous transfer pipes, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS transmits a zero-length packet following the OUT token and sets the associated NRDYSTS.PIPEnNRDY bit and the FRMNUM.OVRN bit to 1.
- During communications other than setup transactions on pipes not used for isochronous transfers, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device)
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK
- During communications other than setup transactions, when the STALL handshake is received from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the PID[1:0] setting for the associated pipe to STALL (11b).

#### For receiving pipes

- For isochronous transfer pipes, when the time to issue an IN token comes but there is no space available in the FIFO buffer. In this case, the USBFS discards the received data for the IN token and sets the PIPEnNRDY bit associated with the pipe and the OVRN bit to 1. When a packet error is detected in the received data for the IN token, the USBFS also sets the FRMNUM.CRCE bit to 1.
- For non-isochronous transfer pipes, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device for the IN token issued by the USBFS (when timeout is detected before detection of the DATA packet from the peripheral device)
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK
- For isochronous transfer pipes, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe to 1. The PID[1:0] setting for the pipe is not changed.
- For isochronous transfer pipes, when a CRC error or a bit stuffing error is detected in the received data packet. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe and the CRCE bit to 1.
- When the STALL handshake is received. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe to 1 and changes the PID[1:0] setting for the associated pipe to STALL.

### (2) In device controller mode

#### For transmitting pipes

- When an IN token is received while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS generates a NRDY interrupt request on reception of the IN token and sets the NRDYSTS.PIPEnNRDY bit to 1. For an isochronous transfer pipe in which an interrupt is generated, the USBFS transmits a zero-length packet and sets the FRMNUM.OVRN bit to 1.

#### For receiving pipes

- When an OUT token is received but there is no space available in the FIFO buffer. For an isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request on reception of the OUT token and sets the PIPEnNRDY bit to 1 and OVRN bit to 1. For a non-isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request when a NAK handshake is transferred after the data following the OUT token is received, and sets the PIPEnNRDY bit to 1. The NRDY interrupt request is not generated during retransmission

在设备控制器模式下控制传输的状态阶段执行期间，不会产生内部NRDY中断请求。

### (1) 在主机控制器模式下

#### 用于传输管道

在以下任何一种情况下，USBFS都会检测到NRDY中断：

- 对于同步传输管道，当FIFO缓冲区中没有要传输的数据时发出OUT令牌的时间到来。在这种情况下，USBFS在OUT令牌之后发送一个长度为零的数据包，并将相关的NRDYSTS.PIPEnNRDY位和FRMNUM.OVRN位设置为1。
- 在不用于同步传输的管道上的设置事务以外的通信期间，当以下两种情况的任意组合连续发生3次时：
  - 外围设备没有返回响应（当在检测到来自外围设备的握手包之前检测到超时
  - 在来自外围设备的数据包中检测到错误。在这种情况下，USBFS将相关的PIPEnNRDY位设置为1，并将管道的相关PID[1:0]设置更改为NAK
- 在设置事务以外的通信期间，当从外围设备接收到STALL握手时。在这种情况下，USBFS将相关的PIPEnNRDY位设置为1，并将相关管道的PID[1:0]设置更改为STALL(11b)。

#### 用于接收管道

- 对于同步传输管道，当发出IN令牌的时间到来但FIFO中没有可用空间时缓冲。在这种情况下，USBFS丢弃接收到的IN令牌数据，并将与管道关联的PIPEnNRDY位和OVRN位设置为1。当在接收到的IN令牌数据中检测到数据包错误时，USBFS也会设置FRMNUM.CRCE位为1。
- 对于非等时传输管道，当以下两种情况的任意组合连续出现3次时：
  - USBFS发出的IN令牌没有从外围设备返回响应（当在检测到来自外围设备的DATA包之前检测到超时
  - 在来自外围设备的数据包中检测到错误。在这种情况下，USBFS将相关的PIPEnNRDY位设置为1，并将管道的相关PID[1:0]设置更改为NAK
- 对于同步传输管道，当外围设备没有返回对IN令牌的响应时（在检测到来自外围设备的DATA数据包之前检测到超时）或在外围设备的数据包中检测到错误。在这种情况下，USBFS将与管道关联的PIPEnNRDY位设置为1。管道的PID[1:0]设置不会更改。
- 对于同步传输管道，当在接收到的数据包中检测到CRC错误或比特填充错误时。在这种情况下，USBFS将与管道关联的PIPEnNRDY位和CRCE位设置为1。
- 收到STALL握手时。在这种情况下，USBFS将与管道关联的PIPEnNRDY位设置为1，并将关联管道的PID[1:0]设置更改为STALL。

### (2) 在设备控制器模式下

#### 用于传输管道

- 当接收到一个IN令牌而FIFO缓冲区中没有要传输的数据时。在这种情况下，USBFS在接收到IN令牌时生成NRDY中断请求并将NRDYSTS.PIPEnNRDY位设置为1。对于产生中断的同步传输管道，USBFS发送一个长度为零的数据包并将FRMNUM.OVRN位设置为1。

#### 用于接收管道

- 当接收到OUT令牌但FIFO缓冲区中没有可用空间时。对于产生中断的同步传输管道，USBFS在接收到OUT令牌时产生一个NRDY中断请求，并将PIPEnNRDY位设置为1，并将OVRN位设置为1。USBFS在接收到OUT令牌之后的数据后，在传输NAK握手时产生NRDY中断请求，并将PIPEnNRDY位设置为1。重传期间不产生NRDY中断请求

because of a DATA-PID mismatch. In addition, the NRDY interrupt request is not generated if an error occurs in the DATA packet.

- For isochronous transfer pipes, when a token is not received successfully within an interval frame. In this case, the USBFS generates an NRDY interrupt request when the SOF is received, and sets the PIPEnNRDY bit to 1.

Figure 26.13 shows the timing of NRDY interrupt generation in device controller mode.

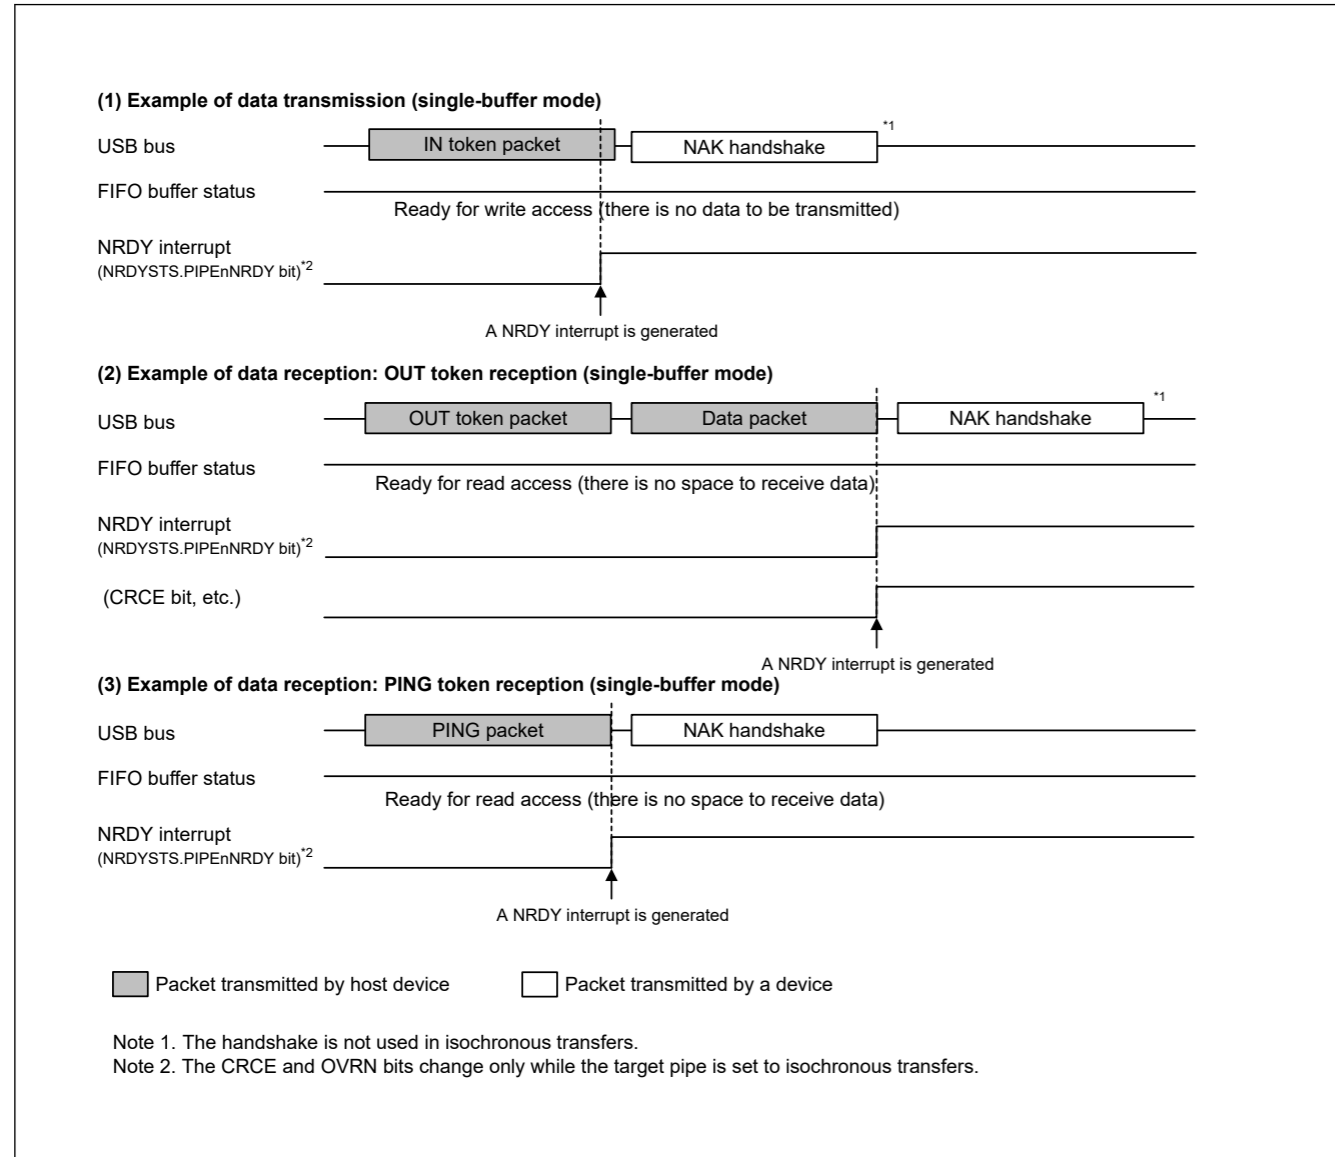

Figure 26.13 Timing of NRDY interrupt generation in device controller mode

### 26.3.3.3 BEMP interrupt

On detecting a BEMP interrupt for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated BEMPSTS.PIPEnBEMP bit to 1. If the associated bit in BEMPENB is set to 1 by software, the USBFS sets the INTSTS0.BEMP bit to 1 and generates a USBFS interrupt. This section describes the conditions in which the USBFS generates an internal BEMP interrupt request.

#### (1) For transmitting pipes

When the FIFO buffer of the associated pipe is empty on completion of transmission, including zero-length packet transmission, and in single buffer mode, an internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for a non-DCP pipe. The internal BEMP interrupt request is not generated in any of the following conditions:

因为DATA-PID不匹配。此外，如果DATA包发生错误，则不会产生NRDY中断请求。

- 对于同步传输管道，当在间隔帧内没有成功接收到令牌时。在这种情况下，USBFS在接收到SOF时产生一个NRDY中断请求，并将PIPEnNRDY位设置为1。

图26.13显示了设备控制器模式下NRDY中断产生的时序。

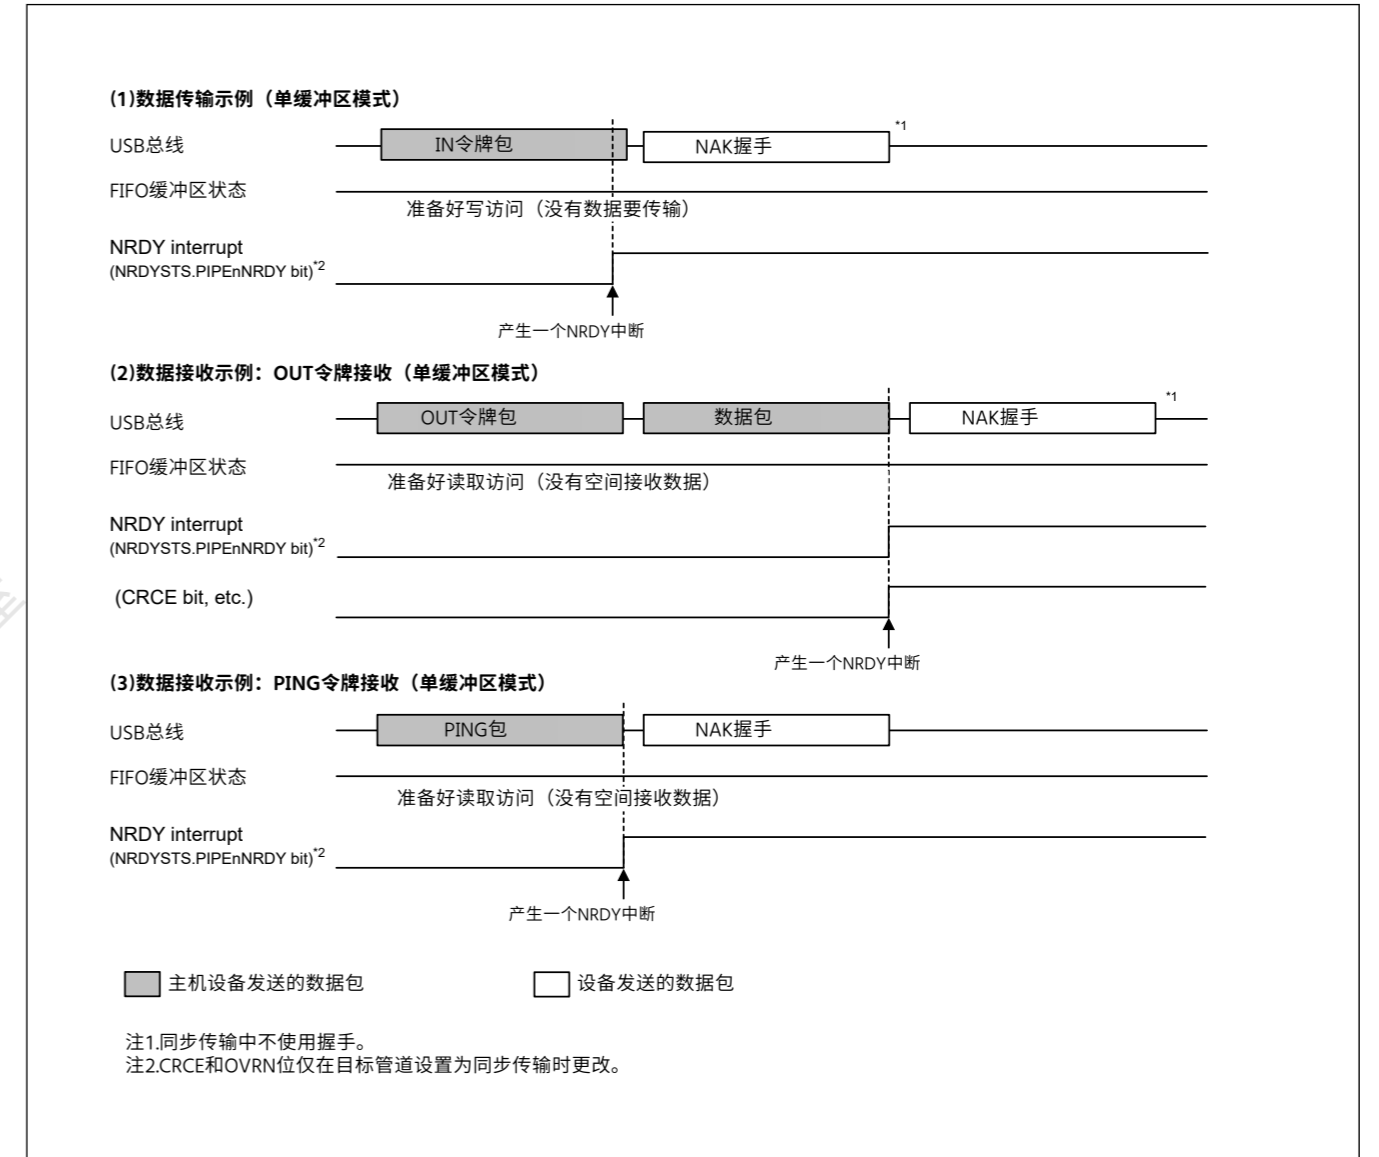

Figure 26.13 设备控制器模式下NRDY中断产生的时序

### 26.3.3.3 BEMP interrupt

在检测到PID位被软件设置为BUF的管道的BEMP中断时，USBFS将相关的BEMPSTS.PIPEnBEMP位设置为1。如果BEMPENB中的相关位被软件设置为1，USBFS将设置INTSTS0.BEMP位为1并产生USBFS中断。本节介绍USBFS产生内部BEMP中断请求的条件。

#### (1) 用于传输管道

当相关管道的FIFO缓冲区在传输完成时空时，包括零长度数据包传输，并且在单缓冲区模式下，内部BEMP中断请求与非DCP管道的BRDY中断同时生成。在以下任何一种情况下都不会产生内部BEMP中断请求：

- When the CPU or DMA/DTC has already started writing data to the FIFO buffer of the CPU on completion of transmitting data from one FIFO buffer in double buffer mode
- When the buffer is cleared (emptied) by setting the PIPEnCTR.ACLRM or the BCLR bit to 1 in the port control register
- When an IN transfer (zero-length packet transmission) is performed during the control transfer status stage in device controller mode

(2) For receiving pipes

When a successfully-received data packet size exceeds the specified maximum packet size. In this case, the USBFS generates a BEMP interrupt request, sets the associated BEMPSTS.PIPEnBEMP bit to 1, discards the received data, and changes the associated PID[1:0] setting for the pipe to STALL (11b). The USBFS returns no response in host controller mode, and returns STALL response in device controller mode.

The internal BEMP interrupt request is not generated in any of the following conditions:

- When a CRC error or a bit stuffing error is detected in the received data
- When a setup transaction is being performed:
  - Writing 0 to the BEMPSTS.PIPEnBEMP bit clears the status
  - Writing 1 to the BEMPSTS.PIPEnBEMP bit has no effect

Figure 26.14 shows the timing of BEMP interrupt generation in device controller mode.

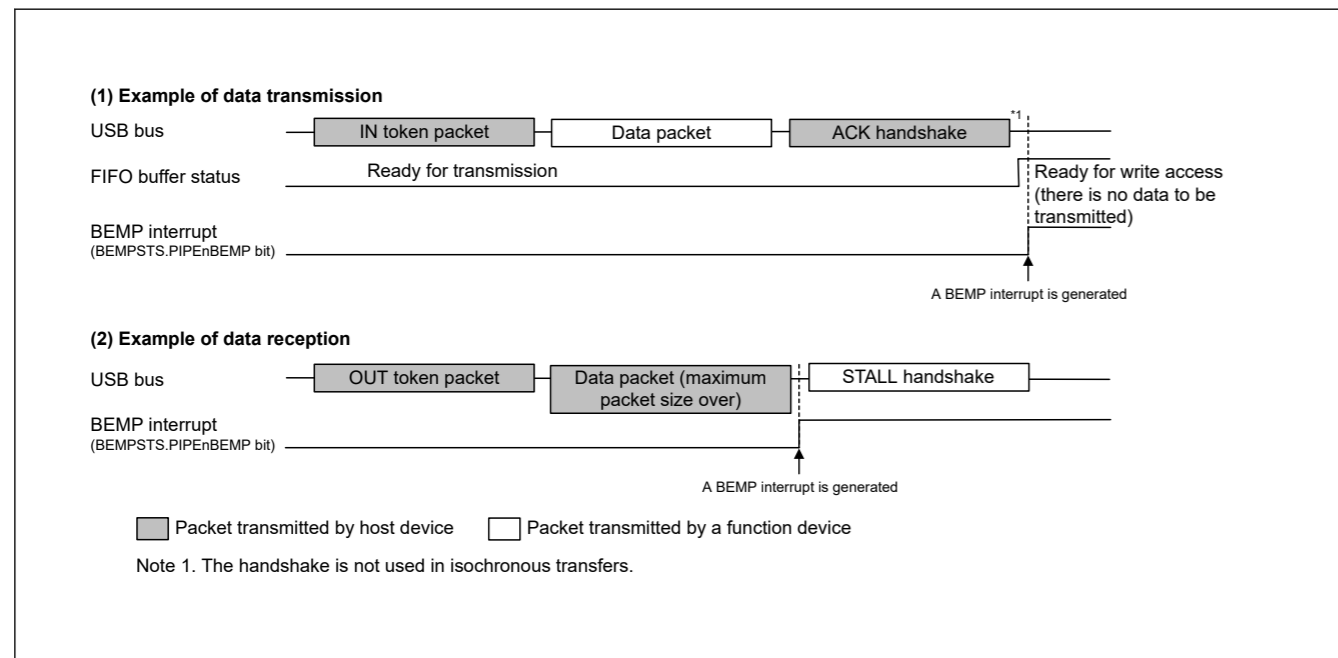

Figure 26.14 Timing of BEMP interrupt generation in device controller mode

26.3.3.4 Device state transition interrupt (device controller mode)

Figure 26.15 shows a diagram of the USBFS device state transitions. The USBFS controls device states and generates device state transition interrupts. However, recovery from the Suspend state (resume signal detection) is detected by means of the resume interrupt. Device state transition interrupts can be enabled or disabled independently in INTENB0. Devices whose states have changed can be checked in the INTSTS0.DVSQ[2:0] bits.

When a transition is made to the default state, a device state transition interrupt is generated after a USB bus reset is detected.

The USBFS controls device states, and device state transition interrupts can be generated, only in device controller mode.

- 当CPU或DMADTC在双缓冲模式下从一个FIFO缓冲区完成数据传输后已经开始向CPU的FIFO缓冲区写入数据时
- 通过将端口控制寄存器中的PIPEnCTR.ACLRM或BCLR位设置为1来清除 (清空) 缓冲区时
- 在设备控制器模式的控制传输状态阶段进行IN传输 (零长度包传输) 时

(2) 用于接收管道

当成功接收的数据包大小超过指定的最大包大小时。在这种情况下, USBFS生成一个BEMP中断请求, 将相关的BEMPSTS.PIPEnBEMP位设置为1, 丢弃接收到的数据, 并将管道的相关PID[1:0]设置更改为STALL(11b)。USBFS在主机控制器模式下不返回响应, 在设备控制器模式下返回STALL响应。

在以下任何一种情况下都不会产生内部BEMP中断请求:

- 在接收到的数据中检测到CRC错误或位填充错误时
- 执行设置事务时:
  - 将0写入BEMPSTS.PIPEnBEMP位可清除状态
  - 向BEMPSTS.PIPEnBEMP位写入1无效

图26.14显示了设备控制器模式下BEMP中断产生的时序。

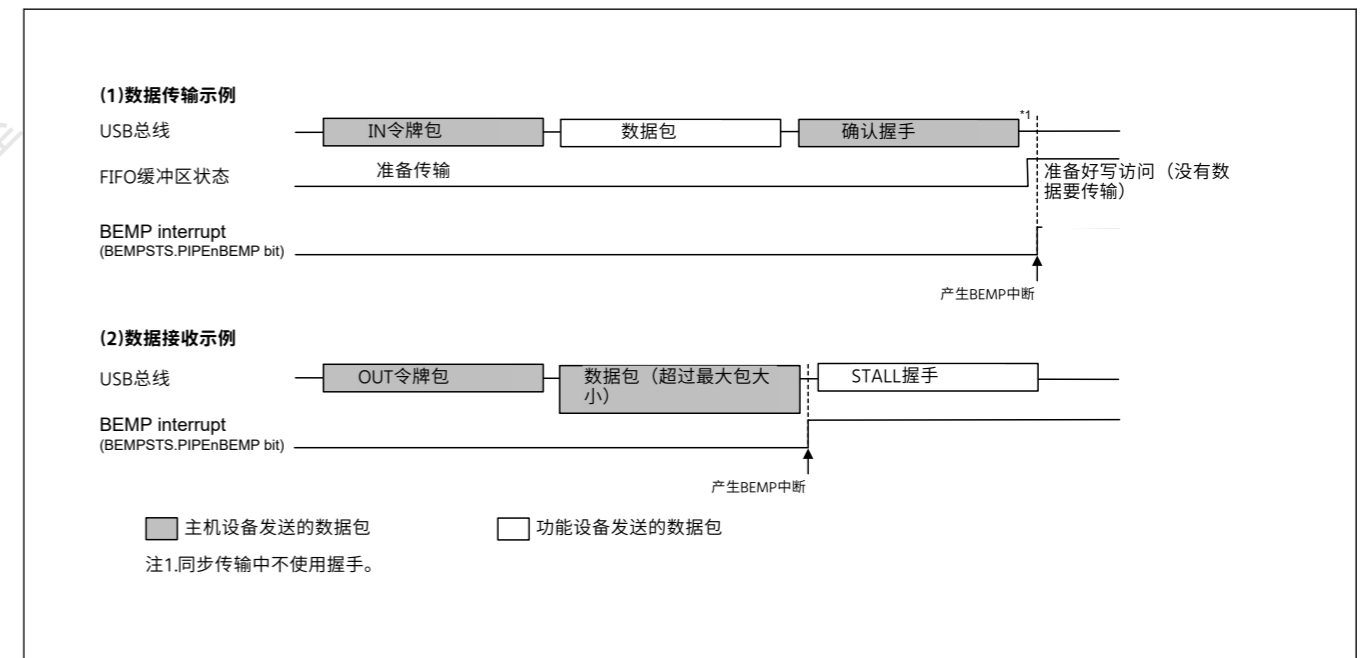

Figure 26.14 设备控制器模式下BEMP中断产生的时序

26.3.3.4 设备状态转换中断 (设备控制器模式)

图26.15显示了USBFS设备状态转换的示意图。USBFS控制设备状态并产生设备状态转换中断。但是, 从挂起状态的恢复 (恢复信号检测) 是通过恢复中断来检测的。可以在INTENB0中独立启用或禁用设备状态转换中断。可以在INTSTS0.DVSQ[2:0]位中检查状态已更改的设备。

当转换到默认状态时, 检测到USB总线复位后会产生设备状态转换中断。

USBFS控制设备状态, 并且只能在设备控制器模式下产生设备状态转换中断。

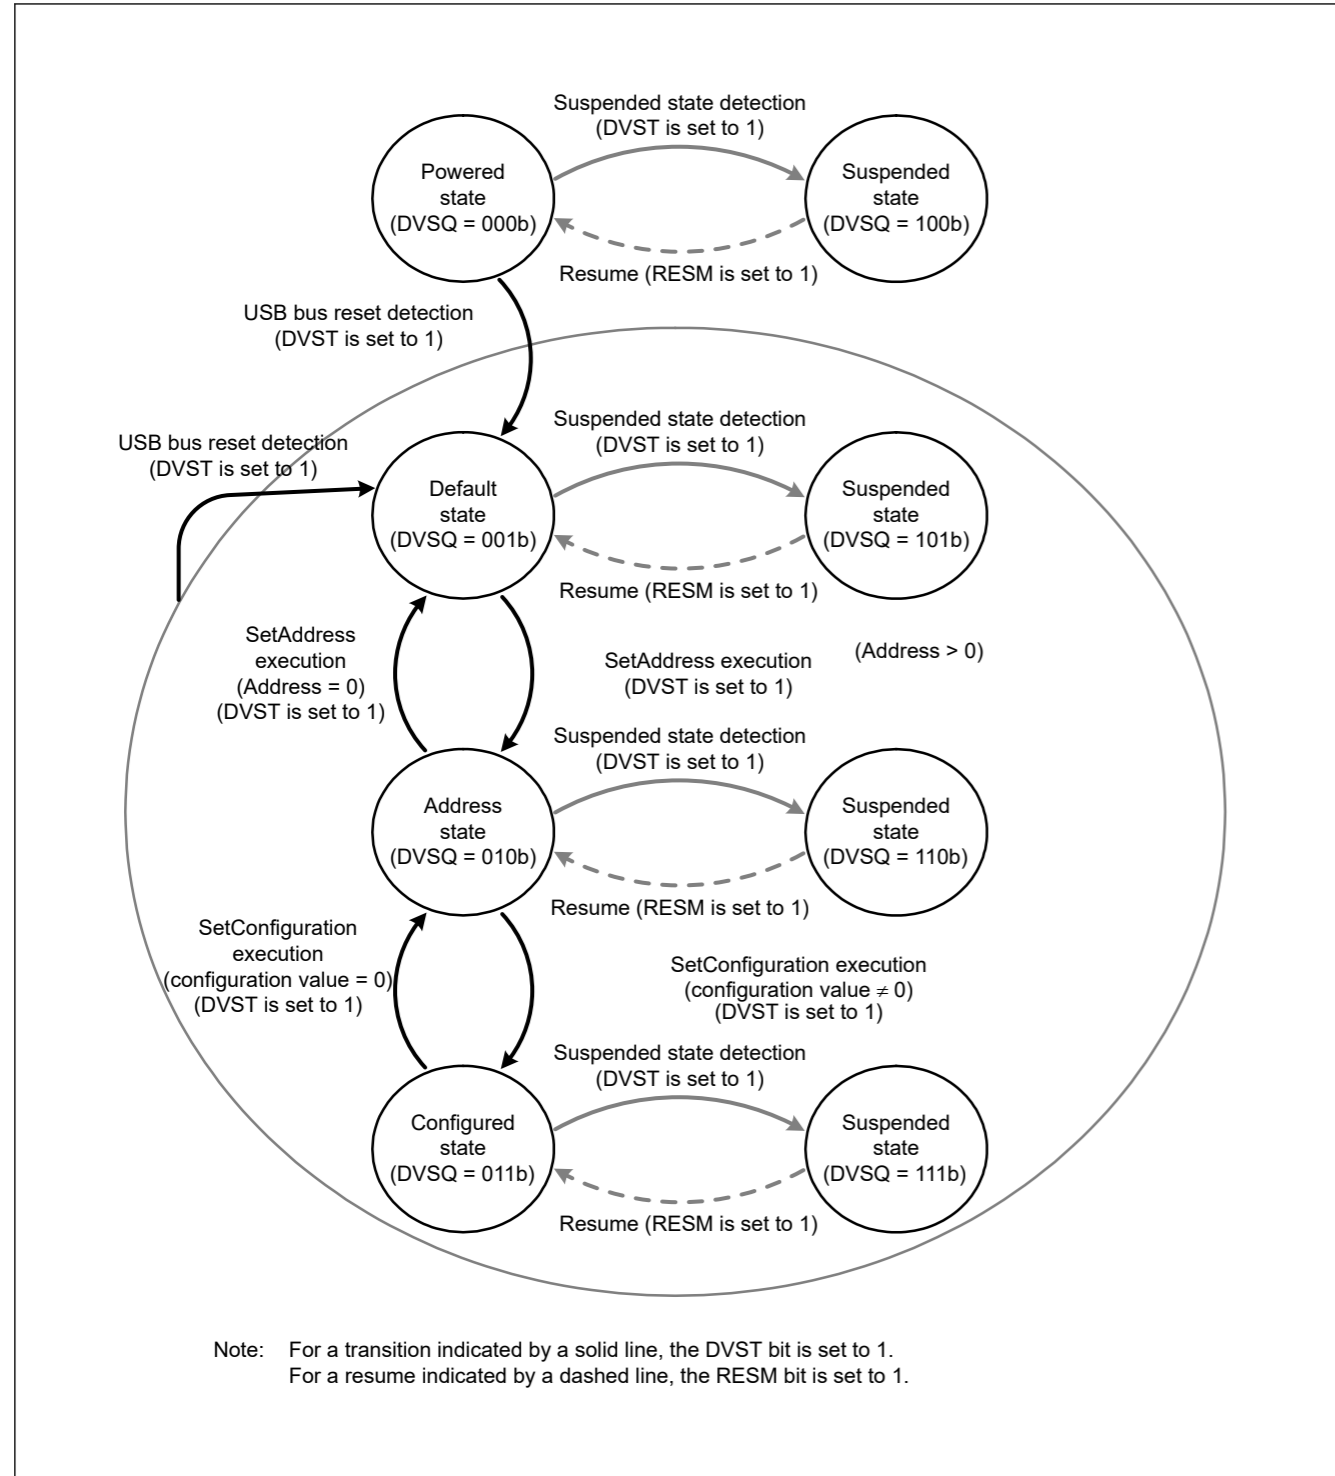

Figure 26.15 Device state transitions

26.3.3.5 Control transfer stage transition interrupt (device controller mode)

Figure 26.16 shows a diagram of the control transfer stage transitions of the USBFS. The USBFS controls the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled independently in INTENB0. Transfer stages that have transitioned can be checked in the INTSTS0.CTSQ[2:0] bits.

Control transfer stage transition interrupts are generated only in device controller mode. This section describes control transfer sequence errors. If an error occurs, the DCPCTR.PID[1:0] bits are set to 1xb (STALL response).

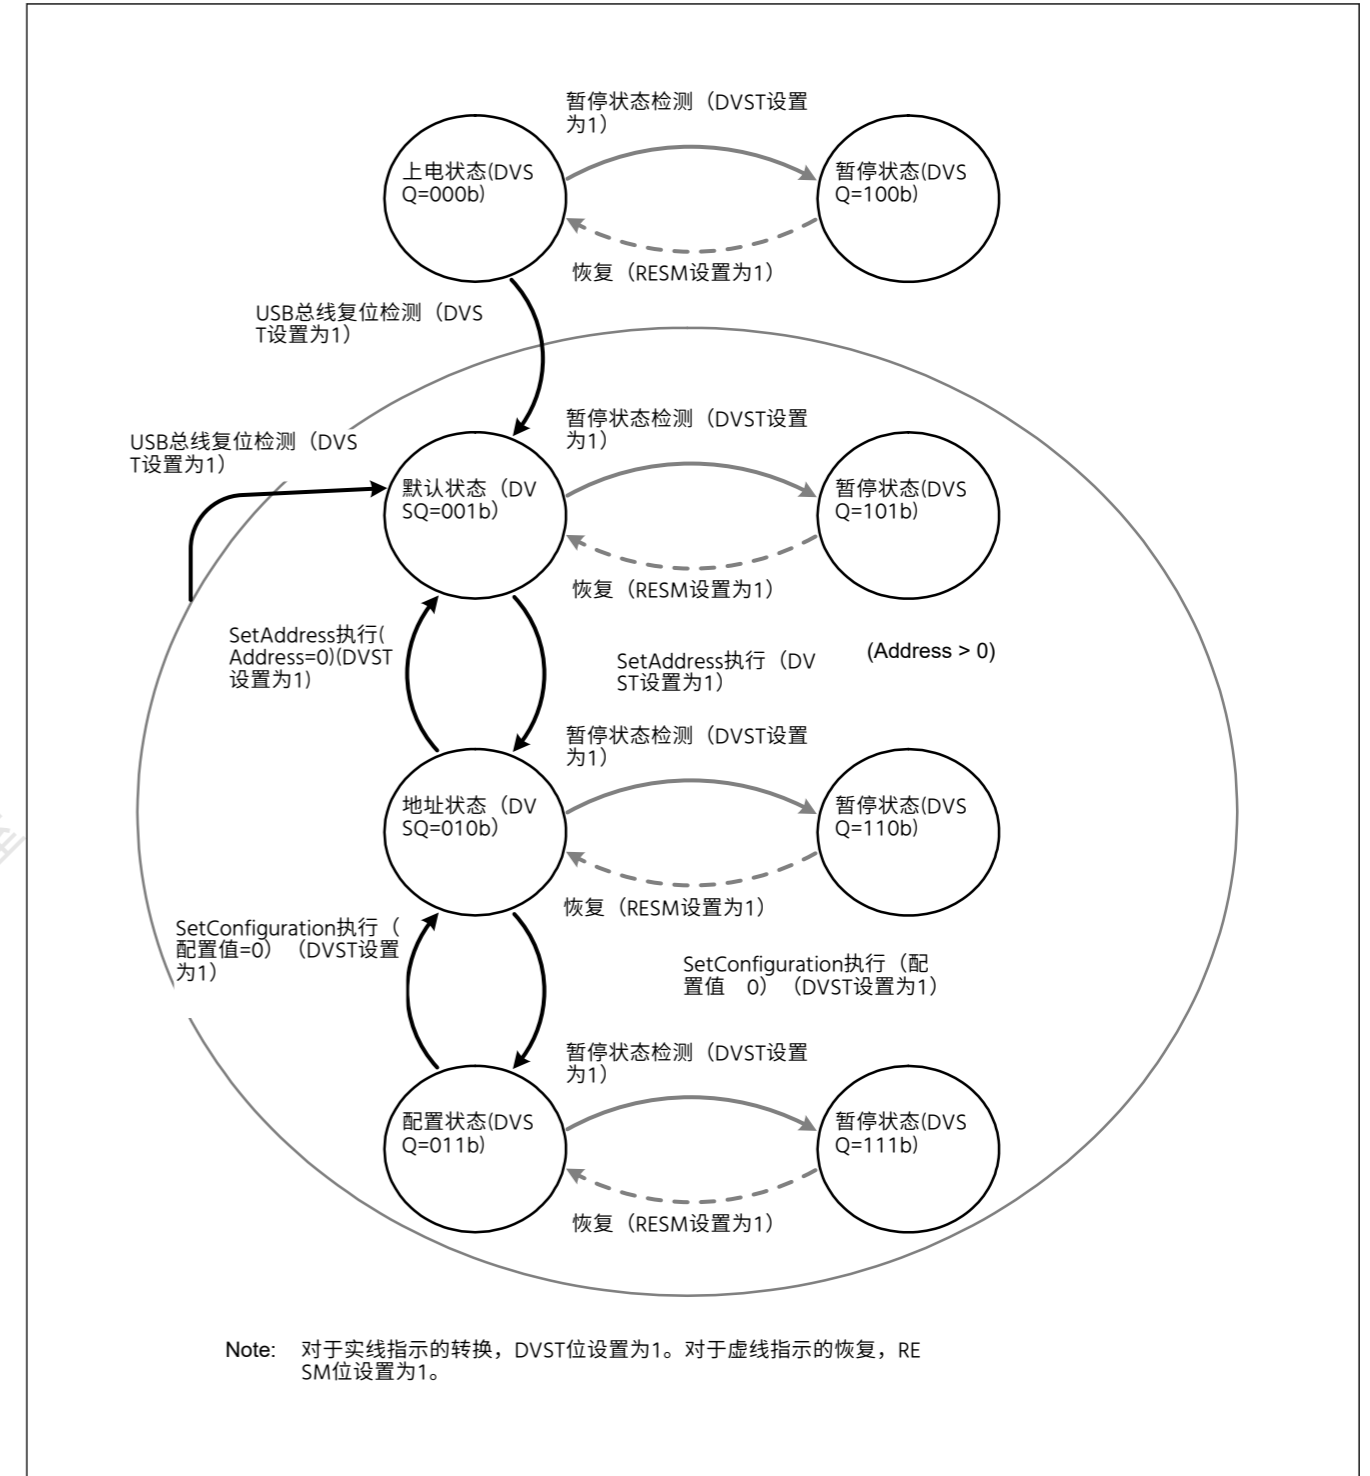

Figure 26.15 设备状态转换

26.3.3.5 控制转移阶段转换中断 (设备控制器模式)

图26.16显示了USBFS的控制传输阶段转换图。USBFS控制控制传输序列并产生控制传输阶段转换中断。控制转移阶段转换中断可以在INTENB0中独立启用或禁用。可以在INTSTS0.CTSQ[2:0]位中检查已转换的传输阶段。

控制转移阶段转换中断仅在设备控制器模式下产生。本节描述控制传输序列错误。如果发生错误, 则DCPCTR.PID[1:0]位设置为1xb (STALL响应)。

(1) Control read transfer errors

- An OUT token is received but no data is transferred in response to the IN token at the data stage
- An IN token is received at the status stage
- A data packet with DATAPID = DATA0 is received at the status stage

(2) Control write transfer errors

- An IN token is received but no ACK is returned in response to the OUT token at the data stage
- A data packet with DATAPID = DATA0 is received as the first data packet at the data stage
- An OUT token is received at the status stage

(3) Control write no data transfer errors

- An OUT token is received at the status stage

At the control write transfer data stage, if the receive data length exceeds the wLength value of the USB request, it is not recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (INTSTS0.CTRT = 1), the CTSQ[2:0] = 110b value is saved until the CTRT bit is set to 0, clearing the interrupt status. While CTSQ[2:0] = 110b is being saved, no CTRT interrupt for ending the setup stage is generated, even if a new USB request is received. The USBFS saves the setup stage completion status, and it generates a CTRT interrupt after the interrupt status is cleared by software.

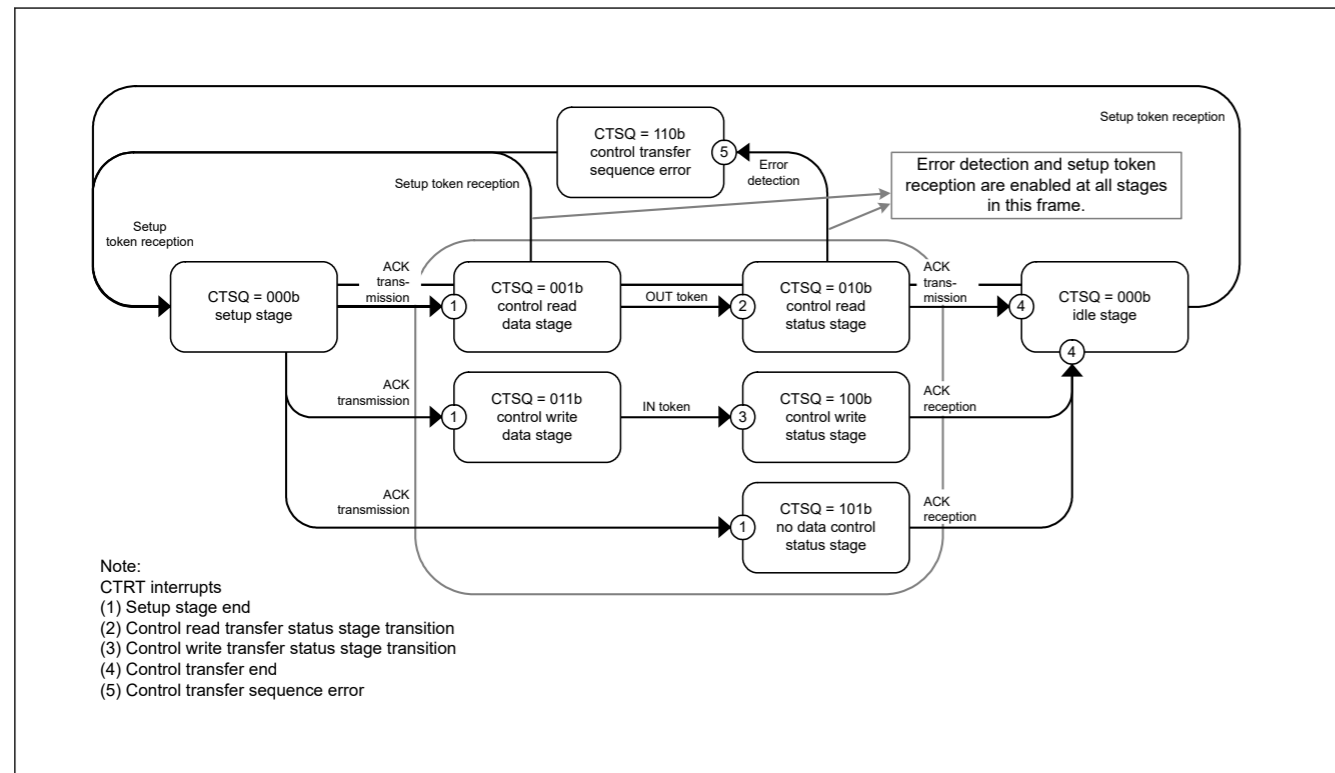

Figure 26.16 Control transfer stage transitions

26.3.3.6 Frame update interrupt

In host controller mode, an interrupt is generated when the frame number is updated.

In device controller mode, an SOFR interrupt is generated when the frame number is updated. The USBFS updates the frame number and generates an SOFR interrupt if it detects a new SOF packet during full-speed operation.

(1) 控制读取传输错误

- 在数据阶段收到一个OUT令牌，但没有传输数据以响应IN令牌
- 在状态阶段收到一个IN令牌
- 在状态阶段接收到DATAPID=DATA0的数据包

(2) 控制写入传输错误

- 在数据阶段收到一个IN令牌，但没有返回ACK响应OUT令牌
- DATAPID=DATA0的数据包作为数据阶段的第一个数据包被接收
- 在状态阶段收到一个OUT令牌

(3) 控制写入无数据传输错误

- 在状态阶段收到一个OUT令牌

在控制写入传输数据阶段，如果接收数据长度超过USB请求的wLength值，则不被识别为控制传输序列错误。在控制读取传输状态阶段，除了零长度数据包之外的数据包被一个ACK响应接收并且传输正常结束。

当响应序列错误 (INTSTS0.CTRT=1) 而发生CTRT中断时，将保存CTSQ[2:0]=110b值，直到CTRT位设置为0，清除中断状态。在保存CTSQ[2:0]=110b时，不会产生用于结束设置阶段的CTRT中断，即使收到新的USB请求也是如此。USBFS保存设置阶段完成状态，软件清除中断状态后产生CTRT中断。

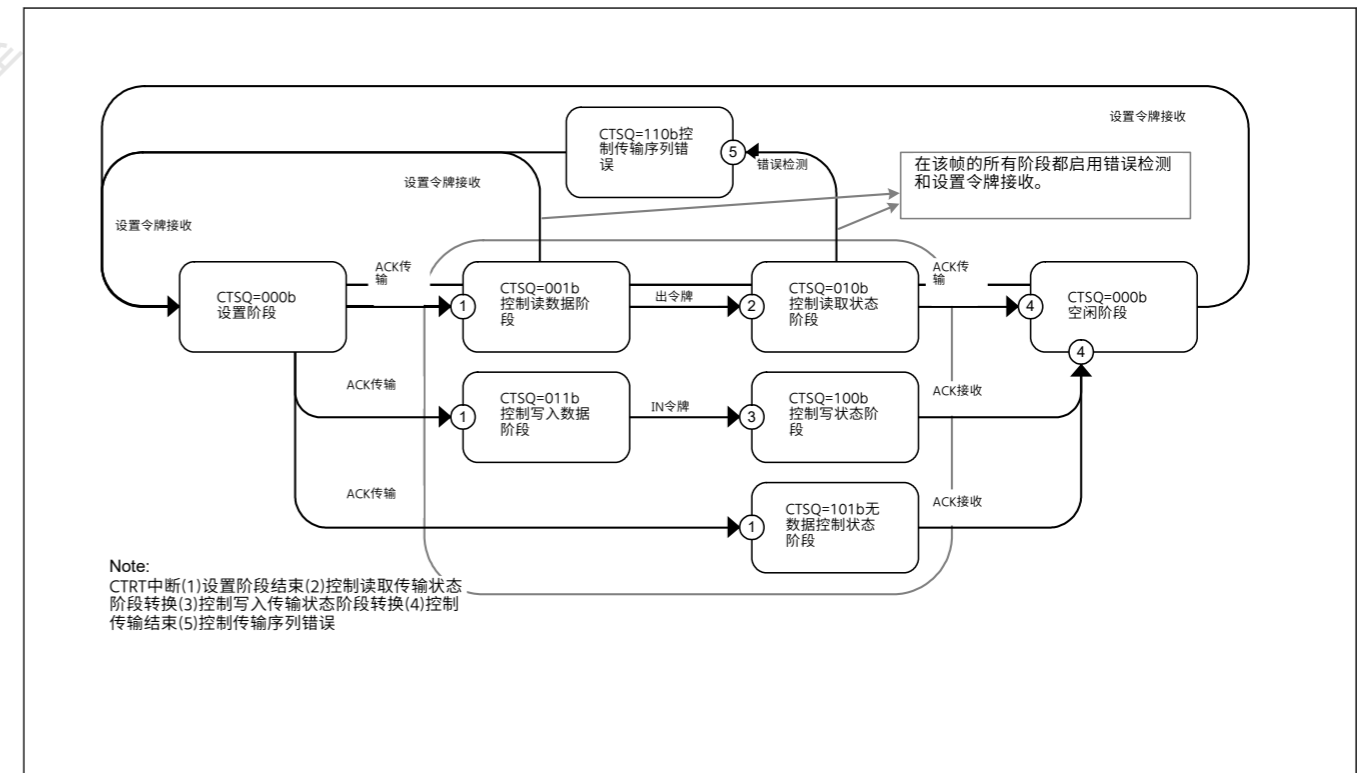

Figure 26.16 控制转移阶段转换

26.3.3.6 帧更新中断

在主机控制器模式下，更新帧号时会产生中断。

在设备控制器模式下，更新帧号时会产生SOFR中断。如果USBFS在全速运行期间检测到新的SOF数据包，则USBFS会更新帧号并生成SOFR中断。

### 26.3.3.7 VBUS interrupt

When the USB\_VBUS pin level changes, a VBUS interrupt is generated. The level of the USB\_VBUS pin can be checked with the INTSTS0.VBSTS bit. Whether the host controller is connected or disconnected can be confirmed using the VBUS interrupt. If the system is activated with the host controller connected, the first VBUS interrupt is not generated, because there is no change in the USB\_VBUS pin level.

### 26.3.3.8 Resume interrupt

In device controller mode, a resume interrupt is generated when the device state is the Suspend state and the USB bus state has changed (from J-state to K-state, or from J-state to SE0). Recovery from the Suspend state is detected by means of the resume interrupt.

In host controller mode, no resume interrupt is generated. Use the BCHG interrupt to detect a change in the USB bus state.

### 26.3.3.9 OVRCCR interrupt

An OVRCCR interrupt is generated when the USB\_OVRCURA or USB\_OVRCURB pin level has changed. The levels of the USB\_OVRCURA and USB\_OVRCURB pins can be checked in the SYSSTS0.OVCMON[1:0] flags. The external power supply IC can check whether overcurrent is detected using the OVRCCR interrupt.

For OTG connections, the OVRCCR interrupt allows you to check whether a change is detected in the VBUS comparator.

### 26.3.3.10 BCHG interrupt

A BCHG interrupt is generated when the USB bus state has changed. The BCHG interrupt can be used to detect whether a peripheral device is connected and can also be used to detect a remote wakeup in host controller mode. The BCHG interrupt is generated in both host and device controller modes.

### 26.3.3.11 DTCH interrupt

A DTCH interrupt occurs when a USB bus disconnect is detected in host controller mode. The USBFS detects bus disconnects in compliance with the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by software. The pipes enter the wait state for a bus connection to the port, waiting for an ATTCH interrupt to occur.

Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt is detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state

### 26.3.3.12 SACK interrupt

A SACK interrupt is generated when an ACK response for the transmitted setup packet is received from the peripheral device in host controller mode. The SACK interrupt can be used to confirm that the setup transaction is successfully complete.

### 26.3.3.13 SIGN interrupt

A SIGN interrupt is generated when an ACK response for the transmitted setup packet is not correctly received from the peripheral device three consecutive times in host controller mode. The SIGN interrupt can be used to detect no ACK response transmitted from the peripheral device or corruption of an ACK packet.

### 26.3.3.14 ATTCH interrupt

An ATTCH interrupt is generated when J-state or K-state of the full-speed signal level is detected on the USB port for 2.5 μs in host controller mode. To be more specific, an ATTCH interrupt is detected on any of the following conditions:

- When K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 μs
- When J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 μs

### 26.3.3.7 VBUS interrupt

当USB\_VBUS引脚电平改变时,会产生VBUS中断。USB\_VBUS引脚的电平可以通过INTSTS0.VBSTS位检查。主控制器是连接还是断开可以使用VBUS中断来确认。如果系统在连接主机控制器的情况下激活,则不会产生第一个VBUS中断,因为USB\_VBUS引脚电平没有变化。

### 26.3.3.8 恢复中断

在设备控制器模式下,当设备状态为Suspend状态且USB总线状态发生变化(从J-state到K-state,或从J-state到SE0)时,会产生恢复中断。通过恢复中断检测从挂起状态的恢复。

在主机控制器模式下,不会产生恢复中断。使用BCHG中断来检测USB总线状态的变化。

### 26.3.3.9 OVRCCR interrupt

当USB\_OVRCURA或USB\_OVRCURB引脚电平发生变化时,会产生OVRCCR中断。的水平USB\_OVRCURA和USB\_OVRCURB引脚可以在SYSSTS0.OVCMON[1:0]标志中检查。外部电源IC可以使用OVRCCR中断检查是否检测到过电流。

对于OTG连接,OVRCCR中断允许您检查是否在VBUS比较器中检测到变化。

### 26.3.3.10 BCHG interrupt

当USB总线状态改变时会产生BCHG中断。BCHG中断可用于检测是否连接了外围设备,也可用于检测主机控制器模式下的远程唤醒。BCHG中断在主机和设备控制器模式下产生。

### 26.3.3.11 DTCH interrupt

当在主机控制器模式下检测到USB总线断开连接时,会发生DTCH中断。USBFS检测符合USB2.0规范的总线断开连接。

在检测到中断时,为相关端口执行通信的所有管道必须由软件终止。管道进入等待状态,等待总线连接到端口,等待ATTCH中断发生。无论相关中断使能位中设置的值如何,USBFS硬件:

- 将检测到DTCH中断的端口的DVSTCTR0.UACT位设置为0
- 将发生DTCH中断的端口置于空闲状态

### 26.3.3.12 SACK中断

当在主机控制器模式下从外围设备接收到对发送的设置数据包的ACK响应时,将产生SACK中断。SACK中断可用于确认设置事务成功完成。

### 26.3.3.13 标志中断

在主机控制器模式下,如果连续三次未从外围设备正确接收到已发送的设置数据包的ACK响应,则会产生SIGN中断。SIGN中断可用于检测没有从外围设备发送的ACK响应或ACK数据包的损坏。

### 26.3.3.14 ATTCH interrupt

在主机控制器模式下,当在USB端口上检测到全速信号电平的J状态或K状态持续2.5μs时,将产生ATTCH中断。更具体地说,在以下任何条件下都会检测到ATTCH中断:

- 当K-state、SE0或SE1变为J-state时,J-state持续2.5μs
- J-state、SE0或SE1变为K-state时,K-state持续2.5μs

### 26.3.3.15 EOFERR interrupt

An EOFERR interrupt occurs when the USBFS detects that communication is not complete at the EOF2 timing defined in the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by software, and the port must be re-enumerated. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt is detected to 0
- Puts the port in which the EOFERR interrupt is generated into the idle state

### 26.3.3.16 Portable Device Detection Interrupt

The USBFS sets the INTSTS1.PDDETINT flag to 1 on detecting a portable device and generates the portable device detection interrupt. When the portable device detection interrupt is generated, use software to repeat reading the BCCTRL1.PDDETSTS flag until the same value is read three or more times, and perform debounce processing.

## 26.3.4 Pipe Control

Table 26.19 lists the pipe settings for the USBFS. USB data transfer is performed through logical pipes that the software associates with endpoints. The USBFS provides 10 pipes that are used for data transfer. Set up the pipes based on your system specifications.

Table 26.19 Pipe settings (1 of 2)

| Register name       | Bit name     | Setting  | Notes   |
|---------------------|--------------|--|---|
| DCPCFG<br>PIPECFG   | TYPE         | Transfer type                                      | Pipes 1 to 9: Settable  |
|                     | BFRE         | BRDY interrupt mode                                | Pipes 1 to 5: Settable  |
|                     | DBLB         | Double buffer select                               | Pipes 1 to 5: Settable  |
|                     | DIR          | Transfer direction select                          | IN or OUT settable  |
|                     | EPNUM        | Endpoint number                                    | Pipes 1 to 9: Settable<br>A value other than 0000b must be set when the pipe is used.   |
|                     | SHTNAK       | Selects disabled state for pipe when transfer ends | Pipes 1 and 2: Settable only for bulk transfers<br>Pipes 3 to 5: Settable   |
| DCPMAXP<br>PIPEMAXP | DEVSEL       | Device select                                      | Referenced only in host controller mode.  |
|                     | MXPS         | Maximum packet size                                | Compliant with the USB 2.0 specification.   |
| PIPEPERI            | IFIS         | Buffer flush                                       | Pipes 1 and 2: Settable only for isochronous transfers<br>Pipes 3 to 9: Setting disabled  |
|                     | IITV         | Interval counter                                   | Pipes 1 and 2: Settable only for isochronous transfers<br>Pipes 3 to 5: Setting disabled<br>Pipes 6 to 9: Settable only in host controller mode |
| DCPCTR<br>PIPECTR   | BSTS         | Buffer status                                      | For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit.   |
|                     | INBUFM       | IN buffer monitor                                  | Available only for pipes 1 to 5.  |
|                     | SUREQ        | Setup request                                      | Settable only for the DCP and controlled in host controller mode  |
|                     | SUREQCLR     | SUREQ clear  | Settable only for the DCP and controlled in host controller mode  |
|                     | ATREPM       | Auto response mode                                 | Pipes 1 to 5: Settable only in device controller mode   |

### 26.3.3.15 EOFERR interrupt

当USBFS检测到在USB2.0规范中定义的EOF2时序未完成通信时，将发生EOFERR中断。

在检测到中断时，所有为相关端口执行通信的管道必须由软件终止，并且必须重新枚举该端口。无论相关中断使能位中设置的值如何，USBFS硬件：

- 将检测到EOFERR中断的端口的DVSTCTR0.UACT位设置为0
- 将产生EOFERR中断的端口置于空闲状态

### 26.3.3.16 便携式设备检测中断

USBFS在检测到便携式设备时将INTSTS1.PDDETINT标志设置为1，并生成便携式设备检测中断。当便携式设备检测中断产生时，使用软件重复读取BCCTRL1.PDDETSTS标志，直到读取相同的值3次或更多次，并进行抖动处理。

## 26.3.4 管道控制

表26.19列出了USBFS的管道设置。USB数据传输是通过软件与端点关联的逻辑管道执行的。USBFS提供了10个用于数据传输的管道。根据您的系统规格设置管道。

Table 26.19 管道设置(1of2)

| 注册名称                | 位名称      | Setting              | Notes   |

Table 26.19 Pipe settings (2 of 2)

| Register name | Bit name | Setting                           | Notes                  |
|---------------|----------|-----------------------------------|------------------------|
| PIPEnTRE      | TRENB    | Transaction counter enable        | Pipes 1 to 5: Settable |
|               | TRCLR    | Current transaction counter clear | Pipes 1 to 5: Settable |
| PIPEnTRN      | TRNCNT   | Transaction counter               | Pipes 1 to 5: Settable |

### 26.3.4.1 Pipe control register switching procedures

The following bits in the pipe control registers can be changed only when USB communication is prohibited (PID = NAK).

Do not change the following registers and bits when USB communication is enabled (PID = BUF):

- Bits in DCPCFG and DCPMAXP
- SQCLR and SQSET bits in DCPCTR
- Bits in PIPECFG, PIPEMAXP, and PIPEPERI
- ATREPM, ACLRM, SQCLR, and SQSET bits in PIPEnCTR
- Bits in PIPEnTRE and PIPEnTRN

To set these bits when USB communication is enabled (PID = BUF):

1. A request to change the bits in the pipe control register occurs.
2. Set the PID[1:0] bits associated with the pipe to NAK.
3. Wait until the associated PBUSY bit clears to 0.
4. Set the bits in the pipe control register.

The following bits in the pipe control registers can be changed only when the selected pipe information is not set in the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

Do not set the following registers when the CURPIPE[3:0] bits are set:

- Bits in DCPCFG and DCPMAXP
- Bits in PIPECFG, PIPEMAXP and PIPEPERI

To change pipe information, you must set the CURPIPE[3:0] bits in the port select registers to a pipe other than the one to be changed. For the DCP, the buffer must be cleared using the BCLR bit in the Port Control Register after the pipe information is changed.

### 26.3.4.2 Transfer types

The PIPECFG.TYPE[1:0] bits specify the following transfer types for each pipe:

- DCP: No setting is necessary (fixed at control transfer)
- Pipes 1 and 2: Set to bulk or isochronous transfer
- Pipes 3 to 5: Set to bulk transfer
- Pipes 6 to 9: Set to interrupt transfer

### 26.3.4.3 Endpoint number

The PIPECFG.EPNUM[3:0] bits are used to set the endpoint number for each pipe. The DCP is fixed at endpoint 0. The other pipes can be set from endpoint 1 to 15.

- DCP: No setting is necessary (fixed at endpoint 0)
- Pipes 1 to 9: Select and set the endpoint numbers from 1 to 15 so that the combination of the PIPECFG.DIR and EPNUM[3:0] bits is unique

Table 26.19 管道设置(2of2)

| 注册名称     | 位名称    | Setting  | Notes      |
|----------|--------|----------|------------|
| PIPEnTRE | TRENB  | 事务计数器启用  | 管道1至5: 可设置 |
|          | TRCLR  | 当前交易柜台清零 | 管道1至5: 可设置 |
| PIPEnTRN | TRNCNT | 交易柜台     | 管道1至5: 可设置 |

### 26.3.4.1 管道控制寄存器切换程序

只有当USB通信被禁止(PID=NAK)时, 管道控制寄存器中的以下位才能更改。

当启用USB通信(PID=BUF)时, 请勿更改以下寄存器和位:

- DCPCFG和DCPMAXP中的位
- DCPCTR中的SQCLR和SQSET位
- PIPECFG、PIPEMAXP和PIPEPERI中的位
- PIPEnCTR中的ATREPM、ACLRM、SQCLR和SQSET位
- PIPEnTRE和PIPEnTRN中的位

要在启用USB通信(PID=BUF)时设置这些位:

- 1.发生更改管道控制寄存器中的位的请求。
- 2.将与管道关联的PID[1:0]位设置为NAK。
- 3.等到相关的PBUSY位清除为0。
- 4.设置管道控制寄存器中的位。

管道控制寄存器中的以下位只有在所选管道信息未设置时才能更改CFIFOSEL、D0FIFOSEL和D1FIFOSEL中的CURPIPE[3:0]位。

设置CURPIPE[3:0]位时不要设置以下寄存器:

- DCPCFG和DCPMAXP中的位
- PIPECFG、PIPEMAXP和PIPEPERI中的位

要更改管道信息, 您必须将端口选择寄存器中的CURPIPE[3:0]位设置为要更改的管道以外的管道。对于DCP, 必须在管道信息更改后使用端口控制寄存器中的BCLR位清除缓冲区。

### 26.3.4.2 传输类型

PIPECFG.TYPE[1:0]位为每个管道指定以下传输类型:

- DCP: 无需设置 (控制转移时固定)
- 管道1和2: 设置为批量或同步传输
- 管道3到5: 设置为批量传输
- 管道6到9: 设置为中断传输

### 26.3.4.3 端点编号

PIPECFG.EPNUM[3:0]位用于设置每个管道的端点编号。DCP固定在端点0。其他管道可以设置从端点1到15。

- DCP: 无需设置 (固定在端点0)
- 管道1到9: 从1到15选择和设置端点编号, 以便PIPECFG.DIR和EPNUM[3:0]位的组合是唯一的

### 26.3.4.4 Maximum packet size setting

Specify the maximum packet size for each pipe in the DCPMAXP.MXPS[6:0] and PIPEMAXP.MXPS[9:0] bits. The DCP and pipes 1 to 5 can be set to any of the maximum pipe sizes defined in the USB 2.0 specification. For pipes 6 to 9, the maximum packet size is 64 bytes. Set the maximum packet size as follows before starting a transfer (PID = BUF):

- DCP: Set to 8, 16, 32, or 64
- Pipes 1 to 5: Set to 8, 16, 32, or 64 for bulk transfers
- Pipes 1 and 2: Set between 1 and 256 for isochronous transfers
- Pipes 6 to 9: Set between 1 and 64

### 26.3.4.5 Transaction counter for pipes 1 to 5 in the receiving direction

When the specified number of transactions is complete in the data packet receiving direction, the USBFS recognizes that the transfer ended. Two transaction counters are provided: one is the PIPEnTRN register, which specifies the number of transactions to be executed, and the other is the current counter, which internally counts the number of executed transactions. If the PIPECFG.SHTNAK bit is set to 1, when the current counter value matches the specified number of transactions, the associated PIPEnCTR.PID[1:0] bits are set to NAK and the subsequent transfer is disabled. The transactions can be counted again from the beginning by initializing the current counter of the transaction counter function through the PIPEnTRE.TRCLR bit. The data read from PIPEnTRN differs depending on the PIPEnTRE.TRENB setting as follows:

- The TRENB bit = 0: Specified transaction counter value can be read
- The TRENB bit = 1: Current counter value indicating the internally counted number of executed transactions can be read

The following constraints apply when working with the TRCLR bit:

- If the transactions are being counted and PID = BUF, the current counter cannot be cleared
- If there is any data left in the buffer, the current counter cannot be cleared

### 26.3.4.6 Response PID

Specify the response PID for each pipe in the PID[1:0] bits in DCPCTR and PIPEnCTR. This section describes the USBFS operation with different response PID settings.

#### (1) Software response PID settings in host controller mode

Select the response PID to specify the execution of transactions as follows:

- NAK setting: Using pipes is disabled and no transactions are executed
- BUF setting: Transactions are executed based on the FIFO buffer state:
  - OUT direction: An OUT token is issued if the FIFO buffer contains transmit data.
  - IN direction: An IN token is issued if the FIFO buffer is not full and can receive data.
- STALL setting: Using pipes is disabled and no transactions are executed

Note: Use the DCPCTR.SUREQ bit to execute setup transactions for the DCP.

#### (2) Software response PID settings in device controller mode

Select the response PID to respond as follows to transactions from the host:

- NAK setting: A NAK response is returned to all generated transactions
- BUF setting: A response is returned to transactions based on the FIFO buffer
- STALL setting: A STALL response is returned to all generated transactions

Note: For setup transactions, an ACK response is always returned, regardless of the PID[1:0] bits setting, and the USB request is stored in the register.

### 26.3.4.4 最大数据包大小设置

在DCPMAXP.MXPS[6:0]和PIPEMAXP.MXPS[9:0]位中指定每个管道的最大数据包大小。DCP和管道1到5可以设置为USB2.0规范中定义的任何最大管道尺寸。对于管道6到9，最大数据包大小为64字节。在开始传输之前设置最大数据包大小如下 (PID=BUF)：

- DCP：设置为8、16、32或64
- 管道1到5：设置为8、16、32或64以进行批量传输
- 管道1和2：设置在1和256之间，用于同步传输
- 管道6到9：设置在1到64之间

### 26.3.4.5 接收方向上管道1到5的事务计数器

当在数据包接收方向完成指定数量的事务时，USBFS识别传输结束。提供了两个事务计数器：一个是PIPEnTRN寄存器，指定要执行的事务数，另一个是当前计数器，内部统计执行的事务数。如果PIPECFG.SHTNAK位设置为1，则当当前计数器值与指定的事务数匹配时，相关的PIPEnCTR.PID[1:0]位将设置为NAK，并禁用后续传输。通过PIPEnTRE.TRCLR位初始化事务计数器功能的当前计数器，事务可以从头开始重新计数。从PIPEnTRN读取的数据因PIPEnTRE.TRENB设置而异，如下所示：

- TRENB位=0：可以读取指定的事务计数器值
- TRENB位=1：表示内部计数的已执行事务数的当前计数器值可被读取

使用TRCLR位时适用以下约束：

- 如果正在对事务进行计数且PID=BUF，则无法清除当前计数器
- 如果缓冲区中还有数据，则无法清除当前计数器

### 26.3.4.6 响应PID

在DCPCTR和PIPEnCTR的PID[1:0]位中指定每个管道的响应PID。本节介绍具有不同响应PID设置的USBFS操作。

#### (1) 主机控制器模式下的软件响应PID设置

选择响应PID来指定事务的执行，如下所示：

- NAK设置：禁用使用管道，不执行任何事务
- BUF设置：根据FIFO缓冲区状态执行事务：
  - OUT方向：如果FIFO缓冲区包含发送数据，则发出OUT令牌。
  - IN方向：如果FIFO缓冲区未充满并且可以接收数据，则发出IN令牌。
- STALL设置：禁止使用管道，不执行任何事务

Note: 使用DCPCTR.SUREQ位执行DCP的设置事务。

#### (2) 设备控制器模式下的软件响应PID设置

选择响应PID以对来自主机的事务进行如下响应：

- NAK设置：对所有生成的事务返回NAK响应
- BUF设置：根据FIFO缓冲区向事务返回响应
- STALL设置：向所有生成的事务返回STALL响应

Note: 对于设置事务，无论PID[1:0]位设置如何，始终返回ACK响应，并且USB请求存储在寄存器中。

Sections (3) and (4) describe situations in which the USBFS writes to the PID[1:0] bits because of specific transaction results.

### (3) Hardware response PID settings in host controller mode

- NAK setting: PID = NAK is set in the following cases, and issuing of tokens is automatically stopped:
  - When a non-isochronous transfer is performed and an NRDY interrupt is generated  
(For details, see [section 26.3.3.2. NRDY interrupt.](#))
  - If a short packet is received when the PIPECFG.SHTNAK bit is set to 1 for bulk transfers
  - If transaction counting ends when the SHTNAK bit is set to 1 for bulk transfers
- BUF setting: The USBFS does not write this setting.
- STALL setting: PID = STALL is set in the following cases, and issuing of tokens is automatically stopped:
  - When STALL is received in response to a transmitted token
  - When a received data packet exceeds the maximum packet size

### (4) Hardware response PID settings in device controller mode

- NAK setting: PID = NAK is set in the following cases, and a NAK response is returned to transactions:
  - When the setup token is received normally (DCP only)
  - If transaction counting ends or a short packet is received when the PIPECFG.SHTNAK bit is set to 1 for bulk transfers
- BUF setting: There is no BUF writing by the USBFS.
- STALL setting: PID = STALL is set in the following cases, and a STALL response is returned to transactions:
  - When a received data packet exceeds the maximum packet size
  - When a control transfer sequence error is detected (DCP only)

#### 26.3.4.7 Data PID sequence bit

The USBFS automatically toggles the sequence bit in the data PID when data is transferred successfully in the control transfer data stage, bulk transfer, and interrupt transfer. The sequence bit of the next data PID to be transmitted can be confirmed with the SQMON bit in DCPCTR and PIPEnCTR. When data is transmitted, the sequence bit toggles on ACK handshake reception. When data is received, the sequence bit toggles on ACK handshake transmission. The SQCLR bit in DCPCTR and the SQSET bit in PIPEnCTR can be used to change the data PID sequence bit.

In device controller mode when control transfers are used, the USBFS automatically sets the sequence bit for stage transitions. DATA1 is returned when the setup stage ends. The sequence bit is not referenced and PID = DATA1 is returned in the status stage. Therefore, no software settings are required. However, in host controller mode when control transfers are used, the sequence bit must be set by software for the stage transitions.

For ClearFeature requests for transmission or reception, the data PID sequence bit must be set by software in both host and device controller modes.

#### 26.3.4.8 Response PID = NAK function

The USBFS provides a function for disabling pipe operation (PID response = NAK) when the final data packet of a transaction is received. The USBFS automatically distinguishes this based on reception of a short packet or the transaction counter. Enable this function by setting the PIPECFG.SHTNAK bit to 1.

When the double buffer mode is being used for the FIFO buffer, using this function enables reception of data packets in transfer units. If pipe operation is disabled, the software must enable the pipe again (PID response = BUF).

The response PID = NAK function can be used only for bulk transfers.

第(3)和(4)节描述了USBFS由于特定事务结果而写入PID[1:0]位的情况。

### (3) 主机控制器模式下的硬件响应PID设置

- NAK设置: PID=NAK在以下情况下设置, 令牌自动停止发行:
  - 当执行非同步传输并产生NRDY中断时  
(有关详细信息, 请参阅第26.3.3.2节。NRDY中断。)
  - 如果在PIPECFG.SHTNAK位设置为1以进行批量传输时接收到短数据包
  - 如果在SHTNAK位设置为1以进行批量传输时事务计数结束
- BUF设置: USBFS不写入此设置。
- STALL设置: PID=STALL在以下情况下设置, 并且自动停止发行令牌:
  - 当接收到STALL以响应传输的令牌时
  - 当接收到的数据包超过最大包大小时

### (4) 设备控制器模式下的硬件响应PID设置

- NAK设置: PID=NAK在以下情况下设置, 并向事务返回NAK响应:
  - 正常接收到设置令牌时 (仅DCP)
  - 当PIPECFG.SHTNAK位设置为1以进行批量传输时, 如果事务计数结束或收到短数据包
- BUF设置: USBFS不写入BUF。
- STALL设置: PID=STALL在以下情况下设置, 并向事务返回STALL响应:
  - 当接收到的数据包超过最大包大小时
  - 当检测到控制传输序列错误时 (仅限DCP)

#### 26.3.4.7 数据PID序列位

当数据在控制传输数据阶段、批量传输和中断传输成功传输时, USBFS会自动切换数据PID中的序列位。下一个要发送的数据PID的序列位可以通过DCPCTR和PIPEnCTR中的SQMON位来确认。发送数据时, 序列位在ACK握手接收时切换。当接收到数据时, 序列位在ACK握手传输上切换。DCPCTR中的SQCLR位和PIPEnCTR中的SQSET位可用于更改数据PID序列位。

在使用控制传输的设备控制器模式下, USBFS自动设置阶段转换的序列位。DATA1在设置阶段结束时返回。不引用序列位, 在状态阶段返回PID=DATA1。因此, 不需要任何软件设置。但是, 在使用控制传输的主机控制器模式下, 必须由软件设置序列位以进行阶段转换。

对于发送或接收的ClearFeature请求, 数据PID序列位必须由软件在主机和设备控制器模式下设置。

#### 26.3.4.8 响应PID=NAK功能

USBFS提供了在接收到事务的最终数据包时禁用管道操作 (PID响应=NAK) 的功能。USBFS根据收到的短数据包或事务计数器自动区分这一点。通过将PIPECFG.SHTNAK位设置为1来启用此功能。

当FIFO缓冲区使用双缓冲区模式时, 使用此功能可以接收以传输为单位的数据包。如果管道操作被禁用, 软件必须再次启用管道 (PID响应=BUF)。

响应PID=NAK函数只能用于批量传输。

### 26.3.4.9 Auto response mode

For bulk transfer pipes (1 to 5), when the PIPEnCTR.ATREPM bit is set to 1, a transition is made to auto response mode. During an OUT transfer (PIPECFG.DIR = 0), OUT-NAK mode is invoked, and during an IN transfer (DIR = 1), null auto response mode is invoked.

### 26.3.4.10 OUT-NAK mode

For bulk OUT transfer pipes, NAK is returned in response to an OUT token, and an NRDY interrupt is output when the PIPEnCTR.ATREPM bit is set to 1. To transition from normal mode to OUT-NAK mode, specify OUT-NAK mode while pipe operation is disabled (PID[1:0] = 00b for NAK response). Next enable pipe operation (PID[1:0] = 01b for BUF response), on which OUT-NAK mode becomes valid. If an OUT token is received immediately before pipe operation is disabled, the token data is normally received, and an ACK is returned to the host.

To transition from OUT-NAK mode to normal mode, cancel OUT-NAK mode while pipe operation is disabled (NAK). Next enable pipe operation (BUF). In normal mode, reception of OUT data is enabled.

### 26.3.4.11 Null auto response mode

For bulk IN transfer pipes, zero-length packets are continuously transmitted when the PIPEnCTR.ATREPM bit is set to 1.

To transition from normal mode to null auto response mode, specify null auto response mode while pipe operation is disabled (response PID = NAK). Next enable pipe operation (response PID = BUF) on which null auto response mode becomes valid. Before setting null auto response mode, check that PIPEnCTR.INBUFM = 0, because the mode can be set only when the buffer is empty. If the INBUFM bit is 1, empty the buffer using the PIPEnCTR.ACLRM bit. Do not write data from the FIFO port while a transition to null auto response mode is being made.

To transition from null auto response mode to normal mode, keep pipe operation disabled (response PID = NAK) for the period of the zero-length packet transmission (about 10 μs) before canceling the null auto response mode. In normal mode, data can be written from the FIFO port, so packet transmission to the host is enabled by enabling pipe operation (response PID = BUF).

## 26.3.5 FIFO Buffer

The USBFS provides a FIFO buffer for data transfers, and it manages the memory area used for each pipe. The FIFO buffer has two states depending on whether the access right is assigned to the system (CPU side) or the USBFS (SIE side).

### (1) Buffer status

Table 26.20 and Table 26.21 show the buffer status in the USBFS. The FIFO buffer status can be confirmed using the DCPCTR.BSTS and PIPEnCTR.INBUFM bits. The transfer direction for the FIFO buffer can be specified in either the PIPECFG.DIR or CFIFOSEL.ISEL bit (when DCP is selected).

The INBUFM bit is valid for pipes 0 to 5 in the transmitting direction.

When a transmitting pipe uses double buffering, the software can read the BSTS bit to monitor the FIFO buffer status on the CPU side and the INBUFM bit to monitor the FIFO buffer status on the SIE side. When write access to the FIFO port by the CPU or DMA/DTC is slow and the buffer empty status cannot be determined using the BEMP interrupt, the software can use the INBUFM bit to confirm the end of transmission.

**Table 26.20 Buffer status indicated in the BSTS bit**

| ISEL or DIR                | BSTS | FIFO buffer status   |
|----------------------------|------|--|
| 0 (receiving direction)    | 0    | There is no received data, or data is being received.<br>Reading from the FIFO port is disabled.   |
| 0 (receiving direction)    | 1    | There is received data, or a zero-length packet is received.<br>Reading from the FIFO port is allowed.<br>When a zero-length packet is received, reading is not possible and the buffer must be cleared. |
| 1 (transmitting direction) | 0    | Transmission has not completed.<br>Writing to the FIFO port is disabled.   |
| 1 (transmitting direction) | 1    | Transmission is complete.<br>CPU write is allowed.   |

### 26.3.4.9 自动响应模式

对于批量传输管道（1到5），当PIPEnCTR.ATREPM位设置为1时，将转换到自动响应模式。在OUT传输期间(PIPECFG.DIR=0)，将调用OUT-NAK模式，在IN传输期间(DIR=1)，将调用空自动响应模式。

### 26.3.4.10 OUT-NAK mode

对于批量OUT传输管道，NAK响应OUT令牌返回，并且当PIPEnCTR.ATREPM位设置为1。要从正常模式转换到OUT-NAK模式，请在禁用管道操作时指定OUT-NAK模式（对于NAK响应，PID[1:0]=00b）。接下来启用管道操作（PID[1:0]=01b用于BUF响应），此时OUT-NAK模式变为有效。如果在禁用管道操作之前立即收到OUT令牌，则正常接收令牌数据，并向主机返回ACK。

要从OUT-NAK模式转换到正常模式，请在禁用管道操作(NAK)时取消OUT-NAK模式。接下来启用管道操作(BUF)。在正常模式下，可以接收OUT数据。

### 26.3.4.11 空自动响应模式

对于批量IN传输管道，当PIPEnCTR.ATREPM位设置为1时，将连续传输零长度数据包。

要从正常模式转换为空自动响应模式，请在禁用管道操作时指定空自动响应模式（响应PID=NAK）。接下来启用空自动响应模式有效的管道操作（响应PID=BUF）。在设置空自动响应模式之前，请检查PIPEnCTR.INBUFM=0，因为只有当缓冲区为空时才能设置模式。如果INBUFM位为1，则使用PIPEnCTR.ACLRM位清空缓冲区。在转换到空自动响应模式时，不要从FIFO端口写入数据。

要从空值自动响应模式转换到正常模式，在取消空值自动响应模式之前，在零长度数据包传输期间（约10μs）保持管道操作禁用（响应PID=NAK）。在正常模式下，可以从FIFO端口写入数据，因此通过启用管道操作（响应PID=BUF）来启用到主机的数据包传输。

## 26.3.5 FIFO Buffer

USBFS为数据传输提供FIFO缓冲区，并管理用于每个管道的内存区域。根据访问权限是分配给系统（CPU端）还是USBFS（SIE端），FIFO缓冲区有两种状态。

### (1) 缓冲状态

表26.20和表26.21显示了USBFS中的缓冲区状态。FIFO缓冲区状态可以使用确认DCPCTR.BSTS和PIPEnCTR.INBUFM位。FIFO缓冲区的传输方向可以在任一pipecfg.dir或cfifosel.isel位（选择DCP时）。

INBUFM位对传输方向的管道0到5有效。

当传输管道使用双缓冲时，软件可以读取BSTS位来监控CPU侧的FIFO缓冲区状态，以及读取INBUFM位来监控SIE侧的FIFO缓冲区状态。当写访问FIFO端口由

CPU或DMADTC较慢且无法使用BEMP中断确定缓冲区空状态，软件可以使用INBUFM位确认传输结束。

**Table 26.20 BSTS位中指示的缓冲区状态**

| ISEL或DIR                   | BSTS | FIFO缓冲区状态  |
|----------------------------|------|--|
| 0 (receiving direction)    | 0    | 没有接收到数据，或正在接收数据。<br>禁止从FIFO端口读取。                               |
| 0 (receiving direction)    | 1    | 有接收数据，或接收到零长度数据包。<br>允许从FIFO端口读取。<br>当接收到零长度数据包时，无法读取，必须清除缓冲区。 |
| 1 (transmitting direction) | 0    | 传输尚未完成。<br>禁止写入FIFO端口。   |
| 1 (transmitting direction) | 1    | 传输完成。<br>允许CPU写入。  |

Table 26.21 Buffer status indicated in the INBUFM bit

| DIR                        | INBUFM  | FIFO buffer status  |
|----------------------------|---------|---|
| 0 (receiving direction)    | Invalid | Invalid   |
| 1 (transmitting direction) | 0       | Transmission is complete.<br>There is no data waiting to be transmitted.          |
| 1 (transmitting direction) | 1       | The FIFO port has written data to the buffer.<br>There is data to be transmitted. |

### 26.3.6 FIFO Buffer Clearing

Table 26.22 shows the methods for clearing the FIFO buffer. The FIFO buffer can be cleared using BCLR bit in the port control register, DnFIFOSEL.DCLRM, or the PIPEnCTR.ACLRM bit.

Single or double buffering can be selected for pipes 1 to 5 in the PIPECFG.DBLB bit.

Table 26.22 Buffer clearing methods

| FIFO buffer clearing mode | Clearing FIFO buffer on the CPU side | Mode for automatically clearing the FIFO buffer after reading the specified pipe data | Auto buffer clear mode for discarding all received packets |
|---------------------------|--------------------------------------|---|--|
| Register used             | CFIFOCTR<br>DnFIFOCTR                | DnFIFOSEL   | PIPEnCTR   |
| Bit used                  | BCLR                                 | DCLRM   | ACLRM  |
| Clearing condition        | Cleared by writing 1                 | 1: Mode valid<br>0: Mode invalid  | 1: Mode valid<br>0: Mode invalid                           |

#### (1) Auto buffer clear mode function

The USBFS discards all received data packets if the PIPEnCTR.ACLRM bit is set to 1. If a correct data packet is received, the ACK response is returned to the host controller. The auto buffer clear mode function can only be set in the FIFO buffer reading direction.

Setting the ACLRM bit to 1 and then to 0 clears the FIFO buffer of the selected pipe regardless of the access direction. An access cycle of at least 100 ns is required for the internal hardware sequence processing between ACLRM = 1 and ACLRM = 0.

### 26.3.7 FIFO Port Functions

Table 26.23 shows the settings for the FIFO port functions. In write access, writing data until the maximum packet size is reached automatically enables transmission of the data. To enable transmission before the maximum packet size is reached, set the BVAL flag in the port control register to end writing. To send a zero-length packet, use the BCLR bit to clear the buffer, and then set the BVAL flag to end writing.

In reading, reception of new packets is automatically enabled when all data is read. Data cannot be read when a zero-length packet is received (DTLN[8:0] = 0), so the buffer must be cleared with the BCLR bit. The length of the receive data can be confirmed in the DTLN[8:0] bits in the port control register.

Table 26.23 FIFO port function settings (1 of 2)

| Register name                        | Bit name | Description   |
|--------------------------------------|----------|---|
| CFIFOSEL,<br>DnFIFOSEL<br>(n = 0, 1) | RCNT     | Selects DTLN[11:0] read mode  |
|                                      | REW      | FIFO buffer rewind (re-read, rewrite)   |
|                                      | DCLRM    | Automatically clears receive data for a specified pipe after the data is read (only for DnFIFO) |
|                                      | DREQE    | Enables DMA/DTC transfers (only for DnFIFO)   |
|                                      | MBW      | FIFO port access bit width  |
|                                      | BIGEND   | Selects FIFO port endian  |
|                                      | ISEL     | FIFO port access direction (only for DCP)   |
|                                      | CURPIPE  | Selects the current pipe  |

Table 26.21 INBUFM位中指示的缓冲区状态

| DIR                        | INBUFM  | FIFO缓冲区状态                   |
|----------------------------|---------|-----------------------------|
| 0 (receiving direction)    | Invalid | Invalid                     |
| 1 (transmitting direction) | 0       | 传输完成。<br>没有等待传输的数据。         |
| 1 (transmitting direction) | 1       | FIFO端口已将数据写入缓冲区。<br>有数据要传输。 |

### 26.3.6 FIFO缓冲区清除

表26.22显示了清除FIFO缓冲区的方法。可以使用端口控制寄存器中的BCLR位、DnFIFOSEL.DCLRM或PIPEnCTR.ACLRM位清除FIFO缓冲区。

可以在PIPECFG.DBLB位中为管道1到5选择单缓冲或双缓冲。

Table 26.22 缓冲区清除方法

| FIFO缓冲区清除模式 | 清除FIFO缓冲区CPU端         | 读取指定管道数据后自动清除FIFO缓冲区的模式 | 自动缓冲区清除模式，用于丢弃所有接收到的数据包 |
|-------------|-----------------------|-------------------------|-------------------------|
| 注册使用        | CFIFOCTR<br>DnFIFOCTR | DnFIFOSEL               | PIPEnCTR                |
| 使用的位        | BCLR                  | DCLRM                   | ACLRM                   |
| 清算条件        | 通过写1清除                | 1: 模式有效0<br>: 模式无效      | 1: 模式有效0<br>: 模式无效      |

#### (1) 自动缓冲清除模式功能

如果PIPEnCTR.ACLRM位设置为1，USBFS将丢弃所有接收到的数据包。如果接收到正确的数据包，则向主机控制器返回ACK响应。自动缓冲区清除模式功能只能在FIFO缓冲区读取方向设置。

无论访问方向如何，将ACLRM位设置为1，然后设置为0都会清除所选管道的FIFO缓冲区。ACLRM=1和ACLRM=0之间的内部硬件序列处理需要至少100ns的访问周期。

### 26.3.7 FIFO端口功能

表26.23显示了FIFO端口功能的设置。在写访问中，在达到最大数据包大小之前写入数据会自动启用数据传输。要在达到最大数据包大小之前启用传输，请设置端口控制寄存器中的BVAL标志以结束写入。要发送零长度数据包，请使用BCLR位清除缓冲区，然后设置BVAL标志以结束写入。

在读取中，当所有数据被读取时，自动启用新数据包的接收。接收到零长度数据包时 (DTLN[8:0]=0) 无法读取数据，因此必须使用BCLR位清除缓冲区。接收数据的长度可以在端口控制寄存器的DTLN[8:0]位中确认。

Table 26.23 FIFO端口功能设置(1of2)

| 注册名称                                 | 位名称     | Description                     |
|--------------------------------------|---------|---------------------------------|
| CFIFOSEL,<br>DnFIFOSEL<br>(n = 0, 1) | RCNT    | 选择DTLN[11:0]读取模式                |
|                                      | REW     | FIFO缓冲区倒带 (重新读取、重写)             |
|                                      | DCLRM   | 读取数据后自动清除指定管道的接收数据 (仅适用于DnFIFO) |
|                                      | DREQE   | 启用DMADTC传输 (仅适用于DnFIFO)         |
|                                      | MBW     | FIFO端口访问位宽                      |
|                                      | BIGEND  | 选择FIFO端口字节序                     |
|                                      | ISEL    | FIFO端口访问方向 (仅适用于DCP)            |
|                                      | CURPIPE | 选择当前管道                          |

Table 26.23 FIFO port function settings (2 of 2)

| Register name                        | Bit name | Description                            |
|--------------------------------------|----------|--|
| CFIFOCTR,<br>DnFIFOCTR<br>(n = 0, 1) | BVAL     | Ends writing to the FIFO buffer        |
|                                      | BCLR     | Clears the FIFO buffer on the CPU side |
|                                      | DTLN     | Checks the length of receive data      |

## (1) FIFO port selection

Table 26.24 shows the pipes that can be selected with the different FIFO ports. The pipe to be accessed must be selected in the CURPIPE[3:0] bits in the port select register. After the pipe is selected, the software must check whether the written value can be read correctly from the CURPIPE[3:0] bits. (If the previous pipe number is read, it indicates that the USBFS is modifying the pipe.) Next, the software checks that the FRDY bit in the port control register is 1.

In addition, the software must specify the bus width to be accessed in the MBW bit in the port select register. The FIFO buffer access direction conforms to the PIPECFG.DIR setting. For the DCP only, the ISEL bit in the port select register determines the direction.

Table 26.24 FIFO port access by pipe

| Pipe         | Access method  | Ports that can be used   |
|--------------|----------------|--|
| DCP          | CPU access     | CFIFO port register  |
| Pipes 1 to 9 | CPU access     | <ul style="list-style-type: none"> <li>CFIFO port register</li> <li>D0FIFO/D1FIFO port register</li> </ul> |
|              | DMA/DTC access | D0FIFO/D1FIFO port register  |

## (2) REW bit

It is possible to temporarily stop access to a pipe currently being accessed, access a different pipe, and then continue processing for the first pipe again. The REW bit in the port select register is used for this processing.

If a pipe is selected in the CURPIPE[3:0] bits in the port select register with the REW bit set to 1, the pointer used for reading from and writing to the FIFO buffer is reset, and reading or writing can be carried out from the first byte. If a pipe is selected with 0 set for the REW bit, data can be read and written in continuation from the previous selection, without the pointer being reset.

To access the FIFO port, the software must check that the FRDY bit in the port control register is 1 after selecting a pipe.

## 26.3.8 DMA Transfers (D0FIFO and D1FIFO Ports)

## (1) Overview of DMA transfers

For pipes 1 to 9, the FIFO port can be accessed using the DMAC. When buffer access for a pipe targeted for DMA transfer is enabled, a DMA transfer request is issued.

Select the unit of transfer to the FIFO port in the DnFIFOSEL.MBW bit, and select the pipe targeted for the DMA transfer in the DnFIFOSEL.CURPIPE[3:0] bits. Do not change the selected pipe during the DMA transfer.

## (2) DnFIFO auto clear mode (D0FIFO and D1FIFO port reading direction)

If 1 is set in the DnFIFOSEL.DCLRM bit, the USBFS automatically clears the FIFO buffer of the selected pipe when reading of data from the FIFO buffer is complete.

Table 26.25 shows the packet reception and FIFO buffer clearing processing by software for each of the settings. As shown in the table, the buffer clearing conditions depend on the value set in the PIPECFG.BFRE bit. Using the DnFIFOSEL.DCLRM bit eliminates the need for the buffer to be cleared by software in any situation that requires buffer clearing. This enables DMA transfers without involving software.

The DnFIFO auto clear mode can only be set in the FIFO buffer reading direction.

Table 26.23 FIFO端口功能设置(2of2)

| 注册名称                                 | 位名称  | Description    |
|--------------------------------------|------|----------------|
| CFIFOCTR,<br>DnFIFOCTR<br>(n = 0, 1) | BVAL | 结束写入FIFO缓冲区    |
|                                      | BCLR | 清除CPU端的FIFO缓冲区 |
|                                      | DTLN | 检查接收数据的长度      |

## (1) 先进先出端口选择

表26.24显示了可以使用不同FIFO端口选择的管道。必须在端口选择寄存器的CURPIPE[3:0]位中选择要访问的管道。选择管道后，软件必须检查是否可以从CURPIPE[3:0]位正确读取写入的值。（如果读取了之前的管道号，则表明USBFS正在修改管道。）接下来，软件检查端口控制寄存器中的FRDY位是否为1。

此外，软件必须在端口选择寄存器的MBW位中指定要访问的总线宽度。FIFO缓冲区访问方向符合PIPECFG.DIR设置。仅对于DCP，端口选择寄存器中的ISEL位决定方向。

Table 26.24 通过管道访问FIFO端口

| Pipe  | 访问方法           | 可以使用的端口  |
|-------|----------------|--|
| DCP   | CPU访问          | CFIFO端口寄存器   |
| 管道1至9 | CPU访问          | <ul style="list-style-type: none"> <li>CFIFO端口寄存器</li> <li>D0FIFO/D1FIFO端口寄存器</li> </ul> |
|       | DMA/DTC access | D0FIFO/D1FIFO端口寄存器   |

## (2) REW位

可以暂时停止对当前正在访问的管道的访问，访问不同的管道，然后再次继续处理第一个管道。端口选择寄存器中的REW位用于此处理。

如果在端口选择寄存器的CURPIPE[3:0]位中选择一个管道，并且REW位设置为1，则用于读取和写入FIFO缓冲区的指针复位，可以进行读取或写入从第一个字节开始。如果在REW位设置为0的情况下选择管道，则可以从先前的选择继续读取和写入数据，而无需重置指针。

要访问FIFO端口，软件必须在选择管道后检查端口控制寄存器中的FRDY位是否为1。

## 26.3.8 DMA传输 (D0FIFO和D1FIFO端口)

## (1) DMA传输概述

对于管道1到9，可以使用DMAC访问FIFO端口。当启用以DMA传输为目标的管道的缓冲区访问时，将发出DMA传输请求。

在DnFIFOSEL.MBW位中选择传输到FIFO端口的单位，并在DnFIFOSEL.CURPIPE[3:0]位中选择DMA传输的目标管道。在DMA传输期间不要更改选定的管道。

## (2) DnFIFO自动清除模式 (D0FIFO和D1FIFO端口读取方向)

如果DnFIFOSEL.DCLRM位设置为1，USBFS会在从FIFO缓冲区读取数据完成时自动清除所选管道的FIFO缓冲区。

表26.25显示了软件对每个设置的数据包接收和FIFO缓冲区清除处理。如表所示，缓冲区清除条件取决于PIPECFG.BFRE位中设置的值。使用DnFIFOSEL.DCLRM位无需在任何需要清除缓冲区的情况下通过软件清除缓冲区。这可以在不涉及软件的情况下实现DMA传输。

DnFIFO自动清除模式只能设置在FIFO缓冲区读取方向。

Table 26.25 Packet reception and FIFO buffer clearing processing by software

| Buffer status when packet is received | Register setting     |                      |                      |                      |
|---------------------------------------|----------------------|----------------------|----------------------|----------------------|
|                                       | DCLRM = 0            |                      | DCLRM = 1            |                      |
|                                       | BFRE = 0             | BFRE = 1             | BFRE = 0             | BFRE = 1             |
| Buffer full                           | No clearing required | No clearing required | No clearing required | No clearing required |
| Zero-length packet reception          | Clearing required    | Clearing required    | No clearing required | No clearing required |
| Normal short packet reception         | No clearing required | Clearing required    | No clearing required | No clearing required |
| Transaction count end                 | No clearing required | Clearing required    | No clearing required | No clearing required |

### 26.3.9 Control Transfers Using the DCP

The DCP is used for data transfers in the control transfer data stage. The FIFO buffer of the DCP is a 64-byte single buffer with a fixed area for both control reads and control writes. The FIFO buffer can be accessed only through the CFIFO port.

#### 26.3.9.1 Control transfers in host controller mode

##### (1) Setup stage

The USQREQ, USBVAL, USBINDX, and USBLENG registers are used to transmit USB requests for setup transactions. Writing the setup packet data to the registers and then writing 1 to the DCPCTR.SUREQ bit transmits the specified data for the setup transaction. On completion of the transaction, the SUREQ bit clears to 0. Do not change these USB request registers while SUREQ = 1.

When an attached function device is detected, the software must issue the first setup transaction for the device using this sequence with the DCPMAXP.DEVSEL[3:0] bits cleared to 0 and the DEVADD0.USBSPD[1:0] bits set appropriately.

When an attached function device is shifted to the Address state, the software must issue setup transactions using this sequence with the assigned USB address set in the DEVSEL[3:0] bits and the bits in DEVADDn corresponding to the specified USB address set appropriately. For example, when PIPEMAXP.DEVSEL[3:0] = 0010b, make appropriate settings in DEVADD2. When PIPEMAXP.DEVSEL[3:0] = 0101b, make appropriate settings in DEVADD5.

When the setup transaction data is sent, an interrupt request is generated based on the response from the peripheral device (SIGN or SACK bit in INTSTS1). This interrupt request allows the software to check the setup transaction result.

A DATA0 data packet (USB request) for the setup transaction is always transmitted regardless of the status of the DCPCTR.SQMON bit.

##### (2) Data stage

The data stage is used to transfer data using the DCP FIFO buffer.

Before accessing the DCP FIFO buffer, specify the access direction in the CFIFOSEL.ISEL bit. Specify the transfer direction in the DCPCFG.DIR bit.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Set data PID = DATA1 in the DCPCTR.SQSET bit and set the PID bits = BUF. Completion of data transfer is detected using the BRDY or BEMP interrupt.

For control write transfers, when the number of data bytes to be sent is an integer multiple of the maximum packet size, the software must send a zero-length packet at the end.

##### (3) Status stage

The status stage is used for zero-length packet data transfers in the reverse direction of the data stage. As in the data stage, data is transferred using the DCP FIFO buffer. Transactions are executed using the same procedure as the data stage.

Data packets in the status stage must be transmitted and received with the data PID set to DATA1 using the DCPCTR.SQSET bit.

When a zero-length packet is received, check the receive-data length in the CFIFOCTR.DTLN[8:0] bits after a BRDY interrupt is generated, and then clear the FIFO buffer using the BCLR bit.

Table 26.25 通过软件进行数据包接收和FIFO缓冲区清除处理

| 收到数据包时的缓冲区状态 | 注册设置      |          |           |          |
|--------------|-----------|----------|-----------|----------|
|              | DCLRM = 0 |          | DCLRM = 1 |          |
|              | BFRE = 0  | BFRE = 1 | BFRE = 0  | BFRE = 1 |
| 缓冲区已满        | 无需清算      | 无需清算     | 无需清算      | 无需清算     |
| 零长度数据包接收     | 需要清算      | 需要清算     | 无需清算      | 无需清算     |
| 正常短包接收       | 无需清算      | 需要清算     | 无需清算      | 无需清算     |
| 交易计数结束       | 无需清算      | 需要清算     | 无需清算      | 无需清算     |

### 26.3.9 使用DCP进行控制传输

DCP用于控制传输数据阶段的数据传输。DCP的FIFO缓冲区是一个64字节的单缓冲区，具有用于控制读取和控制写入的固定区域。FIFO缓冲区只能通过CFIFO端口访问。

#### 26.3.9.1 主机控制器模式下的控制传输

##### (1) 设置阶段

USQREQ、USBVAL、USBINDX和USBLENG寄存器用于传输设置事务的USB请求。将设置数据包数据写入寄存器，然后向DCPCTR.SUREQ位写入1，以传输设置事务的指定数据。事务完成后，SUREQ位清除为0。在SUREQ=1时不要更改这些USB请求寄存器。

当检测到连接的功能器件时，软件必须使用此序列为器件发出第一个设置事务，其中DCPMAXP.DEVSEL[3:0]位清零，DEVADD0.USBSPD[1:0]位适当设置。

当连接的功能器件转移到地址状态时，软件必须使用此序列发出设置事务，其中指定的USB地址设置在DEVSEL[3:0]位中，并且DEVADDn中的位对应于指定的USB地址设置适当。例如，当PIPEMAXP.DEVSEL[3:0]=0010b时，在DEVADD2中进行适当的设置。当PIPEMAXP.DEVSEL[3:0]=0101b时，在DEVADD5中进行适当的设置。

发送设置事务数据时，根据外围设备的响应（INTSTS1中的SIGN或SACK位）生成中断请求。该中断请求允许软件检查设置事务结果。

一个DATA0数据包（USB请求）用于设置事务总是被传输，无论状态如何DCPCTR.SQMON bit。

##### (2) 数据阶段

数据级用于使用DCPFIFO缓冲区传输数据。

在访问DCPFIFO缓冲区之前，请在CFIFOSEL.ISEL位中指定访问方向。在DCPCFG.DIR位中指定传输方向。

对于数据阶段的第一个数据包，数据PID必须作为DATA1传输。在DCPCTR.SQSET位中设置数据PID=DATA1，并设置PID位=BUF。使用BRDY或BEMP中断检测数据传输的完成。

对于控制写传输，当要发送的数据字节数是最大数据包大小的整数倍时，软件必须在最后发送一个长度为零的数据包。

##### (3) 状态阶段

状态阶段用于在数据阶段的相反方向上进行零长度分组数据传输。与数据阶段一样，使用DCPFIFO缓冲区传输数据。事务使用与数据阶段相同的过程执行。

状态阶段的数据包必须在数据PID设置为DATA1的情况下使用DCPCTR.SQSET bit。

当接收到零长度数据包时，在产生BRDY中断后检查CFIFOCTR.DTLN[8:0]位中的接收数据长度，然后使用BCLR位清除FIFO缓冲区。

### 26.3.9.2 Control transfers in device controller mode

#### (1) Setup stage

The USBFS sends an ACK response to a normal setup packet for the USBFS. The USBFS operates in the setup stage as follows:

On receiving a new setup packet, the USBFS sets the following bits:

- Sets the INTSTS0.VALID bit to 1
- Sets the DCPCTR.PID[1:0] bits to NAK
- Sets the DCPCTR.CCPL bit to 0

When the USBFS receives a data packet following a setup packet, it stores the USB request parameters in USBREQ, USBVAL, USBINDX, and USBLENG.

Before performing the response processing for a control transfer, set the VALID flag to 0. When the VALID bit = 1, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the VALID bit function, the USBFS can suspend a request being processed when it receives a new USB request during a control transfer and return a response to the latest request.

In addition, the USBFS automatically detects the direction bit (bmRequestType bit [8]) and the request data length (wLength) in the received USB request. It distinguishes between control read transfers, control write transfers, and no-data control transfers, and it controls stage transitions. For an incorrect sequence, a sequence error occurs in the control transfer stage transition interrupt, and the interrupt is reported to the software. For a diagram of the stage control by the USBFS, see Figure 26.16.

#### (2) Data stage

The DCP must be used to execute data transfers for received USB requests. Before accessing the DCP FIFO buffer, specify the access direction in the CFIFOSEL.ISEL bit.

If the transfer data is larger than the size of the DCP FIFO buffer, execute the data transfer using the BRDY interrupt for control write transfers and the BEMP interrupt for control read transfers.

#### (3) Status stage

Control transfers are terminated by setting the DCPCTR.CCPL bit to 1 while the DCPCTR.PID[1:0] bits are set to BUF.

After this setting is made, the USBFS automatically executes the status stage based on the data transfer direction determined at the setup stage. The procedure is as follows:

- For control read transfers  
The USBFS receives a zero-length packet from the USB host and transmits an ACK response.
- For control write transfers and no-data control transfers  
The USBFS transmits a zero-length packet and receives an ACK response from the USB host.

#### (4) Control transfer auto response function

The USBFS automatically responds to a correct SET\_ADDRESS request. If any of the following errors occurs in the SET\_ADDRESS request, a response from the software is necessary.

- bmRequestType is not 00h: Any transfer other than a control write transfer
- wIndex is not 00h: Request error
- wLength is not 00h: Any transfer other than a no-data control transfer
- wValue is larger than 7Fh: Request error
- INTSTS0.DVSQ[2:0] are 011b (Configured state): Control transfer of a device state error

For all requests other than the SET\_ADDRESS request, a response is required from the corresponding software.

### 26.3.9.2 设备控制器模式下的控制传输

#### (1) 设置阶段

USBFS向USBFS的正常设置数据包发送ACK响应。USBFS在设置阶段运行如下:

在接收到新的设置数据包时, USBFS设置以下位:

- 将INTSTS0.VALID位设置为1
- 将DCPCTR.PID[1:0]位设置为NAK
- 将DCPCTR.CCPL位设置为0

当USBFS在setup数据包之后接收到数据包时, 它会将USB请求参数存储在USBREQ中, USBVAL, USBINDX, and USBLENG.

在执行控制传输的响应处理之前, 将VALID标志设置为0。当VALID位=1时, PID=BUF不能设置, 数据阶段不能终止。

使用VALID位功能, USBFS可以在控制传输期间接收到新的USB请求时暂停正在处理的请求, 并返回对最新请求的响应。

此外, USBFS会自动检测接收到的USB请求中的方向位 (bmRequestTypebit[8]) 和请求数据长度 (wLength)。它区分控制读取传输、控制写入传输和无数据控制传输, 并控制阶段转换。对于不正确的序列, 在控制转移阶段转换中断中发生序列错误, 并将中断报告给软件。USBFS的阶段控制图见图26.16。

#### (2) 数据阶段

DCP必须用于执行接收到的USB请求的数据传输。在访问DCPFIFO缓冲区之前, 请在CFIFOSEL.ISEL位中指定访问方向。

如果传输数据大于DCPFIFO缓冲区的大小, 则使用控制写传输的BRDY中断和控制读传输的BEMP中断执行数据传输。

#### (3) 状态阶段

通过将DCPCTR.CCPL位设置为1而将DCPCTR.PID[1:0]位设置为BUF来终止控制传输。

完成此设置后, USBFS根据设置阶段确定的数据传输方向自动执行状态阶段。程序如下:

- 用于控制读取传输  
USBFS从USB主机接收零长度数据包并发送ACK响应。
- 用于控制写传输和无数据控制传输  
USBFS发送一个长度为零的数据包并接受来自USB主机的ACK响应。

#### (4) 控制转移自动响应功能

USBFS自动响应正确的SET\_ADDRESS请求。如果出现以下任何错误SET\_ADDRESS请求, 需要软件的响应。

- bmRequestType不是00h: 控制写入传输以外的任何传输
- wIndex不是00h: 请求错误
- wLength不是00h: 除无数据控制传输之外的任何传输
- wValue大于7Fh: 请求错误
- INTSTS0.DVSQ[2:0]为011b (已配置状态): 设备状态错误的控制传输

对于除SET\_ADDRESS请求之外的所有请求, 都需要相应软件的响应。

### 26.3.10 Bulk Transfers (Pipes 1 to 5)

The FIFO buffer usage (single/double buffer setting) is configurable for bulk transfers. The USBFS provides the following functions for bulk transfers:

- BRDY interrupt function (PIPECFG.BFRE bit), see [section 26.3.3.1. BRDY interrupt](#)
- Transaction count function (PIPEnTRE.TRENB, TRCLR, and PIPEnTRN.TRNCNT[15:0] bits), see [section 26.3.4.5. Transaction counter for pipes 1 to 5 in the receiving direction](#)
- Response PID = NAK function (PIPECFG.SHTNAK bit), see [section 26.3.4.8. Response PID = NAK function](#)
- Auto response mode (PIPEnCTR.ATREPM bit), see [section 26.3.4.9. Auto response mode](#)

### 26.3.11 Interrupt Transfers (Pipes 6 to 9)

In device controller mode, the USBFS performs interrupt transfers based on the timing dictated by the host controller.

In host controller mode, the software can set the timing for issuing tokens using the interval counter.

#### 26.3.11.1 Interval counter for interrupt transfers in host controller mode

Specify the transaction interval for interrupt transfers in the PIPEPERI.IITV[2:0] bits. The USBFS issues interrupt transfer tokens based on this interval.

##### (1) Counter initialization

The USBFS initializes the interval counter under the following conditions:

- Power-on reset  
This initializes the IITV[2:0] bits.
- FIFO buffer initialization using the PIPEnCTR.ACLRM bit:  
This does not initialize the IITV[2:0] bits, but does initialize the count value. Setting the PIPEnCTR.ACLRM bit to 0 starts counting from the value set in IITV[2:0].

The interval counter is not initialized in the following case:

- USB bus reset or USB suspended  
The IITV[2:0] bits are not initialized. Setting 1 to the DVSTCTR0.UACT bit starts counting from the value saved before entering the USB bus reset state or USB suspend state.

##### (2) Operation when tokens cannot be transmitted or received even on token generation

No token is generated in the following cases even at token generation time. In these cases, the USBFS tries to execute the transaction in the next interval.

- When the PID is set to NAK or STALL
- When the FIFO buffer is full at token transmit time in the receiving (IN) direction
- When there is no data to be transmitted in the FIFO buffer at token transmit time in the transmitting (OUT) direction

### 26.3.12 Isochronous Transfers (Pipes 1 and 2)

The USBFS provides the following functions for isochronous transfers:

- Notification of isochronous transfer error
- Interval counter specified in the PIPEPERI.IITV[2:0] bits
- Isochronous IN transfer data setup control (IDLY function)
- Isochronous IN transfer buffer flush function specified in the PIPEPERI.IFIS bit

### 26.3.10 批量传输 (管道1到5)

FIFO缓冲区使用 (单双缓冲区设置) 可配置为批量传输。USBFS为批量传输提供以下功能:

- BRDY中断功能 (PIPECFG.BFRE位), 见26.3.3.1节。BRDY中断
- 事务计数函数 (PIPEnTRE.TRENB、TRCLR和PIPEnTRN.TRNCNT[15:0]位), 参见第26.3.4.5节。接收方向上管道1到5的事务计数器
- 响应PID=NAK功能 (PIPECFG.SHTNAK位), 参见第26.3.4.8节。响应PID=NAK功能
- 自动响应模式 (PIPEnCTR.ATREPM位), 见第26.3.4.9节。自动响应模式

### 26.3.11 中断传输 (管道6到9)

在设备控制器模式下, USBFS根据主机控制器规定的时序执行中断传输。

在主机控制器模式下, 软件可以使用间隔计数器设置发布令牌的时间。

#### 26.3.11.1 主机控制器模式下中断传输的间隔计数器

在PIPEPERI.IITV[2:0]位中指定中断传输的事务间隔。USBFS基于此间隔发出中断传输令牌。

##### (1) 计数器初始化

USBFS在以下条件下初始化间隔计数器:

- Power-on reset  
这将初始化IITV[2:0]位。
- 使用PIPEnCTR.ACLRM位初始化FIFO缓冲区:  
这不会初始化IITV[2:0]位, 但会初始化计数值。将PIPEnCTR.ACLRM位设置为0从IITV[2:0]中设置的值开始计数。

在以下情况下不初始化间隔计数器:

- USB总线复位或USB挂起  
IITV[2:0]位未初始化。将DVSTCTR0.UACT位置1从进入USB总线复位状态或USB挂起状态之前保存的值开始计数。

##### (2) 即使在生成令牌时也无法发送或接收令牌时的操作

在以下情况下, 即使在生成令牌时也不会生成令牌。在这些情况下, USBFS会尝试在下一个时间间隔执行事务。

- 当PID设置为NAK或STALL时
- 接收(IN)方向的令牌发送时FIFO缓冲区已满时
- 在发送(OUT)方向的令牌发送时间, FIFO缓冲区中没有要发送的数据时

### 26.3.12 同步传输 (管道1和2)

USBFS为同步传输提供以下功能:

- 同步传输错误通知
- PIPEPERI.IITV[2:0]位中指定的间隔计数器
- 同步IN传输数据设置控制 (IDLY功能)
- PIPEPERI.IFIS位中指定的同步IN传输缓冲区刷新功能

### 26.3.12.1 Error detection in isochronous transfers

The USBFS provides a function for detecting the errors described in this section, so that when errors occur in isochronous transfers, they can be controlled by software. Table 26.26 and Table 26.27 show the priority order for errors detected by the USBFS and the associated interrupts.

#### PID errors

- The PID value of the received packet is invalid.

#### CRC errors and bit stuffing errors

- A CRC error is found in a received packet or the bit stuffing is illegal.

#### Maximum packet size exceeded

- The data size of the received packet exceeds the specified maximum packet size.

#### Overrun and underrun errors

In host controller mode:

- The FIFO buffer is full at token transmit time in the IN (receiving) direction
- There is no data to be sent in the FIFO buffer at token transmit time in the OUT (transmitting) direction

In device controller mode:

- There is no data to be sent in the FIFO buffer at token receive time in the IN (transmitting) direction
- The FIFO buffer is full at token receive time in the OUT (receiving) direction

#### Interval errors

In device controller mode, the following cases are treated as an interval error:

- Failure to receive an IN token in the interval frame during an isochronous IN transfer
- Failure to receive an OUT token in the interval frame during an isochronous OUT transfer

Table 26.26 Error detection for token transmission and reception

| Detection priority | Error                     | Generated interrupt and status  |
|--------------------|---------------------------|---|
| 1                  | PID error                 | No interrupts are generated in either host or device controller mode (ignored as a corrupted packet)  |
| 2                  | CRC or bit stuffing error | No interrupts are generated in either host or device controller mode (ignored as a corrupted packet)  |
| 3                  | Overrun or underrun error | An NRDY interrupt is generated to set the FRMNUM.OVRN bit to 1 in both host and device controller modes.<br>In device controller mode, a zero-length packet is transmitted in response to an IN token. No data packets are received in response to OUT token. |
| 4                  | Interval error            | An NRDY interrupt is generated in device controller mode. No interrupt is generated in host controller mode.  |

Table 26.27 Error detection for data packet reception

| Detection priority | Error                              | Generated interrupt and status  |
|--------------------|------------------------------------|---|
| 1                  | PID error                          | No interrupts are generated (ignored as a corrupted packet)   |
| 2                  | CRC or bit stuffing error          | An NRDY interrupt is generated and the FRMNUM.CRCE bit sets to 1 in both host and device controller modes |
| 3                  | Maximum packet size exceeded error | A BEMP interrupt is generated and the PID[1:0] bits set to STALL in both host and device controller modes |

### 26.3.12.1 同步传输中的错误检测

USBFS提供了检测本节所述的错误的功能，以便在同步传输中发生错误时，可以通过软件进行控制。表26.26和表26.27显示了USBFS检测到的错误和相关中断的优先级顺序。

#### PID错误

- 接收报文的PID值无效。

#### CRC错误和位填充错误

- 收到的报文发现CRC错误或比特填充不合法。

#### 超出最大数据包大小

- 接收到的数据包的数据大小超过了指定的最大数据包大小。

#### 溢出和欠载错误

在主机控制器模式下:

- 在IN（接收）方向发送令牌时，FIFO缓冲区已满
- 在OUT（发送）方向的令牌发送时间，FIFO缓冲区中没有要发送的数据

在设备控制器模式下:

- 在IN（发送）方向的令牌接收时间，FIFO缓冲区中没有要发送的数据
- 在OUT（接收）方向的令牌接收时间，FIFO缓冲区已满

#### 间隔错误

在设备控制器模式下，以下情况被视为间隔错误:

- 等时IN传输期间在间隔帧中接收IN令牌失败
- 在等时OUT传输期间未能在间隔帧中接收到OUT令牌

Table 26.26 令牌发送和接收的错误检测

| 检测优先级 | Error     | 产生的中断和状态  |
|-------|-----------|---|
| 1     | PID错误     | 在主机或设备控制器模式下都不会产生中断（被忽略为损坏的数据包）   |
| 2     | CRC或位填充错误 | 在主机或设备控制器模式下都不会产生中断（被忽略为损坏的数据包）   |
| 3     | 溢出或欠载错误   | 在主机和设备控制器模式下，都会产生一个NRDY中断来将FRMNUM.OVRN位设置为1。在设备控制器模式下，发送一个零长度数据包以响应IN令牌。<br>没有接收到响应OUT令牌的数据包。 |
| 4     | 间隔误差      | 在设备控制器模式下会产生一个NRDY中断。在主机控制器模式下不产生中断。  |

Table 26.27 数据包接收错误检测

| 检测优先级 | Error       | 产生的中断和状态                                   |
|-------|-------------|--|
| 1     | PID错误       | 不产生中断（作为损坏的数据包被忽略）                         |
| 2     | CRC或位填充错误   | 在主机和设备控制器模式下都会产生一个NRDY中断并且FRMNUM.CRCE位设置为1 |
| 3     | 超出最大数据包大小错误 | 在主机和设备控制器模式下都会产生BEMP中断并且PID[1:0]位设置为STALL  |

## 26.3.12.2 DATA-PID

In device controller mode, the USBFS responds to a received PID as follows:

## (1) IN direction

- DATA0: Transmitted as data packet PID
- DATA1: Not transmitted
- DATA2: Not transmitted
- mData: Not transmitted

## (2) OUT direction

- DATA0: Received normally as data packet PID
- DATA1: Received normally as data packet PID
- DATA2: Packets ignored
- mData: Packets ignored

## 26.3.12.3 Interval counter

The isochronous transfer interval can be set in the PIPEPERI.IITV[2:0] bits. In device controller mode, the interval counter enables the functions as shown in Table 26.28. In host controller mode, the USBFS generates the token issuance timing, and the interval counter operation is the same as that for interrupt transfers.

Table 26.28 Interval counter functions in device controller mode

| Transfer direction | Function                              | Conditions for detection   |
|--------------------|---------------------------------------|--|
| IN                 | Transmit buffer flush                 | Failure to receive an IN token successfully in the interval frame during an isochronous IN transfer.   |
| OUT                | Notification of no reception of token | Failure to receive an OUT token successfully in the interval frame during an isochronous OUT transfer. |

The interval count is performed when an SOF is received or for interpolated SOFs, so the isochronism can be maintained even if an SOF is corrupt. The frame interval can be set to  $2^{IITV}$  frames.

## (1) Counter initialization in device controller mode

The USBFS initializes the interval counter under the following conditions:

- Power-on reset  
This initializes the PIPEPERI.IITV[2:0] bits.
- FIFO buffer initialization using the ACLRM bit  
This does not initialize the IITV[2:0] bits, but does initialize the count value.

After the interval counter is initialized, the interval count starts under one of the following conditions when a packet is transferred successfully:

- An SOF is received after data is transmitted in response to an IN token when PID = BUF
- An SOF is received after data is received in response to an OUT token when PID = BUF

The interval counter is not initialized in the following conditions:

- When the PID[1:0] bits are set to NAK or STALL  
This does not stop the interval timer. The USBFS attempts the transaction in the next interval.
- When the USB bus is reset or USBFS is suspended  
This does not initialize the IITV[2:0] bits. When an SOF is received, the interval counter starts counting from the value set before SOF was received.

## 26.3.12.2 DATA-PID

在设备控制器模式下，USBFS响应接收到的PID如下：

## (1) 在方向

- DATA0：作为数据包PID发送
- DATA1：未发送
- DATA2：未传输
- mDATA：不传输

## (2) 出方向

- DATA0：作为数据包PID正常接收
- DATA1：作为数据包PID正常接收
- DATA2：忽略的数据包
- mDATA：忽略的数据包

## 26.3.12.3 间隔计数器

同步传输间隔可以在PIPEPERI.IITV[2:0]位中设置。在设备控制器模式下，间隔计数器启用如表26.28所示的功能。在主机控制器模式下，USBFS产生令牌发布时序，间隔计数器操作与中断传输相同。

Table 26.28 设备控制器模式下的间隔计数器功能

| 转移方向 | Function | 检测条件                        |
|------|----------|-----------------------------|
| IN   | 发送缓冲区刷新  | 在同步IN传输期间未能在间隔帧中成功接收IN令牌。   |
| OUT  | 未收到令牌的通知 | 在同步OUT传输期间未能在间隔帧中成功接收OUT令牌。 |

间隔计数在接收到SOF时执行或对插值SOF执行，因此即使SOF损坏也可以保持等时性。帧间隔可以设置为2个IITV帧。

## (1) 设备控制器模式下的计数器初始化

USBFS在以下条件下初始化间隔计数器：

- Power-on reset  
这将初始化PIPEPERI.IITV[2:0]位。
- 使用ACLRM位初始化FIFO缓冲区  
这不会初始化IITV[2:0]位，但会初始化计数值。

间隔计数器初始化后，当数据包传输成功时，间隔计数在以下条件之一开始：

- 当PID=BUF时，响应IN令牌传输数据后收到SOF
- 当PID=BUF时，接收到响应OUT令牌的数据后接收到SOF

间隔计数器在以下情况下不会初始化：

- 当PID[1:0]位设置为NAK或STALL时  
这不会停止间隔计时器。USBFS在下一个间隔尝试事务。
- USB总线复位或USBFS挂起时  
这不会初始化IITV[2:0]位。当接收到SOF时，间隔计数器从接收到SOF之前设置的值开始计数。

(2) Interval counting and transfer control in host controller mode

The USBFS controls the interval between token issuance operations based on the PIPEPERI.IITV[2:0] bits settings. Specifically, the USBFS issues a token for a selected pipe once every  $2^{IITV}$  frames.

The USBFS starts counting the token issuance interval at the frame following the frame in which the PID[1:0] bits are set to BUF by software.

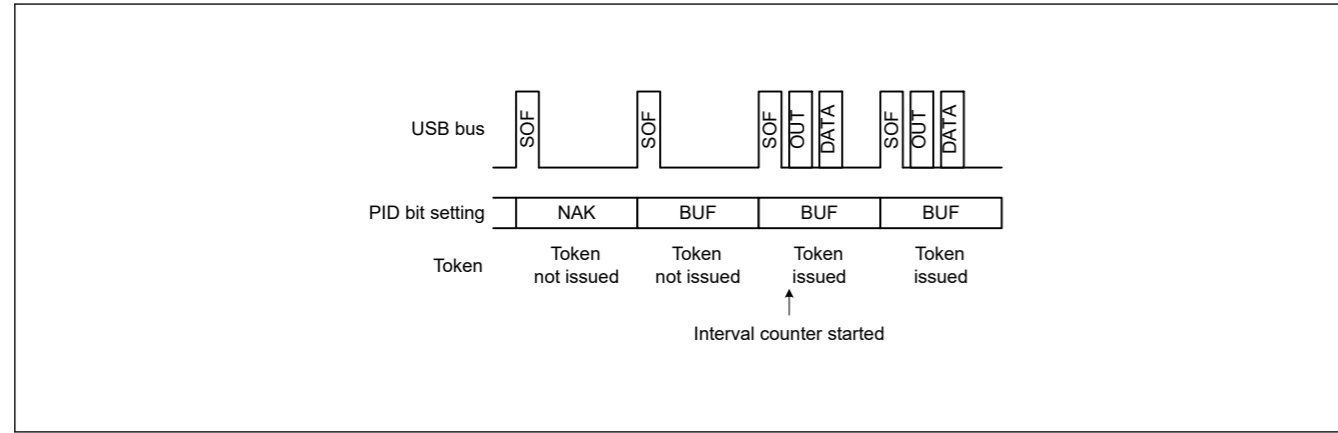

Figure 26.17 Token issuance when IITV = 0

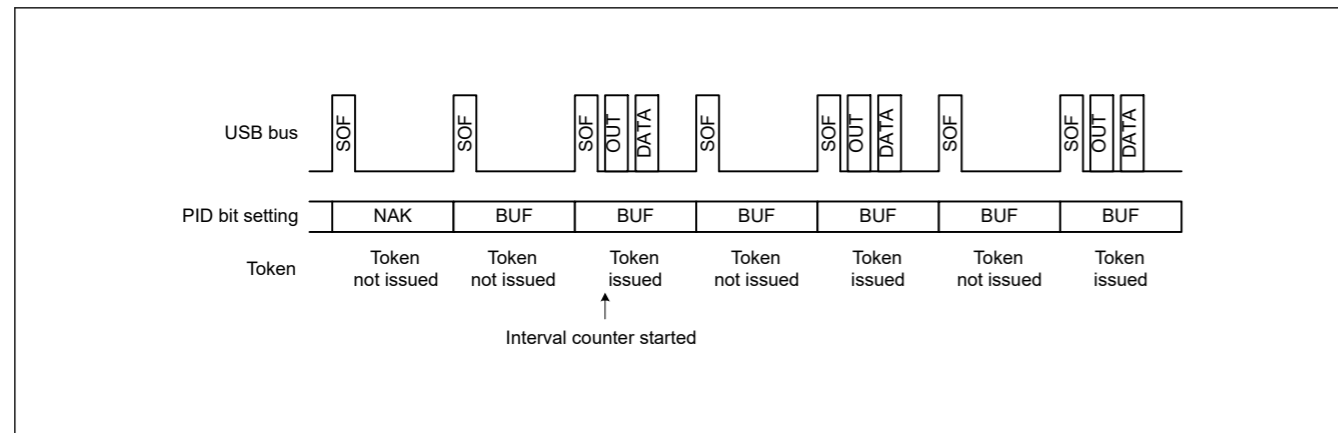

Figure 26.18 Token issuance when IITV = 1

When the selected pipe is set for isochronous transfers, the USBFS performs the following operation in addition to controlling the token issuance interval. The USBFS issues a token even when the NRDY interrupt generation condition is satisfied.

**When the selected pipe is for isochronous IN transfers**

The USBFS generates an NRDY interrupt when the USBFS issues an IN token but does not successfully receive a packet from a peripheral device (no response or packet error).

The USBFS sets the FRMNUM.OVRN bit to 1, generating an NRDY interrupt, when the time to issue an IN token occurs while the USBFS cannot receive data because the FIFO buffer is full, because the CPU or DMAC/DTC is too slow in reading data from the FIFO buffer.

**When the selected pipe is for isochronous OUT transfers**

The USBFS sets the OVRN bit to 1, generating an NRDY interrupt and transmitting a zero-length packet, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer, or because the CPU or DMAC/DTC is too slow in writing data to the FIFO buffer.

The token issuance interval is reset on any of the following conditions:

- When the USBFS is reset through a reset pin  
This initializes the IITV[2:0] bits.

(2) 主机控制器模式下的间隔计数和传输控制

USBFS根据PIPEPERI.IITV[2:0]位设置控制令牌发布操作之间的间隔。具体来说，USBFS每2个IITV帧为所选管道发布一次令牌。

USBFS在PID[1:0]位设置为的帧之后的帧开始计算令牌发布间隔BUF通过软件。

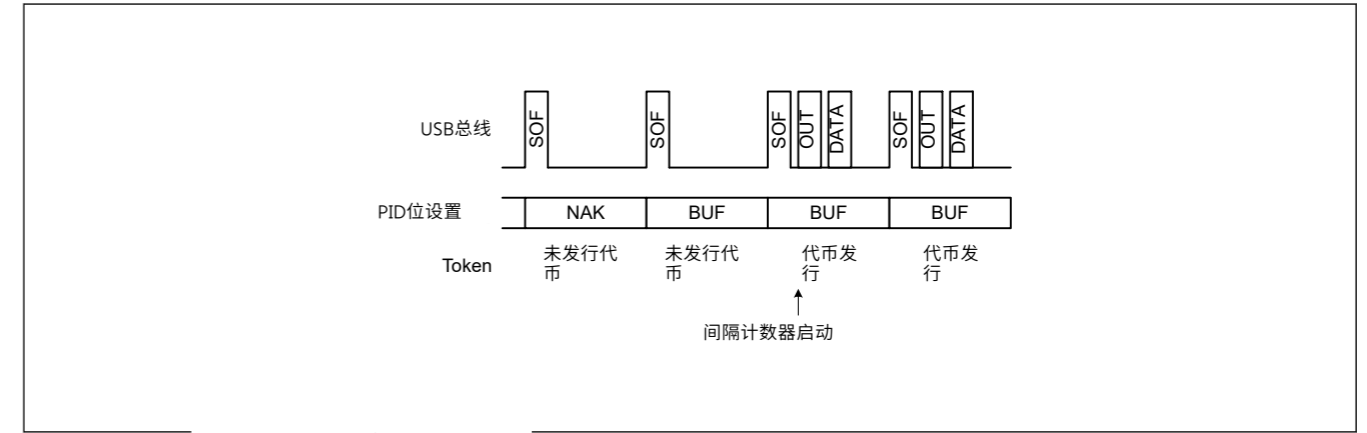

Figure 26.17 IITV=0时的代币发行

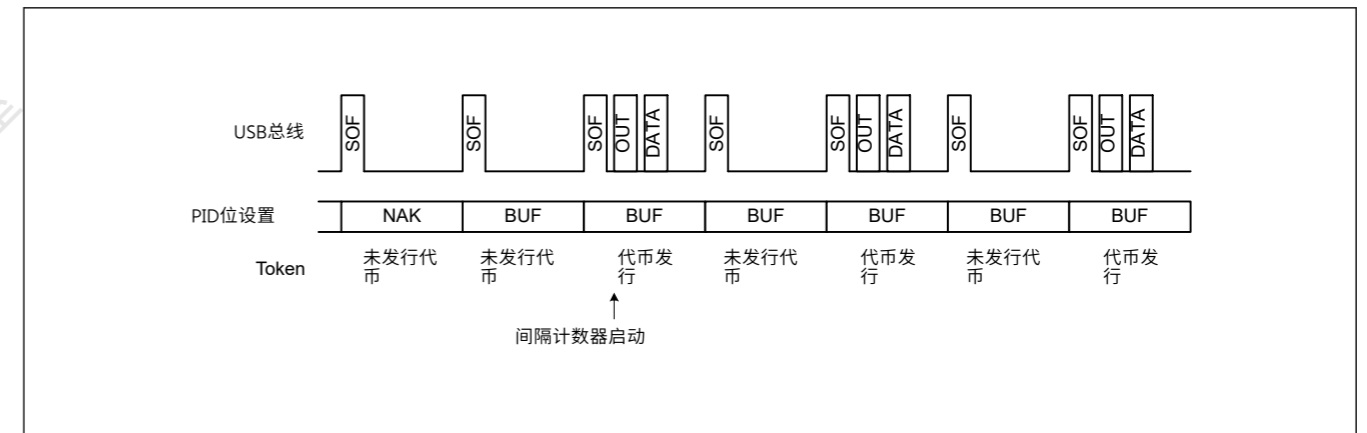

Figure 26.18 IITV=1时的代币发行

当所选管道设置为同步传输时，USBFS除了控制令牌发布间隔外，还执行以下操作。即使满足NRDY中断生成条件，USBFS也会发出令牌。

**当所选管道用于同步IN传输时**

当USBFS发出IN令牌但未成功接收到来自外围设备的数据包（无响应或数据包错误）时，USBFS会生成NRDY中断。

USBFS将FRMNUM.OVRN位设置为1，产生一个NRDY中断，此时发生发出IN令牌的时间，而USBFS无法接收数据，因为FIFO缓冲区已满，因为CPU或DMAC/DTC读取数据太慢从FIFO缓冲区。

**当所选管道用于同步OUT传输时**

USBFS将OVRN位设置为1，产生一个NRDY中断并发送一个长度为零的数据包，当发出OUT令牌的时间到来而FIFO缓冲区中没有要发送的数据时，或者因为CPU或DMAC/DTC将数据写入FIFO缓冲区太慢。

令牌发行间隔在以下任何条件下重置：

- USBFS通过复位引脚复位时  
这将初始化IITV[2:0]位。

- When the PIPEnCTR.ACLRM bit is set to 1 by software

(3) Interval counting and transfer control in device controller mode

**When the selected pipe is for isochronous OUT transfers**

The USBFS generates an NRDY interrupt when it fails to receive a data packet within the interval set in the PIPEPERI.IITV[2:0] bits.

The USBFS also generates an NRDY interrupt when it fails to receive data because of a CRC error or other errors contained in the data packet or because the FIFO buffer is full.

The NRDY interrupt is generated on SOF packet reception. Even if the SOF packet is corrupted, internal interpolation allows the interrupt to be generated when the SOF packet is received. However, when the IITV bits are set to a value other than 0, the USBFS generates an NRDY interrupt on receiving an SOF packet for every interval after interval counting starts.

When the PID[1:0] bits are set to NAK by software after starting the interval timer, the USBFS does not generate an NRDY interrupt on receiving an SOF packet.

The timing for starting interval counting depend on the IITV[2:0] setting as follows:

- When the IITV[2:0] bits = 0:
  - Interval counting starts at the next frame after the software changes the PID[1:0] bits of the selected pipe to BUF.
- When the IITV[2:0] bits ≠ 0:
  - Interval counting starts on completion of successful reception of the first data packet after the PID[1:0] bits for the selected pipe are changed to BUF.

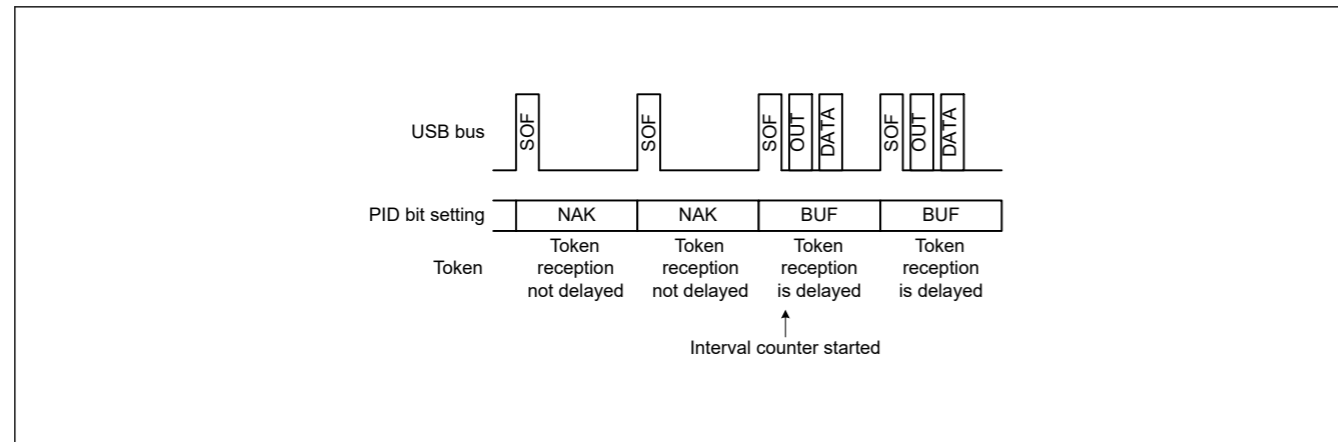

Figure 26.19 Relationship between frames and expected token reception when IITV[2:0] = 0

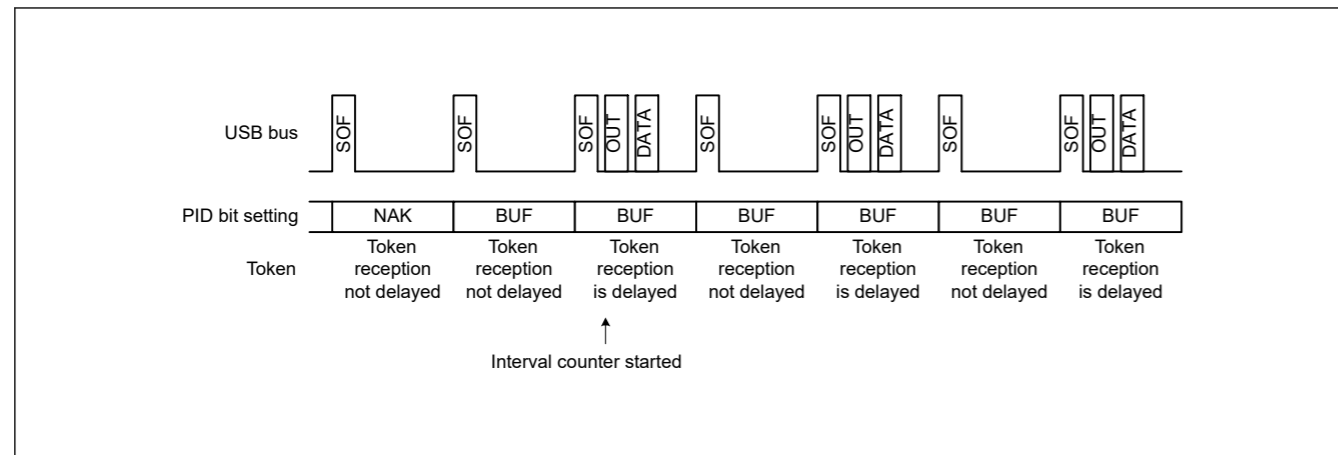

Figure 26.20 Relationship between frames and expected token reception when IITV[2:0] ≠ 0

- PIPEnCTR.ACLRM位由软件设置为1时

(3) 设备控制器模式下的间隔计数和传输控制

**当所选管道用于同步OUT传输时**

当USBFS在设置的时间间隔内没有接收到数据包时，会产生一个NRDY中断。PIPEPERI.IITV[2:0] bits.

当由于数据包中包含的CRC错误或其他错误或FIFO缓冲区已满而无法接收数据时，USBFS也会产生NRDY中断。

NRDY中断在SOF数据包接收时产生。即使SOF数据包损坏，内部插值也允许在接收到SOF数据包时产生中断。但是，当IITV位设置为0以外的值时，USBFS会在间隔计数开始后的每个间隔接收到SOF数据包时产生NRDY中断。

当PID[1:0]位在启动间隔定时器后被软件设置为NAK时，USBFS在接收到SOF数据包时不会产生NRDY中断。

开始间隔计数的时间取决于IITV[2:0]设置，如下所示：

- 当IITV[2:0]位=0时：
  - 软件将所选管道的PID[1:0]位更改为BUF后，间隔计数从下一帧开始。
- 当IITV[2:0]位≠0时：
  - 在所选管道的PID[1:0]位更改为BUF后，成功接收第一个数据包后，间隔计数开始。

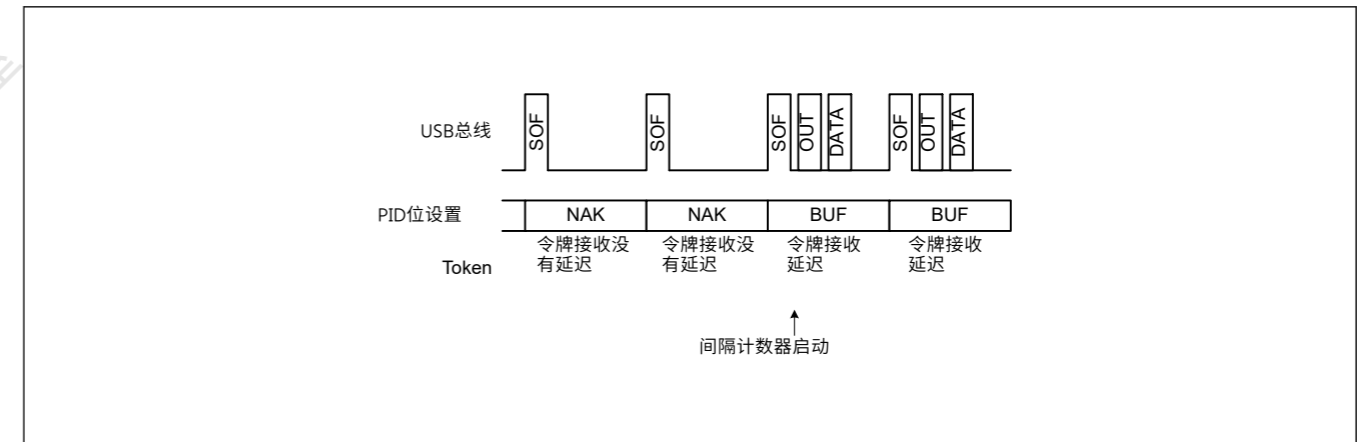

Figure 26.19 IITV[2:0]=0时帧与预期令牌接收之间的关系

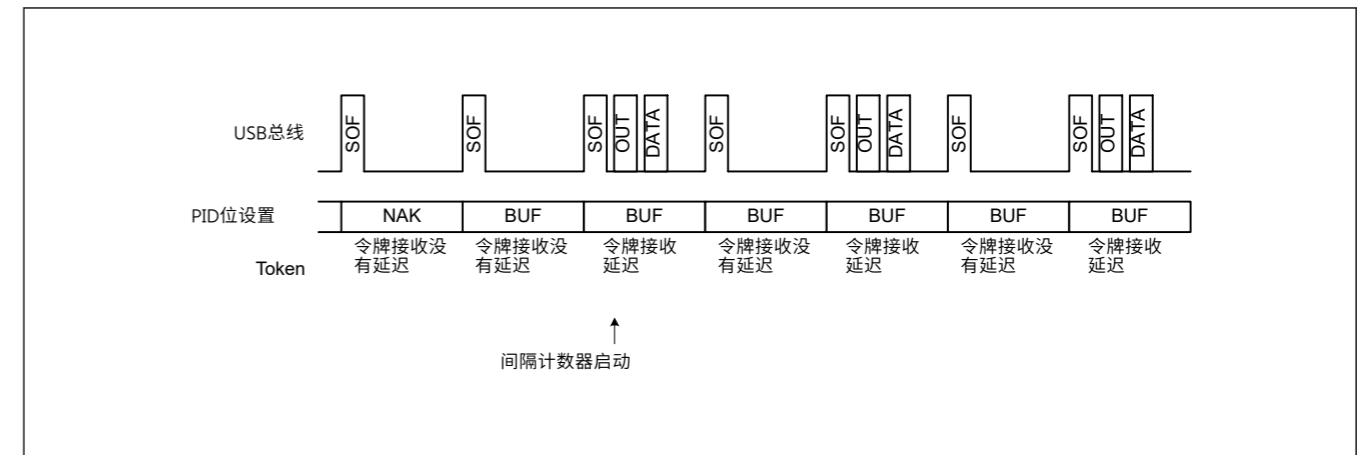

Figure 26.20 IITV[2:0]≠0时帧与预期令牌接收的关系

**When the selected pipe is for isochronous IN transfers**

The PIPEPERI.IFIS bit must be 1 for this use case. When IFIS = 0, the USBFS transmits a data packet in response to a received IN token regardless of the PIPEPERI.IITV[2:0] setting.

When IFIS is 1 and there is data to be transmitted in the FIFO buffer, the USBFS clears the FIFO buffer when it fails to receive an IN token in the frame at the interval set in the IITV[2:0] bits.

The USBFS also clears the FIFO buffer when it fails to receive an IN token successfully because of a bus error, such as a CRC error, contained in the IN token.

The FIFO buffer is cleared on SOF packet reception. Even if the SOF packet is corrupted, the internal interpolation allows the FIFO buffer to be cleared when the SOF packet is received.

The timing to start interval counting depends on the IITV[2:0] setting, as with OUT transfers.

The interval is counted on any of the following conditions in device controller mode:

- When a hardware reset is applied to the USBFS (which also sets the IITV[2:0] bits to 000b)
- When the PIPEnCTR.ACLRM bit is set to 1 by software
- When the USBFS detects a USB bus reset

**(4) Transmit data setup for isochronous transfers in device controller mode**

With isochronous data transmission using the USBFS in device controller mode, after data is written to the FIFO buffer, a data packet can be transmitted in the first frame after the SOF packet is detected. This isochronous transfer transmit data setup function can identify the frame that started transmission.

When the double buffering is used, transmission is only enabled for the buffer where data writing was completed first, even after the data write to both buffers is complete. Accordingly, even if multiple IN tokens are received, only the one packet of FIFO buffer data is transmitted.

When the FIFO buffer is ready to transmit data when an IN token is received, the data is transferred and a normal response is returned. However, if the FIFO buffer cannot transmit data, a zero-length packet is transmitted and an underrun error occurs.

Figure 26.21 shows an example transmission using the isochronous transfer transmission data setup function when IITV = 0 (every frame) is set.

**当所选管道用于同步IN传输时**

对于此用例，PIPEPERI.IFIS位必须为1。当IFIS=0时，无论PIPEPERI.IITV[2:0]设置如何，USBFS都会发送一个数据包以响应接收到的IN令牌。

当IFIS为1且FIFO缓冲区中有数据要发送时，如果USBFS在IITV[2:0]位设置的时间间隔内未能接收到帧中的IN令牌，则清除FIFO缓冲区。

当USBFS由于总线错误（例如CRC错误，包含在IN令牌中。

FIFO缓冲区在SOF数据包接收时被清除。即使SOF数据包损坏，内部插值也允许在接收到SOF数据包时清除FIFO缓冲区。

开始间隔计数的时间取决于IITV[2:0]设置，与OUT传输一样。

在设备控制器模式下，根据以下任何条件计算间隔：

- 当对USBFS应用硬件复位时（也将IITV[2:0]位设置为000b）
- PIPEnCTR.ACLRM位由软件设置为1时
- 当USBFS检测到USB总线复位时

**(4) 设备控制器模式下同步传输的传输数据设置**

在设备控制器模式下使用USBFS进行同步数据传输，数据写入FIFO缓冲区后，可在检测到SOF包后的第一帧发送数据包。此同步传输传输数据设置功能可以识别开始传输的帧。

使用双缓冲时，仅对先完成数据写入的缓冲区启用传输，即使在两个缓冲区的数据写入完成后也是如此。因此，即使接收到多个IN令牌，也仅发送一包FIFO缓冲器数据。

当接收到IN令牌时，当FIFO缓冲区准备好传输数据时，将传输数据并返回正常响应。但是，如果FIFO缓冲区无法传输数据，则会传输零长度数据包并发生欠载错误。

图26.21显示了在设置IITV=0（每帧）时使用同步传输传输数据设置功能的示例传输。

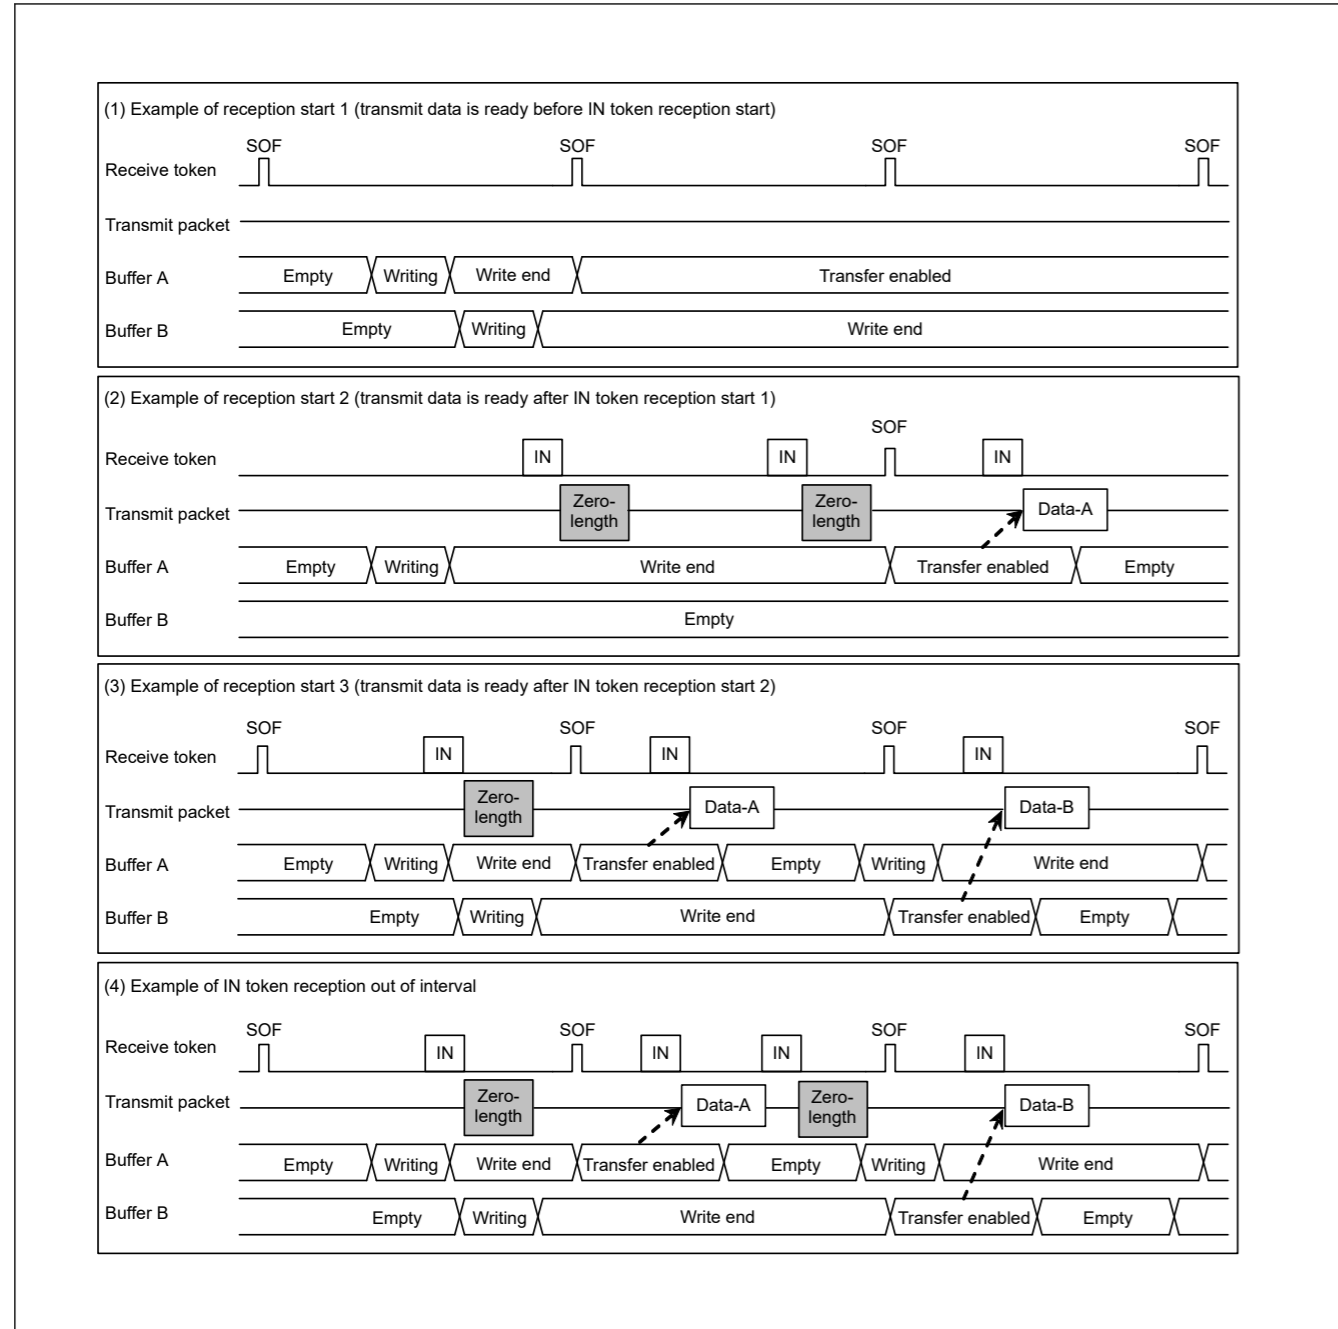

Figure 26.21 Example data setup operation

(5) Transmit buffer flush for isochronous transfers in device controller mode

In device controller mode during isochronous data transmission, if the USBFS receives an SOF packet for the next frame without receiving an IN token in the interval frame, it operates as if the IN token is corrupt and clears the buffer that is enabled for transmission, putting that buffer in the writing enabled state.

When double buffering is used and writing to both buffers is complete, the cleared FIFO buffer is assumed to be the one where the data was transmitted in the interval frame, and transmission is enabled for the FIFO buffer that was not cleared on SOF packet reception.

The timing of the buffer flush function depends on the PIPEPERL.IITV[2:0] setting as follows:

- When IITV = 0:  
The buffer flush operation starts from the first frame after the pipe is enabled.
- When IITV ≠ 0:  
The buffer flush operation starts after the first normal transaction.

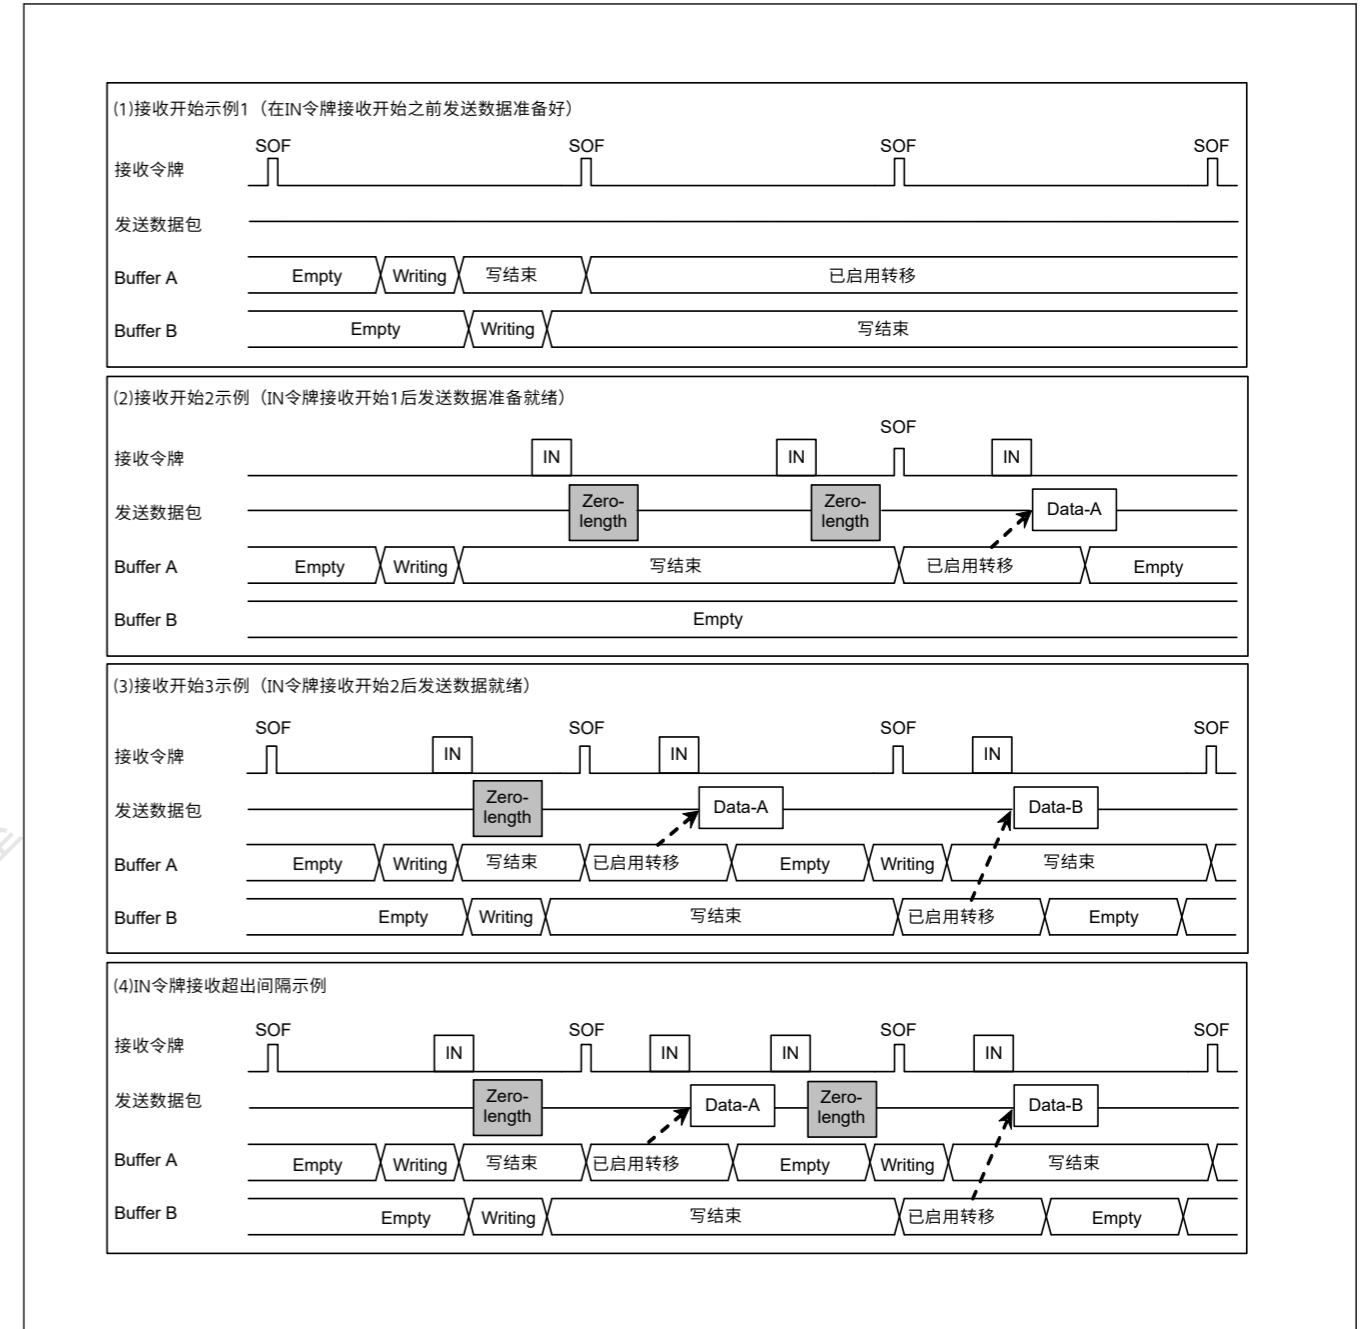

Figure 26.21 示例数据设置操作

(5) 设备控制器模式下同步传输的传输缓冲区刷新

在同步数据传输期间的设备控制器模式下，如果USBFS接收到下一帧的SOF数据包，而在间隔帧中没有接收到IN令牌，则它会像IN令牌损坏一样操作并清除启用传输的缓冲区，将该缓冲区处于写入启用状态。

当使用双缓冲并完成对两个缓冲区的写入时，已清除的FIFO缓冲区被假定为在间隔帧中传输数据的缓冲区，并为接收SOF数据包时未清除的FIFO缓冲区启用传输。

缓冲区刷新功能的时间取决于PIPEPERL.IITV[2:0]设置，如下所示：

- When IITV = 0:  
缓冲区刷新操作从启用管道后的第一帧开始。
- When IITV ≠ 0:  
缓冲区刷新操作在第一个正常事务之后开始。

Figure 26.22 shows an example buffer flush. When an unanticipated token is received before the interval frame, the USBFS sends the write data or a zero-length packet as an underrun error, depending on the data setup status.

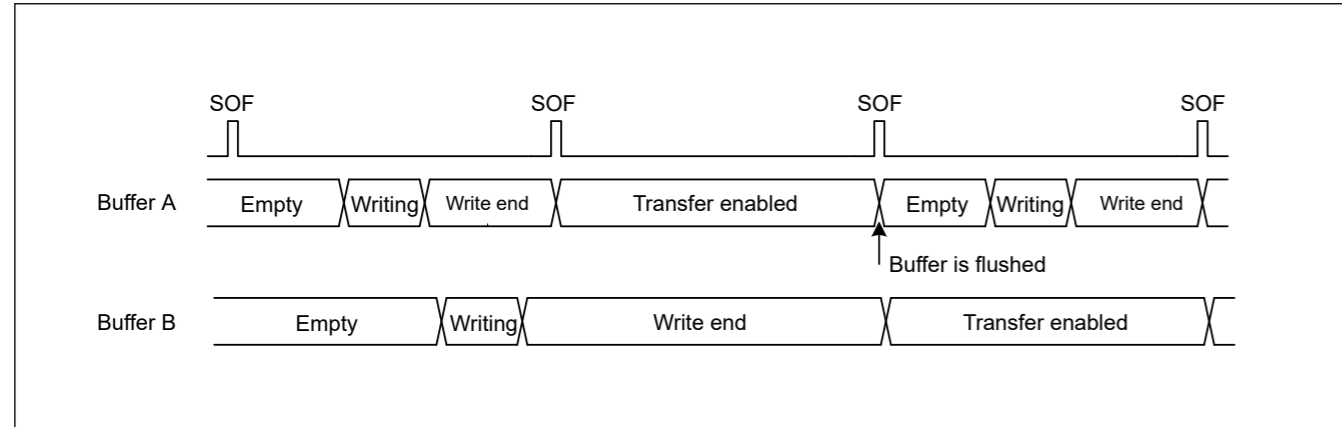

Figure 26.22 Example buffer flush operation

Figure 26.23 shows an example interval error occurrence. There are five types of interval errors, as shown in the figure. An interval error occurs at timing (A), and the buffer flush function is activated.

If an interval error occurs during an IN transfer, the buffer flush function is activated. If it occurs during an OUT transfer, an NRDY interrupt is generated. Use the FRMNUM.OVRN bit to distinguish between this and NRDY interrupts triggered by received packet errors and overrun errors.

For tokens that are shaded in the figure, responses are returned based on the FIFO buffer status.

- IN direction:
  - If the buffer is ready to transfer data, the data is transferred and a normal response is returned
  - If the buffer is not ready to transfer data, a zero-length packet is transmitted and an underrun error occurs
- OUT direction:
  - If the buffer is ready to receive data, the data is received and a normal response is returned
  - If the buffer is not ready to receive data, the received data is discarded and an overrun error occurs

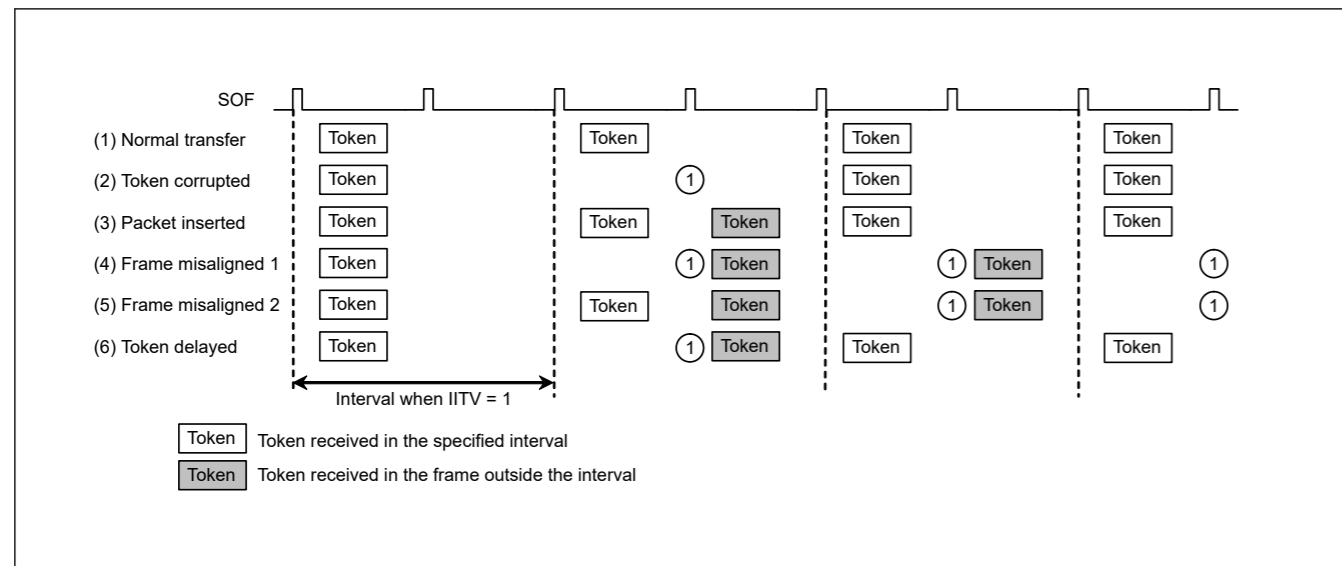

Figure 26.23 Example interval error occurrence when IITV = 1

### 26.3.13 SOF Interpolation Function

In device controller mode, if packet reception is disabled at intervals of 1 ms because the SOF packet is corrupted or missing, the USBFS interpolates the SOF. SOF interpolation begins when the USBE and SCKE bits in SYSCFG are set to 1 and an SOF packet is received.

图26.22显示了一个示例缓冲区刷新。当在间隔帧之前接收到意外令牌时，USBFS将根据数据设置状态发送写数据或零长度数据包作为欠载错误。

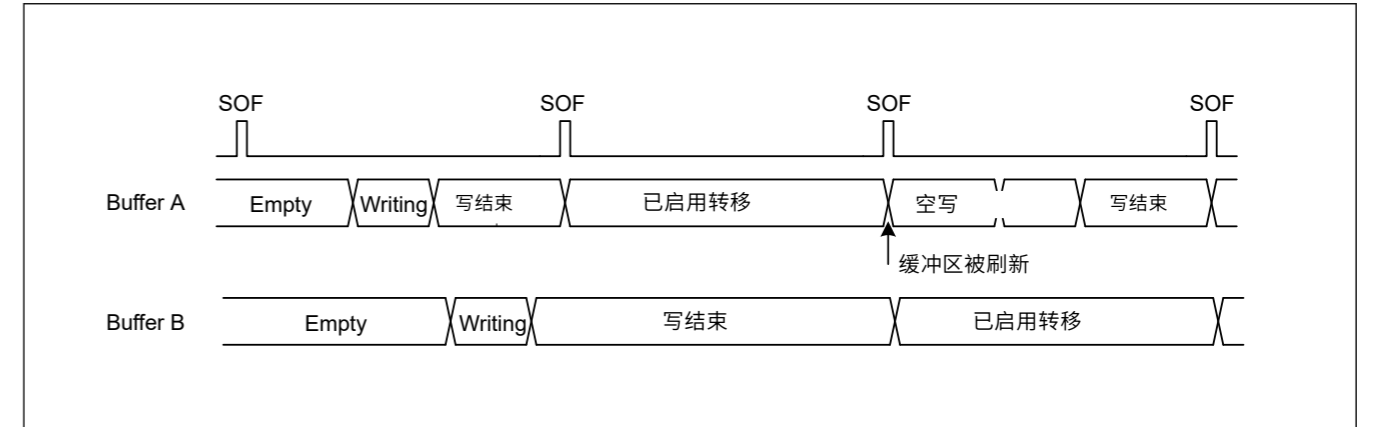

Figure 26.22 缓冲区刷新操作示例

图26.23显示了一个发生间隔错误的示例。如图所示，有五种区间误差。在时间 (A) 发生间隔错误，缓冲刷新功能被激活。

如果在IN传输期间发生间隔错误，则会激活缓冲区刷新功能。如果它发生在OUT传输期间，则NRDY中断产生。使用FRMNUM.OVRN位来区分此中断和由接收数据包错误和溢出错误触发的NRDY中断。

对于图中带阴影的令牌，根据FIFO缓冲区状态返回响应。

- IN direction:
  - 如果缓冲区准备好传输数据，则传输数据并返回正常响应
  - 如果缓冲区未准备好传输数据，则传输零长度数据包并发生欠载错误
- OUT direction:
  - 如果缓冲区准备好接收数据，则接收数据并返回正常响应
  - 如果缓冲区没有准备好接收数据，则丢弃接收到的数据并发生溢出错误

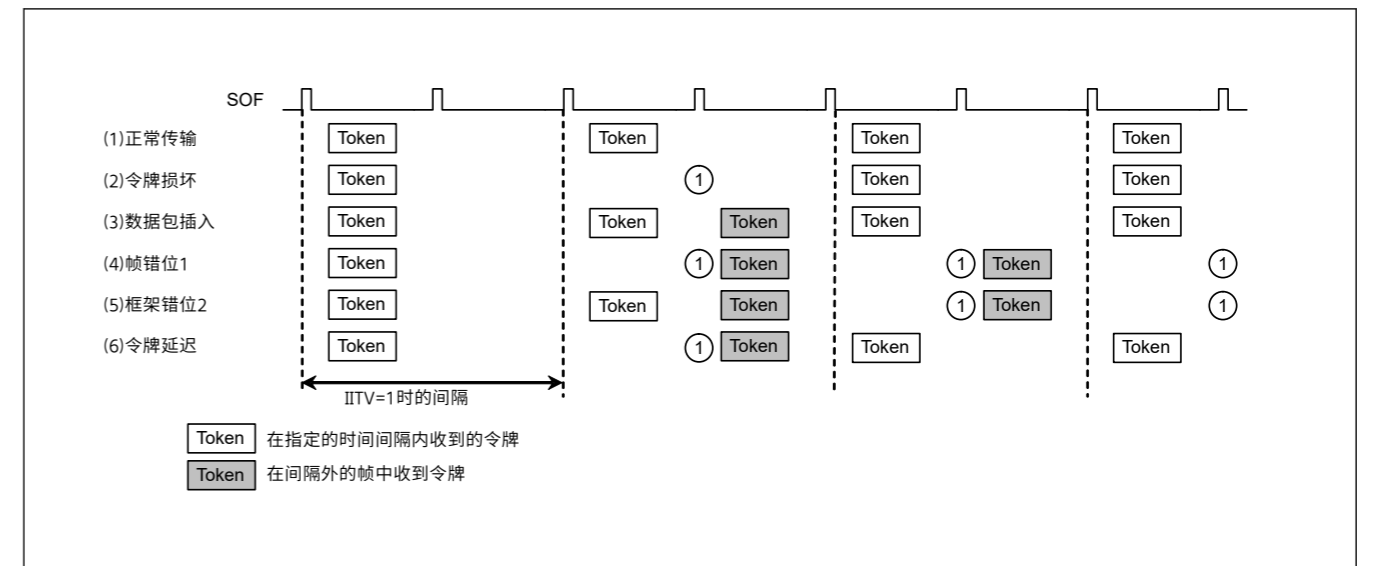

Figure 26.23 IITV=1时发生的示例间隔错误

### 26.3.13 SOF插值函数

在设备控制器模式下，如果由于SOF数据包损坏或丢失而每隔1ms禁用数据包接收，则USBFS会内插SOF。当SYSCFG中的USBE和SCKE位设置为1并且接收到SOF数据包时，SOF内插开始。

The interpolation function is initialized under the following conditions:

- MCU reset
- USB bus reset
- Suspend state detection

The SOF interpolation operates as follows:

- The interpolation function is not activated until an SOF packet is received
- When the first SOF packet is received, interpolation is performed by counting 1 ms on the 48-MHz internal clock
- When the second and subsequent SOF packets are received, interpolation is performed at the previous reception interval
- Interpolation is not performed in the Suspend state or on reception of a USB bus reset

The USBFS supports the following functions controlled by SOF packet reception. These functions operate normally with SOF interpolation if the SOF packet is missing:

- Updating of the frame number
- SOFR interrupt timing
- Isochronous transfer interval count

If an SOF packet is missing during full-speed operation, the FRMNUM.FRNM[10:0] bits are not updated.

### 26.3.14 Pipe Schedule

#### 26.3.14.1 Conditions for generating transactions

In host controller mode and when the DVSTCTR0.UACT bit is set to 1, the USBFS generates transactions under the conditions shown in Table 26.29.

Table 26.29 Conditions for generating transactions

| Transaction  | Conditions for generation |     |         |                      |           |
|--|---------------------------|-----|---------|----------------------|-----------|
|  | DIR                       | PID | IITV0   | Buffer state         | SUREQ     |
| Setup  | —*1                       | —*1 | —*1     | —*1                  | 1 setting |
| Control transfer data stage, status stage, bulk transfer | IN                        | BUF | Invalid | Receive area exists  | —*1       |
|  | OUT                       | BUF | Invalid | Transmit data exists | —*1       |
| Interrupt transfer                                       | IN                        | BUF | Valid   | Receive area exists  | —*1       |
|  | OUT                       | BUF | Valid   | Transmit data exists | —*1       |
| Isochronous transfer                                     | IN                        | BUF | Valid   | *2                   | —*1       |
|  | OUT                       | BUF | Valid   | *3                   | —*1       |

Note 1. An em dash (—) in the table indicates that the condition is unrelated to the generating of tokens. "Valid" indicates that, for interrupt transfers and isochronous transfers, a transaction is generated only in transfer frames that are based on the interval counter. "Invalid" indicates that a transaction is generated regardless of the interval counter.

Note 2. This indicates that a transaction is generated regardless of whether there is a receive area. If there is no receive area, however, the received data is discarded.

Note 3. This indicates that a transaction is generated regardless of whether there is any data to be transmitted. If there is no data to be transmitted, however, a zero-length packet is transmitted.

#### 26.3.14.2 Transfer schedule

This section describes the transfer scheduling within a frame of the USBFS. After the USBFS sends an SOF, the transfer is carried out in the following sequence:

1. Execution of periodic transfers:

插值函数在以下条件下初始化:

- MCU reset
- USB总线复位
- 暂停状态检测

SOF插值操作如下:

- 直到收到SOF数据包才激活插值功能
- 当接收到第一个SOF数据包时, 通过在48-MHz内部时钟上计数1ms执行插值
- 当接收到第二个和后续的SOF数据包时, 按照之前的接收间隔进行插值
- 在挂起状态或接收到USB总线复位时不执行插值

USBFS支持以下由SOF数据包接收控制的功能。这些功能正常运行如果SOF数据包丢失, 则SOF插值:

- 更新帧号
- SOFR中断时序
- 同步传输间隔计数

如果在全速运行期间丢失SOF数据包, 则不会更新FRMNUM.FRNM[10:0]位。

### 26.3.14 管道计划

#### 26.3.14.1 产生交易的条件

在主机控制器模式下, 当DVSTCTR0.UACT位设置为1时, USBFS在表26.29所示的条件下生成事务。

Table 26.29 产生交易的条件

| Transaction          | 生成条件 |     |         |        |           |
|----------------------|------|-----|---------|--------|-----------|
|                      | DIR  | PID | IITV0   | 缓冲状态   | SUREQ     |
| Setup                | —*1  | —*1 | —*1     | —*1    | 1 setting |
| 控制传输数据阶段、状态阶段、批量传输   | IN   | BUF | Invalid | 接收区存在  | —*1       |
|                      | OUT  | BUF | Invalid | 传输数据存在 | —*1       |
| 中断传输                 | IN   | BUF | Valid   | 接收区存在  | —*1       |
|                      | OUT  | BUF | Valid   | 传输数据存在 | —*1       |
| Isochronous transfer | IN   | BUF | Valid   | *2     | —*1       |
|                      | OUT  | BUF | Valid   | *3     | —*1       |

注1.表中的破折号(—)表示该条件与令牌的生成无关。“有效”表示, 对于中断传输和同步传输, 事务仅在基于间隔计数器的传输帧中生成。“无效”表示无论间隔计数器如何都生成事务。

注2.这表示无论是否有接收区域, 都会生成一个事务。但是, 如果没有接收区域, 则丢弃接收到的数据。

注3.这表示无论是否有任何数据要传输, 都会产生交易。然而, 如果没有要传输的数据, 则传输零长度数据包。

#### 26.3.14.2 转移时间表

本节介绍USBFS帧内的传输调度。USBFS发送SOF后, 按以下顺序进行传输:

- 1.定期转账的执行:

A pipe is searched for in the order of pipe 1 → pipe 2 → pipe 6 → pipe 7 → pipe 8 → pipe 9, and then if there is a pipe for which an isochronous or interrupt transfer transaction can be generated, the transaction is generated.

## 2. Setup transactions for control transfers:

The DCP is checked, and if a setup transaction is possible, it is sent.

## 3. Execution of bulk transfers, control transfer data stages, and control transfer status stages:

A pipe is searched for in the order of DCP → pipe 1 → pipe 2 → pipe 3 → pipe 4 → pipe 5, and then if there is a pipe for which a transaction for a bulk transfer, a control transfer data stage, or a control transfer status stage can be generated, the transaction is generated.

When a transaction is generated, processing moves to the next pipe transaction regardless of whether the response from the peripheral device is ACK or NAK. If there is time for transfer within the frame, step 3 is repeated.

### 26.3.14.3 Enabling USB communication

Setting the DVSTCR0.UACT bit to 1 initiates an SOF transmission, and transaction generation is enabled. Setting the UACT bit to 0 stops SOF transmission and the Suspend state is invoked. If the UACT setting is changed from 1 to 0, processing stops after the next SOF is sent.

### 26.3.15 Battery Charging Detection Processing

The USBFS provides control over the data contact detection processing (D+ line contact checking), primary detection processing (charger detection processing), and secondary detection processing (charger determination processing) as defined in the Battery Charging Specification.

#### 26.3.15.1 Processing in device controller mode

To operate a function device as a battery charging portable device:

1. Start primary detection processing after detecting contact with the D+ and D- lines. The Battery Charging Specification describes two processing methods for Data Contact Detection. The USBFS supports both methods as follows:
  - Software processing
 

After a VBINT interrupt or polling of the VBSTS flag indicates a change in the state of the USBFS\_VBUS input pin, software controls a wait from 300 to 900 ms. The BCCTRL1.VDPSRCE and CHGDETE bits are then both set to 1 to start primary detection processing.
  - Hardware Processing
 

Apply 7 to 13  $\mu$ A of current to the D+ line to hold the D+ line at the logical high level. This is done to detect the D+ and D- lines going to the logical low level because of pull-down resistors on the host device side when the D+ and D- lines come in contact with those of the host. Monitor the SYSSTS0.LNST[1:0] flags while the PHYSECTRL.CNEN bit, BCCTRL1.RPDME and IDPSRCE bit are set to 1 to see when the level on the D+ line changes from high to low. After detecting a low level on the D+ line, clear the PHYSECTRL.CNEN bit, BCCTRL1.RPDME and IDPSRCE bit to 0 and set both the BCCTRL1.VDPSRCE and CHGDETE bits to 1 to start primary detection processing. The VDPSRCE and CHGDETE bits must be set to 1 simultaneously.
2. After the start of primary detection processing followed by a software-controlled wait of 40 ms, check the BCCTRL1.CHGDETSTS flag. A value of 1 indicates detection of a charger, and secondary detection processing starts.\*1
3. To start secondary detection processing, clear the BCCTRL1.VDPSRCE bit to 0, then clear the BCCTRL1.CHGDETE bits to 0 after a software-controlled wait of 20 ms. Next, set both the BCCTRL1.VDMSRCE and PDDETE bits to 1.
4. After the start of secondary detection processing followed by a software-controlled wait of 40 ms, check the BCCTRL1.PDDETSTS flag, and determine the result of the secondary detection processing.

Note 1. In primary detection processing, detection of a voltage above the range from 0.25 to 0.4 V and below the range from 0.8 to 2.0 V on the D-Line indicates that the other device is a host device that supports battery charging (charging downstream port). The BCCTRL1.CHGDETSTS flag in the PHY block only indicates whether the voltage on the D-line is higher than the range from 0.25 to 0.4 V, so add processing as required to read the SYSSTS0.LNST[1:0] flags and confirm that the voltage on the D- line is also below the range from 0.8 to 2.0 V.

Figure 26.24 shows the process flow.

按照管道1→管道2→管道6→管道7→管道8→管道9的顺序查找管道，如果有管道可以生成等时或中断传输事务，则生成事务。

## 2.为控制转移设置交易:

DCP被检查，如果设置事务是可能的，它被发送。

## 3、批量传输、控制传输数据阶段、控制传输状态阶段的执行:

按照DCP→管道1→管道2→管道3→管道4→管道5的顺序搜索管道，然后如果有管道需要进行批量传输、控制传输数据阶段或可以生成控制转移状态阶段，生成事务。

生成事务时，无论来自外围设备的响应是ACK还是NAK，处理都会转移到下一个管道事务。如果帧内有时间进行传输，则重复步骤3。

### 26.3.14.3 启用USB通信

将DVSTCR0.UACT位设置为1启动SOF传输，并启用事务生成。设置UACT位为0停止SOF传输并调用暂停状态。如果UACT设置从1更改为0，则在发送下一个SOF后处理停止。

### 26.3.15 电池充电检测处理

USBFS提供对电池充电规范中定义的数据接触检测处理 (D+线路接触检查)、一次检测处理 (充电器检测处理) 和二次检测处理 (充电器确定处理) 的控制。

#### 26.3.15.1 设备控制器模式下的处理

将功能设备作为电池充电便携式设备操作:

1.检测到与D+和Dlines的接触后开始初级检测处理。电池充电规范描述了数据接触检测的两种处理方法。USBFS支持以下两种方法:

##### ●软件处理

在VBINT中断或VBSTS标志的轮询指示USBFS\_VBUS输入引脚的状态发生变化后，软件控制从300到900ms的等待。然后将BCCTRL1.VDPSRCE和CHGDETE位都设置为1以启动主要检测处理。

##### ●硬件处理

向D+线施加7到13 $\mu$ A的电流，以将D+线保持在逻辑高电平。这样做是为了检测D+和Dlines进入逻辑低电平，因为当D+和Dlines与主机的那些接触时，由于主机设备侧的下拉电阻器。在PHYSECTRL.CNEN位、BCCTRL1.RPDME和IDPSRCE位设置为1时监控SYSSTS0.LNST[1:0]标志，以查看D+线上的电平何时从高变为低。检测到D+线上的低电平后，将PHYSECTRL.CNEN位、BCCTRL1.RPDME和IDPSRCE位清除为0，并将BCCTRL1.VDPSRCE和CHGDETE位都设置为1，以启动初级检测处理。VDPSRCE和CHGDETE位必须同时设置为1。

2.主要检测处理开始后，软件控制等待40毫秒后，检查

BCCTRL1.CHGDETSTS标志。值为1表示检测到充电器，并开始二次检测处理。\*1

3.要启动二次检测处理，将BCCTRL1.VDPSRCE位清零，然后在软件控制的20ms等待后将BCCTRL1.CHGDETE位清零。接下来，将BCCTRL1.VDMSRCE和PDDETE位都设置为1。

4.二次检测处理开始后，软件控制等待40ms，检查BCCTRL1.PDDETSTS标志，确定二次检测处理的结果。

注1.在初级检测处理中，在D-Line上检测到高于0.25至0.4V范围且低于0.8至2.0V范围的电压表示其他设备是支持电池充电的主机设备 (充电下游港口)。PHY模块中的BCCTRL1.CHGDETSTS标志位仅指示Dline上的电压是否高于0.25到0.4V的范围，因此根据需要添加处理以读取SYSSTS0.LNST[1:0]标志位并确认电压Dline上的电压也低于0.8至2.0V的范围。

图26.24显示了处理流程。

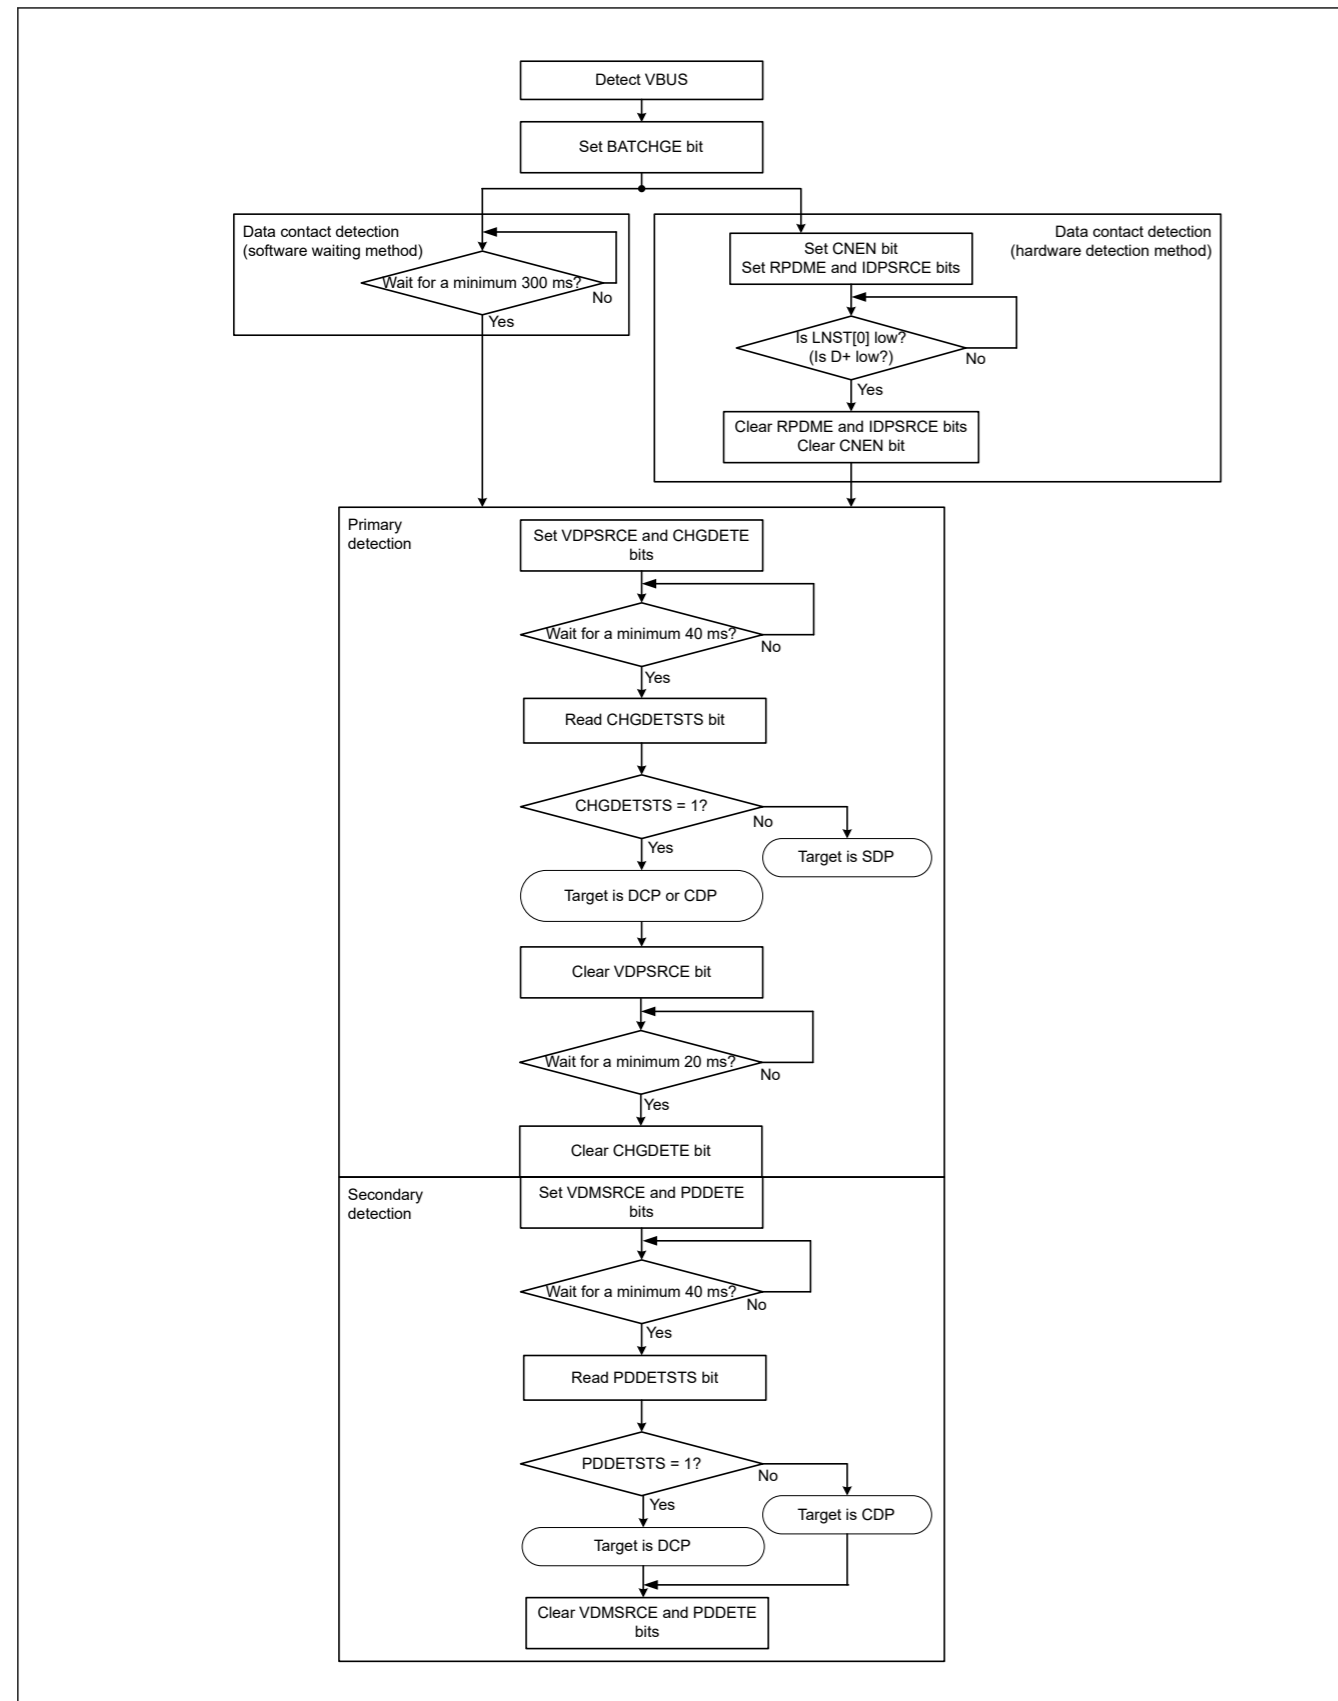

Figure 26.24 Processing flow as portable device

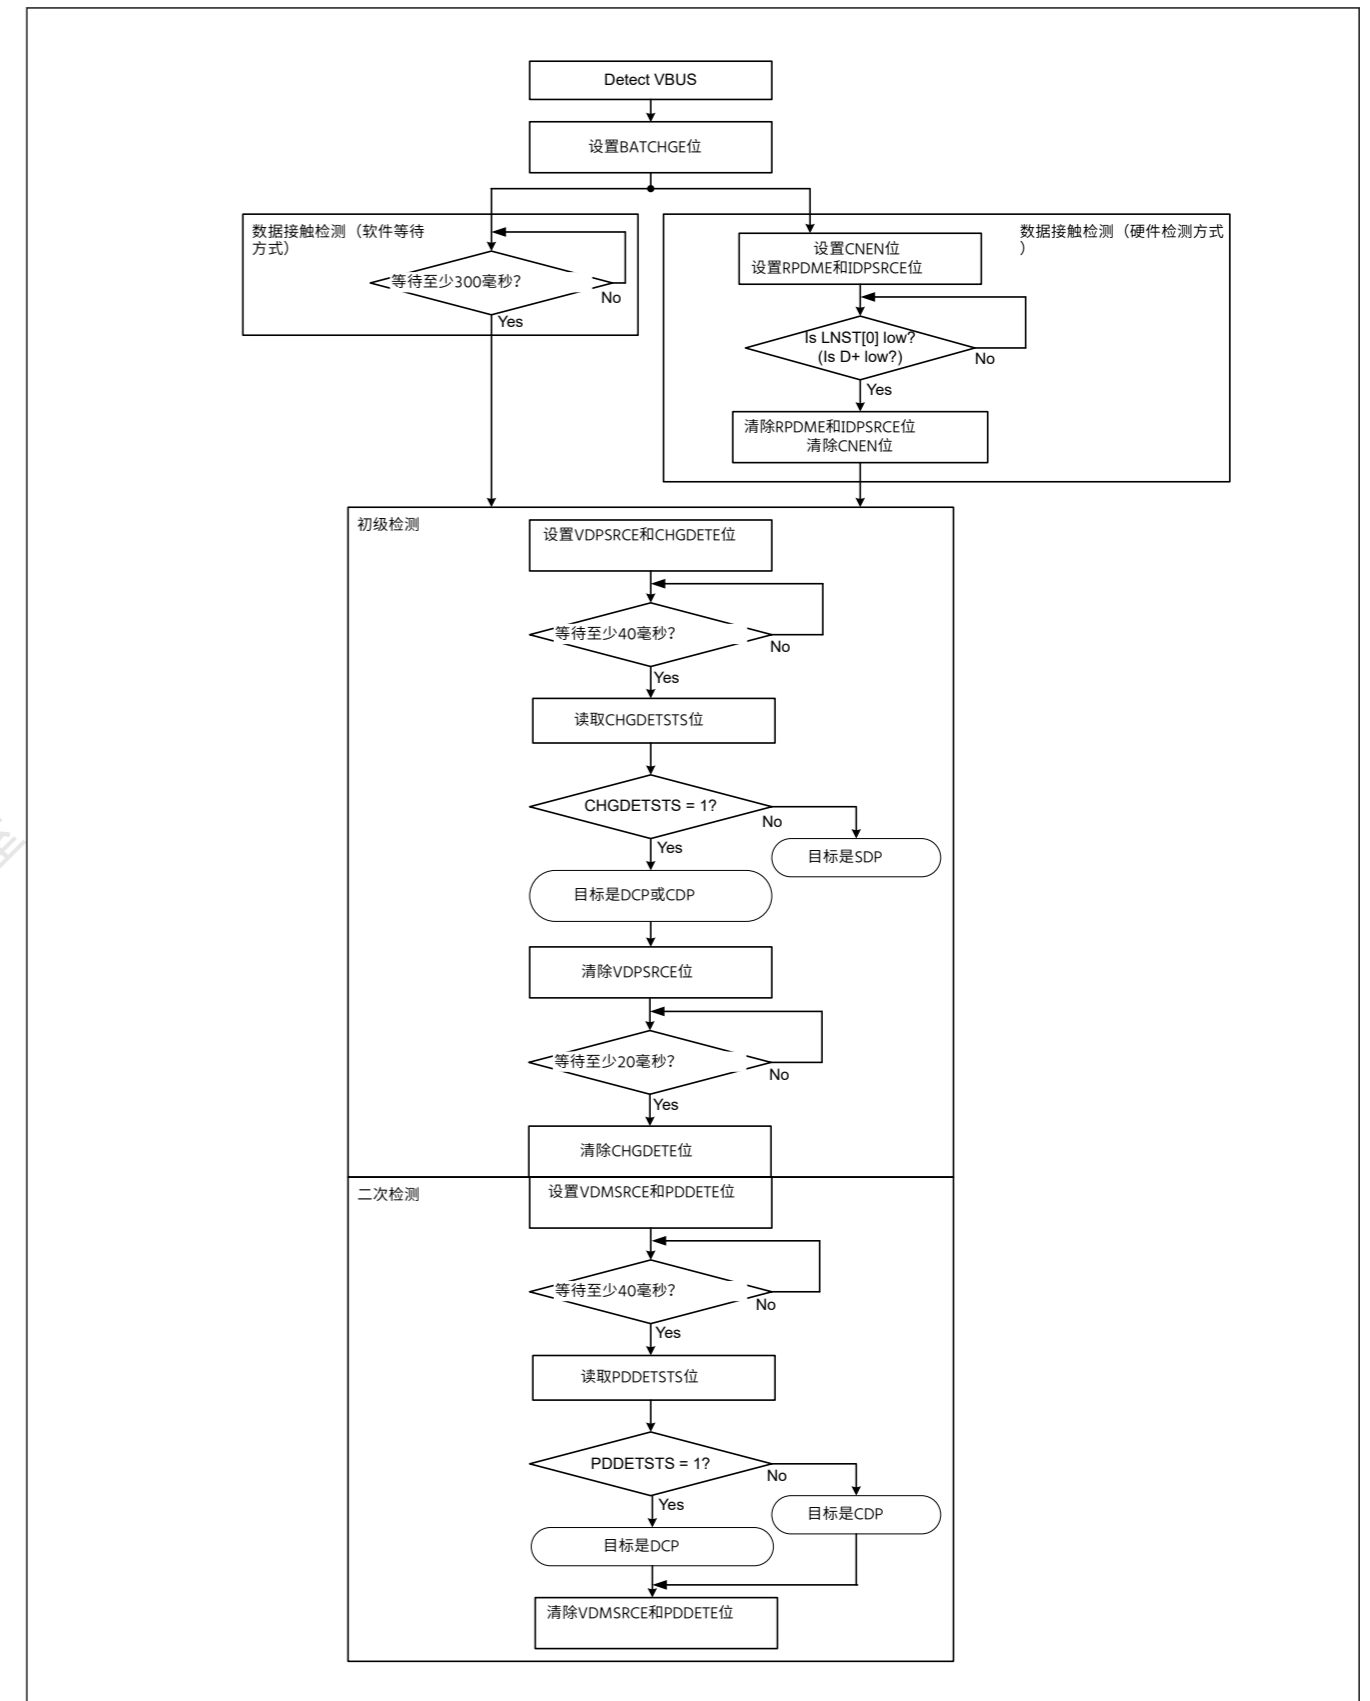

Figure 26.24 作为便携式设备的处理流程

### 26.3.15.2 Processing in host controller mode

In host controller mode, driving the D- line is required for a portable device to perform primary detection. The USBFS supports the following two primary detection methods:

#### When using the Portable Device detection function

The D- line is driven when a Portable Device is detected.

1. Start driving the VBUS.
2. Set the BCCTRL1.PDDETE bit to 1 to enable the portable device detection circuit.
3. Monitor the portable device detection signal and start driving the D- line when the level of the portable device detection signal is high.\*1
4. Stop driving the D- line when the portable device detection signal is at the low level.\*1

Note 1. The PDDTINT interrupt indicates a change in the level of the portable device detection signal, and the current level can be obtained by reading the PDDTSTS flag.

#### When not using the Portable Device detection function

Regardless of whether or not a Portable Device was detected, drive the D- line after device disconnection is detected, and leave the D- line open after connection is detected. Software handles the timing of a and b.

- a. After disconnection is detected, start driving the D- line within 200 ms.
- b. After connection is detected, stop driving the D- line within 10 ms.

Figure 26.25 shows the process flow for steps 1. to 4. and Figure 26.26 shows the process flow for steps a. and b., respectively.

### 26.3.15.2 主机控制器模式下的处理

在主机控制器模式下，便携式设备需要驱动Dline才能执行初级检测。USBFS支持以下两种主要检测方法：

#### 使用便携式设备检测功能时

当检测到便携式设备时驱动Dline。

- 1.开始驱动VBUS。
- 2.将BCCTRL1.PDDETE位设置为1以启用便携式设备检测电路。
- 3.监测便携设备检测信号，当便携设备检测信号为高电平时开始驱动Dline。\*1
- 4、当便携设备检测信号为低电平时，停止驱动Dline。\*1

注1.PDDTINT中断表示便携式设备检测信号电平的变化，当前电平可通过读取PDDTSTS标志获得。

#### 不使用便携设备检测功能时

无论是否检测到便携式设备，在检测到设备断开后驱动Dline，在检测到连接后保持Dline处于打开状态。软件处理a和b的时序。

- a. 检测到断线后，在200ms内开始驱动Dline。
- 湾。检测到连接后，请在10ms内停止驱动Dline。

图26.25显示了步骤1.到4.的处理流程，图26.26显示了步骤a.的处理流程。和b.，分别。

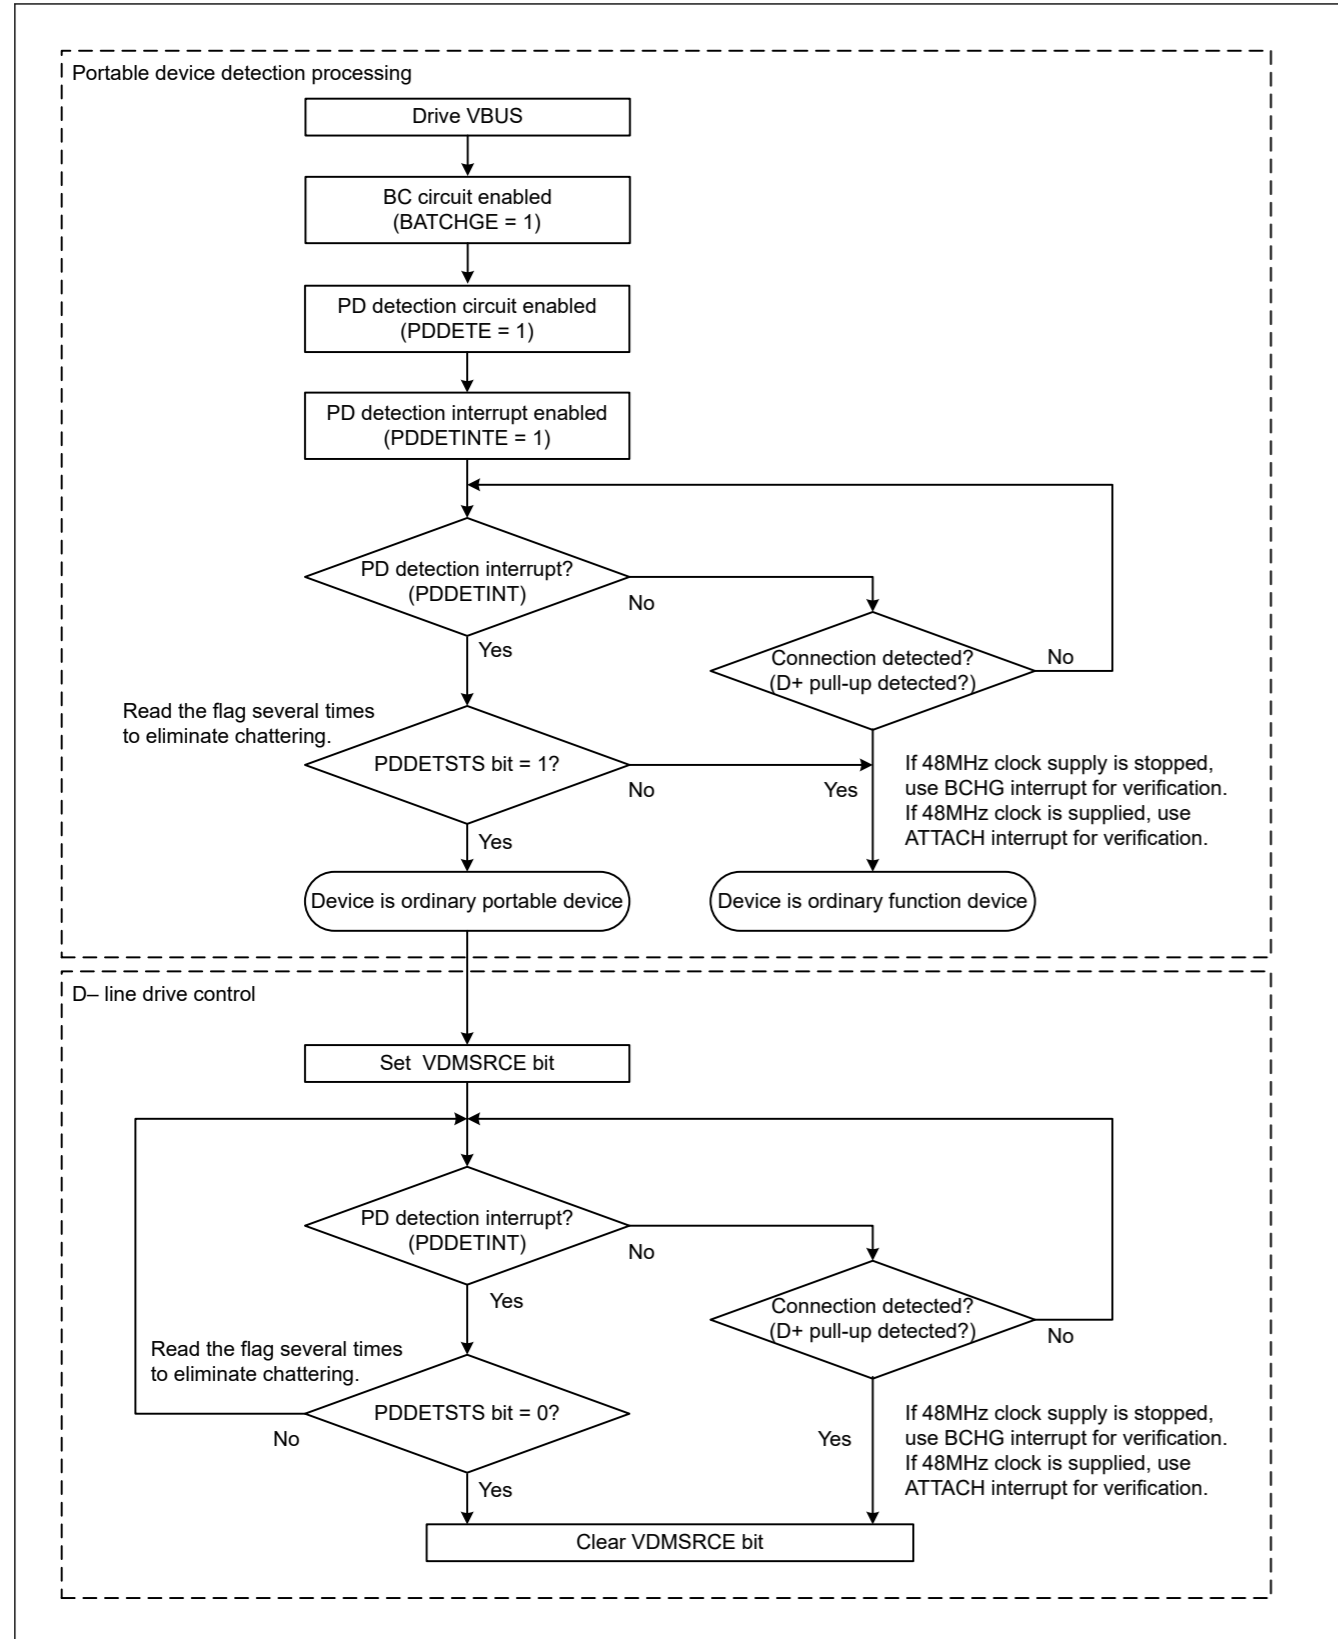

Figure 26.25 Processing flow when using the Portable Device detection function (steps 1. to 4.)

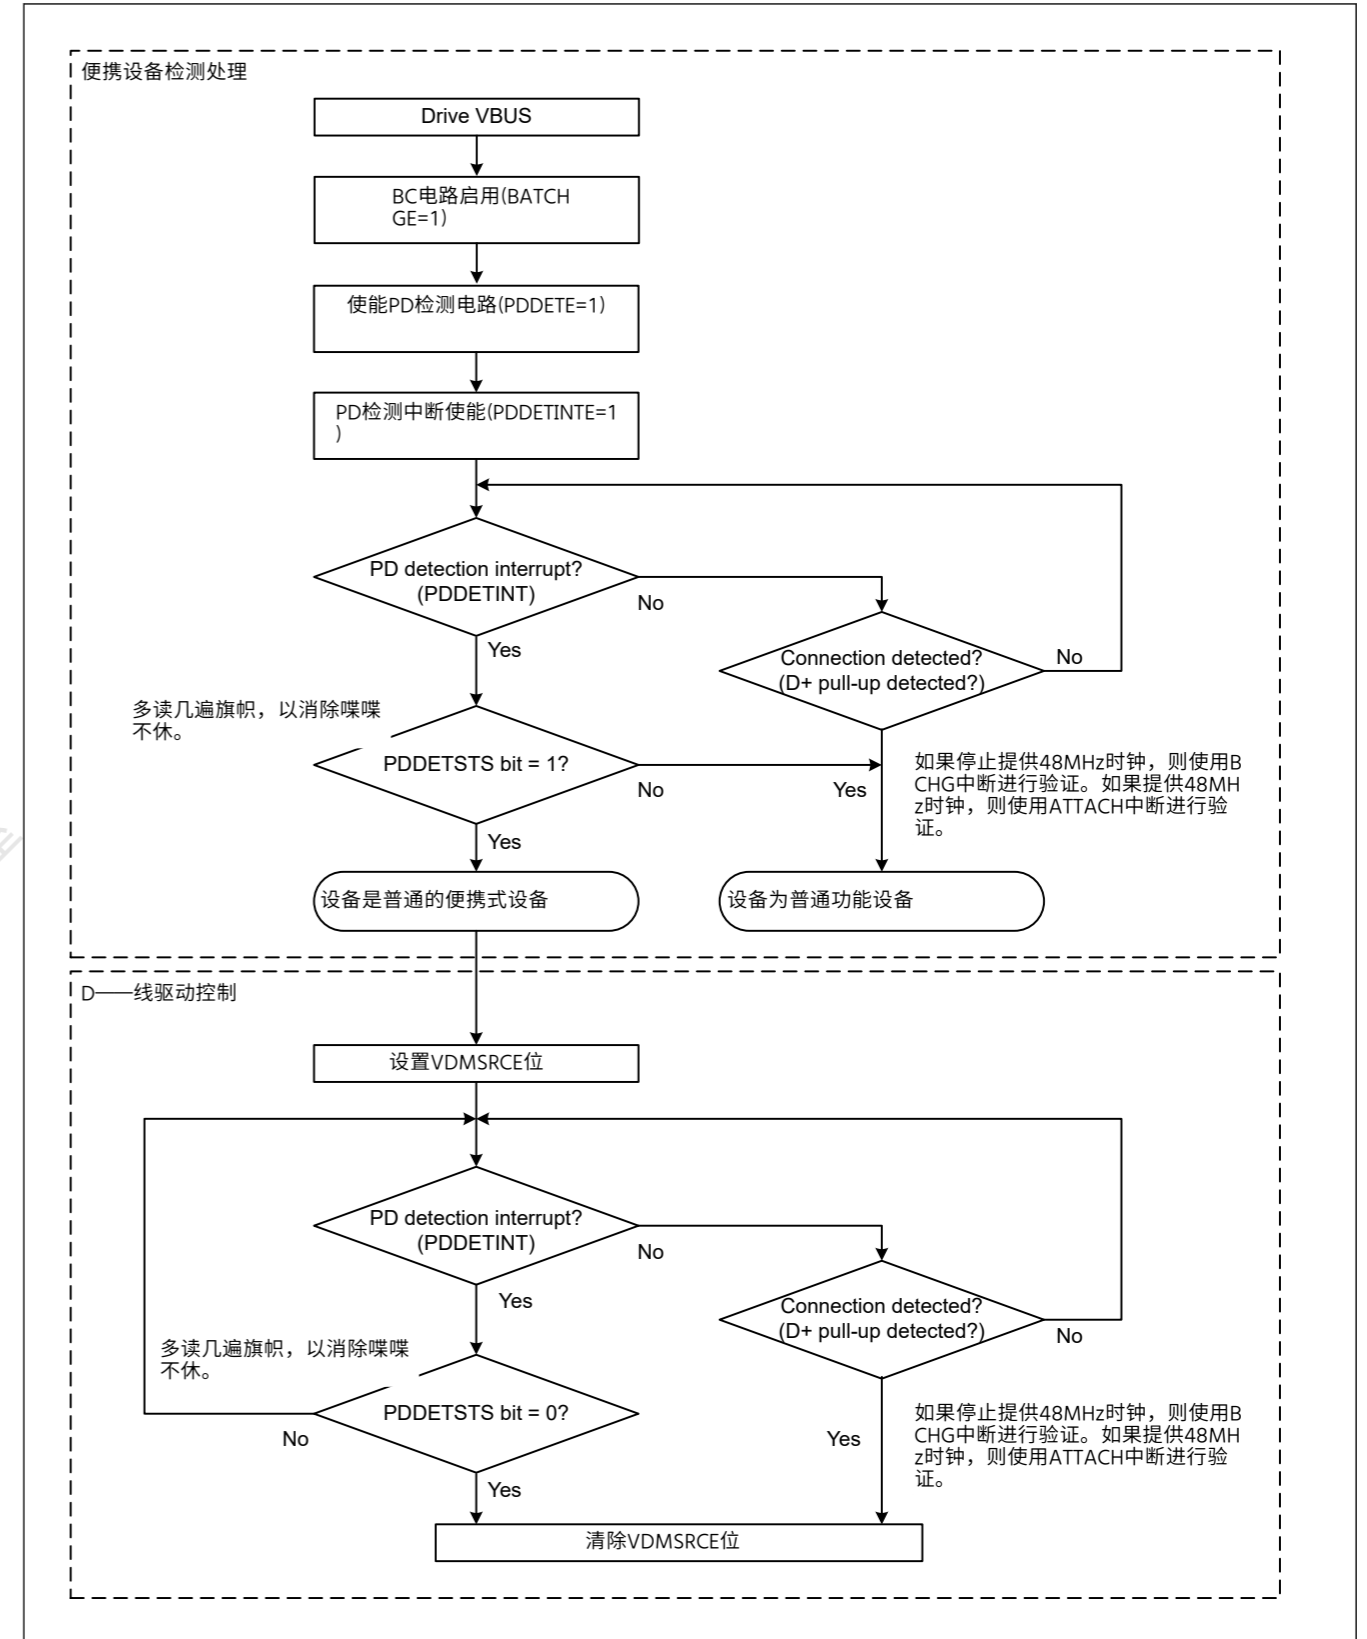

Figure 26.25 使用便携式设备检测功能时的处理流程 (步骤1.至4.)

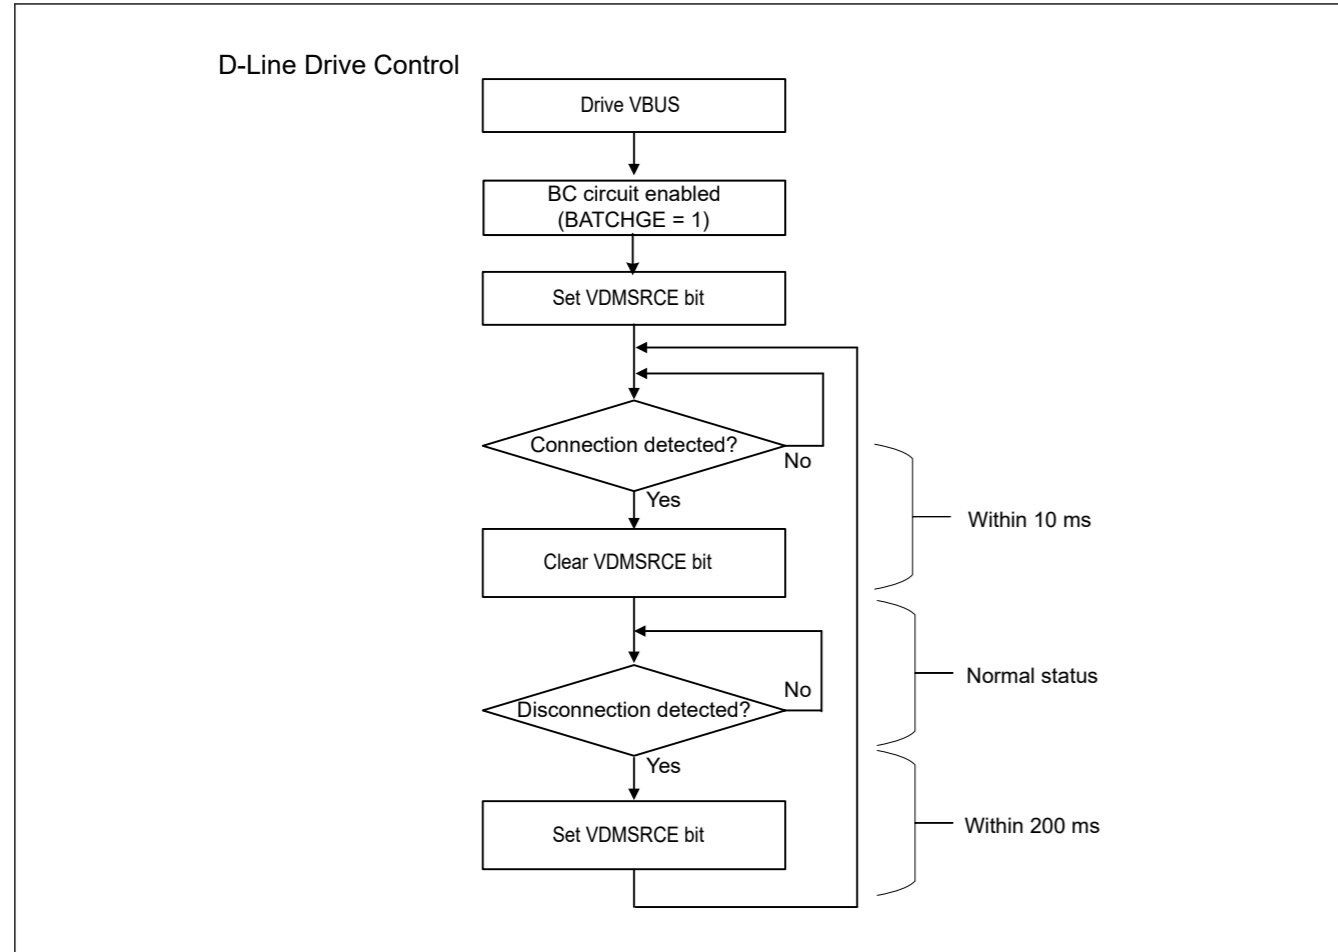

Figure 26.26 Processing flow when not using Portable Device detection function (steps a. and b.)

26.4 Usage Notes

26.4.1 Settings for the Module-Stop State

USBFS operation can be disabled or enabled using Module Stop Control Register B (MSTPCRB). The USBFS is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

26.4.2 Clearing the Interrupt Status Register on Exiting Software Standby Mode

Because the input buffer is always enabled in Software Standby mode, an unexpected interrupt might occur under the following conditions:

- When the interrupt is enabled in Normal mode
- When the interrupt is disabled in Software Standby mode
- When the input level of the pin that cancels software standby is changed in Software Standby mode

These conditions might cause the associated interrupt flag in the Interrupt Status Register to set unexpectedly. After the MCU exits the Software Standby mode, the unexpected interrupt might be sent to the interrupt controller. To avoid this, always clear the INTSTS0 and INTSTS1 registers in the canceling sequence.

26.4.3 Clearing the Interrupt Status Register after Setting Up the Port Function

The input buffer is disabled before the PmnPFS.PSEL and PmnPFS.PMR port is set up, so the internal signal is fixed high or low. The input buffer is enabled after the port is set so that the external pin state is propagated to the MCU. An unexpected interrupt might occur at this time, causing the VBINT and OVRCCR bits in INTSTS0 and INTSTS1, or other

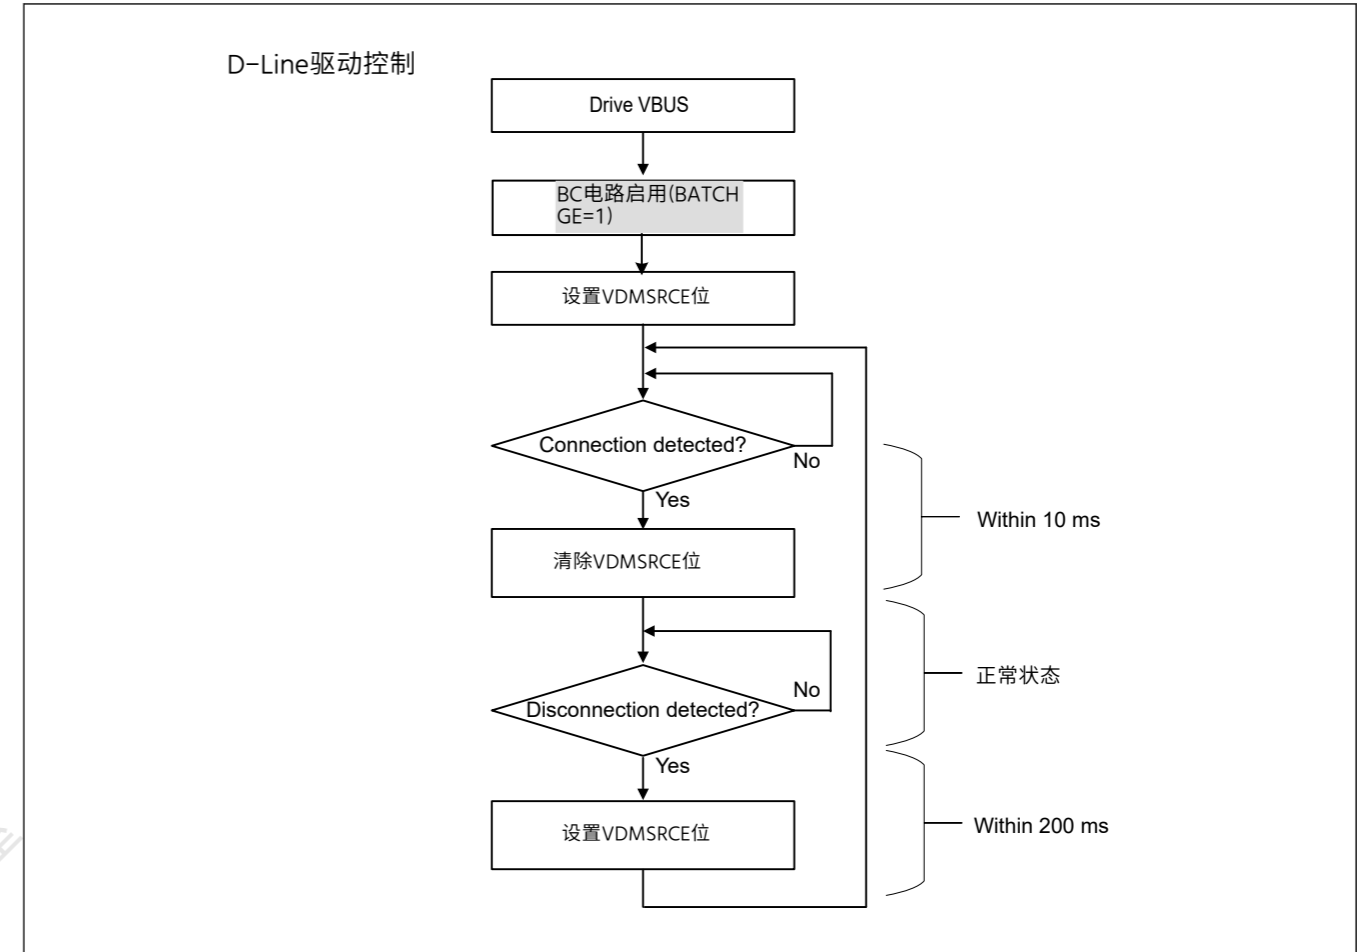

Figure 26.26 不使用便携设备检测功能时的处理流程 (步骤a.和b.)

26.4 使用说明

26.4.1 模块停止状态的设置

可以使用模块停止控制寄存器B(MSTPCRB)禁用或启用USBFS操作。USBFS在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

26.4.2 退出软件待机模式时清除中断状态寄存器

由于在软件待机模式下始终启用输入缓冲区，因此在以下情况下可能会发生意外中断：

- 在正常模式下使能中断时
- 在软件待机模式下禁用中断时
- 在软件待机模式下，取消软件待机的引脚的输入电平发生变化时

这些情况可能会导致中断状态寄存器中的相关中断标志意外设置。MCU退出软件待机模式后，可能会向中断控制器发送意外中断。为避免这种情况，请始终在取消序列中清除INTSTS0和INTSTS1寄存器。

26.4.3 设置端口功能后清除中断状态寄存器

在设置PmnPFS.PSEL和PmnPFS.PMR端口之前，输入缓冲器被禁用，因此内部信号固定为高电平或低电平。设置端口后启用输入缓冲器，以便将外部引脚状态传播到MCU。此时可能会发生意外中断，导致INTSTS0和INTSTS1中的VBINT和OVRCCR位，或其他

interrupt status flags to set to 1. To avoid a malfunction, always clear the INTSTS0 and INTSTS1 registers after setting up the port.

中断状态标志设置为1。为避免故障，请在设置端口后始终清除INTSTS0和INTSTS1寄存器。

## 27. Serial Communications Interface (SCI)

### 27.1 Overview

The Serial Communications Interface (SCI) × 6 channels have asynchronous and synchronous serial interfaces:

- Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))
- 8-bit clock synchronous interface
- Simple IIC (master-only)
- Simple SPI
- Smart card interface
- Manchester interface
- Extended Serial interface

The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCIn (n = 0, 3, 4, 9) has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator.

In this section, PCLK refers to PCLKA.

Table 27.1 lists the SCI specifications, Figure 27.1 shows a block diagram of SCI, and Table 27.3 lists the I/O pins.

**Table 27.1 SCI specifications (1 of 3)**

| Parameter   | Specifications   |  |
|---|--|--|
| Number of modules                                 | 6 (SCIn (n = 0 to 4, 9))   |  |
| Serial communication modes                        | <ul style="list-style-type: none"> <li>● Asynchronous</li> <li>● Clock synchronous</li> <li>● Simple IIC</li> <li>● Simple SPI</li> <li>● Smart card interface</li> <li>● Manchester interface (SCIn (n = 3, 4))</li> <li>● Extended Serial interface (SCIn (n = 1, 2))</li> </ul> |  |
| Transfer speed                                    | Bit rate specifiable with the on-chip baud rate generator  |  |
| Full-duplex communications                        | <ul style="list-style-type: none"> <li>● Transmitter: Continuous transmission possible using double-buffering</li> <li>● Receiver: Continuous reception possible using double-buffering</li> </ul>   |  |
| Data transfer                                     | Selectable as LSB-first or MSB-first transfer  |  |
| Inverter for communication terminals (RXDn, TXDn) | Selectable inverter for each terminals (RXDn, TXDn) (SCIn (n = 0, 3, 4, 9))  |  |
| Interrupt sources                                 | Transmit data empty, receive data full, receive error, receive data ready*, address match*. (* SCIn (n = 0, 3, 4, 9) support)<br>Completion of generation of a start condition, restart condition, or stop condition (for simple IIC mode)   |  |
| Module-stop function                              | Module-stop state can be set for each channel  |  |
| Snooze end request                                | SCI0 address mismatch (SCI0_DCUF)  |  |
| Clock synchronous mode                            | Data length  | 8 bits   |
|   | Receive error detection  | Overflow error   |
|   | Clock source   | Selectable to internal clock (master mode) or external clock (slave mode)                  |
|   | Hardware flow control  | Transmission and reception controllable with CTSn_RTSn pins                                |
|   | Transmission and reception   | Selectable to 1-stage register or 16-stage FIFO (only SCIn (n = 0, 3, 4, 9) supports FIFO) |
| Asynchronous mode                                 | Data length  | 7, 8, or 9 bits  |
|   | Transmission stop bit  | 1 or 2 bits  |
|   | Adjustment of receive sampling timing  | Adjustable receive sampling timing before/after the default timing                         |

## 27. 串行通信接口(SCI)

### 27.1 Overview

串行通信接口(SCI)×6通道具有异步和同步串行接口:

- 异步接口 (UART和异步通信接口适配器(ACIA))
- 8位时钟同步接口
  - Simple IIC (master-only)
  - 简单的SPI
  - 智能卡接口
  - 曼彻斯特接口
  - 扩展串行接口

智能卡接口符合ISO/IEC7816-3电子信号和传输协议标准。SCIn(n=0 3 4 9)具有FIFO缓冲区以实现连续和全双工通信，并且可以使用片上波特率发生器独立配置数据传输速度。

在本节中，PCLK指的是PCLKA。

表27.1列出了SCI规格，图27.1显示了SCI的框图，表27.3列出了IO引脚。

**Table 27.1 SCI规范(1of3)**

| Parameter                  | Specifications  |  |
|----------------------------|---|--|
| 模块数量                       | 6 (SCIn (n = 0 to 4, 9))  |  |
| 串行通信模式                     | <ul style="list-style-type: none"> <li>● Asynchronous</li> <li>● 时钟同步</li> <li>● Simple IIC</li> <li>● 简单的SPI</li> <li>● 智能卡接口</li> <li>● 曼彻斯特接口(SCIn(n=3 4))</li> <li>● 扩展串行接口(SCIn(n=1 2))</li> </ul> |  |
| 传输速度                       | 可通过片上波特率发生器指定比特率  |  |
| Full-duplex communications | <ul style="list-style-type: none"> <li>● 发送器: 可使用双缓冲进行连续传输</li> <li>● 接收器: 使用双缓冲可以连续接收</li> </ul>   |  |
| 数据传输                       | 可选择LSB优先或MSB优先传输  |  |
| 通信终端用变频器 (RXDn, TXDn)      | 每个端子(RXDn TXDn)的可选逆变器(SCIn(n=0 3 4 9))  |  |
| 中断源                        | 发送数据空, 接收数据满, 接收错误, 接收数据就绪*, 地址匹配*。( *SCIn(n=0 3 4 9)support)完成启动条件、重启条件或停止条件的生成 (对于简单IIC模式)  |  |
| Module-stop function       | 每个通道可设置模块停止状态   |  |
| 暂停结束请求                     | SCI0地址不匹配(SCI0_DCUF)  |  |
| 时钟同步模式                     | 数据长度  | 8 bits   |
|                            | 接收错误检测  | 溢出错误   |
|                            | 时钟源   | 可选择内部时钟 (主模式) 或外部时钟 (从模式)                      |
|                            | 硬件流控制   | 可通过CTS <sub>n</sub> RTS <sub>n</sub> 引脚控制发送和接收 |
|                            | 传输和接收   | 可选择1级寄存器或16级FIFO (仅SCIn(n=0 3 4 9)支持FIFO)      |
| 异步模式                       | 数据长度  | 7、8或9位   |
|                            | 传输停止位   | 1或2位   |
|                            | 接收采样时序的调整   | 默认时序后可调接收采样时序                                  |

Table 27.1 SCI specifications (2 of 3)

| Parameter                                 | Specifications  |  |
|---|---|--|
| Adjustment of transmit timing             | Adjustable edge timing of transmit waveform controlled by the setting value of registers.   |  |
| Parity                                    | Even parity, odd parity, or no parity   |  |
| Receive error detection                   | <ul style="list-style-type: none"> <li>Parity error</li> <li>Overrun error</li> <li>Framing error</li> </ul>  |  |
| Hardware flow control                     | Transmission and reception controllable with CTSn_RTsn pins   |  |
| Transmission and reception                | Selectable to 1-stage register or 16-stage FIFO (SCIn (n = 0, 3, 4, 9) supports FIFO)   |  |
| Address match                             | Interrupt request/event output can be issued upon detecting a match between received data and the value in the compare match register (SCIn (n = 0, 3, 4, 9) support) |  |
| Address mismatch (SCIO only) receive data | Snooze end request can be issued when detecting a mismatch between the received data and the value in the compare match register                                      |  |
| Start-bit detection                       | Selectable to low level or falling edge detection   |  |
| Break detection                           | Breaks from framing errors detectable by read from SPTR register  |  |
| Clock source                              | Selectable to internal or external clock<br>Transfer rate clock input from the GPT can be used. (SCIn (n = 1, 2))   |  |
| Double-speed mode                         | Baud rate generator double-speed mode is selectable   |  |
| Multi-processor communications function   | Serial communication enabled among multiple processors  |  |
| Noise cancellation                        | Digital noise filters included on signal paths from the RXDn pin inputs   |  |
| Smart card interface mode                 | Error processing  | Error signal can be automatically transmitted upon detecting a parity error during reception<br>Data can be automatically retransmitted upon receiving an error signal during transmission |
|   | Data type   | Both direct and inverse convention supported   |
| Manchester mode                           | Communication format  | Manchester code with the preface and the Start Bit added   |
|   | Data length   | 7,8, or 9 bits   |
|   | Transmission stop bit   | 1 or 2 bits  |
|   | Parity function   | Even parity, odd parity, or no parity  |
|   | Receive error detection   | Parity, overrun, framing, Manchester errors  |
|   | Hardware flow control   | CTSn and RTSn pins can be used in controlling transmission   |
|   | Clock source  | Only internal clock can be used.   |
|   | Double-speed mode   | Baud rate generator double-speed mode is selectable  |
|   | Multi-processor communication function  | Serial communication among multiple processors   |
|   | Noise cancellation  | The signal paths from input on the RXDn pins incorporate digital noise filters   |
|   | Preface setting / detection function  | The function outputs the configured the preface pattern and detects it.  |
|   | Start Bit setting / detection function  | The function outputs the configured the Start Bit pattern and detects it.  |
|   | Reception retiming function   | Timing correction is performed for each bit of the received signal   |
| Simple IIC mode                           | Transfer format   | I <sup>2</sup> C bus format (MSB-first only)   |
|   | Operating mode  | Master (single-master operation only)  |

Table 27.1 SCI规范(2of3)

| Parameter           | Specifications   |   |
|---------------------|--|---|
| 发射时序的调整             | 由寄存器的设定值控制的发送波形边沿时序。   |   |
| Parity              | 偶校验、奇校验或无校验  |   |
| 接收错误检测              | <ul style="list-style-type: none"> <li>奇偶校验错误</li> <li>溢出错误</li> <li>构图错误</li> </ul> |   |
| 硬件流控制               | 可通过CTSn_RTsn引脚控制发送和接收  |   |
| 传输和接收               | 可选择1级寄存器或16级FIFO(SCIn(n=0 3 4 9)支持FIFO)  |   |
| 地址匹配                | 检测到接收数据与比较匹配寄存器中的值匹配时, 可以发出中断请求事件输出 (SCIn(n=0 3 4 9)支持)                              |   |
| 地址不匹配 (仅SCIO) 接收数据  | 当检测到接收到的数据与比较匹配寄存器中的值不匹配时, 可以发出贪睡结束请求  |   |
| Start-bit detection | 可选择低电平或下降沿检测   |   |
| 断线检测                | 通过从SPTR寄存器读取可检测到的帧错误中断   |   |
| 时钟源                 | 可选择内部或外部时钟<br>可以使用来自GPT的传输速率时钟输入。(SCIn(n=1 2))                                       |   |
| Double-speed mode   | 波特率发生器双速模式可选   |   |
| 多处理器通讯功能            | 在多个处理器之间启用串行通信   |   |
| 噪音消除                | 来自RXDn引脚输入的信号路径上包含数字噪声滤波器  |   |
| 智能卡接口方式             | 错误处理   | 在接收过程中检测到奇偶校验错误时可以自动发送错误信号<br>传输过程中接收到错误信号可自动重传数据 |
|                     | 数据类型   | 支持直接和反向约定   |
| 曼彻斯特模式              | 通讯格式   | 添加了前言和起始位的曼彻斯特代码                                  |
|                     | 数据长度   | 7 8或9位  |
|                     | 传输停止位  | 1或2位  |
|                     | 奇偶校验函数   | 偶校验、奇校验或无校验                                       |
|                     | 接收错误检测   | 奇偶校验、超限、成帧、曼彻斯特错误                                 |
|                     | 硬件流控制  | CTSn和RTSn引脚可用于控制传输                                |
|                     | 时钟源  | 只能使用内部时钟。   |
|                     | Double-speed mode  | 波特率发生器双速模式可选                                      |
|                     | 多处理器通讯功能   | 多个处理器之间的串行通信                                      |
|                     | 噪音消除   | 来自RXDn引脚输入的信号路径包含数字噪声滤波器                          |
|                     | 前言设定检测功能   | 该函数输出配置的序言模式并检测它。                                 |
|                     | 起始位设置检测功能  | 该函数输出配置的起始位模式并检测它。                                |
|                     | 接收重定时功能  | 对接收信号的每一位进行定时校正                                   |
| 简单IIC模式             | 传输格式   | I <sup>2</sup> C总线格式 (仅MSB优先)                     |
|                     | 操作模式   | 主机 (仅限单主机操作)                                      |

Table 27.1 SCI specifications (3 of 3)

| Parameter                    |                          | Specifications   |
|------------------------------|--------------------------|--|
|                              | Transfer rate            | Up to 400 kbps   |
|                              | Noise cancellation       | The signal paths from input on the SCLn and SDAn pins incorporate digital noise filters and provide an adjustable interval for noise cancellation  |
| Simple SPI mode              | Data length              | 8 bits   |
|                              | Error detection          | Overrun error  |
|                              | Clock source             | Selectable to internal clock (master mode) or external clock (slave mode)  |
|                              | SSn input pin function   | High impedance state can be invoked on the output pins by driving the SSn pin high.  |
|                              | Clock settings           | Configurable among four clock phase and clock polarity settings  |
| Extended serial mode         | Start Frame transmission | <ul style="list-style-type: none"> <li>Output of a low level as the Break Field over a specified width and generation of interrupts on completion</li> <li>Detection of bus collisions and the generation of interrupts on detection</li> </ul>  |
|                              | Start Frame reception    | <ul style="list-style-type: none"> <li>Detection of the Break Field low width and generation of an interrupt on detection</li> <li>Comparison of Control Fields 0 and 1 and generation of an interrupt when the two match</li> <li>Two kinds of data for comparison (primary and secondary) can be set in Control Field 1.</li> <li>A priority interrupt bit can be set in Control Field 1.</li> <li>Handling of Start Frames that do not include a Break Field</li> <li>Handling of Start Frames that do not include a Control Field 0</li> <li>Function for measuring bit rates</li> </ul> |
|                              | I/O control function     | <ul style="list-style-type: none"> <li>Selectable polarity for TXDXn and RXDXn signals</li> <li>Selection of a digital filter for the RXDXn signal</li> <li>Half-duplex operation employing RXDXn and TXDXn signals multiplexed on the same pin</li> <li>Selectable timing for the sampling of data received through RXDXn</li> <li>Signals received on RXDXn can be passed through to SCIn (n = 1, 2) when the extended serial mode control section is off.</li> </ul>  |
|                              | Timer function           | <ul style="list-style-type: none"> <li>Usable as a reloading timer</li> </ul>  |
| Bit rate modulation function |                          | Error reduction through correction of outputs from the on-chip baud rate generator   |
| Event link function          |                          | Error event output for receive error or error signal detection (SCIn_ERI) (n = 0 to 4, 9)<br>Receive data full event output (SCIn_RXI) (n = 0 to 4, 9)<br>Transmit data empty event output (SCIn_TXI) (n = 0 to 4, 9)<br>Address match event output (SCIn_AM) (n = 0, 3, 4, 9)<br>Transmit end event output (SCIn_TEI) (n = 0, 3, 4, 9)  |
| TrustZone Fileter            |                          | Security attribution can be set for each channels  |

## 27.2 Register Descriptions

### 27.2.1 RSR : Receive Shift Register

RSR is a shift register that receives serial data input from the RXDn pin and converts it into parallel data. When one frame of data is received, the data is automatically transferred to the RDR, RDRHL, or the receive FIFO register. The RSR register cannot be directly accessed by the CPU.

### 27.2.2 RDR : Receive Data Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x05

RDR is an 8-bit register that stores received data. When one frame of serial data is received, it is transferred from RSR to RDR, and the RSR register can receive more data. Because RSR and RDR function as a double buffer, continuous received operations can be performed.

Read the RDR only once after a receive data full interrupt (SCIn\_RXI) occurs.

Note: If the next frame of data is received before reading the received data from RDR, an overrun error occurs. The CPU cannot write to the RDR.

### 27.2.3 RDRHL : Receive Data Register for Non-Manchester mode (MMR.MANEN = 0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x10

| Bit  | Symbol    | Function                  | R/W |
|------|-----------|---------------------------|-----|
| 8:0  | RDAT[8:0] | Serial Receive Data       | R   |
| 15:9 | —         | These bits are read as 0. | R   |

RDRHL is a 16-bit register that stores received data. Use this register when asynchronous mode and 9-bit data length are selected.

The lower 8 bits of RDRHL are the shadow register of RDR, so access to RDRHL affects the RDR register. Access to the RDRHL register is prohibited if 7-bit or 8-bit data length is selected.

After one frame of data is received, the received data is transferred from the RSR register to the RDR/RDRHL registers, allowing the RSR register to receive more data.

The RSR and RDRHL registers form a double-buffered structure to enable continuous reception. RDRHL should be read only when a receive data full interrupt (SCIn\_RXI) request is issued. An overrun error occurs when the next frame of data is received before the received data is read from RDRHL. The CPU cannot write to the RDRHL register.

## 27.2 注册说明

### 27.2.1 RSR:接收移位寄存器

RSR是一个移位寄存器，它接收从RXDn引脚输入的串行数据并将其转换为并行数据。当接收到一帧数据时，数据会自动传输到RDR、RDRHL或接收FIFO寄存器。CPU不能直接访问RSR寄存器。

### 27.2.2 RDR:接收数据寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x05

RDR是一个8位寄存器，用于存储接收到的数据。当接收到一帧串行数据时，将其从RSR传输到RDR，而RSR寄存器可以接收更多的数据。由于RSR和RDR用作双缓冲器，因此可以执行连续接收操作。

在接收数据完全中断(SCIn\_RXI)发生后，仅读取一次RDR。

Note: 如果在从RDR读取接收到的数据之前接收到下一帧数据，则会发生溢出错误。CPU无法写入RDR。

### 27.2.3 RDRHL:非曼彻斯特模式的接收数据寄存器(MMR.MANEN=0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x10

| Bit  | Symbol    | Function | R/W |
|------|-----------|----------|-----|
| 8:0  | RDAT[8:0] | 串行接收数据   | R   |
| 15:9 | —         | 这些位读为0。  | R   |

RDRHL是一个16位寄存器，用于存储接收到的数据。选择异步模式和9位数据长度时，请使用此寄存器。

RDRHL的低8位是RDR的影子寄存器，因此访问RDRHL会影响RDR寄存器。访问如果选择7位或8位数据长度，则禁止RDRHL寄存器。

接收到一帧数据后，将接收到的数据从RSR寄存器传送到RDR/RDRHL寄存器，使RSR寄存器可以接收更多数据。

RSR和RDRHL寄存器形成一个双缓冲结构以实现连续接收。只有在发出接收数据完全中断(SCIn\_RXI)请求时才应读取RDRHL。在从RDRHL读取接收到的数据之前接收到下一帧数据时，会发生溢出错误。CPU无法写入RDRHL寄存器。

## 27.2.4 RDRHL\_MAN : Receive Data Register for Manchester mode (MMR.MANEN = 1)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x10

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 8:0   | RDAT[8:0] | Serial receive data<br>It can read serial receive data  | R   |
| 9     | MPB       | Multi-processor bit<br>It can read multi-processor bit corresponded to serial receive data (RDAT[8:0])<br>0: Data transmission cycles<br>1: ID transmission cycles                              | R   |
| 11:10 | —         | These bits are read as 0. The write value should be 0.  | R   |
| 12    | RSYNC     | Receive SYNC data bit<br>It is valid when MMR.SBSEL = 1 in Manchester mode, 0 is read otherwise.<br>0: The received the Start Bit is DATA SYNC<br>1: The received the Start Bit is COMMAND SYNC | R   |
| 15:13 | —         | These bits are read as 0. The write value should be 0.  | R   |

RDRHL\_MAN is a 16-bit register that stores received data. Use this register when asynchronous mode and 9-bit data length are selected. The lower 8 bits of RDRHL\_MAN are the shadow register of RDR, so access to RDRHL\_MAN affects the RDR register. Access to the RDRHL\_MAN register is prohibited if 7-bit or 8-bit data length is selected.

After one frame of data is received, the received data is transferred from the RSR register to the RDR/RDRHL\_MAN registers, allowing the RSR register to receive more data.

The RSR and RDRHL\_MAN registers form a double-buffered structure to enable continuous reception.

RDRHL\_MAN should be read only when a receive data full interrupt (SCIn\_RXI) request is issued. An overrun error occurs when the next frame of data is received before the received data is read from RDRHL\_MAN.

The CPU cannot write to the RDRHL\_MAN register.

**RDAT[8:0] bit (Serial receive data)**

It can read serial receive data.

**MPB bit (Multi-processor bit)**

Holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

**RSYNC bit (Receive SYNC data bit)**

When Manchester mode and MMR.SBSEL = "1", this bit indicates the type of SYNC of the received the Start Bit. For other settings, it is fixed to 0.

## 27.2.5 FRDRHL/FRDRH/FRDRL : Receive FIFO Data Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x10 (FRDRHL/FRDRH)  
0x11 (FRDRL)

## 27.2.4 RDRHL\_MAN: 曼彻斯特模式的接收数据寄存器 (MMR.MANEN=1)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x10

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 8:0   | RDAT[8:0] | 串口接收数据<br>可读取串口接收数据   | R   |
| 9     | MPB       | Multi-processor bit<br>它可以读取对应于串行接收数据的多处理器位 (RDAT[8:0])<br>0: 数据传输周期1: ID传输周期       | R   |
| 11:10 | —         | 这些位被读取为0。写入值应为0。  | R   |
| 12    | RSYNC     | 接收同步数据位<br>曼彻斯特模式下MMR.SBSEL=1时有效, 否则读取0。<br>0: 接收的起始位为DATASYNC1: 接收的起始位为COMMANDSYNC | R   |
| 15:13 | —         | 这些位被读取为0。写入值应为0。  | R   |

RDRHL\_MAN是一个16位寄存器, 用于存储接收到的数据。选择异步模式和9位数据长度时, 请使用此寄存器。RDRHL\_MAN的低8位是RDR的影子寄存器, 因此访问RDRHL\_MAN会影响RDR寄存器。如果选择7位或8位数据长度, 则禁止访问RDRHL\_MAN寄存器。

接收到一帧数据后, 将接收到的数据从RSR寄存器传送到RDR/RDRHL\_MAN寄存器, 从而允许RSR寄存器接收更多数据。

RSR和RDRHL\_MAN寄存器形成一个双缓冲结构以实现连续接收。

只有在发出接收数据完全中断(SCIn\_RXI)请求时, 才应读取RDRHL\_MAN。在从RDRHL\_MAN读取接收到的数据之前接收到下一帧数据时, 会发生溢出错误。

CPU无法写入RDRHL\_MAN寄存器。

**RDAT[8:0]位 (串行接收数据)**

它可以读取串行接收数据。

**MPB bit (Multi-processor bit)**

保存接收帧中多处理器位的值。当SCR.RE位为0时, 该位不变。

**RSYNC位 (接收SYNC数据位)**

当曼彻斯特模式和MMR.SBSEL="1"时, 该位指示接收到的StartBit的SYNC类型。对于其他设置, 它固定为0。

## 27.2.5 FRDRHL/FRDRH/FRDRL:接收FIFO数据寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x10 (FRDRHL/FRDRH)  
0x11 (FRDRL)

| Bit | Symbol    | Function   | R/W             |
|-----|-----------|--|-----------------|
| 8:0 | RDAT[8:0] | Serial receive data<br>Stores the serial receive data.<br>Valid only in asynchronous mode, including multi-processor mode, and clock synchronous mode, and with FIFO selected.   | R               |
| 9   | MPB       | Multi-Processor Bit Flag<br>Stores the value of the multi-processor bit in the serial receive data, RDAT[8:0]. Valid only in asynchronous mode with SMR.MP = 1, and with FIFO selected.<br>0: Data transmission cycle<br>1: ID transmission cycle  | R               |
| 10  | DR        | Receive Data Ready Flag<br>This flag is the same as SSR_FIFO.DR.<br>0: Receiving is in progress, or no received data remains in the FRDRH and FRDRL registers after successfully completed reception<br>1: Next receive data is not received for a period after successfully completed reception                       | R <sup>*1</sup> |
| 11  | PER       | Parity Error Flag<br>0: No parity error occurred in the first data of FRDRH and FRDRL<br>1: Parity error occurred in the first data of FRDRH and FRDRL   | R               |
| 12  | FER       | Framing Error Flag<br>0: No framing error occurred in the first data of FRDRH and FRDRL<br>1: Framing error occurred in the first data of FRDRH and FRDRL  | R               |
| 13  | ORER      | Overrun Error Flag<br>This flag is the same as SSR_FIFO.ORER.<br>0: No overrun error occurred<br>1: Overrun error occurred   | R <sup>*1</sup> |
| 14  | RDF       | Receive FIFO Data Full Flag<br>This flag is the same as SSR_FIFO.RDF.<br>0: The amount of receive data written in FRDRH and FRDRL is less than the specified receive triggering number<br>1: The amount of receive data written in FRDRH and FRDRL is equal to or greater than the specified receive triggering number | R <sup>*1</sup> |
| 15  | —         | This bit is read as 0.   | R               |

Note 1. If this flag is read, it indicates the same value as that read from the SSR\_FIFO register. Write 0 to the SSR\_FIFO register to clear the flag.

FRDRHL is a 16-bit register that consists of the 8-bit FRDRH and FRDRL registers. FRDRH is assigned to the FRDRHL[15:8] bits, and allocated to the same address as FRDRHL. FRDRL is assigned to the FRDRHL[7:0] bits, and allocated to (the address of FRDRHL + 1) address.

FRDRH and FRDRL constitute a 16-stage FIFO register that stores serial receive data and related status information readable by software. This register is only valid in asynchronous mode, including multi-processor mode, or clock synchronous mode.

The SCI completes reception of one frame of serial data by transferring the received data from the Receive Shift Register (RSR) into FRDRH and FRDRL for storage. Continuous reception is executed until 16 stages are stored. If data is read when there is no received data in FRDRH and FRDRL, the value is undefined. When FRDRH and FRDRL are full, subsequent serial receive data is lost. The CPU can read from the FRDRH and FRDRL registers but cannot write to them.

Reading 1 from the RDF, ORER, or DR flags of the FRDRH register is the same as reading from those bits in the SSR\_FIFO register. When writing 0 to clear a flag in the SSR\_FIFO register after reading the FRDRH register, write 0 only to the flag that is to be cleared and write 1 to the other flags.

When reading both the FRDRH and FRDRL registers, read in order from FRDRH to FRDRL. The FRDRHL register can be accessed in 16-bit units.

| Bit | Symbol    | Function  | R/W             |
|-----|-----------|---|-----------------|
| 8:0 | RDAT[8:0] | 串口接收数据<br>存储串行接收数据。仅在异步模式下有效，包括多处理器模式和时钟同步模式，并且选择了FIFO。   | R               |
| 9   | MPB       | 多处理器位标志<br>将多处理器位的值存储在串行接收数据RDAT[8:0]中。仅在SMR.MP=1且选择了FIFO的异步模式下有效。<br>0: 数据发送周期1: ID发送周期                      | R               |
| 10  | DR        | 接收数据就绪标志<br>该标志与SSR_FIFO.DR相同。<br>0: 接收中，或成功完成接收后，FRDRH和FRDRL寄存器中没有接收到的数据<br>1: 接收成功后一段时间内没有接收到下一个接收数据        | R <sup>*1</sup> |
| 11  | PER       | 奇偶校验错误标志<br>0: FRDRH和FRDRL的第一个数据没有发生奇偶校验错误1: FRDRH和FRDRL的第一个数据发生奇偶校验错误  | R               |
| 12  | FER       | 成帧错误标志<br>0: FRDRH和FRDRL的第一个数据没有发生帧错误1: FRDRH和FRDRL的第一个数据发生了帧错误   | R               |
| 13  | ORER      | 溢出错误标志<br>该标志与SSR_FIFO.ORER相同。<br>0: 未发生溢出错误1: 发生溢出错误   | R <sup>*1</sup> |
| 14  | RDF       | 接收FIFO数据满标志<br>该标志与SSR_FIFO.RDF相同。<br>0: FRDRH和FRDRL写入的接收数据量小于指定的接收触发数<br>1: 写入FRDRH和FRDRL的接收数据量等于或大于指定的接收触发数 | R <sup>*1</sup> |
| 15  | —         | 该位读为0。  | R               |

注1.如果读取该标志，则表示与从SSR\_FIFO寄存器读取的值相同。将0写入SSR\_FIFO寄存器以清除标志。

FRDRHL是一个16位寄存器，由8位FRDRH和FRDRL寄存器组成。FRDRH被分配到FRDRHL[15:8]位，并分配到与FRDRHL相同的地址。FRDRL分配给FRDRHL[7:0]位，并分配给(FRDRHL+1的地址)地址。

FRDRH和FRDRL构成一个16级FIFO寄存器，用于存储串行接收数据和软件可读的相关状态信息。该寄存器仅在异步模式下有效，包括多处理器模式或时钟同步模式。

SCI通过将接收到的数据从接收移位寄存器(RSR)传送到FRDRH和FRDRL中进行存储，从而完成一帧串行数据的接收。执行连续接收，直到存储16个阶段。如果在FRDRH和FRDRL中没有接收到数据时读取数据，则该值未定义。当FRDRH和FRDRL已满时，后续的串行接收数据会丢失。CPU可以读取FRDRH和FRDRL寄存器，但不能写入它们。

从FRDRH寄存器的RDF、ORER或DR标志读取1与从SSR\_FIFO寄存器。在读取FRDRH寄存器后写入0以清除SSR\_FIFO寄存器中的标志时，仅将0写入要清除的标志，将1写入其他标志。

读取FRDRH和FRDRL寄存器时，按从FRDRH到FRDRL的顺序读取。FRDRHL寄存器可以以16位为单位进行访问。

## 27.2.6 TDR : Transmit Data Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x03

| Bit | Symbol | Function             | R/W |
|-----|--------|----------------------|-----|
| 7:0 | n/a    | Serial Transmit Data | R/W |

TDR is an 8-bit register that stores transmit data.

When the SCI detects that the TSR register is empty, it transfers the transmit data written in the TDR register to the TSR register and starts transmission.

The double-buffered structure of the TDR and TSR registers enables continuous serial transmission. If the next transmit data is already written to TDR when one frame of data is transmitted, the SCI transfers the written data to the TSR register to continue transmission.

The CPU can read from or write to TDR at any time. Only write transmit data to TDR once after each instance of the transmit data empty interrupt (SCIn\_TXI).

## 27.2.7 TDRHL : Transmit Data Register for Non-Manchester mode (MMR.MANEN = 0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0E

| Bit  | Symbol    | Function  | R/W |
|------|-----------|---|-----|
| 8:0  | TDAT[8:0] | Serial Transmit Data                                | R/W |
| 15:9 | —         | This bit is read as 1. The write value should be 1. | R/W |

TDRHL is a 16-bit register that stores transmit data. Use this register when asynchronous mode and 9-bit data length are selected.

The lower 8 bits of TDRHL are the shadow register of TDR, so access to TDRHL affects the TDR register. Access to the TDRHL register is prohibited if 7-bit or 8-bit data length is selected.

When empty space is detected in the TSR register, the transmit data stored in the TDRHL registers is transferred to TSR and transmission starts.

The TSR and TDRHL registers have a double-buffered structure to support continuous transmission. When the next data to be transmitted is stored in TDRHL after one frame of data is transmitted, the transmitting operation continues by transferring the data to the TSR register.

The CPU can read and write to the TDRHL register. Bits [15:9] in TDRHL are fixed to 1. These bits are read as 1. The write value should be 1.

Write transmit data to the TDRHL register only once when a transmit data empty interrupt (SCIn\_TXI) request is issued.

## 27.2.6 TDR: 发送数据寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x03

| Bit | Symbol | Function | R/W |
|-----|--------|----------|-----|
| 7:0 | n/a    | 串行传输数据   | R/W |

TDR是一个8位寄存器，用于存储发送数据。

当SCI检测到TSR寄存器为空时，将写入TDR寄存器的发送数据传送到TSR寄存器并开始发送。

TDR和TSR寄存器的双缓冲结构可实现连续串行传输。如果在发送一帧数据时，下一个发送数据已经写入TDR，则SCI将写入的数据传输到TSR寄存器继续发送。

CPU可以随时读取或写入TDR。每次发送数据空中断(SCIn\_TXI)后，仅将发送数据写入TDR一次。

## 27.2.7 TDRHL: 非曼彻斯特模式的发送数据寄存器 (MMR.MANEN=0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0E

| Bit  | Symbol    | Function       | R/W |
|------|-----------|----------------|-----|
| 8:0  | TDAT[8:0] | 串行传输数据         | R/W |
| 15:9 | —         | 该位读取为1。写入值应为1。 | R/W |

TDRHL是一个16位寄存器，用于存储发送数据。选择异步模式和9位数据长度时，请使用此寄存器。

TDRHL的低8位是TDR的影子寄存器，因此访问TDRHL会影响TDR寄存器。访问如果选择7位或8位数据长度，则禁止TDRHL寄存器。

当在TSR寄存器中检测到空空间时，存储在TDRHL寄存器中的发送数据被传送到TSR并开始发送。

TSR和TDRHL寄存器具有双缓冲结构以支持连续传输。当发送完一帧数据后，下一个要发送的数据存储在TDRHL中时，通过将数据传输到TSR寄存器来继续发送操作。

CPU可以读取和写入TDRHL寄存器。TDRHL中的位[15:9]固定为1。这些位被读取为1。写入值应为1。

当发送数据空中断(SCIn\_TXI)请求发出时，仅将发送数据写入TDRHL寄存器一次。

## 27.2.8 TDRHL\_MAN : Transmit Data Register for Manchester mode (MMR.MANEN = 1)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n(n = 3, 4)

Offset address: 0x0E

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 8:0   | TDAT[8:0] | Serial transmit data<br>It can set serial transmit data  | R/W |
| 9     | MPBT      | Multi-processor transfer bit flag<br>Value of the multi-processor bit in the transmission frame<br>0: Data transmission cycles<br>1: ID transmission cycles  | R/W |
| 11:10 | —         | The write value should be 1.   | R   |
| 12    | TSYNC     | Transmit SYNC data bit<br>It is valid when MMR.SBSEL = 1 and MMR.SYNSEL = 1 in Manchester mode.<br>0: The Start Bit is transmitted as DATA SYNC.<br>1: The Start Bit is transmitted as COMMAND SYNC. | R/W |
| 15:13 | —         | The write value should be 1.   | R   |

TDRHL\_MAN is a 16-bit register that stores transmit data. Use this register when asynchronous mode and 9-bit data length are selected.

The lower 8 bits of TDRHL\_MAN are the shadow register of TDR, so access to TDRHL\_MAN affects the TDR register. Access to the TDRHL\_MAN register is prohibited if 7-bit or 8-bit data length is selected.

When empty space is detected in the TSR register, the transmit data stored in the TDRHL\_MAN registers is transferred to TSR and transmission starts.

The TSR and TDRHL\_MAN registers have a double-buffered structure to support continuous transmission. When the next data to be transmitted is stored in TDRHL\_MAN after one frame of data is transmitted, the transmitting operation continues by transferring the data to the TSR register.

Write transmit data to the TDRHL\_MAN register only once when a transmit data empty interrupt (SCIn\_TXI) request is issued.

**TDAT[8:0] bit (Serial transmit data)**

This register sets serial transmission data.

**MPBT bit (Multi-processor transfer bit flag)**

Selects the multi processor bit of transmit frame.

**TSYNC bit (Transmit SYNC data bit)**

When Manchester mode and MMR.SBSEL = "1" and MMR.SYNSEL = "1", the type of SYNC selected according to this bit becomes the Start Bit of the transmission frame.

## 27.2.8 TDRHL\_MAN: 曼彻斯特模式的发送数据寄存器 (MMR.MANEN=1)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n(n = 3, 4)

Offset address: 0x0E

| Bit   | Symbol    | Function  | R/W |
|-------|-----------|---|-----|
| 8:0   | TDAT[8:0] | 串行传输数据<br>可设置串口发送数据   | R/W |

| 11:10 | —         | 写入值应为1。   | R   |
| 12    | TSYNC     | 发送SYNC数据位<br>在曼彻斯特模式下, 当MMR.SBSEL=1和MMR.SYNSEL=1时有效。<br>0: 起始位作为DATASYNC发送。1: 起始位作为COM<br>MANDSYNC发送。 | R/W |
| 15:13 | —         | 写入值应为1。   | R   |

TDRHL\_MAN是一个16位寄存器, 用于存储发送数据。选择异步模式和9位数据长度时, 请使用此寄存器。

TDRHL\_MAN的低8位是TDR的影子寄存器, 因此访问TDRHL\_MAN会影响TDR寄存器。如果选择7位或8位数据长度, 则禁止访问TDRHL\_MAN寄存器。

当在TSR寄存器中检测到空空间时, 存储在TDRHL\_MAN寄存器中的发送数据被传输到TSR和传输开始。

TSR和TDRHL\_MAN寄存器具有双缓冲结构以支持连续传输。当下一个要发送的数据在发送一帧数据后存储在TDRHL\_MAN中时, 通过将数据传输到TSR寄存器来继续发送操作。

当发出发送数据空中断(SCIn\_TXI)请求时, 仅将发送数据写入TDRHL\_MAN寄存器一次。

**TDAT[8:0]位 (串行发送数据)**

该寄存器设置串行传输数据。

**MPBT位 (多处理器传输位标志)**

选择发送帧的多处理器位。

**TSYNC位 (发送SYNC数据位)**

当曼彻斯特模式和MMR.SBSEL="1"且MMR.SYNSEL="1"时, 根据该位选择的SYNC类型成为传输帧的起始位。

## 27.2.9 FTDRHL/FTDRH/FTDRL : Transmit FIFO Data Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x0E (FTDRHL/FTDRH)  
0x0F (FTDRL)

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 8:0   | TDAT[8:0] | Serial transmit data<br>Specifies the serial transmit data.<br>Valid only in asynchronous mode, including multi-processor mode, and clock synchronous mode, and with FIFO selected.  | W   |
| 9     | MPBT      | Multi-Processor Transfer Bit Flag<br>Specifies the multi-processor bit in the transmission frame. Valid only in asynchronous mode and SMR.MP = 1, and with FIFO selected. Valid only in asynchronous mode, including multi-processor mode, and clock synchronous mode, and with FIFO selected.<br><br>0: Data transmission cycle<br>1: ID transmission cycle | W   |
| 15:10 | —         | The write value should be 1.   | W   |

FTDRHL is a 16-bit register that consists of the 8-bit FTDRH and FTDRL registers. FTDRH is assigned to the FTDRHL[15:8] bits, and allocated to the same address as FTDRHL. FTDRL is assigned to the FTDRHL[7:0] bits, and allocated to (the address of FTDRHL + 1) address.

FTDRH and FTDRL constitute a 16-stage FIFO register that stores data for serial transmission and a multi-processor transfer bit. This register is only valid in asynchronous mode, including multi-processor mode, or clock synchronous mode.

When the SCI detects that the Transmit Shift Register (TSR) is empty, it transfers data written in the FTDRH and FTDRL registers to the TSR register and starts serial transmission. Continuous serial transmission is executed until no transmit data is left in FTDRH and FTDRL. When FTDRHL is full of transmit data, no more data can be written. If writing new data is attempted, the data is ignored. The CPU can write to the FTDRH and FTDRL registers but cannot read them.

When writing to both the FTDRH and FTDRL registers, write in order from FTDRH to FTDRL.

**TDAT[8:0] bits (Serial transmit data)**

The TDAT[8:0] bits set the serial transmission data. This is valid only when FIFO is selected in asynchronous mode (including multiprocessor) or clock synchronous mode.

**MPBT flag (Multi-Processor Transfer Bit Flag)**

The MPBT flag specifies the value of the multi-processor bit of the transmit frame. When FCR.FM = 1, SSR.MPBT is invalid.

## 27.2.10 TSR : Transmit Shift Register

TSR is a shift register that transmits serial data. To perform serial data transmission, the SCI first automatically transfers transmit data from TDR, TDRHL, or transmit FIFO to TSR, then sends the data to the TXDn pin. The CPU cannot directly access the TSR.

## 27.2.9 FTDRHLFTDRHFTDRL:发送FIFO数据寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x0E (FTDRHL/FTDRH)  
0x0F (FTDRL)

| Bit   | Symbol    | Function   | R/W |
|-------|-----------|--|-----|
| 8:0   | TDAT[8:0] | 串行传输数据<br>指定串行传输数据。<br>仅在异步模式下有效，包括多处理器模式和时钟同步模式，并且选择了FIFO。  | W   |
| 9     | MPBT      | 多处理器传输位标志<br>指定传输帧中的多处理器位。仅在异步模式和SMR.MP=1且选择FIFO时有效。仅在异步模式下有效，包括多处理器模式和时钟同步模式，并选择FIFO。<br><br>0: 数据发送周期1: ID发送周期 | W   |
| 15:10 | —         | 写入值应为1。  | W   |

FTDRHL是一个16位寄存器，由8位FTDRH和FTDRL寄存器组成。FTDRH分配给FTDRHL[15:8]位，并分配到与FTDRHL相同的地址。FTDRL分配给FTDRHL[7:0]位，并分配给（FTDRHL的地址+1）地址。

FTDRH和FTDRL构成一个16级FIFO寄存器，用于存储串行传输的数据和一个多处理器传输位。该寄存器仅在异步模式下有效，包括多处理器模式或时钟同步模式。

当SCI检测到传输移位寄存器(TSR)为空时，它将写入FTDRH和FTDRL寄存器的数据传输到TSR寄存器并开始串行传输。执行连续串行传输，直到在FTDRH和FTDRL中没有剩余传输数据。当FTDRHL充满传输数据时，不能再写入数据。如果尝试写入新数据，则忽略该数据。CPU可以写入FTDRH和FTDRL寄存器，但不能读取它们。

当同时写入FTDRH和FTDRL寄存器时，按照从FTDRH到FTDRL的顺序写入。

**TDAT[8:0]位 (串行发送数据)**

TDAT[8:0]位设置串行传输数据。这仅在异步模式（包括多处理器）或时钟同步模式下选择FIFO时有效。

**MPBT标志 (多处理器传输位标志)**

MPBT标志指定发送帧的多处理器位的值。FCR.FM=1时，SSR.MPBT无效。

## 27.2.10 TSR: 发送移位寄存器

TSR是传送串行数据的移位寄存器。为了进行串行数据传输，SCI首先自动将发送数据从TDR、TDRHL或发送FIFO传输到TSR，然后将数据发送到TXDn引脚。CPU不能直接访问TSR。

27.2.11 SMR : Serial Mode Register for Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x00

| Bit | Symbol   | Function   | R/W              |
|-----|----------|--|------------------|
| 1:0 | CKS[1:0] | Clock Select<br>0 0: PCLK clock (n = 0) <sup>*1</sup><br>0 1: PCLK/4 clock (n = 1) <sup>*1</sup><br>1 0: PCLK/16 clock (n = 2) <sup>*1</sup><br>1 1: PCLK/64 clock (n = 3) <sup>*1</sup>   | R/W <sup>4</sup> |
| 2   | MP       | Multi-Processor Mode<br>Valid only in asynchronous mode.<br>0: Disable multi-processor communications function<br>1: Enable multi-processor communications function  | R/W <sup>4</sup> |
| 3   | STOP     | Stop Bit Length<br>Valid only in asynchronous mode.<br>0: 1 stop bit<br>1: 2 stop bits   | R/W <sup>4</sup> |
| 4   | PM       | Parity Mode<br>Valid only when the PE bit is 1.<br>0: Even parity<br>1: Odd parity   | R/W <sup>4</sup> |
| 5   | PE       | Parity Enable<br>Valid only in asynchronous mode.<br>0: When transmitting: Do not add parity bit<br>When receiving: Do not check parity bit<br>1: When transmitting: Add parity bit<br>When receiving: Check parity bit  | R/W <sup>4</sup> |
| 6   | CHR      | Character Length<br>Valid only in asynchronous mode. <sup>*2</sup><br>Selects the transmit/receive character length in combination with the SCMR.CHR1 bit.<br>0: SCMR.CHR1 = 0: Transmit/receive in 9-bit data length<br>SCMR.CHR1 = 1: Transmit/receive in 8-bit data length (initial value)<br>1: SCMR.CHR1 = 0: Transmit/receive in 9-bit data length<br>SCMR.CHR1 = 1: Transmit/receive in 7-bit data length <sup>*3</sup> | R/W <sup>4</sup> |
| 7   | CM       | Communication Mode<br>0: Asynchronous mode or simple IIC mode<br>1: Clock synchronous mode or simple SPI mode  | R/W <sup>4</sup> |

Note 1. n is the decimal notation of the value of n in the BRR register. See [section 27.2.20. BRR : Bit Rate Register](#).  
 Note 2. In any mode other than asynchronous mode, this bit setting is invalid and a fixed data length of 8 bits is used.  
 Note 3. LSB-first is fixed and the MSB (bit [7]) in the TDR register is not transmitted in transmit mode.  
 Note 4. Writable only when SCR.TE = 0 and SCR.RE = 0 (both serial transmission and reception are disabled).

The SMR register sets the communication format and clock source for the on-chip baud rate generator.

**CKS[1:0] bits (Clock Select)**

The CKS[1:0] bits select the clock source for the on-chip baud rate generator. For the relationship between the settings of these bits and the baud rate, see [section 27.2.20. BRR : Bit Rate Register](#).

27.2.11 SMR: 非智能卡接口模式的串行模式寄存器 (SCMR.SMIF=0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x00

| Bit | Symbol   | Function  | R/W              |

| 1:0 | CKS[1:0] | 时钟选择<br>0 0: PCLK clock (n = 0) <sup>*1</sup><br>0 1: PCLK/4 clock (n = 1) <sup>*1</sup><br>1 0: PCLK/16 clock (n = 2) <sup>*1</sup><br>1 1: PCLK/64 clock (n = 3) <sup>*1</sup>              | R/W <sup>4</sup> |
| 2   | MP       | Multi-Processor Mode<br>仅在异步模式下有效。<br>0: 禁用多机通讯功能1: 启用多机通讯功能  | R/W <sup>4</sup> |
| 3   | STOP     | 停止位长度<br>仅在异步模式下有效。<br>0: 1个停止位<br>1: 2个停止位   | R/W <sup>4</sup> |
| 4   | PM       | 奇偶校验模式<br>仅在PE位为1时有效。<br>0: 偶校验1: 奇校验   | R/W <sup>4</sup> |
| 5   | PE       | 奇偶校验使能<br>仅在异步模式下有效。<br>0: 发送时: 不加校验位接收时: 不校验校验位<br>1: 发送时: 添加校验位接收时: 校验校验位   | R/W <sup>4</sup> |
| 6   | CHR      | 字符长度<br>仅在异步模式下有效。 <sup>*2</sup><br>结合SCMR.CHR1位选择发送接收字符长度。<br>0: SCMR.CHR1=0: 发送接收9位数据长度<br>SCMR.CHR1=1: 发送接收8位数据长度 (初始值)<br>1: SCMR.CHR1=0: 发送接收9位数据长度SCMR.CHR1=1: 发送接收7位数据长度 <sup>*3</sup> | R/W <sup>4</sup> |
| 7   | CM       | 通讯方式<br>0: 异步模式或简单IIC模式1: 时钟同步模式或简单SPI模式  | R/W <sup>4</sup> |

注1.n是BRR寄存器中n值的十进制表示法。请参阅第27.2.20节。BRR: 比特率寄存器。  
 注2.在异步模式以外的任何模式下, 该位设置无效, 使用8位的固定数据长度。  
 注3.LSB-first是固定的, 并且TDR寄存器中的MSB (位[7]) 在发送模式下不发送。  
 注4.仅当SCR.TE=0且SCR.RE=0时可写 (串行发送和接收均禁用)。

SMR寄存器设置片内波特率发生器的通信格式和时钟源。

**CKS[1:0] bits (Clock Select)**

CKS[1:0]位选择片内波特率发生器的时钟源。关于这些位的设置与波特率之间的关系, 请参见第27.2.20节。BR: 比特率寄存器。

**MP bit (Multi-Processor Mode)**

The MP bit disables or enables the multi-processor communications function. The PE and PM bit settings are invalid in multi-processor mode.

**STOP bit (Stop Bit Length)**

The STOP bit selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

**PM bit (Parity Mode)**

The PM bit selects the parity mode (even or odd) for transmission and reception. The PM bit setting is invalid in multiprocessor mode.

**PE bit (Parity Enable)**

When the PE bit is set to 1, the parity bit is added to transmit data, and the parity bit is checked in reception. Regardless of the PE bit setting, the parity bit is not added or checked in multi-processor format.

**CHR bit (Character Length)**

The CHR bit selects the data length for transmission and reception in combination with the SCMR.CHR1 bit. In modes other than asynchronous, a fixed data length of 8 bits is used.

**CM bit (Communication Mode)**

The CM bit selects the communication mode:

- Asynchronous mode or simple IIC mode
- Clock synchronous mode or simple SPI mode

**27.2.12 SMR\_SMCI : Serial Mode Register for Smart Card Interface Mode (SCMR.SMIF = 1)**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x00

|                    |    |     |    |    |          |          |   |   |
|--------------------|----|-----|----|----|----------|----------|---|---|
| Bit position:      | 7  | 6   | 5  | 4  | 3        | 2        | 1 | 0 |
| Bit field:         | GM | BLK | PE | PM | BCP[1:0] | CKS[1:0] |   |   |
| Value after reset: | 0  | 0   | 0  | 0  | 0        | 0        | 0 | 0 |

| Bit | Symbol   | Function   | R/W              |
|-----|----------|--|------------------|
| 1:0 | CKS[1:0] | Clock Select<br>0 0: PCLK clock (n = 0) <sup>*1</sup><br>0 1: PCLK/4 clock (n = 1) <sup>*1</sup><br>1 0: PCLK/16 clock (n = 2) <sup>*1</sup><br>1 1: PCLK/64 clock (n = 3) <sup>*1</sup> | R/W <sup>2</sup> |
| 3:2 | BCP[1:0] | Base Clock Pulse<br>Selects the number of base clock cycles in combination with the SCMR.BCP2 bit. Table 27.4 lists the combinations of the SCMR.BCP2 and SMR.BCP[1:0] bits.             | R/W <sup>2</sup> |
| 4   | PM       | Parity Mode<br>Valid only when the PE bit is 1.<br>0: Even parity<br>1: Odd parity   | R/W <sup>2</sup> |
| 5   | PE       | Parity Enable<br>When this bit is set to 1, a parity bit is added to transmit data, and the parity of received data is checked. Set this bit to 1 in smart card interface mode.          | R/W <sup>2</sup> |

**MP bit (Multi-Processor Mode)**

MP位禁用或启用多处理器通信功能。PE和PM位设置在多处理器模式下无效。

**停止位 (停止位长度)**

STOP位选择传输中的停止位长度。

在接收中, 无论该位设置如何, 都只检查第一个停止位。如果第二个停止位为0, 则将其视为下一个发送帧的起始位。

**PM bit (Parity Mode)**

PM位选择发送和接收的奇偶校验模式 (偶数或奇数)。PM位设置在多处理器模式下无效。

**PE位 (奇偶校验使能)**

当PE位设置为1时, 发送数据时添加奇偶校验位, 接收时检查奇偶校验位。无论PE位设置如何, 在多处理器格式中都不会添加或检查奇偶校验位。

**CHR bit (Character Length)**

CHR位与SCMR.CHR1位一起选择发送和接收的数据长度。在非异步模式下, 使用8位的固定数据长度。

**CM bit (Communication Mode)**

CM位选择通信模式:

- 异步模式或简单IIC模式
- 时钟同步模式或简单SPI模式

**27.2.12 SMR\_SMCI: 智能卡接口模式的串行模式寄存器(SCMR.SMIF=1)**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

| 1             | 01b                    | 64 clock cycles (S = 64)  |
| 1             | 10b                    | 372 clock cycles (S = 372)  |
| 1             | 11b                    | 256 clock cycles (S = 256)  |

Note 1. S is the value of S in BRR (see [section 27.2.20. BRR : Bit Rate Register](#)).

#### PM bit (Parity Mode)

The PM bit selects the parity mode for transmission and reception (even or odd). For details on the usage of this bit in smart card interface mode, see [section 27.7.2. Data Format \(Except in Block Transfer Mode\)](#).

#### PE bit (Parity Enable)

Set the PE bit to 1. The parity bit is added to transmit data before transmission, and the parity bit is checked in reception.

#### BLK bit (Block Transfer Mode)

Setting the BLK bit to 1 enables block transfer mode operation. For details, see [section 27.7.3. Block Transfer Mode](#).

#### GM bit (GSM Mode)

Setting the GM bit to 1 enables GSM mode operation. In GSM mode, the SSR\_SMCI.TEND flag set timing is moved forward to 11.0 ETUs (elementary time unit = 1-bit transfer time) from the start bit, and clock output control is added. For details, see [section 27.7.6. Serial Data Transmission \(Except in Block Transfer Mode\)](#) and [section 27.7.8. Clock Output Control](#).

| Bit | Symbol | Function                        | R/W              |
|-----|--------|---------------------------------|------------------|
| 6   | BLK    | 块传输模式<br>0: 正常模式操作1: 块传输模式操作    | R/W <sup>2</sup> |
| 7   | GM     | GSM Mode<br>0: 正常模式操作1: GSM模式操作 | R/W <sup>2</sup> |

注1.n是BRR寄存器中n值的十进制表示法。请参阅第27.2.20节。BRR: 比特率寄存器。

注2.仅当SCR\_SMCI.TE=0且SCR\_SMCI.RE=0时可写(串行发送和接收均禁用)。

SMR\_SMCI寄存器设置片内波特率发生器的通信格式和时钟源。

#### CKS[1:0] bits (Clock Select)

CKS[1:0]位选择片内波特率发生器的时钟源。关于这些位的设置与波特率之间的关系, 请参见第27.2.20节。BR: 比特率寄存器。

#### BCP[1:0]位 (基本时钟脉冲)

BCP[1:0]位选择智能卡接口模式下1位数据传输时间内的基本时钟周期数。将这些位与SCMR.BCP2位一起设置。

有关详细信息, 请参阅第27.7.4节。接收数据采样时序和接收余量。

Table 27.4 SCMR.BCP2和SMR\_SMCI.BCP[1:0]位的组合

| SCMR.BCP2 bit | SMR_SMCI.BCP[1:0] bits | 1位传输周期的基本时钟周期数*1    |
|---------------|------------------------|---------------------|
| 0             | 00b                    | 93个时钟周期(S=93)       |
| 0             | 01b                    | 128个时钟周期(S=128)     |
| 0             | 10b                    | 186个时钟周期(S=186)     |
| 0             | 11b                    | 512个时钟周期(S=512)     |
| 1             | 00b                    | 32个时钟周期(S=32) (初始值) |
| 1             | 01b                    | 64个时钟周期(S=64)       |
| 1             | 10b                    | 372个时钟周期(S=372)     |
| 1             | 11b                    | 256个时钟周期(S=256)     |

注1.S是BRR中S的值(参见第27.2.20节。BRR: 比特率寄存器)。

#### PM bit (Parity Mode)

PM位选择发送和接收的奇偶校验模式(偶数或奇数)。关于智能卡接口模式下该位的使用详情, 请参见第27.7.2节。数据格式(块传输模式除外)。

#### PE位 (奇偶校验使能)

将PE位设置为1。发送数据前添加奇偶校验位, 接收时校验奇偶校验位。

#### BLK位 (块传输模式)

将BLK位设置为1可启用块传输模式操作。详见27.7.3节。块传输模式。

#### GM bit (GSM Mode)

将GM位设置为1启用GSM模式操作。在GSM模式下, SSR\_SMCI.TEND标志设置时序从起始位前移到11.0ETU(基本时间单位=1位传输时间), 并添加了时钟输出控制。详见27.7.6节。串行数据传输(块传输模式除外)和第27.7.8节。时钟输出控制。

27.2.13 SCR : Serial Control Register for Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x02

Bit position: 7 6 5 4 3 2 1 0

|            |     |     |    |    |      |      |          |
|------------|-----|-----|----|----|------|------|----------|
| Bit field: | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] |
|------------|-----|-----|----|----|------|------|----------|

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol   | Function  | R/W              |
|-----|----------|---|------------------|
| 1:0 | CKE[1:0] | Clock Enable<br>0 0: In asynchronous mode, the SCKn pin is available for use as an I/O port based on the I/O port settings.<br>In clock synchronous mode, the SCKn pin functions as the clock output pin.<br>0 1: In asynchronous mode, a clock with the same frequency as the bit rate is output from the SCKn pin.<br>In clock synchronous mode, the SCKn pin functions as the clock output pin.<br>Others: In asynchronous mode, input a clock with a frequency 16 times the bit rate from the SCKn pin when the SEMR.ABCS bit is 0. Input a clock signal with a frequency eight times the bit rate when the SEMR.ABCS bit is 1. The SCKn pin is available for use as an I/O port based on the I/O port settings when the GPT clock <sup>4</sup> is used.<br>In clock synchronous mode, the SCKn pin functions as the clock input pin. | R/W <sup>1</sup> |
| 2   | TEIE     | Transmit End Interrupt Enable<br>0: Disable SCIn_TEI interrupt requests<br>1: Enable SCIn_TEI interrupt requests  | R/W              |
| 3   | MPIE     | Multi-Processor Interrupt Enable<br>Valid in asynchronous mode when SMR.MP = 1.<br>0: Normal reception<br>1: When data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags RDRF, ORER, and FER in SSR to 1 and the status flags SYER, PFER, and SBER in MESR are disabled.<br>When data with the multi-processor bit set to 1 is received, the MPIE bit is automatically set to 0, and normal reception is resumed.   | R/W <sup>3</sup> |
| 4   | RE       | Receive Enable<br>0: Disable serial reception<br>1: Enable serial reception   | R/W <sup>2</sup> |
| 5   | TE       | Transmit Enable<br>0: Disable serial transmission<br>1: Enable serial transmission  | R/W <sup>2</sup> |
| 6   | RIE      | Receive Interrupt Enable<br>0: Disable SCIn_RXI and SCIn_ERI interrupt requests<br>1: Enable SCIn_RXI and SCIn_ERI interrupt requests   | R/W              |
| 7   | TIE      | Transmit Interrupt Enable<br>0: Disable SCIn_TXI interrupt requests<br>1: Enable SCIn_TXI interrupt requests  | R/W              |

- Note 1. Writable only when TE = 0 and RE = 0.  
 Note 2. 1 can be written only when TE = 0 and RE = 0, when the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written to TE and RE. When the SMR.CM bit is 0 and the SIMR1.IICM bit is 0, writing is enabled under any condition.  
 Note 3. When writing a new value to a bit other than the MPIE bit of this register in multi-processor mode (SMR.MP bit = 1), write 0 to the MPIE bit using the store instruction to avoid accidentally setting the MPIE bit to 1 by a read-modify-write operation when using a bit manipulation instruction.  
 Note 4. GPT clock is selectable for SCI1 and SCI2.

The SCR register controls operation and clock source selection for transmission and reception.

**CKE[1:0] bits (Clock Enable)**

The CKE[1:0] bits select the clock source and the SCKn pin function.

27.2.13 SCR: 非智能卡接口模式的串行控制寄存器 (SCMR.SMIF=0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x02

Bit position: 7 6 5 4 3 2 1 0

|            |     |     |    |    |      |      |          |
|------------|-----|-----|----|----|------|------|----------|
| Bit field: | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] |
|------------|-----|-----|----|----|------|------|----------|

重置后的值: 0 0 0 0 0 0 0 0

| Bit | Symbol   | Function   | R/W              |
|-----|----------|--|------------------|
| 1:0 | CKE[1:0] | 时钟使能<br>00: 在异步模式下, SCKn引脚可根据IO端口设置用作IO端口。在时钟同步模式下, SCKn引脚用作时钟输出引脚。<br>01: 在异步模式下, 从SCKn引脚输出与比特率相同频率的时钟。在时钟同步模式下, SCKn引脚用作时钟输出引脚。<br>其他: 异步模式下, SEMR.ABCS位为0时, 从SCKn引脚输入16倍比特率的时钟。SEMR.ABCS位为1时, 输入8倍比特率的时钟信号。当使用GPT时钟 <sup>4</sup> 时, SCKn引脚可根据IO端口设置用作IO端口。在时钟同步模式下, SCKn引脚用作时钟输入引脚。 | R/W <sup>1</sup> |
| 2   | TEIE     | 发送结束中断使能<br>0: 禁用SCIn_TEI中断请求<br>1: 启用SCIn_TEI中断请求   | R/W              |
| 3   | MPIE     | 多处理器中断使能<br>当SMR.MP=1时在异步模式下有效。<br>0: 正常接收<br>1: 接收多处理器位设置为0的数据时, 不读取数据, 将SSR中的状态标志RDRF、ORER和FER设置为1, 并将状态标志SYER、PFER和MESR中的SBER被禁用。当接收到多处理器位设置为1的数据时, MPIE位自动设置为0, 并恢复正常接收。   | R/W <sup>3</sup> |
| 4   | RE       | 接收启用<br>0: 禁用串口接收<br>1: 启用串口接收   | R/W <sup>2</sup> |
| 5   | TE       | 发送启用<br>0: 禁用串口传输<br>1: 启用串口传输   | R/W <sup>2</sup> |
| 6   | RIE      | 接收中断使能<br>0: 禁用SCIn_RXI和SCIn_ERI中断请求<br>1: 启用SCIn_RXI和SCIn_ERI中断请求   | R/W              |
| 7   | TIE      | 发送中断使能<br>0: 禁用SCIn_TXI中断请求<br>1: 启用SCIn_TXI中断请求   | R/W              |

- 注1. 仅当TE=0且RE=0时可写。  
 注2. 只有当TE=0且RE=0时, 当SMR.CM位为1时, 才能写入1。将TE或RE设置为1后, TE和RE只能写入0。当SMR.CM位为0且SIMR1.IICM位为0时, 在任何情况下都可以写入。  
 注3. 在多处理器模式下 (SMR.MP位=1) 向该寄存器的MPIE位以外的位写入新值时, 将0写入MPIE位使用存储指令以避免在使用位操作指令时通过读-修改-写操作意外将MPIE位设置为1。  
 注4. GPT时钟可选择用于SCI1和SCI2。

SCR寄存器控制发送和接收的操作和时钟源选择。

**CKE[1:0] bits (Clock Enable)**

CKE[1:0]位选择时钟源和SCKn引脚功能。

**TEIE bit (Transmit End Interrupt Enable)**

The TEIE bit enables or disables SCIn\_TEI interrupt requests. Set TEIE to 0 to disable an SCIn\_TEI interrupt request.

In simple IIC mode, SCIn\_TEI is allocated to the interrupt on completion of issuing a start, restart, or stop condition (STIn). In this case, the TEIE bit can be used to enable or disable the STI.

**MPIE bit (Multi-Processor Interrupt Enable)**

When the MPIE bit is set to 1 and data with the multi-processor bit set to 0 is received, the data is not read and setting the status flags RDRF, ORER, FER, RDF, and DR in SSR/SSR\_FIFO to 1 is disabled. When data with the multi-processor bit set to 1 is received, the MPIE bit is automatically set to 0, and normal reception resumes. For details, see [section 27.4. Multi-Processor Communication Function](#).

**Multi-Processor Communication Function.**

When the MPB bit in the SSR register is 0, the receive data is not transferred from the RSR register to the RDR register, a receive error is not detected, and setting the flags ORER and FER to 1 is disabled.

When the MPB bit is set to 1, the MPIE bit is automatically set to 0, SCIn\_RXI and SCIn\_ERI interrupt requests are enabled (if the RIE bit in SCR is set to 1), and setting of the ORER and FER flags to 1 is enabled.

Set MPIE to 0 if the multi-processor communications function is not used.

**RE bit (Receive Enable)**

The RE bit enables or disables serial reception. When the RE bit is set to 1, serial reception starts by detecting the start bit in asynchronous mode or the synchronous clock input in clock synchronous mode. Set the reception format in the SMR register before setting the RE bit to 1.

In non-FIFO operation, when reception is halted by setting the RE bit to 0, the RDRF, ORER, FER, and PER flags in the SSR register are not affected, and the previous values are retained.

When FIFO operation is selected and reception is halted by setting the RE bit to 0, the RDF, ORER, FER, PER, and DR flags in SSR\_FIFO are not affected and the previous values are retained.

**TE bit (Transmit Enable)**

The TE bit enables or disables serial transmission.

When the TE bit is set to 1, serial transmission is started by writing transmit data to the TDR register. Set the transmission format in the SMR register before setting the TE bit to 1.

**RIE bit (Receive Interrupt Enable)**

The RIE bit enables or disables SCIn\_RXI and SCIn\_ERI interrupt requests.

SCIn\_RXI and SCIn\_ERI interrupt requests are disabled by setting the RIE bit to 0.

An SCIn\_ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in SSR/SSR\_FIFO then setting the flag to 0, or by setting the RIE bit to 0.

**TIE bit (Transmit Interrupt Enable)**

The TIE bit enables or disables SCIn\_TXI interrupt requests. SCIn\_TXI interrupt requests are disabled by setting the TIE bit to 0.

Note: To switch the TIE bit value from 0 to 1 in FIFO mode, set the TIE and TE bits to 1 simultaneously or set the TIE bit to 1 when TE = 1. When TE = 0 in FIFO mode, setting the TIE bit to 1 is prohibited.

**TEIE位 (发送结束中断允许)**

TEIE位启用或禁用SCIn\_TEI中断请求。将TEIE设置为0以禁用SCIn\_TEI中断请求。

在简单IIC模式下，SCIn\_TEI在完成发出启动、重新启动或停止条件(STIn)时分配给中断。在这种情况下，TEIE位可用于启用或禁用STI。

**MPIE位 (多处理器中断允许)**

当MPIE位设置为1并且接收到多处理器位设置为0的数据时，不读取数据并且将SSR/SSR\_FIFO中的状态标志RDRF、ORER、FER、RDF和DR设置为1被禁用。当接收到多处理器位设置为1的数据时，MPIE位自动设置为0，并恢复正常接收。有关详细信息，请参阅第27.4节。多处理器通信功能。

当SSR寄存器的MPB位为0时，接收数据不会从RSR寄存器传送到RDR寄存器，不会检测到接收错误，并且将标志ORER和FER设置为1被禁止。

当MPB位设置为1时，MPIE位自动设置为0，允许SCIn\_RXI和SCIn\_ERI中断请求（如果SCR中的RIE位设置为1），并且允许设置ORER和FER标志为1。

如果不使用多处理器通信功能，则将MPIE设置为0。

**RE位 (接收使能)**

RE位启用或禁用串行接收。当RE位设置为1时，串行接收通过检测异步模式下的起始位或时钟同步模式下的同步时钟输入来启动。在将RE位设置为1之前，在SMR寄存器中设置接收格式。

在非FIFO操作中，当通过将RE位设置为0来停止接收时，RDRF、ORER、FER和PER标志SSR寄存器不受影响，保留之前的值。

When FIFO operation is selected and reception is halted by setting the RE bit to 0, the RDF, ORER, FER, PER, and DR flags in SSR\_FIFO are not affected and the previous values are retained.

**TE位 (发送使能)**

TE位启用或禁用串行传输。

当TE位设置为1时，通过将发送数据写入TDR寄存器开始串行发送。在将TE位设置为1之前，在SMR寄存器中设置传输格式。

**RIE位 (接收中断允许)**

RIE位启用或禁用SCIn\_RXI和SCIn\_ERI中断请求。

通过将RIE位设置为0来禁用SCIn\_RXI和SCIn\_ERI中断请求。

SCIn\_ERI中断请求可以通过从SSR/SSR\_FIFO中的ORER、FER或PER标志读取1然后将该标志设置为0或通过RIE位设置为0来取消。

**TIE位 (发送中断允许)**

TIE位启用或禁用SCIn\_TXI中断请求。通过将TIE位设置为0来禁用SCIn\_TXI中断请求。

Note: 要在FIFO模式下将TIE位值从0切换为1，请将TIE和TE位同时设置为1，或者在TE=1时将TIE位设置为1。在FIFO模式下，当TE=0时，将TIE位设置为1是禁止。

## 27.2.14 SCR\_SMCI : Serial Control Register for Smart Card Interface Mode (SCMR.SMIF = 1)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x02

Bit position: 7 6 5 4 3 2 1 0

|            |     |     |    |    |      |      |          |

| 7   | TIE      | Transmit Interrupt Enable<br>0: Disable SCIn_TXI interrupt requests<br>1: Enable SCIn_TXI interrupt requests   | R/W              |

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0. After setting TE or RE to 1, only 0 can be written to TE and RE.

The SCR\_SMCI register sets transmission and reception control, interrupt control, and clock source selection for transmission and reception.

For details on interrupt requests, see [section 27.12. Interrupt Sources](#).

### CKE[1:0] bits (Clock Enable)

The CKE[1:0] bits control the clock output from the SCKn pin. In GSM mode, clock output can be dynamically switched.

For details, see [section 27.7.8. Clock Output Control](#).

### TEIE bit (Transmit End Interrupt Enable)

Set the TEIE bit to 0 in smart card interface mode.

### MPIE bit (Multi-Processor Interrupt Enable)

Set the MPIE bit to 0 in smart card interface mode.

## 27.2.14 SCR\_SMCI: 智能卡接口模式的串行控制寄存器(SCMR.SMIF=1)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x02

Bit position: 7 6 5 4 3 2 1 0

注1. 仅当TE=0且RE=0时可写。

注2. 只有TE=0且RE=0时才能写入1。将TE或RE设置为1后, TE和RE只能写入0。

SCR\_SMCI寄存器设置发送和接收的发送和接收控制、中断控制以及发送和接收的时钟源选择。

有关中断请求的详细信息, 请参阅第27.12节。中断源。

### CKE[1:0] bits (Clock Enable)

CKE[1:0]位控制SCKn引脚的时钟输出。在GSM模式下, 时钟输出可以动态切换。

有关详细信息, 请参阅第27.7.8节。时钟输出控制。

### TEIE位 (发送结束中断允许)

在智能卡接口模式下将TEIE位设置为0。

### MPIE位 (多处理器中断允许)

在智能卡接口模式下将MPIE位设置为0。

**RE bit (Receive Enable)**

The RE bit enables or disables serial reception. When the RE bit is set to 1, serial reception starts by detecting the start bit. Set the reception format in the SMR\_SMCI register before setting the RE bit to 1.

If reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR\_SMCI are not affected and the previous values are retained.

**TE bit (Transmit Enable)**

The TE bit enables or disables serial transmission. When the TE bit is set to 1, serial transmission is started by writing transmit data to TDR. Set the transmission format in the SMR\_SMCI register before setting the TE bit to 1.

**RIE bit (Receive Interrupt Enable)**

The RIE bit enables or disables SCIn\_RXI and SCIn\_ERI interrupt requests.

SCIn\_RXI and SCIn\_ERI interrupt requests are disabled by setting the RIE bit to 0.

An SCIn\_ERI interrupt request can be canceled by reading 1 from the ORER, FER, or PER flag in the SSR\_SMCI register, and then setting the flag to 0, or by setting the RIE bit to 0.

**TIE bit (Transmit Interrupt Enable)**

The TIE bit enables or disables SCIn\_TXI interrupt requests. SCIn\_TXI interrupt requests are disabled by setting the TIE bit to 0.

### 27.2.15 SSR : Serial Status Register for Non-Smart Card Interface and Non-FIFO Mode (SCMR.SMIF = 0, FCR.FM = 0, and MMR.MANEN = 0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x04

|                    |      |      |      |     |     |      |     |      |
|--------------------|------|------|------|-----|-----|------|-----|------|
| Bit position:      | 7    | 6    | 5    | 4   | 3   | 2    | 1   | 0    |
| Bit field:         | TDRE | RDRF | ORER | FER | PER | TEND | MPB | MPBT |
| Value after reset: | 1    | 0    | 0    | 0   | 0   | 1    | 0   | 0    |

| Bit | Symbol | Function   | R/W                 |
|-----|--------|--|---------------------|
| 0   | MPBT   | Multi-Processor Bit Transfer<br>Sets the value of the multi-processor bit in the transmission frame.<br>0: Data transmission cycle<br>1: ID transmission cycle | R/W                 |
| 1   | MPB    | Multi-Processor<br>Value of the multi-processor bit in the reception frame.<br>0: Data transmission cycle<br>1: ID transmission cycle                          | R                   |
| 2   | TEND   | Transmit End Flag<br>0: A character is being transmitted<br>1: Character transfer is complete  | R                   |
| 3   | PER    | Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred   | R/(W) <sup>*1</sup> |
| 4   | FER    | Framing Error Flag<br>0: No framing error occurred<br>1: Framing error occurred  | R/(W) <sup>*1</sup> |
| 5   | ORER   | Overrun Error Flag<br>0: No overrun error occurred<br>1: Overrun error occurred  | R/(W) <sup>*1</sup> |

**RE位 (接收使能)**

RE位启用或禁用串行接收。当RE位设置为1时，串行接收通过检测起始位开始。在将RE位设置为1之前，在SMR\_SMCI寄存器中设置接收格式。

如果通过将RE位设置为0来停止接收，则SSR\_SMCI中的ORER、FER和PER标志不受影响，并且保留以前的值。

**TE位 (发送使能)**

TE位启用或禁用串行传输。当TE位设置为1时，通过将发送数据写入TDR开始串行发送。在将TE位设置为1之前，在SMR\_SMCI寄存器中设置传输格式。

**RIE位 (接收中断允许)**

RIE位启用或禁用SCIn\_RXI和SCIn\_ERI中断请求。

通过将RIE位设置为0来禁用SCIn\_RXI和SCIn\_ERI中断请求。

通过从SSR\_SMCI寄存器中的ORER、FER或PER标志读取1，然后将该标志设置为0，或将RIE位设置为0，可以取消SCIn\_ERI中断请求。

**TIE位 (发送中断允许)**

TIE位启用或禁用SCIn\_TXI中断请求。通过将TIE位设置为0来禁用SCIn\_TXI中断请求。

### 27.2.15 SSR: 非智能卡接口和非FIFO模式的串行状态寄存器 (SCMR.SMIF=0、FCR.FM=0和MMR.MANEN=0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x04

|               |      |      |      |     |     |      |     |      |
|---------------|------|------|------|-----|-----|------|-----|------|

| 4   | FER    | 成帧错误标志<br>0: 未发生帧错误1: 发生帧错误                           | R/(W) <sup>*1</sup> |
| 5   | ORER   | 溢出错误标志<br>0: 未发生溢出错误1: 发生溢出错误                         | R/(W) <sup>*1</sup> |

| Bit | Symbol | Function  | R/W     |
|-----|--------|---|---------|
| 6   | RDRF   | Receive Data Full Flag<br>0: No received data in RDR register<br>1: Received data in RDR register   | R/(W)*1 |
| 7   | TDRE   | Transmit Data Empty Flag<br>0: Transmit data in TDR register<br>1: No transmit data in TDR register | R/(W)*1 |

Note 1. Only 0 can be written to clear the flag after reading 1.

The SSR register provides SCI status flags and transmission and reception multi-processor bits.

#### MPBT bit (Multi-Processor Bit Transfer)

The MPBT bit sets the value of the multi-processor bit in the transmit frame.

#### MPB bit (Multi-Processor)

The MPB bit holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

#### TEND flag (Transmit End Flag)

The TEND flag indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 (serial transmission is disabled) and the FCR.FM bit is set to 0 (non-FIFO selected). When the SCR.TE bit is set to 1, the TEND flag is not affected and retains the value 1.
- When the TDR register is not updated on transmission of the tail-end bit of a character being transmitted.

[Clearing conditions]

- When transmit data is written to the TDR register while the SCR.TE bit is 1
- When 0 is written to TDRE after reading TDRE = 1 while the SCR.TE bit is 1

#### PER flag (Parity Error Flag)

The PER flag indicates that a parity error occurred during reception in asynchronous mode and the reception ended abnormally.

[Setting condition]

- When a parity error is detected during reception in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).  
Although receive data is transferred to the RDR register when the parity error occurs, no SCIn\_RXI interrupt request occurs. When the PER flag is set to 1, the subsequent receive data is not transferred to the RDR register.

[Clearing condition]

- When 0 is written to PER after reading PER = 1. After writing 0 to the PER flag, read the PER flag to check that it is actually set to 0.

When the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

#### FER flag (Framing Error Flag)

The FER flag indicates that a framing error occurred during reception in asynchronous mode and the reception ended abnormally.

[Setting condition]

- When 0 is sampled as the stop bit during reception in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

In 2-stop-bit mode, only the first stop bit is checked. The second stop bit is not checked. Although receive data is transferred to the RDR register when the framing error occurs, no SCIn\_RXI interrupt request occurs. When the FER flag is to 1, the subsequent receive data is not transferred to the RDR register.

| Bit | Symbol | Function                                    | R/W     |
|-----|--------|---|---------|
| 6   | RDRF   | 接收数据满标志<br>0: RDR寄存器中没有接收到数据1: RDR寄存器中接收到数据 | R/(W)*1 |
| 7   | TDRE   | 传输数据空标志<br>0: 在TDR寄存器中发送数据1: 在TDR寄存器中不发送数据  | R/(W)*1 |

注1.读1后只能写0清除标志。

SSR寄存器提供SCI状态标志和发送和接收多处理器位。

#### MPBT bit (Multi-Processor Bit Transfer)

MPBT位设置发送帧中多处理器位的值。

#### MPB bit (Multi-Processor)

MPB位保存接收帧中多处理器位的值。当SCR.RE位为0时，该位不变。

#### TEND标志（发送结束标志）

TEND标志表示传输完成。

[Setting conditions]

- 当SCR.TE位设置为0（禁用串行传输）且FCR.FM位设置为0（选择非FIFO）时。当SCR.TE位设置为1时，TEND标志不受影响并保持值1。
- TDR寄存器未在发送字符的尾端位时更新时。

[Clearing conditions]

- 当SCR.TE位为1时将发送数据写入TDR寄存器
- 当SCR.TE位为1时，读取TDRE=1后向TDRE写入0

#### PER标志（奇偶校验错误标志）

PER标志表示在异步模式接收过程中发生奇偶校验错误，接收异常结束。

[Setting condition]

- 当地址匹配功能被禁用（DCCR.DCME=0）时，在异步模式接收期间检测到奇偶校验错误。

尽管发生奇偶校验错误时接收数据被传送到RDR寄存器，但不会发生SCIn\_RXI中断请求。当PER标志设置为1时，后续接收数据不会传送到RDR寄存器。

[Clearing condition]

- 读取PER=1后向PER写入0时。将0写入PER标志后，读取PER标志以检查它是否实际设置为0。

当SCR.RE位设置为0（禁用串行接收）时，PER标志不受影响并保留其先前的值。

#### FER标志（帧错误标志）

FER标志表示在异步模式下接收过程中发生了帧错误，并且接收异常结束。

[Setting condition]

- 当地址匹配功能被禁用（DCCR.DCME=0）时，在异步模式接收期间采样0作为停止位时。

在2停止位模式下，仅检查第一个停止位。不检查第二个停止位。虽然发生帧错误时接收数据被传输到RDR寄存器，但不会发生SCIn\_RXI中断请求。当FER标志为1时，后续接收数据不传送到RDR寄存器。

[Clearing condition]

- When 0 is written to FER after reading FER = 1. After writing 0 to the FER flag, read the FER flag to check that it is actually set to 0.

When the SCR.RE bit is set to 0 (serial reception is disabled), the FER flag is not affected and retains its previous value.

**ORER flag (Overrun Error Flag)**

The ORER flag indicates that an overrun error occurred during reception and the reception ended abnormally.

[Setting condition]

- When the next data is received before receive data that does not have a parity error and a framing error is read from the RDR register.

The data received before an overrun error occurred is saved in the RDR register, but data received after the error is lost. When the ORER flag is set to 1, receive data is not forwarded to the RDR register. In clock synchronous mode, serial transmission and reception are stopped.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1. After writing 0 to the ORER flag, read the ORER flag to check that it is actually set to 0.

When the SCR.RE bit is set to 0 (serial reception is disabled), the ORER flag is not affected and retains its previous value.

**RDRF flag (Receive Data Full Flag)**

The RDRF flag indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register.

[Clearing conditions]

- When 0 is written to RDRF after reading RDRF = 1
- When data is forwarded from the RDR register

**TDRE flag (Transmit Data Empty Flag)**

The TDRE flag indicates the presence of transmit data in the TDR register.

[Setting conditions]

- When the SCR.TE bit is 0
- When data is transmitted from the TDR register to the TSR register

[Clearing conditions]

- When 0 is written to TDRE after reading TDRE = 1
- When the SCR.TE bit is 1 and data is written to the TDR register

### 27.2.16 SSR\_FIFO : Serial Status Register for Non-Smart Card Interface and FIFO Mode (SCMR.SMIF = 0, FCR.FM = 1, and MMR.MANEN = 0)

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x04

|                    |      |     |      |     |     |      |   |    |
|--------------------|------|-----|------|-----|-----|------|---|----|
| Bit position:      | 7    | 6   | 5    | 4   | 3   | 2    | 1 | 0  |
| Bit field:         | TDFE | RDF | ORER | FER | PER | TEND | — | DR |
| Value after reset: | 1    | 0   | 0    | 0   | 0   | 0    | x | 0  |

[Clearing condition]

- 当读取FER=1后向FER写入0时。将0写入FER标志后，读取FER标志以检查它是否实际设置为0。

当SCR.RE位设置为0（禁用串行接收）时，FER标志不受影响并保留其先前的值。

**ORER标志（溢出错误标志）**

ORER标志表示接收期间发生溢出错误，接收异常结束。

[Setting condition]

- 在接收没有奇偶校验错误和帧错误的数据之前接收下一个数据时，从RDR寄存器中读取。

溢出错误发生前接收到的数据保存在RDR寄存器中，但错误发生后接收到的数据丢失。当ORER标志设置为1时，接收数据不转发到RDR寄存器。在时钟同步模式下，串行发送和接收停止。

[Clearing condition]

- 读取ORER=1后向ORER写入0时。向ORER标志写入0后，读取ORER标志以检查它是否实际设置为0。

当SCR.RE位设置为0（禁用串行接收）时，ORER标志不受影响并保留其先前的值。

**RDRF标志（接收数据满标志）**

RDRF标志指示RDR寄存器中存在接收数据。

[Setting condition]

- 接收正常结束时，接收数据从RSR寄存器转发到RDR寄存器。

[Clearing conditions]

- 读取RDRF=1后向RDRF写入0时
- 从RDR寄存器转发数据时

**TDRE标志（传输数据空标志）**

TDRE标志表示TDR寄存器中存在发送数据。

[Setting conditions]

- 当SCR.TE位为0时
- 当数据从TDR寄存器传送到TSR寄存器时

[Clearing conditions]

- 读取TDRE=1后写入0时
- 当SCR.TE位为1且数据写入TDR寄存器时

### 27.2.16 SSR\_FIFO：非智能卡接口和FIFO模式的串行状态寄存器（SCMR.SMIF=0、FCR.FM=1和MMR.MANEN=0）

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x04

|               |      |     |      |     |     |      |   |    |
|---------------|------|-----|------|-----|-----|------|---|----|
| Bit position: | 7    | 6   | 5    | 4   | 3   | 2    | 1 | 0  |
| Bit field:    | TDFE | RDF | ORER | FER | PER | TEND | — | DR |
| 重置后的值:        | 1    | 0   | 0    | 0   | 0   | 0    | x | 0  |

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 0   | DR     | Receive Data Ready Flag<br>0: Receiving is in progress, or no received data remains in FRDRHL after successfully completed reception (receive FIFO empty)<br>1: Next receive data is not received for a period after normal receiving is complete, when the amount of data stored in the FIFO is equal to or less than the receive triggering number | R/W <sup>1</sup> |
| 1   | —      | The read value is undefined. The write value should be 1.  | R/W              |
| 2   | TEND   | Transmit End Flag<br>0: A character is being transmitted<br>1: Character transfer is complete  | R/W <sup>1</sup> |
| 3   | PER    | Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred   | R/W <sup>1</sup> |
| 4   | FER    | Framing Error Flag<br>0: No framing error occurred<br>1: Framing error occurred  | R/W <sup>1</sup> |
| 5   | ORER   | Overrun Error Flag<br>0: No overrun error occurred<br>1: Overrun error occurred  | R/W <sup>1</sup> |
| 6   | RDF    | Receive FIFO Data Full Flag<br>0: The amount of receive data written in FRDRHL is less than the specified receive triggering number<br>1: The amount of receive data written in FRDRHL is equal to or greater than the specified receive triggering number   | R/W <sup>1</sup> |
| 7   | TDFE   | Transmit FIFO Data Empty Flag<br>0: The amount of transmit data written in FTDRHL exceeds the specified transmit triggering number<br>1: The amount of transmit data written in FTDRHL is equal to or less than the specified transmit triggering number   | R/W <sup>1</sup> |

Note 1. Only 0 can be written, to clear the flag after reading 1.

The SSR\_FIFO register provides the SCI with FIFO mode status flags.

#### DR flag (Receive Data Ready Flag)

The DR flag indicates that the amount of data stored in the Receive FIFO Data Register (FRDRHL) falls below the specified receive triggering number, and that no next data is received after 15 ETUs (elementary time units) from the last stop bit in asynchronous mode. This flag is valid only in asynchronous mode, including multi-processor mode, when FIFO operation is selected.

In clock synchronous mode, the DR flag is not set to 1.

[Setting condition]

- When FRDRHL contains less data than the specified receive triggering number, and no next data is received after 15 ETUs<sup>1</sup> from the last stop bit, and the SSR\_FIFO.FER and SSR\_FIFO.PER flags are 0.

[Clearing conditions]

- When 1 is read from DR, after all received data is read
- When the FCR.FM bit is changed from 0 to 1

Note 1. This is equivalent to 1.5 frames in the 8-bit format with one stop bit.

The DR flag is only set to 1 when FIFO is selected in asynchronous mode, including multi-processor mode. It is not set to 1 in other operation modes.

#### TEND flag (Transmit End Flag)

The TEND flag indicates that FTDRHL does not contain valid data when transmitting the last bit of a serial character, so the transmission is halted.

[Setting condition]

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 0   | DR     | 接收数据就绪标志<br>0: 接收中, 或者接收成功后FRDRHL中没有接收到的数据 (接收FIFO为空)<br>1: 正常接收完成后一段时间内没有接收到下一个接收数据, 此时FIFO中存储的数据量等于或小于接收触发数 | R/W <sup>1</sup> |
| 1   | —      | 读取值未定义。写入值应为1。  | R/W              |
| 2   | TEND   | 发送结束标志<br>0: 字符传输中1: 字符传输完成   | R/W <sup>1</sup> |
| 3   | PER    | 奇偶校验错误标志<br>0: 未发生奇偶校验错误1<br>: 发生奇偶校验错误   | R/W <sup>1</sup> |
| 4   | FER    | 成帧错误标志<br>0: 未发生帧错误1: 发生帧错误   | R/W <sup>1</sup> |
| 5   | ORER   | 溢出错误标志<br>0: 未发生溢出错误1: 发生溢出错误   | R/W <sup>1</sup> |
| 6   | RDF    | 接收FIFO数据满标志<br>0: 写入FRDRHL的接收数据量小于指定的接收触发数<br>1: 写入FRDRHL的接收数据量等于或大于指定的接收触发数                                  | R/W <sup>1</sup> |
| 7   | TDFE   | 发送FIFO数据空标志<br>0: 写入FTDRHL的发送数据量超过指定的发送触发数<br>1: 写入FTDRHL的发送数据量等于或小于指定的发送触发数                                  | R/W <sup>1</sup> |

注1.只能写入0, 读取1后清除标志。

SSR\_FIFO寄存器为SCI提供FIFO模式状态标志。

#### DR标志 (接收数据就绪标志)

DR标志表示存储在接收FIFO数据寄存器(FRDRHL)中的数据量低于指定的接收触发数, 并且在异步模式下从最后一个停止位开始15个ETU (基本时间单位) 后没有接收到下一个数据.此标志仅在选择FIFO操作时在异步模式下有效, 包括多处理器模式。

在时钟同步模式下, DR标志不设置为1。

[Setting condition]

- 当FRDRHL包含的数据少于指定的接收触发数, 并且从最后一个停止位开始15个ETU\*1后没有接收到下一个数据, 并且SSR\_FIFO.FER和SSR\_FIFO.PER标志为0。

[Clearing conditions]

- 从DR读取1时, 在读取所有接收到的数据后
- 当FCR.FM位由0变为1时

注1.这相当于8位格式的1.5帧, 带有一位停止位。

只有在异步模式 (包括多处理器模式) 下选择FIFO时, DR标志才设置为1。在其他操作模式下不设置为1。

#### TEND标志 (发送结束标志)

TEND标志表明FTDRHL在发送串行字符的最后一位时不包含有效数据, 因此暂停发送。

[Setting condition]

- When FTDRHL does not contain transmit data when the last bit of a 1-byte serial character is transmitted.

[Clearing conditions]

- When transmit data is written to FTDRHL\*<sup>1</sup> while the SCR.TE bit is 1
- When 0 is written to TEND after 1 is read from TEND, when the SCR.TE bit is 1
- When the FCR.FM bit is changed from 0 to 1

Note 1. Do not use the TEND bit as a transmit end flag when the DTC writes data to FTDRHL in response to an SCIn\_TXI interrupt request.

#### PER flag (Parity Error Flag)

The PER flag indicates whether there is a parity error in the data read from the FRDRHL register in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

[Setting condition]

- When data is received and a parity error is detected, when the address match function is disabled (DCCR.DCME = 0).

[Clearing condition]

- When 0 is written to PER after reading PER = 1.

The reception operation is continuous, and the receive data is stored in the FRDRHL register, even when a parity error occurs during reception.

When the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

#### FER flag (Framing Error Flag)

The FER flag indicates whether there is a framing error in the data read from the FRDRHL register in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

[Setting condition]

- When 0 is sampled as the stop bit during reception when the address match function is disabled (DCCR.DCME = 0).

[Clearing condition]

- When 0 is written to FER after reading FER = 1.

The reception operation is continuous, and the receive data is stored in the FRDRHL register, even when a framing error occurs during reception.

When the SCR.RE bit is set to 0 (serial reception is disabled), the FER flag is not affected and retains its previous value.

#### ORER flag (Overrun Error Flag)

The ORER flag indicates that the receive operation stopped abnormally because an overrun error occurred.

[Setting condition]

- When the next serial reception completes while the receive FIFO is full with 16-byte receive data.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1.

When the SCR.RE bit is set to 0 (serial reception is disabled), the ORER flag is not affected and retains its previous value.

#### RDF flag (Receive FIFO Data Full Flag)

The RDF flag indicates that receive data was transferred to the FRDRHL register, and the amount of data in FRDRHL is equal to or exceeds the specified receive triggering number. When RTRG is set to 0, the RDF flag is not set even when the amount of data in the receive FIFO is equal to 0.

[Setting condition]

- When the amount of receive data equal to or greater than the specified receive triggering number is stored in FRDRHL,\*<sup>1</sup> and the FIFO is not empty.

- 当FTDRHL不包含发送数据时，发送1字节串行字符的最后一位。

[Clearing conditions]

- 当SCR.TE位为1时将发送数据写入FTDRHL\*<sup>1</sup>
- 从TEND读取1后，向TEND写入0时，SCR.TE位为1时
- 当FCR.FM位由0变为1时

注1.当DTC将数据写入FTDRHL以响应SCIn\_TXI中断请求时，请勿使用TEND位作为发送结束标志。

#### PER标志 (奇偶校验错误标志)

PER标志指示在禁用地址匹配功能 (DCCR.DCME=0) 时，异步模式下从FRDRHL寄存器读取的数据是否存在奇偶校验错误。

[Setting condition]

- 当接收到数据并检测到奇偶校验错误时，当地址匹配功能被禁用时 (DCCR.DCME=0)。

[Clearing condition]

- 读取PER=1后向PER写入0时。

接收操作是连续的，接收数据存储在FRDRHL寄存器中，即使在接收过程中发生奇偶校验错误。

当SCR.RE位设置为0 (禁用串行接收) 时，PER标志不受影响并保留其先前的值。

#### FER标志 (帧错误标志)

FER标志指示在禁用地址匹配功能 (DCCR.DCME=0) 时，异步模式下从FRDRHL寄存器读取的数据是否存在帧错误。

[Setting condition]

- 当地址匹配功能被禁用 (DCCR.DCME=0) 时，在接收期间采样0作为停止位时。

[Clearing condition]

- 读取FER=1后向FER写入0时。

接收操作是连续的，接收数据存储在FRDRHL寄存器中，即使在接收过程中发生帧错误。

当SCR.RE位设置为0 (禁用串行接收) 时，FER标志不受影响并保留其先前的值。

#### ORER标志 (溢出错误标志)

ORER标志指示接收操作由于发生溢出错误而异常停止。

[Setting condition]

- 当接收FIFO已满16字节接收数据时，下一次串行接收完成时。

[Clearing condition]

- 读取ORER=1后向ORER写入0时。

当SCR.RE位设置为0 (禁用串行接收) 时，ORER标志不受影响并保留其先前的值。

#### RDF标志 (接收FIFO数据满标志)

RDF标志表示接收数据已传送到FRDRHL寄存器，并且FRDRHL中的数据量等于或超过指定的接收触发数。当RTRG设置为0时，即使接收FIFO中的数据量等于0，RDF标志也不会设置。

[Setting condition]

- 当FRDRHL中存储了等于或大于指定接收触发数的接收数据量时，\*<sup>1</sup>且FIFO不为空。

[Clearing conditions]

- When 0 is written to RDF after reading RDF = 1
- When FRDRHL is read by the DTC, but only when the block transfer is the last transmission
- When the setting and clearing conditions occur at the same time, the RDF bit is set to 0. After that, when the amount of data stored in the FRDRHL register is the same as or greater than the RTRG value, RDF is set to 1 after 1 PCLK.

Note 1. Because FRDRHL is a 16-stage FIFO register, the maximum amount of data that can be read when RDF is 1 is equivalent to the specified receive triggering number. If an attempt is made to read after all the data in FRDRHL is read, the data is undefined.

**TDFE flag (Transmit FIFO Data Empty Flag)**

The TDFE flag indicates that data is transferred from the FTDRHL register into the TSR register, the amount of data in FTDRHL is below the specified transmit triggering number, and writing of transmit data to FTDRHL is enabled.

[Setting conditions]

- When the TE bit in SCR is 0
- When the amount of transmit data written in FTDRHL is equal to or less than the specified transmit triggering number\*1

[Clearing conditions]

- When writing to FTDRHL is executed on the last transmission while the DTC is activated
- When 0 is written to the TDFE flag after reading TDFE = 1.\*2  
The setting conditions are given priority when TE = 0. When the setting condition and clearing condition occur at the same time, the TDFE flag is set to 0. After that, when the amount of data stored in the FTDRHL register is equal to or less than the TTRG value, TDFE is set to 1 after 1 PCLK.

Note 1. Because the FTDRHL register is a 16-stage FIFO register, when the TDFE flag is 1, the maximum amount of data that can be written to the FTDRHL register is 16 minus FDR.T[4:0] bytes. If more data is written, data is discarded.

Note 2. Do not clear the TDFE flag during block transfer processing by the DTC.

**27.2.17 SSR\_SMCI : Serial Status Register for Smart Card Interface Mode (SCMR.SMIF = 1, and MMR.MANEN = 0)**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x04

| Bit | Symbol | Function   | R/W   |
|-----|--------|--|-------|
| 0   | MPBT   | Multi-Processor Bit Transfer<br>Set this bit to 0 in smart card interface mode                       | R/W   |
| 1   | MPB    | Multi-Processor<br>Set this bit to 0 in smart card interface mode                                    | R     |
| 2   | TEND   | Transmit End Flag<br>0: A character is being transmitted<br>1: Character transfer is complete        | R     |
| 3   | PER    | Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred                         | R/W*1 |
| 4   | ERS    | Error Signal Status Flag<br>0: No low error signal response<br>1: Low error signal response occurred | R/W*1 |

[Clearing conditions]

- 读取RDF=1后向RDF写入0时
- 当DTC读取FRDRHL时，但仅当块传输是最后一次传输时
- 当设置和清除条件同时发生时，RDF位被设置为0。之后，当FRDRHL寄存器中存储的数据量等于或大于RTRG值时，RDF被设置为1在1个PCLK之后。

注1.因为FRDRHL是16级FIFO寄存器，所以当RDF为1时可以读取的最大数据量等于指定的接收触发数。如果在读取FRDRHL中的所有数据后尝试读取，则数据未定义。

**TDFE标志（发送FIFO数据空标志）**

TDFE标志表示数据从FTDRHL寄存器传送到TSR寄存器，在FTDRHL低于指定的发送触发数，并且允许将发送数据写入FTDRHL。

[Setting conditions]

- 当SCR的TE位为0时
- 当写入FTDRHL的发送数据量等于或小于指定的发送触发数时\*1

[Clearing conditions]

- 当DTC激活时，在最后一次传输上执行写入FTDRHL时
- 读取TDFE=1后向TDFE标志写入0时。\*2  
当TE=0时，设置条件优先。当设置条件和清除条件同时发生时，TDFE标志设置为0。之后，当FTDRHL寄存器中存储的数据量等于或小于比TTRG值，TDFE在1个PCLK后设置为1。

注1.由于FTDRHL寄存器为16级FIFO寄存器，因此当TDFE标志为1时，可写入FTDRHL寄存器的最大数据量为16减去FDR.T[4:0]字节。如果写入更多数据，则丢弃数据。

注2.在DTC的块传输处理过程中，不要清除TDFE标志。

**27.2.17 SSR\_SMCI: 智能卡接口模式的串行状态寄存器 (SCMR.SMIF=1, MMR.MANEN=0)**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x04

| Bit | Symbol | Function                                | R/W   |
|-----|--------|---|-------|
| 0   | MPBT   | 多处理器位传输<br>在智能卡接口模式下将此位设置为0             | R/W   |
| 1   | MPB    | Multi-Processor<br>在智能卡接口模式下将此位设置为0     | R     |
| 2   | TEND   | 发送结束标志<br>0: 字符传输中1: 字符传输完成             | R     |
| 3   | PER    | 奇偶校验错误标志<br>0: 未发生奇偶校验错误1<br>: 发生奇偶校验错误 | R/W*1 |
| 4   | ERS    | 错误信号状态标志<br>0: 无低位错误信号响应1: 发生低位错误信号响应   | R/W*1 |

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 5   | ORER   | Overrun Error Flag<br>0: No overrun error occurred<br>1: Overrun error occurred                     | R/W <sup>1</sup> |
| 6   | RDRF   | Receive Data Full Flag<br>0: No received data in RDR register<br>1: Received data in RDR register   | R/W <sup>1</sup> |
| 7   | TDRE   | Transmit Data Empty Flag<br>0: Transmit data in TDR register<br>1: No transmit data in TDR register | R/W <sup>1</sup> |

Note 1. Only 0 can be written, to clear the flag after reading 1.

The SSR\_SMCI register provides the SCI with smart card interface mode status flags.

#### TEND flag (Transmit End Flag)

When there is no error signal from the receiving side, the TEND flag is set to 1 when more data for transfer is ready to be transferred to the TDR register.

[Setting conditions]

- When the SCR\_SMCI.TE bit = 0 (serial transmission is disabled).  
When the SCR\_SMCI.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When a specified period elapses after the latest transmission of 1 byte, the ERS flag is 0, and the TDR register is not updated.

The set timing is determined by the following register settings:

- When SMR\_SMCI.GM = 0 and SMR\_SMCI.BLK = 0, 12.5 ETUs after the start of transmission
- When SMR\_SMCI.GM = 0 and SMR\_SMCI.BLK = 1, 11.5 ETUs after the start of transmission
- When SMR\_SMCI.GM = 1 and SMR\_SMCI.BLK = 0, 11.0 ETUs after the start of transmission
- When SMR\_SMCI.GM = 1 and SMR\_SMCI.BLK = 1, 11.0 ETUs after the start of transmission

[Clearing conditions]

- When transmit data is written to the TDR register while the SCR\_SMCI.TE bit is 1
- When 0 is written to TDRE after reading TDRE = 1 while the SCR\_SMCI.TE bit is 1

#### PER flag (Parity Error Flag)

The PER flag indicates that a parity error occurred during reception in asynchronous mode and the reception ended abnormally.

[Setting condition]

- When a parity error is detected during reception. Although receive data is transferred to RDR when a parity error occurs, no SCIn\_RXI interrupt request occurs. After the PER flag is set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1. After writing 0 to the PER flag, read the flag to check that it is actually set to 0.

When the RE bit in SCR\_SMCI is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

#### ERS flag (Error Signal Status Flag)

[Setting condition]

- When a low error signal is sampled.

[Clearing condition]

| Bit | Symbol | Function                                    | R/W              |
|-----|--------|---|------------------|
| 5   | ORER   | 溢出错误标志<br>0: 未发生溢出错误1: 发生溢出错误               | R/W <sup>1</sup> |
| 6   | RDRF   | 接收数据满标志<br>0: RDR寄存器中没有接收到数据1: RDR寄存器中接收到数据 | R/W <sup>1</sup> |
| 7   | TDRE   | 传输数据空标志<br>0: 在TDR寄存器中发送数据1: 在TDR寄存器中不发送数据  | R/W <sup>1</sup> |

注1.只能写入0, 读取1后清除标志。

SSR\_SMCI寄存器为SCI提供智能卡接口模式状态标志。

#### TEND标志 (发送结束标志)

当接收端没有错误信号时, 当更多数据准备好传输到TDR寄存器时, TEND标志设置为1。

[Setting conditions]

- 当SCR\_SMCI.TE位=0时(禁用串行传输)。  
当SCR\_SMCI.TE位从0变为1时, TEND标志不受影响并保持值1。
- 在最后一次发送1个字节后经过指定时间后, ERS标志为0, 并且不更新TDR寄存器。

设置时序由以下寄存器设置确定:

- 当SMR\_SMCI.GM=0且SMR\_SMCI.BLK=0时, 传输开始后12.5ETU
- 当SMR\_SMCI.GM=0和SMR\_SMCI.BLK=1时, 传输开始后11.5ETU
- 当SMR\_SMCI.GM=1和SMR\_SMCI.BLK=0时, 传输开始后11.0ETU
- 当SMR\_SMCI.GM=1且SMR\_SMCI.BLK=1时, 传输开始后11.0ETU

[Clearing conditions]

- 当SCR\_SMCI.TE位为1时将发送数据写入TDR寄存器
- 当SCR\_SMCI.TE位为1时, 读取TDRE=1后向TDRE写入0

#### PER标志 (奇偶校验错误标志)

PER标志表示在异步模式接收过程中发生奇偶校验错误, 接收异常结束。

[Setting condition]

- 在接收过程中检测到奇偶校验错误时。尽管发生奇偶校验错误时将接收数据传输到RDR, 但不会发生SCIn\_RXI中断请求。PER标志设置为1后, 后续接收数据不会传输到RDR。

[Clearing condition]

- 读取PER=1后向PER写入0时。将0写入PER标志后, 读取该标志以检查它是否实际设置为0。

当SCR\_SMCI中的RE位设置为0(禁用串行接收)时, PER标志不受影响并保留其先前的值。

#### ERS标志 (错误信号状态标志)

[Setting condition]

- 采样低误差信号时。

[Clearing condition]

- When 0 is written to ERS after reading ERS = 1.

**ORER flag (Overrun Error Flag)**

The ORER flag indicates that an overrun error occurred during reception and the reception ended abnormally.

[Setting condition]

- When the next data is received before receive data that does not have a parity error is read from the RDR register. The data received before an overrun error occurred is saved in the RDR, but data received after the error is lost. When the ORER flag is set to 1, receive data is not forwarded to the RDR register.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1. After writing 0 to the ORER flag, read the flag to check that it is actually set to 0.

When the RE bit in SCR\_SMCI is set to 0, the ORER flag is not affected and retains its previous value.

**RDRF flag (Receive Data Full Flag)**

The RDRF flag indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register.

[Clearing conditions]

- When 0 is written to RDRF after reading RDRF = 1
- When data is forwarded from the RDR register

**TDRE flag (Transmit Data Empty Flag)**

The TDRE flag indicates the presence of transmit data in the TDR register.

[Setting conditions]

- When the SCR\_SMCLTE bit is 0
- When data is transmitted from the TDR register to the TSR register

[Clearing conditions]

- When 0 is written to TDRE after reading TDRE = 1
- When the SCR\_SMCLTE bit is 1 and data is written to the TDR register

**27.2.18 SSR\_MANC : Serial Status Register for Manchester Mode (SCMR.SMIF = 0, and MMR.MANEN = 1)**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x04

| Bit | Symbol | Function   | R/W                |
|-----|--------|--|--------------------|
| 0   | MER    | Manchester Error Flag<br>Valid for Manchester mode only<br>0: No Manchester error occurred<br>1: Manchester error has occurred | R/(W) <sup>1</sup> |

- 读取ERS =1后向ERS 写入0时。

**ORER标志 (溢出错误标志)**

ORER标志表示接收期间发生溢出错误，接收异常结束。

[Setting condition]

- 在从RDR寄存器读取没有奇偶校验错误的接收数据之前接收到下一个数据时。发生溢出错误前接收的数据保存在RDR中，但错误发生后接收的数据会丢失。当ORER标志设置为1时，接收数据不转发到RDR寄存器。

[Clearing condition]

- 读取ORER=1后向ORER写入0时。向ORER标志写入0后，读取该标志以检查它是否实际设置为0。

当SCR\_SMCI中的RE位设置为0时，ORER标志不受影响并保留其先前的值。

**RDRF标志 (接收数据满标志)**

RDRF标志指示RDR寄存器中存在接收数据。

[Setting condition]

- 接收正常结束时，接收数据从RSR寄存器转发到RDR寄存器。

[Clearing conditions]

- 读取RDRF=1后向RDRF写入0时
- 从RDR寄存器转发数据时

**TDRE标志 (传输数据空标志)**

TDRE标志表示TDR寄存器中存在发送数据。

[Setting conditions]

- 当SCR\_SMCLTE位为0时
- 当数据从TDR寄存器传送到TSR寄存器时

[Clearing conditions]

- 读取TDRE=1后写入0时
- 当SCR\_SMCLTE位为1且数据写入TDR寄存器时

**27.2.18 SSR\_MANC: 曼彻斯特模式的串行状态寄存器 (SCMR.SMIF=0, 并且 MMR.MANEN = 1)**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x04

| Bit | Symbol | Function  | R/W                |
|-----|--------|---|--------------------|
| 0   | MER    | 曼彻斯特错误标志<br>仅适用于曼彻斯特模式<br>0: 未发生曼彻斯特错误<br>1: 发生曼彻斯特错误 | R/(W) <sup>1</sup> |

| Bit | Symbol | Function   | R/W     |
|-----|--------|--|---------|
| 1   | MPB    | Multi-Processor<br>Value of the multi-processor bit in the reception frame<br>0: Data transmission cycles<br>1: ID transmission cycles | R       |
| 2   | TEND   | Transmit End Flag<br>0: A character is being transmitted<br>1: Character transfer has been completed.                                  | R       |
| 3   | PER    | Parity Error Flag<br>0: No parity error occurred<br>1: A parity error has occurred   | R/(W)*1 |
| 4   | FER    | Framing Error Flag<br>0: No framing error occurred<br>1: A framing error has occurred  | R/(W)*1 |
| 5   | ORER   | Overrun Error Flag<br>0: No overrun error occurred<br>1: An overrun error has occurred   | R/(W)*1 |
| 6   | RDRF   | Receive Data Full Flag<br>0: No received data is in RDR register<br>1: Received data is in RDR register                                | R/(W)*1 |
| 7   | TDRE   | Transmit Data Empty Flag<br>0: Transmit data is in TDR register<br>1: No transmit data is in TDR register                              | R/(W)*1 |

Note 1. Only 0 can be written to this bit, to clear the flag after confirmed(read) the flag is set to 1.

SSR is constructed in the status flag of SCI and reception multi processor bits.

#### MER flag (Manchester Error Flag)

When data is received in Manchester mode, Manchester error is detected and it is displayed.

[Setting conditions]

- When receiving in Manchester mode and detecting Manchester code error in data area of received frame. Received data when an error occurs is transferred to the RDR register, but the RXI interrupt request is not generated and the ERI interrupt request is generated.  
When the Manchester error flag is set to "1", subsequent receive data is not transferred to the RDR register. For details on Manchester error, see [section 27.5.11. Errors in Manchester Mode](#).

[Clearing conditions]

- When 0 is written to MER after reading MER = 1 (after writing 0 to it, read the MER bit to check that it has actually been set to 0.)  
Even when the RE bit in SCR is set to 0 (serial reception is disabled), the MER flag is not affected and retains its previous value.

#### MPB flag (Multi-Processor)

Holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

#### TEND flag (Transmit End Flag)

Indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 (serial transmission is disabled) and FCR.FM bit is set to 0 (non-FIFO selected).  
When the SCR.TE bit is changed from 0 to 1, the TEND flag is not affected and retains the value 1.
- When the TDR register is not updated at the time of transmission of the tail-end bit of a character being transmitted

[Clearing conditions]

- When transmit data are written to the TDR register while the SCR.TE bit is 1.

| Bit | Symbol | Function   | R/W     |
|-----|--------|--|---------|
| 1   | MPB    | Multi-Processor<br>接收帧中多处理器位的值<br>0: 数据传输周期1: ID传输周期 | R       |
| 2   | TEND   | 发送结束标志<br>0: 正在传输字符1: 已完成字符传输。                       | R       |
| 3   | PER    | 奇偶校验错误标志<br>0: 未发生奇偶校验错误1: 发生奇偶校验错误                  | R/(W)*1 |
| 4   | FER    | 成帧错误标志<br>0: 未发生帧错误1: 发生帧错误                          | R/(W)*1 |
| 5   | ORER   | 溢出错误标志<br>0: 未发生溢出错误1: 发生溢出错误                        | R/(W)*1 |
| 6   | RDRF   | 接收数据满标志<br>0: RDR寄存器中没有接收到的数据1: RDR寄存器中接收到的数据        | R/(W)*1 |
| 7   | TDRE   | 传输数据空标志<br>0: 发送数据在TDR寄存器1: 没有发送数据在TDR寄存器            | R/(W)*1 |

注1.该位只能写入0,确认(读取)后清除标志,标志设置为1。

SSR由SCI的状态标志和接收多处理器位构成。

#### MER标志(曼彻斯特错误标志)

在曼彻斯特模式下接收数据时,检测到曼彻斯特错误并显示出来。

[Setting conditions]

- 曼彻斯特模式接收时,检测接收帧数据区的曼彻斯特码错误。  
发生错误时接收到的数据被传送到RDR寄存器,但不产生RXI中断请求,产生ERI中断请求。当曼彻斯特错误标志设置为"1"时,后续接收数据不会传输到RDR寄存器。

有关曼彻斯特错误的详细信息,请参阅第27.5.11节。曼彻斯特模式中的错误。

[Clearing conditions]

- 读MER=1后向MER写入0时(向其写入0后,读取MER位以检查它是否已实际设置为0。)即使SCR中的RE位设置为0(串行接收是禁用),MER标志不受影响并保留其先前的值。

#### MPB flag (Multi-Processor)

保存接收帧中多处理器位的值。当SCR.RE位为0时,该位不变。

#### TEND标志(发送结束标志)

表示传输完成。

[Setting conditions]

- 当SCR.TE位设置为0(禁用串行传输)且FCR.FM位设置为0(选择非FIFO)时。当SCR.TE位从0变为1时,TEND标志不受影响并保持值1。
- 发送字符尾端位时,TDR寄存器未更新时

[Clearing conditions]

- 当SCR.TE位为1时将发送数据写入TDR寄存器。

- When 0 is written to TDRE after reading TDRE = 1 while the SCR.TE bit is 1.

**PER flag (Parity Error Flag)**

Indicates that a parity error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When a parity error is detected during reception in Asynchronous Mode and the state of Address Match function invalidity (DCCR.DCME = 0).  
Although receive data when the parity error occurs is transferred to RDR, no RXI interrupt request occurs. Note that when the PER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after reading PER = 1 (after writing 0 to it, read the PER bit to check that it has actually been set to 0.)

Even when the RE bit in SCR is set to 0 (serial reception is disabled), the PER flag is not affected and retains its previous value.

**FER flag (Framing Error Flag)**

Indicates that a framing error has occurred during reception in asynchronous mode and the reception ends abnormally.

[Setting condition]

- When "0" is sampled as the stop bit during reception in Asynchronous Mode and the state of Address Match function invalidity (DCCR.DCME = 0).  
In 2-stop-bit mode, only the first stop bit is checked whether it is 1 but the second stop bit is not checked. Note that although receive data when the framing error occurs is transferred to RDR, no RXI interrupt request occurs. In addition, when the FER flag is being set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to FER after reading FER = 1 (after writing 0 to it, read the FER bit to check that it has actually been set to 0.)

Even when the RE bit in SCR is set to 0, the FER flag is not affected and retains its previous value.

**ORER flag (Overrun Error Flag)**

Indicates that an overrun error has occurred during reception and the reception ends abnormally.

[Setting condition]

- When the next data is received before receive data is read from RDR which don't have any valid reception error.  
In RDR, receive data prior to an overrun error occurrence is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, reception data isn't forwarded to RDR register. Note that, in clock synchronous mode, serial transmission and reception will be stop.

[Clearing condition]

- When 0 is written to ORER after reading ORER = 1 (after writing 0 to it, read the ORER bit to check that it has actually been set to 0.)

Even when the RE bit in SCR is set to 0, the ORER flag is not affected and retains its previous value.

**RDRF flag (Receive Data Full Flag)**

Indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register

[Clearing conditions]

- When it's written to "0" after the state of "1" is read

- 当SCR.TE位为1时，读取TDRE=1后向TDRE写入0。

**PER标志 (奇偶校验错误标志)**

表示异步接收时发生奇偶校验错误，接收异常结束。

[Setting condition]

- 在异步模式接收过程中检测到奇偶校验错误并且地址匹配功能无效状态 (DCCR.DCME=0)。虽然发生奇偶校验错误时的接收数据被传输到RDR，但没有发生RXI中断请求。请注意，当PER标志设置为1时，后续接收数据不会传输到RDR。

[Clearing condition]

- 读取PER=1后向PER写入0时 (写入0后，读取PER位以检查其是否已实际设置为0。)

即使SCR中的RE位设置为0 (禁用串行接收)，PER标志也不受影响并保持其先前的值。

**FER标志 (帧错误标志)**

表示异步模式接收时出现帧错误，接收异常结束。

[Setting condition]

- 当在异步模式接收期间采样"0"作为停止位和地址匹配功能无效状态 (DCCR.DCME=0)。在2-stop-bit模式下，只检查第一个停止位是否为1，不检查第二个停止位。请注意，虽然发生帧错误时的接收数据被传输到RDR，但不会发生RXI中断请求。此外，当FER标志设置为1时，后续接收数据不会传输到RDR。

[Clearing condition]

- 读取FER=1后向FER写入0时 (写入0后，读取FER位以检查其是否已实际设置为0。)

即使SCR中的RE位设置为0，FER标志也不受影响并保持其先前的值。

**ORER标志 (溢出错误标志)**

表示接收过程中发生溢出错误，接收异常结束。

[Setting condition]

- 在接收数据从没有任何有效接收错误的RDR读取之前接收到下一个数据时。在RDR中，保留发生溢出错误之前的接收数据，但发生溢出错误之后接收的数据会丢失。当ORER标志设置为1时，接收数据不转发到RDR寄存器。请注意，在时钟同步模式下，串行发送和接收将停止。

[Clearing condition]

- 读ORER=1后向ORER写入0时 (写入0后，读取ORER位以检查其是否已实际设置为0。)

即使SCR中的RE位设置为0，ORER标志也不受影响并保留其先前的值。

**RDRF标志 (接收数据满标志)**

指示RDR寄存器中存在接收数据。

[Setting condition]

- 接收正常结束时，接收数据从RSR寄存器转发到RDR寄存器

[Clearing conditions]

- 读取"1"状态后写入"0"时

- When it's read the data from the RDR register

**TDRE flag (Transmit Data Empty Flag)**

Indicates the presence of transmit data in the TDR register.

[Setting conditions]

- When the SCR.TE bit is "0"
- When data is transmitted from the TDR register to the TSR register

[Clearing conditions]

- When it's written to "0" after the state of "1" is read
- When the SCR.TE bit is 1, it's written to the TDR register

Note: RDRF and TDRE should not be cleared by SSR register access unless communication is interrupted.

**27.2.19 SCMR : Smart Card Mode Register**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x06

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 0   | SMIF   | Smart Card Interface Mode Select<br>0: Non-smart card interface mode (asynchronous mode, clock synchronous mode, simple SPI mode, or simple IIC mode)<br>1: Smart card interface mode  | R/W <sup>1</sup> |
| 1   | —      | This bit is read as 1. The write value should be 1.  | R/W              |
| 2   | SINV   | Transmitted/Received Data Invert<br>Set the SINV bit to 0 for operation in simple IIC mode.<br>The level of communication terminals (RXD, TXD) are controlled by combination of this bit and SPTR.TINV/RINV. For details, see Figure 27.5.<br>The SINV bit can be used in the following modes:<br>• Smart card interface mode<br>• Asynchronous mode (including multi-processor mode)<br>• Clock synchronous mode<br>• Simple SPI mode<br>0: TDR contents are transmitted as they are. Received data is stored as received in the RDR register.<br>1: TDR register contents are inverted before transmission. Receive data is stored in inverted form in the RDR register. | R/W <sup>1</sup> |
| 3   | SDIR   | Transmitted/Received Data Transfer Direction<br>Set the SDIR bit to 1 for operation in simple IIC mode.<br>The SDIR bit can be used in the following modes:<br>• Smart card interface mode<br>• Asynchronous mode (including multi-processor mode)<br>• Clock synchronous mode<br>• Simple SPI mode<br>0: Transfer LSB-first<br>1: Transfer MSB-first  | R/W <sup>1</sup> |

- 从RDR寄存器读取数据时

**TDRE标志 (传输数据空标志)**

指示TDR寄存器中存在发送数据。

[Setting conditions]

- SCR.TE位为“0”时
- 当数据从TDR寄存器传送到TSR寄存器时

[Clearing conditions]

- 读取“1”状态后写入“0”时
- SCR.TE位为1时，写入TDR寄存器

Note: RDRF和TDRE不应被SSR寄存器访问清除，除非通信中断。

**27.2.19 SCMR:智能卡模式寄存器**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x06

| Bit | Symbol | Function  | R/W              |

| Bit | Symbol | Function   | R/W   |
|-----|--------|--|-------|
| 4   | CHR1   | Character Length 1<br>Valid only in asynchronous mode.*2<br>Selects the transmit/receive character length in combination with the SMR.CHR bit.<br>0: SMR.CHR = 0: Transmit/receive in 9-bit data length<br>SMR.CHR = 1: Transmit/receive in 9-bit data length<br>1: SMR.CHR = 0: Transmit/receive in 8-bit data length (initial value)<br>SMR.CHR = 1: Transmit/receive in 7-bit data length*3 | R/W*1 |
| 6:5 | —      | These bits are read as 1. The write value should be 1.   | R/W   |
| 7   | BCP2   | Base Clock Pulse 2<br>Selects the number of base clock cycles in combination with the SMR_SMCI.BCP[1:0] bits.<br>Table 27.5 lists the combinations of the SCMR.BCP2 and SMR_SMCI.BCP[1:0] bits.  | R/W*1 |

Note 1. Writable only when the TE and RE bits in SCR/SCR\_SMCI are 0 (both serial transmission and reception are disabled).

Note 2. The setting is invalid and a fixed data length of 8 bits is used in modes other than asynchronous mode.

Note 3. LSB-first must be selected and the value of the MSB (bit [7]) in TDR cannot be transmitted.

The SCMR register selects the smart card interface and communication format.

#### SMIF bit (Smart Card Interface Mode Select)

Setting the SMIF bit to 1 selects smart card interface mode. Setting it to 0 selects all other modes:

- Asynchronous mode, including multi-processor mode
- Clock synchronous mode
- Simple SPI mode
- Simple IIC mode

#### SINV bit (Transmitted/Received Data Invert)

The SINV bit inverts the transmit and receive data logic level. It does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SMR or SMR\_SMCI.

#### CHR1 bit (Character Length 1)

The CHR1 bit selects the data length of transmit and receive data in combination with the CHR bit in the SMR register. A fixed data length of 8 bits is used in modes other than asynchronous mode.

#### BCP2 bit (Base Clock Pulse 2)

The BCP2 bit selects the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set this bit in combination with the SMR\_SMCI.BCP[1:0] bits.

Table 27.5 Combinations of the SCMR.BCP2 and SMR\_SMCI.BCP[1:0] bits

| SCMR.BCP2 bit | SMR_SMCI.BCP[1:0] bits | Number of base clock cycles for 1-bit transfer period |
|---------------|------------------------|---|
| 0             | 00b                    | 93 clock cycles (S = 93)*1                            |
| 0             | 01b                    | 128 clock cycles (S = 128)*1                          |
| 0             | 10b                    | 186 clock cycles (S = 186)*1                          |
| 0             | 11b                    | 512 clock cycles (S = 512)*1                          |
| 1             | 00b                    | 32 clock cycles (S = 32) (Initial Value)*1            |
| 1             | 01b                    | 64 clock cycles (S = 64)*1                            |
| 1             | 10b                    | 372 clock cycles (S = 372)*1                          |
| 1             | 11b                    | 256 clock cycles (S = 256)*1                          |

Note 1. S is the value of S in BRR : Bit Rate Register.

| Bit | Symbol | Function   | R/W   |
|-----|--------|--|-------|
| 4   | CHR1   | 字符长度1<br>仅在异步模式下有效。*2<br>结合SMR.CHR位选择发送接收字符长度。<br>0: SMR.CHR=0: 发送接收9位数据长度SMR.CHR=1:<br>发送接收9位数据长度<br>1: SMR.CHR=0: 发送接收以8位数据长度(初始值) SMR.CHR=1:<br>发送接收以7位数据长度*3 | R/W*1 |
| 6:5 | —      | 这些位被读取为1。写入值应为1。   | R/W   |
| 7   | BCP2   | 基本时钟脉冲2<br>结合SMR_SMCI.BCP[1:0]位选择基本时钟周期数。<br>表27.5列出了SCMR.BCP2和SMR_SMCI.BCP[1:0]位的组合。  | R/W*1 |

注1.仅当SCR/SCR\_SMCI中的TE和RE位为0时可写(串行发送和接收均禁用)。

注2.设置无效,异步模式以外的模式使用固定的8位数据长度。

注3.必须选择LSB-first并且不能传输TDR中MSB(位[7])的值。

SCMR寄存器选择智能卡接口和通信格式。

#### SMIF位(智能卡接口模式选择)

将SMIF位设置为1选择智能卡接口模式。将其设置为0会选择所有其他模式:

- 异步模式,包括多处理器模式
- 时钟同步模式
- 简单SPI模式
- 简单IIC模式

#### SINV位(发送接收数据反转)

SINV位反转发送和接收数据逻辑电平。它不影响奇偶校验位的逻辑电平。要反转奇偶校验位,请反转SMR或SMR\_SMCI中的PM位。

#### CHR1位(字符长度1)

CHR1位结合SMR寄存器中的CHR位选择发送和接收数据的数据长度。在异步模式以外的模式中使用8位的固定数据长度。

#### BCP2位(基本时钟脉冲2)

BCP2位选择智能卡接口模式下1位数据传输时间内的基本时钟周期数。将该位与SMR\_SMCI.BCP[1:0]位一起设置。

Table 27.5 SCMR.BCP2和SMR\_SMCI.BCP[1:0]位的组合

| SCMR.BCP2 bit | SMR_SMCI.BCP[1:0] bits | 1位传输周期的基本时钟周期数       |
|---------------|------------------------|----------------------|
| 0             | 00b                    | 93个时钟周期(S=93)*1      |
| 0             | 01b                    | 128个时钟周期(S=128)*1    |
| 0             | 10b                    | 186个时钟周期(S=186)*1    |
| 0             | 11b                    | 512个时钟周期(S=512)*1    |
| 1             | 00b                    | 32个时钟周期(S=32)(初始值)*1 |
| 1             | 01b                    | 64个时钟周期(S=64)*1      |
| 1             | 10b                    | 372个时钟周期(S=372)*1    |
| 1             | 11b                    | 256个时钟周期(S=256)*1    |

注1.S是BRR中S的值:比特率寄存器。

27.2.20 BRR : Bit Rate Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x01

BRR is an 8-bit register that adjusts the bit rate.

As each SCI channel has independent baud rate generator control, different bit rates can be set for each channel. Table 27.6 shows the relationship between the setting (N) in the BRR and the bit rate (B) for normal asynchronous mode, multi-processor transfer, clock synchronous mode, smart card interface mode, simple SPI mode, and simple IIC mode.

The initial value of the BRR register is 0xFF. The BRR register can be read by the CPU, but it can be written to only when the TE and RE bits in SCR/SCR\_SMCI are 0.

Table 27.6 Relationship between N setting in BRR and bit rate B

| Mode                                   | SEMR settings |            |            | BRR setting  | Error  |
|--|---------------|------------|------------|--|--|
|  | BGDM bit      | ABCS bit   | ABCS E bit |  |  |
| Asynchronous, multi-processor transfer | 0             | 0          | 0          | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
|  | 1             | 0          | 0          | $N = \frac{PCLK \times 10^6}{32 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
|  | 0             | 1          | 0          | $N = \frac{PCLK \times 10^6}{16 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
|  | 1             | 1          | 0          | $N = \frac{PCLK \times 10^6}{12 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
|  | Don't care    | Don't care | 1          | $N = \frac{PCLK \times 10^6}{12 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
| Clock synchronous, simple SPI          |               |            |            | $N = \frac{PCLK \times 10^6}{8 \times 2^{2n-1} \times B} - 1$  | —  |
| Smart card interface                   |               |            |            | $N = \frac{PCLK \times 10^6}{S \times 2^{2n+1} \times B} - 1$  | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1 \right\} \times 100$  |
| Simple IIC <sup>1</sup>                |               |            |            | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | —  |

Note: B: Bit rate (bps)  
 N: BRR setting for on-chip baud rate generator (0 ≤ N ≤ 255)  
 PCLK: Operating frequency (MHz)  
 n and S: Determined by the SMR/SMR\_SMCI and SCMR register settings as listed in Table 27.8 and Table 27.9.  
 Note 1. Adjust the bit rate so that the widths of high and low level of the SCLn output in simple IIC mode satisfy the I<sup>2</sup>C bus standard.

Table 27.7 Calculating widths of SCLn high and low levels

| Mode | SCLn                                | Formula (result in seconds)   |
|------|-------------------------------------|---|
| IIC  | Width at high level (minimum value) | $(N + 1) \times 4 \times 2^{2n-1} \times 7 \times \frac{1}{PCLK \times 10^6}$ |
|      | Width at low level (minimum value)  | $(N + 1) \times 4 \times 2^{2n-1} \times 8 \times \frac{1}{PCLK \times 10^6}$ |

27.2.20 BRR:比特率寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x01

BRR是一个8位寄存器，用于调整比特率。

由于每个SCI通道都有独立的波特率发生器控制，因此可以为每个通道设置不同的比特率。表27.6显示了BRR中的设置(N)与正常异步模式、多处理器传输、时钟同步模式、智能卡接口模式、简单SPI模式和简单IIC模式的比特率(B)之间的关系。

BRR寄存器的初始值为0xFF。BRR寄存器可以被CPU读取，但只有当SCR/SCR\_SMCI中的TE和RE位为0时才能写入。

Table 27.6 BRR中的N设置与比特率B的关系

| Mode                    | SEMR settings |            |         | BRR setting  | Error  |
|-------------------------|---------------|------------|---------|--|--|
|                         | BGDM bit      | ABCS 位     | ABCS E位 |  |  |
| 异步、多处理器传输               | 0             | 0          | 0       | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
|                         | 1             | 0          | 0       | $N = \frac{PCLK \times 10^6}{32 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
|                         | 0             | 1          | 0       | $N = \frac{PCLK \times 10^6}{16 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
|                         | 1             | 1          | 0       | $N = \frac{PCLK \times 10^6}{12 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
|                         | Don't care    | Don't care | 1       | $N = \frac{PCLK \times 10^6}{12 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
| 时钟同步，简单的SPI             |               |            |         | $N = \frac{PCLK \times 10^6}{8 \times 2^{2n-1} \times B} - 1$  | —  |
| 智能卡接口                   |               |            |         | $N = \frac{PCLK \times 10^6}{S \times 2^{2n+1} \times B} - 1$  | $Error (\%) = \left\{ \frac{PCLK \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1 \right\} \times 100$  |
| Simple IIC <sup>1</sup> |               |            |         | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | —  |

Note: B: 比特率 (bps)  
 N: 片内波特率发生器的BRR设置 (0≤N≤255)  
 PCLK: 工作频率(MHz)n和S: 由表27.8和表27.9中列出的SMR/SMR\_SMCI和SCMR寄存器设置决定。

注1.调整比特率，使简单IIC模式下SCLn输出的高低电平宽度满足I2C总线标准。

Table 27.7 计算SCLn高低电平的宽度

| Mode | SCLn        | 公式 (以秒为单位的結果)   |
|------|-------------|---|
| IIC  | 高电平宽度 (最小值) | $(N + 1) \times 4 \times 2^{2n-1} \times 7 \times \frac{1}{PCLK \times 10^6}$ |
|      | 低电平宽度 (最小值) | $(N + 1) \times 4 \times 2^{2n-1} \times 8 \times \frac{1}{PCLK \times 10^6}$ |

Table 27.8 Clock source settings

| SMR or SMR_SMCI.CKS[1:0] bits setting | Clock source  | n |
|---------------------------------------|---------------|---|
| CKS[1:0] bits                         |               |   |
| 00b                                   | PCLK clock    | 0 |
| 01b                                   | PCLK/4 clock  | 1 |
| 10b                                   | PCLK/16 clock | 2 |
| 11b                                   | PCLK/64 clock | 3 |

Table 27.9 Base clock settings in smart card interface mode

| SCMR.BCP2 bit setting | SMR_SMCI.BCP[1:0] bits setting | Base clock cycles for 1-bit period | S   |
|-----------------------|--------------------------------|------------------------------------|-----|
| BCP2 bit              | BCP[1:0] bits                  |                                    |     |
| 0                     | 00b                            | 93 clock cycles                    | 93  |
| 0                     | 01b                            | 128 clock cycles                   | 128 |
| 0                     | 10b                            | 186 clock cycles                   | 186 |
| 0                     | 11b                            | 512 clock cycles                   | 512 |
| 1                     | 00b                            | 32 clock cycles                    | 32  |
| 1                     | 01b                            | 64 clock cycles                    | 64  |

Table 27.10 and Table 27.11 list examples of BRR (N) settings in normal asynchronous mode. Table 27.12 lists the maximum bit rate settable for each operating frequency. Table 27.16 lists examples of BRR (N) settings in smart card interface mode.

In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, see section 27.7.4. Receive Data Sampling Timing and Reception Margin. Table 27.13 and Table 27.15 list the maximum bit rates with external clock input.

When either the Asynchronous Mode Base Clock Select bit (ABCS) or the Baud Rate Generator Double-speed Mode Select bit (BGDM) in the Serial Extended Mode Register (SEMR) is set to 1 in asynchronous mode, the bit rate becomes twice the value listed in Table 27.17. When both of those registers are set to 1, the bit rate becomes four times the listed value.

Table 27.10 Examples of BRR settings for different bit rates in asynchronous mode (1) (1 of 2)

| Bit rate (bps) | Operating frequency PCLK (MHz) |     |           |        |     |           |    |     |           |    |     |           |        |     |           |

Table 27.8 时钟源设置

| SMR或SMR_SMCI.CKS[1:0]位设置 | 时钟源           | n |
|--------------------------|---------------|---|
| CKS[1:0] bits            |               |   |
| 00b                      | PCLK clock    | 0 |
| 01b                      | PCLK/4 clock  | 1 |
| 10b                      | PCLK/16 clock | 2 |
| 11b                      | PCLK/64 clock | 3 |

Table 27.9 智能卡接口模式下的基本时钟设置

| SCMR.BCP2位设置 | SMR_SMCI.BCP[1:0]位设置 | 1位周期的基本时钟周期 | S   |
|--------------|----------------------|-------------|-----|
| BCP2 bit     | BCP[1:0] bits        |             |     |
| 0            | 00b                  | 93个时钟周期     | 93  |
| 0            | 01b                  | 128个时钟周期    | 128 |
| 0            | 10b                  | 186个时钟周期    | 186 |
| 0            | 11b                  | 512个时钟周期    | 512 |
| 1            | 00b                  | 32个时钟周期     | 32  |
| 1            | 01b                  | 64个时钟周期     | 64  |
| 1            | 10b                  | 372个时钟周期    | 372 |
| 1            | 11b                  | 256个时钟周期    | 256 |

表27.10和表27.11列出了正常异步模式下的BRR(N)设置示例。表27.12列出了每个工作频率可设置的最大比特率。表27.16列出了智能卡接口模式下的BRR(N)设置示例。

在智能卡接口模式下，可以选择1位数据传输时间内的基本时钟周期数S。有关详细信息，请参阅第27.7.4节。接收数据采样时序和接收余量。表27.13和表27.15列出了外部时钟输入的最大比特率。

当串行扩展模式寄存器(SEMR)中的异步模式基本时钟选择位(ABCS)或波特率发生器双速模式选择位(BGDM)在异步模式下设置为1时，比特率变为该值的两倍列于表27.17中。当这两个寄存器都设置为1时，比特率变为所列值的四倍。

Table 27.10 异步模式下不同比特率的BRR设置示例(1)(1of2)

| 比特率 (bps) | 工作频率PCLK(MHz) |     |           |        |     |           |    |     |           |    |     |           |        |     |           |

| 38400          | —                              | —   | —         | 0  | 12  | 0.16      | 0       | 13  | 0.00      | 0  | 14  | -2.34     | 0       | 15  | 0.00      |

Note: In this example, SEMR.ABCS = 0, SEMR.ABCSE = 0, and SEMR.BGDM = 0.  
When either the ABCS or BGDM bit is set to 1, the bit rate doubles.  
When both ABCS and BGDM are set to 1, the bit rate increases four times.

Table 27.11 Examples of BRR settings for different bit rates in asynchronous mode (2) (1 of 3)

| Bit rate (bps) | Operating frequency PCLK (MHz) |     |           |    |     |           |    |     |           |    |     |           |    |     |           |
|----------------|--------------------------------|-----|-----------|----|-----|-----------|----|-----|-----------|----|-----|-----------|----|-----|-----------|
|                | 20                             |     |           | 25 |     |           | 30 |     |           | 33 |     |           | 40 |     |           |
|                | n                              | N   | Error (%) | n  | N   | Error (%) | n  | N   | Error (%) | n  | N   | Error (%) | n  | N   | Error (%) |

| 38400     | —             | —   | —         | 0  | 12  | 0.16      | 0       | 13  | 0.00      | 0  | 14  | -2.34     | 0       | 15  | 0.00      |

Note: 在此示例中, SEMR.ABCS=0、SEMR.ABCSE=0和SEMR.BGDM=0。  
当ABCS或BGDM位设置为1时, 比特率加倍。  
当ABCS和BGDM都设置为1时, 比特率增加四倍。

Note: In this example, SEMR.ABCS = 0, SEMR.ABCSE = 0, and SEMR.BGDM = 0.  
 When either the ABCS or BGDM bit is set to 1, the bit rate doubles.  
 When both ABCS = 1 and BGDM = 1, the bit rate quadruples.

Table 27.12 Maximum bit rate for each operating frequency in asynchronous mode (1 of 2)

| PCLK (MHz) | SEMR settings |          |           |   |           | Maximum bit rate (bps) | PCLK (MHz) | SEMR settings |          |           |           |         | Maximum bit rate (bps) |
|------------|---------------|----------|-----------|---|-----------|------------------------|------------|---------------|----------|-----------|-----------|---------|------------------------|

Note: 在此示例中, SEMR.ABCS=0、SEMR.ABCSE=0和SEMR.BGDM=0。  
 当ABCS或BGDM位设置为1时, 比特率加倍。  
 当ABCS=1和BGDM=1时, 比特率翻四倍。

Note: Space: Setting prohibited.

—: Can be set, but an error occurs.

Note 1. Continuous transmission or reception is not possible. After transmitting or receiving one frame of data, a 1-bit period elapses before starting to transmit or receive the next frame of data. The output of the synchronization clock is stopped for a 1-bit period. Therefore, it takes 9 bits worth of time to transfer one frame (8 bits) of data, and the average transfer rate is 8/9 times the bit rate. When the FIFO is selected, this setting (BRR = 00h and SMR.CKS[1:0] = 00b) is not available.

Table 27.15 Maximum bit rate with external clock input in clock synchronous and simple SPI modes (1 of 2)

| PCLK (MHz) | External input clock (MHz) | Maximum bit rate (Mbps) |
|------------|----------------------------|-------------------------|

Note: 空格: 禁止设置。—: 可以设置, 但发生错误。

注1.不能连续发送或接收。发送或接收一帧数据后, 经过1位周期后开始发送或接收下一帧数据。同步时钟的输出停止1位周期。因此, 传输一帧(8位)数据需要9位的时间, 平均传输速率为89倍的位速率。选择FIFO时, 此设置(BRR=00h且SMR.CKS[1:0]=00b)不可用。

Table 27.15 时钟同步和简单SPI模式下外部时钟输入的最大比特率 (1of2)

## 27.2.21 MDDR : Modulation Duty Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x12

| Bit position:      | 7                   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------------------|---------------------|---|---|---|---|---|---|---|
| Bit field:         | [ 1 1 1 1 1 1 1 1 ] |   |   |   |   |   |   |   |
| Value after reset: | 1                   | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

MDDR corrects the bit rate adjusted by the BRR register.

When the BRME bit in SEMR is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected using the settings in MDDR (M/256). Table 27.20 shows the relationship between the MDDR setting (M) and the bit rate (B).

The initial value of MDDR is 0xFF. Bit [7] in this register is fixed to 1.

The CPU can read the MDDR register, but this register is only writable when the TE and RE bits in SCR/SCR\_SMCI are 0.

Table 27.19 简单IIC模式下多个比特率的SCL高电平和低电平的最小宽度 (4个中的4个)

| 比特率(bps) | 工作频率PCLK(MHz) |   |                           |    |    |                   |     |   |                           |
|----------|---------------|---|---------------------------|----|----|-------------------|-----|---|---------------------------|

## 27.2.21 MDDR: 调制占空比寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x12

| Bit position: | 7                   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------------|---------------------|---|---|---|---|---|---|---|
| Bit field:    | [ 1 1 1 1 1 1 1 1 ] |   |   |   |   |   |   |   |
| 重置后的值:        | 1                   | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

MDDR校正由BRR寄存器调整的比特率。

当SEMR中的BRME位设置为1时，片上波特率发生器生成的比特率使用MDDR(M256)中的设置进行均匀校正。表27.20显示了MDDR设置(M)和比特率(B)之间的关系。

MDDR的初始值为0xFF。该寄存器中的位[7]固定为1。

CPU可以读取MDDR寄存器，但该寄存器只有在SCR/SCR\_SMCI中的TE和RE位为0时才可写。

**Table 27.20 Relationship between MDDR setting (M) and bit rate (B) when bit rate modulation function is used**

B: Bit rate (bps)  
 M: MDDR setting (128 ≤ MDDR ≤ 256)  
 N: BRR setting for baud rate generator (0 ≤ N ≤ 255)  
 PCLK: Operating frequency (MHz)  
 n and S: Determined by the SMR/SMR\_SMCI and SCMR register settings as listed in Table 27.8 and Table 27.9 in section 27.2.20. BRR: Bit Rate Register.

| Mode                                 | SEMR settings |          |           | BRR setting   | Error  |
|--------------------------------------|---------------|----------|-----------|---|--|
|                                      | BGDM bit      | ABCS bit | ABCSE bit |   |  |
| Asynchronous multiprocessor transfer | 0             | 0        | 0         | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
|                                      | 1             | 0        | 0         | $N = \frac{PCLK \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
|                                      | 0             | 1        | 0         | $N = \frac{PCLK \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
|                                      | 1             | 1        | 0         | $N = \frac{PCLK \times 10^6}{12 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
| Clock synchronous, simple SPI*1      | ×             | ×        | 1         | $N = \frac{PCLK \times 10^6}{8 \times 2^{2n-1} \times (256/M) \times B} - 1$  | —  |
| Smart card interface                 |               |          |           | $N = \frac{PCLK \times 10^6}{S \times 2^{2n+1} \times (256/M) \times B} - 1$  | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times S \times 2^{2n+1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$  |
| Simple IIC*2                         |               |          |           | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$ | —  |

Note 1. Do not use this function in clock synchronous mode or in the highest speed settings in simple SPI mode (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).  
 Note 2. Adjust the bit rate so that the widths at high and low level of the SCLn output in simple IIC mode satisfy the IIC standard.

Table 27.21 and Table 27.22 list examples of N settings in BRR and M settings in MDDR in normal asynchronous mode.

**Table 27.21 Examples of the BRR and MDDR settings for different bit rates in asynchronous mode (1) (1 of 3)**

| Bit rate (bps) | Operating frequency PCLK (MHz) |   |     |          |           |        |   |         |          |           |    |    |     |          |           |

**Table 27.20 使用比特率调制功能时MDDR设置(M)和比特率(B)的关系**

B: 比特率 (bps)  
 M: MDDR setting (128 ≤ MDDR ≤ 256)  
 N: 波特率发生器的BRR设置 (0 ≤ N ≤ 255)  
 PCLK: 工作频率(MHz)n和S: 由SMRSMR\_SMCI和SCMR寄存器设置确定, 如第27.2.20节中的表27.8和表27.9中所列。BRR: 比特率寄存器。

| Mode          | SEMR settings |        |           | BRR setting   | Error  |
|---------------|---------------|--------|-----------|---|--|
|               | BGDM bit      | ABCS 位 | ABCSE bit |   |  |
| 异步多处理器传输      | 0             | 0      | 0         | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
|               | 1             | 0      | 0         | $N = \frac{PCLK \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
|               | 0             | 1      | 0         | $N = \frac{PCLK \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
|               | 1             | 1      | 0         | $N = \frac{PCLK \times 10^6}{12 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
| 时钟同步, 简单SPI*1 | ×             | ×      | 1         | $N = \frac{PCLK \times 10^6}{8 \times 2^{2n-1} \times (256/M) \times B} - 1$  | —  |
| 智能卡接口         |               |        |           | $N = \frac{PCLK \times 10^6}{S \times 2^{2n+1} \times (256/M) \times B} - 1$  | $Error(\%) = \left\{ \frac{PCLK \times 10^6}{B \times S \times 2^{2n+1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$  |
| Simple IIC*2  |               |        |           | $N = \frac{PCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$ | —  |

注1.不要在时钟同步模式或简单SPI模式的最高速度设置中使用此功能 (SMR.CKS[1:0]=00b, SCR.CKE[1] = 0, and BRR = 0).  
 注2.调整比特率, 使简单IIC模式下SCLn输出的高低电平宽度满足IIC标准。

表27.21和表27.22列出了正常异步模式下BRR中的N设置和MDDR中的M设置的示例。

**Table 27.21 异步模式下不同比特率的BRR和MDDR设置示例(1)(1of3)**

| Bit | Symbol  | Function  | R/W              |
|-----|---------|---|------------------|
| 6   | BGDM    | Baud Rate Generator Double-Speed Mode Select<br>Valid only in asynchronous mode with SCR.CKE[1] = 0.<br>0: Output clock from baud rate generator with normal frequency<br>1: Output clock from baud rate generator with doubled frequency | R/W <sup>1</sup> |
| 7   | RXDESEL | Asynchronous Start Bit Edge Detection Select<br>Valid only in asynchronous mode.<br>0: Detect low level on RXDn pin as start bit<br>1: Detect falling edge of RXDn pin as start bit   | R/W <sup>1</sup> |

Note 1. Writable only when the TE and RE bits in SCR/SCR\_SMCI are 0 (both serial transmission and reception are disabled).

The SEMR register selects the clock source for the 1-bit period in asynchronous mode.

#### ACS0 bit (Asynchronous Mode Clock Source Select)

Selects the clock source in the asynchronous mode.

The ACS0 bit is valid in asynchronous mode (SMR.CM bit = 0) and when an external clock input is selected (SCR.CKE[1:0] bits = 10b or 11b). This bit is used to select an external clock input or the logical AND of compare matches output from the internal GPT.

Set the ACS0 bit to 0 in other than asynchronous mode.

For SCI1 and SCI2, the GTIOCnA output (n = 3, 4, 6, 7) of GPT can be set as the serial transfer base clock. Refer to Table 27.23 for details.

These bits for the other SCI channels than SCI1 and SCI2 are reserved. The write values to these bits for other than SCI1 and SCI2 should be 0.

Table 27.23 Correspondence between SCI Channels and Compare Match Outputs

| SCI  | GPT  | Compare Match Output |
|------|------|----------------------|
| SCI1 | GPT3 | GTIOC3A              |
|      | GPT4 | GTIOC4A              |
| SCI2 | GPT6 | GTIOC6A              |
|      | GPT7 | GTIOC7A              |

Figure 27.3, Figure 27.4 show a setting example of when GTIOC3A and GTIOC4A are selected for output.

This figure shows an example when GPT clock is input to SCI1.

When generating 187.5 kbps of GPT average transfer rate for PCLKD = 32 MHz:

1. Generate a frequency of 4 MHz using GTIOC3A as the base clock.
2. Generate 3/4 clock enable of base clock to set an average transfer rate of  $3 \text{ MHz}/16 = 187.5 \text{ kbps}$  using GTIOC4A.

Setting examples of GPT and SCI

- GPT3.GTSSR = 0x80000000, GPT4.GTSSR = 0x80000000 (Enable software counter start)
- GPT3.GTPR = 0x00000007, GPT4.GTPR = 0x0000001F (Maximum count value of GTCNT)
- GPT3.GTCCRA = 0x00000003, GPT4.GTCCRA = 0x00000007 (Compare match value)
- GPT3.GTCR = 0x00000000, GPT4.GTCR = 0x00000000 (Saw-wave PWM mode, timer prescaler is PCLKD/1)
- GPT3.GTIOR = 0x00000306, GPT4.GTIOR = 0x00000306

(Initial output low, output high at GTCCRA compare match, output low at cycle end)

- SCR.SCK[1:0] = 10b (External clock input or GPT clock input is selected)
- SEMR = 0x01 (TMR clock input is selected with 16 base clock cycles for 1-bit period)
- GPT3.GTSTR = 0x00000018 (Software start GTCNT counter)

| Bit | Symbol  | Function  | R/W              |
|-----|---------|---|------------------|
| 6   | BGDM    | 波特率发生器双速模式选择<br>仅在SCR.CKE[1]=0的异步模式下有效。<br>0: 波特率发生器输出时钟, 正常频率<br>1: 波特率发生器输出时钟, 频率加倍 | R/W <sup>1</sup> |
| 7   | RXDESEL | 异步起始位边沿检测选择<br>仅在异步模式下有效。<br>0: 检测RXDn引脚的低电平作为起始位<br>1: 检测RXDn引脚的下降沿作为起始位             | R/W <sup>1</sup> |

注1.仅当SCR/SCR\_SMCI中的TE和RE位为0时可写(串行发送和接收均禁用)。

SEMR寄存器选择异步模式下1位周期的时钟源。

#### ACS0位(异步模式时钟源选择)

选择异步模式下的时钟源。

ACS0位在异步模式(SMR.CM位=0)和选择外部时钟输入时(SCR.CKE[1:0]位=10b或11b)有效。该位用于选择外部时钟输入或内部GPT的比较匹配输出的逻辑与。

在非异步模式下将ACS0位设置为0。

对于SCI1和SCI2, GPT的GTIOCnA输出(n=3 4 6 7)可以设置为串行传输基准时钟。详见表27.23。

这些位用于除SCI1和SCI2之外的其他SCI通道。SCI1和SCI2以外的这些位的写入值应为0。

Table 27.23 SCI通道和比较匹配输出之间的对应关系

| SCI  | GPT  | 比较匹配输出  |
|------|------|---------|
| SCI1 | GPT3 | GTIOC3A |
|      | GPT4 | GTIOC4A |
| SCI2 | GPT6 | GTIOC6A |
|      | GPT7 | GTIOC7A |

图27.3、图27.4显示了选择GTIOC3A和GTIOC4A进行输出时的设置示例。

此图显示了GPT时钟输入到SCI1时的示例。

当为PCLKD=32MHz生成187.5kbps的GPT平均传输速率时:

- 1.使用GTIOC3A作为基本时钟生成4MHz的频率。
- 2.使用GTIOC4A生成基本时钟的3/4时钟使能,以设置 $3 \text{ MHz}/16 = 187.5 \text{ kbps}$ 的平均传输速率。

GPT和SCI的树立榜样

- GPT3.GTSSR=0x80000000, GPT4.GTSSR=0x80000000 (启用软件计数器启动)
- GPT3.GTPR=0x00000007 GPT4.GTPR=0x0000001F (GTCNT的最大计数值)
- GPT3.GTCCRA = 0x00000003, GPT4.GTCCRA = 0x00000007 (Compare match value)
- GPT3.GTCR=0x00000000 GPT4.GTCR=0x00000000 (锯波PWM模式, 定时器预分频器为PCLKD1)
- GPT3.GTIOR = 0x00000306, GPT4.GTIOR = 0x00000306

(初始输出低, GTCCRA比较匹配时输出高, 循环结束时输出低)

- SCR.SCK[1:0]=10b (选择外部时钟输入或GPT时钟输入)
- SEMR=0x01 (TMR时钟输入选择16个基本时钟周期用于1位周期)
- GPT3.GTSTR = 0x00000018 (Software start GTCNT counter)

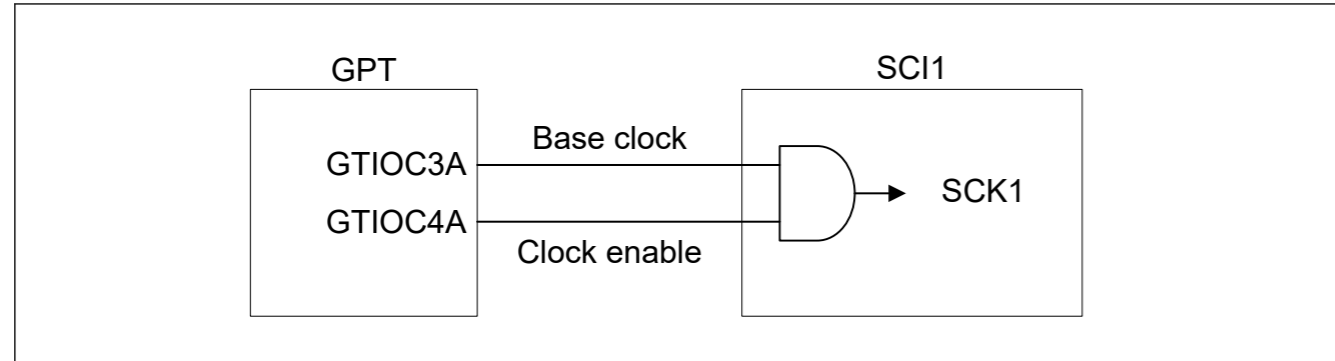

Figure 27.3 example of GPT and SCI connection

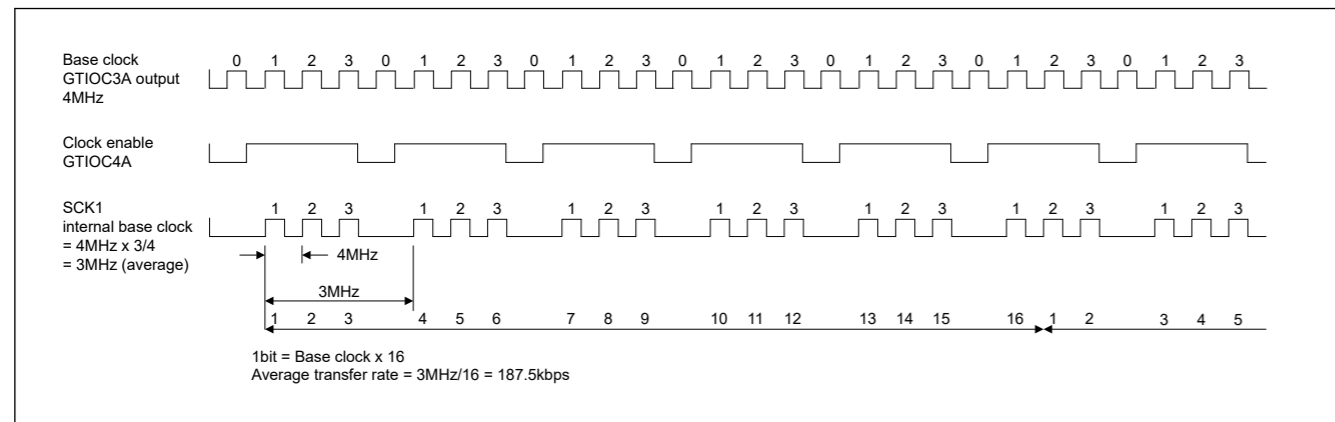

Figure 27.4 Example of Average Transfer Rate Setting When GPT Clock is Input

**PADIS bit (Preamble function Disable)**

In asynchronous mode, select enable / disable of preamble function. In Manchester mode, preamble is not output regardless of this bit setting

**BRME bit (Bit Rate Modulation Enable)**

The BRME bit enables or disables the bit rate modulation function. The bit rate generated by the on-chip baud rate generator is evenly corrected when this function is enabled. Set to 0 in Manchester mode.

**ABCSE bit (Asynchronous Mode Extended Base Clock Select 1)**

The ABCSE bit sets the pulse number for the base clock in a 1-bit period to 6, and the double-frequency clock is output from the baud rate generator. When the bit rate is set to 6 while dividing the bus clock frequency, use this bit and set SMR.CKS[1:0] = 00b and BRR = 0.

Set it to "0" in modes other than asynchronous mode. Even in asynchronous mode, set it to "0" when using external clock.

**ABCS bit (Asynchronous Mode Base Clock Select)**

The ABCS bit selects the number of clock cycles for a 1-bit period.

Set it to "0" in modes other than asynchronous mode and Manchester mode.

**NFEN bit (Digital Noise Filter Function Enable)**

The NFEN bit enables or disables the digital noise filter function.

When the digital noise filter function is enabled:

- Noise cancellation is applied to the RXDn input signal in asynchronous mode
- Noise cancellation is applied to the SDAn and SCLn input signals in simple I<sup>2</sup>C mode

In all other modes, set the NFEN bit to 0 to disable the digital noise filter function. When the function is disabled, input signals are transferred as received.

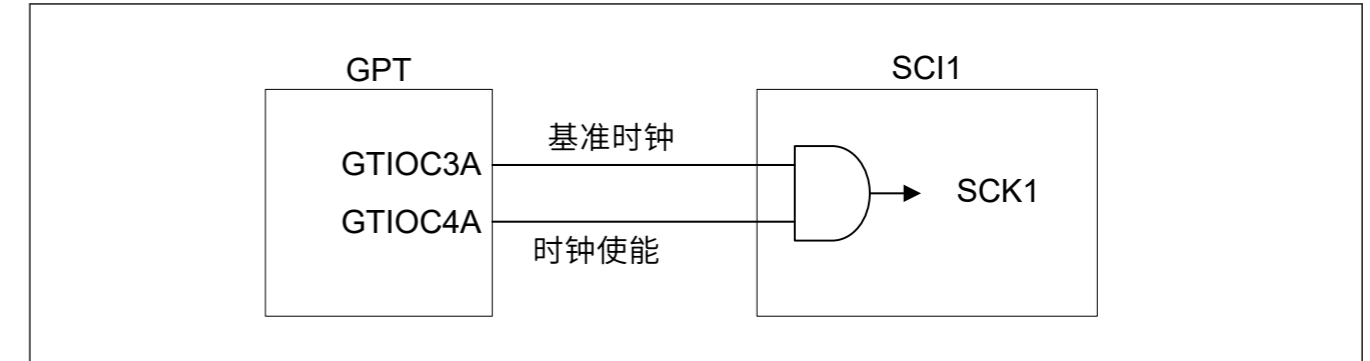

Figure 27.3 GPT和SCI连接示例

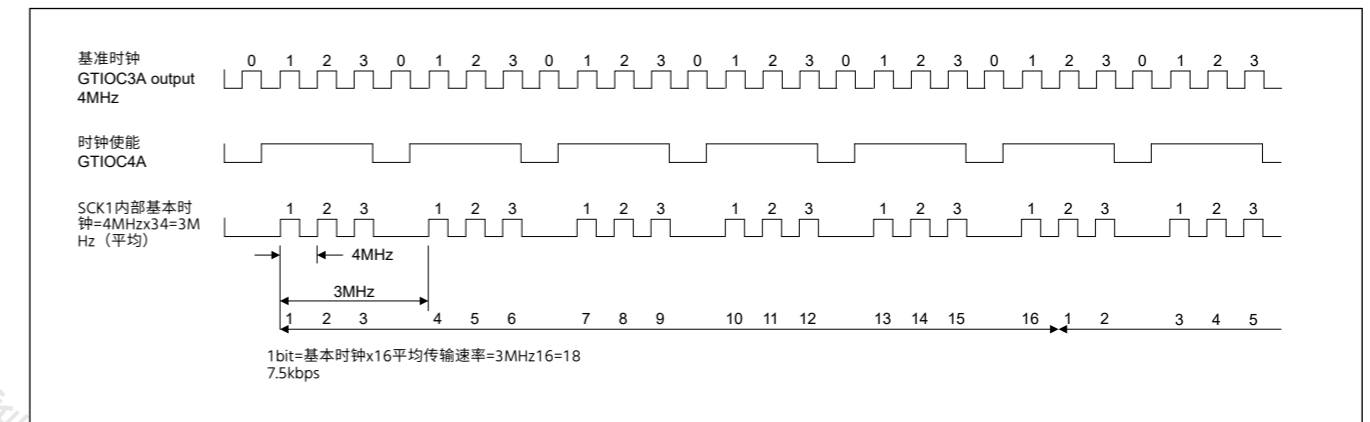

Figure 27.4 输入GPT时钟时的平均传输速率设置示例

**PADIS位（前导功能禁用）**

在异步模式下，选择enable/disable of preamble功能。在曼彻斯特模式下，无论该位设置如何，都不会输出前导码

**BRME位（比特率调制启用）**

BRME位启用或禁用比特率调制功能。该功能使能时，片内波特率发生器产生的比特率得到均匀校正。在曼彻斯特模式下设置为0。

**ABCSE位（异步模式扩展基本时钟选择1）**

ABCSE位将基本时钟在1位周期内的脉冲数设置为6，并从波特率发生器输出双频时钟。当比特率设置为6并同时分频总线时钟频率时，使用该位并设置SMR.CKS[1:0]=00b和BRR=0。

在异步模式以外的模式下将其设置为“0”。即使在异步模式下，使用外部时钟时也将其设置为“0”。

**ABCS位（异步模式基本时钟选择）**

ABCS位选择1位周期的时钟周期数。

在异步模式和曼彻斯特模式以外的模式下将其设置为“0”。

**NFEN位（数字噪声滤波器功能使能）**

NFEN位启用或禁用数字噪声滤波器功能。

启用数字噪声滤波器功能时：

- 在异步模式下对RXDn输入信号应用噪声消除
- 在简单I<sup>2</sup>C模式下，对SDAn和SCLn输入信号应用噪声消除

在所有其他模式下，将NFEN位设置为0以禁用数字噪声滤波器功能。禁用该功能时，输入信号按接收到的方式传输。

**BGDM bit (Baud Rate Generator Double-Speed Mode Select)**

The BGDM bit selects whether or not to double the base clock frequency output from the baud rate generator.

The BGDM bit is valid when the on-chip baud rate generator is selected as the clock source (SCR.CKE[1] = 0) in asynchronous mode (SMR.CM = 0) or Manchester mode (MMR.MANEN = 1). When external clock is selected (SCR.CKE[1] = 1), set it to 0. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1, the base clock cycle is halved and the bit rate is doubled.

Set this bit to 0 in modes other than asynchronous mode or Manchester mode.

**RXDESEL bit (Asynchronous Start Bit Edge Detection Select)**

The RXDESEL bit selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data reception operation depends on the setting of this bit. Set this bit to 1 when reception must be stopped while a break occurs or when reception must be started without keeping the RXDn pin input at the high level for the period of one data frame or longer after completion of the break.

Set this bit to 0 in modes other than asynchronous mode.

**27.2.23 SNFR : Noise Filter Setting Register**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x08

|                    |   |   |   |   |   |           |   |   |
|--------------------|---|---|---|---|---|-----------|---|---|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2         | 1 | 0 |
| Bit field:         | — | — | — | — | — | NFCS[2:0] |   |   |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0         | 0 | 0 |

| Bit | Symbol    | Function  | R/W              |
|-----|-----------|---|------------------|
| 2:0 | NFCS[2:0] | Noise Filter Clock Select<br>In asynchronous mode, selects the standard setting for the base clock.<br>In simple I <sup>2</sup> C mode, selects the standard settings for the clock source of the on-chip baud rate generator selected in the SMR.CKS[1:0] bits.<br>0 0 0: In asynchronous mode: Use clock signal divided by 1 with noise filter<br>In simple I <sup>2</sup> C mode: Setting prohibited<br>0 0 1: In asynchronous mode: Setting prohibited<br>In simple I <sup>2</sup> C mode: Use clock signal divided by 1 with noise filter<br>0 1 0: In asynchronous mode: Setting prohibited<br>In simple I <sup>2</sup> C mode: Use clock signal divided by 2 with noise filter<br>0 1 1: In asynchronous mode: Setting prohibited<br>In simple I <sup>2</sup> C mode: Use clock signal divided by 4 with noise filter<br>1 0 0: In asynchronous mode: Setting prohibited<br>In simple I <sup>2</sup> C mode: Use clock signal divided by 8 with noise filter<br>Others: Setting prohibited | R/W <sup>1</sup> |
| 7:3 | —         | These bits are read as 0. The write value should be 0.  | R/W              |

Note 1. Writing to these bits is only possible when the RE and TE bits in SCR/SCR\_SMCI are 0 (serial reception and transmission disabled).

The SNFR register sets the digital noise filter clock.

**NFCS[2:0] bits (Noise Filter Clock Select)**

The NFCS[2:0] bits select the sampling clock for the digital noise filter. To use the noise filter in asynchronous mode, set these bits to 000b. In simple I<sup>2</sup>C mode, when 32 clocks are selected as one bit period in the basic clock selection bits of the SEMR register, set the NFCS [2: 0] bits in the range from 001b to 100b. When any other value is selected for the basic clock selection bit, set the NFCS bit to 001b.

**BGDM位 (波特率发生器双速模式选择)**

BGDM位选择是否将波特率发生器输出的基本时钟频率加倍。

在异步模式(SMR.CM=0)或曼彻斯特模式(MMR.MANEN=1)选择片内波特率发生器作为时钟源(SCR.CKE[1]=0)时, BGDM位有效。选择外时钟(SCR.CKE[1]=1)时, 将其设置为0。基本时钟是由BaudRateGenerator的时钟输出生成的。当BGDM位设置为1时, 基本时钟周期减半, 比特率加倍。

在异步模式或曼彻斯特模式以外的模式下将此位设置为0。

**RXDESEL位 (异步起始位边沿检测选择)**

RXDESEL位选择异步模式下接收起始位的检测方法。发生中断时, 数据接收操作取决于该位的设置。如果在发生中断时必须停止接收, 或者在中断完成后, RXDn引脚输入在一个数据帧或更长时间内不保持高电平而必须开始接收时, 将该位设置为1。

在异步模式以外的模式下将此位设置为0。

**27.2.23 SNFR: 噪声滤波器设置寄存器**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x08

|               |   |   |   |   |   |           |   |   |

| Bit | Symbol    | Function  | R/W              |
|-----|-----------|---|------------------|
| 2:0 | NFCS[2:0] | 噪声滤波器时钟选择<br>在异步模式下, 选择基本时钟的标准设置。<br>在简单I <sup>2</sup> C模式下, 选择SMR.CKS[1:0]位中选择的片内波特率发生器时钟源的标准设置。<br><br>000: 在异步模式下: 使用时钟信号除以1和噪声滤波器在简单I <sup>2</sup> C模式下: 禁止设置<br>001: 异步模式下: 禁止设置<br>在简单I <sup>2</sup> C模式下: 使用时钟信号除以1和噪声滤波器<br>010: 异步模式下: 禁止设置<br>在简单I <sup>2</sup> C模式下: 使用时钟信号除以2和噪声滤波器<br>011: 异步模式下: 禁止设置<br>在简单I <sup>2</sup> C模式下: 使用时钟信号除以4和噪声滤波器<br>100: 异步模式下: 禁止设置<br>在简单I <sup>2</sup> C模式下: 使用时钟信号除以8和噪声滤波器<br>其他: 禁止设置 | R/W <sup>1</sup> |
| 7:3 | —         | 这些位被读取为0。写入值应为0。  | R/W              |

注1.只有当SCR/SCR\_SMCI中的RE和TE位为0(串行接收和发送禁用)时, 才能写入这些位。

SNFR寄存器设置数字噪声滤波器时钟。

**NFCS[2:0]位 (噪声滤波器时钟选择)**

NFCS[2:0]位选择数字噪声滤波器的采样时钟。要在异步模式下使用噪声滤波器, 请将这些位设置为000b。在简单I<sup>2</sup>C模式下, 当在SEMR寄存器的基本时钟选择位中选择32个时钟作为一个位周期时, 将NFCS[2:0]位设置在001b到100b的范围内。当基本时钟选择位选择任何其他值时, 将NFCS位设置为001b。

27.2.24 SIMR1 : IIC Mode Register 1

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCLm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x09

| Bit | Symbol     | Function   | R/W              |
|-----|------------|--|------------------|
| 0   | IICM       | Simple IIC Mode Select<br>0: SCMR.SMIF = 0: Asynchronous mode (including multi-processor mode), clock synchronous mode, or simple SPI mode<br>SCMR.SMIF = 1: Smart card interface mode<br>1: SCMR.SMIF = 0: Simple IIC mode<br>SCMR.SMIF = 1: Setting prohibited | R/W <sup>1</sup> |
| 2:1 | —          | These bits are read as 0. The write value should be 0.   | R/W              |
| 7:3 | IICDL[4:0] | SDAn Delay Output Select<br>SDAn signal output delay in cycles of the clock signal from the on-chip baud rate generator.<br>0x00: No output delay<br>Others: (IICDL - 1) to (IICDL) cycles   | R/W <sup>1</sup> |

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (both serial transmission and reception are disabled).

SIMR1 selects simple IIC mode and the number of delay stages for the SDAn output.

**IICM bit (Simple IIC Mode Select)**

In combination with the SCMR.SMIF bit, the IICM bit selects the operating mode.

**IICDL[4:0] bits (SDAn Delay Output Select)**

The IICDL[4:0] bits specify an output delay on the SDAn pin relative to the falling edge of the output on the SCLn pin.

The available delay settings range from no delay to 31 cycles, with the clock signal from the on-chip baud rate generator as the base. The signal obtained by frequency-dividing PCLK by the divisor set in SMR.CKS[1:0] is supplied as the clock signal from the on-chip baud rate generator. Set 00000b to IICDL[4:0] bits unless operation is in simple IIC mode. In simple IIC mode, set the bits to a value in the range from 00001b to 11111b.

Table 27.24 Settable value of IICDL[4: 0] bits in each communication mode

| Communication mode         | ABCS       | Settable value of IICDL[4:0] bits |
|----------------------------|------------|-----------------------------------|
| Other than simple IIC mode | Don't care | 00000b                            |
| Simple IIC mode            | 0          | 00001b to 11111b                  |
|                            | 1          | 00001b to 00100b                  |

27.2.25 SIMR2 : IIC Mode Register 2

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCLm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0A

27.2.24 SIMR1：IIC模式寄存器1

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCLm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x09

| Bit | Symbol     | Function   | R/W              |
|-----|------------|--|------------------|
| 0   | IICM       | 简单IIC模式选择<br>0: SCMR.SMIF=0: 异步模式（包括多处理器模式）、时钟同步模式或简单SPI模式<br>SCMR.SMIF=1: 智能卡接口模式<br>1: SCMR.SMIF=0: 简单IIC模式SCMR.SMIF=1: 禁止设置 | R/W <sup>1</sup> |
| 2:1 | —          | 这些位被读取为0。写入值应为0。   | R/W              |
| 7:3 | IICDL[4:0] | SDAn延迟输出选择<br>SDAn信号输出延迟来自片内波特率发生器的时钟信号周期。<br>0x00: 无输出延迟<br>其他: (IICDL1) 至 (IICDL) 周期   | R/W <sup>1</sup> |

注1.只有当SCR寄存器中的RE和TE位为0（串行发送和接收都被禁止）时，才能写入这些位。

SIMR1选择简单IIC模式和SDAn输出的延迟级数。

**IICM位（简单IIC模式选择）**

IICM位与SCMR.SMIF位一起选择工作模式。

**IICDL[4:0]位（SDAn延迟输出选择）**

IICDL[4:0]位指定SDAn引脚上相对于SCLn引脚输出下降沿的输出延迟。

可用的延迟设置范围从无延迟到31个周期，以来自片上波特率发生器的时钟信号为基准。通过在SMR.CKS[1:0]中设置的除数对PCLK进行分频获得的信号作为来自片上波特率发生器的时钟信号提供。除非在简单IIC模式下操作，否则将00000b设置为IICDL[4:0]位。在简单IIC模式下，将位设置为00001b到11111b范围内的值。

Table 27.24 每种通信模式下IICDL[4:0]位的可设置值

| 通讯方式       | ABCS | IICDL[4:0]位的可设置值 |
|------------|------|------------------|
| 除了简单的IIC模式 | 不在乎  | 00000b           |
| 简单IIC模式    | 0    | 00001b to 11111b |
|            | 1    | 00001b to 00100b |

27.2.25 SIMR2：IIC模式寄存器2

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCLm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0A

| Bit | Symbol  | Function  | R/W              |
|-----|---------|---|------------------|
| 0   | IICINTM | IIC Interrupt Mode Select<br>0: Use ACK/NACK interrupts<br>1: Use reception and transmission interrupts | R/W <sup>1</sup> |
| 1   | IICCS   | Clock Synchronization<br>0: Do not synchronize with clock signal<br>1: Synchronize with clock signal    | R/W <sup>1</sup> |
| 4:2 | —       | These bits are read as 0. The write value should be 0.  | R/W              |
| 5   | IICACKT | ACK Transmission Data<br>0: ACK transmission<br>1: NACK transmission and ACK/NACK reception             | R/W              |
| 7:6 | —       | These bits are read as 0. The write value should be 0.  | R/W              |

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (serial reception and transmission disabled).

SIMR2 selects how reception and transmission are controlled in simple IIC mode.

#### IICINTM bit (IIC Interrupt Mode Select)

The IICINTM bit selects the sources of interrupt requests in simple IIC mode.

#### IICCS bit (Clock Synchronization)

Set the IICCS bit to 1 if the internally generated SCLn clock signal is to be synchronized when the SCLn pin is driven low because a wait was inserted by another other device.

The SCLn clock signal is not synchronized if the IICCS bit is 0. The SCLn clock signal is generated according to the rate selected in the BRR register regardless of the level being input on the SCLn pin.

Set the IICCS bit to 1 except during debugging.

#### IICACKT bit (ACK Transmission Data)

Transmitted data contains ACK bits. Set the IICACKT bit to 1 when ACK and NACK bits are received.

### 27.2.26 SIMR3 : IIC Mode Register 3

Base address: SCLn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCLm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0B

| Bit | Symbol  | Function                                     | R/W              |
|-----|---------|--|------------------|
| 0   | IICINTM | IIC中断模式选择<br>0: 使用ACK/NACK中断<br>1: 使用接收和发送中断 | R/W <sup>1</sup> |
| 1   | IICCS   | 时钟同步<br>0: 不与时钟信号同步<br>1: 与时钟信号同步            | R/W <sup>1</sup> |
| 4:2 | —       | 这些位被读取为0。写入值应为0。                             | R/W              |
| 5   | IICACKT | ACK传输数据<br>0: ACK发送<br>1: NACK发送和ACK/NACK接收  | R/W              |
| 7:6 | —       | 这些位被读取为0。写入值应为0。                             | R/W              |

注1.只有当SCR寄存器中的RE和TE位为0（串行接收和发送禁用）时，才能写入这些位。

SIMR2选择在简单IIC模式下如何控制接收和发送。

#### IICINTM位 (IIC中断模式选择)

IICINTM位选择简单IIC模式下的中断请求源。

#### IICCS bit (Clock Synchronization)

如果在SCLn引脚被驱动为低电平时内部生成的SCLn时钟信号要同步，则将IICCS位设置为1，因为另一个其他设备插入了等待。

如果IICCS位为0，则SCLn时钟信号不同步。SCLn时钟信号根据BRR寄存器中选择的速率生成，与SCLn引脚上输入的电平无关。

除调试期间外，将IICCS位设置为1。

#### IICACKT位 (ACK传输数据)

传输的数据包含ACK位。当收到ACK和NACK位时，将IICACKT位设置为1。

### 27.2.26 SIMR3: IIC模式寄存器3

Base address: SCLn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCLm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0B

| Bit position: | 7            | 6            | 5       | 4         | 3            | 2         | 1         | 0         |
|---------------|--------------|--------------|---------|-----------|--------------|-----------|-----------|-----------|
| Bit field:    | IICSCLS[1:0] | IICSDAS[1:0] | IICSTIF | IICSTPREQ | IICRS TARE Q | IICSTAREQ | IICSTAREQ | IICSTAREQ |

重置后的值: 0 0 0 0 0 0 0 0 0

| Bit | Symbol     | Function   | R/W |
|-----|------------|--|-----|
| 0   | IICSTAREQ  | 开始条件生成<br>0: 不产生启动条件<br>1: 产生启动条件 <sup>*1 *3 *5 *6</sup> | R/W |
| 1   | IICRSTAREQ | 重启条件生成<br>0: 不产生重启条件<br>1: 产生重启条件 <sup>*2 *3 *5 *6</sup> | R/W |
| 2   | IICSTPREQ  | 停止条件生成<br>0: 不产生停止条件<br>1: 产生停止条件 <sup>*2 *3 *5 *6</sup> | R/W |

| Bit | Symbol       | Function  | R/W              |
|-----|--------------|---|------------------|
| 3   | IICSTIF      | Issuing of Start, Restart, or Stop Condition Completed Flag<br>0: No requests are being made for generating conditions, or a condition is being generated<br>1: Generation of start, restart, or stop condition is complete.<br>When 0 is written to IICSTIF, it is set to 0 <sup>4</sup> | R/W <sup>4</sup> |
| 5:4 | IICSDAS[1:0] | SDAn Output Select<br>00: Output serial data<br>01: Generate start, restart, or stop condition<br>10: Output low on SDAn pin<br>11: Drive SDAn pin to high-impedance state  | R/W              |
| 7:6 | IICSCLS[1:0] | SCLn Output Select<br>00: Output serial clock<br>01: Generate start, restart, or stop condition<br>10: Output low on SCLn pin<br>11: Drive SCLn pin to high-impedance state   | R/W              |

- Note 1. Only generate a start condition after checking the bus state and confirming that the bus is free.  
 Note 2. Generate a restart or stop condition after checking the bus state and confirming that the bus is busy.  
 Note 3. Do not set more than one of the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits to 1 at a given time.  
 Note 4. Write only 0. When 1 is written, the value is ignored.  
 Note 5. Execute the generation of a condition after the value of the IICSTIF flag is 0.  
 Note 6. Do not write 0 to this bit while it is 1. Generation of a condition is suspended by writing 0 to this bit while it is 1.

The SIMR3 register is used to control the start, restart, and stop conditions in the simple I<sup>2</sup>C mode, and to hold the SSDAn and SSCLn pins at fixed levels.

#### IICSTAREQ bit (Start Condition Generation)

When a start condition is to be generated, set both IICSDAS[1:0] and IICSCLS[1:0] to 01b in addition to setting the IICSTAREQ bit to 1.

[Setting condition]

- On writing 1 to the bit.

[Clearing condition]

- On completion of start condition generation.

#### IICRSTAREQ bit (Restart Condition Generation)

When a restart condition is to be generated, set both IICSDAS[1:0] and IICSCLS[1:0] to 01b in addition to setting the IICRSTAREQ bit to 1.

[Setting condition]

- On writing 1 to the bit.

[Clearing condition]

- On completion of restart condition generation.

#### IICSTPREQ bit (Stop Condition Generation)

When a stop condition is to be generated, set both IICSDAS[1:0] and IICSCLS[1:0] to 01b in addition to setting the IICSTPREQ bit to 1.

[Setting condition]

- On writing 1 to the bit.

[Clearing condition]

- On completion of stop condition generation.

| Bit | Symbol       | Function  | R/W              |
|-----|--------------|---|------------------|
| 3   | IICSTIF      | 发出启动、重启或停止条件完成标志<br>0: 没有请求生成条件, 或者正在生成条件<br>1: 启动、重启或停止条件的生成完成。0写入IICSTIF时, 设置为0*4 | R/W <sup>4</sup> |
| 5:4 | IICSDAS[1:0] | SDAn输出选择<br>00: 输出串行数据01: 产生启动、重启或停止条件10: SDAn引脚输出低电平11: 驱动SDAn引脚为高阻状态              | R/W              |
| 7:6 | IICSCLS[1:0] | SCLn输出选择<br>00: 输出串行时钟01: 产生启动、重启或停止条件10: SCLn引脚输出低电平11: 驱动SCLn引脚为高阻状态              | R/W              |

- 注1.仅在检查总线状态并确认总线空闲后才生成启动条件。  
 注2.检查总线状态并确认总线繁忙后, 生成重新启动或停止条件。  
 注3.在给定时间, 不要将IICSTAREQ、IICRSTAREQ和IICSTPREQ位中的一个以上设置为1。  
 注4.只写0。当写1时, 该值被忽略。  
 注5.在IICSTIF标志的值为0后执行条件生成。  
 注6.当该位为1时, 请勿向该位写入0。当该位为1时, 通过向该位写入0来暂停条件的产生。

SIMR3寄存器用于控制简单I<sup>2</sup>C模式下的启动、重启和停止条件, 并将SSDAn和SSCLn引脚保持在固定电平。

#### IICSTAREQ位 (开始条件生成)

当要产生一个开始条件时, 除了设置IICSDAS[1:0]和IICSCLS[1:0]为01b IICSTAREQ位为1。

[Setting condition]

- 向该位写入1。

[Clearing condition]

- 完成启动条件生成。

#### IICRSTAREQ位 (重启条件生成)

当要产生重启条件时, 除了设置IICSDAS[1:0]和IICSCLS[1:0]为01b IICRSTAREQ位为1。

[Setting condition]

- 向该位写入1。

[Clearing condition]

- 完成重启条件生成。

#### IICSTPREQ位 (停止条件生成)

当要产生停止条件时, 除了设置IICSDAS[1:0]和IICSCLS[1:0]为01b IICSTPREQ位为1。

[Setting condition]

- 向该位写入1。

[Clearing condition]

- 停止条件生成完成时。

**IICSTIF flag (Issuing of Start, Restart, or Stop Condition Completed Flag)**

After generating a condition, the IICSTIF flag indicates that the condition generation is complete. When using the IICSTAREQ, IICRSTAREQ, or IICSTPREQ bit to cause generation of a condition, do so after setting the IICSTIF flag to 0.

When the IICSTIF flag is 1 while an interrupt request is enabled by setting the SCR.TEIE bit, an STI request is output.

[Setting condition]

- On completion of a start, restart, or stop condition generation.

If the setting condition conflicts with any of the clearing conditions for the flag, the clearing condition takes precedence.

[Clearing conditions]

- On writing 0 to the bit. After writing 0 to the IICSTIF bit, read the bit to check that it is actually set to 0.
- On writing 0 to the SIMR1.IICM bit when operation is not in simple IIC mode.
- On writing 0 to the SCR.TE bit.

**IICSDAS[1:0] bits (SDAn Output Select)**

The IICSDAS[1:0] bits control output from the SDAn pin. Set IICSDAS[1:0] and IICSCLS[1:0] to the same value during normal operations.

**IICSCLS[1:0] bits (SCLn Output Select)**

The IICSCLS[1:0] bits control output from the SCLn pin. Set IICSDAS[1:0] and IICSCLS[1:0] to the same value during normal operations.

**27.2.27 SISR : IIC Status Register**

Base address: SCLn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCLm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0C

|                    |   |   |   |   |   |   |   |         |
|--------------------|---|---|---|---|---|---|---|---------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:         | — | — | — | — | — | — | — | IICACKR |
| Value after reset: | 0 | 0 | x | x | 0 | x | 0 | 0       |

| Bit | Symbol  | Function   | R/W |
|-----|---------|--|-----|
| 0   | IICACKR | ACK Reception Data Flag<br>0: ACK received<br>1: NACK received | R   |
| 1   | —       | This bit is read as 0.   | R   |
| 2   | —       | The read value is undefined.                                   | R   |
| 3   | —       | This bit is read as 0.   | R   |
| 5:4 | —       | The read value is undefined.                                   | R   |
| 7:6 | —       | These bits are read as 0.                                      | R   |

SISR monitors the state in simple IIC mode.

**IICACKR flag (ACK Reception Data Flag)**

Received ACK and NACK bits can be read from the IICACKR flag. The IICACKR flag is updated on the rising edge of the SCLn clock for the received ACK/NACK bit.

**IICSTIF标志 (发出启动、重启或停止条件完成标志)**

生成条件后，IICSTIF标志指示条件生成完成。使用时IICSTAREQ、IICRSTAREQ或IICSTPREQ位会导致条件生成，请在将IICSTIF标志设置为0后执行此操作。

当IICSTIF标志为1且通过设置SCR.TEIE位使能中断请求时，输出STI请求。

[Setting condition]

- 完成启动、重新启动或停止条件生成时。

如果设置条件与标志的任何清除条件冲突，则清除条件优先。

[Clearing conditions]

- 向该位写入0。将0写入IICSTIF位后，读取该位以检查它是否实际设置为0。
- 在非简单IIC模式下向SIMR1.IICM位写入0。
- 将0写入SCR.TE位。

**IICSDAS[1:0]位 (SDAn输出选择)**

IICSDAS[1:0]位控制SDAn引脚的输出。在正常操作期间将IICSDAS[1:0]和IICSCLS[1:0]设置为相同的值。

**IICSCLS[1:0]位 (SCLn输出选择)**

IICSCLS[1:0]位控制SCLn引脚的输出。在正常操作期间将IICSDAS[1:0]和IICSCLS[1:0]设置为相同的值。

**27.2.27 SISR:IIC状态寄存器**

Base address: SCLn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
SCLm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0C

|               |   |   |   |   |   |   |   |         |
|---------------|---|---|---|---|---|---|---|---------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
| Bit field:    | — | — | — | — | — | — | — | IICACKR |
| 重置后的值:        | 0 | 0 | x | x | 0 | x | 0 | 0       |

| Bit | Symbol  | Function                       | R/W |
|-----|---------|--------------------------------|-----|
| 0   | IICACKR | ACK接收数据标志<br>0: 收到ACK1: 收到NACK | R   |
| 1   | —       | 该位读为0。                         | R   |
| 2   | —       | 读取值未定义。                        | R   |
| 3   | —       | 该位读为0。                         | R   |
| 5:4 | —       | 读取值未定义。                        | R   |
| 7:6 | —       | 这些位读为0。                        | R   |

SISR在简单IIC模式下监控状态。

**IICACKR标志 (ACK接收数据标志)**

接收到的ACK和NACK位可以从IICACKR标志中读取。IICACKR标志在上升沿更新接收到的ACK/NACK位的SCLn时钟。

## 27.2.28 SPMR : SPI Mode Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0D

|                    |      |       |   |     |        |     |      |     |
|--------------------|------|-------|---|-----|--------|-----|------|-----|
| Bit position:      | 7    | 6     | 5 | 4   | 3      | 2   | 1    | 0   |
| Bit field:         | CKPH | CKPOL | — | MFF | CSTPEN | MSS | CTSE | SSE |
| Value after reset: | 0    | 0     | 0 | 0   | 0      | 0   | 0    | 0   |

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 0   | SSE    | SSn Pin Function Enable<br>0: Disable SSn pin function<br>1: Enable SSn pin function  | R/W <sup>1</sup> |
| 1   | CTSE   | CTS Enable<br>0: Disable CTS function (enable RTS output function)<br>1: Enable CTS function  | R/W <sup>1</sup> |
| 2   | MSS    | Master Slave Select<br>0: Transmit through TXDn pin and receive through RXDn pin (master mode)<br>1: Receive through TXDn pin and transmit through RXDn pin (slave mode)  | R/W <sup>1</sup> |
| 3   | CSTPEN | CTS external pin Enable<br>0: Alternate setting to use CTS and RTS functions as either one terminal<br>1: Dedicated setting for separately using CTS and RTS functions with 2 terminals<br>These bits for the other SCI channels than SCIn (n = 0, 3, 4, 9) are reserved. | R/W              |
| 4   | MFF    | Mode Fault Flag<br>0: No mode fault error<br>1: Mode fault error  | R/W <sup>2</sup> |
| 5   | —      | This bit is read as 0. The write value should be 0.   | R/W              |
| 6   | CKPOL  | Clock Polarity Select<br>0: Do not invert clock polarity<br>1: Invert clock polarity  | R/W <sup>1</sup> |
| 7   | CKPH   | Clock Phase Select<br>0: Do not delay clock<br>1: Delay clock   | R/W <sup>1</sup> |

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (both serial transmission and reception are disabled).

Note 2. Only 0 can be written to this bit, to clear the flag.

SPMR selects the extension settings in asynchronous and clock synchronous modes.

**SSE bit (SSn Pin Function Enable)**

Set the SSE bit to 1 to use the SSn pin to control transmission and reception in simple SPI mode. Set this bit to 0 in all other modes. In simple SPI mode, when master mode is selected (SCR.CKE[1:0] = 00b and SPMR.MSS = 0) and there is a single master, the SSn pin on the master side is not required to control reception and transmission. In such a case, set the SSE bit to 0. Do not set both the SSE and CTSE bits to 1. If this setting is made, operation is the same as that when these bits are set to 0.

**CTSE bit (CTS Enable)**

Set the CTSE bit to 1 if the SSn pin is to be used for inputting the CTS control signal to control transmission and reception. The RTS signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode, simple SPI mode, and simple IIC mode. Do not set both the CTSE and SSE bits to 1. If this setting is made, operation is the same as that when these bits are set to 0.

**MSS bit (Master Slave Select)**

The MSS bit selects master or slave operation in simple SPI mode. The functions of the TXDn and RXDn pins are reversed when this bit is set to 1, so that data is received through the TXDn pin and transmitted through the RXDn pin.

## 27.2.28 SPMR:SPI模式寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)  
 SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x0D

|               |      |       |   |     |        |     |      |     |
|---------------|------|-------|---|-----|--------|-----|------|-----|
| Bit position: | 7    | 6     | 5 | 4   | 3      | 2   | 1    | 0   |
| Bit field:    | CKPH | CKPOL | — | MFF | CSTPEN | MSS | CTSE | SSE |
| 重置后的值:        | 0    | 0     | 0 | 0   | 0      | 0   | 0    | 0   |

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|

| 1   | CTSE   | CTS Enable<br>0: 关闭CTS功能 (开启RTS输出功能)<br>1: 开启CTS功能  | R/W <sup>1</sup> |
| 2   | MSS    | 主从选择<br>0: 通过TXDn引脚发送并通过RXDn引脚接收 (主模式)<br>1: 通过TXDn引脚接收并通过RXDn引脚发送 (从模式)                                    | R/W <sup>1</sup> |
| 3   | CSTPEN | CTS外部引脚使能<br>0: 作为一个端子使用CTS和RTS功能的交替设置<br>1: 单独使用2个端子的CTS和RTS功能的专用设置<br>这些位用于SCIn以外的其他SCI通道 (n=0、3、4、9) 保留。 | R/W              |
| 4   | MFF    | 模式故障标志<br>0: 无模式故障错误<br>1: 模式故障错误   | R/W <sup>2</sup> |
| 5   | —      | 该位读取为0。写入值应为0。  | R/W              |
| 6   | CKPOL  | 时钟极性选择<br>0: 不反转时钟极性<br>1: 反转时钟极性   | R/W <sup>1</sup> |
| 7   | CKPH   | 时钟相位选择<br>0: 不延迟时钟<br>1: 延迟时钟   | R/W <sup>1</sup> |

注1.只有当SCR寄存器中的RE和TE位为0 (串行发送和接收都被禁止) 时,才能写入这些位。

注2.该位只能写入0,以清除标志。

SPMR在异步和时钟同步模式下选择扩展设置。

**SSE位 (SSn引脚功能使能)**

将SSE位设置为1以使用SSn引脚控制简单SPI模式下的发送和接收。在所有其他模式下将此位设置为0。在简单的SPI模式下,选择主模式 (SCR.CKE[1:0]=00B和SPMR.MSS=0),并且有一个主人,主侧不需要SSNPIN来控制接收和传输。在这种情况下,请将SSE位设置为0。不要将SSE和CTSE位都设置为1。如果进行此设置,则操作与将这些位设置为0时的操作相同。

**CTSE bit (CTS Enable)**

如果SSn引脚用于输入CTS控制信号以控制发送和接收,请将CTSE位设置为1。该位设置为0时输出RTS信号。在智能卡接口模式、简单SPI模式和简单模式下设置该位为0 IIC模式。不要将CTSE和SSE位都设置为1。如果进行此设置,则操作与将这些位设置为0时的操作相同。

**MSS位 (主从选择)**

MSS位选择简单SPI模式下的主机或从机操作。当该位设置为1时, TXDn和RXDn引脚的功能相反,因此数据通过TXDn引脚接收并通过RXDn引脚发送。

Set this bit to 0 in modes other than simple SPI mode.

**CSTPEN bit (CTS external pin Enable)**

Select the terminals usage method when using the CTS and RTS functions.

**MFF flag (Mode Fault Flag)**

The MFF flag indicates mode fault errors. In a multi-master configuration, determine the mode fault error occurrence by reading this flag.

[Setting condition]

- When input on the SSn pin is low during master operation in simple SPI mode (SSE bit = 1 and MSS bit = 0).

[Clearing condition]

- On writing 0 to the bit after it is read as 1.

**CKPOL bit (Clock Polarity Select)**

The CKPOL bit selects the polarity of the clock signal output through the SCKn pin. See Figure 27.99 for details. Set the CKPOL bit to 0 in all modes other than simple SPI mode and clock synchronous mode.

**CKPH bit (Clock Phase Select)**

The CKPH bit selects the phase of the clock signal output through the SCKn pin. See Figure 27.99 for details. Set the CKPH bit to 0 in all modes other than simple SPI mode and clock synchronous mode.

**27.2.29 FCR : FIFO Control Register**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x14

| Bit | Symbol    | Function   | R/W              |
|-----|-----------|--|------------------|
| 0   | FM        | FIFO Mode Select<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode.<br>0: Non-FIFO mode.<br>Selects TDR/RDR or TDRHL/RDRHL for communication.<br>1: FIFO mode.<br>Selects FTDRHL/FRDRHL for communication. | R/W <sup>1</sup> |
| 1   | RFRST     | Receive FIFO Data Register Reset<br>Valid only when FCR.FM = 1.<br>0: Do not reset FRDRHL<br>1: Reset FRDRHL   | R/W              |
| 2   | TFRST     | Transmit FIFO Data Register Reset<br>Valid only when FCR.FM = 1.<br>0: Do not reset FTDRHL<br>1: Reset FTDRHL  | R/W              |
| 3   | DRES      | Receive Data Ready Error Select<br>Selects the interrupt requested when detecting receive data ready.<br>0: Receive data full interrupt (SCIn_RXI)<br>1: Receive error interrupt (SCIn_ERI)  | R/W              |
| 7:4 | TTRG[3:0] | Transmit FIFO Data Trigger Number<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode.<br>The trigger number is specified in the TTRG[3:0] bits.   | R/W              |

在简单SPI模式以外的模式下将此位设置为0。

**CSTPEN位 (CTS外部引脚使能)**

使用CTS和RTS功能时选择终端使用方法。

**MFF标志 (模式故障标志)**

MFF标志指示模式故障错误。在多主机配置中，通过读取该标志确定模式故障错误发生。

[Setting condition]

- 在简单SPI模式 (SSE位=1和MSS位=0) 的主机操作期间，SSn引脚上的输入为低电平。

[Clearing condition]

- 读为1后向该位写入0。

**CKPOL位 (时钟极性选择)**

CKPOL位选择通过SCKn引脚输出的时钟信号的极性。详见图27.99。设置在除简单SPI模式和时钟同步模式之外的所有模式中，CKPOL位为0。

**CKPH位 (时钟相位选择)**

CKPH位选择通过SCKn引脚输出的时钟信号的相位。详见图27.99。设置CKPH位在除简单SPI模式和时钟同步模式之外的所有模式下为0。

**27.2.29 FCR：先进先出控制寄存器**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x14

| Bit | Symbol    | Function  | R/W              |
|-----|-----------|---|------------------|
| 0   | FM        | 先进先出模式选择<br>仅在异步模式下有效，包括多处理器模式或时钟同步模式。<br>0: Non-FIFO mode.<br>选择TDRRDR或TDRHLRDRHL进行通信。<br>1: FIFO mode.<br>选择FTDRHLFRDRHL进行通信。 | R/W <sup>1</sup> |
| 1   | RFRST     | 接收FIFO数据寄存器复位<br>仅当FCR.FM=1时有效。<br>0: 不复位FRDRHL1: 复位FRDRHL  | R/W              |
| 2   | TFRST     | 发送FIFO数据寄存器复位<br>仅当FCR.FM=1时有效。<br>0: 不复位FTDRHL1: 复位FTDRHL  | R/W              |
| 3   | DRES      | 接收数据就绪错误选择<br>当检测到接收数据就绪时选择请求的中断。<br>0: 接收数据满中断 (SCIn_RXI) 1: 接收错误中断 (SCIn_ERI)   | R/W              |
| 7:4 | TTRG[3:0] | 发送FIFO数据触发数<br>仅在异步模式下有效，包括多处理器模式或时钟同步模式。触发编号在TTRG[3:0]位中指定。  | R/W              |

| Bit   | Symbol     | Function  | R/W |
|-------|------------|---|-----|
| 11:8  | RTRG[3:0]  | Receive FIFO Data Trigger Number<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode.<br>The trigger number is specified in the RTRG[3:0] bits.   | R/W |
| 15:12 | RSTRG[3:0] | RTS Output Active Trigger Number Select<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, when FCR.FM = 1, SPMR.CTSE = 0, and SPMR.SSE = 0.<br>The trigger number is specified in the RSTRG[3:0] bits. | R/W |

Note 1. Writable only when TE = 0 and RE = 0.

FCR selects FIFO mode, resets FTDRHL and FRDRHL, selects the FIFO data trigger number for transmission or reception, and selects the RTS output active trigger number.

#### FM bit (FIFO Mode Select)

When the FM bit is set to 1, FTDRHL and FRDRHL are selected for communication. When the FM bit is set to 0, TDR and RDR, or TDRHL and RDRHL are selected for communication.

#### RFRST bit (Receive FIFO Data Register Reset)

When the RFRST bit is set to 1, the FRDRHL register is reset and the received data count resets to 0. When 1 is written to the RFRST bit, it clears to 0 after 1 PCLK.

#### TFRST bit (Transmit FIFO Data Register Reset)

When the TFRST bit is set to 1, the FTDRHL register is reset and the transmit data count resets to 0. When 1 is written to the TFRST bit, it clears to 0 after 1 PCLK.

#### DRES bit (Receive Data Ready Error Select)

When detecting a receive data ready error, the selection can be made from an SCIn\_RXI interrupt request or an SCIn\_ERI interrupt request. When starting DTC or DMAC and reading from the FRDRH and FRDRL registers, set the DRES bit to 1.

#### TTRG[3:0] bits (Transmit FIFO Data Trigger Number)

The TDFE flag is set to 1 when the amount of transmit data in FTDRHL is equal to or less than the transmit triggering number specified in the TTRG[3:0] bits, and software can write data to FTDRHL. If SCR.TIE = 1, an SCIn\_TXI interrupt request occurs.

#### RTRG[3:0] bits (Receive FIFO Data Trigger Number)

The RDF flag is set to 1 when the amount of receive data in FRDRHL is equal to or greater than the receive triggering number specified in the RTRG[3:0] bits, and software can read data from FRDRHL. If SCR.RIE = 1, an SCIn\_RXI interrupt request occurs.

When RTRG[3:0] is 0, the RDF flag is not set even when the amount of data in the receive FIFO is equal to 0, and an SCIn\_RXI interrupt does not occur.

#### RSTRG[3:0] bits (RTS Output Active Trigger Number Select)

When the amount of receive data stored in FRDRHL is equal to or greater than the receive triggering number specified in the RSTRG[3:0] bits, the RTS signal goes high.

When RSTRG[3:0] is 0, the RTS signal does not go high even when the amount of data in FRDRHL is equal to 0.

### 27.2.30 FDR : FIFO Data Count Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x16

|                    |    |    |    |        |    |    |   |   |   |   |        |   |   |   |   |   |
|--------------------|----|----|----|--------|----|----|---|---|---|---|--------|---|---|---|---|---|
| Bit position:      | 15 | 14 | 13 | 12     | 11 | 10 | 9 | 8 | 7 | 6 | 5      | 4 | 3 | 2 | 1 | 0 |
| Bit field:         | —  | —  | —  | T[4:0] |    |    |   | — | — | — | R[4:0] |   |   |   |   |   |
| Value after reset: | 0  | 0  | 0  | 0      | 0  | 0  | 0 | 0 | 0 | 0 | 0      | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol     | Function   | R/W |
|-------|------------|--|-----|
| 11:8  | RTRG[3:0]  | 接收FIFO数据触发数<br>仅在异步模式下有效，包括多处理器模式或时钟同步模式。触发编号在RTRG[3:0]位中指定。                                   | R/W |
| 15:12 | RSTRG[3:0] | RTS输出有源触发数选择<br>仅在异步模式下有效，包括多处理器模式或时钟同步模式，当FCR.FM=1、SPMR.CTSE=0和SPMR.SSE=0时。触发数在RSTRG[3:0]中指定。 | R/W |

注1.仅当TE=0且RE=0时可写。

FCR选择FIFO模式，复位FTDRHL和FRDRHL，选择发送或接收的FIFO数据触发数，选择RTS输出激活触发数。

#### FM位 (FIFO模式选择)

当FM位设置为1时，选择FTDRHL和FRDRHL进行通信。当FM位设置为0时，TDR和选择RDR或TDRHL和RDRHL进行通信。

#### RFRST位 (接收FIFO数据寄存器复位)

当RFRST位设置为1时，FRDRHL寄存器复位，接收数据计数复位为0。当向RFRST位写入1时，它在1个PCLK后清除为0。

#### TFRST位 (发送FIFO数据寄存器复位)

当TFRST位设置为1时，FTDRHL寄存器复位并且发送数据计数复位为0。当1写入TFRST位时，它在1个PCLK后清除为0。

#### DRES位 (接收数据就绪错误选择)

当检测到接收数据就绪错误时，可以从SCIn\_RXI中断请求或SCIn\_ERI中断请求中进行选择。启动DTC或DMAC并读取FRDRH和FRDRL寄存器时，将DRES位设置为1。

#### TTRG[3:0]位 (发送FIFO数据触发编号)

当FTDRHL中的发送数据量等于或小于TTRG[3:0]位中指定的发送触发数时，TDFE标志设置为1，并且软件可以将数据写入FTDRHL。如果SCR.TIE=1，则发生SCIn\_TXI中断请求。

#### RTRG[3:0]位 (接收FIFO数据触发编号)

当FRDRHL中的接收数据量等于或大于RTRG[3:0]位中指定的接收触发数时，RDF标志设置为1，并且软件可以从FRDRHL中读取数据。如果SCR.RIE=1，则发生SCIn\_RXI中断请求。

当RTRG[3:0]为0时，即使接收FIFO中的数据量等于0，RDF标志也不置位，并且SCIn\_RXI中断不发生。

#### RSTRG[3:0]位 (RTS输出有效触发数选择)

当FRDRHL中存储的接收数据量等于或大于RSTRG[3:0]位中指定的接收触发数时，RTS信号变为高电平。

当RSTRG[3:0]为0时，即使FRDRHL中的数据量等于0，RTS信号也不会变高。

### 27.2.30 FDR:FIFO数据计数寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x16

|               |    |    |    |        |    |    |   |   |   |   |        |   |   |   |   |   |
|---------------|----|----|----|--------|----|----|---|---|---|---|--------|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12     | 11 | 10 | 9 | 8 | 7 | 6 | 5      | 4 | 3 | 2 | 1 | 0 |
| Bit field:    | —  | —  | —  | T[4:0] |    |    |   | — | — | — | R[4:0] |   |   |   |   |   |
| 重置后的值:        | 0  | 0  | 0  | 0      | 0  | 0  | 0 | 0 | 0 | 0 | 0      | 0 | 0 | 0 | 0 | 0 |

| Bit   | Symbol | Function   | R/W |
|-------|--------|--|-----|
| 4:0   | R[4:0] | Receive FIFO Data Count<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, when FCR.FM = 1.<br>Indicates the amount of receive data stored in FRDRHL.          | R   |
| 7:5   | —      | These bits are read as 0.  | R   |
| 12:8  | T[4:0] | Transmit FIFO Data Count<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, when FCR.FM = 1.<br>Indicates the amount of non-transmitted data stored in FTDRHL. | R   |
| 15:13 | —      | These bits are read as 0.  | R   |

The FDR register indicates the amount of data stored in FRDRHL and FTDRHL.

#### R[4:0] bits (Receive FIFO Data Count)

The R[4:0] bits indicate the amount of receive data stored in FRDRHL. 0x00 means no receive data, and 0x10 means that the maximum received data is stored in FRDRHL.

#### T[4:0] bits (Transmit FIFO Data Count)

The T[4:0] bits indicate the amount of non-transmitted data stored in FTDRHL. 0x00 means no transmit data, and 0x10 means that all (maximum amount) of the data to be transmitted is stored in FTDRHL.

### 27.2.31 LSR : Line Status Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x18

| Bit position:      | 15 | 14 | 13 | 12        | 11 | 10 | 9 | 8 | 7         | 6 | 5 | 4 | 3 | 2    | 1 | 0 |
|--------------------|----|----|----|-----------|----|----|---|---|-----------|---|---|---|---|------|---|---|
| Bit field:         | —  | —  | —  | PNUM[4:0] |    |    |   | — | FNUM[4:0] |   |   |   | — | ORER |   |   |
| Value after reset: | 0  | 0  | 0  | 0         | 0  | 0  | 0 | 0 | 0         | 0 | 0 | 0 | 0 | 0    | 0 | 0 |

| Bit   | Symbol    | Function  | R/W            |
|-------|-----------|---|----------------|
| 0     | ORER      | Overrun Error Flag<br>Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, and when FIFO is selected.<br>0: No overrun error occurred<br>1: Overrun error occurred | R <sup>1</sup> |
| 1     | —         | This bit is read as 0.  | R              |
| 6:2   | FNUM[4:0] | Framing Error Count<br>Indicates the amount of data with a framing error in the receive data stored in FRDRHL.  | R              |
| 7     | —         | This bit is read as 0.  | R              |
| 12:8  | PNUM[4:0] | Parity Error Count<br>Indicates the amount of data with a parity error in the receive data stored in FRDRHL.  | R              |
| 15:13 | —         | These bits are read as 0.   | R              |

Note 1. Write 0 to SSR\_FIFO.ORER to clear the flag.

The LSR register indicates the receive error status.

#### ORER flag (Overrun Error Flag)

The ORER flag reflects the value in SSR\_FIFO.ORER.

#### FNUM[4:0] bits (Framing Error Count)

The FNUM[4:0] value indicates the amount of data with a framing error stored in the FRDRHL register.

| Bit   | Symbol | Function   | R/W |
|-------|--------|--|-----|
| 4:0   | R[4:0] | ReceiveFIFODataCount仅在异步模式下有效，包括多处理器模式，或时钟同步模式，当FCR.FM=1时。表示FRDRHL中存储的接收数据量。   | R   |
| 7:5   | —      | 这些位读为0。  | R   |
| 12:8  | T[4:0] | TransmitFIFODataCount仅在异步模式下有效，包括多处理器模式或时钟同步模式，当FCR.FM=1时。表示存储在FTDRHL中的未发送数据量。 | R   |
| 15:13 | —      | 这些位读为0。  | R   |

FDR寄存器指示存储在FRDRHL和FTDRHL中的数据量。

#### R[4:0]位（接收FIFO数据计数）

R[4:0]位指示存储在FRDRHL中的接收数据量。0x00表示没有接收数据，0x10表示最大接收数据存储在FRDRHL中。

#### T[4:0]位（发送FIFO数据计数）

T[4:0]位指示存储在FTDRHL中的未传输数据量。0x00表示没有传输数据，0x10表示所有（最大量）要传输的数据都存储在FTDRHL中。

### 27.2.31 LSR：线路状态寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x18

| Bit position: | 15 | 14 | 13 | 12        | 11 | 10 | 9 | 8 | 7         | 6 | 5 | 4 | 3 | 2    | 1 | 0 |
|---------------|----|----|----|-----------|----|----|---|---|-----------|---|---|---|---|------|---|---|
| Bit field:    | —  | —  | —  | PNUM[4:0] |    |    |   | — | FNUM[4:0] |   |   |   | — | ORER |   |   |
| 重置后的值:        | 0  | 0  | 0  | 0         | 0  | 0  | 0 | 0 | 0         | 0 | 0 | 0 | 0 | 0    | 0 | 0 |

| Bit   | Symbol    | Function  | R/W            |
|-------|-----------|---|----------------|
| 0     | ORER      | 溢出错误标志<br>仅在异步模式下有效，包括多处理器模式或时钟同步模式，以及选择FIFO时。<br>0: 未发生溢出错误1: 发生溢出错误 | R <sup>1</sup> |
| 1     | —         | 该位读为0。  | R              |
| 6:2   | FNUM[4:0] | 帧错误计数<br>表示FRDRHL中存储的接收数据中存在帧错误的数量。                                   | R              |
| 7     | —         | 该位读为0。  | R              |
| 12:8  | PNUM[4:0] | 奇偶错误计数<br>表示FRDRHL中存储的接收数据中有奇偶校验错误的数量。                                | R              |
| 15:13 | —         | 这些位读为0。   | R              |

注1.将0写入SSR\_FIFO.ORER以清除标志。

LSR寄存器指示接收错误状态。

#### ORER标志（溢出错误标志）

ORER标志反映了SSR\_FIFO.ORER中的值。

#### FNUM[4:0]位（帧错误计数）

FNUM[4:0]值表示存储在FRDRHL寄存器中的具有帧错误的数量。

**PNUM[4:0] bits (Parity Error Count)**

The PNUM[4:0] value indicates the amount of data with a parity error stored in the FRDRHL register.

**27.2.32 CDR : Compare Match Data Register**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x1A

| Bit  | Symbol    | Function  | R/W |
|------|-----------|---|-----|
| 8:0  | CMPD[8:0] | Compare Match Data<br>Holds compare data pattern for address match wakeup function. | R/W |
| 15:9 | —         | These bits are read as 0. The write value should be 0.                              | R/W |

The CDR register sets the compare data for the address match function.

**CMPD[8:0] bits (Compare Match Data)**

The CMPD[8:0] bits set the data to be compared to receive data for the address match function, when the address match function is enabled (DCCR.DCME = 1).

Three bit lengths are available:

- CMPD[6:0] with 7-bit length
- CMPD[7:0] with 8-bit length
- CMPD[8:0] with 9-bit length

**27.2.33 DCCR : Data Compare Match Control Register**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x13

| Bit | Symbol | Function   | R/W     |
|-----|--------|--|---------|
| 0   | DCMF   | Data Compare Match Flag<br>0: Not matched<br>1: Matched  | R/(W)*1 |
| 2:1 | —      | These bits are read as 0. The write value should be 0.   | R/W     |
| 3   | DPER   | Data Compare Match Parity Error Flag<br>0: No parity error occurred<br>1: Parity error occurred    | R/(W)*1 |
| 4   | DFER   | Data Compare Match Framing Error Flag<br>0: No framing error occurred<br>1: Framing error occurred | R/(W)*1 |
| 5   | —      | This bit is read as 0. The write value should be 0.  | R/W     |

**PNUM[4:0]位 (奇偶校验错误计数)**

PNUM[4:0]值表示存储在FRDRHL寄存器中的具有奇偶校验错误的数量。

**27.2.32 CDR:比较匹配数据寄存器**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x1A

| Bit  | Symbol    | Function                     | R/W |
|------|-----------|------------------------------|-----|
| 8:0  | CMPD[8:0] | 比较匹配数据<br>保存地址匹配唤醒功能的比较数据模式。 | R/W |
| 15:9 | —         | 这些位被读取为0。写入值应为0。             | R/W |

CDR寄存器设置地址匹配功能的比较数据。

**CMPD[8:0]位 (比较匹配数据)**

当地址匹配功能启用时 (DCCR.DCME=1)，CMPD[8:0]位设置要比较的数据以接收地址匹配功能的数据。

提供三种位长:

- CMPD[6:0], 7位长度
- CMPD[7:0] 8位长度
- CMPD[8:0], 9位长度

**27.2.33 DCCR:数据比较匹配控制寄存器**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x13

| Bit | Symbol | Function                                      | R/W     |
|-----|--------|---|---------|
| 0   | DCMF   | 数据比较匹配标志<br>0: 不匹配 1: 匹配                      | R/(W)*1 |
| 2:1 | —      | 这些位被读取为0。写入值应为0。                              | R/W     |
| 3   | DPER   | 数据比较匹配奇偶校验错误标志<br>0: 未发生奇偶校验错误<br>1: 发生奇偶校验错误 | R/(W)*1 |
| 4   | DFER   | 数据比较匹配帧错误标志<br>0: 未发生帧错误 1: 发生帧错误             | R/(W)*1 |
| 5   | —      | 该位读取为0。写入值应为0。                                | R/W     |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 6   | IDSEL  | ID Frame Select<br>Valid only in asynchronous mode, including multi-processor mode.<br>0: Always compare data regardless of the MPB bit value<br>1: Only compare data when MPB bit = 1 (ID frame) | R/W |
| 7   | DCME   | Data Compare Match Enable<br>Valid only in asynchronous mode, including multi-processor mode.<br>0: Disable address match function<br>1: Enable address match function                            | R/W |

Note 1. Only 0 can be written, to clear the flag after reading 1.

The DCCR register controls the address match function.

#### DCMF flag (Data Compare Match Flag)

The DCMF flag indicates that the SCI detected a receive data match with the comparison data (CDR.CMPD).

[Setting condition]

- On match of the comparison data (CDR.CMPD) with the receive data when DCCR.DCME = 1.

[Clearing condition]

- When 0 is written after 1 is read from DCMF.

Clearing the SCR.RE bit to 0 does not affect the DCMF flag, which retains its previous value.

#### DPER flag (Data Compare Match Parity Error Flag)

The DPER flag indicates that a parity error occurred on address match detection (receive data match detection).

[Setting condition]

- When a parity error is detected in a frame in which an address match is detected.

[Clearing conditions]

- When 0 is written after 1 is read from DPER.

When the SCR.RE bit is set to 0 (serial reception is disabled), the DPER flag is not affected and retains its previous value.

#### DFER flag (Data Compare Match Framing Error Flag)

The DFER flag indicates that a framing error occurred on address match detection (receive data match detection).

[Setting conditions]

- When a stop bit of a frame in which an address match is detected is 0.  
When in 2-stop-bit mode, only the first bit of the stop bits is checked for a value of 1 (the second stop bit is not checked).

[Clearing conditions]

- When 0 is written after 1 is read from DFER.

When the SCR.RE bit is set to 0 (serial reception is disabled), the DFER flag is not affected and retains its previous value.

#### IDSEL bit (ID Frame Select)

The IDSEL bit selects whether to compare data regardless of the MPB bit value or to compare data only when MPB = 1 (ID frame), when the address match function is enabled.

#### DCME bit (Data Compare Match Enable)

The DCME bit enables or disables the address match function (data compare match function).

If the SCI detects a match to the comparison data (CDR.CMPD) with the receive data, the DCME bit clears automatically, after which SCI operation mode is in normal receive mode. See [section 27.3.6. Address Match \(Receive Data Match Detection\) Function](#).

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 6   | IDSEL  | ID帧选择<br>仅在异步模式下有效，包括多处理器模式。<br>0: 无论MPB位值如何，始终比较数据1: 仅当MPB位=1时比较数据 (ID帧) | R/W |
| 7   | DCME   | 数据比较匹配启用<br>仅在异步模式下有效，包括多处理器模式。<br>0: 禁用地址匹配功能1: 启用地址匹配功能                 | R/W |

注1.只能写入0，读取1后清除标志。

DCCR寄存器控制地址匹配功能。

#### DCMF标志 (数据比较匹配标志)

DCMF标志表示SCI检测到接收数据与比较数据(CDR.CMPD)匹配。

[Setting condition]

- 当DCCR.DCME=1时，比较数据(CDR.CMPD)与接收数据匹配。

[Clearing condition]

- 从DCMF读取1后写入0时。

将SCR.RE位清除为0不会影响DCMF标志，它保留其先前的值。

#### DPER标志 (数据比较匹配奇偶校验错误标志)

DPER标志表示在地址匹配检测 (接收数据匹配检测) 时发生奇偶校验错误。

[Setting condition]

- 在检测到地址匹配的帧中检测到奇偶校验错误时。

[Clearing conditions]

- 从DPER读取1后写入0时。

当SCR.RE位设置为0 (禁用串行接收) 时，DPER标志不受影响并保留其先前的值。

#### DFER标志 (数据比较匹配帧错误标志)

DFER标志表示在地址匹配检测 (接收数据匹配检测) 时发生了帧错误。

[Setting conditions]

- 当检测到地址匹配的帧的停止位为0时。  
在2停止位模式下，仅检查停止位的第一位是否为1 (不检查第二个停止位)。

[Clearing conditions]

- 从DFER读取1后写入0时。

当SCR.RE位设置为0 (禁用串行接收) 时，DFER标志不受影响并保留其先前的值。

#### IDSEL位 (ID帧选择)

IDSEL位选择无论MPB位值如何比较数据，还是仅在MPB=1 (ID帧) 时比较数据，当地址匹配功能启用时。

#### DCME位 (数据比较匹配使能)

DCME位启用或禁用地址匹配功能 (数据比较匹配功能)。

如果SCI检测到比较数据 (CDR.CMPD) 与接收数据匹配，则DCME位自动清零，此后SCI操作模式进入正常接收模式。请参见第27.3.6节。地址匹配 (接收数据匹配检测) 功能。

The write value must be 0 for all modes other than asynchronous mode.

### 27.2.34 SPTR : Serial Port Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x1C

| Bit | Symbol | Function   | R/W   |
|-----|--------|--|-------|
| 0   | RXDMON | Serial Input Data Monitor<br>Indicates the state of the RXDn pin.<br>0: When RINV is 1'b0, RXDn terminal is the low level.<br>When RINV is 1'b1, RXDn terminal is the High level.<br>1: When RINV is 1'b0, RXDn terminal is the High level.<br>When RINV is 1'b1, RXDn terminal is the Low level.  | R     |
| 1   | SPB2DT | Serial Port Break Data Select<br>Selects the output level of the TXDn pin when SCR.TE = 0.<br>0: When TINV is 1'b0, Low level is output in TXDn terminal.<br>When TINV is 1'b1, High level is output in TXDn terminal.<br>1: When TINV is 1'b0, High level is output in TXDn terminal.<br>When TINV is 1'b1, Low level is output in TXDn terminal.   | R/W   |
| 2   | SPB2IO | Serial Port Break I/O*1<br>Selects whether the value of SPB2DT is output to TXDn pin.<br>0: Do not output value of SPB2DT bit on TXDn pin<br>1: Output value of SPB2DT bit on TXDn pin   | R/W   |
| 3   | —      | These bits are read as 0. The write value should be 0.   | R/W   |
| 4   | RINV   | RXD invert bit<br>0: Received data from RXDn is not inverted and input.*2<br>1: Received data from RXDn is inverted and input.   | R/W*3 |
| 5   | TINV   | TXD invert bit<br>0: Transmit data is not inverted and output to TXDn.*2<br>1: Transmit data is inverted and output to TXDn.   | R/W*3 |
| 6   | ASEN   | Adjust receive sampling timing enable<br>(This bit enables in asynchronous mode using internal clock)<br>This function can adjust the receive sampling timing.<br>In asynchronous mode using internal clock, see <a href="#">section 27.3.10. The function of adjust receive sampling timing (Asynchronous Mode)</a> in detail.<br>0: Adjust sampling timing disable.<br>1: Adjust sampling timing enable. | R/W*3 |
| 7   | ATEN   | Adjust transmit timing enable<br>(This bit enables in asynchronous mode using internal clock)<br>This function can adjust the transmit edge of TXDn waveform. See <a href="#">section 27.3.11. The function of adjust transmit timing (Asynchronous Mode)</a> in detail.<br>0: Adjust transmit timing disable.<br>1: Adjust transmit timing enable.  | R/W*3 |

Note 1. Please use this bit in asynchronous mode and manchester mode. Movement by other mode isn't guaranteed.

Note 2. RINV/TINV should be set 1'b0 in smart card interface mode and simple I2C mode.

Note 3. Change the value of these bits only at SCR.TE = SCR.RE = 1'b0.

The SPTR register provides confirmation of the serial reception pin (RXDn pin) status and sets the transmission and receive pin status.

And SPTR register has enable bits for adjust functions of receive sampling timing and transmit timing.

The TXDn pin status is determined by the combination of SCR.TE, SPTR.SPB2IO, and SPTR.SPB2DT settings, as shown in [Table 27.25](#).

对于异步模式以外的所有模式，写入值必须为0。

### 27.2.34 SPTR:串行端口寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3, 4, 9)

Offset address: 0x1C

| Bit | Symbol | Function  | R/W   |
|-----|--------|---|-------|
| 0   | RXDMON | 串行输入数据监视器<br>指示RXDn引脚的状态。<br>0: 当RINV为1'b0时, RXDn端为低电平。当RINV为1'b1时, RXDn端为高电平。<br>1: 当RINV为1'b0时, RXDn端为高电平。当RINV为1'b1时, RXDn端为低电平。                 | R     |
| 1   | SPB2DT | 串行端口中断数据选择<br>选择SCR.TE=0时TXDn引脚的输出电平。<br>0: 当TINV为1'b0时, TXDn端输出低电平。当TINV为1'b1时, TXDn端输出高电平。<br>1: 当TINV为1'b0时, TXDn端输出高电平。当TINV为1'b1时, TXDn端输出低电平。 | R/W   |
| 2   | SPB2IO | 串口中断IO*1<br>选择是否将SPB2DT的值输出到TXDn引脚。<br>0: 不输出TXDn引脚上SPB2DT位的值1: 输出TXDn引脚上SPB2DT位的值  | R/W   |
| 3   | —      | 这些位被读取为0。写入值应为0。  | R/W   |
| 4   | RINV   | RXD反转位<br>0: 从RXDn接收的数据不反相输入。*2<br>1: 从RXDn接收到的数据被反转并输入。  | R/W*3 |
| 5   | TINV   | TXD反转位<br>0: 发送数据不反相并输出到TXDn。*2<br>1: 发送数据反转并输出到TXDn。   | R/W*3 |
| 6   | ASEN   | 调整接收采样时序使能 (该位在使用内部时钟的异步模式下使能) 该功能可以调整接收采样时序。<br><br>在使用内部时钟的异步模式下, 请参阅第27.3.10节。详细调整接收采样时间(异步模式)的功能。<br>0: 调整采样时序禁用。1: 调整采样时序使能。                   | R/W*3 |
| 7   | ATEN   | 调整发送时序使能 (该位在使用内部时钟的异步模式下使能) 该功能可以调整TXDn波形的发送边沿。请参阅第27.3.11节。详细调整发送时间(异步模式)的功能。<br><br>0: 调整发送时序禁用。1: 调整发送时序使能。                                     | R/W*3 |

注1.请在异步模式和曼彻斯特模式下使用该位。不能保证通过其他模式移动。

注2.RINV/TINV在智能卡接口模式和简单I2C模式下应设置为1'b0。

注3.仅在SCR.TE=SCR.RE=1'b0时更改这些位的值。

SPTR寄存器提供串行接收引脚 (RXDn引脚) 状态的确认, 并设置发送和接收引脚状态。

SPTR寄存器具有调整接收采样时序和发送时序功能的使能位。

TXDn引脚状态由SCR.TE、SPTR.SPB2IO和SPTR.SPB2DT设置的组合决定, 如表27.25所示。

The data of RDR is controlled by RINV and SCMR.SINV. And the data from TXDn terminal is controlled by TINV and SCMR.SINV. The control by RINV/TINV are done to communication terminals(RXDn/TXDn), so they can control not only data-bits but also other bits (start bit, stop bit, parity bit). Please refer to Figure 27.5 in detail.

Table 27.25 TXDn pin status

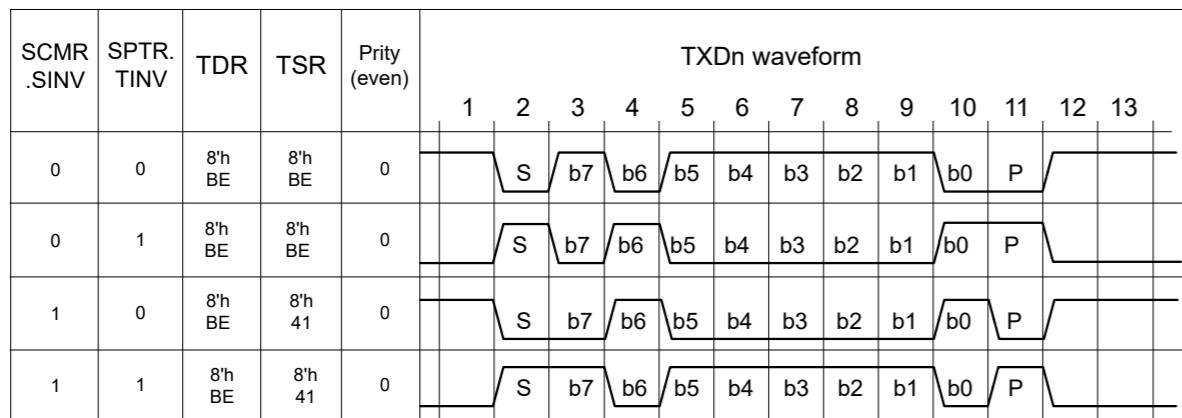

| Value of SCR.TE | Value of SPTR.SPB2IO | Value of SPTR.SPB2DT | TXDn pin status                |
|-----------------|----------------------|----------------------|--------------------------------|
| 0               | 0                    | —                    | Hi-Z (initial value)           |
| 0               | 1                    | 0                    | Low level output               |
| 0               | 1                    | 1                    | High level output              |
| 1               | —                    | —                    | Serial transmit data is output |

Note: —: Do not care.

Note: Use the SPTR register in asynchronous mode only. Using this register in any other mode is not guaranteed.

The receive/transmit data control (Data size=8bits, Even parity, MSB first)

The transmit data is controlled by SPTR.TINV and SCMR.SINV.

The received data is controlled by SPTR.RINV and SCMR.SINV.

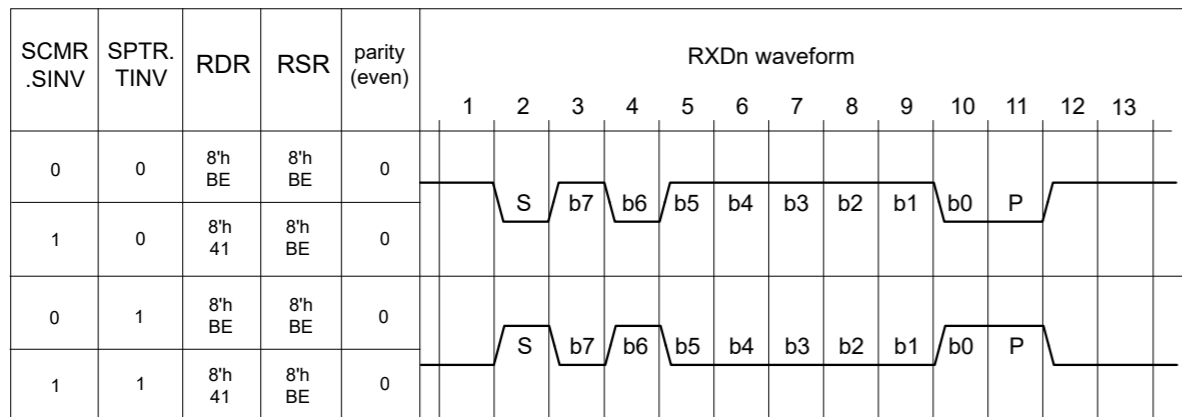

Figure 27.5 Example of the receive/transmit data control

RDR的数据由RINV和SCMR.SINV控制。来自TXDn终端的数据由TINV和SCMR.SINV。RINVTINV的控制是对通信终端 (RXDnTXDn) 进行的，因此它们不仅可以控制数据位，还可以控制其他位（起始位、停止位、奇偶校验位）。详细请参考图27.5。

Table 27.25 TXDn引脚状态

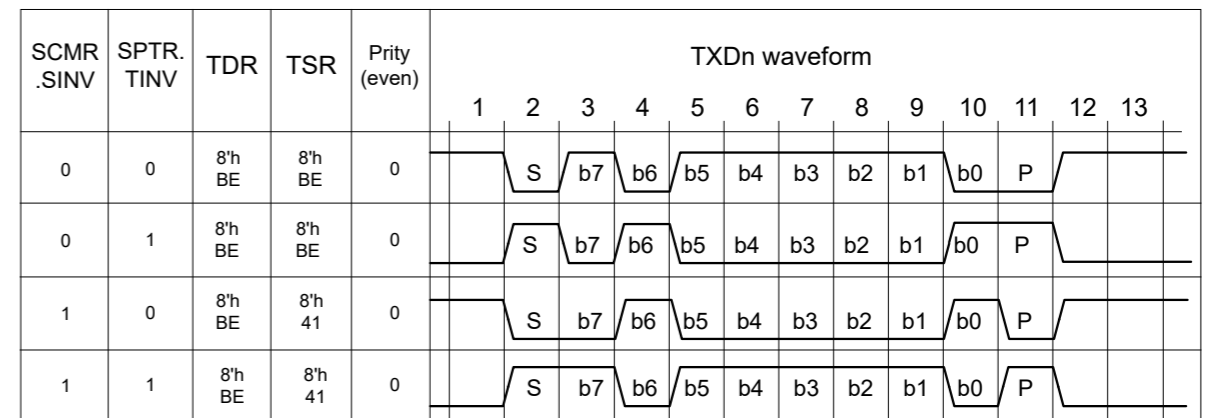

| SCR.TE的值 | SPTR.SPB2IO的值 | SPTR.SPB2DT的值 | TXDn引脚状态             |
|----------|---------------|---------------|----------------------|
| 0        | 0             | —             | Hi-Z (initial value) |
| 0        | 1             | 0             | 低电平输出                |
| 0        | 1             | 1             | 高电平输出                |
| 1        | —             | —             | 串行传输数据输出             |

Note: -: 不管。

Note: 仅在异步模式下使用SPTR寄存器。不保证在任何其他模式下使用该寄存器。

接收发送数据控制 (数据大小=8bits, 偶校验, MSB在前)

发送数据由SPTR.TINV和SCMR.SINV控制。

接收的数据由SPTR.RINV和SCMR.SINV控制。

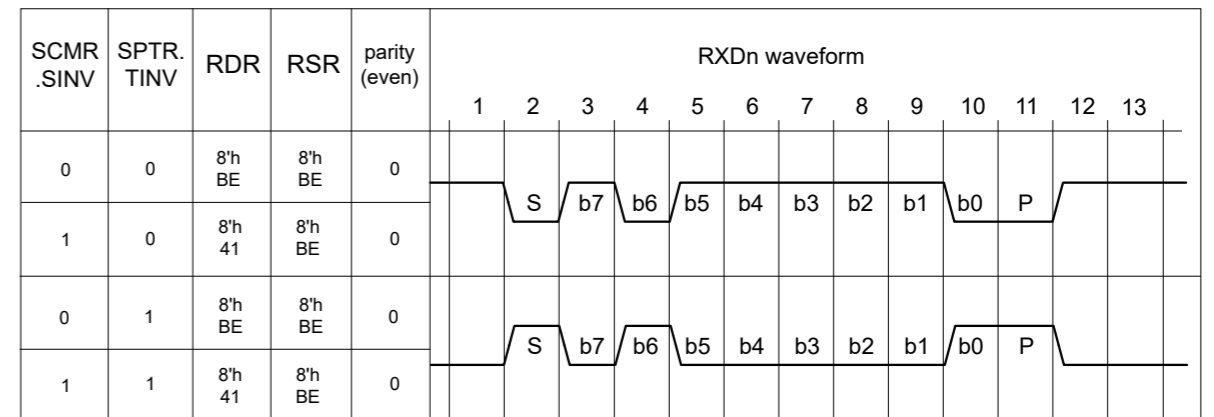

Figure 27.5 接收发送数据控制示例

## 27.2.35 ACTR : Adjustment Communication Timing Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3 to 5)

Offset address: 0x1D

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 2:0 | AST    | Adjustment value for receive Sampling Timing<br>The sampling timing of RXD terminal is adjusted from the middle of bit by the following formula.<br>Adjustment sampling timing = base clock * the setting value of AST[2:0].<br>This bit is effective only at SPTR.ASEN = 1. This setting timing is limited by setting the base clock cycles. Refer to <a href="#">section 27.3.10. The function of adjust receive sampling timing (Asynchronous Mode)</a> in detail. | R/W <sup>1</sup> |
| 3   | AJD    | Adjustment Direction for receive sampling timing<br>Adjustment direction for RXD receive sampling timing is determined by this bit.<br>0: The sampling timing is adjusted backward to the middle of bit.<br>1: The sampling timing is adjusted forward to the middle of bit.<br>This bit is effective only at SPTR.ASEN = 1. Refer to <a href="#">section 27.3.10. The function of adjust receive sampling timing (Asynchronous Mode)</a> in detail.                  | R/W <sup>1</sup> |
| 6:4 | ATT    | Adjustment value for Transmit timing<br>The selected edge timing of TXD is adjusted by the following formula.<br>Adjustment edge timing = base clock * the setting value of ATT[2:0].<br>This bit is effective only at SPTR.ATEN = 1. This setting timing is limited by setting the base clock cycles. Refer to <a href="#">section 27.3.11. The function of adjust transmit timing (Asynchronous Mode)</a> in detail.  | R/W <sup>2</sup> |
| 7   | AET    | Adjustment edge for transmit timing<br>The adjustable edge is set by this bit.<br>When SPTR.TINV is 1'b0,<br>0: Adjust the rising edge timing.<br>1: Adjust the falling edge timing.<br>When SPTR.TINV is 1'b1,<br>0: Adjust the falling edge timing.<br>1: Adjust the rising edge timing.<br>This bit is effective only at SPTR.ATEN = 1. Refer to <a href="#">section 27.3.11. The function of adjust transmit timing (Asynchronous Mode)</a> in detail.            | R/W <sup>2</sup> |

Note 1. Write this bit only when SPTR.ASEN = 0.

Note 2. Write this bit only when SPTR.ATEN = 0.

This register controls adjustment of receive sampling timing and transmit timing. This register is effective only when asynchronous mode using internal clock.

Refer to [section 27.3.10. The function of adjust receive sampling timing \(Asynchronous Mode\)](#) about adjustment receive sampling timing by this register.

Refer to [section 27.3.11. The function of adjust transmit timing \(Asynchronous Mode\)](#) about adjustment transmit timing by this register.

Note: Sentences and a timing chart of the IP operation explanation (except [section 27.1. Overview](#), [section 27.2. Register Descriptions](#), [section 27.3.10. The function of adjust receive sampling timing \(Asynchronous Mode\)](#) and [section 27.3.11. The function of adjust transmit timing \(Asynchronous Mode\)](#)) are mentioned by the condition that the function added in SCIM-7 is off (SPTR.ASEN = 1'b0, SPTR.ATEN = 1'b0).

## 27.2.35 ACTR:调整通信时序寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 0, 3 to 5)

Offset address: 0x1D

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 2:0 | AST    | 接收采样时序的调整值<br>RXD端的采样时序由下式从位中间开始调整。调整采样时序=基准时钟*AST[2:0]的设置值。<br>该位仅在SPTR.ASEN=1时有效。此设置时序受设置基本时钟周期的限制。请参阅 <a href="#">第27.3.10节。详细调整接收采样时间（异步模式）的功能。</a>                                      | R/W <sup>1</sup> |
| 3   | AJD    | 接收采样时序调整方向<br>RXD接收采样时序的调整方向由该位决定。<br>0: 采样定时向后调整到位中间。1: 采样定时向前调整到位中间。<br>该位仅在SPTR.ASEN=1时有效。请参阅 <a href="#">第27.3.10节。详细调整接收采样时间（异步模式）的功能。</a>  | R/W <sup>1</sup> |
| 6:4 | ATT    | 发送时间的调整值<br>TXD的选定边沿时序通过以下公式进行调整。<br>调整边沿时序=基准时钟*ATT[2:0]的设置值。<br>该位仅在SPTR.ATEN=1时有效。此设置时序受设置基本时钟周期的限制。请参阅 <a href="#">第27.3.11节。详细调整发送时间（异步模式）的功能。</a>                                      | R/W <sup>2</sup> |
| 7   | AET    | 发送定时的调整边沿<br>可调边沿由该位设置。<br>当SPTR.TINV为1'b0时,<br>0: 调整上升沿时序。1: 调整下降沿时序。<br>当SPTR.TINV为1'b1时,<br>0: 调整下降沿时序。1: 调整上升沿时序。<br>该位仅在SPTR.ATEN=1时有效。请参阅 <a href="#">第27.3.11节。详细调整发送时间（异步模式）的功能。</a> | R/W <sup>2</sup> |

注1.仅当SPTR.ASEN=0时写入该位。注2.仅当SPTR.ATEN=0时写入该位。

该寄存器控制接收采样时序和发送时序的调整。该寄存器仅在异步模式使用内部时钟时有效。

请参阅[第27.3.10节。通过该寄存器调整接收采样时序的调整接收采样时序（异步模式）功能。](#)

请参阅[第27.3.11节。通过该寄存器调整发送时序的调整发送时序（异步模式）功能。](#)

Note: IP操作说明的语句和时序图（除了[第27.1节概述](#)，[第27.2节注册说明](#)，[第27.3.10节。调整接收采样时间（异步模式）的功能](#)和[第27.3.11节。调整发送时间（异步模式）的功能](#)是在SCIM-7中添加的功能关闭（SPTR.ASEN=1'b0, SPTR.ATEN=1'b0）的条件下提到的。

## 27.2.36 MMR : Manchester Mode Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x20

|                    |           |           |            |            |   |           |           |           |

| 3   | —      | This bit is read as 0. The write value should be 0.   | R                |
| 4   | SYNVAL | SYNC value Setting<br>Sets the SYNC type of the start bit(s) in the Manchester code<br>When the start bit area consists of one bit.(SBSEL = "0") <ul style="list-style-type: none"> <li>when transmitting <ul style="list-style-type: none"> <li>0: The start bit is added as a zero-to-one transition.</li> <li>1: The start bit is added as a one-to-zero transition.</li> </ul> </li> <li>when receiving <ul style="list-style-type: none"> <li>0: Only when the start bit is a zero-to-one transition, the data is received. The other cases are judged as an error.</li> <li>1: Only when the start bit is a one-to-zero transition, the data is received. The other cases are judged as an error.</li> </ul> </li> </ul> When the start bit area consists of three bits.(SBSEL = "1") <ul style="list-style-type: none"> <li>when transmitting <ul style="list-style-type: none"> <li>0: The start bits are added as a zero-to-one transition. (DATA SYNC)</li> <li>1: The start bits are coded as a one-to-zero transition. (COMMAND SYNC)</li> </ul> </li> <li>when receiving <ul style="list-style-type: none"> <li>0: The start bits are added as a zero-to-one transition. (DATA SYNC)</li> <li>1: The start bits are coded as a one-to-zero transition. (COMMAND SYNC)</li> </ul> </li> </ul> When the start bit area consists of three bits, data is received regardless of the value of this bit. | R/W <sup>1</sup> |
| 5   | SYNSEL | SYNC Select<br>0: The start bit pattern is set with the SYNVAL bit<br>1: The start bit pattern is set with the TSYNC bit.   | R/W <sup>1</sup> |
| 6   | SBSEL  | Start Bit Select<br>0: The start bit area consists of one bit.<br>1: The start bit area consists of three bits (COMMAND SYNC or DATA SYNC)  | R/W <sup>1</sup> |
| 7   | MANEN  | Manchester Mode Enable<br>Sets the Manchester mode<br>0: Disables the Manchester mode<br>1: Enables the Manchester mode   | R/W <sup>1</sup> |

Note: Bits 6 to 0 in this register are valid only when the Manchester mode is enabled.(MANEN = "1") in bit 7.

Note 1. Writing to these bits is only possible when the RE and TE bits in SCR are 0 (both serial transmission and reception are disabled).

This register is used to enable or disable the Manchester mode, set the start bit area, and set the logic polarity.

## 27.2.36 MMR:曼彻斯特模式寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x20

| 6   | SBSEL  | 起始位选择<br>0: 起始位区域由一位组成。1: 起始位区域由三位组成 (COMMAND SYNC或DATASYNC)   | R/W <sup>1</sup> |
| 7   | MANEN  | ManchesterModeEnable设置曼彻斯特模式<br>0: 禁用曼彻斯特模式1: 启用曼彻斯特模式   | R/W <sup>1</sup> |

Note: 该寄存器中的位6到0仅在启用曼彻斯特模式时有效。(MANEN="1")在位7中。

注1.只有当SCR中的RE和TE位为0(串行发送和接收都被禁用)时,才能写入这些位。

该寄存器用于启用或禁用曼彻斯特模式、设置起始位区域和设置逻辑极性。

**RMPOL bit (Polarity of Received Manchester Code)**

This bit sets the polarity of the received Manchester code. For details, see [section 27.5.7. Serial Data Reception in Manchester Mode](#).

**TMPOL bit (Polarity of Transmit Manchester Code)**

This bit sets the polarity of the transmit Manchester code. For details, see [section 27.5.6. Serial data transmission in Manchester mode](#).

**ERTEN bit (Manchester Edge Retiming Enable)**

This bit sets the receive retiming function in Manchester mode.

For information on the receive retiming function, see [section 27.5.9. Receive Retiming](#).

**SYNVAL bit (SYNC value Setting)**

This bit is valid when the SYNSEL bit of this register is set to “0”.

The SYNC type can be set by combining this bit and the SBSEL bit.

For the start bit area determined by the combination of this bit and the SBSEL bit, see [Figure 27.52](#) and [Figure 27.53](#).

**SYNSEL bit (SYNC Select)**

This bit is valid when the SBSEL bit of this register is set to “1”. This bit determines the destination to be referred to for setting the SYNC type of the start bit area added to Manchester frames.

When this bit is set to “0”, the SYNVAL bit of this register is referred to.

When this bit is set to “1”, the TSYNC bit in the TDRH register is referred to.

For detail, see the bit table in [section 27.2.36. MMR : Manchester Mode Register](#).

**SBSEL bit (Start Bit Select)**

This bit sets the start bit area in Manchester frames.

When this bit is set to 1, the start bit area added to each frame consists of three bits, and the SYNSEL and SYNVAL bits in this register are valid.

When this bit is set to 0, the start bit area added to each frame consists of one bit.

**MANEN bit (Manchester Mode Enable)**

This bit sets the Manchester mode.

When this bit is set to 0, the Manchester mode is disabled.

When this bit is set to 1, the Manchester mode is enabled.

**27.2.37 Tmpr : Transmit Manchester Preface Setting Register**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x22

|                    |   |   |            |            |   |   |   |   |
|--------------------|---|---|------------|------------|---|---|---|---|
| Bit position:      | 7 | 6 | 5          | 4          | 3 | 2 | 1 | 0 |
| Bit field:         | — | — | TPPAT[1:0] | TPLEN[3:0] |   |   |   |   |
| Value after reset: | 0 | 0 | 0          | 0          | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 3:0 | TPLEN  | Transmit preface length<br>Set the preface length of the transmit data in Manchester mode<br>0x0: Disables the transmit preface generation<br>Others: Transmit preface length (bit length) | R/W <sup>1</sup> |

**RMPOL位 (接收曼彻斯特码的极性)**

该位设置接收到的曼彻斯特码的极性。有关详细信息，请参见第27.5.7节。串行数据接收曼彻斯特模式。

**TMPOL位 (发送曼彻斯特码的极性)**

该位设置发送曼彻斯特码的极性。详见27.5.6节。串行数据传输曼彻斯特模式。

**ERTEN位 (曼彻斯特边沿重定时使能)**

该位设置曼彻斯特模式下的接收重定时功能。

有关接收重定时功能的信息，请参见第27.5.9节。接收重定时。

**SYNVAL位 (SYNC值设置)**

当该寄存器的SYNSEL位设置为“0”时，该位有效。

SYNC类型可以通过组合该位和SBSEL位来设置。

由该位和SBSEL位组合决定的起始位区域，请参见图27.52和图27.53。

**SYNSEL位 (SYNC Select)**

当该寄存器的SBSEL位设置为“1”时，该位有效。该位确定要参考的目标，以设置添加到曼彻斯特帧的起始位区域的SYNC类型。

当该位设置为“0”时，参考该寄存器的SYNVAL位。

当该位设置为“1”时，参考TDRH寄存器中的TSYNC位。

详细请参见27.2.36节中的位表。MMR：曼彻斯特模式寄存器。

**SBSEL位 (Start Bit Select)**

该位设置曼彻斯特帧中的起始位区域。

当该位设置为1时，添加到每帧的起始位区域由3位组成，该寄存器中的SYNSEL和SYNVAL位有效。

当该位设置为0时，添加到每一帧的起始位区域由一位组成。

**MANEN位 (曼彻斯特模式使能)**

该位设置曼彻斯特模式。

当该位设置为0时，曼彻斯特模式被禁用。

当该位设置为1时，启用曼彻斯特模式。

**27.2.37 Tmpr : 发送曼彻斯特前言设置寄存器**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x22

|               |   |   |            |            |   |   |   |   |
|---------------|---|---|------------|------------|---|---|---|---|
| Bit position: | 7 | 6 | 5          | 4          | 3 | 2 | 1 | 0 |
| Bit field:    | — | — | TPPAT[1:0] | TPLEN[3:0] |   |   |   |   |
| 重置后的值:        | 0 | 0 | 0          | 0          | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 3:0 | TPLEN  | 传输前言长度<br>设置曼彻斯特模式下发送数据的前言长度<br>0x0: 禁用发送前言生成<br>其他: 传输前言长度 (位长) | R/W <sup>1</sup> |

| Bit | Symbol | Function  | R/W              |
|-----|--------|---|------------------|
| 5:4 | TPPAT  | Transmit preface pattern<br>Set the preface pattern of the transmit data<br>0 0: ALL ZERO<br>0 1: ZERO ONE<br>1 0: ONE ZERO<br>1 1: ALL ONE | R/W <sup>1</sup> |
| 7:6 | —      | The read value is undefined. The write value should be 0.   | R                |

Note: This register is valid only when the Manchester mode is enabled (MMR.MANEN = 1).

Note 1. Writing to these bits is only possible when the RE and TE bits in SCR are 0 (both serial transmission and reception are disabled).

This register is used to set the preface length and preface pattern of the transmit data in Manchester mode.

#### TPLEN bit (Transmit preface length)

These bits set the preface bit length of the transmit data in Manchester mode.

The settable range is 0h to Fh (0d to 15d). 0h disables the transmit preface, which is not added.

#### TPPAT bit (Transmit preface pattern)

These bits set one of the four preface patterns in Manchester mode.

When these bits are set to 00b, the preface area is set to all zeros.

When these bits are set to 01b, the preface area is set to the zero-one-zero-one pattern.

When these bits are set to 10b, the preface area is set to the one-zero-one-zero pattern.

When these bits are set to 11b, the preface area is set to all ones.

Note: For the transmit and receive data when the TPPAT bits are set, see Figure 27.51.

### 27.2.38 RMPR : Receive Manchester Preface Setting Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x23

|                    |   |   |            |   |            |   |   |   |
|--------------------|---|---|------------|---|------------|---|---|---|
| Bit position:      | 7 | 6 | 5          | 4 | 3          | 2 | 1 | 0 |
| Bit field:         | — | — | RPPAT[1:0] |   | RPLEN[3:0] |   |   |   |
| Value after reset: | 0 | 0 | 0          | 0 | 0          | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 3:0 | RPLEN  | Receive Preface Length<br>Set the preface length in received frames when Manchester mode is enabled<br>0: Disables the receive preface generation<br>Others: Receive preface length (bit length) | R/W <sup>1</sup> |
| 5:4 | RPPAT  | Receive Preface Pattern<br>Set the preface pattern of received frames<br>0 0: ALL ZERO<br>0 1: ZERO ONE<br>1 0: ONE ZERO<br>1 1: ALL ONE   | R/W <sup>1</sup> |
| 7:6 | —      | These bits are read as 0. The write value should be 0.   | R                |

Note: This register is valid only when the Manchester mode is enabled (MMR.MANEN = 1).

Note 1. Writing to these bits is only possible when the RE and TE bits in SCR are 0 (both serial transmission and reception are disabled).

This register is used to set the preface length and preface pattern of the received frames in Manchester mode.

#### RPLEN bit (Receive Preface Length)

These bits set the preface bit length of the received frames in Manchester mode.

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 5:4 | TPPAT  | 传输前言模式<br>设置发送数据的前言模式<br>00: 全零01: 零<br>—10: 一个零11<br>: 全一 | R/W <sup>1</sup> |
| 7:6 | —      | 读取值未定义。写入值应为0。   | R                |

Note: 该寄存器仅在启用曼彻斯特模式 (MMR.MANEN=1) 时有效。

注1.只有当SCR中的RE和TE位为0 (串行发送和接收都被禁用) 时, 才能写入这些位。

该寄存器用于设置曼彻斯特模式下发送数据的前言长度和前言样式。

#### TPLEN位 (发送前言长度)

这些位设置曼彻斯特模式下发送数据的前言位长度。

可设置范围为0h到Fh (0d到15d)。0h禁用未添加的发送前言。

#### TPPAT位 (发送前言模式)

这些位设置曼彻斯特模式中的四个前言模式之一。

当这些位设置为00b时, 前言区域设置为全零。

当这些位设置为01b时, 前言区域设置为零—零—零—零模式。

当这些位设置为10b时, 前言区域设置为一零—零—零—零模式。

当这些位设置为11b时, 前言区域设置为全1。

Note: 对于设置TPPAT位时的发送和接收数据, 请参见图27.51。

### 27.2.38 RMPR:接收曼彻斯特前言设置寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x23

|               |   |   |            |   |            |   |   |   |
|---------------|---|---|------------|---|------------|---|---|---|
| Bit position: | 7 | 6 | 5          | 4 | 3          | 2 | 1 | 0 |
| Bit field:    | — | — | RPPAT[1:0] |   | RPLEN[3:0] |   |   |   |
| 重置后的值:        | 0 | 0 | 0          | 0 | 0          | 0 | 0 | 0 |

| Bit | Symbol | Function   | R/W              |
|-----|--------|--|------------------|
| 3:0 | RPLEN  | 接收序言长度<br>启用曼彻斯特模式时设置接收帧中的前言长度<br>0: 禁用接收前言生成<br>其他: 接收前言长度 (位长) | R/W <sup>1</sup> |
| 5:4 | RPPAT  | 接收前言模式<br>设置接收帧的前言模式<br>00: 全零01: 零<br>—10: 一个零11<br>: 全一        | R/W <sup>1</sup> |
| 7:6 | —      | 这些位被读取为0。写入值应为0。   | R                |

Note: 该寄存器仅在启用曼彻斯特模式 (MMR.MANEN=1) 时有效。

注1.只有当SCR中的RE和TE位为0 (串行发送和接收都被禁用) 时, 才能写入这些位。

该寄存器用于设置曼彻斯特模式下接收帧的序言长度和序言模式。

#### RPLEN位 (接收前言长度)

这些位设置曼彻斯特模式下接收帧的前言位长度。

The settable range is 0h to Fh (0d to 15d). 0h disables the receive preface, which is not added. When 1h to Fh is set, the set value is handled as the receive preface bit length.

#### RPPAT bit (Receive Preface Pattern)

These bits set one of the four preface patterns in Manchester mode.

When these bits are set to 00b, the preface area is handled as all zeros.

When these bits are set to 01b, the preface area is handled as the zero-one-zero-one pattern.

When these bits are set to 10b, the preface area is handled as the one-zero-one-zero pattern.

When these bits are set to 11b, the preface area is handled as all ones.

Note: For the transmit and receive data when the RPPAT bits are set, see Figure 27.51.

### 27.2.39 MESR : Manchester Extended Error Status Register

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x24

|                    |   |   |   |   |   |      |      |      |
|--------------------|---|---|---|---|---|------|------|------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2    | 1    | 0    |
| Bit field:         | — | — | — | — | — | SBER | SYER | PFER |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0    | 0    | 0    |

| Bit | Symbol | Function   | R/W                 |
|-----|--------|--|---------------------|
| 0   | PFER   | Preface Error flag<br>This bit is set when a preface error (pattern mismatch) is detected<br>0: No preface error detected<br>1: Preface error detected                             | R/(W) <sup>*1</sup> |
| 1   | SYER   | SYNC Error flag<br>This bit is set when no edge is detected in the adjustable range during receive retiming<br>0: No receive SYNC error detected<br>1: Receive SYNC error detected | R/(W) <sup>*1</sup> |
| 2   | SBER   | Start Bit Error flag<br>This bit is set when a pattern mismatch in the start bit area is detected<br>0: No start bit error detected<br>1: Start bit error detected                 | R/(W) <sup>*1</sup> |
| 7:3 | —      | These bits are read as 0. The write value should be 0.   | R                   |

Note: This register is valid only when the Manchester mode is enabled (MMR.MANEN = 1).

Note 1. Only 0 can be written to this bit, to clear the flag. To clear the flag, confirm that the flag is 1 before setting it to 0.

This register indicates an error status when receiving frames in Manchester mode.

A preface error, receive SYNC error or start bit error was detected.

#### PFER bit (Preface Error flag)

This bit indicates that a preface error was detected when receiving frames in Manchester mode.

[Setting condition]

- When detecting a preface error when receiving frames in Manchester mode  
The following operations are performed when a preface error occurs.  
When MECR.PFEREN = 1  
The received data is not transferred to the RDR register and no RXI interrupt request occurs. Instead, an ERI interrupt request occurs. Note that when the PFER flag is being set to 1, the subsequently received data is not transferred to the RDR register.  
When MECR.PFEREN = 0  
The received data is transferred to the RDR register and an RXI interrupt request occurs. An ERI interrupt request is not generated. The subsequent receive operations are not affected even with the PFER flag being set to 1.

可设置范围为0h到Fh（0d到15d）。0h禁用接收前言，没有添加。当设置1h至Fh时，设置值作为接收前言位长度处理。

#### RPPAT位（接收前言模式）

这些位设置曼彻斯特模式中的四个前言模式之一。

当这些位设置为00b时，前言区域被处理为全零。

当这些位设置为01b时，前言区域作为零一零一模式处理。

当这些位设置为10b时，前言区域作为一零一零模式处理。

当这些位被设置为11b时，前言区域被当作全1处理。

Note: 对于设置RPPAT位时的发送和接收数据，请参见图27.51。

### 27.2.39 MESR: 曼彻斯特扩展错误状态寄存器

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x24

|               |   |   |   |   |   |      |      |      |
|---------------|---|---|---|---|---|------|------|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2    | 1    | 0    |
| Bit field:    | — | — | — | — | — | SBER | SYER | PFER |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0    | 0    | 0    |

| Bit | Symbol | Function   | R/W                 |
|-----|--------|--|---------------------|
| 0   | PFER   | 前言错误标志<br>当检测到前言错误（模式不匹配）时设置该位<br>0: 未检测到前言错误<br>1: 检测到前言错误          | R/(W) <sup>*1</sup> |
| 1   | SYER   | 同步错误标志<br>当接收重定时期在可调范围内未检测到边沿时，该位置位<br>0: 未检测到接收同步错误<br>1: 检测到接收同步错误 | R/(W) <sup>*1</sup> |
| 2   | SBER   | 起始位错误标志<br>当检测到起始位区域中的模式不匹配时，设置该位<br>0: 未检测到起始位错误<br>1: 检测到起始位错误     | R/(W) <sup>*1</sup> |
| 7:3 | —      | 这些位被读取为0。写入值应为0。   | R                   |

Note: 该寄存器仅在启用曼彻斯特模式（MMR.MANEN=1）时有效。

注1.该位只能写入0，以清除标志。要清除标志，请先确认标志为1，然后再将其设置为0。

该寄存器指示在曼彻斯特模式下接收帧时的错误状态。

检测到前言错误、接收同步错误或起始位错误。

#### PFER位（前言错误标志）

该位表示在曼彻斯特模式下接收帧时检测到前言错误。

[Setting condition]

- 曼彻斯特模式接收帧时检测到前言错误出现前言错误时执行以下操作。
  - When MECR.PFEREN = 1  
接收到的数据不会传输到RDR寄存器，也不会发生RXI中断请求。相反，会发生ERI中断请求。请注意，当PFER标志设置为1时，随后接收到的数据不会传输到RDR寄存器。
  - When MECR.PFEREN = 0  
接收到的数据被传送到RDR寄存器并产生一个RXI中断请求。不产生ERI中断请求。即使PFER标志设置为1，后续接收操作也不受影响。

[Clearing condition]

- When 0 is written to the bit after it was read as 1

Even if the SCR.RE bit is cleared, the PFER flag is not affected, and the previous state is retained.

**SYER bit (SYNC Error flag)**

This bit indicates that a receive SYNC error was detected when receiving frames in Manchester mode with MMR.ERTEN = 1 (Manchester edge retiming enabled).

[Setting condition]

- When detecting a receive SYNC error when receiving frames in Manchester mode  
The following operations are performed when a receive SYNC error occurs.  
When MECR.SYEREN = 1  
Although the received data is transferred to the RDR register, no RXI interrupt request occurs. Instead, an ERI interrupt request occurs. Note that when the SYER flag is being set to 1, the subsequently received data is not transferred to the RDR register.  
When MECR.SYEREN = 0  
The received data is transferred to the RDR register and an RXI interrupt request occurs. An ERI interrupt request is not generated. The subsequent receive operations are not affected even with the SYER flag being set to 1.

[Clearing condition]

- When 0 is written to the bit after it was read as 1

Even if the SCR.RE bit is cleared, the SYER flag is not affected, and the previous state is retained.

**SBER bit (Start Bit Error flag)**

This bit indicates that a start bit error was detected when receiving frames in Manchester mode.

[Setting condition]

- When detecting a start bit error when receiving frames in Manchester mode  
The following operations are performed when a start bit error occurs.  
When MECR.SBEREN = 1  
The received data is not transferred to the RDR register and no RXI interrupt request occurs. Instead, an ERI interrupt request occurs. Note that when the SBER flag is being set to 1, the subsequently received data is not transferred to the RDR register.  
When MECR.SBEREN = 0  
The received data is transferred to the RDR register and an RXI interrupt request occurs. An ERI interrupt request is not generated. The subsequent receive operations are not affected even with the SBER flag being set to 1.

[Clearing condition]

- When 0 is written to the bit after it was read as 1

Even if the SCR.RE bit is cleared, the SBER flag is not affected, and the previous state is retained.

**27.2.40 MECR : Manchester Extended Error Control Register**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x25

|                    |   |   |   |   |   |         |         |         |
|--------------------|---|---|---|---|---|---------|---------|---------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2       | 1       | 0       |
| Bit field:         | — | — | — | — | — | SBER EN | SYER EN | PFER EN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0       | 0       | 0       |

[Clearing condition]

- 读为1后写入0时

即使SCR.RE位被清除，PFER标志也不受影响，并且保持之前的状态。

**SYER位 (SYNC错误标志)**

该位表示在曼彻斯特模式下接收帧时检测到接收同步错误  
MMR.ERTEN=1（启用曼彻斯特边沿重定时）。

[Setting condition]

- 在曼彻斯特模式下接收帧时检测到接收SYNC错误发生接收SYNC错误时执行以下操作。  
When MECR.SYEREN = 1  
虽然接收到的数据被传送到RDR寄存器，但没有发生RXI中断请求。相反，会发生ERI中断请求。请注意，当SYER标志设置为1时，随后接收到的数据不会传输到RDR寄存器。  
When MECR.SYEREN = 0  
接收到的数据被传送到RDR寄存器并产生一个RXI中断请求。不产生ERI中断请求。即使SYER标志设置为1，后续接收操作也不受影响。

[Clearing condition]

- 读为1后写入0时

即使清除SCR.RE位，SYER标志也不受影响，并且保持之前的状态。

**SBER位 (起始位错误标志)**

该位表示在曼彻斯特模式下接收帧时检测到起始位错误。

[Setting condition]

- 在曼彻斯特模式下接收帧时检测到起始位错误发生起始位错误时执行以下操作。  
When MECR.SBEREN = 1  
接收到的数据不会传输到RDR寄存器，也不会发生RXI中断请求。相反，会发生ERI中断请求。请注意，当SBER标志设置为1时，随后接收到的数据不会传输到RDR寄存器。  
When MECR.SBEREN = 0  
接收到的数据被传送到RDR寄存器并产生一个RXI中断请求。不产生ERI中断请求。即使SBER标志设置为1，后续接收操作也不受影响。

[Clearing condition]

- 读为1后写入0时

即使SCR.RE位被清除，SBER标志也不受影响，并且保持之前的状态。

**27.2.40 MECR: 曼彻斯特扩展错误控制寄存器**

Base address: SCIn = 0x4011\_8000 + 0x0100 × n (n = 3, 4)

Offset address: 0x25

|               |   |   |   |   |   |         |         |         |
|---------------|---|---|---|---|---|---------|---------|---------|

| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0       | 0       | 0       |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | PFEREN | Preface Error Enable<br>Specifies whether to handle a preface error as an interrupt source<br>0: Does not handle a preface error as an interrupt source<br>1: Handles a preface error as an interrupt source                     | R/W |
| 1   | SYEREN | Receive SYNC Error Enable<br>Specifies whether to handle a receive SYNC error as an interrupt source<br>0: Does not handle a receive SYNC error as an interrupt source<br>1: Handles a receive SYNC error as an interrupt source | R/W |
| 2   | SBEREN | Start Bit Error Enable<br>Specifies whether to handle a start bit error as an interrupt source<br>0: Does not handle a start bit error as an interrupt source<br>1: Handles a start bit error as an interrupt source             | R/W |
| 7:3 | —      | These bits are read as 0. The write value should be 0.   | R   |

Note: This register is valid only when the Manchester mode is enabled (MMR.MANEN = 1).

This register is used to specify whether to handle a preface error, receive SYNC error, or a start bit error as an interrupt source in Manchester mode. If those errors are handled as interrupt sources, interrupt requests and event requests are generated at the occurrence of each error, and the next reception is not performed until the corresponding error flag is cleared.

Please set this register when MMR.MANEN = "0". And do not change this register during communication.

#### PFEREN bit (Preface Error Enable)

This bit specifies whether to handle a preface error as an interrupt source.

When it is set to 0, a preface error is not handled as an interrupt source. When it is set to 1, a preface error is handled as an interrupt source.

#### SYEREN bit (Receive SYNC Error Enable)

This bit specifies whether to handle a receive SYNC error as an interrupt source.

When it is set to 0, a receive SYNC error is not handled as an interrupt source. When it is set to 1, a receive SYNC error is handled as an interrupt source.

#### SBEREN bit (Start Bit Error Enable)

This bit specifies whether to handle a start bit error as an interrupt source.

When it is set to 0, a start bit error is not handled as an interrupt source. When it is set to 1, a start bit error is handled as an interrupt source.

### 27.2.41 ESMER : Extended Serial Module Enable Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x20

|                    |   |   |   |   |   |   |   |      |
|--------------------|---|---|---|---|---|---|---|------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
| Bit field:         | — | — | — | — | — | — | — | ESME |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0    |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | ESME   | Extended Serial Mode Enable<br>0: The extended serial mode is disabled.<br>1: The extended serial mode is enabled. | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.   | R/W |

#### ESME bit (Extended Serial Mode Enable)

When the ESME bit is 1, the facilities of the extended serial mode control section are enabled.

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | PFEREN | 前言错误启用<br>指定是否将序言错误作为中断源处理<br>0: 不将序言错误作为中断源处理1: 将序言错误作为中断源处理           | R/W |
| 1   | SYEREN | 接收同步错误启用<br>指定是否将接收SYNC错误作为中断源处理<br>0: 不将接收同步错误作为中断源处理1: 将接收同步错误作为中断源处理 | R/W |
| 2   | SBEREN | 启动位错误启用<br>指定是否将起始位错误作为中断源处理<br>0: 不将起始位错误作为中断源处理1: 将起始位错误作为中断源处理       | R/W |
| 7:3 | —      | 这些位被读取为0。写入值应为0。  | R   |

Note: 该寄存器仅在启用曼彻斯特模式 (MMR.MANEN=1) 时有效。

该寄存器用于指定在曼彻斯特模式下是否处理序言错误、接收同步错误或起始位错误作为中断源。如果将这些错误作为中断源处理，则在每个错误发生时都会产生中断请求和事件请求，并且在相应的错误标志被清除之前不会执行下一次接收。

请在MMR.MANEN="0"时设置该寄存器。并且不要在通信过程中更改该寄存器。

#### PFEREN位 (前言错误使能)

该位指定是否将序言错误作为中断源处理。

当它设置为0时，前言错误不作为中断源处理。当它设置为1时，前言错误作为中断源处理。

#### SYEREN位 (接收同步错误使能)

该位指定是否将接收同步错误作为中断源处理。

当它设置为0时，接收SYNC错误不作为中断源处理。当它设置为1时，接收SYNC错误作为中断源处理。

#### SBEREN位 (启动位错误启用)

该位指定是否将起始位错误作为中断源处理。

当它设置为0时，起始位错误不作为中断源处理。当它设置为1时，起始位错误作为中断源处理。

### 27.2.41 ESMER:扩展串行模块使能寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x20

|               |   |   |   |   |   |   |   |      |
|---------------|---|---|---|---|---|---|---|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
| Bit field:    | — | — | — | — | — | — | — | ESME |
| 重置后的值:        | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0    |

| Bit | Symbol | Function                             | R/W |
|-----|--------|--------------------------------------|-----|
| 0   | ESME   | 扩展串行模式启用<br>0: 禁用扩展串行模式。1: 使能扩展串行模式。 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。                     | R/W |

#### ESME位 (扩展串行模式启用)

当ESME位为1时，启用扩展串行模式控制部分的功能。

When the ESME bit is 0, the extended serial mode control section is initialized.

**Table 27.26 Settings of the ESME Bit and Timer Operation Mode**

| ESME Bit | Timer Mode  | Break Field Low Width Determination Mode | Break Field Low Width Output Mode |
|----------|-------------|--|-----------------------------------|
| 0        | Available*1 | Not available                            | Not available                     |
| 1        | Available   | Available                                | Available                         |

Note 1. Operation is only possible with PCLK selected.

### 27.2.42 CR0 : Control Register 0

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x21

Note: 当SCIn.SEMR.ABCS为0时, SCI基本时钟的周期为单位周期的116, 而当SCIn.SEMR.ABCS为1时, SCI基准时钟的周期为单位周期的18。

注1.要使用SCI基本时钟, 请将SCIn.SCR.TE位设置为1。

Note 2. The SCI base clock divided by 2 is the filter clock when the SEMR.BGDM bit is 1 and the SMR.CKS[1:0] bits are 00b.

### 27.2.45 CR3 : Control Register 3

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x24

|                    |   |   |   |   |   |   |   |      |
|--------------------|---|---|---|---|---|---|---|------|
| Bit position:      | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
| Bit field:         | — | — | — | — | — | — | — | SDST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0    |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | SDST   | Start Frame Detection Start<br>0: Detection of Start Frame is not performed.<br>1: Detection of Start Frame is performed. | R/W |
| 7:1 | —      | These bits are read as 0. The write value should be 0.  | R/W |

#### SDST bit (Start Frame Detection Start)

Detection of a Start Frame begins when this bit is set to 1. The bit is read as 0.

### 27.2.46 PCR : Port Control Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x25

|                    |   |   |   |            |   |   |            |            |
|--------------------|---|---|---|------------|---|---|------------|------------|
| Bit position:      | 7 | 6 | 5 | 4          | 3 | 2 | 1          | 0          |
| Bit field:         | — | — | — | SHAR<br>PS | — | — | RXDX<br>PS | TXDX<br>PS |
| Value after reset: | 0 | 0 | 0 | 0          | 0 | 0 | 0          | 0          |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | TXDXPS | TXDXn Signal Polarity Select<br>0: The polarity of TXDXn signal is not inverted for output.<br>1: The polarity of TXDXn signal is inverted for output. | R/W |
| 1   | RXDXPS | RXDXn Signal Polarity Select<br>0: The polarity of RXDXn signal is not inverted for input.<br>1: The polarity of RXDXn signal is inverted for input.   | R/W |
| 3:2 | —      | These bits are read as 0. The write value should be 0.   | R/W |
| 4   | SHARPS | TXDXn/RXDXn Pin Multiplexing Select<br>0: The TXDXn and RXDXn pins are independent.<br>1: The TXDXn and RXDXn signals are multiplexed on the same pin. | R/W |
| 7:5 | —      | These bits are read as 0. The write value should be 0.   | R/W |

#### SHARPS bit (TXDXn/RXDXn Pin Multiplexing Select)

When this bit is set to 1, the TXDXn and RXDXn signals are multiplexed on the same pin so that half-duplex communications become possible.

注2.当SEMR.BGDM位为1且SMR.CKS[1:0]位为00b时，SCI基本时钟除以2为滤波器时钟。

### 27.2.45 CR3：控制寄存器3

|-----|--------|----------------------------------|-----|
| 0   | SDST   | 开始帧检测开始<br>0: 不检测起始帧。1: 执行起始帧检测。 | R/W |
| 7:1 | —      | 这些位被读取为0。写入值应为0。                 | R/W |

#### SDST位 (开始帧检测开始)

当该位设置为1时开始检测起始帧。该位被读取为0。

### 27.2.46 PCR：端口控制寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x25

|               |   |   |   |            |   |   |            |            |
|---------------|---|---|---|------------|---|---|------------|------------|
| Bit position: | 7 | 6 | 5 | 4          | 3 | 2 | 1          | 0          |
| Bit field:    | — | — | — | SHAR<br>PS | — | — | RXDX<br>PS | TXDX<br>PS |
| 重置后的值:        | 0 | 0 | 0 | 0          | 0 | 0 | 0          | 0          |

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | TXDXPS | TXDXn信号极性选择<br>0: TXDXn信号的极性不反相输出。1: TXDXn信号极性反相输出。                | R/W |
| 1   | RXDXPS | RXDXn信号极性选择<br>0: RXDXn信号极性不反相输入。1: RXDXn信号极性反相输入。                 | R/W |
| 3:2 | —      | 这些位被读取为0。写入值应为0。   | R/W |
| 4   | SHARPS | TXDXn/RXDXn引脚复用选择<br>0: TXDXn和RXDXn引脚独立。1: TXDXn和RXDXn信号在同一个引脚上复用。 | R/W |
| 7:5 | —      | 这些位被读取为0。写入值应为0。   | R/W |

#### SHARPS位 (TXDXn/RXDXn引脚复用选择)

当该位设置为1时，TXDXn和RXDXn信号在同一引脚上复用，从而可以进行半双工通信。

## 27.2.47 ICR : Interrupt Control Register

### 27.2.52 CF0RR : Control Field 0 Receive Data Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x2B

CF0RR is a readable register that holds the value received in Control Field 0.

CF0DR寄存器是一个8位可读写寄存器，它保存一个用于与控制字段0进行比较的值。

### 27.2.51 CF0CR：控制字段0比较使能寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x2A

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | CF0CE0 | 控制字段0位0比较使能<br>0: 禁止与控制字段0的位0进行比较。1: 启用与控制字<br>段0的位0的比较。 | R/W |
| 1   | CF0CE1 | 控制字段1位0比较使能<br>0: 禁止与控制字段0的位1进行比较。1: 启用与控制字<br>段0的位1的比较。 | R/W |
| 2   | CF0CE2 | 控制字段2位0比较使能<br>0: 禁止与控制字段0的位2进行比较。1: 启用与控制字<br>段0的位2的比较。 | R/W |
| 3   | CF0CE3 | 控制字段3位0比较使能<br>0: 禁止与控制字段0的位3比较。1: 启用与控制字<br>段0的位3的比较。   | R/W |
| 4   | CF0CE4 | 控制字段4位0比较使能<br>0: 禁止与控制字段0的位4进行比较。1: 启用与控制字<br>段0的位4的比较。 | R/W |
| 5   | CF0CE5 | 控制字段5位0比较使能<br>0: 禁止与控制字段0的位5进行比较。1: 启用与控制字<br>段0的位5的比较。 | R/W |
| 6   | CF0CE6 | 控制字段6位0比较使能<br>0: 禁止与控制字段0的位6进行比较。1: 启用与控制字<br>段0的位6的比较。 | R/W |
| 7   | CF0CE7 | 控制字段7位0比较使能<br>0: 禁止与控制字段0的位7进行比较。1: 启用与控制字<br>段0的第7位比较。 | R/W |

### 27.2.52 CF0RR:控制字段0接收数据寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x2B

CF0RR是一个可读寄存器，它保存在控制字段0中接收到的值。

27.2.53 PCF1DR : Primary Control Field 1 Data Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)  
 Offset address: 0x2C

PCF1DR is an 8-bit readable and writable register that holds the 8-bit primary value for comparison with Control Field 1.

27.2.54 SCF1DR : Secondary Control Field 1 Data Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)  
 Offset address: 0x2D

SCF1DR is an 8-bit readable and writable register that holds the 8-bit secondary value for comparison with Control Field 1.

27.2.55 CF1CR : Control Field 1 Compare Enable Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)  
 Offset address: 0x2E

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 0   | CF1CE0 | Control Field 1 Bit 0 Compare Enable<br>0: Comparison with bit 0 of Control Field 1 is disabled.<br>1: Comparison with bit 0 of Control Field 1 is enabled. | R/W |
| 1   | CF1CE1 | Control Field 1 Bit 1 Compare Enable<br>0: Comparison with bit 1 of Control Field 1 is disabled.<br>1: Comparison with bit 1 of Control Field 1 is enabled. | R/W |
| 2   | CF1CE2 | Control Field 1 Bit 2 Compare Enable<br>0: Comparison with bit 2 of Control Field 1 is disabled.<br>1: Comparison with bit 2 of Control Field 1 is enabled. | R/W |
| 3   | CF1CE3 | Control Field 1 Bit 3 Compare Enable<br>0: Comparison with bit 3 of Control Field 1 is disabled.<br>1: Comparison with bit 3 of Control Field 1 is enabled. | R/W |
| 4   | CF1CE4 | Control Field 1 Bit 4 Compare Enable<br>0: Comparison with bit 4 of Control Field 1 is disabled.<br>1: Comparison with bit 4 of Control Field 1 is enabled. | R/W |
| 5   | CF1CE5 | Control Field 1 Bit 5 Compare Enable<br>0: Comparison with bit 5 of Control Field 1 is disabled.<br>1: Comparison with bit 5 of Control Field 1 is enabled. | R/W |
| 6   | CF1CE6 | Control Field 1 Bit 6 Compare Enable<br>0: Comparison with bit 6 of Control Field 1 is disabled.<br>1: Comparison with bit 6 of Control Field 1 is enabled. | R/W |

27.2.53 PCF1DR: 主控制字段1数据寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)  
 Offset address: 0x2C

PCF1DR是一个8位可读写寄存器，它保存8位主值，用于与控制字段1进行比较。

27.2.54 SCF1DR: 辅助控制字段1数据寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)  
 Offset address: 0x2D

SCF1DR是一个8位可读写寄存器，保存8位辅助值，用于与控制字段1进行比较。

27.2.55 CF1CR: 控制字段1比较使能寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)  
 Offset address: 0x2E

| Bit | Symbol | Function   | R/W |
|-----|--------|--|-----|
| 0   | CF1CE0 | 控制字段1位0比较使能<br>0: 禁止与控制字段1的位0进行比较。1: 启用与控制字段1的位0的比较。 | R/W |
| 1   | CF1CE1 | 控制字段1位1比较使能<br>0: 禁止与控制字段1的位1比较。1: 启用与控制字段1的位1的比较。   | R/W |
| 2   | CF1CE2 | 控制字段1位2比较使能<br>0: 禁止与控制字段1的位2进行比较。1: 启用与控制字段1的位2的比较。 | R/W |
| 3   | CF1CE3 | 控制字段1位3比较使能<br>0: 禁止与控制字段1的位3比较。1: 启用与控制字段1的位3的比较。   | R/W |
| 4   | CF1CE4 | 控制字段1位4比较使能<br>0: 禁止与控制字段1的位4比较。1: 启用与控制字段1的位4的比较。   | R/W |
| 5   | CF1CE5 | 控制字段1位5比较使能<br>0: 禁止与控制字段1的位5进行比较。1: 启用与控制字段1的位5的比较。 | R/W |
| 6   | CF1CE6 | 控制字段1位6比较使能<br>0: 禁止与控制字段1的位6进行比较。1: 启用与控制字段1的位6的比较。 | R/W |

| Bit | Symbol | Function  | R/W |
|-----|--------|---|-----|
| 7   | CF1CE7 | Control Field 1 Bit 7 Compare Enable<br>0: Comparison with bit 7 of Control Field 1 is disabled.<br>1: Comparison with bit 7 of Control Field 1 is enabled. | R/W |

### 27.2.56 CF1RR : Control Field 1 Receive Data Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x2F

Bit position: 7 6 5 4 3 2 1 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0

CF1RR is a readable register that holds the value received in Control Field 1.

### 27.2.57 TCR : Timer Control Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x30

Bit position: 7 6 5 4 3 2 1 0

Bit field:  TCST

| 7   | CF1CE7 | 控制字段1位7比较使能<br>0: 禁止与控制字段1的位7进行比较。1: 启用与控制字段1的位7比较。 | R/W |

### 27.2.56 CF1RR:控制字段1接收数据寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x2F

Bit position: 7 6 5 4 3 2 1 0

Bit field:

重置后的值: 0 0 0 0 0 0 0 0

CF1RR是一个可读寄存器，它保存在控制字段1中接收到的值。

### 27.2.57 TCR: 定时器控制寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x30

Bit position: 7 6 5 4 3 2 1 0

Bit field:  TCST

重置后的值: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function                        | R/W |

|-----|-----------|--|-----|
| 6:4 | TCSS[2:0] | Timer Count Clock Source Select*1<br>0 0 0: PCLK<br>0 0 1: PCLK/2<br>0 1 0: PCLK/4<br>0 1 1: PCLK/8<br>1 0 0: PCLK/16<br>1 0 1: PCLK/32<br>1 1 0: PCLK/64<br>1 1 1: PCLK/128 | R/W |
| 7   | —         | This bit is read as 0. The write value should be 0.  | R/W |

Note 1. Rewrite the TOMS[1:0] and TCSS[2:0] bits only when the timer is stopped (TCST = 0).

#### TWRC bit (Counter Write Control)

This bit determines whether a value written to TPRES or TCNT is written to the reload register only or is written to both the reload register and the counter.

#### 27.2.59 TPRES : Timer Prescaler Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x32

TPRES consists of an 8-bit reload register, a read buffer, and a counter, each of which has FFh as its initial value. The counter counts down in synchronization with the counter clock selected by the TMR.TCSS[2:0] bits, and is reloaded with the value in the reload register when it underflows. Underflows of this register provide the clock source to drive counting by the TCNT register. The reload register and read buffer are allocated to the same address. Data is written to the reload register in writing, and the counter value that has been transferred to the read buffer is returned in reading.

It takes one PCLK cycle to load a value from the reload register to the counter.

#### 27.2.60 TCNT : Timer Count Register

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x33

TCNT consists of an 8-bit reload register, a read buffer, and a counter, each of which has FFh as its initial value. This down-counter counts underflows of the TPRES register until the TCNT register underflows, and is then reloaded with the value from the reload register. The reload register and read buffer are allocated to the same address. Data is written to the reload register in writing, and the counter value that has been transferred to the read buffer is returned in reading.

It takes one PCLK cycle to load a value from the reload register to the counter.

### 27.3 Operation in Asynchronous Mode

Figure 27.6 shows the general format for asynchronous serial communications. One frame consists of a start bit (low level), transmit or receive data, a parity bit, and stop bits (high level). In asynchronous serial communications, the communications line is usually held in the mark state (high level).

| Bit | Symbol    | Function  | R/W |
|-----|-----------|---|-----|
| 6:4 | TCSS[2:0] | 定时器计数时钟源选择*1<br>0 0 0: PCLK<br>0 0 1: PCLK/2<br>0 1 0: PCLK/4<br>0 1 1: PCLK/8<br>1 0 0: PCLK/16<br>1 0 1: PCLK/32<br>1 1 0: PCLK/64<br>1 1 1: PCLK/128 | R/W |
| 7   | —         | 该位读取为0。写入值应为0。  | R/W |

注1.仅当定时器停止(TCST=0)时才重写TOMS[1:0]和TCSS[2:0]位。

#### TWRC位 (计数器写控制)

该位确定写入TPRES或TCNT的值是仅写入重载寄存器还是同时写入重载寄存器和计数器。

#### 27.2.59 TPRES: 定时器预分频寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x32

TPRES由一个8位重载寄存器、一个读缓冲区和一个计数器组成，每个计数器的初始值都为FFh。计数器与TMR.TCSS[2:0]位选择的计数器时钟同步递减计数，并在下溢时重新加载重载寄存器中的值。该寄存器的下溢提供时钟源来驱动TCNT寄存器的计数。重载寄存器和读缓冲区被分配到同一个地址。写入时数据被写入重载寄存器，读取时返回已传送到读缓冲区的计数器值。

将一个值从重载寄存器加载到计数器需要一个PCLK周期。

#### 27.2.60 TCNT: 定时器计数寄存器

Base address: SCIm = 0x4011\_8000 + 0x0100 × m (m = 1, 2)

Offset address: 0x33

TCNT由一个8位重载寄存器、一个读缓冲区和一个计数器组成，每个计数器的初始值都为FFh。该递减计数器对TPRES寄存器的下溢进行计数，直到TCNT寄存器下溢，然后用重新加载寄存器中的值重新加载。重载寄存器和读缓冲区被分配到同一个地址。写入时数据被写入重载寄存器，读取时返回已传送到读缓冲区的计数器值。

将一个值从重载寄存器加载到计数器需要一个PCLK周期。

### 27.3 异步模式下的操作

图27.6显示了异步串行通信的一般格式。一帧由起始位（低电平）、发送或接收数据、奇偶校验位和停止位（高电平）组成。在异步串行通信中，通信线路通常保持在标记状态（高电平）。

The SCI monitors the communications line. When the SCI detects a low, it regards that as a start bit and starts serial communication.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and receiver have a double-buffered structure in addition to FIFO mode, so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

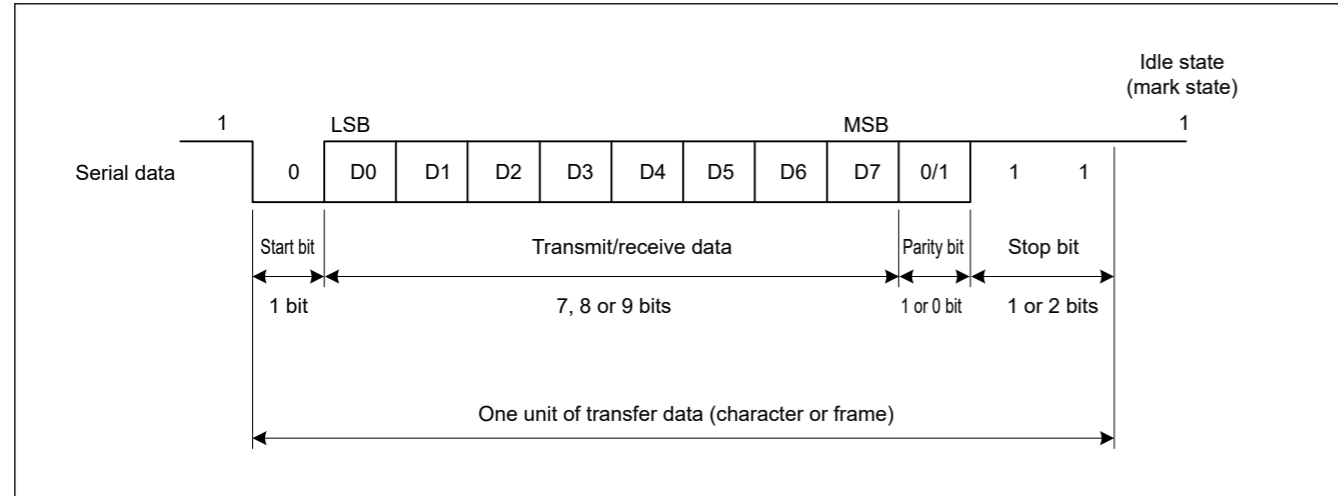

Figure 27.6 Data format in asynchronous serial communications with 8-bit data, parity bit, and 2 stop bits

### 27.3.1 Serial Data Transfer Format

Table 27.27 lists the serial data transfer formats that can be used in asynchronous mode. Any of 18 transfer formats can be selected with the SMR and SCMR settings. For details on the multi-processor function, see section 27.4. Multi-Processor Communication Function.

Table 27.27 Serial transfer formats in asynchronous mode (1 of 2)

| SCMR setting | SMR setting |     |    |    | Serial transfer format and frame length |    |            |   |   |   |   |   |    |    |    |    |    |    |  |
|--------------|-------------|-----|----|----|---|----|------------|---|---|---|---|---|----|----|----|----|----|----|--|

| 1            | 0           | 1   | 0  | 1  | 1                                       | ST | 8-bit data |   |   |   |   |   |    | P  | SP | SP |    |    |  |
| 1            | 1           | 0   | 0  | 0  | 0                                       | ST | 7-bit data |   |   |   |   |   | SP |    |    |    |    |    |  |

SCI监控通信线路。当SCI检测到低电平时，将其视为起始位并开始串行通信。

在SCI内部，发射器和接收器是独立的单元，可实现全双工通信。发送器和接收器除了FIFO模式外，都具有双缓冲结构，从而可以在发送或接收过程中读取或写入数据，从而实现数据的连续发送和接收。

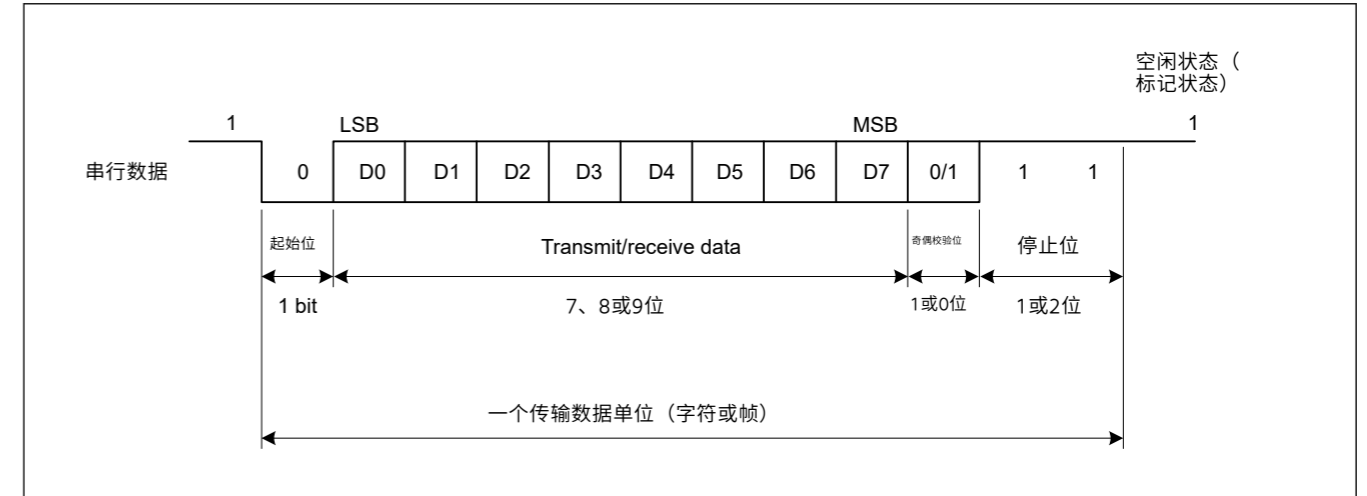

Figure 27.6 异步串行通信中的数据格式，包含8位数据、奇偶校验位和2个停止位

### 27.3.1 串行数据传输格式

表27.27列出了可以在异步模式下使用的串行数据传输格式。可以使用SMR和SCMR设置选择18种传输格式中的任何一种。关于多处理器功能的详细内容，请参阅27.4节。多处理器通信功能。

Table 27.27 异步模式下的串行传输格式 (1 of 2)

| SCMR setting | SMR setting |     |    |    | 串行传输格式和帧长 |    |            |   |   |   |   |   |    |    |    |    |    |    |  |

ST: Start bit  
 SP: Stop bit  
 P: Parity bit  
 MPB: Multi-processor bit

27.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times\*1 the bit rate.

In reception, the SCI samples the falling edge of the start bit using the base clock, and performs internal synchronization.\*2

Because receive data is sampled on the rising edge of the 8th pulse\*1 of the base clock, data is latched at the middle of each bit (when sampling timing does not adjust (“SPTR.ASEN = 1'b0”)), as shown in Figure 27.7 The reception margin in asynchronous mode is determined by the following formula (1):

$$M = \left[ \left( 0.5 - \frac{1}{2N} \right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right] \times 100 [\%] \quad \dots \text{Formula (1)}$$

M: Reception margin

N: Ratio of bit rate to clock

(N = 16 when SEMR.ABCSE = 0 and SEMR.ABCS = 0. N = 8 when SEMR.ABCS = 1. N = 6 when SEMR.ABCSE = 1.)

D: Duty cycle of clock (D = 0.5 to 1.0)

L: Frame length (L = 9 to 13)

F: Absolute value of clock frequency deviation

Assuming values of F = 0 and D = 0.5 in formula (1), the reception margin is determined using the following formula:

$$M = \{0.5 - 1/(2 \times 16)\} \times 100 (\%) = 46.875 \%$$

This represents the computed value. Renesas recommends a margin of 20% to 30% in system design.

Note 1. In this example, the SEMR.ABCS bit is 0 and the SEMR.ABCSE is 0. When the ABCS bit is 1 and the ABCSE bit is 0, a frequency of 8 times the bit rate is used as a base clock, and receive data is sampled on the rising edge of the 4th pulse of the base clock.

Table 27.27 异步模式下的串行传输格式(2of2)

27.3.2 异步模式下接收数据采样时序和接收余量

在异步模式下，SCI在频率为16倍\*1比特率的基本时钟上运行。

在接收时，SCI使用基本时钟对起始位的下降沿进行采样，并执行内部同步。\*2

因为接收数据在基本时钟的第8个脉冲\*1的上升沿采样，所以数据在每个位的中间锁存（当采样时序不调整时（“SPTR.ASEN=1'b0”）），如如图27.7所示，异步模式下的接收余量由下式（1）确定：

$$M = \left[ \left( 0.5 - \frac{1}{2N} \right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right] \times 100 [\%] \quad \dots \text{Formula (1)}$$

M: 接收余量

N: 比特率与时钟的比率（当SEMR.ABCSE=0和SEMR.ABCS=0时，N=16。当SEMR.ABCS=1时，N=8。当SEMR.ABCSE=1时，N=6。）D: 占空比时钟（D=0.5到1.0）

L: 帧长（L=9到13）

F: 时钟频率偏差的绝对值

假设公式（1）中的F=0和D=0.5的值，接收裕量使用以下公式确定：

$$M = \{0.5 - 1/(2 \times 16)\} \times 100 (\%) = 46.875 \%$$

这表示计算值。瑞萨建议在系统设计中留出20%到30%的余量。

注1.本例中，SEMR.ABCS位为0，SEMR.ABCSE位为0。当ABCS位为1，ABCSE位为0时，使用8倍比特率的频率作为基准时钟，并在基本时钟的第4个脉冲的上升沿对接收数据进行采样。

When the ABCSE bit is 1, a sextuple frequency of a bit rate is used as a base clock, and receive data is sampled on the rising edge of the 3rd pulse of the base clock.

Note 2. The determination condition of the start bit is as follows.

The function of adjust sampling timing is OFF (ASEN = 0):

The determination condition of a start bit is that Low beyond half bit length continues. It is same as the sampling timing. In Figure 27.7, Low period should be kept over 8-cycles to detect a start bit. If Low period does not keep over 8-cycles, the IP judges this as a noise. So, the IP does not start reception and wait start bit.

The function of adjust sampling timing is ON (ASEN = 1):

The determination condition of a start bit is that Low keeps up until the sampling timing. Adjusting the sampling timing forward (AJD = 1) increases the possibility of erroneously determining a noise as the start bit.

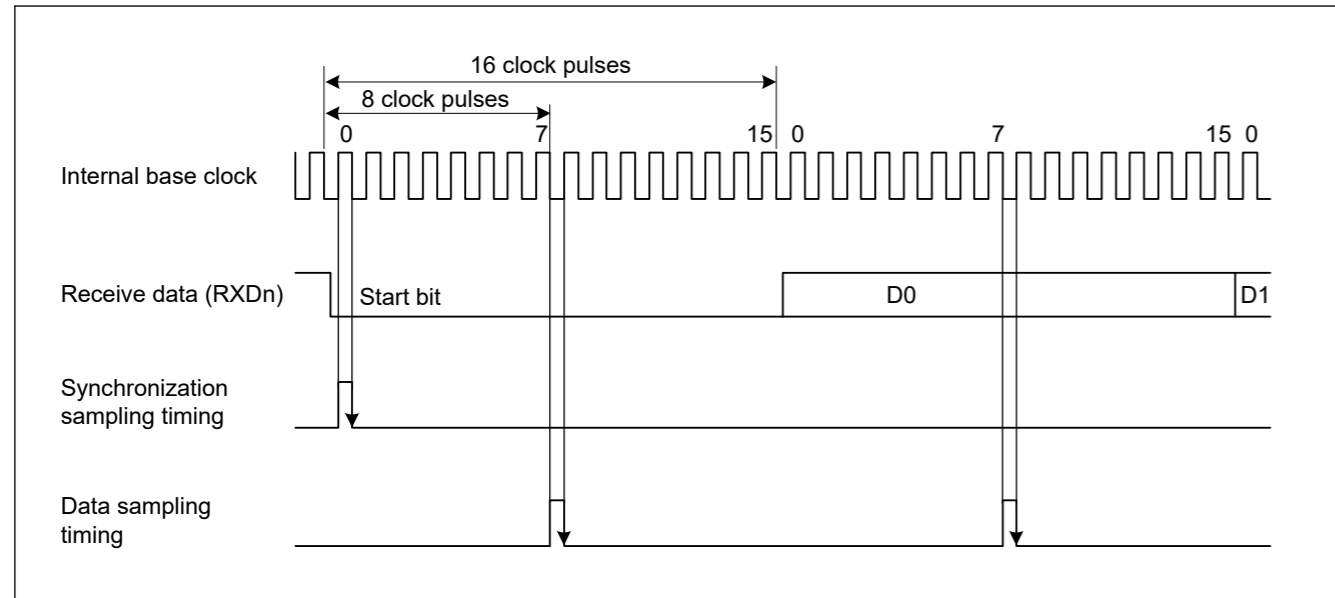

Figure 27.7 Receive data sampling timing in asynchronous mode

### 27.3.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input to the SCKn pin can be selected as the transfer clock of the SCI, based on the SMR.CM and SCR.CKE[1:0] settings.

When an external clock is input to the SCKn pin, the clock frequency must be 16 times the bit rate (when SEMR.ABCS = 0) or 8 times the bit rate (when SEMR.ABCS = 1).

When the SCI uses its internal clock, the clock can be output from the SCKn pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is configured so that the rising edge of the clock is in the middle of the transmit data, as shown in Figure 27.8.

When clock output is enabled, the clock is output after setting the SCR.TE or SCR.RE bit to 1.

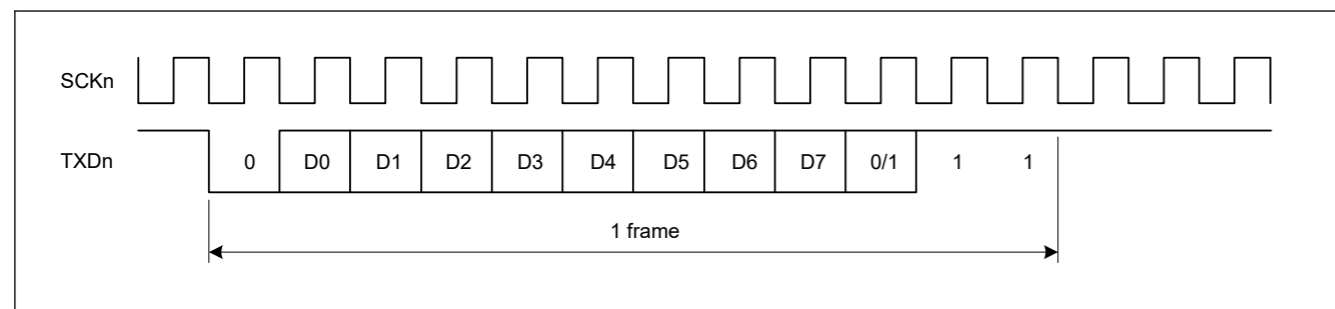

Figure 27.8 Phase relationship between output clock and transmit data in asynchronous mode when SMR.CHR = 0, PE = 1, MP = 0, and STOP = 1

当ABCSE位为1时，以比特率的六倍频为基准时钟，在基准时钟的第3个脉冲的上升沿对接收数据进行采样。

注2.起始位的判断条件如下。

调整采样定时功能关闭 (ASEN=0) :

起始位的确定条件是超过半位长度的Low继续。与采样时间相同。在图27.7中，低电平周期应保持超过8个周期以检测起始位。如果Low周期未保持超过8个周期，则IP将其判断为噪声。因此，IP不开始接收并等待起始位。

调整采样定时功能开启 (ASEN=1) :

起始位的确定条件是Low一直保持到采样定时。向前调整采样时序(AJD=1)会增加错误地将噪声确定为起始位的可能性。

Figure 27.7 异步模式下接收数据采样时序

### 27.3.3 Clock

根据SMR.CM和SCR.CKE[1:0]设置，可以选择片内波特率发生器产生的内部时钟或输入到SCKn引脚的外部时钟作为SCI的传输时钟。

当外部时钟输入到SCKn引脚时，时钟频率必须为比特率的16倍 (SEMR.ABCS=0时) 或比特率的8倍 (SEMR.ABCS=1时)。

当SCI使用其内部时钟时，时钟可以从SCKn引脚输出。在这种情况下，时钟输出的频率等于比特率，并配置相位，使时钟的上升沿位于发送数据的中间，如图27.8所示。

时钟输出使能时，将SCR.TE或SCR.RE位设置为1后输出时钟。

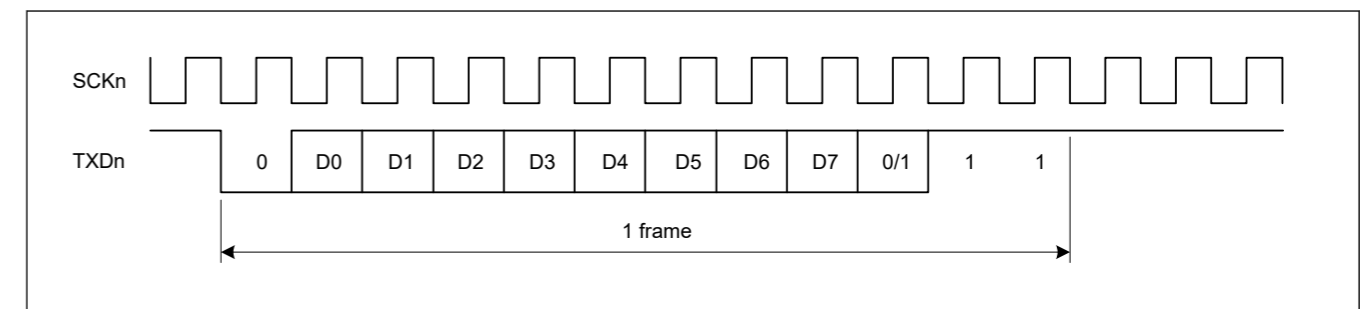

Figure 27.8 异步模式下输出时钟与传输数据的相位关系  
SMR.CHR=0, PE=1, MP=0, STOP=1

### 27.3.4 Double-Speed Operation and Frequency of 6 Times the Bit Rate

When the SEMR.ABCS bit is set to 1 and eight pulses of the base clock for a 1-bit period is selected, the SCI operates on the bit rate twice that of when ABCS is set to 0. When the SEMR.BGDM bit is set to 1, the cycle of the base clock is half and the bit rate is double that of when BGDM is set to 0. When the SCR.CKE[1] bit is set to 0 and the on-chip baud rate generator is selected, setting the ABCS and BGDM bits to 1 allows the SCI to operate at a bit rate four times that when the ABCS and BGDM bits are set to 0. When the SEMR.ABCSE bit is set to 1, the number of basic clock pulses is 6 during a period of 1 bit, and the SCI operates at a bit rate 16/3 times that when SEMR.ABCS = 0, SEMR.BGDM = 0, and SEMR.ABCSE = 0.

As shown by Formula (1) in [section 27.3.2. Receive Data Sampling Timing and Reception Margin in Asynchronous Mode](#), the reception margin decreases when the SEMR.ABCS or SEMR.ABCSE bit in SEMR is set to 1. Therefore, if the target bit rate can be obtained with ABCS or ABCSE set to 0, it is recommended that you use the SCI with ABCS and ABCSE set to 0.

### 27.3.5 CTS and RTS Functions

The CTS function uses input on the CTSn\_RTSn pin in transmission control. Setting the SPMR.CTSE bit to 1 enables the CTS function. For the functions of CTS and RTS, you can select the alternate setting that uses either function with one terminal and the dedicated setting that uses each function independently with two terminals. This setting is done with the SPMR.CTSPEN bit. When the CTS function is enabled, placing a low level on the CTSn\_RTSn pin causes transmission to start.

Driving the CTSn\_RTSn pin high while transmission is in progress does not affect transmission of the current frame.

In the RTS function, which uses output on the CTSn\_RTSn pin, a low level is output when reception becomes possible. Conditions for output of the low and high levels are shown in this section.

[Conditions for low level output]

Satisfaction of all conditions are listed in this section.

#### Non-FIFO selected

- The value of the SCR.RE bit is 1
- Reception is not in progress
- There is no received data yet to be read
- The ORER, FER, and PER flags in the SSR register are all 0

#### FIFO selected

- The value of the SCR.RE bit is 1
- The amount of receive data written in FRDRHL is equal to or less than the setting value of FCRH.RSTRG[3:0]
- The ORER flag in the SSR\_FIFO register (ORER in FRDRH) is 0

[Condition for high level output]

- The conditions for low-level output are not satisfied

### 27.3.6 Address Match (Receive Data Match Detection) Function

The address match function can be used only in asynchronous mode.

If the DCCR.DCME bit is set to 1, when one frame of data is received, the SCI compares that received data with the data set in CDR.CMPD. If the SCI detects a match to the comparison data (CDR.CMPD\*3) with the received data, the SCI can issue the SCIn\_RXI interrupt request.

If the SMR.MP bit is set to 0, comparison occurs only for valid data in receive format. In multi-processor mode (SMR.MP bit = 1), if the DCCR.IDSEL bit is set to 1, receive data where the MPB bit is 1 is subject to comparison for address match and receive data where the MPB bit is 0 is always treated as a non-match.

If the DCCR.IDSEL bit is set to 0, SCI performs address match detection regardless of the MPB bit value of the received data.

### 27.3.4 双倍速操作和6倍比特率的频率

当SEMR.ABCS位设置为1并选择1位周期的8个基本时钟脉冲时，SCI以ABCS设置为0时的两倍比特率运行。当SEMR.BGDM位设置为1，基本时钟的周期是BGDM设置为0时的一半，比特率是两倍。当SCR.CKE[1]位设置为0并且选择片内波特率发生器时，设置ABCS和BGDM位为1允许SCI以四倍于ABCS和BGDM位设置为0时的比特率运行。当SEMR.ABCSE位设置为1时，基本时钟脉冲数为6在1位周期内，SCI以16的比特率运行，是SEMR.ABCS=0、SEMR.BGDM=0和SEMR.ABCSE=0时的3倍。

如第27.3.2节中的公式(1)所示。异步模式下的接收数据采样时序和接收裕度，当SEMR中的SEMR.ABCS或SEMR.ABCSE位设置为1时，接收裕度减小。因此，如果将ABCS或ABCSE设置为0即可获得目标码率，建议您使用SCI，ABCSE和ABCSE设置为0。

### 27.3.5 CTS和RTS函数

CTS功能在传输控制中使用CTSn\_RTSn引脚上的输入。将SPMR.CTSE位设置为1可启用CTS功能。对于CTS和RTS的功能，您可以选择在一个端子上使用任一功能的交替设置和在两个端子上独立使用每个功能的专用设置。该设置通过SPMR.CTSPEN位完成。当CTS功能使能时，将CTSn\_RTSn引脚置于低电平会导致传输开始。

在传输过程中将CTSn\_RTSn引脚驱动为高电平不会影响当前帧的传输。

在使用CTSn\_RTSn引脚输出的RTS功能中，当可以接收时输出低电平。本节显示了低电平和高电平的输出条件。

【低电平输出的条件】

本节列出了所有条件的满足情况。

#### Non-FIFO selected

- SCR.RE位的值为1
- 接收未进行
- 没有接收到的数据尚未读取
- SSR寄存器中的ORER、FER、PER标志位均为0

#### FIFO selected

- SCR.RE位的值为1
- 写入FRDRHL的接收数据量等于或小于FCRH.RSTRG[3:0]的设定值
- SSR\_FIFO寄存器中的ORER标志（FRDRH中的ORER）为0

【高电平输出条件】

- 不满足低电平输出条件

### 27.3.6 地址匹配（接收数据匹配检测）功能

地址匹配功能只能在异步模式下使用。

如果DCCR.DCME位设置为1，当接收到一帧数据时，SCI会将接收到的数据与CDR.CMPD中设置的数据进行比较。如果SCI检测到比较数据(CDR.CMPD\*3)与接收到的数据匹配，则SCI可以发出SCIn\_RXI中断请求。

如果SMR.MP位设置为0，则仅对接收格式的有效数据进行比较。在多处理器模式下（SMR.MP位=1），如果DCCR.IDSEL位设置为1，则接收MPB位为1的数据进行地址匹配比较，接收MPB位为0的数据始终被视为不匹配。

如果DCCR.IDSEL位设置为0，SCI执行地址匹配检测，而不管接收数据的MPB位值如何。

Until SCI detects a match to the comparison data (CDR.CMPD\*<sup>3</sup>) with receive data, received data is skipped (discarded), and the SCI cannot detect a parity error or framing error.

When SCI detects a match, the DCCR.DCME bit is automatically cleared, and the DCCR.DCMF flag is set to 1. If the DCCR.IDSEL bit is set to 1, the SCR.MPIE bit is automatically cleared. If DCCR.IDSEL is set to 0, the value of the SCR.MPIE bit is retained. If the SCR.RIE bit is set to 1, the SCI issues an SCIn\_RXI interrupt request.

If the SCI detects a framing error in the receive data for which a match is detected, the DCCR.DFER flag is set to 1, and if the SCI detects a parity error in that frame, the DCCR.DPER flag is set to 1. The compared receive data is not stored in the RDR register\*<sup>1</sup>, and SSR.RDRF remains 0.\*<sup>2</sup>

After the SCI detects a match, and DCCR.DCME is automatically cleared, the SCI receives the next data continuously based on the current register setting.

When the DCCR.DFER or DCCR.DPER flag is set, the address match is not performed. Before enabling the address match function, set the DCCR.DFER and DCCR.DPER flags to 0.

Examples of the address match function are shown in [Figure 27.9](#) and [Figure 27.10](#).

Note 1. When FCR.FM = 1, this refers to the FRDRHL register.

Note 2. When FCR.FM = 1, this refers to the SSR\_FIFO.RDF flag.

Note 3. This comparative target can select one length of 3 types: CMPD[6:0] with 7-bit length, CMPD[7:0] with 8-bit length, and CMPD[8:0] with 9-bit length.

在SCI检测到与接收数据的比较数据(CDR.CMPD\*3)匹配之前, 会跳过(丢弃)接收到的数据, 并且SCI无法检测奇偶校验错误或帧错误。

当SCI检测到匹配时, 自动清除DCCR.DCME位, 并将DCCR.DCMF标志设置为1。如果DCCR.IDSEL位设置为1, SCR.MPIE位自动清零。如果DCCR.IDSEL设置为0, 则SCR.MPIE位被保留。如果SCR.RIE位设置为1, 则SCI发出SCIn\_RXI中断请求。

如果SCI在检测到匹配的接收数据中检测到帧错误, 则DCCR.DFER标志设置为1, 如果SCI在该帧中检测到奇偶校验错误, 则DCCR.DPER标志设置为1。比较后的接收数据不保存在RDR寄存器\*1中, SSR.RDRF保持为0。\*2

SCI检测到匹配后, DCCR.DCME自动清零, SCI根据当前寄存器设置连续接收下一个数据。

当设置DCCR.DFER或DCCR.DPER标志时, 不执行地址匹配。在启用地址匹配功能之前, 将DCCR.DFER和DCCR.DPER标志设置为0。

地址匹配函数的例子如图27.9和图27.10所示。

注1.当FCR.FM=1时, 指的是FRDRHL寄存器。

注2.当FCR.FM=1时, 这指的是SSR\_FIFO.RDF标志。

注3.此比较目标可以选择3种长度中的一种: 7位长度的CMPD[6:0]、8位长度的CMPD[7:0]和9位长度的CMPD[8:0]。

### 27.3.7 SCI Initialization in Asynchronous Mode

Before transmitting and receiving data, start by writing the initial value 0x00 to the SCR register, then continue through the SCI initialization procedure (select non-FIFO or FIFO) shown in Table 27.28 and Table 27.29. Whenever the operating mode or transfer format is to be changed, the SCR register must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied during initialization.

Figure 27.10 地址匹配示例 (二) 多处理器模式

### 27.3.7 异步模式下的SCI初始化

在发送和接收数据之前，首先将初始值0x00写入SCR寄存器，然后继续执行SCI初始化程序（选择非FIFO或FIFO）如表27.28和表27.29所示。每当要更改操作模式或传输格式时，必须在更改之前初始化SCR寄存器。

在异步模式下使用外部时钟时，请确保在初始化期间提供时钟信号。

Note: Setting the SCR.RE bit to 0 initializes neither the ORER, FER, RDRF, RDF, PER, and DR flags in SSR/SSR\_FIFO nor RDR and RDRHL. When the TE bit is set to 0, the TEND flag for the selected FIFO buffer is not initialized.

Note: In non-FIFO mode, switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of an SCIn\_TXI interrupt request.

Table 27.28 Example flow of SCI initialization in asynchronous mode with non-FIFO selected

| No. | Step Name   | Description   |
|-----|---|---|
| 1   | Start initialization  |   |
| 2   | Set the SCR.TIE, RIE, TE, RE, and TEIE bits to 0                    |   |
| 3   | Set the FCR.FM bit to 0   | Set the FCR.FM bit to 0.  |
| 4   | Set the SCR.CKE[1:0] bits   | Set the clock selection in SCR.<br>When the clock output is selected in asynchronous mode, the clock is output immediately after SCR settings are made.       |
| 5   | Set the SIMR1.IICM bit to 0. Set the SPMR.CKPH and CKPOL bits to 0. | Set the SIMR1.IICM bit to 0.<br>Set the SPMR.CKPH and CKPOL bits to 0.<br>Step 5 can be skipped if the values have not been changed from the initial values.  |
| 6   | Set the data transmission/reception format in SMR, SCMR, and SEMR   | Set data transmission/reception format in SMR, SCMR, and SEMR.  |
| 7   | Set a value in SPTR and ACTR  | Set the communication terminals status in SPTR and adjustable sampling values in ACTR.  |
| 8   | Set a value in BRR  | Write a value corresponding to the bit rate to BRR.<br>This step is not necessary if an external clock is used.   |
| 9   | Set a value in MDDR   | Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is set to 0 or an external clock is used. |
| 10  | Set the I/O port functions  | Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.  |
| 11  | Set the SCR.TE or RE bit to 1, and set the SCR.TIE and RIE bits     | Set the SCR.TE or RE bit to 1. Also set the SCR.TIE and RIE bits.<br>Setting the TE and RE bits allows TXDn and RXDn to be used.                              |
| 12  | Initialization completion   |   |

Table 27.29 Example flow of SCI initialization in asynchronous mode with FIFO selected (1 of 2)

| No. | Step Name  | Description  |
|-----|--|--|
| 1   | Start initialization   |  |
| 2   | Set the SCR.TIE, RIE, TE, RE, and TEIE bits to 0   |  |
| 3   | Set the FCR.FM, TFRST, and RFRST bits to 1 (FIFO mode enabled, transmit/receive FIFOs empty). Set the FCR.TTRG[3:0], RTRG[3:0], and RSTRG[3:0] bits. | Set the FCR.FM, TFRST, and RFRST bits to 1 (FIFO mode enabled, transmit/receive FIFOs empty).<br>Set the FCR.TTRG[3:0], RTRG[3:0], and RSTRG[3:0] bits.      |
| 4   | Set the SCR.CKE[1:0] bits  | Set the clock selection in SCR.<br>When the clock output is selected in asynchronous mode, the clock is output immediately after SCR settings are made.      |
| 5   | Set the SIMR1.IICM bit to 0. Set the SPMR.CKPH and CKPOL bits to 0.  | Set the SIMR1.IICM bit to 0.<br>Set the SPMR.CKPH and CKPOL bits to 0.<br>Step 5 can be skipped if the values have not been changed from the initial values. |
| 6   | Set the data transmission/reception format in SMR, SCMR, and SEMR  | Set data transmission/reception format in SMR, SCMR, and SEMR.   |
| 7   | Set a value in SPTR and ACTR   | Set the communication terminals status in SPTR and adjustable sampling values in ACTR.   |
| 8   | Set a value in BRR   | Write a value corresponding to the bit rate to BRR.<br>This step is not necessary if an external clock is used.  |

Note: 将SCR.RE位设置为0既不会初始化SSR/SSR\_FIFO中的ORER、FER、RDRF、RDF、PER和DR标志，也不会初始化RDR和RDRHL。当TE位设置为0时，所选FIFO缓冲区的TEND标志未初始化。

Note: 在非FIFO模式下，当SCR.TIE位为1时，将SCR.TE位的值从1切换为0或从0切换为1会导致产生SCIn\_TXI中断请求。

Table 27.29 Example flow of SCI initialization in asynchronous mode with FIFO selected (2 of 2)

| No. | Step Name   | Description   |
|-----|---|---|
| 9   | Set a value in MDDR   | Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is set to 0 or an external clock is used. |
| 10  | Set the FCR.TFRST and RFRST bits to 0                           | Set the FCR.TFRST and RFRST bits to 0.  |
| 11  | Set the I/O port functions                                      | Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.  |
| 12  | Set the SCR.TE or RE bit to 1, and set the SCR.TIE and RIE bits | Set the SCR.TE or RE bit to 1. Also set the SCR.TIE and RIE bits. Setting the TE and RE bits allows TXDn and RXDn to be used.                                 |
| 13  | Initialization completion                                       |   |

### 27.3.8 Serial Data Transmission in Asynchronous Mode

#### (1) Non-FIFO selected

Figure 27.11, Figure 27.12, and Figure 27.13 show examples of serial transmission in asynchronous mode.

In serial transmission, the SCI operates as described in this section. When the SCR.TE bit is set to 1, the high level is output to TXDn for one frame. However, when SEMR.PADIS is set to "1", this preamble will not be output. An example of operation when preamble is not output is shown in Figure 27.14.

- The SCI transfers data from the TDR\*1 register to the TSR register when data is written to TDR\*1 in the SCIn\_TXI interrupt handling routine.  
The SCIn\_TXI interrupt request at the beginning of transmission is generated when the SCR.TE and SCR.TIE bits are set to 1 simultaneously by a single instruction.
- Transmission starts after the SPMR.CTSE bit is set to 0 (CTS function is disabled) or a low level on the CTSn\_RTsn pin causes data transfer from the TDR\*1 register to the TSR register. If the SCR.TIE bit is 1, an SCIn\_TXI interrupt request is generated. Continuous transmission is possible by writing the next transmit data to the TDR\*1 register in the SCIn\_TXI interrupt handling routine before transmission of the current transmit data is complete. When SCIn\_TEI interrupt requests are in use, set the SCR.TIE bit to 0 (SCIn\_TXI interrupt requests are disabled) and the SCR.TEIE bit to 1 (an SCIn\_TEI interrupt request is enabled) after the last of the data to be transmitted is written to the TDR\*1 register from the handling routine for SCIn\_TXI requests.
- Data is sent from the TXDn pin in the following order:
  - Start bit
  - Transmit data
  - Parity bit or multi-processor bit (can be omitted depending on the format)
  - Stop bit
- The SCI checks for update of the TDR register on output of the stop bit.
- When the TDR register is updated, setting the SPMR.CTSE bit to 0 (CTS function is disabled) or a low level input on the CTSn\_RTsn pin causes transfer of the next transmit data from the TDR\*1 register to the TSR register and transmission of the stop bit, after which serial transmission of the next frame starts.
- If the TDR register is not updated, the SSR.TEND flag is set to 1, the stop bit is sent, and the mark state is entered, in which 1 is output. If the SCR.TEIE bit is 1, the SSR.TEND flag is set to 1 and an SCIn\_TEI interrupt request is generated.

Note 1. The TDRHL register when 9-bit data length is selected.

Figure 27.11, Figure 27.12, and Figure 27.13 show examples of serial transmission in asynchronous mode.

Table 27.29 选择FIFO的异步模式下SCI初始化示例流程 (2个中的2个)

| No. | 步骤名称                            | Description   |
|-----|---------------------------------|---|
| 9   | 在MDDR中设置一个值                     | 在MDDR中写入通过纠正比特率错误获得的值。这一步是没有必要的，如果SEMR中的BRME位设置为0或使用外部时钟。 |
| 10  | 设置FCR.TFRST和RFRST位为0            | 将FCR.TFRST和RFRST位设置为0。                                    |
| 11  | 设置IO端口功能                        | 进行IO端口设置以启用TXDn、RXDn和所需的输入和输出功能SCKn pins。                 |
| 12  | 将SCR.TE或RE位设置为1，并设置SCR.TIE和RIE位 | 将SCR.TE或RE位设置为1。同时设置SCR.TIE和RIE位。设置TE和RE位允许使用TXDn和RXDn。   |
| 13  | 初始化完成                           |   |

### 27.3.8 异步模式下的串行数据传输

(1)选择非FIFO图27.11、图27.12和图27.13显示了异步模式下串行传输的示例。

在串行传输中，SCI的操作如本节所述。当SCR.TE位设置为1时，高电平输出到TXDn一帧。但是，当SEMR.PADIS设置为"1"时，不会输出此前导码。图27.14显示了不输出前导码时的操作示例。

1.当在SCIn\_TXI中断处理程序中将数据写入TDR\*1时，SCI将数据从TDR\*1寄存器传输到TSR寄存器。当一条指令同时将SCR.TE和SCR.TIE位设置为1时，会在传输开始时产生SCIn\_TXI中断请求。

2.在SPMR.CTSE位设置为0（禁用CTS功能）或CTSn\_RTsn引脚上的低电平导致数据从TDR\*1寄存器传输到TSR寄存器后，传输开始。如果SCR.TIE位为1，则产生SCIn\_TXI中断请求。通过在当前发送数据的发送完成之前将下一个发送数据写入SCIn\_TXI中断处理程序中的TDR\*1寄存器，可以进行连续发送。使用SCIn\_TEI中断请求时，在写入最后一个要发送的数据后，将SCR.TIE位设置为0（禁止SCIn\_TXI中断请求）并将SCR.TEIE位设置为1（启用SCIn\_TEI中断请求）从SCIn\_TXI请求的处理例程到TDR\*1寄存器。

3.数据按以下顺序从TXDn引脚发送：

- 起始位
- 传输数据
- 奇偶校验位或多处理器位（可根据格式省略）
- 停止位

4.SCI在停止位输出时检查TDR寄存器的更新。

5.当TDR寄存器更新时，将SPMR.CTSE位设置为0（禁用CTS功能）或CTSn\_RTsn引脚上的低电平输入会导致下一个发送数据从TDR\*1寄存器传输到TSR寄存器，并且传输停止位，然后开始下一帧的串行传输。

6.如果TDR寄存器没有更新，则将SSR.TEND标志置1，发送停止位，进入标记状态，其中输出1。如果SCR.TEIE位为1，则SSR.TEND标志设置为1，并产生SCIn\_TEI中断请求。

注1.选择9位数据长度时的TDRHL寄存器。

图27.11、图27.12和图27.13显示了异步模式下的串行传输示例。

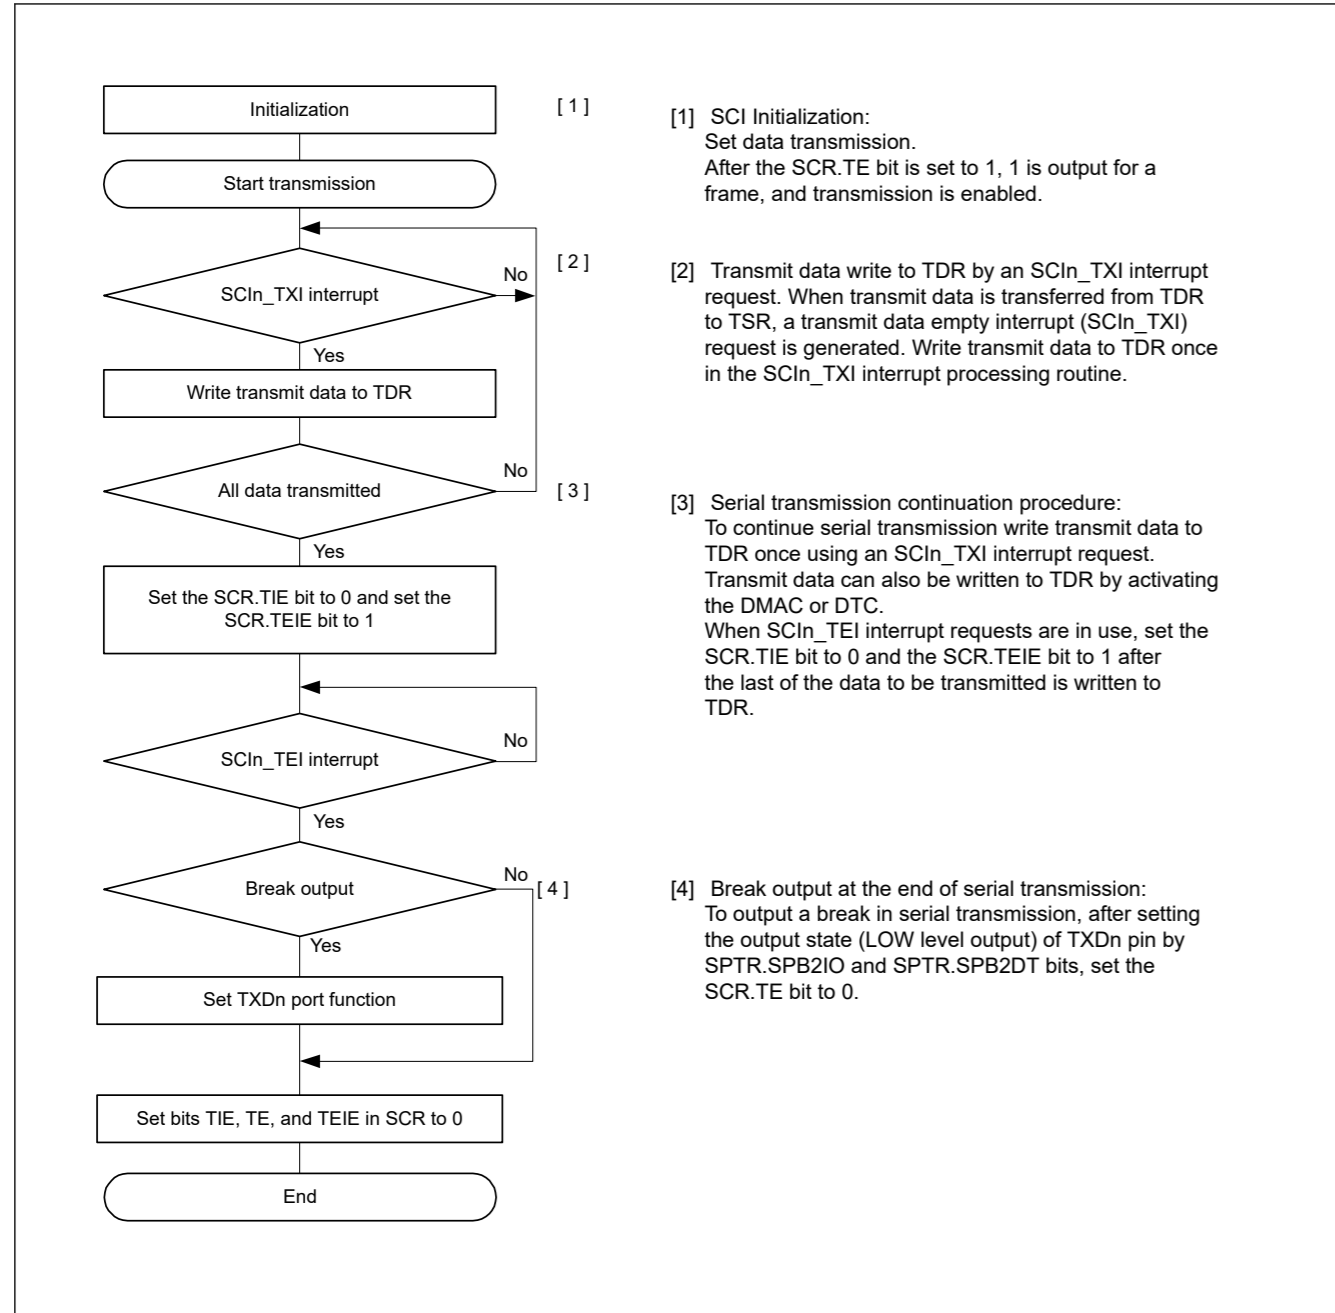

Figure 27.15 Example flow of serial transmission in asynchronous mode with non-FIFO selected

(2) FIFO selected

Figure 27.16 shows an example of a data format that is written to FTDRH and FTDRL in asynchronous mode.

Data corresponding to the data length is set to FTDRH and FTDRL. Write 0 for unused bits. Write in order from FTDRH to FTDRL.

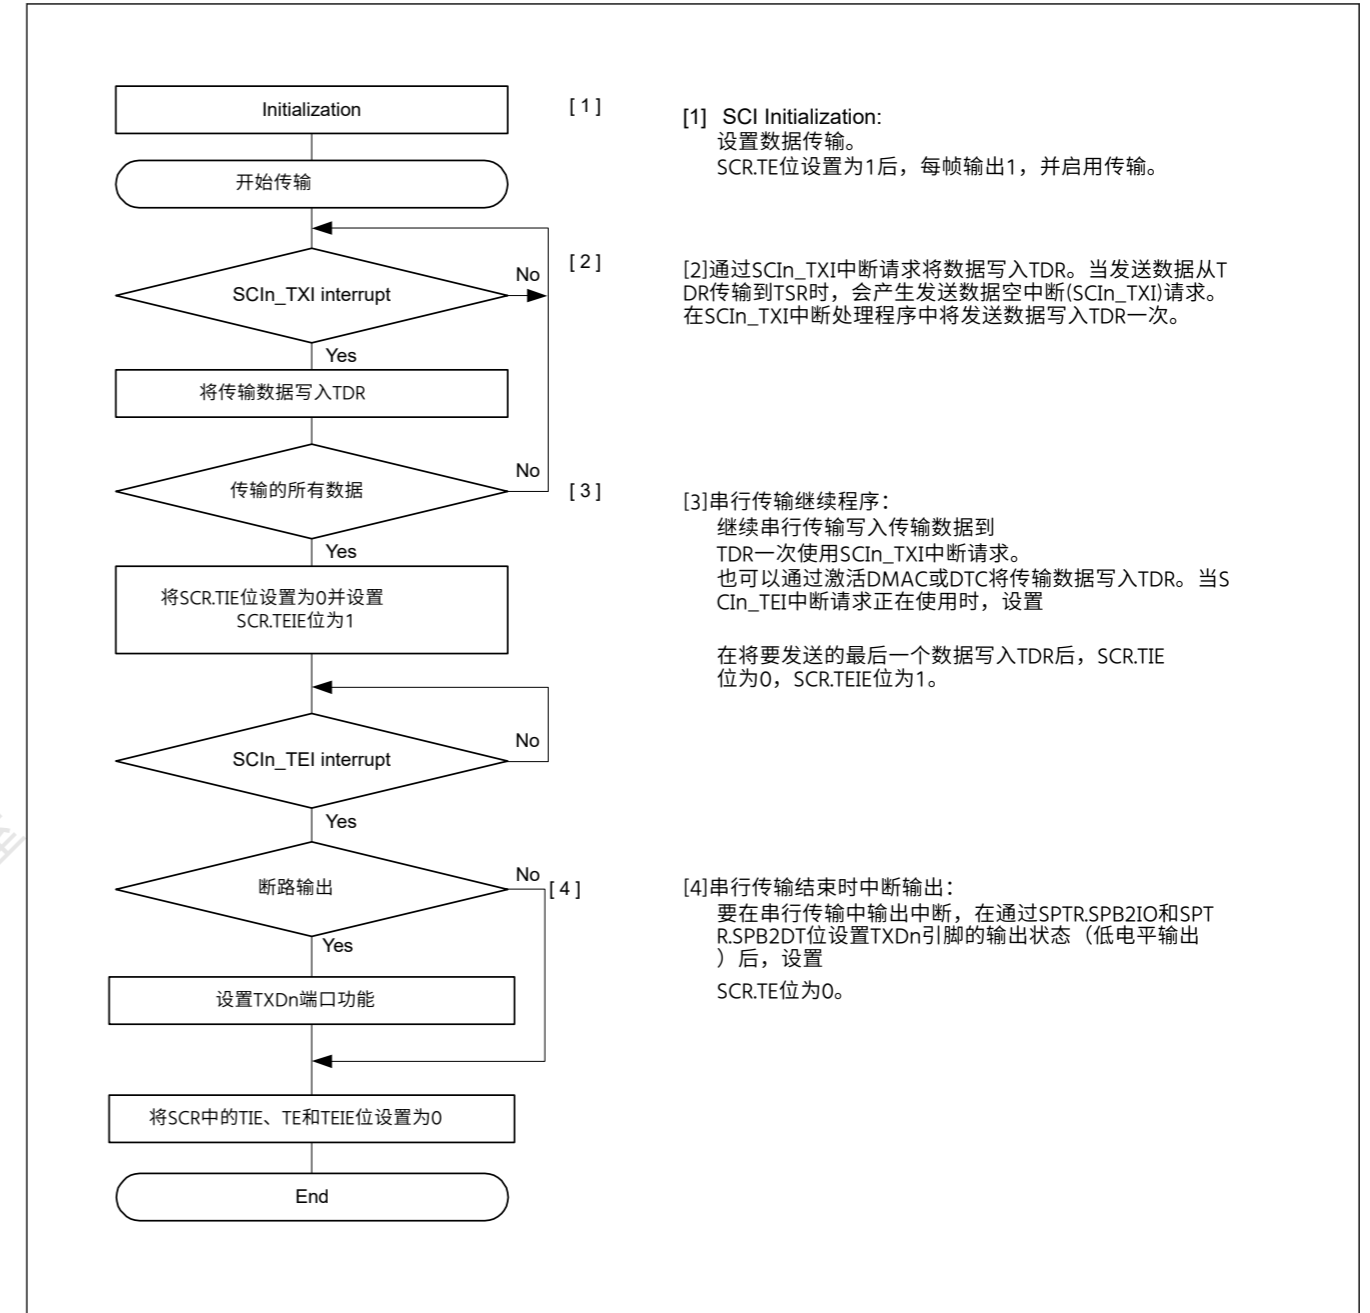

Figure 27.15 选择非FIFO的异步模式下串行传输示例流程

(2) FIFO selected

图27.16显示了以异步模式写入FTDRH和FTDRL的数据格式示例。

对应于数据长度的数据被设置为FTDRH和FTDRL。为未使用的位写入0。从FTDRH按顺序写到FTDRL。

| Data Length | Register Setting |            | Transmit data in FTDRH, FTDRL |    |    |    |    |    |    |    |       |    |    |    |    |    |    |                     |
|-------------|------------------|------------|-------------------------------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|---------------------|
|             | SCMR. CHR1       | SMR. CHR   | FTDRH                         |    |    |    |    |    |    |    | FTDRL |    |    |    |    |    |    |                     |
|             |                  |            | b7                            | b6 | b5 | b4 | b3 | b2 | b1 | b0 | b7    | b6 | b5 | b4 | b3 | b2 | b1 | b0                  |
| 7 bits      | 1                | 0          | -                             | -  | -  | -  | -  | -  | -  | -  | -     | -  | -  | -  | -  | -  | -  | 7-bit transmit data |
| 8 bits      | 1                | 1          | -                             | -  | -  | -  | -  | -  | -  | -  | -     | -  | -  | -  | -  | -  | -  | 8-bit transmit data |
| 9 bits      | 0                | Don't care | -                             | -  | -  | -  | -  | -  | -  | -  | -     | -  | -  | -  | -  | -  | -  | 9-bit transmit data |

Note: —: Invalid. The write value should be 0.

Figure 27.16 Data format written to FTDRH and FTDRL with FIFO selected

In serial transmission, the SCI operates as described in this section. When the TE bit is set to 1, the high level is output to TXDn for one frame (preamble).

- The SCI transfers data from the FTDRL\*1 register to the TSR register when data is written to FTDRL\*1 in the SCIn\_TXI interrupt handling routine. The amount of data that can be written to FTDRL is 16 minus FDR.T[4:0] bytes. The SCIn\_TXI interrupt request at the beginning of transmission is generated when the SCR.TE and SCR.TIE bits are set to 1 simultaneously by a single instruction.
- Transmission starts after the SPMR.CTSE bit is set to 0 (CTS function is disabled) or a low level on the CTSn\_RTsn pin causes data transfer from the FTDRL\*1 register to the TSR register. When the amount of transmit data written in FTDRL is equal to or less than the specified transmit triggering number, SSR\_FIFO.TDFE is set to 1. If the SCR.TIE bit is 1, an SCIn\_TXI interrupt request is generated. Continuous transmission is possible by writing the next transmit data to FTDRL\*1 in the SCIn\_TXI interrupt handling routine before transmission of the current transmit data is complete. When SCIn\_TEI interrupt requests are in use, set the SCR.TIE bit to 0 (SCIn\_TXI interrupt requests are disabled) and the SCR.TEIE bit to 1 (an SCIn\_TEI interrupt request is enabled) after the last of the data to be transmitted is written to the FTDRL\*1\*2 register from the handling routine for SCIn\_TXI requests.
- Data is sent from the TXDn pin in the following order:
  - Start bit
  - Transmit data
  - Parity bit or multi-processor bit (can be omitted depending on the format)
  - Stop bit
- On output of the stop bit, the SCI checks whether non-transmitted data remains in the FTDRL\*3 register.
- When data is set to FTDRL\*3, setting the SPMR.CTSE bit to 0 (CTS function is disabled) or a low level input on the CTSn\_RTsn pin causes transfer of the next transmit data from FTDRL\*1 to TSR and transmission of the stop bit, after which serial transmission of the next frame starts.
- If data is not set in FTDRL\*3, the TEND flag in SSR\_FIFO is set to 1, the stop bit is sent, and the mark state is entered in which 1 is output. If the SCR.TEIE bit is 1, the SSR\_FIFO.TEND flag is set to 1 and an SCIn\_TEI interrupt request is generated.

- Note 1. Write data not to FTDRL but to the FTDRH and FTDRL registers.  
 Note 2. Write data in order from FTDRH to FTDRL when 9-bit data length is selected.  
 Note 3. The SCI only checks for update to the FTDRL register and not the FTDRH register when 9-bit data length is selected.

Figure 27.17 shows an example flow of serial transmission in asynchronous mode with FIFO selected.

| 数据长度   | 寄存器设置      |            | 在FTDRH、FTDRL中传输数据 |    |    |    |    |    |    |    |       |    |    |    |    |    |    |        |
|--------|------------|------------|-------------------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|--------|
|        | SCMR. CHR1 | SMR. CHR   | FTDRH             |    |    |    |    |    |    |    | FTDRL |    |    |    |    |    |    |        |
|        |            |            | b7                | b6 | b5 | b4 | b3 | b2 | b1 | b0 | b7    | b6 | b5 | b4 | b3 | b2 | b1 | b0     |
| 7 bits | 1          | 0          | -                 | -  | -  | -  | -  | -  | -  | -  | -     | -  | -  | -  | -  | -  | -  | 7位传输数据 |
| 8 bits | 1          | 1          | -                 | -  | -  | -  | -  | -  | -  | -  | -     | -  | -  | -  | -  | -  | -  | 8位传输数据 |
| 9 bits | 0          | Don't care | -                 | -  | -  | -  | -  | -  | -  | -  | -     | -  | -  | -  | -  | -  | -  | 9位传输数据 |

Note: -: 无效的。写入值应为0。

Figure 27.16 选择FIFO写入FTDRH和FTDRL的数据格式

在串行传输中，SCI的操作如本节所述。当TE位设置为1时，高电平输出到TXDn一帧（前导码）。

- 当数据写入FTDRL\*1时，SCI将数据从FTDRL\*1寄存器传输到TSR寄存器  
 SCIn\_TXI中断处理程序。可写入FTDRL的数据量为16减去FDR.T[4:0]字节。当一条指令同时将SCR.TE和SCR.TIE位设置为1时，会在传输开始时产生SCIn\_TXI中断请求。
- 在SPMR.CTSE位设置为0（禁用CTS功能）或CTSn\_RTsn引脚上的低电平导致数据从FTDRL\*1寄存器传输到TSR寄存器后，传输开始。当写入FTDRL的发送数据量等于或小于指定的发送触发数时，SSR\_FIFO.TDFE设置为1。如果SCR.TIE位为1，则产生SCIn\_TXI中断请求。在当前发送数据的发送完成之前，通过在SCIn\_TXI中断处理例程中将下一个发送数据写入FTDRL\*1，可以进行连续发送。当使用SCIn\_TEI中断请求时，将SCR.TIE位设置为0（禁止SCIn\_TXI中断请求）并且  
 将要发送的最后一个数据写入到SCR.TEIE位为1（启用SCIn\_TEI中断请求）  
 FTDRL\*1\*2来自SCIn\_TXI请求处理例程的寄存器。
- 数据按以下顺序从TXDn引脚发送：
  - 起始位
  - 传输数据
  - 奇偶校验位或多处理器位（可根据格式省略）
  - 停止位
- 在停止位输出时，SCI检查未发送的数据是否保留在FTDRL\*3寄存器中。
- 当数据设置为FTDRL\*3时，将SPMR.CTSE位设置为0（禁用CTS功能）或CTSn\_RTsn引脚上的低电平输入会导致下一个传输数据从FTDRL\*1传输到TSR并传输停止位，之后开始下一帧的串行传输。
- 如果FTDRL\*3中没有设置数据，则将SSR\_FIFO中的TEND标志设置为1，发送停止位，并进入输出1的标记状态。如果SCR.TEIE位为1，则SSR\_FIFO.TEND标志设置为1，并产生SCIn\_TEI中断请求。

- 注1.不要将数据写入FTDRL，而是写入FTDRH和FTDRL寄存器。  
 注2.选择9位数据长度时，按从FTDRH到FTDRL的顺序写入数据。  
 注意3.SCI仅检查对FTDRL寄存器的更新，而不是选择9位数据长度时的FTDRH寄存器。

图27.17显示了选择FIFO的异步模式下串行传输的示例流程。

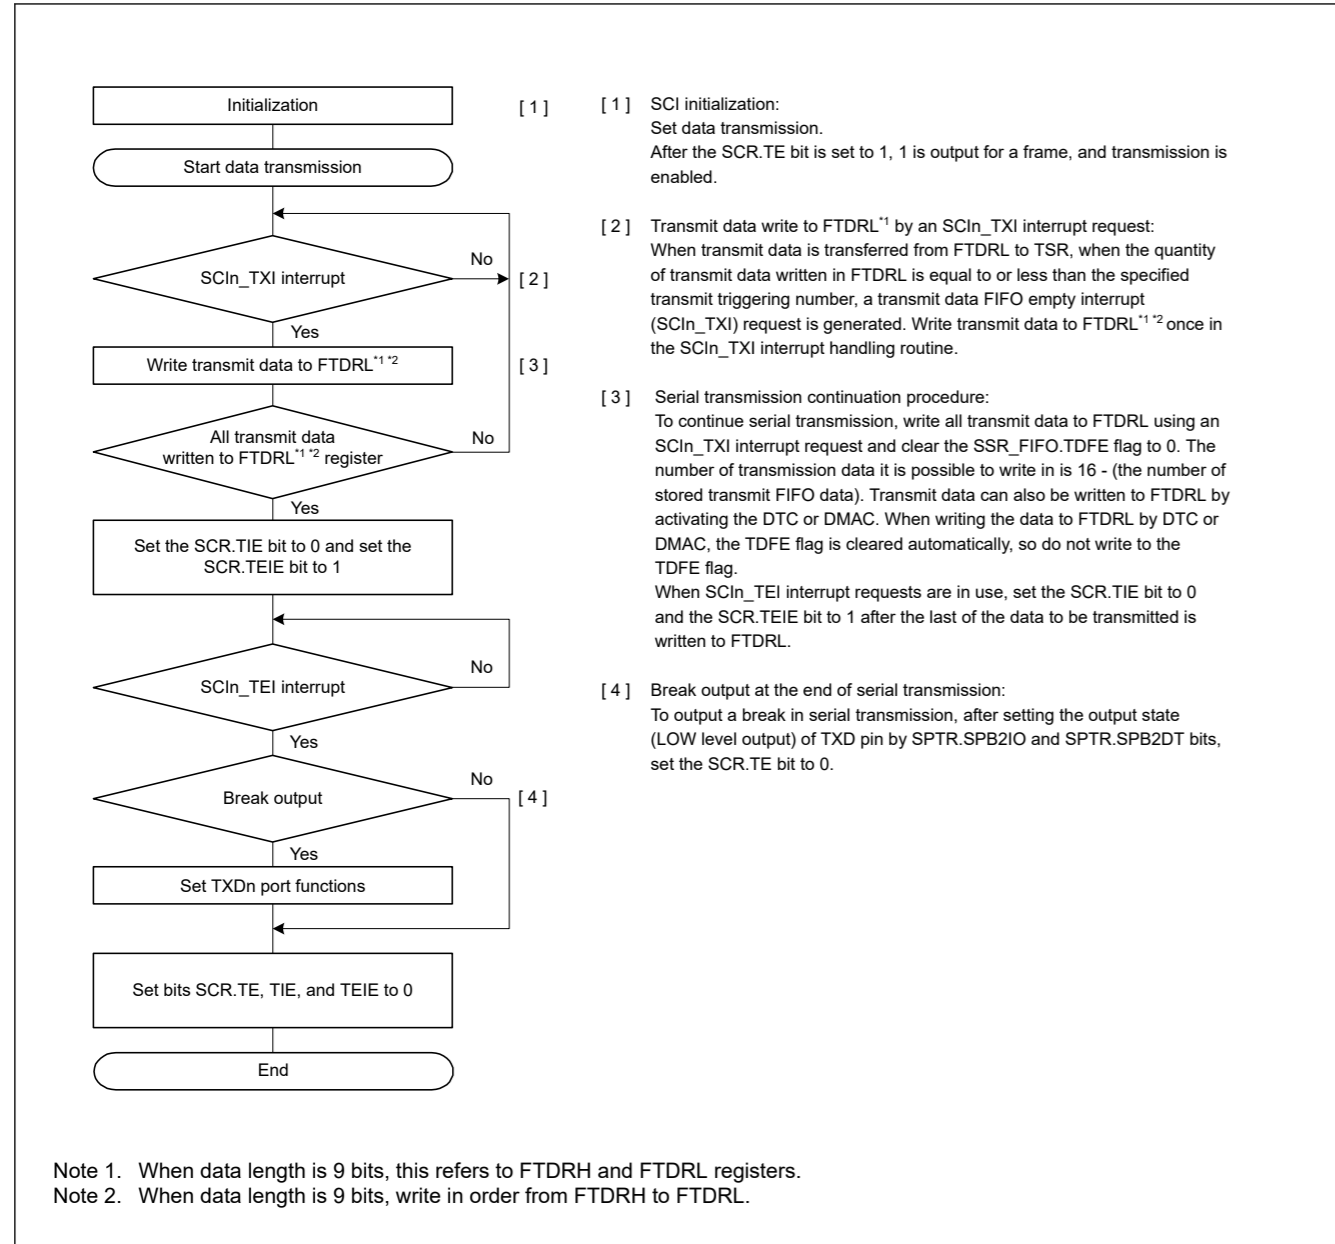

Figure 27.17 Example flow of serial transmission in asynchronous mode with FIFO selected

### 27.3.9 Serial Data Reception in Asynchronous Mode

(1) Non-FIFO selected

Figure 27.18 and Figure 27.19 show an example of the operation for serial data reception in asynchronous mode.

In serial data reception, the SCI operates as follows:

1. When the value of the SCR.RE bit becomes 1, the output signal on the CTSn\_RTsn pin goes low.
2. The SCI monitors the communications line and when it detects a start bit, the SCI performs internal synchronization, stores receive data in RSR.
3. If the multi-processor communication function is enabled (SMR.MP = 1), see section 27.4.2. Multi-Processor Serial Data Reception. If the address match function (data compare match function) is enabled (DCCR.DCME = 1), the SCI cannot detect a parity or framing error as receive data are skipped (discarded) until the SCI detects a match between the receive data and comparison data (CDR.CMPD<sup>\*1</sup>).
4. If the SCI detects an address match, the DCCR.DCME bit is automatically cleared, the DCCR.DCMF flag becomes 1, and an SCIn\_AM interrupt<sup>\*2</sup> request is generated. To enable the generation of an SCIn\_RXI interrupt request, set the SCR.RIE bit to 1. The compared receive data are not stored in the RDR register<sup>\*3</sup>. The SSR.RDRF flag remains 0.

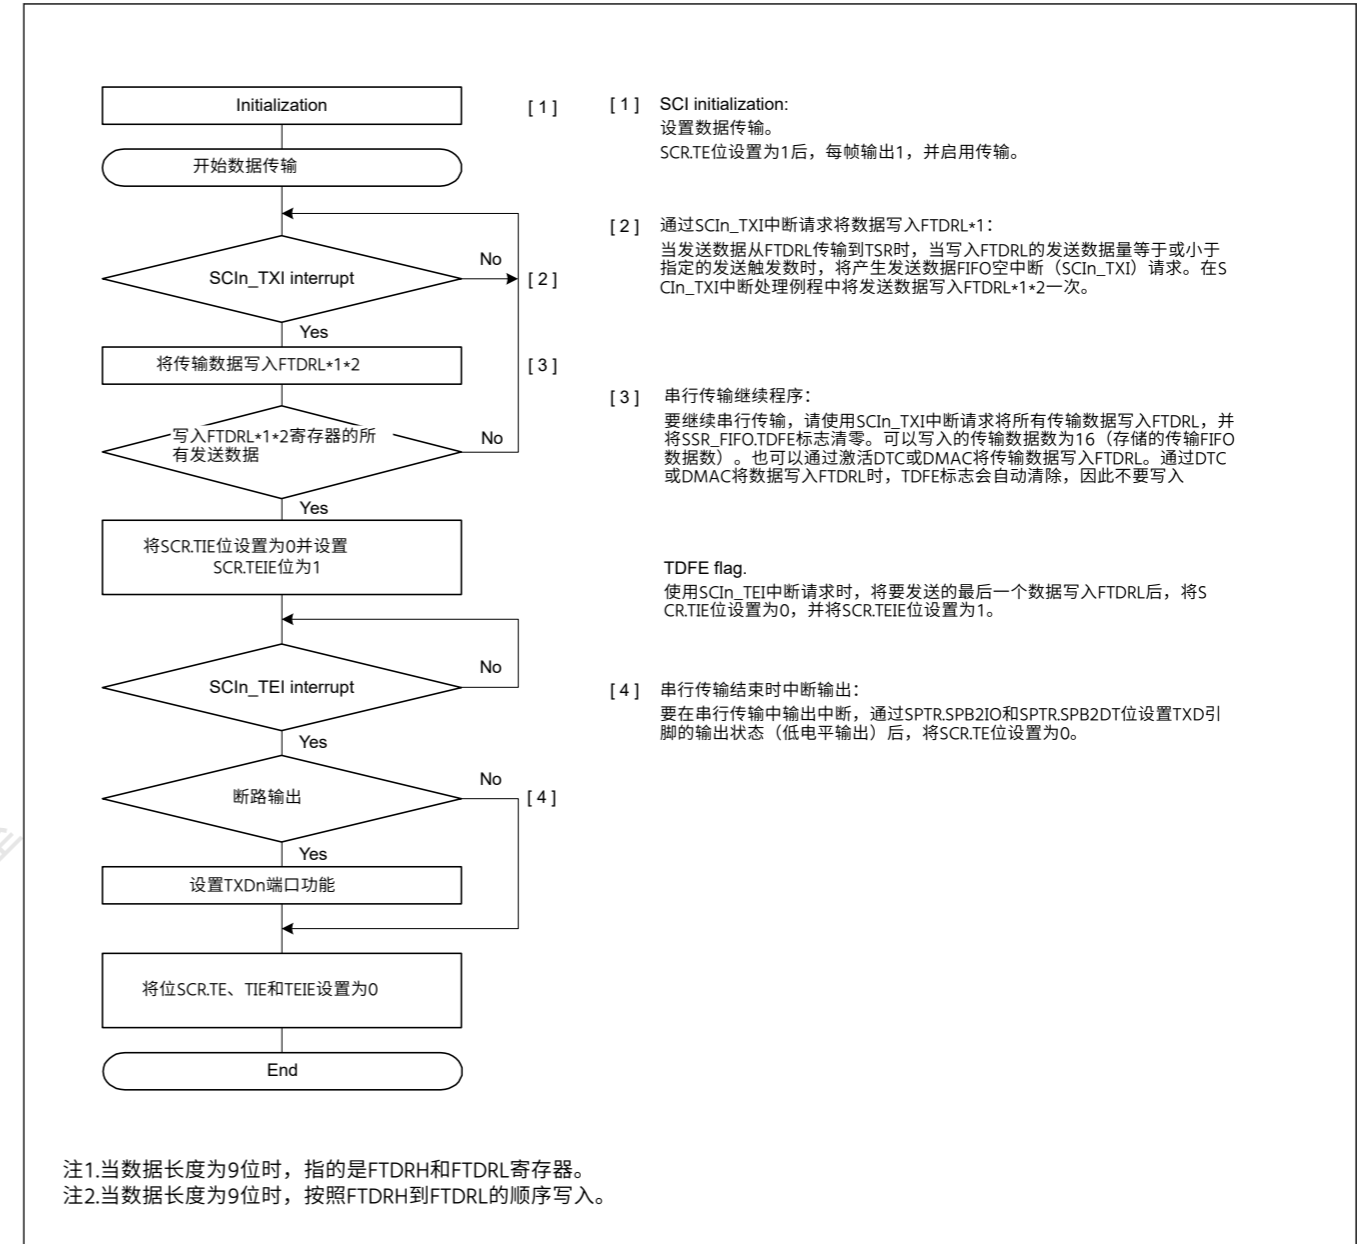

Figure 27.17 选择FIFO的异步模式下串行传输示例流程

### 27.3.9 异步模式下的串行数据接收

(1) Non-FIFO selected

图27.18和图27.19显示了异步模式下串行数据接收操作的示例。

在串行数据接收中，SCI操作如下：

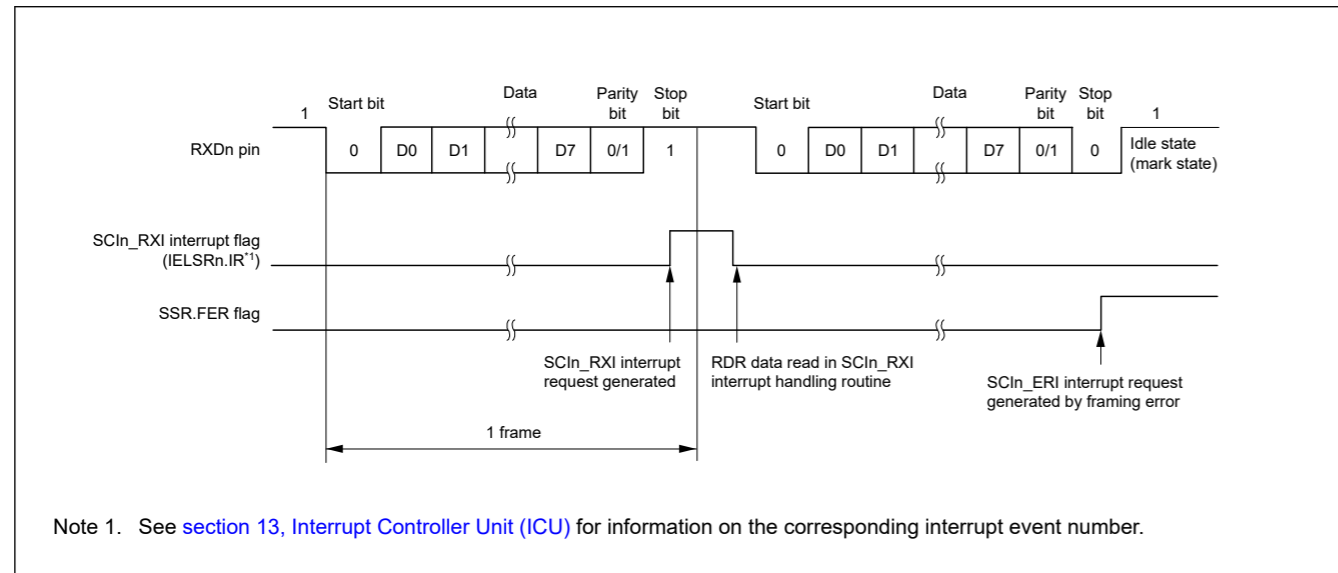

- 1.当SCR.RE位的值变为1时，CTSn\_RTsn引脚上的输出信号变为低电平。
- 2.SCI监控通信线路，当检测到起始位时，SCI执行内部同步，将接收数据存储存储在RSR中。
- 3.如果启用多处理器通信功能（SMR.MP=1），请参见第27.4.2节。多处理器串行数据接收。如果地址匹配功能（数据比较匹配功能）被启用（DCCR.DCME=1），SCI无法检测奇偶校验或帧错误，因为接收数据被跳过（丢弃），直到SCI检测到接收数据和比较之间的匹配数据（CDR.CMPD\*1）。
- 4.如果SCI检测到地址匹配，DCCR.DCME位自动清零，DCCR.DCMF标志变为1，并产生SCIn\_AM中断\*2请求。要启用SCIn\_RXI中断请求的生成，请将SCR.RIE位设置为1。比较的接收数据不存储在RDR寄存器\*3中。SSR.RDRF标志保持为0。

- If the SCI detects a framing error in the receive data for which an address match is detected, the DCCR.DFER flag is set to 1, and if the SCI detects a parity error in that frame, the DCCR.DPER flag becomes 1. To enable the generation of an SCIn\_ERI interrupt request, set the SCR.RIE bit to 1.
- If a framing or a parity error is detected (the DCCR.DFER flag or DCCR.DPER flag is 1) in the SCIn\_AM interrupt handling routine, set the DCCR.DFER and DCCR.DPER flags to 0 and set the DCCR.DCME bit to 1 to enable the address match function again. If neither a framing nor a parity error has been detected (the DCCR.DFER and DCCR.DPER flags are both 0), set the DCCR.DCMF flag to 0. See Figure 27.9.
- If an overrun error occurs, the SSR.ORER flag is set to 1. If the SCR.RIE bit is 1, an SCIn\_ERI interrupt request is generated. Receive data is not transferred to the RDR\*3 register.
- If a parity error is detected, the SSR.PER flag is set to 1 and receive data is transferred to the RDR\*3 register. If the SCR.RIE bit is 1, an SCIn\_ERI interrupt request is generated.
- If a framing error is detected, the SSR.FER flag is set to 1 and receive data is transferred to the RDR\*3 register. If the SCR.RIE bit is 1, an SCIn\_ERI interrupt request is generated.
- When reception finishes successfully, receive data is transferred to the RDR\*3 register. If the SCR.RIE bit is 1, an SCIn\_RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to the RDR register in the SCIn\_RXI interrupt handling routine before reception of the next receive data is complete. Reading the received data that was transferred to the RDR register causes the CTSn\_RTsn pin to output low.

Note 1. This scope of comparison is selectable as one of three lengths: CMPD[6:0] is for 7-bit length, CMPD[7:0] is for 8-bit length, and CMPD[8:0] is for 9-bit length.

Note 2. As no interrupt enable bit is assigned to the SCIn\_AM interrupt, an interrupt request is generated by setting the DCCR.DCMF to 1.

Note 3. Only read data in the RDRHL register when 9-bit data length is selected.

Note 1. See section 13, Interrupt Controller Unit (ICU) for information on the corresponding interrupt event number.

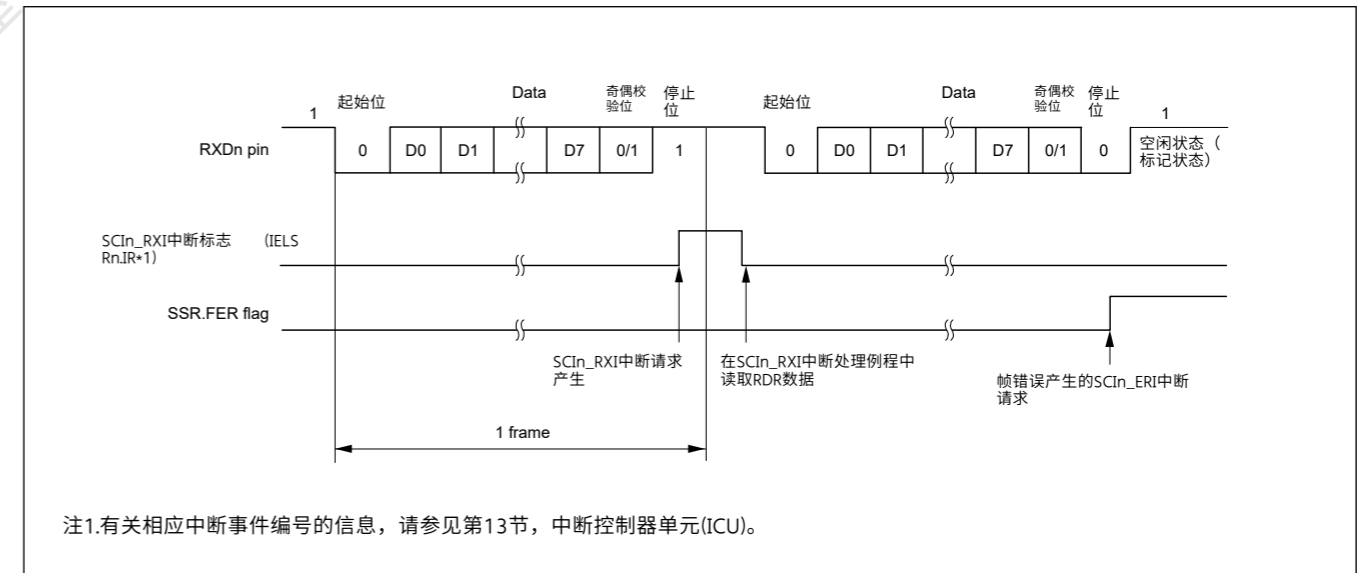

Figure 27.18 Example of SCI operation for serial reception in asynchronous mode (1) when the RTS function is not used, and with 8-bit data, parity bit, and 1 stop bit

- 如果SCI在检测到地址匹配的接收数据中检测到帧错误，则DCCR.DFER标志设置为1，如果SCI在该帧中检测到奇偶校验错误，则DCCR.DPER标志变为1。要启用SCIn\_ERI中断请求的生成，请将SCR.RIE位设置为1。
- 如果在SCIn\_AM中断处理例程中检测到成帧或奇偶校验错误（DCCR.DFER标志或DCCR.DPER标志为1），则将DCCR.DFER和DCCR.DPER标志设置为0，并设置DCCR.DCME位为1以再次启用地址匹配功能。如果既没有检测到成帧错误也没有检测到奇偶校验错误（DCCR.DFER和DCCR.DPER标志都为0），将DCCR.DCMF标志设置为0。参见图27.9。
- 如果发生溢出错误，则SSR.ORER标志设置为1。如果SCR.RIE位为1，则产生SCIn\_ERI中断请求。接收数据不传送到RDR\*3寄存器。
- 如果检测到奇偶校验错误，则将SSR.PER标志设置为1，并将接收数据传输到RDR\*3寄存器。如果SCR.RIE位为1，则产生SCIn\_ERI中断请求。
- 如果检测到帧错误，则将SSR.FER标志设置为1，并将接收数据传输到RDR\*3寄存器。如果SCR.RIE位为1，则产生SCIn\_ERI中断请求。
- 接收成功后，接收数据被传送到RDR\*3寄存器。如果SCR.RIE位为1，则SCIn\_RXI中断请求产生。通过读取传输到的接收数据启用连续接收。在接收下一个接收数据完成之前，SCIn\_RXI中断处理程序中的RDR寄存器。读取传输到RDR寄存器的接收数据会导致CTS<sub>n</sub>RTS<sub>n</sub>引脚输出低电平。

注1.此比较范围可选择以下三种长度之一：CMPD[6:0]用于7位长度，CMPD[7:0]用于8位长度，CMPD[8:0]用于9位长度。

注2.由于没有为SCIn\_AM中断分配中断使能位，因此通过设置DCCR.DCMF to 1.

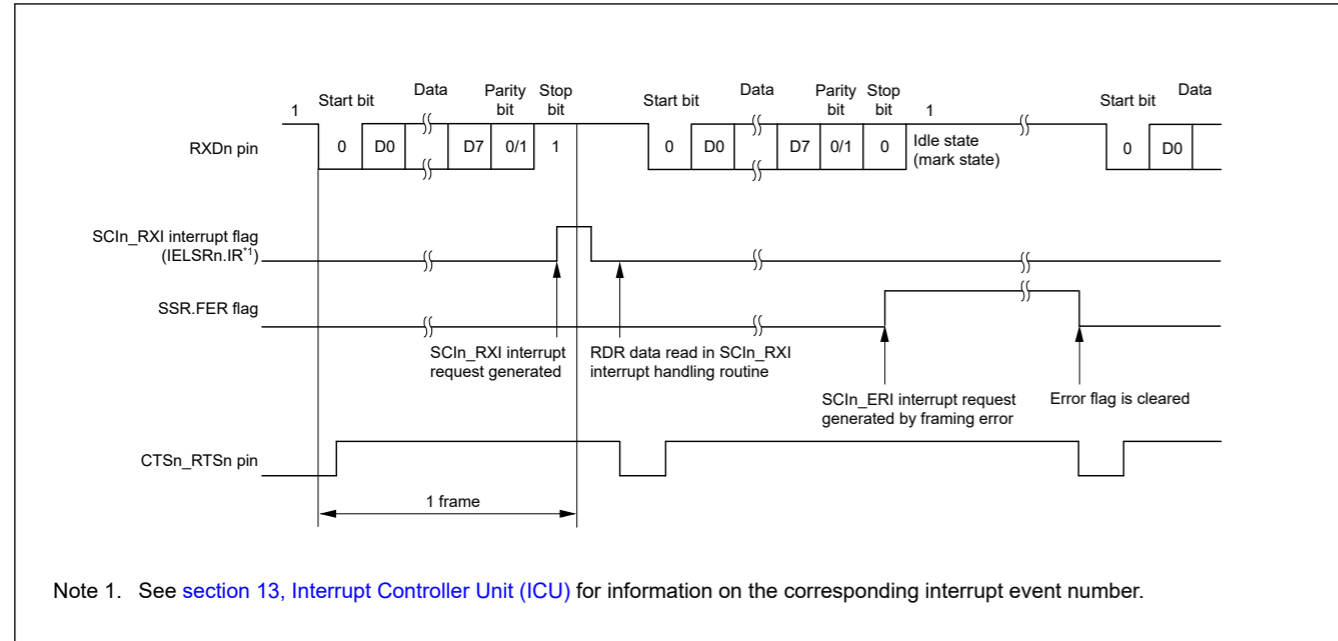

注3.选择9位数据长度时，仅读取RDRHL寄存器中的数据。

注1.有关相应中断事件编号的信息，请参见第13节，中断控制器单元(ICU)。

Figure 27.18 异步模式下串行接收的SCI操作示例(1)不使用RTS功能时，具有8位数据、奇偶校验位和1个停止位

Note 1. See section 13, Interrupt Controller Unit (ICU) for information on the corresponding interrupt event number.

Figure 27.19 Example of SCI operation for serial reception in asynchronous mode (2) when RTS function is used, and with 8-bit data, parity bit, and 1 stop bit

Table 27.30 lists the states of the flags in the SSR register and receive data handling when a receive error is detected.

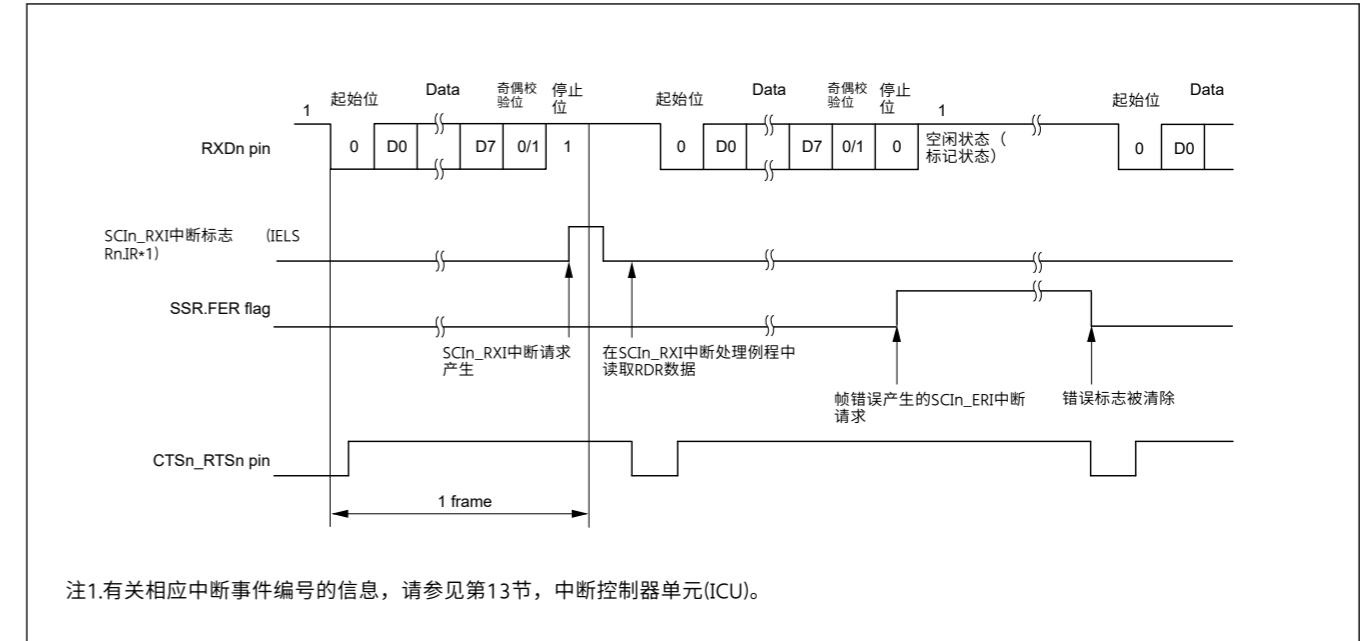

If a receive error is detected, an SCIn\_ERI interrupt request is generated but an SCIn\_RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Accordingly, set the ORER, FER, and PER bits to 0 before resuming reception. In addition, be sure to read the RDR or RDRHL register during overrun error processing. When a reception is forced to terminate by setting the SCR.RE bit to 0 during operation, read the RDR or RDRHL register because received data that is not yet read might be left in the RDR or RDRHL.

Figure 27.20 and Figure 27.21 show example flows of serial data reception.

Table 27.30 Flags in SSR Status Register and receive data handling

| Flags in the SSR Status Register |     |     | Receive data         | Receive error type                           |
|----------------------------------|-----|-----|----------------------|--|
| ORER                             | FER | PER |                      |  |
| 1                                | 0   | 0   | Lost                 | Overrun error                                |
| 0                                | 1   | 0   | Transferred to RDR*1 | Framing error                                |
| 0                                | 0   | 1   | Transferred to RDR*1 | Parity error                                 |
| 1                                | 1   | 0   | Lost                 | Overrun error + framing error                |
| 1                                | 0   | 1   | Lost                 | Overrun error + parity error                 |
| 0                                | 1   | 1   | Transferred to RDR*1 | Framing error + parity error                 |
| 1                                | 1   | 1   | Lost                 | Overrun error + framing error + parity error |

Note 1. Only read data in the RDRHL register when 9-bit data length is selected.

注1.有关相应中断事件编号的信息,请参见第13节,中断控制器单元(ICU)。

Figure 27.19 使用RTS功能,8位数据、奇偶校验位和1个停止位时,异步模式下串行接收的SCI操作示例(2)

表27.30列出了SSR寄存器中标志的状态以及检测到接收错误时的接收数据处理。

如果检测到接收错误,则会产生SCIn\_ERI中断请求,但不会产生SCIn\_RXI中断请求。当接收错误标志为1时,无法恢复数据接收。因此,在恢复接收之前,请将ORER、FER和PER位设置为0。此外,请务必在溢出错误处理期间读取RDR或RDRHL寄存器。如果在操作期间通过将SCR.RE位设置为0来强制终止接收,请读取RDR或RDRHL寄存器,因为尚未读取的已接收数据可能留在RDR或RDRHL中。

图27.20和图27.21显示了串行数据接收的示例流程。

Table 27.30 SSR状态寄存器中的标志和接收数据处理

| SSR状态寄存器中的标志 |     |     | 接收数据     | 接收错误类型          |
|--------------|-----|-----|----------|-----------------|
| ORER         | FER | PER |          |                 |
| 1            | 0   | 0   | Lost     | 溢出错误            |
| 0            | 1   | 0   | 转移到RDR*1 | 构图错误            |
| 0            | 0   | 1   | 转移到RDR*1 | 奇偶校验错误          |
| 1            | 1   | 0   | Lost     | 溢出错误+成帧错误       |
| 1            | 0   | 1   | Lost     | 溢出错误+奇偶校验错误     |
| 0            | 1   | 1   | 转移到RDR*1 | 成帧错误+奇偶校验错误     |
| 1            | 1   | 1   | Lost     | 溢出错误+帧错误+奇偶校验错误 |

注1.选择9位数据长度时,仅读取RDRHL寄存器中的数据。

(2) FIFO selected

Figure 27.25 shows an example of a data format that is written to FRDRH register and FRDRL register in asynchronous mode.

In asynchronous mode, 0 is written to the MPB bit in the FRDRH register. Data that corresponds to the data length is written to FRDRH and FRDRL. Unused bits are written as 0. Read in order from FRDRH to FRDRL. If software reads FRDRL, the

Figure 27.24 异步模式下串行接收的示例流程图 (未选择FIFO和地址 Matching Enabled) (3)

(2) FIFO selected

图27.25显示了在异步模式下写入FRDRH寄存器和FRDRL寄存器的数据格式示例。

在异步模式下，将0写入FRDRH寄存器的MPB位。对应于数据长度的数据被写入FRDRH和FRDRL。未使用的位写为0。按从FRDRH到FRDRL的顺序读取。如果软件读取FRDRL，则

SCI updates FER, PER, and receive data (RDAT[8:0]) in the FRDRL register with the next data. The flags RDF, ORER, and DR in the FRDRH register always reflect the associated flags in the SSR\_FIFO register.

| Data Length | Register Setting |            | Receive data in FRDRH, FRDRL |     |      |     |     |     |    |                    |                    |                    |    |    |    |    |    |    |
|-------------|------------------|------------|------------------------------|-----|------|-----|-----|-----|----|--------------------|--------------------|--------------------|----|----|----|----|----|----|
|             | SCMR. CHR1       | SMR. CHR   | FRDRH                        |     |      |     |     |     |    |                    |                    |                    |    |    |    |    |    |    |
|             |                  |            | b15                          | b14 | b13  | b12 | b11 | b10 | b9 | b8                 | b7                 | b6                 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7 bits      | 1                | 0          | —                            | RDF | ORER | FER | PER | DR  | 0  | 0                  | 0                  | 7-bit receive data |    |    |    |    |    |    |
| 8 bits      | 1                | 1          | —                            | RDF | ORER | FER | PER | DR  | 0  | 0                  | 8-bit receive data |                    |    |    |    |    |    |    |
| 9 bits      | 0                | Don't care | —                            | RDF | ORER | FER | PER | DR  | 0  | 9-bit receive data |                    |                    |    |    |    |    |    |    |

Note: 0 is always read for MPB bit (FRDRH[1])  
When data length is 7 bits, 0 is always read for FRDRH[0] and FRDRL[7]  
When data length is 8 bits, 0 is always read for FRDRH[0]  
FRDRH[7] bit is read as an indefinite value

**Figure 27.25 Data format stored in FRDRH and FRDRL with FIFO selected**

In serial data reception, the SCI operates as follows:

- When the value of the SCR.RE bit becomes 1, the output signal on the CTSn\_RTSn pin goes low.
- The SCI monitors the communications line and, when it detects a start bit, the SCI performs internal synchronization, stores receive data in the RSR register.
- If the multi-processor communications function is enabled (SMR.MP = 1), see [section 27.4.2. Multi-Processor Serial Data Reception](#). If the address match function (data compare match function) is enabled (DCCR.DCME = 1), the SCI cannot detect a parity or framing error as receive data are skipped (discarded) until the SCI detects a match between the receive data and the data for comparison (CDR.CMPD\*1).
- If the SCI detects an address match, the DCCR.DCME bit is automatically cleared, the DCCR.DCMF flag becomes 1, and an SCIn\_AM interrupt\*2 request is generated. To enable the generation of an SCIn\_RXI interrupt request, set the SCR.RIE bit to 1. The compared receive data are not stored in the RDR register\*3. The SSR.RDRF flag remains 0.
- If the SCI detects a framing error in the receive data for which an address match was detected, the DCCR.DFER flag is set to 1, and if the SCI detects a parity error in that frame, the DCCR.DPER flag becomes 1. To enable the generation of an SCIn\_ERI interrupt request, set the SCR.RIE bit to 1.
- If a framing or a parity error is detected (the DCCR.DFER flag or DCCR.DPER flag is 1) in the SCIn\_AM interrupt handling routine, set the DCCR.DFER and DCCR.DPER flags to 0 and set the DCCR.DCME bit to 1 to enable the address match function again. If neither a framing nor a parity error has been detected (the DCCR.DFER and DCCR.DPER flags are 0), set the DCCR.DCMF flag to 0. See [Figure 27.9](#).
- If an overrun error occurs during normal communications, the SSR\_FIFO.ORER flag is set to 1. If the SCR.RIE bit in SCR is 1, an SCIn\_ERI interrupt request is generated. Receive data is not transferred to the FRDRL\*3 register.
- If a parity error is detected, the PER flag and receive data are transferred to the FRDRL\*3 register. If the SCR.RIE bit is set to 1, an SCIn\_ERI interrupt request is generated.
- If a framing error is detected, the FER flag and receive data are transferred to the FRDRL\*3 register. If the SCR.RIE bit is set to 1, an SCIn\_ERI interrupt request is generated.
- After a framing error is detected and when SCI detects that the continuous receive data is for one frame, reception stops.
- When the amount of data stored in the FRDRL register falls below the specified receive triggering number, and the next data is not received after 15 ETUs from the last stop bit in asynchronous mode, the SSR\_FIFO.DR flag is set to 1. When the SCR.RIE bit is 1 and the FCR.DRES bit is 0, the SCI generates an SCIn\_RXI interrupt request. When the FCR.DRES bit is 1, SCI generates an SCIn\_ERI interrupt request.
- When reception finishes successfully, receive data is transferred to the FRDRL\*3 register. The RDF bit is set to 1 when the amount of receive data written to FRDRHL is equal to or greater than the specified receive triggering number. If the

SCI使用下一个数据更新FRDRL寄存器中的FER、PER和接收数据(RDAT[8:0])。标志RDF、ORER和FRDRH寄存器中的DR始终反映SSR\_FIFO寄存器中的相关标志。

| 数据长度   | 寄存器设置      |            | 在FRDRH、FRDRL中接收数据 |     |      |     |     |     |    |        |        |        |    |    |    |    |    |    |
|--------|------------|------------|-------------------|-----|------|-----|-----|-----|----|--------|--------|--------|----|----|----|----|----|----|
|        | SCMR. CHR1 | SMR. CHR   | FRDRH             |     |      |     |     |     |    |        |        |        |    |    |    |    |    |    |
|        |            |            | b15               | b14 | b13  | b12 | b11 | b10 | b9 | b8     | b7     | b6     | b5 | b4 | b3 | b2 | b1 | b0 |
| 7 bits | 1          | 0          | —                 | RDF | ORER | FER | PER | DR  | 0  | 0      | 0      | 7位接收数据 |    |    |    |    |    |    |
| 8 bits | 1          | 1          | —                 | RDF | ORER | FER | PER | DR  | 0  | 0      | 8位接收数据 |        |    |    |    |    |    |    |
| 9 bits | 0          | Don't care | —                 | RDF | ORER | FER | PER | DR  | 0  | 9位接收数据 |        |        |    |    |    |    |    |    |

Note: MPB位(FRDRH[1])始终读取0当数据长度为7位时, FRDRH[0]和FRDRL[7]始终读取0  
当数据长度为8位时, FRDRH[0]总是读取0  
FRDRH[7]位被读取为不定值

**Figure 27.25 存储在FRDRH和FRDRL中的数据格式, 选择了FIFO**

在串行数据接收中, SCI操作如下:

- 当SCR.RE位的值变为1时, CTSn\_RTSn引脚上的输出信号变为低电平。
- SCI监视通信线路, 当它检测到一个起始位时, SCI执行内部同步, 将接收数据存储到RSR寄存器中。
- 如果启用多处理器通信功能 (SMR.MP=1), 请参见第27.4.2节。多处理器串行数据接收。如果地址匹配功能 (数据比较匹配功能) 被启用 (DCCR.DCME=1), SCI无法检测奇偶校验或帧错误, 因为接收数据被跳过 (丢弃), 直到SCI检测到接收数据与用于比较的数据 (CDR.CMPD\*1)。
- 如果SCI检测到地址匹配, DCCR.DCME位自动清零, DCCR.DCMF标志变为1, 并产生SCIn\_AM中断\*2请求。要启用SCIn\_RXI中断请求的生成, 请将SCR.RIE位设置为1。比较的接收数据不存储在RDR寄存器\*3中。SSR.RDRF标志保持为0。
- 如果SCI在检测到地址匹配的接收数据中检测到帧错误, 则DCCR.DFER标志设置为1, 如果SCI在该帧中检测到奇偶校验错误, 则DCCR.DPER标志变为1。要启用SCIn\_ERI中断请求的生成, 请将SCR.RIE位设置为1。
- 如果在SCIn\_AM中断处理例程中检测到成帧或奇偶校验错误 (DCCR.DFER标志或DCCR.DPER标志为1), 则将DCCR.DFER和DCCR.DPER标志设置为0, 并设置DCCR.DCME位为1以再次启用地址匹配功能。如果既没有检测到成帧错误也没有检测到奇偶校验错误 (DCCR.DFER和DCCR.DPER标志为0), 将DCCR.DCMF标志设置为0。参见图27.9。
- 如果在正常通信过程中发生溢出错误, 则SSR\_FIFO.ORER标志设置为1。如果SCR中的SCR.RIE位为1, 则产生SCIn\_ERI中断请求。接收数据不传送到FRDRL\*3寄存器。
- 如果检测到奇偶校验错误, 则将PER标志和接收数据传送到FRDRL\*3寄存器。如果SCR.RIE位设置为1, 则会产生SCIn\_ERI中断请求。
- 如果检测到帧错误, 则将FER标志和接收数据传送到FRDRL\*3寄存器。如果SCR.RIE位设置为1, 则会产生SCIn\_ERI中断请求。
- 检测到帧错误后, 当SCI检测到连续接收数据为一帧时, 停止接收。
- 当FRDRL寄存器中存储的数据量低于指定的接收触发数, 并且在异步模式下从最后一个停止位开始15个ETU后没有接收到下一个数据时, SSR\_FIFO.DR标志设置为1。SCR.RIE位为1, FCR.DRES位为0, SCI产生一个SCIn\_RXI中断请求。当FCR.DRES位为1时, SCI产生一个SCIn\_ERI中断请求。
- 接收成功后, 接收数据被传送到FRDRL\*3寄存器。当写入FRDRHL的接收数据量等于或大于指定的接收触发数时, RDF位设置为1。如果

SCR.RIE bit in SCR is 1, an SCIn\_RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to the FRDRL\*4 register in the SCIn\_RXI interrupt handling routine, before an overrun error occurs. If the received data that is transferred to FRDRL\*5 is less than the RTS trigger number, the CTSn\_RTsn pin outputs low.

- Note 1. One of three lengths is selected for the target for comparison: CMPD[6:0] is for 7-bit length, CMPD[7:0] is for 8-bit length, and CMPD[8:0] is for 9-bit length.
- Note 2. As no interrupt enable bit is assigned to the SCIn\_AM interrupt, an interrupt request is generated by setting the DCCR.DCMF to 1.
- Note 3. Only read data in the FRDRH and FRDRL registers when 9-bit data length is selected.
- Note 4. Read data in order from FRDRH to FRDRL when 9-bit data length is selected.
- Note 5. The SCI only checks for update to the FRDRL register and not to the FRDRH register when 9-bit data length is selected.

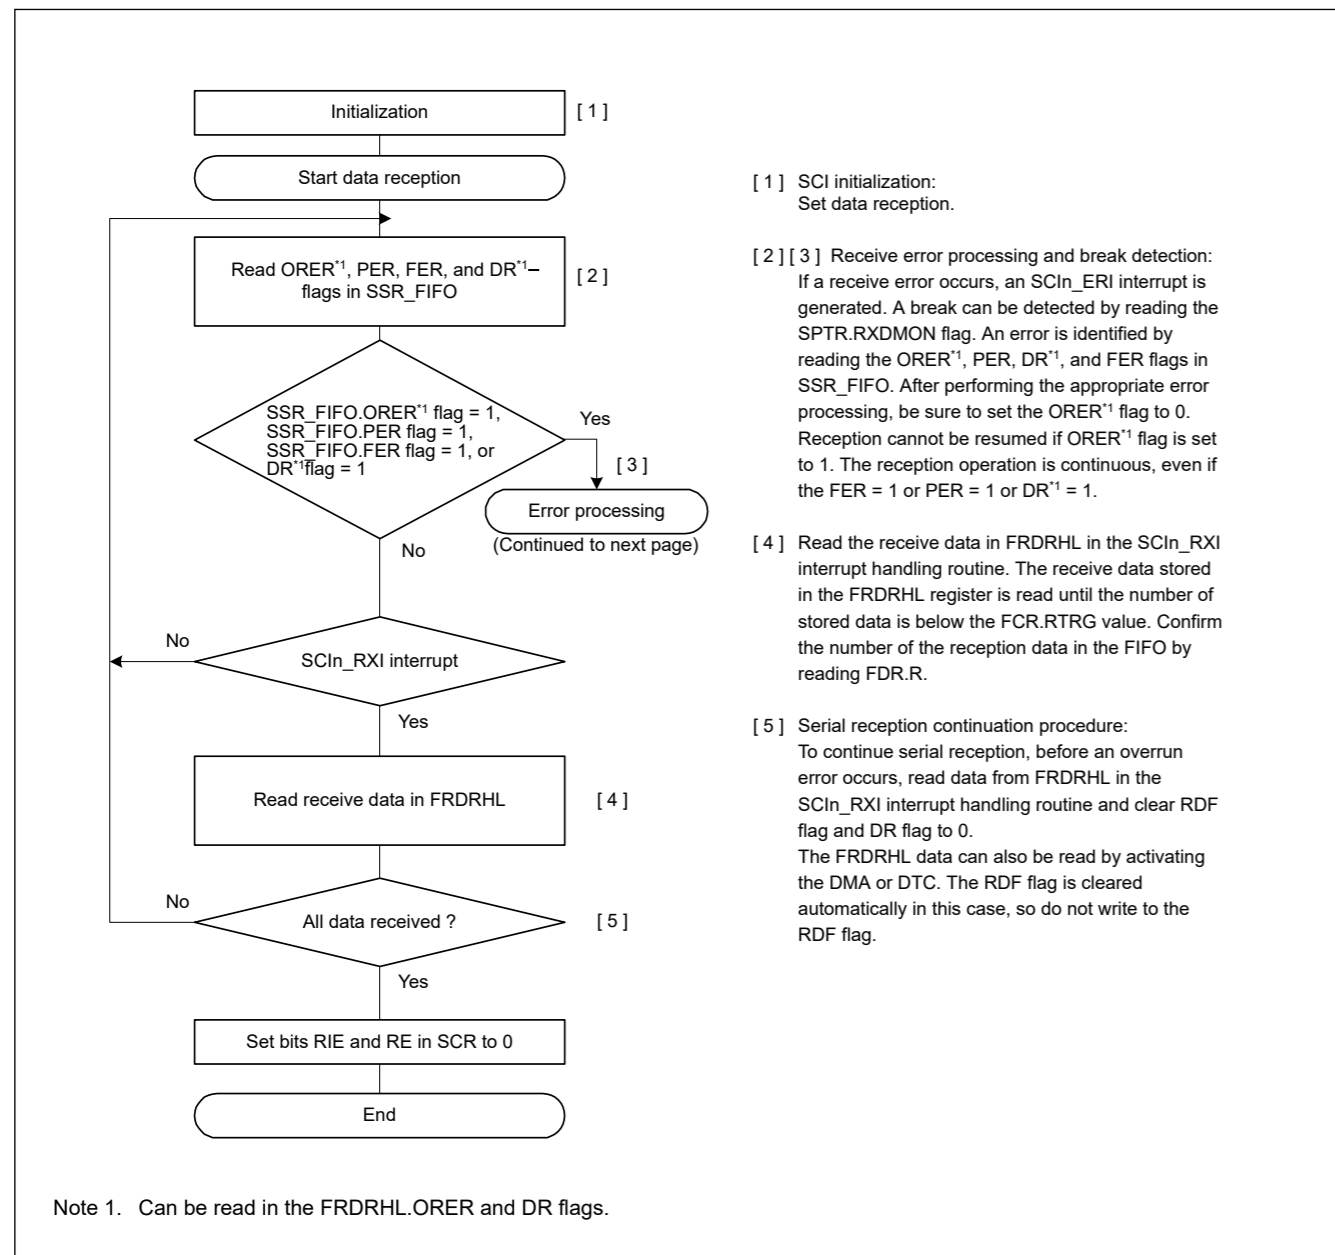

Figure 27.26 Example flow of serial reception in asynchronous mode with FIFO selected and Address Matching Enabled (1)

SCR中的SCR.RIE位为1, 产生SCIn\_RXI中断请求。在发生溢出错误之前, 通过在SCIn\_RXI中断处理程序中读取传输到FRDRL\*4寄存器的接收数据来启用连续接收。如果传送到FRDRL\*5的接收数据小于RTS触发数, CTSn\_RTsn引脚输出低电平。

- 注1.选择三个长度之一作为目标进行比较: CMPD[6:0]为7位长度, CMPD[7:0]为8位长度, CMPD[8:0]为9位长度。
- 注2.由于没有为SCIn\_AM中断分配中断使能位, 因此通过设置DCCR.DCMF to 1.
- 注3.选择9位数据长度时, 仅读取FRDRH和FRDRL寄存器中的数据。
- 注4.选择9位数据长度时, 按从FRDRH到FRDRL的顺序读取数据。
- Note5.TheSCIonlychecksforupdatetotheFRDRLregisterandnottotheFRDRHregisterwhen9-bitdatalengthisselected.

27.3.10 The function of adjust receive sampling timing (Asynchronous Mode)

When there is the difference between the rising transfer time and the falling transfer time through a photo coupler, the receive sampling timing at middle of bit affects the reception margin. In this case, the receive sampling timing is able to adjust from the middle of bit to the optimum timing by using this function.

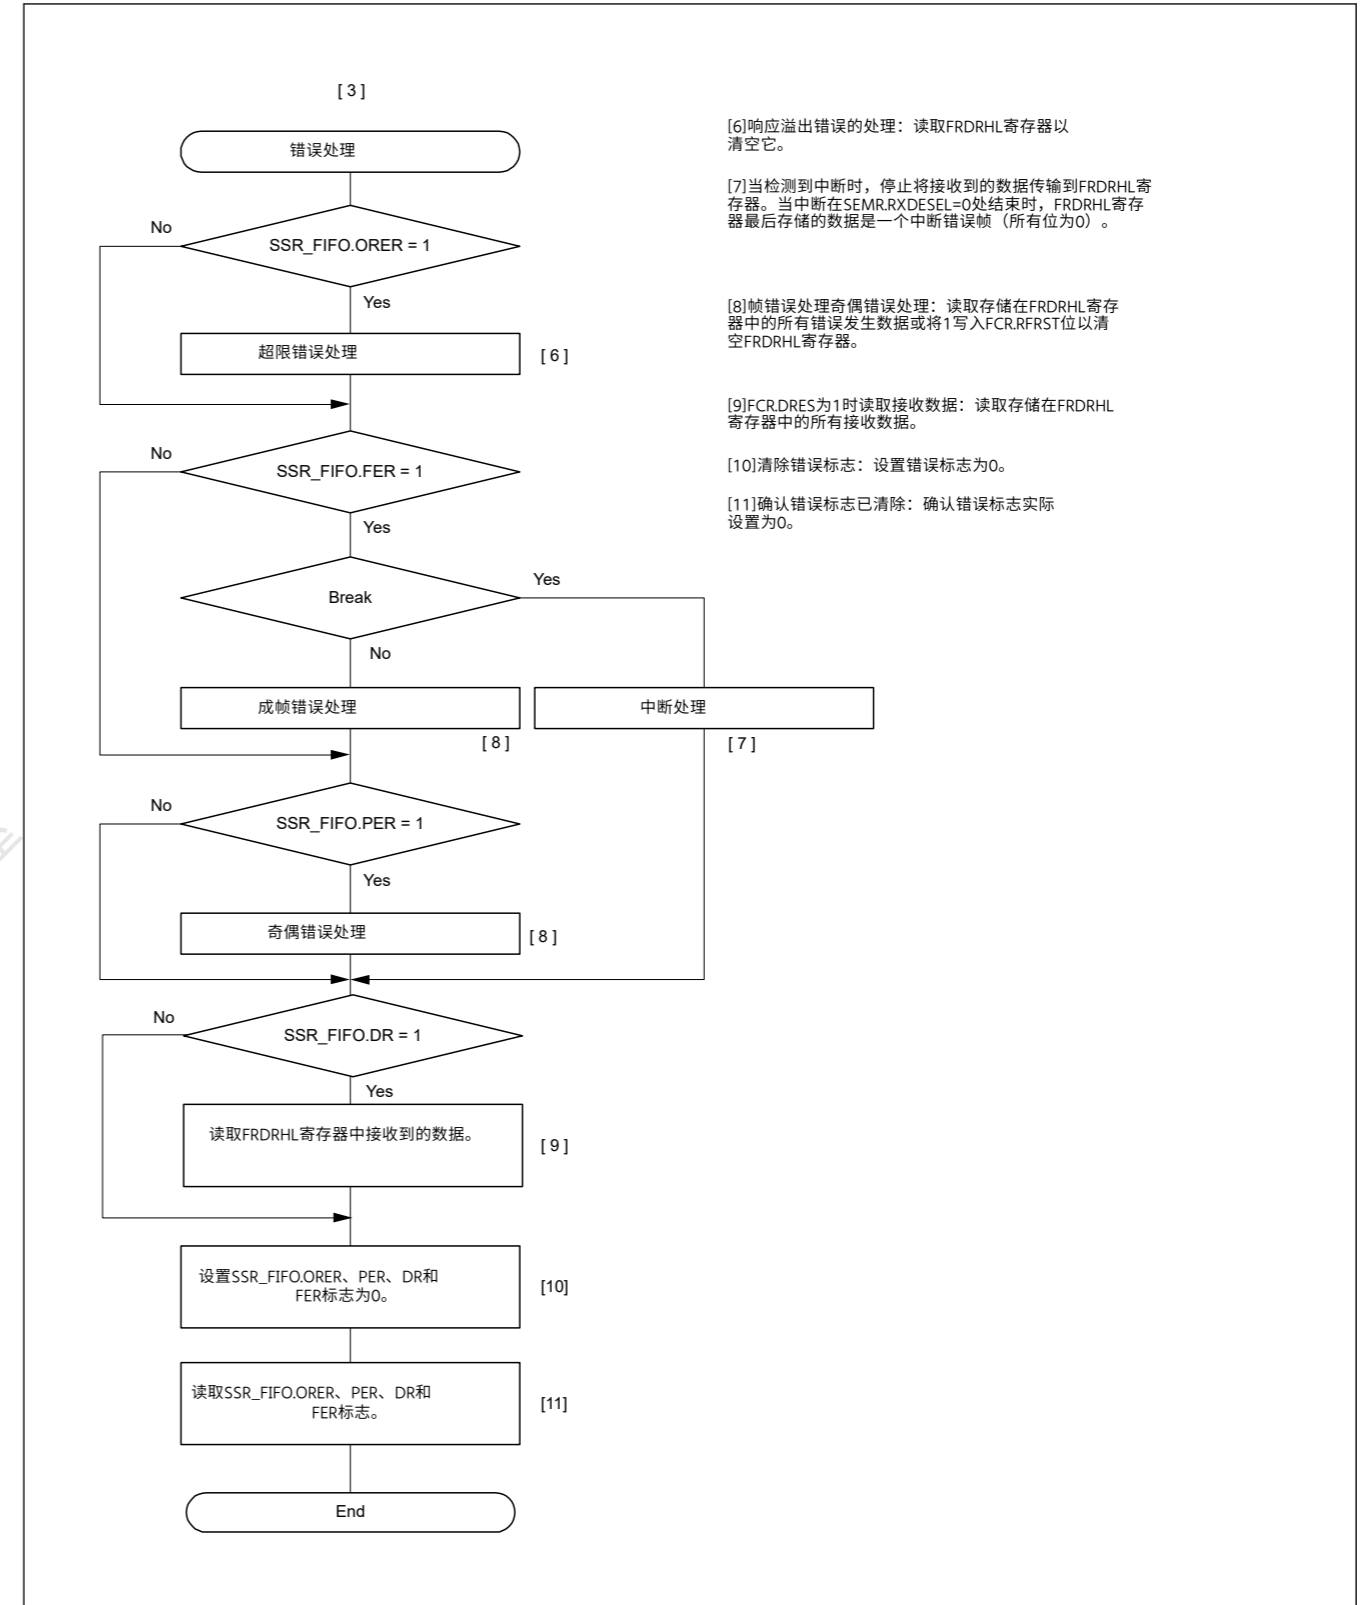

Figure 27.30 异步模式下串行接收的示例流程图（FIFO选择和地址匹配使能）(3)

27.3.10 调整接收采样定时功能（异步模式）

当通过光电耦合器的上升传输时间和下降传输时间之间存在差异时，位中间的接收采样时间会影响接收裕度。在这种情况下，接收采样时序可以通过使用该功能从比特中间调整到最佳时序。

The receive sampling timing is adjusted from the middle of bit by following formula. And the adjustable direction is set by ACTR.AJD. You can select forward or backward from the middle of bit. When adjusting backward (ACTR.AJD = 0), substitute AJD = +1 and substitute AJD = -1 when adjusting forward (ACTR.AJD = 1).

Adjusted sampling timing = the middle of bit + AJD \* (base clock \* the setting value of AST[2:0])

The setting timing is limited by base clock cycles per 1 bit. Please refer to Table 27.31 in detail.

A reception movement image figure of the communication through a photo coupler with this function is shown in Figure 27.31, Figure 27.32 and Figure 27.33, the movement explanation of this function is shown in Figure 27.34.

Please don't use this function when there is no difference between the rising transfer time and the falling transfer time, because there is a possibility of deteriorating the reception margin.

Table 27.31 The acceptable value of ACTR (asynchronous mode using internal clock)

| SEMR.ABCSE | SEMR.ABCS | The number of base clock cycles/1bit | The acceptable value of ACTR |                         |
|------------|-----------|--------------------------------------|------------------------------|-------------------------|
|            |           |                                      | ACTR.AJD                     | ACTR.AST                |
| 1          | x         | 6                                    | 0                            | 000 - 010 <sup>*1</sup> |
|            |           |                                      | 1                            |                         |
| 0          | 1         | 8                                    | 0                            | 000 - 011 <sup>*1</sup> |
|            |           |                                      | 1                            |                         |
| 0          | 0         | 16                                   | 0                            | 000 - 111               |
|            |           |                                      | 1                            |                         |

Note: x : Don't care

Note 1. When the value of ACTR.AST is over the acceptable value, sampling is done at default timing. (Adjustment of sampling is not done.)

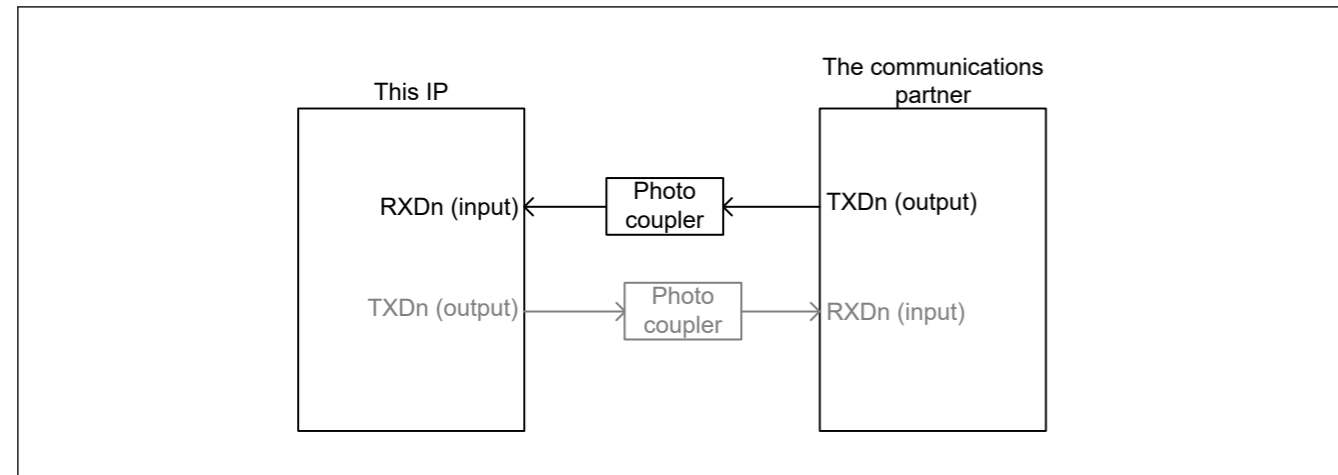

Figure 27.31 block diagram image of the reception through a photo coupler

接收采样定时通过以下公式从位中间调整。可调方向由 ACTR.AJD。您可以从位的中间选择向前或向后。向后调整时(ACTR.AJD=0)，代入AJD=+1，向前调整时代入AJD=-1(ACTR.AJD=1)。

调整后的采样时间=位中间值+AJD\*(基准时钟\*AST[2:0]的设置值)

设置时序受限于每1位的基本时钟周期。详见表27.31。

图27.31、图27.32、图27.33为具有该功能的光耦通信的接收动作图，该功能的动作说明如图27.34所示。

请不要在上升传输时间和下降传输时间没有差异时使用此功能，因为有可能恶化接收余量。

Table 27.31 ACTR的可接受值 (使用内部时钟的异步模式)

| SEMR.ABCSE | SEMR.ABCS | 基本时钟周期数1bit | ACTR的可接受值 |                         |
|------------|-----------|-------------|-----------|-------------------------|
|            |           |             | ACTR.AJD  | ACTR.AST                |
| 1          | x         | 6           | 0         | 000 - 010 <sup>*1</sup> |
|            |           |             | 1         |                         |
| 0          | 1         | 8           | 0         | 000 - 011 <sup>*1</sup> |
|            |           |             | 1         |                         |
| 0          | 0         | 16          | 0         | 000 - 111               |
|            |           |             | 1         |                         |

Note: x : Don't care

注1.当ACTR.AST的值超过可接受的值时，将在默认时间进行采样。(未进行采样调整。)

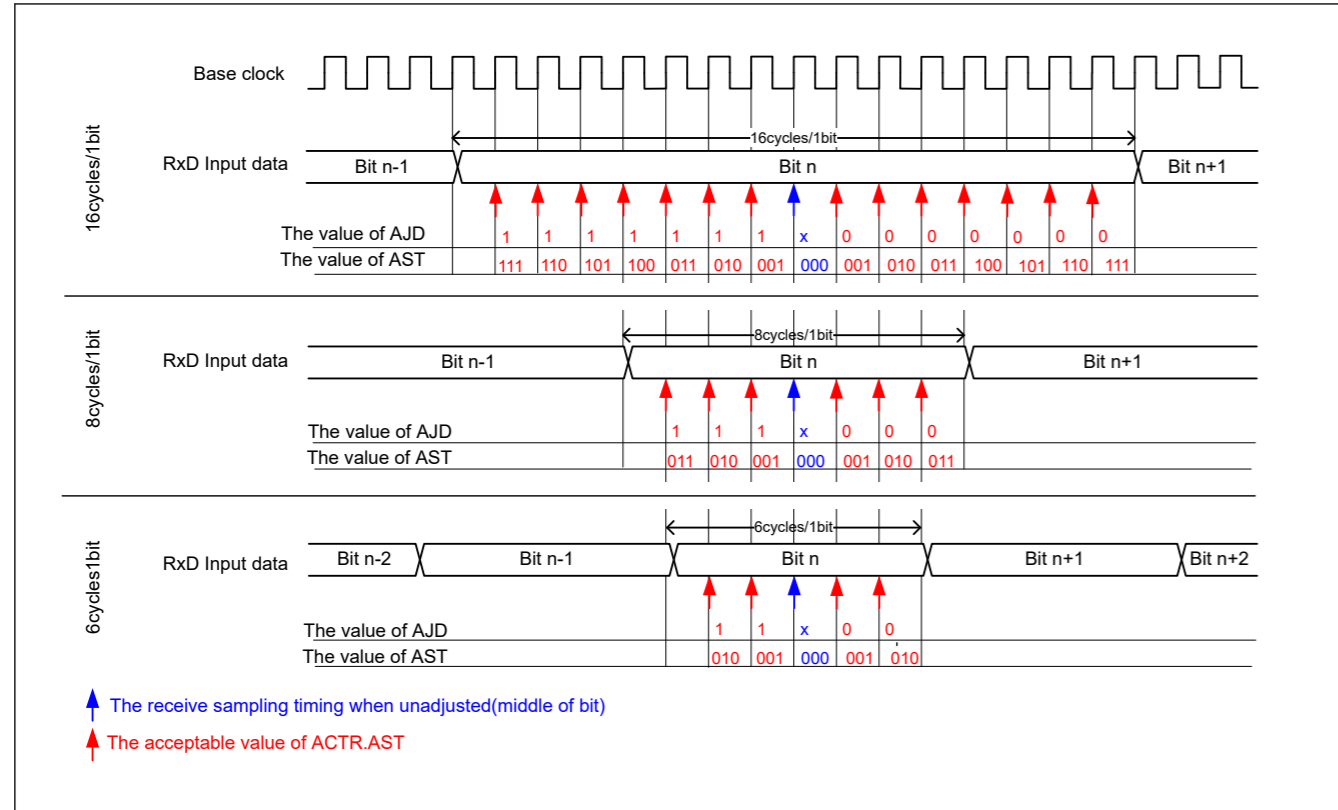

Figure 27.34 The adjustment operation explanation for the receive sampling timing (asynchronous mode using internal clock)

27.3.11 The function of adjust transmit timing (Asynchronous Mode)

In communication via a photo coupler or the like, when either the rising or falling transition time of the TXD output signal is long, then a communication partner receive dulled waveform. In this case, the reception margin may be affected.

In these cases, make a communication partner to be sampling at middle of bit using the function of adjust transmit timing.

When SPTR.ATEN is 1, this function can adjust the edge timing at the timing calculated by the following formula for the edge set with ACTR.AET.

$$\text{The adjustment edge timing} = \text{the base clock} * \text{ACTR.ATT}[2:0]$$

In addition, the upper limit of the adjustment edge timing is limited by setting the base clock cycles. Refer to Table 27.32 in details.

A transmission movement image figure of the communication through a photo coupler with this function is shown in Figure 27.35, Figure 27.36 and Figure 27.37, the movement explanation of this function is shown in Figure 27.38 and Figure 27.39.

Please don't use this function when there is not the difference between the rising transfer time and the falling transfer time, there is a possibility of deteriorating the reception margin of a communication partner.

Table 27.32 The acceptable value of ACTR.AET and ACTR.ATT (asynchronous mode using internal clock) (1 of 2)

| ABCSE | ABCS | The number of base clock cycles/1bit | The acceptable value of ACTR |           |
|-------|------|--------------------------------------|------------------------------|-----------|
|       |      |                                      | AET                          | ATT[2:0]  |
| 1     | x    | 6                                    | 0                            | 000 – 101 |
|       |      |                                      | 1                            |           |
| 0     | 1    | 8                                    | 0                            | 000 – 111 |
|       |      |                                      | 1                            |           |

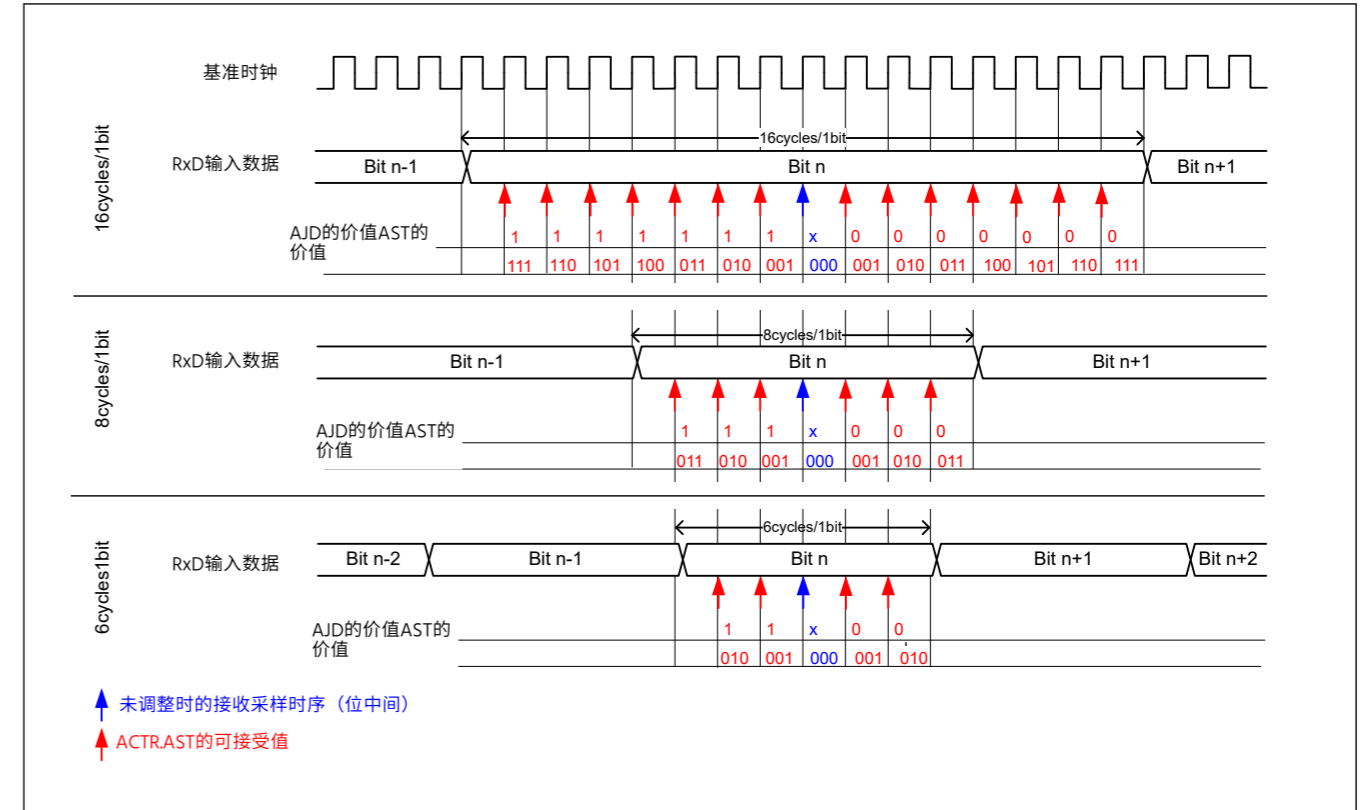

Figure 27.34 接收采样时序调整操作说明 (使用内部时钟的异步模式)

27.3.11 调整发送时间的功能 (异步模式)

在经由光电耦合器等的通信中，当TXD输出信号的上升或下降过渡时间较长时，通信伙伴接收到钝化的波形。在这种情况下，接收裕量可能会受到影响。

在这些情况下，使用调整发送时间的功能使通信伙伴在位中间进行采样。

当SPTR.ATEN为1时，该功能可以在ACTR.AET设置的边沿通过以下公式计算的时序调整边沿时序。

$$\text{调整边沿时序} = \text{基准时钟} * \text{ACTR.ATT}[2:0]$$

另外，调整边沿时序的上限是通过设置基本时钟周期来限制的。详见表27.32。

图27.35、图27.36和图27.37所示为具有该功能的光电耦合器通信的传输动作图，该功能的动作说明如图27.38和图27.39所示。

请不要在上升传输时间和下降传输时间之间没有差异时使用此功能，这可能会降低通信伙伴的接收裕度。

Table 27.32 ACTR.AET和ACTR.ATT的可接受值 (使用内部时钟的异步模式) (1of2)

| ABCSE | ABCS | 基本时钟周期数1bit | ACTR的可接受值 |           |
|-------|------|-------------|-----------|-----------|
|       |      |             | AET       | ATT[2:0]  |
| 1     | x    | 6           | 0         | 000 – 101 |
|       |      |             | 1         |           |
| 0     | 1    | 8           | 0         | 000 – 111 |

## 27.4 Multi-Processor Communication Function

The multi-processor communication function enables the SCI to transmit and receive data between multiple processors by sharing an asynchronous serial communication line that has an added multi-processor bit. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station.

The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle:

- When the multi-processor bit is set to 1, the transmission cycle is the ID transmission cycle
- When the multi-processor bit is set to 0, the transmission cycle is the data transmission cycle

Figure 27.40 shows an example of communication between processors using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1 is added to the ID code of the receiving station. Next, the transmitting station transmits communication data in which the multi-processor bit set to 0 is added to the transmit data. After receiving communication data with the multi-processor bit set to 1, the receiving station compares the received ID with the ID of the receiving station itself. If the two match, the receiving station receives communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until it receives data in which the multi-processor bit is set to 1.

### (1) Non-FIFO selected

To support this function, the SCI provides the SCR.MPIE bit. When the MPIE bit is set to 1, the following operations are disabled until the reception of data in which the multi-processor bit is set to 1:

- Transfer of receive data from the RSR register to the RDR register (the RDRHL register when 9-bit data length is selected)
- Detection of a receive error

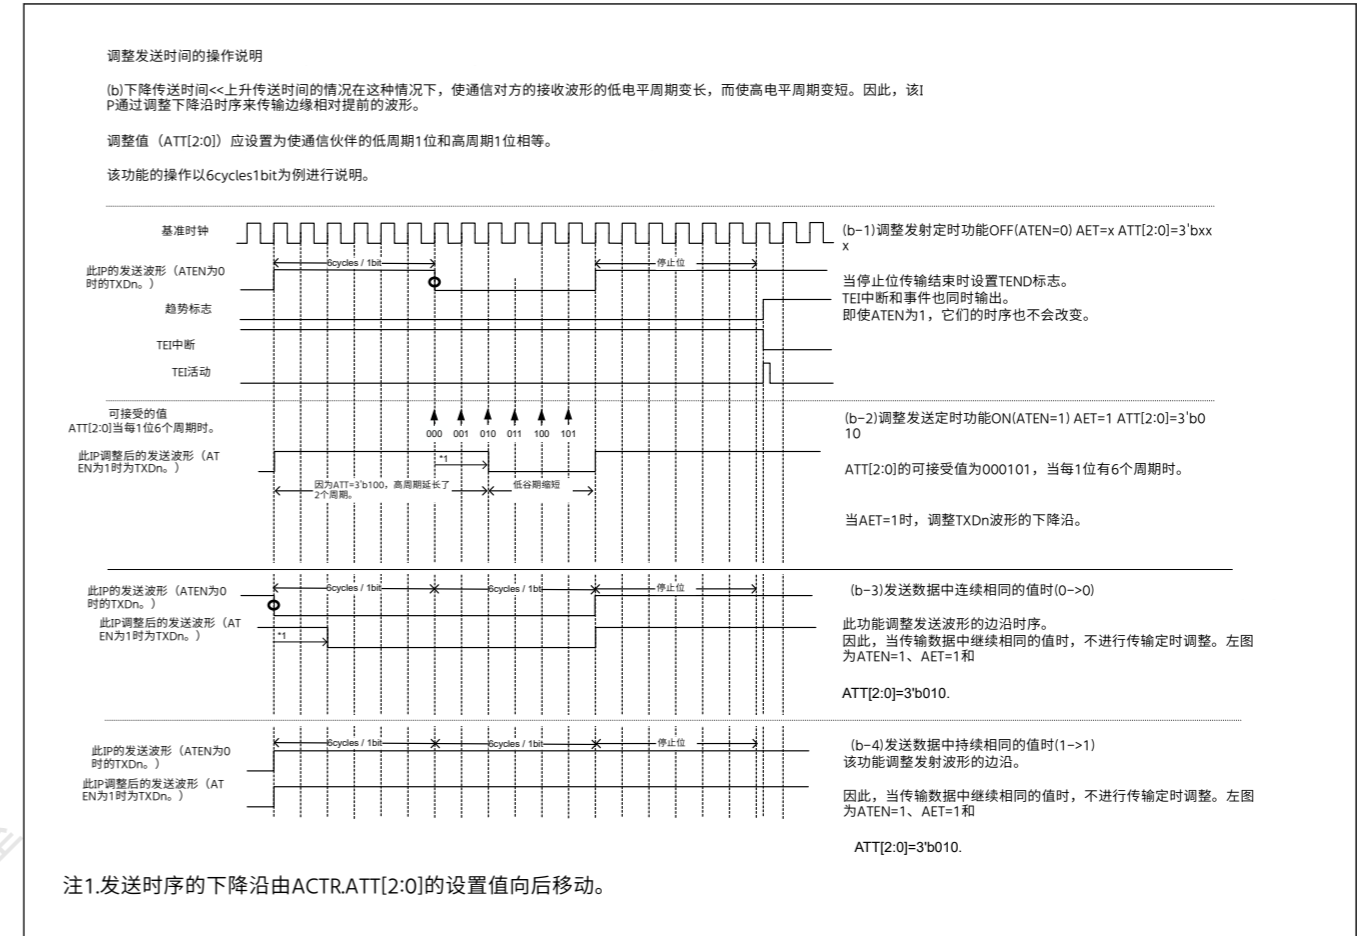

Figure 27.39 AET为1时发射时序调整操作说明

## 27.4 多处理器通信功能

多处理器通信功能使SCI能够通过共享一条增加了多处理器位的异步串行通信线路在多个处理器之间发送和接收数据。在多处理器通信中,为每个接收站分配一个唯一的ID代码。串行通信周期由指定接收站的ID传输周期和向指定接收站传输数据的数据传输周期组成。

多处理器位用于区分ID传输周期和数据传输周期:

- 当多处理器位设置为1时,传输周期为ID传输周期
- 当多处理器位设置为0时,传输周期为数据传输周期

图27.40显示了使用多处理器格式的处理器之间的通信示例。首先,发送站发送将设置为1的多处理器位添加到接收站的ID码的通信数据。接着,发送站发送在发送数据中附加了多处理器比特为0的通信数据。接收站接收到多处理器位设置为1的通信数据后,将接收到的ID与接收站自身的ID进行比较。如果两者匹配,则接收站接收随后发送的通信数据。如果接收到的ID与接收站的ID不匹配,则接收站跳过通信数据,直到接收到多处理器位设置为1的数据。

### (1) Non-FIFO selected

为了支持这个功能,SCI提供了SCR.MPIE位。当MPIE位设置为1时,以下操作被禁止,直到接收到多处理器位设置为1的数据:

- 将接收数据从RSR寄存器传送到RDR寄存器(选择9位数据长度时的RDRHL寄存器)
- 接收错误检测

- Setting of the respective RDRF, ORER, and FER status flags in the SSR register

When the SCI receives a character in which the multi-processor bit is set to 1, the SSR.MPBT bit is set to 1 and the SCR.MPIE bit is automatically cleared, returning the SCI to normal reception operation. If the SCR.RIE bit is set to 1, an SCIn\_RXI interrupt is generated.

When the multi-processor format is specified, the parity bit function is disabled. Apart from this, there is no difference from operation in normal asynchronous mode. The clock used for the multi-processor communication is the same as the clock used in normal asynchronous mode.

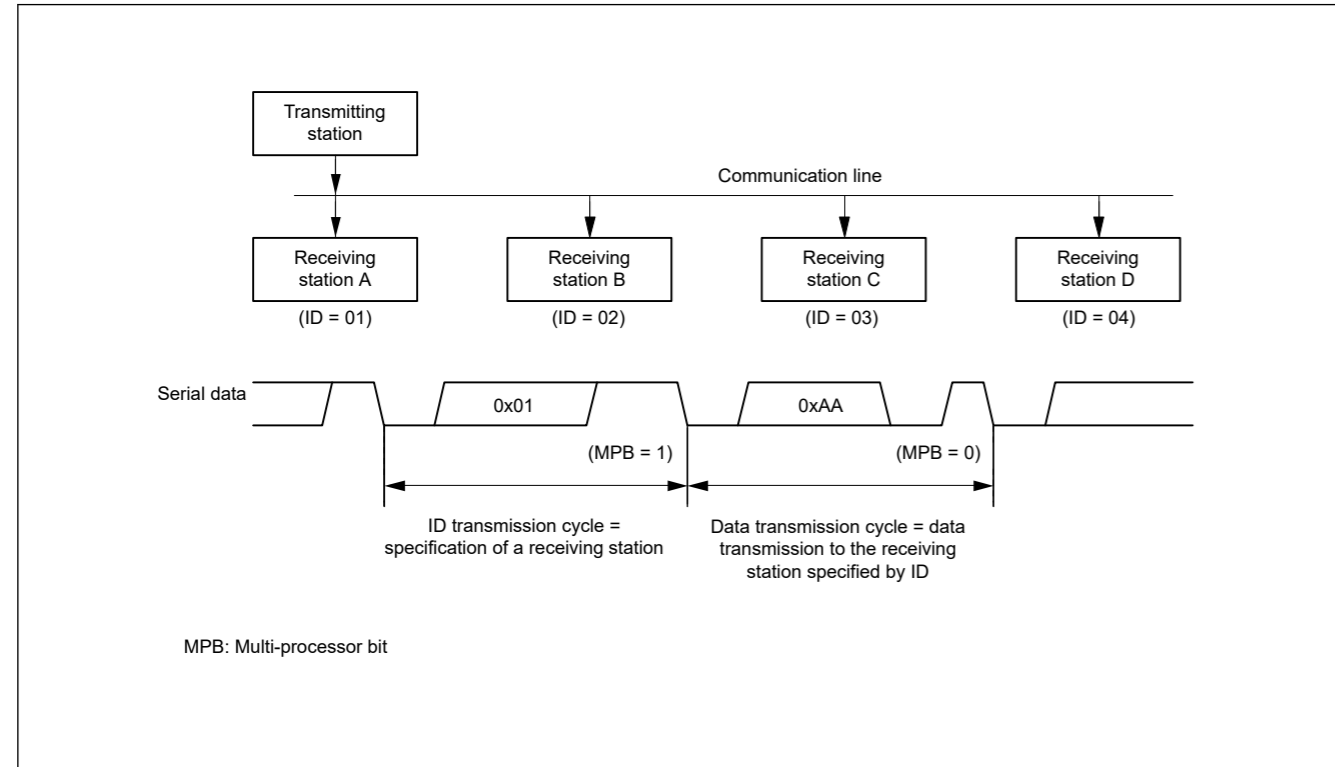

Figure 27.40 Example of communication using multi-processor format with transmission of data 0xAA to receiving station A

#### (2) FIFO selected

For data transmission, software must write data to FTDRHL.MPBT that corresponds to transmit data in FTDRHL.TDAT. For data reception, the multi-processor bit that is part of the receive data is written to FTDRHL.MPB and receive data is written to FRDRL.

When the MPIE bit is set to 1, the following operations are disabled until reception of data in which the multi-processor bit is set to 1:

- Transfer of receive data from the RSR register to the FRDRHL register
- Detection of a receive error
- Break
- Setting of the respective RDF, ORER, and FER status flags in the SSR\_FIFO register

When the SCI receives an 8-bit character in which the multi-processor bit is set to 1, the FTDRHL.MPB bit is set to 1 and receive data is written to FRDRHL.RDAT. The SCR.MPIE bit is automatically cleared, returning the SCI to normal reception operation. If the SCR.RIE bit is set to 1, an SCIn\_RXI interrupt is generated.

When the multi-processor format is specified, the parity bit function is disabled. Apart from this, there is no difference from operation in normal asynchronous mode with non-FIFO selected.

### 27.4.1 Multi-Processor Serial Data Transmission

#### (1) Non-FIFO selected

- 在SSR寄存器中设置相应的RDRF、ORER和FER状态标志

当SCI接收到多处理器位设置为1的字符时，SSR.MPBT位设置为1，并且SCR.MPIE位自动清零，使SCI恢复正常接收操作。如果SCR.RIE位设置为1，则SCIn\_RXI中断产生。

当指定多处理器格式时，奇偶校验位功能被禁用。除此之外，与正常异步模式下的操作没有区别。用于多处理器通信的时钟与正常异步模式下使用的时钟相同。

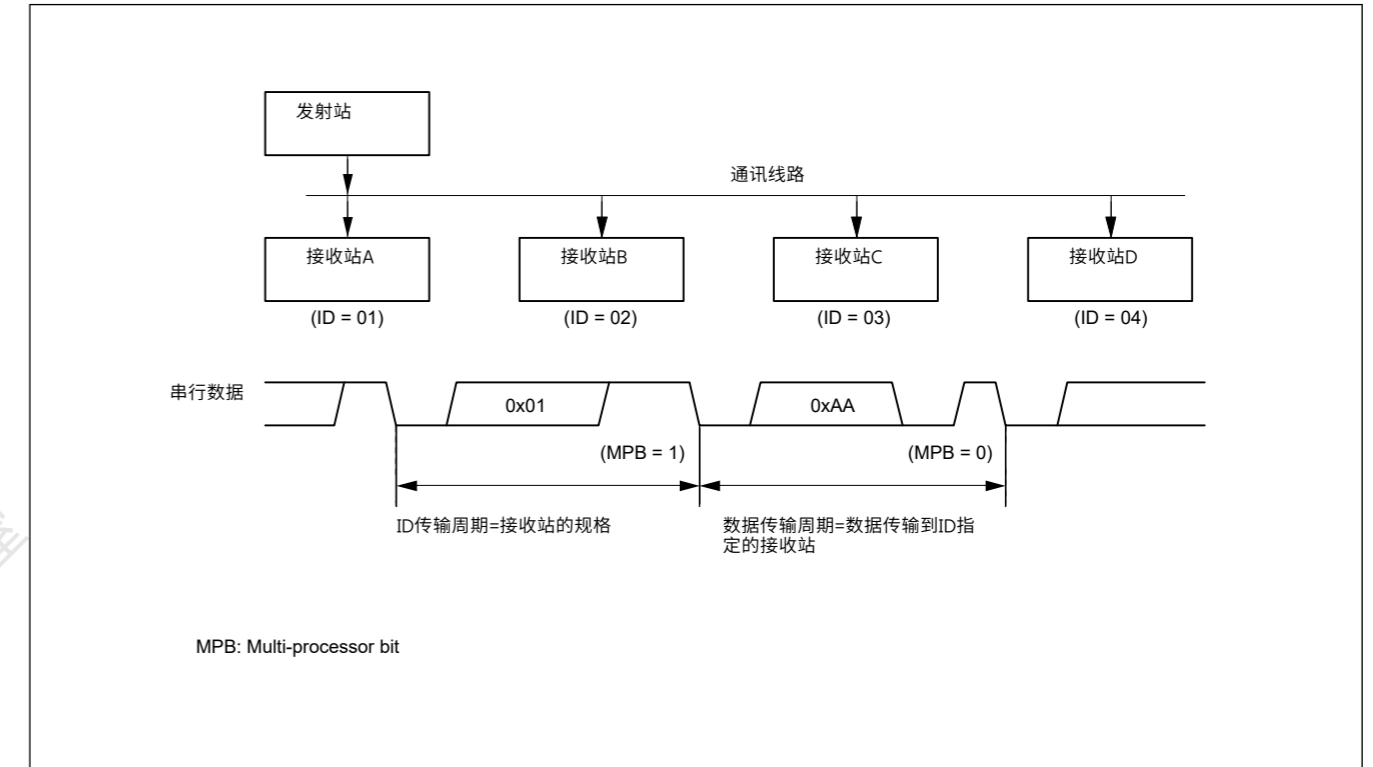

Figure 27.40 使用多处理器格式的通信示例，将数据0xAA传输到接收站A

#### (2) FIFO selected

对于数据传输，软件必须将数据写入与FTDRHL.TDAT中的传输数据相对应的FTDRHL.MPBT。对于数据接收，作为接收数据一部分的多处理器位被写入FTDRHL.MPB，接收数据被写入FRDRL。

当MPIE位设置为1时，以下操作被禁止，直到接收到多处理器位设置为1的数据：

- 将接收数据从RSR寄存器传送到FRDRHL寄存器
- 接收错误检测
- Break
- 在SSR\_FIFO寄存器中设置相应的RDF、ORER和FER状态标志

当SCI接收到多处理器位设置为1的8位字符时，FTDRHL.MPB位设置为1，接收数据写入FRDRHL.RDAT。SCR.MPIE位自动清零，使SCI恢复正常接收操作。如果SCR.RIE位设置为1，则会产生SCIn\_RXI中断。

当指定多处理器格式时，奇偶校验位功能被禁用。除此之外，与选择非FIFO的正常异步模式下的操作没有区别。

### 27.4.1 多处理器串行数据传输

#### (1) Non-FIFO selected

Figure 27.41 shows an example flow of multi-processor data transmission. In the ID transmission cycle, the ID must be transmitted with the SSR.MPBT bit set to 1. In the data transmission cycle, the data must be transmitted with the MPBT bit set to 0. The rest of the operations are the same as operations in asynchronous mode. Write the values in the order of the FTDRH register then the FTDRL register.

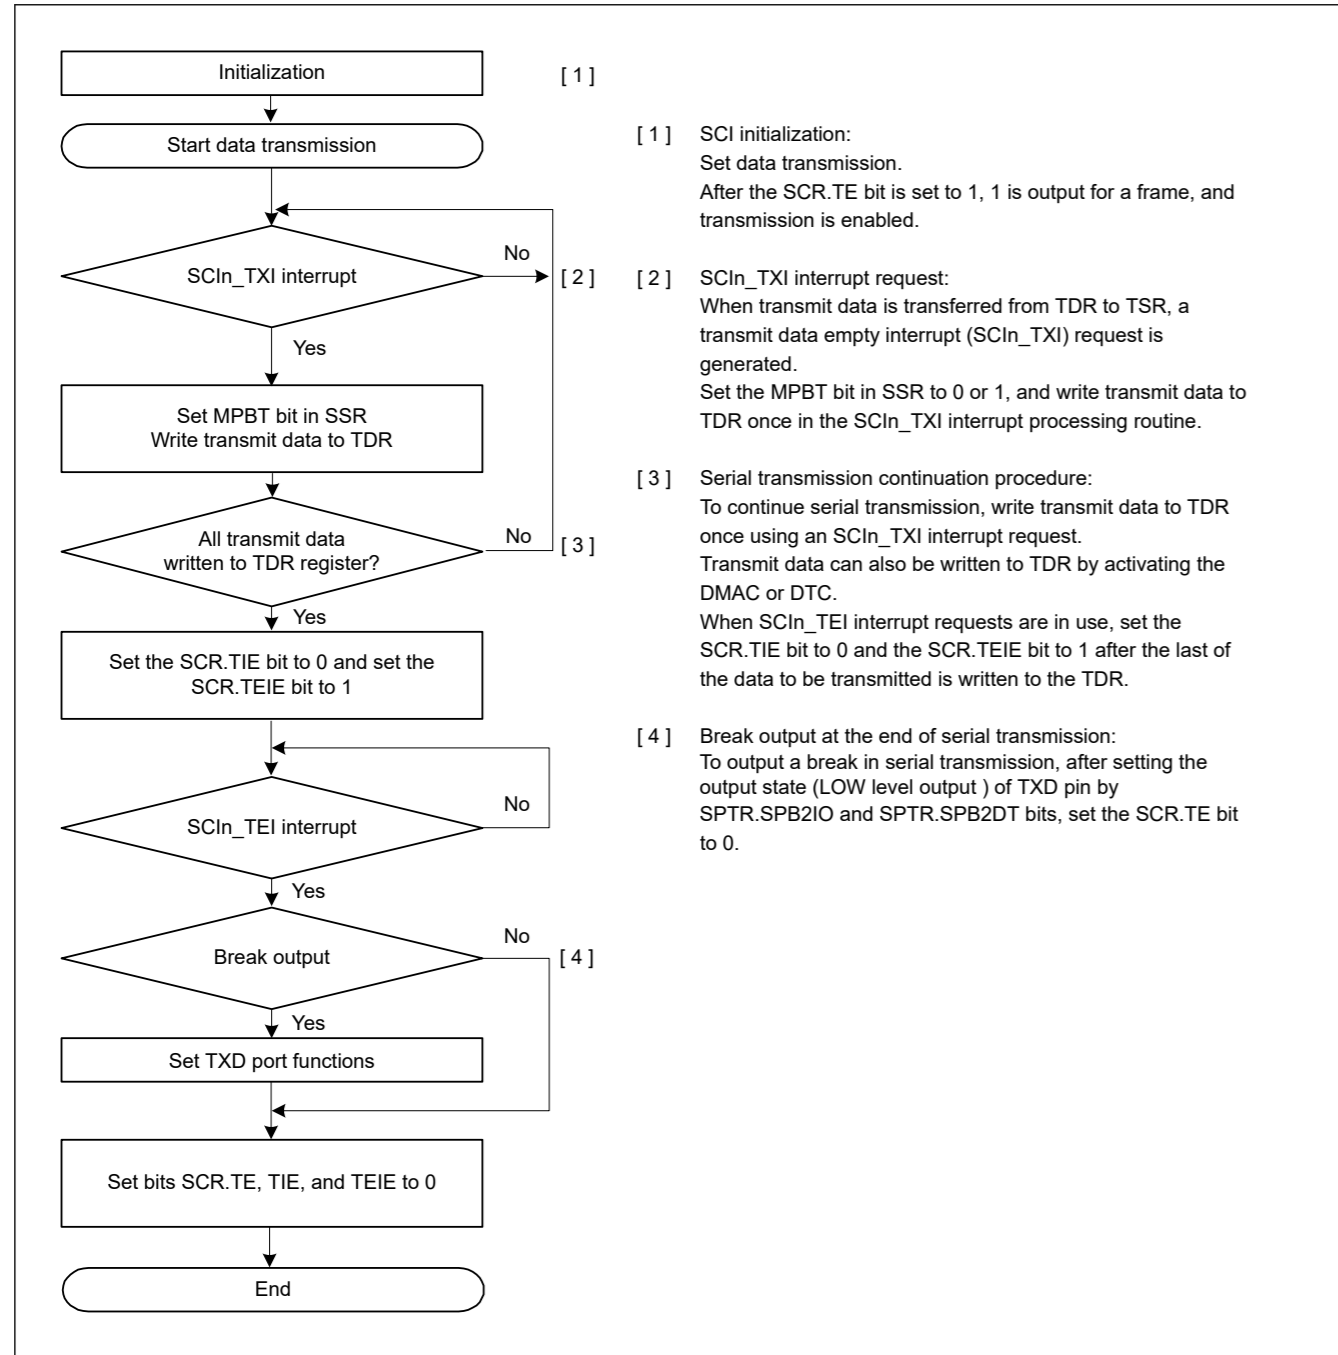

Figure 27.41 Example flow of multi-processor serial transmission with non-FIFO selected

(2) FIFO selected

Figure 27.42 shows an example of data format that is written to FTDRH and FTDRL in multi-processor mode. The FTDRH.MPBT bit is set to 1. Data is set to FTDRH and FTDRL with the correct data length. Write 0 for unused bits. Write in order from FTDRH to FTDRL.

图27.41显示了一个多处理器数据传输的示例流程。在ID传输周期，ID必须在SSR.MPBT位设置为1的情况下传输。在数据传输周期，数据必须在MPBT位设置为0的情况下传输。其余操作与操作相同在异步模式下。按照FTDRH寄存器然后FTDRL寄存器的顺序写入值。

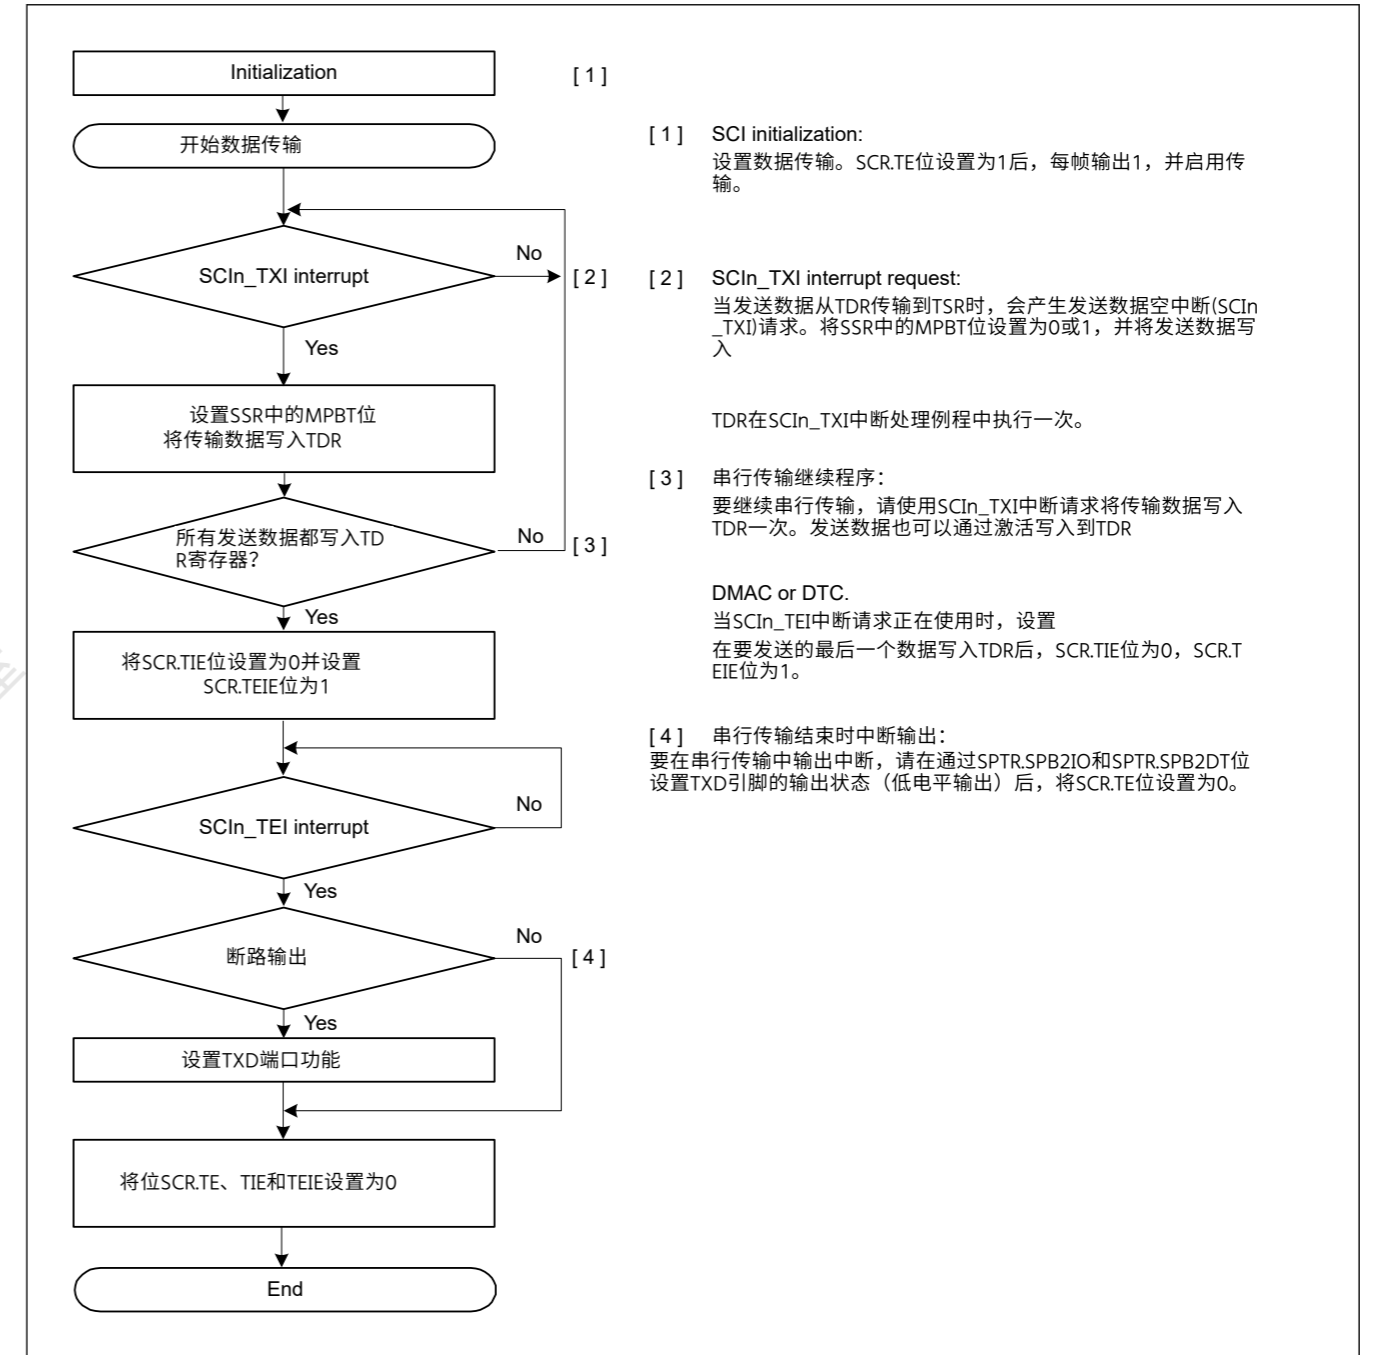

Figure 27.41 选择非FIFO的多处理器串行传输示例流程

(2) FIFO selected

图27.42显示了在多处理器模式下写入FTDRH和FTDRL的数据格式示例。这 FTDRH.MPBT位设置为1。数据设置为具有正确数据长度的FTDRH和FTDRL。为未使用的位写入0。从FTDRH到FTDR L的顺序写。

| Data Length | Register Setting |            | Transmit data in FTDRH, FTDRL |     |     |     |     |     |      |    |       |    |    |    |    |    |    |    |
|-------------|------------------|------------|-------------------------------|-----|-----|-----|-----|-----|------|----|-------|----|----|----|----|----|----|----|
|             | SCMR. CHR1       | SMR. CHR   | FTDRHL                        |     |     |     |     |     |      |    |       |    |    |    |    |    |    |    |
|             |                  |            | FTDRH                         |     |     |     |     |     |      |    | FTDRL |    |    |    |    |    |    |    |
|             |                  |            | b15                           | b14 | b13 | b12 | b11 | b10 | b9   | b8 | b7    | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7 bits      | 1                | 0          | -                             | -   | -   | -   | -   | -   | MPBT | -  | -     | -  | -  | -  | -  | -  | -  | -  |
| 8 bits      | 1                | 1          | -                             | -   | -   | -   | -   | -   | MPBT | -  | -     | -  | -  | -  | -  | -  | -  | -  |
| 9 bits      | 0                | Don't care | -                             | -   | -   | -   | -   | -   | MPBT | -  | -     | -  | -  | -  | -  | -  | -  | -  |

Note: -: Invalid. The write value should be 0.

Figure 27.42 Data format written to FTDRH and FTDRL in multi-processor mode with FIFO selected

Figure 27.43 shows an example flow of multi-processor serial transmission with FIFO selected. In the ID transmission cycle, the ID must be transmitted with the FTDRH.MPBT bit set to 1. In the data transmission cycle, the data must be transmitted with the MPBT bit set to 0. The rest of the operations are the same as operations in asynchronous mode with non-FIFO selected.

| 数据长度   | 寄存器设置      |            | 在FTDRH、FTDRL中传输数据 |     |     |     |     |     |      |    |       |    |    |    |    |    |    |    |

| 9 bits | 0          | Don't care | -                 | -   | -   | -   | -   | -   | MPBT | -  | -     | -  | -  | -  | -  | -  | -  | -  |

Note: -: 无效的。写入值应为0。

Figure 27.42 在选择FIFO的多处理器模式下写入FTDRH和FTDRL的数据格式

图27.43显示了选择FIFO的多处理器串行传输示例流程。在ID传输周期中，必须在FTDRH.MPBT位设置为1的情况下传输ID。在数据传输周期中，必须在MPBT位设置为0的情况下传输数据。其余操作与操作相同在异步模式下选择非FIFO。

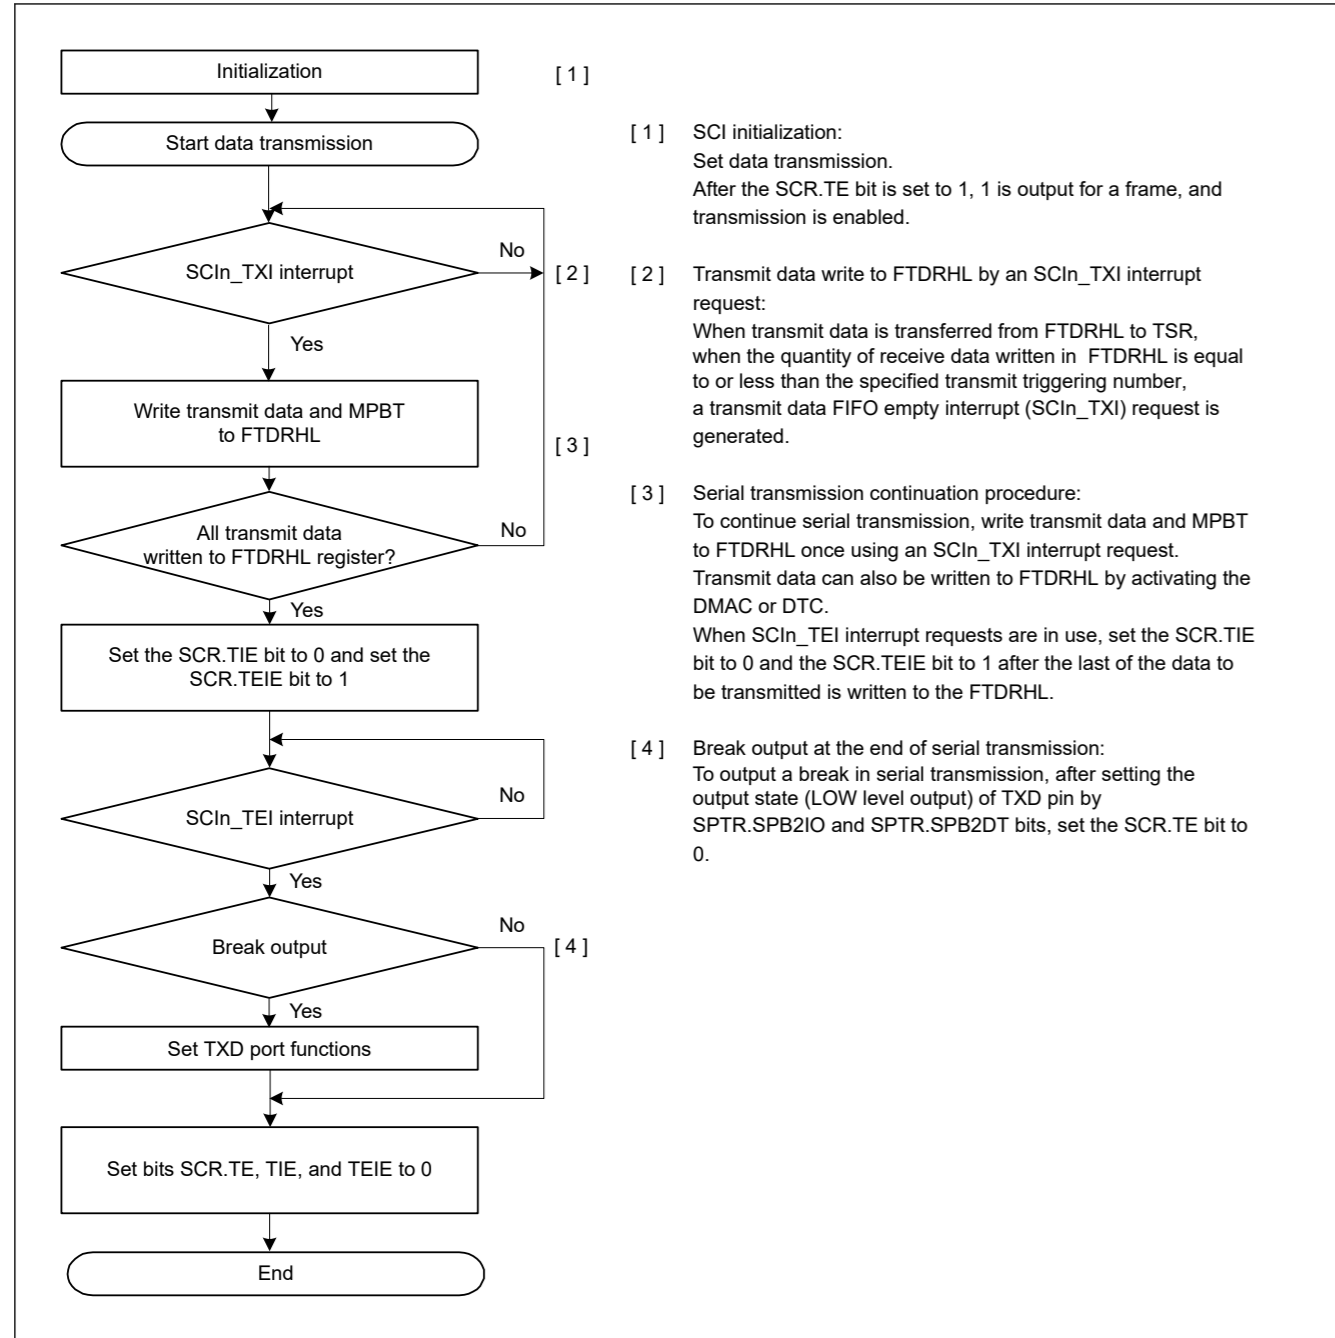

Figure 27.43 Example flow of serial transmission in multi-processor mode with FIFO selected

### 27.4.2 Multi-Processor Serial Data Reception

(1) Non-FIFO selected

Figure 27.45 and Figure 27.46 are example flows of multi-processor serial reception. When the SCR.MPIE bit is set to 1, reading communication data is skipped until reception of communication data in which the multi-processor bit is set to 1. When communication data in which the multi-processor bit is set to 1 is received, the received data is transferred to the RDR register (the RDRHL register when 9-bit data length is selected), and the SCIn\_RXI interrupt request is generated. The rest of the operations are the same as operations in asynchronous mode. Read the order from FRDRH to FRDRL.

Figure 27.44 shows an example operation for data reception.

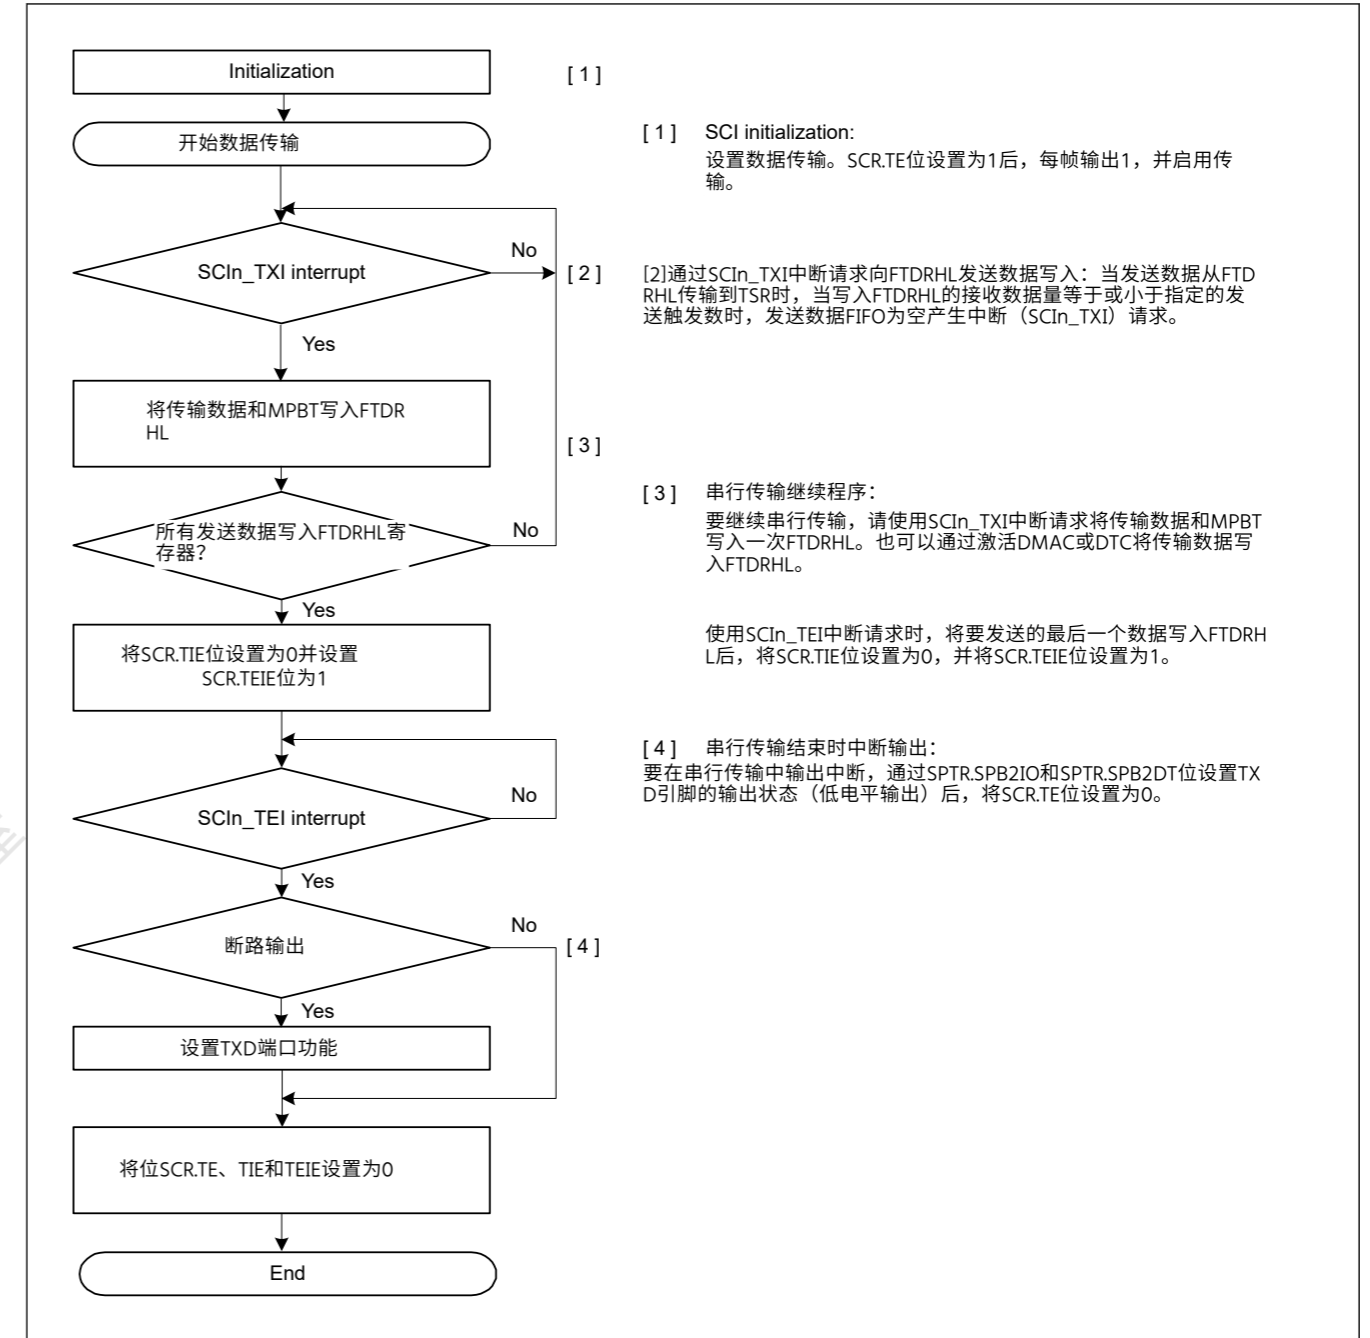

Figure 27.43 选择FIFO的多处理器模式下的串行传输示例流程

### 27.4.2 多处理器串行数据接收

(1) Non-FIFO selected

图27.45和图27.46是多处理器串行接收的示例流程。当SCR.MPIE位设置为1时，将跳过读取通信数据，直到接收到多处理器位设置为1的通信数据。当接收到多处理器位设置为1的通信数据时，接收到的数据被传输到

RDR寄存器（选择9位数据长度时的RDRHL寄存器），并产生SCIn\_RXI中断请求。其余操作与异步模式下的操作相同。读取从FRDRH到FRDRL的订单。

图27.44显示了数据接收的示例操作。

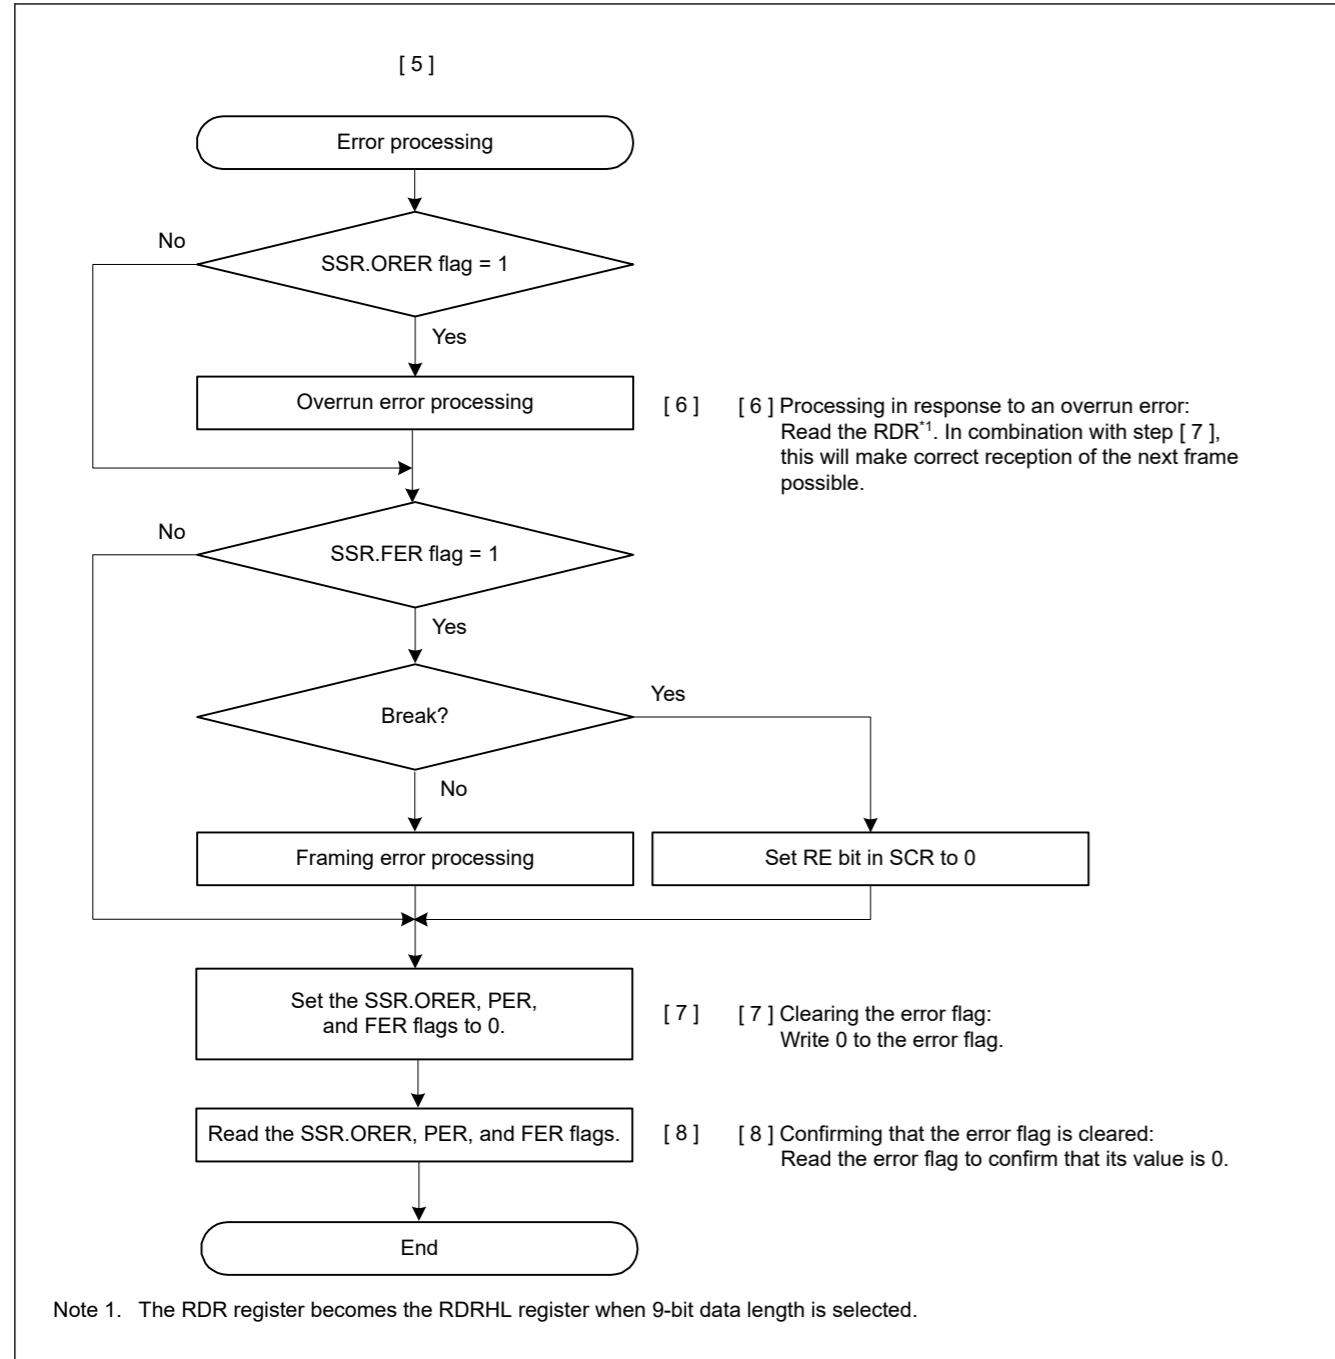

Figure 27.46 Example flow of multi-processor serial reception with non-FIFO selected (2)

(2) FIFO selected

Figure 27.47 shows an example of a data format that is written to FRDRH and FRDRL in multi-processor mode.

In multi-processor mode, the MPB value that is a part of the receive data is written to the FRDRH.MPB bit. A value of 0 is written to the FRDRH.PER flag. Data is written to FRDRH and FRDRL with the correct data length. Unused bits are written with 0. Read in order from FRDRH to FRDRL. When software reads the FRDRL register, the SCI updates FER, MPB, and receive data (RDAT[8:0]) in FRDRL with the next data. The RDF, ORER and DR flags in the FRDRH register always reflect the associated flags in the SSR\_FIFO register.

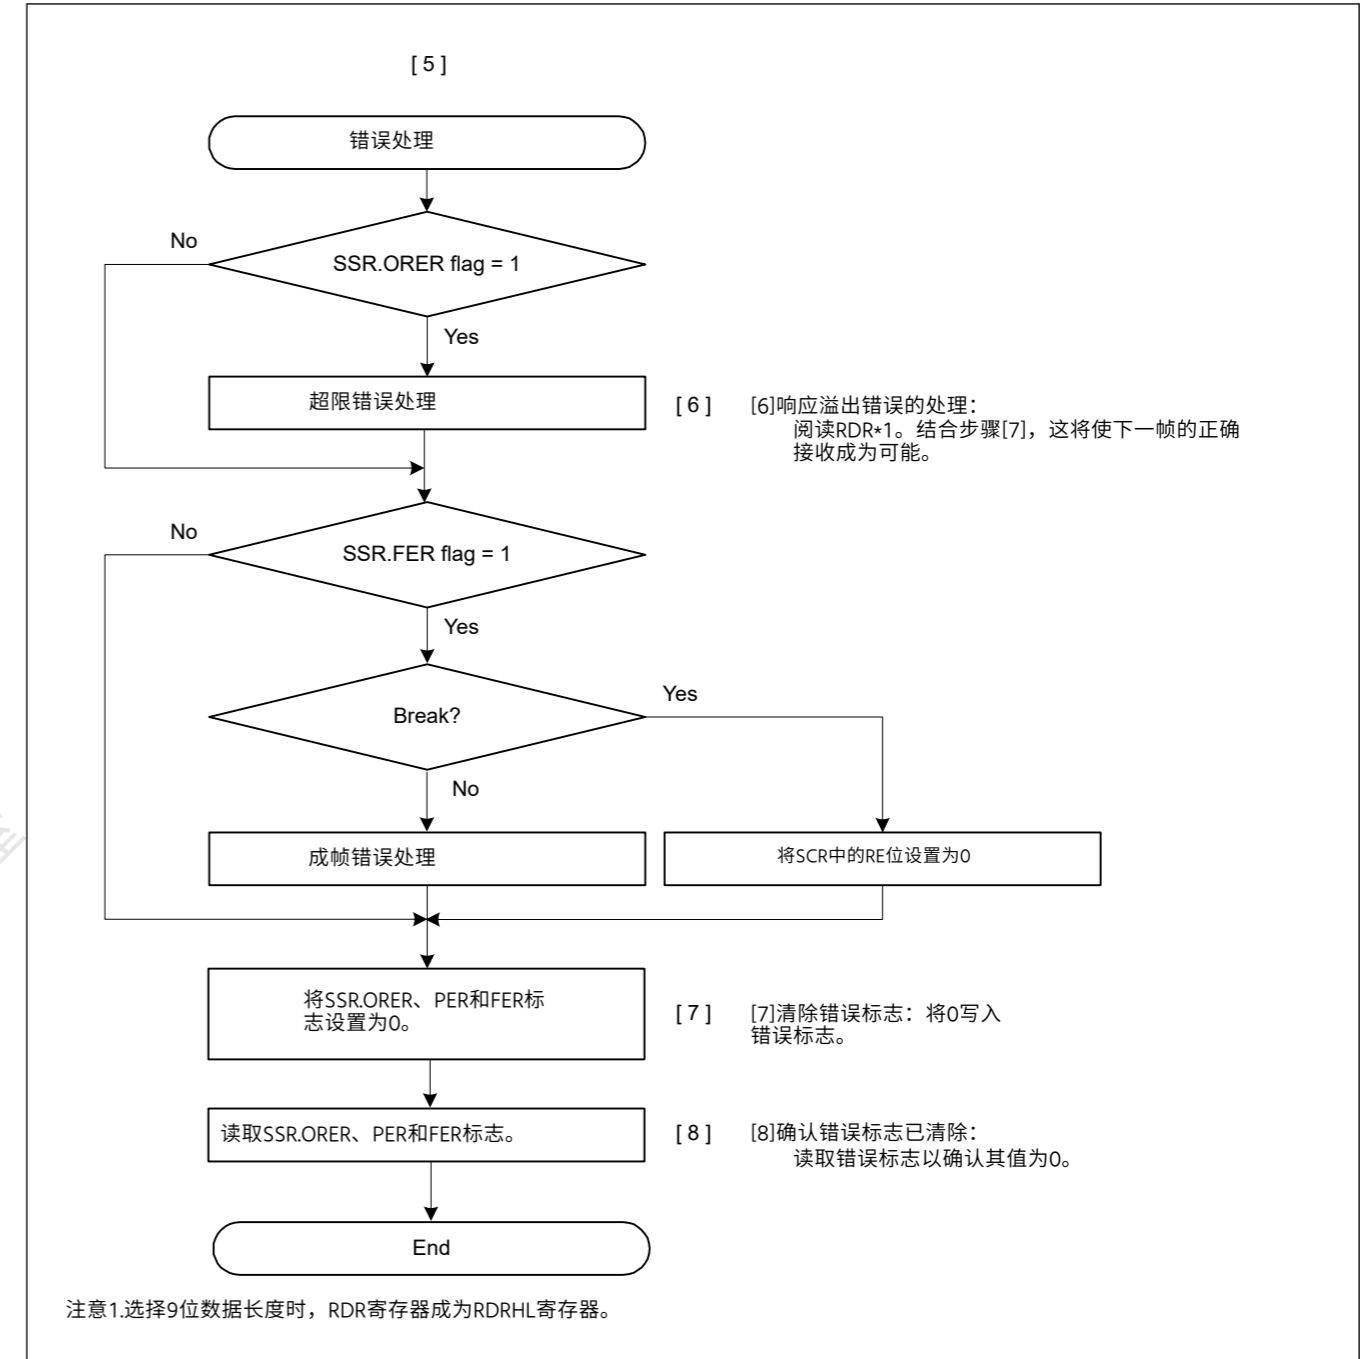

Figure 27.46 选择非FIFO的多处理器串行接收示例流程(2)

(2) FIFO selected

图27.47显示了在多处理器模式下写入FRDRH和FRDRL的数据格式示例。

在多处理器模式下，作为接收数据一部分的MPB值被写入FRDRH.MPB位。值0写入FRDRH.PER标志。数据以正确的数据长度写入FRDRH和FRDRL。未使用的位写入0。按从FRDRH到FRDRL的顺序读取。当软件读取FRDRL寄存器时，SCI用下一个数据更新FER、MPB和FRDRL中的接收数据 (RDAT[8:0])。FRDRH寄存器中的RDF、ORER和DR标志始终反映SSR\_FIFO寄存器中的相关标志。

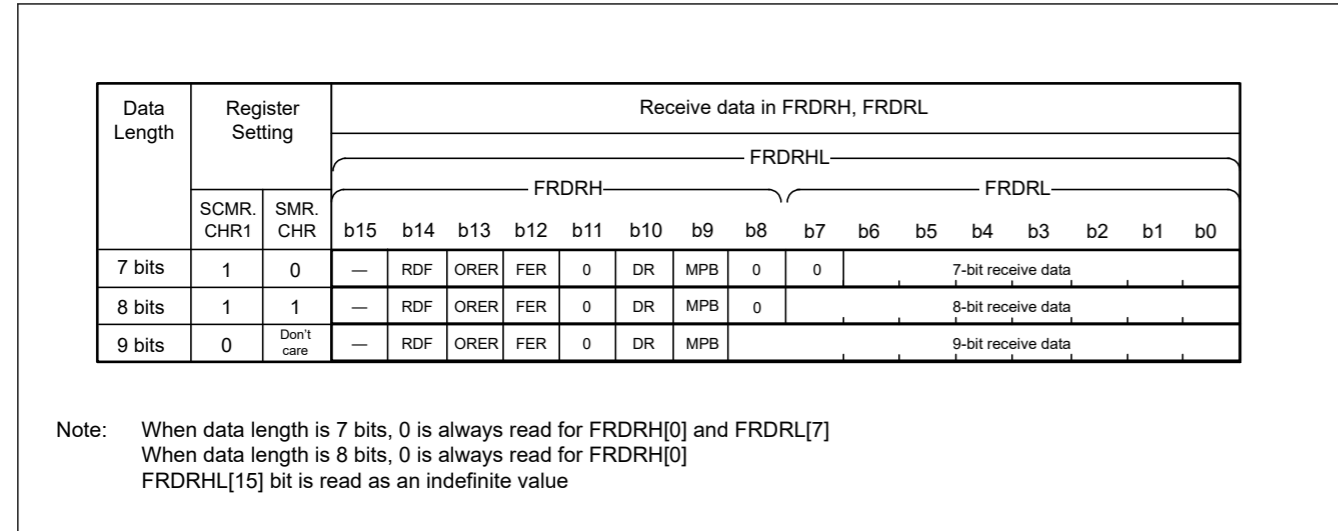

Figure 27.47 Data format stored in FRDRH and FRDRL in multi-processor mode with FIFO selected

Figure 27.48 shows an example flow of multi-processor data reception with FIFO selected. When the SCR.MPIE is set to 1, reading communication data is skipped until reception of communication data in which the multi-processor bit is set to 1. When communication data in which the multi-processor bit is set to 1 is received, the received data, MPB and associated errors are transferred to the FRDRHL register. The SCR.MPIE bit is automatically cleared and normal reception continues.

If a framing error occurs and the SSR\_FIFO.FER flag is set to 1, the SCI continues data reception. The rest of the operations are the same as operations in asynchronous mode with non-FIFO selected.

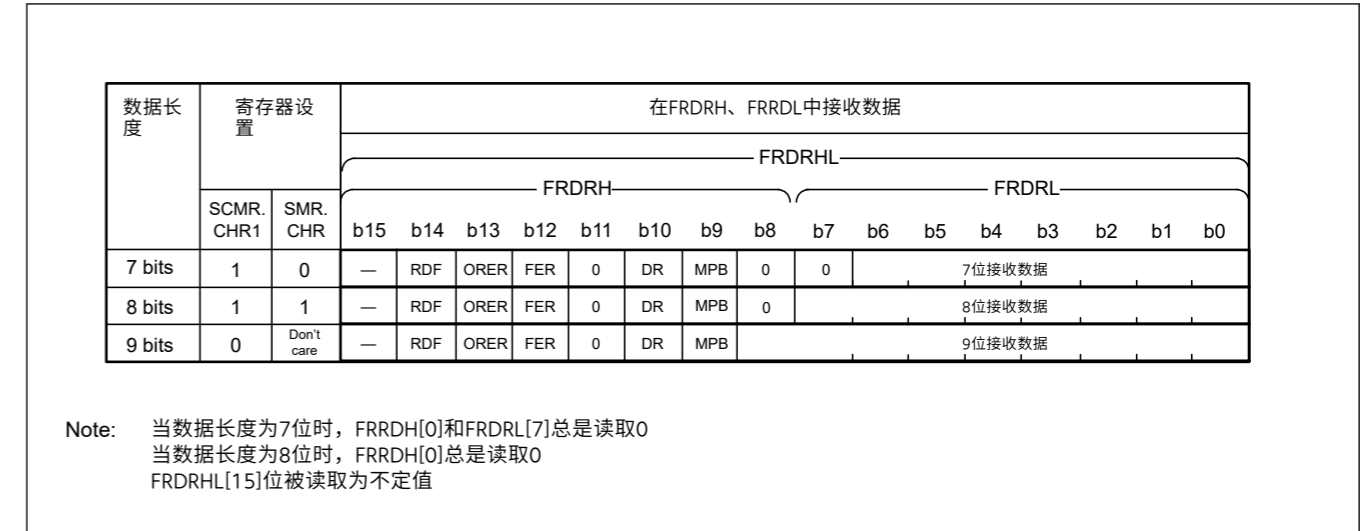

Figure 27.47 选择FIFO的多处理器模式下存储在FRDRH和FRDRL中的数据格式

图27.48显示了选择FIFO的多处理器数据接收示例流程。当SCR.MPIE设置为1时，将跳过读取通信数据，直到接收到多处理器位设置为1的通信数据。当接收到多处理器位设置为1的通信数据时，接收到的数据、MPB和相关错误被传送到FRDRHL寄存器。SCR.MPIE位自动清零并继续正常接收。

如果发生帧错误并且SSR\_FIFO.FER标志设置为1，则SCI继续数据接收。其余操作与选择非FIFO的异步模式中的操作相同。

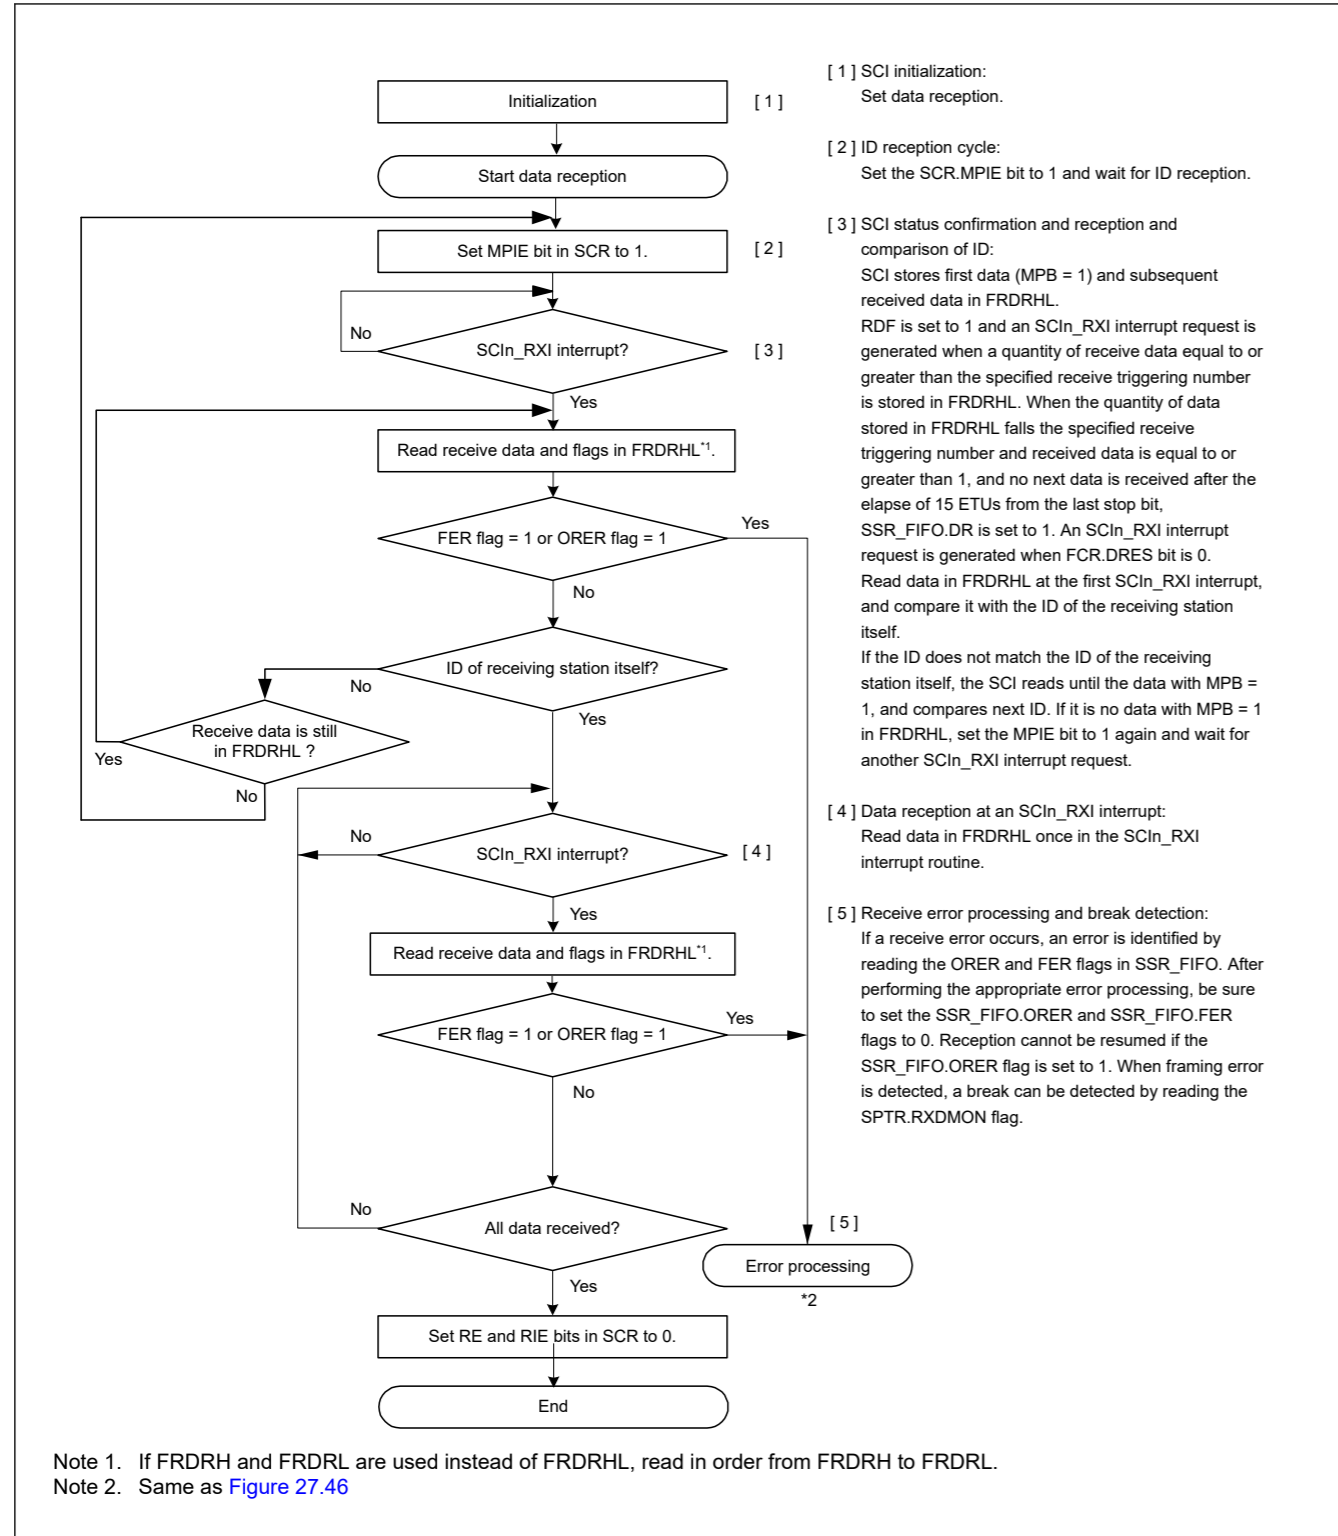

Figure 27.48 Example flow of serial ID reception in multi-processor mode with FIFO selected

### 27.5 Operation in Manchester mode

In Manchester mode, the transmit or receive serial data is coded in Manchester encoding.

Figure 27.49 shows the conceptual image of Manchester encoding.

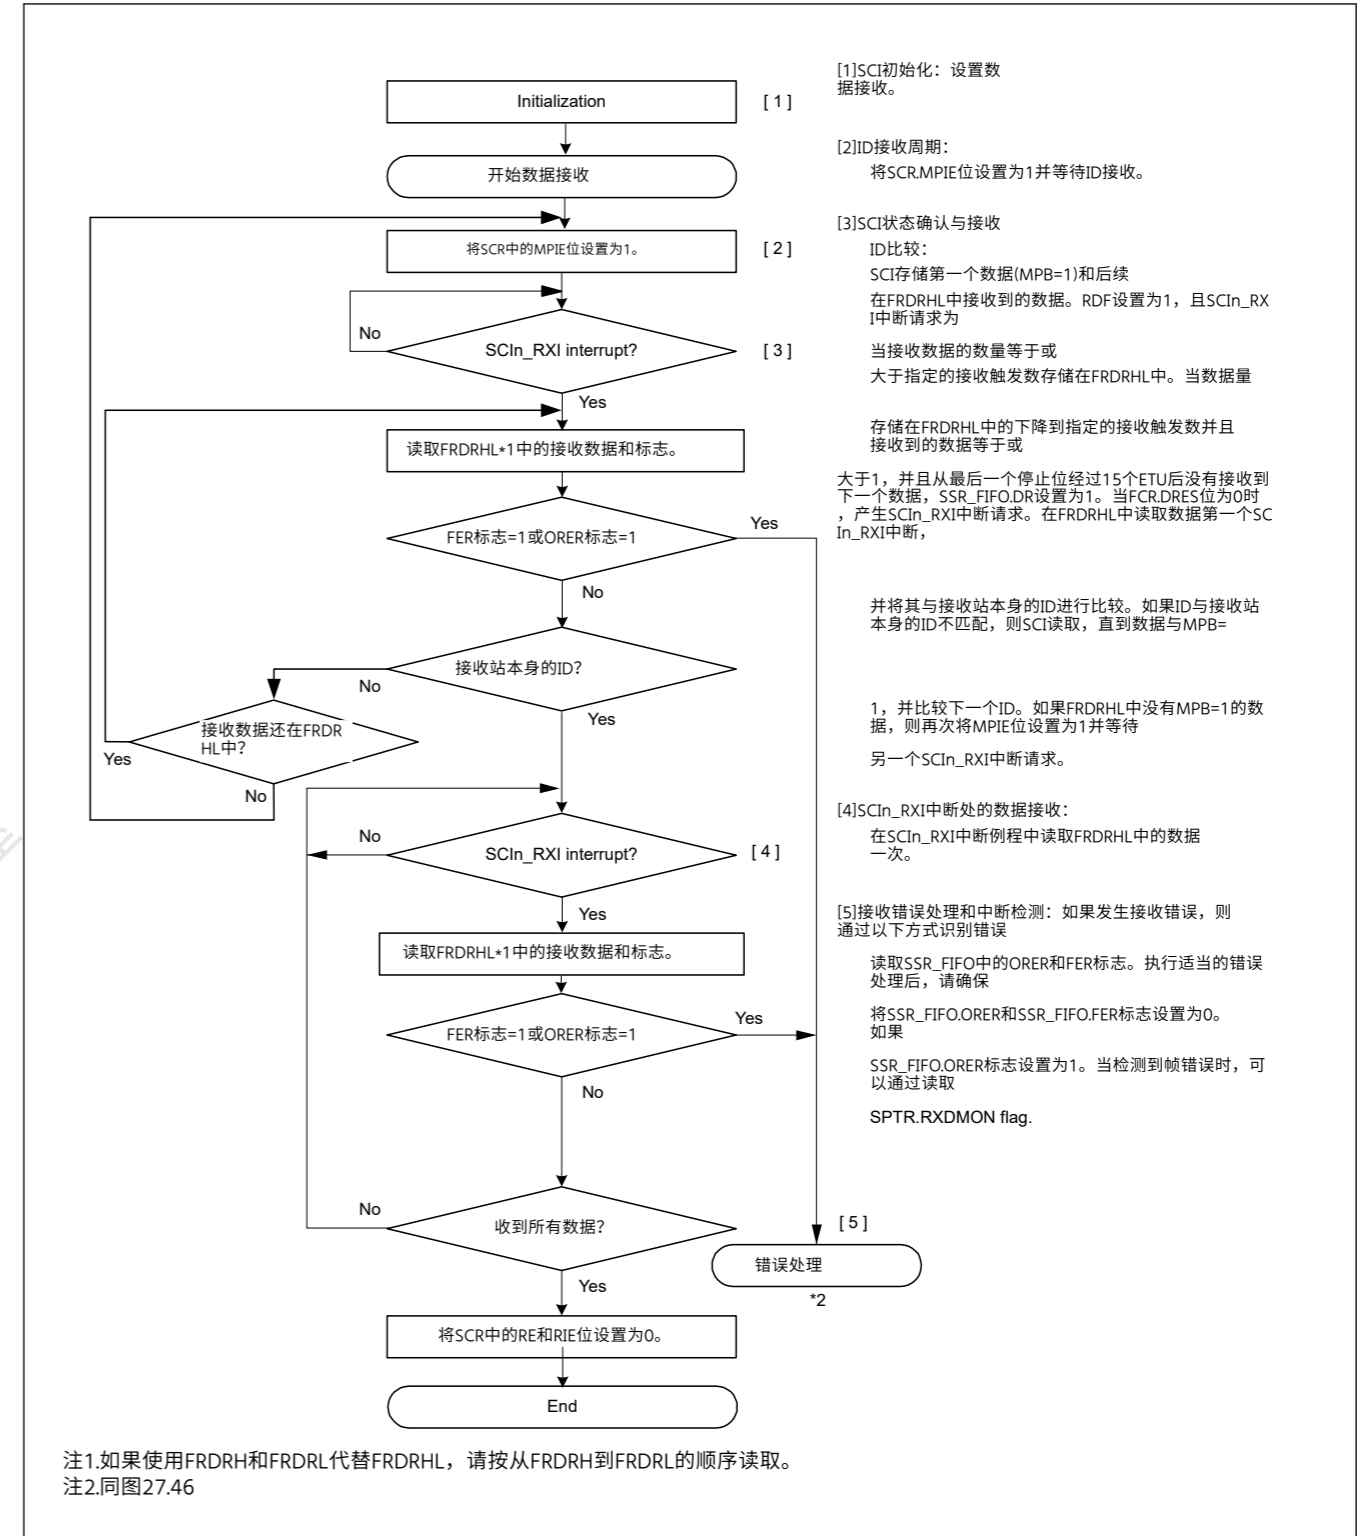

Figure 27.48 选择FIFO的多处理器模式下的串行接收示例流程

### 27.5 曼彻斯特模式下的操作

在曼彻斯特模式下,发送或接收串行数据以曼彻斯特编码进行编码。

图27.49显示了曼彻斯特编码的概念图。

Figure 27.49 Example of Manchester Encoding

In Manchester mode, a preface and a start bit area are added to the transmit data in the register to configure a transmit frame. For transmission, data is encoded in Manchester encoding. When data is received, frames having the same format as transmitted frames are detected and Manchester decoding is performed.

For details on the frame format, see section 27.5.1. Frame Format.

### 27.5.1 Frame Format

Figure 27.50 shows the frame format in Manchester mode.

In the upper half of the figure, relevant setting registers are shown.

The preface area and the data area are encoded in Manchester encoding.

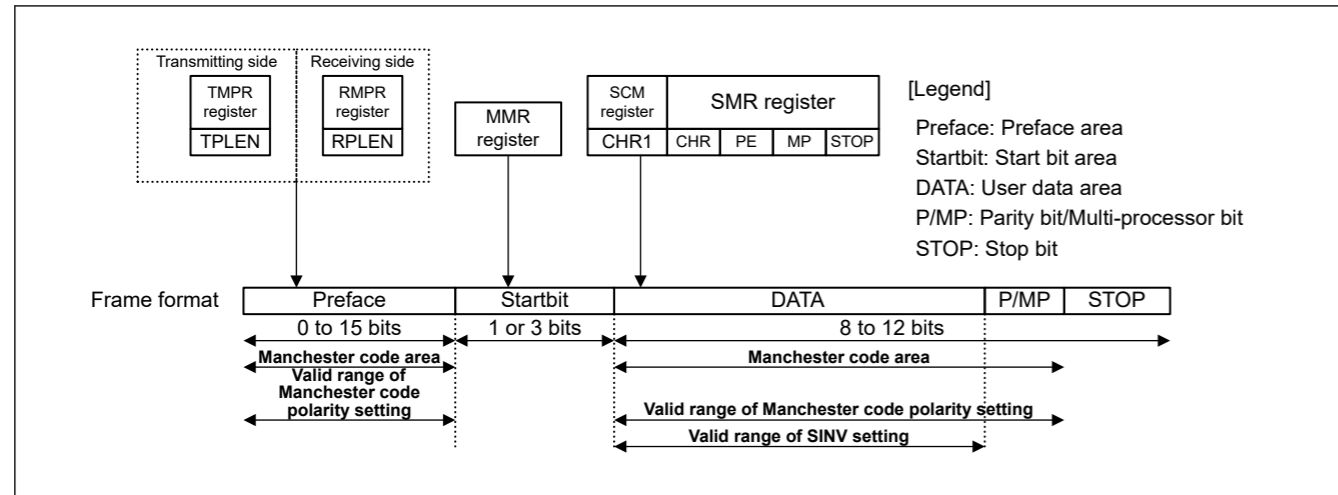

Figure 27.50 Frame Format in Manchester Mode

#### (1) Preface area

This is a fixed pattern area located at the beginning of each frame.

Different registers are used to set the preface area for transmission and reception. The preface length is determined by setting TMR.TPLEN[3:0] for transmission. It is determined by setting RMPR.RPLEN[3:0] for reception.

If it is set to 0, the transmit preface is disabled and is not added.

If it is set to 1d to 15d, a preface whose length is determined by this setting is added.

(For example, if it is set to 1d, a 1-bit preface is added. If it is set to 15d, a 15-bit preface is added.)

The preface pattern is set with TMR.TPPAT[1:0] for transmission and RMPR.RPPAT[1:0] for reception, and is selected from four types of patterns.

Figure 27.51 shows how the preface pattern is set. The preface area and the start bit area are added for each communication frame.

Figure 27.49 曼彻斯特编码示例

在曼彻斯特模式下，前言和起始位区域被添加到寄存器中的发送数据以配置发送帧。对于传输，数据以曼彻斯特编码进行编码。当接收到数据时，检测与传输帧格式相同的帧并执行曼彻斯特解码。

有关帧格式的详细信息，请参阅第27.5.1节。帧格式。

### 27.5.1 帧格式

图27.50显示了曼彻斯特模式下的帧格式。

在图的上半部分，显示了相关的设置寄存器。

前言区和数据区采用曼彻斯特编码。

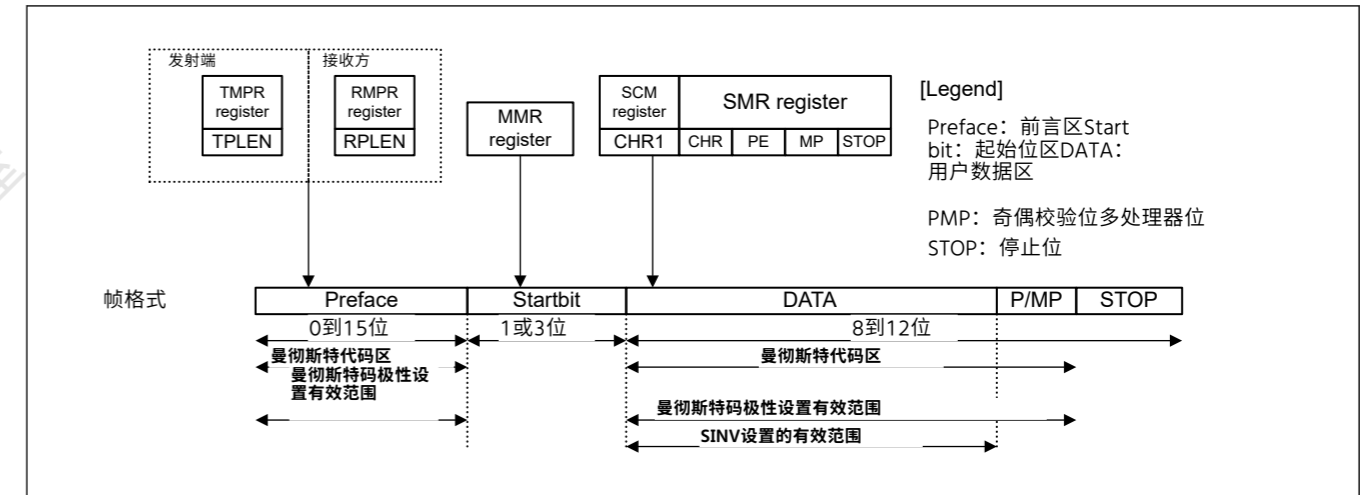

Figure 27.50 曼彻斯特模式下的帧格式

#### (1) 前言区

这是位于每帧开始处的固定模式区域。

不同的寄存器用于设置发送和接收的前言区域。前言长度通过设置TMR.TPLEN[3:0]来决定传输。通过设置RMPR.RPLEN[3:0]来确定接收。

如果设置为0，则发送前言被禁用且不添加。

如果设置为1d到15d，则添加一个长度由该设置确定的前言。

(例如，如果设置为1d，则添加1位前言。如果设置为15d，则添加15位前言。)

前言模式设置为发送用TMR.TPPAT[1:0]，接收用RMPR.RPPAT[1:0]，从四种模式中选择。

图27.51显示了如何设置前言模式。为每个通信帧添加前言区和起始位区。

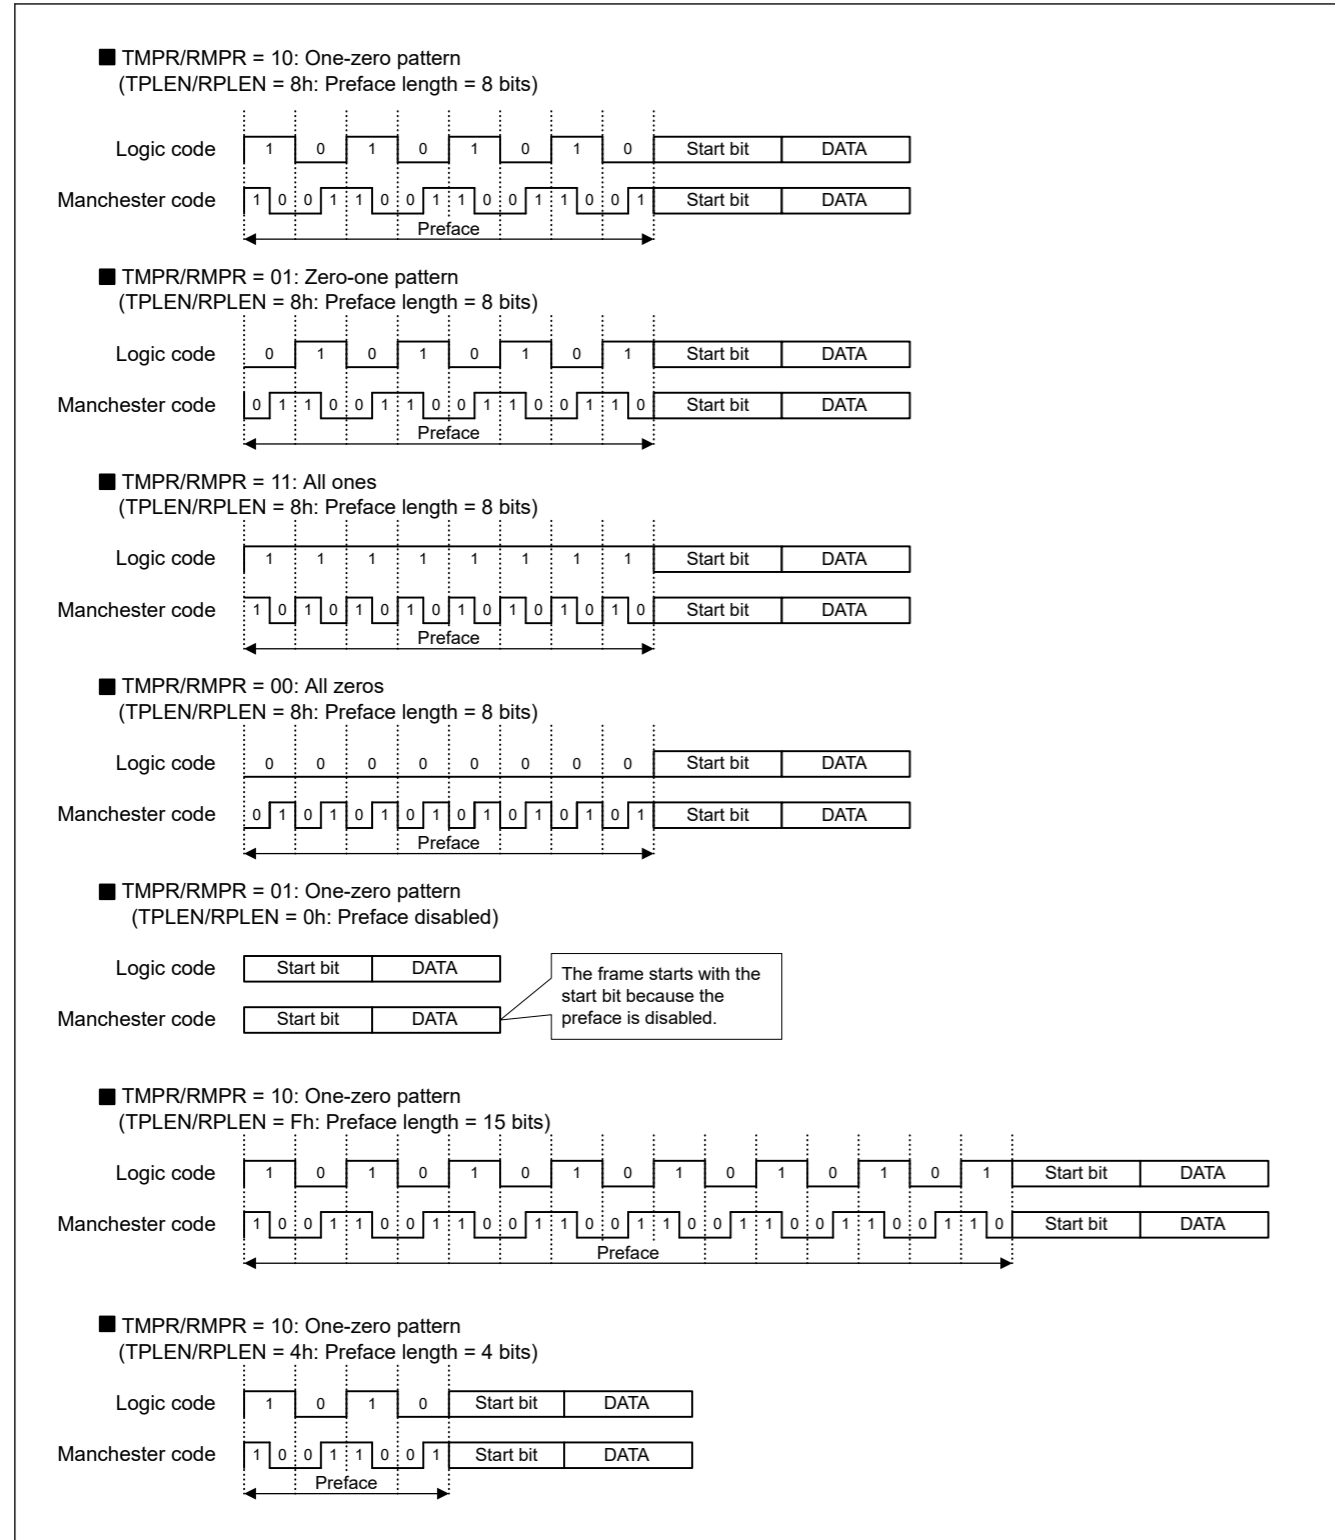

Figure 27.51 Preface Pattern Setting Example

(2) Start bit area

This is an area indicating the start of valid data in a frame. It is added after the preface area.

The start bit length is determined by MMR.SBSEL setting. When MMR.SBSEL = "0", the start bit length is 1 bit.

When MMR.SBSEL = "1", the start bit length is 3 bits.

When MMR.SBSEL = "1", the SYNC type can be selected from command SYNC and data SYNC.

Command SYNC means the three start bits are added as a one-to-zero transition.

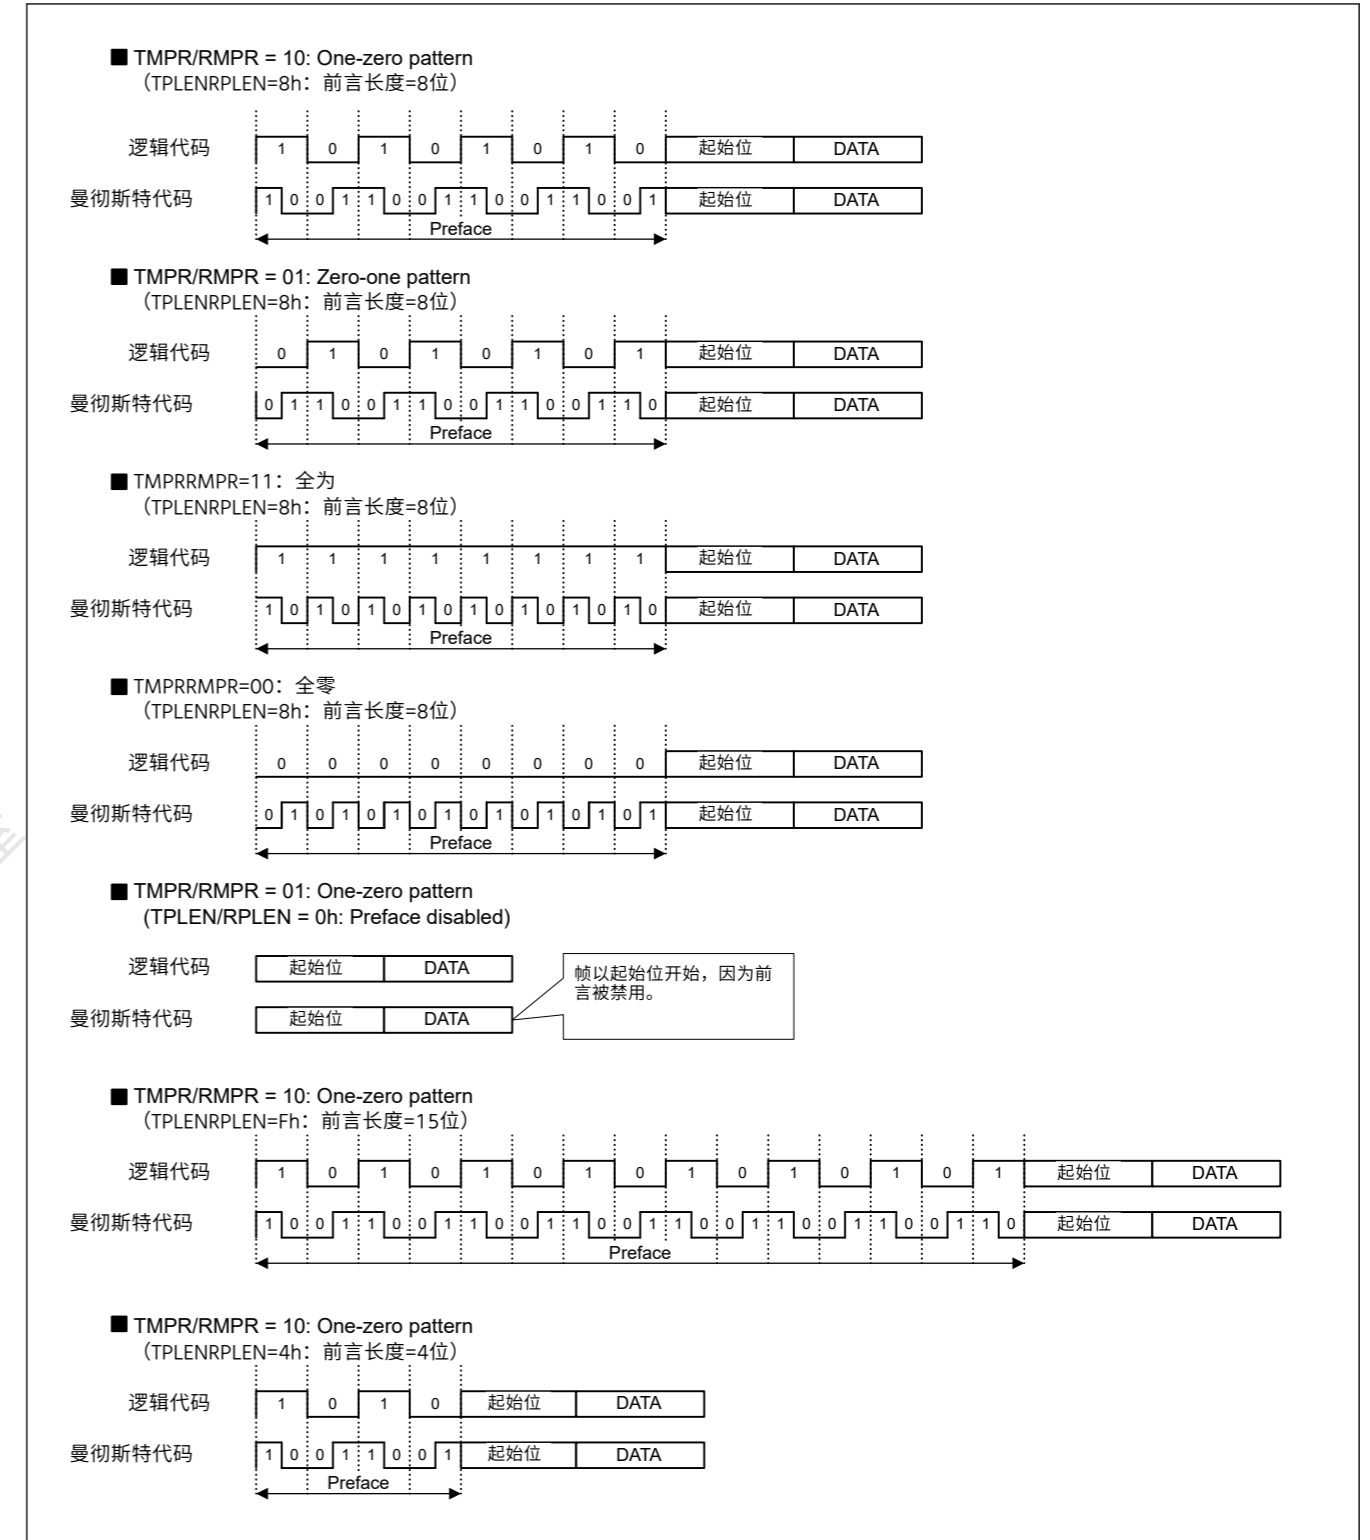

Figure 27.51 前言模式设置示例

(2) 起始位区

这是指示帧中有效数据开始的区域。它添加在前言区域之后。

起始位长度由MMR.SBSEL设置决定。当MMR.SBSEL="0"时，起始位长度为1位。

当MMR.SBSEL="1"时，起始位长度为3位。

当MMR.SBSEL="1"时，SYNC类型可以从命令SYNC和数据SYNC中选择。

命令SYNC意味着三个起始位被添加为一个从1到零的转换。

Data SYNC means the three start bits are added as a zero-to-one transition.

The SYNC type is determined by the MMR.SYNSEL, MMR.SYNVAL and TDRH.TSYNC settings.

(When receiving, the received result is applied to RDRH.RSYNC.)

When MMR.SBSEL = "0", the start bit is added as a zero-to-one or one-to-zero transition.

The selection is determined by the MMR.SYNVAL setting.

The MMR.SYNSEL bit specifies the destination to be referred to when setting for transmission.

When the MMR.SYNSEL bit is set to "1", the MMR.SYNVAL setting is referred to. When the MMR.SYNSEL bit is set to "0", the TDRH.TSYNC setting is referred to.

Figure 27.52 shows the state of the start bit area according to the settings in the MMR.SYNSEL, MMR.SYNVAL and TDRH.TSYNC registers in the case of transmission. Figure 27.53 shows that in the case of reception.

The start bit(s) is not affected by the MMR.TMPOL or MMR.RMPOL setting.

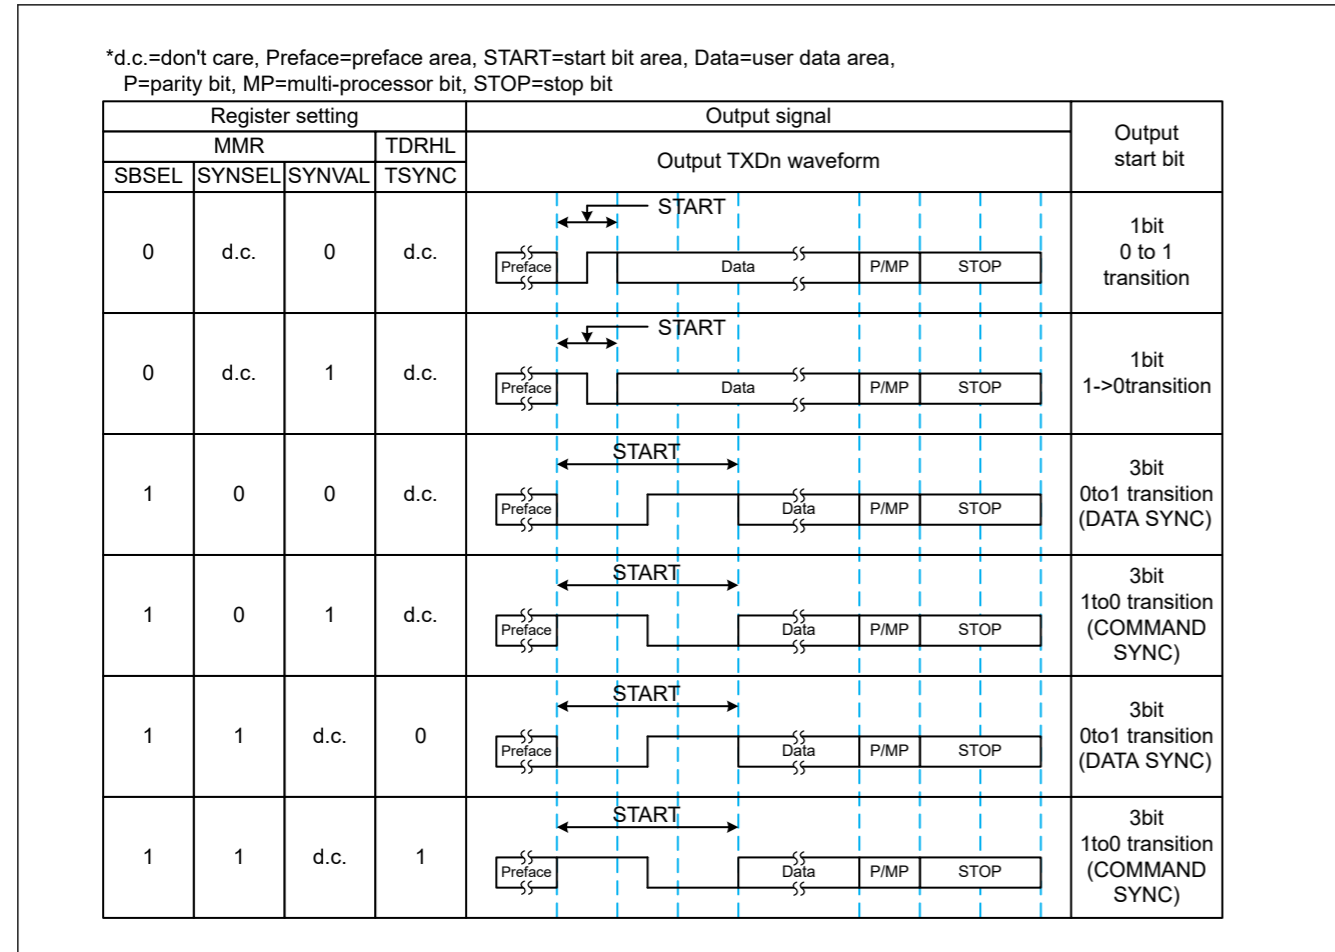

Figure 27.52 Settings Related to and Format of the Start Bit Area at Transmission

数据同步意味着三个起始位被添加为一个零到一的转换。

SYNC类型由MMR.SYNSEL、MMR.SYNVAL和TDRH.TSYNC设置确定。

(接收时，将接收到的结果应用到RDRH.RSYNC。)

当MMR.SBSEL="0"时，添加起始位作为零到一或一到零的转换。

选择由MMR.SYNVAL设置决定。

MMR.SYNSEL位指定发送设置时要参考的目标。

当MMR.SYNSEL位设置为"1"时，参考MMR.SYNVAL设置。当MMR.SYNSEL位设置为"0"时，参考TDRH.TSYNC设置。

图27.52显示了根据MMR.SYNSEL、MMR.SYNVAL和TDRH.TSYNC寄存器在传输的情况下。图27.53显示了在接收的情况下。

起始位不受MMR.TMPOL或MMR.RMPOL设置的影响。

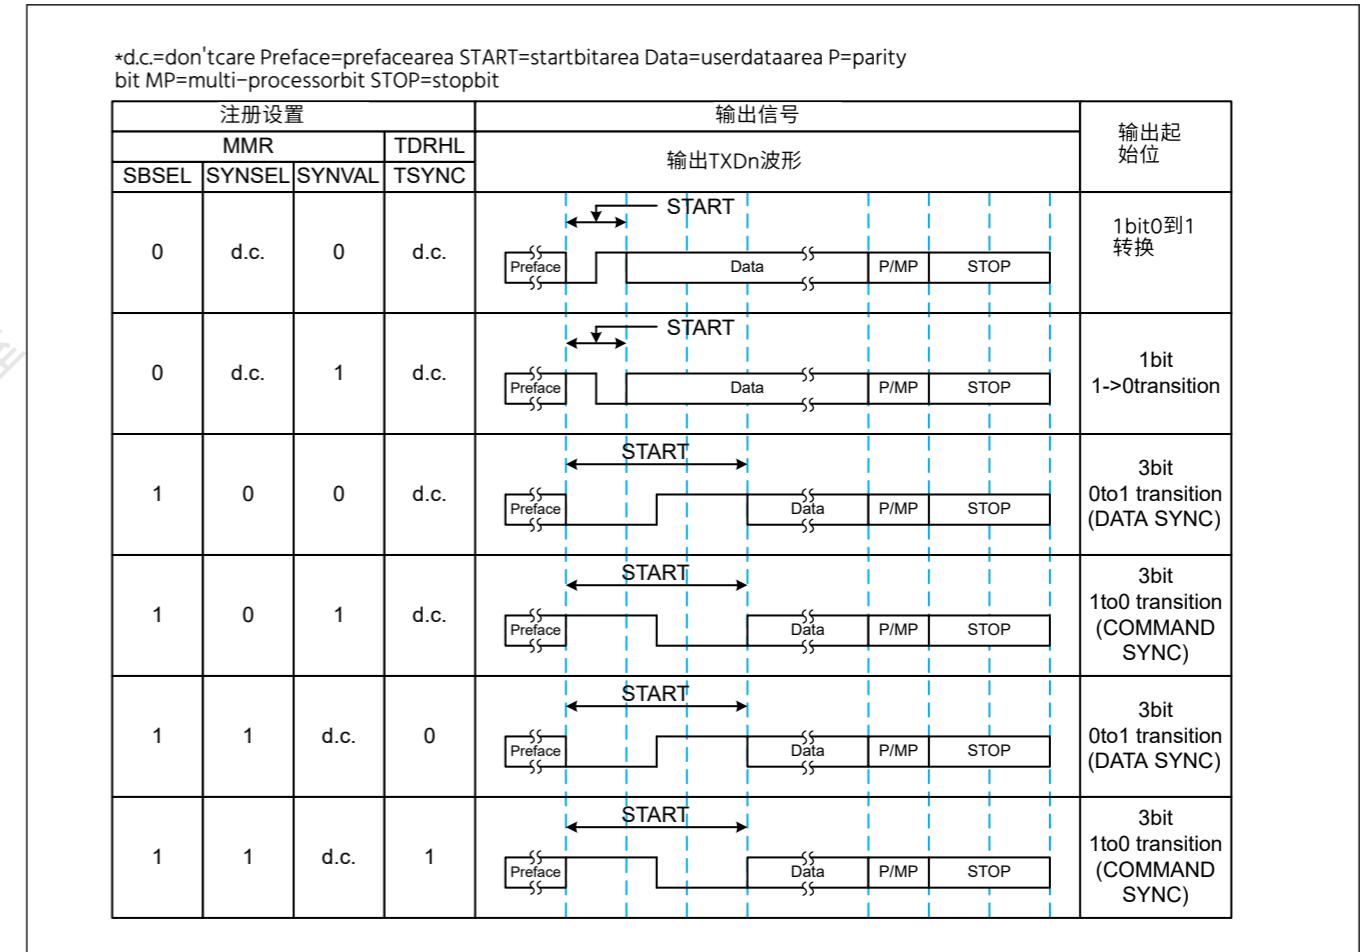

Figure 27.52 发送时起始位区域的相关设置和格式

Figure 27.53 接收时起始位区域的相关设置和判断

### (3) DATA

Since the format of the data area is the same as that of the asynchronous mode, see [section 27.3.1. Serial Data Transfer Format](#).

As shown in [Figure 27.49](#), Frame Format in Manchester Mode, the stop bit is not included in the Manchester encoding range.

#### 27.5.2 Clock

As the transfer clock in Manchester mode, the clock generated by the on-chip baud rate generator is used by setting the SMR.CKS[1:0] bit.

Also it is possible to set the oversampling (transfer rate of one-bit period) by SEMR.ABCS bit.

When the SMER.ABCS bit is set to 0, oversampling x16 is selected with the one-bit period being 16 cycles of the base clock. When the SMER.ABCS bit is set to 1, oversampling x8 is selected with the one-bit period being 8 cycles of the base clock.

#### 27.5.3 Initialization of the SCI in Manchester Mode

Before transferring data, write the initial value (00h) to the SCR register and initialize the SCI following the example of flowchart shown in [Figure 27.54](#).

Whenever the operating mode or transfer format is changed, the SCR register must be initialized before the change is made.

Note that setting the SCR.RE bit to 0 initializes none of: the ORER, FER, PER, MER, RDRF, and RDF flags in the SSR register, the SYER, PFER and SBER flags in the MESR register, and the RDR, RDRH, and RDRL registers.

Note also that switching the value of SCR.TE from “0” to “1” when SCR.TIE is “1” generates a TXI interrupt request.

### (3) DATA

由于数据区的格式与异步模式相同，见27.3.1节。串行数据传输 [Format](#)。

如图27.49，曼彻斯特模式下的帧格式，停止位不包含在曼彻斯特编码范围内。

#### 27.5.2 Clock

作为曼彻斯特模式下的传输时钟，片内波特率发生器产生的时钟用于设置 SMR.CKS[1:0] bit。

也可以通过SEMR.ABCS位设置过采样（一位周期的传输率）。

当SMER.ABCS位设置为0时，选择过采样x16，一位周期为基本时钟的16个周期。当SMER.ABCS位设置为1时，选择过采样x8，一位周期为基本时钟的8个周期。

#### 27.5.3 曼彻斯特模式下SCI的初始化

在传输数据之前，将初始值（00h）写入SCR寄存器并按照图27.54所示的流程图示例初始化SCI。

每当改变操作模式或传输格式时，必须在改变之前初始化SCR寄存器。

请注意，将SCR.RE位设置为0不会初始化以下各项：SSR寄存器中的ORER、FER、PER、MER、RDRF和RDF标志，MESR寄存器中的SYER、PFER和SBER标志，以及RDR、RDRH和RDRL寄存器。

另请注意，当SCR.TIE为“1”时，将SCR.TE的值从“0”切换为“1”会产生TXI中断请求。

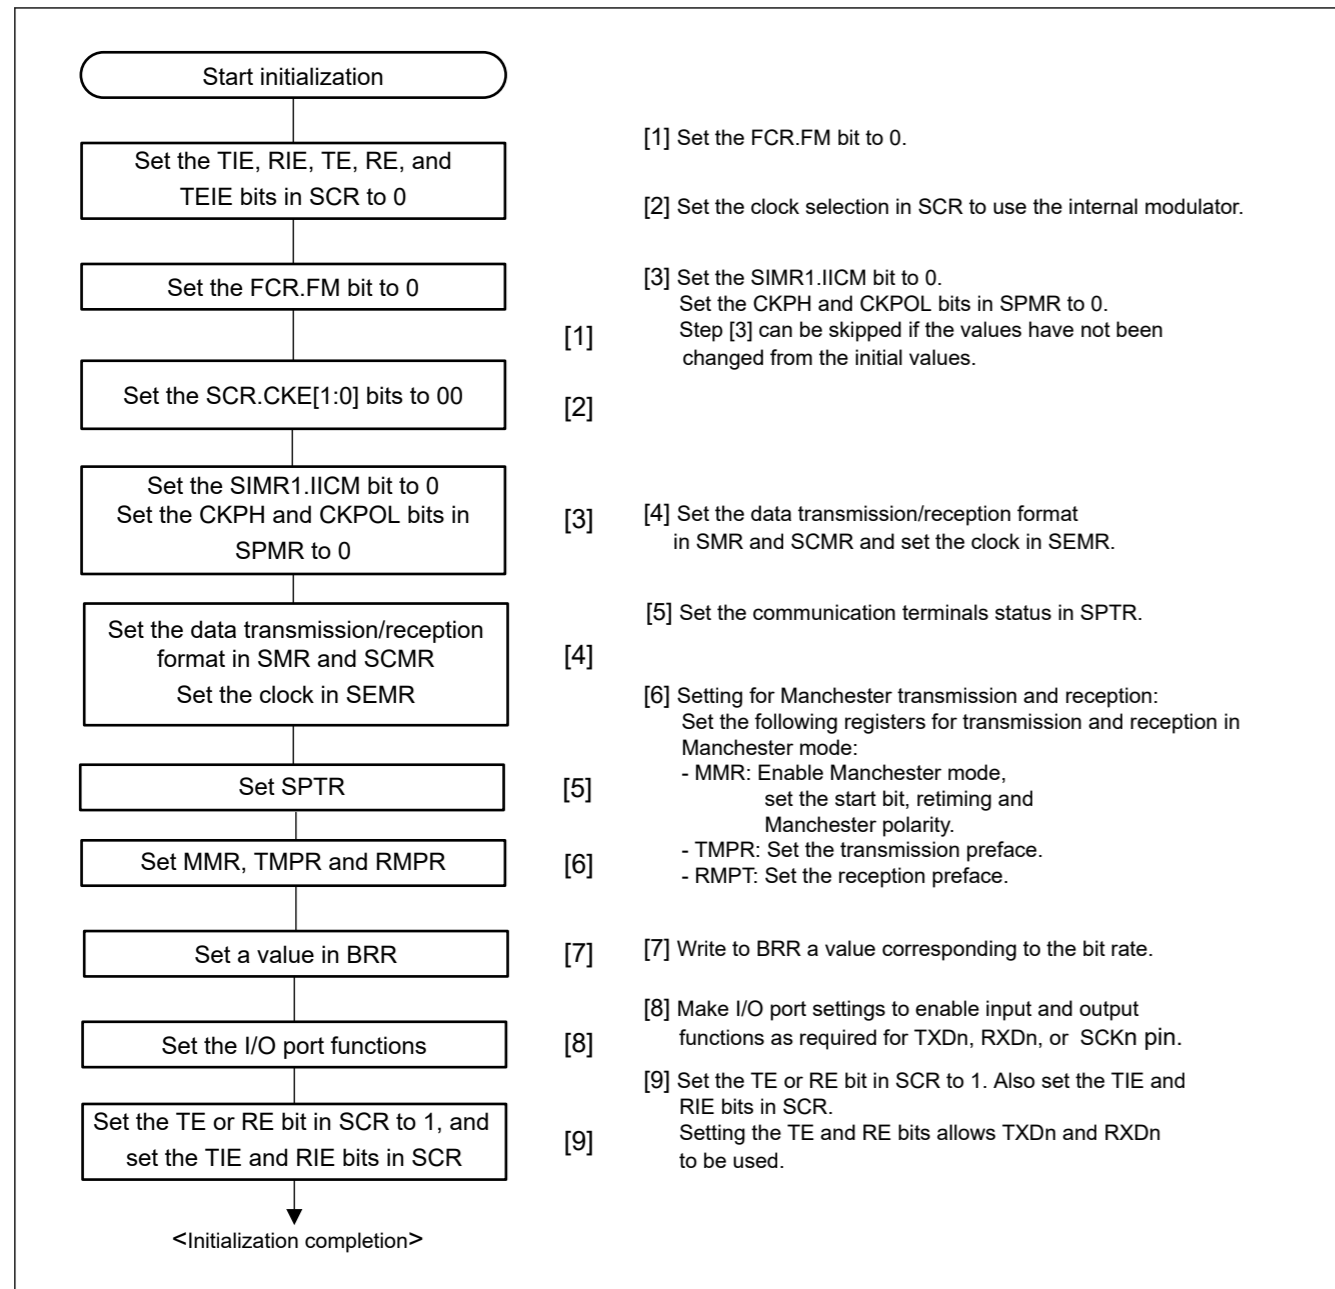

Figure 27.54 SCI Initialization Flow in Manchester Mode

27.5.4 Double-speed operation

When the ABCS bit in SEMR is set to “1” and eight pulses of the base clock for a 1-bit period is selected, the SCI operates on the bit rate twice that of when ABCS is set to “0”.

When the BGDM bit in SEMR is set to “1”, the cycle of the base clock is reduced to half and the SCI operates on the bit rate twice that of when ABCS is set to “0”.

When the ABCS bit in SEMR and the BGDM bit in SEMR are set to “1”, the SCI operates on the bit rate four times that of when the ABCS bit in SEMR and the BGDM bit in SEMR are set to “0”.

27.5.5 CTS and RTS functions

The CTS function uses input on the CTSn\_RTSn pin in transmission control. Setting the CTSE bit in SPMR to 1 enables the CTS function. The CTSn\_RTSn pin can be set as a multiplexed pin which allows one pin to be used for either function, or as dedicated pins with each pin for a single function. Use the CTSPEN bit in SPMR for this setting.

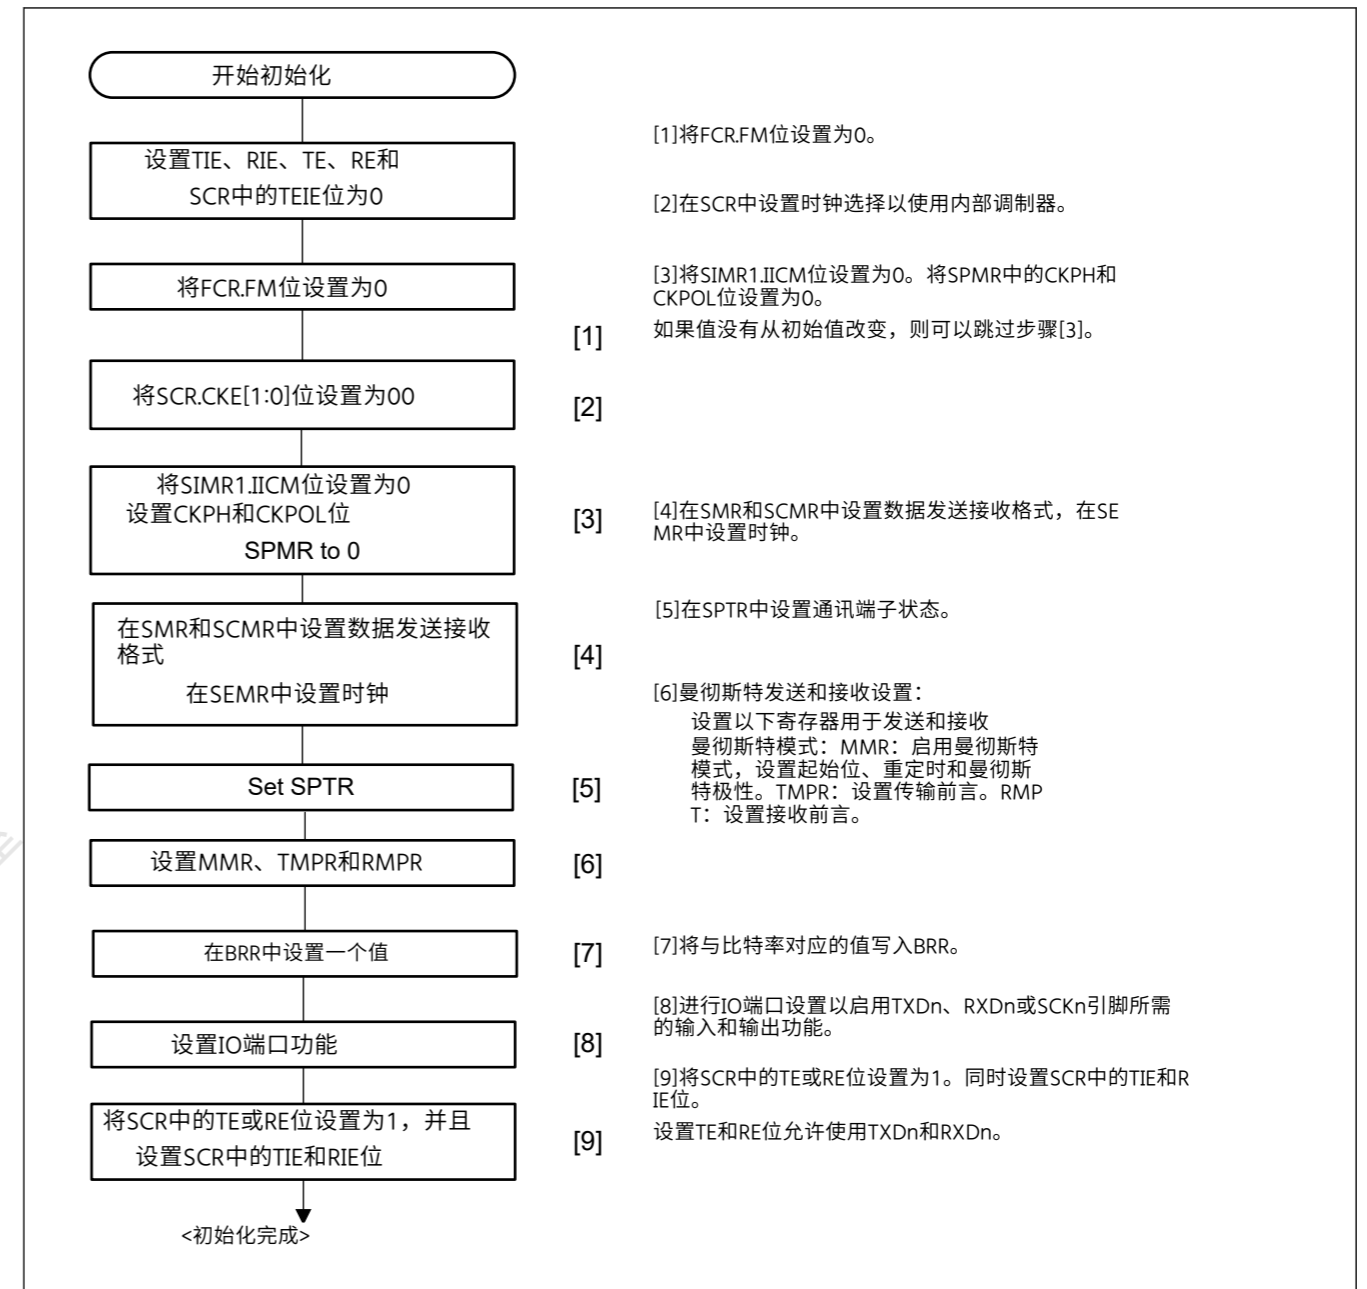

Figure 27.54 曼彻斯特模式下的SCI初始化流程

27.5.4 Double-speed operation

当SEMR中的ABCS位设置为“1”并选择1位周期的8个基本时钟脉冲时，SCI以ABCS设置为“0”时的两倍比特率运行。

当SEMR中的BGDM位设置为“1”时，基本时钟的周期减半，并且SCI以两倍于ABCS设置为“0”时的比特率运行。

当SEMR中的ABCS位和SEMR中的BGDM位设置为“1”时，SCI以SEMR中的ABCS位和SEMR中的BGDM位设置为“0”时的4倍比特率运行。

27.5.5 CTS和RTS功能

CTS功能在传输控制中使用CTSn\_RTSn引脚上的输入。将SPMR中的CTSE位设置为1使能CTS功能。CTSn\_RTSn管脚可以设置为多路复用管脚，允许一个管脚用于任一功能，或作为专用管脚，每个管脚用于单一功能。使用SPMR中的CTSPEN位进行此设置。

When the CTS function is enabled, reception starts only when the CTSn\_RTsn pin is at the low level.

Applying a high level to the CTSn\_RTsn pin after transmission starts does not affect transmission of the current frame, which continues.

The RTS function uses output on the CTSn\_RTsn pin to request transmission. When the SCI is ready to receive, it outputs a low level to the CTSn\_RTsn pin. Conditions for output of the low level and high level are as follows:

[Conditions for low-level output]

When all conditions listed below are satisfied:

- The value of the RE bit in SCR is 1.
- The SCI is ready to receive.
- There is no received data yet to be read.
- All of the following flags are set to 0: SSR.ORER, FER, PER and MER flags, and MESR.SYER (when SYEREN = 1), PFER (when PFEREN = 1) and SBER flags (when SBEREN = 1).

[Conditions for high-level output]

- When the conditions for low output are not satisfied

### 27.5.6 Serial data transmission in Manchester mode

The SCI encodes data in Manchester encoding and sends the resultant data in Manchester mode.

When the polarity setting (MR.TMPOL) set to 0, logic 0 is coded as a zero-to-one transition in Manchester code and logic 1 is coded as a one-to-zero transition in Manchester code.

When the polarity setting (MR.TMPOL) set to 1, logic 0 is coded as a one-to-zero transition in Manchester code and logic 1 is coded as a zero-to-one transition in Manchester code.

For this reason, a level transition occurs with the Manchester encoded data in the middle of individual logic data. (See [Figure 27.49](#)).

The transmitter constructs transmit frames in a specific format by adding a preface area to data and setting the start bit(s) according to the polarity setting and sends resultant serial data.

For details on the frame format, see [section 27.5.1. Frame Format](#).

[Figure 27.55](#) shows the flowchart in transmission. [Figure 27.56](#), [Figure 27.57](#), and [Figure 27.58](#) show examples of the operation for serial transmission in Manchester mode.

当CTS功能使能时，只有在CTSn\_RTsn引脚为低电平时才开始接收。

传输开始后将高电平应用到CTSn\_RTsn引脚不会影响当前帧的传输，当前帧会继续传输。

RTS功能使用CTSn\_RTsn引脚上的输出来请求传输。当SCI准备好接收时，向CTSn\_RTsn管脚输出一个低电平，输出低电平和高电平的条件如下：

[Conditions for low-level output]

当满足下列所有条件时：

- SCR中RE位的值为1。
- SCI已准备好接收。
- 没有接收到的数据尚未读取。
- 以下所有标志都设置为0：SSR.ORER、FER、PER和MER标志，以及MESR.SYER（当SYEREN=1时）、PFER（当PFEREN=1时）和SBER标志（当SBEREN=1时）。

[Conditions for high-level output]

- 不满足低输出条件时

### 27.5.6 曼彻斯特模式下的串行数据传输

SCI以曼彻斯特编码对数据进行编码，并以曼彻斯特模式发送结果数据。

当极性设置(MR.TMPOL)设置为0时，逻辑0被编码为曼彻斯特代码中的零到一转换，逻辑1被编码为曼彻斯特代码中的一到零转换。

当极性设置(MR.TMPOL)设置为1时，逻辑0被编码为曼彻斯特代码中的一对零转换，逻辑1被编码为曼彻斯特代码中的零到一转换。

出于这个原因，在各个逻辑数据中间的曼彻斯特编码数据会发生电平转换。（看 [Figure 27.49](#)）。

发送器通过向数据添加前言区域并根据极性设置设置起始位来构建特定格式的发送帧，并发送结果串行数据。

有关帧格式的详细信息，请参阅第27.5.1节。帧格式。

图27.55显示了传输的流程图。图27.56、图27.57和图27.58显示了曼彻斯特模式下串行传输的操作示例。

## 27.5.7 Serial Data Reception in Manchester Mode

In Manchester mode, the SCI operates on a base clock with a frequency of 16 times<sup>\*1</sup> the bit rate. Reception starts by sampling the falling edges of received data at the base clock. As shown in Figure 27.59, reception starts at a falling edge of the received data and it continues if the received data keeps low for the duration of 1/4 bit. If the received data goes high within the duration of 1/4 bit, the SCI judges it as an error and waits for a falling edge again.

If a high level is expected in the first half of a bit in the received data, the SCI judges a low level that continues for one base clock cycle as an error and ignores the change to the low level.

Note 1. This is the case when SEMR.ABCS = 0. When SEMR.ABCS = 1, the SCI operates on a base clock with a frequency of 8 times the bit rate.

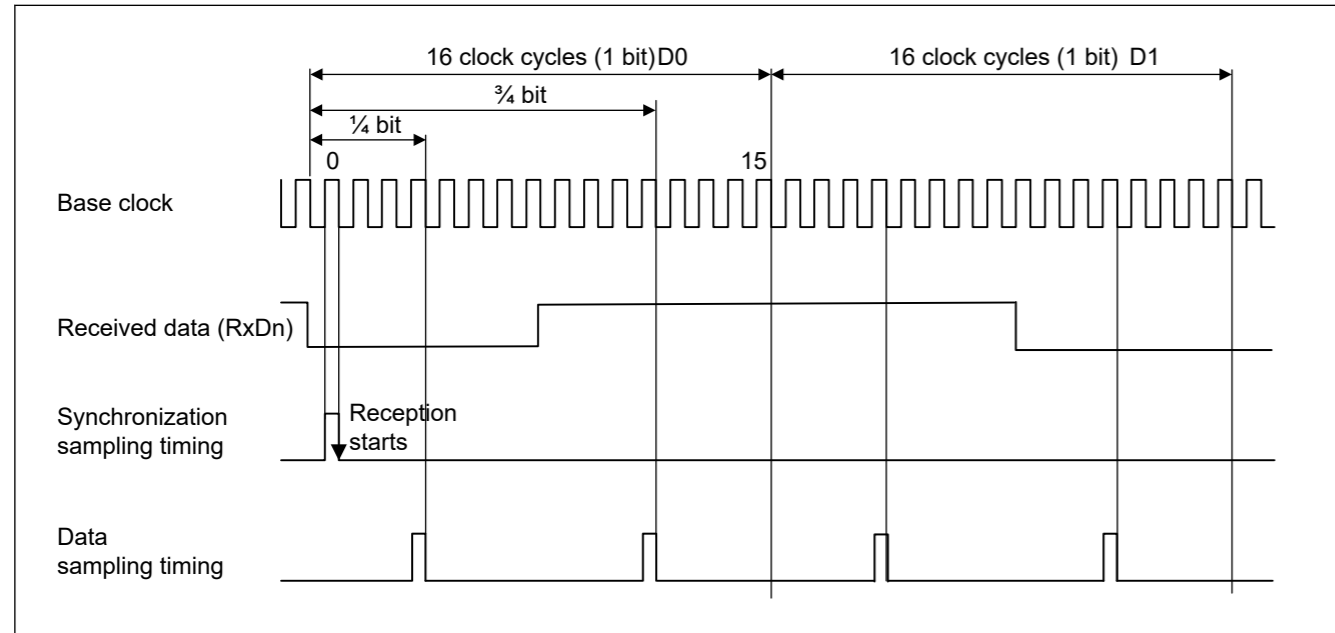

Figure 27.59 Data Reception Sampling Timing in Manchester Mode

In Manchester mode, data reception starts with detection of a preface and start bit area.

The SCI checks the input from the RXD pin to see whether a preface is added based on the value of RMPR.RPLEN.

If the preface is disabled (RMPR.RPLEN = 0), it moves on to the detection of a start bit area without detecting a preface.

When a preface is enabled, it identifies a preface pattern setting according to the set value in RMPR.RPPAT, and compares it with the RXD input for a pattern match to detect a preface pattern.

Upon detection of a preface pattern match, it judges it as a normal preface and moves on to the detection of a start bit area.

If detecting a preface pattern mismatch or a Manchester code error in the preface area, it judges it as a preface error and asserts a preface error (PFER).

For start bit detection, the SCI selects an expected value based on the register settings (MMR.SBSEL and SYNVAL), compares it with the RXD input for a pattern match to detect a start bit area. Upon detection of a start bit pattern match, it judges it as a normal start bit area and moves on to the data processing.

Only when a preface and a start bit area are detected normally, it moves on to the next phase of data reception.

Upon detection of a start bit pattern mismatch, it asserts a start bit error flag (SBER).

In data processing, the SCI shifts the data by the expected received data length based on the register settings (SCMR.CHR1 and SMR.CHR) through the RSR register. If two sampling points in a bit of the received data are identical, the SCI judges this as a Manchester code error.

For details, see para. (4) in section 27.5.11. Errors in Manchester Mode.

When the parity function is disabled (SMR.PE = 0), the SCI moves on to the next phase of stop bit detection. When the parity function is enabled (SMR.PE = 1), the SCI performs parity checking. If detecting a parity error, it asserts a parity error flag (PER), and then moves on to stop bit detection.

## 27.5.7 曼彻斯特模式下的串行数据接收

在曼彻斯特模式下，SCI在频率为16倍\*1比特率的基本时钟上运行。接收开始于在基本时钟处对接收到的数据的下降沿进行采样。如图27.59所示，接收在接收数据的下降沿开始，如果接收数据保持低电平持续14位，则继续接收。如果接收到的数据在14bit的时间内变高，则SCI判断为错误，再次等待下降沿。

如果在接收数据的前半个比特中预期为高电平，则SCI将持续一个基本时钟周期的低电平判断为错误，并忽略向低电平的变化。

注1.这是SEMR.ABCS=0时的情况。当SEMR.ABCS=1时，SCI在频率为比特率8倍的基本时钟上运行。

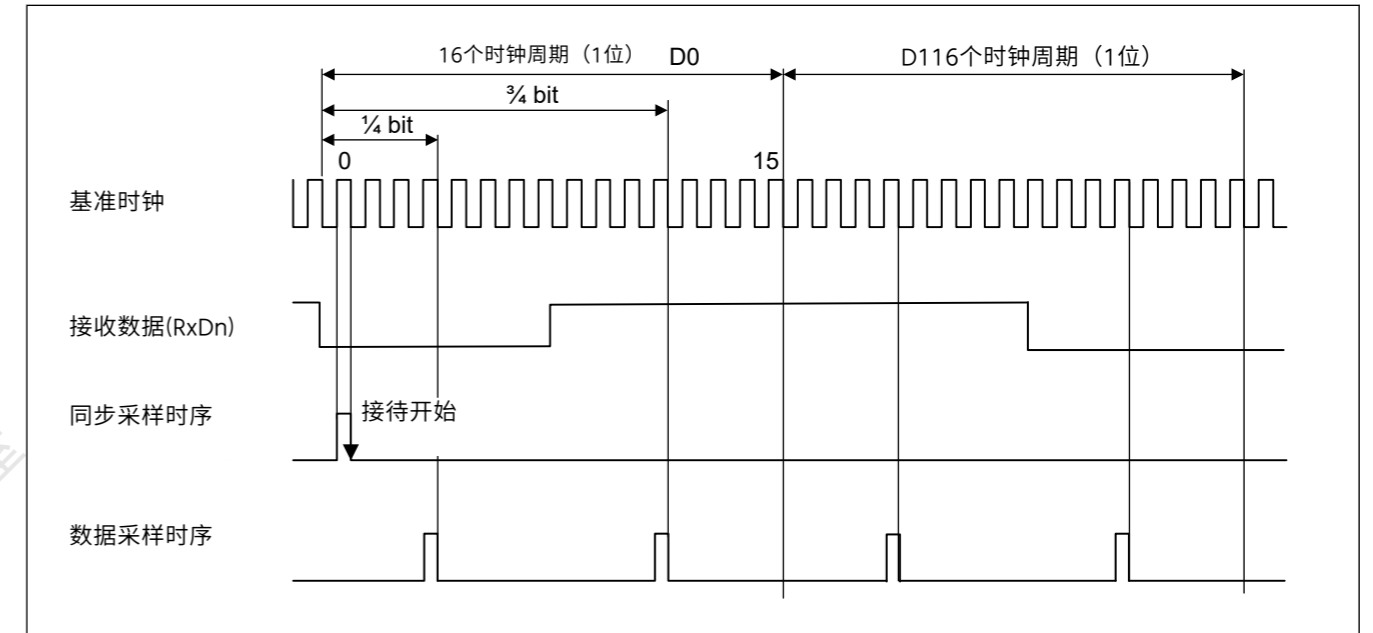

Figure 27.59 曼彻斯特模式下的数据接收采样时序

在曼彻斯特模式下，数据接收从检测前言和起始位区域开始。

SCI检查来自RXD引脚的输入，以查看是否根据RMPR.RPLEN的值添加了前言。

如果前言被禁用 (RMPR.RPLEN=0)，它会继续检测起始位区域而不检测前言。

启用前言时，它根据RMPR.RPPAT中的设置值识别前言模式设置，并将其与模式匹配的RXD输入进行比较，以检测前言模式。

在检测到前言模式匹配时，将其判断为正常前言并继续检测起始位区域。

如果在前言区域检测到前言模式不匹配或曼彻斯特码错误，则将其判断为前言错误并断言前言错误 (PFER)。

对于起始位检测，SCI根据寄存器设置 (MMR.SBSEL和SYNVAL) 选择预期值，将其与模式匹配的RXD输入进行比较，以检测起始位区域。在检测到起始位模式匹配时，将其判断为正常起始位区域并继续进行数据处理。

只有在正常检测到前言和起始位区域时，才进入下一个数据接收阶段。

在检测到起始位模式不匹配时，它会断言起始位错误标志(SBER)。

在数据处理中，SCI根据寄存器设置 (SCMR.CHR1和SMR.CHR) 通过RSR寄存器将数据移位预期的接收数据长度。如果接收到的数据位中的两个采样点相同，则SCI判断为曼彻斯特码错误。

有关详细信息，请参阅段落。(4)第27.5.11节。曼彻斯特模式中的错误。

当奇偶校验功能被禁用 (SMR.PE=0) 时，SCI进入下一个停止位检测阶段。当启用奇偶校验功能时 (SMR.PE=1)，SCI执行奇偶校验。如果检测到奇偶校验错误，它会置位奇偶校验错误标志(PER)，然后继续进行停止位检测。

In stop bit detection, the SCI checks the following in the stop bit area of the received frame:

It has two sampling points in a bit. If both points are at the high level, the bit is recognized as a normal stop bit and the data is stored in the RDR register. At least one low-level point is judged as an abnormal stop bit, causing a framing error flag (FER) to be set. Even when an error is detected, the received data is stored in the RDR register as abnormal data.

Figure 27.60 shows an example of the operation for serial data reception in Manchester mode.

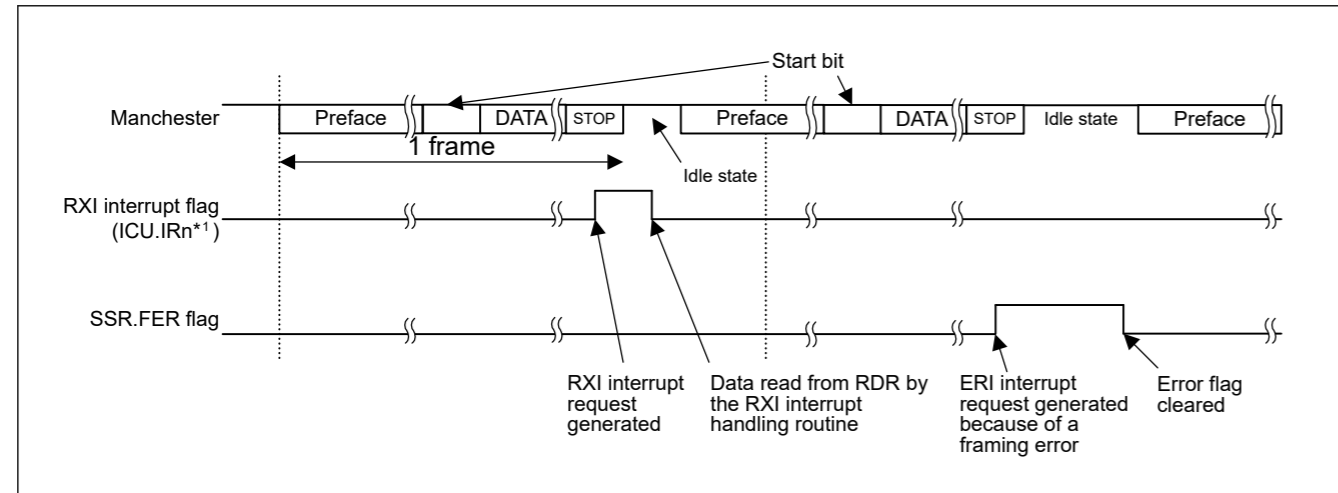

Figure 27.60 Example of Operation for Serial Data Reception in Manchester mode (with a Preface)

For the state of each status flag in the SSR register and RXD input processing when a receive error is detected, see section 27.5.11. Errors in Manchester Mode.

If a receive error is detected, an ERI interrupt request is generated but an RXI interrupt request is not generated.

Data reception cannot be resumed while the receive error flag is 1. Accordingly, set the ORER, FER, PER, MER, SYER\*1, PFER\*1, and SBER\*1 flags to 0 before resuming reception. Also, be sure to read the RDR (or RDRL) register during overrun error processing. When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read the RDR (or the RDRL) register because received data which has not yet been read may be left in the RDR (or the RDRL) register.

Figure 27.61 and Figure 27.62 show examples of serial data reception flowchart in Manchester mode.

Note 1. Effective when the corresponding bit is enabled.

在停止位检测中，SCI在接收帧的停止位区域中检查以下内容：

它有两个采样点。如果两个点都处于高电平，则该位被识别为正常停止位，数据存储在RDR寄存器中。至少有一个低电平点被判断为异常停止位，导致设置帧错误标志（FER）。即使检测到错误，接收到的数据也会作为异常数据存储在RDR寄存器中。

图27.60显示了曼彻斯特模式下串行数据接收操作的示例。

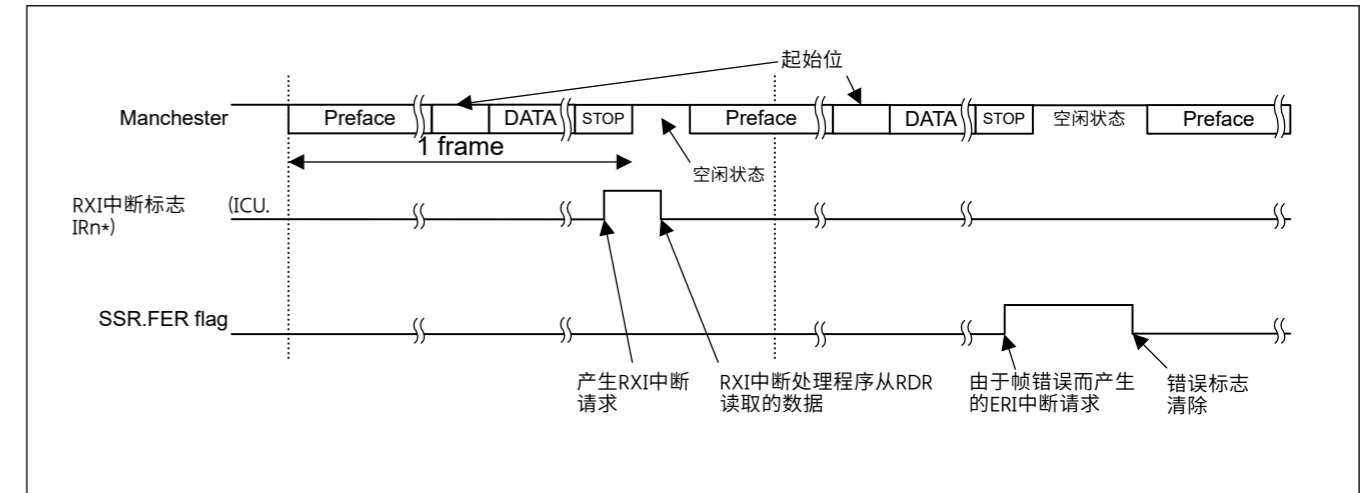

Figure 27.60 曼彻斯特模式下串行数据接收操作示例（附前言）

关于SSR寄存器中各状态标志的状态和检测到接收错误时的RXD输入处理，请参阅第27.5.11节。曼彻斯特模式中的错误。

如果检测到接收错误，则会产生ERI中断请求，但不会产生RXI中断请求。

当接收错误标志为1时，无法恢复数据接收。因此，在恢复接收之前将ORER、FER、PER、MER、SYER\*1、PFER\*1和SBER\*1标志设置为0。此外，请务必在溢出错误处理期间读取RDR（或RDRL）寄存器。如果在操作期间通过将SCR.RE位设置为0来强制终止接收，请读取RDR（或RDRL）寄存器，因为尚未读取的接收数据可能留在RDR（或RDRL）寄存器中。

图27.61和图27.62显示了曼彻斯特模式下的串行数据接收流程图示例。

注1.当相应位使能时有效。

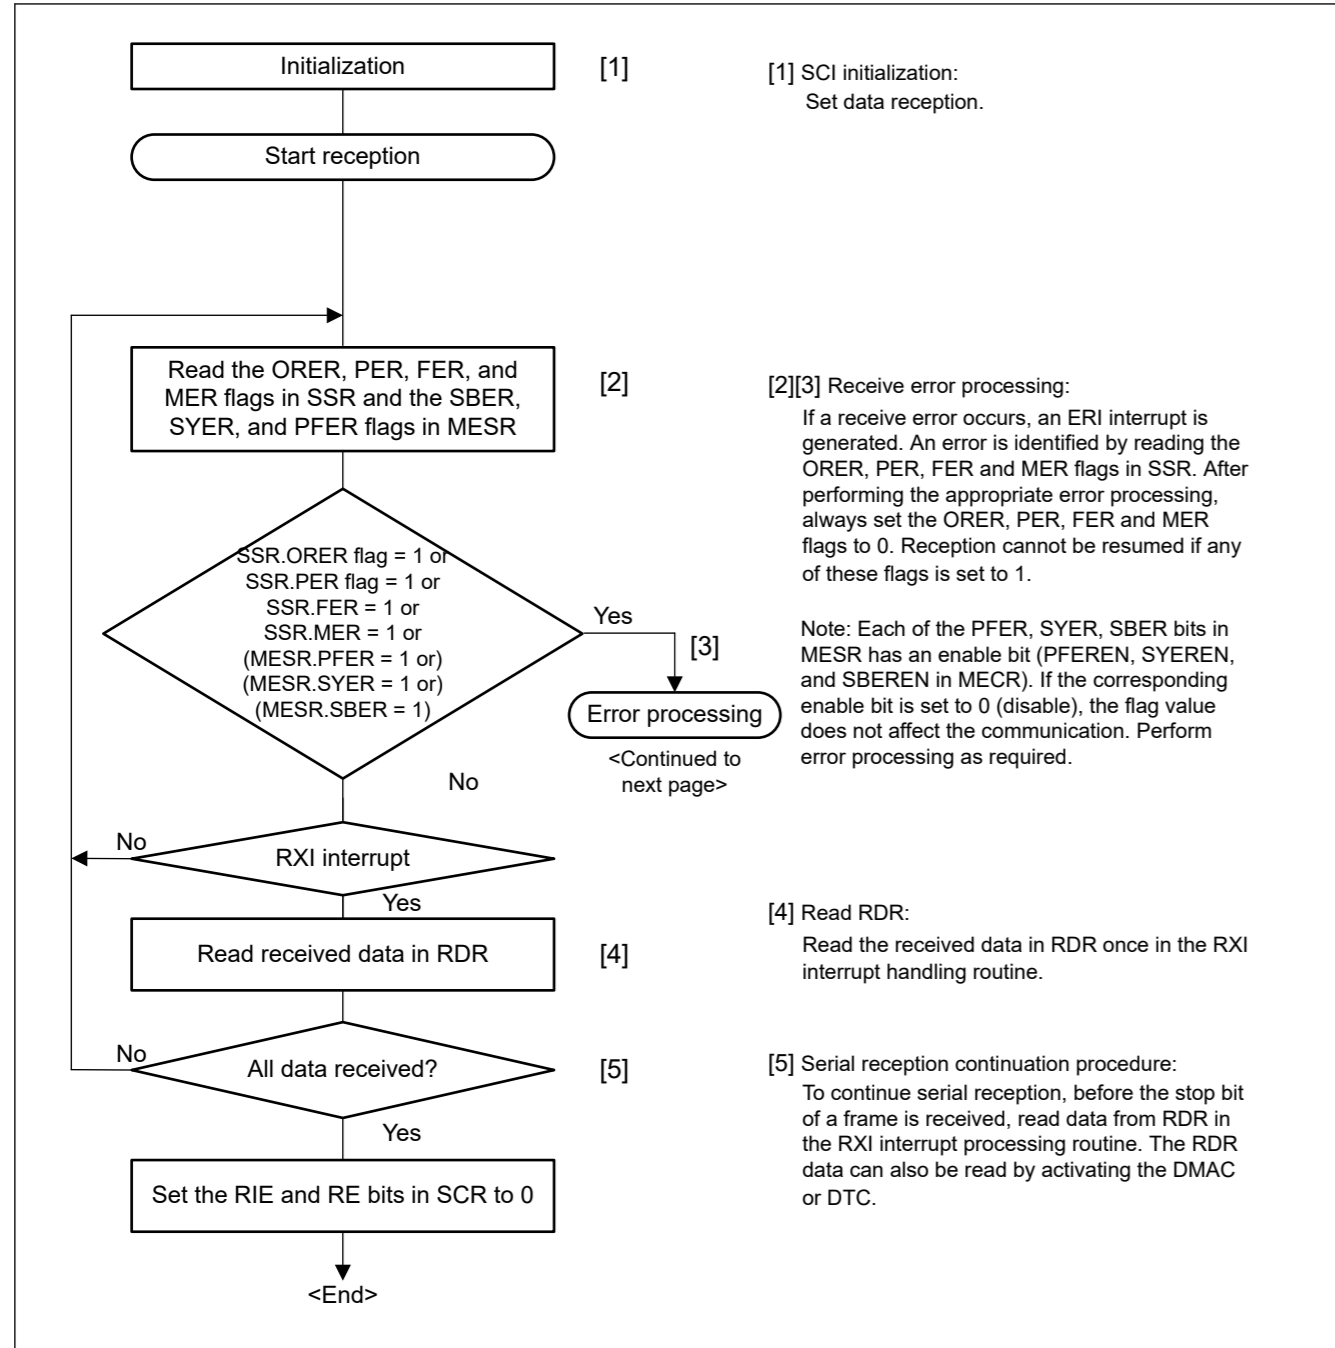

Figure 27.61 Example of Serial Data Reception Flowchart in Manchester Mode (Normal Reception)

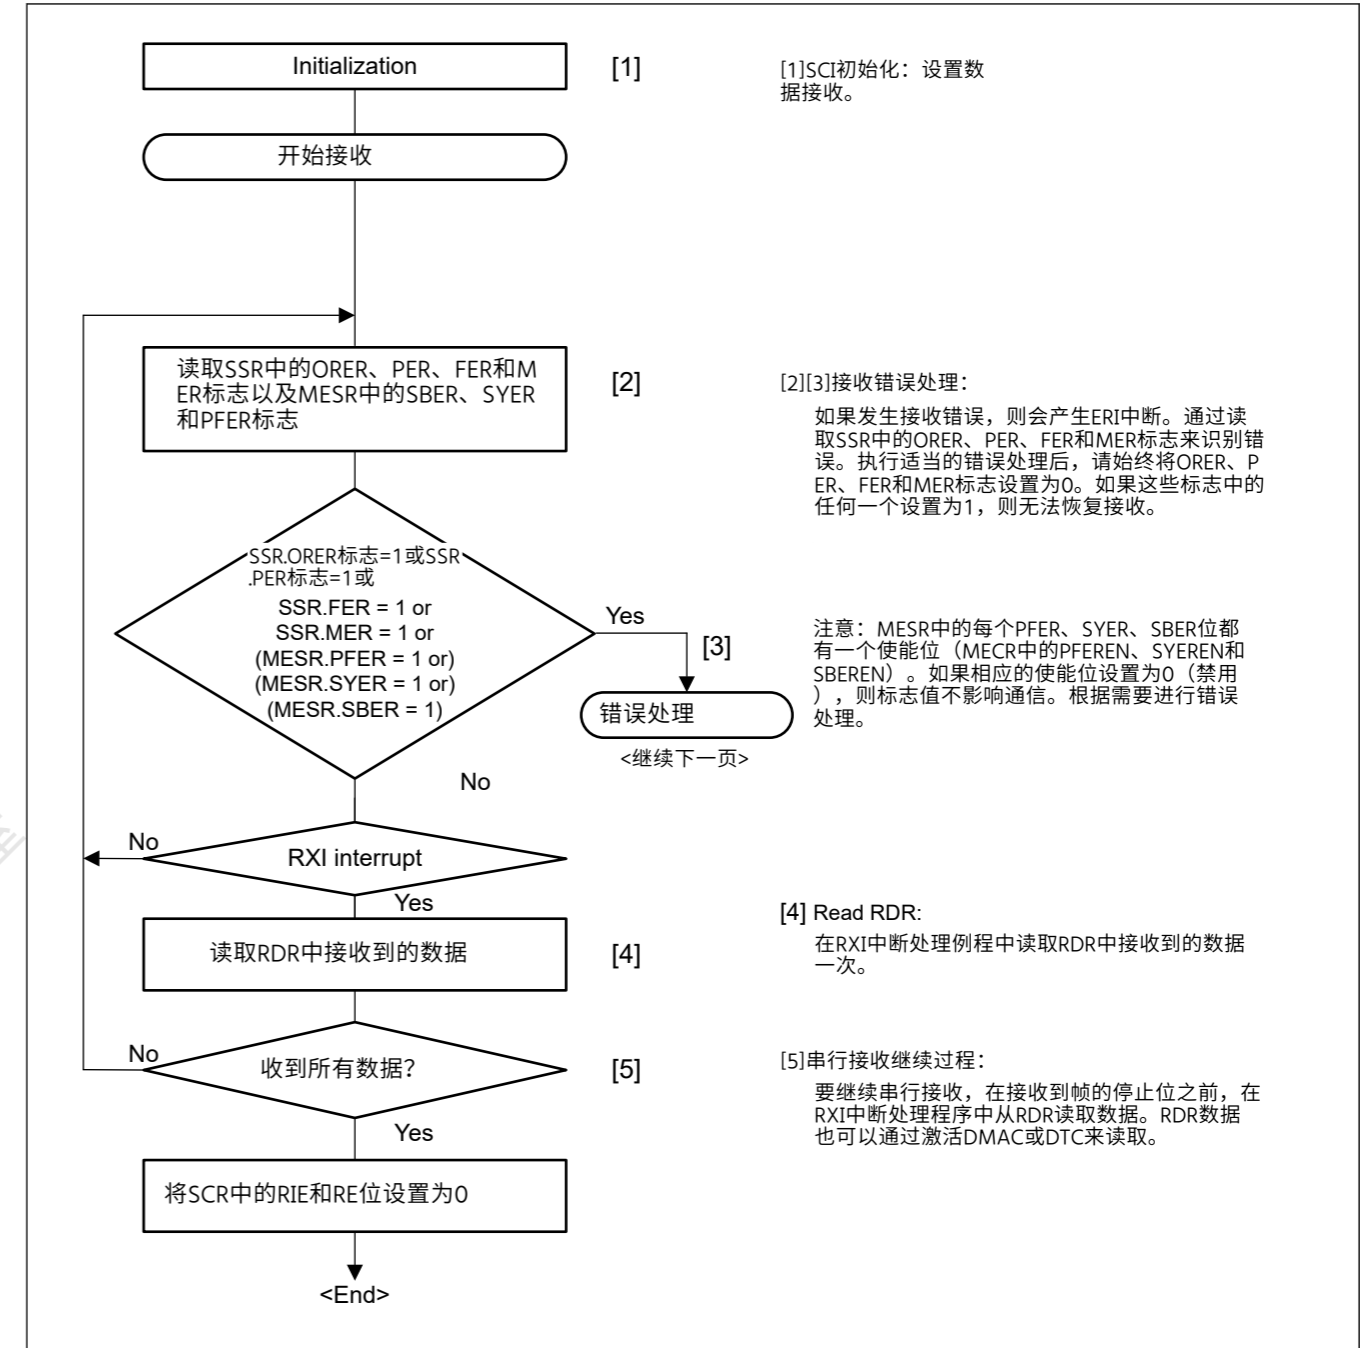

Figure 27.61 曼彻斯特模式下的串行数据接收流程图示例 (正常接收)

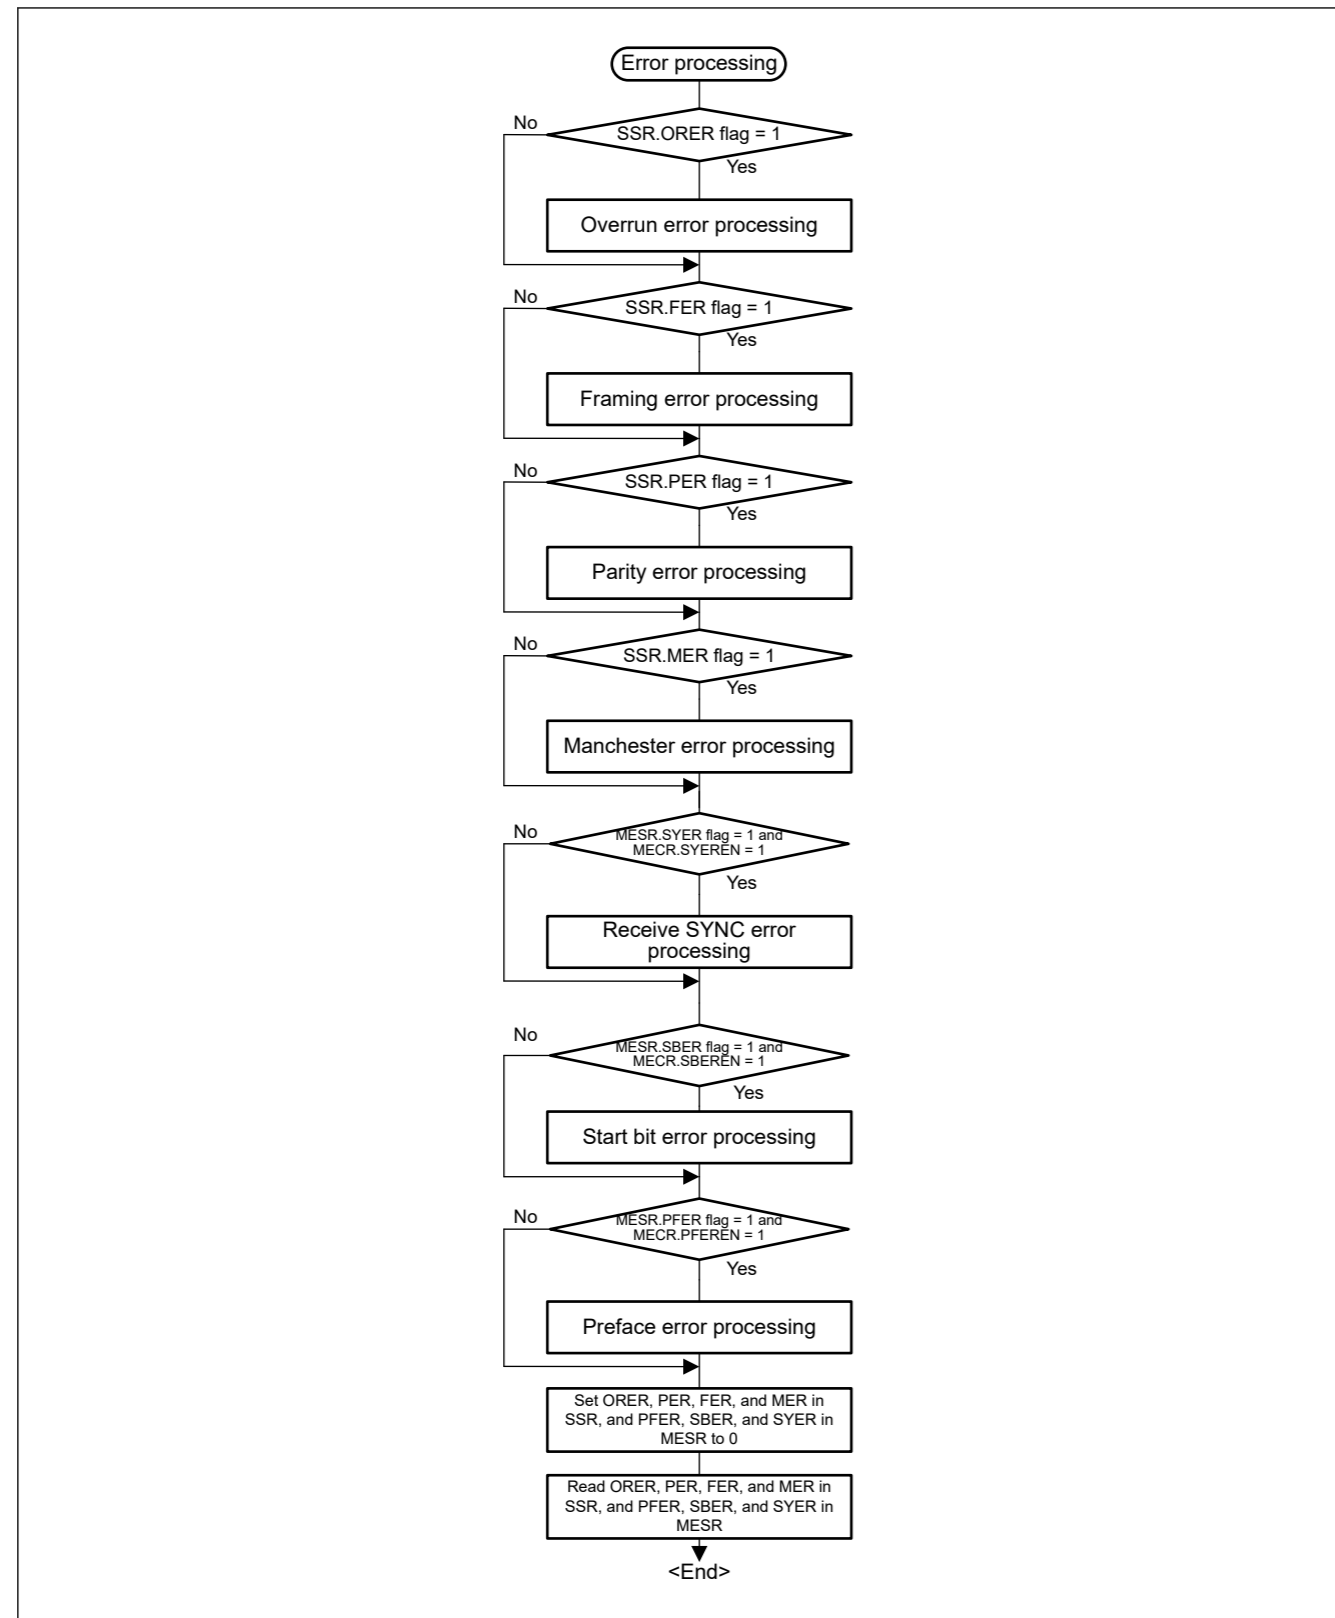

Figure 27.62 Example of Serial Reception Flowchart in Manchester Mode (Error Processing)

## 27.5.8 Operation When Multi-Processor Bit Is Used

See [section 27.4. Multi-Processor Communication Function \(1\)](#) for the operation in Manchester mode when using multi-processor mode because the operation is the same.

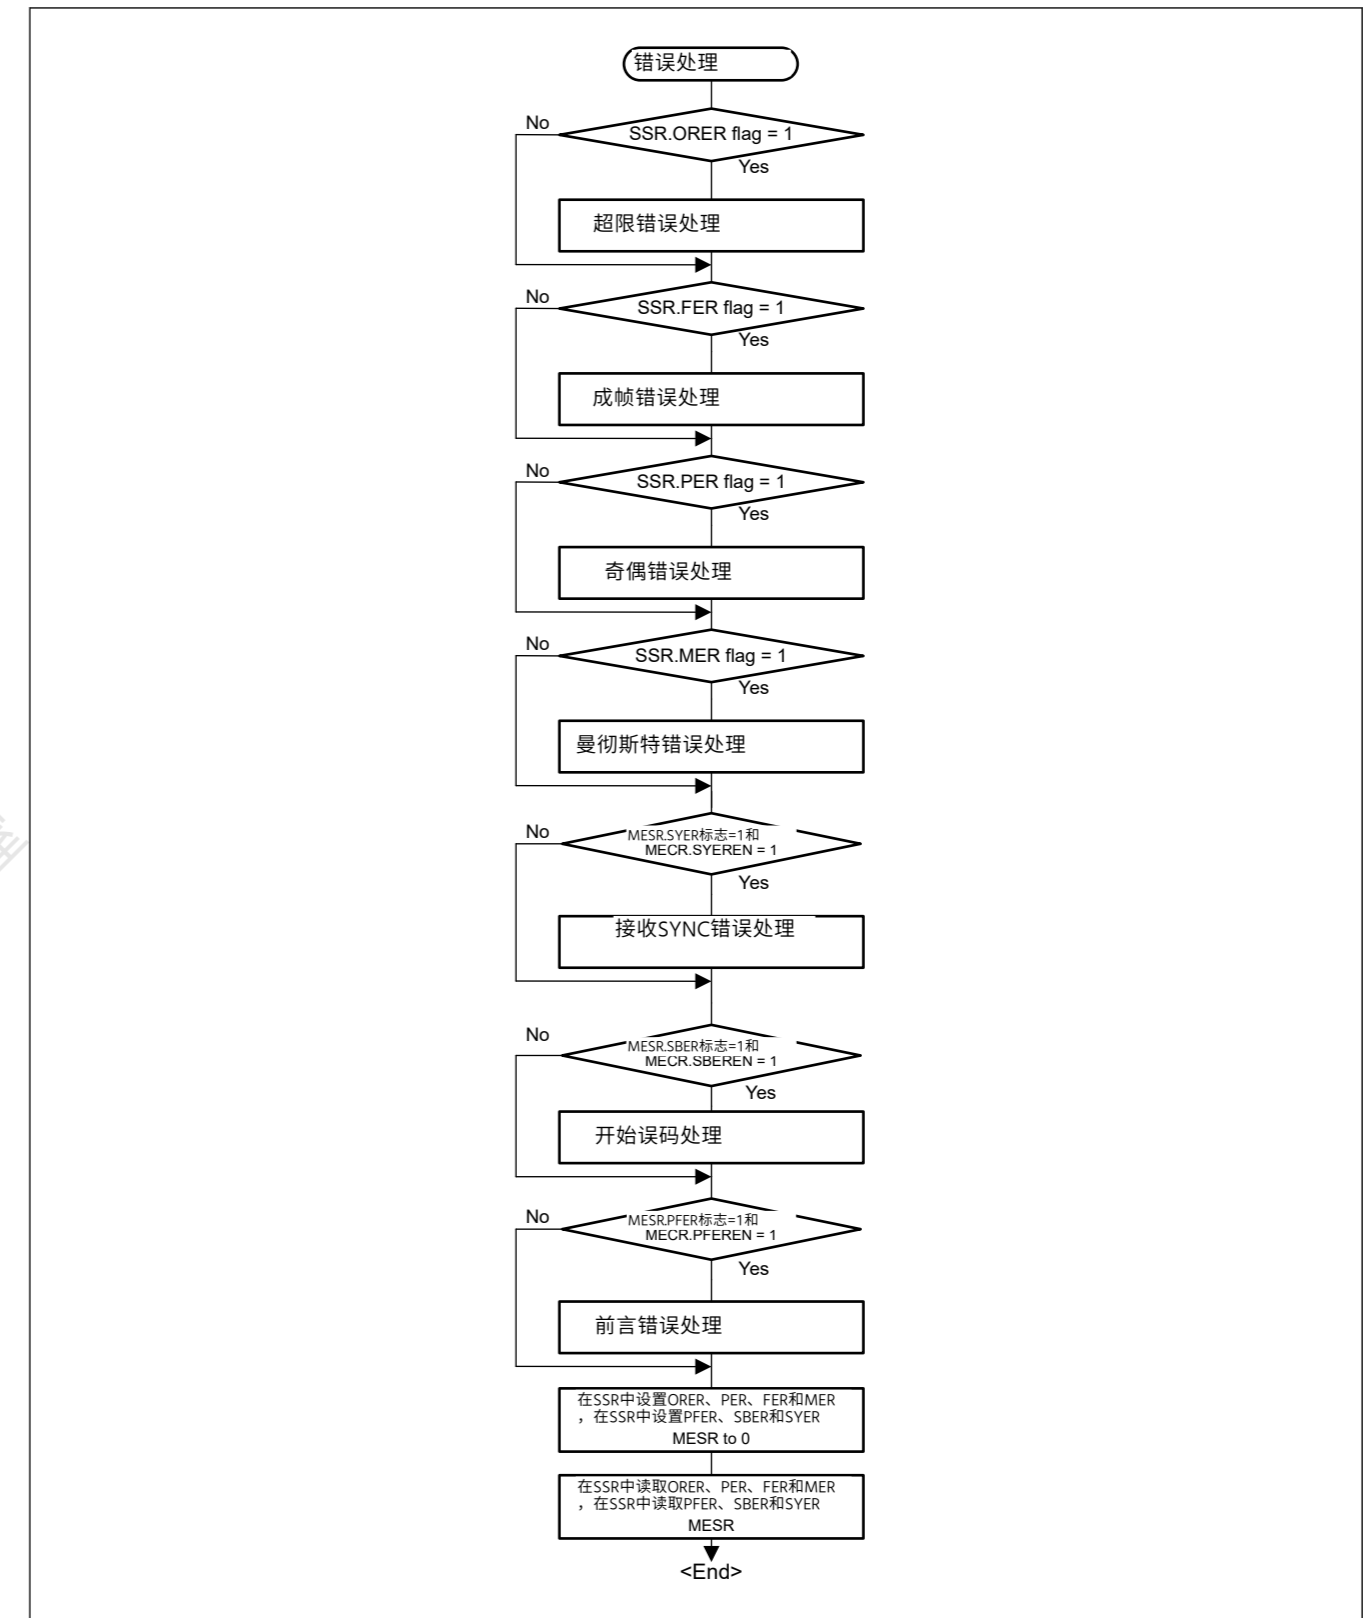

Figure 27.62 曼彻斯特模式下的串行接收流程图示例 (错误处理)

## 27.5.8 使用多处理器位时的操作

请参见第27.4节。多处理器通信功能(1)曼彻斯特模式下的操作在使用多处理器模式时因为操作是一样的。

A preface and a start bit area are added to the frame format in Manchester mode. See [Figure 27.62](#) for error processing in Manchester mode for the reception flowchart ([Figure 27.46](#)). Refer to [Table 27.35](#) for the operation status when detecting various errors.

### 27.5.9 Receive Retiming

This function corrects the timing for each central edge of the bit, taking advantage of the fact that each bit has an edge in the center in Manchester code.

The receive retiming function can be turned on or off by setting the ERTEN bit in the MMR register.

When the receive retiming function is turned off (MMR.ERTEN = 0), retiming is not performed, causing misalignment between the internal clock and the RXD input to be accumulated and the receive margin to be reduced.

When the receive retiming function is turned on (MMR.ERTEN = 1), retiming is performed for the preface area, the start bit area<sup>1</sup>, and the data area (excluding the stop bit).

Note 1. Retiming is not performed for the start bit area if the preface length is 0 and the start bit length is 3.

As an example, the receive retiming when oversampling x16 is selected is shown below.

When detecting an RXD input edge two to four cycles before the expected receive cycle, the receive processing is shortened by one sampling CLK cycle.

When detecting an RXD input edge two to three cycles after the expected receive cycle, the receive processing is extended by one sampling CLK cycle.

(Even if the clock is misaligned with the data by more than two cycles, one cycle is corrected for each bit.)

[Figure 27.63](#) shows the conceptual image of receive retiming range.

When detecting an edge in the tolerance area in the figure, data is received as is without making correction.

When detecting an edge in the SyncJump area in the figure, data is corrected for reception.

When detecting an edge in the SyncError area in the figure, data is received as abnormal data with no correction made.

For a Manchester code error (data matches at the 1/4-phase and 3/4-phase sampling points), the SCI reports a code error.

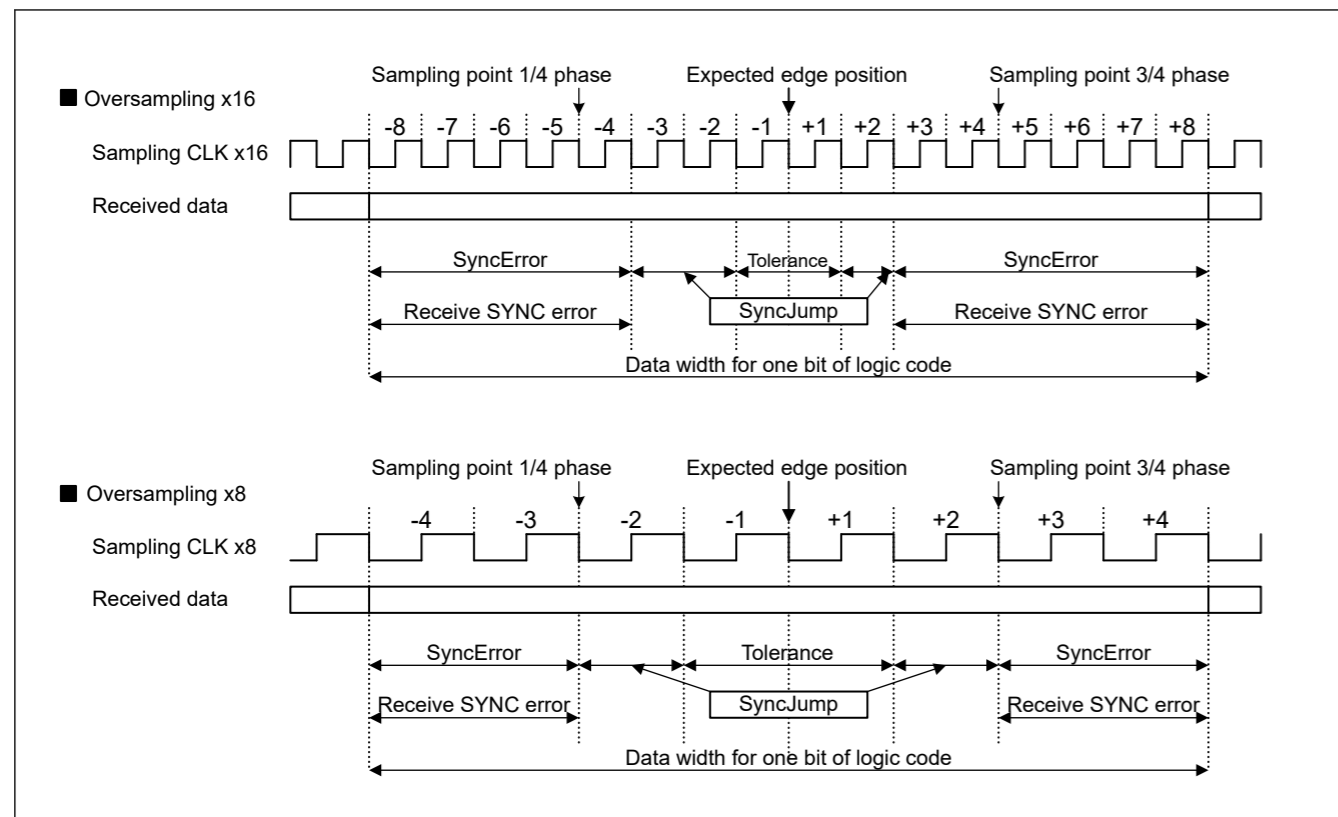

Figure 27.63 Conceptual Image of Reception Retiming Range

曼彻斯特模式的帧格式中添加了前言和起始位区域。接收流程图（图27.46）在曼彻斯特模式下的错误处理见图27.62。检测各种错误时的动作状态见表27.35。

### 27.5.9 接收重定时

该函数利用曼彻斯特码中每个位在中心的边缘这一事实，校正位的每个中心边沿的时序。

通过设置MMR寄存器中的ERTEN位可以打开或关闭接收重定时功能。

当接收重定时功能关闭（MMR.ERTEN=0）时，不执行重定时，导致内部时钟和RXD输入之间的错位被累积，接收裕量减少。

当接收重定时功能打开时（MMR.ERTEN=1），对前言区、起始位区\*1和数据区（不包括停止位）执行重定时。

注1.如果序言长度为0且起始位长度为3，则不对起始位区域执行重定时。

例如，选择过采样x16时的接收重定时如下所示。

当在预期接收周期前2到4个周期检测到RXD输入边沿时，接收处理将缩短1个采样CLK周期。

当在预期接收周期后两到三个周期检测到RXD输入边沿时，接收处理将延长一个采样CLK周期。

（即使时钟与数据的偏差超过两个周期，也会为每一位校正一个周期。）

图27.63显示了接收重定时范围的概念图。

在图中的公差范围内检测边缘时，直接接收数据而不进行校正。

当在图中的SyncJump区域检测到边缘时，数据被校正以进行接收。

当在图中的SyncError区域检测到边缘时，数据作为异常数据接收，没有进行校正。

对于曼彻斯特编码错误（数据在1个4相和3个4相采样点匹配），SCI报告编码错误。

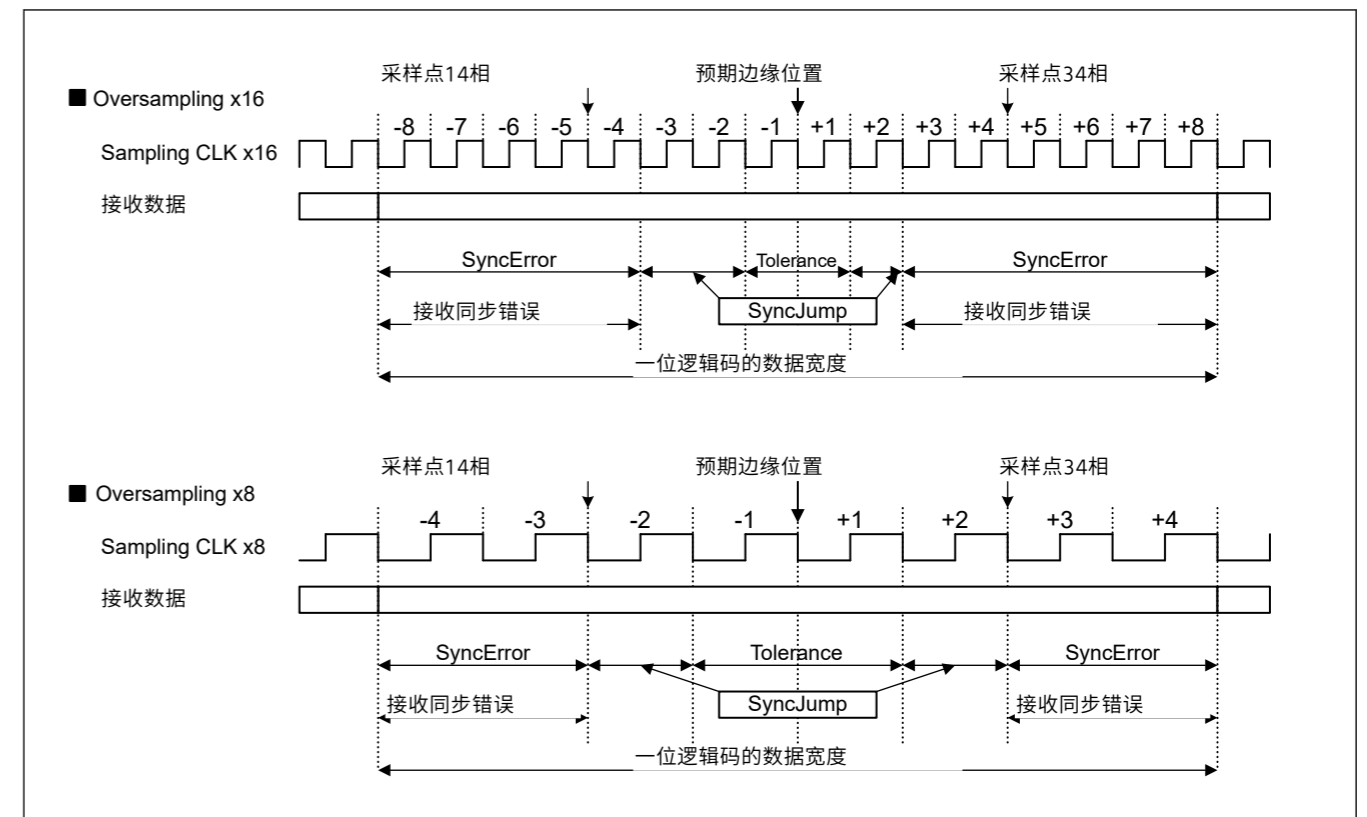

Figure 27.63 接收重定时范围的概念图

### 27.5.10 Polarity Setting for Manchester Code

The polarity of the Manchester code can be set with the Manchester Mode Register (MMR). It can be set separately for transmission and reception. Use the MMR.TMPOL bit to set the polarity for transmission and the MMR.RMPOL bit to set the polarity for reception.

The Manchester code polarity setting is valid for the preface area, the data area, and the parity or multi-processor area.

When the initial settings (TMPOL/RMPOL = 0) are used for the polarity of Manchester code, logic 0 is encoded as a zero-to-one transition in Manchester code and logic 1 is encoded as a one-to-zero transition in Manchester code. If the settings are changed to TMPOL/RMPOL = 1, logic 0 is encoded as a one-to-zero transition in Manchester code and logic 1 is encoded as a zero-to-one transition in Manchester code. Figure 27.64 shows the conceptual image of the settings and operation.

Separately from the function above, the transmitted and received data in the data area can be inverted by the transmitted/received data inversion function (SCMR.SINV). Since the polarity of Manchester code (MMR.TMPOL/RMPOL) can be set separately from the transmitted/received data invert function (SCMR.SINV), if both are set to inversion (MMR.TMPOL/RMPOL = 1 and SCMR.SINV = 1), the transmitted and received data are set to initial state (inversion + inversion = normal).

The polarity of the start bit area can be set by a register different from the ones mentioned above.

Since a different register is used, the polarity of the start bit area is not affected by the polarity setting for Manchester code mentioned above.

For details on the setting for the start bit area, see para. (2) in section 27.5.1. Frame Format.

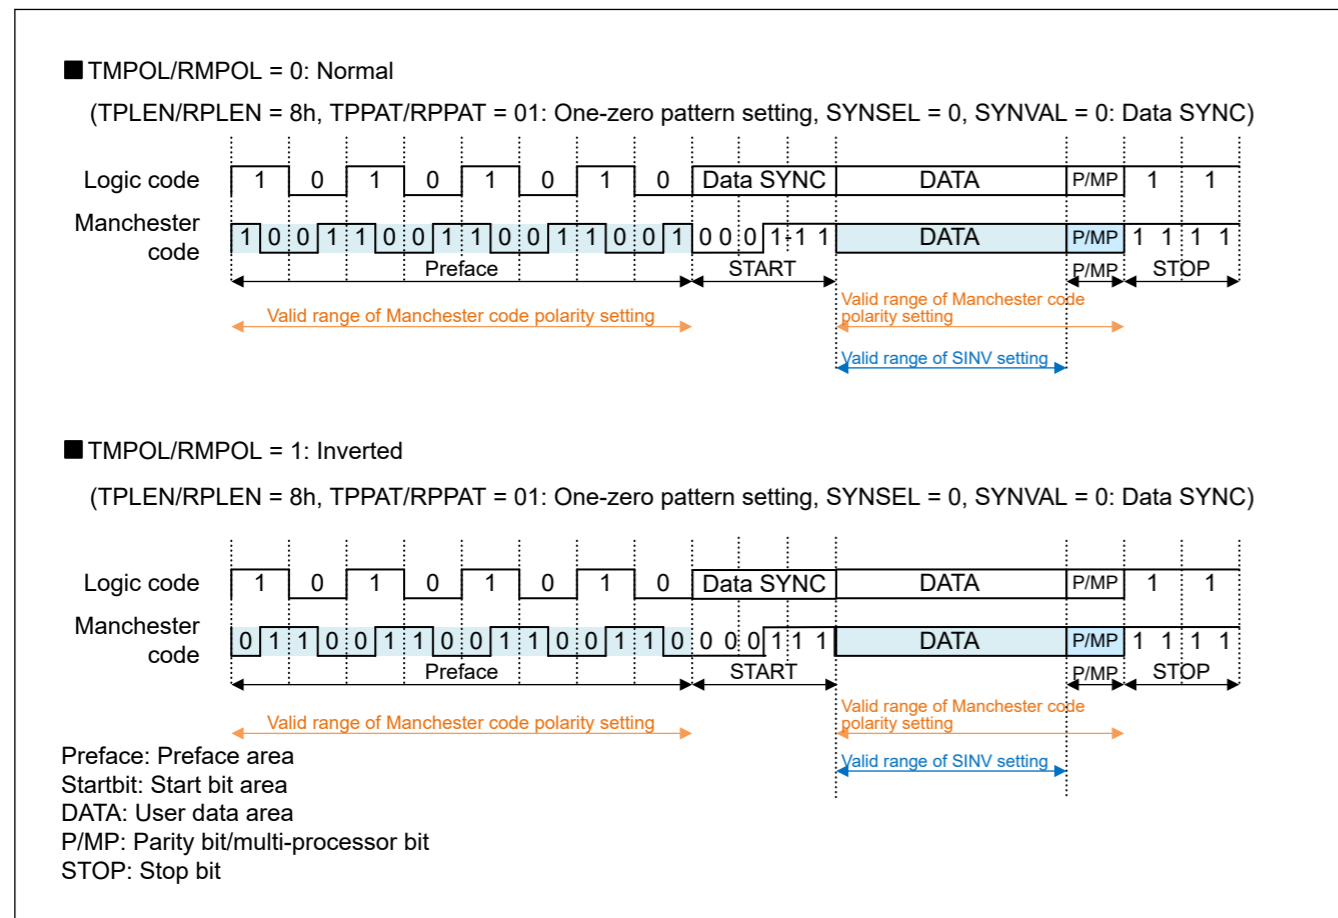

Figure 27.64 Valid Range of the Manchester Code Polarity Setting

### 27.5.11 Errors in Manchester Mode

There are the following errors in Manchester mode:

### 27.5.10 曼彻斯特码的极性设置

曼彻斯特码的极性可以通过曼彻斯特模式寄存器(MMR)设置。

可以分别设置发送和接收。使用MMR.TMPOL位设置传输的极性和MMR.RMPOL位设置接收极性。

曼彻斯特码极性设置对前言区、数据区、奇偶校验或多处理器区有效。

当初始设置(TMPOL/RMPOL=0)用于曼彻斯特代码的极性时，逻辑0被编码为曼彻斯特代码中的零到一转换，逻辑1被编码为曼彻斯特代码中的一对零转换。如果设置更改为TMPOL/RMPOL=1，则逻辑0被编码为曼彻斯特代码中的一对零转换，逻辑1被编码为曼彻斯特代码中的零到一转换。图27.64显示了设置和操作的概概念图。

与上述功能不同，数据区中的发送和接收数据可以通过发送接收数据反转功能(SCMR.SINV)反转。由于曼彻斯特码的极性(MMR.TMPOL/RMPOL)可以与发送的接收数据反转功能(SCMR.SINV)分开设置，如果两者都设置为反转(MMR.TMPOL/RMPOL=1和SCMR.SINV=1)，发送和接收的数据设置为初始状态(反转+反转=正常)。

起始位区域的极性可以通过与上述不同的寄存器来设置。

由于使用了不同的寄存器，因此起始位区域的极性不受上述曼彻斯特码极性设置的影响。

有关起始位区域设置的详细信息，请参见第1段。(2)在第27.5.1节中。帧格式。

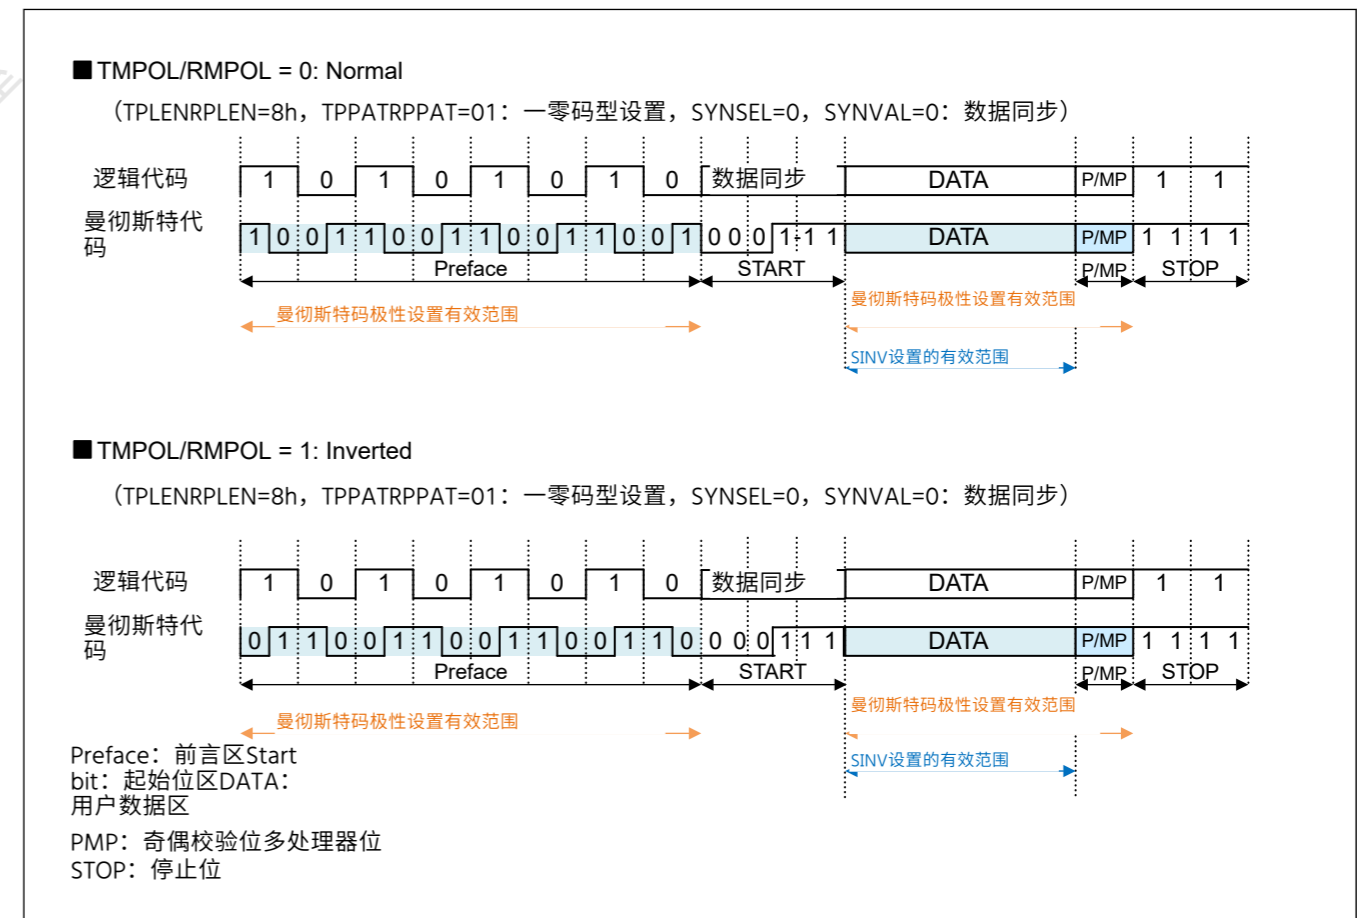

Figure 27.64 曼彻斯特码极性设置的有效范围

### 27.5.11 曼彻斯特模式中的错误

曼彻斯特模式有以下错误:

1. Parity error
2. Over run error
3. Framing error
4. Manchester error
5. Preface error
6. Start Bit error
7. Receive SYNC error

For errors (1) to (3), see [section 27.3.9. Serial Data Reception in Asynchronous Mode](#) (1) because they are the same as in asynchronous mode.

Each errors are judged in each area, but they are reflected on flags and operations at the timing of 3/4-bit sampling of the STOP bit area. If a preface error or start bit error is detected, subsequent data will not be received. Therefore, no other error detection is performed, and the error flag holds the previous information.

[Table 27.33](#) lists the states of the serial status register when detecting errors and judgment about whether to store data in the RDR.

[Table 27.34](#) lists the errors that can be detected in each area of a Manchester frame.

If a Preface error or Start bit error is detected, subsequent data will not be received. Therefore, no other error detection is performed, and the error flag holds the result of the previous frame reception. Also, if an error is detected in the previous frame, data will not be received, but errors in the pre-face area and start bit area will update that flag. [Table 27.35](#) shows the flags and actions in this case.

#### (4) Manchester error

A Manchester error is generated when a Manchester code error is detected.

In Manchester code, there must be an edge (transition) in the center of the bit.

In the data area of a received frame (including the parity/multi-processor bit), the values of the 1/4-bit and 3/4-bit sampling points are checked in each received 1-bit data, and a Manchester code error is determined if these two values match.

If a Manchester code error is detected, the Manchester error flag (SSR.MER) is asserted.

If a Manchester error occurs, it is handled as an interrupt source and event source. If a Manchester error is detected, the next reception is not performed until the corresponding error flag is cleared.

#### (5) Preface error

A preface error is generated when the preface pattern does not match or a Manchester code error is detected in the preface area. If a preface error is detected, the preface error flag (SSR.PFER) is asserted.

It is possible to set whether to use this error flag as an interrupt source with the setting of the MECCR register.

When MECCR.PFEREN = 1, a preface error is handled as an interrupt source or event source. If a preface error is detected, the next reception is not performed until the corresponding error flag is cleared.

When MECCR.PFEREN = 0, a preface error is not handled as an interrupt source or event source, and the next reception is not halted. However, a preface error is notified to MESR.PFER.

#### (6) Start bit error

A start bit error is generated when a mismatch is detected between the start bit area in the received frame and the preset start bit pattern. Upon detection of a start bit error, a start bit error flag (MESR.SBER) is asserted.

It is possible to set whether to use the start bit error as an interrupt source with the setting of the MECCR register.

When MECCR.SBEREN = 1, a start bit error is handled as an interrupt source or event source. If a start bit error is detected, the next reception is not performed until the corresponding error flag is cleared.

When MECCR.SBEREN = 0, a start bit error is not handled as an interrupt source or event source, and the next reception is not halted. However, a start bit error is notified to MESR.SBER.

#### (7) Receive SYNC error

When the receive retiming function described in [section 27.5.9. Receive Retiming](#) is enabled, the receive retiming operation is performed.

- 1.奇偶校验错误
- 2.溢出错误
- 3.构图错误
- 4.曼彻斯特错误
- 5.前言错误
- 6.起始位错误
- 7.收到SYNC错误

关于错误(1)至(3), 请参阅第27.3.9节。异步模式下的串行数据接收(1)因为它们与异步模式下相同。

在每个区域中判断每个错误, 但它们反映在标志和操作上, 在3个4位采样的时间停止位区域。如果检测到前言错误或起始位错误, 则不会接收后续数据。因此, 不进行其他错误检测, 错误标志保存先前的信息。

表27.33列出了串口状态寄存器在检测错误和判断是否存储数据时的状态RDR。

表27.34列出了可以在曼彻斯特帧的每个区域中检测到的错误。

如果检测到Preface错误或Startbit错误, 则不会接收后续数据。因此, 不进行其他错误检测, 错误标志保存前一帧接收的结果。此外, 如果在前一帧中检测到错误, 则不会接收数据, 但前脸区域和起始位区域中的错误将更新该标志。表27.35显示了这种情况下的标志和操作。

#### (4)曼彻斯特错误

当检测到曼彻斯特码错误时, 就会产生曼彻斯特错误。

在曼彻斯特码中, 位的中心必须有一个边(转换)。

在接收帧的数据区(包括奇偶校验多处理器位), 在每个接收的1位数据中检查1个4位和3个4位采样点的值, 确定曼彻斯特码错误如果这两个值匹配。

如果检测到曼彻斯特代码错误, 则曼彻斯特错误标志(SSR.MER)被置位。

如果发生曼彻斯特错误, 则将其作为中断源和事件源进行处理。如果检测到曼彻斯特错误, 则在清除相应错误标志之前不会执行下一次接收。

#### (5)前言错误

当前言模式不匹配或在前言区检测到曼彻斯特码错误时, 会产生前言错误。如果检测到前言错误, 则断言前言错误标志(SSR.PFER)。

可以通过MECCR寄存器的设置来设置是否使用该错误标志作为中断源。

当MECCR.PFEREN=1时, 前言错误作为中断源或事件源处理。如果检测到前言错误, 则在相应的错误标志被清除之前不会执行下一次接收。

当MECCR.PFEREN=0时, 前言错误不会作为中断源或事件源处理, 并且不会停止下一次接收。但是, 前言错误会通知给MESR.PFER。

#### (6)起始位错误

当检测到接收帧中的起始位区域与预设的起始位模式不匹配时, 会产生起始位错误。在检测到起始位错误时, 将置位起始位错误标志(MESR.SBER)。

可以通过MECCR寄存器的设置来设置是否使用起始位错误作为中断源。

当MECCR.SBEREN=1时, 起始位错误作为中断源或事件源处理。如果检测到起始位错误, 则在清除相应错误标志之前不会执行下一次接收。

当MECCR.SBEREN=0时, 不将起始位错误作为中断源或事件源处理, 并且不会停止下一次接收。但是, 将向MESR.SBER通知起始位错误。

#### (7)接收同步错误

当接收重定时功能在第27.5.9节中描述。启用接收重定时, 执行接收重定时操作。

If no edges are detected within the receive retiming range (SyncError area in Figure 27.63) when receive timing operation is being performed, a receive SYNC error is generated. Upon detection of a receive SYNC error, a receive SYNC error flag (MESR.SYER) is asserted. In areas not subject to retiming, receive SYNC errors are not detected.

The preface area\*1, the start bit area\*1,\*2, and the data area (excluding the stop bit) for which receive retiming operation is performed are checked.

It is possible to set whether to use the receive SYNC error as an interrupt source with the setting of the MECR register.

When MECR.SYEREN = 1, a receive SYNC error is handled as an interrupt source or event source. If a receive SYNC error is detected, the next reception is not performed until the corresponding error flag is cleared.

When MECR.SYEREN = 0, a receive SYNC error is not handled as an interrupt source or event source, and the next reception is not halted. However, a receive SYNC error is notified to MESR.SYER.

Note 1. In the case of a frame that starts with a pattern that expects the first half of the bit to be High, it is excluded from retiming.

Note 2. In the start bit area, when there is no preface length and 3 bit start bit is set, it is not subject to retiming.

Also, the 1st bit and the 2nd bit in the start bit area when 3 bit start bit is set are not subject to retiming.

Table 27.33 Flags in the SSR Register and Receive Data Handling in Manchester Mode

| Flag in the SSR register |                      |      |      | Flag in the MERS register |         |       | received data   | Received error status (ERI interrupt / event generation)         |
|--------------------------|----------------------|------|------|---------------------------|---------|-------|-----------------|--|
| ORE R                    | FER                  | PER  | MER  | SBE R*1                   | PFER *1 | SYE R |                 |  |
| 0                        | 0                    | 0    | 0    | 0                         | 0       | 0     | transfer to RDR | No error   |
| 0                        | 1                    | 0    | 0    | 0                         | 0       | 0     | transfer to RDR | Framin error   |
| 0                        | 0                    | 1    | 0    | 0                         | 0       | 0     | transfer to RDR | Parity error   |
| 0                        | 1                    | 1    | 0    | 0                         | 0       | 0     | transfer to RDR | Framing error + Parity error                                     |
| 0                        | 0                    | 0    | 1    | 0                         | 0       | 0     | transfer to RDR | Manchester error   |
| 0                        | 1                    | 0    | 1    | 0                         | 0       | 0     | transfer to RDR | Framing error + Manchester error                                 |
| 0                        | 0                    | 1    | 1    | 0                         | 0       | 0     | transfer to RDR | Parity error + Manchester error                                  |

| hold                     | hold                 | hold | hold | 0                         | 1       | 1     | Lost            | Preface error*3 + Receive SYNC error*2                           |
| hold                     | hold                 | hold | hold | 1                         | 0       | 1     | Lost            | Start bit error*3 + Receive SYNC error*2                         |

Note 1. Start bit error and Preface error never become "1" at the same time.

Note 2. When MECR.SYEREN = "1", ERI interrupt / event is generated by SYER factor.

Note 3. If MECR.PFEREN = "1" or MECR.SBEREN = "1", an ERI interrupt / event is generated when the corresponding flag is set.

如果在执行接收定时操作时在接收重定时范围内（图27.63中的SyncError区域）没有检测到边沿，则会产生接收SYNC错误。在检测到接收同步错误时，接收同步错误标志(MESR.SYER)被置位。在不受重定时限制的区域中，不会检测到接收同步错误。

检查执行接收重定时操作的前言区域\*1、起始位区域\*1、\*2和数据区域（不包括停止位）。

可以通过MECR寄存器的设置来设置是否使用接收SYNC错误作为中断源。

当MECR.SYEREN=1时，接收SYNC错误将作为中断源或事件源处理。如果检测到接收SYNC错误，则在清除相应错误标志之前不会执行下一次接收。

当MECR.SYEREN=0时，接收SYNC错误不会作为中断源或事件源处理，并且不会停止下一次接收。但是，接收同步错误会通知给MESR.SYER。

注1.对于以预期位的前半部分为高的模式开始的帧，它被排除在重定时之外。

注2.在起始位区域中，当没有序言长度且设置了3位起始位时，不进行重定时。

此外，当设置3位起始位时，起始位区域中的第1位和第2位不受重定时的影响。

Table 27.33 SSR寄存器中的标志和曼彻斯特模式下的接收数据处理

| SSR寄存器中的标志 |      |      |      | MERS寄存器中的标志 |         |       | 接收数据   | 接收错误状态 (ERI中断事件产生)      |
|------------|------|------|------|-------------|---------|-------|--------|-------------------------|

| 1          | 1    | 1    | 1    | 0           | 0       | 0     | Lost   | 溢出错误+成帧错误+奇偶校验错误+曼彻斯特错误 |
| 0          | 以上结合 |      |      | 0           | 0       | 0     | 转移到RDR | 上述错误+接收同步错误*2           |
| 1          |      |      |      | 0           | 0       | 0     | Lost   | 上述错误+接收同步错误*2           |
| hold       | hold | hold | hold | 0           | 1       | 0     | Lost   | 前言错误*3                  |
| hold       | hold | hold | hold | 1           | 0       | 0     | Lost   | 起始位错误*3                 |
| hold       | hold | hold | hold | 0           | 1       | 1     | Lost   | 前言错误*3+接收同步错误*2         |
| hold       | hold | hold | hold | 1           | 0       | 1     | Lost   | 起始位错误*3+接收同步错误*2        |

注1.起始位错误和序言错误永远不会同时变为"1"。

注2.当MECR.SYEREN="1"时，由SYER因素产生ERI中断事件。

注3.如果MECR.PFEREN="1"或MECR.SBEREN="1"，则在设置相应标志时产生ERI中断事件。

Table 27.34 Errors Detectable in Each Area

|                      | Preface error (PFER) | Start Bit error (SBER) | Manchester error (MER) | Receive SYNC error (SYER) | Parity error (PER) | Framing error (FER) |
|----------------------|----------------------|------------------------|------------------------|---------------------------|--------------------|---------------------|
| Preface area         | ✓                    | —                      | —*1                    | ✓*2                       | —                  | —                   |
| Start Bit area       | —                    | ✓                      | —                      | ✓*2                       | —                  | —                   |
| Data area            | —                    | —                      | ✓                      | ✓                         | —                  | —                   |
| Parity area          | —                    | —                      | ✓                      | ✓                         | ✓                  | —                   |

| Stop Bit area        | —                    | —                      | —                      | —                         | —                  | ✓                   |

Note: ✓: Detected, —: Not detected

Note 1. When an Manchester code error occurs in the preface area, it is defined as a preface error.

Note 2. It may not be subject to Receive SYNC error detection. For details see the text [section 27.5.11. Errors in Manchester Mode \(7\)](#)

Table 27.35 Operation status due to presence / absence of error in previous frame and operation status list in multiprocessor mode (1 of 2)

| Previous frame           | Each area of the Frame |            |            |            |            | PFER N     | SBER N     | SYER N     | received data   | Error flag       | Interrupt request | Event signal |

Note: ✓: 检测到, —: 未检测到

注1.当序言区出现曼彻斯特码错误时, 定义为序言错误。

注2.它可能不受ReceiveSYNC错误检测的影响。有关详细信息, 请参阅文本部分27.5.11。曼彻斯特模式中的错误(7)

- Note 1. If SYER is detected, the SYER flag is also set. Other operations are as shown in this table.
- Note 2. Other detected error flags including ORER are also set.
- Note 3. If all the error flags are cleared before the STOP bit is judged, the operation will be the same as the case where there is no error in the previous frame of this table.
- Note 4. Since the ERI interrupt request is level output, it remains active due to errors in the previous frame regardless of the presence or absence of error in the relevant frame.
- Note 5. Since the error cause is continuously detected, the ERI event is not newly output regardless of the presence or absence of errors in the relevant frame.
- Note 6. For PFER, SBER, and SYER, when each enable bit is set to disable, it is treated as no error.

**Table 27.36 Operation when MPIE = "1" in multi-processor mode (MPIE = "0")**

| 1     | 没有错误    | 没有错误    | 不在乎  | 不在乎    | 不在乎  | 不在乎    | 不在乎     | 不在乎     | 转移到RDR | 设置一些标志   | output*2          | output*2 |
|       | No PFER | No SBER | 不在乎  | 不在乎    | 不在乎  | 不在乎    | 不在乎     | 0       |        |          |                   |          |
|       | SYER*3  | SYER*3  |      |        |      |        |         | 1       | Lost   | 不要设置任何标志 | 不输出               | 不输出      |
|       | PFER    | 没有错误    | 不在乎  | 不在乎    | 不在乎  | 不在乎    | 不在乎     | 不在乎     |        |          |                   |          |
|       | 没有错误    | SBER    | 不在乎  | 不在乎    | 不在乎  | 不在乎    | 不在乎     | 不在乎     |        |          |                   |          |

- 注1.如果接收到的MPB位为"0"，则不接收帧，操作同本表接收数据丢失。
- 注2.如果没有检测到错误，则输出RXI中断请求或事件，如果检测到，则输出ERI中断请求或事件。

Note 3. When SYER is detected in the preface area or the start bit area, the behavior of handling as an error depending on the SYEREN bit changes.

## 27.6 Operation in Clock Synchronous Mode

Figure 27.65 shows the data format for clock synchronous serial data communications.

In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In clock synchronous mode, no parity bit can be added.

In data transmission, the SCI outputs data from one falling edge of the synchronization clock to the next. In data reception, the SCI receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the transmission line holds the last bit as output state. When the SPMR.CKPH bit is 1 in slave mode, the transmission line holds the first bit output state.

Within the SCI, the transmitter and receiver are independent units, enabling full-duplex communications by using a shared clock. Both the transmitter and the receiver also have a double-buffered structure, so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.

However, it is not possible to perform continuous transfer in the fastest bit rate setting (BRR[7:0] = 0x00 and SMR.CKS[1:0] = 00b). Therefore, when the FIFO is selected, this setting (BRR[7:0] = 0x00 and SMR.CKS[1:0] = 00b) is not available.

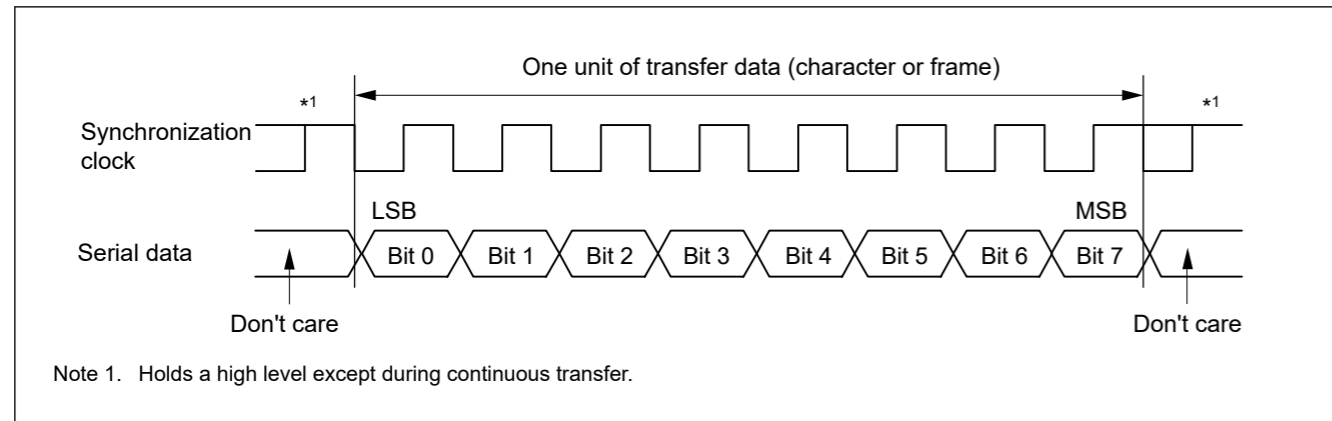

Figure 27.65 Data format in clock synchronous serial communications with LSB-first order

### 27.6.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCKn pin can be selected based on the SCR.CKE[1:0] setting.

When the SCI operates on an internal clock, the synchronization clock is output from the SCKn pin. Eight synchronization clock pulses are output in the transfer of one character. When no transfer is performed, the clock is held high. However, when only data reception is performed while the CTS function is disabled, the synchronization clock output starts when the SCR.RE bit set to 1. The synchronization clock stops when it goes high\*1 and an overrun error occurs or the SCR.RE bit is set to 0.

When only data reception is performed and the CTS function is enabled, the clock output does not start when the SCR.RE bit set to 1 and the CTSn\_RTsn pin input is high. The synchronization clock output starts when the SCR.RE bit is set to 1 and the CTSn\_RTsn pin input is low. Following that, when the CTSn\_RTsn pin input is high on completion of the frame reception, the synchronization clock output stops when it goes high. If the CTSn\_RTsn pin input continues to be low, the synchronization clock stops when it goes high\*1 and an overrun error occurs or the SCR.RE bit is set to 0.

Note 1. The signal is held high while (SPMR.CKPH = 0 and SPMR.CKPOL = 1) or (SPMR.CKPH = 1 and SPMR.CKPOL = 1). It is held low while (SPMR.CKPH = 0 and SPMR.CKPOL = 0) or (SPMR.CKPH = 1 and SPMR.CKPOL = 0).

### 27.6.2 CTS and RTS Functions

In the CTS function, the CTSn\_RTsn pin input controls the start of data reception or transmission when the clock source is the internal clock. Setting the SPMR.CTSE bit to 1 enables the CTS function. When the CTS function is enabled, setting the CTSn\_RTsn pin low causes data reception or transmission to start.

注3.在序言区域或起始位区域中检测到SYER时,根据SYEREN位作为错误处理的行为会发生变化。

## 27.6 时钟同步模式下的操作

图27.65显示了时钟同步串行数据通信的数据格式。

在时钟同步模式下,数据的发送或接收与时钟脉冲同步。传输数据中的一个字符由8位数据组成。在时钟同步模式下,不能添加奇偶校验位。

在数据传输中,SCI从同步时钟的一个下降沿输出数据到下一个下降沿。在数据接收中,SCI与同步时钟的上升沿同步接收数据。8位数据输出后,传输线保持最后一位作为输出状态。当SPMR.CKPH位在从机模式下为1时,传输线保持第一位输出状态。

在SCI中,发送器和接收器是独立的单元,通过使用共享时钟实现全双工通信。发送端和接收端都具有双缓冲结构,可以在发送时写入下一个发送数据,或者在接收时读取前一个接收数据,实现数据的连续传输。

但是,不可能以最快的比特率设置(BRR[7:0]=0x00和SMR.CKS[1:0]=00b)。因此,当FIFO被选中时,此设置(BRR[7:0]=0x00和SMR.CKS[1:0]=00b)不可用。

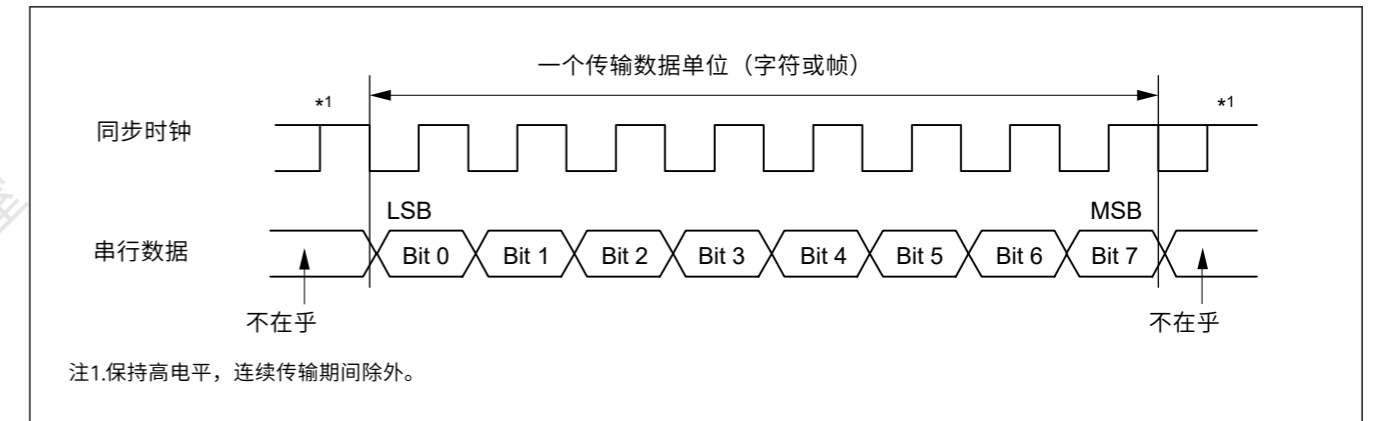

Figure 27.65 具有LSB优先顺序的时钟同步串行通信中的数据格式

### 27.6.1 Clock

可以根据SCR.CKE[1:0]设置选择由片内波特率发生器生成的内部时钟或SCKn引脚上的外部同步时钟输入。

当SCI在内部时钟上运行时,同步时钟从SCKn引脚输出。在一个字符的传输中输出八个同步时钟脉冲。当不执行传输时,时钟保持高电平。但是,当CTS功能禁用时仅执行数据接收时,同步时钟输出会在SCR.RE位设置为1时开始。同步时钟在变为高电平时停止\*1并且发生溢出错误或SCR.RE位设置为0。

仅执行数据接收且启用CTS功能时,当SCR.RE位设置为1且CTSn\_RTsn引脚输入为高电平时,时钟输出不会启动。当SCR.RE位设置为1且CTSn\_RTsn引脚输入为低电平时,同步时钟输出开始。之后,当CTSn\_RTsn引脚输入在帧接收完成时为高电平时,同步时钟输出在其变为高电平时停止。如果CTSn\_RTsn引脚输入持续为低电平,则同步时钟在变为高电平时停止\*1并发生溢出错误或SCR.RE位设置为0。

注1.当(SPMR.CKPH=0且SPMR.CKPOL=1)或(SPMR.CKPH=1且SPMR.CKPOL=1)时,信号保持高电平。它在(SPMR.CKPH=0和SPMR.CKPOL=0)或(SPMR.CKPH=1和SPMR.CKPOL=0)时保持低电平。

### 27.6.2 CTS和RTS函数

在CTS功能中,当时钟源为内部时钟时,CTSn\_RTsn引脚输入控制数据接收或发送的开始。将SPMR.CTSE位设置为1可启用CTS功能。当CTS功能使能时,将CTSn\_RTsn引脚设置为低电平会导致数据接收或发送开始。

Setting the CTSn\_RTsn pin high while the data transmission or reception is in progress does not affect transmission or reception of the current frame.

In the RTS function, the CTSn\_RTsn pin output is used to request the start of data reception or transmission when the clock source is an external synchronizing clock. The CTSn\_RTsn output goes low when serial communication becomes possible. Conditions for output of the CTSn\_RTsn low and high are shown as follows:

[Conditions for low output]

Satisfaction of all the following conditions:

#### Non-FIFO selected when all of the following conditions are satisfied

- The value of the SCR.RE bit or the SCR.TE bit is 1
- Neither transmission nor reception is in progress
- There is no received data available to be read when the SCR.RE bit is 1
- Transmit data is written when the SCR.TE bit is 1 and SCR.CKE[1] bit is 0
- Data is available for transmission in the TSR register when SCR.TE bit is 1 and SCR.CKE[1] bit is 1
- The SSR.ORER flag is 0

#### FIFO selected when all of the following conditions are satisfied

- The value of the SCR.RE bit or the SCR.TE bit is 1
- Neither transmission nor reception is in progress
- The amount of receive data written in FRDRHL is less than the setting value of FCRH.RSTRG[3:0] when SCR.RE = 1
- Data that has not been transmitted is available in FTDRHL when SCR.TE bit is 1 and SCR.CKE[1] bit is 0
- Data is available for transmission in the TSR register when SCR.TE bit is 1 and SCR.CKE[1] bit is 1
- The SSR\_FIFO.ORER flag is 0

[Condition for high output]

- The conditions for low output are not satisfied

### 27.6.3 SCI Initialization in Clock Synchronous Mode

Before transmitting and receiving data, start by writing the initial value 0x00 to the SCR register, then continue through the SCI initialization procedure given in the sections describing non-FIFO and FIFO selection in [section 27.6.2. CTS and RTS Functions](#). Anytime the operating mode or transfer format is to be changed, the SCR register must be initialized before the change can be made.

Note: Setting the SCR.RE bit to 0 initializes neither the ORER, FER, and PER flags in SSR/SSR\_FIFO nor the RDR register. When the TE bit is set to 0, the TEND flag for the selected FIFO buffer is not initialized.

Note: In non-FIFO mode, switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 when the SCR.TIE bit is 1 generates an SCIn\_TXI interrupt request.

Table 27.37 Example flow of SCI initialization in clock synchronous mode with non-FIFO selected (1 of 2)

| No. | Step Name  | Description   |
|-----|--|---|
| 1   | Start initialization   |   |
| 2   | Set the SCR.TIE, RIE, TE, RE, and TEIE bits to 0               |   |
| 3   | Set the FCR.FM bit to 0  | Set the FCR.FM bit to 0.  |
| 4   | Set the SCR.CKE[1:0] bits                                      | Set the clock selection in SCR.   |
| 5   | Set the SIMR1.IICM bit to 0. Set the SPMR.CKPH and CKPOL bits. | Set the SIMR1.IICM bit to 0. Set the SPMR.CKPH and CKPOL bits. Step 5 can be skipped if the values have not been changed from the initial values. |

在数据发送或接收过程中将CTSn\_RTsn引脚设置为高电平不会影响当前帧的发送或接收。

在RTS功能中，当时钟源为外部同步时钟时，CTSn\_RTsn引脚输出用于请求开始数据接收或发送。当串行通信成为可能时，CTSn\_RTsn输出变为低电平。CTSn\_RTsn低电平和高电平的输出条件如下所示：

[低输出的条件]

满足以下所有条件：

#### 满足以下所有条件时选择非FIFO

- SCR.RE位或SCR.TE位的值为1
- 发送和接收都没有进行
- 当SCR.RE位为1时，没有可读取的接收数据
- 当SCR.TE位为1且SCR.CKE[1]位为0时写入发送数据
- 当SCR.TE位为1且SCR.CKE[1]位为1时，TSR寄存器中的数据可用于传输
- SSR.ORER标志为0

#### 满足以下所有条件时选择FIFO

- SCR.RE位或SCR.TE位的值为1
- 发送和接收都没有进行
- SCR.RE=1时，FRDRHL写入的接收数据量小于FCRH.RSTRG[3:0]的设定值
- 当SCR.TE位为1且SCR.CKE[1]位为0时，FTDRHL中未发送的数据可用
- 当SCR.TE位为1且SCR.CKE[1]位为1时，TSR寄存器中的数据可用于传输
- SSR\_FIFO.ORER标志为0

【高输出条件】

- 不满足低输出条件

### 27.6.3 时钟同步模式下的SCI初始化

在发送和接收数据之前，首先将初始值0x00写入SCR寄存器，然后继续执行第27.6.2节中描述非FIFO和FIFO选择的部分中给出的SCI初始化过程。CTS和RTS功能。任何时候要更改操作模式或传输格式，必须先初始化SCR寄存器，然后才能进行更改。

Note: 将SCR.RE位设置为0既不会初始化SSR/SSR\_FIFO中的ORER、FER和PER标志，也不会初始化RDR寄存器。当TE位设置为0时，所选FIFO缓冲区的TEND标志未初始化。

Note: 在非FIFO模式下，当SCR.TIE位为1时，将SCR.TE位的值从1切换为0或从0切换为1会产生SCIn\_TXI中断请求。

Table 27.37 在时钟同步模式下选择非FIFO的SCI初始化示例流程 (1 of 2)

| No. | 步骤名称                                 | Description   |
|-----|--------------------------------------|---|
| 1   | 开始初始化                                |   |
| 2   | 将SCR.TIE、RIE、TE、RE和TEIE位设置为0         |   |
| 3   | 将FCR.FM位设置为0                         | 将FCR.FM位设置为0。   |
| 4   | 设置SCR.CKE[1:0]位                      | 在SCR中设置时钟选择。  |
| 5   | 将SIMR1.IICM位设置为0。设置SPMR.CKPH和CKPOL位。 | 将SIMR1.IICM位设置为0。设置SPMR.CKPH和CKPOL位。如果这些值没有从初始值改变，则可以跳过第5步。 |

Table 27.37 Example flow of SCI initialization in clock synchronous mode with non-FIFO selected (2 of 2)

| No. | Step Name   | Description   |
|-----|---|---|
| 6   | Set the data transmission/reception format in SMR, SCMR, and SEMR | Set data transmission/reception format in SMR, SCMR, and SEMR.  |
| 7   | Set a value in SPTR   | Set the communication terminals status in SPTR.   |
| 8   | Set a value in BRR  | Write a value corresponding to the bit rate to BRR. This step is not necessary if an external clock is used.  |
| 9   | Set a value in MDDR   | Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is set to 0 or an external clock is used. |
| 10  | Set the I/O port functions  | Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.  |
| 11  | Set the SCR.TE or RE bit to 1, and set the SCR.TIE and RIE bits   | Set the SCR.TE or RE bit to 1. Also set the SCR.TIE and RIE bits. Setting the TE and RE bits allows TXDn and RXDn pins to be used.                            |
| 12  | Initialization completion   |   |

Note: In simultaneous transmit and receive operations, the TE and RE bits in SCR must both be set to 0 or set to 1 simultaneously

Table 27.38 Example flow of SCI initialization in clock synchronous mode with FIFO selected

| No. | Step Name  | Description   |
|-----|--|---|
| 1   | Start initialization   |   |
| 2   | Set the SCR.TIE, RIE, TE, RE, and TEIE bits to 0   |   |
| 3   | Set the FCR.FM, TFRST, and RFRST bits to 1. Set the FCR.TTRG[3:0], RTRG[3:0], and RSTRG[3:0] bits. | Set the FCR.FM, TFRST, and RFRST bits to 1 (FIFO mode enabled, transmit/receive FIFOs empty). Set the FCR.TTRG[3:0], RTRG[3:0], and RSTRG[3:0] bits.          |
| 4   | Set the SCR.CKE[1:0] bits  | Set the clock selection in SCR.   |
| 5   | Set the SIMR1.IICM bit to 0. Set the SPMR.CKPH and CKPOL bits.                                     | Set the SIMR1.IICM bit to 0. Set the SPMR.CKPH and CKPOL bits. Step 5 can be skipped if the values have not been changed from the initial values.             |
| 6   | Set the data transmission/reception format in SMR, SCMR, and SEMR                                  | Set data transmission/reception format in SMR, SCMR, and SEMR.  |
| 7   | Set a value in SPTR  | Set the communication terminals status in SPTR.   |
| 8   | Set a value in BRR   | Write a value corresponding to the bit rate to BRR. This step is not necessary if an external clock is used.  |
| 9   | Set a value in MDDR  | Write the value obtained by correcting a bit rate error in MDDR. This step is not necessary if the BRME bit in SEMR is set to 0 or an external clock is used. |
| 10  | Set the FCR.TFRST and RFRST bits to 0  | Set the FCR.TFRST and RFRST bits to 0.  |
| 11  | Set the I/O port functions   | Make I/O port settings to enable input and output functions as required for TXDn, RXDn, and SCKn pins.  |
| 12  | Set the SCR.TE or RE bit to 1, and set the SCR.TIE and RIE bits                                    | Set the SCR.TE or RE bit to 1. Also set the SCR.TIE and RIE bits. Setting the TE and RE bits allows TXDn and RXDn pins to be used.                            |
| 13  | Initialization completion  |   |

Note: In simultaneous transmit and receive operations, the TE and RE bits in SCR must both be set to 0 or set to 1 simultaneously.

## 27.6.4 Serial Data Transmission in Clock Synchronous Mode

### (1) Non-FIFO selected

Figure 27.66, Figure 27.67, and Figure 27.68 show examples of serial transmission in clock synchronous mode.

| 11  | 设置IO端口功能  | 进行IO端口设置以启用TXDn、RXDn和所需的输入和输出功能SCKn pins。  |
| 12  | 将SCR.TE或RE位设置为1,并设置SCR.TIE和RIE位                                 | 将SCR.TE或RE位设置为1。同时设置SCR.TIE和RIE位。设置TE和RE位允许使用TXDn和RXDn引脚。                            |
| 13  | 初始化完成   |  |

Note: 在同时发送和接收操作中,SCR中的TE和RE位必须都设置为0或同时设置为1。

## 27.6.4 时钟同步模式下的串行数据传输

### (1) Non-FIFO selected

图27.66、图27.67和图27.68显示了时钟同步模式下的串行传输示例。

In serial data transmission, the SCI operates as follows:

1. The SCI transfers data from the TDR register to the TSR register when data is written to TDR in the SCIn\_TXI interrupt handling routine. The SCIn\_TXI interrupt request at the beginning of transmission is generated when the TE bit is set to 1 but only after the TIE bit in the SCR is also set to 1 or when these two bits are set to 1 simultaneously by a single instruction.
2. After transferring data from TDR to TSR, the SCI starts transmission. When the SCR.TIE bit is set to 1, an SCIn\_TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to TDR in the SCIn\_TXI interrupt handling routine before transmission of the current transmit data finishes. When SCIn\_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to the TDR register from the handling routine for SCIn\_TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when the clock output mode is specified and in synchronization with the input clock when the use of an external clock is specified. Output of the clock signal is suspended until the input CTS signal is low when the SPMR.CTSE bit is 1.
4. The SCI checks for update to the TDR register on output of the last bit.
5. When the TDR register is updated, the next transmit data is transferred from TDR to TSR, and serial transmission of the next frame starts.
6. If TDR is not updated, the SSR.TEND flag is set to 1. The TXDn pin retains the output state of the last bit. If the SCR.TEIE bit is 1, an SCIn\_TEI interrupt request is generated and the SCKn pin is held high.

Figure 27.66, Figure 27.67, and Figure 27.68 show examples of serial data transmission.

Transmission does not start while a receive error flag (ORER, FER, or PER in SSR) is set to 1. Always set the receive error flags to 0 before starting transmission.

Note: Setting the SCR.RE bit to 0 does not clear the receive error flags.

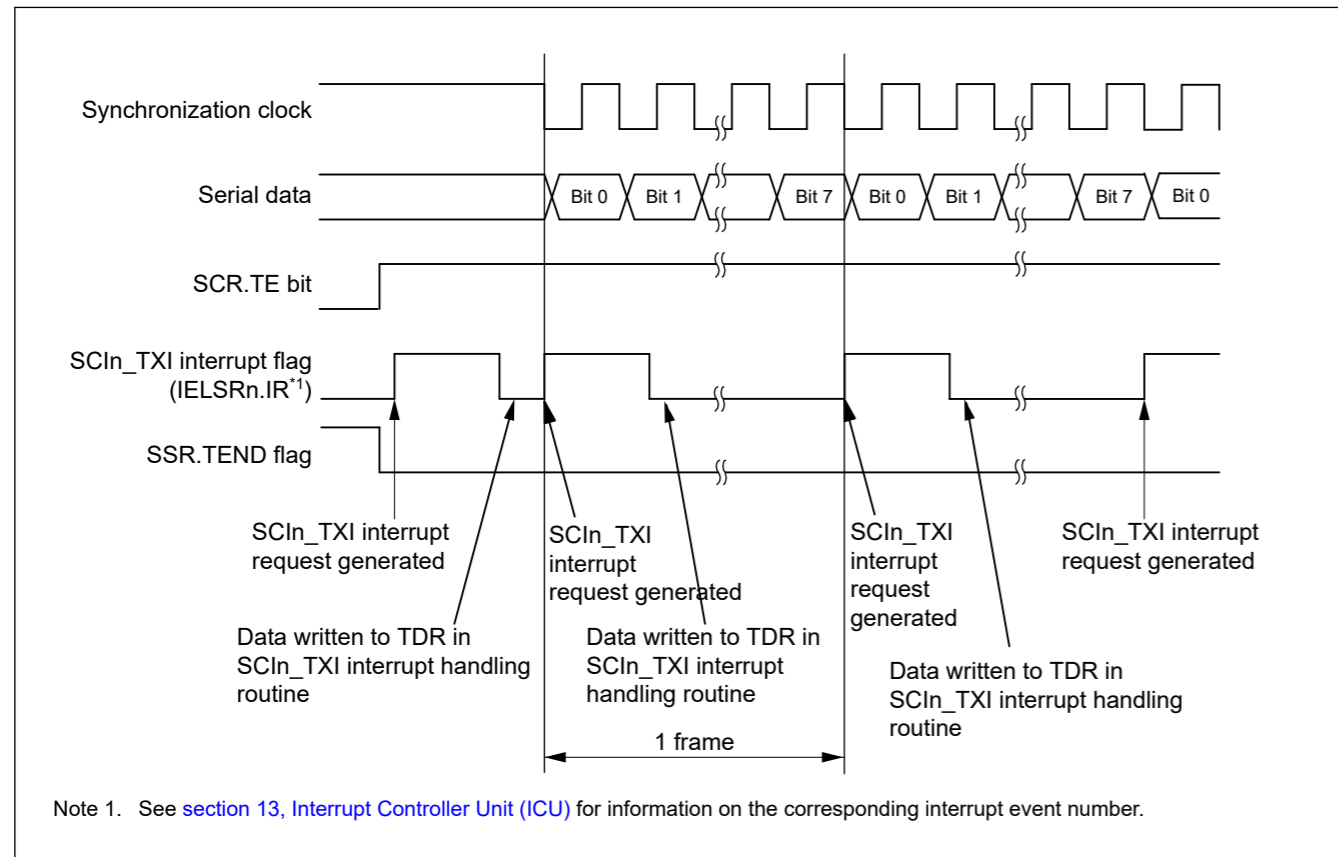

Figure 27.66 Example of serial data transmission in clock synchronous mode when the CTS function is not used at the beginning of transmission

在串行数据传输中，SCI操作如下：

- 1.当数据在SCIn\_TXI中断处理程序中写入TDR时，SCI将数据从TDR寄存器传输到TSR寄存器。发送开始时的SCIn\_TXI中断请求在TE位设置为1且仅在SCR中的TIE位也设置为1或当这两个位通过一条指令同时设置为1时产生。
- 2.将数据从TDR传输到TSR后，SCI开始传输。当SCR.TIE位设置为1时，会产生SCIn\_TXI中断请求。在当前发送数据发送完成之前，通过在SCIn\_TXI中断处理例程中将下一个发送数据写入TDR来启用连续发送。使用SCIn\_TEI中断请求时，在SCIn\_TXI请求的处理例程中将要发送的最后一个数据写入TDR寄存器后，将SCR.TIE位设置为0，并将SCR.TEIE位设置为1。
- 3.指定时钟输出模式时，与输出时钟同步，指定使用外部时钟时，与输入时钟同步，从TXDn引脚发送8位数据。当SPMR.CTSE位为1时，时钟信号的输出被暂停，直到输入CTS信号为低电平。
- 4.SCI在最后一位输出时检查对TDR寄存器的更新。
- 5.TDR寄存器更新后，下一个发送数据从TDR传送到TSR，开始下一帧的串行发送。
- 6.如果TDR未更新，则SSR.TEND标志设置为1。TXDn引脚保持最后一位的输出状态。如果SCR.TEIE位为1，则产生SCIn\_TEI中断请求并且SCKn引脚保持高电平。

图27.66、图27.67和图27.68显示了串行数据传输的示例。

当接收错误标志（SSR中的ORER、FER或PER）设置为1时，发送不会开始。在开始发送之前，请务必将接收错误标志设置为0。

Note: 将SCR.RE位设置为0不会清除接收错误标志。

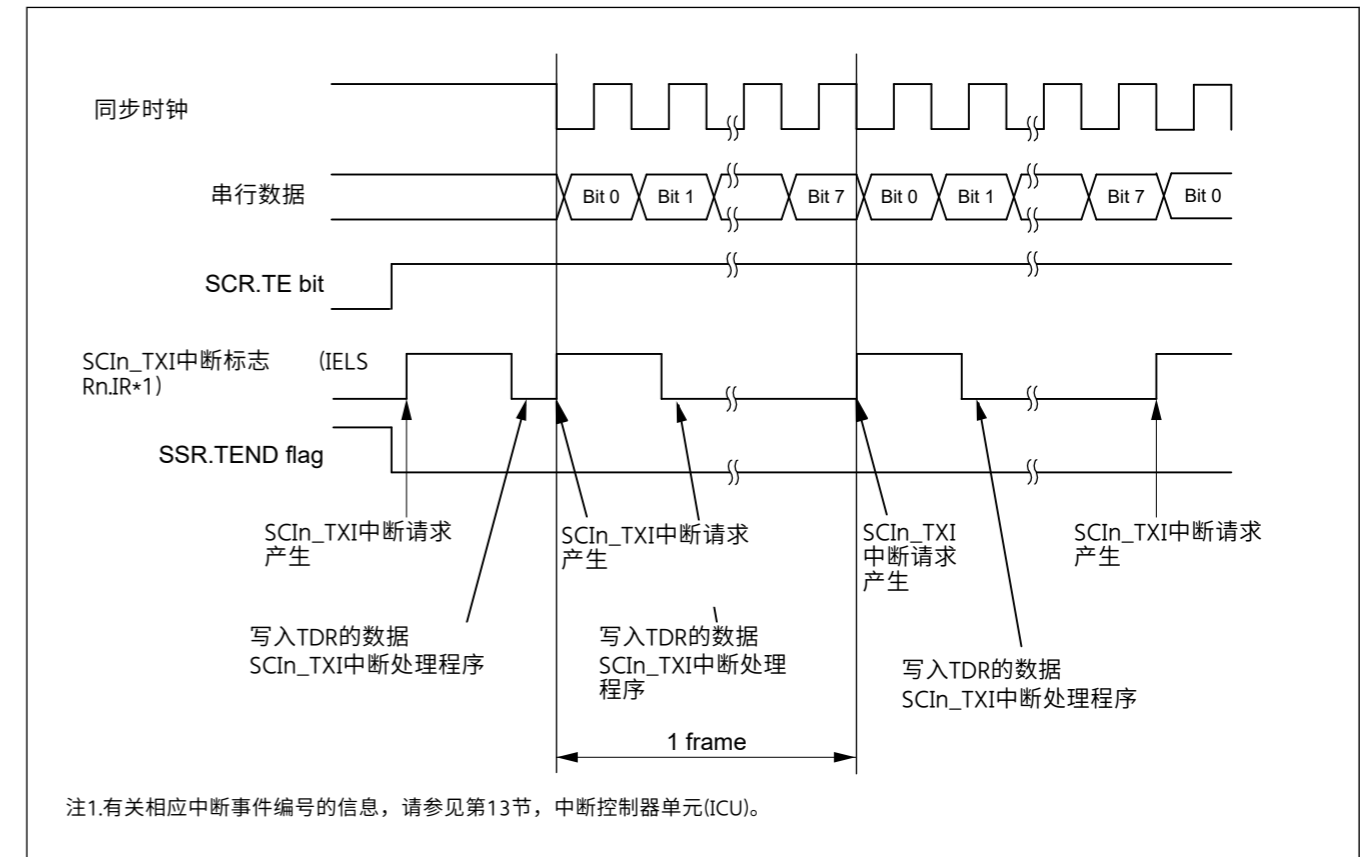

Figure 27.66 传输开始时未使用CTS功能时时钟同步模式下的串行数据传输示例

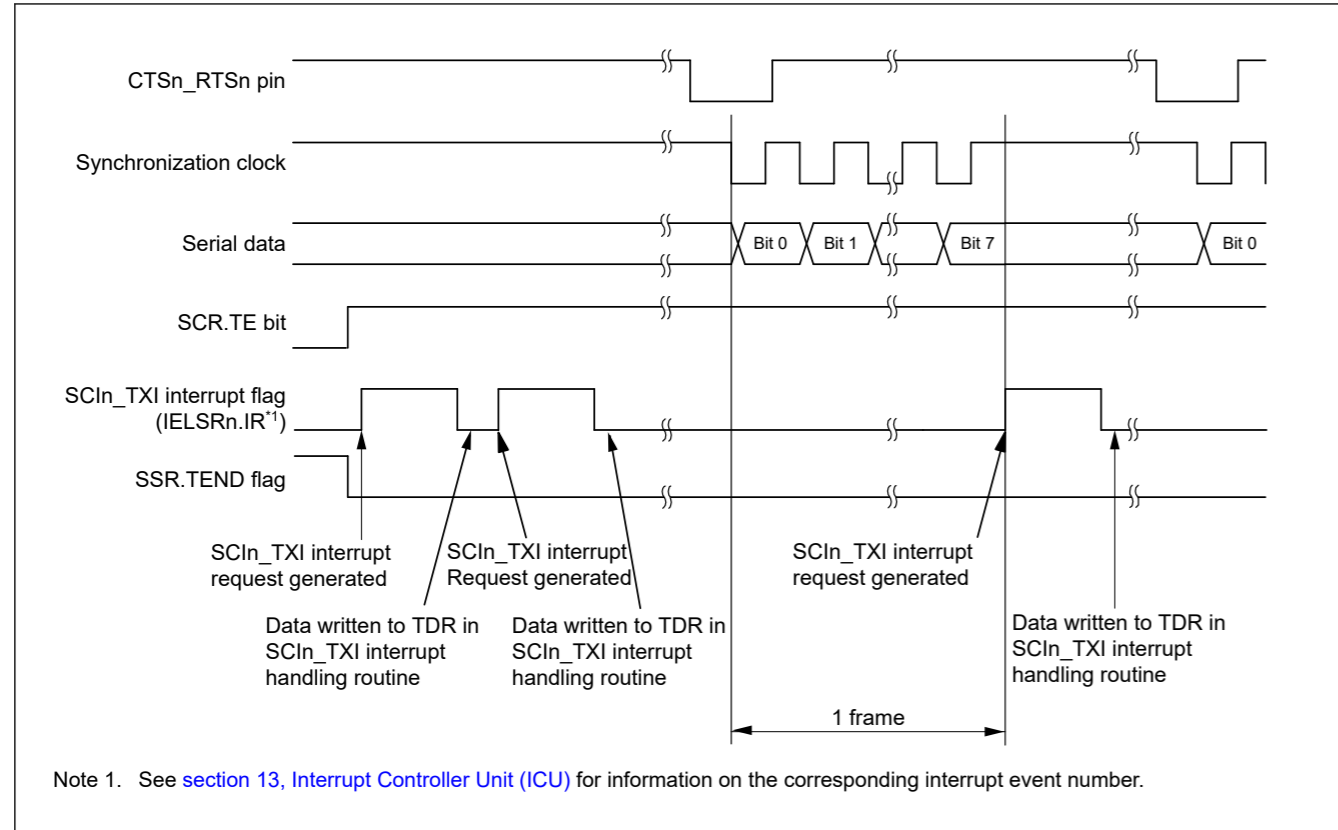

Figure 27.67 Example of serial data transmission in clock synchronous mode when the CTS function is used at the beginning of transmission

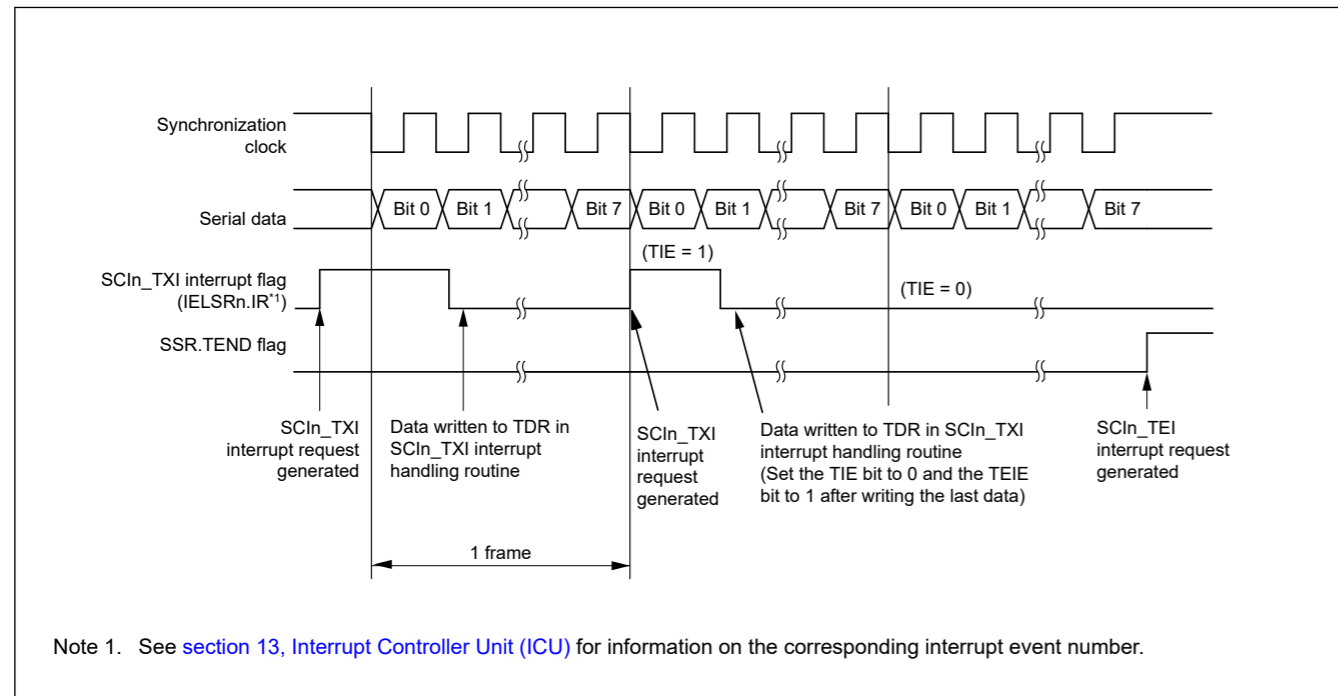

Figure 27.68 Example of serial data transmission in clock synchronous mode from the middle of transmission until transmission completion

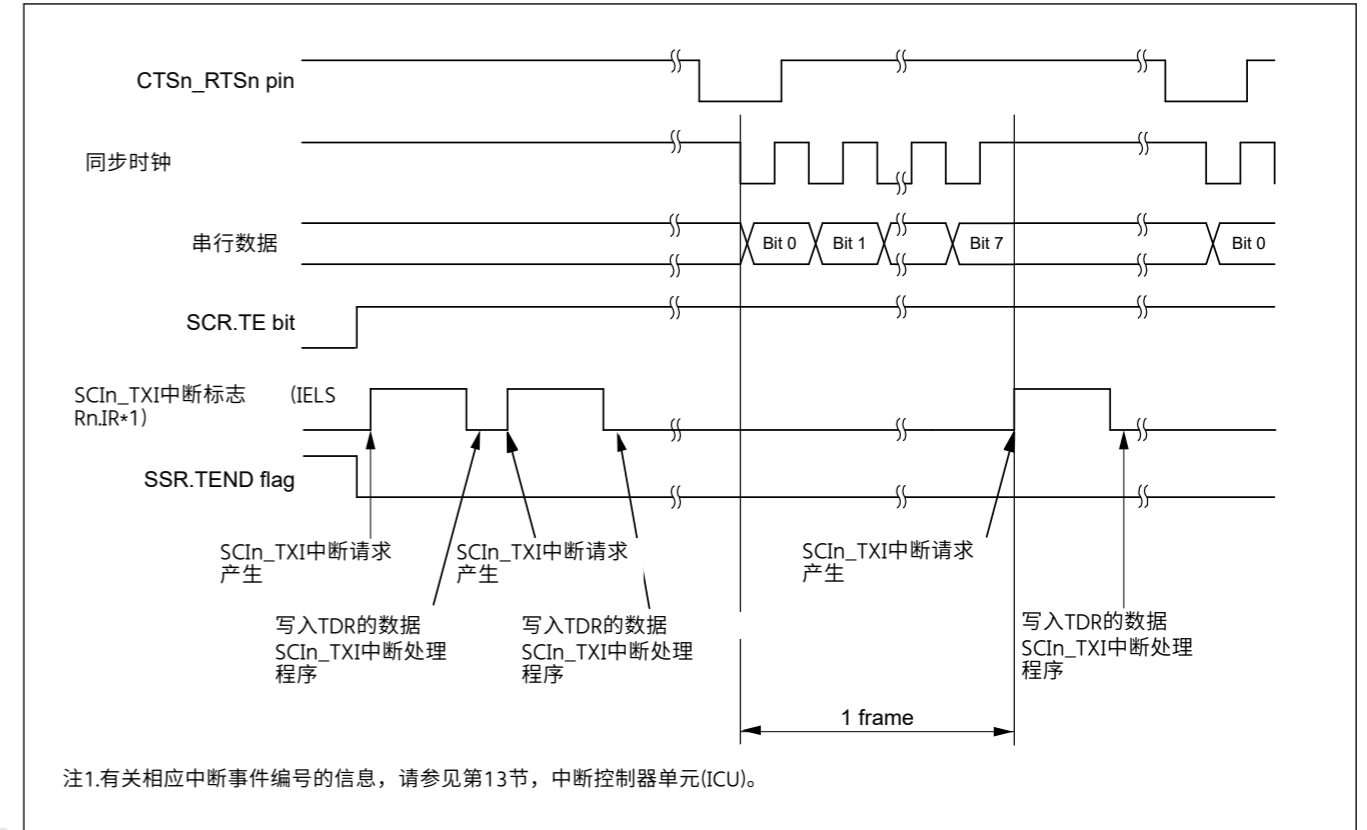

Figure 27.67 传输开始时使用CTS功能时时钟同步模式下的串行数据传输示例

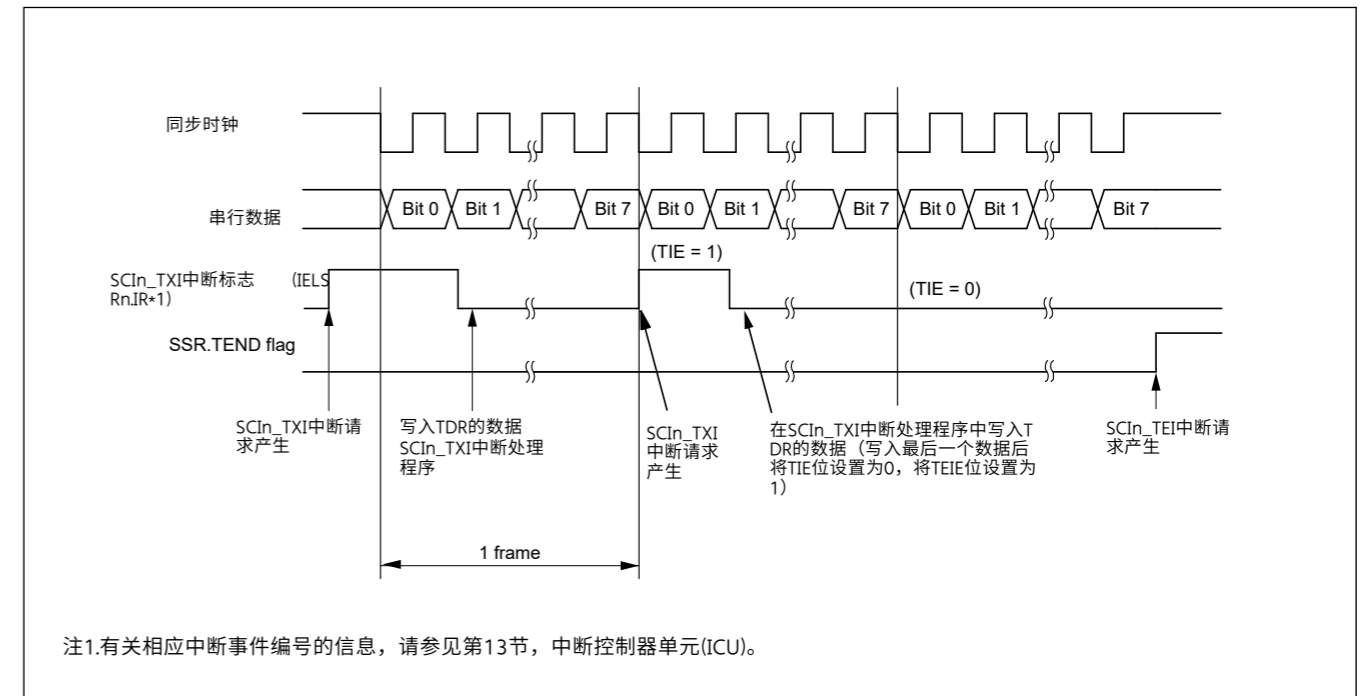

Figure 27.68 从传输中间到传输完成的时钟同步模式下的串行数据传输示例

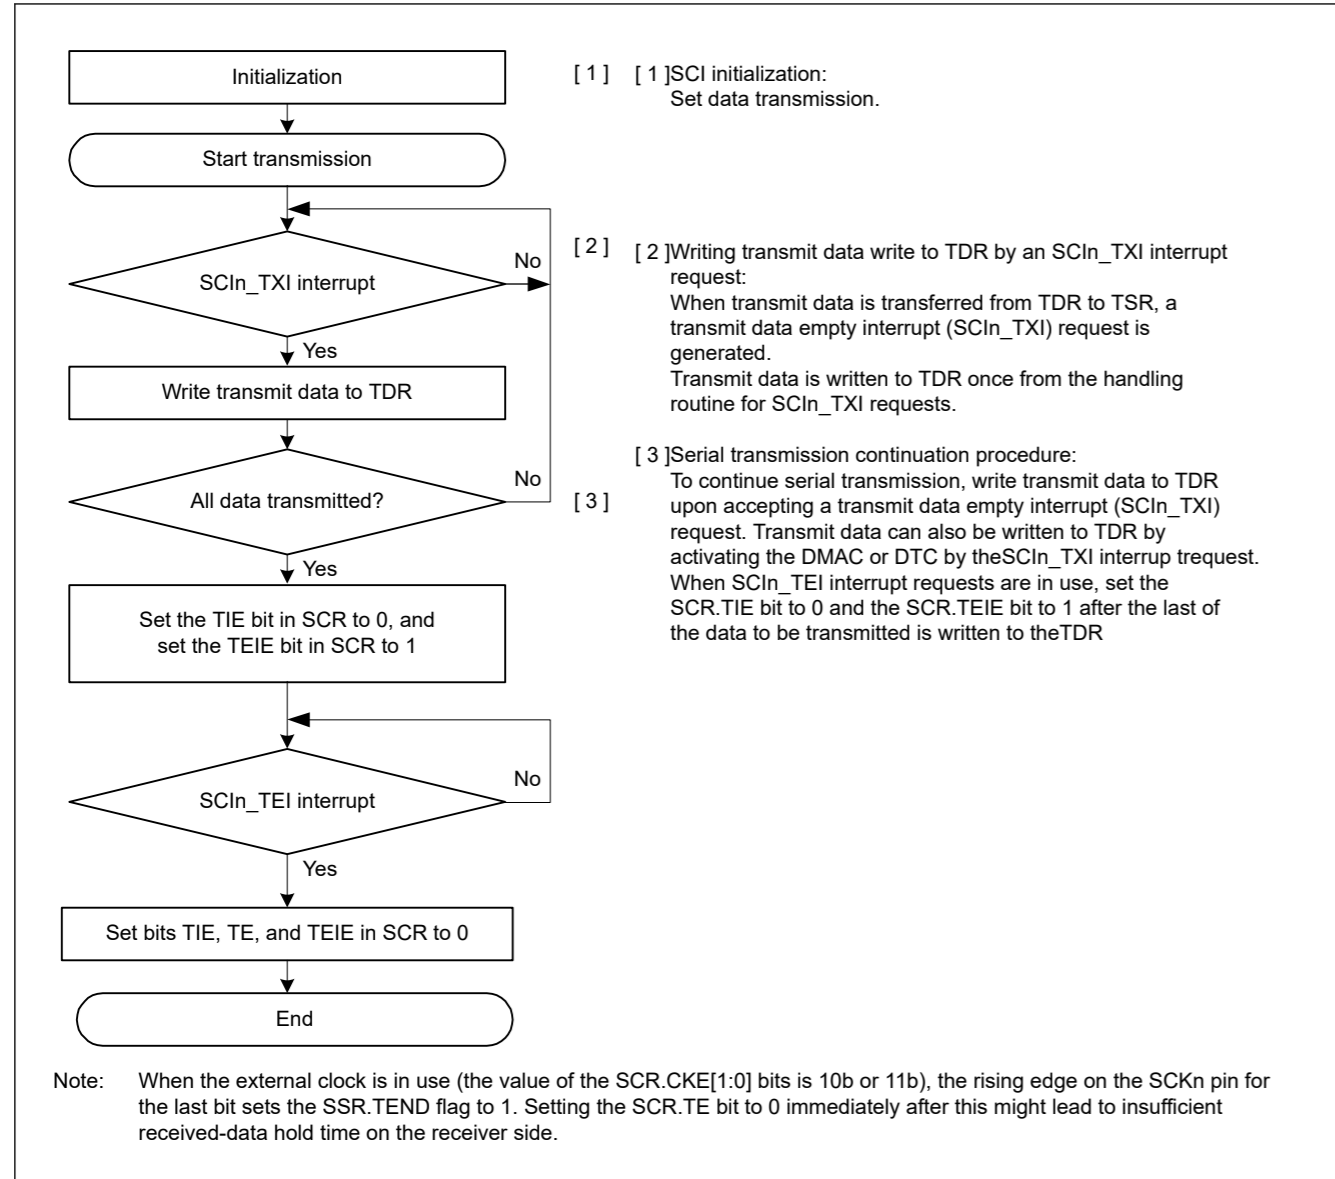

Figure 27.69 Example flow of serial transmission in clock synchronous mode with non-FIFO selected

(2) FIFO selected

Figure 27.70 shows an example of serial transmission in clock synchronous mode with FIFO selected.

In serial data transmission, the SCI operates as follows:

1. The SCI transfers data from the FTDRL\*1 register to the TSR register when data is written to FTDRL\*1 in the SCIn\_TXI interrupt handling routine. The amount of data that can be written to FTDRL is 16 minus FDR.T[4:0] bytes. The SCIn\_TXI interrupt request at the beginning of transmission is generated when the SCR.TE bit is set to 1 but only after the SCR.TIE bit is also set to 1 or when these two bits are set to 1 simultaneously by a single instruction.
2. After transferring data from FTDRL to TSR, the SCI starts transmission. When the amount of transmit data written in FTDRL is equal to or less than the specified transmit triggering number, the SSR\_FIFO.TDFE is set to 1. When the SCR.TIE bit is set to 1, an SCIn\_TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to FTDRL in the SCIn\_TXI interrupt handling routine before transmission of the current transmit data has finished. When SCIn\_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to the FTDRL from the handling routine for SCIn\_TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when the clock output mode is specified and in synchronization with the input clock when the use of an external clock is specified. Output of the clock signal is suspended until the input CTS signal is low when the SPMR.CTSE bit is 1.
4. The SCI checks whether non-transmitted data remains in FTDRL on output of the stop bit.

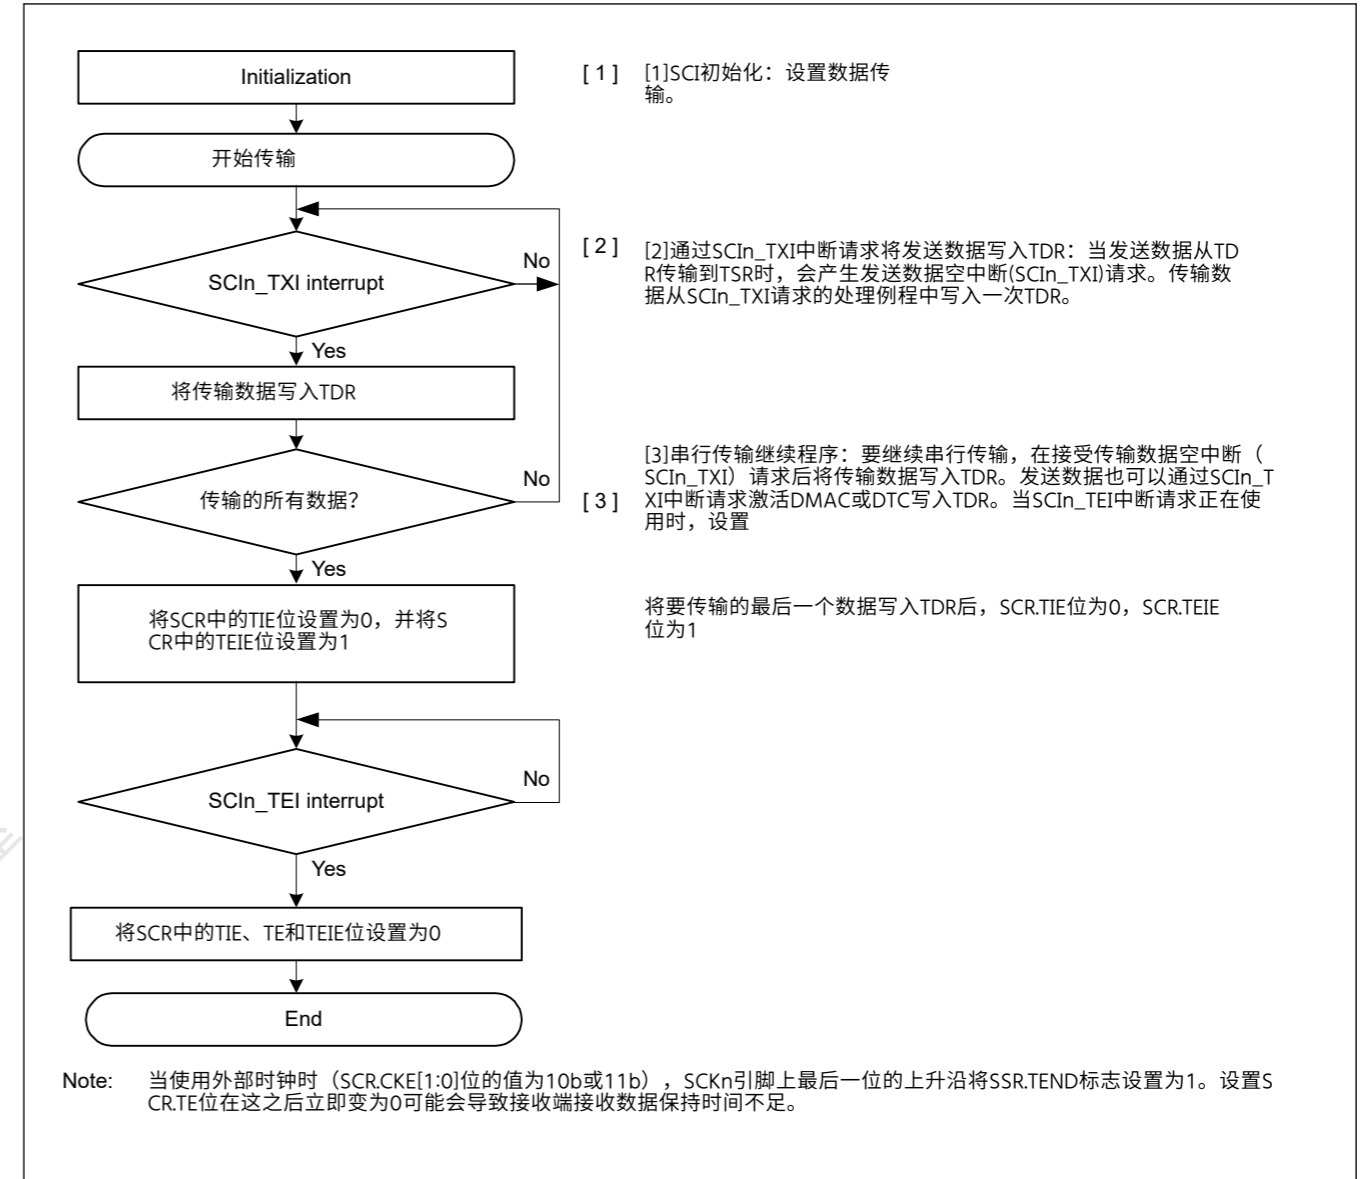

Figure 27.69 选择非FIFO的时钟同步模式下的串行传输示例流程

(2)选择FIFO图27.70显示了在时钟同步模式下选择FIFO的串行传输示例。

在串行数据传输中，SCI操作如下：

- 1.当数据写入FTDRL\*1时，SCI将数据从FTDRL\*1寄存器传输到TSR寄存器  
SCIn\_TXI中断处理程序。可写入FTDRL的数据量为16减去FDR.T[4:0]字节。发送开始时的SCIn\_TXI中断请求在SCR.TE位设置为1时产生，但仅在SCR.TIE位也设置为1或当这两个位通过一条指令同时设置为1时产生。
- 2.将数据从FTDRL传输到TSR后，SCI开始传输。当写入FTDRL的发送数据量等于或小于指定的发送触发数时，SSR\_FIFO.TDFE设置为1。当  
SCR.TIE位设置为1，产生SCIn\_TXI中断请求。在当前发送数据的发送完成之前，通过在SCIn\_TXI中断处理例程中将下一个发送数据写入FTDRL来启用连续发送。当使用SCIn\_TEI中断请求时，在SCIn\_TXI请求的处理例程中将要发送的最后一个数据写入FTDRL后，将SCR.TIE位设置为0，并将SCR.TEIE位设置为1。
- 3.指定时钟输出模式时，与输出时钟同步，指定使用外部时钟时，与输入时钟同步，从TXDn引脚发送8位数据。当SPMR.CTSE位为1时，时钟信号的输出被暂停，直到输入CTS信号为低电平。
- 4.SCI在停止位输出时检查未传输的数据是否保留在FTDRL中。

- When FTDRL is updated, the next transmit data is transferred from FTDRL to TSR and serial transmission of the next frame starts.
- If FTDRL is not updated, the SSR\_FIFO.TEND flag is set to 1. The TXDn pin retains the output state of the last bit. If the SCR.TEIE bit is 1, an SCIn\_TEI interrupt request is generated and the SCKn pin is held high.

Note 1. In clock synchronous mode, FTDRH is not used.

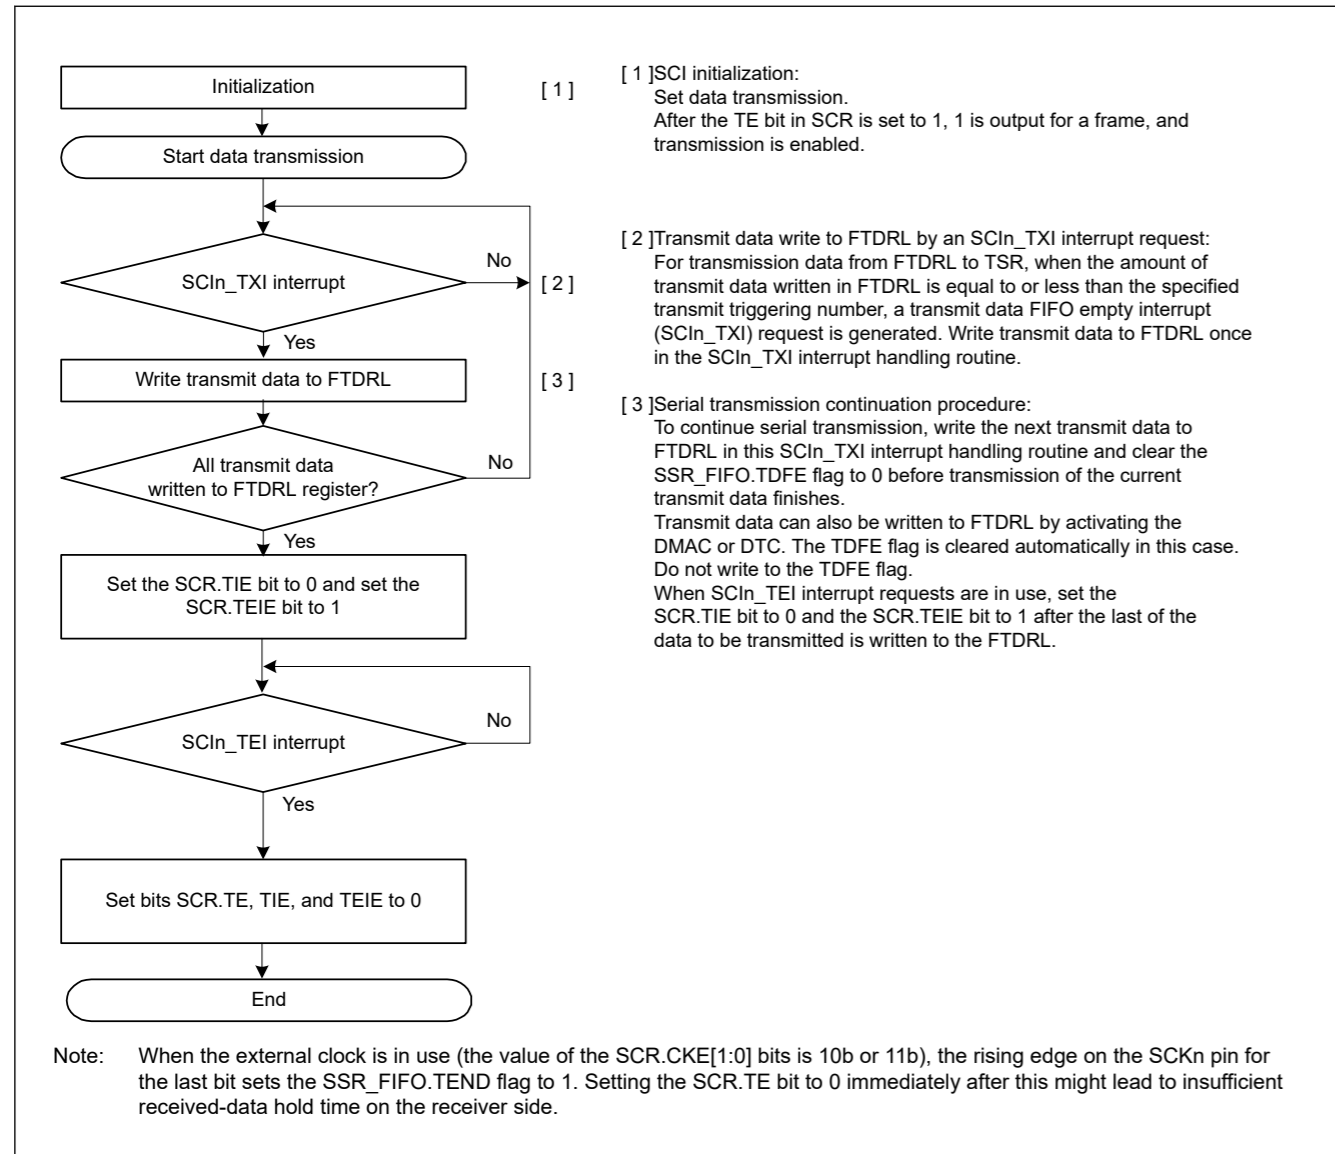

Figure 27.70 Example flow of serial transmission in clock synchronous mode with FIFO selected

### 27.6.5 Serial Data Reception in Clock Synchronous Mode

(1) Non-FIFO selected

Figure 27.71 and Figure 27.72 show examples of SCI operation for serial reception in clock synchronous mode.

In serial data reception, the SCI operates as follows:

- When the value of the SCR.RE bit becomes 1, the CTSn\_RTsn pin goes low.
- The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in the RSR register.
- If an overrun error occurs, the SSR.ORER flag is set to 1. If the SCR.RIE bit is 1, an SCIn\_ERI interrupt request is generated. Receive data is not transferred to the RDR register.

- 当FTDRL更新时，下一个传输数据从FTDRL传输到TSR并开始下一帧的串行传输。
- 如果FTDRL未更新，则SSR\_FIFO.TEND标志设置为1。TXDn引脚保持最后一位的输出状态。如果SCR.TEIE位为1，则产生SCIn\_TEI中断请求并且SCKn引脚保持高电平。

注1.在时钟同步模式下，不使用FTDRH。

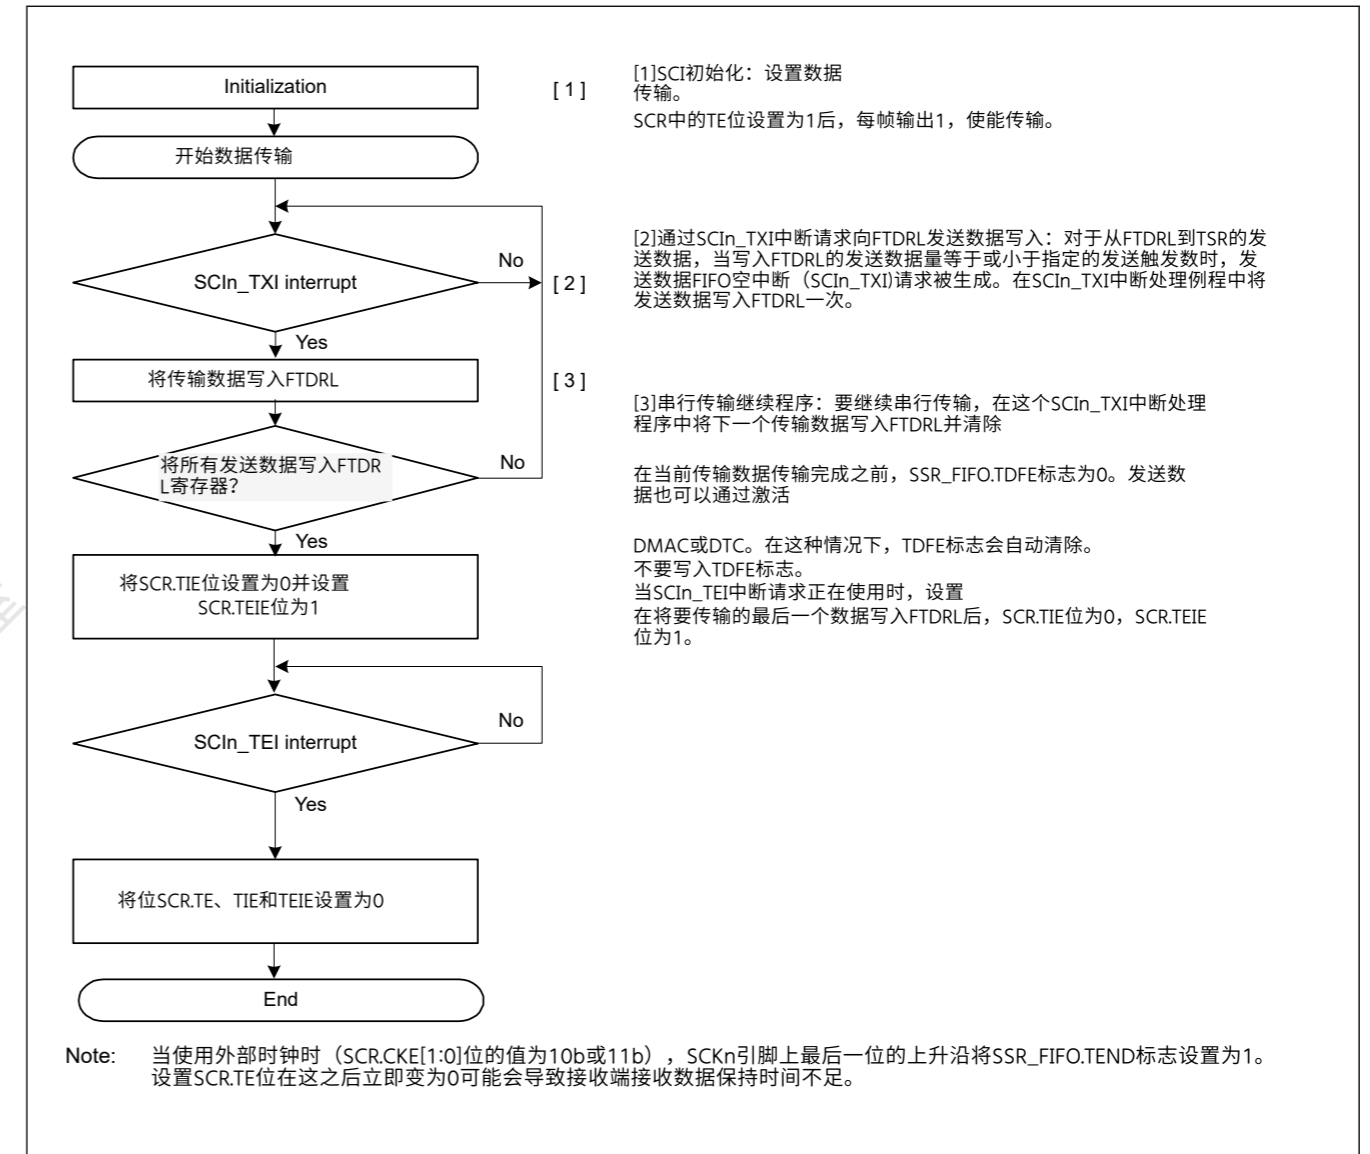

Figure 27.70 选择FIFO的时钟同步模式下的串行传输示例流程

### 27.6.5 时钟同步模式下的串行数据接收

(1) Non-FIFO selected

图27.71和图27.72显示了时钟同步模式下串行接收的SCI操作示例。

在串行数据接收中，SCI操作如下：

- 当SCR.RE位的值变为1时，CTSn\_RTsn引脚变为低电平。
- SCI执行内部初始化，并与同步时钟输入或输出同步开始接收数据，并将接收数据存储存储在RSR寄存器中。
- 如果发生溢出错误，则SSR.ORER标志设置为1。如果SCR.RIE位为1，则产生SCIn\_ERI中断请求。接收数据不传送到RDR寄存器。

4. When reception completes successfully, receive data is transferred to the RDR register. If the SCR.RIE bit is 1, an SCIn\_RXI interrupt request is generated. Continuous reception is enabled by reading the received data transferred to the RDR register in the SCIn\_RXI interrupt handling routine before reception of the next receive data completes. Reading the received data that is transferred to RDR causes the CTSn\_RTSn pin to output low.

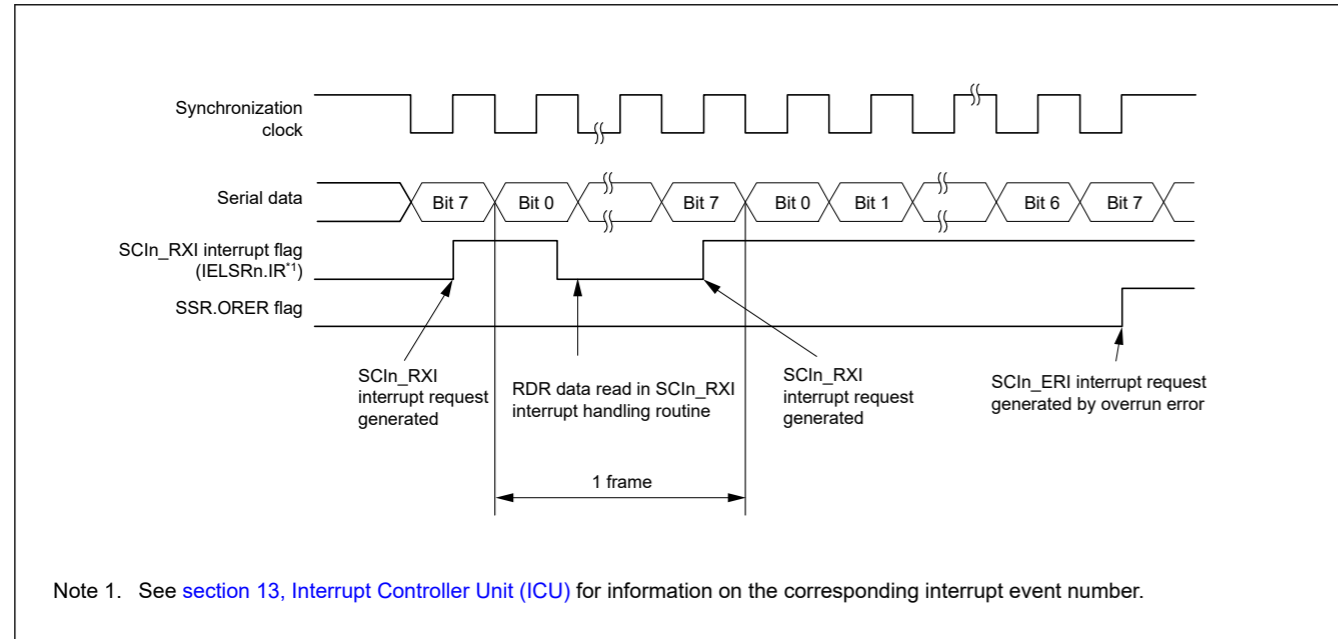

Figure 27.71 Example operation for serial reception in clock synchronous mode (1) when the RTS function is not used

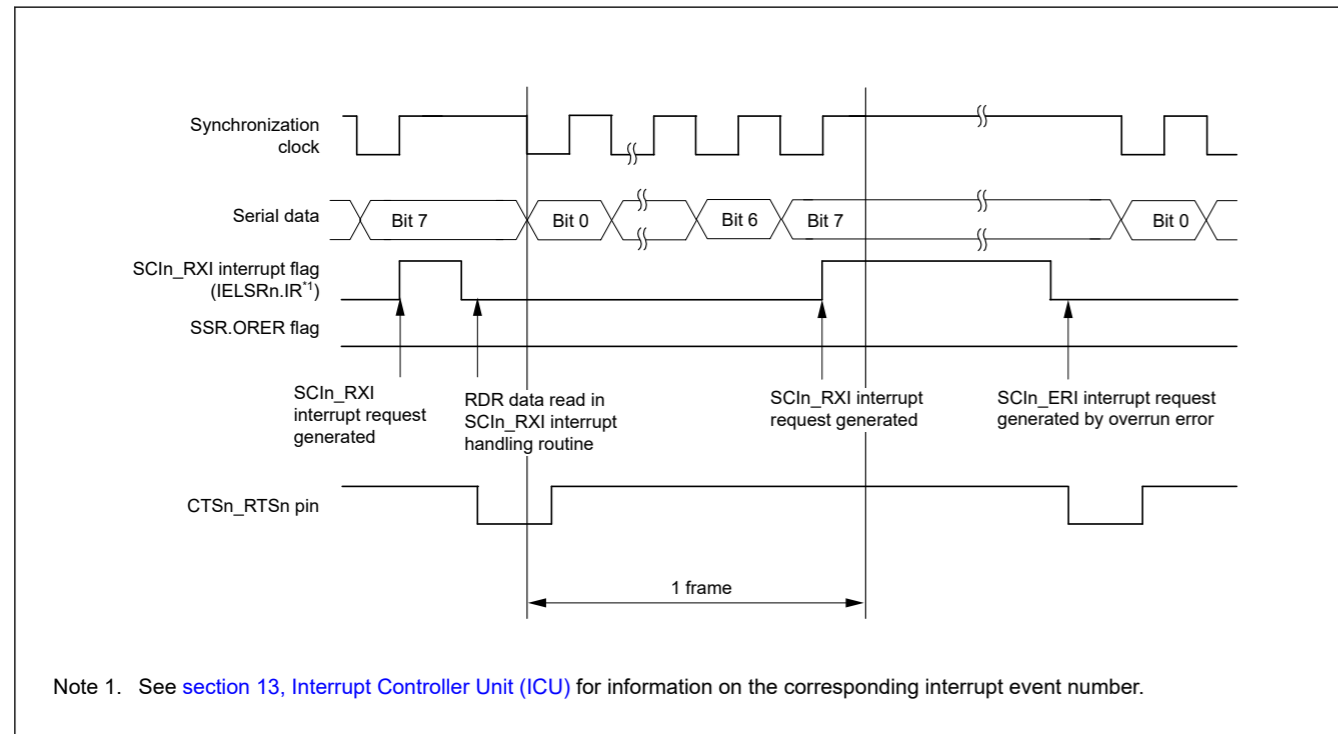

Figure 27.72 Example operation for serial reception in clock synchronous mode (2) when RTS function is used

Data transfer cannot resume while the receive error flag is 1. Therefore, clear the ORER, FER, and PER flags in the SSR register to 0 before resuming data reception. Additionally, always read the RDR register during overrun error processing. When a data reception is forced to terminate by a 0 write to the SCR.RE bit during operation, read the RDR register because received data that is not yet read might be left in the RDR register.

- 4.当接收成功完成时，接收数据被传送到RDR寄存器。如果SCR.RIE位为1，则SCIn\_RXI中断请求产生。连续接收是通过读取接收到的数据传输到RDR寄存器在接收下一个接收数据完成之前，SCIn\_RXI中断处理程序中的RDR寄存器。读取传输到RDR的接收数据会导致CTS<sub>n</sub>RTSn引脚输出低电平。

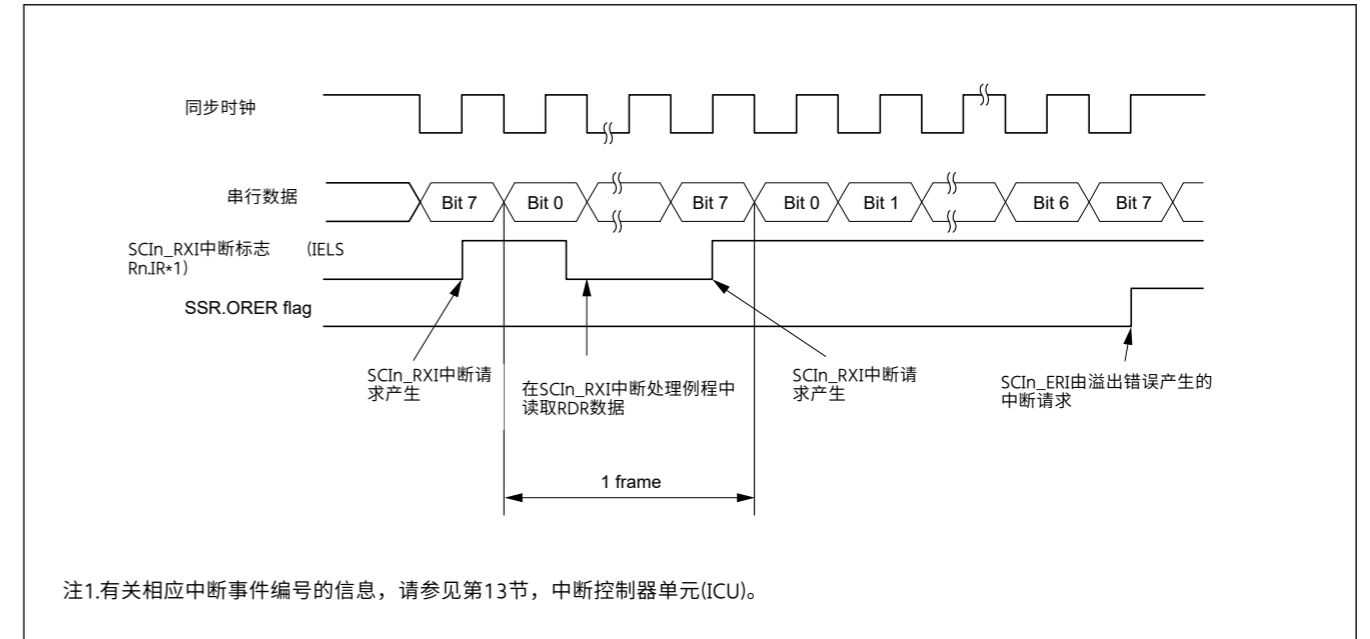

Figure 27.71 不使用RTS功能时时钟同步模式下串行接收的示例操作(1)

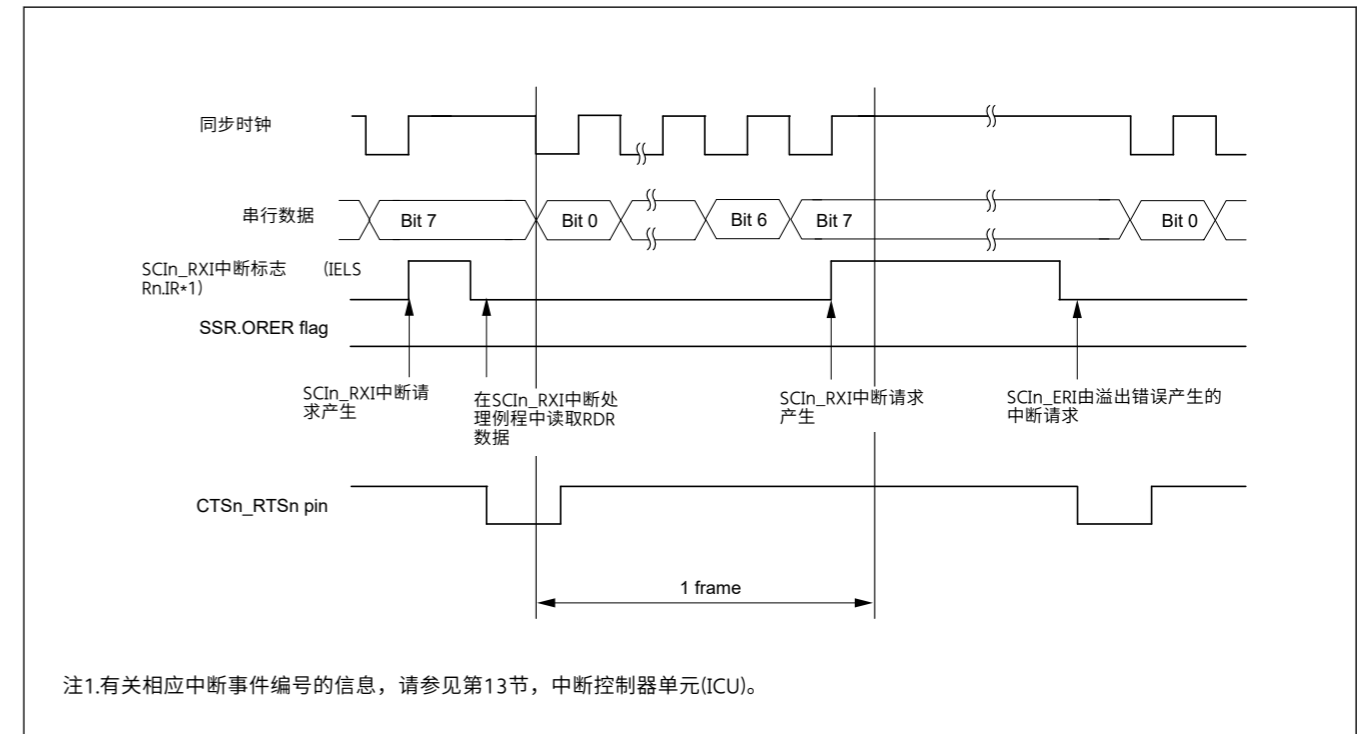

Figure 27.72 使用RTS功能时时钟同步模式下串行接收的示例操作(2)

接收错误标志为1时无法恢复数据传输。因此，在恢复数据接收之前，将SSR寄存器中的ORER、FER和PER标志清除为0。此外，在溢出错误处理期间始终读取RDR寄存器。如果在操作期间通过向SCR.RE位写入0来强制终止数据接收，请读取RDR寄存器，因为尚未读取的已接收数据可能会留在RDR寄存器中。

Figure 27.73 shows an example flow of serial data reception.

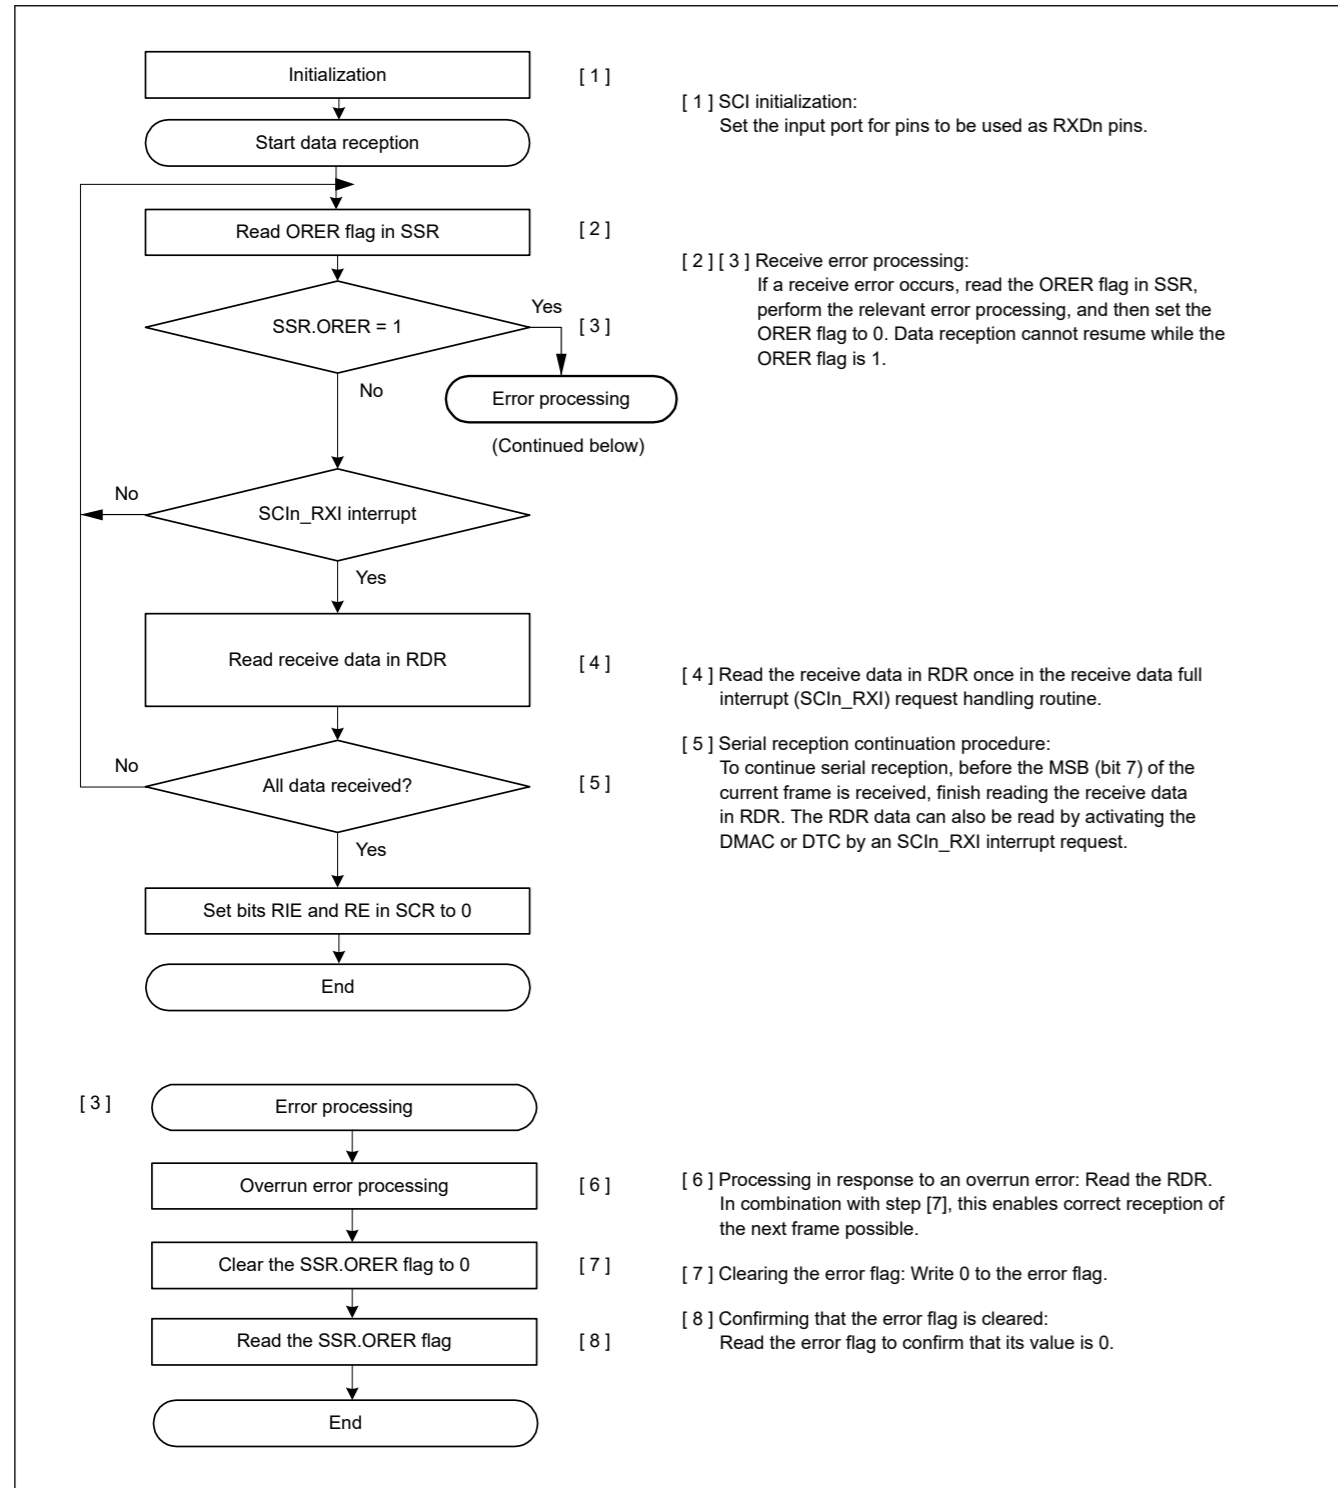

Figure 27.73 Example flow of serial reception in clock synchronous mode with non-FIFO selected

(2) FIFO selected

Figure 27.74 shows an example of serial reception in clock synchronous mode with FIFO selected.

In serial data reception, the SCI operates as follows:

1. When the value of the SCR.RE bit becomes 1, the CTSn\_RTSn pin goes low.
2. The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in the RSR register.

图27.73显示了串行数据接收的示例流程。

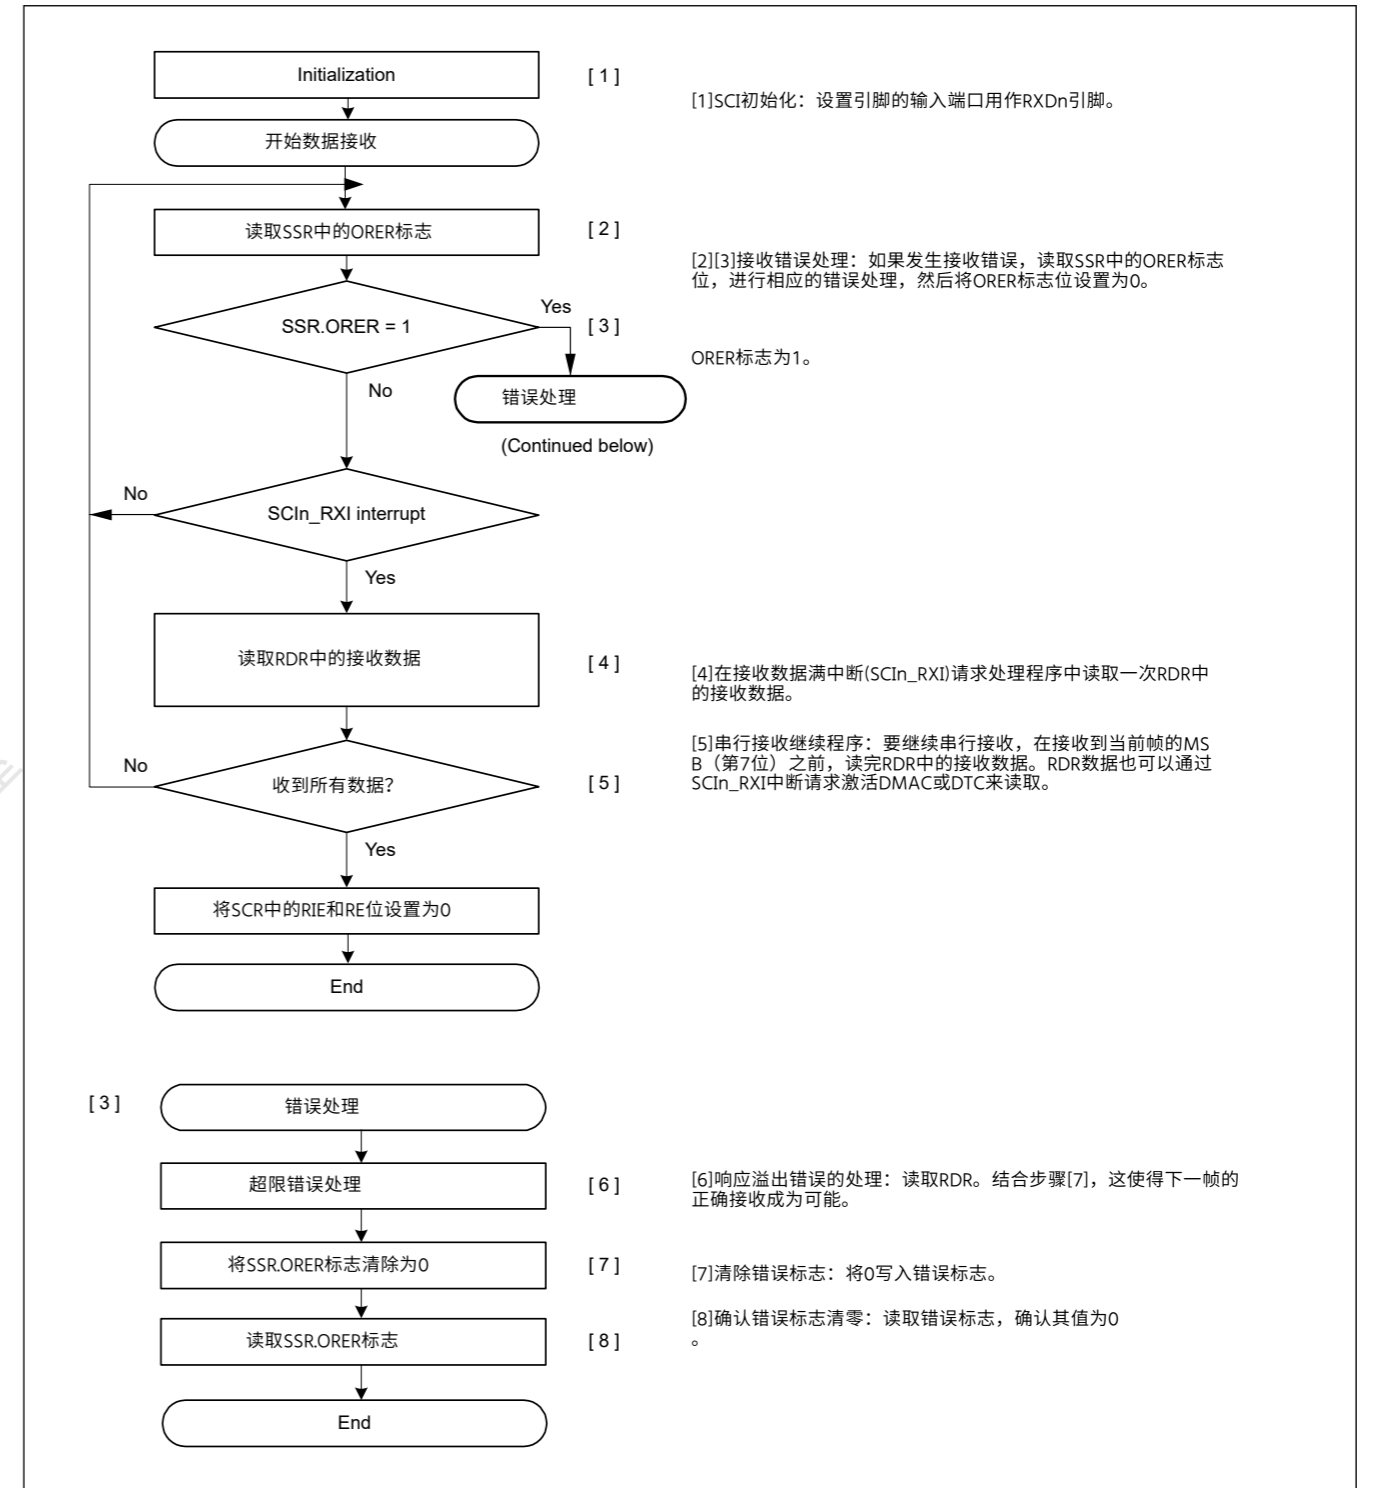

Figure 27.73 选择非FIFO的时钟同步模式下的串行接收示例流程

(2)选择FIFO图27.74显示了在时钟同步模式下选择FIFO的串行接收示例。

在串行数据接收中，SCI操作如下：

- 1.当SCR.RE位的值变为1时，CTSn\_RTSn引脚变为低电平。
- 2.SCI执行内部初始化，并与同步时钟输入或输出同步开始接收数据，并将接收数据存储在RSR寄存器中。

3. If an overrun error occurs, the SSR\_FIFO.Over flag is set to 1. If the SCR.RIE bit is 1, an SCIn\_ERI interrupt request is generated. Received data is not transferred to the FRDRL\*1 register.
4. When data reception completes successfully, the receive data is transferred to the FRDRL\*1 register. The RDF flag is set to 1 when the amount of the receive data stored in FRDRL is equal to or greater than the specified receive triggering number. If the SCR.RIE bit is 1, an SCIn\_RXI interrupt request is generated. Continuous data reception is enabled by reading the receive data transferred to FRDRL\*2 in the SCIn\_RXI interrupt handling routine before an overrun error occurs. If the amount of received data that is transferred to FRDRL is less than the RTS trigger number, the CTSn\_RTsn pin goes low.

Note 1. In clock synchronous mode, FRDRH is not used.

Note 2. Read data in order from FRDRH to FRDRL when RDF and ORER are read with receive data.

- 3.如果发生溢出错误,则SSR\_FIFO.Over标志设置为1。如果SCR.RIE位为1,则产生SCIn\_ERI中断请求。接收到的数据不传送到FRDRL\*1寄存器。
- 4.当数据接收成功完成时,接收数据被传送到FRDRL\*1寄存器。当存储在FRDRL中的接收数据量等于或大于指定的接收触发数时,RDF标志设置为1。如果SCR.RIE位为1,则产生SCIn\_RXI中断请求。在发生溢出错误之前,通过在SCIn\_RXI中断处理程序中读取传输到FRDRL\*2的接收数据来启用连续数据接收。如果传输到FRDRL的接收数据量小于RTS触发数,则CTSn\_RTsn引脚变为低电平。

注1.在时钟同步模式下,不使用FRDRH。

注2.RDF和ORER与接收数据一起读取时,按FRDRH到FRDRL的顺序读取数据。

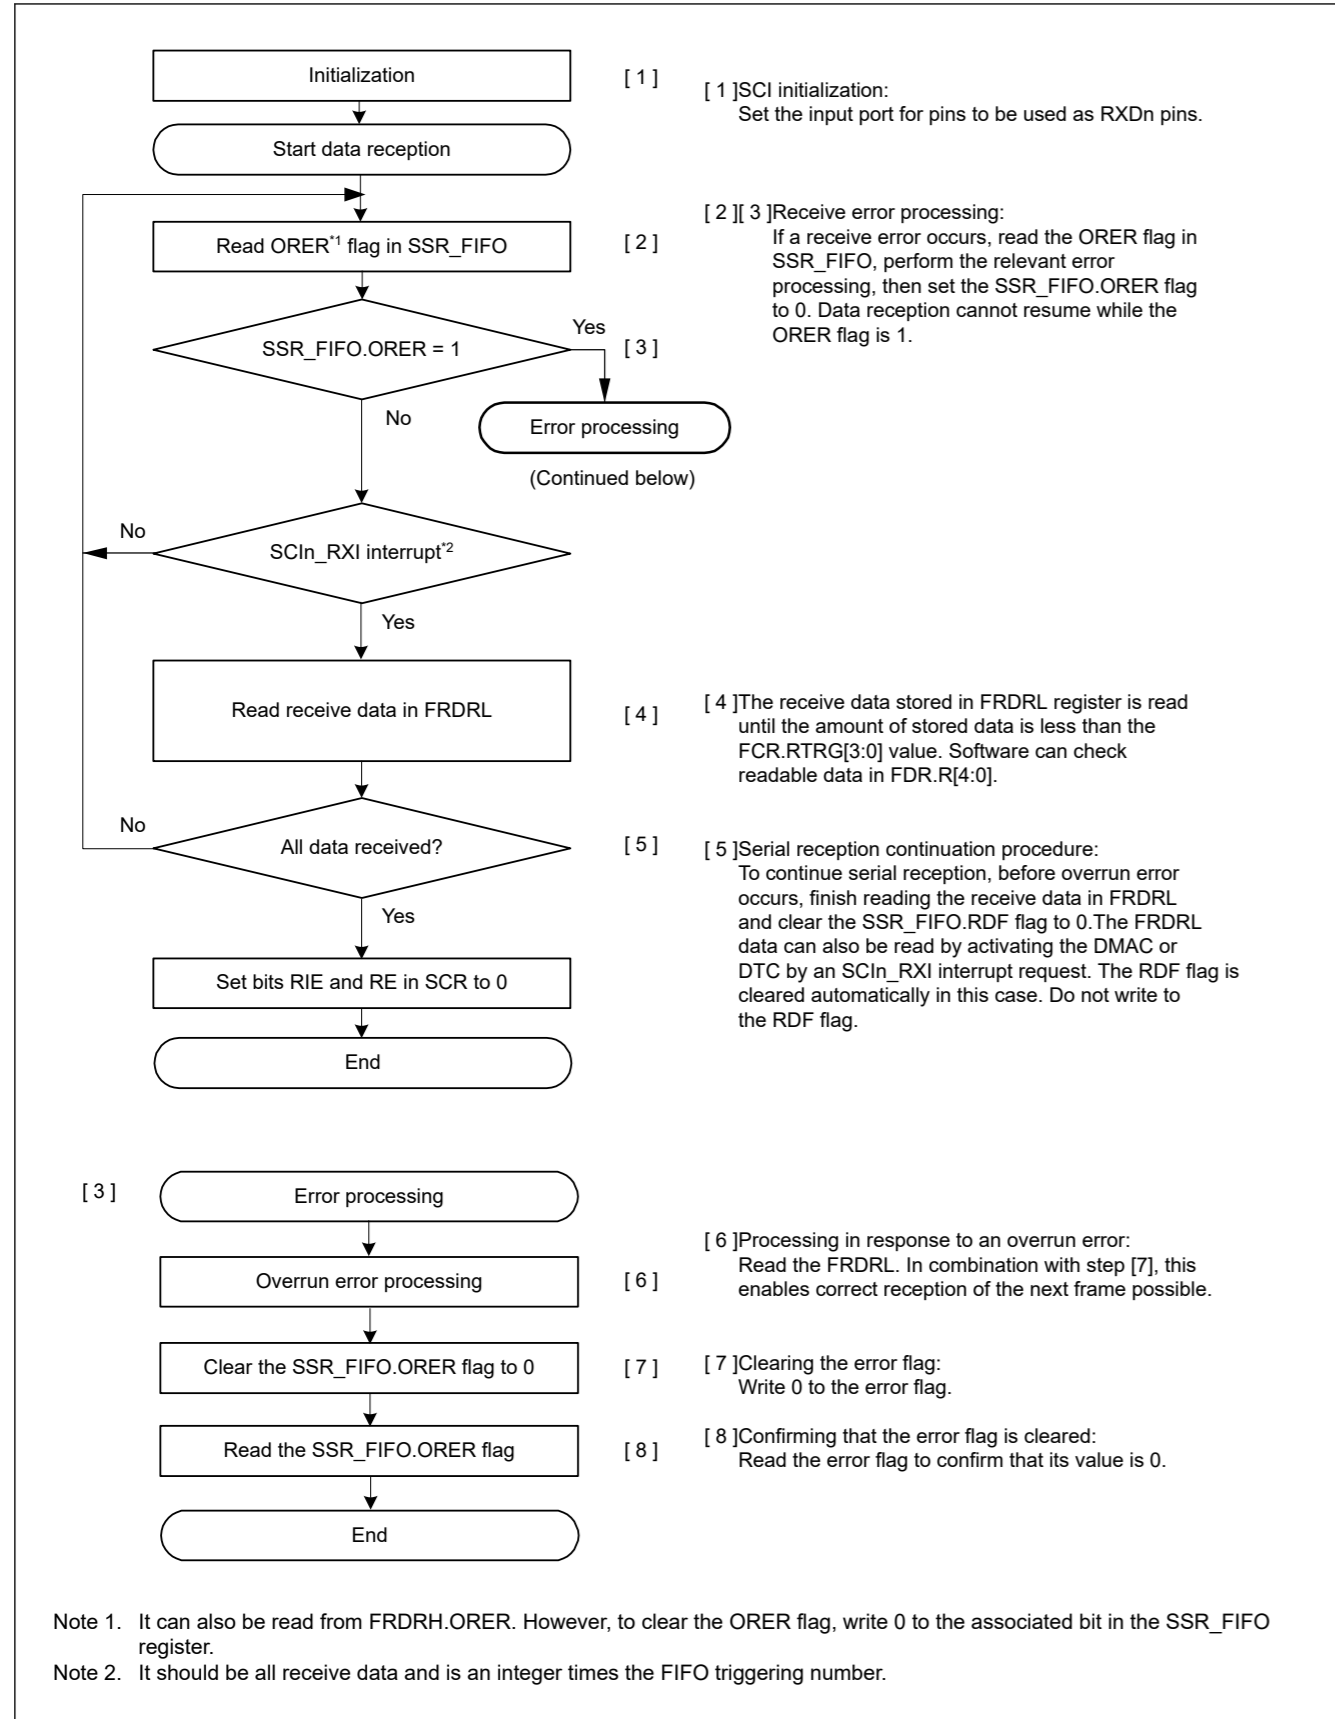

Figure 27.74 Example flow of serial reception in clock synchronous mode with FIFO selected

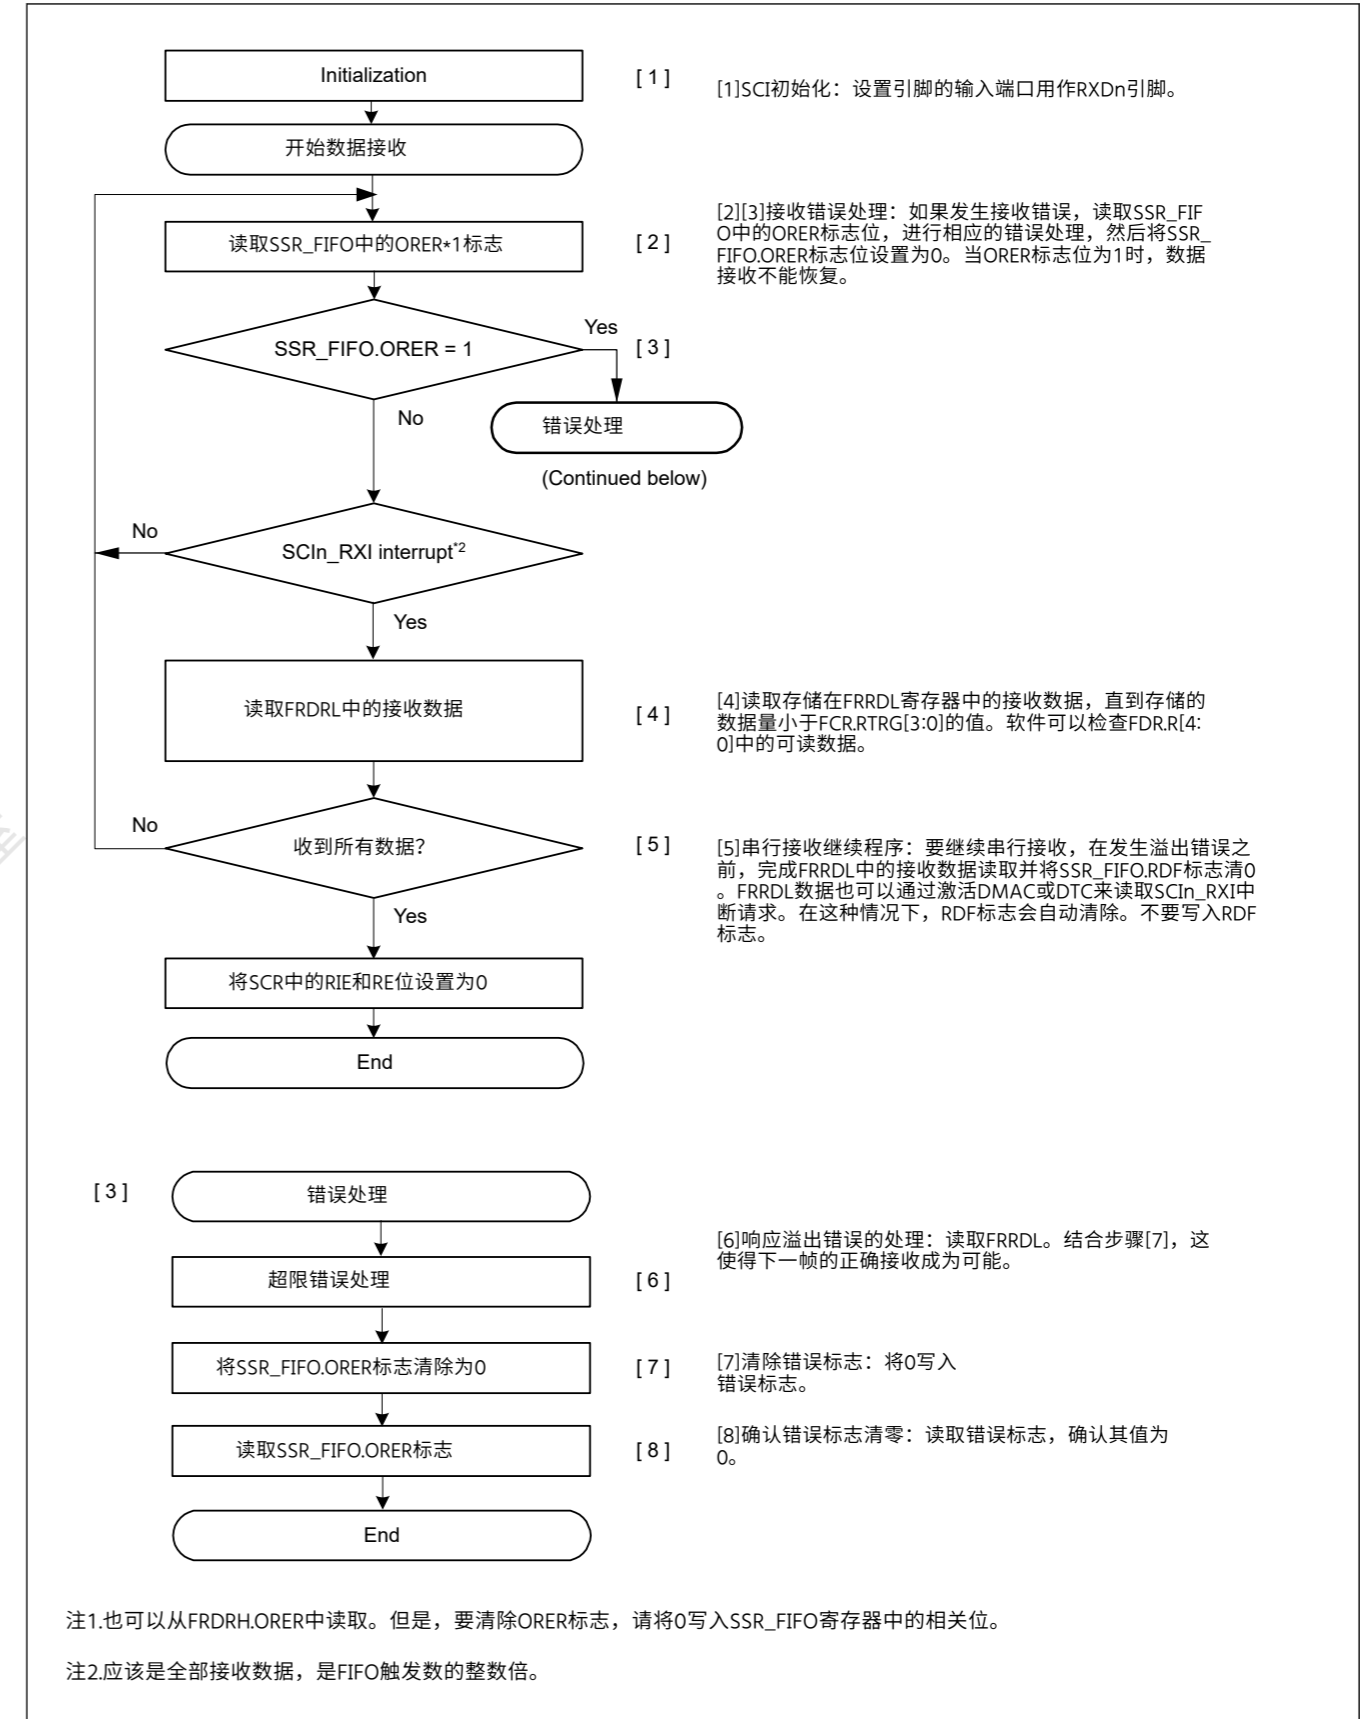

Figure 27.74 选择FIFO的时钟同步模式下的串行接收示例流程

### 27.6.6 Simultaneous Serial Data Transmission and Reception in Clock Synchronous Mode

(1) Non-FIFO selected

Figure 27.75 shows an example flow of simultaneous serial transmit and receive operations in clock synchronous mode. After initializing the SCI, use the following procedure for simultaneous serial data transmit and receive operations.

To switch from transmit mode to simultaneous transmit and receive mode:

1. Check that the SCI completes the data transmission by verifying that the SSR.TEND flag is set to 1.
2. Initialize the SCR register, and then set the TIE, RIE, TE, and RE bits in the SCR register to 1 simultaneously by a single instruction.

To switch from receive mode to simultaneous transmit and receive mode:

1. Check that the SCI completes the data reception.
2. Set the RIE and RE bits to 0, and then check that the receive error flag ORER in the SSR register is 0.
3. Set the TIE, RIE, TE, and RE bits in the SCR register to 1 simultaneously by a single instruction.

### 27.6.6 时钟同步的同时串行数据发送和接收 Mode

(1) Non-FIFO selected

图27.75显示了时钟同步模式下同时串行发送和接收操作的示例流程。初始化SCI后，使用以下程序同时进行串行数据发送和接收操作。

从发送模式切换到同时发送和接收模式：

- 1.通过验证SSR.TEND标志是否设置为1来检查SCI是否完成数据传输。
- 2.初始化SCR寄存器，然后通过一条指令同时将SCR寄存器中的TIE、RIE、TE和RE位设置为1。

从接收模式切换到同时发送和接收模式：

- 1.检查SCI是否完成数据接收。
- 2.将RIE和RE位设置为0，然后检查SSR寄存器中的接收错误标志ORER是否为0。
- 3.通过一条指令同时将SCR寄存器中的TIE、RIE、TE和RE位设置为1。

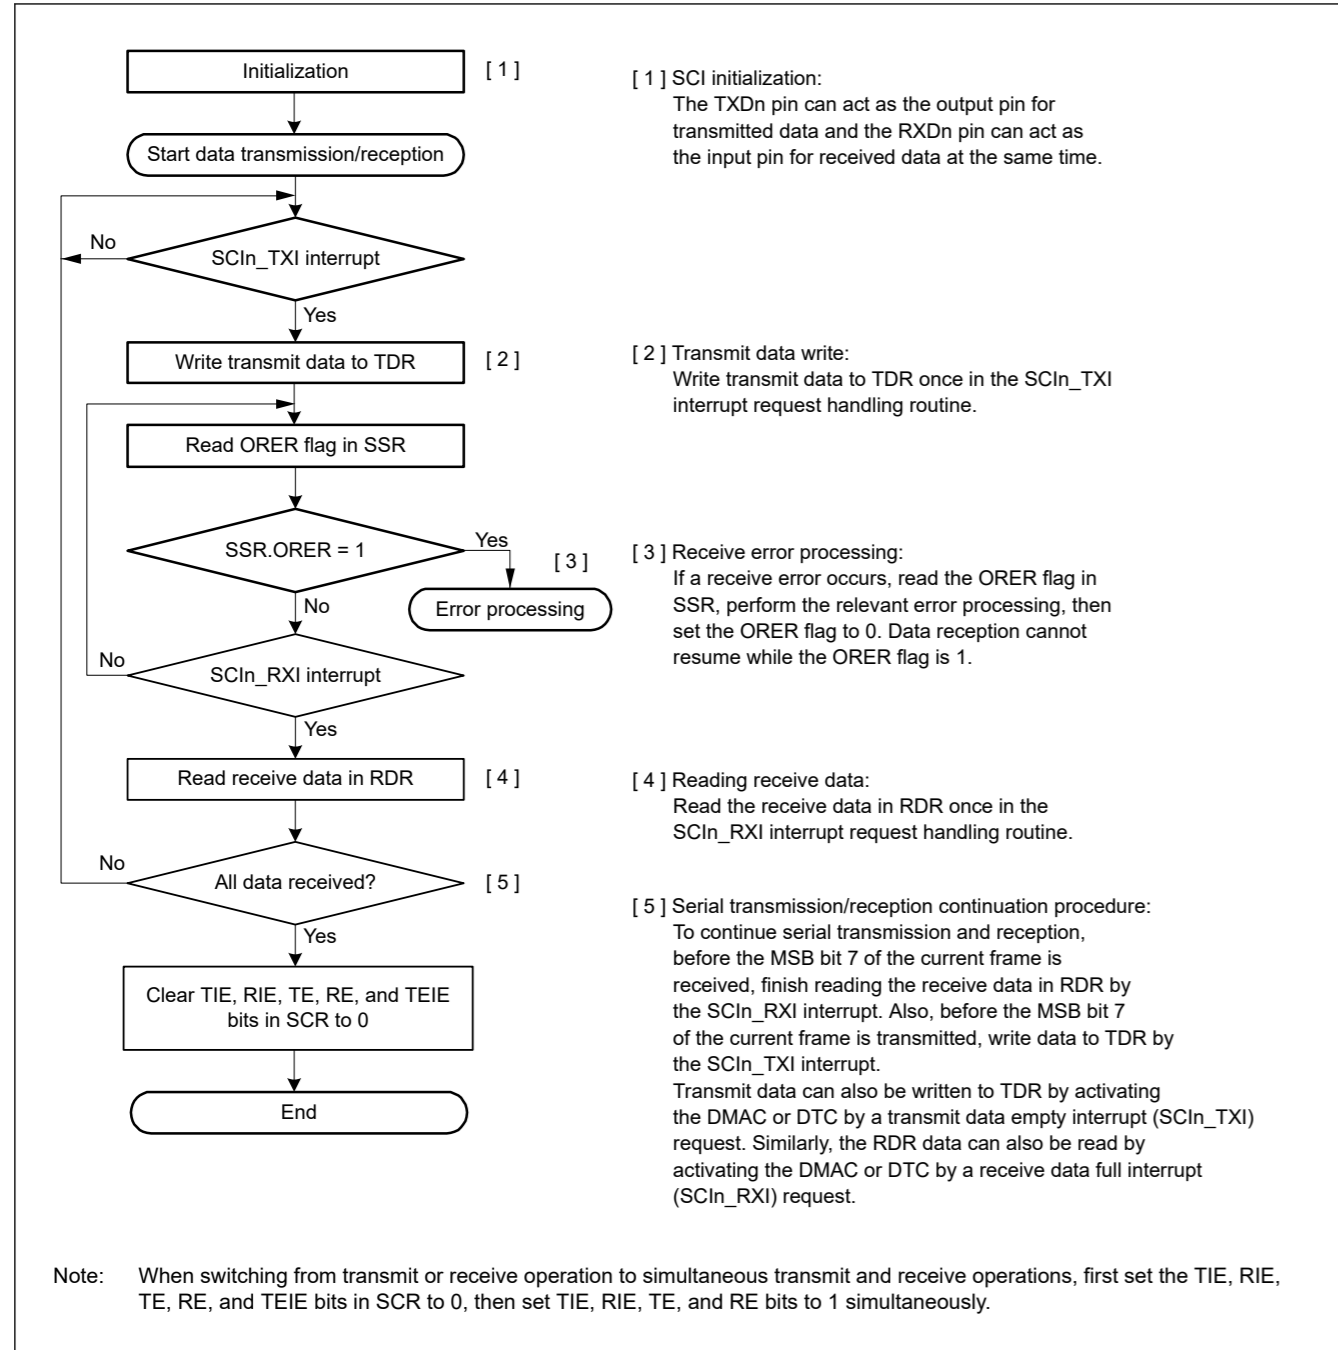

Figure 27.75 Example flow of simultaneous serial transmission and reception in clock synchronous mode with non-FIFO selected

(2) FIFO selected

Figure 27.76 shows an example flow of simultaneous serial transmit and receive operations in clock synchronous mode with FIFO selected.

After initializing the SCI, use the following procedure for simultaneous serial data transmit and receive operations.

To switch from transmit mode to simultaneous transmit and receive mode:

1. Check that the SCI completes the transmission by verifying that the SSR\_FIFO.TEND flag is set to 1.
2. Initialize the SCR register, then set the TIE, RIE, TE, and RE bits in the SCR register to 1 simultaneously by a single instruction.

To switch from receive mode to simultaneous transmit and receive mode:

1. Check that the SCI completes the reception.

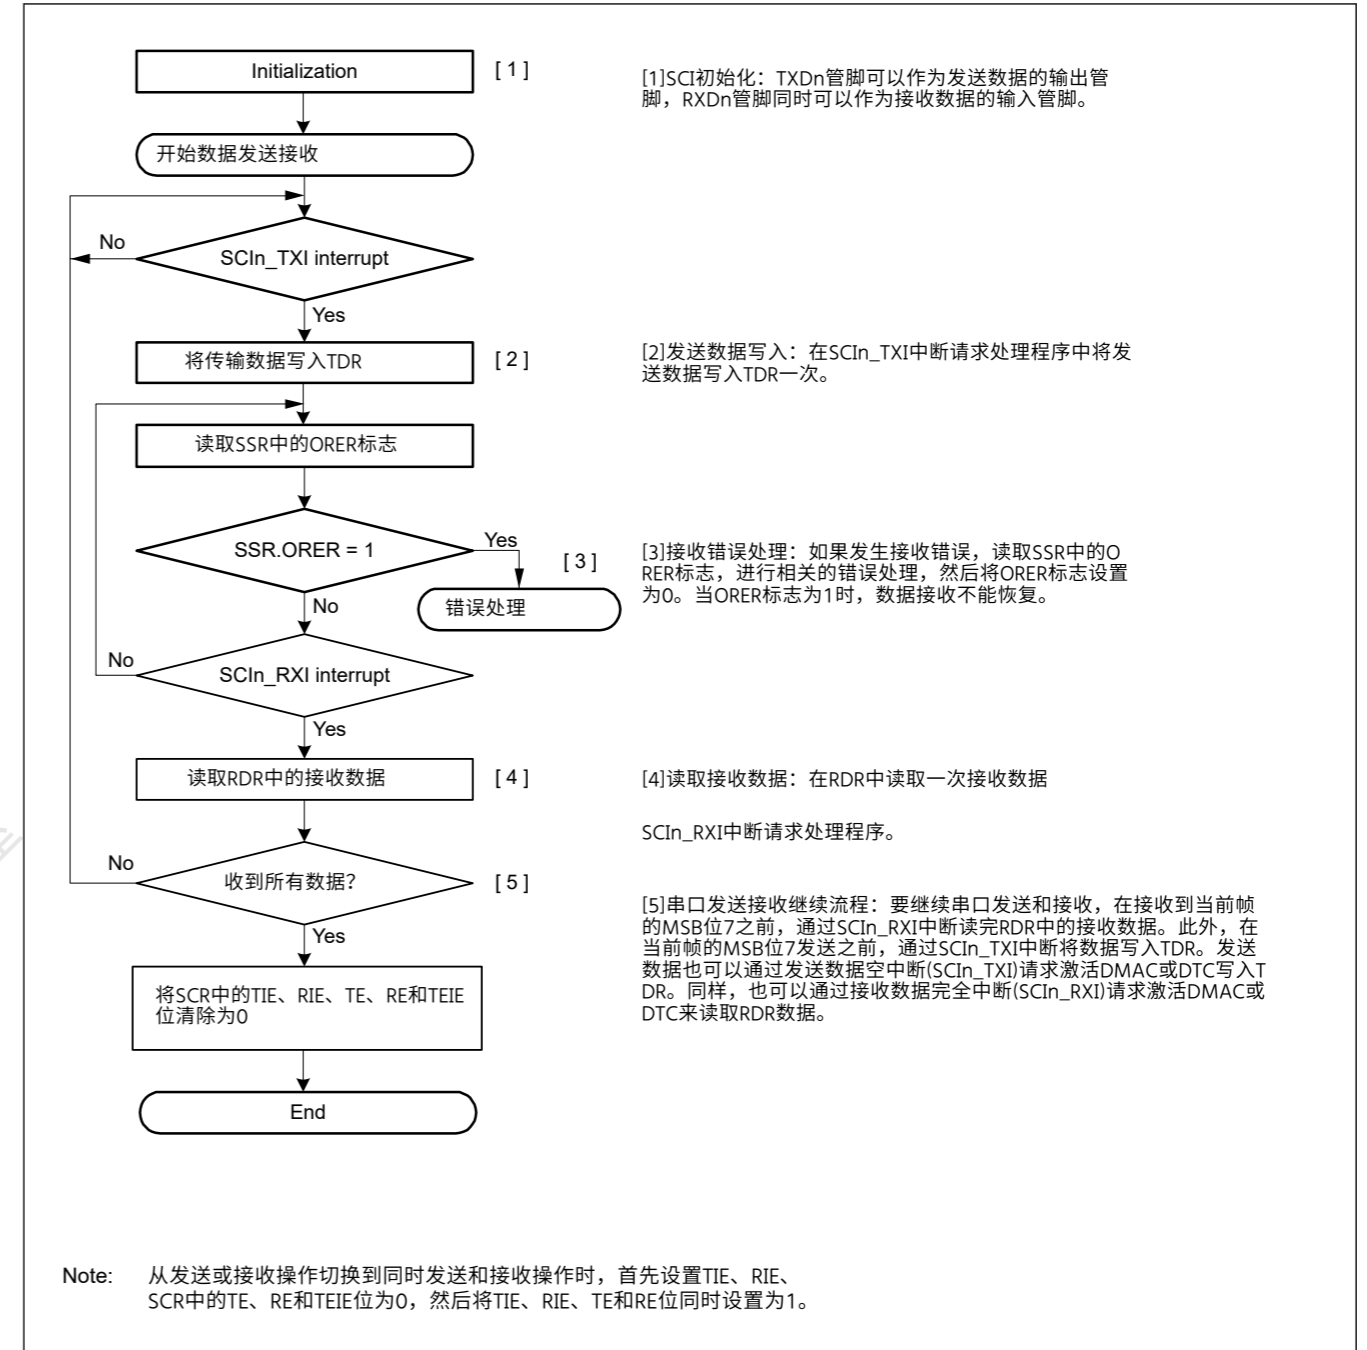

Figure 27.75 选择非FIFO的时钟同步模式下同时串行发送和接收的示例流程

(2) FIFO selected

图27.76显示了在时钟同步模式下同时串行发送和接收操作的示例流程, 其中FIFO selected.

初始化SCI后, 使用以下程序同时进行串行数据发送和接收操作。

从发送模式切换到同时发送和接收模式:

- 1.通过验证SSR\_FIFO.TEND标志设置为1来检查SCI是否完成传输。
- 2.初始化SCR寄存器, 然后通过一条指令同时将SCR寄存器中的TIE、RIE、TE和RE位设置为1。

从接收模式切换到同时发送和接收模式:

- 1.检查SCI是否完成接收。

- Set the RIE and RE bits to 0.
- Check that the receive error flags ORER in the SSR\_FIFO register are 0, and then set the TIE, RIE, TE, and RE bits in the SCR register to 1 simultaneously by a single instruction.

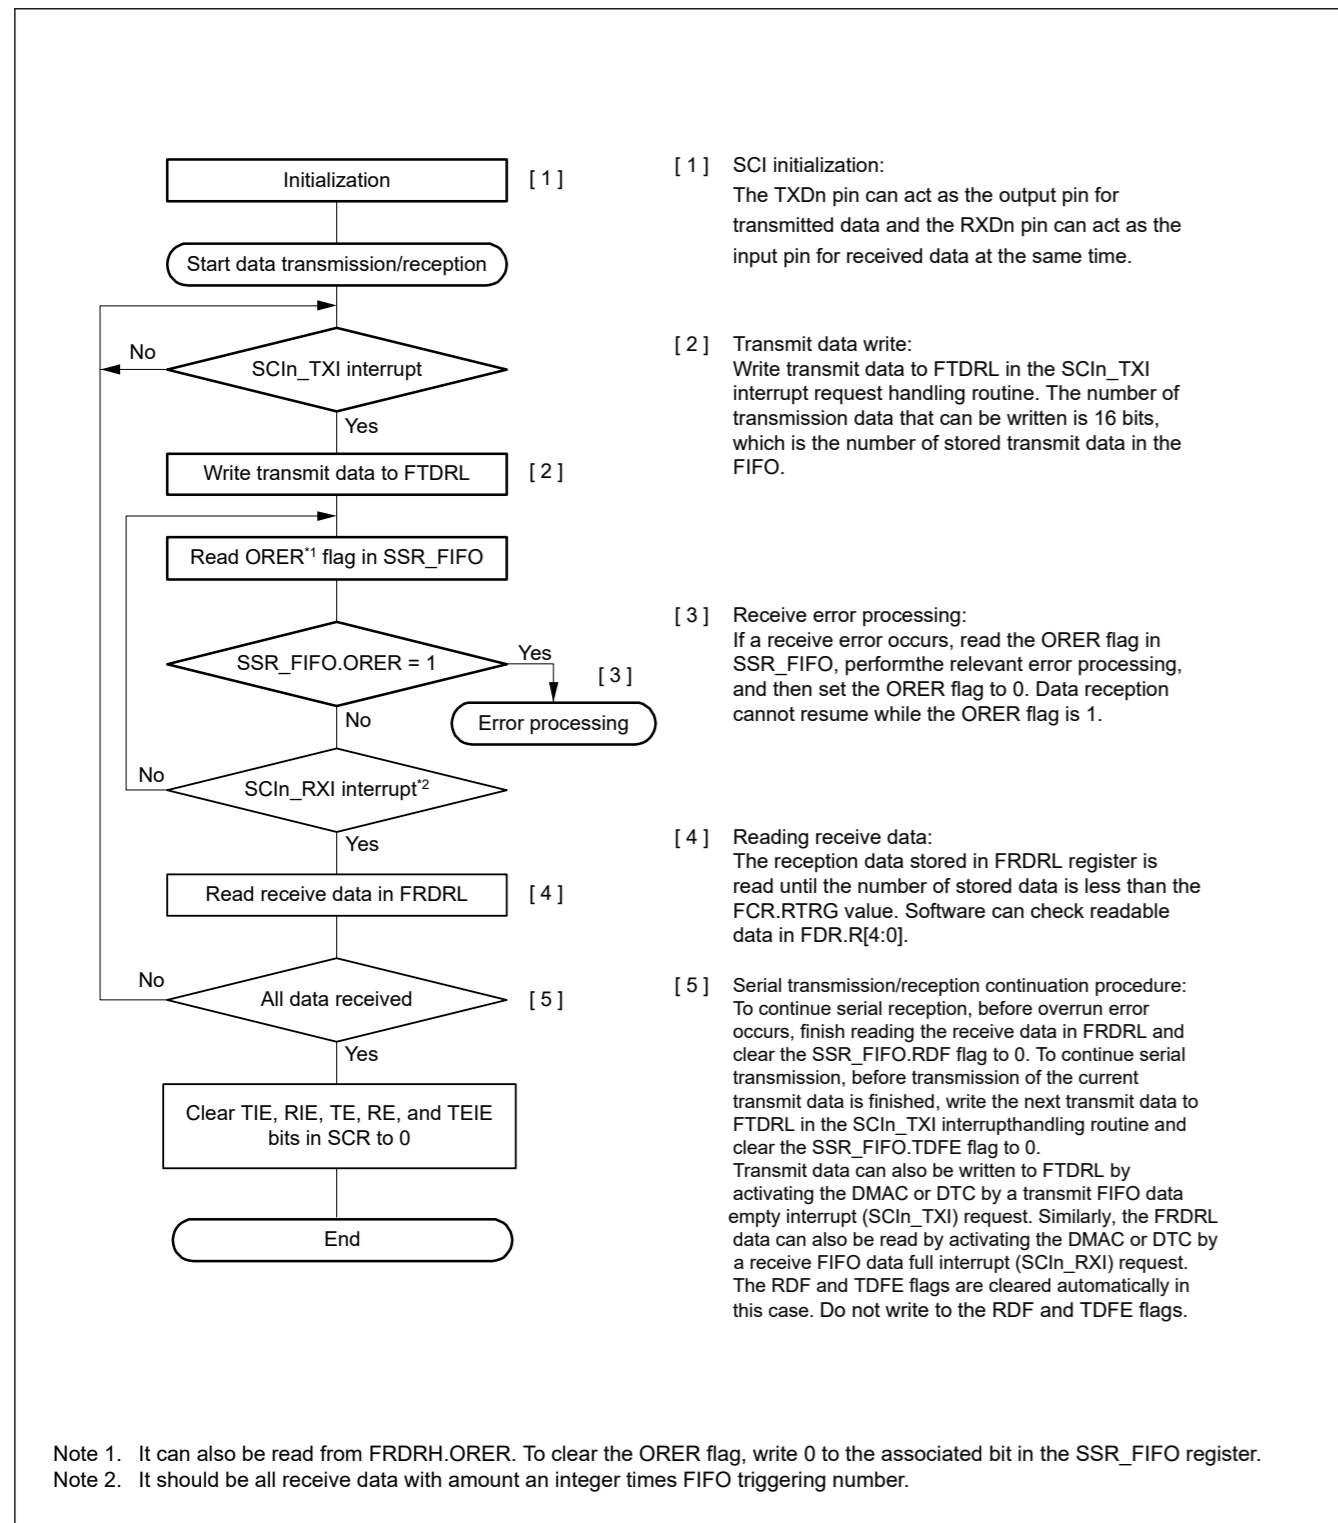

Figure 27.76 Example flow of simultaneous serial transmission and reception in clock synchronous mode with FIFO selected

- 将RIE和RE位设置为0。
- 检查SSR\_FIFO寄存器中的接收错误标志ORER是否为0，然后通过一条指令将SCR寄存器中的TIE、RIE、TE和RE位同时设置为1。

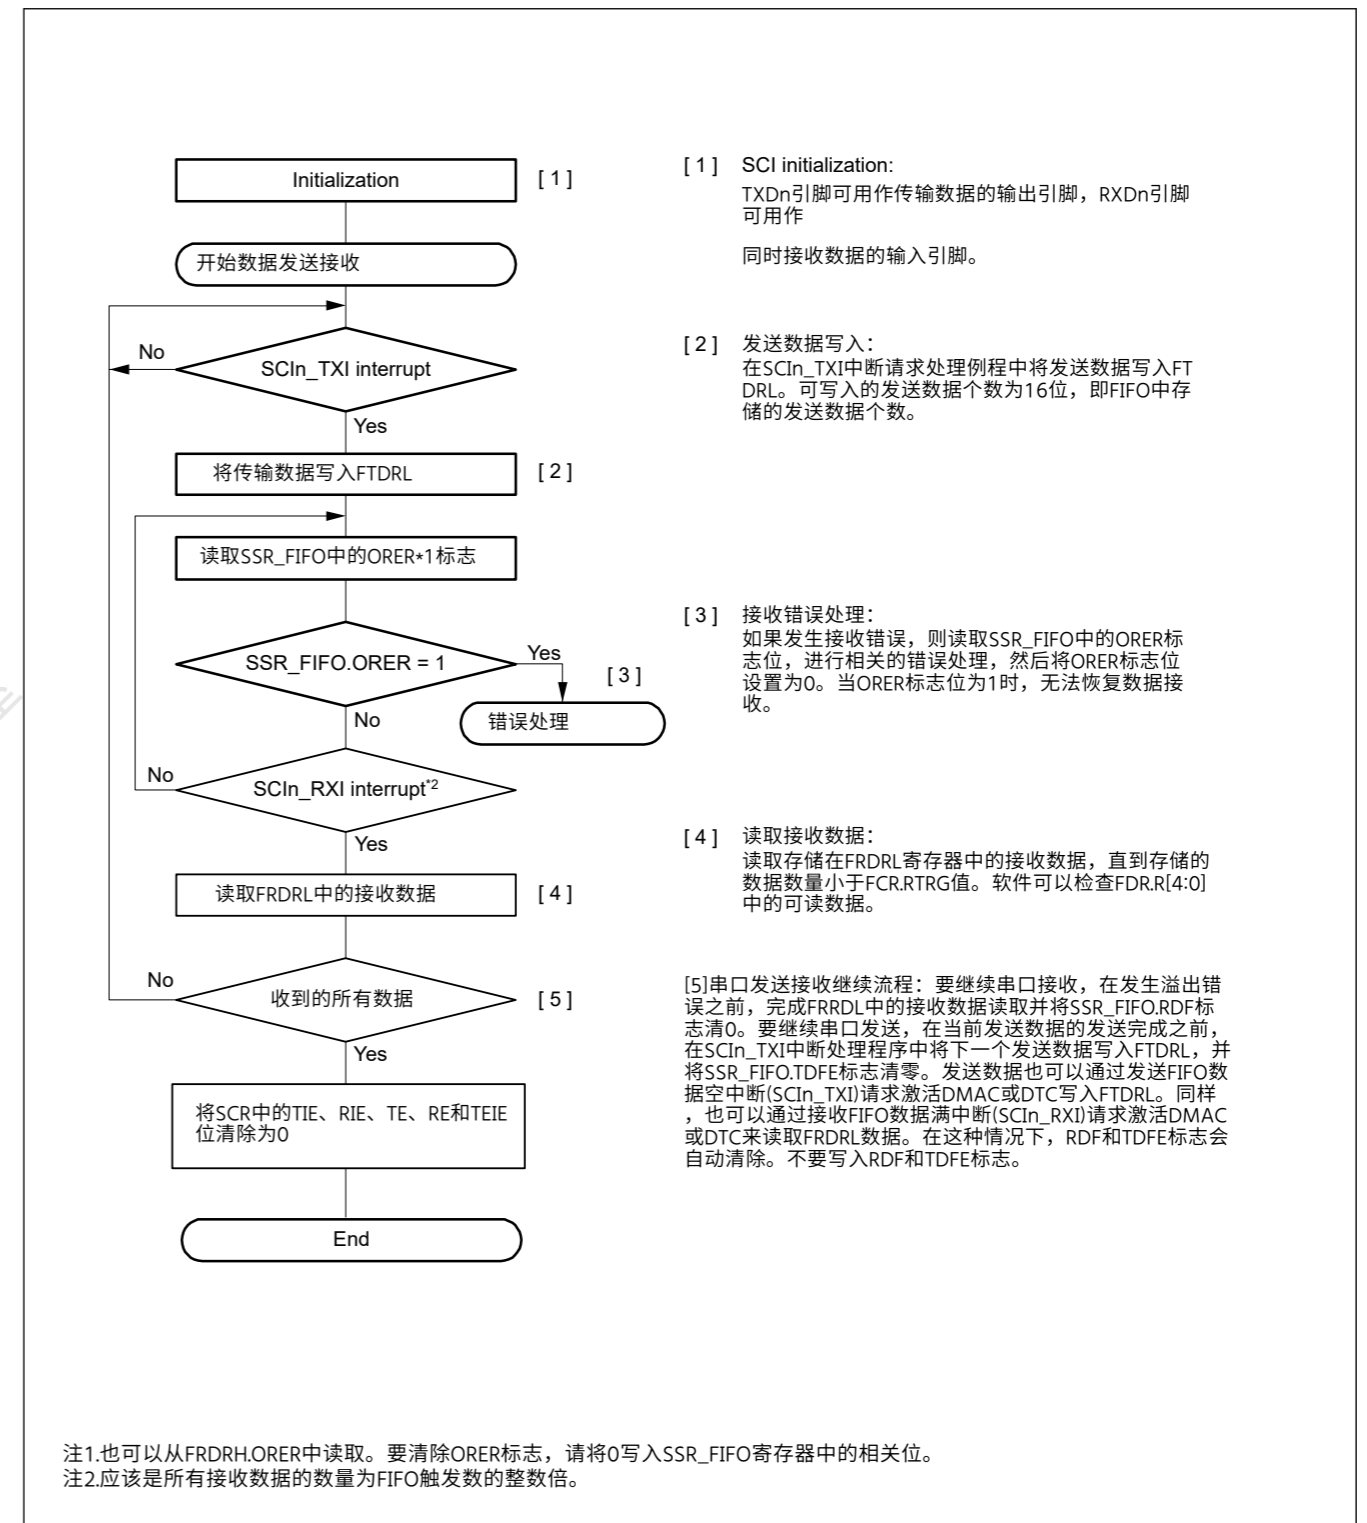

Figure 27.76 选择FIFO的时钟同步模式下同时串行发送和接收的示例流程

## 27.7 Operation in Smart Card Interface Mode

The SCI supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards), as an extended function of the SCI.

Smart card interface mode can be selected using the appropriate register.

### 27.7.1 Example Connection

Figure 27.77 shows an example connection between a smart card (IC card) and the MCU. As shown in Figure 27.77, because the MCU communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to VCC using a resistor.

Setting the SCR\_SMCI.TE and SCR\_SMCI.RE bits to 1 with an IC card disconnected enables closed-loop transmission or reception, allowing self-diagnosis. To supply an IC card with the clock pulses generated by the SCI, input the SCKn pin output to the CLK pin of an IC card.

An output port of the MCU can be used to output a reset signal.

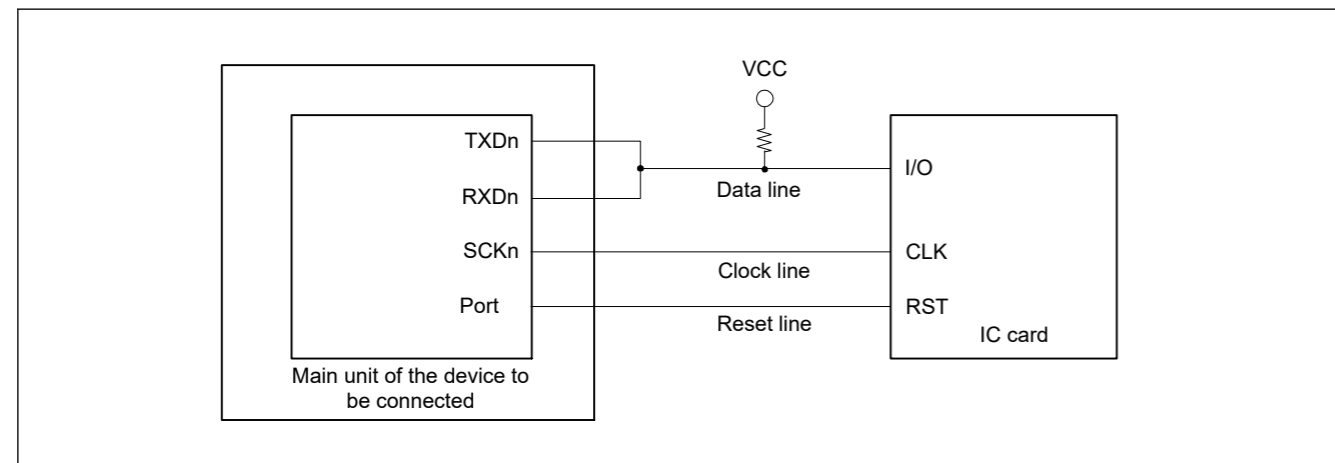

Figure 27.77 Example connection with a smart card (IC card)

### 27.7.2 Data Format (Except in Block Transfer Mode)

Figure 27.78 shows the data transfer formats in smart card interface mode:

- One frame consists of 8-bit data and a parity bit in asynchronous mode.
- During transmission, at least 2 ETUs (elementary time unit – the time required for transferring 1 bit) is set as a guard time from the end of the parity bit until the start of the next frame.
- If a parity error is detected during reception, a low error signal is output for 1 ETU after 10.5 ETUs elapse from the start bit.
- If an error signal is sampled during transmission, the same data is automatically retransmitted after at least 2 ETUs.

## 27.7 智能卡接口模式下的操作

SCI支持符合ISO/IEC7816-3（识别卡标准）的智能卡（IC卡）接口，作为SCI的扩展功能。

可以使用适当的寄存器选择智能卡接口模式。

### 27.7.1 示例连接

图27.77显示了智能卡（IC卡）和MCU之间的示例连接。如图27.77所示，由于MCU使用单条传输线与IC卡通信，因此将TXDn和RXDn引脚互连，并使用电阻将数据传输线上拉到VCC。

在断开IC卡的情况下将SCR\_SMCI.TE和SCR\_SMCI.RE位设置为1可启用闭环发送或接收，从而实现自诊断。要将SCI产生的时钟脉冲提供给IC卡，请将SCKn引脚输出输入到IC卡的CLK引脚。

MCU的输出端口可用于输出复位信号。

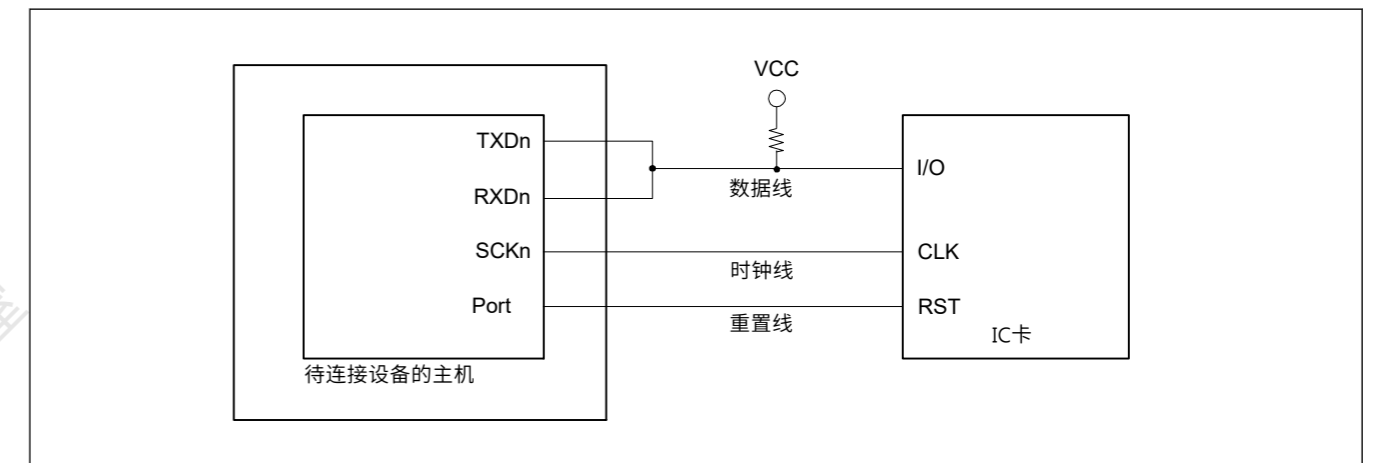

Figure 27.77 与智能卡（IC卡）的连接示例

### 27.7.2 数据格式（块传输模式除外）

图27.78显示了智能卡接口模式下的数据传输格式：

- 一帧由8位数据和一个异步模式的奇偶校验位组成。
- 在传输过程中，至少设置2个ETU（基本时间单位——传输1位所需的时间）作为从奇偶校验位结束到下一帧开始的保护时间。
- 如果在接收过程中检测到奇偶校验错误，则在从起始位经过10.5ETU后输出1ETU的低错误信号。
- 如果在传输过程中对错误信号进行采样，相同的数据会在至少2个ETU后自动重传。

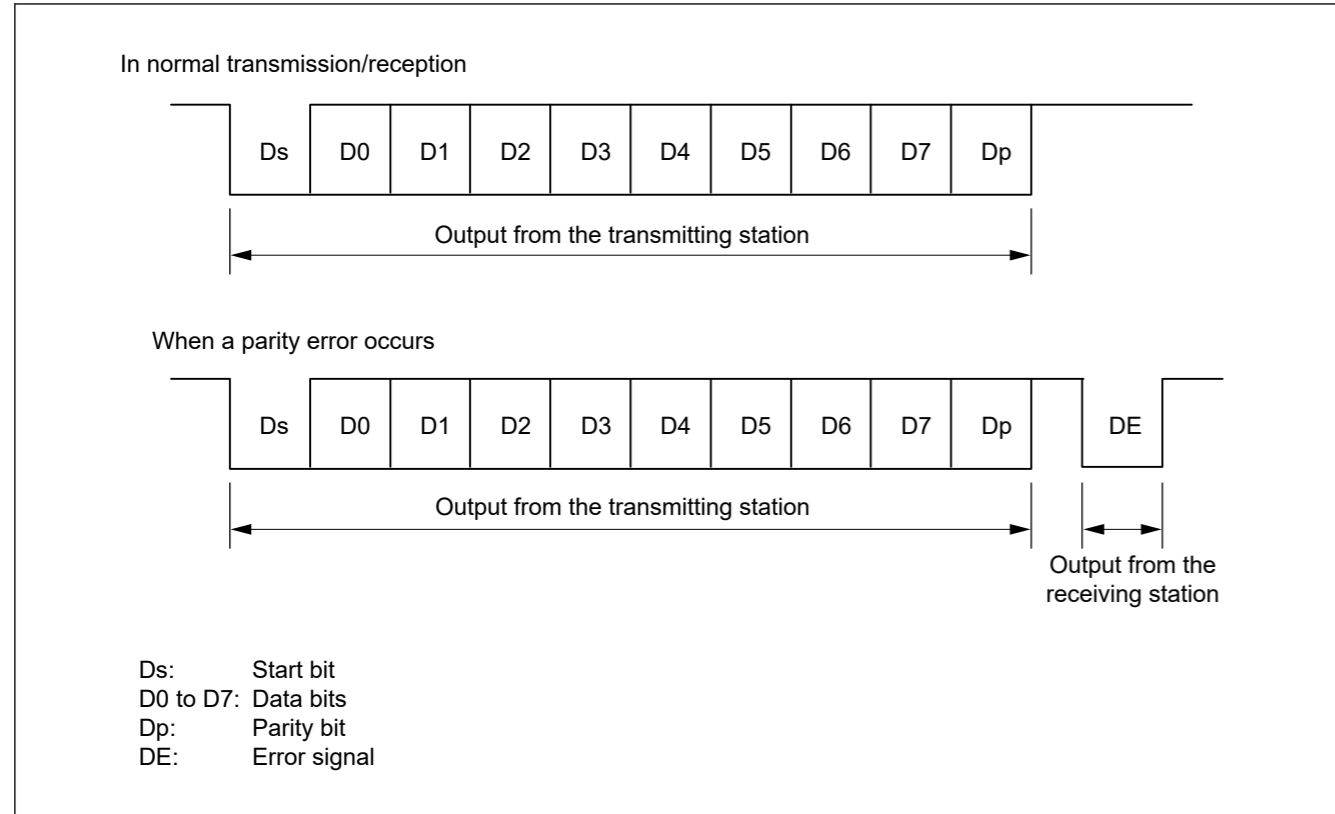

Figure 27.78 Data formats in smart card interface mode

For communications with IC cards of the direct convention type and inverse convention type, follow the procedures in this section.

(1) Direct Convention Type

For the direct convention type, logic levels 1 and 0 indicate the Z and A states, respectively, and data is transferred with LSB-first for the start character, as shown in Figure 27.79. Therefore, data in the start character in the figure is 0x3B.

When using the direct convention type, write 0 to both the SCMR.SDIR and SCMR.SINV bits. Write 0 to the SMR\_SMCI.PM bit to use even parity, which is prescribed by the smart card standard.

Figure 27.79 Direct convention with SDIR in SCMR = 0, SINV in SCMR = 0, and PM in SMR\_SMCI = 0

(2) Inverse Convention Type

For the inverse convention type, logic levels 1 and 0 indicate the A and Z states, respectively, and data is transferred with MSB-first for the start character, as shown in Figure 27.80. Therefore, data in the start character in the figure is 0x3F.

When using the inverse convention type, write 1 to both the SCMR.SDIR and SCMR.SINV bits. The parity bit is logic level 0 to produce even parity, which is prescribed by the smart card standard, and corresponds to the Z state. Because the SINV bit of the MCU only inverts data bits D7 to D0, write 1 to the PM bit in SMR\_SMCI to invert the parity bit for both transmission and reception.

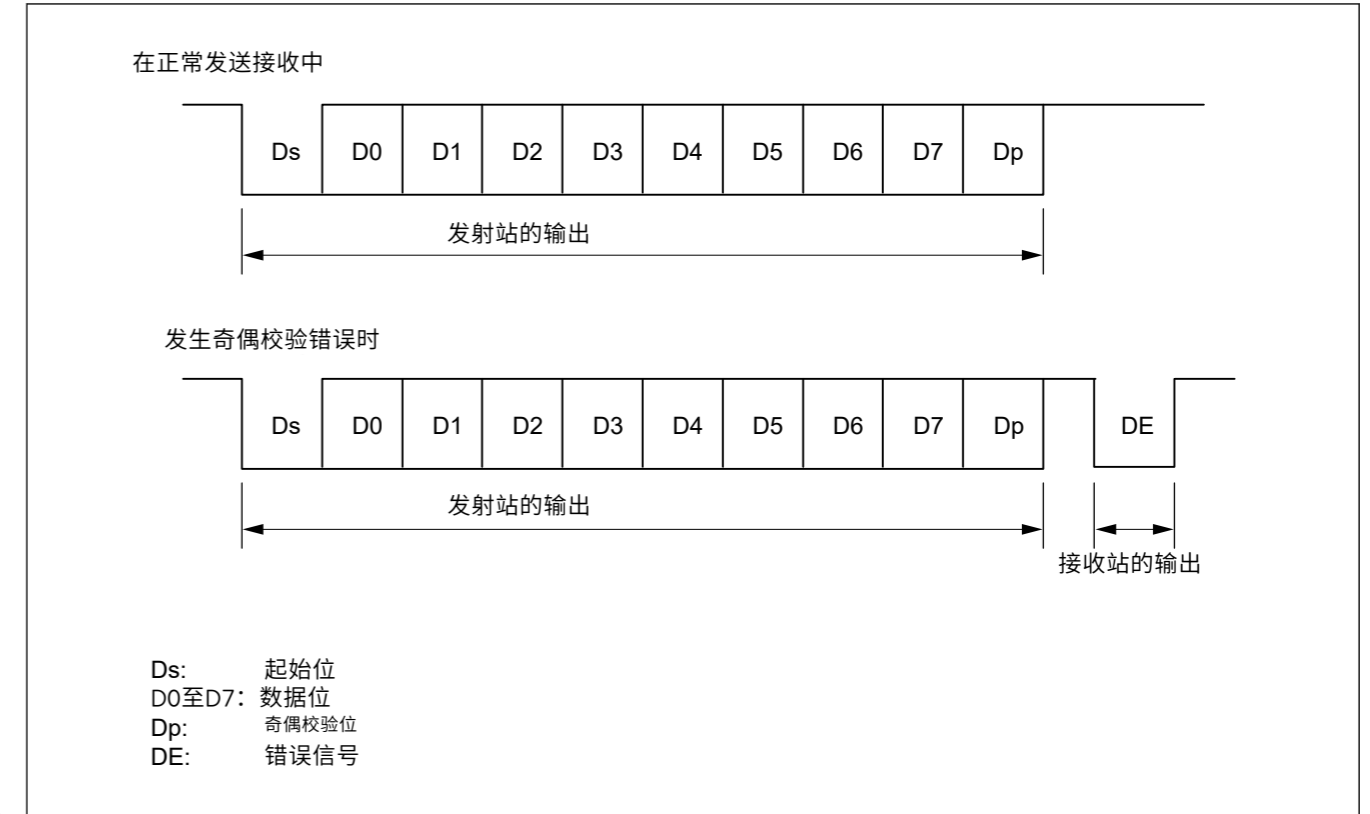

Figure 27.78 智能卡接口模式下的数据格式

与直接约定型和逆约定型IC卡进行通信时，请按照本节的步骤进行。

(1) 直接约定型

对于直接约定类型，逻辑电平1和0分别表示Z和A状态，数据通过 LSB-first为起始字符，如图27.79所示。因此，图中起始字符中的数据为0x3B。

使用直接约定类型时，将0写入SCMR.SDIR和SCMR.SINV位。将0写入 SMR\_SMCI.PM位使用智能卡标准规定的偶校验。

Figure 27.79 与SCMR=0中的SDIR、SCMR=0中的SINV和SMR\_SMCI=0中的PM的直接约定

(2) 逆约定型

对于逆约定类型，逻辑电平1和0分别表示A和Z状态，数据通过 MSB-first为起始字符，如图27.80所示。因此，图中起始字符中的数据为0x3F。

使用逆约定类型时，将1写入SCMR.SDIR和SCMR.SINV位。奇偶校验位为逻辑电平0，产生偶校验，这是智能卡标准规定的，对应于Z状态。由于MCU的SINV位仅将数据位D7反转为D0，因此向SMR\_SMCI中的PM位写入1以反转发送和接收的奇偶校验位。

Figure 27.80 Inverse convention with SDIR in SCMR = 1, SINV in SCMR = 1, and PM in SMR\_SMCI = 1

### 27.7.3 Block Transfer Mode

Block transfer mode differs from normal smart card interface mode as follows:

- Even if a parity error is detected during reception, no error signal is output. Because the PER flag in SSR\_SMCI is set by error detection, clear the PER flag before receiving the parity bit of the next frame.
- During transmission, at least 1 ETU is set as a guard time from the end of the parity bit until the start of the next frame.
- Because the same data is not retransmitted, the TEND flag in SSR\_SMCI is set to 11.5 ETUs after transmission starts.
- In block transfer mode, the ERS flag in SSR\_SMCI indicates the error signal status as in normal smart card interface mode, but the flag is read as 0 because no error signal is transferred.

### 27.7.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the on-chip baud rate generator can be used as a transfer clock in smart card interface mode.

In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate set up in the SCMR.BCP2 and the SMR\_SMCI.BCP[1:0] bits. The frequency is always 16 times the bit rate in normal asynchronous mode.

For data reception, the falling edge of the start bit is sampled with the base clock to perform internal synchronization.

Receive data is sampled on the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, and 256th rising edges of the base clock so that it can be latched at the middle of each bit as shown in Figure 27.81. The reception margin is determined by the following formula:

$$M = \left| \left( 0.5 - \frac{1}{2N} \right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100 \text{ [%]}$$

M: Reception margin (%)

N: Ratio of bit rate to clock (N = 32, 64, 372, 256)

D: Duty cycle of clock (D = 0 to 1.0)

L: Frame length (L = 10)

F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5, and N = 372 in the specified formula, the reception margin is determined using the following formula:

$$M = \{0.5 - 1/(2 \times 372)\} \times 100 \text{ [%]} = 49.866 \text{ %}$$

Figure 27.80 SCMR=1中的SDIR、SCMR=1中的SINV和SMR\_SMCI=1中的PM的逆约定

### 27.7.3 块传输模式

块传输模式与普通智能卡接口模式的区别如下:

- 即使在接收过程中检测到奇偶校验错误,也不会输出错误信号。因为SSR\_SMCI中的PER标志是由错误检测设置的,所以在接收下一帧的奇偶校验位之前清除PER标志。
- 在传输过程中,从奇偶校验位结束到下一帧开始至少设置1个ETU作为保护时间
- 由于没有重传相同的数据,所以在传输开始后,SSR\_SMCI中的TEND标志设置为11.5ETU
- 在块传输模式下,SSR\_SMCI中的ERS标志指示错误信号状态,与普通智能卡接口模式一样,但该标志被读取为0,因为没有传输错误信号

### 27.7.4 接收数据采样时序和接收裕量

只有片内波特率发生器产生的内部时钟可以用作智能卡接口模式下的传输时钟。

在这种模式下,SCI可以在频率为SCMR.BCP2和SMR\_SMCI.BCP[1:0]位。在正常异步模式下,频率始终是比特率的16倍。

对于数据接收,起始位的下降沿用基准时钟进行采样,以进行内部同步。

接收数据在基本时钟的第16、32、186、128、46、64、93和256个上升沿进行采样,以便在每个位的中间锁存,如图27.81所示。接收余量由以下公式确定:

$$M = \left| \left( 0.5 - \frac{1}{2N} \right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100 \text{ [%]}$$

M: 接收余量 (%)

N: 比特率与时钟的比率 (N=32、64、372、256)

D: 时钟的占空比 (D=0到1.0)

L: 帧长 (L=10)

F: 时钟频率偏差的绝对值

假设指定公式中的F=0、D=0.5和N=372的值,则使用以下公式确定接收余量:

$$M = \{0.5 - 1/(2 \times 372)\} \times 100 \text{ [%]} = 49.866 \text{ %}$$

Figure 27.81 Receive data sampling timing in smart card interface mode when the clock frequency is 372 times the bit rate

27.7.5 SCI Initialization (Smart Card Interface Mode)

Before transmitting and receiving data, write the initial value 0x00 in the SCR\_SMCI register and initialize the SCI following the example flow shown in Table 27.39.

Always set the initial value in the TIE, RIE, TE, RE, TEIE bits in the SCR\_SMCI register before switching from transmission to reception mode or from reception to transmission mode. When SCR\_SMCI.RE is set to 0, the RDR register is not initialized.

To change from reception mode to transmission mode, first check that reception has completed, then initialize the SCI. At the end of initialization, set SCR\_SMCI.TE = 1 and SCR\_SMCI.RE = 0. Reception completion can be verified by reading the SCIn\_RXI request, ORER, or PER flag in SSR\_SMCI.

To change transmission mode to reception mode, first check that transmission has completed, then initialize the SCI. At the end of initialization, set SCR\_SMCI.TE = 0 and SCR\_SMCI.RE = 1. Transmission completion can be verified by reading the TEND flag in SSR\_SMCI.

Table 27.39 Example flow of SCI initialization in smart card interface mode (1 of 2)

| No. | Step Name  | Description  |
|-----|--|--|
| 1   | Start initialization   |  |
| 2   | Set SCR_SMCI.TIE, RIE, TE, RE, TEIE, and CKE[1:0] to 0                 | Stop the communication and initialize SKE[1:0].                              |
| 3   | Set SIMR1.IICM bit to 0. Set SCMR.SMIF to 1.                           | Set to smart card interface mode.  |
| 4   | Set SSR_SMCI.ORER, ERS, PER to 0                                       | Write to SSR_SMCI after reading SSR_SMCI.                                    |
| 5   | Set SPMR.CKPH, CKPOL   | Set the transmission or reception format in SPMR.                            |
| 6   | Set SMR_SMCI.GM, BLK, PM, BCP[1:0], CKS[1:0], and set SMR_SMCI.PE to 1 | Set the operation mode and the transmission or reception format in SMR_SMCI. |
| 7   | Set SCMR.BCP2, SDIR, SINV  | Set the transmission or reception format in SCMR.                            |
| 8   | Set SPTR to the initial value.   | Set the Initial value to SPTR.   |

Figure 27.81 时钟频率为372倍比特率时智能卡接口模式下接收数据采样时序

27.7.5 SCI初始化 (智能卡接口模式)

在发送和接收数据之前，将初始值0x00写入SCR\_SMCI寄存器并按照表27.39所示的示例流程初始化SCI。

在从发送模式切换到接收模式或从接收模式切换到发送模式之前，请务必在SCR\_SMCI寄存器中的TIE、RIE、TE、RE、TEIE位中设置初始值。当SCR\_SMCI.RE设置为0时，RDR寄存器未初始化。

要从接收模式更改为发送模式，首先检查接收是否完成，然后初始化SCI。在初始化结束时，设置SCR\_SMCI.TE=1和SCR\_SMCI.RE=0。可以通过读取SSR\_SMCI中的SCIn\_RXI请求、ORER或PER标志来验证接收完成。

要将传输模式更改为接收模式，首先检查传输是否完成，然后初始化SCI。在初始化结束时，设置SCR\_SMCI.TE=0和SCR\_SMCI.RE=1。可以通过读取SSR\_SMCI中的TEND标志来验证传输完成。

Table 27.39 智能卡接口模式下SCI初始化示例流程 (1of2)

| No. | 步骤名称  | Description               |
|-----|---|---------------------------|
| 1   | 开始初始化   |                           |
| 2   | 将SCR_SMCI.TIE、RIE、TE、RE、TEIE和CKE[1:0]设置为0                         | 停止通信并初始化SKE[1:0]。         |
| 3   | 将SIMR1.IICM位设置为0。将SCMR.SMIF设置为1。                                  | 设置为智能卡接口模式。               |
| 4   | 设置SSR_SMCI.ORER、ERS、PER到0   | 读取SSR_SMCI后写入SSR_SMCI。    |
| 5   | Set SPMR.CKPH, CKPOL  | 在SPMR中设置发送或接收格式。          |
| 6   | Set SMR_SMCI.GM, BLK, PM, BCP[1:0], CKS[1:0], 并设置SMR_SMCI.PE to 1 | 在SMR_SMCI中设置操作模式和发送或接收格式。 |
| 7   | Set SCMR.BCP2, SDIR, SINV   | 在SCMR中设置发送或接收格式。          |
| 8   | 将SPTR设置为初始值。  | 将初始值设置为SPTR。              |

Table 27.39 Example flow of SCI initialization in smart card interface mode (2 of 2)

| No. | Step Name   | Description  |
|-----|---|--|
| 9   | Set SEMR.BRME and SEMR.RXDESEL to 0                   | Set SEMR.BRME and SEMR.RXDESEL to 0.   |
| 10  | Set a value in BRR                                    | Write the value for the bit rate in BRR.   |
| 11  | Set the I/O port functions                            | Set the I/O port functions for TXDn, RXDn, and SCKn.   |
| 12  | Set a value in SCR_SMCI.CKE[1:0]                      | Set the SCR_SMCI.CKE[1:0]. Even though the function depends on SMR_SMCI.GM, when the CKE[0] bit is set to 1, the clock is output from the SCKn pin.                |
| 13  | Set SCR_SMCI.TE or RE to 1, and set SCR_SMCI.TIE, RIE | Set the TE or RE bit in SCR_SMCI to 1, then set the TIE and RIE bits in SCR_SMCI. Do not simultaneously set the TE and RE bits to 1 if self-diagnosis is not used. |
| 14  | Initialization completed                              |  |

### 27.7.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode) is different from that in non-smart card interface mode, in that an error signal is sampled and data can be re-transmitted in smart card mode. Figure 27.82 shows the data re-transfer operation during transmission.

- When an error signal from the receiver end is sampled after 1-frame data is transmitted, the SSR\_SMCI.ERS flag is set to 1. If the SCR\_SMCI.RIE bit is 1, an SCIn\_ERI interrupt request is generated. Clear the ERS flag to 0 before the next parity bit is sampled.
- For a frame in which an error signal is received, the SSR\_SMCI.TEND flag is not set. Data is re-transferred from TDR to TSR, allowing automatic data retransmission.
- If no error signal is returned from the receiver, the ERS flag is not set to 1.
- In this case, the SCI determines that transmission of 1-frame data, including the re-transfer, is complete, and the TEND flag is set. If the SCR\_SMCI.TIE bit is 1, an SCIn\_TXI interrupt request is generated. Write transmit data to the TDR to start transmission of the next data.

Figure 27.84 shows an example flow of serial transmission. All the processing steps are automatically performed using an SCIn\_TXI interrupt request to activate the DTC or DMAC.

When the SSR\_SMCI.TEND flag is set to 1 in transmission and when the SCR\_SMCI.TIE bit is 1, an SCIn\_TXI interrupt request is generated.

The DTC or DMAC is activated by an SCIn\_TXI interrupt request if the SCIn\_TXI interrupt request is previously specified as a source of DTC or DMAC activation, allowing the transfer of transmit data. The TEND flag is automatically set to 0 when the DTC or DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During this retransmission, the TEND flag is kept at 0 and the DTC or DMAC is not activated. Therefore, the SCI and DTC or DMAC automatically transmit the specified number of bytes, including retransmission when an error occurs. Because the ERS flag is not automatically cleared, set the RIE bit to 1 before enabling an SCIn\_ERI interrupt request to be generated if an error occurs, and clear the ERS flag to 0.

When transmitting or receiving data using the DTC or DMAC, always enable the DTC or DMAC before making the SCI settings.

For DTC or DMAC settings, see section 17, Data Transfer Controller (DTC), section 16, DMA Controller (DMAC).

Table 27.39 智能卡接口模式下SCI初始化流程示例 (2之2)

| No. | 步骤名称                                     | Description  |
|-----|--|--|
| 9   | 将SEMR.BRME和SEMR.RXDESEL设置为0              | 将SEMR.BRME和SEMR.RXDESEL设置为0。   |
| 10  | 在BRR中设置一个值                               | 在BRR中写入比特率的值。  |
| 11  | 设置IO端口功能                                 | 设置TXDn、RXDn和SCKn的IO端口功能。   |
| 12  | 在中设置一个值 SCR_SMCI.CKE[1:0]                | 设置SCR_SMCI.CKE[1:0]。即使函数依赖于SMR_SMCI.GM, 当CKE[0]位设置为1, 时钟从SCKn引脚输出。       |
| 13  | 将SCR_SMCI.TE或RE设置为1, 并设置SCR_SMCI.TIE、RIE | 将SCR_SMCI中的TE或RE位设置为1, 然后设置SCR_SMCI中的TIE和RIE位。如果不使用自诊断, 请勿同时将TE和RE位设置为1。 |
| 14  | 初始化完成                                    |  |

### 27.7.6 串行数据传输 (块传输模式除外)

智能卡接口模式下的串行数据传输 (块传输模式除外) 与非智能卡接口模式下的串行数据传输不同之处在于, 在智能卡模式下对错误信号进行采样, 数据可以重新传输。图27.82显示了传输过程中的数据重传操作。

- 发送1帧数据后, 在接收端采样到错误信号时, SSR\_SMCI.ERS标志置1。如果SCR\_SMCI.RIE位为1, 则产生SCIn\_ERI中断请求。在采样下一个奇偶校验位之前将ERS标志清零。
- 对于接收到错误信号的帧, 不设置SSR\_SMCI.TEND标志。数据从TDR重新传输到TSR, 允许自动数据重新传输。
- 如果接收器没有返回错误信号, 则ERS标志不设置为1。
- 在这种情况下, SCI确定1帧数据的传输 (包括重新传输) 已完成, 并设置TEND标志。如果SCR\_SMCI.TIE位为1, 则产生SCIn\_TXI中断请求。将传输数据写入TDR以开始传输下一个数据。

图27.84显示了串行传输的示例流程。所有处理步骤都使用一个自动执行SCIn\_TXI中断请求以激活DTC或DMAC。

当发送中SSR\_SMCI.TEND标志设置为1且SCR\_SMCI.TIE位为1时, 将产生SCIn\_TXI中断请求。

如果先前将SCIn\_TXI中断请求指定为DTC或DMAC激活源, 则DTC或DMAC由SCIn\_TXI中断请求激活, 从而允许传输数据。当DTC或DMAC传输数据时, TEND标志自动设置为0。

如果发生错误, SCI会自动重新传输相同的数据。在此重传期间, TEND标志保持为0, 并且DTC或DMAC未激活。因此, SCI和DTC或DMAC会自动传输指定的字节数, 包括发生错误时的重传。因为ERS标志不会自动清零, 所以如果发生错误, 在使能SCIn\_ERI中断请求之前将RIE位设置为1, 并将ERS标志清零。

使用DTC或DMAC发送或接收数据时, 请务必在进行SCI设置之前启用DTC或DMAC。

对于DTC或DMAC设置, 请参阅第17节, 数据传输控制器(DTC), 第16节, DMA控制器(DMAC)。

Figure 27.82 Data re-transfer operation in smart card interface transmission mode

The SSR\_SMCI.TEND flag is set at different timings depending on the SMR\_SMCI.GM bit setting. Figure 27.83 shows the TEND flag generation timing.

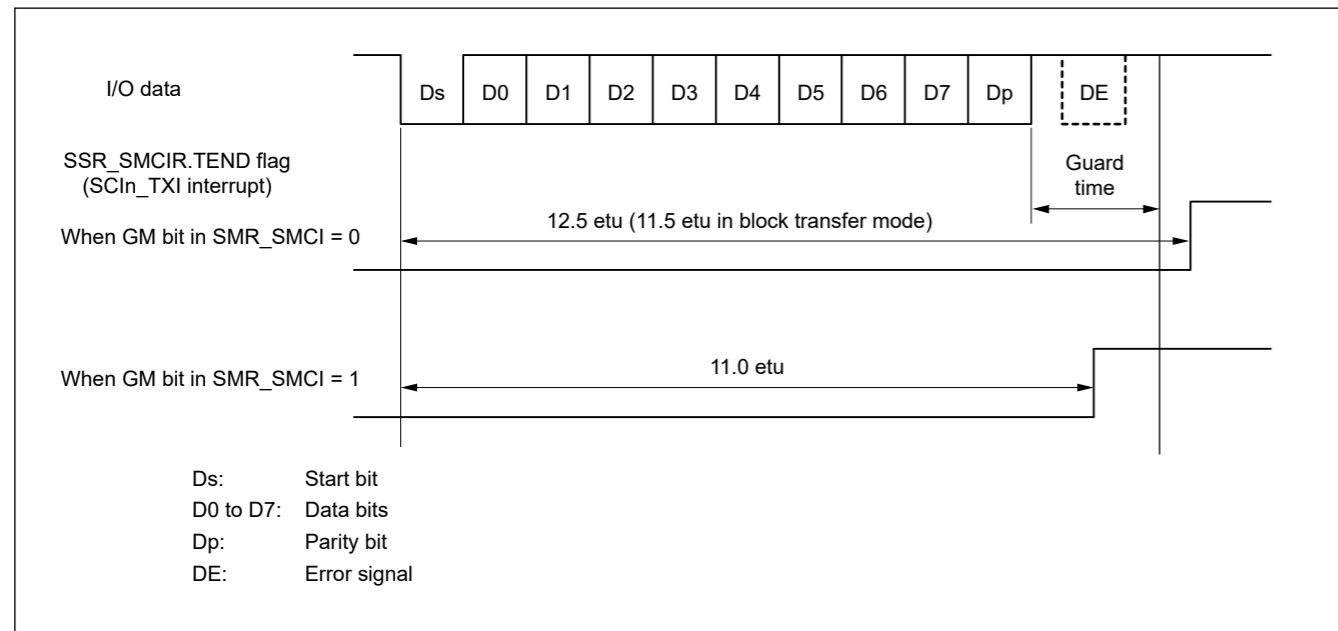

Figure 27.83 SSR.TEND flag generation timing during transmission

Figure 27.82 智能卡接口传输模式下的数据重传操作

SSR\_SMCI.TEND标志根据SMR\_SMCI.GM位设置在不同的时间设置。图27.83显示了TEND标志生成时序。

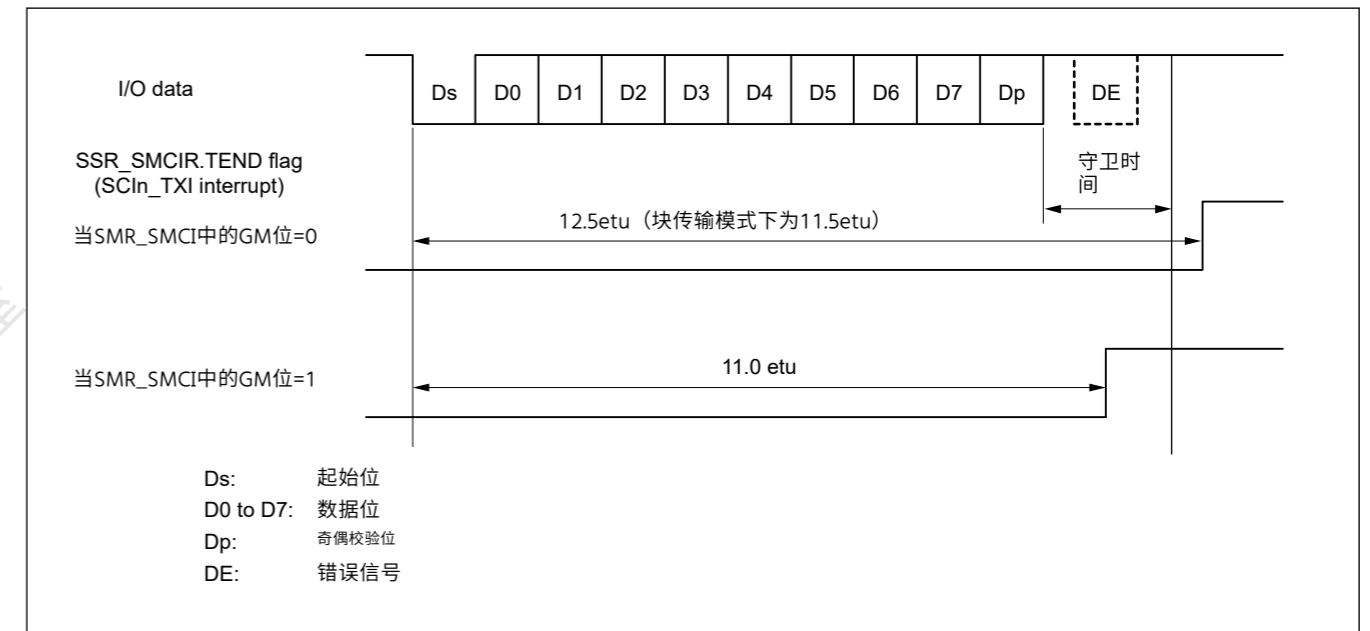

Figure 27.83 发送期间的SSR.TEND标志生成时序

Figure 27.84 Example flow of smart card interface transmission

### 27.7.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is similar to that in non-smart card interface mode. Figure 27.85 shows the data re-transfer operation in reception mode.

1. If a parity error is detected in the receive data, the SSR\_SMCI.PER flag is set to 1. When the SCR\_SMCI.RIE bit is 1, an SCIn\_ERI interrupt request is generated. Clear the PER flag to 0 before the next parity bit is sampled.
2. For a frame in which a parity error is detected, no SCIn\_RXI interrupt is generated.
3. When no parity error is detected, the SCR\_SMCI.PER flag is not set to 1.
4. In this case, data is determined to be received successfully. When the SCR\_SMCI.RIE bit is 1, an SCIn\_RXI interrupt request is generated.

Figure 27.86 shows an example flow of serial data reception. All the processing steps are automatically performed using an SCIn\_RXI interrupt request to activate the DTC or DMAC.

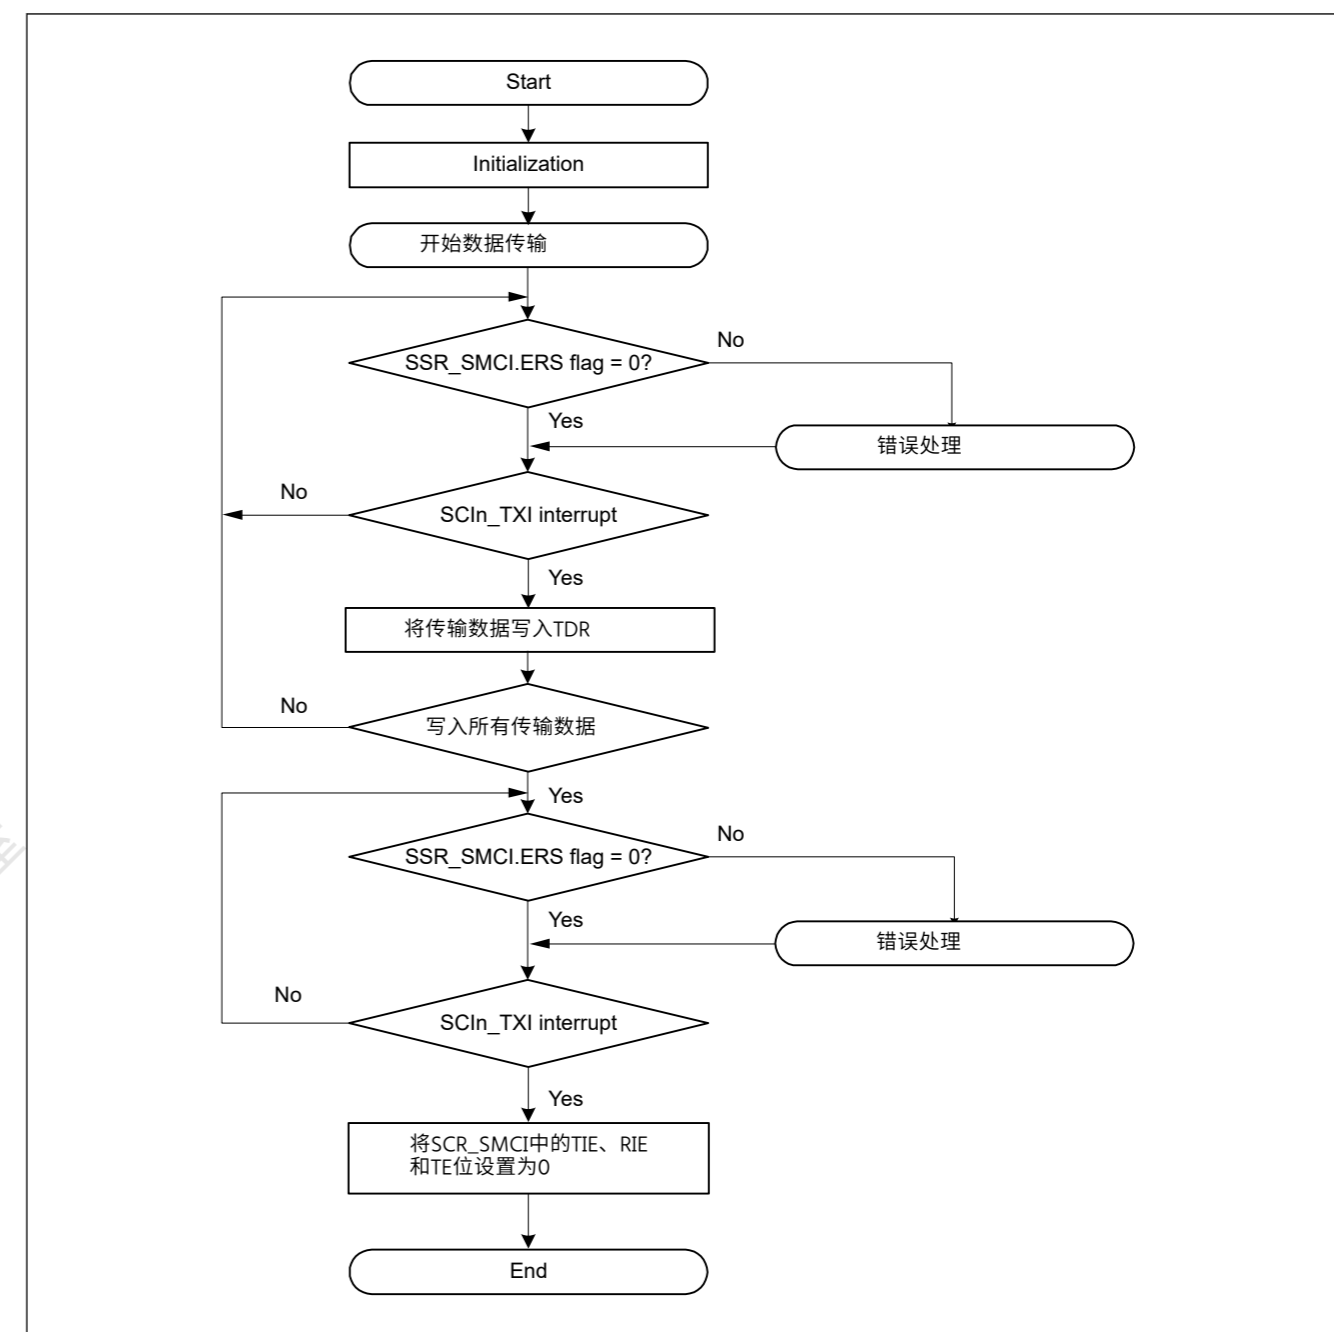

Figure 27.84 智能卡接口传输示例流程

### 27.7.7 串行数据接收（块传输模式除外）

智能卡接口模式下的串行数据接收与非智能卡接口模式下的串行数据接收类似。图27.85显示了接收模式下的数据重传操作。

- 1.如果在接收数据中检测到奇偶校验错误，则SSR\_SMCI.PER标志设置为1。当SCR\_SMCI.RIE位为1时，产生SCIn\_ERI中断请求。在采样下一个奇偶校验位之前将PER标志清零。
- 2.对于检测到奇偶校验错误的帧，不产生SCIn\_RXI中断。
- 3.未检测到奇偶校验错误时，SCR\_SMCI.PER标志不设置为1。
- 4.在这种情况下，确定数据接收成功。当SCR\_SMCI.RIE位为1时，产生SCIn\_RXI中断请求。

图27.86显示了串行数据接收的示例流程。所有处理步骤都使用一个自动执行SCIn\_RXI中断请求以激活DTC或DMAC。

In reception, setting the RIE bit to 1 allows an SCIn\_RXI interrupt request to be generated. The DTC or DMAC is activated by an SCIn\_RXI interrupt request if the SCIn\_RXI interrupt request is previously specified as a source of DTC or DMAC activation, allowing the transfer of receive data.

If an error occurs during reception and either the ORER or PER flag in SSR\_SMCI is set to 1, a receive error interrupt (SCIn\_ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DTC or DMAC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DTC or DMAC is transferred.

If a parity error occurs and the PER flag is set to 1 during reception, the receive data is transferred to RDR, allowing the data to be read.

When a reception is forced to terminate by setting SCR\_SMCI.RE to 0 during operation, read the RDR register because the received data that is not yet read might be left in the RDR.

Note: For operations in block transfer mode, see [section 27.3.9. Serial Data Reception in Asynchronous Mode](#).

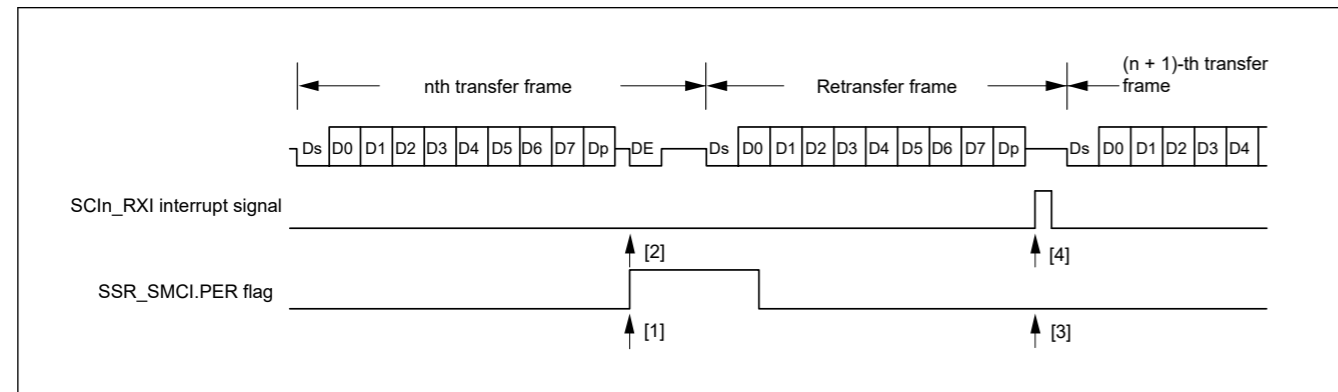

Figure 27.85 Data re-transfer operation in smart card interface reception mode

在接收时，将RIE位设置为1允许产生SCIn\_RXI中断请求。如果先前将SCIn\_RXI中断请求指定为DTC或DMAC激活源，则DTC或DMAC由SCIn\_RXI中断请求激活，从而允许传输接收数据。

如果接收期间发生错误并且SSR\_SMCI中的ORER或PER标志设置为1，则会生成接收错误中断(SCIn\_ERI)请求。错误发生后清除错误标志。如果发生错误，则不会激活DTC或DMAC并跳过接收数据。因此，将传输DTC或DMAC中指定的接收数据字节数。

如果在接收过程中发生奇偶校验错误并且PER标志设置为1，则接收数据将传输到RDR，从而可以读取数据。

如果在操作期间通过将SCR\_SMCI.RE设置为0来强制终止接收，请读取RDR寄存器，因为尚未读取的已接收数据可能留在RDR中。

Note: 关于块传输模式下的操作，请参见第27.3.9节。异步模式下的串行数据接收。

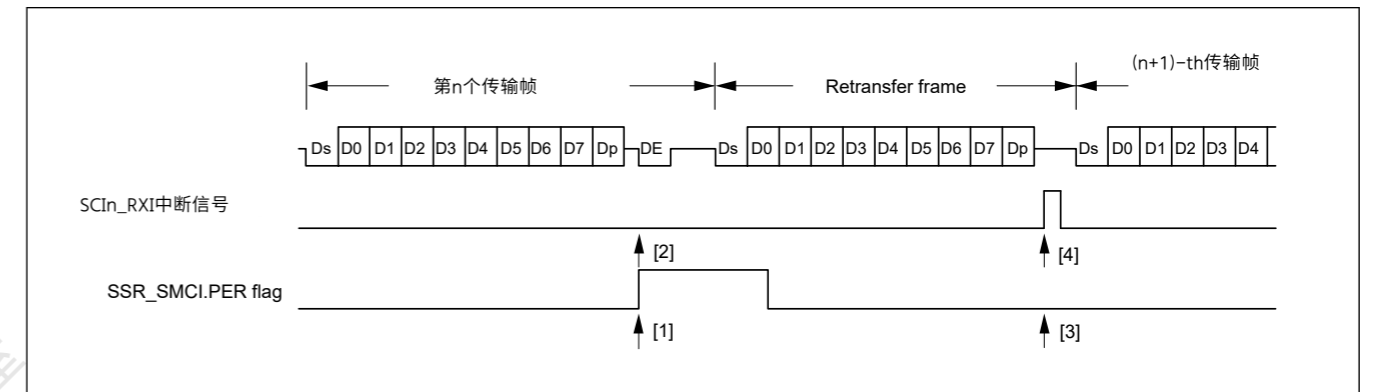

Figure 27.85 智能卡接口接收模式下的数据重传操作

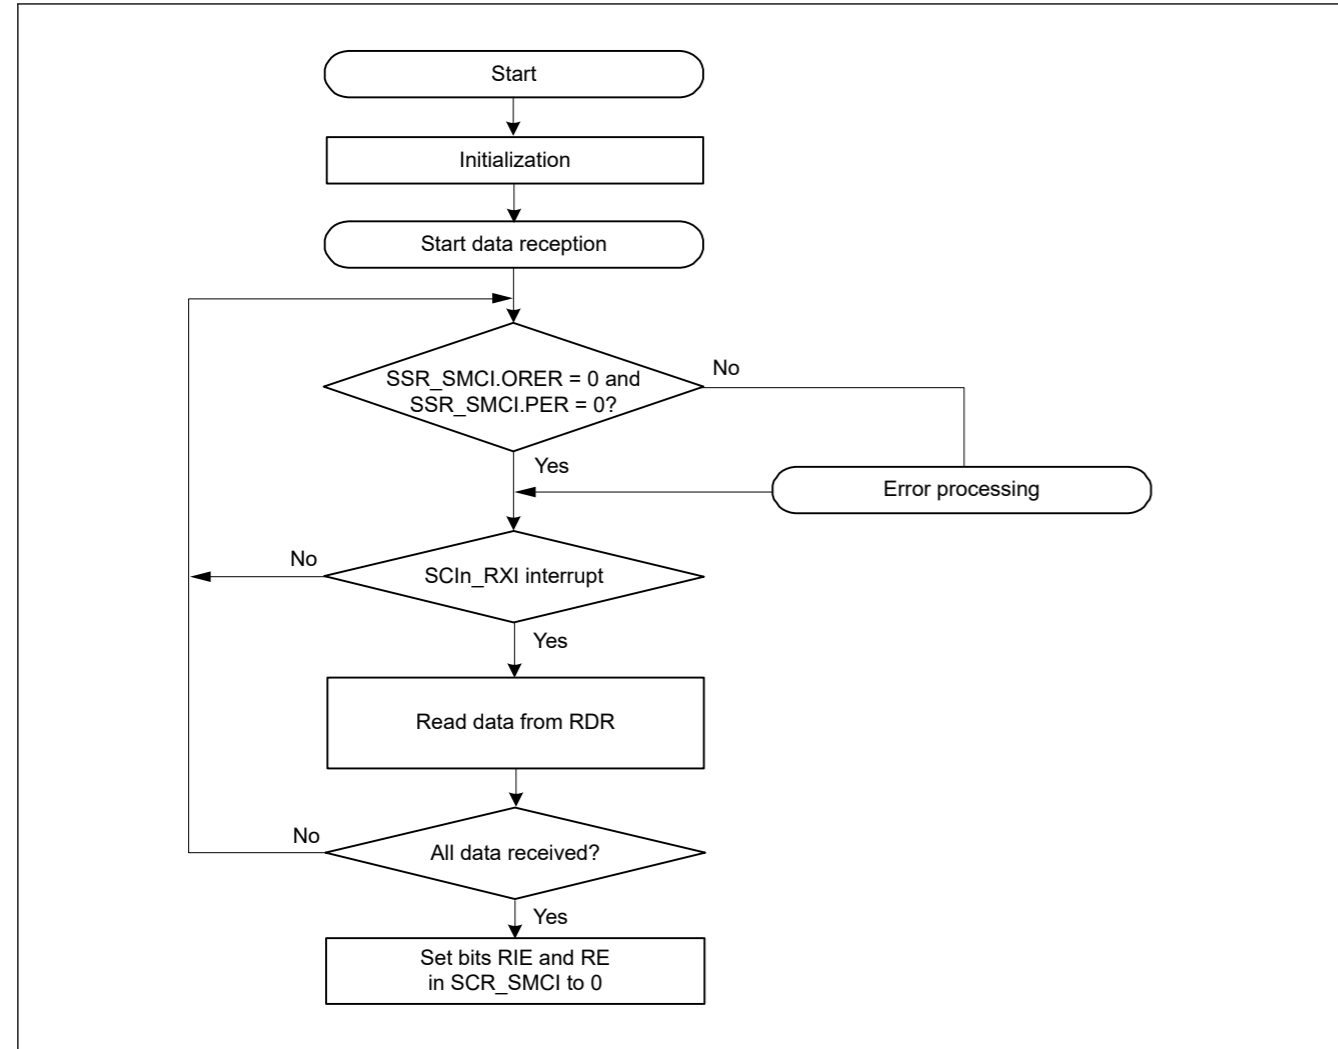

Figure 27.86 Example flow of smart card interface reception

### 27.7.8 Clock Output Control

When the GM bit in SMR\_SMCI is set to 1, the clock output can be controlled by the CKE[1:0] bits in SCR\_SMCI. For details on the CKE[1:0] bits, see [section 27.2.14. SCR\\_SMCI: Serial Control Register for Smart Card Interface Mode \(SCMR.SMIF = 1\)](#). When setting the clock output, the base clock described in [section 27.7.4. Receive Data Sampling Timing and Reception Margin](#).

[Figure 27.87](#) shows an example timing for the clock output control when the CKE[1] bit in SCR\_SMCI is set to 0 and the CKE[0] bit in SCR\_SMCI is controlled.

When the GM bit in SMR\_SMCI is 0, output control by the CKE[0] bit in SCR\_SMCI is immediately reflected on the SCKn pin, so there is a possibility that pulses with an unintended width may be output from the SCKn pin.

When the GM bit in SMR\_SMCI is 1, the clock with the same pulse width as the base clock is output even if the CKE[0] bit in SCR\_SMCI is changed.

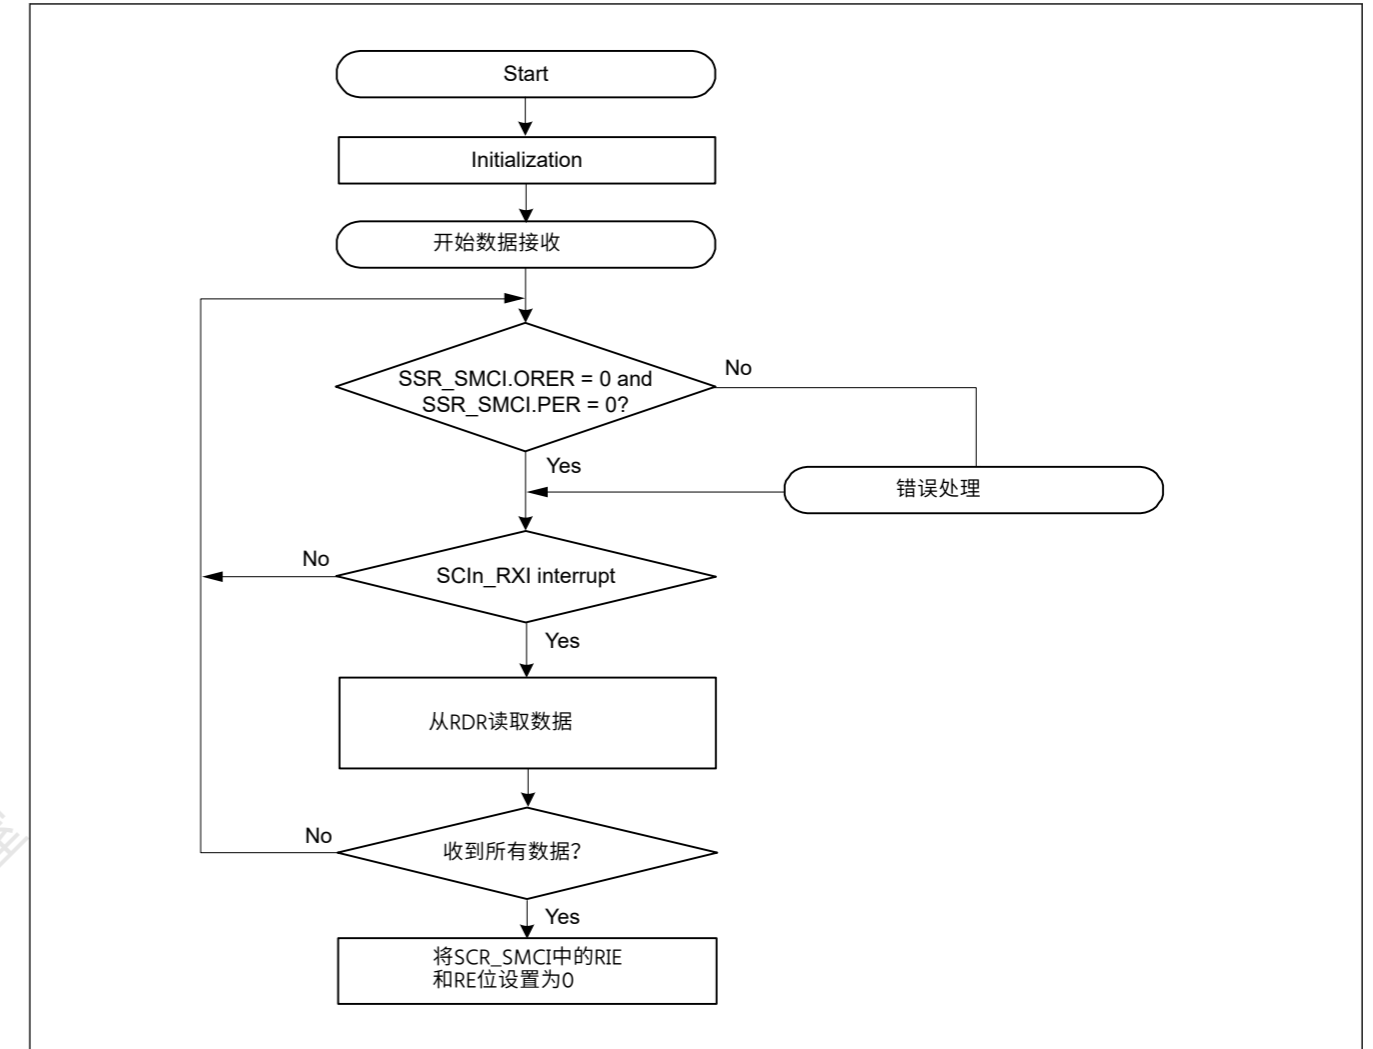

Figure 27.86 智能卡接口接收示例流程

### 27.7.8 时钟输出控制

当SMR\_SMCI中的GM位设置为1时，时钟输出可以由SCR\_SMCI中的CKE[1:0]位控制。有关CKE[1:0]位的详细信息，请参见第27.2.14节。SCR\_SMCI：智能卡接口模式的串行控制寄存器(SCMR.SMIF=1)。设置时钟输出时，使用第27.7.4节中描述的基本时钟。接收数据采样时序和接收余量。

图27.87显示了当SCR\_SMCI中的CKE[1]位设置为0且控制SCR\_SMCI中的CKE[0]位。

当SMR\_SMCI中的GM位为0时，SCR\_SMCI中CKE[0]位的输出控制立即反映在SCKn引脚，因此有可能会从SCKn引脚输出具有意外宽度的脉冲。

当SMR\_SMCI中的GM位为1时，即使SCR\_SMCI中的CKE[0]位发生变化，也会输出与基本时钟脉冲宽度相同的时钟。

Figure 27.87 Clock Output timing

### 27.8 Operation in Simple IIC Mode

Simple IIC mode format is composed of 8 data bits and an acknowledge bit. By continuing into a slave-address frame after a start condition or restart condition, a master device can specify a slave device as the partner for communications. The currently specified slave device remains valid until a new slave device is specified or a stop condition is satisfied. The 8 data bits in all frames are transmitted in order from the MSB.

The I<sup>2</sup>C bus format and timing of the I<sup>2</sup>C bus are shown in Figure 27.88 and Figure 27.89.

Figure 27.88 I<sup>2</sup>C bus format

Figure 27.87 时钟输出时序

### 27.8 简单IIC模式下的操作

简单IIC模式格式由8个数据位和一个确认位组成。通过在启动条件或重新启动条件之后继续进入从地址帧，主设备可以指定从设备作为通信伙伴。当前指定的从设备保持有效，直到指定新的从设备或满足停止条件。所有帧中的8个数据位从MSB开始按顺序传输。

I<sup>2</sup>C总线格式和I<sup>2</sup>C总线时序如图27.88和图27.89所示。

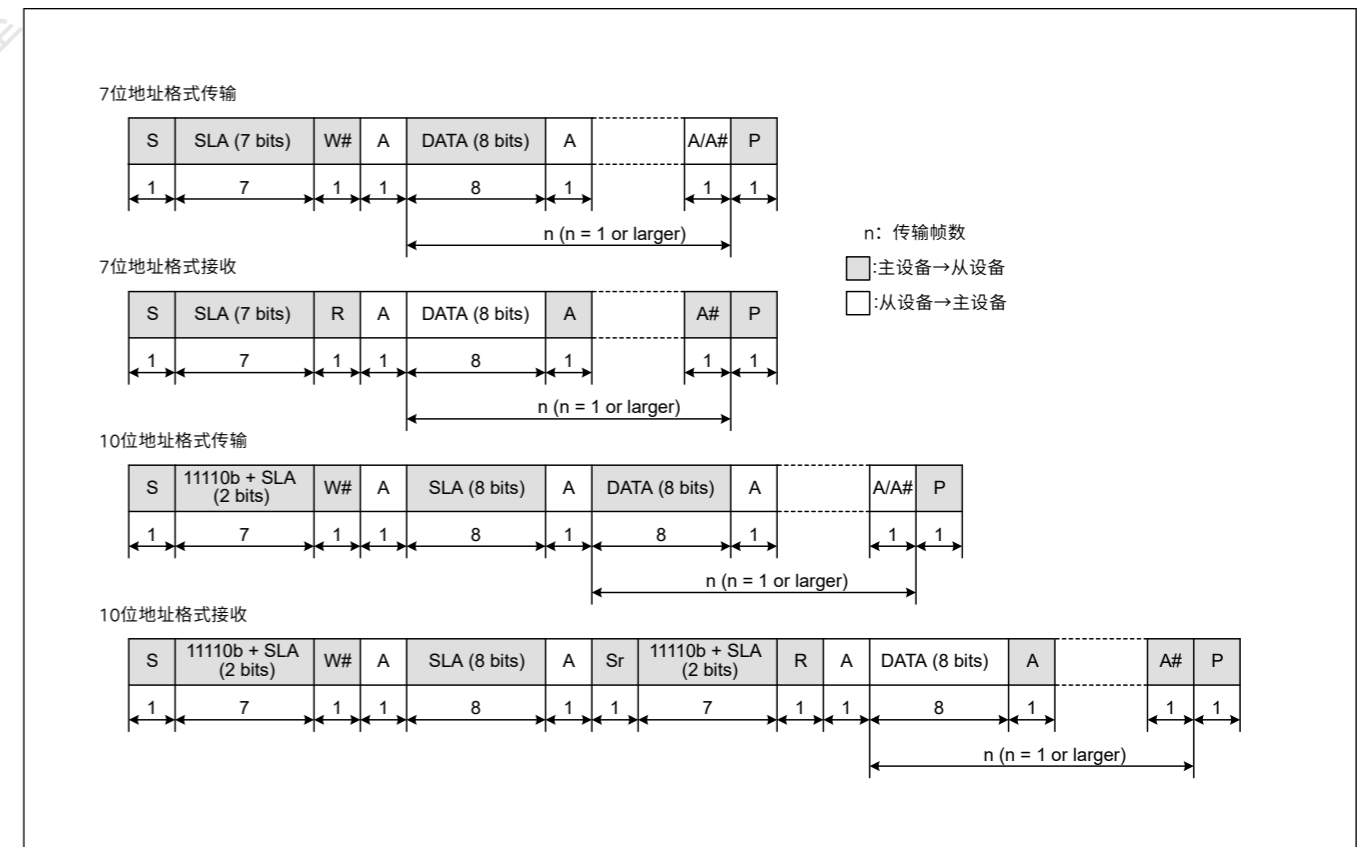

Figure 27.88 I<sup>2</sup>C总线格式

Figure 27.89 I<sup>2</sup>C bus timing when SLA is 7 bits

- S: Indicates a start condition, when the master device changes the level on the SDA<sub>n</sub> line from high to low while the SCL<sub>n</sub> line is high
- SLA: Indicates a slave address, by which the master device selects a slave device
- R/W#: Indicates the direction of transfer (reception or transmission). The value 1 indicates transfer from the slave device to the master device and 0 indicates transfer from the master device to the slave device.
- A/A#: Indicates an acknowledge bit. This is returned by the slave device for master transmission and by the master device for master reception. Return low indicates ACK and return high indicates NACK.
- Sr: Indicates a restart condition, when the master device changes the level on the SDA<sub>n</sub> line from high to low while the SCL<sub>n</sub> line is high and after the setup time elapses
- DATA: Indicates the data being received or transmitted
- P: Indicates a stop condition, when the master device changes the level on the SDA<sub>n</sub> line from low to high while the SCL<sub>n</sub> line is high

### 27.8.1 Generation of Start, Restart, and Stop Conditions

Writing 1 to the SIMR3.IICSTAREQ bit causes the generation of a start condition. The generation of a start condition proceeds through the following operations:

- The level on the SDA<sub>n</sub> line falls (from the high level to the low level) and the SCL<sub>n</sub> line is kept in the released state
- The hold time for the start condition is set as half of a bit period at the bit rate determined by the BRR setting
- The level on the SCL<sub>n</sub> line falls (from the high level to the low level), the IICSTAREQ bit in SIMR3 is set to 0, and a start-condition generated interrupt is output

Writing 1 to the IICRSTAREQ bit in SIMR3 causes the generation of a restart condition. The generation of a restart condition proceeds through the following operations:

- The SDA<sub>n</sub> line is released and the SCL<sub>n</sub> line is kept at the low level
- The period at low level for the SCL<sub>n</sub> line is set as half of a bit period at the bit rate determined by the BRR setting
- The SCL<sub>n</sub> line is released (transition from the low to the high level)
- When a high level is detected on the SCL<sub>n</sub> line, the setup time for the restart condition is set as half of a bit period at the bit rate determined by the BRR setting
- The level on the SDA<sub>n</sub> line falls (from the high level to the low level)
- The hold time for the restart condition is set as half of a bit period at the bit rate determined by the BRR setting
- The level on the SCL<sub>n</sub> line falls (from the high level to the low level), the SIMR3.IICRSTAREQ bit is set to 0, and a restart-condition generated interrupt is output

Writing 1 to the SIMR3.IICSTPREQ bit causes the generation of a stop condition. The generation of a stop condition proceeds through the following operations:

- The level on the SDA<sub>n</sub> line falls (from the high level to the low level) and the SCL<sub>n</sub> line is kept at the low level
- The period at low level for the SCL<sub>n</sub> line is set as half of a bit period at the bit rate determined by the BRR setting
- The SCL<sub>n</sub> line is released (transition from the low to the high level)

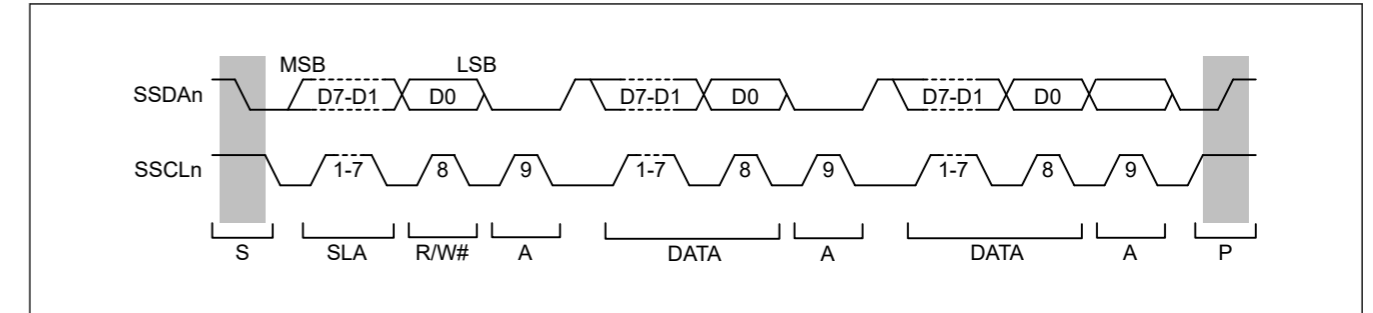

Figure 27.89 SLA为7位时的I2C总线时序

- S: 表示启动条件，当主设备在SCL<sub>n</sub>线为高时将SDA<sub>n</sub>线上的电平从高电平变为低电平
- SLA: 表示从地址，主设备通过该地址选择从设备
- RW#: 指示传输方向（接收或传输）。值1表示从从设备传输到主设备，0表示从主设备传输到从设备。
- AA#: 表示确认位。这由从设备返回用于主传输，并由主设备返回用于主接收。返回低电平表示ACK，返回高电平表示NACK。
- Sr: 表示重启条件，当主设备将SDA<sub>n</sub>线上的电平从高电平变为低电平，而SCL<sub>n</sub>线为高电平且经过设置时间后
- DATA: 表示正在接收或发送的数据
- P: 表示停止条件，当主设备将SDA<sub>n</sub>线上的电平从低电平变为高电平而SCL<sub>n</sub>线为高电平时

### 27.8.1 启动、重启和停止条件的生成

将1写入SIMR3.IICSTAREQ位会导致产生启动条件。开始条件的生成通过以下操作进行:

- SDA<sub>n</sub>线上的电平下降（从高电平到低电平），SCL<sub>n</sub>线保持在释放状态
- 开始条件的保持时间设置为比特周期的一半，比特率由BRR设置确定
- SCL<sub>n</sub>线上的电平下降（从高电平到低电平），SIMR3中的IICSTAREQ位设置为0，并输出一个起始条件产生的中断

将1写入SIMR3中的IICRSTAREQ位会导致产生重启条件。重新启动条件的生成通过以下操作进行:

- SDA<sub>n</sub>线释放，SCL<sub>n</sub>线保持低电平
- SCL<sub>n</sub>线的低电平周期设置为比特周期的一半，比特率由BRR设置确定
- SCL<sub>n</sub>线被释放（由低电平转变为高电平）
- 当在SCL<sub>n</sub>线上检测到高电平时，重新启动条件的建立时间设置为BRR设置确定的比特率的半个比特周期
- SDA<sub>n</sub>线上的电平下降（从高电平到低电平）
- 重启条件的保持时间设置为比特周期的一半，比特率由BRR设置确定
- SCL<sub>n</sub>线上的电平下降（从高电平变为低电平），SIMR3.IICRSTAREQ位设置为0，并输出重启条件产生的中断

将1写入SIMR3.IICSTPREQ位会导致产生停止条件。停止条件的生成通过以下操作进行:

- SDA<sub>n</sub>线上的电平下降（从高电平到低电平），SCL<sub>n</sub>线保持在低电平
- SCL<sub>n</sub>线的低电平周期设置为比特周期的一半，比特率由BRR设置确定
- SCL<sub>n</sub>线被释放（由低电平转变为高电平）

- When a high level is detected on the SCLn line, the setup time for the stop condition is set as half of a bit period at the bit rate determined by the BRR setting
- The SDA<sub>n</sub> line is released (transition from the low to the high level), the SIMR3.IICSTPREQ bit is set to 0, and a stop-condition generated interrupt is output

Figure 27.90 shows the timing of operations in the generation of start, restart, and stop conditions.

Figure 27.90 Timing of operations in generation of start, restart, and stop conditions

### 27.8.2 Clock Synchronization

The SCLn line can be driven low if a wait is inserted by a slave device at the other side of the transfer. Setting the SIMR2.IICCSC bit to 1 applies control to obtain synchronization when a difference arises between the levels of the internal SCLn clock signal and the level being input on the SCLn pin.

When the SIMR2.IICCSC bit is set to 1, the level of the internal SCLn clock signal changes from low to high. Counting to determine the period at a high level stops while the low level is being input on the SCLn pin. Counting to determine the period at a high level starts after the transition of the input on the SCLn pin to the high level.

The interval from this time until counting to determine the period at high level starts on the transition of the SCLn pin to the high level, is the total of the delay of SCLn output, delay for noise filtering of the input on the SCLn pin (2 or 3 cycles of sampling clock for the noise filter), and delay for internal processing (1 or 2 cycles of PCLK). The period at high level of the internal SCLn clock is extended even when other devices do not place the low level on the SCLn line.

If the SIMR2.IICCSC bit is 1, synchronization is obtained for the transmission and reception of data by taking the logical AND of the input on the SCLn pin and the internal SCLn clock. If the SIMR2.IICCSC bit is 0, synchronization with the internal SCLn clock is obtained for the transmission and reception of data.

If a slave device inserts a wait period into the interval until the transition of the internal SCLn clock signal from the low to the high level after a request for the generation of a start, restart, or stop condition is issued, the time until generation is prolonged by that period.

If a slave device inserts a wait period after the transition of the internal SCLn clock signal from the low to the high level, although the generation-completed interrupt is issued without stopping the waiting period, generation of the condition itself is not guaranteed. Figure 27.91 shows an example operation for synchronizing the clocks.

- 当在SCLn线上检测到高电平时，停止条件的建立时间设置为比特周期的一半，比特率由BRR设置确定
- SDA<sub>n</sub>线被释放（从低电平转换为高电平），SIMR3.IICSTPREQ位设置为0，并输出停止条件生成中断

图27.90显示了生成启动、重新启动和停止条件的操作时序。

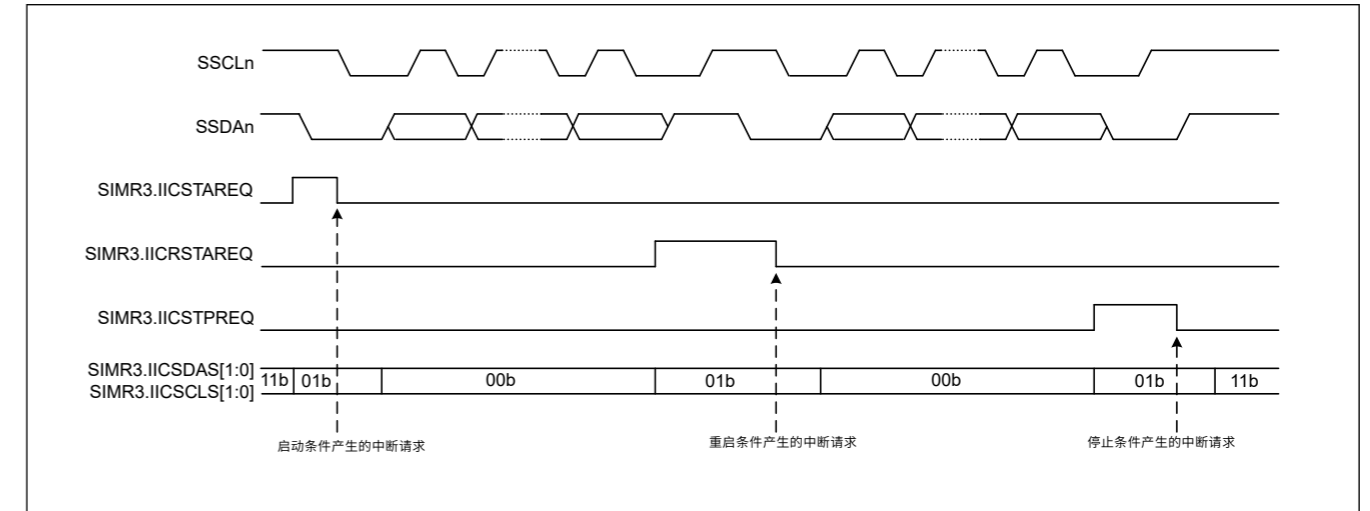

Figure 27.90 生成启动、重启和停止条件时的操作时序

### 27.8.2 时钟同步

如果从设备在传输的另一侧插入等待，则可以将SCLn线驱动为低电平。设置当内部电平之间出现差异时，SIMR2.IICCSC位为1应用控制以获得同步SCLn时钟信号和输入到SCLn引脚的电平。

当SIMR2.IICCSC位设置为1时，内部SCLn时钟信号的电平由低变为高。当SCLn引脚输入低电平时，停止计数以确定高电平周期。在SCLn引脚上的输入转换为高电平后，开始计数以确定高电平的周期。

从这个时间到从SCLn引脚转变为高电平开始计数确定高电平周期的时间间隔是SCLn输出延迟的总和，SCLn引脚上输入的噪声过滤延迟（2或3个周期的采样时钟用于噪声滤波器），以及延迟用于内部处理（1或2个PCLK周期）。即使其他设备没有将低电平置于SCLn线上，内部SCLn时钟的高电平周期也会延长。

如果SIMR2.IICCSC位为1，则通过取逻辑数据的发送和接收来获得同步SCLn引脚上的输入与内部SCLn时钟的与。如果SIMR2.IICCSC位为0，则与内部SCLn时钟同步以进行数据的发送和接收。

如果从设备在发出启动、重启或停止条件的生成请求后，在内部SCLn时钟信号从低电平转变为高电平之前的间隔中插入一个等待周期，则直到生成的时间为延长了那个时期。

如果从设备在内部SCLn时钟信号从低电平转变为高电平之后插入等待周期，尽管在不停止等待周期的情况下发出生成完成中断，但不能保证条件本身的生成。图27.91显示了同步时钟的示例操作。

Figure 27.91 Example operations for clock synchronization

### 27.8.3 SDAn Output Delay

The SIMR1.IICDL[4:0] bits can be used to set a delay for output on the SDAn pin relative to falling edges of output on the SCLn pin. Delay settings from 0 to 31 are selectable, representing periods of the corresponding numbers of cycles of the clock signal from the on-chip baud rate generator (derived by frequency-dividing the base clock, PCLK, by the divisor selected in the SMR.CKS[1:0] bits). A delay for output on the SDAn pin applies to the start condition/restart condition/stop condition signal, 8-bit transmit data, and acknowledge bit.

If the SDAn output delay is shorter than the time for the level on the SCLn pin to fall, the change of the output on the SDAn pin starts while the output level on the SCLn pin is falling, creating a possibility of erroneous operation for slave devices. Ensure that settings for the delay of output on the SDAn pin specify times greater than the time output on the SCLn pin takes to fall (300 ns for IIC in normal mode and fast mode).

Figure 27.92 shows the timing of delays in SDAn output.

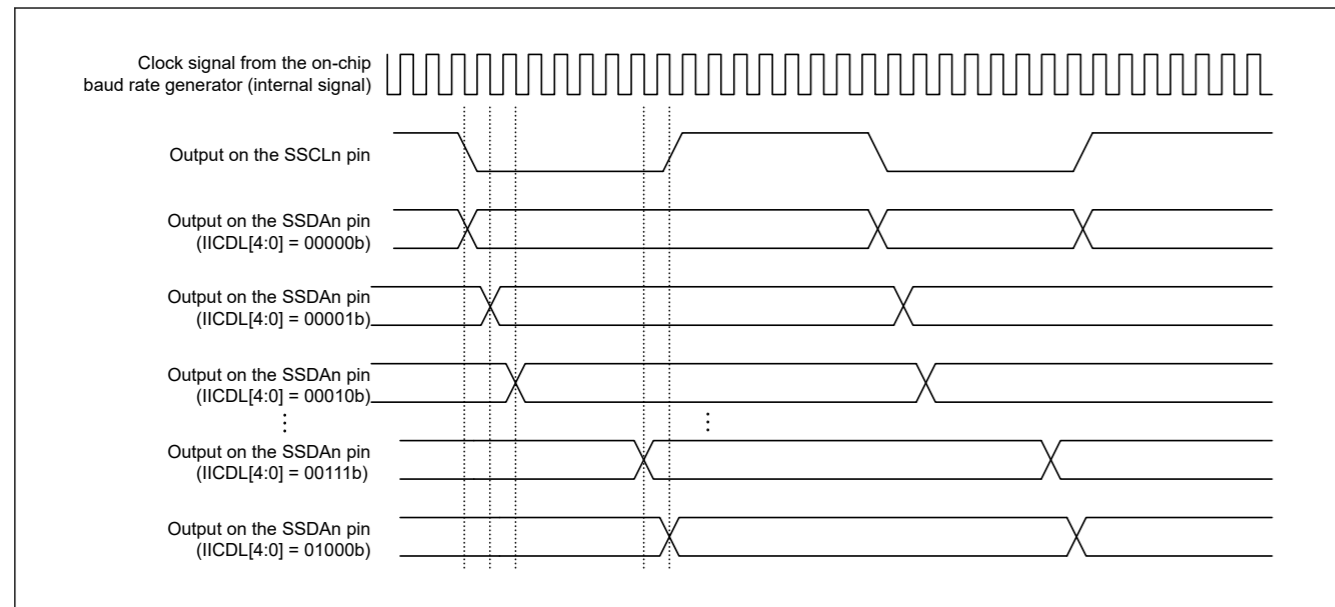

Figure 27.92 Timing of delays in SDAn output

### 27.8.4 SCI Initialization in Simple IIC Mode

Before transferring data, write the initial value 0x00 to SCR and initialize the interface following the example shown in Table 27.40.

Figure 27.91 时钟同步的示例操作

### 27.8.3 SDAn输出延迟

SIMR1.IICDL[4:0]位可用于设置SDAn引脚输出相对于输出下降沿的延迟。SCLn引脚。从0到31的延迟设置是可选的，表示来自片上波特率发生器的时钟信号的相应周期数的周期（通过在SMR.CKS中选择的除数对基本时钟PCLK进行分频得出[1:0]位）。SDAn引脚上的输出延迟适用于启动条件/重启条件/停止条件信号、8位发送数据和确认位。

如果SDAn输出延迟小于SCLn引脚电平下降的时间，则SDAn引脚上的输出变化会在SCLn引脚上的输出电平下降时开始，从而产生从设备错误操作的可能性。确保SDAn引脚上的输出延迟设置指定的时间大于SCLn引脚上输出的下降时间（IIC在正常模式和快速模式下为300ns）。

图27.92显示了SDAn输出中的延迟时间。

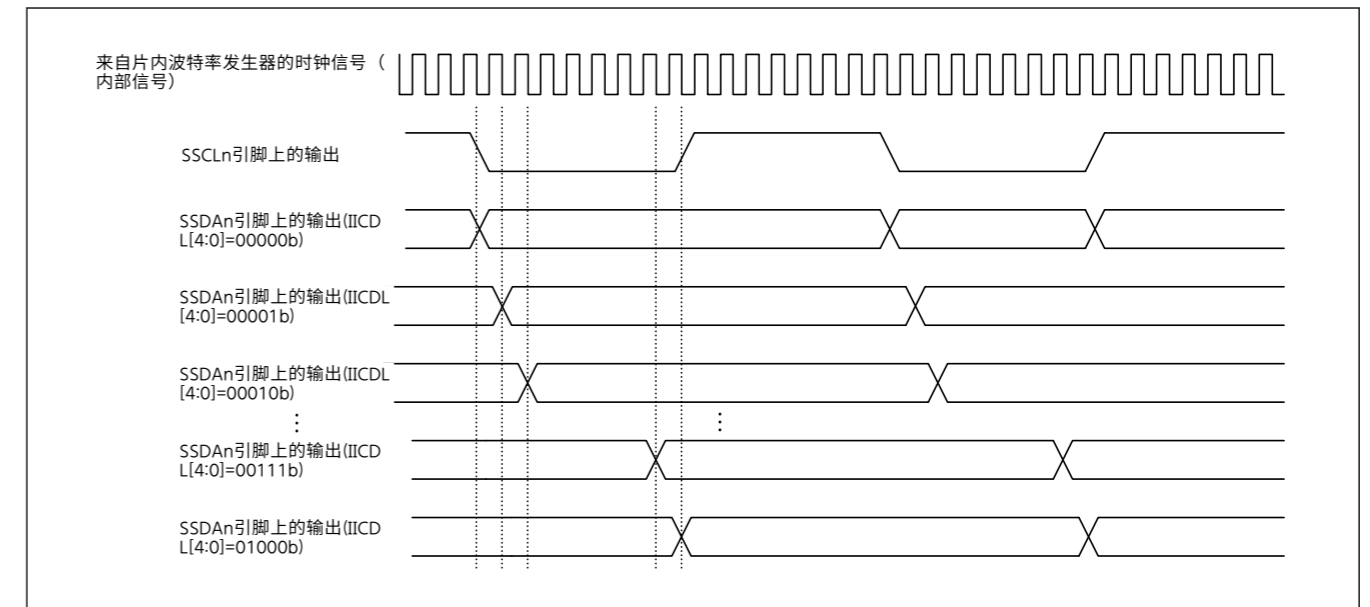

Figure 27.92 SDAn输出中的延迟时间

### 27.8.4 简单IIC模式下的SCI初始化

在传输数据之前，将初始值0x00写入SCR并按照中所示的示例初始化接口 Table 27.40.

Before making any changes to the operating mode or transfer format, be sure to set SCR to its initial value. In simple IIC mode, the open-drain setting for the communication ports should be made on the port side.

**Table 27.40 Example flow of SCI initialization in simple IIC mode**

| No. | Step Name   | Description   |
|-----|---|---|
| 1   | Start of initialization   |   |
| 2   | Set the TIE, RIE, TE, RE, TEIE and CKE[1:0] bits in SCR to 0          |   |
| 3   | Set the I/O port functions  | Set the I/O port to allow use (on N-channel open-drain output pins) of the SSCLn and SSDAn pin functions.   |
| 4   | Set the IICSDAS[1:0] and IICSCLS[1:0] bits in SIMR3 to 11b            | Place the SSCLn and SSDAn pins in the high-impedance state until a start condition is to be generated.  |
| 5   | Set up the transfer or reception format in SMR and SCMR               | Set the format for transmission and reception in SMR and SCMR. In SMR, set the CKS[1:0] bits to the target value and set the other bits to 0. In SCMR, set the SDIR bit to 1 and the SINV and SMIF bits to 0.   |
| 6   | Set the initial value to SPTR.  | Set the Initial value to SPTR.  |
| 7   | Set the value in BRR  | Write the value for the targeted bit rate to BRR.   |
| 8   | Set a value in MDDR   | Write the value obtained by correcting a bit rate error in MDDR. This step is not required if the BRME bit in SEMR is set to 0.   |
| 9   | Set the values in SEMR, SNFR, SIMR1, SIMR2, and SPMR                  | Set the values in SEMR, SNFR, SIMR1, SIMR2, and SPMR. Set the NFEN and BRME bits in SEMR. In SNFR, set the NFCS[2:0] bits. In SIMR1, set the IICM bit to 1 and the IICDL[4:0] bits as required. In SIMR2, set the IICACKT and IICCS bits to 1 and the IICINTM bits as required. In SPMR, set all the bits to 0. |
| 10  | Set the SCR.RE and TE bit to 1 and set the SCR.TIE, RIE and TEIE bits | Set the RE and TE bits in the SCR to 1. Then, set the SCR.TIE, RIE, and TEIE bits (for transmission and when the SIMR2.IICINTM bit is 1, set the RIE bit to 0). Setting the TE and RE bits to 1 enables the SSCLn and SSDAn pin functions.  |
| 11  | Start of transmission or reception                                    |   |

### 27.8.5 Operation in Master Transmission in Simple IIC Mode

Figure 27.93 and Figure 27.94 show examples of master transmission and Figure 27.95 shows an example flow of data transmission. The value of the SIMR2.IICINTM bit is assumed to be 1 (use reception and transmission interrupts) and the value of the SCR.RIE bit is assumed to be 0 (SCIn\_RXI and SCIn\_ERI interrupt requests are disabled). See Table 27.45 for more information on the STI interrupt.

When 10-bit slave addresses are in use, steps [3] and [4] in Figure 27.95 are repeated twice.

In simple IIC mode, the transmit data empty interrupt (SCIn\_TXI) is generated when communication of one frame is complete, unlike the SCIn\_TXI interrupt request generation timing during clock synchronous transmission.

在对操作模式或传输格式进行任何更改之前，请务必将SCR设置为其初始值。在简单IIC模式下，通信端口的开漏设置应在端口侧进行。

**Table 27.40 简单IIC模式下SCI初始化示例流程**

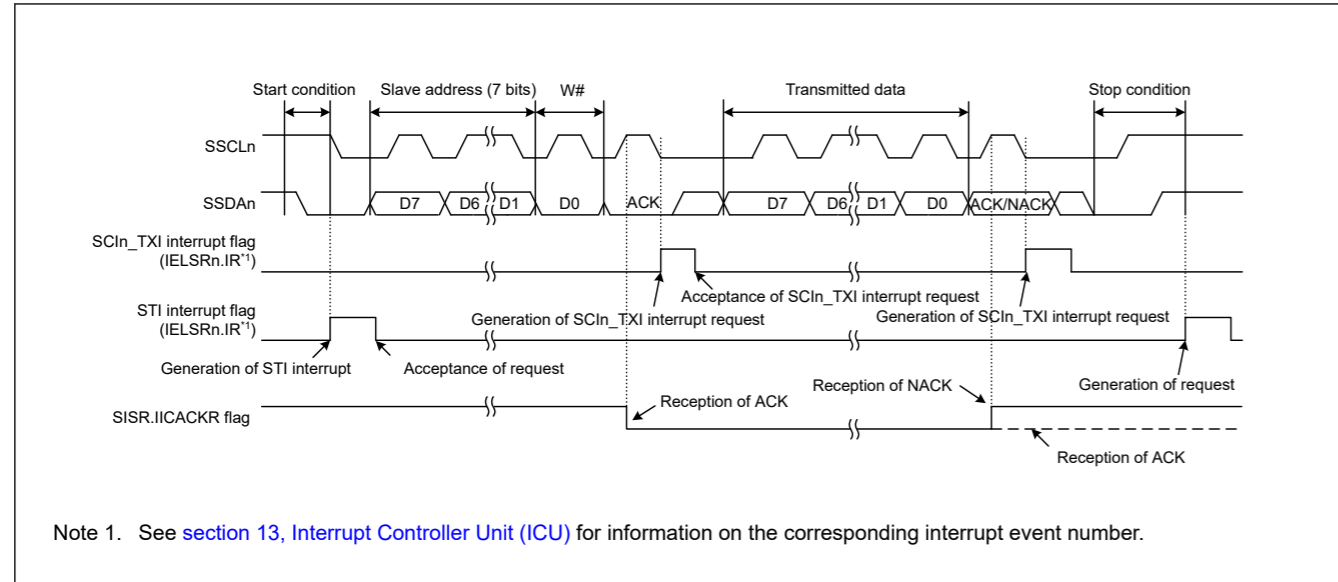

| No. | 步骤名称                                    | Description   |
|-----|---|---|
| 1   | 初始化开始                                   |   |
| 2   | 将SCR中的TIE、RIE、TE、RE、TEIE和CKE[1:0]位设置为0  |   |
| 3   | 设置IO端口功能                                | 设置IO端口以允许使用（在N通道开漏输出引脚上）SSCLn和SSDAn引脚功能。  |
| 4   | 设置IICSDAS[1:0]和SIMR3至11b中的IICSCLS[1:0]位 | 将SSCLn和SSDAn引脚置于高阻抗状态，直到产生启动条件。   |
| 5   | 在SMR和SCMR中设置传输或接收格式                     | 在SMR和SCMR中设置发送和接收的格式。在SMR中，将CKS[1:0]位设置为目标值，并将其他位设置为0。在SCMR中，将SDIR位设置为1，将SINV和SMIF位设置为0。  |
| 6   | 将初始值设置为SPTR。                            | 将初始值设置为SPTR。  |
| 7   | 设置BRR中的值                                | 将目标比特率的值写入BRR。  |
| 8   | 在MDDR中设置一个值                             | 在MDDR中写入通过纠正比特率错误获得的值。此步骤不是必需的，如果SEMR中的BRME位设置为0。   |
| 9   | 设置SEMR中的值，SNFR, SIMR1, SIMR2, and SPMR  | 设置SEMR、SNFR、SIMR1、SIMR2和SPMR中的值。设置SEMR中的NFEN和BRME位。在SNFR中，设置NFCS[2:0]位。在SIMR1中，根据需要将IICM位和IICDL[4:0]位设置为1。在SIMR2中，根据需要将IICACKT和IICCS位设置为1，并将IICINTM位设置为1。在SPMR中，将所有位设置为0。 |
| 10  | 将SCR.RE和TE位设置为1，并设置SCR.TIE、RIE和TEIE位    | 将SCR中的RE和TE位设置为1。然后，设置SCR.TIE、RIE和TEIE位（用于传输且当SIMR2.IICINTM位为1时，将RIE位设置为0）。将TE和RE位设置为1启用SSCLn和SSDAn引脚功能。  |
| 11  | 开始发送或接收                                 |   |

### 27.8.5 简单IIC模式下的主传输操作

图27.93和图27.94显示了主机传输的示例，图27.95显示了数据传输的示例流程。SIMR2.IICINTM位的值假定为1（使用接收和发送中断），SCR.RIE位的值假定为0（SCIn\_RXI和SCIn\_ERI中断请求被禁用）。有关STI中断的更多信息，请参见表27.45。

当使用10位从地址时，图27.95中的步骤[3]和[4]重复两次。

在简单IIC模式下，与时钟同步传输期间的SCIn\_TXI中断请求产生时序不同，当一帧的通信完成时产生发送数据空中断（SCIn\_TXI）。

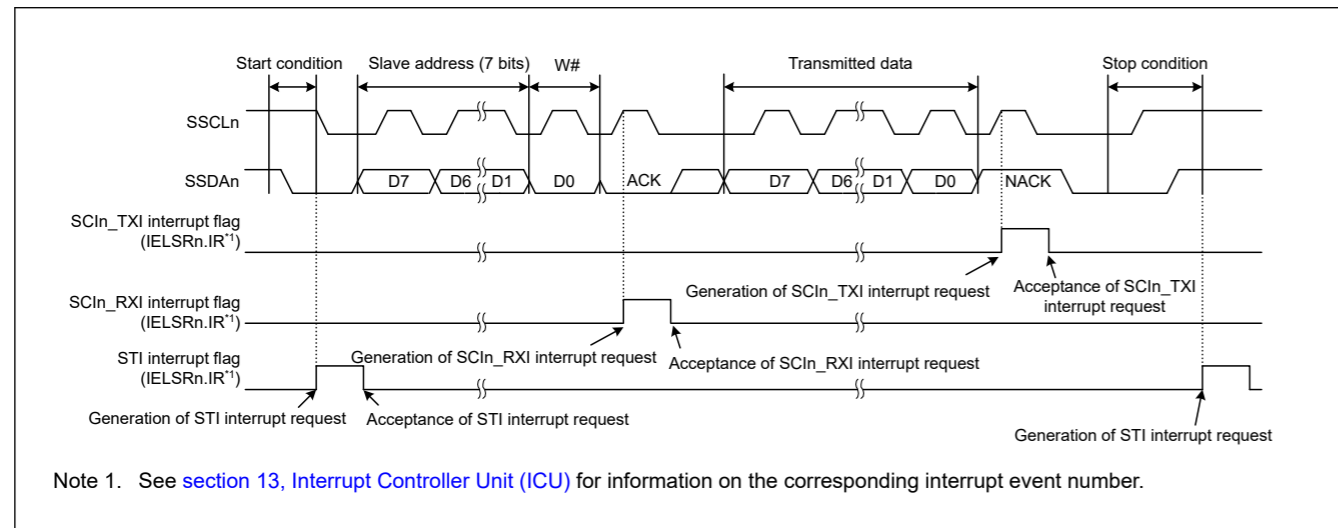

Note 1. See section 13, Interrupt Controller Unit (ICU) for information on the corresponding interrupt event number.

Figure 27.93 Example 1 of operations for master transmission in simple IIC mode with 7-bit slave addresses, transmission interrupts, and reception interrupts

When the SIMR2.IICINTM bit is set to 0 (use ACK/NACK interrupts) during master transmission, the DTC or DMAC is activated by the ACK interrupt as the trigger and required number of data bytes are transmitted. When the NACK is received, error processing such as transmission stop and retransmission is performed using the NACK interrupt as the trigger.

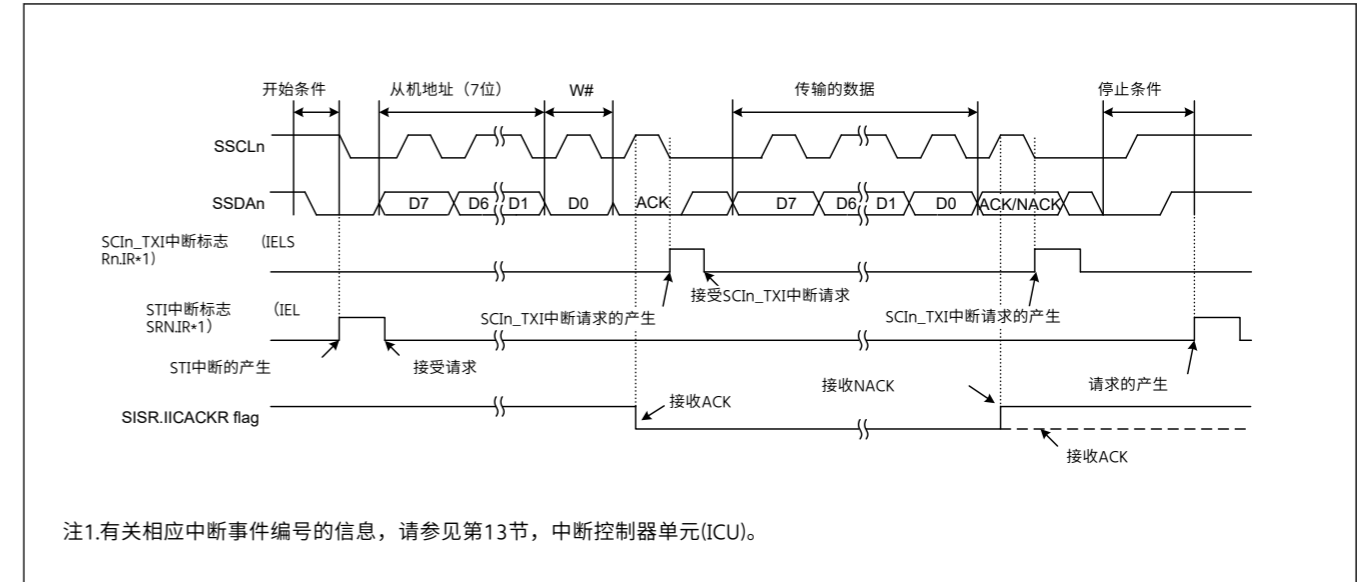

To restart communication for some reason after writing data in the TDR register, use the following procedure:

1. Set the TE and RE bits in the SCR register to 0 to stop communication.
2. Set 0xF0 in the SIMR3 register, release the I<sup>2</sup>C bus, and clear the generation of a condition.
3. If the RDRF flag in the SSR register is set, clear it.
4. Set the TE and RE bits in the SCR register to 1 and start the next communication.

Note 1. See section 13, Interrupt Controller Unit (ICU) for information on the corresponding interrupt event number.

Figure 27.94 Example 2 of operations for master transmission in simple IIC mode with 7-bit slave addresses, ACK interrupts, and NACK interrupts

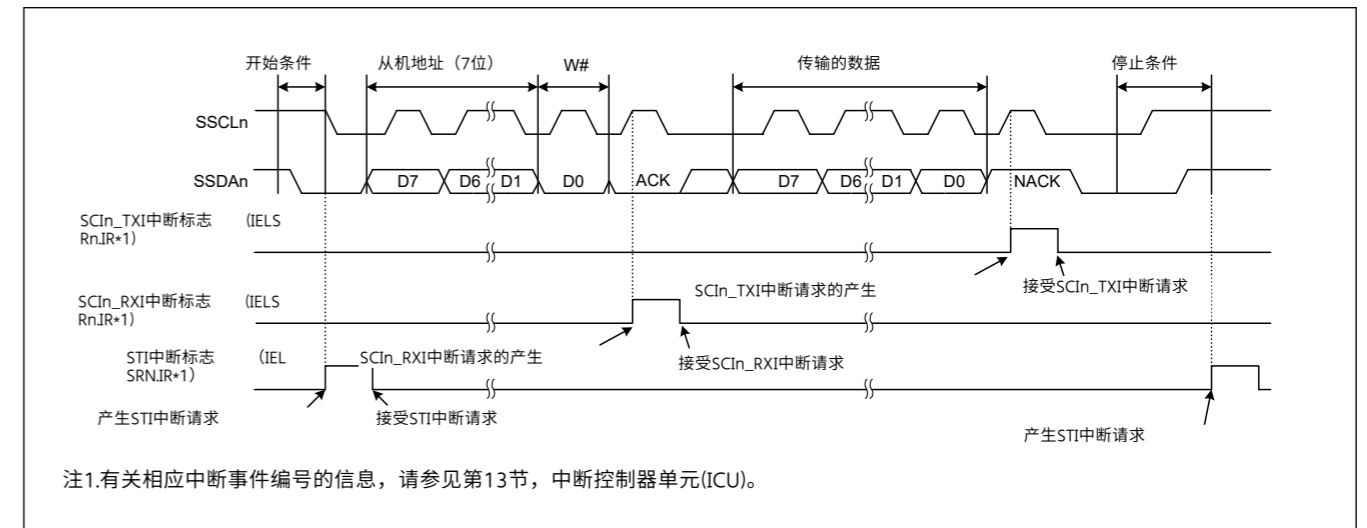

注1.有关相应中断事件编号的信息，请参见第13节，中断控制器单元(ICU)。

Figure 27.93 简单IIC模式下主机发送操作示例1，具有7位从机地址、发送中断和接收中断

当SIMR2.IICINTM位在主机传输期间设置为0（使用ACK/NACK中断）时，DTC或DMAC由ACK中断作为触发器激活并传输所需的数据字节数。接收到NACK时，以NACK中断为触发进行发送停止、重发等错误处理。

要在将数据写入TDR寄存器后出于某种原因重新启动通信，请使用以下过程：

- 1.将SCR寄存器中的TE和RE位设置为0以停止通信。
- 2.设置SIMR3寄存器中的0xF0，释放I<sup>2</sup>C总线，并清除条件的产生。
- 3.如果SSR寄存器中的RDRF标志被设置，则清除它。
- 4.将SCR寄存器中的TE和RE位设置为1，开始下一次通信。

注1.有关相应中断事件编号的信息，请参见第13节，中断控制器单元(ICU)。

Figure 27.94 使用7位从机地址、ACK中断和NACK中断的简单IIC模式下主机传输操作示例2

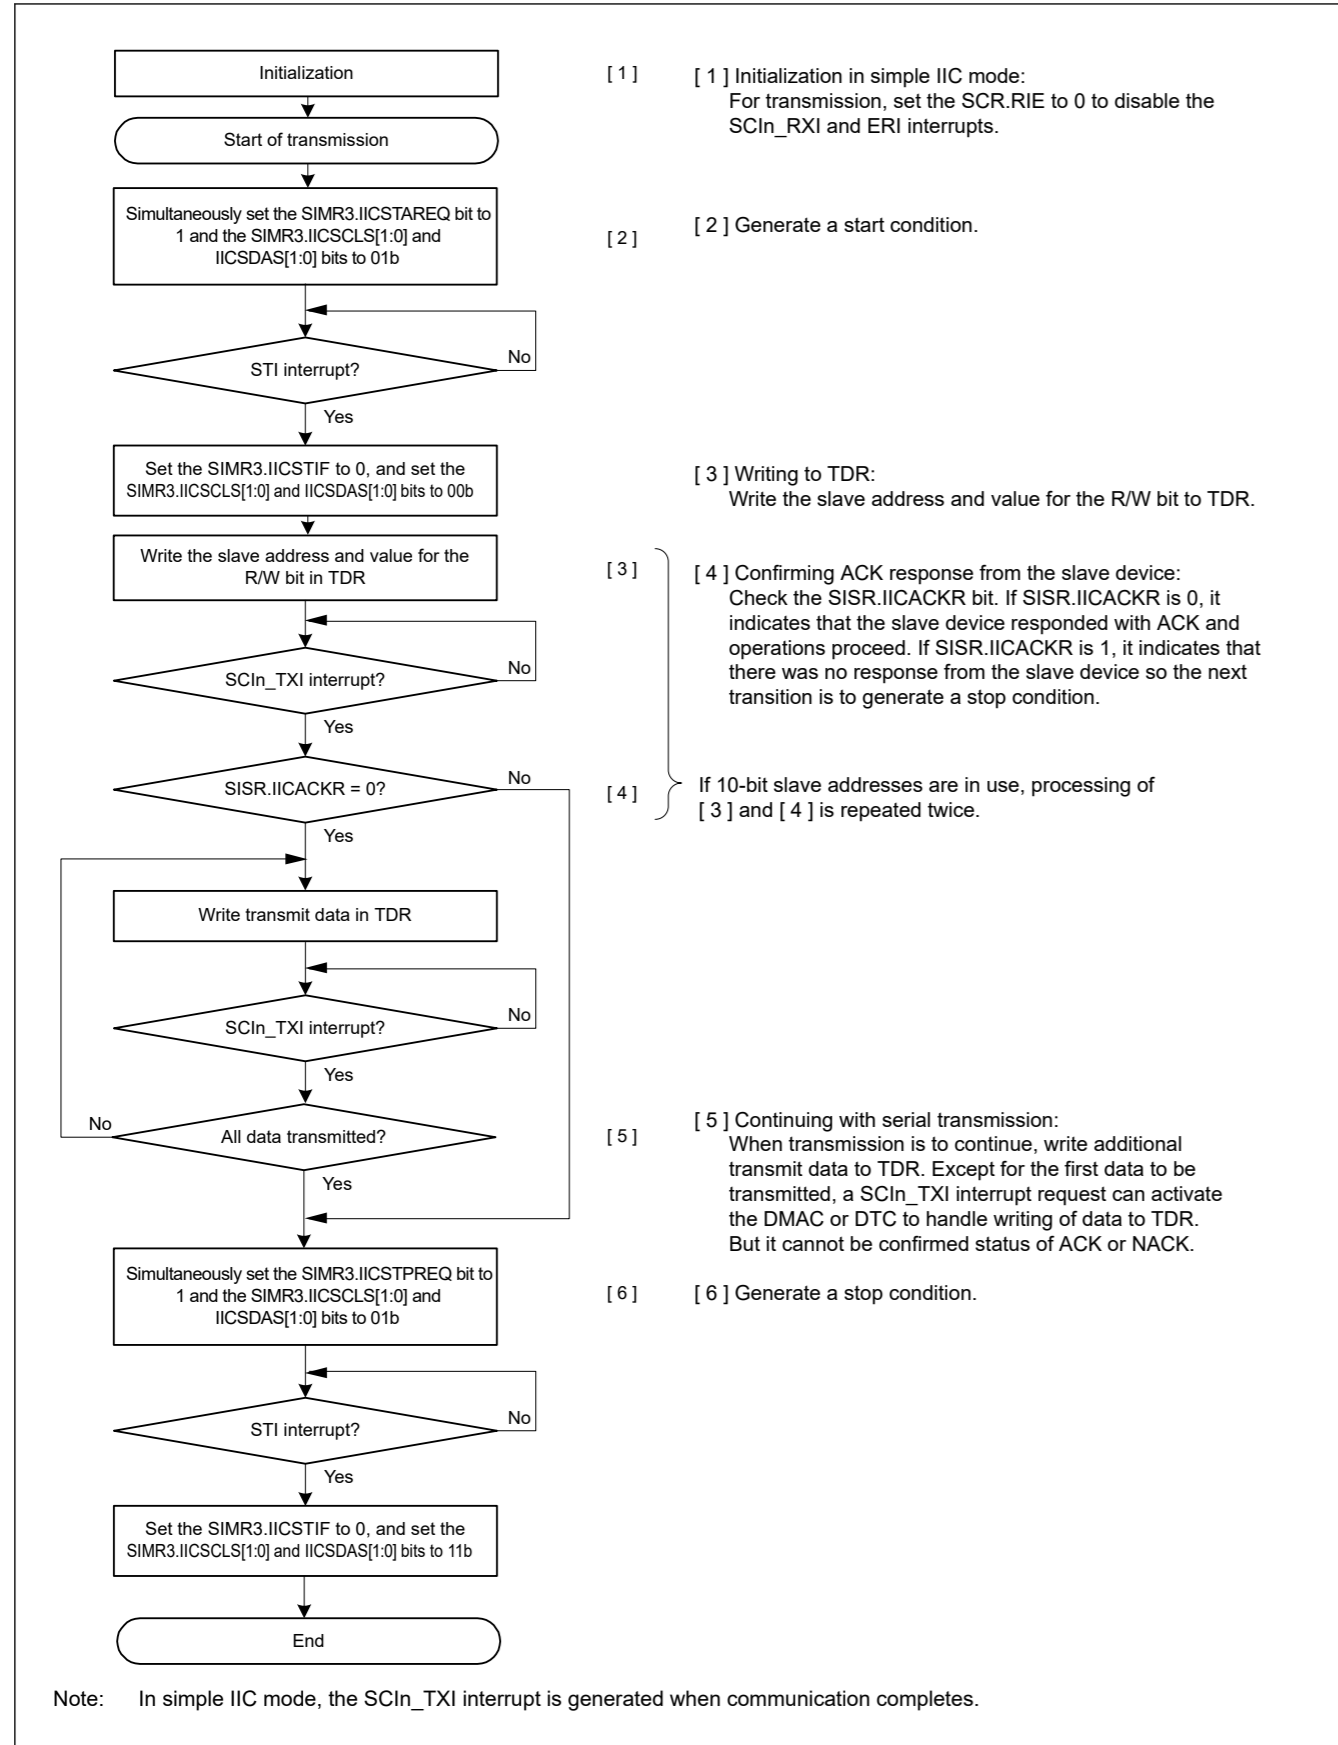

Figure 27.95 Example flow of master transmission in simple IIC mode with transmission interrupts and reception interrupts

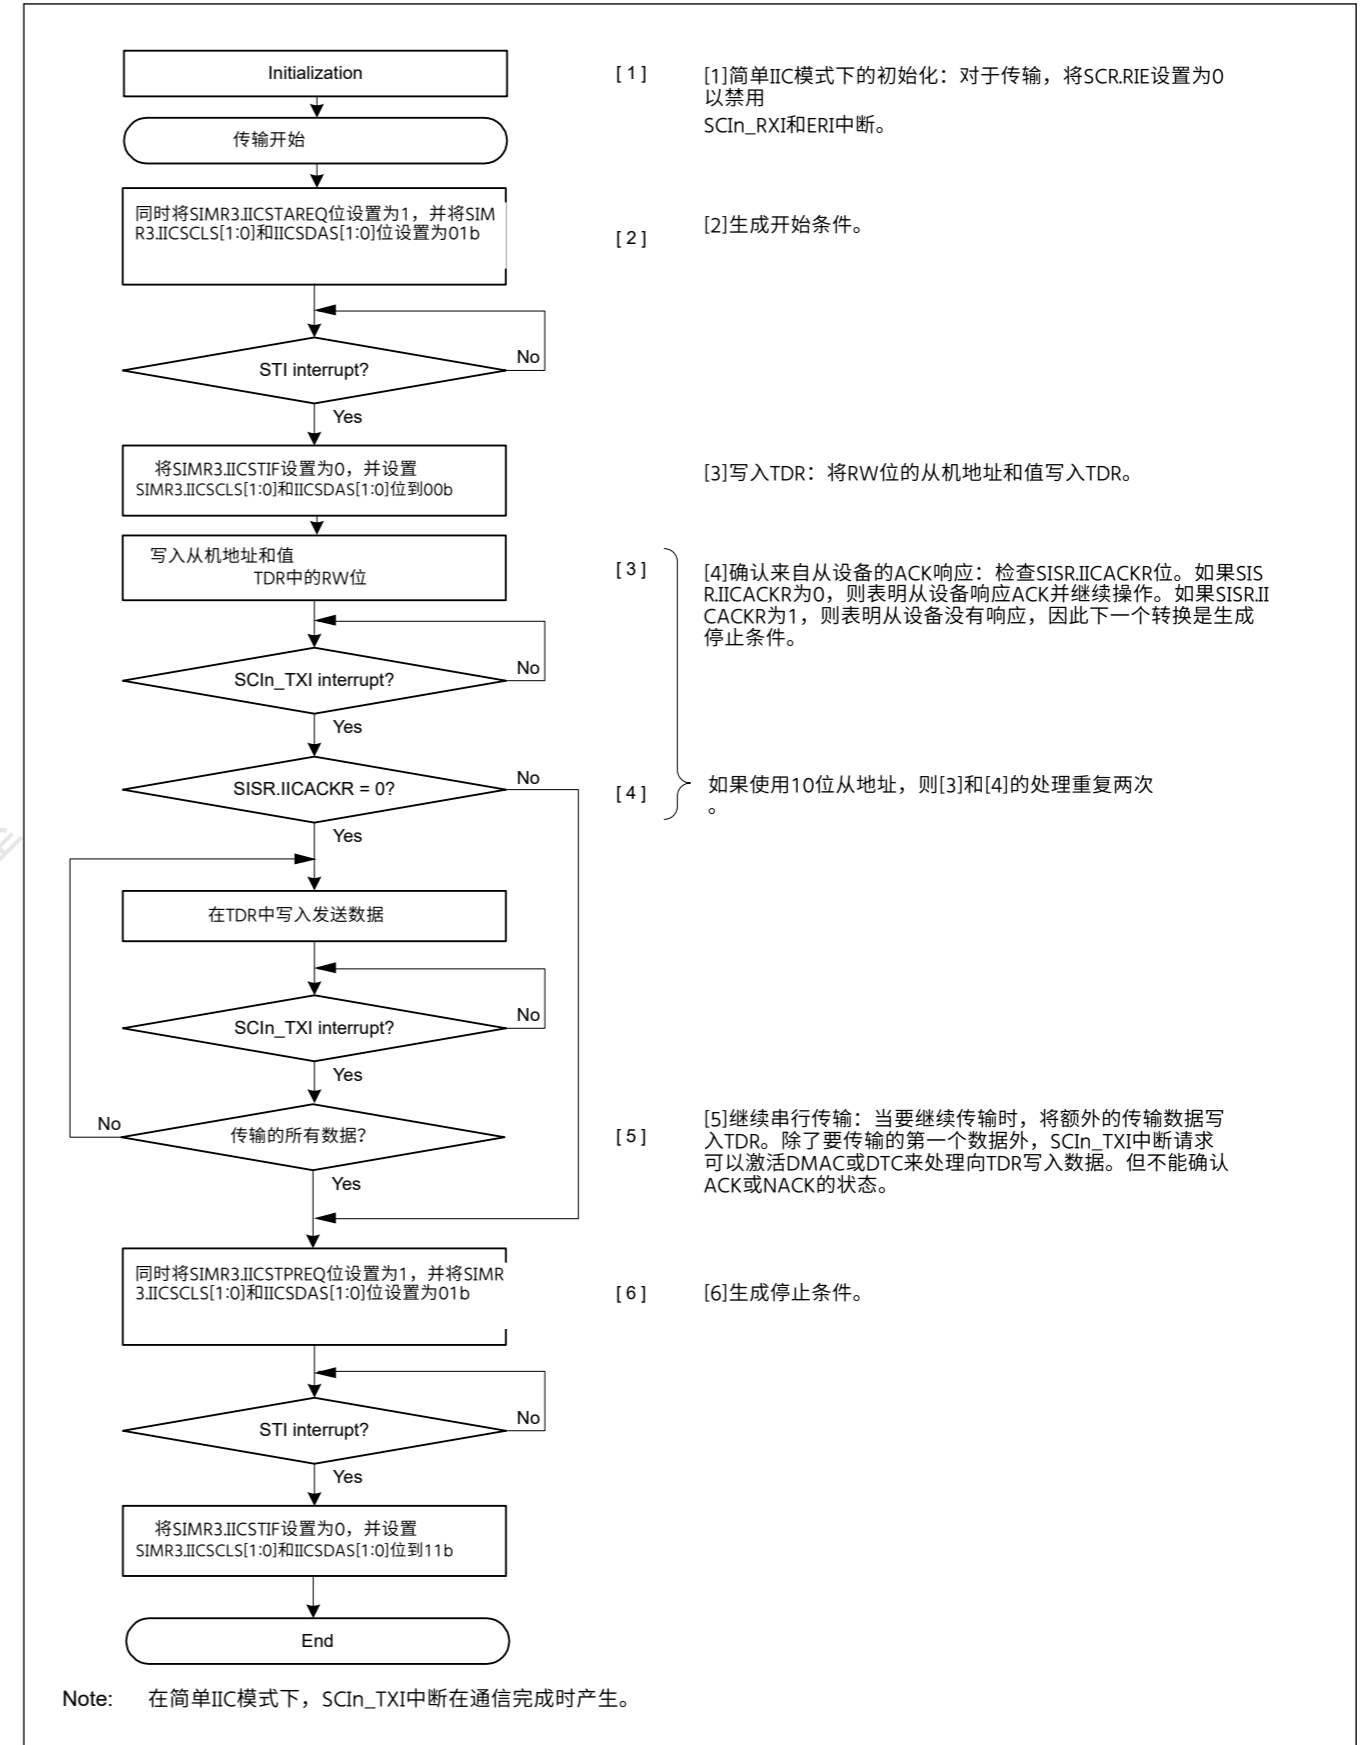

Figure 27.95 带有发送中断和接收中断的简单IIC模式下的主机发送示例流程

27.8.6 Master Reception in Simple IIC Mode

Figure 27.96 shows an example operation in simple IIC mode master reception and Figure 27.97 shows an example flow of master reception.

The value of the SIMR2.IICINTM bit is assumed to be 1 (use reception and transmission interrupts).

In simple IIC mode, the transmit data empty interrupt (SCIn\_TXI) is generated when communication of one frame is complete, unlike the SCIn\_TXI interrupt request generation timing during clock synchronous transmission.

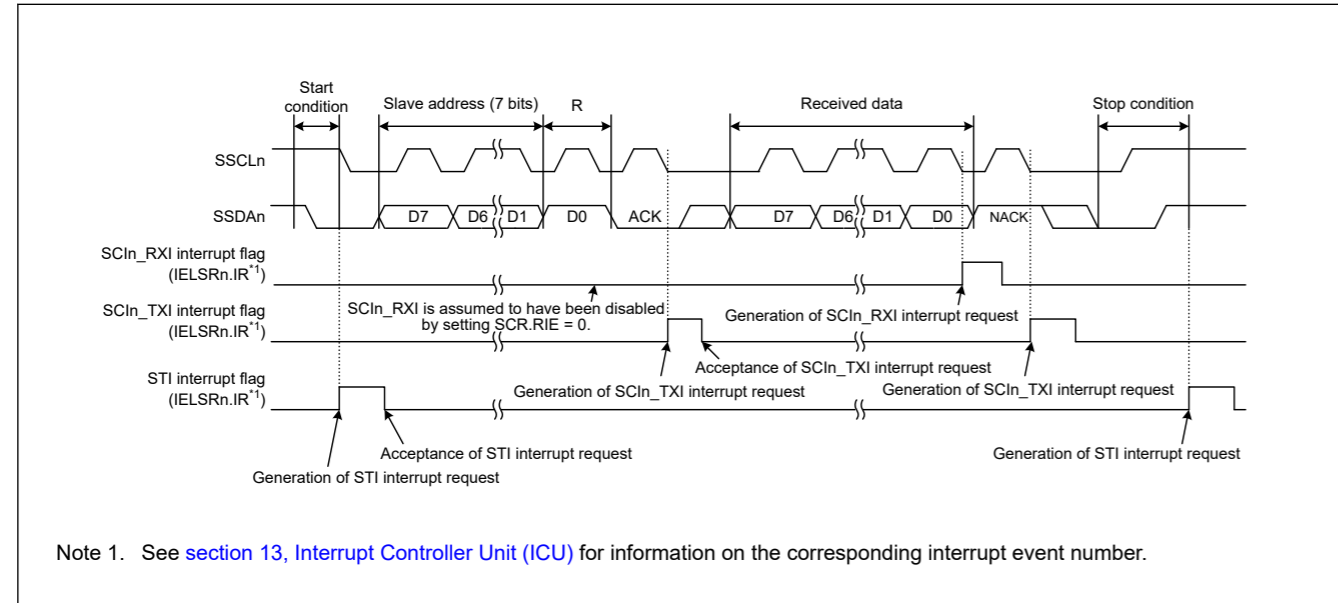

Figure 27.96 Example operations for master reception in simple IIC mode with 7-bit slave addresses, transmission interrupts, and reception interrupts

27.8.6 简单IIC模式下的主接收

图27.96显示了简单IIC模式主机接收的示例操作，图27.97显示了主机接收的示例流程。

SIMR2.IICINTM位的值假定为1（使用接收和发送中断）。

在简单IIC模式下，与时钟同步传输期间的SCIn\_TXI中断请求产生时序不同，当一帧的通信完成时产生发送数据空中断（SCIn\_TXI）。

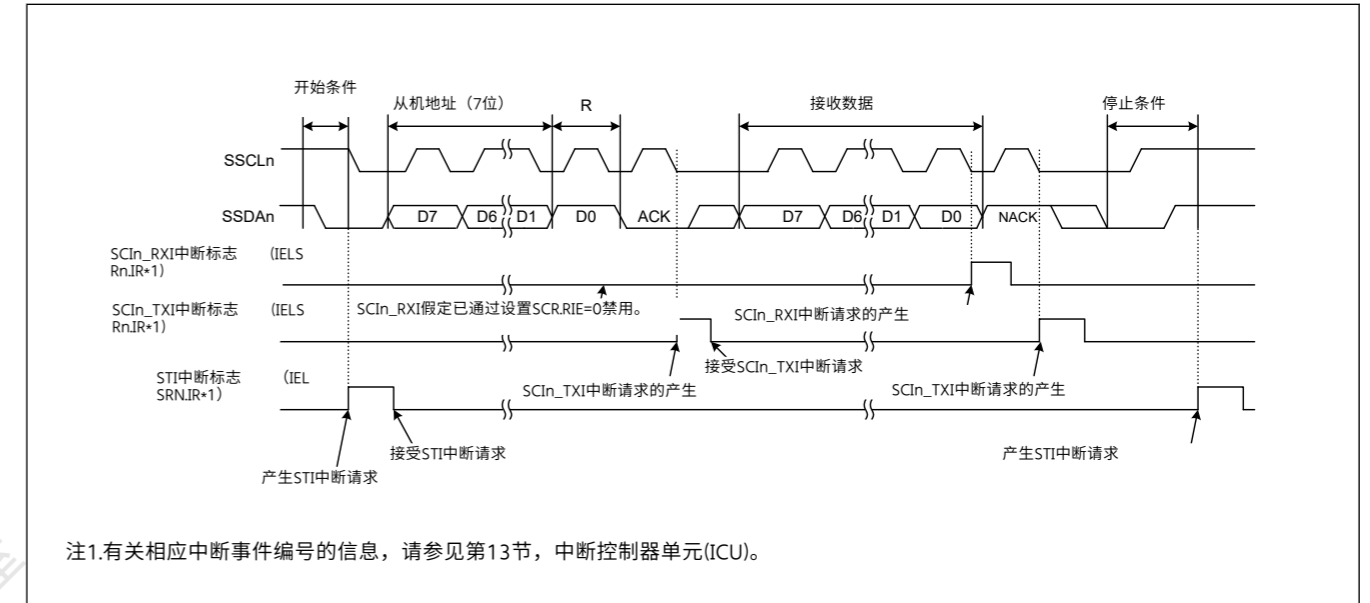

Figure 27.96 使用7位从地址、发送中断和接收中断的简单IIC模式下的主机接收示例操作

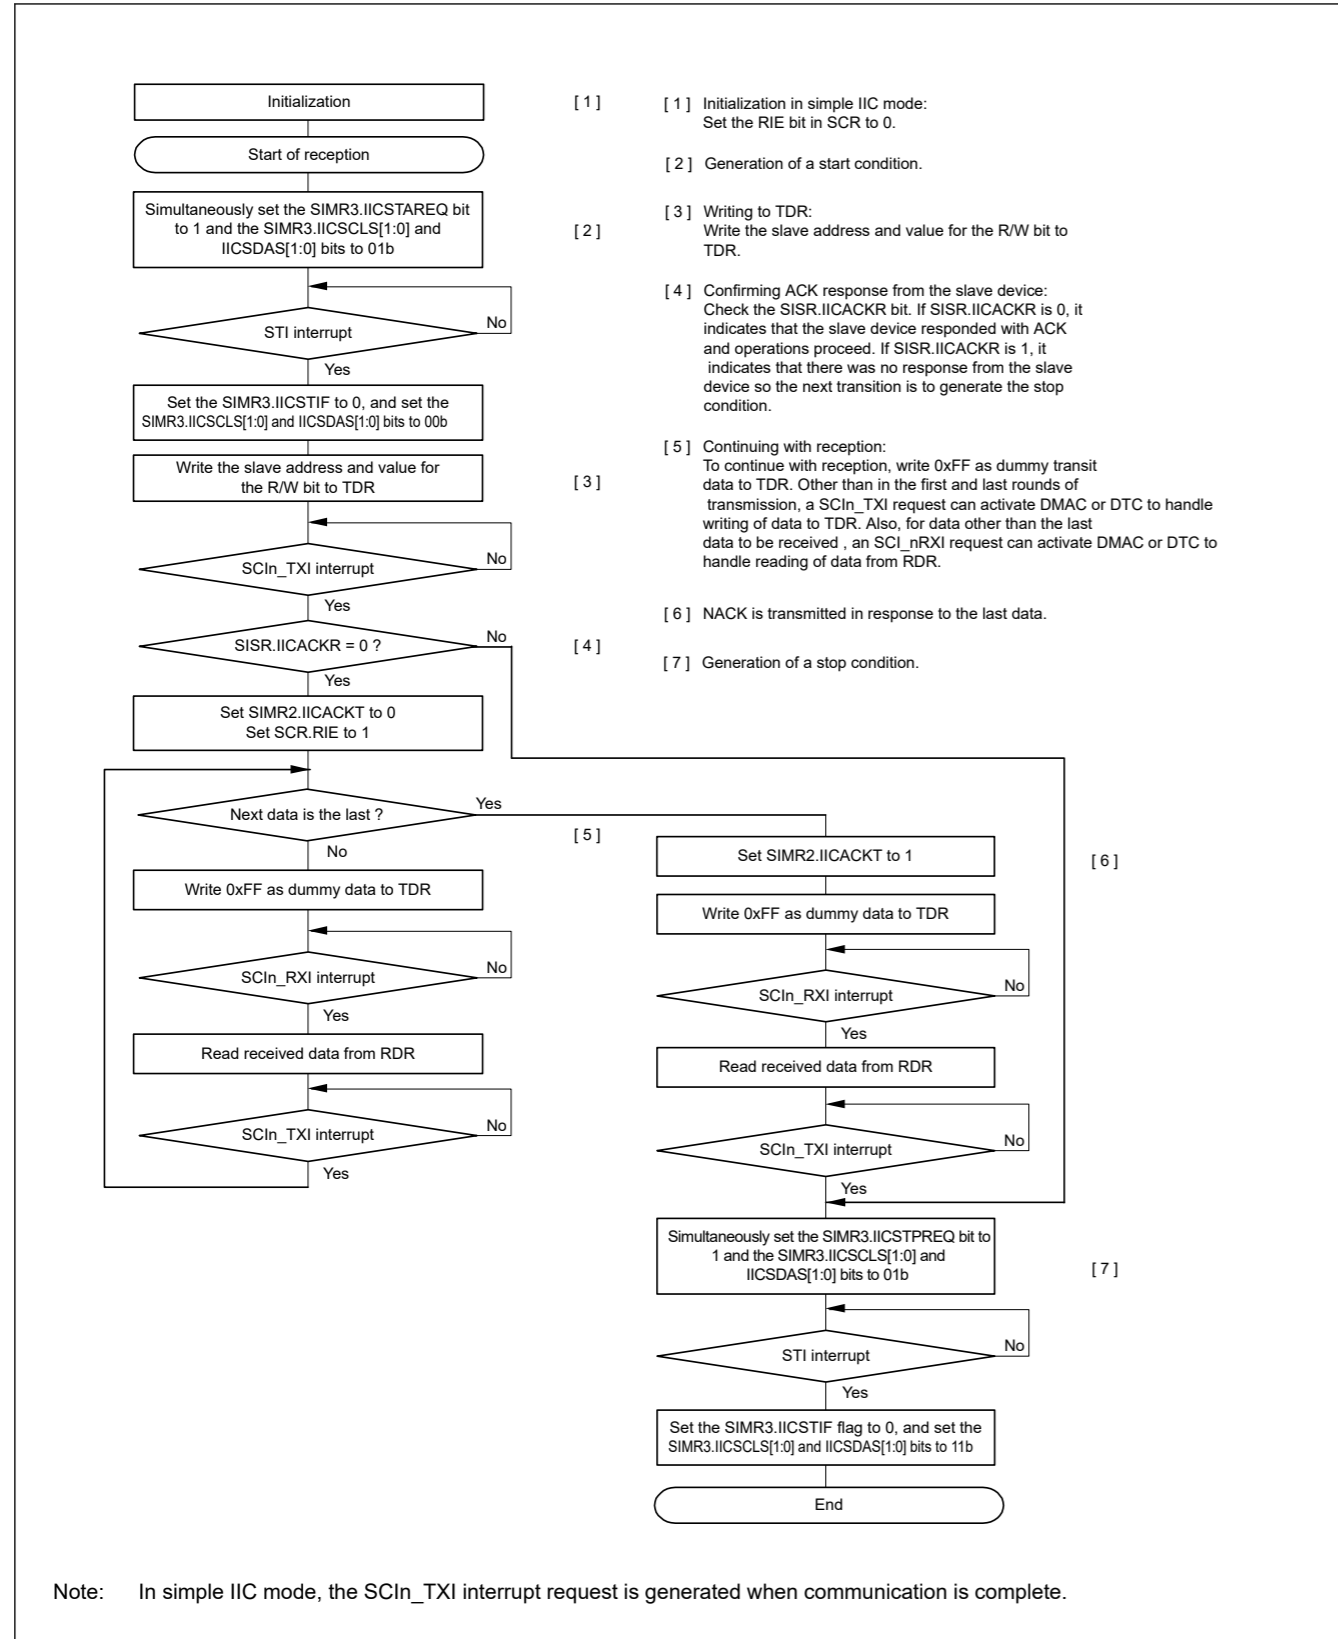

Figure 27.97 Example flow of master reception in simple IIC mode with transmission interrupts and reception interrupts

27.9 Operation in Simple SPI Mode

As an extended function, the SCI supports a simple SPI mode that handles transfer among one or multiple master devices and multiple slave devices.

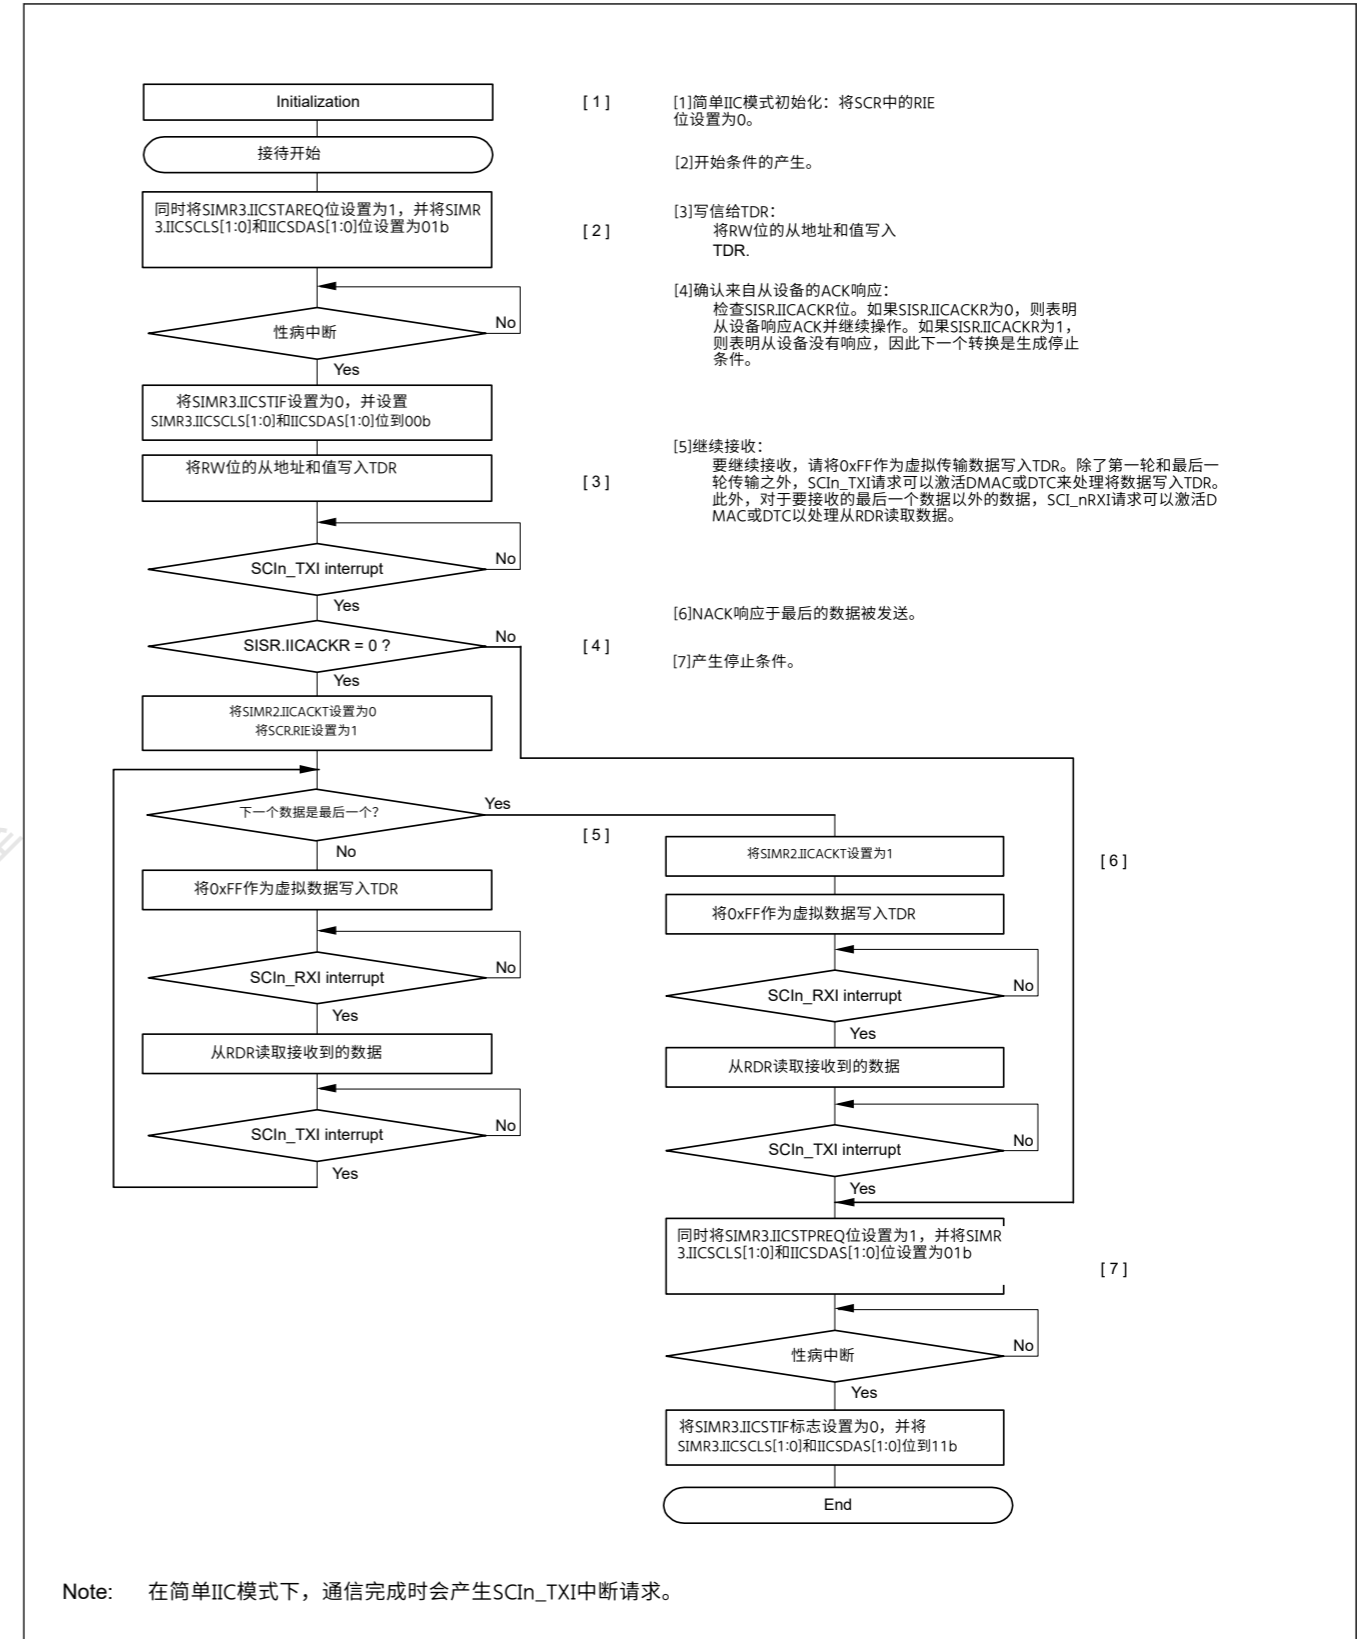

Figure 27.97 带有发送中断和接收中断的简单IIC模式下的主机接收示例流程

27.9 简单SPI模式下的操作

作为一项扩展功能, SCI支持简单的SPI模式, 可处理一个或多个主设备与多个从设备之间的传输。

Using the settings for clock synchronous mode (SCMR.SMIF = 0, SIMR1.IICM = 0, SMR.CM = 1) and setting the SPMR.SSE bit to 1 places the SCI in simple SPI mode. However, the SSn pin function on the master side is not required for connection of the device used as the master in simple SPI mode when the configuration only has a single master. Therefore, set the SPMR.SSE bit to 0 in such cases.

Figure 27.98 shows an example of connections for simple SPI mode. Control a general port pin to produce the SSn output signal from the master.

In simple SPI mode, data is transferred in synchronization with clock pulses in the same way as in clock synchronous mode. One character of data for transfer consists of 8 bits of data, and parity bits cannot be appended. The data can be inverted by setting the SCMR.SINV bit to 1.

Because the receiver and transmitter are independent of each other within the SCI module, full-duplex communications are possible, with a shared clock signal. Additionally, because both the transmitter and receiver have a buffered structure, writing the next transmit data while transmission is in progress and reading previously received data while reception is in progress are both possible. This enables continuous transfer.

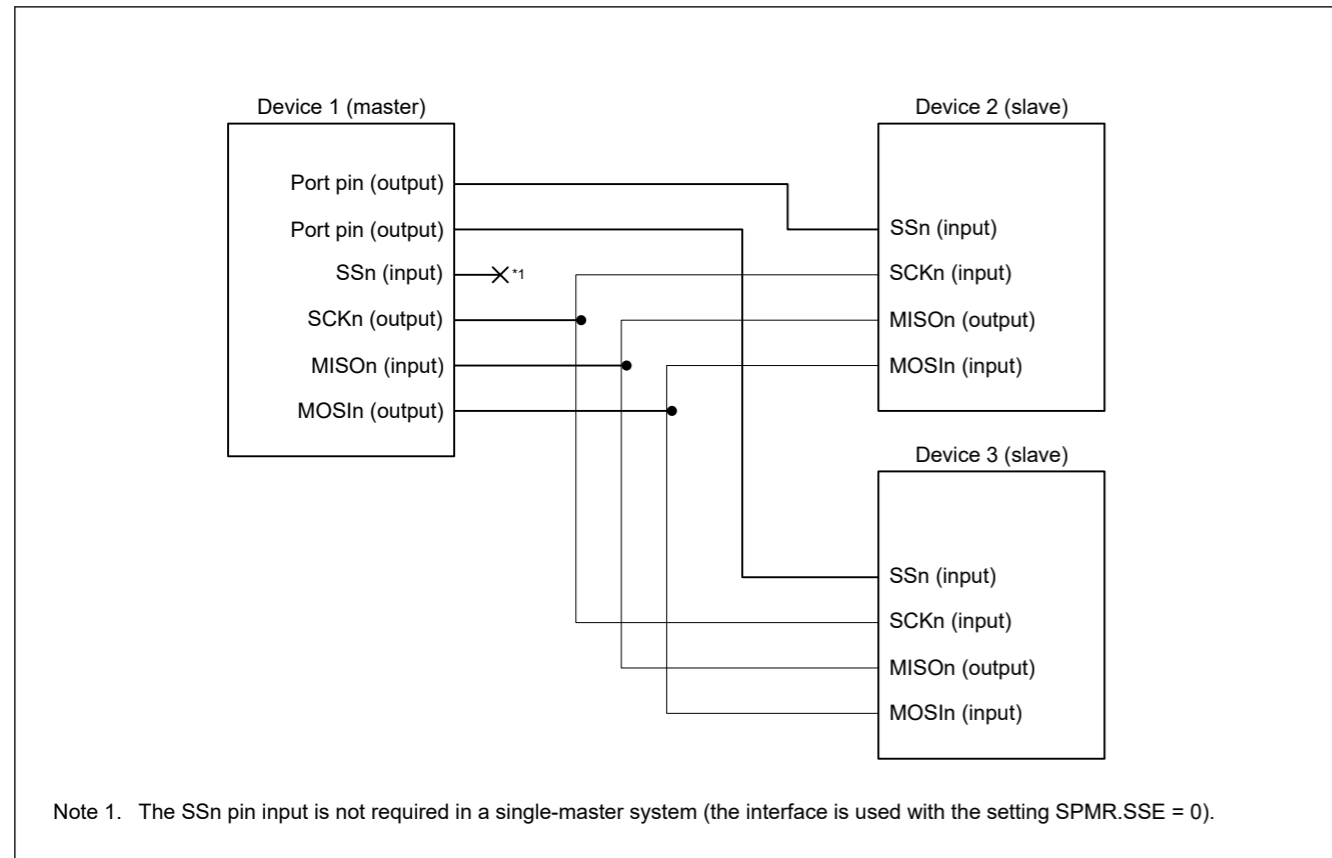

Figure 27.98 Example connections using simple SPI mode in single master mode with SPMR.SSE bit = 0

### 27.9.1 States of Pins in Master and Slave Modes

The direction (input or output) of pins for the simple SPI mode interface differs according to whether the device is a master (SCR.CKE[1:0] = 00b or 01b and SPMR.MSS = 0) or slave (SCR.CKE[1:0] = 10b or 11b and SPMR.MSS = 1).

Table 27.41 lists the relationship between the pin states, mode, and level on the SSn pin.

Table 27.41 States of pins by mode and input level on SSn pin (1 of 2)

| Mode          | Input on SSn pin                    | State of MOSI pin              | State of MISO pin                      | State of SCKn pin |
|---------------|-------------------------------------|--------------------------------|--|-------------------|
| Master mode*1 | High level (transfer can proceed)   | Output for data transmission*2 | Input for received data                | Clock output*3    |
|               | Low level (transfer cannot proceed) | High-impedance                 | Input for received data (but disabled) | High-impedance    |

使用时钟同步模式的设置(SCMR.SMIF=0 SIMR1.IICM=0 SMR.CM=1)并设置 SPMR.SSE位为1将SCI置于简单SPI模式。但是，当配置只有一个主控时，在简单SPI模式下连接用作主控的设备不需要主控侧的SSn引脚功能。因此，在这种情况下，将SPMR.SSE位设置为0。

图27.98显示了简单SPI模式的连接示例。控制一个通用端口引脚以产生来自主机的SSn输出信号。

在简单SPI模式下，数据与时钟脉冲同步传输，方式与时钟同步模式相同。1个字符的传输数据由8位数据组成，不能附加奇偶校验位。可以通过将SCMR.SINV位设置为1来反转数据。

由于接收器和发送器在SCI模块中彼此独立，因此可以使用共享时钟信号进行全双工通信。此外，由于发送器和接收器都具有缓冲结构，因此在发送过程中写入下一个发送数据和在接收过程中读取先前接收到的数据都是可能的。这使得连续传输成为可能。

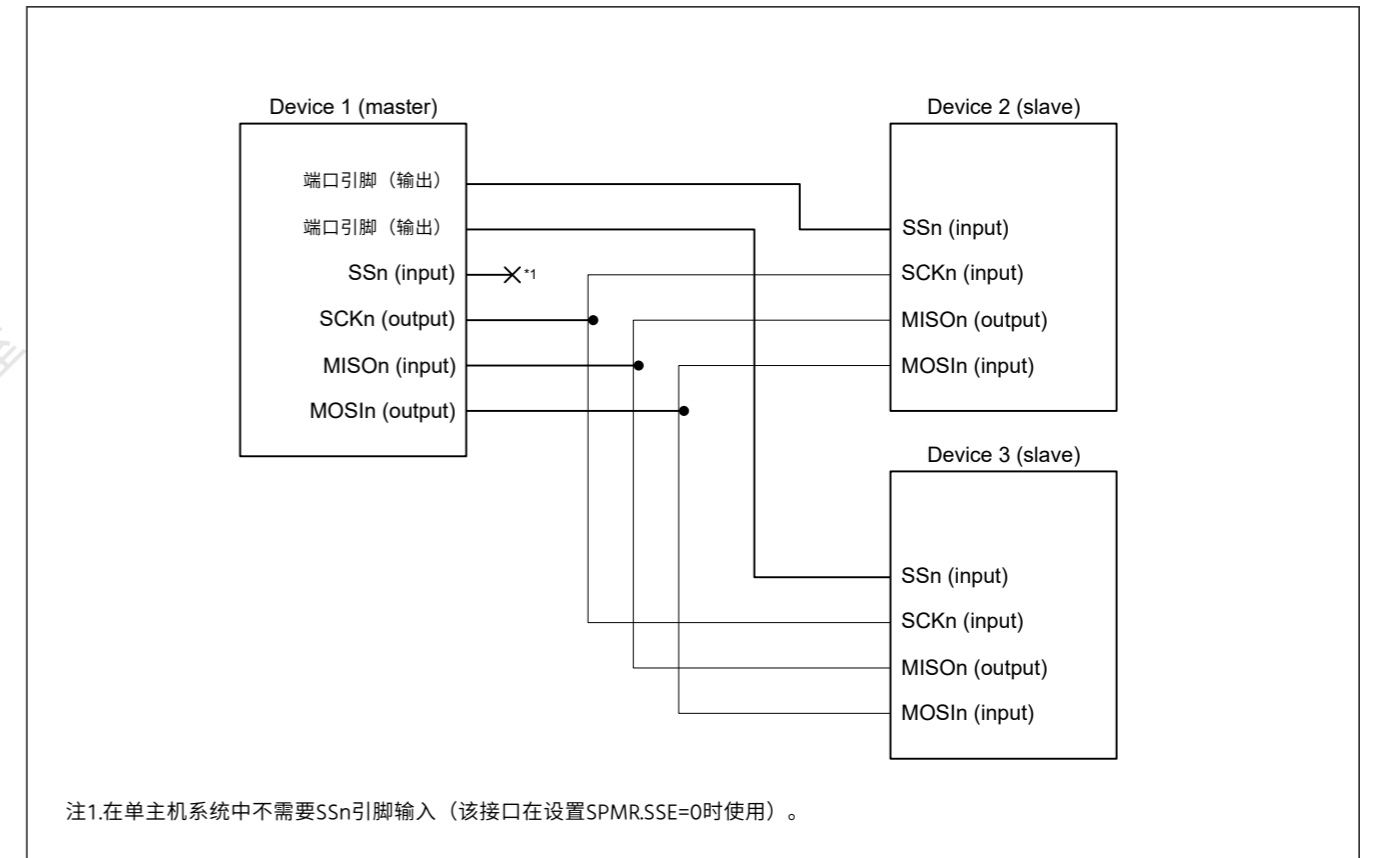

Figure 27.98 在SPMR.SSE位=0的单主模式下使用简单SPI模式的示例连接

### 27.9.1 主从模式下的引脚状态

简单SPI模式接口的引脚方向（输入或输出）根据设备是主设备（SCR.CKE[1:0]=00b或01b且SPMR.MSS=0）还是从设备（SCR.CKE[1:0]=10b或11b且SPMR.MSS=1）而不同。

表27.41列出了SSn引脚上的引脚状态、模式和电平之间的关系。

Table 27.41 SSn引脚上的模式和输入电平的引脚状态（2个中的1个）

| Mode  | SSn引脚上的输入   | MOSI引脚状态       | MISO引脚的状态    | SCKn引脚状态       |
|-------|-------------|----------------|--------------|----------------|
| 主模式*1 | 高电平（可以进行转移） | 数据传输用输出*2      | 接收数据的输入      | 时钟输出*3         |
|       | 低电平（传输无法进行） | High-impedance | 接收数据的输入（但禁用） | High-impedance |

Table 27.41 States of pins by mode and input level on SSn pin (2 of 2)

| Mode       | Input on SSn pin                     | State of MOSIn pin                     | State of MISOn pin           | State of SCKn pin          |
|------------|--------------------------------------|--|------------------------------|----------------------------|
| Slave mode | High level (transfer cannot proceed) | Input for received data (but disabled) | High-impedance               | Clock input (but disabled) |
|            | Low level (transfer can proceed)     | Input for received data                | Output for data transmission | Clock input                |

Note 1. When there is only a single master (SPMR.SSE = 0), transfer is possible regardless of the input level on the SSn pin. This is equivalent to input of a high level on the SSn pin.

Note 2. The MOSIn pin output is in the high-impedance state when serial transmission is disabled (SCR.TE bit = 0).

Note 3. The SCKn pin output is in the high-impedance state when serial transmission is disabled (SCR.TE and RE bits = 00b) in a multi-master configuration (SPMR.SSE = 1).

### 27.9.2 SS Function in Master Mode

Setting the CKE[1:0] bits in the SCR to 00b and the MSS bit in the SPMR to 0 selects master operation. The SSn pin is not used in single-master configurations (SPMR.SSE = 0), so transmission or reception can proceed regardless of the value of the SSn pin.

When the level on the SSn pin is high in a multi-master configuration (SPMR.SSE = 1), a master device outputs clock signals from the SCKn pin before starting transmission or reception to indicate that there are no other masters or another master is performing reception or transmission.

When the level on the SSn pin is low in a multi-master configuration (SPMR.SSE = 1), there are other masters, and a transmission or reception is in progress. The MOSIn output and SCKn pins are placed in the high-impedance state and starting transmission or reception is not possible. In addition, the value of the SPMR.MFF bit is 1, indicating a mode fault error. In a multi-master configuration, start error processing by reading SPMR.MFF flag. If a mode fault error occurs while transmission or reception is in progress, transmission or reception does not stop, but the MOSIn and SCKn outputs are in the high-impedance state after completion of the transfer. Use a general port pin to produce the SS output signal from the master.

### 27.9.3 SS Function in Slave Mode

Setting the SCR.CKE[1:0] bits to 10b and the SPMR.MSS bit to 1 selects slave operation. When the SSn pin is high, the MISOn output pin is in the high-impedance state and clock input through the SCKn pin is ignored. When the SSn pin is low, clock input through the SCKn pin is valid and transmission or reception can proceed.

If the input on the SSn pin changes from low to high during transmission or reception, the MISOn output pin is placed in the high-impedance state. Meanwhile, the internal processing for transmission or reception continues at the rate of the clock input through the SCKn pin until processing for the character being transmitted or received is complete, after which it stops, and the appropriate interrupt (SCIn\_TXI, SCIn\_RXI, or SCIn\_TEI) is generated.

### 27.9.4 Relationship between Clock and Transmit/Receive Data

The CKPOL and CKPH bits in the SPMR register can be used to set up the clock for use in transmission and reception in four different ways. The relation between the clock signal and the transmission and reception of data is shown in Figure 27.99. The relation is the same for both master and slave operation. This is the same as when the level on the SSn pin is high.

Table 27.41 SSn引脚上的模式和输入电平的引脚状态 (2个中的2个)

| Mode | SSn引脚上的输入    | MOSIn管脚状态     | MISOn引脚的状态     | SCKn引脚状态   |
|------|--------------|---------------|----------------|------------|
| 从机模式 | 高电平 (传输无法进行) | 接收数据的输入 (但禁用) | High-impedance | 时钟输入 (但禁用) |
|      | 低电平 (可以继续传输) | 接收数据的输入       | 数据传输输出         | 时钟输入       |

注1.当只有一个主机(SPMR.SSE=0)时,无论SSn引脚上的输入电平如何,都可以进行传输。这相当于在SSn引脚上输入高电平。

注2.当串行传输被禁用(SCR.TE位=0)时,MOSIn引脚输出处于高阻抗状态。

注3.在多主机配置(SPMR.SSE=1)中禁用串行传输(SCR.TE和RE位=00b)时,SCKn引脚输出处于高阻抗状态。

### 27.9.2 主控模式下的SS功能

将SCR中的CKE[1:0]位设置为00b并将SPMR中的MSS位设置为0来选择主机操作。SSn引脚不用于单主机配置(SPMR.SSE=0),因此无论SSn引脚的值如何,都可以进行发送或接收。

在多主机配置(SPMR.SSE=1)中,当SSn引脚上的电平为高电平时,主机设备在开始发送或接收之前从SCKn引脚输出时钟信号,以指示没有其他主机或另一个主机在进行接收或发送。

在多主机配置(SPMR.SSE=1)中,当SSn引脚上的电平为低电平时,存在其他主机,并且正在进行发送或接收。MOSIn输出和SCKn引脚处于高阻状态,无法开始发送或接收。此外,SPMR.MFF位的值为1,表示模式故障错误。在多主机配置中,通过读取SPMR.MFF标志开始错误处理。如果在发送或接收过程中发生模式故障错误,则发送或接收不会停止,但MOSIn和SCKn输出在传输完成后处于高阻抗状态。使用通用端口引脚从主机产生SS输出信号。

### 27.9.3 从模式下的SS功能

将SCR.CKE[1:0]位设置为10b并将SPMR.MSS位设置为1选择从机操作。当SSn引脚为高电平时,MISOn输出引脚处于高阻抗状态,通过SCKn引脚输入的时钟被忽略。当SSn引脚为低电平时,通过SCKn引脚输入的时钟有效,可以进行发送或接收。

如果SSn引脚上的输入在发送或接收期间从低电平变为高电平,则MISOn输出引脚处于高阻抗状态。同时,发送或接收的内部处理以通过SCKn引脚输入的时钟速率继续进行,直到对正在发送或接收的字符的处理完成,之后它停止,并出现适当的中断(SCIn\_TXI、SCIn\_RXI或SCIn\_TEI)生成。

### 27.9.4 时钟与发送接收数据的关系

SPMR寄存器中的CKPOL和CKPH位可用于以四种不同的方式设置用于发送和接收的时钟。时钟信号与数据收发发的关系如图27.99所示。主从操作的关系是相同的。这与SSn引脚上的电平为高电平时相同。

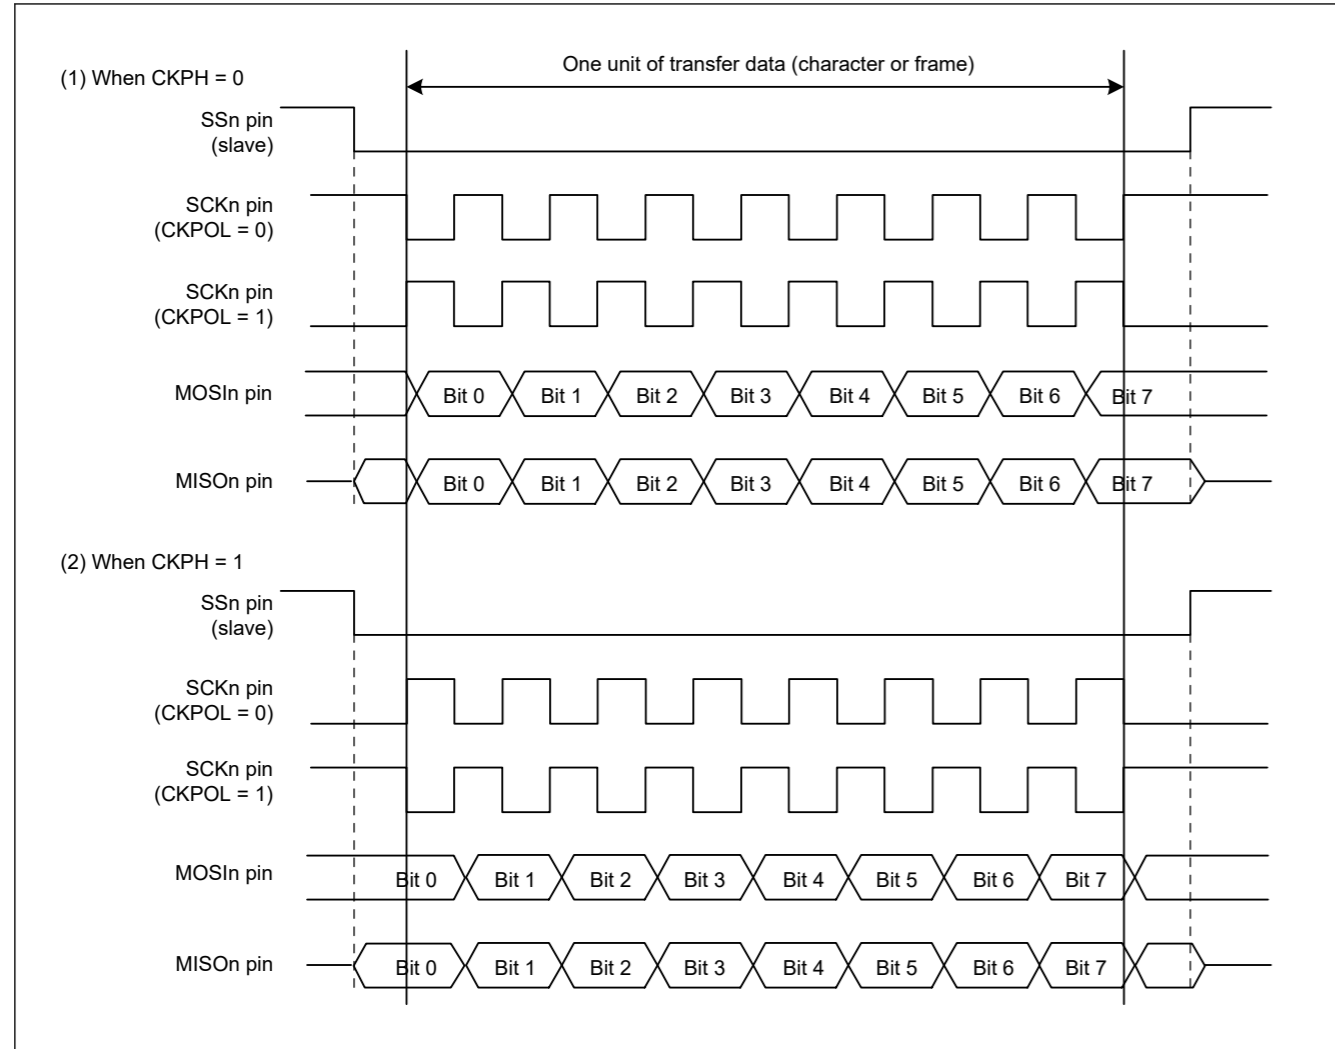

Figure 27.99 Relation between clock signal and transmit or receive data in simple SPI mode

### 27.9.5 SCI Initialization in Simple SPI Mode

Initialization in simple SPI mode is the same as in clock synchronous mode. See [section 27.6.3. SCI Initialization in Clock Synchronous Mode](#) for an example initialization flow. The CKPOL and CKPH bits in the SPMR register must be set to ensure that the clock signal is suitable for both master and slave devices.

Always initialize the SCR register before making any changes to the operating mode or transfer format.

Note: Only the RE bit is set to 0. The SSR.ORER, FER, PER, and RDR flags are not initialized.

Changing the value of the TE bit from 1 to 0 or from 0 to 1 when the TIE bit in the SCR register is 1 at the same time, leads to the generation of a transmit data empty interrupt (SCIn\_TXI).

### 27.9.6 Transmission and Reception of Serial Data in Simple SPI Mode

In master operation, ensure that the SSn pin of the slave device on the other side of the transfer is at the low level before starting the transfer and at the high level on completion of the transfer. Otherwise, the procedures are the same as in clock synchronous mode.

### 27.10 Bit Rate Modulation Function

Using the bit rate modulation function, the bit rate can be evenly corrected using the number specified in the MDDR register when the PCLK is selected in the CKS[1:0] bits in SMR/SMR\_SMCI.

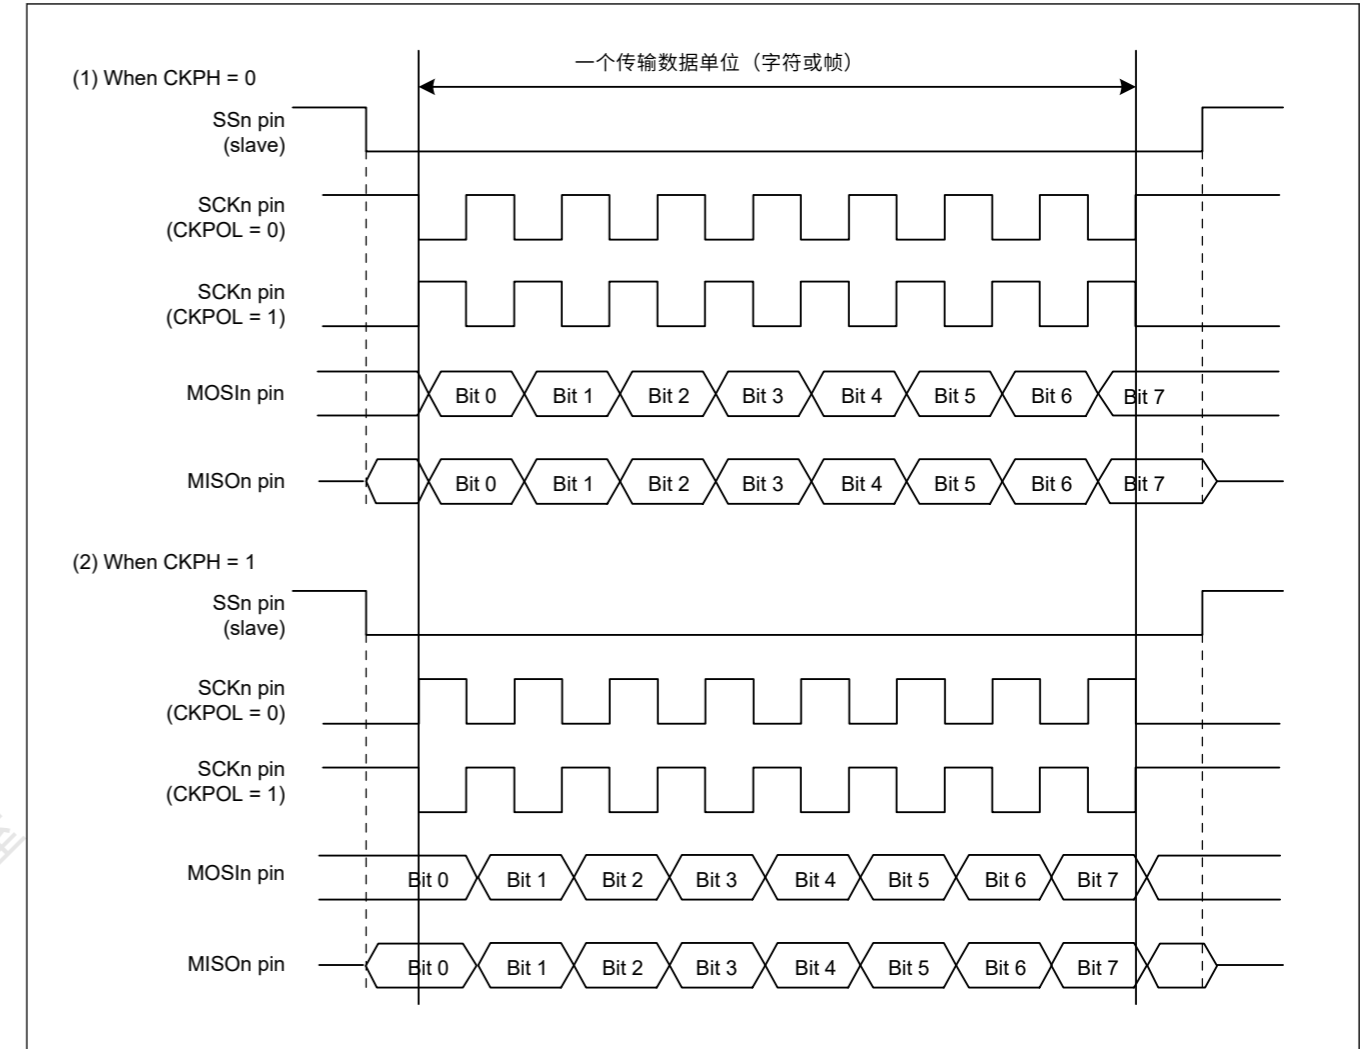

Figure 27.99 简单SPI模式下时钟信号与发送或接收数据的关系

### 27.9.5 简单SPI模式下的SCI初始化

简单SPI模式的初始化与时钟同步模式相同。请参见第27.6.3节。时钟中的SCI初始化示例初始化流程的同步模式。必须设置SPMR寄存器中的CKPOL和CKPH位，以确保时钟信号适用于主设备和从设备。

在对操作模式或传输格式进行任何更改之前，始终初始化SCR寄存器。

Note: 只有RE位设置为0。SSR.ORER、FER、PER和RDR标志未初始化。

当SCR寄存器中的TIE位同时为1时，将TE位的值从1更改为0或从0更改为1，会导致产生发送数据空中断（SCIn\_TXI）。

### 27.9.6 简单SPI模式下串行数据的发送和接收

在主机操作中，确保传输另一侧的从设备的SSn管脚在开始传输前为低电平，在传输完成时为高电平。否则，过程与时钟同步模式相同。

### 27.10 比特率调制功能

使用比特率调制功能，当在SMRSMR\_SMCI的CKS[1:0]位中选择PCLK时，可以使用MDDR寄存器中指定的数字均匀地校正比特率。

Figure 27.100 shows an example where the PCLK is selected in the CKS[1:0] bits in SMR/SMR\_SMCI, the BRR bit is set to 0, and the MDDR is set to 160 in asynchronous mode. In this example, the cycle of the base clock is evenly corrected (256/160) and the bit rate is also corrected (160/256).

Note: Enabling an internal clock causes bias, and expansion and contraction are generated in the pulse width of the internal base clock.

Do not use this function in clock synchronous mode and in the highest speed settings in simple SPI mode (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).

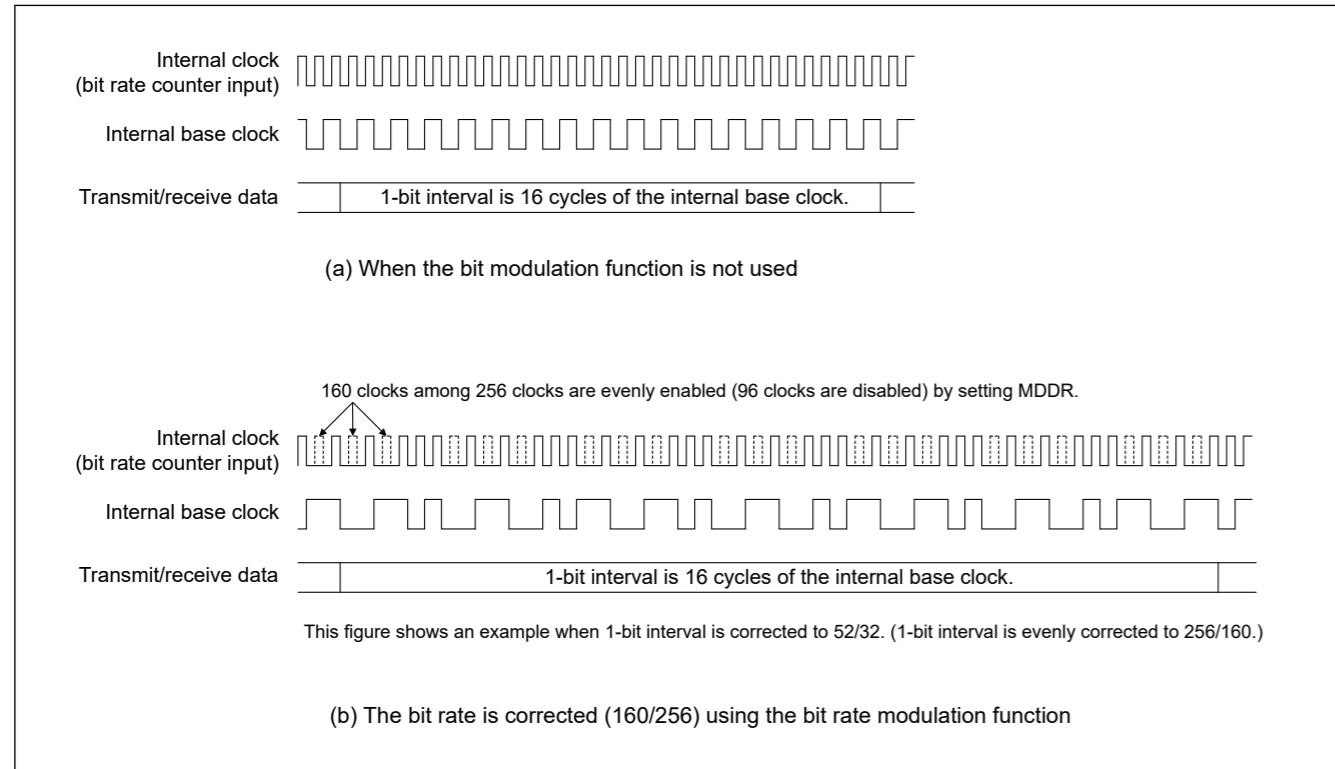

Figure 27.100 Example internal base clock when bit rate modulation function is used

## 27.11 Extended Serial Mode Control Section: Description of Operation

### 27.11.1 Serial Transfer Protocol

In conjunction with the SCIG module, the extended serial mode control section of the SCIH module can realize the serial transfer protocol composed of Start Frames and Information Frames that is shown in Figure 27.101.

A Start Frame is composed of a Break Field, Control Field 0, and Control Field 1. An Information Frame is composed of a number of Data Fields, a CRC16 Upper Field, and a CRC16 Lower Field.

图27.100显示了一个示例，其中在SMRSMR\_SMCI的CKS[1:0]位中选择PCLK，BRR位设置为0，异步模式下MDDR设置为160。在这个例子中，基本时钟的周期被均匀地校正（256/160）并且比特率也被校正（160/256）。

Note: 启用内部时钟会导致偏差，并且会在内部基本时钟的脉冲宽度中产生扩展和收缩。

不要在时钟同步模式和简单SPI模式的最高速度设置（SMR.CKS[1:0]=00b，SCR.CKE[1]=0和BRR=0）中使用此功能。

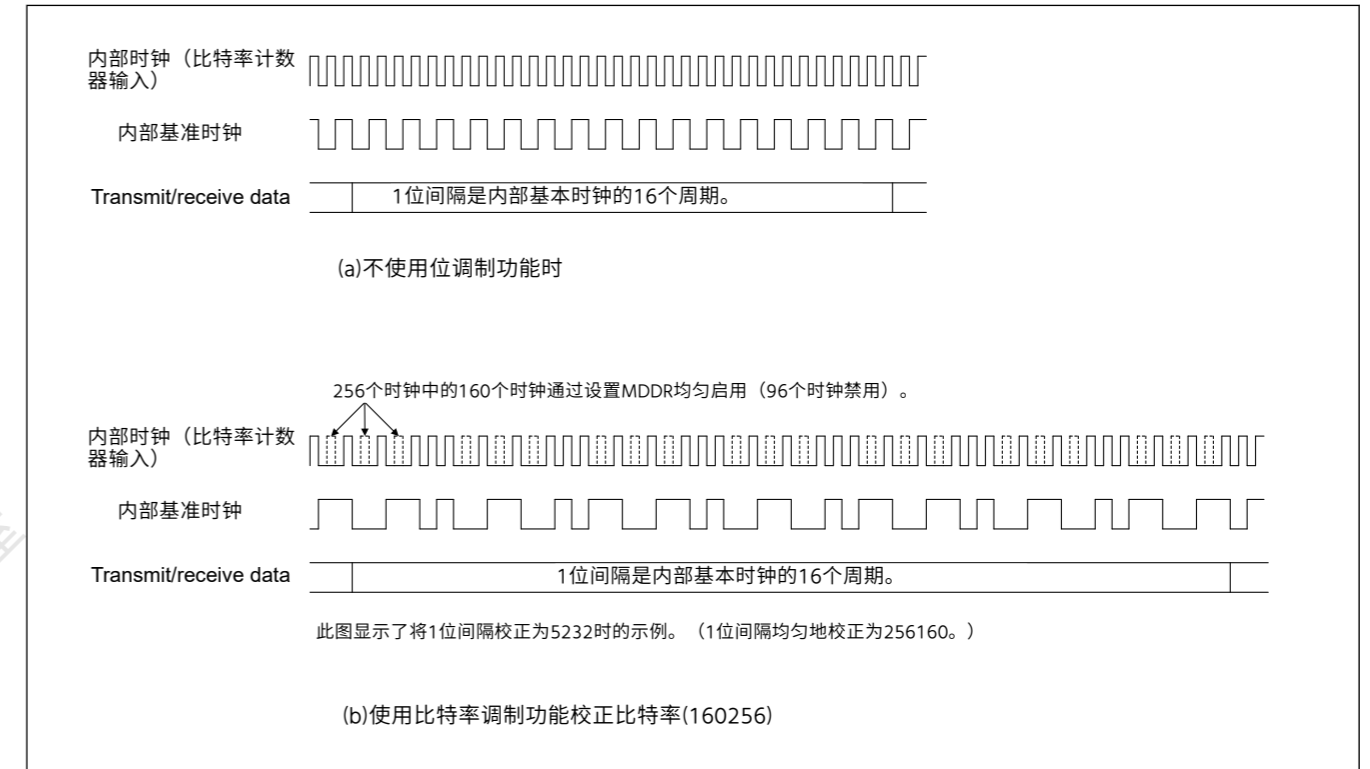

图27.100使用比特率调制功能时的内部基准时钟示例

## 27.11 扩展串行模式控制部分：操作说明

### 27.11.1 串行传输协议

结合SCIG模块，SCIH模块的扩展串行模式控制部分可以实现由StartFrames和信息帧组成的串行传输协议，如图27.101所示。

起始帧由中断字段、控制字段0和控制字段1组成。信息帧由多个数据字段、CRC16上字段和CRC16下字段组成。

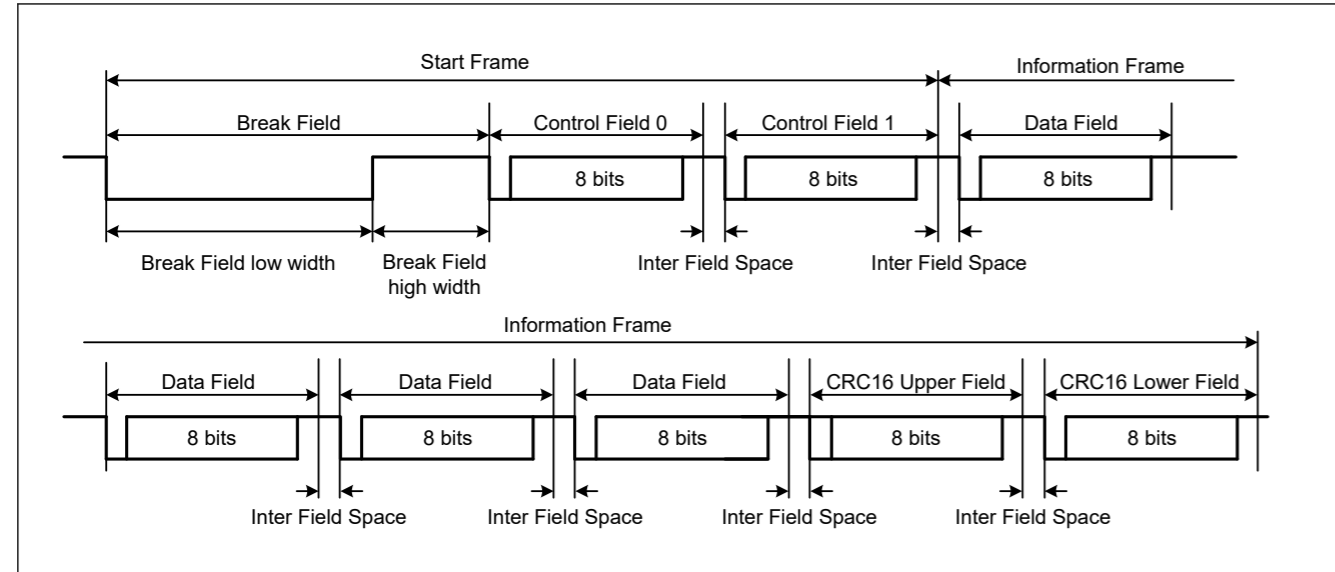

Figure 27.101 Protocol for Serial Transfer by the Extended Serial Mode Control Section

### 27.11.2 Transmitting a Start Frame

Figure 27.102 shows an example of operations to transmit a Start Frame, which is composed of the Break Field low width, Control Field 0, and Control Field 1. Figure 27.103 and Figure 27.104 are flowcharts for the transmission of a Start Frame.

Operations when the extended serial mode control section is to be used to transmit a Start Frame are as listed below. Be sure to use the SCIn (n = 1, 2) in asynchronous mode.

1. With Break Field low width output mode as the operating mode for the timer, writing 1 to the TCR.TCST bit starts counting by the timer, and the low level will be output from the TXDXn (n = 1, 2) pin over the period corresponding to registers TCNT and TPRE settings.
2. The output on the TXDXn pin is inverted when the timer counter underflows, and the STR.BFDF flag is set to 1. An SCIX0 interrupt is also generated if the value of the ICR.BFDIE bit is 1.
3. Write 0 to the TCR.TCST bit to stop counting by the timer, and send the data for Control Field 0 by using SCIn. After the Break Field low width output, stop counting before the next underflow occurs.
4. When the data for Control Field 0 have been transmitted, send the data for Control Field 1.
5. When the data for Control Field 1 have been transmitted, send an Information Frame.

Omit the Break Field and Control Field 0 to suit the structure of the Start Frame.

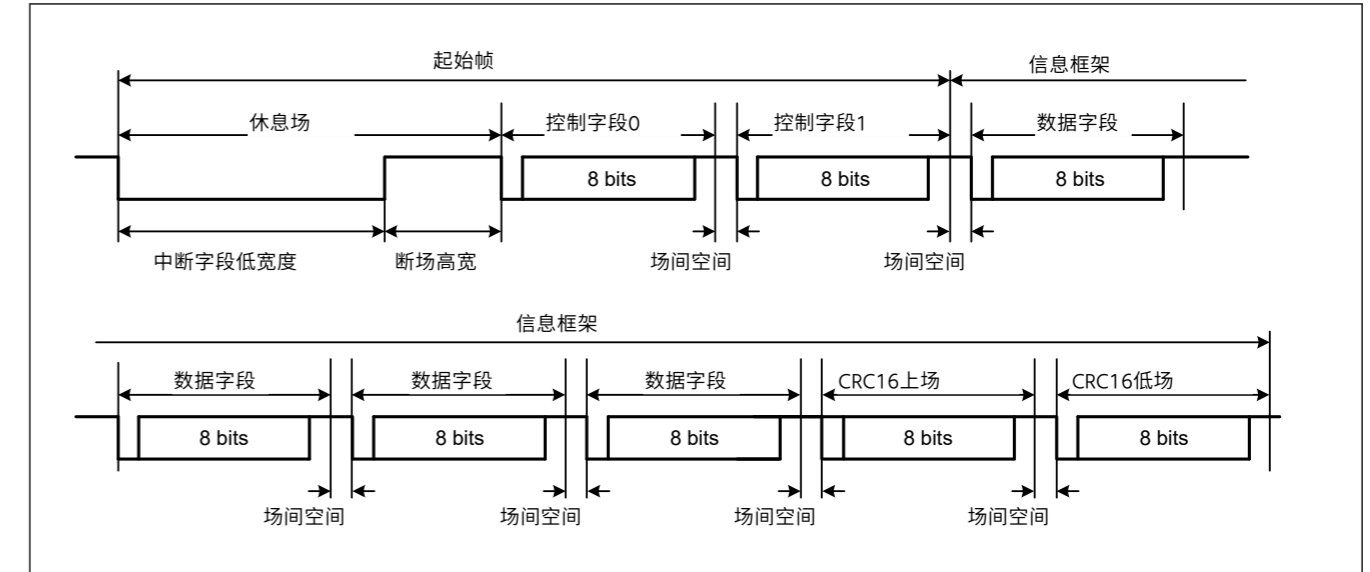

图27.101扩展串行模式控制部分的串行传输协议

### 27.11.2 发送起始帧

图27.102显示了发送起始帧的操作示例，起始帧由中断字段低宽度、控制字段0和控制字段1组成。图27.103和图27.104是发送起始帧的流程图。

使用扩展串行模式控制部分发送起始帧时的操作如下所列。请务必在异步模式下使用SCIn(n=1, 2)。

- 1.以中断场低宽度输出模式作为定时器的工作模式，开始向TCR.TCST位写入1  
通过定时器计数，在对应于寄存器TCNT和TPRE设置的周期内，低电平将从TXDXn(n=1, 2)引脚输出。
- 2.当定时器计数器下溢时，TXDXn引脚的输出反相，STR.BFDF标志设置为1。如果ICR.BFDIE位的值为1，也会产生SCIX0中断。
- 3.将0写入TCR.TCST位以停止定时器计数，并使用SCIn发送控制字段0的数据。在BreakField低宽度输出之后，在下次下溢发生之前停止计数。
- 4.当控制字段0的数据传输完毕后，发送控制字段1的数据。
- 5.当控制字段1的数据传输完毕后，发送一个信息帧。

省略BreakField和控制Field0以适应起始帧的结构。

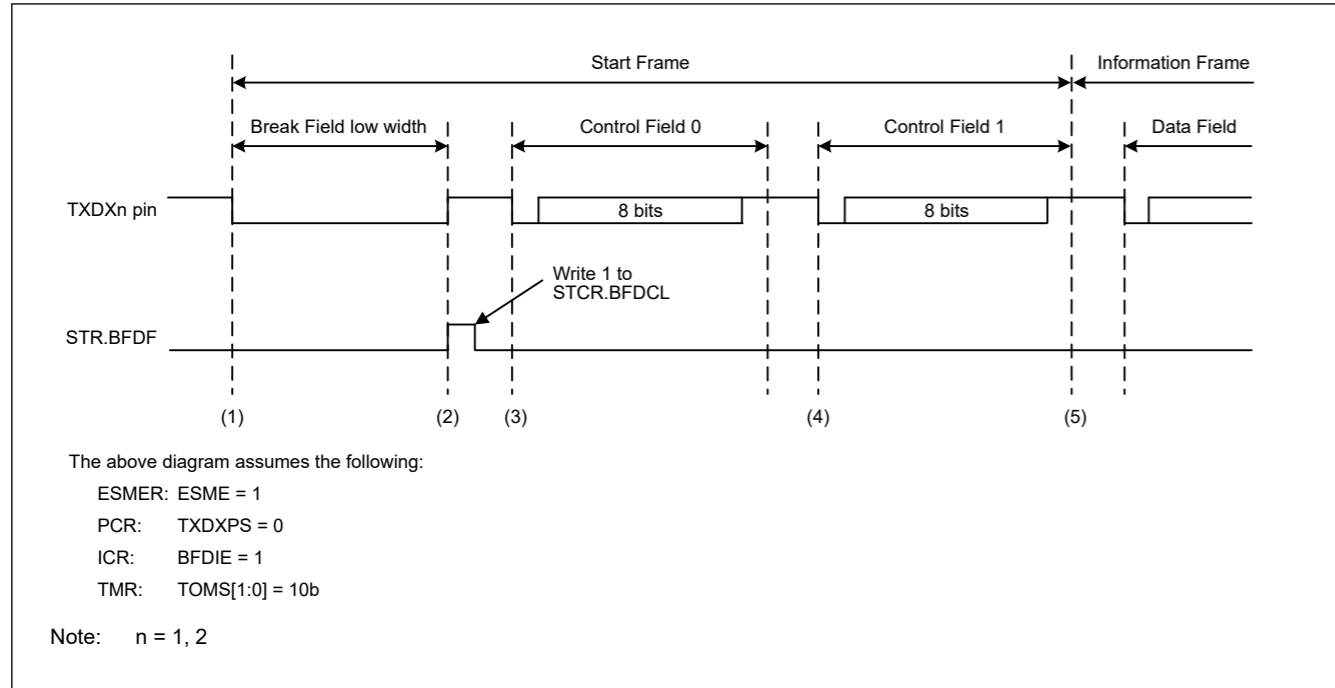

Figure 27.102 Example of Operations When Transmitting a Start Frame

图27.103起始帧传输示例(1/2)

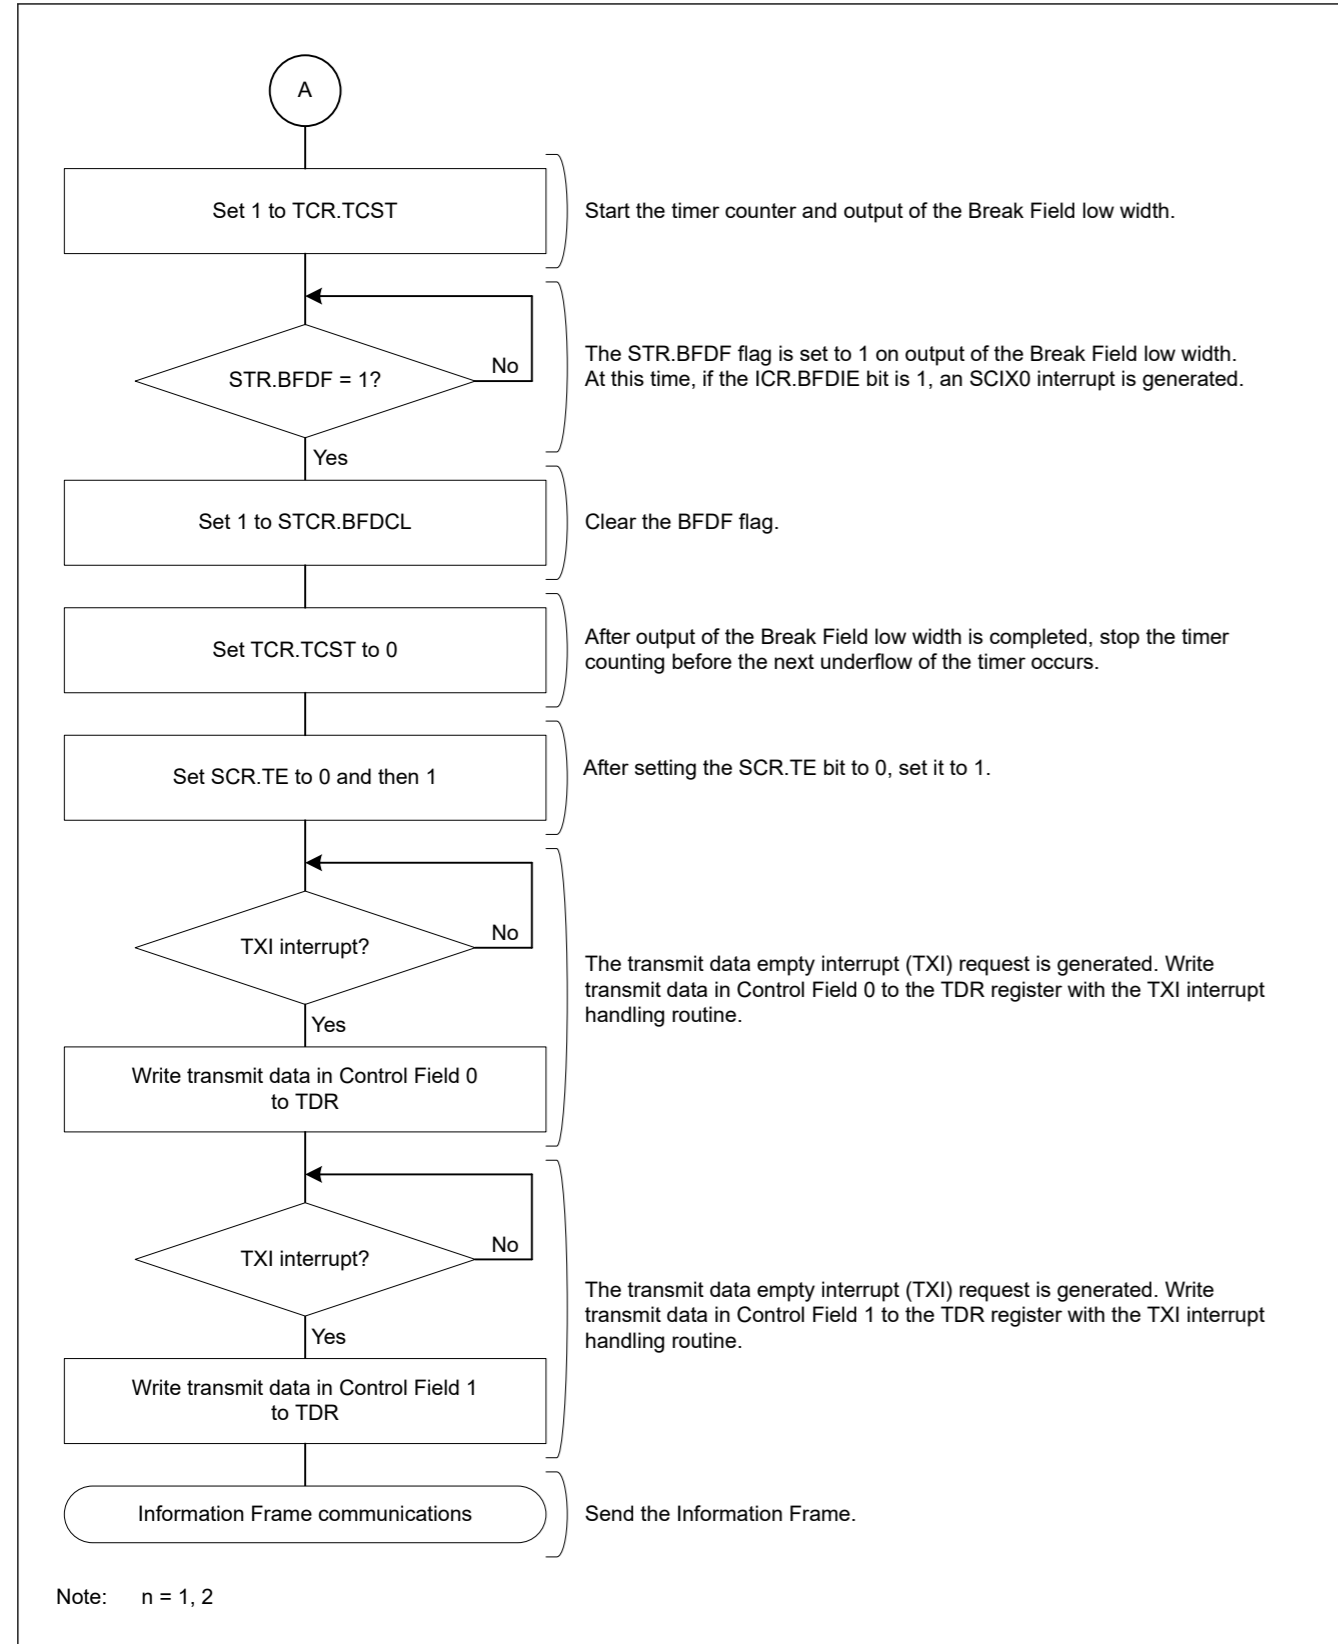

Figure 27.104 Example of Start Frame Transmission (2/2)

27.11.3 Receiving a Start Frame

The extended serial mode control section is capable of receiving Start Frames with the structures listed in Figure 27.105.

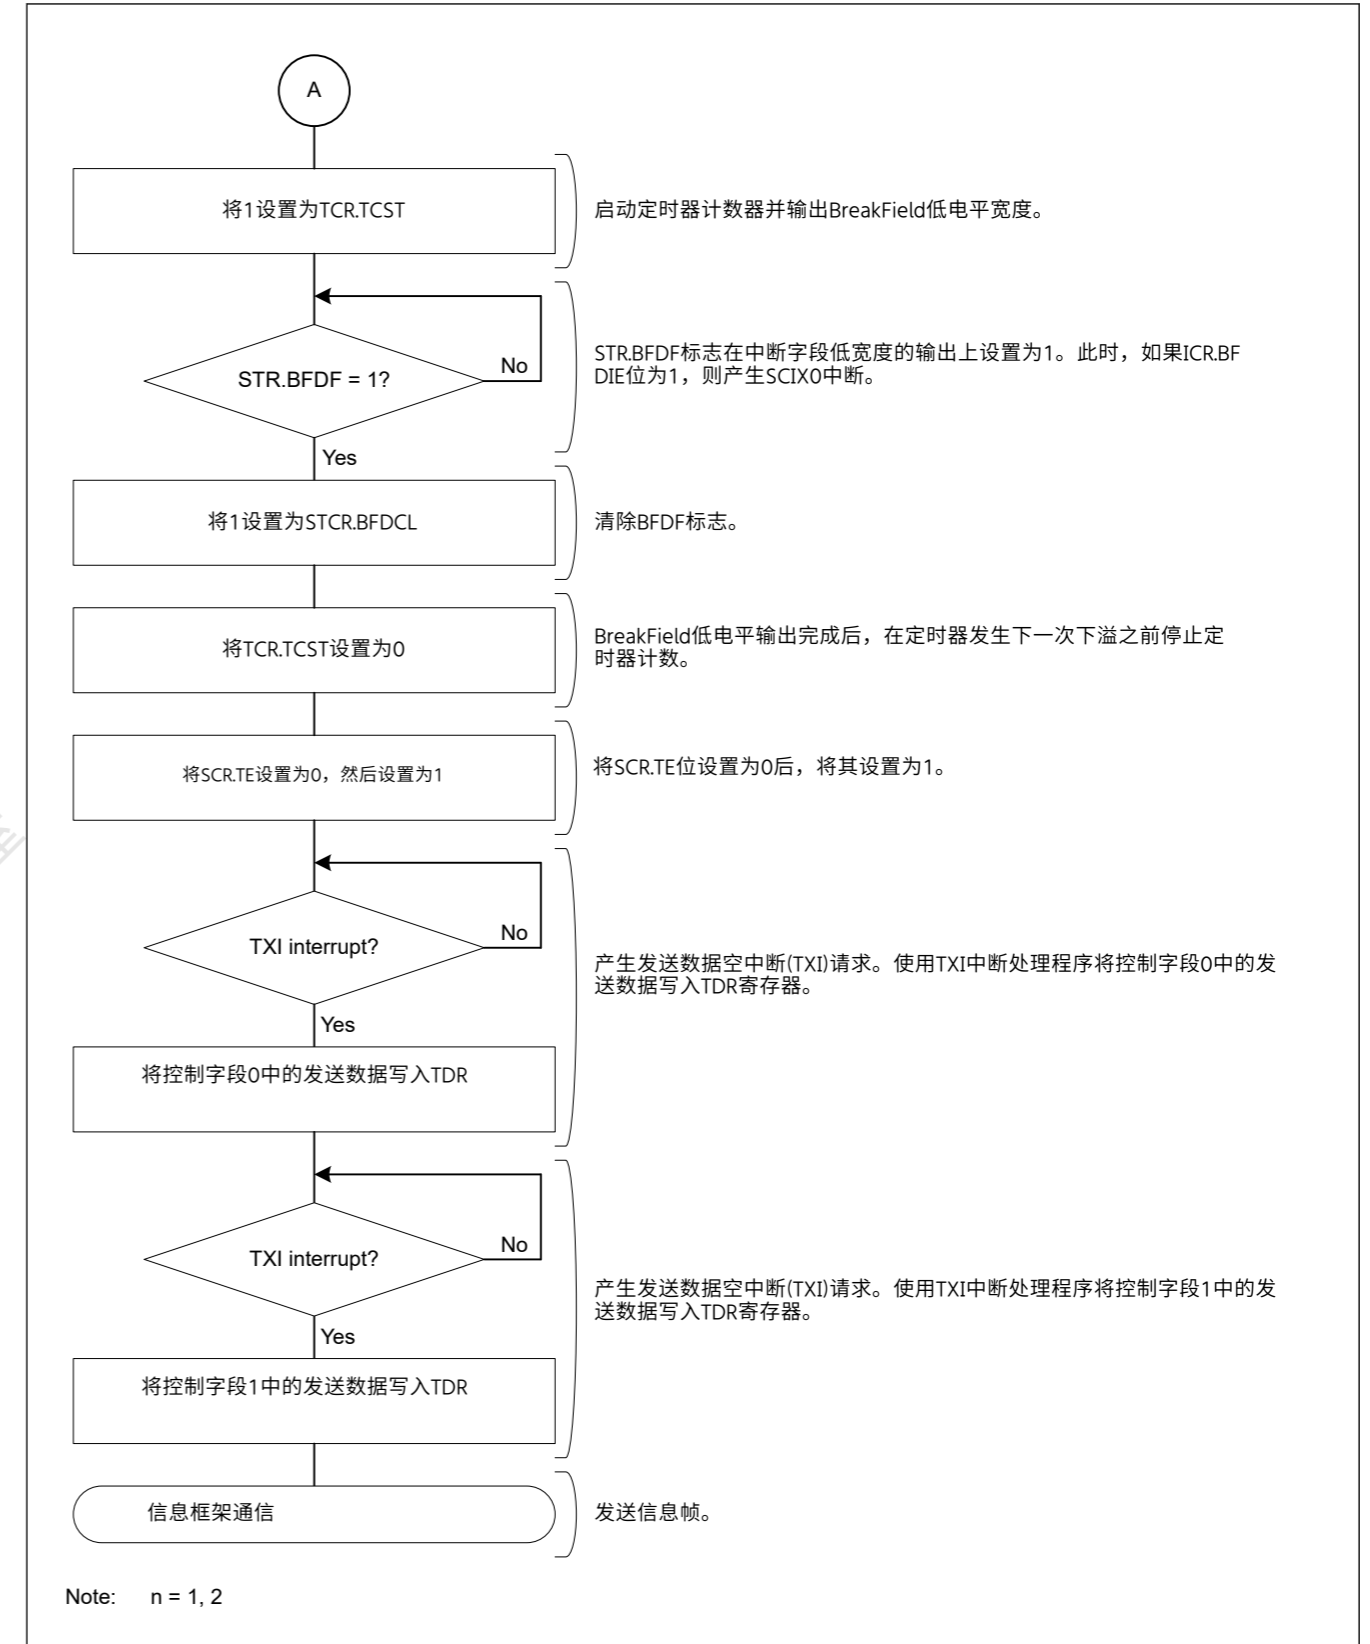

图27.104起始帧传输示例(2/2)

27.11.3 接收起始帧

扩展串行模式控制部分能够接收具有图27.105中列出的结构的起始帧。

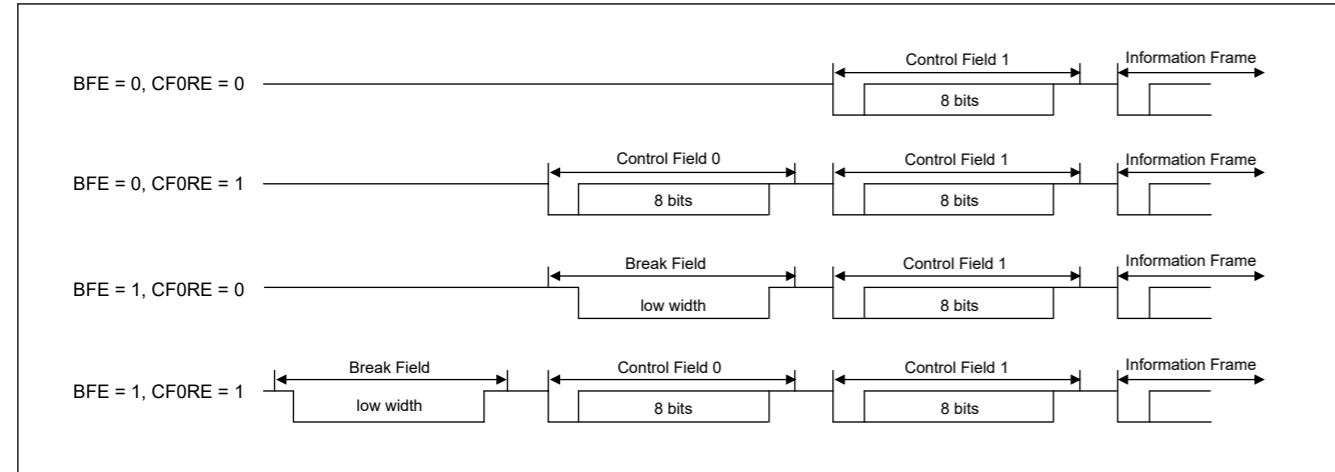

Figure 27.105 Structures of Start Frames

Figure 27.106 shows an example of operations to receive a Start Frame, which is composed of the Break Field low width, Control Field 0, and Control Field 1. Figure 27.107 and Figure 27.108 are flowcharts for the reception of a Start Frame, and Figure 27.109 is a state transition diagram for the extended serial mode control section.

Operations when the extended serial mode control section is to be used to receive a Start Frame are as listed below. Be sure to use the SCIn (n = 1, 2) in asynchronous mode.

1. With Break Field low width detection mode as the operating mode for the timer, writing 1 to the CR3.SDST bit enables detection of the Break Field low width. RXDXn input to the SCIn is disabled at this time.
2. Low-level input on the RXDXn pin continuing over a period longer than that corresponding to the settings of registers TCNT and TPRES is detected as the Break Field low width. At this time, the STR.BFDF flag is set to 1. An SCIX0 interrupt is also generated if the value of the ICR.BFDIE bit is 1.
3. When the input from the RXDXn pin goes high after the Break Field low width, the CR0.RXDSF flag becomes 0 and reception of Control Field 0 by the SCIn starts.
4. If the data received in Control Field 0 match the data set in the CF0DR register, the STR.CF0MF flag is set to 1. An SCIX1 interrupt is also generated if the value of the ICR.CF0MIE bit is 1. Reception of Control Field 1 by the SCIn starts after that. If the data received in Control Field 0 do not match the data set in the CF0DR register, a transition to the state prior to Break Field low width detection proceeds.
5. If the data received in Control Field 1 match the data set in registers PCF1DR and SCF1DR, the STR.CF1MF flag is set to 1. An SCIX1 interrupt is also generated if the value of the ICR.CF1MIE bit is 1. Transfer of the Information Frame by the SCIn starts after that. If the data received in Control Field 1 do not match the data set in either or both of registers PCF1DR and SCF1DR, a transition to the state prior to Break Field low width detection proceeds.

Omit the Break Field and Control Field 0 to suit the structure of the Start Frame.

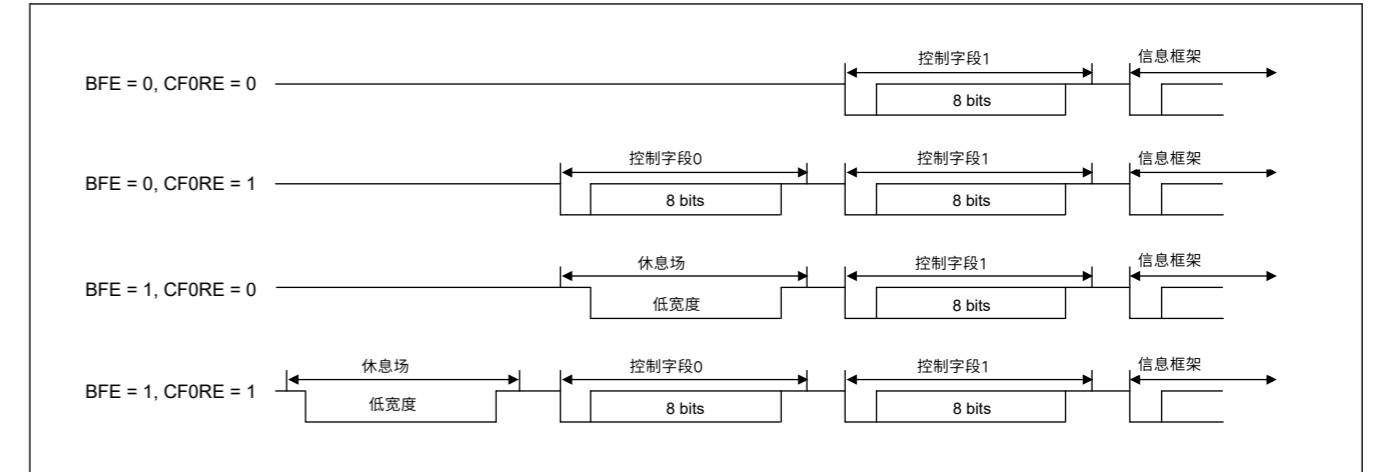

图27.105起始帧的结构

图27.106显示了接收起始帧的操作示例，起始帧由中断字段低宽度组成，控制字段0和控制字段1。图27.107和图27.108是接收起始帧的流程图，以及图27.109是扩展串行模式控制部分的状态转换图。

使用扩展串行模式控制部分接收起始帧时的操作如下所列。请务必在异步模式下使用SCIn(n=1, 2)。

- 1.使用间隔场低宽度检测模式作为定时器的操作模式，向CR3.SDST位写入1可启用间隔场低宽度检测。此时SCIn的RXDXn输入被禁用。
- 2.RXDXn引脚上的低电平输入持续时间长于对应寄存器TCNT和TPRES的设置的时间被检测为中断场低电平宽度。此时，STR.BFDF标志置1。如果ICR.BFDIE位的值为1，也会产生SCIX0中断。
- 3.当来自RXDXn引脚的输入在BreakField低电平宽度之后变为高电平时，CR0.RXDSF标志变为0，并且SCIn开始接收ControlField0。
- 4.如果控制域0中接收的数据与CF0DR寄存器中设置的数据匹配，则STR.CF0MF标志设置为1。如果ICR.CF0MIE位的值为1，也会产生SCIX1中断。接收控制SCIn的字段1在那之后开始。如果在控制字段0中接收到的数据与CF0DR寄存器中设置的数据不匹配，则转换到中断字段低宽度检测之前的状态。
- 5.如果控制字段1中接收的数据与寄存器PCF1DR和SCF1DR中设置的数据匹配，则STR.CF1MF标志设置为1。如果ICR.CF1MIE位的值为1，也会产生SCIX1中断。SCIn的信息帧在此之后开始。如果在控制字段1中接收到的数据与寄存器PCF1DR和SCF1DR中的一个或两个中设置的数据不匹配，则转换到中断字段低宽度检测之前的状态。

省略BreakField和ControlField0以适应起始帧的结构。

图27.108接收起始帧的示例流程图(2)

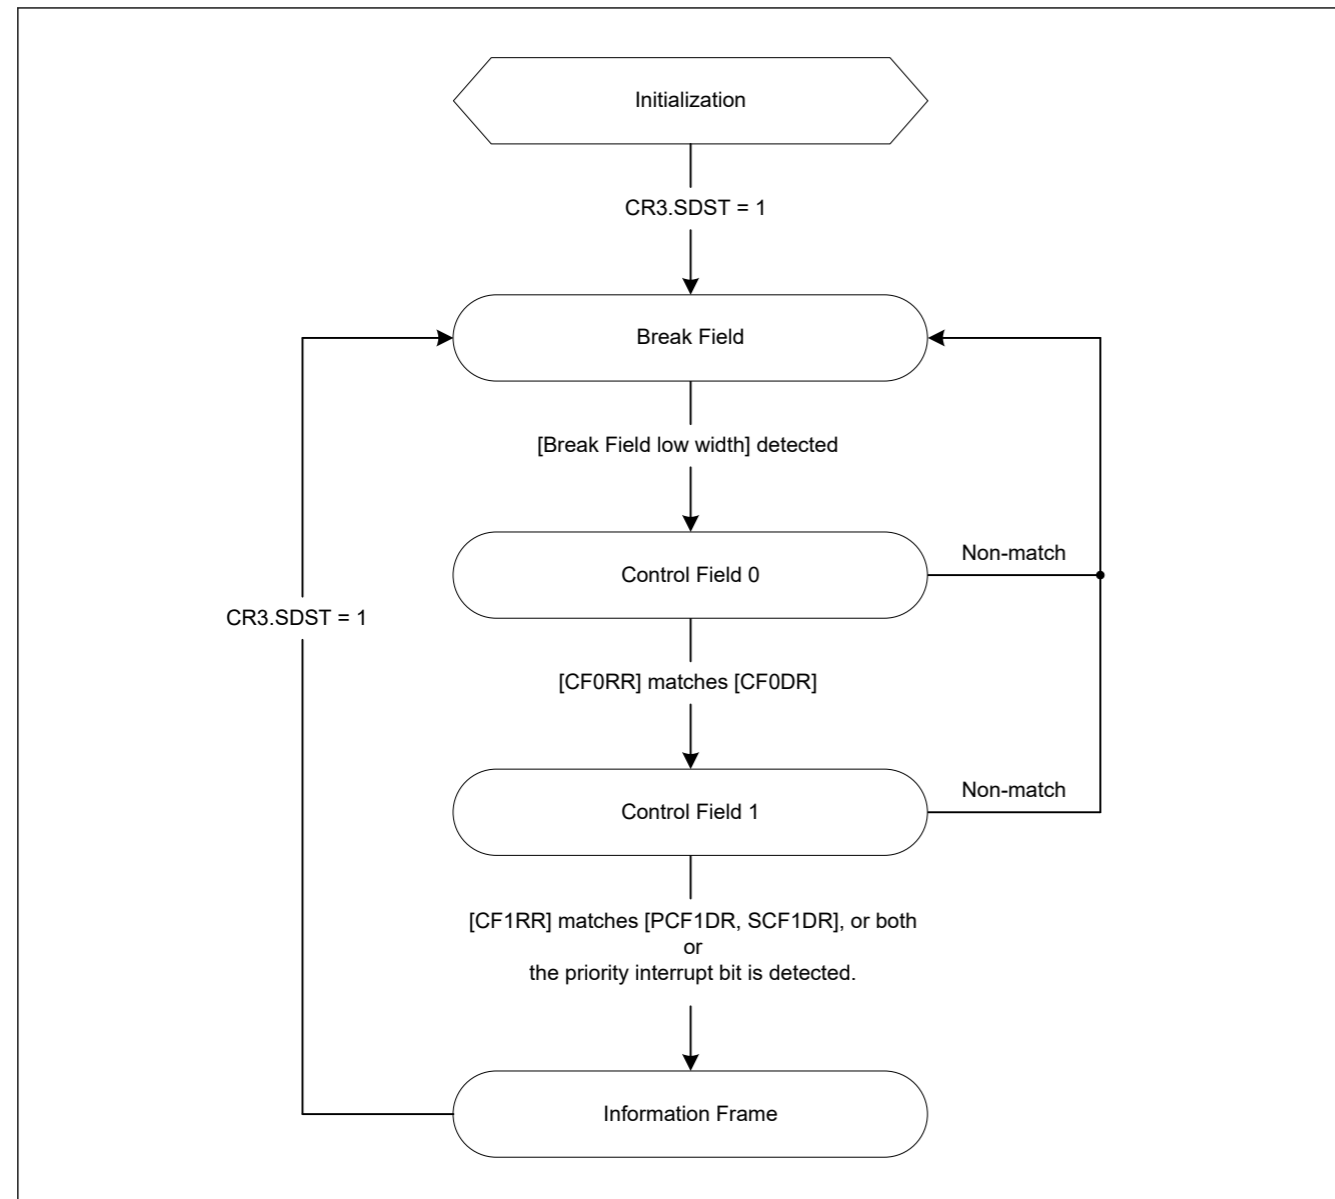

Figure 27.109 State Transitions When Receiving a Start Frame

### 27.11.3.1 Priority Interrupt Bit

Figure 27.110 shows an example of operation in Start Frame reception where a priority interrupt bit is in use. Setting the CR1.PIBDF bit to 1 enables the use of a priority interrupt bit.

Operations of the extended serial mode control section in start Frame reception where a priority interrupt bit is in use are as described below.

Steps (1) to (4) are the same as in Figure 27.106, for Start Frame reception.

(5) If the value of the bit selected by the CR1.PIBS[2:0] bits matches the corresponding bit in the PCF1DR register, the STR.PIBDF flag is set to 1. An SCIX1 interrupt is also generated if the value of the ICR.PIBDIE bit is 1. Transfer of the Information Frame by the SCIn (n = 1, 2) starts after that. If the data received in Control Field 1 do not match the data set in either or both of registers PCF1DR and SCF1DR and the priority interrupt bit is not detected, a transition to the state prior to Break Field low width detection proceeds.

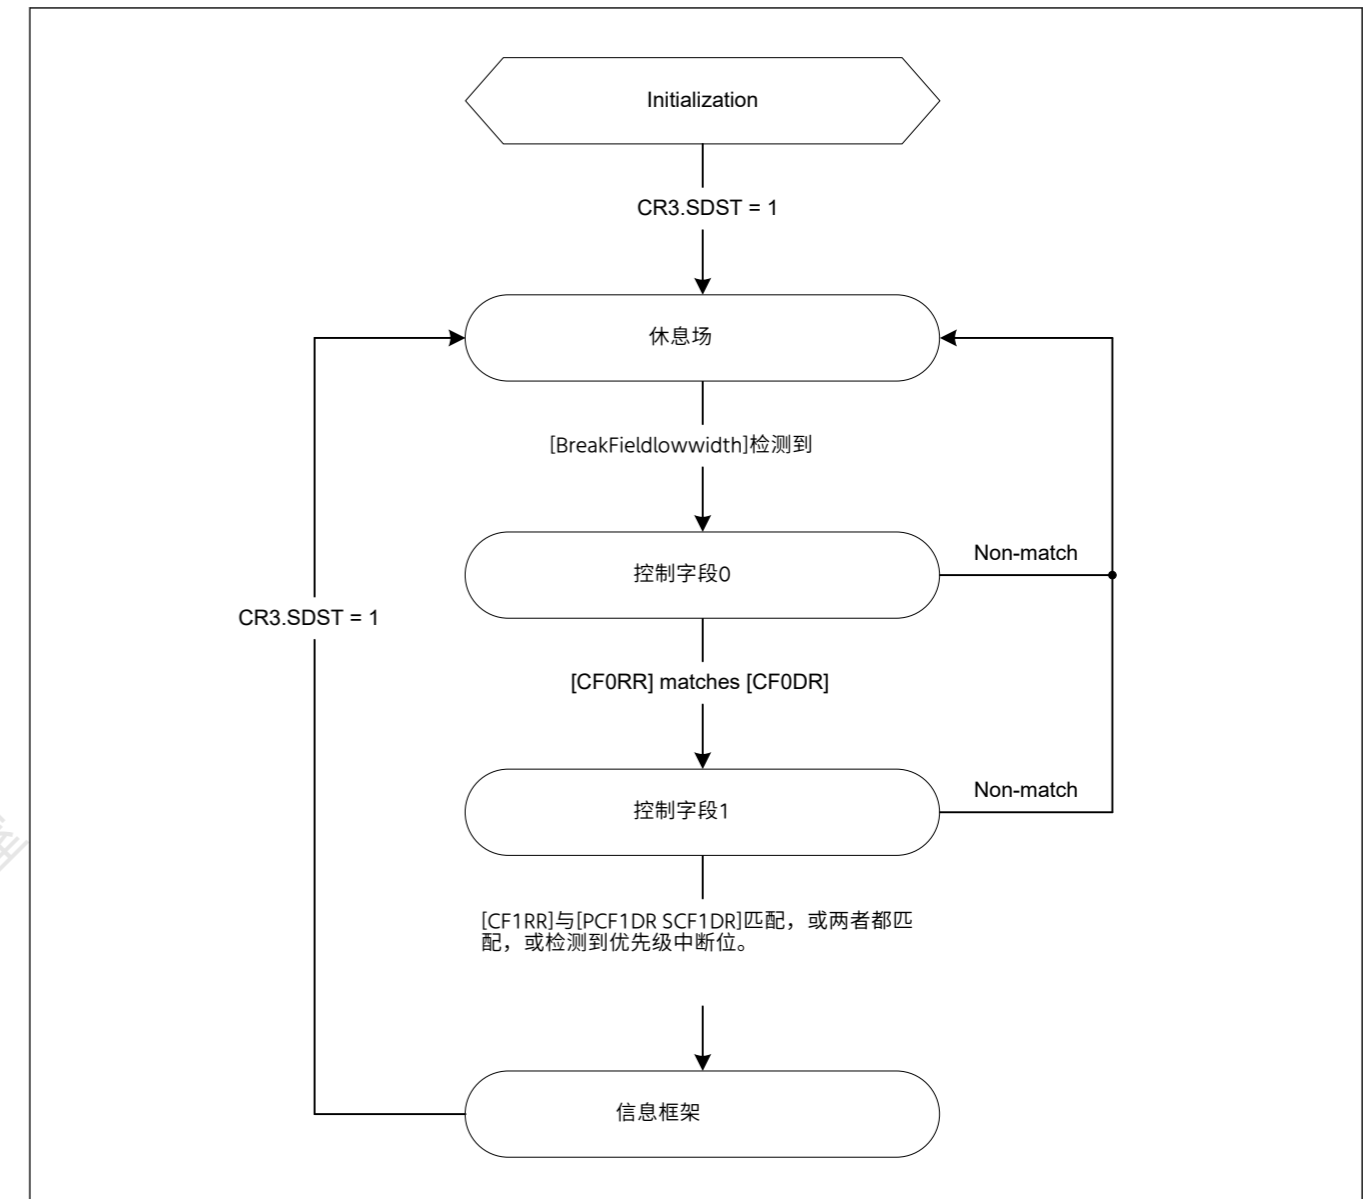

图27.109接收起始帧时的状态转换

### 27.11.3.1 优先中断位

图27.110显示了使用优先中断位的起始帧接收操作示例。设置CR1.PIBDF位为1启用优先级中断位。

在使用优先中断位的开始帧接收中扩展串行模式控制部分的操作如下所述。

步骤(1)到(4)与图27.106中的相同，用于接收起始帧。

(5)如果CR1.PIBS[2:0]位选择的位的值与PCF1DR寄存器中的相应位相匹配，则STR.PIBDF标志设置为1。如果ICR.PIBDIE位为1。

SCIn(n=1, 2)的信息帧在此之后开始。如果在控制字段1中接收的数据与寄存器PCF1DR和SCF1DR中的一个或两个中设置的数据不匹配，并且未检测到优先级中断位，则转换到中断字段低宽度检测之前的状态。

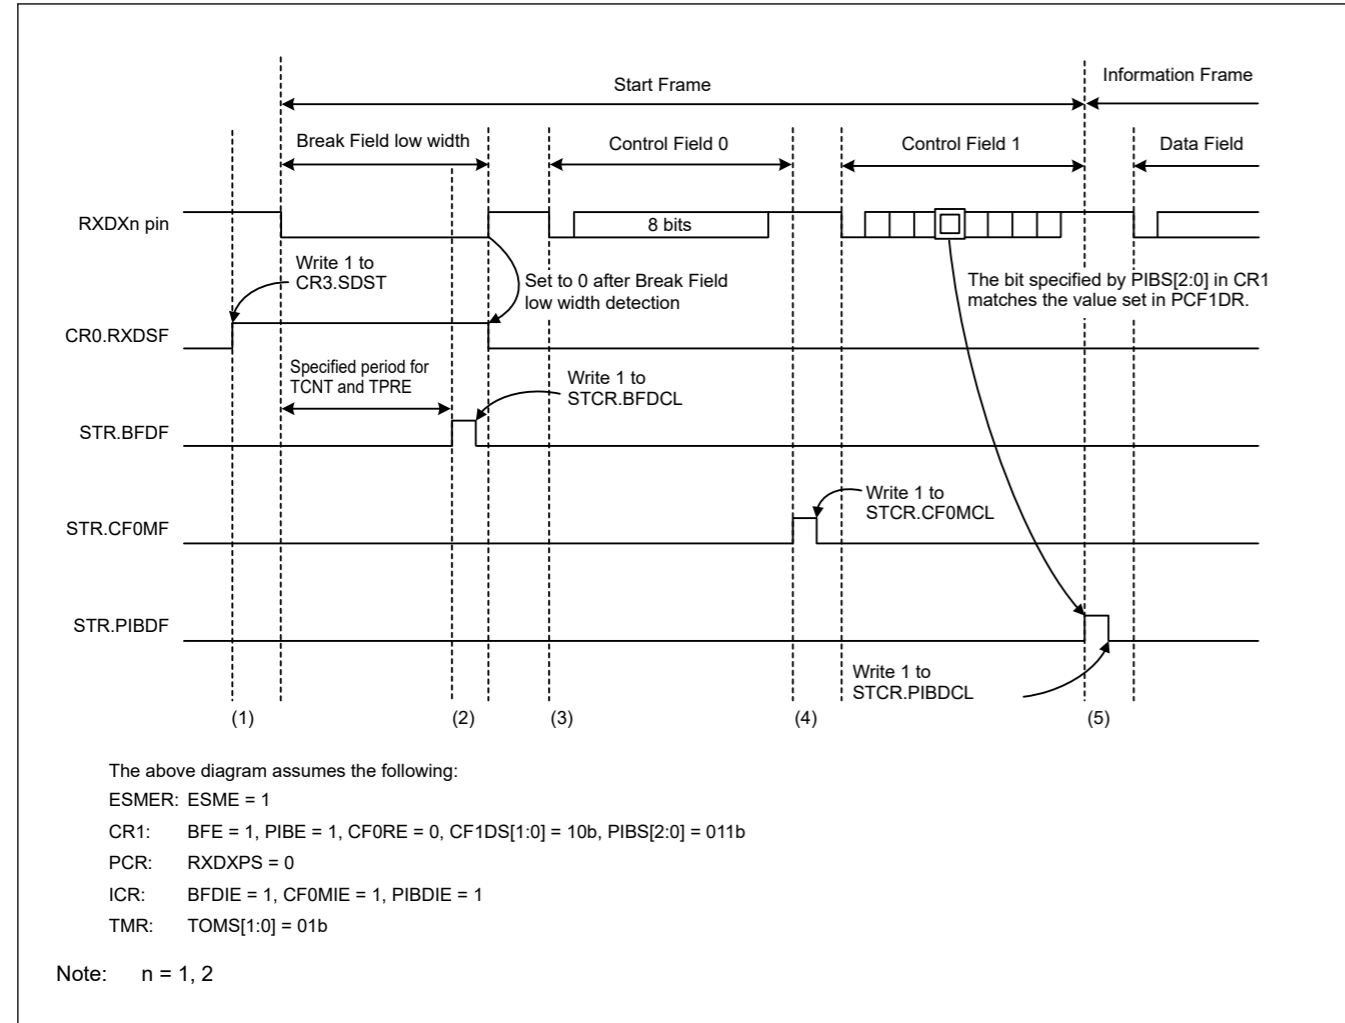

Figure 27.110 Example of Operations When Receiving a Start Frame While the CR1.PIBE Bit is 1

### 27.11.4 Detection of Bus Collisions

Detection of bus collisions operate for cases where output of the Break Field low width and transmission of data by the SCIn (n = 1, 2) are in progress when the ESMER.ESME bit and the SCIn.SCI.TE bit are set to 1.

Figure 27.111 shows an example of operations with bus collision detection. Signals output through TXDXn and input through RXDXn are sampled with the bus collision detection clock set with the CR2.BCCS[1:0] bits as the sampling clock, and the STR.BCDF flag is set to 1 if the signals fail to match three times in a row. An SCIX2 interrupt is also generated if the value of the ICR.BCDIE bit is 1.

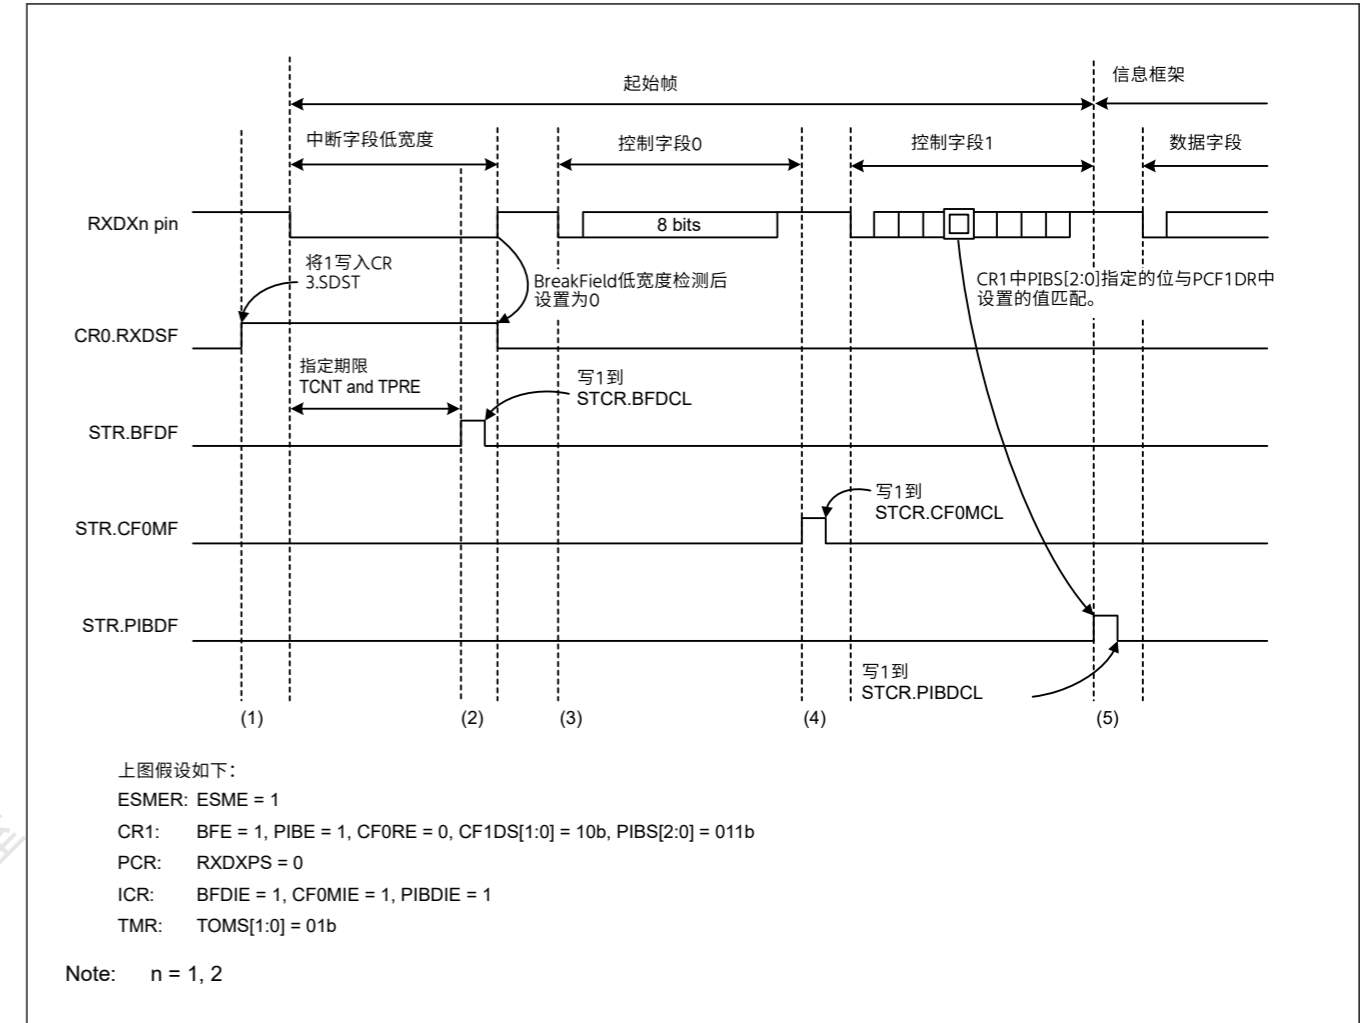

图27.110 CR1.PIBE位为1时接收起始帧时的操作示例

### 27.11.4 总线碰撞检测

总线冲突检测适用于中断字段低宽度的输出和数据传输的情况当ESMER.ESME位和SCIn.SCI.TE位设置为1时，SCIn(n=1,2)正在进行。

图27.111显示了带有总线冲突检测的操作示例。通过TXDXn输出和通过RXDXn输入的信号以CR2.BCCS[1:0]位设置的总线冲突检测时钟作为采样时钟进行采样，如果信号不匹配三个，则STR.BCDF标志设置为1连续几次。如果ICR.BCDIE位的值为1，也会产生SCIX2中断。

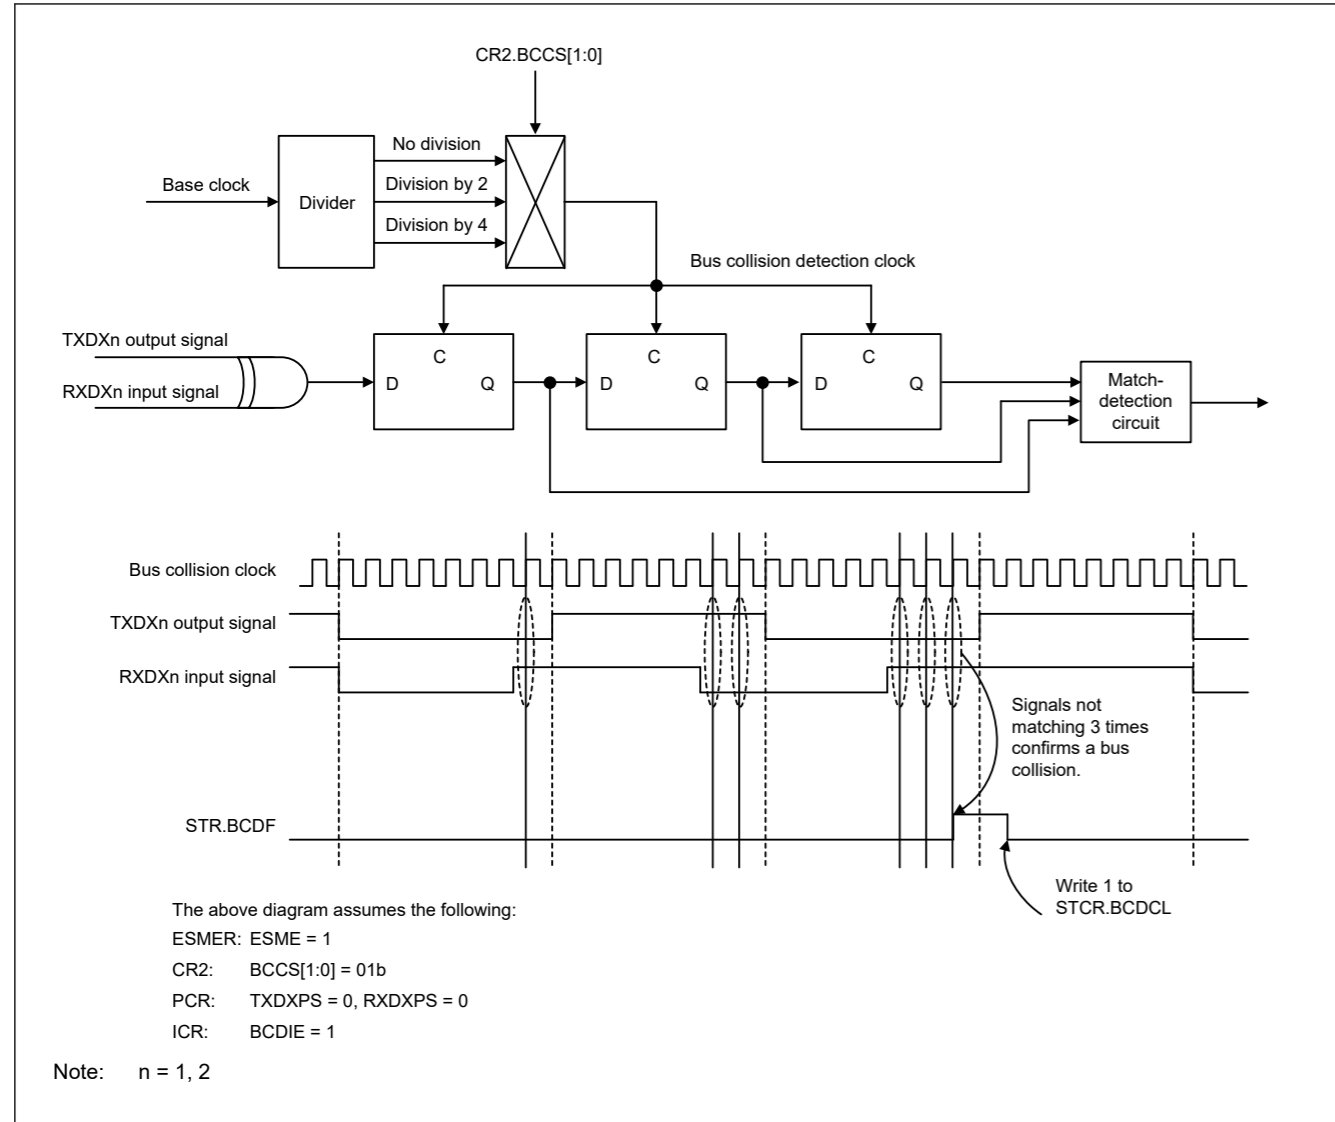

Figure 27.111 Example of Operations with Bus Collision Detection

27.11.5 Digital Filter for Input on the RXDXn (n = 1, 2) Pin

Signals input through the RXDXn pin can be passed through a digital filter before they are conveyed to the internal circuits. The digital filter consists of three flip-flop circuit stages connected in series and a match-detecting circuit. The CR2.DFCS[2:0] bits select the sampling clock for the RXDXn pin input signals. If the outputs of all three latches match, the given level is conveyed to subsequent circuits. If the levels do not match, the previous value is retained. In other words, levels are confirmed as being the signal if they are retained for at least three cycles of the sampling clock but judged to be noise rather than changes in the signal level if they change within three cycles of the sampling clock. Figure 27.112 shows an example of operations with the digital filter.

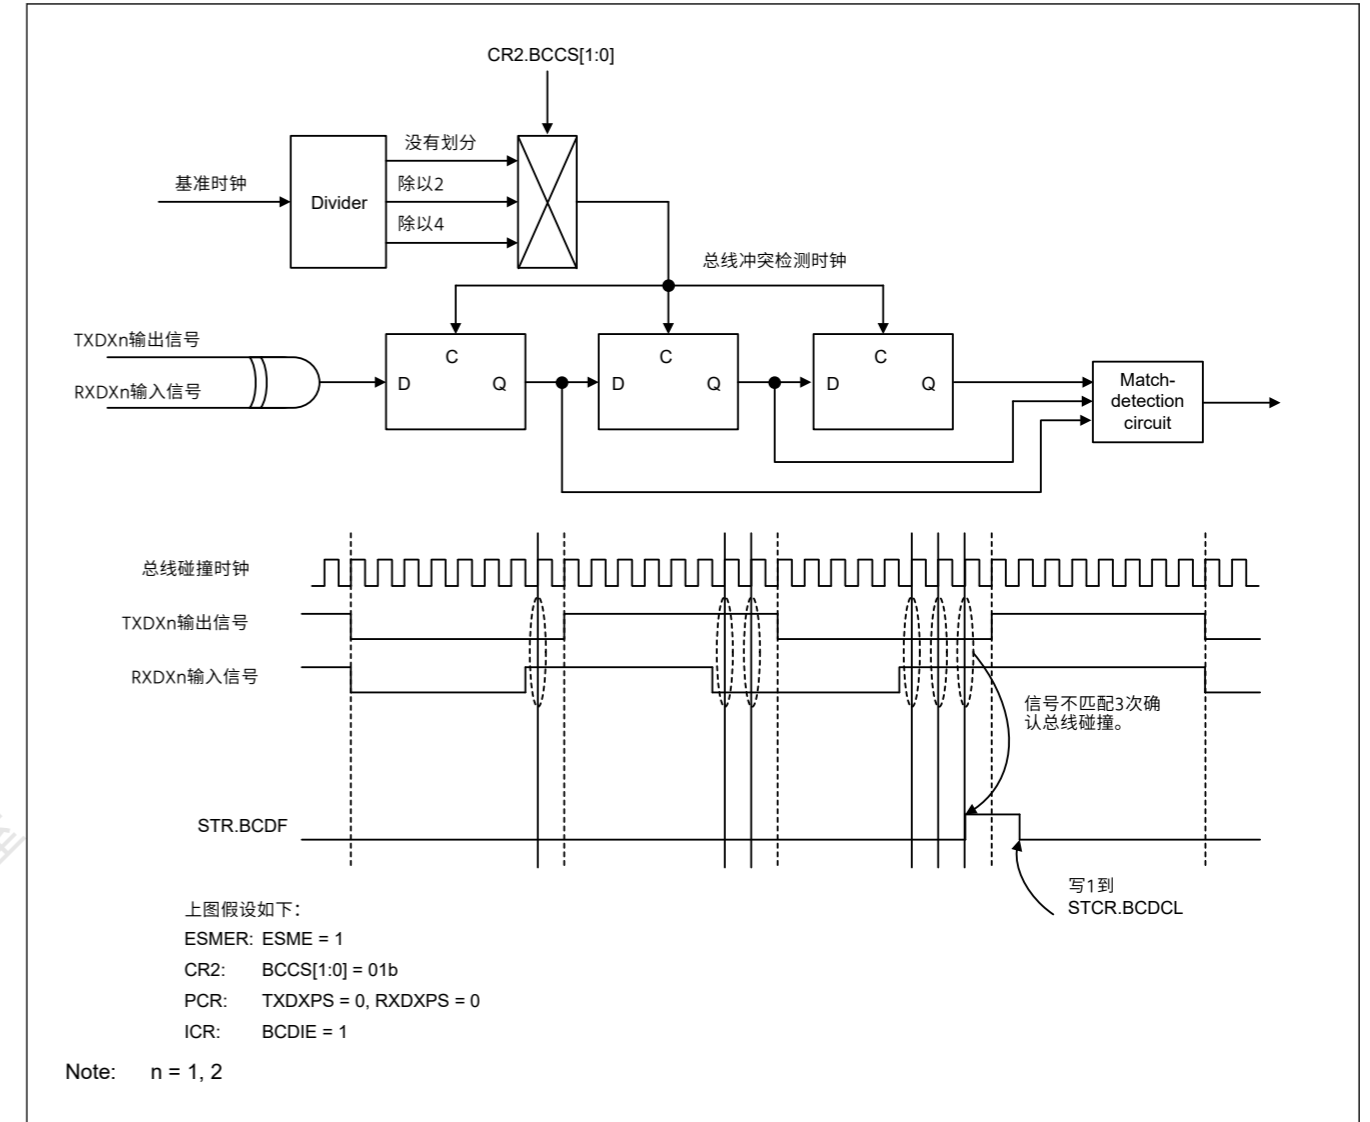

图27.111 带有总线冲突检测的操作示例

27.11.5 RXDXn(n=1 2)引脚上的输入数字滤波器

通过RXDXn引脚输入的信号在传送到内部电路之前可以通过数字滤波器。数字滤波器由三个串联的触发器电路级和一个匹配检测电路组成。这 CR2.DFCS[2:0]位选择RXDXn引脚输入信号的采样时钟。如果所有三个锁存器的输出都匹配，则将给定电平传送到后续电路。如果级别不匹配，则保留先前的值。换言之，如果电平在采样时钟的至少三个周期内保持，则确认电平为信号，但如果在采样时钟的三个周期内变化，则判断为噪声而不是信号电平的变化的。图27.112显示了使用数字滤波器的操作示例。

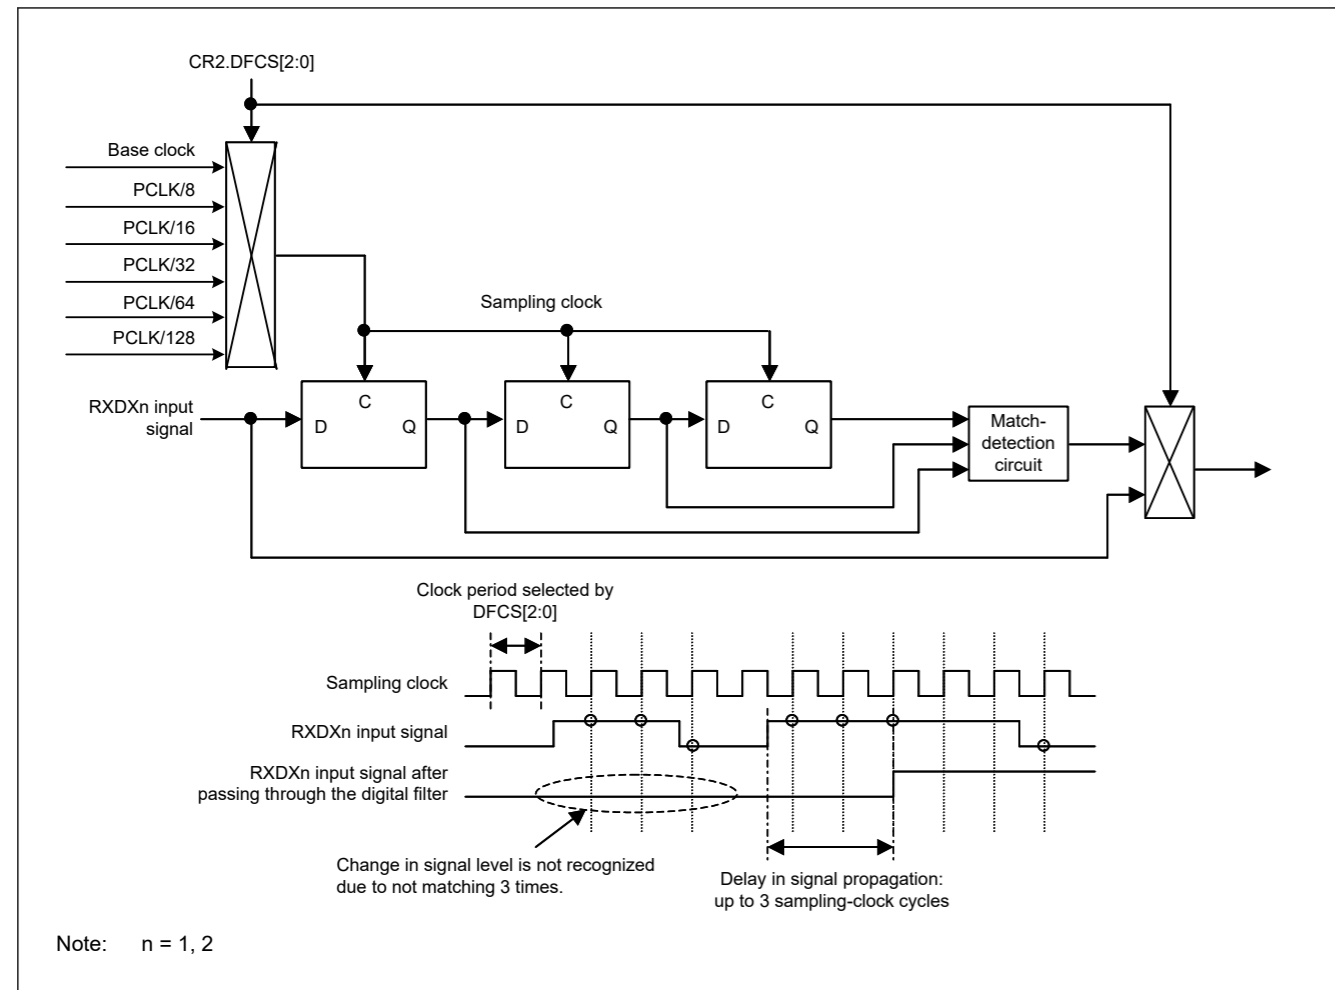

Figure 27.112 Example of Operations with the Digital Filter

### 27.11.6 Bit Rate Measurement

The bit rate measurement function measures the intervals between rising and falling edges and between falling and rising edges of the signal input from the RXDXn (n = 1, 2) pin. Figure 27.113 shows an example of operations for bit rate measurement.

1. Writing 1 to the CR0.BRME bit enables bit rate measurement. Only set the BRME bit to 1 when you wish to proceed with bit rate measurement. Furthermore, bit rate measurement will not proceed during a Break Field, even if the BRME bit is set to 1.
2. After detection of the Break Field low width, bit rate measurement starts when the level input on the RXDXn pin becomes high.
3. Once bit rate measurement has started, counter values from the timer are retained in the read buffers on the input of valid edges from the RXDXn pin (rising and falling edges) and the counter is reloaded. An SCIX3 interrupt is also generated if the value of the ICR.AEDIE bit is 1. Retention by registers TCNT and TPRE is released by reading these registers.
4. The bit rate as calculated from the values counted during intervals between valid edges can be used for adjusting the rate by changing the settings of the SCIn. To disable the bit rate measurement after a match with Control Field 1, write 0 to the CR0.BRME bit.

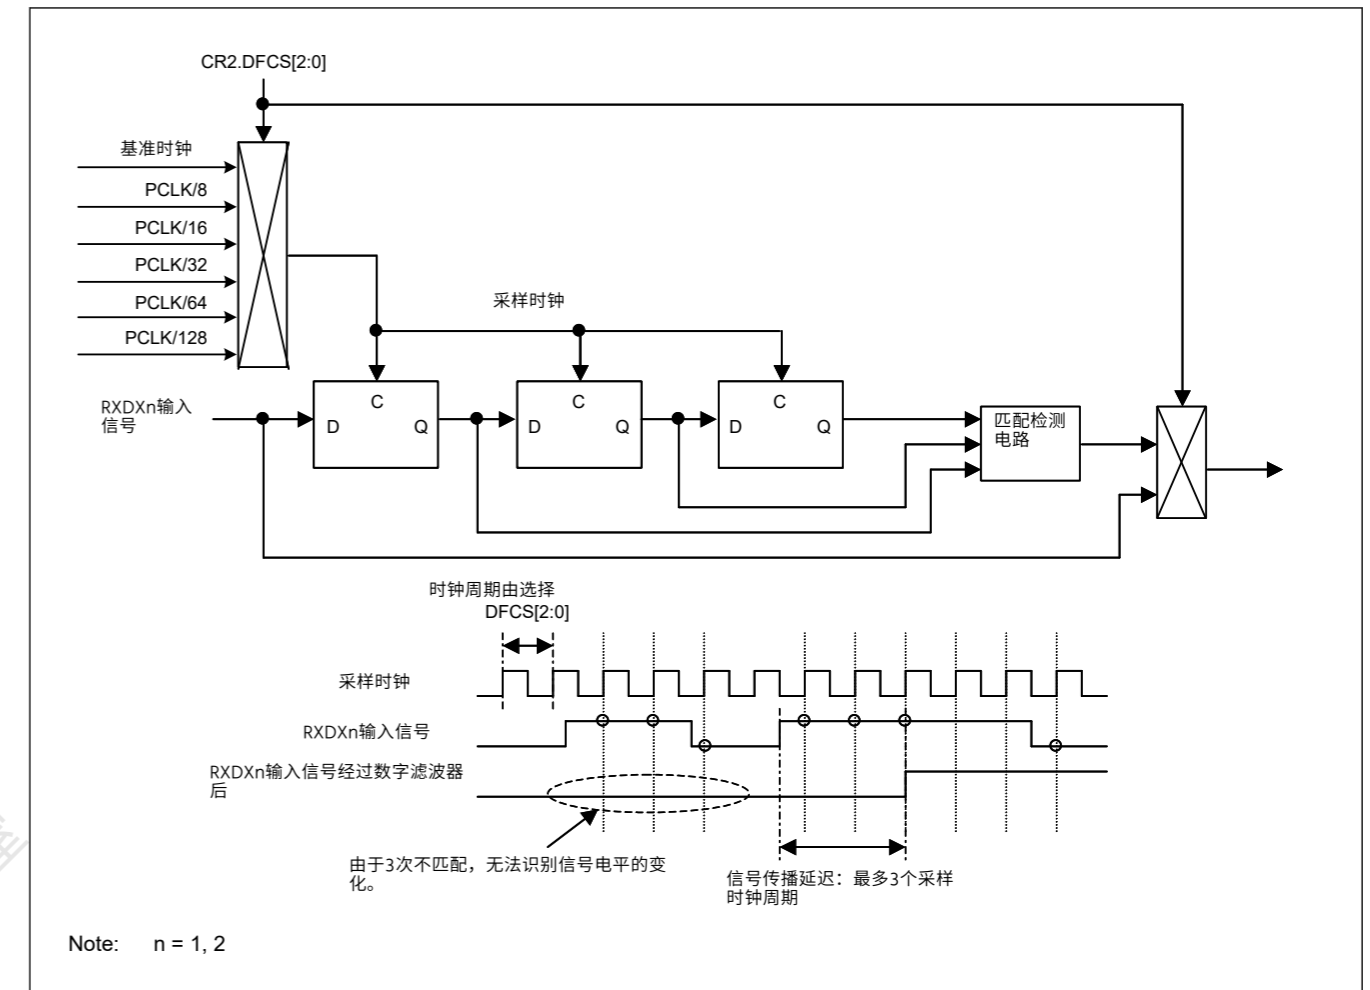

图27.112使用数字滤波器的操作示例

### 27.11.6 比特率测量

比特率测量功能测量从RXDXn(n=1,2)引脚输入的信号的上升沿和下降沿之间以及下降沿和上升沿之间的间隔。图27.113显示了比特率测量的操作示例。

- 1.将1写入CR0.BRME位启用比特率测量。仅当您希望继续进行比特率测量时，才将BRME位设置为1。此外，即使BRME位设置为1，在中断字段期间也不会进行比特率测量。
- 2.检测到BreakField低电平宽度后，当RXDXn引脚上的电平输入变为高电平时开始比特率测量。
- 3.一旦比特率测量开始，来自定时器的计数器值在来自RXDXn引脚的有效边沿（上升沿和下降沿）的输入上保留在读缓冲器中，并且计数器被重新加载。如果ICR.AEDIE位的值为1，也会产生SCIX3中断。寄存器TCNT和TPRE的保留通过读取这些寄存器来释放。
- 4.根据有效边沿之间的间隔期间计数的值计算的比特率可用于通过更改SCIn的设置来调整速率。要在与控制字段1匹配后禁用比特率测量，请将0写入CR0.BRME位。

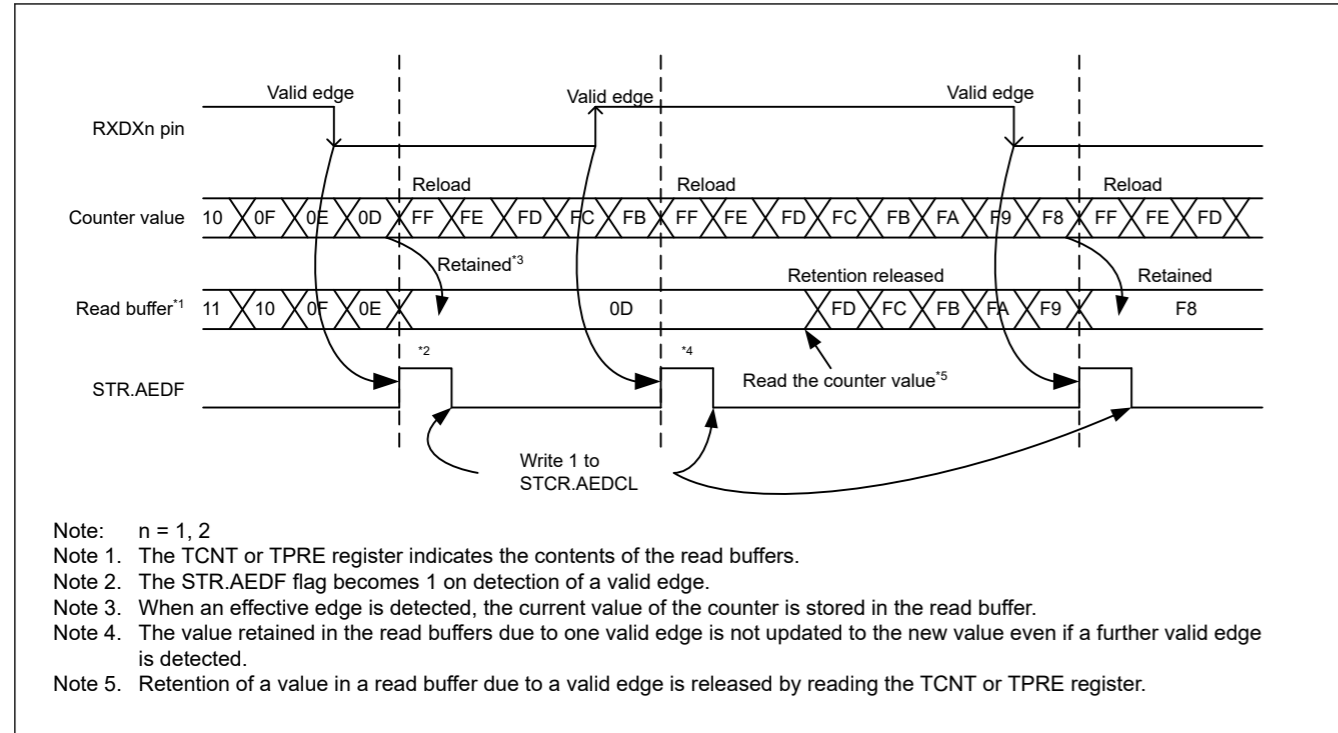

Figure 27.113 Example of Operations for Bit Rate Measurement

### 27.11.7 Selectable Timing for Sampling Data Received through RXDXn (n = 1, 2)

The extended serial mode control section provides a way of adjusting the timing for the sampling of data received through the RXDXn pin of an SCIn by setting the CR2.RTS[1:0] bits to select the rising edges of 8th, 10th, 12th, or 14th cycle of the SCI base clock. If the value of the SEMR.ABCS bit is 1, the bits select the rising edges of 4th, 5th, 6th, or 7th cycle of the PCLK clock of the SCIn. Figure 27.114 shows timing for the sampling of data received through RXDXn.

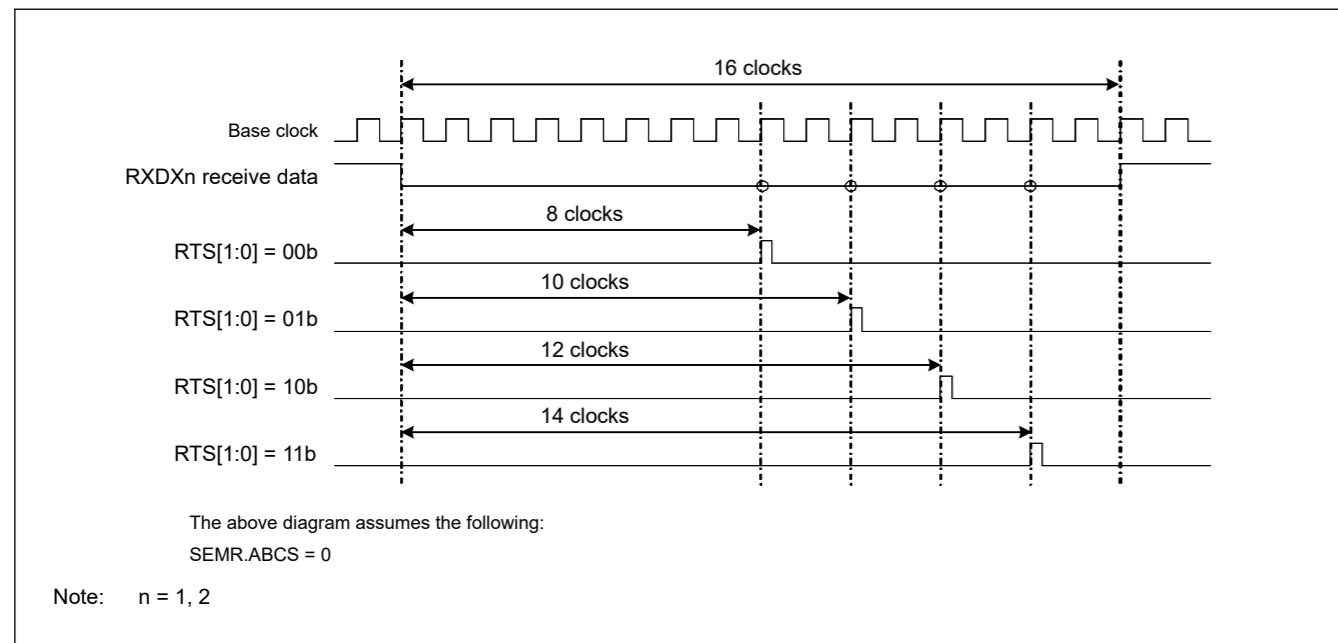

Figure 27.114 Timing for Sampling of Data Received through RXDXn

### 27.11.8 Timer

The timer has the following operating modes.

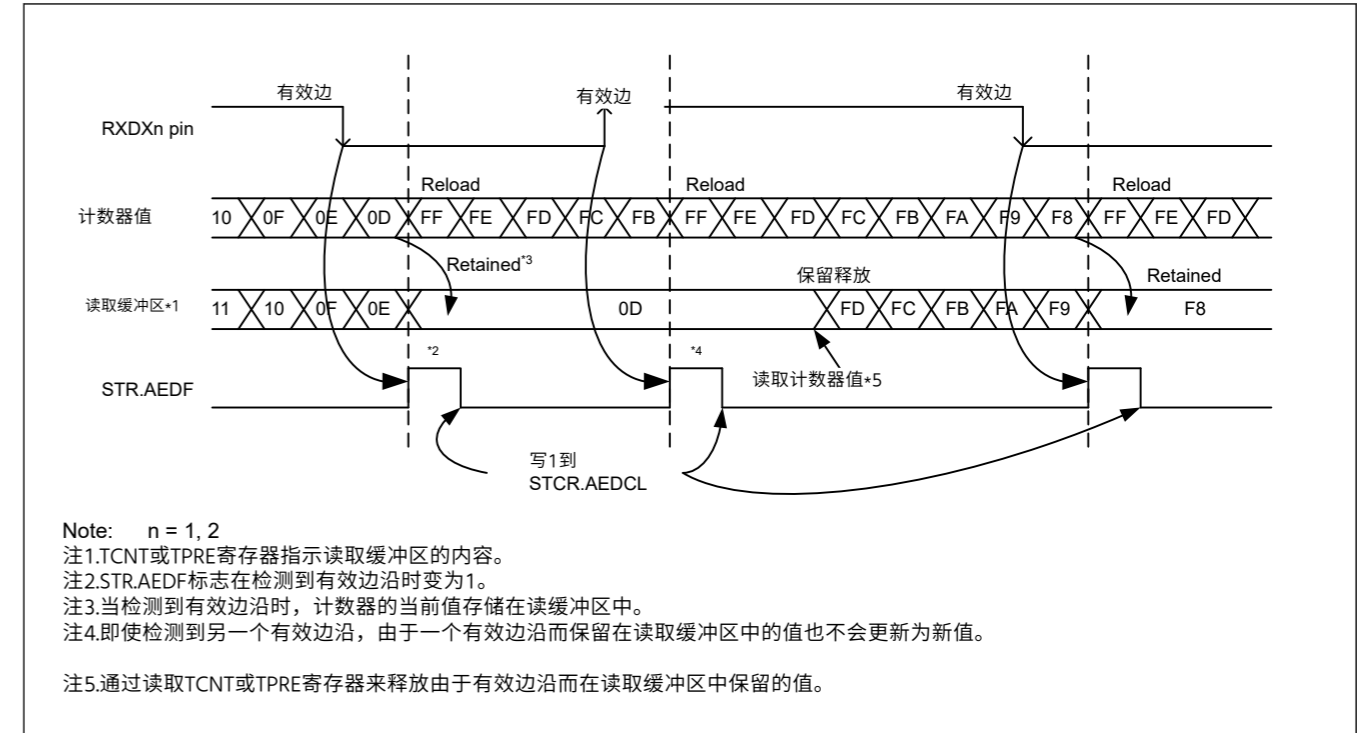

图27.113比特率测量操作示例

### 27.11.7 对通过RXDXn(n=1,2)接收的数据进行采样的可选时序

扩展串行模式控制部分通过设置CR2.RTS[1:0]位来选择第8、10、12、或SCI基本时钟的第14个周期。如果SEMR.ABCS位的值为1，则这些位选择第4、第5、第6或第7个周期的上升沿。SCIn的PCLK时钟。图27.114显示了对通过RXDXn接收的数据进行采样的时序。

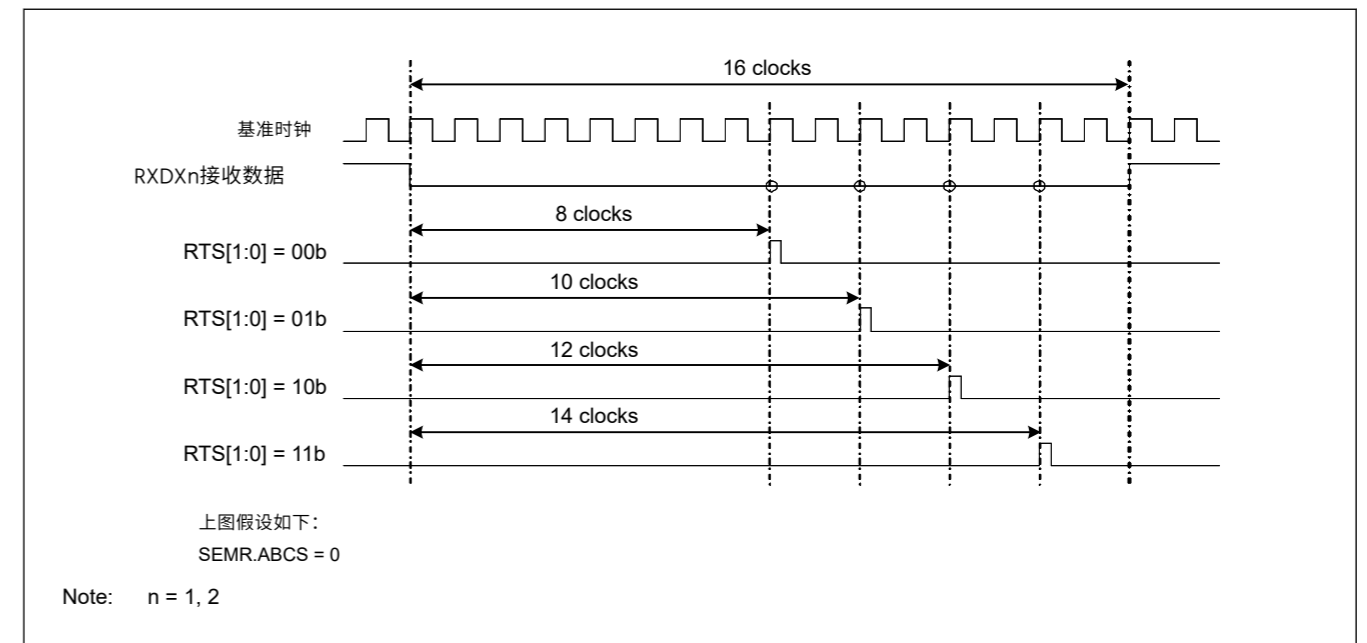

图27.114对通过RXDXn接收的数据进行采样的时序

### 27.11.8 Timer

定时器具有以下操作模式。

(1) Break Field Low Width Output Mode

This mode is for output through the TXDXn (n = 1, 2) pin of the low level over the Break Field low width at the transmission of a Start Frame. Setting the TMR.TOMS[1:0] bits to 10b switches operation to Break Field low width output mode. The TMR.TCSS[2:0] bits select the clock source for the counter. When the TCR.TCST bit is set to 1, the output on the TXDXn pin goes to the low level and counting starts. When the timer underflows, the output on the TXDXn pin goes to the high level and the STR.BFDF flag is set to 1. An SCIX0 interrupt is also generated if the value of the ICR.BFDIE bit is 1. When 0 is written to the TCR.TCST bit, counting stops after reloading of registers TPRES and TCNT. After output of the Break Field low width is completed, stop the timer before it underflows again. Figure 27.115 shows an example of operations in Break Field low width output mode.

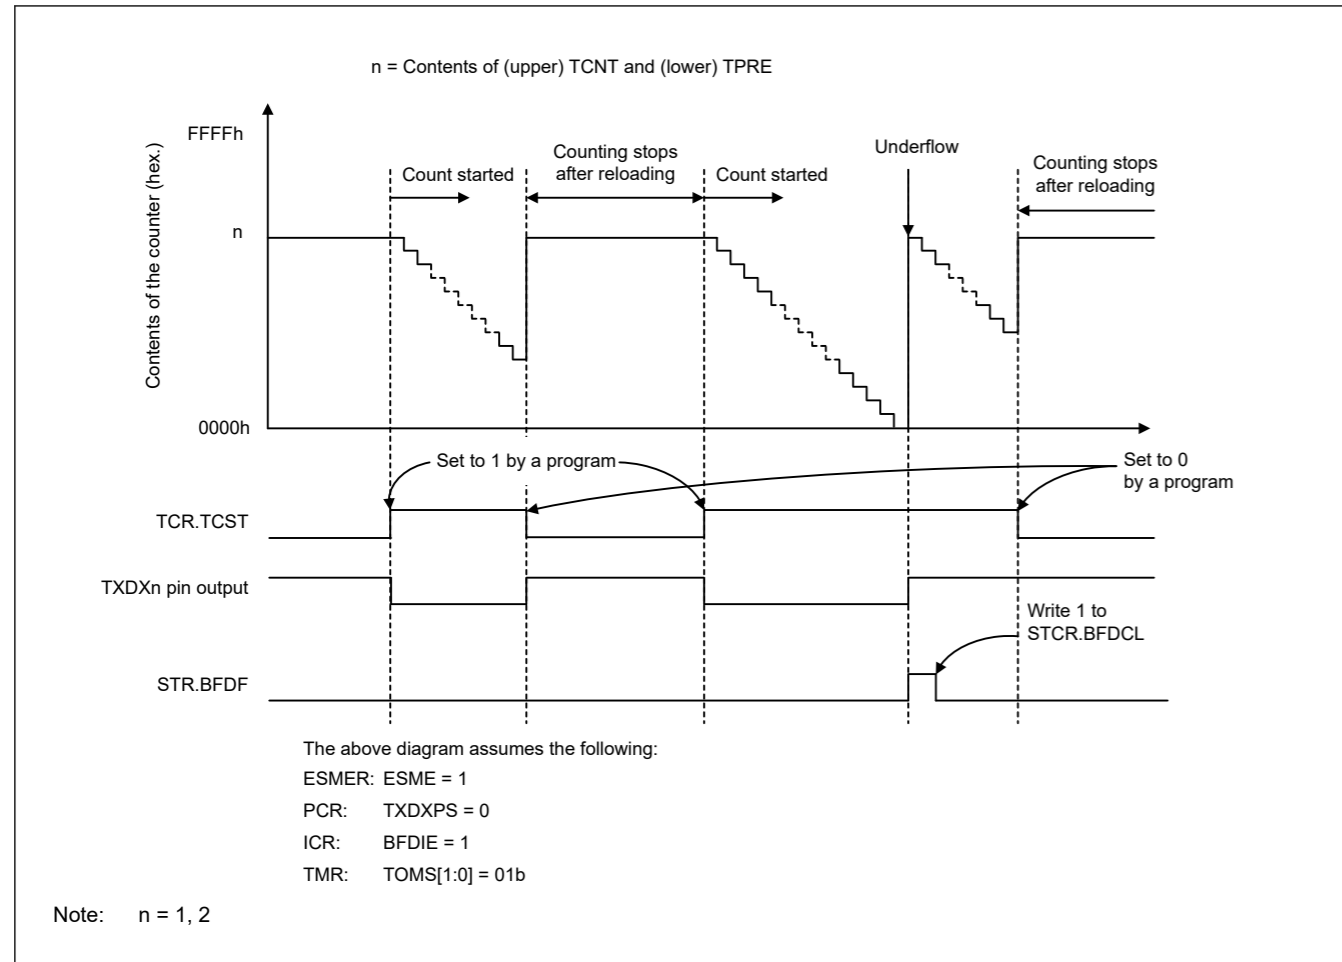

Figure 27.115 Example of Operations in Break Field Low Width Output Mode

(2) Break Field Low Width Determination Mode

This mode is for determining the Break Field low width in the input signal on the RXDXn (n = 1, 2) pin at the reception of a Start Frame. Setting the TMR.TOMS[1:0] bits to 01b switches operation to Break Field low width determination mode. The TMR.TCSS[2:0] bits select the clock source for the counter. When the TCR.TCST bit is set to 1, the interface enters the Break Field low width determinable state. Determination starts when a low level is input from the RXDXn pin. When a high level is then input on the RXDXn pin, registers TPRES and TCNT are reloaded and the interface enters the Break Field low width determinable state. When the timer underflows during Break Field low width determination, the STR.BFDF flag is set to 1. An SCIX0 interrupt is also generated if the value of the ICR.BFDIE bit is 1. If an underflow of the timer during data transfer cause a problem in the form of interrupt generation, stop the timer after Break Field low width determination. Figure 27.116 shows an example of operations in Break Field low width output mode.

(1) 断场低宽度输出模式

此模式用于在传输起始帧时通过中断字段低电平宽度上的低电平TXDXn(n=1,2)引脚输出。将TMR.TOMS[1:0]位设置为10b会将操作切换到BreakField低宽度输出模式。TMR.TCSS[2:0]位选择计数器的时钟源。当TCR.TCST位设置为1时，TXDXn引脚上的输出变为低电平并开始计数。当定时器下溢时，TXDXn引脚上的输出变为高电平，STR.BFDF标志设置为1。如果ICR.BFDIE位的值为1，也会产生SCIX0中断。当写入0时TCR.TCST位，重新加载寄存器TPRES和TCNT后计数停止。BreakField低宽度输出完成后，在定时器再次下溢之前停止定时器。图27.115显示了中断场低宽度输出模式下的操作示例。

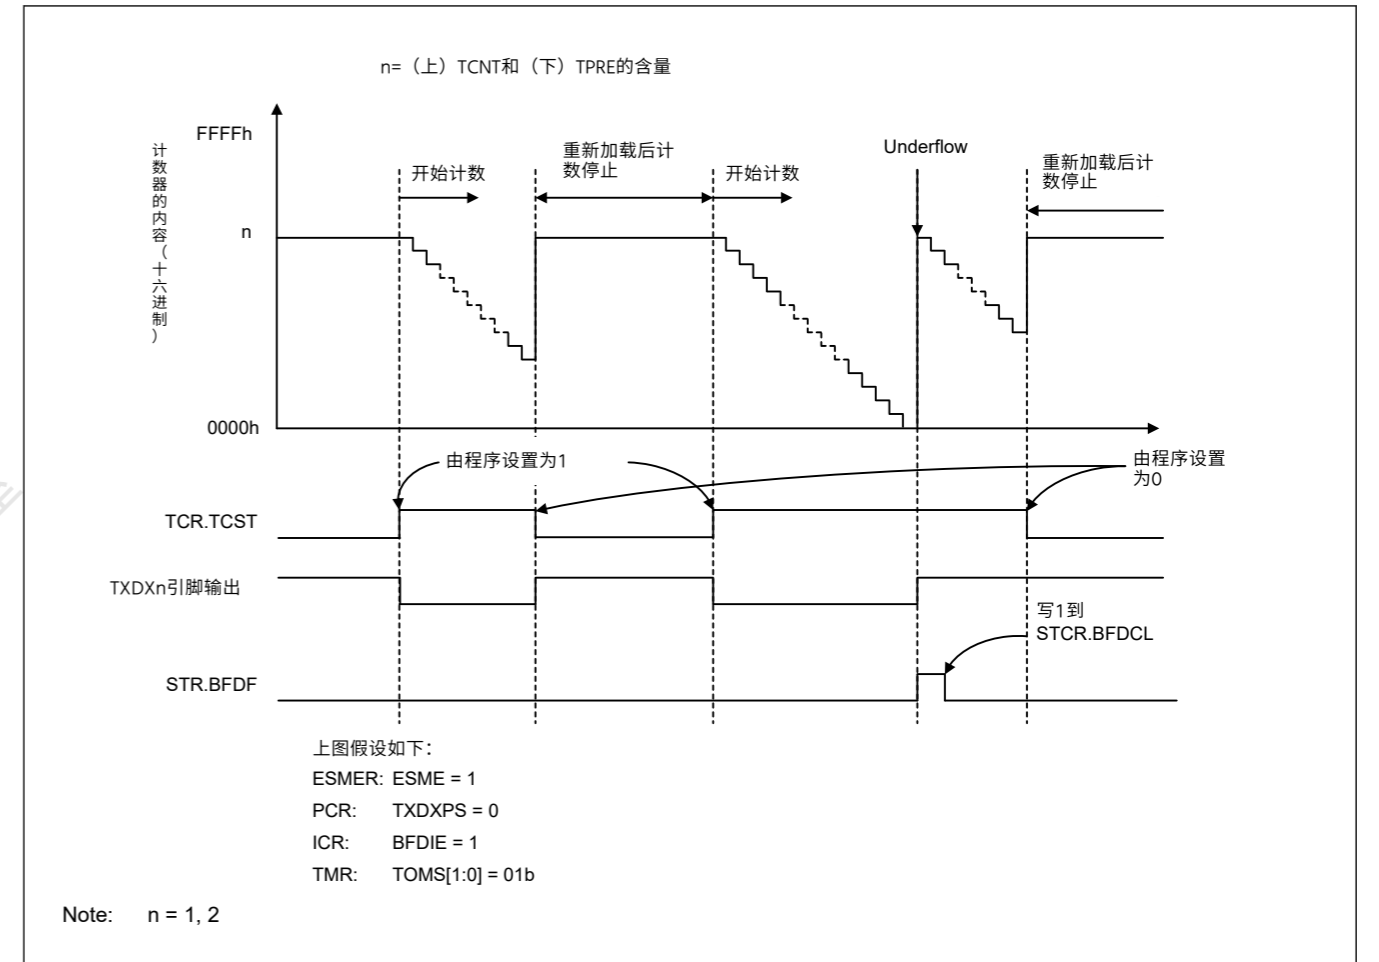

图27.115中断场低宽度输出模式下的操作示例

(2) 断场低宽度测定模式

该模式用于在接收起始帧时确定RXDXn(n=1,2)引脚上的输入信号中的中断场低电平宽度。将TMR.TOMS[1:0]位设置为01b会将操作切换到中断字段低宽度确定模式。TMR.TCSS[2:0]位选择计数器的时钟源。当TCR.TCST位设置为1时，接口进入BreakField低宽度可确定状态。当从RXDXn引脚输入低电平时开始确定。当RXDXn引脚输入高电平时，寄存器TPRES和TCNT被重新加载，接口进入中断字段低宽度可确定状态。在中断字段低宽度确定期间定时器下溢时，STR.BFDF标志设置为1。如果ICR.BFDIE位的值为1，也会产生SCIX0中断。如果在数据传输期间定时器下溢导致中断产生形式的问题，在BreakField低宽度确定后停止定时器。图27.116显示了中断场低宽度输出模式下的操作示例。

Figure 27.116 Example of Operations in Break Field Low Width Determination Mode

(3) Timer Mode

This mode is for counting cycles of the internal clock as the clock source. Setting the TMR.TOMS[1:0] bits to 00b switches operation to timer mode. The TMR.TCSS[2:0] bits select the clock source for the counter. Counting starts when 1 is written to the TCR.TCST bit and stops when 0 is written to the TCST bit. Registers TPRE and TCNT both count down. The TPRE register counts cycles of the clock source for counting, and underflows of the TPRE register provide the clock source for counting by the TCNT register. When the timer underflows, the STR.BFDF flag is set to 1. An SCIX0 interrupt is also generated if the value of the ICR.BFDIE bit is 1.

27.12 Interrupt Sources

27.12.1 Buffer Operation for SCIn\_TXI and SCIn\_RXI Interrupts (non-FIFO selected)

If the conditions for an SCIn\_TXI and SCIn\_RXI interrupt are satisfied while the interrupt status flag in the ICU is 1, the ICU does not output the interrupt request but saves it internally with a capacity for retention of one request per source.

When the interrupt status flag in the ICU is set to 0, the interrupt request retained within the ICU is output. The internally retained interrupt request is automatically discarded when the actual interrupt is output. Clearing of the associated interrupt enable bit (the TIE or RIE bit in the SCR/SCR\_SMCI) can also be used to discard an internally retained interrupt request.

27.12.2 Buffer Operation for SCIn\_TXI and SCIn\_RXI Interrupts (FIFO selected)

When an interrupt status flag in the ICU is set to 1, the SCIn\_TXI and SCIn\_RXI interrupts do not output interrupt requests to the ICU. When an interrupt status flag of the ICU is set to 0, and if the conditions for an SCIn\_TXI and SCIn\_RXI interrupts are satisfied, an interrupt request is generated.

图27.116中断场低宽度确定模式下的操作示例

(3) 定时器模式

该模式用于计数内部时钟作为时钟源的周期。将TMR.TOMS[1:0]位设置为00b会将操作切换到定时器模式。TMR.TCSS[2:0]位选择计数器的时钟源。将1写入TCR.TCST位时开始计数，将0写入TCST位时停止计数。寄存器TPRE和TCNT都倒计时。TPRE寄存器对时钟源的周期计数进行计数，TPRE寄存器的下溢为TCNT寄存器的计数提供时钟源。当定时器下溢时，STR.BFDF标志设置为1。如果ICR.BFDIE位的值为1，也会产生SCIX0中断。

27.12 中断源

27.12.1 SCIn\_TXI和SCIn\_RXI中断的缓冲区操作（选择非FIFO）

如果在ICU中的中断状态标志为1时满足SCIn\_TXI和SCIn\_RXI中断的条件，则ICU不输出中断请求，而是将其保存在内部，每个源可以保留一个请求。

当ICU中的中断状态标志设置为0时，输出ICU中保留的中断请求。当实际中断输出时，内部保留的中断请求会被自动丢弃。清除相关中断使能位（SCR/SCR\_SMCI中的TIE或RIE位）也可用于丢弃内部保留的中断请求。

27.12.2 SCIn\_TXI和SCIn\_RXI中断的缓冲区操作（选择FIFO）

当ICU中的中断状态标志设置为1时，SCIn\_TXI和SCIn\_RXI中断不会向ICU输出中断请求。当ICU的中断状态标志设置为0，并且满足SCIn\_TXI和SCIn\_RXI中断的条件时，将产生中断请求。

### 27.12.3 Interrupts in Asynchronous, Manchester, Clock Synchronous, and Simple SPI Modes

#### (1) Non-FIFO selected

Table 27.42 lists interrupt sources in asynchronous mode, Manchester mode, clock synchronous mode, and simple SPI mode. A different interrupt vector can be assigned to each interrupt source. Individual interrupt sources can be enabled or disabled with the enable bits in the SCR register.

If the SCR.TIE bit is 1, an SCIn\_TXI interrupt request is generated when transmit data is transferred from the TDR or TDRHL register\*1 to the TSR register. An SCIn\_TXI interrupt request can also be generated by using a single instruction to set the SCR.TE and SCR.TIE bits to 1 at the same time. An SCIn\_TXI interrupt request can activate the DTC or DMAC to handle data transfer.

An SCIn\_TXI interrupt request is not generated by setting the SCR.TE bit to 1 when SCR.TIE is 0 or by setting the SCR.TIE bit to 1 when the SCR.TE is 1.\*2

When new data is not written by the time of transmission of the last bit of the current transmit data and SCR.TEIE is 1, the SSR.TEND flag is set to 1 and an SCIn\_TEI interrupt request is generated. Additionally, when SCR.TE is 1, the SSR.TEND flag retains the value 1 until more transmit data is written to the TDR or TDRHL register\*1, and setting SCR.TEIE to 1 leads to the generation of an SCIn\_TEI interrupt request.

Writing data to the TDR or TDRHL register\*1 leads to clearing of the SSR.TEND flag and, after a certain time, discarding of the SCIn\_TEI interrupt request.

If the SCR.RIE bit is 1, an SCIn\_RXI interrupt request is generated when received data is stored in the RDR register. An SCIn\_RXI interrupt request can activate the DTC or DMAC to handle data transfer.

Setting any of the SSR.ORER, FER, PER and MER\*3 flags to 1 when the SCR.RIE bit is 1 leads to the generation of an SCIn\_ERI interrupt request. An SCIn\_RXI interrupt request is not generated in this case. Clearing all these flags (ORER, FER, PER, MER\*3, SYER\*3, PFER\*3 and SBER\*3) leads to discarding of the SCIn\_ERI interrupt request.

Note 1. When asynchronous mode and 9-bit data length are selected.

Note 2. To temporarily prohibit SCIn\_TXI interrupts on transmission of the last of the data when a new round of transmission is to be started, after handling the transmission-completed interrupt, control activation of the interrupt by using the interrupt request enable bit in the ICU rather than using the SCR.TIE bit. This approach can prevent the suppression of SCIn\_TXI interrupt requests in the transfer of new data.

Note 3. MER, SYER, PFER, and SBER work as a factor of ERI interrupt only in Manchester mode. SYER, PFER, and SBER also only work if its enable bits (SYEREN, PFEREN, SBEREN in MECCR) are set to "1".

#### (2) FIFO selected

Table 27.43 lists interrupt sources in FIFO selected mode.

If the SCR.TIE bit is 1, an SCIn\_TXI interrupt request is generated when the stored amount of data in the FTDRL register becomes the threshold value indicated in FCR.TTRG or below. An SCIn\_TXI interrupt request can also be generated by using a single instruction to set the SCR.TIE and SCR.TE bits to 1 simultaneously or by setting SCR.TIE to 1 when SCR.TE is 1.

An SCIn\_TXI interrupt request is not generated by setting SCR.TE to 1 when SCR.TIE is 0.

If SCR.TEIE is 1 and if the next data is not written to the FTDRL register by the time the last bit of the transmit data is sent, the SSR\_FIFO.TEND flag is set to 1 and the SCIn\_TEI interrupt request is generated.

If SCR.RIE is 1, the SCIn\_RXI interrupt request is generated when the stored amount of data in the FRDRL register is equal to or greater than the threshold value indicated in FCR.RTRG. When RTRG is 0, an SCIn\_RXI interrupt does not occur even when the amount of data in the receive FIFO is equal to 0.

If the SCR.RIE bit is 1, when the SSR\_FIFO.ORER flag is set to 1 or data with a framing error or a parity error is stored in the FRDRL register, the SCIn\_ERI interrupt request is generated. When the amount of data stored in the FRDRL register is at the threshold value or above, the SCIn\_RXI interrupt request is also generated. The SCIn\_ERI interrupt request can be canceled, in which case SSR\_FIFO.ORER, FER, and PER flags are all cleared.

### 27.12.3 异步、曼彻斯特、时钟同步和简单SPI中的中断 Modes

#### (1) Non-FIFO selected

表27.42列出了异步模式、曼彻斯特模式、时钟同步模式和简单SPI模式下的中断源。可以为每个中断源分配不同的中断向量。可以使用SCR寄存器中的启用位启用或禁用各个中断源。

如果SCR.TIE位为1，则当发送数据从TDR传输或TDRHL寄存器\*1到TSR寄存器。也可以使用一条指令同时将SCR.TE和SCR.TIE位设置为1，从而产生SCIn\_TXI中断请求。SCIn\_TXI中断请求可以激活DTC或DMAC来处理数据传输。

当SCR.TIE为0时将SCR.TE位设置为1或通过设置当SCR.TE为1时，SCR.TIE位为1。\*2

当当前发送数据的最后一位发送时尚未写入新数据且SCR.TEIE为1，则SSR.TEND标志设置为1并产生SCIn\_TEI中断请求。此外，当SCR.TE为1时，SSR.TEND标志保持值1，直到更多的发送数据写入TDR或TDRHL寄存器\*1，并且将SCR.TEIE设置为1会导致产生SCIn\_TEI中断请求。

将数据写入TDR或TDRHL寄存器\*1会导致SSR.TEND标志清零，并在一定时间后丢弃SCIn\_TEI中断请求。

如果SCR.RIE位为1，则当接收到的数据存储在RDR寄存器中时会产生SCIn\_RXI中断请求。一个SCIn\_RXI中断请求可以激活DTC或DMAC来处理数据传输。

当SCR.RIE位为1时，将任何SSR.ORER、FER、PER和MER\*3标志设置为1会导致生成SCIn\_ERI中断请求。在这种情况下不会产生SCIn\_RXI中断请求。清除所有这些标志（ORER，FER PER MER\*3 SYER\*3 PFER\*3 and SBER\*3）导致丢弃SCIn\_ERI中断请求。

注意1.选择异步模式和9位数据长度时。

注2.为了在新一轮传输开始时，在传输最后一个数据时暂时禁止SCIn\_TXI中断，在处理完传输完成中断后，使用ICU中的中断请求使能位控制中断的激活而不是使用SCR.TIE位。这种方法可以防止在传输新数据时抑制SCIn\_TXI中断请求。

注3.MER、SYER、PFER和SBER仅在曼彻斯特模式下作为ERI中断的一个因素起作用。SYER、PFER和SBER也仅在其启用位（MECCR中的SYEREN、PFEREN、SBEREN）设置为“1”时才起作用。

#### (2) FIFO selected

表27.43列出了FIFO选择模式下的中断源。

如果SCR.TIE位为1，当FTDRL寄存器中存储的数据量变为FCR.TTRG中指示的阈值或更低时，将产生SCIn\_TXI中断请求。SCIn\_TXI中断请求也可以通过使用一条指令同时将SCR.TIE和SCR.TE位设置为1或在SCR.TE为1时将SCR.TIE设置为1来生成。

当SCR.TIE为0时，将SCR.TE设置为1不会产生SCIn\_TXI中断请求。

如果SCR.TEIE为1，并且在发送数据的最后一位时下一个数据未写入FTDRL寄存器，则SSR\_FIFO.TEND标志设置为1，并产生SCIn\_TEI中断请求。

如果SCR.RIE为1，则当FRDRL寄存器中存储的数据量等于或大于FCR.RTRG中指示的阈值时，将产生SCIn\_RXI中断请求。当RTRG为0时，即使接收FIFO中的数据量等于0，也不会发生SCIn\_RXI中断。

如果SCR.RIE位为1，当SSR\_FIFO.ORER标志设置为1或帧错误或奇偶校验错误的的数据存储在FRDRL寄存器中时，将产生SCIn\_ERI中断请求。当FRDRL寄存器中存储的数据量在阈值或以上时，也会产生SCIn\_RXI中断请求。SCIn\_ERI中断请求可以被取消，在这种情况下SSR\_FIFO.ORER、FER和PER标志都被清除。

Table 27.42 SCI interrupt sources with non-FIFO selected

| Name                     | Interrupt source    | Interrupt flag   | Interrupt enable | DTC or DMAC activation |
|--------------------------|---------------------|--|------------------|------------------------|
| SCIn_ERI (n = 0 to 4, 9) | Receive error*1     | SSR.ORER, SSR.FER, SSR.PER, DCCR.DFER, DCCR.DPER, (SSR.MER, MESR.SYER, MESR.PFER, MESR.SBER)*2 | SCR.RIE          | Not possible           |
| SCIn_RXI (n = 0 to 4, 9) | Receive data full   | SSR.RDRF   | SCR.RIE          | Possible               |
|                          | Address match       | DCCR.DCMF  | SCR.RIE          | Possible               |
| SCIn_AM (n = 0, 3, 4, 9) | Address match       | DCCR.DCMF  | —                | Not possible           |
| SCIn_TXI (n = 0 to 4, 9) | Transmit data empty | SSR.TDRE   | SCR.TIE          | Possible               |
| SCIn_TEI (n = 0 to 4, 9) | Transmit end        | SSR.TEND   | SCR.TEIE         | Not possible           |

Note 1. The interrupt flag is only ORER when in clock synchronous and simple SPI mode.  
 Note 2. MER, SYER, PFER, and SBER work as a factor of ERI interrupt only in Manchester mode. SYER, PFER, and SBER also only work if its enable bits (SYEREN, PFEREN, SBEREN in MECR) are set to "1".

Table 27.43 SCI interrupt sources with FIFO selected

| Name                     | Interrupt source    | Interrupt flag  | Interrupt enable | DTC or DMAC activation |
|--------------------------|---------------------|---|------------------|------------------------|
| SCIn_ERI (n = 0 to 4, 9) | Receive error*1     | SSR_FIFO.ORER, SSR_FIFO.FER, SSR_FIFO.PER, DCCR.DFER, DCCR.DPER | SCR.RIE          | Not possible           |
|                          |                     | SSR_FIFO.DR (when FCR.DRES = 1)                                 | SCR.RIE          | Not possible           |
| SCIn_RXI (n = 0 to 4, 9) | Receive data full   | SSR_FIFO.RDF  | SCR.RIE          | Possible               |
|                          | Receive data ready  | SSR_FIFO.DR (when FCR.DRES = 0)                                 | SCR.RIE          | Possible               |
|                          | Address match       | DCCR.DCMF   | SCR.RIE          | Possible               |
| SCIn_AM (n = 0, 3, 4, 9) | Address match       | DCCR.DCMF   | —                | Not possible           |
| SCIn_TXI (n = 0 to 4, 9) | Transmit data empty | SSR_FIFO.TDFE   | SCR.TIE          | Possible               |
| SCIn_TEI (n = 0 to 4, 9) | Transmit end        | SSR_FIFO.TEND   | SCR.TEIE         | Not possible           |

Note 1. The interrupt flag is only ORER when in clock synchronous and simple SPI mode.

### 27.12.4 Interrupts in Smart Card Interface Mode

Table 27.44 lists interrupt sources in smart card interface mode. A transmit end interrupt (SCIn\_TEI) request and an address match (SCIn\_AM) request cannot be used in this mode.

Table 27.44 SCI Interrupt sources

| Name                     | Interrupt source                        | Interrupt flag                            | Interrupt enable | DTC or DMAC activation |
|--------------------------|---|---|------------------|------------------------|
| SCIn_ERI (n = 0 to 4, 9) | Receive error or error signal detection | SSR_SMCI.ORER, SSR_SMCI.PER, SSR_SMCI.ERS | SCR_SMCI.RIE     | Not possible           |
| SCIn_RXI (n = 0 to 4, 9) | Receive data full                       | SSR_SMCI.RDRF                             | SCR_SMCI.RIE     | Possible               |
| SCIn_TXI (n = 0 to 4, 9) | Transmit data empty                     | SSR_SMCI.TEND                             | SCR_SMCI.TIE     | Possible               |

Data transmission or reception using the DTC or DMAC is also possible in smart card interface mode, similar to normal SCI mode. In transmission, when the SSR\_SMCI.TEND flag is set to 1, an SCIn\_TXI interrupt request is generated. This

Table 27.42 选择了非FIFO的SCI中断源

| Name                     | 中断源    | 中断标志   | 中断使能     | DTC或DMAC激活 |
|--------------------------|--------|--|----------|------------|
| SCIn_ERI (n = 0 to 4, 9) | 接收错误*1 | SSR.ORER, SSR.FER, SSR.PER, DCCR.DFER, DCCR.DPER, (SSR.MER, MESR.SYER, MESR.PFER, MESR.SBER)*2 | SCR.RIE  | 不可能        |
| SCIn_RXI (n = 0 to 4, 9) | 接收数据已满 | SSR.RDRF   | SCR.RIE  | Possible   |
|                          | 地址匹配   | DCCR.DCMF  | SCR.RIE  | Possible   |
| SCIn_AM (n = 0, 3, 4, 9) | 地址匹配   | DCCR.DCMF  | —        | 不可能        |
| SCIn_TXI (n = 0 to 4, 9) | 传输数据为空 | SSR.TDRE   | SCR.TIE  | Possible   |
| SCIn_TEI (n = 0 to 4, 9) | 发射端    | SSR.TEND   | SCR.TEIE | 不可能        |

注1.中断标志 仅在时钟同步和简单SPI模式下为ORER。  
 注2.MER、SYER、PFER和SBER仅在曼彻斯特模式下作为ERI中断的一个因素起作用。SYER、PFER和SBER也仅在其启用位（MECR中的SYEREN、PFEREN、SBEREN）设置为“1”时才起作用。

Table 27.43 选择了FIFO的SCI中断源

| Name                     | 中断源    | 中断标志  | 中断使能     | DTC或DMAC激活 |
|--------------------------|--------|---|----------|------------|
| SCIn_ERI (n = 0 to 4, 9) | 接收错误*1 | SSR_FIFO.ORER, SSR_FIFO.FER, SSR_FIFO.PER, DCCR.DFER, DCCR.DPER | SCR.RIE  | 不可能        |
|                          |        | SSR_FIFO.DR (when FCR.DRES = 1)                                 | SCR.RIE  | 不可能        |
| SCIn_RXI (n = 0 to 4, 9) | 接收数据已满 | SSR_FIFO.RDF  | SCR.RIE  | Possible   |
|                          | 接收数据就绪 | SSR_FIFO.DR (when FCR.DRES = 0)                                 | SCR.RIE  | Possible   |
|                          | 地址匹配   | DCCR.DCMF   | SCR.RIE  | Possible   |
| SCIn_AM (n = 0, 3, 4, 9) | 地址匹配   | DCCR.DCMF   | —        | 不可能        |
| SCIn_TXI (n = 0 to 4, 9) | 传输数据为空 | SSR_FIFO.TDFE   | SCR.TIE  | Possible   |
| SCIn_TEI (n = 0 to 4, 9) | 发射端    | SSR_FIFO.TEND   | SCR.TEIE | 不可能        |

注1.中断标志 仅在时钟同步和简单SPI模式下为ORER。

### 27.12.4 智能卡接口模式中的中断

表27.44列出了智能卡接口模式下的中断源。在此模式下不能使用发送结束中断(SCIn\_TEI)请求和地址匹配(SCIn\_AM)请求。

Table 27.44 SCI中断源

| Name                     | 中断源         | 中断标志                                      | 中断使能         | DTC或DMAC激活 |
|--------------------------|-------------|---|--------------|------------|
| SCIn_ERI (n = 0 to 4, 9) | 接收错误或错误信号检测 | SSR_SMCI.ORER, SSR_SMCI.PER, SSR_SMCI.ERS | SCR_SMCI.RIE | 不可能        |
| SCIn_RXI (n = 0 to 4, 9) | 接收数据已满      | SSR_SMCI.RDRF                             | SCR_SMCI.RIE | Possible   |
| SCIn_TXI (n = 0 to 4, 9) | 传输数据为空      | SSR_SMCI.TEND                             | SCR_SMCI.TIE | Possible   |

在智能卡接口模式下也可以使用DTC或DMAC进行数据传输或接收，类似于正常SCI模式。在发送过程中，当SSR\_SMCI.TEND标志设置为1时，会产生一个SCIn\_TXI中断请求。这个

SCIn\_TXI interrupt request activates the DTC or DMAC, allowing transfer of transmit data if the SCIn\_TXI request is previously specified as a source of DTC or DMAC activation. The TEND flag is automatically set to 0 when the DTC or DMAC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During the retransmission, the TEND flag is kept at 0 and the DTC or DMAC is not activated. Therefore, the SCI and DTC or DMAC automatically transmit the specified number of bytes, including retransmission after an error occurrence. However, the SSR\_SMCLERS flag is not automatically set to 0 at error occurrence. Therefore, the ERS flag must be cleared by previously setting the SCR\_SMCLRIE bit to 1 to enable an SCIn\_ERI interrupt request to be generated at error occurrence.

When transmitting or receiving data using the DTC or DMAC, always enable the DTC or DMAC before making the SCI settings. For DTC or DMAC settings, see [section 17, Data Transfer Controller \(DTC\)](#), [section 16, DMA Controller \(DMAC\)](#).

In reception, an SCIn\_RXI interrupt request is generated when receive data is set to the RDR register. This SCIn\_RXI interrupt request activates the DTC or DMAC, allowing transfer of the receive data if the SCIn\_RXI request is previously specified as a source of DTC or DMAC activation. If an error occurs, the error flag is set. Therefore, the DTC or DMAC is not activated and an SCIn\_ERI interrupt request is issued to the CPU instead. The error flag must be cleared.

### 27.12.5 Interrupts in Simple IIC Mode

[Table 27.45](#) lists the interrupt sources in simple IIC mode. The STI interrupt is allocated to the transmit end interrupt (SCIn\_TEI) request. The receive error interrupt (SCIn\_ERI) and the address match (SCIn\_AM) request cannot be used.

The DTC or DMAC can also be used to handle transfer in simple IIC mode.

When the SIMR2.IICINTM bit is 1:

- An SCIn\_RXI request is generated on the falling edge of the SCLn signal for the 8<sup>th</sup> bit. If SCIn\_RXI is previously set up as an activation source for the DTC or DMAC, the SCIn\_RXI request activates the DTC or DMAC to handle transfer of the received data.
- An SCIn\_TXI request is generated on the falling edge of the SCLn signal for the 9<sup>th</sup> bit (acknowledge bit). If SCIn\_TXI is previously set up as an activation source for the DTC or DMAC, the SCIn\_TXI request activates the DTC or DMAC to handle transfer of the transmit data.

When the SIMR2.IICINTM bit is 0:

- An SCIn\_RXI request (ACK detection) is generated if the input on the SDAn pin is low on the rising edge of the SCLn signal for the 9<sup>th</sup> bit (acknowledge bit)
- An SCIn\_TXI request (NACK detection) is generated if the input on the SDAn pin is high on the rising edge of the SCLn signal for the 9<sup>th</sup> bit (acknowledge bit)
- If SCIn\_RXI is previously set up as an activation source for the DTC or DMAC, the SCIn\_RXI request activates the DTC or DMAC to handle transfer of the received data.

If the DTC or DMAC is used for data transfer in reception or transmission, always set up and enable the DTC or DMAC before setting up the SCI.

When the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits in SIMR3 are used to generate a start condition, restart condition, or stop condition, the STI request is issued when generation is complete.

**Table 27.45 SCI interrupt sources**

| Name                           | Interrupt source  | Interrupt flag | Interrupt enable | DTC or DMAC activation |
|--------------------------------|---|----------------|------------------|------------------------|
| SCIn_RXI (n = 0 to 4, 9)       | Reception, ACK detection  | —              | SCMR.RIE         | Possible*1             |
| SCIn_TXI (n = 0 to 4, 9)       | Transmission, NACK detection                                    | —              | SCMR.TIE         | Possible               |
| SCIn_TEI(STIn) (n = 0 to 4, 9) | Completion of generation of a start, restart, or stop condition | SIMR3.IICSTIF  | SCMR.TEIE        | Not possible           |

Note 1. Activation of the DTC or DMAC is only possible when the SIMR2.IICINTM bit is 1 (use reception and transmission interrupts)

SCIn\_TXI中断请求激活DTC或DMAC，如果之前将SCIn\_TXI请求指定为DTC或DMAC激活源，则允许传输数据。当DTC或DMAC传输数据时，TEND标志自动设置为0。

如果发生错误，SCI会自动重新传输相同的数据。在重传期间，TEND标志保持为0，并且DTC或DMAC不被激活。因此，SCI和DTC或DMAC会自动传输指定的字节数，包括发生错误后的重传。但是，发生错误时，SSR\_SMCLERS标志不会自动设置为0。因此，必须通过预先将SCR\_SMCLRIE位设置为1来清除ERS标志，以在发生错误时启用SCIn\_ERI中断请求。

使用DTC或DMAC发送或接收数据时，请务必在进行SCI设置之前启用DTC或DMAC。对于DTC或DMAC设置，请参阅第17节，数据传输控制器(DTC)，第16节，DMA控制器(DMAC)。

在接收中，当接收数据设置到RDR寄存器时，会产生SCIn\_RXI中断请求。该SCIn\_RXI中断请求激活DTC或DMAC，如果先前将SCIn\_RXI请求指定为DTC或DMAC激活源，则允许传输接收数据。如果发生错误，则设置错误标志。因此，不会激活DTC或DMAC，而是向CPU发出SCIn\_ERI中断请求。必须清除错误标志。

### 27.12.5 简单IIC模式下的中断

表27.45列出了简单IIC模式下的中断源。STI中断分配给发送结束中断(SCIn\_TEI)请求。不能使用接收错误中断(SCIn\_ERI)和地址匹配(SCIn\_AM)请求。

DTC或DMAC也可用于处理简单IIC模式下的传输。

当SIMR2.IICINTM位为1时：

- SCIn\_RXI请求在第8位的SCLn信号下降沿产生。如果SCIn\_RXI先前设置为DTC或DMAC的激活源，则SCIn\_RXI请求将激活DTC或DMAC以处理接收数据的传输。
- SCIn\_TXI请求在第9位（确认位）的SCLn信号的下降沿产生。如果SCIn\_TXI先前设置为DTC或DMAC的激活源，则SCIn\_TXI请求将激活DTC或DMAC以处理传输数据的传输。

当SIMR2.IICINTM位为0时：

- 如果SDAn引脚上的输入在第9位（确认位）的SCLn信号的上升沿为低电平，则生成SCIn\_RXI请求（ACK检测）
- 如果SDAn引脚上的输入在第9位（确认位）的SCLn信号的上升沿为高电平，则生成SCIn\_TXI请求（NACK检测）
- 如果先前将SCIn\_RXI设置为DTC或DMAC的激活源，则SCIn\_RXI请求将激活DTC或DMAC以处理接收数据的传输。

如果DTC或DMAC用于接收或传输中的数据，请务必在设置SCI之前设置并启用DTC或DMAC。

当SIMR3中的IICSTAREQ、IICRSTAREQ和IICSTPREQ位用于生成开始条件、重新启动条件或停止条件时，生成完成时会发出STI请求。

**Table 27.45 SCI中断源**

| Name                           | 中断源               | 中断标志          | 中断使能      | DTC或DMAC激活 |
|--------------------------------|-------------------|---------------|-----------|------------|
| SCIn_RXI (n = 0 to 4, 9)       | 接收、ACK检测          | —             | SCMR.RIE  | Possible*1 |
| SCIn_TXI (n = 0 to 4, 9)       | 传输、NACK检测         | —             | SCMR.TIE  | Possible   |
| SCIn_TEI(STIn) (n = 0 to 4, 9) | 完成启动、重新启动或停止条件的生成 | SIMR3.IICSTIF | SCMR.TEIE | 不可能        |

注1.仅当SIMR2.IICINTM位为1时才可能激活DTC或DMAC（使用接收和发送中断）

### 27.12.6 Interrupt Requests from the Extended Serial Mode Control Section

The extended serial mode control section has a total of six types of interrupt request for generating the SCIX0 interrupt (Break Field low width detected), SCIX1 interrupt (Control Field 0 match, Control Field 1 match, priority interrupt bit detected), SCIX2 interrupt (bus collision detected), and SCIX3 interrupt (valid edge detected). When any of the interrupt factors is generated, the corresponding status flag is set to 1. Details of all of the interrupt requests are listed in Table 27.46.

**Table 27.46 Interrupt Sources of the Extended Serial Mode Control Section**

| Interrupt Request                                 | Status Flag | Interrupt Factors  |
|---|-------------|--|
| SCIX0 interrupt (Break Field low width detected)  | BDFD        | <ul style="list-style-type: none"> <li>Detection of a Break Field low width longer than the interval corresponding to the timer setting</li> <li>Completion of the output of a Break Field low width over the interval corresponding to the timer setting</li> <li>Underflow of the timer</li> </ul> |
| SCIX1 interrupt (Control Field 0 match)           | CF0MF       | The data received in Control Field 0 matching the value set in CF0DR   |
| SCIX1 interrupt (Control Field 1 match)           | CF1MF       | The data received in Control Field 1 matching the value set in PCF1DR or SCF1DR  |
| SCIX1 interrupt (priority interrupt bit detected) | PIBDF       | The value of the bit specified as the priority interrupt bit matching the value set in PCF1DR  |
| SCIX2 interrupt (bus collision detected)          | BCDF        | The output level on the RXDXn (n = 1, 2) pin and the input level on the RXDXn pin not matching on three consecutive cycles of the bus collision detection clock  |
| SCIX3 interrupt (valid edge detected)             | AEDF        | Detection of a valid edge during bit rate measurement  |

### 27.13 Event Linking

By using interrupt request signals as event signals, the SCIn can provide linked operation through the ELC for modules selected in advance.

Event signals can be output regardless of the values of the associated interrupt request enable bits.

#### (1) Error event output (receive error or error signal detected) (SCIn\_ERI, n = 0 to 4, 9)

- Indicates abnormal termination because of a parity error during reception in asynchronous mode
- Indicates abnormal termination because of a framing error during reception in asynchronous mode
- Indicates abnormal termination because of an overrun error during reception
- Indicates detection of the error signal during transmission in smart card interface mode
- The SSR\_FIFO.FER and PER flags are 0, and receive data less than the receive FIFO data trigger number is set in a reception FIFO buffer, and it indicates that 15 ETUs elapse when FIFO is selected and the FCR.DRES bit is 1

#### (2) Receive data full event output (SCIn\_RXI, n = 0 to 4, 9)

- Indicates that ACK is detected if the SIMR2.IICINTM bit is 0 in simple IIC mode
- Indicates that the 8th-bit SCLn falling edge is detected if the SIMR2.IICINTM bit is 1 in simple IIC mode
- When the SIMR2.IICINTM bit is 1 during master transmission in simple IIC mode, set the ELC so that receive data full events are not used

#### Non-FIFO selected

- Indicates that received data is set in the Receive Data Register (RDR or RDRHL).

#### FIFO selected

- Using this event output is prohibited.

#### (3) Transmit data empty event output (SCIn\_TXI, n = 0 to 4, 9)

- Indicates that the SCR/SCR\_SMCI.TE bit is changed from 0 to 1

### 27.12.6 来自扩展串行模式控制部分的中断请求

扩展串行模式控制部分共有六种中断请求，用于产生SCIX0中断（BreakFieldlowwidthdetected）、SCIX1中断（ControlField0match、ControlField1match、优先级中断位检测）、SCIX2中断（检测到总线冲突）和SCIX3中断（检测到有效边沿）。当产生任何中断因素时，相应的状态标志设置为1。所有中断请求的详细信息如表27.46所示。

**Table 27.46 扩展串行模式控制部分的中断源**

| 中断请求              | 状态标志  | 中断因素   |
|-------------------|-------|--|
| SCIX0中断（检测到断场低宽度） | BDFD  | <ul style="list-style-type: none"> <li>检测到比定时器设置对应的间隔长的中断字段低宽度</li> <li>在与定时器设置相对应的时间间隔内完成中断字段低宽度的输出</li> <li>定时器下溢</li> </ul> |
| SCIX1中断（控制字段0匹配）  | CF0MF | 在控制字段0中接收到的数据与设置的值匹配 CF0DR   |
| SCIX1中断（控制字段1匹配）  | CF1MF | 控制字段1中接收到的数据与设置的值匹配 PCF1DR or SCF1DR   |
| SCIX1中断（检测到优先中断位） | PIBDF | 指定为优先级中断位的位的值与PCF1DR中设置的值匹配  |
| SCIX2中断（检测到总线冲突）  | BCDF  | RXDXn(n=1,2)引脚上的输出电平和RXDXn引脚上的输入电平在总线冲突检测时钟的三个连续周期上不匹配   |
| SCIX3中断（检测到有效边沿）  | AEDF  | 在比特率测量期间检测有效边沿   |

### 27.13 事件链接

通过使用中断请求信号作为事件信号，SCIn可以通过ELC为预先选择的模块提供链接操作。

无论相关中断请求使能位的值如何，都可以输出事件信号。

#### (1) 错误事件输出（接收错误或检测到错误信号）(SCIn\_ERI, n=0到4、9)

- 表示异步模式接收时奇偶校验错误导致异常终止
- 表示异步模式接收时因帧错误而异常终止
- 表示接收过程中由于溢出错误而异常终止
