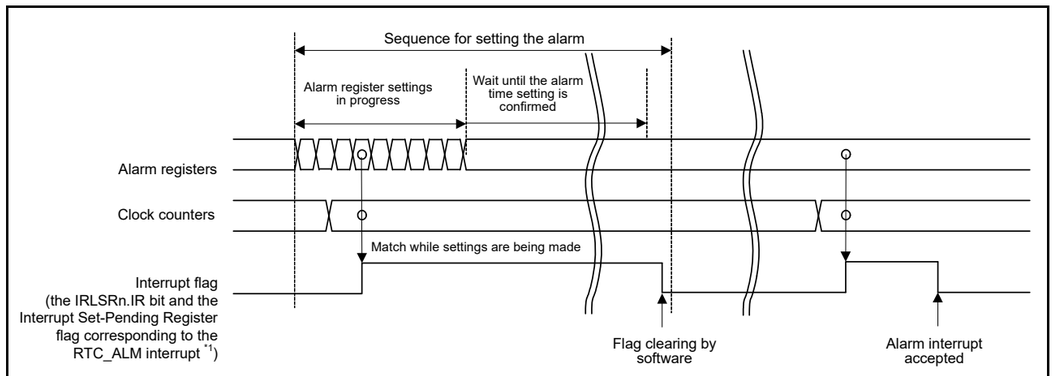
Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the IELSRn.IR bit and the Interrupt Set-Pending Register associated with the RTC_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to mismatching of the alarm registers and clock counters, the flag is not set again until there is another match or the values of the alarm registers are modified again.



Note 1. See section 14, Interrupt Controller Unit (ICU) for details on the associated interrupt vector number.

Figure 26.11 Timing for the alarm interrupt (RTC_ALM)

(2) Periodic interrupt (RTC_PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected in the RCR1.PES[3:0] bits.

(3) Carry interrupt (RTC_CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

26.4 中断源

RTC具有三个中断源，列于表26.3中。

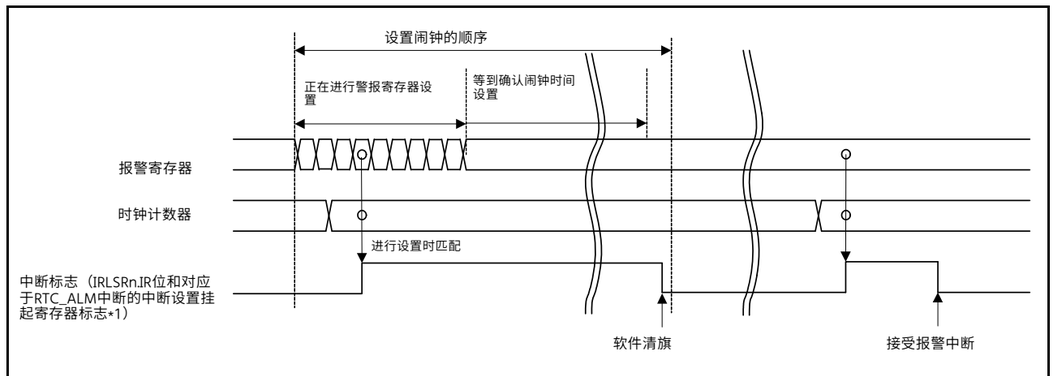
Table 26.3 RTC中断源

Name	中断源
RTC_ALM	报警中断
RTC_PRD	周期性中断
RTC_CUP	进位中断

(1) 闹钟中断(RTC_ALM)

该中断是根据闹钟寄存器和RTC计数器之间的比较结果产生的。有关详细信息，请参见第26.3.6节，报警功能。

因为当闹钟寄存器的设置与时钟计数器匹配时中断标志可能被设置为1，请等待闹钟时间设置被确认并清除IELSRn.IR位和与修改闹钟寄存器的值后，RTC_ALM中断再次为0。报警中断的中断标志置1并返回报警寄存器和时钟计数器不匹配的状态后，直到再次匹配或再次修改报警寄存器的值时才再次设置该标志。



Note 1. 有关相关中断向量编号的详细信息，请参见第14节，中断控制器单元(ICU)。

Figure 26.11 闹钟中断的时序(RTC_ALM)

(2) 周期性中断(RTC_PRD)

此中断以2秒、1秒、12秒、14秒、18秒、116秒、132秒、164秒、1128秒或1256秒的间隔生成。可以在RCR1.PES[3:0]位中选择中断间隔。

(3) 进位中断(RTC_CUP)

当第二个计数器二进制计数器0的进位发生或在对64-Hz计数器的读访问期间发生对R64CNT计数器的进位时，将产生此中断。

RA生态工作室

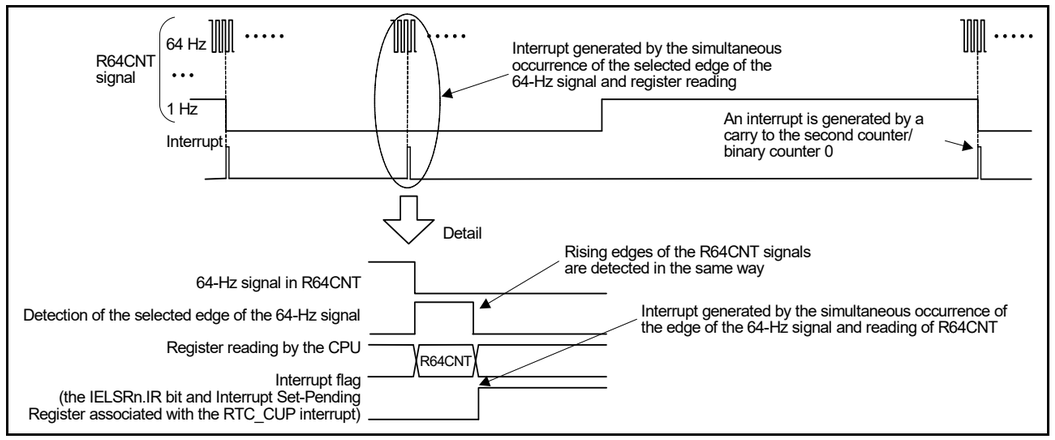


Figure 26.12 Timing for the carry interrupt (RTC_CUP)

26.5 Event Link Output

The RTC generates periodic event output (RTC_PRD) event signal for the ELC that can be used to initiate operations by other modules selected in advance.

The periodic event signal is output at the interval selected from 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by setting the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

Note: If event linking from the RTC is used, only set the ELC after setting the RTC, for example, initialization and time settings. Setting the RTC after the ELC can lead to output of unexpected event signals.

26.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output to the CPU when an interrupt source is generated while the associated enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal through the ELC when an interrupt source is generated, regardless of the setting of the associated interrupt enable bit.

Note: Although alarm and periodic interrupts can still be output during Software Standby mode or Deep Software Standby mode, the periodic event signals for the ELC are not output.

26.6 Usage Notes

26.6.1 Register Writing during Counting

The following registers must not be written to during counting, that is, while the RCR2.START bit is 1:

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS

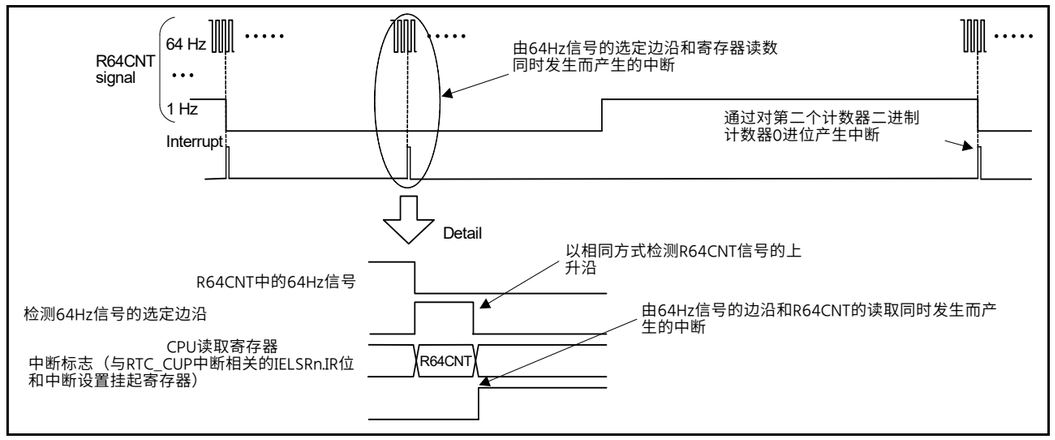

Figure 26.12 进位中断(RTC_CUP)的时序

26.5 事件链接输出

RTC为ELC生成周期性事件输出(RTC_PRD)事件信号，该信号可用于启动预先选择的其他模块的操作。

通过设置RCR1.PES[3:0，以从1256、1128、164、132、116、18、14、12、1和2秒中选择的间隔输出周期性事件信号]位。

不保证选择事件生成后的事件生成周期。

Note: 如果使用来自RTC的事件链接，则仅在设置RTC后设置ELC，例如初始化和时间设置。在ELC之后设置RTC会导致意外事件信号的输出。

26.5.1 中断处理和事件链接

RTC有一个位来启用或禁用周期性中断。当相关使能位使能时产生中断源时，将向CPU输出中断请求信号。

相反，当产生中断源时，事件链接输出信号作为事件信号通过ELC发送到其他模块，而不管相关中断使能位的设置如何。

Note: 虽然在软件待机模式或深度软件期间仍然可以输出警报和周期性中断
待机模式下，不输出ELC的周期性事件信号。

26.6 使用说明

26.6.1 计数期间的寄存器写入

计数期间不得写入以下寄存器，即RCR2.START位为1时：

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS

- RCR2.RTCOE
- RCR2.HR24
- RFRL.

The counter must be stopped before writing to any of these registers.

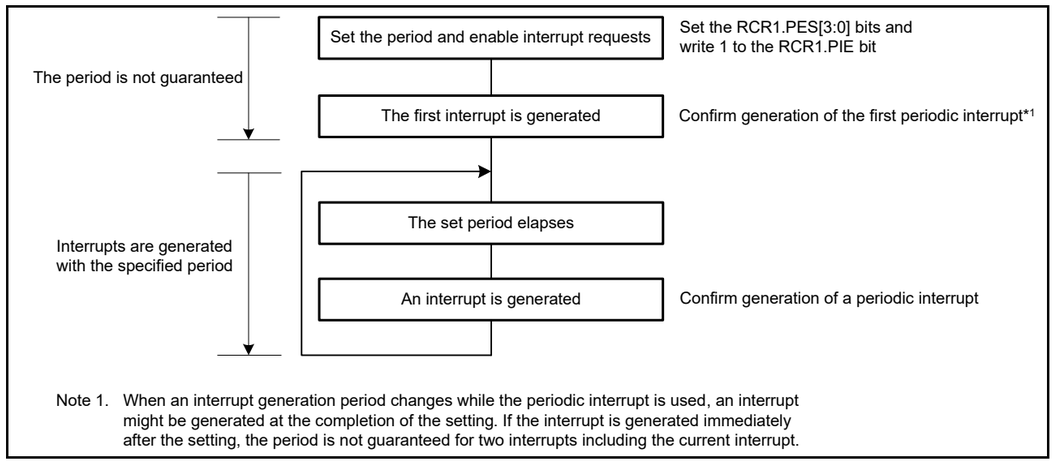
26.6.2 Use of Periodic Interrupts

The procedure for using periodic interrupts is shown in Figure 26.13.

The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits. In addition, any of the following operation can affect the interrupt period:

- Stopping/restarting or resetting counter operation
- Reset by RTC software
- 30-second adjustment by changing the RCR2 value.

When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted based on the adjustment value.



Note 1. When an interrupt generation period changes while the periodic interrupt is used, an interrupt might be generated at the completion of the setting. If the interrupt is generated immediately after the setting, the period is not guaranteed for two interrupts including the current interrupt.

Figure 26.13 Using the periodic interrupt function

26.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value, affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted based on the adjustment value.

26.6.4 Transitions to Low Power Modes after Setting Registers

A transition to a low power state (Software Standby mode, Deep Software Standby mode, or battery backup) during a write to an RTC register might corrupt the value in the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power state.

26.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after writing to the counter register, follow the procedure in section 26.3.5, Reading 64-Hz Counter and Time
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and

- RCR2.RTCOE
- RCR2.HR24
- RFRL.

在写入任何这些寄存器之前，必须停止计数器。

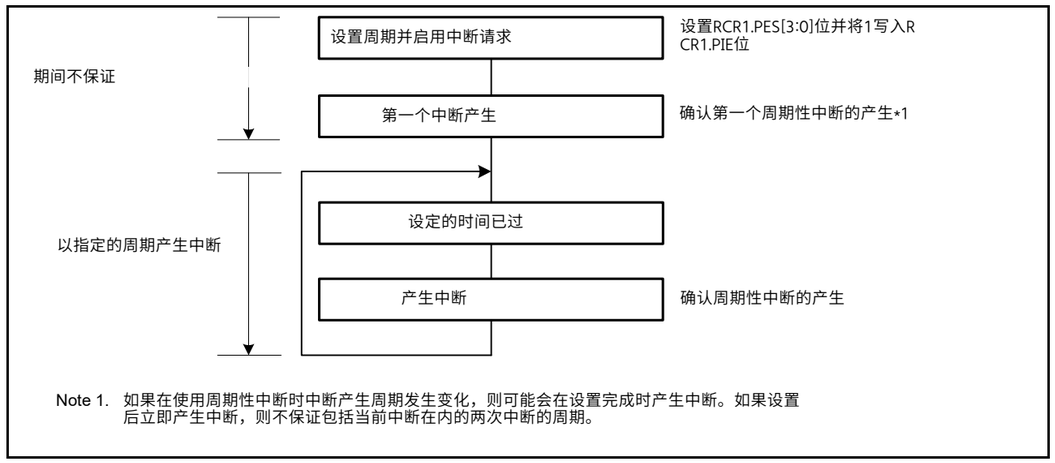
26.6.2 使用周期性中断

使用周期性中断的过程如图26.13所示。

可以通过设置RCR1.PES[3:0]位来更改周期性中断的产生和周期。但是，由于预分频器R64CNT和RSECCNTBCNT0用于产生中断，因此在设置RCR1.PES[3:0]位后不能立即保证中断周期。此外，以下任何操作都会影响中断周期：

- 停止重新启动或重置计数器操作
- 通过RTC软件复位
- 通过更改RCR2值进行30秒调整。

使用时间误差调整功能时，根据调整值加减调整后的中断产生周期。



Note 1. 如果在使用周期性中断时中断产生周期发生变化，则可能会在设置完成时产生中断。如果设置后立即产生中断，则不保证包括当前中断在内的两次中断的周期。

Figure 26.13 使用周期性中断功能

26.6.3 RTCOUT(1-Hz64-Hz)时钟输出

停止重新启动或重置计数器操作、由RTC软件重置以及通过更改RCR2值进行的30秒调整，都会影响RTCOUT(1-Hz64-Hz)输出的周期。使用时间误差调整功能时，调整后的RTCOUT（1-Hz64-Hz）输出的周期根据调整值加减。

26.6.4 设置寄存器后转换到低功耗模式

在写入RTC寄存器期间转换到低功耗状态（软件待机模式、深度软件待机模式或电池备份）可能会损坏寄存器中的值。设置寄存器后，在开始转换到低功耗状态之前确认设置到位。

26.6.5 关于写入和读取寄存器的注意事项

- 在写入计数器寄存器后读取计数器寄存器（例如第二个计数器）时，请按照第26.3.5节中的步骤，读取64-Hz计数器和时间
- 写入计数寄存器、闹钟寄存器、年份闹钟启用寄存器、位RCR2.AADJE、AADJP和

RA生态工作室

HR24, RCR4 register, or frequency register is reflected when four read operations are performed after writing

- The values written to the RCR1.CIE, RCR1.RTCOS, and RCR2.RTCOE bits can be read immediately after writing
- To read the value from the timer counter after return from a reset, Software Standby mode, Deep Software Standby mode, or the battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit is 1)
- After a reset is generated, write to the RTC register after 6 cycles of the count source clock have elapsed.

26.6.6 Changing the Count Mode

When changing the count mode (calendar/binary), set the RCR2.START bit to 0, stop the counting operation, then restart it from the initial setting. For details on the initial setting, see section 26.3.1, Outline of Initial Settings of Registers after Power On.

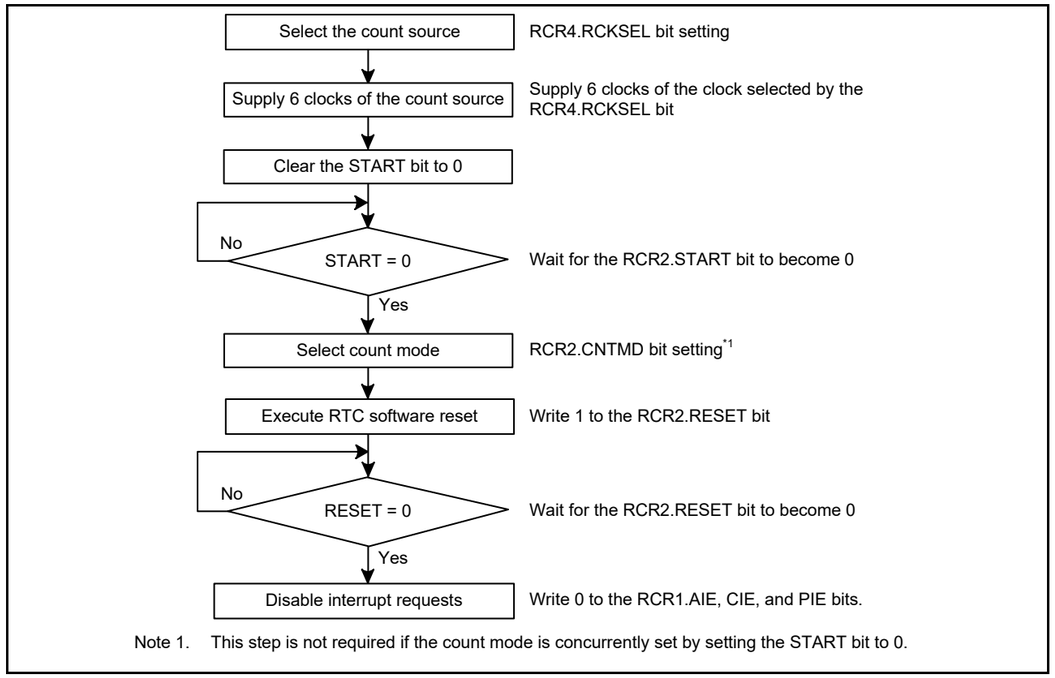
26.6.7 Initialization Procedure when the RTC Is Not To Be Used

Registers in the RTC are not initialized by a reset. Depending on the initial state, the generation of an unintentional interrupt request or operation of the counter might lead to increased power consumption.

For applications that do not require a realtime clock, initialize the registers by following the initialization procedure shown in Figure 26.14.

Alternatively, when the sub-clock oscillator is not used as the system clock or realtime clock, the counter can be stopped by writing 0 (sub-clock oscillator is selected) to the RCR4.RCKSEL bit and stopping the sub-clock oscillator. To stop the sub-clock oscillator, write 1 to the SOSCCR.SOSTP bit.

For details on the setting of the SOSCCR.SOSTP bit, see section 9, Clock Generation Circuit.



Note 1. This step is not required if the count mode is concurrently set by setting the START bit to 0.

Figure 26.14 Initialization procedure

26.6.8 When Switching Source Clock

When switching a clock source by changing SCKCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. If the RTC periodical interrupt or RTC periodical event output was generated at this time, the interrupt or event is invalid.

HR24、RCR4寄存器或频率寄存器在写后进行四次读操作时反映

- 写入RCR1.CIE、RCR1.RTCOS和RCR2.RTCOE位的值可在写入后立即读取
- 要在从复位、软件待机模式、深度软件待机模式或电池备份状态返回后从定时器计数器读取值，请在时钟运行时等待1128秒（RCR2.START位为1）
- 产生复位后，在计数源时钟的6个周期过去后写入RTC寄存器。

26.6.6 更改计数模式

更改计数模式（日历二进制）时，将RCR2.START位设置为0，停止计数操作，然后从初始设置重新启动。有关初始设置的详细信息，请参阅第26.3.1节“通电后寄存器初始设置概述”。

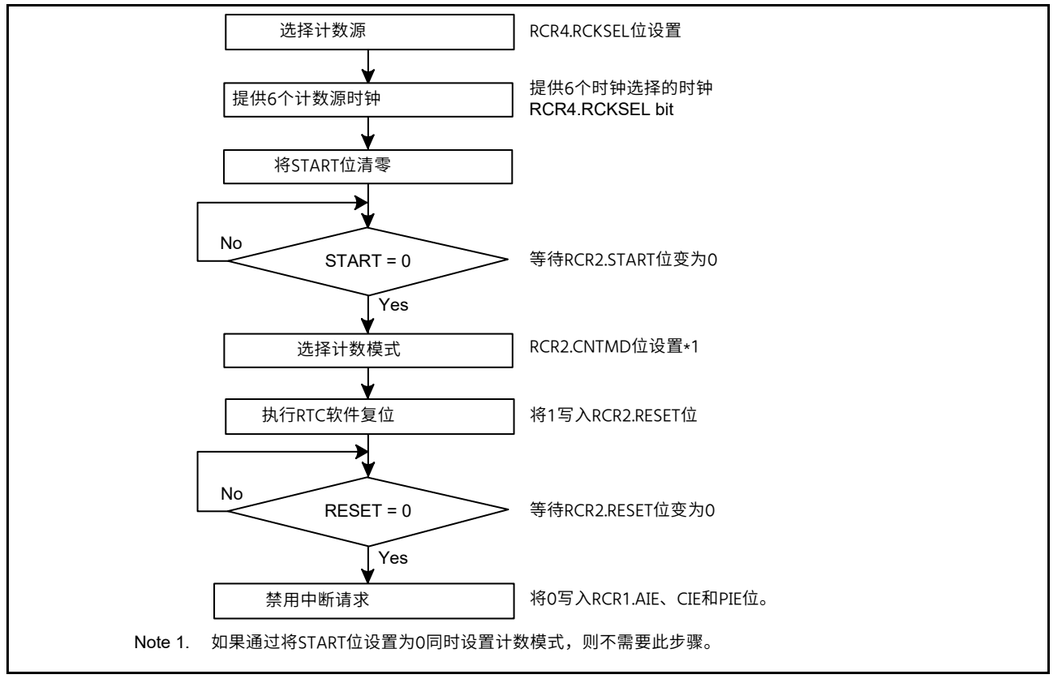
26.6.7 不使用RTC时的初始化程序

RTC中的寄存器不会因复位而初始化。根据初始状态，意外中断请求的生成或计数器的操作可能会导致功耗增加。

对于不需要实时时钟的应用程序，按照图26.14所示的初始化过程初始化寄存器。

或者，当副时钟振荡器不用作系统时钟或实时时钟时，可以通过向RCR4.RCKSEL位写入0（选择副时钟振荡器）并停止副时钟振荡器来停止计数器。要停止副时钟振荡器，将1写入SOSCCR.SOSTP位。

有关SOSCCR.SOSTP位设置的详细信息，请参见第9节，时钟生成电路。



Note 1. 如果通过将START位设置为0同时设置计数模式，则不需要此步骤。

Figure 26.14 初始化程序

26.6.8 切换源时钟时

当通过改变SCKCR.CKSEL[2:0]来切换时钟源时，选择器的时钟输出在切换时钟的4个周期内停止。如果此时产生了RTC周期性中断或RTC周期性事件输出，则该中断或事件无效。

27. Watchdog Timer (WDT)

27.1 Overview

The Watchdog Timer (WDT) is a 14-bit down-counter and can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. The refresh-permitted period can be set to refresh the counter and to detect when the system runs out of control.

Table 27.1 lists the WDT specifications and Figure 27.1 shows a block diagram.

Table 27.1 WDT specifications

Parameter	Specifications
Count source	Peripheral clock (PCLKB)
Clock division ratio	Division by 4, 64, 128, 512, 2,048, or 8,192
Counter operation	Counting down using a 14-bit down-counter
Conditions for starting the counter	• Auto start mode: Counting automatically starts after a reset, or after an underflow or refresh error occurs • Register start mode: Counting is started with a refresh by writing to the WDTRR register.
Conditions for stopping the counter	• Reset (the down-counter and other registers return to their initial values) • A counter underflows or a refresh error is generated.
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
WDT reset sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error).
Non-maskable interrupt/interrupt sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error).
Reading of the counter value	The down-counter value can be read by the WDTSR register
Event link function (output)	• Down-counter underflow event output • Refresh error event output.
Output signal (internal signal)	• Reset output • Interrupt request output • Sleep mode count stop control output.

27. 看门狗定时器(WDT)

27.1 Overview

看门狗定时器(WDT)是一个14位递减计数器，可用于在计数器下溢时复位MCU，因为系统已失控且无法刷新WDT。此外，WDT可用于产生不可屏蔽中断或下溢中断。可以设置刷新允许周期来刷新计数器并检测系统何时失控。

表27.1列出了WDT规范，图27.1显示了框图。

Table 27.1 WDT specifications

Parameter	Specifications
计数来源	外设时钟(PCLKB)
时钟分频比	除以4、64、128、512、2 048或8 192
计数器操作	使用14位递减计数器进行递减计数
启动计数器的条件	自动启动模式：在复位后或发生下溢或刷新错误后自动开始计数 寄存器启动模式：通过写入WDTRR寄存器以刷新开始计数。
停止计数器的条件	复位（递减计数器和其他寄存器返回其初始值） 计数器下溢或产生刷新错误。
窗口功能	可以指定窗口开始和结束位置（允许刷新和禁止刷新期间）
WDT复位源	递减计数器下溢 在允许刷新的时间之外刷新（刷新错误）。
Non-maskable interrupt/interrupt sources	递减计数器下溢 在允许刷新的时间之外刷新（刷新错误）。
读取计数器值	递减计数器的值可以通过WDTSR寄存器读取
事件链接功能（输出）	递减计数器下溢事件输出 刷新错误事件输出。
输出信号（内部信号）	复位输出 中断请求输出 睡眠模式计数停止控制输出。

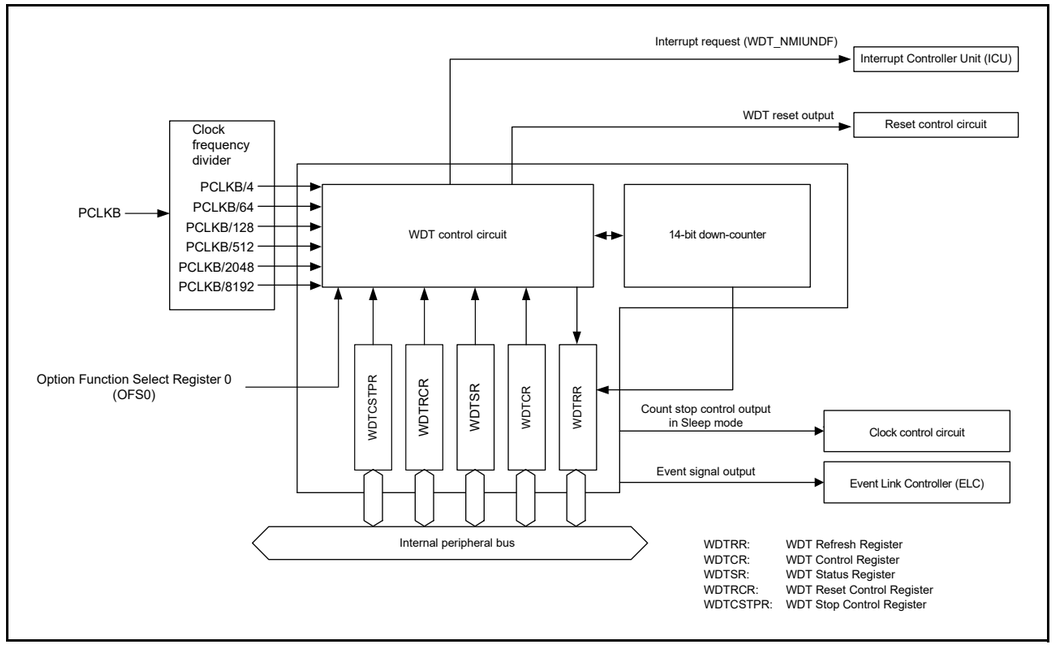


Figure 27.1 WDT block diagram

27.2 Register Descriptions

27.2.1 WDT Refresh Register (WDTRR)

Address(es): WDT.WDTRR 4004 4200h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

Bit	Description	R/W
b7 to b0	The down-counter is refreshed by writing 00h and then writing FFh to this register	R/W

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 00h and then writing FFh to WDTRR (refresh operation) within the refresh-permitted period.

After the down-counter is refreshed, it starts counting down from the value selected in the WDT Timeout Period Select bits (OFS0.WDTTOPS[1:0]) in the Option Function Select Register 0 in auto start mode. In register start mode, counting down starts from the value selected in the Timeout Period Select bits (WDTCR.TOPS[1:0]) in the WDT Control Register.

When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh. For details on the refresh operation, see section 27.3.3, Refresh Operation.

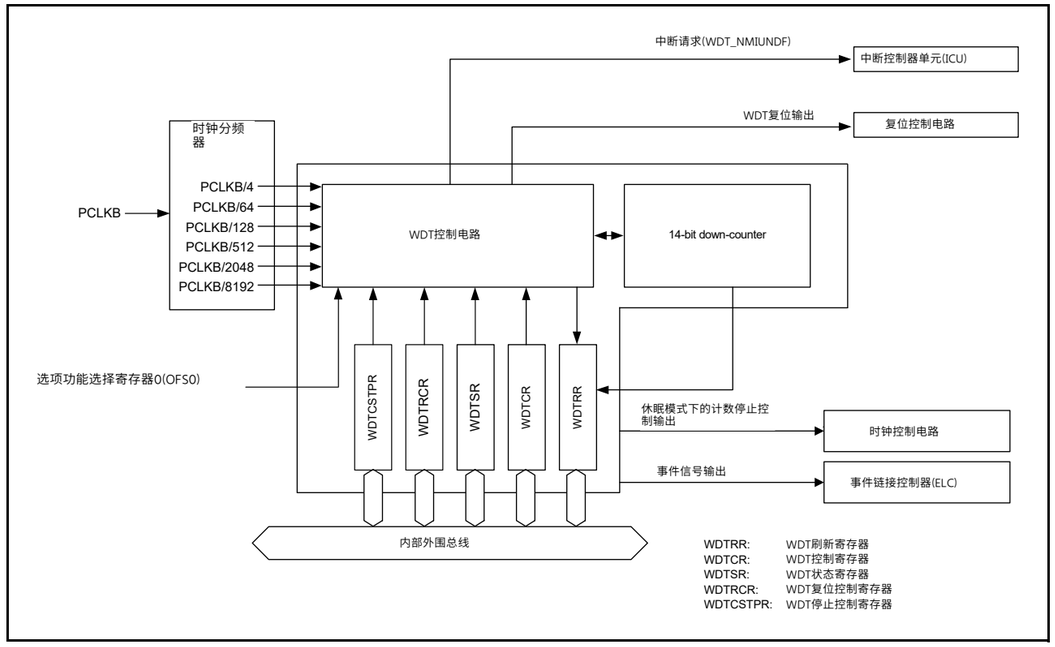

Figure 27.1 看门狗框图

27.2 注册说明

27.2.1 WDT刷新寄存器(WDTRR)

Address(es): WDT.WDTRR 4004 4200h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	1	1	1	1	1	1	1	1

Bit	Description	R/W
b7 to b0	通过写入00h然后将FFh写入该寄存器来刷新递减计数器	R/W

WDTRR寄存器刷新WDT的递减计数器。

WDT的递减计数器通过写入00h进行刷新，然后在允许刷新期间将FFh写入WDTRR（刷新操作）。

递减计数器刷新后，在自动启动模式下，它从选项功能选择寄存器0中的WDT超时周期选择位(OFS0.WDTTOPS[1:0])中选择的值开始递减计数。在寄存器启动模式下，倒计时从WDT控制寄存器的超时周期选择位(WDTCR.TOPS[1:0])中选择的值开始。

写入00h时，读取值为00h。写入00h以外的值时，读取值为FFh。有关刷新操作的详细信息，请参阅第27.3.3节，刷新操作。

27.2.2 WDT Control Register (WDTCR)

Address(es): WDT.WDTCR 4004 4202h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	RPSS[1:0]		—	—	RPES[1:0]		CKS[3:0]				—	—	TOPS[1:0]	
Value after reset:	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	1

Bit	Symbol	Bit name	Description	R/W
b1, b0	TOPS[1:0]	Timeout Period Select	b1 b0 0 0: 1024 cycles (03FFh) 0 1: 4096 cycles (0FFFh) 1 0: 8192 cycles (1FFFh) 1 1: 16384 cycles (3FFFh).	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7 to b4	CKS[3:0]	Clock Division Ratio Select	b7 b4 0 0 0 1: PCLKB/4 0 1 0 0: PCLKB/64 1 1 1 1: PCLKB/128 0 1 1 0: PCLKB/512 0 1 1 1: PCLKB/2048 1 0 0 0: PCLKB/8192. Other settings are prohibited.	R/W
b9, b8	RPES[1:0]	Window End Position Select	b9 b8 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (do not specify window end position).	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13, b12	RPSS[1:0]	Window Start Position Select	b13 b12 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (do not specify window start position).	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Some constraints apply to writes to the WDTCR register. For details, see section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the settings in the WDTCR register are disabled, and the settings in the Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made for the OFS0 register. For details, see section 27.3.7, Association between Option Function Select Register 0 (OFS0) and WDT Registers.

TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

Table 27.2 lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

27.2.2 WDT控制寄存器(WDTCR)

Address(es): WDT.WDTCR 4004 4202h

b11, b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b13, b12	RPSS[1:0]	窗口起始位置选择	b13b1200:25%01:50%10:75%11:100%（不指定窗口起始位置）。	R/W
b15, b14	—	Reserved	这些位被读取为0。写入值应为0。	R/W

一些限制适用于写入WDTCR寄存器。有关详细信息，请参阅第27.3.2节，控制对WDTCR、WDTRCR和WDTCSTPR寄存器。

在自动启动模式下，WDTCR寄存器中的设置被禁用，OptionFunctionSelect中的设置使能寄存器0(OFS0)。WDTCR寄存器的设置也可以对OFS0寄存器进行。有关详细信息，请参阅第27.3.7节，选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联。

TOPS[1:0]位（超时周期选择）

TOPS[1:0]位从1024、4096、8192和16384个周期中选择超时周期，即递减计数器下溢之前的周期，将CKS[3:0]位中指定的分频时钟作为1个周期.向下计数器刷新后，CKS[3:0]和TOPS[1:0]位的组合决定了PCLKB周期数，直到计数器下溢。

表27.2列出了CKS[3:0]和TOPS[1:0]位设置、超时时间和PCLKB cycles.

Table 27.2 Timeout period settings

CKS[3:0] bits				TOPS[1:0] bits		Clock division ratio	Timeout period (number of cycles)	PCLKB clock cycles
b7	b6	b5	b4	b1	b0			
0	0	0	1	0	0	PCLKB/4	1024	4096

				0	1		4096	524288
				1	0		8192	1048576
				1	1		16384	2097152
0	1	1	0	0	0	PCLKB/512	1024	524288
				0	1		4096	2097152
				1	0		8192	4194304
				1	1		16384	8388608
0	1	1	1	0	0	PCLKB/2048	1024	2097152
				0	1		4096	8388608
				1	0		8192	16777216
				1	1		16384	33554432
1	0	0	0	0	0	PCLKB/8192	1024	8388608
				0	1		4096	33554432
				1	0		8192	67108864
				1	1		16384	134217728

CKS[3:0] bits (Clock Division Ratio Select)

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the peripheral clock (PCLKB) divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, a count period between 4096 and 134217728 PCLKB clock cycles can be selected for the WDT.

RPES[1:0] bits (Window End Position Select)

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. The selected window end position should be a value less than the value for the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

RPSS[1:0] bits (Window Start Position Select)

The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. The selected window start position should be a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window end position is set to 0%.

Table 27.3 lists the counter values for the window start and end positions, and Figure 27.2 shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 27.2 超时时间设置

CKS[3:0] bits				TOPS[1:0] bits		时钟分频比	超时时间（周期数）	PCLKB时钟周期
b7	b6	b5	b4	b1	b0			
0	0	0	1	0	0	PCLKB/4	1024	4096
				0	1		4096	16384
				1	0		8192	32768
				1	1		16384	65536
0	1	0	0	0	0	PCLKB/64	1024	65536
				0	1		4096	262144
				1	0		8192	524288
				1	1		16384	1048576
1	1	1	1	0	0	PCLKB/128	1024	131072
				0	1		4096	524288
				1	0		8192	1048576
				1	1		16384	2097152
0	1	1	0	0	0	PCLKB/512	1024	524288
				0	1		4096	2097152
				1	0		8192	4194304
				1	1		16384	8388608
0	1	1	1	0	0	PCLKB/2048	1024	2097152
				0	1		4096	8388608
				1	0		8192	16777216
				1	1		16384	33554432
1	0	0	0	0	0	PCLKB/8192	1024	8388608
				0	1		4096	33554432
				1	0		8192	67108864
				1	1		16384	134217728

CKS[3:0]位（时钟分频比选择）

CKS[3:0]位指定用于递减计数器的时钟的分频比。分频比可以从外设时钟（PCLKB）除以4、64、128、512、2048和8192中选择。结合TOPS[1:0]位设置，计数周期在4096到134217728个PCLKB时钟周期之间可以为WDT选择。

RPES[1:0]位（窗口结束位置选择）

RPES[1:0]位指定指示刷新允许周期的窗口结束位置。可以为窗口结束位置选择75%、50%、25%或0%的超时时间。所选窗口结束位置的值应小于窗口开始位置的值（窗口开始位置>窗口结束位置）。如果窗口结束位置大于窗口起始位置，则仅启用窗口起始位置设置。

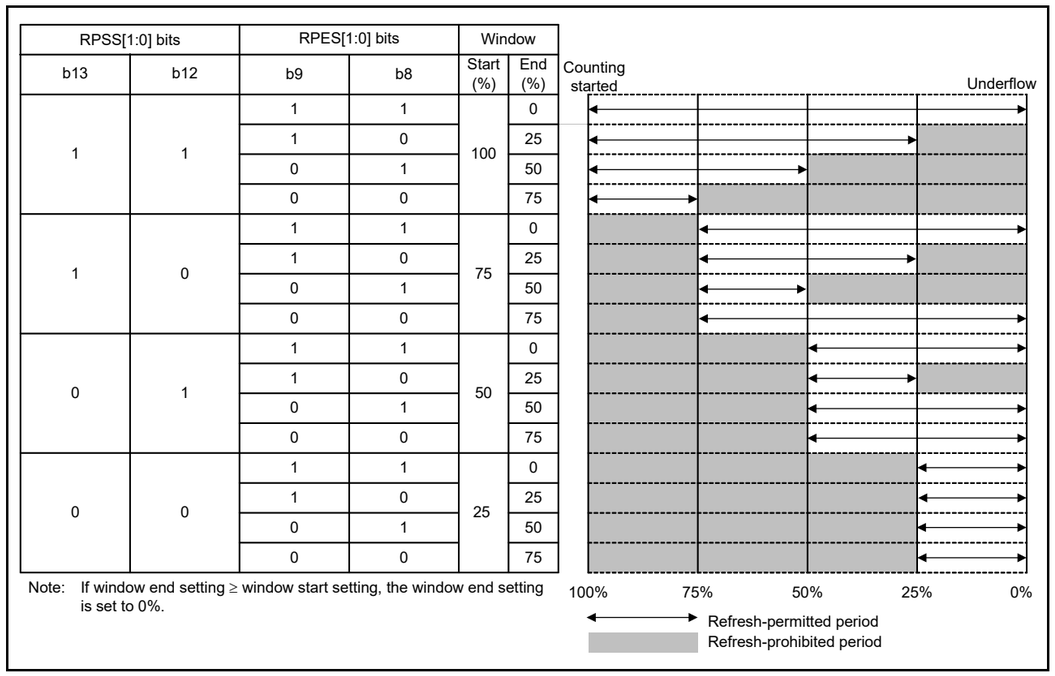
RPSS[1:0]位（窗口起始位置选择）

RPSS[1:0]位指定指示允许刷新周期的窗口起始位置。窗口起始位置可选择100%、75%、50%或25%的超时时间。所选窗口开始位置的值应大于窗口结束位置的值。如果窗口开始位置设置为小于或等于窗口结束位置的值，则窗口结束位置设置为0%。

表27.3列出了窗口开始和结束位置的计数器值，图27.2显示了在RPSS[1:0]、RPES[1:0]和TOPS[1:0]位中设置的允许刷新周期。

Table 27.3 Relationship between the timeout period and window start and end counter values

TOPS[1:0] bits		Timeout period		Window start and end counter value			
		Cycles	Counter value	100%	75%	50%	25%
0	0	1024	03FFh	03FFh	02FFh	01FFh	00FFh
0	1	4096	0FFFh	0FFFh	0BFFh	07FFh	03FFh
1	0	8192	1FFFh	1FFFh	17FFh	0FFFh	07FFh
1	1	16384	3FFFh	3FFFh	2FFFh	1FFFh	0FFFh



Note: If window end setting ≥ window start setting, the window end setting is set to 0%.

Note 1. 只能写入0来清除标志。

RA生态工作室

CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the down-counter. A value of 1 indicates that the down-counter underflowed. Write 0 to the UNDFF flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFF flag takes (N + 1) PCLKB cycles. In addition, clearing of the flag is ignored for (N + 1) PCLKB cycles after an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0001b, N = 4
- When WDTCR.CKS[3:0] = 0100b, N = 64
- When WDTCR.CKS[3:0] = 1111b, N = 128
- When WDTCR.CKS[3:0] = 0110b, N = 512
- When WDTCR.CKS[3:0] = 0111b, N = 2048
- When WDTCR.CKS[3:0] = 1000b, N = 8192.

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred. A value of 1 indicates that a refresh error occurred. Write 0 to the REFEF flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N + 1) PCLKB cycles. In addition, clearing of the flag is ignored for (N + 1) PCLKB cycles following a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0001b, N = 4
- When WDTCR.CKS[3:0] = 0100b, N = 64
- When WDTCR.CKS[3:0] = 1111b, N = 128
- When WDTCR.CKS[3:0] = 0110b, N = 512
- When WDTCR.CKS[3:0] = 0111b, N = 2048
- When WDTCR.CKS[3:0] = 1000b, N = 8192.

27.2.4 WDT Reset Control Register (WDTRCR)

Address(es): WDT.WDTRCR 4004 4206h

	b7	b6	b5	b4	b3	b2	b1	b0
	RSTIRQS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	RSTIRQS	Reset Interrupt Request Select	0: Non-maskable interrupt request or interrupt request output is enabled 1: Reset output is enabled.	R/W

Some constraints apply to writes to the WDTRCR register. For details, see section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the WDTRCR register settings are disabled, and the settings in the Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made for the OFS0 register. For details, see section 27.3.7, Association between Option Function Select Register 0 (OFS0) and WDT Registers.

CNTVAL[13:0]位（递减计数器值）

读取CNTVAL[13:0]位以确认递减计数器的值。读取的值可能与实际计数相差1。

UNDFF flag (Underflow Flag)

读取UNDFF标志以确认递减计数器中是否发生下溢。值1表示递减计数器下溢。将0写入UNDFF标志以将值设置为0。写入1无效。

清除UNDFF标志需要(N+1)个PCLKB周期。此外，在下溢后(N+1)个PCLKB周期内忽略标志的清除。N在WDTCR.CKS[3:0]位中指定如下：

- When WDTCR.CKS[3:0] = 0001b, N = 4
- When WDTCR.CKS[3:0] = 0100b, N = 64
- When WDTCR.CKS[3:0] = 1111b, N = 128
- When WDTCR.CKS[3:0] = 0110b, N = 512
- When WDTCR.CKS[3:0] = 0111b, N = 2048
- When WDTCR.CKS[3:0] = 1000b, N = 8192.

REFEF标志（刷新错误标志）

读取REFEF标志以确认是否发生刷新错误。值1表示发生了刷新错误。
将0写入REFEF标志以将值设置为0。写入1无效。

清除REFEF标志需要(N+1)个PCLKB周期。此外，在刷新错误后的(N+1)个PCLKB周期内，标志的清除将被忽略。N在WDTCR.CKS[3:0]位中指定如下：

- When WDTCR.CKS[3:0] = 0001b, N = 4
- When WDTCR.CKS[3:0] = 0100b, N = 64
- When WDTCR.CKS[3:0] = 1111b, N = 128
- When WDTCR.CKS[3:0] = 0110b, N = 512
- When WDTCR.CKS[3:0] = 0111b, N = 2048
- When WDTCR.CKS[3:0] = 1000b, N = 8192.

27.2.4 WDT复位控制寄存器(WDTRCR)

Address(es): WDT.WDTRCR 4004 4206h

	b7	b6	b5	b4	b3	b2	b1	b0
	RSTIRQS	—	—	—	—	—	—	—
重置后的值：	1	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b6 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	RSTIRQS	复位中断请求选择	0：使能不可屏蔽中断请求或中断请求输出1：使能复位输出。	R/W

一些限制适用于写入WDTRCR寄存器。有关详细信息，请参阅第27.3.2节，控制对WDTCR、WDTRCR和WDTCSTPR寄存器。

在自动启动模式下，WDTRCR寄存器设置被禁用，而选项功能选择寄存器0(OFS0)中的设置被启用。WDTCR寄存器的设置也可以对OFS0寄存器进行。有关详细信息，请参阅第27.3.7节，选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联。

27.2.5 WDT Count Stop Control Register (WDTCSTPR)

Address(es): WDT.WDTCSTPR 4004 4208h

	b7	b6	b5	b4	b3	b2	b1	b0
	SLCSTP	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	SLCSTP	Sleep-Mode Count Stop Control	0: Count stop is disabled 1: Count is stopped when transition to Sleep mode.	R/W

The WDTCSTPR register controls whether to stop the WDT counter in a low power mode. Some restrictions apply to writes to the WDTCSTPR register. For details, see section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the WDTCSTPR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSTPR register can also be made for the OFS0 register. For details, see section 27.3.7, Association between Option Function Select Register 0 (OFS0) and WDT Registers.

SLCSTP bit (Sleep-Mode Count Stop Control)

The SLCSTP bit selects whether to stop counting when transition to Sleep mode.

27.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see section 27.3.7, Association between Option Function Select Register 0 (OFS0) and WDT Registers.

27.3 Operation

27.3.1 Count Operation in each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting is started with a refresh by writing to the register.

In auto start mode, counting automatically starts after a release from the reset state based on the settings in the Option Function Select Register 0 (OFS0) in the flash.

In register start mode, counting starts with a refresh by writing to the register after the respective registers are set after a release from the reset state.

Select auto start mode or register start mode by setting the WDT Start Mode Select bit (OFS0.WDTSTRT) in the OFS0 register. When the auto start mode is selected, the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are disabled, while the settings in the OFS0 register are enabled.

When the register start mode is selected, the OFS0 register setting is disabled while the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are enabled.

27.3.1.1 Register start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) is 1, register start mode is selected and the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are enabled.

After the reset state is released, set the following to Sleep mode in the WDTCSTPR register:

27.2.5 WDT计数停止控制寄存器(WDTCSTPR)

Address(es): WDT.WDTCSTPR 4004 4208h

	b7	b6	b5	b4	b3	b2	b1	b0
	SLCSTP	—	—	—	—	—	—	—
重置后的值：	1	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b6 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	SLCSTP	睡眠模式计数停止控制	0：禁止计数停止1：转换到睡眠模式时停止计数。	R/W

WDTCSTPR寄存器控制是否在低功耗模式下停止WDT计数器。一些限制适用于写入WDTCSTPR寄存器。有关详细信息，请参见第27.3.2节，控制对WDTCR、WDTRCR和WDTCSTPR寄存器的写入。

在自动启动模式下，WDTCSTPR寄存器设置被禁用，而选项功能选择寄存器0(OFS0)中的设置被启用。也可以对OFS0寄存器进行WDTCSTPR寄存器的设置。有关详细信息，请参阅第27.3.7节，选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联。

SLCSTP位（休眠模式计数停止控制）

SLCSTP位选择在转换到休眠模式时是否停止计数。

27.2.6 选项功能选择寄存器0(OFS0)

有关OFS0寄存器的信息，请参见第27.3.7节，选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联。

27.3 Operation

27.3.1 每种启动模式下的计数操作

WDT有两种启动模式：

- 自动启动模式，从复位状态释放后自动开始计数
- 寄存器启动模式，在这种模式下，通过写入寄存器来启动计数。

在自动启动模式下，根据选项中的设置从复位状态释放后自动开始计数
功能选择闪存中的寄存器0(OFS0)。

在寄存器启动模式中，在从复位状态释放后，在设置各个寄存器后，通过写入寄存器来开始计数。

通过设置OFS0寄存器中的WDT启动模式选择位(OFS0.WDTSTRT)来选择自动启动模式或寄存器启动模式。选择自动启动模式后，WDT控制寄存器（WDTCR）中的设置，WDTRESET控制寄存器（WDTRCR）和WDT计数停止控制寄存器（WDTCSTPR）被禁用，而OFS0寄存器中的设置则启用。

选择寄存器启动模式时，在WDT控件中的设置时，禁用OFS0寄存器设置
使能寄存器(WDTCR)、WDT复位控制寄存器(WDTRCR)和WDT计数停止控制寄存器(WDTCSTPR)。

27.3.1.1 注册启动模式

当WDT启动模式选择位(OFS0.WDTSTRT)为1时，选择寄存器启动模式并且WDT控制
使能寄存器(WDTCR)、WDT复位控制寄存器(WDTRCR)和WDT计数停止控制寄存器(WDTCSTPR)。

释放复位状态后，在WDTCSTPR寄存器中将以下内容设置为休眠模式：

- Clock division ratio
- Window start and end positions
- Timeout period in the WDTCR register
- Reset output or interrupt request output in the WDTRCR register
- Counter stop control during transitions to Sleep mode in the WDTCSTPR register.

Refresh the down-counter to start counting down from the value set in the Timeout Period Select bits (WDTCR.TOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The WDT does not output the reset signal as long as counting continues. However, if the down-counter underflows because the down-counter cannot be refreshed because of a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs a reset signal or a non-maskable interrupt request/interrupt request (WDT_NMIUNDF). Reset output or interrupt request output can be selected in the WDT Reset Interrupt Request Select bit (WDTRCR.RSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 27.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.WDTSTRT = 1)
- Reset output is enabled (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b).

- 时钟分频比
- 窗口开始和结束位置
- WDTCR寄存器中的超时时间
- WDTRCR寄存器中的复位输出或中断请求输出
- 在WDTCSTPR寄存器中转换到休眠模式期间的计数器停止控制。

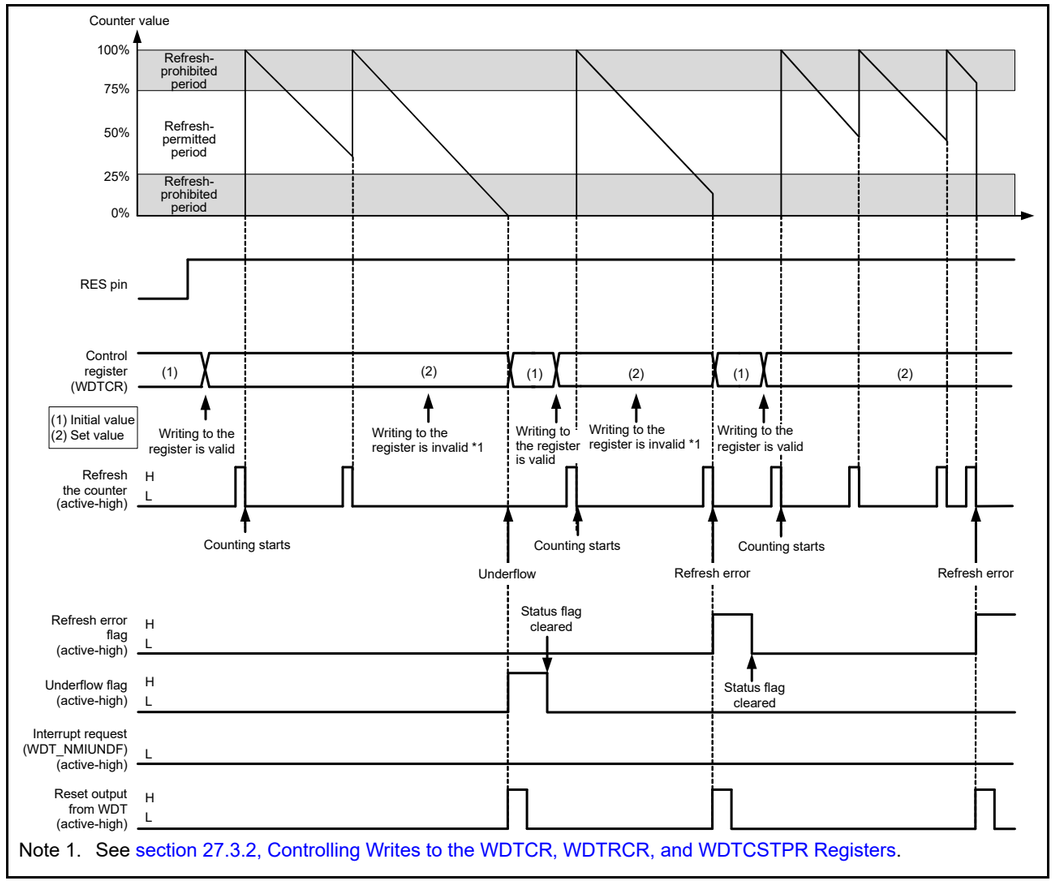
刷新递减计数器以从超时周期选择位(WDTCR.TOPS[1:0])中设置的值开始递减计数。

此后，只要在可刷新期间刷新计数器，每次刷新计数器时计数器中的值都会被重置，并继续递减计数。只要继续计数，WDT就不会输出复位信号。但是，如果由于程序失控而无法刷新递减计数器而导致递减计数器下溢，或者由于计数器在刷新允许时间之外刷新而发生刷新错误，则WDT会输出复位信号或非可屏蔽中断请求中断请求(WDT_NMIUNDF)。可以在WDT复位中断请求选择位(WDTRCR.RSTIRQS)中选择复位输出或中断请求输出。可以在WDT下溢刷新错误中断 允许位(NMIER.WDTEN)中选择不可屏蔽的中断请求或中断请求。

图27.3显示了以下条件下的操作示例：

- 寄存器启动模式（OFS0.WDTSTRT=1）
- 使能复位输出(WDTRCR.RSTIRQS=1）
- 窗口起始位置为75%(WDTCR.RPSS[1:0]=10b)
- 窗口结束位置为25%(WDTCR.RPES[1:0]=10b)。

RA生态工作室



Note 1. See section 27.3.2, Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

Figure 27.3 Operation example in register start mode

27.3.1.2 Auto start mode

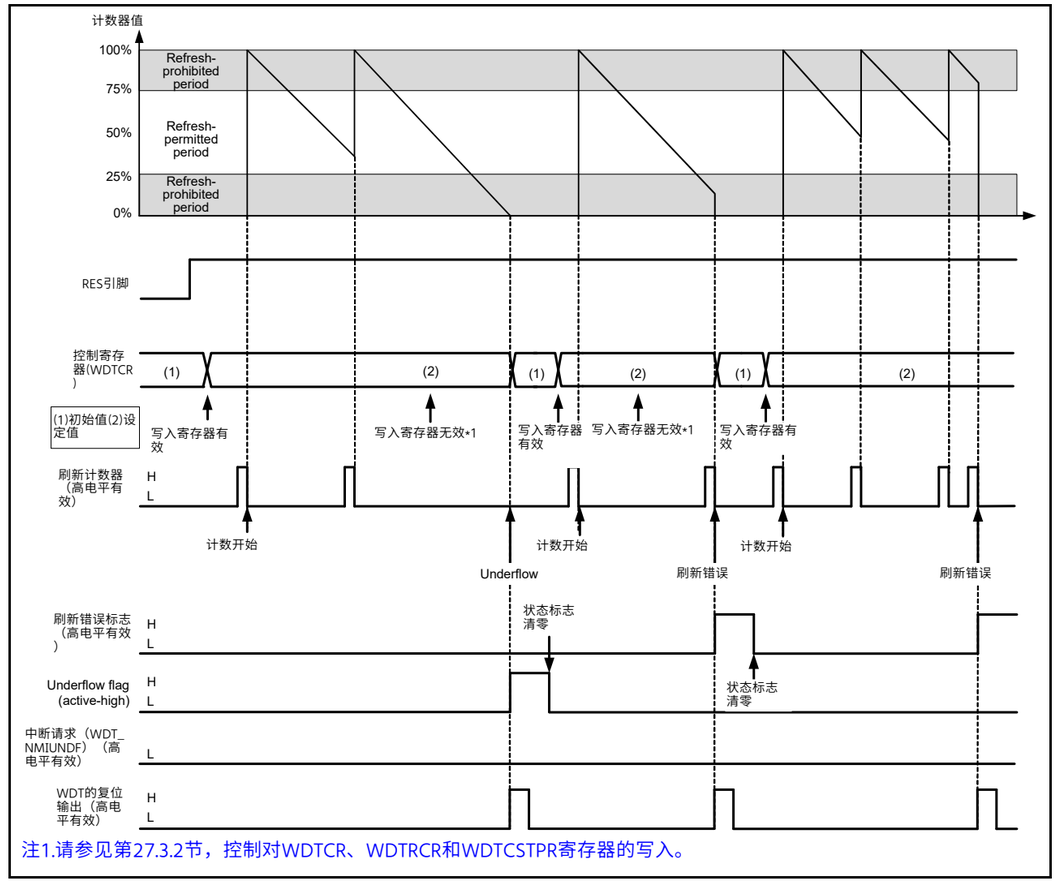
When the WDT Start Mode Select bit (OFS0.WDTSTRT) in the Option Function Select Register 0 (OFS0) is 0, auto start mode is selected. The WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are disabled while the settings in the OFS0 register are enabled.

Within the reset state, the following values in the Option Function Select Register 0 (OFS0) are set in the WDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control on transition to Sleep mode.

When the reset state is released, the down-counter automatically starts counting down from the value set in the WDT Timeout Period Select bits (OFS0.WDTTOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The WDT does not output the reset signal as long as the counting continues. However, if the down-counter underflows because refreshing of the down-counter is not possible due to a runaway program or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the



注1.请参见第27.3.2节，控制对WDTCR、WDTRCR和WDTCSTPR寄存器的写入。

Figure 27.3 寄存器启动模式下的操作示例

27.3.1.2 自动启动模式

当WDT启动模式选择位置（OFS0.WDTSTRT）中的选项功能选择寄存器0（OFS0）为0时，选择了自动启动模式。WDT控制寄存器(WDTCR)、WDT复位控制寄存器(WDTRCR)和WDT计数停止控制寄存器(WDTCSTPR)被禁用，而OFS0寄存器中的设置被启用。

在复位状态下，选项功能选择寄存器0(OFS0)中的以下值在WDT寄存器中设置：

- 时钟分频比
- 窗口开始和结束位置
- 超时时间
- 复位输出或中断请求
- 转换到睡眠模式时的计数器停止控制。

当复位状态解除时，递减计数器自动从WDT中设置的值开始递减计数
超时周期选择位(OFS0.WDTTOPS[1:0])。

此后，只要在可刷新期间刷新计数器，每次刷新计数器时计数器中的值都会被重置，并继续递减计数。只要继续计数，WDT就不会输出复位信号。但是，如果由于程序失控而无法刷新递减计数器而导致递减计数器下溢，或者如果由于刷新允许刷新时间之外的刷新而发生刷新错误，则WDT输出

RA生态工作室

reset signal or non-maskable interrupt request/interrupt request (WDT_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle. The value of the timeout period is set in the down-counter and counting restarts.

Reset output or interrupt request output can be selected in the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 27.4 shows an example of operation (non-maskable interrupt) under the following conditions:

- Auto start mode (OFS0.WDTSTRT = 0)
- Non-maskable interrupt request output is enabled (OFS0.WDTRSTIRQS = 0)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b).

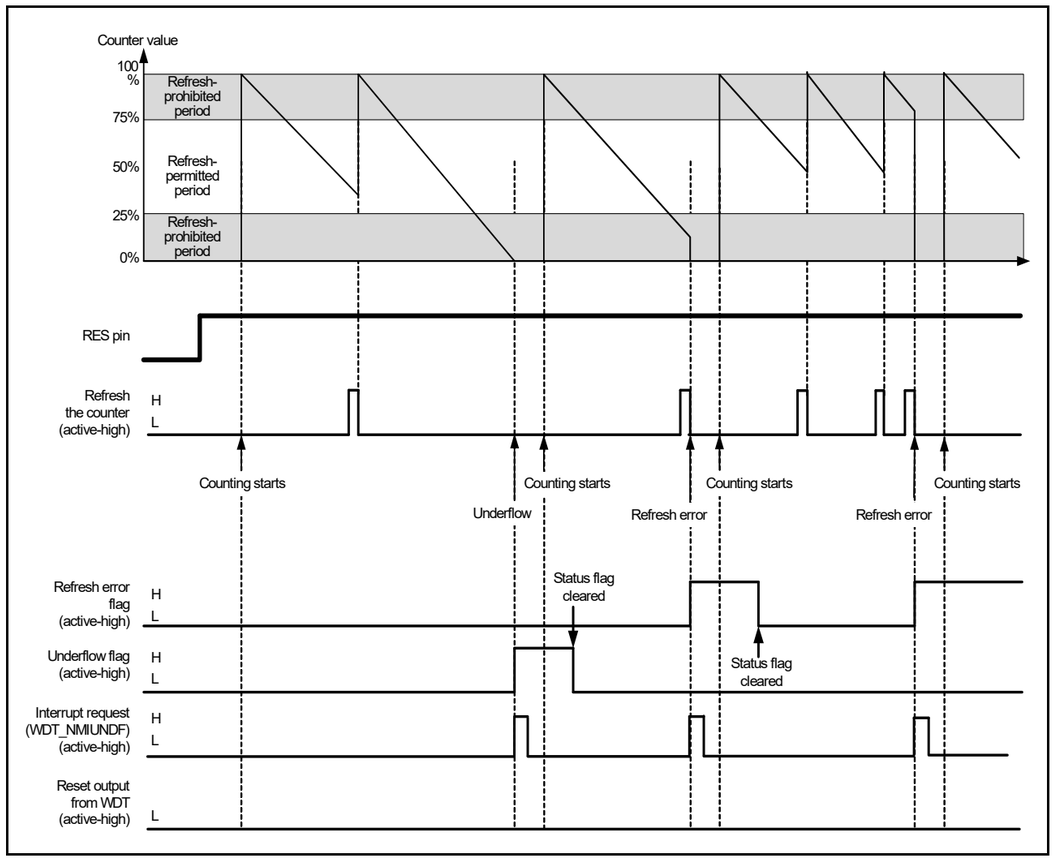


Figure 27.4 Operation example in auto start mode

27.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers

Writing to the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), or WDT Count Stop Control Register (WDTCSTPR) is possible once between the release from the reset state and the first refresh operation.

After a refresh (counting starts) or a write to WDTCR, WDTRCR or WDTCSTPR, the protection signal in the WDT becomes 1 to protect WDTCR, WDTRCR and WDTCSTPR against subsequent write attempts. This protection is released by a reset source of the WDT. With other reset sources, the protection is not released.

复位信号或不可屏蔽中断请求中断请求(WDT_NMIUNDF)。

复位信号或不可屏蔽中断请求中断请求产生后，计数器在计数1个周期后重新加载超时周期。超时时间的值在递减计数器中设置并重新开始计数。

可以在WDT复位中断请求选择位(OFS0.WDTRSTIRQS)中选择复位输出或中断请求输出。可以在WDT下溢刷新错误中断　　允许位(NMIER.WDTEN)中选择不可屏蔽的中断请求或中断请求。

图27.4显示了以下条件下的操作示例（不可屏蔽中断）：

- 自动启动模式（OFS0.WDTSTRT=0）
- 使能不可屏蔽中断请求输出(OFS0.WDTRSTIRQS=0)
- 窗口起始位置为75%(WDTCR.RPSS[1:0]=10b)
- 窗口结束位置为25%(WDTCR.RPES[1:0]=10b)。

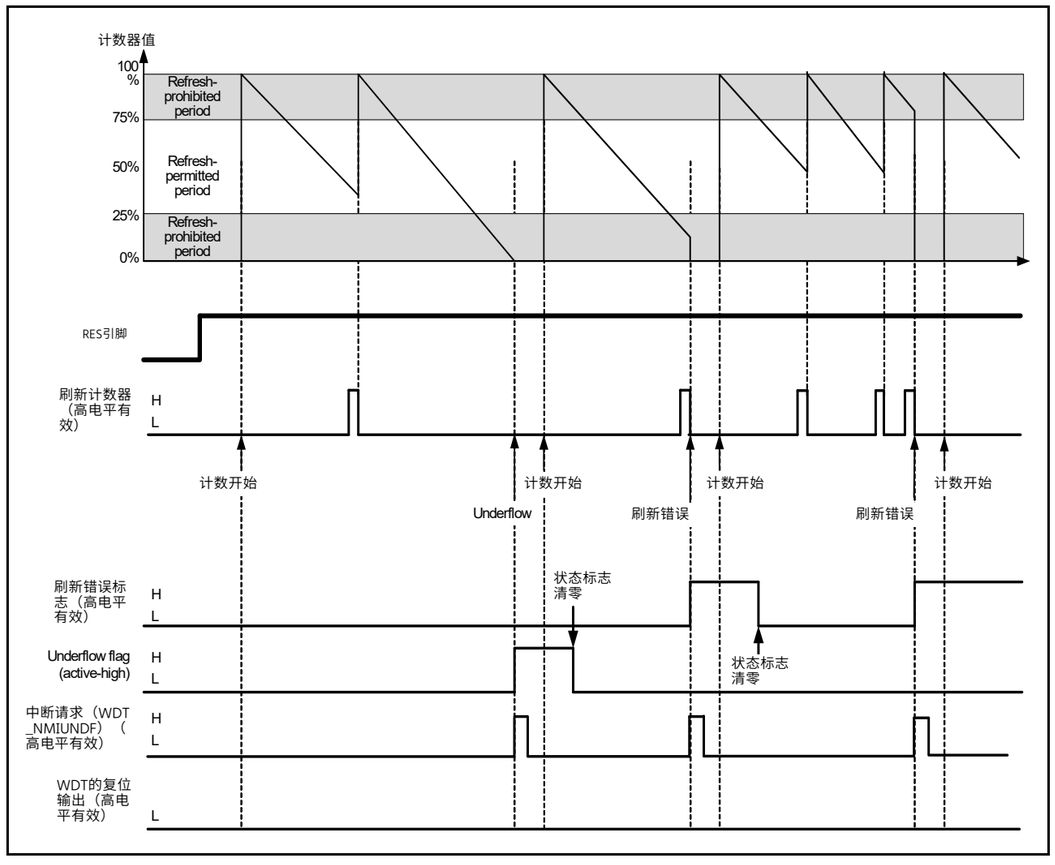

Figure 27.4 自动启动模式下的操作示例

27.3.2 控制对WDTCR、WDTRCR和WDTCSTPR寄存器的写入

写入WDT控制寄存器(WDTCR)、WDT复位控制寄存器(WDTRCR)或WDT计数停止控制寄存器(WDTCSTPR)在从复位状态释放到第一次刷新操作之间是可能的。

在刷新（计数开始）或写入WDTCR、WDTRCR或WDTCSTPR后，WDT中的保护信号变为1，以保护WDTCR、WDTRCR和WDTCSTPR免受后续写入尝试。该保护由WDT的复位源解除。使用其他复位源时，不会解除保护。

RA生态工作室

Figure 27.5 shows control waveforms produced in response to writing to the WDTCR.

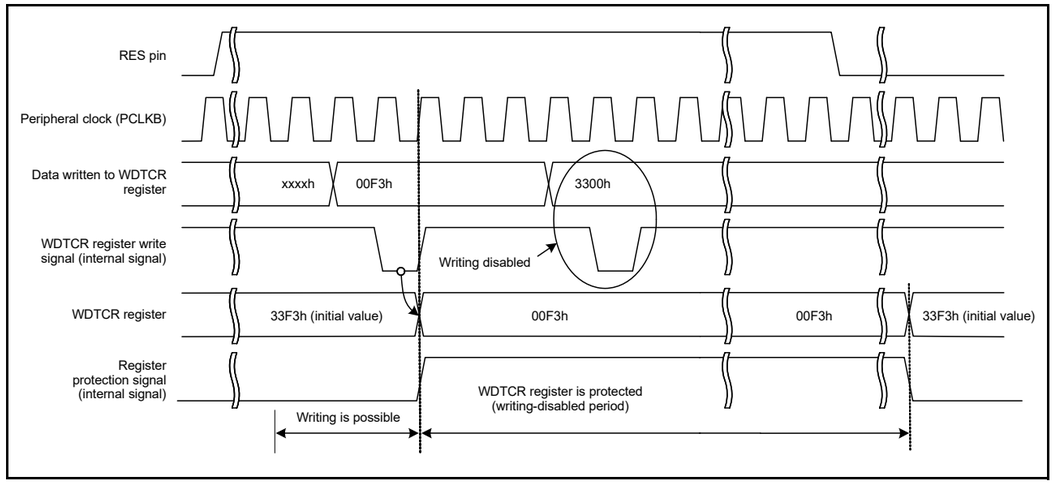

Figure 27.5 Control waveforms produced in response to writes to the WDTCR register

27.3.3 Refresh Operation

The down-counter is refreshed by writing the values 00h and FFh to the WDT Refresh Register (WDTRR). If a value other than FFh is written after 00h, the down-counter is not refreshed. If an invalid value is written, correct refreshing resumes by writing 00h and FFh to the WDTRR register.

Correct refreshing is performed when a register other than WDTRR is accessed or when WDTRR is read between writing 00h and writing FFh to WDTRR.

Writing to refresh the counter must be performed within the refresh-permitted period, and whether this is done is determined by writing FFh. For this reason, correct refreshing is performed even when 00h is written outside the refresh-permitted period.

[Example write sequences that are valid when refreshing the counter]

- 00h → FFh
- 00h ((n - 1)th time) → 00h (nth time) → FFh
- 00h → access to another register or read from WDTRR → FFh.

[Example write sequences that are invalid when refreshing the counter]

- 23h (a value other than 00h) → FFh
- 00h → 54h (a value other than FFh)
- 00h→ AAh (00h and a value other than FFh) → FFh.

After FFh is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 cycles of the signal for counting. To meet this requirement, complete writing FFh to WDTRR 4 cycle counts before the down-counter underflows.

Figure 27.6 shows the WDT refresh-operation waveforms when the clock division ratio is PCLKB/64.

图27.5显示了响应写入WDTCR产生的控制波形。

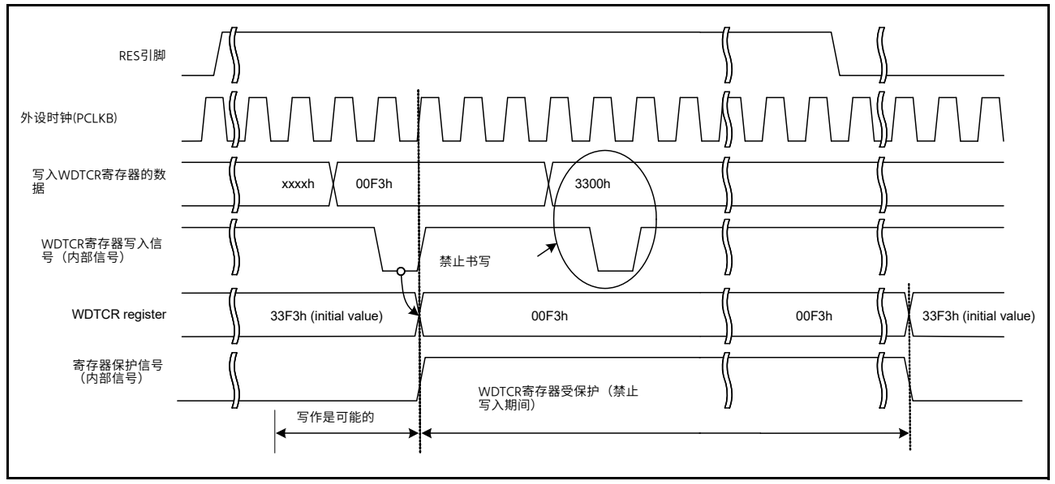

Figure 27.5 响应写入WDTCR寄存器而产生的控制波形

27.3.3 刷新操作

通过将值00h和FFh写入WDT刷新寄存器(WDTRR)来刷新递减计数器。如果在00h之后写入FFh以外的值，则不刷新递减计数器。如果写入无效值，则通过将00h和FFh写入WDTRR寄存器来恢复正确刷新。

当访问WDTRR以外的寄存器或在写入00h和将FFh写入WDTRR之间读取WDTRR时，执行正确刷新。

刷新计数器的写入必须在可刷新期间内执行，是否执行由写入FFh决定。因此，即使在允许刷新期间之外写入00h，也会执行正确的刷新。

[刷新计数器时有效的示例写入序列]

- 00h → FFh
- 00h ((n - 1)th time) → 00h (nth time) → FFh
- 00h→访问另一个寄存器或从WDTRR→FFh读取。

[刷新计数器时无效的写入序列示例]

- 23h（00h以外的值）→FFh
- 00h→54h（FFh以外的值）
- 00h→AAh（00h和FFh以外的值）→FFh。

将FFh写入WDT刷新寄存器(WDTRR)后，刷新递减计数器最多需要4个信号周期进行计数。为满足此要求，请在递减计数器下溢之前将FFh写入WDTRR4个周期计数。

图27.6显示了时钟分频比为PCLKB64时的WDT刷新操作波形。

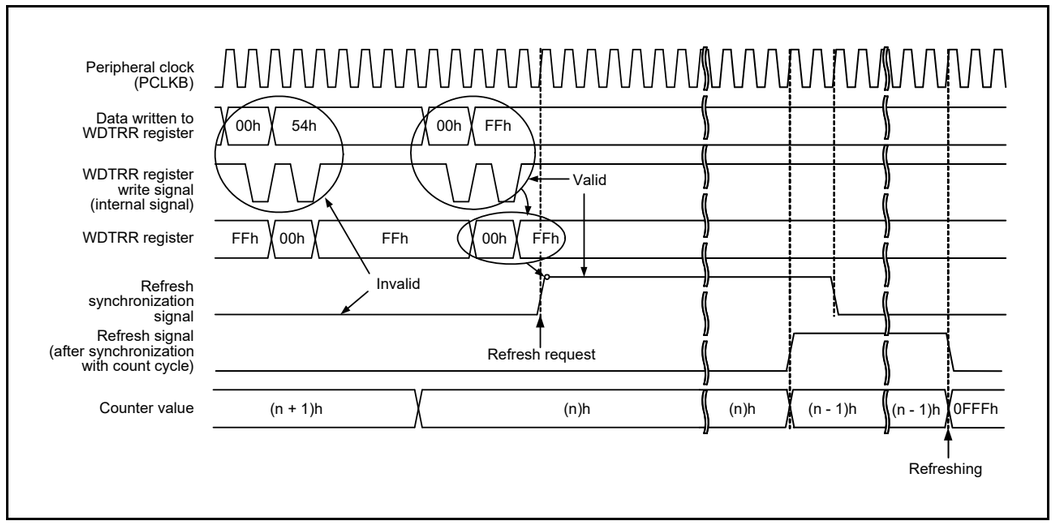

Figure 27.6 WDT refresh operation waveforms when WDTCR.CKS[3:0] = 0100b and WDTCR.TOPS[1:0] = 01b

27.3.4 Reset Output

When the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) is set to 1 in register start mode, or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1 in auto start mode, a reset signal is output for 1 cycle count when an underflow in the down-counter or a refresh error occurs.

In register start mode, the down-counter is initialized (all bits set to 0) and stopped in that state after output of a reset signal. After the reset state is released and the program is restarted, the counter is set up and counting down starts again with a refresh. In auto start mode, counting down starts automatically after the reset state is released.

27.3.5 Interrupt Sources

When the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) is set to 0 in register start mode or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0 in auto start mode, an interrupt signal (WDT_NMIUNDF) is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see section 14, Interrupt Controller Unit (ICU).

Table 27.4 WDT interrupt sources

Name	Interrupt source	DTC activation	DMAC activation
WDT_NMIUNDF	• Down-counter underflow • Refresh error.	Not possible	Not possible

27.3.6 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) in the WDT Status Register. Check these bits to obtain the counter value.

Figure 27.7 shows the processing for reading the WDT down-counter value when the clock division ratio is PCLKB/64.

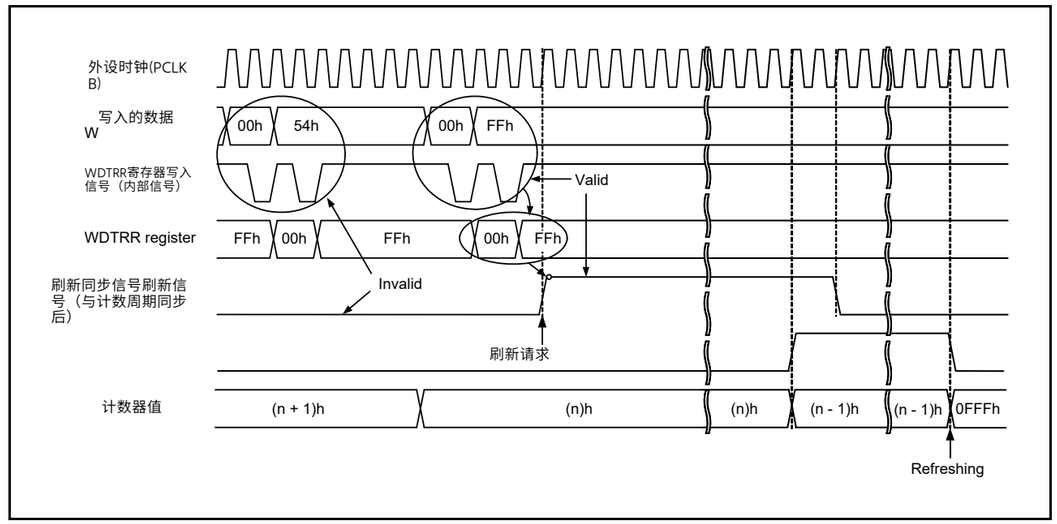

Figure 27.6 WDTCR.CKS[3:0]=0100b和WDTCR.TOPS[1:0]=01b时的WDT刷新操作波形

27.3.4 复位输出

当重置中断请求选择位（wdtrcr.rstirqs）在寄存器开始模式下设置为1，或者在wdtrepreptinterrupt请求中选择位（ofs0.wdtrstirqs）在选项函数函数选择寄存器0（OFS0）中设置为1in在自动启动模式下，当递减计数器下溢或发生刷新错误时，会在1个周期计数内输出复位信号。

在寄存器启动模式下，递减计数器被初始化（所有位设置为0）并在输出复位信号后停止在该状态。复位状态解除并重新启动程序后，计数器设置并通过刷新重新开始倒计时。在自动启动模式下，复位状态解除后自动开始倒计时。

27.3.5 中断源

当在寄存器启动模式下复位中断请求选择位(WDTRCR.RSTIRQS)设置为0或WDT
在自动启动模式下，选项功能选择寄存器0(OFS0)中的复位中断请求选择位(OFS0.WDTRSTIRQS)设置为0，当计数器下溢或发生刷新错误时会产生中断信号(WDT_NMIUNDF)。此中断可用作不可屏蔽中断或中断。有关详细信息，请参阅第14节，中断控制器单元(ICU)。

Table 27.4 WDT中断源

Name	中断源	DTC activation	DMAC activation
WDT_NMIUNDF	递减计数器下溢 刷新错误 。	不可能	不可能

27.3.6 读取递减计数器值

WDT将计数器值存储在WDT状态的递减计数器值位(WDTSR.CNTVAL[13:0])中
登记。检查这些位以获得计数器值。

图27.7显示了当时钟分频比为PCLKB64时读取WDT递减计数器值的处理。

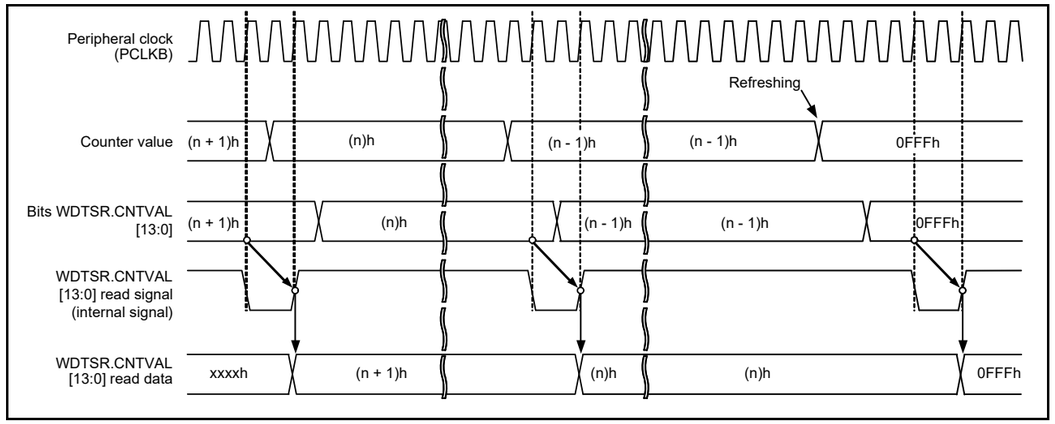

Figure 27.7 Processing for reading WDT down-counter value when WDTCR.CKS[3:0] = 0100b and WDTCR.TOPS[1:0] = 01b

27.3.7 Association between Option Function Select Register 0 (OFS0) and WDT Registers

Table 27.5 lists the association between the Option Function Select Register 0 (OFS0) used in auto start mode, and the registers used in register start mode. Do not change the OFS0 register settings during WDT operation. For details on the Option Function Select Register 0 (OFS0), see section 7, Option Function Select Register 0 (OFS0).

Table 27.5 Association between Option Function Select Register 0 (OFS0) and the WDT registers

Control target	Function	OFS0 register (enabled in auto start mode) OFS0.WDTSTRT = 0	WDT registers (enabled in register start mode) OFS0.WDTSTRT = 1
Down-counter	Timeout period select	OFS0.WDTTOPS[1:0]	WDTCR.TOPS[1:0]
	Clock division ratio select	OFS0.WDTCKS[3:0]	WDTCR.CKS[3:0]
	Window start position select	OFS0.WDTRPSS[1:0]	WDTCR.RPSS[1:0]
	Window end position select	OFS0.WDTRPES[1:0]	WDTCR.RPES[1:0]
Reset output or interrupt request output	Reset output or interrupt request output select	OFS0.WDTRSTIRQS	WDTRCR.RSTIRQS
Count stop	Sleep-mode count stop control	OFS0.WDTSTPCTL	WDTCSTPR.SLCSTP

27.4 Link Operation by ELC

The WDT is capable of a link operation for the previously specified module when interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow or refresh error.

An event signal is output regardless of the setting in the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) in register start mode or the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in auto start mode. An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (WDTSR.REFEF) or Underflow flag (WDTSR.UNDFF) is 1. For details, see section 19, Event Link Controller (ELC).

27.5 Usage Notes

27.5.1 ICU Event Link Setting Register n (IELSRn) Setting

Setting 47h to the ICU Event Link Setting Register n (IELSRn.IELS[8:0] bits) is prohibited when enabling the WDT reset assertion (OFS0.WDTRSTIRQS = 1 or WDTRCR.RSTIRQS = 1), or when enabling the event link operation (47h is set to ELSRm.ELS[8:0]).

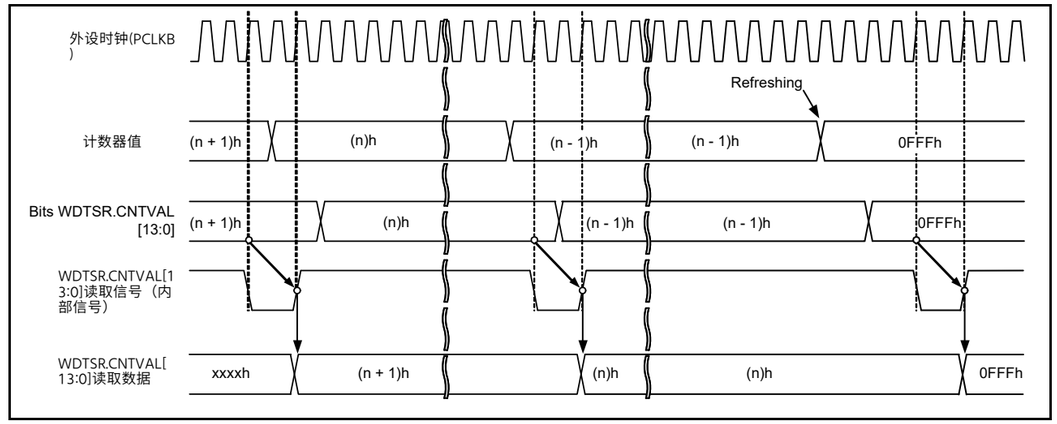

Figure 27.7 当WDTCR.CKS[3:0]=0100b和WDTCR.TOPS[1:0] = 01b

27.3.7 选项功能选择寄存器0(OFS0)和WDT之间的关联 Registers

表27.5列出了用于自动启动模式的选项功能选择寄存器0(OFS0)和用于寄存器启动模式的寄存器之间的关联。请勿在WDT操作期间更改OFS0寄存器设置。有关选项功能选择寄存器0(OFS0)的详细信息，请参见第7节，选项功能选择寄存器0(OFS0)。

Table 27.5 选项功能选择寄存器0(OFS0)和WDT寄存器之间的关联

控制目标	Function	OFS0寄存器（在自动启动模式下启用）OFS0.WDTSTRT=0	WDT寄存器（在寄存器启动模式下启用）OFS0.WDTSTRT=1
Down-counter	超时时间选择	OFS0.WDTTOPS[1:0]	WDTCR.TOPS[1:0]
	时钟分频比选择	OFS0.WDTCKS[3:0]	WDTCR.CKS[3:0]
	窗口起始位置选择	OFS0.WDTRPSS[1:0]	WDTCR.RPSS[1:0]
	窗口结束位置选择	OFS0.WDTRPES[1:0]	WDTCR.RPES[1:0]
复位输出或中断请求输出	复位输出或中断请求输出选择	OFS0.WDTRSTIRQS	WDTCR.RSTIRQS
计数停止	睡眠模式计数停止控制	OFS0.WDTSTPCTL	WDTCSTPR.SLCSTP

27.4 ELC的链接操作

当ELC将中断请求信号用作事件信号时，WDT能够对先前指定的模块进行链接操作。事件信号由计数器下溢或刷新错误输出。

无论寄存器启动模式下的复位中断请求选择位(WDTRCR.RSTIRQS)或自动启动模式下的WDT复位中断请求选择位(OFS0.WDTRSTIRQS)的设置如何，都会输出事件信号。当刷新错误标志(WDTSR.REFEF)或下溢标志(WDTSR.UNDFF)为1时，也可以在产生下一个中断源时输出事件信号。有关详细信息，请参阅第19节，事件链接控制器(ELC)。

27.5 使用说明

27.5.1 ICU事件链接设置寄存器n(IELSRn)设置

当启用WDT复位断言（OFS0.WDTRSTIRQS=1或WDTRCR.RSTIRQS=1）或启用事件链接操作时，禁止将47h设置为ICU事件链接设置寄存器n（IELSRn.IELS[8:0]位）（47h设置为ELSRm.ELS[8:0]）。

28. Independent Watchdog Timer (IWDT)

28.1 Overview

The Independent Watchdog Timer (IWDT) is a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT can be used to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates using an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a failsafe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.

The functions of the IWDT are different from those of the WDT in the following ways:

- The divided IWDT-dedicated clock (IWDTCLK) is used as the count source (not affected by PCLKB)
- IWDT does not support the register start mode
- When transitioning to a low power mode (excluding Deep Software Standby mode), the OFS0.IWDTSTPCTL bit can be used to select whether to stop the counter or not.

Table 28.1 lists the IWDT specifications and Figure 28.1 shows a block diagram.

Table 28.1 IWDT specifications

Parameter	Specifications
Count source*1	IWDT-dedicated clock (IWDTCLK)
Clock division ratio	Division by 1, 16, 32, 64, 128, or 256
Counter operation	Counting down using a 14-bit down-counter
Condition for starting the counter	Counting automatically starts after a reset
Conditions for stopping the counter	• Reset (the down-counter and other registers return to their initial values) • A counter underflows or a refresh error is generated (counting restarts automatically).
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
IWDT reset sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error).
Non-maskable interrupt/interrupt sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error).
Reading of the counter value	The down-counter value can be read by the IWDTSR register
Event link function (output)	• Down-counter underflow event output • Refresh error event output.
Output signal (internal signal)	• Reset output • Interrupt request output • Sleep-mode count stop control output.
Auto start mode	Configurable to the following triggers: • Clock frequency division ratio after a reset (OFS0.IWDTCKS[3:0] bits) • Timeout period of the IWDT (OFS0.IWDTTOPS[1:0] bits) • Window start position in the IWDT (OFS0.IWDTRPSS[1:0] bits) • Window end position in the IWDT (OFS0.IWDTRPES[1:0] bits) • Reset output or interrupt request output (OFS0.IWDTRSTIRQS bit) • Down-count stop function at transition to Sleep mode, Software Standby mode, or Snooze mode (OFS0.IWDTSTPCTL bit).

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ 4 × (the frequency of the count clock source after division).

To use the IWDT, you must supply the IWDT-dedicated clock (IWDTCLK). The bus interface and registers operate with PCLKB, and the 14-bit counter and control circuits operate with IWDTCLK.

28. 独立看门狗定时器(IWDT)

28.1 Overview

独立看门狗定时器(IWDT)是一个14位递减计数器，必须定期对其进行服务以防止计数器下溢。IWDT可用于复位MCU或产生不可屏蔽中断或下溢中断。由于定时器使用独立的专用时钟源运行，因此当系统失控时，它在将MCU作为故障保护机制返回到已知状态时特别有用。IWDT可以通过复位、下溢、刷新错误或寄存器中的计数值的刷新来自动触发。

IWDT的功能与WDT的功能有以下不同：

- 分频的IWDT专用时钟（IWDTCLK）用作计数源（不受PCLKB影响）
- IWDT不支持寄存器启动模式
- 当转换到低功耗模式（不包括深度软件待机模式）时，OFS0.IWDTSTPCL位可用于选择是否停止计数器。

表28.1列出了IWDT规范，图28.1显示了框图。

Table 28.1 IWDT specifications

Parameter	Specifications
Count source*1	IWDT-dedicated clock (IWDTCLK)
时钟分频比	除以1、16、32、64、128或256
计数器操作	使用14位递减计数器进行递减计数
启动计数器的条件	复位后自动开始计数
停止计数器的条件	复位（递减计数器和其他寄存器返回其初始值） 计数器下溢或产生刷新错误（计数自动重新开始）。
窗口功能	可以指定窗口开始和结束位置（允许刷新和禁止刷新期间）
IWDT复位源	递减计数器下溢 在允许刷新的时间之外刷新（刷新错误）。
Non-maskable interrupt/interrupt sources	递减计数器下溢 在允许刷新的时间之外刷新（刷新错误）。
读取计数器值	递减计数器的值可以通过IWDTSR寄存器读取
事件链接功能（输出）	递减计数器下溢事件输出 刷新错误事件输出。
输出信号（内部信号）	复位输出 中断请求输出 睡眠模式计数停止控制输出。
自动启动模式	可配置为以下触发器： 复位后的时钟分频比（OFS0.IWDTCKS[3:0]位） IWDT的超时周期（OFS0.IWDTTOPS[1:0]位） IWDT中的窗口开始位置（OFS0.IWDTRPSS[1:0]位） IWDT中的窗口结束位置（OFS0.IWDTRPES[1:0]位） 复位输出或中断请求输出（OFS0.IWDTRSTIRQS位） 向下计数停止功能在转换到睡眠模式、软件待机模式或贪睡模式（OFS0.IWDTSTPCL位）。

Note 1. 满足外围模块时钟（PCLKB）的频率 4×（分频后的计数时钟源的频率）。

要使用IWDT，您必须提供IWDT专用时钟(IWDTCLK)。总线接口和寄存器操作PCLKB、14位计数器和控制电路使用IWDTCLK工作。

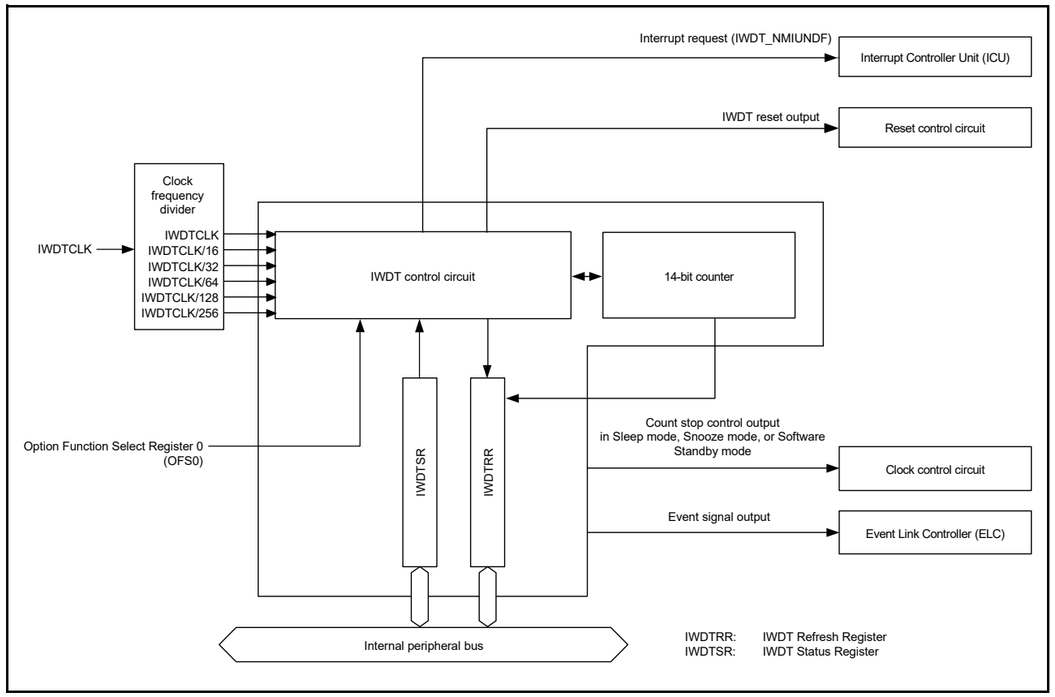

Figure 28.1 IWDT block diagram

28.2 Register Descriptions

28.2.1 IWDT Refresh Register (IWDTRR)

Address(es): IWDT.IWDTRR 4004 4400h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

Bit	Description	R/W
b7 to b0	The down-counter is refreshed by writing 00h and then writing FFh to this register	R/W

The IWDTRR register refreshes the down-counter of the IWDT. The down-counter of the IWDT is refreshed by writing 00h and then writing FFh to IWDTRR (refresh operation) within the refresh-permitted period. After the down-counter is refreshed, it starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]) in Option Function Select Register 0 (OFS0).

When 00h is written, the read value is 00h. When a value other than 00h is written, the read value is FFh. For details on the refresh operation, see section 28.3.2, Refresh Operation.

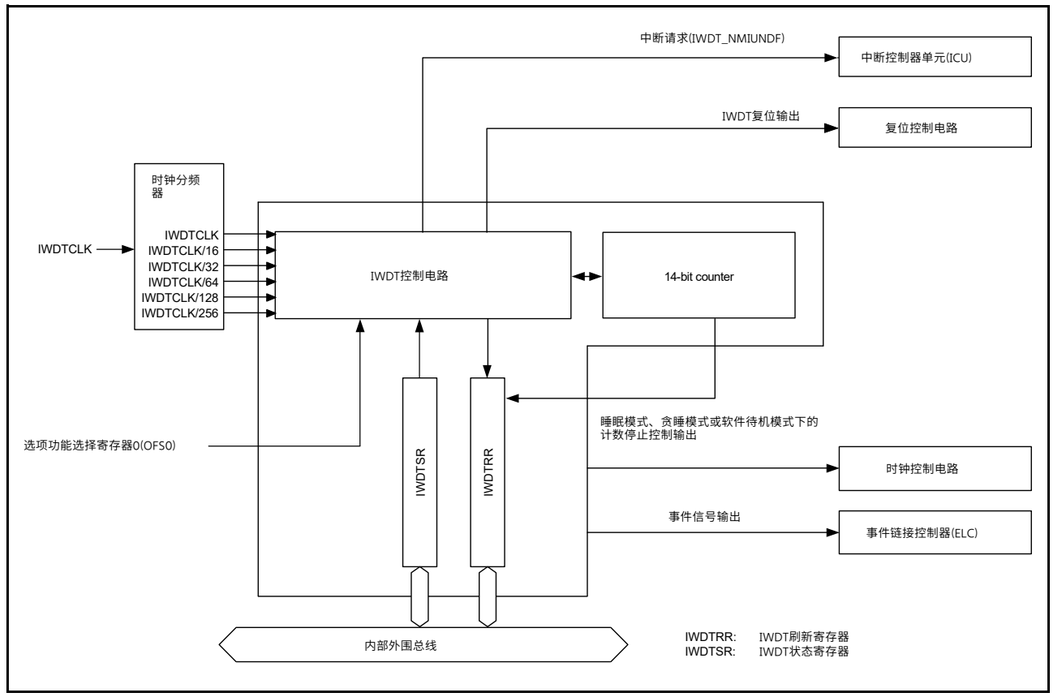

Figure 28.1 IWDT框图

28.2 注册说明

28.2.1 IWDT刷新寄存器(IWDTRR)

Address(es): IWDT.IWDTRR 4004 4400h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	1	1	1	1	1	1	1	1

Bit	Description	R/W
b7 to b0	通过写入00h然后将FFh写入该寄存器来刷新递减计数器	R/W

IWDTRR寄存器刷新IWDT的递减计数器。IWDT的递减计数器通过写入00h进行刷新，然后在允许刷新期间将FFh写入IWDTRR（刷新操作）。递减计数器刷新后，它从选项功能选择寄存器0(OFS0)中的IWDT超时周期选择位(OFS0.IWDTTOPS[1:0])中选择的值开始递减计数。

写入00h时，读取值为00h。写入00h以外的值时，读取值为FFh。有关刷新操作的详细信息，请参阅第28.3.2节，刷新操作。

28.2.2 IWDT Status Register (IWDTSR)

Address(es): IWDT.IWDTSR 4004 4404h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	REFEF	UNDFF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b13 to b0	CNTVAL[13:0]	Counter Value	Value counted by the down-counter	R
b14	UNDFF	Underflow Flag	0: No underflow occurred 1: Underflow occurred.	R/(W)*1
b15	REFEF	Refresh Error Flag	0: No refresh error occurred 1: Refresh error occurred.	R/(W)*1

Note 1. Only 0 can be written to clear the flag.

CNTVAL[13:0] bits (Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the down-counter. A value of 1 indicates that the down-counter underflowed. Write 0 to the UNDFF flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFF flag takes (N + 2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of the flag is ignored for (N + 2) IWDTCLK cycles after an underflow. N is specified in the IWDTCKS[3:0] bits as follows:

- When IWDTCKS[3:0] = 0000b, N = 1
- When IWDTCKS[3:0] = 0010b, N = 16
- When IWDTCKS[3:0] = 0011b, N = 32
- When IWDTCKS[3:0] = 0100b, N = 64
- When IWDTCKS[3:0] = 1111b, N = 128
- When IWDTCKS[3:0] = 0101b, N = 256.

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred. This indicates that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the REFEF flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N + 2) IWDTCLK cycles and 2 PCLKB cycles. In addition, clearing of the flag is ignored for (N + 2) IWDTCLK cycles after a refresh error. N is specified in the IWDTCKS[3:0] bits as follows:

- When IWDTCKS[3:0] = 0000b, N = 1
- When IWDTCKS[3:0] = 0010b, N = 16
- When IWDTCKS[3:0] = 0011b, N = 32
- When IWDTCKS[3:0] = 0100b, N = 64
- When IWDTCKS[3:0] = 1111b, N = 128
- When IWDTCKS[3:0] = 0101b, N = 256.

28.2.2 IWDT状态寄存器(IWDTSR)

Address(es): IWDT.IWDTSR 4004 4404h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	REFEF	UNDFF	CNTVAL[13:0]													
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b13 to b0	CNTVAL[13:0]	计数器值	递减计数器计数的值	R
b14	UNDFF	Underflow Flag	0：未发生下溢1：发生下溢。	R/(W)*1
b15	REFEF	刷新错误标志	0：未发生刷新错误1：发生刷新错误。	R/(W)*1

Note 1. 只能写入0来清除标志。

CNTVAL[13:0]位（计数器值）

读取CNTVAL[13:0]位以确认递减计数器的值。读取的值可能与实际计数相差1。

UNDFF flag (Underflow Flag)

读取UNDFF标志以确认递减计数器中是否发生下溢。值1表示递减计数器下溢。将0写入UNDFF标志以将值设置为0。写入1无效。

清除UNDFF标志需要(N+2)个IWDTCLK周期和2个PCLKB周期。此外，在下溢后(N+2)个IWDTCLK周期内忽略标志的清除。N在IWDTCKS[3:0]位中指定如下：

- When IWDTCKS[3:0] = 0000b, N = 1
- When IWDTCKS[3:0] = 0010b, N = 16
- When IWDTCKS[3:0] = 0011b, N = 32
- When IWDTCKS[3:0] = 0100b, N = 64
- When IWDTCKS[3:0] = 1111b, N = 128
- When IWDTCKS[3:0] = 0101b, N = 256.

REFEF标志（刷新错误标志）

读取REFEF标志以确认是否发生刷新错误。这表示在禁止期间执行了刷新操作。值1表示发生了刷新错误。将0写入REFEF标志以将值设置为0。写入1无效。

清除REFEF标志需要(N+2)个IWDTCLK周期和2个PCLKB周期。此外，在刷新错误后(N+2)个IWDTCLK周期内忽略标志的清除。N在IWDTCKS[3:0]位中指定如下：

- When IWDTCKS[3:0] = 0000b, N = 1
- When IWDTCKS[3:0] = 0010b, N = 16
- When IWDTCKS[3:0] = 0011b, N = 32
- When IWDTCKS[3:0] = 0100b, N = 64
- When IWDTCKS[3:0] = 1111b, N = 128
- When IWDTCKS[3:0] = 0101b, N = 256.

28.2.3 Option Function Select Register 0 (OFS0)

For information on the Option Function Select Register 0 (OFS0), see section 7.2.1, Option Function Select Register 0 (OFS0).

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits select the timeout period, that is, the period until the down-counter underflows, from 128, 512, 1024, or 2048 cycles, taking the divided clock specified in the IWDTCKS[3:0] bits as 1 cycle.

After the down-counter is refreshed, the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits determines the number of IWDTCLK cycles until the counter underflows.

Table 28.2 lists the relationship between the IWDTCKS[3:0] and IWDTTOPS[1:0] bit settings, the timeout period, and the number of IWDTCLK cycles.

Table 28.2 Timeout period settings

IWDTCKS[3:0] bits				IWDTTOPS[1:0] bits		Clock division ratio	Timeout period (number of cycles)	IWDTCLK cycles
b7	b6	b5	b4	b1	b0			
0	0	0	0	0	0	IWDTCLK	128	128
				0	1		512	512
				1	0		1024	1024
				1	1		2048	2048
0	0	1	0	0	0	IWDTCLK/16	128	2048
				0	1		512	8192
				1	0		1024	16384
				1	1		2048	32768
0	0	1	1	0	0	IWDTCLK/32	128	4096
				0	1		512	16384
				1	0		1024	32768
				1	1		2048	65536
0	1	0	0	0	0	IWDTCLK/64	128	8192
				0	1		512	32768
				1	0		1024	65536
				1	1		2048	131072
1	1	1	1	0	0	IWDTCLK/128	128	16384
				0	1		512	65536
				1	0		1024	131072
				1	1		2048	262144
0	1	0	1	0	0	IWDTCLK/256	128	32768
				0	1		512	131072
				1	0		1024	262144
				1	1		2048	524288

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the IWDT-dedicated clock (IWDTCLK) divided by 1, 16, 32, 64, 128, and 256. Combined with the IWDTTOPS[1:0] bit setting, the IWDT can be configured to a count period between 128 and 524288 IWDTCLK cycles.

IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the window start position (window start position > window end position). If the window end position is greater than the window start position, only the window start position setting is enabled.

28.2.3 选项功能选择寄存器0(OFS0)

有关选项功能选择寄存器0(OFS0)的信息，请参阅第7.2.1节，选项功能选择寄存器0(OFS0)。

IWDTTOPS[1:0]位（IWDT超时周期选择）

IWDTTOPS[1:0]位选择超时周期，即从128、512、1024或2048个周期开始，直到递减计数器下溢的周期，采用IWDTCKS[3:0]位中指定的分频时钟作为1个周期。

向下计数器刷新后，IWDTCKS[3:0]和IWDTTOPS[1:0]位的组合决定了在计数器下溢之前的IWDTCLK周期数。

表28.2列出了IWDTCKS[3:0]和IWDTTOPS[1:0]位设置、超时周期和IWDTCLK周期数之间的关系。

Table 28.2 超时时间设置

IWDTCKS[3:0] bits				IWDTTOPS[1:0] bits		时钟分频比	超时时间（周期数）	IWDTCLK cycles
b7	b6	b5	b4	b1	b0			
0	0	0	0	0	0	IWDTCLK	128	128
				0	1		512	512
				1	0		1024	1024
				1	1		2048	2048
0	0	1	0	0	0	IWDTCLK/16	128	2048
				0	1		512	8192
				1	0		1024	16384
				1	1		2048	32768
0	0	1	1	0	0	IWDTCLK/32	128	4096
				0	1		512	16384
				1	0		1024	32768
				1	1		2048	65536
0	1	0	0	0	0	IWDTCLK/64	128	8192
				0	1		512	32768
				1	0		1024	65536
				1	1		2048	131072
1	1	1	1	0	0	IWDTCLK/128	128	16384
				0	1		512	65536
				1	0		1024	131072
				1	1		2048	262144
0	1	0	1	0	0	IWDTCLK/256	128	32768
				0	1		512	131072
				1	0		1024	262144
				1	1		2048	524288

IWDTCKS[3:0]位（IWDT专用时钟分频比选择）

IWDTCKS[3:0]位指定用于递减计数器的时钟分频比。分频比可以从IWDT专用时钟(IWDTCLK)除以1、16、32、64、128和256中选择。结合IWDTTOPS[1:0]位设置，可以将IWDT配置为计数128到524288个IWDTCLK周期之间的周期。

IWDTRPES[1:0]位（IWDT窗口结束位置选择）

IWDTRPES[1:0]位指定指示刷新允许周期的窗口结束位置。可以为窗口结束位置选择75%、50%、25%或0%的超时时间。将窗口结束位置设置为小于窗口开始位置的值（窗口开始位置>窗口结束位置）。如果窗口结束位置大于窗口起始位置，则仅启用窗口起始位置设置。

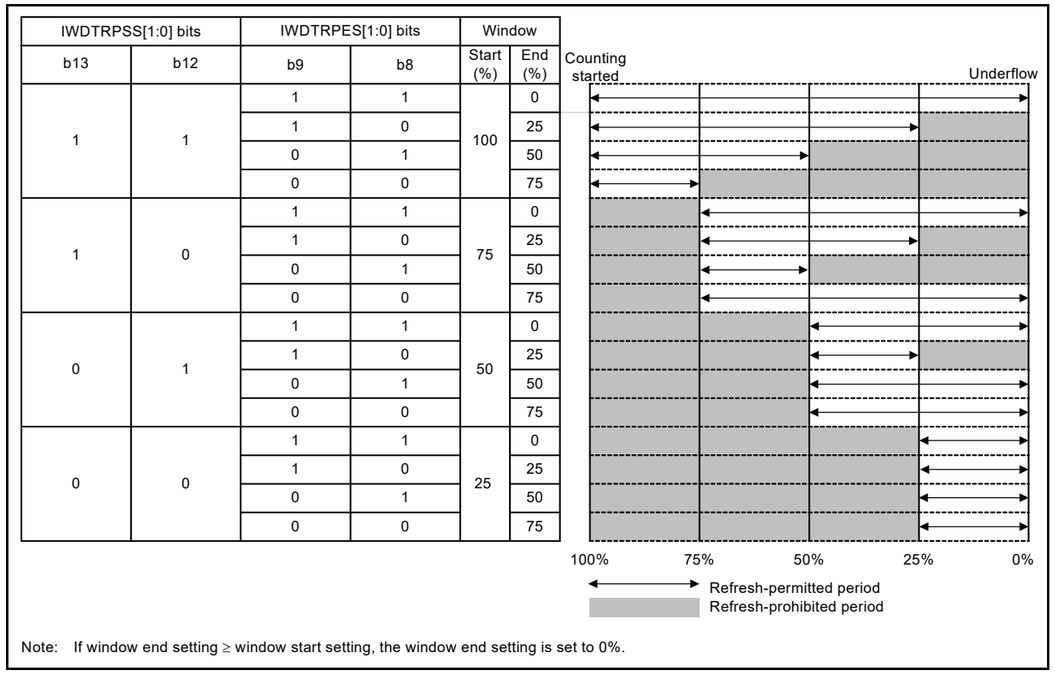
IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the window end position. If the window start position is less than or equal to the window end position, the window end position is set to 0%.

Table 28.3 lists the counter values for the window start and end positions, and Figure 28.2 shows the refresh-permitted period set in the IWDTRPSS[1:0], IWDTRPES[1:0], and IWDTTOPS[1:0] bits.

Table 28.3 Relationship between the timeout period and window start and end counter values

IWDTTOPS[1:0] bits		Timeout period		Window start and end counter value			
b1	b0	Cycles	Counter value	100%	75%	50%	25%
0	0	128	007Fh	007Fh	005Fh	003Fh	001Fh
0	1	512	01FFh	01FFh	017Fh	00FFh	007Fh
1	0	1,024	03FFh	03FFh	02FFh	01FFh	00FFh
1	1	2,048	07FFh	07FFh	05FFh	03FFh	01FFh



Note: If window end setting ≥ window start setting, the window end setting is set to 0%.

Figure 28.2 IWDTRPSS[1:0] and IWDTRPES[1:0] bit settings and refresh-permitted period

IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDTRSTIRQS bit specifies the behavior when an underflow or a refresh error occurred. Set this bit to 1 to select reset output. Set this bit to 0 for non-maskable interrupt or interrupt.

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit selects whether to stop counting on transition to Sleep, Snooze, or Software Standby mode.

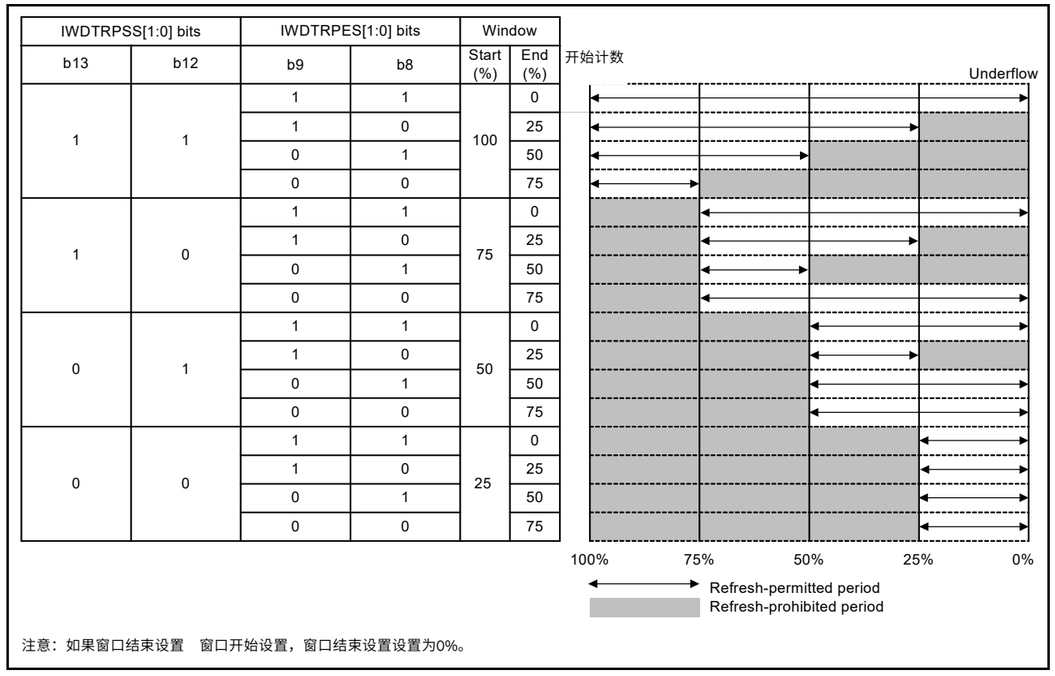
IWDTRPSS[1:0]位（IWDT窗口起始位置选择）

IWDTRPSS[1:0]位指定指示刷新允许周期的窗口起始位置。窗口起始位置可选择100%、75%、50%或25%的超时时间。将窗口开始位置设置为大于窗口结束位置的值。如果窗口开始位置小于或等于窗口结束位置，则窗口结束位置设置为0%。

表28.3列出了窗口开始和结束位置的计数器值，图28.2显示了在IWDTRPSS[1:0]、IWDTRPES[1:0]和IWDTTOPS[1:0]位中设置的允许刷新周期。

Table 28.3 超时时间与窗口开始和结束计数器值之间的关系

IWDTTOPS[1:0] bits		超时时间		窗口开始和结束计数器值			
b1	b0	Cycles	计数器值	100%	75%	50%	25%
0	0	128	007Fh	007Fh	005Fh	003Fh	001Fh
0	1	512	01FFh	01FFh	017Fh	00FFh	007Fh
1	0	1,024	03FFh	03FFh	02FFh	01FFh	00FFh
1	1	2,048	07FFh	07FFh	05FFh	03FFh	01FFh



注意：如果窗口结束设置　窗口开始设置，窗口结束设置设置为0%。

Figure 28.2 IWDTRPSS[1:0]和IWDTRPES[1:0]位设置和允许刷新周期

IWDTRSTIRQS位（IWDT复位中断请求选择）

IWDTRSTIRQS位指定发生下溢或刷新错误时的行为。将此位设置为1以选择复位输出。将该位设置为0表示不可屏蔽中断或中断。

IWDTSTPCTL位（IWDT停止控制）

IWDTSTPCTL位选择在转换到休眠、贪睡或软件待机模式时是否停止计数。

28.3 Operation

28.3.1 Auto Start Mode

When the IWDT Start Mode Select bit (OFS0.IWDTSTRT) in the Option Function Select Register 0 is 0, auto start mode is selected, otherwise the IWDT is disabled.

Within the reset state, the following values in Option Function Select Register 0 (OFS0) are set in the IWDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control at transitions to low power mode.

When the reset state is released, the down-counter automatically starts counting down from the value set in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]).

After that, as long as the program continues normal operation and the counter is refreshed within the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The IWDT does not output the reset signal as long as this procedure continues. However, if the counter underflows because the program crashed, or because a refresh error occurred when an attempt is made to refresh outside the refresh-permitted period, the IWDT asserts the reset signal or non-maskable interrupt request/interrupt request (IWDT_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle, and restarts the count. Reset output or interrupt request output can be selected in the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the IWDT Underflow/Refresh Error Interrupt Enable bit (NMIER.IWDTEN).

Figure 28.3 shows an example of operation under the following conditions:

- Auto start mode (OFS0.IWDTSTRT = 0)
- Non-maskable interrupt request output is enabled (OFS0.IWDTRSTIRQS = 0)
- The window start position is 75% (OFS0.IWDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDTRPES[1:0] = 10b).

28.3 Operation

28.3.1 自动启动模式

当IWDT启动模式选择位置（OFS0.IWDTSTRT）中的选项函数选择寄存器0为0时，选择了自动启动模式，否则IWDT将被禁用。

在复位状态下，选项功能选择寄存器0(OFS0)中的以下值在IWDT寄存器中设置：

- 时钟分频比
- 窗口开始和结束位置
- 超时时间
- 复位输出或中断请求
- 转换到低功耗模式时的计数器停止控制。

复位状态解除后，递减计数器自动从IWDT中设置的值开始递减计数
超时周期选择位(OFS0.IWDTOPS[1:0])。

之后，只要程序继续正常运行，并且在允许刷新的时间内刷新计数器，每次刷新计数器并继续递减计数时，计数器中的值都会被复位。只要此过程继续，IWDT就不会输出复位信号。但是，如果由于程序崩溃或在刷新允许周期之外尝试刷新时发生刷新错误导致计数器下溢，则IWDT将置位复位信号或不可屏蔽中断请求中断请求(IWDT_NMIUNDF)。

复位信号或不可屏蔽中断请求中断请求产生后，计数器在计数1个周期后重新加载超时周期，重新开始计数。可以在IWDT复位中断请求选择位(OFS0.IWDTRSTIRQS)中选择复位输出或中断请求输出。可以在IWDT下溢刷新错误中断　　允许位(NMIER.IWDTEN)中选择不可屏蔽的中断请求或中断请求。

图28.3显示了以下条件下的操作示例：

- 自动启动模式（OFS0.IWDTSTRT=0）
- 使能不可屏蔽中断请求输出(OFS0.IWDTRSTIRQS=0)
- 窗口起始位置为75%(OFS0.IWDTRPSS[1:0]=10b)
- 窗口结束位置为25%(OFS0.IWDTRPES[1:0]=10b)。

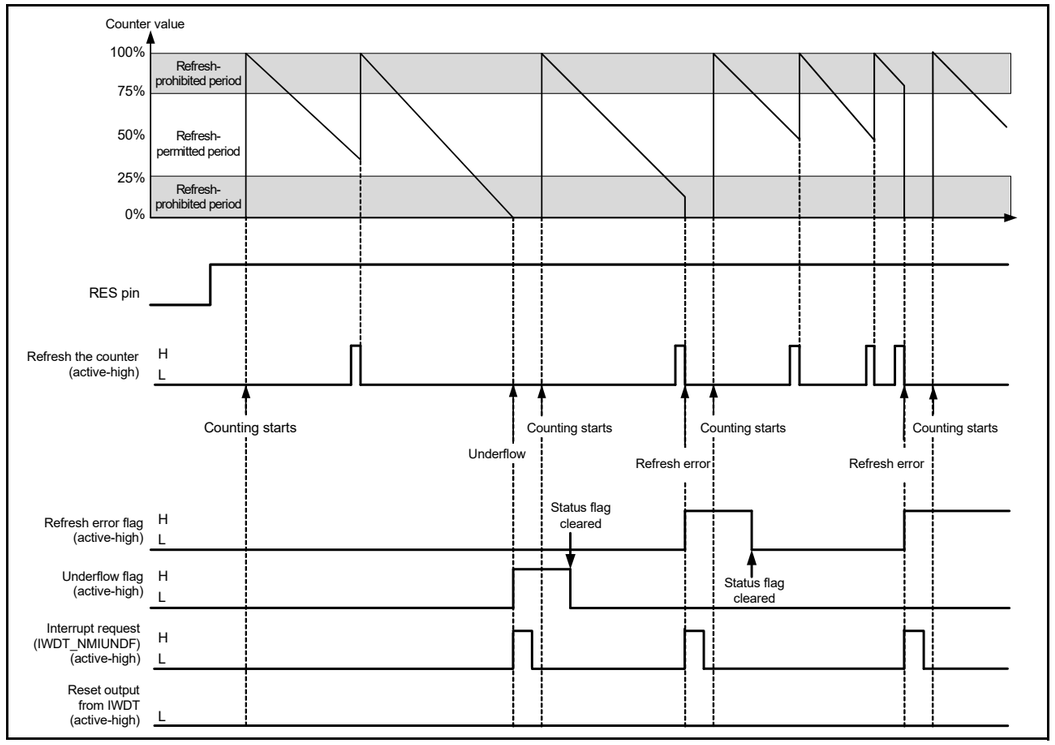


Figure 28.3 Operation example in auto start mode

28.3.2 Refresh Operation

The down-counter is refreshed by writing the values 00h and FFh to the IWDT Refresh Register (IWDTRR). If a value other than FFh is written after 00h, the down-counter is not refreshed. If an invalid value is written, correct refreshing resumes on writing 00h and FFh to the IWDTRR.

When writing is done in the order of 00h (first time) → 00h (second time), and if FFh is written after that, the writing order 00h → FFh is satisfied. Writing 00h ((n - 1)th time) → 00h (nth time) → FFh is valid, and the refresh is performed correctly. Even when the first value written before 00h is not 00h, correct refreshing is performed as long as the operation contains the write sequence 00h → FFh.

Correct refreshing is also performed regardless of whether a register other than IWDTRR is accessed or IWDTRR is read between writing 00h and writing FFh to IWDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by writing FFh. For this reason, correct refreshing is performed even when 00h is written outside the refresh-permitted period.

[Example write sequences that are valid to refresh the counter]

- 00h → FFh
- 00h ((n - 1)th time) → 00h (nth time) → FFh
- 00h → access to another register or read from IWDTRR → FFh.

[Example write sequences that are invalid to refresh the counter]

- 23h (a value other than 00h) → FFh
- 00h → 54h (a value other than FFh)
- 00h → AAh (00h and a value other than FFh) → FFh.

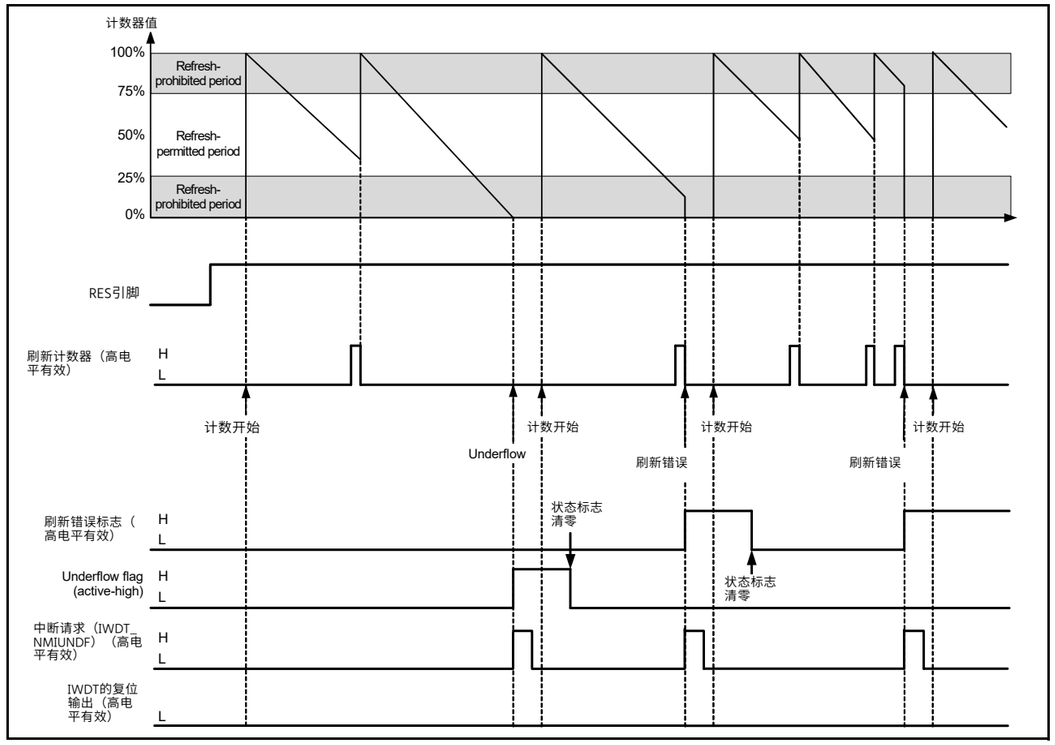

Figure 28.3 自动启动模式下的操作示例

28.3.2 刷新操作

通过将值00h和FFh写入IWDT刷新寄存器(IWDTRR)来刷新递减计数器。如果在00h之后写入FFh以外的值，则不刷新递减计数器。如果写入无效值，则在将00h和FFh写入IWDTRR时会恢复正确刷新。

当以00h（第一次）→00h（第二次）的顺序进行写入时，如果在此之后写入FFh，则满足写入顺序00h→FFh。写入00h（第（n1）次）→00h（第n次）→FFh有效，刷新正确。即使在00h之前写入的第一个值不是00h，只要操作包含写入序列00h→FFh，就会执行正确的刷新。

无论在写入00h和将FFh写入IWDTRR之间是否访问IWDTRR以外的寄存器或读取IWDTRR，也会执行正确刷新。刷新计数器的写操作必须在允许刷新的周期内进行，这由写FFh决定。因此，即使在刷新允许期间之外写入00h，也会执行正确的刷新。

[对刷新计数器有效的示例写入序列]

- 00h → FFh
- 00h ((n - 1)th time) → 00h (nth time) → FFh
- 00h→访问另一个寄存器或从IWDTRR→FFh读取。

[对刷新计数器无效的示例写入序列]

- 23h（00h以外的值）→FFh
- 00h→54h（FFh以外的值）
- 00h→AAh(00h和FFh以外的值)→FFh。

After FFh is written to the IWDTRR, refreshing the down-counter requires up to 4 cycles of the signal for counting (the IWDT-Dedicated Clock Frequency Division Ratio Select bits (OFS0.IWDTCKS[3:0]) to determine how many cycles of the IWDT-dedicated clock (IWDTCLK) make up 1 counting cycle. To meet this requirement, writing FFh to IWDTRR must be completed 4 count cycles before the end of the refresh-permitted period or a counter underflow. The value of the counter can be checked in the counter bits (IWDTSR.CNTVAL[13:0]).

[Example refreshing timings]

- When the window start position is set to 1FFFh, even if 00h is written to IWDTRR before 1FFFh is reached (at 2002h, for example), refreshing occurs if FFh is written to IWDTRR after the value of the IWDTSR.CNTVAL[13:0] bits reaches 1FFFh
- When the window end position is set to 1FFFh, refreshing occurs if 2003h (4 count cycles before 1FFFh) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 00h → FFh to IWDTRR
- When the refresh-permitted period continues until count 0000h, refreshing can be performed immediately before an underflow. In this case, if 0003h (4 count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 00h → FFh to IWDTRR, no underflow occurs and refreshing is performed.

Figure 28.4 shows the IWDT refresh-operation waveforms when PCLKB > IWDTCLK and the clock division ratio is IWDTCLK.

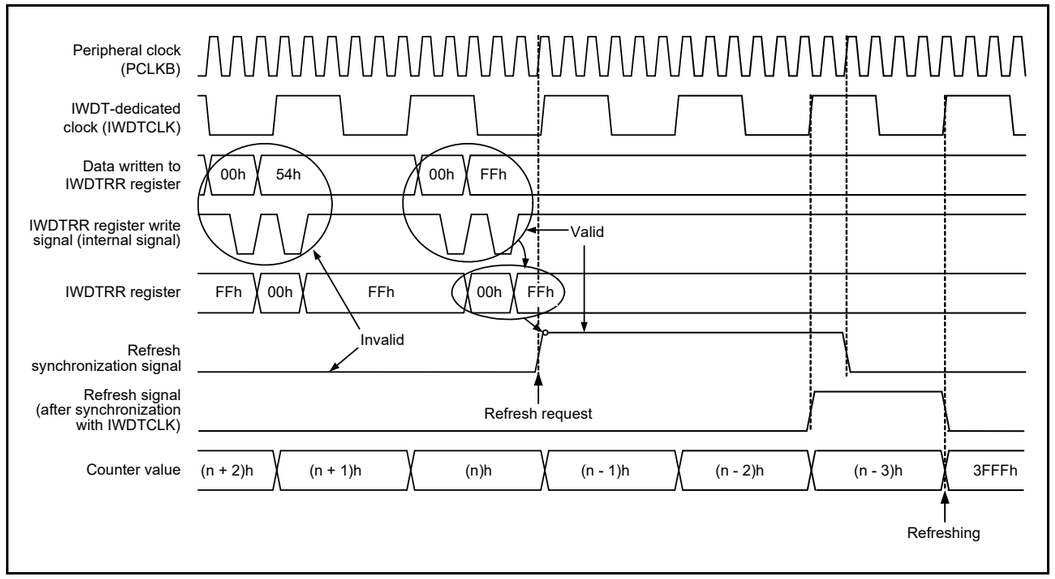

Figure 28.4 IWDT refresh operation waveforms when OFS0.IWDTCKS[3:0] = 0000b, OFS0.IWDTTOPS[1:0] = 11b

28.3.3 Status Flags

The refresh error (IWDTSR.REFEF) and underflow (IWDTSR.UNDFF) flags retain the source of the reset signal output or the source of the interrupt request from the IWDT. After a release from the reset state or interrupt request generation, read the IWDTSR.REFEF and UNDFF flags to check for the reset or interrupt source. For each flag, writing 0 clears the bit and writing 1 has no effect.

Leaving the status flags unchanged does not affect operation. If the flags are not cleared on the next reset or interrupt request from the IWDT, the earlier reset or interrupt source is cleared and the new reset or interrupt source is written. After 0 is written to each flag, up to 3 IWDTCLK cycles and 2 PCLKB cycles are required before the value is reflected.

将FFh写入IWDTRR后，刷新递减计数器需要多达4个信号周期用于计数（IWDT专用时钟分频比选择位（OFS0.IWDTCKS[3:0]）来确定有多少个周期IWDT专用时钟(IWDTCLK)构成1个计数周期。为满足此要求，必须在刷新允许周期结束或计数器下溢之前4个计数周期完成将FFh写入IWDTRR。计数器的值可以是检查计数器位(IWDTSR.CNTVAL[13:0])。

[Example refreshing timings]

- 当窗口起始位置设置为1FFFh时，即使在到达1FFFh之前将00h写入IWDTRR（例如在2002h），如果在IWDTSR.CNTVAL[13:0]的值之后将FFh写入IWDTRR，也会发生刷新位达到1FFFh
- 当窗口结束位置设置为1FFFh时，如果在将00h→FFh写入IWDTRR后立即从IWDTSR.CNTVAL[13:0]位读取2003h（1FFFh之前的4个计数周期）或更大的值，则会发生刷新
- 当刷新允许周期持续到计数0000h时，可以在下溢之前立即执行刷新。在这种情况下，如果在将00h→FFh写入IWDTRR后立即从IWDTSR.CNTVAL[13:0]位读取0003h（下溢前的4个计数周期）或更大的值，则不会发生下溢并执行刷新。

图28.4显示了当PCLKB>IWDTCLK并且时钟分频比为时的IWDT刷新操作波形
IWDTCLK.

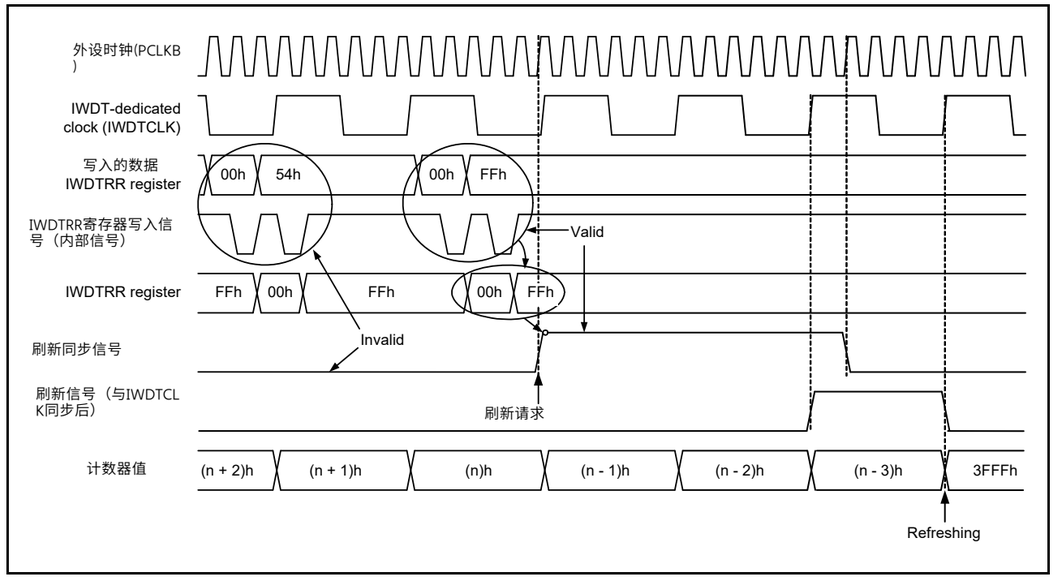

Figure 28.4 OFS0.IWDTCKS[3:0]=0000b OFS0.IWDTCKS[1:0]=11b时的IWDT刷新操作波形

28.3.3 状态标志

刷新错误(IWDTSR.REFEF)和下溢(IWDTSR.UNDFF)标志保留复位信号输出源或来自IWDT的中断请求源。从复位状态释放或产生中断请求后，读取IWDTSR.REFEF和UNDFF标志以检查复位或中断源。对于每个标志，写入0清除该位，写入1无效。

保持状态标志不变不会影响操作。如果在下一次来自IWDT的复位或中断请求时未清除标志，则清除较早的复位或中断源并写入新的复位或中断源。将0写入每个标志后，最多需要3个IWDTCLK周期和2个PCLKB周期才能反映该值。

RA生态工作室

28.3.4 Reset Output

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1, a reset signal is output when an underflow in the down-counter or a refresh error occurs. Counting down automatically starts after the reset output.

28.3.5 Interrupt Sources

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0, an interrupt signal (IWDT_NMIUNDF) is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see section 14, Interrupt Controller Unit (ICU).

Table 28.4 IWDT interrupt source

Name	Interrupt source	DTC activation	DMAC activation
IWDT_NMIUNDF	• Down-counter underflow • Refresh error.	Not possible	Not possible

28.3.6 Reading the Down-Counter Value

Because the counter is a IWDT-dedicated clock (IWDTCLK), the counter value cannot be read directly. The IWDT synchronizes the counter value with the peripheral clock (PCLKB) and stores it in the down-counter value bits (IWDTSR.CNTVAL[13:0]) in the IWDT Status register. Check these bits to obtain the counter value indirectly.

Reading the counter value requires multiple PCLKB clock cycles (up to 4 clock cycles), and the read counter value might differ from the actual counter value by a value of one count.

Figure 28.5 shows the processing for reading the IWDT counter value when PCLKB > IWDTCLK and the clock division ratio is IWDTCLK.

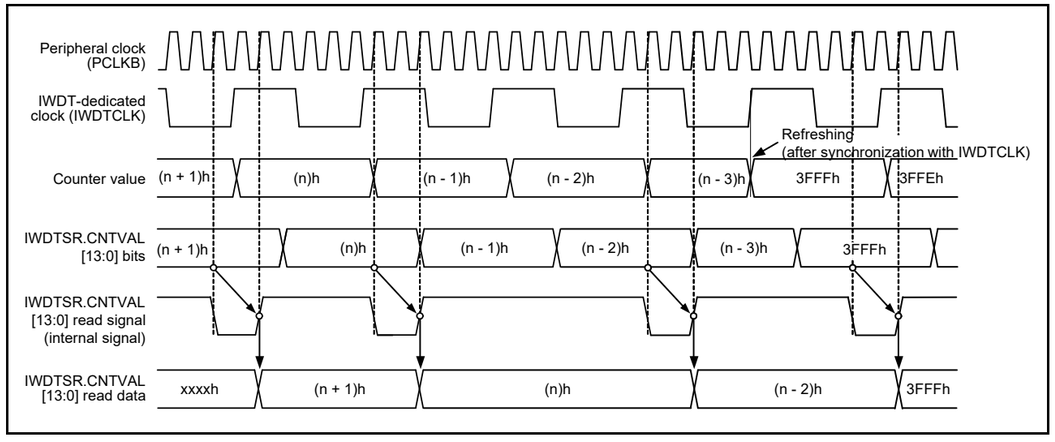

Figure 28.5 Processing for reading IWDT counter value when OFS0.IWDTCKS[3:0] = 0000b and OFS0.IWDTTOPS[1:0] = 11b

28.3.4 复位输出

当IWDT重置中断请求选择位置（OFS0.IWDTRSTIRQS）中的选项函数选择寄存器0（OFS0）中的位置为1时，当下部访问或刷新错误发生时，将输出重置信号。复位输出后自动开始倒计时。

28.3.5 中断源

当IWDT重置中断请求选择位置（OFS0.IWDTRSTIRQS）中的选项函数选择寄存器0（OFS0）的位置为0时，当计数器中的下流或刷新错误发生时，会生成中断信号（IWDT_NMIUNDF）。此中断可用作不可屏蔽中断或中断。有关详细信息，请参阅第14节，中断控制器单元(ICU)。

Table 28.4 IWDT中断源

Name	中断源	DTC activation	DMAC activation
IWDT_NMIUNDF	递减计数器下溢 刷新错误。	不可能	不可能

28.3.6 读取递减计数器值

因为计数器是IWDT专用时钟(IWDTCLK)，所以无法直接读取计数器值。IWDT将计数器值与外设时钟(PCLKB)同步，并将其存储在IWDT状态寄存器的递减计数器值位(IWDTSR.CNTVAL[13:0])中。检查这些位以间接获得计数器值。

读取计数器值需要多个PCLKB时钟周期（最多4个时钟周期），读取的计数器值可能与实际计数器值相差一个计数值。

图28.5显示了当PCLKB>IWDTCLK并且时钟分频比为IWDTCLK时读取IWDT计数器值的处理。

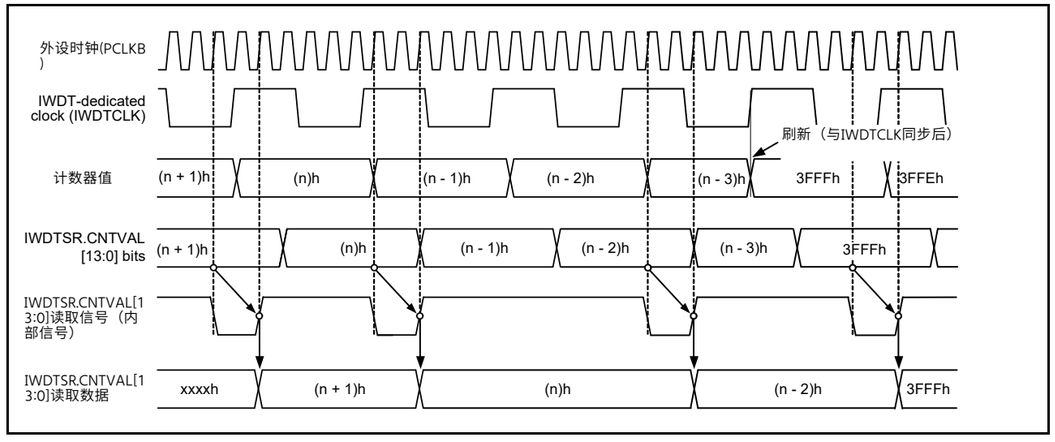

Figure 28.5 当OFS0.IWDTCKS[3:0]=0000b和时读取IWDT计数器值的处理 OFS0.IWDTTOPS[1:0] = 11b

28.4 Link Operation by the ELC

The IWDT is capable of link operation for a specified module when the interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow or refresh error.

An event signal is output regardless of the setting in the OFS0.WDTRSTIRQS bit. An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (IWDTSR.REFEF) or Underflow flag (IWDTSR.UNDFF) is 1. For details, see section 19, Event Link Controller (ELC).

28.5 Usage Notes

28.5.1 Refresh Operations

While configuring the refresh time, consider variations in the range of errors given the accuracy of PCLKB and IWDTCLK. Set values that ensure refreshing is possible.

28.5.2 Restrictions on the Clock Division Ratio Setting

Satisfy the following required frequency of the peripheral module clock (PCLKB):

PCLKB ≥ 4 × (the frequency of the count clock source after division).

28.4 ELC的链接操作

当中断请求信号被ELC用作事件信号时，IWDT能够对指定模块进行链接操作。事件信号由计数器下溢或刷新错误输出。

无论OFS0.WDTRSTIRQS位的设置如何，都会输出事件信号。当刷新错误标志(IWDTSR.REFEF)或下溢标志(IWDTSR.UNDFF)为1时，也可以在产生下一个中断源时输出事件信号。有关详细信息，请参阅第19节，事件链接控制器(ELC)。

28.5 使用说明

28.5.1 刷新操作

在配置刷新时间时，考虑到给定PCLKB精度和误差范围的变化IWDTCLK。设置确保可以刷新的值。

28.5.2 时钟分频比设置的限制

满足以下所需的外围模块时钟（PCLKB）频率：

PCLKB 4 （分频后计数时钟源的频率）。

29. USB 2.0 Full-Speed Module (USBFS)

29.1 Overview

The MCU provides a USB 2.0 Full-Speed module (USBFS) that operates as a host or device controller compliant with the Universal Serial Bus (USB) specification revision 2.0. The host controller supports USB 2.0 full-speed and low-speed transfers, and the device controller supports USB 2.0 full-speed transfers. The USBFS has an internal USB transceiver and supports all of the transfer types defined in the USB 2.0 specification.

The USBFS has a FIFO buffer for data transfers, providing a maximum of 10 pipes. Any endpoint number can be assigned to pipes 1 to 9, based on the peripheral devices or the communication requirements for your system.

Table 29.1 lists the USBFS specifications, Figure 29.1 shows a block diagram, and Table 29.2 lists the I/O pins.

Table 29.1 USBFS specifications

Parameter	Specifications
Features	• USB Device Controller (UDC) and USB 2.0 transceiver supporting host controller, device controller, and On-The-Go (OTG) functions (one channel) • Host and device controller can be switched by software • Self-power or bus power mode can be selected.
	Host controller features: • Full-speed transfer (12 Mbps) and low-speed transfer (1.5 Mbps) • Automatic scheduling for SOF and packet transmissions • Programmable intervals for isochronous and interrupt transfers • Communications with multiple peripheral devices connected through a single hub.
	Device controller features: • Full-speed transfer (12 Mbps)*1 • Control transfer stage control function • Device state control function • Auto response function for SET_ADDRESS request • SOF interpolation function.
Communication data transfer type	• Control transfer • Bulk transfer • Interrupt transfer • Isochronous transfer.
Pipe configuration	• FIFO buffer for USB communication • Up to 10 pipes can be selected, including the Default Control Pipe (DCP) • Pipes 1 to 9 can be assigned to any endpoint number.
	Transfer conditions that can be set for each pipe: • Pipe 0: Control transfer with 64-byte single buffer • Pipes 1 and 2: Bulk transfer with 64-byte double buffer or isochronous transfer with 256-byte double buffer • Pipes 3 to 5: Bulk transfer with 64-byte double buffer • Pipes 6 to 9: Interrupt transfer with 64-byte single buffer.
Other features	• Reception end function using transaction count • Function that changes the BRDY interrupt event notification timing (BFRE) • Automatic clearing of the FIFO buffer after data for the pipe specified in the DnFIFO port (n = 0, 1) is read (DCLRM) • NAK setting function for response PID generated on transfer end (SHTNAK) • On-chip pull-up and pull-down resistors for D+ and D-.
Module-stop function	Module-stop state can be set to reduce power consumption

Note 1. Low-speed transfer (1.5 Mbps) is not supported.

29. USB2.0全速模块(USBFS)

29.1 Overview

MCU提供USB2.0全速模块(USBFS)，可作为主机或设备控制器运行，符合通用串行总线(USB)规范修订版2.0。主机控制器支持USB2.0全速和低速传输，设备控制器支持USB2.0全速传输。USBFS有一个内部USB收发器，支持USB2.0规范中定义的所有传输类型。

USBFS有一个用于数据传输的FIFO缓冲区，最多提供10个管道。根据外围设备或系统的通信要求，可以将任何端点编号分配给管道1到9。

表29.1列出了USBFS规范，图29.1显示了框图，表29.2列出了IO引脚。

Table 29.1 USBFS specifications

Parameter	Specifications
Features	USB设备控制器(UDC)和USB2.0收发器，支持主机控制器、设备控制器和On-The-Go(OTG)功能（一个通道） 主机和设备控制器可以通过软件切换 自供电或总线供电模式可以选择。
	主机控制器特性： 全速传输(12Mbps)和低速传输(1.5Mbps) SOF和数据包传输的自动调度 同步和中断传输的可编程间隔 与通过单个集线器连接的多个外围设备进行通信。
	设备控制器特性： 全速传输(12Mbps)*1 控制传输级控制功能 设备状态控制功能 SET_ADDRESS请求的自动响应功能 SOF插值功能。
通讯数据传输类型	控制传输 批量传输 中断传输 同步传输。
管道配置	用于USB通信的FIFO缓冲区 最多可以选择10个管道，包括默认控制管道(DCP) 管道1到9可以分配给任何端点编号。
	可为每个管道设置的传输条件： 管道0：使用64字节单缓冲区的控制传输 管道1和2：使用64字节双缓冲区 的批量传输或使用256字节双缓冲区 的同步传输 管道3到5：使用64字节双缓冲区 的批量传输 管道6到9：使用64字节单缓冲区的中断传输。
其它功能	使用事务计数的接收结束功能 更改BRDY中断事件通知时序(BFRE)的功能 读取DnFIFO端口(n=0 1)中指定管道的数据后自动清除FIFO缓冲区(DCLRM) 传输结束时产生的响应PID的NAK设置功能(SHTNAK) D+和D-的片上上拉和下拉电阻。
Module-stop function	可设置模块停止状态以降低功耗

Note 1. 不支持低速传输(1.5Mbps)。

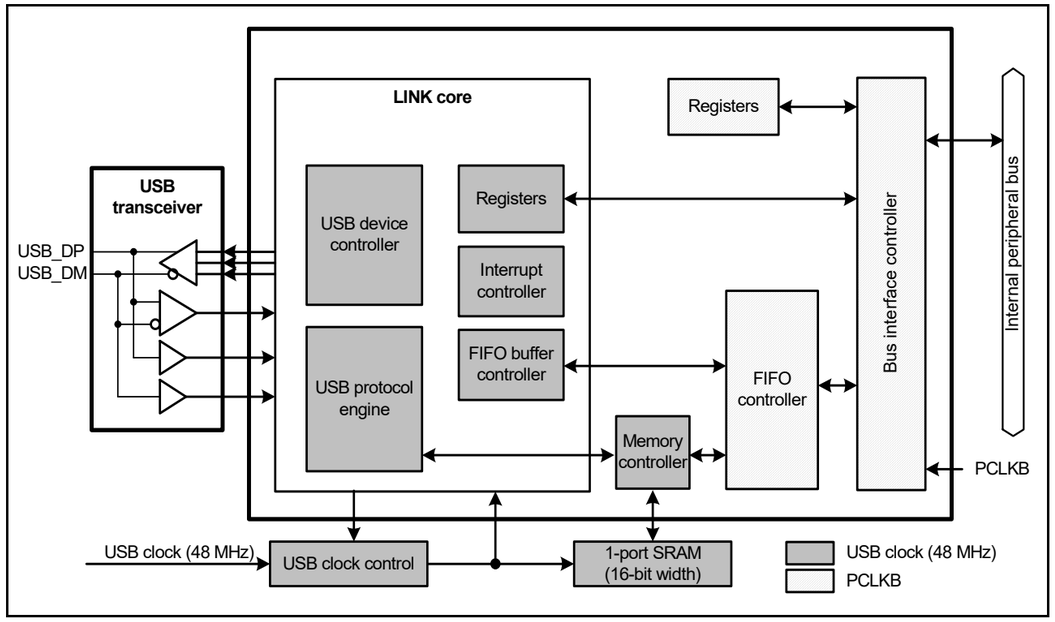

Figure 29.1 USBFS block diagram

Table 29.2 USBFS pin configuration

Port	Pin name	I/O	Function
USBFS	USB_DP	I/O	D+ I/O for the on-chip USB transceiver. Must be connected to the D+ data line of the USB bus.
	USB_DM	I/O	D- I/O pin for the on-chip USB transceiver. Must be connected to the D- data line of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. Must be connected to VBUS signal on the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USBFS is a device controller.*1
	USB_EXICEN	Output	Low-power control signal for the OTG power supply IC
	USB_VBUSEN	Output	VBUS (5 V) enable signal for the external power supply IC
	USB_OVRCURA USB_OVRCURB	Input	Overcurrent pins for USBFS. Must be connected to external overcurrent detection signals. When the OTG power supply chip is connected, must be connected to the VBUS comparator signals.
	USB_ID	Input	Must be connected to MicroAB connector ID input signal in OTG mode
Common	VCC_USB	Input	USB transceiver input supply voltage
	VSS_USB	Input	USB ground pin

Note 1. P407 is 5-V tolerant.

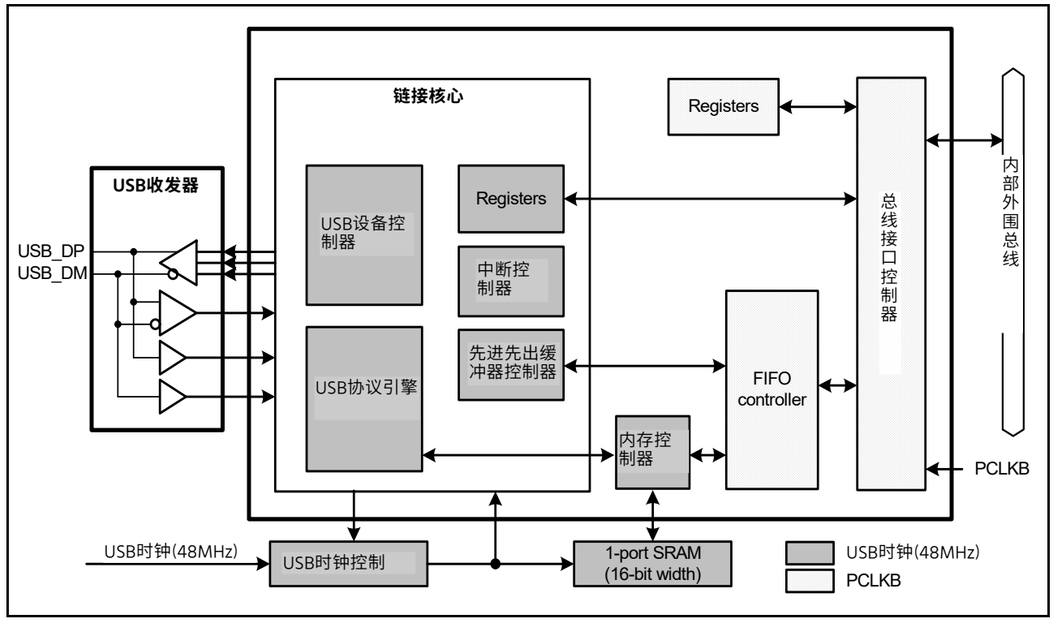

Figure 29.1 USBFS框图

Table 29.2 USBFS引脚配置

Port	引脚名称	I/O	Function
USBFS	USB_DP	I/O	D+IO用于片上USB收发器。 必须连接到USB总线的D+数据线。
	USB_DM	I/O	用于片上USB收发器的DIO引脚。 必须连接到USB总线的Ddata线。
	USB_VBUS	Input	USB电缆连接监视器引脚。 必须连接到USB总线上的VBUS信号。当USBFS为设备控制器时，可以检测VBUS引脚状态（连接或断开）。*1
	USB_EXICEN	Output	OTG电源IC的低功耗控制信号
	USB_VBUSEN	Output	外部电源IC的VBUS(5V)使能信号
	USB_OVRCURA USB_OVRCURB	Input	USBFS的过流引脚。 必须连接外部过流检测信号。当OTG供电芯片接上时，必须接上VBUS比较器信号。
	USB_ID	Input	OTG模式下必须连接MicroAB连接器ID输入信号
Common	VCC_USB	Input	USB收发器输入电源电压
	VSS_USB	Input	USB接地引脚

Note 1. P407可耐受5V。

29.2 Register Descriptions

29.2.1 System Configuration Control Register (SYSCFG)

Address(es): USBFS.SYSCFG 4009 0000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCKE	—	—	—	DCFM	DRPD	DPRPU	—	—	—	USBE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	USBE	USBFS Operation Enable	0: Disabled 1: Enabled.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	DPRPU	D+ Line Resistor Control	0: Line pull-up disabled 1: Line pull-up enabled.	R/W
b5	DRPD	D+/D- Line Resistor Control	0: Line pull-up disabled 1: Line pull-up enabled.	R/W
b6	DCFM	Controller Function Select	0: Device controller selected 1: Host controller selected.	R/W
b9 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b10	SCKE	USB Clock Enable	0: Clock supply to the USBFS stopped 1: Clock supply to the USBFS enabled.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: After writing 1 to the SCKE bit, read it to confirm that it is set to 1.

USBE bit (USBFS Operation Enable)

The USBE bit enables or disables operation of the USBFS.

Changing the USBE bit from 1 to 0 initializes the bits listed in Table 29.3. Only change this bit while the SCKE bit is 1. In host controller mode, this bit must be set to 1 after setting the DRPD bit to 1, eliminating SYSSTS0.LNST[1:0] bit chattering, and confirming that the USB bus state is stable.

Table 29.3 Registers initialized by writing 0 to SYSCFG.USBE bit

Selected function	Register	Bit	Remarks
Device controller	SYSSTS0	LNST[1:0]	Value is saved in host controller mode
	DVSTCTR0	RHST[2:0]	-
	INTSTS0	DVSQ[2:0]	Value is saved in host controller mode
	USBADDR	USBADDR[6:0]	Value is saved in host controller mode
	USBREQ	BREQUEST[7:0], BMREQUESTTYPE[7:0]	Value is saved in host controller mode
	USBVAL	WVALUE[15:0]	Value is saved in host controller mode

	USBLENG	WLENTUH[15:0]	Value is saved in host controller mode
Host controller	DVSTCTR0	RHST[2:0]	-
	FRMNUM	FRNM[10:0]	Value is saved in device controller mode

29.2 注册说明

29.2.1 系统配置控制寄存器(SYSCFG)

Address(es): USBFS.SYSCFG 4009 0000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCKE	—	—	—	DCFM	DRPD	DPRPU	—	—	—	USBE
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	USBE	USBFS操作启用	0：禁用1 ：启用。	R/W
b3 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b4	DPRPU	D+线路电阻控制	0：线路上拉禁用1：线 路上拉使能。	R/W
b5	DRPD	D+DLine电阻控制	0：线路上拉禁用1：线 路上拉使能。	R/W
b6	DCFM	控制器功能选择	0：选择设备控制器1：选择 主机控制器。	R/W
b9 to b7	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b10	SCKE	USB时钟使能	0：停止向USBFS提供时钟1：使能向US BFS提供时钟。	R/W
b15 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 将1写入SCKE位后，读取它以确认其设置为1。

USBE位（USBFS操作使能）

USBE位启用或禁用USBFS的操作。

将USBE位从1更改为0会初始化表29.3中列出的位。仅在SCKE位为1时更改该位。
在主机控制器模式下，必须在将DRPD位设置为1后将该位设置为1，消除SYSSTS0.LNST[1:0]位抖动，并确认USB总线状态稳定。

Table 29.3 通过向SYSCFG.USBE位写入0来初始化寄存器

所选功能	Register	Bit	Remarks
设备控制器	SYSSTS0	LNST[1:0]	值以主机控制器模式保存
	DVSTCTR0	RHST[2:0]	-
	INTSTS0	DVSQ[2:0]	值以主机控制器模式保存
	USBADDR	USBADDR[6:0]	值以主机控制器模式保存
	USBREQ	BREQUEST[7:0], BMREQUESTTYPE[7:0]	值以主机控制器模式保存
	USBVAL	WVALUE[15:0]	值以主机控制器模式保存
	USBINDX	WINDEX[15:0]	值以主机控制器模式保存

主机控制器	DVSTCTR0	RHST[2:0]	-
	FRMNUM	FRNM[10:0]	值保存在设备控制器模式中

DPRPU bit (D+ Line Resistor Control)

The DPRPU bit enables or disables pulling up the D+ line in device controller mode.

When the DPRPU bit is set to 1 in device controller mode, the USBFS pulls up the D+ line to notify the USB host that it attached. Changing the DPRPU bit from 1 to 0 releases the pull-up, thereby notifying the USB host that it detached.

Set this bit to 1 in device controller mode and to 0 in host controller mode.

DRPD bit (D+/D- Line Resistor Control)

The DRPD bit enables or disables pulling down D+ and D- lines in host controller mode.

Set this bit to 1 in host controller mode and to 0 in device controller mode.

DCFM bit (Controller Function Select)

The DCFM bit selects the host or device function of the USBFS.

Only change this bit when the DPRPU and DRPD bits are both 0.

SCKE bit (USB Clock Enable)

The SCKE bit stops or enables the 48-MHz clock supply to the USBFS.

When this bit is 0, only SYSCFG can be read from and written to. No other USB-related registers can be read from or written to.

29.2.2 System Configuration Status Register 0 (SYSSTS0)

Address(es): USBFS.SYSSTS0 4009 0004h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVCMON[1:0]		—	—	—	—	—	—	—	HTACT	SOFEA	—	—	IDMON	LNST[1:0]	
Value after reset:	0*1	0*1	0	0	0	0	0	0	0	0	0	0	0	0*1	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	LNST[1:0]	USB Data Line Status Monitor	Indicates the status of the USB data lines. See Table 29.4.	R
b2	IDMON	External ID0 Input Pin Monitor	0: USB_ID pin is low 1: USB_ID pin is high.	R
b4, b3	—	Reserved	These bits are read as 0 and cannot be modified	R
b5	SOFEA	Active Monitor When the Host Controller Is Selected	0: SOF output stopped 1: SOF output operating.	R
b6	HTACT	USB Host Sequencer Status Monitor	0: Host sequencer completely stopped 1: Host sequencer not completely stopped.	R
b13 to b7	—	Reserved	These bits are read as 0 and cannot be changed	R
b15, b14	OVCMON[1:0]	External USB_OVRCURA/ USB_OVRCURB Input Pin Monitor	OVCMON[1] indicates the USB_OVRCURA pin status. OVCMON[0] indicates the USB_OVRCURB pin status.	R

Note 1. Depends on the status of the USB_OVRCURA, USB_OVRCURB, and USB_ID pins.

LNST[1:0] bits (USB Data Line Status Monitor)

The LNST[1:0] bits indicate the state of the USB data lines, D+ and D-. For details, see Table 29.4.

In device controller mode, read the LNST[1:0] bits after connection processing (SYSCFG.DPRPU bit = 1). In host controller mode, read them after enabling the pull-down of the lines (SYSCFG.DRPD bit = 1).

DPRPU位（D+线路电阻控制）

DPRPU位启用或禁用在设备控制器模式下上拉D+线。

当DPRPU位在设备控制器模式下设置为1时，USBFS拉高D+线以通知USB主机它已连接。将DPRPU位从1更改为0会释放上拉电阻，从而通知USB主机它已分离。

在设备控制器模式下将此位设置为1，在主机控制器模式下设置为0。

DRPD位（D+DLine电阻控制）

DRPD位在主机控制器模式下启用或禁用下拉D+和Dlines。

在主机控制器模式下将此位设置为1，在设备控制器模式下设置为0。

DCFM位（控制器功能选择）

DCFM位选择USBFS的主机或设备功能。

仅当DPRPU和DRPD位都为0时更改该位。

SCKE位（USB时钟使能）

SCKE位停止或启用向USBFS提供48MHz时钟。

当该位为0时，只能读取和写入SYSCFG。无法读取或写入其他与USB相关的寄存器。

29.2.2 系统配置状态寄存器0(SYSSTS0)

Address(es): USBFS.SYSSTS0 4009 0004h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVCMON[1:0]		—	—	—	—	—	—	—	HTACT	SOFEA	—	—	IDMON	LNST[1:0]	
重置后的值：	0*1	0*1	0	0	0	0	0	0	0	0	0	0	0	0*1	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	LNST[1:0]	USB数据线状态监视器	指示USB数据线的状态。见表29.4。	R
b2	IDMON	外部ID0输入引脚监视器	0：USB_ID引脚为低电平1：USB_ID引脚为高电平。	R
b4, b3	—	Reserved	这些位被读为0，不能修改	R
b5	SOFEA	主机时主动监控选择控制器	0：SOF输出停止1：SOF输出工作。	R
b6	HTACT	USB主机定序器状态监视器	0：主机定序器完全停止1：主机定序器未完全停止。	R
b13 to b7	—	Reserved	这些位被读取为0，不能更改	R
b15, b14	OVCMON[1:0]	External USB_OVRCURA/ USB_OVRCURB输入引脚监视器	OVCMON[1]指示USB_OVRCURA引脚状态。OVCMON[0]指示USB_OVRCURB引脚状态。	R

Note 1. 取决于USB_OVRCURA、USB_OVRCURB和USB_ID引脚的状态。

LNST[1:0]位（USB数据线状态监视器）

LNST[1:0]位指示USB数据线D+和D−的状态。详见表29.4。

在设备控制器模式下，在连接处理后读取LNST[1:0]位（SYSCFG.DPRPU位=1）。在主机控制器模式下，在启用线路下拉后读取它们（SYSCFG.DRPD位=1）。

Table 29.4 Status of USB data bus lines (D+ line, D- line)

LNST[1:0] bits	During full-speed operation	During low-speed operation
00b	SE0	SE0
01b	J-State	K-State
10b	K-State	J-State
11b	SE1	SE1

SOFEA bit (Active Monitor When the Host Controller Is Selected)

The SOFEA bit is used in host controller mode to check whether the output of the last SOF is complete when the USBFS is suspended because of a 0 setting in the DVSTCTR0.UACT bit.

In host controller mode, check that both the HTACT and SOFEA bits are 0 before setting the SYSCFG.USBE bit to 0 to stop the USBFS, or before setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

HTACT bit (USB Host Sequencer Status Monitor)

The HTACT bit is set to 0 when the host sequencer of the USBFS is completely stopped.

In host controller mode, check that the HTACT bit is 0 before setting the DVSTCTR0.UACT bit to 0 to place the USBFS in a suspended state, or before setting the SCKE bit to 0 to stop the clock signal supply during communication.

OVCMON[1:0] bits (External USB_OVRCURA/ USB_OVRCURB Input Pin Monitor)

The OVCMON[1:0] bits indicate the status of the overcurrent signals from an external power supply IC.

29.2.3 Device State Control Register 0 (DVSTCTR0)

Address(es): USBFS.DVSTCTR0 4009 0008h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	HNPBTOA	EXICEN	VBUSEN	WKUP	RWUPE	USBRST	RESUME	UACT	—	RHST[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W

R
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	UACT	USB Bus Enable	0: Downstream port disabled (SOF transmission disabled) 1: Downstream port enabled (SOF transmission enabled).	R/W
b5	RESUME	Resume Output	0: Resume signal not output 1: Resume signal output.	R/W
b6	USBRST	USB Bus Reset Output	0: USB bus reset signal not output 1: USB bus reset signal output.	R/W
b7	RWUPE	Wakeup Detection Enable	0: Downstream port remote wakeup disabled 1: Downstream port remote wakeup enabled.	R/W

Table 29.4 USB数据总线状态（D+线、Dline）

LNST[1:0] bits	全速运行期间	低速运转时
00b	SE0	SE0
01b	J-State	K-State
10b	K-State	J-State
11b	SE1	SE1

SOFEA位（选择主机控制器时的主动监视器）

SOFEA位在主机控制器模式下用于检查当USBFS由于DVSTCTR0.UACT位中的0设置而暂停时最后一个SOF的输出是否完成。

在主机控制器模式下，在将SYSCFG.USBE位设置为0以停止USBFS之前，或在将SYSCFG.SCKE位设置为0以在通信期间停止时钟信号供应之前，请检查HTACT和SOFEA位是否都为0。

HTACT位（USB主机定序器状态监视器）

当USBFS的主机定序器完全停止时，HTACT位设置为0。

在主机控制器模式下，在将DVSTCTR0.UACT位设置为0以将USBFS置于挂起状态之前检查HTACT位是否为0，或者在将SCKE位设置为0以在通信期间停止时钟信号供应之前。

OVCMON[1:0]位（外部USB_OVRCURAUSB_OVRCURB输入引脚监视器）

OVCMON[1:0]位指示来自外部电源IC的过流信号的状态。

29.2.3 设备状态控制寄存器0(DVSTCTR0)

Address(es): USBFS.DVSTCTR0 4009 0008h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b11	HNPBTOA	Host Negotiation Protocol (HNP) Control	Use this bit when switching from device B to device A in OTG mode. If the HNPBTOA bit is 1, the internal function control remains in the suspended state until the HNP processing ends even if SYSCFG.DPRPU = 0 or SYSCFG.DCFM = 1.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

x: Don't care

The USBFS controller does not support low-speed connections in device controller mode. When this value is read, abnormal connection processing must be executed in higher level application software.

RHST[2:0] bits (USB Bus Reset Status)

The RHST[2:0] bits indicate the status of the USB bus reset.

In host controller mode, writing 1 to the USBRST bit causes the RHST[2:0] bits to set to 100b. When 0 is written to the USBRST bit and the USBFS ends the SE0 state, the RHST[2:0] bits update to a new value.

In device controller mode, if the USBFS detects a USB bus reset, the RHST[2:0] bits indicate 010b if the DPRPU bit is 1, and a DVST interrupt is generated.

UACT bit (USB Bus Enable)

When set to 1 in host controller mode, the UACT bit enables USB bus operation by controlling SOF packet transmission to the USB bus in addition to data and reception. The USBFS starts SOF packet output within one frame period after the UACT bit is set to 1. When UACT is set to 0, the USBFS enters the idle state after the SOF packet output.

The USBFS sets the UACT bit to 0 on any of the following conditions:

- A DTCH interrupt is detected during communication (when UACT = 1)
- An EOFERR interrupt is detected during communication (when UACT = 1).

Always write 1 to the UACT bit at the end of the USB bus reset processing (writing 0 to the USBRST bit) or at the end of resume processing from the suspended state (writing 0 to the RESUME bit).

In device controller mode, always set this bit to 0.

RESUME bit (Resume Output)

The RESUME bit controls the resume signal output in host controller mode.

When this bit is set to 1, the USBFS drives the USB port to the K-state and outputs the resume signal. The USBFS sets the bit to 1 on detection of a remote wakeup signal while the RWUPE bit is 1, and in the USB suspend state.

The USBFS continues outputting the K-state while the RESUME bit is 1, until the bit is set to 0 by software. The RESUME bit must be 1 (resume period) for the time defined in the USB 2.0 specification. Only set this bit to 1 while the interface is in the suspended state. Write 1 to the UACT bit simultaneously with the end of the resume processing (writing 0 to the RESUME bit).

Always set this bit to 0 in device controller mode.

USBRST bit (USB Bus Reset Output)

The USBRST bit controls the output of the USB bus signal in host controller mode. When this bit is set to 1, the USBFS drives the USB port to the SE0 state to reset the USB bus. The USBFS continues outputting SE0 while the USBRST bit is 1, until the bit is set to 0 by software. The USBRST bit must be 1 (USB bus reset period) for the time defined in the USB 2.0 specification. Writing 1 to the USBRST bit during communication (UACT bit = 1) or during resume processing (RESUME bit = 1) prevents the USBFS from starting the USB bus reset processing until both the UACT and RESUME

Bit	Symbol	位名称	Description	R/W
b8	WKUP	唤醒输出	0：不输出远程唤醒信号1：输出远程唤醒信号。	R/W
b9	VBUSEN	USB_VBUSEN输出引脚控制	0：外部USB_VBUSEN引脚输出低电平1：外部USB_VBUSEN引脚输出高电平。	R/W
b10	EXICEN	USB_EXICEN输出引脚控制	0：外部USB_EXICEN引脚输出低电平1：外部USB_EXICEN引脚输出高电平。	R/W
b11	HNPBTOA	主机协商协议(HNP) Control	在OTG模式下从设备B切换到设备A时使用该位。如果HNPBTOA位为1，即使SYSCFG.DPRPU=0或SYSCFG.DCFM=1，内部功能控制仍保持暂停状态直到HNP处理结束。	R/W
b15 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W

x: Don't care

USBFS控制器不支持设备控制器模式下的低速连接。当读取此值时，必须在更高级别的应用软件中执行异常连接处理。

RHST[2:0]位（USB总线复位状态）

RHST[2:0]位指示USB总线复位的状态。

在主机控制器模式下，将1写入USBRST位会导致RHST[2:0]位设置为100b。当0被写入USBRST位和USBFS结束SE0状态，RHST[2:0]位更新为新值。

在设备控制器模式下，如果USBFS检测到USB总线复位，如果DPRPU位为1，则RHST[2:0]位指示010b，并产生DVST中断。

UACT位（USB总线使能）

在主机控制器模式下设置为1时，UACT位通过控制向USB总线发送SOF数据包以及数据和接收来启用USB总线操作。USBFS在UACT位设置为1后的一帧周期内开始SOF数据包输出。当UACT设置为0时，USBFS在SOF数据包输出后进入空闲状态。

USBFS在以下任何条件下将UACT位设置为0：

- 在通信期间检测到DTCH中断（当UACT=1时）
- 通信期间检测到EOFERR中断（当UACT=1时）。

在USB总线复位处理结束（将0写入USBRST位）或从挂起状态恢复处理结束（将0写入RESUME位）时，始终向UACT位写入1。

在设备控制器模式下，始终将此位设置为0。

RESUME位（恢复输出）

RESUME位控制主机控制器模式下的恢复信号输出。

当该位设置为1时，USBFS将USB端口驱动到K状态并输出恢复信号。当RUPE位为1且处于USB挂起状态时，USBFS在检测到远程唤醒信号时将该位设置为1。

当RESUME位为1时，USBFS继续输出K状态，直到该位被软件设置为0。在USB2.0规范中定义的时间内，RESUME位必须为1（恢复周期）。仅当接口处于挂起状态时将此位设置为1。在恢复处理结束的同时向UACT位写入1（向RESUME位写入0）。

在设备控制器模式下始终将此位设置为0。

USBRST位（USB总线复位输出）

USBRST位控制主机控制器模式下USB总线信号的输出。当该位设置为1时，USBFS将USB端口驱动到SE0状态以复位USB总线。当USBRST位为1时，USBFS继续输出SE0，直到该位被软件设置为0。在USB2.0规范中定义的时间内，USBRST位必须为1（USB总线复位周期）。在通信期间（UACT位=1）或恢复处理期间（RESUME位=1）向USBRST位写入1可防止USBFS开始USB总线复位处理，直到UACT和RESUME

bits become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset processing (writing 0 to the USBRST bit).

Always set this bit to 0 in device controller mode.

RWUPE bit (Wakeup Detection Enable)

The RWUPE bit enables or disables remote wakeup signals (resume signals) from downstream peripheral devices in host controller mode. When this bit is set to 1, the USBFS detects a remote wakeup signal (K-state for 2.5 µs) from a downstream peripheral device, and performs resume processing, driving the K-state.

When this bit is set to 0, the USBFS ignores remote wakeup signals (K-states) from peripheral devices connected to the USB port. Do not stop the internal clock when the RWUPE bit is 1, even in the suspended state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in device controller mode.

WKUP bit (Wakeup Output)

The WKUP bit enables or disables remote wakeup signals (resume signals) to the USB bus in device controller mode.

The USBFS controls the output timing of the remote wakeup signals. When this bit is set to 1, the USBFS clears it to 0 after outputting the K-state for 10 ms. The USB 2.0 specification specifies that the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is sent. If the USBFS writes 1 to the WKUP bit immediately after detecting the suspended state, the K-state is output after 2 ms.

Only write 1 to the WKUP bit when the device is in the suspended state (INTSTS0.DVSQ[2:0] bits = 1xxb) and the USB host enables the remote wakeup signal (RWUPE = 1). Do not stop the internal clock while this bit is 1, even in the suspended state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in host controller mode.

HNPBTOA bit (Host Negotiation Protocol (HNP) Control)

The HNPBTOA bit is used when switching from device B to device A while in OTG mode.

If the HNPBTOA bit is 1, the internal function control maintains the suspended state until HNP processing ends, even if the SYSCFG.DPRPU bit is set to 0 or the SYSCFG.DCFM bit is set to 1. Resume (RESM) interrupts are not generated even if a falling edge of D+ is detected.

The HNP processing ends when a host attach event is detected, because of a pull-up by the initiating party, or the HNPBTOA bit is set to 0 by software because the HNP processing times out.

29.2.4 CFIFO Port Register (CFIFO/CFIFOL) D0FIFO Port Register (D0FIFO/D0FIFOL) D1FIFO Port Register (D1FIFO/D1FIFOL)

(1) When the MBW bit is 1

Address(es): USBFS.CFIFO 4009 0014h, USBFS.D0FIFO 4009 0018h, USBFS.D1FIFO 4009 001Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FIFOPORT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

(2) When the MBW bit is 0

Address(es): USBFS.CFIFOL 4009 0014h, USBFS.D0FIFOL 4009 0018h, USBFS.D1FIFOL 4009 001Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	FIFOPORT[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

位变为0。在USB总线复位处理结束的同时将1写入UACT位（将0写入USBRST位）。

在设备控制器模式下始终将此位设置为0。

RUPE位（唤醒检测使能）

在主机控制器模式下，RWUPE位启用或禁用来自下游外围设备的远程唤醒信号（恢复信号）。当该位设置为1时，USBFS检测到来自下游外围设备的远程唤醒信号（K状态持续2.5µs），并执行恢复处理，驱动K状态。

当该位设置为0时，USBFS忽略来自连接到USB端口的外围设备的远程唤醒信号（K状态）。当RHUPE位为1时不要停止内部时钟，即使处于挂起状态（SYSCFG.SCKE位必须设置为1）。

在设备控制器模式下始终将此位设置为0。

WKUP位（唤醒输出）

WKUP位在设备控制器模式下启用或禁用到USB总线的远程唤醒信号（恢复信号）。

USBFS控制远程唤醒信号的输出时序。当该位设置为1时，USBFS在输出K状态10ms后将其清除为0。USB2.0规范规定，在发送远程唤醒信号之前，USB总线空闲状态必须保持5ms或更长时间。如果USBFS在检测到挂起状态后立即向WKUP位写入1，则在2ms后输出K状态。

仅当设备处于挂起状态（INTSTS0.DVSQ[2:0]位=1xxb）且USB主机使能远程唤醒信号（RWUPE=1）时向WKUP位写入1。当该位为1时不要停止内部时钟，即使处于挂起状态（SYSCFG.SCKE位必须设置为1）。

在主机控制器模式下始终将此位设置为0。

HNPBTOA位（主机协商协议(HNP)控制）

在OTG模式下从设备B切换到设备A时使用HNPBTOA位。

如果HNPBTOA位为1，内部功能控制保持挂起状态直到HNP处理结束，即使SYSCFG.DPRPU位设置为0或SYSCFG.DCFM位设置为1。不产生恢复(RESM)中断即使检测到D+的下降沿。

当检测到主机连接事件时，HNP处理结束，因为发起方的上拉，或者HNPBTOA位由软件设置为0，因为HNP处理超时。

29.2.4 CFIFO端口寄存器(CFIFOCFIFOL) D0FIFO端口寄存器(D0FIFOD0FIFOL)D1FIFO端口寄存器(D1FIFOD1FIFOL)

(1)MBW位为1时

Address(es): USBFS.CFIFO 4009 0014h, USBFS.D0FIFO 4009 0018h, USBFS.D1FIFO 4009 001Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	FIFOPORT[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

(2)MBW位为0时

Address(es): USBFS.CFIFOL 4009 0014h, USBFS.D0FIFOL 4009 0018h, USBFS.D1FIFOL 4009 001Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	FIFOPORT[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	FIFOPORT[15:0]*1	FIFO Port	Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits	R/W

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW, D0FIFOSEL.MBW, and D1FIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND, D0FIFOSEL.BIGEND, and D1FIFOSEL.BIGEND) in the associated port select register. See Table 29.5 and Table 29.6.

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO.

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port select register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR).

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port select register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU.

FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT[15:0] bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer.

The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1. The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port select register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See Table 29.5 and Table 29.6.

Table 29.5 Endian operation in 16-bit access

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	N + 1 data	N + 0 data
1	N + 0 data	N + 1 data

Bit	Symbol	位名称	Description	R/W
b15 to b0	FIFOPORT[15:0]*1	FIFO Port	通过访问这些位从FIFO缓冲区读取接收数据或将发送数据写入FIFO缓冲区	R/W

Note 1. 有效位取决于相关端口选择寄存器中的MBW设置（CFIFOSEL.MBW、D0FIFOSEL.MBW和D1FIFOSEL.MBW）和BIGEND设置（CFIFOSEL.BIGEND、D0FIFOSEL.BIGEND和D1FIFOSEL.BIGEND）。请参见表29.5和表29.6。

三个FIFO端口可用：

- CFIFO
- D0FIFO
- D1FIFO.

每个FIFO端口配置有：

- 处理从FIFO缓冲区读取数据和将数据写入FIFO缓冲区的端口寄存器（CFIFO、D0FIFO或D1FIFO）
- 选择分配给FIFO端口的管道的端口选择寄存器（CFIFOSEL、D0FIFOSEL或D1FIFOSEL）
- 端口控制寄存器（CFIFOCTR、D0FIFOCTR或D1FIFOCTR）。

每个FIFO端口具有以下约束：

- 通过CFIFO端口访问DCP控制传输的FIFO缓冲区
- 通过D0FIO或D1FIFO端口访问DMA或DTC传输的FIFO缓冲区
- CPU也可以访问D0FIFO和D1FIFO端口
- 当使用特定于FIFO端口的功能时，例如DMA或DTC传输功能，您无法更改在端口选择寄存器的CURPIPE[3:0]位中选择的管道编号
- 配置FIFO端口的寄存器不会影响其他FIFO端口
- 不得将同一管道分配给两个或多个FIFO端口
- 有两种FIFO缓冲区状态，一种授予CPU访问权限，另一种授予串行接口引擎(SIE)。当SIE有访问权限时，CPU不能访问FIFO缓冲区。

FIFOPORT[15:0]位（FIFO端口）

当访问FIFOPORT[15:0]位时，USBFS从FIFO缓冲区读取接收数据或将发送数据写入FIFO缓冲区。

只有当相关端口控制寄存器中的FRDY位（CFIFOCTR、D0FIFOCTR或D1FIFOCTR）为1。FIFO端口寄存器中的有效位取决于端口选择寄存器（CFIFOSEL、D0FIFOSEL或D1FIFOSEL）中的MBW和BIGEND设置。请参见表29.5和表29.6。

Table 29.5 16位访问中的字节序操作

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	N + 1 data	N + 0 data
1	N + 0 data	N + 1 data

Table 29.6 Endian operation in 8-bit access

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	Access prohibited*1	N + 0 data
1	Access prohibited*1	N + 0 data

Note 1. Writing to or reading from an access-prohibited area is not allowed.

29.2.5 CFIFO Port Select Register (CFIFOSEL)
D0FIFO Port Select Register (D0FIFOSEL)
D1FIFO Port Select Register (D1FIFOSEL)

CFIFOSEL

Address(es): USBFS.CFIFOSEL 4009 0020h

b15	RCNT	读取计数模式	0：DTLN[8:0]位（CFIFOCTR.DTLN[8:0]，当从CFIFO读取所有接收数据时，D0FIFOCTR.DTLN[8:0]、D1FIFOCTR.DTLN[8:0])被清除。在双缓冲模式下，当仅从单个平面读取所有数据时，清除DTLN[8:0]位的值。1：每次从CFIFO读取接收数据时，DTLN[8:0]位递减。	R/W

Note 1. 只能读取0。

Do not specify the same pipe number in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected.

Do not change the pipe number while DMA or DTC transfer is enabled.

CURPIPE[3:0] bits (CFIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the CFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, the current access setting is maintained until the access is complete, even if software attempts to change the CURPIPE[3:0] setting.

ISEL bit (CFIFO Port Access Direction When DCP Is Selected)

After writing a new value to the ISEL bit with DCP as the selected pipe, read the ISEL bit to check that the written value agrees with the read value before proceeding to the next process. Set this bit and the CURPIPE[3:0] bits simultaneously.

MBW bit (CFIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the CFIFO port.

When the selected pipe is receiving, set the CURPIPE[3:0] and MBW bits simultaneously. After a write to these bits starts a data read from the FIFO buffer, do not change the bits until all of the data is read. When reading the FIFO buffer, read with the access size that is set in MBW.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the REW bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data unit for the transmitting pipe, use the BCLR bit.

不要在CFIFOSEL、D0FIFOSEL和D1FIFOSEL寄存器的CURPIPE[3:0]位中指定相同的管道编号。当D0FIFOSEL和D1FIFOSEL寄存器中的CURPIPE[3:0]位设置为0000b时，不选择管道。

启用DMA或DTC传输时不要更改管道编号。

CURPIPE[3:0]位（CFIFO端口访问管道规范）

CURPIPE[3:0]位指定用于通过CFIFO端口读取或写入数据的管道编号。写入这些位后，读取它们以检查写入的值是否与读取的值一致，然后再进行下一个过程。不要为CFIFOSEL、D0FIFOSEL和D1FIFOSEL中的CURPIPE[3:0]位设置相同的管道编号。

在FIFO缓冲区访问期间，即使软件尝试更改CURPIPE[3:0]设置，也会保持当前访问设置直到访问完成。

ISEL位（选择DCP时的CFIFO端口访问方向）

在以DCP作为选定管道的情况下将新值写入ISEL位后，读取ISEL位以检查写入的值是否与读取的值一致，然后再进行下一个过程。同时设置该位和CURPIPE[3:0]位。

MBW位（CFIFO端口访问位宽度）

MBW位指定访问CFIFO端口的位宽。

当所选管道正在接收时，同时设置CURPIPE[3:0]和MBW位。在写入这些位开始从FIFO缓冲区读取数据后，在读取所有数据之前不要更改这些位。读取FIFO缓冲区时，读取以MBW为单位设置的访问大小。

当所选管道正在传输时，位宽不能从8位更改为16位，同时数据正在写入FIFO缓冲区。

即使选择了16位宽度，也可以通过字节访问控制写入奇数个字节。

REW位（缓冲区指针倒带）

REW位指定是否倒回缓冲区指针。

当所选管道正在接收时，在读取FIFO缓冲区时将此位设置为1允许从第一个数据重新读取FIFO缓冲区。在双缓冲中，此设置允许从第一个条目重新读取当前读取的FIFO缓冲区平面。

请勿在同时更改CURPIPE[3:0]位时将此位设置为1。在将REW位设置为1之前，请务必检查FRDY位是否为1。

要从传输管道的第一个数据单元重写FIFO缓冲区，请使用BCLR位。

D0FIFOSEL, D1FIFOSEL

Address(es): USBFS.D0FIFOSEL 4009 0028h, USBFS.D1FIFOSEL 4009 002Ch

b15	RCNT	Read Count Mode	0: The DTLN[8:0] bits (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) are cleared when all receive data is read from DnFIFO. In double buffer mode, the DTLN[8:0] bit value is cleared when all data is read from a single plane. 1: The DTLN[8:0] bits are decremented each time receive data is read from DnFIFO. n = 0, 1.	R/W

Note 1. Only 0 can be read.

Do not specify the same pipe number in the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected.

Do not change the pipe number while DMA or DTC transfer is enabled.

CURPIPE[3:0] bits (FIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the DnFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is maintained until access is complete.

b12	DREQE	DMADTC传输请求启用	0：禁用DMADTC传输请求1：启用DMADTC传输请求。	R/W
b13	DCLRM	读取指定管道数据后访问的自动缓冲存储器清除模式	0：禁用自动缓冲区清除模式1：启用自动缓冲区清除模式。	R/W
b14	REW	缓冲区指针倒带	0：不倒回缓冲区指针1：倒回缓冲区指针。	R/W*1
b15	RCNT	读取计数模式	0：DTLN[8:0]位（CFIFOCTR.DTLN[8:0]，D0FIFOCTR.DTLN[8:0]、D1FIFOCTR.DTLN[8:0]）在从DnFIFO读取所有接收数据时被清除。在双缓冲模式下，当从单个平面读取所有数据时，清除DTLN[8:0]位的值。1：每次从DnFIFO读取接收数据时，DTLN[8:0]位递减。n=01。	R/W

Note 1. 只能读取0。

不要在CFIFOSEL、D0FIFOSEL和D1FIFOSEL寄存器的CURPIPE[3:0]位中指定相同的管道编号。
当D0FIFOSEL和D1FIFOSEL寄存器中的CURPIPE[3:0]位设置为0000b时，不选择管道。

启用DMA或DTC传输时不要更改管道编号。

CURPIPE[3:0]位（FIFO端口访问管道规范）

CURPIPE[3:0]位指定用于通过DnFIFO端口读取或写入数据的管道编号。写入这些位后，读取它们以检查写入的值是否与读取的值一致，然后再进行下一个过程。不要为CFIFOSEL、D0FIFOSEL和D1FIFOSEL中的CURPIPE[3:0]位设置相同的管道编号。

在FIFO缓冲区访问期间，即使尝试更改CURPIPE[3:0]设置，当前访问设置也会保持到访问完成为止。

RA生态工作室

MBW bit (FIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the DnFIFO port.

When the selected pipe is receiving, after a write to these bits starts a data read from the FIFO buffer, do not change the bits until all of the data is read. Set the CURPIPE[3:0] and MBW bits simultaneously. When reading the FIFO buffer, read using the access size that is set in MBW.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

DREQE bit (DMA/DTC Transfer Request Enable)

The DREQE bit enables or disables the issuing of DMA or DTC transfer requests. To enable DMA or DTC transfer requests, set this bit to 1 after setting the CURPIPE[3:0] bits. To change the CURPIPE[3:0] setting, first set this bit to 0.

DCLRM bit (Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read)

The DCLRM bit enables or disables automatic FIFO buffer clearing after the data in the selected pipe is read.

When this bit is set to 1, on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or when reading of a received short packet is complete while the PIPECFG.BFRE bit is 1, the USBFS sets the BCLR bit in the FIFO Port Control Register to 1.

When using the USBFS with the SOFCFG.BRDYM bit set to 1, set this bit to 0.

REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

RCNT bit (Read Count Mode)

The RCNT bit specifies the read mode for the value in the CFIFOCTR.DTLN bit. When accessing DnFIFO with the PIPECFG.BFRE bit set to 1, set the RCNT bit to 0.

29.2.6 CFIFO Port Control Register (CFIFOCTR) D0FIFO Port Control Register (D0FIFOCTR) D1FIFO Port Control Register (D1FIFOCTR)

Address(es): USBFS.CFIFOCTR 4009 0022h, USBFS.D0FIFOCTR 4009 002Ah, USBFS.D1FIFOCTR 4009 002Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit name	Description	R/W
b8 to b0	DTLN[8:0]	Receive Data Length	Indicates the receive data length. These bits indicate different values depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits.	R
b12 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

MBW位（FIFO端口访问位宽）

MBW位指定访问DnFIFO端口的位宽。

当所选管道正在接收时，在写入这些位后开始从FIFO缓冲区读取数据，在读取所有数据之前不要更改这些位。同时设置CURPIPE[3:0]和MBW位。读取FIFO缓冲区时，使用以MBW为单位设置的访问大小进行读取。

当所选管道正在传输时，位宽不能从8位更改为16位，同时数据正在写入FIFO缓冲区。

即使选择了16位宽度，也可以通过字节访问控制写入奇数个字节。

DREQE位（DMADTC传输请求使能）

DREQE位启用或禁用DMA或DTC传输请求的发出。要启用DMA或DTC传输请求，请在设置CURPIPE[3:0]位后将此位设置为1。要更改CURPIPE[3:0]设置，首先将该位设置为0。

DCLRM位（读取指定管道数据后访问的自动缓冲存储器清除模式）

在读取选定管道中的数据后，DCLRM位启用或禁用自动FIFO缓冲区清除。

当该位设置为1时，在分配给所选管道的FIFO缓冲区为空时接收到零长度数据包，或者当PIPECFG.BFRE位为1时完成读取接收到的短数据包时，USBFS设置FIFO端口控制寄存器中的BCLR位为1。

当使用SOFCFG.BRDYM位设置为1的USBFS时，将此位设置为0。

REW位（缓冲区指针倒带）

REW位指定是否倒回缓冲区指针。

当所选管道正在接收时，在读取FIFO缓冲区时将此位设置为1允许从第一个数据重新读取FIFO缓冲区。在双缓冲中，此设置允许从第一个条目重新读取当前读取的FIFO缓冲区平面。

请勿在同时更改CURPIPE[3:0]位时将此位设置为1。在将该位设置为1之前，请务必检查FRDY位是否为1。

要从传输管道的第一个数据重写FIFO缓冲区，请使用BCLR位。

RCNT位（读取计数模式）

RCNT位指定CFIFOCTR.DTLN位中值的读取模式。当使用DnFIFO访问PIPECFG.BFRE位设置为1，将RCNT位设置为0。

29.2.6 CFIFO端口控制寄存器(CFIFOCTR) D0FIFO端口控制寄存器(D0FIFOCTR)D1FIFO端口控制寄存器(D1FIFOCTR)

Address(es): USBFS.CFIFOCTR 4009 0022h, USBFS.D0FIFOCTR 4009 002Ah, USBFS.D1FIFOCTR 4009 002Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	位名称	Description	R/W
b8 to b0	DTLN[8:0]	接收数据长度	表示接收数据长度。 这些位指示不同的值，具体取决于端口选择寄存器中的RCNT位设置。有关详细信息，请参见DTLN[8:0]位的说明。	R
b12 to b9	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Bit	Symbol	Bit name	Description	R/W
b13	FRDY	FIFO Port Ready	0: FIFO port access disabled 1: FIFO port access enabled.	R
b14	BCLR	CPU Buffer Clear	0: No operation 1: FIFO buffer cleared in the CPU.	R/W*1
b15	BVAL	Buffer Memory Valid Flag	0: Invalid (writing 0 has no effect) 1: Writing ended.	R/W

Note 1. Only 0 can be read.

CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0
  The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.
  While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.
- RCNT = 1
  The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.
  The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read by the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1.

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer in the CPU for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling the transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO Port Control Register is 1 (set by the USBFS).

BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer in the CPU for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag in the following cases:

Bit	Symbol	位名称	Description	R/W
b13	FRDY	FIFO端口就绪	0：禁止FIFO端口访问1：使能FIFO端口访问。	R
b14	BCLR	CPU缓冲区清除	0：无操作1：清除CPU中的FIFO缓冲区。	R/W*1
b15	BVAL	缓冲存储器有效标志	0：无效（写入0无效）1：写入结束。	R/W

Note 1. 只能读取0。

CFIFOCTR、D0FIFOCTR和D1FIFOCTR寄存器对应于CFIFO、D0FIFO和D1FIFO缓冲区。

DTLN[8:0]位（接收数据长度）

DTLN[8:0]位指示接收数据的长度。

在读取FIFO缓冲区时，DTLN[8:0]位指示不同的值，具体取决于DnFIFOSEL.RCNT位(n=0 1)，如下所示：

- RCNT = 0
  USBFS设置DTLN[8:0]位以指示接收数据的长度，直到CPU或DMADTC从单个FIFO缓冲区平面读取所有接收数据。当PIPECFG.BFRE位=1时，USBFS将保留接收数据的长度，直到BCLR位设置为1，即使在读取所有数据之后也是如此。
- RCNT = 1
  每次从FIFO缓冲区读取数据时，USBFS都会递减DTLN[8:0]位中指示的值。当MBW=0时该值减1，当MBW=1时减2。当从一个FIFO缓冲区平面读取所有数据时，USBFS将这些位设置为0。在双缓冲区模式下，如果在一个FIFO缓冲区平面中的所有数据从另一个平面读取之前接收到数据，USBFS设置这些位以指示在读取所有数据时前一个平面中接收数据的长度从后一个平面。

FRDY位（FIFO端口就绪）

FRDY位指示FIFO端口是否可以被CPU或DMADTC访问。

在以下情况下，USBFS将FRDY位设置为1，但FIFO端口无法读取数据，因为没有要读取的数据：

- 当分配给所选管道的FIFO缓冲区为空时，接收到零长度数据包
- 当PIPECFG.BFRE位=1时，接收到一个短数据包并完全读取数据。

在这些情况下，将BCLR位设置为1以清除FIFO缓冲区，并启用下一个数据的发送和接收。

BCLR位（CPU缓冲区清除）

将BCLR位设置为1以清除CPU中所选管道的FIFO缓冲区。

当分配给所选管道的FIFO缓冲区设置为双缓冲区模式时，USBFS仅清除
即使两个平面都已启用读取，也有FIFO缓冲区。

当DCP为选定管道时，将BCLR位设置为1允许USBFS清除FIFO缓冲区，而不管CPU或SIE是否具有访问权限。要在SIE具有访问权限时清除缓冲区，请将DCPCTR.PID[1:0]位设置为00b（NAK响应），然后再将BCLR位设置为1。

当所选管道正在传输时，如果同时向BVAL标志和BCLR位写入1，则USBFS会清除已写入的数据，从而可以传输零长度数据包。

WhentheselectedpipeisnottheDCP onlywrite1totheBCLRbitwhiletheFRDYbitintheFIFOPortControl
寄存器为1（由USBFS设置）。

BVAL标志（缓冲存储器有效标志）

当数据完全写入CPU中所选管道的FIFO缓冲区时，将BVAL标志设置为1
CURPIPE[3:0].

当所选管道正在传输时，在以下情况下设置此标志：

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer.

The USBFS then switches the FIFO buffer from the CPU to the SIE, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU to the SIE, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

29.2.7 Interrupt Enable Register 0 (INTENB0)

Address(es): USBFS.INTENB0 4009 0030h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b12	DVSE	Device State Transition Interrupt Enable*1	0: Interrupt request disabled 1: Interrupt request enabled.	R/W
b13	SOFE	Frame Number Update Interrupt Enable	0: Interrupt request disabled 1: Interrupt request enabled.	R/W
b14	RSME	Resume Interrupt Enable*1	0: Interrupt request disabled 1: Interrupt request enabled.	R/W
b15	VBSE	VBUS Interrupt Enable	0: Interrupt request disabled 1: Interrupt request enabled.	R/W

Note 1. The RSME, DVSE, and CTRE bits can only be set to 1 in device controller mode. Do not set these bits to 1 in host controller mode.

When a status flag in the INTSTS0 register is set to 1 and the associated interrupt request enable bit setting in the INTENB0 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB0 register setting, the status flag in the INTSTS0 register is set to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB0 register is switched from 0 to 1 while the associated status flag in the INTSTS0 register is set to 1, a USBFS interrupt is requested.

- 要发送短数据包，请在写入数据后将此标志设置为1
- 要发送长度为零的数据包，请在将数据写入FIFO缓冲区之前将此标志设置为1。

然后USBFS将FIFO缓冲区从CPU切换到SIE，从而启用传输。

当在连续传输模式下为管道写入最大数据包大小的数据时，USBFS将BVAL标志设置为1，并将FIFO缓冲区从CPU切换到SIE，从而启用传输。

仅在FRDY位为1（由USBFS设置）时将1写入BVAL标志。当所选管道正在接收时，不要将BVAL标志设置为1。

29.2.7 中断使能寄存器0(INTENB0)

Address(es): USBFS.INTENB0 4009 0030h

b9	PIPE9BRDYE	BRDY Interrupt Enable for Pipe 9	0: Interrupt request disabled 1: Interrupt request enabled.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The BRDYENB register enables or disables the INTSTS0.BRDY bit to be set to 1 when a BRDY interrupt is detected for each pipe.

When a status flag in the BRDYSTS register is set to 1 and the associated PIPEnBRDYE bit (n = 0 to 9) setting in the BRDYENB register is 1, the INTSTS0.BRDY flag is set to 1. In this case, if the BRDYE bit in INTENB0 is 1, the USBFS generates a BRDY interrupt request.

While at least one PIPEnBRDY bit indicates 1, the USB generates the BRDY interrupt request when the associated interrupt request enable bit in the BRDYENB register is changed from 0 to 1 by software.

29.2.10 NRDY Interrupt Enable Register (NRDYENB)

Address(es): USBFS.NRDYENB 4009 0038h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b6	PIPE6BRDYE	管道6的BRDY中断启用	0：禁止中断请求1：允许中断请求。	R/W
b7	PIPE7BRDYE	管道7的BRDY中断启用	0：禁止中断请求1：允许中断请求。	R/W
b8	PIPE8BRDYE	管道8的BRDY中断启用	0：禁止中断请求1：允许中断请求。	R/W
b9	PIPE9BRDYE	管道9的BRDY中断启用	0：禁止中断请求1：允许中断请求。	R/W
b15 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

当检测到每个管道的BRDY中断时，BRDYENB寄存器启用或禁用INTSTS0.BRDY位以设置为1。

当BRDYSTS寄存器中的状态标志设置为1并且相关的PIPEnBRDYE位（n=0到9）在BRDYENB寄存器为1，INTSTS0.BRDY标志设置为1。在这种情况下，如果INTENB0中的BRDYE位为1，则USBFS产生一个BRDY中断请求。

当至少一个PIPEnBRDY位指示1时，当BRDYENB寄存器中相关的中断请求使能位由软件从0变为1时，USB产生BRDY中断请求。

29.2.10 NRDY中断使能寄存器(NRDYENB)

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	EDGESTS	Edge Interrupt Output Status Monitor*1	Indicates 1 during the edge processing of an edge interrupt output signal	R
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6	BRDYM	BRDY Interrupt Status Clear Timing	0: BRDY flag cleared by software 1: BRDY flag cleared by the USBFS through a data read from the FIFO buffer or data write to the FIFO buffer.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b8	TRNENSEL	Transaction-Enabled Time Select*1	0: Not low-speed communication 1: Low-speed communication.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Confirm that this bit is 0 before stopping the clock supply to the USBFS.

EDGESTS bit (Edge Interrupt Output Status Monitor*1)

The EDGESTS bit indicates 1 during the edge processing of an edge interrupt output signal. Confirm that this bit is 0 before stopping the clock supply to the USBFS.

BRDYM bit (BRDY Interrupt Status Clear Timing)

The BRDYM bit specifies how the BRDY interrupt status flags for the pipes are cleared.

TRNENSEL bit (Transaction-Enabled Time Select*1)

When the USB port is in use for full-speed or low-speed communications, the TRNENSEL bit specifies the timing with which the USBFS issues tokens in a frame (transaction-enabled time).

Set this bit to 1 when a low-speed device is connected. The bit is only valid in host controller mode. Set this bit to 0 in device controller mode.

当BEMPENB寄存器中的相关中断请求使能位由软件从0变为1时，BEMP中断请求。

29.2.12 SOF输出配置寄存器(SOFCFG)

Address(es): USBFS.SOFCFG 4009 003Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b7	—	Reserved	该位读取为0。写入值应为0。	R/W
b8	TRNENSEL	Transaction-Enabled Time Select*1	0：非低速通讯1：低速通讯。	R/W
b15 to b9	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 在停止向USBFS提供时钟之前，请确认该位为0。

EDGESTS位（边沿中断输出状态监视器*1）

在边沿中断输出信号的边沿处理期间，EDGESTS位指示1。在停止向USBFS提供时钟之前，请确认该位为0。

BRDYM位（BRDY中断状态清除时序）

BRDYM位指定如何清除管道的BRDY中断状态标志。

TRNENSEL位（事务使能时间选择*1）

当USB端口用于全速或低速通信时，TRNENSEL位指定USBFS在帧中发出令牌的时间（事务启用时间）。

当连接了低速设备时，将此位设置为1。该位仅在主机控制器模式下有效。在设备控制器模式下将此位设置为0。

29.2.13 Interrupt Status Register 0 (INTSTS0)

Address(es): USBFS.INTSTS0 4009 0040h

x: Don't care

Note 1. The value is 0 when the MCU is reset and 1 after a USB bus reset.
Note 2. The value is 1 when the USB_VBUS pin is high and 0 when the USB_VBUS pin is low.
Note 3. The value is 000b when the MCU is reset and 001b after a USB bus reset.
Note 4. To clear the VBINT, RESM, SOFR, DVST, CTRT, or VALID bit, write 0 only to the bits to be cleared. Write 1 to the other bits. Do not write 0 to the status bits indicating 0.
Note 5. The status of the RESM, DVST, and CTRT bits are changed only in device controller mode. Set the associated interrupt enable bits to 0 (disabled) in host controller mode.
Note 6. The USBFS detects a change in the status indicated in the VBINT and RESM bits even while the clock supply is stopped (SCKE bit is 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply before clearing the status through software.

CTSQ[2:0] bits (Control Transfer Stage)

In host controller mode, the read value of the CTSQ[2:0] bits is invalid.

29.2.13 中断状态寄存器0(INTSTS0)

Address(es): USBFS.INTSTS0 4009 0040h

b13	SOFR	帧号刷新中断状态	0：未发生SOF中断1：发生SOF中断。	R/W*4
b14	RESM	恢复中断状态*5 *6	0：未发生恢复中断1：发生恢复中断。	R/W*4
b15	VBINT	VBUS Interrupt Status*6	0：未发生VBUS中断1：发生VBUS中断。	R/W*4

x: Don't care

Note 1. MCU复位时为0，USB总线复位后为1。
Note 2. 当USB_VBUS引脚为高电平时值为1，当USB_VBUS引脚为低电平时值为0。
Note 3. MCU复位时值为000b，USB总线复位后值为001b。
Note 4. 要清除VBINT、RESM、SOFR、DVST、CTRT或VALID位，只需将0写入要清除的位。将1写入其他位。不要将0写入指示0的状态位。
Note 5. RESM、DVST和CTRT位的状态仅在设备控制器模式下更改。在主机控制器模式下，将相关的中断使能位设置为0（禁用）。
Note 6. USBFS检测到VBINT和RESM位指示的状态变化，即使在时钟供应停止（SCKE位为0）时，它也会在相关的中断请求位为1时请求中断。在清除时钟之前启用时钟供应通过软件状态。

CTSQ[2:0]位（控制传输阶段）

在主机控制器模式下，CTSQ[2:0]位的读取值无效。

VALID bit (USB Request Reception)

In host controller mode, the read value of the VALID bit is invalid.

DVSQ[2:0] bits (Device State)

The DVSQ[2:0] bits are initialized by a USB bus reset. In host controller mode, the read value is invalid.

BRDY bit (Buffer Ready Interrupt Status)

The BRDY bit indicates the BRDY interrupt status.

The USBFS sets the BRDY bit to 1 when it detects a BRDY interrupt status (PIPEnBRDY = 1, n = 0 to 9) on at least one pipe for which BRDY interrupts are enabled (BRDYENB.PIPEnBRDYE = 1).

For the conditions that cause the PIPEnBRDY status to be asserted, see section 29.3.3.1, BRDY interrupt.

The USBFS sets the BRDY bit to 0 when software writes 0 to all the PIPEnBRDY bits associated with the PIPEnBRDYE bits that are set to 1. Writing 0 to the BRDY bit in software does not clear the bit.

NRDY bit (Buffer Not Ready Interrupt Status)

The NRDY bit indicates the NRDY interrupt status.

The USBFS sets the NRDY bit to 1 when it detects a NRDY interrupt status (PIPEnNRDY = 1, n = 0 to 9) on at least one pipe for which NRDY interrupts are enabled (NRDYENB.PIPEnNRDYE = 1).

For the conditions that cause the PIPEnNRDY status to be asserted, see section 29.3.3.2, NRDY interrupt.

The USBFS sets the NRDY bit to 0 when software writes 0 to all the PIPEnNRDY bits associated with the PIPEnNRDYE bits that are set to 1. Writing 0 to the NRDY bit in software does not clear the bit.

BEMP bit (Buffer Empty Interrupt Status)

The BEMP bit indicates the BEMP interrupt status.

The USBFS sets the BEMP bit to 1 when it detects a BEMP interrupt status (PIPEnBEMP = 1, n = 0 to 9) on at least one pipe for which the BEMP interrupts are enabled (BEMPENB.PIPEnBEMPE = 1).

For the conditions that cause the PIPEnBEMP status to be asserted, see section 29.3.3.3, BEMP interrupt.

The USBFS sets the BEMP bit to 0 when software writes 0 to all the PIPEnBEMP bits associated with the PIPEnBEMPE bits that are set to 1. Writing 0 to the BEMP bit in software does not clear the bit.

CTRT bit (Control Transfer Stage Transition Interrupt Status*5)

In device controller mode, the USBFS updates the value of the CTSQ[2:0] bits and sets the CTRT bit to 1 on detecting a transition in the control transfer stage. When a control transfer stage transition interrupt occurs, clear the CTRT bit before the USBFS detects the next control transfer stage transition.

Values read from the CTRT bit in host controller mode are invalid.

DVST bit (Device State Transition Interrupt Status*5)

In device controller mode, the USBFS updates the value of the DVSQ[2:0] bits and sets the DVST bit to 1 on detecting a change in the device state. When a device state transition interrupt occurs, clear the DVST bit before the USBFS detects the next device state transition.

Values read from the DVST bit in host controller mode are invalid.

SOFR bit (Frame Number Refresh Interrupt Status)

In host controller mode, the USBFS sets the SOFR bit to 1 on updating the frame number when the DVSTCTR0.UACT bit is set to 1 by software. An SOFR interrupt is detected every 1 ms.

In device controller mode, the USBFS sets the SOFR bit to 1 on updating the frame number. A frame number refresh interrupt is detected every 1 ms.

The USBFS can detect an SOFR interrupt through the internal interpolation function even when a corrupted SOF packet is received from the USB host.

有效位（USB请求接收）

在主机控制器模式下，VALID位的读取值无效。

DVSQ[2:0]位（设备状态）

DVSQ[2:0]位由USB总线复位初始化。在主机控制器模式下，读取的值无效。

BRDY位（缓冲区就绪中断状态）

BRDY位指示BRDY中断状态。

当USBFS在至少一个启用了BRDY中断(BRDYENB.PIPEnBRDYE=1)的管道上检测到BRDY中断状态(PIPEnBRDY=1 n=0到9)时，将BRDY位设置为1。

有关导致PIPEnBRDY状态被断言的条件，请参见第29.3.3.1节，BRDY中断。

USBFS将BRDY位设置为0，当软件将0写入与
设置为1的PIPEnBRDYE位。在软件中将0写入BRDY位不会清除该位。

NRDY位（缓冲区未就绪中断状态）

NRDY位指示NRDY中断状态。

当USBFS在至少一个启用了NRDY中断(NRDYENB.PIPEnNRDYE=1)的管道上检测到NRDY中断状态(PIPEnNRDY=1 n=0到9)时，将NRDY位设置为1。

有关导致PIPEnNRDY状态被断言的条件，请参见第29.3.3.2节，NRDY中断。

USBFS将NRDY位设置为0，当软件将0写入与
设置为1的PIPEnNRDYE位。在软件中将0写入NRDY位不会清除该位。

BEMP位（缓冲区空中断状态）

BEMP位指示BEMP中断状态。

当USBFS在至少一个启用了BEMP中断(BEMPENB.PIPEnBEMPE=1)的管道上检测到BEMP中断状态(PIPEnBEMP=1 n=0到9)时，将BEMP位设置为1。

有关导致PIPEnBEMP状态被断言的条件，请参见第29.3.3.3节，BEMP中断。

当软件将0写入与设置为1的PIPEnBEMPE位相关的所有PIPEnBEMP位时，USBFS将BEMP位设置为0。在软件中向BEMP位写入0不会清除该位。

CTRT位（控制传输阶段转换中断状态*5）

在设备控制器模式下，USBFS更新CTSQ[2:0]位的值，并在检测到控制传输阶段的转换时将CTRT位设置为1。当控制传输阶段转换中断发生时，在USBFS检测到下一个控制传输阶段转换之前清除CTRT位。

在主机控制器模式下从CTRT位读取的值无效。

DVST位（设备状态转换中断状态*5）

在设备控制器模式下，USBFS在检测到设备状态发生变化时更新DVSQ[2:0]位的值并将DVST位设置为1。当设备状态转换中断发生时，在USBFS检测到下一个设备状态转换之前清除DVST位。

在主机控制器模式下从DVST位读取的值无效。

SOFR位（帧号刷新中断状态）

在主机控制器模式下，当软件将DVSTCTR0.UACT位设置为1时，USBFS在更新帧号时将SOFR位设置为1。每1ms检测一次SOFR中断。

在设备控制器模式下，USBFS在更新帧号时将SOFR位设置为1。每1ms检测一次帧号刷新中断。

即使从USB主机接收到损坏的SOF数据包，USBFS也可以通过内部插值功能检测SOFR中断。

RESM bit (Resume Interrupt Status*5,*6)

In device controller mode, the USBFS sets the RESM bit to 1 on detecting the falling edge of the signal on the USB_DP pin in the suspended state (DVSQ[2:0] = 1xxb). Values read from the RESM bit in host controller mode are invalid.

VBINT bit (VBUS Interrupt Status*6)

The USBFS sets the VBINT bit to 1 on detecting a level change (high to low or low to high) in the USB_VBUS pin input value. The USBFS sets the VBSTS bit to indicate the USB_VBUS pin input value. When a VBUS interrupt occurs, eliminate transient elements by reading the VBSTS bit at least three times through software processing and check that the values read are the same.

29.2.14 Interrupt Status Register 1 (INTSTS1)

Address(es): USBFS.INTSTS1 4009 0042h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVRCR	BCHG	—	DTCH	ATTCH	—	—	—	—	EOFERR	SIGN	SACK	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	SACK	Setup Transaction Normal Response Interrupt Status	0: No SACK interrupt occurred 1: SACK interrupt occurred.	R/W *1
b5	SIGN	Setup Transaction Error Interrupt Status	0: No SIGN interrupt occurred 1: SIGN interrupt occurred.	R/W *1
b6	EOFERR	EOF Error Detection Interrupt Status	0: No EOFERR interrupt occurred 1: EOFERR interrupt occurred.	R/W *1
b10 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b11	ATTCH	ATTCH Interrupt Status	0: No ATTCH interrupt occurred 1: ATTCH interrupt occurred.	R/W *1
b12	DTCH	USB Disconnection Detection Interrupt Status	0: No DTCH interrupt occurred 1: DTCH interrupt occurred.	R/W *1
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b14	BCHG	USB Bus Change Interrupt Status*2	0: No BCHG interrupt occurred 1: BCHG interrupt occurred.	R/W *1
b15	OVRCR	Overcurrent Input Change Interrupt Status*2	0: No OVRCR interrupt occurred 1: OVRCR interrupt occurred.	R/W *1

Note 1. To clear the bits in INTSTS1, write 0 only to the bits to be cleared. Write 1 to the other bits.
Note 2. The USBFS detects a change in the status in the OVRCR or BCHG bit even when the clock supply is stopped (SYSCFG.SCKE = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply (SYSCFG.SCKE = 1) before clearing the status through software. No other interrupts can be detected while the clock supply is stopped (SYSCFG.SCKE bit = 0).

INTSTS1 is used to confirm the status of each interrupt in host controller mode. Only enable the status change interrupts indicated in the bits in INTSTS1 in host controller mode.

RESM位（恢复中断状态*5 *6）

在设备控制器模式下，USBFS在检测到处于挂起状态(DVSQ[2:0]=1xxb)的USB_DP引脚上的信号下降沿时将RESM位设置为1。在主机控制器模式下从RESM位读取的值无效。

VBINT位（VBUS中断状态*6）

USBFS在检测到USB_VBUS引脚输入值的电平变化（从高到低或从低到高）时将VBINT位设置为1。USBFS设置VBSTS位以指示USB_VBUS引脚输入值。当发生VBUS中断时，通过软件处理至少3次读取VBSTS位来消除瞬态元素，并检查读取的值是否相同。

29.2.14 中断状态寄存器1(INTSTS1)

Address(es): USBFS.INTSTS1 4009 0042h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVRCR	BCHG	—	DTCH	ATTCH	—	—	—	—	EOFERR	SIGN	SACK	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b4	SACK	设置事务正常响应中断状态	0：未发生SACK中断1：发生SACK中断。	R/W *1
b5	SIGN	设置事务错误中断状态	0：未发生SIGN中断1：发生SIGN中断。	R/W *1
b6	EOFERR	EOF错误检测中断状态	0：没有EOFERR中断发生1：EOFERR中断发生。	R/W *1
b10 to b7	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b11	ATTCH	ATTCH中断状态	0：未发生ATTCH中断1：发生ATTCH中断。	R/W *1
b12	DTCH	USB断线检测中断Status	0：未发生DTCH中断1：发生DTCH中断。	R/W *1
b13	—	Reserved	该位读取为0。写入值应为0。	R/W
b14	BCHG	USB总线更改中断状态 *2	0：未发生BCHG中断1：发生BCHG中断。	R/W *1
b15	OVRCR	过流输入变化中断Status*2	0：未发生OVRCR中断1：发生OVRCR中断。	R/W *1

Note 1. 要清除INTSTS1中的位，只需将0写入要清除的位。将1写入其他位。
Note 2. 即使停止时钟供应（SYSCFG.SCKE=0），USBFS也会检测到OVRCR或BCHG位的状态变化，并在相关中断请求位为1时请求中断。启用时钟供应（SYSCFG.SCKE）。SCKE=1)在通过软件清除状态之前。停止提供时钟（SYSCFG.SCKE位=0）时，不会检测到其他中断。

INTSTS1用于确认主机控制器模式下每个中断的状态。仅在主机控制器模式下启用INTSTS1位中指示的状态更改中断。

SACK bit (Setup Transaction Normal Response Interrupt Status)

The SACK bit indicates the status of the setup transaction normal response interrupt in host controller mode.

The USBFS detects the SACK interrupt and sets this bit to 1 when an ACK response is returned from a peripheral device during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

Values read from the SACK bit in device controller mode are invalid.

SIGN bit (Setup Transaction Error Interrupt Status)

The SIGN bit indicates the status of setup transaction error interrupts in host controller mode.

The USBFS detects the SIGN interrupt and sets this bit to 1 when an ACK response is not returned from the peripheral device three consecutive times during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions:

- Timeout is detected by the USBFS when the peripheral device returned no response
- A corrupted ACK packet is received
- A handshake other than ACK (NAK, NYET, or STALL) is received.

Values read from the SIGN bit in device controller mode are invalid.

EOFERR bit (EOF Error Detection Interrupt Status)

The EOFERR bit indicates the status of the EOF error detection interrupts in host controller mode.

The USBFS detects the EOFERR interrupt and sets this bit to 1 on detecting that communication did not complete at the EOF2 timing defined in the USB 2.0 specification. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

After detecting the EOFERR interrupt, the USBFS controls the hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit to 0 for the port in which the EOFERR interrupt was detected
- Puts the port in which the EOFERR interrupt occurred into the idle state.

Software must terminate all pipes in which communications are currently being carried out and re-enumerate the USB port.

Values read from the EOFERR bit in device controller mode are invalid.

ATTCH bit (ATTCH Interrupt Status)

The ATTCH bit indicates the status of USB attach detection interrupts in host controller mode.

The USBFS detects the ATTCH interrupt and sets this bit to 1 on detecting a J-state or K-state on the full-speed or low-speed signal level for 2.5 µs. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the ATTCH interrupt on any of the following conditions:

- K-state, SE0, or SE1 changes to J-state, and J-state continues for 2.5 µs
- J-state, SE0, or SE1 changes to K-state, and K-state continues for 2.5 µs.

Values read from the ATTCH bit in device controller mode are invalid.

DTCH bit (USB Disconnection Detection Interrupt Status)

The DTCH bit indicates the status of USB disconnection detection interrupts in host controller mode.

The USBFS detects the DTCH interrupt and sets this bit to 1 on detecting a USB bus detach event. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

SACK位（设置事务正常响应中断状态）

SACK位指示主机控制器模式下设置事务正常响应中断的状态。

在USBFS发出的设置事务期间，当外围设备返回ACK响应时，USBFS检测到SACK中断并将该位设置为1。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

在设备控制器模式下从SACK位读取的值无效。

SIGN位（设置事务错误中断状态）

SIGN位指示主机控制器模式下设置事务错误中断的状态。

在USBFS发出的设置事务期间，如果连续3次未从外围设备返回ACK响应，USBFS检测到SIGN中断并将该位设置为1。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

当三个连续的设置事务发生以下任何响应条件时，USBFS检测到SIGN中断：

- 外围设备无响应时USBFS检测到超时
- 收到损坏的ACK数据包
- 收到除ACK（NAK、NYET或STALL）以外的握手。

在设备控制器模式下从SIGN位读取的值无效。

EOFERR位（EOF错误检测中断状态）

EOFERR位指示主机控制器模式下EOF错误检测中断的状态。

USBFS检测到EOFERR中断并在检测到通信未完成时将该位设置为1
USB2.0规范中定义的EOF2时序。如果相关的中断使能位由软件设置为1，则
USBFS产生中断。

检测到EOFERR中断后，USBFS对硬件进行如下控制，而不考虑相关的中断使能位设置：

- 将检测到EOFERR中断的端口的DVSTCTR0.UACT位设置为0
- 将发生EOFERR中断的端口置于空闲状态。

软件必须终止当前正在执行通信的所有管道并重新枚举USB端口。

在设备控制器模式下从EOFERR位读取的值无效。

ATTCH位（ATTCH中断状态）

ATTCH位指示主机控制器模式下USB连接检测中断的状态。

USBFS检测到ATTCH中断，并在检测到全速或低速信号电平的J状态或K状态2.5µs时将该位设置为1。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

USBFS在以下任何条件下检测ATTCH中断：

- K-state、SE0或SE1变为J-state，J-state持续2.5µs
- J-state、SE0或SE1变为K-state，K-state持续2.5µs。

在设备控制器模式下从ATTCH位读取的值无效。

DTCH位（USB断线检测中断状态）

DTCH位指示主机控制器模式下USB断开检测中断的状态。

USBFS检测到DTCH中断并在检测到USB总线分离事件时将该位设置为1。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

The USBFS detects bus detach events based on the USB 2.0 specification.

After detecting the DTCH interrupt, the USBFS controls hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit to 0 for the port in which the DTCH interrupt was detected
- Puts the port in which the DTCH interrupt occurred into the idle state.

Software must terminate all pipes in which communications are being carried out and invoke the wait state for attaching to the USB port (waiting for ATTCH interrupt generation).

Values read from the DTCH bit in device controller mode are invalid.

BCHG bit (USB Bus Change Interrupt Status)

The BCHG bit indicates the status of the USB bus change interrupts in host controller mode.

The USBFS detects the BCHG interrupt and sets this bit to 1 when a change in the full-speed or low-speed signal level occurs on the USB port. This includes any change from J-state, K-state, or SE0 to J-state, K-state, or SE0. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS sets the LNST[1:0] bits to indicate the input state of the USB port. When a BCHG interrupt occurs, eliminate transient elements by repeat reading the LNST[1:0] bits through software until the same value is read at least three times.

Change in the USB bus state can be detected while the internal clock is stopped.

Values read from the BCHG bit in device controller mode are invalid.

OVRCR bit (Overcurrent Input Change Interrupt Status)

The OVRCR bit indicates the status of USB_OVRCURA and USB_OVRCURB input pin change interrupts.

The USBFS detects the OVRCR interrupt and sets this bit to 1 when a change (high to low or low to high) occurs in at least one of the input values to the USB_OVRCURA and USB_OVRCURB pins. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

29.2.15 BRDY Interrupt Status Register (BRDYSTS)

Address(es): USBFS.BRDYSTS 4009 0046h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b6	PIPE6BRDY	BRDY Interrupt Status for Pipe 6*2	0: No BRDY interrupt occurred 1: BRDY interrupt occurred.	R/W*1

USBFS根据USB2.0规范检测总线分离事件。

检测到DTCH中断后，USBFS对硬件进行如下控制，而不管相关的中断使能位设置如何：

- 将检测到DTCH中断的端口的DVSTTR0.UACT位设置为0
- 将发生DTCH中断的端口置于空闲状态。

软件必须终止正在执行通信的所有管道并调用等待状态以连接到USB端口（等待ATTCH中断生成）。

在设备控制器模式下从DTCH位读取的值无效。

BCHG位（USB总线更改中断状态）

BCHG位指示主机控制器模式下USB总线更改中断的状态。

当USB端口上发生全速或低速信号电平变化时，USBFS检测到BCHG中断并将该位设置为1。这包括从J-state、K-state或SE0到J-state、K-state或SE0的任何更改。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

USBFS设置LNST[1:0]位以指示USB端口的输入状态。当发生BCHG中断时，通过软件重复读取LNST[1:0]位来消除瞬态元素，直到至少读取3次相同的值。

当内部时钟停止时，可以检测到USB总线状态的变化。

在设备控制器模式下从BCHG位读取的值无效。

OVRCR位（过流输入变化中断状态）

OVRCR位指示USB_OVRCURA和USB_OVRCURB输入引脚变化中断的状态。

当USB_OVRCURA和USB_OVRCURB引脚的至少一个输入值发生变化（从高到低或从低到高）时，USBFS检测到OVRCR中断并将该位设置为1。如果相关的中断使能位由软件设置为1，则USBFS产生中断。

b3	PIPE3BEMP	BEMP Interrupt Status for Pipe 3	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W*1
b4	PIPE4BEMP	BEMP Interrupt Status for Pipe 4	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W*1
b5	PIPE5BEMP	BEMP Interrupt Status for Pipe 5	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W*1
b6	PIPE6BEMP	BEMP Interrupt Status for Pipe 6	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W*1
b7	PIPE7BEMP	BEMP Interrupt Status for Pipe 7	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W*1
b8	PIPE8BEMP	BEMP Interrupt Status for Pipe 8	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W*1
b9	PIPE9BEMP	BEMP Interrupt Status for Pipe 9	0: No BEMP interrupt occurred 1: BEMP interrupt occurred.	R/W*1
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. To clear the status indicated by the bits in BEMPSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

29.2.18 Frame Number Register (FRMNUM)

Address(es): USBFS.FRMNUM 4009 004Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVRN	CRCE	—	—	—	FRNM[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b10 to b0	FRNM[10:0]	Frame Number	Latest frame number	R
b13 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	CRCE	Receive Data Error	0: No error occurred 1: Error occurred.	R/W*1
b15	OVRN	Overrun/Underrun Detection Status	0: No error occurred 1: Error occurred.	R/W*1

Note 1. To clear the status, write 0 only to the bits to be cleared. Write 1 to the other bits.

29.2.17 BEMP中断状态寄存器(BEMPSTS)

Address(es): USBFS.BEMPSTS 4009 004Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	PIPE0BEMP	管道0的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b1	PIPE1BEMP	管道1的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b2	PIPE2BEMP	管道2的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b3	PIPE3BEMP	管道3的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b4	PIPE4BEMP	管道4的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b5	PIPE5BEMP	管道5的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b6	PIPE6BEMP	管道6的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b7	PIPE7BEMP	管道7的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b8	PIPE8BEMP	管道8的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b9	PIPE9BEMP	管道9的BEMP中断状态	0：未发生BEMP中断1：发生BEMP中断。	R/W*1
b15 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 要清除BEMPSTS中的位指示的状态，只需将0写入要清除的位。将1写入其他位。

29.2.18 帧号寄存器(FRMNUM)

Address(es): USBFS.FRMNUM 4009 004Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OVRN	CRCE	—	—	—	FRNM[10:0]										
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b10 to b0	FRNM[10:0]	帧号	最新帧号	R
b13 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b14	CRCE	接收数据错误	0：未发生错误1：发生错误。	R/W*1
b15	OVRN	OverrunUnderrun检测状态	0：未发生错误1：发生错误。	R/W*1

Note 1. 要清除状态，只向要清除的位写入0。将1写入其他位。

FRNM[10:0] bits (Frame Number)

The USBFS sets the FRNM[10:0] bits to indicate the latest frame number, which is updated every 1 ms, when an SOF packet is issued or received.

CRCE bit (Receive Data Error)

The CRCE bit is set to 1 when a CRC error or bit stuffing error occurs during isochronous transfer. On detecting a CRC error in host controller mode, the USBFS generates an internal NRDY interrupt.

To clear the CRCE bit, write 0 to it while writing 1 to the other bits in the FRMNUM register.

OVRN flag (Overrun/Underrun Detection Status)

The OVRN flag is set to 1 when an overrun or underrun error occurs during isochronous transfer. To clear the flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

In host controller mode, the OVRN bit is set to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the time to issue an OUT token comes before all of the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the time to issue an IN token comes when no FIFO buffer planes are empty.

In device controller mode, the OVRN bit is set to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the IN token is received before all of the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the OUT token is received when no FIFO buffer planes are empty.

29.2.19 Device State Change Register (DVCHGR)

Address(es): USBFS.DVCHGR 4009 004Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DVCHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b14 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	DVCHG	Device State Change	0: Writes to USBADDR.STSRECOV[3:0] and USBADDR.USBADDR[6:0] bits disabled 1: Writes to USBADDR.STSRECOV[3:0] and USBADDR.USBADDR[6:0] bits enabled.	R/W

For details, see section 29.3.1.5, Release from Deep Software Standby mode because of USB suspend/resume interrupts.

FRNM[10:0]位（帧号）

USBFS设置FRNM[10:0]位以指示最新的帧号，该帧号每1ms更新一次，当发出或接收SOF数据包时。

CRCE位（接收数据错误）

当同步传输期间发生CRC错误或位填充错误时，CRCE位设置为1。在主机控制器模式下检测到CRC错误时，USBFS会生成内部NRDY中断。

要清除CRCE位，请向其写入0，同时向FRMNUM寄存器中的其他位写入1。

OVRN标志（溢出欠载检测状态）

当同步传输期间发生溢出或欠载错误时，OVRN标志设置为1。要清除该标志，请向其写入0，同时向FRMNUM寄存器中的其他位写入1。

在主机控制器模式下，OVRN位在以下任一条件下设置为1：

- 对于传输同步管道，发出OUT令牌的时间出现在所有传输数据写入FIFO缓冲区之前
- 对于接收同步管道，在没有FIFO缓冲区平面为空时发出IN令牌。

在设备控制器模式下，OVRN位在以下任一条件下设置为1：

- 对于传输同步管道，在所有传输数据写入FIFO缓冲区之前接收到IN令牌
- 对于接收同步管道，当没有FIFO缓冲区平面为空时接收OUT令牌。

29.2.19 设备状态更改寄存器(DVCHGR)

Address(es): USBFS.DVCHGR 4009 004Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DVCHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b14 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b15	DVCHG	设备状态更改	0：禁止写入USBADDR.STSRECOV[3:0]和USBADDR.USBADDR[6:0]位1：允许写入USBADDR.STSRECOV[3:0]和USBADDR.USBADDR[6:0]位。	R/W

有关详细信息，请参阅第29.3.1.5节，由于USB挂起恢复中断而从深度软件待机模式中释放。

29.2.20 USB Address Register (USBADDR)

Address(es): USBFS.USBADDR 4009 0050h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	STSRECOV[3:0]				—	USBADDR[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	USBADDR[6:0]	USB Address	In device controller mode, these bits indicate the USB address assigned by the host when the USBFS processed the SET_ADDRESS request successfully	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b11 to b8	STSRECOV[3:0]	Status Recovery	• Recovery in device controller mode b11 b8 1 0 0 1: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 001b (default state) 1 0 1 0: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 010b (address state) 1 0 1 1: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 011b (configured state). Other settings are prohibited. • Recovery in host controller mode b11 b8 0 1 0 0: Return to the low-speed state (bits DVSTCTR0.RHST[2:0] = 001b) 1 0 0 0: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b). Other settings are prohibited.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

USBADDR[6:0] bits (USB Address)

In device controller mode, the USBADDR[6:0] bits indicate the USB address received when the USBFS processed a SetAddress request successfully. The USBFS sets the USBADDR[6:0] bits to 00h on detecting a USB bus reset.

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1. On recovering from a USB power shut-off, operation can resume from the USB address set before software shut-off.

In host controller mode, the USBADDR[6:0] bits are invalid.

STSRECOV[3:0] bits (Status Recovery)

Use the STSRECOV[3:0] bits to resume the state of the internal sequencer on recovering from USB power shut-off. For details, see section 29.3.1.5, Release from Deep Software Standby mode because of USB suspend/resume interrupts.

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1.

29.2.20 USB地址寄存器(USBADDR)

Address(es): USBFS.USBADDR 4009 0050h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	STSRECOV[3:0]				—	USBADDR[6:0]						
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b6 to b0	USBADDR[6:0]	USB地址	在设备控制器模式下，这些位指示USBFS成功处理SET_ADDRESS请求时主机分配的USB地址	R/W
b7	—	Reserved	该位读取为0。写入值应为0。	R/W
b11 to b8	STSRECOV[3:0]	状态恢复	在设备控制器模式下恢复b11b81001：返回全速状态（位DVSTCTR0.RHST[2:0]=010b），位INTSTS0.DVSQ[2:0]=001b（默认状态）1010：返回全速状态（位DVSTCTR0.RHST[2:0]=010b），位INTSTS0.DVSQ[2:0]=010b（地址状态）1011：返回全速速度状态（位DVSTCTR0.RHST[2:0]=010b），位INTSTS0.DVSQ[2:0]=011b（配置状态）。禁止其他设置。 在主机控制器模式下恢复b11b80100：返回低速状态（位DVSTCTR0.RHST[2:0]=001b）1000：返回全速状态（位DVSTCTR0.RHST[2:0]=010b)。禁止其他设置。	R/W
b15 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W

USBADDR[6:0]位（USB地址）

在设备控制器模式下，USBADDR[6:0]位指示当USBFS处理一个SetAddress请求成功。USBFS在检测到USB总线复位时将USBADDR[6:0]位设置为00h。

当DVCHGR.DVCHG位设置为1时，可以写入这些位。从USB电源关闭恢复后，操作可以从软件关闭之前设置的USB地址恢复。

在主机控制器模式下，USBADDR[6:0]位无效。

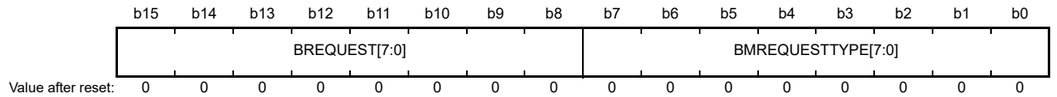
STSRECOV[3:0]位（状态恢复）

使用STSRECOV[3:0]位在从USB电源关闭恢复时恢复内部定序器的状态。有关详细信息，请参阅第29.3.1.5节，由于USB挂起恢复中断而从深度软件待机模式中释放。

当DVCHGR.DVCHG位设置为1时，可以写入这些位。

29.2.21 USB Request Type Register (USBREQ)

Address(es): USBFS.USBREQ 4009 0054h



Bit	Symbol	Bit name	Description	R/W
b7 to b0	BMREQUESTTYPE[7:0]	Request Type	These bits store the USB request bmRequestType value	R/W*1
b15 to b8	BREQUEST[7:0]	Request	These bits store the USB request bRequest value	R/W*1

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBREQ stores setup requests for control transfers.

In device controller mode, the USBREQ stores the received values of bRequest and bmRequestType. In host controller mode, it is set to the bRequest and bmRequestType values to be transmitted.

USBREQ is initialized by a USB bus reset.

BMREQUESTTYPE[7:0] bits (Request Type)

The BMREQUESTTYPE[7:0] bits hold the bmRequestType value of USB requests.

- In host controller mode:
  Set these bits to the value of the USB request data in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the value of the USB request data in the setup transactions for reception. Writing to these bits has no effect.

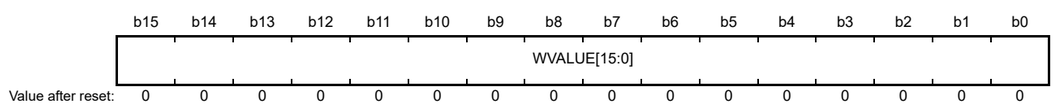
BREQUEST[7:0] bits (Request)

The BREQUEST[7:0] bits store the bRequest value of the USB request.

- In host controller mode:
  Set these bits to the value of the USB request data in the setup transactions for transmission. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the value of the USB request data in the setup transactions for reception. Writing to these bits has no effect.

29.2.22 USB Request Value Register (USBVAL)

Address(es): USBFS.USBVAL 4009 0056h

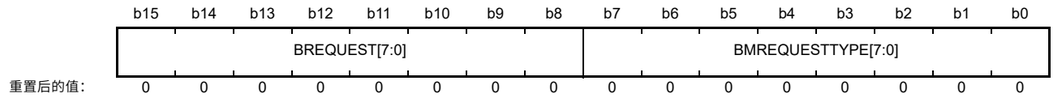


Bit	Symbol	Bit name	Description	R/W
b15 to b0	WVALUE[15:0]	Value	These bits store the USB request wValue value	R/W*1

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

29.2.21 USB请求类型寄存器(USBREQ)

Address(es): USBFS.USBREQ 4009 0054h



Bit	Symbol	位名称	Description	R/W
b7 to b0	BMREQUESTTYPE[7:0]	请求类型	这些位存储USB请求bmRequestType值	R/W*1
b15 to b8	BREQUEST[7:0]	Request	这些位存储USB请求bRequest值	R/W*1

Note 1. 在设备控制器模式下，可以读取这些位，但写入它们无效。在主机控制器模式下，这些位都是读写位。

USBREQ存储控制传输的设置请求。

在设备控制器模式下，USBREQ存储接收到的bRequest和bmRequestType值。在主机控制器模式下，它被设置为要传输的bRequest和bmRequestType值。

USBREQ由USB总线复位初始化。

BMREQUESTTYPE[7:0]位（请求类型）

BMREQUESTTYPE[7:0]位保存USB请求的bmRequestType值。

- 在主机控制器模式下：
  在传输设置事务中将这些位设置为USB请求数据的值。当DCPCTR.SUREQ位为1时，不要更改位的值。
- 在设备控制器模式下：
  这些位指示用于接收的设置事务中的USB请求数据的值。写入这些位无效。

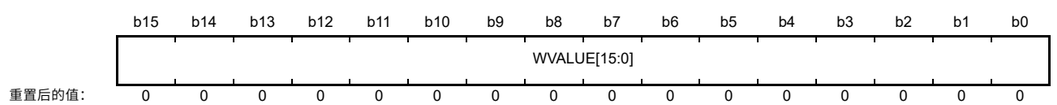
BREQUEST[7:0]位（请求）

BREQUEST[7:0]位存储USB请求的bRequest值。

- 在主机控制器模式下：
  将这些位设置为用于传输的设置事务中的USB请求数据的值。当DCPCTR.SUREQ位为1时，不要更改位的值。
- 在设备控制器模式下：
  这些位指示用于接收的设置事务中的USB请求数据的值。写入这些位无效。

29.2.22 USB请求值寄存器(USBVAL)

Address(es): USBFS.USBVAL 4009 0056h



Bit	Symbol	位名称	Description	R/W
b15 to b0	WVALUE[15:0]	Value	这些位存储USB请求wValue值	R/W*1

Note 1. 在设备控制器模式下，可以读取这些位，但写入它们无效。在主机控制器模式下，这些位都是读写位。

In device controller mode, USBVAL stores the received wValue value. In host controller mode, it is set to the wValue value to be transmitted.

USBVAL is initialized by a USB bus reset.

WVALUE[15:0] bits (Value)

The WVALUE[15:0] bits store wValue value of the USB request.

- In host controller mode:
  Set these bits to the value of the wValue field of USB requests in the setup transactions for transmission. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the wValue value of USB requests in the setup transactions for reception. Writing to the bits has no effect.

29.2.23 USB Request Index Register (USBINDX)

Address(es): USBFS.USBINDX 4009 0058h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WINDEX[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	WINDEX[15:0]	Index	These bits store the USB request wIndex value	R/W*1

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBINDX stores setup requests for control transfers.

In device controller mode, it stores the received wIndex value. In host controller mode, it is set to the wIndex value to be transmitted.

USBINDX is initialized by a USB bus reset.

WINDEX[15:0] bits (Index)

The WINDEX[15:0] bits hold the wIndex value of a USB request.

- In host controller mode:
  Set these bits to the wIndex value of USB requests in the setup transactions for transmission. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the wIndex value of USB requests in the setup transactions for reception. Writing to these bits has no effect.

在设备控制器模式下，USBVAL存储接收到的wValue值。在主机控制器模式下，它被设置为要传输的wValue值。

USBVAL由USB总线复位初始化。

WVALUE[15:0]位（值）

WVALUE[15:0]位存储USB请求的wValue值。

- 在主机控制器模式下：
  将这些位设置为用于传输的设置事务中USB请求的wValue字段的值。当DCPCTR.SUREQ位为1时，不要更改位的值。
- 在设备控制器模式下：
  这些位指示接收设置事务中USB请求的wValue值。写入位无效。

29.2.23 USB请求索引寄存器(USBINDX)

Address(es): USBFS.USBINDX 4009 0058h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WINDEX[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	WINDEX[15:0]	Index	这些位存储USB请求wIndex值	R/W*1

Note 1. 在设备控制器模式下，可以读取这些位，但写入它们无效。在主机控制器模式下，这些位都是读写位。

USBINDX存储控制传输的设置请求。

在设备控制器模式下，它存储接收到的wIndex值。在主机控制器模式下，它被设置为要传输的wIndex值。

USBINDX由USB总线复位初始化。

WINDEX[15:0]位（索引）

WINDEX[15:0]位保存USB请求的wIndex值。

- 在主机控制器模式下：
  将这些位设置为传输设置事务中USB请求的wIndex值。当DCPCTR.SUREQ位为1时，不要更改位的值。
- 在设备控制器模式下：
  这些位指示接收设置事务中USB请求的wIndex值。写入这些位无效。

29.2.24 USB Request Length Register (USBLENG)

Address(es): USBFS.USBLENG 4009 005Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WLENTUH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	WLENTUH[15:0]	Length	These bits store the USB request wLength value	R/W*1

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBLENG stores setup requests for control transfers.

In device controller mode, the received value of wLength is stored. In host controller mode, the value of wLength to be transmitted is set.

USBLENG is initialized by a USB bus reset.

WLENTUH[15:0] bits (Length)

The WLENTUH[15:0] bits hold the wLength value of a USB request.

- In host controller mode:
  Set these bits to the wLength value of USB requests in the setup transactions for transmission. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
  These bits indicate the wLength value of USB requests in the setup transactions for reception. Writing to these bits has no effect.

29.2.25 DCP Configuration Register (DCPCFG)

Address(es): USBFS.DCPCFG 4009 005Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	SHTNAK	—	—	DIR	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	DIR	Transfer Direction*1	0: Data receiving direction 1: Data transmitting direction.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	SHTNAK	Pipe Disabled at End of Transfer*1	0: Pipe kept open after transfer ends 1: Disable pipe after transfer ends.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only set this bit while the PID is NAK. Before setting this bit after changing the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK, check that the DCPCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through software is not required.

DIR bit (Transfer Direction*1)

In host controller mode, the DIR bit sets the transfer direction of the data stage and status stage for control transfers. In device controller mode, set the DIR bit to 0.

29.2.24 USB请求长度寄存器(USBLENG)

Address(es): USBFS.USBLENG 4009 005Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	WLENTUH[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	WLENTUH[15:0]	Length	这些位存储USB请求wLength值	R/W*1

Note 1. 在设备控制器模式下，可以读取这些位，但写入它们无效。在主机控制器模式下，这些位都是读写位。

USBLENG存储控制传输的设置请求。

在设备控制器模式下，存储接收到的wLength值。在主机控制器模式下，设置要传输的wLength的值。

USBLENG由USB总线复位初始化。

WLENTUH[15:0]位（长度）

WLENTUH[15:0]位保存USB请求的wLength值。

- 在主机控制器模式下：
  将这些位设置为传输设置事务中USB请求的wLength值。当DCPCTR.SUREQ位为1时，不要更改位的值。
- 在设备控制器模式下：
  这些位指示接收设置事务中USB请求的wLength值。写入这些位无效。

29.2.25 DCP配置寄存器(DCPCFG)

Address(es): USBFS.DCPCFG 4009 005Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b6, b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	SHTNAK	管道在传输结束时禁用*1	0：传输结束后管道保持打开1：传输结束后禁用管道。	R/W
b15 to b8	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 仅在PID为NAK时设置该位。在将DCPCR.PID[1:0]位从BUF更改为NAK之后设置此位之前，请检查DCPCTR.PBUSY位是否为0。但是，如果PID[1:0]位通过以下方式更改为NAKUSBFS，检查
不需要通过软件进行PBUSY位。

DIR位（传输方向*1）

在主机控制器模式下，DIR位设置控制传输的数据阶段和状态阶段的传输方向。在设备控制器模式下，将DIR位设置为0。

RA生态工作室

SHTNAK bit (Pipe Disabled at End of Transfer*1)

The SHTNAK bit specifies whether to change PID to NAK on transfer end when the selected pipe is receiving. It is only valid when the selected pipe is receiving.

When the SHTNAK bit is 1, the USBFS changes the DCPCTR.PID[1:0] bits for the DCP to NAK on determining that a transfer has ended. The USBFS determines that the transfer has ended on the following condition:

- A short packet, including a zero-length packet, is successfully received.

29.2.26 DCP Maximum Packet Size Register (DCPMAXP)

Address(es): USBFS.DCPMAXP 4009 005Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DEVSEL[3:0]				—	—	—	—	—	MXPS[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	MXPS[6:0]	Maximum Packet Size*1	These bits set the maximum data payload specification (maximum packet size) for the DCP	R/W
b11 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b12	DEVSEL[3:0]	Device Select*2	b15 b12 0 0 0 0: Address 0000b 0 0 0 1: Address 0001b 0 0 1 0: Address 0010b 0 0 1 1: Address 0011b 0 1 0 0: Address 0100b 0 1 0 1: Address 0101b. Other settings are prohibited.	R/W

Note 1. Only set the MXPS[6:0] bits while PID is NAK. Before setting these bits after changing the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK, check that the DCPCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through software is not required. After modifying the MXPS[6:0] bits and setting the DCP to the CURPIPE[3:0] bits in the port select register, clear the buffer by setting the BCLR bit in the port control register to 1.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK and the DCPCTR.SUREQ bit is 0. Before setting these bits after changing the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK, check that the DCPCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through software is not required.

MXPS[6:0] bits (Maximum Packet Size)

The MXPS[6:0] bits specify the maximum data payload (maximum packet size) for the DCP. The initial value is 40h (64 bytes). Set the bits to a USB 2.0-compliant value. Do not write to the FIFO buffer or set PID = BUF while MXPS[6:0] is set to 0.

DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target peripheral device for a control transfer. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0010b, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0000b.

SHTNAK位（传输结束时管道禁用*1）

SHTNAK位指定当所选管道正在接收时，是否在传输结束时将PID更改为NAK。仅在所选管道正在接收时有效。

当SHTNAK位为1时，USBFS在确定传输已结束时将DCPCR.PID[1:0]位更改为DCP为NAK。USBFS在以下条件下确定传输已结束：

- 成功接收到一个短数据包，包括一个长度为零的数据包。

29.2.26 DCP最大数据包大小寄存器(DCPMAXP)

Address(es): USBFS.DCPMAXP 4009 005Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DEVSEL[3:0]				—	—	—	—	—	MXPS[6:0]						
重置后的值：	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	Symbol	位名称		Description	R/W
b6 to b0	MXPS[6:0]	最大数据包大小	*1	这些位设置DCP的最大数据有效负载规范（最大数据包大小）	R/W
b11 to b7	—	Reserved		这些位被读取为0。写入值应为0。	R/W
b15 to b12	DEVSEL[3:0]	设备选择	*2	b15b120000：地址0000b0 001：地址0001b0010：地 址0010b0011：地址0011b0 100：地址0100b0101：地 址0101b。禁止其他设置。	R/W

Note 1. 仅在PID为NAK时设置MXPS[6:0]位。在将DCPCR.PID[1:0]位从BUF更改为NAK之后设置这些位之前，请检查DCPCTR.PBUSY位是否为0。但是，如果PID[1:0]位通过以下方式更改为NAKUSBFS，不需要通过软件检查PBUSY位。修改MXPS[6:0]位并将DCP设置为端口选择寄存器中的CURPIPE[3:0]位后，通过将端口控制寄存器中的BCLR位设置为1来清除缓冲区。

Note 2. 仅在PID为NAK且DCPCTR.SUREQ位为0时设置DEVSEL[3:0]位。在将DCPCR.PID[1:0]位从BUF更改为NAK后设置这些位之前，请检查DCPCTR.PBUSY位为0。但是，如果PID[1:0]位被USBFS更改为NAK，则不需要通过软件检查PBUSY位。

MXPS[6:0]位（最大数据包大小）

MXPS[6:0]位指定DCP的最大数据有效载荷（最大数据包大小）。初始值为40h（64字节）。将这些位设置为符合USB2.0的值。当MXPS[6:0]设置为0时，不要写入FIFO缓冲区或设置PID=BUF。

DEVSEL[3:0]位（设备选择）

在主机控制器模式下，DEVSEL[3:0]位指定目标外围设备的地址以进行控制传输。首先在相关的DEVADDn（n=0到5）寄存器中设置设备地址，然后将这些位设置为相应的值。例如，要将DEVSEL[3:0]位设置为0010b，首先要设置DEVADD2寄存器中的地址。

在设备控制器模式下，将这些位设置为0000b。

29.2.27 DCP Control Register (DCPCTR)

Address(es): USBFS.DCPCTR 4009 0060h

b13, b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	SUREQ	Setup Token Transmission	Sets up token transmission in host controller mode. 0: Invalid (writing 0 has no effect) 1: Transmit setup packet.	R/W
b15	BSTS	Buffer Status	0: Buffer access disabled 1: Buffer access enabled.	R

Note 1. This bit is read as 0.
Note 2. Only set the SQSET and SQCLR bits to 1 while PID is NAK. Before setting these bits after changing the PID[1:0] bits for the DCP from 01b (BUF) to 00b (NAK), check that the PBUSY bit is 0. However, if the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through software is not required.

PID[1:0] bits (Response PID)

The PID[1:0] bits control the USB response type during control transfers.

In host controller mode, to change the PID[1:0] setting from NAK to BUF:

- When the transmitting direction is set:

29.2.27 DCP控制寄存器(DCPCTR)

Address(es): USBFS.DCPCTR 4009 0060h

b15	BSTS	缓冲区状态	0：禁止缓冲区访问1：允许缓冲区访问。	R

Note 1. 该位读为0。
Note 2. 仅当PID为NAK时将SQSET和SQCLR位设置为1。在更改PID[1:0]位后设置这些位之前DCP从01b(BUF)到00b(NAK)，检查PBUSY位是否为0。但是，如果PID[1:0]位由USBFS，不需要通过软件检查PBUSY位。

PID[1:0]位（响应PID）

PID[1:0]位在控制传输期间控制USB响应类型。

在主机控制器模式下，要将PID[1:0]设置从NAK更改为BUF：

- 设置传输方向时：

a. Write all of the transmit data to the FIFO buffer while the DVSTCTR0.UACT bit is 1 and PID is NAK.

b. Set PID[1:0] bits to 01b (BUF).
The USBFS then executes the OUT transaction.

- When the receiving direction is set:

a. Check that the FIFO buffer is empty (or empty the buffer) while the DVSTCTR0.UACT bit is 1 and PID is NAK.

b. Set PID[1:0] bits to 01b (BUF).
The USBFS then executes the IN transaction.

The USBFS changes the PID[1:0] setting as follows:

- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets the PID[1:0] to STALL (11b)
- When a reception error, such as a CRC error, is detected three times consecutively, the USBFS sets the PID[1:0] bits to NAK (00b)
- On receiving the STALL handshake, the USBFS sets PID[1:0] to STALL (11b).

In device controller mode, the USBFS changes the PID[1:0] setting as follows:

- On receiving a setup packet, the USBFS sets PID[1:0] to NAK (00b). The USBFS then sets the INTSTS0.VALID flag to 1, and the PID[1:0] setting cannot be changed until software clears the VALID flag to 0.
- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets PID[1:0] to STALL (11b)
- On detecting a control transfer sequence error, the USBFS sets PID[1:0] to STALL (1xb)
- On detecting a USB bus reset, the USBFS sets PID[1:0] to NAK.

The USBFS does not check the PID[1:0] setting while processing a SET_ADDRESS request.

The PID[1:0] bits are initialized by a USB bus reset.

CCPL bit (Control Transfer End Enable)

In device controller mode, setting the CCPL bit to 1 enables the status stage of the control transfer to be completed. When this bit is set to 1 by software while the associated PID[1:0] bits are set to BUF, the USBFS completes the control transfer status stage.

During control read transfers, the USBFS transmits the ACK handshake in response to the OUT transaction from the USB host. During control write or no-data control transfers, it transmits the zero-length packet in response to the IN transaction from the USB host. On detecting a SET_ADDRESS request, the USBFS operates in auto response mode from the setup stage up to the status stage completion regardless of the CCPL bit setting.

The USBFS changes the CCPL bit from 1 to 0 on receiving a new setup packet. Software cannot write 1 to the bit while the INTSTS0.VALID bit is 1. The CCPL bit is initialized by a USB bus reset.

In host controller mode, always write 0 to the CCPL bit.

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether DCP is used for the transaction when the USBFS changes the PID[1:0] bits from BUF to NAK. The USBFS changes the PBUSY bit from 0 to 1 at the start of a USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

After PID is set to NAK by software, the value in the PBUSY bit indicates whether changes to pipe settings can proceed.

For details, see section 29.3.4.1, Pipe control register switching procedures.

SQMON bit (Sequence Toggle Bit Monitor)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

The USBFS toggles the SQMON bit on successful completion of the transaction. It does not toggle the bit, however, when a DATA-PID mismatch occurs during a transfer in the receiving direction.

一个。当DVSTCTR0.UACT位为1且PID为NAK时，将所有发送数据写入FIFO缓冲区。

湾。将PID[1:0]位设置为01b(BUF)。
然后USBFS执行OUT事务。

- 设置接收方向时：

一个。在DVSTCTR0.UACT位为1且PID为NAK时检查FIFO缓冲区是否为空（或清空缓冲区）。

湾。将PID[1:0]位设置为01b(BUF)。
然后USBFS执行IN事务。

USBFS更改PID[1:0]设置如下：

- 当PID[1:0]位被软件设置为BUF(01b)并且USBFS接收到的数据超过MaxPacketSize，USBFS将PID[1:0]设置为STALL(11b)
- 当连续3次检测到接收错误（例如CRC错误）时，USBFS将PID[1:0]位设置为NAK(00b)
- 在接收到STALL握手时，USBFS将PID[1:0]设置为STALL(11b)。

在设备控制器模式下，USBFS将PID[1:0]设置更改如下：

- 接收到设置数据包后，USBFS将PID[1:0]设置为NAK(00b)。然后USBFS将INTSTS0.VALID标志设置为1，并且PID[1:0]设置不能更改，直到软件将VALID标志清除为0。
- 当PID[1:0]位被软件设置为BUF(01b)并且USBFS接收到的数据超过MaxPacketSize，USBFS将PID[1:0]设置为STALL(11b)
- 在检测到控制传输序列错误时，USBFS将PID[1:0]设置为STALL(1xb)
- 在检测到USB总线复位时，USBFS将PID[1:0]设置为NAK。

USBFS在处理SET_ADDRESS请求时不检查PID[1:0]设置。

PID[1:0]位由USB总线复位初始化。

CCPL位（控制传输结束使能）

在设备控制器模式下，将CCPL位设置为1可以完成控制传输的状态阶段。
当该位由软件设置为1且相关的PID[1:0]位设置为BUF时，USBFS完成控制传输状态阶段。

在控制读取传输期间，USBFS发送ACK握手以响应来自USB主机的OUT事务。在控制写入或无数据控制传输期间，它传输零长度数据包以响应来自USB主机的IN事务。在检测到SET_ADDRESS请求时，USBFS从设置阶段到状态阶段完成以自动响应模式运行，而不管CCPL位设置如何。

USBFS在接收到新的设置数据包时将CCPL位从1更改为0。当INTSTS0.VALID位为1时，软件不能向该位写入1。
CCPL位由USB总线复位初始化。

在主机控制器模式下，始终将0写入CCPL位。

PBUSY位（管道忙）

PBUSY位指示当USBFS将PID[1:0]位从BUF更改为NAK时是否使用DCP进行事务处理。USBFS在所选管道的USB事务开始时将PBUSY位从0更改为1，并在完成一个事务时将PBUSY位从1更改为0。

在软件将PID设置为NAK后，PBUSY位中的值指示是否可以继续对管道设置进行更改。

详见29.3.4.1管道控制寄存器切换流程。

SQMON位（序列切换位监视器）

SQMON位指示DCP传输期间下一个事务的序列切换位的预期值。

USBFS在事务成功完成时切换SQMON位。但是，当在接收方向的传输过程中发生DATA-PID不匹配时，它不会切换该位。

In device controller mode, the USBFS sets the SQMON bit to 1 (specifies DATA1 as the expected value) on successful reception of the setup packet.

In device controller mode, the USBFS does not reference the SQMON bit during IN or OUT transactions at the status stage, and it does not toggle the bit on normal completion.

SQSET bit (Sequence Toggle Bit Set*2)

The SQSET bit specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

SQCLR bit (Sequence Toggle Bit Clear*2)

The SQCLR bit specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer. It is read as 0.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

SUREQCLR bit (SUREQ Bit Clear)

In host controller mode, setting the SUREQCLR bit to 1 clears the SUREQ bit to 0. This bit is read as 0.

If transfer stops while the SUREQ bit is set to 1 in a setup transaction, set the SUREQCLR bit to 1 by software. This is not necessary at the end of a normal setup transaction, because the USBFS automatically clears the SUREQ bit to 0.

Only control the SUREQ bit through the SUREQCLR bit while the DVSTCTR0.UACT bit is 0. When UACT is 0, communication is halted or no transfer occurs because a bus disconnection was detected.

In device controller mode, always write 0 to this bit.

SUREQ bit (Setup Token Transmission)

In host controller mode, setting the SUREQ bit to 1 triggers the USBFS to transmit the setup packet. After completing the setup transaction process, the USBFS generates either the SACK or SIGN interrupt and clears the SUREQ bit to 0. The USBFS also clears the SUREQ bit to 0 when software sets the SUREQCLR bit to 1.

Before setting the SUREQ bit to 1, set the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, and USBLENG appropriately to transmit the target USB request in the setup transaction. Also check that the PID[1:0] bits for the DCP are set to NAK. After setting the SUREQ bit to 1, do not change the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, or USBLENG until the setup transaction is complete (SUREQ bit = 1). Write 1 to the SUREQ bit only when transmitting the setup token. Otherwise, write 0.

In device controller mode, always write 0 to this bit.

BSTS bit (Buffer Status)

The BSTS bit indicates the status of access to the DCP FIFO buffer. The meaning of this bit varies as follows depending on the CFIFOSEL.ISEL setting:

- When ISEL = 0, this bit indicates whether receive data can be read from the buffer
- When ISEL = 1, this bit indicates whether transmit data can be written to the buffer.

在设备控制器模式下，USBFS在成功接收到设置数据包时将SQMON位设置为1（指定DATA1作为预期值）。

在设备控制器模式下，USBFS在状态阶段的IN或OUT事务期间不参考SQMON位，并且在正常完成时不切换该位。

SQSET位（序列切换位设置*2）

SQSET位将DATA1指定为DCP传输期间下一个事务的序列切换位的预期值。

不要同时将SQCLR和SQSET位设置为1。

SQCLR位（序列切换位清除*2）

SQCLR位将DATA0指定为DCP传输期间下一个事务的序列切换位的预期值。读为0。

不要同时将SQCLR和SQSET位设置为1。

SUREQCLR位（SUREQ位清零）

在主机控制器模式下，将SUREQCLR位设置为1会将SUREQ位清除为0。该位被读取为0。

如果在设置事务中将SUREQ位设置为1时传输停止，则通过软件将SUREQCLR位设置为1。这在正常设置事务结束时不是必需的，因为USBFS会自动将SUREQ位清除为0。

当DVSTCTR0.UACT位为0时，仅通过SUREQCLR位控制SUREQ位。当UACT为0时，由于检测到总线断开，通信停止或不发生传输。

在设备控制器模式下，始终向该位写入0。

SUREQ位（设置令牌传输）

在主机控制器模式下，将SUREQ位设置为1会触发USBFS发送设置数据包。完成设置事务处理后，USBFS产生SACK或SIGN中断并将SUREQ位清零。当软件将SUREQCLR位设置为1时，USBFS也将SUREQ位清零。

在将SUREQ位设置为1之前，适当地设置DCPMAXP.DEVSEL[3:0]位、USBREQ、USBVAL、USBINDX和USBLENG以在设置事务中传输目标USB请求。还要检查DCP的PID[1:0]位是否设置为NAK。将SUREQ位设置为1后，在设置事务完成（SUREQ位=1）之前，不要更改DCPMAXP.DEVSEL[3:0]位、USBREQ、USBVAL、USBINDX或USBLENG。将1写入

仅在发送设置令牌时才使用SUEQ位。否则，写0。

在设备控制器模式下，始终向该位写入0。

BSTS位（缓冲区状态）

BSTS位指示访问DCPFIFO缓冲区的状态。根据CFIFOSEL.ISEL设置，该位的含义如下所示：

- 当ISEL=0时，该位指示是否可以从缓冲区读取接收数据
- 当ISEL=1时，该位指示是否可以将发送数据写入缓冲区。

29.2.28 Pipe Window Select Register (PIPESEL)

Address(es): USBFS.PIPESEL 4009 0064h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	PIPESEL[3:0]	Pipe Window Select	b3 b0 0 0 0 0: No pipe selected 0 0 0 1: Pipe 1 0 0 1 0: Pipe 2 0 0 1 1: Pipe 3 0 1 0 0: Pipe 4 0 1 0 1: Pipe 5 0 1 1 0: Pipe 6 0 1 1 1: Pipe 7 1 0 0 0: Pipe 8 1 0 0 1: Pipe 9. Other settings are prohibited.	R/W
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Set pipes 1 to 9 using the PIPESEL, PIPECFG, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN registers (n = 0 to 9).

After selecting the pipe in the PIPESEL register, set the pipe functions in the associated PIPECFG, PIPEMAXP, and PIPEPERI registers. The PIPEnCTR, PIPEnTRE, and PIPEnTRN registers can be set independently of the pipe selection in the PIPESEL register.

PIPESEL[3:0] bits (Pipe Window Select)

The PIPESEL[3:0] bits select the pipe number associated with the PIPECFG, PIPEMAXP, and PIPEPERI registers used for data writing and reading. Selecting a pipe number in the PIPESEL[3:0] bits allows writing to and reading from PIPECFG, PIPEMAXP, and PIPEPERI associated with the selected pipe number.

When PIPESEL[3:0] = 0000b, 0 is read from all of the bits in PIPECFG, PIPEMAXP, and PIPEPERI. Writing to these bits is invalid.

29.2.29 Pipe Configuration Register (PIPECFG)

Address(es): USBFS.PIPECFG 4009 0068h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b15 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

使用PIPESEL、PIPECFG、PIPEMAXP、PIPEPERI、PIPEnCTR、PIPEnTRE和PIPEnTRN寄存器（n=0到9）设置管道1到9。

在PIPESEL寄存器中选择管道后，在相关的PIPECFG、PIPEMAXP和PIPEPERI寄存器。PIPEnCTR、PIPEnTRE和PIPEnTRN寄存器可以独立于PIPESEL寄存器中的管道选择进行设置。

PIPESEL[3:0]位（管道窗口选择）

PIPESEL[3:0]位选择与用于数据写入和读取的PIPECFG、PIPEMAXP和PIPEPERI寄存器相关的管道编号。在PIPESEL[3:0]位中选择一个管道编号允许写入和读取与所选管道编号相关的PIPECFG、PIPEMAXP和PIPEPERI。

当PIPESEL[3:0]=0000b时，从PIPECFG、PIPEMAXP和PIPEPERI中的所有位读取0。写入这些位无效。

29.2.29 管道配置寄存器(PIPECFG)

Address(es): USBFS.PIPECFG 4009 0068h

R/W

Note 1. Only set the TYPE[1:0], SHTNAK, and EPNUM[3:0] bits while PID is NAK. Before setting this bit after changing the PIPEnCTR.PID[1:0] bits from BUF to NAK, check that the PIPEnCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through software is not required.

Note 2. Only set the BFRE, DBLB, and DIR bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits after changing the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK), check that the PIPEnCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through software is not required.

Note 3. To change the BFRE, DBLB, or DIR bits after completing USB communication on the selected pipe, in addition to the constraints described in Note 2., write 1 and then 0 to the PIPEnCTR.ACLRM bit continuously through software to clear the FIFO buffer assigned to the selected pipe.

PIPECFG specifies the transfer type, FIFO buffer access direction, and endpoint numbers for pipes 1 to 9. It also selects single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

EPNUM[3:0] bits (Endpoint Number*1)

The EPNUM[3:0] bits specify the endpoint number for the selected pipe. Setting 0000b indicates the pipe is not used. Set these bits so that the combination of the DIR and EPNUM[3:0] settings is different from those for other pipes. The EPNUM[3:0] bits can be set to 0000b for all pipes.

DIR bit (Transfer Direction*2,*3)

The DIR bit specifies the transfer direction for the selected pipe.

When software sets this bit to 0, the USBFS uses the selected pipe for receiving. When software sets this bit to 1, the USBFS uses the selected pipe for transmitting.

SHTNAK bit (Pipe Disabled at End of Transfer*1)

The SHTNAK bit specifies whether to change the PIPEnCTR.PID[1:0] bits to 00b (NAK) at the end of transfer when the selected pipe is set in the receiving direction. The SHTNAK bit is valid for pipes 1 to 5 in the receiving direction.

When software sets this bit to 1 for a receiving pipe, the USBFS changes the PIPEnCTR.PID[1:0] bits associated with the selected pipe to 00b (NAK) on determining the transfer end. The USBFS determines that the transfer has ended on the following conditions:

- A short packet data (including a zero-length packet) is successfully received
- The transaction counter is used and the number of packets specified for the transaction counter are successfully received.

Bit	Symbol	位名称	Description	R/W
b9	DBLB	双缓冲模式*2 *3	0：单缓冲区1： 双缓冲区。	R/W
b10	BFRE	BRDY中断操作 Specification*2,*3	0：发送或接收数据时产生BRDY中断1：完成读取数据时产生BRDY中断。	R/W
b13 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b15, b14	TYPE[1:0]	Transfer Type*1	管道1和2b15b1400：管道未使用01：批量传输10：设置禁止11：同步传输。 管道3至5b15b1400：管道未使用01：批量传输10：禁止设置11：禁止设置。 管道6至9b15b1400：未使用管道01：禁止设置10：中断传输11：禁止设置。	R/W

Note 1. 仅在PID为NAK时设置TYPE[1:0]、SHTNAK和EPNUM[3:0]位。更改后设置该位之前PIPEnCTR.PID[1:0]位从BUF到NAK，检查PIPEnCTR.PBUSY位是否为0。但是，如果PID[1:0]位被USBFS更改为NAK，则通过软件检查PBUSY位是不需要。

Note 2. 仅在PID为NAK且在端口选择寄存器的CURPIPE[3:0]位中选择管道之前设置BFRE、DBLB和DIR位。在将PIPEnCTR.PID[1:0]位从01b(BUF)更改为00b(NAK)之后设置这些位之前，请检查PIPEnCTR.PBUSY位是否为0。但是，如果PID[1:0]位更改由USBFS设置为00(NAK)，不需要通过软件检查PBUSY位。

Note 3. 要在所选管道上完成USB通信后更改BFRE、DBLB或DIR位，除了注释2中描述的约束之外，通过软件连续向PIPEnCTR.ACLRM位写入1和0，以清除分配的FIFO缓冲区到选定的管道。

PIPECFG指定管道1到9的传输类型、FIFO缓冲区访问方向和端点编号。它还选择单缓冲区或双缓冲区模式，以及在传输结束时是继续还是禁用管道操作。

EPNUM[3:0]位（端点编号*1）

EPNUM[3:0]位指定所选管道的端点号。设置0000b表示不使用管道。设置这些位，以便DIR和EPNUM[3:0]设置的组合不同于其他管道的设置。对于所有管道，EPNUM[3:0]位可以设置为0000b。

DIR位（传输方向*2 *3）

DIR位指定所选管道的传输方向。

当软件将此位设置为0时，USBFS使用所选管道进行接收。当软件将该位设置为1时，USBFS使用选定的管道进行传输。

SHTNAK位（传输结束时管道禁用*1）

SHTNAK位指定当所选管道设置为接收方向时，是否在传输结束时将PIPEnCTR.PID[1:0]位更改为00b(NAK)。SHTNAK位对接收方向的管道1到5有效。

当软件将该位设置为接收管道时，USBFS在确定传输结束时将与所选管道关联的PIPEnCTR.PID[1:0]位更改为00b(NAK)。USBFS在以下条件下确定传输已结束：

- 成功接收短包数据（包括零长度包）
- 使用事务计数器并成功接收为事务计数器指定的数据包数量。

DBLB bit (Double Buffer Mode*2,*3)

The DBLB bit selects either single or double buffer mode for the FIFO buffer used by the selected pipe. This bit is valid for pipes 1 to 5.

BFRE bit (BRDY Interrupt Operation Specification*2,*3)

The BFRE bit specifies the BRDY interrupt generation timing from the USBFS to the CPU for the selected pipe.

When software sets the BFRE bit to 1 and the selected pipe is receiving, the USBFS detects the transfer completion and generates the BRDY interrupt on reading the packet.

When a BRDY interrupt is generated with this setting, write 1 to the BCLR bit in the port control register with software. The FIFO buffer assigned to the selected pipe is not enabled for reception until 1 is written to the BCLR bit.

When the BFRE bit is set to 1 by software and the selected pipe is transmitting, the USBFS does not generate the BRDY interrupt. For details, see section 29.3.3.1, BRDY interrupt.

TYPE[1:0] bits (Transfer Type*1)

The TYPE[1:0] bits specify the transfer type for the pipe selected in the PIPESEL.PIPESEL[3:0] bits. Before setting PID to BUF and starting USB communication on the selected pipe, set the TYPE[1:0] bits to a value other than 00b.

29.2.30 Pipe Maximum Packet Size Register (PIPEMAXP)

Address(es): USBFS.PIPEMAXP 4009 006Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DEVSEL[3:0]				—	—	—	MXPS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0/1*1	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b8 to b0	MXPS[8:0]	Maximum Packet Size*2	• Pipes 1 and 2 1 byte (001h) to 256 bytes (100h) • Pipes 3 to 5 8 bytes (008h), 16 bytes (010h), 32 bytes (020h), 64 bytes (040h) Bits MXPS[8:7] and MXPS[2:0] are not supported. • Pipes 6 to 9 1 byte (001h) to 64 bytes (040h) Bits MXPS[8:7] are not supported.	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b12	DEVSEL[3:0]	Device Select*3	b3 b0 0 0 0 0: Address 0000b 0 0 0 1: Address 0001b 0 0 1 0: Address 0010b 0 0 1 1: Address 0011b 0 1 0 0: Address 0100b 0 1 0 1: Address 0101b. Other settings are prohibited.	R/W

Note 1. The value of the MXPS[8:0] bits is 000h when no pipe is selected in the PIPESEL.PIPESEL[3:0] bits and 040h when a pipe is selected.

Note 2. Only set the MXPS[8:0] bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits after changing the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK), check that the PIPEnCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through software is not required.

Note 3. Only set the DEVSEL[3:0] bits while PID is NAK. Before setting these bits after changing the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK), check that the PIPEnCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through software is not required.

PIPEMAXP specifies the maximum packet size for pipes 1 to 9.

DBLB位(双缓冲模式*2 *3)

DBLB位为所选管道使用的FIFO缓冲区选择单缓冲区模式或双缓冲区模式。该位对管道1到5有效。

BFRE位(BRDY中断操作规范*2 *3)

BFRE位为所选管道指定从USBFS到CPU的BRDY中断生成时序。

当软件将BFRE位设置为1并且所选管道正在接收时，USBFS检测到传输完成并在读取数据包时产生BRDY中断。

当使用该设置产生BRDY中断时，用软件将1写入端口控制寄存器中的BCLR位。
在将1写入BCLR位之前，分配给所选管道的FIFO缓冲区不会用于接收。

当BFRE位被软件设置为1并且所选管道正在发送时，USBFS不会产生BRDY中断。有关详细信息，请参阅第29.3.3.1节，BRDY中断。

TYPE[1:0]位（传输类型*1）

TYPE[1:0]位指定在PIPESEL.PIPESEL[3:0]位中选择的管道的传输类型。在将PID设置为BUF并在所选管道上启动USB通信之前，请将TYPE[1:0]位设置为00b以外的值。

29.2.30 管道最大数据包大小寄存器(PIPEMAXP)

Address(es): USBFS.PIPEMAXP 4009 006Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DEVSEL[3:0]				—	—	—	MXPS[8:0]

Bit	Symbol	位名称	Description	R/W
b8 to b0	MXPS[8:0]	最大数据包大小*2	管道1和2 1字节(001h)到256字节(100h) 管道3到5 不支持8字节(008h)、16字节(010h)、32字节(020h)、64字节(040h)位MXPS[8:7]和MXPS[2:0]。 管道6至9 不支持1字节(001h)到64字节(040h)位MXPS[8:7]。	R/W
b11 to b9	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b15 to b12	DEVSEL[3:0]	Device Select*3	b3b00000：地址0000b0001：地址0001b0010：地址0010b0011：地址0011b0100：地址0100b0101：地址0101b。禁止其他设置。	R/W

Note 1. 当在管道中选择未选择管道时，MXPS[8：0]位的值为000H。pipesel[3：0]位和选择管道时040H。

Note 2. 仅在PID为NAK且在端口选择寄存器的CURPIPE[3:0]位中选择管道之前设置MXPS[8:0]位。在将PIPEnCTR.PID[1:0]位从01b(BUF)更改为00b(NAK)之后设置这些位之前，请检查PIPEnCTR.PBUSY位是否为0。但是，如果PID[1:0]位发生更改由USBFS设置为00(NAK)，不需要通过软件检查PBUSY位。

Note 3. 仅在PID为NAK时设置DEVSEL[3:0]位。在将PIPEnCTR.PID[1:0]位从01b(BUF)更改为00b(NAK)之后设置这些位之前，请检查PIPEnCTR.PBUSY位是否为0。但是，如果PID[1:0]位发生更改由USBFS设置为00(NAK)，不需要通过软件检查PBUSY位。

PIPEMAXP指定管道1到9的最大数据包大小。

MXPS[8:0] bits (Maximum Packet Size*2)

The MXPS[8:0] bits specify the maximum data payload (maximum packet size) for the selected pipe.

Set these bits to the appropriate value for each transfer type based on the USB 2.0 specification. When MXPS[8:0] = 0, do not write to the FIFO buffer or set PID to BUF. These writes have no effect.

DEVSEL[3:0] bits (Device Select*3)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target device for USB communication. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0010b, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0000b.

29.2.31 Pipe Cycle Control Register (PIPEPERI)

Address(es): USBFS.PIPEPERI 4009 006Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	IITV[2:0]*1	Interval Error Detection Interval	Specifies the interval error detection timing for the selected pipe as the nth power of 2 of the frame timing	R/W
b11 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	IFIS	Isochronous IN Buffer Flush	0: Do not flush buffer 1: Flush buffer.	R/W
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only set the IITV[2:0] bits while PID is NAK. Before setting these bits after changing the PID[1:0] bits from 01b (BUF) to 00b (NAK), check that the PBUSY bit is 0. However, if the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through software is not required.

PIPEPERI selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfers, and sets the interval error detection interval for pipes 1 to 9.

IITV[2:0] bits (Interval Error Detection Interval)

To change the IITV[2:0] bits to another value after they are set and USB communication is performed, set the PIPEnCTR.PID[1:0] bits to 00b (NAK), then set the PIPEnCTR.ACLRM bit to 1 to initialize the interval timer.

The IITV[2:0] bits are not provided for pipes 3 to 5. Write 000b to the bit positions of the IITV[2:0] bits associated with pipes 3 to 5.

IFIS bit (Isochronous IN Buffer Flush)

The IFIS bit specifies whether to flush the buffer when the pipe selected in the PIPESEL. The PIPESEL[3:0] bits are used for isochronous IN transfers.

In device controller mode when the selected pipe is for isochronous IN transfers, the USBFS automatically clears the FIFO buffer if the USBFS fails to receive the IN token from the USB host within the interval set in the IITV[2:0] bits in terms of frames.

When double buffering is specified (PIPECFG.DBLB = 1), the USBFS only clears the data in the previously used plane.

The USBFS clears the FIFO buffer on receiving the SOF packet immediately after the frame in which the USBFS expected to receive the IN token. Even if the SOF packet is corrupted, the FIFO buffer is cleared at the time the SOF packet is expected to be received by using the internal interpolation function.

When the host controller function is selected, set this bit to 0. Set this bit to 0 when the selected pipe is not for isochronous transfer.

MXPS[8:0]位（最大数据包大小*2）

MXPS[8:0]位指定所选管道的最大数据有效负载（最大数据包大小）。

根据USB2.0规范将这些位设置为每种传输类型的适当值。当MXPS[8:0]=0时，不要写入FIFO缓冲区或将PID设置为BUF。这些写入没有效果。

DEVSEL[3:0]位（设备选择*3）

在主机控制器模式下，DEVSEL[3:0]位指定USB通信的目标设备的地址。首先在相关的DEVADDn（n=0到5）寄存器中设置设备地址，然后将这些位设置为相应的值。例如，要将DEVSEL[3:0]位设置为0010b，首先要设置DEVADD2寄存器中的地址。

在设备控制器模式下，将这些位设置为0000b。

29.2.31 管道周期控制寄存器(PIPEPERI)

Address(es): USBFS.PIPEPERI 4009 006Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	IITV[2:0]*1	间隔错误检测间隔	将所选管道的间隔错误检测时序指定为帧时序的2的n次方	R/W
b11 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b12	IFIS	同步IN缓冲区刷新	0：不刷新缓冲区1： 刷新缓冲区。	R/W
b15 to b13	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 仅在PID为NAK时设置IITV[2:0]位。在将PID[1:0]位从01b(BUF)更改为00b(NAK)后设置这些位之前，请检查PBUSY位是否为0。但是，如果PID[1:0]位更改为00(NAK))通过USBFS，不需要通过软件检查PBUSY位。

PIPEPERI选择在同步IN传输期间发生间隔错误时是否刷新缓冲区，并设置管道1到9的间隔错误检测间隔。

IITV[2:0]位（间隔错误检测间隔）

要在设置IITV[2:0]位并在执行USB通信后将其更改为另一个值，请设置
PIPEnCTR.PID[1:0]位为00b(NAK)，然后将PIPEnCTR.ACLRM位设置为1以初始化间隔定时器。

不为管道3到5提供IITV[2:0]位。将000b写入与管道3到5关联的IITV[2:0]位的位位置。

IFIS位（同步IN缓冲区刷新）

IFIS位指定在PIPESEL中选择管道时是否刷新缓冲区。PIPESEL[3:0]位用于同步IN传输。

在设备控制器模式下，当所选管道用于同步IN传输时，USBFS会自动清除
如果USBFS未能在IITV[2:0]位（以帧为单位）设置的间隔内接收来自USB主机的IN令牌，则FIFO缓冲区。

当指定双缓冲时（PIPECFG.DBLB=1），USBFS只清除先前使用的平面中的数据。

在USBFS预期接收IN令牌的帧之后，USBFS在接收到SOF数据包后立即清除FIFO缓冲区。即使SOF数据包损坏，FIFO缓冲区也会在预期接收SOF数据包时使用内部插值功能清除。

Whenthehostcontrollerfunctionisselected setthisbitto0.Setthisbitto0whentheselectedpipeisnotforisochronoustransfer.

b10	ATREPM	Auto Response Mode*2	0: Auto response mode disabled 1: Auto response mode enabled.	R/W
b13 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	INBUFM	Transmit Buffer Monitor	0: No data to be transmitted is in the FIFO buffer 1: Data to be transmitted is in the FIFO buffer.	R
b15	BSTS	Buffer Status	0: Buffer access by the CPU disabled 1: Buffer access by the CPU enabled.	R

Note 1. Only 0 can be read.
Note 2. Only set the ATREPM bit or write 1 to the SQCLR or SQSET bit while PID is NAK. Before setting these bits after changing the PID[1:0] bits from 01b (BUF) to 00b (NAK), check that the PBUSY bit is 0. However, if the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through software is not required.
Note 3. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits after changing the PID[1:0] bits from 01b (BUF) to 00b (NAK), check that the PBUSY bit is 0. However, if the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through software is not required.

PIPEnCTR can be set for any pipe selection in the PIPESEL register.

PID[1:0] bits (Response PID)

The PID[1:0] bits specify the response type for the next transaction on the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USBFS transfer. Table 29.7 and Table 29.8 show the basic operations of the USBFS (when there are no errors in the communication packets) based on the PID[1:0] bit setting.

After changing the PID[1:0] setting from BUF to NAK through software during USBFS communication on the selected pipe, check that the PBUSY bit is 1 to determine if USBFS transfer on the selected pipe has actually entered the NAK

29.2.32 PIPEn控制寄存器(PIPEnCTR)(n=1到9)

PIPEnCTR (n = 1 to 5)

Address(es): USBFS.PIPE1CTR 4009 0070h, USBFS.PIPE2CTR 4009 0072h, USBFS.PIPE3CTR 4009 0074h, USBFS.PIPE4CTR 4009 0076h, USBFS.PIPE5CTR 4009 0078h

b13 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b14	INBUFM	发送缓冲区监视器	0：FIFO缓冲区中没有要发送的数据1：FIFO缓冲区中没有要发送的数据。	R
b15	BSTS	缓冲区状态	0：禁止CPU访问缓冲区1：允许CPU访问缓冲区。	R

Note 1. 只能读取0。
Note 2. PID为NAK时，仅设置ATREPM位或将1写入SQCLR或SQSET位。在更改后设置这些位之前PID[1:0]位从01b(BUF)到00b(NAK)，检查PBUSY位是否为0。但是，如果PID[1:0]位被USBFS更改为00(NAK)，检查不需要通过软件进行PBUSY位。
Note 3. 仅在PID为NAK时以及在端口选择寄存器的CURPIPE[3:0]位中选择管道之前设置ACLRM位。在将PID[1:0]位从01b(BUF)更改为00b(NAK)后设置这些位之前，请检查PBUSY位是否为0。但是，如果PID[1:0]位更改为00(NAK))通过USBFS，不需要通过软件检查PBUSY位。

PIPEnCTR可以为PIPESEL寄存器中的任何管道选择设置。

PID[1:0]位（响应PID）

PID[1:0]位指定所选管道上下一个事务的响应类型。

默认PID[1:0]设置为NAK。将PID[1:0]设置更改为BUF以使用关联管道进行USBFS传输。
表29.7和表29.8显示了基于PID[1:0]位设置的USBFS的基本操作（当通信数据包中没有错误时）。

在所选管道上的USBFS通信期间通过软件将PID[1:0]设置从BUF更改为NAK后，检查PBUSY位是否为1以确定所选管道上的USBFS传输是否实际进入NAK

state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through software is not required.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to NAK on recognizing completion of the transfer when the selected pipe is receiving and the PIPECFG.SHTNAK bit for the selected pipe is set to 1 by software
- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode.

To specify the response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, transition to NAK and then BUF.

Table 29.7 USBFS operation based on PID[1:0] bit setting in host controller mode

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
00b (NAK)	Does not depend on the setting	Does not depend on the setting	Does not issue tokens
01b (BUF)	Bulk or interrupt	Does not depend on the setting	Issues tokens when the DVSTCTR0.UACT bit is 1 and the FIFO buffer associated with the selected pipe is ready for transmission and reception. Does not issue tokens when the DVSTCTR0.UACT bit is 0 or the FIFO buffer associated with the selected pipe is not ready for transmission or reception.
	Isochronous	Does not depend on the setting	Issues tokens regardless of the status of the FIFO buffer associated with the selected pipe
10b (STALL) or 11b (STALL)	Does not depend on the setting	Does not depend on the setting	Does not issue tokens

Table 29.8 USBFS operation based on PID[1:0] setting in device controller mode (1 of 2)

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
00b (NAK)	Bulk or interrupt	Does not depend on the setting	Returns NAK in response to the token from the USB host
	Isochronous	Does not depend on the setting	Returns nothing in response to the token from the USB host

状态。如果USBFS将PID[1:0]位更改为NAK，则不需要通过软件检查PBUSY位。

USBFS在以下情况下更改PIPEnCTR.PID[1:0]设置：

- USBFS在识别到传输完成时将PID设置为NAK，当所选管道正在接收并且所选管道的PIPECFG.SHTNAK位由软件设置为1
- USBFS在接收到有效载荷超过所选管道的最大数据包大小的数据包时将PID设置为STALL(11b)
- USBFS在设备控制器模式下检测到USB总线复位时将PID设置为NAK
- USBFS在主机控制器模式下连续3次检测到接收错误（例如CRC错误）时将PID设置为NAK
- USBFS在主机控制器模式下接收到STALL握手时将PID设置为STALL(11b)。

要指定响应类型，请按如下方式设置PID[1:0]位：

- 要从NAK(00b)转换到STALL，请设置10b
- 要从BUF(01b)转换到STALL，请设置11b
- 要从STALL(11b)转换到NAK，请设置10b，然后设置00b
- 要从STALL过渡到BUF，先过渡到NAK，然后再过渡到BUF。

Table 29.7 USBFS操作基于主机控制器模式下的PID[1:0]位设置

PID[1:0] value	传输类型	传输方向（DIR位）	USBFS operation
00b (NAK)	不依赖于设置	不依赖于设置	不发行代币
01b (BUF)	批量或中断	不依赖于设置	当DVSTCTR0.UACT位为1并且与所选管道关联的FIFO缓冲区已准备好进行发送和接收时，发出令牌。当DVSTCTR0.UACT位为0或 与所选管道关联的FIFO缓冲区尚未准备好进行发送或接收。
	Isochronous	不依赖于设置	无论与所选管道关联的FIFO缓冲区的状态如何，都会发出令牌
10b (STALL) or 11b (STALL)	不依赖于设置	不依赖于设置	不发行代币

Table 29.8 USBFS操作基于设备控制器模式下的PID[1:0]设置（1of2）

PID[1:0] value	传输类型	传输方向（DIR位）	USBFS operation
00b (NAK)	批量或中断	不依赖于设置	返回NAK以响应来自USB主机的令牌
	Isochronous	不依赖于设置	响应来自USB主机的令牌，不返回任何内容

Table 29.8 USBFS operation based on PID[1:0] setting in device controller mode (2 of 2)

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
01b (BUF)	Bulk	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception
	Interrupt	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception
	Bulk or interrupt	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the FIFO buffer associated with the selected pipe is ready for transmission. Otherwise, returns NAK.
	Isochronous	Receiving direction (DIR = 0)	Receives data in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception. Otherwise, discards the data.
	Isochronous	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the associated FIFO buffer is ready for transmission. Otherwise, transmits a zero-length packet.
10b (STALL) or 11b (STALL)	Bulk or interrupt	Does not depend on the setting	Returns STALL in response to the token from the USB host
	Isochronous	Does not depend on the setting	Returns nothing in response to the token from the USB host

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 at the start of the USBFS transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit with software after PID is set to NAK allows you to check whether changing the pipe setting is possible. For details, see section 29.3.4.1, Pipe control register switching procedures.

SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

When the selected pipe is not the isochronous transfer type, the USBFS toggles the SQMON flag on successful completion of the transaction. However, the USBFS does not toggle the SQMON bit when a DATA-PID mismatch occurs during transfer in the receiving direction.

SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS sets the SQSET bit to 0.

SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS sets the SQCLR bit to 0.

ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 29.9 shows the data cleared by writing 1 and 0 to the ACLRM bit continuously and the cases in which this processing is required.

Table 29.8 USBFS操作基于设备控制器模式下的PID[1:0]设置（2个中的2个）

PID[1:0] value	传输类型	传输方向（DIR位）	USBFS operation
01b (BUF)	Bulk	接收方向(DIR=0)	如果与所选管道关联的FIFO缓冲区已准备好接收，则接收数据并返回ACK以响应来自USB主机的OUT令牌
	Interrupt	接收方向(DIR=0)	如果与所选管道关联的FIFO缓冲区已准备好接收，则接收数据并返回ACK以响应来自USB主机的OUT令牌
	批量或中断	发射方向(DIR=1)	传输数据以响应来自USB主机的令牌，如果 与所选管道关联的FIFO缓冲区已准备好进行传输。否则， 返回NAK。
	Isochronous	接收方向(DIR=0)	如果与所选管道关联的FIFO缓冲区已准备好接收，则接收数据以响应来自USB主机的OUT令牌。 否则，丢弃数据。
	Isochronous	发射方向(DIR=1)	如果关联的FIFO缓冲区已准备好传输，则传输数据以响应来自USB主机的令牌。否则，发送零长度数据包。
10b (STALL) or 11b (STALL)	批量或中断	不依赖于设置	返回STALL以响应来自USB主机的令牌
	Isochronous	不依赖于设置	响应来自USB主机的令牌，不返回任何内容

PBUSY位（管道忙）

PBUSY位指示所选管道是否正在用于当前事务。

USBFS在所选管道的USBFS事务开始时将PBUSY位从0更改为1，并在完成一个事务时将PBUSY位从1更改为0。

在PID设置为NAK后，用软件读取PBUSY位可以检查是否可以更改管道设置。详见29.3.4.1管道控制寄存器切换流程。

SQMON位（序列切换位确认）

SQMON位指示所选管道的下一个事务的序列切换位的预期值。

当所选管道不是同步传输类型时，USBFS在事务成功完成时切换SQMON标志。但是，当在接收方向的传输过程中发生DATA-PID不匹配时，USBFS不会触发SQMON位。

SQSET位（序列切换位设置）

通过软件将SQSET位设置为1会导致USBFS将DATA1设置为所选管道上下一个事务的序列切换位的预期值。USBFS将SQSET位设置为0。

SQCLR位（序列切换位清除）

通过软件将SQCLR位设置为1会导致USBFS将所选管道上下一个事务的序列切换位的预期值清除为DATA0。USBFS将SQCLR位设置为0。

ACLRM位（自动缓冲区清除模式）

ACLRM位启用或禁用所选管道的自动缓冲区清除模式。彻底清除数据库中的数据FIFO缓冲区分配给所选管道，向ACLRM位连续写入1和0。

表29.9显示了通过向ACLRM位连续写入1和0来清除的数据以及需要进行此处理的情况。

Table 29.9 Data cleared by the USBFS when ACLRM = 1

Number	Data cleared by setting the ACLRM bit	Situations requiring data clear
1	All data in the FIFO buffer allocated to the selected pipe (two FIFO buffers in double buffer mode)	When initializing the selected pipe
2	Interval count value when the selected pipe is the isochronous transfer type	When resetting the interval count value
3	Internal flags of the PIPECFG.BFRE bit	When changing the PIPECFG.BFRE setting
4	FIFO buffer toggle control	When changing the PIPECFG.DBLB setting
5	Internal flags of the transaction count	When forcing the transaction count function to terminate

ATREPM bit (Auto Response Mode)

The ATREPM bit enables or disables auto response mode for the selected pipe.

This bit can be set to 1 in device controller mode when the selected pipe is for bulk transfer. When this bit is set to 1, the USBFS responds to the token from the USB host as follows:

- When the selected pipe is set for bulk IN transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 1):
  - When ATREPM = 1 and PID = BUF, the USBFS transmits a zero-length packet in response to the IN token.
  - The USBFS updates (allows toggling of) the sequence toggle bit (DATA-PID) each time the USBFS receives ACK from the USB host. In a single transaction, the IN token is received, a zero-length packet is transmitted, and ACK is received. The USBFS does not generate the BRDY or BEMP interrupt.
- When the selected pipe is for bulk OUT transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 0):
  - When ATREPM = 1 and PID = BUF, the USBFS returns NAK in response to the OUT token and generates an NRDY interrupt.

For USB communication in auto response mode, set the ATREPM bit to 1 while the FIFO buffer is empty. Do not write to the FIFO buffer during USB communication in auto response mode. When the selected pipe uses isochronous transfer, always set this bit to 0.

In host controller mode, always set the ATREPM bit to 0.

INBUFM bit (Transmit Buffer Monitor)

The INBUMFM bit indicates the FIFO buffer status for the selected pipe in the transmitting direction.

When the selected pipe is transmitting (PIPECFG.DIR = 1), the USBFS sets this bit to 1 when the CPU or DMA/DTC completes writing data to at least one FIFO buffer plane.

The USBFS sets the INBUMFM bit to 0 when it completes transmission of the data from the FIFO buffer plane to which all the data is written. In double buffer mode (PIPECFG.DBLB = 1), the USBFS sets the INBUFM bit to 0 when it completes transmission of the data from the two FIFO buffer planes before the CPU or DMA/DTC completes writing data to one FIFO buffer plane.

The INBUFM bit indicates the same value as the BSTS bit when the selected pipe is receiving (PIPECFG.DIR = 0).

BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 29.10.

Table 29.9 ACLRM=1时USBFS清除的数据

Number	通过设置ACLRM位清除数据	需要数据清楚的情况
1	FIFO缓冲区中的所有数据分配给选定的管道（两个双缓冲模式下的FIFO缓冲）	初始化选定管道时
2	选择管道为等时传输类型时的间隔计数值	重置间隔计数值时
3	PIPECFG.BFRE位的内部标志	更改PIPECFG.BFRE设置时
4	FIFO缓冲区切换控制	更改PIPECFG.DBLB设置时
5	事务计数的内部标志	强制事务计数函数终止时

ATREPM位（自动响应模式）

ATREPM位启用或禁用所选管道的自动响应模式。

当所选管道用于批量传输时，该位可以在设备控制器模式下设置为1。当该位设置为1时，USBFS对来自USB主机的令牌的响应如下：

- 当所选管道设置为批量IN传输时（PIPECFG.TYPE[1:0]=01b和PIPECFG.DIR=1）：
  - 当ATREPM=1且PID=BUF时，USBFS发送一个长度为零的数据包以响应IN令牌。
  - 每次USBFS从USB主机接收到ACK时，USBFS都会更新（允许切换）序列切换位(DATA-PID)。在单个事务中，收到IN令牌，传输零长度数据包，并收到ACK。USBFS不会产生BRDY或BEMP中断。
- 当所选管道用于批量OUT传输时（PIPECFG.TYPE[1:0]=01b和PIPECFG.DIR=0）：
  - 当ATREPM=1且PID=BUF时，USBFS返回NAK以响应OUT令牌并生成一个NRDY interrupt.

对于自动响应模式下的USB通信，当FIFO缓冲区为空时，将ATREPM位设置为1。在自动响应模式下的USB通信期间不要写入FIFO缓冲区。当所选管道使用同步传输时，始终将此位设置为0。

在主机控制器模式下，始终将ATREPM位设置为0。

INBUFM位（发送缓冲区监视器）

INBUMFM位指示发送方向上所选管道的FIFO缓冲区状态。

当所选管道正在传输时（PIPECFG.DIR=1），当CPU或DMADTC完成将数据写入至少一个FIFO缓冲区平面时，USBFS将该位设置为1。

当USBFS完成从写入所有数据的FIFO缓冲区平面的数据传输时，将INBUMFM位设置为0。在双缓冲模式(PIPECFG.DBLB=1)中，USBFS在CPU或DMADTC完成将数据写入一个FIFO缓冲层之前完成从两个FIFO缓冲层的数据传输时将INBUFM位设置为0。

当所选管道正在接收(PIPECFG.DIR=0)时，INBUFM位指示与BSTS位相同的值。

BSTS位（缓冲区状态）

BSTS位指示所选管道的FIFO缓冲区状态。

BSTS位的含义取决于PIPECFG.DIR、PIPECFG.BFRE和DnFIFOSEL.DCLRM设置，如表29.10所示。

Table 29.10 BSTS bit operation

DIR value	BFRE value	DCLRM value	BSTS bit function
0	0	0	Sets to 1 when receive data can be read from the FIFO buffer, and sets to 0 on completion of data read
		1	Setting prohibited
	1	0	Sets to 1 when receive data can be read from the FIFO buffer, and sets to 0 when software sets the BCLR bit in the port control register to 1 after the data read is complete
		1	Sets to 1 when receive data can be read from the FIFO buffer, and sets to 0 on completion of data read
1	0	0	Sets to 1 when transmit data can be written to the FIFO buffer, and sets to 0 on completion of data write
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

PIPEnCTR (n = 6 to 9)

Address(es): USBFS.PIPE6CTR 4009 007Ah, USBFS.PIPE7CTR 4009 007Ch, USBFS.PIPE8CTR 4009 007Eh, USBFS.PIPE9CTR 4009 0080h

b14 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b15	BSTS	缓冲区状态	0：禁止缓冲区访问1：允许缓冲区访问。	R

Note 1. 只能读取0。只能写1个。
Note 2. PID为NAK时，仅向SQCLR或SQSET位写入1。在将PID[1:0]位从01b(BUF)更改为00b(NAK)后设置这些位之前，请检查PBUSY位是否为0。但是，如果PID[1:0]位更改为00(NAK))通过USBFS，不需要通过软件检查PBUSY位。

Note 3. 仅在PID为NAK时以及在端口选择寄存器的CURPIPE[3:0]位中选择管道之前设置ACLRM位。
在将PID[1:0]位从01b(BUF)更改为00b(NAK)之后设置这些位之前，请检查PBUSY位是否为0。但是，

if the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through software is not required.

PID[1:0] bits (Response PID)

The PID[1:0] bits specify the response type for the next transaction of the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the selected pipe for USBFS transfer. Table 29.7 and Table 29.8 show the basic operation of the USBFS (when there are no errors in the transmitted and received packets) based on the PID[1:0] setting.

After changing the PID[1:0] setting from BUF to NAK through software during USBFS communication on the selected pipe, check that the PBUSY bit is 1 to determine if USB transfer on the selected pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through software is not required.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode.

To specify each response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF).

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 at the start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit through software after PID is set to NAK allows you to check whether changing the pipe setting is possible.

SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

The USBFS toggles the SQMON bit on successful completion of the transaction. However, the USBFS does not toggle the SQMON bit when a DATA-PID mismatch occurs during transfer in the receiving direction.

SQSET bit (Sequence Toggle Bit Set*2)

Setting the SQSET bit to 1 through software allows the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction of the selected pipe. The USBFS sets the SQSET bit to 0.

SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through software allows the USBFS to set DATA0 as the expected value of the sequence toggle bit for the next transaction of the selected pipe. The USBFS sets the SQCLR bit to 0.

ACLRM bit (Auto Buffer Clear Mode*3)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

如果PID[1:0]位被USBFS更改为00(NAK)，则不需要通过软件检查PBUSY位。

PID[1:0]位（响应PID）

PID[1:0]位指定所选管道的下一个事务的响应类型。

默认PID[1:0]设置为NAK。将PID[1:0]设置更改为BUF以使用所选管道进行USBFS传输。
表29.7和表29.8显示了基于PID[1:0]设置的USBFS的基本操作（在发送和接收的数据包中没有错误时）。

在选定管道上的USBFS通信期间，通过软件将PID[1:0]设置从BUF更改为NAK后，检查PBUSY位是否为1以确定选定管道上的USB传输是否实际进入NAK状态。如果USBFS将PID[1:0]位更改为NAK，则不需要通过软件检查PBUSY位。

USBFS在以下情况下更改PIPEnCTR.PID[1:0]设置：

- USBFS在接收到有效载荷超过所选管道的最大数据包大小的数据包时将PID设置为STALL(11b)
- USBFS在设备控制器模式下检测到USB总线复位时将PID设置为NAK
- USBFS在主机控制器模式下连续3次检测到接收错误（例如CRC错误）时将PID设置为NAK
- USBFS在主机控制器模式下接收到STALL握手时将PID设置为STALL(11b)。

要指定每种响应类型，请按如下方式设置PID[1:0]位：

- 要从NAK(00b)转换到STALL，请设置10b
- 要从BUF(01b)转换到STALL，请设置11b
- 要从STALL(11b)转换到NAK，请设置10b，然后设置00b
- 要从STALL转换到BUF，请设置00b(NAK)，然后设置01b(BUF)。

PBUSY位（管道忙）

PBUSY位指示所选管道是否正在用于当前事务。

USBFS在所选管道的USB事务开始时将PBUSY位从0更改为1，并更改
PBUSY位在一个事务完成时从1变为0。

在PID设置为NAK后通过软件读取PBUSY位可以检查是否可以更改管道设置。

SQMON位（序列切换位确认）

SQMON位指示所选管道的下一个事务的序列切换位的预期值。

USBFS在事务成功完成时切换SQMON位。但是，当在接收方向的传输过程中发生DATA-PID不匹配时，USBFS不会触发SQMON位。

SQSET位（序列切换位设置*2）

通过软件将SQSET位设置为1允许USBFS将DATA1设置为所选管道下一个事务的序列切换位的预期值。USBFS将SQSET位设置为0。

SQCLR位（序列切换位清除）

通过软件将SQCLR位设置为1允许USBFS将DATA0设置为所选管道的下一个事务的序列切换位的预期值。USBFS将SQCLR位设置为0。

ACLRM位（自动缓冲区清除模式*3）

ACLRM位启用或禁用所选管道的自动缓冲区清除模式。彻底清除数据库中的数据
FIFO缓冲区分配给所选管道，向ACLRM位连续写入1和0。

Table 29.11 shows the data cleared by writing 1 and 0 continuously to the ACLRM bit and the cases in which this processing is required.

Table 29.11 Data cleared by the USBFS when ACLRM = 1

Number	Data cleared by setting the ACLRM bit	Situations requiring data clear
1	All data in the FIFO buffer allocated to the selected pipe	When initializing the selected pipe
2	Interval count value when the selected pipe is the isochronous transfer type	When resetting the interval count value
3	Internal flags related to the PIPECFG.BFRE bit	When changing the PIPECFG.BFRE setting
4	Internal flags related to the transaction count	When forcing the transaction count function to terminate

BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 29.10.

29.2.33 PIPEn Transaction Counter Enable Register (PIPEnTRE) (n = 1 to 5)

Address(es): USBFS.PIPE1TRE 4009 0090h, USBFS.PIPE2TRE 4009 0094h, USBFS.PIPE3TRE 4009 0098h, USBFS.PIPE4TRE 4009 009Ch, USBFS.PIPE5TRE 4009 00A0h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	TRCLR	Transaction Counter Clear	0: Invalid (writing 0 has no effect) 1: The current counter value is cleared.	R/W
b9	TRENB	Transaction Counter Enable	0: Transaction counter disabled 1: Transaction counter enabled.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Set each bit in PIPEnTRE while PID is NAK. Before setting these bits after changing the PID[1:0] bits for the selected pipe from BUF to NAK, check that the PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through software is not required.

TRCLR bit (Transaction Counter Clear)

When the TRCLR bit is set to 1, the USBFS clears the current value of the transaction counter associated with the selected pipe and then sets the TRCLR bit to 0.

TRENB bit (Transaction Counter Enable)

The TRENB bit enables or disables the transaction counter.

For receiving pipes, setting the TRENB bit to 1 after setting the total number of the packets to be received in the PIPEnTRN.TRNCNT[15:0] bits through software allows the USBFS to control hardware on having received the number of packets equal to the TRNCNT[15:0] setting, as follows:

- When the PIPECFG.SHTNAK bit is 1, the USBFS changes the PID bits to NAK for the associated pipe on having received the number of packets equal to the TRNCNT[15:0] setting
- When the PIPECFG.BFRE bit is 1, the USBFS asserts the BRDY interrupt on having received the number of packets equal to the TRNCNT[15:0] setting and then reading the last received data.

For transmitting pipes, set the TRENB bit to 0.

表29.11显示了通过向ACLRM位连续写入1和0来清除的数据以及需要进行此处理的情况。

Table 29.11 ACLRM=1时USBFS清除的数据

Number	通过设置ACLRM位清除数据	需要数据清楚的情况
1	分配给所选管道的FIFO缓冲区中的所有数据	初始化选定管道时
2	选择管道为等时传输类型时的间隔计数值	重置间隔计数值时
3	与PIPECFG.BFRE位相关的内部标志	更改PIPECFG.BFRE设置时
4	与事务计数相关的内部标志	强制事务计数函数终止时

BSTS位（缓冲区状态）

BSTS位指示所选管道的FIFO缓冲区状态。

BSTS位的含义取决于PIPECFG.DIR、PIPECFG.BFRE和DnFIFOSEL.DCLRM设置，如表29.10所示。

29.2.33 PIPEn事务计数器使能寄存器(PIPEnTRE)(n=1到5)

Address(es): USBFS.PIPE1TRE 4009 0090h, USBFS.PIPE2TRE 4009 0094h, USBFS.PIPE3TRE 4009 0098h, USBFS.PIPE4TRE 4009 009Ch, USBFS.PIPE5TRE 4009 00A0h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	TRCLR	交易计数器清除	0：无效（写0无效）1：清除当前计数器值。	R/W
b9	TRENB	事务计数器启用	0：事务计数器禁用1：事务计数器启用。	R/W
b15 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 当PID为NAK时，设置PIPEnTRE中的每个位。在更改所选管道的PID[1:0]位之后设置这些位之前BUF到NAK，检查PBUSY位是否为0。但是，如果PID[1:0]位被USBFS更改为NAK，则检查不需要通过软件进行PBUSY位。

TRCLR位（事务计数器清零）

当TRCLR位设置为1时，USBFS清除与所选管道关联的事务计数器的当前值，然后将TRCLR位设置为0。

TRENB位（事务计数器使能）

TRENB位启用或禁用事务计数器。

对于接收管道，在设置接收管道的总包数后，将TRENB位设置为1 PIPEnTRN.TRNCNT[15:0]位通过软件允许USBFS在接收到等于TRNCNT[15:0]设置的数据包数量时控制硬件，如下所示：

- 当PIPECFG.SHTNAK位为1时，USBFS在接收到等于TRNCNT[15:0]设置的数据包数量时将关联管道的PID位更改为NAK
- 当PIPECFG.BFRE位为1时，USBFS在接收到等于TRNCNT[15:0]设置的数据包数量并读取最后接收到的数据时断言BRDY中断。

对于传输管道，将TRENB位设置为0。

When the transaction counter is not used, set the TRENB bit to 0. When the transaction counter is used, set the TRNCNT[15:0] bits before setting the TRENB bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.

29.2.34 PIPEn Transaction Counter Register (PIPEnTRN) (n = 1 to 5)

Address(es): USBFS.PIPE1TRN 4009 0092h, USBFS.PIPE2TRN 4009 0096h, USBFS.PIPE3TRN 4009 009Ah, USBFS.PIPE4TRN 4009 009Eh, USBFS.PIPE5TRN 4009 00A2h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TRNCNT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	TRNCNT[15:0]	Transaction Counter	When written to, this bit specifies the total packets (number of transactions) to be received by the selected pipe. When read from with the PIPEnTRE.TRENB bit at 0, this bit indicates the specified number of transactions. When PIPEnTRE.TRENB is 1, this bit indicates the current transaction count.	R/W

The PIPEnTRN registers retain their settings during a USB bus reset.

TRNCNT[15:0] bits (Transaction Counter)

The USBFS increments the value of the TRNCNT[15:0] bits by 1 when all of the following conditions are satisfied on receiving the packet:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value ≠ current counter value + 1) on receiving the packet
- The payload of the received packet aligns with the PIPEMAXP.MXPS[8:0] setting.

The USBFS sets the value of the TRNCNT[15:0] bits to 0 when any of the following conditions are satisfied:

All of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value = current counter value + 1) on receiving the packet
- The payload of the received packet aligns with the PIPEMAXP.MXPS[8:0] setting.

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The USBFS received a short packet.

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The PIPEnTRE.TRCLR bit was set to 1 by software.

For transmitting pipes, set the TRNCNT[15:0] bits to 0. When the transaction counter is not used, set the TRNCNT[15:0] bits to 0.

Setting the number of transactions to be transferred to the TRNCNT[15:0] bits is only enabled when the PIPEnTRE.TRENB bit is 0. To set the number of transactions to be transferred, set the TRCLR bit to 1 to clear the current counter value before setting the PIPEnTRE.TRENB bit to 1.

当不使用事务计数器时，将TRENB位设置为0。当使用事务计数器时，设置在将TRENB位设置为1之前设置TRNCNT[15:0]位。在接收要由事务计数器计数的第一个数据包之前将此位设置为1。

29.2.34 PIPEn事务计数器寄存器(PIPEnTRN)(n=1到5)

Address(es): USBFS.PIPE1TRN 4009 0092h, USBFS.PIPE2TRN 4009 0096h, USBFS.PIPE3TRN 4009 009Ah, USBFS.PIPE4TRN 4009 009Eh, USBFS.PIPE5TRN 4009 00A2h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TRNCNT[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	TRNCNT[15:0]	交易柜台	写入时，该位指定所选管道要接收的总数据包（事务数）。当PIPEnTRE.TRENB位为0时，该位指示指定的事务数。 当PIPEnTRE.TRENB为1时，该位指示当前事务计数。	R/W

PIPEnTRN寄存器在USB总线复位期间保留其设置。

TRNCNT[15:0]位（事务计数器）

当接收到数据包时满足以下所有条件时，USBFS将TRNCNT[15:0]位的值加1：

- PIPEnTRE.TRENB位=1
- (TRNCNT[15:0]设定值≠当前计数器值+1)收到数据包
- 接收到的数据包的有效负载与PIPEMAXP.MXPS[8:0]设置一致。

当满足以下任一条件时，USBFS将TRNCNT[15:0]位的值设置为0：

满足以下所有条件：

- PIPEnTRE.TRENB位=1
- (TRNCNT[15:0]设置值=当前计数器值+1)接收数据包时
- 接收到的数据包的有效负载与PIPEMAXP.MXPS[8:0]设置一致。

满足以下两个条件：

- PIPEnTRE.TRENB位=1
- USBFS收到一个短数据包。

满足以下两个条件：

- PIPEnTRE.TRENB位=1
- PIPEnTRE.TRCLR位由软件设置为1。

对于传输管道，将TRNCNT[15:0]位设置为0。当不使用事务计数器时，将TRNCNT[15:0]位设置为0。

设置要传输到TRNCNT[15:0]位的事务数仅在PIPEnTRE.TRENB位为0。要设置要传输的事务数，请将TRCLR位设置为1以清除当前计数器值，然后再将PIPEnTRE.TRENB位设置为1。

29.2.35 Device Address n Configuration Register (DEVADDn) (n = 0 to 5)

Address(es): USBFS.DEVADD0 4009 00D0h, USBFS.DEVADD1 4009 00D2h, USBFS.DEVADD2 4009 00D4h, USBFS.DEVADD3 4009 00D6h, USBFS.DEVADD4 4009 00D8h, USBFS.DEVADD5 4009 00DAh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	USBSPD[1:0]		—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7, b6	USBSPD[1:0]	Transfer Speed of Communication Target Device	b7 b6 0 0: DEVADDn not used 0 1: Low-speed 1 0: Full-speed 1 1: Setting prohibited.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The DEVADDn register specifies the transfer speed of the peripheral device that is the communication target for pipes 0 to 9.

In host controller mode, set all the DEVADDn bits before starting communication with any pipes. Only change the bits in DEVADDn when no valid pipes are using the bit settings. A valid pipe is defined as one that satisfies both of the following conditions:

- DEVADDn is selected in the DEVSEL[3:0] bits
- The PID[1:0] bits are set to BUF for the selected pipe, or the selected pipe is the DCP with the DCPCTR.SUREQ bit set to 1.

In device controller mode, set all bits in this register to 0.

USBSPD[1:0] bits (Transfer Speed of Communication Target Device)

The USBSPD[1:0] bits specify the USB transfer speed of the target peripheral device. Set these bits to 10b when a full-speed device is connected through the hub. In host controller mode, the USBFS generates packets based on the USBSPD[1:0] setting. In device controller mode, set these bits to 00b.

29.2.36 PHY Cross Point Adjustment Register (PHYSLEW)

Address(es): USBFS.PHYSLEW 4009 00F0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b15 to b8	—	Reserved	这些位被读取为0。写入值应为0。	R/W

DEVADDn寄存器指定作为管道0到9的通信目标的外围设备的传输速度。

在主机控制器模式下，在开始与任何管道通信之前设置所有DEVADDn位。仅更改中的位DEVADDn当没有有效管道使用位设置时。有效管道被定义为同时满足以下两个条件的管道：

- DEVADDn在DEVSEL[3:0]位中选择
- 所选管道的PID[1:0]位设置为BUF，或者所选管道是DCPCTR.SUREQ位设置为1的DCP。

在设备控制器模式下，将此寄存器中的所有位设置为0。

USBSPD[1:0]位（通信目标设备的传输速度）

USBSPD[1:0]位指定目标外围设备的USB传输速度。当通过集线器连接全速设备时，将这些位设置为10b。在主机控制器模式下，USBFS根据USBSPD[1:0]设置生成数据包。在设备控制器模式下，将这些位设置为00b。

29.2.36 PHY交叉点调整寄存器（PHYSLEW）

RA生态工作室

DPINTE0 bit (USB DP Interrupt Enable/Clear)

The DPINET0 bit enables or disables triggering of recovery from Deep Software Standby mode by the DP input of the USBFS. Writing 0 to this bit while the DPINT0 bit is 1 sets the DPINT0 bit to 0.

DMINTE0 bit (USB DM Interrupt Enable/Clear)

The DMINTE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the DM input of the USBFS. Writing 0 to this bit while the DMINT0 bit is 1 clears the DMINTE0 bit to 0.

DOVRCRAE0 bit (USB OVRCURA Interrupt Enable/Clear)

The DOVRCRAE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the OVRCURA input of the USBFS. Writing 0 to this bit while the DOVRCRA0 bit is 1 clears the DOVRCRAE0 bit to 0.

DVBSE0 bit (USB VBUS Interrupt Enable/Clear)

The DVBSE0 bit enables or disables triggering of recovery from Deep Software Standby mode by the VBUS input of the USBFS. Writing 0 to this bit while the DVBINT0 bit is 1 clears the DVBINT0 bit to 0.

DPINT0 bit (USB DP Interrupt Source Recovery)

The DPINT0 bit indicates that the system has returned from Deep Software Standby mode because of the DP input of the USBFS. This recovery is only enabled when the DPINTE0 bit is 1. Writing 0 to the DPINTE0 bit while this bit is 1 clears this bit to 0.

DMINT0 bit (USB DM Interrupt Source Recovery)

The DMINT0 bit indicates that the system has returned from Deep Software Standby mode because of the DM input of the USBFS. This recovery is only enabled when the DMINTE0 bit is 1. Writing 0 to the DPINTE0 bit while this bit is 1 clears this bit to 0.

DOVRCRA0 bit (USB OVRCURA Interrupt Source Recovery)

The DOVRCRA0 bit indicates that the system has returned from Deep Software Standby mode because of the OVRCURA input of the USBFS. This recovery is only enabled when the DOVRCRAE0 bit is 1. Writing 0 to the DOVRCRAE0 bit while this bit is 1 clears this bit to 0.

DVBINT0 bit (USB VBUS Interrupt Source Recovery)

The DVBINT0 bit indicates that the system has returned from Deep Software Standby mode because of the VBUS input of the USBFS. This recovery is only enabled when the DVBSE0 bit is 1. Writing 0 to the DVBSE0 bit while this bit is 1 clears this bit to 0.

29.3 Operation

29.3.1 System Control

This section describes register settings required for initializing the USBFS and controlling power consumption.

29.3.1.1 Setting data to the USBFS-related registers

Setting the SYSCFG.USBE bit to 1 after starting the clock supply (SYSCFG.SCKE bit = 1) enables and starts USBFS operation.

29.3.1.2 Selecting the controller function

The USBFS can operate as either a host or device controller.

Use the SYSCFG.DCFM bit to select one of these USBFS functions. The DCFM bit must be changed in the initial settings immediately after a reset or in the D+ pull-up-disabled state (SYSCFG.DPRPU bit = 0) and D+ and D- pull-down-disabled state (SYSCFG.DRPD bit = 0).

DPINTE0位（USBDP中断使能清除）

DPINET0位启用或禁用触发从深度软件待机模式恢复由DP输入USBFS。当DPINT0位为1时向该位写入0会将DPINT0位设置为0。

DMINTE0位（USBDM中断使能清除）

DMINTE0位启用或禁用触发从深度软件待机模式恢复由DM输入USBFS。当DMINT0位为1时向该位写入0会将DMINTE0位清除为0。

DOVRCRAE0位（USBOVRCURA中断使能清除）

DOVRCRAE0位通过USBFS的OVRCURA输入启用或禁用从深度软件待机模式恢复的触发。当DOVRCRA0位为1时向该位写入0会将DOVRCRAE0位清除为0。

DVBSE0位（USBVBUS中断使能清除）

DVBSE0位通过VBUS输入启用或禁用从深度软件待机模式恢复的触发USBFS。当DVBINT0位为1时向该位写入0会将DVBINT0位清除为0。

DPINT0位（USBDP中断源恢复）

由于USBFS的DP输入，DPINT0位指示系统已从深度软件待机模式返回。此恢复仅在DPINTE0位为1时启用。当该位为1时向DPINTE0位写入0将该位清除为0。

DMINT0位（USBDM中断源恢复）

由于USBFS的DM输入，DMINT0位指示系统已从深度软件待机模式返回。此恢复仅在DMINTE0位为1时启用。当该位为1时将0写入DPINTE0位可将该位清除为0。

DOVRCRA0位（USBOVRCURA中断源恢复）

DOVRCRA0位指示系统已从深度软件待机模式返回，因为USBFS的OVRCURA输入。此恢复仅在DOVRCRAE0位为1时启用。将0写入DOVRCRAE0位当该位为1时将该位清除为0。

DVBINT0位（USBVBUS中断源恢复）

由于USBFS的VBUS输入，DVBINT0位指示系统已从深度软件待机模式返回。此恢复仅在DVBSE0位为1时启用。当该位为1时将0写入DVBSE0位可将该位清除为0。

29.3 Operation

29.3.1 系统控制

本节介绍初始化USBFS和控制功耗所需的寄存器设置。

29.3.1.1 将数据设置到USBFS相关寄存器

启动时钟供应（SYSCFG.SCKE位=1）后将SYSCFG.USBE位设置为1启用并启动USBFS操作。

29.3.1.2 选择控制器功能

USBFS可以作为主机或设备控制器运行。

使用SYSCFG.DCFM位选择这些USBFS功能之一。DCFM位必须在复位后立即更改为初始设置或在D+上拉禁用状态（SYSCFG.DPRPU位=0）和D+和Dpulldown禁用状态（SYSCFG.DRPD位=0）。

29.3.1.3 Controlling the USB data bus using resistors

The USBFS provides pull-up and pull-down resistors for the D+ and D- lines. Pull these lines up or down by setting the SYSCFG.DPRPU and DRPD bits.

In device controller mode, confirm that connection to the USB host is made, and then set the SYSCFG.DPRPU bit to 1 and pull up the D+ line (in full-speed communication).

When the SYSCFG.DPRPU bit is set to 0 during communication with a PC, the USBFS disables the pull-up resistor of the USB data line, thereby notifying the USB host of disconnection.

In host controller mode, set the SYSCFG.DRPD bit to 1 to pull down the D+ and D- lines.

Table 29.12 USB data bus resistor control

SYSCFG register settings		USB data bus control		
DRPD bit	DPRPU bit	D-	D+	Function
0	0	Open	Open	When resistors not used
0	1	Open	Pull-up	When operating as a device controller at full-speed
1	0	Pull-down	Pull-down	When operating as a host controller
1	1	—	—	Setting prohibited

29.3.1.4 Example external connection circuits

Figure 29.2 shows an example OTG connection of the USB connector in the self-powered state. The USBFS controls the pull-up resistor of the D+ line and the pull-down resistor of D+ and D- lines. Select pull-up and pull-down for the lines in the SYSCFG.DPRPU and SYSCFG.DRPD bits. In device controller mode, the pull-up resistor of USB data line is disabled if SYSCFG.DPRPU bit is set to 0 while communicating with the USB host. The USBFS can use this to notify the USB host of a device disconnect.

29.3.1.3 使用电阻控制USB数据总线

USBFS为D+和Dlines提供上拉和下拉电阻。通过设置SYSCFG.DPRPU和DRPD位。

在设备控制器模式下，确认与USB主机的连接已建立，然后将SYSCFG.DPRPU位设置为1并拉高D+线（全速通信）。

当SYSCFG.DPRPU位在与PC通信期间设置为0时，USBFS禁用USB数据线的上拉电阻，从而通知USB主机断开连接。

在主机控制器模式下，将SYSCFG.DRPD位设置为1以拉低D+和Dlines。

Table 29.12 USB数据总线电阻控制

SYSCFG寄存器设置		USB数据总线控制		
DRPD bit	DPRPU bit	D-	D+	Function
0	0	Open	Open	不使用电阻时
0	1	Open	Pull-up	作为设备控制器全速运行时
1	0	Pull-down	Pull-down	作为主机控制器运行时
1	1	—	—	禁止设置

29.3.1.4 外部连接电路示例

图29.2显示了自供电状态下USB连接器的示例OTG连接。USBFS控制D+线的上拉电阻和D+和Dlines的下拉电阻。为SYSCFG.DPRPU和SYSCFG.DRPD位中的线路选择上拉和下拉。在设备控制器模式下，如果在与USB主机通信时将SYSCFG.DPRPU位设置为0，则禁用USB数据线的上拉电阻。USBFS可以使用它来通知USB主机设备断开连接。

RA生态工作室

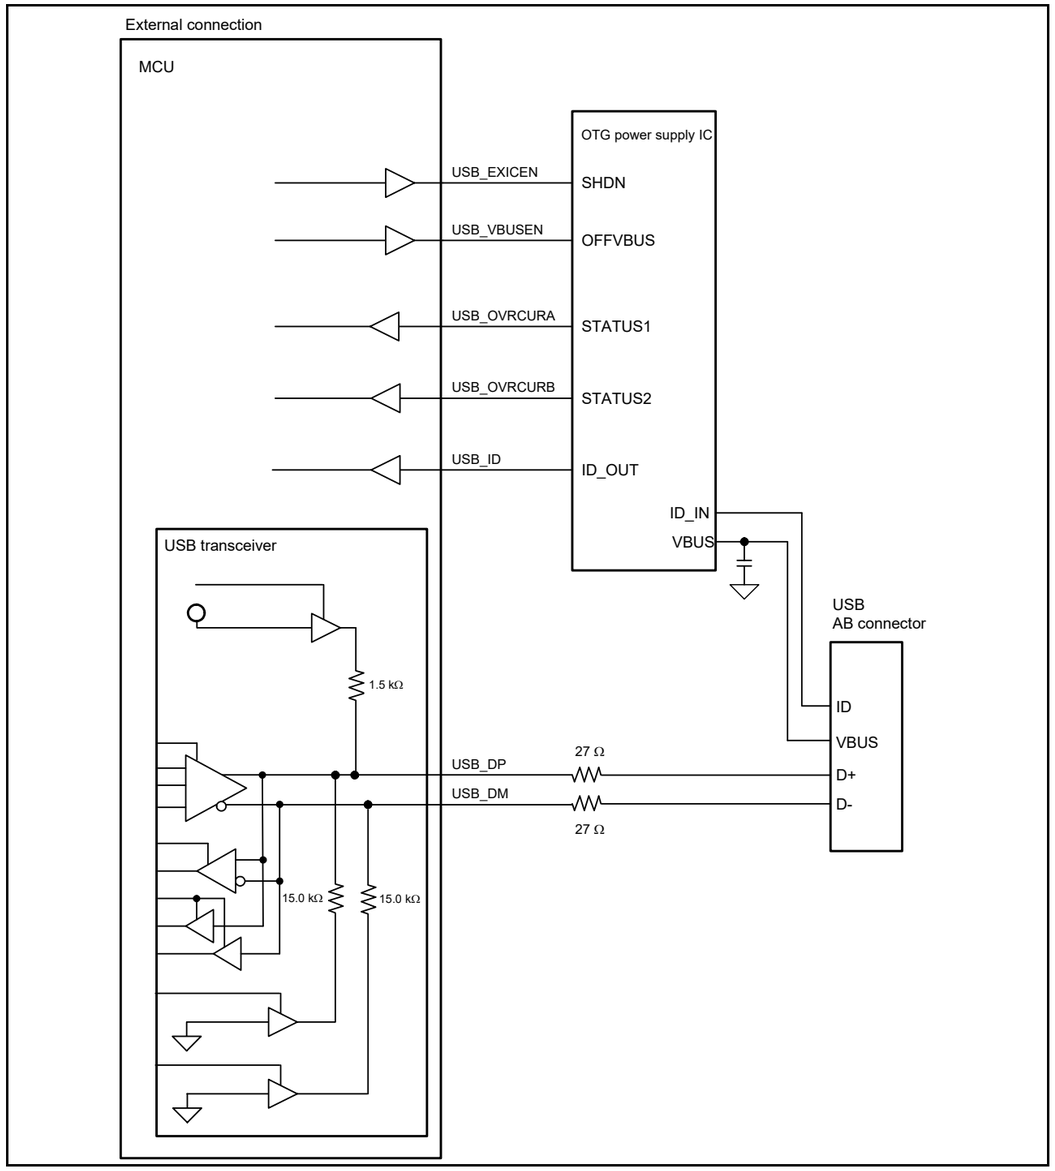

Figure 29.2 Example OTG connection in a self-powered state

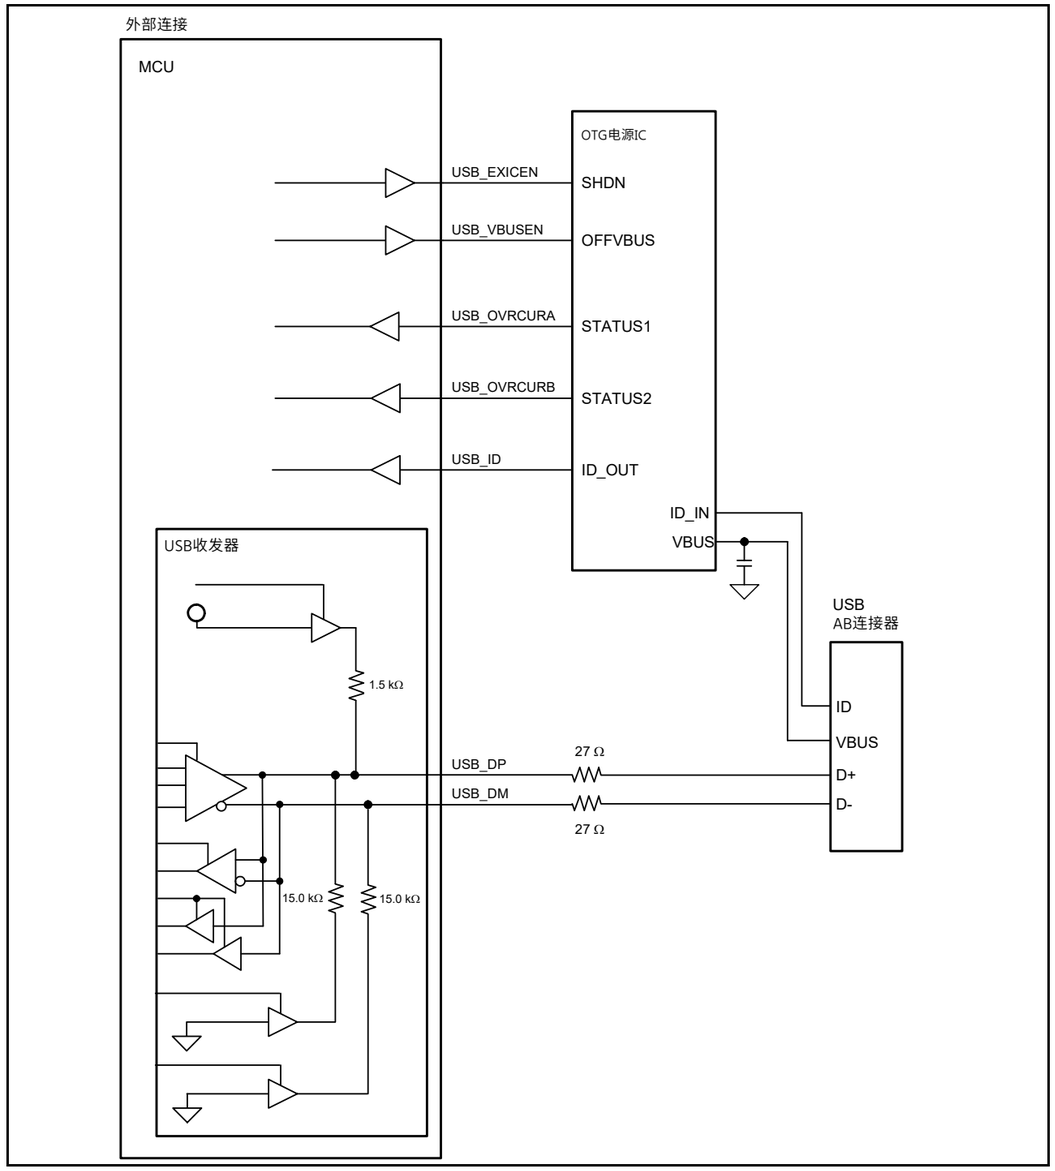

Figure 29.2 自供电状态下的示例OTG连接

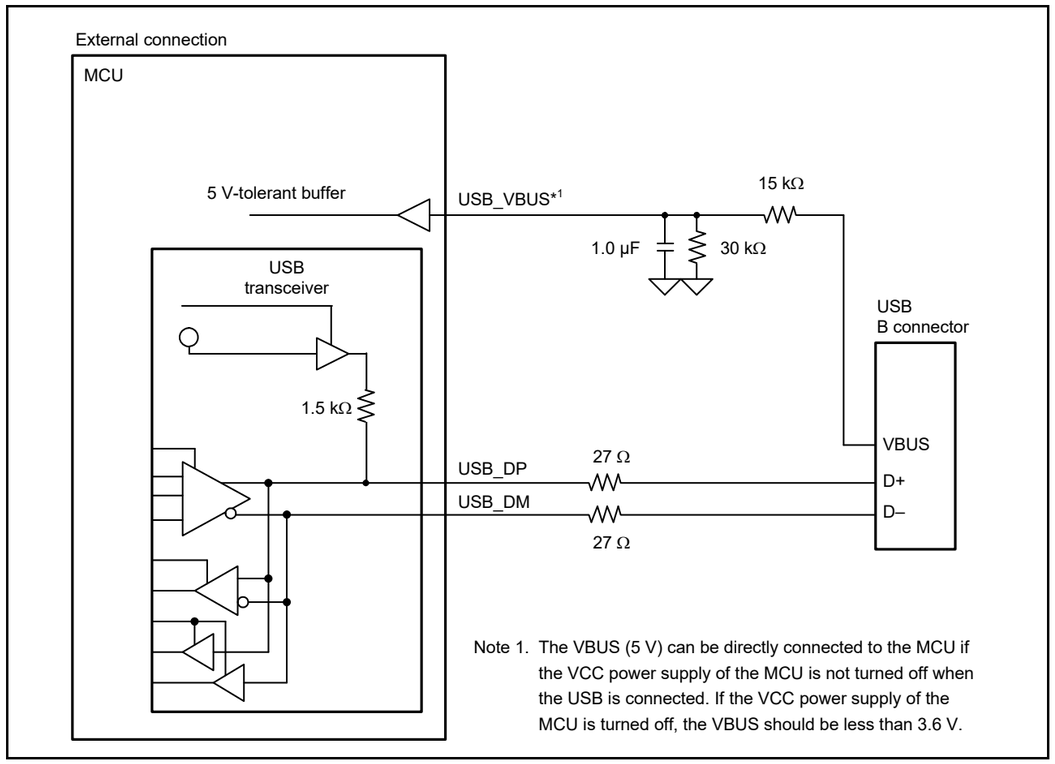
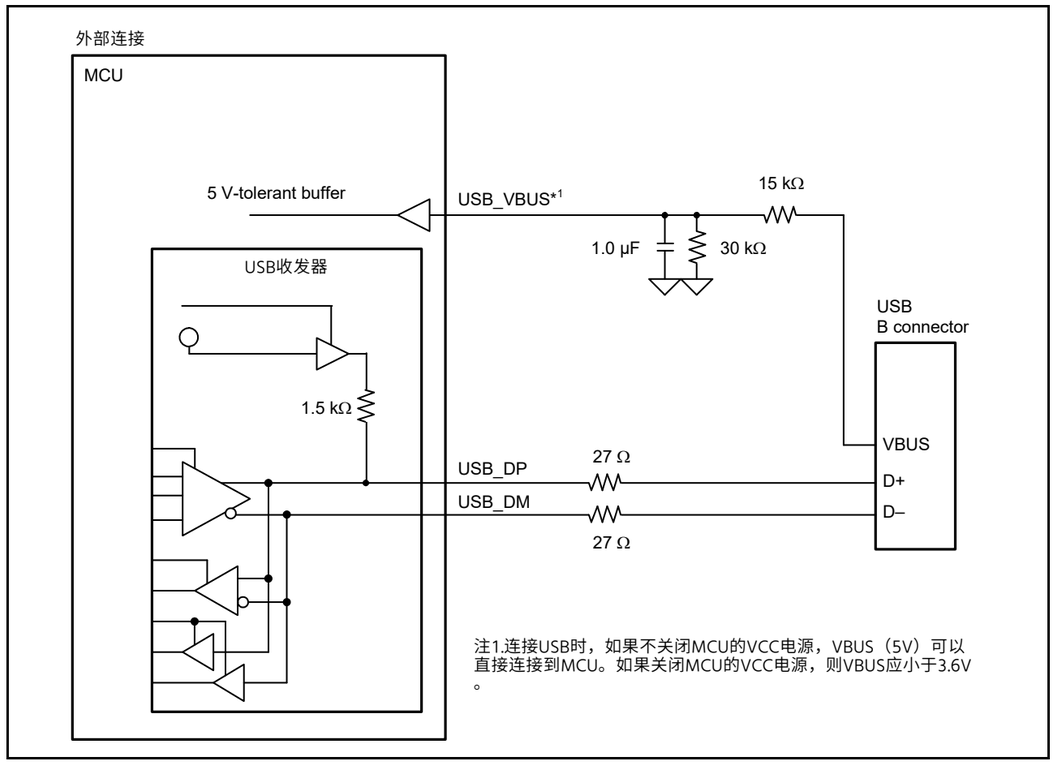
Figure 29.3 shows an example device connection in a self-powered state.



Note 1. The VBUS (5 V) can be directly connected to the MCU if the VCC power supply of the MCU is not turned off when the USB is connected. If the VCC power supply of the MCU is turned off, the VBUS should be less than 3.6 V.

Figure 29.3 Example device connection in a self-powered state

图29.3显示了自供电状态下的示例设备连接。



注1.连接USB时，如果不关闭MCU的VCC电源，VBUS（5V）可以直接连接到MCU。如果关闭MCU的VCC电源，则VBUS应小于3.6V。

Figure 29.3 自供电状态下的示例设备连接

本节中给出的外部电路示例是简化电路，不保证它们在每个系统中的操作。

29.3.1.5 Release from Deep Software Standby mode because of USB suspend/resume interrupts

Deep Software Standby mode can be canceled by a USB suspend/resume interrupt. USB suspend/resume interrupts are detected by the USB resume detecting unit, which controls and monitors the USB I/O pins to detect the interrupts.

Figure 29.6 shows a schematic diagram of the connection between the USB resume detecting unit and the USB I/O pins.

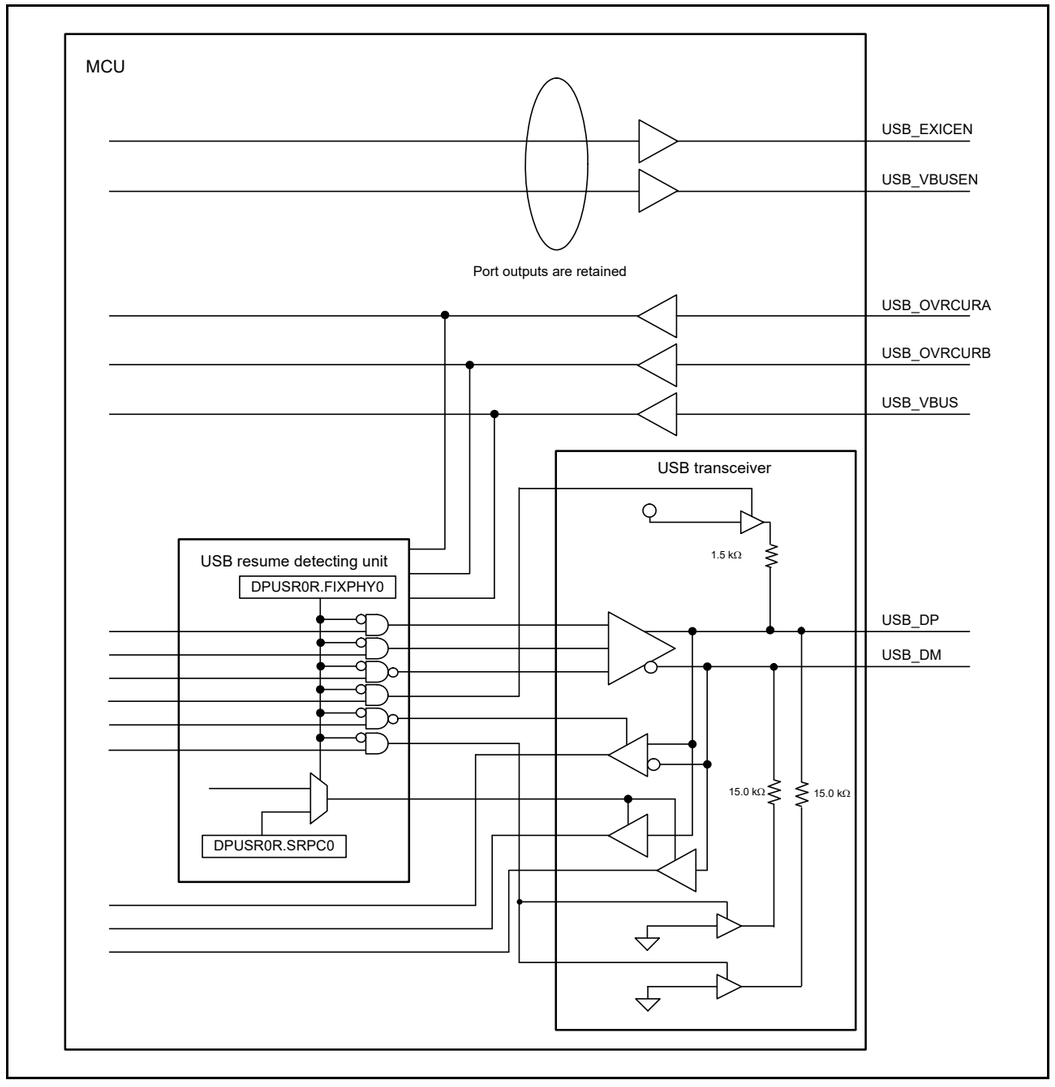

Figure 29.6 Connection between the USB resume detecting unit and the USB I/O pins

29.3.1.5 由于USB挂起恢复中断而从深度软件待机模式中释放

深度软件待机模式可以通过USB挂起恢复中断来取消。USB暂停恢复中断由USB恢复检测单元检测，该单元控制和监视USBIO引脚以检测中断。

图29.6显示了USB恢复检测单元与USBIO引脚之间的连接示意图。

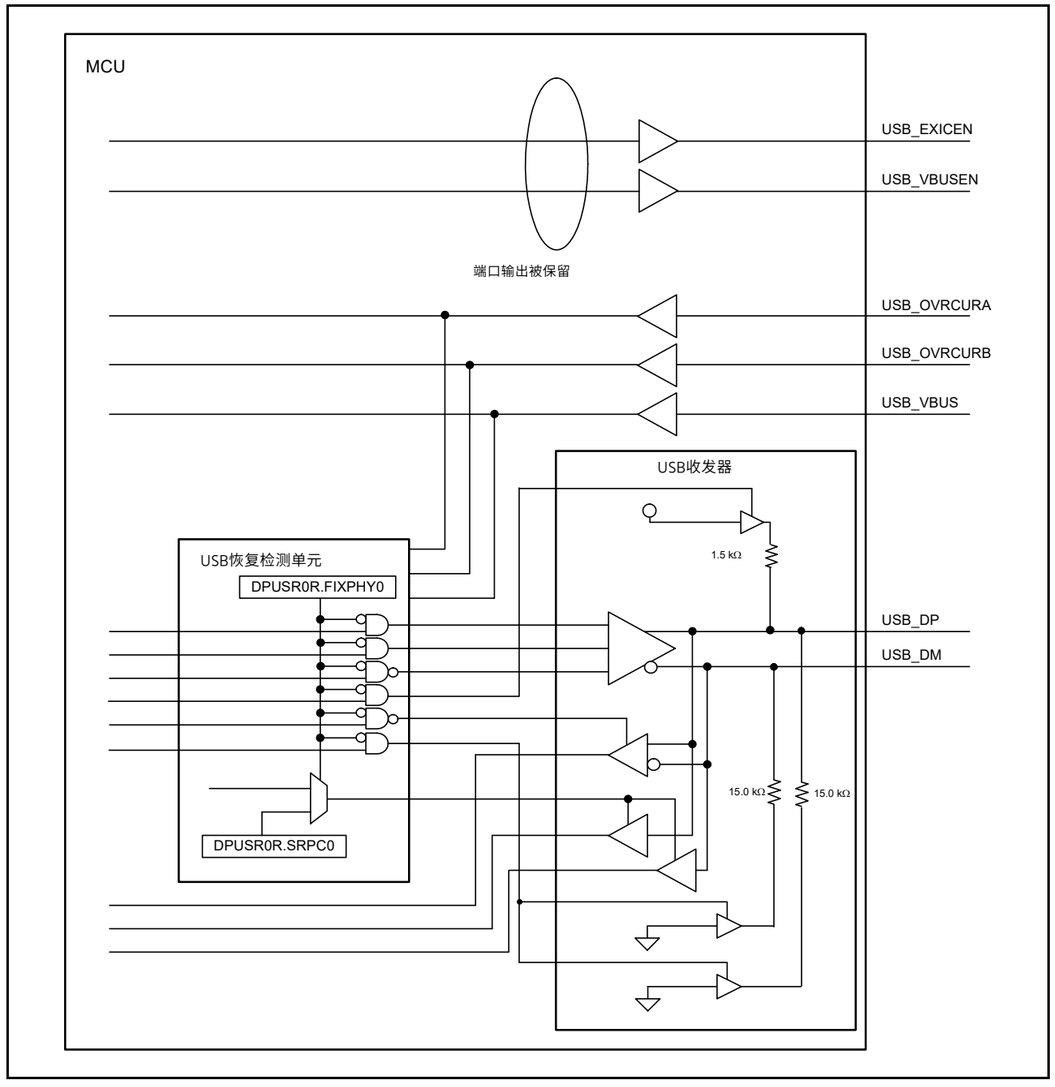

Figure 29.6 USB恢复检测单元与USBIO管脚的连接

Table 29.13 shows the USB suspend and resume interrupt sources and their associated I/O pins.

Table 29.13 USB suspend and resume interrupt sources and their associated I/O pins

USB operating mode	Source	Pin name
Device, OTG	Resume	USB_DP
Host, OTG	Attach or detach	USB_DP, USB_DM
Device	Attach or detach	USB_VBUS
Host	Overcurrent detection	USB_OVRCURA
OTG	Overcurrent detection	USB_OVRCURA, USB_OVRCURB

Figure 29.7 shows the flow for setting the USBFS when entering Deep Software Standby mode from either host or device controller mode. Figure 29.8 shows the flow for setting the USBFS when canceling Deep Software Standby mode from host controller mode. Figure 29.9 shows the flow for setting the USBFS when canceling Deep Software Standby mode from device controller mode.

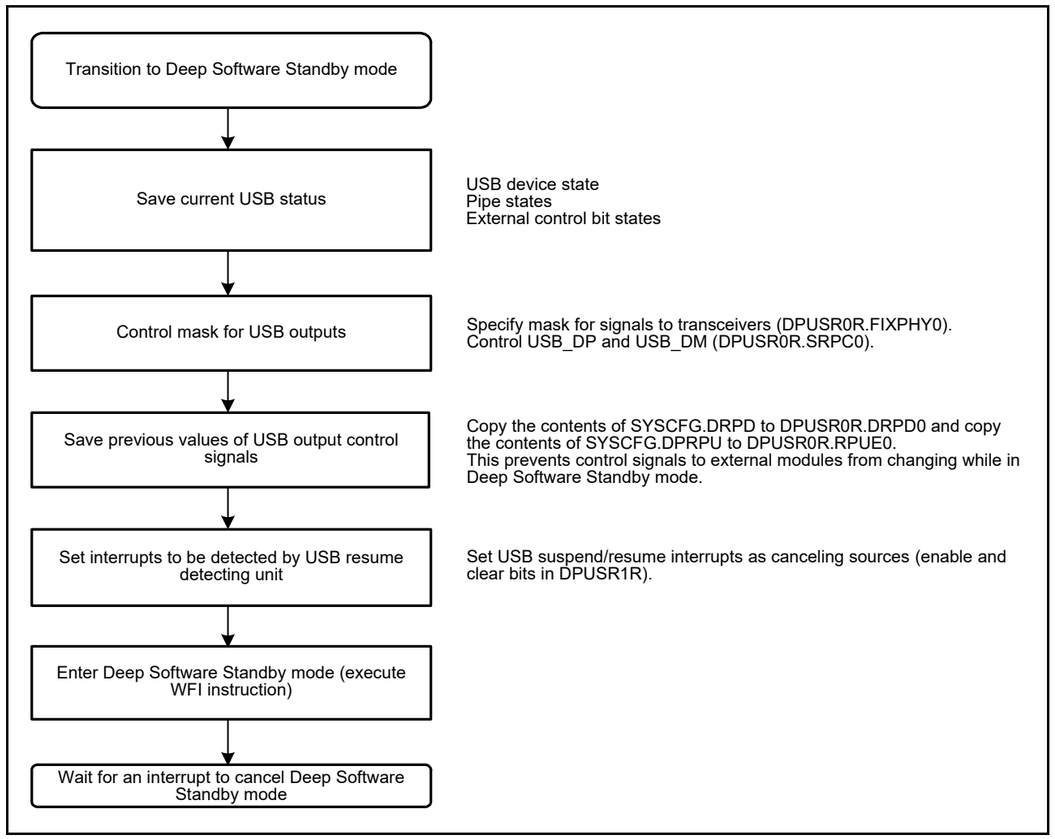

Figure 29.7 USBFS setup flow for transition to Deep Software Standby mode as host or device controller

表29.13显示了USB挂起和恢复中断源及其相关的IO引脚。

Table 29.13 USB挂起和恢复中断源及其相关的IO引脚

USB操作模式	Source	引脚名称
Device, OTG	Resume	USB_DP
Host, OTG	连接或分离	USB_DP, USB_DM
Device	连接或分离	USB_VBUS
Host	Overcurrent detection	USB_OVRCURA
OTG	Overcurrent detection	USB_OVRCURA, USB_OVRCURB

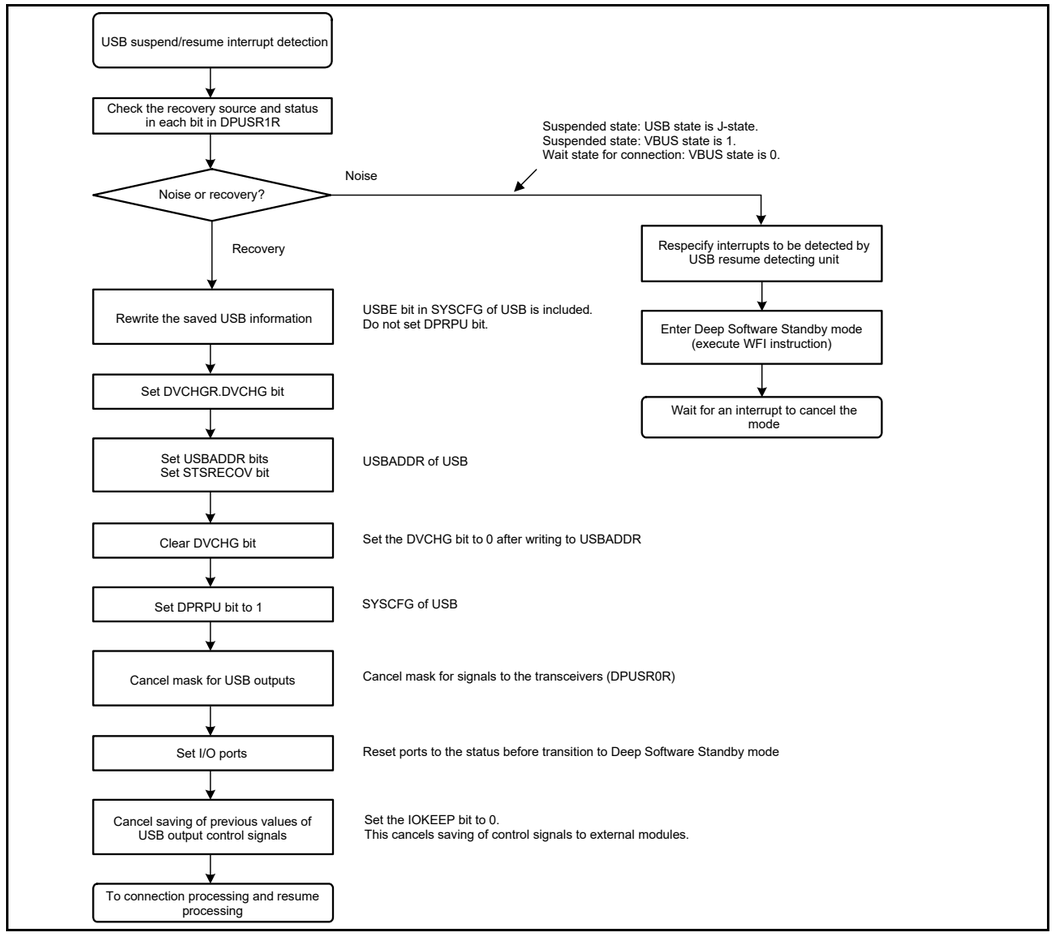

Figure 29.9 USBFS setup flow for canceling Deep Software Standby mode as device controller

29.3.2 Interrupts

Table 29.14 lists the interrupt sources in the USBFS. When an interrupt generation condition is satisfied and the interrupt output is enabled using the associated interrupt enable register, a USBFS interrupt request is issued to the Interrupt Controller Unit (ICU) and a USBFS interrupt is generated. See section 14, Interrupt Controller Unit (ICU).

Table 29.14 Interrupt sources (1 of 3)

Bit to be set to 1	Name	Interrupt source	Applicable controller function	Status flag
VBINT	VBUS interrupt	• A change in the state of the USB_VBUS input pin was detected (low to high or high to low)	Host or device*1	INTSTS0.VBSTS
RESM	Resume interrupt	• A change in the state of the USB bus was detected in the suspended state (J-state to K-state or J-state to SE0)	Device	—

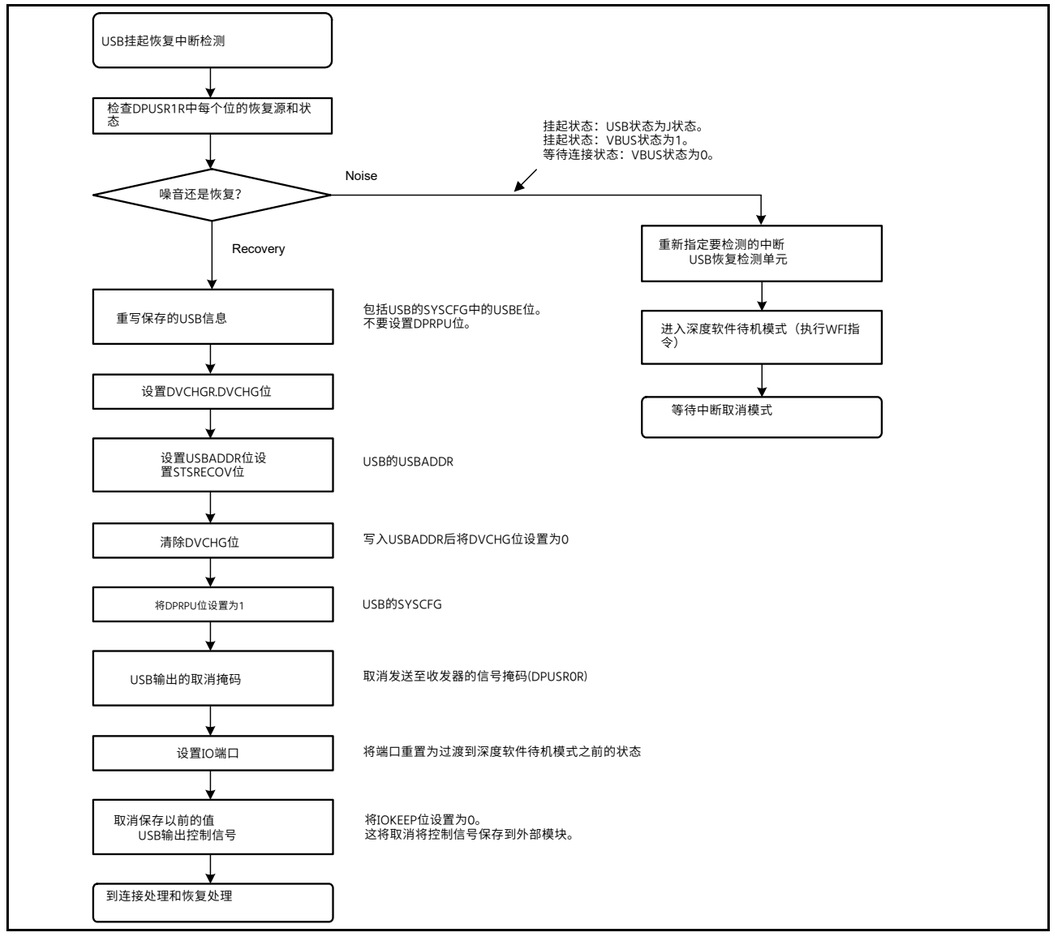

Figure 29.9 用于取消作为设备控制器的深度软件待机模式的USBFS设置流程

29.3.2 Interrupts

表29.14列出了USBFS中的中断源。当满足中断生成条件并使用相关的中断使能寄存器启用中断输出时，将向中断控制器单元(ICU)发出USBFS中断请求并生成USBFS中断。参见第14节，中断控制器单元(ICU)。

Table 29.14 中断源(1of3)

要设置为1的位	Name	中断源	适用控制器功能	状态标志
VBINT	VBUS interrupt	检测到USB_VBUS输入引脚的状态变化（从低到高或从高到低）	主机或设备*1	INTSTS0.VBSTS
RESM	恢复中断	在挂起状态下检测到USB总线的状态变化（J状态到K状态或J状态到SE0）	Device	—

Table 29.14 Interrupt sources (2 of 3)

Bit to be set to 1	Name	Interrupt source	Applicable controller function	Status flag
SOFR	Frame number update interrupt	In host controller mode: • An SOF packet with a different frame number was transmitted In device controller mode: • An SOF packet with a different frame number was received.	Host or device	—
DVST	Device state transition interrupt	• One of the following device state transitions was detected: - USB bus reset was detected - Suspended state was detected - SET_ADDRESS request was received - SET_CONFIGURATION request was received	Device	INTSTS0.DVSQ[2:0]
CTRT	Control transfer stage transition interrupt	• A control transfer stage transition was detected because of one of the following: - Setup stage completed - Control write transfer status stage transition occurred - Control read transfer status stage transition occurred - Control transfer completed - Control transfer sequence error occurred.	Device	INTSTS0.CTSQ[2:0]
BEMP	Buffer empty interrupt	• The buffer is empty after all FIFO buffer data was transmitted • A packet larger than the maximum packet size was received.	Host or device	BEMPSTS.PIPEnBEMP
NRDY	Buffer not ready interrupt	In host controller mode: • A STALL response was received from the peripheral device in response to the issued token • The response from the peripheral device in response to the issued token was not received successfully (no response three times consecutively or packet reception error three times consecutively) • An overrun or underrun error occurred during isochronous transfer. In device controller mode: • NAK was returned for an IN or OUT token while the PID[1:0] bits were set to 01b (BUF) • A CRC error or bit stuffing error occurred during data reception in isochronous transfer • An overrun or underrun occurred during data reception in isochronus transfer.	Host or device	NRDYSTS.PIPEnNRDY
BRDY	Buffer ready interrupt	• The buffer is ready (read/write state)	Host or device	BRDYSTS.PIPEnBRDY
OVRCR	Overcurrent input change interrupt	• USB_OVRCURA or USB_OVRCURB input pin state change was detected (low to high or high to low)	Host	INTSTS1.OVRCR
BCHG	Bus change interrupt	• USB bus state change was detected	Host or device	SYSSTS0.LNST[1:0]

29.3.3 Interrupt Descriptions

29.3.3.1 BRDY interrupt

The BRDY interrupt is generated in both host and device controller modes. This section describes the conditions in which the USBFS sets the associated bit in BRDYSTS to 1. Under these conditions, the USBFS generates a BRDY interrupt if software sets 1 to the bit in BRDYENB associated with the given pipe, and 1 to the INTENB0.BRDYE bit.

The conditions for generating and clearing the BRDY interrupt depend on the SOFCFG.BRDYM and PIPECFG.BFRE settings for each pipe as follows:

(1) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, the USBFS generates an internal BRDY interrupt request trigger and sets 1 to the BRDYSTS.PIPEnBRDY bit associated with the selected pipe to 1.

(a) For transmitting pipes

- When the DIR bit is changed from 0 to 1 by software
- When packet transmission is complete for a pipe while write-access from the CPU to the FIFO buffer for the pipe is disabled (when the BSTS bit is read as 0)
- When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode
- No request trigger is generated until the completion of writing data to the currently-written FIFO buffer even if transmission to the other FIFO buffer is complete
- When the hardware flushes the buffer of the pipe for isochronous transfers
- When 1 is written to the PIPEnCTR.ACLRM bit, which causes the FIFO buffer to transition from the write-disabled to write-enabled state.

No request trigger is generated for the DCP during data transmission for control transfers.

(b) For receiving pipes

- When packet reception is successfully complete, enabling the FIFO buffer to be read while read-access from the CPU to the FIFO buffer for the given pipe is disabled (when the BSTS bit is read as 0). No request trigger is generated for transactions in which a DATA-PID mismatch has occurred.
- When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode. No request trigger is generated until the completion of reading data from the currently-read FIFO buffer, even if reception by the other FIFO buffer is complete.

In device controller mode, the BRDY interrupt is not generated in the status stage of control transfers. The PIPEnBRDY

29.3.3 中断说明

29.3.3.1 BRDY interrupt

在主机和设备控制器模式下都会产生BRDY中断。本节描述USBFS将BRDYSTS中的相关位设置为1的条件。在这些条件下，如果软件将BRDYENB中与给定管道相关的位设置为1，并且将INTENB0.BRDYE设置为1，USBFS将生成BRDY中断少量。

产生和清除BRDY中断的条件取决于每个管道的SOFCFG.BRDYM和PIPECFG.BFRE设置，如下所示：

(1) 当SOFCFG.BRDYM=0且PIPECFG.BFRE=0时

通过这些设置，BRDY中断指示FIFO端口可访问。

在以下任一条件下，USBFS产生内部BRDY中断请求触发并将1设置为BRDYSTS.PIPEnBRDY位与所选管道相关联为1。

(a) 用于传输管道

- 当DIR位由软件从0变为1时
- 当管道的数据包传输完成而从CPU到管道的FIFO缓冲区的写访问被禁用时（当BSTS位被读取为0时）
- 双缓冲模式下，当一个FIFO缓冲区在完成向另一个FIFO缓冲区写入数据时为空时
- 直到向当前写入的FIFO缓冲区写入数据完成，才会产生请求触发，即使传输到另一个FIFO缓冲区已完成
- 当硬件刷新管道缓冲区以进行同步传输时
- 当1写入PIPEnCTR.ACLRM位时，这会导致FIFO缓冲区从写禁止状态转换为写使能状态。

在控制传输的数据传输期间，不会为DCP生成请求触发。

(b) 用于接收管道

- 当数据包接收成功完成后，在从CPU到给定管道的FIFO缓冲区被禁用（当BSTS位被读取为0时）。对于发生DATA-PID不匹配的事务，不会生成请求触发器。
- 当一个FIFO缓冲区在双缓冲区模式下完成从另一个FIFO缓冲区读取数据后启用读取。在从当前读取的FIFO缓冲区读取数据完成之前，不会生成请求触发，即使其他FIFO缓冲区的接收已完成。

在设备控制器模式下，在控制传输的状态阶段不会产生BRDY中断。PIPEnBRDY

interrupt status of the selected pipe can be set to 0 by writing 0 to the associated PIPEnBRDY bit through software. In this case, the other PIPEnBRDY bit should be set to 1.

Clear the BRDY status before accessing the FIFO buffer.

(2) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 1

With these settings, the USBFS generates a BRDY interrupt on completion of reading all data for a single transfer using the receiving pipe, and sets 1 to the bit in BRDYSTS associated with the selected pipe.

On any of the following conditions, the USBFS determines that the last data for a single transfer was received:

- When a short packet including a zero-length packet is received
- When the PIPEn Transaction Counter Register (PIPEnTRN) is used and the number of packets specified in the PIPEnTRN.TRNCNT[15:0] bits are completely received.

When the data is completely read after any of the specified conditions is satisfied, the USBFS determines that all data for a single transfer is completely read.

When a zero-length packet is received while the FIFO buffer is empty, the USBFS determines that all data for a single transfer is completely read when the FRDY bit in the FIFO port control register is 1 and the DTLN[8:0] bits are 0. In this case, to start the next transfer, write 1 to the BCLR bit in the associated port control register through software. With these settings, the USBFS does not detect a BRDY interrupt for the transmitting pipe.

The PIPEnBRDY interrupt status of the selected pipe can be set to 0 by writing 0 to the associated BRDYSTS.PIPEnBRDY bit through software. In this case, the other PIPEnBRDY bits should be set to 1.

In this mode, do not change the PIPECFG.BFRE bit setting until all data for a single transfer is processed. When modification to the PIPECFG.BFRE bit is required before processing completes, clear all FIFO buffers for the pipe with the PIPEnCTR.ACLRM bit.

(3) When SOFCFG.BRDYM = 1 and PIPECFG.BFRE = 0

With these settings, the BRDYSTS.PIPEnBRDY values are linked to the BSTS bit setting for each pipe. In other words, the BRDY interrupt status bits (PIPEnBRDY) are set to 1 or 0 by the USB depending on the FIFO buffer status.

(a) For transmitting pipes

The BRDY interrupt status bits are set to 1 when the FIFO buffer is ready for write access, and are set to 0 when it is not ready. The BRDY interrupt is not generated for the DCP in the transmitting direction even when it is ready for write access.

(b) For receiving pipes

The BRDY interrupt status bits set to 1 when the FIFO buffer is ready for read access, and set to 0 when all data is read (not ready for read access).

When a zero-length packet is received while the FIFO buffer is empty, the associated bit is set to 1 and the BRDY interrupt is continuously generated until software writes 1 to BCLR. With this setting, the PIPEnBRDY bit cannot be set to 0 by software. When the SOFCFG.BRDYM bit is set to 1, set the PIPECFG.BFRE bit for all pipes to 0.

通过软件将0写入相关的PIPEnBRDY位，可以将所选管道的中断状态设置为0。在这种情况下，其他PIPEnBRDY位应设置为1。

在访问FIFO缓冲区之前清除BRDY状态。

(2) 当SOFCFG.BRDYM=0且PIPECFG.BFRE=1时

使用这些设置，USBFS在完成使用接收管道读取所有数据以进行单次传输时生成BRDY中断，并将BRDYSTS中与所选管道关联的位设置为1。

在以下任何一种情况下，USBFS都会确定接收到单次传输的最后一个数据：

- 当接收到包含零长度数据包的短数据包时
- 当使用PIPEn事务计数器寄存器(PIPEnTRN)并且在PIPEnTRN.TRNCNT[15:0]位被完全接收。

当满足任何指定条件后数据被完全读取时，USBFS确定单次传输的所有数据都被完全读取。

当FIFO缓冲区为空时接收到零长度数据包时，当FIFO端口控制寄存器中的FRDY位为1且DTLN[8:0]位为0.在这种情况下，要开始下一次传输，通过软件向相关端口控制寄存器中的BCLR位写入1。使用这些设置，USBFS不会检测到传输管道的BRDY中断。

选择管道的PIPEnBRDY中断状态可以通过向关联的写入0来设置为0 BRDYSTS.PIPEnBRDY位通过软件。在这种情况下，其他PIPEnBRDY位应设置为1。

在此模式下，在处理完单次传输的所有数据之前，不要更改PIPECFG.BFRE位设置。如果需要在处理完成之前修改PIPECFG.BFRE位，请使用PIPEnCTR.ACLRM位清除管道的所有FIFO缓冲区。

(3) 当SOFCFG.BRDYM=1且PIPECFG.BFRE=0时

通过这些设置，BRDYSTS.PIPEnBRDY值链接到每个管道的BSTS位设置。换言之，BRDY中断状态位(PIPEnBRDY)由USB设置为1或0，具体取决于FIFO缓冲区状态。

(a) 用于传输管道

当FIFO缓冲区准备好进行写访问时，BRDY中断状态位设置为1，当它未准备好时设置为0。发送方向上的DCP不会产生BRDY中断，即使它已准备好进行写访问。

(b) 用于接收管道

当FIFO缓冲区准备好进行读取访问时，BRDY中断状态位设置为1，并在读取所有数据（未准备好进行读取访问）时设置为0。

当FIFO缓冲区为空时接收到零长度数据包时，相关位设置为1，并且BRDY中断持续产生，直到软件向BCLR写入1。使用此设置，PIPEnBRDY位不能通过软件设置为0。当SOFCFG.BRDYM位设置为1时，将所有管道的PIPECFG.BFRE位设置为0。

Figure 29.11 shows the timing of BRDY interrupt generation.

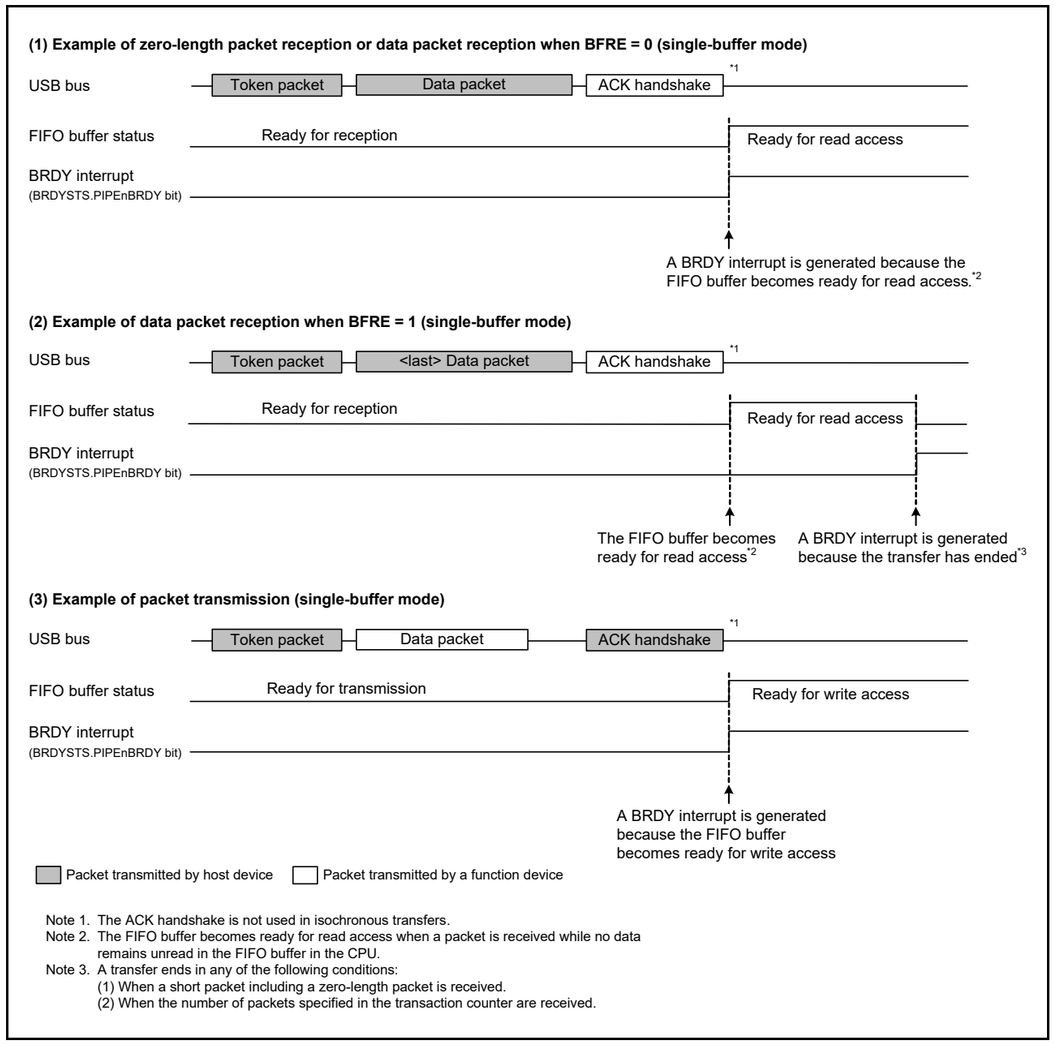

Figure 29.11 Timing of BRDY interrupt generation

The condition for clearing the INTSTS0.BRDY bit depends on the SOFCFG.BRDYM bit setting, as shown in Table 29.16.

Table 29.16 Conditions for clearing BRDY bit

BRDYM bit	Condition for clearing BRDY bit
0	When all bits in BRDYSTS are set to 0 by software

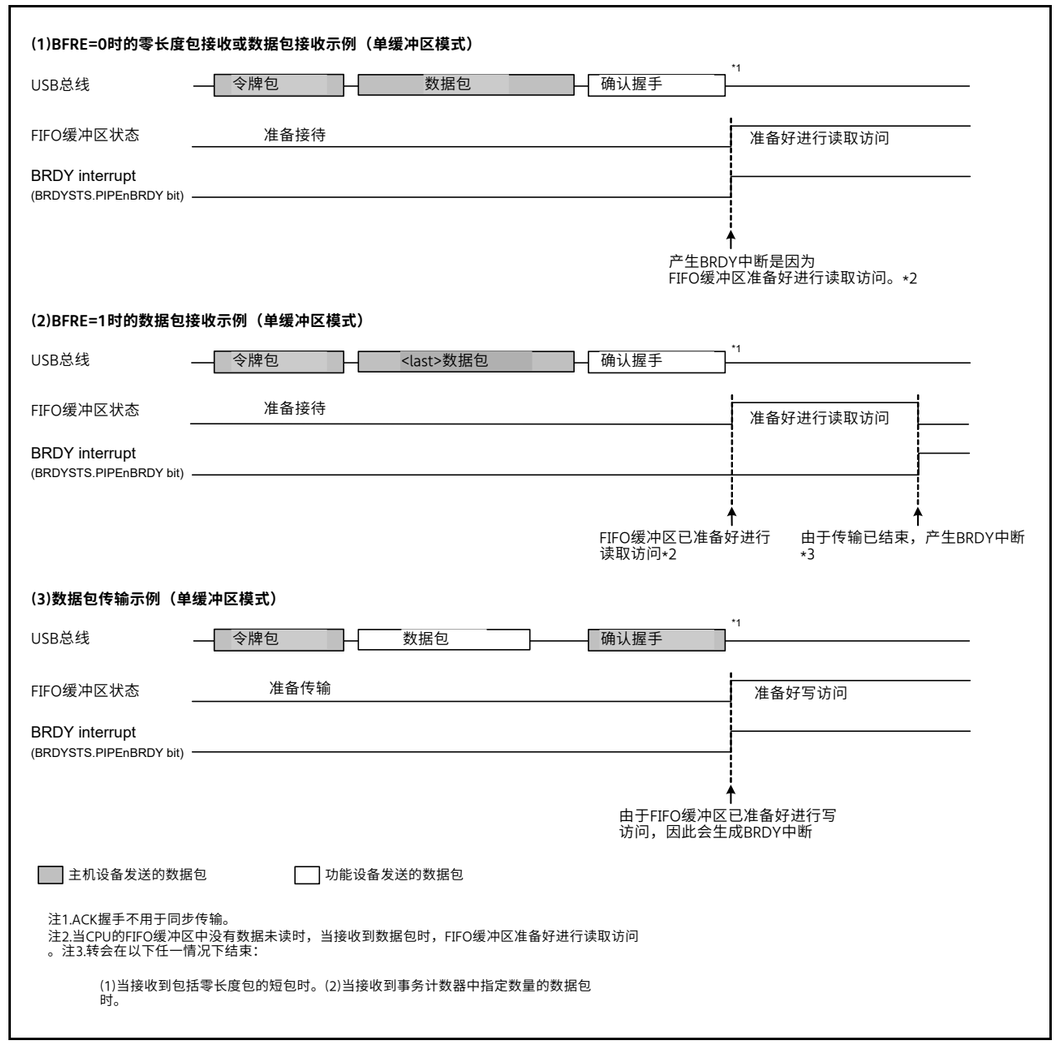

Figure 29.11 BRDY中断产生的时序

清除INTSTS0.BRDY位的条件取决于SOFCFG.BRDYM位设置，如表29.16所示。

Table 29.16 清除BRDY位的条件

BRDYM bit	清除BRDY位的条件
0	当BRDYSTS中的所有位由软件设置为0时
1	当所有管道的BSTS位变为0时

29.3.3.2 NRDY interrupt

On generating an internal NRDY interrupt request for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated PIPEnNRDY bit in NRDYSTS to 1. If the associated bit in NRDYENB is set to 1 by software, the USBFS sets the INTSTS0.NRDY bit to 1 and generates a USBFS interrupt.

This section describes the conditions in which the USBFS generates the internal NRDY interrupt request for a given pipe.

The internal NRDY interrupt request is not generated during setup transaction execution in host controller mode. During setup transactions in host controller mode, the SACK or SIGN interrupt is detected.

The internal NRDY interrupt request is not generated during status stage execution of the control transfer in device controller mode.

(1) In host controller mode

(a) For transmitting pipes

On any of the following conditions, the USBFS detects an NRDY interrupt:

- For isochronous transfer pipes, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS transmits a zero-length packet following the OUT token and sets the associated NRDYSTS.PIPEnNRDY bit and the FRMNUM.OVRN bit to 1.
- During communications other than setup transactions on pipes not used for isochronous transfers, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK.
- During communications other than setup transactions, when the STALL handshake is received from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the PID[1:0] setting for the associated pipe to STALL (11b).

(b) For receiving pipes

- For isochronous transfer pipes, when the time to issue an IN token comes but there is no space available in the FIFO buffer. In this case, the USBFS discards the received data for the IN token and sets the PIPEnNRDY bit associated with the pipe and the OVRN bit to 1. When a packet error is detected in the received data for the IN token, the USBFS also sets the FRMNUM.CRCE bit to 1.
- For non-isochronous transfer pipes, when any combination of the following two cases occur three consecutive times:
  - No response is returned from the peripheral device for the IN token issued by the USBFS (when timeout is detected before detection of the DATA packet from the peripheral device)
  - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPEnNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK.
- For isochronous transfer pipes, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device. In this case, the USBFS sets 1 to the PIPEnNRDY bit associated with the pipe. The PID[1:0] setting for the pipe is not changed.
- For isochronous transfer pipes, when a CRC error or a bit stuffing error is detected in the received data packet. In this case, the USBFS sets the PIPEnNRDY bit associated with the pipe and the CRCE bit to 1.
- When the STALL handshake is received. In this case, the USBFS sets 1 to the PIPEnNRDY bit associated with the pipe and changes the PID[1:0] setting for the associated pipe to STALL.

29.3.3.2 NRDY interrupt

在为PID位由软件设置为BUF的管道生成内部NRDY中断请求时，USBFS将NRDYSTS中的相关PIPEnNRDY位设置为1。如果NRDYENB中的相关位由软件设置为1，则USBFS设置INTSTS0.NRDY位为1并产生USBFS中断。

本节描述USBFS为给定管道生成内部NRDY中断请求的条件。

内部NRDY中断请求在主控制器模式下的设置事务执行期间不会产生。在主机控制器模式下的设置事务期间，检测到SACK或SIGN中断。

在设备控制器模式下控制传输的状态阶段执行期间，不会产生内部NRDY中断请求。

(1) 在主机控制器模式下

(a) 用于传输管道

在以下任何一种情况下，USBFS都会检测到NRDY中断：

- 对于同步传输管道，当发出OUT令牌的时间到来时，FIFO缓冲区中没有要传输的数据。在这种情况下，USBFS在OUT令牌之后发送一个长度为零的数据包，并将相关的NRDYSTS.PIPEnNRDY位和FRMNUM.OVRN位设置为1。
- 在不用于同步传输的管道上的设置事务以外的通信期间，当以下两种情况的任意组合连续发生3次时：
  - 外围设备没有返回响应（当在检测到来自外围设备的握手包之前检测到超时时
  - 在来自外围设备的数据包中检测到错误。在这种情况下，USBFS设置关联的PIPEnNRDY位为1并将管道的相关PID[1:0]设置更改为NAK。
- 在设置事务以外的通信期间，当从外围设备接收到STALL握手时。在这种情况下，USBFS将相关的PIPEnNRDY位设置为1，并将相关管道的PID[1:0]设置更改为STALL(11b)。

(b) 用于接收管道

- 对于同步传输管道，当发出IN令牌的时间到来但FIFO缓冲区中没有可用空间时。在这种情况下，USBFS丢弃接收到的IN令牌数据，并将与管道关联的PIPEnNRDY位和OVRN位设置为1。当在接收到的IN令牌数据中检测到数据包错误时，USBFS也会设置FRMNUM.CRCE位为1。
- 对于非等时传输管道，当下列两种情况的任意组合连续出现3次时：
  - USBFS发出的IN令牌没有从外围设备返回响应（当在检测到来自外围设备的DATA包之前检测到超时时）
  - 在来自外围设备的数据包中检测到错误。在这种情况下，USBFS设置关联的PIPEnNRDY位为1并将管道的相关PID[1:0]设置更改为NAK。
- 对于同步传输管道，当外围设备没有返回对IN令牌的响应时（在检测到来自外围设备的DATA数据包之前检测到超时）或在来自外围设备的数据包中检测到错误。在这种情况下，USBFS将与管道关联的PIPEnNRDY位设置为1。管道的PID[1:0]设置未更改。
- 对于同步传输管道，当在接收到的数据包中检测到CRC错误或位填充错误时。在这种情况下，USBFS将与管道关联的PIPEnNRDY位和CRCE位设置为1。
- 当收到STALL握手时。在这种情况下，USBFS将与管道关联的PIPEnNRDY位设置为1，并将关联管道的PID[1:0]设置更改为STALL。

(2) In device controller mode

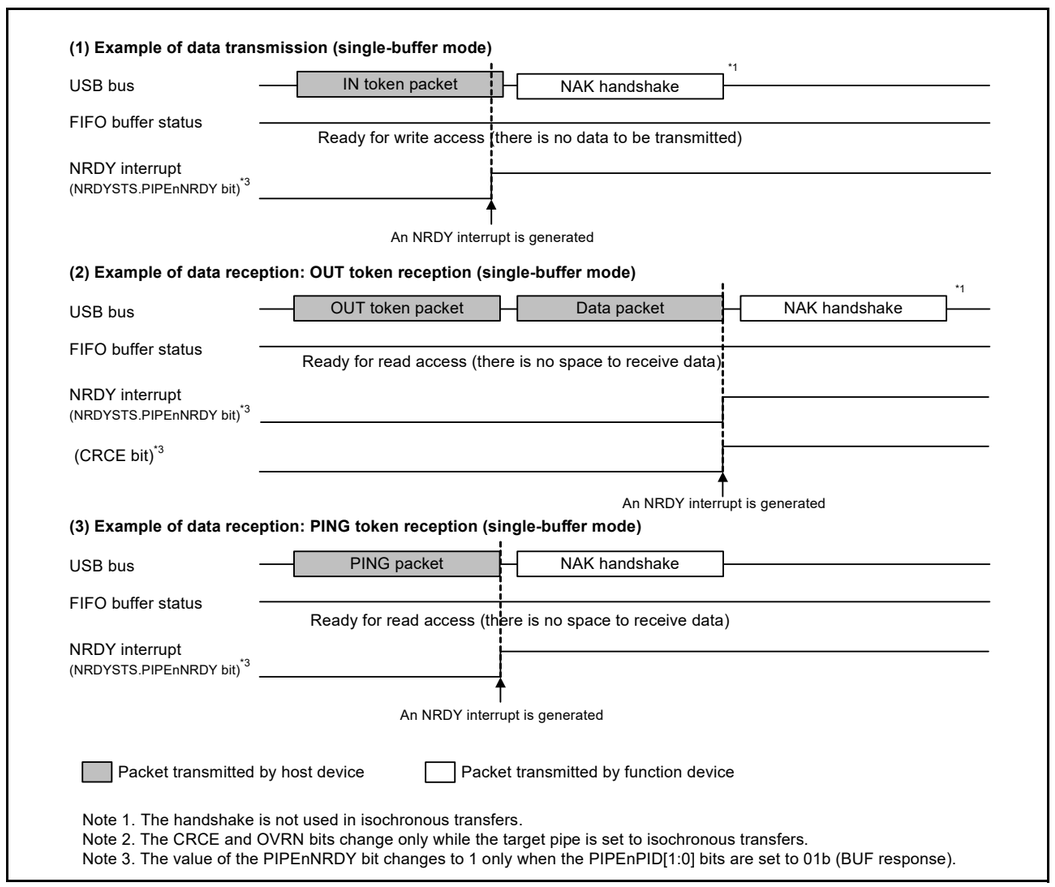
(a) For transmitting pipes

- When an IN token is received while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS generates a NRDY interrupt request on reception of the IN token and sets the NRDYSTS.PIPEnNRDY bit to 1. For an isochronous transfer pipe in which an interrupt is generated, the USBFS transmits a zero-length packet and sets the FRMNUM.OVRN bit to 1.

(b) For receiving pipes

- When an OUT token is received but there is no space available in the FIFO buffer. For an isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request on reception of the OUT token and sets the PIPEnNRDY bit and OVRN bit to 1. For a non-isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request when a NAK handshake is transferred after the data following the OUT token is received, and sets the PIPEnNRDY bit to 1. The NRDY interrupt request is not generated during retransmission because of a DATA-PID mismatch. In addition, the NRDY interrupt request is not generated if an error occurs in the DATA packet.
- For isochronous transfer pipes, when a token is not received successfully within an interval frame. In this case, the USBFS generates an NRDY interrupt request when the SOF is received, and sets the PIPEnNRDY bit to 1.

Figure 29.12 shows the timing of NRDY interrupt generation in device controller mode.



Note 1. The handshake is not used in isochronous transfers.
Note 2. The CRCE and OVRN bits change only while the target pipe is set to isochronous transfers.
Note 3. The value of the PIPEnNRDY bit changes to 1 only when the PIPEnPID[1:0] bits are set to 01b (BUF response).

Figure 29.12 Timing of NRDY interrupt generation in device controller mode

(2) 在设备控制器模式下

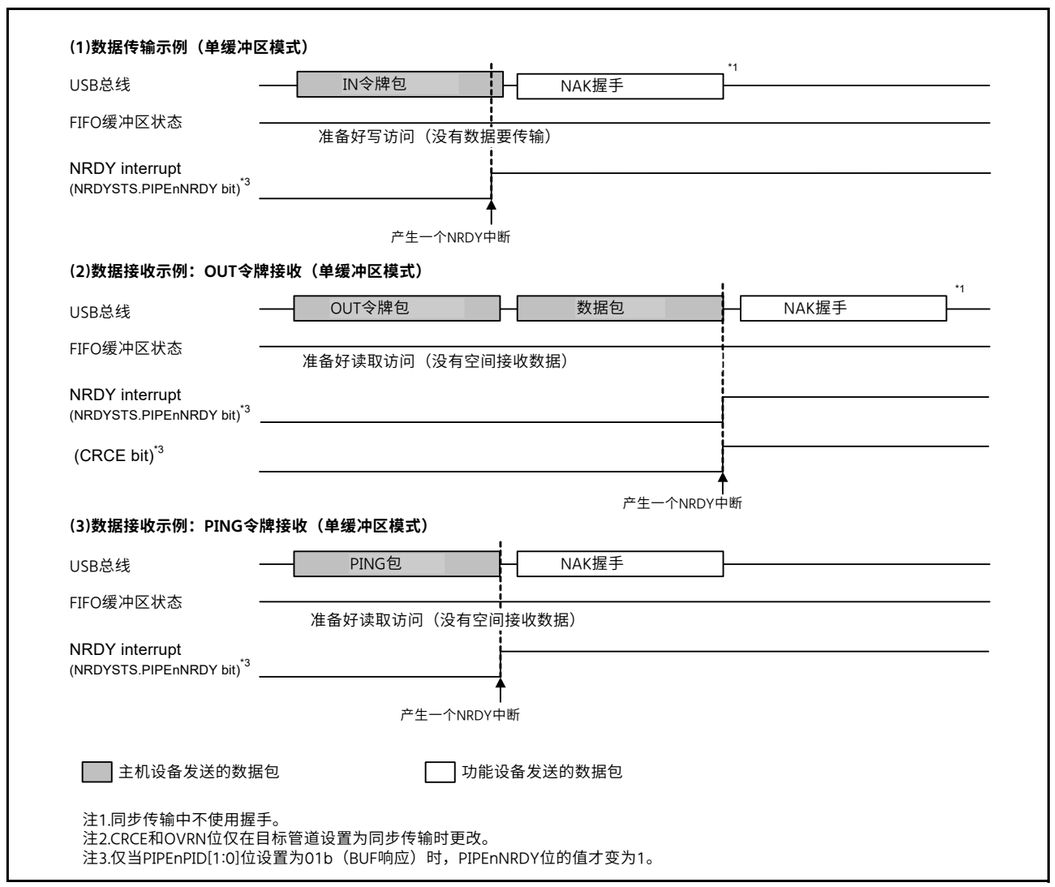
(a) 用于传输管道

- 当FIFO缓冲区中没有要传输的数据时接收到IN令牌。在这种情况下，USBFS在接收到IN令牌时产生一个NRDY中断请求，并将NRDYSTS.PIPEnNRDY位设置为1。对于产生中断的同步传输管道，USBFS发送一个长度为零的数据包并将FRMNUM.OVRN位为1。

(b) 用于接收管道

- 当接收到OUT令牌但FIFO缓冲区中没有可用空间时。对于产生中断的同步传输管道，USBFS在接收到OUT令牌时产生一个NRDY中断请求，并将PIPEnNRDY位和OVRN位设置为1。对于产生中断的非同步传输管道，USBFS在接收到OUT令牌之后的数据后，在传输NAK握手时生成NRDY中断请求，并将PIPEnNRDY位设置为1。由于DATA-PID不匹配，在重传期间不会生成NRDY中断请求。此外，如果DATA包发生错误，则不会产生NRDY中断请求。
- 对于同步传输管道，当在间隔帧内未成功接收到令牌时。在这种情况下，USBFS在接收到SOF时产生一个NRDY中断请求，并将PIPEnNRDY位设置为1。

图29.12显示了设备控制器模式下NRDY中断产生的时序。



注1.同步传输中不使用握手。
注2.CRCE和OVRN位仅在目标管道设置为同步传输时更改。
注3.仅当PIPEnPID[1:0]位设置为01b（BUF响应）时，PIPEnNRDY位的值才变为1。

Figure 29.12 设备控制器模式下NRDY中断产生的时序

29.3.3.3 BEMP interrupt

On detecting a BEMP interrupt for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated BEMPSTS.PIPEnBEMP bit to 1. If the associated bit in BEMPENB is set to 1 by software, the USBFS sets the INTSTS0.BEMP bit to 1 and generates a USBFS interrupt. This section describes the conditions in which the USBFS generates an internal BEMP interrupt request.

(1) For transmitting pipes

When the FIFO buffer of the associated pipe is empty on completion of transmission, including zero-length packet transmission, and in single buffer mode, an internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for a non-DCP pipe. The internal BEMP interrupt request is not generated in any of the following conditions:

- When the CPU or DMA/DTC has already started writing data to the FIFO buffer of the CPU on completion of transmitting data from one FIFO buffer in double buffer mode
- When the buffer is cleared (emptied) by setting the PIPEnCTR.ACLRM or the BCLR bit in the port control register to 1
- When an IN transfer (zero-length packet transmission) is performed during the control transfer status stage in device controller mode.

(2) For receiving pipes

When a successfully-received data packet size exceeds the specified maximum packet size. In this case, the USBFS generates a BEMP interrupt request, sets the associated BEMPSTS.PIPEnBEMP bit to 1, discards the received data, and changes the associated PID[1:0] setting for the pipe to STALL (11b). The USBFS returns no response in host controller mode, and returns STALL response in device controller mode.

The internal BEMP interrupt request is not generated on any of the following conditions:

- When a CRC error or a bit stuffing error is detected in the received data
- When a setup transaction is being performed:
  - Writing 0 to the BEMPSTS.PIPEnBEMP bit clears the status
  - Writing 1 to the BEMPSTS.PIPEnBEMP bit has no effect.

Figure 29.13 shows the timing of the BEMP interrupt generation in device controller mode.

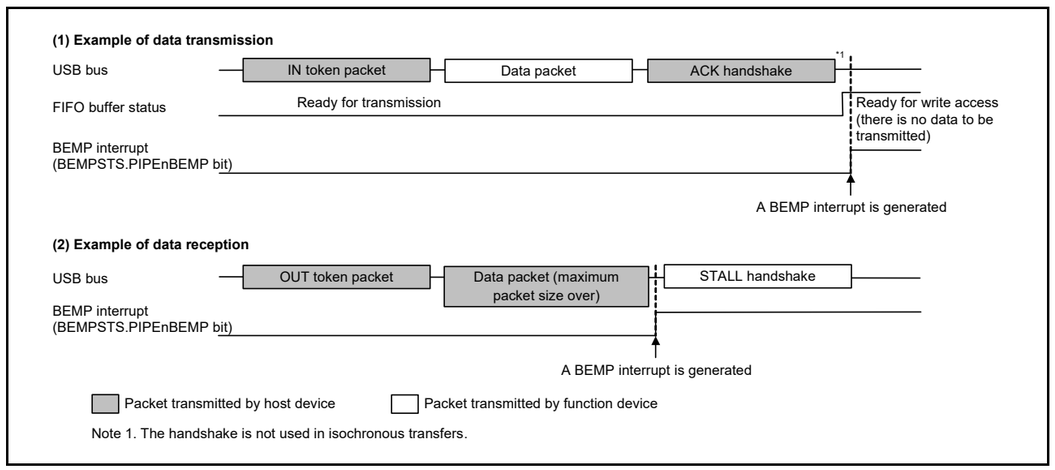


Figure 29.13 Timing of BEMP interrupt generation in device controller mode

29.3.3.3 BEMP interrupt

在检测到PID位被软件设置为BUF的管道的BEMP中断时，USBFS将相关的BEMPSTS.PIPEnBEMP位设置为1。如果BEMPENB中的相关位被软件设置为1，USBFS将设置
INTSTS0.BEMP位为1并产生USBFS中断。本节介绍USBFS产生内部BEMP中断请求的条件。

(1) 用于传输管道

当相关管道的FIFO缓冲区在传输完成时为空时，包括零长度数据包传输，并且在单缓冲区模式下，内部BEMP中断请求与非DCP管道的BRDY中断同时生成。在以下任何一种情况下都不会产生内部BEMP中断请求：

- 当CPU或DMADTC在双缓冲模式下从一个FIFO缓冲区完成数据传输后已经开始向CPU的FIFO缓冲区写入数据时
- 当通过将端口控制寄存器中的PIPEnCTR.ACLRM或BCLR位设置为1来清除（清空）缓冲区时
- 在设备控制器模式下的控制传输状态阶段执行IN传输（零长度数据包传输）时。

(2) 用于接收管道

当成功接收的数据包大小超过指定的最大包大小时。在这种情况下，USBFS生成一个BEMP中断请求，将相关的BEMPSTS.PIPEnBEMP位设置为1，丢弃接收到的数据，并将管道的相关PID[1:0]设置更改为STALL(11b)。USBFS在主机控制器模式下不返回响应，在设备控制器模式下返回STALL响应。

在以下任何情况下都不会产生内部BEMP中断请求：

- 在接收到的数据中检测到CRC错误或位填充错误时
- 执行设置事务时：
  - 将0写入BEMPSTS.PIPEnBEMP位可清除状态
  - 向BEMPSTS.PIPEnBEMP位写入1无效。

图29.13显示了设备控制器模式下BEMP中断产生的时序。

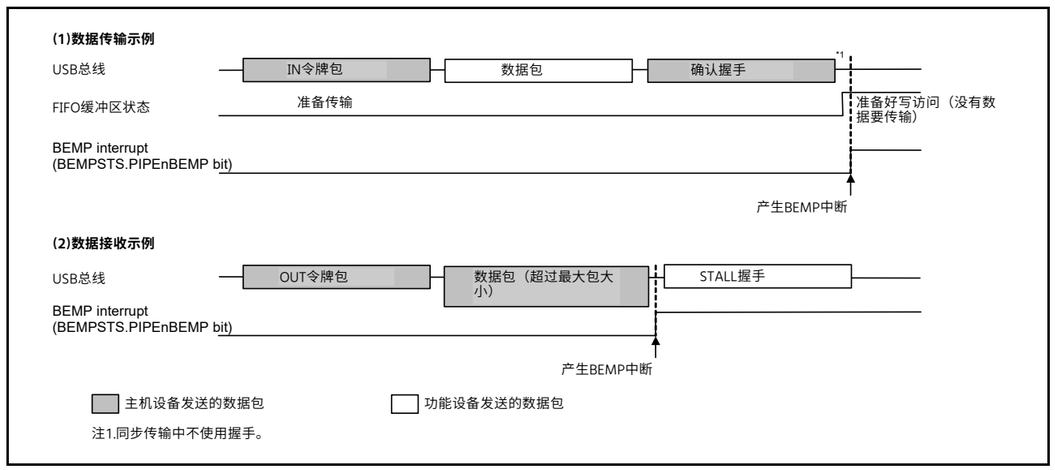

Figure 29.13 设备控制器模式下BEMP中断产生的时序

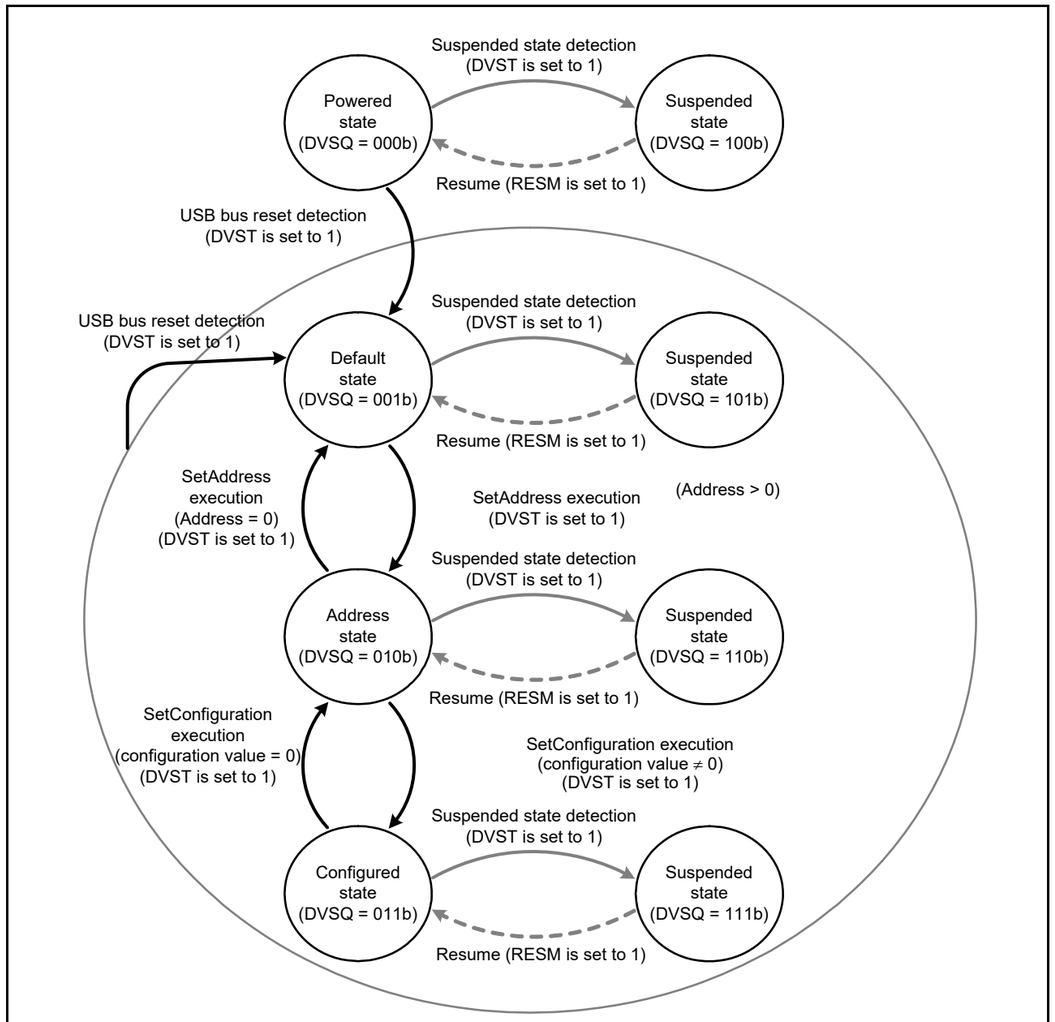
29.3.3.4 Device state transition interrupt (device controller mode)

Figure 29.14 shows a diagram of the USBFS device state transitions. The USBFS controls device states and generates device state transition interrupts. However, recovery from the suspended state (resume signal detection) is detected by means of the resume interrupt. Device state transition interrupts can be enabled or disabled independently in INTENB0. Devices whose states have changed can be checked in the INTSTS0.DVSQ[2:0] bits.

When a transition is made to the default state, a device state transition interrupt is generated after a USB bus reset is detected.

The USBFS controls device states, and device state transition interrupts can be generated, only in device controller mode.



Note: For a transition indicated by a solid line, the DVST bit is set to 1.
For a resume indicated by a dashed line, the RESM bit is set to 1.

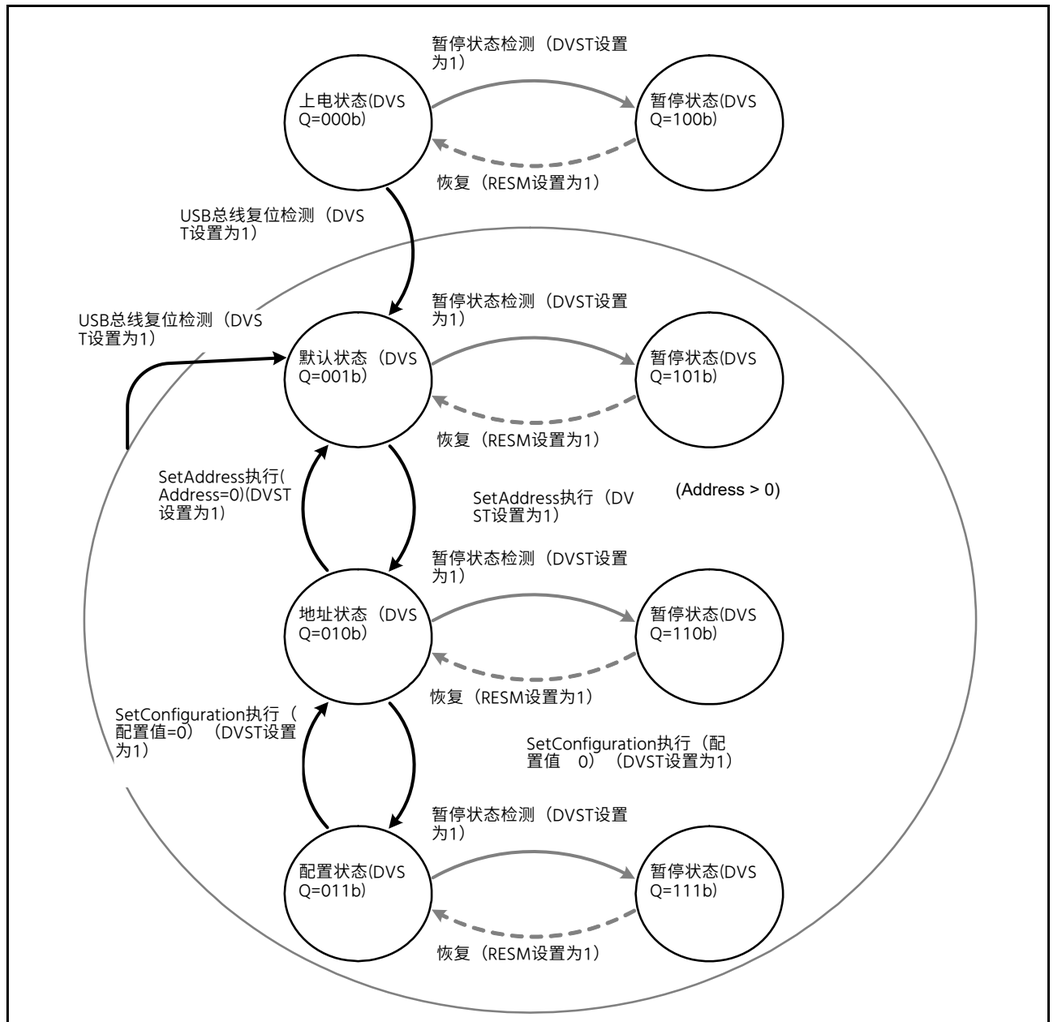
Figure 29.14 Device state transitions

29.3.3.4 设备状态转换中断（设备控制器模式）

图29.14显示了USBFS设备状态转换的示意图。USBFS控制设备状态并产生设备状态转换中断。但是，通过恢复中断检测从暂停状态的恢复（恢复信号检测）。可以在INTENB0中独立启用或禁用设备状态转换中断。可以在INTSTS0.DVSQ[2:0]位中检查状态已更改的设备。

当转换到默认状态时，检测到USB总线复位后会产生设备状态转换中断。

USBFS控制设备状态，并且只能在设备控制器模式下产生设备状态转换中断。



Note: 对于实线指示的转换，DVST位设置为1。对于虚线指示的恢复，RESM位设置为1。

Figure 29.14 设备状态转换

29.3.3.5 Control transfer stage transition interrupt (device controller mode)

Figure 29.15 shows a diagram of the control transfer stage transitions of the USBFS. The USBFS controls the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled independently in INTENB0. Transfer stages that have transitioned can be checked in the INTSTS0.CTSQ[2:0] bits.

Control transfer stage transition interrupts are generated only in device controller mode. This section describes control transfer sequence errors. When an error occurs, the DCPCTR.PID[1:0] bits are set to 1xb (STALL response).

(1) Control read transfer errors

- An OUT token is received but no data is transferred in response to the IN token at the data stage
- An IN token is received at the status stage
- A data packet with DATAPID = DATA0 is received at the status stage.

(2) Control write transfer errors

- An IN token is received but no ACK is returned in response to the OUT token at the data stage
- A data packet with DATAPID = DATA0 is received as the first data packet at the data stage
- An OUT token is received at the status stage.

(3) Control write no data transfer errors

- An OUT token is received at the status stage.

At the control write transfer data stage, if the receive data length exceeds the wLength value of the USB request, it is not recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (INTSTS0.CTRT = 1), the CTSQ[2:0] = 110b value is saved until the CTRT bit is set to 0, clearing the interrupt status. While CTSQ[2:0] = 110b is being saved, no CTRT interrupt for ending the setup stage is generated, even when a new USB request is received. The USBFS saves the setup stage completion status, and it generates a CTRT interrupt after software clears the interrupt status.

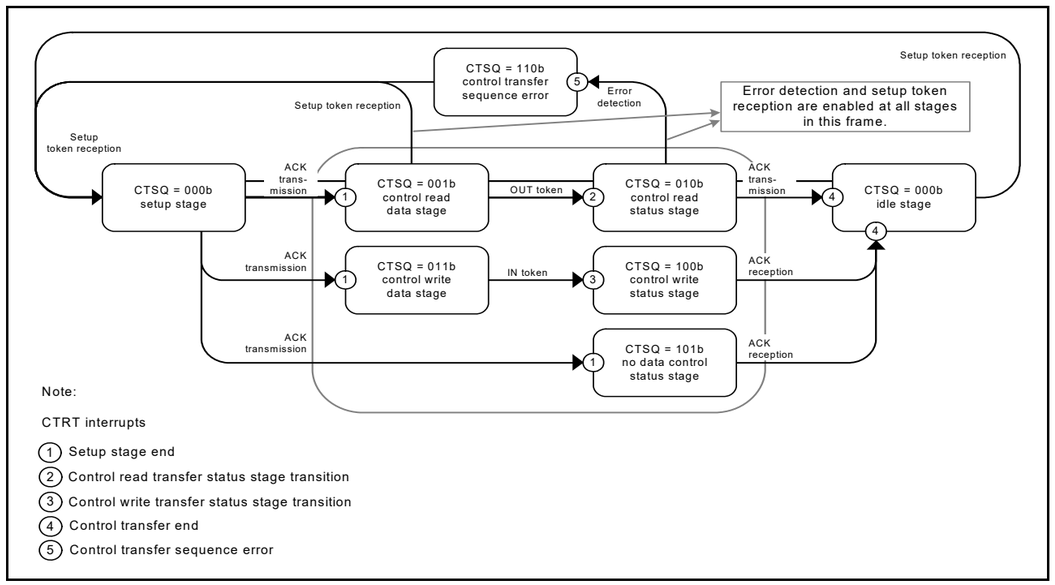


Figure 29.15 Control transfer stage transitions

29.3.3.5 控制转移阶段转换中断（设备控制器模式）

图29.15显示了USBFS的控制传输阶段转换图。USBFS控制控制传输序列并产生控制传输阶段转换中断。控制转移阶段转换中断可以在INTENB0中独立启用或禁用。可以在INTSTS0.CTSQ[2:0]位中检查已转换的传输阶段。

控制转移阶段转换中断仅在设备控制器模式下产生。本节描述控制传输序列错误。发生错误时，DCPCTR.PID[1:0]位设置为1xb（STALL响应）。

(1) 控制读取传输错误

- 接收到OUT令牌，但在数据阶段没有响应IN令牌传输数据
- 在状态阶段收到一个IN令牌
- 在状态阶段接收到一个DATAPID=DATA0的数据包。

(2) 控制写入传输错误

- 在数据阶段接收到IN令牌但没有返回ACK以响应OUT令牌
- DATAPID=DATA0的数据包作为数据阶段的第一个数据包被接收
- 在状态阶段收到一个OUT令牌。

(3) 控制写入无数据传输错误

- 在状态阶段收到一个OUT令牌。

在控制写入传输数据阶段，如果接收数据长度超过USB请求的wLength值，则不被识别为控制传输序列错误。
在控制读取传输状态阶段，除了零长度数据包之外的数据包被一个ACK响应接收并且传输正常结束。

当响应序列错误（INTSTS0.CTRT=1）而发生CTRT中断时，将保存CTSQ[2:0]=110b值，直到CTRT位设置为0，清除中断状态。在保存CTSQ[2:0]=110b时，不会生成用于结束设置阶段的CTRT中断，即使收到新的USB请求也是如此。USBFS保存设置阶段完成状态，软件清除中断状态后产生CTRT中断。

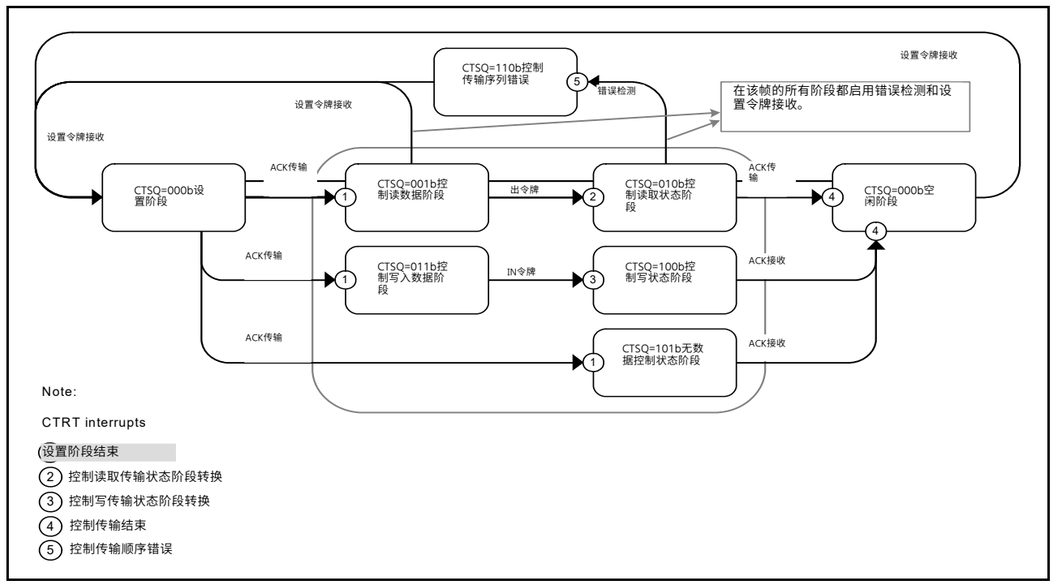

Figure 29.15 控制转移阶段转换

29.3.3.6 Frame update interrupt

In host controller mode, an interrupt is generated when the frame number is updated.

In device controller mode, an SOFR interrupt is generated when the frame number is updated. The USBFS updates the frame number and generates an SOFR interrupt if it detects a new SOF packet during full-speed operation.

29.3.3.7 VBUS interrupt

When the USB_VBUS pin level changes, a VBUS interrupt is generated. The level of the USB_VBUS pin can be checked with the INTSTS0.VBSTS bit. Whether the host controller is connected or disconnected can be confirmed using the VBUS interrupt. If the system is activated with the host controller connected, the first VBUS interrupt is not generated, because there is no change in the USB_VBUS pin level.

29.3.3.8 Resume interrupt

In device controller mode, a resume interrupt is generated when the device state is the suspended state, and the USB bus state has changed from J-state to K-state, or from J-state to SE0. Recovery from the suspended state is detected by means of the resume interrupt.

In host controller mode, no resume interrupt is generated. Use the BCHG interrupt to detect a change in the USB bus state.

29.3.3.9 OVRCR interrupt

An OVRCR interrupt is generated when the USB_OVRCURA or USB_OVRCURB pin level has changed. The levels of the USB_OVRCURA and USB_OVRCURB pins can be checked in the SYSSTS0.OVCMON[1:0] bits. The external power supply IC can check whether overcurrent is detected using the OVRCR interrupt.

For OTG connections, the OVRCR interrupt allows you to check whether a change is detected in the VBUS comparator.

29.3.3.10 BCHG interrupt

A BCHG interrupt is generated when the USB bus state has changed. The BCHG interrupt can be used to detect whether a peripheral device is connected and can also be used to detect a remote wakeup in host controller mode. The BCHG interrupt is generated in both host and device controller modes.

29.3.3.11 DTCH interrupt

A DTCH interrupt is generated when a USB bus disconnect is detected in host controller mode. The USBFS detects bus disconnects in compliance with the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by software. The pipes enter the wait state for a bus connection to the port, waiting for an ATTCH interrupt to occur. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt is detected, to 0
- Puts the port in which the DTCH interrupt occurred into an idle state.

29.3.3.12 SACK interrupt

A SACK interrupt is generated when an ACK response for the transmitted setup packet is received from the peripheral device in host controller mode. The SACK interrupt can be used to confirm that the setup transaction is successfully complete.

29.3.3.13 SIGN interrupt

A SIGN interrupt is generated when an ACK response for the transmitted setup packet is not correctly received from the peripheral device three consecutive times in host controller mode. The SIGN interrupt can be used to detect that no ACK response was transmitted from the peripheral device or that corruption of an ACK packet occurred.

29.3.3.6 帧更新中断

在主机控制器模式下，更新帧号时会产生中断。

在设备控制器模式下，更新帧号时会产生SOFR中断。如果USBFS在全速运行期间检测到新的SOF数据包，则USBFS会更新帧号并生成SOFR中断。

29.3.3.7 VBUS interrupt

当USB_VBUS引脚电平改变时，会产生VBUS中断。USB_VBUS引脚的电平可以通过INTSTS0.VBSTS位检查。主控制器是连接还是断开可以使用VBUS中断来确认。如果系统在连接主机控制器的情况下激活，则不会产生第一个VBUS中断，因为USB_VBUS引脚电平没有变化。

29.3.3.8 恢复中断

在设备控制器模式下，当设备状态为挂起状态，并且USB总线状态已从J-state变为K-state，或从J-state变为SE0时，产生恢复中断。通过恢复中断检测从挂起状态的恢复。

在主机控制器模式下，不会产生恢复中断。使用BCHG中断来检测USB总线状态的变化。

29.3.3.9 OVRCR interrupt

当USB_OVRCURA或USB_OVRCURB引脚电平发生变化时，会产生OVRCR中断。USB_OVRCURA和USB_OVRCURB引脚的电平可以在SYSSTS0.OVCMON[1:0]位中检查。外部电源IC可以使用OVRCR中断检查是否检测到过电流。

对于OTG连接，OVRCR中断允许您检查是否在VBUS比较器中检测到变化。

29.3.3.10 BCHG interrupt

当USB总线状态改变时会产生BCHG中断。BCHG中断可用于检测是否连接了外围设备，也可用于检测主机控制器模式下的远程唤醒。BCHG中断在主机和设备控制器模式下产生。

29.3.3.11 DTCH interrupt

当在主机控制器模式下检测到USB总线断开连接时，会产生DTCH中断。USBFS检测符合USB2.0规范的总线断开连接。

在检测到中断时，为相关端口执行通信的所有管道必须由软件终止。管道进入等待状态，等待总线连接到端口，等待ATTCH中断发生。无论相关中断使能位中设置的值如何，USBFS硬件：

- 将检测到DTCH中断的端口的DVSTCTR0.UACT位设置为0
- 将发生DTCH中断的端口置于空闲状态。

29.3.3.12 SACK中断

当在主机控制器模式下从外围设备接收到对发送的设置数据包的ACK响应时，将产生SACK中断。SACK中断可用于确认设置事务成功完成。

29.3.3.13 标志中断

在主机控制器模式下，如果连续三次未从外围设备正确接收到已发送的设置数据包的ACK响应，则会产生SIGN中断。SIGN中断可用于检测未从外围设备发送ACK响应或发生ACK数据包损坏。

29.3.3.14 ATTCH interrupt

An ATTCH interrupt is generated when J-state or K-state of the full-speed signal level is detected on the USB port for 2.5 µs in host controller mode. Specifically, an ATTCH interrupt is detected on any of the following conditions:

- When K-state, SE0, or SE1 changes to J-state, and J-state continues at 2.5 µs
- When J-state, SE0, or SE1 changes to K-state, and K-state continues at 2.5 µs.

29.3.3.15 EOFERR interrupt

An EOFERR interrupt occurs when the USBFS detects that communication is not complete at the EOF2 timing defined in the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by software, and the port must be re-enumerated. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt is detected to 0
- Puts the port in which the EOFERR interrupt is generated into the idle state.

29.3.4 Pipe Control

Table 29.17 lists the pipe settings for the USBFS. USB data transfer is performed through logical pipes that software associates with endpoints. The USBFS has 10 pipes for data transfer. Set up the pipes based on your system specifications.

Table 29.17 Pipe settings (1 of 2)

Register name	Bit name	Setting	Remarks
DCPCFG PIPECFG	TYPE	Transfer type	Pipes 1 to 9: Can be set
	BFRE	BRDY interrupt mode	Pipes 1 to 5: Can be set
	DBLB	Double buffer select	Pipes 1 to 5: Can be set
	DIR	Transfer direction select	IN or OUT can be set
	EPNUM	Endpoint number	Pipes 1 to 9: Can be set Set a value other than 0000b when the pipe is used.
	SHTNAK	Disabled state select for pipe when transfer ends	Pipes 1 and 2: Can be set only for bulk transfers Pipes 3 to 5: Can be set
DCPMAXP PIPEMAXP	DEVSEL	Device select	Referenced only in host controller mode
	MXPS	Maximum packet size	Compliant with the USB 2.0 specification
PIPEPERI	IFIS	Buffer flush	Pipes 1 and 2: Can be set only for isochronous transfers Pipes 3 to 9: Setting disabled
	IITV	Interval counter	Pipes 1 and 2: Can be set only for isochronous transfers Pipes 3 to 5: Setting disabled Pipes 6 to 9: Can be set only in host controller mode

29.3.3.14 ATTCH interrupt

在主机控制器模式下，当在USB端口上检测到全速信号电平的J状态或K状态持续2.5µs时，将产生ATTCH中断。具体来说，在以下任何条件下都会检测到ATTCH中断：

- 当K-state、SE0或SE1变为J-state时，J-state持续2.5µs
- 当J状态、SE0或SE1变为K状态时，K状态持续2.5µs。

29.3.3.15 EOFERR interrupt

当USBFS检测到在USB2.0规范中定义的EOF2时序未完成通信时，将发生EOFERR中断。

在检测到中断时，所有为相关端口执行通信的管道必须由软件终止，并且必须重新枚举该端口。无论相关中断使能位中设置的值如何，USBFS硬件：

- 将检测到EOFERR中断的端口的DVSTCTR0.UACT位设置为0
- 将产生EOFERR中断的端口置于空闲状态。

29.3.4 管道控制

表29.17列出了USBFS的管道设置。USB数据传输是通过软件与端点关联的逻辑管道执行的。USBFS有10个用于数据传输的管道。根据您的系统规格设置管道。

Table 29.17 管道设置(1of2)

注册名称	位名称	Setting	Remarks
DCPCFG PIPECFG	TYPE	传输类型	管道1至9：可设置
	BFRE	BRDY中断模式	管道1至5：可设置
	DBLB	双缓冲选择	管道1至5：可设置
	DIR	传输方向选择	可设置IN或OUT
	EPNUM	端点编号	管道1至9：可设置 使用管道时，请设置0000b以外的值。
	SHTNAK	传输结束时管道的禁用状态选择	管道1和2：只能为批量传输设置 管道3至5：可设置
DCPMAXP PIPEMAXP	DEVSEL	设备选择	仅在主机控制器模式下引用
	MXPS	最大数据包大小	符合USB2.0规范
PIPEPERI	IFIS	缓冲区刷新	管道1和2：只能为同步传输设置 管道3到9：设置禁用
	IITV	间隔计数器	管道1和2：只能为同步传输设置 管道3到5：禁用设置 管道6到9：只能在主机控制器模式下设置

Table 29.17 Pipe settings (2 of 2)

Register name	Bit name	Setting	Remarks
DCPCTR PIPEnCTR	BSTS	Buffer status	For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit
	INBUFM	IN buffer monitor	Available only for pipes 1 to 5
	SUREQ	Setup request	Can only be set for the DCP and controlled in host controller mode
	SUREQCLR	SUREQ clear	Can only be set for the DCP and controlled in host controller mode
	ATREPM	Auto response mode	Pipes 1 to 5: Can only be set in device controller mode
	ACLRM	Auto buffer clear	Pipes 1 to 9: Can be set
	SQCLR	Sequence clear	Clears the data toggle bit
	SQSET	Sequence set	Sets the data toggle bit
	SQMON	Sequence monitor	Monitors the data toggle bit
	PBUSY	Pipe busy status	-
	PID	Response PID	See section 29.3.4.6, Response PID
PIPEnTRE	TRENB	Transaction counter enable	Pipes 1 to 5: Can be set
	TRCLR	Current transaction counter clear	Pipes 1 to 5: Can be set
PIPEnTRN	TRNCNT	Transaction counter	Pipes 1 to 5: Can be set

29.3.4.1 Pipe control register switching procedures

Do not change the following bits when USB communication is enabled (PID = BUF). These bits in the pipe control registers can be changed only when USB communication is prohibited (PID = NAK):

- Bits in DCPCFG and DCPMAXP
- SQCLR and SQSET bits in DCPCTR
- Bits in PIPECFG, PIPEMAXP, and PIPEPERI
- ATREPM, ACLRM, SQCLR, and SQSET bits in PIPEnCTR
- Bits in PIPEnTRE and PIPEnTRN.

To set these bits when USB communication is enabled (PID = BUF):

1. A request to change the bits in the pipe control register occurs.
2. Set the PID[1:0] bits associated with the pipe to NAK.
3. Wait until the associated PBUSY bit is set to 0.
4. Set the bits in the pipe control register.

Do not set the following bits when the CURPIPE[3:0] bits are set. These bits in the pipe control registers can only be changed when the selected pipe information is not set in the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL:

- Bits in DCPCFG and DCPMAXP
- Bits in PIPECFG, PIPEMAXP and PIPEPERI.

To change pipe information, you must set the CURPIPE[3:0] bits in the port select registers to a pipe other than the one to be changed. For the DCP, the buffer must be cleared using the BCLR bit in the port control register after the pipe information is changed.

29.3.4.2 Transfer types

The PIPECFG.TYPE[1:0] bits specify the following transfer types for each pipe:

- DCP — No setting is required (fixed at control transfer)
- Pipes 1 and 2 — Set to bulk or isochronous transfer

Table 29.17 管道设置(2of2)

注册名称	位名称	Setting	Remarks
DCPCTR PIPEnCTR	BSTS	缓冲状态	对于DCP，接收缓冲区状态和发送缓冲区状态通过ISEL位切换
	INBUFM	IN缓冲监视器	仅适用于管道1至5
	SUREQ	设置请求	只能为DCP设置并在主机控制器模式下控制
	SUREQCLR	SUREQ clear	只能为DCP设置并在主机控制器模式下控制
	ATREPM	自动响应模式	管道1到5：只能在设备控制器模式下设置
	ACLRM	自动缓冲区清除	管道1至9：可设置
	SQCLR	序列清晰	清除数据切换位
	SQSET	序列集	设置数据切换位
	SQMON	序列监视器	监控数据切换位
	PBUSY	管道繁忙状态	-
	PID	响应PID	请参阅第29.3.4.6节，响应PID
PIPEnTRE	TRENB	事务计数器启用	管道1至5：可设置
	TRCLR	当前交易柜台清零	管道1至5：可设置
PIPEnTRN	TRNCNT	交易柜台	管道1至5：可设置

29.3.4.1 管道控制寄存器切换程序

当启用USB通信(PID=BUF)时，请勿更改以下位。只有当USB通信被禁止(PID=NAK)时，才能更改管道控制寄存器中的这些位：

- DCPCFG和DCPMAXP中的位
- DCPCTR中的SQCLR和SQSET位
- PIPECFG、PIPEMAXP和PIPEPERI中的位
- PIPEnCTR中的ATREPM、ACLRM、SQCLR和SQSET位
- PIPEnTRE和PIPEnTRN中的位。

要在启用USB通信(PID=BUF)时设置这些位：

1. 发生更改管道控制寄存器中的位的请求。
2. 将与管道关联的PID[1:0]位设置为NAK。
3. 等到相关的PBUSY位设置为0。
4. 设置管道控制寄存器中的位。

设置CURPIPE[3:0]位时不要设置以下位。只有在CFIFOSEL、D0FIFOSEL和D1FIFOSEL的CURPIPE[3:0]位中未设置所选管道信息时，才能更改管道控制寄存器中的这些位：

- DCPCFG和DCPMAXP中的位
- PIPECFG、PIPEMAXP和PIPEPERI中的位。

要更改管道信息，您必须将端口选择寄存器中的CURPIPE[3:0]位设置为要更改的管道以外的管道。对于DCP，必须在管道信息更改后使用端口控制寄存器中的BCLR位清除缓冲区。

29.3.4.2 传输类型

PIPECFG.TYPE[1:0]位为每个管道指定以下传输类型：

- DCP—无需设置（在控制转移时固定）
- 管道1和2-设置为批量传输或同步传输

- Pipes 3 to 5 — Set to bulk transfer
- Pipes 6 to 9 — Set to interrupt transfer.

29.3.4.3 Endpoint number

The PIPECFG.EPNUM[3:0] bits set the endpoint number for each pipe. The DCP is fixed at endpoint 0. The other pipes can be set from endpoint 1 to 15.

- DCP — No setting is required (fixed at endpoint 0)
- Pipes 1 to 9 — Select and set the endpoint numbers from 1 to 15 so that the combination of the PIPECFG.DIR and EPNUM[3:0] bits is unique.

29.3.4.4 Maximum packet size setting

The DCPMAXP.MXPS[6:0] and PIPEMAXP.MXPS[8:0] bits specify the maximum packet size for each pipe. The DCP and pipes 1 to 5 can be set to any of the maximum pipe sizes defined in the USB 2.0 specification. For pipes 6 to 9, the maximum packet size is 64 bytes. Set the maximum packet size as follows before starting a transfer (PID = BUF):

- DCP — Set to 8, 16, 32, or 64
- Pipes 1 to 5 — Set to 8, 16, 32, or 64 for bulk transfers
- Pipes 1 and 2 — Set between 1 and 256 for isochronous transfers
- Pipes 6 to 9 — Set between 1 and 64.

29.3.4.5 Transaction counter for pipes 1 to 5 in the receiving direction

When the specified number of transactions is complete in the data packet receiving direction, the USBFS recognizes that the transfer ended. Two transaction counters are provided:

- The PIPEnTRN register that specifies the number of transactions to be executed
- The current counter that internally counts the number of executed transactions.

If the PIPECFG.SHTNAK bit is set to 1, when the current counter value matches the specified number of transactions, the associated PIPEnCTR.PID[1:0] bits are set to NAK and the subsequent transfer is disabled. The transactions can be counted again from the beginning by initializing the current counter of the transaction counter function through the PIPEnTRE.TRCLR bit. The data read from PIPEnTRN differs depending on the PIPEnTRE.TRENB setting as follows:

- TRENB bit = 0: Specified transaction counter value can be read
- TRENB bit = 1: Current counter value indicating the internally counted number of executed transactions can be read.

The following constraints apply when working with the TRCLR bit:

- If the transactions are counted and PID = BUF, the current counter cannot be cleared
- If there is any data left in the buffer, the current counter cannot be cleared.

29.3.4.6 Response PID

The PID[1:0] bits in DCPCTR and PIPEnCTR set the response PID for each pipe. This section describes the USBFS operation with different response PID settings.

(1) Software response PID settings in host controller mode

Select the response PID to specify the execution of transactions as follows:

- NAK setting — Using pipes is disabled and no transactions are executed
- BUF setting — Transactions are executed based on the FIFO buffer state:
  - OUT direction — An OUT token is issued if the FIFO buffer contains transmit data
  - IN direction — An IN token is issued if the FIFO buffer is not full and can receive data.
- STALL setting — Using pipes is disabled and no transactions are executed.

- 管道3到5—设置为批量传输
- 管道6到9—设置为中断传输。

29.3.4.3 端点编号

PIPECFG.EPNUM[3:0]位设置每个管道的端点号。DCP固定在端点0。其他管道可以设置从端点1到15。

- DCP—无需设置（固定在端点0）
- 管道1到9—选择并设置从1到15的端点编号，以便PIPECFG.DIR和EPNUM[3:0]位是唯一的。

29.3.4.4 最大数据包大小设置

DCPMAXP.MXPS[6:0]和PIPEMAXP.MXPS[8:0]位指定每个管道的最大数据包大小。DCP和管道1到5可以设置为USB2.0规范中定义的任何最大管道尺寸。对于管道6到9，最大数据包大小为64字节。在开始传输之前设置最大数据包大小如下（PID=BUF）：

- DCP—设置为8、16、32或64
- 管道1到5—设置为8、16、32或64以进行批量传输
- 管道1和2—设置在1和256之间，用于同步传输
- 管道6到9—设置在1到64之间。

29.3.4.5 接收方向上管道1到5的事务计数器

当在数据包接收方向完成指定数量的事务时，USBFS识别传输结束。提供了两个交易柜台：

- PIPEnTRN寄存器，指定要执行的事务数
- 内部计算已执行事务数的当前计数器。

如果PIPECFG.SHTNAK位设置为1，则当当前计数器值与指定的事务数匹配时，相关的PIPEnCTR.PID[1:0]位将设置为NAK，并禁用后续传输。通过PIPEnTRE.TRCLR位初始化事务计数器功能的当前计数器，事务可以从头开始重新计数。从PIPEnTRN读取的数据因PIPEnTRE.TRENB设置而异，如下所示：

- TRENB位=0：可以读取指定的事务计数器值
- TRENB位=1：可以读取指示内部计数的已执行事务数的当前计数器值。

使用TRCLR位时适用以下约束：

- 如果事务被计数并且PID=BUF，则当前计数器不能被清除
- 如果缓冲区中还有任何数据，则无法清除当前计数器。

29.3.4.6 响应PID

DCPCTR和PIPEnCTR中的PID[1:0]位设置每个管道的响应PID。本节介绍具有不同响应PID设置的USBFS操作。

(1) 主机控制器模式下的软件响应PID设置

选择响应PID来指定事务的执行，如下所示：

- NAK设置–禁用使用管道并且不执行任何事务
- BUF设置—事务根据FIFO缓冲区状态执行：
  - OUT方向—如果FIFO缓冲区包含传输数据，则发出OUT令牌
  - IN方向—如果FIFO缓冲区未满并且可以接收数据，则发出一个IN令牌。
- STALL设置—禁用使用管道并且不执行任何事务。

Note: Use the DCPCTR.SUREQ bit to execute setup transactions for the DCP.

(2) Software response PID settings in device controller mode

Select the response PID to respond to transactions from the host as follows:

- NAK setting — A NAK response is returned to all generated transactions
- BUF setting — A response is returned to transactions based on the FIFO buffer
- STALL setting — A STALL response is returned to all generated transactions.

Note: For setup transactions, an ACK response is always returned, regardless of the PID[1:0] setting, and the USB request is stored in the register.

Sections (3) and (4) describe situations in which the USBFS writes to the PID[1:0] bits because of specific transaction results.

(3) Hardware response PID settings in host controller mode

- NAK setting — PID = NAK is set in the following cases, and issuing of tokens is automatically stopped:
  - When a non-isochronous transfer is performed and an NRDY interrupt is generated.
    For details, see section 29.3.3.2, NRDY interrupt.
  - If a short packet is received when the PIPECFG.SHTNAK bit is set to 1 for bulk transfers
  - If transaction counting ends when the SHTNAK bit is set to 1 for bulk transfers.
- BUF setting — The USBFS does not write this setting.
- STALL setting — PID = STALL is set in the following cases, and issuing of tokens is automatically stopped:
  - When STALL is received in response to a transmitted token
  - When a received data packet exceeds the maximum packet size.

(4) Hardware response PID settings in device controller mode

- NAK setting — PID = NAK is set in the following cases, and a NAK response is returned to transactions:
  - When the setup token is received normally (DCP only)
  - If transaction counting ends or a short packet is received when the PIPECFG.SHTNAK bit is set to 1 for bulk transfers.
- BUF setting — There is no BUF writing by the USBFS.
- STALL setting — PID = STALL is set in the following cases, and a STALL response is returned to transactions:
  - When a received data packet exceeds the maximum packet size
  - When a control transfer sequence error is detected (DCP only).

29.3.4.7 Data PID sequence bit

The USBFS automatically toggles the sequence bit in the data PID when data is transferred successfully in the control transfer data stage, bulk transfer, and interrupt transfer. The sequence bit of the next data PID to be transmitted can be confirmed with the SQMON bit in DCPCTR and PIPEnCTR. When data is transmitted, the sequence bit toggles on ACK handshake reception. When data is received, the sequence bit toggles on ACK handshake transmission. The SQCLR and SQSET bits in the DCPCTR and PIPEnCTR registers can be used to change the data PID sequence bit.

In device controller mode when control transfers are used, the USBFS automatically sets the sequence bit for stage transitions. DATA1 is returned when the setup stage ends. The sequence bit is not referenced and PID = DATA1 is returned in the status stage. Therefore, no software settings are required. However, in host controller mode when control transfers are used, the sequence bit must be set by software for the stage transitions.

For ClearFeature requests for transmission or reception, software must set the data PID sequence bit in both host and device controller modes.

Note: 使用DCPCTR.SUREQ位执行DCP的设置事务。

(2) 设备控制器模式下的软件响应PID设置

选择响应PID以响应来自主机的事务，如下所示：

- NAK设置—向所有生成的事务返回NAK响应
- BUF设置—根据FIFO缓冲区向事务返回响应
- STALL设置—向所有生成的事务返回STALL响应。

Note: 对于设置事务，无论PID[1:0]设置如何，总是返回一个ACK 响应，并且USB请求存储在寄存器中。

第(3)和(4)节描述了USBFS由于特定事务结果而写入PID[1:0]位的情况。

(3) 主机控制器模式下的硬件响应PID设置

- NAK设置—PID=NAK在以下情况下设置，并自动停止发行令牌：
  - 当执行非同步传输并产生NRDY中断时。
    有关详细信息，请参阅第29.3.3.2节，NRDY中断。
  - 如果在PIPECFG.SHTNAK位设置为1以进行批量传输时接收到短数据包
  - 如果在SHTNAK位设置为1以进行批量传输时事务计数结束。
- BUF设置—USBFS不写入此设置。
- STALL设置—PID=STALL在以下情况下设置，并自动停止发行令牌：
  - 当接收到STALL以响应传输的令牌时
  - 当接收到的数据包超过最大包大小时。

(4) 设备控制器模式下的硬件响应PID设置

- NAK设置—PID=NAK在以下情况下设置，并向事务返回NAK响应：
  - 正常接收设置令牌时（仅DCP）
  - 如果在PIPECFG.SHTNAK位设置为1以进行批量传输时，事务计数结束或收到短数据包。

- BUF设置—USBFS没有写入BUF。
- STALL设置—在以下情况下设置PID=STALL，并向事务返回STALL响应：
  - 当接收到的数据包超过最大包大小时
  - 当检测到控制传输序列错误时（仅限DCP）。

29.3.4.7 数据PID序列位

当数据在控制传输数据阶段、批量传输和中断传输成功传输时，USBFS会自动切换数据PID中的序列位。下一个要发送的数据PID的序列位可以通过DCPCTR和PIPEnCTR中的SQMON位来确认。发送数据时，序列位在ACK握手接收时切换。当接收到数据时，序列位在ACK握手传输上切换。DCPCTR和PIPEnCTR寄存器中的SQCLR和SQSET位可用于更改数据PID序列位。

在使用控制传输的设备控制器模式下，USBFS自动设置阶段转换的序列位。DATA1在设置阶段结束时返回。不引用序列位，在状态阶段返回PID=DATA1。因此，不需要任何软件设置。但是，在使用控制传输的主机控制器模式下，必须由软件设置序列位以进行阶段转换。

对于发送或接收的ClearFeature请求，软件必须在主机和设备控制器模式下设置数据PID序列位。

29.3.4.8 Response PID = NAK function

The USBFS provides a function for disabling pipe operation (PID response = NAK) when the final data packet of a transaction is received. The USBFS automatically distinguishes this based on reception of a short packet or the transaction counter. Enable this function by setting the PIPECFG.SHTNAK bit to 1.

When the double buffer mode is being used for the FIFO buffer, using this function enables the reception of data packets in transfer units. If pipe operation is disabled, software must enable the pipe again (PID response = BUF).

The response PID = NAK function can be used only for bulk transfers.

29.3.4.9 Auto response mode

For bulk transfer pipes 1 to 5, when the PIPEnCTR.ATREPM bit is set to 1, a transition is made to auto response mode. During an OUT transfer (PIPECFG.DIR = 0), OUT-NAK mode is invoked, and during an IN transfer (DIR = 1), null auto response mode is invoked.

29.3.4.10 OUT-NAK mode

For bulk OUT transfer pipes, NAK is returned in response to an OUT token, and an NRDY interrupt is output when the PIPEnCTR.ATREPM bit is set to 1. To transition from normal mode to OUT-NAK mode, specify OUT-NAK mode while pipe operation is disabled (PID[1:0] = 00b for NAK response). Next, enable pipe operation (PID[1:0] = 01b for BUF response), on which OUT-NAK mode becomes valid. If an OUT token is received immediately before pipe operation is disabled, the token data is normally received, and an ACK is returned to the host.

To transition from OUT-NAK mode to normal mode, cancel OUT-NAK mode while pipe operation is disabled (NAK). Next, enable pipe operation (BUF). In normal mode, reception of OUT data is enabled.

29.3.4.11 Null auto response mode

For bulk IN transfer pipes, zero-length packets are continuously transmitted when the PIPEnCTR.ATREPM bit is set to 1.

To transition from normal mode to null auto response mode, specify null auto response mode while pipe operation is disabled (response PID = NAK). Next, enable pipe operation (response PID = BUF) on which null auto response mode becomes valid. Before setting null auto response mode, check that PIPEnCTR.INBUFM = 0, because the mode can only be set when the buffer is empty. If the INBUFM bit is 1, empty the buffer using the PIPEnCTR.ACLRM bit. Do not write data from the FIFO port while a transition to null auto response mode is made.

To transition from null auto response mode to normal mode, keep the pipe operation disabled (response PID = NAK) for the period of the zero-length packet transmission (about 10 µs) before canceling the null auto response mode. In normal mode, data can be written from the FIFO port, so packet transmission to the host is enabled by enabling pipe operation (response PID = BUF).

29.3.5 FIFO Buffer Memory

The USBFS provides a FIFO buffer for data transfers, and it manages the memory area used for each pipe. The FIFO buffer has two states depending on whether the access right is assigned to the system (CPU) or the USBFS (SIE).

(1) Buffer status

Table 29.18 and Table 29.19 show the buffer status in the USBFS. The FIFO buffer status can be confirmed using the DCPCTR.BSTS and PIPEnCTR.INBUFM bits. The transfer direction for the FIFO buffer can be specified in either the PIPECFG.DIR or CFIFOSEL.ISEL bit (when DCP is selected). The INBUFM bit is valid for pipes 0 to 5 in the transmitting direction.

When a transmitting pipe uses double buffering, software can read the BSTS bit to monitor the FIFO buffer status on the CPU and the INBUFM bit to monitor the FIFO buffer status on the SIE. When write access to the FIFO port by the CPU or DMA/DTC is slow and the buffer empty status cannot be determined using the BEMP interrupt, software can use the INBUFM bit to confirm the end of transmission.

29.3.4.8 响应PID=NAK功能

USBFS提供了在接收到事务的最终数据包时禁用管道操作（PID响应=NAK）的功能。USBFS根据收到的短数据包或事务计数器自动区分这一点。通过将PIPECFG.SHTNAK位设置为1来启用此功能。

当FIFO缓冲区使用双缓冲区模式时，使用此功能可以接收以传输为单位的数据包。如果管道操作被禁用，软件必须再次启用管道（PID响应=BUF）。

响应PID=NAK函数只能用于批量传输。

29.3.4.9 自动响应模式

对于批量传输管道1到5，当PIPEnCTR.ATREPM位设置为1时，将转换到自动响应模式。在OUT传输期间(PIPECFG.DIR=0)，将调用OUT-NAK模式，在IN传输期间(DIR=1)，将调用空自动响应模式。

29.3.4.10 OUT-NAK mode

对于批量OUT传输管道，NAK响应OUT令牌返回，并且当PIPEnCTR.ATREPM位设置为1时输出NRDY中断。要从正常模式转换到OUT-NAK模式，请指定OUT-NAK模式，同时管道操作被禁用（PID[1:0]=00b用于NAK响应）。接下来，启用管道操作（PID[1:0]=01b用于BUF响应），此时OUT-NAK模式变为有效。如果在禁用管道操作之前立即收到OUT令牌，则正常接收令牌数据，并向主机返回ACK。

要从OUT-NAK模式转换到正常模式，请在禁用管道操作(NAK)时取消OUT-NAK模式。
接下来，启用管道操作(BUF)。在正常模式下，可以接收OUT数据。

29.3.4.11 空自动响应模式

对于批量IN传输管道，当PIPEnCTR.ATREPM位设置为1时，将连续传输零长度数据包。

要从正常模式转换为空自动响应模式，请在禁用管道操作时指定空自动响应模式（响应PID=NAK）。接下来，启用无效自动响应模式变为有效的管道操作（响应PID=BUF）。在设置空自动响应模式之前，请检查PIPEnCTR.INBUFM=0，因为该模式只能在缓冲区为空时设置。如果INBUFM位为1，则使用PIPEnCTR.ACLRM位清空缓冲区。当转换到空自动响应模式时，不要从FIFO端口写入数据。

要从空值自动响应模式转换到正常模式，在取消空值自动响应模式之前，在零长度数据包传输期间（约10μs）保持管道操作禁用（响应PID=NAK）。在正常模式下，可以从FIFO端口写入数据，因此通过启用管道操作（响应PID=BUF）来启用到主机的数据包传输。

29.3.5 先进先出缓冲存储器

USBFS为数据传输提供FIFO缓冲区，并管理用于每个管道的内存区域。FIFO缓冲区有两种状态，具体取决于访问权限是分配给系统(CPU)还是USBFS(SIE)。

(1) 缓冲状态

表29.18和表29.19显示了USBFS中的缓冲区状态。FIFO缓冲区状态可以使用确认DCPCTR.BSTS和PIPEnCTR.INBUFM位。FIFO缓冲区的传输方向可以在任一pipecfg.dir或cfifoselisel位（选择DCP时）。INBUFM位对传输方向的管道0到5有效。

当传输管道使用双缓冲时，软件可以读取BSTS位来监视CPU上的FIFO缓冲区状态，以及读取INBUFM位来监视SIE上的FIFO缓冲区状态。当CPU或DMADTC对FIFO端口的写访问速度较慢且无法使用BEMP中断确定缓冲区空状态时，软件可以使用INBUFM位来确认传输结束。

Table 29.18 Buffer status indicated by BSTS bit

ISEL or DIR	BSTS	FIFO buffer status
0 (receiving direction)	0	There is no received data, or data is being received. Reading from the FIFO port is disabled.
0 (receiving direction)	1	There is received data, or a zero-length packet is received. Reading from the FIFO port is allowed. When a zero-length packet is received, reading is not possible and the buffer must be cleared.
1 (transmitting direction)	0	Transmission is not complete. Writing to the FIFO port is disabled.
1 (transmitting direction)	1	Transmission is complete. CPU write is allowed.

Table 29.19 Buffer status indicated by INBUFM bit

DIR	INBUFM	FIFO buffer status
0 (receiving direction)	Invalid	Invalid
1 (transmitting direction)	0	Transmission is complete. There is no data waiting to be transmitted.
1 (transmitting direction)	1	The FIFO port has written data to the buffer. There is data to be transmitted.

29.3.6 FIFO Buffer Clearing

Table 29.20 shows the methods for clearing the FIFO buffer. The FIFO buffer can be cleared using BCLR bit in the port control register, DnFIFOSEL.DCLRM, or the PIPEnCTR.ACLRM bit. Single or double buffering can be selected for pipes 1 to 5 in the PIPECFG.DBLB bit.

Table 29.20 Buffer clearing methods

FIFO buffer clearing mode	Clearing FIFO buffer on the CPU	Mode for automatically clearing the FIFO buffer after reading the specified pipe data	Auto buffer clear mode for discarding all received packets
Register used	CFIFOCTR DnFIFOCTR	DnFIFOSEL	PIPEnCTR
Bit used	BCLR	DCLRM	ACLRM
Clearing condition	Cleared by writing 1	1: Mode valid 0: Mode invalid	1: Mode valid 0: Mode invalid.

(1) Auto buffer clear mode function

The USBFS discards all received data packets if the PIPEnCTR.ACLRM bit is set to 1. If a correct data packet is received, the ACK response is returned to the host controller. The auto buffer clear mode function can only be set in the FIFO buffer reading direction.

Setting the ACLRM bit to 1 and then to 0 clears the FIFO buffer of the selected pipe regardless of the access direction. An access cycle of at least 100 ns is required for the internal hardware sequence processing between ACLRM = 1 and ACLRM = 0.

29.3.7 FIFO Port Functions

Table 29.21 shows the settings for the FIFO port functions of the USBFS. In write access, writing data until the maximum packet size is reached automatically enables transmission of the data. To enable transmission before the maximum packet size is reached, set the BVAL flag in the port control register to end writing. To send a zero-length packet, use the BCLR bit to clear the buffer, and then set the BVAL flag to end writing.

In reading, reception of new packets is automatically enabled when all data is read. Data cannot be read when a zero-length packet is received (DTLN[8:0] = 0), so use the BCLR bit to clear the buffer. The length of the receive data can be confirmed with the DTLN[8:0] bits in the port control register.

Table 29.18 由BSTS位指示的缓冲区状态

ISEL或DIR	BSTS	FIFO缓冲区状态
0 (receiving direction)	0	没有接收到数据，或正在接收数据。 禁止从FIFO端口读取。
0 (receiving direction)	1	有接收数据，或接收到零长度数据包。 允许从FIFO端口读取。 当接收到零长度数据包时，无法读取，必须清除缓冲区。
1 (transmitting direction)	0	传输未完成。 禁止写入FIFO端口。
1 (transmitting direction)	1	传输完成。 允许CPU写入。

Table 29.19 INBUFM位指示的缓冲区状态

DIR	INBUFM	FIFO缓冲区状态
0 (receiving direction)	Invalid	Invalid
1 (transmitting direction)	0	传输完成。 没有等待传输的数据。
1 (transmitting direction)	1	FIFO端口已将数据写入缓冲区。 有数据要传输。

29.3.6 FIFO缓冲区清除

表29.20显示了清除FIFO缓冲区的方法。可以使用端口控制寄存器中的BCLR位、DnFIFOSEL.DCLRM或PIPEnCTR.ACLRM位清除FIFO缓冲区。可以在PIPECFG.DBLB位中为管道1到5选择单缓冲或双缓冲。

Table 29.20 缓冲区清除方法

FIFO缓冲区清除模式	清除FIFO缓冲区CPU	读取指定管道数据后自动清除FIFO缓冲区的模式	自动缓冲区清除模式，用于丢弃所有接收到的数据包
注册使用	CFIFOCTR DnFIFOCTR	DnFIFOSEL	PIPEnCTR
使用的位	BCLR	DCLRM	ACLRM
清算条件	通过写1清除	1：模式有效0 ：模式无效	1：模式有效0 ：模式无效。

(1) 自动缓冲清除模式功能

如果PIPEnCTR.ACLRM位设置为1，USBFS将丢弃所有接收到的数据包。如果接收到正确的数据包，则向主机控制器返回ACK响应。自动缓冲区清除模式功能只能在FIFO缓冲区读取方向设置。

无论访问方向如何，将ACLRM位设置为1，然后设置为0都会清除所选管道的FIFO缓冲区。ACLRM=1和之间的内部硬件序列处理需要至少100ns的访问周期
ACLRM = 0.

29.3.7 FIFO端口功能

表29.21显示了USBFS的FIFO端口功能的设置。在写访问中，在达到最大数据包大小之前写入数据会自动启用数据传输。要在达到最大数据包大小之前启用传输，请设置端口控制寄存器中的BVAL标志以结束写入。要发送零长度数据包，请使用BCLR位清除缓冲区，然后设置BVAL标志以结束写入。

在读取中，当所有数据被读取时，自动启用新数据包的接收。接收到零长度数据包时（DTLN[8:0]=0）无法读取数据，因此使用BCLR位清除缓冲区。接收数据的长度可以通过端口控制寄存器中的DTLN[8:0]位来确认。

Table 29.21 FIFO port function settings

Register name	Bit name	Description
CFIFOSEL, DnFIFOSEL (n = 0, 1)	RCNT	Selects DTLN[8:0] read mode
	REW	FIFO buffer rewind (re-read, rewrite)
	DCLRM	Automatically clears receive data for a specified pipe after the data is read (only for DnFIFO)
	DREQE	Enables DMA/DTC transfers (only for DnFIFO)
	MBW	FIFO port access bit width
	BIGEND	Selects FIFO port endian
	ISEL	FIFO port access direction (only for DCP)
	CURPIPE	Selects the current pipe
CFIFOCTR, DnFIFOCTR (n = 0, 1)	BVAL	Ends writing to the FIFO buffer
	BCLR	Clears the FIFO buffer on the CPU
	DTLN	Checks the length of receive data

(1) FIFO port selection

Table 29.22 shows the pipes that can be selected with the different FIFO ports. The pipe to be accessed must be selected with the CURPIPE[3:0] bits in the port select register. After the pipe is selected, software must check whether the written value can be read correctly from the CURPIPE[3:0] bits. If the previous pipe number is read, it indicates that the USBFS is modifying the pipe. Next, software checks that the FRDY bit in the port control register is 1.

In addition, software must specify the bus width to be accessed using the MBW bit in the port select register. The FIFO buffer access direction conforms to the PIPECFG.DIR setting. Only for the DCP that the ISEL bit in the port select register determines the direction.

Table 29.22 FIFO port access by pipe

Pipe	Access method	Ports that can be used
DCP	CPU access	CFIFO port register
Pipes 1 to 9	CPU access	• CFIFO port register • D0FIFO/D1FIFO port register.
	DMA/DTC access	D0FIFO/D1FIFO port register

(2) REW bit

It is possible to temporarily stop access to the pipe currently being accessed, access a different pipe, and then continue processing for the first pipe again. The REW bit in the port select register is used for this processing.

If a pipe is selected in the CURPIPE[3:0] bits in the port select register with the REW bit set to 1, the pointer used for reading from and writing to the FIFO buffer is reset, and reading or writing can be carried out from the first byte. If a pipe is selected with 0 set for the REW bit, data can be read and written in continuation from the previous selection, without the pointer being reset. To access the FIFO port, software must check that the FRDY bit in the port control register is 1 after selecting a pipe.

29.3.8 DMA Transfers (D0FIFO and D1FIFO Ports)

(1) Overview of DMA transfers

For pipes 1 to 9, the FIFO port can be accessed using the DMAC. When buffer access for a pipe targeted for DMA transfer is enabled, a DMA transfer request is issued.

Select the unit of transfer to the FIFO port in the DnFIFOSEL.MBW bit, and select the pipe targeted for the DMA transfer in the DnFIFOSEL.CURPIPE[3:0] bits. Do not change the selected pipe during the DMA transfer.

(2) DnFIFO auto clear mode (D0FIFO and D1FIFO port reading direction)

If 1 is set in the DnFIFOSEL.DCLRM bit, the USBFS automatically clears the FIFO buffer of the selected pipe when reading of data from the FIFO buffer is complete.

Table 29.21 FIFO端口功能设置

注册名称	位名称	Description
CFIFOSEL, DnFIFOSEL (n = 0, 1)	RCNT	选择DTLN[8:0]读取模式
	REW	FIFO缓冲区倒带（重新读取、重写）
	DCLRM	读取数据后自动清除指定管道的接收数据（仅适用于DnFIFO）
	DREQE	启用DMADTC传输（仅适用于DnFIFO）
	MBW	FIFO端口访问位宽
	BIGEND	选择FIFO端口字节序
	ISEL	FIFO端口访问方向（仅适用于DCP）
	CURPIPE	选择当前管道
CFIFOCTR, DnFIFOCTR (n = 0, 1)	BVAL	结束写入FIFO缓冲区
	BCLR	清除CPU上的FIFO缓冲区
	DTLN	检查接收数据的长度

(1) 先进先出端口选择

表29.22显示了可以使用不同FIFO端口选择的管道。必须使用端口选择寄存器中的CURPIPE[3:0]位来选择要访问的管道。选择管道后，软件必须检查是否可以从CURPIPE[3:0]位正确读取写入的值。如果读取到之前的管道号，说明USBFS正在修改管道。接下来，软件检查端口控制寄存器中的FRDY位是否为1。

此外，软件必须使用端口选择寄存器中的MBW位指定要访问的总线宽度。FIFO缓冲区访问方向符合PIPECFG.DIR设置。只有端口选择寄存器中的ISEL位决定方向的DCP。

Table 29.22 通过管道访问FIFO端口

Pipe	访问方法	可以使用的端口
DCP	CPU访问	CFIFO端口寄存器
管道1至9	CPU访问	CFIFO端口寄存器 D0FIFOD1FIFO端口寄存器。
	DMA/DTC access	D0FIFOD1FIFO端口寄存器

(2) REW位

可以暂时停止对当前正在访问的管道的访问，访问不同的管道，然后再次继续处理第一个管道。端口选择寄存器中的REW位用于此处理。

如果在端口选择寄存器的CURPIPE[3:0]位中选择了一个管道，并且REW位设置为1，则用于读取和写入FIFO缓冲区的指针复位，可以进行读取或写入从第一个字节开始。如果在REW位设置为0的情况下选择管道，则可以从先前的选择继续读取和写入数据，而无需重置指针。要访问FIFO端口，软件必须在选择管道后检查端口控制寄存器中的FRDY位是否为1。

29.3.8 DMA传输（D0FIFO和D1FIFO端口）

(1) DMA传输概述

对于管道1到9，可以使用DMAC访问FIFO端口。当启用以DMA传输为目标的管道的缓冲区访问时，将发出DMA传输请求。

在DnFIFOSEL.MBW位中选择传输到FIFO端口的单位，并在DnFIFOSEL.CURPIPE[3:0]位中选择DMA传输的目标管道。在DMA传输期间不要更改选定的管道。

(2) DnFIFO自动清除模式（D0FIFO和D1FIFO端口读取方向）

如果DnFIFOSEL.DCLRM位设置为1，USBFS会在从FIFO缓冲区读取数据完成时自动清除所选管道的FIFO缓冲区。

Table 29.23 shows the packet reception and FIFO buffer clearing processing by software for each of the settings. As shown in the table, the buffer clearing conditions depend on the value set in the PIPECFG.BFRE bit. Using the DnFIFOSEL.DCLRM bit eliminates the need for the buffer to be cleared by software in any situation that requires buffer clearing. This enables the DMA transfers without involving software.

The DnFIFO auto clear mode can only be set in the FIFO buffer reading direction.

Table 29.23 Packet reception and FIFO buffer clearing processing by software

Buffer status when packet is received	Register setting			
	DCLRM = 0		DCLRM = 1	
	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	No clearing required	No clearing required	No clearing required	No clearing required
Zero-length packet reception	Clearing required	Clearing required	No clearing required	No clearing required
Normal short packet reception	No clearing required	Clearing required	No clearing required	No clearing required
Transaction count end	No clearing required	Clearing required	No clearing required	No clearing required

29.3.9 Control Transfers Using the DCP

The Default Control Pipe (DCP) is used for data transfers in the control transfer data stage. The FIFO buffer of the DCP is a 64-byte single buffer with a fixed area for both control reads and control writes. The FIFO buffer can only be accessed through the CFIFO port.

29.3.9.1 Control transfers in host controller mode

(1) Setup stage

The USQREQ, USBVAL, USBINDX, and USBLENG registers are used to transmit USB requests for setup transactions. Writing the setup packet data to the registers and then writing 1 to the DCPCTR.SUREQ bit transmits the specified data for the setup transaction. On completion of the transaction, the SUREQ bit clears to 0. Do not change these USB request registers while SUREQ = 1.

When an attached function device is detected, software must issue the first setup transaction for the device using this sequence with the DCPMAXP.DEVSEL[3:0] bits set to 0 and the DEVADD0.USBSPD[1:0] bits set appropriately.

When an attached function device is shifted to the Address state, software must issue setup transactions using this sequence with the assigned USB address set in the DEVSEL[3:0] bits, and the bits in DEVADDn associated with the specified USB address set appropriately. For example, when PIPEMAXP.DEVSEL[3:0] = 0010b, select the appropriate settings in DEVADD2. When PIPEMAXP.DEVSEL[3:0] = 0101b, select the appropriate settings in DEVADD5.

When the setup transaction data is sent, an interrupt request is generated based on the response from the peripheral device (SIGN or SACK bit in INTSTS1). This interrupt request allows software to check the setup transaction result.

A DATA0 data packet (USB request) for the setup transaction is always transmitted regardless of the status of the DCPCTR.SQMON bit.

(2) Data stage

The data stage is used to transfer data using the DCP FIFO buffer.

Before accessing the DCP FIFO buffer, specify the access direction in the CFIFOSEL.ISEL bit. Specify the transfer direction in the DCPCFG.DIR bit.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Set data PID = DATA1 in the DCPCTR.SQSET bit and set the PID bits = BUF. Completion of data transfer is detected using the BRDY or BEMP interrupt.

For control write transfers, when the number of data bytes to be sent is an integer multiple of the maximum packet size, software must send a zero-length packet at the end.

表29.23显示了软件对每个设置的数据包接收和FIFO缓冲区清除处理。如表所示，缓冲区清除条件取决于PIPECFG.BFRE位中设置的值。使用DnFIFOSEL.DCLRM位无需在任何需要清除缓冲区的情况下通过软件清除缓冲区。这样就可以在不涉及软件的情况下进行DMA传输。

DnFIFO自动清除模式只能设置在FIFO缓冲区读取方向。

Table 29.23 通过软件进行数据包接收和FIFO缓冲区清除处理

收到数据包时的缓冲区状态	注册设置			
	DCLRM = 0		DCLRM = 1	
	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
缓冲区已满	无需清算	无需清算	无需清算	无需清算
零长度数据包接收	需要清算	需要清算	无需清算	无需清算
正常短包接收	无需清算	需要清算	无需清算	无需清算
交易计数结束	无需清算	需要清算	无需清算	无需清算

29.3.9 使用DCP进行控制传输

默认控制管道(DCP)用于控制传输数据阶段的数据传输。DCP的FIFO缓冲区是一个64字节的单缓冲区，具有用于控制读取和控制写入的固定区域。FIFO缓冲区只能通过CFIFO端口访问。

29.3.9.1 主机控制器模式下的控制传输

(1) 设置阶段

USQREQ、USBVAL、USBINDX和USBLENG寄存器用于传输设置事务的USB请求。将设置数据包数据写入寄存器，然后向DCPCTR.SUREQ位写入1，以传输设置事务的指定数据。事务完成后，SUREQ位清除为0。在SUREQ=1时不要更改这些USB请求寄存器。

当检测到连接的功能设备时，软件必须使用此序列为设备发出第一个设置事务，并将DCPMAXP.DEVSEL[3:0]位设置为0，并适当设置DEVADD0.USBSPD[1:0]位。

当连接的功能器件转换到地址状态时，软件必须使用该序列发出设置事务，并在DEVSEL[3:0]位中设置分配的USB地址，并适当设置与指定USB地址相关的DEVADDn中的位。例如，当PIPEMAXP.DEVSEL[3:0]=0010b时，在DEVADD2中选择适当的设置。当PIPEMAXP.DEVSEL[3:0]=0101b时，在DEVADD5中选择适当的设置。

发送设置事务数据时，根据外围设备的响应（INTSTS1中的SIGN或SACK位）生成中断请求。该中断请求允许软件检查设置事务结果。

一个DATA0数据包（USB请求）用于设置事务总是被传输，无论状态如何
DCPCTR.SQMON bit.

(2) 数据阶段

数据级用于使用DCPFIFO缓冲区传输数据。

在访问DCPFIFO缓冲区之前，请在CFIFOSEL.ISEL位中指定访问方向。在DCPCFG.DIR位中指定传输方向。

对于数据阶段的第一个数据包，数据PID必须作为DATA1传输。在DCPCTR.SQSET位中设置数据PID=DATA1，并设置PID位=BUF。使用BRDY或BEMP中断检测数据传输的完成。

对于控制写传输，当要发送的数据字节数是最大数据包大小的整数倍时，软件必须在最后发送一个长度为零的数据包。

(3) Status stage

The status stage is used for zero-length packet data transfers in the reverse direction of the data stage. As in the data stage, data is transfered using the DCP FIFO buffer. Transactions are executed using the same procedure as the data stage.

Data packets in the status stage must be transmitted and received with the data PID set to DATA1 using the DCPCTR.SQSET bit.

When a zero-length packet is received, check the receive-data length in the CFIFOCTR.DTLN[8:0] bits after a BRDY interrupt is generated, and then clear the FIFO buffer using the BCLR bit.

29.3.9.2 Control transfers in device controller mode

(1) Setup stage

The USBFS sends an ACK response to a normal setup packet for the USBFS. The USBFS operates in the setup stage as follows:

On receiving a new setup packet, the USBFS sets the following bits:

- INTSTS0.VALID bit to 1
- DCPCTR.PID[1:0] bits to NAK
- DCPCTR.CCPL bit to 0.

When the USBFS receives a data packet following a setup packet, it stores the USB request parameters in USBREQ, USBVAL, USBINDX, and USBLENG.

Before performing the response processing for a control transfer, set the VALID bit to 0. When the VALID bit = 1, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the VALID bit function, the USBFS can suspend the current processing request when receiving a new USB request during a control transfer and return a response to the latest request.

In addition, the USBFS automatically detects the direction bit (bmRequestType bit [8]) and the request data length (wLength) in the received USB request. The USBFS distinguishes between control read transfers, control write transfers, and no-data control transfers, and it controls stage transitions. For an incorrect sequence, a sequence error occurs in the control transfer stage transition interrupt, and the interrupt is reported to software. For a diagram of the stage control by the USBFS, see Figure 29.15.

(2) Data stage

The DCP must be used to execute data transfers for received USB requests. Before accessing the DCP FIFO buffer, specify the access direction with the CFIFOSEL.ISEL bit. If the transfer data is larger than the size of the DCP FIFO buffer, execute the data transfer using the BRDY interrupt for control write transfers and the BEMP interrupt for control read transfers.

(3) Status stage

Control transfers are terminated by setting the DCPCTR.CCPL bit to 1 while the DCPCTR.PID[1:0] bits are set to BUF.

After this setting is made, the USBFS automatically executes the status stage based on the data transfer direction determined at the setup stage. The procedure is as follows:

- For control read transfers
  The USBFS receives a zero-length packet from the USB host and transmits an ACK response.
- For control write transfers and no-data control transfers
  The USBFS transmits a zero-length packet and receives an ACK response from the USB host.

(4) Control transfer auto response function

The USBFS automatically responds to a correct SET_ADDRESS request. If any of the following errors occurs in the SET_ADDRESS request, a response from software is required:

- bmRequestType is not 00h — Any transfer other than a control write transfer

(3) 状态阶段

状态阶段用于在数据阶段的相反方向上进行零长度分组数据传输。与数据阶段一样，使用DCPFIFO缓冲区传输数据。事务使用与数据阶段相同的过程执行。

状态阶段的数据包必须在数据PID设置为DATA1的情况下使用
DCPCTR.SQSET bit.

当接收到零长度数据包时，在产生BRDY中断后检查CFIFOCTR.DTLN[8:0]位中的接收数据长度，然后使用BCLR位清除FIFO缓冲区。

29.3.9.2 设备控制器模式下的控制传输

(1) 设置阶段

USBFS向USBFS的正常设置数据包发送ACK响应。USBFS在设置阶段运行如下：

在接收到新的设置数据包时，USBFS设置以下位：

- INTSTS0.VALID位为1
- DCPCTR.PID[1:0]位到NAK
- DCPCTR.CCPL位为0。

当USBFS在setup数据包之后接收到数据包时，它会将USB请求参数存储在USBREQ中，
USBVAL, USBINDX, and USBLENG.

在执行控制传输的响应处理之前，请将VALID位设置为0。当VALID位=1时，PID=
BUF不能设置，数据阶段不能终止。

使用VALID位功能，USBFS可以在控制传输期间接收到新的USB请求时暂停当前的处理请求，并返回对最新请求的响应。

此外，USBFS会自动检测接收到的USB请求中的方向位（bmRequestTypebit[8]）和请求数据长度（wLength）。USBFS区分控制读取传输、控制写入传输和无数据控制传输，并控制阶段转换。对于不正确的序列，在控制转移阶段转换中断中发生序列错误，并将中断报告给软件。USBFS的阶段控制图见图29.15。

(2) 数据阶段

DCP必须用于执行接收到的USB请求的数据传输。在访问DCPFIFO缓冲区之前，使用CFIFOSELISEL位指定访问方向。如果传输数据大于DCPFIFO缓冲区的大小，则使用控制写传输的BRDY中断和控制读传输的BEMP中断执行数据传输。

(3) 状态阶段

通过将DCPCTR.CCPL位设置为1而将DCPCTR.PID[1:0]位设置为BUF来终止控制传输。

完成此设置后，USBFS根据设置阶段确定的数据传输方向自动执行状态阶段。程序如下：

- 对于控制读取传输
  USBFS从USB主机接收零长度数据包并发送ACK响应。
- 用于控制写传输和无数据控制传输
  USBFS发送一个长度为零的数据包并接收来自USB主机的ACK响应。

(4) 控制转移自动响应功能

USBFS自动响应正确的SET_ADDRESS请求。如果出现以下任何错误
SET_ADDRESS请求，需要软件的响应：

- bmRequestType不是00h—除控制写入传输之外的任何传输

- wIndex is not 00h — Request error
- wLength is not 00h — Any transfer other than a no-data control transfer
- wValue is larger than 7Fh — Request error
- INTSTS0.DVSQ[2:0] are 011b (configured state) — Control transfer of a device state error.

For all requests other than the SET_ADDRESS request, a response is required from the associated software.

29.3.10 Bulk Transfers (Pipes 1 to 5)

The FIFO buffer usage (single or double buffer setting) can be selected for bulk transfers. The USBFS provides the following functions for bulk transfers:

- BRDY interrupt function (PIPECFG.BFRE bit), see section 29.3.3.1, (2) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 1
- Transaction count function (PIPEnTRE.TRENB, TRCLR, and PIPEnTRN.TRNCNT[15:0] bits), see section 29.3.4.5, Transaction counter for pipes 1 to 5 in the receiving direction
- Response PID = NAK function (PIPECFG.SHTNAK bit), see section 29.3.4.8, Response PID = NAK function
- Auto response mode (PIPEnCTR.ATREPM bit), see section 29.3.4.9, Auto response mode.

29.3.11 Interrupt Transfers (Pipes 6 to 9)

In device controller mode, the USBFS performs interrupt transfers based on the timing dictated by the host controller. In host controller mode, software can set the timing for issuing tokens using the interval counter.

29.3.11.1 Interval counter for interrupt transfers in host controller mode

Specify the transaction interval for interrupt transfers in the PIPEPERI.IITV[2:0] bits. The USBFS issues interrupt transfer tokens based on this interval.

(1) Counter initialization

The USBFS initializes the interval counter under the following conditions:

- Power-on reset
  This initializes the IITV[2:0] bits.
- FIFO buffer initialization using the PIPEnCTR.ACLRM bit:
  This does not initialize the IITV[2:0] bits, but does initialize the count value. Setting the PIPEnCTR.ACLRM bit to 0 starts counting from the value set in IITV[2:0].

The interval counter is not initialized in the following case:

- USB bus reset or USB suspended
  The IITV[2:0] bits are not initialized. Setting 1 to the DVSTCTR0.UACT bit starts counting from the value saved before entering the USB bus reset state or USB suspended state.

(2) Operation when tokens cannot be transmitted or received even on token generation

No token is generated in the following cases even at token generation time. In these cases, the USBFS tries to execute the transaction in the next interval:

- When the PID is set to NAK or STALL
- When the FIFO buffer is full at token transmit time in the receiving (IN) direction
- When there is no data to be transmitted in the FIFO buffer at token transmit time in the transmitting (OUT) direction.

29.3.12 Isochronous Transfers (Pipes 1 and 2)

The USBFS provides the following functions for isochronous transfers:

- Notification of isochronous transfer error

- wIndex不是00h—请求错误
- wLength不是00h—除无数据控制传输之外的任何传输
- wValue大于7Fh—请求错误
- INTSTS0.DVSQ[2:0]是011b（配置状态）—设备状态错误的控制传输。

对于除SET_ADDRESS请求之外的所有请求，都需要相关软件的响应。

29.3.10 批量传输（管道1到5）

可以为批量传输选择FIFO缓冲区使用（单缓冲区或双缓冲区设置）。USBFS为批量传输提供以下功能：

- BRDY中断功能（PIPECFG.BFRE位），见第29.3.3.1节，(2)当SOFCFG.BRDYM=0且PIPECFG.BFRE = 1
- 事务计数函数（PIPEnTRE.TRENB、TRCLR和PIPEnTRN.TRNCNT[15:0]位），请参见第29.3.4.5节，接收方向上管道1到5的事务计数器
- 响应PID=NAK功能（PIPECFG.SHTNAK位），请参见第29.3.4.8节，响应PID=NAK功能
- 自动响应模式（PIPEnCTR.ATREPM位），请参见第29.3.4.9节，自动响应模式。

29.3.11 中断传输（管道6到9）

在设备控制器模式下，USBFS根据主机控制器规定的时序执行中断传输。在主机控制器模式下，软件可以使用间隔计数器设置发布令牌的时间。

29.3.11.1 主机控制器模式下中断传输的间隔计数器

在PIPEPERI.IITV[2:0]位中指定中断传输的事务间隔。USBFS基于此间隔发出中断传输令牌。

(1) 计数器初始化

USBFS在以下条件下初始化间隔计数器：

- Power-on reset
  这将初始化IITV[2:0]位。
- 使用PIPEnCTR.ACLRM位初始化FIFO缓冲区：
  这不会初始化IITV[2:0]位，但会初始化计数值。将PIPEnCTR.ACLRM位设置为0从IITV[2:0]中设置的值开始计数。

在以下情况下不初始化间隔计数器：

- USB总线复位或USB挂起
  IITV[2:0]位未初始化。将DVSTCTR0.UACT位置1从进入USB总线复位状态或USB挂起状态之前保存的值开始计数。

(2) 即使在生成令牌时也无法发送或接收令牌时的操作

在以下情况下，即使在生成令牌时也不会生成令牌。在这些情况下，USBFS尝试在下一个时间间隔执行事务：

- 当PID设置为NAK或STALL时
- 当FIFO缓冲区在接收(IN)方向的令牌传输时间已满时
- 在发送(OUT)方向的令牌发送时间，当FIFO缓冲区中没有要发送的数据时。

29.3.12 同步传输（管道1和2）

USBFS为同步传输提供以下功能：

- 同步传输错误通知

- Interval counter specified in the PIPEPERI.IITV[2:0] bits
- Isochronous IN transfer data setup control (IDLY function)
- Isochronous IN transfer buffer flush function specified in the PIPEPERI.IFIS bit.

29.3.12.1 Error detection in isochronous transfers

The USBFS provides a function for detecting the errors described in this section, so that when errors occur in isochronous transfers, they can be controlled by software. Table 29.24 and Table 29.25 show the priority order for errors detected by the USBFS and the associated interrupts.

(a) PID errors

- The PID value of the received packet is invalid.

(b) CRC errors and bit stuffing errors

- A CRC error is found in a received packet or the bit stuffing is invalid.

(c) Maximum packet size exceeded

- The data size of the received packet exceeds the specified maximum packet size.

(d) Overrun and underrun errors

In host controller mode:

- The FIFO buffer is full at token transmit time in the IN (receiving) direction
- There is no data to be sent in the FIFO buffer at token transmit time in the OUT (transmitting) direction.

In device controller mode:

- There is no data to be sent in the FIFO buffer at token receive time in the IN (transmitting) direction
- The FIFO buffer is full at token receive time in the OUT (receiving) direction.

(e) Interval errors

In device controller mode, the following cases are treated as an interval error:

- Failure to receive an IN token in the interval frame during an isochronous IN transfer
- Failure to receive an OUT token in the interval frame during an isochronous OUT transfer.

Table 29.24 Error detection for token transmission and reception

Detection priority	Error	Generated interrupt and status
1	PID error	No interrupts are generated in either host or device controller mode (ignored as a corrupted packet)
2	CRC or bit stuffing error	No interrupts are generated in either host or device controller mode (ignored as a corrupted packet)
3	Overrun or underrun error	An NRDY interrupt is generated to set the FRMNUM.OVRN bit to 1 in both host and device controller modes. In device controller mode, a zero-length packet is transmitted in response to an IN token. No data packets are received in response to OUT token.
4	Interval error	An NRDY interrupt is generated in device controller mode. No interrupt is generated in host controller mode.

Table 29.25 Error detection for data packet reception (1 of 2)

Detection priority	Error	Generated interrupt and status
1	PID error	No interrupts are generated (ignored as a corrupted packet)

- 在PIPEPERI.IITV[2:0]位中指定的间隔计数器
- 同步IN传输数据设置控制（IDLY功能）
- 在PIPEPERI.IFIS位中指定的同步IN传输缓冲区刷新功能。

29.3.12.1 同步传输中的错误检测

USBFS提供了检测本节所述的错误的功能，以便在同步传输中发生错误时，可以通过软件进行控制。表29.24和表29.25显示了USBFS检测到的错误和相关中断的优先级顺序。

(a) PID错误

- 接收到的数据包的PID值无效。

(b) CRC错误和位填充错误

- 在收到的数据包中发现CRC错误或位填充无效。

(c) 超出最大数据包大小

- 接收到的数据包的数据大小超过了指定的最大数据包大小。

(d) 溢出和欠载错误

在主机控制器模式下：

- FIFO缓冲区在IN（接收）方向的令牌发送时间已满
- 在OUT（发送）方向的令牌发送时，FIFO缓冲区中没有要发送的数据。

在设备控制器模式下：

- 在IN（发送）方向的令牌接收时间，FIFO缓冲区中没有要发送的数据
- FIFO缓冲区在OUT（接收）方向上的令牌接收时间已满。

(e) 间隔错误

在设备控制器模式下，以下情况被视为间隔错误：

- 在同步IN传输期间未能在间隔帧中接收IN令牌
- 在同步OUT传输期间未能在间隔帧中接收OUT令牌。

Table 29.24 令牌发送和接收的错误检测

检测优先级	Error	产生的中断和状态
1	PID错误	在主机或设备控制器模式下都不会产生中断（被忽略为损坏的数据包）
2	CRC或位填充错误	在主机或设备控制器模式下都不会产生中断（被忽略为损坏的数据包）
3	溢出或欠载错误	在主机和设备控制器模式下，都会产生一个NRDY中断来将FRMNUM.OVRN位设置为1。在设备控制器模式下，发送一个零长度数据包以响应IN令牌。没有接收到响应OUT令牌的数据包。
4	间隔误差	在设备控制器模式下会产生一个NRDY中断。在主机控制器模式下不产生中断。

Table 29.25 数据包接收错误检测(1of2)

检测优先级	Error	产生的中断和状态
1	PID错误	不产生中断（作为损坏的数据包被忽略）

Table 29.25 Error detection for data packet reception (2 of 2)

Detection priority	Error	Generated interrupt and status
2	CRC or bit stuffing error	An NRDY interrupt is generated and the FRMNUM.CRCE bit is set to 1 in both host and device controller modes
3	Maximum packet size exceeded error	A BEMP interrupt is generated and the PID[1:0] bits are set to STALL in both host and device controller modes

29.3.12.2 DATA-PID

In device controller mode, the USBFS responds to a received PID as follows:

(1) IN direction

- DATA0 — Transmitted as data packet PID
- DATA1 — Not transmitted
- DATA2 — Not transmitted
- mDATA — Not transmitted.

(2) OUT direction

- DATA0 — Received normally as data packet PID
- DATA1 — Received normally as data packet PID
- DATA2 — Packets ignored
- mDATA — Packets ignored.

29.3.12.3 Interval counter

The isochronous transfer interval can be set in the PIPEPERI.IITV[2:0] bits. In device controller mode, the interval counter enables the functions as shown in Table 29.26. In host controller mode, the USBFS generates the token issuance timing, and the interval counter operation is the same as that for interrupt transfers.

Table 29.26 Interval counter functions in device controller mode

Transfer direction	Function	Conditions for detection
IN	Transmit buffer flush	Failure to receive an IN token successfully in the interval frame during an isochronous IN transfer
OUT	Notification of no reception of token	Failure to receive an OUT token successfully in the interval frame during an isochronous OUT transfer

The interval count is performed when an SOF is received or for interpolated SOFs, so the isochronism can be maintained even if an SOF is corrupt. The frame interval can be set to 2^{IITV} frames.

(1) Counter initialization in device controller mode

The USBFS initializes the interval counter under the following conditions:

- Power-on reset
  This initializes the PIPEPERI.IITV[2:0] bits.
- FIFO buffer initialization using the ACLRM bit
  This does not initialize the IITV[2:0] bits, but does initialize the count value.

After the interval counter is initialized, the interval count starts under one of the following conditions when a packet is transferred successfully:

- An SOF is received after data is transmitted in response to an IN token when PID = BUF
- An SOF is received after data is received in response to an OUT token when PID = BUF.

Table 29.25 数据包接收错误检测(2of2)

检测优先级	Error	产生的中断和状态
2	CRC或位填充错误	在主机和设备控制器模式下都会产生一个NRDY中断并且FRMNUM.CRCE位设置为1
3	超出最大数据包大小错误	在主机和设备控制器模式下都会产生BEMP中断并且PID[1:0]位设置为STALL

29.3.12.2 DATA-PID

在设备控制器模式下，USBFS响应接收到的PID如下：(1)

在方向

- DATA0—作为数据包PID传输
- DATA1—未传输
- DATA2—未传输
- mDATA—未传输。

(2) 出方向

- DATA0—作为数据包PID正常接收
- DATA1—作为数据包PID正常接收
- DATA2-忽略的数据包
- mDATA—数据包被忽略。

29.3.12.3 间隔计数器

同步传输间隔可以在PIPEPERI.IITV[2:0]位中设置。在设备控制器模式下，间隔计数器启用如表29.26所示的功能。在主机控制器模式下，USBFS产生令牌发布时序，间隔计数器操作与中断传输相同。

Table 29.26 设备控制器模式下的间隔计数器功能

转移方向	Function	检测条件
IN	发送缓冲区刷新	在等时IN传输期间未能在间隔帧中成功接收IN令牌
OUT	未收到令牌的通知	在等时期间未能在间隔帧中成功接收OUT令牌转出

间隔计数在接收到SOF时执行或对插值SOF执行，因此即使SOF损坏也可以保持等时性。帧间隔可以设置为2个IITV帧。

(1) 设备控制器模式下的计数器初始化

USBFS在以下条件下初始化间隔计数器：

- Power-on reset
  这将初始化PIPEPERI.IITV[2:0]位。
- 使用ACLRM位初始化FIFO缓冲区
  这不会初始化IITV[2:0]位，但会初始化计数值。

间隔计数器初始化后，当数据包传输成功时，间隔计数在以下条件之一开始：

- 当PID=BUF时，响应IN令牌传输数据后收到SOF
- 当PID=BUF时，接收到响应于OUT令牌的数据后接收到SOF。

The interval counter is not initialized in the following conditions:

- When the PID[1:0] bits are set to NAK or STALL
  This does not stop the interval timer. The USBFS attempts the transaction in the next interval.
- When the USB bus is reset or USBFS is suspended
  This does not initialize the IITV[2:0] bits. When an SOF is received, the interval counter starts counting from the value set before SOF was received.

(2) Interval counting and transfer control in host controller mode

The USBFS controls the interval between token issuance operations based on the PIPEPERI.IITV[2:0] bit settings. Specifically, the USBFS issues a token for a selected pipe once every 2^{IITV} frames.

The USBFS starts counting the token issuance interval at the frame following the frame in which the PID[1:0] bits are set to BUF by software.

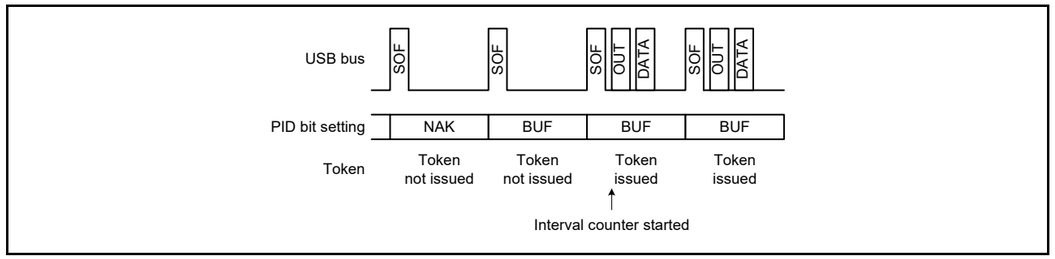

Figure 29.16 Token issuance when IITV = 0

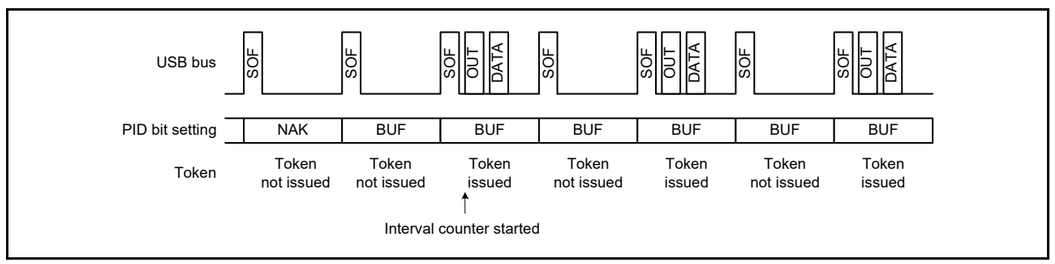

Figure 29.17 Token issuance when IITV = 1

When the selected pipe is set for isochronous transfers, the USBFS performs the following operation in addition to controlling the token issuance interval. The USBFS issues a token even when the NRDY interrupt generation condition is satisfied.

(a) When the selected pipe is for isochronous IN transfers

The USBFS generates an NRDY interrupt when the USBFS issues an IN token but does not successfully receive a packet from a peripheral device (no response or packet error).

The USBFS sets the FRMNUM.OVRN bit to 1, generating an NRDY interrupt, when the time to issue an IN token occurs while the USBFS cannot receive data because the FIFO buffer is full, because the CPU or DMAC/DTC is too slow in reading data from the FIFO buffer.

(b) When the selected pipe is for isochronous OUT transfers

The USBFS sets the OVRN bit to 1, generating an NRDY interrupt and transmitting a zero-length packet, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer, because the CPU or DMAC/DTC is too slow in writing data to the FIFO buffer.

The token issuance interval is reset on any of the following conditions:

- When the USBFS is reset through a reset pin

间隔计数器在以下情况下不会初始化：

- 当PID[1:0]位设置为NAK或STALL
  这不会停止间隔计时器。USBFS在下一个间隔尝试事务。
- 当USB总线复位或USBFS暂停时
  这不会初始化IITV[2:0]位。当接收到SOF时，间隔计数器从接收到SOF之前设置的值开始计数。

(2) 主机控制器模式下的间隔计数和传输控制

USBFS根据PIPEPERI.IITV[2:0]位设置控制令牌发布操作之间的间隔。
具体来说，USBFS每2个IITV帧为所选管道发布一次令牌。

USBFS在PID[1:0]位被软件设置为BUF的帧之后的帧开始计算令牌发布间隔。

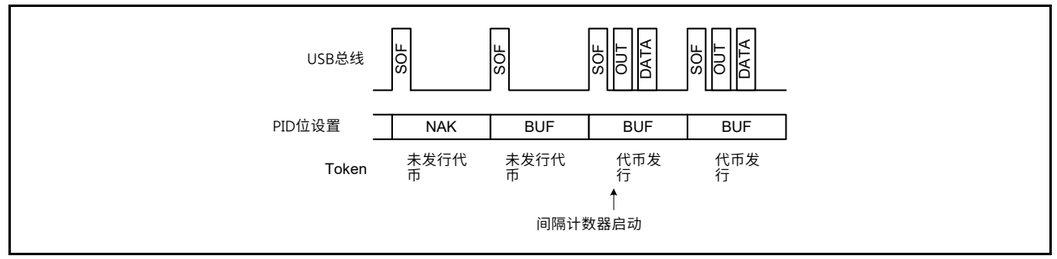

Figure 29.16 IITV=0时的代币发行

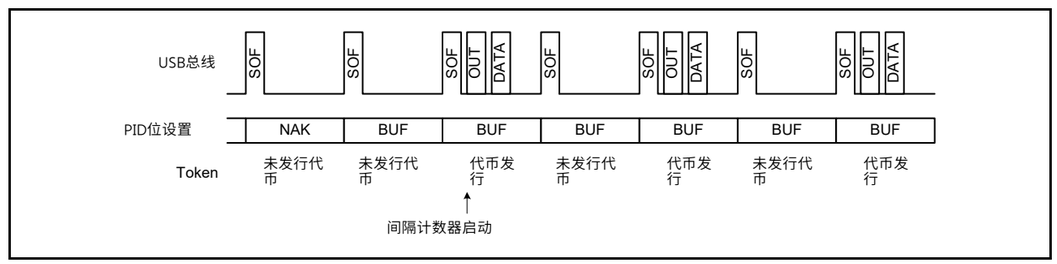

Figure 29.17 IITV=1时的代币发行

当所选管道设置为同步传输时，USBFS除了控制令牌发布间隔外，还执行以下操作。即使满足NRDY中断生成条件，USBFS也会发出令牌。

(a) 当所选管道用于同步IN传输时

当USBFS发出IN令牌但未成功接收到来自外围设备的数据包（无响应或数据包错误）时，USBFS会生成NRDY中断。

USBFS将FRMNUM.OVRN位设置为1，产生一个NRDY中断，此时发生发出IN令牌的时间，而USBFS无法接收数据，因为FIFO缓冲区已满，因为CPU或DMACDTC读取数据太慢从FIFO缓冲区。

(b) 当所选管道用于同步OUT传输时

USBFS将OVRN位设置为1，产生一个NRDY中断并发送一个长度为零的数据包，当发出OUT令牌的时间到来而FIFO缓冲区中没有要发送的数据时，因为CPU或DMACDTC是将数据写入FIFO缓冲区太慢。

令牌发行间隔在以下任何条件下重置：

- 当USBFS通过复位引脚复位时

This initializes the IITV[2:0] bits.

- When the PIPEnCTR.ACLRM bit is set to 1 by software.

(3) Interval counting and transfer control in device controller mode

(a) When the selected pipe is for isochronous OUT transfers

The USBFS generates an NRDY interrupt when it fails to receive a data packet within the interval set in the PIPEPERI.IITV[2:0] bits.

The USBFS also generates an NRDY interrupt when it fails to receive data because of a CRC error or other errors contained in the data packet or because the FIFO buffer is full.

The NRDY interrupt is generated on SOF packet reception. Even if the SOF packet is corrupted, internal interpolation allows the interrupt to be generated when the SOF packet is received. However, when the IITV bits are set to a value other than 0, the USBFS generates an NRDY interrupt on receiving an SOF packet for every interval after interval counting starts.

When the PID[1:0] bits are set to NAK by software after starting the interval timer, the USBFS does not generate an NRDY interrupt on receiving an SOF packet.

The timing for starting interval counting depends on the IITV[2:0] setting as follows:

- When the IITV[2:0] bits = 0:
  Interval counting starts at the next frame after software changes the PID[1:0] bits of the selected pipe to BUF.

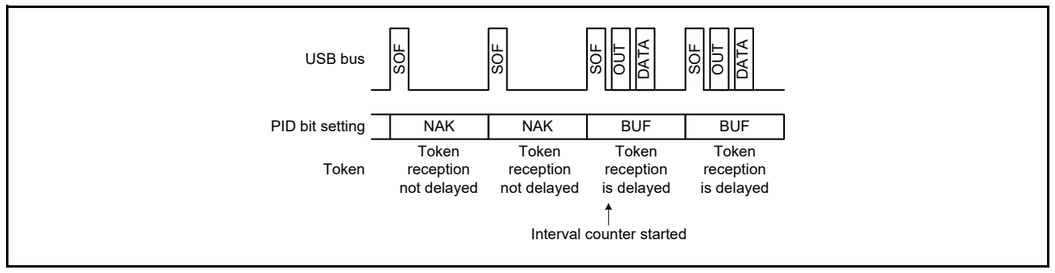

Figure 29.18 Relationship between frames and expected token reception when IITV[2:0] = 0

- When the IITV[2:0] bits ≠ 0:
  Interval counting starts on completion of successful reception of the first data packet after the PID[1:0] bits for the selected pipe are changed to BUF.

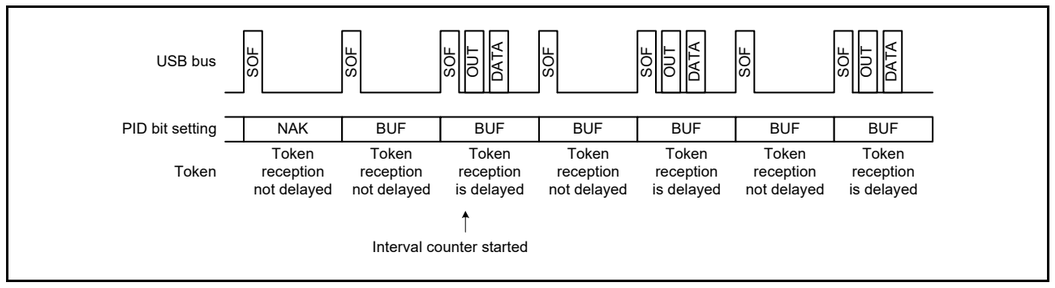

Figure 29.19 Relationship between frames and expected token reception when IITV[2:0] ≠ 0

(b) When the selected pipe is for isochronous IN transfers

The PIPEPERI.IFIS bit must be 1 for this use case. When IFIS = 0, the USBFS transmits a data packet in response to a received IN token regardless of the PIPEPERI.IITV[2:0] setting.

When IFIS is 1 and there is data to be transmitted in the FIFO buffer, the USBFS clears the FIFO buffer when it fails to

这将初始化IITV[2:0]位。

- 当PIPEnCTR.ACLRM位由软件设置为1时。

(3) 设备控制器模式下的间隔计数和传输控制

(a) 当所选管道用于同步OUT传输时

当USBFS在设置的时间间隔内没有接收到数据包时，会产生一个NRDY中断。
PIPEPERI.IITV[2:0] bits.

当由于数据包中包含的CRC错误或其他错误或FIFO缓冲区已满而无法接收数据时，USBFS也会产生NRDY中断。

NRDY中断在SOF数据包接收时产生。即使SOF数据包损坏，内部插值也允许在接收到SOF数据包时产生中断。但是，当IITV位设置为0以外的值时，USBFS会在间隔计数开始后的每个间隔接收到SOF数据包时产生NRDY中断。

当PID[1:0]位在启动间隔定时器后由软件设置为NAK时，USBFS不会产生接收到SOF数据包时的NRDY中断。

开始间隔计数的时间取决于IITV[2:0]设置，如下所示：

- 当IITV[2:0]位=0时：
  在软件将所选管道的PID[1:0]位更改为BUF后，间隔计数从下一帧开始。

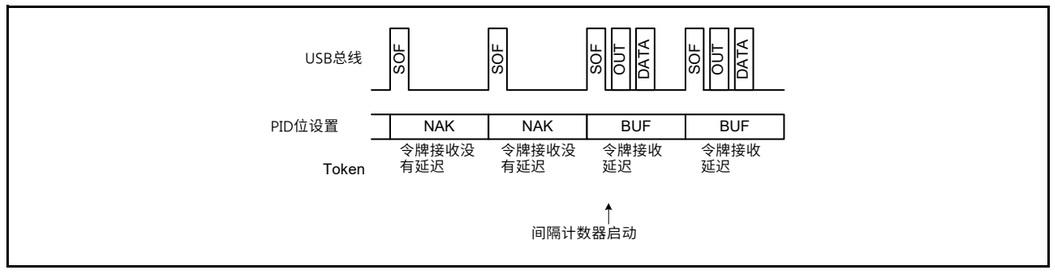

Figure 29.18 IITV[2:0]=0时帧与预期令牌接收之间的关系

- 当IITV[2:0]位≠0时：
  在所选管道的PID[1:0]位更改为BUF后，成功接收第一个数据包后，间隔计数开始。

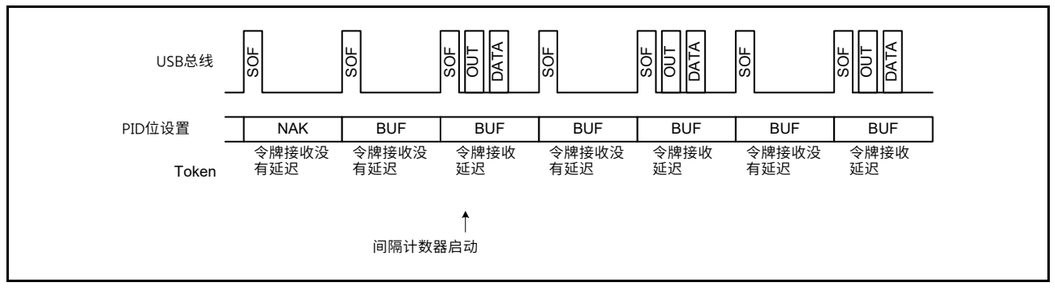

Figure 29.19 IITV[2:0]≠0时帧与预期令牌接收的关系

(b) 当所选管道用于同步IN传输时

对于此用例，PIPEPERI.IFIS位必须为1。当IFIS=0时，无论PIPEPERI.IITV[2:0]设置如何，USBFS都会发送一个数据包以响应接收到的IN令牌。

当IFIS为1且FIFO缓冲区中有数据要发送时，USBFS发送失败时清除FIFO缓冲区

receive an IN token in the frame at the interval set in the IITV[2:0] bits.

The USBFS also clears the FIFO buffer when it fails to receive an IN token successfully because of a bus error, such as a CRC error, contained in the IN token.

The FIFO buffer is cleared on SOF packet reception. Even if the SOF packet is corrupted, the internal interpolation allows the FIFO buffer to be cleared when the SOF packet is received.

The timing to start interval counting depends on the IITV[2:0] setting, as with OUT transfers.

The interval is counted on any of the following conditions in device controller mode:

- When a hardware reset is applied to the USBFS (which also sets the IITV[2:0] bits to 000b)
- When the PIPEnCTR.ACLRM bit is set to 1 by software
- When the USBFS detects a USB bus reset.

(4) Transmit data setup for isochronous transfers in device controller mode

With isochronous data transmission using the USBFS in device controller mode, after data is written to the FIFO buffer, a data packet can be transmitted in the first frame after the SOF packet is detected. This isochronous transfer transmit data setup function can identify the frame that started transmission.

When double buffering is used, transmission is only enabled for the buffer where data writing was completed first, even after the data write to both buffers is complete. Accordingly, even if multiple IN tokens are received, only one packet of FIFO buffer data is transmitted.

When the FIFO buffer is ready to transmit data when an IN token is received, data is transferred and a normal response is returned. However, if the FIFO buffer cannot transmit data, a zero-length packet is transmitted and an underrun error occurs.

Figure 29.20 shows an example transmission using the isochronous transfer transmission data setup function when IITV = 0 (every frame) is set.

以在IITV[2:0]位中设置的间隔接收帧中的IN令牌。

当USBFS由于总线错误（例如
CRC错误，包含在IN令牌中。

FIFO缓冲区在SOF数据包接收时被清除。即使SOF数据包损坏，内部插值也允许在接收到SOF数据包时清除FIFO缓冲区。

开始间隔计数的时间取决于IITV[2:0]设置，与OUT传输一样。

在设备控制器模式下，根据以下任何条件计算间隔：

- 当对USBFS应用硬件复位时（也将IITV[2:0]位设置为000b）
- 当PIPEnCTR.ACLRM位由软件设置为1时
- 当USBFS检测到USB总线复位时。

(4) 设备控制器模式下同步传输的传输数据设置

在设备控制器模式下使用USBFS进行同步数据传输，数据写入FIFO缓冲区后，可在检测到SOF包后的第一帧发送数据包。此同步传输传输数据设置功能可以识别开始传输的帧。

使用双缓冲时，仅对先完成数据写入的缓冲区启用传输，即使在两个缓冲区的数据写入完成后也是如此。因此，即使接收到多个IN令牌，也仅发送一包FIFO缓冲器数据。

当接收到IN令牌时，当FIFO缓冲区准备好传输数据时，将传输数据并返回正常响应。但是，如果FIFO缓冲区无法传输数据，则会传输零长度数据包并发生欠载错误。

图29.20显示了在设置IITV=0（每帧）时使用同步传输传输数据设置功能的示例传输。

RA生态工作室

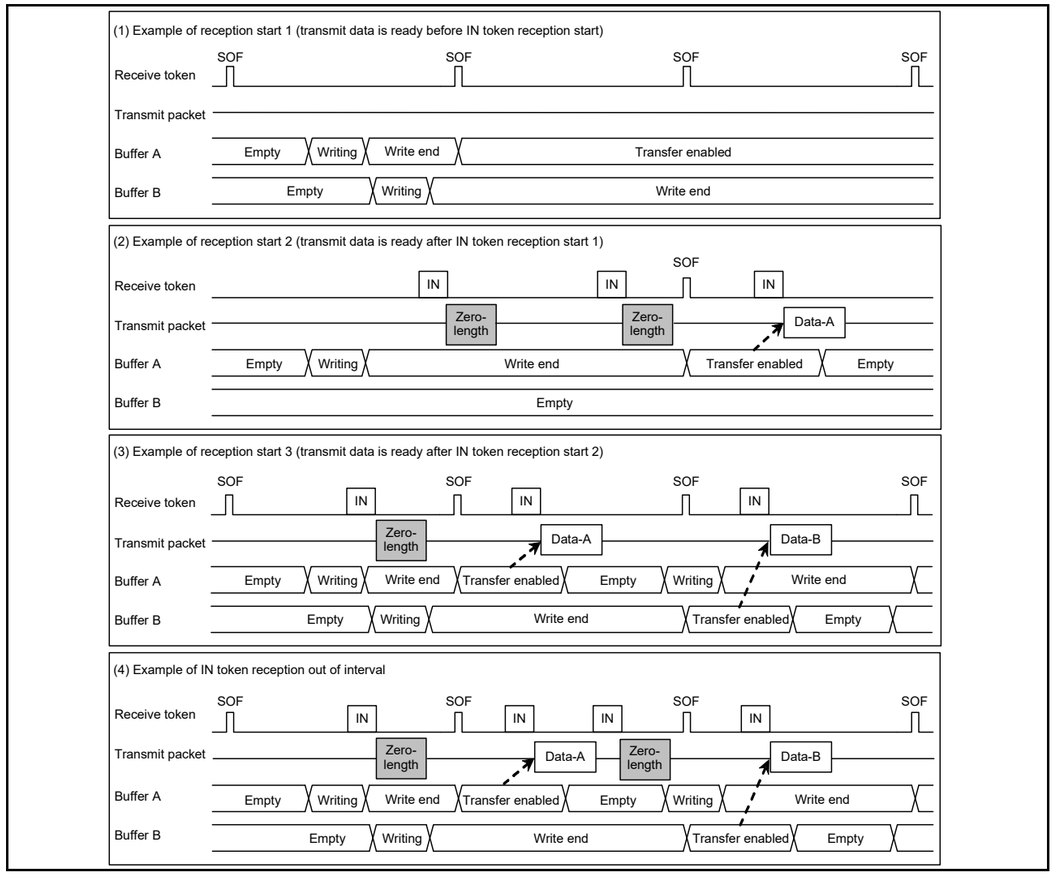

Figure 29.20 Example data setup operation

(5) Transmit buffer flush for isochronous transfers in device controller mode

In device controller mode during isochronous data transmission, if the USBFS receives an SOF packet for the next frame without receiving an IN token in the interval frame, it operates as if the IN token is corrupt and clears the buffer that is enabled for transmission, putting that buffer in the writing enabled state.

When double buffering is used and writing to both buffers is complete, the cleared FIFO buffer is assumed to be the one where the data was transmitted in the interval frame, and transmission is enabled for the FIFO buffer that was not cleared on SOF packet reception.

The timing of the buffer flush function depends on the PIPEPERI.IITV[2:0] setting as follows:

- When IITV = 0:
  The buffer flush operation starts from the first frame after the pipe is enabled
- When IITV ≠ 0:
  The buffer flush operation starts after the first normal transaction.

Figure 29.21 shows an example buffer flush. When an unanticipated token is received before the interval frame, the USBFS sends the write data or a zero-length packet as an underrun error, depending on the data setup status.

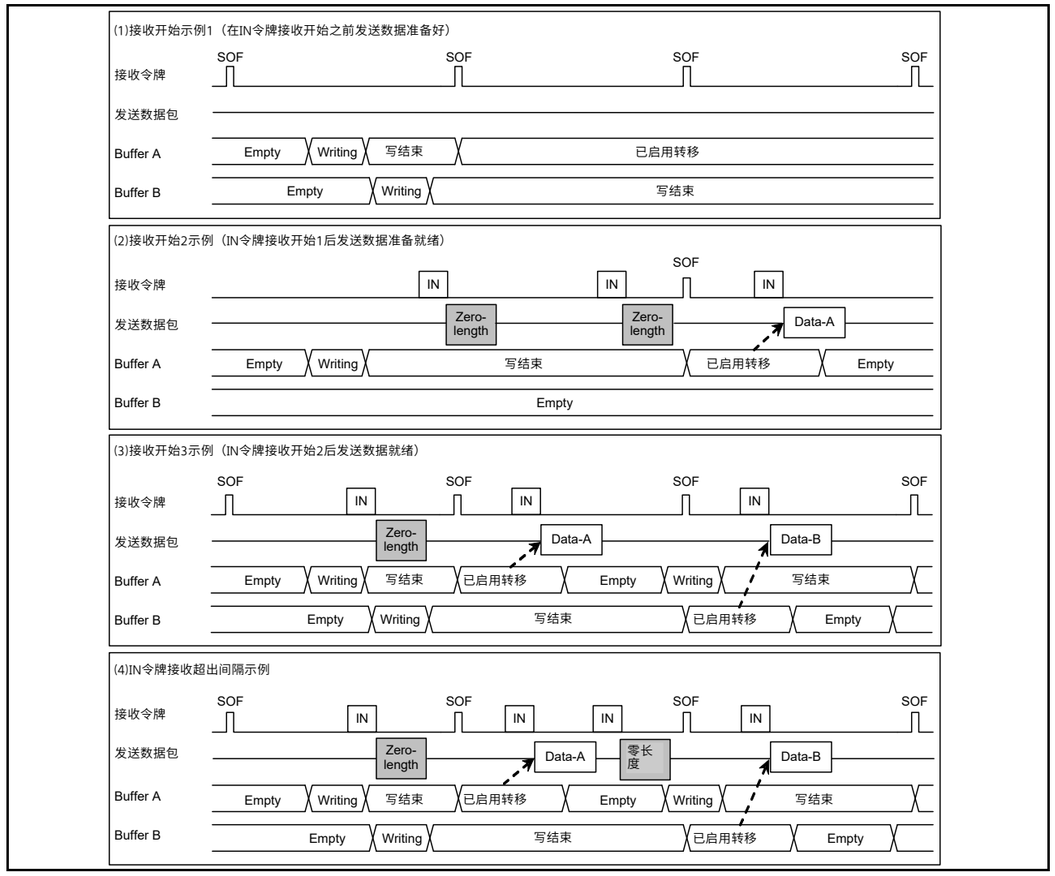

Figure 29.20 示例数据设置操作

(5) 设备控制器模式下同步传输的传输缓冲区刷新

在同步数据传输期间的设备控制器模式下，如果USBFS接收到下一帧的SOF数据包，而在间隔帧中没有接收到IN令牌，则它会像IN令牌损坏一样操作并清除启用传输的缓冲区，将该缓冲区处于写入启用状态。

当使用双缓冲并完成对两个缓冲区的写入时，已清除的FIFO缓冲区被假定为在间隔帧中传输数据的缓冲区，并为接收SOF数据包时未清除的FIFO缓冲区启用传输。

缓冲区刷新功能的时间取决于PIPEPERI.IITV[2:0]设置，如下所示：

- When IITV = 0:
  缓冲区刷新操作从启用管道后的第一帧开始
- When IITV ≠ 0:
  缓冲区刷新操作在第一个正常事务之后开始。

图29.21显示了一个示例缓冲区刷新。当在间隔帧之前收到未预料到的令牌时，USBFS根据数据设置状态将写入数据或零长度数据包作为欠载错误发送。

RA生态工作室

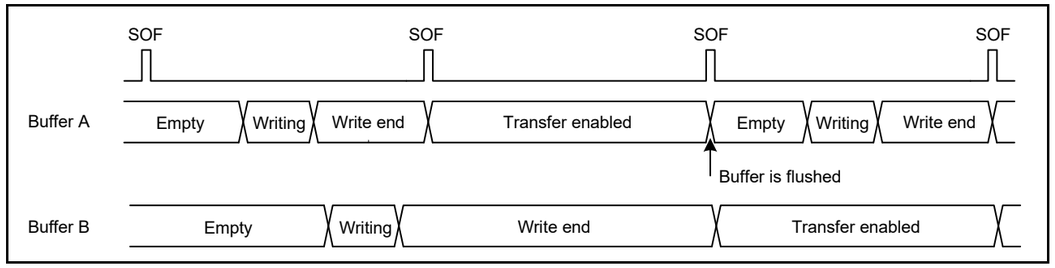

Figure 29.21 Example buffer flush operation

Figure 29.22 shows an example interval error occurrence. There are five types of interval errors, as shown in the figure. An interval error occurs at timing ①, and the buffer flush function is activated.

If an interval error occurs during an IN transfer, the buffer flush function is activated. If it occurs during an OUT transfer, an NRDY interrupt is generated. Use the FRMNUM.OVRN bit to distinguish between this and NRDY interrupts triggered by received packet errors and overrun errors.

For tokens that are shaded in the figure, responses are returned based on the FIFO buffer status.

- IN direction:
  - If the buffer is ready to transfer data, the data is transferred and a normal response is returned
  - If the buffer is not ready to transfer data, a zero-length packet is transmitted and an underrun error occurs.
- OUT direction:
  - If the buffer is ready to receive data, the data is received and a normal response is returned
  - If the buffer is not ready to receive data, the received data is discarded and an overrun error occurs.

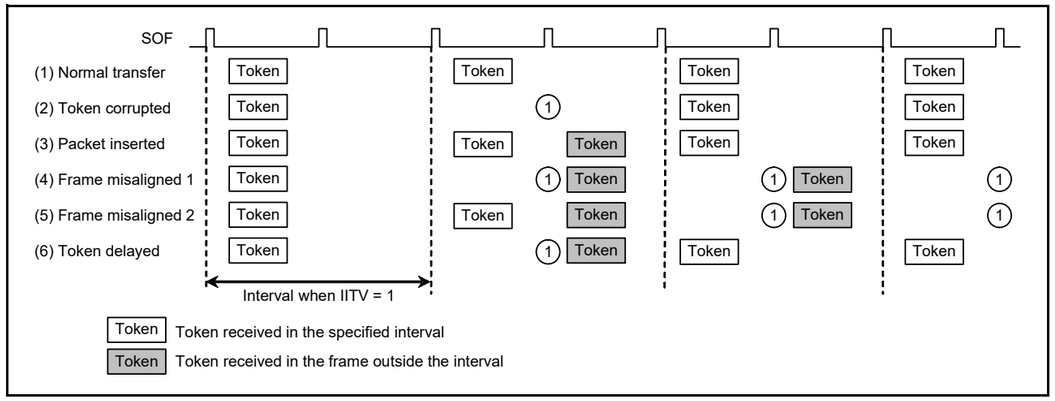

Figure 29.22 Example interval error occurrence when IITV = 1

29.3.13 SOF Interpolation Function

In device controller mode, if packet reception is disabled at intervals of 1 ms because the SOF packet is corrupted or missing, the USBFS interpolates the SOF. SOF interpolation begins when the USBE and SCKE bits in SYSCFG are set to 1 and an SOF packet is received.

The interpolation function is initialized under the following conditions:

- MCU reset
- USB bus reset

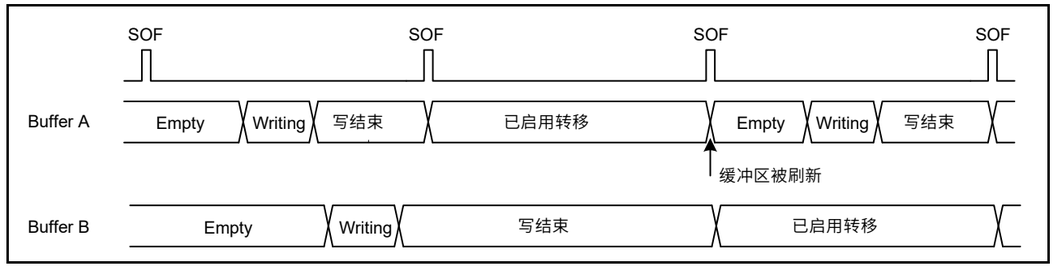

Figure 29.21 缓冲区刷新操作示例

图29.22显示了一个发生间隔错误的示例。如图所示，有五种区间误差。
定时出现间隔错误 ① 并且缓冲区刷新功能被激活。

如果在IN传输期间发生间隔错误，则会激活缓冲区刷新功能。如果它发生在OUT传输期间，则会产生NRDY中断。使用FRMNUM.OVRN位来区分此中断和由接收数据包错误和溢出错误触发的NRDY中断。

对于图中带阴影的令牌，根据FIFO缓冲区状态返回响应。

- IN direction:
  - 如果缓冲区准备好传输数据，则传输数据并返回正常响应
  - 如果缓冲区尚未准备好传输数据，则会传输零长度数据包并发生欠载错误。
- OUT direction:
  - 如果缓冲区准备好接收数据，则接收数据并返回正常响应
  - 如果缓冲区没有准备好接收数据，则丢弃接收到的数据并发生溢出错误。

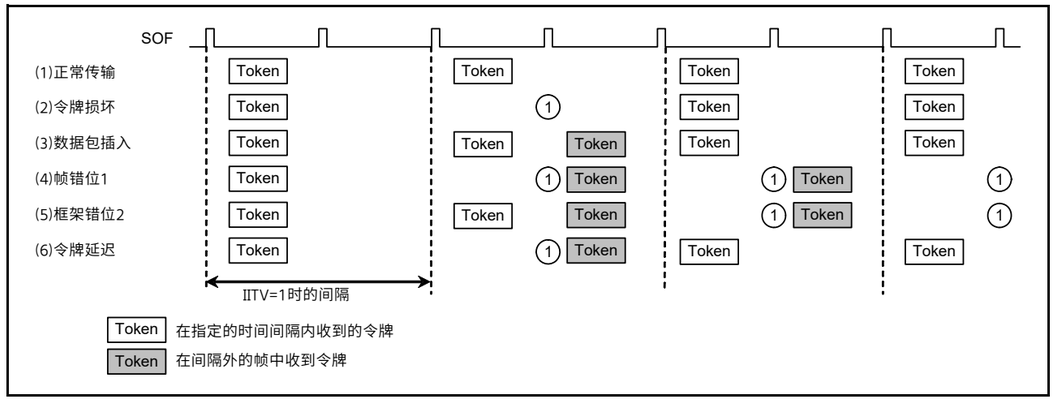

Figure 29.22 IITV=1时发生的示例间隔错误

29.3.13 SOF插值函数

在设备控制器模式下，如果由于SOF数据包损坏或丢失而每隔1ms禁用数据包接收，则USBFS会内插SOF。当SYSCFG中的USBE和SCKE位设置为1并且接收到SOF数据包时，SOF内插开始。

插值函数在以下条件下初始化：

- MCU reset
- USB总线复位

- Suspended state detection.

The SOF interpolation operates as follows:

- The interpolation function is not activated until an SOF packet is received
- When the first SOF packet is received, interpolation is performed by counting 1 ms on the 48-MHz internal clock
- When the second and subsequent SOF packets are received, interpolation is performed at the previous reception interval
- Interpolation is not performed in the suspended state or on reception of a USB bus reset.

The USBFS supports the following functions controlled by SOF packet reception. These functions operate normally with SOF interpolation if the SOF packet is missing:

- Updating of the frame number
- SOFR interrupt timing
- Isochronous transfer interval count.

If an SOF packet is missing during full-speed operation, the FRMNUM.FRNM[10:0] bits are not updated.

29.3.14 Pipe Schedule

29.3.14.1 Conditions for generating transactions

In host controller mode, when the DVSTCTR0.UACT bit is set to 1, the USBFS generates transactions under the conditions shown in Table 29.27.

Table 29.27 Conditions for generating transactions

Transaction	Conditions for generation				
	DIR	PID	IITV0	Buffer state	SUREQ
Setup	—*1	—*1	—*1	—*1	1 setting
Control transfer data stage, status stage, bulk transfer	IN	BUF	Invalid	Receive area exists	—*1
	OUT	BUF	Invalid	Transmit data exists	—*1
Interrupt transfer	IN	BUF	Valid	Receive area exists	—*1
	OUT	BUF	Valid	Transmit data exists	—*1
Isochronous transfer	IN	BUF	Valid	*2	—*1
	OUT	BUF	Valid	*3	—*1

Note 1. An em dash (—) in the table indicates that the condition is unrelated to the generating of tokens. “Valid” indicates that, for interrupt transfers and isochronous transfers, a transaction is generated only in transfer frames that are based on the interval counter. “Invalid” indicates that a transaction is generated regardless of the interval counter.

Note 2. This indicates that a transaction is generated regardless of whether there is a receive area. If there is no receive area, however, the received data is discarded.

Note 3. This indicates that a transaction is generated regardless of whether there is any data to be transmitted. If there is no data to be transmitted, however, a zero-length packet is transmitted.

29.3.14.2 Transfer schedule

This section describes the transfer scheduling within a frame of the USBFS. After the USBFS sends an SOF, the transfer is carried out in the following sequence:

1. Execution of periodic transfers:
   A pipe is searched for in the order pipe 1 → pipe 2 → pipe 6 → pipe 7 → pipe 8 → pipe 9, and if there is a pipe for which an isochronous or interrupt transfer transaction can be generated, the transaction is generated.
2. Setup transactions for control transfers:
   The DCP is checked, and if a setup transaction is possible, it is sent.

- 暂停状态检测。

SOF插值操作如下：

- 直到收到SOF数据包才激活插值功能
- 当接收到第一个SOF数据包时，通过在48-MHz内部时钟上计数1ms来执行插值
- 当接收到第二个和随后的SOF数据包时，以先前的接收间隔执行插值

- 在挂起状态或接收到USB总线复位时不执行插值。

USBFS支持以下由SOF数据包接收控制的功能。这些功能正常运行
如果SOF数据包丢失，则SOF插值：

- 更新帧号
- SOFR中断时序
- 同步传输间隔计数。

如果在全速运行期间丢失SOF数据包，则不会更新FRMNUM.FRNM[10:0]位。

29.3.14 管道计划

29.3.14.1 产生交易的条件

在主机控制器模式下，当DVSTCTR0.UACT位设置为1时，USBFS在表29.27所示的条件下生成事务。

Table 29.27 产生交易的条件

Transaction	生成条件				
	DIR	PID	IITV0	缓冲状态	SUREQ
Setup	—*1	—*1	—*1	—*1	1 setting
控制传输数据阶段、状态阶段、批量传输	IN	BUF	Invalid	接收区存在	—*1
	OUT	BUF	Invalid	传输数据存在	—*1
中断传输	IN	BUF	Valid	接收区存在	—*1
	OUT	BUF	Valid	传输数据存在	—*1
Isochronous transfer	IN	BUF	Valid	*2	—*1
	OUT	BUF	Valid	*3	—*1

Note 1. 表中的破折号(—)表示该条件与令牌的生成无关。“有效”表示，对于中断传输和同步传输，事务仅在基于间隔计数器的传输帧中生成。“无效”表示无论间隔计数器如何都生成事务。

Note 2. 这表示不管是否有接收区域，都会产生一个事务。但是，如果没有接收区域，则丢弃接收到的数据。

Note 3. 这表明无论是否有任何数据要传输，都会生成一个事务。然而，如果没有要传输的数据，则传输零长度数据包。

29.3.14.2 转移时间表

本节介绍USBFS帧内的传输调度。USBFS发送SOF后，按以下顺序进行传输：

1. 执行定期转账：
   管道按照管道1 管道2 管道6 管道7 管道8 管道9的顺序搜索管道，如果有管道可以生成等时或中断传输事务，则生成事务。
2. 为控制转移设置交易：
   DCP被检查，如果设置事务是可能的，它被发送。

3. Execution of bulk transfers, control transfer data stages, and control transfer status stages:
   A pipe is searched for in the order DCP → pipe 1 → pipe 2 → pipe 3 → pipe 4 → pipe 5, and if there is a pipe for which a transaction for a bulk transfer, a control transfer data stage, or a control transfer status stage can be generated, the transaction is generated.
   When a transaction is generated, processing moves to the next transaction pipe regardless of whether the response from the peripheral device is ACK or NAK. If there is time for transfer within the frame, this step is repeated.

29.3.14.3 Enabling USB communication

Setting the DVSTCTR0.UACT bit to 1 initiates an SOF transmission, and transaction generation is enabled. Setting the UACT bit to 0 stops SOF transmission and the suspended state is invoked. If the UACT setting is changed from 1 to 0, processing stops after the next SOF is sent.

29.4 Usage Notes

29.4.1 Settings for the Module-Stop State

The Module Stop Control Register B (MSTPCRB) can enable or disable USBFS operation. The USBFS is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

29.4.2 Clearing the Interrupt Status Register on Exiting Software Standby Mode

Because the input buffer is always enabled in Software Standby mode, an unexpected interrupt might occur under the following conditions:

- When the interrupt is enabled in Normal mode
- When the interrupt is disabled in Software Standby mode
- When the input level of the pin that cancels software standby is changed in Software Standby mode.

These conditions might cause the associated interrupt flag in the Interrupt Status Register to set unexpectedly. After the MCU exits Software Standby mode, the unexpected interrupt might be sent to the interrupt controller. To avoid this, always clear the INTSTS0 and INTSTS1 registers in the canceling sequence.

29.4.3 Clearing the Interrupt Status Register after Setting Up the Port Function

The input buffer is disabled before the PmnPFS.PSEL[4:0] and PmnPFS.PMR ports are set up, so the internal signal is fixed high or low. The input buffer is enabled after the port is set so that the external pin state is propagated to the MCU. An unexpected interrupt might occur at this time, causing the VBINT and OVRCR bits in INTSTS0 and INTSTS1, or other interrupt status flags to set to 1. To avoid a malfunction, always clear the INTSTS0 and INTSTS1 registers after setting up the port.

3. 批量传输、控制传输数据阶段和控制传输状态阶段的执行：
   管道按DCP 管道1 管道2 管道3 管道4 管道5的顺序搜索，并且如果存在用于批量传输、控制传输数据阶段或控制传输的事务的管道可以生成状态阶段，生成事务。生成事务时，无论来自外围设备的响应是ACK还是NAK，处理都会移至下一个事务管道。如果帧内有时间进行传输，则重复此步骤。

29.3.14.3 启用USB通信

将DVSTCR0.UACT位设置为1启动SOF传输，并启用事务生成。将UACT位设置为0会停止SOF传输并调用挂起状态。如果UACT设置从1更改为0，则在发送下一个SOF后处理停止。

29.4 使用说明

29.4.1 模块停止状态的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用USBFS操作。USBFS在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

29.4.2 退出软件待机模式时清除中断状态寄存器

由于在软件待机模式下始终启用输入缓冲区，因此在以下情况下可能会发生意外中断：

- 在正常模式下启用中断时
- 在软件待机模式下禁用中断时
- 当取消软件待机的引脚的输入电平在软件待机模式下发生变化时。

这些情况可能会导致中断状态寄存器中的相关中断标志意外设置。之后MCU退出软件待机模式，意外中断可能被发送到中断控制器。为避免这种情况，请始终在取消序列中清除INTSTS0和INTSTS1寄存器。

29.4.3 设置端口功能后清除中断状态寄存器

在设置PmnPFS.PSEL[4:0]和PmnPFS.PMR端口之前禁用输入缓冲器，因此内部信号固定为高或低。设置端口后启用输入缓冲器，以便将外部引脚状态传播到MCU。此时可能会发生意外中断，导致INTSTS0和INTSTS1中的VBINT和OVRCR位或其他中断状态标志设置为1。为避免故障，请务必在设置端口后清除INTSTS0和INTSTS1寄存器。

30. Serial Communications Interface (SCI)

30.1 Overview

The Serial Communications Interface (SCI) is configurable to five asynchronous and synchronous serial interfaces:

- Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))
- 8-bit clock synchronous interface
- Simple IIC (master-only)
- Simple SPI
- Smart card interface.

The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. Each SCI channel has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator.

Table 30.1 lists the SCI specifications, Figure 30.1 shows a block diagram of SCI channel n, and Table 30.2 lists the I/O pins by mode.

Table 30.1 SCI specifications (1 of 2)

Parameter	Specifications
Serial communication modes	• Asynchronous • Clock synchronous • Smart card interface • Simple IIC • Simple SPI.
Transfer speed	Bit rate specifiable with the on-chip baud rate generator
Full-duplex communications	• Transmitter: Continuous transmission possible using double-buffering • Receiver: Continuous reception possible using double-buffering.
I/O pins	See Table 30.2
Data transfer	Selectable as LSB-first or MSB-first transfer
Interrupt sources	• Transmit end, transmit data empty, receive data full, receive error, receive data ready, and address match • Completion of generation of a start condition, restart condition, or stop condition (for simple IIC mode).
Module-stop function	Module-stop state can be set for each channel
Snooze end request	SCI0 address mismatch (SCI0_DCUF)

30. 串行通信接口(SCI)

30.1 Overview

串行通信接口(SCI)可配置为五个异步和同步串行接口：

- 异步接口（UART和异步通信接口适配器(ACIA)）
- 8位时钟同步接口
- Simple IIC (master-only)
- 简单的SPI
- 智能卡接口。

智能卡接口符合ISOIEC7816-3电子信号和传输协议标准。
每个SCI通道都有FIFO缓冲区以实现连续和全双工通信，并且可以使用片上波特率发生器独立配置数据传输速度。

表30.1列出了SCI规格，图30.1显示了SCI通道n的框图，表30.2列出了按模式划分的IO引脚。

Table 30.1 SCI规范(1of2)

Parameter	Specifications
串行通信模式	异步 时钟同步 智能卡接口 简单IIC 简单SPI。
传输速度	可通过片上波特率发生器指定比特率
Full-duplex communications	发送器：可以使用双缓冲进行连续传输 接收器：可以使用双缓冲进行连续接收。
I/O pins	见表30.2
数据传输	可选择LSB优先或MSB优先传输
中断源	发送结束、发送数据空、接收数据满、接收错误、接收数据就绪和地址匹配开始条件、重启条件或停止条件的生成完成（对于简单IIC模式）。
Module-stop function	每个通道可设置模块停止状态
暂停结束请求	SCI0地址不匹配(SCI0_DCUF)

Table 30.1 SCI specifications (2 of 2)

Parameter		Specifications
Asynchronous mode	Data length	7, 8, or 9 bits
	Transmission stop bit	1 or 2 bits
	Parity	Even parity, odd parity, or no parity
	Receive error detection	Parity, overrun, and framing errors
	Hardware flow control	Transmission and reception controllable with CTSn_RTSn pins
	Transmission/reception	Selectable to 1-stage register or 16-stage FIFO
	Address match	Interrupt request/event output can be issued on detecting a match between the received data and the value in the compare match register
	Address mismatch (SCI0 only) receive data	Snooze end request can be issued on detecting a mismatch between the received data and the value in the compare match register
	Start-bit detection	Selectable to low level or falling edge detection
	Break detection	Breaks from framing errors detectable by reading from the SPTR register
	Clock source	Selectable to internal or external clock
	Double-speed mode	Baud rate generator double-speed mode is selectable
	Multi-processor communications function	Serial communication enabled between multiple processors
	Noise cancellation	Digital noise filters included on signal paths from RXDn pin inputs
Clock synchronous mode	Data length	8 bits
	Receive error detection	Overrun error
	Clock source	Selectable to internal clock (master mode) or external clock (slave mode)
	Hardware flow control	Transmission and reception controllable with CTSn_RTSn pins
	Transmission/reception	Selectable to 1-stage register or 16-stage FIFO
Smart card interface mode	Error processing	Error signal can be automatically transmitted on detecting a parity error during reception
		Data can be automatically retransmitted on receiving an error signal during transmission
	Data type	Both direct and inverse convention supported
Simple IIC mode	Transfer format	I^2C bus format (MSB-first only)
	Operating mode	Master (single-master operation only)
	Transfer rate	Up to 400 kbps
	Noise cancellation	The signal paths from input on the SCLn and SDAn pins incorporate digital noise filters and provide an adjustable interval for noise cancellation
Simple SPI mode	Data length	8 bits
	Error detection	Overrun error
	Clock source	Selectable to internal clock (master mode) or external clock (slave mode)
	SS input pin function	High impedance state can be invoked on the output pins by driving the SSn pin high
	Clock settings	Configurable between four clock phase and clock polarity settings
Bit rate modulation function		Error reduction through correction of outputs from the on-chip baud rate generator
Event link function		Error event output (SCIn_ERI)*1 for receive error or error signal detection
		Receive data full event output (SCIn_RXI)*1,*2
		Transmit data empty event output (SCIn_TXI)*1,*2
		Transmit end event output (SCIn_TEI)*1,*2
		Address match event output (SCIn_AM)*1

Note 1. Channel number (n = 0 to 4, 8, 9).
Note 2. Using this event link function is prohibited when FIFO operation is selected in asynchronous mode.

Table 30.1 SCI规范（2个中的2个）

Parameter		Specifications
异步模式	数据长度	7、8或9位
	传输停止位	1或2位
	Parity	偶校验、奇校验或无校验
	接收错误检测	奇偶校验、溢出和成帧错误
	硬件流控制	可通过CTSn_RTSn引脚控制发送和接收
	Transmission/reception	可选择1级寄存器或16级FIFO
	地址匹配	检测到接收数据与比较匹配寄存器中的值匹配时，可发出中断请求事件输出
	地址不匹配（仅SCI0）接收数据	检测到接收到的数据与比较匹配寄存器中的值不匹配时，可以发出贪睡结束请求
	Start-bit detection	可选择低电平或下降沿检测
	断线检测	通过从SPTR寄存器读取可检测到的帧错误中断
	时钟源	可选择内部或外部时钟
	Double-speed mode	波特率发生器双速模式可选
	多处理器通讯功能	在多个处理器之间启用串行通信
	噪音消除	RXDn引脚输入的信号路径上包含数字噪声滤波器
时钟同步模式	数据长度	8 bits
	接收错误检测	溢出错误
	时钟源	可选择内部时钟（主模式）或外部时钟（从模式）
	硬件流控制	可通过CTSn_RTSn引脚控制发送和接收
	Transmission/reception	可选择1级寄存器或16级FIFO
智能卡接口方式	错误处理	在接收过程中检测到奇偶校验错误时可以自动发送错误信号
		传输过程中接收到错误信号可自动重传数据
	数据类型	支持直接和反向约定
简单IIC模式	传输格式	I2C总线格式（仅MSB优先）
	操作模式	主机（仅限单主机操作）
	传输率	高达400kbps
	噪音消除	来自SCLn和SDAn引脚输入的信号路径包含数字噪声滤波器，并提供可调节的噪声消除间隔
简单SPI模式	数据长度	8 bits
	错误检测	溢出错误
	时钟源	可选择内部时钟（主模式）或外部时钟（从模式）
	SS输入引脚功能	通过将SSn引脚驱动为高电平，可以在输出引脚上调用高阻抗状态
	时钟设置	可在四个时钟相位和时钟极性设置之间进行配置
比特率调制功能		通过校正片上波特率发生器的输出来减少错误
事件链接功能		错误事件输出(SCIn_ERI)*1用于接收错误或错误信号检测
		接收数据满事件输出(SCIn_RXI)*1 *2
		发送数据空事件输出(SCIn_TXI)*1 *2
		传输结束事件输出(SCIn_TEI)*1 *2
		地址匹配事件输出(SCIn_AM)*1

注1.通道编号（n=0至4、8、9）。
注2.在异步模式下选择FIFO操作时，禁止使用此事件链接功能。

30.2 Register Descriptions

30.2.1 Receive Shift Register (RSR)

RSR is a shift register that receives serial data input from the RXDn pin and converts it into parallel data. When one frame of data is received, the data is automatically transferred to the RDR, RDRHL, or the receive FIFO register. The RSR register cannot be directly accessed by the CPU.

30.2.2 Receive Data Register (RDR)

Address(es): SCI0.RDR 4007 0005h, SCI1.RDR 4007 0025h, SCI2.RDR 4007 0045h, SCI3.RDR 4007 0065h, SCI4.RDR 4007 0085h, SCI8.RDR 4007 0105h, SCI9.RDR 4007 0125h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0

RDR is an 8-bit register that stores receive data. When one frame of serial data is received, it is transferred from RSR to RDR, and the RSR register can receive more data. Because RSR and RDR function as a double buffer, continuous received operations can be performed.

Read the RDR register only once after a receive data full interrupt (SCIn_RXI) occurs.

Note: If the next frame of data is received before reading the received data from RDR, an overrun error occurs. The CPU cannot write to the RDR.

30.2.3 Receive 9-Bit Data Register (RDRHL)

Address(es): SCI0.RDRHL 4007 0010h, SCI1.RDRHL 4007 0030h, SCI2.RDRHL 4007 0050h, SCI3.RDRHL 4007 0070h, SCI4.RDRHL 4007 0090h, SCI8.RDRHL 4007 0110h, SCI9.RDRHL 4007 0130h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RDRHL is a 16-bit register that stores receive data. Use this register when asynchronous mode and 9-bit data length are selected.

The lower 8 bits of RDRHL are the shadow register of RDR, so access to RDRHL affects the RDR register. Access to the RDRHL register is prohibited if 7-bit or 8-bit data length is selected.

After one frame of data is received, the received data is transferred from the RSR to the RDR or RDRHL register, allowing the RSR register to receive more data.

The RSR and RDRHL registers have a double-buffered structure to enable continuous reception. RDRHL should be read only when a receive data full interrupt (SCIn_RXI) request is issued. An overrun error occurs when the next frame of data is received before the received data is read from RDRHL. The CPU cannot write to the RDRHL register. Bits [15:9] of the RDRHL register are fixed to 0. These bits are read as 0. The write value should be 0.

Table 30.2 SCIIO引脚（2个中的2个）

30.2 注册说明

30.2.1 接收移位寄存器(RSR)

RSR是一个移位寄存器，它接收从RXDn引脚输入的串行数据并将其转换为并行数据。当接收到一帧数据时，数据会自动传输到RDR、RDRHL或接收FIFO寄存器。CPU不能直接访问RSR寄存器。

30.2.2 接收数据寄存器(RDR)

Address(es): SCI0.RDR 4007 0005h, SCI1.RDR 4007 0025h, SCI2.RDR 4007 0045h, SCI3.RDR 4007 0065h, SCI4.RDR 4007 0085h, SCI8.RDR 4007 0105h, SCI9.RDR 4007 0125h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0

RDR是一个8位寄存器，用于存储接收数据。当接收到一帧串行数据时，将其从RSR传输到RDR，而RSR寄存器可以接收更多的数据。由于RSR和RDR用作双缓冲器，因此可以执行连续接收操作。

在接收数据完全中断(SCIn_RXI)发生后，仅读取一次RDR寄存器。

Note: 如果在从RDR读取接收到的数据之前接收到下一帧数据，则会发生溢出错误。这CPU无法写入RDR。

30.2.3 接收9位数据寄存器(RDRHL)

Address(es): SCI0.RDRHL 4007 0010h, SCI1.RDRHL 4007 0030h, SCI2.RDRHL 4007 0050h, SCI3.RDRHL 4007 0070h, SCI4.RDRHL 4007 0090h, SCI8.RDRHL 4007 0110h, SCI9.RDRHL 4007 0130h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RDRHL是一个16位寄存器，用于存储接收数据。选择异步模式和9位数据长度时，请使用此寄存器。

RDRHL的低8位是RDR的影子寄存器，因此访问RDRHL会影响RDR寄存器。访问
如果选择7位或8位数据长度，则禁止RDRHL寄存器。

接收到一帧数据后，将接收到的数据从RSR传送到RDR或RDRHL寄存器，让RSR寄存器接收更多数据。

RSR和RDRHL寄存器具有双缓冲结构以实现连续接收。只有在发出接收数据完全中断(SCIn_RXI)请求时才应读取RDRHL。在从RDRHL读取接收到的数据之前接收到下一帧数据时，会发生溢出错误。CPU无法写入RDRHL寄存器。RDRHL寄存器的位[15:9]固定为0。这些位被读取为0。写入值应为0。

30.2.4 Receive FIFO Data Register H, L, HL (FRDRH, FRDRL, FRDRHL)

Receive FIFO Data Register H (FRDRH)

Address(es): SCI0.FRDRH 4007 0010h, SCI1.FRDRH 4007 0030h, SCI2.FRDRH 4007 0050h, SCI3.FRDRH 4007 0070h, SCI4.FRDRH 4007 0090h, SCI8.FRDRH 4007 0110h, SCI9.FRDRH 4007 0130h

Receive FIFO Data Register L (FRDRL)

Address(es): SCI0.FRDRL 4007 0011h, SCI1.FRDRL 4007 0031h, SCI2.FRDRL 4007 0051h, SCI3.FRDRL 4007 0071h, SCI4.FRDRL 4007 0091h, SCI8.FRDRL 4007 0111h, SCI9.FRDRL 4007 0131h

Receive FIFO Data Register HL (FRDRHL)

Address(es): SCI0.FRDRHL 4007 0010h, SCI1.FRDRHL 4007 0030h, SCI2.FRDRHL 4007 0050h, SCI3.FRDRHL 4007 0070h, SCI4.FRDRHL 4007 0090h, SCI8.FRDRHL 4007 0110h, SCI9.FRDRHL 4007 0130h

SCIn.FRDRHL

SCIn.FRDRH | SCIn.FRDRL

b14	RDF	接收FIFO数据满标志	该标志与SSR_FIFO.RDF相同：0：写入FRDRH和FRDRL的接收数据量小于指定的接收触发数1：写入FRDRH和FRDRL的接收数据量等于或大于指定的接收数据量接收触发号码。	R*1
b15	—	Reserved	该位读为0	R

Note 1. 如果读取该标志，则表示与从SSR_FIFO寄存器读取的值相同。将0写入SSR_FIFO寄存器以清除标志。

FRDRHL is a 16-bit register that consists of the 8-bit FRDRH and FRDRL registers.

FRDRH and FRDRL constitute a 16-stage FIFO register that stores serial receive data and related status information readable by software. This register is only valid in asynchronous mode, including multi-processor mode, or clock synchronous mode.

The SCI completes reception of one frame of serial data by transferring the received data from the RSR register into FRDRH and FRDRL for storage. Continuous reception is executed until 16 stages are stored. If data is read when there is no received data in FRDRH and FRDRL, the value is undefined. When FRDRH and FRDRL are full of receive data, subsequent serial receive data is lost. The CPU can read from FRDRH and FRDRL but cannot write to them.

Reading 1 from the RDF, ORER, or DR flag of the FRDRH register is the same as reading from those bits in the SSR_FIFO register. When writing 0 to clear a flag in the SSR_FIFO register after reading the FRDRH register, write 0 only to the flag that is to be cleared and write 1 to the other flags.

When reading both the FRDRH and FRDRL registers, read in the order from FRDRH to FRDRL. The FDRHL register can be accessed in 16-bit units.

30.2.5 Transmit Data Register (TDR)

Address(es): SCI0.TDR 4007 0003h, SCI1.TDR 4007 0023h, SCI2.TDR 4007 0043h, SCI3.TDR 4007 0063h, SCI4.TDR 4007 0083h, SCI8.TDR 4007 0103h, SCI9.TDR 4007 0123h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

TDR is an 8-bit register that stores transmit data.

When the SCI detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts transmission.

The double-buffered structure of TDR and TSR enables continuous serial transmission. If the next transmit data is already written to TDR when one frame of data is transmitted, the SCI transfers the written data to TSR to continue transmission.

The CPU can read from or write to TDR at any time. Only write transmit data to TDR once after each instance of the transmit data empty interrupt (SCIn_TXI).

30.2.6 Transmit 9-Bit Data Register (TDRHL)

Address(es): SCI0.TDRHL 4007 000Eh, SCI1.TDRHL 4007 002Eh, SCI2.TDRHL 4007 004Eh, SCI3.TDRHL 4007 006Eh, SCI4.TDRHL 4007 008Eh, SCI8.TDRHL 4007 010Eh, SCI9.TDRHL 4007 012Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

TDRHL is a 16-bit register that stores transmit data. Use this register when asynchronous mode and 9-bit data length are selected.

The lower 8 bits of TDRHL are the shadow register of TDR, so access to TDRHL affects the TDR register. Access to the TDRHL register is prohibited if 7-bit or 8-bit data length is selected. When empty space is detected in the TSR register, the transmit data stored in the TDRHL register is transferred to TSR and transmission starts.

The TSR and TDRHL registers have a double-buffered structure to support continuous transmission. When the next data to be transmitted is stored in TDRHL after one frame of data is transmitted, the transmitting operation continues by transferring the data from the TDRHL register to the TSR register.

The CPU can read from and write to the TDRHL register. Bits [15:9] in TDRHL are fixed to 1. These bits are read as 1. The write value should be 1. Write transmit data to the TDRHL register only when a transmit data empty interrupt (SCIn_TXI) request is issued.

FRDRHL是一个16位寄存器，由8位FRDRH和FRDRL寄存器组成。

FRDRH和FRDRL构成一个16级FIFO寄存器，用于存储串行接收数据和软件可读的相关状态信息。该寄存器仅在异步模式下有效，包括多处理器模式或时钟同步模式。

SCI将接收到的数据从RSR寄存器传送到FRDRH和FRDRL中存储，完成一帧串行数据的接收。执行连续接收，直到存储16个阶段。如果在FRDRH和FRDRL中没有接收到数据时读取数据，则该值未定义。当FRDRH和FRDRL充满接收数据时，后续串行接收数据丢失。CPU可以从FRDRH和FRDRL读取，但不能写入它们。

从FRDRH寄存器的RDF、ORER或DR标志读取1与从寄存器中的这些位读取相同SSR_FIFO寄存器。在读取FRDRH寄存器后写入0以清除SSR_FIFO寄存器中的标志时，仅将0写入要清除的标志，将1写入其他标志。

读取FRDRH和FRDRL寄存器时，按照从FRDRH到FRDRL的顺序读取。FDRHL寄存器可以以16位为单位进行访问。

30.2.5 发送数据寄存器(TDR)

Address(es): SCI0.TDR 4007 0003h, SCI1.TDR 4007 0023h, SCI2.TDR 4007 0043h, SCI3.TDR 4007 0063h, SCI4.TDR 4007 0083h, SCI8.TDR 4007 0103h, SCI9.TDR 4007 0123h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	1	1	1	1	1	1	1	1

TDR是一个8位寄存器，用于存储发送数据。

当SCI检测到TSR为空时，它将写入TDR的发送数据传送到TSR并开始发送。

TDR和TSR的双缓冲结构可实现连续串行传输。如果在发送一帧数据时，下一个发送数据已经写入TDR，则SCI将写入的数据传输到TSR继续发送。

CPU可以随时读取或写入TDR。每次发送数据空中断(SCIn_TXI)后，仅将发送数据写入TDR一次。

30.2.6 发送9位数据寄存器(TDRHL)

Address(es): SCI0.TDRHL 4007 000Eh, SCI1.TDRHL 4007 002Eh, SCI2.TDRHL 4007 004Eh, SCI3.TDRHL 4007 006Eh, SCI4.TDRHL 4007 008Eh, SCI8.TDRHL 4007 010Eh, SCI9.TDRHL 4007 012Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

TDRHL是一个16位寄存器，用于存储发送数据。选择异步模式和9位数据长度时，请使用此寄存器。

TDRHL的低8位是TDR的影子寄存器，因此访问TDRHL会影响TDR寄存器。如果选择7位或8位数据长度，则禁止访问TDRHL寄存器。当在TSR寄存器中检测到空空间时，存储在TDRHL寄存器中的发送数据被传送到TSR并开始发送。

TSR和TDRHL寄存器具有双缓冲结构以支持连续传输。当下一个要发送的数据在发送一帧数据后存储在TDRHL中时，通过将数据从TDRHL寄存器传送到TSR寄存器来继续发送操作。

CPU可以读取和写入TDRHL寄存器。TDRHL中的位[15:9]固定为1。这些位读为1。
写入值应为1。仅当发出发送数据空中断(SCIn_TXI)请求时，才将发送数据写入TDRHL寄存器。

30.2.7 Transmit FIFO Data Register H, L, HL (FTDRH, FTDRL, FTDRHL)

Transmit FIFO Data Register H (FTDRH)

Address(es): SCI0.FTDRH 4007 000Eh, SCI1.FTDRH 4007 002Eh, SCI2.FTDRH 4007 004Eh, SCI3.FTDRH 4007 006Eh, SCI4.FTDRH 4007 008Eh, SCI8.FTDRH 4007 010Eh, SCI9.FTDRH 4007 012Eh

Transmit FIFO Data Register L (FTDRL)

SCIn.FTDRH | SCIn.FTDRL

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MPBT	TDAT[8:0]								
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b8 to b0	TDAT[8:0]	Serial Transmit Data	Serial transmit data, valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, with FIFO selected	W
b9	MPBT	Multi-Processor Transfer Bit Flag	Specifies the multi-processor bit in the transmission frame: 0: Data transmission cycle 1: ID transmission cycle. Valid only in asynchronous mode with SMR.MP = 1 and FIFO selected.	W
b15 to b10	—	Reserved	The write value should be 1	W

FTDRHL is a 16-bit register that consists of 8-bit FTDRH and FTDRL registers.

FTDRH and FTDRL constitute a 16-stage FIFO register that stores data for serial transmission and a multi-processor transfer bit. This register is valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode.

When the SCI detects that the Transmit Shift Register (TSR) is empty, it transfers data written in the FTDRH and FTDRL registers to the TSR register and starts serial transmission. Continuous serial transmission is executed until no transmit data is left in FTDRH and FTDRL. When FTDRHL is full of transmit data, no more data can be written. If writing new data is attempted, the data is ignored. The CPU can write to the FTDRH and FTDRL registers but cannot read them.

When writing to both the FTDRH and FTDRL registers, write in the order from FTDRH to FTDRL.

MPBT flag (Multi-Processor Transfer Bit Flag)

The MPBT flag specifies the value of the multi-processor bit of the transmit frame. When FCR.FM = 1, SSR.MPBT is not valid.

30.2.7 发送FIFO数据寄存器H L HL(FTDRH FTDRL FTDRHL)

发送FIFO数据寄存器H(FTDRH)

Address(es): SCI0.FTDRH 4007 000Eh, SCI1.FTDRH 4007 002Eh, SCI2.FTDRH 4007 004Eh, SCI3.FTDRH 4007 006Eh, SCI4.FTDRH 4007 008Eh, SCI8.FTDRH 4007 010Eh, SCI9.FTDRH 4007 012Eh

发送FIFO数据寄存器HL(FTDRHL)

Address(es): SCI0.FTDRHL 4007 000Eh, SCI1.FTDRHL 4007 002Eh, SCI2.FTDRHL 4007 004Eh, SCI3.FTDRHL 4007 006Eh, SCI4.FTDRHL 4007 008Eh, SCI8.FTDRHL 4007 010Eh, SCI9.FTDRHL 4007 012Eh

SCIn.FTDRHL

SCIn.FTDRH | SCIn.FTDRL

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MPBT	TDAT[8:0]								
重置后的值:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	位名称	Description	R/W
b8 to b0	TDAT[8:0]	串行传输数据	串行发送数据，仅在异步模式下有效，包括多处理器模式，或时钟同步模式，选择FIFO	W
b9	MPBT	多处理器传输位标志	指定传输帧中的多处理器位：0：数据传输周期1：ID传输周期。仅在SMR.MP=1且选择了FIFO的异步模式下有效。	W
b15 to b10	—	Reserved	写入值应为1	W

FTDRHL是一个16位寄存器，由8位FTDRH和FTDRL寄存器组成。

FTDRH和FTDRL构成一个16级FIFO寄存器，用于存储串行传输的数据和一个多处理器传输位。该寄存器仅在异步模式下有效，包括多处理器模式或时钟同步模式。

当SCI检测到发送移位寄存器(TSR)为空时，它会传输写入FTDRH中的数据并FTDRL注册到TSR寄存器并开始串行传输。执行连续串行传输，直到在FTDRH和FTDRL中没有剩余传输数据。当FTDRHL充满传输数据时，不能再写入数据。如果尝试写入新数据，则忽略该数据。CPU可以写入FTDRH和FTDRL寄存器，但不能读取它们。

写入FTDRH和FTDRL寄存器时，按照从FTDRH到FTDRL的顺序写入。

MPBT标志（多处理器传输位标志）

MPBT标志指定发送帧的多处理器位的值。当FCR.FM=1时，SSR.MPBT无效。

30.2.8 Transmit Shift Register (TSR)

TSR is a shift register that transmits serial data. To perform serial data transmission, the SCI first automatically transfers transmit data from TDR, TDRHL, or transmit FIFO to TSR, then sends the data to the TXDn pin. The CPU cannot directly access the TSR.

30.2.9 Serial Mode Register (SMR) for Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Address(es): SCI0.SMR 4007 0000h, SCI1.SMR 4007 0020h, SCI2.SMR 4007 0040h, SCI3.SMR 4007 0060h, SCI4.SMR 4007 0080h, SCI8.SMR 4007 0100h, SCI9.SMR 4007 0120h

	b7	b6	b5	b4	b3	b2	b1	b0
	CM	CHR	PE	PM	STOP	MP	CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	CKS[1:0]	Clock Select	b1 b0 0 0: PCLKA clock (n = 0)*1 0 1: PCLKA/4 clock (n = 1)*1 1 0: PCLKA/16 clock (n = 2)*1 1 1: PCLKA/64 clock (n = 3)*1.	R/W*4
b2	MP	Multi-Processor Mode	Valid only in asynchronous mode: 0: Multi-processor communications function is disabled 1: Multi-processor communications function is enabled.	R/W*4
b3	STOP	Stop Bit Length	Valid only in asynchronous mode: 0: 1 stop bit 1: 2 stop bits.	R/W*4
b4	PM	Parity Mode	Valid only when the PE bit is 1: 0: Even parity is selected 1: Odd parity is selected.	R/W*4
b5	PE	Parity Enable	Valid only in asynchronous mode: • When transmitting: 0: Parity bit is not added 1: Parity bit is added. • When receiving: 0: Parity bit is not checked 1: Parity bit is checked.	R/W*4
b6	CHR	Character Length	Valid only in asynchronous mode*2. Selects the transmit/receive character length in combination with the SCMR.CHR1 bit: CHR1 CHR 0 0: Transmit/receive in 9-bit data length 0 1: Transmit/receive in 9-bit data length 1 0: Transmit/receive in 8-bit data length (initial value) 1 1: Transmit/receive in 7-bit data length*3.	R/W*4
b7	CM	Communication Mode	0: Asynchronous mode or simple IIC mode 1: Clock synchronous mode or simple SPI mode.	R/W*4

Note 1. n is the decimal notation of the value of n in BRR, see section 30.2.17, Bit Rate Register (BRR).
Note 2. In any mode other than asynchronous mode, this bit setting is invalid and a fixed data length of 8 bits is used.
Note 3. LSB-first is fixed and the MSB bit [7] in TDR is not transmitted.
Note 4. Writable only when SCR.TE = 0 and SCR.RE = 0 (both serial transmission and reception are disabled).

The SMR register sets the communication format and the clock source for the on-chip baud rate generator.

30.2.8 发送移位寄存器(TSR)

TSR是传送串行数据的移位寄存器。为了进行串行数据传输，SCI首先自动将发送数据从TDR、TDRHL或发送FIFO传输到TSR，然后将数据发送到TXDn引脚。CPU不能直接访问TSR。

30.2.9 非智能卡接口模式的串行模式寄存器(SMR)(SCMR.SMIF=0)

Address(es): SCI0.SMR 4007 0000h, SCI1.SMR 4007 0020h, SCI2.SMR 4007 0040h, SCI3.SMR 4007 0060h, SCI4.SMR 4007 0080h, SCI8.SMR 4007 0100h, SCI9.SMR 4007 0120h

	b7	b6	b5	b4	b3	b2	b1	b0
	CM	CHR	PE	PM	STOP	MP	CKS[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	CKS[1:0]	时钟选择	b1 b0 0 0: PCLKA clock (n = 0)*1 0 1: PCLKA/4 clock (n = 1)*1 1 0: PCLKA/16 clock (n = 2)*1 1 1: PCLKA/64 clock (n = 3)*1.	R/W*4
b2	MP	Multi-Processor Mode	仅在异步模式下有效：0：禁用多处理器通信功能1：启用多处理器通信功能。	R/W*4
b3	STOP	停止位长度	仅在异步模式下有效：0：1个停止位1：2个停止位。	R/W*4
b4	PM	奇偶校验模式	仅当PE位为1时有效：0：选择偶校验1：选择奇校验。	R/W*4
b5	PE	奇偶校验使能	仅在异步模式下有效：　发送时：0：不添加奇偶校验位1：添加奇偶校验位。　接收时：0：不检查奇偶校验位1：检查奇偶校验位。	R/W*4
b6	CHR	字符长度	仅在异步模式下有效*2。 结合SCMR.CHR1位选择发送接收字符长度：CHR1CHR00：发送接收9位数据长度01：发送接收9位数据长度10：发送接收8位数据长度（初始值）11：以7位数据长度发送接收*3。	R/W*4
b7	CM	通讯方式	0：异步模式或简单IIC模式1：时钟同步模式或简单SPI模式。	R/W*4

Note 1. n是BRR中n值的十进制表示法，请参见第30.2.17节，比特率寄存器(BRR)。
Note 2. 在异步模式以外的任何模式下，该位设置无效，使用固定的8位数据长度。
Note 3. LSB-first是固定的，并且不传输TDR中的MSB位[7]。
Note 4. 仅当SCR.TE=0和SCR.RE=0时可写（串行发送和接收均禁用）。

SMR寄存器设置片内波特率发生器的通信格式和时钟源。

CKS[1:0] bits (Clock Select)

The CKS[1:0] bits select the clock source for the on-chip baud rate generator.

For the relationship between the settings of these bits and the baud rate, see section 30.2.17, Bit Rate Register (BRR).

MP bit (Multi-Processor Mode)

The MP bit disables or enables the multi-processor communications function. The settings of the PE and PM bits are invalid in multi-processor mode.

STOP bit (Stop Bit Length)

The STOP bit selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

PM bit (Parity Mode)

The PM bit selects the parity mode (even or odd) for transmission and reception.

The PM bit setting is invalid in multi-processor mode.

PE bit (Parity Enable)

When the PE bit is set to 1, the parity bit is added to transmit data, and the parity bit is checked at reception.

Regardless of the PE bit setting, the parity bit is not added or checked in multi-processor format.

CHR bit (Character Length)

The CHR bit selects the data length for transmission and reception in combination with the SCMR.CHR1 bit.

In modes other than asynchronous, a fixed data length of 8 bits is used.

CM bit (Communication Mode)

The CM bit selects the communication mode:

- Asynchronous mode or simple IIC mode
- Clock synchronous mode or simple SPI mode.

30.2.10 Serial Mode Register for Smart Card Interface Mode (SMR_SMCI) (SCMR.SMIF = 1)

Address(es): SCI0.SMR_SMCI 4007 0000h, SCI1.SMR_SMCI 4007 0020h, SCI2.SMR_SMCI 4007 0040h, SCI3.SMR_SMCI 4007 0060h, SCI4.SMR_SMCI 4007 0080h, SCI8.SMR_SMCI 4007 0100h, SCI9.SMR_SMCI 4007 0120h

	b7	b6	b5	b4	b3	b2	b1	b0
	GM	BLK	PE	PM	BCP[1:0]		CKS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	CKS[1:0]	Clock Select	b1 b0 0 0: PCLKA clock (n = 0)*1 0 1: PCLKA/4 clock (n = 1)*1 1 0: PCLKA/16 clock (n = 2)*1 1 1: PCLKA/64 clock (n = 3)*1.	R/W*2
b3, b2	BCP[1:0]	Base Clock Pulse	Selects the number of base clock cycles in combination with the SCMR.BCP2 bit. Table 30.3 lists the combinations of the SCMR.BCP2 and SMR.BCP[1:0] bits.	R/W*2

CKS[1:0]位（时钟选择）

CKS[1:0]位选择片内波特率发生器的时钟源。

有关这些位的设置与波特率之间的关系，请参见第30.2.17节，比特率寄存器(BRR)。

MP位（多处理器模式）

MP位禁用或启用多处理器通信功能。PE和PM位的设置在多处理器模式下无效。

停止位（停止位长度）

STOP位选择传输中的停止位长度。

在接收中，无论该位设置如何，都只检查第一个停止位。如果第二个停止位为0，则将其视为下一个发送帧的起始位。

PM位（奇偶校验模式）

PM位选择发送和接收的奇偶校验模式（偶数或奇数）。

PM位设置在多处理器模式下无效。

PE位（奇偶校验使能）

当PE位设置为1时，发送数据时添加奇偶校验位，接收时检查奇偶校验位。

无论PE位设置如何，在多处理器格式中都不会添加或检查奇偶校验位。

CHR位（字符长度）

CHR位与SCMR.CHR1位一起选择发送和接收的数据长度。

在非异步模式下，使用8位的固定数据长度。

CM位（通信模式）

CM位选择通信模式：

- 异步模式或简单IIC模式
- 时钟同步模式或简单的SPI模式。

30.2.10 智能卡接口模式的串行模式寄存器(SMR_SMCI)(SCMR.SMIF=1)

Address(es): SCI0.SMR_SMCI 4007 0000h, SCI1.SMR_SMCI 4007 0020h, SCI2.SMR_SMCI 4007 0040h, SCI3.SMR_SMCI 4007 0060h, SCI4.SMR_SMCI 4007 0080h, SCI8.SMR_SMCI 4007 0100h, SCI9.SMR_SMCI 4007 0120h

	b7	b6	b5	b4	b3	b2	b1	b0
	GM	BLK	PE	PM	BCP[1:0]		CKS[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	CKS[1:0]	时钟选择	b1 b0 0 0: PCLKA clock (n = 0)*1 0 1: PCLKA/4 clock (n = 1)*1 1 0: PCLKA/16 clock (n = 2)*1 1 1: PCLKA/64 clock (n = 3)*1.	R/W*2
b3, b2	BCP[1:0]	基本时钟脉冲	结合SCMR.BCP2位选择基本时钟周期数。表30.3列出了SCMR.BCP2和 SMR.BCP[1:0] bits.	R/W*2

Bit	Symbol	Bit name	Description	R/W
b4	PM	Parity Mode	Valid only when the PE bit is 1: 0: Even parity is selected 1: Odd parity is selected.	R/W*2
b5	PE	Parity Enable	When this bit is set to 1, a parity bit is added to transmit data, and the parity of received data is checked. Set this bit to 1 in smart card interface mode.	R/W*2
b6	BLK	Block Transfer Mode	0: Non-block transfer mode operation 1: Block transfer mode operation.	R/W*2
b7	GM	GSM Mode	0: Non-GSM mode operation 1: GSM mode operation.	R/W*2

Note 1. n is the decimal notation of the value of n in BRR, see section 30.2.17, Bit Rate Register (BRR).
Note 2. Writable only when SCR_SMCI.TE = 0 and SCR_SMCI.RE = 0 (both serial transmission and reception are disabled).

The SMR_SMCI register sets the communication format and clock source for the on-chip baud rate generator.

CKS[1:0] bit (Clock Select)

The CKS[1:0] bits select the clock source for the on-chip baud rate generator.

For the relationship between the settings of these bits and the baud rate, see section 30.2.17, Bit Rate Register (BRR).

BCP[1:0] bits (Base Clock Pulse)

The BCP[1:0] bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode.

Set these bits in combination with the SCMR.BCP2 bit.

For details, see section 30.6.4, Receive Data Sampling Timing and Reception Margin.

Table 30.3 Combinations of SCMR.BCP2 and SMR_SMCI.BCP[1:0] bits

SCMR.BCP2 bit	SMR_SMCI.BCP[1:0] bits	Number of base clock cycles for 1-bit transfer period
0	00	93 clock cycles (S = 93)*1
0	01	128 clock cycles (S = 128)*1
0	10	186 clock cycles (S = 186)*1
0	11	512 clock cycles (S = 512)*1
1	00	32 clock cycles (S = 32)*1 (initial value)
1	01	64 clock cycles (S = 64)*1
1	10	372 clock cycles (S = 372)*1
1	11	256 clock cycles (S = 256)*1

Note 1. S is the value of S in BRR, see section 30.2.17, Bit Rate Register (BRR).

PM bit (Parity Mode)

The PM bit selects the parity mode for transmission and reception (even or odd). For details on the usage of this bit in smart card interface mode, see section 30.6.2, Data Format (Except in Block Transfer Mode).

PE bit (Parity Enable)

Set the PE bit to 1. The parity bit is added to the transmit data before transmission, and the parity bit is checked at reception.

BLK bit (Block Transfer Mode)

Set the BLK bit to 1 to enable the block transfer mode operation. For details, see section 30.6.3, Block Transfer Mode.

GM bit (GSM Mode)

Set the GM bit to 1 to enable GSM mode operation. In GSM mode, the SSR_SMCI.TEND flag set timing is moved forward to 11.0 ETUs (elementary time unit = 1-bit transfer time) from the start bit, and the clock output control function is enabled. For details, see section 30.6.6, Serial Data Transmission (Except in Block Transfer Mode) and section 30.6.8, Clock Output Control.

Bit	Symbol	位名称	Description	R/W
b4	PM	奇偶校验模式	仅当PE位为1时有效：0：选择偶校验1：选择奇校验。	R/W*2
b5	PE	奇偶校验使能	当该位设置为1时，发送数据时添加一个奇偶校验位，并检查接收数据的奇偶校验。在智能卡接口模式下将此位设置为1。	R/W*2
b6	BLK	块传输模式	0：非块传输模式操作1：块传输模式操作。	R/W*2
b7	GM	GSM Mode	0：非GSM模式操作1：GSM模式操作。	R/W*2

Note 1. n是BRR中n值的十进制表示法，请参见第30.2.17节，比特率寄存器(BRR)。
Note 2. 仅当SCR_SMCI.TE=0且SCR_SMCI.RE=0时可写（串行传输和接收均禁用）。

SMR_SMCI寄存器设置片内波特率发生器的通信格式和时钟源。

CKS[1:0]位（时钟选择）

CKS[1:0]位选择片内波特率发生器的时钟源。

有关这些位的设置与波特率之间的关系，请参见第30.2.17节，比特率寄存器(BRR)。

BCP[1:0]位（基本时钟脉冲）

BCP[1:0]位选择智能卡接口模式下1位数据传输时间内的基本时钟周期数。

将这些位与SCMR.BCP2位一起设置。

有关详细信息，请参见第30.6.4节，接收数据采样时序和接收余量。

Table 30.3 SCMR.BCP2和SMR_SMCI.BCP[1:0]位的组合

SCMR.BCP2 bit	SMR_SMCI.BCP[1:0] bits	1位传输周期的基本时钟周期数
0	00	93个时钟周期(S=93)*1
0	01	128个时钟周期(S=128)*1
0	10	186个时钟周期(S=186)*1
0	11	512个时钟周期(S=512)*1
1	00	32个时钟周期(S=32)*1（初始值）
1	01	64个时钟周期(S=64)*1
1	10	372个时钟周期(S=372)*1
1	11	256个时钟周期(S=256)*1

Note 1. S是BRR中S的值，请参见第30.2.17节，比特率寄存器(BRR)。

PM位（奇偶校验模式）

PM位选择发送和接收的奇偶校验模式（偶数或奇数）。有关该位在智能卡接口模式下的使用详情，请参见第30.6.2节，数据格式（块传输模式除外）。

PE位（奇偶校验使能）

将PE位设置为1。奇偶校验位在发送前添加到发送数据中，并在接收时检查奇偶校验位。

BLK位（块传输模式）

将BLK位设置为1以启用块传输模式操作。有关详细信息，请参阅第30.6.3节，块传输模式。

GM位（GSM模式）

将GM位设置为1以启用GSM模式操作。在GSM模式下，SSR_SMCI.TEND标志设置时序从起始位前移到11.0ETU（基本时间单位=1位传输时间），并启用时钟输出控制功能。有关详细信息，请参见第30.6.6节，串行数据传输（块传输模式除外）和第30.6.8节，时钟输出控制。

30.2.11 Serial Control Register (SCR) for Non-Smart Card Interface Mode (SCMR.SMIF = 0)

Address(es): SCI0.SCR 4007 0002h, SCI1.SCR 4007 0022h, SCI2.SCR 4007 0042h, SCI3.SCR 4007 0062h, SCI4.SCR 4007 0082h, SCI8.SCR 4007 0102h, SCI9.SCR 4007 0122h

	b7	b6	b5	b4	b3	b2	b1	b0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	CKE[1:0]	Clock Enable	• Asynchronous mode: b1 b0 0 0: On-chip baud rate generator. The SCKn pin is available for use as an I/O port based on the I/O port settings. 0 1: On-chip baud rate generator. A clock with the same frequency as the bit rate is output from the SCKn pin. 1 x: External clock. A clock with a frequency 16 times the bit rate should be input from the SCKn pin when the SEMR.ABCS bit is 0. Input a clock signal with a frequency eight times the bit rate when the SEMR.ABCS bit is 1. • Clock synchronous mode: b1 b0 0 x: Internal clock. The SCKn pin functions as the clock output pin. 1 x: External clock. The SCKn pin functions as the clock input pin.	R/W*1
b2	TEIE	Transmit End Interrupt Enable	0: An SCIn_TEI interrupt request is disabled 1: An SCIn_TEI interrupt request is enabled.	R/W
b3	MPIE	Multi-Processor Interrupt Enable	Valid in asynchronous mode when SMR.MP = 1: 0: Non-multi-processor reception 1: When data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags RDRF, ORER, and FER in SSR to 1 is disabled. When data with the multi-processor bit set to 1 is received, the MPIE bit is automatically set to 0, and non-multi-processor reception is resumed.	R/W*3
b4	RE	Receive Enable	0: Serial reception is disabled 1: Serial reception is enabled.	R/W*2
b5	TE	Transmit Enable	0: Serial transmission is disabled 1: Serial transmission is enabled.	R/W*2
b6	RIE	Receive Interrupt Enable	0: SCIn_RXI and SCIn_ERI interrupt requests are disabled 1: SCIn_RXI and SCIn_ERI interrupt requests are enabled.	R/W
b7	TIE	Transmit Interrupt Enable	0: An SCIn_TXI interrupt request is disabled 1: An SCIn_TXI interrupt request is enabled.	R/W

x: Don't care

Note 1. Writable only when TE = 0 and RE = 0.

Note 2. 1 can be written only when TE = 0 and RE = 0, when the SMR.CM bit is 1. After setting TE or RE to 1, only 0 can be written to TE and RE. When the SMR.CM bit is 0 and the SIMR1.IICM bit is 0, writing is enabled under any condition.

Note 3. When writing a new value to a bit other than the MPIE bit of this register in multi-processor mode (SMR.MP bit = 1), write 0 to the MPIE bit using the store instruction to avoid accidentally setting the MPIE bit to 1 by a read-modify-write operation when using a bit manipulation instruction.

The SCR controls operation and clock source selection for transmission and reception.

CKE[1:0] bits (Clock Enable)

The CKE[1:0] bits select the clock source and the SCKn pin function.

30.2.11 非智能卡接口模式的串行控制寄存器(SCR)(SCMR.SMIF=0)

Address(es): SCI0.SCR 4007 0002h, SCI1.SCR 4007 0022h, SCI2.SCR 4007 0042h, SCI3.SCR 4007 0062h, SCI4.SCR 4007 0082h, SCI8.SCR 4007 0102h, SCI9.SCR 4007 0122h

b7	TIE	发送中断使能	0：禁止SCIn_TXI中断请求1：使能SCIn_TXI中断请求。	R/W

x：不关心注

1。 仅当TE=0且RE=0时可写。

Note 2. 只有当TE=0且RE=0时，SMR.CM位为1时才能写入1。将TE或RE设置为1后，TE和RE只能写入0。当SMR.CM位为0且SIMR1.IICM位为0时，在任何情况下都可以写入。

Note 3. 在多处理器模式下（SMR.MP位=1）向该寄存器的MPIE位以外的位写入新值时，使用存储指令将0写入MPIE位，以避免意外将MPIE位设置为1使用位操作指令时的读-修改-写操作。

SCR控制发送和接收的操作和时钟源选择。

CKE[1:0]位（时钟使能）

CKE[1:0]位选择时钟源和SCKn引脚功能。

TEIE bit (Transmit End Interrupt Enable)

The TEIE bit enables or disables an SCIn_TEI interrupt request. Set the TEIE bit to 0 to disable the SCIn_TEI interrupt request.

In simple IIC mode, SCIn_TEI is allocated to the interrupt on completion of issuing a start, restart, or stop condition (STIn). In this case, the TEIE bit can be used to enable or disable the STI.

MPIE bit (Multi-Processor Interrupt Enable)

When the MPIE bit is set to 1 and data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags RDRF, RDF, ORER, and FER in SSR/SSR_FIFO to 1 is disabled. When data with the multi-processor bit set to 1 is received, the MPIE bit is automatically set to 0, and non-multi-processor reception resumes. For details, see section 30.4, Multi-Processor Communication Function.

When the MPB bit in the SSR is 0, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER and FER to 1 is disabled.

When the MPB bit is 1, the MPIE bit is automatically set to 0, SCIn_RXI and SCIn_ERI interrupt requests are enabled (if the RIE bit in SCR is set to 1), and setting of the ORER and FER flags to 1 is enabled.

Set MPIE to 0 if the multi-processor communications function is not used.

RE bit (Receive Enable)

The RE bit enables or disables serial reception.

When this bit is set to 1, serial reception starts by detecting the start bit in asynchronous mode or the synchronous clock input in clock synchronous mode. Set the reception format in the SMR register before setting the RE bit to 1.

When non-FIFO operation is selected and reception is halted by setting the RE bit to 0, the RDRF, ORER, FER, and PER flags in the SSR register are not affected, and the previous values are saved.

When FIFO operation is selected and reception is halted by setting the RE bit to 0, the RDF, ORER, FER, PER, and DR flags in SSR_FIFO are not affected and the previous values are saved.

TE bit (Transmit Enable)

The TE bit enables or disables serial transmission.

When the TE bit is set to 1, serial transmission starts by writing transmit data to TDR. Set the transmission format in the SMR register before setting the TE bit to 1.

RIE bit (Receive Interrupt Enable)

The RIE bit enables or disables SCIn_RXI and SCIn_ERI interrupt requests.

Setting the RIE bit to 0 disables SCIn_RXI and SCIn_ERI interrupt requests.

To cancel an SCIn_ERI interrupt request, read 1 from the ORER, FER, or PER flag in SSR/SSR_FIFO, then set the flag to 0, or set the RIE bit to 0.

TIE bit (Transmit Interrupt Enable)

The TIE bit enables or disables SCIn_TXI interrupt requests.

Setting the TIE bit to 0 disables an SCIn_TXI interrupt request. For the SCIn_TXI interrupt to occur, set the TE and TIE bits to 1 simultaneously, before transfer starts.

TEIE位（发送结束中断使能）

TEIE位启用或禁用SCIn_TEI中断请求。将TEIE位设置为0以禁用SCIn_TEI中断请求。

在简单IIC模式下，SCIn_TEI在完成发出启动、重新启动或停止条件(STIn)时分配给中断。在这种情况下，TEIE位可用于启用或禁用STI。

MPIE位（多处理器中断使能）

当MPIE位设置为1并且接收到多处理器位设置为0的数据时，不读取数据，并且将SSRSSR_FIFO中的状态标志RDRF、RDF、ORER和FER设置为1被禁用。当接收到多处理器位设置为1的数据时，MPIE位自动设置为0，并恢复非多处理器接收。有关详细信息，请参阅第30.4节，多处理器通信功能。

当SSR中的MPB位为0时，接收数据不会从RSR传送到RDR，不会检测到接收错误，并且将标志ORER和FER设置为1被禁止。

当MPB位为1时，MPIE位自动设置为0，允许SCIn_RXI和SCIn_ERI中断请求（如果SCR中的RIE位设置为1），并且允许设置ORER和FER标志为1。

如果不使用多处理器通信功能，则将MPIE设置为0。

RE位（接收使能）

RE位启用或禁用串行接收。

当该位设置为1时，串行接收通过检测异步模式下的起始位或时钟同步模式下的同步时钟输入来启动。在将RE位设置为1之前，在SMR寄存器中设置接收格式。

Whennon-FIFOoperationisselectedandreceptionishaltedbysettingtheREbitto0 theRDRF ORER FER andPERflagsintheSSRregisterarenotaffected andthepreviousvaluesaresaved.

WhenFIFOoperationisselectedandreceptionishaltedbysettingtheREbitto0 theRDF ORER FER PER andDRflagsinSSR_FIFOarenotaffectedandthepreviousvaluesaresaved.

TE位（发送使能）

TE位启用或禁用串行传输。

当TE位设置为1时，串行发送通过将发送数据写入TDR开始。设置传输格式
将TE位设置为1之前的SMR寄存器。

RIE位（接收中断使能）

RIE位启用或禁用SCIn_RXI和SCIn_ERI中断请求。

将RIE位设置为0会禁用SCIn_RXI和SCIn_ERI中断请求。

要取消SCIn_ERI中断请求，请从SSRSSR_FIFO中的ORER、FER或PER标志读取1，然后将该标志设置为0，或将RIE位设置为0。

TIE位（发送中断使能）

TIE位启用或禁用SCIn_TXI中断请求。

将TIE位设置为0将禁用SCIn_TXI中断请求。为了使SCIn_TXI中断发生，在传输开始之前将TE和TIE位同时设置为1。

30.2.12 Serial Control Register for Smart Card Interface Mode (SCR_SMCI) (SCMR.SMIF = 1)

Address(es): SCI0.SCR_SMCI 4007 0002h, SCI1.SCR_SMCI 4007 0022h, SCI2.SCR_SMCI 4007 0042h, SCI3.SCR_SMCI 4007 0062h, SCI4.SCR_SMCI 4007 0082h, SCI8.SCR_SMCI 4007 0102h, SCI9.SCR_SMCI 4007 0122h

	b7	b6	b5	b4	b3	b2	b1	b0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	CKE[1:0]	Clock Enable	• When GM in SMR_SMCI = 0: b1 b0 0 0: Output disabled. b7	TIE	Transmit Interrupt Enable	0: SCIn_TXI interrupt request is disabled 1: SCIn_TXI interrupt request is enabled.	R/W

x: Don't care
Note 1. Writable only when TE = 0 and RE = 0.
Note 2. 1 can be written only when TE = 0 and RE = 0. After setting TE or RE to 1, only 0 can be written to TE and RE.

The SCR_SMCI sets transmission and reception control, interrupt control, and clock source selection for transmission and reception.

For details on interrupt requests, see section 30.10, Interrupt Sources.

CKE[1:0] bits (Clock Enable)

The CKE[1:0] bits control the clock output from the SCKn pin.

In GSM mode, clock output can be dynamically switched. For details, see section 30.6.8, Clock Output Control.

TEIE bit (Transmit End Interrupt Enable)

Set the TEIE bit to 0 in smart card interface mode.

MPIE bit (Multi-Processor Interrupt Enable)

Set the MPIE bit to 0 in smart card interface mode.

30.2.12 智能卡接口模式的串行控制寄存器(SCR_SMCI)(SCMR.SMIF=1)

Address(es): SCI0.SCR_SMCI 4007 0002h, SCI1.SCR_SMCI 4007 0022h, SCI2.SCR_SMCI 4007 0042h, SCI3.SCR_SMCI 4007 0062h, SCI4.SCR_SMCI 4007 0082h, SCI8.SCR_SMCI 4007 0102h, SCI9.SCR_SMCI 4007 0122h

b6	RIE	接收中断使能	0：禁用SCIn_RXI和SCIn_ERI中断请求1：启用SCIn_RXI和SCIn_ERI中断请求。	R/W
b7	TIE	发送中断使能	0：禁止SCIn_TXI中断请求1：使能SCIn_TXI中断请求。	R/W

x：不关心注
1。 仅当TE=0且RE=0时可写。
Note 2. 只有在TE=0和RE=0时才能写入1。将TE或RE设置为1后，TE和RE只能写入0。

SCR_SMCI设置发送和接收的发送和接收控制、中断控制和时钟源选择。

有关中断请求的详细信息，请参见第30.10节，中断源。

CKE[1:0]位（时钟使能）

CKE[1:0]位控制SCKn引脚的时钟输出。

在GSM模式下，时钟输出可以动态切换。有关详细信息，请参见第30.6.8节，时钟输出控制。

TEIE位（发送结束中断使能）

在智能卡接口模式下将TEIE位设置为0。

MPIE位（多处理器中断使能）

在智能卡接口模式下将MPIE位设置为0。

RE bit (Receive Enable)

The RE bit enables or disables serial reception.

When this bit is set to 1, serial reception starts by detecting the start bit. Set the reception format in the SMR_SMCI register before setting the RE bit to 1.

If reception is halted by setting the RE bit to 0, the ORER, FER, and PER flags in SSR_SMCI are not affected and the previous values are saved.

TE bit (Transmit Enable)

The TE bit enables or disables serial transmission. When this bit is set to 1, serial transmission starts by writing transmit data to TDR. Set the transmission format in the SMR_SMCI register before setting the TE bit to 1.

RIE bit (Receive Interrupt Enable)

The RIE bit enables or disables SCIn_RXI and SCIn_ERI interrupt requests.

Setting the RIE bit to 0 disables SCIn_RXI and SCIn_ERI interrupt requests.

To cancel an SCIn_ERI interrupt request, read 1 from the ORER, FER, or PER flag in the SSR_SMCI register, then set the flag to 0, or set the RIE bit to 0.

TIE bit (Transmit Interrupt Enable)

The TIE bit enables or disables an SCIn_TXI interrupt request.

Setting the TIE bit to 0 disables an SCIn_TXI interrupt request. Set the TIE bit to 1 while the TE bit is 1. For the SCIn_TXI interrupt to occur, set the TE and TIE bits to 1 simultaneously before transfer starts.

30.2.13 Serial Status Register (SSR) for Non-Smart Card Interface and Non-FIFO Mode (SCMR.SMIF = 0 and FCR.FM = 0)

Address(es): SCI0.SSR 4007 0004h, SCI1.SSR 4007 0024h, SCI2.SSR 4007 0044h, SCI3.SSR 4007 0064h, SCI4.SSR 4007 0084h, SCI8.SSR 4007 0104h, SCI9.SSR 4007 0124h

	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Value after reset:	1	0	0	0	0	1	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MPBT	Multi-Processor Bit Transfer	Value of the multi-processor bit in the transmission frame: 0: Data transmission cycle 1: ID transmission cycle.	R/W
b1	MPB	Multi-Processor	Value of the multi-processor bit in the reception frame: 0: Data transmission cycle 1: ID transmission cycle.	R
b2	TEND	Transmit End Flag	0: A character is being transmitted 1: Character transfer is complete.	R
b3	PER	Parity Error Flag	0: No parity error occurred 1: Parity error occurred.	R/(W)*1
b4	FER	Framing Error Flag	0: No framing error occurred 1: Framing error occurred.	R/(W)*1
b5	ORER	Overrun Error Flag	0: No overrun error occurred 1: Overrun error occurred.	R/(W)*1
b6	RDRF	Receive Data Full Flag	0: No received data in RDR register 1: Received data in RDR register.	R/(W)*1
b7	TDRE	Transmit Data Empty Flag	0: Transmit data in TDR register 1: No transmit data in TDR register.	R/(W)*1

RE位（接收使能）

RE位启用或禁用串行接收。

当该位设置为1时，串行接收通过检测起始位开始。在将RE位设置为1之前，在SMR_SMCI寄存器中设置接收格式。

如果通过将RE位设置为0来停止接收，则SSR_SMCI中的ORER、FER和PER标志不受影响，并且之前的值被保存。

TE位（发送使能）

TE位启用或禁用串行传输。当该位设置为1时，串行传输通过将发送数据写入TDR开始。在将TE位设置为1之前，在SMR_SMCI寄存器中设置传输格式。

RIE位（接收中断使能）

RIE位启用或禁用SCIn_RXI和SCIn_ERI中断请求。

将RIE位设置为0会禁用SCIn_RXI和SCIn_ERI中断请求。

要取消SCIn_ERI中断请求，请从SSR_SMCI寄存器中的ORER、FER或PER标志读取1，然后将该标志设置为0，或将RIE位设置为0。

TIE位（发送中断使能）

TIE位启用或禁用SCIn_TXI中断请求。

将TIE位设置为0将禁用SCIn_TXI中断请求。当TE位为1时，将TIE位设置为1。对于SCIn_TXI中断发生，在传输开始前将TE和TIE位同时设置为1。

30.2.13 用于非智能卡接口和非FIFO模式的串行状态寄存器(SSR)（SCMR.SMIF=0和FCR.FM=0）

Address(es): SCI0.SSR 4007 0004h, SCI1.SSR 4007 0024h, SCI2.SSR 4007 0044h, SCI3.SSR 4007 0064h, SCI4.SSR 4007 0084h, SCI8.SSR 4007 0104h, SCI9.SSR 4007 0124h

	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
重置后的值：	1	0	0	0	0	1	0	0

b0	MPBT	多处理器位传输	传输帧中多处理器位的值：0：数据传输周期1：ID传输周期。	R/W
b1	MPB	Multi-Processor	接收帧中多处理器位的值：0：数据发送周期1：ID发送周期。	R
b2	TEND	发送结束标志	0：正在传输字符1：字符传输完成。	R
b3	PER	奇偶校验错误标志	0：未发生奇偶校验错误1：发生奇偶校验错误。	R/(W)*1
b4	FER	成帧错误标志	0：未发生帧错误1：发生帧错误。	R/(W)*1
b5	ORER	溢出错误标志	0：未发生溢出错误1：发生溢出错误。	R/(W)*1
b6	RDRF	接收数据满标志	0：RDR寄存器中没有接收到数据1：RDR寄存器中接收到数据。	R/(W)*1
b7	TDRE	传输数据空标志	0：在TDR寄存器中发送数据1：在TDR寄存器中不发送数据。	R/(W)*1

Note 1. Only 0 can be written to clear the flag after reading 1.

The SSR register provides the SCI status flags and transmission/reception multi-processor bits.

MPBT bit (Multi-Processor Bit Transfer)

The MPBT bit selects the multi-processor bit in the transmit frame.

MPB bit (Multi-Processor)

The MPB bit holds the value of the multi-processor bit in the reception frame. This bit does not change when the SCR.RE bit is 0.

TEND flag (Transmit End Flag)

The TEND flag indicates completion of transmission.

[Setting conditions]

- When the SCR.TE bit is set to 0 to disable serial transmission and the FCR.FM bit is set to 0 (non-FIFO selected)
- When the SCR.TE bit is set to 1, the TEND flag is not affected and keeps the value 1
- When the TDR register is not updated on transmission of the tail-end bit of a character.

[Clearing conditions]

- When transmit data is written to the TDR register when the SCR.TE bit is 1
- When 0 is written to TDRE after reading TDRE = 1 when the SCR.TE bit is 1.

PER flag (Parity Error Flag)

The PER flag indicates that a parity error occurred during reception in asynchronous mode and the reception ended abnormally.

[Setting condition]

- When a parity error is detected during reception in asynchronous mode and the address match function is disabled (DCCR.DCME = 0).

  Although receive data is transferred to the RDR register when the parity error occurs, no SCIn_RXI interrupt request occurs. When the PER flag is set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to the PER flag after reading PER = 1. After writing 0 to this flag, read it to verify that its value is 0.

When the SCR.RE bit is set to 0 to disable serial reception, the PER flag is not affected and keeps its previous value.

FER flag (Framing Error Flag)

The FER flag indicates that a framing error occurred during reception in asynchronous mode and the reception ended abnormally.

[Setting condition]

- When 0 is sampled as the stop bit during reception in asynchronous mode and the address match function is disabled (DCCR.DCME = 0).

  In 2-stop-bit mode, only the first stop bit is checked, but the second stop bit is not checked. Although receive data is transferred to the RDR register when the framing error occurs, no SCIn_RXI interrupt request occurs. Also, when the FER flag is set to 1, the subsequent receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to the FER flag after reading FER = 1. After writing 0 to this flag, read it to verify that its value is 0.

When the SCR.RE bit is set to 0 (serial reception is disabled), the FER flag is not affected and keeps its previous value.

Note 1. 读1后只能写0清除标志。

SSR寄存器提供SCI状态标志和发送接收多处理器位。

MPBT位（多处理器位传输）

MPBT位选择发送帧中的多处理器位。

MPB bit (Multi-Processor)

MPB位保存接收帧中多处理器位的值。该位不改变时
SCR.RE位为0。

TEND标志（发送结束标志）

TEND标志表示传输完成。

[Setting conditions]

- 当SCR.TE位设置为0以禁用串行传输且FCR.FM位设置为0（选择非FIFO）时
- 当SCR.TE位设置为1时，TEND标志不受影响并保持值1
- 当TDR寄存器未在字符尾端位传输时更新时。

[Clearing conditions]

- 当SCR.TE位为1时将发送数据写入TDR寄存器
- 当SCR.TE位为1时，读取TDRE=1后将0写入TDRE。

PER标志（奇偶校验错误标志）

PER标志表示在异步模式接收过程中发生奇偶校验错误，接收异常结束。

[Setting condition]

- 当在异步模式下接收期间检测到奇偶校验错误并且地址匹配功能被禁用（DCCR.DCME=0）。

尽管发生奇偶校验错误时接收数据被传送到RDR寄存器，但不会发生SCIn_RXI中断请求。当PER标志设置为1时，后续接收数据不传输到RDR。【结算条件】

- 当读取PER=1后将0写入PER标志。在向该标志写入0后，读取它以验证其值为0。

当SCR.RE位设置为0以禁用串行接收时，PER标志不受影响并保持其先前的值。

FER标志（帧错误标志）

FER标志表示在异步模式下接收过程中发生了帧错误，并且接收异常结束。

[Setting condition]

- 在异步模式下接收期间采样0作为停止位并且禁用地址匹配功能(DCCR.DCME=0)。

在2-stop-bit模式下，只检查第一个停止位，但不检查第二个停止位。虽然发生帧错误时接收数据被传输到RDR寄存器，但不会发生SCIn_RXI中断请求。此外，当FER标志设置为1时，后续接收数据不会传输到RDR。【结算条件】

- 当读取FER=1后将0写入FER标志时。将0写入此标志后，读取它以验证其值为0。

当SCR.RE位设置为0（禁用串行接收）时，FER标志不受影响并保持其先前的值。

ORER flag (Overrun Error Flag)

The ORER flag indicates that an overrun error occurred during reception and the reception ended abnormally.

[Setting condition]

- When the next data is received before receive data that does not have a parity error and a framing error is read from RDR.

  In RDR, data received prior to an overrun error occurrence is saved, but data received after the overrun error is lost. When the ORER flag is set to 1, data received is not forwarded to the RDR register. In clock synchronous mode, serial transmission and reception are stopped.

[Clearing condition]

- When 0 is written to the ORER flag after 1 is read. After writing 0 to this flag, read it to verify that its value is 0.

When the SCR.RE bit is set to 0 to disable serial reception, the ORER flag is not affected and keeps its previous value.

RDRF flag (Receive Data Full Flag)

The RDRF flag indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register.

[Clearing conditions]

- When 0 is written to RDRF flag after 1 is read
- When data is read from the RDR register.

Note: Do not clear RDRF flag by accessing RDRF bit in SSR register unless communication is aborted.

TDRE flag (Transmit Data Empty Flag)

The TDRE flag indicates the presence of transmit data in the TDR register.

[Setting conditions]

- When the SCR.TE bit is 0
- When data is transmitted from the TDR register to the TSR register.

[Clearing conditions]

- When 0 is written to TDRE flag after 1 is read
- When the SCR.TE bit is 1 and data is written to the TDR register.

Note: Do not clear TDRE flag by accessing TDRE in the SSR register unless communication is aborted.

ORER标志（溢出错误标志）

ORER标志表示接收期间发生溢出错误，接收异常结束。

[Setting condition]

- 在接收没有奇偶校验错误和帧错误的数据之前接收下一个数据时，从
  RDR.

  在RDR中，会保存发生溢出错误之前接收的数据，但会丢失发生溢出错误之后接收的数据。

当ORER标志设置为1时，接收到的数据不转发到RDR寄存器。在时钟同步模式下，串行发送和接收停止。【结算条件】

- 在读取1后将0写入ORER标志时。将0写入此标志后，读取它以验证其值为0。

当SCR.RE位设置为0以禁用串行接收时，ORER标志不受影响并保持其先前的值。

RDRF标志（接收数据满标志）

RDRF标志指示RDR寄存器中存在接收数据。

[Setting condition]

- 当接收正常结束时，接收数据从RSR寄存器转发到RDR寄存器。

[Clearing conditions]

- 读取1后将0写入RDRF标志时
- 从RDR寄存器读取数据时。

Note: 除非通信中止，否则不要通过访问SSR寄存器中的RDRF位来清除RDRF标志。

TDRE标志（传输数据空标志）

TDRE标志表示TDR寄存器中存在发送数据。

[Setting conditions]

- 当SCR.TE位为0时
- 当数据从TDR寄存器传输到TSR寄存器时。

[Clearing conditions]

- 读取1后将0写入TDRE标志时
- 当SCR.TE位为1且数据写入TDR寄存器时。

Note: 除非通信中止，否则不要通过访问SSR寄存器中的TDRE来清除TDRE标志。

30.2.14 Serial Status Register for Non-Smart Card Interface and FIFO Mode (SSR_FIFO) (SCMR.SMIF = 0 and FCR.FM = 1)

Address(es): SCI0.SSR_FIFO 4007 0004h, SCI1.SSR_FIFO 4007 0024h, SCI2.SSR_FIFO 4007 0044h, SCI3.SSR_FIFO 4007 0064h, SCI4.SSR_FIFO 4007 0084h, SCI8.SSR_FIFO 4007 0104h, SCI9.SSR_FIFO 4007 0124h

	b7	b6	b5	b4	b3	b2	b1	b0
	TDFE	RDF	ORER	FER	PER	TEND	—	DR
Value after reset:	1	0	0	0	0	0	x	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	DR	Receive Data Ready Flag	0: Reception is in progress, or no received data remains in FRDRHL after successfully completed reception (receive FIFO is empty) 1: Next receive data is not received for a period after successfully completed reception, and when the amount of data stored in the FIFO is equal to or less than the receive triggering number.	R/(W)*1
b1	—	Reserved	The read value is undefined. The write value should be 1.	R/W
b2	TEND	Transmit End Flag	0: A character is being transmitted 1: Character transfer is complete.	R/(W)*1
b3	PER	Parity Error Flag	0: No parity error occurred 1: Parity error occurred.	R/(W)*1
b4	FER	Framing Error Flag	0: No framing error occurred 1: Framing error occurred.	R/(W)*1
b5	ORER	Overrun Error Flag	0: No overrun error occurred 1: Overrun error occurred.	R/(W)*1
b6	RDF	Receive FIFO Data Full Flag	0: The amount of receive data written in FRDRHL is less than the specified receive triggering number 1: The amount of receive data written in FRDRHL is equal to or greater than the specified receive triggering number.	R/(W)*1
b7	TDFE	Transmit FIFO Data Empty Flag	0: The amount of transmit data written in FTDRHL exceeds the specified transmit triggering number 1: The amount of transmit data written in FTDRHL is equal to or less than the specified transmit triggering number.	R/(W)*1

Note 1. Only 0 can be written to clear the flag after reading 1.

The SSR_FIFO register provides the SCI with FIFO mode status flags.

DR flag (Receive Data Ready Flag)

The DR flag indicates that the amount of data stored in the Receive FIFO Data Register (FRDRHL) falls below the specified receive triggering number, and that no next data is received after 15 ETUs (elementary time units) from the last stop bit in asynchronous mode. This flag is valid only in asynchronous mode, including multi-processor mode, and when FIFO operation is selected. In clock synchronous mode, this flag is not set to 1.

[Setting condition]

- When FRDRHL contains less data than the specified receive triggering number, and no next data is received after 15 ETUs*1 from the last stop bit, and the SSR_FIFO.FER and SSR_FIFO.PER flags are 0.

[Clearing conditions]

- When 1 is read from DR, after all received data is read
- When the FCR.FM bit is changed from 0 to 1.

30.2.14 非智能卡接口和FIFO模式的串行状态寄存器(SSR_FIFO)（SCMR.SMIF=0和FCR.FM=1）

Address(es): SCI0.SSR_FIFO 4007 0004h, SCI1.SSR_FIFO 4007 0024h, SCI2.SSR_FIFO 4007 0044h, SCI3.SSR_FIFO 4007 0064h, SCI4.SSR_FIFO 4007 0084h, SCI8.SSR_FIFO 4007 0104h, SCI9.SSR_FIFO 4007 0124h

	b7	b6	b5	b4	b3	b2	b1	b0
	TDFE	RDF	ORER	FER	PER	TEND	—	DR
重置后的值：	1	0	0	0	0	0	x	0

x: Undefined

Bit	Symbol	位名称	Description	R/W
b0	DR	接收数据就绪标志	0：接收中，或接收成功后FRDRHL中没有接收到的数据（接收FIFO为空）1：接收成功后一段时间内没有接收到下一个接收数据，当FIFO中存储的数据量达到等于或小于接收触发数。	R/(W)*1
b1	—	Reserved	读取值未定义。写入值应为1。	R/W
b2	TEND	发送结束标志	0：正在传输字符1：字符传输完成。	R/(W)*1
b3	PER	奇偶校验错误标志	0：未发生奇偶校验错误1：发生奇偶校验错误。	R/(W)*1
b4	FER	成帧错误标志	0：未发生帧错误1：发生帧错误。	R/(W)*1
b5	ORER	溢出错误标志	0：未发生溢出错误1：发生溢出错误。	R/(W)*1
b6	RDF	接收FIFO数据满标志	0：写入FRDRHL的接收数据量小于指定的接收触发数1：写入FRDRHL的接收数据量为 等于或大于指定的接收触发数。	R/(W)*1
b7	TDFE	发送FIFO数据空标志	0：写入FTDRHL的发送数据量超过指定的发送触发数1：写入FTDRHL的发送数据量等于或小于指定的发送触发数。	R/(W)*1

Note 1. 读1后只能写0清除标志。

SSR_FIFO寄存器为SCI提供FIFO模式状态标志。

DR标志（接收数据就绪标志）

DR标志表示存储在接收FIFO数据寄存器(FRDRHL)中的数据量低于指定的接收触发数，并且在异步模式下从最后一个停止位开始15个ETU（基本时间单位）后没有接收到下一个数据.该标志仅在异步模式（包括多处理器模式）以及选择FIFO操作时有效。在时钟同步模式下，该标志不设置为1。

[Setting condition]

- 当FRDRHL包含的数据少于指定的接收触发数，并且从最后一个停止位开始15个ETU*1后没有接收到下一个数据，并且SSR_FIFO.FER和SSR_FIFO.PER标志为0。

[Clearing conditions]

- 从DR读取1时，在读取所有接收到的数据之后
- 当FCR.FM位从0变为1时。

Note 1. This is equivalent to 1.5 frames in the 8-bit format with one stop bit.
The DR flag is only set to 1 when FIFO is selected in asynchronous mode, including multi-processor mode. It is not set to 1 in other operation modes.

TEND flag (Transmit End Flag)

The TEND flag indicates that FTDRHL does not contain valid data when transmitting the last bit of a serial character, so the transmission is halted.

[Setting condition]

- TEND is set to 1 when FTDRHL does not contain transmit data when the last bit of a 1-byte serial character is transmitted.

[Clearing conditions]

- When transmit data is written to FTDRHL when the SCR.TE bit is 1
- When 0 is written to TEND after 1 is read, when the SCR.TE bit is 1
- When the FCR.FM bit is changed from 0 to 1.

PER flag (Parity Error Flag)

The PER flag indicates whether there is a parity error in the data read from the FRDRHL register in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

[Setting condition]

- When data is received and a parity error is detected, and the address match function is disabled (DCCR.DCME = 0).

[Clearing condition]

- When 0 is written to PER after 1 is read.

The receive operation is continuous when receive data is stored in the FRDRHL register even when a parity error occurs during reception.

When the SCR.RE bit is set to 0 (serial reception is disabled), the PER flag is not affected and keeps its previous value.

FER flag (Framing Error Flag)

The FER flag indicates whether there is a framing error in the data read from the FRDRHL register in asynchronous mode when the address match function is disabled (DCCR.DCME = 0).

[Setting condition]

- When 0 is sampled as the stop bit during reception and the address match function is disabled (DCCR.DCME = 0).

[Clearing condition]

- When 0 is written to FER after 1 is read.

The receive operation is continuous, and receive data is stored to the FRDRHL register even when a framing error occurs during reception.

When the SCR.RE bit is set to 0 (serial reception is disabled), the FER flag is not affected and keeps its previous value.

ORER flag (Overrun Error Flag)

The ORER flag indicates that the receive operation stopped abnormally because an overrun error occurred.

[Setting condition]

- When the next serial reception completes while the receive FIFO is full with 16-byte receive data.

[Clearing condition]

- When 0 is written to ORER after 1 is read.

When the SCR.RE bit is set to 0 (serial reception is disabled), the ORER flag is not affected and keeps its previous value.

注1.这相当于8位格式的1.5帧，带有一位停止位。
只有在异步模式（包括多处理器模式）下选择FIFO时，DR标志才设置为1。在其他操作模式下不设置为1。

TEND标志（发送结束标志）

TEND标志表明FTDRHL在发送串行字符的最后一位时不包含有效数据，因此暂停发送。

[Setting condition]

- 当发送1字节串行字符的最后一位时，如果FTDRHL不包含发送数据，则TEND设置为1。

[Clearing conditions]

- 当SCR.TE位为1时将发送数据写入FTDRHL
- 读取1后向TEND写入0时，SCR.TE位为1时
- 当FCR.FM位从0变为1时。

PER标志（奇偶校验错误标志）

PER标志指示在禁用地址匹配功能（DCCR.DCME=0）时，异步模式下从FRDRHL寄存器读取的数据是否存在奇偶校验错误。

[Setting condition]

- 当接收到数据并检测到奇偶校验错误时，地址匹配功能被禁用（DCCR.DCME=0）。

[Clearing condition]

- 在读取1后将0写入PER时。

当接收数据存储在FRDRHL寄存器中时，即使在接收过程中发生奇偶校验错误，接收操作也会继续进行。

当SCR.RE位设置为0（禁用串行接收）时，PER标志不受影响并保持其先前的值。

FER标志（帧错误标志）

FER标志指示在禁用地址匹配功能（DCCR.DCME=0）时，异步模式下从FRDRHL寄存器读取的数据是否存在帧错误。

[Setting condition]

- 当在接收期间采样0作为停止位并且地址匹配功能被禁用(DCCR.DCME=0)。

[Clearing condition]

- 在读取1后将0写入FER时。

接收操作是连续的，即使在接收过程中发生帧错误，接收数据也会存储到FRDRHL寄存器中。

当SCR.RE位设置为0（禁用串行接收）时，FER标志不受影响并保持其先前的值。

ORER标志（溢出错误标志）

ORER标志指示接收操作由于发生溢出错误而异常停止。

[Setting condition]

- 当接收FIFO充满16字节接收数据时，下一次串行接收完成。

[Clearing condition]

- 在读取1后将0写入ORER时。

当SCR.RE位设置为0（禁用串行接收）时，ORER标志不受影响并保持其先前的值。

RDF flag (Receive FIFO Data Full Flag)

The RDF flag indicates that receive data is transferred to the FRDRHL register, and the amount of data in FRDRHL is equal to or exceeds the specified receive triggering number. When RTRG is set to 0, the RDF flag is not set even when the amount of data in the receive FIFO is equal to 0.

[Setting condition]

- When the amount of receive data equal to or greater than the specified receive triggering number is stored in FRDRHL,*1 and the FIFO is not empty.

[Clearing conditions]

- When 0 is written to RDF after 1 is read
- When FRDRHL is read by the DMAC or DTC, but only when the block transfer is the last transmission
- When the setting and clearing conditions occur at the same time, the RDF flag is 0. After that, when the amount of data stored in the FRDRHL register is equal to or greater than the RTRG value, RDF is set to 1 after 1 PCLKA.

Note: Do not clear the RDF flag by accessing RDF in the SSR register before reading receive data unless communication is aborted.

Note 1. Because FRDRHL is a 16-stage FIFO register, the maximum amount of data that can be read when RDF is 1 is equivalent to the specified receive triggering number. If an attempt is made to read after all the data in FRDRHL is read, the data is undefined.

TDFE flag (Transmit FIFO Data Empty Flag)

The TDFE flag indicates that when data is transferred from the FTDRHL register into the TSR register, the amount of data in FTDRHL is less than the specified transmit triggering number, and writing of transmit data to FTDRHL is enabled.

[Setting conditions]

- When the TE bit in SCR is 0
- When the amount of transmit data written in FTDRHL is equal to or less than the specified transmit triggering number.*1

[Clearing conditions]

- When writing to FTDRHL is executed on the last transmission while the DMAC or DTC is activated
- When 0 is written to the TDFE flag after 1 is read.
  The setting conditions are given priority when TE = 0. When the setting and clearing conditions occur at the same time, the TDFE flag is 0. After that, when the amount of data stored in the FTDRHL register is equal to or less than the TTRG value, TDFE is set to 1 after 1 PCLKA.

Note: Do not clear the TDFE flag by accessing TDFE in the SSR register before writing transmit data unless communication is aborted.

Note 1. Because the FTDRHL register is a 16-stage FIFO register, the maximum amount of data that can be written when the TDFE flag is set to 1 is 16 minus FDR.T[4:0]. If more data is written, data is discarded.

RDF标志（接收FIFO数据满标志）

RDF标志表示接收数据被传送到FRDRHL寄存器，并且FRDRHL中的数据量等于或超过指定的接收触发数。当RTRG设置为0时，即使接收FIFO中的数据量等于0，RDF标志也不会设置。

[Setting condition]

- 当接收数据量等于或大于指定的接收触发数时存储在FRDRHL *1且FIFO不为空。

[Clearing conditions]

- 读取1后将0写入RDF时
- 当DMAC或DTC读取FRDRHL时，但仅当块传输是最后一次传输时
- 当置位和清零条件同时发生时，RDF标志为0。此后，当FRDRHL寄存器中存储的数据量等于或大于RTRG值时，1个PCLKA后RDF置1。

注意：除非通信中止，否则在读取接收数据之前不要通过访问SSR寄存器中的RDF来清除RDF标志。注1.因为FRDRHL是16级FIFO寄存器，所以当RDF为1时可以读取的最大数据量等于指定的接收触发数。如果在读取FRDRHL中的所有数据后尝试读取，则数据未定义。

TDFE标志（发送FIFO数据空标志）

TDFE标志表示当数据从FTDRHL寄存器传输到TSR寄存器时，FTDRHL中的数据量小于指定的发送触发数，并且允许将发送数据写入FTDRHL。

[Setting conditions]

- 当SCR的TE位为0时
- 当写入FTDRHL的传输数据量等于或小于指定的传输触发数时。*1

[Clearing conditions]

- 当DMAC或DTC被激活时，在最后一次传输上执行写入FTDRHL
- 读取1后向TDFE标志写入0时。
  当TE=0时，设置条件优先。当设置和清除条件同时发生时，TDFE标志为0。之后，当FTDRHL寄存器中存储的数据量等于或小于TTRG时值，TDFE在1个PCLKA之后设置为1。

注意：除非通信中止，否则在写入发送数据之前不要通过访问SSR寄存器中的TDFE来清除TDFE标志。注1.因为FTDRHL寄存器是16级FIFO寄存器，所以TDFE标志设置为1时可写入的最大数据量为16减去FDR.T[4:0]。如果写入更多数据，则丢弃数据。

30.2.15 Serial Status Register for Smart Card Interface Mode (SSR_SMCI) (SCMR.SMIF = 1)

Address(es): SCI0.SSR_SMCI 4007 0004h, SCI1.SSR_SMCI 4007 0024h, SCI2.SSR_SMCI 4007 0044h, SCI3.SSR_SMCI 4007 0064h, SCI4.SSR_SMCI 4007 0084h, SCI8.SSR_SMCI 4007 0104h, SCI9.SSR_SMCI 4007 0124h

	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	ERS	PER	TEND	MPB	MPBT
Value after reset:	1	0	0	0	0	1	0	0

Bit	Symbol	Bit name	Description	R/W
b0	MPBT	Multi-Processor Bit Transfer	Set this bit to 0 in smart card interface mode	R/W
b1	MPB	Multi-Processor	Set this bit to 0 in smart card interface mode	R
b2	TEND	Transmit End Flag	0: A character is being transmitted 1: Character transfer is complete.	R
b3	PER	Parity Error Flag	0: No parity error occurred 1: Parity error occurred.	R/(W)*1
b4	ERS	Error Signal Status Flag	0: Low error signal is not sampled 1: Low error signal is sampled.	R/(W)*1
b5	ORER	Overrun Error Flag	0: No overrun error occurred 1: Overrun error occurred.	R/(W)*1
b6	RDRF	Receive Data Full Flag	0: No received data in RDR register 1: Received data in RDR register.	R/(W)*1
b7	TDRE	Transmit Data Empty Flag	0: Transmit data in TDR register 1: No transmit data in TDR register.	R/(W)*1

Note 1. Only 0 can be written to clear the flag after 1 is read.

The SSR_SMCI register provides SCI with smart card interface mode status flags.

TEND flag (Transmit End Flag)

When there is no error signal from the receiving side, the TEND flag is set to 1 when more data is ready to be transferred to the TDR register.

[Setting conditions]

- When the SCR_SMCI.TE bit = 0 (serial transmission is disabled). When the SCR_SMCI.TE bit changes from 0 to 1, the TEND flag is not affected and keeps the value 1.
- When a specified period elapses after the latest transmission of 1 byte, the ERS flag is 0, and the TDR register is not updated.

  The set timing is determined by the following register settings:
  - When SMR_SMCI.GM = 0 and SMR_SMCI.BLK = 0, 12.5 ETUs after the start of transmission
  - When SMR_SMCI.GM = 0 and SMR_SMCI.BLK = 1, 11.5 ETUs after the start of transmission
  - When SMR_SMCI.GM = 1 and SMR_SMCI.BLK = 0, 11.0 ETUs after the start of transmission
  - When SMR_SMCI.GM = 1 and SMR_SMCI.BLK = 1, 11.0 ETUs after the start of transmission.

[Clearing conditions]

- When transmit data is written to the TDR register while the SCR_SMCI.TE bit is 1
- When 0 is written to TDRE after 1 is read while the SCR_SMCI.TE bit is 1.

PER flag (Parity Error Flag)

The PER flag indicates that a parity error occurred during reception in asynchronous mode and the reception ended abnormally.

30.2.15 智能卡接口模式的串行状态寄存器(SSR_SMCI)(SCMR.SMIF=1)

Address(es): SCI0.SSR_SMCI 4007 0004h, SCI1.SSR_SMCI 4007 0024h, SCI2.SSR_SMCI 4007 0044h, SCI3.SSR_SMCI 4007 0064h, SCI4.SSR_SMCI 4007 0084h, SCI8.SSR_SMCI 4007 0104h, SCI9.SSR_SMCI 4007 0124h

	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	RDRF	ORER	ERS	PER	TEND	MPB	MPBT
重置后的值:	1	0	0	0	0	1	0	0

Bit	Symbol	位名称	Description	R/W
b0	MPBT	多处理器位传输	在智能卡接口模式下将此位设置为0	R/W
b1	MPB	Multi-Processor	在智能卡接口模式下将此位设置为0	R
b2	TEND	发送结束标志	0：正在传输字符1：字符传输完成 。	R
b3	PER	奇偶校验错误标志	0：未发生奇偶校验错误1 ：发生奇偶校验错误。	R/(W)*1
b4	ERS	错误信号状态标志	0：不采样低误差信号1：采样低 误差信号。	R/(W)*1
b5	ORER	溢出错误标志	0：未发生溢出错误1：发生 溢出错误。	R/(W)*1
b6	RDRF	接收数据满标志	0：RDR寄存器中没有接收到数据1 ：RDR寄存器中接收到数据。	R/(W)*1
b7	TDRE	传输数据空标志	0：在TDR寄存器中发送数据1：在T DR寄存器中不发送数据。	R/(W)*1

Note 1. 读取1后，只能写入0以清除标志。

SSR_SMCI寄存器为SCI提供智能卡接口模式状态标志。

TEND标志（发送结束标志）

当接收端没有错误信号时，当更多数据准备好传输到TDR寄存器时，TEND标志设置为1。

[Setting conditions]

- 当SCR_SMCI.TE位=0时（禁用串行传输）。当SCR_SMCI.TE位由0变为1时，TEND标志不受影响，保持值为1。
- 在最后一次发送1个字节后经过指定时间后，ERS标志为0，并且不更新TDR寄存器。

  设置时序由以下寄存器设置确定：
  - 当SMR_SMCI.GM=0且SMR_SMCI.BLK=0时，传输开始后12.5ETU
  - 当SMR_SMCI.GM=0且SMR_SMCI.BLK=1时，传输开始后11.5ETU
  - 当SMR_SMCI.GM=1且SMR_SMCI.BLK=0时，传输开始后11.0ETU
  - 当SMR_SMCI.GM=1和SMR_SMCI.BLK=1时，传输开始后11.0ETU。

[Clearing conditions]

- 当SCR_SMCI.TE位为1时将发送数据写入TDR寄存器
- 当SCR_SMCI.TE位为1时读取1后将0写入TDRE。

PER标志（奇偶校验错误标志）

PER标志表示在异步模式接收过程中发生奇偶校验错误，接收异常结束。

[Setting condition]

- When a parity error is detected during reception. Although receive data is transferred to RDR when a parity error occurs, no SCIn_RXI interrupt request occurs. After the PER flag is set to 1, the next receive data is not transferred to RDR.

[Clearing condition]

- When 0 is written to PER after 1 is read. After writing 0 to the PER flag, read it to verify that its value is 0.

When the RE bit in SCR_SMCI is set to 0 (serial reception is disabled), the PER flag is not affected and keeps its previous value.

ERS flag (Error Signal Status Flag)

[Setting condition]

- When a low error signal is sampled.

[Clearing condition]

- When 0 is written to the ERS flag after 1 is read.

ORER flag (Overrun Error Flag)

The ORER flag indicates that an overrun error occurred during reception and the reception ended abnormally.

[Setting condition]

- When the next data is received before receive data that does not have a parity error is read from the RDR register. The data received before an overrun error occurred is saved in the RDR, but data received after the overrun error is lost. When the ORER flag is set to 1, receive data is not forwarded to the RDR register.

[Clearing condition]

- When 0 is written to the ORER flag after 1 is read. After writing 0 to the ORER flag, read it to verify that its value is 0.

When the RE bit in SCR_SMCI is set to 0, the ORER flag is not affected and keeps its previous value.

RDRF flag (Receive Data Full Flag)

The RDRF flag indicates the presence of receive data in the RDR register.

[Setting condition]

- When the reception ends normally, and receive data is forwarded from the RSR register to the RDR register.

[Clearing conditions]

- When 0 is written to the RDRF flag after 1 is read
- When data is read from the RDR register.

Note: Do not clear the RDRF flag by accessing RDRF in the SSR register unless communication is aborted.

TDRE flag (Transmit Data Empty Flag)

The TDRE flag indicates the presence of transmit data in the TDR register.

[Setting conditions]

- When the SCR_SMCI.TE bit is 0
- When data is transmitted from the TDR register to the TSR register.

[Clearing conditions]

- When 0 is written to the TDRE flag after 1 is read
- When the SCR_SMCI.TE bit is 1 and data is written to the TDR register.

Note: Do not clear TDRE flag by accessing TDRE in the SSR register unless communication is aborted.

[Setting condition]

- 在接收过程中检测到奇偶校验错误时。尽管发生奇偶校验错误时将接收数据传输到RDR，但不会发生SCIn_RXI中断请求。PER标志设置为1后，下一个接收数据不会传输到RDR。

[Clearing condition]

- 在读取1后将0写入PER时。将0写入PER标志后，读取它以验证其值为0。

当SCR_SMCI中的RE位设置为0（禁用串行接收）时，PER标志不受影响并保持其先前的值。

ERS标志（错误信号状态标志）

[Setting condition]

- 当对低误差信号进行采样时。

[Clearing condition]

- 读取1后将0写入ERS 标志时。

ORER标志（溢出错误标志）

ORER标志表示接收期间发生溢出错误，接收异常结束。

[Setting condition]

- 在从RDR寄存器读取没有奇偶校验错误的接收数据之前接收到下一个数据时。溢出错误发生前接收的数据保存在RDR中，但溢出错误后接收的数据丢失。当ORER标志设置为1时，接收数据不转发到RDR寄存器。

[Clearing condition]

- 在读取1后将0写入ORER标志时。将0写入ORER标志后，读取它以验证其值为0。

当SCR_SMCI中的RE位设置为0时，ORER标志不受影响并保持其先前的值。

RDRF标志（接收数据满标志）

RDRF标志指示RDR寄存器中存在接收数据。

[Setting condition]

- 当接收正常结束时，接收数据从RSR寄存器转发到RDR寄存器。

[Clearing conditions]

- 读取1后向RDRF标志写入0时
- 从RDR寄存器读取数据时。

Note: 除非通信被中止，否则不要通过访问SSR寄存器中的RDRF来清除RDRF标志。

TDRE标志（传输数据空标志）

TDRE标志表示TDR寄存器中存在发送数据。

[Setting conditions]

- 当SCR_SMCI.TE位为0时
- 当数据从TDR寄存器传输到TSR寄存器时。

[Clearing conditions]

- 读取1后向TDRE标志写入0时
- 当SCR_SMCI.TE位为1且数据写入TDR寄存器时。

Note: 除非通信中止，否则不要通过访问SSR寄存器中的TDRE来清除TDRE标志。

30.2.16 Smart Card Mode Register (SCMR)

Address(es): SCI0.SCMR 4007 0006h, SCI1.SCMR 4007 0026h, SCI2.SCMR 4007 0046h, SCI3.SCMR 4007 0066h, SCI4.SCMR 4007 0086h, SCI8.SCMR 4007 0106h, SCI9.SCMR 4007 0126h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCP2	—	—	CHR1	SDIR	SINV	—	SMIF
Value after reset:	1	1	1	1	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b0	SMIF	Smart Card Interface Mode Select	0: Non-smart card interface mode (asynchronous mode, clock synchronous mode, simple SPI mode, or simple IIC mode) 1: Smart card interface mode.	R/W*1
b1	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b2	SINV	Transmitted/Received Data Invert	0: TDR register contents are transmitted as is. Receive data is stored as received in the RDR. 1: TDR register contents are inverted before transmitted. Receive data is stored in inverted form in the RDR. This bit can be used in the following modes: • Smart card interface mode • Asynchronous mode including multi-processor mode • Clock synchronous mode • Simple SPI mode. Set this bit to 0 for operation in simple IIC mode.	R/W*1
b3	SDIR	Transmitted/Received Data Transfer Direction	0: Transfer with LSB-first 1: Transfer with MSB-first. This bit can be used in the following modes: • Smart card interface mode • Asynchronous mode including multi-processor mode • Clock synchronous mode • Simple SPI mode. Set this bit to 1 for operation in simple IIC mode.	R/W*1
b4	CHR1	Character Length 1	Valid only in asynchronous mode.*2 Selects the transmit/receive character length in combination with the SMR.CHR bit: CHR1 CHR 0 0: Transmit/receive in 9-bit data length 0 1: Transmit/receive in 9-bit data length 1 0: Transmit/receive in 8-bit data length (initial value) 1 1: Transmit/receive in 7-bit data length.*3	R/W*1
b6, b5	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b7	BCP2	Base Clock Pulse 2	Selects the number of base clock cycles in combination with the SMR_SMCI.BCP[1:0] bits. Table 30.4 lists the combinations of the SCMR.BCP2 and SMR_SMCI.BCP[1:0] bits.	R/W*1

Note 1. Writable only when the TE and RE bits in SCR/SCR_SMCI are 0 (both serial transmission and reception are disabled).
Note 2. The setting is invalid and a fixed data length of 8 bits is used in modes other than asynchronous mode.
Note 3. LSB-first should be selected and the value of the MSB bit [7] in TDR cannot be transmitted.

The SCMR register selects the smart card interface and communication format.

30.2.16 智能卡模式寄存器(SCMR)

Address(es): SCI0.SCMR 4007 0006h, SCI1.SCMR 4007 0026h, SCI2.SCMR 4007 0046h, SCI3.SCMR 4007 0066h, SCI4.SCMR 4007 0086h, SCI8.SCMR 4007 0106h, SCI9.SCMR 4007 0126h

	b7	b6	b5	b4	b3	b2	b1	b0
	BCP2	—	—	CHR1	SDIR	SINV	—	SMIF
重置后的值:	1	1	1	1	0	0	1	0

Bit	Symbol	位名称	Description	R/W
b0	SMIF	智能卡接口模式选择	0：非智能卡接口模式（异步模式， 时钟同步模式、简单SPI模式或简单IIC模式）1：智能卡接口模式。	R/W*1
b1	—	Reserved	该位读取为1。写入值应为1。	R/W
b2	SINV	发送接收数据反转	0：TDR寄存器内容按原样发送。接收数据存储在RDR中。1：TDR寄存器内容在发送前反转。接收数据以反转形式存储在RDR中。 该位可用于以下模式： 智能卡接口模式 包括多处理器模式的异步模式 时钟同步模式 简单SPI模式。将此位设置为0以在简单IIC模式下运行。	R/W*1
b3	SDIR	Transmitted/Received Data 转移方向	0：以LSB-first传输1：以MSB-first传输。 该位可用于以下模式： 智能卡接口模式 包括多处理器模式的异步模式 时钟同步模式 简单SPI模式。将该位设置为1以在简单IIC模式下运行。	R/W*1
b4	CHR1	字符长度1	仅在异步模式下有效。*2 结合SMR.CHR位选择发送接收字符长度：CHR1CHR 0 0：以9位数据长度发送接收 0 1：以9位数据长度发送接收 1 0：发送接收8位数据长度（初始值） 1 1：以7位数据长度发送接收。*3	R/W*1
b6, b5	—	Reserved	这些位被读取为1。写入值应为1。	R/W
b7	BCP2	基本时钟脉冲2	结合SMR_SMCI.BCP[1:0]位选择基本时钟周期数。表30.4列出了SCMR.BCP2和 SMR_SMCI.BCP[1:0] bits.	R/W*1

Note 1. 仅当SCRSCR_SMCI中的TE和RE位为0时可写（串行发送和接收都被禁用）。
Note 2. 该设置无效，并且在非异步模式下使用了固定的8位数据长度。
Note 3. 应该选择LSB-first并且不能传输TDR中MSB位[7]的值。

SCMR寄存器选择智能卡接口和通信格式。

SMIF bit (Smart Card Interface Mode Select)

Setting the SMIF bit to 1 selects the smart card interface mode. Setting it to 0 selects all other modes as follows:

- Asynchronous mode, including multi-processor mode
- Clock synchronous mode
- Simple SPI mode
- Simple IIC mode.

SINV bit (Transmitted/Received Data Invert)

The SINV bit inverts the transmit/receive data logic level. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SMR or SMR_SMCI.

CHR1 bit (Character Length 1)

The CHR1 bit selects the data length of transmit/receive data in combination with the CHR bit in SMR.

A fixed data length of 8 bits is used in modes other than asynchronous mode.

BCP2 bit (Base Clock Pulse 2)

The BCP2 bit selects the number of base clock cycles in a 1-bit data transfer time in smart card interface mode. Set this bit in combination with the SMR_SMCI.BCP[1:0] bits.

Table 30.4 Combinations of SCMR.BCP2 bit and SMR_SMCI.BCP[1:0] bits

SCMR.BCP2 bit	SMR_SMCI.BCP[1:0] bits	Number of base clock cycles for 1-bit transfer period
0	00	93 clock cycles (S = 93)*1
0	01	128 clock cycles (S = 128)*1
0	10	186 clock cycles (S = 186)*1
0	11	512 clock cycles (S = 512)*1
1	00	32 clock cycles (S = 32)*1 (initial value)
1	01	64 clock cycles (S = 64)*1
1	10	372 clock cycles (S = 372)*1
1	11	256 clock cycles (S = 256)*1

Note 1. For S, see section 30.2.17, Bit Rate Register (BRR).

30.2.17 Bit Rate Register (BRR)

Address(es): SCI0.BRR 4007 0001h, SCI1.BRR 4007 0021h, SCI2.BRR 4007 0041h, SCI3.BRR 4007 0061h, SCI4.BRR 4007 0081h, SCI8.BRR 4007 0101h, SCI9.BRR 4007 0121h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

BRR is an 8-bit register that adjusts the bit rate.

As each SCI channel has independent baud rate generator control, different bit rates can be set for each channel. Table 30.5 shows the relationship between the setting (N) and the bit rate (B) in the BRR for asynchronous mode, multi-processor transfer, clock synchronous mode, smart card interface mode, simple SPI mode, and simple IIC mode.

The initial value of the BRR register is FFh. The BRR can be read by the CPU, but can only be written to when the TE and RE bits in SCR/SCR_SMCI are 0.

SMIF位（智能卡接口模式选择）

将SMIF位设置为1选择智能卡接口模式。将其设置为0会选择所有其他模式，如下所示：

- 异步模式，包括多处理器模式
- 时钟同步模式
- 简单SPI模式
- 简单的IIC模式。

SINV位（发送接收数据反转）

SINV位反转发送接收数据逻辑电平。该位不影响奇偶校验位的逻辑电平。要反转奇偶校验位，请反转SMR或SMR_SMCI中的PM位。

CHR1位（字符长度1）

CHR1位结合SMR中的CHR位选择发送接收数据的数据长度。

在异步模式以外的模式中使用8位的固定数据长度。

BCP2位（基本时钟脉冲2）

BCP2位选择智能卡接口模式下1位数据传输时间内的基本时钟周期数。将该位与SMR_SMCI.BCP[1:0]位一起设置。

Table 30.4 SCMR.BCP2位和SMR_SMCI.BCP[1:0]位的组合

SCMR.BCP2 bit	SMR_SMCI.BCP[1:0] bits	1位传输周期的基本时钟周期数
0	00	93个时钟周期(S=93)*1
0	01	128个时钟周期(S=128)*1
0	10	186个时钟周期(S=186)*1
0	11	512个时钟周期(S=512)*1
1	00	32个时钟周期(S=32)*1（初始值）
1	01	64个时钟周期(S=64)*1
1	10	372个时钟周期(S=372)*1
1	11	256个时钟周期(S=256)*1

Note 1. 对于S，请参见第30.2.17节，比特率寄存器(BRR)。

30.2.17 比特率寄存器(BRR)

Address(es): SCI0.BRR 4007 0001h, SCI1.BRR 4007 0021h, SCI2.BRR 4007 0041h, SCI3.BRR 4007 0061h, SCI4.BRR 4007 0081h, SCI8.BRR 4007 0101h, SCI9.BRR 4007 0121h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	1	1	1	1	1	1	1	1

BRR是一个8位寄存器，用于调整比特率。

由于每个SCI通道都有独立的波特率发生器控制，因此可以为每个通道设置不同的比特率。表30.5显示了异步模式、多处理器传输、时钟同步模式、智能卡接口模式、简单SPI模式和简单IIC模式的BRR中的设置(N)和比特率(B)之间的关系。

BRR寄存器的初始值为FFh。BRR可以被CPU读取，但只能在SCRSCR_SMCI中的TE和RE位为0时写入。

Table 30.5 Relationship between N setting in BRR and bit rate B

Mode	SEMR settings BGDM bit	ABCS bit	ABCSE bit	BRR setting	Error
Asynchro-nous, multi-processor transfer	0	0	0	$N = \frac{PCLKA \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	1	0	0	$N = \frac{PCLKA \times 10^6}{32 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	0	1	0		
	1	1	0	$N = \frac{PCLKA \times 10^6}{16 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	Don't care	Don't care	1	$N = \frac{PCLKA \times 10^6}{12 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
Clock synchronous, simple SPI				$N = \frac{PCLKA \times 10^6}{8 \times 2^{2n-1} \times B} - 1$	-
Smart card interface				$N = \frac{PCLKA \times 10^6}{S \times 2^{2n+1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1\} \times 100$
Simple IIC*1				$N = \frac{PCLKA \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	-

B: Bit rate (bps)
N: BRR setting for on-chip baud rate generator ($0 \le N \le 255$)
PCLKA: Operating frequency (MHz)
n and S: Determined by the SMR/SMR_SMCI and SCMR register settings as listed in Table 30.7 and Table 30.8.

Note 1. Adjust the bit rate so that the high and low-level widths of the SCLn output in simple IIC mode satisfy the I²C bus standard.

Table 30.6 Calculating widths at high and low level for SCL

Mode	SCL	Formula (result in seconds)
Simple IIC	Width at high level (minimum value)	$(N+1) \times 4 \times 2^{2n-1} \times 7 \times \frac{1}{PCLKA \times 10^6}$
	Width at low level (minimum value)	$(N+1) \times 4 \times 2^{2n-1} \times 8 \times \frac{1}{PCLKA \times 10^6}$

Table 30.7 Clock source settings

SMR or SMR_SMCI.CKS[1:0] bit setting		
CKS[1:0] bits	Clock source	n
0 0	PCLKA clock	0
0 1	PCLKA/4 clock	1
1 0	PCLKA/16 clock	2
1 1	PCLKA/64 clock	3

Table 30.5 BRR中的N设置与比特率B的关系

Mode	SEMR settings BGDM bit	ABCS 位	ABCSE bit	BRR setting	Error
异步、多处理器传输	0	0	0	$N = \frac{PCLKA \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	1	0	0	$N = \frac{PCLKA \times 10^6}{32 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	0	1	0		
	1	1	0	$N = \frac{PCLKA \times 10^6}{16 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
	Don't care	Don't care	1	$N = \frac{PCLKA \times 10^6}{12 \times 2^{2n-1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1\} \times 100$
时钟同步，简单的SPI				$N = \frac{PCLKA \times 10^6}{8 \times 2^{2n-1} \times B} - 1$	-
智能卡接口				$N = \frac{PCLKA \times 10^6}{S \times 2^{2n+1} \times B} - 1$	$Error\ (\%) = \{\frac{PCLKA \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1\} \times 100$
Simple IIC*1				$N = \frac{PCLKA \times 10^6}{64 \times 2^{2n-1} \times B} - 1$	-

B：比特率（bps）
N：片内波特率发生器的BRR设置(0 N 255)
PCLKA：工作频率(MHz)n和S：由表30.7和表30.8中列出的SMRSMR_SMCI和SCMR寄存器设置决定。

注1.调整比特率，使简单IIC模式下SCLn输出的高低电平宽度满足I2C总线标准。

Table 30.6 计算SCL的高低电平宽度

Mode	SCL	公式（以秒为单位的结果）
Simple IIC	高电平宽度（最小值）	$(N+1) \times 4 \times 2^{2n-1} \times 7 \times \frac{1}{PCLKA \times 10^6}$
	低电平宽度（最小值）	$(N+1) \times 4 \times 2^{2n-1} \times 8 \times \frac{1}{PCLKA \times 10^6}$

Table 30.7 时钟源设置

SMR或SMR_SMCI.CKS[1:0]位设置		
CKS[1:0] bits	时钟源	n
0 0	PCLKA clock	0
0 1	PCLKA/4 clock	1
1 0	PCLKA/16 clock	2
1 1	PCLKA/64 clock	3

Table 30.8 Base clock settings in smart card interface mode

SCMR.BCP2 bit setting	SMR_SMCI.BCP[1:0] bit setting	Base clock cycles for 1-bit period	S
0	0 0	93 clock cycles	93
0	0 1	128 clock cycles	128
0	1 0	186 clock cycles	186
0	1 1	512 clock cycles	512
1	0 0	32 clock cycles	32
1	0 1	64 clock cycles	64
1	1 0	372 clock cycles	372
1	1 1	256 clock cycles	256

Table 30.9 and Table 30.10 list examples of BRR (N) settings in asynchronous mode. Table 30.11 lists the maximum bit rate selectable for each operating frequency. Table 30.15 lists examples of BRR (N) settings in smart card interface mode.

Table 30.17 lists examples of BRR (N) settings in simple IIC mode. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, see section 30.6.4, Receive Data Sampling Timing and Reception Margin. Table 30.12 and Table 30.14 list the maximum bit rates with external clock input.

When either the Asynchronous Mode Base Clock Select bit (ABCS) or the Baud Rate Generator Double-Speed Mode Select bit (BGDM) in the Serial Extended Mode Register (SEMR) is set to 1 in asynchronous mode, the bit rate becomes twice the value listed in Table 30.16. When both of those bits are set to 1, the bit rate becomes four times the listed value.

Table 30.9 Examples of BRR settings for different bit rates in asynchronous mode (1)

Bit rate (bps)	Operating frequency PCLKA (MHz)														
	8			9.8304			10			12			12.288

Table 30.8 智能卡接口模式下的基本时钟设置

SCMR.BCP2位设置	SMR_SMCI.BCP[1:0]位设置	1位周期的基本时钟周期	S
0	0 0	93个时钟周期	93
0	0 1	128个时钟周期	128
0	1 0	186个时钟周期	186
0	1 1	512个时钟周期	512
1	0 0	32个时钟周期	32
1	0 1	64个时钟周期	64
1	1 0	372个时钟周期	372
1	1 1	256个时钟周期	256

表30.9和表30.10列出了异步模式下的BRR(N)设置示例。表30.11列出了每个工作频率可选择的最大比特率。表30.15列出了智能卡接口模式下的BRR(N)设置示例。

表30.17列出了简单IIC模式下的BRR(N)设置示例。在智能卡接口模式下，可以选择1位数据传输时间内的基本时钟周期数S。有关详细信息，请参见第30.6.4节，接收数据采样时序和接收余量。表30.12和表30.14列出了外部时钟输入的最大比特率。

当异步模式基本时钟选择位(ABCS)或波特率发生器双速模式
串行扩展模式寄存器(SEMR)中的选择位(BGDM)在异步模式下设置为1，比特率变为表30.16中列出的值的两倍。当这两个位都设置为1时，比特率变为所列值的四倍。

Table 30.9 异步模式下不同比特率的BRR设置示例（一）

比特率(bps)	工作频率PCLKA(MHz)

38400	0	15	1.73	0	19	1.73	0	23	1.73	0	26	-0.54	0	32	-1.36

Bit rate (bps)	Operating frequency PCLKA (MHz)								
	50			60			120		
	n	N	Error (%)	n	N	Error (%)	n	N	Error (%)
110	3	221	-0.02	-	-	-	-	-	-
150	3	162	-0.15	3	194	0.16	-	-	-
300	3	80	0.47	3	97	-0.35	3	194	0.16
600	2	162	-0.15	3	48	-0.35	3	97	-0.35
1200	2	80	0.47	2	97	-0.35	3	48	-0.35
2400	1	162	-0.15	2	48	-0.35	2	97	-0.35
4800	1	80	0.47	1	97	-0.35	2	48	-0.35
9600	0	162	-0.15	1	48	-0.35	1	97	-0.35
19200	0	80	0.47	0	97	-0.35	1	48	-0.35
31250	0	49	0.00	0	59	0.00	0	119	0
38400	0	40	-0.76	0	48	-0.35	0	97	-0.35

Note: In this example, SEMR.ABCS = 0, SEMR.ABCSE = 0, and SEMR.BGDM = 0.
When either the ABCS or BGDM bit is set to 1, the bit rate doubles.
When both ABCS and BGDM are set to 1, the bit rate quadruples.

比特率(bps)	工作频率PCLKA(MHz)														
	14			16			17.2032			18			19.6608		
	n	N	Error (%)	n	N	Error (%)	n	N	Error (%)	n	N	Error (%)	n	N	Error (%)
9600	0	45	-0.93	0	51	0.16	0	55	0.00	0	58	-0.69	0	63	0.00
19200	0	22	-0.93	0	25	0.16	0	27	0.00	0	28	1.02	0	31	0.00
31250	0	13	0.00	0	15	0.00	0	16	1.20	0	17	0.00	0	19	-1.70
38400	-	-	-	0	12	0.16	0	13	0.00	0	14	-2.34	0	15	0.00

Note: 在此示例中，SEMR.ABCS=0、SEMR.ABCSE=0和SEMR.BGDM=0。
当ABCS或BGDM位设置为1时，比特率加倍。当ABCS和BGDM都设置为1时，比特率翻四倍。

10 M	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0*1	x	x	x	x	0	2

x: Setting prohibited.

—: Can be set, but an error occurs.

Note 1. Continuous transmission or reception is not possible. After transmitting or receiving one frame of data, a 1-bit period elapses before starting to transmit or receive the next frame of data. The output of the synchronization clock is stopped for a 1-bit period. Therefore, it takes 9 bits worth of time to transfer one frame (8 bits) of data, and the average transfer rate is 8/9 times the bit rate. When the FIFO is selected, this setting (BRR = 00h and SMR.CKS[1:0] = 00b) is not available.

Table 30.14 Maximum bit rate with external clock input in clock synchronous mode and simple SPI mode

PCLKA (MHz)	External input clock (MHz)	Maximum bit rate (Mbps)

×：禁止设定。—：可以设置，但发
生错误。

Note 1. 无法连续发送或接收。在发送或接收一帧数据后，在开始发送或接收下一帧数据之前会经过1位周期。同步时钟的输出停止1位周期。因此，传输一帧（8位）数据需要9位的时间，平均传输速率为89倍的位速率。选择FIFO时，此设置（BRR=00h且SMR.CKS[1:0]=00b）不可用。

Bit rate (bps)	Operating frequency PCLKA (MHz)								
	50			60			120		
	n	N	Min. widths at SCL high/low levels (µs)	n	N	Min. widths at SCL high/low levels (µs)	n	N	Min. widths at SCL high/low levels (µs)
350 k	0	4	1.40/1.60	0	4	1.17/1.33	0	10	1.28/1.47
400 k	0	3	1.12/1.28	0	4	1.17/1.33	0	8	1.05/1.20

Note 1. The minimum value of low width is smaller than 1.3 µs which is the standard value of the fast mode. The setting values are the same as in Table 30.17.

30.2.18 Modulation Duty Register (MDDR)

Address(es): SCI0.MDDR 4007 0012h, SCI1.MDDR 4007 0032h, SCI2.MDDR 4007 0052h, SCI3.MDDR 4007 0072h, SCI4.MDDR 4007 0092h, SCI8.MDDR 4007 0112h, SCI9.MDDR 4007 0132h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

The MDDR register corrects the bit rate adjusted by the BRR register.

When the SEMR.BRME bit is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected using the settings in the MDDR register (M/256). Table 30.19 shows the relationship between the MDDR setting (M) and the bit rate (B).

The initial value of the MDDR register is FFh. Bit [7] in this register is fixed to 1. The CPU can read the MDDR register, but the MDDR register is only writable when the TE and RE bits in SCR/SCR_SMCI are 0.

Table 30.19 Relationship between MDDR setting (M) and bit rate (B) when bit rate modulation function is used

Mode	SEMR settings			BRR setting	Error
	BGDM bit	ABCS bit	ABCSE bit		
Asynchronous, multi-processor transfer	0	0	0	$N = \frac{PCLKA \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
	1	0	0	$N = \frac{PCLKA \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
	0	1	0		
	1	1	0	$N = \frac{PCLKA \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
	Don't care	Don't care	1	$N = \frac{PCLKA \times 10^6}{12 \times 2^{2n-1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times 12 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
Clock synchronous, simple SPI*1				$N = \frac{PCLKA \times 10^6}{8 \times 2^{2n-1} \times (256/M) \times B} - 1$	-
Smart card interface				$N = \frac{PCLKA \times 10^6}{S \times 2^{2n+1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times S \times 2^{2n+1} \times (256/M) \times (N+1)} - 1\} \times 100$
Simple IIC*2				$N = \frac{PCLKA \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	-

B: Bit rate (bps)
M: MDDR setting (128 ≤ MDDR ≤ 255)

比特率(bps)	工作频率PCLKA(MHz)								
	50			60			120		
	n	N	分钟。SCL高低电平时的宽度(µs)	n	N	分钟。SCL高低电平时的宽度(µs)	n	N	分钟。SCL高低电平时的宽度(µs)
350 k	0	4	1.40/1.60	0	4	1.17/1.33	0	10	1.28/1.47
400 k	0	3	1.12/1.28	0	4	1.17/1.33	0	8	1.05/1.20

Note 1. 低宽度的最小值小于1.3µs，这是快速模式的标准值。
设定值与表30.17相同。

30.2.18 调制占空比寄存器(MDDR)

Address(es): SCI0.MDDR 4007 0012h, SCI1.MDDR 4007 0032h, SCI2.MDDR 4007 0052h, SCI3.MDDR 4007 0072h, SCI4.MDDR 4007 0092h, SCI8.MDDR 4007 0112h, SCI9.MDDR 4007 0132h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	1	1	1	1	1	1	1	1

MDDR寄存器校正由BRR寄存器调整的比特率。

当SEMR.BRME位设置为1时，片上波特率发生器生成的比特率使用MDDR寄存器(M256)中的设置进行均匀校正。表30.19显示了MDDR设置(M)和比特率(B)之间的关系。

MDDR寄存器的初始值为FFh。该寄存器中的Bit[7]固定为1。CPU可以读取MDDR寄存器，但MDDR寄存器只有在SCRSCR_SMCI中的TE和RE位为0时才可写。

Table 30.19 使用比特率调制功能时MDDR设置(M)和比特率(B)的关系

Mode	SEMR settings			BRR setting	Error
	BGDM bit	ABCS 位	ABCSE bit		
异步、多处理器传输	0	0	0	$N = \frac{PCLKA \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
	1	0	0	$N = \frac{PCLKA \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
	0	1	0		
	1	1	0	$N = \frac{PCLKA \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
	Don't care	Don't care	1	$N = \frac{PCLKA \times 10^6}{12 \times 2^{2n-1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times 12 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1\} \times 100$
时钟同步，简单SPI*1				$N = \frac{PCLKA \times 10^6}{8 \times 2^{2n-1} \times (256/M) \times B} - 1$	-
智能卡接口				$N = \frac{PCLKA \times 10^6}{S \times 2^{2n+1} \times (256/M) \times B} - 1$	Error (%) $= \{\frac{PCLKA \times 10^6}{B \times S \times 2^{2n+1} \times (256/M) \times (N+1)} - 1\} \times 100$
Simple IIC*2				$N = \frac{PCLKA \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$	-

B：比特率（bps）
M: MDDR setting (128 ≤ MDDR ≤ 255)

N: BRR setting for baud rate generator (0 ≤ N ≤ 255)
PCLKA: Operating frequency (MHz)
n and S: Determined by the SMR/SMR_SMCI and SCMR register settings as listed in Table 30.7 and Table 30.8. See section 30.2.17, Bit Rate Register (BRR) for details.

Note 1. Do not use this function in clock synchronous mode or in the highest speed settings in simple SPI mode (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).
Note 2. Adjust the bit rate so that the high and low-level widths of the SCL output in simple IIC mode satisfy the I²C standard.

Table 30.20 and Table 30.21 list examples of N settings in BRR and M settings in MDDR in asynchronous mode.

Table 30.20 Examples of BRR and MDDR settings for different bit rates in asynchronous mode (1)

Bit rate (bps)	Operating frequency PCLKA (MHz)														
	8					9.8304					16

230400	0	1	192	0	0.00	0	4	236	1	0.03	0	1	151	0	0.00

N：波特率发生器的BRR设置（0≤N≤255）
PCLKA：工作频率(MHz)n和S：由表30.7和表30.8中列出的SMRSMR_SMCI和SCMR寄存器设置决定。有关详细信息，请参见第30.2.17节，比特率寄存器(BRR)。

Note 1. 请勿在时钟同步模式或简单SPI模式的最高速度设置中使用此功能（SMR.CKS[1:0]=00b，SCR.CKE[1] = 0, and BRR = 0).
Note 2. 调整码率，使简单IIC模式下SCL输出的高低电平宽度满足I2C标准。

表30.20和表30.21列出了异步模式下BRR中的N设置和MDDR中的M设置的示例。

Table 30.20 异步模式下不同比特率的BRR和MDDR设置示例(1)

Note 2. 在本例中，SEMR寄存器中的ABCS和ABCSE位为0。SEMR.BRME=0(M=256)禁用比特率调制功能。

30.2.19 串行扩展模式寄存器(SEMR)

Address(es): SCI0.SEMR 4007 0007h, SCI1.SEMR 4007 0027h, SCI2.SEMR 4007 0047h, SCI3.SEMR 4007 0067h, SCI4.SEMR 4007 0087h, SCI8.SEMR 4007 0107h, SCI9.SEMR 4007 0127h

	b7	b6	b5	b4	b3	b2	b1	b0
	RXDESEL	BGDM	NFEN	ABCS	ABCSE	BRME	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0, b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b2	BRME	比特率调制 Enable	0：码率调制功能关闭1：码率调制功能开启。	R/W*1
b3	ABCSE	异步模式扩展基本时钟 Select 1	仅在SCR.CKE[1]=0的异步模式下有效：0：1位周期的时钟周期由SEMR寄存器中的BGDM和ABCS位组合确定1：波特率为1位的6个基本时钟周期时期。	R/W*1
b4	ABCS	异步模式 基本时钟选择	仅在异步模式下有效：0：为1位周期选择16个基本时钟周期1：为1位周期选择8个基本时钟周期。	R/W*1

Bit	Symbol	Bit name	Description	R/W
b5	NFEN	Digital Noise Filter Function Enable	In asynchronous mode: 0: Noise cancellation function for the RXDn input signal is disabled 1: Noise cancellation function for the RXDn input signal is enabled. In simple IIC mode: 0: Noise cancellation function for the SCLn and SDAn input signals is disabled 1: Noise cancellation function for the SCLn and SDAn input signals is enabled. The NFEN bit must be 0 in all other modes.	R/W*1
b6	BGDM	Baud Rate Generator Double-Speed Mode Select	Valid only in asynchronous mode with SCR.CKE[1] = 0: 0: Baud rate generator outputs the clock with single frequency 1: Baud rate generator outputs the clock with double frequency.	R/W*1
b7	RXDESEL	Asynchronous Start Bit Edge Detection Select	Valid only in asynchronous mode: 0: The low level on the RXDn pin is detected as the start bit 1: A falling edge on the RXDn pin is detected as the start bit.	R/W*1

Note 1. Writable only when the TE and RE bits in SCR/SCR_SMCI are 0 (both serial transmission and reception are disabled).

The SEMR register selects the clock source for a 1-bit period in asynchronous mode.

BRME bit (Bit Rate Modulation Enable)

The BRME bit enables or disables the bit rate modulation function. The bit rate generated by the on-chip baud rate generator is evenly corrected when this function is enabled.

ABCSE bit (Asynchronous Mode Extended Base Clock Select 1)

The ABCSE bit sets the pulse number for the base clock in a 1-bit period to 6, and the double-frequency clock is output from the baud rate generator. When the bit rate is set to 6 while dividing the bus clock frequency, use the ABCSE bit to set SMR.CKS[1:0] to 00b and BRR to 0. Set this bit to 0 except in asynchronous mode.

ABCS bit (Asynchronous Mode Base Clock Select)

The ABCS bit selects the clock cycles for a 1-bit period. Set this bit to 0 except in asynchronous mode.

NFEN bit (Digital Noise Filter Function Enable)

The NFEN bit enables or disables the digital noise filter function.

When the digital noise filter function is enabled:

- Noise cancellation is applied to the RXDn input signal in asynchronous mode
- Noise cancellation is applied to the SDAn and SCLn input signals in simple IIC mode.

In all other modes, set the NFEN bit to 0 to disable the digital noise filter function. When the function is disabled, input signals are transferred as received.

BGDM bit (Baud Rate Generator Double-Speed Mode Select)

The BGDM bit selects the cycle of output clock for the baud rate generator to be either single or double frequency.

This bit is valid when the on-chip baud rate generator is selected as the clock source (SCR.CKE[1] = 0) in asynchronous mode (SMR.CM = 0). The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1, the base clock cycle is halved and the bit rate is doubled.

Set this bit to 0 in modes other than asynchronous mode.

RXDESEL bit (Asynchronous Start Bit Edge Detection Select)

The RXDSEL bit selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, set this bit to 1 to stop reception, or to start reception without retaining the RXDn pin input at a high level for the period of one data frame or longer after completion of the break.

Set this bit to 0 in modes other than asynchronous mode.

Bit	Symbol	位名称	Description	R/W
b5	NFEN	数字噪声滤波器功能启用	在异步模式下：0：禁用RXDn输入信号的噪声消除功能1：启用RXDn输入信号的噪声消除功能。在简单IIC模式下：0：禁用SCLn和SDAn输入信号的噪声消除功能1：启用SCLn和SDAn输入信号的噪声消除功能。在所有其他模式下，NFEN位必须为0。	R/W*1
b6	BGDM	波特率发生器双速模式选择	仅在SCR.CKE[1]=0的异步模式下有效：0：波特率发生器输出单频时钟1：波特率发生器输出双频时钟。	R/W*1
b7	RXDESEL	异步起始位边沿检测选择	仅在异步模式下有效：0：将RXDn引脚的低电平检测为起始位1：将RXDn引脚的下降沿检测为起始位。	R/W*1

Note 1. 仅当SCRSCR_SMCI中的TE和RE位为0时可写（串行发送和接收都被禁用）。

SEMR寄存器在异步模式下选择1位周期的时钟源。

BRME位（比特率调制使能）

BRME位启用或禁用比特率调制功能。该功能使能时，片内波特率发生器产生的比特率得到均匀校正。

ABCSE位（异步模式扩展基本时钟选择1）

ABCSE位将基本时钟在1位周期内的脉冲数设置为6，并从波特率发生器输出双频时钟。当比特率设置为6并同时分频总线时钟频率时，使用ABCSE位将SMR.CKS[1:0]设置为00b并将BRR设置为0。除异步模式外，将此位设置为0。

ABCS位（异步模式基本时钟选择）

ABCS位选择1位周期的时钟周期。除异步模式外，将此位设置为0。

NFEN位（数字噪声滤波器功能使能）

NFEN位启用或禁用数字噪声滤波器功能。

启用数字噪声滤波器功能时：

- 噪声消除应用于异步模式下的RXDn输入信号
- 噪声消除应用于简单IIC模式下的SDAn和SCLn输入信号。

在所有其他模式下，将NFEN位设置为0以禁用数字噪声滤波器功能。禁用该功能时，输入信号按接收到的方式传输。

BGDM位（波特率发生器双速模式选择）

BGDM位选择波特率发生器的输出时钟周期为单频或双频。

当在异步模式（SMR.CM=0）下选择片内波特率发生器作为时钟源（SCR.CKE[1]=0）时，该位有效。基本时钟由波特率发生器的时钟输出生成。当BGDM位设置为1时，基本时钟周期减半，比特率加倍。

在异步模式以外的模式下将此位设置为0。

RXDESEL位（异步起始位边沿检测选择）

RXDSEL位选择异步模式下接收起始位的检测方法。发生中断时，将该位设置为1以停止接收，或在中断完成后不将RXDn引脚输入保持为高电平的情况下开始接收1个数据帧或更长时间。

在异步模式以外的模式下将此位设置为0。

30.2.20 Noise Filter Setting Register (SNFR)

Address(es): SCI0.SNFR 4007 0008h, SCI1.SNFR 4007 0028h, SCI2.SNFR 4007 0048h, SCI3.SNFR 4007 0068h, SCI4.SNFR 4007 0088h, SCI8.SNFR 4007 0108h, SCI9.SNFR 4007 0128h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	NFCS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	NFCS[2:0]	Noise Filter Clock Select	In asynchronous mode, the standard setting for the base clock is as follows: b2 b0 0 0 0: The clock signal divided by 1 is used with the noise filter. In simple IIC mode, the standard settings for the clock source of the on-chip baud rate generator selected in the SMR.CKS[1:0] bits are as follows: b2 b0 0 0 1: The clock signal divided by 1 is used with noise filter 0 1 0: The clock signal divided by 2 is used with noise filter 0 1 1: The clock signal divided by 4 is used with noise filter 1 0 0: The clock signal divided by 8 is used with noise filter. Other settings are prohibited.	R/W*1
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits is only possible when the RE and TE bits in SCR/SCR_SMCI are 0 (serial reception and transmission disabled).

The SNFR register sets the digital noise filter clock.

NFCS[2:0] bits (Noise Filter Clock Select)

The NFCS[2:0] bits select the sampling clock for the digital noise filter. To use the noise filter in asynchronous mode, set these bits to 000b. In simple IIC mode, set the bits to a value in the range from 001b to 100b.

30.2.21 I2C Mode Register 1 (SIMR1)

Address(es): SCI0.SIMR1 4007 0009h, SCI1.SIMR1 4007 0029h, SCI2.SIMR1 4007 0049h, SCI3.SIMR1 4007 0069h, SCI4.SIMR1 4007 0089h, SCI8.SIMR1 4007 0109h, SCI9.SIMR1 4007 0129h

b2, b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Bit	Symbol	Bit name	Description	R/W
b7 to b3	IICDL[4:0]	SDA Delay Output Select	The following cycles are of the clock signal from the on-chip baud rate generator: b7 b3 0 0 0 0 0: No output delay 0 0 0 0 1: 0 to 1 cycle 0 0 0 1 0: 1 to 2 cycles 0 0 0 1 1: 2 to 3 cycles 0 0 1 0 0: 3 to 4 cycles 0 0 1 0 1: 4 to 5 cycles : 1 1 1 1 0: 29 to 30 cycles 1 1 1 1 1: 30 to 31 cycles.	R/W*1

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (both serial transmission and reception are disabled).

SIMR1 selects simple IIC mode and the number of delay stages for the SDAn output.

IICM bit (Simple IIC Mode Select)

In combination with the SMIF bit in SCMR, the IICM bit selects the operating mode.

IICDL[4:0] bits (SDA Delay Output Select)

The IICDL[4:0] bits specify an output delay on the SDAn pin relative to the falling edge of the output on the SCLn pin.

The available delay settings range from no delay to 31 cycles, with the clock signal from the on-chip baud rate generator as the base. The signal obtained by frequency-dividing PCLKA by the divisor set in SMR.CKS[1:0] is supplied as the clock signal from the on-chip baud rate generator. Set these bits to 00000b unless the operation is in simple IIC mode. In simple IIC mode, set the bits to a value in the range from 00001b to 11111b.

30.2.22 I²C Mode Register 2 (SIMR2)

Address(es): SCI0.SIMR2 4007 000Ah, SCI1.SIMR2 4007 002Ah, SCI2.SIMR2 4007 004Ah, SCI3.SIMR2 4007 006Ah, SCI4.SIMR2 4007 008Ah, SCI8.SIMR2 4007 010Ah, SCI9.SIMR2 4007 012Ah

b0	IICINTM	IIC Interrupt Mode Select	0: Use ACK/NACK interrupts 1: Use reception and transmission interrupts.	R/W*1
b1	IICCSC	Clock Synchronization	0: No synchronization with the clock signal 1: Synchronization with the clock signal.	R/W*1
b4 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	IICACKT	ACK Transmission Data	0: ACK transmission 1: NACK transmission and ACK/NACK reception.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (serial reception and transmission disabled).

SIMR2 selects how reception and transmission are controlled in simple IIC mode.

IICINTM bit (IIC Interrupt Mode Select)

The IICINTM bit selects the sources of interrupt requests in simple IIC mode.

IICCSC bit (Clock Synchronization)

Set the IICCSC bit to 1 to synchronize the internally generated SCLn clock signal when the SCLn pin is driven low

Bit	Symbol	位名称	Description	R/W
b7 to b3	IICDL[4:0]	SDA延迟输出选择	以下周期是来自片内波特率发生器的时钟信号： b7b300000：无输出延迟 00001：0到1个周期00010：1到2个周期00011：2到3个周期00100：3到4个周期循环00101：4到5个循环 ：11110：29至30个周期 11111：30至31个周期。	R/W*1

Note 1. 只有当SCR寄存器中的RE和TE位为0（串行发送和接收都被禁用）时，才能写入这些位。

SIMR1选择简单IIC模式和SDAn输出的延迟级数。

IICM位（简单IIC模式选择）

IICM位结合SCMR中的SMIF位选择工作模式。

IICDL[4:0]位（SDA延迟输出选择）

IICDL[4:0]位指定SDAn引脚上相对于SCLn引脚输出下降沿的输出延迟。

可用的延迟设置范围从无延迟到31个周期，以来自片上波特率发生器的时钟信号为基准。通过在SMR.CKS[1:0]中设置的除数对PCLKA进行分频获得的信号作为来自片上波特率发生器的时钟信号提供。除非操作处于简单IIC模式，否则将这些位设置为00000b。在简单IIC模式下，将位设置为00001b到11111b范围内的值。

30.2.22 I2C模式寄存器2(SIMR2)

Address(es): SCI0.SIMR2 4007 000Ah, SCI1.SIMR2 4007 002Ah, SCI2.SIMR2 4007 004Ah, SCI3.SIMR2 4007 006Ah, SCI4.SIMR2 4007 008Ah, SCI8.SIMR2 4007 010Ah, SCI9.SIMR2 4007 012Ah

b4 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b5	IICACKT	ACK传输数据	0：ACK发送1：NACK发送和ACKNACK接收。	R/W
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只有当SCR寄存器中的RE和TE位为0（串行接收和发送禁用）时，才能写入这些位。

SIMR2选择在简单IIC模式下如何控制接收和发送。

IICINTM位（IIC中断模式选择）

IICINTM位选择简单IIC模式下的中断请求源。

IICCSC bit (Clock Synchronization)

当SCLn引脚驱动为低电平时，将IICCSC位设置为1以同步内部生成的SCLn时钟信号

because of a wait inserted by another device, for example.

The SCL clock signal is not synchronized if the IICCSC bit is 0. The SCLn clock signal is generated according to the rate selected in the BRR register regardless of the level being input on the SCLn pin.

Set this bit to 1 except during debugging.

IICACKT bit (ACK Transmission Data)

The IICACKT bit transmits data that contains ACK bits. Set this bit to 1 when ACK and NACK bits are received.

30.2.23 I²C Mode Register 3 (SIMR3)

Address(es): SCI0.SIMR3 4007 000Bh, SCI1.SIMR3 4007 002Bh, SCI2.SIMR3 4007 004Bh, SCI3.SIMR3 4007 006Bh, SCI4.SIMR3 4007 008Bh, SCI8.SIMR3 4007 010Bh, SCI9.SIMR3 4007 012Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	IICSCLS[1:0]		IICSDAS[1:0]		IICSTIF	IICSTP REQ	IICRST AREQ	IICSTA REQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	IICSTAREQ	Start Condition Generation	0: Do not generate start condition 1: Generate start condition.*1, *3, *5, *6	R/W
b1	IICRSTAREQ	Restart Condition Generation	0: Do not generate restart condition 1: Generate restart condition.*2, *3, *5, *6	R/W
b2	IICSTPREQ	Stop Condition Generation	0: Do not generate stop condition 1: Generate stop condition.*2, *3, *5, *6	R/W
b3	IICSTIF	Issuing of Start, Restart, or Stop Condition Completed Flag	0: No requests are being made for generating conditions, or a condition is being generated 1: Generation of start, restart, or stop condition is complete. When 0 is written to IICSTIF, it is set to 0.*4	R/W*4
b5, b4	IICSDAS[1:0]	SDA Output Select	b5 b4 0 0: Output serial data 0 1: Generate start, restart, or stop condition 1 0: Output low on SDAn pin 1 1: Drive SDAn pin to high-impedance state.	R/W
b7, b6	IICSCLS[1:0]	SCL Output Select	b7 b6 0 0: Output serial clock 0 1: Generate start, restart, or stop condition 1 0: Output low on SCLn pin 1 1: Drive SCLn pin to high-impedance state.	R/W

Note 1. Only generate a start condition after checking the bus state and confirming that the bus is free.
Note 2. Generate a restart or stop condition after checking the bus state and confirming that the bus is busy.
Note 3. Do not set more than one of the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits to 1 at a given time.
Note 4. Write only 0. When 1 is written, the value is ignored.
Note 5. Execute the generation of a condition after the value of the IICSTIF flag is 0.
Note 6. Do not write 0 to this bit while it is 1. Generation of a condition is suspended by writing 0 to this bit while it is 1.

IICSTAREQ bit (Start Condition Generation)

When a start condition is to be generated, set both IICSDAS[1:0] and IICSCLS[1:0] to 01b in addition to setting the IICSTAREQ bit to 1.

[Setting condition]

- Writing 1 to the bit.

[Clearing condition]

- When generation of a start condition is complete.

例如，由于另一个设备插入了等待。

如果IICCSC位为0，则SCL时钟信号不同步。SCLn时钟信号根据BRR寄存器中选择的速率生成，与SCLn引脚上输入的电平无关。

除调试期间外，将此位设置为1。

IICACKT位（ACK传输数据）

IICACKT位发送包含ACK位的数据。当收到ACK和NACK位时，将该位设置为1。

30.2.23 I2C模式寄存器3(SIMR3)

b2	IICSTPREQ	停止条件生成	0：不产生停止条件1：产生停止条件。*2 *3 *5 *6	R/W
b3	IICSTIF	发出启动、重启或停止条件已完成 Flag	0：没有请求生成条件，或正在生成条件1：开始、重新启动或停止条件的生成已完成。当0写入IICSTIF时，设置为0.*4	R/W*4
b5, b4	IICSDAS[1:0]	SDA输出选择	b5b400：输出串行数据01：产生启动、重启或停止条件10：SDAn引脚1输出低电平1：驱动SDAn引脚为高阻态。	R/W
b7, b6	IICSCLS[1:0]	SCL输出选择	b7b600：输出串行时钟01：产生启动、重启或停止条件10：在SCLn引脚上输出低电平11：将SCLn引脚驱动为高阻态。	R/W

Note 1. 只有在检查总线状态并确认总线空闲后才产生启动条件。
Note 2. 在检查总线状态并确认总线繁忙后生成重新启动或停止条件。
Note 3. 在给定时间，不要将IICSTAREQ、IICRSTAREQ和IICSTPREQ位中的一个以上设置为1。
Note 4. 仅写入0。写入1时，忽略该值。
Note 5. 在IICSTIF标志的值为0后执行条件的生成。
Note 6. 请勿在该位为1时向其写入0。当该位为1时，向该位写入0可暂停条件的生成。

IICSTAREQ位（开始条件生成）

当要产生一个开始条件时，除了设置IICSDAS[1:0]和IICSCLS[1:0]为01b IICSTAREQ位为1。

[Setting condition]

- 向该位写入1。

[Clearing condition]

- 当开始条件的生成完成时。

IICRSTAREQ bit (Restart Condition Generation)

When a restart condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b in addition to setting the IICRSTAREQ bit to 1.

[Setting condition]

- Writing 1 to the bit.

[Clearing condition]

- When generation of a restart condition is complete.

IICSTPREQ bit (Stop Condition Generation)

When a stop condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b in addition to setting the IICSTPREQ bit to 1.

[Setting condition]

- Writing 1 to the bit.

[Clearing condition]

- When generation of a stop condition is complete.

IICSTIF flag (Issuing of Start, Restart, or Stop Condition Completed Flag)

After generating a condition, the IICSTIF flag indicates that the condition generation is complete. When using the IICSTAREQ, IICRSTAREQ, or IICSTPREQ bit to cause generation of a condition, do so after setting the IICSTIF flag to 0.

When the IICSTIF flag is 1 while an interrupt request is enabled by setting the SCR.TEIE bit, an STI request is output.

[Setting condition]

- When generation of a start, restart, or stop condition completes. If the setting condition conflicts with any of the clearing conditions for the flag, the clearing condition takes precedence.

[Clearing conditions]

- Writing 0 to the bit, then confirm that the IICSTIF flag is 0.
- Writing 0 to the SIMR1.IICM bit when operation is not in simple IIC mode
- Writing 0 to the SCR.TE bit.

IICSDAS[1:0] bits (SDA Output Select)

The IICSDAS[1:0] bits control output from the SDAn pin. Set the IICSDAS[1:0] and IICSCLS[1:0] bits to the same value.

IICSCLS[1:0] bits (SCL Output Select)

The IICSCLS[1:0] bits control output from the SCLn pin. Set the IICSCLS[1:0] and IICSDAS[1:0] bits to the same value.

IICRSTAREQ位（重启条件生成）

当要产生重启条件时，除了将IICRSTAREQ位设置为1之外，将IICSDAS[1:0]和IICSCLS[1:0]位都设置为01b。

[Setting condition]

- 向该位写入1。

[Clearing condition]

- 当重新启动条件的生成完成时。

IICSTPREQ位（停止条件生成）

当要产生停止条件时，除了将IICSTPREQ位设置为1之外，还将IICSDAS[1:0]和IICSCLS[1:0]位设置为01b。

[Setting condition]

- 向该位写入1。

[Clearing condition]

- 当停止条件的生成完成时。

IICSTIF标志（发出启动、重启或停止条件完成标志）

生成条件后，IICSTIF标志指示条件生成完成。使用时IICSTAREQ、IICRSTAREQ或IICSTPREQ位会导致条件生成，请在将IICSTIF标志设置为0后执行此操作。

当IICSTIF标志为1且通过设置SCR.TEIE位使能中断请求时，输出STI请求。

[Setting condition]

- 当启动、重新启动或停止条件的生成完成时。如果设置条件与标志的任何清除条件冲突，则清除条件优先。

[Clearing conditions]

- 将0写入该位，然后确认IICSTIF标志为0。
- 非简单IIC模式下向SIMR1.IICM位写入0
- 将0写入SCR.TE位。

IICSDAS[1:0]位（SDA输出选择）

IICSDAS[1:0]位控制SDAn引脚的输出。将IICSDAS[1:0]和IICSCLS[1:0]位设置为相同的值。

IICSCLS[1:0]位（SCL输出选择）

IICSCLS[1:0]位控制SCLn引脚的输出。将IICSCLS[1:0]和IICSDAS[1:0]位设置为相同的值。

30.2.24 I²C Status Register (SISR)

Address(es): SCI0.SISR 4007 000Ch, SCI1.SISR 4007 002Ch, SCI2.SISR 4007 004Ch, SCI3.SISR 4007 006Ch, SCI4.SISR 4007 008Ch, SCI8.SISR 4007 010Ch, SCI9.SISR 4007 012Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	IICACKR
Value after reset:	0	0	x	x	0	x	0	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	IICACKR	ACK Reception Data Flag	0: ACK received 1: NACK received.	R
b1	—	Reserved	This bit is read as 0	R
b2	—	Reserved	The read value is undefined	R
b3	—	Reserved	This bit is read as 0	R
b5, b4	—	Reserved	The read value is undefined	R
b7, b6	—	Reserved	These bits are read as 0	R

SISR monitors the state in simple IIC mode.

IICACKR flag (ACK Reception Data Flag)

Received ACK and NACK bits can be read from the IICACKR flag. This flag is updated on the rising edge of the SCLn clock for the received ACK/NACK bit.

30.2.25 SPI Mode Register (SPMR)

Address(es): SCI0.SPMR 4007 000Dh, SCI1.SPMR 4007 002Dh, SCI2.SPMR 4007 004Dh, SCI3.SCI3 4007 006Dh, SCI4.SPMR 4007 008Dh, SCI8.SPMR 4007 010Dh, SCI9.SPMR 4007 012Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	CKPH	CKPOL	—	MFF	—	MSS	CTSE	SSE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SSE	SSn Pin Function Enable	0: SSn pin function is disabled 1: SSn pin function is enabled.	R/W*1
b1	CTSE	CTS Enable	0: CTS function is disabled (RTS output function is enabled) 1: CTS function is enabled.	R/W*1
b2	MSS	Master Slave Select	0: Transmission is through the TXDn pin and reception is through the RXDn pin (master mode) 1: Reception is through the TXDn pin and transmission is through the RXDn pin (slave mode).	R/W*1
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	MFF	Mode Fault Flag	0: No mode fault error 1: Mode fault error.	R/W*2
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6	CKPOL	Clock Polarity Select	0: Clock polarity is not inverted 1: Clock polarity is inverted.	R/W*1
b7	CKPH	Clock Phase Select	0: Clock is not delayed 1: Clock is delayed.	R/W*1

Note 1. Writing to these bits is only possible when the RE and TE bits in the SCR register are 0 (both serial transmission and reception

30.2.24 I2C状态寄存器(SISR)

Address(es): SCI0.SISR 4007 000Ch, SCI1.SISR 4007 002Ch, SCI2.SISR 4007 004Ch, SCI3.SISR 4007 006Ch, SCI4.SISR 4007 008Ch, SCI8.SISR 4007 010Ch, SCI9.SISR 4007 012Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	IICACKR
重置后的值：	0	0	x	x	0	x	0	0

x: Undefined

Bit	Symbol	位名称	Description	R/W
b0	IICACKR	ACK接收数据标志	0：收到ACK1：收到NACK。	R
b1	—	Reserved	该位读为0	R
b2	—	Reserved	读取值未定义	R
b3	—	Reserved	该位读为0	R
b5, b4	—	Reserved	读取值未定义	R
b7, b6	—	Reserved	这些位被读为0	R

SISR在简单IIC模式下监控状态。

IICACKR标志（ACK接收数据标志）

接收到的ACK和NACK位可以从IICACKR标志中读取。该标志在接收到的ACKNACK位的SCLn时钟的上升沿更新。

30.2.25 SPI模式寄存器(SPMR)

Address(es): SCI0.SPMR 4007 000Dh, SCI1.SPMR 4007 002Dh, SCI2.SPMR 4007 004Dh, SCI3.SCI3 4007 006Dh, SCI4.SPMR 4007 008Dh, SCI8.SPMR 4007 010Dh, SCI9.SPMR 4007 012Dh

	CKPH	CKPOL	—	MFF	—	MSS	CTSE	SSE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SSE	SSn引脚功能使能	0：禁用SSn引脚功能1：启用SSn引脚功能。	R/W*1
b1	CTSE	CTS Enable	0：CTS功能无效（RTS输出功能有效）1：CTS功能有效。	R/W*1
b2	MSS	主从选择	0：通过TXDn引脚发送，通过RXDn引脚接收（主模式）1：通过TXDn引脚接收，通过RXDn引脚发送（从模式）。	R/W*1
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	MFF	模式故障标志	0：无模式故障错误1：模式故障错误。	R/W*2
b5	—	Reserved	该位读取为0。写入值应为0。	R/W
b6	CKPOL	时钟极性选择	0：时钟极性不反转1：时钟极性反转。	R/W*1
b7	CKPH	时钟相位选择	0：时钟不延迟1：时钟延迟。	R/W*1

Note 1. 仅当SCR寄存器中的RE和TE位为0时才可以写入这些位（串行发送和接收

are disabled).
Note 2. Only 0 can be written to this bit to clear the flag.

The SPMR register selects settings for simple SPI mode.

SSE bit (SSn Pin Function Enable)

Set the SSE bit to 1 to use the SSn pin to control transmission and reception in simple SPI mode. Set this bit to 0 in all other modes. When master mode is selected (SCR.CKE[1:0] = 00b and SPMR.MSS = 0) and there is a single master, the SSn pin on the master side is not required to control reception and transmission. In such a case, set the SSE bit to 0. Do not set both the SSE and CTSE bits to 1 as the operation is the same as that when these bits are set to 0.

CTSE bit (CTS Enable)

Set the CTSE bit to 1 to use the SSn pin to input the CTS control signal for controlling transmission and reception. The RTS signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode, simple SPI mode, and simple IIC mode. Do not set both the CTSE and SSE bits to 1 as the operation is the same as that when these bits are set to 0.

MSS bit (Master Slave Select)

The MSS bit selects between master or slave operation in simple SPI mode. The functions of the TXDn and RXDn pins are reversed when this bit is set to 1, so that data is received through the TXDn pin and transmitted through the RXDn pin. Set this bit to 0 in modes other than simple SPI mode.

MFF flag (Mode Fault Flag)

The MFF flag indicates mode fault errors. In a multi-master configuration, determine the mode fault error occurrence by reading this flag.

[Setting condition]

- When input on the SSn pin is low during master operation in simple SPI mode (SSE bit = 1 and MSS bit = 0).

[Clearing condition]

- Writing 0 to the bit after 1 is read.

CKPOL bit (Clock Polarity Select)

The CKPOL bit selects the polarity of the clock signal output through the SCKn pin. See Figure 30.70 for details. Set the CKPOL bit to 0 in modes other than simple SPI mode and clock synchronous mode.

CKPH bit (Clock Phase Select)

The CKPH bit selects the phase of the clock signal output through the SCKn pin. See Figure 30.70 for details. Set the CKPH bit to 0 in modes other than simple SPI mode and clock synchronous mode.

30.2.26 FIFO Control Register (FCR)

Address(es): SCI0.FCR 4007 0014h, SCI1.FCR 4007 0034h, SCI2.FCR 4007 0054h, SCI3.FCR 4007 0074h, SCI4.FCR 4007 0094h, SCI8.FCR 4007 0114h, SCI9.FCR 4007 0134h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RSTRG[3:0]				RTRG[3:0]				TTRG[3:0]				DRES	TFRST	RFRST	FM
Value after reset:	1	1	1	1	1	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FM	FIFO Mode Select	Valid only in asynchronous mode, including multi-processor or clock synchronous mode: 0: Non-FIFO mode. Selects TDR/RDR or TDRHL/RDRHL for communication. 1: FIFO mode. Selects FTDRHL/FRDRHL for communication.	R/W*1

are disabled).
Note 2. 只能向该位写入0以清除标志。

SPMR寄存器选择简单SPI模式的设置。

SSE位（SSn引脚功能使能）

将SSE位设置为1以使用SSn引脚控制简单SPI模式下的发送和接收。在所有其他模式下将此位设置为0。Whenmastermodeisselected(SCR.CKE[1:0]=00bandSPMR.MSS=0)andthereisasinglemaster theSSnpinonthemastersideisnotrequiredtocontrolreceptionandtransmission.在这种情况下，请将SSE位设置为0。不要将SSE和CTSE位都设置为1，因为操作与将这些位设置为0时的操作相同。

CTSE位（CTS使能）

将CTSE位设置为1以使用SSn引脚输入CTS控制信号以控制发送和接收。该位设置为0时输出RTS信号。在智能卡接口模式、简单SPI模式和简单模式下设置该位为0
IIC模式。不要将CTSE和SSE位都设置为1，因为操作与将这些位设置为0时的操作相同。

MSS位（主从选择）

MSS位在简单SPI模式下选择主操作或从操作。当该位设置为1时，TXDn和RXDn引脚的功能相反，因此数据通过TXDn引脚接收并通过RXDn引脚发送。在简单SPI模式以外的模式下将此位设置为0。

MFF标志（模式故障标志）

MFF标志指示模式故障错误。在多主机配置中，通过读取该标志确定模式故障错误发生。

[Setting condition]

- 在简单SPI模式（SSE位=1和MSS位=0）下主机操作期间SSn引脚上的输入为低电平时。

[Clearing condition]

- 读取1后向该位写入0。

CKPOL位（时钟极性选择）

CKPOL位选择通过SCKn引脚输出的时钟信号的极性。详见图30.70。设置在简单SPI模式和时钟同步模式以外的模式下，CKPOL位为0。

CKPH位（时钟相位选择）

CKPH位选择通过SCKn引脚输出的时钟信号的相位。详见图30.70。设置在简单SPI模式和时钟同步模式以外的模式下，CKPH位为0。

30.2.26 先进先出控制寄存器(FCR)

Address(es): SCI0.FCR 4007 0014h, SCI1.FCR 4007 0034h, SCI2.FCR 4007 0054h, SCI3.FCR 4007 0074h, SCI4.FCR 4007 0094h, SCI8.FCR 4007 0114h, SCI9.FCR 4007 0134h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RSTRG[3:0]				RTRG[3:0]				TTRG[3:0]				DRES	TFRST	RFRST	FM
重置后的值：	1	1	1	1	1	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	FM	先进先出模式选择	仅在异步模式下有效，包括多处理器或时钟同步模式：0：非FIFO模式。 选择TDRRDR或TDRHLRDRHL进行通信。1：先进先出模式。 选择FTDRHLFRDRHL进行通信。	R/W*1

Bit	Symbol	Bit name	Description	R/W
b1	RFRST	Receive FIFO Data Register Reset	Valid only when FCR.FM = 1: 0: Do not reset FRDRHL 1: Reset FRDRHL.	R/W
b2	TFRST	Transmit FIFO Data Register Reset	Valid only when FCR.FM = 1: 0: Do not reset FTDRHL 1: Reset FTDRHL.	R/W
b3	DRES	Receive Data Ready Error Select Bit	Selects the interrupt request when detecting a receive data ready: 0: Receive data full interrupt (SCIn_RXI) 1: Receive error interrupt (SCIn_ERI).	R/W
b7 to b4	TTRG[3:0]	Transmit FIFO Data Trigger Number	Valid only in asynchronous mode, including multi-processor or clock synchronous mode: 0000: Trigger number 0 : 1111: Trigger number 15.	R/W
b11 to b8	RTRG[3:0]	Receive FIFO Data Trigger Number	Valid only in asynchronous mode, including multi-processor or clock synchronous mode: 0000: Trigger number 0 : 1111: Trigger number 15.	R/W
b15 to b12	RSTRG[3:0]	RTS Output Active Trigger Number Select	Valid only in asynchronous mode, including multi-processor or clock synchronous mode, while FCR.FM = 1, SPMR.CTSE = 0, and SPMR.SSE = 0: 0000: Trigger number 0 : 1111: Trigger number 15.	R/W

Note 1. Writable only when TE = 0 and RE = 0.

FCR selects the FIFO mode, resets FTDRHL/FRDRHL, selects the FIFO data trigger number for transmission/reception, and selects the RTS output active trigger number.

FM bit (FIFO Mode Select)

When the FM bit is set to 1, FTDRHL and FRDRHL are selected for communication. When the FM bit is set to 0, TDR and RDR, or TDRHL and RDRHL are selected for communication.

RFRST bit (Receive FIFO Data Register Reset)

When the RFRST bit is set to 1, the FRDRHL register is reset, and the receive data count is reset to 0. When 1 is written to the RFRST bit, it is set to 0 after 1 PCLKA.

TFRST bit (Transmit FIFO Data Register Reset)

When the TFRST bit is set to 1, the FTDRHL register is reset, and the transmit data count is reset to 0. When 1 is written to the TFRST bit, it is set to 0 after 1 PCLKA.

DRES bit (Receive Data Ready Error Select Bit)

On detecting a receive data ready error, the DRES bit selects between an SCIn_RXI interrupt request or an SCIn_ERI interrupt request. Set the DRES bit to 1 when starting the DMAC or DTC and reading from the FRDRH and FRDRL registers.

TTRG[3:0] bits (Transmit FIFO Data Trigger Number)

The TDFE flag is set to 1 when the amount of transmit data in FTDRHL is equal to or less than the transmit triggering number specified in the TTRG[3:0] bits, and software can write data to FTDRHL. If SCR.TIE = 1, an SCIn_TXI interrupt request occurs.

RTRG[3:0] bits (Receive FIFO Data Trigger Number)

The RDF flag is set to 1 when the amount of receive data in FRDRHL is equal to or greater than the specified receive triggering number specified in the RTRG[3:0] bits, and software can read data from FRDRHL. If SCR.RIE = 1, an SCIn_RXI interrupt request occurs.

When RTRG[3:0] is set to 0, the RDF flag is not set even when the amount of data in the receive FIFO is equal to 0, and an SCIn_RXI interrupt does not occur.

Bit	Symbol	位名称	Description	R/W
b1	RFRST	接收FIFO数据寄存器 Reset	仅在FCR.FM=1时有效：0：不复位FRDRHL1：复位FRDRHL 。	R/W
b2	TFRST	发送FIFO数据 注册重置	仅当FCR.FM=1时有效：0：不复位FTDRHL1：复位FTDRHL 。	R/W
b3	DRES	接收数据就绪错误 选择位	检测到接收数据就绪时选择中断请求：0：接收数据满中断（SCIn_RXI）1：接收错误中断（SCIn_ERI）。	R/W
b7 to b4	TTRG[3:0]	发送FIFO数据触发 Number	仅在异步模式下有效，包括多处理器或时钟同步模式：0000：触发编号0 :1111:触发器编号15。	R/W
b11 to b8	RTRG[3:0]	接收FIFO数据触发 Number	仅在异步模式下有效，包括多处理器或时钟同步模式：0000：触发编号0 :1111:触发器编号15。	R/W
b15 to b12	RSTRG[3:0]	RTS输出有源触发 号码选择	仅在异步模式下有效，包括多处理器或时钟同步模式，同时FCR.FM=1，SPMR.CTSE=0，和SPMR.SSE=0：0000：触发编号0 :1111:触发器编号15。	R/W

Note 1. 仅当TE=0且RE=0时可写。

FCR选择FIFO模式，复位FTDRHLFRDRHL，选择发送接收的FIFO数据触发数，选择RTS输出激活触发数。

FM位（FIFO模式选择）

当FM位设置为1时，选择FTDRHL和FRDRHL进行通信。当FM位设置为0时，选择TDR和RDR，或TDRHL和RDRHL进行通信。

RFRST位（接收FIFO数据寄存器复位）

当RFRST位设置为1时，FRDRHL寄存器复位，接收数据计数复位为0。当RFRST位写入1时，1个PCLKA后设置为0。

TFRST位（发送FIFO数据寄存器复位）

当TFRST位设置为1时，FTDRHL寄存器复位，发送数据计数复位为0。当TFRST位写入1时，经过1个PCLKA后设置为0。

DRES位（接收数据就绪错误选择位）

在检测到接收数据就绪错误时，DRES位在SCIn_RXI中断请求或SCIn_ERI中断请求之间进行选择。启动DMAC或DTC并读取FRDRH和FRDRL寄存器时，将DRES位设置为1。

TTRG[3:0]位（发送FIFO数据触发数）

当FTDRHL中的发送数据量等于或小于TTRG[3:0]位中指定的发送触发数时，TDFE标志设置为1，并且软件可以将数据写入FTDRHL。如果SCR.TIE=1，则发生SCIn_TXI中断请求。

RTRG[3:0]位（接收FIFO数据触发数）

当FRDRHL中的接收数据量等于或大于RTRG[3:0]位中指定的接收触发数时，RDF标志设置为1，并且软件可以从FRDRHL中读取数据。如果SCR.RIE=1，则发生SCIn_RXI中断请求。

当RTRG[3:0]设置为0时，即使接收FIFO中的数据量等于0，也不会设置RDF标志，并且不会发生SCIn_RXI中断。

RSTRG[3:0] bits (RTS Output Active Trigger Number Select)

When the amount of receive data stored in FRDRHL is equal to or greater than the receive triggering number specified in the RSTRG[3:0] bits, the RTS signal goes high.

When RSTRG[3:0] is 0, the RTS signal does not go high even when the amount of data in FRDRHL is equal to 0.

30.2.27 FIFO Data Count Register (FDR)

Address(es): SCI0.FDR 4007 0016h, SCI1.FDR 4007 0036h, SCI2.FDR 4007 0056h, SCI3.FDR 4007 0076h, SCI4.FDR 4007 0096h, SCI8.FDR 4007 0116h, SCI9.FDR 4007 0136h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	T[4:0]					—	—	—	R[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	R[4:0]	Receive FIFO Data Count	Indicates the amount of receive data stored in FRDRHL (valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, when FCR.FM = 1)	R
b7 to b5	—	Reserved	These bits are read as 0.	R
b12 to b8	T[4:0]	Transmit FIFO Data Count	Indicates the amount of non-transmitted data stored in FTDRHL (valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, when FCR.FM = 1)	R
b15 to b13	—	Reserved	These bits are read as 0	R

The FDR register indicates the amount of data stored in FRDRHL/FTDRHL.

R[4:0] bits (Receive FIFO Data Count)

The R[4:0] bits indicate the amount of receive data stored in FRDRHL. A value of 00h indicates no receive data, and 10h means that the maximum received data is stored in FRDRHL.

T[4:0] bits (Transmit FIFO Data Count)

The T[4:0] bits indicate the amount of non-transmitted data stored in FTDRHL. A value of 00h indicates no transmit data, and 10h indicates that all (maximum amount) of the data to be transmitted is stored in FTDRHL.

30.2.28 Line Status Register (LSR)

Address(es): SCI0.LSR 4007 0018h, SCI1.LSR 4007 0038h, SCI2.LSR 4007 0058h, SCI3.LSR 4007 0078h, SCI4.LSR 4007 0098h, SCI8.LSR 4007 0118h, SCI9.LSR 4007 0138h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ORER	Overrun Error Flag	Valid only in asynchronous mode, including multi-processor mode, or clock synchronous mode, with FIFO operation selected: 0: No overrun error occurred 1: Overrun error occurred.	R*1
b1	—	Reserved	This bit is read as 0	R
b6 to b2	FNUM[4:0]	Framing Error Count	Indicates the amount of data with a framing error in the receive data stored in the Receive FIFO Data Register (FRDRHL)	R
b7	—	Reserved	This bit is read as 0	R

RSTRG[3:0]位（RTS输出有效触发数选择）

当FRDRHL中存储的接收数据量等于或大于RSTRG[3:0]位中指定的接收触发数时，RTS信号变为高电平。

当RSTRG[3:0]为0时，即使FRDRHL中的数据量等于0，RTS信号也不会变高。

30.2.27 FIFO数据计数寄存器(FDR)

Address(es): SCI0.FDR 4007 0016h, SCI1.FDR 4007 0036h, SCI2.FDR 4007 0056h, SCI3.FDR 4007 0076h, SCI4.FDR 4007 0096h, SCI8.FDR 4007 0116h, SCI9.FDR 4007 0136h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	T[4:0]					—	—	—	R[4:0]				
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b4 to b0	R[4:0]	接收FIFO数据计数	表示FRDRHL中存储的接收数据量（仅在异步模式下有效，包括多处理器模式，或时钟同步模式，当FCR.FM=1时）	R
b7 to b5	—	Reserved	这些位读为0。	R
b12 to b8	T[4:0]	发送FIFO数据计数	表示FTDRHL中存储的未传输数据量（仅在异步模式下有效，包括多处理器模式，或时钟同步模式，当FCR.FM=1时）	R
b15 to b13	—	Reserved	这些位被读为0	R

FDR寄存器指示存储在FRDRHLFTDRHL中的数据量。

R[4:0]位（接收FIFO数据计数）

R[4:0]位指示存储在FRDRHL中的接收数据量。00h表示没有接收数据，10h表示最大接收数据存储在FRDRHL中。

T[4:0]位（发送FIFO数据计数）

T[4:0]位指示存储在FTDRHL中的未传输数据量。值00h表示没有发送数据，而10h表示要发送的所有（最大量）数据都存储在FTDRHL中。

30.2.28 线路状态寄存器(LSR)

Address(es): SCI0.LSR 4007 0018h, SCI1.LSR 4007 0038h, SCI2.LSR 4007 0058h, SCI3.LSR 4007 0078h, SCI4.LSR 4007 0098h, SCI8.LSR 4007 0118h, SCI9.LSR 4007 0138h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PNUM[4:0]					—	FNUM[4:0]					—	ORER
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	ORER	溢出错误标志	仅在异步模式下有效，包括多处理器模式，或时钟同步模式，选择FIFO操作：0：未发生溢出错误1：发生溢出错误。	R*1
b1	—	Reserved	该位读为0	R
b6 to b2	FNUM[4:0]	帧错误计数	指示存储在接收FIFO数据寄存器(FRDRHL)中的接收数据中存在帧错误的数据量	R
b7	—	Reserved	该位读为0	R

Bit	Symbol	Bit name	Description	R/W
b12 to b8	PNUM[4:0]	Parity Error Count	Indicates the amount of data with a parity error in the receive data stored in the Receive FIFO Data Register (FRDRHL)	R
b15 to b13	—	Reserved	These bits are read as 0	R

Note 1. If this flag is 1, write 0 to SSR_FIFO.ORER to clear the flag.

The LSR register indicates the status of receive error.

ORER flag (Overrun Error Flag)

The ORER flag reflects the value in SSR_FIFO.ORER.

FNUM[4:0] bits (Framing Error Count)

The FNUM[4:0] bit value indicates the amount of data with a framing error stored in the FRDRHL register.

PNUM[4:0] bits (Parity Error Count)

The PNUM[4:0] bit value indicates the amount of data with a parity error stored in the FRDRHL register.

30.2.29 Compare Match Data Register (CDR)

Address(es): SCI0.CDR 4007 001Ah, SCI1.CDR 4007 003Ah, SCI2.CDR 4007 005Ah, SCI3.CDR 4007 007Ah, SCI4.CDR 4007 009Ah, SCI8.CDR 4007 011Ah, SCI9.CDR 4007 013Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPD[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b8 to b0	CMPD[8:0]	Compare Match Data	Holds compare data pattern for address match wakeup function	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The CDR register sets the compare data for the address match function.

CMPD[8:0] bits (Compare Match Data)

The CMPD[8:0] bits set the data to be compared to receive data for the address match function when the address match function is enabled (DCCR.DCME = 1).

Three bit lengths are available:

- CMPD[6:0] with 7-bit length
- CMPD[7:0] with 8-bit length
- CMPD[8:0] with 9-bit length.

Bit	Symbol	位名称	Description	R/W
b12 to b8	PNUM[4:0]	奇偶错误计数	表示存储在接收FIFO数据寄存器(FRDRHL)中的接收数据中有奇偶校验错误的数据量	R
b15 to b13	—	Reserved	这些位被读为0	R

Note 1. 如果该标志为1，则向SSR_FIFO.ORER写入0以清除该标志。

LSR寄存器指示接收错误的状态。

ORER标志（溢出错误标志）

ORER标志反映了SSR_FIFO.ORER中的值。

FNUM[4:0]位（帧错误计数）

FNUM[4:0]位值表示存储在FRDRHL寄存器中的具有帧错误的数据量。

PNUM[4:0]位（奇偶错误计数）

PNUM[4:0]位值表示存储在FRDRHL寄存器中的具有奇偶校验错误的数据量。

30.2.29 比较匹配数据寄存器(CDR)

Address(es): SCI0.CDR 4007 001Ah, SCI1.CDR 4007 003Ah, SCI2.CDR 4007 005Ah, SCI3.CDR 4007 007Ah, SCI4.CDR 4007 009Ah, SCI8.CDR 4007 011Ah, SCI9.CDR 4007 013Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPD[8:0]								
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b8 to b0	CMPD[8:0]	比较匹配数据	保存地址匹配唤醒功能的比较数据模式	R/W
b15 to b9	—	Reserved	这些位被读取为0。写入值应为0。	R/W

CDR寄存器设置地址匹配功能的比较数据。

CMPD[8:0]位（比较匹配数据）

当地址匹配功能使能（DCCR.DCME=1）时，CMPD[8:0]位设置要比较的数据以接收地址匹配功能的数据。

提供三种位长：

- 7位长度的CMPD[6:0]
- CMPD[7:0]8位长度
- CMPD[8:0]，长度为9位。

30.2.30 Data Compare Match Control Register (DCCR)

Address(es): SCI0.DCCR 4007 0013h, SCI1.DCCR 4007 0033h, SCI2.DCCR 4007 0053h, SCI3.DCCR 4007 0073h, SCI4.DCCR 4007 0093h, SCI8.DCCR 4007 0113h, SCI9.DCCR 4007 0133h

	b7	b6	b5	b4	b3	b2	b1	b0
	DCME	IDSEL	—	DFER	DPER	—	—	DCMF
Value after reset:	0	1	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DCMF	Data Compare Match Flag	0: Not matched 1: Matched.	R/(W)*1
b2, b1	—	Reserved	These bits are read as 0. The write value should be 0.	R
b3	DPER	Data Compare Match Parity Error Flag	0: No parity error occurred 1: Parity error occurred.	R/(W)*1
b4	DFER	Data Compare Match Framing Error Flag	0: No framing error occurred 1: Framing error occurred.	R/(W)*1
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6	IDSEL	ID Frame Select	Valid only in asynchronous mode, including multi-processor mode: 0: Always compare data regardless of the MPB bit value 1: Only compare data when MPB bit is 1 (ID frame).	R/W
b7	DCME	Data Compare Match Enable	Valid only in asynchronous mode, including multi-processor mode: 0: Address match function disabled 1: Address match function enabled.	R/W

Note 1. Only 0 can be written to clear the flag after reading 1.

The DCCR register sets control of the address match function.

DCMF flag (Data Compare Match Flag)

The DCMF flag indicates that the SCI detects a match of the comparison data (CDR.CMPD) with receive data.

[Setting condition]

- When comparison data (CDR.CMPD) matches the receive data, when DCCR.DCME = 1.

[Clearing condition]

- When 0 is written after 1 is read from DCMF.

Clearing the SCR.RE bit to 0 does not affect the DCMF flag, which keeps its previous value.

DPER flag (Data Compare Match Parity Error Flag)

The DPER flag indicates that a parity error occurred at address match detection (receive data match detection).

[Setting condition]

- When a parity error is detected in the frame in which an address match is detected.

[Clearing conditions]

- When 0 is written after 1 is read from DPER.

Clearing the SCR.RE bit to 0 (serial reception is disabled) does not affect the DPER flag, which keeps its previous value.

DFER flag (Data Compare Match Framing Error Flag)

The DFER flag indicates that a framing error occurred at address match detection (receive data match detection).

[Setting conditions]

- When a stop bit is 0 in the frame in which an address match is detected.

30.2.30 数据比较匹配控制寄存器(DCCR)

Address(es): SCI0.DCCR 4007 0013h, SCI1.DCCR 4007 0033h, SCI2.DCCR 4007 0053h, SCI3.DCCR 4007 0073h, SCI4.DCCR 4007 0093h, SCI8.DCCR 4007 0113h, SCI9.DCCR 4007 0133h

	b7	b6	b5	b4	b3	b2	b1	b0
	DCME	IDSEL	—	DFER	DPER	—	—	DCMF
重置后的值:	0	1	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	DCMF	数据比较匹配标志	0：不匹配1： 匹配。	R/(W)*1
b2, b1	—	Reserved	这些位被读取为0。写入值应为0。	R
b3	DPER	数据比较匹配奇偶校验 错误标志	0：未发生奇偶校验错误1 ：发生奇偶校验错误。	R/(W)*1
b4	DFER	数据比较匹配 成帧错误标志	0：未发生帧错误1：发生帧 错误。	R/(W)*1
b5	—	Reserved	该位读取为0。写入值应为0。	R/W
b6	IDSEL	ID帧选择	仅在异步模式下有效，包括多处理器模式：0：无论MPB位值如何 ，始终比较数据1：仅当MPB位为1（ID帧）时比较数据。	R/W
b7	DCME	数据比较匹配 Enable	仅在异步模式下有效，包括多处理器模式：0：禁用地址匹配功能1 ：启用地址匹配功能。	R/W

Note 1. 读1后只能写0清除标志。

DCCR寄存器设置地址匹配功能的控制。

DCMF标志（数据比较匹配标志）

DCMF标志表示SCI检测到比较数据(CDR.CMPD)与接收数据的匹配。

[Setting condition]

- 当比较数据(CDR.CMPD)与接收数据匹配时，当DCCR.DCME=1。

[Clearing condition]

- 从DCMF读取1后写入0时。

将SCR.RE位清除为0不会影响DCMF标志，它保持其先前的值。

DPER标志（数据比较匹配奇偶校验错误标志）

DPER标志表示在地址匹配检测（接收数据匹配检测）时发生奇偶校验错误。

[Setting condition]

- 在检测到地址匹配的帧中检测到奇偶校验错误时。

[Clearing conditions]

- 当从DPER读取1后写入0。

将SCR.RE位清为0（禁用串行接收）不会影响DPER标志，它保持其先前的值。

DFER标志（数据比较匹配成帧错误标志）

DFER标志表示在地址匹配检测（接收数据匹配检测）时发生了帧错误。

[Setting conditions]

- 当检测到地址匹配的帧中停止位为0时。

- When in 2-stop-bit mode, only the first stop bit is checked for a value of 1, while the second stop bit is not checked.

[Clearing condition]

- When 0 is written after 1 is read from DFER.

When the SCR.RE bit is set to 0 (serial reception is disabled), the DFER flag is not affected and keeps its previous value.

IDSEL bit (ID Frame Select)

The IDSEL bit selects whether to compare data regardless of the MPB bit value or to compare data only when MPB = 1 (ID frame), when the address match function is enabled.

DCME bit (Data Compare Match Enable)

The DCME bit enables or disables the address match function (data compare match function).

If the SCI detects a match between comparison data (CDR.CMPD) and receive data, the DCME bit is cleared automatically and the SCI operates in receive mode without the data compare match function. See section 30.3.6, Address Match (Receive Data Match Detection) Function.

The write value should be 0 for any mode other than asynchronous mode.

30.2.31 Serial Port Register (SPTR)

Address(es): SCI0.SPTR 4007 001Ch, SCI1.SPTR 4007 003Ch, SCI2.SPTR 4007 005Ch, SCI3.SPTR 4007 007Ch, SCI4.SPTR 4007 009Ch, SCI8.SPTR 4007 011Ch, SCI9.SPTR 4007 013Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPB2IO	SPB2DT	RXDMON
Value after reset:	0	0	0	0	0	0	1	1

Bit	Symbol	Bit name	Description	R/W
b0	RXDMON	Serial Input Data Monitor	Indicates the state of the RXDn pin: 0: RXDn pin is low 1: RXDn pin is high.	R
b1	SPB2DT	Serial Port Break Data Select	Selects the output level of the TXDn pin when SCR.TE = 0: 0: Output low on TXDn pin 1: Output high on TXDn pin.	R/W
b2	SPB2IO	Serial Port Break I/O	Selects whether the value of SPB2DT is output on the TXDn pin: 0: The value of SPB2DT bit is not output on TXDn pin 1: The value of SPB2DT bit is output on TXDn pin.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SPTR register provides confirmation of the serial reception pin (RXDn) status and sets the transmission pin (TXDn) status. This register can only be used in asynchronous mode.

The TXDn pin status is determined by the combination of SCR.TE, SPTR.SPB2IO, and SPTR.SPB2DT bit settings, as shown in Table 30.22.

Table 30.22 TXDn pin status

Value of SCR.TE	Value of SPTR.SPB2IO	Value of SPTR.SPB2DT	TXDn pin status
0	0	x	Hi-Z (initial value)
0	1	0	Low level output
0	1	1	High level output
1	x	x	Serial transmit data is output

x: Don't care.

Note: Use the SPTR register in asynchronous mode only. Using this register in any other mode is not guaranteed.

- 在2停止位模式下，仅检查第一个停止位的值是否为1，而不检查第二个停止位。

[Clearing condition]

- 从DFER读取1后写入0。

当SCR.RE位设置为0（禁用串行接收）时，DFER标志不受影响并保持其先前的值。

IDSEL位（ID帧选择）

IDSEL位选择无论MPB位值如何比较数据，还是仅在MPB=1（ID帧）时比较数据，当地址匹配功能启用时。

DCME位（数据比较匹配使能）

DCME位启用或禁用地址匹配功能（数据比较匹配功能）。

如果SCI检测到比较数据（CDR.CMPD）与接收数据匹配，则DCME位自动清零，SCI在接收模式下运行，没有数据比较匹配功能。请参见第30.3.6节，地址匹配（接收数据匹配检测）功能。

对于异步模式以外的任何模式，写入值都应为0。

30.2.31 串行端口寄存器(SPTR)

Address(es): SCI0.SPTR 4007 001Ch, SCI1.SPTR 4007 003Ch, SCI2.SPTR 4007 005Ch, SCI3.SPTR 4007 007Ch, SCI4.SPTR 4007 009Ch, SCI8.SPTR 4007 011Ch, SCI9.SPTR 4007 013Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPB2IO	SPB2DT	RXDMON
重置后的值：	0	0	0	0	0	0	1	1

Bit	Symbol	位名称	Description	R/W
b0	RXDMON	串行输入数据监视器	指示RXDn引脚的状态：0：RXDn引脚为低电平1：RXDn引脚为高电平。	R
b1	SPB2DT	串口中断数据Select	选择SCR.TE=0时TXDn引脚的输出电平：0：TXDn引脚输出低电平1：TXDn引脚输出高电平。	R/W
b2	SPB2IO	串口中断IO	选择是否在TXDn引脚上输出SPB2DT的值：0：在TXDn引脚上不输出SPB2DT位的值1：在TXDn引脚上输出SPB2DT位的值。	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SPTR寄存器提供串行接收引脚(RXDn)状态的确认并设置发送引脚(TXDn)状态。该寄存器只能在异步模式下使用。

TXDn引脚状态由SCR.TE、SPTR.SPB2IO和SPTR.SPB2DT位设置的组合决定，如表30.22所示。

Table 30.22 TXDn引脚状态

SCR.TE的价值	SPTR.SPB2IO的值	SPTR.SPB2DT的值	TXDn引脚状态
0	0	x	Hi-Z (initial value)
0	1	0	低电平输出
0	1	1	高电平输出
1	x	x	串行传输数据输出

x: Don't care.

Note: 仅在异步模式下使用SPTR寄存器。不保证在任何其他模式下使用该寄存器。

30.3 Operation in Asynchronous Mode

Figure 30.2 shows the general format for asynchronous serial communications. One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level). In asynchronous serial communications, the communications line is held in the mark state (high level) when not communicating. The SCI monitors the communications line. When the SCI detects a low, it regards that as a start bit and starts serial communication.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communications. Both the transmitter and receiver have a double-buffered structure in addition to FIFO mode, so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

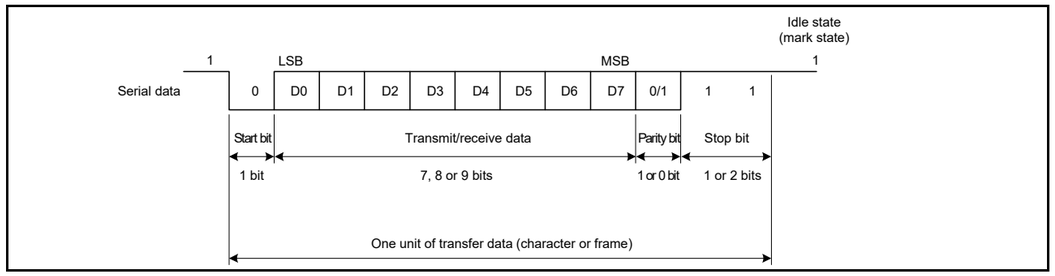

Figure 30.2 Data format in asynchronous serial communications with 8-bit data, parity bit, and 2 stop bits

30.3.1 Serial Data Transfer Format

Table 30.23 lists the serial data transfer formats that can be used in asynchronous mode. Any of the 18 transfer formats can be selected in the SMR and SCMR register settings. For details on the multi-processor function, see section 30.4, Multi-Processor Communication Function.

Table 30.23 Serial transfer formats in asynchronous mode (1 of 2)

SCMR setting	SMR setting				Serial transfer format and frame length												
CHR1	CHR	PE	MP	STOP	1	2	3	4	5	6	7	8	9	10	11	12	13
0	0	0	0	0	S	9-bit data									STOP		
0	0	0	0	1	S	9-bit data									STOP	STOP	
0	0	1	0	0	S	9-bit data									P	STOP	
0	0	1	0	1	S	9-bit data									P	STOP	STOP
1	0	0	0	0	S	8-bit data								STOP			
1	0	0	0	1	S	8-bit data								STOP	STOP		

30.3 异步模式下的操作

图30.2显示了异步串行通信的一般格式。一帧由起始位（低电平）、发送接收数据、奇偶校验位和停止位（高电平）组成。在异步串行通信中，通信线在不通信时保持在标记状态（高电平）。SCI监控通信线路。当SCI检测到低电平时，将其视为起始位并开始串行通信。

在SCI内部，发射器和接收器是独立的单元，可实现全双工通信。发送器和接收器除了FIFO模式外，都具有双缓冲结构，从而可以在发送或接收过程中读取或写入数据，从而实现数据的连续发送和接收。

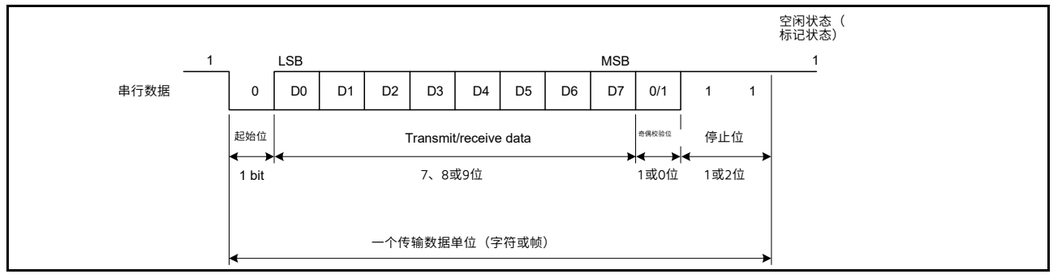

Figure 30.2 异步串行通信中的数据格式，包含8位数据、奇偶校验位和2个停止位

30.3.1 串行数据传输格式

表30.23列出了可以在异步模式下使用的串行数据传输格式。可以在SMR和SCMR寄存器设置中选择18种传输格式中的任何一种。有关多处理器功能的详细信息，请参见第30.4节，多处理器通信功能。

Table 30.23 异步模式下的串行传输格式（1of2）

SCMR setting	SMR setting				串行传输格式和帧长												
CHR1	CHR	PE	MP	STOP	1	2	3	4	5	6	7	8	9	10	11	12	13
0	0	0	0	0	S	9-bit data									STOP		
0	0	0	0	1	S	9-bit data									STOP	STOP	
0	0	1	0	0	S	9-bit data									P	STOP	
0	0	1	0	1	S	9-bit data									P	STOP	STOP

1	1	-	1	1	S	7-bit data							MPB	STOP	STOP		

S: 起始位
STOP: 停止位
P: 奇偶校验位
MPB: Multi-processor bit

30.3.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a base clock with a frequency of 16 times*1 the bit rate.

In reception, the SCI samples the falling edge of the start bit using the base clock, and performs internal synchronization.

Because receive data is sampled on the rising edge of the 8th pulse*1 of the base clock, data is latched at the middle of each bit, as shown in Figure 30.3. The reception margin in asynchronous mode is determined by the following formula (1):

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)\ F - \frac{\left| D - 0.5 \right|}{N} (1 + F) \right| \times 100\ [\%] \cdots \text{Formula (1)}$$

M: Reception margin
N: Ratio of bit rate to clock
N = 16 when SEMR.ABCSE = 0 and SEMR.ABCS = 0
N = 8 when SEMR.ABCS = 1
N = 6 when SEMR.ABCSE = 1
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 13)
F: Absolute value of clock frequency deviation

Assuming values of F = 0 and D = 0.5 in formula (1), the reception margin is determined by the following formula:

$$M = \{0.5 - 1/(2 \times 16)\} \times 100\ (\%) = 46.875\%$$

This represents the computed value. Renesas recommends that a margin of 20% to 30% should be allowed in system design.

Note 1. In this example, the SEMR.ABCS bit is 0 and the SEMR.ABCSE is 0. When the ABCS bit is 1 and the ABCSE bit is 0, a frequency of 8 times the bit rate is used as a base clock, and receive data is sampled on the rising edge of the 4th pulse of the base clock.
When the ABCSE bit is 1, a frequency of 6 times the bit rate is used as a base clock, and the receive data is sampled on the rising edge of the 3rd pulse of the base clock.

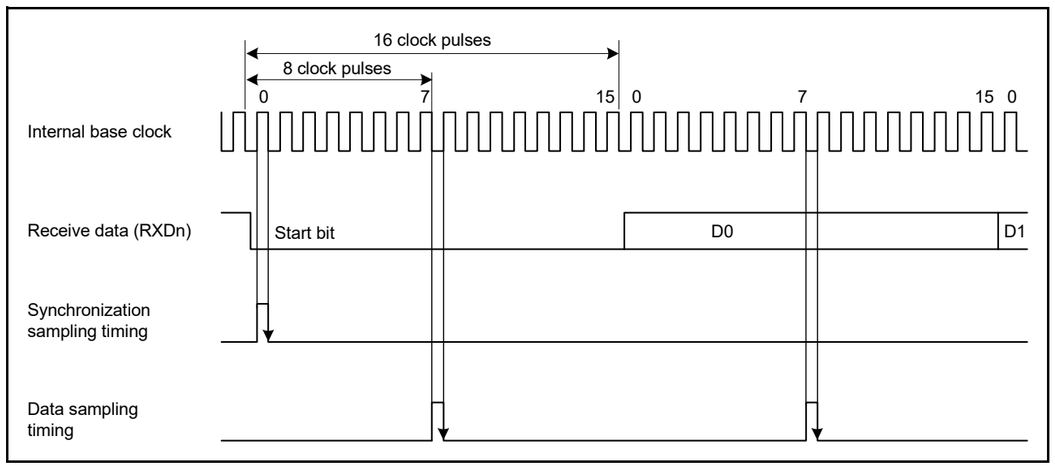

Figure 30.3 Receive data sampling timing in asynchronous mode

30.3.2 异步模式下接收数据采样时序和接收余量

在异步模式下，SCI在频率为16倍*1比特率的基本时钟上运行。

在接收时，SCI使用基本时钟对起始位的下降沿进行采样，并执行内部同步。

因为接收数据是在基本时钟的第8个脉冲*1的上升沿采样的，所以数据在每个位的中间被锁存，如图30.3所示。异步模式下的接收余量由以下公式（1）确定：

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)\ F - \frac{\left| D - 0.5 \right|}{N} (1 + F) \right| \times 100\ [\%] \cdots \text{Formula (1)}$$

M：接收余量
N：比特率与时钟的比率
当SEMR.ABCSE=0和SEMR.ABCS=0时N=16
N = 8 when SEMR.ABCS = 1
N = 6 when SEMR.ABCSE = 1
D:时钟占空比(D=0.5to1.0)
L：帧长（L=9到13）
F：时钟频率偏差的绝对值

假设公式（1）中F=0，D=0.5，接收裕量由下式确定：

$$M = \{0.5 - 1/(2 \times 16)\} \times 100\ (\%) = 46.875\%$$

这表示计算值。瑞萨建议在系统设计中应留出20%至30%的余量。

注1.本例中，SEMR.ABCS位为0，SEMR.ABCSE位为0。当ABCS位为1，ABCSE位为0时，使用8倍比特率的频率作为基准时钟，接收数据在基准时钟的第4个脉冲的上升沿采样。当ABCSE位为1时，以6倍比特率的频率作为基准时钟，在基准时钟的第3个脉冲的上升沿对接收数据进行采样。

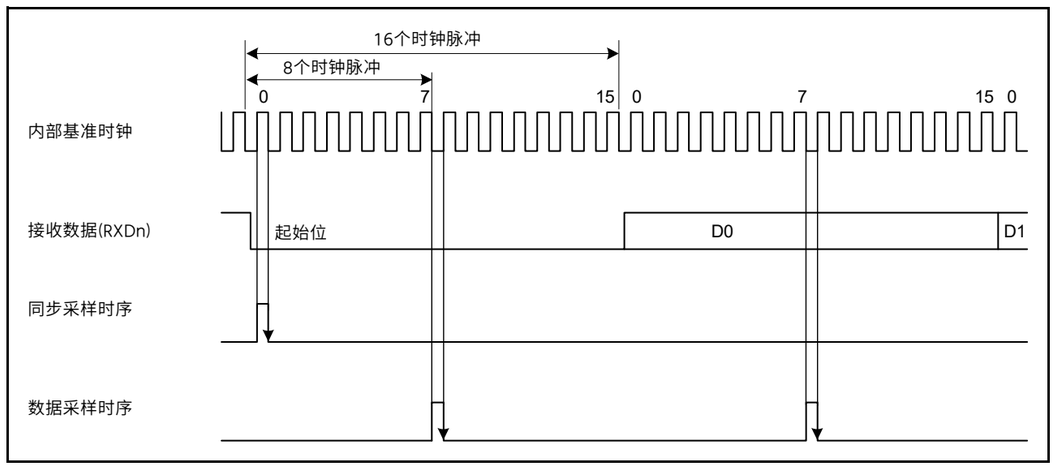

Figure 30.3 异步模式下接收数据采样时序

30.3.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input to the SCKn pin can be selected as the SCI transfer clock, based on the SMR.CM and SCR.CKE[1:0] bit settings.

When an external clock is input to the SCKn pin, the clock frequency must be 16 times the bit rate (when SEMR.ABCS = 0) or 8 times the bit rate (when SEMR.ABCS = 1).

When the SCI uses its internal clock, the clock can be output from the SCKn pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as Figure 30.4 shows.

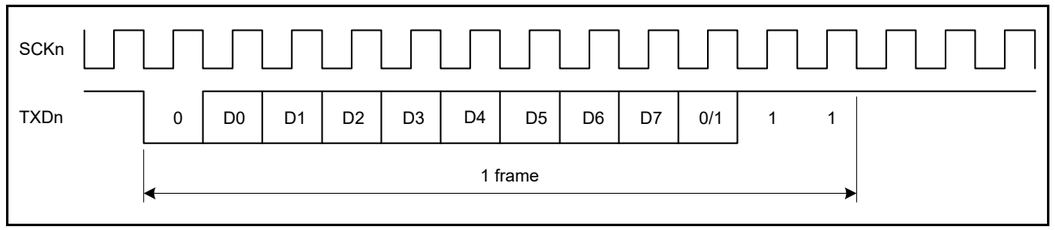

Figure 30.4 Phase relationship between output clock and transmit data in asynchronous mode when SMR.CHR = 0, PE = 1, MP = 0, and STOP = 1

30.3.4 Double-Speed Operation and Frequency of 6 Times the Bit Rate

When the SEMR.ABCS bit is set to 1 and 8 pulses of the base clock for a 1-bit period is selected, the SCI operates on the bit rate that is equal to twice the value when ABCS is set to 0. When the SEMR.BGDM bit is set to 1, the cycle of the base clock is half and the bit rate is double the value when BGDM is set to 0. When the SCR.CKE[1] bit is set to 0 and the on-chip baud rate generator is selected, setting the ABCS and BGDM bits to 1 allows the SCI to operate at a bit rate equal to four times the value when the ABCS and BGDM bits are set to 0. When the SEMR.ABCSE bit is set to 1, the number of basic clock pulses is 6 during a period of 1 bit, and the SCI operates at a bit rate that is equal to 16/3 times the value when SEMR.ABCS, SEMR.BGDM, and SMER.ABCSE are 0.

As shown by formula (1) in section 30.3.2, Receive Data Sampling Timing and Reception Margin in Asynchronous Mode, the reception margin decreases when the ABCS or ABCSE bit in SEMR is set to 1. Therefore, if the target bit rate can be obtained with ABCS or ABCSE set to 0, it is recommended that you use the SCI with ABCS and ABCSE set to 0.

30.3.5 CTS and RTS Functions

The CTS function uses the input on the CTSn_RTSn pin in transmission control. Setting the SPMR.CTSE bit to 1 enables the CTS function. When the CTS function is enabled, driving the CTSn_RTSn pin low causes transmission to start.

Driving the CTSn_RTSn pin high while transmission is in progress does not affect transmission of the current frame.

In the RTS function that uses the output on the CTSn_RTSn pin, a low level is output when reception becomes possible. Conditions for low level and high level output are shown in this section.

[Conditions for low-level output]

(a) Non-FIFO selected when all of the following conditions are satisfied

- The value of the SCR.RE bit is 1
- Reception is not in progress
- There is no receive data yet to be read
- The ORER, FER, and PER flags in the SSR register are all 0.

(b) FIFO selected when all of the following conditions are satisfied

- The value of the SCR.RE bit is 1

30.3.3 Clock

根据SMR.CM和SCR.CKE[1:0]位的设置，可以选择片内波特率发生器产生的内部时钟或输入到SCKn引脚的外部时钟作为SCI传输时钟。

当外部时钟输入到SCKn引脚时，时钟频率必须为比特率的16倍（SEMR.ABCS=0时）或比特率的8倍（SEMR.ABCS=1时）。

当SCI使用其内部时钟时，时钟可以从SCKn引脚输出。在这种情况下，时钟输出的频率等于比特率，并且相位使得时钟的上升沿位于传输数据的中间，如图30.4所示。

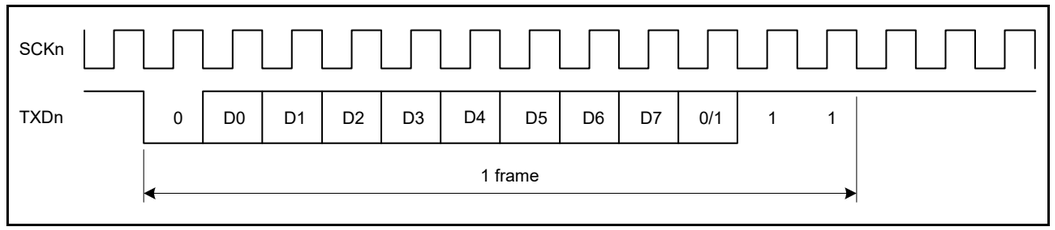

Figure 30.4 异步模式下输出时钟与传输数据的相位关系 SMR.CHR=0，PE=1，MP=0，STOP=1

30.3.4 双倍速操作和6倍比特率的频率

当SEMR.ABCS位设置为1并选择8个基本时钟脉冲持续1位周期时，SCI以等于ABCS设置为0时值的两倍的比特率运行。当SEMR.BGDM位设置为1，基本时钟的周期为BGDM设置为0时的一半，比特率是其值的两倍。当SCR.CKE[1]位设置为0且片上波特率选择速率发生器，将ABCS和BGDM位设置为1允许SCI以等于ABCS和BGDM位设置为0时值的四倍的比特率运行。当SEMR.ABCSE位设置为1时，在1位周期内基本时钟脉冲数为6，SCI以等于SEMR.ABCS、SEMR.BGDM和SMER.ABCSE为0时值的163倍的比特率运行。

如30.3.2节，异步接收数据采样时序和接收裕量中的公式（1）所示
模式下，SEMR中的ABCS或ABCSE位设置为1时，接收余量减小。因此，如果设置ABCS或ABCSE为0可以获得目标码率，建议您使用设置了ABCS和ABCSE的SCI为0。

30.3.5 CTS和RTS函数

CTS功能在传输控制中使用CTSn_RTSn引脚上的输入。将SPMR.CTSE位设置为1可启用CTS功能。当CTS功能使能时，将CTSn_RTSn引脚驱动为低电平会导致传输开始。

在传输过程中将CTSn_RTSn引脚驱动为高电平不会影响当前帧的传输。

在使用CTSn_RTSn引脚输出的RTS功能中，当可以接收时输出低电平。
本节显示低电平和高电平输出的条件。

[Conditions for low-level output]

(a) 满足以下所有条件时选择非FIFO

- SCR.RE位的值为1
- 接收未进行
- 没有接收数据尚未读取
- SSR寄存器中的ORER、FER和PER标志位均为0。

(b) 满足以下所有条件时选择FIFO

- SCR.RE位的值为1

- The amount of receive data written in FRDRHL is equal to or less than the specified receive triggering number
- The ORER bit in the SSR_FIFO register (ORER in FRDRH) is 0.

[Condition for high-level output]

(a) Non-FIFO selected

- The conditions for low-level output are not satisfied
- When reception is terminated with SCR.RE = 0 without reading the RDR register after reception is complete, RTS remains high. At this time, read the SCR register for dummy values after writing 0 to SCR.RE.

(b) FIFO selected

- The conditions for low-level output are not satisfied.

30.3.6 Address Match (Receive Data Match Detection) Function

The address match function can be used only in asynchronous mode.

If the DCCR.DCME bit is set to 1*4, when one frame of data is received, the SCI compares that received data with the data set in CDR.CMPD. If SCI detects a match between the comparison data (CDR.CMPD*3) and the received data, the SCI can issue the SCIn_RXI interrupt request.

If the SMR.MP bit is set to 0, comparison occurs only for valid data in receive format. In multi-processor mode (SMR.MP bit = 1), if the DCCR.IDSEL bit is set to 1, receive data where the MPB bit is 1 is subject to comparison for address match. Receive data where the MPB bit is 0 is always treated as a mismatch.

If the DCCR.IDSEL bit is set to 0, the SCI performs address match detection regardless of the MPB bit value of the received data. Until the SCI detects a match between the comparison data (CDR.CMPD*3) and the receive data, the received data is skipped (discarded), and the SCI cannot detect a parity error or framing error. When the SCI detects a match, the DCCR.DCME bit is automatically cleared, and the DCCR.DCMF flag is set to 1.

If the DCCR.IDSEL bit is set to 1, the SCR.MPIE bit is automatically cleared. If DCCR.IDSEL is set to 0, the value of the SCR.MPIE bit is retained. If the SCR.RIE bit is set to 1, the SCI issues an SCIn_RXI interrupt request.

If the SCI detects a framing error in the receive data for which a match is detected, the DCCR.DFER bit is set to 1, and if the SCI detects a parity error in that frame, the DCCR.DPER bit is set to 1. The compared receive data is not stored in the RDR register*1, and SSR.RDRF remains at 0.*2

After the SCI detects a match, and DCCR.DCME is automatically cleared, the SCI receives the next data continuously based on the current register setting.

When the DCCR.DFER or DCCR.DPER flag is set, the address match is not performed. Before enabling the address match function, set the DCCR.DFER and DCCR.DPER flags to 0.

Examples of the address match function are shown in Figure 30.5 and Figure 30.6.

Note 1. When FCR.FM = 1, this refers to the FRDRHL register.
Note 2. When FCR.FM = 1, this refers to the SSR_FIFO.RDF flag.
Note 3. This comparative target can select one length of 3 types: CMPD[6:0] with 7-bit length, CMPD[7:0] with 8-bit length, or CMPD[8:0] with 9-bit length.
Note 4. Set the DCCR.DCME bit to 1 before receiving the start bit of the received frame that performs address matching.

- FRDRHL中写入的接收数据量等于或小于指定的接收触发数
- SSR_FIFO寄存器中的ORER位（FRRDH中的ORER）为0。

[Condition for high-level output]

(a) Non-FIFO selected

- 不满足低电平输出的条件
- 当接收结束后接收结束且SCR.RE=0且未读取RDR寄存器时，RTS保持高电平。此时，将0写入SCR.RE后，读取SCR寄存器的虚拟值。

(b) FIFO selected

- 不满足低电平输出的条件。

30.3.6 地址匹配（接收数据匹配检测）功能

地址匹配功能只能在异步模式下使用。

如果DCCR.DCME位设置为1*4，当接收到一帧数据时，SCI会将接收到的数据与CDR.CMPD中设置的数据进行比较。如果SCI检测到比较数据(CDR.CMPD*3)与接收到的数据匹配，则SCI可以发出SCIn_RXI中断请求。

如果SMR.MP位设置为0，则仅对接收格式的有效数据进行比较。在多处理器模式下（SMR.MP位=1），如果DCCR.IDSEL位设置为1，则接收MPB位为1的数据将进行地址匹配比较。MPB位为0的接收数据始终被视为不匹配。

如果DCCR.IDSEL位设置为0，则SCI执行地址匹配检测，而不管接收数据的MPB位值如何。直到SCI检测到比较数据（CDR.CMPD*3）与接收数据匹配，接收数据被跳过（丢弃），SCI无法检测奇偶校验错误或成帧错误。当SCI检测到匹配时，自动清除DCCR.DCME位，并将DCCR.DCMF标志设置为1。

如果DCCR.IDSEL位设置为1，则SCR.MPIE位自动清零。如果DCCR.IDSEL设置为0，则保留SCR.MPIE位的值。如果SCR.RIE位设置为1，则SCI发出SCIn_RXI中断请求。

如果SCI在检测到匹配的接收数据中检测到帧错误，则DCCR.DFER位设置为1，如果SCI在该帧中检测到奇偶校验错误，则DCCR.DPER位设置为1。比较后的接收数据不存入RDR寄存器*1，SSR.RDRF保持为0。*2

SCI检测到匹配后，DCCR.DCME自动清零，SCI根据当前寄存器设置连续接收下一个数据。

当设置DCCR.DFER或DCCR.DPER标志时，不执行地址匹配。在启用地址匹配功能之前，将DCCR.DFER和DCCR.DPER标志设置为0。

地址匹配函数的例子如图30.5和图30.6所示。

注1.当FCR.FM=1时，指的是FRDRHL寄存器。
注2.当FCR.FM=1时，这指的是SSR_FIFO.RDF标志。
注3.此比较目标可以选择3种长度中的一种：7位长度的CMPD[6:0]、8位长度的CMPD[7:0]或9位长度的CMPD[8:0].注4.在接收到执行地址匹配的接收帧的起始位之前，将DCCR.DCME位设置为1。

30.3.7 SCI Initialization in Asynchronous Mode

Before transmitting and receiving data, start by writing the initial value 00h to the SCR register, then continue through to the SCI initialization procedure (select non-FIFO or FIFO) shown in Figure 30.7 and Figure 30.8. Whenever the operating mode or transfer format is to be changed, the SCR register must be initialized before the change is made.

When the external clock is used in asynchronous mode, ensure that the clock signal is supplied during initialization.

Note: When the SCR.RE bit is set to 0, the ORER, FER, RDRF, RDF, PER, and DR flags in SSR/SSR_FIFO, and the RDR and RDRHL registers are not initialized. When the SCR.TE bit is set to 0, the TEND flag for the selected FIFO buffer is not initialized.

Note: Switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 while the SCR.TIE bit is 1 leads to the generation of an SCIn_TXI interrupt request.

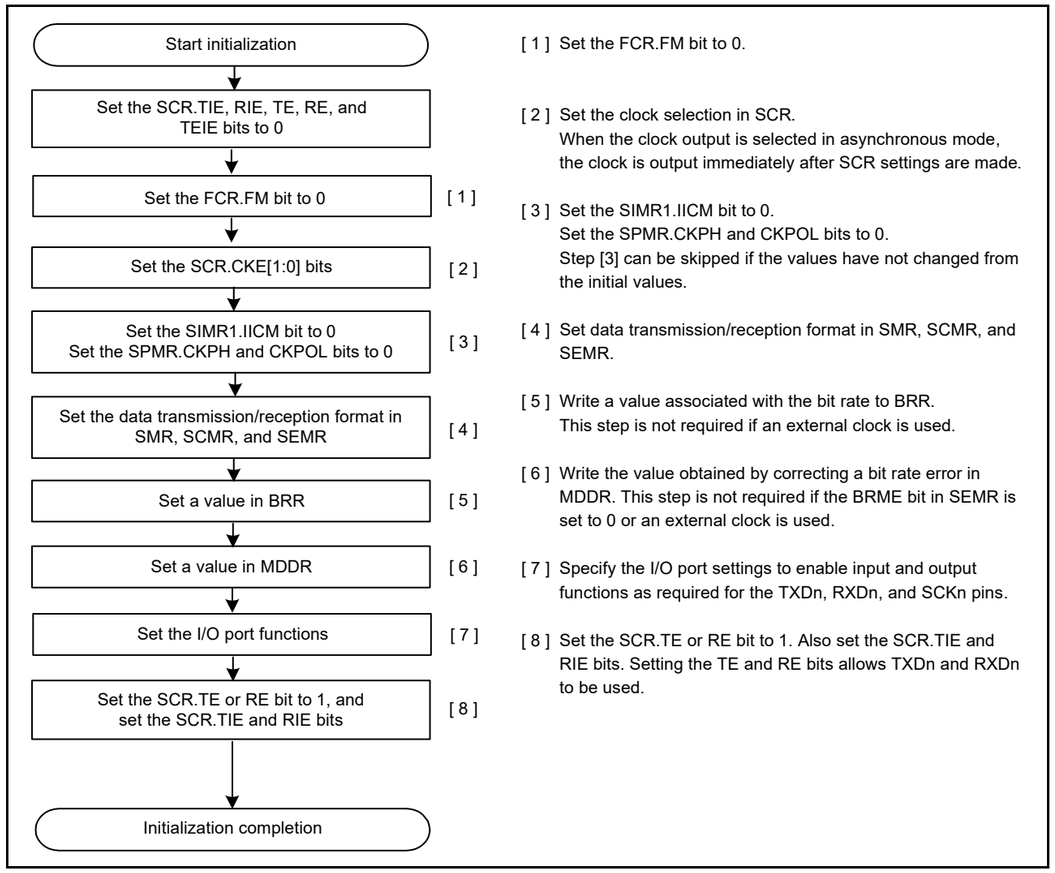

Figure 30.7 Example SCI initialization flow in asynchronous mode with non-FIFO selected

30.3.7 异步模式下的SCI初始化

在发送和接收数据之前，首先将初始值00h写入SCR寄存器，然后继续进行图30.7和图30.8所示的SCI初始化过程（选择非FIFO或FIFO）。每当要更改操作模式或传输格式时，必须在更改之前初始化SCR寄存器。

在异步模式下使用外部时钟时，请确保在初始化期间提供时钟信号。

Note: 当SCR.RE位设置为0时，SSRSSR_FIFO中的ORER、FER、RDRF、RDF、PER和DR标志，以及RDR和RDRHL寄存器未初始化。当SCR.TE位设置为0时，选择的TEND标志FIFO缓冲区未初始化。

Note: 当SCR.TIE位为1时，将SCR.TE位的值从1切换到0或0到1会导致生成SCIn_TXI中断请求。

30.3.8 Serial Data Transmission in Asynchronous Mode

(1) Non-FIFO selected

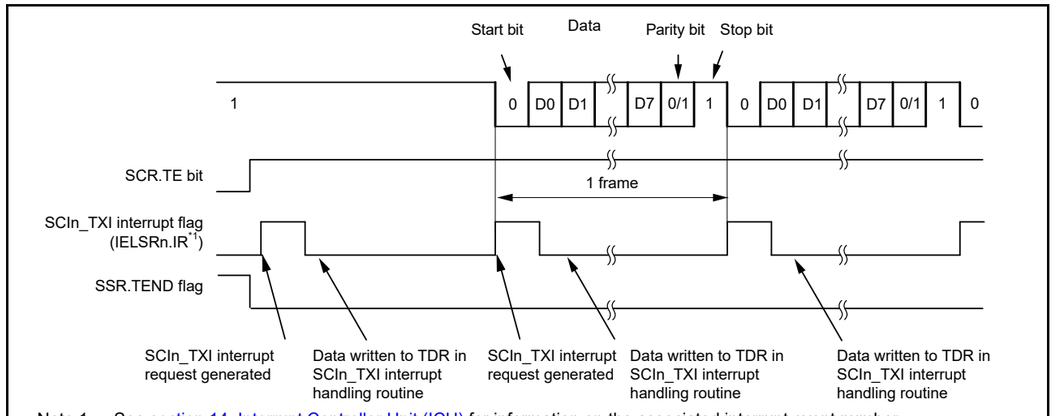
Figure 30.9, Figure 30.10, and Figure 30.11 show examples of serial transmission in asynchronous mode.

In serial transmission, the SCI operates as described in this section. When the SCR.TE bit is set to 1, the high level for one frame (preamble) is output to TXDn.

1. The SCI transfers data from TDR*1 to TSR when data is written to TDR*1 in the SCIn_TXI interrupt handling routine.
   The SCIn_TXI interrupt request at the beginning of transmission is generated when the TE and TIE bits in the SCR are set to 1 simultaneously by a single instruction.
2. Transmission starts after the SPMR.CTSE bit is set to 0 (CTS function is disabled) or a low level on the CTSn_RTSn pin causes data transfer from TDR*1 to TSR. If the SCR.TIE bit is 1, an SCIn_TXI interrupt request is generated. Continuous transmission is possible by writing the next transmit data to TDR*1 in the SCIn_TXI interrupt handling routine before transmission of the current transmit data is complete. When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 (an SCIn_TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (an SCIn_TEI interrupt request is enabled) after the last of the data to be transmitted is written to TDR*1 from the handling routine for SCIn_TXI requests.
3. Data is sent from the TXDn pin in the following order:
   - Start bit
   - Transmit data
   - Parity bit or multi-processor bit (can be omitted depending on the format)
   - Stop bit.
4. The SCI checks for an update of the TDR register on the output of the stop bit.
5. When TDR is updated, setting the SPMR.CTSE bit to 0 (CTS function is disabled) or a low-level input on the CTSn_RTSn pin, causes the transfer of the next transmit data from TDR*1 to TSR and transmission of the stop bit, after which serial transmission of the next frame starts.
6. If TDR is not updated, the SSR.TEND flag is set to 1, the stop bit is sent, and the mark state is entered, where 1 is output. If the SCR.TEIE bit is 1, the SSR.TEND flag is set to 1 and an SCIn_TEI interrupt request is generated.

Note 1. Only write data to the TDRHL register when 9-bit data length is selected.

Figure 30.9, Figure 30.10, and Figure 30.11 show examples of serial transmission in asynchronous mode.



Note 1. See section 14, Interrupt Controller Unit (ICU) for information on the associated interrupt event number.

Figure 30.9 Example of operation for serial transmission in asynchronous mode (1) with 8-bit data, parity bit, 1 stop bit, CTS function not used, and at the beginning of transmission

30.3.8 异步模式下的串行数据传输

(1) Non-FIFO selected

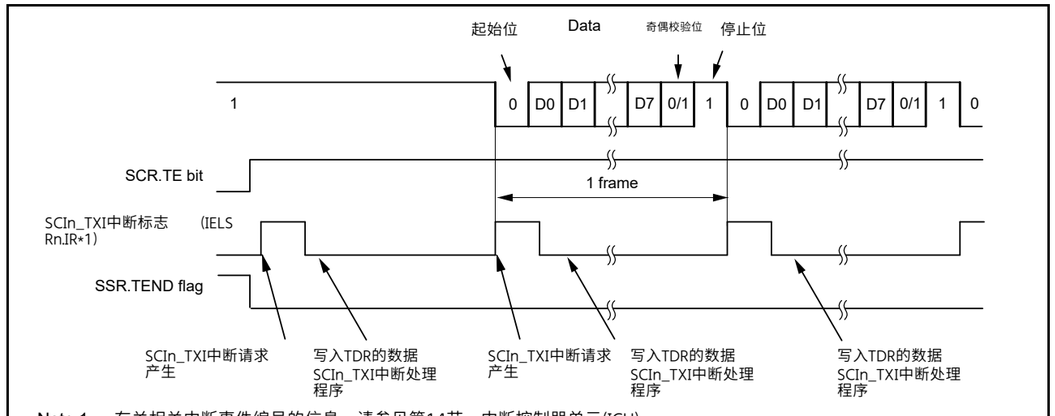
图30.9、图30.10和图30.11显示了异步模式下的串行传输示例。

在串行传输中，SCI的操作如本节所述。当SCR.TE位设置为1时，一帧（前导码）的高电平输出到TXDn。

1. 当在SCIn_TXI中断处理程序中将数据写入TDR*1时，SCI将数据从TDR*1传输到TSR。当SCR中的TE和TIE位通过一条指令同时设置为1时，会在传输开始时产生SCIn_TXI中断请求。
2. 在SPMR.CTSE位设置为0（禁用CTS功能）或低电平后开始发送CTSn_RTSn引脚导致数据从TDR*1传输到TSR。如果SCR.TIE位为1，则产生SCIn_TXI中断请求。在当前发送数据的发送完成之前，通过在SCIn_TXI中断处理例程中将下一个发送数据写入TDR*1，可以进行连续发送。当使用SCIn_TEI中断请求时，在要发送的最后一个数据完成后，将SCR.TIE位设置为0（禁用SCIn_TXI中断请求）并将SCR.TEIE位设置为1（启用SCIn_TEI中断请求）从SCIn_TXI请求的处理例程写入TDR*1。
3. 数据按以下顺序从TXDn引脚发送：
   - 起始位
   - 传输数据
   - 奇偶校验位或多处理器位（可根据格式省略）
   - 停止位。
4. SCI在停止位的输出上检查TDR寄存器的更新。
5. 更新TDR时，将SPMR.CTSE位设置为0（禁用CTS功能）或在CTSn_RTSn引脚，使下一个传输数据从TDR*1传输到TSR并传输停止位，然后开始下一帧的串行传输。
6. 如果TDR没有更新，则SSR.TEND标志设置为1，发送停止位，并进入标记状态，其中输出1。如果SCR.TEIE位为1，则SSR.TEND标志设置为1，并产生SCIn_TEI中断请求。

注意1.选择9位数据长度时，仅将数据写入TDRHL寄存器。

图30.9、图30.10和图30.11显示了异步模式下的串行传输示例。



Note 1. 有关相关中断事件编号的信息，请参见第14节，中断控制器单元(ICU)。

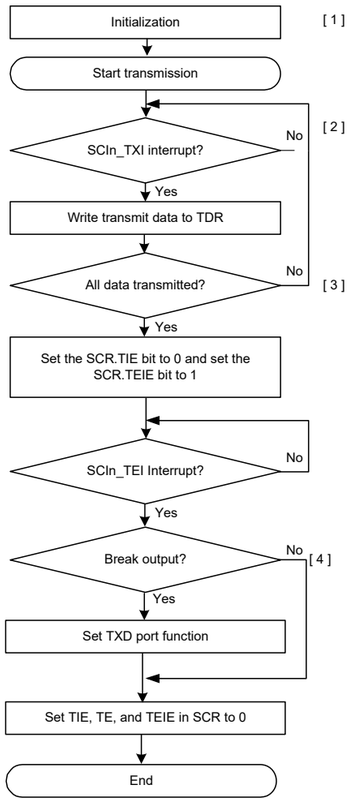
Figure 30.11 8位数据、奇偶校验位、1个停止位、未使用CTS功能的异步模式串行传输操作示例(3)，从传输中间到传输完成



[1] SCI Initialization:
Set data transmission.
After the SCR.TE bit is set to 1, 1 is output for a frame (preamble), and transmission is enabled.

[2] Transmit data write to TDR by an SCIn_TXI interrupt request. When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (SCIn_TXI) request is generated. Write transmit data to TDR while in the SCIn_TXI interrupt processing routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using an SCIn_TXI interrupt request. Transmit data can also be written to TDR by activating the DMAC or DTC.
When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to TDR.

[4] Break output at the end of serial transmission:
To output a break in serial transmission, after setting the output state (low-level output) of TXDn pin using the SPTR.SPB2IO and SPTR.SPB2DT bits, set the SCR.TE bit to 0.

Note: The TDR register becomes the TDRHL register when 9-bit data length is selected.

Figure 30.12 Example of serial transmission flow in asynchronous mode with non-FIFO selected

(2) FIFO selected

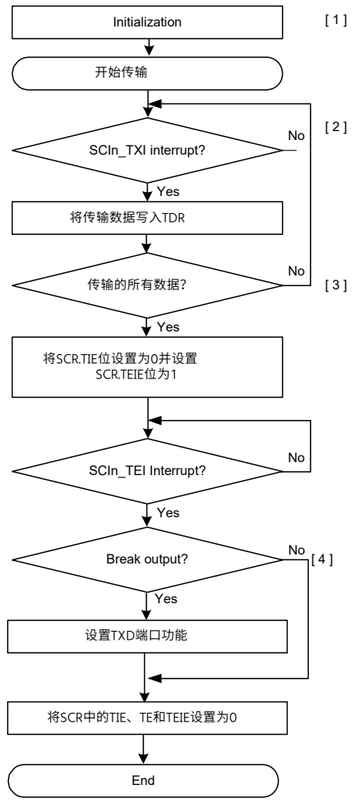
Figure 30.13 shows an example of a data format that is written to FTDRH and FTDRL in asynchronous mode.

Data that corresponds to the data length is set to FTDRH and FTDRL. Write 0 for unused bits. Write in order from FTDRH to FTDRL.

Data Length	Register Setting		Transmit data in FTDRH, FTDRL															
			FTDRHL															
			FTDRH								FTDRL							
	SCMR.CHR1	SMR.CHR	b7	b6	b5	b4	b3	b2	b1	b0	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	0	—	—	—	—	—	—	—	—	—	7-bit transmit data						
8 bits	1	1	—	—	—	—	—	—	—	—	8-bit transmit data							
9 bits	0	Don't care	—	—	—	—	—	—	—	9-bit transmit data								

—: Invalid. The write value should be 0.

Figure 30.13 Data format written to FTDRH and FTDRL with FIFO selected



[1] SCI Initialization:
设置数据传输。
SCR.TE位设置为1后，为一个帧（前导码）输出1，并启用传输。

[2]通过SCIn_TXI中断请求将数据写入TDR。当发送数据从TDR传输到TSR时，会产生发送数据空中断(SCIn_TXI)请求。在SCIn_TXI中断处理程序中将发送数据写入TDR。

[3]串行传输继续程序：
要继续串行传输，请使用SCIn_TXI中断请求将传输数据写入TDR一次。
也可以通过激活DMAC或DTC将传输数据写入TDR。当SCIn_TEI中断请求正在使用时，设置

在将要发送的最后一个数据写入TDR后，SCR.TIE位为0，SCR.TEIE位为1。

[4]串行传输结束时中断输出：
要在串行传输中输出中断，在使用SPTR.SPB2IO和SPTR.SPB2DT位设置TXDn引脚的输出状态（低电平输出）后，将SCR.TE位设置为0。

Note: 选择9位数据长度时，TDR寄存器成为TDRHL寄存器。

Figure 30.12 选择非FIFO的异步模式下串行传输流示例

(2) FIFO selected

图30.13显示了以异步模式写入FTDRH和FTDRL的数据格式示例。

与数据长度对应的数据设置为FTDRH和FTDRL。为未使用的位写入0。从以下顺序写FTDRH to FTDRL.

数据长度	寄存器设置		在FTDRH、FTDRL中传输数据															
			FTDRHL															
			FTDRH								FTDRL							
	SCMR.CHR1	SMR.CHR	b7	b6	b5	b4	b3	b2	b1	b0	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	0	—	—	—	—	—	—	—	—	—	7位传输数据						
8 bits	1	1	—	—	—	—	—	—	—	—	8位传输数据							
9 bits	0	不在乎	—	—	—	—	—	—	—	9位传输数据								

–：无效的。写入值应为0。

Figure 30.13 选择FIFO写入FTDRH和FTDRL的数据格式

RA生态工作室

In serial transmission, the SCI operates as described in this section. When the TE bit is set to 1, the high level for one frame (preamble) is output to TXD.

1. The SCI transfers data from FTDRL*1 to TSR when data is written to FTDRL*1 in the SCIn_TXI interrupt handling routine. The amount of data that can be written to FTDRL is 16 minus FDR.T[4:0] bytes. The SCIn_TXI interrupt request at the beginning of transmission is generated when the TE and TIE bits in SCR are set to 1 simultaneously by a single instruction.
2. Transmission starts after the SPMR.CTSE bit is set to 0 (CTS function is disabled) or a low level on the CTSn_RTSn pin causes data transfer from FTDRL*1 to TSR. When the amount of transmit data written in FTDRL is equal to or less than the specified transmit triggering number, SSR_FIFO.TDFE is set to 1. If the SCR.TIE bit is 1, an SCIn_TXI interrupt request is generated. Continuous transmission is possible by writing the next transmit data to FTDRL*1 in the SCIn_TXI interrupt handling routine before transmission of the current transmit data is complete. When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 (an SCIn_TXI interrupt request is disabled) and the SCR.TEIE bit to 1 (an SCIn_TEI interrupt request is enabled) after the last of the data to be transmitted is written to FTDRL*1 *2 from the handling routine for SCIn_TXI requests.
3. Data is sent from the TXDn pin in the following order:
   - Start bit
   - Transmit data
   - Parity bit or multi-processor bit (can be omitted depending on the format)
   - Stop bit.
4. On output of the stop bit, the SCI checks whether non-transmitted data remains in FTDRL*3.
5. When data is set to FTDRL*3, setting the SPMR.CTSE bit to 0 (CTS function is disabled) or a low-level input on the CTSn_RTSn pin causes transfer of the next transmit data from FTDRL*1 to TSR and transmission of the stop bit, after which serial transmission of the next frame starts.
6. If data is not set in FTDRL*3, the TEND flag in SSR_FIFO is set to 1, the stop bit is sent, and the mark state is entered where 1 is output. If the SCR.TEIE bit is 1, the SSR_FIFO.TEND flag is set to 1 and an SCIn_TEI interrupt request is generated.

Note 1. Write data to the FTDRH and FTDRL registers when 9-bit data length is selected.
Note 2. Write data in order from FTDRH to FTDRL when 9-bit data length is selected.
Note 3. The SCI only checks for an update to the FTDRL register and not the FTDRH register when 9-bit data length is selected.

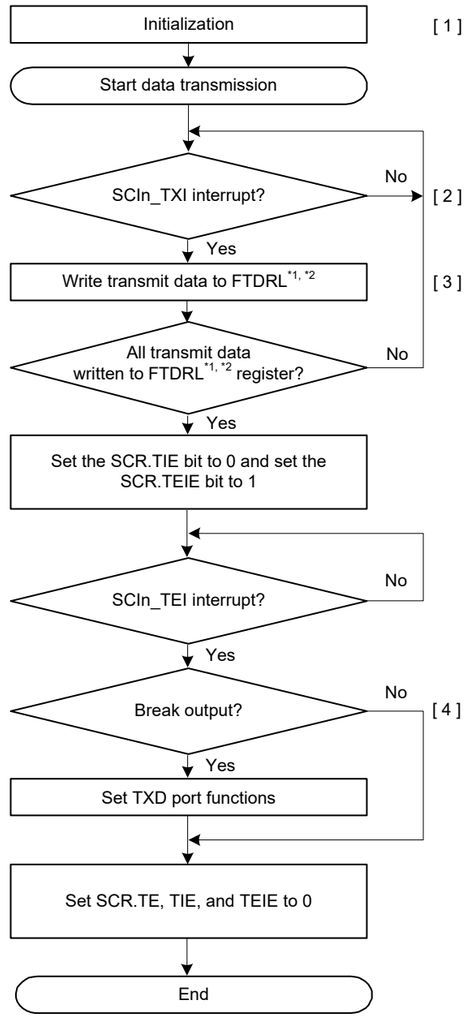
Figure 30.14 shows an example flow of serial transmission in asynchronous mode with FIFO selected.

在串行传输中，SCI的操作如本节所述。当TE位设置为1时，一帧（前导码）的高电平输出到TXD。

1. 在SCIn_TXI中断处理例程中将数据写入FTDRL*1时，SCI将数据从FTDRL*1传输到TSR。可写入FTDRL的数据量为16减去FDR.T[4:0]字节。当一条指令同时将SCR中的TE和TIE位设置为1时，会在传输开始时产生SCIn_TXI中断请求。
2. 在SPMR.CTSE位设置为0（禁用CTS功能）或低电平后开始发送CTSn_RTSn引脚导致数据从FTDRL*1传输到TSR。当写入FTDRL的发送数据量等于或小于指定的发送触发数时，SSR_FIFO.TDFE设置为1。如果SCR.TIE位为1，则产生SCIn_TXI中断请求。在当前传输数据传输完成之前，通过在SCIn_TXI中断处理例程中将下一个传输数据写入FTDRL*1可以实现连续传输。当使用SCIn_TEI中断请求时，在要发送的最后一个数据完成后，将SCR.TIE位设置为0（禁用SCIn_TXI中断请求）并将SCR.TEIE位设置为1（启用SCIn_TEI中断请求）从SCIn_TXI请求的处理例程写入FTDRL*1*2。
3. 数据按以下顺序从TXDn引脚发送：
   - 起始位
   - 传输数据
   - 奇偶校验位或多处理器位（可根据格式省略）
   - 停止位。
4. 在停止位输出时，SCI检查未传输的数据是否保留在FTDRL*3中。
5. 当数据设置为FTDRL*3时，将SPMR.CTSE位设置为0（禁用CTS功能）或CTSn_RTSn引脚上的低电平输入会导致下一个传输数据从FTDRL*1传输到TSR并传输停止位，之后开始下一帧的串行传输。
6. 如果FTDRL*3中未设置数据，则将SSR_FIFO中的TEND标志设置为1，发送停止位，并在输出1时进入标记状态。如果SCR.TEIE位为1，则SSR_FIFO.TEND标志设置为1，并产生SCIn_TEI中断请求。

注意1.选择9位数据长度时，将数据写入FTDRH和FTDRL寄存器。
注2.选择9位数据长度时，按从FTDRH到FTDRL的顺序写入数据。
注意3.SCI仅检查对FTDRL寄存器的更新，而不是选择9位数据长度时的FTDRH寄存器。

图30.14显示了选择FIFO的异步模式下串行传输的示例流程。



[1] SCI initialization:
Set data transmission.
After the SCR.TE bit is set to 1, 1 is output for a frame (preamble), and transmission is enabled.

[2] Transmit data write to FTDRL*1 by an SCIn_TXI interrupt request:
For data transmission from FTDRL to TSR, when the amount of transmit data written in FTDRL is equal to or less than the specified transmit triggering number, a transmit data FIFO empty interrupt (SCIn_TXI) request is generated. Write transmit data to FTDRL*1, *2 once in the SCIn_TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write all transmit data to FTDRL using an SCIn_TXI interrupt request and clear the SSR_FIFO.TDFE flag to 0. It is possible to write 16 minus the amount of data stored in the transmit FIFO. Transmit data can also be written to FTDRL by activating the DMAC or DTC. When data is written to FTDRL by DMAC or DTC, the TDFE flag is cleared automatically. Therefore, do not write to the TDFE flag.
When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to FTDRL.

[4] Break output at the end of serial transmission:
To output a break in serial transmission, after setting the output state (low-level output) of the TXDn pin using SPTR.SPB2IO and SPTR.SPB2DT bits, set the SCR.TE bit to 0.

Note 1. When data length is 9 bits, FTDRH and FTDRL registers are used.
Note 2. When data length is 9 bits, write in order from FTDRH to FTDRL.

Figure 30.14 Example of serial transmission flow in asynchronous mode with FIFO selected

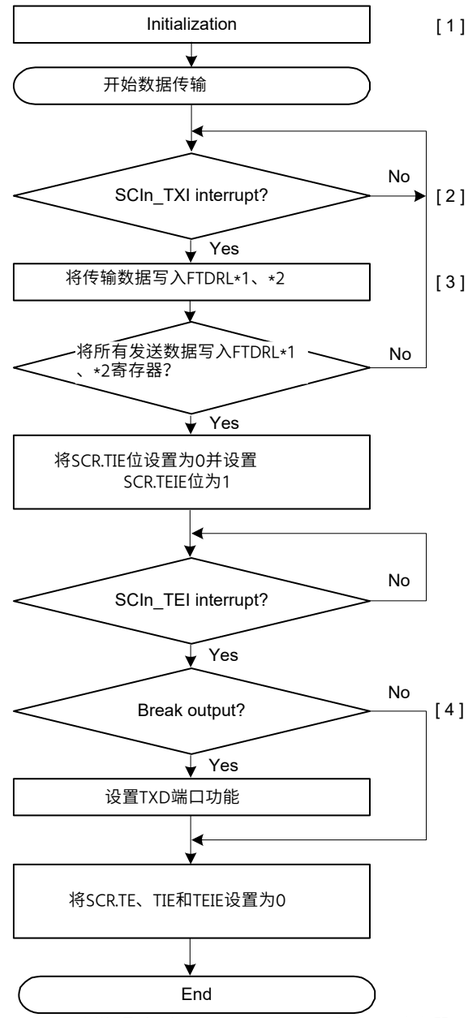
30.3.9 Serial Data Reception in Asynchronous Mode

(1) Non-FIFO selected

Figure 30.15 and Figure 30.16 show an example of the operation for serial data reception in asynchronous mode.

In serial data reception, the SCI operates as follows:

1. When the value of the SCR.RE bit becomes 1, the output signal on the CTSn_RTSn pin goes low.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in RSR, and checks the parity bit and stop bit.
3. If an overrun error occurs, the SSR.ORER flag is set to 1. If the SCR.RIE bit is 1, an SCIn_ERI interrupt request is generated. Receive data is not transferred to RDR*1.



[1] SCI initialization:
设置数据传输。
SCR.TE位设置为1后，为一个帧（前导码）输出1，并启用传输。

[2] 通过SCIn_TXI中断请求将数据写入FTDRL*1：对于从FTDRL到TSR的数据传输，当写入FTDRL的发送数据量等于或小于指定的发送触发数时，发送数据FIFO空中断（SCIn_TXI)请求生成。在SCIn_TXI中断处理例程中将发送数据写入FTDRL*1、*2一次。

[3] 串行传输继续程序：
要继续串行传输，请将所有传输数据写入FTDRL使用SCIn_TXI中断请求并将SSR_FIFO.TDFE标志清除为0。可以写入16减去发送FIFO中存储的数据量。也可以通过激活DMAC或DTC将传输数据写入FTDRL。当数据通过DMAC或DTC写入FTDRL时，TDFE标志自动清零。因此，不要写入TDFE标志。

当SCIn_TEI中断请求正在使用时，设置
在将要传输的最后一个数据写入FTDRL后，SCR.TIE位为0，SCR.TEIE位为1。

[4] 串行传输结束时中断输出：
要在串行传输中输出中断，在使用SPTR.SPB2IO和SPTR.SPB2DT位设置TXDn引脚的输出状态（低电平输出）后，将SCR.TE位设置为0。

Note 1. 当数据长度为9位时，使用FTDRH和FTDRL寄存器。
Note 2. 当数据长度为9位时，按照FTDRH到FTDRL的顺序写入。

Figure 30.14 选择FIFO的异步模式下串行传输流程示例

30.3.9 异步模式下的串行数据接收

(1) Non-FIFO selected

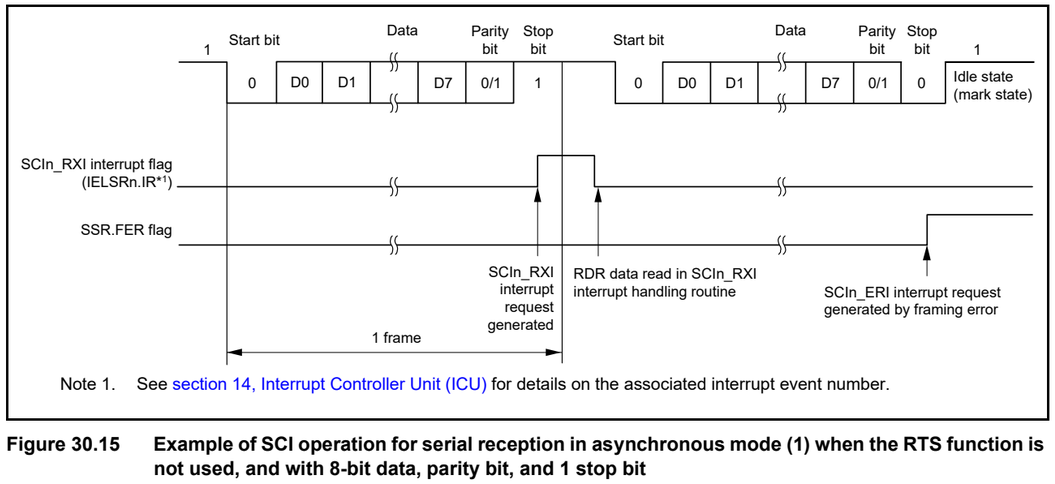
图30.15和图30.16显示了异步模式下串行数据接收操作的示例。

在串行数据接收中，SCI操作如下：

1. 当SCR.RE位的值变为1时，CTSn_RTSn引脚上的输出信号变为低电平。
2. 当SCI监视通信线路并检测到起始位时，它会执行内部同步，将接收数据存储在RSR中，并检查奇偶校验位和停止位。
3. 如果发生溢出错误，则SSR.ORER标志设置为1。如果SCR.RIE位为1，则产生SCIn_ERI中断请求。接收数据不传输到RDR*1。

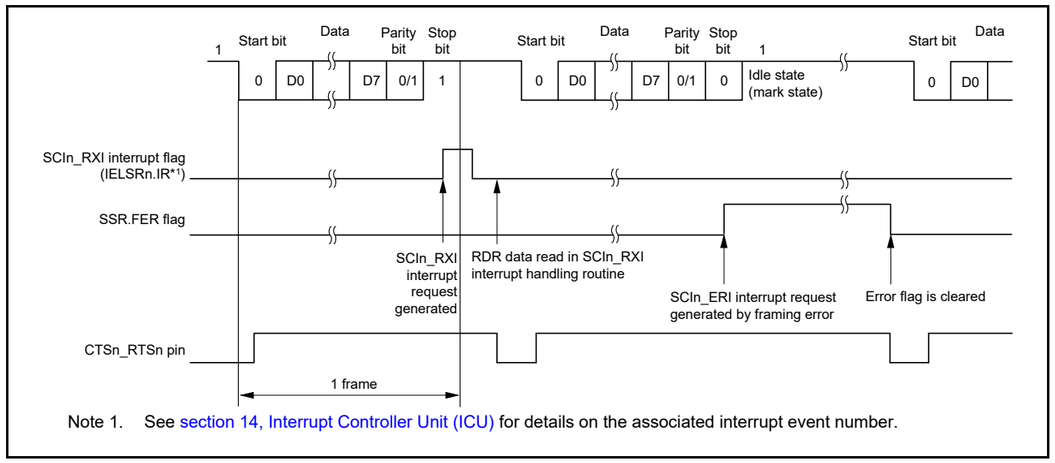
4. If a parity error is detected, the SSR.PER flag is set to 1 and receive data is transferred to RDR*1. If the SCR.RIE bit is 1, an SCIn_ERI interrupt request is generated.
5. If a frame error is detected, the SSR.FER flag is set to 1 and receive data is transferred to RDR*1. If the SCR.RIE bit is 1, an SCIn_ERI interrupt request is generated.
6. When reception finishes successfully, receive data is transferred to RDR*1. If the SCR.RIE bit is 1, an SCIn_RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to RDR in the SCIn_RXI interrupt handling routine before reception of the next receive data completes. Reading the received data that was transferred to RDR causes the CTSn_RTSn pin to output low.

Note 1. Only read data in the RDRHL register when 9-bit data length is selected.



Note 1. See section 14, Interrupt Controller Unit (ICU) for details on the associated interrupt event number.

Figure 30.15 Example of SCI operation for serial reception in asynchronous mode (1) when the RTS function is not used, and with 8-bit data, parity bit, and 1 stop bit



Note 1. See section 14, Interrupt Controller Unit (ICU) for details on the associated interrupt event number.

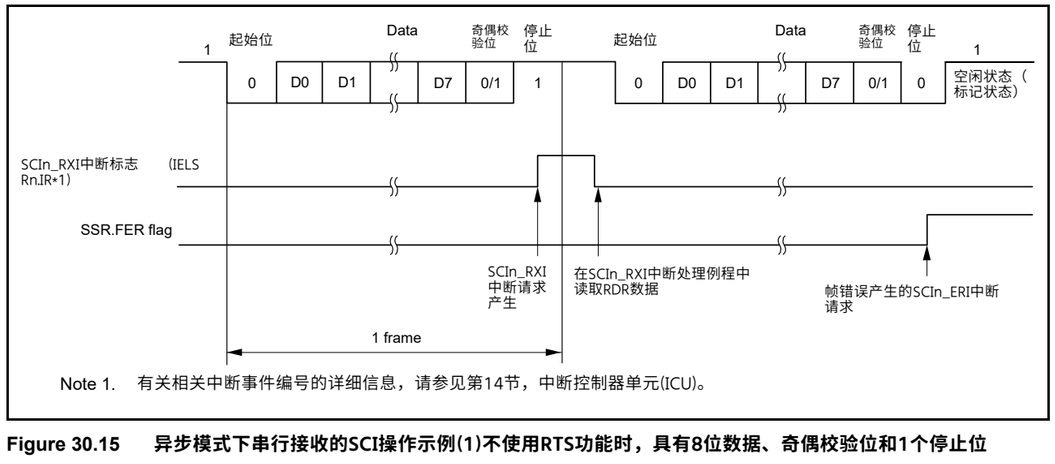
Figure 30.16 Example of SCI operation for serial reception in asynchronous mode (2) when RTS function is used, and with 8-bit data, parity bit, and 1 stop bit

Table 30.24 lists the states of the flags in the SSR register and receive data handling when a receive error is detected.

If a receive error is detected, an SCIn_ERI interrupt request is generated but an SCIn_RXI interrupt request is not generated. Data reception cannot be resumed while the receive error flag is 1. Also, set the ORER, FER, and PER flags to 0 before resuming reception. In addition, be sure to read the RDR or RDRHL register during overrun error processing.

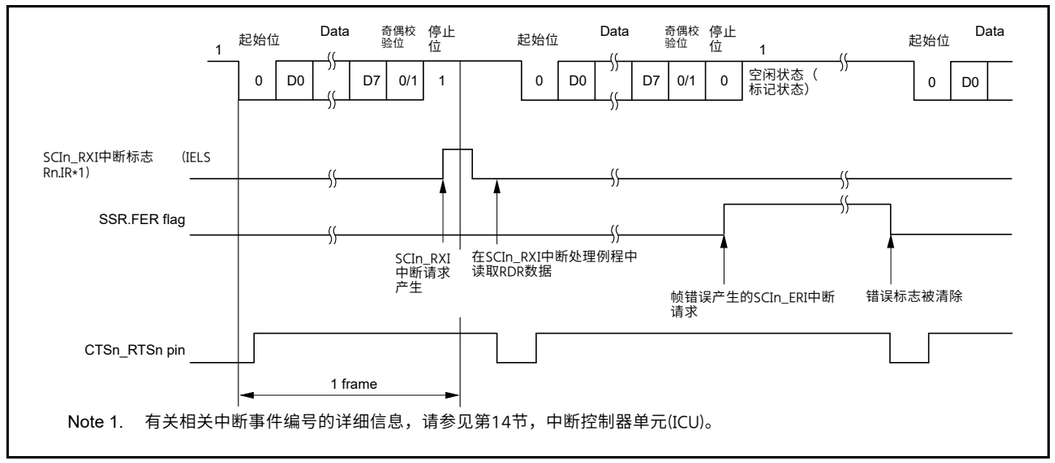
4. 如果检测到奇偶校验错误，则将SSR.PER标志设置为1，并将接收数据传输到RDR*1。如果SCR.RIE位为1，则产生SCIn_ERI中断请求。
5. 如果检测到帧错误，则将SSR.FER标志设置为1，并将接收数据传输到RDR*1。如果SCR.RIE位为1，则产生SCIn_ERI中断请求。
6. 当接收成功完成时，接收数据被传输到RDR*1。如果SCR.RIE位为1，则产生SCIn_RXI中断请求。在接收下一个接收数据完成之前，通过在SCIn_RXI中断处理例程中读取传输到RDR的接收数据来启用连续接收。读取传输到RDR的接收数据会导致CTSn_RTSn引脚输出低电平。

注1.选择9位数据长度时，仅读取RDRHL寄存器中的数据。



Note 1. 有关相关中断事件编号的详细信息，请参见第14节，中断控制器单元(ICU)。

Figure 30.15 异步模式下串行接收的SCI操作示例(1)不使用RTS功能时，具有8位数据、奇偶校验位和1个停止位



Note 1. 有关相关中断事件编号的详细信息，请参见第14节，中断控制器单元(ICU)。

Figure 30.16 使用RTS功能，8位数据、奇偶校验位和1个停止位时，异步模式下串行接收的SCI操作示例(2)

表30.24列出了SSR寄存器中标志的状态以及检测到接收错误时的接收数据处理。

如果检测到接收错误，则会产生SCIn_ERI中断请求，但不会产生SCIn_RXI中断请求。接收错误标志为1时无法恢复数据接收。此外，在恢复接收前，请将ORER、FER和PER标志设置为0。此外，请务必在溢出错误处理期间读取RDR或RDRHL寄存器。

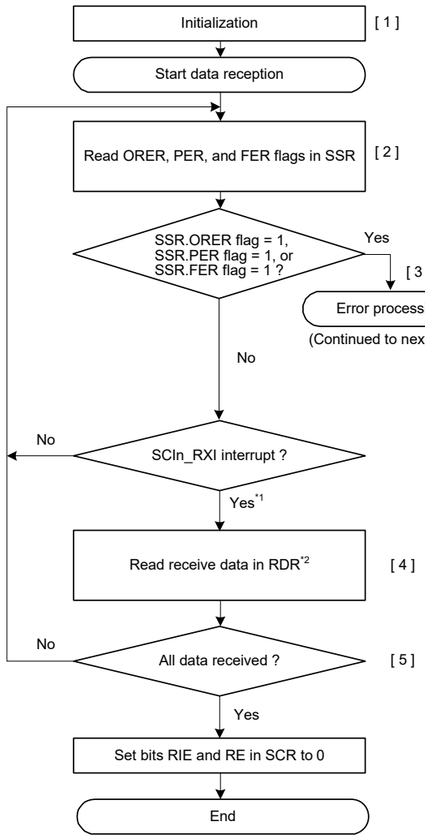
When a reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read the RDR or RDRHL register because the received data that is not yet read might be left in RDR or RDRHL.

Figure 30.17 and Figure 30.18 show example flows for serial data reception.

Table 30.24 Flags in SSR Status Register and receive data handling

Flags in the SSR Status Register				
ORER	**FER**	**PER**	**Receive data**	**Receive error type**
1	0	0	Lost	Overrun error
0	1	0	Transferred to RDR	Framing error
0	0	1	Transferred to RDR	Parity error
1	1	0	Lost	Overrun error + framing error
1	0	1	Lost	Overrun error + parity error
0	1	1	Transferred to RDR	Framing error + parity error
1	1	1	Lost	Overrun error + framing error + parity error

Note 1. Only read data in the RDRHL register when 9-bit data length is selected.



[1] SCI initialization:
Set data reception.

[2] [3] Receive error processing and break detection:
If a receive error occurs, an SCIn_ERI interrupt is generated. The error type is identified by reading the ORER, PER, and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER, PER, and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1. For a framing error, a break can be detected by reading the value of the input port associated with the RXDn pin.

[4] Read the receive data in RDR once in the SCIn_RXI interrupt handling routine.

[5] Serial reception continuation procedure:
To continue serial reception, before the stop bit of the current frame is received, read data from RDR in the SCIn_RXI interrupt processing routine. The RDR data can also be read by activating the DMAC or DTC.

Note 1. Do not set RE to 0 before reading RDR.
Note 2. The RDR register becomes the RDRHL register when 9-bit data length is selected.

Figure 30.17 Example flow of serial reception in asynchronous mode with non-FIFO selected (1)

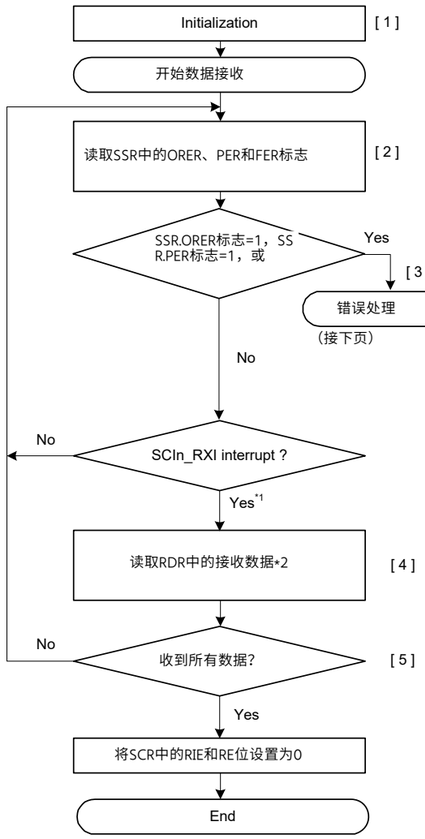
如果在操作期间通过将SCR.RE位设置为0来强制终止接收，请读取RDR或RDRHL寄存器，因为尚未读取的接收数据可能留在RDR或RDRHL中。

图30.17和图30.18显示了串行数据接收的示例流程。

Table 30.24 SSR状态寄存器中的标志和接收数据处理

SSR状态寄存器中的标志				
ORER	**FER**	**PER**	**接收数据**	**接收错误类型**
1	0	0	Lost	溢出错误
0	1	0	转移到RDR	构图错误
0	0	1	转移到RDR	奇偶校验错误
1	1	0	Lost	溢出错误+成帧错误
1	0	1	Lost	溢出错误+奇偶校验错误
0	1	1	转移到RDR	成帧错误+奇偶校验错误
1	1	1	Lost	溢出错误+帧错误+奇偶校验错误

Note 1. 仅在选择9位数据长度时读取RDRHL寄存器中的数据。



[1] SCI initialization:
设置数据接收。

[2][3]接收错误处理和断线检测：
如果发生接收错误，则会产生SCIn_ERI中断。错误类型通过读取SSR中的ORER、PER和FER标志来识别。执行适当的错误处理后，请务必将ORER、PER和FER标志设置为0。如果这些标志中的任何一个设置为1，则无法恢复接收。对于 帧错误，可以通过读取值来检测中断与RXDn引脚相关的输入端口。

[4] 在SCIn_RXI中断处理程序中读取一次RDR中的接收数据。

[5] 串行接收继续过程：
要继续串行接收，在接收到当前帧的停止位之前，在SCIn_RXI中断处理程序中从RDR中读取数据。RDR数据也可以通过激活DMAC或DTC来读取。

Note 1. 在读取RDR之前不要将RE设置为0。
Note 2. 选择9位数据长度时，RDR寄存器成为RDRHL寄存器。

Figure 30.17 选择非FIFO的异步模式下串行接收示例流程(1)

RA生态工作室

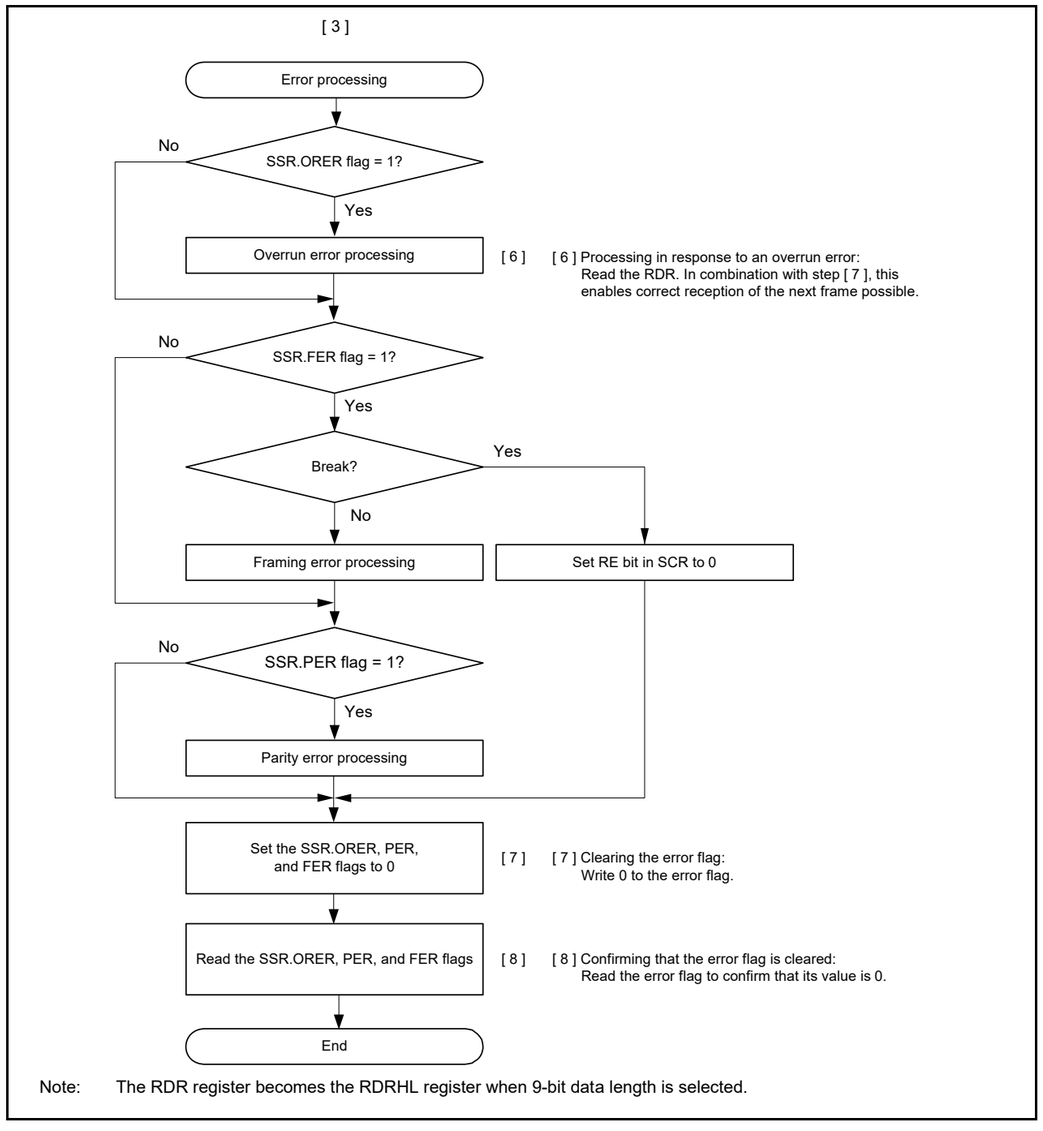


Figure 30.18 Example flow of serial reception in asynchronous mode with non-FIFO selected (2)

(2) FIFO selected

Figure 30.19 shows an example of a data format that is written to FRDRH and FRDRL in asynchronous mode.

In asynchronous mode, 0 is written to the MPB flag in FRDRH. Data that corresponds to the data length is written to FRDRH and FRDRL. Unused bits are written as 0. Read in the order from FRDRH to FRDRL. If software reads FRDRL, the SCI updates FER, PER, and receive data (RDAT[8:0]) in FRDRL with the next data. The RDF, ORER, and DR flags in FRDRH always reflect the associated flags in the SSR_FIFO register.

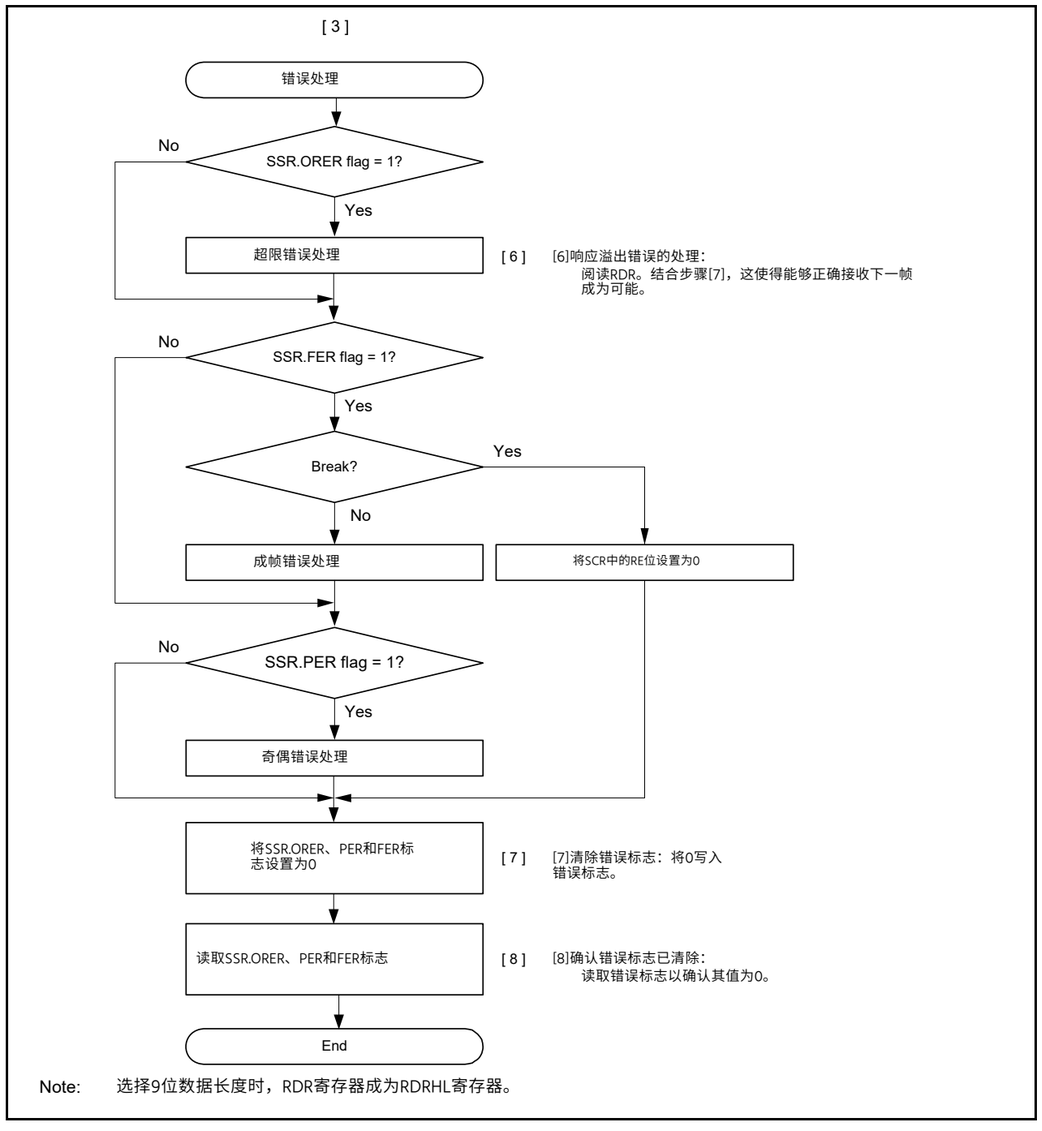

Figure 30.18 选择非FIFO的异步模式下串行接收示例流程(2)

(2) FIFO selected

图30.19显示了以异步模式写入FRDRH和FRDRL的数据格式示例。

在异步模式下，将0写入FRDRH中的MPB标志。对应数据长度的数据被写入FRDRH和FRDRL。未使用的位写入0。按照从FRDRH到FRDRL的顺序读取。如果软件读取FRDRL，SCI更新FER、PER，并用下一个数据接收FRDRL中的数据（RDAT[8:0]）。RDF、ORER和FRDRH中的DR标志始终反映SSR_FIFO寄存器中的相关标志。

RA生态工作室

Data Length	Register Setting		Receive data in FRDRH, FRDRL															
			FRDRHL															
			FRDRH								FRDRL							
	SCMR.CHR1	SMR.CHR	b7	b6	b5	b4	b3	b2	b1	b0	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	0	—	RDF	ORER	FER	PER	DR	0	0	0	7-bit receive data						
8 bits	1	1	—	RDF	ORER	FER	PER	DR	0	0	8-bit receive data							
9 bits	0	Don't care	—	RDF	ORER	FER	PER	DR	0	9-bit receive data								

Note: 0 is always read for MPB flag (FRDRH[1]).
When data length is 7 bits, 0 is always read for FRDRH[0] and FRDRL[7].
When data length is 8 bits, 0 is always read for FRDRH[0].
FRDRH[7] bit is read as an indefinite value.

Figure 30.19 Data format stored in FRDRH and FRDRL with FIFO selected

In serial data reception, the SCI operates as follows:

1. When the value of the SCR.RE bit becomes 1, the output signal on the CTSn_RTSn pin goes low.
2. When the SCI monitors the communications line and detects a start bit, it performs internal synchronization, stores receive data in the RSR register, and checks the parity bit and stop bit.
3. When the FRDRL register is full, an overrun error occurs. If an overrun error occurs, the SSR_FIFO.ORER flag is set to 1. When the SCR.RIE bit is 1, an SCIn_ERI interrupt request is generated. Receive data is not transferred to FRDRL*1.
4. If a parity error is detected, the PER flag and receive data are transferred to FRDRL*1. When the RIE bit is set to 1, an SCIn_ERI interrupt request is generated.
5. If a frame error is detected, the FER flag and receive data are transferred to FRDRL*1. When the RIE bit is set to 1, an SCIn_ERI interrupt request is generated.
6. After a framing error is detected and when SCI detects that the continuous receive data is for one frame, reception stops.
7. When the amount of data stored in the FRDRL register falls below the specified receive triggering number, and the next data is not received after 15 ETUs from the last stop bit in asynchronous mode, the SSR_FIFO.DR bit is set to 1. When the RIE bit is 1 and the FCR.DRES bit is 0, the SCI generates an SCIn_RXI interrupt request. When the FCR.DRES bit is 1, SCI generates an SCIn_ERI interrupt request.
8. When reception finishes successfully, receive data is transferred to FRDRL*1. The RDF bit is set to 1 when the amount of receive data written to FRDRHL is equal to or greater than the specified receive triggering number. When the SCR.RIE bit is 1, an SCIn_RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to FRDRL*2 in the SCIn_RXI interrupt handling routine, before an overrun error occurs. If the received data that is transferred to FRDRL*3 is less than the RTS trigger number, the CTSn_RTSn pin outputs low.

Note 1. Only read the data in the FRDRH and FRDRL registers when 9-bit data length is selected.
Note 2. Read the data in the order from FRDRH to FRDRL when 9-bit data length is selected.
Note 3. The SCI only checks for an update to the FRDRL register and not to the FRDRH register when 9-bit data length is selected.

数据长度	寄存器设置		在FRDRH、FRRDL中接收数据															
			FRDRHL															
			FRDRH								FRDRL							
	SCMR.CHR1	SMR.CHR	b7	b6	b5	b4	b3	b2	b1	b0	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	0	—	RDF	ORER	FER	PER	DR	0	0	0	7位接收数据						
8 bits	1	1	—	RDF	ORER	FER	PER	DR	0	0	8位接收数据							
9 bits	0	不在乎	—	RDF	ORER	FER	PER	DR	0	9位接收数据								

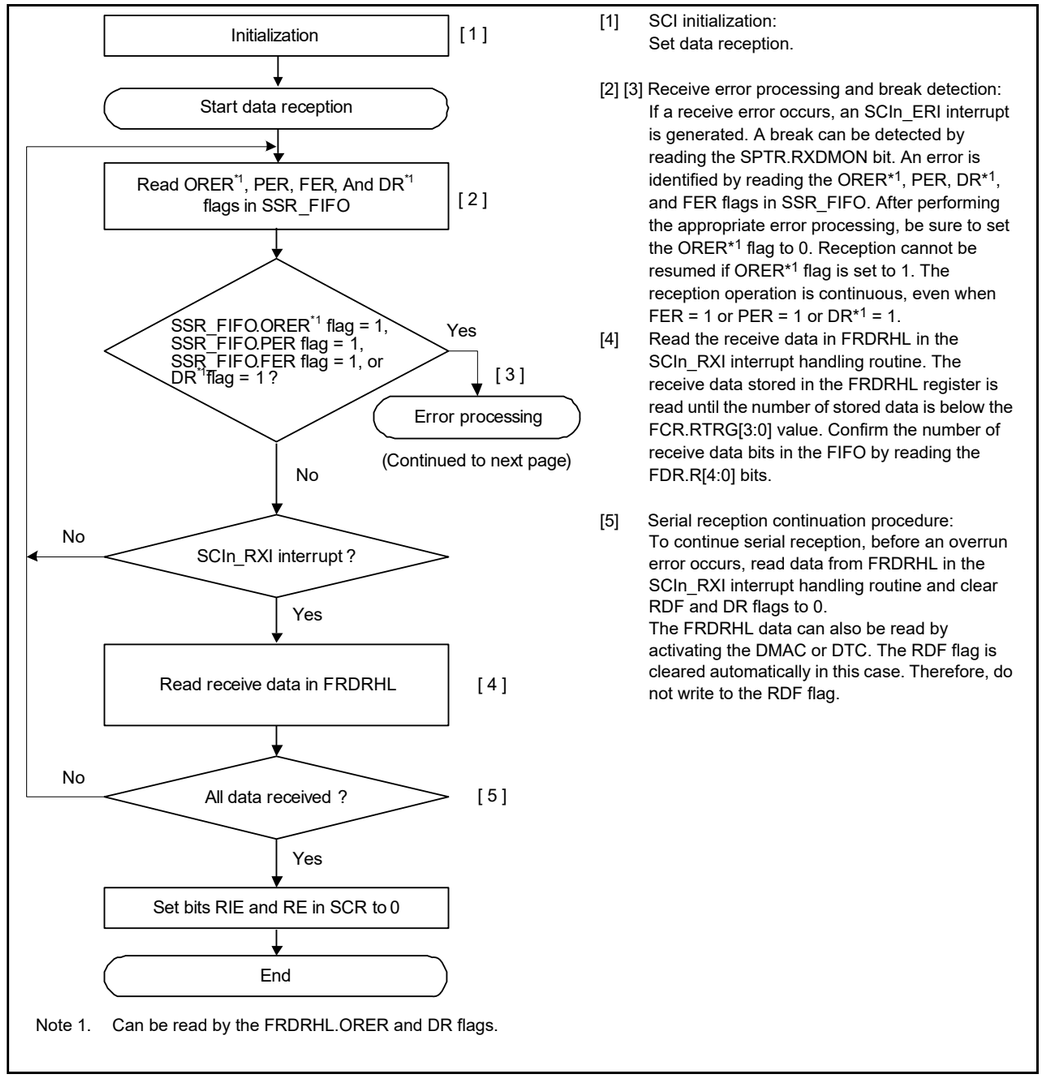
Note: MPB标志(FRDRH[1])总是读取0。当数据长度为7位时，FRRDH[0]和FRDRL[7]总是读取0。
当数据长度为8位时，FRRDH[0]总是读取0。
FRDRH[7]位被读取为不定值。

Figure 30.19 存储在FRDRH和FRDRL中的数据格式，选择了FIFO

在串行数据接收中，SCI操作如下：

1. 当SCR.RE位的值变为1时，CTSn_RTSn引脚上的输出信号变为低电平。
2. 当SCI监视通信线路并检测到一个起始位时，它执行内部同步，将接收数据存储在RSR寄存器中，并检查奇偶校验位和停止位。
3. 当FRDRL寄存器已满时，会发生溢出错误。如果发生溢出错误，则SSR_FIFO.ORER标志设置为1。当SCR.RIE位为1时，将产生SCIn_ERI中断请求。接收数据不传输到FRDRL*1。
4. 如果检测到奇偶校验错误，则将PER标志和接收数据传输到FRDRL*1。当RIE位设置为1时，将产生SCIn_ERI中断请求。
5. 如果检测到帧错误，则将FER标志和接收数据传输到FRDRL*1。当RIE位设置为1时，将产生SCIn_ERI中断请求。
6. 检测到帧错误后，当SCI检测到连续接收数据为一帧时，接收停止。
7. 当存储在FRDRL寄存器中的数据量低于指定的接收触发数，并且在异步模式下从最后一个停止位开始15个ETU后没有接收到下一个数据时，SSR_FIFO.DR位设置为1。当RIE位为1且FCR.DRES位为0，SCI产生一个SCIn_RXI中断请求。当FCR.DRES位为1时，SCI产生一个SCIn_ERI中断请求。
8. 当接收成功完成时，接收数据被传输到FRDRL*1。当写入FRDRHL的接收数据量等于或大于指定的接收触发数时，RDF位设置为1。当SCR.RIE位为1时，产生SCIn_RXI中断请求。在发生溢出错误之前，通过在SCIn_RXI中断处理程序中读取传输到FRDRL*2的接收数据来启用连续接收。如果传送到FRDRL*3的接收数据小于RTS触发数，CTSn_RTSn引脚输出低电平。

注1.选择9位数据长度时，仅读取FRDRH和FRDRL寄存器中的数据。
Note2.ReadthedataintheorderfromFRDRHtoFRDRLwhen9-bitdatalengthisselected.
Note3.TheSCIonlychecksforanupdatetotheFRDRLregisterandnottotheFRDRHregisterwhen9-bitdatalengthisselected.



[1] SCI initialization:
Set data reception.

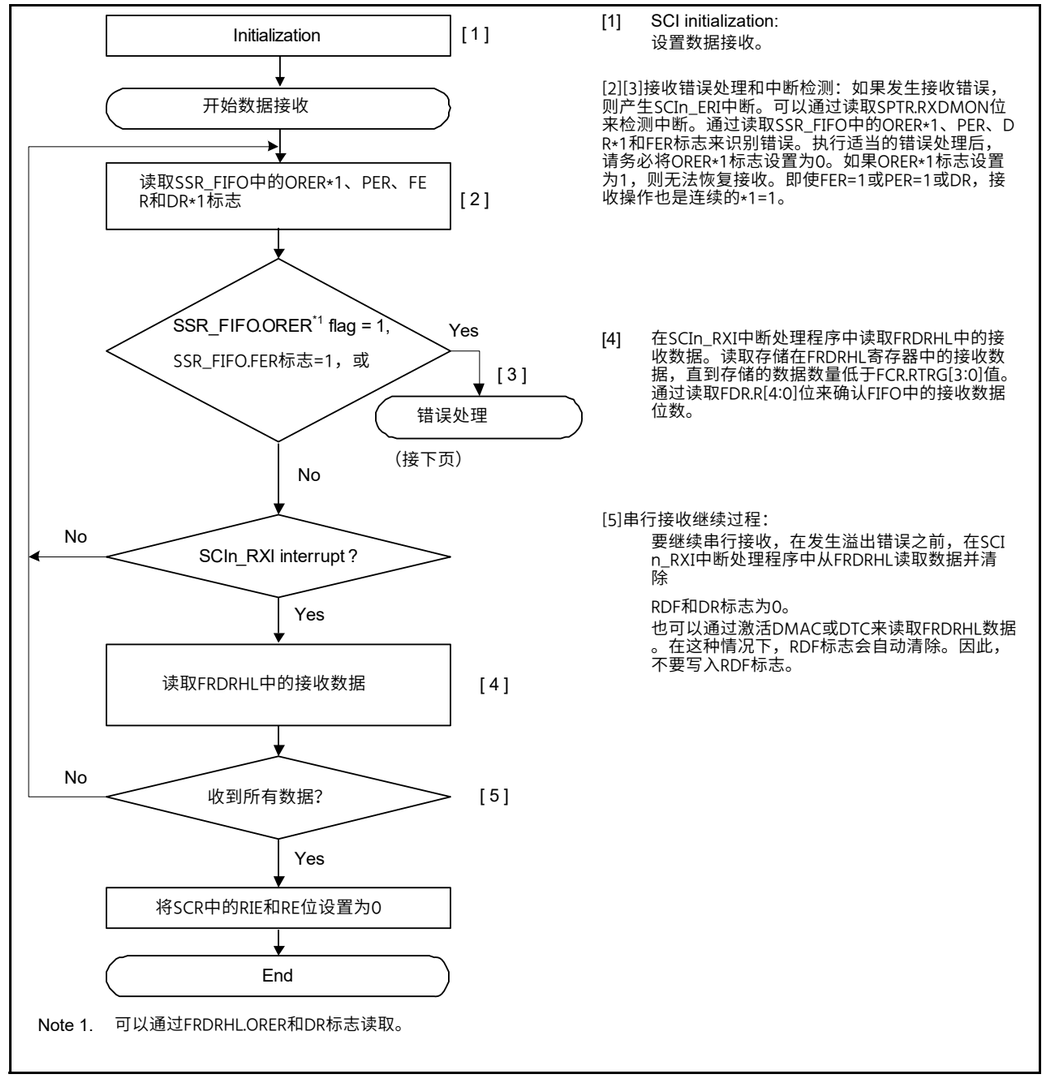
[2] [3] Receive error processing and break detection:
If a receive error occurs, an SCIn_ERI interrupt is generated. A break can be detected by reading the SPTR.RXDMON bit. An error is identified by reading the ORER*1, PER, DR*1, and FER flags in SSR_FIFO. After performing the appropriate error processing, be sure to set the ORER*1 flag to 0. Reception cannot be resumed if ORER*1 flag is set to 1. The reception operation is continuous, even when FER = 1 or PER = 1 or DR*1 = 1.

[4] Read the receive data in FRDRHL in the SCIn_RXI interrupt handling routine. The receive data stored in the FRDRHL register is read until the number of stored data is below the FCR.RTRG[3:0] value. Confirm the number of receive data bits in the FIFO by reading the FDR.R[4:0] bits.

[5] Serial reception continuation procedure:
To continue serial reception, before an overrun error occurs, read data from FRDRHL in the SCIn_RXI interrupt handling routine and clear RDF and DR flags to 0.
The FRDRHL data can also be read by activating the DMAC or DTC. The RDF flag is cleared automatically in this case. Therefore, do not write to the RDF flag.

Note 1. Can be read by the FRDRHL.ORER and DR flags.

Figure 30.20 Example flow of serial reception in asynchronous mode with FIFO selected (1)



[1] SCI initialization:
设置数据接收。

[2][3]接收错误处理和中断检测：如果发生接收错误，则产生SCIn_ERI中断。可以通过读取SPTR.RXDMON位来检测中断。通过读取SSR_FIFO中的ORER*1、PER、DR*1和FER标志来识别错误。执行适当的错误处理后，请务必将ORER*1标志设置为0。如果ORER*1标志设置为1，则无法恢复接收。即使FER=1或PER=1或DR，接收操作也是连续的*1=1。

[4] 在SCIn_RXI中断处理程序中读取FRDRHL中的接收数据。读取存储在FRDRHL寄存器中的接收数据，直到存储的数据数量低于FCR.RTRG[3:0]值。通过读取FDR.R[4:0]位来确认FIFO中的接收数据位数。

[5]串行接收继续过程：
要继续串行接收，在发生溢出错误之前，在SCIn_RXI中断处理程序中从FRDRHL读取数据并清除
RDF和DR标志为0。
也可以通过激活DMAC或DTC来读取FRDRHL数据。在这种情况下，RDF标志会自动清除。因此，不要写入RDF标志。

Note 1. 可以通过FRDRHL.ORER和DR标志读取。

Figure 30.20 选择FIFO的异步模式下串行接收示例流程(1)

RA生态工作室

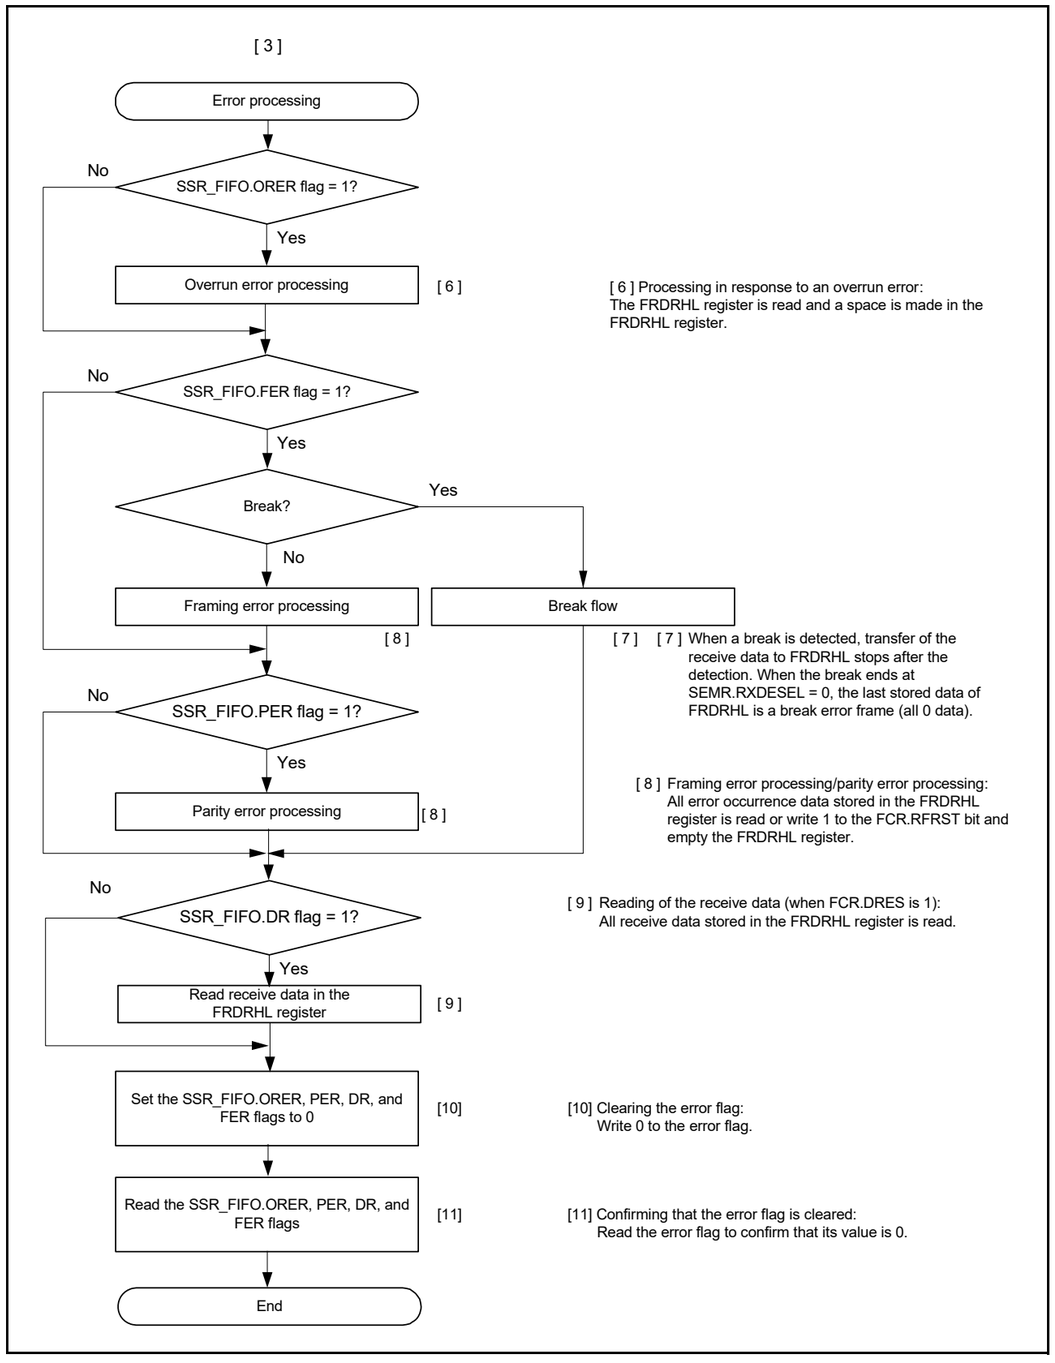


Figure 30.21 Example flow of serial reception in asynchronous mode with FIFO selected (2)

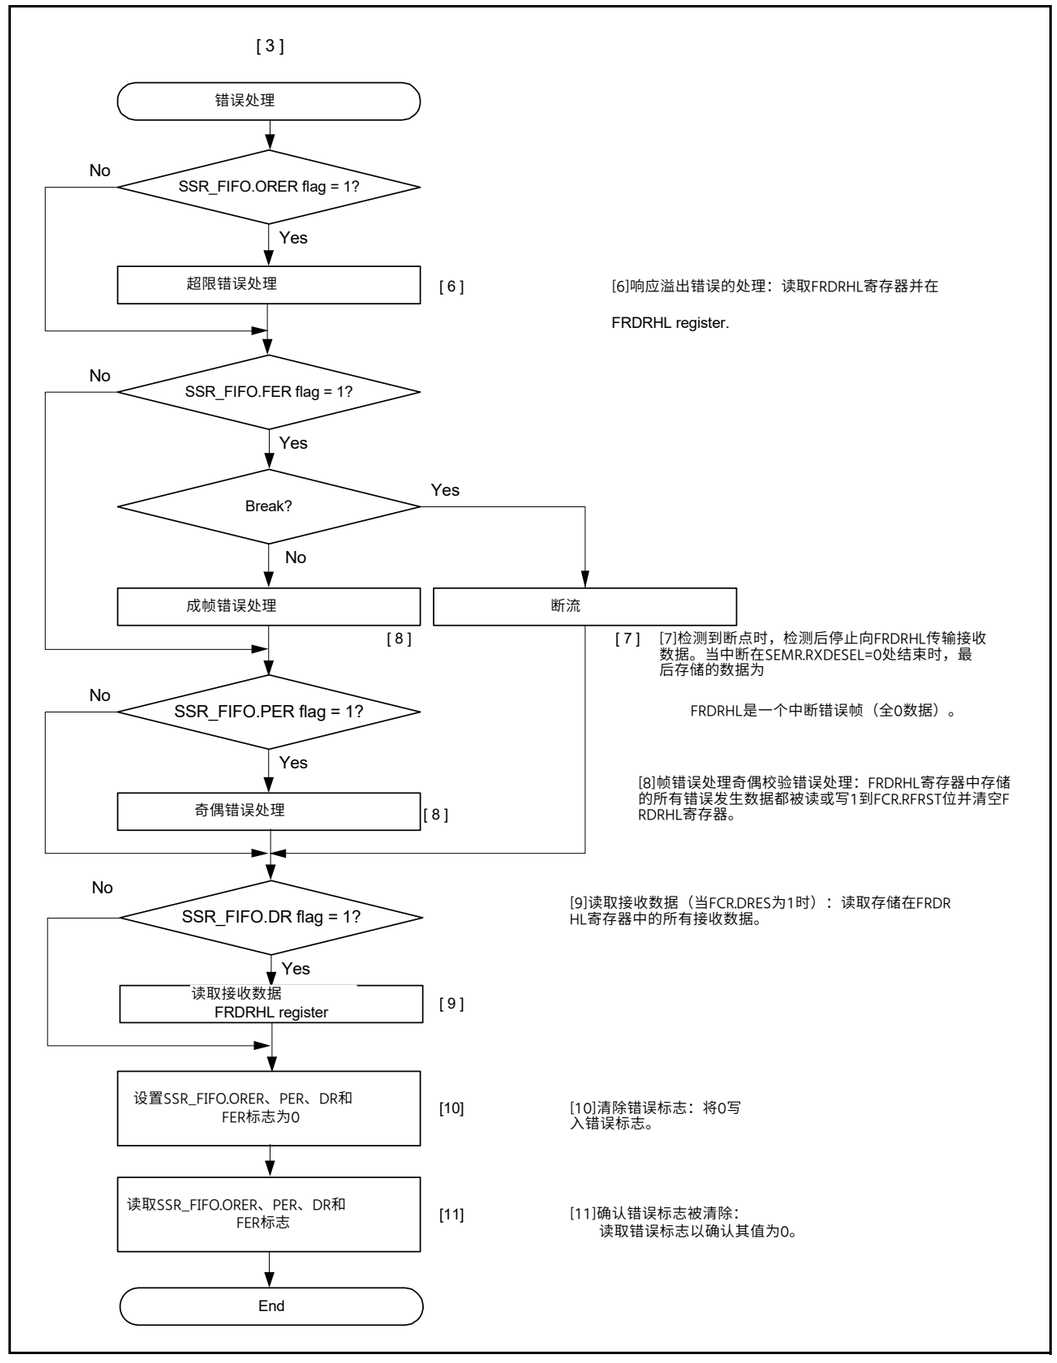

Figure 30.21 选择FIFO的异步模式下串行接收示例流程(2)

30.4 Multi-Processor Communication Function

The multi-processor communication function enables the SCI to transmit and receive data by sharing a communication line between multiple processors, using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station.

The multi-processor bit is used to distinguish between the ID transmission cycle and the data transmission cycle:

- When the multi-processor bit is set to 1, the transmission cycle is the ID transmission cycle
- When the multi-processor bit is set to 0, the transmission cycle is the data transmission cycle.

Figure 30.22 shows an example of communication between processors using a multi-processor format. First, a transmitting station transmits communication data in which the multi-processor bit set to 1, is added to the ID code of the receiving station. Next, the transmitting station transmits communication data in which the multi-processor bit set to 0, is added to the transmit data. After receiving communication data with the multi-processor bit set to 1, the receiving station compares the received ID with the ID of the receiving station itself. If the two match, the receiving station receives communication data that is subsequently transmitted. If the received ID does not match with the ID of the receiving station, the receiving station skips the communication data until it receives data again in which the multi-processor bit is set to 1.

(1) Non-FIFO selected

To support this function, the SCI provides the SCR.MPIE bit. When the MPIE bit is set to 1, the following operations are disabled until the reception of data in which the multi-processor bit is set to 1:

- Transfer of receive data from the RSR to the RDR (the RDRHL register when 9-bit data length is selected)
- Detection of a receive error
- Setting of the respective RDRF, ORER, and FER status flags in the SSR register.

When the SCI receives a character in which the multi-processor bit is set to 1, the SSR.MPBT bit is set to 1 and the SCR.MPIE bit is automatically cleared, returning the SCI to non-multi-processor reception operation. An SCIn_RXI interrupt is generated if the RIE bit in SCR is set.

When the multi-processor format is specified, the parity bit function is disabled. Apart from this, there is no difference from operation in non-multi-processor asynchronous mode. The clock used for multi-processor communication is the same as the clock used in non-multi-processor asynchronous mode.

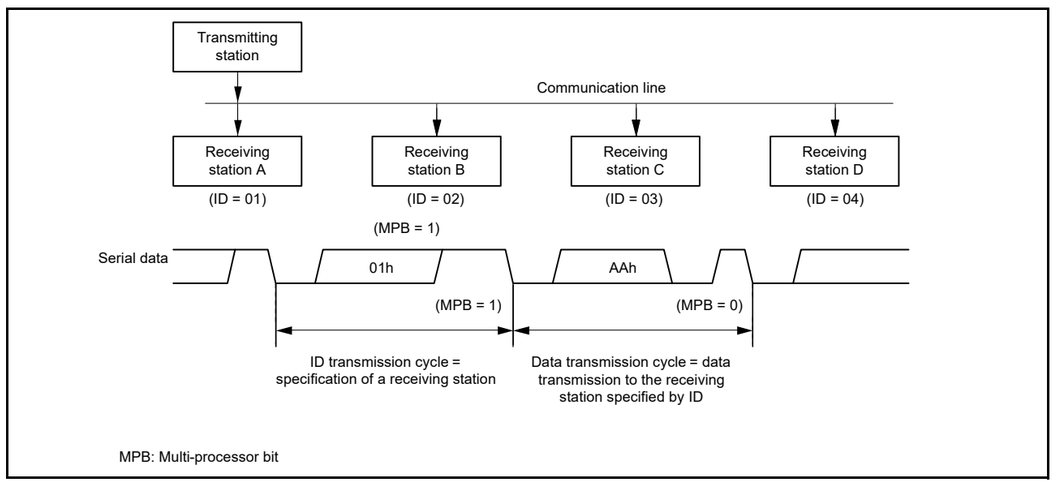

Figure 30.22 Example of communication using multi-processor format with transmission of data AAh to receiving station A

30.4 多处理器通信功能

多处理器通信功能使SCI通过在多个处理器之间共享一条通信线路，使用添加了多处理器位的异步串行通信来发送和接收数据。在多处理器通信中，为每个接收站分配一个唯一的ID代码。串行通信周期由指定接收站的ID传输周期和向指定接收站传输数据的数据传输周期组成。

多处理器位用于区分ID传输周期和数据传输周期：

- 当多处理器位设置为1时，发送周期为ID发送周期
- 当多处理器位设置为0时，传输周期为数据传输周期。

图30.22显示了使用多处理器格式的处理器之间的通信示例。首先，发送站发送将多处理器位设置为1的通信数据，该通信数据被添加到接收站的ID码。接着，发送站发送将多处理器位设置为0的通信数据被添加到发送数据。接收站接收到多处理器位设置为1的通信数据后，将接收到的ID与接收站自身的ID进行比较。如果两者匹配，则接收站接收随后发送的通信数据。如果接收到的ID与接收站的ID不匹配，则接收站跳过通信数据，直到再次接收到多处理器位设置为1的数据。

(1) Non-FIFO selected

为了支持这个功能，SCI提供了SCR.MPIE位。当MPIE位设置为1时，以下操作被禁止，直到接收到多处理器位设置为1的数据：

- 将接收数据从RSR传输到RDR（选择9位数据长度时的RDRHL寄存器）
- 检测接收错误
- 在SSR寄存器中设置相应的RDRF、ORER和FER状态标志。

当SCI接收到多处理器位设置为1的字符时，SSR.MPBT位设置为1，并且SCR.MPIE位自动清零，将SCI返回到非多处理器接收操作。如果SCR中的RIE位置位，则会产生SCIn_RXI中断。

当指定多处理器格式时，奇偶校验位功能被禁用。除此之外，与非多处理器异步模式下的操作没有区别。多处理器通信使用的时钟与非多处理器异步模式使用的时钟相同。

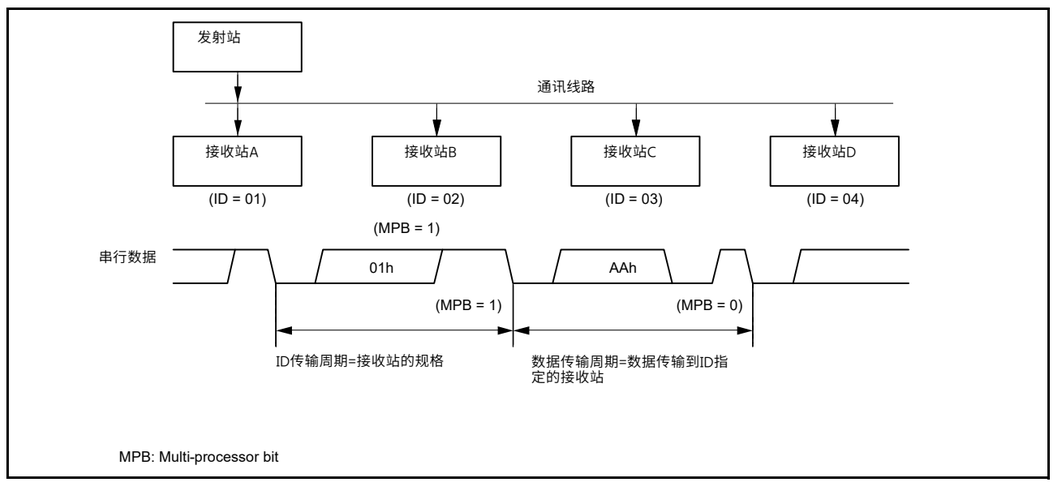

Figure 30.22 使用多处理器格式的通信示例，将数据AAh传输到接收站A

(2) FIFO selected

For data transmission, software must write data to FTDRHL.MPBT that corresponds to transmit data in FTDRHL.TDAT. For data reception, the multi-processor bit that is part of the receive data is written to FRDRHL.MPB, and receive data is written to FRDRL.

When the MPIE bit is set to 1, the following operations are disabled until reception of data in which the multi-processor bit is set to 1:

- Transfer of receive data from RSR to FRDRHL
- Detection of a receive error
- Break
- Setting of the respective RDF, ORER, and FER status flags in the SSR_FIFO register.

On receiving an 8-bit character in which the multi-processor bit is set to 1, the FRDRHL.MPB bit is set to 1 and receive data is written to FRDRHL.RDAT. The SCR.MPIE bit is automatically cleared, therefore returning the SCI to non-multi-processor reception operation. An SCIn_RXI interrupt is generated if the RIE bit in SCR is set.

When the multi-processor format is specified, the parity bit function is disabled. Apart from this, there is no difference from operation in non multi-processor asynchronous mode with non-FIFO selected.

30.4.1 Multi-Processor Serial Data Transmission

(1) Non-FIFO selected

Figure 30.23 shows an example flow of multi-processor data transmission. In the ID transmission cycle, the ID must be transmitted with the SSR.MPBT bit set to 1. In the data transmission cycle, the data must be transmitted with the MPBT bit set to 0. The rest of the operations are the same as in asynchronous mode.

(2) FIFO selected

对于数据传输，软件必须将数据写入与FTDRHL.TDAT中的传输数据相对应的FTDRHL.MPBT。对于数据接收，作为接收数据一部分的多处理器位被写入FRDRHL.MPB，接收数据被写入FRDRL。

当MPIE位设置为1时，以下操作被禁止，直到接收到多处理器位设置为1的数据：

- 将接收数据从RSR传输到FRDRHL
- 检测接收错误
- Break
- 在SSR_FIFO寄存器中设置相应的RDF、ORER和FER状态标志。

在接收到多处理器位设置为1的8位字符时，FRDRHL.MPB位设置为1，并且接收数据写入FRDRHL.RDAT。SCR.MPIE位自动清零，因此将SCI返回到非多处理器接收操作。如果SCR中的RIE位置位，则会产生SCIn_RXI中断。

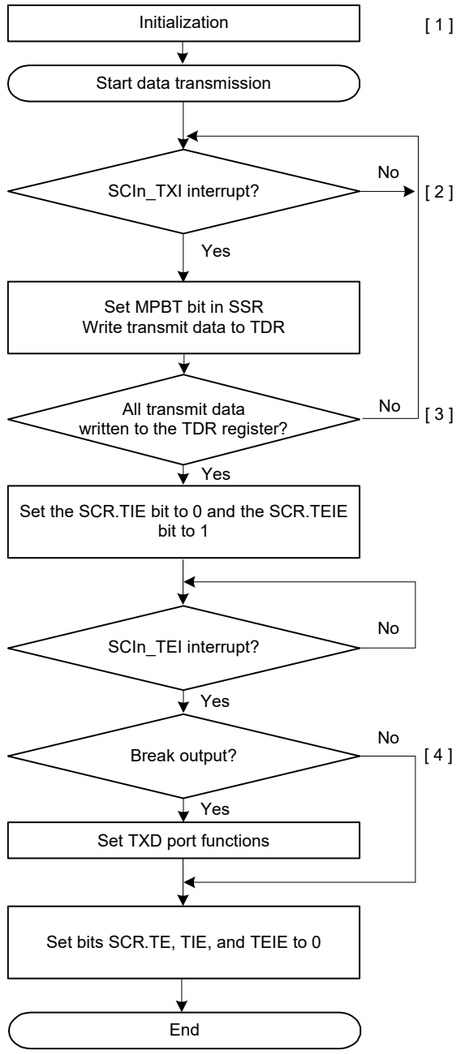
当指定多处理器格式时，奇偶校验位功能被禁用。除此之外，与选择非FIFO的非多处理器异步模式下的操作没有区别。

30.4.1 多处理器串行数据传输

(1) Non-FIFO selected

图30.23显示了一个多处理器数据传输的示例流程。在ID传输周期，ID必须在SSR.MPBT位设置为1的情况下传输。在数据传输周期，数据必须在MPBT位设置为0的情况下传输。其余操作同异步模式。

RA生态工作室



[1] SCI initialization:
Set data transmission.
After the SCR.TE bit is set to 1, 1 is output for a frame, and transmission is enabled.

[2] SCIn_TXI interrupt request:
When transmit data is transferred from TDR to TSR, a transmit data empty interrupt (SCIn_TXI) request is generated.
Set the MPBT bit in SSR to 0 or 1, and write transmit data to TDR in the SCIn_TXI interrupt processing routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR once using an SCIn_TXI interrupt request.
Transmit data can also be written to TDR by activating the DMAC or DTC.
When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to the TDR.

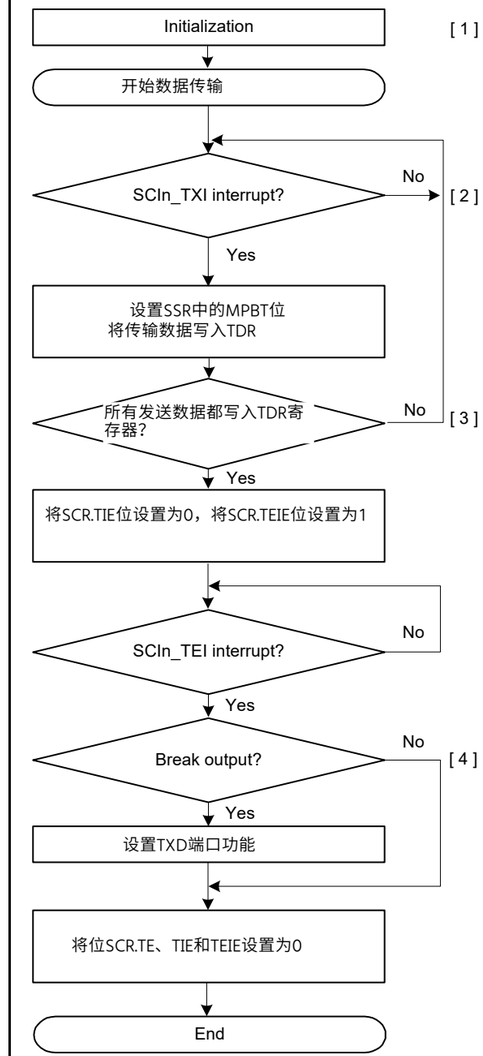
[4] Break output at the end of serial transmission:
To output a break in serial transmission, after setting the output state (low level output) of the TXDn pin using SPTR.SPB2IO and SPTR.SPB2DT bits, set the SCR.TE bit to 0.

Figure 30.23 Example flow of multi-processor serial transmission with non-FIFO selected

(2) FIFO selected

Figure 30.24 shows an example of the data format that is written to FTDRH and FTDRL in multi-processor mode.

The FTDRH.MPBT bit is set to 1. Data is set to FTDRH and FTDRL with the correct data length. Write 0 for unused bits. Write in the order from FTDRH to FTDRL.



[1] SCI initialization:
设置数据传输。SCR.TE位设置为1后，每帧输出1，并启用传输。

[2] SCIn_TXI interrupt request:
当发送数据从TDR传输到TSR时，会产生发送数据空中断(SCIn_TXI)请求。将SSR中的MPBT位设置为0或1，并将发送数据写入

SCIn_TXI中断处理程序中的TDR。

[3] 串行传输继续程序：
要继续串行传输，请使用SCIn_TXI中断请求将传输数据写入TDR一次。发送数据也可以通过激活写入到TDR

DMAC or DTC.
当SCIn_TEI中断请求正在使用时，设置
在要发送的最后一个数据写入TDR后，SCR.TIE位为0，SCR.TEIE位为1。

[4] 串行传输结束时中断输出：
要在串行传输中输出中断，在使用SPTR.SPB2IO和SPTR.SPB2DT位设置TXDn引脚的输出状态（低电平输出）后，将SCR.TE位设置为0。

Figure 30.23 选择非FIFO的多处理器串行传输示例流程

(2) FIFO selected

图30.24显示了在多处理器模式下写入FTDRH和FTDRL的数据格式示例。

FTDRH.MPBT位设置为1。数据设置为具有正确数据长度的FTDRH和FTDRL。为未使用的位写入0。按照从FTDRH到FTDRL的顺序写入。

Data Length	Register Setting		Transmit data in FTDRH, FTDRL															
			FTDRHL															
			FTDRH								FTDRL

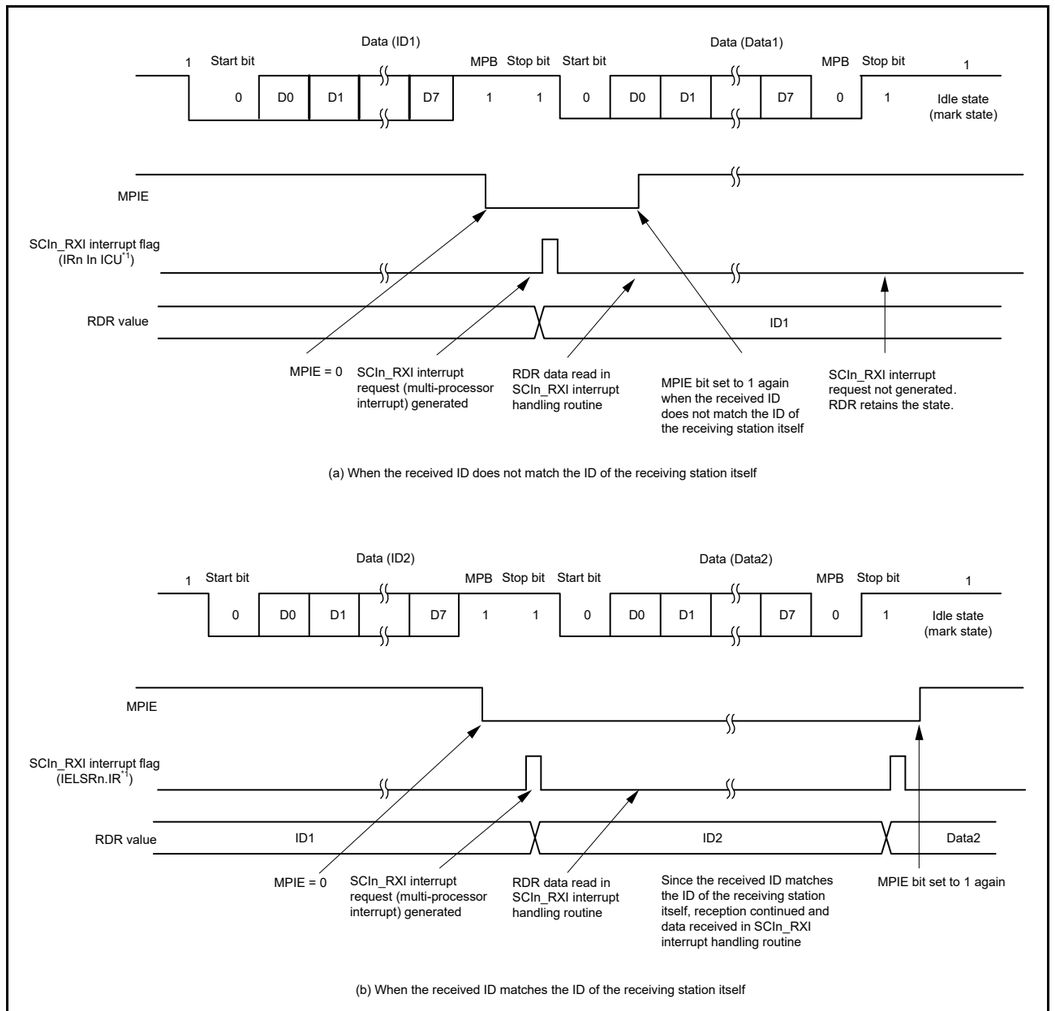
30.4.2 Multi-Processor Serial Data Reception

(1) Non-FIFO selected

Figure 30.27 and Figure 30.28 show example flows of multi-processor data reception. When the SCR.MPIE bit is set to 1, reading communication data is skipped until the reception of communication data in which the multi-processor bit is set to 1. When communication data in which the multi-processor bit is set to 1 is received, the received data is transferred to RDR, or RDRHL when 9-bit data length is selected, and the SCIn_RXI interrupt request is generated. The rest of the operations are the same as in asynchronous mode.

Figure 30.26 shows an example of operation for data reception.



Note 1. See section 14, Interrupt Controller Unit (ICU) for information on the associated interrupt event number.

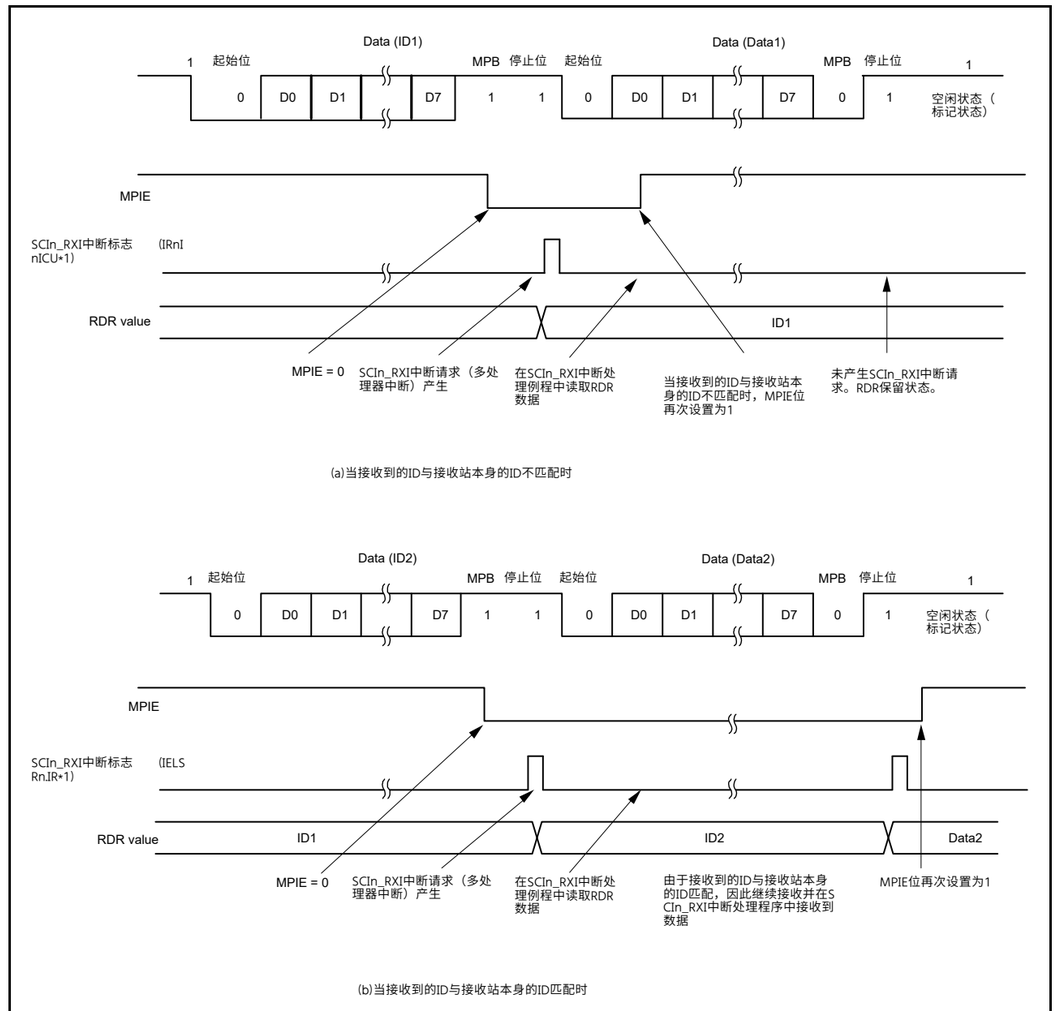
Figure 30.26 Example of SCI reception with 8-bit data, multi-processor bit, and 1 stop bit

30.4.2 多处理器串行数据接收

(1) Non-FIFO selected

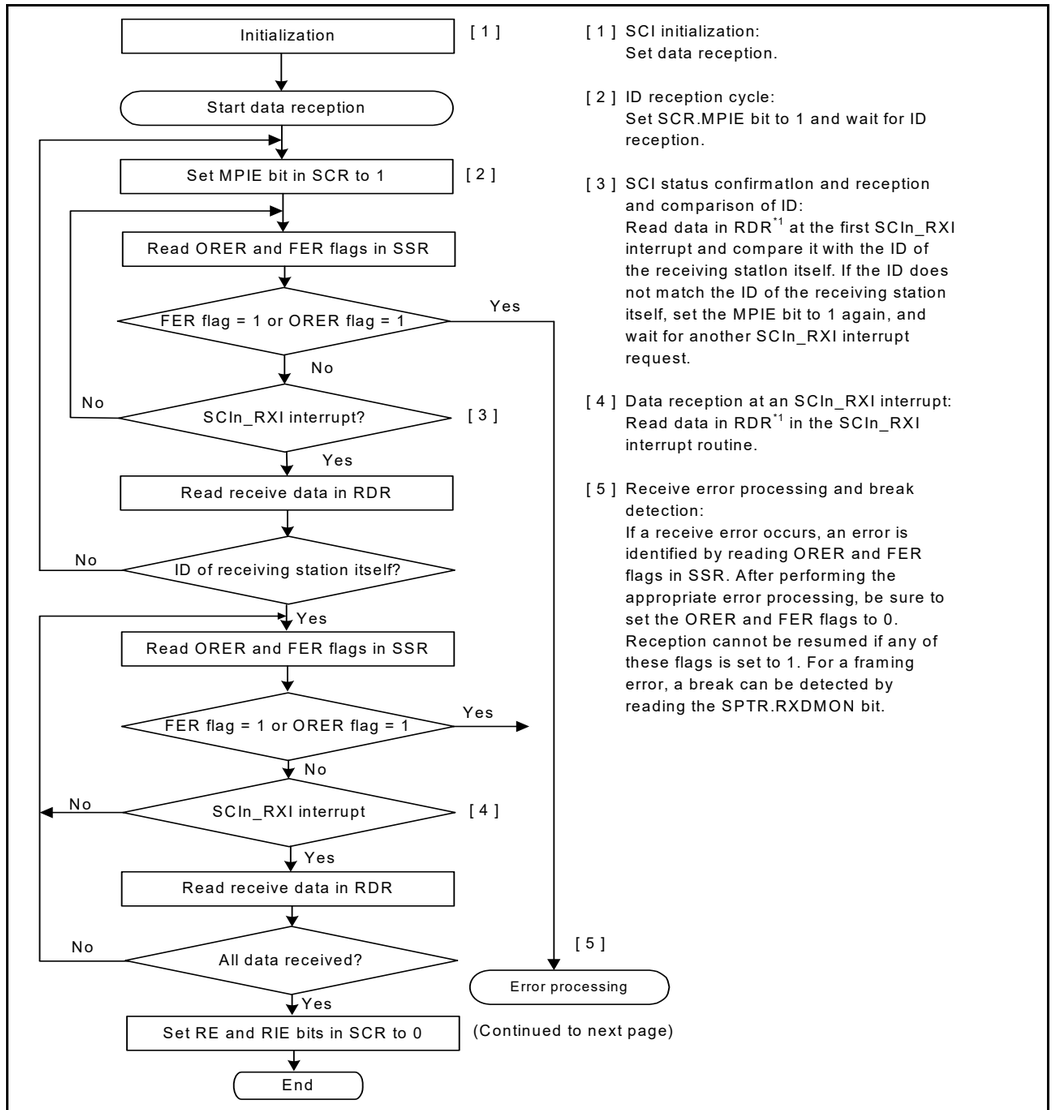
图30.27和图30.28显示了多处理器数据接收的示例流程。当SCR.MPIE位设置为1时，将跳过读取通信数据，直到接收到多处理器位设置为1的通信数据。当接收到多处理器位设置为1的通信数据时 thereceiveddataistransferredtoRDR orRDRHLwhen9-bitdatalengthisselected andtheSCIn_RXIinterruptrequestisgenerated.其余操作与异步模式相同。

图30.26显示了数据接收的操作示例。



Note 1. 有关相关中断事件编号的信息，请参见第14节，中断控制器单元(ICU)。

Figure 30.26 使用8位数据、多处理器位和1个停止位的SCI接收示例



[1] SCI initialization:
Set data reception.

[2] ID reception cycle:
Set SCR.MPIE bit to 1 and wait for ID reception.

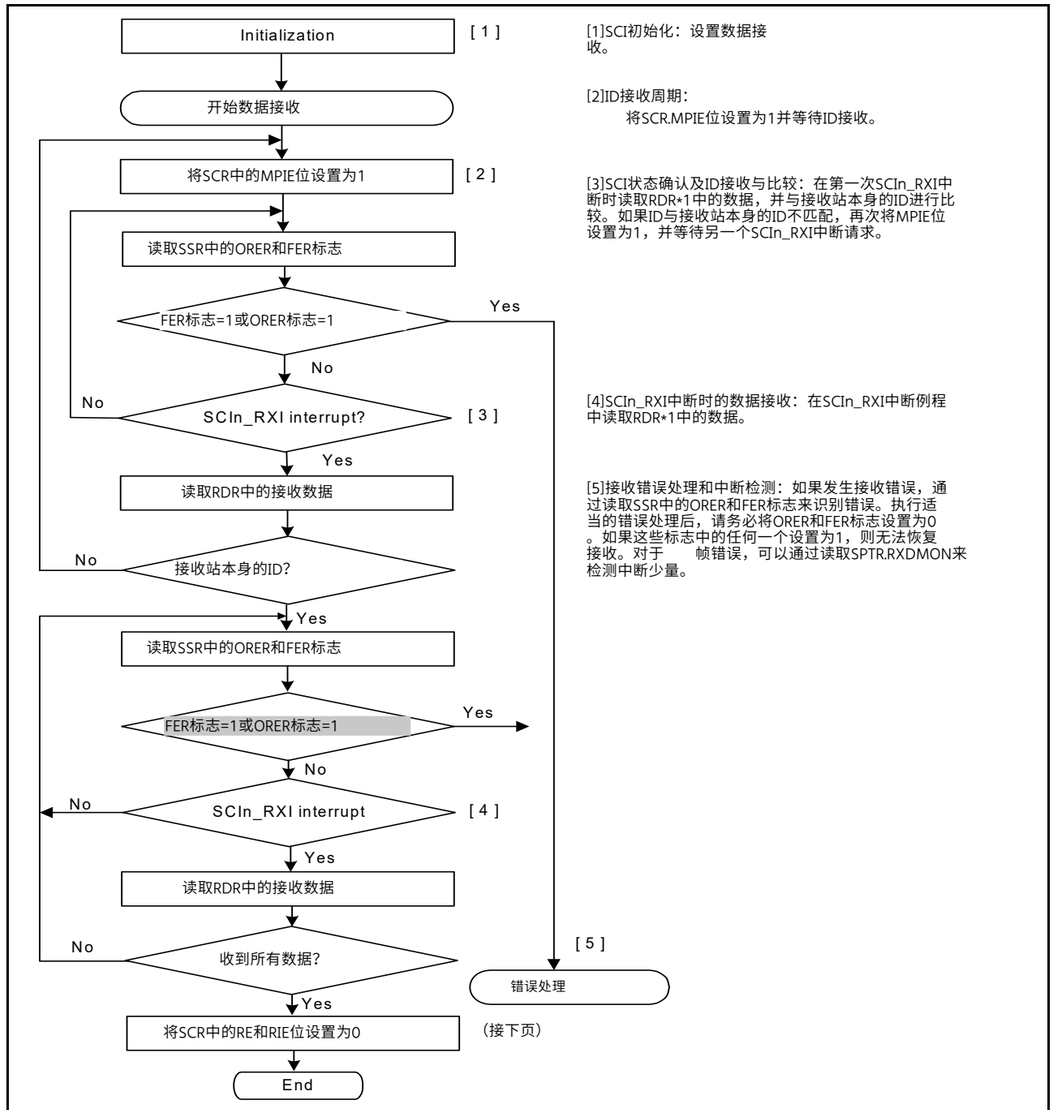
[3] SCI status confirmatIon and reception and comparison of ID:
Read data in RDR*1 at the first SCIn_RXI interrupt and compare it with the ID of the receiving statIon itself. If the ID does not match the ID of the receiving station itself, set the MPIE bit to 1 again, and wait for another SCIn_RXI interrupt request.

[4] Data reception at an SCIn_RXI interrupt:
Read data in RDR*1 in the SCIn_RXI interrupt routine.

[5] Receive error processing and break detection:
If a receive error occurs, an error is identified by reading ORER and FER flags in SSR. After performing the appropriate error processing, be sure to set the ORER and FER flags to 0. Reception cannot be resumed if any of these flags is set to 1. For a framing error, a break can be detected by reading the SPTR.RXDMON bit.

Note 1. The RDR register becomes the RDRHL register when 9-bit data length is selected.

Figure 30.27 Example flow of multi-processor serial reception with non-FIFO selected (1)



[1]SCI初始化：设置数据接收。

[2]ID接收周期：
将SCR.MPIE位设置为1并等待ID接收。

[3]SCI状态确认及ID接收与比较：在第一次SCIn_RXI中断时读取RDR*1中的数据，并与接收站本身的ID进行比较。如果ID与接收站本身的ID不匹配，再次将MPIE位设置为1，并等待另一个SCIn_RXI中断请求。

[4]SCIn_RXI中断时的数据接收：在SCIn_RXI中断例程中读取RDR*1中的数据。

[5]接收错误处理和中断检测：如果发生接收错误，通过读取SSR中的ORER和FER标志来识别错误。执行适当的错误处理后，请务必将ORER和FER标志设置为0。如果这些标志中的任何一个设置为1，则无法恢复接收。对于 帧错误，可以通过读取SPTR.RXDMON来检测中断少量。

Note 1. 选择9位数据长度时，RDR寄存器成为RDRHL寄存器。

Figure 30.27 选择非FIFO的多处理器串行接收示例流程(1)

RA生态工作室

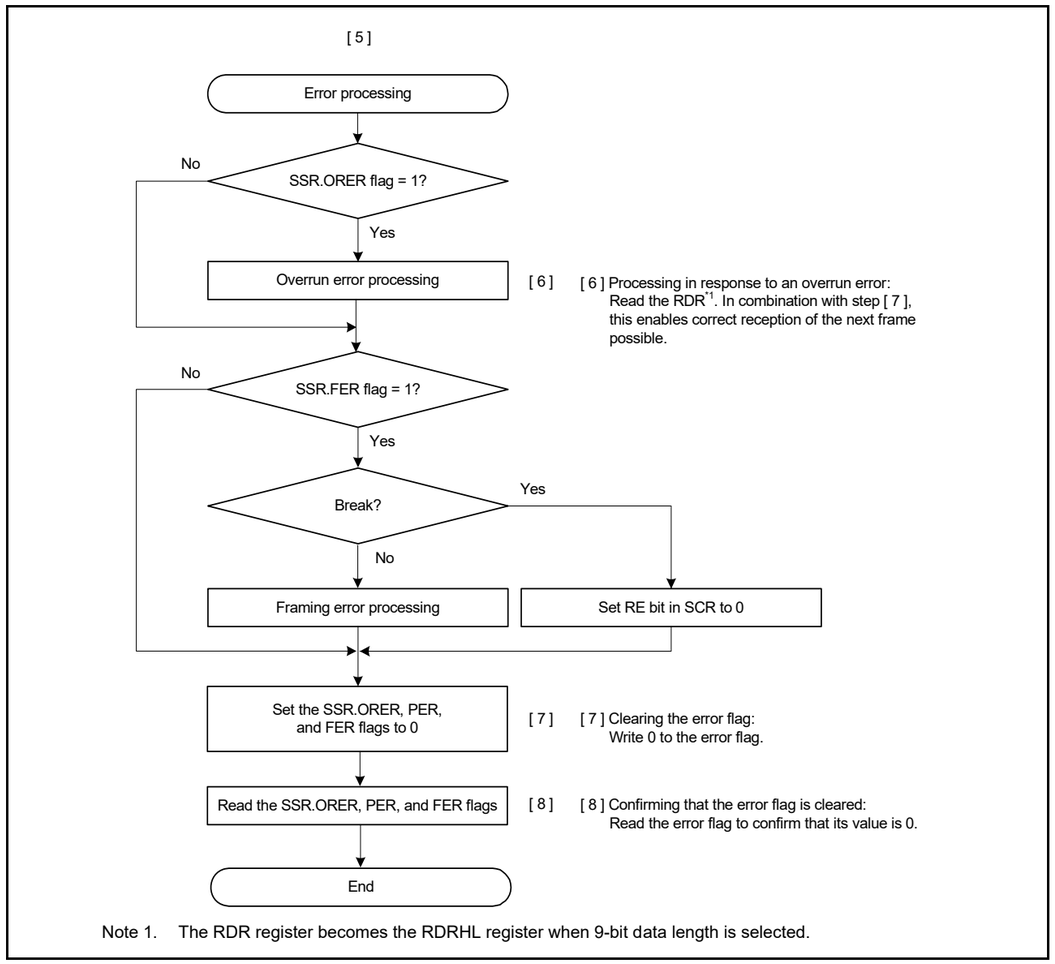


Figure 30.28 Example flow of multi-processor serial reception with non-FIFO selected (2)

(2) FIFO selected

Figure 30.29 shows an example of a data format that is written to FRDRH and FRDRL in multi-processor mode.

In multi-processor mode, the MPB value that is a part of the receive data is written to the FRDRH.MPB flag. A value of 0 is written to the FRDRH.PER flag. Data is written to FRDRH and FRDRL with the correct data length. Unused bits are written with 0.

Read in the order from FRDRH to FRDRL. When software reads the FRDRL register, the SCI updates FER, MPB, and receive data (RDAT[8:0]) in FRDRL with the next data. The RDF, ORER and DR flags in FRDRH always reflect the associated flags in the SSR_FIFO register.

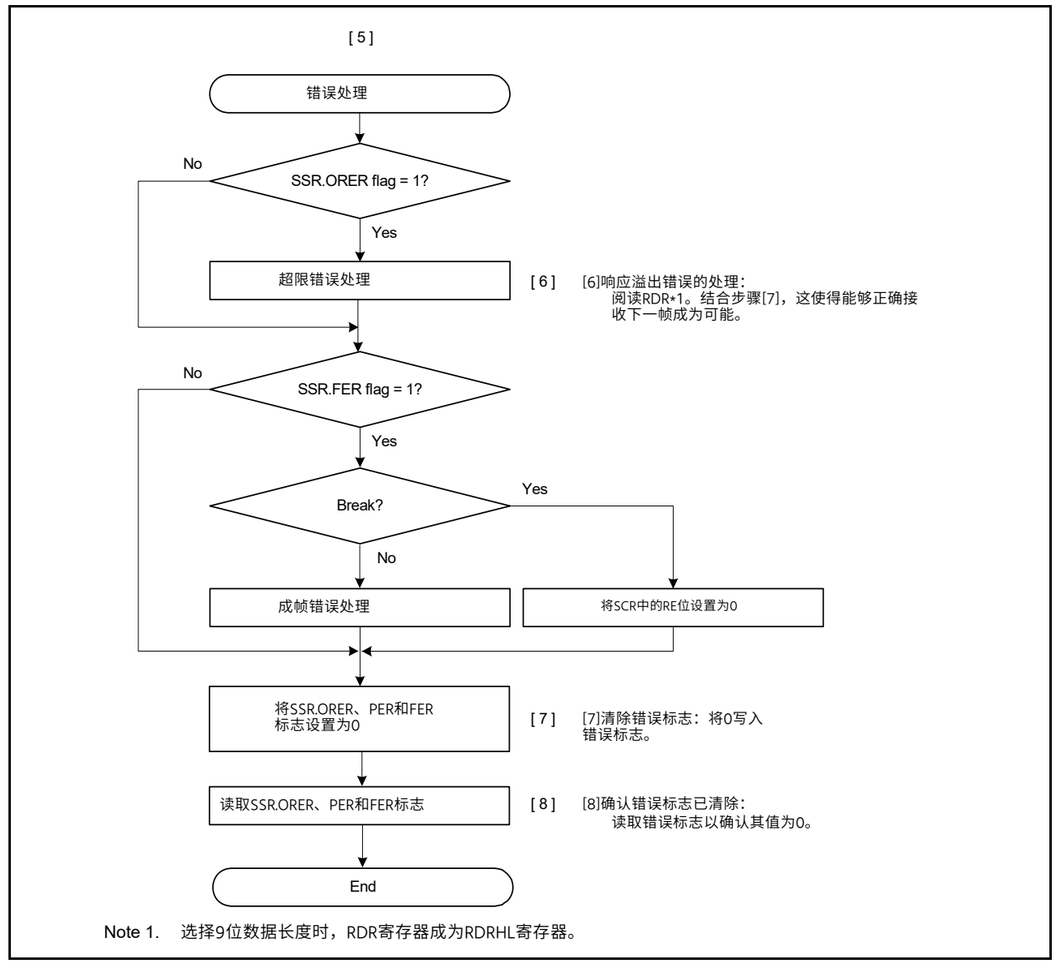

Figure 30.28 选择非FIFO的多处理器串行接收示例流程(2)

(2) FIFO selected

图30.29显示了在多处理器模式下写入FRDRH和FRDRL的数据格式示例。

在多处理器模式下，作为接收数据一部分的MPB值被写入FRDRH.MPB标志。值0写入FRDRH.PER标志。数据以正确的数据长度写入FRDRH和FRDRL。未使用的位用0写入。

按从FRDRH到FRDRL的顺序读取。当软件读取FRDRL寄存器时，SCI用下一个数据更新FER、MPB和FRDRL中的接收数据（RDAT[8:0]）。FRDRH中的RDF、ORER和DR标志始终反映SSR_FIFO寄存器中的相关标志。

Data Length	Register Setting		Receive data in FRDRH, FRDRL															
			FRDRHL															
			FRDRH								FRDRL							
	SCMR.CHR1	SMR.CHR	b7	b6	b5	b4	b3	b2	b1	b0	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	0	—	RDF	ORER	FER	0	DR	MPB	0	0	7-bit receive data						
8 bits	1	1	—	RDF	ORER	FER	0	DR	MPB	0	8-bit receive data							
9 bits	0	Don't care	—	RDF	ORER	FER	0	DR	MPB	9-bit receive data								

Note: When data length is 7 bits, 0 is always read for FRDRH[0] and FRDRL[7].
When data length is 8 bits, 0 is always read for FRDRH[0].
FRDRH[7] bit is read as an indefinite value.

Figure 30.29 Data format stored to FRDRH and FRDRL in multi-processor mode with FIFO selected

Figure 30.30 shows an example flow for multi-processor data reception with FIFO selected.

When the SCR.MPIE is set to 1, reading communication data is skipped until the reception of communication data in which the multi-processor bit is set to 1. When communication data in which the multi-processor bit is set to 1 is received, the received data, MPB and the associated errors are transferred to the FRDRHL register. The SCR.MPIE bit is automatically cleared and non-multi-processor reception continues.

If a frame error occurs and the SSR_FIFO.FER flag is set to 1, the SCI continues data reception. The rest of the operations are the same as in asynchronous mode with non-FIFO selected.

数据长度	寄存器设置		在FRDRH、FRRDL中接收数据															
			FRDRHL															
			FRDRH								FRDRL							
	SCMR.CHR1	SMR.CHR	b7	b6	b5	b4	b3	b2	b1	b0	b7	b6	b5	b4	b3	b2	b1	b0
7 bits	1	0	—	RDF	ORER	FER	0	DR	MPB	0	0	7位接收数据						
8 bits	1	1	—	RDF	ORER	FER	0	DR	MPB	0	8位接收数据							
9 bits	0	不在乎	—	RDF	ORER	FER	0	DR	MPB	9位接收数据								

Note: 当数据长度为7位时，FRRDH[0]和FRDRL[7]总是读取0。
当数据长度为8位时，FRRDH[0]总是读取0。
FRDRH[7]位被读取为不定值。

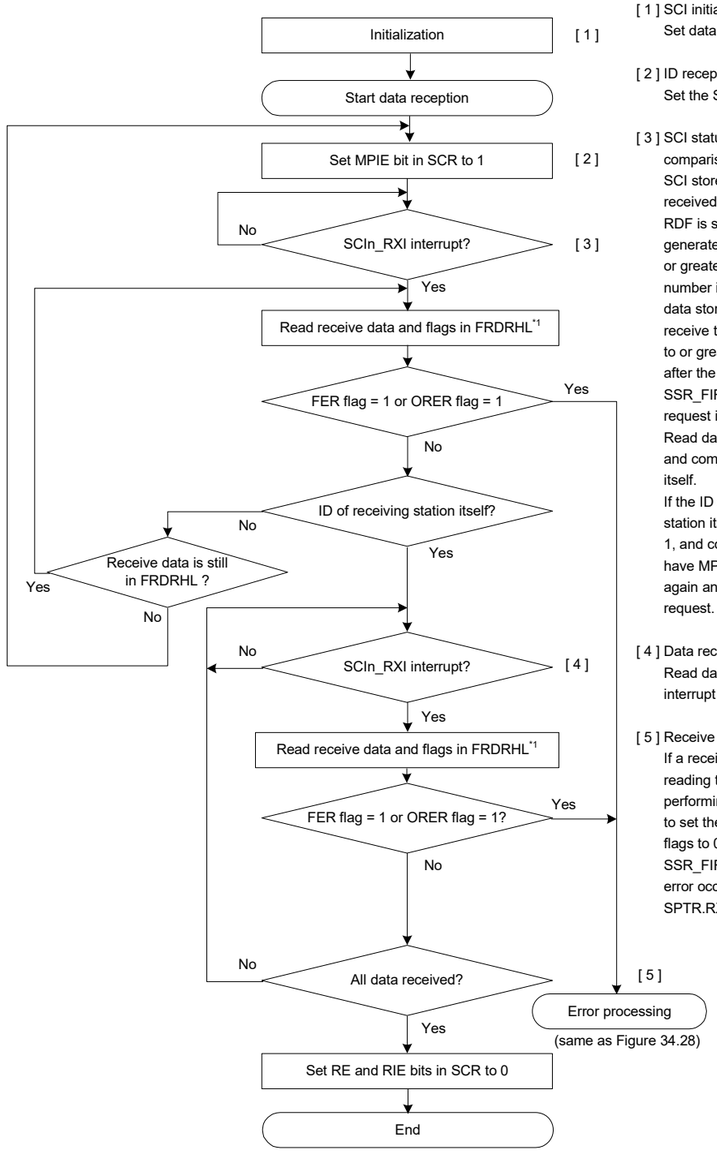
Figure 30.29 在选择FIFO的多处理器模式下存储到FRDRH和FRDRL的数据格式

图30.30显示了选择FIFO的多处理器数据接收示例流程。

当SCR.MPIE设置为1时，将跳过读取通信数据，直到接收到多处理器位设置为1的通信数据。当接收到多处理器位设置为1的通信数据时，接收到的数据、MPB和相关的错误被传送到FRDRHL寄存器。SCR.MPIE位自动清零，非多处理器接收继续。

如果发生帧错误并且SSR_FIFO.FER标志设置为1，则SCI继续数据接收。其余操作与选择非FIFO的异步模式相同。

RA生态工作室



[1] SCI initialization:
Set data reception.

[2] ID reception cycle:
Set the SCR.MPIE bit to 1 and wait for ID reception.

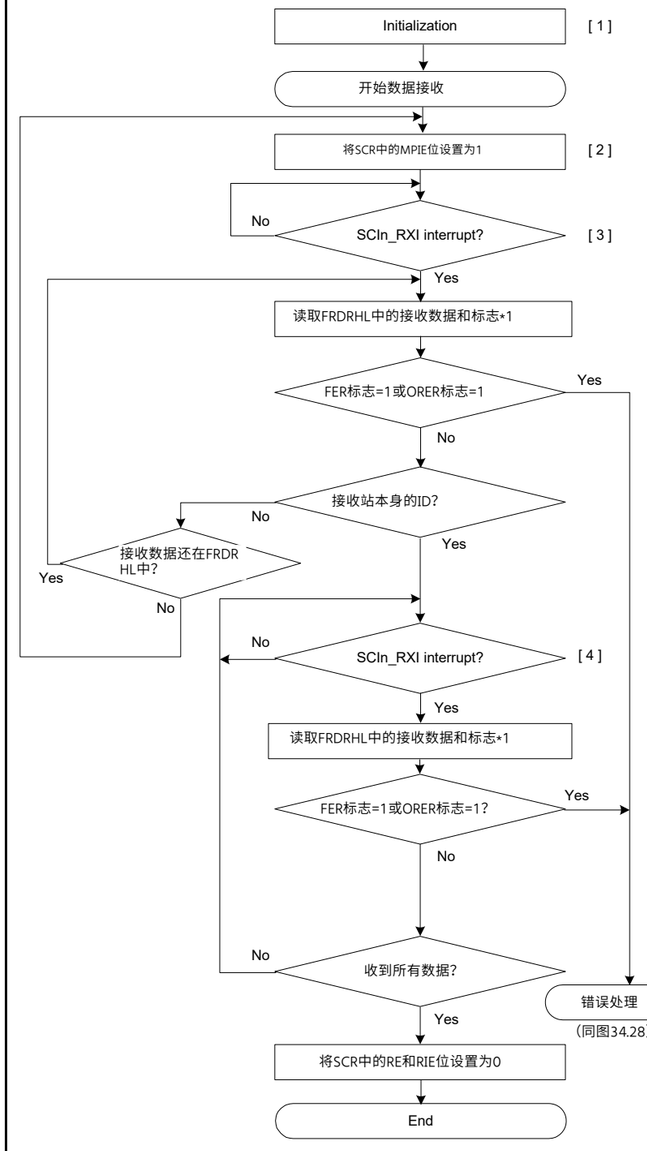
[3] SCI status confirmation and reception and comparison of ID:
SCI stores first data (MPB = 1) and subsequent received data in FRDRHL.
RDF is set to 1 and an SCIn_RXI interrupt request is generated when the amount of receive data equal to or greater than the specified receive triggering number is stored in FRDRHL. When the amount of data stored in FRDRHL falls below the specified receive triggering number and received data is equal to or greater than 1, and no new data is received after the elapse of 15 ETUs from the last stop bit, SSR_FIFO.DR is set to 1. An SCIn_RXI interrupt request is generated when FCR.DRES bit is 0.
Read data in FRDRHL at the first SCIn_RXI interrupt, and compare it with the ID of the receiving station itself.
If the ID does not match the ID of the receiving station itself, the SCI reads until the data with MPB = 1, and compares the next ID. If the data does not have MPB = 1 in FRDRHL, set the MPIE bit to 1 again and wait for another SCIn_RXI interrupt request.

[4] Data reception at an SCIn_RXI interrupt:
Read data in FRDRHL once in the SCIn_RXI interrupt routine.

[5] Receive error processing and break detection:
If a receive error occurs, an error is identified by reading the ORER and FER flags in SSR_FIFO. After performing the appropriate error processing, be sure to set the SSR_FIFO.ORER and SSR_FIFO.FER flags to 0. Reception cannot be resumed if the SSR_FIFO.ORER flag is set to 1. When a framing error occurs, a break can be detected by reading the SPTR.RXDMON bit.

Note 1. If FRDRH and FRDRL are used instead of FRDRHL, read in the order from FRDRH to FRDRL.

Figure 30.30 Example flow of serial reception in multi-processor mode with FIFO selected



[1]SCI初始化：设置数据接收。

[2]ID接收周期：
将SCR.MPIE位设置为1并等待ID接收。

[3]SCI状态确认和ID的接收与比较：SCI将第一个数据（MPB=1）和后续接收到的数据存储在FRDRHL中。当FRDRHL中存储的接收数据量等于或大于指定的接收触发数时，RDF设置为1并产生SCIn_RXI中断请求。当FRDRHL中存储的数据量低于指定的接收触发数且接收到的数据等于或大于1，并且从最后一个停止位开始经过15个ETU后没有接收到新数据时，SSR_FIFO.DR设置为1.FCR.DRES位为0时产生SCIn_RXI中断请求。在第一个SCIn_RXI中断时读取FRDRHL中的数据，并与接收站本身的ID进行比较。如果ID与接收站本身的ID不匹配，则SCI读取直到MPB=1的数据，并比较下一个ID。如果数据在FRDRHL中没有MPB=1，则再次将MPIE位设置为1，并等待另一个SCIn_RXI中断请求。

[4]SCIn_RXI中断处的数据接收：
在SCIn_RXI中断例程中读取FRDRHL中的数据一次。

[5]接收错误处理和中断检测：如果发生接收错误，则通过读取SSR_FIFO中的ORER和FER标志来识别错误。执行适当的错误处理后，请务必将SSR_FIFO.ORER和SSR_FIFO.FER标志设置为0。如果SSR_FIFO.ORER标志设置为1，则无法恢复接收。发生帧错误时，可以通过以下方式检测中断读取SPTR.RXDMON位。

Note 1. 如果使用FRDRH和FRDRL代替FRDRHL，请按照从FRDRH到FRDRL的顺序读取。

Figure 30.30 选择FIFO的多处理器模式下的串行接收示例流程

RA生态工作室

30.5 Operation in Clock Synchronous Mode

Figure 30.31 shows the data format for clock synchronous serial data communications.

In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In clock synchronous mode, no parity bit can be added.

In data transmission, the SCI outputs data from one falling edge of the synchronization clock to the next. In data reception, the SCI receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the transmission line holds the last bit as the output state. When the SPMR.CKPH bit is 1 in slave mode, the transmission line holds the first bit as the output state.

Within the SCI, the transmitter and receiver are independent units, enabling full-duplex communications by using a common clock. Both the transmitter and the receiver have a double-buffered structure, so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.

However, it is not possible to perform continuous transfer in the fastest bit rate setting (BRR[7:0] = 00h and SMR.CKS[1:0] = 00b). Therefore, when the FIFO is selected, this setting (BRR[7:0] = 00h and SMR.CKS[1:0] = 00b) is not available.

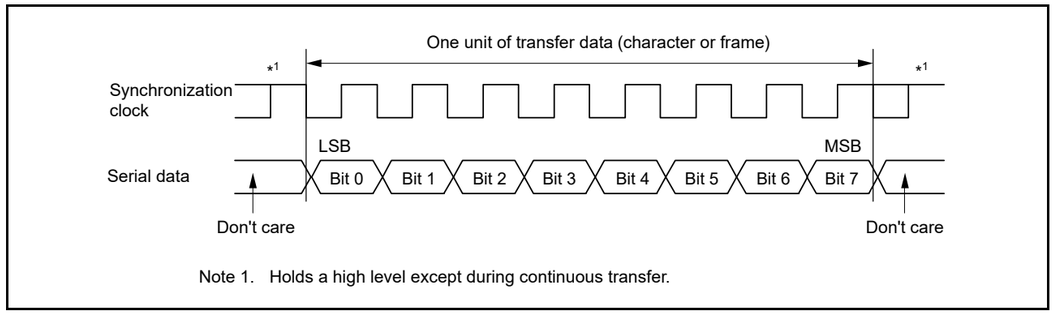


Figure 30.31 Data format in clock synchronous serial communications with LSB-first

30.5.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCKn pin can be selected based on the SCR.CKE[1:0] setting.

When the SCI operates on an internal clock, the synchronization clock is output from the SCKn pin. Eight synchronization clock pulses are output in the transfer of one character. When no transfer is performed, the clock is held high. However, when only data reception is performed while the CTS function is disabled, the synchronization clock output starts when the SCR.RE bit is set to 1. The synchronization clock stops when it is held high*1 and when an overrun error occurs, or when the SCR.RE bit is set to 0.

When only data reception occurs and the CTS function is enabled, the clock output does not start when the SCR.RE bit is set to 1 and the CTSn_RTSn pin input is high. The synchronization clock output starts when the SCR.RE bit is set to 1 and the CTSn_RTSn pin input is low. When the CTSn_RTSn pin input is high on completion of the frame reception, the synchronization clock output stops when it goes high. If the CTSn_RTSn pin input continues to be low, the synchronization clock stops when it goes high*1 and when an overrun error occurs, or when the SCR.RE bit is set to 0.

Note 1. The signal is held high when SPMR.CKPH is 0 and SPMR.CKPOL is 0, or when SPMR.CKPH is 1 and SPMR.CKPOL is 1.
It is held low when SPMR.CKPH is 0 and SPMR.CKPOL is 1, or when SPMR.CKPH is 1 and SPMR.CKPOL is 0.

30.5 时钟同步模式下的操作

图30.31显示了时钟同步串行数据通信的数据格式。

在时钟同步模式下，数据的发送或接收与时钟脉冲同步。传输数据中的一个字符由8位数据组成。在时钟同步模式下，不能添加奇偶校验位。

在数据传输中，SCI从同步时钟的一个下降沿输出数据到下一个下降沿。在数据接收中，SCI与同步时钟的上升沿同步接收数据。8位数据输出后，传输线保持最后一位作为输出状态。当SPMR.CKPH位在从机模式下为1时，传输线保持第一位作为输出状态。

在SCI中，发送器和接收器是独立的单元，通过使用公共时钟实现全双工通信。发送器和接收器都具有双缓冲结构，因此可以在发送过程中写入下一个发送数据或在接收过程中读取上一个接收数据，从而实现数据的连续传输。

但是，在最快的比特率设置（BRR[7:0]=00h和SMR.CKS[1:0]=00b)。Therefore whentheFIFOisselected thissetting(BRR[7:0]=00handSMR.CKS[1:0]=00b)isnot available.

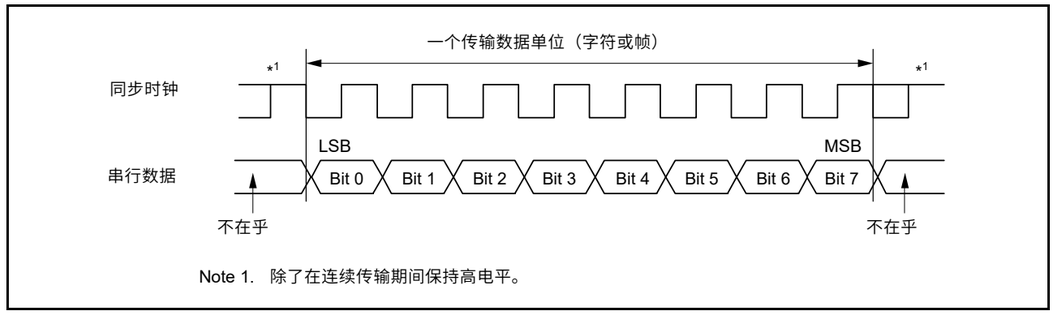

Figure 30.31 LSB优先时钟同步串行通信中的数据格式

30.5.1 Clock

由片内波特率发生器产生的内部时钟或外部同步时钟输入SCKn引脚可根据SCR.CKE[1:0]设置进行选择。

当SCI在内部时钟上运行时，同步时钟从SCKn引脚输出。在一个字符的传输中输出八个同步时钟脉冲。当不执行传输时，时钟保持高电平。但是，当CTS功能禁用时仅执行数据接收时，同步时钟输出会在SCR.RE位设置为1时开始。同步时钟在保持高电平*1和发生溢出错误时停止，或者当SCR.RE位设置为0时。

当仅发生数据接收且CTS功能使能时，当SCR.RE位设置为1且CTSn_RTSn引脚输入为高电平时，时钟输出不会启动。当SCR.RE位设置为1且CTSn_RTSn引脚输入为低电平时，同步时钟输出开始。当CTSn_RTSn引脚输入在帧接收完成时为高电平时，同步时钟输出在其变为高电平时停止。如果CTSn_RTSn引脚输入持续为低电平，则同步时钟在变为高电平*1和发生溢出错误时或当SCR.RE位设置为0时停止。

注1.当SPMR.CKPH为0且SPMR.CKPOL为0或SPMR.CKPH为1且
SPMR.CKPOL is 1.
当SPMR.CKPH为0且SPMR.CKPOL为1或SPMR.CKPH为1且SPMR.CKPOL为0时，它保持低电平。

RA生态工作室

30.5.2 CTS and RTS Functions

In the CTS function, the CTSn_RTSn pin input controls the start of data reception or transmission when the clock source is the internal clock. Setting the SPMR.CTSE bit to 1 enables the CTS function. When the CTS function is enabled, setting the CTSn_RTSn pin low causes data reception or transmission to start.

Setting the CTSn_RTSn pin high while the data transmission or reception is in progress does not affect transmission or reception of the current frame.

In the RTS function, the CTSn_RTSn pin output is used to request the start of data reception or transmission when the clock source is an external synchronizing clock. The CTSn_RTSn output goes low when serial communication becomes possible. Conditions for output of CTSn_RTSn low and high are as follows:

[Conditions for low output]

(a) Non-FIFO selected when all of the following conditions are satisfied

- The value of the RE or TE bit in the SCR is 1
- When serial communication is enabled
- There is no received data available to be read when the SCR.RE bit is 1
- Transmit data is written when the SCR.TE bit is 1 and SCR.CKE[1] bit is 0
- Data is available for transmission in the TSR register when SCR.TE bit is 1 and SCR.CKE[1] bit is 1
- The ORER flag in SSR is 0.

(b) FIFO selected when all of the following conditions are satisfied

- The value of the RE or TE bit in SCR is 1
- When serial communication is enabled
- The amount of receive data written in FRDRHL is less than the specified CTSn_RTSn output triggering number when SCR.RE = 1
- Data that has not been transmitted is available in FTDRHL when the SCR.TE bit is 1 and the SCR.CKE[1] bit is 0
- Data is available for transmission in the TSR register when the SCR.TE bit is 1 and the SCR.CKE[1] bit is 1
- The ORER flag in SSR_FIFO is 0.

[Condition for high output]

(a) Non-FIFO selected

- The conditions for low output are not satisfied.
- When reception is terminated with SCR.RE = 0 without reading the RDR register after reception is complete, RTS remains high. At this time, read the SCR register for dummy values after writing 0 to SCR.RE.

(b) FIFO selected

- The conditions for low output are not satisfied.

30.5.3 SCI Initialization in Clock Synchronous Mode

Before transmitting and receiving data, start by writing the initial value 00h to the SCR register, then continue through the SCI procedure in 30.5.2 CTS and RTS Functions. Any time the operating mode or transfer format is to be changed, the SCR register must be initialized before the change can be made.

Note: Setting the SCR.RE bit to 0 does not initialize the ORER, FER, RDRF, RDF, PER and DR flags in SSR/SSR_FIFO or the RDR and the RDRHL registers. When the TE bit is set to 0, the TEND flag for the selected FIFO buffer is not initialized.

Note: Switching the value of the SCR.TE bit from 1 to 0 or 0 to 1 when the SCR.TIE bit is 1 generates an SCIn_TXI interrupt request.

30.5.2 CTS和RTS函数

在CTS功能中，当时钟源为内部时钟时，CTSn_RTSn引脚输入控制数据接收或发送的开始。将SPMR.CTSE位设置为1可启用CTS功能。当CTS功能使能时，将CTSn_RTSn引脚设置为低电平会导致数据接收或发送开始。

在数据发送或接收过程中将CTSn_RTSn引脚设置为高电平不会影响当前帧的发送或接收。

在RTS功能中，当时钟源为外部同步时钟时，CTSn_RTSn引脚输出用于请求开始数据接收或发送。当串行通信成为可能时，CTSn_RTSn输出变为低电平。CTSn_RTSn低电平和高电平的输出条件如下：

[低输出的条件]

(a) 满足以下所有条件时选择非FIFO

- SCR中RE或TE位的值为1
- 启用串行通信时
- 当SCR.RE位为1时，没有可读取的接收数据
- 当SCR.TE位为1且SCR.CKE[1]位为0时写入发送数据
- 当SCR.TE位为1且SCR.CKE[1]位为1时，TSR寄存器中的数据可用于传输
- SSR中的ORER标志为0。

(b) 满足以下所有条件时选择FIFO

- SCR中RE或TE位的值为1
- 启用串行通信时
- 当SCR.RE=1时，FRDRHL中写入的接收数据量小于指定的CTSn_RTSn输出触发数
- 当SCR.TE位为1且SCR.CKE[1]位为0时，FTDRHL中的数据可用
- 当SCR.TE位为1且SCR.CKE[1]位为1时，TSR寄存器中的数据可用于传输
- SSR_FIFO中的ORER标志为0。

【高输出条件】

(a) Non-FIFO selected

- 不满足低输出的条件。
- 当接收结束后接收结束且SCR.RE=0且未读取RDR寄存器时，RTS保持高电平。此时，将0写入SCR.RE后，读取SCR寄存器的虚拟值。

(b) FIFO selected

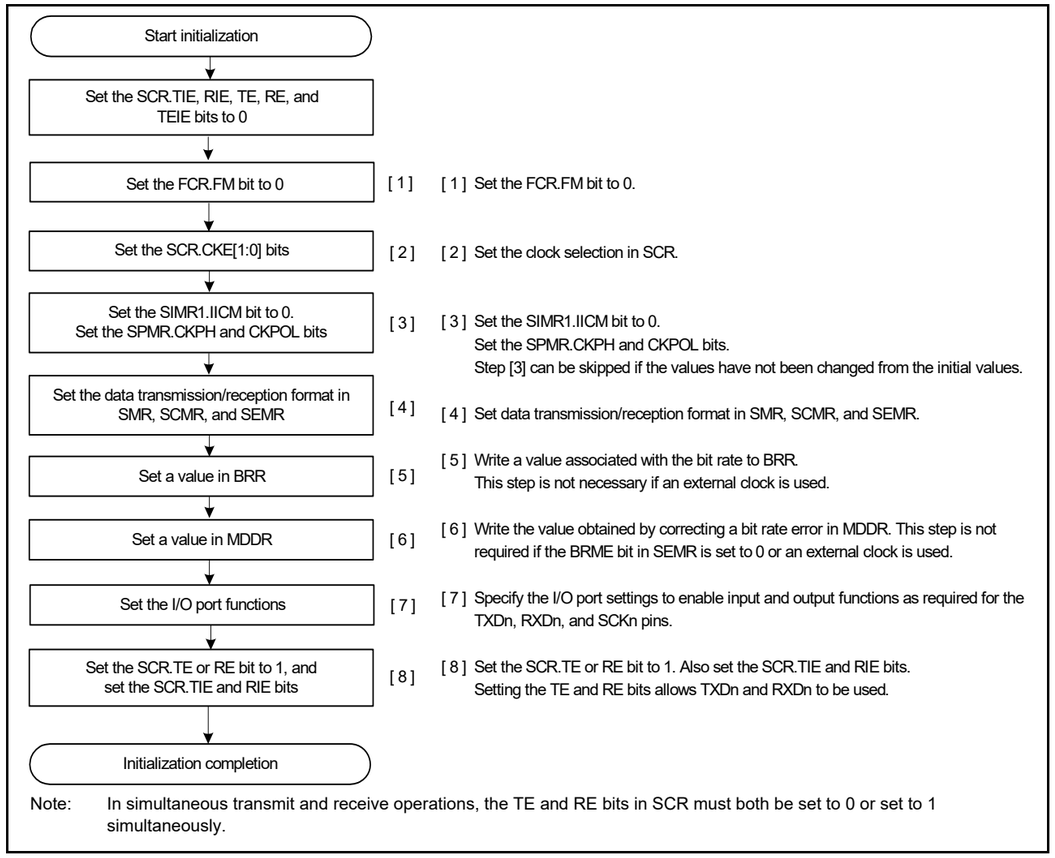
- 不满足低输出的条件。

30.5.3 时钟同步模式下的SCI初始化

在发送和接收数据之前，首先将初始值00h写入SCR寄存器，然后继续执行30.5.2CTS和RTS功能中的SCI程序。任何时候要更改操作模式或传输格式，必须先初始化SCR寄存器，然后才能进行更改。

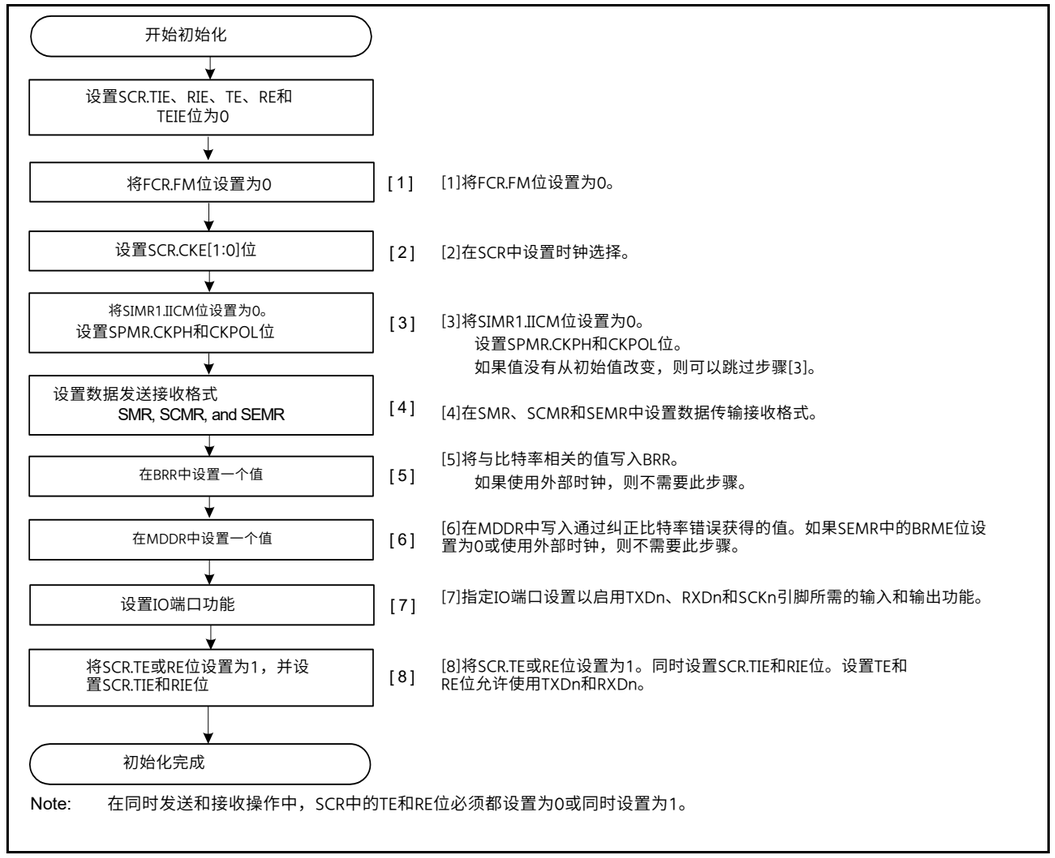
Note: 将SCR.RE位设置为0不会初始化ORER、FER、RDRF、RDF、PER和DR标志SSRSSR_FIFO或RDR和RDRHL寄存器。当TE位设置为0时，选择的TEND标志FIFO缓冲区未初始化。

Note: 当SCR.TIE位为1时，将SCR.TE位的值从1切换到0或0到1会产生SCIn_TXI中断请求。



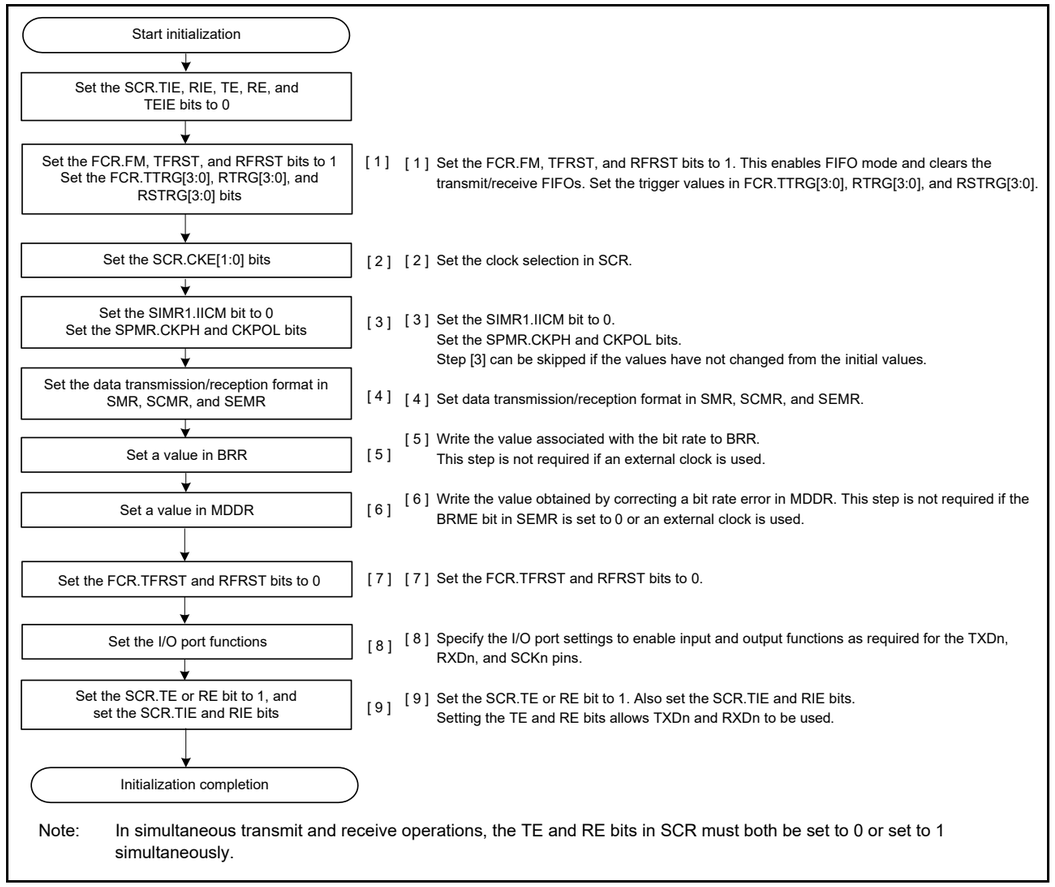
Note: In simultaneous transmit and receive operations, the TE and RE bits in SCR must both be set to 0 or set to 1 simultaneously.

Figure 30.32 Example flow of SCI initialization in clock synchronous mode with non-FIFO selected



Note: 在同时发送和接收操作中，SCR中的TE和RE位必须都设置为0或同时设置为1。

Figure 30.32 在时钟同步模式下选择非FIFO的SCI初始化示例流程



Note: In simultaneous transmit and receive operations, the TE and RE bits in SCR must both be set to 0 or set to 1 simultaneously.

Figure 30.33 Example flow of SCI initialization in clock synchronous mode with FIFO selected

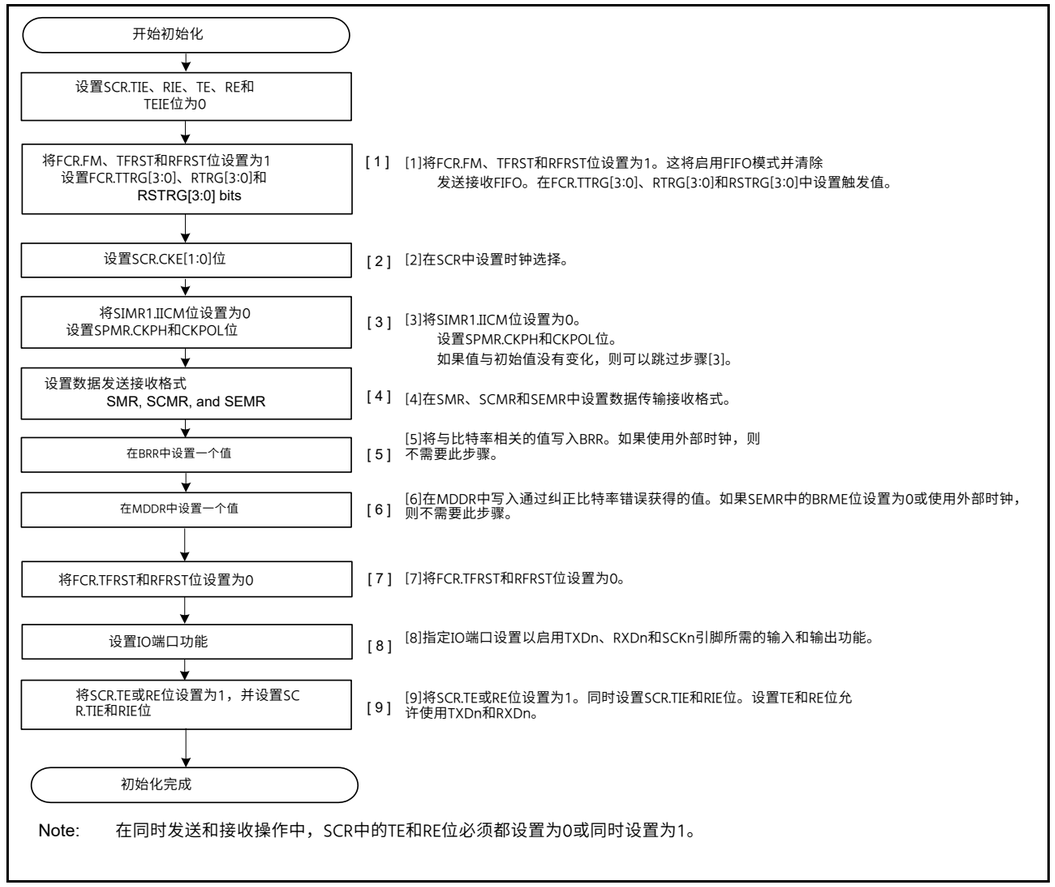
30.5.4 Serial Data Transmission in Clock Synchronous Mode

(1) Non-FIFO selected

Figure 30.34, Figure 30.35, and Figure 30.36 show examples of serial transmission in clock synchronous mode.

In serial data transmission, the SCI operates as follows:

1. The SCI transfers data from the TDR register to the TSR register when data is written to TDR in the SCIn_TXI interrupt handling routine. The SCIn_TXI interrupt request at the beginning of transmission is generated when the TE bit is set to 1, but only after the SCR.TIE bit is also set to 1, or when SCR.TE and SCR.TIE are both set to 1 simultaneously by a single instruction.
2. After transferring data from TDR to TSR, the SCI starts transmission. When the SCR.TIE bit is set to 1, an SCIn_TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to TDR in the SCIn_TXI interrupt handling routine before transmission of the current transmit data is complete. When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to the TDR register from the handling routine for SCIn_TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when the clock output mode is specified, and in synchronization with the input clock, when the use of an external clock is specified. Output of the clock signal is suspended until the input CTS signal is low and while the SPMR.CTSE bit is 1.
4. The SCI checks for updates to the TDR register on the output of the last bit.



Note: 在同时发送和接收操作中，SCR中的TE和RE位必须都设置为0或同时设置为1。

Figure 30.33 选择FIFO的时钟同步模式下的SCI初始化示例流程

30.5.4 时钟同步模式下的串行数据传输

(1) Non-FIFO selected

图30.34、图30.35和图30.36显示了时钟同步模式下的串行传输示例。

在串行数据传输中，SCI操作如下：

1. 当数据在SCIn_TXI中断处理程序中写入TDR时，SCI将数据从TDR寄存器传输到TSR寄存器。发送开始时的SCIn_TXI中断请求在TE位设置为1时产生，但仅在SCR.TIE位也设置为1之后，或者当SCR.TE和SCR.TIE同时设置为1时一条指令。
2. 将数据从TDR传输到TSR后，SCI开始传输。当SCR.TIE位设置为1时，一个SCIn_TXI中断请求产生。通过将下一个传输数据写入启用连续传输在当前发送数据传输完成之前的SCIn_TXI中断处理例程中的TDR。当使用SCIn_TEI中断请求时，在SCIn_TXI请求的处理程序将要发送的最后一个数据写入TDR寄存器后，将SCR.TIE位设置为0，并将SCR.TEIE位设置为1。
3. 当指定时钟输出模式时，从TXDn引脚发送8位数据，与输出时钟同步；当指定使用外部时钟时，与输入时钟同步。时钟信号的输出暂停，直到输入CTS信号为低电平并且SPMR.CTSE位为1。
4. SCI在最后一位的输出上检查TDR寄存器的更新。

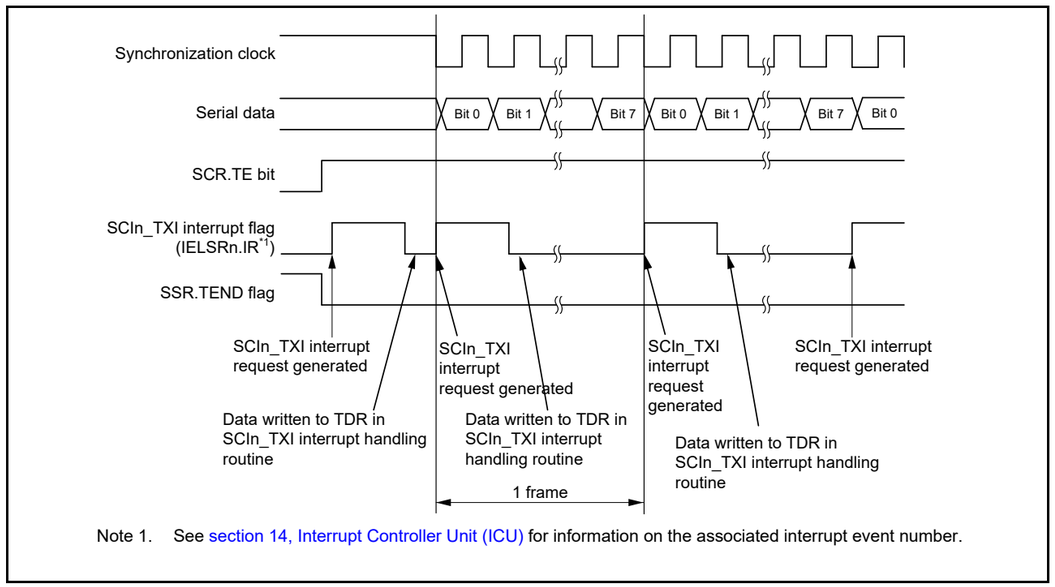
RA生态工作室

5. When the TDR register is updated, the next transmit data is transferred from TDR to TSR, and serial transmission of the next frame starts.
6. If TDR is not updated, the SSR.TEND flag is set to 1. The TXDn pin keeps the output state of the last bit. If the SCR.TEIE bit is 1, an SCIn_TEI interrupt request is generated and the SCKn pin is held high.

Figure 30.34, Figure 30.35, and Figure 30.36 show example flows of serial data transmission.

Transmission does not start while a receive error flag (ORER, FER, or PER in SSR) is set to 1. Be sure to set the receive error flags to 0 before starting transmission.

Note: Setting the SCR.RE bit to 0 does not clear the receive error flags.



Note 1. See section 14, Interrupt Controller Unit (ICU) for information on the associated interrupt event number.

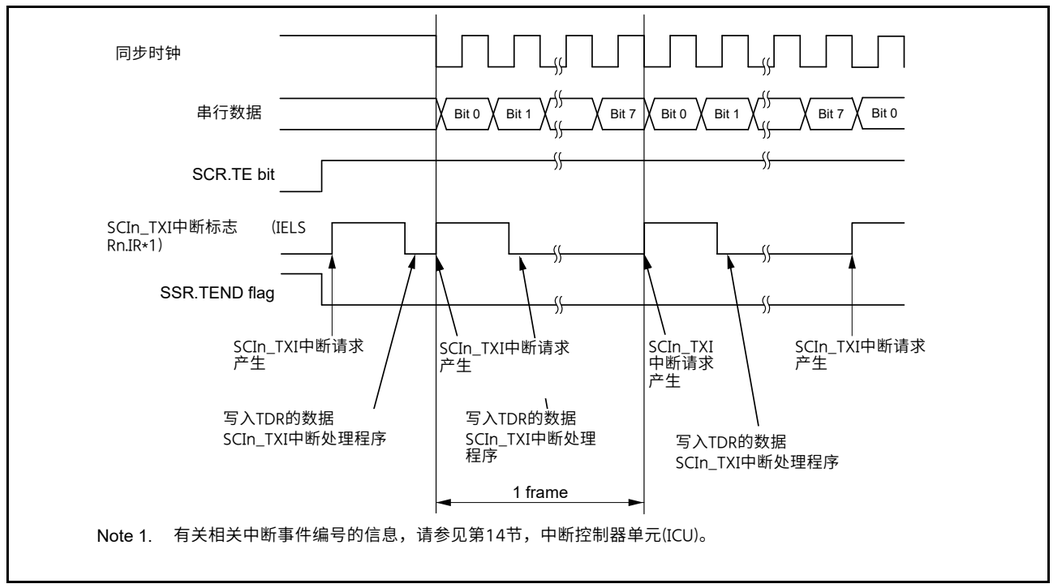
Figure 30.34 Example of serial data transmission in clock synchronous mode when the CTS function is not used at the beginning of transmission

5. 当更新TDR寄存器时，下一个发送数据从TDR传输到TSR，并开始下一帧的串行传输。
6. 如果TDR未更新，则SSR.TEND标志设置为1。TXDn引脚保持最后一位的输出状态。如果SCR.TEIE位为1，产生SCIn_TEI中断请求且SCKn引脚保持高电平。

图30.34、图30.35和图30.36显示了串行数据传输的示例流程。

当接收错误标志（SSR中的ORER、FER或PER）设置为1时，发送不会开始。请务必在开始发送之前将接收错误标志设置为0。

Note: 将SCR.RE位设置为0不会清除接收错误标志。



Note 1. 有关相关中断事件编号的信息，请参见第14节，中断控制器单元(ICU)。

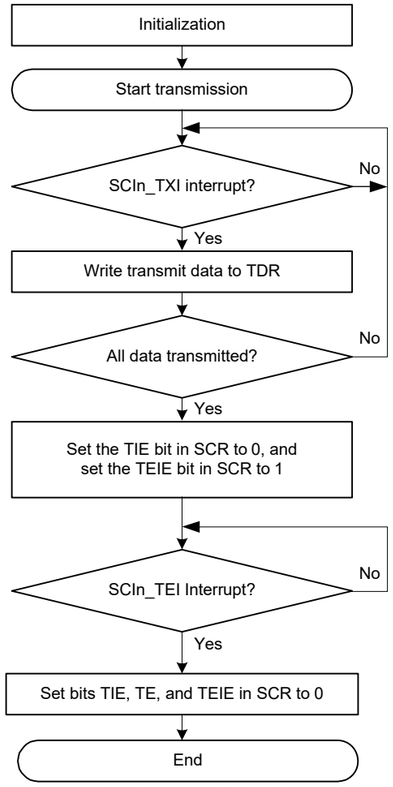
Figure 30.36 从传输中间到传输完成的时钟同步模式下的串行数据传输示例



[1] [1] SCI initialization:
Set data transmission.

[2] [2] Write transmit data to TDR by an SCIn_TXI interrupt request:
When data transmission is transferred from TDR to TSR, a transmit data empty interrupt (SCIn_TXI) request is generated.
Transmit data is written to TDR once from the handling routine for SCIn_TXI requests.

[3] Serial transmission continuation procedure:
To continue serial transmission, write transmit data to TDR on accepting a transmit data empty interrupt (SCIn_TXI) request.
Transmit data can also be written to TDR by activating the DMAC or DTC by the SCIn_TXI interrupt request.

[3] When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to TDR.

Note: When the external clock is in use (the value of the SCR.CKE[1:0] bits is 10b or 11b), the rising edge on the SCK pin for the last bit sets the SSR.TEND flag to 1. Setting the SCR.TE bit to 0 immediately after this might lead to insufficient received data hold time on the receiver side.

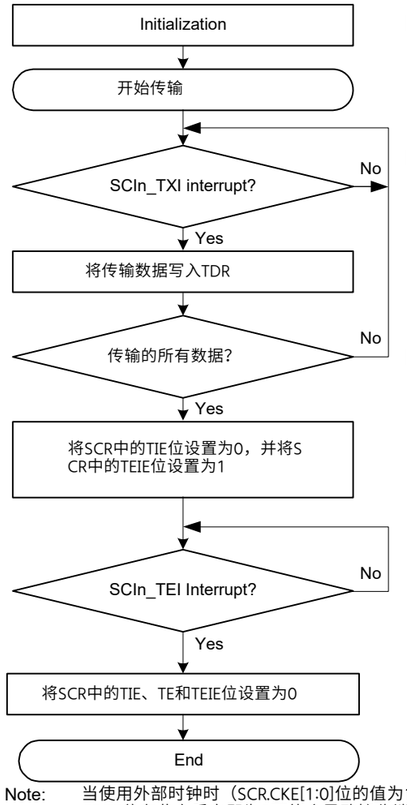
Figure 30.37 Example flow of serial transmission in clock synchronous mode with non-FIFO selected

(2) FIFO selected

Figure 30.38 shows an example of serial transmission in clock synchronous mode with FIFO selected.

In serial data transmission, the SCI operates as follows:

1. The SCI transfers data from the FTDRL*1 register to the TSR register when data is written to FTDRL*1 in the SCIn_TXI interrupt handling routine. The amount of data that can be written to FTDRL is 16 minus FDR.T[4:0] bytes. The SCIn_TXI interrupt request at the beginning of transmission is generated when the SCR.TE bit is set to 1, but only after the SCR.TIE bit is also set to 1, or when SCR.TE and SCR.TIE are both set to 1 simultaneously by a single instruction.
2. After transferring data from FTDRL to TSR, the SCI starts transmission. When the amount of transmit data written in FTDRL is equal to or less than the specified transmit triggering number, the SSR_FIFO.TDFE is set to 1. When the SCR.TIE bit is set to 1, an SCIn_TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to FTDRL in the SCIn_TXI interrupt handling routine before transmission of the current transmit data is complete. When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to the FTDRL from the handling routine for SCIn_TXI requests.
3. 8-bit data is sent from the TXDn pin in synchronization with the output clock when the clock output mode is specified and in synchronization with the input clock when the use of an external clock is specified. Output of the clock signal is suspended until the input CTS signal is low and while the SPMR.CTSE bit is 1.



[1] [1]SCI初始化：设置数据传输。

[2]通过SCIn_TXI中断请求将发送数据写入TDR：当数据从TDR传输到TSR时，会产生发送数据空中断（SCIn_TXI）请求。传输数据从处理例程写入TDR一次

[2]

SCIn_TXI requests.

[3]串行传输继续程序：要继续串行传输，在接受传输数据空中断（SCIn_TXI）请求时将传输数据写入TDR。发送数据也可以通过SCIn_TXI中断请求激活DMAC或DTC写入TDR。

[3] 使用SCIn_TEI中断请求时，将要发送的最后一个数据写入TDR后，将SCR.TIE位设置为0，并将SCR.TEIE位设置为1。

Note: 当使用外部时钟时（SCR.CKE[1:0]位的值为10b或11b），SCK引脚上最后一位的上升沿将SSR.TEND标志设置为1。设置SCR.TE位在此之后立即为0可能会导致接收端接收数据保持时间不足。

Figure 30.37 选择非FIFO的时钟同步模式下的串行传输示例流程

(2) FIFO selected

图30.38显示了选择FIFO的时钟同步模式下的串行传输示例。

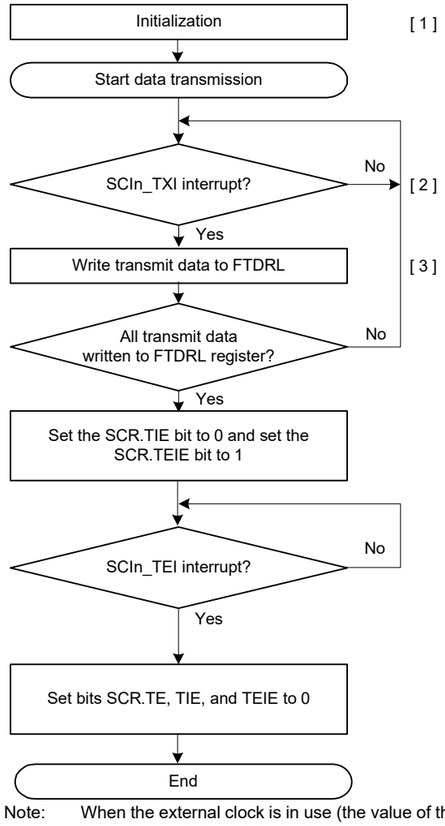
在串行数据传输中，SCI操作如下：

1. 当数据写入FTDRL*1时，SCI将数据从FTDRL*1寄存器传输到TSR寄存器
   SCIn_TXI中断处理程序。可写入FTDRL的数据量为16减去FDR.T[4:0]字节。发送开始时的SCIn_TXI中断请求在SCR.TE位设置为1时产生，但仅在SCR.TIE位也设置为1之后，或者当SCR.TE和SCR.TIE均设置为1时同时通过一条指令。
2. 将数据从FTDRL传输到TSR后，SCI开始传输。当写入FTDRL的发送数据量等于或小于指定的发送触发数时，SSR_FIFO.TDFE设置为1。当SCR.TIE位设置为1时，产生SCIn_TXI中断请求。在当前发送数据的发送完成之前，通过在SCIn_TXI中断处理例程中将下一个发送数据写入FTDRL来启用连续发送。当使用SCIn_TEI中断请求时，在将要传输的最后一个数据从处理例程写入FTDRL后，将SCR.TIE位设置为0，并将SCR.TEIE位设置为1。

   SCIn_TXI requests.
3. 指定时钟输出模式时，与输出时钟同步，指定使用外部时钟时，与输入时钟同步，从TXDn引脚发送8位数据。时钟信号的输出暂停，直到输入CTS信号为低电平并且SPMR.CTSE位为1。

4. The SCI checks whether non-transmitted data remains in FTDRL on the output of the stop bit.
5. When FTDRL is updated, the next transmit data is transferred from FTDRL to TSR and serial transmission of the next frame starts.
6. If FTDRL is not updated, the SSR_FIFO.TEND flag is set to 1. The TXDn pin keeps the output state of the last bit. If the SCR.TEIE bit is 1, an SCIn_TEI interrupt request is generated and the SCKn pin is held high.

Note 1. In clock synchronous mode, FTDRH is not used.



[1] SCI initialization:
Set data transmission.
After the SCR.TE bit is set to 1, 1 is output for a frame, and transmission is enabled.

[2] Transmit data write to FTDRL by an SCIn_TXI interrupt request:
When data transmission is transferred from FTDRL to TSR, and when the amount of transmit data written in FTDRL is equal to or less than the specified transmit triggering number, a transmit data FIFO empty interrupt (SCIn_TXI) request is generated. Write transmit data to FTDRL once in the SCIn_TXI interrupt handling routine.

[3] Serial transmission continuation procedure:
To continue serial transmission, write the next transmit data to FTDRL in the SCIn_TXI interrupt handling routine and clear the SSR_FIFO.TDFE flag to 0 before transmission of the current transmit data is complete.
Transmit data can also be written to FTDRL by activating the DMAC or DTC. The TDFE flag is cleared automatically in this case. Do not write to the TDFE flag.
When SCIn_TEI interrupt requests are in use, set the SCR.TIE bit to 0 and the SCR.TEIE bit to 1 after the last of the data to be transmitted is written to the FTDRL.

Note: When the external clock is in use (the value of the SCR.CKE[1:0] bits is 10b or 11b), the rising edge on the SCK pin for the last bit sets the SSR_FIFO.TEND flag to 1. Setting the SCR.TE bit to 0 immediately after this might lead to insufficient hold time for received data on the receiver side.

Figure 30.38 Example flow of serial transmission in clock synchronous mode with FIFO selected

30.5.5 Serial Data Reception in Clock Synchronous Mode

(1) Non-FIFO selected

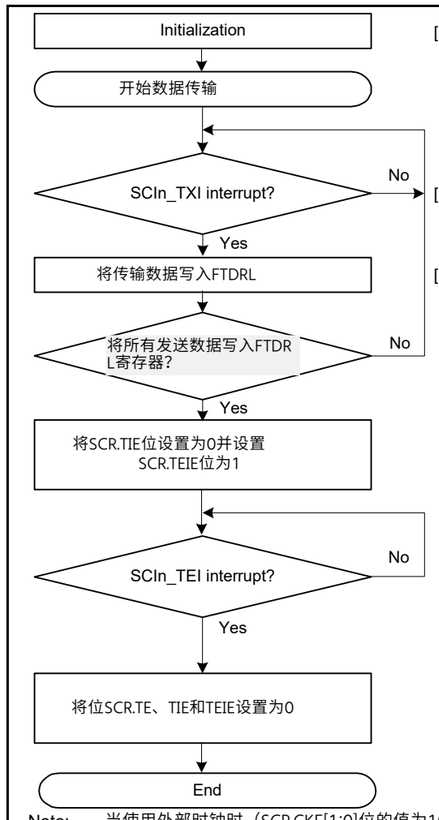
Figure 30.39 and Figure 30.40 show examples of SCI operation for serial reception in clock synchronous mode.

In serial data reception, the SCI operates as follows:

1. When the value of the SCR.RE bit becomes 1, the CTSn_RTSn pin goes low.
2. The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in the RSR register.
3. If an overrun error occurs, the SSR.ORER flag is set to 1. If the SCR.RIE bit is 1, an SCIn_ERI interrupt request is

4. SCI在停止位的输出上检查未传输的数据是否保留在FTDRL中。
5. 当FTDRL被更新时，下一个传输数据从FTDRL传输到TSR并开始下一帧的串行传输。
6. 如果FTDRL未更新，则SSR_FIFO.TEND标志设置为1。TXDn引脚保持最后一位的输出状态。
   如果SCR.TEIE位为1，则产生SCIn_TEI中断请求并且SCKn引脚保持高电平。

注1.在时钟同步模式下，不使用FTDRH。



[1]SCI初始化：设置数据传输。

SCR.TE位设置为1后，每帧输出1，并启用传输。

[2]通过SCIn_TXI中断请求向FTDRL写入数据传输：当数据传输从FTDRL传输到TSR时，并且当写入FTDRL的传输数据量等于或小于指定的传输触发数时，传输数据FIFO产生空中断（SCIn_TXI）请求。在SCIn_TXI中断处理例程中将发送数据写入FTDRL一次。

[3]串行传输继续程序：要继续串行传输，在SCIn_TXI中断处理程序中将下一个传输数据写入FTDRL，并在当前传输数据传输完成之前将SSR_FIFO.TDFE标志清零。也可以通过激活DMAC或DTC将传输数据写入FTDRL。在这种情况下，TDFE标志会自动清除。不要写入TDFE标志。使用SCIn_TEI中断请求时，将要发送的最后一个数据写入FTDRL后，将SCR.TIE位设置为0，并将SCR.TEIE位设置为1。

Note: 当使用外部时钟时（SCR.CKE[1:0]位的值为10b或11b），SCK引脚上最后一位的上升沿将SSR_FIFO.TEND标志设置为1。设置SCR.TE位在此之后立即为0可能会导致接收端接收数据的保持时间不足。

Figure 30.38 选择FIFO的时钟同步模式下的串行传输示例流程

30.5.5 时钟同步模式下的串行数据接收

(1) Non-FIFO selected

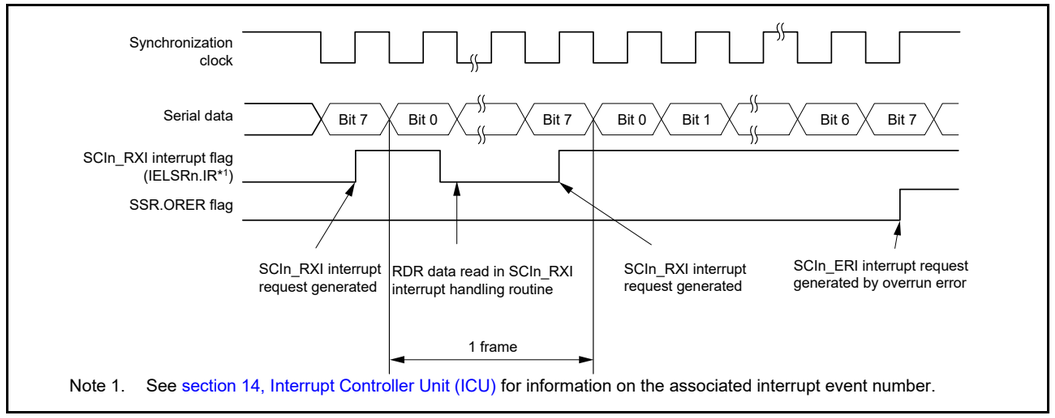
图30.39和图30.40显示了时钟同步模式下串行接收的SCI操作示例。

在串行数据接收中，SCI操作如下：

1. 当SCR.RE位的值变为1时，CTSn_RTSn引脚变为低电平。
2. SCI执行内部初始化并与同步时钟输入或输出同步开始接收数据，并将接收数据存储在RSR寄存器中。
3. 如果发生溢出错误，则SSR.ORER标志设置为1。如果SCR.RIE位为1，则SCIn_ERI中断请求

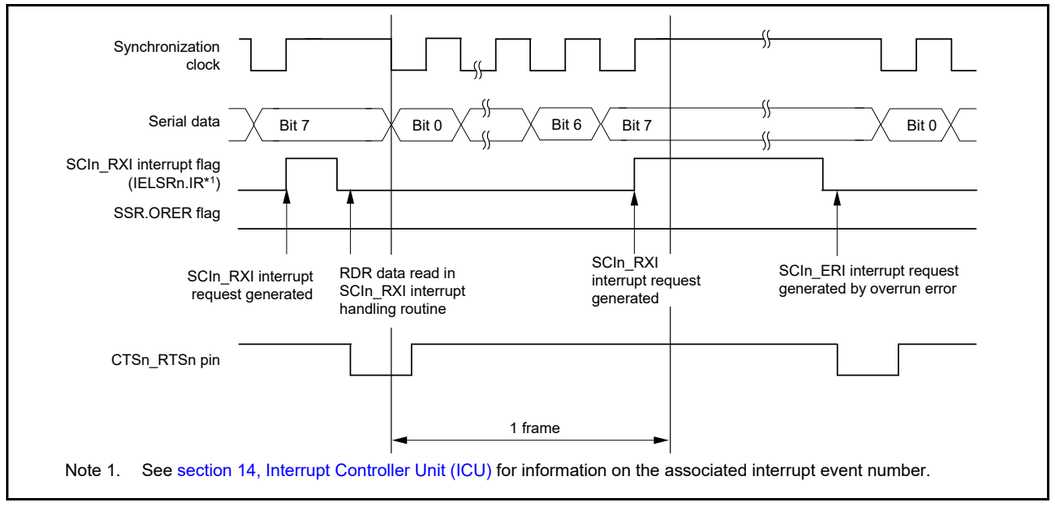
generated. Receive data is not transferred to the RDR register.

4. When reception completes successfully, receive data is transferred to the RDR register. If the SCR.RIE bit is 1, an SCIn_RXI interrupt request is generated. Continuous reception is enabled by reading the received data transferred to the RDR register in the SCIn_RXI interrupt handling routine before the reception of the next receive data completes. Reading the received data from RDR causes the CTSn_RTSn pin to output low.



Note 1. See section 14, Interrupt Controller Unit (ICU) for information on the associated interrupt event number.

Figure 30.39 Example operation of serial reception in clock synchronous mode (1) when the RTS function is not used



Note 1. See section 14, Interrupt Controller Unit (ICU) for information on the associated interrupt event number.

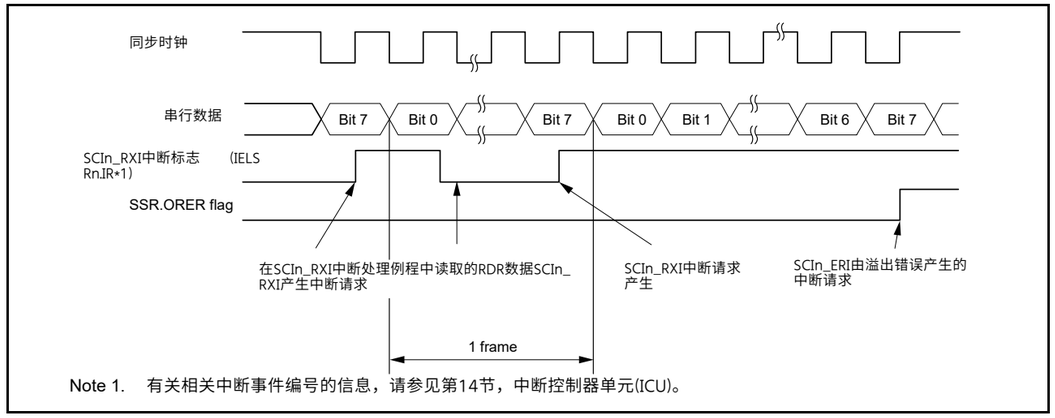
Figure 30.40 Example operation of serial reception in clock synchronous mode (2) when RTS function is used

Data transfer cannot resume while the receive error flag is 1. Therefore, clear the ORER, FER, and PER flags in the SSR register to 0 before resuming data reception. Additionally, be sure to read the RDR register during overrun error processing. When a data reception is forcibly terminated by setting the SCR.RE bit to 0 during operation, read the RDR register because received data that is not yet read might be left in the RDR register.

Figure 30.41 shows an example flow of serial data reception.

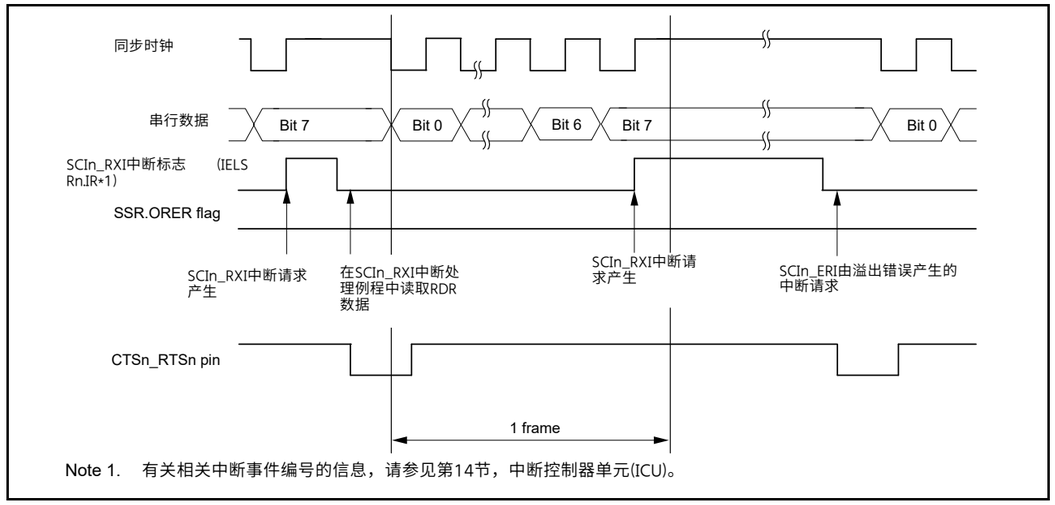
生成。接收数据不传送到RDR寄存器。

4. 当接收成功完成时，接收数据被传送到RDR寄存器。如果SCR.RIE位为1，则产生SCIn_RXI中断请求。在下一个接收数据的接收完成之前，通过在SCIn_RXI中断处理程序中读取传输到RDR寄存器的接收数据来启用连续接收。从RDR读取接收到的数据会导致CTSn_RTSn引脚输出低电平。



Note 1. 有关相关中断事件编号的信息，请参见第14节，中断控制器单元(ICU)。

Figure 30.39 不使用RTS功能时时钟同步模式下串行接收的示例操作(1)

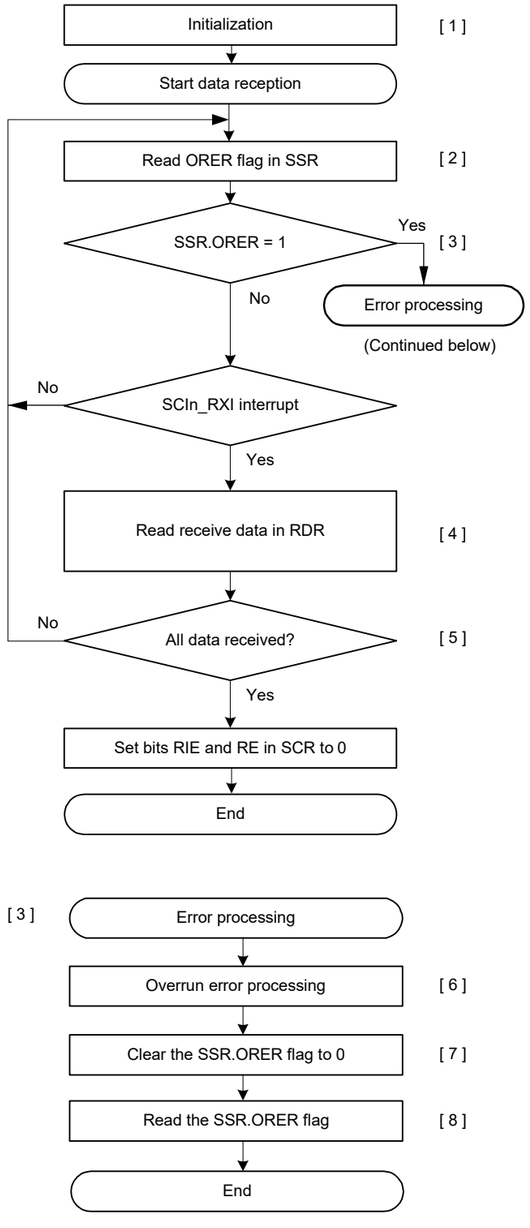


Note 1. 有关相关中断事件编号的信息，请参见第14节，中断控制器单元(ICU)。

Figure 30.40 使用RTS功能时时钟同步模式下串行接收的示例操作(2)

接收错误标志为1时无法恢复数据传输。因此，在恢复数据接收之前，将SSR寄存器中的ORER、FER和PER标志清除为0。此外，请务必在溢出错误处理期间读取RDR寄存器。如果在操作期间通过将SCR.RE位设置为0来强制终止数据接收，请读取RDR寄存器，因为尚未读取的接收数据可能会留在RDR寄存器中。

图30.41显示了串行数据接收的示例流程。



[1] SCI initialization:
Set the input port for pins to be used as RXDn pins.

[2] [3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, then set the ORER flag to 0. Data reception cannot resume while the ORER flag is 1.

[4] Read the receive data in RDR once in the receive data full interrupt (SCIn_RXI) request handling routine.

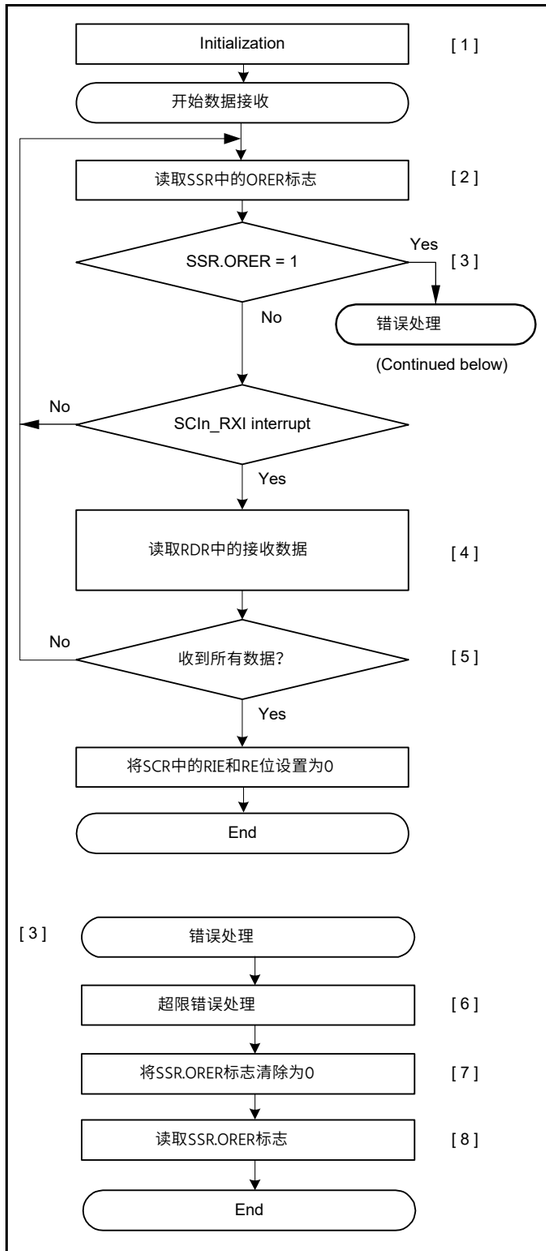
[5] Serial reception continuation procedure:
To continue serial reception, before the MSB bit [7] of the current frame is received, finish reading the receive data in RDR. The RDR data can also be read by activating the DMAC or DTC by an SCIn_RXI interrupt request.

[6] Processing in response to an overrun error:
Read the RDR. In combination with step [7], this enables correct reception of the next frame possible.

[7] Clearing the error flag:
Write 0 to the error flag.

[8] Confirming that the error flag is cleared:
Read the error flag to confirm that its value is 0.

Figure 30.41 Example flow of serial reception in clock synchronous mode with non-FIFO selected



[1] SCI initialization:
将引脚的输入端口设置为RXDn引脚。

[2] [3]接收错误处理：如果发生接收错误，读取SSR中的ORER标志，进行相关的错误处理，然后将ORER标志置0。当ORER标志为1时，数据接收不能恢复。

[4] 在接收数据完全中断(SCIn_RXI)请求处理程序中读取一次RDR中的接收数据。

[5] 串行接收继续过程：
要继续串行接收，在接收到当前帧的MSB位[7]之前，完成读取RDR中的接收数据。RDR数据也可以通过SCIn_RXI中断请求激活DMAC或DTC来读取。

[6] 响应溢出错误的处理：读取RDR。结合步骤[7]，这使得下一帧的正确接收成为可能。

[7] 清除错误标志：将0写入错误标志。

[8] 确认错误标志已清除：
读取错误标志以确认其值为0。

Figure 30.41 选择非FIFO的时钟同步模式下的串行接收示例流程

RA生态工作室

(2) FIFO selected

Figure 30.42 shows an example of serial reception in clock synchronous mode with FIFO selected.

In serial data reception, the SCI operates as follows:

1. When the value of the SCR.RE bit becomes 1, the CTSn_RTSn pin goes low.
2. The SCI performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores the receive data in RSR.
3. If an overrun error occurs, the ORER flag in SSR_FIFO is set to 1. If the SCR.RIE bit is 1, an SCIn_ERI interrupt request is generated. Receive data is not transferred to the FRDRL*1 register.
4. When data reception completes successfully, the receive data is transferred to the FRDRL*1 register. The RDF bit is set to 1 when the amount of the receive data stored in FRDRL is equal to or greater than the specified receive triggering number. If the SCR.RIE bit is 1, an SCIn_RXI interrupt request is generated. Continuous data reception is enabled by reading the receive data transferred to FRDRL*2 in the SCIn_RXI interrupt handling routine before an overrun error occurs. If the amount of received data that is transferred to FRDRL is less than the RTS trigger number, the CTSn_RTSn pin goes low.

Note 1. In clock synchronous mode, FRDRH is not used.
Note 2. Read data in the order from FRDRH to FRDRL when RDF and ORER are read with receive data.

(2) FIFO selected

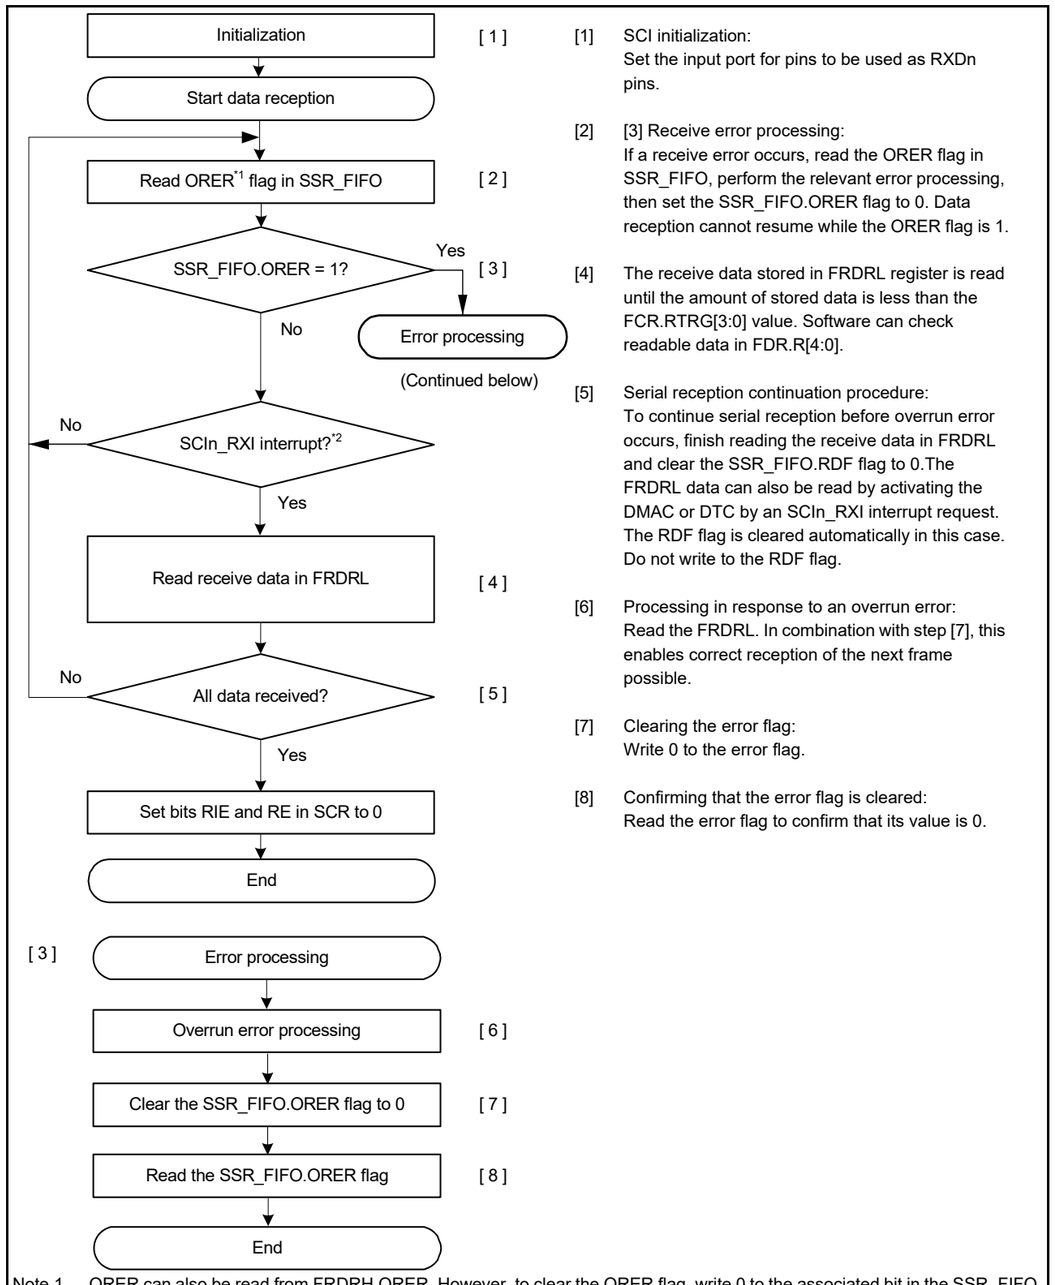
图30.42显示了选择FIFO的时钟同步模式下的串行接收示例。

在串行数据接收中，SCI操作如下：

1. 当SCR.RE位的值变为1时，CTSn_RTSn引脚变为低电平。
2. SCI执行内部初始化并与同步时钟输入或输出同步开始接收数据，并将接收数据存储在RSR中。
3. 如果发生溢出错误，则SSR_FIFO中的ORER标志设置为1。如果SCR.RIE位为1，则产生SCIn_ERI中断请求。接收数据不传送到FRDRL*1寄存器。
4. 当数据接收成功完成时，接收数据被传送到FRDRL*1寄存器。当存储在FRDRL中的接收数据量等于或大于指定的接收触发数时，RDF位设置为1。如果SCR.RIE位为1，则产生SCIn_RXI中断请求。在发生溢出错误之前，通过在SCIn_RXI中断处理例程中读取传输到FRDRL*2的接收数据来启用连续数据接收。如果传输到FRDRL的接收数据量小于RTS触发数，则CTSn_RTSn引脚变为低电平。

注1.在时钟同步模式下，不使用FRDRH。
注2.RDF和ORER与接收数据一起读取时，按照从FRDRH到FRDRL的顺序读取数据。

RA生态工作室



[1] SCI initialization:
Set the input port for pins to be used as RXDn pins.

[2] [3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR_FIFO, perform the relevant error processing, then set the SSR_FIFO.ORER flag to 0. Data reception cannot resume while the ORER flag is 1.

[4] The receive data stored in FRDRL register is read until the amount of stored data is less than the FCR.RTRG[3:0] value. Software can check readable data in FDR.R[4:0].

[5] Serial reception continuation procedure:
To continue serial reception before overrun error occurs, finish reading the receive data in FRDRL and clear the SSR_FIFO.RDF flag to 0.The FRDRL data can also be read by activating the DMAC or DTC by an SCIn_RXI interrupt request. The RDF flag is cleared automatically in this case. Do not write to the RDF flag.

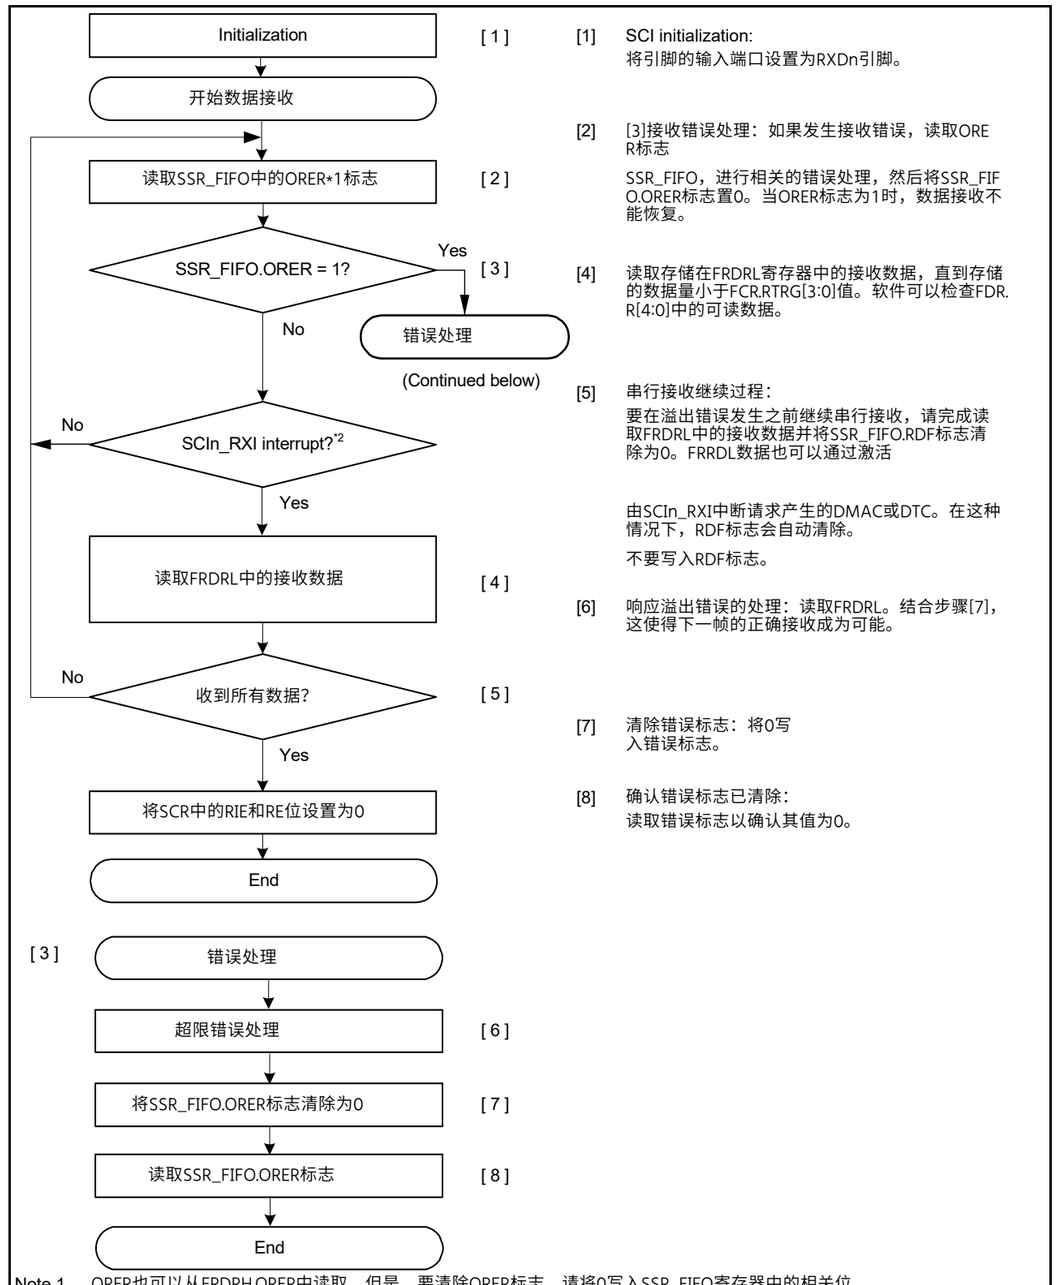
[6] Processing in response to an overrun error:
Read the FRDRL. In combination with step [7], this enables correct reception of the next frame possible.

[7] Clearing the error flag:
Write 0 to the error flag.

[8] Confirming that the error flag is cleared:
Read the error flag to confirm that its value is 0.

Note 1. ORER can also be read from FRDRH.ORER. However, to clear the ORER flag, write 0 to the associated bit in the SSR_FIFO register.
Note 2. All receive data is an integer multiple of the FIFO triggering number.

Figure 30.42 Example flow of serial reception in clock synchronous mode with FIFO selected



[1] SCI initialization:
将引脚的输入端口设置为RXDn引脚。

[2] [3]接收错误处理：如果发生接收错误，读取ORER标志
SSR_FIFO，进行相关的错误处理，然后将SSR_FIFO.ORER标志置0。当ORER标志为1时，数据接收不能恢复。

[4] 读取存储在FRDRL寄存器中的接收数据，直到存储的数据量小于FCR.RTRG[3:0]值。软件可以检查FDR.R[4:0]中的可读数据。

[5] 串行接收继续过程：
要在溢出错误发生之前继续串行接收，请完成读取FRDRL中的接收数据并将SSR_FIFO.RDF标志清除为0。FRRDL数据也可以通过激活
由SCIn_RXI中断请求产生的DMAC或DTC。在这种情况下，RDF标志会自动清除。
不要写入RDF标志。

[6] 响应溢出错误的处理：读取FRDRL。结合步骤[7]，这使得下一帧的正确接收成为可能。

[7] 清除错误标志：将0写入错误标志。

[8] 确认错误标志已清除：
读取错误标志以确认其值为0。

Note 1. ORER也可以从FRDRH.ORER中读取。但是，要清除ORER标志，请将0写入SSR_FIFO寄存器中的相关位。
Note 2. 所有接收数据都是FIFO触发数的整数倍。

30.5.6 Simultaneous Serial Data Transmission and Reception in Clock Synchronous Mode

(1) Non-FIFO selected

Figure 30.43 shows an example flow of simultaneous serial transmission and reception operations in clock synchronous mode. After initializing the SCI, use the following procedure for simultaneous serial data transmission and reception operations.

To switch from transmit mode to simultaneous transmit and receive mode:

1. Check that the SCI completes the data transmission by verifying that the SSR.TEND flag is set to 1.
2. Initialize the SCR register and then set the TIE, RIE, TE, and RE bits in the SCR register to 1 simultaneously with a single instruction.

To switch from receive mode to simultaneous transmit and receive mode:

1. Check that the SCI completes the data reception.
2. Set the RIE and RE bits in the SCR register to 0, then check that the receive error flag ORER in the SSR register is 0.
3. Set the TIE, RIE, TE, and RE bits in the SCR register to 1 simultaneously with a single instruction.

30.5.6 时钟同步的同时串行数据发送和接收 Mode

(1) Non-FIFO selected

图30.43显示了时钟同步模式下同时串行发送和接收操作的示例流程。初始化SCI后，使用以下程序同时进行串行数据发送和接收操作。

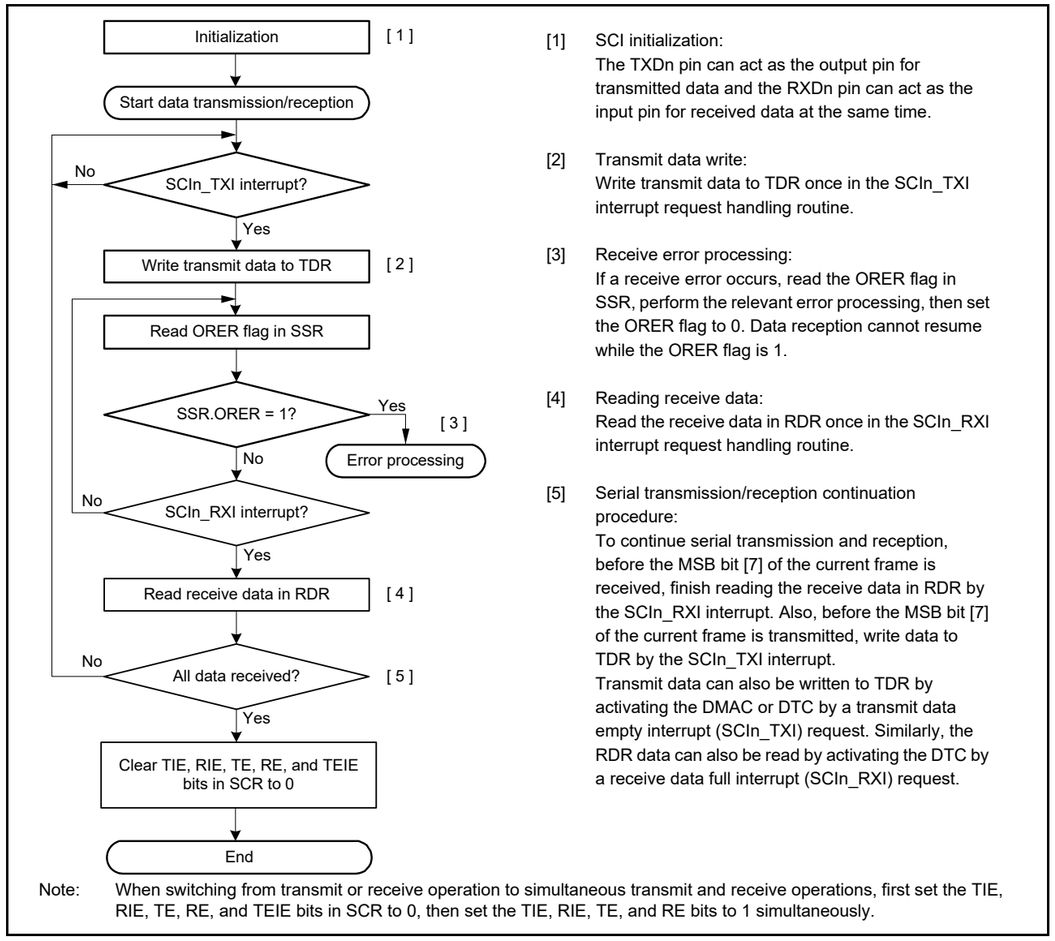
从发送模式切换到同时发送和接收模式：

1. 通过验证SSR.TEND标志是否设置为1来检查SCI是否完成了数据传输。
2. 初始化SCR寄存器，然后用一条指令同时将SCR寄存器中的TIE、RIE、TE和RE位设置为1。

从接收模式切换到同时发送和接收模式：

1. 检查SCI是否完成数据接收。
2. 将SCR寄存器中的RIE和RE位设置为0，然后检查SSR寄存器中的接收错误标志ORER是否为0。
3. 通过一条指令同时将SCR寄存器中的TIE、RIE、TE和RE位设置为1。

RA生态工作室



[1] SCI initialization:
The TXDn pin can act as the output pin for transmitted data and the RXDn pin can act as the input pin for received data at the same time.

[2] Transmit data write:
Write transmit data to TDR once in the SCIn_TXI interrupt request handling routine.

[3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR, perform the relevant error processing, then set the ORER flag to 0. Data reception cannot resume while the ORER flag is 1.

[4] Reading receive data:
Read the receive data in RDR once in the SCIn_RXI interrupt request handling routine.

[5] Serial transmission/reception continuation procedure:
To continue serial transmission and reception, before the MSB bit [7] of the current frame is received, finish reading the receive data in RDR by the SCIn_RXI interrupt. Also, before the MSB bit [7] of the current frame is transmitted, write data to TDR by the SCIn_TXI interrupt.
Transmit data can also be written to TDR by activating the DMAC or DTC by a transmit data empty interrupt (SCIn_TXI) request. Similarly, the RDR data can also be read by activating the DTC by a receive data full interrupt (SCIn_RXI) request.

Note: When switching from transmit or receive operation to simultaneous transmit and receive operations, first set the TIE, RIE, TE, RE, and TEIE bits in SCR to 0, then set the TIE, RIE, TE, and RE bits to 1 simultaneously.

Figure 30.43 Example flow of simultaneous serial transmission and reception in clock synchronous mode with non-FIFO selected

(2) FIFO selected

Figure 30.44 shows an example flow of simultaneous serial transmit and receive operations in clock synchronous mode with FIFO selected.

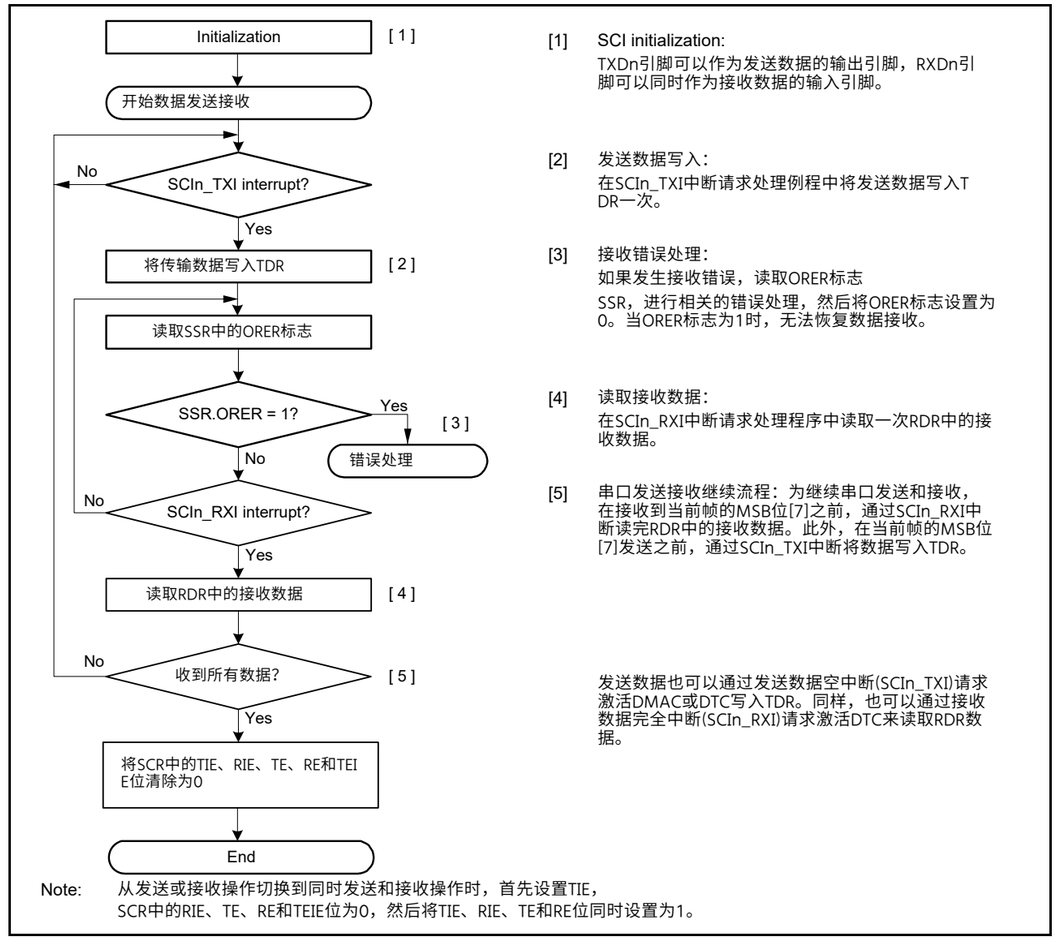
After initializing the SCI, use the following procedure for simultaneous serial data transmit and receive operations.

To switch from transmit mode to simultaneous transmit and receive mode:

1. Check that the SCI completes the transmission by verifying that the TEND flag in SSR_FIFO is set to 1.
2. Initialize the SCR register, then set the TIE, RIE, TE, and RE bits in the SCR register to 1 simultaneously with a single instruction.

To switch from receive mode to simultaneous transmit and receive mode:

1. Check that the SCI completes the reception.
2. Set the RIE and RE bits to 0, then check that the receive error flag ORER in SSR_FIFO is 0.
3. Set the TIE, RIE, TE, and RE bits in SCR register to 1 simultaneously with a single instruction.



[1] SCI initialization:
TXDn引脚可以作为发送数据的输出引脚，RXDn引脚可以同时作为接收数据的输入引脚。

[2] 发送数据写入：
在SCIn_TXI中断请求处理例程中将发送数据写入TDR一次。

[3] 接收错误处理：
如果发生接收错误，读取ORER标志
SSR，进行相关的错误处理，然后将ORER标志设置为0。当ORER标志为1时，无法恢复数据接收。

[4] 读取接收数据：
在SCIn_RXI中断请求处理程序中读取一次RDR中的接收数据。

[5] 串口发送接收继续流程：为继续串口发送和接收，在接收到当前帧的MSB位[7]之前，通过SCIn_RXI中断读完RDR中的接收数据。此外，在当前帧的MSB位[7]发送之前，通过SCIn_TXI中断将数据写入TDR。

发送数据也可以通过发送数据空中断(SCIn_TXI)请求激活DMAC或DTC写入TDR。同样，也可以通过接收数据完全中断(SCIn_RXI)请求激活DTC来读取RDR数据。

Note: 从发送或接收操作切换到同时发送和接收操作时，首先设置TIE，SCR中的RIE、TE、RE和TEIE位为0，然后将TIE、RIE、TE和RE位同时设置为1。

Figure 30.43 选择非FIFO的时钟同步模式下同时串行发送和接收的示例流程

(2) FIFO selected

图30.44显示了在时钟同步模式下同时串行发送和接收操作的示例流程，并选择了FIFO。

初始化SCI后，使用以下程序同时进行串行数据发送和接收操作。

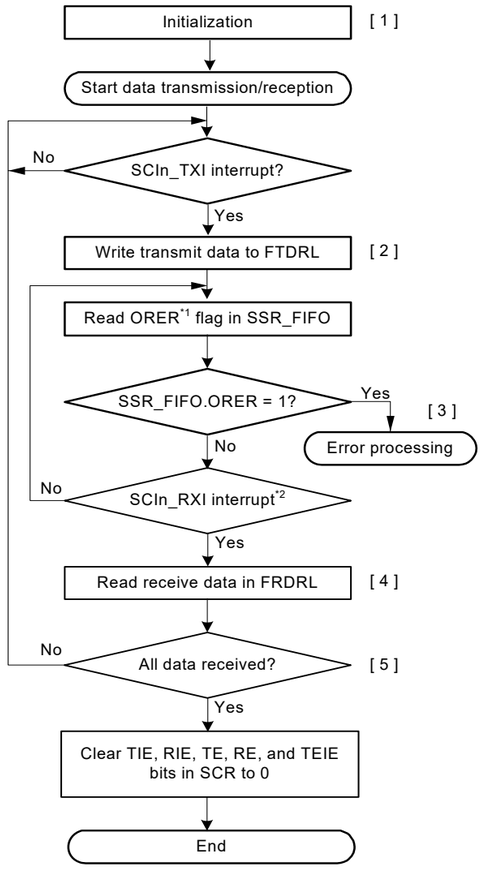
从发送模式切换到同时发送和接收模式：

1. 通过验证SSR_FIFO中的TEND标志是否设置为1来检查SCI是否完成了传输。
2. 初始化SCR寄存器，然后用一条指令同时将SCR寄存器中的TIE、RIE、TE和RE位设置为1。

从接收模式切换到同时发送和接收模式：

1. 检查SCI是否完成接收。
2. 将RIE和RE位设置为0，然后检查SSR_FIFO中的接收错误标志ORER是否为0。
3. 用一条指令同时将SCR寄存器中的TIE、RIE、TE和RE位设置为1。

RA生态工作室



[1] SCI initialization:
The TXDn pin can act as the output pin for transmitted data and the RXDn pin can act as the input pin for received data at the same time.

[2] Transmit data write:
Write transmit data to FTDRL in the SCIn_TXI interrupt request handling routine. The amount of transmit data that can be written is 16 bits, which is the number of stored transmit data in the FIFO.

[3] Receive error processing:
If a receive error occurs, read the ORER flag in SSR_FIFO, perform the relevant error processing, and then set the ORER flag to 0. Data reception cannot resume while the ORER flag is 1.

[4] Reading receive data:
The receive data stored in FRDRL register is read until the number of stored data is less than the FCR.RTRG value. Software can check readable data in FDR.R[4:0].

[5] Serial transmission/reception continuation procedure:
To continue serial reception, before overrun error occurs, finish reading the receive data in FRDRL and clear the SSR_FIFO.RDF flag to 0. To continue serial transmission, before transmission of the current transmit data is finished, write the next transmit data to FTDRL in the SCIn_TXI interrupt handling routine and clear the SSR_FIFO.TDFE flag to 0.
Transmit data can also be written to FTDRL by activating the DMAC or DTC by a transmit FIFO data empty interrupt (SCIn_TXI) request. Similarly, the FRDRL data can also be read by activating the DMAC or DTC by a receive FIFO data full interrupt (SCIn_RXI) request. The RDF and TDFE flags are cleared automatically in this case.
Do not write to the RDF and TDFE flags.

Note 1. ORER can also read from FRDRH.ORER. To clear the ORER flag, write 0 to SSR_FIFO.ORER.
Note 2. The total receive data amount must be an integral multiple of the FIFO triggering number.

Figure 30.44 Example flow of simultaneous serial transmission and reception in clock synchronous mode with FIFO selected

30.6 Operation in Smart Card Interface Mode

The SCI supports smart card (IC card) interfaces conforming to ISO/IEC 7816-3 (standard for Identification Cards), as an extended function of the SCI.

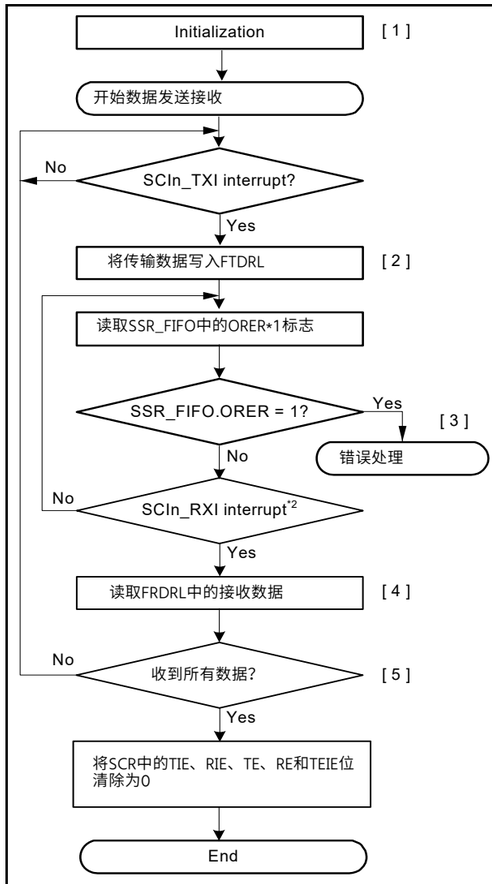
Smart card interface mode can be selected using the appropriate register.

30.6.1 Example Connection

Figure 30.45 shows an example connection between a smart card (IC card) and the MCU.

Because the MCU communicates with an IC card using a single transmission line, interconnect the TXDn and RXDn pins and pull up the data transmission line to VCC using a resistor, as shown in Figure 30.45.

Setting the TE and RE bits in the SCR_SMCI register to 1 with an IC card disconnected enables closed-loop transmission or reception, allowing self-diagnosis. To supply an IC card with the clock pulses generated by the SCI, input the SCKn pin output to the CLK pin of an IC card. The output port of the MCU can be used to output a reset signal.



[1] SCI initialization:
TXDn引脚可以作为发送数据的输出引脚，RXDn引脚可以同时作为接收数据的输入引脚。

[2] 发送数据写入：
在SCIn_TXI中断请求处理例程中将发送数据写入FTDRL。可写入的发送数据量为16位，即FIFO中存储的发送数据的数量。

[3] 接收错误处理：
如果发生接收错误，则读取SSR_FIFO中的ORER标志位，进行相关的错误处理，然后将ORER标志位设置为0。

ORER标志为1。

[4] 读取接收数据：
读取FRDRL寄存器中存储的接收数据，直到存储的数据数量小于FCR.RTRG值。软件可以检查FDR.R[4:0]中的可读数据。

[5] 串行发送接收继续程序：
继续串口接收，在溢出错误发生前，完成FRRDL中接收数据的读取并将SSR_FIFO.RDF标志清0。继续串口发送，在当前发送数据发送完成之前，将下一个发送数据写入FTDRL中SCIn_TXI中断处理例程，并将SSR_FIFO.TDFE标志清零。发送数据也可以通过发送FIFO数据空中断(SCIn_TXI)请求激活DMAC或DTC写入FTDRL。同样，也可以通过接收FIFO数据满中断(SCIn_RXI)请求激活DMAC或DTC来读取FRDRL数据。在这种情况下，RDF和TDFE标志会自动清除。不要写入RDF和TDFE标志。

Note 1. ORER也可以从FRDRH.ORER中读取。要清除ORER标志，请将0写入SSR_FIFO.ORER。
Note 2. 总接收数据量必须是FIFO触发数的整数倍。

Figure 30.44 时钟同步模式下同时串行发送和接收的示例流程 FIFO selected

30.6 智能卡接口模式下的操作

SCI支持符合ISOIEC7816-3（识别卡标准）的智能卡（IC卡）接口，作为SCI的扩展功能。

可以使用适当的寄存器选择智能卡接口模式。

30.6.1 示例连接

图30.45显示了智能卡（IC卡）和MCU之间的示例连接。

由于MCU使用单条传输线与IC卡通信，因此将TXDn和RXDn引脚互连，并使用电阻将数据传输线上拉到VCC，如图30.45所示。

在断开IC卡的情况下将SCR_SMCI寄存器中的TE和RE位设置为1可启用闭环发送或接收，从而实现自诊断。要将SCI产生的时钟脉冲提供给IC卡，请将SCKn引脚输出输入到IC卡的CLK引脚。MCU的输出端口可用于输出复位信号。

RA生态工作室

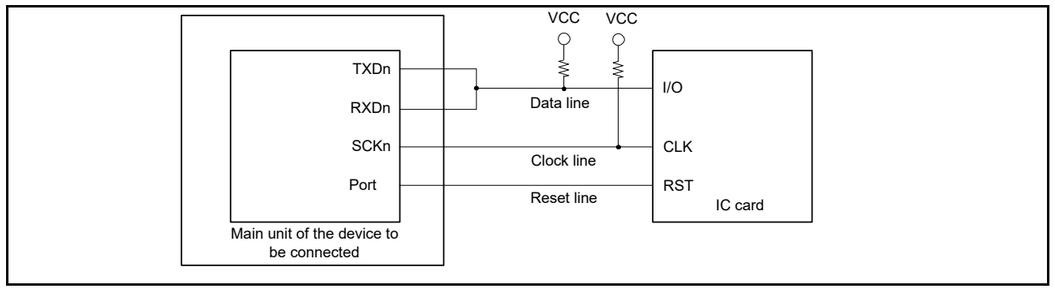


Figure 30.45 Example connection with a smart card (IC card)

30.6.2 Data Format (Except in Block Transfer Mode)

Figure 30.46 shows the data transfer formats in smart card interface mode.

The data transfer format is as follows:

- One frame consists of 8-bit data and a parity bit in asynchronous mode
- During transmission, a value of at least 2 ETUs (elementary time unit, which is the time required to transfer 1 bit) is set as a guard time from the end of the parity bit until the start of the next frame
- If a parity error is detected during reception, a low error signal is output for 1 ETU after 10.5 ETUs elapse from the start bit
- If an error signal is sampled during transmission, the same data is automatically retransmitted after at least 2 ETUs.

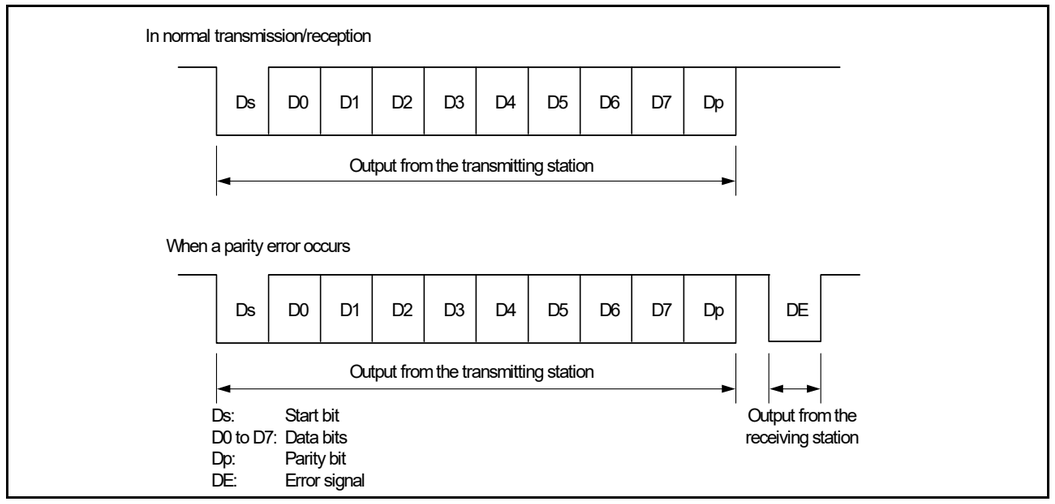

Figure 30.46 Data formats in smart card interface mode

For communication with IC cards of the direct convention type and inverse convention type, follow the procedures in this section.

(1) Direct convention type

For the direct convention type, logic levels 1 and 0 correspond to the Z and A states, respectively, and data is transferred with LSB-first for the start character, as shown in Figure 30.47. Therefore, data in the start character in Figure 30.47 is 3Bh.

When using the direct convention type, write 0 to both the SDIR and SINV bits in SCMR. Write 0 to the PM bit in SMR_SMCI to use even parity, which is recommended by the smart card standard.

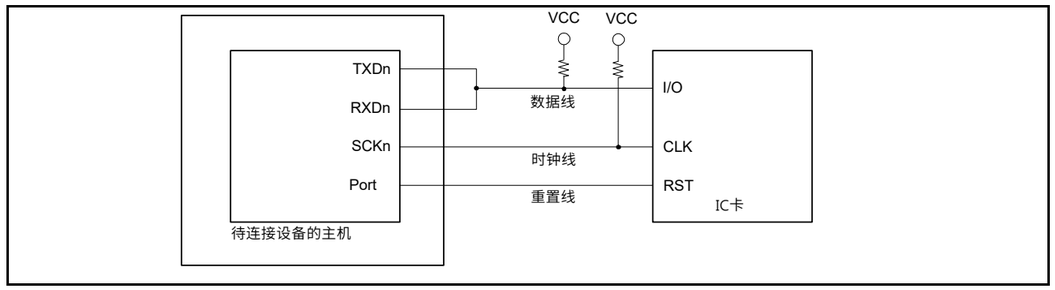

Figure 30.45 与智能卡（IC卡）的连接示例

30.6.2 数据格式（块传输模式除外）

图30.46显示了智能卡接口模式下的数据传输格式。

数据传输格式如下：

- 一帧由异步模式下的8位数据和一个奇偶校验位组成
- 在传输过程中，至少2个ETU（基本时间单位，即传输1位所需的时间）的值被设置为从奇偶校验位结束到下一帧开始的保护时间
- 如果在接收期间检测到奇偶校验错误，则在从起始位经过10.5ETU后输出1ETU的低错误信号
- 如果在传输过程中对错误信号进行采样，则在至少2个ETU后会自动重新传输相同的数据。

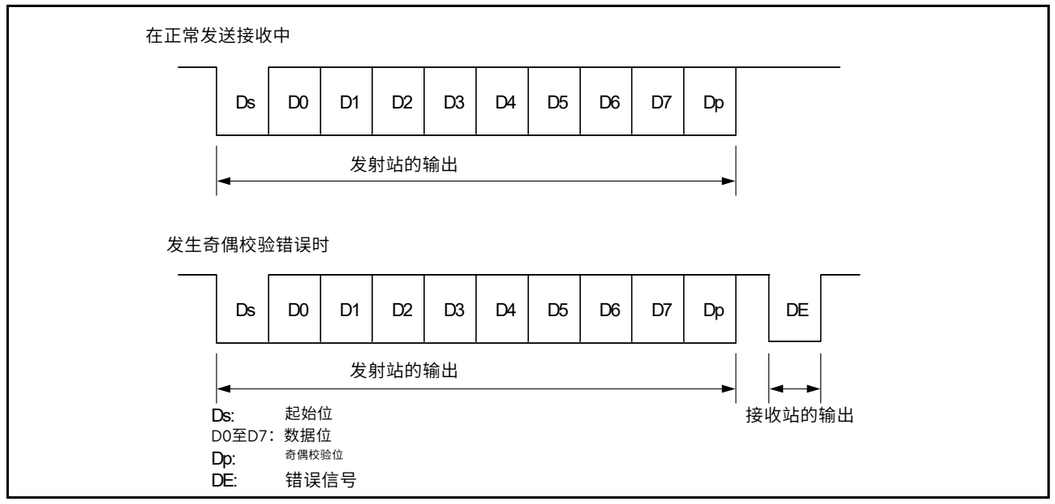

Figure 30.46 智能卡接口模式下的数据格式

与直接约定型和逆约定型的IC卡进行通信时，请按照本节的步骤进行。

(1) 直接约定型

对于直接约定类型，逻辑电平1和0分别对应于Z和A状态，数据以LSB-first作为起始字符传输，如图30.47所示。因此，图30.47中起始字符中的数据为3Bh。

使用直接约定类型时，将0写入SCMR中的SDIR和SINV位。将0写入PM位SMR_SMCI使用智能卡标准推荐的偶校验。

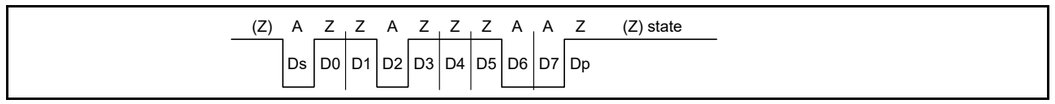

Figure 30.47 Direct convention with SDIR in SCMR = 0, SINV in SCMR = 0, and PM in SMR_SMCI = 0

(2) Inverse convention type

For the inverse convention type, logic levels 1 and 0 indicate the A and Z states respectively, and data is transferred with MSB-first as the start character, as shown in Figure 30.48. Therefore, data in the start character in Figure 30.48 is 3Fh.

When using the inverse convention type, write 1 to both the SCMR.SDIR and SCMR.SINV bits. The parity bit is at logic level 0 to produce even parity, which is required by the smart card standard, and corresponds to the Z state. Because the SINV bit only inverts data bits D7 to D0, write 1 to the PM bit in SMR_SMCI to invert the parity bit for both transmission and reception.

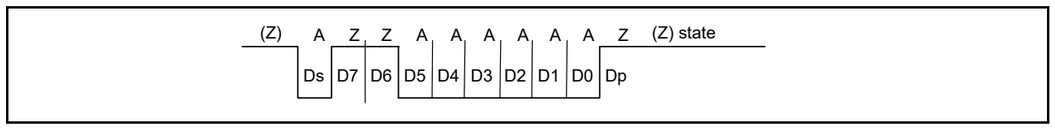

Figure 30.48 Inverse convention with SDIR in SCMR = 1, SINV in SCMR = 1, and PM in SMR_SMCI = 1

30.6.3 Block Transfer Mode

Block transfer mode differs from non-block transfer mode of the smart card interface mode as follows:

- If a parity error is detected during reception, no error signal is output. Because the PER flag in SSR_SMCI is set by error detection, clear the PER flag before receiving the parity bit of the next frame.
- During transmission, at least 1 ETU is set as a guard time from the end of the parity bit until the start of the next frame
- Because the same data is not retransmitted, the TEND flag in SSR_SMCI is set to 11.5 ETUs after transmission starts
- In block transfer mode, the ERS flag in SSR_SMCI indicates the error signal status as in non-block transfer mode of smart card interface mode, but the flag is read as 0 because no error signal is transferred.

30.6.4 Receive Data Sampling Timing and Reception Margin

Only the clock generated by the on-chip baud rate generator can be used as a transfer clock in smart card interface mode.

In this mode, the SCI can operate on a base clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate according to the SCMR.BCP2 and SMR_SMCI.BCP[1:0] bit settings.

For data reception, the falling edge of the start bit is sampled with the base clock to perform synchronization.

Receive data is sampled on the 16^{th}, 32^{nd}, 186^{th}, 128^{th}, 46^{th}, 64^{th}, 93^{rd}, and 256^{th} rising edges of the base clock so that it can be latched at the middle of each bit as shown in Figure 30.49. The reception margin is determined by the following formula:

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\ [\%]$$

M: Reception margin (%)

N: Ratio of bit rate to clock (N = 32, 64, 372, 256)

D: Duty cycle of clock (D = 0 to 1.0)

L: Frame length (L = 10)

F: Absolute value of clock frequency deviation

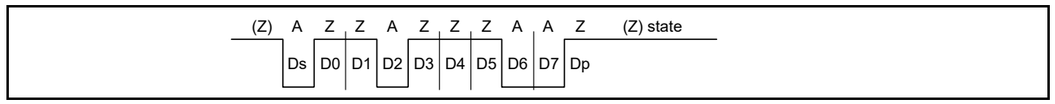

Figure 30.47 与SCMR=0中的SDIR、SCMR=0中的SINV和SMR_SMCI=0中的PM的直接约定

(2) 逆约定型

对于逆约定类型，逻辑电平1和0分别表示A和Z状态，数据通过
MSB-first作为起始字符，如图30.48所示。因此，图30.48中起始字符中的数据为3Fh。

使用逆约定类型时，将1写入SCMR.SDIR和SCMR.SINV位。奇偶校验位处于逻辑电平0以产生偶校验，这是智能卡标准所要求的，并且对应于Z状态。由于SINV位仅将数据位D7反转为D0，因此向SMR_SMCI中的PM位写入1以反转发送和接收的奇偶校验位。

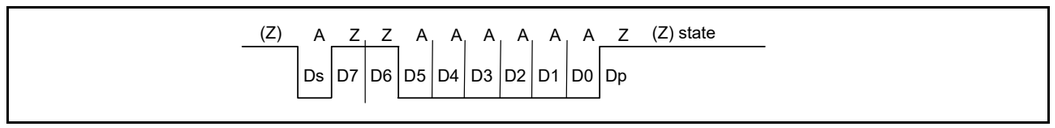

Figure 30.48 SCMR=1中的SDIR、SCMR=1中的SINV和SMR_SMCI=1中的PM的逆约定

30.6.3 块传输模式

块传输模式与智能卡接口模式的非块传输模式的区别如下：

- 如果在接收期间检测到奇偶校验错误，则不输出错误信号。因为SSR_SMCI中的PER标志是由错误检测设置的，所以在接收下一帧的奇偶校验位之前清除PER标志。
- 在传输过程中，从奇偶校验位结束到下一帧开始至少设置1个ETU作为保护时间
- 因为没有重传相同的数据，所以在传输开始后SSR_SMCI中的TEND标志设置为11.5ETU
- 在块传输模式下，SSR_SMCI中的ERS 标志指示错误信号状态，与智能卡接口模式的非块传输模式一样，但该标志被读取为0，因为没有传输错误信号。

30.6.4 接收数据采样时序和接收裕量

只有片内波特率发生器产生的时钟可以用作智能卡接口模式下的传输时钟。

在此模式下，SCI可以在频率为32、64、372、256、93、128、186或512倍比特率的基本时钟上运行，具体取决于SCMR.BCP2和SMR_SMCI.BCP[1:0]位设置。

对于数据接收，起始位的下降沿与基本时钟一起采样以执行同步。

接收数据在基本时钟的第16 32 186 128 46 64 93和256个上升沿采样，以便在每个位的中间锁存，如图所示在图30.49中。接收余量由以下公式确定：

$$M = \left| (0.5 - \frac{1}{2N}) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100\ [\%]$$

M：接收余量（%）

N：比特率与时钟的比率（N=32、64、372、256）

D：时钟的占空比（D=0到1.0）

L：帧长（L=10）

F：时钟频率偏差的绝对值

Assuming values of F = 0, D = 0.5, and N = 372 in the specified formula, the reception margin is determined by the following formula:

M = {0.5 - 1/(2 × 372)} × 100 [%] = 49.866%

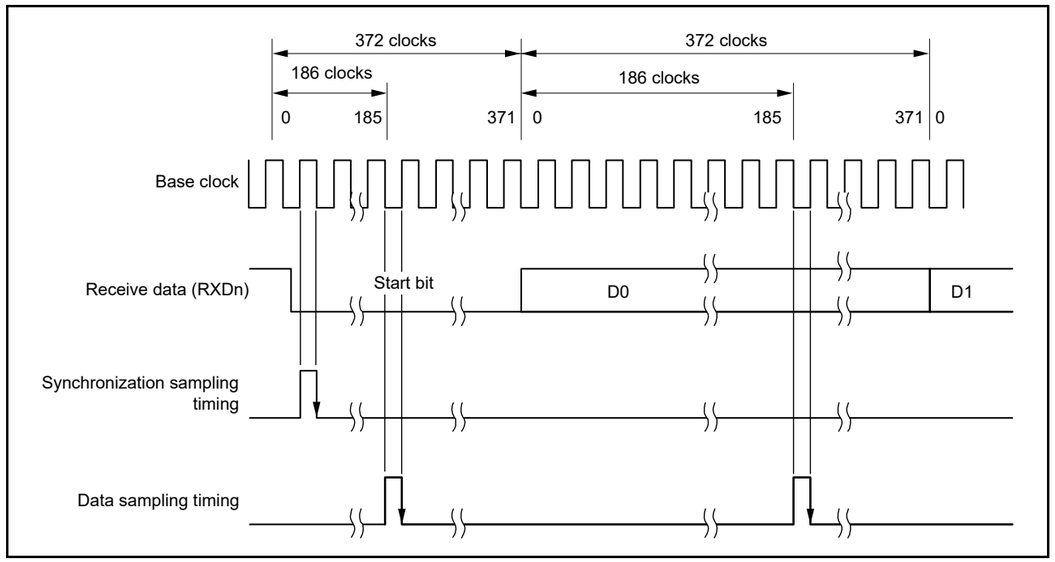

Figure 30.49 Receive data sampling timing in smart card interface mode when clock frequency is 372 times the bit rate

30.6.5 SCI Initialization

Before transmitting and receiving data, write the initial value 00h in the SCR_SMCI register and initialize the SCI using the example flow shown in Figure 30.50.

Be sure to set the initial value in the TIE, RIE, TE, RE, and TEIE bits in the SCR_SMCI register before switching from transmission to reception mode or from reception to transmission mode. When the SCR_SMCI.RE bit is set to 0, the RDR register is not initialized.

To change from reception mode to transmission mode, first check that the reception is complete, then initialize the SCI. At the end of initialization, set TE = 1 and RE = 0. Reception completion can be verified by reading the SCIn_RXI request, ORER, or PER flag in SSR_SMCI.

To change transmission mode to reception mode, first check that the transmission is complete, then initialize the SCI. At the end of the initialization, set TE = 0 and RE = 1. Transmission completion can be verified by reading the TEND flag in SSR_SMCI.

假设指定公式中的F=0、D=0.5和N=372的值，则接收裕度由以下公式确定：

M = {0.5 - 1/(2 × 372)} × 100 [%] = 49.866%

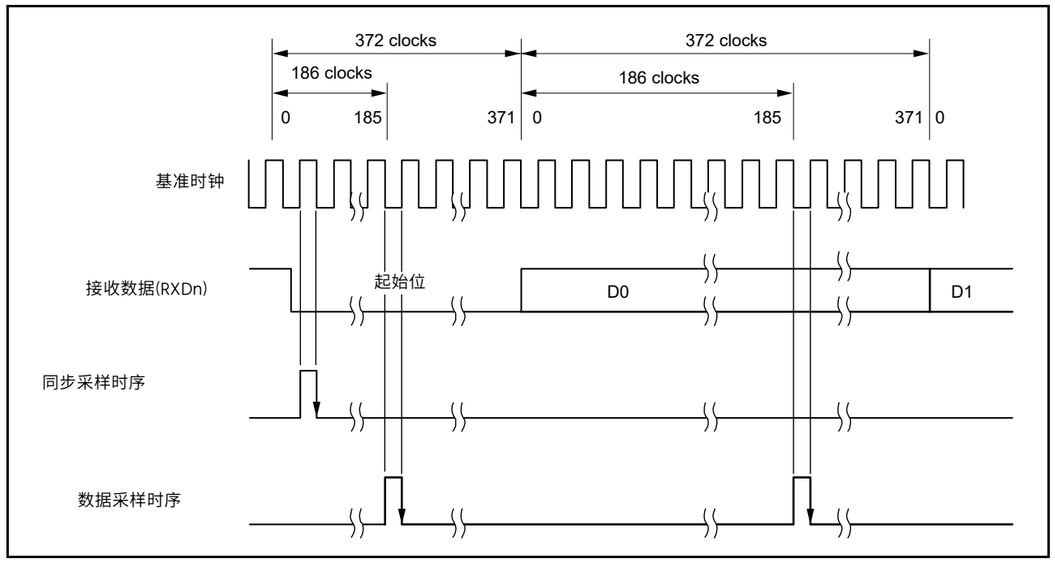

Figure 30.49 时钟频率为372倍比特率时智能卡接口模式下的接收数据采样时序

30.6.5 SCI初始化

在发送和接收数据之前，将初始值00h写入SCR_SMCI寄存器并使用图30.50所示的示例流程初始化SCI。

在从发送模式切换到接收模式或从接收模式切换到发送模式之前，请务必在SCR_SMCI寄存器的TIE、RIE、TE、RE和TEIE位中设置初始值。当SCR_SMCI.RE位设置为0时，RDR寄存器未初始化。

要从接收模式更改为发送模式，首先检查接收是否完成，然后初始化SCI。
在初始化结束时，设置TE=1和RE=0。可以通过读取SSR_SMCI中的SCIn_RXI请求、ORER或PER标志来验证接收是否完成。

要将传输模式更改为接收模式，首先检查传输是否完成，然后初始化SCI。在初始化结束时，设置TE=0和RE=1。可以通过读取SSR_SMCI中的TEND标志来验证传输完成。

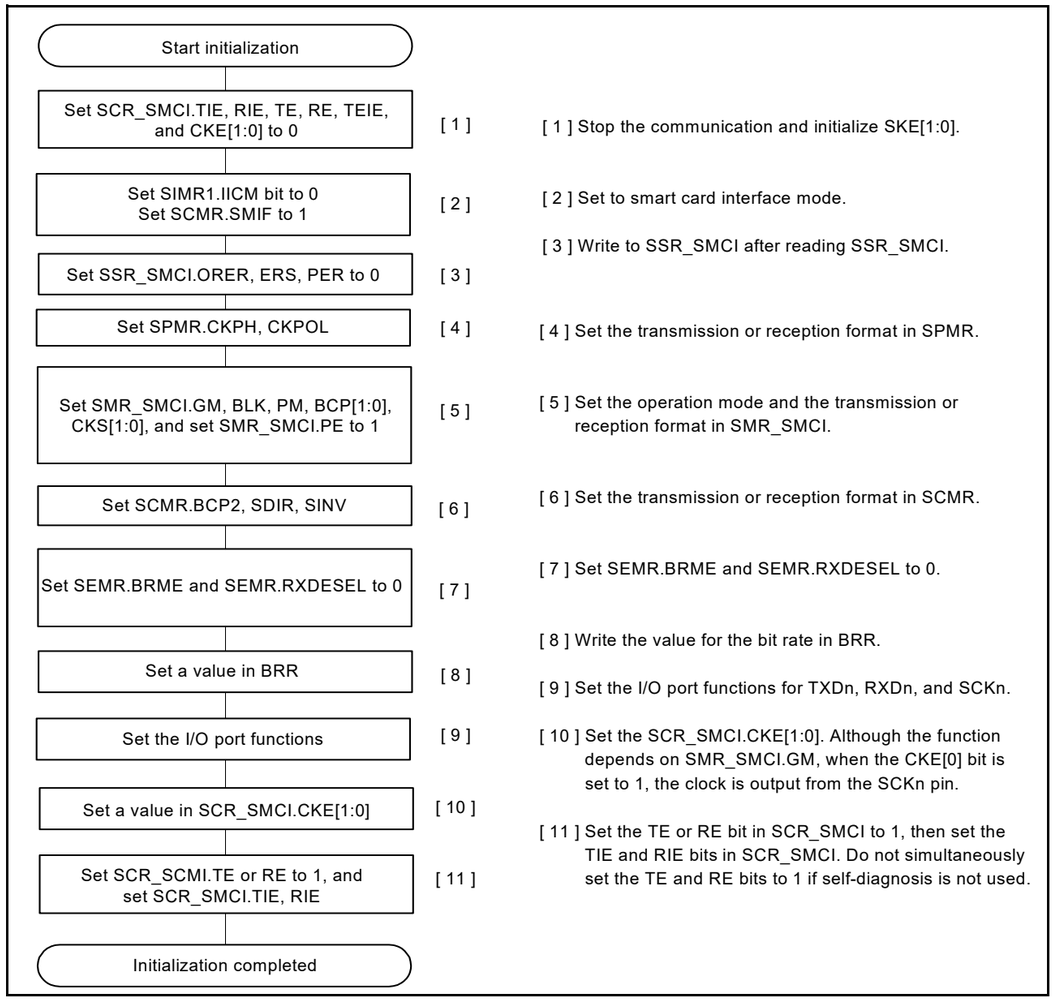

Figure 30.50 Example flow of SCI initialization in smart card interface mode

Figure 30.51 shows a timing diagram when data transmission is performed by transitioning to smart card interface mode according to the flow in Figure 30.50. Figure 30.51 shows when the GM bit in SMR_SMCI is set to 0. The timing in Figure 30.51 shows when the port is connected as SCKn and TXDn, the pins are Hi-Z because the CKE[0] bit in SCR_SMCI is 0.

Start the clock output to the SCK pin by setting the CKE[0] bit in SCR_SMCI to 1, then start data transmission by writing the transmit data after setting the TE bit in SCR_SMCI to 1. When the TE bit in SCR_SMCI changes from 0 to 1, there is a preamble period for one frame before data transmission starts. In smart card interface mode, the TXDn pin is Hi-Z when there is a preamble period. Pull-up or pull-down for the SCKn and TXDn pins is required outside the MCU.

In smart card interface mode, even when the TE and RE bits in SCR_SMCI are 0, the clock is continuously output if the clock output setting is used.

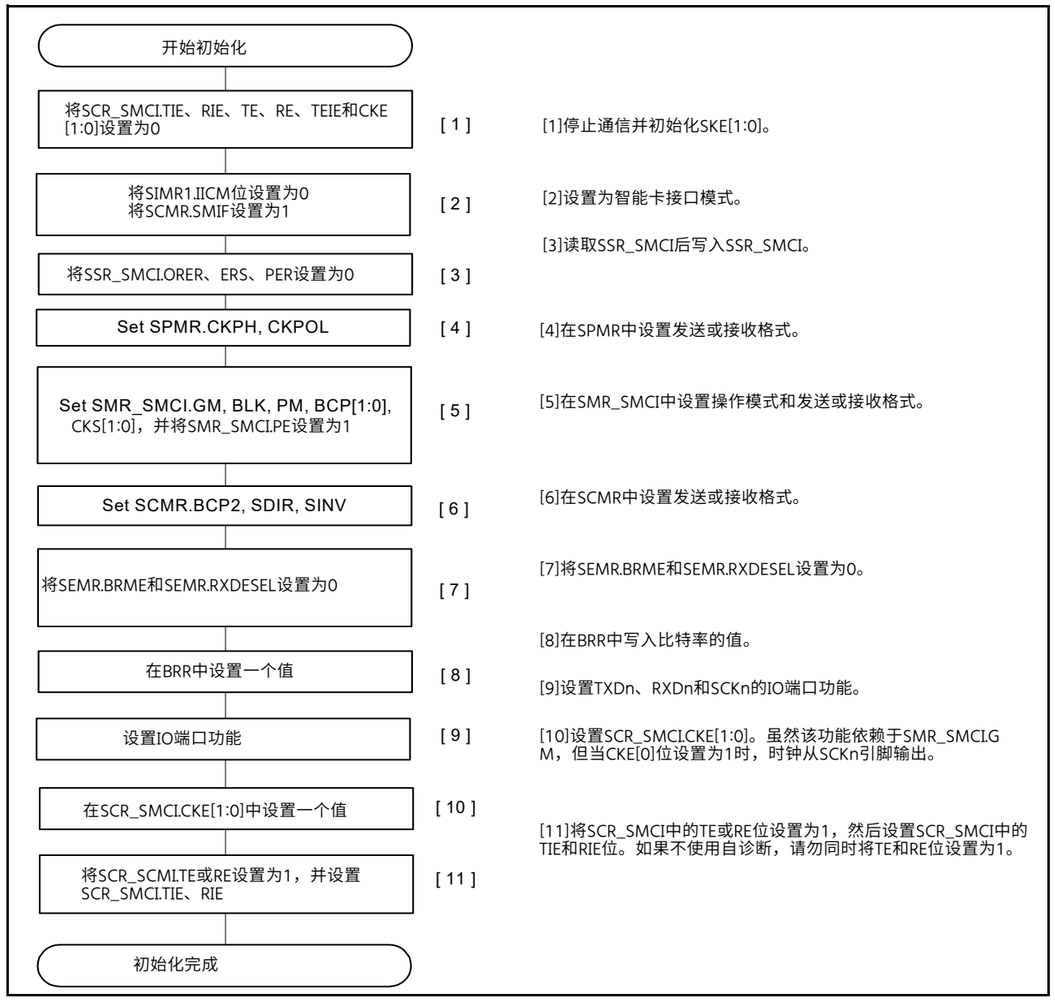

Figure 30.50 智能卡接口模式下SCI初始化流程示例

图30.51显示了当按照图30.50中的流程通过转换到智能卡接口模式来执行数据传输时的时序图。图30.51显示了SMR_SMCI中的GM位设置为0时。图30.51中的时序显示了当端口连接为SCKn和TXDn时，引脚为Hi-Z，因为CKE[0]位在

SCR_SMCI is 0.

将SCR_SMCI中的CKE[0]位设置为1，开始向SCK引脚输出时钟，然后将SCR_SMCI中的TE位设置为1后，通过写入发送数据开始数据传输。当SCR_SMCI中的TE位从0变为如图1所示，在数据传输开始之前有一帧的前导周期。在智能卡接口模式下，当有前导周期时，TXDn引脚为Hi-Z。SCKn和TXDn引脚的上拉或下拉需要在MCU外部进行。

在智能卡接口模式下，即使SCR_SMCI中的TE和RE位为0，如果使用时钟输出设置，时钟也会持续输出。

RA生态工作室

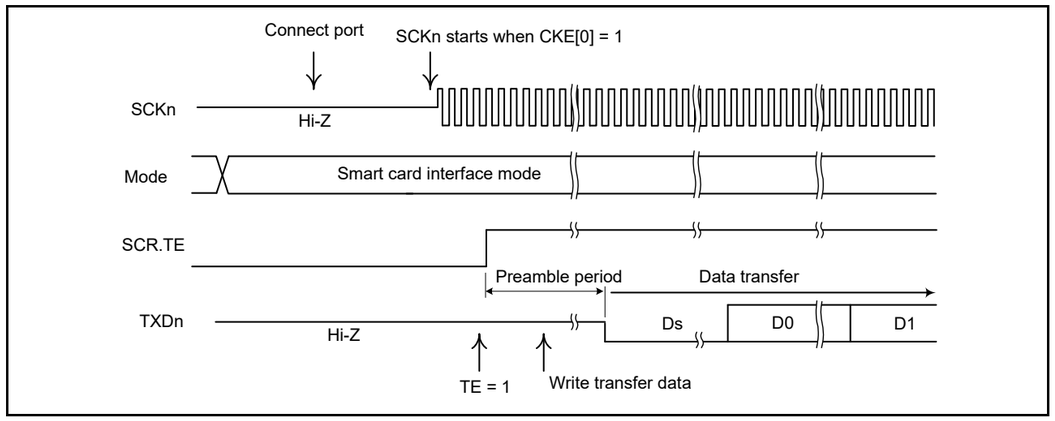

Figure 30.51 Example timing of data transmission in smart card interface mode

30.6.6 Serial Data Transmission (Except in Block Transfer Mode)

Serial data transmission in smart card interface mode (except in block transfer mode) is different from that in non-smart card interface mode, in that an error signal is sampled and data can be retransmitted in smart card mode. Figure 30.52 shows the data retransfer operation during transmission.

In Figure 30.52:

- [1] indicates when an error signal from the receiver end is sampled after 1-frame data is transmitted, the SSR_SMCI.ERS flag is set to 1. If the SCR_SMCI.RIE bit is 1, an SCIn_ERI interrupt request is generated. Clear the ERS flag to 0 before the next parity bit is sampled.
- [2] indicates for a frame in which an error signal is received, the SSR_SMCI.TEND flag is not set. Data is retransferred from TDR to TSR, allowing automatic data retransmission.
- [3] indicates if no error signal is returned from the receiver, the ERS flag is not set to 1.
- [4] indicates the SCI determines that the transmission of 1-frame data, including the retransfer, is complete, and the TEND flag is set. If the SCR_SMCI.TIE bit is 1, an SCIn_TXI interrupt request is generated. Write transmit data to the TDR to start transmission of the next data.

Figure 30.54 shows an example flow of serial transmission. All the processing steps are automatically performed using an SCIn_TXI interrupt request to activate the DMAC or DTC.

When the SSR_SMCI.TEND flag is set to 1 in transmission and when the SCR_SMCI.TIE bit is 1, an SCIn_TXI interrupt request is generated.

The DMAC or DTC is activated by an SCIn_TXI interrupt request if the SCIn_TXI interrupt request is previously specified as a source of DMAC or DTC activation, allowing the transfer of transmit data. The TEND flag is automatically set to 0 when the DMAC or DTC transfers data.

If an error occurs, the SCI automatically retransmits the same data. During this retransmission, the TEND flag is kept at 0 and the DMAC or DTC is not activated. Therefore, the SCI and DMAC or DTC automatically transmit the specified number of bytes, including retransmission when an error occurs. Because the ERS flag is not automatically cleared, set the RIE bit to 1 to enable an SCIn_ERI interrupt request generation when an error occurs, and clear the ERS flag to 0.

When transmitting or receiving data using the DMAC or DTC, always enable the DMAC or DTC before setting the SCI.

For DMAC or DTC settings, see section 17, DMA Controller (DMAC) and section 18, Data Transfer Controller (DTC).

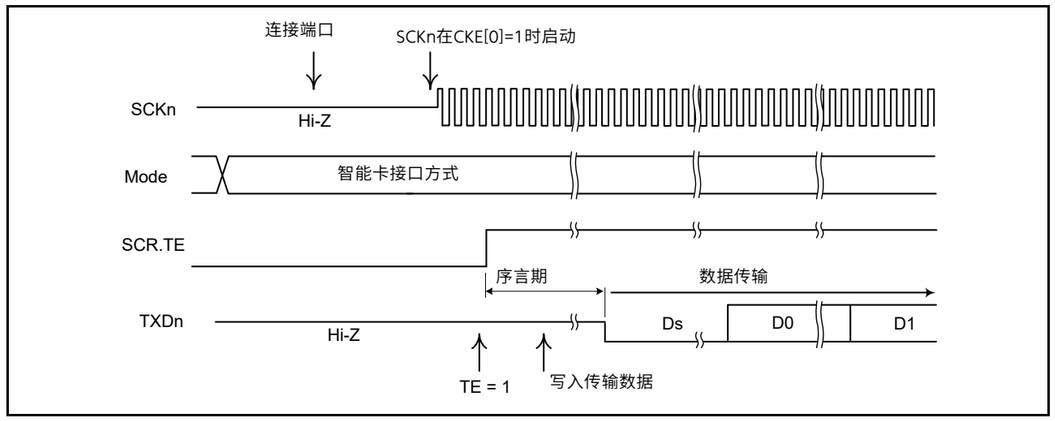

Figure 30.51 智能卡接口模式下数据传输时序示例

30.6.6 串行数据传输（块传输模式除外）

智能卡接口模式下的串行数据传输（块传输模式除外）与非智能卡接口模式下的串行数据传输不同之处在于，在智能卡模式下对错误信号进行采样，数据可以重传。图30.52显示了传输过程中的数据重传操作。

在图30.52中：

- [1]表示在发送1帧数据后采样到来自接收端的错误信号时，SSR_SMCI.ERS标志置1。如果SCR_SMCI.RIE位为1，则产生SCIn_ERI中断请求。在采样下一个奇偶校验位之前将ERS 标志清零。
- [2]表示对于接收到错误信号的帧，未设置SSR_SMCI.TEND标志。数据从TDR重新传输到TSR，允许自动数据重新传输。
- [3]表示如果接收器没有返回错误信号，则ERS 标志不设置为1。
- [4]表示SCI确定1帧数据的传输（包括重传）已完成，并且设置了TEND标志。如果SCR_SMCI.TIE位为1，则产生SCIn_TXI中断请求。将传输数据写入TDR以开始传输下一个数据。

图30.54显示了串行传输的示例流程。所有处理步骤都使用SCIn_TXI中断请求自动执行以激活DMAC或DTC。

当发送中SSR_SMCI.TEND标志设置为1且SCR_SMCI.TIE位为1时，将产生SCIn_TXI中断请求。

如果先前将SCIn_TXI中断请求指定为DMAC或DTC激活源，则DMAC或DTC由SCIn_TXI中断请求激活，从而允许传输发送数据。当DMAC或DTC传输数据时，TEND标志自动设置为0。

如果发生错误，SCI会自动重新传输相同的数据。在此重传期间，TEND标志保持为0，并且不激活DMAC或DTC。因此，SCI和DMAC或DTC会自动传输指定的字节数，包括发生错误时的重传。因为ERS 标志不会自动清除，所以将RIE位设置为1以在发生错误时启用SCIn_ERI中断请求生成，并将ERS 标志清除为0。

使用DMAC或DTC发送或接收数据时，请务必在设置SCI之前启用DMAC或DTC。

对于DMAC或DTC设置，请参阅第17节，DMA控制器(DMAC)和第18节，数据传输控制器(DTC)。

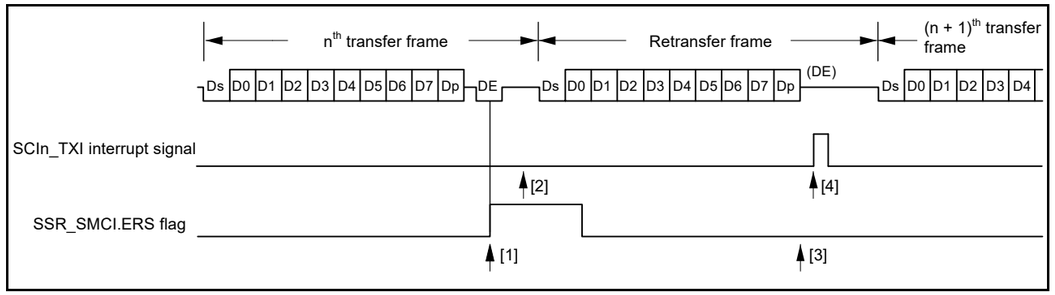

Figure 30.52 Data retransfer operation in SCI transmission mode

Note: The SSR_SMCI.TEND flag is set at different timings depending on the SMR_SMCI.GM bit setting.

Figure 30.53 shows the TEND flag generation timing.

Note: SSR_SMCI.TEND标志根据SMR_SMCI.GM位设置在不同的时间设置。

图30.53显示了TEND标志生成时序。

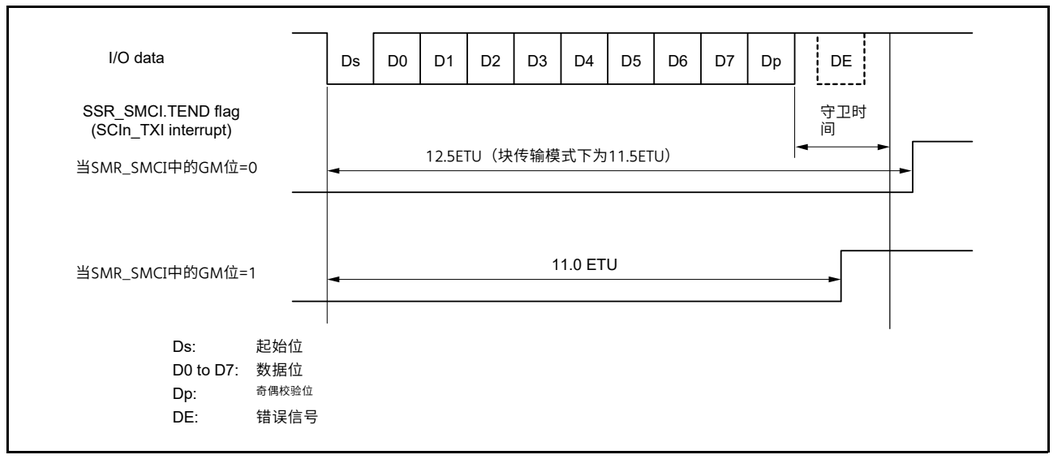

Figure 30.53 发送期间的SSR.TEND标志生成时序

Figure 30.54 Example flow of smart card interface transmission

30.6.7 Serial Data Reception (Except in Block Transfer Mode)

Serial data reception in smart card interface mode is similar to that in non-smart card interface mode. Figure 30.55 shows the data retransfer operation in reception mode.

- [1] indicates if a parity error is detected in the receive data, the SSR_SMCI.PER flag is set to 1. When the SCR_SMCI.RIE bit is 1, an SCIn_ERI interrupt request is generated. Clear the PER flag to 0 before the next parity bit is sampled.
- [2] indicates for a frame in which a parity error is detected, no SCIn_RXI interrupt is generated.
- [3] indicates when no parity error is detected, the SCR_SMCI.PER flag is not set to 1.
- [4] indicates the data is determined to be received successfully. When the SCR_SMCI.RIE bit is 1, an SCIn_RXI interrupt request is generated.

Figure 30.56 shows an example flow of serial data reception. All the processing steps are automatically performed using an SCIn_RXI interrupt request to activate the DMAC or DTC.

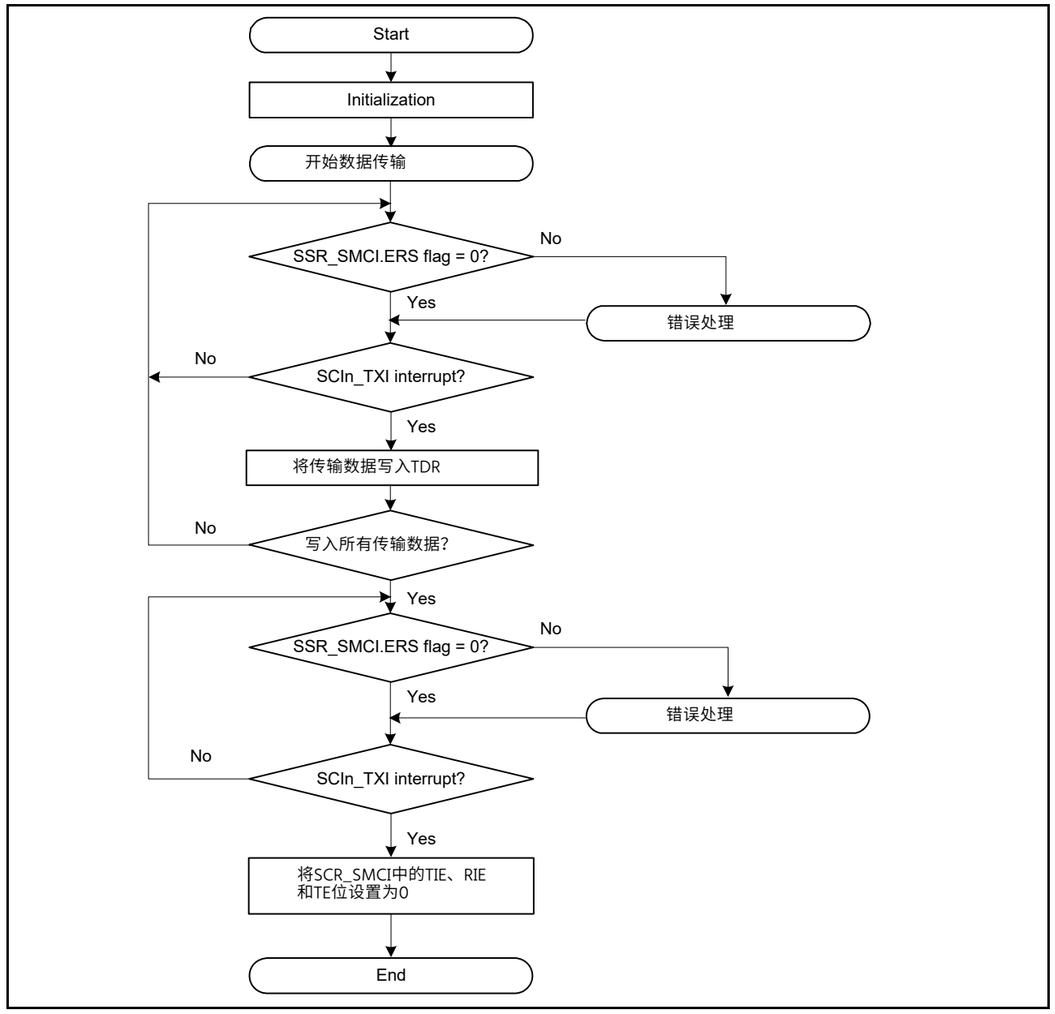

Figure 30.54 智能卡接口传输示例流程

30.6.7 串行数据接收（块传输模式除外）

智能卡接口模式下的串行数据接收与非智能卡接口模式下的串行数据接收类似。图30.55显示了接收模式下的数据重传操作。

- [1]表示如果在接收数据中检测到奇偶校验错误，则SSR_SMCI.PER标志设置为1。当SCR_SMCI.RIE位为1时，产生SCIn_ERI中断请求。在采样下一个奇偶校验位之前将PER标志清零。
- [2]表示对于检测到奇偶校验错误的帧，不产生SCIn_RXI中断。
- [3]表示当没有检测到奇偶校验错误时，SCR_SMCI.PER标志不设置为1。
- [4]表示确定数据接收成功。当SCR_SMCI.RIE位为1时，产生SCIn_RXI中断请求。

图30.56显示了串行数据接收的示例流程。所有处理步骤都使用SCIn_RXI中断请求自动执行以激活DMAC或DTC。

In reception, setting the RIE bit to 1 allows an SCIn_RXI interrupt request to be generated. The DMAC or DTC is activated by an SCIn_RXI interrupt request if the SCIn_RXI interrupt request is previously specified as a source of DMAC or DTC activation, allowing the transfer of receive data.

If an error occurs during reception and either the ORER or PER flag in SSR_SMCI is set to 1, a receive error interrupt (SCIn_ERI) request is generated. Clear the error flag after the error occurrence. If an error occurs, the DMAC or DTC is not activated and receive data is skipped. Therefore, the number of bytes of receive data specified in the DMAC or DTC is transferred.

If a parity error occurs and the PER flag is set to 1 during reception, the receive data is transferred to RDR, therefore allowing the data to be read.

When a reception is forced to terminate by setting SCR_SMCI.RE to 0 during operation, read the RDR register because the received data that is not yet read might be left in the RDR.

Note: For operations in block transfer mode, see section 30.3.9, Serial Data Reception in Asynchronous Mode.

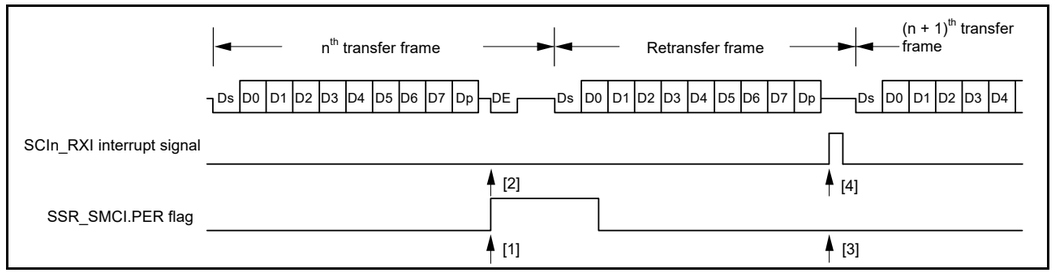

Figure 30.55 Data retransfer operation in SCI reception mode

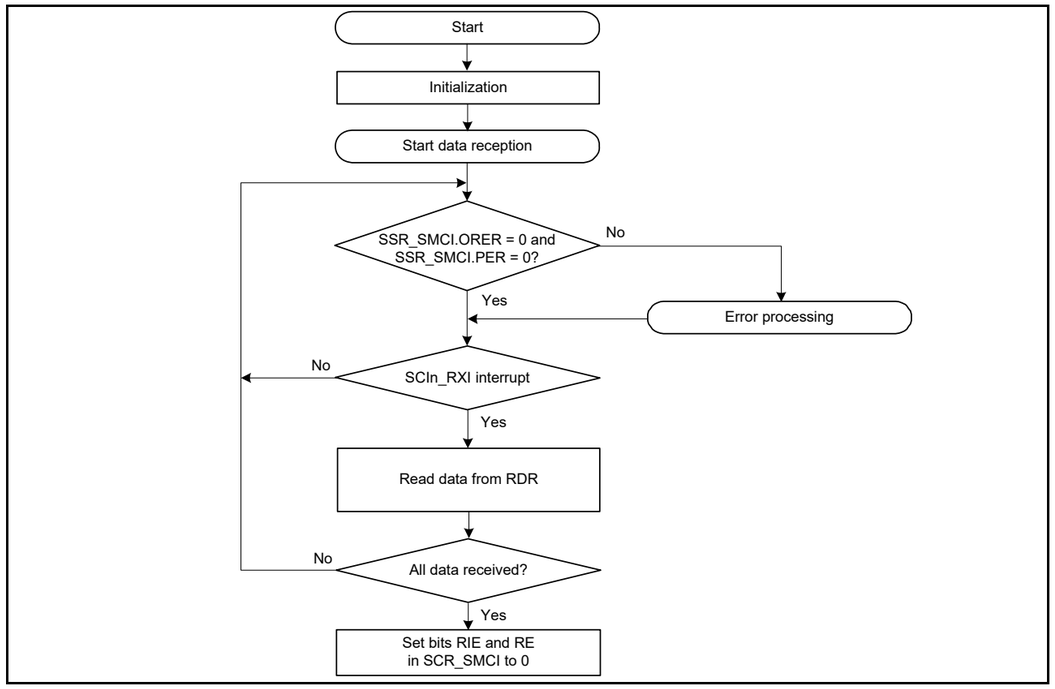

Figure 30.56 Example flow of smart card interface reception

在接收时，将RIE位设置为1允许产生SCIn_RXI中断请求。如果SCIn_RXI中断请求先前被指定为DMAC或DTC激活源，则DMAC或DTC由SCIn_RXI中断请求激活，从而允许传输接收数据。

如果接收期间发生错误并且SSR_SMCI中的ORER或PER标志设置为1，则会生成接收错误中断(SCIn_ERI)请求。错误发生后清除错误标志。如果发生错误，则不激活DMAC或DTC并跳过接收数据。因此，将传输DMAC或DTC中指定的接收数据字节数。

如果在接收过程中发生奇偶校验错误并且PER标志设置为1，则接收数据将传输到RDR，因此可以读取数据。

如果在操作期间通过将SCR_SMCI.RE设置为0来强制终止接收，请读取RDR寄存器，因为尚未读取的已接收数据可能留在RDR中。

Note: 有关块传输模式下的操作，请参阅第30.3.9节，异步模式下的串行数据接收。

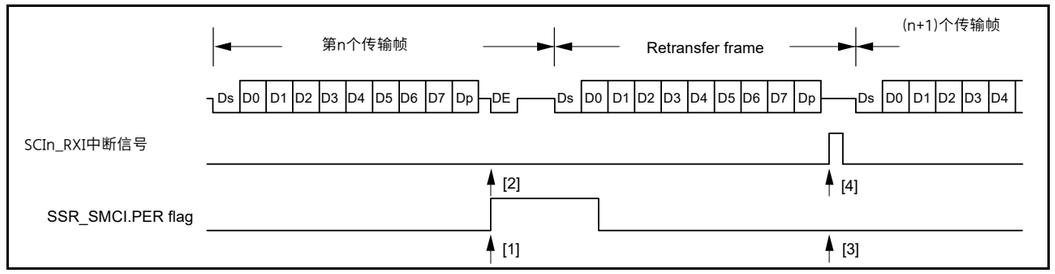

Figure 30.55 SCI接收模式下的数据重传操作

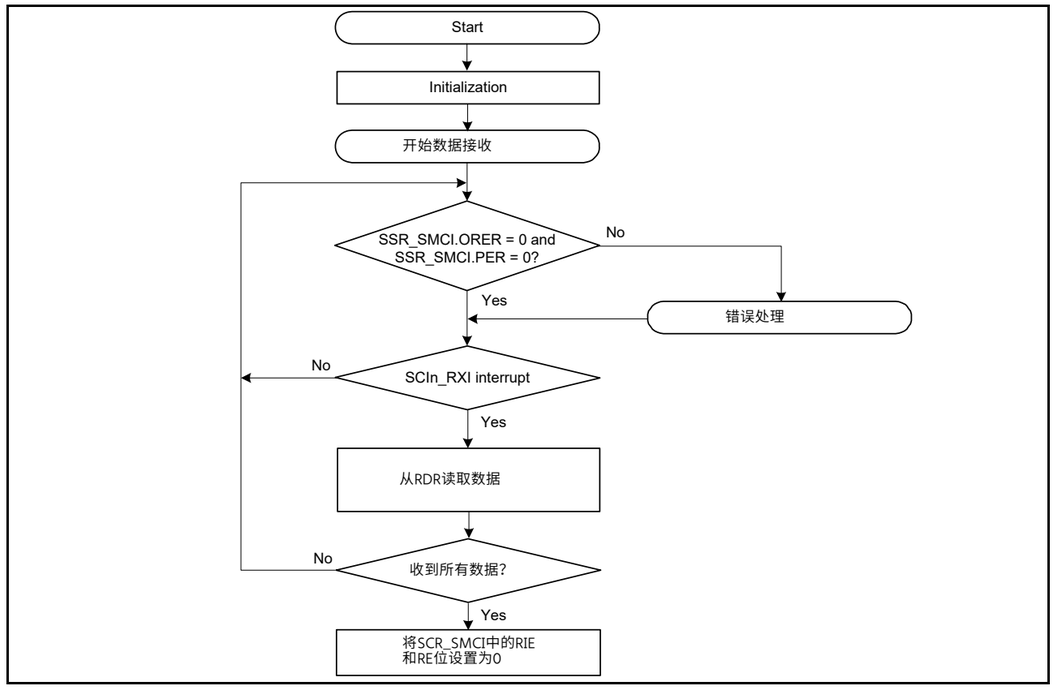

Figure 30.56 智能卡接口接收示例流程

30.6.8 Clock Output Control

When the GM bit in SMR_SMCI is set to 1, the clock output can be controlled by the CKE[1: 0] bits in SCR_SMCI. For details on the CKE[1:0] bits, see section 30.2.12, Serial Control Register for Smart Card Interface Mode (SCR_SMCI) (SCMR.SMIF = 1). When setting the clock output, the base clock described in section 30.6.4, Receive Data Sampling Timing and Reception Margin is output.

Figure 30.57 shows an example timing for the clock output control when the CKE[1] bit in SCR_SMCI is set to 0 and the CKE[0] bit in SCR_SMCI is controlled.

When the GM bit in SMR_SMCI is 0, output control by the CKE[0] bit in SCR_SMCI is immediately reflected in the SCK pin, so there is a possibility that pulses with an unintended width might be output from the SCK pin.

When the GM bit in SMR_SMCI is 1, the clock with the same pulse width as the base clock is output even if the CKE[0] bit in SCR_SMCI is changed.

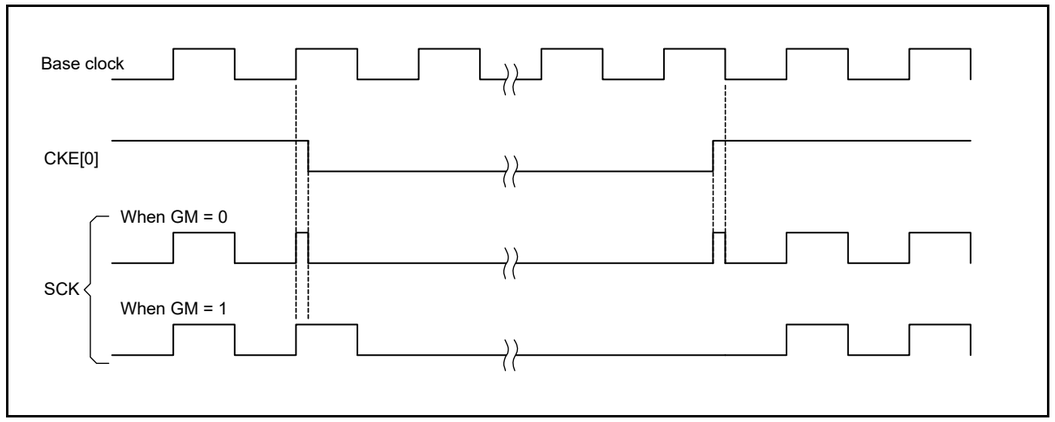

Figure 30.57 Clock output control

30.7 Operation in Simple IIC Mode

Simple I2C bus format is composed of 8 data bits and an acknowledge bit. By continuing into a slave-address frame after a start condition or restart condition, a master device can specify a slave device as a partner for communications. The currently specified slave device remains valid until a new slave device is specified or a stop condition is satisfied. The 8 data bits in all frames are transmitted in order from the MSB.

The I2C bus format and timing are shown in Figure 30.58 and Figure 30.59.

30.6.8 时钟输出控制

当SMR_SMCI中的GM位设置为1时，时钟输出可由SCR_SMCI中的CKE[1:0]位控制。有关CKE[1:0]位的详细信息，请参见第30.2.12节，智能卡接口模式的串行控制寄存器(SCR_SMCI)(SCMR.SMIF=1)。设置时钟输出时，输出第30.6.4节"接收数据采样时序和接收余量"中描述的基本时钟。

图30.57显示了当SCR_SMCI中的CKE[1]位设置为0且控制SCR_SMCI中的CKE[0]位。

当SMR_SMCI中的GM位为0时，SCR_SMCI中CKE[0]位的输出控制立即反映在SCK引脚，因此有可能会从SCK引脚输出具有意外宽度的脉冲。

当SMR_SMCI中的GM位为1时，即使SCR_SMCI中的CKE[0]位发生变化，也会输出与基本时钟脉冲宽度相同的时钟。

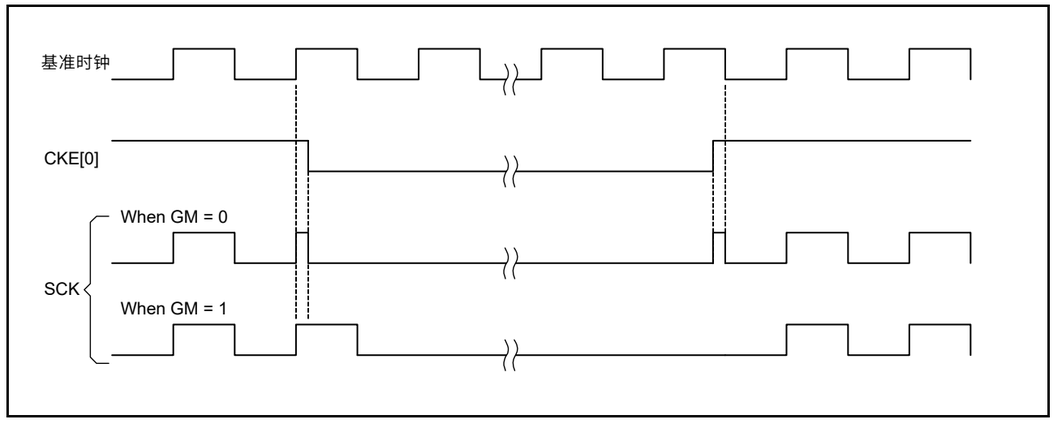

Figure 30.57 时钟输出控制

30.7 简单IIC模式下的操作

简单I2C总线格式由8个数据位和一个确认位组成。通过在启动条件或重启条件之后继续进入从地址帧，主设备可以指定从设备作为通信伙伴。当前指定的从设备保持有效，直到指定新的从设备或满足停止条件。所有帧中的8个数据位从MSB开始按顺序传输。

I2C总线格式和时序如图30.58和图30.59所示。

RA生态工作室

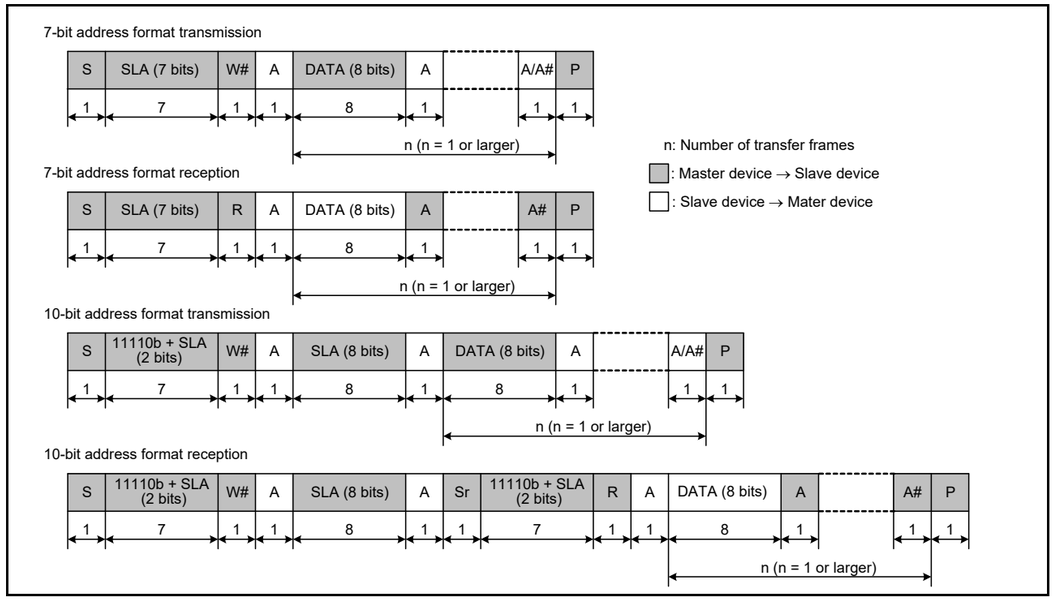

Figure 30.58 I²C bus format

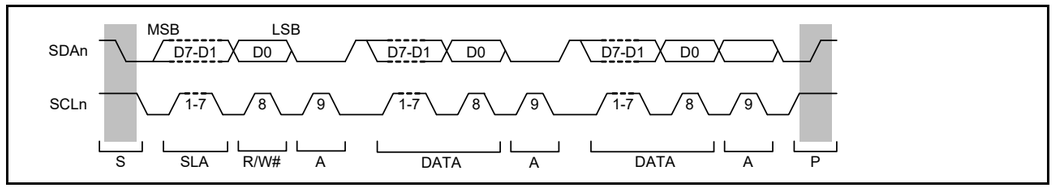

Figure 30.59 I²C bus timing when SLA is 7 bits

S: Indicates a start condition, when the master device changes the level on the SDAn line from high to low while the SCLn line is high.

SLA: Indicates a slave address, by which the master device selects a slave device.

R/W#: Indicates the direction of transfer (reception or transmission). The value 1 indicates transfer from the slave device to the master device and 0 indicates transfer from the master device to the slave device.

A/A#: Indicates an acknowledge bit. This is returned by the slave device for master transmission and by the master device for master reception. Return low indicates ACK and return high indicates NACK.

Sr: Indicates a restart condition when the master device changes the level on the SDAn line from high to low while the SCLn line is high and after the setup time elapses.

DATA: Indicates the data being received or transmitted.

P: Indicates a stop condition, when the master device changes the level on the SDAn line from low to high while the SCLn line is high.

30.7.1 Generation of Start, Restart, and Stop Conditions

Writing 1 to the SIMR3.IICSTAREQ bit causes the generation of a start condition. The generation of a start condition proceeds through the following operations:

- The level on the SDAn line falls (from high level to low level) and the SCLn line is kept in the released state
- The hold time for the start condition is set as half of a bit period at the bit rate determined by the BRR setting

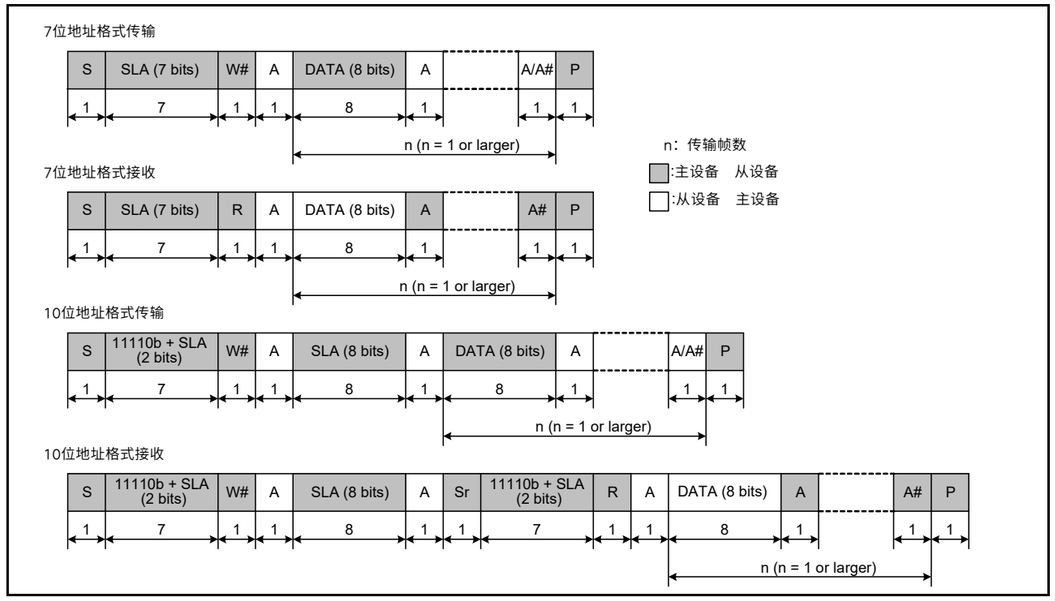

Figure 30.58 I2C总线格式

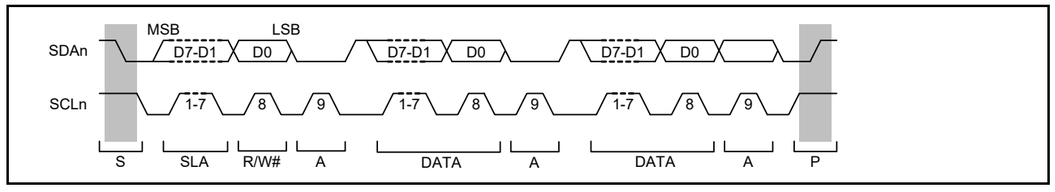

Figure 30.59 SLA为7位时的I2C总线时序

S: 当主设备在SCLn线为高时将SDAn线上的电平从高电平变为低电平时，表示启动条件。

SLA: 指示从地址，主设备通过该地址选择从设备。

R/W#: 指示传输方向（接收或传输）。值1表示从从设备传输到主设备，0表示从主设备传输到从设备。

AA#：表示确认位。这由从设备返回用于主传输，并由主设备返回用于主接收。返回低电平表示ACK，返回高电平表示NACK。

Sr：当主设备将SDAn线上的电平从高电平变为低电平而SCLn线为高电平且经过设置时间后，表示重启条件。

DATA: 表示正在接收或发送的数据。

P：表示停止条件，当主设备将SDAn线上的电平从低电平变为高电平而SCLn线为高电平时。

30.7.1 启动、重启和停止条件的生成

将1写入SIMR3.IICSTAREQ位会导致产生启动条件。开始条件的生成通过以下操作进行：

- SDAn线上的电平下降（从高电平到低电平），SCLn线保持在释放状态
- 开始条件的保持时间设置为比特周期的一半，比特率由BRR设置确定

- The level on the SCLn line falls (from high level to low level), the IICSTAREQ bit in SIMR3 is set to 0, and a start-condition generated interrupt is output.

Writing 1 to the IICRSTAREQ bit in SIMR3 causes the generation of a restart condition. The generation of a restart condition proceeds through the following operations:

- The SDAn line is released and the SCLn line is kept at a low level
- The period at low level for the SCLn line is set as half of a bit period at the bit rate determined by the BRR setting
- The SCLn line is released (transition from low level to high level)
- When a high level is detected on the SCLn line, the setup time for the restart condition is set as half of a bit period at the bit rate determined by the BRR setting
- The level on the SDAn line falls (from high level to low level)
- The hold time for the restart condition is set as half of a bit period at the bit rate determined by the BRR setting
- The level on the SCLn line falls (from high level to low level), the SIMR3.IICRSTAREQ bit is set to 0, and a restart-condition generated interrupt is output.

Writing 1 to the SIMR3.IICSTPREQ bit causes the generation of a stop condition. The generation of a stop condition proceeds through the following operations:

- The level on the SDAn line falls (from high level to low level) and the SCLn line is kept at a low level
- The period at low level for the SCLn line is set as half of a bit period at the bit rate determined by the BRR setting
- The SCLn line is released (transition from low level to high level)
- When a high level is detected on the SCLn line, the setup time for the stop condition is set as half of a bit period at the bit rate determined by the BRR setting
- The SDAn line is released (transition from low level to high level), the SIMR3.IICSTPREQ bit is set to 0, and a stop-condition generated interrupt is output.

Figure 30.60 shows the timing of operations in the generation of start, restart, and stop conditions.

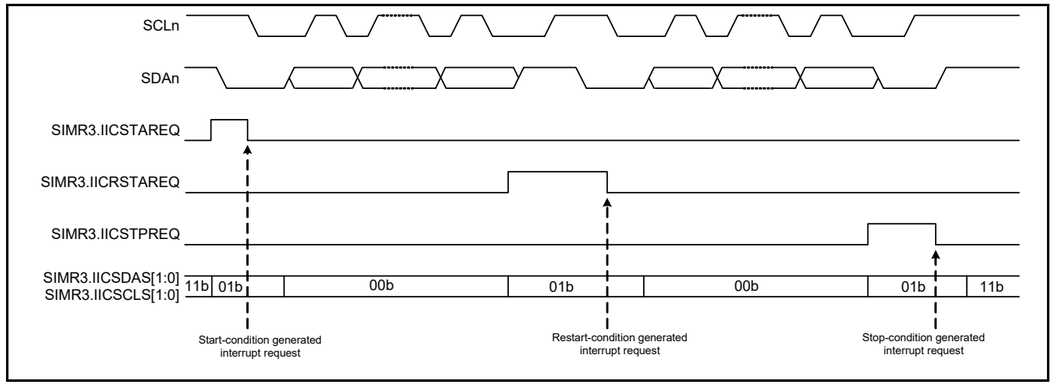

Figure 30.60 Timing of operations to generate start, restart, and stop conditions

30.7.2 Clock Synchronization

The SCLn line can be driven low if a wait is inserted by a slave device at the other side of the transfer. Setting the SIMR2.IICCSC bit to 1 allows clock synchronization control when a difference arises between the levels of the internal SCLn clock signal and the level being input on the SCLn pin.

When the SIMR2.IICCSC bit is set to 1, the level of the internal SCLn clock signal changes from low to high. Counting to determine the period at a high level stops while the low level is being input on the SCLn pin. Counting to determine the period at a high level starts after the input on the SCLn pin transitions to the high level.

- SCLn线上的电平下降（从高电平变为低电平），SIMR3中的IICSTAREQ位设置为0，并输出起始条件产生的中断。

将1写入SIMR3中的IICRSTAREQ位会导致产生重启条件。重新启动条件的生成通过以下操作进行：

- SDAn线被释放，SCLn线保持低电平
- SCLn线的低电平周期设置为比特周期的一半，比特率由BRR设置确定
- SCLn线被释放（从低电平转变为高电平）
- 当在SCLn线上检测到高电平时，重新启动条件的建立时间设置为比特周期的一半，比特率由BRR设置确定
- SDAn线上的电平下降（从高电平到低电平）
- 重启条件的保持时间设置为比特周期的一半，比特率由BRR设置确定
- SCLn线上的电平下降（从高电平变为低电平），SIMR3.IICRSTAREQ位设置为0，并输出重启条件产生的中断。

将1写入SIMR3.IICSTPREQ位会导致产生停止条件。停止条件的生成通过以下操作进行：

- SDAn线上的电平下降（从高电平到低电平），SCLn线保持在低电平
- SCLn线的低电平周期设置为比特周期的一半，比特率由BRR设置确定
- SCLn线被释放（从低电平转变为高电平）
- 当在SCLn线上检测到高电平时，停止条件的建立时间设置为由BRR设置确定的比特率的半个比特周期
- SDAn线被释放（从低电平转换为高电平），SIMR3.IICSTPREQ位设置为0，并输出停止条件产生的中断。

图30.60显示了生成启动、重启和停止条件的操作时序。

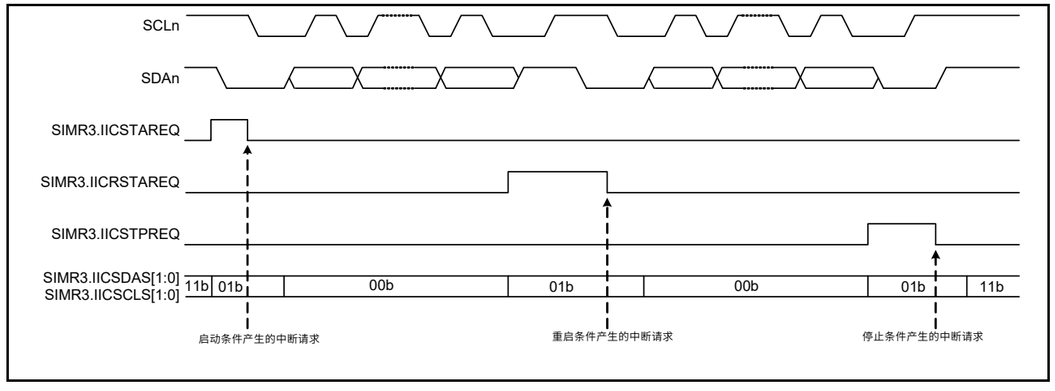

Figure 30.60 生成启动、重启和停止条件的操作时序

30.7.2 时钟同步

如果从设备在传输的另一侧插入等待，则可以将SCLn线驱动为低电平。设置当内部电平之间出现差异时，SIMR2.IICCSC位为1允许时钟同步控制SCLn时钟信号和输入到SCLn引脚的电平。

当SIMR2.IICCSC位设置为1时，内部SCLn时钟信号的电平由低变为高。当SCLn引脚输入低电平时，停止计数以确定高电平周期。在SCLn引脚上的输入转换为高电平后，开始计数以确定高电平的周期。

The interval from the time until counting, to determine the period at high level that starts on the transition of the SCLn pin to the high level, is the total of the delay of SCLn output, delay for noise filtering of the input on the SCLn pin (2 or 3 cycles of sampling clock for the noise filter), and delay for internal processing (1 or 2 PCLKA cycles). The period at high level of the internal SCLn clock is extended even when other devices are not placing the low level on the SCLn line.

If the SIMR2.IICCSC bit is 1, synchronization is obtained for the transmission and reception of data by taking the logical AND of the input on the SCLn pin and the internal SCLn clock. If the SIMR2.IICCSC bit is 0, synchronization with the internal SCLn clock is obtained for the transmission and reception of data.

If a slave device inserts a wait period into the interval until the transition of the internal SCLn clock signal from the low to the high level after a request for the generation of a start, restart, or stop condition is issued, the time until generation is prolonged by that period.

If a slave device inserts a wait period after a transition of the internal SCLn clock signal from the low to the high level, although the generation-completed interrupt is issued without stopping the waiting period, generation of the condition itself is not guaranteed. Figure 30.61 shows an example of operation to synchronize the clocks.

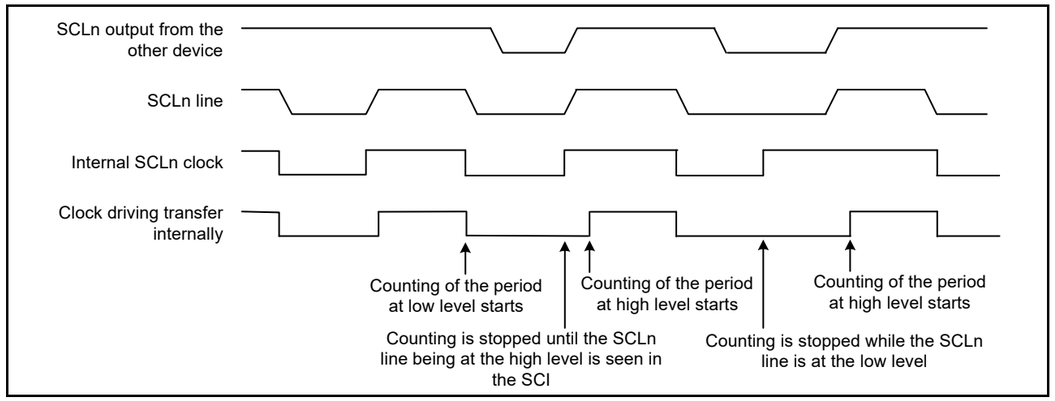

Figure 30.61 Example of operations for clock synchronization

30.7.3 SDA Output Delay

The SIMR1.IICDL[4:0] bits can be used to set a delay for the output on the SDAn pin relative to the falling edges of output on the SCLn pin. Delay settings from 0 to 31 are selectable. The delay settings represent periods of the associated numbers of cycles of the clock signal from the on-chip baud rate generator (derived by frequency-dividing the base clock, PCLKA, by the divisor selected in the SMR.CKS[1:0] bits). A delay for output on the SDAn pin applies to the start condition/restart condition/stop condition signal, 8-bit transmit data, and an acknowledge bit.

If the SDA output delay is shorter than the time required for the level on the SCLn pin to fall, the change of the output on the SDAn pin starts while the output level on the SCLn pin is falling, creating a possibility of erroneous operation of slave devices. Ensure that the settings for output delay on the SDAn pin specify a time period greater than the time that the output on the SCLn pin takes to fall (300 ns for IIC in standard mode and fast mode).

Figure 30.62 shows the timing of delays in SDA output.

从时间到计数的时间间隔，确定从SCLn引脚转换为高电平开始的高电平周期，是SCLn输出延迟的总和，SCLn引脚输入的噪声过滤延迟（噪声滤波器的采样时钟为2或3个周期），内部处理的延迟（1或2个PCLKA周期）。即使其他设备没有将低电平置于SCLn线上，内部SCLn时钟的高电平周期也会延长。

如果SIMR2.IICCSC位为1，则通过对SCLn引脚上的输入和内部SCLn时钟进行逻辑与来获得数据发送和接收的同步。如果SIMR2.IICCSC位为0，则与内部SCLn时钟同步以进行数据的发送和接收。

如果从设备在发出启动、重启或停止条件的生成请求后，在内部SCLn时钟信号从低电平转变为高电平之前的间隔中插入一个等待周期，则直到生成的时间为延长了那个时期。

如果从设备在内部SCLn时钟信号从低电平转换为高电平之后插入等待周期，尽管在不停止等待周期的情况下发出生成完成中断，但不能保证条件本身的生成。图30.61显示了同步时钟的操作示例。

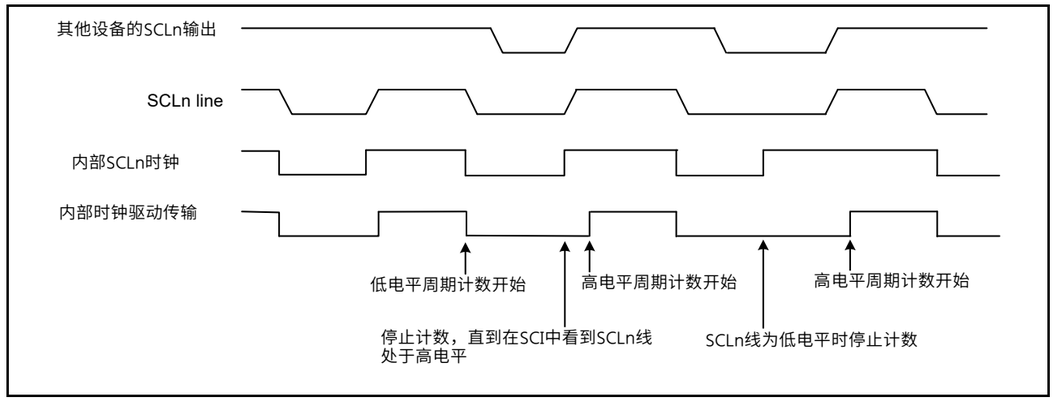

Figure 30.61 时钟同步操作示例

30.7.3 SDA输出延迟

SIMR1.IICDL[4:0]位可用于设置SDAn引脚输出相对于SCLn引脚输出下降沿的延迟。可选择从0到31的延迟设置。延迟设置表示来自片上波特率发生器的时钟信号的相关周期数的周期（通过将基本时钟PCLKA除以在SMR.CKS[1:0]位中选择的除数分频得出）。SDAn引脚上的输出延迟适用于启动条件重启条件停止条件信号、8位发送数据和确认位。

如果SDA输出延迟小于SCLn引脚电平下降所需的时间，则SDAn引脚上的输出变化会在SCLn引脚上的输出电平下降时开始，从而产生从机错误操作的可能性设备。确保SDAn引脚上的输出延迟设置指定的时间段大于SCLn引脚上的输出下降所需的时间（标准模式和快速模式下的IIC为300ns）。

图30.62显示了SDA输出的延迟时间。

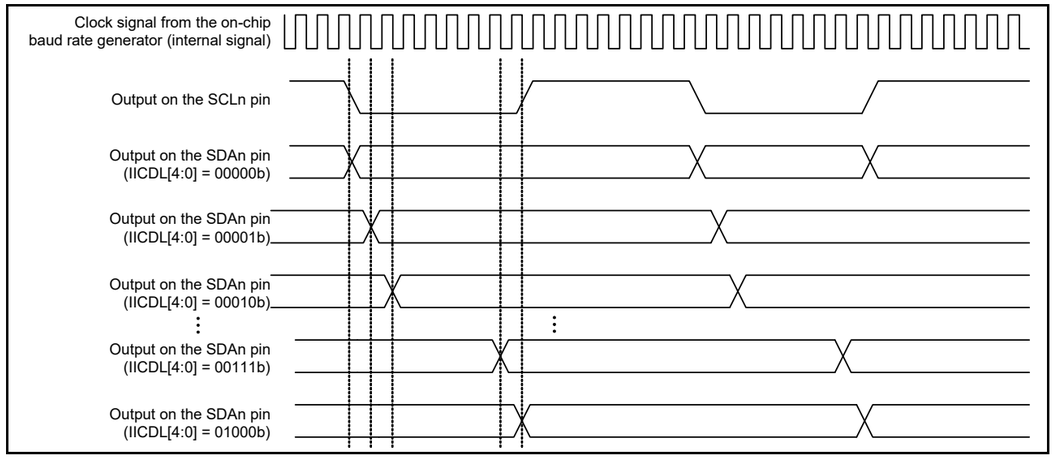

Figure 30.62 Timing of delays in SDA output

30.7.4 SCI Initialization in Simple IIC Mode

Before transferring data, write the initial value of 00h to SCR and initialize the interface as shown in the example in Figure 30.63. Before making any changes to the operating mode or transfer format, be sure to set SCR to its initial value. In simple IIC mode, the open-drain setting for the communication ports should be made on the port side.

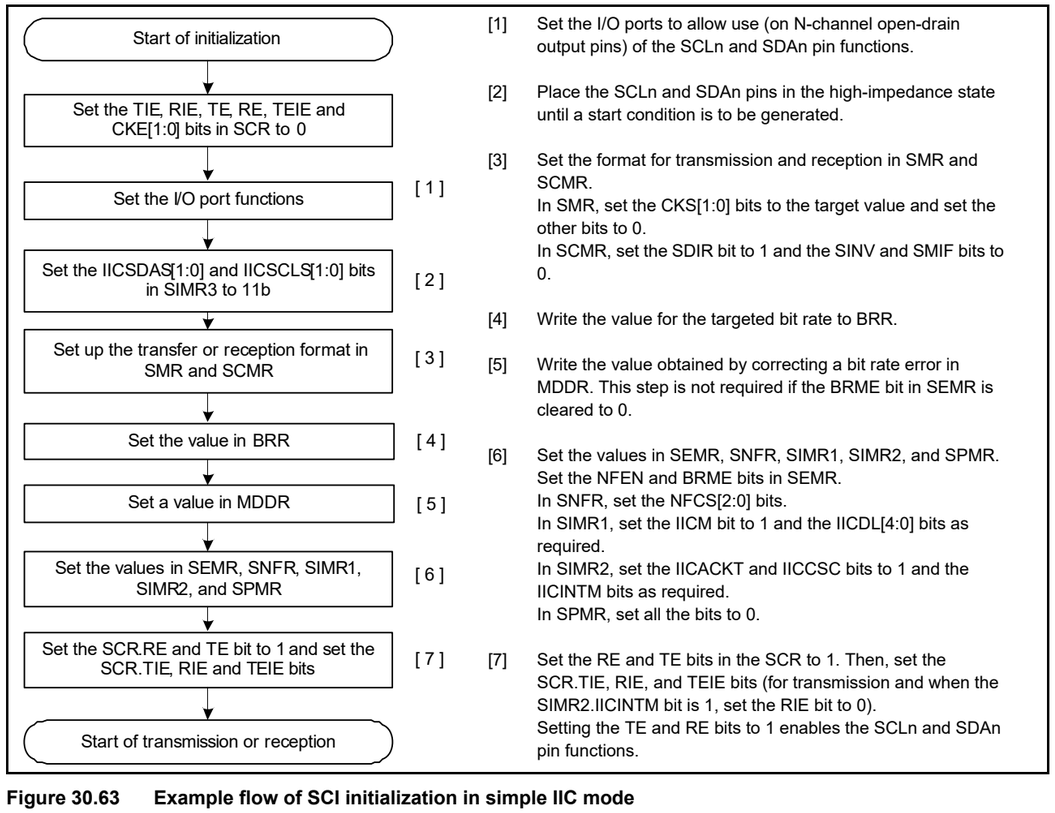

Figure 30.63 Example flow of SCI initialization in simple IIC mode

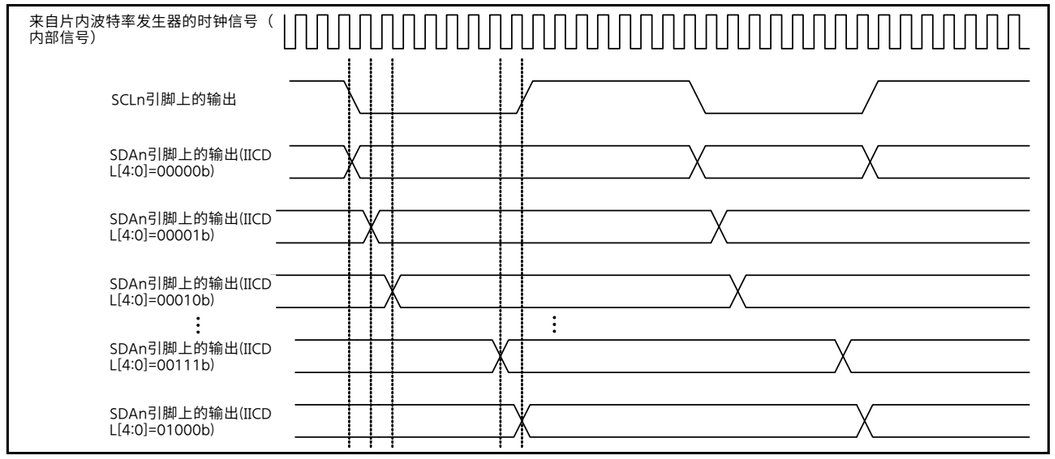

Figure 30.62 SDA输出的延迟时间

30.7.4 简单IIC模式下的SCI初始化

在传输数据之前，将初始值00h写入SCR并初始化接口，如示例中所示
图30.63。在对操作模式或传输格式进行任何更改之前，请务必将SCR设置为其初始值。
在简单IIC模式下，通信端口的开漏设置应在端口侧进行。

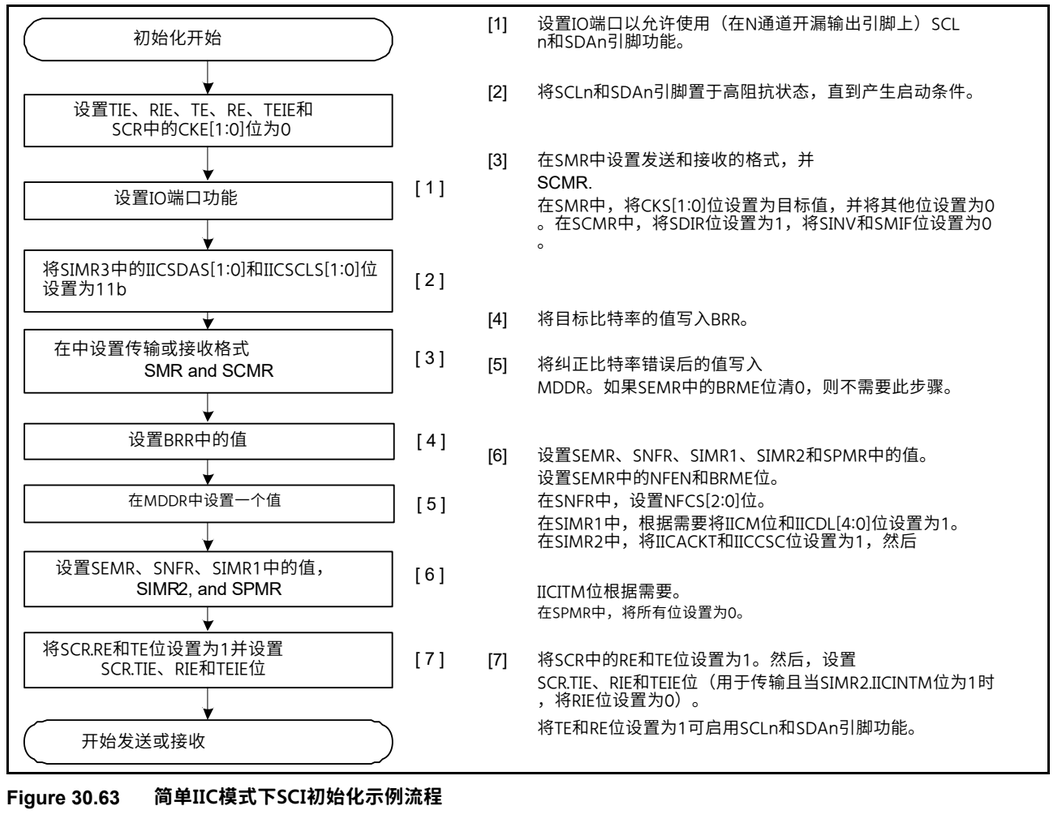

Figure 30.63 简单IIC模式下SCI初始化示例流程

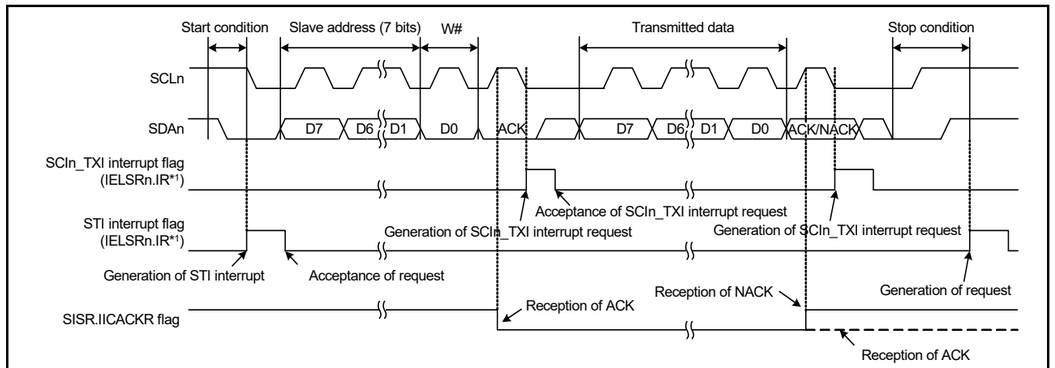
30.7.5 Operation in Master Transmission in Simple IIC Mode

Figure 30.64 and Figure 30.65 show examples of master transmission and Figure 30.66 shows an example flow of data transmission. The value of the SIMR2.IICINTM bit is assumed to be 1 (use reception and transmission interrupts) and the value of the SCR.RIE bit is assumed to be 0 (SCIn_RXI and SCIn_ERI interrupt requests are disabled). See Table 30.29 for more information on the STI interrupt.

When 10-bit slave addresses are in use, steps [3] and [4] in Figure 30.66 are repeated twice.

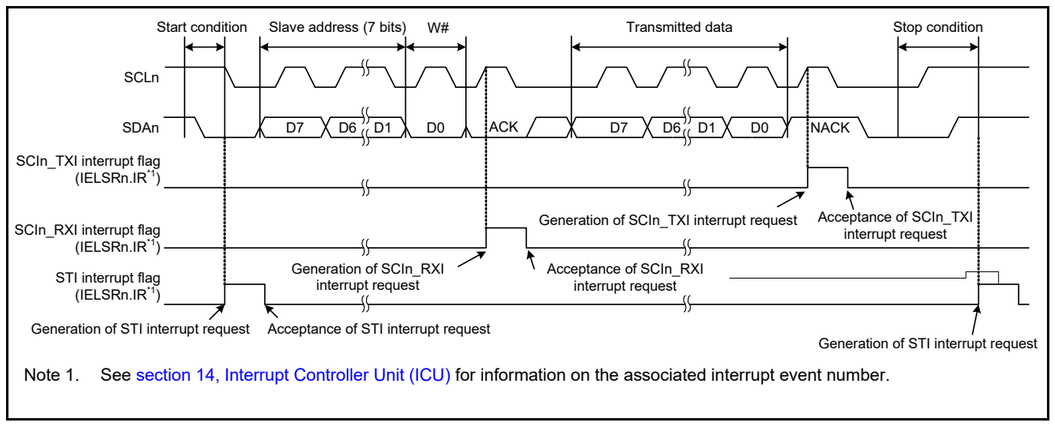
In simple IIC mode, the transmit data empty interrupt (SCIn_TXI) is generated when communication of one frame is complete, unlike the timing of the SCIn_TXI interrupt request generation during clock synchronous transmission.



Note 1. See section 14, Interrupt Controller Unit (ICU) for information on the associated interrupt event number.

Figure 30.64 Example 1 operation for master transmission in simple IIC mode with 7-bit slave addresses, transmission interrupts, and reception interrupts

When the SIMR2.IICINTM bit is set to 0, using ACK/NACK interrupts during master transmission, the DMAC or DTC is activated by the ACK interrupt as the trigger and the required number of data bytes are transmitted. When a NACK is received, error processing such as transmission stop and retransmission is performed using the NACK interrupt as the trigger.



Note 1. See section 14, Interrupt Controller Unit (ICU) for information on the associated interrupt event number.

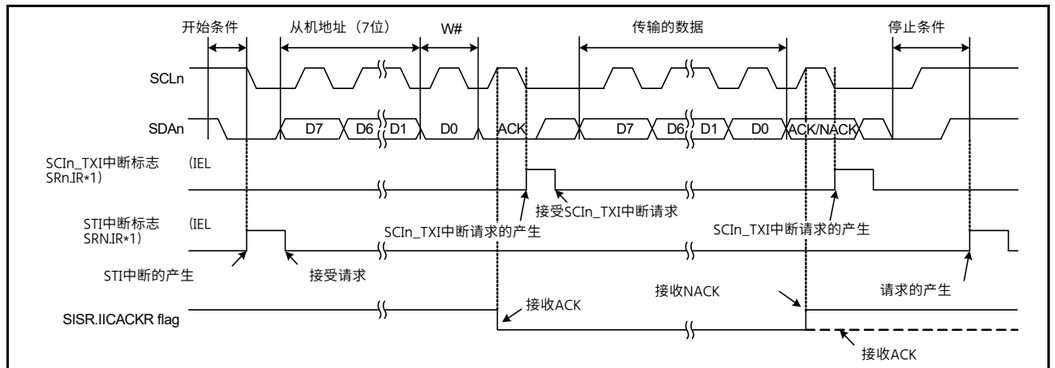
Figure 30.65 Example 2 operation for master transmission in simple IIC mode with 7-bit slave addresses, ACK interrupts, and NACK interrupts

30.7.5 简单IIC模式下的主传输操作

图30.64和图30.65显示了主机传输的示例，图30.66显示了数据传输的示例流程。SIMR2.IICINTM位的值假定为1（使用接收和发送中断），SCR.RIE位的值假定为0（SCIn_RXI和SCIn_ERI中断请求被禁用）。有关STI中断的更多信息，请参见表30.29。

当使用10位从地址时，图30.66中的步骤[3]和[4]重复两次。

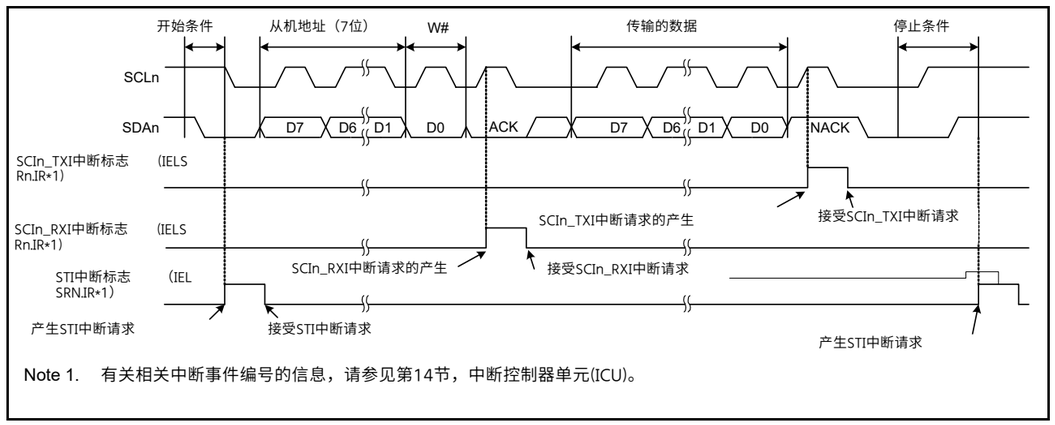
在简单IIC模式下，发送数据空中断(SCIn_TXI)在一帧通信完成时产生，与时钟同步传输期间的SCIn_TXI中断请求产生的时序不同。



Note 1. 有关相关中断事件编号的信息，请参见第14节，中断控制器单元(ICU)。

Figure 30.64 示例1简单IIC模式下的主机发送操作，具有7位从机地址、发送中断和接收中断

当SIMR2.IICINTM位设置为0时，在主机发送期间使用ACKNACK中断，DMAC或DTC由ACK中断作为触发器激活，并发送所需数量的数据字节。接收到NACK时，以NACK中断为触发进行发送停止、重发等错误处理。



Note 1. 有关相关中断事件编号的信息，请参见第14节，中断控制器单元(ICU)。

30.8 Operation in Simple SPI Mode

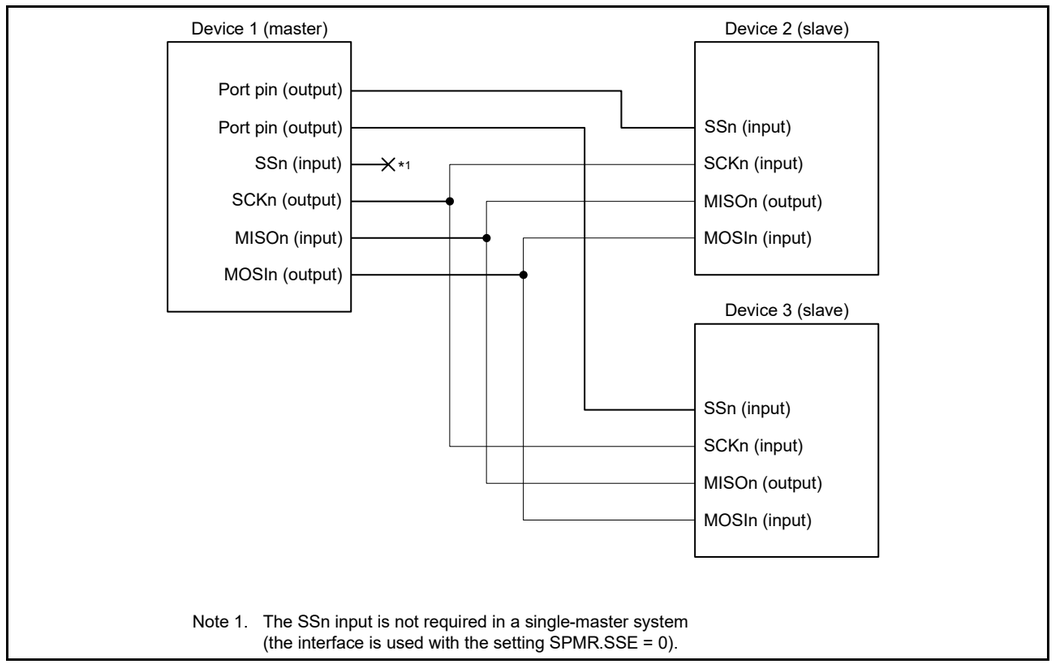
As an extended function, the SCI supports a simple SPI mode that handles transfer between one or multiple master devices and multiple slave devices.

To place the SCI in simple SPI mode, use the settings for clock synchronous mode (SCMR.SMIF = 0, SIMR1.IICM = 0, SMR.CM = 1) and set the SPMR.SSE bit to 1. When the configuration only has a single master, the SSn pin function on the master side is not required to connect the device used as the master in simple SPI mode. Therefore, set the SPMR.SSE bit to 0 in this case.

Figure 30.69 shows an example of connections in simple SPI mode. Use a general port pin to produce the SSn output signal from the master.

In simple SPI mode, data is transferred in synchronization with clock pulses in the same way as in clock synchronous mode. One character of transfer data consists of 8 bits of data, and parity bits cannot be appended. The data can be inverted by setting the SCMR.SINV bit to 1.

Because the receiver and transmitter are independent of each other within the SCI module, full-duplex communications are possible, with a common clock signal. Additionally, because both the transmitter and receiver have a buffered structure, it is possible to write the next transmit data while transmission is in progress and also read previously received data while reception is in progress. This enables continuous transfer.



Note 1. The SSn input is not required in a single-master system (the interface is used with the setting SPMR.SSE = 0).

Figure 30.69 Example connections using simple SPI mode in single master mode with SPMR.SSE bit = 0

30.8.1 States of Pins in Master and Slave Modes

The direction (input or output) of pins for the simple SPI mode interface differs according to whether the device is a master (SCR.CKE[1:0] = 00b or 01b and SPMR.MSS = 0) or slave (SCR.CKE[1:0] = 10b or 11b and SPMR.MSS = 1).

Table 30.25 lists the relationship between the pin states, mode, and input level on the SSn pin.

30.8 简单SPI模式下的操作

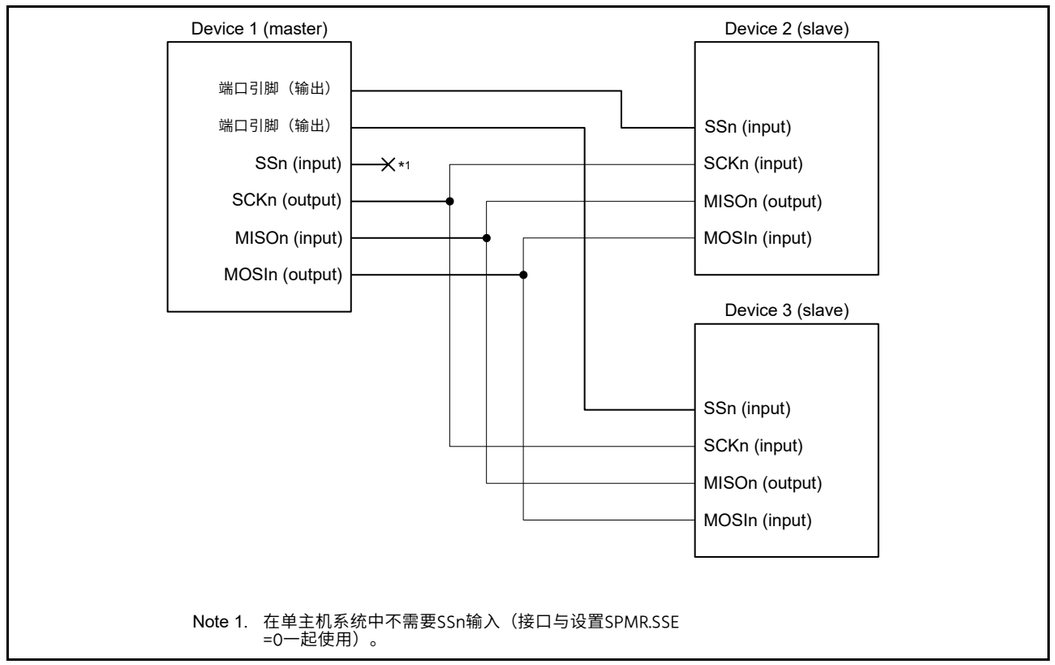
作为一项扩展功能，SCI支持简单的SPI模式，用于处理一个或多个主设备与多个从设备之间的传输。

要将SCI置于简单SPI模式，请使用时钟同步模式的设置（SCMR.SMIF=0，SIMR1.IICM=0，SMR.CM=1）并将SPMR.SSE位设置为1。当配置只有单主控，在简单SPI模式下连接作为主控的设备不需要主控侧的SSn引脚功能。因此，在这种情况下，将SPMR.SSE位设置为0。

图30.69显示了简单SPI模式下的连接示例。使用通用端口引脚从主机产生SSn输出信号。

在简单SPI模式下，数据与时钟脉冲同步传输，方式与时钟同步模式相同。1个字符的传输数据由8位数据组成，不能附加奇偶校验位。可以通过将SCMR.SINV位设置为1来反转数据。

由于接收器和发送器在SCI模块中相互独立，因此可以使用公共时钟信号进行全双工通信。此外，由于发送器和接收器都具有缓冲结构，因此可以在发送过程中写入下一个发送数据，并在接收过程中读取先前接收到的数据。这使得连续传输成为可能。



Note 1. 在单主机系统中不需要SSn输入（接口与设置SPMR.SSE=0一起使用）。

Figure 30.69 在SPMR.SSE位=0的单主模式下使用简单SPI模式的示例连接

30.8.1 主从模式下的引脚状态

简单SPI模式接口的引脚方向（输入或输出）根据设备是主设备（SCR.CKE[1:0]=00b或01b且SPMR.MSS=0）还是从设备（SCR.CKE）而不同[1:0]=10b或11b且SPMR.MSS=1)。

表30.25列出了SSn引脚上的引脚状态、模式和输入电平之间的关系。

RA生态工作室

Table 30.25 Pin states by mode and input level on the SSn pin

Mode	Input on SSn pin	State of TXDn pin	State of RXDn pin	State of SCKn pin
Master mode*1	High level (transfer can proceed)	Output for data transmission*2	Input for received data	Clock output*3
	Low level (transfer cannot proceed)	High-impedance	Input for received data (but disabled)	High-impedance
Slave mode	High level (transfer cannot proceed)	Input for received data (but disabled)	High-impedance	Clock input (but disabled)
	Low level (transfer can proceed)	Input for received data	Output for data transmission	Clock input

Note 1. When there is only a single master (SPMR.SSE = 0), transfer is possible regardless of the input level on the SSn pin. This is equivalent to the input of a high level on the SSn pin. Because the SSn pin function is not required, the pin is available for other purposes.
Note 2. The MOSIn pin output is in a high-impedance state when serial transmission is disabled (SCR.TE = 0).
Note 3. The SCKn pin output is in a high-impedance state when serial transmission is disabled (SCR.TE and RE = 00b) in a multi-master configuration (SPMR.SSE = 1).

30.8.2 SS Function in Master Mode

Setting the SCR.CKE[1:0] bits to 00b and the SPMR.MSS bit to 0 selects master operation. The SSn pin is not used in single-master configurations (SPMR.SSE = 0), so transmission or reception can proceed regardless of the value of the SSn pin.

When the level on the SSn pin is high in a multi-master configuration (SPMR.SSE = 1), a master device outputs clock signals from the SCKn pin before starting transmission or reception to indicate that there are no other masters or another master is performing reception or transmission.

When the level on the SSn pin is low in a multi-master configuration (SPMR.SSE = 1), there are other masters, and this indicates that transmission or reception is in progress. The MOSIn output and SCKn pins are placed in a high-impedance state and starting transmission or reception is not possible. In addition, the value of the SPMR.MFF bit is 1, indicating a mode fault error. In a multi-master configuration, start error processing by reading the SPMR.MFF flag. Even if a mode fault error occurs while transmission or reception is in progress, transmission or reception does not stop, but the MOSIn and SCKn outputs are placed in the high-impedance state after completion of the transfer. Use a general port pin to produce the SS output signal from the master.

30.8.3 SS Function in Slave Mode

Setting the SCR.CKE[1:0] bits to 10b and the SPMR.MSS bit to 1 selects slave operation. When the level on the SSn pin is high, the MISOn output pin is in a high-impedance state and the clock input through the SCKn pin is ignored. When the level on the SSn pin is low, clock input through the SCKn pin is valid and transmission or reception can proceed.

If the input on the SSn pin changes from low to high during transmission or reception, the MISOn output pin is placed in a high-impedance state. Meanwhile, the internal processing for transmission or reception continues at the rate of the clock input through the SCKn pin until processing for the current transmitted or received character is complete, after which it stops, and the appropriate interrupt (SCIn_TXI, SCIn_RXI, or SCIn_TEI) is then generated.

30.8.4 Relationship between Clock and Transmit/Receive Data

The CKPOL and CKPH bits in the SPMR can be used to set up the clock for use in transmission and reception in four different ways. The relation between the clock signal and the transmission and reception of data is shown in Figure 30.70. The relation is the same for both master and slave operation. This is the same as when the level on the SSn pin is high.

Table 30.25 SSn引脚上的模式和输入电平的引脚状态

Mode	SSn引脚上的输入	TXDn引脚状态	RXDn引脚状态	SCKn引脚状态
Master mode*1	高电平（可以进行转移）	数据传输输出*2	接收数据的输入	Clock output*3
	低电平（传输无法进行）	High-impedance	接收数据的输入（但禁用）	High-impedance
从机模式	高电平（传输无法进行）	接收数据的输入（但禁用）	High-impedance	时钟输入（但禁用）
	低电平（可以继续传输）	接收数据的输入	数据传输输出	时钟输入

注1.当只有一个主机(SPMR.SSE=0)时，无论SSn引脚上的输入电平如何，都可以进行传输。这相当于在SSn引脚上输入高电平。由于不需要SSn引脚功能，因此该引脚可用于其他用途。注2.当串行传输被禁用(SCR.TE=0)时，MOSIn引脚输出处于高阻抗状态。

注3.在多主机配置(SPMR.SSE=1)中禁用串行传输(SCR.TE和RE=00b)时，SCKn引脚输出处于高阻抗状态。

30.8.2 主控模式下的SS功能

将SCR.CKE[1:0]位设置为00b并将SPMR.MSS位设置为0选择主机操作。SSn引脚不用于单主机配置(SPMR.SSE=0)，因此无论SSn引脚的值如何，都可以进行发送或接收。

在多主机配置（SPMR.SSE=1）中，当SSn引脚上的电平为高电平时，主机设备在开始发送或接收之前从SCKn引脚输出时钟信号，以指示没有其他主机或另一个主机在进行接收或发送。

在多主机配置中（SPMR.SSE=1），当SSn引脚上的电平为低电平时，还有其他主机，这表明正在发送或接收。MOSIn输出和SCKn引脚处于高阻抗状态，无法开始发送或接收。此外，SPMR.MFF位的值为1，表示模式故障错误。在多主机配置中，通过读取SPMR.MFF标志开始错误处理。即使在发送或接收过程中发生模式故障错误，发送或接收也不会停止，而是在传输完成后将MOSIn和SCKn输出置于高阻抗状态。使用通用端口引脚从主机产生SS输出信号。

30.8.3 从模式下的SS功能

将SCR.CKE[1:0]位设置为10b并将SPMR.MSS位设置为1选择从机操作。当SSn引脚上的电平为高电平时，MISOn输出引脚处于高阻状态，通过SCKn引脚输入的时钟被忽略。当SSn引脚为低电平时，通过SCKn引脚输入的时钟有效，可以进行发送或接收。

如果SSn引脚上的输入在发送或接收期间从低电平变为高电平，则MISOn输出引脚处于高阻抗状态。同时，发送或接收的内部处理以通过SCKn引脚输入的时钟速率继续，直到对当前发送或接收字符的处理完成，之后它停止，并且适当的中断（SCIn_TXI、SCIn_RXI或SCIn_TEI）然后生成。

30.8.4 时钟与发送接收数据的关系

SPMR中的CKPOL和CKPH位可用于以四种不同的方式设置用于发送和接收的时钟。时钟信号与数据收发的关系如图30.70所示。主从操作的关系是相同的。这与SSn引脚上的电平为高电平时相同。

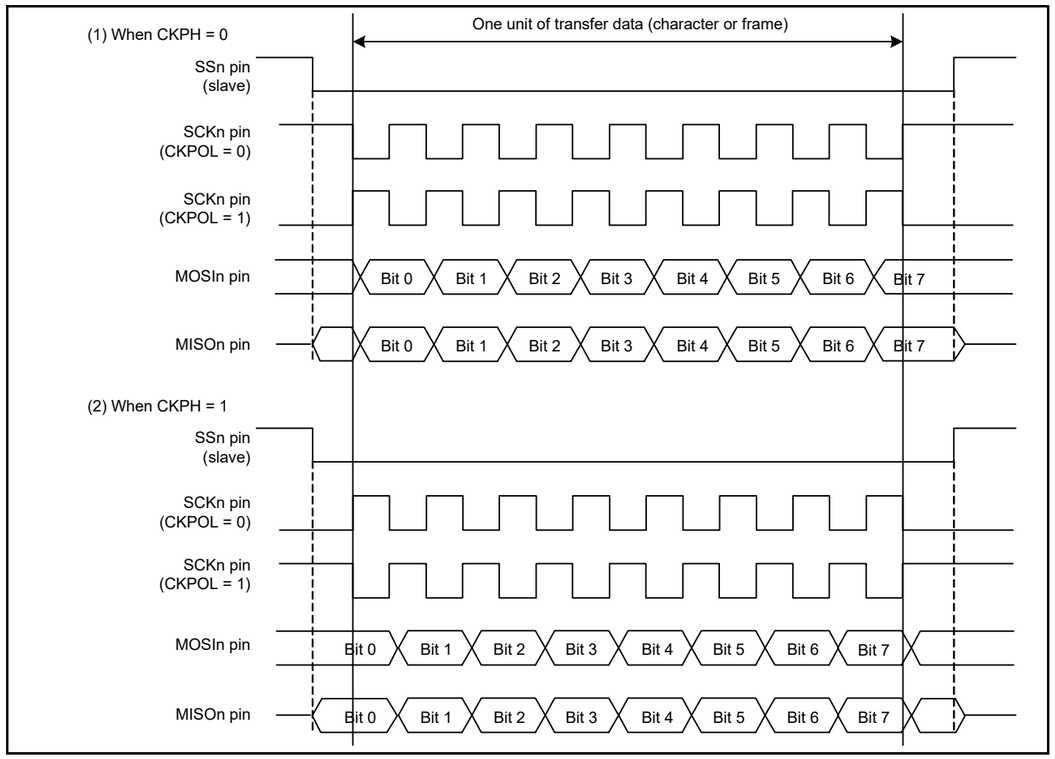


Figure 30.70 Relation between clock signal and transmit or receive data in simple SPI mode

30.8.5 SCI Initialization in Simple SPI Mode

Initialization in simple SPI mode is the same as in clock synchronous mode. See Figure 30.32 for an example initialization flow. The CKPOL and CKPH bits in the SPMR must be set to ensure that the selected clock signal configuration is suitable for both master and slave devices.

Always initialize the SCR register before making any changes to the operating mode or transfer format.

Note: Only the RE bit is set to 0. The SSR.ORER, FER, PER, and RDR flags are not initialized.

Changing the value of the TE bit from 1 to 0 or from 0 to 1 when the TIE bit in the SCR register is 1 at the same time, leads to the generation of a transmit data empty interrupt (SCIn_TXI).

30.8.6 Transmission and Reception of Serial Data in Simple SPI Mode

In master operation, ensure that the SSn pin of the slave device on the other side of the transfer is at a low level before starting the transfer and at a high level on completion of the transfer. Otherwise, the procedures are the same as in clock synchronous mode.

30.9 Bit Rate Modulation Function

Using the bit rate modulation function, the bit rate can be evenly corrected using the number specified in the MDDR register when PCLKA is selected in the CKS[1:0] bits in SMR/SMR_SMCI.

Figure 30.71 shows an example where PCLKA is selected in the CKS[1:0] bits in SMR/SMR_SMCI, the BRR bit is set to 0, and the MDDR is set to 160 in asynchronous mode. In this example, the cycle of the base clock is evenly corrected (256/160) and the bit rate is also corrected (160/256).

Note: Enabling an internal clock causes bias and expansion. Contraction is generated in the pulse width of the internal base clock.

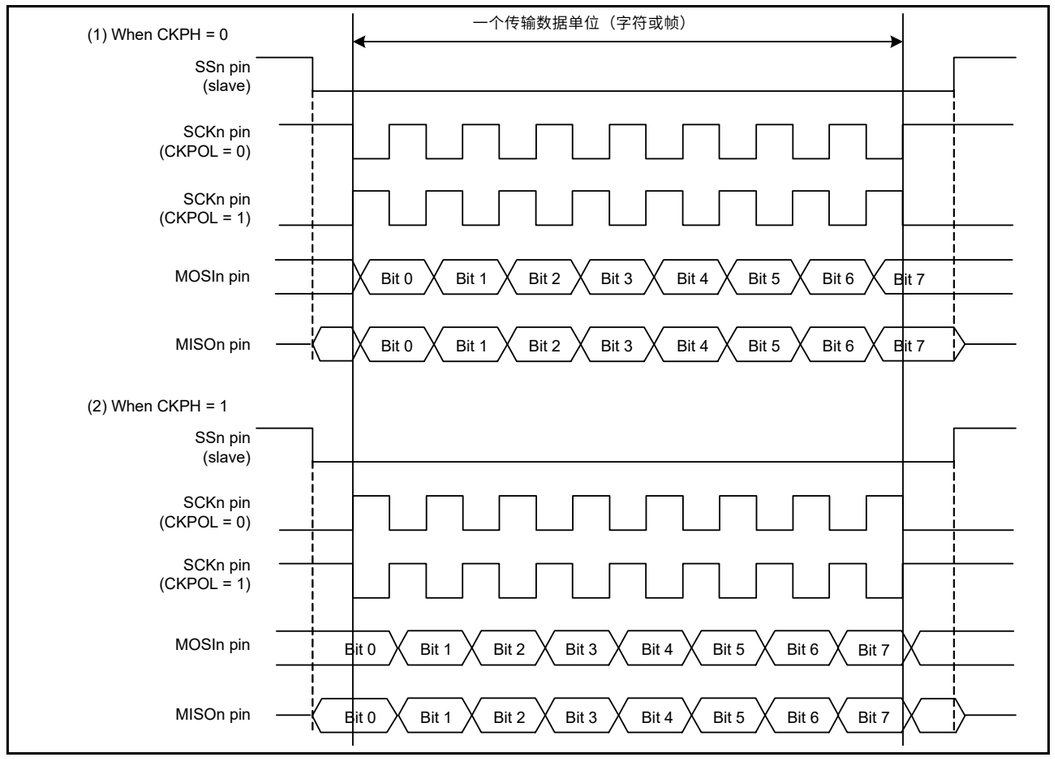

Figure 30.70 简单SPI模式下时钟信号与发送或接收数据的关系

30.8.5 简单SPI模式下的SCI初始化

简单SPI模式的初始化与时钟同步模式相同。有关示例初始化流程，请参见图30.32。必须设置SPMR中的CKPOL和CKPH位，以确保所选时钟信号配置适用于主器件和从器件。

在对操作模式或传输格式进行任何更改之前，始终初始化SCR寄存器。

Note: 只有RE位设置为0。SSR.ORER、FER、PER和RDR标志未初始化。

当SCR寄存器中的TIE位同时为1时，将TE位的值从1更改为0或从0更改为1，会导致产生发送数据空中断（SCIn_TXI）。

30.8.6 简单SPI模式下串行数据的发送和接收

在主机操作中，确保传输另一侧的从设备的SSn引脚在开始传输之前为低电平，在传输完成时为高电平。否则，过程与时钟同步模式相同。

30.9 比特率调制功能

使用比特率调制功能，当在SMRSMR_SMCI的CKS[1:0]位中选择PCLKA时，可以使用MDDR寄存器中指定的数字均匀地校正比特率。

图30.71显示了在SMRSMR_SMCI的CKS[1:0]位中选择PCLKA的示例，BRR位设置为0，异步模式下MDDR设置为160。在这个例子中，基本时钟的周期被均匀地校正（256160）并且比特率也被校正（160256）。

Note: 启用内部时钟会导致偏差和扩展。内部基准时钟的脉冲宽度产生收缩。

Do not use this function in clock synchronous mode and in the highest speed settings in simple SPI mode (SMR.CKS[1:0] = 00b, SCR.CKE[1] = 0, and BRR = 0).

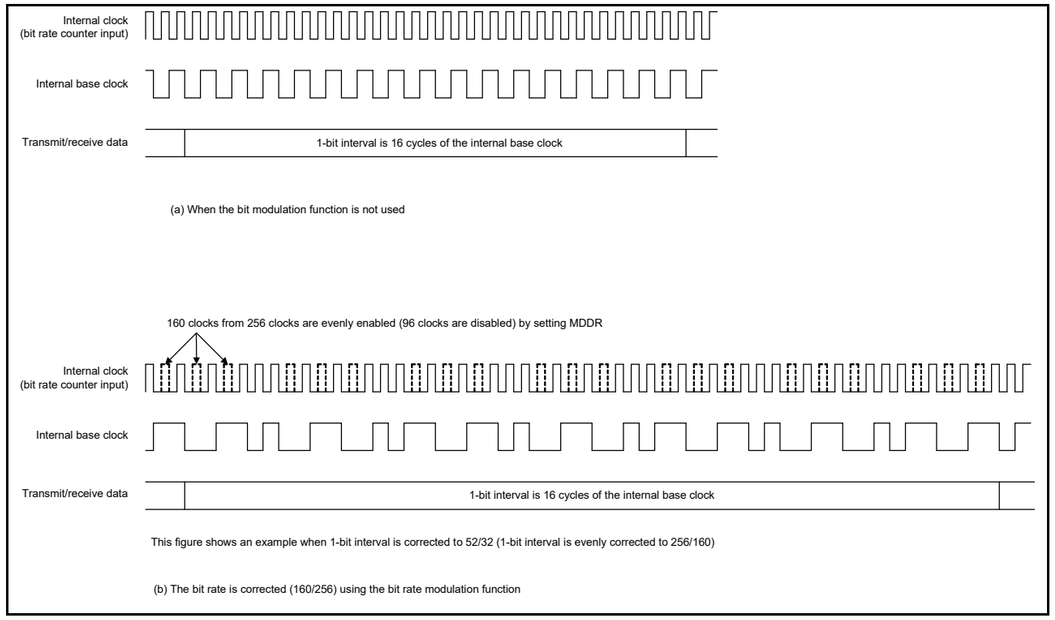

Figure 30.71 Example of internal base clock using bit rate modulation function

30.10 Interrupt Sources

30.10.1 Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts (non-FIFO selected)

If the conditions for an SCIn_TXI and SCIn_RXI interrupt are satisfied while the interrupt status flag in the ICU is 1, the ICU does not output the interrupt request but saves it internally, with a capacity for saving one request per source.

When the interrupt status flag in the ICU becomes 0, the interrupt request retained within the ICU is output. The internally retained interrupt request is automatically discarded when the actual interrupt is output. Clearing of the associated interrupt enable bit (the TIE or RIE bit in the SCR/SCR_SMCI) can also be used to discard an internally retained interrupt request.

30.10.2 Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts (FIFO selected)

When an interrupt status flag in the ICU is set to 1, the SCIn_TXI and SCIn_RXI interrupts do not output interrupt requests to the ICU. When an interrupt status flag of the ICU is set to 0, and if the conditions for SCIn_TXI and SCIn_RXI interrupts are satisfied, an interrupt request is generated.

30.10.3 Interrupts in Asynchronous, Clock Synchronous, and Simple SPI Modes

(1) Non-FIFO selected

Table 30.26 lists interrupt sources in asynchronous, clock synchronous, and simple SPI modes. A different interrupt vector can be assigned to each interrupt source. Individual interrupt sources can be enabled or disabled with the enable bits in the SCR register.

If the SCR.TIE bit is 1, an SCIn_TXI interrupt request is generated when transmit data is transferred from the TDR or TDRHL register*1 to the TSR register. An SCIn_TXI interrupt request can also be generated using a single instruction to set the SCR.TE and SCR.TIE bits to 1 simultaneously. An SCIn_TXI interrupt request can activate the DMAC or DTC to handle data transfer.

不要在时钟同步模式和简单SPI模式的最高速度设置（SMR.CKS[1:0]=00b，SCR.CKE[1]=0和BRR=0）中使用此功能。

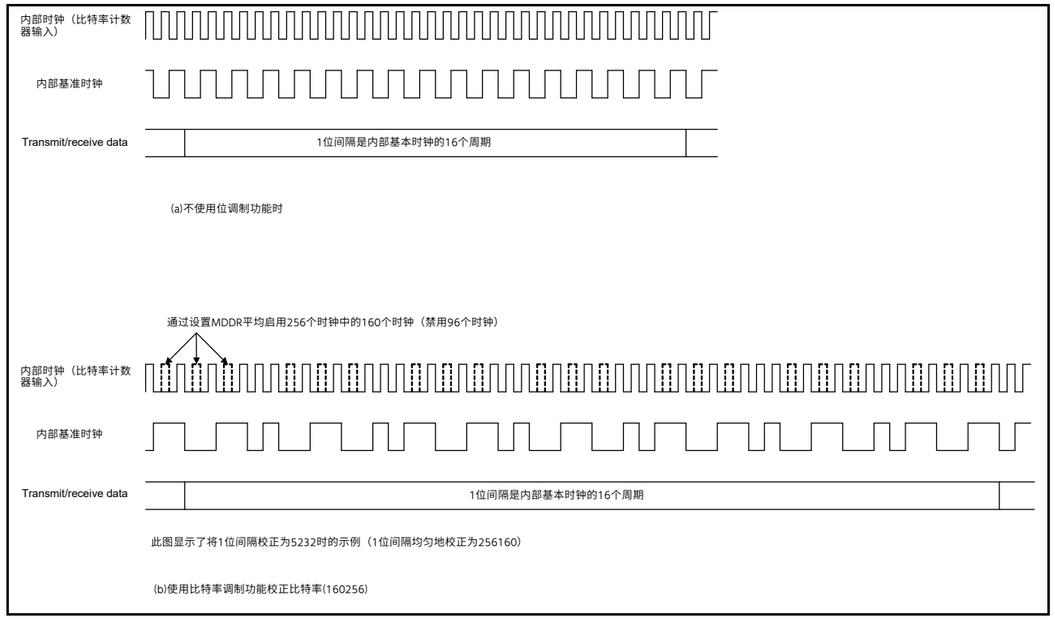

Figure 30.71 使用比特率调制功能的内部基准时钟示例

30.10 中断源

30.10.1 SCIn_TXI和SCIn_RXI中断的缓冲区操作（选择非FIFO）

如果在ICU中的中断状态标志为1时满足SCIn_TXI和SCIn_RXI中断的条件，则ICU不输出中断请求，而是在内部保存，每个源可以保存一个请求。

当ICU中的中断状态标志变为0时，输出ICU中保留的中断请求。当实际中断输出时，内部保留的中断请求会被自动丢弃。清除相关中断使能位（SCRSCR_SMCI中的TIE或RIE位）也可用于丢弃内部保留的中断请求。

30.10.2 SCIn_TXI和SCIn_RXI中断的缓冲区操作（选择FIFO）

当ICU中的中断状态标志设置为1时，SCIn_TXI和SCIn_RXI中断不会向ICU输出中断请求。当ICU的中断状态标志设置为0时，如果满足SCIn_TXI和SCIn_RXI中断的条件，则产生中断请求。

30.10.3 异步、时钟同步和简单SPI模式下的中断

(1) Non-FIFO selected

表30.26列出了异步、时钟同步和简单SPI模式下的中断源。可以为每个中断源分配不同的中断向量。可以使用SCR寄存器中的启用位启用或禁用各个中断源。

如果SCR.TIE位为1，则当发送数据从TDR传输或TDRHL寄存器*1到TSR寄存器。也可以使用一条指令同时将SCR.TE和SCR.TIE位设置为1来生成SCIn_TXI中断请求。SCIn_TXI中断请求可以激活DMAC或DTC来处理数据传输。

An SCIn_TXI interrupt request is not generated by setting the SCR.TE bit to 1 when SCR.TIE is 0 or by setting the SCR.TIE bit to 1 when the SCR.TE is 1.*2

When new data is not written by the time of transmission of the last bit of the current transmit data and SCR.TEIE is 1, the SSR.TEND flag sets to 1 and an SCIn_TEI interrupt request is generated. Additionally, when SCR.TE is 1, the SSR.TEND flag retains the value 1 until more transmit data are written to the TDR or TDRHL register*1, and setting SCR.TEIE to 1 leads to the generation of an SCIn_TEI interrupt request.

Writing data to the TDR or TDRHL register*1 leads to clearing of the SSR.TEND flag and, after a certain time, discarding of the SCIn_TEI interrupt request.

If the SCR.RIE bit is 1, an SCIn_RXI interrupt request is generated when received data is stored in the RDR register. An SCIn_RXI interrupt request can activate the DMAC or DTC to handle data transfer.

Setting any of the ORER, FER, and PER flags in the SSR register to 1 while the SCR.RIE bit is 1 leads to the generation of an SCIn_ERI interrupt request. An SCIn_RXI interrupt request is not generated at this time. Clearing all three flags (ORER, FER, and PER) leads to discarding of the SCIn_ERI interrupt request.

(2) FIFO selected

Table 30.27 lists the interrupt sources in FIFO selected mode.

If the SCR.TIE bit is 1, an SCIn_TXI interrupt request is generated when the amount of stored data in the FTDRL register becomes equal to or less than the threshold value indicated in FCR.TTRG. An SCIn_TXI interrupt request can also be generated by using a single instruction to set the SCR.TE and SCR.TIE bits to 1 simultaneously.

An SCIn_TXI interrupt request is not generated by setting SCR.TE to 1 when SCR.TIE is 0 or by setting SCR.TIE to 1 when SCR.TE is 1.

If SCR.TEIE is 1 and if the next data is not written to the FTDRL register by the time the last bit of the transmit data is sent, the SSR_FIFO.TEND flag is set to 1 and the SCIn_TEI interrupt request is generated.

If SCR.RIE is 1, the SCIn_RXI interrupt request is generated when the amount of stored data in the FRDRL register becomes equal to or greater than the threshold value indicated in FCR.RTRG. When RTRG is 0, an SCIn_RXI interrupt does not occur even when the amount of data in the receive FIFO is equal to 0.

If the SCR.RIE bit is 1, when the SSR_FIFO.ORER flag is set to 1 or data with a framing error or a parity error is stored in the FRDRL register, the SCIn_ERI interrupt request is generated. When the amount of data stored in the FRDRL register is at or above the threshold value, the SCIn_RXI interrupt request is also generated. The SCIn_ERI interrupt request can be canceled, in which case the SSR_FIFO.ORER, FER, and PER flags are all cleared.

Note 1. When asynchronous mode and 9-bit data length are selected.
Note 2. To temporarily prohibit the SCIn_TXI interrupts on transmission of the last of the data when a new round of transmission is to be started, after handling the transmission-completed interrupt, control the activation of the interrupt by using the interrupt request enable bit in the ICU rather than using the SCR.TIE bit. This approach can prevent the suppression of the SCIn_TXI interrupt requests in the transfer of new data.

Table 30.26 SCI interrupt sources with non-FIFO selected

Name	Interrupt source	Interrupt flag	Interrupt enable	DTC activation	DMAC activation
SCIn_ERI	Receive error*1	ORER, FER, PER, DFER, DPER	RIE	Not possible	Not possible
SCIn_RXI	Receive data full	RDRF	RIE	Possible	Possible
	Address match	DCMF	RIE	Possible	Possible
SCIn_AM	Address match	DCMF	-	Possible	Possible
SCIn_TXI	Transmit data empty	TDRE	TIE	Possible	Possible
SCIn_TEI	Transmit end	TEND	TEIE	Not possible	Not possible

Note 1. The interrupt flag is only ORER when in clock synchronous mode and simple SPI mode.

当SCR.TIE为0时将SCR.TE位设置为1或通过设置
当SCR.TE为1时，SCR.TIE位为1。*2

如果在当前发送数据的最后一位发送时没有写入新数据且SCR.TEIE为1，则SSR.TEND标志设置为1，并产生SCIn_TEI中断请求。此外，当SCR.TE为1时，SSR.TEND标志保持值1，直到有更多发送数据写入TDR或TDRHL寄存器*1，并且设置

SCR.TEIE为1导致产生SCIn_TEI中断请求。

将数据写入TDR或TDRHL寄存器*1会导致SSR.TEND标志清零，并在一定时间后丢弃SCIn_TEI中断请求。

如果SCR.RIE位为1，则当接收到的数据存储在RDR寄存器中时会产生SCIn_RXI中断请求。一个SCIn_RXI中断请求可以激活DMAC或DTC来处理数据传输。

当SCR.RIE位为1时，将SSR寄存器中的任何ORER、FER和PER标志设置为1会导致产生SCIn_ERI中断请求。此时不产生SCIn_RXI中断请求。清除所有三个标志（ORER、FER和PER）会导致丢弃SCIn_ERI中断请求。

(2) FIFO selected

表30.27列出了FIFO选择模式下的中断源。

如果SCR.TIE位为1，则当FTDRL寄存器中存储的数据量等于或小于FCR.TTRG中指示的阈值时，将产生SCIn_TXI中断请求。通过使用一条指令同时将SCR.TE和SCR.TIE位设置为1，也可以生成SCIn_TXI中断请求。

当SCR.TIE为0时将SCR.TE设置为1，或者当SCR.TE为1时将SCR.TIE设置为1，不会产生SCIn_TXI中断请求。

如果SCR.TEIE为1，并且在发送数据的最后一位时下一个数据未写入FTDRL寄存器，则SSR_FIFO.TEND标志设置为1，并产生SCIn_TEI中断请求。

如果SCR.RIE为1，则当FRDRL寄存器中存储的数据量等于或大于FCR.RTRG中指示的阈值时，将产生SCIn_RXI中断请求。当RTRG为0时，即使接收FIFO中的数据量等于0，也不会发生SCIn_RXI中断。

如果SCR.RIE位为1，当SSR_FIFO.ORER标志设置为1或帧错误或奇偶校验错误的数据存储在FRDRL寄存器中时，将产生SCIn_ERI中断请求。当FRDRL寄存器中存储的数据量等于或高于阈值时，也会产生SCIn_RXI中断请求。SCIn_ERI中断请求可以被取消，在这种情况下SSR_FIFO.ORER、FER和PER标志都被清除。

注意1.选择异步模式和9位数据长度时。
注2.为在新一轮传输开始时暂时禁止SCIn_TXI中断对最后一个数据的传输，在处理完传输完成中断后，使用中断请求使能位控制中断的激活。ICU而不是使用SCR.TIE位。这种方法可以防止在传输新数据时抑制SCIn_TXI中断请求。

Table 30.26 选择了非FIFO的SCI中断源

Name	中断源	中断标志	中断使能	DTC activation	DMAC activation
SCIn_ERI	Receive error*1	ORER、FER、PER、DFER, DPER	RIE	不可能	不可能
SCIn_RXI	接收数据已满	RDRF	RIE	Possible	Possible
	地址匹配	DCMF	RIE	Possible	Possible
SCIn_AM	地址匹配	DCMF	-	Possible	Possible
SCIn_TXI	传输数据为空	TDRE	TIE	Possible	Possible
SCIn_TEI	发射端	TEND	TEIE	不可能	不可能

注1.仅在时钟同步模式和简单SPI模式下中断标志为ORER。

Table 30.27 SCI interrupt sources with FIFO selected

Name	Interrupt source	Interrupt flag	Interrupt enable	DTC activation	DMAC activation
SCIn_ERI	Receive error*1	ORER, FER, PER, DFER, DPER	RIE	Not possible	Not possible
		DR (when FCR.DRES = 1)	RIE	Not possible	Not possible
SCIn_RXI	Receive data full	RDF	RIE	Possible	Possible
	Receive data ready	DR (when FCR.DRES = 0)	RIE	Possible	Possible
	Address match	DCMF	RIE	Possible	Possible
SCIn_AM	Address match	DCMF	-	Possible	Possible
SCIn_TXI	Transmit data empty	TDFE	TIE	Possible	Possible
SCIn_TEI	Transmit end	TEND	TEIE	Not possible	Not possible

Note 1. The interrupt flag is only ORER when in clock synchronous mode and simple SPI mode.

30.10.4 Interrupts in Smart Card Interface Mode

Table 30.28 lists the interrupt sources in smart card interface mode. A transmit end interrupt (SCIn_TEI) request and an address match (SCIn_AM) request cannot be used in this mode.

Table 30.28 SCI Interrupt sources in smart card interface mode

Name	Interrupt source	Interrupt flag	Interrupt enable	DTC activation	DMAC activation
SCIn_ERI	Receive error or error signal detection	ORER, FER, ERS	RIE	Not possible	Not possible
SCIn_RXI	Receive data full	RDRF	RIE	Possible	Possible
SCIn_TXI	Transmit end	TEND	TIE	Possible	Possible

Data transmission or reception using the DMAC or DTC is also possible in smart card interface mode. In transmission, when the SSR_SMCI.TEND flag is set to 1, an SCIn_TXI interrupt request is generated. The SCIn_TXI interrupt request activates the DMAC or DTC, allowing the transfer of transmit data if the SCIn_TXI request is previously specified as a source for DMAC or DTC activation. The TEND flag is automatically set to 0 when the DMAC or DTC transfers the data.

If an error occurs, the SCI automatically retransmits the same data. During the retransmission, the TEND flag is kept at 0 and the DMAC or DTC is not activated. Therefore, the SCI and DMAC or DTC automatically transmit the specified number of bytes, including retransmission when errors occur. However, the SSR_SMCI.ERS flag is not automatically cleared to 0 at error occurrence. Therefore, the ERS flag must be cleared by previously setting the SCR_SMCI.RIE bit to 1 to enable an SCIn_ERI interrupt request to be generated at error occurrence.

When transmitting or receiving data using the DMAC or DTC, always enable the DMAC or DTC before setting the SCI. For DMAC or DTC settings, see section 17, DMA Controller (DMAC) and section 18, Data Transfer Controller (DTC).

In reception, an SCIn_RXI interrupt request is generated when receive data is set to RDR. The SCIn_RXI interrupt request activates the DMAC or DTC, allowing transfer of receive data if the SCIn_RXI request is previously specified as a source of DMAC or DTC activation. If an error occurs, the error flag is set. Therefore, the DMAC or DTC is not activated and an SCIn_ERI interrupt request is issued to the CPU instead. The error flag must be cleared.

30.10.5 Interrupts in Simple IIC Mode

Table 30.29 lists the interrupt sources in simple IIC mode. The STI interrupt is allocated to the transmit end interrupt (SCIn_TEI) request. The receive error interrupt (SCIn_ERI) and the address match (SCIn_AM) request cannot be used.

The DMAC or DTC can also be used to handle transfer in simple IIC mode.

When the SIMR2.IICINTM bit is 1:

- An SCIn_RXI request is generated on the falling edge of the SCLn signal for the 8th bit. If SCIn_RXI is previously

Table 30.27 选择了FIFO的SCI中断源

Name	中断源	中断标志	中断使能	DTC activation	DMAC activation
SCIn_ERI	Receive error*1	ORER、FER、PER、DFER, DPER	RIE	不可能	不可能
		DR (when FCR.DRES = 1)	RIE	不可能	不可能
SCIn_RXI	接收数据已满	RDF	RIE	Possible	Possible
	接收数据就绪	DR (when FCR.DRES = 0)	RIE	Possible	Possible
	地址匹配	DCMF	RIE	Possible	Possible
SCIn_AM	地址匹配	DCMF	-	Possible	Possible
SCIn_TXI	传输数据为空	TDFE	TIE	Possible	Possible
SCIn_TEI	发射端	TEND	TEIE	不可能	不可能

注1.仅在时钟同步模式和简单SPI模式下中断标志为ORER。

30.10.4 智能卡接口模式中的中断

表30.28列出了智能卡接口模式下的中断源。在此模式下不能使用发送结束中断(SCIn_TEI)请求和地址匹配(SCIn_AM)请求。

Table 30.28 智能卡接口模式下的SCI中断源

Name	中断源	中断标志	中断使能	DTC activation	DMAC activation
SCIn_ERI	接收错误或错误信号检测	ORER、FER、ERS	RIE	不可能	不可能
SCIn_RXI	接收数据已满	RDRF	RIE	Possible	Possible
SCIn_TXI	发射端	TEND	TIE	Possible	Possible

在智能卡接口模式下也可以使用DMAC或DTC进行数据传输或接收。在发送过程中，当SSR_SMCI.TEND标志设置为1时，会产生一个SCIn_TXI中断请求。SCIn_TXI中断请求激活DMAC或DTC，如果之前将SCIn_TXI请求指定为DMAC或DTC激活源，则允许传输数据。当DMAC或DTC传输数据时，TEND标志自动设置为0。

如果发生错误，SCI会自动重新传输相同的数据。在重传期间，TEND标志保持为0，并且不激活DMAC或DTC。因此，SCI和DMAC或DTC会自动传输指定的字节数，包括发生错误时的重传。但是，发生错误时，SSR_SMCI.ERS标志不会自动清除为0。因此，必须通过预先将SCR_SMCI.RIE位设置为1来清除ERS 标志，以在发生错误时启用SCIn_ERI中断请求。

使用DMAC或DTC发送或接收数据时，请务必在设置SCI之前启用DMAC或DTC。对于DMAC或DTC设置，请参阅第17节，DMA控制器(DMAC)和第18节，数据传输控制器(DTC)。

在接收中，当接收数据设置为RDR时会产生SCIn_RXI中断请求。SCIn_RXI中断请求激活DMAC或DTC，如果之前将SCIn_RXI请求指定为DMAC或DTC激活源，则允许传输接收数据。如果发生错误，则设置错误标志。因此，不会激活DMAC或DTC，而是向CPU发出SCIn_ERI中断请求。必须清除错误标志。

30.10.5 简单IIC模式下的中断

表30.29列出了简单IIC模式下的中断源。STI中断分配给发送结束中断(SCIn_TEI)请求。不能使用接收错误中断(SCIn_ERI)和地址匹配(SCIn_AM)请求。

DMAC或DTC也可用于处理简单IIC模式下的传输。

当SIMR2.IICINTM位为1时：

- SCIn_RXI请求在第8位的SCLn信号的下降沿产生。如果SCIn_RXI之前是

set up as an activation source for the DMAC or DTC, the SCIn_RXI request activates the DMAC or DTC to handle transfer of the received data.

- An SCIn_TXI request is generated on the falling edge of the SCLn signal for the 9th bit (acknowledge bit). If SCIn_TXI is previously set up as an activation source for the DMAC or DTC, the SCIn_TXI request activates the DMAC or DTC to handle transfer of the transmit data.

When the SIMR2.IICINTM bit is 0:

- An SCIn_RXI request (ACK detection) is generated if the input on the SDAn pin is low on the rising edge of the SCLn signal for the 9th bit (acknowledge bit)
- An SCIn_TXI request (NACK detection) is generated if the input on the SDAn pin is high on the rising edge of the SCLn signal for the 9th bit (acknowledge bit)
- If SCIn_RXI is previously set up as an activation source for the DMAC or DTC, the SCIn_RXI request activates the DMAC or DTC to handle the transfer of the received data.

If the DMAC or DTC is used for data transfer in reception or transmission, always set up and enable the DMAC or DTC before setting up the SCI.

When the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits in SIMR3 are used to generate a start condition, restart condition, or stop condition, the STI request is issued when generation is complete.

Table 30.29 SCI interrupt sources in simple IIC mode

Name	Interrupt source	Interrupt flag	Interrupt enable	DTC activation	DMAC activation
SCIn_RXI	Reception, ACK detection	-	RIE	Possible	Possible
SCIn_TXI	Transmission, NACK detection	-	TIE	Possible	Possible
STIn	Completion of generation of a start, restart, or stop condition	IICSTIF	TEIE	Not possible	Not possible

Note 1. Activation of the DTC is only possible when the SIMR2.IICINTM bit is 1 (use reception and transmission interrupts).

30.11 Event Linking

By using interrupt request signals as event signals, the SCI can provide linked operation through the Event Link Controller (ELC) for modules selected in advance.

Event signals can be output regardless of the values of the associated interrupt request enable bits.

(1) Error event output (receive error or error signal detected)

- Indicates abnormal termination because of a parity error during reception in asynchronous mode
- Indicates abnormal termination because of a framing error during reception in asynchronous mode
- Indicates abnormal termination because of an overrun error during reception
- Indicates detection of the error signal during transmission in smart card interface mode
- Indicates that when the SSR_FIFO.FER and PER flags are 0, and receive data less than the receive FIFO data trigger number is in the receive FIFO buffer, 15 ETUs elapse when FIFO is selected and the FCR.DRES bit is 1.

(2) Receive data full event output

- Indicates that ACK is detected if the SIMR2.IICINTM bit is 0 in simple IIC mode
- Indicates that the 8th bit SCLn falling edge is detected if the SIMR2.IICINTM bit is 1 in simple IIC mode
- When the SIMR2.IICINTM bit is 1 during master transmission in simple IIC mode, set the ELC so that receive data full events are not used.

设置为DMAC或DTC的激活源时，SCIn_RXI请求将激活DMAC或DTC以处理接收数据的传输。

- SCIn_TXI请求在第9位（确认位）的SCLn信号的下降沿生成。如果SCIn_TXI先前设置为DMAC或DTC的激活源，SCIn_TXI请求激活DMAC或DTC来处理传输数据的传输。

当SIMR2.IICINTM位为0时：

- 如果SDAn引脚上的输入在第9位的SCLn信号（确认位）
- 如果SDAn引脚上的输入在第9位的SCLn信号（确认位）
- 如果SCIn_RXI先前设置为DMAC或DTC的激活源，则SCIn_RXI请求会激活DMAC或DTC来处理接收数据的传输。

如果DMAC或DTC用于接收或传输中的数据传输，请始终在设置SCI之前设置并启用DMAC或DTC。

当SIMR3中的IICSTAREQ、IICRSTAREQ和IICSTPREQ位用于生成开始条件、重新启动条件或停止条件时，生成完成时会发出STI请求。

Table 30.29 简单IIC模式下的SCI中断源

Name	中断源	中断标志	中断使能	DTC activation	DMAC activation
SCIn_RXI	接收、ACK检测	-	RIE	Possible	Possible
SCIn_TXI	传输、NACK检测	-	TIE	Possible	Possible
STIn	完成启动、重新启动或停止条件的生成	IICSTIF	TEIE	不可能	不可能

注1.只有当SIMR2.IICINTM位为1（使用接收和发送中断）时，才能激活DTC。

30.11 事件链接

通过使用中断请求信号作为事件信号，SCI可以通过EventLink提供链接操作预先选择的模块的控制器(ELC)。

无论相关中断请求使能位的值如何，都可以输出事件信号。

(1) 错误事件输出（接收错误或检测到错误信号）

- 表示在异步模式下接收期间由于奇偶校验错误而异常终止
- 指示在异步模式下接收期间由于帧错误而异常终止
- 表示接收期间由于溢出错误而异常终止
- 指示在智能卡接口模式下传输期间检测到错误信号
- 表示当SSR_FIFO.FER和PER标志为0且接收数据小于接收FIFO数据触发数在接收FIFO缓冲区中时，选择FIFO且FCR.DRES位为1时经过15个ETU。

(2) 接收数据满事件输出

- 如果SIMR2.IICINTM位在简单IIC模式下为0，则表示检测到ACK
- 表示如果SIMR2.IICINTM位在简单IIC模式下为1，则检测到第8位SCLn下降沿
- 当SIMR2.IICINTM位在简单IIC模式下主机发送期间为1时，设置ELC以便不使用接收数据满事件。

(a) Non-FIFO selected

- Indicates that received data is set in the Receive Data Register (RDR or RDRHL).

(b) FIFO selected

- Using this event output is prohibited.

(3) Transmit data empty event output

- Indicates that the SCR/SCR_SMCI.TE bit changed from 0 to 1
- Indicates that transmission is complete in smart card interface mode
- Indicates that NACK is detected if the SIMR2.IICINTM bit is 0 in simple IIC mode
- Indicates that the 9th-bit SCLn falling edge is detected if the SIMR2.IICINTM bit is 1 in simple IIC mode.

(a) Non-FIFO selected

- Indicates that transmit data is transferred from the Transmit Data Register (TDR or TDRHL) to the Transmit Shift Register (TSR).

(b) FIFO selected

- Using this event output is prohibited.

(4) Transmit end event output

- Indicates the completion of transmission
- Indicates that the starting condition, restart condition, or stop condition is generated in simple IIC mode

Note: When FIFO is selected, using this event output is prohibited.

(5) Address match event output

- Indicates a match of the comparison data (CDR.CMPD) with one frame of receive data when DCCR.DCME is set to 1 in asynchronous mode, including multi-processor mode.

30.12 Address Mismatch Event Output (SCI0_DCUF)

The address mismatch event output, SCI0_DCUF, indicates a mismatch of the comparison data (CDR.CMPD) with one frame of receive data when DCCR.DCME is set to 1 in asynchronous mode, including multi-processor mode. This event can be used for snooze end request only.

30.13 Noise Cancellation Function

Figure 30.72 shows the configuration of the noise filter used for noise cancellation. The noise filter consists of a 2-stage flip-flop circuit and a match detection circuit. When the input signals of the noise filter and the output signals of the 2-stage flip-flop circuits completely match, the matched level is an internal signal. Unless a match occurs, the previous value is retained. When the same level is retained for 3 cycles or longer on the sampling clock of the noise filter, it is considered as a valid receive signal. A change in pulse for 3 cycles or shorter is considered as noise and not as a receive signal.

When SEMR.ABCS = 0 and SEMR.ABCSE = 0, the cycle is 1/16 the period of 1 transfer bit.

When SEMR.ABCS = 1 and SEMR.ABCSE = 0, the cycle is 1/8 the period of 1 transfer bit.

When SEMR.ABCSE = 1, the cycle is 1/6 the period of 1 transfer bit.

In asynchronous mode, the noise cancellation function can be applied to the receive signal input on the RXDn pin. The receive level of the RXDn is sampled in the flip-flop circuit of the noise filter on the base clock of the asynchronous mode.

In simple IIC mode, the noise cancellation function can be used for each input on SDAn and SCLn. The sampling clock for the noise cancellation function is selected in the SNFR.NFCS[2:0] bit by dividing the baud rate generator source clock by 1, 2, 4, or 8.

If the base clock is stopped with the noise filter enabled and the base clock input is restarted again, the noise filter

(a) Non-FIFO selected

- 表示接收数据设置在接收数据寄存器（RDR或RDRHL）中。

(b) FIFO selected

- 禁止使用此事件输出。

(3) 传输数据空事件输出

- 表示SCRSCR_SMCI.TE位由0变为1
- 表示在智能卡接口模式下传输完成
- 如果SIMR2.IICINTM位在简单IIC模式下为0，则表示检测到NACK
- 表示如果SIMR2.IICINTM位在简单IIC模式下为1，则检测到第9位SCLn下降沿。

(a) Non-FIFO selected

- 表示发送数据从发送数据寄存器（TDR或TDRHL）传输到发送移位 Register (TSR).

(b) FIFO selected

- 禁止使用此事件输出。

(4) 发送结束事件输出

- 表示传输完成
- 指示在简单IIC模式下生成启动条件、重启条件或停止条件

Note: 选择FIFO时，禁止使用该事件输出。

(5) 地址匹配事件输出

- 当DCCR.DCME在异步模式（包括多处理器模式）下设置为1时，表示比较数据(CDR.CMPD)与一帧接收数据的匹配。

30.12 地址不匹配事件输出(SCI0_DCUF)

地址不匹配事件输出SCI0_DCUF指示当DCCR.DCME在异步模式（包括多处理器模式）下设置为1时比较数据(CDR.CMPD)与一帧接收数据不匹配。此事件仅可用于贪睡结束请求。

30.13 降噪功能

图30.72显示了用于噪声消除的噪声滤波器的配置。噪声滤波器由一个2级触发器电路和一个匹配检测电路组成。当噪声滤波器的输入信号与2级触发器电路的输出信号完全匹配时，匹配电平为内部信号。除非发生匹配，否则将保留先前的值。当相同电平在噪声滤波器的采样时钟上保持3个周期或更长时间时，它被认为是有效的接收信号。3个周期或更短的脉冲变化被认为是噪声而不是接收信号。

当SEMR.ABCS=0且SEMR.ABCSE=0时，周期为1161个传输位的周期。

当SEMR.ABCS=1和SEMR.ABCSE=0时，周期为181个传输位的周期。

当SEMR.ABCSE=1时，周期为161个传输位的周期。

在异步模式下，可以对RXDn引脚上的接收信号输入应用噪声消除功能。RXDn的接收电平在异步模式的基本时钟上在噪声滤波器的触发器电路中进行采样。

在简单IIC模式下，可以对SDAn和SCLn上的每个输入使用噪声消除功能。通过将波特率发生器源时钟除以1、2、4或8，在SNFR.NFCS[2:0]位中选择噪声消除功能的采样时钟。

如果在启用噪声滤波器的情况下停止基本时钟并且再次重新启动基本时钟输入，则噪声滤波器

operation resumes from the state where the clock was stopped. When SCR.TE and SCR.RE are set to 0 during base clock input, all of the noise filter flip-flop values are initialized to 1. Accordingly, if the input data is 1 when reception operation resumes, the function determines that a level match is detected and the result is an internal signal. When the level being input corresponds to 0, the initial output of the noise filter is retained until the level matches in 3 consecutive sampling cycles.

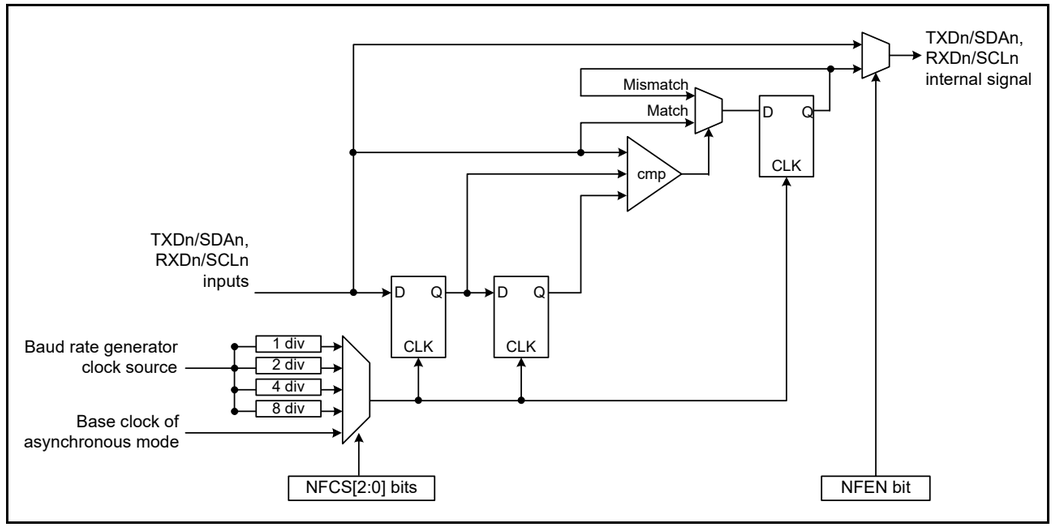

Figure 30.72 Digital noise filter circuit block diagram

30.14 Usage Notes

30.14.1 Settings for the Module-Stop State

The Module Stop Control Register B (MSTPCRB) can enable or disable SCI operation. The SCI is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

30.14.2 SCI Operation during Low Power State

(1) Transmission

When setting the module to the stopped state or in transition to Software Standby, stop the operation (by setting the TIE, TE, and TEIE bits in the SCR/SCR_SMCI to 0) after switching the TXDn pin to the general I/O port pin function. When setting the I/O port as an SCI connection, the SPTR register can control the state of the TXDn pin. Setting the TE bit to 0 initializes the TSR register. The TEND bit in the SSR/SSR_SMCI is initialized to 1 with non-FIFO selected. The value is saved with FIFO selected. Depending on the port settings and the SPTR register settings, output pins might output the level before a transition to the low power state is made after release from the module-stop state or Software Standby mode. When transitions to these states are made during transmission, the transmitted data becomes indeterminate.

To transmit data in the same transmission mode after cancellation of the low power state:

1. Set the TE bit to 1.
2. Read SSR/SSR_FIFO/SSR_SMCI.
3. Write data to TDR sequentially to start data transmission.

To transmit data with a different transmission mode, initialize the SCI first.

Figure 30.73 shows an example flow of transition to Software Standby mode during transmission. Figure 30.74 and Figure 30.75 show the port pin states during transition to Software Standby mode.

Before specifying the module-stop state or making a transition to Software Standby mode from the transmission mode

操作从时钟停止的状态恢复。当SCR.TE和SCR.RE在基本时钟输入期间设置为0时，所有噪声滤波器触发器值都被初始化为1。因此，如果在接收操作恢复时输入数据为1，则该函数确定一个电平检测到匹配，结果是一个内部信号。当输入的电平对应于0时，保留噪声滤波器的初始输出，直到电平在3个连续采样周期内匹配。

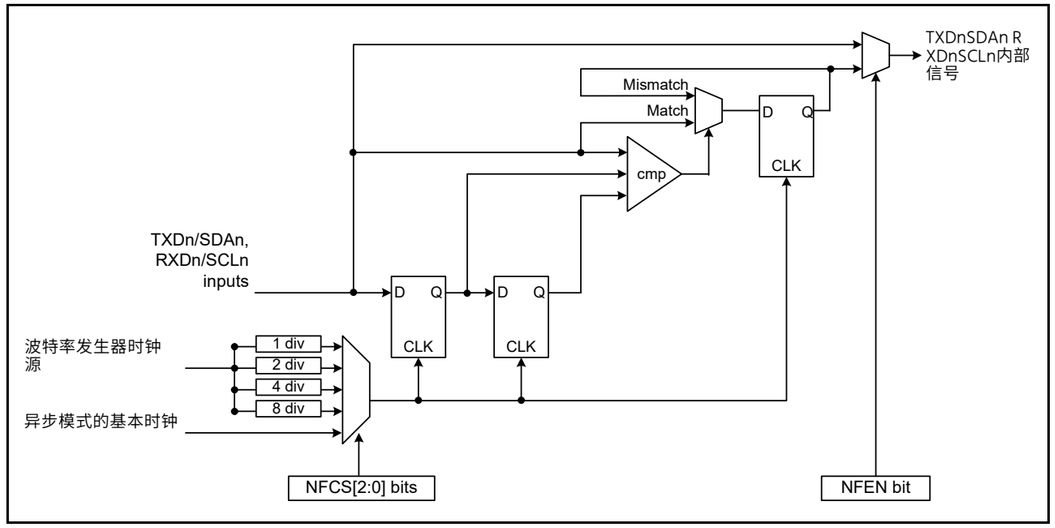

Figure 30.72 数字噪声滤波器电路框图

30.14 使用说明

30.14.1 模块停止状态的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用SCI操作。SCI在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

30.14.2 低功耗状态下的SCI操作

(1) Transmission

将模块设置为停止状态或转换为软件待机时，在将TXDn引脚切换为通用IO端口引脚功能后停止操作（通过将SCRSCR_SMCI中的TIE、TE和TEIE位设置为0）。当设置IO口为SCI连接时，SPTR寄存器可以控制TXDn引脚的状态。将TE位设置为0初始化TSR寄存器。SSRSSR_SMCI中的TEND位在选择非FIFO时初始化为1。该值在选择FIFO的情况下保存。根据端口设置和SPTR寄存器设置，输出引脚可能会在从模块停止状态或软件待机模式释放后转换到低功耗状态之前输出电平。在传输过程中转换到这些状态时，传输的数据变得不确定。

在取消低功耗状态后以相同的传输模式传输数据：

1. 将TE位设置为1。
2. Read SSR/SSR_FIFO/SSR_SMCI.
3. 将数据顺序写入TDR以开始数据传输。

要以不同的传输模式传输数据，请先初始化SCI。

图30.73显示了传输期间转换到软件待机模式的示例流程。图30.74和图30.75显示了转换到软件待机模式期间的端口引脚状态。

在指定模块停止状态或从传输模式转换到软件待机模式之前

using DTC transfer, stop the transmit operations (TE = 0). To start transmission after cancellation using the DTC, set the TE bit to 1. The SCIn_TXI interrupt flag is set to 1 and transmission starts using the DTC.

(2) Reception

(a) When address match function is not used as a wakeup condition

Before specifying the module-stop state or making a transition to Software Standby mode, stop the receive operations (RE = 0 in SCR/SCR_SMCI). If transition is made during data reception, the received data is invalid.

Figure 30.76 shows an example flow for transition to Software Standby mode during reception.

(b) When address match function is used as a wakeup condition

Before specifying the module-stop state or making a transition to Software Standby mode:

1. Set the operations after cancellation of the low power state.
2. Set CDR.CMPD and DCCR.DCME to 1.
3. Set the receive operations (RE = 1 in SCR/SCR_SMCI).
4. Set the module-stop state or Software Standby mode.

When the SCI transfers to the low power mode, if the receive data pin (RXD) is at the low level, set SEMR.RXDESEL to 0. When setting SEMR.RXDESEL to 1, there is a possibility that a start bit (falling edge of RXDn pin) cannot be detected on release of the low power mode.

Figure 30.77 shows an example flow of transition to Software Standby mode during reception with address match.

(c) When using SCI0 in Snooze mode

When using SCI0 in Snooze mode, some restrictions apply, including maximum bit rates. For details, see section 11, Low Power Modes.

使用DTC传输，停止传输操作(TE=0)。要在使用DTC取消后开始发送，请将TE位设置为1。SCIn_TXI中断标志 设置为1并使用DTC开始发送。

(2) Reception

(a) 当地址匹配功能不用作唤醒条件时

在指定模块停止状态或转换到软件待机模式之前，停止接收操作（SCRSCR_SMCI中的RE=0）。如果在数据接收期间进行转换，则接收到的数据无效。

图30.76显示了接收期间转换到软件待机模式的示例流程。

(b) 当地址匹配功能用作唤醒条件时

在指定模块停止状态或转换到软件待机模式之前：

1. 设置取消低功耗状态后的操作。
2. 将CDR.CMPD和DCCR.DCME设置为1。
3. 设置接收操作（在SCRSCR_SMCI中RE=1）。
4. 设置模块停止状态或软件待机模式。

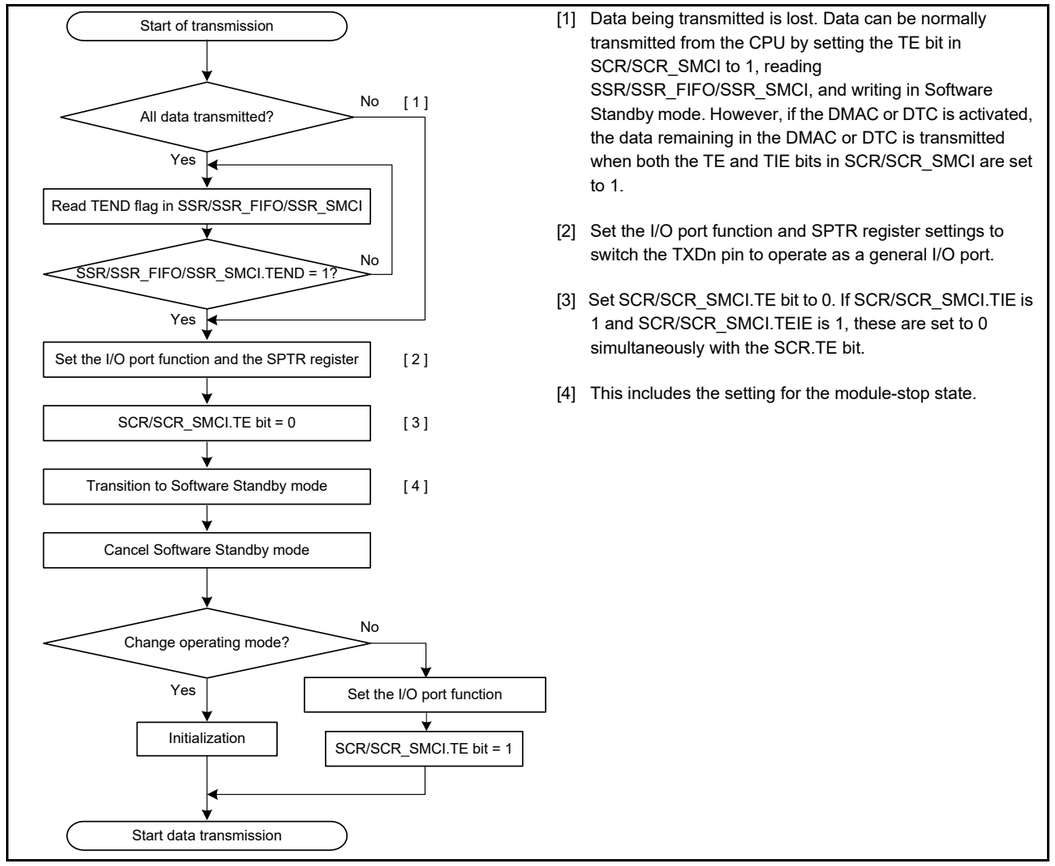
当SCI转移到低功耗模式时，如果接收数据引脚(RXD)为低电平，则将SEMR.RXDESEL设置为0。当设置SEMR.RXDESEL为1时，有可能出现起始位（下降沿RXDn引脚）不能在低功耗模式释放时被检测到。

图30.77显示了在地址匹配的接收期间转换到软件待机模式的示例流程。

(c) 在贪睡模式下使用SCI0时

在贪睡模式下使用SCI0时，有一些限制，包括最大比特率。有关详细信息，请参阅第11节，低功耗模式。

RA生态工作室



[1] Data being transmitted is lost. Data can be normally transmitted from the CPU by setting the TE bit in SCR/SCR_SMCI to 1, reading SSR/SSR_FIFO/SSR_SMCI, and writing in Software Standby mode. However, if the DMAC or DTC is activated, the data remaining in the DMAC or DTC is transmitted when both the TE and TIE bits in SCR/SCR_SMCI are set to 1.

[2] Set the I/O port function and SPTR register settings to switch the TXDn pin to operate as a general I/O port.

[3] Set SCR/SCR_SMCI.TE bit to 0. If SCR/SCR_SMCI.TIE is 1 and SCR/SCR_SMCI.TEIE is 1, these are set to 0 simultaneously with the SCR.TE bit.

[4] This includes the setting for the module-stop state.

Figure 30.73 Example flow of transition to Software Standby mode during transmission

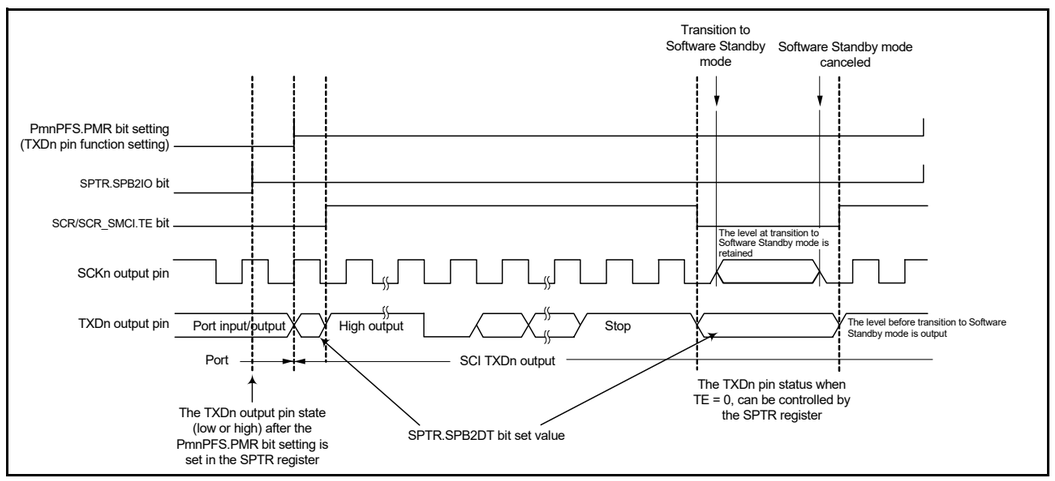


Figure 30.74 Port pin states during transition to Software Standby mode with internal clock and asynchronous transmission

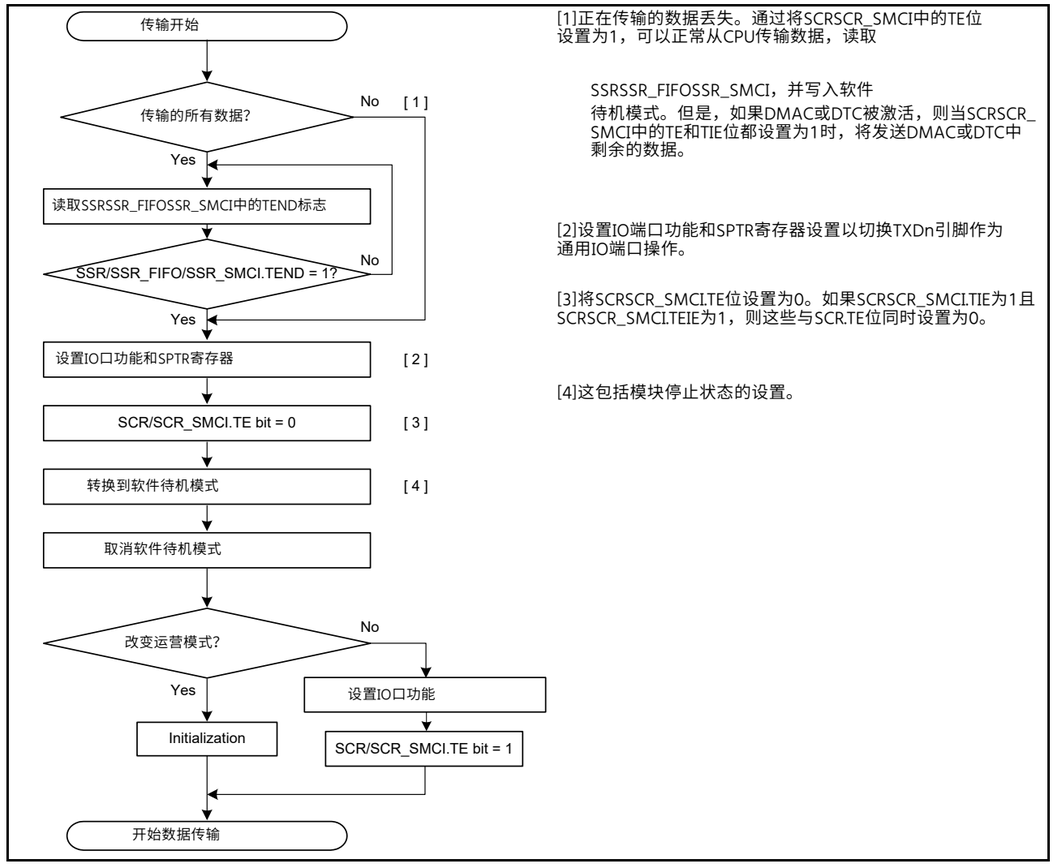

[1]正在传输的数据丢失。通过将SCRSCR_SMCI中的TE位设置为1，可以正常从CPU传输数据，读取

SSRSSR_FIFOSSR_SMCI，并写入软件待机模式。但是，如果DMAC或DTC被激活，则当SCRSCR_SMCI中的TE和TIE位都设置为1时，将发送DMAC或DTC中剩余的数据。

[2]设置IO端口功能和SPTR寄存器设置以切换TXDn引脚作为通用IO端口操作。

[3]将SCRSCR_SMCI.TE位设置为0。如果SCRSCR_SMCI.TIE为1且SCRSCR_SMCI.TEIE为1，则这些与SCR.TE位同时设置为0。

[4]这包括模块停止状态的设置。

Figure 30.73 传输期间转换到软件待机模式的示例流程

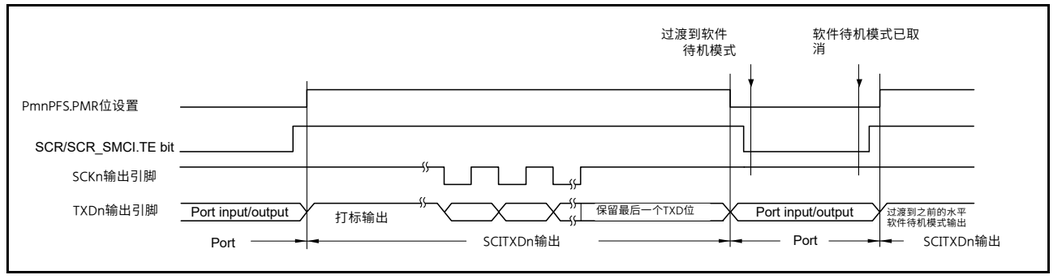

Figure 30.75 通过内部时钟和时钟同步传输转换到软件待机模式期间的端口引脚状态

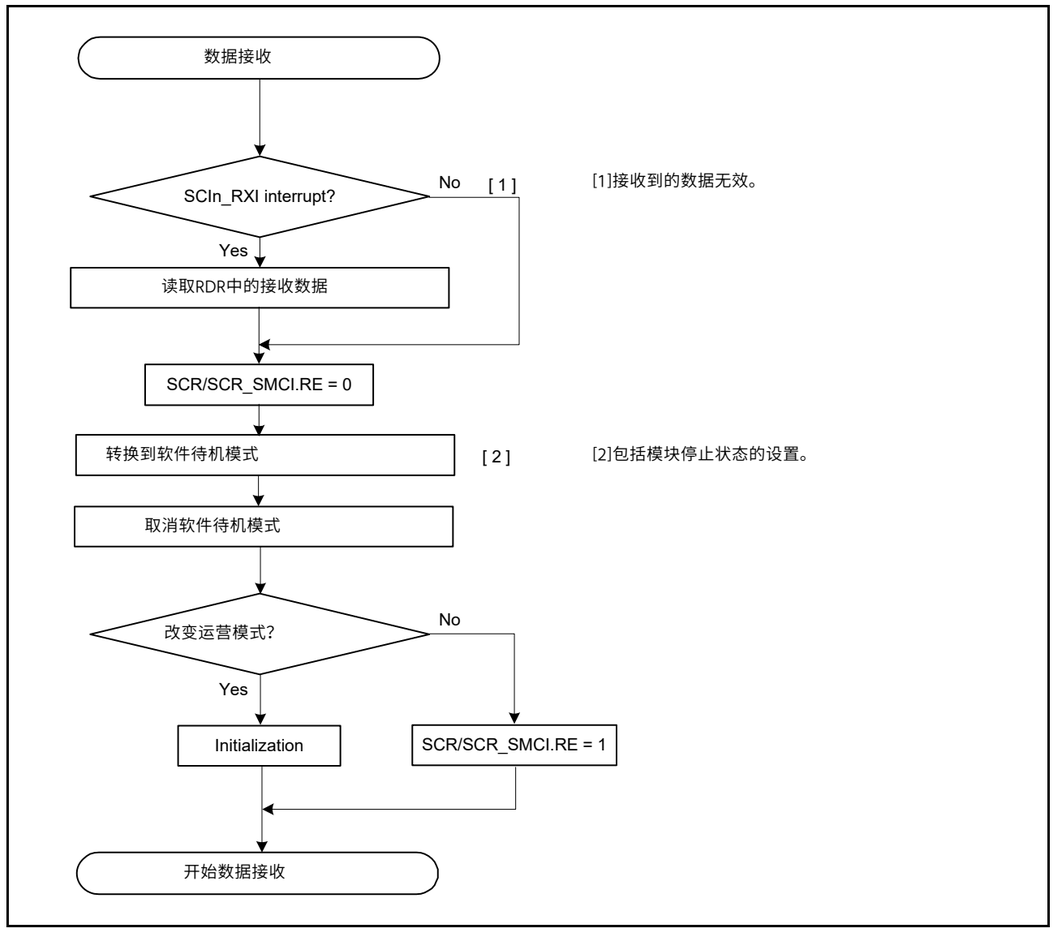

Figure 30.76 接收期间转换到软件待机模式的示例流程

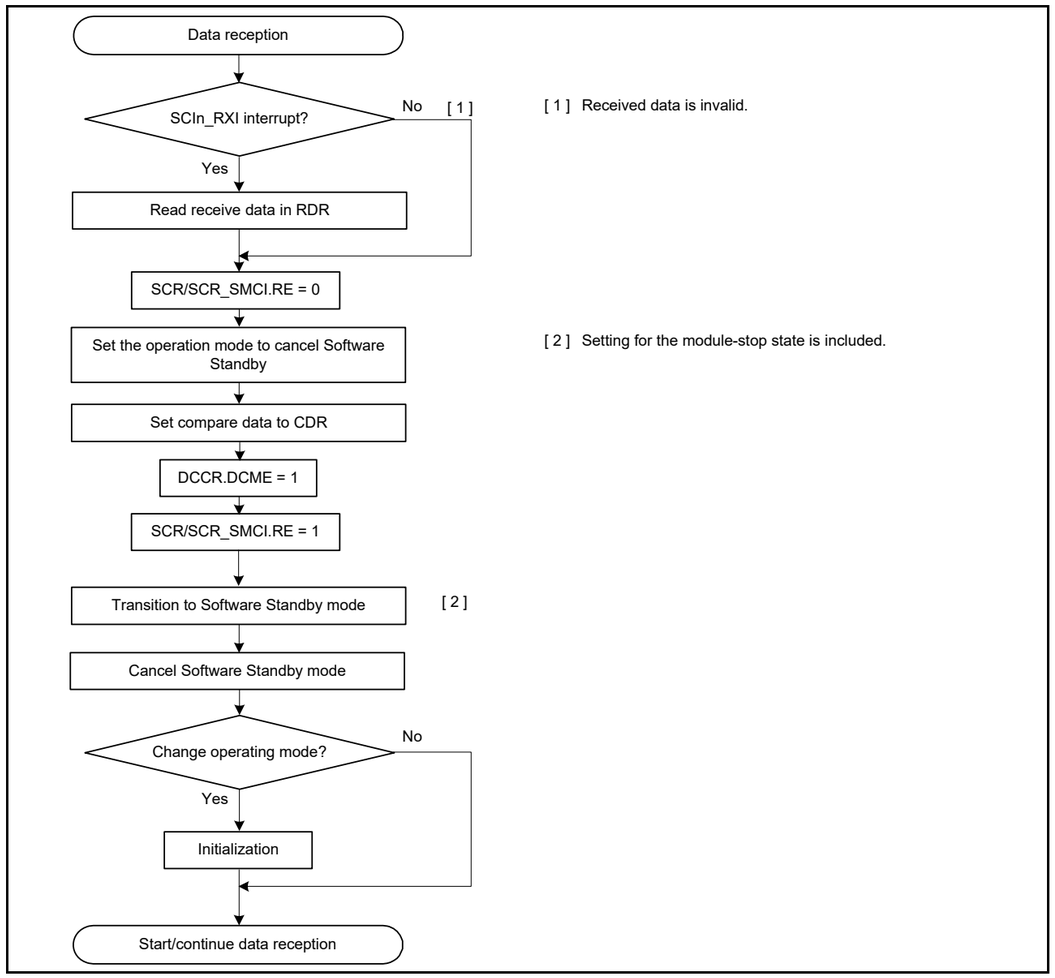

Figure 30.77 Example flow of transition to Software Standby mode during reception with address match

30.14.3 Break Detection and Processing

(1) Non-FIFO selected

When a framing error is detected, a break can be detected by reading the RXDn pin value directly. In a break, the input from the RXDn pin becomes all 0s, and the SSR.FER flag is set to 1 to indicate a framing error. The SSR.PER flag might also be set to 1 to indicate a parity error. The SCI continues the receive operation even after a break is received. Therefore, even if the FER flag is 0, indicating that no framing error occurred, it is set to 1 again. When the SEMR.RXDESEL bit is 1, the SCI sets the SSR.FER flag to 1 and stops the receiving operations until a start bit of the next data frame is detected. If the SSR.FER flag is set to 0, the SSR.FER flag retains 0 during the break.

When the RXDn pin is set to 1 and the break ends, detecting the beginning of the start bit on the first falling edge of the RXDn pin allows the SCI to start the receiving operation.

(2) FIFO selected

After a framing error is detected and when the SCI detects that continuous receive data is 0 for one frame, reception stops. When a framing error is detected, a break can be detected by reading the SPTR.RXDMON bit value. After the RXD signal is in the mark state and the break ends, data reception to the FRDRHL register resumes.

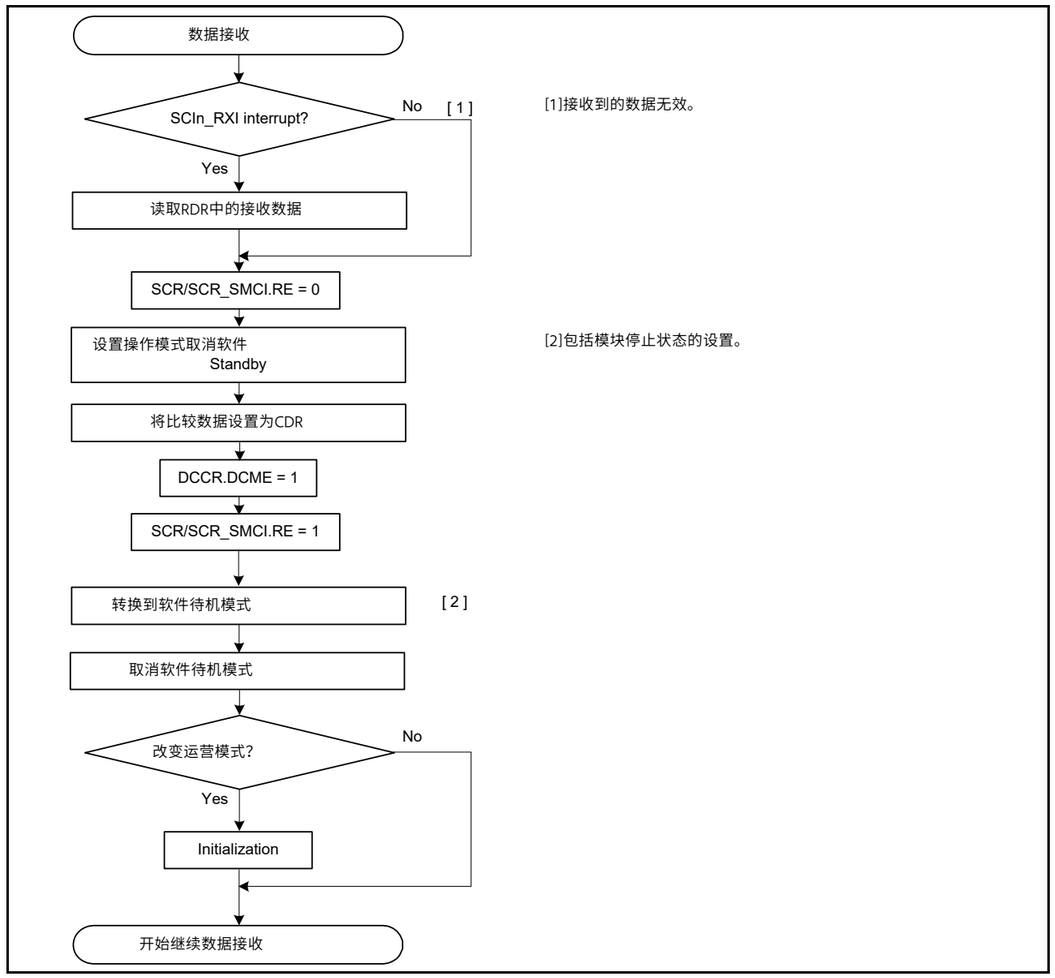

Figure 30.77 在地址匹配的接收期间转换到软件待机模式的示例流程

30.14.3 断裂检测和处理

(1) Non-FIFO selected

当检测到帧错误时，可以通过直接读取RXDn引脚值来检测中断。在中断时，来自RXDn引脚的输入变为全0，并且SSR.FER标志设置为1以指示帧错误。SSR.PER标志也可能设置为1以指示奇偶校验错误。即使在收到中断后，SCI仍继续接收操作。因此，即使FER标志为0，表示没有发生帧错误，它也会再次设置为1。当。。。的时候

SEMR.RXDESEL位为1，SCI设置SSR.FER标志为1并停止接收操作，直到检测到下一个数据帧的起始位。如果SSR.FER标志设置为0，则SSR.FER标志在中断期间保持0。

当RXDn引脚设置为1且中断结束时，在第一个下降沿检测起始位的开始
RXDn引脚允许SCI开始接收操作。

(2) FIFO selected

检测到帧错误后，当SCI检测到一帧连续接收数据为0时，接收停止。当检测到帧错误时，可以通过读取SPTR.RXDMON位的值来检测中断。在RXD信号处于标记状态并且中断结束后，重新接收到FRDRHL寄存器的数据。

30.14.4 Mark State and Production of Breaks

When the SCR/SCR_SMCI.TE bit is 0, disabling serial transmission, the state of the TXDn pin can be set using the SPTR.SPB2IO and SPTR.SPB2DT bits. With this approach, a TXDn pin can be placed in the mark state to transmit a break.

Before setting the SCR/SCR_SMCI.TE bit to 1, enabling serial transmission, set the SPB2IO and SPB2DT bits to put the communication line in the mark state (the state of 1), and change the TxDn pin using the I/O port function. To output a break on data transmission, after setting the TXDn pin to output 0 by setting the SPB2IO and SPB2DT bits, change the TXDn pin using the I/O port function and set the SCR/SCR_SMCI.TE bit to 0. When the SCR/SCR_SMCI.TE bit is set to 0, the transmitter is initialized regardless of the current state of transmission.

30.14.5 Receive Error Flags and Transmit Operation in Clock Synchronous and Simple SPI Modes

Transmission cannot start when a receive error flag (ORER) in SSR/SSR_FIFO is set to 1, even if data is written to TDR or FTDRL*1. Be sure to set the receive error flags to 0 before starting transmission.

Note: The receive error flags cannot be set to 0 when serial reception is disabled by setting the RE bit in SCR/SCR_SMCI to 0.

Note 1. Do not use the FTDRH register in simple SPI mode.

30.14.6 Restrictions on Clock Synchronous Transmission in Clock Synchronous Mode and Simple SPI Mode

When the external clock source is used as a synchronization clock, the following restrictions apply.

(1) Start of transmission

Wait at least the following time from writing transmit data to TDR to the start of the external clock input:

1 PCLKA cycle + data output delay time for the slave (t_{DO}) + setup time for the master (t_{SU}).

See Figure 30.78.

(2) Continuous transmission

Write the next transmit data to TDR or TDRHL before the falling edge of the transmit clock for bit [7]. See Figure 30.78.

When updating TDR after bit [7] starts to transmit, update TDR while the synchronization clock is in the low-level period, and set the high-level width of the transmit clock, bit [7] (D7) to 4 PCLKA cycles or longer. See Figure 30.78.

30.14.4 标记状态和产生的中断

当SCRSCR_SMCI.TE位为0时，禁用串行传输，TXDn引脚的状态可以使用SPTR.SPB2IO和SPTR.SPB2DT位。使用这种方法，可以将TXDn引脚置于标记状态以发送中断。

在设置SCRSCR_SMCI.TE位为1，使能串行传输之前，设置SPB2IO和SPB2DT位使通信线处于标记状态（状态为1），并使用IO端口功能更改TxDn引脚。要输出数据传输中断，通过设置SPB2IO和SPB2DT位将TXDn引脚设置为输出0后，使用IO端口功能更改TXDn引脚并将SCRSCR_SMCI.TE位设置为0。当SCRSCR_SMCI.TE位设置为0，无论当前的传输状态如何，都初始化发送器。

30.14.5 在时钟同步和简单的接收错误标志和发送操作SPI模式

当SSRSSR_FIFO中的接收错误标志(ORER)设置为1时，传输无法开始，即使数据写入TDR或FTDRL*1也是如此。确保在开始传输之前将接收错误标志设置为0。

Note: 当通过设置RE位禁用串行接收时，接收错误标志不能设置为0
SCR/SCR_SMCI to 0.

注1.不要在简单SPI模式下使用FTDRH寄存器。

30.14.6 时钟同步模式和简单SPI模式下时钟同步传输的限制

当外部时钟源用作同步时钟时，有以下限制。

(1) 传输开始

从将发送数据写入TDR到外部时钟输入开始，至少等待以下时间：

1个PCLKA周期+从机的数据输出延迟时间(tDO)+主机的建立时间(tSU)。

请参见图30.78。

(2) 连续传输

在位[7]的发送时钟下降沿之前将下一个发送数据写入TDR或TDRHL。请参见图30.78。

在bit[7]开始发送后更新TDR时，在同步时钟处于低电平期间更新TDR，并将发送时钟bit[7]（D7）的高电平宽度设置为4个PCLKA周期或更长。请参见图30.78。

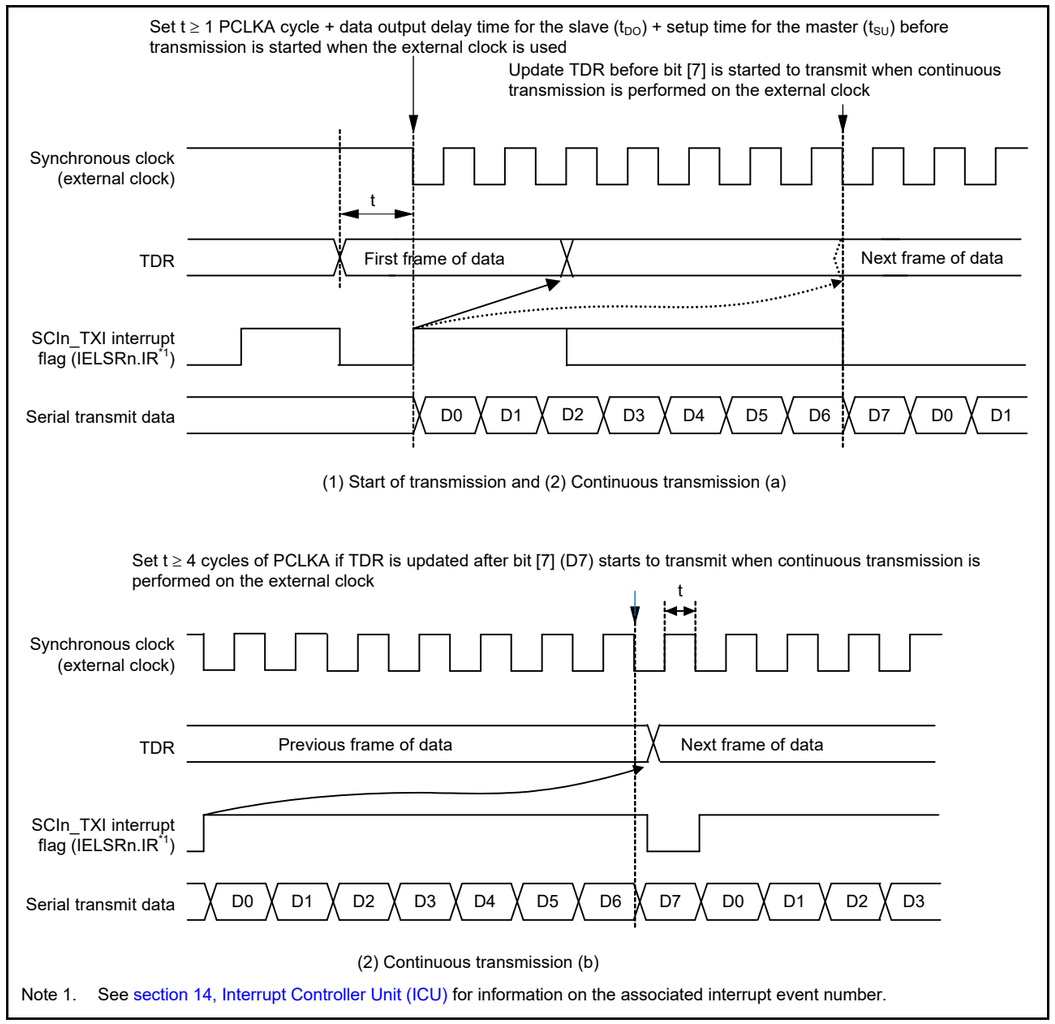

Figure 30.78 Restrictions on the use of external clock in clock synchronous transmission

30.14.7 Restrictions on Using DMAC or DTC

During transmission or reception operations using the DMAC or DTC, do not set transfer data for the DMAC/DTC.

(1) Writing data to TDR (FTDRHL)

(a) Non-FIFO selected

Data can be written to TDR and TDRHL. However, if new data is written to TDR or TDRHL when transmit data remains in TDR or TDRHL, the previous data in TDR and TDRHL is lost because it was not yet transferred to TSR. When using DMAC or DTC, be sure to write transmit data to TDR or TDRHL in the SCIn_TXI interrupt request handling routine.

(b) FIFO selected

It is possible to write data to the FTDRH and FTDRL registers when SCR.TE is 1. Confirm the amount of writable data using the FDR.T[4:0] bits.

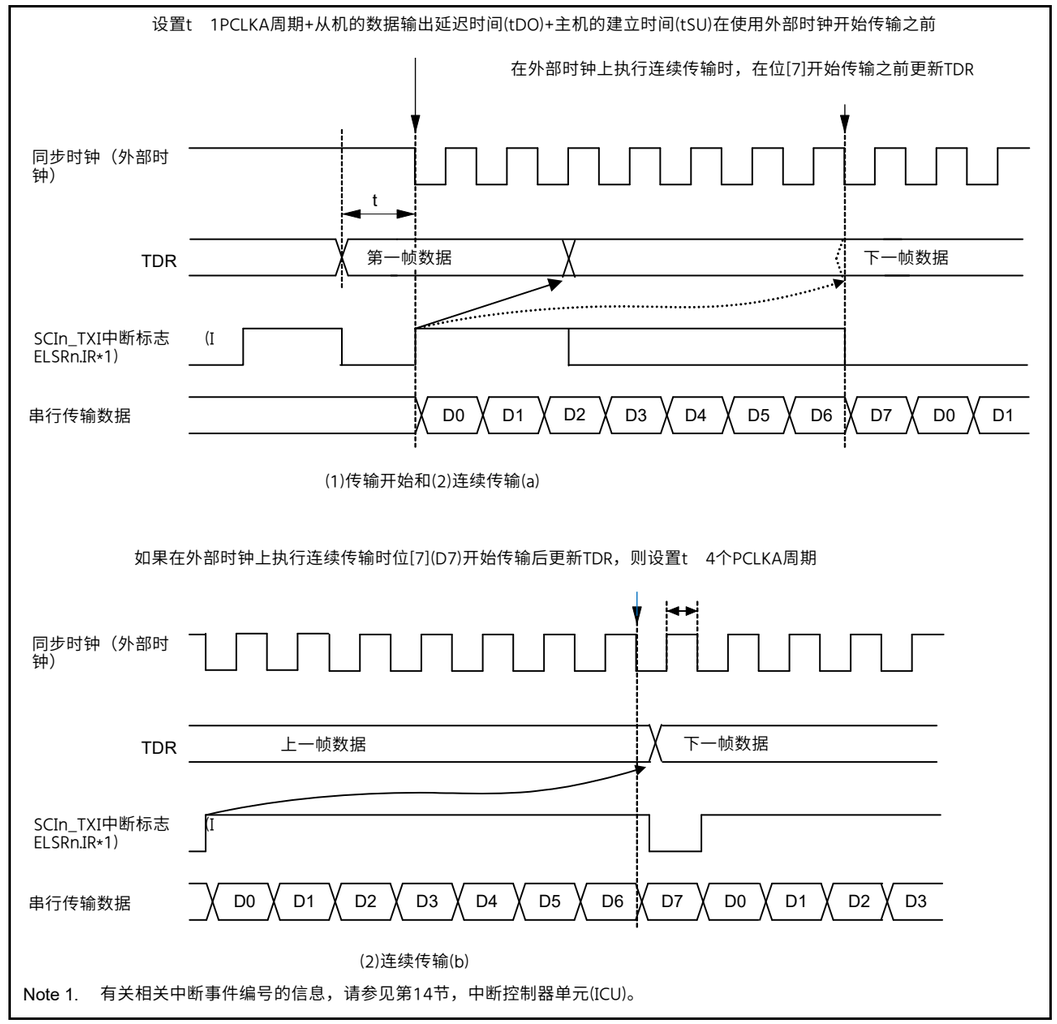

Figure 30.78 时钟同步传输中使用外部时钟的限制

30.14.7 使用DMAC或DTC的限制

在使用DMAC或DTC进行发送或接收操作期间，请勿为DMACDTC设置传输数据。

(1) 将数据写入TDR(FTDRHL)

(a) Non-FIFO selected

数据可以写入TDR和TDRHL。但是，如果在发送数据仍保留在TDR或TDRHL中时将新数据写入TDR或TDRHL，则TDR和TDRHL中的先前数据将丢失，因为它尚未传输到TSR。使用DMAC或DTC时，请务必在SCIn_TXI中断请求处理程序中将发送数据写入TDR或TDRHL。

(b) FIFO selected

当SCR.TE为1时，可以将数据写入FTDRH和FTDRL寄存器。使用FDR.T[4:0]位确认可写入的数据量。

RA生态工作室

(2) Reading data from RDR (FRDRHL)

When using the DMAC or DTC to read RDR and RDRHL, be sure to set the receive data full interrupt (SCIn_RXI) as the activation source of the relevant SCI channel.

30.14.8 Notes on Starting Transfer

When transfer starts while the Interrupt Status flag (IELSRn.IR) in the ICU is 1, follow the procedure in this section to clear interrupt requests before permitting operations (by setting the SCR/SCR_SMCI.TE or SCR/SCR_SMCI.RE bit to 1).

For details on the Interrupt Status flag, see section 14, Interrupt Controller Unit (ICU).

1. Confirm that the transfer stopped (the SCR/SCR_SMCI.TE or SCR/SCR_SMCI.RE bit is 0).
2. Set the associated interrupt enable bit (SCR/SCR_SMCI.TIE or SCR/SCR_SMCI.RIE) to 0.
3. Read the associated interrupt enable bit (SCR/SCR_SMCI.TIE or SCR/SCR_SMCI.RIE bit) to check that it is 0.
4. Set the Interrupt Status flag (IELSRn.IR) in the ICU to 0.

30.14.9 External Clock Input in Clock Synchronous Mode and Simple SPI Mode

In clock synchronous mode and simple SPI mode, the external clock (SCKn) must be input as follows:

High-pulse period, low-pulse period = 2 PCLKA cycles or more, period = 6 PCLKA cycles or more.

30.14.10 Limitations on Simple SPI Mode

(1) Master mode

- Use a resistor to pull up or pull down the clock line matching the initial settings for the transfer clock set in the SPMR.CKPH and CKPOL bits when the SPMR.SSE bit is 1. This prevents the clock line from being placed in the high-impedance state when the SCR.TE bit is set to 0 or unexpected edges from being generated on the clock line when the SCR.TE bit changes from 0 to 1. When the SPMR.SSE bit is 0 in single master mode, pulling up or pulling down the clock line is not required because the clock line is not placed in the high-impedance state even when the SCR.TE bit is set to 0.
- For the clock delay setting (SPMR.CKPH bit is 1), the receive data full interrupt (SCIn_RXI) is generated before the final clock edge on the SCKn pin, as indicated in Figure 30.79. If the TE and RE bits in the SCR register become 0 before the final edge of the clock signal on the SCKn pin, the SCKn pin is placed in the high-impedance state, so the width of the last clock pulse of the transfer clock is shortened. Additionally, an SCIn_RXI interrupt might lead to the input signal on the SSn pin of a connected slave going to the high level before the final edge of the clock signal on the SCKn pin, leading to incorrect operation of the slave.
- In a multi-master configuration, the SCKn pin output goes to high-impedance while the input on the SSn pin is at the low level if a mode fault error occurs while a character is being transferred, stopping supply of the clock signal to the connected slave. Reset the connected slave to avoid misaligned bits when transfer is restarted.

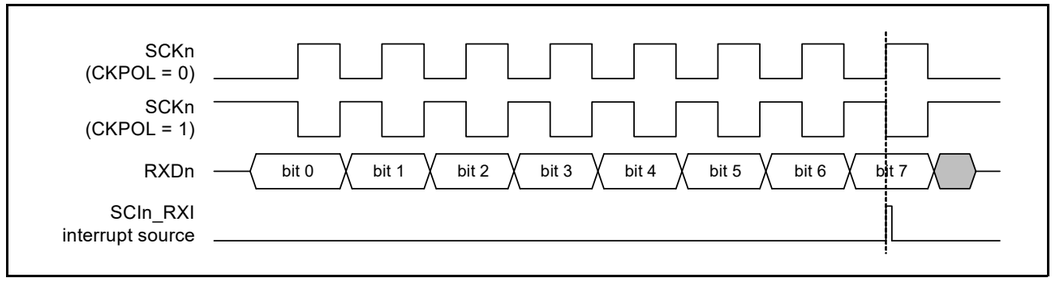

Figure 30.79 Timing of SCIn_RXI interrupt in simple SPI mode with clock delay

(2) 从RDR(FRDRHL)读取数据

使用DMAC或DTC读取RDR和RDRHL时，务必将接收数据满中断（SCIn_RXI）设置为相关SCI通道的激活源。

30.14.8 开始转移注意事项

当ICU中的中断状态标志(IELSRn.IR)为1时开始传输时，请按照本节中的程序在允许操作之前清除中断请求（通过将SCRSCR_SMCI.TE或SCRSCR_SMCI.RE位设置为1）。

有关中断状态标志的详细信息，请参见第14节，中断控制器单元(ICU)。

1. 确认传输已停止（SCRSCR_SMCI.TE或SCRSCR_SMCI.RE位为0）。
2. 将相关的中断使能位（SCRSCR_SMCI.TIE或SCRSCR_SMCI.RIE）设置为0。
3. 读取相关的中断使能位（SCRSCR_SMCI.TIE或SCRSCR_SMCI.RIE位）以检查它是否为0。
4. 将ICU中的中断状态标志(IELSRn.IR)设置为0。

30.14.9 时钟同步模式和简单SPI模式下的外部时钟输入

在时钟同步模式和简单SPI模式下，外部时钟（SCKn）必须输入如下：

高脉冲周期，低脉冲周期=2个PCLKA周期或更多，周期=6个PCLKA周期或更多。

30.14.10 简单SPI模式的限制

(1) 主模式

- 使用电阻上拉或下拉与传输时钟设置的初始设置相匹配的时钟线
当SPMR.SSE位为1时，SPMR.CKPH和CKPOL位。这可以防止当SCR.TE位设置为0时将时钟线置于高阻抗状态，或者在SCR.TE位从0变为1。当SPMR.SSE位在单主模式下为0时，不需要上拉或下拉时钟线，因为即使在SCR.TE位设置为0。
- 对于时钟延迟设置（SPMR.CKPH位为1），接收数据满中断（SCIn_RXI）在SCKn引脚的最后一个时钟沿之前产生，如图30.79所示。如果SCR寄存器中的TE和RE位在SCKn引脚上的时钟信号的最后一个边沿之前变为0，则SCKn引脚处于高阻状态，因此传输时钟的最后一个时钟脉冲的宽度为缩短。此外，SCIn_RXI中断可能会导致所连接从机的SSn引脚上的输入信号在SCKn引脚上的时钟信号的最后一个边沿之前变为高电平，从而导致从机的错误操作。
- 在多主机配置中，如果在传输字符时发生模式故障错误，则SCKn引脚输出变为高阻抗，而SSn引脚上的输入处于低电平，从而停止向连接的时钟信号提供奴隶。重新启动传输时，重置连接的从机以避免未对齐的位。

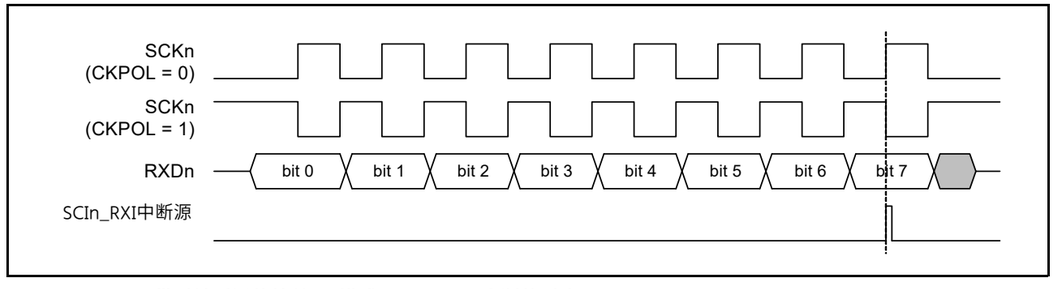

Figure 30.79 带时钟延迟的简单SPI模式下SCIn_RXI中断的时序

(2) Slave mode

- Wait at least the following time from writing transmit data in the TDR register to the start of the external clock input:
  1 PCLKA cycle + data output delay for the slave (t_{DO}) + setup time for the master (t_{SU}).
  Also, wait at least 5 PCLKA cycles from the input of the low level on the SSn pin to the start of the external clock input.
- Provide an external clock signal to the master for the data length for transfer
- Control the input on the SSn pin before the start and after the end of data transfer
- When the input level on the SSn pin changes from low to high while a character is being transferred, set the TE and RE bits in the SCR to 0 and, after restoring the settings, restart transfer of the first byte.

(2) 从机模式

- 从将发送数据写入TDR寄存器到开始外部时钟输入，至少等待以下时间：1个PCLKA周期+从设备的数据输出延迟(tDO)+主设备的建立时间(tSU)。此外，从SSn引脚输入低电平到外部时钟输入开始，至少等待5个PCLKA周期。
- 向主机提供外部时钟信号，用于传输数据长度
- 在数据传输开始之前和结束之后控制SSn引脚上的输入
- 当SSn引脚上的输入电平从低电平变为高电平而字符正在传输时，设置TE和SCR中的RE位为0，并在恢复设置后重新开始传输第一个字节。

RA生态工作室

31. IrDA Interface

31.1 Overview

The IrDA interface sends and receives IrDA data communication waveforms in cooperation with SCI1, according to the IrDA (Infrared Data Association) standard 1.0.

Enabling the IrDA function using the IRE bit in the IRCR register allows the encoding and decoding of the TXD1 and RXD1 signals of the SCI1 to waveforms conforming to the IrDA standard 1.0 (IRTXD1 and IRRXD1 pins).

Connecting the waveforms to an infrared transmitter/receiver implements infrared data communication conforming to the IrDA standard 1.0 system.

With the IrDA standard 1.0 system, data transfer can be started at 9600 bps and the transfer rate can be changed whenever necessary. Because the IrDA interface cannot change the transfer rate automatically, the transfer rate must be changed through software.

Figure 31.1 shows the interaction between the IrDA interface and SCI1.

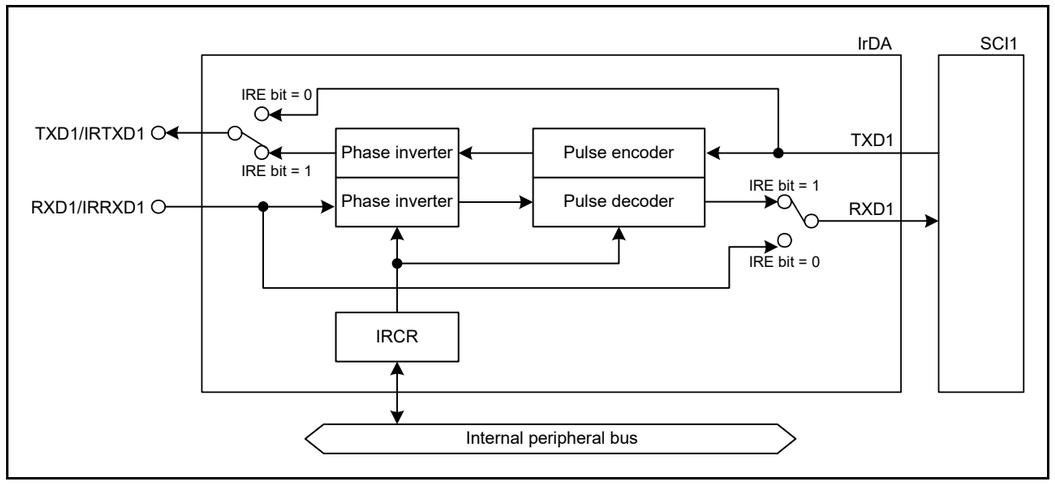

Figure 31.1 Interaction between the IrDA interface and SCI1

Table 31.1 IrDA interface I/O pins

Pin name	I/O	Function
IRTXD1	Output	Data to be transmitted
IRRXD1	Input	Received data

31. IrDA Interface

31.1 Overview

IrDA接口与SCI1配合发送和接收IrDA数据通信波形，根据
IrDA（红外数据协会）标准1.0。

使用IRCR寄存器中的IRE位使能IrDA功能允许对TXD1和
SCI1的RXD1信号转换为符合IrDA标准1.0的波形（IRTXD1和IRRXD1引脚）。

将波形连接到红外发射器接收器可实现符合IrDA标准1.0系统的红外数据通信。

使用IrDA标准1.0系统，可以以9600bps开始数据传输，并且可以随时更改传输速率。因为IrDA接口不能自动改变传输速率，所以必须通过软件来改变传输速率。

图31.1显示了IrDA接口和SCI1之间的交互。

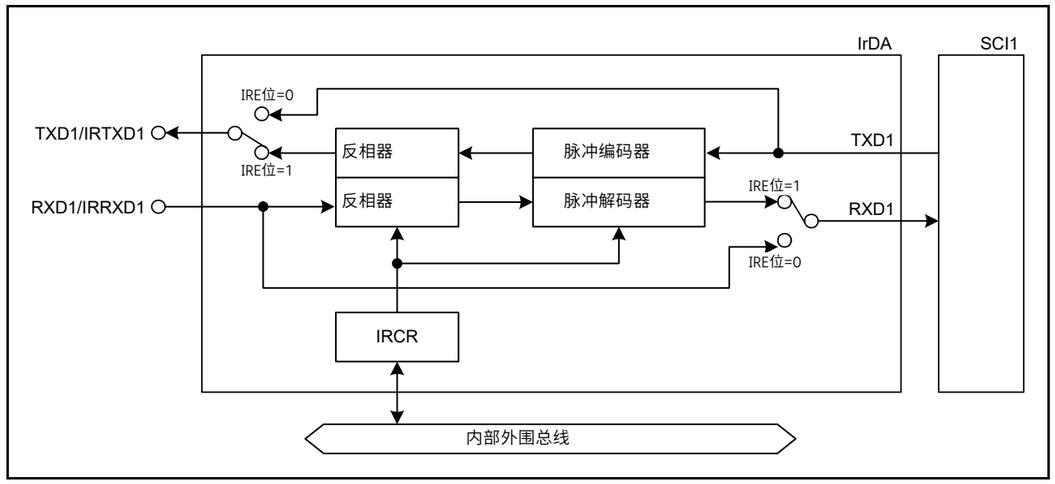

Figure 31.1 IrDA接口与SCI1之间的交互

Table 31.1 IrDA接口IO引脚

引脚名称	I/O	Function
IRTXD1	Output	要传输的数据
IRRXD1	Input	接收数据

31.2 Register Descriptions

31.2.1 IrDA Control Register (IRCR)

Address(es): IRDA.IRCR 4007 0F00h

	b7	b6	b5	b4	b3	b2	b1	b0
	IRE	—	—	—	IRTXINV	IRRXINV	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b2	IRRXINV	IRRXD Polarity Switching	0: Use IRRXD input as received data as-is 1: Use IRRXD input as received data after the polarity is inverted.	R/W
b3	IRTXINV	IRTXD Polarity Switching	0: Output data to be transmitted to IRTXD as-is 1: Output data to be transmitted IRTXD after the polarity is inverted.	R/W
b6 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	IRE	IrDA Enable	0: Use serial input/output pins for normal serial communication 1: Use serial input/output pins for IrDA data communication.	R/W

Note: The IRCR register values are retained in Sleep, Software Standby, and Deep Software Standby modes.

IRRXINV bit (IRRXD Polarity Switching)

The IRRXINV bit inverts the logic level of the IRRXD input. When inverted, the high-level pulse width is applied to the low-level pulse width.

IRTXINV bit (IRTXD Polarity Switching)

The IRTXINV bit inverts the logic level of the IRTXD output. When inverted, the high-level pulse width is applied to the low-level pulse width.

IRE bit (IrDA Enable)

The IRE bit configures the I/O pins for normal communication mode or IrDA data communication mode.

31.3 Operation

31.3.1 IrDA Interface Setup Procedure

To set up IrDA interface operation:

1. Set the associated pins to IRTXD1 and IRRXD1 in the Pin Function Control Register (PmnPFS.PSEL = 00101b) of the I/O ports function.
2. Specify the peripheral function in the Pin Function Control Register (PmnPFS.PMR = 1) of the I/O ports function.
3. Specify the IrDA function in the IRCR register.
4. Set the SCI1-related registers in the Serial Communications Interface (SCI).

31.3.2 Transmission

During transmission, the signals output from SCI1 (UART frames) are converted to IR frame data through the IrDA interface as shown in Figure 31.2. When the IRCR.IRTXINV bit is 0 and serial data is 0, high-level pulses with 3/16 the width of the bit rate (1-bit width period) are output (initial setting). The standard states that the minimum high-level pulse width must be 1.41 µs and the maximum high-level pulse width must be (3/16 + 2.5%) × bit rate or (3/16 × bit rate) + 1.08 µs. When the serial data is 1, no pulses are output.

31.2 注册说明

31.2.1 IrDA控制寄存器(IRCR)

Address(es): IRDA.IRCR 4007 0F00h

	b7	b6	b5	b4	b3	b2	b1	b0
	IRE	—	—	—	IRTXINV	IRRXINV	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b2	IRRXINV	IRRXD极性切换	0：按原样使用IRRXD输入作为接收数据1：在极性反转后使用IRRXD输入作为接收数据。	R/W
b3	IRTXINV	IRTXD极性切换	0：输出数据按原样发送到IRTXD1：输出数据在极性反转后发送到IRTXD。	R/W
b6 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	IRE	IrDA Enable	0：使用串行输入输出引脚进行正常串行通信1：使用串行输入输出引脚进行IrDA数据通信。	R/W

Note: IRCR寄存器值在休眠、软件待机和深度软件待机模式下保持不变。

IRRXINV位（IRRXD极性切换）

IRRXINV位反转IRRXD输入的逻辑电平。反转时，高电平脉冲宽度应用于低电平脉冲宽度。

IRTXINV位（IRTXD极性切换）

IRTXINV位反转IRTXD输出的逻辑电平。反转时，高电平脉冲宽度应用于低电平脉冲宽度。

IRE位（IrDA使能）

IRE位将IO引脚配置为正常通信模式或IrDA数据通信模式。

31.3 Operation

31.3.1 IrDA接口设置程序

设置IrDA接口操作：

1. 在IO端口功能的引脚功能控制寄存器(PmnPFS.PSEL=00101b)中将相关引脚设置为IRTXD1和IRRXD1。
2. 在IO端口功能的引脚功能控制寄存器(PmnPFS.PMR=1)中指定外设功能。
3. 在IRCR寄存器中指定IrDA功能。
4. 设置串行通信接口(SCI)中与SCI1相关的寄存器。

31.3.2 Transmission

在传输过程中，SCI1输出的信号（UART帧）通过IrDA接口转换为IR帧数据，如图31.2所示。当IRCR.IRTXINV位为0且串行数据为0时，输出具有316位速率宽度（1位宽度周期）的高电平脉冲（初始设置）。标准规定最小高电平脉冲宽度必须为1.41µs，最大高电平脉冲宽度必须为(316+2.5%)×比特率或(316×比特率)+1.08µs。当串行数据为1时，不输出脉冲。

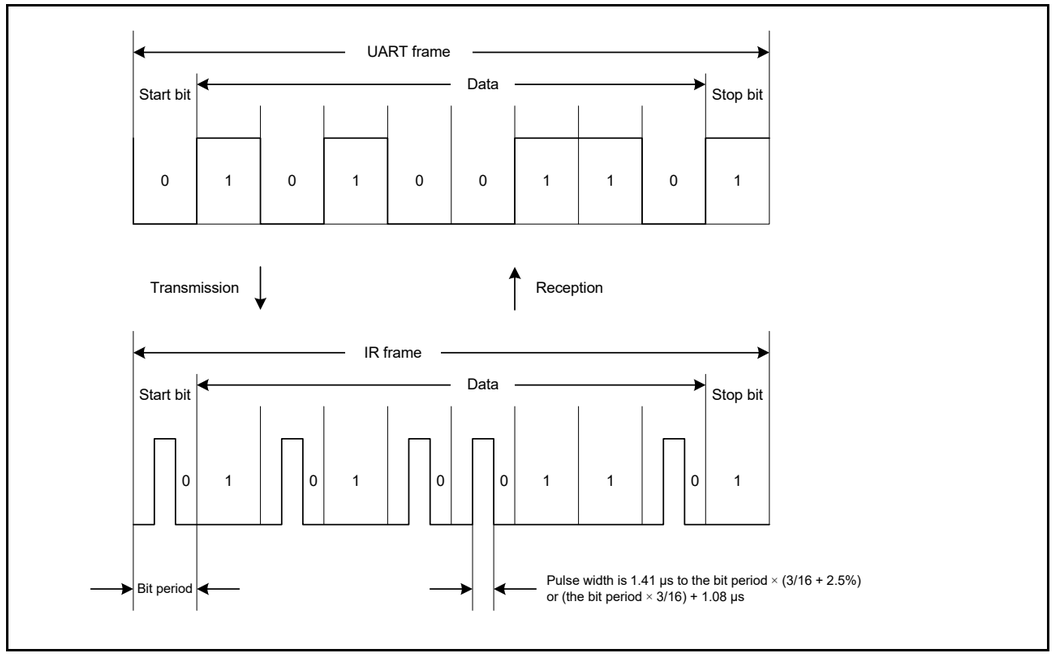

Figure 31.2 IrDA transmission and reception

31.3.3 Reception

During reception, IR frame data is converted to UART frame data through the IrDA interface and is input to SCI1.

Low-level data is input to SCI1 when the IRCR.IRRXINV bit is 0 and a high-level pulse is detected. High-level data is input to SCI1 when no pulse is detected for a 1-bit period.

31.4 Usage Notes

31.4.1 Settings for the Module-Stop State

IrDA operation can be enabled or disabled using the Module Stop Control Register. IrDA is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

31.4.2 Asynchronous Reference Clock for SCI1

The IrDA receives a clock with frequency 16 times the bit rate from SCI1 and operates in conjunction with SCI1.

When using the IrDA, set the SCI1.SEMR.ABCS bit to 0.

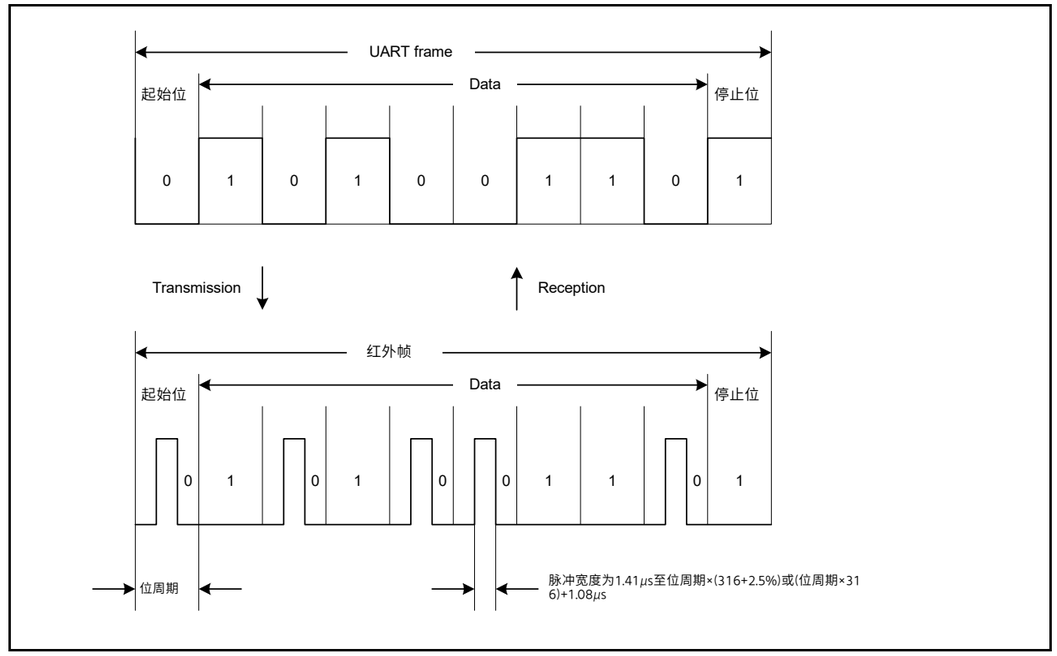

Figure 31.2 IrDA发射和接收

31.3.3 Reception

在接收过程中，IR帧数据通过IrDA接口转换为UART帧数据并输入到SCI1。

当IRCR.IRRXINV位为0且检测到高电平脉冲时，低电平数据输入到SCI1。当1位周期内没有检测到脉冲时，高电平数据输入到SCI1。

31.4 使用说明

31.4.1 模块停止状态的设置

可以使用模块停止控制寄存器启用或禁用IrDA操作。IrDA在复位后最初停止。
释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

31.4.2 SCI1的异步参考时钟

IrDA从SCI1接收频率为比特率16倍的时钟，并与SCI1一起工作。

使用IrDA时，将SCI1.SEMR.ABCS位设置为0。

32. I2C Bus Interface (IIC)

32.1 Overview

The MCU has a 2-channel I2C Bus Interface (IIC) module that conforms with and provides a subset of the NXP I2C bus (Inter-Integrated Circuit) bus interface functions.

Table 32.1 lists the IIC specifications, Figure 32.1 shows a block diagram, and Figure 32.2 shows an example of I/O pin connections to external circuits, with an I2C bus configuration. Table 32.2 lists the I/O pins.

Table 32.1 IIC specifications (1 of 2)

Parameter	Specifications
Communications format	• I2C bus format or SMBus format • Master or slave mode selectable • Automatic securing of the setup times, hold times, and bus-free times for the transfer rate.
Transfer rate	Fast mode plus supported, up to 1 Mbps
SCL clock	For master operation, the duty cycle of the SCL clock is selectable in the range from 4% to 96%
Issuing and detecting conditions	• Start, restart, and stop conditions are automatically generated • Start conditions (including restart conditions) and stop conditions are detectable.
Slave address	• Configurable for up to three different slave addresses • 7-bit and 10-bit address formats supported, including simultaneous use • General call addresses, device ID addresses, and SMBus host addresses detectable.
Acknowledgment	• For transmission, automatic loading of the acknowledge bit. Transfer of the next transmit data can be automatically suspended on detection of a not-acknowledge bit. • For reception, automatic transmission of the acknowledge bit. If a wait between the 8th and 9th clock cycles is selected, software can control the value in the acknowledge field in response to the received value.
Wait function	During reception, the following wait periods are available by holding the SCL clock low: • Waiting between the 8th and 9th clock cycles • Waiting between the 9th clock cycle and the 1st clock cycle of the next transfer.
SDA output delay function	Output timing of transmitted data, including the acknowledge bit, can be delayed
Arbitration	• For multi-master operation: - SCL clock synchronization is possible when conflict occurs with the SCL signal from another master - When issuing the start condition creates conflict on the bus, loss of arbitration is detected by testing for mismatching between the internal signal for the SDA line and the level on the SDA line - In master operation, loss of arbitration is detected by testing for mismatching between the signal on the SDA line and the internal signal for the SDA line • Loss of arbitration because the start condition occurs while the bus is busy is detectable, to prevent the issuing of double start conditions • Loss of arbitration is detectable on transfer of a not-acknowledge bit because the internal signal for the SDA line and the level on the SDA line do not match • Loss of arbitration because mismatching of internal and line levels for data is detectable in slave transmission
Timeout function	Internal detection of long-interval stops of the SCL clock
Noise cancellation	• Digital noise filters for both the SCL and SDA signals • Programmable window for noise cancellation by the filters.
Interrupt sources	• Transfer error or event occurrence (arbitration detection, NACK, timeout, start or restart condition, or stop condition) • Receive data full, including matching with a slave address • Transmit data empty, including matching with a slave address • Transmit end.
Module-stop function	Module-stop state can be set to reduce power consumption
IIC operating modes	• Master transmit • Master receive • Slave transmit • Slave receive.

32. I2C总线接口(IIC)

32.1 Overview

MCU具有2通道I2C总线接口(IIC)模块，该模块符合并提供NXPI2C总线（内部集成电路）总线接口功能的子集。

表32.1列出了IIC规范，图32.1显示了框图，图32.2显示了IO引脚连接到外部电路的示例，具有I2C总线配置。表32.2列出了IO引脚。

Table 32.1 IIC规格(1of2)

Parameter	Specifications
通讯格式	I2C总线格式或SMBus格式 可选择主模式或从模式 自动保护传输速率的设置时间、保持时间和无总线时间。
传输率	支持快速模式，最高1Mbps
SCL clock	对于主机操作，SCL时钟的占空比可在4%至96%的范围内选择
发布和检测条件	自动生成启动、重新启动和停止条件 可检测启动条件（包括重新启动条件）和停止条件。
从机地址	最多可配置三个不同的从属地址 支持7位和10位地址格式，包括同时使用 可检测到广播呼叫地址、设备ID地址和SMBus主机地址。
Acknowledgment	对于传输，自动加载确认位。 检测到未确认位时，可以自动暂停下一个发送数据的传输。 对于接收，确认位的自动传输。 如果选择了第8和第9个时钟周期之间的等待，软件可以控制确认字段中的值以响应接收到的值。
等待功能	在接收期间，通过将SCL时钟保持为低电平可获得以下等待周期： 在第8个和第9个时钟周期之间等待 在第9个时钟周期和下一次传输的第一个时钟周期之间等待。
SDA输出延迟功能	传输数据的输出时序，包括确认位，可以延迟
Arbitration	• For multi-master operation: 当与来自另一个主机的SCL信号发生冲突时，SCL时钟同步是可能的当发出启动条件在总线上产生冲突时，通过测试SDA线的内部信号和SDA线上的电平之间的不匹配来检测仲裁丢失在主机操作中，通过测试SDA线路上的信号与SDA线路的内部信号之间的不匹配来检测仲裁丢失 可检测到由于在总线繁忙时出现启动条件而导致的仲裁丢失，以防止发出双启动条件 由于SDA线路的内部信号和SDA线路上的电平不匹配，在传输未确认位时可检测到仲裁丢失 由于数据的内部和线路电平不匹配，可检测到仲裁丢失在从属传输
超时功能	内部检测SCL时钟的长间隔停止
噪音消除	用于SCL和SDA信号的数字噪声滤波器 用于通过滤波器消除噪声的可编程窗口。
中断源	传输错误或事件发生（仲裁检测、NACK、超时、启动或重启条件或停止条件） 接收数据已满，包括与从地址匹配 传输数据为空，包括与从地址匹配 传输结束。
Module-stop function	可设置模块停止状态以降低功耗
IIC操作模式	主机发送 主机接收 从机发送 从机接收。

Table 32.1 IIC specifications (2 of 2)

Parameter	Specifications
Event link function (output)	• Transfer error or event occurrence (arbitration detection, NACK, timeout, start or restart condition, or stop condition) • Receive data full, including matching with a slave address • Transmit data empty, including matching with a slave address • Transmit end.
Wakeup function*1	CPU can return from Software Standby mode using a wakeup event

Note 1. This function is only available for IIC channel IIC0. IIC1 is not supported.

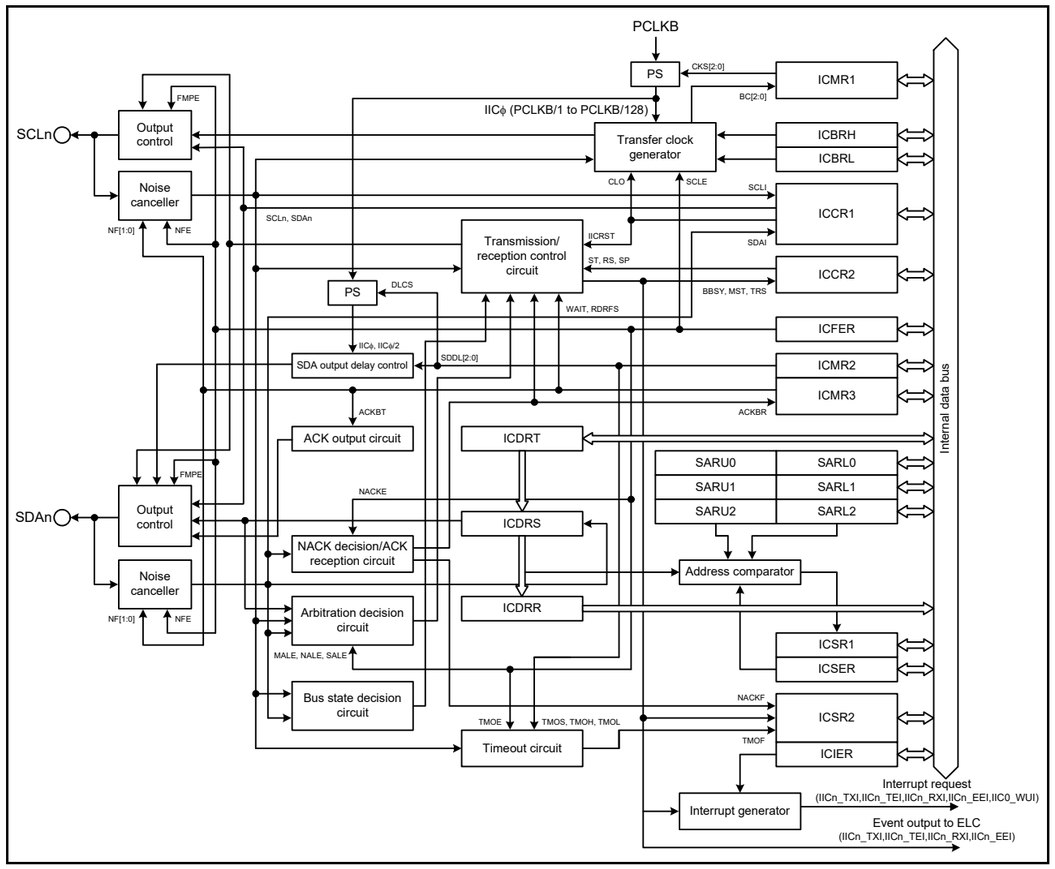

Figure 32.1 IIC block diagram

Table 32.1 IIC规格（2个中的2个）

Parameter	Specifications
事件链接功能（输出）	传输错误或事件发生（仲裁检测、NACK、超时、启动或重启条件或停止条件） 接收数据已满，包括与从地址匹配 传输数据为空，包括与从地址匹配 传输结束。
Wakeup function*1	CPU可以使用唤醒事件从软件待机模式返回

注1.此功能仅适用于IIC通道IIC0。不支持IIC1。

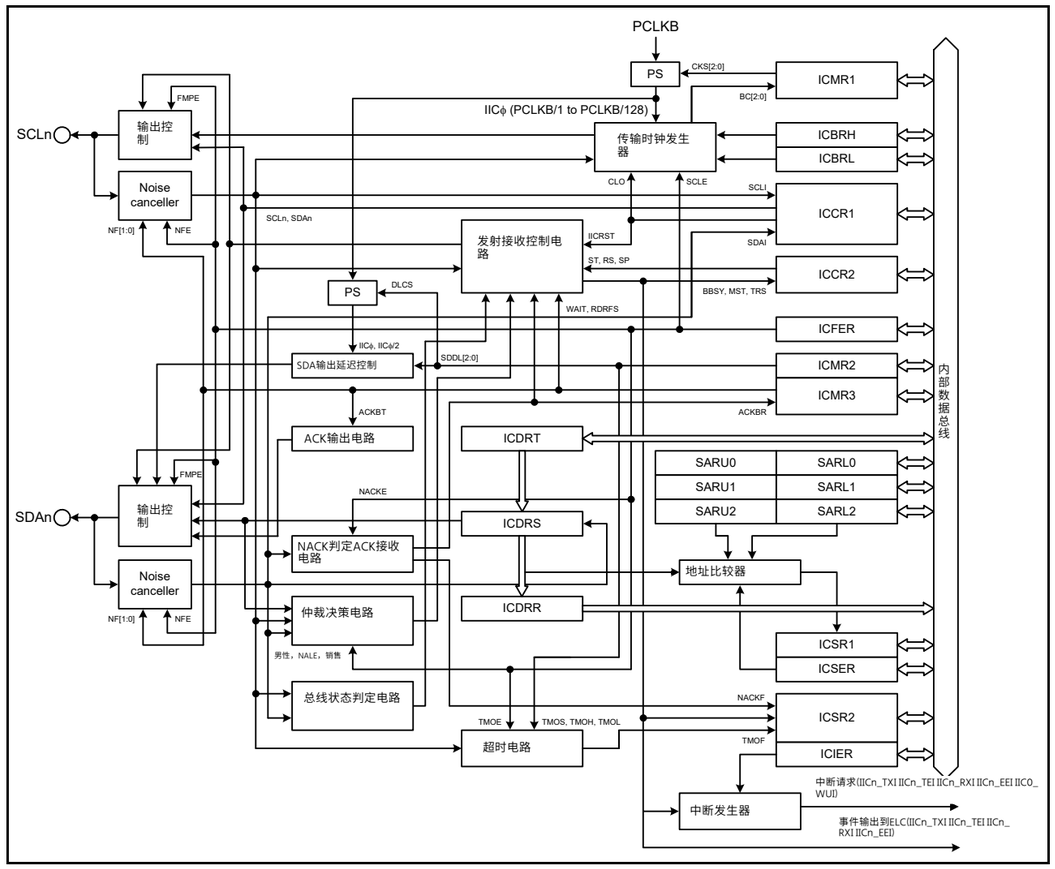

Figure 32.1 IIC框图

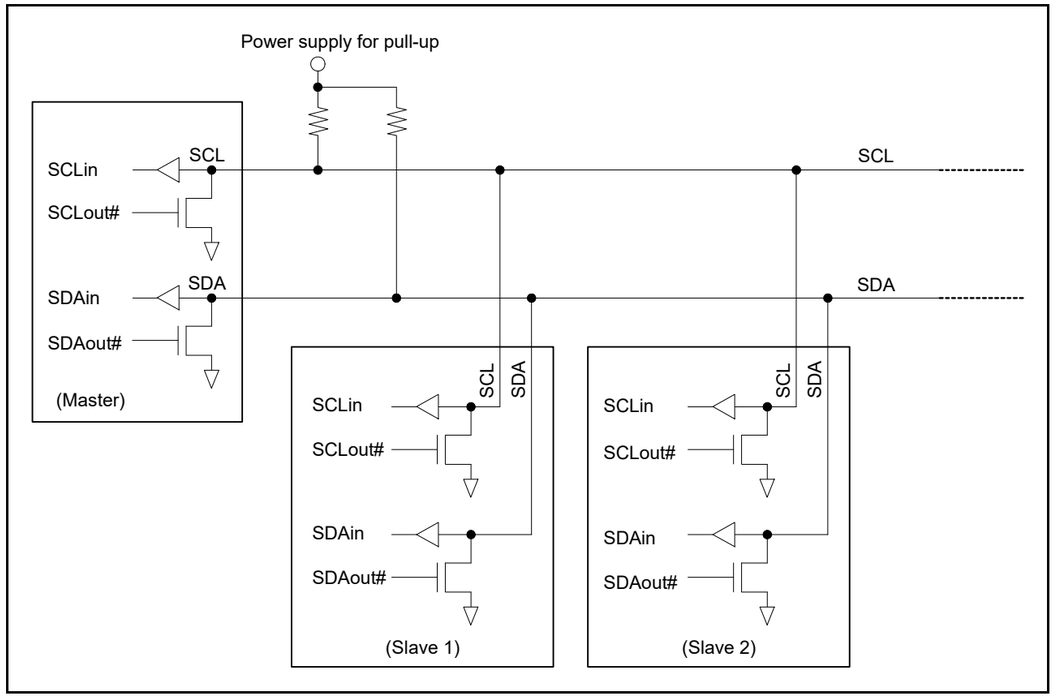

Figure 32.2 I/O pin connection to an external circuit (I2C bus configuration example)

b5	CLO	Extra SCL Clock Cycle Output	0: Do not output extra SCL clock cycle (default) 1: Output extra SCL clock cycle. This bit clears automatically after 1 clock cycle is output.	R/W
b6	IICRST	IIC-Bus Interface Internal Reset	0: Release IIC reset or internal reset 1: Initiate IIC reset or internal reset. This setting clears the bit counter and the SCLn/SDAn output latch.	R/W
b7	ICE	IIC-Bus Interface Enable	0: Disable (SCLn and SDAn pins in inactive state) 1: Enable (SCLn and SDAn pins in active state). Used in combination with the IICRST bit to select either IIC or internal reset.	R/W

SDAO bit (SDA Output Control/Monitor) and SCLO bit (SCL Output Control/Monitor)

The SDAO and SCLO bits directly control the SDAn and SCLn signals output from the IIC.

When writing to these bits, also write 0 to the SOWP bit. Setting these bits results in input to the IIC by the input buffer. When slave mode is selected, a start condition might be detected and the bus might be released, depending on the bit settings.

Do not rewrite these bits during a start condition, stop condition, restart condition, or during transmission, or reception. Operation after rewriting under the specified conditions is not guaranteed. When reading these bits, the state of signals output from the IIC can be read.

CLO bit (Extra SCL Clock Cycle Output)

The CLO bit allows output of an extra SCL clock cycle for debugging or error processing. Normally, set this bit to 0. Setting this bit to 1 in a normal communication state causes a communication error. For details on this function, see section 32.12.2, Extra SCL Clock Cycle Output Function.

IICRST bit (IIC-Bus Interface Internal Reset)

The IICRST bit initiates an internal state reset of the IIC. Setting this bit to 1 initiates an IIC reset or internal reset. Whether an IIC reset or internal reset is initiated is determined by setting this bit in combination with the ICE bit. Table 32.3 lists the IIC resets.

The IIC reset initializes all registers except ICCR1.ICE and ICCR1.IICRST bits, and internal states of the IIC. In addition to the internal states of the IIC, the internal reset initializes the following:

- Bit counter (ICMR1.BC[2:0] bits)
- I2C Bus Shift Register (ICDRS)
- I2C Bus Status Registers (ICSR1 and ICSR2)
- SDAO and SCLO Output Control/Monitor (ICCR1.SCLO and ICCR1.SDAO bits)
- I2C Bus Control Register 2 (except ICCR2.BBSY bit).

Bit	Symbol	位名称	Description	R/W
b1	SCLI	SCL线路监视器	0：SCLn线低1：SC Ln线高。	R
b2	SDAO	SDA Output Control/Monitor	• Read: 0：IIC驱动SDAn引脚为低电 平1：IIC释放SDAn引脚。 写 ： 0：IIC驱动SDAn引脚为低电平 1：IIC释放SDAn引脚。	R/W
b3	SCLO	SCL Output Control/Monitor	• Read: 0：IIC驱动SCLn引脚为低电 平1：IIC释放SCLn引脚。 写 ： 0：IIC驱动SCLn引脚为低电平1：IIC释放SCLn引脚。使 用外部上拉电阻将信号驱动为高电平。	R/W
b4	SOWP	SCLOSDAO写保护	0：写使能SCLO和SDAO位1：写保护S CLO和SDAO位。该位读为1。	R/W
b5	CLO	额外的SCL时钟周期输出	0：不输出额外的SCL时钟周期（默认）1：输出额外的S CL时钟周期。该位在输出1个时钟周期后自动清零。	R/W
b6	IICRST	IIC总线接口内部 Reset	0：释放IIC复位或内部复位1：启动IIC复位或内部复位。该设置清除 位计数器和SCLnSDAn输出锁存器。	R/W
b7	ICE	IIC总线接口使能	0：禁用（SCLn和SDAn引脚处于非活动状态）1：启用（SCLn 和SDAn引脚处于活动状态）。与IICRST位结合使用来选择IIC 或内部复位。	R/W

SDAO位（SDA输出控制监视器）和SCLO位（SCL输出控制监视器）

SDAO和SCLO位直接控制IIC输出的SDAn和SCLn信号。

写入这些位时，还要向SOWP位写入0。设置这些位会导致输入缓冲器向IIC输入。
选择从模式时，可能会检测到启动条件并释放总线，具体取决于位设置。

不要在开始条件、停止条件、重启条件或发送或接收期间重写这些位。不保证在指定条件下重写后的操作。读取这些位时，可以读取IIC输出的信号状态。

CLO位（额外SCL时钟周期输出）

CLO位允许输出额外的SCL时钟周期用于调试或错误处理。通常，将此位设置为0。
在正常通信状态下将此位设置为1会导致通信错误。有关此功能的详细信息，请参见第32.12.2节，额外SCL时钟周期输出功能。

IICRST位（IIC总线接口内部复位）

IICRST位启动IIC的内部状态复位。将此位设置为1会启动IIC复位或内部复位。
是否启动IIC复位或内部复位由设置该位和ICE位共同决定。表32.3列出了IIC复位。

IIC复位初始化除ICCR1.ICE和ICCR1.IICRST位之外的所有寄存器，以及IIC的内部状态。除了IIC的内部状态之外，内部复位还会初始化以下内容：

- 位计数器（ICMR1.BC[2:0]位）
- I2C总线移位寄存器(ICDRS)
- I2C总线状态寄存器（ICSR1和ICSR2）
- SDAO和SCLO输出控制监视器（ICCR1.SCLO和ICCR1.SDAO位）
- I2C总线控制寄存器2（ICCR2.BBSY位除外）。

For the reset conditions of each register, see section 32.15, State of Registers when Issuing each Condition.

An internal reset initiated with the IICRST bit set to 1 during operation (with the ICE bit set to 1) resets the internal states of the IIC without initializing the port settings and the control and setting registers of the IIC. If the IIC hangs up in a low level output state, resetting the internal states cancels the low level output state and releases the bus with the SCLn pin and SDAn pin at high impedance.

Note: If an internal reset is initiated using the IICRST bit for a bus hang-up that occurs during communication with the master device in slave mode, the slave and master devices might enter different states, because the bit counter information differs. For this reason, do not initiate an internal reset in slave mode. Initiate recovery processing from the master device. If an internal reset is required because the IIC hangs with the SCLn line in a low level output state in slave mode, initiate an internal reset, then issue a restart condition from the master device, or issue a stop condition and resume communication from the start condition. If communication is restarted by initiating a reset solely in the slave device without issuing a start or restart condition from the master device, synchronization is lost because the master and slave devices operate asynchronously.

Table 32.3 IIC resets

IICRST	ICE	State	Specifications
1	0	IIC reset	Resets all registers except ICCR1.ICE and ICCR1.IICRST bits, and the internal states of the IIC
	1	Internal reset	Resets the following: • ICMR1.BC[2:0] bits • ICSR1, ICSR2, ICDRS registers • SDAO and SCLO Output Control/Monitor (ICCR1.SCLO and ICCR1.SDAO bits) • I2C Bus Control Register 2 (except ICCR2.BBSY bit) • Internal states of the IIC.

ICE bit (IIC-Bus Interface Enable)

The ICE bit selects the active or inactive state of the SCLn and SDAn pins. It can also be combined with the IICRST bit to initiate one of two types of resets. See Table 32.3 for the reset types.

Set the ICE bit to 1 when using the IIC. The SCLn and SDAn pins are placed in the active state when the ICE bit is set to 1. Set the ICE bit to 0 when the IIC is not used. The SCLn and SDAn pins are placed in the inactive state when the ICE bit is set to 0. Do not assign the SCLn or SDAn pin to the IIC when setting up the pin function control. Slave address comparison is performed if the pins are assigned to the IIC.

32.2.2 I2C Bus Control Register 2 (ICCR2)

Address(es): IIC0.ICCR2 4005 3001h, IIC1.ICCR2 4005 3101h

	b7	b6	b5	b4	b3	b2	b1	b0
	BBSY	MST	TRS	—	SP	RS	ST	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b1	ST	Start Condition Issuance Request	0: Do not issue a start condition request 1: Issue a start condition request.	R/W
b2	RS	Restart Condition Issuance Request	0: Do not issue a restart condition request 1: Issue a restart condition request.	R/W
b3	SP	Stop Condition Issuance Request	0: Do not issue a stop condition request 1: Issue a stop condition request.	R/W
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5	TRS	Transmit/Receive Mode	0: Receive mode 1: Transmit mode.	R/W*1

有关每个寄存器的复位条件，请参阅第32.15节，发出每个条件时的寄存器状态。

在操作期间将IICRST位设置为1（ICE位设置为1）启动的内部复位会复位IIC的内部状态，而无需初始化IIC的端口设置以及控制和设置寄存器。如果IIC在低电平输出状态下挂起，复位内部状态会取消低电平输出状态并释放总线，同时SCLn引脚和SDAn引脚处于高阻态。

Note: 如果在从模式下与主设备通信期间发生的总线挂断使用IICRST位启动内部复位，则从设备和主设备可能会进入不同的状态，因为位计数器信息不同。因此，不要在从模式下启动内部复位。从主设备启动恢复处理。如果由于IIC在从机模式下挂起且SCLn线处于低电平输出状态而需要内部复位，则启动内部复位，然后从主设备发出重新启动条件，或发出停止条件并从开始处恢复通信健康）状况。如果通过仅在从设备中启动复位来重新启动通信，而没有从主设备发出启动或重新启动条件，则由于主设备和从设备异步操作而失去同步。

Table 32.3 IIC resets

IICRST	ICE	State	Specifications
1	0	IIC reset	复位除ICCR1.ICE和ICCR1.IICRST位之外的所有寄存器，以及IIC的内部状态
	1	内部复位	复位以下内容： ICMR1.BC[2:0]位 ICSR1、ICSR2、ICDRS寄存器 SDAO和SCLO输出控制监视器（ICCR1.SCLO和ICCR1.SDAO位） I2C总线控制寄存器2（ICCR2.BBSY位除外） IIC的内部状态。

ICE位（IIC总线接口使能）

ICE位选择SCLn和SDAn引脚的有效或无效状态。它也可以与IICRST位结合来启动两种类型的复位中的一种。复位类型见表32.3。

使用IIC时将ICE位设置为1。当ICE位设置为1时，SCLn和SDAn引脚处于活动状态。不使用IIC时，将ICE位设置为0。当ICE位设置为0时，SCLn和SDAn引脚处于无效状态。在设置引脚功能控制时，不要将SCLn或SDAn引脚分配给IIC。如果引脚分配给IIC，则执行从地址比较。

32.2.2 I2C总线控制寄存器2(ICCR2)

Address(es): IIC0.ICCR2 4005 3001h, IIC1.ICCR2 4005 3101h

	b7	b6	b5	b4	b3	b2	b1	b0
	BBSY	MST	TRS	—	SP	RS	ST	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	—	Reserved	该位读取为0。写入值应为0。	R/W
b1	ST	开始条件签发 Request	0：不发出启动条件请求1：发出启动条件请求。	R/W
b2	RS	重启条件发布 Request	0：不发出重启条件请求1：发出重启条件请求。	R/W
b3	SP	停止条件发布 Request	0：不发出停止条件请求1：发出停止条件请求。	R/W
b4	—	Reserved	该位读取为0。写入值应为0。	R/W
b5	TRS	Transmit/Receive Mode	0：接收模式1：发送模式。	R/W*1

Bit	Symbol	Bit name	Description	R/W
b6	MST	Master/Slave Mode	0: Slave mode 1: Master mode.	R/W*1
b7	BBSY	Bus Busy Detection Flag	0: I2C bus released (bus free state) 1: I2C bus occupied (bus busy state).	R

Note 1. The MST and TRS bits can be written to when the ICMR1.MTWP bit is set to 1.

ST bit (Start Condition Issuance Request)

The ST bit requests transition to master mode and triggers a start condition.

When this bit is set to 1, a start condition is issued when the BBSY flag is set to 0 (bus free state). For details on issuing a start condition, see section 32.11, Start, Restart, and Stop Condition Issuing Function.

[Setting condition]

- When 1 is written to the ST bit.

[Clearing conditions]

- When 0 is written to the ST bit
- When a start condition is issued (a start condition is detected)
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: Only set the ST bit to 1 (start condition request) when the BBSY flag is set to 0 (bus free state). Arbitration might be lost if the ST bit is set to 1 when the BBSY flag is 1 (bus busy state).

RS bit (Restart Condition Issuance Request)

The RS bit requests that a restart condition be issued in master mode.

When this bit is set to 1 to request a restart condition, a restart condition is issued when the BBSY flag is set to 1 (bus busy state) and the MST bit is set to 1 (master mode). For details on issuing a restart condition, see section 32.11, Start, Restart, and Stop Condition Issuing Function.

[Setting condition]

- When 1 is written to the RS bit with the BBSY flag in ICCR2 set to 1.

[Clearing conditions]

- When 0 is written to the RS bit
- When a restart condition is issued (a start condition is detected)
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: Do not set the RS bit to 1 while issuing a stop condition.
Note: If 1 (restart condition request) is written to the RS bit in slave mode, the restart condition is not issued, but the RS bit remains set to 1. If the operating mode changes to master mode without the bit being cleared, a restart condition might be issued.

SP bit (Stop Condition Issuance Request)

The SP bit requests that a stop condition be issued in master mode.

When this bit is set to 1, a stop condition is issued when the BBSY flag is set to 1 (bus busy state) and the MST bit is set to 1 (master mode). For details on this function, see section 32.11, Start, Restart, and Stop Condition Issuing Function.

[Setting condition]

- When 1 is written to the SP bit with both the BBSY flag and the MST bit in ICCR2 set to 1.

Bit	Symbol	位名称	Description	R/W
b6	MST	Master/Slave Mode	0：从模式1：主模式。	R/W*1
b7	BBSY	总线忙检测标志	0：I2C总线释放（总线空闲状态）1：I2C总线占用（总线忙状态）。	R

Note 1. 当ICMR1.MTWP位设置为1时，可以写入MST和TRS位。

ST位（开始条件发布请求）

ST位请求转换到主模式并触发启动条件。

当该位设置为1时，当BBSY标志设置为0（总线空闲状态）时发出启动条件。有关发出启动条件的详细信息，请参阅第32.11节"启动、重启和停止条件发出功能"。

[Setting condition]

- 当1写入ST位时。

[Clearing conditions]

- 当0写入ST位时
- 发出启动条件时（检测到启动条件）
- ICSR2中的AL（仲裁失败）标志设置为1时
- 当向ICCR1中的IICRST位写入1时，应用IIC复位或内部复位。

Note: 仅当BBSY标志设置为0（总线空闲状态）时，才将ST位设置为1（启动条件请求）。如果在BBSY标志为1（总线繁忙状态）时将ST位设置为1，则仲裁可能会丢失。

RS位（重启条件发布请求）

RS位请求在主机模式下发出重启条件。

当该位设置为1以请求重新启动条件时，当BBSY标志设置为1（总线繁忙状态）且MST位设置为1（主模式）时，发出重新启动条件。有关发出重启条件的详细信息，请参阅第32.11节"启动、重启和停止条件发出功能"。

[Setting condition]

- 当ICCR2中的BBSY标志设置为1时，将1写入RS位。

[Clearing conditions]

- 当0写入RS位时
- 发出重新启动条件时（检测到启动条件）
- ICSR2中的AL（仲裁失败）标志设置为1时
- 当向ICCR1中的IICRST位写入1时，应用IIC复位或内部复位。

Note: 发出停止条件时不要将RS位设置为1。
Note: 如果在从模式下将1（重新启动条件请求）写入RS位，则不会发出重新启动条件，但RS位保持设置为1。如果操作模式更改为主模式而未清除该位，则重新启动条件可能会发出。

SP位（停止条件发出请求）

SP位请求在主机模式下发出停止条件。

当该位设置为1时，当BBSY标志设置为1（总线繁忙状态）且MST位设置为1（主模式）时，发出停止条件。有关此功能的详细信息，请参阅第32.11节"启动、重启和停止条件发出功能"。

[Setting condition]

- 当1写入SP位时，且ICCR2中的BBSY标志和MST位都设置为1。

[Clearing conditions]

- When 0 is written to the SP bit
- When a stop condition is issued (a stop condition is detected)
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When a start condition and a restart condition are detected
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: Writing to the SP bit is not possible when the BBSY flag is 0 (bus free state).
Note: Do not set the SP bit to 1 when a restart condition is being issued.

TRS bit (Transmit/Receive Mode)

The TRS bit indicates transmit or receive mode.

The IIC is in receive mode when the TRS bit is 0 and in transmit mode when the bit is 1. The combination of the TRS bit and the MST bit indicates the IIC operating mode.

The value of the TRS bit automatically changes to 1 for transmit mode or 0 for receive mode when a start condition is issued or detected and the R/W# bit is set. Although writing to the TRS bit is possible when the MTWP bit in ICMR1 is set to 1, writing to this bit is not required during normal usage.

[Setting conditions]

- When a start condition is issued normally because of a start condition request (when a start condition is detected with the ST bit set to 1)
- When a restart condition is issued normally because of a restart condition request (when a restart condition is detected with the RS bit set to 1)
- When the R/W# bit appended to the slave address is set to 0 in master mode
- When the address received in slave mode matches the address enabled in ICSER, with the R/W# bit set to 1
- When 1 is written to the TRS bit with the MTWP bit in ICMR1 set to 1.

[Clearing conditions]

- When a stop condition is detected
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When the R/W# bit appended to the slave address is set to 1 in master mode
- In slave mode, on a match between the received address and the address enabled in ICSER when the value of the received R/W# bit is 0, including when the received address is the general call address
- In slave mode, when a restart condition is detected (a start condition is detected with ICCR2.BBSY = 1 and ICCR2.MST = 0)
- When 0 is written to the TRS bit with the MTWP bit in ICMR1 set to 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

MST bit (Master/Slave Mode)

The MST bit indicates master or slave mode. The IIC is in slave mode when the MST bit is set to 0 and is in master mode when the bit is set to 1. The combination of the MST bit and the TRS bit indicates the IIC operating mode.

The value of the MST bit automatically changes to 1 for master mode or 0 for slave mode when a start condition is issued, or when a stop condition is issued or detected. Although writing to the MST bit is possible when the MTWP bit in ICMR1 is set to 1, writing to this bit is not required during normal usage.

[Setting conditions]

- When a start condition is issued normally because of a start condition request (when a start condition is detected with the ST bit set to 1)

[Clearing conditions]

- 当0写入SP位时
- 发出停止条件时（检测到停止条件）
- ICSR2中的AL（仲裁失败）标志设置为1时
- 当检测到启动条件和重新启动条件时
- 当向ICCR1中的IICRST位写入1时，应用IIC复位或内部复位。

Note: 当BBSY标志为0（总线空闲状态）时，不能写入SP位。
Note: 发出重启条件时不要将SP位设置为1。

TRS位（发送接收模式）

TRS位指示发送或接收模式。

当TRS位为0时IIC处于接收模式，当该位为1时IIC处于发送模式。TRS位和MST位的组合表示IIC工作模式。

当发出或检测到启动条件并且设置RW#位时，TRS位的值自动更改为1（发送模式）或0（接收模式）。虽然当ICMR1的MTWP位设置为1时可以写入TRS位，但在正常使用期间不需要写入该位。

[Setting conditions]

- 由于启动条件请求而正常发出启动条件时（在ST位设置为1的情况下检测到启动条件时）
- 由于重新启动条件请求而正常发出重新启动条件时（在RS位设置为1的情况下检测到重新启动条件时）
- 当附加到从地址的RW#位在主模式下设置为0时
- 当从机模式接收到的地址与ICSER中使能的地址匹配时，RW#位设置为1
- 当将1写入TRS位且ICMR1中的MTWP位设置为1时。

[Clearing conditions]

- 检测到停止条件时
- ICSR2中的AL（仲裁失败）标志设置为1时
- 当附加到从地址的RW#位在主模式下设置为1时
- 在从机模式下，当接收到的RW#位的值为0时，接收到的地址与ICSER中使能的地址匹配，包括接收到的地址是广播地址时
- 在从模式下，当检测到重启条件时（检测到ICCR2.BBSY=1和ICCR2.MST = 0)
- 当将0写入TRS位且ICMR1中的MTWP位设置为1时
- 当向ICCR1中的IICRST位写入1时，应用IIC复位或内部复位。

MST位（主从模式）

MST位指示主机或从机模式。当MST位设置为0时，IIC处于从机模式，当该位设置为1时，IIC处于主机模式。MST位和TRS位的组合表示IIC工作模式。

当发出启动条件或发出或检测到停止条件时，MST位的值自动变为1（主模式）或0（从模式）。虽然当ICMR1中的MTWP位设置为1时可以写入MST位，但在正常使用期间不需要写入该位。

[Setting conditions]

- 由于启动条件请求而正常发出启动条件时（在ST位设置为1的情况下检测到启动条件时）

- When 1 is written to the MST bit with the MTWP bit in ICMR1 set to 1.

[Clearing conditions]

- When a stop condition is detected
- When the AL (arbitration-lost) flag in ICSR2 is set to 1
- When 0 is written to the MST bit with the MTWP bit in ICMR1 set to 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

BBSY flag (Bus Busy Detection Flag)

The BBSY flag indicates whether the I2C bus is occupied (bus busy state) or released (bus free state).

This flag is set to 1 when the SDAn line changes from high to low with the SCLn line is high, assuming that a start condition was issued.

This flag is set to 0 when the SDAn line changes from low to high with the SCLn line high, if the bus free time (ICBRL setting) start condition is not detected, assuming that a stop condition was issued.

[Setting condition]

- When a start condition is detected.

[Clearing conditions]

- When the bus free time (ICBRL register setting) start condition is not detected after detecting a stop condition
- When 1 is written to the IICRST bit in ICCR1 with the ICE bit in ICCR1 set to 0 (IIC reset).

32.2.3 I2C Bus Mode Register 1 (ICMR1)

Address(es): IIC0.ICMR1 4005 3002h, IIC1.ICMR1 4005 3102h

	b7	b6	b5	b4	b3	b2	b1	b0
	MTWP	CKS[2:0]			BCWP	BC[2:0]		
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	BC[2:0]	Bit Counter	b2 b0 0 0: 9 bits 0 0: 1 bits 0 1: 3 bits 0 1: 4 bits 1 0: 5 bits 1 0: 6 bits 1 1: 7 bits 1 1: 8 bits.	R/W*1
b3	BCWP	BC Write Protect	0: Write enable BC[2:0] bits 1: Write protect BC[2:0] bits. This bit is read as 1.	R/W*1
b6 to b4	CKS[2:0]	Internal Reference Clock Select	Select the internal reference clock source (IICϕ) for the IIC. b6 b4 0 0: PCLKB clock 0 0: PCLKB/2 clock 0 1: PCLKB/4 clock 0 1: PCLKB/8 clock 1 0: PCLKB/16 clock 1 0: PCLKB/32 clock 1 1: PCLKB/64 clock 1 1: PCLKB/128 clock.	R/W
b7	MTWP	MST/TRS Write Protect	0: Write protect MST and TRS bits in ICCR2 1: Write enable MST and TRS bits in ICCR2.	R/W

- 当ICMR1中的MTWP位设置为1时，将1写入MST位。

[Clearing conditions]

- 检测到停止条件时
- ICSR2中的AL（仲裁失败）标志设置为1时
- 将0写入MST位且ICMR1中的MTWP位设置为1时
- 当向ICCR1中的IICRST位写入1时，应用IIC复位或内部复位。

BBSY标志（总线忙检测标志）

BBSY标志指示I2C总线是被占用（总线繁忙状态）还是被释放（总线空闲状态）。

当SDAn线从高电平变为低电平且SCLn线为高电平时，该标志设置为1，假设发出了启动条件。

如果未检测到总线空闲时间（ICBRL设置）启动条件，假设发出了停止条件，则当SDAn线从低电平变为高电平而SCLn线为高电平时，该标志设置为0。

[Setting condition]

- 当检测到启动条件时。

[Clearing conditions]

- 在检测到停止条件后未检测到总线空闲时间（ICBRL寄存器设置）启动条件时
- 当ICCR1中的IICRST位写入1且ICCR1中的ICE位设置为0时（IIC复位）。

32.2.3 I2C总线模式寄存器1(ICMR1)

Address(es): IIC0.ICMR1 4005 3002h, IIC1.ICMR1 4005 3102h

	b7	b6	b5	b4	b3	b2	b1	b0
	MTWP	CKS[2:0]			BCWP	BC[2:0]

b7	MTWP	MSTTRS写保护	0：写保护ICCR2中的MST和TRS位1：写使能ICCR2中的MST和TRS位。	R/W

Note 1. Rewrite the BC[2:0] bits and set the BCWP bit to 0 at the same time.

BC[2:0] bits (Bit Counter)

The BC[2:0] bits function as a counter that indicates the number of bits remaining to be transferred on detection of a rising edge on the SCLn line. Although BC[2:0] are read/write bits, it is not required to access these bits under normal conditions.

To write to these bits, specify the number of bits to be transferred plus one, for an additional acknowledge bit, between transferred frames when the SCLn line is at a low level.

The value in the BC[2:0] bits returns to 000b at the end of a data transfer, including the acknowledge bit, or when a start or restart condition is detected.

32.2.4 I2C Bus Mode Register 2 (ICMR2)

Address(es): IIC0.ICMR2 4005 3003h, IIC1.ICMR2 4005 3103h

	b7	b6	b5	b4	b3	b2	b1	b0
	DLCS	SDDL[2:0]			—	TMOH	TMOL	TMOS
Value after reset:	0	0	0	0	0	1	1	0

Bit	Symbol	Bit name	Description	R/W
b0	TMOS	Timeout Detection Time Select	0: Select long mode 1: Select short mode.	R/W
b1	TMOL	Timeout L Count Control	0: Disable count while SCLn line is low 1: Enable count while SCLn line is low.	R/W
b2	TMOH	Timeout H Count Control	0: Disable count while SCLn line is high 1: Enable count while SCLn line is high.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6 to b4	SDDL[2:0]	SDA Output Delay Counter	• When ICMR2.DLCS = 0 (IICϕ) b6 b4 0 0 0: No output delay 0 0 1: 1 IICϕ cycle 0 1 0: 2 IICϕ cycles 0 1 1: 3 IICϕ cycles 1 0 0: 4 IICϕ cycles 1 0 1: 5 IICϕ cycles 1 1 0: 6 IICϕ cycles 1 1 1: 7 IICϕ cycles. • When ICMR2.DLCS = 1 (IICϕ/2) b6 b4 0 0 0: No output delay 0 0 1: 1 or 2 IICϕ cycles 0 1 0: 3 or 4 IICϕ cycles 0 1 1: 5 or 6 IICϕ cycles 1 0 0: 7 or 8 IICϕ cycles 1 0 1: 9 or 10 IICϕ cycles 1 1 0: 11 or 12 IICϕ cycles 1 1 1: 13 or 14 IICϕ cycles.	R/W
b7	DLCS	SDA Output Delay Clock Source Select	0: Internal reference clock (IICϕ) selected as the clock source for SDA output delay counter 1: Internal reference clock divided by 2 (IICϕ/2) selected as the clock source for SDA output delay counter.*1	R/W

Note 1. The setting DLCS = 1 (IICϕ/2) is only valid when SCL is low. When SCL is high, the DLCS = 1 setting is invalid and the clock source becomes the internal reference clock (IICϕ).

TMOS bit (Timeout Detection Time Select)

The TMOS bit selects long or short mode for the timeout detection time when the timeout function is enabled (ICFER.TMOE = 1).

Note 1. 重写BC[2:0]位，同时将BCWP位设置为0。

BC[2:0]位（位计数器）

BC[2:0]位用作计数器，指示在检测到SCLn线上的上升沿时要传输的剩余位数。虽然BC[2:0]是读写位，但在正常情况下不需要访问这些位。

要写入这些位，在SCLn线处于低电平时，指定要传输的位数加1，作为附加确认位，在传输的帧之间。

BC[2:0]位中的值在数据传输结束时返回到000b，包括确认位，或者当检测到启动或重启条件时。

32.2.4 I2C总线模式寄存器2(ICMR2)

Address(es): IIC0.ICMR2 4005 3003h, IIC1.ICMR2 4005 3103h

	b7	b6	b5	b4	b3	b2	b1	b0

Note 1. 设置DLCS=1(IIC 2)仅在SCL为低电平时有效。当SCL为高电平时，DLCS=1设置无效，时钟源变为内部参考时钟(IIC)。

TMOS位（超时检测时间选择）

当使能超时功能（ICFER.TMOE=1）时，TMOS位为超时检测时间选择长模式或短模式。

RA生态工作室

When this bit is set to 0, long mode is selected. When it is set to 1, short mode is selected.

In long mode, the timeout detection internal counter functions as a 16 bit-counter. In short mode, the counter functions as a 14-bit counter. While the SCLn line is in the state that enables this counter as specified in the TMOH and TMOL bits, the counter counts up in synchronization with the internal reference clock (IICϕ) as a count source.

For details on this function, see section 32.12.1, Timeout Function.

TMOL bit (Timeout L Count Control)

The TMOL bit enables or disables up-counting on the internal counter of the timeout function while the SCLn line is held low and the timeout function is enabled (ICFER.TMOE = 1).

TMOH bit (Timeout H Count Control)

The TMOH bit enables or disables up-counting on the internal counter of the timeout function while the SCLn line is held high and the timeout function is enabled (ICFER.TMOE = 1).

SDDL[2:0] bits (SDA Output Delay Counter)

The SDDL[2:0] bits can be used to delay the SDA output. This counter works with the clock source selected in the DLCS bit. The SDDL[2:0] setting can be used for all types of SDA output, including the transmission of the acknowledge bit.

Set the SDA output delay to meet the I2C bus standard for the data enable time/acknowledge enable time*1, or the SMBus standard, within [data hold time (300 ns or more + the SCL clock low-level period) - the data setup time (250 ns)]. If a value outside the standard is set, communication between the devices might malfunction or falsely indicate a start or stop condition, depending on the bus state.

For details on this function, see section 32.5, SDA Output Delay Function.

Note 1. Data enable time/acknowledge enable time
3,450 ns for up to 100 kbps: Standard mode (Sm)
900 ns for up to 400 kbps: Fast mode (Fm)
450 ns for up to 1 Mbps: Fast mode plus (Fm+).

32.2.5 I2C Bus Mode Register 3 (ICMR3)

The SCLn line is held low on the falling edge of the 8th clock cycle. Low-hold is released by writing to ACKBT.	R/W*2

当该位设置为0时，选择长模式。当设置为1时，选择短模式。

在长模式下，超时检测内部计数器用作16位计数器。在短模式下，计数器用作14位计数器。当SCLn线处于启用TMOH和TMOL位中指定的计数器的状态时，计数器与作为计数源的内部参考时钟(IIC)同步递增计数。

有关此功能的详细信息，请参阅第32.12.1节，超时功能。

TMOL位（超时L计数控制）

TMOL位启用或禁用超时功能内部计数器的递增计数，同时SCLn线保持低电平且启用超时功能(ICFER.TMOE= 1)。

TMOH位（超时H计数控制）

TMOH位启用或禁用超时功能内部计数器的递增计数，同时SCLn线保持高电平且启用超时功能(ICFER.TMOE= 1)。

SDDL[2:0]位（SDA输出延迟计数器）

SDDL[2:0]位可用于延迟SDA输出。该计数器与在DLCS位中选择的时钟源一起工作。SDDL[2:0]设置可用于所有类型的SDA输出，包括确认位的传输。

设置SDA输出延迟以满足数据启用时间确认启用时间*1的I2C总线标准，或
SMBus标准，在[数据保持时间（300ns或更长+SCL时钟低电平周期）数据建立时间（250ns）]内。如果设置了超出标准的值，则设备之间的通信可能会发生故障或错误地指示开始或停止条件，具体取决于总线状态。

有关此功能的详细信息，请参阅第32.5节，SDA输出延迟功能。

注1.数据使能时间确认使能时间

Bit	Symbol	Bit name	Description	R/W
b6	WAIT	WAIT	0: No wait The period between 9th clock cycle and first clock cycle is not held low 1: Wait The period between 9th clock cycle and first clock cycle is held low. Low-hold is released by reading ICDRR.	R/W*2
b7	SMBS	SMBus/IIC-Bus Select	0: I2C bus selected 1: SMBus selected.	R/W

Note 1. Write to the ACKBT bit only when the ACKWP bit is 1. If the application writes 1 to both the ACKWP and ACKBT bits at the same time, the ACKBT bit is not set to 1.
Note 2. The WAIT and RDRFS bits are only valid in receive mode (invalid in transmit mode).

NF[1:0] bits (Noise Filter Stage Select)

The NF[1:0] bits select the number of stages in the digital noise filter.

For details on this function, see section 32.6, Digital Noise Filter Circuits.

Note: Set the noise range to be filtered out by the noise filter within a range less than the SCLn line high-level period or low-level period. If the noise range is set to a value of [SCL clock width: high-level period or low-level period, whichever is shorter] - [1.5 internal reference clock (IICϕ) cycles + analog noise filter: 120 ns (reference values)] or more, the SCL clock is regarded as noise by the noise filter function of the IIC, which might prevent the IIC from operating normally.

ACKBR bit (Receive Acknowledge)

The ACKBR bit stores the acknowledge bit information received from the receive device in transmit mode.

[Setting condition]

- When 1 is received as the acknowledge bit with the TRS bit in ICCR2 set to 1.

[Clearing conditions]

- When 0 is received as the acknowledge bit with the TRS bit in ICCR2 set to 1
- When 1 is written to the IICRST bit in ICCR1 while the ICE bit in ICCR1 is 0 (IIC reset).

ACKBT bit (Transmit Acknowledge)

The ACKBT bit sets the acknowledge bit to be sent in receive mode.

[Setting condition]

- When 1 is written to this bit with the ACKWP bit set to 1.

[Clearing conditions]

- When 0 is written to this bit with the ACKWP bit set to 1
- When stop condition request is detected with the SP bit in ICCR2 set to 1
- When 1 is written to the IICRST bit in ICCR1 while the ICE bit in ICCR1 is 0 (IIC reset).

ACKWP bit (ACKBT Write Protect)

The ACKWP bit controls write enabling of the ACKBT bit.

RDRFS bit (RDRF Flag Set Timing Select)

The RDRFS bit selects the RDRF flag set timing in receive mode and also selects whether to hold the SCLn line low on the falling edge of the 8th SCL clock cycle.

When the RDRFS bit is 0, the SCLn line is not held low on the falling edge of the 8th SCL clock cycle, and the RDRF flag is set to 1 on the rising edge of the 9th SCL clock cycle.

When the RDRFS bit is 1, the RDRF flag is set to 1 on the rising edge of the 8th SCL clock cycle, and the SCLn line is held low on the falling edge of the 8th SCL clock cycle. The low-hold of the SCLn line is released by a write to the

Bit	Symbol	位名称	Description	R/W
b6	WAIT	WAIT	0：无需等待 第9个时钟周期和第一个时钟周期之间的周期不保持低电平1：等待 第9个时钟周期和第一个时钟周期之间的周期保持低电平。 通过读取ICDRR释放低保持。	R/W*2
b7	SMBS	SMBus/IIC-Bus Select	0：选择I2C总线1 ：选择SMBus。	R/W

Note 1. 仅当ACKWP位为1时才写入ACKBT位。如果应用程序同时向ACKWP和ACKBT位写入1，则ACKBT位不会设置为1。

Note 2. WAIT和RDRFS位仅在接收模式下有效（在发送模式下无效）。

NF[1:0]位（噪声滤波器级选择）

NF[1:0]位选择数字噪声滤波器的级数。

有关此功能的详细信息，请参阅第32.6节，数字噪声滤波器电路。

Note: 将噪声滤波器滤除的噪声范围设置在小于SCLn线高电平周期或低电平周期的范围内。如果噪声范围设置为[SCL时钟宽度：高电平周期或低电平周期，以较短者为准][1.5内部参考时钟(IIC)周期+模拟噪声滤波器：120ns（参考值）]或以上，SCL时钟会被IIC的噪声过滤功能视为噪声，这可能会导致IIC无法正常工作。

ACKBR位（接收确认）

ACKBR位存储在发送模式下从接收设备接收到的确认位信息。

[Setting condition]

- 当ICCR2中的TRS位设置为1接收到1作为确认位时。

[Clearing conditions]

- 当ICCR2中的TRS位设置为1接收到0作为确认位时
- 当ICCR1中的IICRST位写入1而ICCR1中的ICE位为0时（IIC复位）。

ACKBT位（发送确认）

ACKBT位设置要在接收模式下发送的确认位。

[Setting condition]

- 当1写入该位且ACKWP位设置为1时。

[Clearing conditions]

- 当0写入该位且ACKWP位设置为1时
- 当ICCR2的SP位设置为1时检测到停止条件请求
- 当ICCR1中的IICRST位写入1而ICCR1中的ICE位为0时（IIC复位）。

ACKWP位（ACKBT写保护）

ACKWP位控制ACKBT位的写使能。

RDRFS位（RDRF标志设置时序选择）

RDRFS位选择接收模式下的RDRF标志设置时序，并选择是否在第8个SCL时钟周期的下降沿保持SCLn线为低电平。

当RDRFS位为0时，SCLn线在第8个SCL时钟周期的下降沿不保持低电平，并且RDRF标志在第9个SCL时钟周期的上升沿设置为1。

当RDRFS位为1时，RDRF标志在第8个SCL时钟周期的上升沿设置为1，并且SCLn线在第8个SCL时钟周期的下降沿保持低电平。SCLn线的低保持通过向

ACKBT bit.

After data is received with this setting, the SCLn line is automatically held low before the acknowledge bit is sent. This enables processing to send ACK (ACKBT = 0) or NACK (ACKBT = 1), based on the receive data.

WAIT bit (WAIT)

The WAIT bit controls whether to forcefully hold the period between the 9th SCL clock cycle and the 1st SCL clock cycle low until the receive data buffer (ICDRR) is completely read each time a single-byte data is received in receive mode.

When the WAIT bit is 0, the receive operation continues without holding the period between the 9th and the 1st SCL clock cycle low. When both the RDRFS and WAIT bits are 0, continuous receive operation is enabled with the double buffer.

When the WAIT bit is 1, the SCLn line is held low from the falling edge of the 9th clock cycle until the ICDRR value is read each time a single-byte data is received. This enables the receive operation in byte units.

Note: When the value of the WAIT bit is to be read, be sure to first read the ICDRR register first.

SMBS bit (SMBus/IIC-Bus Select)

Setting the SMBS bit to 1 selects the SMBus and enables the HOAE bit in ICSER.

32.2.6 I2C Bus Function Enable Register (ICFER)

Address(es): IIC0.ICFER 4005 3005h, IIC1.ICFER 4005 3105h

	b7	b6	b5	b4	b3	b2	b1	b0
	FMPE	SCLE	NFE	NACKE	SALE	NALE	MALE	TMOE
Value after reset:	0	1	1	1	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b0	TMOE	Timeout Function Enable	0: Timeout function disabled 1: Timeout function enabled.	R/W
b1	MALE	Master Arbitration-Lost Detection Enable	0: Master arbitration-lost detection disabled. Also disables automatic clearing of the MST and TRS bits in ICCR2 when arbitration is lost. 1: Master arbitration-lost detection enabled. Also enables automatic clearing of the MST and TRS bits in ICCR2 when arbitration is lost.	R/W
b2	NALE	NACK Transmission Arbitration-Lost Detection Enable	0: NACK transmission arbitration-lost detection disabled 1: NACK transmission arbitration-lost detection enabled.	R/W
b3	SALE	Slave Arbitration-Lost Detection Enable	0: Slave arbitration-lost detection disabled 1: Slave arbitration-lost detection enabled.	R/W
b4	NACKE	NACK Reception Transfer Suspension Enable	0: Transfer operation not suspended during NACK reception (transfer suspension disabled) 1: Transfer operation suspended during NACK reception (transfer suspension enabled).	R/W
b5	NFE	Digital Noise Filter Circuit Enable	0: No digital noise filter circuit used 1: A digital noise filter circuit used.	R/W
b6	SCLE	SCL Synchronous Circuit Enable	0: No SCL synchronous circuit used 1: An SCL synchronous circuit used.	R/W
b7	FMPE*1	Fast Mode Plus Enable	0:The Fast mode plus slope control circuit for the SCLn and SDAn pins not used 1: The Fast mode plus slope control circuit for the SCLn and SDAn pins used.	R/W

Note 1. The Fast Mode Plus Enable bit (FMPE) is supported only by IIC0 (SCL0-A, SDA0-A). Bit [7] is reserved in IIC1.

ACKBT bit.

使用此设置接收数据后，SCLn线在发送确认位之前自动保持低电平。这使处理能够根据接收数据发送ACK(ACKBT=0)或NACK(ACKBT=1)。

等待位（等待）

WAIT位控制是否强制将第9个SCL时钟周期和第1个SCL时钟周期之间的周期保持为低电平，直到在接收模式下每次接收到一个单字节数据时，接收数据缓冲区(ICDRR)被完全读取。

当WAIT位为0时，接收操作继续，而不会将第9个和第1个SCL时钟周期之间的周期保持为低电平。当RDRFS和WAIT位都为0时，双缓冲器使能连续接收操作。

当WAIT位为1时，SCLn线从第9个时钟周期的下降沿保持低电平，直到每次接收到一个单字节数据时读取ICDRR值。这启用了以字节为单位的接收操作。

Note: 当要读取WAIT位的值时，一定要先读取ICDRR寄存器。

SMBS位（SMBusIIC-Bus选择）

将SMBS位设置为1可选择SMBus并启用ICSER中的HOAE位。

32.2.6 I2C总线功能使能寄存器(ICFER)

Note 1. 只有IIC0（SCL0-A、SDA0-A）支持快速模式加使能位（FMPE）。位[7]在IIC1中保留。

TMOE bit (Timeout Function Enable)

The TMOE bit enables or disables the timeout function.

For details on this function, see section 32.12.1, Timeout Function.

MALE bit (Master Arbitration-Lost Detection Enable)

The MALE bit specifies whether to use the arbitration-lost detection function in master mode. For normal operation, set this bit to 1.

NALE bit (NACK Transmission Arbitration-Lost Detection Enable)

The NALE bit specifies whether to cause loss of arbitration when ACK is detected during the transmission of NACK in receive mode, for example, when slaves with the same address exist on the bus, or when two or more masters select the same slave device simultaneously with a different number of receive bytes.

SALE bit (Slave Arbitration-Lost Detection Enable)

The SALE bit specifies whether to cause loss of arbitration when a value different from the value being transmitted is detected on the bus in slave transmit mode, for example, when slaves with the same address exist on the bus, or when a mismatch with the transmit data occurs because of noise.

NACKE bit (NACK Reception Transfer Suspension Enable)

The NACKE bit specifies whether to continue or discontinue the transfer operation when NACK is received from the slave device in transmit mode. For normal operation, set this bit to 1.

When NACK is received with the NACKE bit set to 1, the next transfer operation is suspended. When the NACKE bit is 0, the next transfer operation continues regardless of the received acknowledge content.

For details, see section 32.9.2, NACK Reception Transfer Suspension Function.

SCLE bit (SCL Synchronous Circuit Enable)

The SCLE bit specifies whether to synchronize the SCL clock with the SCL input clock. For normal operation, set this bit to 1.

When the SCLE bit is set to 0 (no SCL synchronous circuit used), the IIC does not synchronize the SCL clock with the SCLn input clock. With this setting, the IIC outputs the SCL clock with the transfer rate set in ICBRH and ICBRL, regardless of the SCLn line state. For this reason, if the bus load of the I2C bus line is much larger than the specification value, or if the SCLn clock output overlaps in multiple masters, a short-cycle SCL clock that does not meet the specification might be output. When no SCL synchronous circuit is used, it also affects the issuing of the start, restart, and stop conditions, and the continuous output of extra SCL clock cycles.

Do not set the SCLE bit to 0 except when checking the output of the set transfer rate.

FMPE bit (Fast Mode Plus Enable)

The FMPE bit specifies whether to use a slope control circuit for Fast mode plus (Fm+).

When this bit is set to 1, a slope control circuit conforming to the I2C bus Fast mode plus (Fm+) standard (tof) is selected. When this bit is set to 0, a slope control circuit conforming to the I2C bus Standard mode (Sm) and Fast mode (Fm) standards (tof) is selected.

Set this bit to 1 when using transmission rates up to 1 Mbps (Fast mode plus (Fm+) standard). Set it to 0 when using other transmission rates (up to 100 kbps (Sm) or up to 400 kbps (Fm)) or for SMBus (10 to 100 kbps).

TMOE位（超时功能使能）

TMOE位启用或禁用超时功能。

有关此功能的详细信息，请参阅第32.12.1节，超时功能。

MALE位（主仲裁丢失检测使能）

MALE位指定是否在主机模式下使用仲裁丢失检测功能。对于正常操作，将此位设置为1。

NALE位（NACK传输仲裁丢失检测使能）

NALE位指定在接收模式下发送NACK期间检测到ACK时是否导致仲裁丢失，例如，当总线上存在具有相同地址的从设备时，或者当两个或多个主设备同时选择同一个从设备时不同数量的接收字节。

SALE位（从设备仲裁丢失检测使能）

SALE位指定在从机发送模式下，当在总线上检测到与正在发送的值不同的值时，是否导致仲裁丢失，例如，当总线上存在具有相同地址的从机时，或者当与发送不匹配时数据的出现是因为噪声。

NACKE位（NACK接收传输暂停使能）

NACKE位指定在发送模式下从从设备接收到NACK时是继续还是停止传输操作。对于正常操作，将此位设置为1。

当在NACKE位设置为1的情况下接收到NACK时，暂停下一个传输操作。当NACKE位为0时，无论接收到的确认内容如何，　　下一次传输操作都会继续进行。

有关详细信息，请参阅第32.9.2节，NACK接收传输暂停功能。

SCLE位（SCL同步电路使能）

SCLE位指定是否将SCL时钟与SCL输入时钟同步。对于正常操作，将此位设置为1。

当SCLE位设置为0（不使用SCL同步电路）时，IIC不会将SCL时钟与SCLn输入时钟同步。使用此设置，无论SCLn线路状态如何，IIC都会以ICBRH和ICBRL中设置的传输速率输出SCL时钟。因此，如果I2C总线的总线负载远大于规格值，或者多个主机的SCLn时钟输出重叠，则可能会输出不符合规格的短周期SCL时钟。当不使用SCL同步电路时，也会影响启动、重启和停止条件的发出，以及额外SCL时钟周期的连续输出。

请勿将SCLE位设置为0，除非检查设置传输速率的输出。

FMPE位（快速模式加启用）

FMPE位指定是否对Fastmodeplus(Fm+)使用斜率控制电路。

当该位设置为1时，选择符合I2C总线快速模式加(Fm+)标准(tof)的斜率控制电路。
当该位设置为0时，选择符合I2C总线标准模式(Sm)和快速模式(Fm)标准(tof)的斜率控制电路。

当使用高达1Mbps的传输速率（快速模式加(Fm+)标准）时，将此位设置为1。当使用其他传输速率（最高100kbps(Sm)或最高400kbps(Fm)）或SMBus（10至100kbps）时，将其设置为0。

32.2.7 I2C Bus Status Enable Register (ICSER)

Address(es): IIC0.ICSER 4005 3006h, IIC1.ICSER 4005 3106h

	b7	b6	b5	b4	b3	b2	b1	b0
	HOAE	—	DIDE	—	GCAE	SAR2E	SAR1E	SAR0E
Value after reset:	0	0	0	0	1	0	0	1

b2	SAR2E	Slave Address Register 2 Enable	0: Slave address in SARL2 and SARU2 disabled 1: Slave address in SARL2 and SARU2 enabled.	R/W
b3	GCAE	General Call Address Enable	0: General call address detection disabled 1: General call address detection enabled.	R/W
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5	DIDE	Device ID Address Detection Enable	0: Device ID address detection disabled 1: Device ID address detection enabled.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	HOAE	Host Address Enable	0: Host address detection disabled 1: Host address detection enabled.	R/W

SARyE bit (Slave Address Register y Enable) (y = 0 to 2)

The SARyE bit enables or disables the received slave address and the slave address set in the SARLy and SARUy registers.

When this bit is set to 1, the slave address set in the SARLy and SARUy registers is enabled and is compared with the received slave address. When this bit is set to 0, the slave address set in SARLy and SARUy is disabled and is ignored even if it matches the received slave address.

GCAE bit (General Call Address Enable)

The GCAE bit specifies whether to ignore the general call address (0000 000b + 0 [W]: All 0) when it is received.

When this bit is set to 1, if the received slave address matches the general call address, the IIC recognizes the received slave address as the general call address independently of the slave addresses set in SARLy and SARUy (y = 0 to 2), and performs the data receive operation. When this bit is set to 0, the received slave address is ignored even if it matches the general call address.

DIDE bit (Device ID Address Detection Enable)

The DIDE bit specifies whether to recognize and execute the device ID address when a device ID (1111 100b) is received in the first frame after a start or restart condition is detected.

When this bit is set to 1, if the received first frame matches the device ID, the IIC recognizes that the device ID address was received. When the next R/W# bit is 0 (W), the IIC recognizes the second and the subsequent frames as slave addresses and continues the receive operation. When this bit is set to 0, the IIC ignores the received first frame even if it matches the device ID address, and recognizes the first frame as a normal slave address.

For details, see section 32.7.3, Device ID Address Detection.

HOAE bit (Host Address Enable)

The HOAE bit specifies whether to ignore the received host address (0001 000b) when the SMBS bit in ICMR3 is 1.

When this bit is set to 1 while the SMBS bit in ICMR3 is 1, if the received slave address matches the host address, the IIC recognizes the received slave address as the host address independently of the slave addresses set in SARLy and

SARyE位（从地址寄存器y使能）（y=0到2）

SARyE位启用或禁用接收到的从地址以及在SARLy和SARUy寄存器中设置的从地址。

当该位设置为1时，设置在SARLy和SARUy寄存器中的从地址被启用，并与接收到的从地址进行比较。当该位设置为0时，设置在SARLy和SARUy中的从机地址被禁用并被忽略，即使它与接收到的从机地址匹配。

GCAE位（广播呼叫地址使能）

GCAE位指定接收到的广播调用地址（0000000b+0[W]：全0）是否忽略。

当该位设置为1时，如果接收到的从机地址与广播呼叫地址匹配，则IIC将接收到的从机地址识别为广播呼叫地址，独立于SARLy和SARUy中设置的从机地址（y=0到2），并且执行数据接收操作。当该位设置为0时，即使接收到的从机地址与广播呼叫地址匹配，也会忽略它。

DIDE位（设备ID地址检测使能）

DIDE位指定在检测到开始或重新启动条件后的第一帧中接收到设备ID(1111100b)时是否识别和执行设备ID地址。

当该位设置为1时，如果接收到的第一个帧与设备ID匹配，则IIC识别出接收到设备ID地址。当下一个RW#位为0(W)时，IIC将第二个和后续帧识别为从地址并继续接收操作。当该位设置为0时，IIC忽略接收到的第一帧，即使它与设备ID地址匹配，并将第一帧识别为正常的从地址。

有关详细信息，请参阅第32.7.3节，设备ID地址检测。

HOAE位（主机地址使能）

HOAE位指定当ICMR3中的SMBS位为1时是否忽略接收到的主机地址（0001000b）。

当该位设置为1且ICMR3中的SMBS位为1时，如果接收到的从机地址与主机地址匹配，则IIC将接收到的从地址识别为主机地址，与SARLy中设置的从地址无关，并且

RA生态工作室

SARUy (y = 0 to 2), and performs the receive operation.

When the SMBS bit in ICMR3 or the HOAE bit is set to 0, the received slave address is ignored even if it matches the host address.

32.2.8 I2C Bus Interrupt Enable Register (ICIER)

Address(es): IIC0.ICIER 4005 3007h, IIC1.ICIER 4005 3107h

b7	TIE	Transmit Data Empty Interrupt Request Enable	0: Transmit data empty interrupt (IICn_TXI) request disabled 1: Transmit data empty interrupt (IICn_TXI) request enabled.	R/W

TMOIE bit (Timeout Interrupt Request Enable)

The TMOIE bit enables or disables timeout interrupt (TMOIn) requests when the TMOF flag in ICSR2 is 1. To cancel a TMOI interrupt request, set the TMOF flag or the TMOIE bit to 0.

ALIE bit (Arbitration-Lost Interrupt Request Enable)

The ALIE bit enables or disables arbitration-lost interrupt (ALIn) requests when the AL flag in ICSR2 is 1. To cancel an ALI interrupt request, set the AL flag or the ALIE bit to 0.

STIE bit (Start Condition Detection Interrupt Request Enable)

The STIE bit enables or disables start condition detection interrupt (STIn) requests when the START flag in ICSR2 is 1. To cancel an STI interrupt request, set the START flag or the STIE bit to 0.

SPIE bit (Stop Condition Detection Interrupt Request Enable)

The SPIE bit enables or disables stop condition detection interrupt (SPIn) requests when the STOP flag in ICSR2 is 1. To cancel an SPI interrupt request, set the STOP flag or the SPIE bit to 0.

NAKIE bit (NACK Reception Interrupt Request Enable)

The NAKIE bit enables or disables NACK reception interrupt (NAKIn) requests when the NACKF flag in ICSR2 is 1. To cancel an NAKI interrupt request, set the NACKF flag or the NAKIE bit to 0.

RIE bit (Receive Data Full Interrupt Request Enable)

The RIE bit enables or disables receive data full interrupt (IICn_RXI) requests when the RDRF flag in ICSR2 is 1.

SARUy(y=0to2)，并执行接收操作。

当ICMR3中的SMBS位或HOAE位设置为0时，即使接收到的从机地址与主机地址匹配，也会忽略它。

32.2.8 I2C总线中断使能寄存器(ICIER)

Address(es): IIC0.ICIER 4005 3007h, IIC1.ICIER 4005 3107h

b4	NAKIE	NACK接收中断请求Enable	0：禁止NACK接收中断（NAKIn）请求1：允许NACK接收中断（NAKIn）请求。	R/W
b5	RIE	接收数据完整中断请求Enable	0：禁止接收数据完整中断（IICn_RXI）请求1：使能接收数据完整中断（IICn_RXI）请求。	R/W
b6	TEIE	发送结束中断请求Enable	0：禁止发送结束中断（IICn_TEI）请求1：允许发送结束中断（IICn_TEI）请求。	R/W
b7	TIE	发送数据空中断请求启用	0：禁止发送数据空中断（IICn_TXI）请求1：允许发送数据空中断（IICn_TXI）请求。	R/W

TMOIE位（超时中断请求使能）

当ICSR2中的TMOF标志为1时，TMOIE位启用或禁用超时中断(TMOIn)请求。取消一个TMOI中断请求，设置TMOF标志或TMOIE位为0。

ALIE位（仲裁丢失中断请求使能）

当ICSR2中的AL标志为1时，ALIE位启用或禁用仲裁丢失中断(ALIn)请求。取消ALI中断请求，设置AL标志或ALIE位为0。

STIE位（启动条件检测中断请求使能）

当ICSR2中的START标志为1时，STIE位启用或禁用开始条件检测中断(STIn)请求。要取消STI中断请求，请将START标志或STIE位设置为0。

SPIE位（停止条件检测中断请求使能）

当ICSR2中的STOP标志为1时，SPIE位启用或禁用停止条件检测中断(SPIn)请求。要取消SPI中断请求，请将STOP标志或SPIE位设置为0。

NAKIE位（NACK接收中断请求使能）

当ICSR2中的NACKF标志为1时，NAKIE位启用或禁用NACK接收中断(NAKIn)请求。要取消NAKI中断请求，请将NACKF标志或NAKIE位设置为0。

RIE位（接收数据满中断请求使能）

当ICSR2中的RDRF标志为1时，RIE位启用或禁用接收数据完整中断(IICn_RXI)请求。

TEIE bit (Transmit End Interrupt Request Enable)

The TEIE bit enables or disables transmit end interrupt (IICn_TEI) requests when the TEND flag in ICSR2 is 1. To cancel an IICn_TEI interrupt request, set the TEND flag or the TEIE bit to 0.

TIE bit (Transmit Data Empty Interrupt Request Enable)

The TIE bit enables or disables transmit data empty interrupt (IICn_TXI) requests when the TDRE flag in ICSR2 is 1.

32.2.9 I2C Bus Status Register 1 (ICSR1)

Address(es): IIC0.ICSR1 4005 3008h, IIC1.ICSR1 4005 3108h

	b7	b6	b5	b4	b3	b2	b1	b0
	HOA	—	DID	—	GCA	AAS2	AAS1	AAS0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	AAS0	Slave Address 0 Detection Flag	0: Slave address 0 not detected 1: Slave address 0 detected.	R/(W) *1
b1	AAS1	Slave Address 1 Detection Flag	0: Slave address 1 not detected 1: Slave address 1 detected.	R/(W) *1
b2	AAS2	Slave Address 2 Detection Flag	0: Slave address 2 not detected 1: Slave address 2 detected.	R/(W) *1
b3	GCA	General Call Address Detection Flag	0: General call address not detected 1: General call address detected.	R/(W) *1
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5	DID	Device ID Address Detection Flag	0: Device ID command not detected 1: Device ID command detected. This bit is set to 1 when the first frame received immediately after a start condition is detected, matches a value of (device ID (1111 100b) + 0[W]).	R/(W) *1
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	HOA	Host Address Detection Flag	0: Host address not detected 1: Host address detected. This bit is set to 1 when the received slave address matches the host address (0001 000b).	R/(W) *1

Note 1. Only 0 can be written to clear the flag.

AASy flag (Slave Address y Detection Flag) (y = 0 to 2)

The AASy flag indicates whether slave address y was detected.

[Setting conditions]

For 7-bit address format (SARUy.FS = 0):

- When the received slave address matches the SVA[6:0] value in SARLy, with the SARyE bit in ICSER set to 1 (slave address y detection enabled). The AASy flag is set to 1 on the rising edge of the 9th SCL clock cycle in the frame.

For 10-bit address format: (SARUy.FS = 1):

- When the received slave address matches a value of (11110b + SVA[1:0] in SARUy), and the subsequent address matches the SARLy value, with the SARyE bit in ICSER set to 1 (slave address y detection enabled). The AASy flag is set to 1 on the rising edge of the 9th SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the AASy flag after reading AASy = 1

TEIE位（发送结束中断请求使能）

当ICSR2中的TEND标志为1时，TEIE位启用或禁用发送结束中断(IICn_TEI)请求。要取消IICn_TEI中断请求，请将TEND标志或TEIE位设置为0。

TIE位（发送数据空中断请求使能）

当ICSR2中的TDRE标志为1时，TIE位启用或禁用发送数据空中断（IICn_TXI）请求。

32.2.9 I2C总线状态寄存器1(ICSR1)

Address(es): IIC0.ICSR1 4005 3008h, IIC1.ICSR1 4005 3108h

	b7	b6	b5	b4	b3	b2	b1	b0
	HOA	—	DID	—	GCA	AAS2	AAS1	AAS0
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	AAS0	从地址0检测标志	0：未检测到从地址01：检测到从地址0。	R/(W) *1
b1	AAS1	从地址1检测标志	0：未检测到从地址11：检测到从地址1。	R/(W) *1
b2	AAS2	从地址2检测标志	0：未检测到从地址21：检测到从地址2。	R/(W) *1
b3	GCA	广播呼叫地址检测Flag	0：未检测到广播呼叫地址1：检测到广播呼叫地址。	R/(W) *1
b4	—	Reserved	该位读取为0。写入值应为0。	R/W
b5	DID	设备ID地址检测标志	0：未检测到设备ID命令1：检测到设备ID命令。当检测到开始条件后立即接收到的第一个帧与(设备ID(1111100b)+0[W])的值匹配时，该位设置为1。	R/(W) *1
b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b7	HOA	主机地址检测标志	0：未检测到主机地址1：检测到主机地址。当接收到的从机地址与主机地址(0001000b)匹配时，该位设置为1。	R/(W) *1

Note 1. 只能写入0来清除标志。

AASy标志（从机地址y检测标志）（y=0到2）

AASy标志指示是否检测到从地址y。

[Setting conditions]

对于7位地址格式(SARUy.FS=0)：

- 当接收到的从机地址与SARLy中的SVA[6:0]值匹配时，ICSER中的SARyE位设置为1（启用从机地址y检测）。AASy标志在帧中第9个SCL时钟周期的上升沿设置为1。

对于10位地址格式：(SARUy.FS=1)：

- 当接收到的从地址与(SARUy中的11110b+SVA[1:0])值匹配，并且后续地址与SARLy值匹配时，ICSER中的SARyE位设置为1（启用从地址y检测）。AASy标志在帧中第9个SCL时钟周期的上升沿设置为1。

[Clearing conditions]

- 读取AASy=1后将0写入AASy标志时

- When a stop condition is detected
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

For 7-bit address format (SARUy.FS = 0):

- When the received slave address does not match the SVA[6:0] value in SARLy, with the SARyE bit in ICSER set to 1 (slave address y detection enabled). The AASy flag is set to 0 on the rising edge of the 9th SCL clock cycle in the frame.

For 10-bit address format (SARUy.FS = 1):

- When the received slave address does not match a value of 11110b + SVA[1:0] in SARUy, with the SARyE bit in ICSER set to 1 (slave address y detection enabled). The AASy flag is set to 0 on the rising edge of the 9th SCL clock cycle in the frame.
- When the received slave address matches a value of 11110b + SVA[1:0] in SARUy, and the subsequent address does not match the SARLy value, with the SARyE bit in ICSER set to 1 (slave address y detection enabled). The AASy flag is set to 0 on the rising edge of the 9th SCL clock cycle in the frame.

GCA flag (General Call Address Detection Flag)

The GCA flag indicates whether the general call address was detected.

[Setting condition]

- When the received slave address matches the general call address (0000 000b + 0 [W]), with the GCAE bit in ICSER set to 1 (general call address detection enabled). The GCA flag is set to 1 on the rising edge of the 9th SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the GCA flag after reading GCA = 1
- When a stop condition is detected
- When the received slave address does not match the general call address (0000 000b + 0 [W]), with the GCAE bit in ICSER set to 1 (general call address detection enabled). The GCA flag is set to 0 on the rising edge of the 9th SCL clock cycle in the frame.
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

DID flag (Device ID Address Detection Flag)

The DID flag indicates whether the device ID address was detected.

[Setting condition]

- When the first frame received immediately after a start or restart condition is detected matches a value of (device ID (1111 100b) + 0 [W]), with the DIDE bit in ICSER set to 1 (device ID address detection enabled). The DID flag is set to 1 on the rising edge of the 9th SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the DID flag after reading DID = 1
- When a stop condition is detected
- When the first frame received immediately after a start or restart condition is detected does not match a value of the device ID (1111 100b), with the DIDE bit in ICSER set to 1 (device ID address detection enabled). The DID flag is set to 0 on the rising edge of the 9th SCL clock cycle in the frame.
- When the first frame received immediately after a start or restart condition is detected matches a value of (device ID (1111 100b) + 0 [W]), and the second frame does not match any slave address from 0 to 2, with the DIDE bit in ICSER set to 1 (device ID address detection enabled). The DID flag is set to 0 on the rising edge of the 9th SCL clock cycle in the frame.
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

- 检测到停止条件时
- 当向ICCR1中的IICRST位写入1时，应用IIC复位或内部复位。

对于7位地址格式(SARUy.FS=0)：

- 当接收到的从地址与SARLy中的SVA[6:0]值不匹配时，ICSER中的SARyE位设置为1（从地址y检测使能）。AASy标志在帧中第9个SCL时钟周期的上升沿设置为0。

对于10位地址格式(SARUy.FS=1)：

- 当接收到的从地址与SARUy中的值11110b+SVA[1:0]不匹配时，ICSER中的SARyE位设置为1（启用从地址y检测）。AASy标志在帧中第9个SCL时钟周期的上升沿设置为0。
- 当接收到的从地址与SARUy中的值11110b+SVA[1:0]匹配，并且后续地址与SARLy值不匹配时，ICSER中的SARyE位设置为1（启用从地址y检测）。AASy标志在帧中第9个SCL时钟周期的上升沿设置为0。

GCA标志（广播呼叫地址检测标志）

GCA标志指示是否检测到广播呼叫地址。

[Setting condition]

- 当接收到的从机地址与广播地址（0000000b+0[W]）匹配时，GCAE位在ICSER设置为1（启用广播呼叫地址检测）。GCA标志在帧中第9个SCL时钟周期的上升沿设置为1。

[Clearing conditions]

- 读取GCA=1后将0写入GCA标志时
- 检测到停止条件时
- 当接收到的从地址与广播呼叫地址（0000000b+0[W]）不匹配时，将ICSER中的GCAE位设置为1（启用广播呼叫地址检测）。GCA标志在帧中第9个SCL时钟周期的上升沿设置为0。
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

DID标志（设备ID地址检测标志）

DID标志指示是否检测到设备ID地址。

[Setting condition]

- 当检测到启动或重新启动条件后立即接收到的第一帧与(设备ID(1111100b)+0[W])的值匹配时，ICSER中的DIDE位设置为1（启用设备ID地址检测）。DID标志在帧中第9个SCL时钟周期的上升沿设置为1。

[Clearing conditions]

- 当读取DID=1后将0写入DID标志
- 检测到停止条件时
- 当检测到启动或重启条件后立即接收的第一帧与设备ID(1111100b)的值不匹配时，ICSER中的DIDE位设置为1（启用设备ID地址检测）。DID标志在帧中第9个SCL时钟周期的上升沿设置为0。
- 当检测到启动或重新启动条件后立即接收到的第一帧与(设备ID(1111100b)+0[W])的值匹配，并且第二帧不匹配从0到2的任何从地址时，使用DIDEICSER中的位设置为1（启用设备ID地址检测）。DID标志在帧中第9个SCL时钟周期的上升沿设置为0。
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

RA生态工作室

HOA flag (Host Address Detection Flag)

The HOA flag indicates whether the host address was detected.

[Setting condition]

- When the received slave address matches the host address (0001 000b), with the HOAE bit in ICSER set to 1 (host address detection enabled). The HOA flag is set to 1 on the rising edge of the 9th SCL clock cycle in the frame.

[Clearing conditions]

- When 0 is written to the HOA flag after reading HOA = 1
- When a stop condition is detected
- When the received slave address does not match the host address (0001 000b), with the HOAE bit in ICSER set to 1 (host address detection enabled). The HOA flag is set to 0 on the rising edge of the 9th SCL clock cycle in the frame.
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

32.2.10 I2C Bus Status Register 2 (ICSR2)

Address(es): IIC0.ICSR2 4005 3009h, IIC1.ICSR2 4005 3109h

	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	TEND	RDRF	NACKF	STOP	START	AL	TMOF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TMOF	Timeout Detection Flag	0: Timeout not detected 1: Timeout detected.	R/(W)*1
b1	AL	Arbitration-Lost Flag	0: Arbitration not lost 1: Arbitration lost.	R/(W)*1
b2	START	Start Condition Detection Flag	0: Start condition not detected 1: Start condition detected.	R/(W)*1
b3	STOP	Stop Condition Detection Flag	0: Stop condition not detected 1: Stop condition detected.	R/(W)*1
b4	NACKF	NACK Detection Flag	0: NACK not detected 1: NACK detected.	R/(W)*1
b5	RDRF	Receive Data Full Flag	0: ICDRR contains no receive data 1: ICDRR contains receive data.	R/(W)*1
b6	TEND	Transmit End Flag	0: Data being transmitted 1: Data transmit complete.	R/(W)*1
b7	TDRE	Transmit Data Empty Flag	0: ICDRT contains transmit data 1: ICDRT contains no transmit data.	R

Note 1. Only 0 can be written to clear the flag.

TMOF flag (Timeout Detection Flag)

The TMOF flag is set to 1 when the IIC detects a timeout because the SCLn line state remains unchanged for the set period.

[Setting condition]

- When the SCLn line state remains unchanged for the period specified in the ICMR2.TMOH, TMOL, and TMOS bits while the ICFER.TMOE bit is 1 (timeout function enabled) in master or in slave mode and the received slave address matches.

[Clearing conditions]

- When 0 is written to the TMOF flag after reading TMOF = 1

HOA标志（主机地址检测标志）

HOA标志指示是否检测到主机地址。

[Setting condition]

- 当接收到的从机地址与主机地址（0001000b）匹配时，ICSER中的HOAE位设置为1（主机地址检测使能）。HOA标志在帧中第9个SCL时钟周期的上升沿设置为1。

[Clearing conditions]

- 读取HOA=1后将0写入HOA标志时
- 检测到停止条件时
- 当接收到的从机地址与主机地址（0001000b）不匹配时，ICSER中的HOAE位设置为1（启用主机地址检测）。HOA标志在帧中第9个SCL时钟周期的上升沿设置为0。
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

32.2.10 I2C总线状态寄存器2(ICSR2)

Address(es): IIC0.ICSR2 4005 3009h, IIC1.ICSR2 4005 3109h

	b7	b6	b5	b4	b3	b2	b1	b0
	TDRE	TEND	RDRF	NACKF	STOP	START	AL	TMOF
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	TMOF	超时检测标志	0：未检测到超时1：检测到超时。	R/(W)*1
b1	AL	Arbitration-Lost Flag	0：仲裁未失败1：仲裁失败。	R/(W)*1

b3	STOP	停止条件检测标志	0：未检测到停止条件1：检测到停止条件。	R/(W)*1
b4	NACKF	NACK检测标志	0：未检测到NACK1：检测到NACK。	R/(W)*1
b5	RDRF	接收数据满标志	0：ICDRR不包含接收数据1：ICDRR包含接收数据。	R/(W)*1
b6	TEND	发送结束标志	0：数据传输中1：数据传输完成。	R/(W)*1
b7	TDRE	传输数据空标志	0：ICDRT包含发送数据1：ICDRT不包含发送数据。	R

Note 1. 只能写入0来清除标志。

TMOF标志（超时检测标志）

当IIC检测到超时时，TMOF标志设置为1，因为SCLn线路状态在设置的周期内保持不变。

[Setting condition]

- 当SCLn线状态在ICMR2.TMOH、TMOL和TMOS位指定的时间段内保持不变，而ICFER.TMOE位在主机或从机模式下为1（启用超时功能）并且接收到的从机地址匹配。

[Clearing conditions]

- 读取TMOF=1后向TMOF标志写入0时

- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

AL flag (Arbitration-Lost Flag)

The AL flag indicates that the bus mastership is lost in arbitration because of a bus conflict or because of some other reason, when a start condition was issued, or an address and data was transmitted.

The IIC monitors the level on the SDAn line during transmission. If the level on the line does not match the value of the bit being output, the IIC sets the AL flag to 1 to indicate that the bus is occupied by another device. The IIC can also set the AL flag to indicate the detection of arbitration loss during NACK transmission in master mode or during data transmission in slave mode.

[Setting conditions]

When master arbitration-lost detection is enabled (ICFER.MALE = 1):

- When the internal SDA output state does not match the SDAn line level on the rising edge of the SCL clock, except for the ACK period during data transmission in master transmit mode
- When a start condition is detected while the ST bit in ICCR2 is 1 (start condition requested) or the internal SDA output state does not match the SDAn line level
- When the ST bit in ICCR2 is 1 (start condition requested), with the BBSY flag in ICCR2 set to 1.

When NACK arbitration-lost detection is enabled (ICFER.NALE = 1):

- When the internal SDA output state does not match the SDAn line level on the rising edge of the SCL clock in the ACK period during NACK transmission in receive mode.

When slave arbitration-lost detection is enabled (ICFER.SALE = 1):

- When the internal SDA output state does not match the SDAn line level on the rising edge of the SCL clock, except for the ACK period during data transmission in slave transmit mode.

[Clearing conditions]

- When 0 is written to the AL flag after reading AL = 1
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

Table 32.4 Relationship between arbitration-lost generation sources and arbitration-lost enable functions

ICFER			ICSR2		
MALE	NALE	SALE	AL	Error	Arbitration-lost generation source
1	×	×	1	Start condition issuance error	When internal SDA output state does not match SDAn line level when a start condition is detected while the ST bit in ICCR2 is 1
					When ST in ICCR2 is set to 1 while BBSY in ICCR2 is 1
			1	Transmit data mismatch	When transmit data (including slave address) does not match the bus state in master transmit mode
×	1	×	1	NACK transmission mismatch	When ACK is detected during transmission of NACK in master or slave receive mode
×	×	1	1	Transmit data mismatch	When transmit data does not match the bus state in slave transmit mode

×: Don't care

START flag (Start Condition Detection Flag)

The START flag indicates whether a start or restart condition is detected.

[Setting condition]

- When a start or restart condition is detected.

[Clearing conditions]

- When 0 is written to the START flag after reading START = 1

- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

AL标志（仲裁失败标志）

AL标志表示由于总线冲突或其他原因，当发出启动条件或传输地址和数据时，总线控制权在仲裁中丢失。

IIC在传输过程中监控SDAn线上的电平。如果线路上的电平与正在输出的位的值不匹配，则IIC将AL标志设置为1，以指示总线被另一个设备占用。IIC还可以设置AL标志，以指示在主机模式下的NACK传输期间或从机模式下的数据传输期间检测到仲裁丢失。

[Setting conditions]

当启用主机仲裁丢失检测时(ICFER.MALE=1)：

- 当内部SDA输出状态与SCL时钟上升沿上的SDAn线电平不匹配时，除了主机发送模式下数据传输期间的ACK周期
- 当ICCR2中的ST位为1（请求启动条件）或内部SDA输出状态与SDAn线电平不匹配时检测到启动条件
- ICCR2中的ST位为1（请求启动条件）时，ICCR2中的BBSY标志设置为1。

当启用NACK仲裁丢失检测时(ICFER.NALE=1)：

- 当内部SDA输出状态与SCL时钟上升沿上的SDAn线电平不匹配时
  接收模式下NACK传输期间的ACK周期。

当启用从设备仲裁丢失检测时(ICFER.SALE=1)：

- 当内部SDA输出状态与SCL时钟上升沿上的SDAn线电平不匹配时，除了在从机传输模式下数据传输期间的ACK周期。

[Clearing conditions]

- 读取AL=1后向AL标志写入0时
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

Table 32.4 仲裁丢失生成源和仲裁丢失使能函数之间的关系

ICFER			ICSR2		
MALE	NALE	SALE	AL	Error	仲裁失败的生成源
1	×	×	1	开始条件发布错误	当ICCR2中的ST位为1时检测到启动条件时，当内部SDA输出状态与SDAn线电平不匹配时
					ICCR2中的ST设置为1而ICCR2中的BBSY为1时
			1	传输数据不匹配	当发送数据（包括从地址）与主发送模式下的总线状态不匹配时
×	1	×	1	NACK传输不匹配	在主机或从机接收模式下发送NACK期间检测到ACK时
×	×	1	1	传输数据不匹配	当发送数据与从发送模式下的总线状态不匹配时

×: Don't care

START标志（开始条件检测标志）

START标志指示是否检测到启动或重新启动条件。

[Setting condition]

- 当检测到启动或重新启动条件时。

[Clearing conditions]

- 读取START=1后将0写入START标志时

- When a stop condition is detected
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

STOP flag (Stop Condition Detection Flag)

The STOP flag indicates whether a stop condition is detected.

[Setting condition]

- When a stop condition is detected.

[Clearing conditions]

- When 0 is written to the STOP flag after reading STOP = 1
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

NACKF flag (NACK Detection Flag)

The NACKF flag indicates whether a NACK was detected.

[Setting condition]

- When acknowledge is not received (NACK received) from the receive device in transmit mode, with the NACKE bit in ICFER set to 1 (transfer suspension enabled).

[Clearing conditions]

- When 0 is written to the NACKF flag after reading NACKF = 1
- When 1 is written to the IICRST bit in ICCR1 to apply an IIC reset or an internal reset.

Note: When the NACKF flag is set to 1, the IIC suspends data transmission and reception. Writing to ICDRT in transmit mode or reading from ICDRR in receive mode with the NACKF flag set to 1 does not enable data transmit or receive operation. To restart data transmission or reception, set the NACKF flag to 0.

RDRF flag (Receive Data Full Flag)

The RDRF flag indicates whether the IDCRR contains receive data.

[Setting conditions]

- When receive data is transferred from ICDRS to ICDRR. The RDRF flag is set to 1 on the rising edge of the 8th or 9th SCL clock cycle (selected in the RDRFS bit in ICMR3).
- When the received slave address matches after a start (or restart) condition is detected with the TRS bit in ICCR2 set to 0.

[Clearing conditions]

- When 0 is written to the RDRF flag after reading RDRF = 1
- When data is read from ICDRR
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

TEND flag (Transmit End Flag)

The TEND flag indicates whether data transmission is still being transmitted or is complete.

[Setting condition]

- On the rising edge of the 9th SCL clock cycle while the TDRE flag is 1.

[Clearing conditions]

- When 0 is written to the TEND flag after reading TEND = 1
- When data is written to ICDRT
- When a stop condition is detected
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

- 检测到停止条件时
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

停止标志（停止条件检测标志）

STOP标志指示是否检测到停止条件。

[Setting condition]

- 当检测到停止条件时。

[Clearing conditions]

- 在读取STOP=1后将0写入STOP标志时
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

NACKF标志（NACK检测标志）

NACKF标志指示是否检测到NACK。

[Setting condition]

- 当在发送模式下没有从接收设备接收到确认（NACK接收）时，ICFER中的NACKE位设置为1（使能传输暂停）。

[Clearing conditions]

- 读取NACKF=1后将0写入NACKF标志时
- 当向ICCR1中的IICRST位写入1时，应用IIC复位或内部复位。

Note: 当NACKF标志设置为1时，IIC暂停数据发送和接收。在NACKF标志设置为1的情况下，在发送模式下写入ICDRT或在接收模式下从ICDRR读取不会启用数据发送或接收操作。要重新开始数据发送或接收，请将NACKF标志设置为0。

RDRF标志（接收数据满标志）

RDRF标志指示IDCRR是否包含接收数据。

[Setting conditions]

- 当接收数据从ICDRS传输到ICDRR。RDRF标志在第8个或第9个SCL时钟周期的上升沿设置为1（在ICMR3的RDRFS位中选择）。
- 当ICCR2中的TRS位设置为0检测到启动（或重新启动）条件后接收到的从机地址匹配时。

[Clearing conditions]

- 读取RDRF=1后向RDRF标志写入0时
- 从ICDRR读取数据时
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

TEND标志（发送结束标志）

TEND标志指示数据传输是否仍在传输中或已完成。

[Setting condition]

- 在第9个SCL时钟周期的上升沿，同时TDRE标志为1。

[Clearing conditions]

- 读取TEND=1后将0写入TEND标志时
- 数据写入ICDRT时
- 检测到停止条件时
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

RA生态工作室

TDRE flag (Transmit Data Empty Flag)

The TDRE flag indicates whether the ICDRT contains transmit data.

[Setting conditions]

- When data is transferred from ICDRT to ICDRS and ICDRT becomes empty
- When the TRS bit in ICCR2 is set to 1
- When the received slave address matches while the TRS bit is 1.

[Clearing conditions]

- When data is written to ICDRT
- When the TRS bit in ICCR2 is set to 0
- When 1 is written to the IICRST bit in ICCR1 to initiate an IIC reset or an internal reset.

Note: When the NACKF flag is set to 1 while the NACKE bit in ICFER is 1, the IIC suspends data transmission and reception. In this case, if the TDRE flag is 0 (next transmit data written), data is transferred to the ICDRS register and the ICDRT register becomes empty on the rising edge of the 9th clock cycle, but the TDRE flag is not set to 1.

32.2.11 I2C Bus Wakeup Unit Register (ICWUR)

Address(es): IIC0.ICWUR 4005 3016h

	b7	b6	b5	b4	b3	b2	b1	b0
	WUE	WUIE	WUF	WUACK	—	—	—	WUAFA

b3 to b1	—	Reserved	These bit are read as 0. The write value should be 0.	R/W
b4	WUACK	ACK Bit for Wakeup Mode	Choice of four response modes in combination with ICCR1.IICRST and WUACK. See Table 32.5.	R/W
b5	WUF	Wakeup Event Occurrence Flag	0: Slave address not matching during wakeup 1: Slave address matching during wakeup.	R/W
b6	WUIE	Wakeup Interrupt Request Enable	0: Wakeup Interrupt Request (IIC0_WUI) disabled 1: Wakeup Interrupt Request (IIC0_WUI) enabled.	R/W
b7	WUE	Wakeup Function Enable	0: Wakeup function disabled 1: Wakeup function enabled.	R/W

Table 32.5 Wakeup mode

IICRST	WUACK	Operation mode	Description
0	0	Normal wakeup mode 1	ACK response on 9th SCL, and SCL low hold after 9th SCL
0	1	Normal wakeup mode 2	No ACK response immediately and SCL low hold between 8th and 9th SCL. SCL low-hold release and ACK response on 9th SCL.
1	0	Command recovery mode	ACK response on 9th SCL and no SCL low hold
1	1	EEP response mode	NACK response on 9th SCL and no SCL low hold

WUF flag (Wakeup Event Occurrence Flag)

The WUF flag indicates whether the slave address is matching during wakeup.

[Setting condition]

TDRE标志（传输数据空标志）

TDRE标志指示ICDRT是否包含发送数据。

[Setting conditions]

- 当数据从ICDRT传输到ICDRS并且ICDRT变为空时
- ICCR2中的TRS位设置为1时
- 当TRS位为1时接收到的从机地址匹配。

[Clearing conditions]

- 数据写入ICDRT时
- ICCR2中的TRS位设置为0时
- 当向ICCR1中的IICRST位写入1以启动IIC复位或内部复位。

Note: 当ICFER的NACKE位为1时NACKF标志设置为1，IIC暂停数据发送和接收。在这种情况下，如果TDRE标志为0（写入下一个发送数据），则数据被传输到ICDRS寄存器，并且ICDRT寄存器在第9个时钟周期的上升沿变为空，但TDRE标志不设置为1.

1	1	EEP响应模式	第9个SCL的NACK响应和无SCL低保持

WUF标志（唤醒事件发生标志）

WUF标志指示在唤醒期间从地址是否匹配。

[Setting condition]

RA生态工作室

- When PCLKB is supplied after a slave-address match in the first 8th SCL low during wakeup mode.

[Clearing conditions]

- When 0 is written to the WUF flag after reading WUF = 1
- When ICE = 0 and IICRST = 1.

32.2.12 I2C-Bus Wakeup Unit Register 2 (ICWUR2)

Address(es): IIC0.ICWUR2 4005 3017h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	WUSYF	WUASYF	WUSEN
Value after reset:	1	1	1	1	1	1	0	1

Bit	Symbol	Bit name	Description	R/W
b0	WUSEN	Wakeup Function Synchronous Enable	0: IIC asynchronous operation enabled 1: IIC synchronous operation enabled.	R/W
b1	WUASYF	Wakeup Function Asynchronous Operation Status Flag	0: IIC synchronous operation enabled 1: IIC asynchronous operation enabled.	R
b2	WUSYF	Wakeup Function Synchronous Operation Status Flag	0: IIC asynchronous operation enabled 1: IIC synchronous operation enabled.	R
b7 to b3	—	Reserved	These bits are read as1. The write value should be 1.	R/W

WUSEN bit (Wakeup Function Synchronous Enable)

The WUSEN bit is used in combination with the WUASYF flag (or WUSYF flag) to switch between the PCLKB synchronous and asynchronous operation, when the wakeup effective function is enabled (ICWUR.WUE = 1).

The PCLKB operation switches from synchronous to asynchronous operation:

- When the ICCR2.BBSY flag is 0, if 0 is written to the WUSEN bit while the WUASYF flag is 0. The reception occurs independently of the operation of PCLKB (with PCLKB stopped) after it switches to the PCLKB asynchronous operation, on wakeup event detection.

The PCLKB operation switches from asynchronous to synchronous operation:

- When 1 is written to the WUSEN bit, with the WUASYF flag at 1, when a wakeup event is detected. After writing 1, the WUASYF flag immediately becomes 0.
- When the stop condition is detected with a wakeup event undetected.

WUASYF flag (Wakeup Function Asynchronous Operation Status Flag)

The WUASYF flag can place the IIC in PCLKB asynchronous operation when the wakeup effective function is enabled (ICWUR.WUE = 1).

[Setting condition]

- When the ICCR2.BBSY flag is 0, and WUSEN bit is set to 0 with the ICWUR.WUE bit set to 1.

[Clearing conditions]

- When 1 is written to the WUSEN bit after detecting a wakeup event with ICWUR.WUE bit set to 1
- When a stop condition is detected with WUSEN bit set to 1 before detecting the wakeup event with WUASY flag set to 1 with ICWUR.WUE bit set to 1
- When 1 is written to the WUSEN bit with the WUASYF flag set to 1, and a wakeup event is detected with ICWUR.WUE set to 1
- ICCR1.ICE = 0 and ICCRST = 1 (ICC reset)

- 当PCLKB在唤醒模式下的前8个SCL低电平的从地址匹配后提供时。

[Clearing conditions]

- 读取WUF=1后向WUF标志写入0时
- 当ICE=0且IICRST=1时。

32.2.12 I2C-Bus唤醒单元寄存器2(ICWUR2)

Address(es): IIC0.ICWUR2 4005 3017h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	WUSYF	WUASYF	WUSEN
重置后的值:	1	1	1	1	1	1	0	1

Bit	Symbol	位名称	Description	R/W
b0	WUSEN	唤醒功能同步使能	0：IIC异步操作使能1：IIC同步操作使能。	R/W
b1	WUASYF	唤醒功能异步操作状态标志	0：IIC同步操作使能1：IIC异步操作使能。	R
b2	WUSYF	唤醒功能同步操作状态标志	0：IIC异步操作使能1：IIC同步操作使能。	R
b7 to b3	—	Reserved	这些位被读取为1。写入值应为1。	R/W

WUSEN位（唤醒功能同步使能）

WUSEN位与WUASYF标志（或WUSYF标志）结合使用，在启用唤醒有效功能（ICWUR.WUE=1）时在PCLKB同步和异步操作之间切换。

PCLKB操作从同步操作切换到异步操作：

- 当ICCR2.BBSY标志为0时，如果在WUASYF标志为0时将0写入WUSEN位。在唤醒事件切换到PCLKB异步操作后，接收发生独立于PCLKB的操作（PCLKB停止）检测。

PCLKB操作从异步操作切换到同步操作：

- 当WUSEN位写入1且WUASYF标志为1时，检测到唤醒事件。写入1后，WUASYF标志立即变为0。
- 当检测到停止条件且未检测到唤醒事件时。

WUASYF标志（唤醒功能异步操作状态标志）

WUASYF标志可以在启用唤醒有效功能（ICWUR.WUE=1）时将IIC置于PCLKB异步操作中。

[Setting condition]

- 当ICCR2.BBSY标志为0且WUSEN位设置为0且ICWUR.WUE位设置为1时。

[Clearing conditions]

- 当检测到唤醒事件后将1写入WUSEN位且ICWUR.WUE位设置为1
- 在检测到WUASY标志设置为1且ICWUR.WUE位设置为1的唤醒事件之前检测到WUSEN位设置为1的停止条件时
- 当WUASYF标志设置为1的情况下将1写入WUSEN位时，检测到唤醒事件
  ICWUR.WUE设置为1
- ICCR1.ICE = 0 and ICCRST = 1 (ICC reset)

- ICWUR.WUE = 0.

WUSYF flag (Wakeup Function Synchronous Operation Status Flag)

The WUSYF flag can place the IIC in PCLKB synchronous operation when the wakeup function is enabled (ICWUR.WUE = 1). When this flag is used, the WUASYF flag is reserved.

[Setting conditions]

- When 1 is written to the WUSEN bit after detecting a wakeup event with ICWUR.WUE bit set to 1 and WUSYF flag set to 0
- When a stop condition is detected with WUSEN bit set to 1, before detecting a wakeup event with the WUSYF flag set to 0 and the ICWUR.WUE bit set to 1
- ICCR1.ICE = 0 and ICCRST = 1 (ICC reset)
- ICWUR.WUE = 0.

[Clearing condition]

- When the ICCR2.BBSY flag is 0 with the ICWUR.WUE bit set to 1, after writing 0 to the WUSEN bit.

32.2.13 Slave Address Register L y (SARLy) (y = 0 to 2)

Address(es): IIC0.SARL0 4005 300Ah, IIC1.SARL0 4005 310Ah, IIC0.SARL1 4005 300Ch, IIC1.SARL1 4005 310Ch, IIC0.SARL2 4005 300Eh, IIC1.SARL2 4005 310Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	SVA[6:0]							SVA0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SVA0	10-Bit Address LSB	Slave address setting	R/W
b7 to b1	SVA[6:0]	7-Bit Address/10-Bit Address Lower Bits	Slave address setting	R/W

SVA0 bit (10-Bit Address LSB)

When the 10-bit address format is selected (SARUy.FS = 1), the SVA0 bit functions as the LSB of a 10-bit address and is combined with the SVA[6:0] bits to form the lower 8 bits of a 10-bit address.

This bit is valid when the SARyE bit in ICSER is set to 1 (SARLy and SARUy enabled) and the SARUy.FS bit is 1. When the SARUy.FS or SARyE bit is 0, the setting in this bit is ignored.

SVA[6:0] bits (7-Bit Address/10-Bit Address Lower Bits)

When the 7-bit address format is selected (SARUy.FS = 0), the SVA[6:0] bits function as a 7-bit address. When the 10-bit address format is selected (SARUy.FS = 1), these bits combined with the SVA0 bit to form the lower 8 bits of a 10-bit address. When the SARyE bit in ICSER is 0, the setting in these bits is ignored.

- ICWUR.WUE = 0.

WUSYF标志（唤醒功能同步操作状态标志）

WUSYF标志可以在启用唤醒功能（ICWUR.WUE=1）时将IIC置于PCLKB同步操作中。使用此标志时，保留WUASYF标志。

[Setting conditions]

- 当检测到唤醒事件后将1写入WUSEN位时，ICWUR.WUE位设置为1，WUSYF标志位设置为0
- 当WUSEN位设置为1检测到停止条件时，在检测到WUSYF标志设置为0且ICWUR.WUE位设置为1的唤醒事件之前
- ICCR1.ICE = 0 and ICCRST = 1 (ICC reset)
- ICWUR.WUE = 0.

[Clearing condition]

- 当ICCR2.BBSY标志为0且ICWUR.WUE位设置为1时，将0写入WUSEN位。

32.2.13 从地址寄存器Ly(SARLy)(y=0to2)

Address(es): IIC0.SARL0 4005 300Ah, IIC1.SARL0 4005 310Ah, IIC0.SARL1 4005 300Ch, IIC1.SARL1 4005 310Ch, IIC0.SARL2 4005 300Eh, IIC1.SARL2 4005 310Eh

当ICSER中的SARyE位设置为1（启用SARLy和SARUy）且SARUy.FS位为1时，该位有效。当SARUy.FS或SARyE位为0时，忽略该位的设置。

SVA[6:0]位（7位地址10位地址低位）

Whenthe7−bitaddressformatisselected(SARUy.FS=0) theSVA[6:0]bitsfunctionasa7−bitaddress.Whenthe10bitaddressformatisselected(SARUy.FS=1) thesebitscombinedwiththeSVA0bittoformthelower8bitsofa10−bitaddress.当ICSER中的SARyE位为0时，这些位中的设置将被忽略。

32.2.14 Slave Address Register U y (SARUy) (y = 0 to 2)

Address(es): IIC0.SARU0 4005 300Bh, IIC1.SARU0 4005 310Bh, IIC0.SARU1 4005 300Dh, IIC1.SARU1 4005 310Dh, IIC0.SARU2 4005 300Fh, IIC1.SARU2 4005 310Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SVA[1:0]		FS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FS	7-Bit/10-Bit Address Format Select	0: Select 7-bit address format 1: Select 10-bit address format.	R/W
b2, b1	SVA[1:0]	10-Bit Address Upper Bits	Slave address setting	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

FS bit (7-Bit/10-Bit Address Format Select)

The FS bit selects the 7-bit or 10-bit address format for the slave address y (in SARLy and SARUy).

When the SARyE bit in ICSER is set to 1 (SARLy and SARUy enabled) and the SARUy.FS bit is 0, the 7-bit address format is selected for slave address y, the SVA[6:0] setting in SARLy is valid, and the SVA[1:0] and SVA0 settings in SARLy are ignored.

When the SARyE bit in ICSER is set to 1 (SARLy and SARUy enabled) and the SARUy.FS bit is 1, the 10-bit address format is selected for slave address y and the SVA[1:0] and SARLy settings are valid.

When the SARyE bit in ICSER is 0 (SARLy and SARUy disabled), the SARUy.FS bit is invalid.

SVA[1:0] bits (10-Bit Address Upper Bits)

When the 10-bit address format is selected (FS = 1), the SVA[1:0] bits function as the upper 2 bits of a 10-bit address.

These bits are valid when the SARyE bit in ICSER is set to 1 (SARLy and SARUy enabled) and the SARUy.FS bit is 1. When the SARUy.FS or SARyE bit is 0, the setting of these bits is ignored.

32.2.15 I2C Bus Bit Rate Low-Level Register (ICBRL)

Address(es): IIC0.ICBRL 4005 3010h, IIC1.ICBRL 4005 3110h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	BRL[4:0]				
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b4 to b0	BRL[4:0]	Bit Rate Low-Level Period	Low-level period of SCL clock	R/W
b7 to b5	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

ICBRL is a 5-bit register that sets the low-level period of the SCL clock. ICBRL also generates the data setup time for automatic SCL low-hold operation, see section 32.9, Automatic Low-Hold Function for SCL.

BRL[4:0] bits (Bit Rate Low-Level Period)

The BRL[4:0] bits set the low-level period of the SCL clock. ICBRL counts the low-level period with the internal reference clock source (IICϕ) specified in the CKS[2:0] bits in ICMR1. When the IIC is used only in slave mode, the BRL[4:0] bits must be set to a value longer than the data setup time*1.

If the digital noise filter is enabled (NFE bit in ICFER is 1), set the BRL[4:0] bits to a value at least one greater than the

32.2.14 从地址寄存器Uy(SARUy)(y=0to2)

Address(es): IIC0.SARU0 4005 300Bh, IIC1.SARU0 4005 310Bh, IIC0.SARU1 4005 300Dh, IIC1.SARU1 4005 310Dh, IIC0.SARU2 4005 300Fh, IIC1.SARU2 4005 310Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SVA[1:0]		FS
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	FS	7位10位地址格式选择	0：选择7位地址格式1：选择1 0位地址格式。	R/W
b2, b1	SVA[1:0]	10位地址高位	从机地址设置	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

FS位（7位10位地址格式选择）

FS位为从地址y选择7位或10位地址格式（在SARLy和SARUy中）。

当ICSER中的SARyE位设置为1（启用SARLy和SARUy）且SARUy.FS位为0时，从机地址y选择7位地址格式，SARLy中的SVA[6:0]设置有效 并且忽略SARLy中的SVA[1:0]和SVA0设置。

当ICSER中的SARyE位设置为1（启用SARLy和SARUy）且SARUy.FS位为1时，从机地址y选择10位地址格式，并且SVA[1:0]和SARLy设置有效.

当ICSER中的SARyE位为0（SARLy和SARUy禁用）时，SARUy.FS位无效。

SVA[1:0]位（10位地址高位）

Whenthe10-bitaddressformatisselected(FS=1) theSVA[1:0]bitsfunctionastheupper2bitsofa10-bitaddress.

当ICSER中的SARyE位设置为1（启用SARLy和SARUy）且SARUy.FS位为1时，这些位有效。
当SARUy.FS或SARyE位为0时，这些位的设置被忽略。

32.2.15 I2C总线比特率低电平寄存器(ICBRL)

Address(es): IIC0.ICBRL 4005 3010h, IIC1.ICBRL 4005 3110h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	BRL[4:0]				
重置后的值：	1	1	1	1	1	1	1	1

Bit	Symbol	位名称	Description	R/W
b4 to b0	BRL[4:0]	比特率低电平周期	SCL时钟低电平周期	R/W
b7 to b5	—	Reserved	这些位被读取为1。写入值应为1。	R/W

ICBRL是一个5位寄存器，用于设置SCL时钟的低电平周期。ICBRL还为自动SCL低保持操作生成数据建立时间，请参见第32.9节，SCL的自动低保持功能。

BRL[4:0]位（比特率低电平周期）

BRL[4:0]位设置SCL时钟的低电平周期。ICBRL使用ICMR1的CKS[2:0]位中指定的内部参考时钟源(IIC)对低电平周期进行计数。当IIC仅在从机模式下使用时，BRL[4:0]位必须设置为比数据建立时间长*1的值。

如果启用了数字噪声滤波器（ICFER中的NFE位为1），请将BRL[4:0]位设置为至少比

number of stages in the noise filter. For this number, see the description of the ICMR3.NF[1:0] bits.

Note 1. Data setup time ($t_{SU:DAT}$)
250 ns for up to 100 kbps: Standard mode (Sm)
100 ns for up to 400 kbps: Fast mode (Fm)
50 ns for up to 1 Mbps: Fast mode plus (Fm+)

32.2.16 I2C Bus Bit Rate High-Level Register (ICBRH)

Address(es): IIC0.ICBRH 4005 3011h, IIC1.ICBRH 4005 3111h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	BRH[4:0]				
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b4 to b0	BRH[4:0]	Bit Rate High-Level Period	High-level period of SCL clock	R/W
b7 to b5	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

ICBRH is a 5-bit register that sets the high-level period of the SCL clock. ICBRH is valid in master mode.

BRH[4:0] bits (Bit Rate High-Level Period)

The BRH[4:0] bits set the high-level period of the SCL clock. If the IIC is used only in slave mode, do not set the BRH[4:0] bits.

ICBRH counts the high-level period with the internal reference clock source (IICϕ) specified in the CKS[2:0] bits in ICMR1.

If the digital noise filter is enabled (NFE bit in ICFER is 1), set these bits to a value at least one greater than the number of stages in the noise filter. For this number, see the description of the ICMR3.NF[1:0] bits.

The IIC transfer rate and the SCL clock duty are calculated using the following expressions:

1. ICFER.SCLE = 0
   Transfer rate = $1/\{[(BRH + 1) + (BRL + 1)]/IIC\varphi^{*1} + tr^{*2} + tf^{*2}\}$
   Duty cycle = $\{tr + [(BRH + 1)/IIC\varphi]\}/\{tr + tf + [(BRH + 1) + (BRL + 1)]/IIC\varphi\}$
2. ICFER.SCLE = 1 and ICFER.NFE = 0 and CKS[2:0] = 000b (IICφ = PCLKB)
   Transfer rate = $1/\{[(BRH + 3) + (BRL+ 3)]/IIC\varphi + tr + tf\}$
   Duty cycle = $\{tr + [(BRH + 3)/IIC\varphi]\}/\{tr + tf + [(BRH + 3) + (BRL + 3)]/IIC\varphi\}$
3. ICFER.SCLE = 1 and ICFER.NFE = 1 and CKS[2:0] = 000b (IICφ = PCLKB)
   Transfer rate = $1/\{[(BRH + 3 + nf^{*3}) + (BRL + 3 + nf)]/IIC\varphi + tr + tf\}$
   Duty cycle = $\{tr + [(BRH + 3 + nf)/IIC\varphi]\}/\{tr + tf + [(BRH + 3 + nf) + (BRL + 3 + nf)]/IIC\varphi\}$
4. ICFER.SCLE = 1 and ICFER.NFE = 0 and CKS[2:0] ≠ 000b
   Transfer rate = $1/\{[(BRH + 2) + (BRL + 2)]/IIC\varphi + tr + tf\}$
   Duty cycle = $\{tr + [(BRH + 2)/IIC\varphi]\}/\{tr + tf + [(BRH + 2) + (BRL + 2)]/IIC\varphi\}$
5. ICFER.SCLE = 1 and ICFER.NFE = 1 and CKS[2:0] ≠ 000b
   Transfer rate = $1/\{[(BRH + 2 + nf) + (BRL + 2 + nf)]/IIC\varphi + tr + tf\}$
   Duty cycle = $\{tr + [(BRH + 2 + nf)/IIC\varphi]\}/\{tr + tf + [(BRH + 2 + nf) + (BRL + 2 + nf)]/IIC\varphi\}$

Note 1. IICφ = PCLKB × Division ratio.
Note 2. The SCLn line rise time (tr) and SCLn line fall time (tf) depend on the total bus line capacitance (Cb) and the pull-up resistor (Rp). For details, see the I2C bus standard from NXP Semiconductors.
Note 3. nf = Number of digital noise filter stages selected in the ICMR3.NF bit.

噪声滤波器的级数。对于这个数字，请参见ICMR3.NF[1:0]位的描述。

注1.数据建立时间(tSU:DAT)
250ns，最高100kbps：标准模式(Sm)100ns，
最高400kbps：快速模式(Fm)50ns，最高1Mbps
：快速模式加(Fm+)

32.2.16 I2C总线比特率高级寄存器(ICBRH)

Address(es): IIC0.ICBRH 4005 3011h, IIC1.ICBRH 4005 3111h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	BRH[4:0]				
重置后的值：	1	1	1	1	1	1	1	1

Bit	Symbol	位名称	Description	R/W
b4 to b0	BRH[4:0]	比特率高级期	SCL时钟高电平周期	R/W
b7 to b5	—	Reserved	这些位被读取为1。写入值应为1。	R/W

ICBRH是一个5位寄存器，用于设置SCL时钟的高电平周期。ICBRH在主模式下有效。

BRH[4:0]位（比特率高电平周期）

BRH[4:0]位设置SCL时钟的高电平周期。如果IIC仅用于从机模式，则不要设置
BRH[4:0] bits.

ICBRH使用CKS[2:0]位中指定的内部参考时钟源(IIC)计算高电平周期
ICMR1.

如果启用了数字噪声滤波器（ICFER中的NFE位为1），请将这些位设置为至少比噪声滤波器中的级数大1的值。
对于这个数字，请参见ICMR3.NF[1:0]位的描述。

IIC传输速率和SCL时钟占空比使用以下表达式计算：

1. ICFER.SCLE = 0
   传输率=$1\{[(BRH+1)+(BRL+1)]IIC\phi*1+tr*2+tf*2$
   占空比=$\{tr+[(BRH+1)IIC\phi]\ \{tr+tf+[(BRH+1)+(BRL+1)]IIC\phi$
2. ICFER.SCLE = 1 and ICFER.NFE = 0 and CKS[2:0] = 000b (IICφ = PCLKB)
   传输率=$1\{[(BRH+3)+(BRL+3)]IIC\phi+tr+tf$
   占空比=$\{tr+[(BRH+3)IIC\phi]\ \{tr+tf+[(BRH+3)+(BRL+3)]IIC\phi$
3. ICFER.SCLE = 1 and ICFER.NFE = 1 and CKS[2:0] = 000b (IICφ = PCLKB)
   传输率=$1\{[(BRH+3+nf*3)+(BRL+3+nf)]IIC\phi+tr+tf$
   占空比=$\{tr+[(BRH+3+nf)IIC\phi]\ \{tr+tf+[(BRH+3+nf)+(BRL+3+nf)]IIC\phi$
4. ICFER.SCLE = 1 and ICFER.NFE = 0 and CKS[2:0] ≠ 000b
   传输率=$1\{[(BRH+2)+(BRL+2)]IIC\phi+tr+tf$
   占空比=$\{tr+[(BRH+2)IIC\phi]\ \{tr+tf+[(BRH+2)+(BRL+2)]IIC\phi$
5. ICFER.SCLE = 1 and ICFER.NFE = 1 and CKS[2:0] ≠ 000b
   传输率=$1\{[(BRH+2+nf)+(BRL+2+nf)]IIC\phi+tr+tf$
   占空比=$\{tr+[(BRH+2+nf)IIC\phi]\ \{tr+tf+[(BRH+2+nf)+(BRL+2+nf)]IIC\phi$

注1.IICφ=PCLKB×分频比。
注2.SCLn线路上升时间(tr)和SCLn线路下降时间(tf)取决于总总线电容(Cb)和上拉电阻(Rp)。有关详细信息，请参阅NXPSemiconductors的I2C总线标准。注3.nf=在ICMR3.NF位中选择的数字噪声滤波器级数。

32.2.17 I2C Bus Transmit Data Register (ICDRT)

Address(es): IIC0.ICDRT 4005 3012h, IIC1.ICDRT 4005 3112h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

When ICDRT detects a space in the I2C Bus Shift Register (ICDRS), it transfers the transmit data that is written to ICDRT to ICDRS and starts transmitting data in transmit mode.

The double-buffer structure of ICDRT and ICDRS allows continuous transmit operation if the next transmit data is written to ICDRT while the ICDRS data is being transmitted.

ICDRT can always be read from and written to. Write transmit data to ICDRT when a transmit data empty interrupt (IICn_TXI) request is generated.

32.2.18 I2C Bus Receive Data Register (ICDRR)

Address(es): IIC0.ICDRR 4005 3013h, IIC1.ICDRR 4005 3113h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0

When 1 byte of data is received, the received data is transferred from the I2C Bus Shift Register (ICDRS) to ICDRR to enable the next data to be received.

The double-buffer structure of ICDRS and ICDRR allows continuous receive operation if the received data is read from ICDRR while ICDRS is receiving data. ICDRR cannot be written to. Read data from ICDRR when a receive data full interrupt (IICn_RXI) request is generated.

400	010b	5 (E5h)	16 (F0h)	60	01b	(5)
1000	000b	11 (EBh)	25 (F9h)	60	01b	(3)

32.2.17 I2C总线发送数据寄存器(ICDRT)

Address(es): IIC0.ICDRT 4005 3012h, IIC1.ICDRT 4005 3112h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	1	1	1	1	1	1	1	1

当ICDRT在I2C总线移位寄存器(ICDRS)中检测到一个空间时，它会将写入的发送数据传输到ICDRT到ICDRS并开始在传输模式下传输数据。

ICDRT和ICDRS的双缓冲结构允许在发送ICDRS数据的同时将下一个发送数据写入ICDRT进行连续发送操作。

ICDRT始终可以被读取和写入。当产生发送数据空中断(IICn_TXI)请求时，将发送数据写入ICDRT。

32.2.18 I2C总线接收数据寄存器(ICDRR)

Address(es): IIC0.ICDRR 4005 3013h, IIC1.ICDRR 4005 3113h

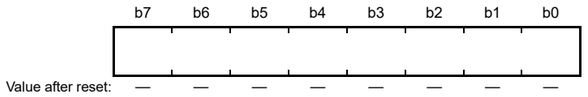
	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0

当接收到1个字节的数据时，接收到的数据会从I2C总线移位寄存器(ICDRS)传输到ICDRR，以便接收下一个数据。

ICDRS和ICDRR的双缓冲结构允许在接收到的数据从ICDRS正在接收数据时的ICDRR。无法写入ICDRR。当产生接收数据完全中断(IICn_RXI)请求时，从ICDRR读取数据。

If ICDRR receives the next receive data before the current data is read from ICDRR while the RDRF flag in ICSR2 is 1, the IIC automatically holds the SCL clock low for 1 clock cycle before the RDRF flag is set to 1 again.

32.2.19 I2C Bus Shift Register (ICDRS)



ICDRS is an 8-bit shift register to transmit and receive data.

During transmission, transmit data is transferred from ICDRT to ICDRS and is sent from the SDAn pin. During reception, data is transferred from ICDRS to ICDRR after 1 byte of data is received. ICDRS cannot be accessed directly.

32.3 Operation

32.3.1 Communication Data Format

The I2C bus format consists of 8-bit data and 1-bit acknowledge. The frame following a start or restart condition is an address frame that specifies a slave device with which the master device communicates. The specified slave is valid until a new slave is specified or a stop condition is issued.

Figure 32.3 shows the I2C bus format, and Figure 32.4 shows the I2C bus timing.

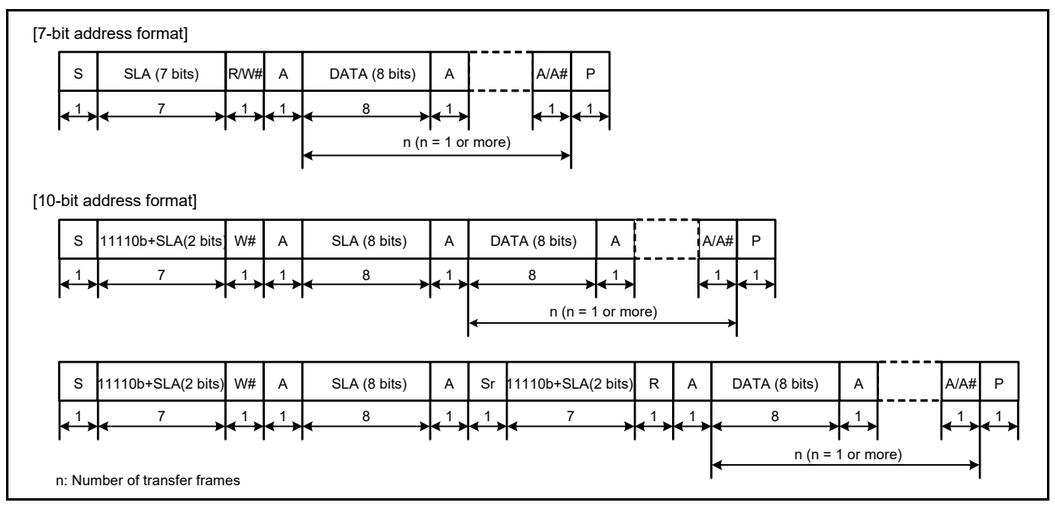


Figure 32.3 I2C bus format

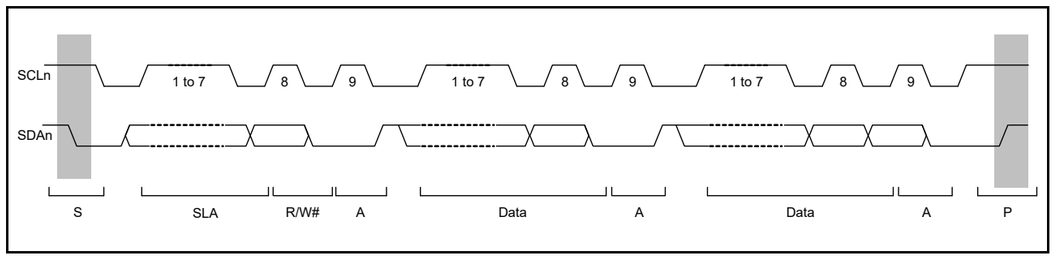

Figure 32.4 I2C bus timing (SLA = 7 bits)

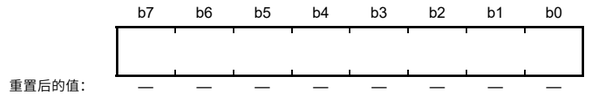
如果ICDRR在从ICDRR读取当前数据之前接收到下一个接收数据，而ICSR2中的RDRF标志为1，则IIC在RDRF标志再次设置为1之前自动将SCL时钟保持低1个时钟周期。

32.2.19 I2C总线移位寄存器(ICDRS)



ICDRS是一个8位移位寄存器，用于发送和接收数据。

在发送期间，发送数据从ICDRT传输到ICDRS，并从SDAn引脚发送。在接收过程中，接收到1个字节的数据后，数据从ICDRS传输到ICDRR。ICDRS不能直接访问。

32.3 Operation

32.3.1 通讯数据格式

I2C总线格式由8位数据和1位确认组成。开始或重启条件之后的帧是地址帧，它指定与主设备通信的从设备。指定的从站有效，直到指定新的从站或发出停止条件。

图32.3显示了I2C总线格式，图32.4显示了I2C总线时序。

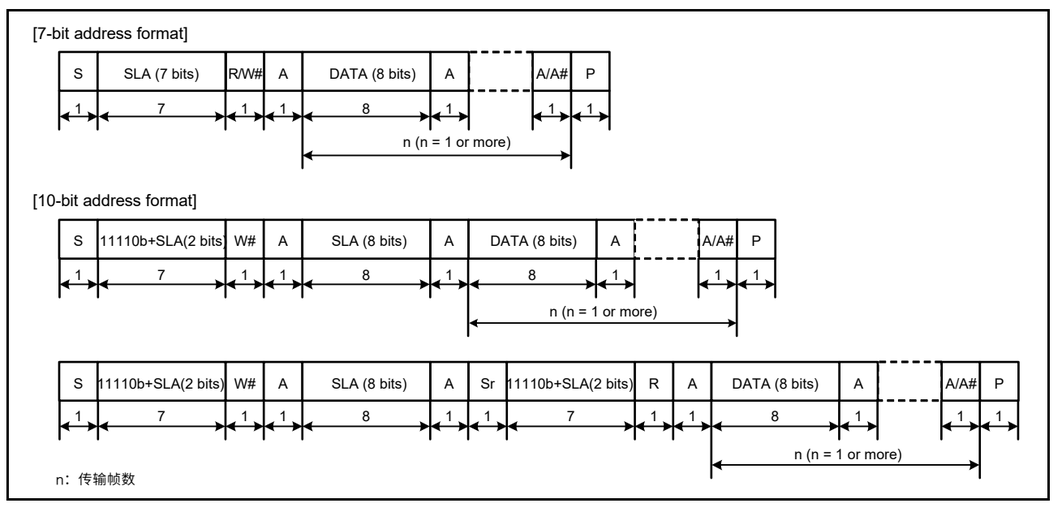


Figure 32.3 I2C总线格式

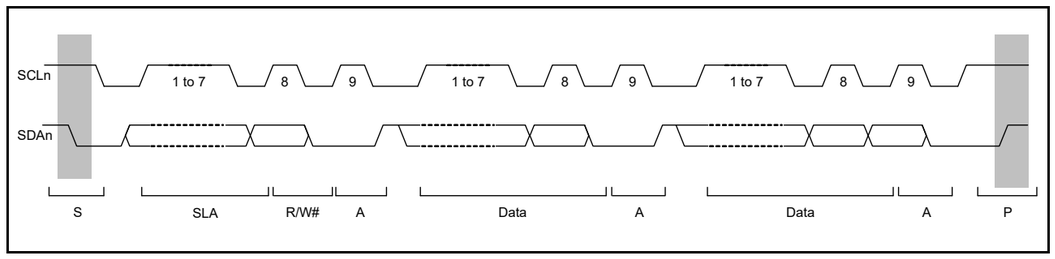

Figure 32.4 I2C总线时序（SLA=7位）

RA生态工作室

S: Start condition. The master device drives the SDAn line low from high while the SCLn line is high.
SLA: Slave address, by which the master device selects a slave device
R/W#: Indicates the direction of data transfer: from the slave device to the master device when R/W# is 1, or from the master device to the slave device when R/W# is 0
A: Acknowledge. The receive device drives the SDAn line low. In master transmit mode, the slave device returns acknowledge. In master receive mode, the master device returns acknowledge.
A#: Not Acknowledge. The receive device drives the SDAn line high.
Sr: Restart condition. The master device drives the SDAn line low from the high after the setup time elapses with the SCLn line high.
DATA: Transmitted or received data
P: Stop condition. The master device drives the SDAn line high from low when the SCLn line is high.

32.3.2 Initial Settings

Before starting data transmission or reception, initialize the IIC using the procedure shown in Figure 32.5.

1. Set the ICCR1.ICE bit set to 0 to set the SCLn and SDAn pins to the inactive state.
2. Set the ICCR1.IICRST bit to 1 to initiate IIC reset.
3. Set the ICCR1.ICE bit to 1 to initiate internal reset, which initializes the flags and the internal state of the ICSR1 register.
4. Set the SARLy, SARUy, ICSER, ICMR1, ICBRH, and ICBRL registers (y = 0 to 2), and set the other registers as required. For initial IIC settings, see Figure 32.5.
5. When the required register settings are complete, set the ICCR1.IICRST bit to 0 to release the IIC reset.

Note: This procedure is not required if the IIC initialization is already complete.

S: 启动条件。主设备将SDAn线从高电平驱动为低电平，而SCLn线为高电平。
SLA: 从地址，主设备通过该地址选择从设备
R/W#: 指示数据传输的方向：当RW#为1时从从设备到主设备，或者当RW#为0时从主设备到从设备
A: 承认。接收设备将SDAn线驱动为低电平。在主发送模式下，从设备返回确认。
在主接收模式下，主设备返回确认。
A#: 不承认。接收设备将SDAn线驱动为高电平。
Sr: 重启条件。建立时间过后，主器件将SDAn线从高电平驱动为低电平，SCLn线为高电平。
DATA: 传输或接收的数据
P: 停止条件。当SCLn线为高电平时，主设备将SDAn线从低电平驱动为高电平。

32.3.2 初始设置

在开始数据发送或接收之前，使用图32.5所示的过程初始化IIC。

1. 将ICCR1.ICE位设置为0，以将SCLn和SDAn引脚设置为无效状态。
2. 将ICCR1.IICRST位设置为1以启动IIC复位。
3. 将ICCR1.ICE位设置为1以启动内部复位，这会初始化ICSR1寄存器的标志和内部状态。
4. 设置SARLy、SARUy、ICSER、ICMR1、ICBRH和ICBRL寄存器（y=0到2），并根据需要设置其他寄存器。有关初始IIC设置，请参见图32.5。
5. 当所需的寄存器设置完成后，将ICCR1.IICRST位设置为0以释放IIC复位。

Note: 如果IIC初始化已经完成，则不需要此过程。

RA生态工作室

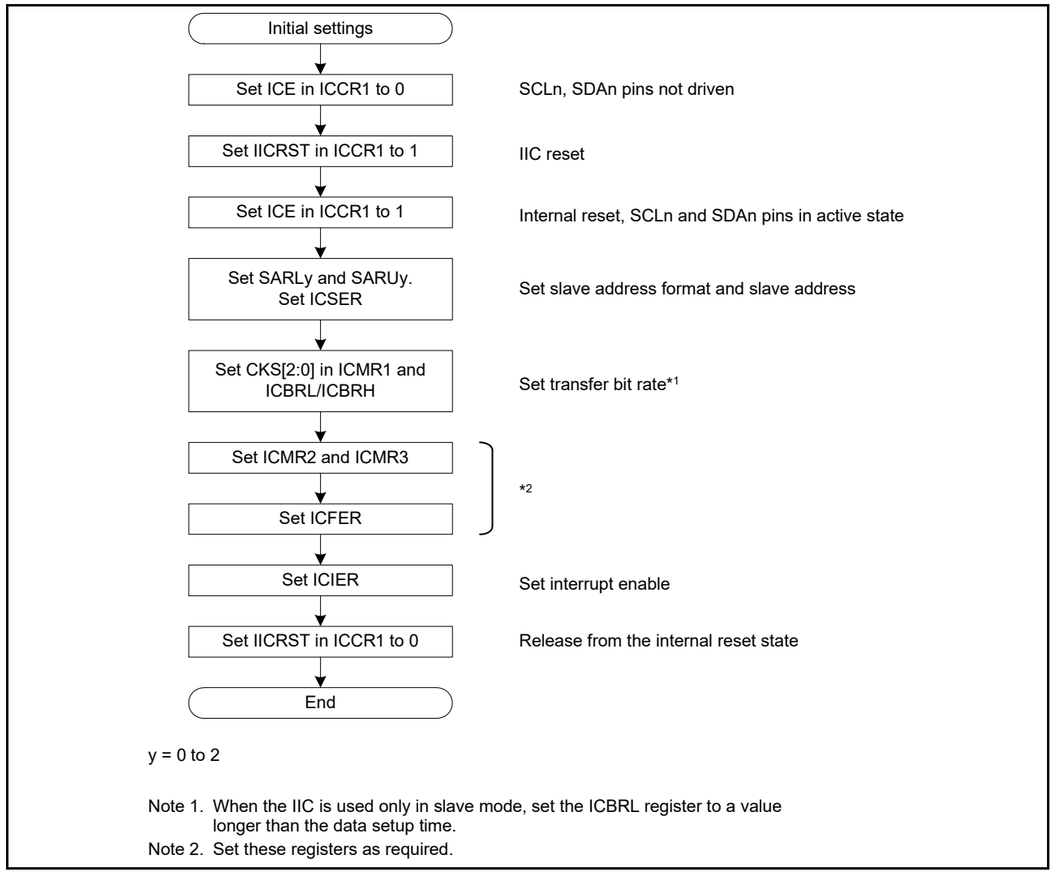

Figure 32.5 Example IIC initialization flow

32.3.3 Master Transmit Operation

In master transmit operation, the IIC outputs the SCL clock and transmit data signals as the master device, and the slave device returns the acknowledgments. Figure 32.6 shows an example of master transmission, and Figure 32.7 to Figure 32.9 show the operation timing in master transmission.

To set up and perform master transmission:

1. Initialize the IIC using the procedure in section 32.3.2, Initial Settings.
2. Read the BBSY flag in ICCR2 to check that the bus is open, then set the ST bit in ICCR2 to 1 (start condition request). On receiving the request, the IIC issues a start condition. At the same time, the BBSY and START flags in ICSR2 automatically set to 1 and the ST bit is automatically set to 0. If the start condition is detected and the internal levels for the SDA output state and the levels on the SDAn line match while the ST bit is 1, the IIC recognizes that the start condition requested by the ST bit has successfully completed, and the MST and TRS bits in ICCR2 automatically set to 1, placing the IIC in master transmit mode. The TDRE flag in ICSR2 is also automatically set to 1 in response to TRS = 1.
3. Check that the TDRE flag in ICSR2 is 1, then write the value for transmission (the slave address and the R/W# bit) to ICDRT. When the transmit data is written to ICDRT, the TDRE flag is automatically set to 0, the data is transferred from ICDRT to ICDRS, and the TDRE flag is again set to 1. After the byte containing the slave address and R/W# bit is transmitted, the value of the TRS bit automatically updates to select master transmit or master receive mode based on the value of the transmitted R/W# bit. If the value of the R/W# bit is 0, the IIC continues in master transmit mode. If the ICSR2.NACKF flag is 1, indicating that no slave device recognized the address or

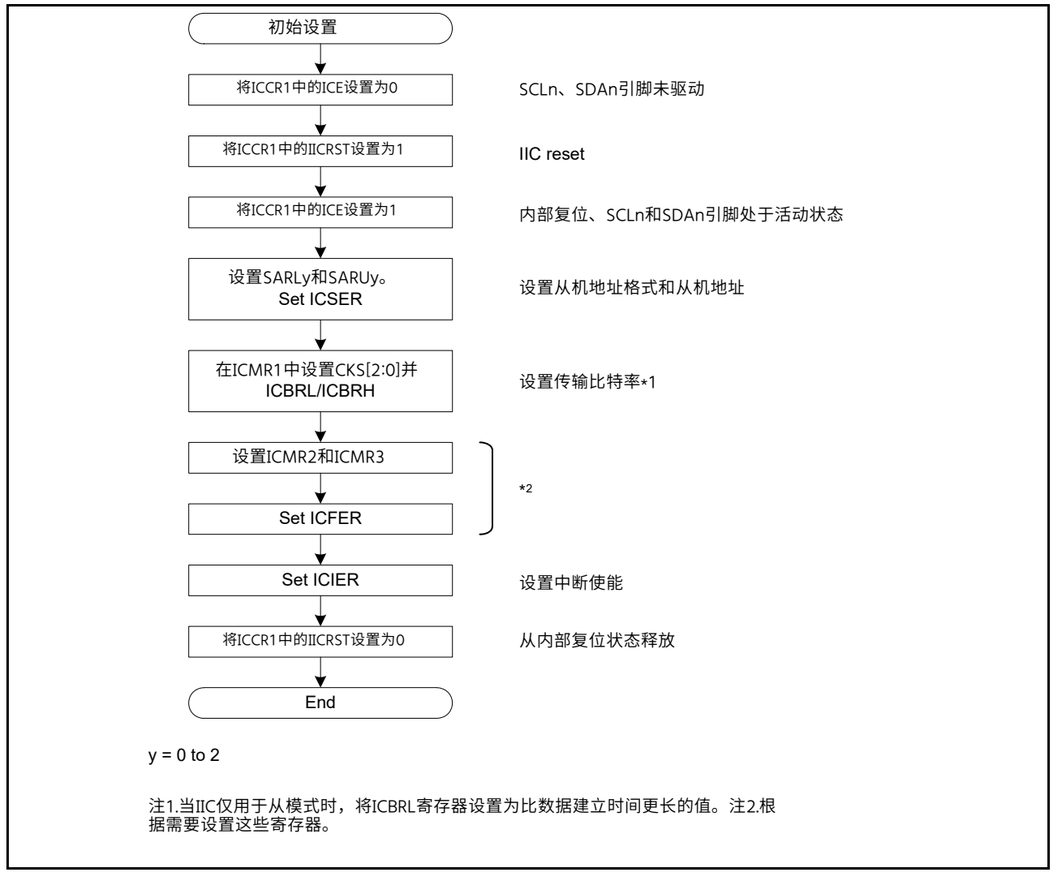

Figure 32.5 示例IIC初始化流程

32.3.3 主发送操作

在主发送操作中，IIC作为主设备输出SCL时钟和发送数据信号，从设备返回确认。图32.6显示了主传输的示例，图32.7至图32.9显示了主传输的操作时序。

设置和执行主传输：

1. 使用第32.3.2节，初始设置中的过程初始化IIC。
2. 读取ICCR2中的BBSY标志以检查总线是否打开，然后将ICCR2中的ST位设置为1（启动条件请求）。收到请求后，IIC发出一个开始条件。同时，ICSR2中的BBSY和START标志自动设置为1，ST位自动设置为0。如果检测到启动条件并且SDA输出状态的内部电平与SDAn线上的电平匹配，则ST位为1，IIC识别到ST位请求的启动条件已成功完成，并且ICCR2中的MST和TRS位自动设置为1，将IIC置于主机发送模式。ICSR2中的TDRE标志也自动设置为1，以响应TRS=1。
3. 检查ICSR2中的TDRE标志是否为1，然后将传输值（从机地址和RW#位）写入ICDRT。当发送数据写入ICDRT时，TDRE标志自动设置为0，数据从ICDRT传输到ICDRS，TDRE标志再次设置为1。在发送包含从机地址和RW#位的字节后，TRS位的值会自动更新，以根据发送的RW#位的值选择主机发送或主机接收模式。如果RW#位的值为0，则IIC继续处于主机发送模式。如果ICSR2.NACKF标志为1，表示没有从设备识别该地址或

there was an error in communications, write 1 to the ICCR2.SP bit to issue a stop condition.
To transmit data with an address in the 10-bit format, start by writing 1111 0b, the two upper bits of the slave address, and W to ICDRT as the first address transmission. For the second address transmission, write the 8 lower bits of the slave address to ICDRT.

4. Check that the TDRE flag in ICSR2 is 1, then write the transmit data to the ICDRT register. The IIC automatically holds the SCLn line low until the transmit data is ready or a stop condition is issued.
5. After all bytes of transmit data are written to the ICDRT register, wait until the value in the TEND flag in ICSR2 returns to 1, then set the SP bit in ICCR2 to 1 (stop condition requested). On receiving a stop condition request, the IIC issues the stop condition. For details, see section 32.11.3, Issuing a Stop Condition.
6. On detecting the stop condition, the IIC automatically sets the MST and TRS bits in ICCR2 to 00b and enters slave receive mode. Additionally, the IIC automatically sets the TDRE and TEND flags to 0, and sets the STOP flag in ICSR2 to 1.
7. Check that the ICSR2.STOP flag is 1, then set the ICSR2.NACKF and STOP flags to 0 for the next transfer operation.

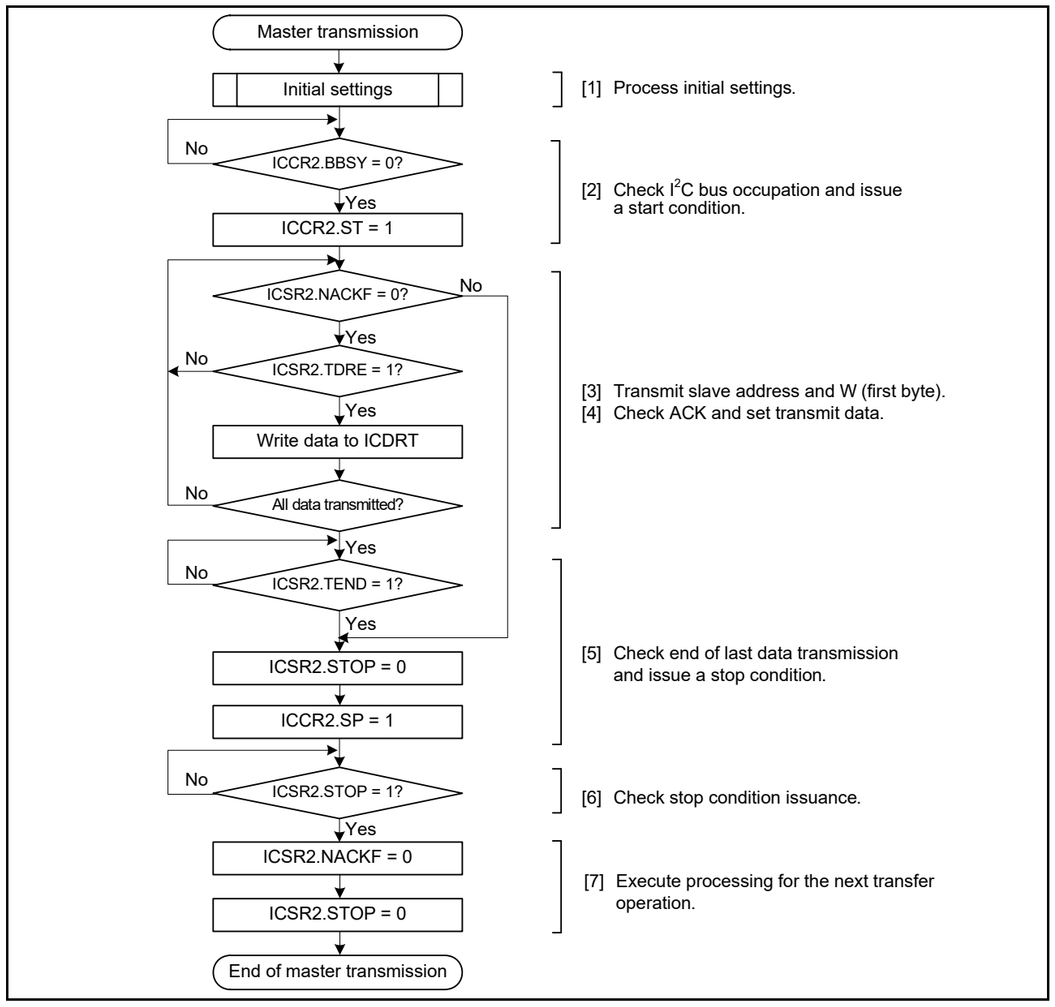

Figure 32.6 Example master transmission flow

通信中出现错误，向ICCR2.SP位写入1以发出停止条件。要以10位格式的地址传输数据，首先将11110b、从机地址的高两位和W写入ICDRT，作为第一个地址传输。对于第二次地址传输，将从地址的低8位写入ICDRT。

4. 检查ICSR2中的TDRE标志是否为1，然后将发送数据写入ICDRT寄存器。IIC自动将SCLn线保持为低电平，直到发送数据准备好或发出停止条件。
5. 将发送数据的所有字节写入ICDRT寄存器后，等待ICSR2中TEND标志的值返回1，然后将ICCR2中的SP位设置为1（请求停止条件）。在收到停止条件请求时，IIC发出停止条件。有关详细信息，请参阅第32.11.3节，发出停止条件。
6. 在检测到停止条件时，IIC自动将ICCR2中的MST和TRS位设置为00b并进入从机接收模式。此外，IIC自动将TDRE和TEND标志设置为0，并将ICSR2中的STOP标志设置为1。
7. 检查ICSR2.STOP标志是否为1，然后将ICSR2.NACKF和STOP标志设置为0以进行下一次传输操作。

32.3.4 Master Receive Operation

In master receive operation, the IIC as a master device outputs the SCL clock, receives data from the slave device, and returns acknowledgments. Because the IIC must start by sending a slave address to the associated slave device, the slave address part of the procedure is performed in master transmit mode, but the subsequent steps are in master receive mode.

Figure 32.10 and Figure 32.11 show examples of master reception (7-bit address format), and Figure 32.12 to Figure 32.14 show the operation timing in master reception.

To set up and perform master reception:

1. Initialize the IIC using the procedure in section 32.3.2, Initial Settings.
2. Read the BBSY flag in ICCR2 to check that the bus is open, then set the ST bit in ICCR2 to 1 to request the issue of a start condition. On receiving the request, the IIC issues a start condition. When the IIC detects the start condition, the BBSY and START flags in ICSR2 automatically set to 1, and the ST bit automatically sets to 0. If the start condition is detected and the levels for the SDA output and the levels on the SDAn line match while the ST bit is 1, the IIC recognizes that the start condition requested by the ST bit has successfully completed, and the MST and TRS bits in ICCR2 automatically set to 1, placing the IIC in master transmit mode. The TDRE flag in ICSR2 is also automatically set to 1 in response to TRS = 1.
3. Check that the TDRE flag in ICSR2 is 1, then write the value for transmission (the first byte indicates the slave address and value of the R/W# bit) to ICDRT. When the transmit data is written to ICDRT, the TDRE flag is automatically set to 0, the data is transferred from ICDRT to ICDRS, and the TDRE flag is again set to 1. When the byte containing the slave address and R/W# bit is transmitted, the value of the ICCR2.TRS bit automatically updates to select transmit or receive mode based on the value of the transmitted R/W# bit. If the value of the R/W# bit is 1, the TRS bit is set to 0 on the rising edge of the 9th cycle of the SCL clock, placing the IIC in master receive mode. At this time, the TDRE flag is set to 0 and the ICSR2.RDRF flag is automatically set to 1.
   If the ICSR2.NACKF flag is 1, indicating that no slave device recognized the address or there was an error in communications, write 1 to the ICCR2.SP bit to issue a stop condition.
   For master reception from a device with a 10-bit address, start by using master transmission to issue the 10-bit address, and then issue a restart condition. After that, transmit 1111 0b, the two upper bits of the slave address, and the R bit to place the IIC in master receive mode.
4. Dummy read the ICDRR after confirming that the RDRF flag in ICSR2 is 1. Doing so causes the IIC to start output of the SCL clock and start data reception.

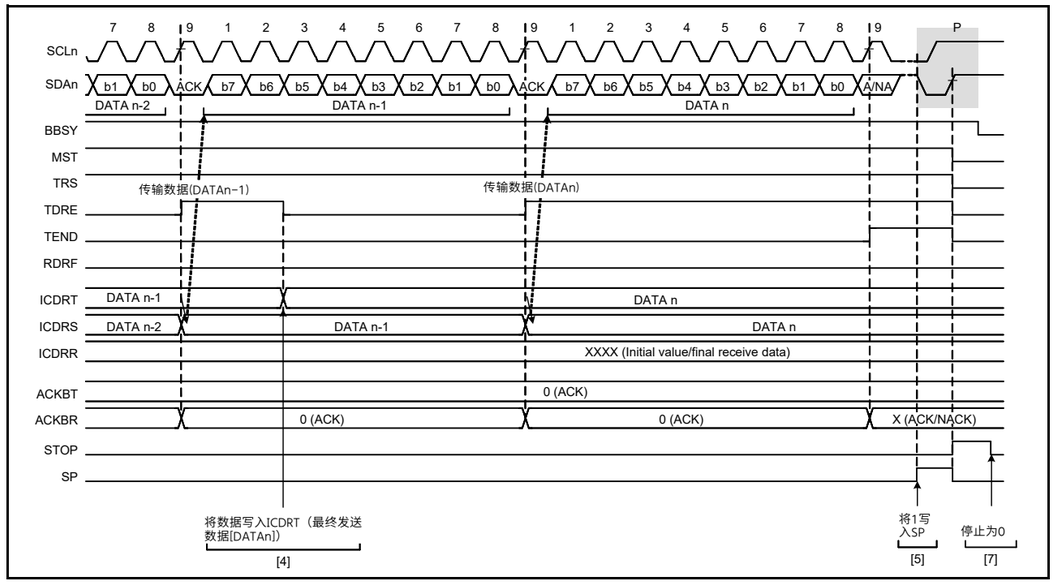

Figure 32.9 主机发送操作时序（3）

32.3.4 主接收操作

在主设备接收操作中，作为主设备的IIC输出SCL时钟，从从设备接收数据，并返回确认。因为IIC必须首先向相关的从设备发送一个从地址，所以该过程的从地址部分在主发送模式下执行，但后续步骤在主接收模式下执行。

图32.10和图32.11显示了主机接收示例（7位地址格式），图32.12至图32.14显示了主机接收中的操作时序。

设置和执行主接收：

1. 使用第32.3.2节，初始设置中的过程初始化IIC。
2. 读取ICCR2中的BBSY标志以检查总线是否打开，然后将ICCR2中的ST位设置为1以请求发出启动条件。收到请求后，IIC发出一个开始条件。当IIC检测到启动条件时，ICSR2中的BBSY和START标志自动设置为1，ST位自动设置为0。如果检测到启动条件并且SDA输出的电平与SDAn线上的电平匹配当ST位为1时，IIC识别到ST位请求的启动条件已成功完成，并且ICCR2中的MST和TRS位自动设置为1，将IIC置于主机发送模式。ICSR2中的TDRE标志也自动设置为1，以响应TRS=1。
3. 检查ICSR2中的TDRE标志是否为1，然后将要发送的值（第一个字节表示从机地址和RW#位的值）写入ICDRT。当发送数据写入ICDRT时，TDRE标志自动设置为0，数据从ICDRT传输到ICDRS，TDRE标志再次设置为1。当发送包含从机地址和RW#位的字节时，ICCR2.TRS位的值自动更新以根据发送的RW#位的值选择发送或接收模式。如果RW#位的值为1，则在SCL时钟的第9个周期的上升沿将TRS位设置为0，将IIC置于主机接收模式。此时TDRE标志置0，ICSR2.RDRF标志自动置1。如果ICSR2.NACKF标志为1，说明没有从设备识别地址或通讯出错，写1ICCR2.SP位发出停止条件。对于来自具有10位地址的设备的主机接收，首先使用主机发送来发出10位地址，然后发出重启条件。之后，发送11110b、从机地址的高两位和R位，将IIC置于主机接收模式。
4. 确认ICSR2中的RDRF标志为1后，虚拟读取ICDRR。这样做会导致IIC开始输出SCL时钟并开始数据接收。

5. After 1 byte of data is received, the RDRF flag in ICSR2 is set to 1 on the rising edge of the 8th or 9th cycle of the SCL clock, as selected in the RDRFS bit in ICMR3. Reading ICDRR produces the received data, and automatically sets the RDRF flag to 0. The value of the acknowledgment field received during the 9th cycle of the SCL clock is returned as the value set in the ICMR3.ACKBT bit. If the next byte to be received is the next to last byte, set the ICMR3.WAIT bit to 1 for wait insertion before reading ICDRR, containing the second byte from the last. In addition to enabling NACK output, even when interrupts or other operations result in delays in setting the ICMR3.ACKBT bit to 1 (NACK) in step (6), this fixes the SCLn line to low on the rising edge of the 9th clock cycle in reception of the last byte, which enables the issue of a stop condition.
6. When the ICMR3.RDRFS bit is 0, and the slave device must be notified that it is to end transfer for data reception after transfer of the next and final byte, set the ICMR3.ACKBT bit to 1 (NACK).
7. After reading the second-to-last byte from the ICDRR register, if the value of the ICSR2.RDRF flag is 1, write 1 to the SP bit in ICCR2 (to request stop condition), then read the last byte from ICDRR. When ICDRR is read, the IIC is released from the wait state and issues the stop condition after low-level output in the 9th clock cycle is complete or the SCLn line is released from the low-hold state.
8. On detecting the stop condition, the IIC automatically sets the MST and TRS bits in ICCR2 to 00b and enters slave receive mode. Additionally, detection of the stop condition sets the ICSR2.STOP flag to 1.
9. Check that the ICSR2.STOP flag is 1, then set the NACKF and STOP flags in ICSR2 to 0 for the next transfer operation.

5. 在接收到1个字节的数据后，ICSR2中的RDRF标志在SCL时钟的第8个或第9个周期的上升沿被设置为1，这在ICMR3中的RDRFS位中选择。读取ICDRR会产生接收到的数据，并自动将RDRF标志设置为0。在SCL时钟的第9个周期内接收到的确认字段的值作为ICMR3.ACKBT位中设置的值返回。如果要接收的下一个字节是倒数第二个字节，则将ICMR3.WAIT位设置为1，以便在读取ICDRR（包含倒数第二个字节）之前等待插入。除了启用NACK输出之外，即使在中断或其他操作导致在步骤(6)中将ICMR3.ACKBT位设置为1(NACK)时出现延迟，这也会在第9个时钟的上升沿将SCLn线固定为低循环接收最后一个字节，这使得发出停止条件。
6. 当ICMR3.RDRFS位为0，并且必须通知从设备在传输下一个和最后一个字节后结束传输以进行数据接收时，将ICMR3.ACKBT位设置为1(NACK)。
7. 从ICDRR寄存器读取倒数第二个字节后，如果ICSR2.RDRF标志的值为1，则将1写入ICCR2中的SP位（请求停止条件），然后从ICDRR读取最后一个字节。当读取ICDRR时，IIC从等待状态中释放，并在第9个时钟周期的低电平输出完成或SCLn线从低保持状态释放后发出停止条件。
8. 在检测到停止条件时，IIC自动将ICCR2中的MST和TRS位设置为00b并进入从机接收模式。此外，检测到停止条件会将ICSR2.STOP标志设置为1。
9. 检查ICSR2.STOP标志是否为1，然后将ICSR2中的NACKF和STOP标志设置为0，以进行下一次传输操作。

32.3.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL clock, the IIC transmits data as a slave device, and the master device returns the acknowledgments.

Figure 32.15 shows an example of slave transmission, and Figure 32.16 and Figure 32.17 show the operation timing in slave transmission.

To set up and perform slave transmission:

1. Initialize the IIC using the procedure in section 32.3.2, Initial Settings.
   After the initialization, the IIC stays in the standby state until it receives a slave address that matches.
2. After receiving a matching slave address, the IIC sets one of the associated ICSR1.HOA, GCA, and AASy (y = 0 to 2) flags to 1 on the rising edge of the 9th cycle of the SCL clock and outputs the value set in the ICMR3.ACKBT bit to the acknowledge bit on the 9th cycle of the SCL clock. If the value of the received R/W# bit is 1, the IIC automatically places itself in slave transmit mode by setting both the ICCR2.TRS bit and the ICSR2.TDRE flag to 1.
3. Check that the ICSR2.TEND flag is 1, then write the transmit data to the ICDRT register. If the IIC receives no acknowledge from the master device (receives an NACK signal) while the ICFER.NACKE bit is 1, the IIC suspends transfer of the next data.
4. Wait until the ICSR2.TEND flag is set to 1 while the ICSR2.TDRE flag is 1, after the ICSR2.NACKF flag is set to 1 or the last byte for transmission is written to the ICDRT register. When the ICSR2.NACKF flag or the TEND flag is 1, the IIC drives the SCLn line low on the 9th falling edge of the SCL clock.
5. When the NACKF or TEND flag in ICSR2 is 1, dummy read ICDRR to complete the processing. This releases the SCLn line.
6. On detecting the stop condition, the IIC automatically sets the ICSR1.HOA, GCA, and AASy (y = 0 to 2) flags, the TDRE and TEND flags in ICSR2, and the ICCR2.TRS bit to 0, and enters slave receive mode.
7. Check that the ICSR2.STOP flag is 1, then set the NACKF and STOP flags in ICSR2 to 0 for the next transfer operation.

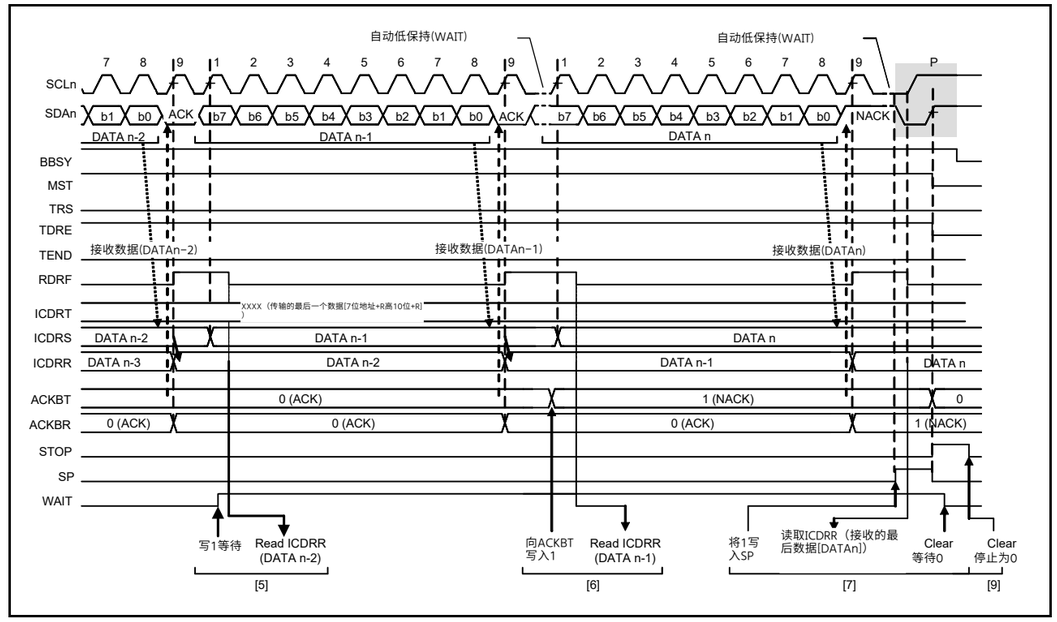

Figure 32.14 RDRFS=0时的主机接收操作时序(3)

32.3.5 从机发送操作

在从发送操作中，主设备输出SCL时钟，IIC作为从设备发送数据，主设备返回确认。

图32.15显示了从机传输的示例，图32.16和图32.17显示了从机传输的操作时序。

设置和执行从属传输：

1. 使用第32.3.2节，初始设置中的过程初始化IIC。
   初始化后，IIC一直处于待机状态，直到收到匹配的从机地址。
2. 接收到匹配的从地址后，IIC设置关联的ICSR1.HOA、GCA和AASy(y=0to2)在SCL时钟的第9个周期的上升沿标记为1，并输出设置在ICMR3.ACKBT位到SCL时钟的第9个周期的确认位。如果接收到的RW#位的值为1，则IIC通过将ICCR2.TRS位和ICSR2.TDRE标志都设置为1自动将自己置于从发送模式。
3. 检查ICSR2.TEND标志是否为1，然后将发送数据写入ICDRT寄存器。如果IIC在ICFER.NACKE位为1时没有收到来自主设备的确认（接收到NACK信号），则IIC暂停下一个数据的传输。
4. 等到ICSR2.TEND标志设置为1，而ICSR2.TDRE标志为1，在ICSR2.NACKF标志设置为1或将要发送的最后一个字节写入ICDRT寄存器之后。当ICSR2.NACKF标志或TEND标志为1时，IIC在SCL时钟的第9个下降沿将SCLn线驱动为低电平。
5. 当ICSR2中的NACKF或TEND标志为1时，假读ICDRR以完成处理。这释放了SCLn line.
6. 在检测到停止条件时，IIC自动设置ICSR1.HOA、GCA和AASy（y=0到2）标志，即ICSR2中的TDRE和TEND标志位，且ICCR2.TRS位为0，进入从机接收模式。
7. 检查ICSR2.STOP标志是否为1，然后将ICSR2中的NACKF和STOP标志设置为0，以进行下一次传输操作。

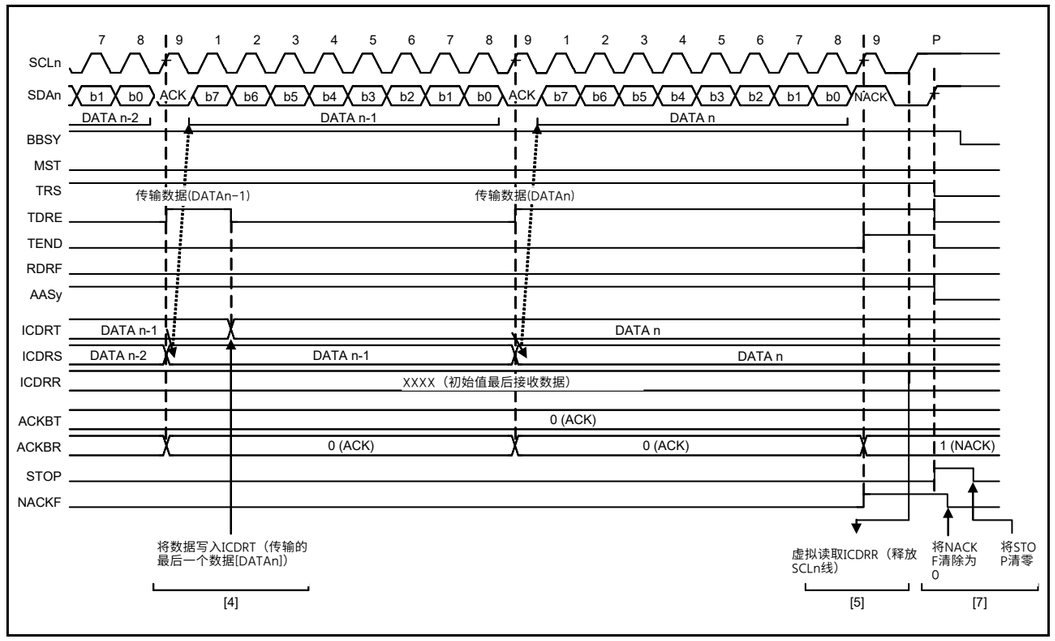

Figure 32.17 从机发送操作时序（2）

32.3.6 Slave Receive Operation

In a slave receive operation, the master device outputs the SCL clock and transmit data, and the IIC returns acknowledgments as a slave device.

Figure 32.18 shows an example of slave reception, and Figure 32.19 and Figure 32.20 show the operation timing in slave reception.

To set up and perform slave reception:

1. Initialize the IIC using the procedure in section 32.3.2, Initial Settings.
   After initialization, the IIC stays in the standby state until it receives a slave address that matches.
2. After receiving a matching slave address, the IIC sets one of the associated ICSR1.HOA, GCA, and AASy (y = 0 to 2) flags to 1 on the rising edge of the 9th cycle of the SCL clock and outputs the value set in the ICMR3.ACKBT bit to the acknowledge bit on the 9th cycle of the SCL clock. If the value of the received R/W# bit is 0, the IIC continues to place itself in slave receive mode and sets the RDRF flag in ICSR2 to 1.
3. Check that the ICSR2.STOP flag is 0 and the ICSR2.RDRF flag is 1, and then dummy read the ICDRR register. The dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower 8 bits when the 10-bit address format is selected.
4. When ICDRR is read, the IIC automatically sets the ICSR2.RDRF flag to 0. If reading of ICDRR is delayed and the next byte is received while the RDRF flag is still set to 1, the IIC holds the SCLn line low until 1 SCL cycle before the point where RDRF must be set. In this case, reading ICDRR releases the SCLn line from being held at low. When the ICSR2.STOP flag is 1 and the ICSR2.RDRF flag is also 1, read ICDRR until all the data is completely received.
5. On detecting the stop condition, the IIC automatically set the ICSR1.HOA, GCA, and AASy (y = 0 to 2) flags in ICSR1 to 0.
6. Check that the ICSR2.STOP flag is 1, then set the ICSR2.STOP flag to 0 for the next transfer operation.

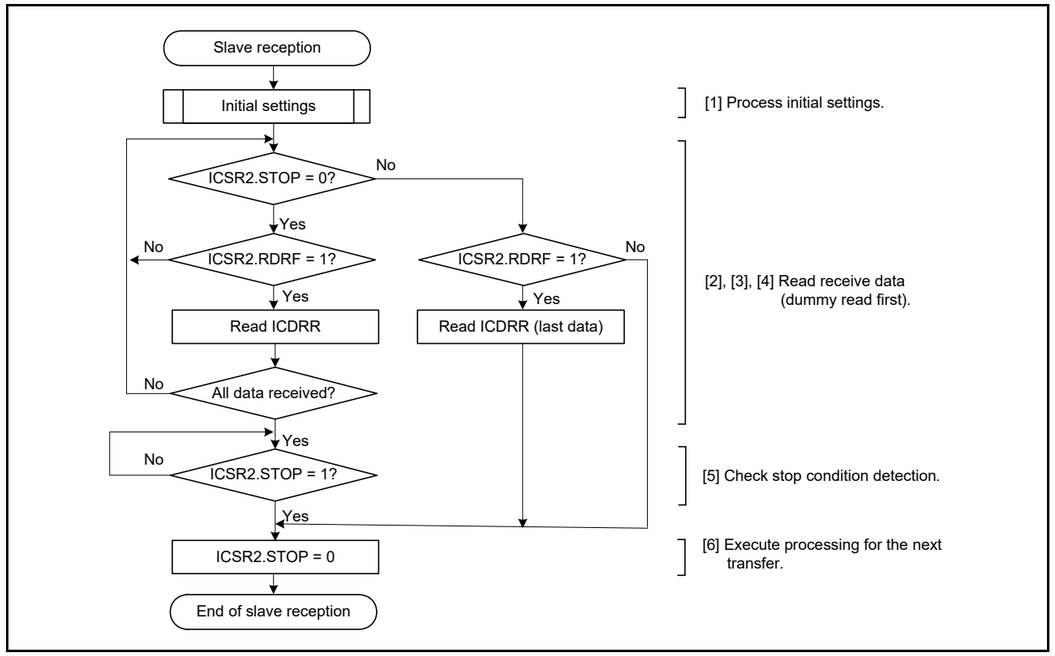

Figure 32.18 Example slave reception flow

32.3.6 从机接收操作

在从机接收操作中，主设备输出SCL时钟并发送数据，IIC作为从设备返回确认。

图32.18显示了从机接收的示例，图32.19和图32.20显示了从机接收的操作时序。

设置和执行从属接收：

1. 使用第32.3.2节，初始设置中的过程初始化IIC。
   初始化后，IIC一直处于待机状态，直到收到匹配的从机地址。
2. 接收到匹配的从地址后，IIC在SCL时钟的第9个周期的上升沿将相关的ICSR1.HOA、GCA和AASy（y=0到2）标志之一设置为1，并输出设置的值在ICMR3.ACKBT位到SCL时钟的第9个周期的确认位。如果接收到的RW#位的值为0，则IIC继续将自身置于从接收模式并将ICSR2中的RDRF标志设置为1。
3. 检查ICSR2.STOP标志为0且ICSR2.RDRF标志为1，然后伪读取ICDRR寄存器。Thedummyvalueconsistsoftheslaveaddress和RW#bitwhenthe7-bitaddressformatisselected orthelower8bitswhenthe10-bitaddressformatisselected.
4. 读取ICDRR时，IIC自动将ICSR2.RDRF标志设置为0。如果ICDRR的读取延迟并且在RDRF标志仍设置为1时接收到下一个字节，则IIC将SCLn线保持为低电平直到1个SCL周期在必须设置RDRF之前。在这种情况下，读取ICDRR会解除SCLn线保持在低电平的状态。当ICSR2.STOP标志为1且ICSR2.RDRF标志也为1时，读取ICDRR直到完全接收到所有数据。
5. 在检测到停止条件时，IIC自动设置ICSR1.HOA、GCA和AASy（y=0到2）标志
   ICSR1 to 0.
6. 检查ICSR2.STOP标志是否为1，然后将ICSR2.STOP标志设置为0以进行下一次传输操作。

32.4 SCL Synchronization Circuit

To generate the SCL clock, the IIC starts counting the value for the high-level period specified in ICBRH when it detects a rising edge on the SCLn line, and drives the SCLn line low when it completes counting. When the IIC detects the falling edge of the SCLn line, it starts counting the value for the low-level period specified in ICBRL, and then stops driving the SCLn line (releases the line) when it completes counting. The IIC repeats this process to generate the SCL clock.

If multiple master devices are connected to the I2C bus, a collision of SCL signals might arise because of contention with another master device. In such cases, the master devices must synchronize their SCL signals. Because this synchronization of SCL signals must be bit-by-bit, IIC includes an SCL synchronization circuit to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCLn line while in master mode.

When the IIC detects a rising edge on the SCLn line and starts counting the high-level period specified in ICBRH, and the level on the SCLn line falls because an SCL signal is being generated by another master device, the IIC performs the following:

1. Stops counting when it detects the falling edge.
2. Drives the level on the SCLn line low.
3. Starts counting the low-level period specified in ICBRL.

When the IIC finishes counting the low-level period, it stops driving the SCLn line low to release the line. If the low-level period of the SCL clock signal from the other master device is longer than the low-level period set in the IIC, the low-level period of the SCL signal is extended. When the low-level period for the other master device ends, the SCL signal rises because the SCLn line is released.

When the IIC finishes outputting the low-level period of the SCL clock, the SCLn line is released and the SCL clock rises. That is, when SCL signals from more than one master are contending, the high-level period of the SCL signal is synchronized with that of the clock with the narrower period, and the low-level period of the SCL signal is synchronized with that of the clock with the broader period. However, such synchronization of the SCL signal is only enabled when the SCLE bit in ICFER is set to 1.

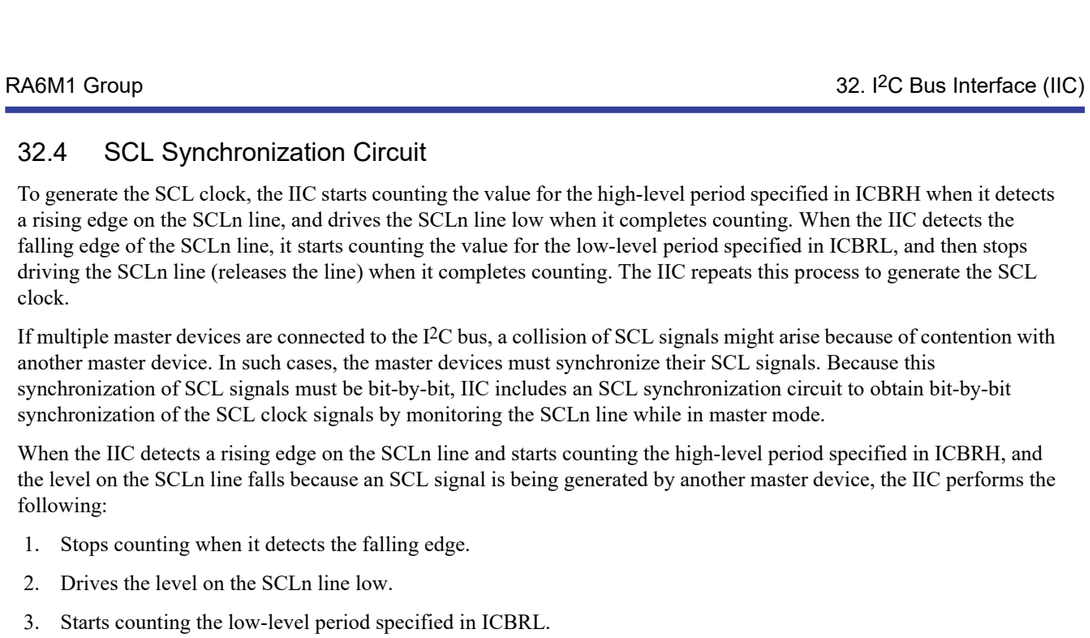

Figure 32.21 Generation and synchronization of SCL signal from the IIC

32.4 SCL同步电路

为了产生SCL时钟，IIC在检测到SCLn线上的上升沿时开始对ICBRH中指定的高电平周期的值进行计数，并在完成计数时将SCLn线驱动为低电平。当IIC检测到SCLn线的下降沿时，它开始对ICBRL中指定的低电平周期的值进行计数，然后在完成计数时停止驱动SCLn线（释放线）。IIC重复此过程以生成SCL时钟。

如果多个主设备连接到I2C总线，由于与另一个主设备争用，可能会出现SCL信号冲突。在这种情况下，主设备必须同步它们的SCL信号。因为SCL信号的这种同步必须是逐位的，所以IIC包括一个SCL同步电路，通过在主机模式下监视SCLn线来获得SCL时钟信号的逐位同步。

当IIC检测到SCLn线上的上升沿并开始计算ICBRH中指定的高电平周期，并且由于另一个主设备正在生成SCL信号而导致SCLn线上的电平下降时，IIC执行以下操作：

1. 检测到下降沿时停止计数。
2. 将SCLn线上的电平驱动为低电平。
3. 开始计算ICBRL中指定的低电平周期。

当IIC完成对低电平周期的计数时，它停止将SCLn线驱动为低电平以释放该线。如果来自其他主设备的SCL时钟信号的低电平周期长于IIC中设置的低电平周期，则延长SCL信号的低电平周期。当另一个主设备的低电平周期结束时，SCL信号上升，因为SCLn线被释放。

当IIC输出完SCL时钟的低电平周期后，SCLn线被释放，SCL时钟上升。即当来自多个主控的SCL信号竞争时，SCL信号的高电平周期与周期较窄的时钟同步，SCL信号的低电平周期与主控的低电平周期同步。具有更广泛周期的时钟。但是，只有当ICFER中的SCLE位设置为1时，才会启用SCL信号的这种同步。

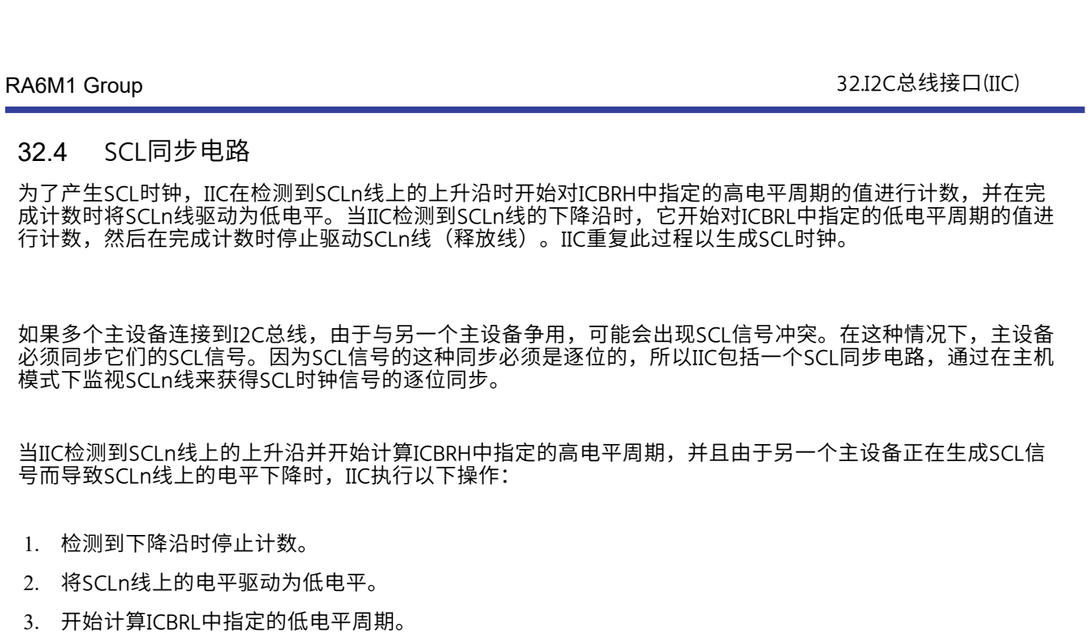

Figure 32.21 从IIC生成和同步SCL信号

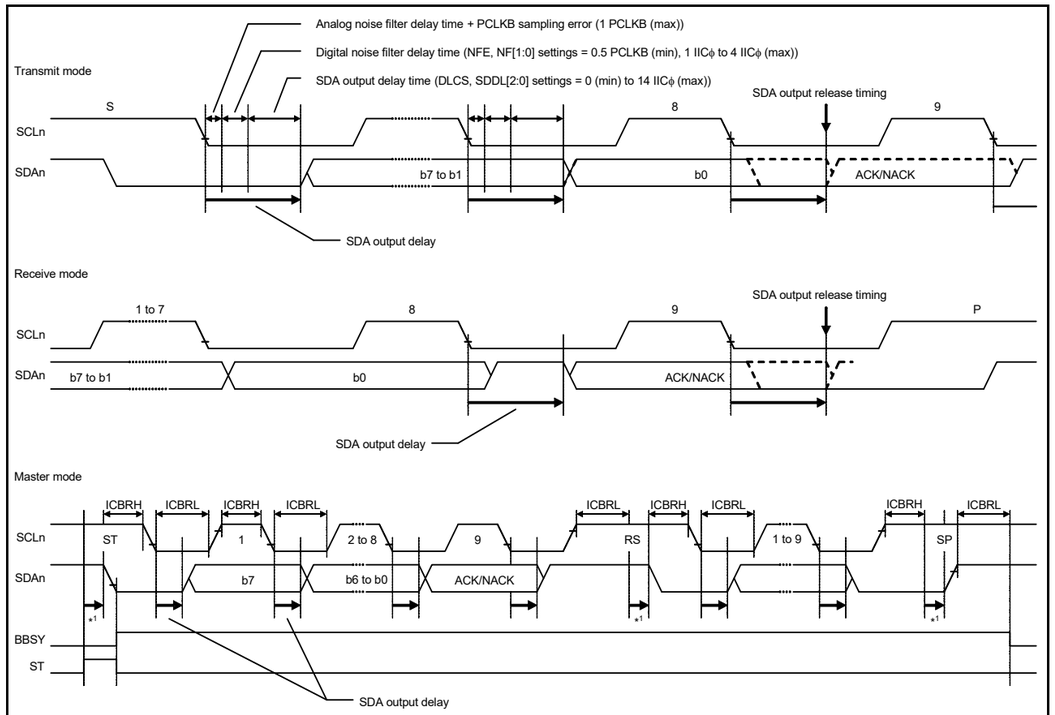
32.5 SDA Output Delay Function

The IIC module provides a function for delaying output on the SDA line. The delay can be applied to all outputs on the SDA line, including issuing of start, restart, and stop conditions, data, and the ACK and NACK signals.

With this function, SDA output is delayed from the detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval during which the SCL clock is low. This approach helps prevent erroneous operation of communication devices, with the aim of satisfying the 300-ns minimum data-hold time requirement of the SMBus specification. The output delay function is enabled by setting the SDDL[2:0] bits in ICMR2 to any value other than 000b, and disabled by setting the same bits to 000b.

When the SDA output delay function is enabled, for example, the DLCS bit in ICMR2 selects the clock source for the SDA output delay counter, either as the internal base clock (IICϕ) for the IIC module or as the internal base clock divided by two (IICϕ/2). The counter counts the number of cycles set in the SDDL[2:0] bits in ICMR2. When the delay count is reached, the IIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.



Note 1. The output delay function is set by the DLCS and SDDL[2:0] bits when a start (ST), restart (RS), or stop (SP) condition is issued.

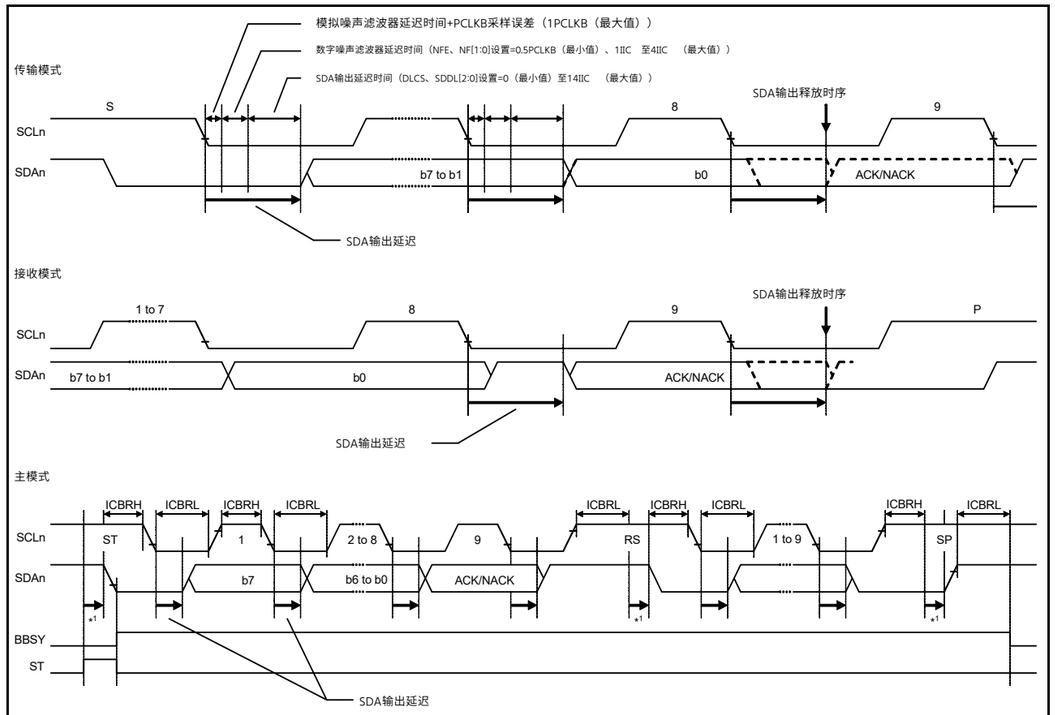
Figure 32.22 SDA output delay function

32.5 SDA输出延迟功能

IIC模块提供了延迟SDA线上输出的功能。延迟可以应用于所有输出
SDA线，包括发出启动、重启和停止条件、数据以及ACK和NACK信号。

使用此功能，SDA输出从检测到SCL信号的下降沿开始延迟，以确保在SCL时钟为低电平的时间间隔内输出SDA信号。这种方法有助于防止通信设备的错误操作，旨在满足SMBus规范的300ns最小数据保持时间要求。通过将ICMR2中的SDDL[2:0]位设置为000b以外的任何值来启用输出延迟功能，并通过将相同位设置为000b来禁用输出延迟功能。

当SDA输出延迟功能使能时，例如ICMR2中的DLCS位选择时钟源
SDA输出延迟计数器，可以作为IIC模块的内部基本时钟(IIC)或作为内部基本时钟除以2(IIC 2)。计数器计算ICMR2中SDDL[2:0]位中设置的周期数。当达到延迟计数时，IIC模块将所需的输出（启动、重启或停止条件、数据或ACK或NACK信号）放在SDA线上。



注1.当发出启动(ST)、重启(RS)或停止(SP)条件时，输出延迟功能由DLCS和SDDL[2:0]位设置。

Figure 32.22 SDA输出延迟功能

32.6 Digital Noise Filter Circuits

The internal circuitry sees the states of the SCLn and SDAn pins through analog and digital noise-filter circuits. Figure 32.23 shows a block diagram of the digital noise-filter circuit.

The on-chip digital noise-filter circuit of the IIC consists of four flip-flop circuit stages connected in series, and a match-detection circuit.

The number of valid stages in the digital noise filter is selected in the NF[1:0] bits in ICMR3. The selected number of valid stages determines the noise-filtering capability as a period from 1 to 4 IICϕ cycles.

The input signal to the SCLn pin (or SDAn pin) is sampled on falling edges of the IICϕ signal. When the input signal level matches the output level of the number of valid flip-flop circuit stages as selected in the NF[1:0] bits in ICMR3, the signal level is seen in the subsequent stage. If the signal levels do not match, the previous value is saved.

If the ratio between the frequency of the internal operating clock (PCLKB) and the transfer rate is small, for example, for a data transfer at 400 kbps with PCLKB at 4 MHz, the digital noise filter might lead to the elimination of the required signals as noise. In such cases, it is possible to disable the digital noise-filter circuit by setting the ICFER.NFE bit to 0, and use only the analog noise-filter circuit.

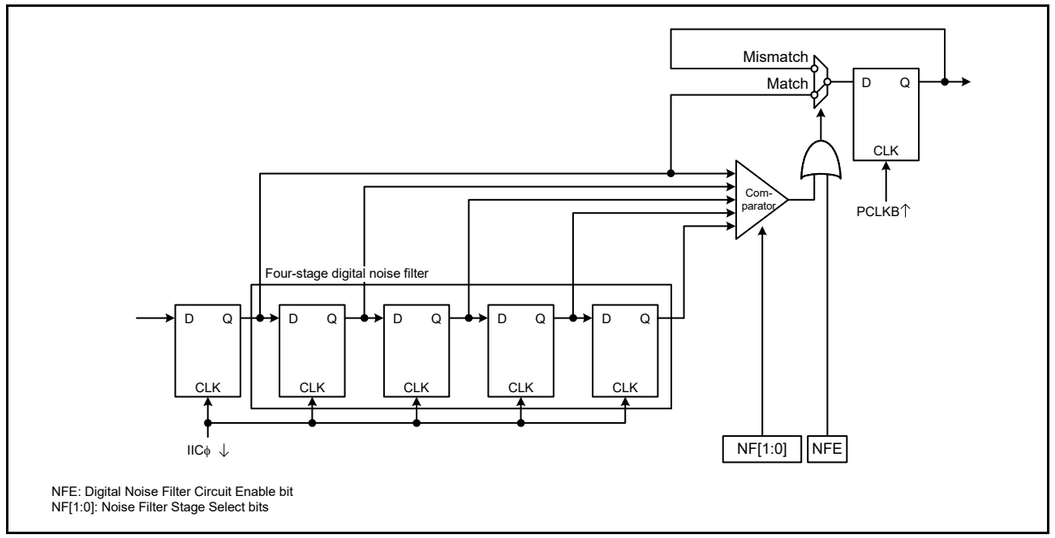


Figure 32.23 Digital noise-filter circuit block diagram

32.7 Address Match Detection

The IIC can set three unique slave addresses in addition to the general call address and host address. The slave addresses can be 7-bit or 10-bit slave addresses.

32.7.1 Slave-Address Match Detection

The IIC can set three unique slave addresses and has a slave address detection function for each unique slave address. When the SARyE bit (y = 0 to 2) in ICSER is set to 1, the slave addresses set in SARUy and SARLy (y = 0 to 2) can be detected.

When the IIC detects a match of the set slave address, the associated AASy (y = 0 to 2) flag in ICSR1 is set to 1 on the rising edge of the 9th SCL clock cycle, and the RDRF flag or TDRE flag in ICSR2 is set to 1 by the subsequent R/W# bit. This causes a receive data full interrupt (IICn_RXI) or transmit data empty interrupt (IICn_TXI) to be generated. The AASy flag identifies which slave address is specified.

32.6 数字噪声滤波器电路

内部电路通过模拟和数字噪声滤波器电路查看SCLn和SDAn引脚的状态。图32.23显示了数字噪声滤波器电路的框图。

IIC的片上数字噪声滤波器电路由四个串联的触发器电路级和一个匹配检测电路组成。

数字噪声滤波器的有效级数在ICMR3的NF[1:0]位中选择。选定的有效级数决定了噪声过滤能力，周期为1到4个IIC 周期。

SCLn引脚（或SDAn引脚）的输入信号在IIC 信号的下降沿采样。当输入信号电平与在ICMR3的NF[1:0]位中选择的有效触发器电路级数的输出电平相匹配时，信号电平将出现在后一级。如果信号电平不匹配，则保存先前的值。

如果内部工作时钟(PCLKB)的频率与传输速率之间的比率很小，例如，对于400kbps的数据传输，PCLKB为4MHz，则数字噪声滤波器可能会导致所需信号的消除作为噪音。在这种情况下，可以通过将ICFER.NFE位设置为0来禁用数字噪声滤波器电路，并仅使用模拟噪声滤波器电路。

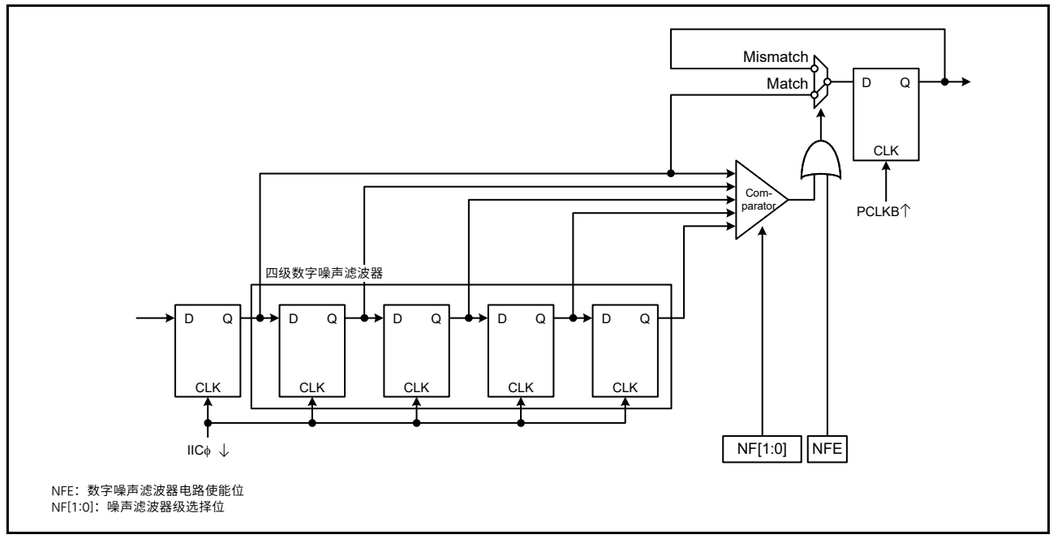

Figure 32.23 数字噪声滤波器电路框图

32.7 地址匹配检测

IIC除了广播地址和主机地址外，还可以设置三个唯一的从机地址。从地址可以是7位或10位从地址。

32.7.1 从地址匹配检测

IIC可以设置三个唯一的从机地址，并对每个唯一的从机地址具有从机地址检测功能。
当ICSER中的SARyE位（y=0到2）设置为1时，可以检测到设置在SARUy和SARLy（y=0到2）中的从机地址。

当IIC检测到设置的从地址匹配时，ICSR1中相关的AASy（y=0到2）标志在第9个SCL时钟周期的上升沿被设置为1，并且ICSR2中的RDRF标志或TDRE标志由随后的RW#位设置为1。这会导致产生接收数据满中断（IICn_RXI）或发送数据空中断（IICn_TXI）。这

AASy标志标识指定了哪个从地址。

Figure 32.24 to Figure 32.26 show the AASy flag set timing in three cases.

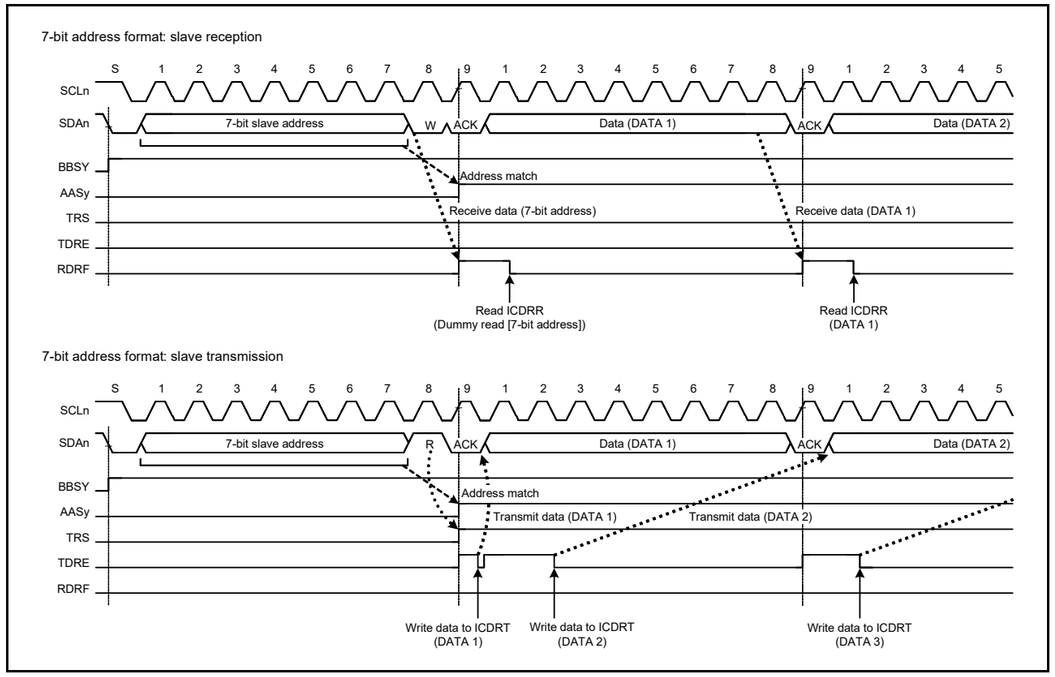

Figure 32.24 AASy flag set timing with 7-bit address format

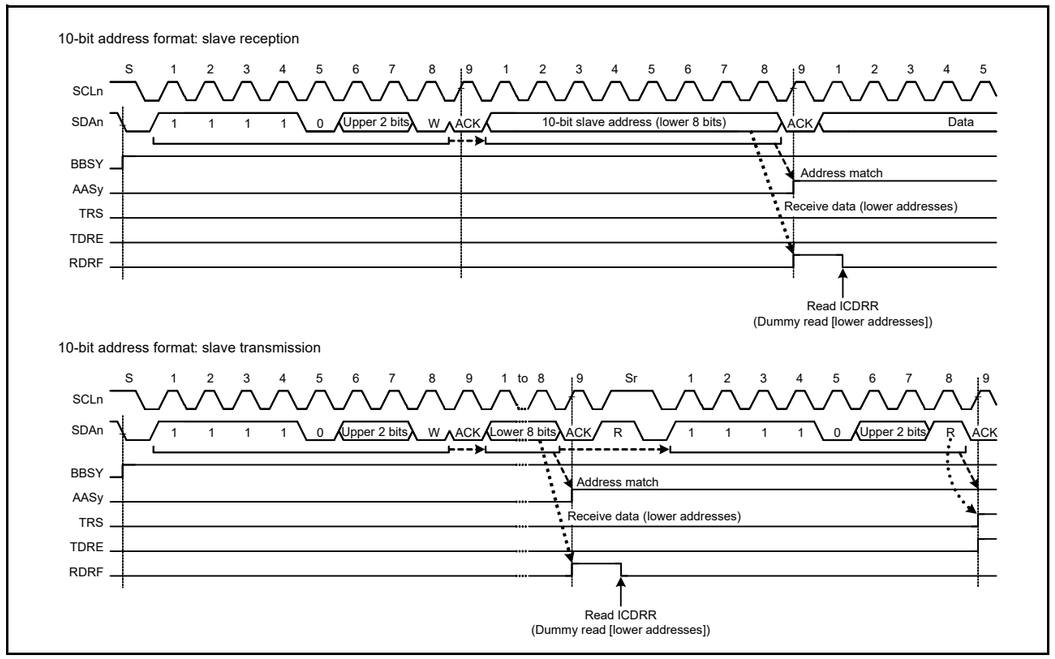

Figure 32.25 AASy flag set timing with 10-bit address format

图32.24至图32.26显示了三种情况下的AASy标志设置时序。

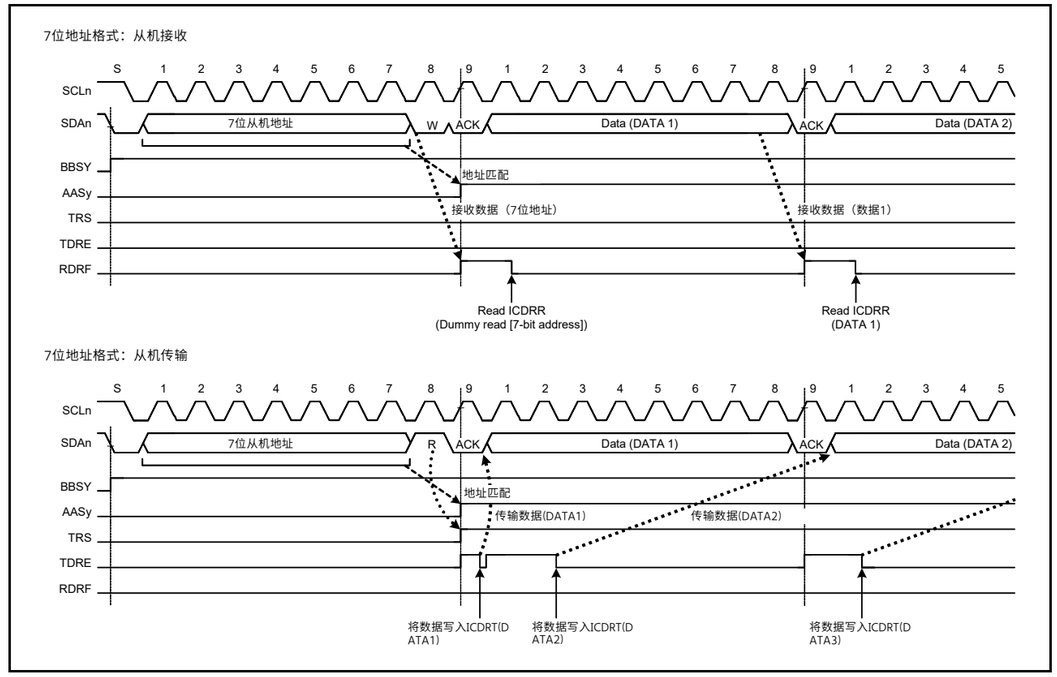

Figure 32.24 7位地址格式的AASy标志设置时序

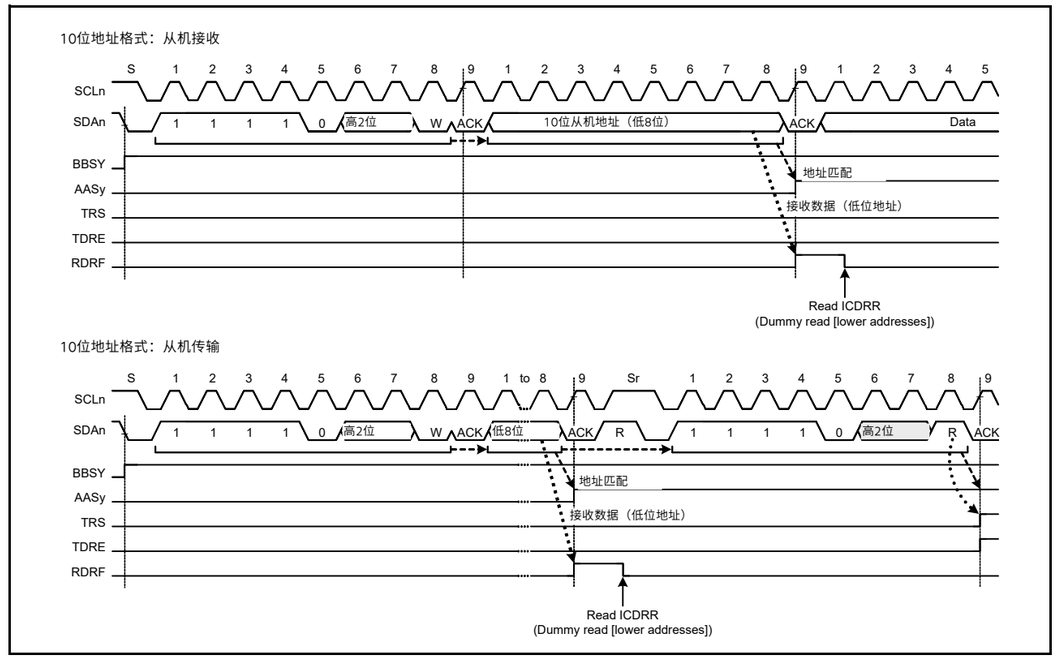

Figure 32.25 10位地址格式的AASy标志设置时序

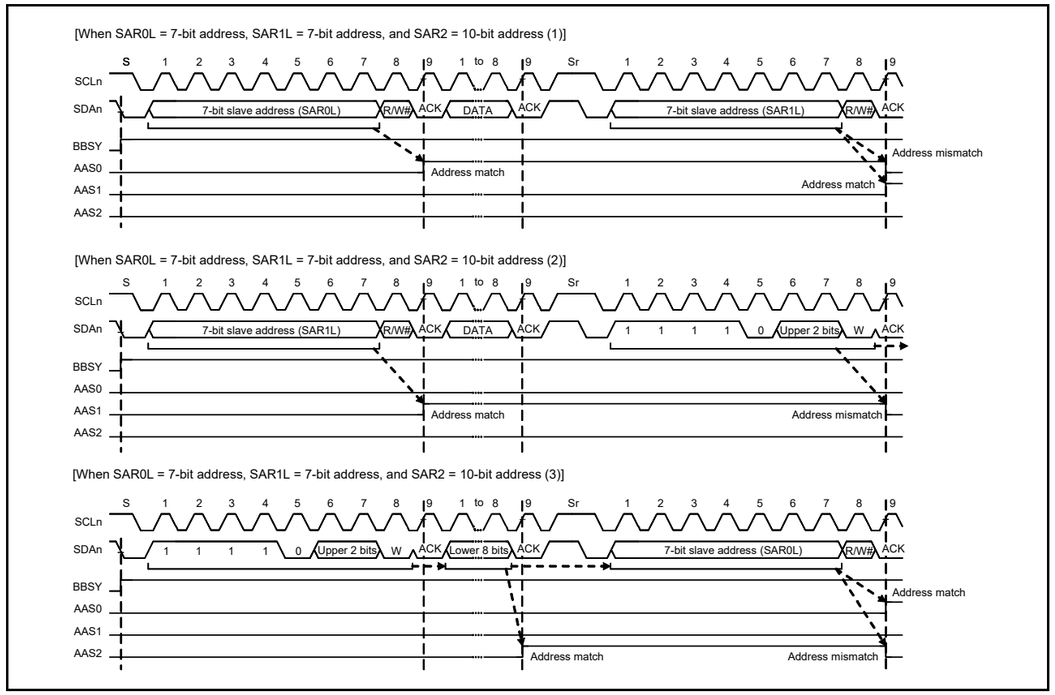

Figure 32.26 AASy flag set and clear timing with 7-bit and 10-bit address formats mixed

32.7.2 Detection of General Call Address

The IIC provides detection of the general call address (0000 000b + 0 [W]). General call address detection is enabled by setting the GCAE bit in ICSER to 1.

If the address received after a start or restart condition is issued is 0000 000b + 1[R] (start byte), the IIC recognizes this as the address of a slave device with an all-zero address, but not as the general call address.

When the IIC detects the general call address, both the GCA flag in ICSR1 and the RDRF flag in ICSR2 are set to 1 on the rising edge of the 9th cycle of the SCL clock. This leads to the generation of a receive data full interrupt (IICn_RXI). The value of the GCA flag can be checked to confirm that the general call address was transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

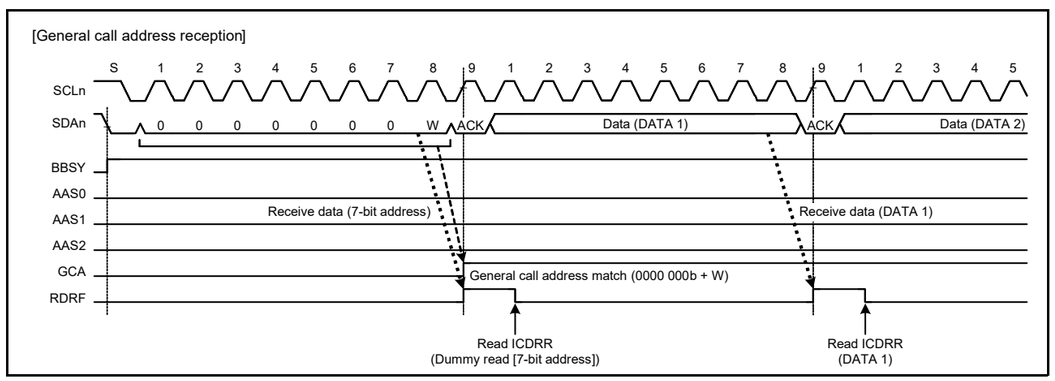

Figure 32.27 Timing of GCA flag setting during reception of general call address

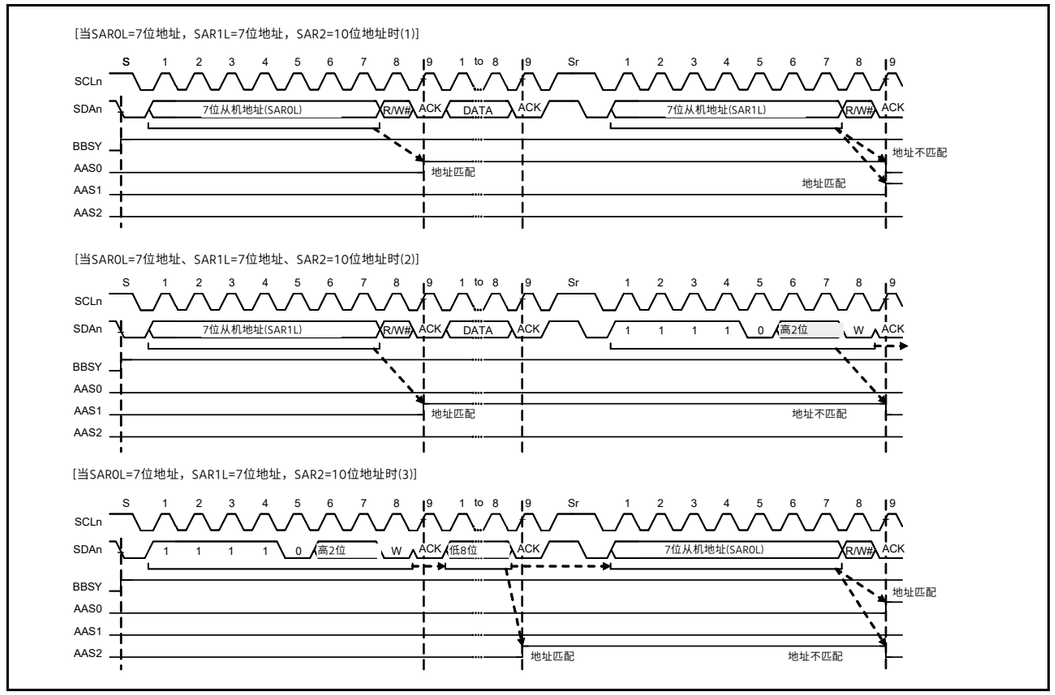

Figure 32.26 混合7位和10位地址格式的AASy标志设置和清除时序

32.7.2 广播呼叫地址检测

IIC提供对广播呼叫地址(0000000b+0[W])的检测。通过将ICSER中的GCAE位设置为1来启用广播呼叫地址检测。

如果在发出启动或重新启动条件后接收到的地址是0000000b+1[R]（起始字节），则IIC将其识别为具有全零地址的从设备的地址，但不是广播地址.

当IIC检测到广播呼叫地址时，ICSR1中的GCA标志和ICSR2中的RDRF标志都在SCL时钟的第9个周期的上升沿设置为1。这会导致接收数据完全中断(IICn_RXI)的产生。可以检查GCA标志的值以确认广播呼叫地址已被传输。

检测到广播呼叫地址后的操作与正常的从机接收操作相同。

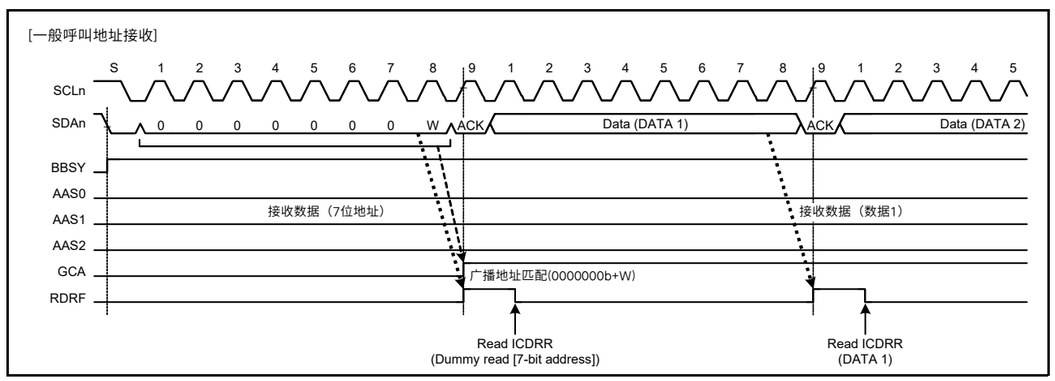

Figure 32.27 在接收广播呼叫地址期间设置GCA标志的时机

32.7.3 Device ID Address Detection

The IIC module provides detection of the device ID address in compliance with the I2C bus specification, revision 03. When the IIC receives 1111 100b as the first byte after a start or restart condition is issued with the DIDE bit in ICSER set to 1, it recognizes the address as a device ID, sets the DID flag in ICSR1 to 1 on the rising edge of the 8th SCL clock cycle when the subsequent R/W# bit is 0, then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the IIC sets the associated AASy (y = 0 to 2) flag in ICSR1 to 1.

When the first byte received after the issue of a start or restart condition matches the device ID address (1111 100b) again and the subsequent R/W# bit is 1, the IIC does not compare the second and subsequent bytes, and sets the ICSR2.TDRE flag to 1.

In the device ID address detection function, the IIC sets the DID flag to 0 if a match with the IIC slave address is not obtained, or a match with the device ID address is not obtained after a match with the IIC slave address, and a restart condition is detected. If the first byte after the detection of a start or restart condition matches the device ID address (1111 100b) and the R/W# bit is 0, the IIC sets the DID flag to 1 and compares the second and subsequent bytes with the slave address of IIC. If the R/W# bit is 1, the DID flag holds the previous value and the IIC does not compare the second and subsequent bytes. Therefore, the reception of a device ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Additionally, prepare the device ID fields (3 bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device ID field as normal transmit data. For details on the information that must be included in device ID fields, contact NXP Semiconductors.

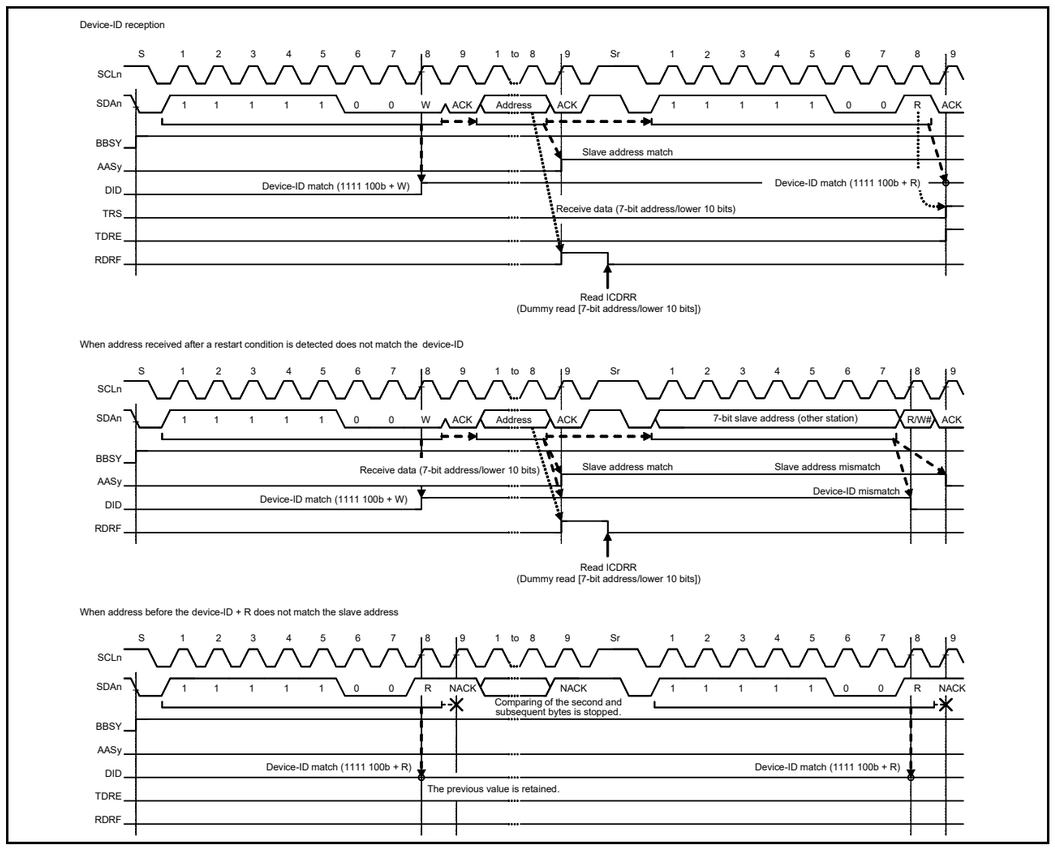

Figure 32.28 AASy and DID flag set and clear timing during reception of device ID

32.7.3 设备ID地址检测

IIC模块提供符合I2C总线规范，修订版03的设备ID地址检测。当IIC在ICSER中的DIDE位设置为1的情况下发出启动或重启条件后收到1111100b作为第一个字节时，它将地址识别为设备ID，当随后的RW#位为0时，在第8个SCL时钟周期的上升沿将ICSR1中的DID标志设置为1，然后将第二个和后续字节与自己的从地址进行比较.如果地址与从地址寄存器中的值匹配，则IIC将ICSR1中相关的AASy（y=0到2）标志设置为1。

当发出启动或重启条件后接收到的第一个字节再次与设备ID地址(1111100b)匹配且后续RW#位为1时，IIC不比较第二个和后续字节，并设置ICSR2.TDRE标志为1。

在设备ID地址检测功能中，如果没有得到与IIC从机地址匹配，或者与IIC从机地址匹配后没有得到与设备ID地址匹配，则IIC将DID标志设置为0，并且检测到重启条件。如果检测到启动或重启条件后的第一个字节与设备ID地址(1111100b)匹配且RW#位为0，则IIC将DID标志设置为1，并将第二个和后续字节与从机地址进行比较国际集成电路。如果RW#位为1，则DID标志保持前一个值，并且IIC不比较第二个和后续字节。因此，在确认TDRE=1后，可以通过读取DID标志来检查设备ID地址的接收。

此外，准备设备ID字段（3个字节：12位表示制造商+9位表示部件+3位表示版本），在接收到连续的设备ID字段作为正常发送数据后必须发送到主机。有关必须包含在设备ID字段中的信息的详细信息，请联系NXPSemiconductors。

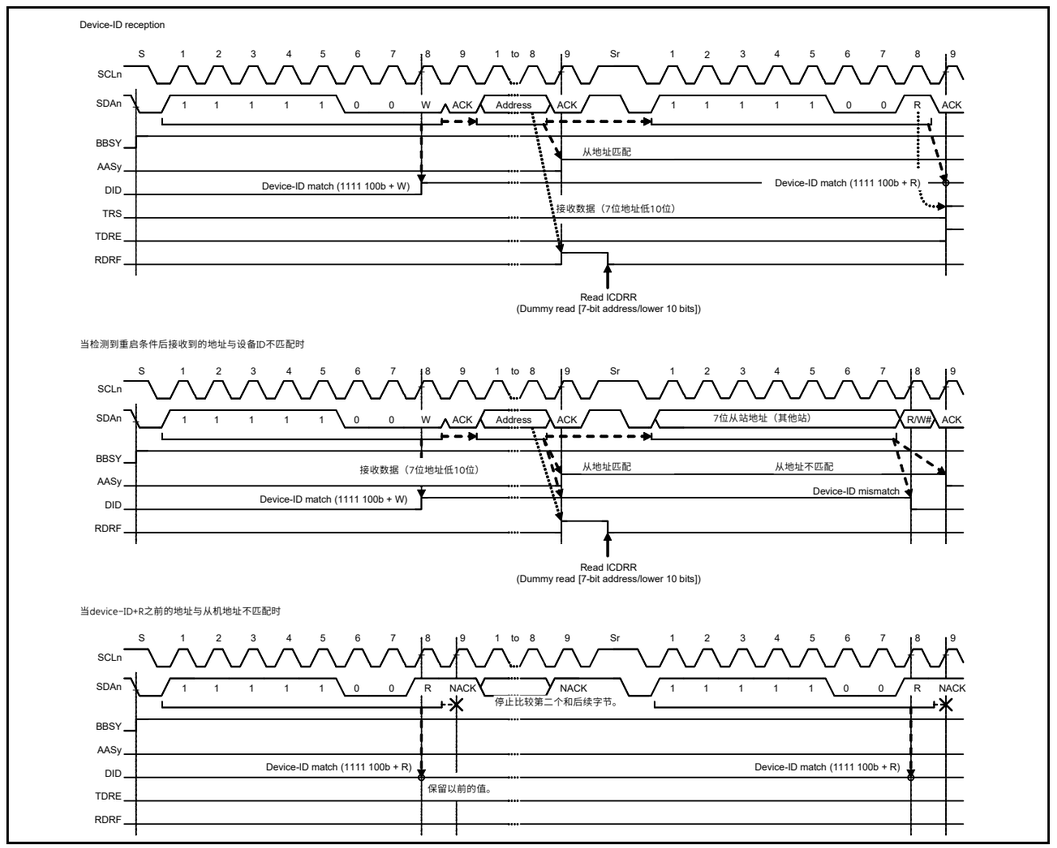

Figure 32.28 在接收设备ID期间设置AASy和DID标志并清除时序

32.7.4 Host Address Detection

The IIC provides host address detection when operating in SMBus mode. When the HOAE bit in ICSER is set to 1 while the SMBS bit in ICMR3 is 1, the IIC can detect the host address (0001 000b) in slave receive mode (MST and TRS bits = 00b in ICCR2).

When the IIC detects the host address, the HOA flag in ICSR1 is set to 1 on the rising edge of the 9th SCL clock cycle. At the same time, the RDRF flag in ICSR2 is set to 1 when the R/W# bit is 0 (Wr bit). This causes a receive data full interrupt (IICn_RXI) to be generated. The HOA flag indicates that the host address was sent from another device.

If the bit following the host address (0001 000b) is a read bit (R/W# bit = 1), the IIC can also detect the host address. After the host address is detected, the IIC operates in the same manner as in normal slave operation.

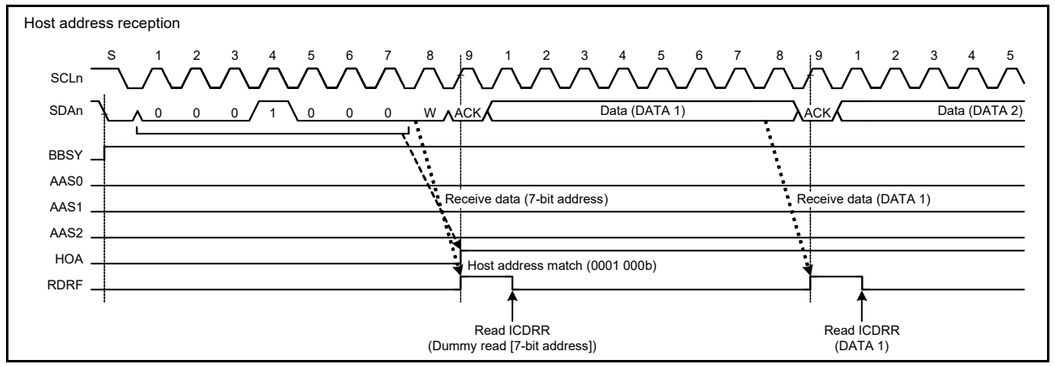

Figure 32.29 HOA flag set timing during reception of host address

32.8 Wakeup Function

The IIC provides a wakeup function that causes the MCU to transition from Software Standby mode to normal operation. The wakeup function enables the reception of data when the system clock is stopped, and generates a wakeup interrupt signal on a match of the slave address of the received data. This wakeup interrupt signal triggers the return to normal operation.

The wakeup function has four operation modes:

- Normal wakeup mode 1
- Normal wakeup mode 2
- Command recovery mode
- EEP response mode.

Table 32.9 describes the behavior in these modes.

Table 32.9 Wakeup operation modes

Operation mode	ACK response timing	ACK response before wakeup	SCL state during wakeup
Normal wakeup mode 1	Before wakeup	ACK	Fixed low
Normal wakeup mode 2	After wakeup	Before wakeup: no response After wakeup: ACK response	Fixed low
Command recovery mode	Before wakeup	ACK	Open
EEP response mode	Before wakeup	NACK	Open

Precautions on the use of the wakeup function

1. Disable the wakeup function (WUE = 0) after a wakeup interrupt triggers the transition from Software Standby mode to normal operation.

32.7.4 主机地址检测

IIC在SMBus模式下工作时提供主机地址检测。当ICSER中的HOAE位设置为1而ICMR3中的SMBS位为1时，IIC可以在从机接收模式下检测主机地址（0001000b）（ICCR2中的MST和TRS位=00b）。

当IIC检测到主机地址时，ICSR1中的HOA标志在第9个SCL时钟周期的上升沿被设置为1。同时，当RW#位为0（Wr位）时，ICSR2中的RDRF标志设置为1。这会导致产生接收数据完全中断（IICn_RXI）。HOA标志表明主机地址是从另一个设备发送的。

如果主机地址（0001000b）后面的位是读取位（RW#位=1），则IIC也可以检测主机地址。
检测到主机地址后，IIC以与正常从机操作相同的方式运行。

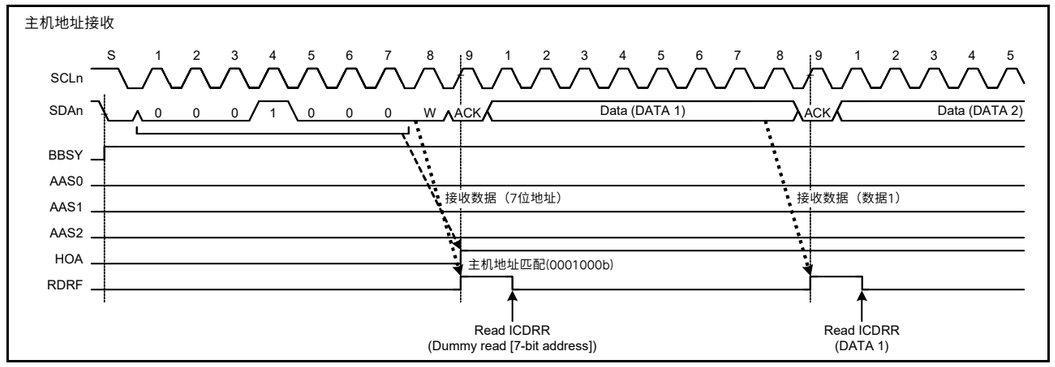

Figure 32.29 接收主机地址期间的HOA标志设置时序

32.8 唤醒功能

IIC提供唤醒功能，使MCU从软件待机模式转换到正常操作。唤醒功能在系统时钟停止时启用数据接收，并在接收到的数据的从地址匹配时产生唤醒中断信号。该唤醒中断信号触发恢复正常操作。

唤醒功能有四种操作模式：

- 正常唤醒模式1
- 正常唤醒模式2
- 命令恢复模式
- EEP响应模式。

表32.9描述了这些模式下的行为。

Table 32.9 唤醒操作模式

操作模式	ACK响应时间	唤醒前的ACK响应	唤醒期间的SCL状态
正常唤醒模式1	醒来前	ACK	固定低
正常唤醒模式2	醒来后	唤醒前：无响应唤醒后：ACK响应	固定低
命令恢复模式	醒来前	ACK	Open
EEP响应模式	醒来前	NACK	Open

唤醒功能使用注意事项

1. 在唤醒中断触发从软件待机模式到正常操作的转换后，禁用唤醒功能(WUE=0)。

2. Do not change the content of the IIC registers while WUF = 0, even if the wakeup interrupt recovers the system clock. Specify the register settings after confirming that WUF = 1.
3. Set WUE = WUIE = 1 and MST = TRS = 0 (slave reception mode) before entering Software Standby mode.
4. Do not transition to Software Standby mode while BBSY = 1.
5. The wakeup function supports the 7-bit slave address of the slave address register SARL0, the general call address, and the host address. 10-bit slave addresses, SARL1 and SARL2, are not supported.
6. When the wakeup function is enabled, disable the interrupts selectable in the TIE, TEIE, RIE, NAKIE, SPIE, STIE, ALIE, and TMOIE bits in the ICIER register.
7. When the wakeup function is enabled, do not use the timeout function.
8. If the transition from Software Standby mode is triggered by an interrupt other than a wakeup interrupt, for example, the IRQn, the WUF flag is not set to 1. Follow the procedures shown in Figure 32.31 and Figure 32.36.

32.8.1 Normal Wakeup Mode 1

This section describes the behavior, timing, and an example operation in normal wakeup mode 1.

In normal wakeup mode 1, a wakeup interrupt triggered by the match of the slave address initiates the transition to normal operation as follows:

Before wakeup: ACK is sent in response to the data received with its own slave address of the IIC.
During wakeup: ACK response is made on the 9th clock cycle of SCL, after which SCL is held low*1.
After wakeup: Normal operation continues.

If the slave address does not match, the SCL line is not held low after the 9th clock cycle of SCL, and the slave operation continues.

Figure 32.30 shows an operation example, and Figure 32.32 shows the detailed timing.

Note 1. Between the 9th clock cycle and the 1st clock cycle during wakeup, WAIT = 1 is invalid.

If the transition from Software Standby mode is triggered by an interrupt other than a wakeup interrupt, for example the IRQn, the WUF flag is not set to 1. Figure 32.31 shows an operation example.

2. 当WUF=0时不要改变IIC寄存器的内容，即使唤醒中断恢复了系统时钟。确认WUF=1后指定寄存器设置。
3. 在进入软件待机模式之前设置WUE=WUIE=1和MST=TRS=0（从接收模式）。
4. 当BBSY=1时不要转换到软件待机模式。
5. 唤醒功能支持从地址寄存器SARL0的7位从地址、广播地址、主机地址。不支持10位从机地址SARL1和SARL2。
6. 启用唤醒功能时，禁用TIE、TEIE、RIE、NAKIE、SPIE、STIE、ICIER寄存器中的ALIE和TMOIE位。
7. 启用唤醒功能时，请勿使用超时功能。
8. 如果从软件待机模式的转换是由唤醒中断以外的中断触发的，例如IRQn，WUF标志不设置为1。按照图32.31和图32.36所示的过程。

32.8.1 正常唤醒模式1

本节介绍正常唤醒模式1下的行为、时序和示例操作。

在正常唤醒模式1中，由匹配从地址触发的唤醒中断会启动到正常操作的转换，如下所示：

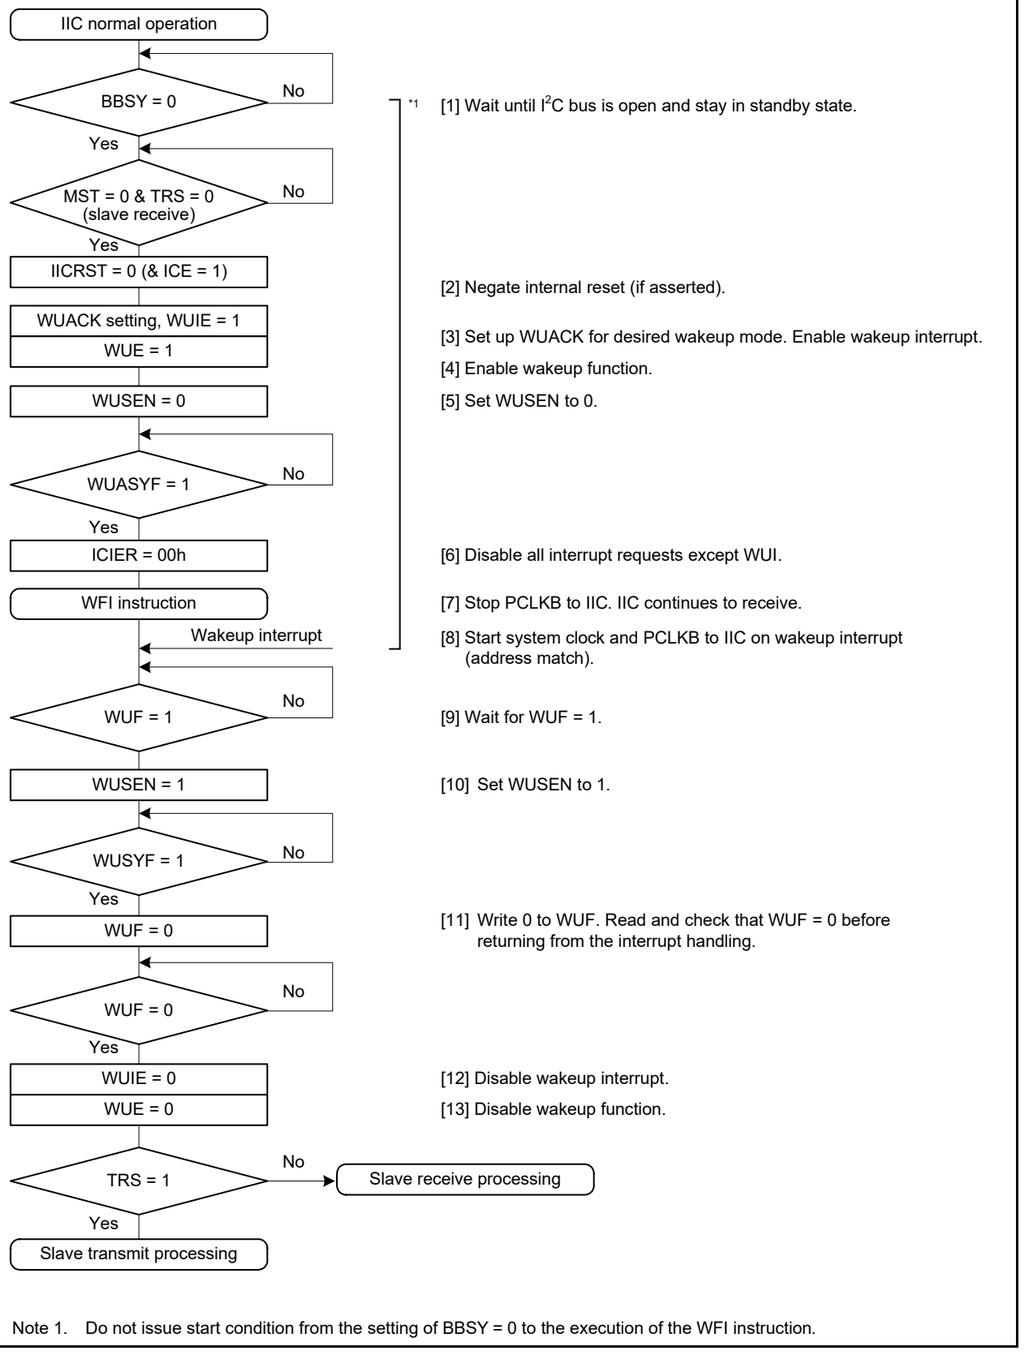
唤醒前：发送ACK以响应接收到的带有IIC从机地址的数据。
唤醒期间：在SCL的第9个时钟周期做出ACK响应，之后SCL保持低电平*1。
唤醒后：继续正常操作。

如果从机地址不匹配，则SCL线在SCL的第9个时钟周期后不保持低电平，从机操作继续。

图32.30显示了一个操作示例，图32.32显示了详细的时序。

注1.在唤醒期间的第9个时钟周期和第1个时钟周期之间，WAIT=1无效。

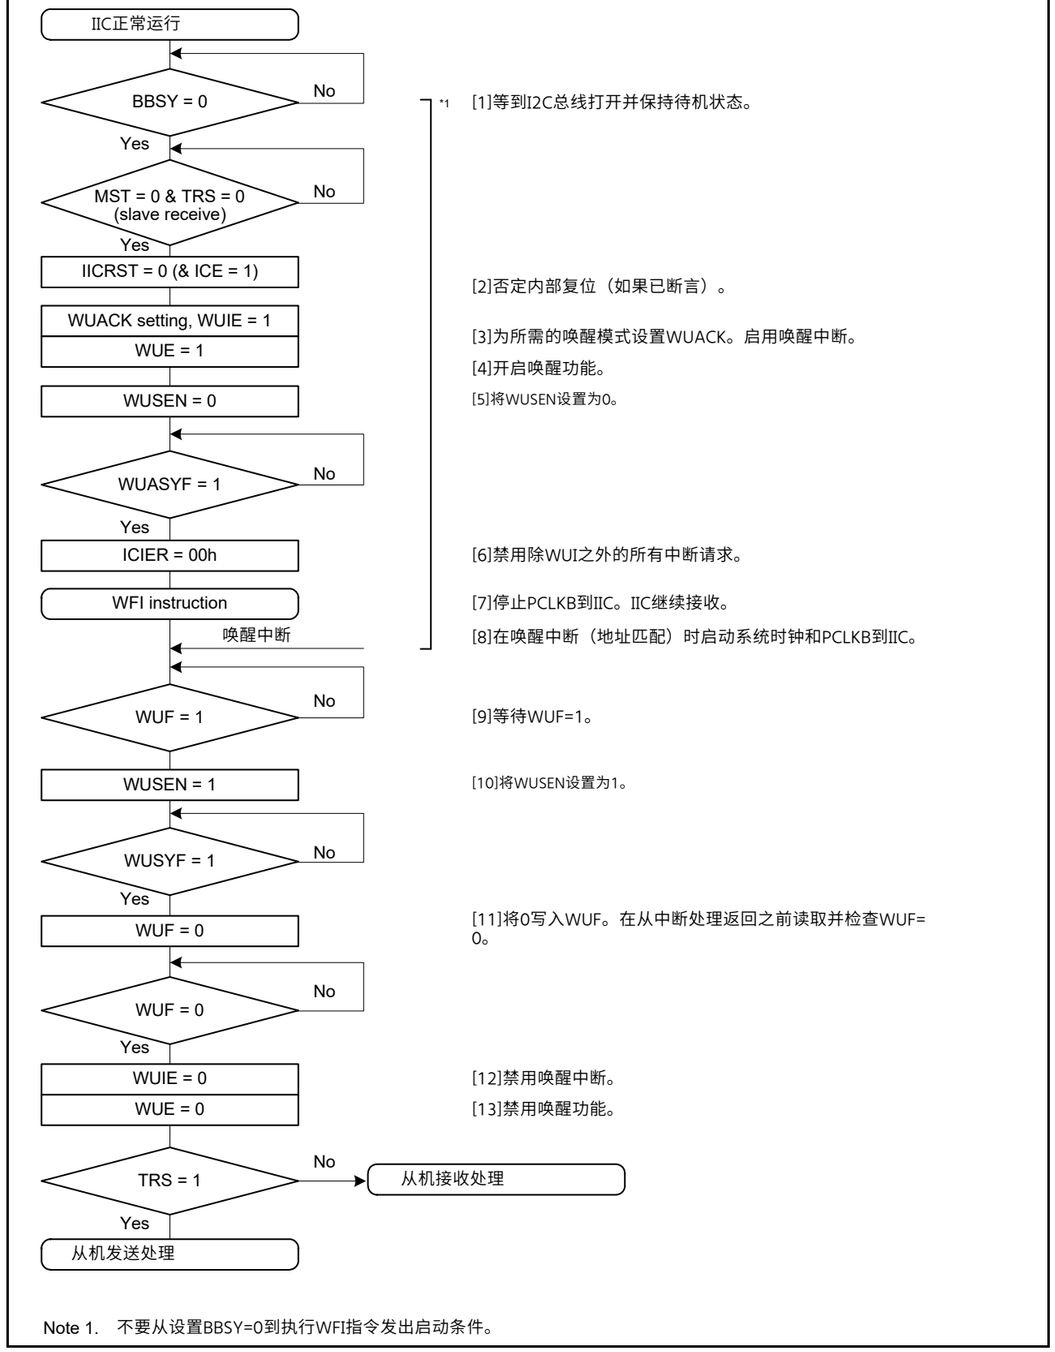
如果从软件待机模式的转换是由唤醒中断以外的中断触发的，例如IRQn，WUF标志未设置为1。图32.31显示了一个操作示例。



Note 1. Do not issue start condition from the setting of BBSY = 0 to the execution of the WFI instruction.

Figure 32.30 Example operation of normal wakeup mode 1 when wakeup is triggered by a wakeup interrupt on match of the slave address

Note: See Precautions on the use of the wakeup function.



Note 1. 不要从设置BBSY=0到执行WFI指令发出启动条件。

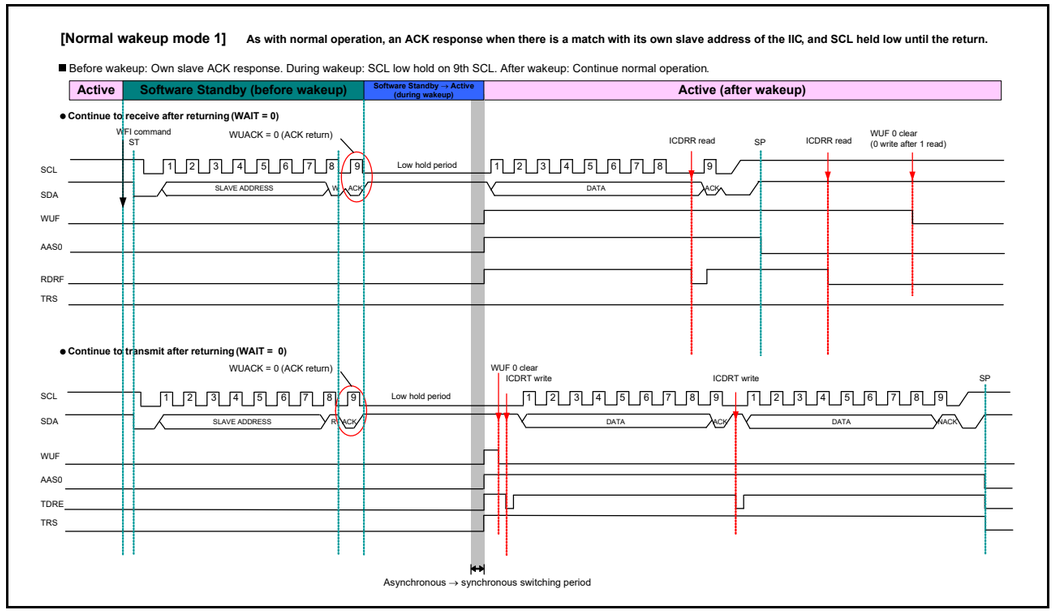

Figure 32.32 Timing of normal wakeup mode 1

32.8.2 Normal Wakeup Mode 2

This section describes the behavior, timing, and an example operation of normal wakeup mode 2.

In normal wakeup mode 2, a wakeup interrupt triggered by a match of the slave address initiates the transition to normal operation as follows:

Before wakeup: No response to data received with its own slave address until the end of the 8th SCL cycle.
During wakeup: SCL line held low during the 8th and 9th clock cycles.
After wakeup: ACK returns on the 9th clock cycle of SCL, and normal operation continues.

If the slave address does not match, the SCL line is not held low after the 8th SCL clock cycle, and the slave operation continues.

Figure 32.33 shows an example operation, and Figure 32.34 shows the detailed timing.

If the transition from Software Standby mode is triggered by an interrupt other than a wakeup interrupt, such as the IRQn for example, the WUF flag is not set to 1. Figure 32.31 shows an operation example.

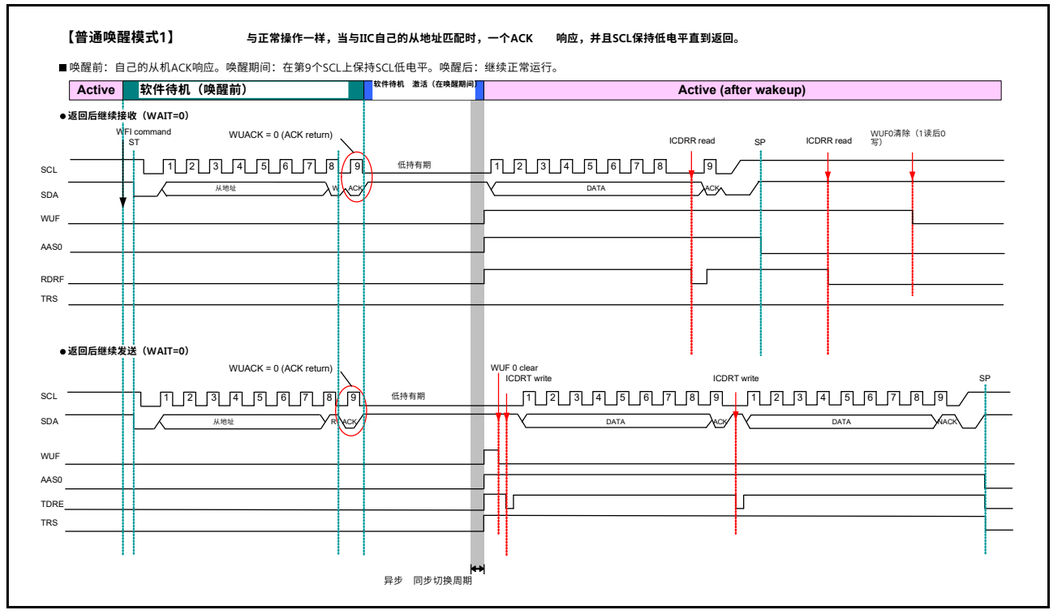

Figure 32.32 正常唤醒模式1的时序

32.8.2 正常唤醒模式2

本节介绍正常唤醒模式2的行为、时序和示例操作。

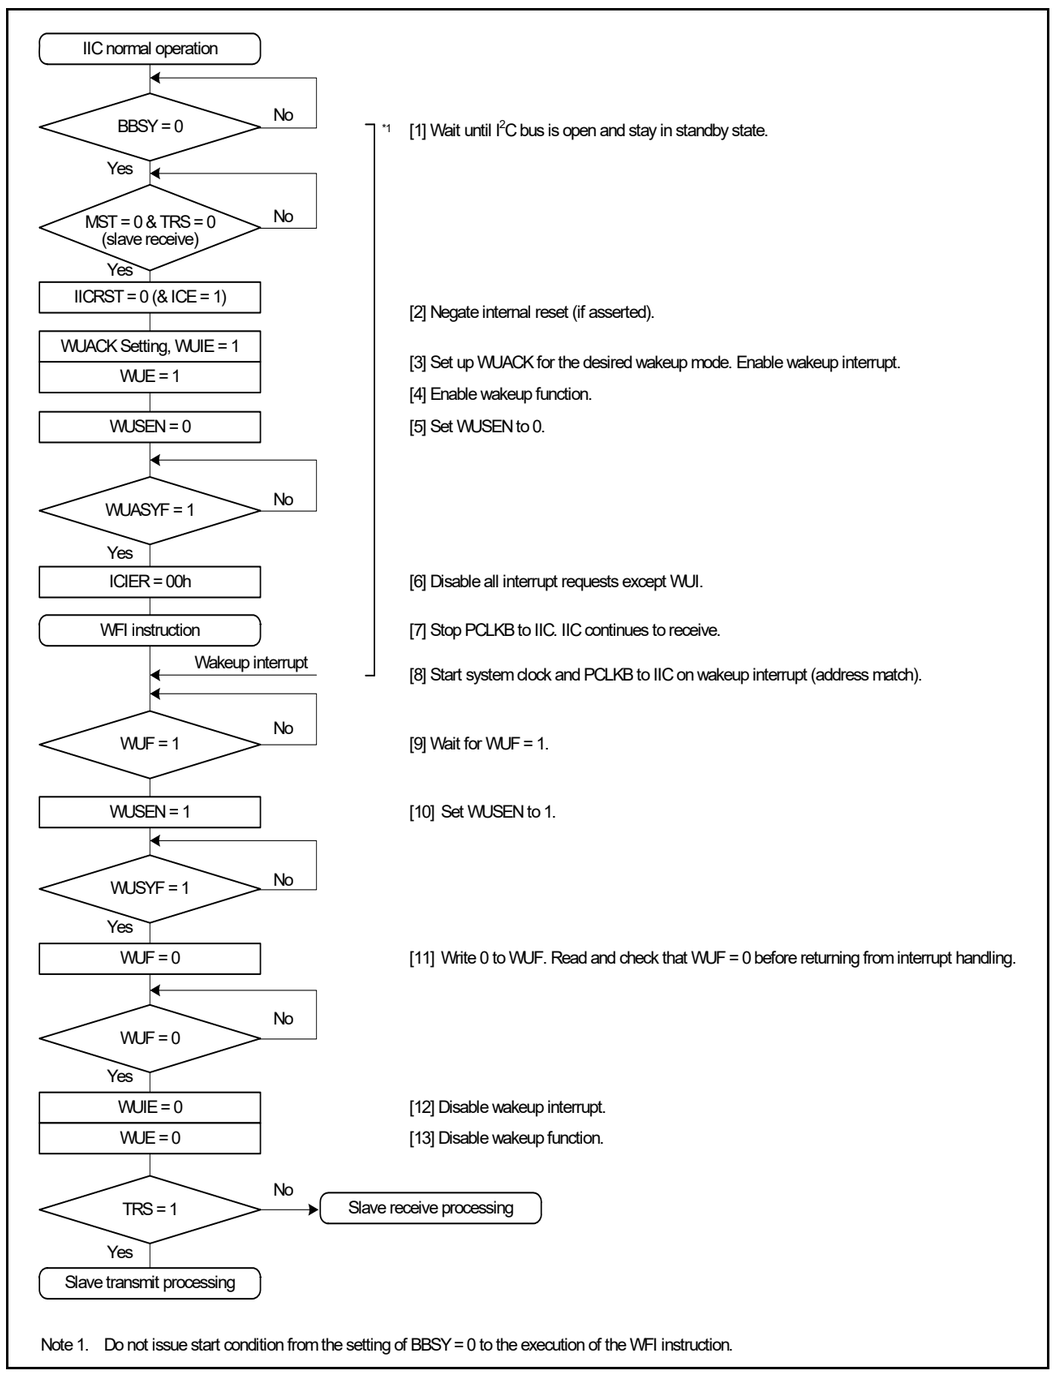
在正常唤醒模式2中，由匹配从机地址触发的唤醒中断会启动到正常操作的转换，如下所示：

唤醒前：在第8个SCL周期结束之前，对接收到的带有自己的从地址的数据没有响应。
唤醒期间：SCL线在第8和第9个时钟周期内保持低电平。
唤醒后：ACK在SCL的第9个时钟周期返回，继续正常运行。

如果从机地址不匹配，则SCL线在第8个SCL时钟周期后不会保持低电平，从机操作继续。

图32.33显示了一个示例操作，图32.34显示了详细的时序。

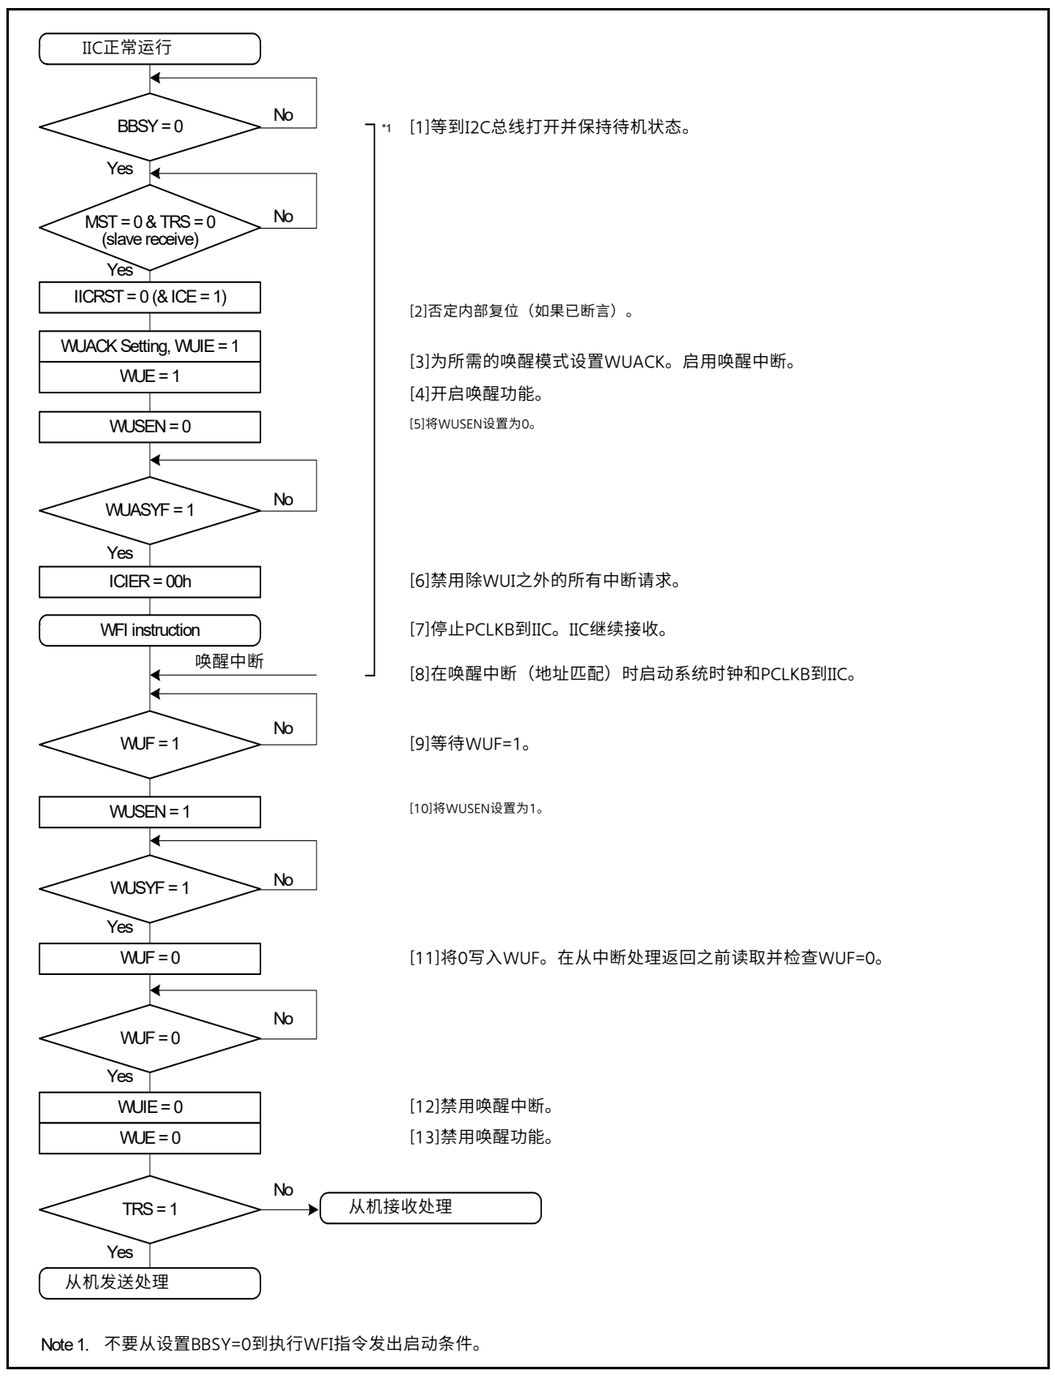
如果从软件待机模式的转换是由唤醒中断以外的中断触发的，例如IRQn，则WUF标志不会设置为1。图32.31显示了一个操作示例。



Note 1. Do not issue start condition from the setting of BBSY = 0 to the execution of the WFI instruction.

Figure 32.33 Example operation of normal wakeup mode 2 when wakeup is triggered by a wakeup interrupt on match of the slave address

Note: See Precautions on the use of the wakeup function.



Note 1. 不要从设置BBSY=0到执行WFI指令发出启动条件。

Note: 请参阅唤醒功能使用注意事项。

RA生态工作室

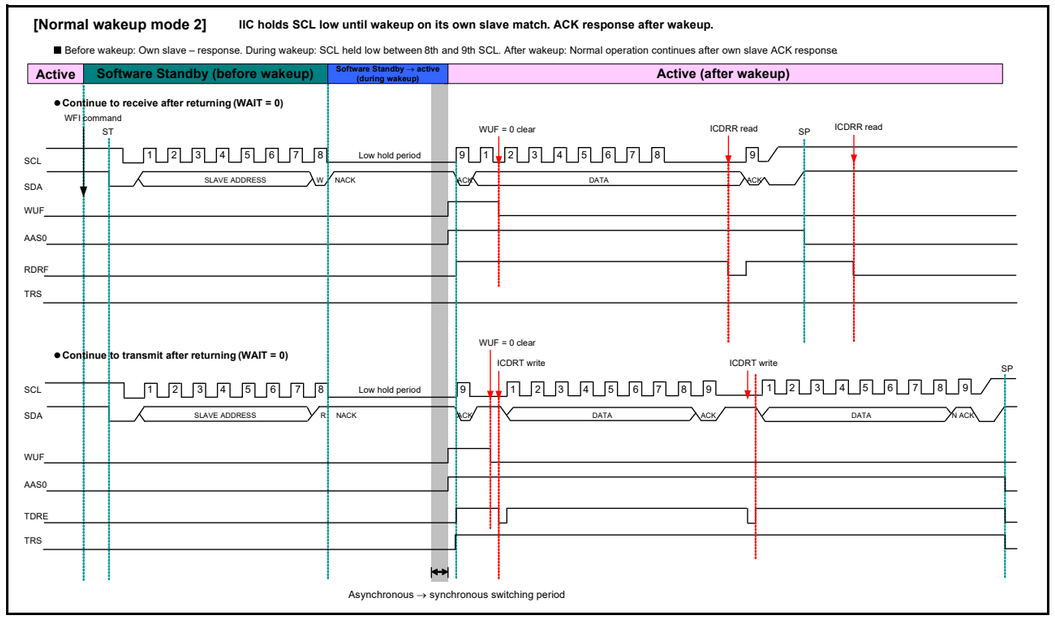

Figure 32.34 Timing of normal wakeup mode 2

32.8.3 Command Recovery Mode and EEP Response Mode (Special Wakeup Modes)

This section describes the behavior, timing, and an example operation in the command recovery and EEP response modes.

In the command recovery and EEP response modes, the SCL line is not held low during the wakeup period (after the rise of the 9th clock cycle of SCL). Therefore, other IIC devices can use the I2C bus during this period.

A wakeup interrupt triggered by a match of the slave address initiates the transition to normal operation as follows:

Before wakeup: In response to data received with its own slave address, the IIC returns ACK (command recovery mode) or NACK (EEP response mode).

During wakeup: The SCL line is not held low.

After wakeup: Normal operation continues after IIC initialization.

If the slave address does not match, the slave operation continues.

Note: Because the SCL line is not held low during wakeup, transmission or reception of the data that follows the slave address is not possible.

Note: The command recovery and EEP response modes are internal reset states (ICE = IICRST = 1). Therefore, the match of the slave address does not set the flags HOA, GCA, ASS0, ASS1, and ASS2 in the ICSR1 register.

Figure 32.35 shows an example of operation in command recovery and EEP response modes. Figure 32.37 shows the detailed timing.

If the transition from Software Standby mode is triggered by an interrupt other than a wakeup interrupt, for example the IRQn, the WUF flag is not set to 1. Figure 32.36 shows an operation example.

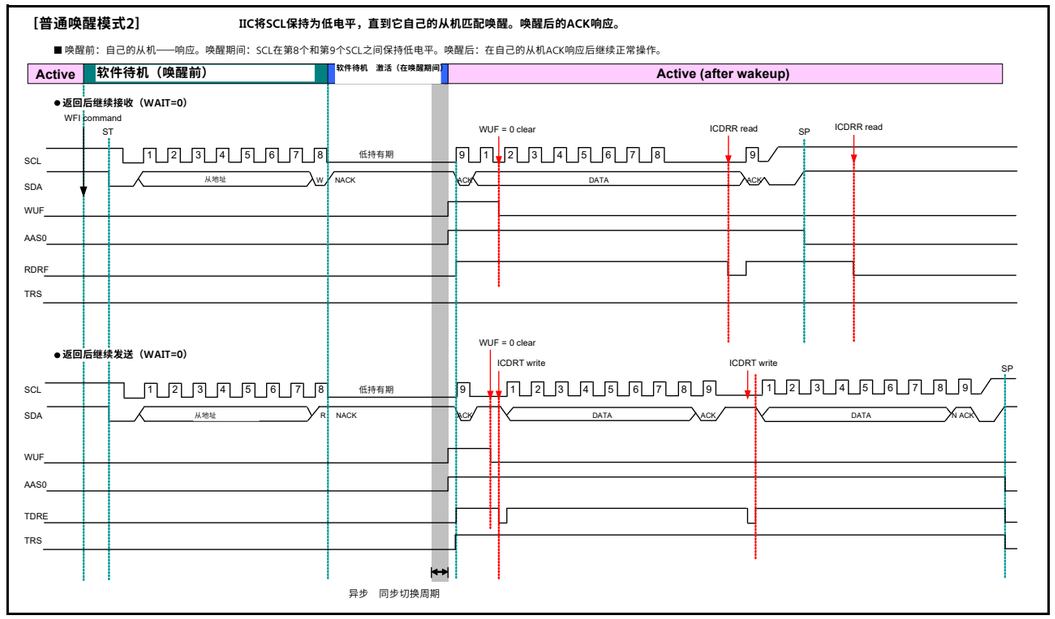

Figure 32.34 正常唤醒模式2的时序

32.8.3 命令恢复模式和EEP响应模式（特殊唤醒模式）

本节介绍命令恢复和EEP响应模式下的行为、时序和示例操作。

在命令恢复和EEP响应模式下，SCL线在唤醒期间（在SCL的第9个时钟周期上升之后）不保持低电平。因此，其他IIC设备在此期间可以使用I2C总线。

由匹配从地址触发的唤醒中断会启动到正常操作的转换，如下所示：

唤醒前：响应接收到带有自己的从机地址的数据，IIC返回ACK（命令恢复模式）或NACK（EEP响应模式）。唤醒期间：SCL线不保持低电平。

唤醒后：IIC初始化后继续正常运行。

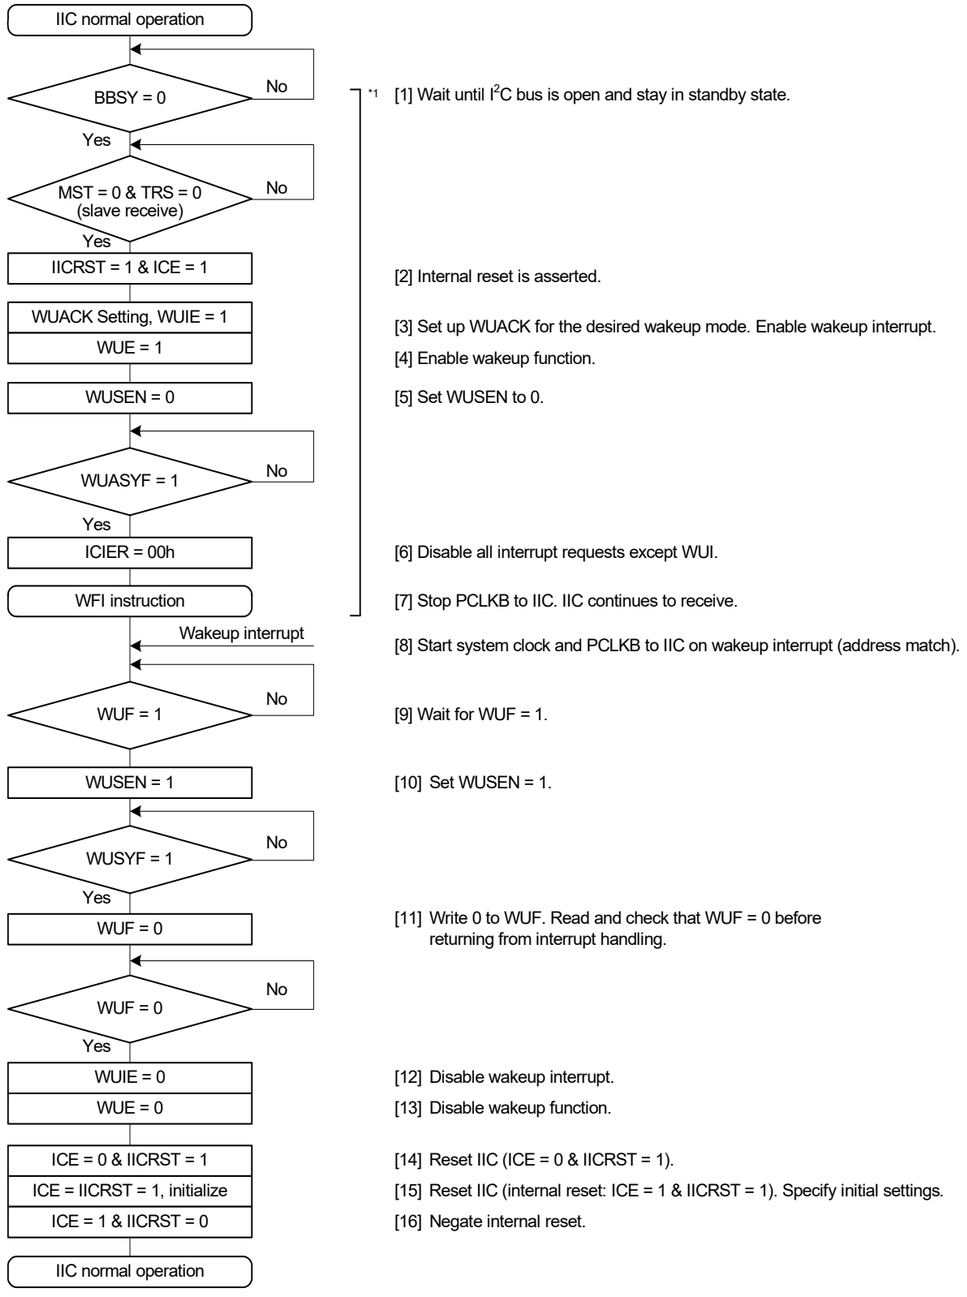
如果从机地址不匹配，从机操作继续。

Note: 因为SCL线在唤醒期间没有保持低电平，所以无法发送或接收跟随从地址的数据。

Note: 命令恢复和EEP响应模式是内部复位状态(ICE=IICRST=1)。因此，从地址的匹配不会设置ICSR1寄存器中的标志HOA、GCA、ASS0、ASS1和ASS2。

图32.35显示了命令恢复和EEP响应模式下的操作示例。图32.37显示了详细的时序。

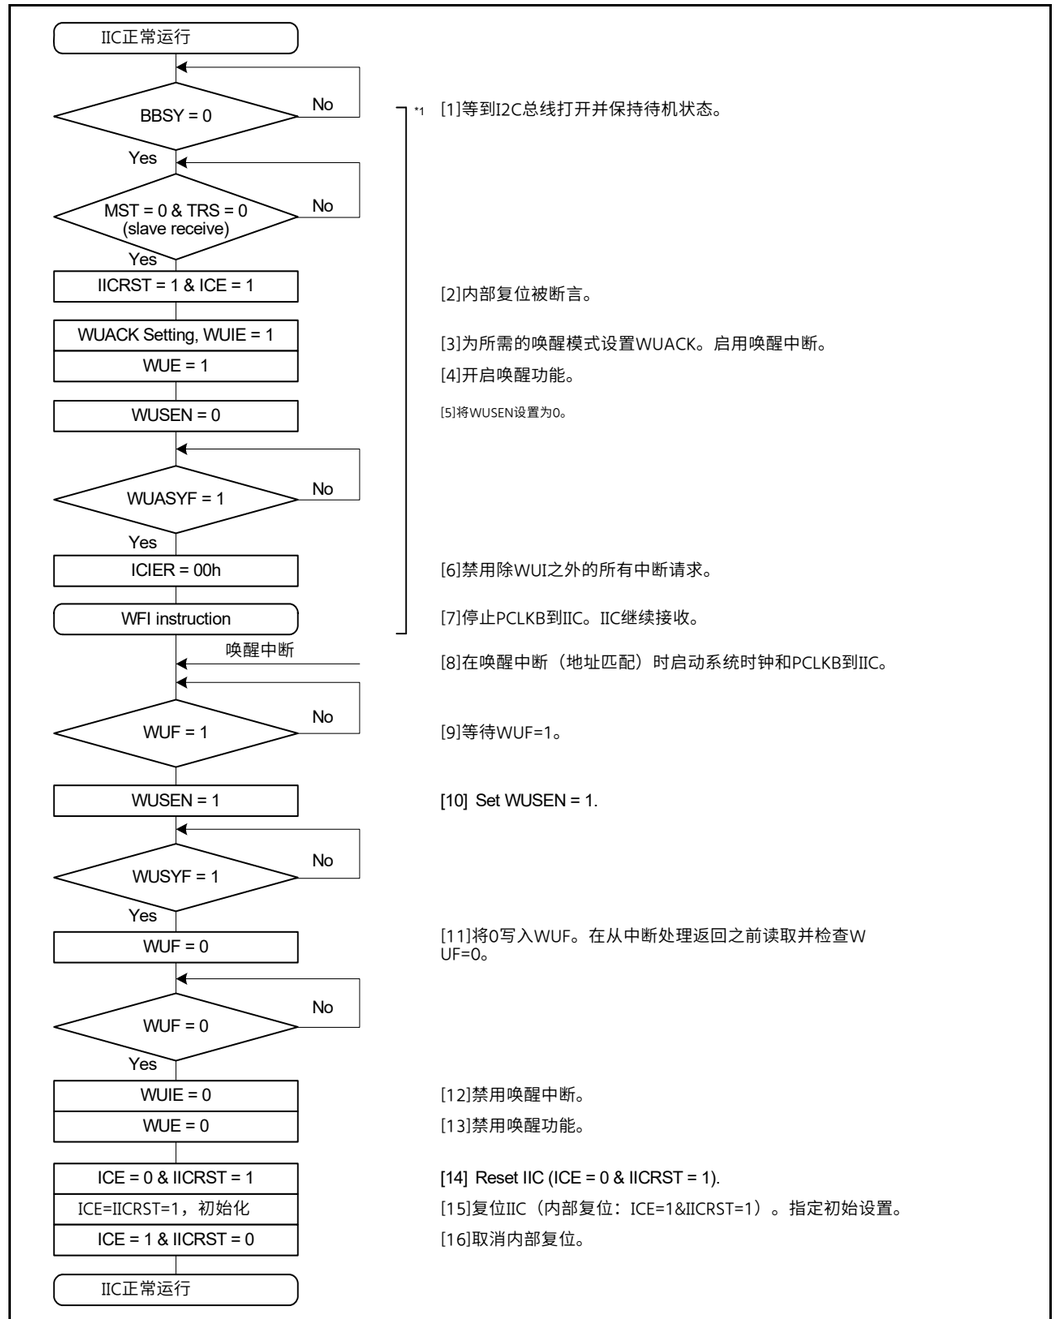
如果从软件待机模式的转换是由唤醒中断以外的中断触发的，例如IRQn，WUF标志未设置为1。图32.36显示了一个操作示例。



Note 1. Do not issue start condition from the setting of BBSY = 0 to the execution of the WFI instruction.

Figure 32.35 Example operation of command recovery and EEP response modes when wakeup is triggered by a wakeup interrupt on match of the slave address

Note: See Precautions on the use of the wakeup function.



Note 1. 不要从设置BBSY=0到执行WFI指令发出启动条件。

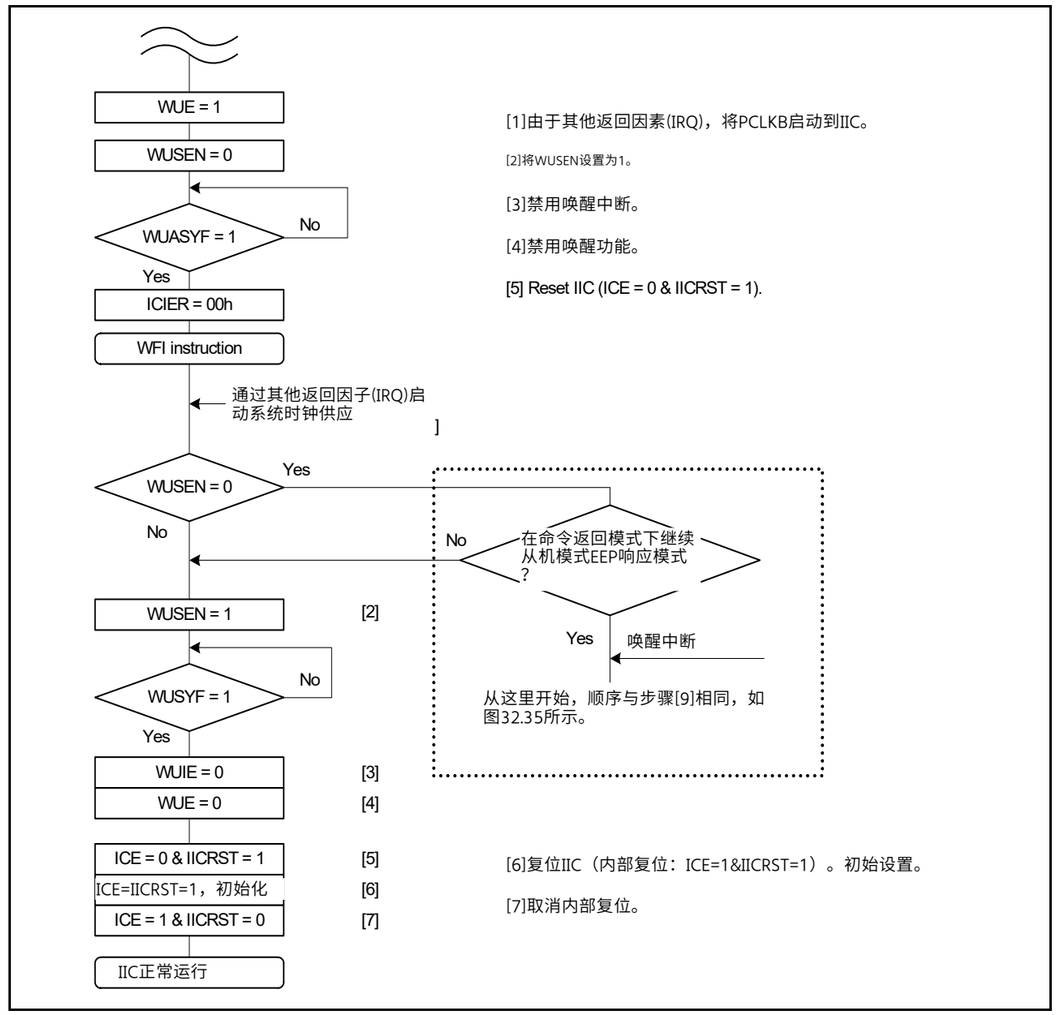

Figure 32.36 由IIC唤醒中断以外的中断（例如IRQn）触发唤醒时的命令恢复模式和EEP响应模式的示例操作

Note: 有关IIC初始设置的详细信息，请参阅第32.3.2节，初始设置。

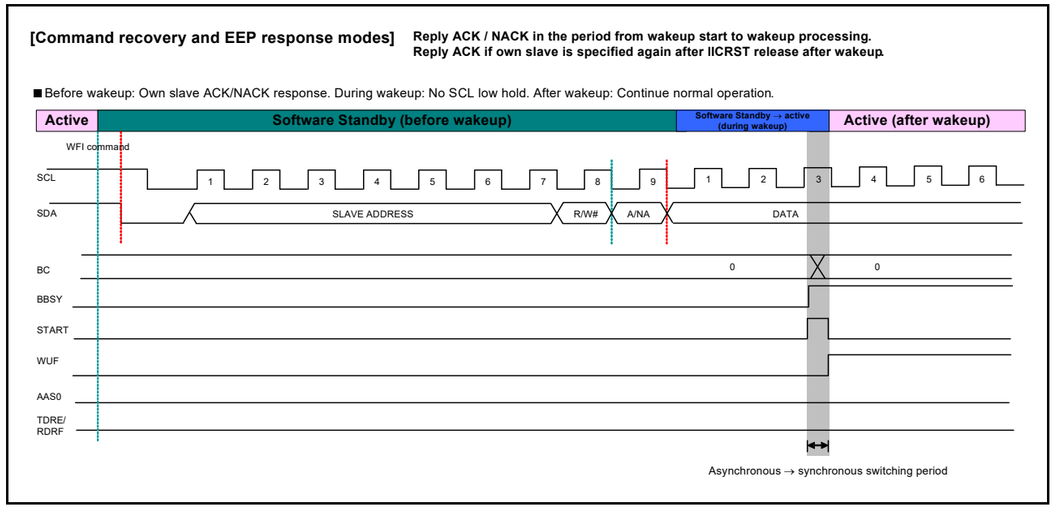

Figure 32.37 Timing of command recovery and EEP response modes

32.8.4 Precautions for WFI Instruction Execution

In the wakeup function examples shown in Figure 32.30, Figure 32.33, and Figure 32.35, make sure that the start condition is not issued during the period from the setting of BBSY = 0 to the execution of the WFI instruction.

When a start condition is issued during this period, NACK is returned after the reception of the first byte of the first data block. Detection of the start or restart condition then enables the wakeup function.

32.9 Automatic Low-Hold Function for SCL

32.9.1 Function to Prevent Wrong Transmission of Transmit Data

If the I2C Bus Shift Register (ICDRS) is empty when data has not been written to the I2C Bus Transmit Data Register (ICDRT) with the IIC in transmission mode (ICCR2.TRS bit = 1), the SCLn line is automatically held at the low level over the subsequent intervals. This low-hold period is extended until the transmit data is written, which prevents the unintended transmission of erroneous data.

Master transmit mode:

- Low-level interval after a start or restart condition is issued
- Low-level interval between the 9th clock cycle of one transfer and the 1st clock cycle of the next.

Slave transmit mode:

- Low-level interval between the 9th clock cycle of one transfer and the 1st clock cycle of the next.

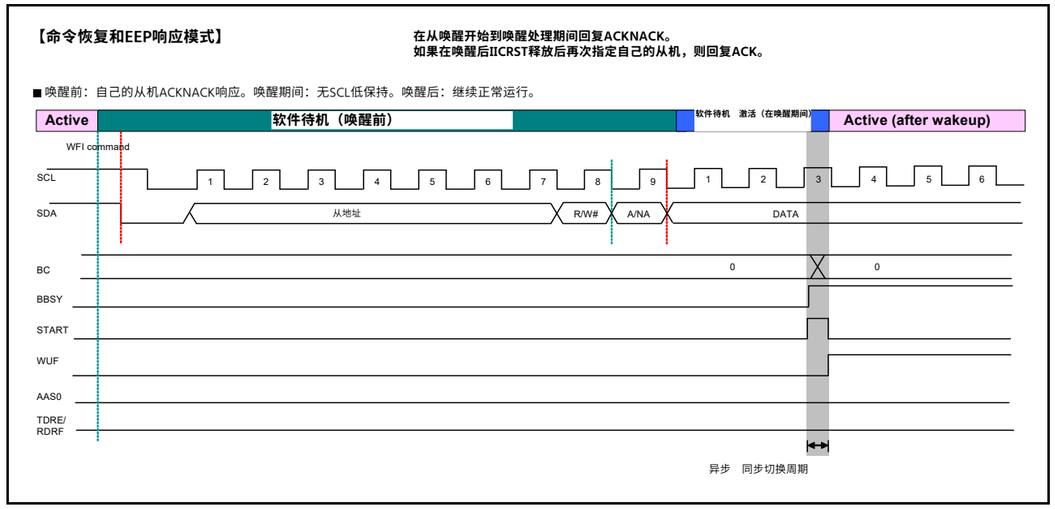

Figure 32.37 命令恢复和EEP响应模式的时序

32.8.4 WFI指令执行注意事项

在图32.30、图32.33和图32.35所示的唤醒功能示例中，请确保在设置BBSY=0到执行WFI指令期间不发出启动条件。

如果在此期间发出启动条件，则在接收到第一个数据块的第一个字节后返回NACK。启动或重启条件的检测然后启用唤醒功能。

32.9 SCL的自动低保持功能

32.9.1 防止传输数据错误传输的功能

如果I2C总线移位寄存器(ICDRS)在IIC处于传输模式（ICCR2.TRS位=1）时尚未将数据写入I2C总线传输数据寄存器(ICDRT)时为空，则SCLn线为在随后的时间间隔内自动保持在低电平。这个低保持期一直延长到发送数据被写入，这样可以防止错误数据的意外传输。

主传输模式：

- 发出启动或重启条件后的低电平间隔
- 一次传输的第9个时钟周期和下一次传输的第1个时钟周期之间的低电平间隔。

从机发送模式：

- 一次传输的第9个时钟周期和下一次传输的第1个时钟周期之间的低电平间隔。

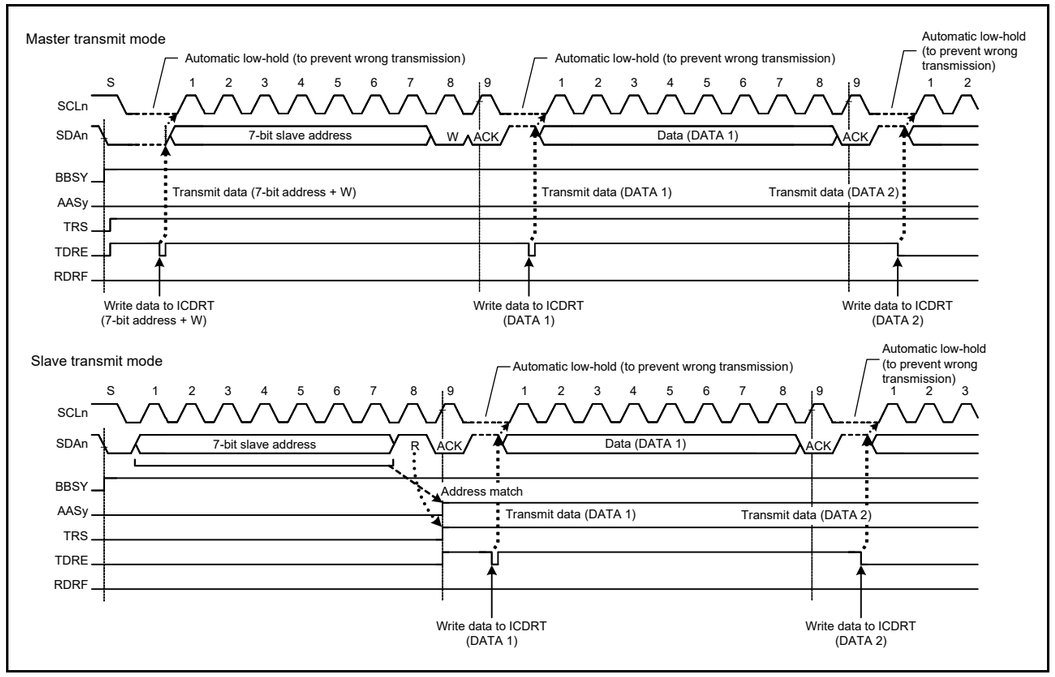

Figure 32.38 Automatic low-hold operation in transmit mode

32.9.2 NACK Reception Transfer Suspension Function

This function suspends transfer operation when NACK is received in transmit mode (ICCR2.TRS bit = 1). This function is enabled when the NACKE bit in ICFER is set to 1 (transfer suspension enabled). If the next transmit data is already written (TDRE flag = 0 in ICSR2) when NACK is received, the next data transmission on the falling edge of the 9th SCL clock cycle is automatically suspended. This prevents the SDAn line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (NACKF = 1 in ICSR2), transmit and receive operations are discontinued. To restore transmit or receive operations, set the NACKF flag to 0. In master transmit mode, after issuing a restart or stop condition, set the NACKF flag to 0, then issue a start condition again.

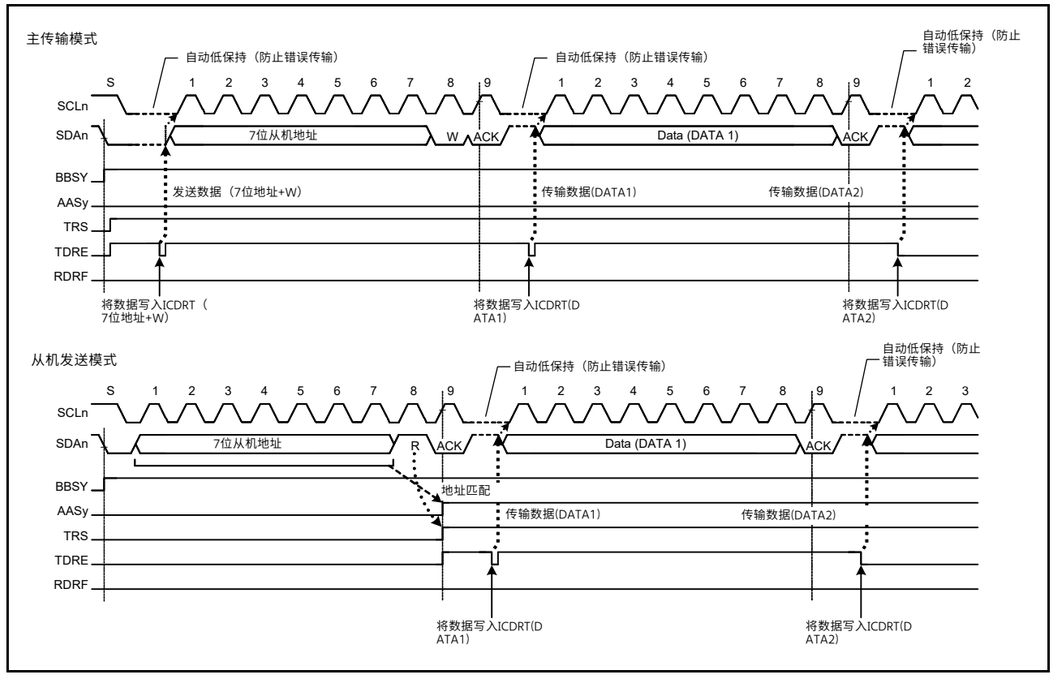

Figure 32.38 发送模式下的自动低保持操作

32.9.2 NACK接收传输暂停功能

当在发送模式下接收到NACK（ICCR2.TRS位=1）时，该函数暂停传输操作。当ICFER中的NACKE位设置为1（传输暂停使能）时，该功能被启用。如果接收到NACK时已经写入下一个发送数据（ICSR2中的TDRE标志=0），则在第9个SCL时钟周期的下降沿自动暂停下一个数据发送。这可以防止SDAn线路输出电平在下一个发送数据的MSB为0时保持低电平。

如果传输操作被此函数挂起（ICSR2中的NACKF=1），发送和接收操作将中断。要恢复发送或接收操作，请将NACKF标志设置为0。在主机发送模式下，发出重新启动或停止条件后，将NACKF标志设置为0，然后再次发出开始条件。

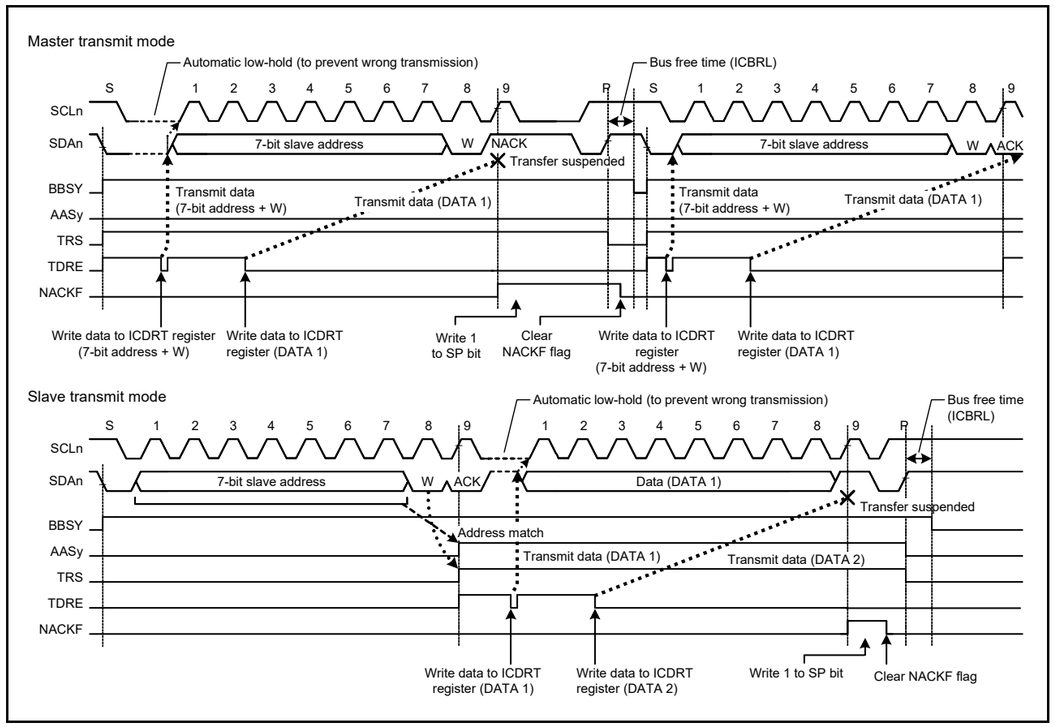

Figure 32.39 Suspension of data transfer when NACK is received (NACKE = 1)

32.9.3 Function to Prevent Failure to Receive Data

If response processing when receive data (ICDRR) read is delayed for a period of one transfer frame or more with receive data full (RDRF flag = 1 in ICSR2) in receive mode (TRS = 0 in ICCR2), the IIC holds the SCLn line low automatically immediately before the next data is received to prevent failure to receive data.

This function is also enabled even if the read processing of the final receive data is delayed and, in the meantime, the IIC slave address is designated after a stop condition is issued. This function does not interfere with other communication because the IIC does not hold the SCLn line low when a mismatch with its own slave address occurs after a stop condition is issued.

Periods in which the SCLn line is held low can be selected with a combination of the WAIT and RDRFS bits in ICMR3.

(1) 1-byte receive operation and automatic low-hold function using the WAIT bit

When the WAIT bit in ICMR3 is set to 1, the IIC performs a 1-byte receive operation using the WAIT bit function. Additionally, when the ICMR3.RDRFS bit is 0, the IIC automatically sends the ACKBT bit value in ICMR3 for the acknowledge bit in the period from the falling edge of the 8th SCL clock cycle to the falling edge of the 9th SCL clock cycle, and automatically holds the SCLn line low on the falling edge of the 9th SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from ICDRR, which enables byte-wise receive operation.

The WAIT bit function is enabled for receive frames after a match with the IIC slave address, including the general call address and host address, is obtained in master receive mode or slave receive mode.

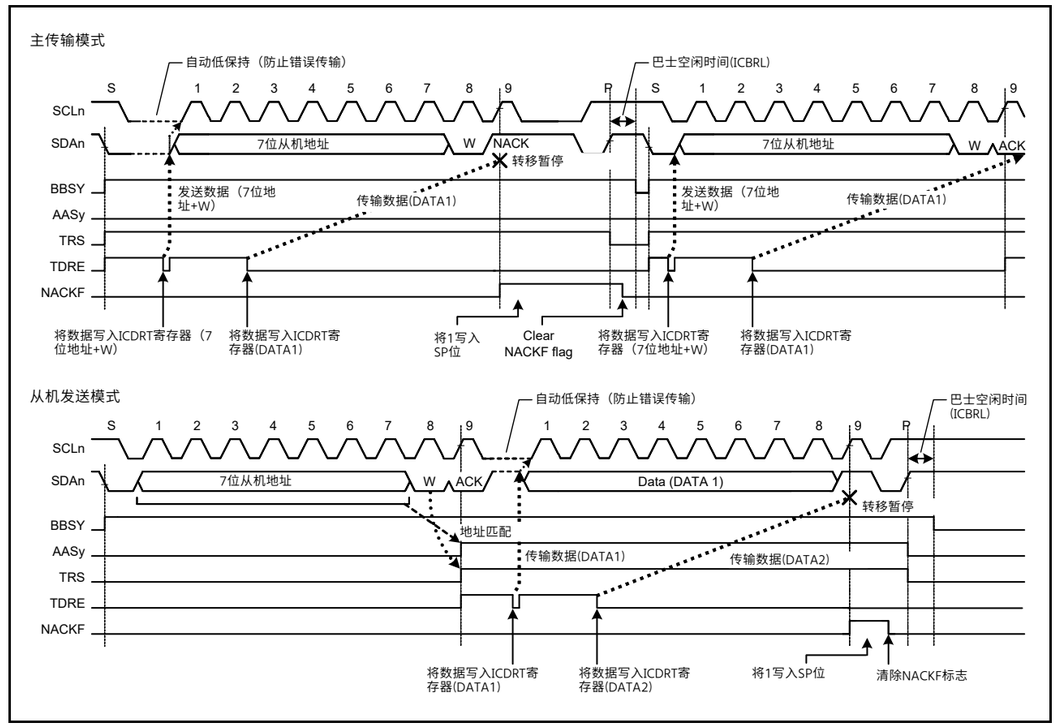

Figure 32.39 接收到NACK时暂停数据传输(NACKE=1)

32.9.3 防止数据接收失败的功能

如果在接收模式（ICCR2中的TRS=0）下接收数据已满（ICSR2中的RDRF标志=1）时，当接收数据（ICDRR）读取延迟一个传输帧或更长时间时的响应处理，则IIC保持SCLn线在接收到下一个数据之前自动拉低，以防止接收数据失败。

即使最终接收数据的读取处理被延迟，该功能也被启用，同时，在发出停止条件后指定IIC从地址。此功能不会干扰其他通信，因为在发出停止条件后发生与其自己的从地址不匹配时，IIC不会将SCLn线保持为低电平。

SCLn线保持低电平的周期可以通过ICMR3中的WAIT和RDRFS位的组合来选择。

(1) 使用WAIT位的1字节接收操作和自动低保持功能

当ICMR3中的WAIT位设置为1时，IIC使用WAIT位功能执行1字节接收操作。此外，当ICMR3.RDRFS位为0时，IIC在第8个SCL时钟周期的下降沿到第9个SCL时钟周期的下降沿期间自动发送ICMR3中的ACKBT位值作为确认位，并使用WAIT位功能在第9个SCL时钟周期的下降沿自动将SCLn线保持为低电平。该低保持通过从ICDRR读取数据来释放，从而启用逐字节接收操作。

在主接收模式或从接收模式下获得与IIC从地址匹配的接收帧，包括广播地址和主机地址，WAIT位功能被启用。

(2) 1-byte receive operation (ACK/NACK transmission control) and automatic low-hold function using the RDRFS bit

When the RDRFS bit in ICMR3 is set to 1, the IIC performs a 1-byte receive operation using the RDRFS bit function. When the RDRFS bit is set to 1, the RDRF (receive data full) flag in ICSR2 is set to 1 on the rising edge of the 8th SCL clock cycle, and the SCLn line is automatically held low on the falling edge of the 8th SCL clock cycle. This low-hold is released by writing a value to the ACKBT bit in ICMR3, but cannot be released by reading data from ICDRR, which enables receive operation through the ACK or NACK transmission control based on the data received in byte units.

The RDRFS bit function is enabled for receive frames after a match with the IIC slave address, including the general call address and host address, is obtained in master receive mode or slave receive mode.

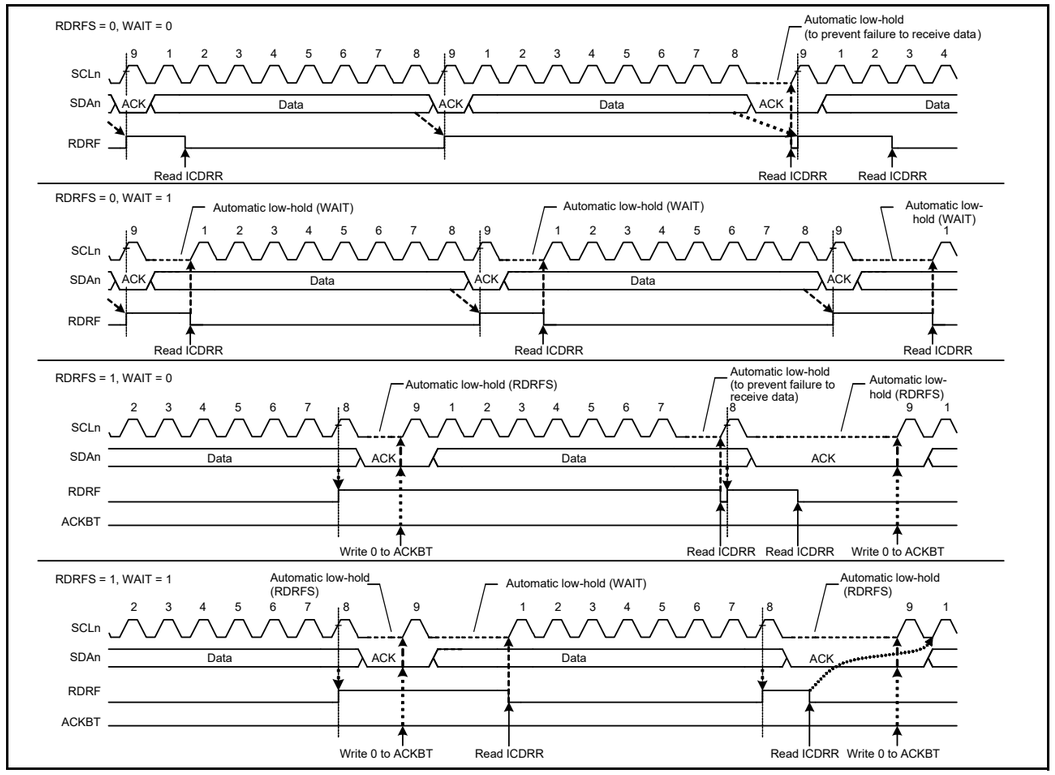

Figure 32.40 Automatic low-hold operation in receive mode using the RDRFS and WAIT bits

32.10 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I2C bus standard, the IIC provides functions to prevent double-issue of a start condition, detect arbitration-lost during the transmission of NACK, and detect arbitration-lost in slave transmit mode.

32.10.1 Master Arbitration-Lost Detection (MALE Bit)

The IIC drives the SDAn line low to issue a start condition. However, if the SDAn line was already driven low by another master device issuing a start condition, the IIC regards its own start condition as an error and considers this a loss in arbitration. Priority is given to transfer by the other master device. Similarly, if a request to issue a start condition is made by setting the ST bit in ICCR2 to 1 while the bus is busy (BBSY = 1 in ICCR2), the IIC regards this as a double-issuing-of-start-condition error and considers itself to have lost the arbitration. This prevents a failure of transfer resulting from a start condition issued while transfer is in progress.

When a start condition is issued successfully, if the transmit data including the address bits (internal SDA output level)

(2) 1字节接收操作（ACKNACK传输控制）和使用RDRFS位的自动低保持功能

当ICMR3中的RDRFS位设置为1时，IIC使用RDRFS位功能执行1字节接收操作。
当RDRFS位设置为1时，ICSR2中的RDRF（接收数据满）标志在第8个SCL时钟周期的上升沿设置为1，并且SCLn线在第8个下降沿自动保持为低第SCL时钟周期。该低保持通过向ICMR3中的ACKBT位写入值来释放，但不能通过从ICDRR读取数据来释放，ICDRR可以根据以字节为单位接收的数据通过ACK或NACK传输控制进行接收操作。

在主接收模式或从接收模式下获得与IIC从地址匹配的接收帧（包括广播地址和主机地址）后，使能RDRFS位功能。

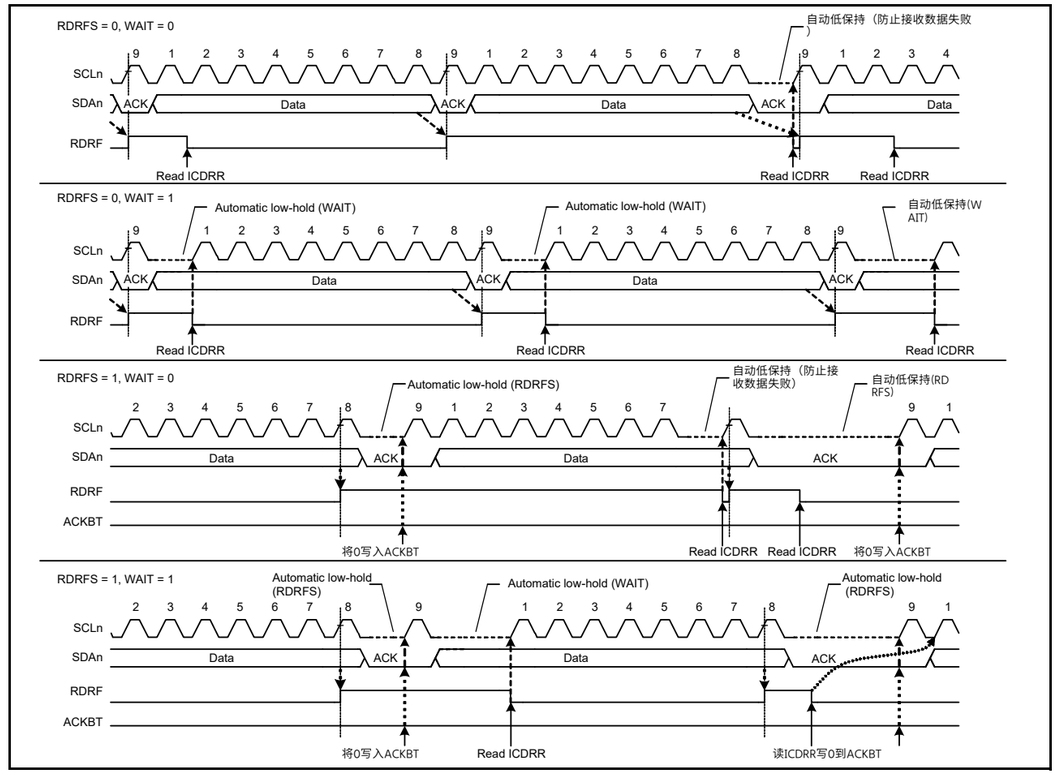

Figure 32.40 使用RDRFS和WAIT位在接收模式下自动保持低电平操作

32.10 仲裁丢失检测功能

除了I2C总线标准定义的正常仲裁丢失检测功能外，IIC还提供防止重复发出启动条件、在NACK传输期间检测仲裁丢失以及在从发送模式下检测仲裁丢失的功能.

32.10.1 主仲裁丢失检测（MALE位）

IIC将SDAn线驱动为低电平以发出启动条件。但是，如果SDAn线已经被另一个发出启动条件的主设备驱动为低电平，则IIC将其自己的启动条件视为错误，并认为这是仲裁失败。其他主设备优先传输。类似地，如果在总线忙时（ICCR2中的BBSY=1）通过将ICCR2中的ST位设置为1来请求发出启动条件，则IIC将此视为双重发出启动条件错误并考虑本身已经失去了仲裁。这可以防止传输过程中发出的开始条件导致传输失败。

成功发出启动条件时，如果发送数据包括地址位（内部SDA输出电平）

RA生态工作室

and the level on the SDAn line do not match (high output as the internal SDA output, meaning the SDAn pin is in the high-impedance state) and a low level is detected on the SDAn line, IIC loses the arbitration.

After a loss in arbitration of mastership, the IIC immediately enters slave receive mode. If a slave address, including the general call address, matches its own address at this time, the IIC continues in slave operation.

A loss in arbitration of mastership is detected when the following conditions are met while the MALE bit in ICFER is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Mismatching of the internal level for output on SDA and the level on the SDAn line after a start condition was issued by setting the ICCR2.ST bit to 1 while the BBSY flag in ICCR2 is set to 0 (erroneous issuing of a start condition)
- Setting of the ICCR2.ST bit to 1 (start condition double-issue error) while the BBSY flag is 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDAn line in master transmit mode (MST and TRS bits = 11b in ICCR2).

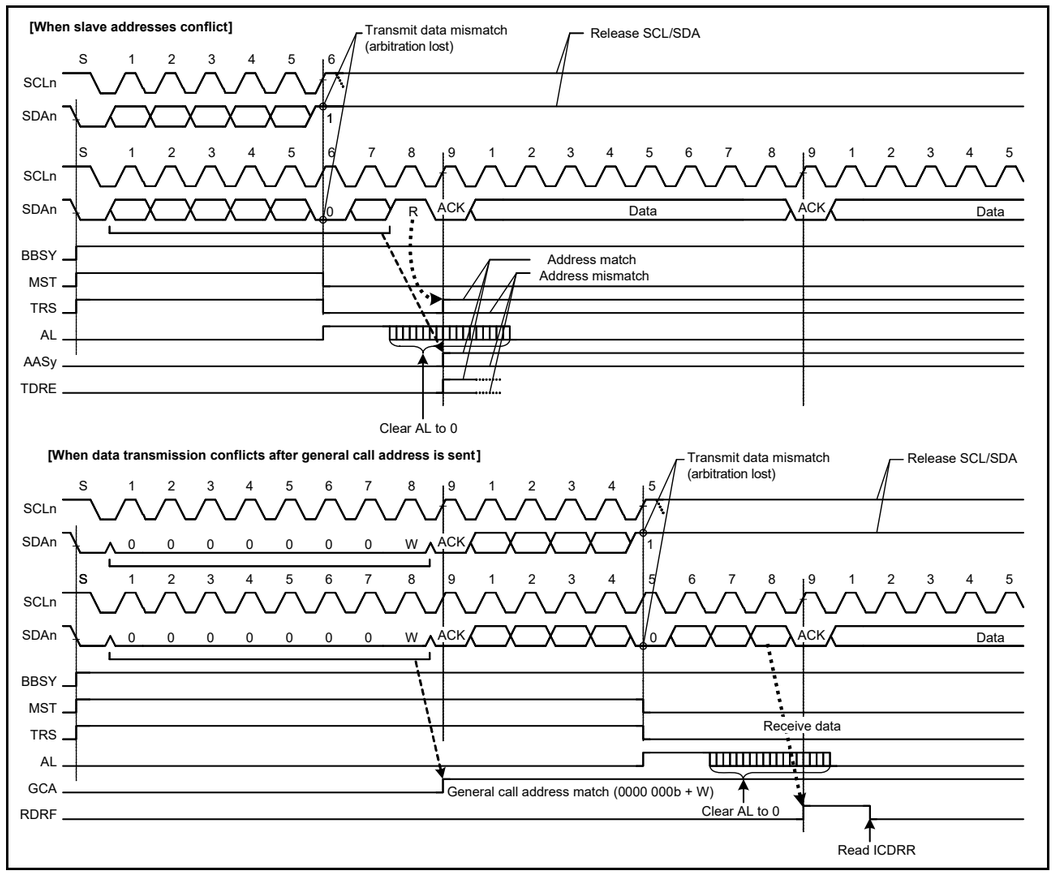

Figure 32.41 Examples of master arbitration-lost detection (MALE = 1)

和SDAn线上的电平不匹配（高输出作为内部SDA输出，意味着SDAn引脚处于高阻状态）并且在SDAn线上检测到低电平，IIC失去仲裁。

在主控权仲裁失败后，IIC立即进入从机接收模式。如果此时从机地址（包括广播地址）与自己的地址匹配，则IIC继续从机操作。

当ICFER中的MALE位为1（启用主仲裁丢失检测）时满足以下条件时，检测到主控仲裁丢失。

[Master arbitration-lost conditions]

- 通过将ICCR2.ST位设置为1而ICCR2中的BBSY标志设置为0发出启动条件后，SDA输出的内部电平与SDAn线上的电平不匹配（错误发出启动条件）
- 当BBSY标志为1时，将ICCR2.ST位设置为1（启动条件双发错误）
- 当发送数据不包括确认（内部SDA输出电平）与主发送模式下SDAn线上的电平不匹配时（ICCR2中的MST和TRS位=11b）。

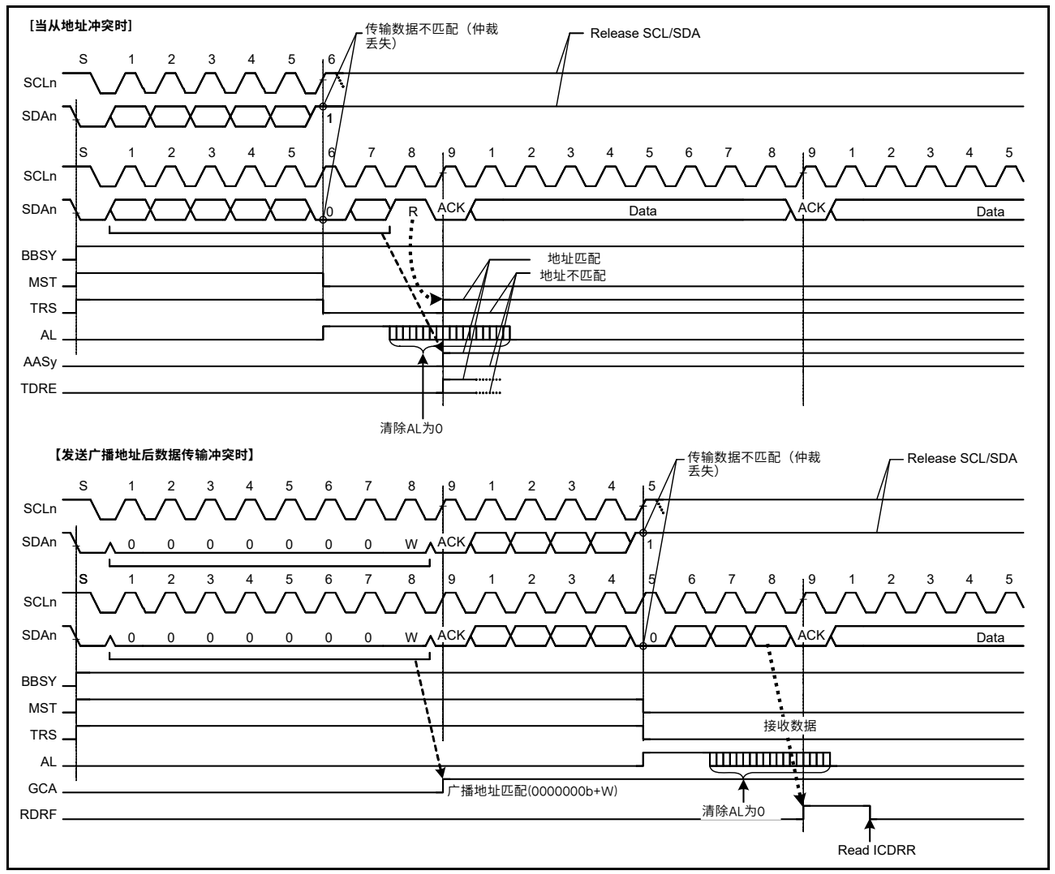

Figure 32.41 主仲裁丢失检测示例(MALE=1)

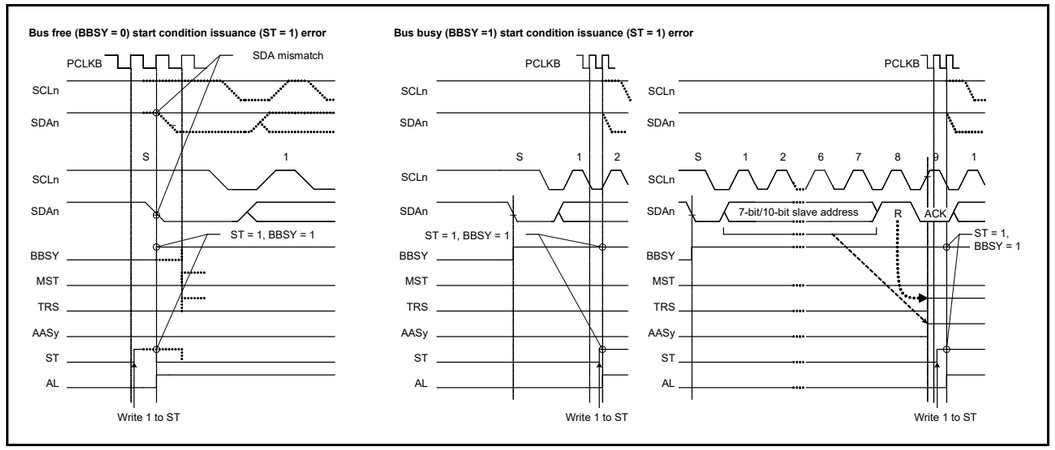

Figure 32.42 Arbitration-lost when start condition is issued (MALE = 1)

32.10.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

This function causes arbitration to be lost if the internal SDA output level does not match the level on the SDAn line during transmission of NACK in receive mode. Arbitration is lost because of a conflict between NACK and ACK transmissions when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send or receive the same information through a single slave device. Figure 32.43 shows an example of arbitration-lost detection during the transmission of NACK.

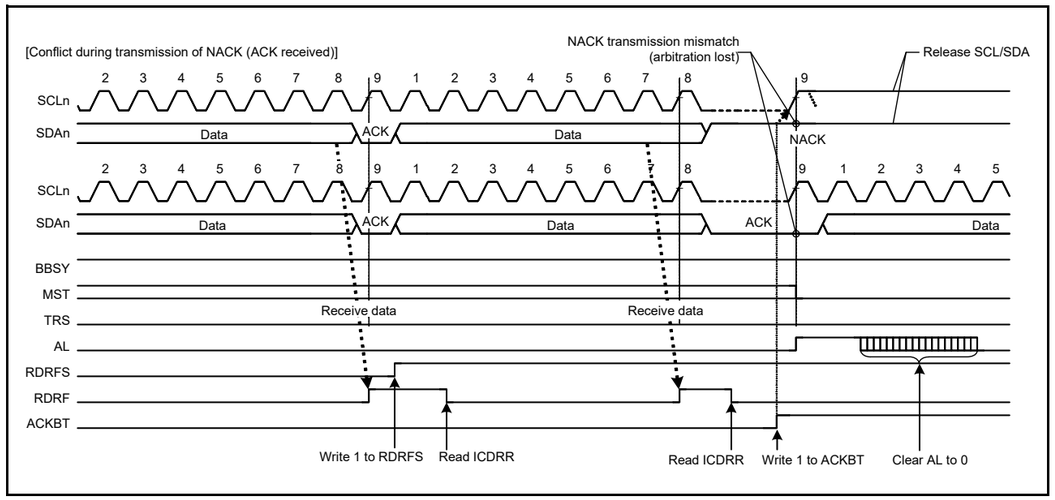

Figure 32.43 Example of arbitration-lost detection during transmission of NACK (NALE = 1)

The following description explains arbitration-lost detection using an example in which two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives 2 bytes of data from the slave device, and master B receives 4 bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in either master A or B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Master A sends NACK when it has received the 2 final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received the required 4 bytes of data.

The NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like

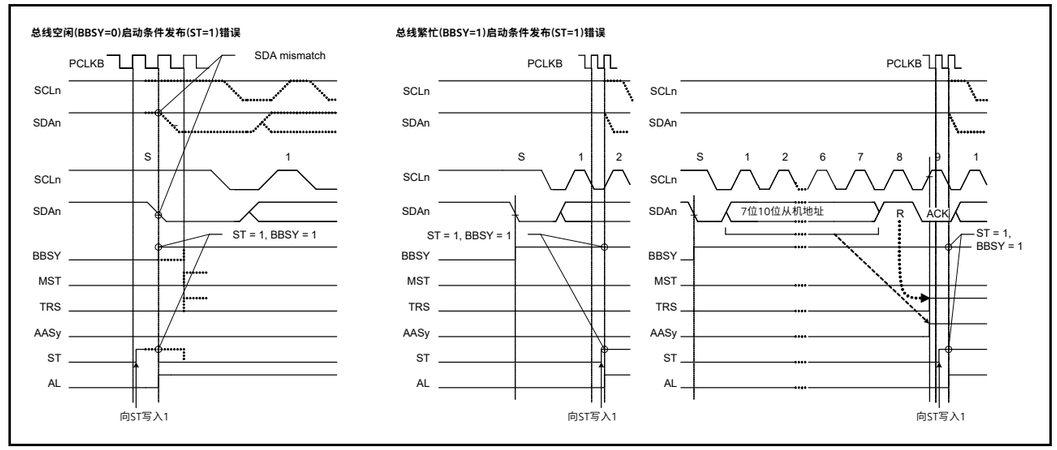

Figure 32.42 发出启动条件时仲裁失败(MALE=1)

32.10.2 在NACK传输期间检测仲裁丢失的功能（NALE位）

如果在接收模式下发送NACK期间内部SDA输出电平与SDAn线上的电平不匹配，此功能会导致仲裁丢失。当多主控系统中两个或多个主控设备同时从同一从属设备接收数据时，由于NACK和ACK传输之间的冲突，仲裁会丢失。当多个主设备通过单个从设备发送或接收相同的信息时，就会发生这种冲突。图32.43显示了在NACK传输期间检测仲裁丢失的示例。

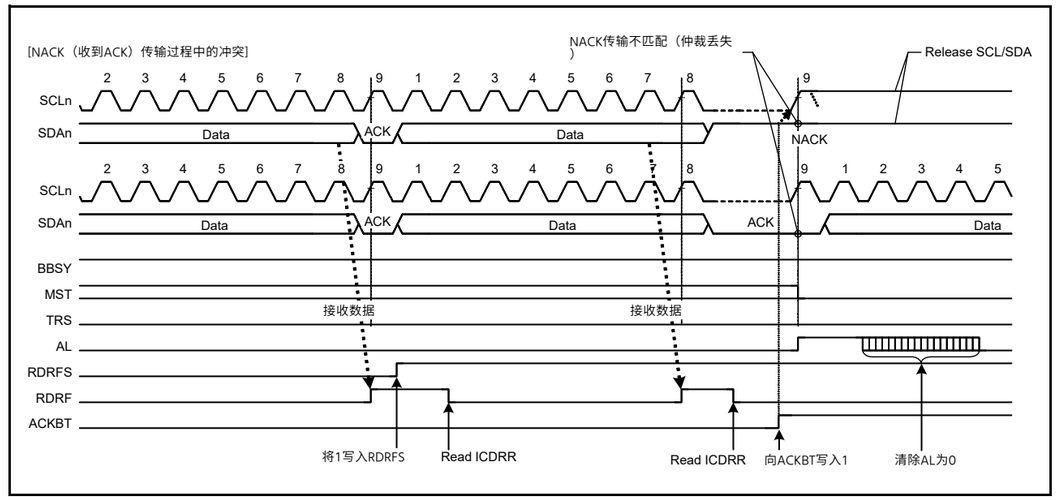

Figure 32.43 NACK(NALE=1)传输期间的仲裁丢失检测示例

以下描述使用通过总线连接两个主设备（主设备A和主设备B）和单个从设备的示例来说明仲裁丢失检测。在本例中，主设备A从从设备接收2个字节的数据，主设备B从从设备接收4个字节的数据。

如果主设备A和主设备B同时访问从设备，因为从设备地址相同，在访问从设备期间，主设备A或B都不会丢失仲裁。因此，主机A和主机B都承认他们已经获得了总线控制权并照此运行。主设备A在从从设备接收到最后2个字节的数据时发送NACK。同时，masterB发送ACK，因为它没有收到所需的4字节数据。

来自主机A的NACK传输和来自主机B的ACK传输冲突。一般来说，如果像这样的冲突

this occurs, master A cannot detect the ACK transmitted by master B and issues a stop condition. The stop condition issue conflicts with the SCL clock output of master B, which disrupts communication.

When the IIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost. If arbitration is lost during transmission of NACK, the IIC immediately cancels the slave match condition and enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

Similarly, in the ARP command processing of SMBus, the function to detect loss of arbitration during transmission of NACK is also available for eliminating the extra clock cycle processing, such as FFh transmission processing, which is required if the UDID (Unique Device Identifier) of the assigned address does not match in the Get UDID general processing after the Assign Address command.

The IIC detects arbitration-lost during transmission of NACK when the following condition is met with the NALE bit in ICFER set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

- When the internal SDA output level does not match the SDAn line (ACK is received) during transmission of NACK (ACKBT bit = 1 in ICMR3).

32.10.3 Slave Arbitration-Lost Detection (SALE Bit)

This function causes arbitration to be lost if the transmit data (internal SDA output level) and the level on the SDAn line do not match in slave transmit mode. This arbitration-lost detection function is mainly used when transmitting a UDID (Unique Device Identifier) over an SMBus.

When the IIC loses slave arbitration, the IIC is immediately released from the slave-matched state and enters slave receive mode. This function can detect conflicts of data during transmission of UDIDs over an SMBus and eliminates subsequent redundant processing for the transmission of FFh.

The IIC detects slave arbitration-lost when the following condition is met with the SALE bit in ICFER set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

- When transmit data excluding acknowledge (internal SDA output level) does not match the SDAn line in slave transmit mode (MST and TRS bits = 01b in ICCR2).

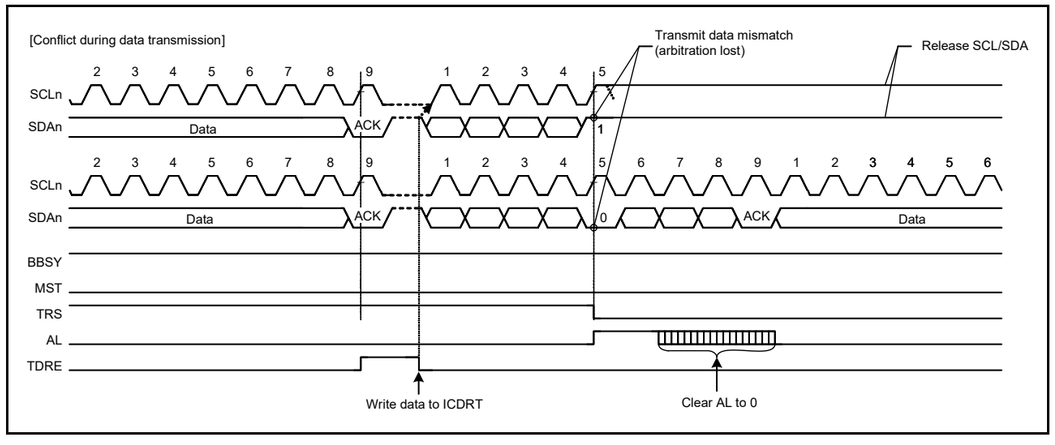

Figure 32.44 Example of slave arbitration-lost detection (SALE = 1)

发生这种情况时，主机A无法检测到主机B发送的ACK并发出停止条件。停止条件问题与主B的SCL时钟输出冲突，从而中断通信。

当IIC在NACK传输过程中收到ACK时，它会检测到与其他主设备冲突的失败并导致仲裁丢失。如果在NACK传输过程中仲裁丢失，IIC立即取消从机匹配条件并进入从机接收模式。这可以防止发出停止条件，从而防止总线上的通信故障。

同样，在SMBus的ARP命令处理中，检测传输过程中仲裁丢失的功能
NACK也可用于消除额外的时钟周期处理，例如FFh传输处理，如果分配地址的UDID（唯一设备标识符）在分配地址命令后的获取UDID常规处理中不匹配，则需要此处理。

IIC在NACK传输期间检测到仲裁丢失，当满足以下条件时
ICFER设置为1（启用NACK传输期间的仲裁丢失检测）。

[在NACK传输期间仲裁丢失的条件]

- 在NACK传输期间内部SDA输出电平与SDAn线不匹配（接收到ACK）时（ICMR3中的ACKBT位=1）。

32.10.3 从设备仲裁丢失检测（SALE位）

如果发送数据（内部SDA输出电平）和SDAn线上的电平在从发送模式下不匹配，此功能会导致仲裁丢失。这种仲裁丢失检测功能主要用于通过SMBus传输UDID（唯一设备标识符）时。

当IIC失去从机仲裁时，IIC立即从从机匹配状态中释放并进入从机接收模式。此功能可以检测在SMBus上传输UDID期间的数据冲突，并消除后续传输FFh的冗余处理。

当ICFER中的SALE位设置为1（启用从设备仲裁丢失检测）满足以下条件时，IIC检测从设备仲裁丢失。

[从机仲裁失败的条件]

- 当发送数据不包括确认（内部SDA输出电平）与从发送模式下的SDAn线不匹配时（MST和TRS位=ICCR2中的01b）。

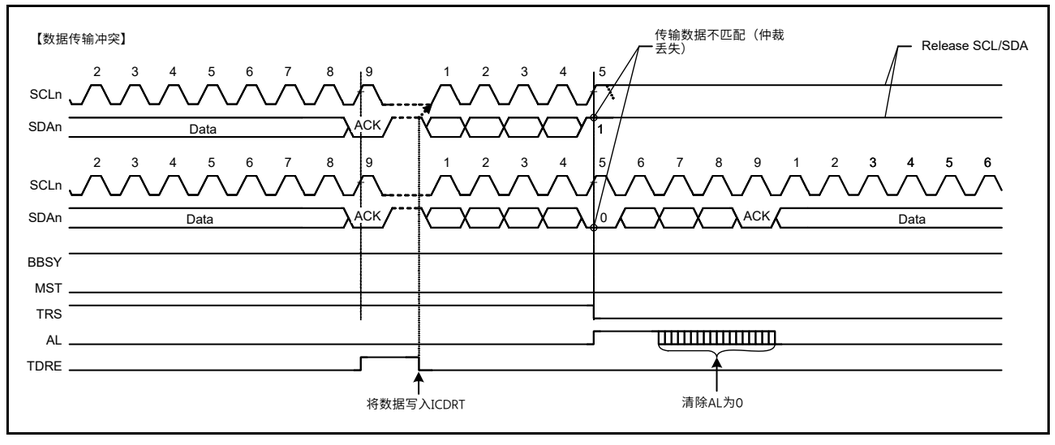

Figure 32.44 从机仲裁丢失检测示例(SALE=1)

32.11 Start, Restart, and Stop Condition Issuing Function

32.11.1 Issuing a Start Condition

The IIC issues a start condition when the ST bit in ICCR2 is set to 1.

When the ST bit is set to 1, a start condition request is made, and the IIC issues a start condition when the BBSY flag in ICCR2 is 0 (bus free state). When a start condition is issued normally, the IIC automatically shifts to the master transmit mode.

To issue a start condition:

1. Drive the SDAn line low (high level to low level).
2. Ensure that the time set in ICBRH and the start condition hold time elapse.
3. Drive the SCLn line low (high level to low level).
4. Detect low level on the SCLn line and ensure the low-level period of the SCLn line set in ICBRL elapses.

32.11.2 Issuing a Restart Condition

The IIC issues a restart condition when the RS bit in ICCR2 is set to 1.

When the RS bit is set to 1, a restart condition request is made. The IIC issues a restart condition when the BBSY flag in ICCR2 is 1 (bus busy state) and the MST bit in ICCR2 is 1 (master mode).

To issue a restart condition:

1. Release the SDAn line.
2. Ensure the low-level period of the SCLn line set in ICBRL elapses.
3. Release the SCLn line (low level to high level).
4. Detect a high level on the SCLn line and ensure the time set in ICBRL and the restart condition setup time elapse.
5. Drive the SDAn line low (high level to low level).
6. Ensure the time set in ICBRH and the restart condition hold time elapse.
7. Drive the SCLn line low (high level to low level).
8. Detect a low level on the SCLn line and ensure the low-level period of the SCLn line set in ICBRL elapses.

Note: When issuing restart condition requests, write the slave address to ICDRT after confirming that ICCR2.RS = 0. Data written while ICCR2.RS = 1 is not forwarded because of the retransmission condition before the occurrence.

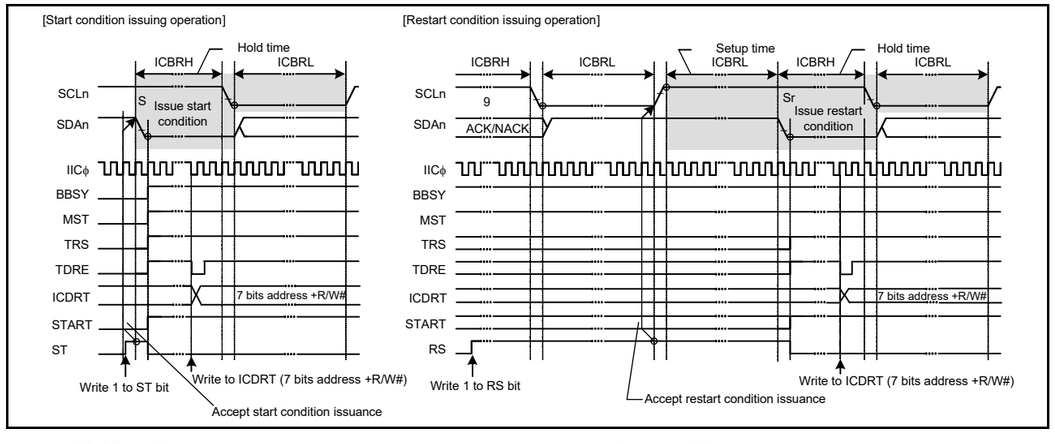

Figure 32.45 Start and restart condition issue timing using the ST and RS bits

32.11 启动、重启和停止条件发布功能

32.11.1 发出开始条件

当ICCR2中的ST位设置为1时，IIC发出启动条件。

当ST位设置为1时，发出启动条件请求，当ICCR2中的BBSY标志为0（总线空闲状态）时，IIC发出启动条件。当启动条件正常发出时，IIC自动切换到主机发送模式。

发出开始条件：

1. 将SDAn线驱动为低电平（高电平到低电平）。
2. 确保ICBRH中设置的时间和启动条件保持时间已过。
3. 将SCLn线驱动为低电平（高电平到低电平）。
4. 检测SCLn线上的低电平，确保经过ICBRL中设置的SCLn线的低电平周期。

32.11.2 发出重启条件

当ICCR2中的RS位设置为1时，IIC发出重启条件。

当RS位设置为1时，发出重启条件请求。当BBSY标志在IIC发出重启条件
ICCR2为1（总线繁忙状态），ICCR2中的MST位为1（主机模式）。

发出重启条件：

1. 释放SDAn线。
2. 确保ICBRL中设置的SCLn线的低电平周期已过。
3. 释放SCLn线（低电平到高电平）。
4. 检测SCLn线上的高电平并确保ICBRL中设置的时间和重启条件设置时间已过。
5. 将SDAn线驱动为低电平（高电平到低电平）。
6. 确保ICBRH中设置的时间和重启条件保持时间已过。
7. 将SCLn线驱动为低电平（高电平到低电平）。
8. 检测SCLn线上的低电平，确保经过ICBRL中设置的SCLn线的低电平周期。

Note: 发出重启条件请求时，确认ICCR2.RS=0后，将从机地址写入ICDRT。
ICCR2.RS=1时写入的数据由于发生前的重发条件而不会转发。

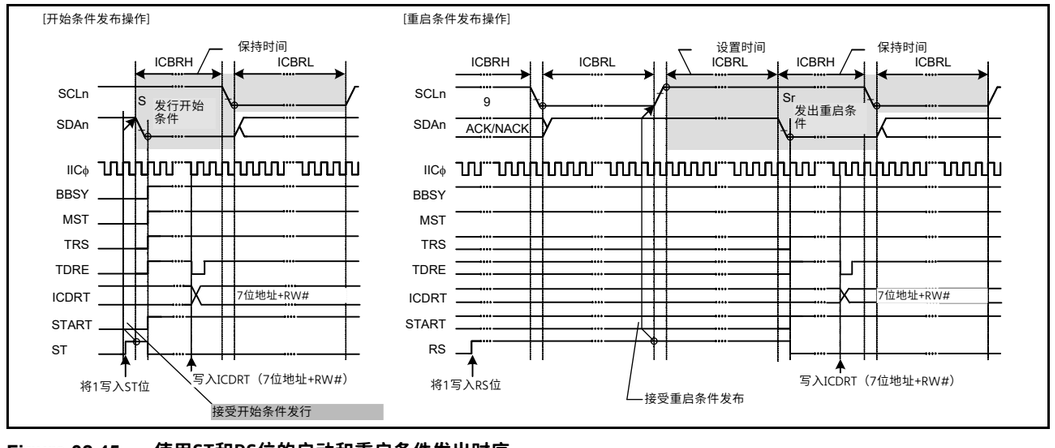

Figure 32.45 使用ST和RS位的启动和重启条件发出时序

Figure 32.46 shows the operation timing when a restart condition is issued after the master transmission.

To issue a restart condition after the master transmission:

1. Initialize the IIC using the procedure in section 32.3.2, Initial Settings.
2. Read the BBSY flag in IICR2 to check that the bus is open, and then set the ICCR2.ST bit to 1 (start condition request). On receiving the request, the IIC issues a start condition. At the same time, the BBSY and the START flags in ICSR2 are automatically set to 1 and the ST bit automatically sets to 0. If the start condition is detected and the internal levels for the SDA output state and the levels on the SDAn line match while the ST bit is 1, the IIC recognizes that a start condition is successfully issued as requested by the ST bit. The MST and TRS bits in ICCR2 automatically set to 1, placing the IIC in master transmit mode. The TDRE flag in ICSR2 is also automatically set to 1 when the TRS bit is set to 1.
3. Check that the TDRE flag in ICSR2 is 1, then write the value for transmission (the slave address and the R/W# bit) to the ICDRT register. After the transmit data is written to ICDRT, the TDRE flag is automatically set to 0, the data is transferred from ICDRT to ICDRS, and the TDRE flag again sets to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode according to the value of the transmitted R/W# bit. If the value of the R/W# bit is 0, the IIC continues in master transmit mode. If the ICSR2.NACKF flag is 1 at this time, indicating that no slave device recognized the address or there was an error in communications, write 1 to ICCR2.SP bit to issue a stop condition.

   To transmit data with an address in the 10-bit format, start by writing 1111 0b, the 2 upper bits of the slave address, and W to ICDRT as the first address transmission. Then, as the second address transmission, write the 8 lower bits of the slave address to the ICDRT register.
4. After confirming that the TDRE flag in ICSR2 is 1, write the data for transmission to the ICDRT register. The IIC automatically holds the SCLn line low until data for transmission is ready, and a restart or stop condition is issued.
5. After all bytes of data for transmission are written to the ICDRT register, wait until the value of the TEND flag in ICSR2 returns to 1. Then, after checking that the START flag in ICSR2 is 1, set the START flag in ICSR2 to 0.
6. Set the RS bit in ICCR2 to 1 (restart condition request). On receiving the request, the IIC issues a restart condition.
7. After checking that the START flag in ICSR2 is 1, write the value for transmission (the slave address and the R/W# bit) to the ICDRT register.

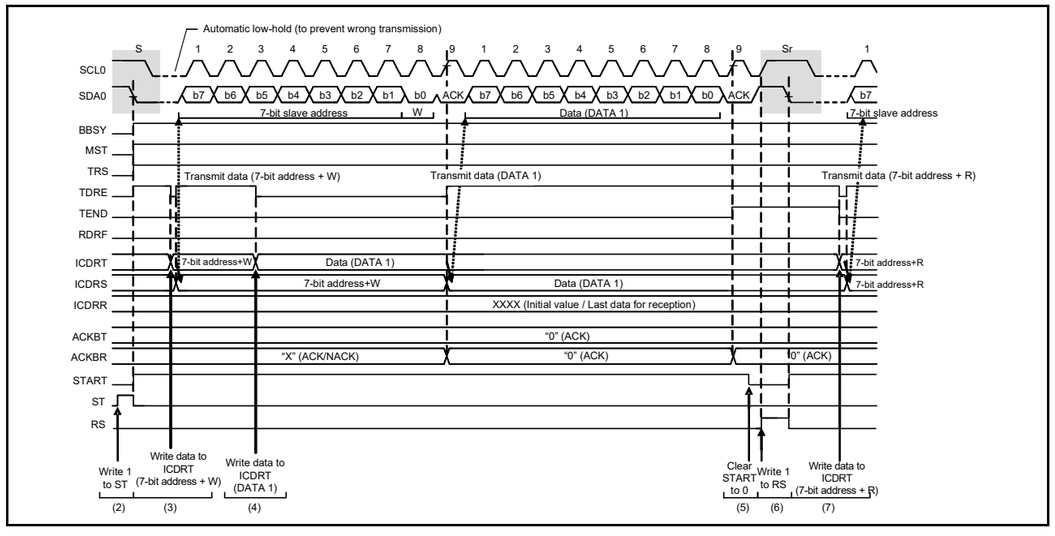

Figure 32.46 Restart condition issue timing after master transmission.

图32.46显示了在主机发送后发出重新启动条件时的操作时序。

在主传输后发出重启条件：

1. 使用第32.3.2节，初始设置中的过程初始化IIC。
2. 读取IICR2中的BBSY标志以检查总线是否打开，然后将ICCR2.ST位设置为1（启动条件请求）。收到请求后，IIC发出一个开始条件。同时，ICSR2中的BBSY和START标志自动设置为1，ST位自动设置为0。如果检测到启动条件并且SDA输出状态的内部电平与SDAn线上的电平匹配当ST位为1时，IIC识别出启动条件已按照ST位的请求成功发出。ICCR2中的MST和TRS位自动设置为1，将IIC置于主机发送模式。当TRS位设置为1时，ICSR2中的TDRE标志也自动设置为1。
3. 检查ICSR2中的TDRE标志是否为1，然后将要发送的值（从机地址和RW#位）写入ICDRT寄存器。发送数据写入ICDRT后，TDRE标志自动设置为0，数据从ICDRT传输到ICDRS，TDRE标志再次设置为1。发送包含从机地址和RW#位的字节后，TRS位的值会根据发送的RW#位的值自动更新以选择主机发送或主机接收模式。如果RW#位的值为0，则IIC继续处于主机发送模式。如果此时ICSR2.NACKF标志位为1，表示没有从设备识别该地址或通信出现错误，向ICCR2.SP位写入1发出停止条件。

   要使用10位格式的地址传输数据，首先将11110b、从机地址的高2位和W写入ICDRT作为第一个地址传输。然后，作为第二次地址传输，将从地址的低8位写入ICDRT寄存器。
4. 确认ICSR2中的TDRE标志为1后，将要发送的数据写入ICDRT寄存器。IIC自动将SCLn线保持在低电平，直到传输数据准备好，并发出重新启动或停止条件。
5. 待传输数据的所有字节写入ICDRT寄存器后，等待直到TEND标志的值ICSR2恢复为1。然后，在检查ICSR2中的START标志为1后，将ICSR2中的START标志设置为0。
6. 将ICCR2中的RS位设置为1（重新启动条件请求）。收到请求后，IIC发出重启条件。
7. 检查ICSR2中的START标志为1后，将要发送的值（从机地址和RW#位）写入ICDRT寄存器。

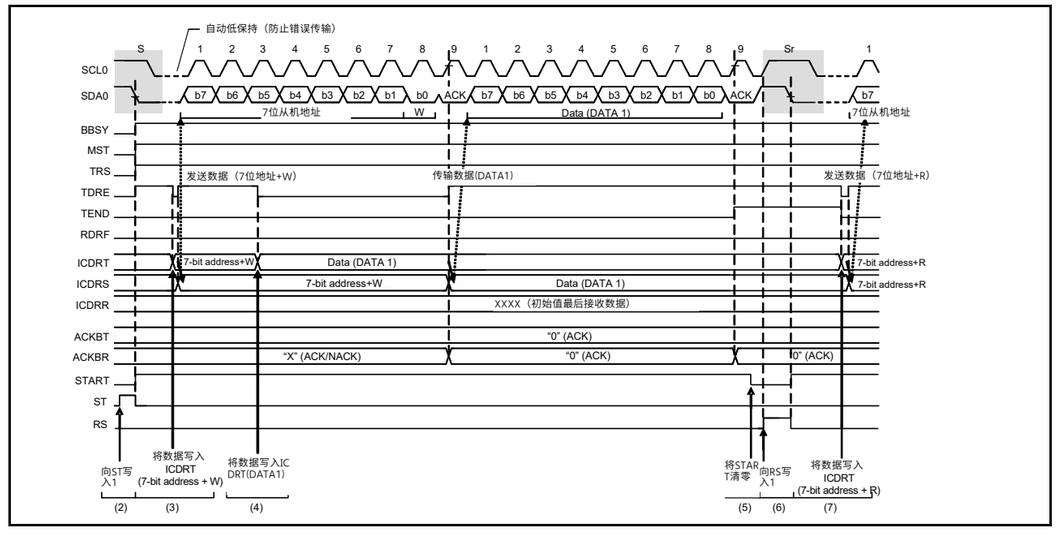

Figure 32.46 主传输后重启条件发出时序。

32.11.3 Issuing a Stop Condition

The IIC issues a stop condition when the SP bit in ICCR2 is set to 1.

When the SP bit is set to 1, a stop condition request is made. The IIC issues a stop condition when the BBSY flag in ICCR2 is 1 (bus busy state) and the MST bit in ICCR2 is 1 (master mode).

To issue a stop condition:

1. Drive the SDAn line low (high level to low level).
2. Ensure that the low-level period of the SCLn line set in ICBRL elapses.
3. Release the SCLn line (low level to high level).
4. Detect a high level on the SCLn line and ensure that the time set in ICBRH and the stop condition setup time elapse.
5. Release the SDAn line (low level to high level).
6. Ensure the time set in ICBRL and the bus free time elapse.
7. Clear the BBSY flag to 0 to release the bus mastership.

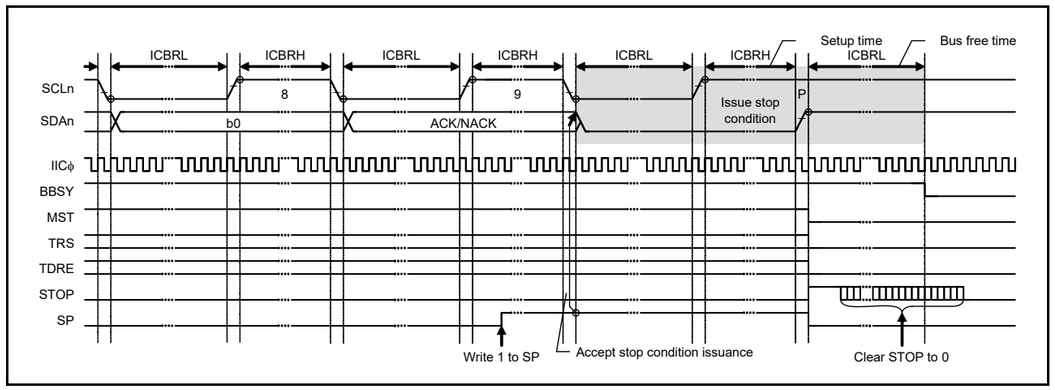

Figure 32.47 Stop condition issue timing using the SP bit

32.12 Bus Hanging

If the clock signals from the master and slave devices are out of synchronization because of noise or other factors, the I2C bus might hang with a fixed level on the SCLn line or SDAn line.

To manage bus hanging, the IIC has:

- A timeout function to detect hanging by monitoring the SCLn line
- A function for the output of an extra SCL clock cycle to release the bus from a hung state because of clock signals being out of synchronization
- An IIC reset function
- An internal reset function.

By checking the SCLO, SDAO, SCLI, and SDAI bits in ICCR1, it is possible to see whether the IIC or its communicating partner is placing the low level on the SCLn or SDAn lines.

32.12.1 Timeout Function

The timeout function can detect when the SCLn line is stuck longer than the predetermined time. The IIC can detect an abnormal bus state by monitoring that the SCLn line is stuck low or high for a predetermined time.

The timeout function monitors the SCLn line state and counts the low-level or high-level period using the internal counter. The timeout function resets the internal counter each time the SCLn line changes (rising or falling), but continues to count unless the SCLn line changes. If the internal counter overflows because no SCLn line changes, the IIC

32.11.3 发出停止条件

当ICCR2中的SP位设置为1时，IIC发出停止条件。

当SP位设置为1时，发出停止条件请求。IIC发出停止条件，当BBSY标志在ICCR2为1（总线繁忙状态），ICCR2中的MST位为1（主机模式）。

发出停止条件：

1. 将SDAn线驱动为低电平（高电平到低电平）。
2. 确保ICBRL中设置的SCLn线的低电平周期已过。
3. 释放SCLn线（低电平到高电平）。
4. 检测SCLn线上的高电平并确保ICBRH中设置的时间和停止条件设置时间已过。
5. 释放SDAn线（低电平到高电平）。
6. 确保ICBRL中设置的时间和巴士空闲时间已过。
7. 将BBSY标志清除为0以释放总线主控权。

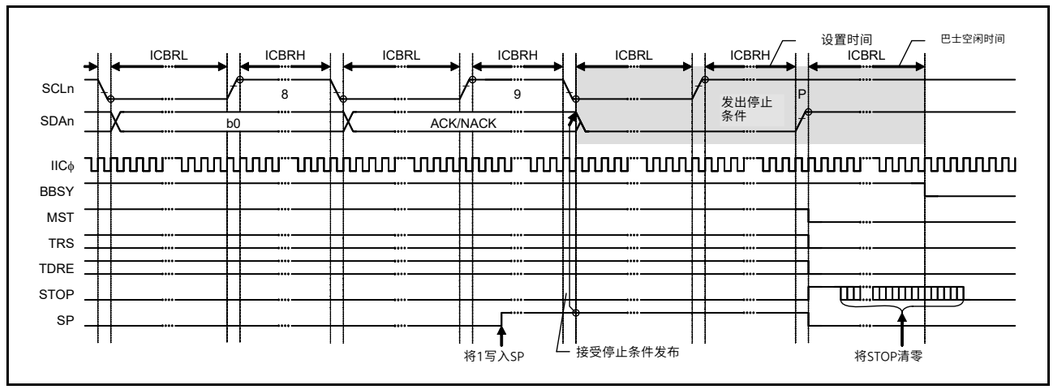

Figure 32.47 使用SP位的停止条件发出时序

32.12 巴士挂

如果来自主从设备的时钟信号由于噪声或其他因素不同步，则I2C总线可能会在SCLn线或SDAn线上以固定电平挂起。

为了管理总线挂起，IIC具有：

- 通过监控SCLn线路来检测挂起的超时功能
- 由于时钟信号不同步而输出额外SCL时钟周期以将总线从挂起状态中释放的功能
- 一个IIC复位功能
- 内部复位功能。

通过检查ICCR1中的SCLO、SDAO、SCLI和SDAI位，可以查看IIC或其通信伙伴是否在SCLn或SDAn线上设置了低电平。

32.12.1 超时功能

超时功能可以检测SCLn线路何时卡住超过预定时间。IIC可以通过监视SCLn线在预定时间内保持低电平或高电平来检测异常总线状态。

超时功能监视SCLn线路状态并使用内部计数器计算低电平或高电平周期。每次SCLn线改变（上升或下降）时，超时功能都会复位内部计数器，但除非SCLn线改变，否则会继续计数。如果内部计数器因SCLn线没有变化而溢出，则IIC

RA生态工作室

can detect the timeout and report the bus hung state.

This timeout function is enabled when the ICFER.TMOE bit is 1. It detects a hung state when the SCLn line is stuck low or high during the following conditions:

- The bus is busy (ICCR2.BBSY flag is 1) in master mode (ICCR2.MST bit is 1)
- The IIC slave address is detected (ICSR1 register is not 00h) and the bus is busy (ICCR2.BBSY flag is 1) in slave mode (ICCR2.MST bit is 0)
- The bus is open (ICCR2.BBSY flag is 0) while a start condition is requested (ICCR2.ST bit is 1).

The internal counter of the timeout function uses the internal reference clock (IICϕ) set in the CKS[2:0] bits in ICMR1 as a count source. It functions as a 16-bit counter when long mode is selected (TMOS bit = 0 in ICMR2) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCLn line level (low, high, or both levels) during which this counter is activated can be selected in the TMOH and TMOL bits in ICMR2. If both TMOL and TMOH bits are set to 0, the internal counter is disabled.

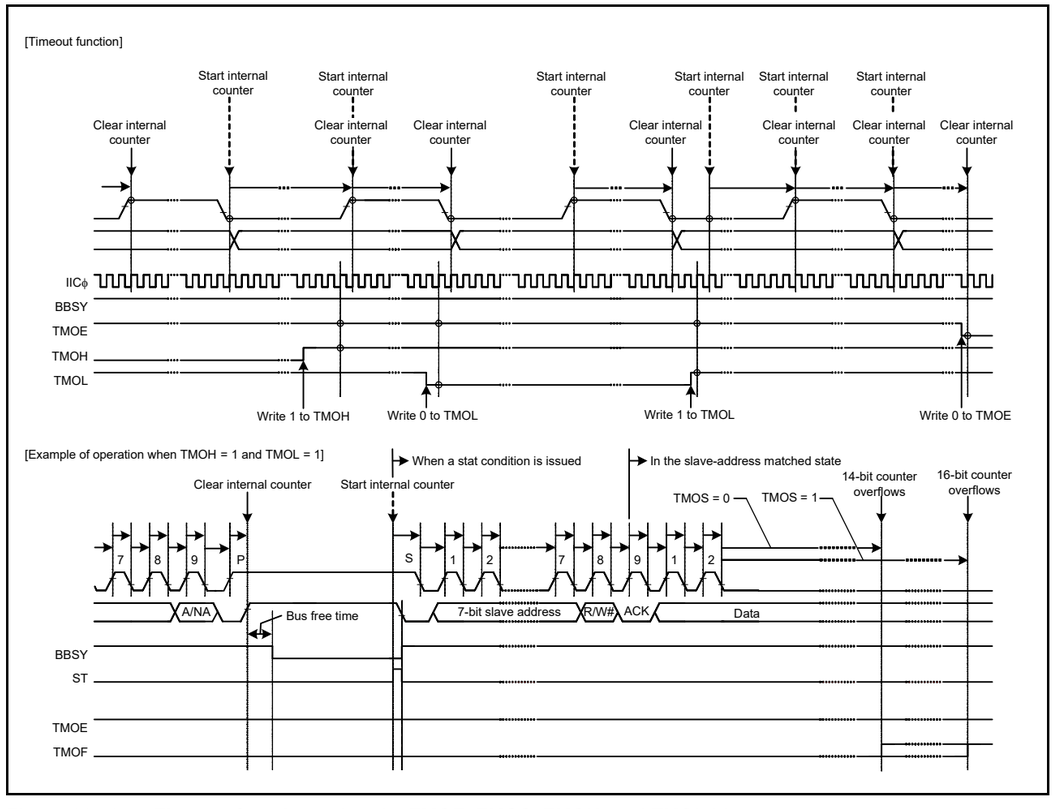

Figure 32.48 Timeout function using the TMOE, TMOS, TMOH, and TMOL bits

32.12.2 Extra SCL Clock Cycle Output Function

In master mode, this function outputs extra SCL clock cycles to release the SDAn line of the slave device from being held low because the master is out of synchronization with the slave device.

This function is mainly used in master mode to release the SDAn line of the slave device from being fixed low by including extra cycles of SCL output from the IIC. It uses single cycles of the SCL clock for a bus error where the IIC cannot issue a stop condition because the slave device is holding the SDAn line at the low level. Do not use this function in normal situations. Using it when communications are proceeding correctly leads to malfunctioning.

可以检测到超时并报告总线挂起状态。

此超时功能在ICFER.TMOE位为1时启用。在以下情况下，当SCLn线卡在低电平或高电平时，它会检测到挂起状态：

- 总线繁忙（ICCR2.BBSY标志为1）处于主模式（ICCR2.MST位为1）
- 检测到IIC从机地址（ICSR1寄存器不是00h）并且在从机模式下总线忙（ICCR2.BBSY标志为1）（ICCR2.MST位为0）
- 请求启动条件（ICCR2.ST位为1）时，总线打开（ICCR2.BBSY标志为0）。

超时功能的内部计数器使用ICMR1的CKS[2:0]位中设置的内部参考时钟(IIC)作为计数源。Itfunctionsasa16-bitcounterwhenlongmodeisselected(TMOSbit=0inICMR2)ora14-bitcounterwhenshortmodeisselected(TMOSbit=1).

可以在TMOH和
ICMR2中的TMOL位。如果TMOL和TMOH位都设置为0，则内部计数器被禁用。

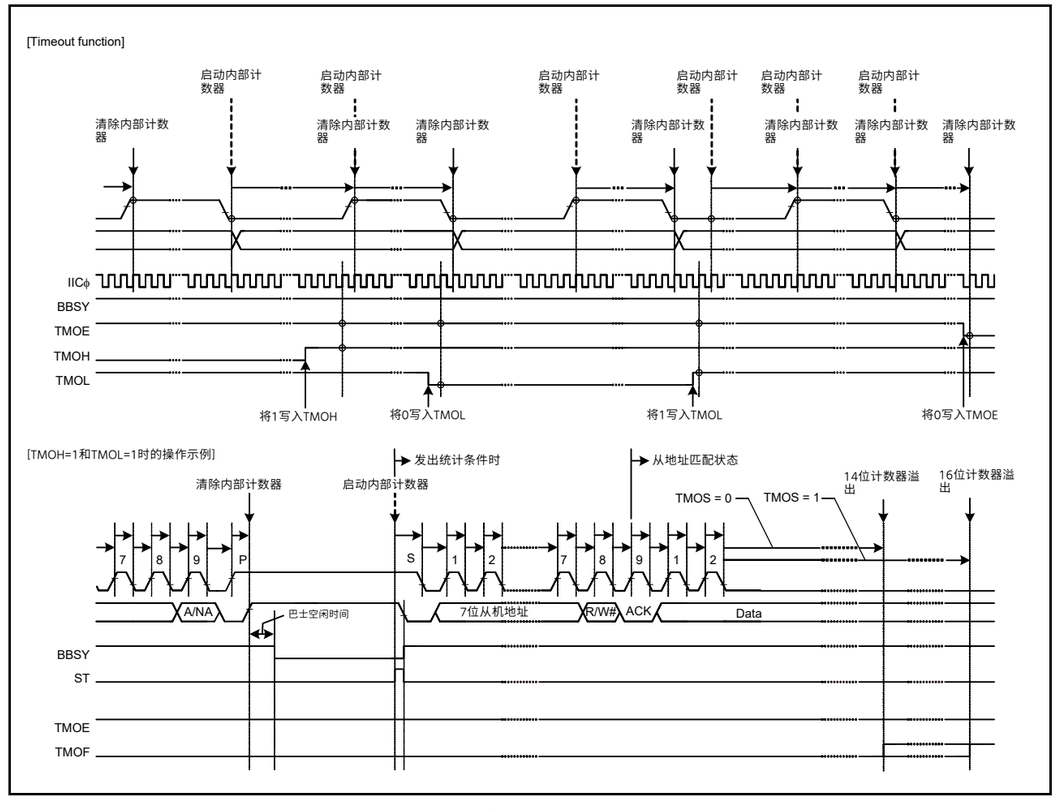

Figure 32.48 使用TMOE、TMOS、TMOH和TMOL位的超时功能

32.12.2 额外的SCL时钟周期输出功能

在主模式下，该函数输出额外的SCL时钟周期，以释放从设备的SDAn线保持低电平，因为主设备与从设备不同步。

该功能主要用于主机模式，通过包含IIC的额外SCL输出周期来释放从机设备的SDAn线固定为低电平。它使用SCL时钟的单个周期来处理IIC无法发出停止条件的总线错误，因为从设备将SDAn线保持在低电平。在正常情况下不要使用此功能。在通信正常进行时使用它会导致故障。

RA生态工作室

When the CLO bit in ICCR1 is set to 1 in master mode, a single cycle of the SCL clock at the transfer rate specified in the CKS[2:0] bits in ICMR1, the ICBRH, and ICBRL registers, is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit is automatically set to 0. Therefore, more extra clock cycles can be output consecutively by writing 1 to the CLO bit after having read CLO = 0.

When the IIC module is in master mode and the slave device is holding the SDAn line low because synchronization with the slave device is lost due to the effects of noise, the output of a stop condition is not possible. This function can be used to output extra cycles of SCL one by one to make the slave device release the SDAn line from being held low, and recover the bus from an unusable state. Release of the SDAn line by the slave device can be monitored by reading the SDAI bit in ICCR1. After confirming the release of the SDAn line by the slave device, complete the communication by reissuing the stop condition.

Use this function with the MALE bit in ICFER set to 0 (master arbitration-lost detection disabled). If the MALE bit is set to 1 (enabled), arbitration is lost when the value of the SDAO bit in ICCR1 does not match the state of the SDAn line.

[Output conditions for using the CLO bit in ICCR1]

- When the bus is free (BBSY flag in ICCR2 = 0) or in master mode (MST bit = 1 and BBSY flag = 1 in ICCR2)
- When the communication device does not hold the SCLn line low.

Figure 32.49 shows the operation timing of the extra SCL clock cycle output function (CLO bit).

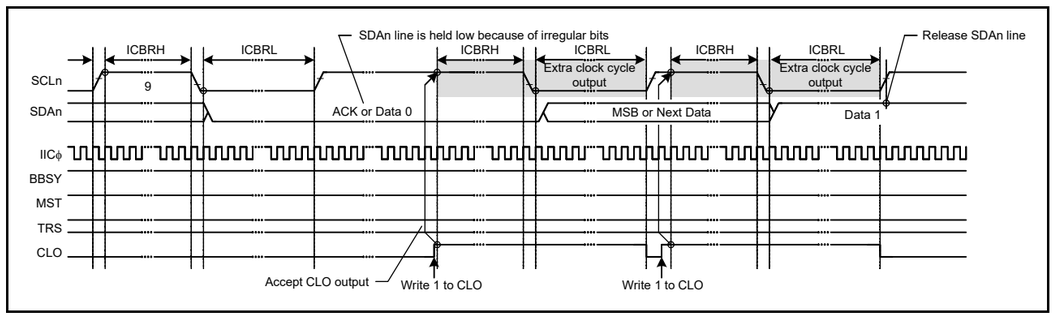

Figure 32.49 Extra SCL clock cycle output function using the CLO bit

32.12.3 IIC Reset and Internal Reset

The IIC module has two types of resets:

- IIC reset, which initializes all registers, including the BBSY flag in ICCR2
- Internal reset, which releases the IIC from the slave-address matched state and initializes the internal counter while saving other settings.

After issuing a reset, be sure to set the IICRST bit in ICCR1 to 0. Both types of resets are valid for release from bus-hung states, because both restore the output state of the SCLn and SDAn pins to the high-impedance state.

Issuing a reset during slave operation might lead to a loss of synchronization between the master device clock and the slave device clock, so avoid this when possible. In addition, monitoring of the bus state, such as for the presence of a start condition, is not possible during an IIC reset (ICE and IICRST bits = 01b in ICCR1).

For a detailed description of the IIC and internal resets, see section 32.15, State of Registers when Issuing each Condition.

32.13 SMBus Operation

The IIC supports data communication conforming to the SMBus Specification, version 2.0. To perform SMBus communication, set the SMBS bit in ICMR3 to 1. To use the transfer rate within a range of 10 kbps to 100 kbps of the SMBus standard, set the CKS[2:0] bits in ICMR1, the ICBRH, and ICBRL registers. In addition, specify the values in the DLCS bit in ICMR2 and the SDDL[2:0] bits in ICMR2 to meet the data hold time specification of 300 ns or more. When the IIC is used only as a slave device, the transfer rate setting is not required, but ICBRL must be set to a value longer than the data setup time (250 ns).

当ICCR1中的CLO位在主机模式下设置为1时，以ICMR1中的CKS[2:0]位、ICBRH和ICBRL寄存器中指定的传输速率输出一个SCL时钟周期作为额外的输出。时钟周期。在SCL时钟的这个单周期输出后，CLO位自动设置为0。因此，在读取CLO=0后，通过向CLO位写入1可以连续输出更多的额外时钟周期。

当IIC模块处于主机模式并且从机保持SDAn线为低电平时，因为与从机的同步由于噪声的影响而丢失，停止条件的输出是不可能的。该功能可用于逐个输出额外的SCL周期，使从设备解除SDAn线的低电平状态，使总线从不可用状态恢复。从设备释放SDAn线可以通过读取ICCR1中的SDAI位来监控。从设备确认SDAn线的释放后，通过重新发出停止条件完成通信。

在ICFER中的MALE位设置为0（禁用主机仲裁丢失检测）时使用此功能。如果MALE位设置为1（启用），当ICCR1中SDAO位的值与SDAn线的状态不匹配时，仲裁将丢失。

[使用ICCR1中CLO位的输出条件]

- 当总线空闲（ICCR2中的BBSY标志=0）或处于主机模式（ICCR2中的MST位=1且BBSY标志=1）时
- 当通信设备不保持SCLn线为低电平时。

图32.49显示了额外SCL时钟周期输出功能（CLO位）的操作时序。

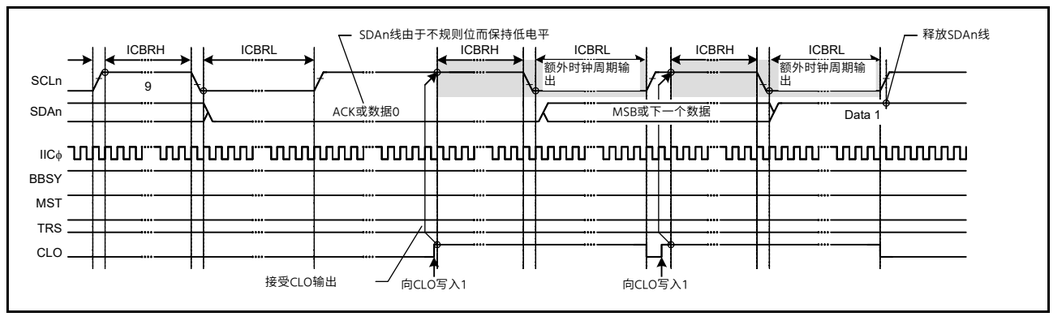

Figure 32.49 使用CLO位的额外SCL时钟周期输出功能

32.12.3 IIC复位和内部复位

IIC模块有两种类型的复位：

- IIC复位，初始化所有寄存器，包括ICCR2中的BBSY标志
- 内部复位，将IIC从从地址匹配状态释放并初始化内部计数器，同时保存其他设置。

发出复位后，务必将ICCR1中的IICRST位设置为0。这两种复位都对从总线挂起状态释放有效，因为两者都将SCLn和SDAn引脚的输出状态恢复为高阻状态。

在从机操作期间发出复位可能会导致主设备时钟和从设备时钟之间失去同步，因此请尽可能避免这种情况。此外，在IIC复位（ICE和IICRST位=ICCR1中的01b）期间无法监控总线状态，例如是否存在启动条件。

有关IIC和内部复位的详细说明，请参阅第32.15节，发出每个寄存器时的寄存器状态
Condition.

32.13 SMBus Operation

IIC支持符合SMBus规范2.0版的数据通信。要执行SMBus通信，请将ICMR3中的SMBS位设置为1。要使用SMBus标准的10kbps至100kbps范围内的传输速率，请设置ICMR1、ICBRH和ICBRL中的CKS[2:0]位寄存器。此外，请指定ICMR2中的DLCS位和ICMR2中的SDDL[2:0]位中的值，以满足300ns或更长的数据保持时间规范。当IIC仅用作从设备时，不需要设置传输速率，但必须将ICBRL设置为比数据建立时间（250ns）更长的值。

RA生态工作室

For the SMBus device default address (1100 001b), use one of the slave address registers L0 to L2 (SARL0, SARL1, and SARL2), and set the associated FS bit (7- or 10-bit address format select) in SARUy (y = 0 to 2) to 0 (7-bit address format).

When transmitting the UDID (Unique Device Identifier), set the SALE bit in ICFER to 1 to enable the slave arbitration-lost detection function.

32.13.1 SMBus Timeout Measurement

(1) Measuring slave device timeout

The following period (timeout interval: $T_{LOW: SEXT}$) must be measured for slave devices in SMBus communication:

- From start condition to stop condition.

To measure timeout for slave devices, measure the period from start condition detection to stop condition detection with the GPT using the IIC start condition detection interrupt (STIn) and stop condition detection interrupt (SPIn). The measured timeout period must be within the total clock low-level period [slave device] $T_{LOW: SEXT}$: 25 ms (maximum) of the SMBus standard.

If the time measured with the GPT exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (minimum) of the SMBus standard, the slave device must release the bus by writing 1 to the IICRST bit in ICCR1 to issue an internal reset of the IIC. When an internal reset is issued, the IIC stops driving the bus for the SCLn and SDAn pins and makes the SCLn/SDAn pin output high-impedance, which releases the bus.

(2) Measuring master device timeout

The following periods (timeout interval: $T_{LOW: MEXT}$) must be measured for master devices in SMBus communication:

- From start condition to acknowledge bit
- Between acknowledge bits
- From acknowledge bit to stop condition.

To measure timeout for master devices, measure these periods with the GPT using the IIC start condition detection interrupt (STIn), stop condition detection interrupt (SPIn), transmit end interrupt (IICn_TEI), or receive data full interrupt (IICn_RXI). The measured timeout period must be within the total clock low-level extended period (master device) $T_{LOW: MEXT}$: 10 ms (maximum) of the SMBus standard, and the total of all $T_{LOW: MEXT}$ values from the start condition to stop condition must be within $T_{LOW: SEXT}$: 25 ms (maximum).

For the ACK receive timing (rising edge of the 9th SCL clock cycle), monitor the TEND flag in ICSR2 in master transmit mode (master transmitter) and the RDRF flag in ICSR2 in master receive mode (master receiver). Perform byte-wise transmit operations in master transmit mode, and hold the RDRFS bit in ICMR3 at 0 until the byte immediately before the reception of the final byte in master receive mode. While the RDRFS bit is 0, the RDRF flag is set to 1 on the rising edge of the 9th SCL clock cycle.

If the period measured with GPT exceeds the total clock low-level extended period (master device), $T_{LOW: MEXT}$: 10 ms (maximum) of the SMBus standard or the total of measured periods exceeds the clock low-level detection timeout, $T_{TIMEOUT}$: 25 ms (minimum) of the SMBus standard, the master device must stop the transaction by issuing a stop condition. In master transmit mode, immediately stop the transmit operation (stop writing data to ICDRT).

对于SMBus器件默认地址(1100001b)，使用从地址寄存器L0到L2之一（SARL0、SARL1和SARL2），并将SARUy(y=0to2)中相关的FS位（7位或10位地址格式选择）设置为0（7位地址格式）。

发送UDID（UniqueDeviceIdentifier）时，将ICFER中的SALE位设置为1，以使能从机仲裁丢失检测功能。

32.13.1 SMBus超时测量

(1) 测量从设备超时

对于SMBus通信中的从设备，必须测量以下周期（超时间隔：TLOW:SEXT）：

- 从开始条件到停止条件。

要测量从设备的超时，请使用GPT使用IIC启动条件检测中断(STIn)和停止条件检测中断(SPIn)测量从启动条件检测到停止条件检测的周期。测得的超时周期必须在总时钟低电平周期[从设备]TLOW:SEXT:SMBus标准的25ms（最大值）内。

如果使用GPT测量的时间超过时钟低电平检测超时TTIMEOUT:SMBus标准的25ms（最小值），从设备必须通过向ICCR1中的IICRST位写入1来释放总线，以发出内部复位IIC。当内部复位发出时，IIC停止驱动SCLn和SDAn引脚的总线，并使SCLnSDAn引脚输出高阻态，从而释放总线。

(2) 测量主设备超时

对于SMBus通信中的主设备，必须测量以下周期（超时间隔：TLOW:MEXT）：

- 从开始条件到确认位
- 确认位之间
- 从确认位到停止条件。

要测量主设备的超时，请使用GPT使用IIC开始条件检测中断(STIn)、停止条件检测中断(SPIn)、发送结束中断(ICn_TEI)或接收数据完整中断(IICn_RXI)来测量这些周期。测得的超时周期必须在总时钟低电平扩展周期（主设备）TLOW:MEXT:SMBus标准的10ms（最大值）内，以及从启动条件到停止的所有TLOW:MEXT值的总和条件必须在TLOW内：SEXT：25ms（最大值）。

对于ACK接收时序（第9个SCL时钟周期的上升沿），在主机发送模式（主机发送器）监视ICSR2中的TEND标志，在主机接收模式（主机接收器）监视ICSR2中的RDRF标志。在主机发送模式下执行逐字节发送操作，并将ICMR3中的RDRFS位保持为0，直到在主机接收模式下接收到最后一个字节之前的字节。当RDRFS位为0时，RDRF标志在第9个SCL时钟周期的上升沿设置为1。

如果用GPT测量的周期超过总时钟低电平扩展周期（主设备），TLOW:MEXT:SMBus标准的10ms（最大值）或总测量周期超过时钟低电平检测超时，TTIMEOUT：SMBus标准的25ms（最小值），主设备必须通过发出停止条件来停止事务。在主机发送模式下，立即停止发送操作（停止向ICDRT写入数据）。

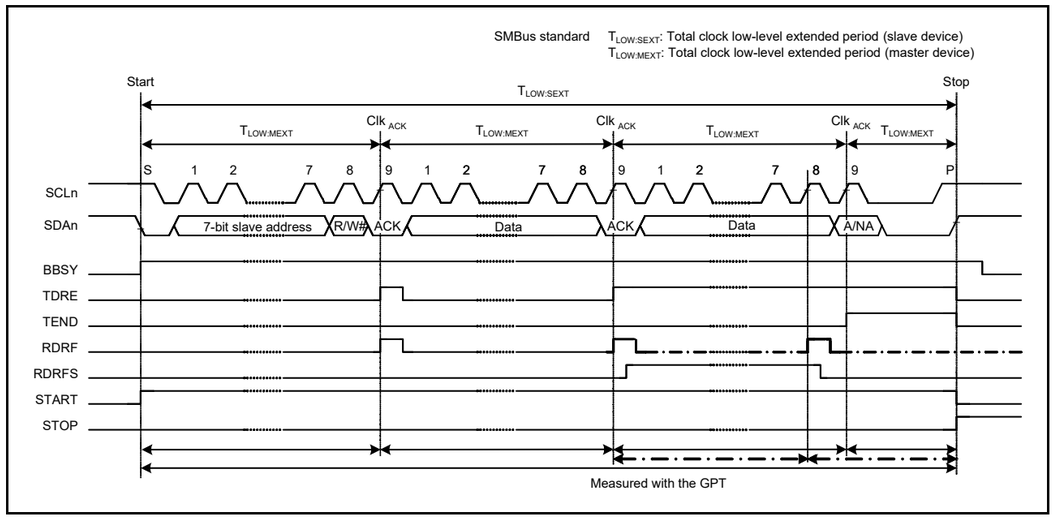

Figure 32.50 SMBus timeout measurement

32.13.2 Packet Error Code (PEC)

The MCU provides a CRC calculator that enables transmission of a Packet Error Code (PEC) or allows checking the received data in SMBus data communication. For the CRC-generating polynomials of the CRC calculator, see section 36, Cyclic Redundancy Check (CRC) Calculator.

In master transmit mode, the PEC data can be generated by writing all transmit data to the CRC Data Input Register (CRCDIR) in the CRC calculator.

In master receive mode, the PEC data can be checked by writing all receive data to CRCDIR in the CRC calculator and comparing the obtained value in the CRC Data Output Register (CRCDOR) with the received PEC data.

To send ACK or NACK based on the match or mismatch result when the final byte is received as a result of the PEC code check, set the RDRFS bit in ICMR3 to 1 before the rising edge of the 8th SCL clock cycle during reception of the final byte, and hold the SCLn line low on the falling edge of the 8th clock cycle.

32.13.3 SMBus Host Notification Protocol (Notify ARP Master Command)

In communications over an SMBus, a slave device can temporarily act as a master device to notify the SMBus host (or ARP master) of its own slave address, or to request its own slave address from the SMBus host.

For a product using the MCU to operate as an SMBus host or ARP master, the host address (0001 000b) sent from the slave device must be detected as a slave address, and so the IIC has a function for detecting the host address. To detect the host address as a slave address, set the SMBS bit in ICMR3 and the HOAE bit in ICSER to 1. Operation after the host address is detected is the same as normal slave operation.

32.14 Interrupt Sources

The IIC issues four types of interrupt requests:

- Transfer error or event generation (arbitration-lost, NACK detection, timeout detection, start or restart condition detection, and stop condition detection)
- Receive data full
- Transmit data empty
- Transmit end.

Table 32.10 lists details of the interrupt requests. The receive data full and transmit data empty interrupts can activate data transfer by the DTC or DMAC.

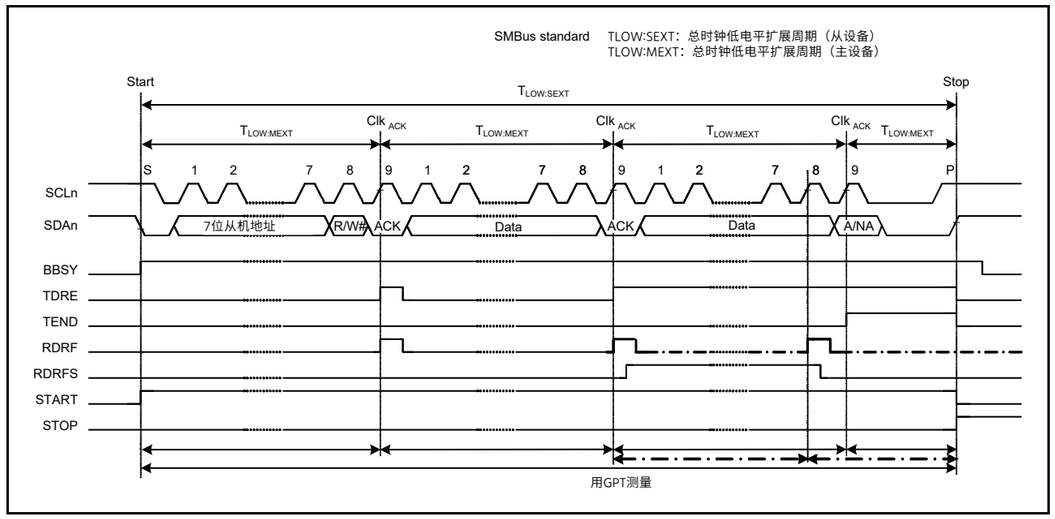

Figure 32.50 SMBus超时测量

32.13.2 数据包错误代码(PEC)

MCU提供了一个CRC计算器，可以传输数据包错误代码(PEC)或检查SMBus数据通信中接收到的数据。有关CRC计算器的CRC生成多项式，请参阅第36节，循环冗余校验(CRC)计算器。

在主机发送模式下，可以通过将所有发送数据写入CRC计算器中的CRC数据输入寄存器(CRCDIR)来生成PEC数据。

在主机接收模式下，可以通过将所有接收数据写入CRC计算器中的CRCDIR并将CRC数据输出寄存器(CRCDOR)中获得的值与接收到的PEC数据进行比较来检查PEC数据。

在接收到作为PEC代码检查的结果的最后一个字节时，要根据匹配或不匹配结果发送ACK或NACK，请在接收到第8个SCL时钟周期的上升沿之前将ICMR3中的RDRFS位设置为1。最后一个字节，并在第8个时钟周期的下降沿保持SCLn线为低电平。

32.13.3 SMBus主机通知协议（通知ARP主机命令）

在通过SMBus进行通信时，从设备可以临时充当主设备来通知SMBus主机（或ARP主机）自己的从地址，或从SMBus主机请求自己的从地址。

对于使用MCU作为SMBus主机或ARP主机的产品，从机发送的主机地址（0001000b）必须被检测为从机地址，因此IIC具有主机地址检测功能。要将主机地址检测为从机地址，请将ICMR3中的SMBS位和ICSER中的HOAE位设置为1。检测到主机地址后的操作与正常从机操作相同。

32.14 中断源

IIC发出四种类型的中断请求：

- 传输错误或事件生成（仲裁丢失、NACK检测、超时检测、启动或重启条件检测和停止条件检测）
- 接收数据已满
- 传输数据为空
- 传送结束。

表32.10列出了中断请求的详细信息。接收数据满和发送数据空中断可以通过DTC或DMAC激活数据传输。

Table 32.10 Interrupt sources

Symbol	Interrupt source	Interrupt flag	DMAC/DTC activation	Interrupt condition
IICn_EEI*5	Transfer error or event generation	AL	Not possible	AL = 1, ALIE = 1
		NACKF		NACKF = 1, NAKIE = 1
		TMOF		TMOF = 1, TMOIE = 1
		START		START = 1, STIE = 1
		STOP		STOP = 1, SPIE = 1
IICn_RXI*2, *5	Receive data full	RDRF	Possible	RDRF = 1, RIE = 1
IICn_TXI*1, *5	Transmit data empty	TDRE	Possible	TDRE = 1, TIE = 1
IICn_TEI*3, *5	Transmit end	TEND	Not possible	TEND = 1, TEIE = 1
IIC0_WUI*4	Slave address match during wakeup function	WUF	Not possible	Slave address match Slave receive complete RWAK operation ASY0 = 1 WUIE = 1

Note: There is a delay between the execution of a write instruction for a peripheral module by the CPU and actual writing to the module. When an interrupt flag is cleared or masked, read the relevant flag again to check whether clearing or masking is complete, and then return from interrupt handling. Not doing so creates the possibility of repeated processing of the same interrupt.

Note 1. Because IICn_TXI is an edge-detected interrupt, it does not require clearing. Additionally, the TDRE flag in ICSR2 (condition for IICn_TXI) is automatically set to 0 when transmit data is written to ICDRT or a stop condition is detected (STOP flag = 1 in ICSR2).

Note 2. Because IICn_RXI is an edge-detected interrupt, it does not require clearing. Additionally, the RDRF flag in ICSR2 (condition for IICn_RXI) automatically is set to 0 when data is read from ICDRR.

Note 3. When using the IICn_TEI interrupt, clear the TEND flag in ICSR2 in the IICn_TEI interrupt handling. The TEND flag in ICSR2 automatically is set to 0 when transmit data is written to ICDRT or a stop condition is detected (STOP flag = 1 in ICSR2).

Note 4. Only channel 0 has a wakeup function, therefore IIC0_WUI is for channel 0 only.

Note 5. Channel number (n = 0, 1).

Clear or mask each flag during interrupt handling.

32.14.1 Buffer Operation for IICn_TXI and IICn_RXI Interrupts

If the conditions for generating an IICn_TXI or IICn_RXI interrupt are satisfied while the associated IR flag is 1, the interrupt request is not output for the ICU but is saved internally. One request per source can be saved internally.

An interrupt request that is saved within the ICU is output when the ICU.IELSRn.IR flag becomes 0. Internally saved interrupt requests are automatically cleared under normal conditions. They can also be cleared by writing 0 to the interrupt enable bit within the associated peripheral module.

32.15 State of Registers when Issuing each Condition

The IIC has two dedicated resets, IIC reset and internal reset. Table 32.11 lists the registers states when issuing each condition.

Table 32.11 Register states when issuing each condition (1 of 2)

Registers		Reset	IIC reset (ICE = 0, IICRST = 1)	Internal reset (ICE = 1, IICRST = 1)	Start or restart condition detection	Stop condition detection
ICCR1	ICE, IICRST	Reset	Saved	Saved	Saved	Saved
	SCLO, SDAO		Reset	Reset		
	Others			Saved		
ICCR2	BBSY	Reset	Reset	Saved	Set	Saved
	ST			Reset	Saved	Saved
	TRS,MST				Set or saved	Reset
	Others				Reset	Reset or saved

Table 32.10 中断源

Symbol	中断源	中断标志	DMAC/DTC activation	中断条件
IICn_EEI*5	传输错误或事件生成	AL	不可能	AL = 1, ALIE = 1
		NACKF		NACKF = 1, NAKIE = 1
		TMOF		TMOF = 1, TMOIE = 1
		START		START = 1, STIE = 1
		STOP		STOP = 1, SPIE = 1
IICn_RXI*2, *5	接收数据已满	RDRF	Possible	RDRF = 1, RIE = 1
IICn_TXI*1, *5	传输数据为空	TDRE	Possible	TDRE = 1, TIE = 1
IICn_TEI*3, *5	发射端	TEND	不可能	TEND = 1, TEIE = 1
IIC0_WUI*4	唤醒功能期间的从机地址匹配	WUF	不可能	从地址匹配 从机接收完成 RWAK operation ASY0 = 1 WUIE = 1

Note: CPU执行外围模块的写指令与实际写入模块之间存在延迟。当一个中断标志被清除或屏蔽时，再次读取相关标志，检查清除或屏蔽是否完成，然后从中断处理返回。不这样做会产生重复处理同一中断的可能性。

Note 1. 因为IICn_TXI是边沿检测中断，所以不需要清除。此外，ICSR2中的TDRE标志（条件为IICn_TXI)在发送数据写入ICDRT或检测到停止条件时自动设置为0(STOPflag=1in ICSR2).

Note 2. 因为IICn_RXI是边沿检测中断，所以不需要清除。此外，从ICDRR读取数据时，ICSR2中的RDRF标志（IICn_RXI的条件）自动设置为0。

Note 3. 使用IICn_TEI中断时，在IICn_TEI中断处理中清除ICSR2中的TEND标志。当发送数据写入ICDRT或检测到停止条件（ICSR2中的STOP标志=1）时，ICSR2中的TEND标志自动设置为0。

Note 4. 只有通道0具有唤醒功能，因此IIC0_WUI仅适用于通道0。

Note 5. 通道号(n=0 1)。

在中断处理期间清除或屏蔽每个标志。

32.14.1 IICn_TXI和IICn_RXI中断的缓冲区操作

如果在相关的IR标志为1时满足产生IICn_TXI或IICn_RXI中断的条件，则中断请求不会输出给ICU，而是在内部保存。每个源的一个请求可以在内部保存。

当ICU.IELSRn.IR标志变为0时，输出ICU中保存的中断请求。在正常情况下，内部保存的中断请求会自动清除。它们也可以通过向相关外围模块中的中断使能位写入0来清除。

32.15 发布每个条件时的注册状态

IIC有两个专用复位，IIC复位和内部复位。表32.11列出了发出每个条件时的寄存器状态。

Table 32.11 发出每个条件时注册状态（2个中的1个）

32.16 Event Link Output

IIC0 and IIC1 modules handle the event output for the Event Link Controller (ELC) for the following sources:

(1) Transfer error event

When a transfer error event occurs, the associated event signal can be output to another module by the ELC.

(2) Receive data full

When a receive data register becomes full, the associated event signal can be output to another module by the ELC.

(3) Transmit data empty

When a transmit data register becomes empty, the associated event signal can be output to another module by the ELC.

(4) Transmit end

On completion of the transfer, the associated event signal can be output to another module by the ELC.

32.16.1 Interrupt Handling and Event Linking

Each of the IIC interrupt types (see Table 32.10) has an enable bit to control enabling and disabling of the associated interrupt signal. An interrupt request signal is output to the CPU when an interrupt source condition is satisfied while the associated enable bit is set.

The associated event link output signals are sent to other modules as event signals by the ELC when the interrupt source conditions are satisfied, regardless of the interrupt enable bit settings. For details on interrupt sources, see Table 32.10.

32.16 事件链接输出

IIC0和IIC1模块为以下源处理事件链接控制器(ELC)的事件输出：

(1) 传输错误事件

当发生传输错误事件时，ELC可以将相关事件信号输出到另一个模块。

(2) 接收数据已满

当接收数据寄存器变满时，ELC可以将相关的事件信号输出到另一个模块。

(3) 传输数据为空

当发送数据寄存器变为空时，ELC可以将相关的事件信号输出到另一个模块。

(4) 发射端

传输完成后，ELC可以将相关的事件信号输出到另一个模块。

32.16.1 中断处理和事件链接

每种IIC中断类型（见表32.10）都有一个启用位来控制相关中断信号的启用和禁用。当相关的使能位设置时，中断源条件成立时，将向CPU输出中断请求信号。

当满足中断源条件时，ELC将关联的事件链接输出信号作为事件信号发送到其他模块，而不管中断使能位设置如何。有关中断源的详细信息，请参见表32.10。

RA生态工作室

32.17 Usage Notes

32.17.1 Settings for the Module-Stop State

The Module Stop Control Register B (MSTPCRB) can enable or disable IIC operation. The IIC module is initially stopped after a reset. Releasing the module-stop state enables access to the registers.

For details on Module Stop Control Register B, see section 11, Low Power Modes.

32.17.2 Notes on Starting Transfer

If the IR flag associated with the IIC interrupt is 1 when the transfer is started (ICCR1.ICE bit = 1), follow the procedure in this section to clear the interrupts before enabling operations. Starting transfer with the IR flag set to 1 while the ICCR1.ICE bit is 1 leads to an interrupt request being internally saved after transfer starts, and this can lead to unexpected behavior of the IR flag.

To clear interrupts before starting transfer operation:

1. Confirm that the ICCR1.ICE bit is 0.
2. Set the relevant interrupt enable bits, such as ICIER.TIE to 0.
3. Read the relevant interrupt enable bits, such as ICIER.TIE, and confirm that the value is 0.
4. Set the IR flag to 0.

32.17 使用说明

32.17.1 模块停止状态的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用IIC操作。IIC模块在复位后最初停止。释放模块停止状态可以访问寄存器。

有关模块停止控制寄存器B的详细信息，请参见第11节，低功耗模式。

32.17.2 开始转移注意事项

如果在传输开始时与IIC中断相关的IR标志为1（ICCR1.ICE位=1），请按照本节中的步骤在使能操作之前清除中断。在ICCR1.ICE位为1时将IR标志设置为1开始传输会导致在传输开始后内部保存中断请求，这可能导致IR标志的意外行为。

在开始传输操作之前清除中断：

1.确认ICCR1.ICE位为0。

2.设置相关的中断使能位，如ICIER.TIE为0。

3、读取相关的中断使能位，如ICIER.TIE，确认值为0。

4.将IR标志设置为0。

RA生态工作室

33. Controller Area Network (CAN) Module

33.1 Overview

The CAN module uses a message-based protocol to receive and transmit data between multiple slaves and masters in electromagnetically noisy applications. The module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported. The CAN module requires an additional external CAN transceiver.

Table 33.1 lists the CAN specifications, and Figure 33.1 shows a block diagram.

Table 33.1 CAN specifications (1 of 2)

Parameter	Specifications
Data transfer rate	ISO11898-1-compliant for standard and extended frames
Bit rate	Programmable up to 1 Mbps (fCAN ≥ 8 MHz) fCAN: CAN clock source
Message box	32 mailboxes, with two selectable mailbox modes • Normal mode: 32 mailboxes independently configurable for transmission or reception • FIFO mode: 24 mailboxes independently configurable for either transmission or reception, with remaining mailboxes used for receive (RX) and transmit (TX) 4-stage FIFOs.
Reception	• Support for data frame and remote frame reception • Reception ID format selectable to only standard ID, only extended ID, or mixed IDs • Programmable one-shot reception function • Selectable between overwrite mode (unread message overwritten) and overrun mode (unread message saved) • Reception complete interrupt independently enabled or disabled for each mailbox.
Acceptance filter	• Eight acceptance masks (one for every four mailboxes) • Masks independently enabled or disabled for each mailbox.
Transmission	• Support for data frame and remote frame transmission • Transmission ID format selectable to only standard ID, only extended ID, or mixed IDs • Programmable one-shot transmission function • Broadcast messaging function • Priority mode selectable based on message ID or mailbox number • Support for transmission request abort, with abort completion confirmable in status flag • Transmission complete interrupt independently enabled or disabled for each mailbox.
Mode transition for bus-off recovery	Mode transition for the recovery from the bus-off state selectable to: • ISO11898-1 specification-compliant • Automatic invoking of CAN halt mode on bus-off entry • Automatic invoking of CAN halt mode on bus-off end • Transition to CAN halt mode through software • Transition to error-active state through software.
Error status monitoring	• Monitoring of CAN bus errors, including stuff error, form error, ACK error, 15-bit CRC error, bit error, and ACK delimiter error • Detection of transition to error states, including error-warning, error-passive, bus-off entry, and bus-off recovery • Support for reading of error counters.
Time stamping	• Time stamp function using a 16-bit counter • Reference clock selectable to 1-bit, 2-bit, 4-bit, and 8-bit time periods.
Interrupt function	Support for five interrupt sources: • Reception complete • Transmission complete • Receive FIFO • Transmit FIFO • Error interrupts.
CAN sleep mode	CAN clock stopped to reduce power consumption

33. 控制器局域网(CAN)模块

33.1 Overview

CAN模块使用基于消息的协议在电磁噪声应用中的多个从机和主机之间接收和传输数据。该模块符合ISO11898-1(CAN2.0ACAN2.0B)标准，最多支持32个邮箱，可配置为普通邮箱和FIFO模式下的发送或接收。支持标准（11位）和扩展（29位）消息格式。CAN模块需要额外的外部CAN收发器。

表33.1列出了CAN规范，图33.1显示了框图。

Table 33.1 CAN规格(1of2)

Parameter	Specifications
数据传输率	标准和扩展框架符合ISO11898-1
比特率	可编程高达1Mbps(fCAN 8MHz)fCAN：CAN 时钟源
消息框	32个邮箱，有两种可选邮箱模式 普通模式：32个邮箱可独立配置用于发送或接收 FIFO模式：24个邮箱可独立配置用于发送或接收，其余邮箱用于接收(RX)和发送(TX)4-阶段FIFO。
Reception	支持数据帧和远程帧接收 接收ID格式可选择仅标准ID、仅扩展ID或混合ID 可编程一次性接收功能 可选择覆盖模式（未读消息覆盖）和溢出模式（保存未读消息） 为每个邮箱独立启用或禁用接收完成中断。
验收过滤器	八个接受掩码（每四个邮箱一个） 为每个邮箱独立启用或禁用掩码。
Transmission	支持数据帧和远程帧传输 传输ID格式可选择仅标准ID、仅扩展ID或混合ID 可编程一次性传输功能 广播消息功能 基于消息ID或邮箱号选择优先模式 支持对于传输请求中止，在状态标志中可确认中止完成 为每个邮箱独立启用或禁用传输完成中断。
总线关闭恢复的模式转换	从总线关闭状态恢复的模式转换可选择： 符合ISO11898-1规范 在总线关闭进入时自动调用CAN暂停模式 在总线关闭结束时自动调用CAN暂停模式 转换到CAN暂停通过软件模式 通过软件转换到错误激活状态。
错误状态监控	监控CAN总线错误，包括填充错误、格式错误、ACK错误、15位CRC错误、位错误和ACK分隔符错误 检测到错误状态的转换，包括错误警告、错误被动、总线关闭入口和总线关闭恢复 支持读取错误计数器。
时间戳	使用16位计数器的时间戳功能 可选择1位、2位、4位和8位时间周期的参考时钟。
中断功能	支持五个中断源： 接收完成 发送完成 接收FIFO 发送FIFO 错误中断。
CAN睡眠模式	CAN时钟停止以降低功耗

Table 33.1 CAN specifications (2 of 2)

Parameter	Specifications
Software support unit	Three software support units: • Acceptance filter support • Mailbox search support, including receive mailbox search, transmit mailbox search, and message lost search • Channel search support.
CAN clock source	PCLKB or CANMCLK
Test mode	Three test modes available for evaluation purposes: • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback).
Module-stop function	Module-stop state can be set to reduce power consumption

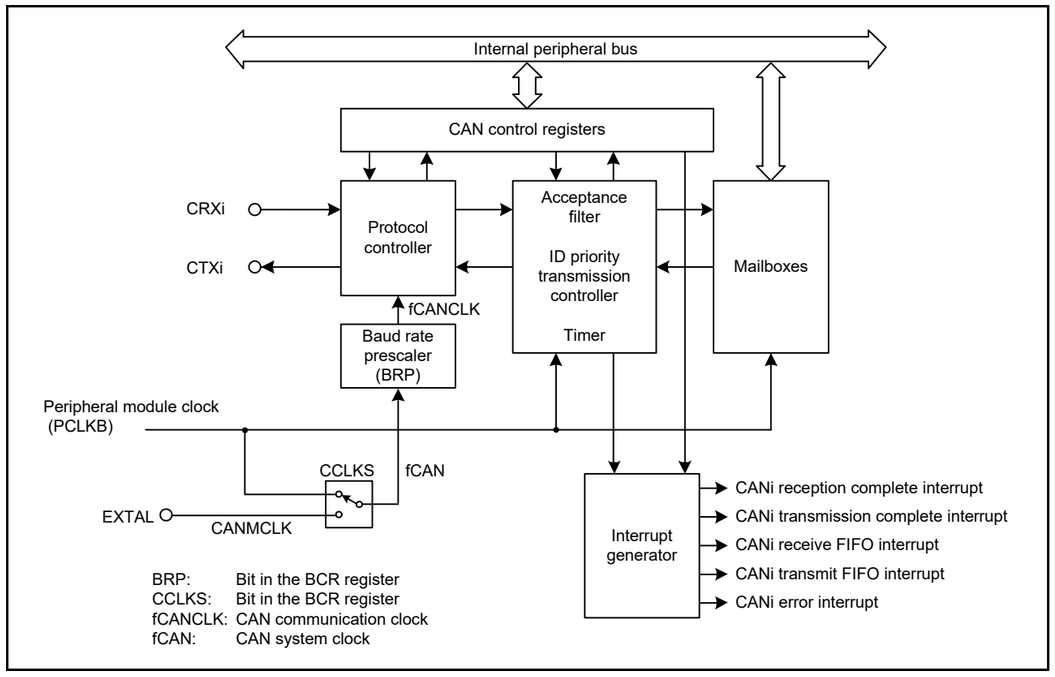

Figure 33.1 CAN module block diagram (i = 0, 1)

The CAN module constitutes the following blocks:

- CAN input and output pins
  CRXi and CTXi, where i = 0, 1
- Protocol controller
  Handles CAN protocol processing such as bus arbitration, bit timing at transmission and reception, stuffing, and error handling
- Mailboxes
  Consists of 32 mailboxes, which can be configured as either transmit or receive. Each mailbox has an individual ID, data length code (DLC), data field (8 bytes), and a time stamp.
- Acceptance filter
  Performs filtering of received messages using MKR0 to MKR7 registers for the filtering process
- Timer
  Used for the time stamp function. The timer value when a message is stored in the mailbox is written as the time stamp value.

Table 33.1 CAN规格（2个中的2个）

Parameter	Specifications
软件支持单位	三个软件支持单元： 接受过滤器支持 邮箱搜索支持，包括接收邮箱搜索、发送邮箱搜索和邮件丢失搜索 渠道搜索支持。
CAN时钟源	PCLKB or CANMCLK
测试模式	三种测试模式可用于评估目的： 只听模式 自测模式0 （外部环回） 自测模式1（内部环回）。
Module-stop function	可设置模块停止状态以降低功耗

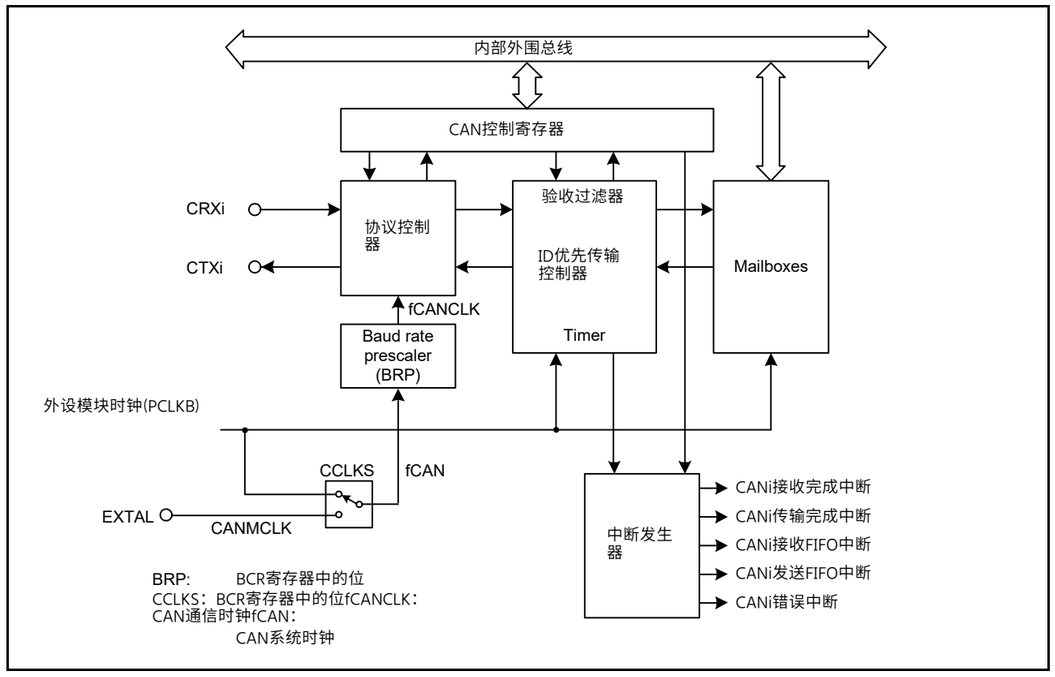

Figure 33.1 CAN模块框图(i=0 1)

CAN模块由以下模块组成：

- CAN输入和输出引脚
  CRXi和CTXi，其中i=0 1
- 协议控制器
  处理CAN协议处理，例如总线仲裁、发送和接收时的位时序、填充和错误处理
- Mailboxes
  包含32个邮箱，可配置为发送或接收。每个邮箱都有一个单独的ID、数据长度代码(DLC)、数据字段（8个字节）和一个时间戳。
- 验收过滤器
  使用用于过滤过程的MKR0到MKR7寄存器对接收到的消息进行过滤
- Timer
  用于时间戳功能。将消息存储在邮箱中时的计时器值作为时间戳值写入。

- Interrupt generator for five types of interrupts:
  - CANi reception complete interrupt
  - CANi transmission complete interrupt
  - CANi receive FIFO interrupt
  - CANi transmit FIFO interrupt
  - CANi error interrupt.

Table 33.2 lists the CAN module pins. These pins are multiplexed with other signals on the MCU. For details, see section 20, I/O Ports.

Table 33.2 CAN module I/O pins

Pin name	I/O	Function
CRX0	Input	Data receive pin
CTX0	Output	Data transmit pin
CRX1	Input	Data receive pin
CTX1	Output	Data transmit pin

33.2 Register Descriptions

33.2.1 Control Register (CTLR)

Address(es): CAN0.CTLR 4005 0840h, CAN1.CTLR 4005 1840h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b9, b8	CANM[1:0]	CAN Operating Mode Select*5	b9 b8 0 0: CAN operation mode 0 1: CAN reset mode 1 0: CAN halt mode 1 1: CAN reset mode (forced transition).	R/W
b10	SLPM	CAN Sleep Mode*5,*6	0: Exit CAN sleep mode 1: Enter CAN sleep mode.	R/W
b12, b11	BOM[1:0]	Bus-Off Recovery Mode*1	b12 b11 0 0: Normal mode (ISO11898-1 specification compliant) 0 1: Enter CAN halt mode automatically on entering bus-off state 1 0: Enter CAN halt mode automatically at the end of bus-off state 1 1: Enter CAN halt mode during bus-off recovery period through a software request.	R/W
b13	RBOC	Forcible Return from Bus-Off*2	0: No return occurred 1: Forced return from bus-off state.*3	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Write to the BOM[1:0], TSPS[1:0], TPM, MLM, IDFM[1:0], and MBM bits in CAN reset mode.
Note 2. Set the RBOC bit to 1 in the bus-off state.
Note 3. This bit automatically sets to 0 after being set to 1. It should be read as 0.
Note 4. Set the TSRC bit to 1 in CAN operation mode.
Note 5. When the CANM[1:0] and SLPM bits are changed, check STR to ensure that the mode is switched. Do not change the CANM[1:0] bits or SLPM bit until the mode is switched.
Note 6. Write to the SLPM bit in CAN reset mode or CAN halt mode. When changing the SLPM bit, write 0 or 1 only to the SLPM bit.

MBM bit (CAN Mailbox Mode Select)

When the MBM bit is 0 (normal mailbox mode), mailboxes 0 to 31 are configured as transmit or receive mailboxes.

When the MBM bit is 1 (FIFO mailbox mode):

- Mailboxes 0 to 23 are configured as transmit or receive mailboxes
- Mailboxes 24 to 27 are configured as transmit FIFO
- Mailboxes 28 to 31 are configured as receive FIFO.

Transmit data is written into mailbox 24, a window mailbox for the transmit FIFO. Receive data is read from mailbox 28, a window mailbox for the receive FIFO.

Table 33.3 lists the mailbox configuration.

IDFM[1:0] bits (ID Format Mode Select)

The IDFM[1:0] bits specify the ID format.

MLM bit (Message Lost Mode Select*1)

The MLM bit specifies the operation when a new message is captured in an unread mailbox. Overwrite mode or overrun mode can be selected. All mailboxes, including the receive FIFO are set to either overwrite mode or overrun mode.

When the MLM bit is 0, all mailboxes are set to overwrite mode. Any new message received overwrites the pre-existing message.

When the MLM bit is 1, all mailboxes are set to overrun mode. Any new message received does not overwrite the pre-existing message, and the new message is discarded.

TPM bit (Transmission Priority Mode Select*1)

The TPM bit specifies the priority when transmitting messages.

The ID priority transmit mode or mailbox number transmit mode can be selected. All mailboxes are set for either ID priority transmission or mailbox number priority transmission.

Bit	Symbol	位名称	Description	R/W
b7, b6	TSPS[1:0]	时间戳预分频器 Select*1	b7b600：每1位时间0 1：每2位时间10：每4位时间11：每8位时间。	R/W
b9, b8	CANM[1:0]	CAN操作模式 Select*5	b9b800：CAN操作模式01：CAN复位模式10：CAN暂停模式11：CAN复位模式（强制转换）。	R/W
b10	SLPM	CAN睡眠模式*5 *6	0：退出CAN睡眠模式1：进入CAN睡眠模式。	R/W
b12, b11	BOM[1:0]	Bus-Off Recovery Mode*1	b12b1100：正常模式（符合ISO11898-1规范）01：进入总线关闭状态时自动进入CAN停止模式10：在总线关闭状态结束时自动进入CAN停止模式11：进入CAN停止在总线关闭恢复期间通过软件请求模式。	R/W
b13	RBOC	强行返回 Bus-Off*2	0：未发生返回1：从总线关闭状态强制返回。*3	R/W
b15, b14	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 在CAN复位模式下写入BOM[1:0]、TSPS[1:0]、TPM、MLM、IDFM[1:0]和MBM位。
Note 2. 在总线关闭状态下将RBOC位设置为1。
Note 3. 该位设置为1后自动设置为0，应读为0。
Note 4. 在CAN操作模式下将TSRC位设置为1。
Note 5. 当CANM[1:0]和SLPM位改变时，检查STR以确保模式切换。不要改变CANM[1:0]位或SLPM位，直到模式切换。
Note 6. 在CAN复位模式或CAN暂停模式下写入SLPM位。更改SLPM位时，仅向SLPM位写入0或1。

MBM位（CAN邮箱模式选择）

当MBM位为0（正常邮箱模式）时，邮箱0到31被配置为发送或接收邮箱。

当MBM位为1（FIFO邮箱模式）时：

- 邮箱0到23被配置为发送或接收邮箱
- 邮箱24到27被配置为发送FIFO
- 邮箱28到31配置为接收FIFO。

发送数据写入邮箱24，这是发送FIFO的窗口邮箱。接收数据从邮箱28中读取，该邮箱是接收FIFO的窗口邮箱。

表33.3列出了邮箱配置。

IDFM[1:0]位（ID格式模式选择）

IDFM[1:0]位指定ID格式。

MLM位（消息丢失模式选择*1）

MLM位指定在未读邮箱中捕获新消息时的操作。可以选择覆盖模式或溢出模式。所有邮箱，包括接收FIFO都设置为覆盖模式或溢出模式。

当MLM位为0时，所有邮箱都设置为覆盖模式。收到的任何新消息都会覆盖先前存在的消息。

当MLM位为1时，所有邮箱都设置为溢出模式。收到的任何新消息都不会覆盖先前存在的消息，并且新消息将被丢弃。

TPM位（传输优先模式选择*1）

TPM位指定传输消息时的优先级。

可选择ID优先传送模式或信箱号码传送模式。所有信箱都设置为ID优先传输或信箱号码优先传输。

When TPM is 0, ID priority transmit mode is selected and transmission priority is arbitrated, as defined in the CAN specification (ISO11898-1). In ID priority transmit mode, mailboxes 0 to 31 (in normal mailbox mode), and mailboxes 0 to 23 (in FIFO mailbox mode), and the transmit FIFO are compared for the IDs of mailboxes configured for transmission. If two or more mailbox IDs are the same, the mailbox with the smaller number has higher priority.

Only the next message to be transmitted from the transmit FIFO is included in the transmission arbitration. If a FIFO message is currently being transmitted, the next pending message within the transmit FIFO is included in the transmission arbitration.

When TPM is 1, mailbox number transmit mode is selected and the transmit mailbox with the smallest mailbox number has the highest priority. In FIFO mailbox mode, the transmit FIFO has lower priority than normal mailboxes (0 to 23).

TSRC bit (Time Stamp Counter Reset Command*4)

The TSRC bit resets the time stamp counter. When this bit is set to 1, TSR is set to 0000h. This bit is automatically set to 0.

TSPS[1:0] bits (Time Stamp Prescaler Select*1)

The TSPS[1:0] bits select the prescaler for the time stamp. The reference clock for the time stamp can be selected to either 1-bit, 2-bit, 4-bit, or 8-bit time periods.

CANM[1:0] bits (CAN Operating Mode Select*5)

The CANM[1:0] bits select one of the following modes for the CAN module:

- CAN operation mode
- CAN reset mode
- CAN halt mode.

The CAN sleep mode is set in the SLPM bit. For details, see section 33.3, Operation Modes. When the CAN module enters CAN halt mode based on the BOM[1:0] setting, the CANM[1:0] bits are automatically set to 10b.

SLPM bit (CAN Sleep Mode)

When the SLPM bit is set to 1, the CAN module enters CAN sleep mode. When the SLPM bit is set to 0, the CAN module exits CAN sleep mode. For details, see section 33.3, Operation Modes.

BOM[1:0] bits (Bus-Off Recovery Mode*1)

The BOM[1:0] bits select bus-off recovery mode for the CAN module.

When the BOM[1:0] bits are 00b, the recovery from bus-off is compliant with the ISO11898-1 CAN specification. The CAN module recovers CAN communication (error-active state) after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request occurs when recovering from bus-off.

When the BOM[1:0] bits are 01b and the CAN module reaches the bus-off state, the CANM[1:0] bits in CTLR are set to 10b to enter CAN halt mode. No bus-off recovery interrupt request occurs when recovering from bus-off, and TECR and RECR are set to 00h.

When the BOM[1:0] bits are 10b, the CANM[1:0] bits are set to 10b as soon as the CAN module reaches the bus-off state. The CAN module enters CAN halt mode after recovery from the bus-off state, and after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request occurs when recovering from bus-off, and TECR and RECR are set to 00h.

When the BOM[1:0] bits are 11b, the CAN module enters CAN halt mode by setting the CANM[1:0] bits to 10b while the CAN module is still in the bus-off state. No bus-off recovery interrupt request is generated when recovering from bus-off, and TECR and RECR are set to 00h. However, if the CAN module recovers from bus-off after detecting 11 consecutive recessive bits 128 times before the CANM[1:0] bits are set to 10b, a bus-off recovery interrupt request is generated.

If the CPU requests an entry to the CAN reset mode at the same time as the CAN module attempts to enter CAN halt mode (at bus-off entry when the BOM[1:0] bits are 01b, or at bus-off end when the BOM[1:0] bits are 10b), then the CPU request has higher priority.

当TPM为0时，选择ID优先传输模式并仲裁传输优先级，如CAN规范(ISO11898-1)中所定义。在ID优先传输模式下，邮箱0到31（在普通邮箱模式下）和邮箱0到23（在FIFO邮箱模式下）和传输FIFO将针对配置为传输的邮箱ID进行比较。如果两个或多个邮箱ID相同，则编号较小的邮箱优先级较高。

只有从发送FIFO发送的下一条消息包含在发送仲裁中。如果当前正在发送FIFO消息，则发送FIFO中的下一个未决消息将包含在发送仲裁中。

当TPM为1时，选择邮箱号发送模式，邮箱号最小的发送邮箱优先级最高。在FIFO邮箱模式下，发送FIFO的优先级低于普通邮箱（0到23）。

TSRC位（时间戳计数器复位命令*4）

TSRC位复位时间戳计数器。当该位设置为1时，TSR设置为0000h。该位自动设置为0。

TSPS[1:0]位（时间戳预分频器选择*1）

TSPS[1:0]位选择时间戳的预分频器。时间戳的参考时钟可以选择为1位、2位、4位或8位时间段。

CANM[1:0]位（CAN操作模式选择*5）

CANM[1:0]位为CAN模块选择以下模式之一：

- CAN操作模式
- CAN复位模式
- CAN暂停模式。

CAN睡眠模式在SLPM位中设置。有关详细信息，请参阅第33.3节，操作模式。当CAN模块根据BOM[1:0]设置进入CAN暂停模式时，CANM[1:0]位自动设置为10b。

SLPM位（CAN休眠模式）

当SLPM位设置为1时，CAN模块进入CAN睡眠模式。当SLPM位设置为0时，CAN模块退出CAN睡眠模式。有关详细信息，请参阅第33.3节，操作模式。

BOM[1:0]位（总线关闭恢复模式*1）

BOM[1:0]位选择CAN模块的总线关闭恢复模式。

当BOM[1:0]位为00b时，总线关闭恢复符合ISO11898-1CAN规范。CAN模块在检测到11个连续隐性位128次后恢复CAN通信（错误激活状态）。
从总线关闭中恢复时会出现总线关闭恢复中断请求。

当BOM[1:0]位为01b且CAN模块达到总线关闭状态时，CTLR中的CANM[1:0]位设置为10b以进入CAN停止模式。总线关闭恢复时不产生总线关闭恢复中断请求，TECR和RECR设置为00h。

当BOM[1:0]位为10b时，CAN模块一到达总线关闭状态，CANM[1:0]位就会设置为10b。CAN模块从总线关闭状态恢复后，并在检测到11个连续的隐性位128次后进入CAN停止模式。总线关闭恢复时产生总线关闭恢复中断请求，TECR和RECR设置为00h。

当BOM[1:0]位为11b时，CAN模块通过将CANM[1:0]位设置为10b进入CAN停止模式，同时CAN模块仍处于总线关闭状态。总线关闭恢复时不产生总线关闭恢复中断请求，TECR和RECR设置为00h。但是，如果CAN模块在CANM[1:0]位设置为10b之前128次检测到11个连续隐性位后从总线关闭中恢复，则会产生总线关闭恢复中断请求。

如果CPU在CAN模块尝试进入CAN暂停模式的同时请求进入CAN复位模式（当BOM[1:0]位为01b时在总线关闭进入，或在总线关闭结束时BOM[1:0]位为10b），则CPU请求具有更高的优先级。

RBOC bit (Forcible Return from Bus-Off*2)

When the RBOC bit is set to 1 in the bus-off state, the CAN module forcibly exits the bus-off state. This bit is automatically set to 0, and the error state changes from bus-off to error-active. When the RBOC bit is set to 1, RECR and TECR are set to 00h and the BOST bit in STR is set to 0, indicating that the CAN module is not in bus-off state. The other registers remain unchanged when RBOC is set to 1. No bus-off recovery interrupt request is generated by this recovery from the bus-off state. Use the RBOC bit only when the BOM[1:0] bits are 00b (normal mode).

Table 33.3 Mailbox configuration

Mailbox	MBM bit = 0 (normal mailbox mode)	MBM bit = 1 (FIFO mailbox mode)*1 to *5
Mailboxes 0 to 23	Normal mailbox	Normal mailbox
Mailboxes 24 to 27		Transmit FIFO
Mailboxes 28 to 31		Receive FIFO

Note 1. The transmit FIFO is controlled by TFCR. The MCTL_TXj registers associated with mailboxes 24 to 27 are disabled. MCTL_TX24 to MCTL_TX27 cannot be used by the transmit FIFO.
Note 2. The receive FIFO is controlled by RFCR. The MCTL_RXj registers associated with mailboxes 28 to 31 are disabled. MCTL_RX28 to MCTL_RX31 cannot be used by the receive FIFO.
Note 3. See the MIER_FIFO register for information on the FIFO interrupts.
Note 4. The bits in MKIVLR associated with mailboxes 24 to 31 are disabled. Set these bits to 0.
Note 5. The transmit and receive FIFOs can be used for both data frames and remote frames.

33.2.2 Bit Configuration Register (BCR)

Address(es): CAN0.BCR 4005 0844h, CAN1.BCR 4005 1844h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TSEG1[3:0]				—	—	BRP[9:0]

	—	—	SJW[1:0]		—	TSEG2[2:0]			—	—	—	—	—	—	—	CCLKS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CCLKS	CAN Clock Source Selection	0: PCLKB (generated by the PLL clock) 1: CANMCLK (generated by the main clock oscillator).	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b10 to b8	TSEG2[2:0]	Time Segment 2 Control	b10 b8 0 0 0: Setting prohibited 0 0 1: 2 Tq 0 1 0: 3 Tq 0 1 1: 4 Tq 1 0 0: 5 Tq 1 0 1: 6 Tq 1 1 0: 7 Tq 1 1 1: 8 Tq.	R/W
b11	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b13, b12	SJW[1:0]	Synchronization Jump Width Control	b13 b12 0 0: 1 Tq 0 1: 2 Tq 1 0: 3 Tq 1 1: 4 Tq.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b25 to b16	BRP[9:0]	Baud Rate Prescaler Select*1	These bits set the frequency of the CAN communication clock (fCANCLK)	R/W

RBOC位（从总线关闭强制返回*2）

当RBOC位在总线关闭状态下设置为1时，CAN模块强制退出总线关闭状态。该位自动设置为0，错误状态从总线关闭变为错误激活。当RBOC位设置为1时，RECR和TECR设置为00h，STR中的BOST位设置为0，表示CAN模块不处于总线关闭状态。当RBOC设置为1时，其他寄存器保持不变。从总线关闭状态恢复不会产生总线关闭恢复中断请求。仅当BOM[1:0]位为00b（正常模式）时才使用RBOC位。

Table 33.3 邮箱配置

Mailbox	MBM位=0（正常邮箱模式）	MBM位=1（FIFO邮箱模式）*1到*5
邮箱0到23	普通邮箱	普通邮箱
邮箱24至27		Transmit FIFO
邮箱28至31		Receive FIFO

Note 1. 发送FIFO由TFCR控制。与邮箱24到27关联的MCTL_TXj寄存器被禁用。发送FIFO不能使用MCTL_TX24到MCTL_TX27。
Note 2. 接收FIFO由RFCR控制。与邮箱28到31关联的MCTL_RXj寄存器被禁用。MCTL_RX28到MCTL_RX31不能被接收FIFO使用。
Note 3. 有关FIFO中断的信息，请参见MIER_FIFO寄存器。
Note 4. MKIVLR中与邮箱24到31关联的位被禁用。将这些位设置为0。
Note 5. 发送和接收FIFO可用于数据帧和远程帧。

33.2.2 位配置寄存器(BCR)

Address(es): CAN0.BCR 4005 0844h, CAN1.BCR 4005 1844h

b11	—	Reserved	该位读取为0。写入值应为0。	R/W
b13, b12	SJW[1:0]	同步跳转宽度控制	b13 b12 0 0: 1 Tq 0 1: 2 Tq 1 0: 3 Tq 1 1: 4 Tq.	R/W
b15, b14	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b25 to b16	BRP[9:0]	Baud Rate Prescaler Select*1	这些位设置CAN通信时钟(fCANCLK)的频率	R/W

Bit	Symbol	Bit name	Description	R/W
b27, b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31 to b28	TSEG1[3:0]	Time Segment 1 Control	b31 b28 0 0 0 0: Setting prohibited 0 0 0 1: Setting prohibited 0 0 1 0: Setting prohibited 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq.	R/W

Tq: Time Quantum

Note 1. Do not select a value less than or equal to 1 while the SCKSCR.CKSEL[2:0] bits are 011b (selecting the main clock oscillator).

For details about setting the bit timing, see section 33.4, Data Transfer Rate Configuration. Set BCR before entering CAN halt mode or CAN operation mode from CAN reset mode. After the setting is made once, this register can be written to in CAN reset mode or CAN halt mode. A 32-bit read/write access must be performed carefully so as not to change bits [7:0].

CCLKS bit (CAN Clock Source Selection)

When the CCLKS bit is 0, the peripheral module clock (PCLKB) produced by the PLL frequency synthesizer is used as the CAN clock source (fCAN). When the CCLKS bit is 1, CANMCLK produced externally by the EXTAL pins is used as the CAN clock source (fCAN).

TSEG2[2:0] bits (Time Segment 2 Control)

The TSEG2[2:0] bits specify the length of the phase buffer segment 2 (PHASE_SEG2) with a Tq value. A value from 2 to 8 Tq can be set. Set a value smaller than that in the TSEG1[3:0] bits.

SJW[1:0] bits (Synchronization Jump Width Control)

The SJW[1:0] bits specify the synchronization jump width with a Tq value. A value from 1 to 4 Tq can be set. Set a value smaller than or equal to that in the TSEG2[2:0] bits.

BRP[9:0] bits (Baud Rate Prescaler Select*1)

The BRP[9:0] bits set the frequency of the CAN communication clock (fCANCLK). The fCANCLK cycle is 1 Tq. If the setting is P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

TSEG1[3:0] bits (Time Segment 1 Control)

The TSEG1[3:0] bits specify the total length of the propagation time segment (PROP_SEG) and phase buffer segment 1 (PHASE_SEG1) with a time quantum (Tq) value. A value from 4 to 16 Tq can be set.

Bit	Symbol	位名称	Description	R/W
b27, b26	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b31 to b28	TSEG1[3:0]	时间段1控制	b31b280000：禁止设置00 01：禁止设置0010：禁止设 置0011：4Tq0100：5Tq01 01：6Tq0110：7Tq0111： 8Tq1000：9Tq1001：10Tq 1010：11Tq1011：12Tq11 00：13Tq1101：14Tq1110 ：15Tq1111：16Tq。	R/W

Tq：时间量子

Note 1. 当SCKSCR.CKSEL[2:0]位为011b（选择主时钟振荡器）时，请勿选择小于或等于1的值。

有关设置位时序的详细信息，请参见第33.4节，数据传输速率配置。在从CAN复位模式进入CAN停止模式或CAN操作模式之前设置BCR。设置一次后，可在CAN复位模式或CAN暂停模式下写入该寄存器。必须小心执行32位读写访问，以免更改位[7:0]。

CCLKS位（CAN时钟源选择）

当CCLKS位为0时，PLL频率合成器产生的外设模块时钟（PCLKB）用作CAN时钟源（fCAN）。当CCLKS位为1时，由EXTAL引脚从外部产生的CANMCLK用作CAN时钟源(fCAN)。

TSEG2[2:0]位（时间段2控制）

TSEG2[2:0]位用Tq值指定相位缓冲段2(PHASE_SEG2)的长度。可以设置2到8Tq的值。设置一个小于TSEG1[3:0]位的值。

SJW[1:0]位（同步跳转宽度控制）

SJW[1:0]位用Tq值指定同步跳转宽度。可以设置1到4Tq的值。设置一个小于或等于TSEG2[2:0]位的值。

BRP[9:0]位（波特率预分频器选择*1）

BRP[9:0]位设置CAN通信时钟(fCANCLK)的频率。fCANCLK周期为1Tq。如果设置为P（0到1023），则波特率预分频器将fCAN除以P+1。

TSEG1[3:0]位（时间段1控制）

TSEG1[3:0]位用时间量(Tq)值指定传播时间段(PROP_SEG)和相位缓冲段1(PHASE_SEG1)的总长度。可以设置4到16Tq的值。

33.2.3 Mask Register k (MKRk) (k = 0 to 7)

Address(es): CAN0.MKR[0] 4005 0400h to CAN0.MKR[7] 4005 041Ch, CAN1.MKR[0] 4005 1400h to CAN1.MKR[7] 4005 141Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	SID[10:0]											EID[17:0]	
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b17 to b0	EID[17:0]	Extended ID	0: Do not compare associated EID[17:0] bits 1: Compare associated EID[17:0] bits.	R/W
b28 to b18	SID[10:0]	Standard ID	0: Do not compare associated SID[10:0] bits 1: Compare associated SID[10:0] bits.	R/W
b31 to b29	—	Reserved	The read value is undefined. The write value should be 0.	R/W

For the mask function in FIFO mailbox mode, see section 33.6, Acceptance Filtering and Masking Functions. Write to MKR0 to MKR7 in CAN reset mode or CAN halt mode.

EID[17:0] bits (Extended ID)

The EID[17:0] bits are the filter mask bits associated with the CAN extended ID bits. They are used to receive extended ID messages. When an EID[17:0] bit is set to 0, the received ID is not compared with the associated mailbox ID. When an EID[17:0] bit is set to 1, the received ID is compared with the associated mailbox ID.

SID[10:0] bits (Standard ID)

The SID[10:0] bits are the filter mask bits associated with the CAN standard ID bits. They are used to receive both standard ID and extended ID messages. When an SID[10:0] bit is set to 0, the received ID is not compared with the associated mailbox ID. When an SID[10:0] bit is set to 1, the received ID is compared with the associated mailbox ID.

33.2.4 FIFO Received ID Compare Registers 0 and 1 (FIDCR0 and FIDCR1)

Address(es): CAN0.FIDCR0 4005 0420h, CAN0.FIDCR1 4005 0424h, CAN1.FIDCR0 4005 1420h, CAN1.FIDCR1 4005 1424h

b17 to b0	EID[17:0]	扩展ID	0：不比较关联的EID[17:0]位1：比较关联的EID[17:0]位。	R/W
b28 to b18	SID[10:0]	标准标识	0：不比较关联的SID[10:0]位1：比较关联的SID[10:0]位。	R/W
b31 to b29	—	Reserved	读取值未定义。写入值应为0。	R/W

对于FIFO邮箱模式下的屏蔽功能，请参见第33.6节，接受过滤和屏蔽功能。写给MKR0至MKR7处于CAN复位模式或CAN暂停模式。

EID[17:0]位（扩展ID）

EID[17:0]位是与CAN扩展ID位相关的过滤器掩码位。它们用于接收扩展ID消息。当EID[17:0]位设置为0时，接收到的ID不会与关联的邮箱ID进行比较。当EID[17:0]位设置为1时，接收的ID将与关联的邮箱ID进行比较。

SID[10:0]位（标准ID）

SID[10:0]位是与CAN标准ID位相关的过滤器掩码位。它们用于接收标准ID和扩展ID消息。当SID[10:0]位设置为0时，接收到的ID不会与关联的邮箱ID进行比较。当SID[10:0]位设置为1时，接收的ID将与关联的邮箱ID进行比较。

33.2.4 FIFO接收ID比较寄存器0和1（FIDCR0和FIDCR1）

Address(es): CAN0.FIDCR0 4005 0420h, CAN0.FIDCR1 4005 0424h, CAN1.FIDCR0 4005 1420h, CAN1.FIDCR1 4005 1424h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EID[17:0]															
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	位名称	Description	R/W
b17 to b0	EID[17:0]	扩展ID	数据和远程帧的扩展ID	R/W
b28 to b18	SID[10:0]	标准标识	数据和远程帧的标准ID	R/W
b29	—	Reserved	读取值未定义。写入值应为0。	R/W
b30	RTR	远程传输 Request	0：数据帧1：远程帧。	R/W

Bit	Symbol	Bit name	Description	R/W
b31	IDE	ID Extension*1	0: Standard ID 1: Extended ID.	R/W

Note 1. When the CTLR.IDFM[1:0] bits are any value other than 10b (mixed ID mode), the IDE bit should be written with 0 and read as 0.

FIDCR0 and FIDCR1 are enabled when the MBM bit in CTLR is set to 1 (FIFO mailbox mode). In this mode, the EID[17:0], SID[10:0], RTR, and IDE bits in mailbox 28 to mailbox 31 are disabled. Write to FIDCR0 and FIDCR1 in CAN reset mode or CAN halt mode. For information on using FIDCR0 and FIDCR1, see section 33.6, Acceptance Filtering and Masking Functions.

EID[17:0] bits (Extended ID)

The EID[17:0] bits set the extended ID of data and remote frames. These bits are used to receive extended ID messages.

SID[10:0] bits (Standard ID)

The SID[10:0] bits set the standard ID of data frames and remote frames. These bits are used to receive both standard ID and extended ID messages.

RTR bit (Remote Transmission Request)

The RTR bit sets the frame format to data frames or remote frames:

- When the RTR bits in both FIDCR0 and FIDCR1 registers are set to 0, only data frames are received
- When the RTR bits in both FIDCR0 and FIDCR1 registers are set to 1, only remote frames are received
- When the RTR bits in both FIDCR0 and FIDCR1 registers are set to different values, both data frames and remote frames are received.

IDE bit (ID Extension*1)

The IDE bit sets the ID format to standard ID or extended ID. The IDE bit is enabled when the IDFM[1:0] bits in CTLR are 10b (mixed ID mode):

- When IDE bits in both FIDCR0 and FIDCR1 are set to 0, only standard ID frames are received
- When IDE bits in both FIDCR0 and FIDCR1 are set to 1, only extended ID frames are received
- When IDE bits in FIDCR0 and FIDCR1 are set to different values, both standard and extended ID frames are received.

33.2.5 Mask Invalid Register (MKIVLR)

Address(es): CAN0.MKIVLR 4005 0428h, CAN1.MKIVLR 4005 1428h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MB31	MB30	MB29	MB28	MB27	MB26	MB25	MB24	MB23	MB22	MB21	MB20	MB19	MB18	MB17	MB16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b31 to b0	MB31 to MB0	Mask Invalid	0: Mask valid 1: Mask invalid.	R/W

Each bit in MKIVLR is associated with a mailbox of the same number. Bit [0] in MKIVLR corresponds to mailbox 0 (MB0), and bit [31] corresponds to mailbox 31 (MB31).

Bit	Symbol	位名称	Description	R/W
b31	IDE	ID Extension*1	0：标准ID1： 扩展ID。	R/W

Note 1. 当CTLR.IDFM[1:0]位为10b以外的任何值（混合ID模式）时，IDE位应写入0，读取为0。

当CTLR中的MBM位设置为1（FIFO邮箱模式）时，FIDCR0和FIDCR1被使能。在此模式下，邮箱28到邮箱31中的EID[17:0]、SID[10:0]、RTR和IDE位被禁用。写入FIDCR0和FIDCR1中
CAN复位模式或CAN暂停模式。有关使用FIDCR0和FIDCR1的信息，请参阅第33.6节，验收
过滤和屏蔽功能。

EID[17:0]位（扩展ID）

EID[17:0]位设置数据和远程帧的扩展ID。这些位用于接收扩展ID消息。

SID[10:0]位（标准ID）

SID[10:0]位设置数据帧和远程帧的标准ID。这些位用于接收标准ID和扩展ID消息。

RTR位（远程传输请求）

RTR位将帧格式设置为数据帧或远程帧：

- 当FIDCR0和FIDCR1寄存器中的RTR位都设置为0时，只接收数据帧
- 当FIDCR0和FIDCR1寄存器中的RTR位都设置为1时，只接收远程帧
- 当FIDCR0和FIDCR1寄存器中的RTR位设置为不同的值时，数据帧和远程帧都会被接收。

IDE位（ID扩展*1）

IDE位将ID格式设置为标准ID或扩展ID。当CTLR中的IDFM[1:0]位为10b（混合ID模式）时，IDE位被使能：

- 当FIDCR0和FIDCR1中的IDE位都设置为0时，只接收标准ID帧
- 当FIDCR0和FIDCR1中的IDE位都设置为1时，只接收扩展ID帧
- 当FIDCR0和FIDCR1中的IDE位设置为不同的值时，标准和扩展ID帧都会被接收。

33.2.5 屏蔽无效寄存器(MKIVLR)

Address(es): CAN0.MKIVLR 4005 0428h, CAN1.MKIVLR 4005 1428h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	位名称	Description	R/W
b31 to b0	MB31 to MB0	掩码无效	0：屏蔽有效1 ：屏蔽无效。	R/W

MKIVLR中的每个位都与一个相同号码的邮箱相关联。MKIVLR中的位[0]对应邮箱0(MB0)，位[31]对应邮箱31(MB31)。

Note: Set bits [31:24] to 0 in FIFO mailbox mode.

When a bit is set to 1, the associated acceptance mask register becomes invalid for the associated mailbox. When a mask invalid bit is set to 1, a message is received by the associated mailbox only if the receive message ID matches the mailbox ID exactly. Write to MKIVLR in CAN reset or halt mode.

33.2.6 Mailbox Register j (MBj_ID, MBj_DL, MBj_Dm, MBj_TS) (j = 0 to 31; m = 0 to 7)

Table 33.4 lists the CANi mailbox memory mapping, and Table 33.5 lists the CAN data frame configuration. The value of the CANi mailbox after reset is undefined.

Write to MBj_ID, MBj_DL, MBj_Dm, and MBj_TS registers only when the related MCTL_TXj or MCTL_RXj register (j = 0 to 31) is 00h and the associated mailbox does not process an abort request. See Table 33.4 for details on register addresses.

Table 33.4 CANi mailbox memory mapping

Address		Message content
CAN0	CAN1	Memory mapping
4005 0200h + 16 × j + 0	4005 1200h + 16 × j + 0	IDE, RTR, SID10 to SID6
4005 0200h + 16 × j + 1	4005 1200h + 16 × j + 1	SID5 to SID0, EID17, EID16
4005 0200h + 16 × j + 2	4005 1200h + 16 × j + 2	EID15 to EID8
4005 0200h + 16 × j + 3	4005 1200h + 16 × j + 3	EID7 to EID0
4005 0200h + 16 × j + 4	4005 1200h + 16 × j + 4	-
4005 0200h + 16 × j + 5	4005 1200h + 16 × j + 5	Data length code (DLC[3:0])
4005 0200h + 16 × j + 6	4005 1200h + 16 × j + 6	Data byte 0
4005 0200h + 16 × j + 7	4005 1200h + 16 × j + 7	Data byte 1
4005 0200h + 16 × j + 8	4005 1200h + 16 × j + 8	Data byte 2
4005 0200h + 16 × j + 9	4005 1200h + 16 × j + 9	Data byte 3

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EID[17:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Note: 在FIFO邮箱模式下将位[31:24]设置为0。

当某个位设置为1时，相关联的接受屏蔽寄存器对于相关联的邮箱变得无效。当掩码无效位设置为1时，只有当接收消息ID与邮箱ID完全匹配时，相关邮箱才会接收消息。在CAN复位或暂停模式下写入MKIVLR。

33.2.6 邮箱寄存器j（MBj_ID、MBj_DL、MBj_Dm、MBj_TS）（j=0到31；m=0到7）

表33.4列出了CANi邮箱内存映射，表33.5列出了CAN数据帧配置。复位后CANi邮箱的值未定义。

仅当相关的MCTL_TXj或MCTL_RXj寄存器（j=0到31）为00h且相关邮箱不处理中止请求时才写入MBj_ID、MBj_DL、MBj_Dm和MBj_TS寄存器。有关寄存器地址的详细信息，请参见表33.4。

RA生态工作室

Bit	Symbol	Bit name	Description	R/W
b7 to b0	TSL[7:0]	Time Stamp Lower Byte	The TSH[7:0] and TSL[7:0] bits store the counter value of the time stamp when received messages are stored in the mailbox.	R/W
b15 to b8	TSH[7:0]	Time Stamp Higher Byte		R/W

EID[17:0] bits (Extended ID*1)

The EID[17:0] bits set the extended ID of data frames and remote frames. These bits transmit or receive extended ID messages.

SID[10:0] bits (Standard ID)

The SID[10:0] bits set the standard ID of data frames and remote frames. These bits transmit or receive both standard ID and extended ID messages.

RTR bit (Remote Transmission Request)

The RTR bit sets the frame format to data frames or remote frames:

- The receive mailbox only receives frames with the format specified in the RTR bit
- The transmit mailbox transmits frames with the frame format specified in the RTR bit
- The receive FIFO mailbox receives the data frame, remote frame, or both frames as specified in the RTR bit in FIDCR0 and FIDCR1
- The transmit FIFO mailbox transmits the data frame or remote frame as specified in the RTR bit in the relevant transmit message.

IDE bit (ID Extension*2)

The IDE bit sets the ID format to standard ID or extended ID. The IDE bit is enabled when the IDFM[1:0] bits in CTLR are 10b (mixed ID mode):

- The receive mailbox receives only the ID format specified in the IDE bit
- The transmit mailbox transmits with the ID format specified in the IDE bit
- The receive FIFO mailbox receives messages with the standard ID and extended ID settings specified in the IDE bit in FIDCR0 and FIDCR1
- The transmit FIFO mailbox transmits messages with the standard ID or extended ID settings specified in the IDE bit in the transmit message.

DLC[3:0] bits (Data Length Code*1)

The DLC[3:0] bits specify the data length to be transmitted in data frames. When a remote frame is used to request data, this field specifies the requested data length.

When a data frame is received, the received data length is stored in this field. When a remote frame is received, this field stores the requested data length.

Bit	Symbol	位名称	Description	R/W
b7 to b0	TSL[7:0]	时间戳低字节	当收到的消息存储在邮箱中时，TSH[7:0]和TSL[7:0]位存储时间戳的计数器值。	R/W
b15 to b8	TSH[7:0]	时间戳高字节		R/W

EID[17:0]位（扩展ID*1）

EID[17:0]位设置数据帧和远程帧的扩展ID。这些位发送或接收扩展ID消息。

SID[10:0]位（标准ID）

SID[10:0]位设置数据帧和远程帧的标准ID。这些位发送或接收标准ID和扩展ID消息。

RTR位（远程传输请求）

RTR位将帧格式设置为数据帧或远程帧：

- 接收邮箱只接收RTR位指定格式的帧
- 发送邮箱以RTR位中指定的帧格式发送帧
- 接收FIFO邮箱接收数据帧、远程帧或两个帧，如 FIDCR0 and FIDCR1
- 发送FIFO邮箱发送相关发送消息中RTR位中指定的数据帧或远程帧。

IDE位（ID扩展*2）

IDE位将ID格式设置为标准ID或扩展ID。当CTLR中的IDFM[1:0]位为10b（混合ID模式）时，IDE位被使能：

- 接收邮箱只接收IDE位指定的ID格式
- 发送邮箱以IDE位中指定的ID格式发送
- 接收FIFO邮箱接收具有FIDCR0和FIDCR1中的IDE位指定的标准ID和扩展ID设置的消息
- 发送FIFO邮箱使用发送消息的IDE位中指定的标准ID或扩展ID设置发送消息。

DLC[3:0]位（数据长度代码*1）

DLC[3:0]位指定要在数据帧中传输的数据长度。当使用远程帧请求数据时，该字段指定请求的数据长度。

当接收到一个数据帧时，接收到的数据长度存储在该字段中。当接收到远程帧时，该字段存储请求的数据长度。

33.2.7 Mailbox Interrupt Enable Register (MIER)

Address(es): CAN0.MIER 4005 042Ch, CAN1.MIER 4005 142Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit name	Description	R/W
b31 to b0	MB31 to MB0	Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled. Bit [31] is associated with mailbox 31 (MB31), and bit [0] with mailbox 0 (MB0).	R/W

The MIER register can enable interrupts for each mailbox independently. This register is available in normal mailbox mode. Do not access this register in FIFO mailbox mode.

Each bit is associated with a mailbox having the same number. These bits enable or disable transmission and reception complete interrupts for the associated mailboxes as follows:

- Bit [0] in MIER is associated with mailbox 0 (MB0)
- Bit [31] in MIER is associated with mailbox 31 (MB31).

Write to MIER only when the associated MCTL_TXj or MCTL_RXj register (j = 0 to 31) is 00h and the associated mailbox does not process a transmission or reception abort request.

33.2.8 Mailbox Interrupt Enable Register for FIFO Mailbox Mode (MIER_FIFO)

Address(es): CAN0.MIER_FIFO 4005 042Ch, CAN1.MIER_FIFO 4005 142Ch

x: Undefined

Bit	Symbol	位名称	Description	R/W
b31 to b0	MB31 to MB0	中断使能	0：中断禁止1：中断允许。位[31]与邮箱31(MB31)相关联，位[0]与邮箱0(MB0)相关联。	R/W

MIER寄存器可以独立启用每个邮箱的中断。该寄存器在正常邮箱模式下可用。不要在FIFO邮箱模式下访问该寄存器。

每个位与具有相同编号的邮箱相关联。这些位启用或禁用相关邮箱的发送和接收完成中断，如下所示：

- MIER中的位[0]与邮箱0(MB0)相关联
- MIER中的位[31]与邮箱31(MB31)相关联。

仅当相关的MCTL_TXj或MCTL_RXj寄存器（j=0到31）为00h且相关邮箱不处理发送或接收中止请求时才写入MIER。

33.2.8 FIFO邮箱模式的邮箱中断使能寄存器(MIER_FIFO)

Address(es): CAN0.MIER_FIFO 4005 042Ch, CAN1.MIER_FIFO 4005 142Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	MB29	MB28	—	—	MB25	MB24	MB23	MB22	MB21	MB20	MB19	MB18	MB17	MB16
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	位名称	Description	R/W
b23 to b0	MB23 to MB0	中断使能	0：中断禁止1：中断允许。位[23]对应邮箱23(MB23)，位[0]对应邮箱0(MB0)。	R/W
b24	MB24	发送FIFO中断Enable	0：中断禁止1：中断允许。	R/W
b25	MB25	发送FIFO中断发电时序控制	0：每次发送完成时产生1：发送完成时发送FIFO清空时产生。	R/W

Bit	Symbol	Bit name	Description	R/W
b27, b26	—	Reserved	The read value is undefined. The write value should be 0.	R/W
b28	MB28	Receive FIFO Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W
b29	MB29	Receive FIFO Interrupt Generation Timing Control*1	0: Generated every time reception completes 1: Generated when the receive FIFO becomes a buffer warning*2 on reception completion.	R/W
b31, b30	—	Reserved	The read value is undefined. The write value should be 0.	R/W

Note 1. No interrupt request occurs when the receive FIFO becomes a buffer warning because it is full.
Note 2. Buffer warning indicates a state in which the third message is stored in the receive FIFO.

The MIER_FIFO register can independently enable interrupts for each mailbox and FIFO. This register is available in FIFO mailbox mode. Do not access this register in normal mailbox mode.

The MB0 to MB23 bits are associated with the mailbox of the same number. These bits enable or disable transmission and reception complete interrupts for the associated mailboxes:

- Bit [0] in MIER_FIFO is associated with mailbox 0 (MB0)
- Bit [23] in MIER_FIFO is associated with mailbox 23 (MB23).

MB24, MB25, MB28, and MB29 specify whether the transmit and receive FIFO interrupts are enabled or disabled, and the timing when interrupt requests are generated.

Write to the MIER_FIFO register only when the associated MCTL_TXj or MCTL_RXj register (j = 0 to 31) is 00h and the associated mailbox does not process a transmission or reception abort request. In addition, change the bits in MIER_FIFO for the associated FIFO only when all the following conditions are true:

- The TFE bit in TFCR is 0 and the TFEST bit is 1
- The RFE bit in RFCR is 0 and the RFEST flag in RFCR is 1.

33.2.9 Message Control Register for Transmit (MCTL_TXj) (j = 0 to 31)

- Transmit mode (when the TRMREQ bit is 1 and the RECREQ bit is 0)

Address(es): CAN0.MCTL_TX[0] 4005 0820h to CAN0.MCTL_TX[31] 4005 083Fh, CAN1.MCTL_TX[0] 4005 1820h to CAN1.MCTL_TX[31] 4005 183Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TRMREQ	RECREQ	—	ONESHOT	—	TRMABT	TRMACTIVE	SENTDATA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SENTDATA	Transmission Complete Flag*1,*2	0: Transmission not complete 1: Transmission complete.	R/W
b1	TRMACTIVE	Transmission-in-Progress Status Flag	0: Transmission pending or not requested 1: Transmission in progress.	R
b2	TRMABT	Transmission Abort Complete Flag*1,*2	0: Transmission started, transmission abort failed because transmission completed, or transmission abort not requested 1: Transmission abort complete.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	ONESHOT	One-Shot Enable*2,*3	0: Disable one-shot transmission 1: Enable one-shot transmission.	R/W
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6	RECREQ	Receive Mailbox Request *2,*3,*4,*5	0: Do not configure for reception 1: Configure for reception.	R/W

Bit	Symbol	位名称	Description	R/W
b27, b26	—	Reserved	读取值未定义。写入值应为0。	R/W
b28	MB28	接收FIFO中断 Enable	0：中断禁止1：中断允许。	R/W
b29	MB29	接收FIFO中断发电时序控制*1	0：每次接收完成时产生1：当接收FIFO变为缓冲区警告*2接收完成时产生。	R/W
b31, b30	—	Reserved	读取值未定义。写入值应为0。	R/W

Note 1. 当接收FIFO因已满而变为缓冲区警告时，不会发生中断请求。
Note 2. 缓冲区警告表示第三个消息存储在接收FIFO中的状态。

MIER_FIFO寄存器可以独立启用每个邮箱和FIFO的中断。该寄存器可在FIFO邮箱模式。不要在普通邮箱模式下访问该寄存器。

MB0到MB23位与相同编号的邮箱相关联。这些位启用或禁用相关邮箱的发送和接收完成中断：

- MIER_FIFO中的位[0]与邮箱0(MB0)相关联
- MIER_FIFO中的位[23]与邮箱23(MB23)相关联。

MB24、MB25、MB28和MB29指定是启用还是禁用发送和接收FIFO中断，以及产生中断请求的时序。

仅当关联的MCTL_TXj或MCTL_RXj寄存器（j=0到31）为00h并且关联的邮箱不处理发送或接收中止请求时才写入MIER_FIFO寄存器。此外，仅当以下所有条件都为真时，才更改关联FIFO的MIER_FIFO中的位：

- TFCR中的TFE位为0，TFEST位为1
- RFCR中的RFE位为0，RFCR中的RFEST标志为1。

33.2.9 用于发送的消息控制寄存器(MCTL_TXj)(j=0到31)

发送模式（当TRMREQ位为1且RECREQ位为0时）

Address(es): CAN0.MCTL_TX[0] 4005 0820h to CAN0.MCTL_TX[31] 4005 083Fh, CAN1.MCTL_TX[0] 4005 1820h to CAN1.MCTL_TX[31] 4005 183Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TRMREQ	RECREQ	—	ONESHOT	—	TRMABT	TRMACTIVE	SENTDATA
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SENTDATA	传输完成 Flag*1,*2	0：传输未完成1：传输完成。	R/W
b1	TRMACTIVE	Transmission-in-Progress 状态标志	0：传输未决或未请求1：传输中。	R
b2	TRMABT	传输中止完成 Flag*1,*2	0：传输开始，传输中止失败，因为传输完成，或未请求传输中止1：传输中止完成。	R/W
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	ONESHOT	One-Shot Enable*2,*3	0：禁止一次性发送1：允许一次性发送。	R/W
b5	—	Reserved	该位读取为0。写入值应为0。	R/W
b6	RECREQ	接收邮箱请求*2 *3 *4 *5	0：不配置接收1：配置接收。	R/W

Bit	Symbol	Bit name	Description	R/W
b7	TRMREQ	Transmit Mailbox Request *2,*4	0: Do not configure for transmission 1: Configure for transmission.	R/W

Note 1. Write 0 only. Writing 1 has no effect.
Note 2. When writing to bits in this register, write 1 to SENTDATA and TRMABT flags if these bits are not the write target.
Note 3. To enter one-shot transmit mode, write 1 to the ONESHOT bit at the same time as setting the TRMREQ bit to 1. To exit one-shot transmit mode, write 0 to the ONESHOT bit after the message is transmitted or aborted.
Note 4. Do not set both the RECREQ and TRMREQ bits to 1.
Note 5. When setting the RECREQ bit to 0, set the SENTDATA, TRMACTIVE, and TRMABT flags to 0 simultaneously.

MCTL_TXj sets mailbox j to transmit mode or receive mode. In transmit mode, MCTL_TXj also controls and indicates the transmission status. Do not access MCTL_TXj if mailbox j is in receive mode. Only write to MCTL_TXj in CAN operation or halt mode. Do not use MCTL_TX24 to MCTL_TX31 in FIFO mailbox mode.

SENTDATA flag (Transmission Complete Flag*1,*2)

The SENTDATA flag is set to 1 when data transmission from the associated mailbox is complete. This flag is set to 0 through a software write. To set this flag to 0, first set the TRMREQ bit to 0. The SENTDATA and TRMREQ flags cannot be set to 0 simultaneously. To transmit a new message from the associated mailbox, set the SENTDATA flag to 0.

TRMACTIVE flag (Transmission-in-Progress Status Flag)

The TRMACTIVE flag is set to 1 when the associated mailbox of the CAN module begins to transmit a message. It is set to 0 when the CAN module loses the CAN bus arbitration, when a CAN bus error occurs, or when data transmission completes.

TRMABT flag (Transmission Abort Complete Flag*1,*2)

The TRMABT flag is set to 1 in the following cases:

- Following a transmission abort request, when the transmission abort is complete before starting transmission
- In one-shot transmission mode (RECREQ = 0, TRMREQ = 1, and ONESHOT = 1), when the CAN module detects a CAN bus arbitration-lost or a CAN bus error.

The TRMABT flag is not set to 1 when data transmission is complete. The SENTDATA flag is set to 1 and the TRMABT flag is set to 0 through a software write.

ONESHOT bit (One-Shot Enable*2,*3)

When the ONESHOT bit is set to 1 in transmit mode (RECREQ = 0 and TRMREQ = 1), the CAN module transmits a message only one time. The CAN module does not transmit the message again if a CAN bus error or CAN bus arbitration-lost occurs. When transmission is complete, the SENTDATA flag is set to 1. If transmission does not complete because of a CAN bus error or CAN bus arbitration-lost error, the TRMABT flag is set to 1. Set the ONESHOT bit to 0 after the SENTDATA or TRMABT flag is set to 1.

RECREQ bit (Receive Mailbox Request)

The RECREQ bit selects the receive modes listed in Table 33.10.

When the RECREQ bit is set to 1, the associated mailbox is configured for reception of a data frame or remote frame.

When the RECREQ bit is set to 0, the associated mailbox is not configured for reception of a data frame or remote frame.

Due to hardware protection, the RECREQ bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from the acceptance filter processing (the beginning of the CRC field)
- Hardware protection is released:
  - For the mailbox that is specified to receive the incoming message, after the received data is stored in the mailbox or a CAN bus error occurs. This means that the maximum period of hardware protection is from the beginning of CRC field to the end of the 7th bit of EOF.
  - For the other mailboxes, after acceptance filter processing
  - If no mailbox is specified to receive the message, after acceptance filter processing.

Bit	Symbol	位名称	Description	R/W
b7	TRMREQ	发送邮箱请求*2 *4	0：不配置传输1：配置传输。	R/W

Note 1. 只写0。写1无效。
Note 2. 写入该寄存器中的位时，如果这些位不是写入目标，则将1写入SENTDATA和TRMABT标志。
Note 3. 要进入一次性发送模式，请在将TRMREQ位设置为1的同时将1写入ONESHOT位。要退出一次性发送模式，请在发送或中止消息后向ONESHOT位写入0。
Note 4. 不要将RECREQ和TRMREQ位都设置为1。
Note 5. 将RECREQ位设置为0时，同时将SENTDATA、TRMACTIVE和TRMABT标志设置为0。

MCTL_TXj将邮箱j设置为发送模式或接收模式。在传输模式下，MCTL_TXj也控制和指示传输状态。如果邮箱j处于接收模式，则不要访问MCTL_TXj。仅在CAN操作或暂停模式下写入MCTL_TXj。不要在FIFO邮箱模式下使用MCTL_TX24到MCTL_TX31。

SENTDATA标志（传输完成标志*1 *2）

当来自相关邮箱的数据传输完成时，SENTDATA标志设置为1。该标志通过软件写入设置为0。要将此标志设置为0，首先将TRMREQ位设置为0。SENTDATA和TRMREQ标志不能同时设置为0。要从关联邮箱发送新消息，请将SENTDATA标志设置为0。

TRMACTIVE标志（传输中状态标志）

当CAN模块的相关邮箱开始发送消息时，TRMACTIVE标志设置为1。当CAN模块失去CAN总线仲裁、发生CAN总线错误或数据传输完成时，它设置为0。

TRMABT标志（传输中止完成标志*1 *2）

在以下情况下，TRMABT标志设置为1：

- 在传输中止请求之后，当传输中止在开始传输之前完成时
- 在发送中止请求之后，当CAN模块检测到CAN总线仲裁丢失或CAN总线错误时
- 在一次性传输模式下（RECREQ=0、TRMREQ=1和ONESHOT=1），当CAN模块检测到CAN总线仲裁丢失或CAN总线错误时。

当数据传输完成时，TRMABT标志不设置为1。SENTDATA标志设置为1，TRMABT标志通过软件写入设置为0。

ONESHOT bit (One-Shot Enable*2,*3)

在发送模式下（RECREQ=0且TRMREQ=1）将ONESHOT位设置为1时，CAN模块仅发送一次报文。如果发生CAN总线错误或CAN总线仲裁失败，CAN模块不会再次发送消息。传输完成后，SENTDATA标志设置为1。如果由于CAN总线错误或CAN总线仲裁丢失错误导致传输未完成，则TRMABT标志设置为1。在SENTDATA或TRMABT标志设置为1。

RECREQ位（接收邮箱请求）

RECREQ位选择表33.10中列出的接收模式。

当RECREQ位设置为1时，相关邮箱配置为接收数据帧或远程帧。

当RECREQ位设置为0时，相关邮箱未配置为接收数据帧或远程帧。

由于硬件保护，RECREQ位在以下期间不能通过软件写入设置为0：

- 硬件保护从验收过滤器处理开始（CRC字段的开始）
- 硬件保护发布：
  - 对于指定接收传入报文的邮箱，在接收到的数据存入邮箱后或出现CAN总线错误。这意味着硬件保护的最大周期是从CRC字段的开始到EOF的第7位结束。
  - 对于其他邮箱，接受过滤处理后
  - 如果没有指定邮箱接收邮件，则经过接受过滤处理。

When setting the RECREQ bit to 1, do not set the TRMREQ bit to 1. To change the configuration of a mailbox from transmission to reception, first abort the transmission, then set the SENTDATA and TRMABT flags to 0 before changing to reception.

Note: MCTL_TXj.RECREQ is the mirror bit of MCTL_RXj.RECREQ.

TRMREQ bit (Transmit Mailbox Request)

The TRMREQ bit selects the transmit modes listed in Table 33.10.

When the TRMREQ bit is set to 1, the associated mailbox is configured for transmission of a data frame or remote frame.

When the TRMREQ bit is set to 0, the associated mailbox is not configured for transmission of a data frame or remote frame.

If the TRMREQ bit is changed from 1 to 0 to cancel the associated transmission request, either the TRMABT or SENTDATA flag is set to 1. When setting the TRMREQ bit to 1, do not set the RECREQ bit to 1. To change the configuration of a mailbox from reception to transmission, first abort the reception, then set the NEWDATA and MSGLOST flags to 0 before changing to transmission.

Note: MCTL_TXj.TRMREQ is the mirror bit of MCTL_RXj.TRMREQ.

33.2.10 Message Control Register for Receive (MCTL_RXj) (j = 0 to 31)

- Receive mode (when the TRMREQ bit is 0 and the RECREQ bit is 1)

Address(es): CAN0.MCTL_RX[0] 4005 0820h to CAN0.MCTL_RX[31] 4005 083Fh, CAN1.MCTL_RX[0] 4005 1820h to CAN1.MCTL_RX[31] 4005 183Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TRMREQ	RECREQ	—	ONESHOT	—	MSGLOST	INVALDATA	NEWDATA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	NEWDATA	Reception Complete Flag*1,*2	0: No data received, or 0 was written to the flag 1: New message is being stored or was stored in the mailbox.	R/W
b1	INVALDATA	Reception-in-Progress Status Flag	0: Message valid 1: Message being updated.	R
b2	MSGLOST	Message Lost Flag*1,*2	0: Message not overwritten or overrun 1: Message overwritten or overrun.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	ONESHOT	One-Shot Enable*2,*3	0: Disable one-shot reception 1: Enable one-shot reception.	R/W
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6	RECREQ	Receive Mailbox Request *2,*3,*4,*5	0: Do not configure for reception 1: Configure for reception.	R/W
b7	TRMREQ	Transmit Mailbox Request *2,*4	0: Do not configure for transmission 1: Configure for transmission.	R/W

Note 1. Write 0 only. Writing 1 has no effect.
Note 2. When writing to bits in this register, write 1 to the NEWDATA and MSGLOST flags if they are not the write target.
Note 3. To enter one-shot receive mode, write 1 to the ONESHOT bit at the same time as setting the RECREQ bit to 1. To exit one-shot receive mode, write 0 to the ONESHOT bit after writing 0 to the RECREQ bit and confirming that it is 0.
Note 4. Do not set both the RECREQ and TRMREQ bits to 1.
Note 5. When setting the RECREQ bit to 0, set MSGLOST, NEWDATA, and RECREQ to 0 simultaneously.

MCTL_RXj sets mailbox j to transmit or receive mode. In receive mode, MCTL_RXj also controls and indicates the reception status.

Do not access MCTL_RXj if mailbox j is in transmit mode. Only write to the MCTL_RXj in CAN operation or halt mode. Do not use MCTL_RX24 to MCTL_RX31 registers in FIFO mailbox mode.

将RECREQ位设置为1时，不要将TRMREQ位设置为1。要将邮箱配置从发送更改为接收，首先中止发送，然后在更改为接收之前将SENTDATA和TRMABT标志设置为0。

Note: MCTL_TXj.RECREQ是MCTL_RXj.RECREQ的镜像位。

TRMREQ位（发送邮箱请求）

TRMREQ位选择表33.10中列出的发送模式。

当TRMREQ位设置为1时，相关邮箱配置为传输数据帧或远程帧。

当TRMREQ位设置为0时，相关邮箱未配置为传输数据帧或远程帧。

如果TRMREQ位从1更改为0以取消相关的发送请求，则TRMABT或SENTDATA标志设置为1。将TRMREQ位设置为1时，不要将RECREQ位设置为1。要更改邮箱从接收到发送，首先中止接收，然后将NEWDATA和MSGLOST标志设置为0，然后再更改为发送。

Note: MCTL_TXj.TRMREQ是MCTL_RXj.TRMREQ的镜像位。

33.2.10 接收消息控制寄存器(MCTL_RXj)(j=0to31)

接收模式（当TRMREQ位为0且RECREQ位为1时）

Address(es): CAN0.MCTL_RX[0] 4005 0820h to CAN0.MCTL_RX[31] 4005 083Fh, CAN1.MCTL_RX[0] 4005 1820h to CAN1.MCTL_RX[31] 4005 183Fh

重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	NEWDATA	接收完成标志*1 *2	0：未接收到数据，或标志位已写入01：新消息正在存储或已存储在邮箱中。	R/W
b1	INVALDATA	Reception-in-Progress Status Flag	0：消息有效1：消息正在更新。	R
b2	MSGLOST	消息丢失标志*1 *2	0：信息未被覆盖或溢出1：信息被覆盖或溢出。	R/W
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	ONESHOT	One-Shot Enable*2,*3	0：关闭一键接收1：打开一键接收。	R/W
b5	—	Reserved	该位读取为0。写入值应为0。	R/W
b6	RECREQ	接收邮箱请求*2 *3 *4 *5	0：不配置接收1：配置接收。	R/W
b7	TRMREQ	发送邮箱请求*2 *4	0：不配置传输1：配置传输。	R/W

Note 1. 只写0。写1无效。
Note 2. 写入此寄存器中的位时，如果NEWDATA和MSGLOST标志不是写入目标，则将它们写入1。
Note 3. 要进入一次性接收模式，请在将RECREQ位设置为1的同时向ONESHOT位写入1。要退出一次性接收模式，请在向RECREQ位写入0并确认后向ONESHOT位写入0它是0。
Note 4. 不要将RECREQ和TRMREQ位都设置为1。
Note 5. 将RECREQ位设置为0时，同时将MSGLOST、NEWDATA和RECREQ设置为0。

MCTL_RXj将邮箱j设置为发送或接收模式。在接收模式下，MCTL_RXj还控制和指示接收状态。

如果邮箱j处于传输模式，则不要访问MCTL_RXj。仅在CAN操作或暂停模式下写入MCTL_RXj。不要在FIFO邮箱模式下使用MCTL_RX24到MCTL_RX31寄存器。

NEWDATA flag (Reception Complete Flag*1,*2)

The NEWDATA flag is set to 1 when a new message is being stored or was stored in the mailbox. Always set this bit to 1 simultaneously with the INVALDATA flag. The NEWDATA flag is set to 0 through a software write. The NEWDATA flag cannot be set to 0 through a software write when the associated INVALDATA flag is 1.

INVALDATA flag (Reception-in-Progress Status Flag)

After the completion of a message reception, the INVALDATA flag is set to 1 while the received message is updated in the associated mailbox. The INVALDATA flag is set to 0 immediately after the message is stored. If the mailbox is read when the INVALDATA flag is 1, the data is undefined.

MSGLOST flag (Message Lost Flag*1,*2)

The MSGLOST flag is set to 1 when the mailbox is overwritten or overrun by a new received message while the NEWDATA flag is 1. The MSGLOST flag is set to 1 at the end of the 6th bit of EOF. The MSGLOST flag is set to 0 through a software write.

In both overwrite and overrun modes, the MSGLOST flag cannot be set to 0 through a software write during the 5 PCLKB cycles following the 6th bit of EOF.

ONESHOT bit (One-Shot Enable*2,*3)

When the ONESHOT bit is set to 1 in receive mode (RECREQ = 1 and TRMREQ = 0), the mailbox receives a message only one time. The mailbox does not behave as a receive mailbox after having received the message one time. The behavior of the NEWDATA and INVALDATA flags is the same as in normal receive mode. In one-shot receive mode, the MSGLOST flag is not set to 1. To set the ONESHOT bit to 0, first write 0 to the RECREQ bit and ensure that it is 0.

RECREQ bit (Receive Mailbox Request)

The RECREQ bit selects the receive modes listed in Table 33.10.

When the RECREQ bit is set to 1, the associated mailbox is configured for reception of a data frame or remote frame.

When the RECREQ bit is set to 0, the associated mailbox is not configured for reception of a data frame or remote frame.

Due to hardware protection, the RECREQ bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from the acceptance filter processing (the beginning of the CRC field)
- Hardware protection is released:
  - For the mailbox that is specified to receive the incoming message, after the received data is stored in the mailbox or a CAN bus error occurs. The maximum period of hardware protection is from the beginning of the CRC field to the end of the 7th bit of EOF.
  - For the other mailboxes, after the acceptance filter processing
  - If no mailbox is specified to receive the message, after acceptance filter processing.

When setting the RECREQ bit to 1, do not set the TRMREQ bit to 1. To change the configuration of a mailbox from transmission to reception, first abort the transmission, then set the SENTDATA and TRMABT flags to 0 before changing to reception.

Note: MCTL_RXj.RECREQ is the mirror bit of MCTL_TXj.RECREQ.

TRMREQ bit (Transmit Mailbox Request)

The TRMREQ bit selects the transmit modes listed in Table 33.10.

When the TRMREQ bit is set to 1, the associated mailbox is configured for transmission of a data frame or remote frame.
When the TRMREQ bit is set to 0, the associated mailbox is not configured for transmission of a data frame or remote frame.

If the TRMREQ bit is changed from 1 to 0 to cancel the associated transmission request, either the TRMABT or the SENTDATA flag is set to 1. When setting the TRMREQ bit to 1, do not set the RECREQ bit to 1. To change the configuration of a mailbox from reception to transmission, first abort the reception, and then set the NEWDATA and MSGLOST flags to 0 before changing to transmission.

NEWDATA标志（接收完成标志*1 *2）

当新消息正在存储或已存储在邮箱中时，NEWDATA标志设置为1。始终将此位与INVALDATA标志同时设置为1。NEWDATA标志通过软件写入设置为0。当关联的INVALDATA标志为1时，不能通过软件写入将NEWDATA标志设置为0。

INVALDATA标志（接收进行中状态标志）

消息接收完成后，INVALDATA标志设置为1，同时在相关邮箱中更新接收到的消息。INVALDATA标志在消息存储后立即设置为0。如果在INVALDATA标志为1时读取邮箱，则数据未定义。

MSGLOST标志（消息丢失标志*1 *2）

当邮箱被新收到的消息覆盖或溢出时，MSGLOST标志设置为1，而
NEWDATA标志为1。MSGLOST标志在EOF的第6位末尾设置为1。MSGLOST标志通过软件写入设置为0。

在覆盖和溢出模式下，MSGLOST标志不能在5期间通过软件写入设置为0
在EOF的第6位之后的PCLKB周期。

ONESHOT bit (One-Shot Enable*2,*3)

在接收模式下（RECREQ=1和TRMREQ=0）将ONESHOT位设置为1时，邮箱只接收一次消息。邮箱在收到一次消息后不再充当接收邮箱。NEWDATA和INVALDATA标志的行为与正常接收模式相同。在单次接收模式下，MSGLOST标志不设置为1。要将ONESHOT位设置为0，首先将0写入RECREQ位并确保其为0。

RECREQ位（接收邮箱请求）

RECREQ位选择表33.10中列出的接收模式。

当RECREQ位设置为1时，相关邮箱配置为接收数据帧或远程帧。

当RECREQ位设置为0时，相关邮箱未配置为接收数据帧或远程帧。

由于硬件保护，RECREQ位在以下期间不能通过软件写入设置为0：

- 硬件保护从验收过滤器处理开始（CRC字段的开始）
- 硬件保护发布：
  - 对于指定接收传入报文的邮箱，在接收到的数据存入邮箱后或出现CAN总线错误。硬件保护的最大周期是从CRC域开始到EOF第7位结束。
  - 对于其他邮箱，接受过滤处理后
  - 如果没有指定邮箱接收邮件，则经过接受过滤处理。

将RECREQ位设置为1时，不要将TRMREQ位设置为1。要将邮箱配置从发送更改为接收，首先中止发送，然后在更改为接收之前将SENTDATA和TRMABT标志设置为0。

Note: MCTL_RXj.RECREQ是MCTL_TXj.RECREQ的镜像位。

TRMREQ位（发送邮箱请求）

TRMREQ位选择表33.10中列出的发送模式。

当TRMREQ位设置为1时，相关邮箱配置为传输数据帧或远程帧。
当TRMREQ位设置为0时，相关邮箱未配置为传输数据帧或远程帧。

如果TRMREQ位从1更改为0以取消相关的传输请求，则TRMABT或SENTDATA标志设置为1。将TRMREQ位设置为1时，不要将RECREQ位设置为1。要更改配置邮箱从接收到发送，首先中止接收，然后在更改为发送之前将NEWDATA和MSGLOST标志设置为0。

Note: MCTL_RXj.TRMREQ is the mirror bit of MCTL_TXj.TRMREQ.

33.2.11 Receive FIFO Control Register (RFCR)

Address(es): CAN0.RFCR 4005 0848h, CAN1.RFCR 4005 1848h

	b7	b6	b5	b4	b3	b2	b1	b0
	RFEST	RFWST	RFFST	RFMLF	RFUST[2:0]			RFE
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RFE	Receive FIFO Enable	0: Receive FIFO disabled 1: Receive FIFO enabled.	R/W
b3 to b1	RFUST[2:0]	Receive FIFO Unread Message Number Status	b3 b1 0 0 0: No unread message 0 0 1: 1 unread message 0 1 0: 2 unread messages 0 1 1: 3 unread messages 1 0 0: 4 unread messages 1 0 1: Reserved 1 1 0: Reserved 1 1 1: Reserved.	R
b4	RFMLF	Receive FIFO Message Lost Flag	0: Receive FIFO message not lost 1: Receive FIFO message lost.	R/W
b5	RFFST	Receive FIFO Full Status Flag	0: Receive FIFO not full 1: Receive FIFO full (4 unread messages).	R
b6	RFWST	Receive FIFO Buffer Warning Status Flag	0: Receive FIFO has no buffer warning 1: Receive FIFO has buffer warning (3 unread messages).	R
b7	RFEST	Receive FIFO Empty Status Flag	0: Unread message in receive FIFO 1: No unread message in receive FIFO.	R

Write to the RFCR register in CAN operation mode or halt mode.

RFE bit (Receive FIFO Enable)

When the RFE bit is set to 1, the receive FIFO is enabled.

When the RFE bit is set to 0, the receive FIFO is disabled for reception and becomes empty (RFEST = 1). Write 0 to the RFE bit simultaneously with the RFMLF flag setting.

Do not set this bit to 1 in normal mailbox mode (MBM bit in CTLR = 0). Due to hardware protection, the RFE bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from acceptance filter processing (the beginning of the CRC field)
- Hardware protection is released:
  - If the receive FIFO is specified to receive the incoming message, after the received data is stored in the receive FIFO or a CAN bus error occurs. The maximum period of hardware protection is from the beginning of the CRC field to the end of the 7th bit of EOF.
  - If the receive FIFO is not specified to receive the message, after acceptance filter processing.

RFUST[2:0] bits (Receive FIFO Unread Message Number Status)

The RFUST[2:0] bits indicate the number of unread messages in the receive FIFO. The value of the RFUST[2:0] bits is initialized to 000b when the RFE bit is set to 0.

RFMLF flag (Receive FIFO Message Lost Flag)

The RFMLF flag is set to 1 (receive FIFO message lost) when the receive FIFO receives a new message and is full. It is set to 1 at the end of the 6th bit of EOF.

Note: MCTL_RXj.TRMREQ是MCTL_TXj.TRMREQ的镜像位。

33.2.11 接收FIFO控制寄存器(RFCR)

Address(es): CAN0.RFCR 4005 0848h, CAN1.RFCR 4005 1848h

	b7	b6	b5	b4	b3	b2	b1	b0
	RFEST	RFWST	RFFST	RFMLF	RFUST[2:0]			RFE
重置后的值：	1	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	RFE	接收FIFO使能	0：接收FIFO禁用1：接收FIFO启用。	R/W
b3 to b1	RFUST[2:0]	接收FIFO未读消息号码状态	b3b1000：没有未读消息001：1条未读消息010：2条未读消息011：3条未读消息100：4条未读消息101：保留110：保留111：预订的。	R
b4	RFMLF	接收FIFO消息丢失标志	0：接收FIFO报文不丢失1：接收FIFO报文丢失。	R/W
b5	RFFST	接收FIFO满状态标志	0：接收FIFO未满1：接收FIFO已满（4个未读消息）。	R
b6	RFWST	接收FIFO缓冲区警告状态标志	0：接收FIFO没有缓冲区警告1：接收FIFO有缓冲区警告（3个未读消息）。	R
b7	RFEST	接收FIFO空状态标志	0：接收FIFO中未读消息1：接收FIFO中没有未读消息。	R

在CAN操作模式或暂停模式下写入RFCR寄存器。

RFE位（接收FIFO使能）

当RFE位设置为1时，启用接收FIFO。

当RFE位设置为0时，接收FIFO禁止接收并变为空(RFEST=1)。将0写入RFE位与RFMLF标志设置同时进行。

在正常邮箱模式下不要将此位设置为1（CTLR中的MBM位=0）。由于硬件保护，RFE位在以下期间不能通过软件写入设置为0：

- 硬件保护从验收过滤器处理开始（CRC字段的开始）
- 硬件保护发布：
  - 如果指定接收FIFO接收传入报文，则在接收到的数据存储在接收FIFO中或发生CAN总线错误后。硬件保护的最大周期是从CRC域开始到EOF第7位结束。
  - 如果接收FIFO没有指定接收报文，接受过滤后处理。

RFUST[2:0]位（接收FIFO未读消息编号状态）

RFUST[2:0]位指示接收FIFO中未读消息的数量。当RFE位设置为0时，RFUST[2:0]位的值初始化为000b。

RFMLF标志（接收FIFO消息丢失标志）

当接收FIFO接收到新消息并已满时，RFMLF标志设置为1（接收FIFO消息丢失）。它在EOF的第6位末尾设置为1。

The RFMLF flag is set to 0 through a software write (writing 1 has no effect). In both overwrite and overrun modes, if the receive FIFO is full and determined to have received a message, the RFMLF flag cannot be set to 0 (no receive FIFO message lost) through a software write during 5 PCLKB cycles following the 6th bit of EOF, due to hardware protection.

RFFST flag (Receive FIFO Full Status Flag)

The RFFST flag is set to 1 (receive FIFO is full) when the number of unread messages in the receive FIFO is 4. The RFFST flag is 0 (receive FIFO is not full) when the number of unread messages in the receive FIFO is less than 4. The flag is set to 0 when the RFE bit is 0.

RFWST flag (Receive FIFO Buffer Warning Status Flag)

The RFWST flag is set to 1 (receive FIFO buffer warning) when the number of unread messages in the receive FIFO is 3. The RFWST flag is 0 (no receive FIFO buffer warning) when the number of unread messages in the receive FIFO is less than 3 or equal to 4. The RFWST flag is set to 0 when the RFE bit is 0.

RFEST flag (Receive FIFO Empty Status Flag)

The RFEST flag is set to 1 (no unread message in receive FIFO) when the number of unread messages in the receive FIFO is 0. The RFEST flag is set to 1 when the RFE bit is set to 0. The RFEST flag is set to 0 (unread message in receive FIFO) when the number of unread messages in the receive FIFO is one or more.

Figure 33.2 shows the receive FIFO mailbox operation.

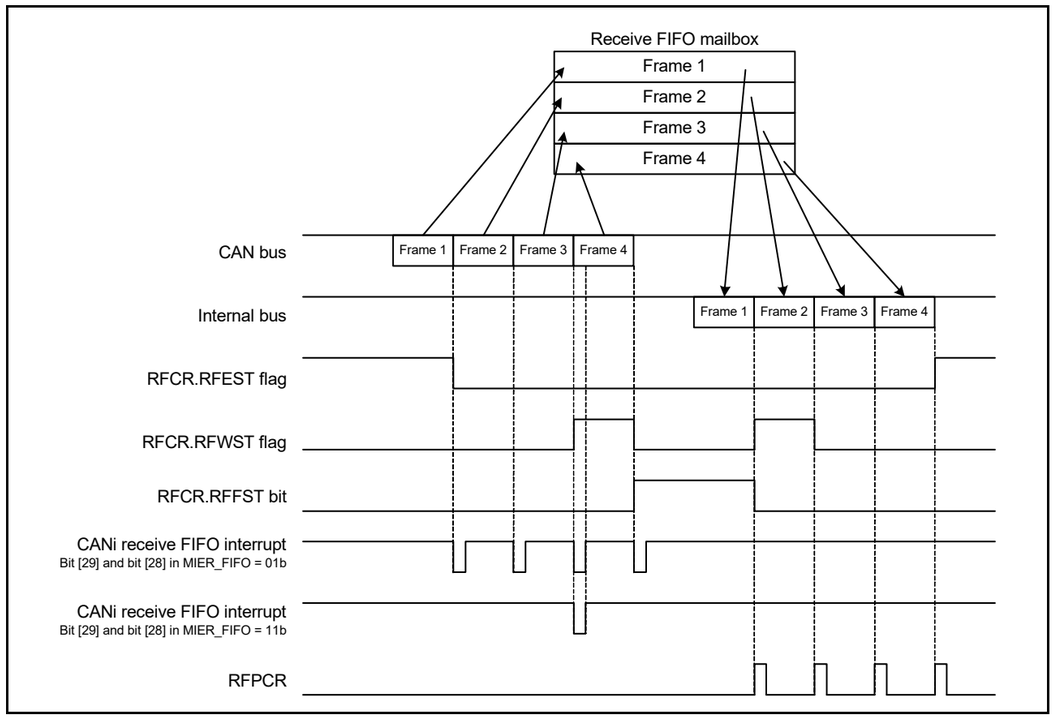

Figure 33.2 Receive FIFO mailbox operation with bits [29:28] in MIER_FIFO = 01b or 11b

RFMLF标志通过软件写入设置为0（写入1无效）。在覆盖和溢出模式下，如果接收FIFO已满并确定已接收到消息，则RFMLF标志不能通过软件在第6位之后的5个PCLKB周期内通过软件写入设置为0（不丢失接收FIFO消息）EOF，由于硬件保护。

RFFST标志（接收FIFO满状态标志）

当接收FIFO中的未读消息数为4时，RFFST标志设置为1（接收FIFO已满）。
当接收FIFO中未读消息的数量小于4时，RFFST标志为0（接收FIFO未满）。当RFE位为0时，该标志设置为0。

RFWST标志（接收FIFO缓冲区警告状态标志）

当接收FIFO中的未读消息数为3时，RFWST标志设置为1（接收FIFO缓冲区警告）。当接收FIFO中的未读消息数较少时，RFWST标志为0（无接收FIFO缓冲区警告）大于3或等于4。当RFE位为0时，RFWST标志设置为0。

RFEST标志（接收FIFO空状态标志）

RFEST标志设置为1（接收FIFO中没有未读消息），当接收中的未读消息数
FIFO为0。当RFE位设置为0时，RFEST标志设置为1。RFEST标志设置为0（接收中的未读消息
FIFO)当接收FIFO中的未读消息数为1或更多时。

图33.2显示了接收FIFO邮箱操作。

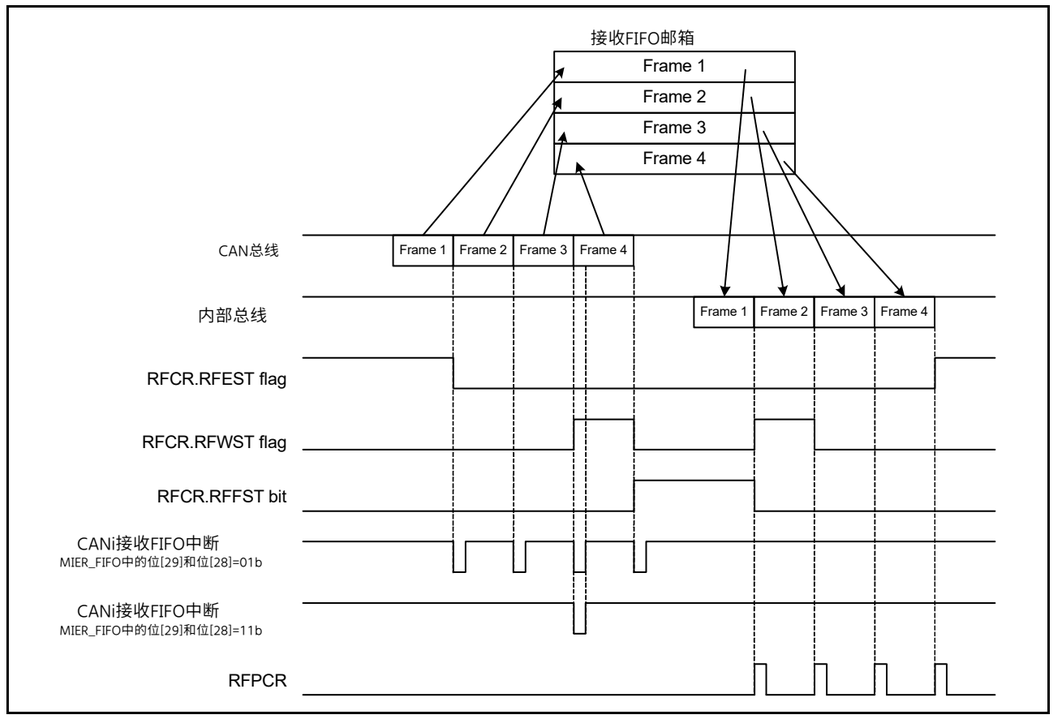

Figure 33.2 使用MIER_FIFO=01b或11b中的位[29:28]接收FIFO邮箱操作

RA生态工作室

33.2.12 Receive FIFO Pointer Control Register (RFPCR)

Address(es): CAN0.RFPCR 4005 0849h, CAN1.RFPCR 4005 1849h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	The CPU pointer for the receive FIFO is incremented by writing FFh to RFPCR	W

When the receive FIFO is not empty, write FFh to RFPCR through software to increment the CPU pointer to the next mailbox location. Do not write to RFPCR when the RFE bit in RFCR is 0 (receive FIFO disabled).

Both the CAN and CPU pointers are incremented when a new message is received and the RFFST flag is 1 (receive FIFO is full) in overwrite mode. When the RFMLF flag is 1 in this condition, the CPU pointer does not increment on a software write to RFPCR.

33.2.13 Transmit FIFO Control Register (TFCR)

Address(es): CAN0.TFCR 4005 084Ah, CAN1.TFCR 4005 184Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	TFEST	TFFST	—	—	TFUST[2:0]			TFE
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TFE	Transmit FIFO Enable	0: Transmit FIFO disabled 1: Transmit FIFO enabled.	R/W
b3 to b1	TFUST[2:0]	Transmit FIFO Unsent Message Number Status	b3 b1 0 0 0: 0 unsent messages 0 0 1: 1 unsent message 0 1 0: 2 unsent messages 0 1 1: 3 unsent messages 1 0 0: 4 unsent messages 1 0 1: Reserved 1 1 0: Reserved 1 1 1: Reserved.	R
b5, b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	TFFST	Transmit FIFO Full Status	0: Transmit FIFO is not full 1: Transmit FIFO is full (4 unsent messages).	R
b7	TFEST	Transmit FIFO Empty Status	0: Unsent message in transmit FIFO 1: No unsent message in transmit FIFO.	R

Write to the TFCR register in CAN operation mode or halt mode.

TFE bit (Transmit FIFO Enable)

When the TFE bit is set to 1, the transmit FIFO is enabled.

When the TFE bit is set to 0, the transmit FIFO becomes empty (TFEST = 1), and unsent messages in the transmit FIFO are lost in the following ways:

- Immediately if a message from the transmit FIFO is not scheduled for the next transmission or is already in transmission

33.2.12 接收FIFO指针控制寄存器(RFPCR)

Address(es): CAN0.RFPCR 4005 0849h, CAN1.RFPCR 4005 1849h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	通过将FFh写入RFPCR，接收FIFO的CPU指针递增	W

当接收FIFO不为空时，通过软件将FFh写入RFPCR，使CPU指针递增到下一个邮箱位置。当RFCR中的RFE位为0（禁用接收FIFO）时，不要写入RFPCR。

CAN和CPU指针都在收到新消息并且RFFST标志为1时递增（接收FIFO已满）处于覆盖模式。在这种情况下，当RFMLF标志为1时，CPU指针不会在软件写入RFPCR时递增。

33.2.13 发送FIFO控制寄存器(TFCR)

Address(es): CAN0.TFCR 4005 084Ah, CAN1.TFCR 4005 184Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	TFEST	TFFST	—	—	TFUST[2:0]			TFE
重置后的值：	1	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	TFE	发送FIFO使能	0：发送FIFO禁用1：发送FIFO使能。	R/W
b3 to b1	TFUST[2:0]	发送FIFO未发送消息号码状态	b3b1000：0条未发送消息001：1条未发送消息010：2条未发送消息011：3条未发送消息100：4条未发送消息101：保留110：保留111：预订的。	R
b5, b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	TFFST	发送FIFO满状态	0：发送FIFO未满1：发送FIFO已满（4条未发送消息）。	R
b7	TFEST	发送FIFO空状态	0：发送FIFO中未发送消息1：发送FIFO中没有未发送消息。	R

在CAN操作模式或暂停模式下写入TFCR寄存器。

TFE位（发送FIFO使能）

当TFE位设置为1时，使能发送FIFO。

当TFE位设置为0时，发送FIFO变为空（TFEST=1），发送FIFO中未发送的消息会以下列方式丢失：

- 如果来自发送FIFO的消息未安排下一次发送或已在发送中，则立即

- On completion of transmission, on a CAN bus error, a CAN bus arbitration-lost, or an entry to CAN halt mode, if a message from the transmit FIFO is scheduled for the next transmission or is already in transmission.

Before setting the TFE bit to 1 again, ensure that the TFEST bit is set to 1. After setting the TFE bit to 1, write transmit data to mailbox 24.

Do not set the TFE bit to 1 in normal mailbox mode (MBM bit in CTLR = 0).

TFUST[2:0] bits (Transmit FIFO Unsent Message Number Status)

The TFUST[2:0] bits indicate the number of unsent messages in the transmit FIFO. These bits are set to 000b after the TFE bit is set to 0 and transmission aborts or completes.

TFFST bit (Transmit FIFO Full Status)

The TFFST bit is set to 1 (transmit FIFO is full) when the number of unsent messages in the transmit FIFO is 4. The TFFST bit is set to 0 (transmit FIFO is not full) when the number of unsent messages in the transmit FIFO is less than 4. The TFFST bit is set to 0 when transmission from the transmit FIFO is aborted.

TFEST bit (Transmit FIFO Empty Status)

The TFEST bit is set to 1 (no message in transmit FIFO) when the number of unsent messages in the transmit FIFO is 0. The TFEST bit is set to 1 when transmission from the transmit FIFO is aborted. The TFEST bit is set to 0 (message in transmit FIFO) when the number of unsent messages in the transmit FIFO is not 0.

Figure 33.3 shows the transmit FIFO mailbox operation.

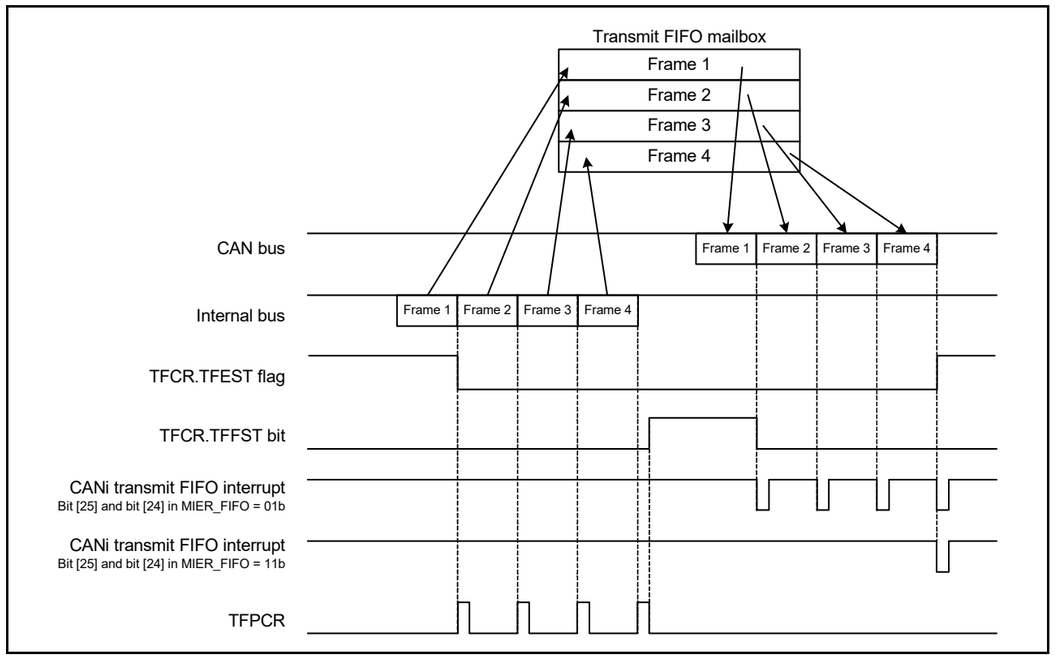

Figure 33.3 Transmit FIFO mailbox operation when bits [25:24] in MIER_FIFO = 01b or 11b

- 在传输完成、CAN总线错误、CAN总线仲裁丢失或进入CAN暂停模式时，如果来自传输FIFO的消息被安排用于下一次传输或已经在传输中。

再次将TFE位设置为1之前，请确保TFEST位设置为1。将TFE位设置为1后，将发送数据写入邮箱24。

不要在正常邮箱模式下将TFE位设置为1（CTLR中的MBM位=0）。

TFUST[2:0]位（发送FIFO未发送消息编号状态）

TFUST[2:0]位指示发送FIFO中未发送消息的数量。这些位被设置为000b后TFE位设置为0，传输中止或完成。

TFFST位（发送FIFO满状态）

当发送FIFO中未发送的消息数为4时，TFFST位设置为1（发送FIFO已满）。
当发送FIFO中未发送消息的数量小于4时，TFFST位设置为0（发送FIFO未满）。
当来自发送FIFO的发送被中止时，TFFST位设置为0。

TFEST位（发送FIFO空状态）

当发送FIFO中未发送消息的数量为0时，TFEST位设置为1（发送FIFO中没有消息）。
当来自发送FIFO的发送被中止时，TFEST位设置为1。当发送FIFO中未发送消息的数量不为0时，TFEST位设置为0（发送FIFO中的消息）。

图33.3显示了发送FIFO邮箱操作。

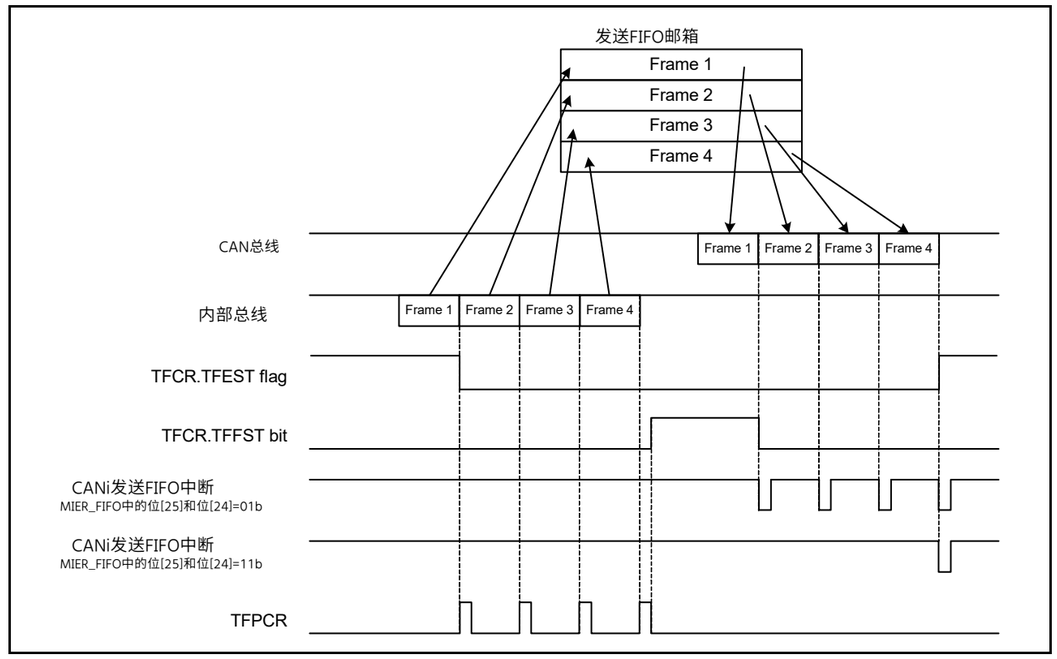

Figure 33.3 当MIER_FIFO中的位[25:24]=01b或11b时发送FIFO邮箱操作

RA生态工作室

33.2.14 Transmit FIFO Pointer Control Register (TFPCR)

Address(es): CAN0.TFPCR 4005 084Bh, CAN1.TFPCR 4005 184Bh

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	The CPU pointer for the transmit FIFO is incremented by writing FFh to TFPCR	W

When the transmit FIFO is not full, write FFh to the TFPCR register through software to increment the CPU pointer for the transmit FIFO to the next mailbox location.

Do not write to TFPCR when the TFE bit in TFCR is 0 (transmit FIFO disabled).

33.2.15 Status Register (STR)

Address(es): CAN0.STR 4005 0842h, CAN1.STR 4005 1842h

NDST flag (NEWDATA Status Flag)

The NDST flag is set to 1 when at least one NEWDATA flag in MCTL_RXj (j = 0 to 31) registers is 1, regardless of the value of MIER or MIER_FIFO. The NDST flag is set to 0 when all NEWDATA flags are 0.

SDST flag (SENTDATA Status Flag)

The SDST flag is set to 1 when at least one SENTDATA flag in MCTL_TXj (j = 0 to 31) registers is 1, regardless of the value of MIER or MIER_FIFO. The SDST flag is set to 0 when all SENTDATA flags are 0.

RFST flag (Receive FIFO Status Flag)

The RFST flag is set to 1 when the receive FIFO is not empty. The RFST flag is set to 0 when the receive FIFO is empty or normal mailbox mode is selected.

TFST flag (Transmit FIFO Status Flag)

The TFST flag is set to 1 when the transmit FIFO is not full. The TFST flag is set to 0 when the transmit FIFO is full or normal mailbox mode is selected.

NMLST flag (Normal Mailbox Message Lost Status Flag)

The NMLST flag is set to 1 when at least one MSGLOST flag in MCTL_RXj (j = 0 to 31) registers is 1, regardless of the value of MIER or MIER_FIFO. The NMLST is set to 0 when all MSGLOST flags are 0.

FMLST flag (FIFO Mailbox Message Lost Status Flag)

The FMLST flag is set to 1 when the RFMLF flag in RFCR is 1, regardless of the value of MIER_FIFO. The FMLST flag is set to 0 when the RFMLF flag is 0.

TABST flag (Transmission Abort Status Flag)

The TABST flag is set to 1 when at least one TRMABT flag in MCTL_TXj (j = 0 to 31) registers is 1, regardless of the value of MIER or MIER_FIFO. The TABST flag is set to 0 when all TRMABT flags are 0.

EST flag (Error Status Flag)

The EST flag is set to 1 when at least one error is detected by EIFR, regardless of the value of EIER. The EST flag is set to 0 when no error is detected by EIFR.

RSTST flag (CAN Reset Status Flag)

The RSTST flag is set to 1 when the CAN module is in CAN reset mode. The RSTST flag is 0 when the CAN module is not in CAN reset mode. Even when the state changes from CAN reset mode to CAN sleep mode, the flag remains 1.

HLTST flag (CAN Halt Status Flag)

The HLTST flag is set to 1 when the CAN module is in CAN halt mode. The HLTST flag is set to 0 when the CAN module is not in CAN halt mode. Even when the state changes from CAN halt mode to CAN sleep mode, the flag remains 1.

SLPST flag (CAN Sleep Status Flag)

The SLPST flag is set to 1 when the CAN module is in CAN sleep mode. The SLPST flag is set to 0 when the CAN module is not in CAN sleep mode.

EPST flag (Error-Passive Status Flag)

The EPST flag is set to 1 when the value of TECR or RECR exceeds 127 and the CAN module is in an error-passive state (128 ≤ TEC < 256 or 128 ≤ REC < 256). The EPST flag is set to 0 when the CAN module is not in the error-passive state.

Bit	Symbol	位名称	Description	R/W
b13	TRMST	发送状态标志	0：总线空闲或接收中1：传输中或总线关闭状态。	R
b14	RECST	接收状态标志	0：总线空闲或传输中1：接收中。	R
b15	—	Reserved	该位读为0	R

NDST标志（NEWDATA状态标志）

无论MIER或MIER_FIFO的值如何，当MCTL_RXj（j=0到31）寄存器中的至少一个NEWDATA标志为1时，NDST标志设置为1。当所有NEWDATA标志为0时，NDST标志设置为0。

SDST标志（SENTDATA状态标志）

无论MIER或MIER_FIFO的值如何，当MCTL_TXj（j=0到31）寄存器中的至少一个SENTDATA标志为1时，SDST标志设置为1。当所有SENTDATA标志为0时，SDST标志设置为0。

RFST标志（接收FIFO状态标志）

当接收FIFO不为空时，RFST标志设置为1。当接收FIFO为空或选择正常邮箱模式时，RFST标志设置为0。

TFST标志（发送FIFO状态标志）

当发送FIFO未满时，TFST标志设置为1。当发送FIFO已满或选择正常邮箱模式时，TFST标志设置为0。

NMLST标志（正常邮箱消息丢失状态标志）

无论MIER或MIER_FIFO的值如何，当MCTL_RXj（j=0到31）寄存器中的至少一个MSGLOST标志为1时，NMLST标志设置为1。当所有MSGLOST标志为0时，NMLST设置为0。

FMLST标志（FIFO邮箱消息丢失状态标志）

当RFCR中的RFMLF标志为1时，无论MIER_FIFO的值如何，FMLST标志都设置为1。当RFMLF标志为0时，FMLST标志设置为0。

TABST标志（传输中止状态标志）

无论MIER或MIER_FIFO的值如何，当MCTL_TXj（j=0到31）寄存器中的至少一个TRMABT标志为1时，TABST标志设置为1。当所有TRMABT标志为0时，TABST标志设置为0。

EST标志（错误状态标志）

当EIFR检测到至少一个错误时，无论EIER的值如何，EST标志设置为1。当EIFR未检测到错误时，EST标志设置为0。

RSTST标志（CAN复位状态标志）

当CAN模块处于CAN复位模式时，RSTST标志设置为1。当CAN模块未处于CAN复位模式时，RSTST标志为0。即使状态从CAN复位模式更改为CAN睡眠模式，该标志仍　　保持为1。

HLTST标志（CAN停止状态标志）

当CAN模块处于CAN暂停模式时，HLTST标志设置为1。当CAN模块未处于CAN暂停模式时，HLTST标志设置为0。即使状态从CAN停止模式更改为CAN睡眠模式，该标志仍　　保持为1。

SLPST标志（CAN睡眠状态标志）

当CAN模块处于CAN睡眠模式时，SLPST标志设置为1。当CAN模块未处于CAN睡眠模式时，SLPST标志设置为0。

EPST标志（错误被动状态标志）

当TECR或RECR的值超过127并且CAN模块处于错误被动状态（128≤TEC<256或128≤REC<256）时，EPST标志设置为1。当CAN模块不处于被动错误状态时，EPST标志设置为0。

BOST flag (Bus-Off Status Flag)

The BOST flag is set to 1 when the value in TECR exceeds 255 and the CAN module is in the bus-off state (TEC ≥ 256). The BOST flag is set to 0 when the CAN module is not in the bus-off state.

TRMST flag (Transmit Status Flag)

The TRMST flag is set to 1 when the CAN module performs as a transmitter node or is in the bus-off state. The TRMST flag is set to 0 when the CAN module performs as a receiver node or is in the bus-idle state.

RECST flag (Receive Status Flag)

The RECST flag is set to 1 when the CAN module performs as a receiver node. The RECST flag is set to 0 when the CAN module performs as a transmitter node or is in the bus-idle state.

33.2.16 Mailbox Search Mode Register (MSMR)

Address(es): CAN0.MSMR 4005 0853h, CAN1.MSMR 4005 1853h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MBSM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	MBSM[1:0]	Mailbox Search Mode Select	b1 b0 0 0: Receive mailbox search mode 0 1: Transmit mailbox search mode 1 0: Message lost search mode 1 1: Channel search mode.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Write to the MSMR register in CAN operation mode or halt mode.

MBSM[1:0] bits (Mailbox Search Mode Select)

The MBSM[1:0] bits select the search mode for the mailbox search function.

When the MBSM[1:0] bits are 00b, receive mailbox search mode is selected. In this mode, the search targets are the NEWDATA flag in MCTL_RXj (j = 0 to 31) registers for the normal mailbox, and the RFEST flag in RFCR.

When the MBSM[1:0] bits are 01b, transmit mailbox search mode is selected. In this mode, the search target is the SENTDATA flag in MCTL_TXj.

When the MBSM[1:0] bits are 10b, message lost search mode is selected. In this mode, the search targets are the MSGLOST flag in MCTL_RXj for the normal mailbox, and the RFMLF flag in RFCR.

When the MBSM[1:0] bits are 11b, channel search mode is selected. In this mode, the search target is CSSR. See section 33.2.18, Channel Search Support Register (CSSR).

BOST标志（总线关闭状态标志）

当TECR中的值超过255并且CAN模块处于总线关闭状态(TEC≥256)时，BOST标志设置为1。
当CAN模块不处于总线关闭状态时，BOST标志设置为0。

TRMST标志（发送状态标志）

当CAN模块作为发送器节点运行或处于总线关闭状态时，TRMST标志设置为1。当CAN模块作为接收器节点运行或处于总线空闲状态时，TRMST标志设置为0。

RECST标志（接收状态标志）

当CAN模块作为接收器节点运行时，RECST标志设置为1。RECST标志设置为0，当CAN模块作为发送器节点运行或处于总线空闲状态。

33.2.16 邮箱搜索模式寄存器(MSMR)

Address(es): CAN0.MSMR 4005 0853h, CAN1.MSMR 4005 1853h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MBSM[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

在CAN操作模式或暂停模式下写入MSMR寄存器。

MBSM[1:0]位（邮箱搜索模式选择）

MBSM[1:0]位选择邮箱搜索功能的搜索模式。

当MBSM[1:0]位为00b时，选择接收邮箱搜索模式。在这种模式下，搜索目标是MCTL_RXj(j=0到31)中的NEWDATA标志为普通邮箱注册，RFCR中的RFEST标志。

当MBSM[1:0]位为01b时，选择发送邮箱搜索模式。在这种模式下，搜索目标是MCTL_TXj中的SENTDATA标志。

当MBSM[1:0]位为10b时，选择消息丢失搜索模式。在这种模式下，搜索目标是正常邮箱的MCTL_RXj中的MSGLOST标志，以及RFCR中的RFMLF标志。

当MBSM[1:0]位为11b时，选择频道搜索模式。在这种模式下，搜索目标是CSSR。请参阅第33.2.18节，频道搜索支持寄存器(CSSR)。

33.2.17 Mailbox Search Status Register (MSSR)

Address(es): CAN0.MSSR 4005 0852h, CAN1.MSSR 4005 1852h

	b7	b6	b5	b4	b3	b2	b1	b0
	SEST	—	—	MBNST[4:0]				
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	MBNST[4:0]	Search Result Mailbox Number Status	These bits output the smallest mailbox number that is found in each search mode selected in the MSMR register	R
b6, b5	—	Reserved	These bits are read as 0	R
b7	SEST	Search Result Status	0: Search result found 1: No search result.	R

MBNST[4:0] bits (Search Result Mailbox Number Status)

In all mailbox search modes, the MBNST[4:0] bits output the smallest mailbox number. In receive mailbox search mode, transmit mailbox search mode, and message lost search mode, the value of the mailbox (the search result to be output) is updated under the following conditions:

- When the associated NEWDATA, SENTDATA, or MSGLOST flag is set to 0 for a mailbox output by MBNST[4:0]
- When the associated NEWDATA, SENTDATA, or MSGLOST flag is set to 1 for a mailbox with a smaller number than that in MBNST[4:0].

If the MBSM[1:0] bits are set to 00b (receive mailbox search mode) or 10b (message lost search mode), the receive FIFO (mailbox 28) is output when it is not empty and there are no unread received messages and no lost messages in any of the normal mailboxes 0 to 23. If the MBSM[1:0] bits are set to 01b (transmit mailbox search mode), the transmit FIFO (mailbox 24) is not output. Table 33.6 lists the behavior of the MBNST[4:0] bits in FIFO mailbox mode.

In channel search mode, the MBNST[4:0] bits output the associated channel number. After MSSR is read by software, the next target channel number is output.

SEST bit (Search Result Status)

The SEST bit is set to 1 (no search result) when no associated mailbox is found after searching all mailboxes. For example, in transmit mailbox search mode, the SEST bit is set to 1 when no SENTDATA flag is 1 for any mailbox. The SEST bit is set to 0 when at least one SENTDATA flag is 1. When the SEST bit is 1, the value of the MBNST[4:0] bits is undefined.

Table 33.6 Behavior of MBNST[4:0] bits in FIFO mailbox mode

MBSM[1:0] bits	Mailbox 24 (transmit FIFO)	Mailbox 28 (receive FIFO)
00b	Mailbox 24 is not output	Mailbox 28 is output when no MCTL_RXj.NEWDATA flag for the normal mailboxes is set to 1 (new message is being stored or was stored in the mailbox) and the receive FIFO is not empty
01b		Mailbox 28 is not output
10b		Mailbox 28 is output when no MCTL_RXj.MSGLOST flag for the normal mailboxes is set to 1 (message is overwritten or overrun) and the RFCR.RFMLF flag is set to 1 (receive FIFO message lost) in the receive FIFO
11b		Mailbox 28 is not output

33.2.17 邮箱搜索状态寄存器(MSSR)

Address(es): CAN0.MSSR 4005 0852h, CAN1.MSSR 4005 1852h

	b7	b6	b5	b4	b3	b2	b1	b0
	SEST	—	—	MBNST[4:0]				
重置后的值：	1	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b4 to b0	MBNST[4:0]	搜索结果邮箱号码状态	这些位输出在MSMR寄存器中选择的每个搜索模式中找到的最小邮箱号	R
b6, b5	—	Reserved	这些位被读为0	R
b7	SEST	搜索结果状态	0：找到搜索结果1： 没有搜索结果。	R

MBNST[4:0]位（搜索结果邮箱号码状态）

在所有邮箱搜索模式中，MBNST[4:0]位输出最小的邮箱号。在接收邮箱搜索模式、发送邮箱搜索模式和消息丢失搜索模式下，邮箱的值（要输出的搜索结果）在以下条件下更新：

- 当邮箱输出的相关NEWDATA、SENTDATA或MSGLOST标志设置为0时MBNST[4:0]
- 当邮箱的相关NEWDATA、SENTDATA或MSGLOST标志设置为1时，邮箱的编号小于MBNST[4:0]中的编号。

如果MBSM[1:0]位设置为00b（接收邮箱搜索模式）或10b（邮件丢失搜索模式），则在接收FIFO（邮箱28）不为空且没有未读接收到的消息时输出在任何正常邮箱0到23中都没有丢失消息。如果MBSM[1:0]位设置为01b（发送邮箱搜索模式），则不输出发送FIFO（邮箱24）。表33.6列出了MBNST[4:0]位在FIFO邮箱模式下的行为。

在频道搜索模式下，MBNST[4:0]位输出相关的频道号。软件读取MSSR后，输出下一个目标通道号。

SEST位（搜索结果状态）

当搜索所有邮箱后未找到相关邮箱时，SEST位设置为1（无搜索结果）。例如，在发送邮箱搜索模式中，当没有任何邮箱的SENTDATA标志为1时，SEST位设置为1。当至少一个SENTDATA标志为1时，SEST位设置为0。当SEST位为1时，MBNST[4:0]位的值未定义。

Table 33.6 FIFO邮箱模式下MBNST[4:0]位的行为

MBSM[1:0] bits	Mailbox 24 (transmit FIFO)	Mailbox 28 (receive FIFO)
00b	邮箱24不输出	当正常邮箱的MCTL_RXj.NEWDATA标志未设置为1（新消息正在存储或已存储在邮箱中）且接收FIFO不为空时，输出邮箱28
01b		28号邮箱不输出
10b		当正常邮箱的MCTL_RXj.MSGLOST标志未设置为1（消息被覆盖或溢出）且接收FIFO中的RFCR.RFMLF标志设置为1（接收FIFO消息丢失）时，输出邮箱28
11b		28号邮箱不输出

33.2.18 Channel Search Support Register (CSSR)

Address(es): CAN0.CSSR 4005 0851h, CAN1.CSSR 4005 1851h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	When the value for the channel search is input, the channel number is output to MSSR	R/W

The bits that are set to 1 in the CSSR are encoded by an 8/3 encoder (the LSB position has the higher priority) and output to the MBNST[4:0] bits in MSSR. The MSSR register outputs the updated value whenever it is read by software.

Write to CSSR only when the MSMR.MBSM[1:0] bits are 11b (channel search mode). Write to CSSR in CAN operation mode or CAN halt mode.

Figure 33.4 shows the write and read operations of the CSSR and MSSR registers.

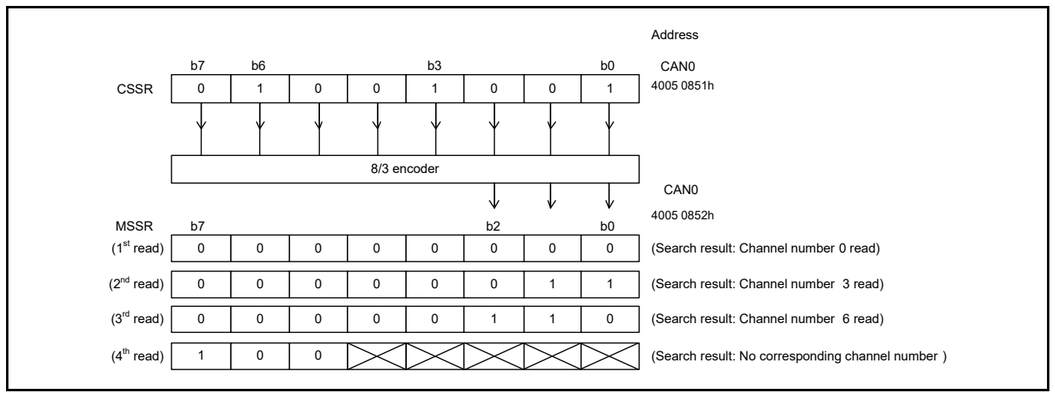

Figure 33.4 Write and read operations of the CSSR and MSSR registers

The value of CSSR is also updated whenever MSSR is read. On this read, the value prior to conversion by the 8/3 encoder can be read.

33.2.19 Acceptance Filter Support Register (AFSR)

Address(es): CAN0.AFSR 4005 0856h, CAN1.AFSR 4005 1856h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b15 to b0	After the standard ID of a received message is written, the value converted for data table search can be read	R/W

Note: Write to AFSR in CAN operation mode or halt mode.

33.2.18 频道搜索支持寄存器(CSSR)

Address(es): CAN0.CSSR 4005 0851h, CAN1.CSSR 4005 1851h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	输入通道搜索值时，通道号输出到MSSR	R/W

CSSR中设置为1的位由83编码器（LSB位置具有较高优先级）编码并输出到MSSR中的MBNST[4:0]位。每当软件读取时，MSSR寄存器就会输出更新的值。

仅当MSMR.MBSM[1:0]位为11b（通道搜索模式）时才写入CSSR。在CAN操作模式或CAN暂停模式下写入CSSR。

图33.4显示了CSSR和MSSR寄存器的写和读操作。

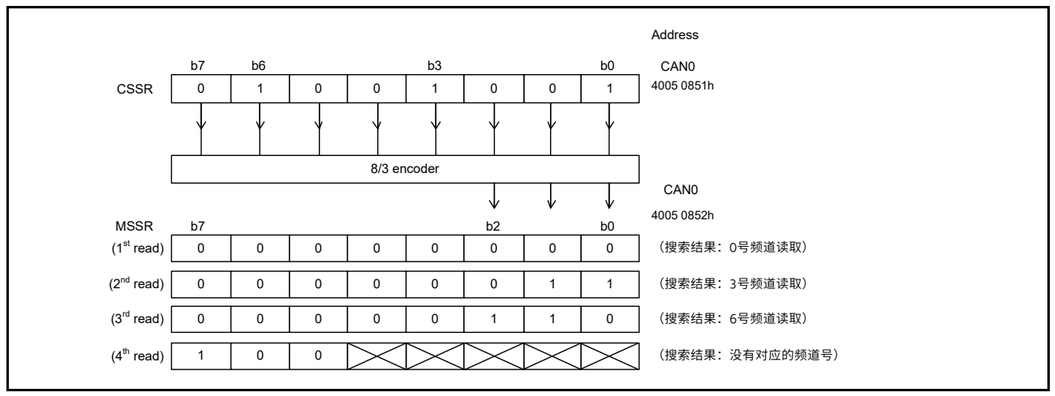

Figure 33.4 CSSR和MSSR寄存器的写和读操作

每当读取MSSR时，CSSR的值也会更新。在此读取中，可以读取83编码器转换之前的值。

33.2.19 接受过滤器支持寄存器(AFSR)

Address(es): CAN0.AFSR 4005 0856h, CAN1.AFSR 4005 1856h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b15 to b0	接收报文的标准ID写入后，即可读取数据查表转换后的值	R/W

Note: 在CAN操作模式或暂停模式下写入AFSR。

RA生态工作室

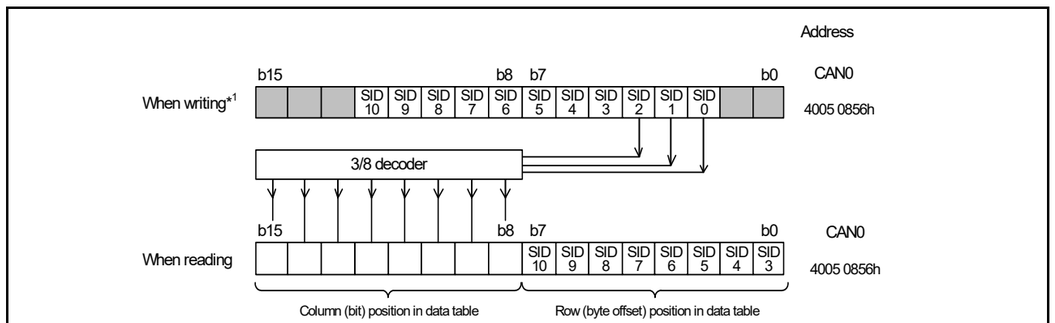
The acceptance filter support unit (ASU) can be used for data table (8 bits × 256) searches. In the data table, all standard IDs that are created are set as valid or invalid in bit units. When AFSR is written with data in 16-bit units including the SID[10:0] bits in MBj_ID (j = 0 to 31), in which a received standard ID is stored, a decoded row (byte offset) position and column (bit) position for data table search can be read. The ASU can be used for standard (11-bit) IDs only.

The ASU is enabled in the following cases:

- When the ID to be received cannot be masked by the acceptance filter.
  For example, if the IDs to be received are 078h, 087h, and 111h.
- When there are too many IDs to receive, and the software filtering time is expected to be shortened.

Note: The AFSR register cannot be set in CAN reset mode.

Figure 33.5 shows the write and read operations in the AFSR register.



Note 1. Write the same value as the 16-bit unit data, including the SID[10:0] bits in MBj_ID (j = 0 to 31).

Figure 33.5 Write and read operations in the AFSR register

33.2.20 Error Interrupt Enable Register (EIER)

Address(es): CAN0.EIER 4005 084Ch, CAN1.EIER 4005 184Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	BLIE	OLIE	ORIE	BORIE	BOEIE	EPIE	EWIE	BEIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BEIE	Bus Error Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W
b1	EWIE	Error-Warning Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W
b2	EPIE	Error-Passive Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W
b3	BOEIE	Bus-Off Entry Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W
b4	BORIE	Bus-Off Recovery Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W
b5	ORIE	Overrun Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W
b6	OLIE	Overload Frame Transmit Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W
b7	BLIE	Bus Lock Interrupt Enable	0: Interrupt disabled 1: Interrupt enabled.	R/W

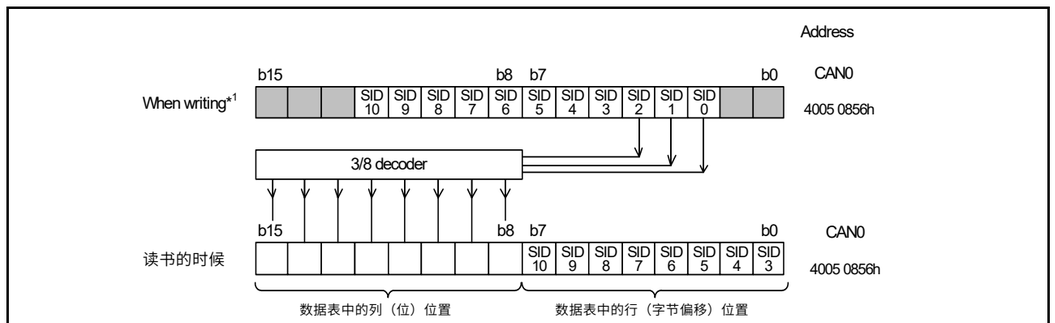
验收滤波器支持单元(ASU)可用于数据表（8位×256）搜索。在数据表中，所有创建的标准ID都以位为单位设置为有效或无效。当AFSR以16位单元写入数据时，包括MBj_ID(j=0到31)中的SID[10:0]位，其中存储了接收到的标准ID，解码的行（字节偏移）位置和列（位）数据表搜索的位置可以被读取。ASU只能用于标准（11位）ID。

ASU在以下情况下启用：

- 当接受过滤器不能屏蔽要接收的ID时。
  例如，如果要接收的ID是078h、087h和111h。
- 当接收的ID太多时，预计软件过滤时间会缩短。

Note: 在CAN复位模式下不能设置AFSR寄存器。

图33.5显示了AFSR寄存器中的写和读操作。



Note 1. 写入与16位单元数据相同的值，包括MBj_ID中的SID[10:0]位（j=0到31）。

Figure 33.5 AFSR寄存器中的写和读操作

33.2.20 错误中断使能寄存器(EIER)

Address(es): CAN0.EIER 4005 084Ch, CAN1.EIER 4005 184Ch

	b7	b6	b5	b4	b3	b2	b1	b0

b7	BLIE	总线锁定中断使能	0：中断禁止1：中断允许。	R/W

The EIER register independently enables or disables the error interrupt for each error interrupt source. Write to EIER in CAN reset mode.

BEIE bit (Bus Error Interrupt Enable)

When the BEIE bit is 0, no error interrupt request occurs even if the BEIF flag in EIFR is 1. When the BEIE bit is 1, an error interrupt request occurs if the BEIF flag is set to 1.

EWIE bit (Error-Warning Interrupt Enable)

When the EWIE bit is 0, no error interrupt request occurs even if the EWIF flag in EIFR is 1. When the EWIE bit is 1, an error interrupt request is generated if the EWIF flag is set to 1.

EPIE bit (Error-Passive Interrupt Enable)

When the EPIE bit is 0, no error interrupt request occurs even if the EPIF flag in EIFR is 1. When the EPIE bit is 1, an error interrupt request occurs if the EPIF flag is set to 1.

BOEIE bit (Bus-Off Entry Interrupt Enable)

When the BOEIE bit is 0, no error interrupt request occurs even if the BOEIF flag in EIFR is 1. When the BOEIE bit is 1, an error interrupt request occurs if the BOEIF flag is set to 1.

BORIE bit (Bus-Off Recovery Interrupt Enable)

When the BORIE bit is 0, no error interrupt request occurs even if the BORIF flag in EIFR is 1. When the BORIE bit is 1, an error interrupt request occurs if the BORIF flag is set to 1.

ORIE bit (Overrun Interrupt Enable)

When the ORIE bit is 0, no error interrupt request occurs even if the ORIF flag in EIFR is 1. When the ORIE bit is 1, an error interrupt request occurs if the ORIF flag is set to 1.

OLIE bit (Overload Frame Transmit Interrupt Enable)

When the OLIE bit is 0, no error interrupt request occurs even if the OLIF flag in EIFR is 1. When the OLIE bit is 1, an error interrupt request occurs if the OLIF flag is set to 1.

BLIE bit (Bus Lock Interrupt Enable)

When the BLIE bit is 0, no error interrupt request occurs even if the BLIF flag in EIFR is 1. When the BLIE bit is 1, an error interrupt request occurs if the BLIF flag is set to 1.

33.2.21 Error Interrupt Factor Judge Register (EIFR)

Address(es): CAN0.EIFR 4005 084Dh, CAN1.EIFR 4005 184Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	BLIF	OLIF	ORIF	BORIF	BOEIF	EPIF	EWIF	BEIF
Value after reset:	0	0	0	0	0	0	0	0

EIER寄存器独立启用或禁用每个错误中断源的错误中断。写信给EIER
CAN复位模式。

BEIE位（总线错误中断使能）

当BEIE位为0时，即使EIFR中的BEIF标志为1，也不会发生错误中断请求。当BEIE位为1时，如果BEIF标志位设置为1，则发生错误中断请求。

EWIE位（错误警告中断使能）

当EWIE位为0时，即使EIFR中的EWIF标志为1，也不会产生错误中断请求。当EWIE位为1时，如果EWIF标志位设置为1，则产生错误中断请求。

EPIE位（错误被动中断使能）

当EPIE位为0时，即使EIFR中的EPIF标志为1，也不会发生错误中断请求。当EPIE位为1时，如果EPIF标志位设置为1，则会发生错误中断请求。

BOEIE位（总线关闭进入中断使能）

当BOEIE位为0时，即使EIFR中的BOEIF标志为1，也不会产生错误中断请求。当BOEIE位为1时，如果将BOEIF标志设置为1，则会产生错误中断请求。

BORIE位（总线关闭恢复中断使能）

当BORIE位为0时，即使EIFR中的BORIF标志为1，也不会产生错误中断请求。当BORIE位为1时，如果将BORIF标志设置为1，则会产生错误中断请求。

ORIE位（溢出中断使能）

当ORIE位为0时，即使EIFR中的ORIF标志为1，也不会发生错误中断请求。当ORIE位为1时，如果将ORIF标志设置为1，则会发生错误中断请求。

OLIE位（过载帧发送中断使能）

当OLIE位为0时，即使EIFR中的OLIF标志为1，也不会产生错误中断请求。当OLIE位为1时，如果OLIF标志被设置为1，则产生错误中断请求。

BLIE位（总线锁定中断使能）

当BLIE位为0时，即使EIFR中的BLIF标志为1，也不会发生错误中断请求。当BLIE位为1时，如果BLIF标志位设置为1，则会发生错误中断请求。

33.2.21 错误中断因素判断寄存器（EIFR）

Address(es): CAN0.EIFR 4005 084Dh, CAN1.EIFR 4005 184Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	BLIF	OLIF	ORIF	BORIF	BOEIF	EPIF	EWIF	BEIF
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	BEIF	总线错误检测标志	0：未检测到总线错误1 ：检测到总线错误。	R/W
b1	EWIF	错误警告检测标志	0：未检测到错误警告1：检测到错误警告。	R/W

Bit	Symbol	Bit name	Description	R/W
b5	ORIF	Receive Overrun Detect Flag	0: No receive overrun detected 1: Receive overrun detected.	R/W
b6	OLIF	Overload Frame Transmission Detect Flag	0: No overload frame transmission detected 1: Overload frame transmission detected.	R/W
b7	BLIF	Bus Lock Detect Flag	0: No bus lock detected 1: Bus lock detected.	R/W

If an event associated with an EIFR flag occurs, the associated bit in EIFR is set to 1, regardless of the setting of EIER.

Clear the bits to 0 through a software write. If a bit is set to 1 at the same time that software clears it, the bit becomes 1. When setting a single bit to 0 in software, use the transfer instruction (MOV) to ensure that only the specified bit is set to 0 and the other bits are set to 1. Writing 1 has no effect to these bit values.

BEIF flag (Bus Error Detect Flag)

The BEIF flag is set to 1 when a bus error is detected.

EWIF flag (Error-Warning Detect Flag)

The EWIF flag is set to 1 when the value of the receive error counter (REC) or transmit error counter (TEC) exceeds 95. This flag is set to 1 only when the REC or TEC value initially exceeds 95. If software writes 0 to this flag while the REC or TEC value remains greater than 95, the EWIF flag is not set to 1 until the REC or TEC value goes below 95, and then exceeds 95 again.

EPIF flag (Error-Passive Detect Flag)

The EPIF flag is set to 1 when the CAN error state becomes error-passive, while the REC or TEC value exceeds 127. This flag is set to 1 only when the REC or TEC value initially exceeds 127. If software writes 0 to this flag while REC or TEC remains greater than 127, the EPIF flag is not set to 1 until REC or TEC goes below 127, and then exceeds 127 again.

BOEIF flag (Bus-Off Entry Detect Flag)

The BOEIF flag is set to 1 when the CAN error state becomes bus-off, while the TEC value exceeds 255. This flag is also set to 1 when the BOM[1:0] bits in CTLR are 01b (automatic entry to CAN halt mode on bus-off entry) and the CAN module enters the bus-off state.

BORIF flag (Bus-Off Recovery Detect Flag)

The BORIF flag is set to 1 when the CAN module recovers from the bus-off state normally by detecting 11 consecutive recessive bits 128 times in the following conditions:

- When the BOM[1:0] bits in CTLR are 00b
- When the BOM[1:0] bits in CTLR are 10b
- When the BOM[1:0] bits in CTLR are 11b.

The BORIF flag is not set to 1 if the CAN module recovers from the bus-off state in the following conditions:

- When the CANM[1:0] bits in CTLR are set to 01b or 11b (CAN reset mode)
- When the RBOC bit in CTLR is set to 1 (forced return from bus-off)
- When the BOM[1:0] bits in CTLR are set to 01b
- When the BOM[1:0] bits in CTLR are set to 11b and the CANM[1:0] bits in CTLR are set to 10b (CAN halt mode) before normal recovery occurs.

Table 33.7 lists the behavior of the BOEIF and BORIF flags for each CTLR.BOM[1:0] bit setting.

Bit	Symbol	位名称	Description	R/W
b5	ORIF	接收溢出检测标志	0：未检测到接收溢出1：检测到接收溢出。	R/W
b6	OLIF	过载帧传输检测标志	0：未检测到过载帧传输1：检测到过载帧传输。	R/W
b7	BLIF	总线锁定检测标志	0：未检测到总线锁定1：检测到总线锁定。	R/W

如果发生与EIFR标志相关的事件，则EIFR中的相关位设置为1，而与EIER的设置无关。

通过软件写入将这些位清除为0。如果在软件清零的同时将某个位设置为1，则该位变为1。在软件中将单个位设置为0时，使用传输指令(MOV)确保只有指定的位设置为0，并且其他位设置为1。写入1对这些位值没有影响。

BEIF标志（总线错误检测标志）

当检测到总线错误时，BEIF标志设置为1。

EWIF标志（错误警告检测标志）

当接收错误计数器(REC)或发送错误计数器(TEC)的值超过95时，EWIF标志设置为1。仅当REC或TEC值最初超过95时，此标志才设置为1。如果软件将0写入当REC或TEC值保持大于95时，EWIF标志不会设置为1，直到REC或TEC值低于95，然后再次超过95。

EPIF标志（错误被动检测标志）

当CAN错误状态变为被动错误，而REC或TEC值超过127时，EPIF标志设置为1。仅当REC或TEC值最初超过127时，此标志设置为1。如果软件将0写入此标志而REC或
TEC保持大于127，EPIF标志不会设置为1，直到REC或TEC低于127，然后再次超过127。

BOEIF标志（总线关闭进入检测标志）

当CAN错误状态变为总线关闭时，BOEIF标志设置为1，而TEC值超过255。当CTLR中的BOM[1:0]位为01b（自动进入CAN停止）时，该标志也设置为1进入总线关闭模式）和CAN模块进入总线关闭状态。

BORIF标志（总线关闭恢复检测标志）

当CAN模块在以下情况下通过检测11个连续的隐性位128次从总线关闭状态正常恢复时，BORIF标志设置为1：

- CTLR的BOM[1:0]位为00b时
- CTLR中BOM[1:0]位为10b时
- 当CTLR的BOM[1:0]位为11b时。

如果CAN模块在以下情况下从总线关闭状态恢复，则BORIF标志不设置为1：

- 当CTLR中的CANM[1:0]位设置为01b或11b时（CAN复位模式）
- 当CTLR的RBOC位设置为1时（从总线关闭强制返回）
- 当CTLR中的BOM[1:0]位设置为01b
- 当CTLR中的BOM[1:0]位设置为11b且CTLR中的CANM[1:0]位设置为10b（CAN停止模式）时，才会发生正常恢复。

表33.7列出了每个CTLR.BOM[1:0]位设置的BOEIF和BORIF标志的行为。

Table 33.7 Behavior of BOEIF and BORIF flags for each CTLR.BOM[1:0] setting

BOM[1:0] bits	BOEIF flag	BORIF flag
00b	Set to 1 on entry to the bus-off state	Set to 1 on exit from the bus-off state
01b		Do not set to 1
10b		Set to 1 on exit from the bus-off state
11b		Set to 1 if normal bus-off recovery occurs before the CANM[1:0] bits are set to 10b (CAN halt mode)

ORIF flag (Receive Overrun Detect Flag)

The ORIF flag is set to 1 when a receive overrun occurs. This flag is not set to 1 in overwrite mode. In overwrite mode, a reception complete interrupt request occurs if an overwrite condition occurs and the ORIF flag is not set to 1.

In overrun mode with normal mailbox mode, if an overrun occurs in any of mailboxes 0 to 31, the ORIF flag is set to 1. In overrun mode with FIFO mailbox mode, if an overrun occurs in any of mailboxes 0 to 23 or the receive FIFO, this flag is set to 1.

OLIF flag (Overload Frame Transmission Detect Flag)

The OLIF flag is set to 1 if the transmitting condition of an overload frame is detected when the CAN module is transmitting or receiving.

BLIF flag (Bus Lock Detect Flag)

The BLIF flag is set to 1 if 32 consecutive dominant bits are detected on the CAN bus while the CAN module is in CAN operation mode.

After the BLIF flag is set to 1, 32 consecutive dominant bits are detected again in either of the following conditions:

- Recessive bits are detected after the BLIF flag changes to 0 from 1
- The CAN module enters CAN reset or halt mode and then enters CAN operation mode again, after the BLIF flag changes to 0 from 1.

33.2.22 Receive Error Count Register (RECR)

Address(es): CAN0.RECR 4005 084Eh, CAN1.RECR 4005 184Eh

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Description	R/W
b7 to b0	Receive error count function. RECR increments or decrements the counter value based on the error status of the CAN module during reception.	R

The RECR register indicates the value of the receive error counter. See the CAN specification (ISO11898-1) for the increment and decrement conditions of the receive error counter. The value of RECR in the bus-off state is undefined.

Table 33.7 每个CTLR.BOM[1:0]设置的BOEIF和BORIF标志的行为

BOM[1:0] bits	BOEIF flag	BORIF flag
00b	进入总线关闭状态时设置为1	退出总线关闭状态时设置为1
01b		不要设置为1
10b		退出总线关闭状态时设置为1
11b		如果在CANM[1:0]位设置为10b（CAN停止模式）之前发生正常的总线关闭恢复，则设置为1

ORIF标志（接收溢出检测标志）

当发生接收溢出时，ORIF标志设置为1。此标志在覆盖模式下不设置为1。在覆盖模式下，如果出现覆盖条件且ORIF标志未设置为1，则会产生接收完成中断请求。

在具有正常邮箱模式的溢出模式中，如果在任何邮箱0到31中发生溢出，则ORIF标志设置为1。在具有FIFO邮箱模式的溢出模式中，如果在任何邮箱0到23或接收中发生溢出FIFO，此标志设置为1。

OLIF标志（过载帧传输检测标志）

如果在CAN模块发送或接收时检测到过载帧的发送条件，则OLIF标志设置为1。

BLIF标志（总线锁定检测标志）

如果在CAN模块处于CAN操作模式时在CAN总线上检测到32个连续显性位，则BLIF标志设置为1。

将BLIF标志设置为1后，在以下任一条件下再次检测到32个连续的显性位：

- BLIF标志从1变为0后检测到隐性位
- CAN模块进入CAN复位或停止模式，然后在BLIF标志从1变为0后再次进入CAN操作模式。

33.2.22 接收错误计数寄存器(RECR)

Address(es): CAN0.RECR 4005 084Eh, CAN1.RECR 4005 184Eh

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0

Bit	Description	R/W
b7 to b0	接收错误计数功能。RECR根据错误状态递增或递减计数器值 接收期间的CAN模块。	R

RECR寄存器指示接收错误计数器的值。有关接收错误计数器的递增和递减条件，请参见CAN规范(ISO11898-1)。总线关闭状态下RECR的值未定义。

33.2.23 Transmit Error Count Register (TECR)

Address(es): CAN0.TECR 4005 084Fh, CAN1.TECR 4005 184Fh

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Description	R/W
b7 to b0	Transmit error count function. TECR increments or decrements the counter value based on the error status of the CAN module during transmission.	R

The TECR register indicates the value of the transmit error counter. See the CAN specification (ISO11898-1) for the increment and decrement conditions of the transmit error counter. The value of TECR in the bus-off state is undefined.

33.2.24 Error Code Store Register (ECSR)

Address(es): CAN0.ECSR 4005 0850h, CAN1.ECSR 4005 1850h

	b7	b6	b5	b4	b3	b2	b1	b0
	EDPM	ADEF	BE0F	BE1F	CEF	AEF	FEF	SEF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SEF	Stuff Error Flag*1,*2	0: No stuff error detected 1: Stuff error detected.	R/W
b1	FEF	Form Error Flag*1,*2	0: No form error detected 1: Form error detected.	R/W
b2	AEF	ACK Error Flag*1,*2	0: No ACK error detected 1: ACK error detected.	R/W
b3	CEF	CRC Error Flag*1,*2	0: No CRC error detected 1: CRC error detected.	R/W
b4	BE1F	Bit Error (recessive) Flag*1,*2	0: No bit error (recessive) detected 1: Bit error (recessive) detected.	R/W
b5	BE0F	Bit Error (dominant) Flag*1,*2	0: No bit error (dominant) detected 1: Bit error (dominant) detected.	R/W
b6	ADEF	ACK Delimiter Error Flag*1,*2	0: No ACK delimiter error detected 1: ACK delimiter error detected.	R/W
b7	EDPM	Error Display Mode Select*3,*4	0: Output first detected error code 1: Output accumulated error code.	R/W

Note 1. Writing 1 has no effect on these bit values.
Note 2. To write 0 to the SEF, FEF, AEF, CEF, BE1F, BE0F, and ADEF bits, use the transfer (MOV) instruction to ensure that only the specified bit is set to 0 and the other bits are set to 1.
Note 3. Write to the EDPM bit in CAN reset mode or halt mode.
Note 4. If more than one error condition is detected simultaneously, all the related bits are set to 1.

ECSR indicates whether an error occurred on the CAN bus. See the CAN specification (ISO11898-1) for the conditions when each error occurs.

Clear all of the bits, except for EDPM, to 0 through a software write. If the ECSR bit is set to 1 by the CAN module at that same time that software writes 0 to it, the bit is set to 1.

33.2.23 发送错误计数寄存器(TECR)

Address(es): CAN0.TECR 4005 084Fh, CAN1.TECR 4005 184Fh

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0

Bit	Description	R/W
b7 to b0	发送错误计数功能。TECR根据错误状态递增或递减计数器值 CAN模块在传输过程中。	R

TECR寄存器指示发送错误计数器的值。有关发送错误计数器的递增和递减条件，请参见CAN规范(ISO11898-1)。总线关闭状态下的TECR值未定义。

33.2.24 错误代码存储寄存器(ECSR)

Address(es): CAN0.ECSR 4005 0850h, CAN1.ECSR 4005 1850h

	b7	b6	b5	b4	b3	b2	b1	b0
	EDPM	ADEF	BE0F	BE1F	CEF	AEF	FEF	SEF
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SEF	填充错误标志*1 *2	0：未检测到填充错误1 ：检测到填充错误。	R/W
b1	FEF	表格错误标志*1 *2	0：未检测到表单错误1 ：检测到表单错误。	R/W
b2	AEF	ACK错误标志*1 *2	0：未检测到ACK错误1： 检测到ACK错误。	R/W
b3	CEF	CRC Error Flag*1,*2	0：未检测到CRC错误1： 检测到CRC错误。	R/W
b4	BE1F	位错误（隐性）标志*1 *2	0：未检测到位错误（隐性）1：检 测到位错误（隐性）。	R/W
b5	BE0F	误码（显性）标志*1 *2	0：未检测到位错误（显性）1：检 测到位错误（显性）。	R/W
b6	ADEF	ACK分隔符错误标志*1 *2	0：未检测到ACK分隔符错误1：检 测到ACK分隔符错误。	R/W
b7	EDPM	错误显示模式选择*3 *4	0：输出第一个检测到的错误代码 1：输出累积错误代码。	R/W

Note 1. 写1对这些位值没有影响。
Note 2. 要将0写入SEF、FEF、AEF、CEF、BE1F、BE0F和ADEF位，请使用传输(MOV)指令确保仅将指定位设置为0，而将其他位设置为1。
Note 3. 在CAN复位模式或暂停模式下写入EDPM位。
Note 4. 如果同时检测到多个错误条件，则所有相关位都设置为1。

ECSR指示CAN总线上是否发生错误。有关每个错误发生的条件，请参见CAN规范(ISO11898-1)。

通过软件写入将除EDPM之外的所有位清零。如果在软件向其写入0的同时CAN模块将ECSR位设置为1，则该位设置为1。

SEF flag (Stuff Error Flag*1,*2)

The SEF flag is set to 1 when a stuff error is detected.

FEF flag (Form Error Flag*1,*2)

The FEF flag is set to 1 when a form error is detected.

AEF flag (ACK Error Flag*1,*2)

The AEF flag is set to 1 when an ACK error is detected.

CEF flag (CRC Error Flag*1,*2)

The CEF flag is set to 1 when a CRC error is detected.

BE1F flag (Bit Error (recessive) Flag*1,*2)

The BE1F flag is set to 1 when a recessive bit error is detected.

BE0F flag (Bit Error (dominant) Flag*1,*2)

The BE0F flag is set to 1 when a dominant bit error is detected.

ADEF flag (ACK Delimiter Error Flag*1,*2)

The ADEF flag is set to 1 when a form error is detected with the ACK delimiter during transmission.

EDPM bit (Error Display Mode Select*3,*4)

The EDPM bit selects the output mode of ECSR. When the EDPM bit is set to 0, ECSR outputs the first error code. When the EDPM bit is set to 1, ECSR outputs the accumulated error code.

33.2.25 Time Stamp Register (TSR)

Address(es): CAN0.TSR 4005 0854h, CAN1.TSR 4005 1854h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	R/W
b15 to b0	Free-running counter value for the time stamp function	R

Note: Read TSR in 16-bit units.

Reading the TSR register returns the current value of the 16-bit free-running time stamp counter. The time stamp counter reference clock is configured in the TSPS[1:0] bits in CTLR. The counter stops in CAN sleep mode and CAN halt mode, and is initialized in CAN reset mode. The time stamp counter value is stored in the TSL[7:0] and TSH[7:0] bits in the MBj_TS register when a received message is stored in a receive mailbox.

SEF标志（StuffErrorFlag*1 *2）

当检测到填充错误时，SEF标志设置为1。

FEF标志（表格错误标志*1 *2）

当检测到表单错误时，FEF标志设置为1。

AEF标志（ACK错误标志*1 *2）

当检测到ACK错误时，AEF标志设置为1。

CEF标志（CRC错误标志*1 *2）

当检测到CRC错误时，CEF标志设置为1。

BE1F标志（误码（隐性）标志*1 *2）

当检测到隐性位错误时，BE1F标志设置为1。

BE0F标志（位错误（显性）标志*1 *2）

当检测到显性位错误时，BE0F标志设置为1。

ADEF标志（ACK分隔符错误标志*1 *2）

当在传输过程中使用ACK定界符检测到格式错误时，ADEF标志设置为1。

EDP M位（错误显示模式选择*3 *4）

EDP M位选择ECSR的输出模式。当EDPM位设置为0时，ECSR输出第一个错误代码。当EDPM位设置为1时，ECSR输出累积的错误代码。

33.2.25 时间戳寄存器(TSR)

Address(es): CAN0.TSR 4005 0854h, CAN1.TSR 4005 1854h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	R/W
b15 to b0	时间戳功能的自由运行计数器值	R

Note: 以16位为单位读取TSR。

读取TSR寄存器返回16位自由运行时间戳计数器的当前值。时间戳计数器参考时钟在CTLR的TSPS[1:0]位中配置。计数器在CAN睡眠模式和CAN暂停模式下停止，并在CAN复位模式下初始化。当接收到的消息存储在接收邮箱中时，时间戳计数器值存储在MBj_TS寄存器的TSL[7:0]和TSH[7:0]位中。

33.2.26 Test Control Register (TCR)

Address(es): CAN0.TCR 4005 0858h, CAN1.TCR 4005 1858h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TSTM[1:0]		TSTE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TSTE	CAN Test Mode Enable	0: CAN test mode disabled 1: CAN test mode enabled.	R/W
b2, b1	TSTM[1:0]	CAN Test Mode Select	b2 b1 0 0: Not CAN test mode 0 1: Listen-only mode 1 0: Self-test mode 0 (external loopback) 1 1: Self-test mode 1 (internal loopback).	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TCR controls the CAN test mode. Write to TCR in CAN halt mode only.

(1) Listen-only mode

The CAN specification (ISO11898-1) recommends an optional bus monitoring mode. In listen-only mode, valid data frames and valid remote frames can be received. However, only recessive bits can be sent on the CAN bus. The ACK bit, overload flag, and active error flag cannot be sent. Listen-only mode can be used for baud rate detection. Do not request transmission from any mailboxes in listen-only mode.

Figure 33.6 shows the connection when listen-only mode is selected.

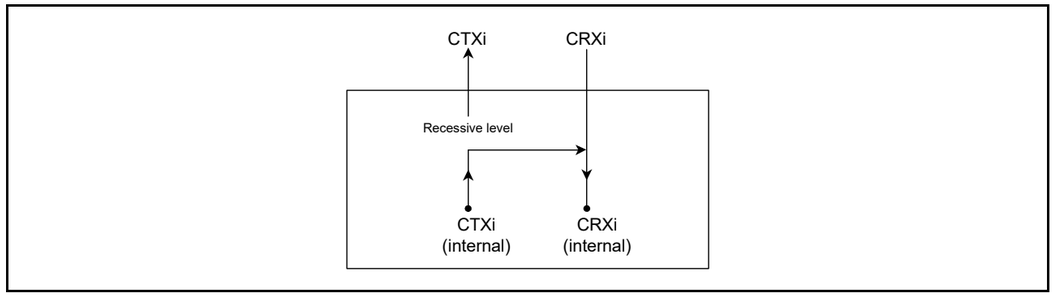

Figure 33.6 Connection when listen-only mode is selected (i = 0, 1)

(2) Self-test mode 0 (external loopback)

Self-test mode 0 is provided for CAN transceiver tests. In this mode, the protocol module treats its own transmitted messages as those received by the CAN transceiver and stores them into the receive mailbox. To be independent from external stimulation, the protocol module generates the ACK bit. Connect the CTXi and CRXi pins to the transceiver.

Figure 33.7 shows the connection when self-test mode 0 is selected.

33.2.26 测试控制寄存器(TCR)

Address(es): CAN0.TCR 4005 0858h, CAN1.TCR 4005 1858h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TSTM[1:0]		TSTE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	TSTE	CAN测试模式启用	0：禁用CAN测试模式1： 启用CAN测试模式。	R/W
b2, b1	TSTM[1:0]	CAN测试模式选择	b2b100：非CAN测试模式01：只听模式1 0：自测模式0（外部环回）11：自测模式 1（内部环回）。	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

TCR控制CAN测试模式。仅在CAN停止模式下写入TCR。

(1) Listen-only mode

CAN规范(ISO11898-1)推荐一种可选的总线监控模式。在只听模式下，可以接收到有效的数据帧和有效的远程帧。但是，只能在CAN总线上发送隐性位。不能发送ACK位、过载标志和活动错误标志。只听模式可用于波特率检测。不要在只听模式下从任何邮箱请求传输。

图33.6显示了选择只听模式时的连接。

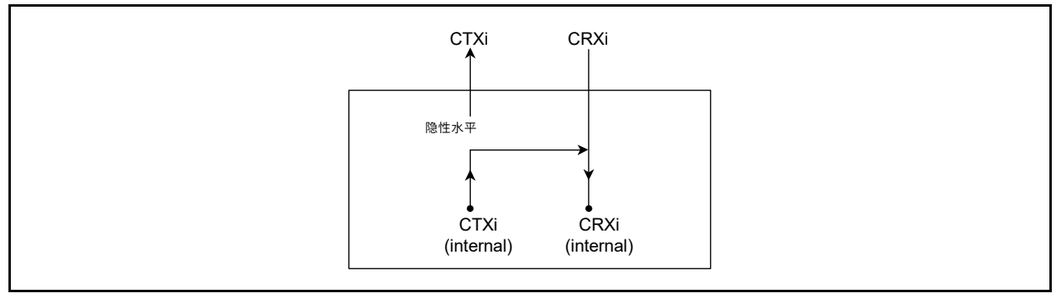

Figure 33.6 选择只听模式时的连接(i=0 1)

(2) Self-test mode 0 (external loopback)

自测模式0用于CAN收发器测试。在该模式下，协议模块将自己发送的报文视为CAN收发器接收到的报文，并将其存储到接收邮箱中。为独立于外部刺激，协议模块生成ACK位。将CTXi和CRXi引脚连接到收发器。

图33.7显示了选择自检模式0时的连接。

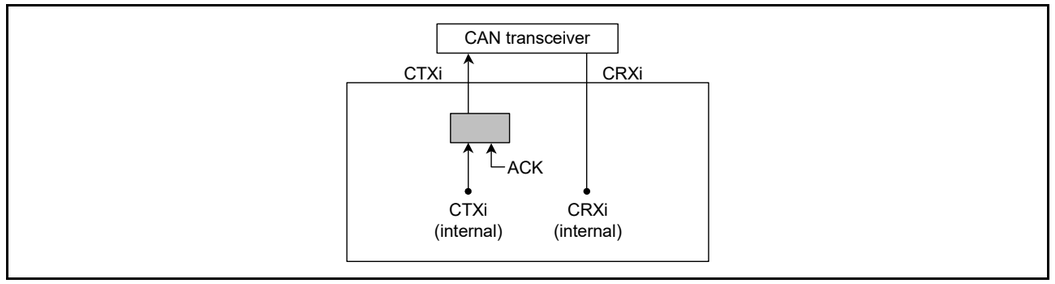

Figure 33.7 Connection when self-test mode 0 is selected (i = 0, 1)

(3) Self-test mode 1 (internal loopback)

Self-test mode 1 is provided for self-test functions. In this mode, the protocol controller treats its transmitted messages as received messages and stores them into the receive mailbox. To be independent from external stimulation, the protocol controller generates the ACK bit.

In self-test mode 1, the protocol controller performs an internal feedback from the internal CTXi pin to the internal CRXi pin. The input value of the external CRXi pin is ignored. The external CTXi pin outputs only recessive bits. The CTXi and CRXi pins are not required to be connected to the CAN bus or any external device.

Figure 33.8 shows the connection when self-test mode 1 is selected.

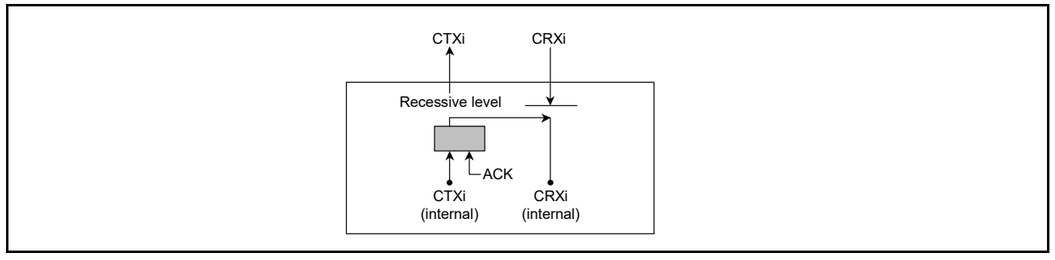

Figure 33.8 Connection when self-test mode 1 is selected (i = 0, 1)

33.3 Operation Modes

The CAN module operation includes the following modes:

- CAN reset mode
- CAN halt mode
- CAN operation mode
- CAN sleep mode.

Figure 33.9 shows the transitions between different operation modes.

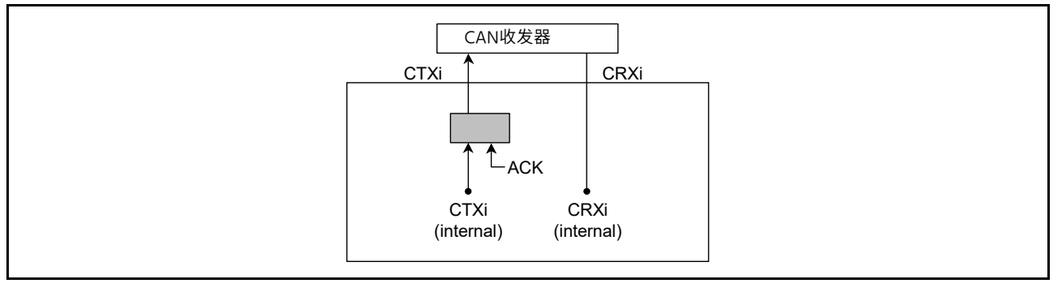

Figure 33.7 选择自检模式0时的连接(i=0 1)

(3) Self-test mode 1 (internal loopback)

自检模式1用于自检功能。在这种模式下，协议控制器将其发送的消息视为接收的消息，并将它们存储到接收邮箱中。为了独立于外部刺激，协议控制器生成ACK位。

在自检模式1中，协议控制器执行从内部CTXi引脚到内部CRXi引脚的内部反馈。外部CRXi引脚的输入值被忽略。外部CTXI引脚仅输出隐性位。CTXi和CRXi引脚不需要连接到CAN总线或任何外部设备。

图33.8显示了选择自检模式1时的连接。

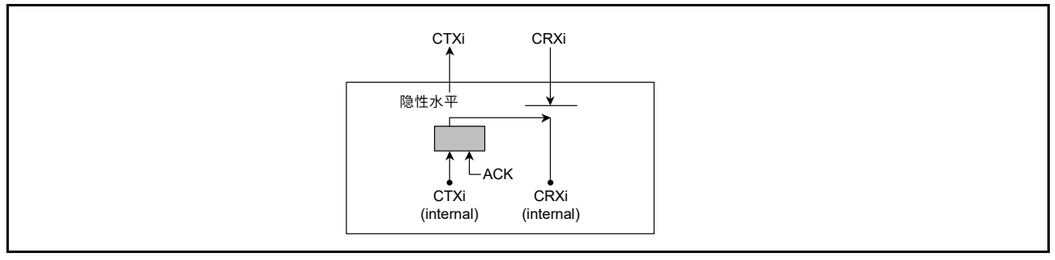

Figure 33.8 选择自检模式1时的连接(i=0 1)

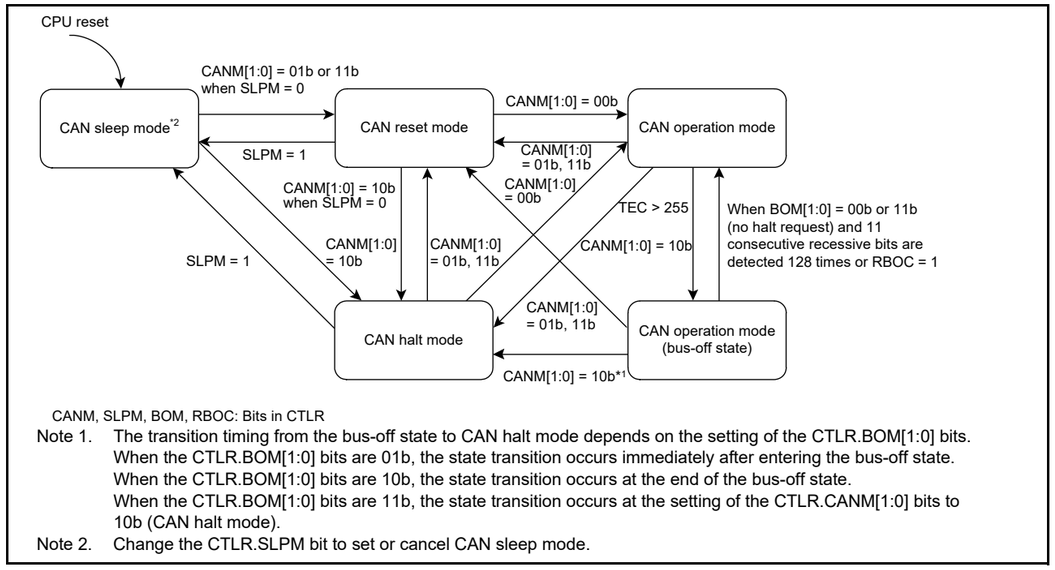
33.3 操作模式

CAN模块操作包括以下模式：

- CAN复位模式
- CAN暂停模式
- CAN操作模式
- CAN睡眠模式。

图33.9显示了不同操作模式之间的转换。



CANM, SLPM, BOM, RBOC: Bits in CTLR

Note 1. The transition timing from the bus-off state to CAN halt mode depends on the setting of the CTLR.BOM[1:0] bits.
When the CTLR.BOM[1:0] bits are 01b, the state transition occurs immediately after entering the bus-off state.
When the CTLR.BOM[1:0] bits are 10b, the state transition occurs at the end of the bus-off state.
When the CTLR.BOM[1:0] bits are 11b, the state transition occurs at the setting of the CTLR.CANM[1:0] bits to 10b (CAN halt mode).

Note 2. Change the CTLR.SLPM bit to set or cancel CAN sleep mode.

Figure 33.9 Transition between different operation modes

33.3.1 CAN Reset Mode

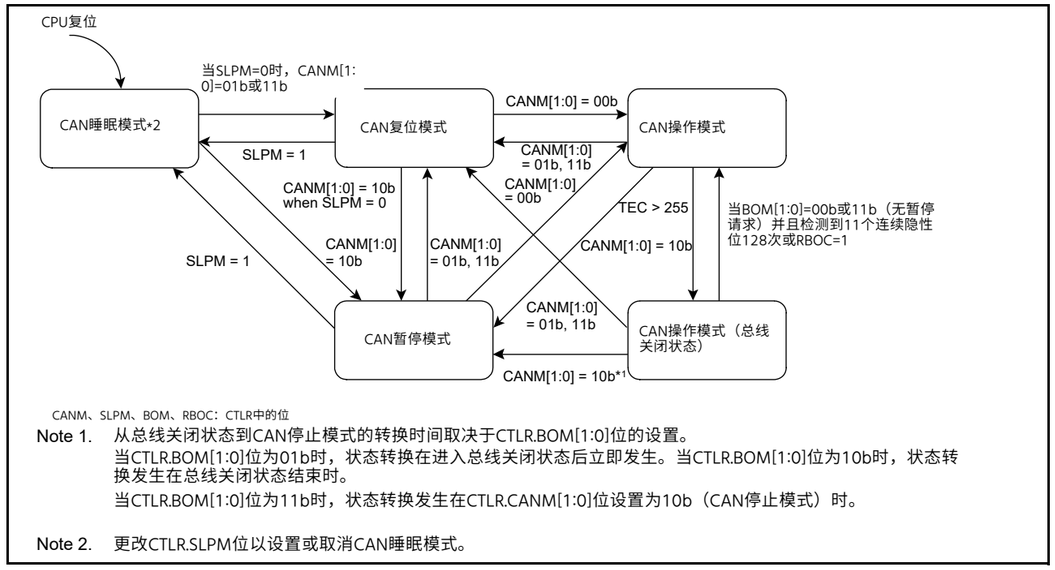
CAN reset mode is provided for CAN communication configuration. When the CTLR.CANM[1:0] bits are set to 01b or 11b, the CAN module enters CAN reset mode. The STR.RSTST flag is then set to 1. Do not change the CTLR.CANM[1:0] bits until the RSTST flag is 1. Set the BCR register before exiting CAN reset mode to enter any other modes.

The following registers are initialized to their reset values after entering CAN reset mode, and their initial values are saved during CAN reset mode:

- MCTL_TXj and MCTL_RXj
- STR (except for the SLPST and TFST bits)
- EIFR
- RECR
- TECR
- TSR
- MSSR
- MSMR
- RFCR
- TFCR
- TCR
- ECSR (except for the EDPM bit).

The following registers retain their previous values even after entering CAN reset mode:

- CTLR
- STR (only the SLPST and TFST bits)
- MIER and MIER_FIFO



CANM、SLPM、BOM、RBOC：CTLR中的位

Note 1. 从总线关闭状态到CAN停止模式的转换时间取决于CTLR.BOM[1:0]位的设置。
当CTLR.BOM[1:0]位为01b时，状态转换在进入总线关闭状态后立即发生。当CTLR.BOM[1:0]位为10b时，状态转换发生在总线关闭状态结束时。
当CTLR.BOM[1:0]位为11b时，状态转换发生在CTLR.CANM[1:0]位设置为10b（CAN停止模式）时。

Note 2. 更改CTLR.SLPM位以设置或取消CAN睡眠模式。

Figure 33.9 不同操作模式之间的转换

33.3.1 CAN复位模式

CAN复位模式用于CAN通信配置。当CTLR.CANM[1:0]位设置为01b或11b时，CAN模块进入CAN复位模式。然后将STR.RSTST标志设置为1。在RSTST标志为1之前不要更改CTLR.CANM[1:0]位。在退出CAN复位模式以进入任何其他模式之前设置BCR寄存器。

以下寄存器在进入CAN复位模式后初始化为其复位值，并在CAN复位模式期间保存其初始值：

- MCTL_TXj and MCTL_RXj
- STR（SLPST和TFST位除外）
- EIFR
- RECR
- TECR
- TSR
- MSSR
- MSMR
- RFCR
- TFCR
- TCR
- ECSR（EDPM位除外）。

即使在进入CAN复位模式后，以下寄存器仍保留其先前的值：

- CTLR
- STR（仅SLPST和TFST位）
- MIER and MIER_FIFO

- EIER
- BCR
- CSSR
- ECSR (only the EDPM bit)
- MBj_ID, MBj_DL, MBj_Dm and MBj_TS
- MKRk
- FIDCR0 and FIDCR1
- MKIVLR
- AFSR
- RFPCR
- TFPCR.

33.3.2 CAN Halt Mode

CAN halt mode is used for mailbox configuration and test mode setting. When the CTLR.CANM[1:0] bits are set to 10b, CAN halt mode is selected and the STR.HLTST bit is set to 1. Do not change the CTLR.CANM[1:0] bits until the HLTST bit is 1. See Table 33.8 for the state transition conditions when transmitting or receiving.

All registers except for the RSTST, HLTST, and SLPST bits in STR remain unchanged when the CAN enters CAN halt mode. Do not change CTLR (except for the CANM[1:0] and SLPM bits) and EIER in CAN halt mode. The BCR register can be changed in CAN halt mode only when listen-only mode is selected for automatic baud rate detection.

Table 33.8 Operation in CAN reset mode and CAN halt mode

Operation mode	Receiver	Transmitter	Bus-off
CAN reset mode (forced transition) CANM[1:0] = 11b	CAN module enters CAN reset mode without waiting for the end of message reception	CAN module enters CAN reset mode without waiting for the end of message transmission	CAN module enters CAN reset mode without waiting for the end of bus-off recovery
CAN reset mode CANM[1:0] = 01b	CAN module enters CAN reset mode without waiting for the end of message reception	CAN module enters CAN reset mode after waiting for the end of message transmission*1,*4	CAN module enters CAN reset mode without waiting for the end of bus-off recovery
CAN halt mode	CAN module enters CAN halt mode after waiting for the end of message reception*2,*3	CAN module enters CAN halt mode after waiting for the end of message transmission*1,*4	• When the BOM[1:0] bits are 00b: A halt request from software is accepted only after bus-off recovery • When the BOM[1:0] bits are 01b: CAN module automatically enters CAN halt mode without waiting for the end of bus-off recovery, regardless of a halt request from software • When the BOM[1:0] bits are 10b: CAN module automatically enters CAN halt mode after waiting for the end of bus-off recovery, regardless of a halt request from software • When the BOM[1:0] bits are 11b: CAN module enters CAN halt mode without waiting for the end of bus-off recovery, if a halt is requested by software during bus-off.

BOM[1:0] bits: Bits in CTLR.

Note 1. If transmission of multiple messages is requested, a mode transition occurs on completion of the first transmission. If the CAN reset mode is being requested during suspend transmission, mode transition occurs when the bus is idle, the next transmission ends, or the CAN module becomes a receiver.

Note 2. If the CAN bus is locked at the dominant level, the program can detect this state by monitoring the BLIF flag in EIFR.

Note 3. If a CAN bus error occurs during reception after CAN halt mode is requested, the CAN module transitions to CAN halt mode.

Note 4. If a CAN bus error or arbitration-lost occurs during transmission after CAN reset mode or CAN halt mode is requested, the CAN module transitions to the requested CAN mode.

- EIER
- BCR
- CSSR
- ECSR (only the EDPM bit)
- MBj_ID, MBj_DL, MBj_Dm and MBj_TS
- MKRk
- FIDCR0 and FIDCR1
- MKIVLR
- AFSR
- RFPCR
- TFPCR.

33.3.2 CAN暂停模式

CAN暂停模式用于邮箱配置和测试模式设置。当CTLR.CANM[1:0]位设置为10b时，选择CAN暂停模式且STR.HLTST位设置为1。请勿更改CTLR.CANM[1:0]位，直到HLTST位为1。发送或接收时的状态转换条件见表33.8。

当CAN进入CAN暂停模式时，除STR中的RSTST、HLTST和SLPST位之外的所有寄存器都保持不变。不要在CAN暂停模式下更改CTLR（CANM[1:0]和SLPM位除外）和EIER。只有在为自动波特率检测选择只听模式时，才能在CAN暂停模式下更改BCR寄存器。

Table 33.8 CAN复位模式和CAN暂停模式下的操作

操作模式	Receiver	Transmitter	Bus-off
CAN复位模式（强制转换）CANM[1:0]=11b	CAN模块无需等待报文接收结束即可进入CAN复位模式	CAN模块无需等待报文传输结束即可进入CAN复位模式	CAN模块无需等待总线关闭恢复结束即可进入CAN复位模式
CAN复位模式CANM[1:0]=01b	CAN模块无需等待报文接收结束即可进入CAN复位模式	CAN模块等待报文传输结束后进入CAN复位模式*1、*4	CAN模块无需等待总线关闭恢复结束即可进入CAN复位模式
CAN暂停模式	CAN模块等待报文接收结束后进入CAN停机模式*2 *3	CAN模块等待报文传输结束后进入CAN停机模式*1、*4	当BOM[1:0]位为00b时：仅在总线关闭恢复后才接受来自软件的暂停请求 当BOM[1:0]位为01b时：CAN模块自动进入CAN暂停模式，无需等待总线关闭恢复结束，无论软件是否有停止请求 当BOM[1:0]位为10b时：CAN模块在等待总线关闭恢复结束后自动进入CAN停止模式，无论是否有停止请求来自软件 当BOM[1:0]位为11b时：如果在总线关闭期间软件请求停止，CAN模块无需等待总线关闭恢复结束即可进入CAN停止模式。

BOM[1:0] bits: CTLR中的位。

Note 1. 如果请求传输多个消息，则在第一次传输完成时发生模式转换。如果在暂停传输期间请求CAN复位模式，则在总线空闲、下一次传输结束或CAN模块成为接收器时发生模式转换。

Note 2. 如果CAN总线被锁定在显性电平，程序可以通过监控EIFR中的BLIF标志来检测该状态。

Note 3. 如果在请求CAN暂停模式后接收期间发生CAN总线错误，则CAN模块将转换到CAN暂停模式。

Note 4. 如果在请求CAN复位模式或CAN暂停模式后的传输过程中发生CAN总线错误或仲裁丢失，则CAN模块将转换到请求的CAN模式。

33.3.3 CAN Sleep Mode

CAN sleep mode reduces power consumption by stopping the clock supply to the CAN module. After a reset from an MCU pin or a software reset, the CAN module starts from CAN sleep mode.

When the SLPM bit in CTLR is set to 1, the CAN module enters CAN sleep mode and the SLPST bit in STR is set to 1. Do not change the value of the SLPM bit until the SLPST bit is 1. The other registers remain unchanged when the CAN module enters CAN sleep mode.

Write to the SLPM bit in CAN reset mode and CAN halt mode. Do not change any registers (except for the SLPM bit) during CAN sleep mode. Read operation is still allowed.

When the SLPM bit is set to 0, the CAN module is released from CAN sleep mode. When the CAN module exits CAN sleep mode, the other registers remain unchanged.

33.3.4 CAN Operation Mode (Excluding Bus-Off State)

CAN operation mode is used for CAN communication. When the CANM[1:0] bits in CTLR are set to 00b, the CAN module enters CAN operation mode. The RSTST and HLTST bits in STR are set to 0. Do not change the value of the CANM[1:0] bits until the RSTST and HLTST bits are 0.

If 11 consecutive recessive bits are detected after entering CAN operation mode:

- The CAN module becomes an active node on the network, which enables transmission and reception of CAN messages
- Error monitoring of the CAN bus, such as receive and transmit error counters, is performed.

During CAN operation mode, the CAN module may be in one of the following three sub-modes, depending on the status of the CAN bus:

- Idle mode: No transmission or reception occurs
- Receive mode: A CAN message sent by another node is being received
- Transmit mode: A CAN message is being transmitted. The CAN module receives a message transmitted by the local node simultaneously when self-test mode 0 (TSTM[1:0] bits in TCR = 10b) or self-test mode 1 (TSTM[1:0] bits = 11b) is selected.

Figure 33.10 shows the sub-modes of CAN operation mode.

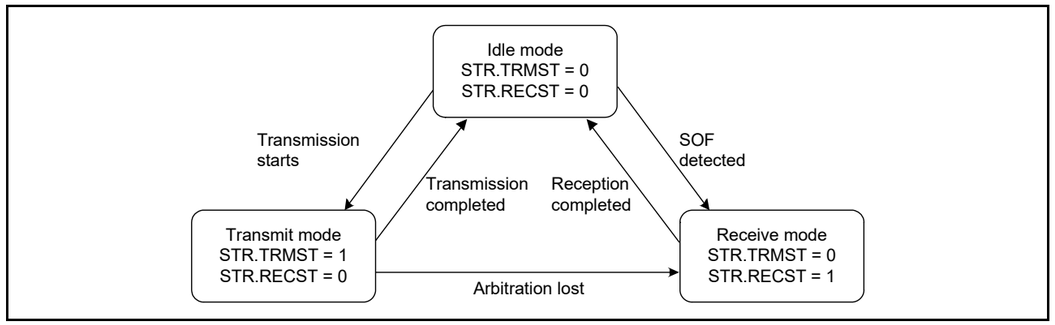


Figure 33.10 Sub-modes of CAN operation mode

33.3.5 CAN Operation Mode (Bus-Off State)

The CAN module enters the bus-off state based on the increment or decrement rules for the transmit or receive error counters, as defined in the CAN specifications.

The following cases apply when the CAN module is recovering from the bus-off state. When the CAN module is in the bus-off state, the values of the CAN module registers remain unchanged, except for those in STR, EIFR, RECR, TECR, and TSR.

33.3.3 CAN睡眠模式

CAN睡眠模式通过停止向CAN模块提供时钟来降低功耗。从一个复位后MCU引脚或软件复位，CAN模块从CAN睡眠模式启动。

CTLR中的SLPM位为1时，CAN模块进入CAN休眠模式，STR中的SLPST位为1。在SLPST位为1之前不要改变SLPM位的值。其他寄存器保持不变当CAN模块进入CAN睡眠模式时。

在CAN复位模式和CAN暂停模式下写入SLPM位。在CAN睡眠模式期间不要更改任何寄存器（SLPM位除外）。仍然允许读取操作。

当SLPM位设置为0时，CAN模块从CAN睡眠模式中释放。当CAN模块退出CAN休眠模式时，其他寄存器保持不变。

33.3.4 CAN操作模式（不包括总线关闭状态）

CAN操作模式用于CAN通信。当CTLR中的CANM[1:0]位设置为00b时，CAN模块进入CAN操作模式。STR中的RSTST和HLTST位设置为0。在RSTST和HLTST位为0之前，不要更改CANM[1:0]位的值。

如果进入CAN操作模式后检测到11个连续的隐性位：

- CAN模块成为网络上的一个活动节点，可以传输和接收CAN报文
- 执行CAN总线的错误监控，例如接收和发送错误计数器。

在CAN操作模式下，CAN模块可能处于以下三种子模式之一，具体取决于CAN总线的状态：

- 空闲模式：没有发送或接收发生
- 接收模式：正在接收另一个节点发送的CAN报文
- 传输模式：正在传输CAN消息。选择自测模式0（TCR中的TSTM[1:0]位=10b）或自测模式1（TSTM[1:0]位=11b）时，CAN模块同时接收本地节点发送的消息.

图33.10显示了CAN操作模式的子模式。

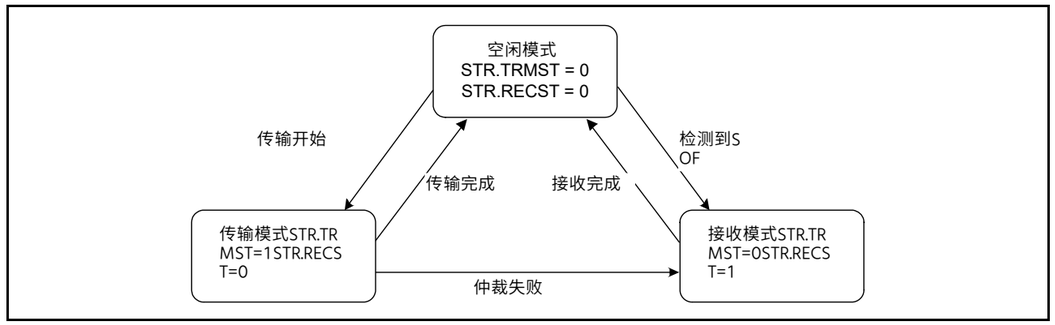

Figure 33.10 CAN操作模式的子模式

33.3.5 CAN操作模式（总线关闭状态）

CAN模块根据CAN规范中定义的发送或接收错误计数器的递增或递减规则进入总线关闭状态。

以下情况适用于CAN模块从总线关闭状态恢复时。当CAN模块处于总线关闭状态时，CAN模块寄存器的值保持不变，除了STR、EIFR、RECR、TECR和TSR中的值。

(1) When CTLR.BOM[1:0] bits = 00b (normal mode)

The CAN module enters the error-active state after it completes recovery from the bus-off state and CAN communication is enabled. The BORIF flag in EIFR is set to 1 (bus-off recovery detected).

(2) When CTLR.RBOC bit = 1 (forced return from bus-off)

The CAN module enters the error-active state when it is in the bus-off state and the RBOC bit is 1. CAN communication is enabled again after 11b consecutive recessive bits are detected. The BORIF flag is not set to 1.

(3) When CTLR.BOM[1:0] bits = 01b (automatic transition to CAN halt mode on bus-off entry)

The CAN module enters CAN halt mode when it reaches the bus-off state. The BORIF flag is not set to 1.

(4) When CTLR.BOM[1:0] bits = 10b (automatic transition to CAN halt mode on bus-off end)

The CAN module enters CAN halt mode when it completes recovery from bus-off. The BORIF flag is set to 1.

(5) When CTLR.BOM[1:0] bits = 11b (automatic transition to CAN halt mode through software) and CTLR.CANM[1:0] bits = 10b (CAN halt mode) during bus-off state

The CAN module enters CAN halt mode when it is in the bus-off state and the CANM[1:0] bits are set to 10b (CAN halt mode). The BORIF flag is not set to 1. If the CANM[1:0] bits are not set to 10b during bus-off, the same behavior as (1) applies.

33.4 Data Transfer Rate Configuration

This section describes how to configure the data transfer rate.

33.4.1 Clock Setting

The CAN module has a CAN clock generator that can be set by the CCLKS and the BRP[9:0] bits in the BCR register.

Figure 33.11 shows a block diagram of the CAN clock generator.

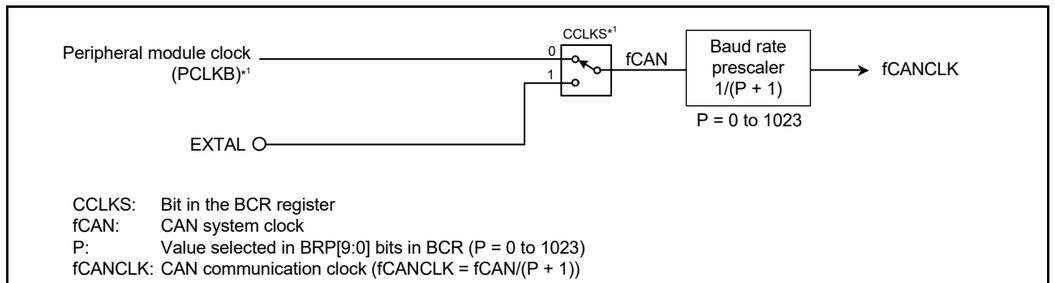

Figure 33.11 Block diagram of CAN clock generator

33.4.2 Bit Timing Setting

The bit timing consists of three segments as shown in Figure 33.12.

(1) 当CTLR.BOM[1:0]位=00b时（正常模式）

CAN模块在完成从总线关闭状态恢复并启用CAN通信后进入错误激活状态。EIFR中的BORIF标志设置为1（检测到总线关闭恢复）。

(2) 当CTLR.RBOC位=1时（从总线关闭强制返回）

当CAN模块处于总线关闭状态且RBOC位为1时，进入错误激活状态。在检测到11b个连续的隐性位后再次启用CAN通信。BORIF标志未设置为1。

(3) 当CTLR.BOM[1:0]位=01b时（进入总线关闭时自动转换到CAN暂停模式）

CAN模块在达到总线关闭状态时进入CAN停止模式。BORIF标志未设置为1。

(4) 当CTLR.BOM[1:0]位=10b时（在总线关闭结束时自动转换到CAN暂停模式）

CAN模块在完成总线关闭恢复后进入CAN暂停模式。BORIF标志设置为1。

(5) 当CTLR.BOM[1:0]位=11b（通过软件自动转换到CAN暂停模式）且CTLR.CANM[1:0]位=10b（CAN暂停模式）时在总线关闭状态

CAN模块在总线关闭状态且CANM[1:0]位设置为10b（CAN停止模式）时进入CAN停止模式。BORIF标志未设置为1。如果在总线关闭期间CANM[1:0]位未设置为10b，则适用与(1)相同的行为。

33.4 数据传输率配置

本节介绍如何配置数据传输速率。

33.4.1 时钟设置

CAN模块有一个CAN时钟发生器，可以通过BCR寄存器中的CCLKS和BRP[9:0]位进行设置。

图33.11显示了CAN时钟发生器的框图。

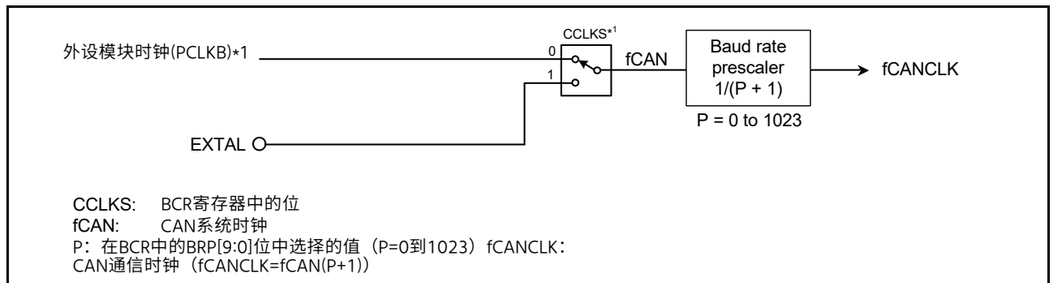

Figure 33.11 CAN时钟发生器框图

33.4.2 位时序设置

位时序由三个部分组成，如图33.12所示。

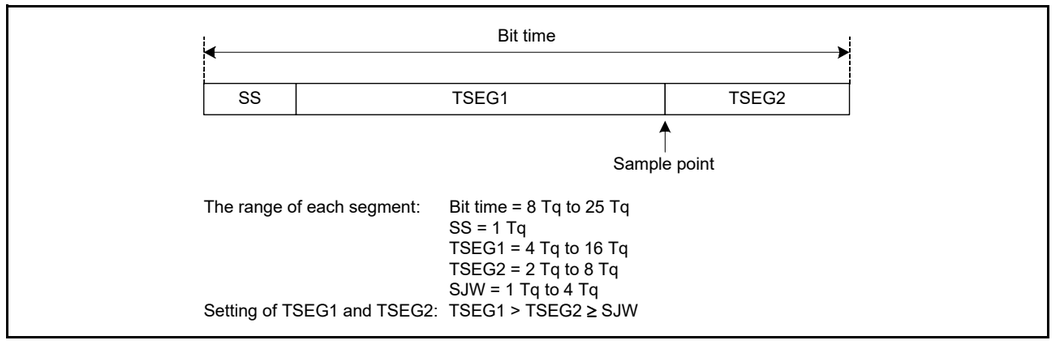

Figure 33.12 Bit timing

33.4.3 Data Transfer Rate

The data transfer rate depends on the division value of fCAN (CAN system clock), the division value of the baud rate prescaler, and the Tq count for 1 bit time.

$$\text{Data transfer rate (bps)} = \frac{\text{fCAN}}{\text{Baud rate prescaler division value*1 x Tq count for 1 bit time}} = \frac{\text{fCANCLK}}{\text{Tq count for 1 bit time}}$$

Note 1. Division value of baud rate prescaler = P + 1 (P: 0 to 1023), where P is the BRP[9:0] setting in BCR.

Table 33.9 lists data transfer rate examples.

Table 33.9 Data transfer rate examples

fCAN	50 MHz		48 MHz		40 MHz		32 MHz	
Data transfer rate	Tq count	P + 1	Tq count	P + 1	Tq count	P + 1	Tq count	P + 1
1 Mbps	10 Tq 25 Tq	5 2	8 Tq 12 Tq 16 Tq	6 4 3	10 Tq 20 Tq	4 2	8 Tq 16 Tq	4 2
500 kbps	10 Tq 25 Tq	10 4	8 Tq 12 Tq 16 Tq	12 8 6	10 Tq 20 Tq	8 4	8 Tq 16 Tq	8 4
250 kbps	10 Tq 25 Tq	20 8	8 Tq 12 Tq 16 Tq	24 16 12	10 Tq 20 Tq	16 8	8 Tq 16 Tq	16 8
125 kbps	10 Tq 25 Tq	40 16	8 Tq 12 Tq 16 Tq	48 32 24	10 Tq 20 Tq	32 16	8 Tq 16 Tq	32 16
83.3 kbps	10 Tq 25 Tq	60 24	8 Tq 12 Tq 16 Tq	72 48 36	8 Tq 10 Tq 16 Tq 20 Tq	60 48 30 24	8 Tq 16 Tq	48 24
33.3 kbps	10 Tq 25 Tq	150 60	8 Tq 12 Tq 16 Tq	180 120 90	8 Tq 10 Tq 20 Tq	150 120 60	8 Tq 10 Tq 16 Tq 20 Tq	120 96 60 48

33.5 Mailbox and Mask Register Structure

Figure 33.13 shows the structure of the 32 mailbox registers MBj_ID, MBj_DL, MBj_Dm, and MBj_TS.

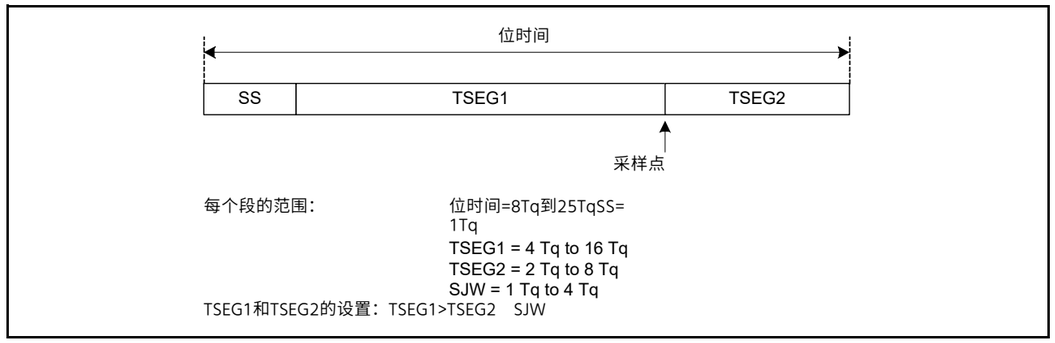

Figure 33.12 位时序

33.4.3 数据传输率

数据传输速率取决于fCAN（CAN系统时钟）的分频值、波特率预分频器的分频值和1位时间的Tq计数。

$$\text{数据传输率(bps)} = \frac{\text{fCAN}}{\text{波特率预分频器分频值*1xTq计数1位时间}} = \frac{\text{fCANCLK}}{\text{1位时间的Tq计数}}$$

注1.波特率预分频器的分频值=P+1(P:0to1023)，其中P是BCR中的BRP[9:0]设置。

表33.9列出了数据传输率示例。

Table 33.9 数据传输率示例

fCAN	50 MHz		48 MHz		40 MHz		32 MHz	
数据传输率	Tq count	P + 1	Tq count	P + 1	Tq count	P + 1	Tq count	P + 1
1 Mbps	10 Tq 25 Tq	5 2	8 Tq 12 Tq 16 Tq	6 4 3	10 Tq 20 Tq	4 2	8 Tq 16 Tq	4 2
500 kbps	10 Tq 25 Tq	10 4	8 Tq 12 Tq 16 Tq	12 8 6	10 Tq 20 Tq	8 4	8 Tq 16 Tq	8 4
250 kbps	10 Tq 25 Tq	20 8	8 Tq 12 Tq 16 Tq	24 16 12	10 Tq 20 Tq	16 8	8 Tq 16 Tq	16 8
125 kbps	10 Tq 25 Tq	40 16	8 Tq 12 Tq 16 Tq	48 32 24	10 Tq 20 Tq	32 16	8 Tq 16 Tq	32 16
83.3 kbps	10 Tq 25 Tq	60 24	8 Tq 12 Tq 16 Tq	72 48 36	8 Tq 10 Tq 16 Tq 20 Tq	60 48 30 24	8 Tq 16 Tq	48 24
33.3 kbps	10 Tq 25 Tq	150 60	8 Tq 12 Tq 16 Tq	180 120 90	8 Tq 10 Tq 20 Tq	150 120 60	8 Tq 10 Tq 16 Tq 20 Tq	120 96 60 48

33.5 邮箱和掩码寄存器结构

图33.13显示了32个邮箱寄存器MBj_ID、MBj_DL、MBj_Dm和MBj_TS的结构。

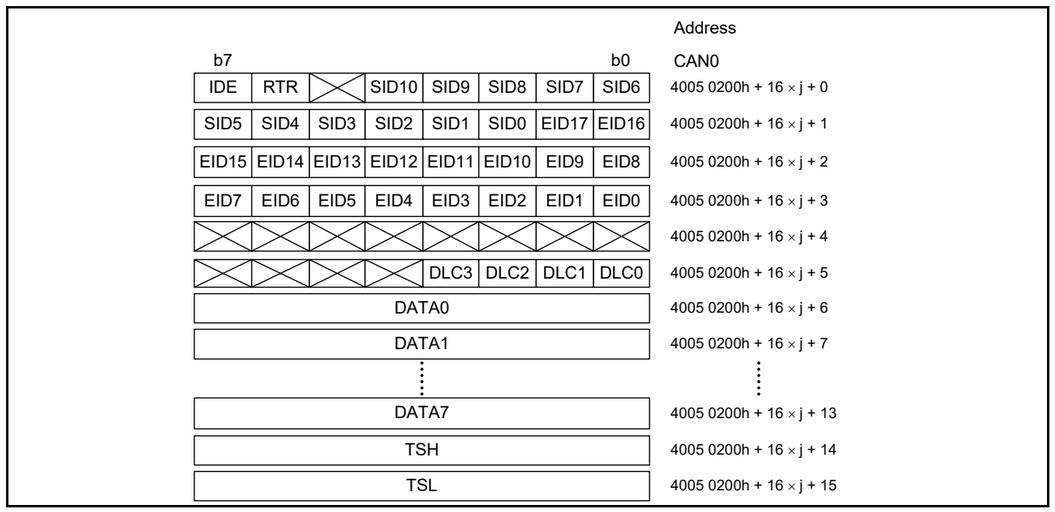

Figure 33.13 Structure of the mailbox registers (j = 0 to 31)

Figure 33.14 shows the structure of the eight mask registers MKRk.

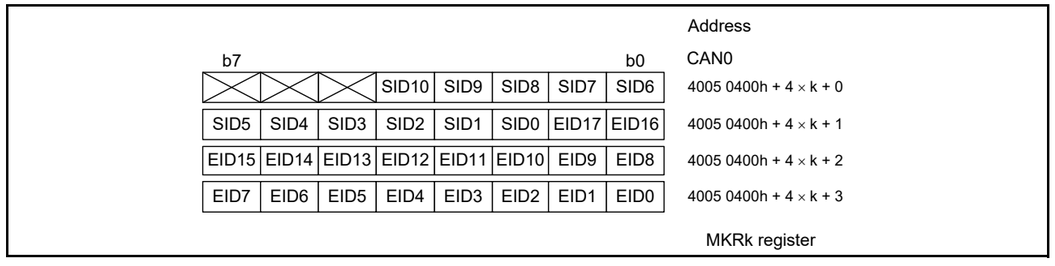

Figure 33.14 Structure of the MKRk registers (k = 0 to 7)

Figure 33.15 shows the structure of the two FIFO received ID compare registers, FIDCR0 and FIDCR1.

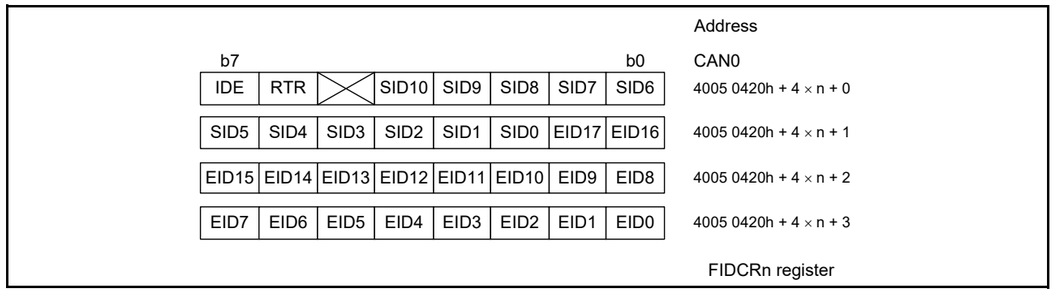

Figure 33.15 Structure of the FIDCRn registers (n = 0, 1)

33.6 Acceptance Filtering and Masking Functions

The acceptance filtering and masking functions allow you to select and receive messages with multiple IDs for mailboxes within a specified range.

The MKRk registers can mask the standard ID and the extended ID of 29 bits:

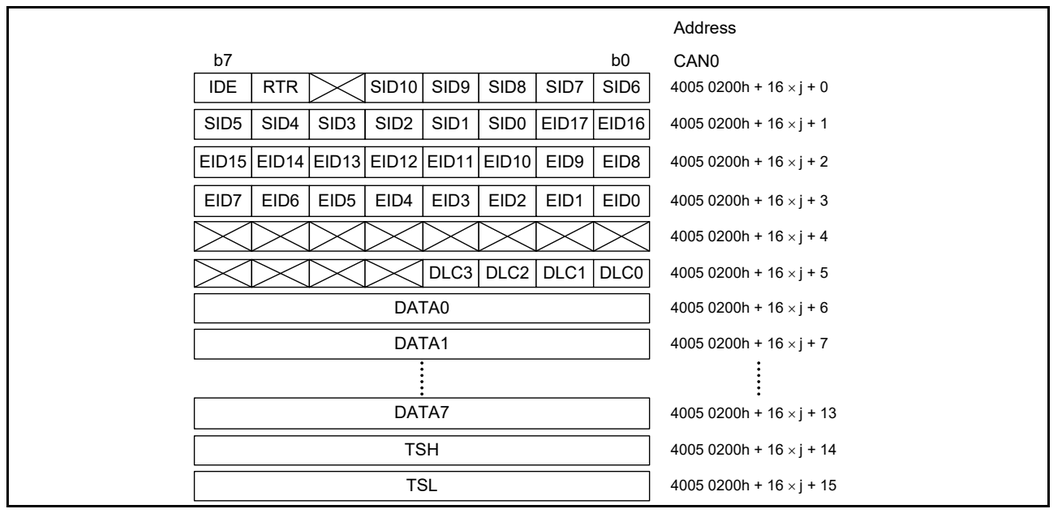

Figure 33.13 邮箱寄存器的结构（j=0到31）

图33.14显示了8个屏蔽寄存器MKRk的结构。

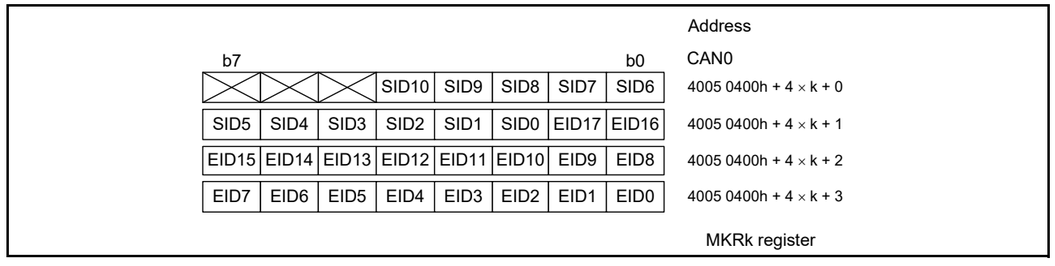

Figure 33.14 MKRk寄存器的结构（k=0到7）

图33.15显示了两个FIFO接收ID比较寄存器FIDCR0和FIDCR1的结构。

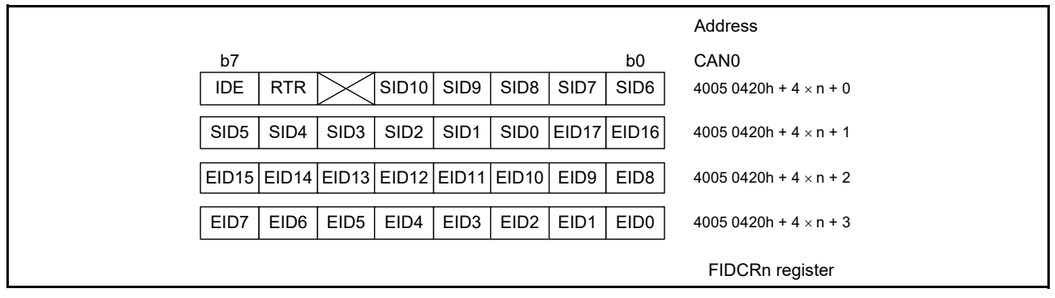

Figure 33.15 FIDCRn寄存器的结构(n=0 1)

33.6 接受过滤和屏蔽功能

接受过滤和屏蔽功能允许您为指定范围内的邮箱选择和接收具有多个ID的消息。

MKRk寄存器可以屏蔽标准ID和29位扩展ID：

- MKR0 is the mask register for mailboxes 0 to 3
- MKR1 is the mask register for mailboxes 4 to 7
- MKR2 is the mask register for mailboxes 8 to 11
- MKR3 is the mask register for mailboxes 12 to 15
- MKR4 is the mask register for mailboxes 16 to 19
- MKR5 is the mask register for mailboxes 20 to 23
- MKR6 is the mask register for mailboxes 24 to 27 in normal mailbox mode and receive FIFO mailboxes 28 to 31 in FIFO mailbox mode
- MKR7 is the mask register for mailboxes 28 to 31 in normal mailbox mode and receive FIFO mailboxes 28 to 31 in FIFO mailbox mode.

MKIVLR disables acceptance filtering independently for each mailbox.

The IDE bit in MBj_ID register is valid when the IDFM[1:0] bits in CTLR are 10b (mixed ID mode).

The RTR bit in MBj_ID register selects a data frame or remote frame.

In FIFO mailbox mode, normal mailboxes 0 to 23 use the associated register (MKR0 to MKR5) for acceptance filtering. The receive FIFO mailboxes 28 to 31 use two registers, MKR6 and MKR7, for acceptance filtering.

The receive FIFO uses two registers, FIDCR0 and FIDCR1, for ID comparison. The EID[17:0], SID[10:0], RTR, and IDE bits in mailbox 28 to mailbox 31 for the receive FIFO are disabled. As acceptance filtering depends on the result of two logic OR operations, two ranges of IDs can be received into the receive FIFO. The MKIVLR is disabled for the receive FIFO.

If different standard ID and extended ID values are set in the IDE bits in FIDCR0 and FIDCR1, both ID formats are received. If different data frame and remote frame values are set in the RTR bits in FIDCR0 and FIDCR1, both data and remote frames are received.

When a combination of two ranges of IDs is not required, set the same mask value and the same ID in both the FIFO ID and mask registers.

Figure 33.16 shows the associations between the mask registers and mailboxes. Figure 33.17 shows acceptance filtering.

- MKR0是邮箱0到3的掩码寄存器
- MKR1是邮箱4到7的掩码寄存器
- MKR2是邮箱8到11的掩码寄存器
- MKR3是邮箱12到15的掩码寄存器
- MKR4是邮箱16到19的掩码寄存器
- MKR5是邮箱20到23的掩码寄存器
- MKR6是普通邮箱模式下邮箱24到27的掩码寄存器，在正常邮箱模式下接收FIFO邮箱28到31 FIFO邮箱模式
- MKR7是普通邮箱模式下邮箱28到31的掩码寄存器，在正常邮箱模式下接收FIFO邮箱28到31 FIFO邮箱模式。

MKIVLR为每个邮箱单独禁用接受过滤。

当CTLR中的IDFM[1:0]位为10b（混合ID模式）时，MBj_ID寄存器中的IDE位有效。

MBj_ID寄存器中的RTR位选择数据帧或远程帧。

在FIFO邮箱模式下，普通邮箱0到23使用相关寄存器（MKR0到MKR5）进行接受过滤。
接收FIFO邮箱28到31使用两个寄存器，MKR6和MKR7，用于接受过滤。

接收FIFO使用两个寄存器FIDCR0和FIDCR1进行ID比较。EID[17:0]、SID[10:0]、RTR和邮箱28到邮箱31中用于接收FIFO的IDE位被禁用。由于接受过滤取决于两个逻辑或运算的结果，因此可以将两个范围的ID接收到接收FIFO中。MKIVLR为接收FIFO禁用。

如果在FIDCR0和FIDCR1的IDE位中设置了不同的标准ID和扩展ID值，则会接收两种ID格式。如果在FIDCR0和FIDCR1的RTR位中设置了不同的数据帧和远程帧值，则数据帧和远程帧都被接收。

当不需要两个ID范围的组合时，在FIFOID和掩码寄存器中设置相同的掩码值和相同的ID。

图33.16显示了掩码寄存器和邮箱之间的关联。图33.17显示了接受过滤。

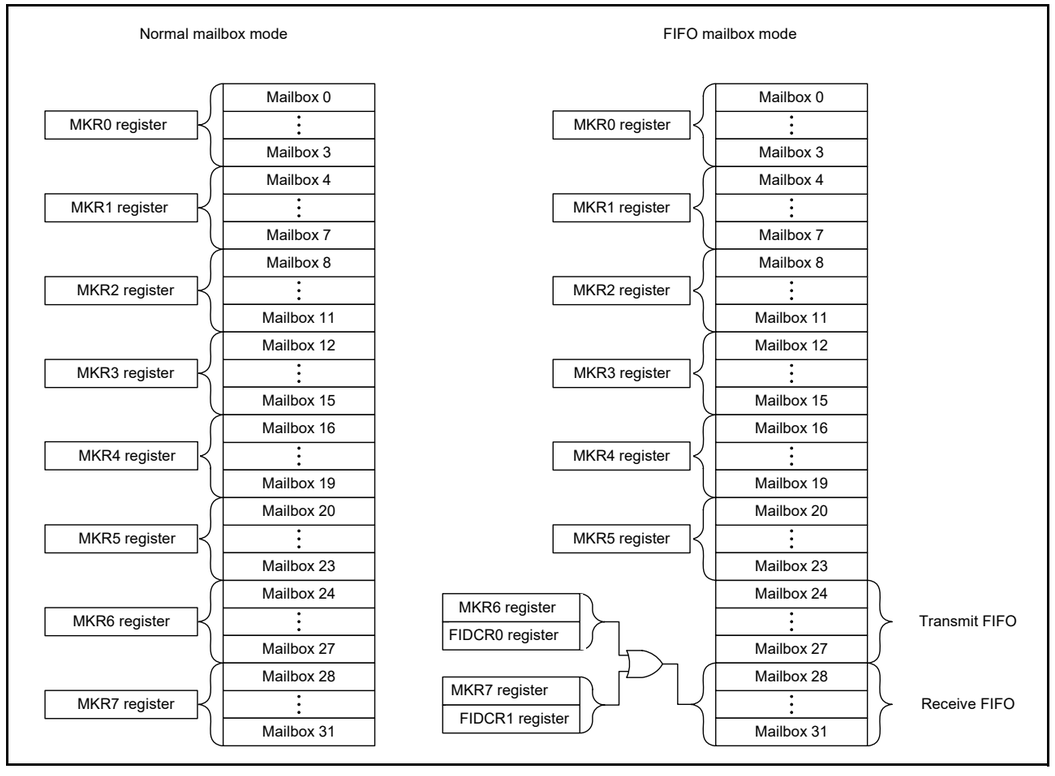

Figure 33.16 Associations between mask registers and mailboxes

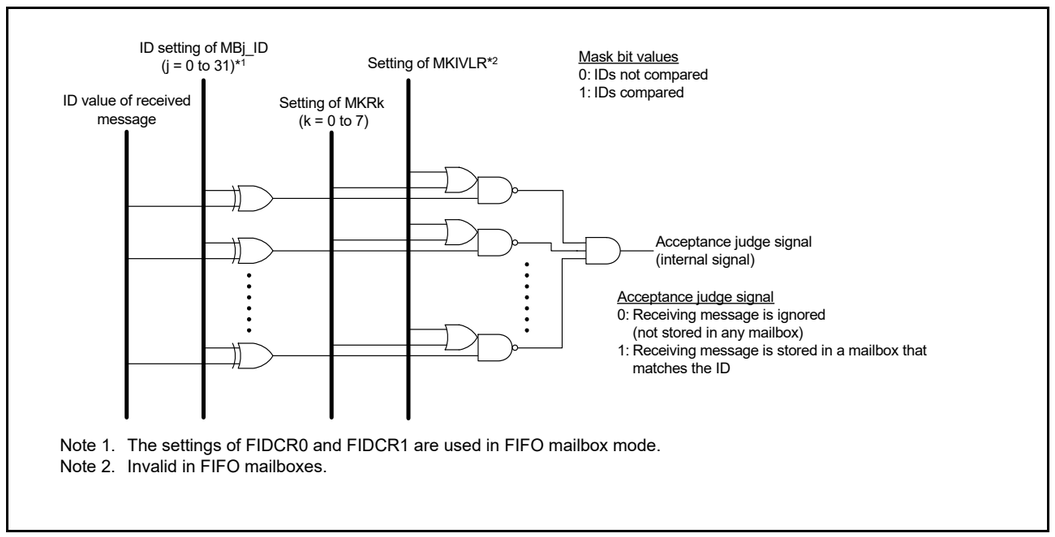

Note 1. The settings of FIDCR0 and FIDCR1 are used in FIFO mailbox mode.
Note 2. Invalid in FIFO mailboxes.

Figure 33.17 Acceptance filtering

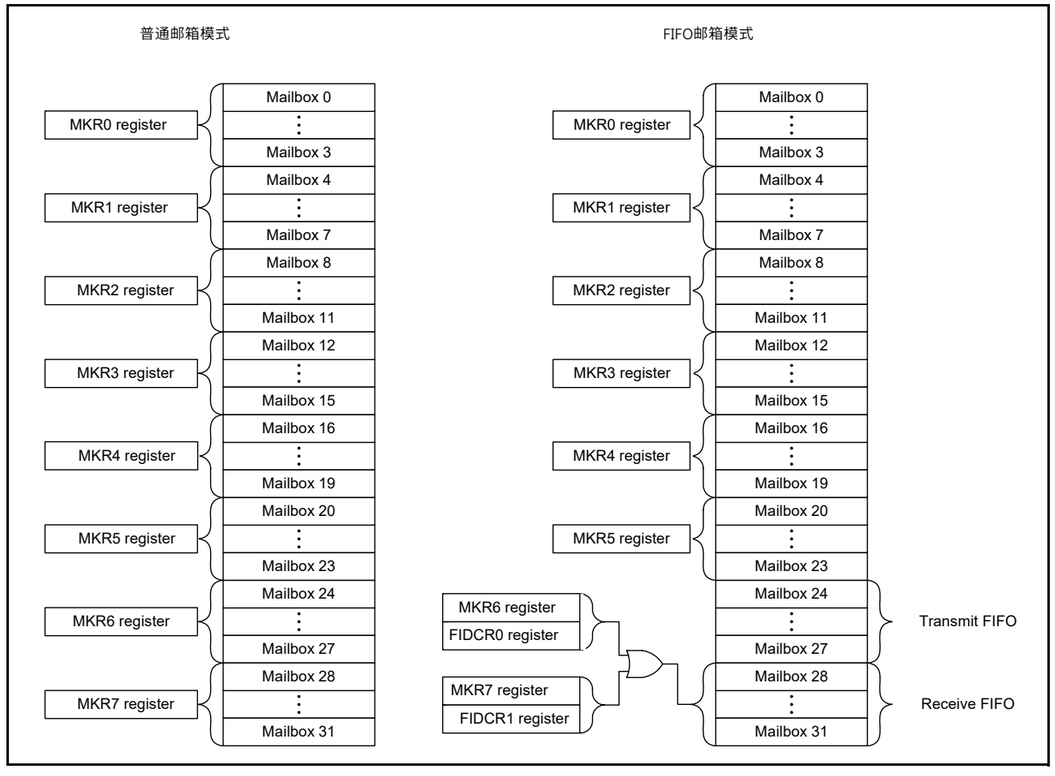

Figure 33.16 掩码寄存器和邮箱之间的关联

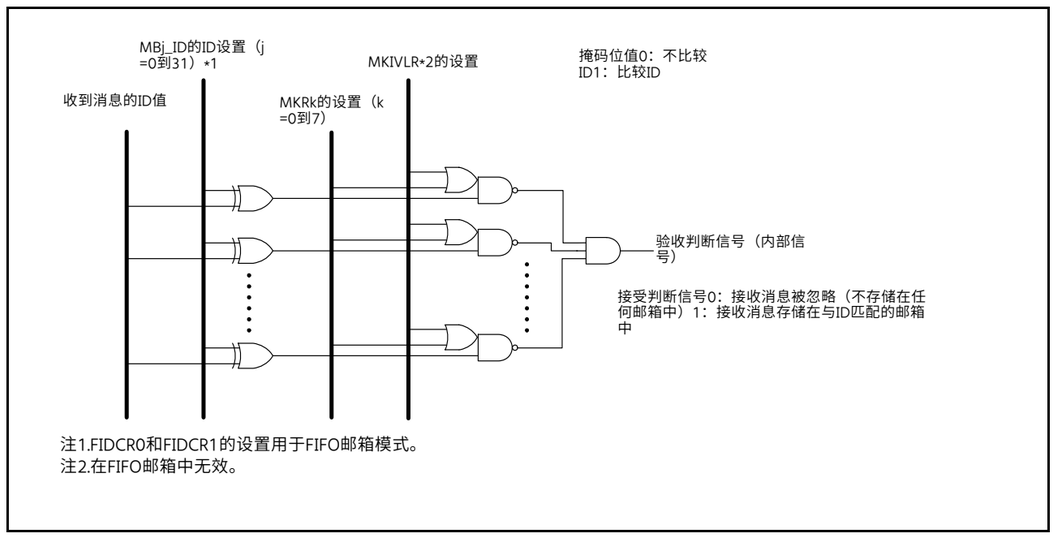

注1.FIDCR0和FIDCR1的设置用于FIFO邮箱模式。
注2.在FIFO邮箱中无效。

Figure 33.17 验收过滤

33.7 Reception and Transmission

Table 33.10 lists the CAN communication mode settings.

Table 33.10 Settings for CAN receive and transmit modes

MCTL_TXj.TRMREQ and MCTL_RXj.TRMREQ	MCTL_TXj.RECREQ and MCTL_RXj.RECREQ	MCTL_TXj.ONESHOT and MCTL_RXj.ONESHOT	Mailbox communication mode
0	0	0	Mailbox disabled or transmission aborted
0	0	1	Can be configured only when transmission or reception from a mailbox programmed in one-shot mode is aborted
0	1	0	Configured as a receive mailbox for a data frame or remote frame
0	1	1	Configured as a one-shot receive mailbox for a data frame or remote frame
1	0	0	Configured as a transmit mailbox for a data frame or remote frame
1	0	1	Configured as a one-shot transmit mailbox for a data frame or remote frame
1	1	0	Do not set
1	1	1	Do not set

j = 0 to 31

When a mailbox is configured as a receive mailbox or a one-shot receive mailbox:

- Before configuring a mailbox, set MCTL_RXj to 00h
- A received message is stored in the first mailbox that matches the condition resulting from the receive mode settings and acceptance filtering. The matching mailbox with the smallest number takes priority for storing the received message.
- In CAN operation mode, the CAN module does not receive its own transmitted data even when the ID is a match. In self-test mode, however, the CAN module receives its own transmitted data and returns ACK.

When configuring a mailbox as a transmit mailbox or a one-shot transmit mailbox:

- Before configuring a mailbox, ensure that MCTL_TXj is 00h and that there is no pending abort process.

33.7.1 Reception

Figure 33.18 shows an operation example of data frame reception in overwrite mode.

The example shows the overwriting of the first message when the CAN module receives two consecutive CAN messages that match the receiving conditions in MCTL_RXj (j = 0 to 31).

33.7 接收和传输

表33.10列出了CAN通信模式设置。

Table 33.10 CAN接收和发送模式的设置

MCTL_TXj.TRMREQ and MCTL_RXj.TRMREQ	MCTL_TXj.RECREQ and MCTL_RXj.RECREQ	MCTL_TXj.ONESHOT and MCTL_RXj.ONESHOT	邮箱通讯方式
0	0	0	邮箱禁用或传输中止
0	0	1	只有在一次性模式中编程的邮箱的发送或接收被中止时才可以配置
0	1	0	配置为数据帧或远程帧的接收邮箱
0	1	1	配置为数据帧或远程帧的一次性接收邮箱
1	0	0	配置为数据帧或远程帧的发送邮箱
1	0	1	配置为数据帧或远程帧的一次性发送邮箱
1	1	0	不要设置
1	1	1	不要设置

j = 0 to 31

当邮箱配置为接收邮箱或一次性接收邮箱时：

- 在配置邮箱之前，将MCTL_RXj设置为00h
- 收到的消息存储在与接收模式设置和接受过滤产生的条件匹配的第一个邮箱中。编号最小的匹配邮箱优先存储收到的消息。
- 在CAN操作模式下，即使ID匹配，CAN模块也不会接收到自己发送的数据。然而，在自检模式下，CAN模块接收自己发送的数据并返回ACK。

将邮箱配置为发送邮箱或一次性发送邮箱时：

- 在配置邮箱之前，请确保MCTL_TXj为00h并且没有挂起的中止进程。

33.7.1 Reception

图33.18显示了覆盖模式下数据帧接收的操作示例。

该示例显示当CAN模块接收到与MCTL_RXj（j=0到31）中的接收条件匹配的两个连续CAN报文时，第一条报文的覆盖。

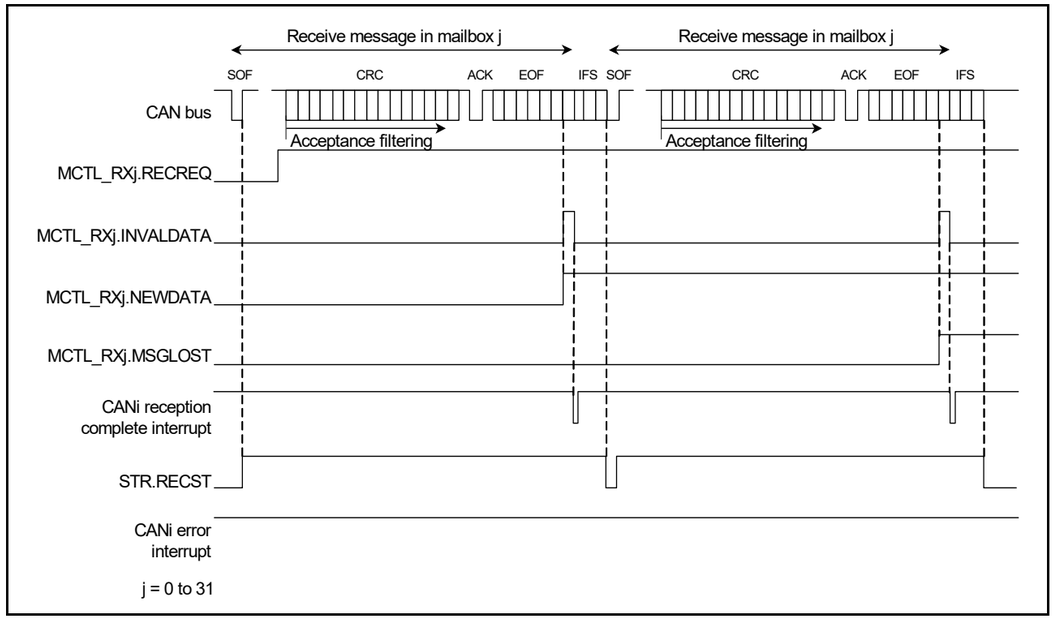

Figure 33.18 Operation example of data frame reception in overwrite mode

1. When an SOF is detected on the CAN bus, the RECST bit in STR is set to 1 (reception in progress) if the CAN module has no message ready to start transmission.
2. Acceptance filtering starts at the beginning of the CRC field to select the receive mailbox.
3. After a message is received, the NEWDATA flag in MCTL_RXj for the receive mailbox is set to 1 (new message is being stored or was stored to the mailbox). The INVALDATA flag in MCTL_RXj is set to 1 (message is updated) at the same time. The INVALDATA flag is set to 0 (message valid) again after the complete message is transferred to the mailbox.
4. When the interrupt enable bit in MIER for the receive mailbox is 1 (interrupt enabled), the INVALDATA flag is set to 0, triggering a CAN0 reception complete interrupt request.
5. After reading the message from the mailbox, the NEWDATA flag must be set to 0 by software.
6. In overwrite mode, if the next CAN message is received while the NEWDATA flag in MCTL_RXj is set to 1, the MSGLOST flag in MCTL_RXj is set to 1 (message was overwritten). The new received message is transferred to the mailbox. The CAN0 reception complete interrupt request is generated in the same as in step 4.

Figure 33.19 shows an operation example of data frame reception in overrun mode. The example shows the overrunning of the second message when the CAN module receives two consecutive CAN messages that match the receiving conditions in MCTL_RXj (j = 0 to 31).

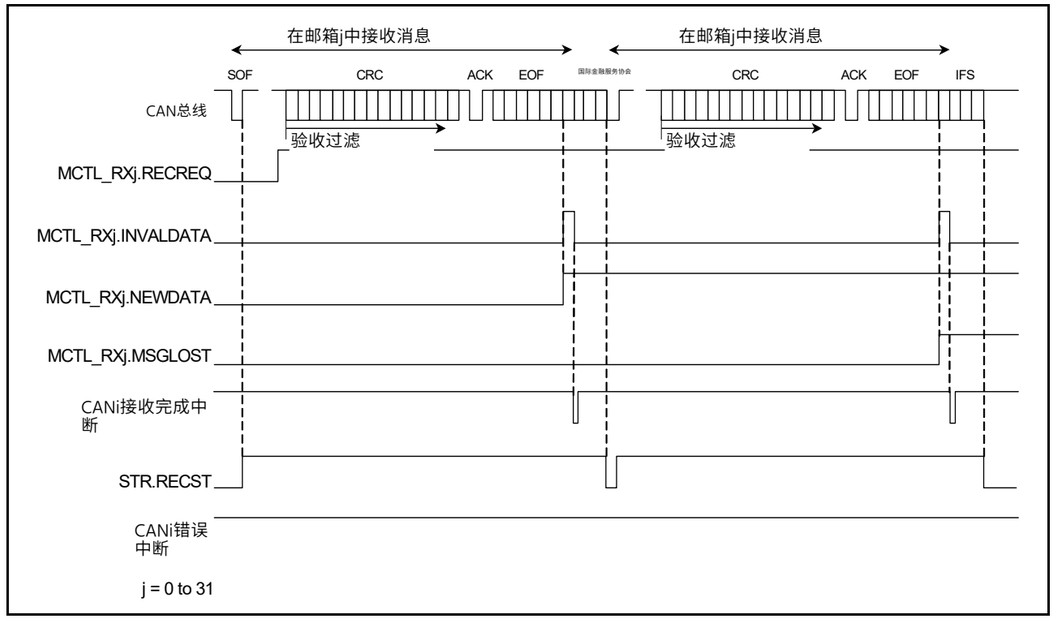

Figure 33.18 覆盖模式下数据帧接收的操作示例

1. 当在CAN总线上检测到SOF时，如果CAN模块没有准备好开始发送的消息，则STR中的RECST位设置为1（正在接收）。
2. 接受过滤从CRC字段的开头开始，以选择接收邮箱。
3. 收到消息后，接收邮箱的MCTL_RXj中的NEWDATA标志设置为1（新消息正在存储或已存储到邮箱中）。MCTL_RXj中的INVALDATA标志同时设置为1（消息已更新）。在完整的消息传送到邮箱后，INVALDATA标志再次设置为0（消息有效）。
4. 当接收邮箱的MIER中的中断允许位为1（允许中断）时，INVALDATA标志设置为0，触发CAN0接收完成中断请求。
5. 从邮箱读取消息后，NEWDATA标志必须由软件设置为0。
6. 在覆盖模式下，如果在MCTL_RXj中的NEWDATA标志设置为1时接收到下一条CAN消息，则MCTL_RXj中的MSGLOST标志设置为1（消息被覆盖）。新收到的消息被传送到邮箱。CAN0接收完成中断请求的产生与步骤4相同。

图33.19显示了溢出模式下数据帧接收的操作示例。该示例显示当CAN模块接收到与MCTL_RXj（j=0到31）中的接收条件匹配的两个连续CAN报文时，第二条报文的溢出。

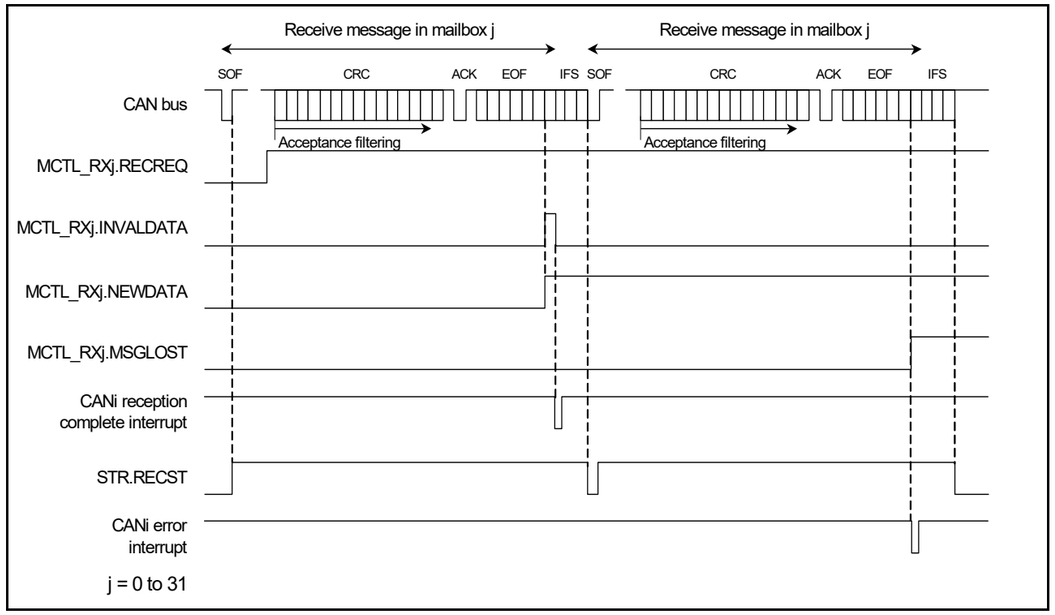

Figure 33.19 Operation example of data frame reception in overrun mode

Steps 1. to 5. are the same as in overwrite mode.

6. In overrun mode, if the next CAN message is received before the NEWDATA flag in MCTL_RXj is set to 0, the MSGLOST flag in MCTL_RXj is set to 1 (message overrun). The new received message is discarded and a CANi error interrupt request occurs if the associated interrupt enable bit in EIER is set to 1 (interrupt enabled).

33.7.2 Transmission

Figure 33.20 shows an example operation of data frame transmission.

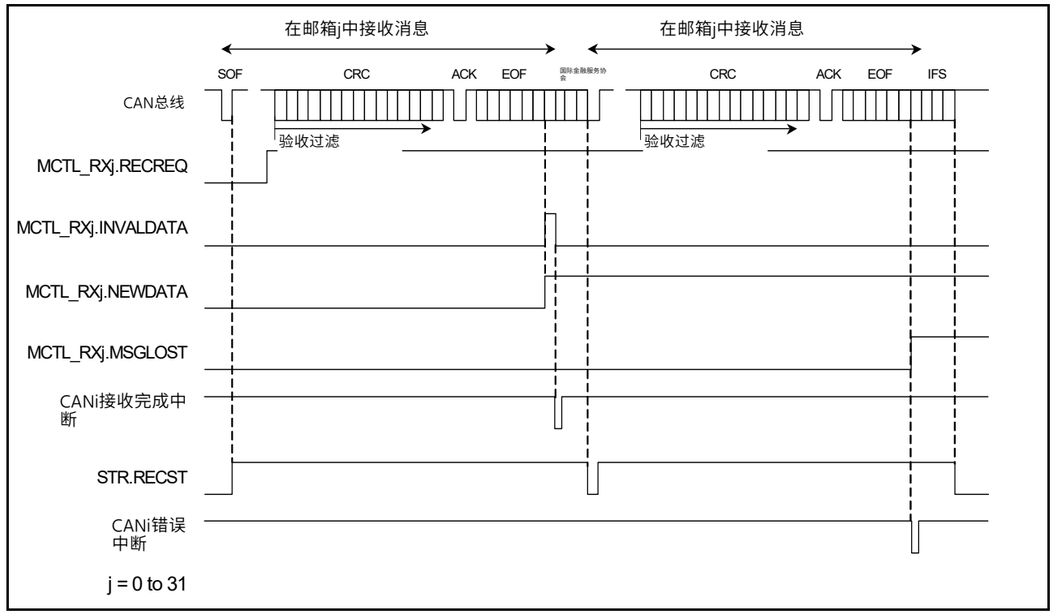

Figure 33.19 溢出模式下数据帧接收的操作示例

步骤1.至5.与覆盖模式相同。

6. 在溢出模式下，如果在MCTL_RXj中的NEWDATA标志设置为0之前接收到下一个CAN报文，则MCTL_RXj中的MSGLOST标志设置为1（消息溢出）。如果EIER中的相关中断使能位设置为1（中断使能），则丢弃新接收到的消息并产生CANi错误中断请求。

33.7.2 Transmission

图33.20显示了数据帧传输的示例操作。

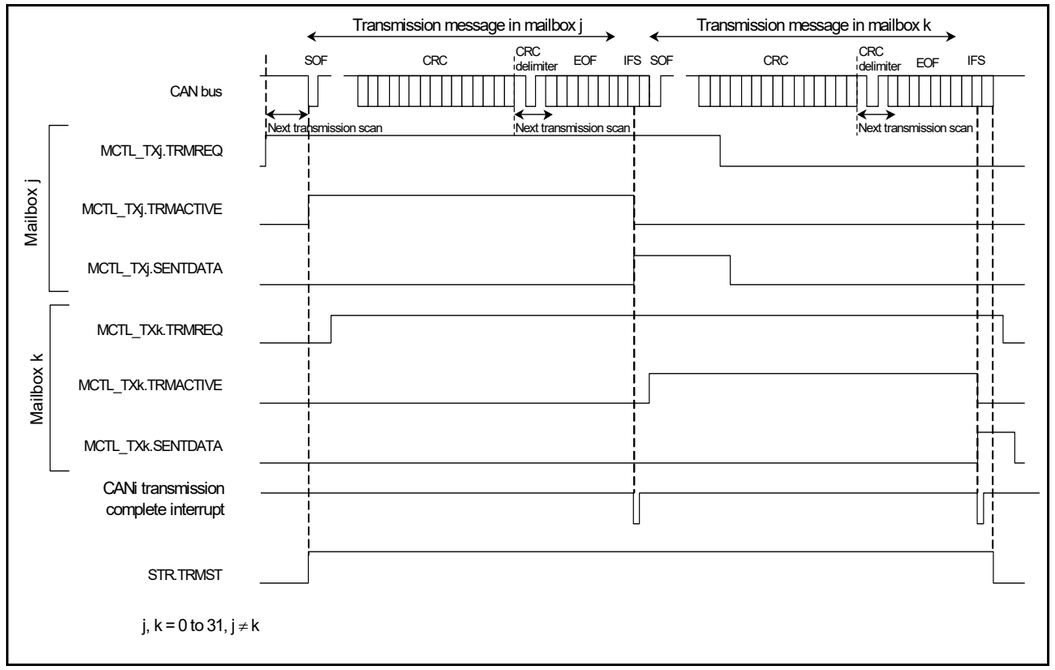

Figure 33.20 Operation example of data frame transmission

1. When a TRMREQ bit in MCTL_TXj (j = 0 to 31) is set to 1 (transmit mailbox) in the bus-idle state, mailbox scanning determines the highest-priority mailbox for transmission. When the transmit mailbox is determined, the TRMACTIVE flag in MCTL_TXj is set to 1 (from acceptance of transmission request to completion of transmission, or error/arbitration-lost), the TRMST bit in STR is set to 1 (transmission in progress), and the CAN module starts transmission.*1
2. If other TRMREQ bits are set, the transmission scanning starts with the CRC delimiter for the next transmission.
3. If transmission is complete without losing arbitration, the SENTDATA flag in MCTL_TXj is set to 1 (transmission complete) and the TRMACTIVE flag is set to 0 (transmission is pending or transmission is not requested). If the interrupt enable bit in MIER is 1 (interrupt enabled), the CANi transmission complete interrupt request is generated.
4. When requesting the next transmission from the same mailbox, set the SENTDATA flag and TRMREQ bit to 0, and then set the TRMREQ bit to 1 after checking that the SENTDATA flag and TRMREQ bit are set to 0.

Note 1. If arbitration is lost after the CAN module starts transmission, the TRMACTIVE flag is set to 0. Transmission scanning is performed again to search for the highest-priority transmit mailbox from the beginning of the CRC delimiter. If an error occurs either during transmission or following arbitration-lost, transmission scanning is performed again to search for the highest-priority transmit mailbox from the start of the CRC delimiter.

33.8 Interrupts

The CAN module provides the following interrupts for each channel:

- CANi reception complete interrupt for mailboxes 0 to 31 (CANi_RXM)
- CANi transmission complete interrupt for mailboxes 0 to 31 (CANi_TXM)
- CANi receive FIFO interrupt (CANi_RXF)
- CANi transmit FIFO interrupt (CANi_TXF)
- CANi error interrupt (CANi_ERS).

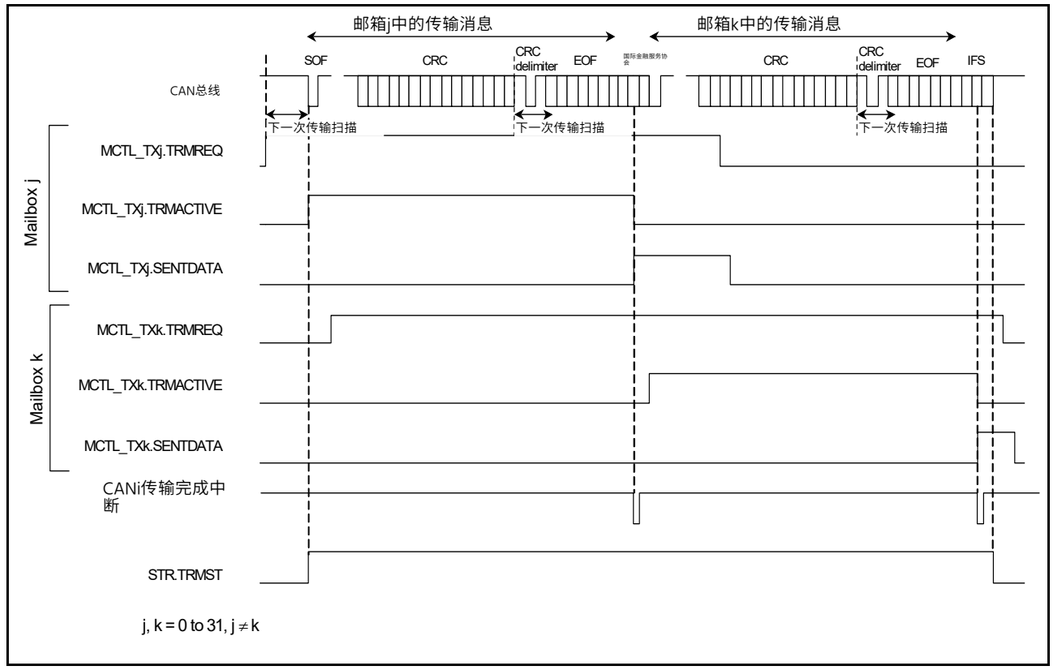

Figure 33.20 数据帧传输的操作示例

1. 当MCTL_TXj（j=0到31）中的TRMREQ位在总线空闲状态下设置为1（发送邮箱）时，邮箱扫描确定发送的最高优先级邮箱。当确定发送邮箱时，MCTL_TXj中的TRMACTIVE标志设置为1（从接受发送请求到发送完成，或错误仲裁失败），STR中的TRMST位设置为1（正在发送），并且CAN模块开始传输。*1
2. 如果设置了其他TRMREQ位，则传输扫描以CRC定界符开始，以进行下一次传输。
3. 如果传输完成且没有丢失仲裁，则MCTL_TXj中的SENTDATA标志设置为1（传输完成），TRMACTIVE标志设置为0（传输挂起或未请求传输）。如果MIER中的中断使能位为1（中断使能），则产生CANi传输完成中断请求。
4. 从同一邮箱请求下一次发送时，将SENTDATA标志和TRMREQ位设置为0，然后在检查SENTDATA标志和TRMREQ位设置为0后将TRMREQ位设置为1。

注1.如果CAN模块开始发送后仲裁丢失，则TRMACTIVE标志设置为0。再次执行发送扫描以从CRC分隔符的开头搜索优先级最高的发送邮箱。如果在传输过程中或仲裁丢失后发生错误，则再次执行传输扫描以从CRC分隔符的开头搜索最高优先级的传输邮箱。

33.8 Interrupts

CAN模块为每个通道提供以下中断：

- 邮箱0到31(CANi_RXM)的CANi接收完成中断
- 邮箱0到31(CANi_TXM)的CANi传输完成中断
- CANi接收FIFO中断(CANi_RXF)
- CANi发送FIFO中断(CANi_TXF)
- CANi错误中断(CANi_ERS)。

Eight interrupt sources are available for the CANi error interrupts. Check the EIFR register to determine the interrupt sources:

- Bus error
- Error-warning
- Error-passive
- Bus-off entry
- Bus-off recovery
- Receive overrun
- Overload frame transmission
- Bus lock.

Table 33.11 lists the CAN interrupts.

Table 33.11 CAN interrupts

Module	Interrupt symbol	Interrupt source	Source flag
CANi i = 0, 1	CANi_ERS	Bus lock detected	EIFR.BLIF
		Overload frame transmission detected	EIFR.OLIF
		Overrun detected	EIFR.ORIF
		Bus-off recovery detected	EIFR.BORIF
		Bus-off entry detected	EIFR.BOEIF
		Error-passive detected	EIFR.EPIF
		Error-warning detected	EIFR.EWIF
		Bus error detected	EIFR.BEIF
	CANi_RXF	Receive FIFO message received (MIER_FIFO.MB29 = 0)	RFCR.RFUST[2:0]
		Receive FIFO warning (MIER_FIFO.MB29 = 1)	
	CANi_TXF	Transmit FIFO message transmission completed (MIER_FIFO.MB25 = 0)	TFCR.TFUST[2:0]
		FIFO last message transmission completed (MIER_FIFO.MB25 = 1)	
	CANi_RXM	Mailbox 0 to 31 message received	MCTL_RX0.NEWDATA to MCTL_RX31.NEWDATA
	CANi_TXM	Mailbox 0 to 31 message transmission completed	MCTL_TX0.SENTDATA to MCTL_TX31.SENTDATA

33.9 Usage Notes

33.9.1 Settings for the Module-Stop State

The Module Stop Control Register B (MSTPCRB) can enable or disable CAN operation. The CAN module is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

33.9.2 Settings for the Operating Clock

The settings for the operating clock can be made as follows:

- The following clock constraint must be satisfied for the CAN module when the CCLKS bit is 1:

  $f_{PCLKB} \geq f_{CANMCLK}$

- The source of the peripheral module clock must be PLL for the CAN module when the CCLKS bit is 0.

八个中断源可用于CANi错误中断。检查EIFR寄存器以确定中断源：

- 总线错误
- Error-warning
- Error-passive
- Bus-off entry
- Bus-off recovery
- 接收溢出
- 过载帧传输
- 巴士锁。

表33.11列出了CAN中断。

Table 33.11 CAN中断

Module	中断符号	中断源	源标志
CANi i = 0, 1	CANi_ERS	检测到总线锁	EIFR.BLIF
		检测到过载帧传输	EIFR.OLIF
		检测到溢出	EIFR.ORIF
		检测到总线关闭恢复	EIFR.BORIF
		检测到总线关闭条目	EIFR.BOEIF
		Error-passive detected	EIFR.EPIF
		Error-warning detected	EIFR.EWIF
		检测到总线错误	EIFR.BEIF
	CANi_RXF	接收接收到的FIFO消息(MIER_FIFO.MB29=0)	RFCR.RFUST[2:0]
		接收FIFO警告(MIER_FIFO.MB29=1)	
	CANi_TXF	传输FIFO消息传输完成(MIER_FIFO.MB25=0)	TFCR.TFUST[2:0]
		FIFO最后一条消息传输完成(MIER_FIFO.MB25=1)	
	CANi_RXM	邮箱0到31收到消息	MCTL_RX0.NEWDATA to MCTL_RX31.NEWDATA
	CANi_TXM	邮箱0到31消息传输完成	MCTL_TX0.SENTDATA to MCTL_TX31.SENTDATA

33.9 使用说明

33.9.1 模块停止状态的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用CAN操作。CAN模块在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

33.9.2 工作时钟设置

工作时钟的设置可按如下方式进行：

- 当CCLKS位为1时，CAN模块必须满足以下时钟约束：

  $f_{PCLKB} \geq f_{CANMCLK}$

- 当CCLKS位为0时，外设模块时钟源必须是CAN模块的PLL。

34. Serial Peripheral Interface (SPI)

34.1 Overview

The MCU provides two independent channels of the Serial Peripheral Interface (SPI). The SPI channels are capable of high-speed, full-duplex, synchronous serial communications with multiple processors and peripheral devices.

Table 34.1 lists the SPI specifications, and Figure 34.1 shows a block diagram.

In this section, *n* indicates A or B, and *i* indicates 0 or 1. A lower-case letter *i* in pin and signal names indicates a value from 0 to 3, and a lower-case letter *m* in SPI Command Register m (SPCMDm) indicates a value from 0 to 7.

Table 34.1 SPI specifications (1 of 2)

Parameter	Specifications
Number of channels	Two channels
SPI transfer functions	• Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows serial communications through SPI operation (4-wire method) or clock synchronous operation (3-wire method) • Transmit-only operation available • Communication mode selectable to full-duplex or transmit-only • RSPCK polarity switching • RSPCK phase switching.
Data format	• MSB-first or LSB-first selectable • Transfer bit length selectable to 8, 9, 10, 11, 12, 13, 14, 15, 16, 20, 24, or 32 bits • 128-bit transmit and receive buffers • Up to four frames transferrable in one round of transmission or reception (each frame consisting of up to 32 bits) • Byte swap operating function.
Bit rate	• In master mode, the on-chip baud rate generator generates RSPCK by frequency-dividing PCLKA (the division ratio ranges from divided by 2 to divided by 4096) • In slave mode, the minimum PCLKA clock divided by 4 can be input as RSPCK (the maximum RSPCK frequency is that of PCLKA divided by 4) Width at high level: 2 PCLKA cycles Width at low level: 2 PCLKA cycles.
Buffer configuration	• Double buffer configuration for the transmit and receive buffers • 128 bits for the transmit and receive buffers.
Error detection	• Mode fault error detection • Underrun error detection • Overrun error detection*1 • Parity error detection.
SSL control function	• Four SSL pins (SSLn0 to SSLn3) for each channel • In single-master mode, SSLn0 to SSLn3 pins are output • In multi-master mode, SSLn0 pin for input and SSLn1 to SSLn3 pins for either for output or unused • In slave mode, SSLn0 pin for input and SSLn1 to SSLn3 pins for unused • Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable delay from RSPCK stop to SSL output negation (SSL negation delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable wait for next-access SSL output assertion (next-access delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Function for changing SSL polarity.
Control in master transfer	• Transfers of up to eight commands, each can be executed sequentially in looped execution • For each command, the following can be set: SSL signal value, bit rate, RSPCK polarity and phase, transfer data length, MSB- or LSB-first, burst, RSPCK delay, SSL negation delay, and next-access delay • Transfers can be initiated by writing to the transmit buffer • MOSI signal value specifiable in SSL negation • RSPCK auto-stop function.

34. 串行外设接口(SPI)

34.1 Overview

MCU提供两个独立的串行外设接口(SPI)通道。SPI通道能够与多个处理器和外围设备进行高速、全双工、同步串行通信。

表34.1列出了SPI规格，图34.1显示了框图。

在本节中，n表示A或B，i表示0或1。引脚和信号名称中的小写字母i表示从0到3的值，SPI命令寄存器m(SPCMDm)中的小写字母m)表示从0到7的值。

Table 34.1 SPI规格（2个中的1个）

Parameter	Specifications
通道数	两个通道
SPI传输函数	使用MOSI（主输出从输入）、MISO（主输入从输出）、SSL（从选择）和RSPCK（SPI时钟）信号允许通过SPI操作（4线方法）或时钟同步操作（3线法） 仅传输操作可用 可选择全双工或仅传输的通信模式 RSPCK极性切换 RSPCK相位切换。
数据格式	可选择MSB优先或LSB优先 传输位长度可选择为8、9、10、11、12、13、14、15、16、20、24或32位 128位发送和接收缓冲区 向上在一轮发送或接收中可传输到四帧（每帧最多由32位组成）•字节交换操作功能。
比特率	在主机模式下，片内波特率发生器通过对PCLKA进行分频产生RSPCK（分频比范围从2分频到4096分频）在从机模式下，可以输入最小PCLKA时钟4分频作为RSPCK（最大RSPCK频率为PCLKA除以4）高电平宽度：2个PCLKA周期低电平宽度：2个PCLKA周期。
缓冲区配置	发送和接收缓冲区的双缓冲区配置 发送和接收缓冲区为128位。
错误检测	模式故障错误检测 欠载错误检测 溢出错误检测*1 奇偶校验错误检测。
SSL控制功能	每个通道有四个SSL引脚（SSLn0到SSLn3） 在单主模式下，SSLn0到SSLn3引脚是输出 在多主模式下，SSLn0引脚用于输入，SSLn1到SSLn3引脚用于输出或未使用 在从机中模式，SSLn0引脚用于输入，SSLn1到SSLn3引脚用于未使用 从SSL输出断言到RSPCK操作的可控延迟（RSPCK延迟）范围：1到8个RSPCK周期（以RSPCK周期为单位设置） 从RSPCK停止到SSL的可控延迟输出否定（SSL否定延迟）范围：1到8个RSPCK周期（以RSPCK周期为单位设置） 可控制等待下一次访问SSL输出断言（下一次访问延迟）范围：1到8个RSPCK周期（以RSPCK-周期为单位设置）周期单位） 改变SSL极性的功能。
主传输中的控制	最多传输8个命令，每个命令可以循环执行 对于每个命令，可以设置以下内容： SSL信号值、比特率、RSPCK极性和相位、传输数据长度、MSB或LSB优先、突发、RSPCK延迟、SSL否定延迟和下一次访问延迟 可以通过写入传输缓冲区来启动传输 在SSL否定中指定的MOSI信号值 RSPCK自动停止功能。

Table 34.1 SPI specifications (2 of 2)

Parameter	Specifications
Interrupt sources	• Receive buffer full interrupt • Transmit buffer empty interrupt • SPI error interrupt (mode-fault, overrun, parity error) • SPI idle interrupt (SPI idle) • Transmission-complete interrupt.
Event link function (output)	The following events can be output to the Event Link Controller (ELC): • Receive buffer full signal • Transmit buffer empty signal • Mode-fault, underrun, overrun, or parity error signal • SPI idle signal • Transmission-completed signal.
Other functions	• Switching between CMOS output and open-drain output • SPI initialization function • Loopback mode.
Module-stop function	Module-stop state can be set to reduce power consumption

Note 1. In master reception, when the RSPCK auto-stop function is enabled, an overrun error does not occur because the transfer clock is stopped on overrun error detection.

Table 34.1 SPI规范（2个中的2个）

Parameter	Specifications
中断源	接收缓冲区满中断 发送缓冲区空中断 SPI错误中断（模式错误、溢出、奇偶校验错误） SPI空闲中断（SPI空闲） 传输完成中断。
事件链接功能（输出）	以下事件可以输出到事件链接控制器(ELC)： 接收缓冲区满信号 发送缓冲区空信号 模式故障、欠载、溢出或奇偶校验错误信号 SPI空闲信号 传输完成信号。
其他功能	在CMOS输出和开漏输出之间切换 SPI初始化功能 环回模式。
Module-stop function	可设置模块停止状态以降低功耗

Note 1. 在主机接收中，当启用RSPCK自动停止功能时，不会发生溢出错误，因为在检测到溢出错误时会停止传输时钟。

Bit	Symbol	Bit name	Description	R/W
b0	SPMS	SPI Mode Select	0: Select SPI operation (4-wire method) 1: Select clock synchronous operation (3-wire method).	R/W
b1	TXMD	Communications Operating Mode Select	0: Select full-duplex synchronous serial communications 1: Select serial communications with transmit-only.	R/W
b2	MODFEN	Mode Fault Error Detection Enable	0: Disable detection of mode fault errors 1: Enable detection of mode fault errors.	R/W
b3	MSTR	SPI Master/Slave Mode Select	0: Select slave mode 1: Select master mode.	R/W
b4	SPEIE	SPI Error Interrupt Enable	0: Disable SPI error interrupt requests 1: Enable SPI error interrupt requests.	R/W
b5	SPTIE	Transmit Buffer Empty Interrupt Enable	0: Disable transmit buffer empty interrupt requests 1: Enable transmit buffer empty interrupt requests.	R/W
b6	SPE	SPI Function Enable	0: Disable SPI function 1: Enable SPI function.	R/W
b7	SPRIE	SPI Receive Buffer Full Interrupt Enable	0: Disable SPI receive buffer full interrupt requests 1: Enable SPI receive buffer full interrupt requests.	R/W

If the SPCR.MSTR, SPCR.MODFEN, or SPCR.TXMD bit is changed while the SPCR.SPE bit is 1, do not perform subsequent operations.

SPMS bit (SPI Mode Select)

The SPMS bit selects SPI operation (4-wire method) or clock synchronous operation (3-wire method).

Table 34.2 SPIIO引脚

Channel	引脚名称	I/O	Function
SPI0	RSPCKA	I/O	Clock input/output
	MOSIA	I/O	主机发送数据输入输出
	MISOA	I/O	从机发送数据输入输出
	SSLA0	I/O	从机选择输入输出
	SSLA1	Output	从机选择输出
	SSLA2	Output	从机选择输出
	SSLA3	Output	从机选择输出
SPI1	RSPCKB	I/O	Clock input/output
	MOSIB	I/O	主机发送数据输入输出
	MISOB	I/O	从机发送数据输入输出
	SSLB0	I/O	从机选择输入输出
	SSLB1	Output	从机选择输出
	SSLB2	Output	从机选择输出
	SSLB3	Output	从机选择输出

34.2 注册说明

34.2.1 SPI控制寄存器(SPCR)

Address(es): SPI0.SPCR 4007 2000h, SPI1.SPCR 4007 2100h

	b7	b6	b5	b4	b3	b2	b1	b0
	SPRIE	SPE	SPTIE	SPEIE	MSTR	MODF EN	TXMD	SPMS
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SPMS	SPI模式选择	0：选择SPI操作（4线方式）1：选择时钟同步操作（3线方式）。	R/W
b1	TXMD	通讯操作模式 Select	0：选择全双工同步串行通信1：选择仅发送的串行通信。	R/W
b2	MODFEN	模式故障错误检测启用	0：禁用模式故障错误检测1：启用模式故障错误检测。	R/W
b3	MSTR	SPI主从模式选择	0：选择从模式1：选择主模式。	R/W
b4	SPEIE	SPI错误中断使能	0：禁用SPI错误中断请求1：启用SPI错误中断请求。	R/W
b5	SPTIE	发送缓冲区空中断 Enable	0：禁止发送缓冲区空中断请求1：使能发送缓冲区空中断请求。	R/W
b6	SPE	SPI功能使能	0：禁用SPI功能1：启用SPI功能。	R/W
b7	SPRIE	SPI接收缓冲器满中断 Enable	0：禁止SPI接收缓冲区满中断请求1：使能SPI接收缓冲区满中断请求。	R/W

如果在SPCR.SPE位为1时更改了SPCR.MSTR、SPCR.MODFEN或SPCR.TXMD位，则不要执行后续操作。

SPMS位（SPI模式选择）

SPMS位选择SPI操作（4线方法）或时钟同步操作（3线方法）。

The SSLn0 to SSLn3 pins are not used in clock synchronous operation. The RSPCKn, MOSIn, and MISOn pins handle communications. For clock synchronous operation in master mode (SPCR.MSTR = 1), the SPCMDm.CPHA bit can be set to either 0 or 1. For clock synchronous operation in slave mode (SPCR.MSTR = 0), set the CPHA bit to 1. Do not perform the operations if the CPHA bit is set to 0 when clock synchronous operation is in slave mode.

TXMD bit (Communications Operating Mode Select)

The TXMD bit selects full-duplex synchronous serial communications or transmit-only operations. When this bit is set to 1, the SPI only performs transmit operations and not receive operations (see section 34.3.6, Data Transfer Modes), and the receive buffer full interrupt requests cannot be used.

MODFEN bit (Mode Fault Error Detection Enable)

The MODFEN bit enables or disables the detection of mode fault errors (see section 34.3.8, Error Detection). In addition, the SPI determines the I/O direction of the SSLn0 to SSLn3 pins based on combinations of the MODFEN and MSTR bit settings (see section 34.3.2, Controlling the SPI Pins).

MSTR bit (SPI Master/Slave Mode Select)

The MSTR bit selects master or slave mode for the SPI. Based on the MSTR bit settings, the SPI determines the direction of the RSPCKn, MOSIn, MISOn, and SSLn0 to SSLn3 pins.

SPEIE bit (SPI Error Interrupt Enable)

The SPEIE bit enables or disables the generation of SPI error interrupt requests when one of the following occurs:

- The SPI detects a mode fault error or underrun error and sets the SPSR.MODF flag to 1
- The SPI detects an overrun error and sets the SPSR.OVRF flag to 1
- The SPI detects a parity error and sets the SPSR.PERF flag to 1.

For details, see section 34.3.8, Error Detection.

SPTIE bit (Transmit Buffer Empty Interrupt Enable)

The SPTIE bit enables or disables the generation of transmit buffer empty interrupt requests when the SPI detects that the transmit buffer is empty. To generate a transmit buffer empty interrupt request when transmission starts, set the SPE and SPTIE bits to 1 at the same time or set the SPE bit to 1 after setting the SPTIE bit to 1.

When the SPTIE bit is 1, transmit buffer interrupts are generated even when the SPI function is disabled (when the SPE bit is changed to 0).

SPE bit (SPI Function Enable)

The SPE bit enables or disables the SPI function. The SPE bit cannot be set to 1 when the SPSR.MODF flag is 1. For details, see section 34.3.8, Error Detection.

Setting the SPE bit to 0 disables the SPI function and initializes a part of the module function. For details, see section 34.3.9, Initializing the SPI. In addition, a transmit buffer empty interrupt request is generated when the SPE bit is changed from 0 to 1 or 1 to 0.

SPRIE bit (SPI Receive Buffer Full Interrupt Enable)

The SPRIE bit enables or disables the generation of an SPI receive buffer full interrupt request when the SPI detects a receive buffer full write after completion of a serial transfer.

SSLn0到SSLn3引脚不用于时钟同步操作。RSPCKn、MOSIn和MIOn引脚处理通信。对于主机模式下的时钟同步操作(SPCR.MSTR=1)，SPCMDm.CPHA位可以设置为0或1。对于从机模式下的时钟同步操作(SPCR.MSTR=0)，将CPHA位设置为1.如果时钟同步操作处于从机模式时CPHA位设置为0，则不要执行这些操作。

TXMD位（通信操作模式选择）

TXMD位选择全双工同步串行通信或仅发送操作。当该位设置为1时，SPI只执行发送操作而不执行接收操作（参见第34.3.6节，数据传输模式），并且无法使用接收缓冲区满中断请求。

MODFEN位（模式故障错误检测使能）

MODFEN位启用或禁用模式故障错误检测（参见第34.3.8节，错误检测）。此外，SPI根据MODFEN和MSTR位设置的组合确定SSLn0到SSLn3引脚的IO方向（请参见第34.3.2节，控制SPI引脚）。

MSTR位（SPI主从模式选择）

MSTR位选择SPI的主模式或从模式。根据MSTR位设置，SPI确定RSPCKn、MOSIn、MISOn和SSLn0到SSLn3引脚的方向。

SPEIE位（SPI错误中断使能）

当发生以下情况之一时，SPEIE位启用或禁用SPI错误中断请求的生成：

- SPI检测到模式故障错误或欠载错误并将SPSR.MODF标志设置为1
- SPI检测到溢出错误并将SPSR.OVRF标志设置为1
- SPI检测到奇偶校验错误并将SPSR.PERF标志设置为1。

有关详细信息，请参阅第34.3.8节，错误检测。

SPTIE位（发送缓冲区空中断使能）

当SPI检测到发送缓冲区为空时，SPTIE位使能或禁止生成发送缓冲区空中断请求。要在发送开始时产生发送缓冲区空中断请求，请将SPE和SPTIE位同时设置为1，或在将SPTIE位设置为1后将SPE位设置为1。

当SPTIE位为1时，即使禁用SPI功能（当SPE位变为0时）也会产生发送缓冲区中断。

SPE位（SPI功能使能）

SPE位启用或禁用SPI功能。当SPSR.MODF标志为1时，SPE位不能设置为1。有关详细信息，请参阅第34.3.8节，错误检测。

将SPE位设置为0将禁用SPI功能并初始化部分模块功能。有关详细信息，请参阅第34.3.9节，初始化SPI。此外，当SPE位从0变为1或1变为0时，会产生发送缓冲区空中断请求。

SPRIE位（SPI接收缓冲区满中断使能）

当SPI在串行传输完成后检测到接收缓冲区已满写入时，SPRIE位启用或禁用SPI接收缓冲区已满中断请求的生成。

34.2.2 SPI Slave Select Polarity Register (SSLP)

Address(es): SPI0.SSLP 4007 2001h, SPI1.SSLP 4007 2101h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	SSL3P	SSL2P	SSL1P	SSL0P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SSL0P	SSL0 Signal Polarity Setting	0: Set SSL0 signal to active-low 1: Set SSL0 signal to active-high.	R/W
b1	SSL1P	SSL1 Signal Polarity Setting	0: Set SSL1 signal to active-low 1: Set SSL1 signal to active-high.	R/W
b2	SSL2P	SSL2 Signal Polarity Setting	0: Set SSL2 signal to active-low 1: Set SSL2 signal to active-high.	R/W
b3	SSL3P	SSL3 Signal Polarity Setting	0: Set SSL3 signal to active-low 1: Set SSL3 signal to active-high.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

If the contents of SSLP are changed when the SPCR.SPE bit is 1, do not perform subsequent operations.

34.2.3 SPI Pin Control Register (SPPCR)

Address(es): SPI0.SPPCR 4007 2002h, SPI1.SPPCR 4007 2102h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	MOIFE	MOIFV	—	—	SPLP2	SPLP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SPLP	SPI Loopback	0: Normal mode 1: Loopback mode, with data inverted for transmission.	R/W
b1	SPLP2	SPI Loopback 2	0: Normal mode 1: Loopback mode, with data not inverted for transmission.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	MOIFV	MOSI Idle Fixed Value	0: Set level output on the MOSIn pin during MOSI idling to low 1: Set level output on the MOSIn pin during MOSI idling to high.	R/W
b5	MOIFE	MOSI Idle Value Fixing Enable	0: Set MOSI output value to equal the final data from previous transfer 1: Set MOSI output value to equal value set in the MOIFV bit.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

If the contents of SPPCR are changed when the SPCR.SPE bit is 1, do not perform subsequent operations.

SPLP bit (SPI Loopback)

The SPLP bit selects the mode of the SPI pins. When this bit is set to 1, SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, and between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0. The SPI then connects the input path and output path for the shift register, establishing loopback mode.

SPLP2 bit (SPI Loopback 2)

The SPLP2 bit selects the mode of the SPI pins. When this bit is set to 1, SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, and between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0. The SPI then connects the input path and the output path for the shift register, establishing loopback mode 2.

34.2.2 SPI从机选择极性寄存器(SSLP)

Address(es): SPI0.SSLP 4007 2001h, SPI1.SSLP 4007 2101h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	SSL3P	SSL2P	SSL1P	SSL0P
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SSL0P	SSL0信号极性设置	0：将SSL0信号设置为低电平有效1： 将SSL0信号设置为高电平有效。	R/W
b1	SSL1P	SSL1信号极性设置	0：设置SSL1信号为低电平有效1 ：设置SSL1信号为高电平有效。	R/W
b2	SSL2P	SSL2信号极性设置	0：将SSL2信号设置为低电平有效1： 将SSL2信号设置为高电平有效。	R/W
b3	SSL3P	SSL3信号极性设置	0：将SSL3信号设置为低电平有效1： 将SSL3信号设置为高电平有效。	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

如果SPCR.SPE位为1时SSLP的内容发生变化，则不要进行后续操作。

34.2.3 SPI引脚控制寄存器(SPPCR)

Address(es): SPI0.SPPCR 4007 2002h, SPI1.SPPCR 4007 2102h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	MOIFE	MOIFV	—	—	SPLP2	SPLP
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SPLP	SPI Loopback	0：正常模式1：环回模式，数据反转传输。	R/W
b1	SPLP2	SPI Loopback 2	0：正常模式1：环回模式，数据不反相传输。	R/W
b3, b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b4	MOIFV	MOSI空闲固定值	0：在MOSI空闲期间将MOSIn引脚上的电平输出设置为低1：在MOSI空闲期间将MOSIn引脚上的电平输出设置为高。	R/W
b5	MOIFE	MOSI空闲值修复Enable	0：设置MOSI输出值等于上次传输的最终数据1：设置MOSI输出值等于MOIFV位中设置的值。	R/W
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W

如果SPCR.SPE位为1时SPPCR的内容发生了变化，则不要进行后续操作。

SPLP位（SPI环回）

SPLP位选择SPI引脚的模式。当该位设置为1时，如果SPCR.MSTR位为1，则SPI关闭MIOn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则关闭MOSIn引脚和移位寄存器之间的路径。SPI然后连接移位寄存器的输入路径和输出路径，建立环回模式。

SPLP2位（SPI环回2）

SPLP2位选择SPI引脚的模式。当该位设置为1时，如果SPCR.MSTR位为1，则SPI关闭MIOn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则关闭MOSIn引脚和移位寄存器之间的路径。SPI然后连接移位寄存器的输入路径和输出路径，建立环回模式2。

MOIFV bit (MOSI Idle Fixed Value)

If the MOIFE bit is 1 in master mode, the MOIFV bit determines the MOSIn pin output value during the SSL negation period, including the SSL retention period during a burst transfer.

MOIFE bit (MOSI Idle Value Fixing Enable)

The MOIFE bit fixes the MOSIn output value when the SPI in master mode is in an SSL negation period, including the SSL retention period during a burst transfer. When the MOIFE bit is 0, the SPI outputs the last data from the previous serial transfer during the SSL negation period to the MOSIn pin. When the MOIFE bit is 1, the SPI outputs the fixed value set in the MOIFV bit to the MOSIn pin.

34.2.4 SPI Status Register (SPSR)

Address(es): SPI0.SPSR 4007 2003h, SPI1.SPSR 4007 2103h

	b7	b6	b5	b4	b3	b2	b1	b0
	SPRF	—	SPTEF	UDRF	PERF	MODF	IDLNF	OVRF
Value after reset:	0	0	1	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OVRF	Overrun Error Flag	0: No overrun error occurred 1: Overrun error occurred.	R/(W)*1
b1	IDLNF	SPI Idle Flag	0: SPI is in idle state 1: SPI is in transfer state.	R
b2	MODF	Mode Fault Error Flag	0: No mode fault or underrun error occurred 1: Mode fault error or underrun error occurred.	R/(W)*1
b3	PERF	Parity Error Flag	0: No parity error occurred 1: Parity error occurred.	R/(W)*1
b4	UDRF	Underrun Error Flag	0: A mode fault error occurred (MODF = 1) 1: An underrun error occurred (MODF = 1). This bit is invalid when MODF is 0.	R/W*1,*2
b5	SPTEF	SPI Transmit Buffer Empty Flag	0: Data is in the transmit buffer 1: No data is in the transmit buffer.	R/(W)*3
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	SPRF	SPI Receive Buffer Full Flag	0: No valid data is in SPDR/SPDR_HA 1: Valid data is in SPDR/SPDR_HA.	R/(W)*3

Note 1. Only 0 can be written to clear the flag after reading 1.
Note 2. Clear the UDRF flag at the same time as the MODF flag.
Note 3. The write value should be 1.

OVRF flag (Overrun Error Flag)

The OVRF flag indicates the occurrence of an overrun error. In master mode (SPCR.MSTR = 1) and when the RSPCK clock auto-stop function is enabled (SPCR2.SCKASE = 1), an overrun error does not occur, and this flag is not set to 1. For details, see section 34.3.8.1, Overrun errors.

[Setting condition]

- When the next serial transfer ends while the SPCR.TXMD bit is 0 and the receive buffer is full.

[Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

IDLNF flag (SPI Idle Flag)

The IDLNF flag indicates the transfer status of the SPI.

[Setting conditions]

MOIFV位（MOSI空闲固定值）

如果MOIFE位在主模式下为1，则MOIFV位确定SSL否定期间的MOSIn引脚输出值，包括突发传输期间的SSL保持期间。

MOIFE位（MOSI空闲值固定使能）

MOIFE位固定SPI在主模式下处于SSL否定周期时的MOSIn输出值，包括
突发传输期间的SSL保留期。当MOIFE位为0时，SPI将SSL否定期间上次串行传输的最后一个数据输出到MOSIn引脚。当MOIFE位为1时，SPI将MOIFV位中设置的固定值输出到MOSIn引脚。

34.2.4 SPI状态寄存器(SPSR)

Address(es): SPI0.SPSR 4007 2003h, SPI1.SPSR 4007 2103h

	b7	b6	b5	b4	b3	b2	b1	b0
	SPRF	—	SPTEF	UDRF	PERF	MODF	IDLNF	OVRF
重置后的值：	0	0	1	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	OVRF	溢出错误标志	0：未发生溢出错误1：发生溢出错误。	R/(W)*1
b1	IDLNF	SPI空闲标志	0：SPI处于空闲状态1：SPI处于传输状态。	R
b2	MODF	模式故障错误标志	0：未发生模式故障或欠载错误1：发生模式故障错误或欠载错误。	R/(W)*1
b3	PERF	奇偶校验错误标志	0：未发生奇偶校验错误1：发生奇偶校验错误。	R/(W)*1
b4	UDRF	欠载错误标志	0：发生模式故障错误(MODF=1)1：发生欠载错误(MODF=1)。当MODF为0时该位无效。	R/W*1,*2
b5	SPTEF	SPI发送缓冲区空标志	0：发送缓冲区中有数据1：发送缓冲区中没有数据。	R/(W)*3
b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b7	SPRF	SPI接收缓冲区满标志	0：SPDRSPDR_HA中没有有效数据1：SPDRSPDR_HA中有有效数据。	R/(W)*3

Note 1. 读1后只能写0清除标志。
Note 2. 在清除MODF标志的同时清除UDRF标志。
Note 3. 写入值应为1。

OVRF标志（溢出错误标志）

OVRF标志指示发生溢出错误。在主机模式（SPCR.MSTR=1）和启用RSPCK时钟自动停止功能（SPCR2.SCKASE=1）时，不会发生溢出错误，并且该标志不设置为1。详细信息见章节34.3.8.1，溢出错误。

[Setting condition]

- 当SPCR.TXMD位为0且接收缓冲区已满时，下一次串行传输结束。

[Clearing condition]

- 当此标志为1时读取SPSR，然后将0写入此标志。

IDLNF标志（SPI空闲标志）

IDLNF标志指示SPI的传输状态。

[Setting conditions]

Master mode

- When conditions 1. and 2. in the master mode, in the clearing conditions, are not satisfied.

Slave mode

- When the SPCR.SPE bit is 1, enabling the SPI function.

[Clearing conditions]

Master mode

- When condition 1. or conditions 2., 3., and 4. are satisfied.

1. The SPCR.SPE bit is 0, indicating that the SPI is initialized.
2. The transmit buffer (SPTX) is empty, indicating that data for the next transfer is not set.
3. The SPSSR.SPCP[2:0] bits are 000b, indicating the beginning of sequence control.
4. The SPI internal sequencer is in the idle state, indicating that operations up to the next-access delay are complete.

Slave mode

- When condition 1. is satisfied.

MODF flag (Mode Fault Error Flag)

The MODF flag indicates the occurrence of a mode fault error or an underrun error. The UDRF flag indicates which error occurred.

[Setting conditions]

Multi-master mode

- When the input level of the SSLni pin changes to an active level while the SPCR.MSTR bit is 1 (master mode) and the SPCR.MODFEN bit is 1 (mode fault error detection is enabled), triggering a mode fault error.

Slave mode

- When condition 1. or 2. is satisfied.

  1. The SSLni pin is negated before the RSPCK cycle required for data transfer ends while the SPCR.MSTR bit is 0 (slave mode) and the SPCR.MODFEN bit is 1 (mode fault error detection is enabled), triggering a mode fault error.
  2. The serial transfer begins with the SPCR.MSTR bit set to 0 (slave mode), the SPCR.SPE bit set to 1, and the transmission data not prepared, triggering an underrun error.

The active level of the SSLni signal is determined by the SSLP.SSLiP bit (SSLi signal polarity setting).

[Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

PERF flag (Parity Error Flag)

The PERF flag indicates the occurrence of a parity error.

[Setting condition]

- When a serial transfer ends while the SPCR.TXMD bit is 0 and the SPCR2.SPPE bit is 1, triggering a parity error.

[Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

UDRF flag (Underrun Error Flag)

The UDRF flag indicates the occurrence of an underrun error.

[Setting condition]

- When the serial transfer begins with the SPCR.MSTR bit set to 0 (slave mode), the SPCR.SPE bit set to 1, and the

主模式

- 当条件1.和2.在主模式中，在清除条件中，不满足。

从机模式

- 当SPCR.SPE位为1时，使能SPI功能。

[Clearing conditions]

主模式

- 当条件1.或条件2.、3.和4.满足时。

1. SPCR.SPE位为0，表示SPI已初始化。
2. 发送缓冲区(SPTX)为空，表示未设置下一次传输的数据。
3. SPSSR.SPCP[2:0]位为000b，表示序列控制的开始。
4. SPI内部定序器处于空闲状态，表示直到下一次访问延迟的操作已完成。

从机模式

- 当条件1.满足时。

MODF标志（模式故障错误标志）

MODF标志指示发生模式故障错误或欠载错误。UDRF标志指示发生了哪个错误。

[Setting conditions]

Multi-master mode

- 当SPCR.MSTR位为1（主模式）且SPCR.MODFEN位为1（使能模式故障错误检测）时SSLni引脚的输入电平变为有效电平，触发模式故障错误。

从机模式

- 当满足条件1.或2.时。

  1.在SPCR.MSTR位为0（从机模式）且SPCR.MODFEN位为1（使能模式故障错误检测）时，SSLni引脚在数据传输所需的RSPCK周期结束前被取反，触发模式故障错误.

  2.串行传输开始时SPCR.MSTR位设置为0（从模式），SPCR.SPE位设置为1，传输数据未准备好，触发欠载错误。

SSLni信号的有效电平由SSLP.SSLiP位（SSLi信号极性设置）确定。

[Clearing condition]

- 当此标志为1时读取SPSR，然后将0写入此标志。

PERF标志（奇偶校验错误标志）

PERF标志指示奇偶校验错误的发生。

[Setting condition]

- 当SPCR.TXMD位为0且SPCR2.SPPE位为1时串行传输结束，触发奇偶校验错误。

[Clearing condition]

- 当此标志为1时读取SPSR，然后将0写入此标志。

UDRF标志（欠载错误标志）

UDRF标志指示发生了欠载错误。

[Setting condition]

- 当串行传输开始时SPCR.MSTR位设置为0（从模式），SPCR.SPE位设置为1，并且

transmission data not prepared, triggering an underrun error.

[Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

SPTEF flag (SPI Transmit Buffer Empty Flag)

The SPTEF flag indicates the status of the transmit buffer for the SPI Data Register (SPDR/SPDR_HA).

[Setting conditions]

- When condition 1. or 2. is satisfied.

  1. The SPCR.SPE bit is 0, indicating that the SPI is initialized.

  2. Transmit data is transferred from the transmit buffer to the shift register.

[Clearing condition]

- When data written to SPDR/SPDR_HA equals the number of frames set in the SPFC[1:0] bits in the SPI Data Control Register (SPDCR).

Data can only be written to SPDR/SPDR_HA when the SPTEF flag is 1. If data is written to the transmit buffer of SPDR/SPDR_HA when the SPTEF flag is 0, data in the transmit buffer is not updated.

SPRF flag (SPI Receive Buffer Full Flag)

The SPRF flag indicates the status of the receive buffer for the SPI Data Register (SPDR/SPDR_HA).

[Setting condition]

- When a serial transfer ends while the Communication Operating Mode Select bit (TXMD) in the SPI Control Register (SPCR) is 0, the SPRF flag is 0, and the SPI transfers the receive data from the shift register to SPDR/SPDR_HA. However, when the OVRF flag is 1, the SPRF flag does not change from 0 to 1.

[Clearing condition]

- When received data is read from SPDR/SPDR_HA.

34.2.5 SPI Data Register (SPDR/SPDR_HA)

Address(es): SPI0.SPDR 4007 2004h, SPI1.SPDR 4007 2104h

SPDR/SPDR_HA is the interface with the buffers that hold data for transmission and reception by the SPI.

When accessing this register in words (SPLW = 1), access the SPDR register. When accessing it in halfwords (SPLW = 0), access the SPDR_HA register.

The transmit buffer (SPTX) and receive buffer (SPRX) are independent but are both mapped to SPDR/SPDR_HA. Figure 34.2 shows the configuration of the SPDR/SPDR_HA register.

传输数据未准备好，触发欠载错误。

[Clearing condition]

- 当此标志为1时读取SPSR，然后将0写入此标志。

SPTEF标志（SPI发送缓冲区空标志）

SPTEF标志指示SPI数据寄存器(SPDRSPDR_HA)的发送缓冲区的状态。

[Setting conditions]

- 当满足条件1.或2.时。

  1.SPCR.SPE位为0，表示SPI初始化。

  2.发送数据从发送缓冲器传送到移位寄存器。

[Clearing condition]

- 当写入SPDR的数据SPDR_HA等于SPI数据中SPFC[1:0]位中设置的帧数时控制寄存器(SPDCR)。

只有当SPTEF标志为1时，才能将数据写入SPDRSPDR_HA。如果将数据写入SPDRSPDR_HA当SPTEF标志为0时，发送缓冲区中的数据不更新。

SPRF标志（SPI接收缓冲区满标志）

SPRF标志指示SPI数据寄存器(SPDRSPDR_HA)的接收缓冲区的状态。

[Setting condition]

- 当串行传输结束而SPI控制中的通信操作模式选择位(TXMD)寄存器（SPCR）为0，SPRF标志为0，SPI将接收到的数据从移位寄存器传送到SPDRSPDR_HA。但是，当OVRF标志为1时，SPRF标志不会从0变为1。

[Clearing condition]

- 当从SPDRSPDR_HA读取接收到的数据时。

34.2.5 SPI数据寄存器(SPDRSPDR_HA)

Address(es): SPI0.SPDR 4007 2004h, SPI1.SPDR 4007 2104h

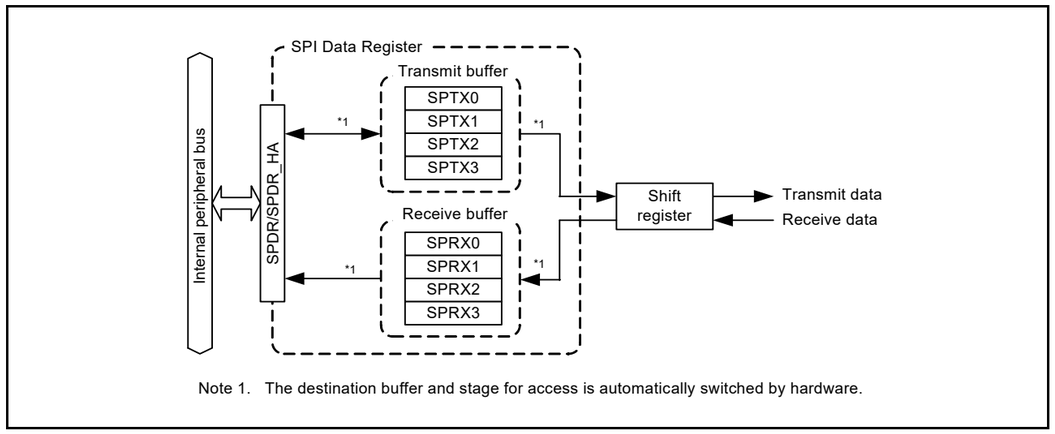
SPDRSPDR_HA是与保存数据以供SPI发送和接收的缓冲区的接口。

当以字（SPLW=1）访问该寄存器时，访问SPDR寄存器。以半字(SPLW=0)访问时，访问SPDR_HA寄存器。

发送缓冲区(SPTX)和接收缓冲区(SPRX)是独立的，但都映射到SPDRSPDR_HA。
图34.2显示了SPDRSPDR_HA寄存器的配置。



Note 1. The destination buffer and stage for access is automatically switched by hardware.

Figure 34.2 Configuration of SPDR/SPDR_HA

The transmit and receive buffers each have four stages. The number of stages to be used is selectable by the number of frames specification bits in the SPI Data Control Register (SPDCR.SPFC[1:0]). The eight stages of the buffer are all mapped to the single address of the SPDR/SPDR_HA register.

Data written to SPDR/SPDR_HA is written to a transmit-buffer stage (SPTXn) (n = 0 to 3) and then transmitted from the buffer. The receive buffer holds the received data on completion of reception. The receive buffer is not updated if an overrun is generated.

If the data length is not 32 bits, the bits not referred to in SPTXn (n = 0 to 3) are stored in the associated bits in SPRXn (n = 0 to 3). For example, if the data length is 9 bits, the received data is stored in the SPRXn[8:0] bits, and the SPTXn[31:9] bits are stored in the SPRXn[31:9] bits.

(1) Bus interface

SPDR/SPDR_HA is an interface with 32-bit wide transmit and receive buffers, each of which has four stages, for a total of 32 bytes. The 32 bytes are mapped to the 4-byte address space for SPDR/SPDR_HA. The unit of access for SPDR/SPDR_HA is selected by the SPI Word Access/Halfword Access Specification bit in the SPI Data Control Register (SPDCR.SPLW). SPDR can also be accessed with the access size specified by the SPI Byte Access bit in the SPI Data Control Register (SPDCR.SPBYT).

Flush the transmission data at the LSB end of the register, and store the received data at the LSB end.

The following sections describe the operations involved in writing to and reading from SPDR/SPDR_HA.

(a) Writing

Data written to SPDR/SPDR_HA is written to a transmit buffer (SPTXn). This is not affected by the value of the SPDCR.SPRDTD bit, unlike when reading from SPDR/SPDR_HA. The transmit buffer includes a transmit buffer write pointer that is automatically updated to reference the next stage each time data is written to SPDR/SPDR_HA.

Figure 34.3 shows the configuration of the bus interface with the transmit buffer when writing to SPDR/SPDR_HA.

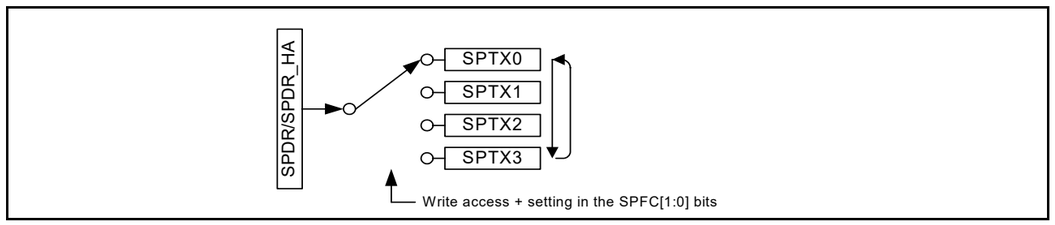


Figure 34.3 Configuration of SPDR/SPDR_HA for write access

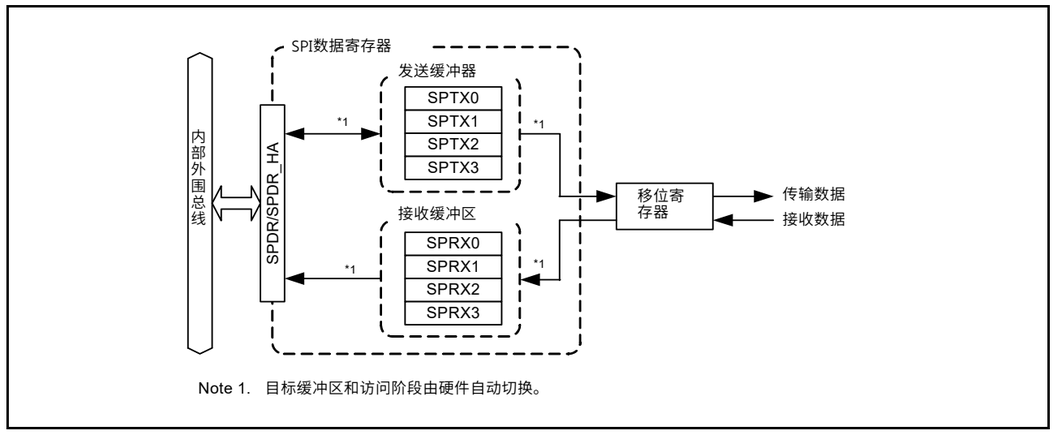

Note 1. 目标缓冲区和访问阶段由硬件自动切换。

Figure 34.2 SPDRSPDR_HA的配置

发送和接收缓冲器各有四个阶段。要使用的级数可通过SPI数据控制寄存器(SPDCR.SPFC[1:0])中的帧数规范位来选择。缓冲区的八个阶段都映射到SPDRSPDR_HA寄存器的单个地址。

写入SPDRSPDR_HA的数据被写入发送缓冲器级(SPTXn)（n=0到3），然后从缓冲器发送。接收缓冲器在接收完成时保存接收到的数据。如果产生溢出，接收缓冲区不会更新。

如果数据长度不是32位，则SPTXn(n=0到3)中未引用的位将存储在SPRXn(n=0到3)的相关位中。例如，如果数据长度为9位，则接收到的数据存储在SPRXn[8:0]位中，SPTXn[31:9]位存储在SPRXn[31:9]位中。

(1) 总线接口

SPDRSPDR_HA是一个具有32位宽的发送和接收缓冲区的接口，每个缓冲区有四个阶段，总共32个字节。32个字节映射到SPDRSPDR_HA的4字节地址空间。SPDRSPDR_HA的访问单元由SPI数据控制中的SPI字访问半字访问规范位选择

寄存器(SPDCR.SPLW)。SPDR也可以通过SPI字节访问位指定的访问大小访问
SPI数据控制寄存器(SPDCR.SPBYT)。

在寄存器的LSB端刷新发送数据，在LSB端存储接收到的数据。

以下部分描述了写入和读取SPDRSPDR_HA所涉及的操作。

(a) Writing

写入SPDRSPDR_HA的数据被写入发送缓冲器(SPTXn)。这不受价值的影响
SPDCR.SPRDTD位，与从SPDRSPDR_HA读取时不同。发送缓冲区包括一个发送缓冲区写指针，每次将数据写入SPDRSPDR_HA时，该写指针会自动更新以引用下一阶段。

图34.3显示了写入SPDRSPDR_HA时带有发送缓冲区的总线接口的配置。

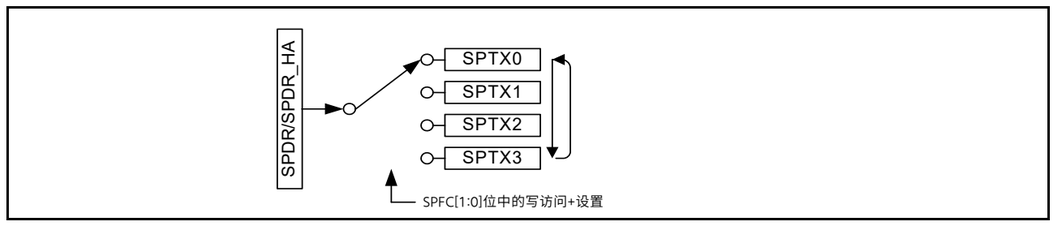

Figure 34.3 为写访问配置SPDRSPDR_HA

The sequence for switching the transmit buffer write pointer changes with the setting of the number of frames specification bits in the SPI Data Control Register (SPDCR.SPFC[1:0]).

The relationship of the SPFC[1:0] setting and the sequence of pointer switching from SPTX0 to SPTX3 is as follows:

- When the SPFC[1:0] bits are 00b: SPTX0 → SPTX0 → SPTX0 → …
- When the SPFC[1:0] bits are 01b: SPTX0 → SPTX1 → SPTX0 → SPTX1 → …
- When the SPFC[1:0] bits are 10b: SPTX0 → SPTX1 → SPTX2 → SPTX0 → SPTX1 → …
- When the SPFC[1:0] bits are 11b: SPTX0 → SPTX1 → SPTX2 → SPTX3 → SPTX0 → SPTX1 → …

When 1 is written to the SPI Function Enable bit in the SPI Control Register (SPCR.SPE) while the bit is 0, SPTX0 is the destination for the next write.

When writing to the transmit buffer (SPTXn) after generation of the transmit buffer empty interrupt (when SPSR.SPTEF is 1), write the number of frames set in the SPI Data Control Register (SPDCR.SPFC[1:0]). Even when the specified number of frames is written to the transmit buffer (SPTXn), the value of the buffer is not updated after completion of the writing and before generation of the next transmit buffer empty interrupt (when SPTEF is 0).

(b) Reading

SPDR/SPDR_HA can be accessed to read the value of a receive buffer (SPRXn) or a transmit buffer (SPTXn). The setting in the SPI Receive/Transmit Data Select bit in the SPI Data Control Register (SPDCR.SPRDTD) selects whether reading is from the receive or transmit buffer.

The sequence of reading the SPDR/SPDR_HA register is controlled by the independent receive buffer and transmit buffer read pointers.

Figure 34.4 shows the configuration of a bus interface with the receive and transmit buffers for reading from SPDR/SPDR_HA.

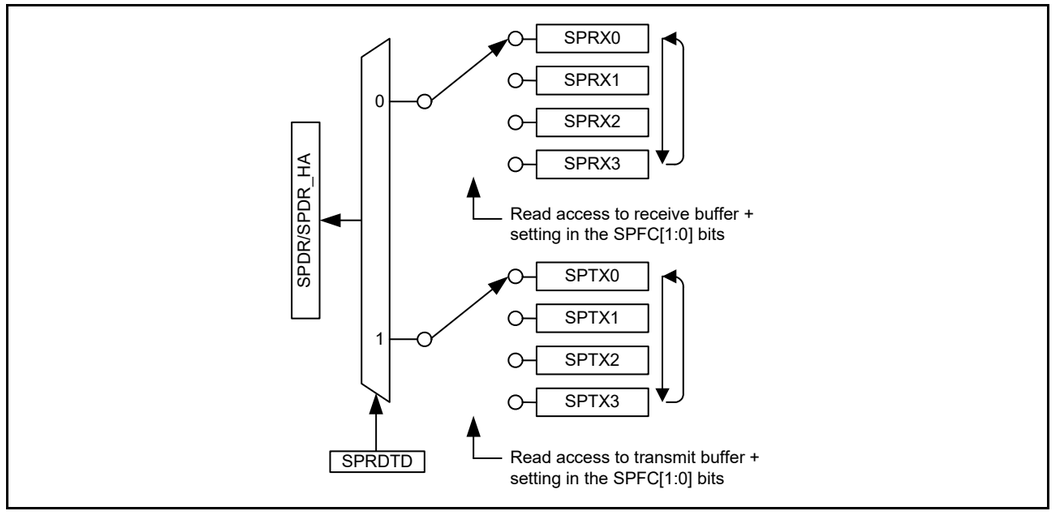

Figure 34.4 Configuration of SPDR/SPDR_HA for read access

Reading the receive buffer switches the receive buffer read pointer to the next buffer automatically. The switching sequence for the receive buffer read pointer is the same as that for the transmit buffer write pointer. However, when 1 is written to the SPI Function Enable bit in the SPI Control Register (SPCR.SPE) when the bit is 1, SPRX0 is referenced by the buffer read pointer for the next read.

The transmit buffer read pointer is updated when writing to SPDR/SPDR_HA, but is not updated when reading from the transmit buffer. When reading from the transmit buffer, the value most recently written to SPDR/SPDR_HA is read.

However, after a transmit buffer empty interrupt is generated, and the transmit buffer becomes full again, reading from

发送缓冲区写指针的切换顺序随SPI数据控制寄存器(SPDCR.SPFC[1:0])中帧数规范位的设置而变化。

SPFC[1:0]设置与指针从SPTX0切换到SPTX3的顺序关系如下：

- 当SPFC[1:0]位为00b时：SPTX0→SPTX0→SPTX0→…
- SPFC[1:0]位为01b时：SPTX0→SPTX1→SPTX0→SPTX1→…
- SPFC[1:0]位为10b时：SPTX0→SPTX1→SPTX2→SPTX0→SPTX1→…
- SPFC[1:0]位为11b时：SPTX0→SPTX1→SPTX2→SPTX3→SPTX0→SPTX1→…

当1写入SPI控制寄存器(SPCR.SPE)中的SPI功能使能位且该位为0时，SPTX0是下一次写入的目标。

在产生发送缓冲区空中断后（当SPSR.SPTEF为1时）写入发送缓冲区(SPTXn)时，写入SPI数据控制寄存器(SPDCR.SPFC[1:0])中设置的帧数。即使指定的帧数被写入发送缓冲区(SPTXn)，缓冲区的值在写入完成后和下一个发送缓冲区空中断发生之前（SPTEF为0时）也不会更新。

(b) Reading

SPDR可以访问SPDR_HA以读取接收缓冲区(SPRXn)或发送缓冲区(SPTXn)的值。SPI数据控制寄存器(SPDCR.SPRDTD)中SPI接收发送数据选择位的设置选择是从接收缓冲区还是从发送缓冲区读取。

读取SPDRSPDR_HA寄存器的顺序由独立的接收缓冲区和发送缓冲区读取指针控制。

图34.4显示了带有接收和发送缓冲区的总线接口配置，用于从
SPDR/SPDR_HA.

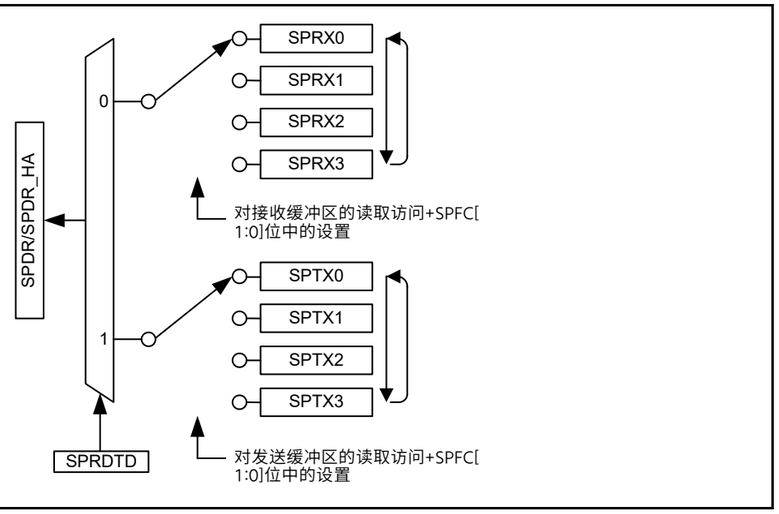

Figure 34.4 为读取访问配置SPDRSPDR_HA

读取接收缓冲区会自动将接收缓冲区读取指针切换到下一个缓冲区。接收缓冲区读指针的切换顺序与发送缓冲区写指针的切换顺序相同。但是，当SPI控制寄存器(SPCR.SPE)中的SPI功能使能位为1时，当该位为1时，SPRX0将被缓冲区读取指针引用以进行下一次读取。

发送缓冲区读指针在写入SPDRSPDR_HA时更新，但在从发送缓冲区读取时不更新。从发送缓冲区读取时，会读取最近写入SPDRSPDR_HA的值。

但是，在产生发送缓冲区空中断后，发送缓冲区再次变满，从

the transmit buffer returns all 0s after the completion of writing the number of frames of data specified in the SPDCR.SPFC[1:0] bits, until the next buffer empty interrupt is generated (when SPTEF is 0).

34.2.6 SPI Sequence Control Register (SPSCR)

Address(es): SPI0.SPSCR 4007 2008h, SPI1.SPSCR 4007 2108h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPSLN[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SPSLN[2:0]	SPI Sequence Length Specification	b2 b0 Sequence Length — Referenced SPCMD0 to SPCMD7 (Number) 0 0 0: 1 — 0→0→… 0 0 1: 2 — 0→1→0→… 0 1 0: 3 — 0→1→2→0→… 0 1 1: 4 — 0→1→2→3→0→… 1 0 0: 5 — 0→1→2→3→4→0→… 1 0 1: 6 — 0→1→2→3→4→5→0→… 1 1 0: 7 — 0→1→2→3→4→5→6→0→… 1 1 1: 8 — 0→1→2→3→4→5→6→7→0→… The sequence length that is set in these bits determines the order in which the SPCMD0 to SPCMD07 registers are referenced. The setting defines the relationship between the sequence length and the SPCMD0 to SPCMD7 registers referenced by the SPI. In slave mode, the SPI references SPCMD0.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SPSCR specifies the sequence length when the SPI operates in master mode. When changing the SPSCR.SPSLN[2:0] bits while both the SPCR.MSTR and SPCR.SPE bits are 1, always check that the SPSR.IDLNF flag is 0.

SPSLN[2:0] bits (SPI Sequence Length Specification)

The SPSLN[2:0] bits specify the sequence length when the SPI in master mode performs sequential operations. The SPI in master mode changes the SPCMD0 to SPCMD7 registers to be referenced, and the order in which they are referenced is based on this sequence length setting. In slave mode, SPCMD0 is referenced.

34.2.7 SPI Sequence Status Register (SPSSR)

Address(es): SPI0.SPSSR 4007 2009h, SPI1.SPSSR 4007 2109h

b7	—	Reserved	This bit is read as 0	R

SPSSR indicates the sequence control status when the SPI operates in master mode. Any writes to SPSSR are ignored.

SPCP[2:0] bits (SPI Command Pointer)

The SPCP[2:0] bits indicate the SPCMDm register that is referenced to by the pointer during sequence control by the SPI. For the SPI sequence control, see section 34.3.10.1, Master mode operation.

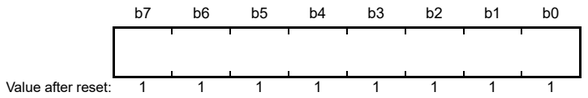
SPECM[2:0] bits (SPI Error Command)

The SPECM[2:0] bits indicate the SPCMDm register that is specified in the SPCP[2:0] bits when an error is detected during sequence control by the SPI. The SPI updates the SPECM[2:0] bits only when an error is detected. If both the SPSR.OVRF and SPSR.MODF flags are 0 and there is no error, the values of the SPECM[2:0] bits have no meaning.

For the SPI error detection function, see section 34.3.8, Error Detection. For the SPI sequence control, see section 34.3.10.1, Master mode operation.

34.2.8 SPI Bit Rate Register (SPBR)

Address(es): SPI0.SPBR 4007 200Ah, SPI1.SPBR 4007 210Ah



SPBR sets the bit rate in master mode. If the contents of SPBR are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

When the SPI is in slave mode, the bit rate depends on the bit rate of the input clock, regardless of the settings in SPBR and the SPCMDm.BRDV[1:0] bits (bit rate division setting). Use bit rates that satisfy the electrical characteristics of the device.

The bit rate is determined by combination of the SPBR and SPCMDm.BRDV[1:0] settings in the SPI Command Register. The equation for calculating the bit rate is as follows:

$$\text{Bit rate} = \frac{f(\text{PCLKA})}{2 \times (n + 1) \times 2^N}$$

In the equation, n denotes an SPBR setting (0, 1, 2, …, 255), and N denotes a BRDV[1:0] setting (0, 1, 2, 3).

Table 34.3 lists examples of the relationship between the SPBR settings, BRDV[1:0] settings, and bit rates.

Table 34.3 Relationship between SPBR settings, BRDV[1:0] settings, and bit rates (1 of 2)

SPBR (n)	BRDV[1:0] bits (N)	Division ratio	Bit rate							
			PCLKA = 32 MHz	PCLKA = 36 MHz	PCLKA = 40 MHz	PCLKA = 50 MHz	PCLKA = 60 MHz	PCLKA = 80 MHz	PCLKA = 100 MHz	PCLKA = 120 MHz
0	0	2	16.0 Mbps	18.0 Mbps	20.0 Mbps	25.0 Mbps	30.0 Mbps	Not supported		
1	0	4	8.00 Mbps	9.00 Mbps	10.0 Mbps	12.5 Mbps	15.0 Mbps	20.0 Mbps	25.0 Mbps	30.0 Mbps

Bit	Symbol	位名称	Description	R/W
b6 to b4	SPECM[2:0]	SPI错误命令	b6 b4 0 0 0: SPCMD0 0 0 1: SPCMD1 0 1 0: SPCMD2 0 1 1: SPCMD3 1 0 0: SPCMD4 1 0 1: SPCMD5 1 1 0: SPCMD6 1 1 1: SPCMD7.	R
b7	—	Reserved	该位读为0	R

SPSSR指示SPI在主模式下工作时的序列控制状态。对SPSSR的任何写入都将被忽略。

SPCP[2:0]位（SPI命令指针）

SPCP[2:0]位指示在序列控制期间由指针引用的SPCMDm寄存器
SPI。对于SPI序列控制，请参见第34.3.10.1节，主模式操作。

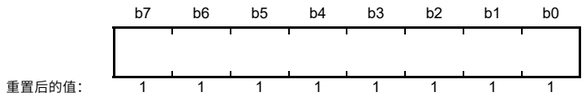
SPECM[2:0]位（SPI错误命令）

SPECM[2:0]位指示在SPI序列控制期间检测到错误时在SPCP[2:0]位中指定的SPCMDm寄存器。SPI仅在检测到错误时更新SPECM[2:0]位。如果SPSR.OVRF和SPSR.MODF标志均为0且没有错误，则SPECM[2:0]位的值没有意义。

关于SPI错误检测功能，请参见第34.3.8节，错误检测。对于SPI序列控制，请参见第34.3.10.1节，主模式操作。

34.2.8 SPI比特率寄存器（SPBR）

Address(es): SPI0.SPBR 4007 200Ah, SPI1.SPBR 4007 210Ah



SPBR在主模式下设置比特率。如果在SPCR.MSTR和SPCR.SPE位都为1时SPBR的内容发生了变化，则不要执行后续操作。

当SPI处于从机模式时，比特率取决于输入时钟的比特率，与SPBR和SPMDm.BRDV[1:0]位（比特率分频设置）的设置无关。使用满足设备电气特性的比特率。

比特率由SPI命令中的SPBR和SPMDm.BRDV[1:0]设置组合确定
登记。比特率的计算公式如下：

$$\text{比特率} = \frac{f(\text{PCLKA})}{2 \times (n + 1) \times 2^N}$$

在等式中，n表示SPBR设置(0 1 2 … 255)，N表示BRDV[1:0]设置(0 1 2 3)。

表34.3列出了SPBR设置、BRDV[1:0]设置和比特率之间的关系示例。

Table 34.3 SPBR设置、BRDV[1:0]设置和比特率之间的关系（1of2）

SPBR (n)	BRDV[1:0] bits (N)	分工比	比特率							
			PCLKA = 32 MHz	PCLKA = 36 MHz	PCLKA = 40 MHz	PCLKA = 50 MHz	PCLKA = 60 MHz	PCLKA = 80 MHz	PCLKA = 100 MHz	PCLKA = 120 MHz
0	0	2	16.0 Mbps	18.0 Mbps	20.0 Mbps	25.0 Mbps	30.0 Mbps	不支持

34.2.9 SPI Data Control Register (SPDCR)

Address(es): SPI0.SPDCR 4007 200Bh, SPI1.SPDCR 4007 210Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	SPBYT	SPLW	SPRDTD	—	—	SPFC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	SPFC[1:0]	Number of Frames Specification	b1 b0 0 0: 1 frame 0 1: 2 frames 1 0: 3 frames 1 1: 4 frames.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	SPRDTD	SPI Receive/Transmit Data Select	0: Read SPDR/SPDR_HA values from the receive buffer 1: Read SPDR/SPDR_HA values from the transmit buffer, but only if the transmit buffer is empty.	R/W
b5	SPLW	SPI Word Access/Halfword Access Specification	0: Set SPDR_HA to valid for halfword access 1: Set SPDR to valid for word access.	R/W
b6	SPBYT	SPI Byte Access Specification	0: SPDR is accessed in halfword or word (SPLW is valid) 1: SPDR is accessed in byte (SPLW is invalid).	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Up to four frames can be transmitted or received in one round of transmission or reception. The amount of data in each transfer is controlled by the combination of the SPCMDm.SPB[3:0] bits, SPSCR.SPSLN[2:0] bits, and SPDCR.SPFC[1:0] bits.

When changing the SPDCR.SPFC[1:0] bits while the SPCR.SPE bit is 1, always check that the SPSR.IDLNF flag is 0.

SPFC[1:0] bits (Number of Frames Specification)

The SPFC[1:0] bits specify the number of frames that can be stored in SPDR/SPDR_HA per transfer activation. Up to four frames can be transmitted or received in one round of transmission or reception.

When the number of transmission data frames specified in the SPFC[1:0] bits is written to the SPDR/SPDR_HA register, the SPI clears the SPSR.SPTEF flag to 0 and begins transmitting. After that, when the number of transmission data frames specified in the SPFC[1:0] bits is transmitted to the shift register, the SPI generates the transmit buffer empty interrupt (SPSR.SPTEF is set to 1).

When the number of data frames specified in the SPFC[1:0] bits is received, the SPI generates a receive buffer full interrupt (SPSR.SPRF is set to 1).

Table 34.3 SPBR设置、BRDV[1:0]设置和比特率之间的关系(2of2)

SPBR (n)	BRDV[1:0] bits (N)	分工比	比特率							
			PCLKA = 32 MHz	PCLKA = 36 MHz	PCLKA = 40 MHz	PCLKA = 50 MHz	PCLKA = 60 MHz	PCLKA = 80 MHz	PCLKA = 100 MHz	PCLKA = 120 MHz

34.2.9 SPI数据控制寄存器(SPDCR)

Address(es): SPI0.SPDCR 4007 200Bh, SPI1.SPDCR 4007 210Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	SPBYT	SPLW	SPRDTD	—	—	SPFC[1:0]	
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	SPFC[1:0]	帧数 Specification	b1b000: 1帧0 1: 2帧10: 3 帧11: 4帧。	R/W
b3, b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b4	SPRDTD	SPI接收发送数据 Select	0: 从接收缓冲区读取SPDRSPDR_HA值1: 从发送缓冲区读取SPDRSPDR_HA值，但前提是发送缓冲区为空。	R/W
b5	SPLW	SPI字访问半字 访问规范	0: 将SPDR_HA设置为对半字访问有效1: 将SPDR设置为对字访问有效。	R/W
b6	SPBYT	SPI字节访问规范	0: SPDR按半字或字访问（SPLW有效）1: SPDR按字节访问（SPLW无效）。	R/W
b7	—	Reserved	该位读取为0。写入值应为0。	R/W

在一轮发送或接收中最多可以发送或接收四帧。每次传输中的数据量由SPCMDm.SPB[3:0]位、SPSCR.SPSLN[2:0]位和SPDCR.SPFC[1:0]位的组合控制。

在SPCR.SPE位为1时更改SPDCR.SPFC[1:0]位时，请始终检查SPSR.IDLNF标志是否为0。

SPFC[1:0]位（帧数规范）

SPFC[1:0]位指定每次传输激活时可以存储在SPDRSPDR_HA中的帧数。在一轮发送或接收中最多可以发送或接收四帧。

当SPFC[1:0]位中指定的传输数据帧数写入SPDRSPDR_HA寄存器时，SPI将SPSR.SPTEF标志清零并开始传输。之后，当SPFC[1:0]位中指定的发送数据帧数被发送到移位寄存器时，SPI产生发送缓冲区空中断（SPSR.SPTEF设置为1）。

当接收到SPFC[1:0]位中指定的数据帧数时，SPI产生接收缓冲区满中断（SPSR.SPRF设置为1）。

Table 34.4 Settable combinations of the SPSLN[2:0] and SPFC[1:0] bits

Setting	SPSLN[2:0]	SPFC[1:0]	Number of frames in a single sequence	Number of frames at which transmit or receive buffer is filled
1-1	000b	00b	1	1
1-2	000b	01b	2	2
1-3	000b	10b	3	3
1-4	000b	11b	4	4
2-1	001b	01b	2	2
2-2	001b	11b	4	4
3	010b	10b	3	3
4	011b	11b	4	4
5	100b	00b	5	1
6	101b	00b	6	1
7	110b	00b	7	1
8	111b	00b	8	1

SPRDTD bit (SPI Receive/Transmit Data Select)

The SPRDTD bit selects whether the SPDR/SPDR_HA reads values from the receive buffer or from the transmit buffer.

If reading is from the transmit buffer, the last value written to the SPDR/SPDR_HA register is read. Read the transmit buffer before the writing of the number of frames set in the SPFC[1:0] bits is finished and after the generation of the transmit buffer empty interrupt (when SPSR.SPTEF is 1).

For details, see section 34.2.5, SPI Data Register (SPDR/SPDR_HA).

SPLW bit (SPI Word Access/Halfword Access Specification)

The SPLW bit specifies the access width for SPDR. Access to SPDR_HA in halfwords is valid when the SPLW bit is 0 and access to SPDR in words is valid when the SPLW bit is 1. Also, when the SPLW bit is 0, set the SPI data length setting bits, SPCMDm.SPB[3:0]), from 8 to 16 bits. Do not perform any operations when a data length of 20, 24, or 32 bits is specified.

SPBYT bit (SPI Byte Access Specification)

The SPBYT bit is used to set the data width of access to the SPI Data Register (SPDR). When SPBYT is 0, use word or half word access to SPDR. When SPBYT is 1 (SPLW is invalid), use byte access to SPDR.

When SPBYT is 1, set the SPI Data Length Setting (SPB[3:0]) bits in the SPI Command Register n (SPCMDn) to 0 bits. If SPB[3:0] are set to 9 to 16, 20, 24, or 32 bits, subsequent operation is not guaranteed.

Table 34.4 SPSLN[2:0]和SPFC[1:0]位的可设置组合

Setting	SPSLN[2:0]	SPFC[1:0]	单个序列中的帧数	填充发送或接收缓冲区的帧数
1-1	000b	00b	1	1
1-2	000b	01b	2	2
1-3	000b	10b	3	3
1-4	000b	11b	4	4
2-1	001b	01b	2	2
2-2	001b	11b	4	4
3	010b	10b	3	3
4	011b	11b	4	4
5	100b	00b	5	1
6	101b	00b	6	1
7	110b	00b	7	1
8	111b	00b	8	1

SPRDTD位（SPI接收发送数据选择）

SPRDTD位选择SPDRSPDR_HA是从接收缓冲区还是从发送缓冲区读取值。

如果从发送缓冲区读取，则读取写入SPDRSPDR_HA寄存器的最后一个值。在SPFC[1:0]位中设置的帧数写入完成之前和发送缓冲区空中断产生之后（当SPSR.SPTEF为1时）读取发送缓冲区。

有关详细信息，请参阅第34.2.5节，SPI数据寄存器(SPDRSPDR_HA)。

SPLW位（SPI字访问半字访问规范）

SPLW位指定SPDR的访问宽度。当SPLW位为0时，以半字访问SPDR_HA有效，当SPLW位为1时，以字访问SPDR有效。另外，当SPLW位为0时，设置SPI数据长度设置位，SPCMDm.SPB[3:0])，从8位到16位。当指定数据长度为20、24或32位时，请勿执行任何操作。

SPBYT位（SPI字节访问规范）

SPBYT位用于设置访问SPI数据寄存器(SPDR)的数据宽度。当SPBYT为0时，使用字或半字访问SPDR。当SPBYT为1（SPLW无效）时，使用字节访问SPDR。

当SPBYT为1时，将SPI命令寄存器n(SPCMDn)中的SPI数据长度设置(SPB[3:0])位设置为0位。
如果SPB[3:0]设置为9至16、20、24或32位，则无法保证后续操作。

34.2.10 SPI Clock Delay Register (SPCKD)

Address(es): SPI0.SPCKD 4007 200Ch, SPI1.SPCKD 4007 210Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCKDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SCKDL[2:0]	RSPCK Delay Setting	b2 b0 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SPCKD specifies the RSPCK delay, the period from the beginning of SSLni signal assertion to RSPCK oscillation, when the SPCMDm.SCKDEN bit is 1. If the contents of SPCKD are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

SCKDL[2:0] bits (RSPCK Delay Setting)

The SCKDL[2:0] bits specify an RSPCK delay value when the SPCMDm.SCKDEN bit is 1. When using the SPI in slave mode, set the SCKDL[2:0] bits to 000b.

34.2.11 SPI Slave Select Negation Delay Register (SSLND)

Address(es): SPI0.SSLND 4007 200Dh, SPI1.SSLND 4007 210Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SLNDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SLNDL[2:0]	SSL Negation Delay Setting	b2 b0 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SSLND specifies the SSL negation delay, the period from the transmission of a final RSPCK edge to the negation of the SSLni signal during a serial transfer by the SPI in master mode. If the contents of SSLND are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

SLNDL[2:0] bits (SSL Negation Delay Setting)

The SLNDL[2:0] bits specify an SSL negation delay value when the SPI is in master mode. When using the SPI in slave mode, set the SLNDL[2:0] bits to 000b.

34.2.10 SPI时钟延迟寄存器(SPCKD)

Address(es): SPI0.SPCKD 4007 200Ch, SPI1.SPCKD 4007 210Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCKDL[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	SCKDL[2:0]	RSPCK延迟设置	b2 b0 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK.	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SPCKD指定RSPCK延迟，即当SPCMDm.SCKDEN位为1时从SSLni信号断言开始到RSPCK振荡的周期。如果在SPCR.MSTR和SPCR.SPE位都为1时改变了SPCKD的内容，请执行不进行后续操作。

SCKDL[2:0]位（RSPCK延迟设置）

当SPCMDm.SCKDEN位为1时，SCKDL[2:0]位指定RSPCK延迟值。在从机模式下使用SPI时，将SCKDL[2:0]位设置为000b。

34.2.11 SPI从机选择否定延迟寄存器(SSLND)

Address(es): SPI0.SSLND 4007 200Dh, SPI1.SSLND 4007 210Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SLNDL[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	SLNDL[2:0]	SSL否定延迟设置	b2 b0 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK.	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SSLND指定SSL否定延迟，从传输最终RSPCK边缘到否定SPI在主模式下进行串行传输期间的SSLni信号。如果SSLND的内容发生更改，而SPCR.MSTR和SPCR.SPE位为1，不执行后续操作。

SLNDL[2:0]位（SSL否定延迟设置）

当SPI处于主模式时，SLNDL[2:0]位指定SSL否定延迟值。在从机模式下使用SPI时，将SLNDL[2:0]位设置为000b。

34.2.12 SPI Next-Access Delay Register (SPND)

Address(es): SPI0.SPND 4007 200Eh, SPI1.SPND 4007 210Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPNDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SPNDL[2:0]	SPI Next-Access Delay Setting	b2 b0 0 0 0: 1 RSPCK + 2 PCLKA 0 0 1: 2 RSPCK + 2 PCLKA 0 1 0: 3 RSPCK + 2 PCLKA 0 1 1: 4 RSPCK + 2 PCLKA 1 0 0: 5 RSPCK + 2 PCLKA 1 0 1: 6 RSPCK + 2 PCLKA 1 1 0: 7 RSPCK + 2 PCLKA 1 1 1: 8 RSPCK + 2 PCLKA.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SPND specifies the next-access delay, the non-active period of the SSLni signal after termination of a serial transfer, when the SPCMDm.SPNDEN bit is 1. If the contents of SPND are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

SPNDL[2:0] bits (SPI Next-Access Delay Setting)

The SPNDL[2:0] bits specify a next-access delay when the SPCMDm.SPNDEN bit is 1. When using the SPI in slave mode, set the SPNDL[2:0] bits to 000b.

34.2.13 SPI Control Register 2 (SPCR2)

Address(es): SPI0.SPCR2 4007 200Fh, SPI1.SPCR2 4007 210Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SCKASE	PTE	SPIIE	SPOE	SPPE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SPPE	Parity Enable	0: No parity bit added to transmit data and parity bit of receive data not checked 1: When SPCR.TXMD = 0, parity bit added to transmit data and parity bit of receive data checked When SPCR.TXMD = 1, parity bit added to transmit data but parity bit of receive data not checked.	R/W
b1	SPOE	Parity Mode	0: Even parity selected for transmission and reception 1: Odd parity selected for transmission and reception.	R/W
b2	SPIIE	SPI Idle Interrupt Enable	0: Idle interrupt requests disabled 1: Idle interrupt requests enabled.	R/W
b3	PTE	Parity Self-Testing	0: Self-diagnosis function of the parity circuit disabled 1: Self-diagnosis function of the parity circuit enabled.	R/W
b4	SCKASE	RSPCK Auto-Stop Function Enable	0: RSPCK auto-stop function disabled 1: RSPCK auto-stop function enabled.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

If the SPPE, SPOE, or SCKASE bit in SPCR2 is changed while the SPCR.SPE bit is 1, do not perform subsequent operations.

34.2.12 SPI下一次访问延迟寄存器(SPND)

Address(es): SPI0.SPND 4007 200Eh, SPI1.SPND 4007 210Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPNDL[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	SPNDL[2:0]	SPI下一次访问延迟设置	b2 b0 0 0 0: 1 RSPCK + 2 PCLKA 0 0 1: 2 RSPCK + 2 PCLKA 0 1 0: 3 RSPCK + 2 PCLKA 0 1 1: 4 RSPCK + 2 PCLKA 1 0 0: 5 RSPCK + 2 PCLKA 1 0 1: 6 RSPCK + 2 PCLKA 1 1 0: 7 RSPCK + 2 PCLKA 1 1 1: 8 RSPCK + 2 PCLKA.	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

当SPCMDm.SPNDEN位为1时，SPND指定下一次访问延迟，即串行传输终止后SSLni信号的非活动周期。如果在SPCR.MSTR和SPCR.SPE都更改了SPND的内容位为1，不执行后续操作。

SPNDL[2:0]位（SPI下一次访问延迟设置）

当SPMDm.SPNDEN位为1时，SPNDL[2:0]位指定下一次访问延迟。在从机模式下使用SPI时，将SPNDL[2:0]位设置为000b。

34.2.13 SPI控制寄存器2(SPCR2)

Address(es): SPI0.SPCR2 4007 200Fh, SPI1.SPCR2 4007 210Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SCKASE	PTE	SPIIE	SPOE	SPPE
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SPPE	奇偶校验使能	0：发送数据不添加奇偶校验位，接收数据不检查奇偶校验位1：当SPCR.TXMD=0时，发送数据添加奇偶校验位，接收数据检查奇偶校验位当SPCR.TXMD=1时，奇偶校验位添加到发送数据但未检查接收数据的奇偶校验位。	R/W
b1	SPOE	奇偶校验模式	0：发送和接收选择偶校验1：发送和接收选择奇校验。	R/W
b2	SPIIE	SPI空闲中断使能	0：禁止空闲中断请求1：允许空闲中断请求。	R/W
b3	PTE	Parity Self-Testing	0：奇偶电路自诊断功能无效1：奇偶电路自诊断功能有效。	R/W
b4	SCKASE	RSPCK Auto-Stop Function Enable	0：RSPCK自动停机功能无效1：RSPCK自动停机功能有效。	R/W
b7 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

如果SPCR.SPE位为1时SPCR2中的SPPE、SPOE或SCKASE位发生变化，则不要执行后续操作。

SPPE bit (Parity Enable)

The SPPE bit enables or disables the parity function.

When the SPCR.TXMD bit is 0 and this bit is 1, the parity bit is added to transmit data and parity checking is performed for receive data.

When the SPCR.TXMD bit is 1 and this bit is 1, the parity bit is added to transmit data but parity checking is not performed for receive data.

SPOE bit (Parity Mode)

The SPOE bit specifies odd or even parity.

When even parity is set, parity bit addition is performed so that the total number of bits whose value is 1 in the transmit or receive character plus the parity bit is even. Similarly, when odd parity is set, parity bit addition is performed so that the total number of bits whose value is 1 in the transmit or receive character plus the parity bit is odd.

The SPOE bit is only valid when the SPPE bit is 1.

SPIIE bit (SPI Idle Interrupt Enable)

The SPIIE bit enables or disables the generation of SPI idle interrupt requests when an idle state is detected in the SPI and the SPSR.IDLNF flag is set to 0.

PTE bit (Parity Self-Testing)

The PTE bit enables self-diagnosis of the parity circuit to check whether the parity function is operating correctly.

SCKASE bit (RSPCK Auto-Stop Function Enable)

The SCKASE bit enables or disables the RSPCK auto-stop function. When this function is enabled, the RSPCK clock is stopped before an overrun error occurs, when data is received in master mode. For details, see section 34.3.8.1, Overrun errors.

34.2.14 SPI Command Registers 0 to 7 (SPCMD0 to SPCMD7)

Address(es): SPI0.SPCMD0 4007 2010h, SPI0.SPCMD1 4007 2012h, SPI0.SPCMD2 4007 2014h, SPI0.SPCMD3 4007 2016h, SPI0.SPCMD4 4007 2018h, SPI0.SPCMD5 4007 201Ah, SPI0.SPCMD6 4007 201Ch, SPI0.SPCMD7 4007 201Eh, SPI1.SPCMD0 4007 2110h, SPI1.SPCMD1 4007 2112h, SPI1.SPCMD2 4007 2114h, SPI1.SPCMD3 4007 2116h, SPI1.SPCMD4 4007 2118h, SPI1.SPCMD5 4007 211Ah, SPI1.SPCMD6 4007 211Ch, SPI1.SPCMD7 4007 211Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SCKDEN	SLNDEN	SPNDEN	LSBF	SPB[3:0]				SSLKP	SSLA[2:0]			BRDV[1:0]		CPOL	CPHA
Value after reset:	0	0	0	0	0	1	1	1	0	0	0	0	1	1	0	1

Bit	Symbol	Bit name	Description	R/W
b0	CPHA	RSPCK Phase Setting	0: Select data sampling on leading edge, data change on trailing edge 1: Select data change on leading edge, data sampling on trailing edge.	R/W
b1	CPOL	RSPCK Polarity Setting	0: Set RSPCK low when idle 1: Set RSPCK high when idle.	R/W
b3, b2	BRDV[1:0]	Bit Rate Division Setting	b3 b2 0 0: Select the base bit rate 0 1: Select the base bit rate divided by 2 1 0: Select the base bit rate divided by 4 1 1: Select the base bit rate divided by 8.	R/W

SPPE位（奇偶校验使能）

SPPE位启用或禁用奇偶校验功能。

当SPCR.TXMD位为0且该位为1时，发送数据添加奇偶校验位，接收数据执行奇偶校验。

当SPCR.TXMD位为1且该位为1时，发送数据添加奇偶校验位，但接收数据不执行奇偶校验。

SPOE位（奇偶校验模式）

SPOE位指定奇校验或偶校验。

当设置了偶校验时，执行奇偶校验位相加，以使发送或接收字符中值为1的总位数加上奇偶校验位为偶数。类似地，当设置奇校验时，执行校验位相加，使得发送或接收字符中值为1的位加上奇偶校验位的总数为奇数。

SPOE位仅在SPPE位为1时有效。

SPIIE位（SPI空闲中断使能）

当在SPI中检测到空闲状态并且SPSR.IDLNF标志设置为0时，SPIIE位启用或禁用SPI空闲中断请求的生成。

PTE位（奇偶自检）

PTE位启用奇偶校验电路的自诊断，以检查奇偶校验功能是否正常运行。

SCKASE位（RSPCK自动停止功能使能）

SCKASE位启用或禁用RSPCK自动停止功能。启用此功能后，在主机模式下接收数据时，RSPCK时钟会在发生溢出错误之前停止。有关详细信息，请参阅第34.3.8.1节，溢出错误。

34.2.14 SPI命令寄存器0到7(SPCMD0到SPCMD7)

Address(es): SPI0.SPCMD0 4007 2010h, SPI0.SPCMD1 4007 2012h, SPI0.SPCMD2 4007 2014h, SPI0.SPCMD3 4007 2016h, SPI0.SPCMD4 4007 2018h, SPI0.SPCMD5 4007 201Ah, SPI0.SPCMD6 4007 201Ch, SPI0.SPCMD7 4007 201Eh, SPI1.SPCMD0 4007 2110h, SPI1.SPCMD1 4007 2112h, SPI1.SPCMD2 4007 2114h, SPI1.SPCMD3 4007 2116h, SPI1.SPCMD4 4007 2118h, SPI1.SPCMD5 4007 211Ah, SPI1.SPCMD6 4007 211Ch, SPI1.SPCMD7 4007 211Eh

b13	SPNDEN	SPI Next-Access Delay Enable	0: Select next-access delay of 1 RSPCK + 2 PCLKA 1: Select next-access delay equal to the setting in the SPI Next-Access Delay Register (SPND).	R/W
b14	SLNDEN	SSL Negation Delay Setting Enable	0: Select SSL negation delay of 1 RSPCK 1: Select SSL negation delay equal to the setting in the SPI Slave Select Negation Delay register (SSLND).	R/W
b15	SCKDEN	RSPCK Delay Setting Enable	0: Select RSPCK delay of 1 RSPCK 1: Select RSPCK delay equal to the setting in the SPI Clock Delay register (SPCKD).	R/W

The SPCMDm registers specify the transfer format for the SPI in master mode. Each SPI channel has eight SPI Command registers (SPCMD0 to SPCMD7). Some of the bits in the SPCMD0 register are used to set the transfer mode for the SPI in slave mode. The SPI in master mode sequentially references the SPCMDm registers based on the settings in the SPSCR.SPSLN[2:0] bits and executes the serial transfer that is set in the referenced SPCMDm register.

Set the SPCMDm registers while the transmit buffer is empty (SPSR.SPTEF is 1 and the data for the next transfer is not set), and before the setting of the data to be transmitted when that SPCMDm register is referenced.

The SPCMDm register referenced by the SPI in master mode can be checked with the SPSSR.SPCP[2:0] bits. If the contents of SPCMDm are changed while the SPCR.MSTR bit is 0 and the SPCR.SPE bit is 1, do not perform subsequent operations.

CPHA bit (RSPCK Phase Setting)

The CPHA bit selects the RSPCK phase of the SPI in master or slave mode. Data communications between SPI modules require the same RSPCK phase setting between the modules.

CPOL bit (RSPCK Polarity Setting)

The CPOL bit selects the RSPCK polarity of the SPI in master or slave mode. Data communications between SPI modules require the same RSPCK polarity setting between the modules.

BRDV[1:0] bits (Bit Rate Division Setting)

The BRDV[1:0] bits determine the bit rate by combination of the settings in the BRDV[1:0] bits and the SPBR register (see section 34.2.8, SPI Bit Rate Register (SPBR)). The SPBR settings determine the base bit rate. The BRDV[1:0] settings select a bit rate obtained by dividing the base bit rate by 1, 2, 4, or 8. Different BRDV[1:0] bit settings can be specified in the SPCMDm registers, enabling the execution of serial transfers at a different bit rate for each command.

SSLA[2:0] bits (SSL Signal Assertion Setting)

The SSLA[2:0] bits control the SSLni signal assertion when the SPI performs serial transfers in master mode. When an SSLni signal is asserted, its polarity is determined by the value set in the associated SSLP. When the SSLA[2:0] bits are set to 000b in multi-master mode, serial transfers are performed with all the SSL signals in the negated state, as the SSLn0 pin acts as input. When using the SPI in slave mode, set the SSLA[2:0] bits to 000b.

Bit	Symbol	位名称	Description	R/W
b7	SSLKP	SSL信号电平保持	0：在传输完成时否定所有SSL信号1：从传输结束到下一次访问开始时保持SSL信号电平。	R/W
b11 to b8	SPB[3:0]	SPI数据长度设置	b11b80100至0111：8位1000：9位1001：10位1010：11位1011：12位1100：13位1101：14位1110：15位1111：16位0000：20位0001：24位0010、0011：32位。	R/W
b12	LSBF	SPILSB优先	0: MSB-first 1: LSB-first.	R/W
b13	SPNDEN	SPI下一次访问延迟Enable	0：选择下一次访问延迟1RSPCK+2PCLKA1：选择下一次访问延迟等于SPI下一次访问延迟寄存器(SPND)中的设置。	R/W
b14	SLNDEN	SSL否定延迟设置Enable	0：选择SSL否定延迟为1RSPCK1：选择SSL否定延迟等于SPI从器件选择否定延迟寄存器(SSLND)中的设置。	R/W
b15	SCKDEN	RSPCK延迟设置启用	0：选择RSPCK延迟为1RSPCK1：选择RSPCK延迟等于SPI时钟延迟寄存器(SPCKD)中的设置。	R/W

SPCMDm寄存器指定主模式下SPI的传输格式。每个SPI通道有8个SPI命令寄存器（SPCMD0到SPCMD7）。SPCMD0寄存器中的一些位用于设置SPI在从机模式下的传输模式。主模式下的SPI根据SPSCR.SPSLN[2:0]位中的设置顺序引用SPCMDm寄存器，并执行在引用的SPCMDm寄存器中设置的串行传输。

在发送缓冲区为空时（SPSR.SPTEF为1，未设置下一次传输的数据）设置SPCMDm寄存器，并且在设置要发送的数据之前，当引用该SPCMDm寄存器时。

SPI在主模式下引用的SPCMDm寄存器可以通过SPSSR.SPCP[2:0]位进行检查。如果在SPCR.MSTR位为0且SPCR.SPE位为1时改变了SPCMDm的内容，则不要执行后续操作。

CPHA位（RSPCK相位设置）

CPHA位在主模式或从模式下选择SPI的RSPCK相位。SPI模块之间的数据通信需要模块之间相同的RSPCK相位设置。

CPOL位（RSPCK极性设置）

CPOL位在主模式或从模式下选择SPI的RSPCK极性。SPI模块之间的数据通信要求模块之间的RSPCK极性设置相同。

BRDV[1:0]位（比特率划分设置）

BRDV[1:0]位通过组合BRDV[1:0]位和SPBR寄存器中的设置来确定比特率（参见第34.2.8节，SPI比特率寄存器(SPBR)）。SPBR设置决定了基本比特率。BRDV[1:0]设置选择通过将基本比特率除以1、2、4或8获得的比特率。可以在SPCMDm寄存器中指定不同的BRDV[1:0]位设置，从而可以执行每个命令以不同的比特率进行串行传输。

SSLA[2:0]位（SSL信号断言设置）

当SPI在主模式下执行串行传输时，SSLA[2:0]位控制SSLni信号断言。当SSLni信号被置位时，其极性由相关SSLP中设置的值确定。当SSLA[2:0]位在多主机模式下设置为000b时，所有SSL信号都在否定状态下执行串行传输，因为SSLn0引脚用作输入。在从机模式下使用SPI时，将SSLA[2:0]位设置为000b。

SSLKP bit (SSL Signal Level Keeping)

When the SPI in master mode performs a serial transfer, the SSLKP bit specifies whether the SSLni signal level for the current command is to be kept or negated between the SSL negation associated with the current command and the SSL assertion timing associated with the next command.

Setting the SSLKP bit to 1 enables a burst transfer. For details, see (4) Burst transfers in section 34.3.10.1, Master mode operation. When using the SPI in slave mode, set the SSLKP bit to 0.

SPB[3:0] bits (SPI Data Length Setting)

The SPB[3:0] bits specify the transfer data length for the SPI in master or slave mode. When the SPLW bit is 0, set these bits from 8 to 16 bits.

LSBF bit (SPI LSB First)

The LSBF bit specifies the data format of the SPI in master or slave mode to MSB-first or LSB-first.

SPNDEN bit (SPI Next-Access Delay Enable)

The SPNDEN bit specifies the next-access delay, the period from the time the SPI in master mode terminates a serial transfer and sets the SSLni signal inactive until the SPI enables the SSLni signal assertion for the next access. If the SPNDEN bit is 0, the SPI sets the next-access delay to 1 RSPCK + 2 PCLKA. If the SPNDEN bit is 1, the SPI inserts a next-access delay in accordance with the SPND setting.

When using the SPI in slave mode, set the SPNDEN bit to 0.

SLNDEN bit (SSL Negation Delay Setting Enable)

The SLNDEN bit specifies the SSL negation delay, the period from the time the SPI in master mode stops RSPCK oscillation until the SPI sets the SSLni signal to inactive. If the SLNDEN bit is 0, the SPI sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, the SPI negates the SSL signal at an SSL negation delay according to the SSLND setting.

When using the SPI in slave mode, set the SLNDEN bit to 0.

SCKDEN bit (RSPCK Delay Setting Enable)

The SCKDEN bit specifies the SPI clock delay, the period from the point when the SPI in master mode asserts the SSLni signal until the RSPCK starts oscillation (SPI clock delay). If the SCKDEN bit is 0, the SPI sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, the SPI starts the oscillation of RSPCK at an RSPCK delay according to the SPCKD setting.

When using the SPI in slave mode, set the SCKDEN bit to 0.

34.2.15 SPI Data Control Register 2 (SPDCR2)

Address(es): SPI0.SPDCR2 4007 2020h, SPI1.SPDCR2 4007 2120h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BYSW
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BYSW	Byte Swap Operating Mode Select	0: Byte swap off 1: Byte swap on.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SPI Data Control Register 2 (SPDCR2) swaps the transmit or receive data in byte units. When transmit buffer data is copied to a shift register, it is swapped in byte units. When shift register data is copied to a receive buffer, it is swapped in byte units.

SSLKP位（SSL信号电平保持）

当主模式的SPI执行串行传输时，SSLKP位指定当前命令的SSLni信号电平是在与当前命令关联的SSL否定和与下一个命令关联的SSL断言时序之间保持还是否定。

将SSLKP位设置为1可启用突发传输。有关详细信息，请参阅第34.3.10.1节，主模式操作中的(4)突发传输。在从机模式下使用SPI时，将SSLKP位设置为0。

SPB[3:0]位（SPI数据长度设置）

SPB[3:0]位指定SPI在主模式或从模式下的传输数据长度。当SPLW位为0时，将这些位设置为8至16位。

LSBF位（SPILSB优先）

LSBF位指定SPI在主模式或从模式下的数据格式为MSB优先或LSB优先。

SPNDEN位（SPI下一次访问延迟使能）

SPNDEN位指定下一次访问延迟，即从主模式下的SPI终止串行传输并将SSLni信号设置为无效到SPI为下一次访问启用SSLni信号断言的时间段。如果SPNDEN位为0，则SPI将下一次访问延迟设置为1RSPCK+2PCLKA。如果SPNDEN位为1，则SPI根据SPND设置插入下一次访问延迟。

在从机模式下使用SPI时，将SPNDEN位设置为0。

SLNDEN位（SSL否定延迟设置启用）

SLNDEN位指定SSL否定延迟，即从主模式下的SPI停止RSPCK振荡到SPI将SSLni信号设置为无效的时间段。如果SLNDEN位为0，则SPI将SSL否定延迟设置为1RSPCK。如果SLNDEN位为1，则SPI根据SSLND设置以SSL否定延迟否定SSL信号。

在从机模式下使用SPI时，将SLNDEN位设置为0。

SCKDEN位（RSPCK延迟设置使能）

SCKDEN位指定SPI时钟延迟，即从主模式下的SPI断言SSLni信号到RSPCK开始振荡的时间段（SPI时钟延迟）。如果SCKDEN位为0，则SPI将RSPCK延迟设置为1RSPCK。如果SCKDEN位为1，则SPI根据SPCKD设置以RSPCK延迟启动RSPCK的振荡。

在从机模式下使用SPI时，将SCKDEN位设置为0。

34.2.15 SPI数据控制寄存器2(SPDCR2)

Address(es): SPI0.SPDCR2 4007 2020h, SPI1.SPDCR2 4007 2120h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BYSW
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	BYSW	字节交换操作模式选择	0：字节交换关闭1 ：字节交换打开。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SPI数据控制寄存器2(SPDCR2)以字节为单位交换发送或接收数据。当发送缓冲区数据被复制到移位寄存器时，它以字节为单位进行交换。当移位寄存器数据被复制到接收缓冲区时，它以字节为单位进行交换。

BYSW bit (Byte Swap Operating Mode Select)

The BYSW bit swaps the transmit or receive data in byte units. When byte access is valid (SPDCR.SPBYT = 1), byte swap is invalid. When byte swap is valid, parity function is invalid (SPCR2.SPPE bit = 0). The BYSW bit can only be changed when the SPCR.SPE bit is 0.

Data after byte swap is different depending on the data length (setting of SPCMD.SPB[3:0]).

At byte swap, the data length must be set to 32 bits or 16 bits. If data length is set to other values such as 8 to 15, 20, 24 bit length, byte swap is not guaranteed. Before swap and after swap (data length is 32 bits or 16 bits), the values are as shown:

- For data length of 32 bits (SPB[3:0] = 0010 or 0011)

  Before swap: [31:24] [23:16] [15:8] [7:0]

  After swap: [7:0] [15:8] [23:16] [31:24]
- For data length data of 16 bits (SPB[3:0] = 1111)

  Before swap: [31:24] [23:16]

  After swap: [23:16] [31:24].

In byte access mode (SPDCR.SPBT = 1), byte swap setting is invalid.

When byte swap is valid, set the parity function to invalid (SPCR2.SPPE = 0). When the parity function is set to valid, the behavior is not guaranteed.

34.3 Operation

In this section, the *serial transfer period* refers to the period from the beginning of driving valid data to the fetching of the final valid data.

34.3.1 Overview of SPI Operation

The SPI is capable of synchronous serial transfers in the following modes:

- Slave mode (SPI operation)
- Single-master mode (SPI operation)
- Multi-master mode (SPI operation)
- Slave mode (clock synchronous operation)
- Master mode (clock synchronous operation).

The SPI mode can be selected with the MSTR, MODFEN, and SPMS bits in SPCR. Table 34.5 lists the relationship between the SPI modes and SPCR settings, and a description of each mode.

Table 34.5 Relationship between SPCR settings and SPI modes (1 of 2)

Mode	Slave (SPI operation)	Single-master (SPI operation)	Multi-master (SPI operation)	Slave (clock synchronous operation)	Master (clock synchronous operation)
MSTR bit setting	0	1	1	0	1
MODFEN bit setting	0 or 1	0	1	0	0
SPMS bit setting	0	0	0	1	1
RSPCKn signal	Input	Output	Output/Hi-Z	Input	Output
MOSIn signal	Input	Output	Output/Hi-Z	Input	Output
MISOn signal	Output/Hi-Z	Input	Input	Output	Input
SSLn0 signal	Input	Output	Input	Hi-Z*1	Hi-Z*1
SSLn1 to SSLn3 signals	Hi-Z*1	Output	Output/Hi-Z	Hi-Z*1	Hi-Z*1

BYSW位（字节交换操作模式选择）

BYSW位以字节为单位交换发送或接收数据。当字节访问有效时（SPDCR.SPBYT=1），字节交换无效。当字节交换有效时，奇偶校验功能无效（SPCR2.SPPE位=0）。BYSW位只能在SPCR.SPE位为0时更改。

字节交换后的数据因数据长度而异（SPCMD.SPB[3:0]的设置）。

在字节交换时，数据长度必须设置为32位或16位。如果数据长度设置为其他值，例如8到15、20、24位长度，则不保证字节交换。交换前和交换后（数据长度为32位或16位），取值如下：

- 对于32位的数据长度（SPB[3:0]=0010或0011）

  Before swap: [31:24] [23:16] [15:8] [7:0]

  After swap: [7:0] [15:8] [23:16] [31:24]
- 对于16位数据长度数据(SPB[3:0]=1111)

  Before swap: [31:24] [23:16]

  After swap: [23:16] [31:24].

在字节访问模式下（SPDCR.SPBT=1），字节交换设置无效。

当字节交换有效时，将奇偶校验功能设置为无效（SPCR2.SPPE=0）。当奇偶校验函数设置为有效时，不能保证行为。

34.3 Operation

在本节中，串行传输周期是指从开始驱动有效数据到获取最终有效数据的周期。

34.3.1 SPI操作概述

SPI能够在以下模式下进行同步串行传输：

- 从机模式（SPI操作）
- Single-master mode (SPI operation)
- Multi-master mode (SPI operation)
- 从机模式（时钟同步操作）
- 主模式（时钟同步操作）。

SPI模式可以通过SPCR中的MSTR、MODFEN和SPMS位进行选择。表34.5列出了SPI模式和SPCR设置之间的关系，以及每种模式的说明。

Table 34.5 SPCR设置和SPI模式之间的关系(1of2)

Mode	Slave (SPI operation)	Single-master (SPI operation)	Multi-master (SPI operation)	从机（时钟同步操作）	主控（时钟同步操作）
MSTR位设置	0	1	1	0	1
MODFEN位设置	0 or 1	0	1	0	0
SPMS位设置	0	0	0	1	1
RSPCKn signal	Input	Output	Output/Hi-Z	Input	Output
MOSIn signal	Input	Output	Output/Hi-Z	Input	Output
MISOn signal	Output/Hi-Z	Input	Input	Output	Input
SSLn0 signal	Input	Output	Input	Hi-Z*1	Hi-Z*1
SSLn1到SSLn3信号	Hi-Z*1	Output	Output/Hi-Z	Hi-Z*1	Hi-Z*1

Table 34.5 Relationship between SPCR settings and SPI modes (2 of 2)

Mode	Slave (SPI operation)	Single-master (SPI operation)	Multi-master (SPI operation)	Slave (clock synchronous operation)	Master (clock synchronous operation)
SSL polarity change function	Supported	Supported	Supported	-	-
Max transfer rate	PCLKA/4	PCLKA/2	PCLKA/2	PCLKA/4	PCLKA/2
Clock source	RSPCKn input	On-chip baud rate generator	On-chip baud rate generator	RSPCKn input	On-chip baud rate generator
Clock polarity	Two				
Clock phase	Two	Two	Two	One (CPHA = 1)	Two
First transfer bit	MSB/LSB				
Transfer data length	8 to 16, 20, 24, 32 bits				
Burst transfer	Possible (CPHA = 1)	Possible (CPHA = 0,1)	Possible (CPHA = 0,1)	-	-
RSPCK delay control	Not supported	Supported	Supported	Not supported	Supported
SSL negation delay control	Not supported	Supported	Supported	Not supported	Supported
Next-access delay control	Not supported	Supported	Supported	Not supported	Supported
Transfer trigger	SSL input active or RSPCK oscillation	Write to transmit buffer on generation of a transmit buffer empty interrupt request (SPTEF = 1)	Write to transmit buffer on generation of a transmit buffer empty interrupt request (SPTEF = 1)	RSPCK oscillation	Write to transmit buffer on generation of a transmit buffer empty interrupt request (SPTEF = 1)
Sequence control	Not supported	Supported	Supported	Not supported	Supported
Transmit buffer empty detection	Supported				
Receive buffer full detection	Supported*2				
Overrun error detection	Supported*2	Supported*2, *4	Supported*2, *4	Supported*2	Supported*2
Parity error detection	Supported*2,*3				
Mode fault error detection	Supported (MODFEN = 1)	Not supported	Supported	Not supported	Not supported
Underrun error detection	Supported	Not supported	Not supported	Supported	Not supported

Note 1. This function is not supported in this mode.
Note 2. When the SPCR.TXMD bit is 1, detection of receiver buffer full, overrun error, and parity error is not performed.
Note 3. When the SPCR2.SPPE bit is 0, parity error detection is not performed.
Note 4. When the SPCR2.SCKASE bit is 1, overrun error detection does not proceed.

34.3.2 Controlling the SPI Pins

The SPI can switch pin states based on the MSTR, MODFEN, and SPMS bit settings in SPCR and the PmnPFS.NCODR bit for the I/O ports. Table 34.6 lists the relationship between the pin states and bit settings. Setting the PmnPFS.NCODR bit for an I/O port to 0 selects the CMOS output. Setting it to 1 selects the open-drain output. The I/O port settings must follow this relationship.

Table 34.5 SPCR设置和SPI模式之间的关系(2of2)

Mode	Slave (SPI operation)	Single-master (SPI operation)	Multi-master (SPI operation)	从机（时钟同步操作）	主控（时钟同步操作）
SSL极性改变功能	Supported	Supported	Supported	-	-
最大传输率	PCLKA/4	PCLKA/2	PCLKA/2	PCLKA/4	PCLKA/2
时钟源	RSPCKn input	片上波特率发生器	片上波特率发生器	RSPCKn input	片上波特率发生器
时钟极性	Two				
时钟相位	Two	Two	Two	One (CPHA = 1)	Two
第一个传输位	MSB/LSB				
传输数据长度	8至16、20、24、32位				
突发传输	Possible (CPHA = 1)	Possible (CPHA = 0,1)	Possible (CPHA = 0,1)	-	-
RSPCK延迟控制	不支持	Supported	Supported	不支持	Supported
SSL否定延迟控制	不支持	Supported	Supported	不支持	Supported
下一次访问延迟控制	不支持	Supported	Supported	不支持	Supported
转移触发	SSL输入有效或RSPCK振荡	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)	RSPCK oscillation	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)
顺序控制	不支持	Supported	Supported	不支持	Supported
发送缓冲区空检测	Supported				
接收缓冲区满检测	Supported*2				
溢出错误检测	Supported*2	Supported*2, *4	Supported*2, *4	Supported*2	Supported*2
奇偶校验错误检测	Supported*2,*3				
模式故障错误检测	Supported (MODFEN = 1)	不支持	Supported	不支持	不支持
欠载错误检测	Supported	不支持	不支持	Supported	不支持

Note 1. 此模式不支持此功能。
Note 2. 当SPCR.TXMD位为1时，不执行接收缓冲器满、溢出错误和奇偶校验错误的检测。
Note 3. 当SPCR2.SPPE位为0时，不执行奇偶校验错误检测。
Note 4. 当SPCR2.SCKASE位为1时，不进行溢出错误检测。

34.3.2 控制SPI引脚

SPI可以根据SPCR中的MSTR、MODFEN和SPMS位设置以及IO端口的PmnPFS.NCODR位来切换引脚状态。表34.6列出了引脚状态和位设置之间的关系。将IO端口的PmnPFS.NCODR位设置为0可选择CMOS输出。将其设置为1选择开漏输出。IO端口设置必须遵循这种关系。

Table 34.6 Relationship between pin states and bit settings

Mode	Pin	Pin state*2	
		PmnPFS.NCODR bit for I/O ports = 0	PmnPFS.NCODR bit for I/O ports = 1
Single-master mode (SPI operation) (MSTR = 1, MODFEN = 0, SPMS = 0)	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3	CMOS output	Open-drain output
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Multi-master mode (SPI operation) (MSTR = 1, MODFEN = 1, SPMS = 0)	RSPCKn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	SSLn0	Input	Input
	SSLn1 to SSLn3*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MOSIn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MISOn	Input	Input
Slave mode (SPI operation) (MSTR = 0, SPMS = 0)	RSPCKn	Input	Input
	SSLn0	Input	Input
	SSLn1 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn*4	CMOS output/Hi-Z	Open-drain output/Hi-Z
Master mode (clock synchronous operation) (MSTR = 1, MODFEN = 0, SPMS = 1)	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Slave mode (clock synchronous operation) (MSTR = 0, SPMS = 1)	RSPCKn	Input	Input
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn	CMOS output	Open-drain output

Note 1. This function is not supported in this mode.
Note 2. SPI settings are not reflected in multiplexed pins for which the SPI function is not selected.
Note 3. When SSLn0 is at the active level, the pin state is Hi-Z.
Note 4. When SSLn0 is at the non-active level or the SPCR.SPE bit is 0, the pin state is Hi-Z.
Note 5. These pins are available for use as I/O port pins.

The SPI in single-master (SPI operation) or multi-master mode (SPI operation) determines the MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) based on the MOIFE and MOIFV bit settings in SPPCR, as listed in Table 34.7.

Table 34.7 MOSI signal value determination during SSL negation period

MOIFE bit	MOIFV bit	MOSIn signal value during SSL negation period
0	0, 1	Final data from previous transfer
1	0	Low
1	1	High

34.3.3 SPI System Configuration Examples

34.3.3.1 Single master and single slave with the MCU as a master

Figure 34.5 shows a single-master and single-slave SPI system configuration example where the MCU is a master. In the single-master/single-slave configuration, the SSLn0 to SSLn3 outputs of the MCU (master) are not used. The SSL input of the SPI slave is fixed to the low level, and the SPI slave stays selected.*1

The MCU (master) drives the RSPCKn and MOSIn signals. The SPI slave drives the MISO signal.

Table 34.6 引脚状态和位设置之间的关系

Mode	Pin	Pin state*2	
		IO端口的PmnPFS.NCODR位=0	IO端口的PmnPFS.NCODR位=1
Single-master mode (SPI operation) (MSTR = 1, MODFEN = 0, SPMS = 0)	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3	CMOS output	Open-drain output
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Multi-master mode (SPI operation) (MSTR = 1, MODFEN = 1, SPMS = 0)	RSPCKn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	SSLn0	Input	Input
	SSLn1 to SSLn3*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MOSIn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MISOn	Input	Input
从机模式（SPI操作）（MSTR=0，SPMS=0）	RSPCKn	Input	Input
	SSLn0	Input	Input
	SSLn1 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn*4	CMOS output/Hi-Z	Open-drain output/Hi-Z
主模式（时钟同步操作）（MSTR=1，MODFEN=0，SPMS=1）	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
从机模式（时钟同步操作）（MSTR=0，SPMS=1）	RSPCKn	Input	Input
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn	CMOS output	Open-drain output

Note 1. 此模式不支持此功能。
Note 2. SPI设置不会反映在未选择SPI功能的复用引脚中。
Note 3. 当SSLn0处于有效电平时，引脚状态为Hi-Z。
Note 4. 当SSLn0处于非活动电平或SPCR.SPE位为0时，引脚状态为Hi-Z。
Note 5. 这些引脚可用作IO端口引脚。

单主机（SPI操作）或多主机模式（SPI操作）的SPI根据SPPCR中的MOIFE和MOIFV位设置确定SSL否定期间（包括突发传输期间的SSL保留期间）的MOSI信号值，如表34.7所列。

Table 34.7 SSL否定期间的MOSI信号值确定

MOIFE bit	MOIFV bit	SSL否定期间的MOSIn信号值
0	0, 1	上次传输的最终数据
1	0	Low
1	1	High

34.3.3 SPI系统配置示例

34.3.3.1 单主单从，单片机为主

图34.5显示了单主单从SPI系统配置示例，其中MCU为主。在单主单从配置中，不使用MCU（主）的SSLn0到SSLn3输出。SPI从机的SSL输入固定为低电平，SPI从机保持选中状态。*1

MCU（主控）驱动RSPCKn和MOSIn信号。SPI从机驱动MISO信号。

RA生态工作室

Note 1. In the transfer format used when the SPCMDm.CPHA bit is 0, the SSL signal for some slave devices cannot be fixed to an active level. In this case, always connect the SSLni output of the MCU to the SSL input of the slave device.

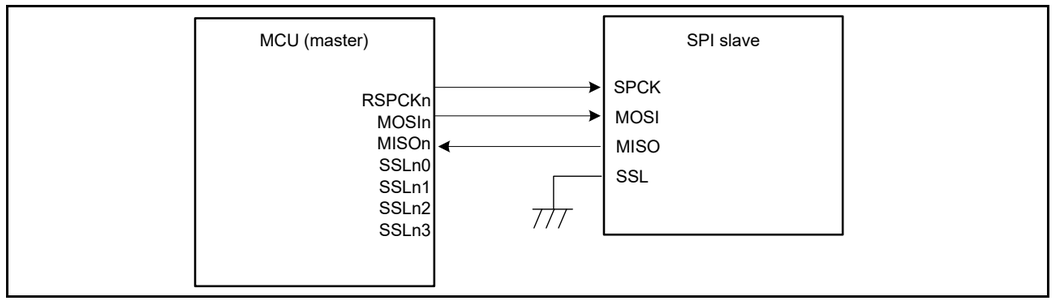

Figure 34.5 Single-master/single-slave configuration example with the MCU as a master

34.3.3.2 Single master and single slave with the MCU as a slave

Figure 34.6 shows a single-master and single-slave SPI system configuration example where the MCU is a slave. When the MCU operates as a slave, the SSLn0 pin is used as SSL input. The SPI master drives the RSPCK and MOSI signals. The MCU (slave) drives the MISOn signal.*1

In the single-slave configuration when the SPCMDm.CPHA bit is set to 1, the SSLn0 input of the MCU (slave) is fixed to the low level and the MCU (slave) stays selected. This enables serial transfer execution (Figure 34.7).

Note 1. When SSLn0 is at a non-active level, the pin state is Hi-Z.

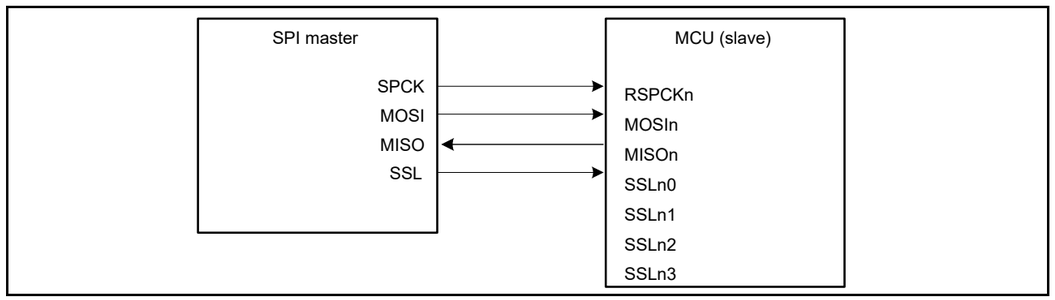

Figure 34.6 Single-master/single-slave configuration example with the MCU as a slave and CPHA = 0

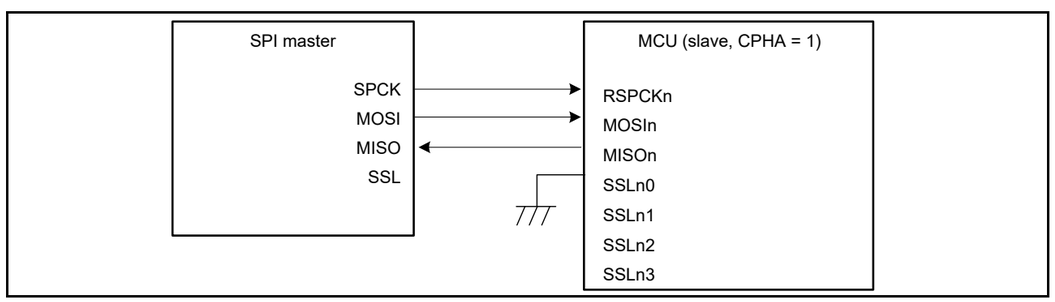

Figure 34.7 Single-master/single-slave configuration example with the MCU as a slave and CPHA = 1

注1.在SPCMDm.CPHA位为0时使用的传输格式中，某些从设备的SSL信号不能固定为有效电平。在这种情况下，请始终将MCU的SSLni输出连接到从设备的SSL输入。

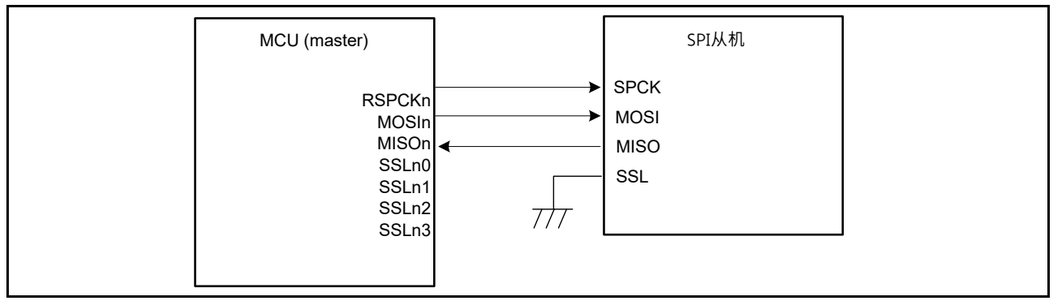

Figure 34.5 MCU为主的单主单从配置示例

34.3.3.2 单主单从单片机作为从机

图34.6显示了单主单从SPI系统配置示例，其中MCU是从设备。当MCU作为从机运行时，SSLn0引脚用作SSL输入。SPI主机驱动RSPCK和MOSI信号。MCU（从机）驱动MIOn信号。*1

在单从配置中，当SPCMDm.CPHA位设置为1时，MCU（从）的SSLn0输入固定为低电平，MCU（从）保持选择状态。这将启用串行传输执行（图34.7）。

注1.当SSLn0处于非活动电平时，引脚状态为Hi-Z。

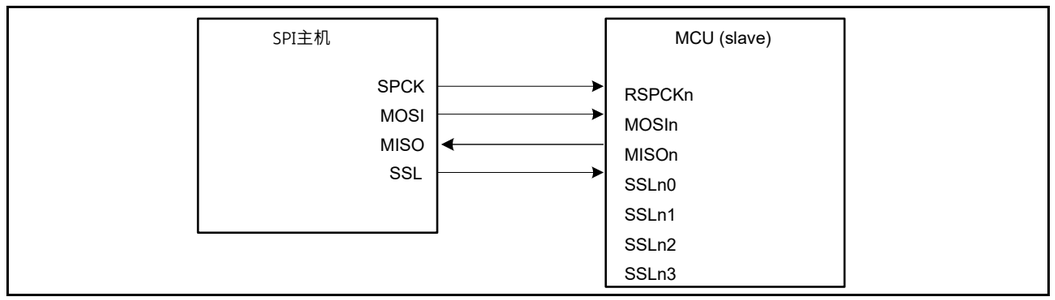

Figure 34.6 单主单从配置示例，单片机作为从机，CPHA=0

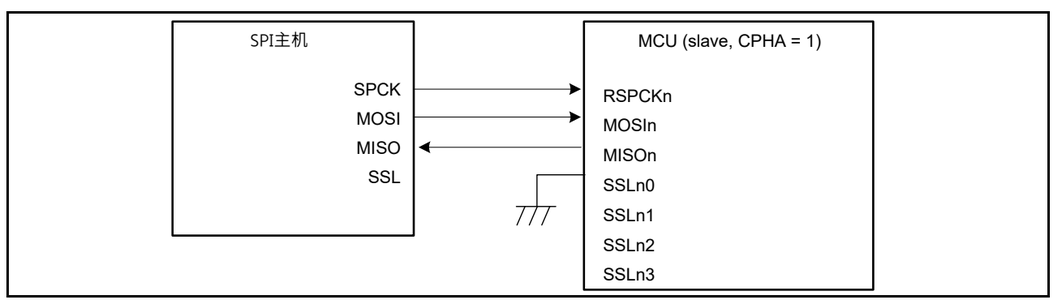

Figure 34.7 MCU作为从机且CPHA=1的单主单从配置示例

34.3.3.3 Single master and multi slave with the MCU as a master

Figure 34.8 shows a single-master and multi-slave SPI system configuration example where the MCU is a master. In the example, the SPI system includes the MCU (master) and four slaves (SPI slave 0 to SPI slave 3).

The RSPCKn and MOSIn outputs of the MCU (master) are connected to the RSPCK and MOSI inputs of SPI slave 0 to SPI slave 3. The MISO outputs of SPI slave 0 to SPI slave 3 are all connected to the MISOn input of the MCU (master). The SSLn0 to SSLn3 outputs of the MCU (master) are connected to the SSL inputs of SPI slave 0 to SPI slave 3, respectively.

The MCU (master) drives the RSPCKn, MOSIn, and SSLn0 to SSLn3 pins. Of the SPI slave 0 to SPI slave 3, the slave that receives low-level input into the SSL input drives the MISO signal.

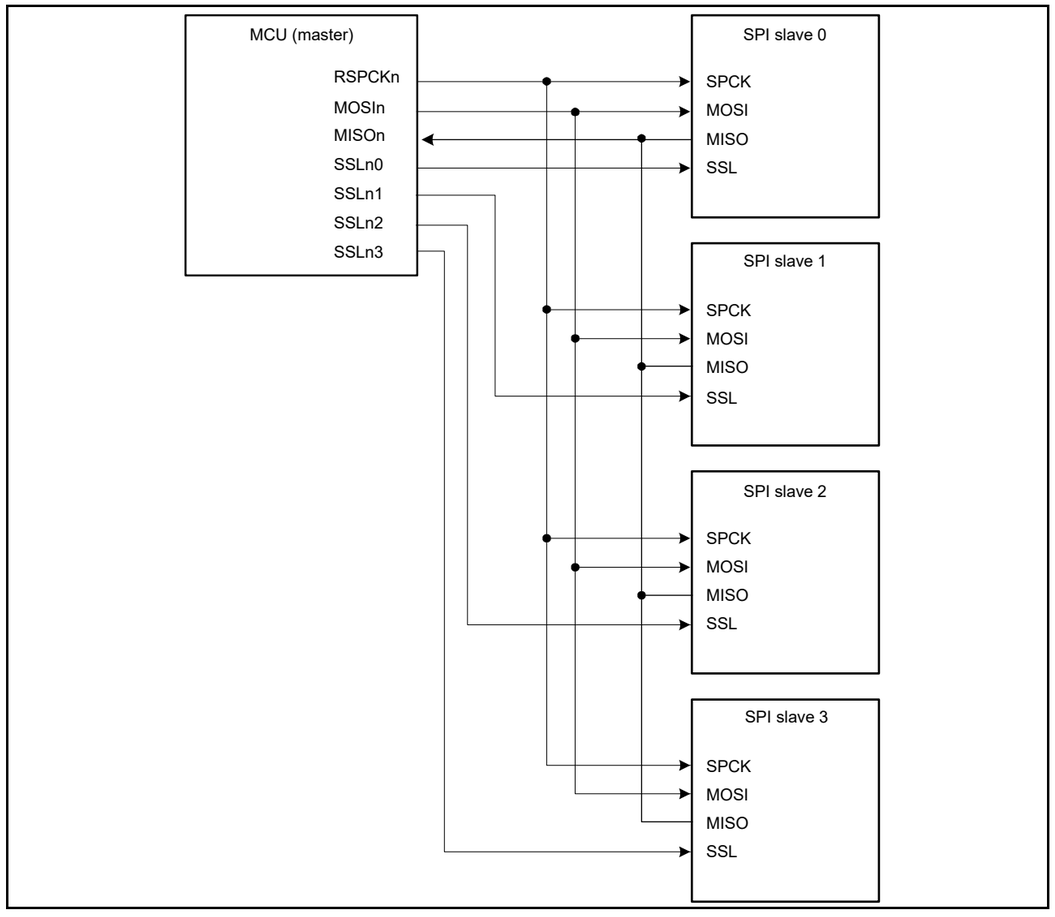

Figure 34.8 Single-master/multi-slave configuration example with the MCU as a a master

34.3.3.4 Single master and multi slave with the MCU as a slave

Figure 34.9 shows a single-master and multi-slave SPI system configuration example where the MCU is a slave. In this example, the SPI system includes an SPI master and two MCUs (slave X and slave Y).

The SPCK and MOSI outputs of the SPI master are connected to the RSPCKn and MOSIn inputs of the MCUs (slaves X and Y). The MISOn outputs of the MCUs (slave X and slave Y) are all connected to the MISO input of the SPI master. The SSLX and SSLY outputs of the SPI master are connected to the SSLn0 inputs of the MCUs (slave X and slave Y), respectively.

34.3.3.3 单主多从，单片机为主

图34.8显示了单主和多从SPI系统配置示例，其中MCU为主。在示例中，SPI系统包括MCU（主机）和四个从机（SPI从机0到SPI从机3）。

MCU（主机）的RSPCKn和MOSIn输出连接到SPI从机0到SPI从机3的RSPCK和MOSI输入。SPI从机0到SPI从机3的MISO输出都连接到MCU的MISOn输入（掌握）。

MCU（主机）的SSLn0到SSLn3输出分别连接到SPI从机0到SPI从机3的SSL输入。

MCU（主控）驱动RSPCKn、MOSIn和SSLn0至SSLn3引脚。在SPI从机0到SPI从机3中，接收到SSL输入的低电平输入的从机驱动MISO信号。

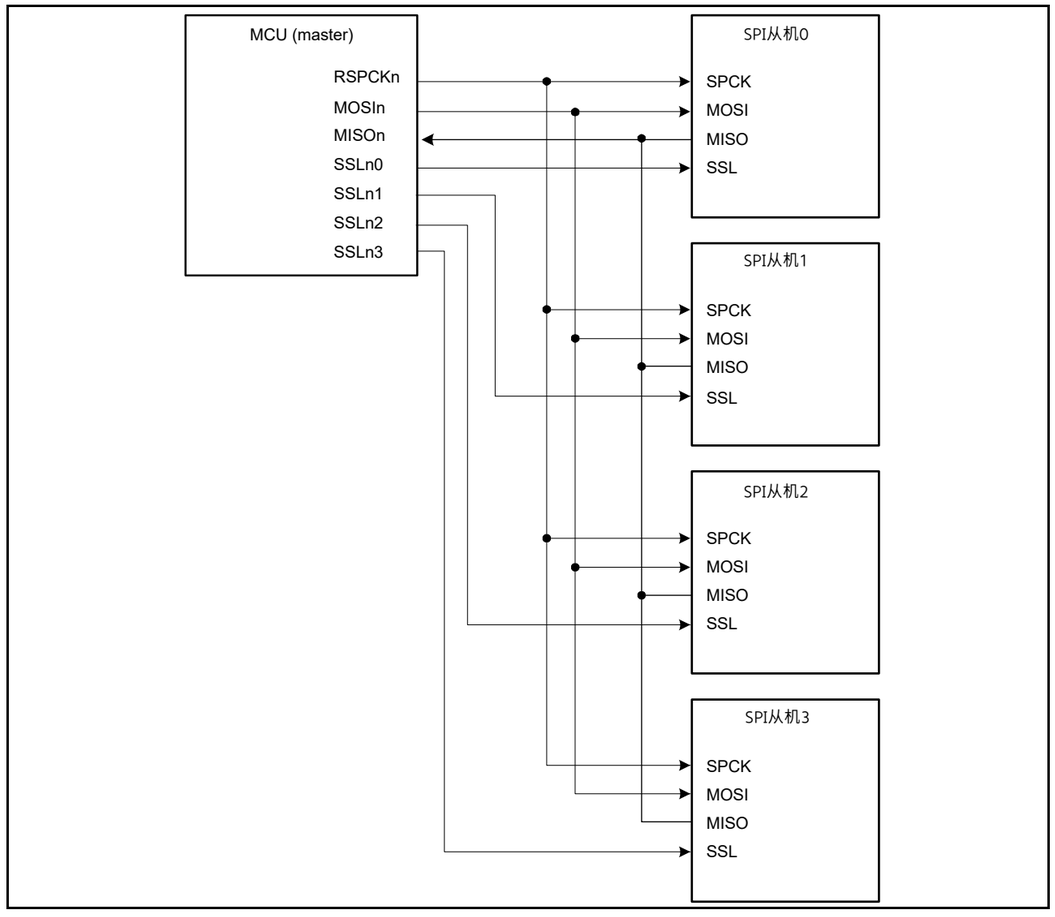

Figure 34.8 MCU为主的单主多从配置示例

34.3.3.4 单主多从，单片机作为从机

图34.9显示了单主多从SPI系统配置示例，其中MCU为从设备。在本例中，SPI系统包括一个SPI主控和两个MCU（从属X和从属Y）。

SPI主机的SPCK和MOSI输出连接到MCU（从机X和Y）的RSPCKn和MOSIn输入。MCU（从X和从Y）的MISOn输出都连接到SPI主控的MISO输入。SPI主机的SSLX和SSLY输出分别连接到MCU（从机X和从机Y）的SSLn0输入。

The SPI master drives the SPCK, MOSI, SSLX, and SSLY signals. Of the MCUs (slave X or slave Y), the slave that receives low-level input into the SSLn0 input drives the MISOn signal.

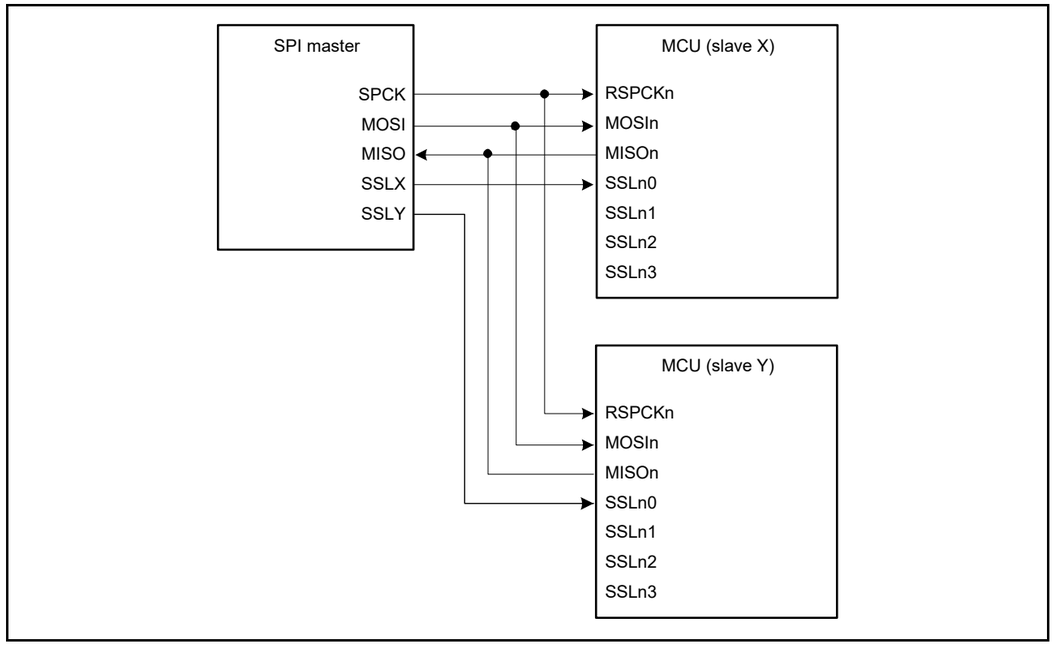

Figure 34.9 Single-master/multi-slave configuration example with the MCU as a slave

34.3.3.5 Multi master and multi slave with the MCU as a master

Figure 34.10 shows a multi-master/multi-slave SPI system configuration example where the MCU is a master. In this example, the SPI system includes two MCUs (master X and master Y) and two SPI slaves (SPI slave 1 and SPI slave 2).

The RSPCKn and MOSIn outputs of the MCUs (master X and master Y) are connected to the RSPCK and MOSI inputs of SPI slaves 1 and 2. The MISO outputs of SPI slaves 1 and 2 are connected to the MISOn inputs of the MCUs (master X and master Y). Any generic port Y output from the MCU (master X) is connected to the SSLn0 input of the MCU (master Y). Any generic port X output of the MCU (master Y) is connected to the SSLn0 input of the MCU (master X). The SSLn1 and SSLn2 outputs of the MCUs (master X and master Y) are connected to the SSL inputs of the SPI slaves 1 and 2. In this configuration example, because the system can be comprised solely of SSLn0 input, and SSLn1, SSLn2 outputs for slave connections, the SSLn3 output of the MCU is not required.

The MCU drives the RSPCKn, MOSIn, SSLn1, and SSLn2 signals when the SSLn0 input level is high. When the SSLn0 input level is low, the MCU detects a mode fault error, sets RSPCKn, MOSIn, SSLn1, and SSLn2 to Hi-Z, and releases the SPI bus directly to the other master. Of the SPI slaves 1 and 2, the slave that receives low-level input into the SSL input drives the MISO signal.

SPI主机驱动SPCK、MOSI、SSLX和SSLY信号。在MCU（从机X或从机Y）中，接收到SSLn0输入的低电平输入的从机驱动MIOn信号。

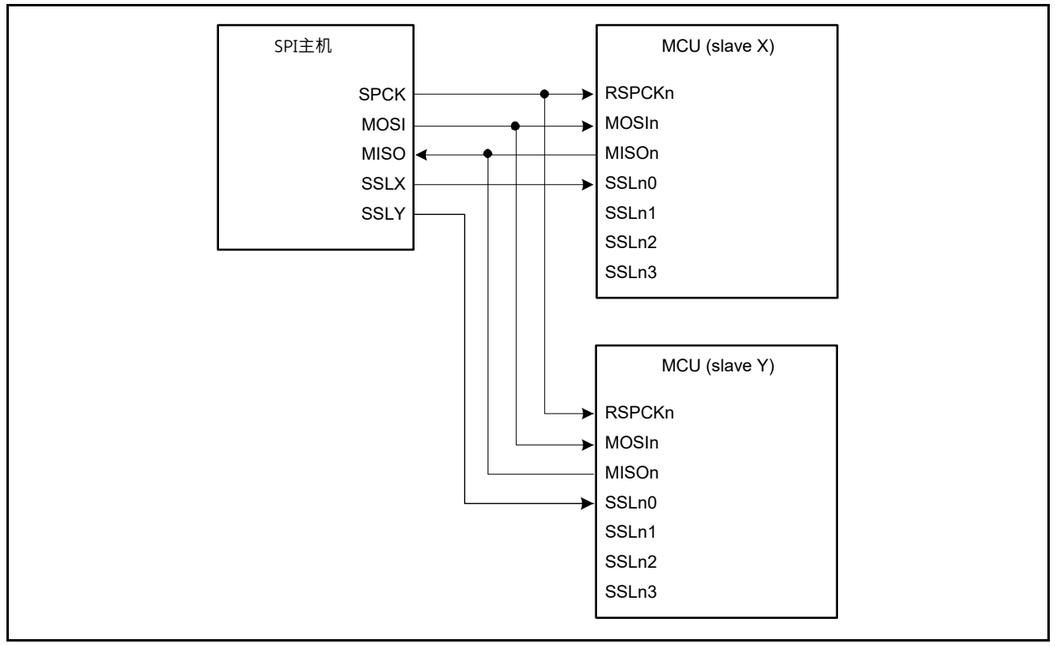

Figure 34.9 MCU作为从机的单主多从配置示例

34.3.3.5 以单片机为主的多主多从

图34.10显示了一个多主多从SPI系统配置示例，其中MCU为主。在本例中，SPI系统包括两个MCU（主X和主Y）和两个SPI从机（SPI从机1和SPI从机2）。

MCU（主X和主Y）的RSPCKn和MOSIn输出连接到SPI从设备1和2的RSPCK和MOSI输入。SPI从设备1和2的MISO输出连接到MCU（主设备）的MISOn输入X和主Y）。来自MCU（主X）的任何通用端口Y输出都连接到MCU（主Y）的SSLn0输入。MCU（主设备Y）的任何通用端口X输出都连接到MCU（主设备X）的SSLn0输入。MCU（主X和主Y）的SSLn1和SSLn2输出连接到SPI从设备1和2的SSL输入。在此配置示例中，因为系统可以仅由SSLn0输入和SSLn1、SSLn2输出组成对于从连接，不需要MCU的SSLn3输出。

当SSLn0输入电平为高电平时，MCU驱动RSPCKn、MOSIn、SSLn1和SSLn2信号。当SSLn0输入电平为低时，MCU检测到模式故障错误，将RSPCKn、MOSIn、SSLn1和SSLn2设置为Hi-Z，并将SPI总线直接释放到另一个主控。在SPI从机1和2中，接收到SSL输入的低电平输入的从机驱动MISO信号。

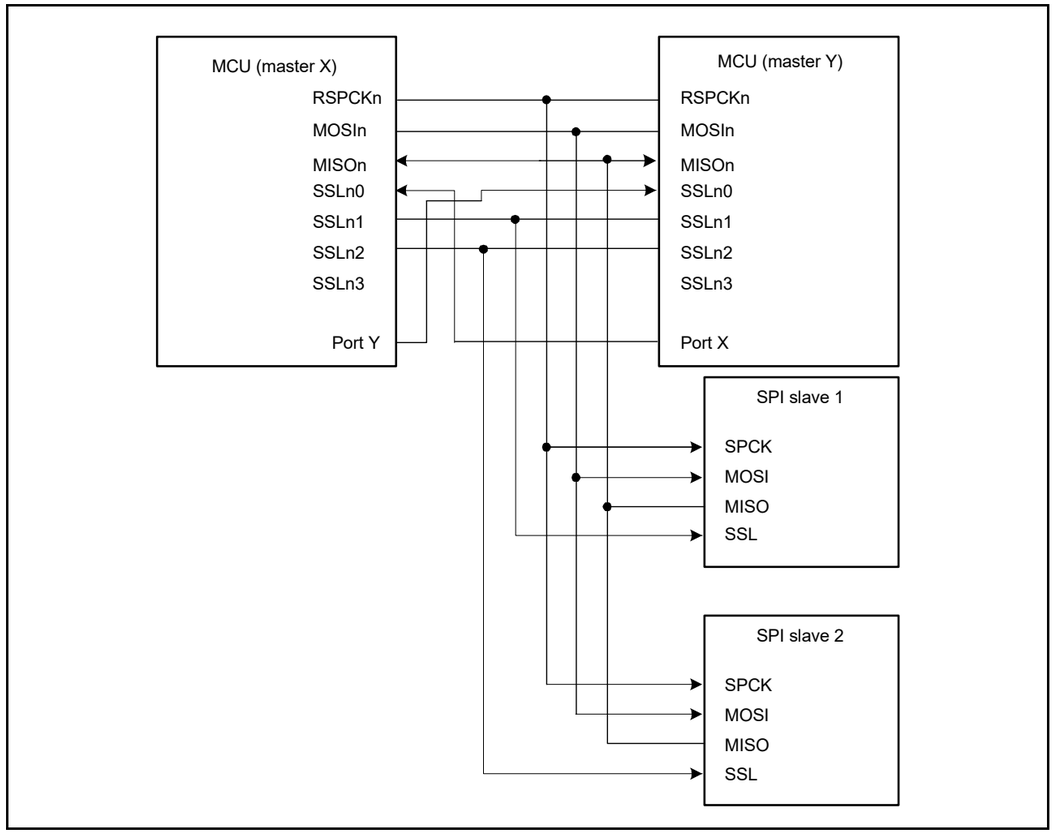

Figure 34.10 Multi-master/multi-slave configuration example with the MCU as a master

34.3.3.6 Master and slave in clock synchronous mode with the MCU as a master

Figure 34.11 shows a master and slave in clock synchronous mode where the MCU is a master. In this configuration, SSLn0 to SSLn3 of the MCU (master) are not used.

The MCU (master) drives the RSPCKn and MOSIn signals. The SPI slave drives the MISO signal.

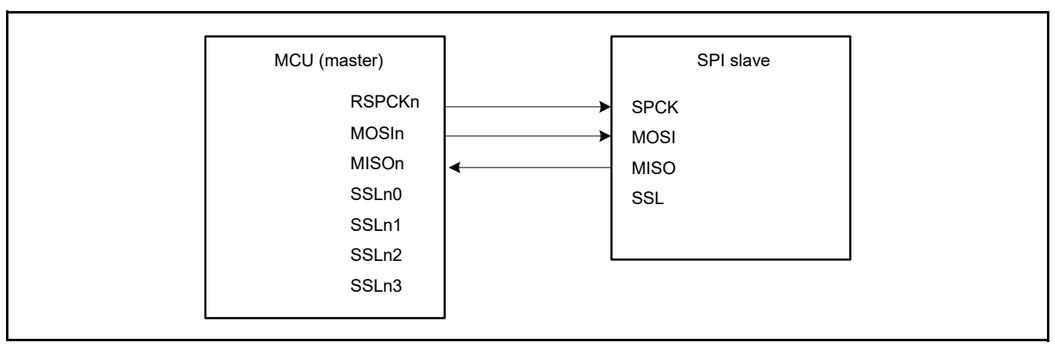

Figure 34.11 Configuration example of master/slave in clock synchronous mode with the MCU as a master

34.3.3.7 Master and slave in clock synchronous mode with the MCU as a slave

Figure 34.12 shows a master and slave in clock synchronous mode configuration where the MCU is a slave. When the MCU operates as a slave in clock synchronous mode, the MCU (slave) drives the MISOn signal and the SPI master drives the SPCK and MOSI signals. SSLn0 to SSLn3 of the MCU (slave) are not used.

The MCU (slave) can only execute serial transfer in the single-slave configuration when the SPCMDm.CPHA bit is set to 1.

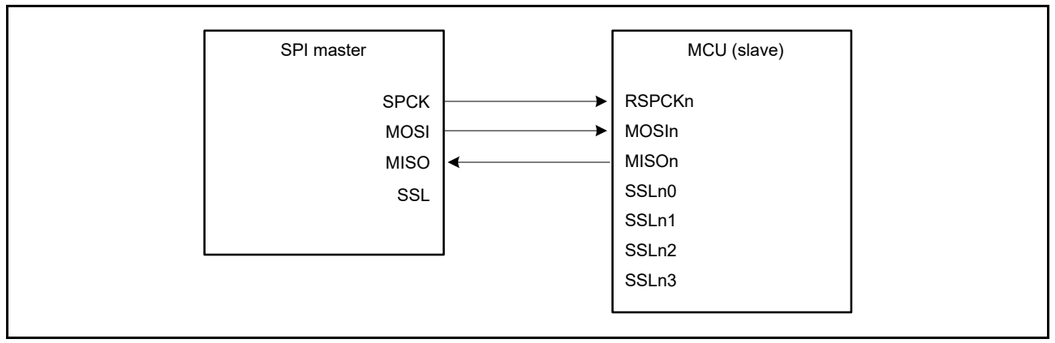

Figure 34.12 Configuration example of master and slave in clock synchronous mode with the MCU as a slave and CPHA = 1

34.3.4 Data Format

The data format of the SPI depends on the settings in the SPI Command Register m (SPCMDm) (m = 0 to 7) and the Parity Enable bit in SPI Control Register 2 (SPCR2.SPPE). Regardless of whether the ordering is MSB- or LSB-first, the SPI treats the range from the LSB bit in the SPI Data Register (SPDR/SPDR_HA) to the bit associated with the selected data length, as transfer data.

This section shows the format of one frame of data before or after transfer.

(a) Data format with parity disabled

When parity is disabled, transmission or reception of data proceeds with the bit length selected in the SPI data length setting bits in SPI Command Register m (SPCMDm.SPB[3:0]).

(b) Data format with parity enabled

When parity is enabled, transmission or reception of data proceeds with the bit length selected in the SPI data length setting bits in the SPI Command Register m (SPCMDm.SPB[3:0]). In this case, however, the last bit is a parity bit.

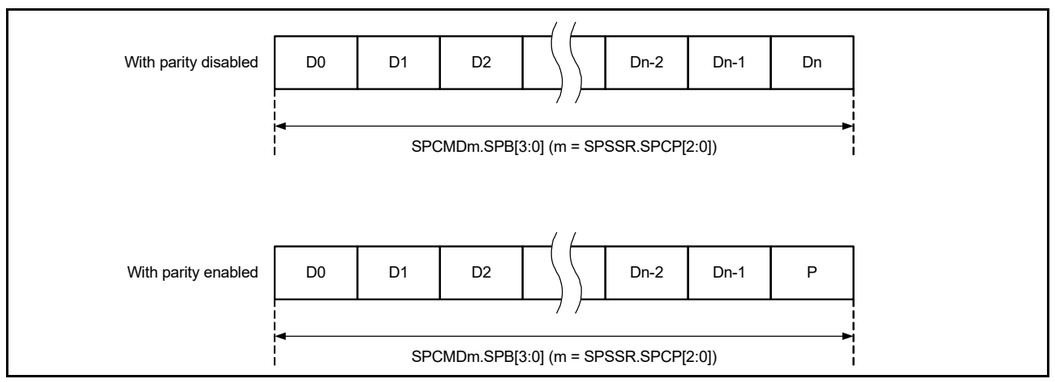

Figure 34.13 Data format with parity disabled and enabled

34.3.3.7 主从时钟同步模式，单片机作为从机

图34.12显示了时钟同步模式配置中的主设备和从设备，其中MCU是从设备。当。。。的时候MCU在时钟同步模式下作为从机运行，MCU（从机）驱动MISON信号，SPI主机驱动SPCK和MOSI信号。不使用MCU（从机）的SSLn0到SSLn3。

当SPCMDm.CPHA位设置为1时，MCU（从机）只能在单从机配置中执行串行传输。

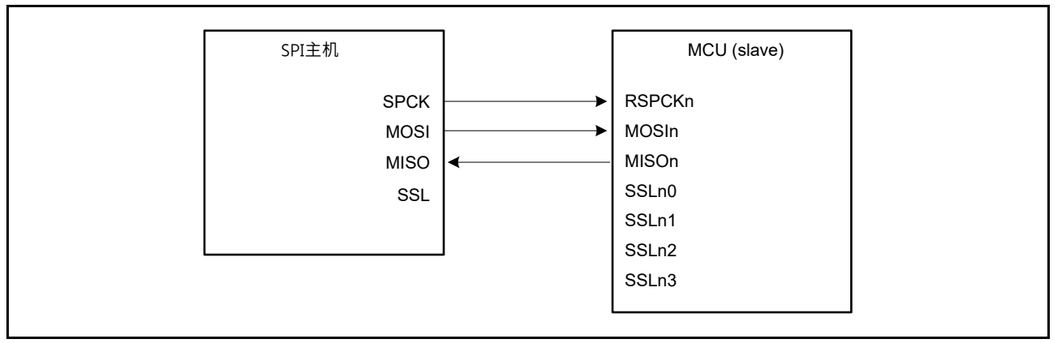

Figure 34.12 单片机作为从机，CPHA=1，时钟同步模式的主从配置示例

34.3.4 数据格式

SPI的数据格式取决于SPI命令寄存器m(SPCMDm)（m=0到7）中的设置和SPI控制寄存器2(SPCR2.SPPE)中的奇偶校验使能位。无论排序是MSB优先还是LSB优先，SPI都将从SPI数据寄存器(SPDRSPDR_HA)中的LSB位到与所选数据长度相关的位的范围视为传输数据。

本节显示传输前后一帧数据的格式。

(a) 禁用奇偶校验的数据格式

当奇偶校验被禁用时，数据的发送或接收将按照在SPI命令寄存器m(SPCMDm.SPB[3:0])中的SPI数据长度设置位中选择的位长度进行。

(b) 启用奇偶校验的数据格式

当奇偶校验使能时，数据的发送或接收按照在SPI命令寄存器m(SPCMDm.SPB[3:0])的SPI数据长度设置位中选择的位长度进行。然而，在这种情况下，最后一位是奇偶校验位。

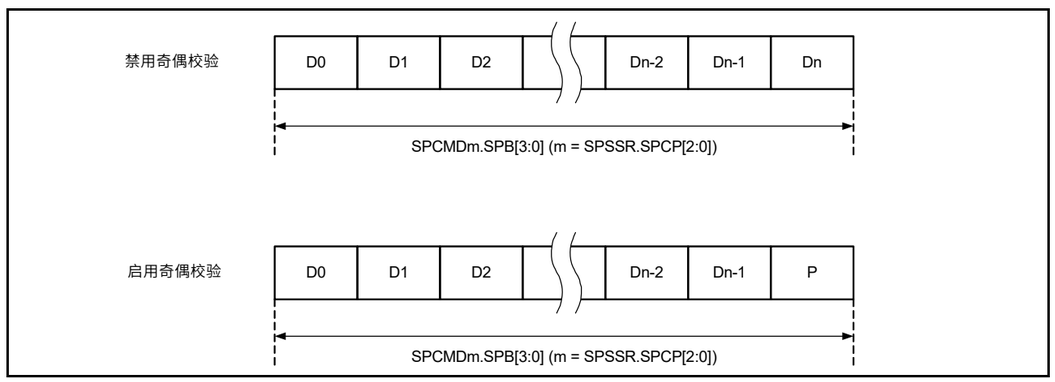

Figure 34.13 禁用和启用奇偶校验的数据格式

34.3.4.1 Operation when parity is disabled (SPCR2.SPPE = 0)

When parity is disabled, data for transmission is copied to the shift register with no pre-processing. This section describes the connection between the SPI Data Register (SPDR/SPDR_HA) and the shift register in terms of the combination of MSB- or LSB-first order and data length.

(1) MSB-first transfer with 32-bit data

Figure 34.14 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity disabled, an SPI data length of 32 bits, and MSB-first selected.

In transmission, bits T31 to T00 from the current stage of the transmit buffer are copied to the shift register. Data for transmission is shifted out from the shift register from T31 to T30, and continuing to T00, in that order.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When R31 to R00 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.

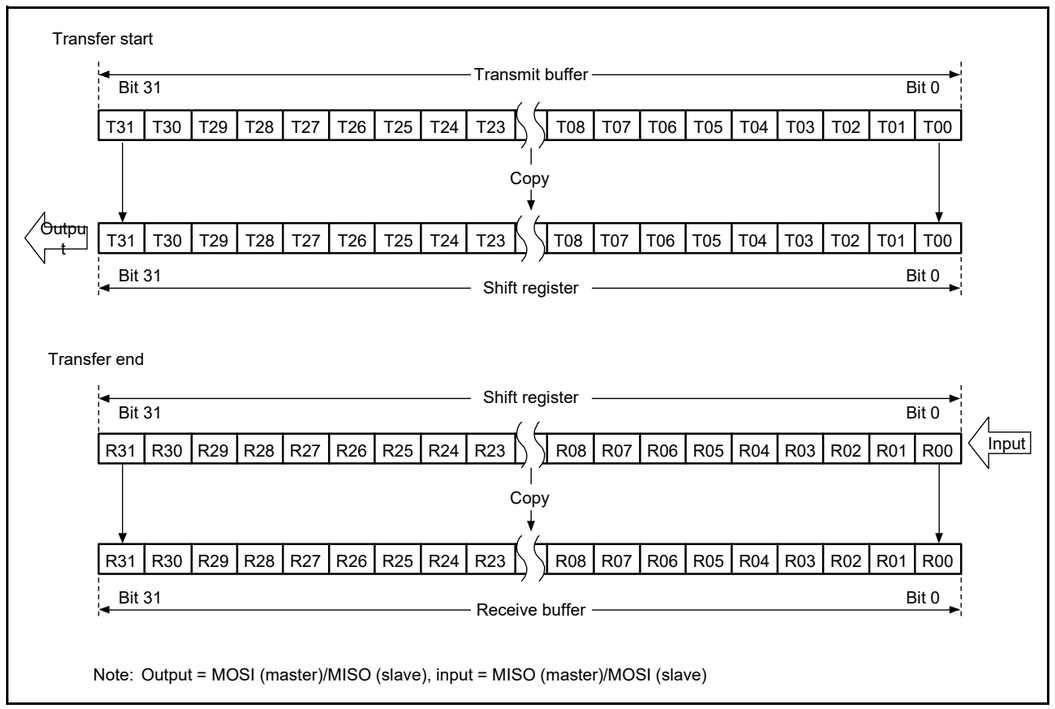

Figure 34.14 MSB-first transfer with 32-bit data and parity disabled

(2) MSB-first transfer with 24-bit data

Figure 34.15 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity disabled, an SPI data length of 24 bits, and MSB-first selected.

In transmission, the lower 24 bits (T23 to T00) from the current stage of the transmit buffer are copied to the shift register. Data for transmission is shifted out from the shift register from T23 to T22, and continuing to T00, in that order.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R23 to R00 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer. Writing 0 to bits T31 to T24 at the time of transmission leads to 0 being inserted in the upper 8 bits of the receive buffer.

34.3.4.1 禁用奇偶校验时的操作(SPCR2.SPPE=0)

当奇偶校验被禁用时，用于传输的数据被复制到移位寄存器而不进行预处理。本节从MSB或LSB-firstor der和数据长度的组合来描述SPI数据寄存器(SPDRSPDR_HA)和移位寄存器之间的连接。

(1) 32位数据的MSB优先传输

图34.14显示了SPI数据寄存器(SPDR)和禁用奇偶校验的移位寄存器的传输操作，
SPI数据长度为32位，且MSB优先选择。

在发送过程中，发送缓冲器当前级的T31到T00位被复制到移位寄存器。用于发送的数据从移位寄存器中移出，从T31移出到T30，并按此顺序继续移到T00。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后，当R31到R00位被收集时，移位寄存器中的值被复制到接收缓冲区。

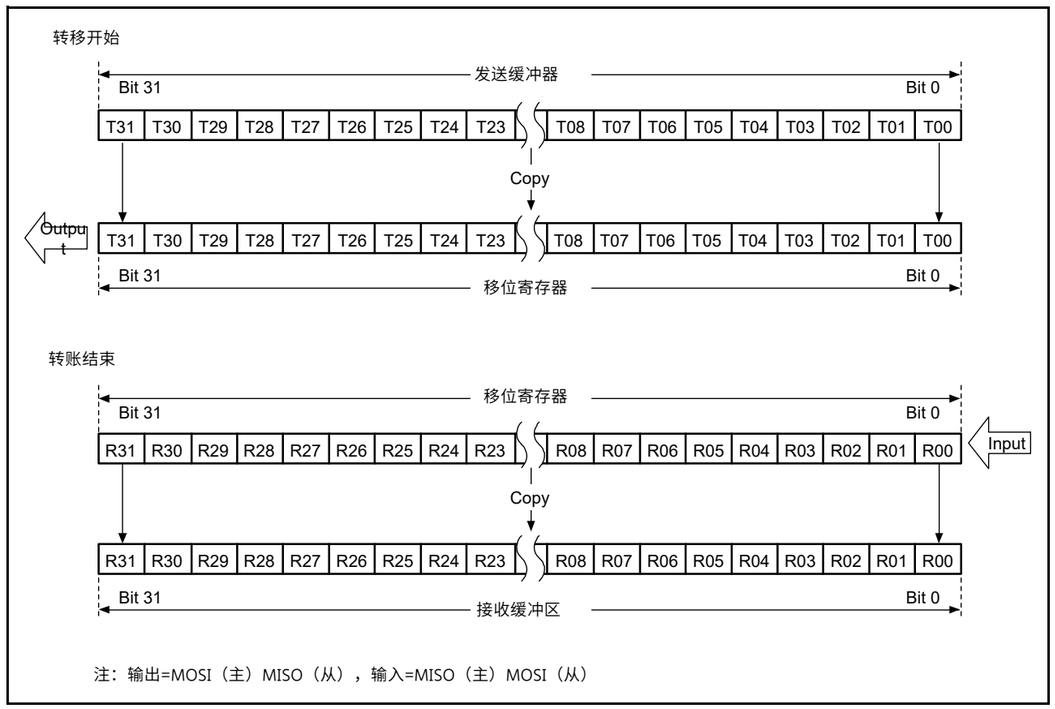

Figure 34.14 禁用32位数据和奇偶校验的MSB优先传输

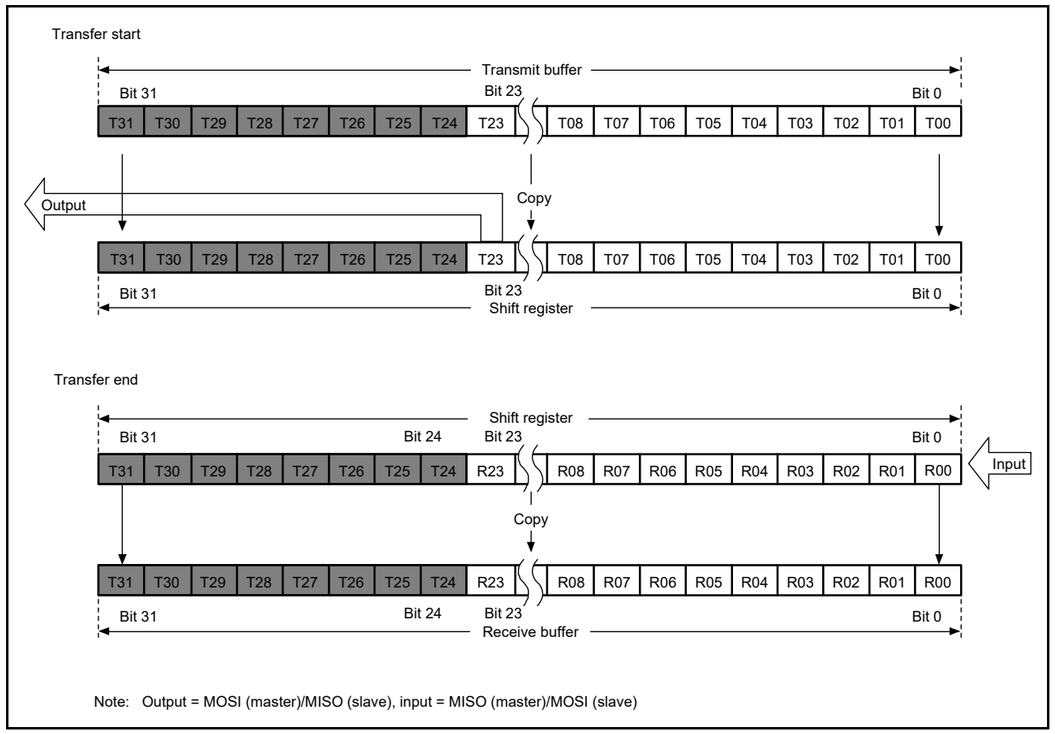
(2) 24位数据的MSB优先传输

图34.15显示了SPI数据寄存器(SPDR)和禁用奇偶校验的移位寄存器的传输操作，
SPI数据长度为24位，且MSB优先选择。

在发送过程中，来自发送缓冲器当前阶段的低24位（T23到T00）被复制到移位寄存器。用于发送的数据从移位寄存器中从T23移出到T22，并按此顺序继续移到T00。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后，当R23到R00位被收集时，移位寄存器中的值被复制到接收缓冲区。发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送时将0写入位T31至T24会导致将0插入接收缓冲区的高8位。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

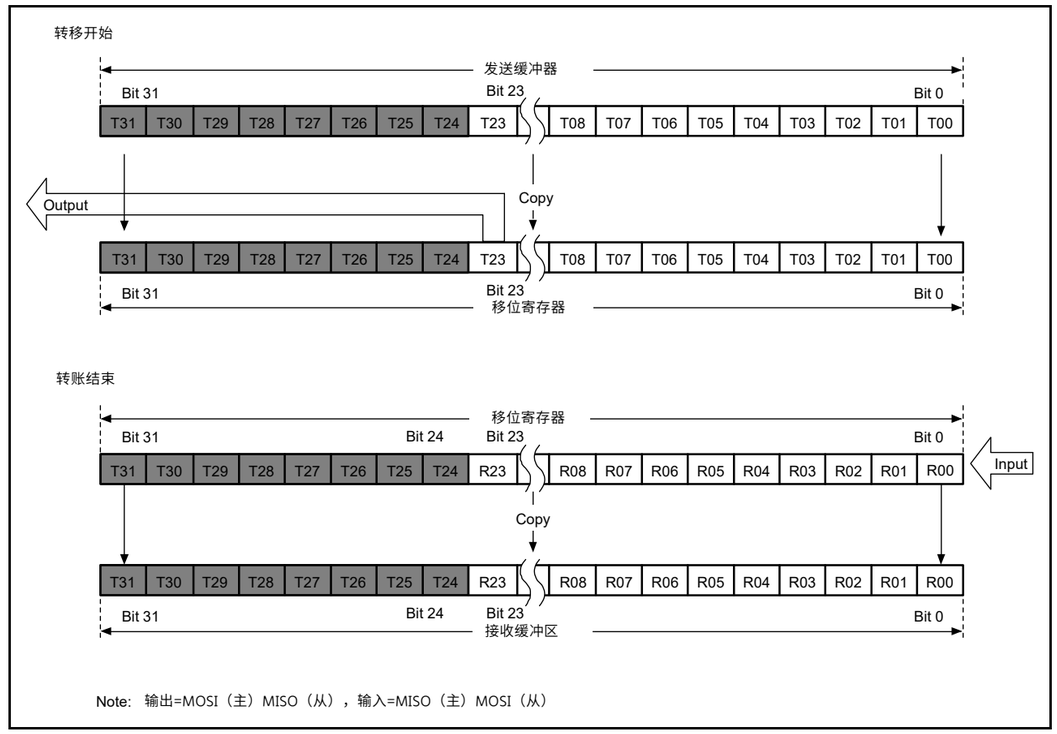
Figure 34.15 MSB-first transfer with 24-bit data and parity disabled

(3) LSB-first transfer with 32-bit data

Figure 34.16 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity disabled, an SPI data length of 32 bits, and LSB-first selected.

In transmission, bits T31 to T00 from the current stage of the transmit buffer are reordered bit-by-bit to obtain the order T00 to T31 for copying to the shift register. Data for transmission is shifted out from the shift register from T00 to T01, and continuing to T3, in that order.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R00 to R31 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

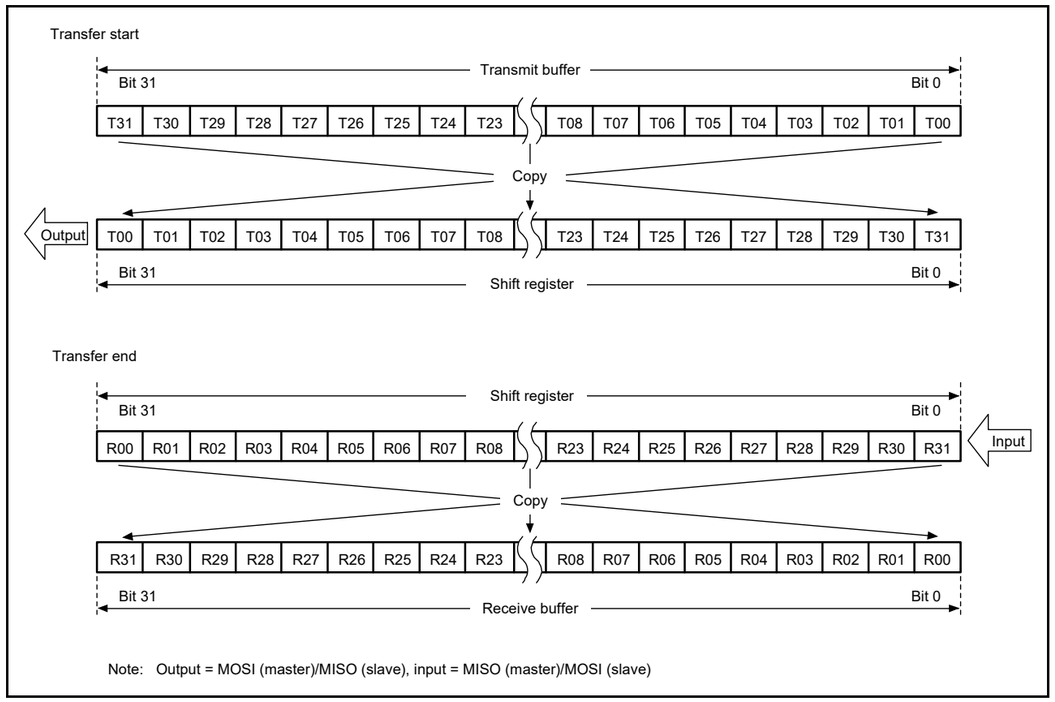
Figure 34.15 禁用24位数据和奇偶校验的MSB优先传输

(3) 32位数据的LSB优先传输

图34.16显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用、SPI数据长度为32位且选择LSB在先的传输中的操作。

在传输过程中，传输缓冲器当前级的位T31到T00被逐位重新排序，以获得用于复制到移位寄存器的顺序T00到T31。用于发送的数据从移位寄存器中从T00移出到T01，并按此顺序继续到T3。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后收集R00至R31位时，将移位寄存器中的值复制到接收缓冲区。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

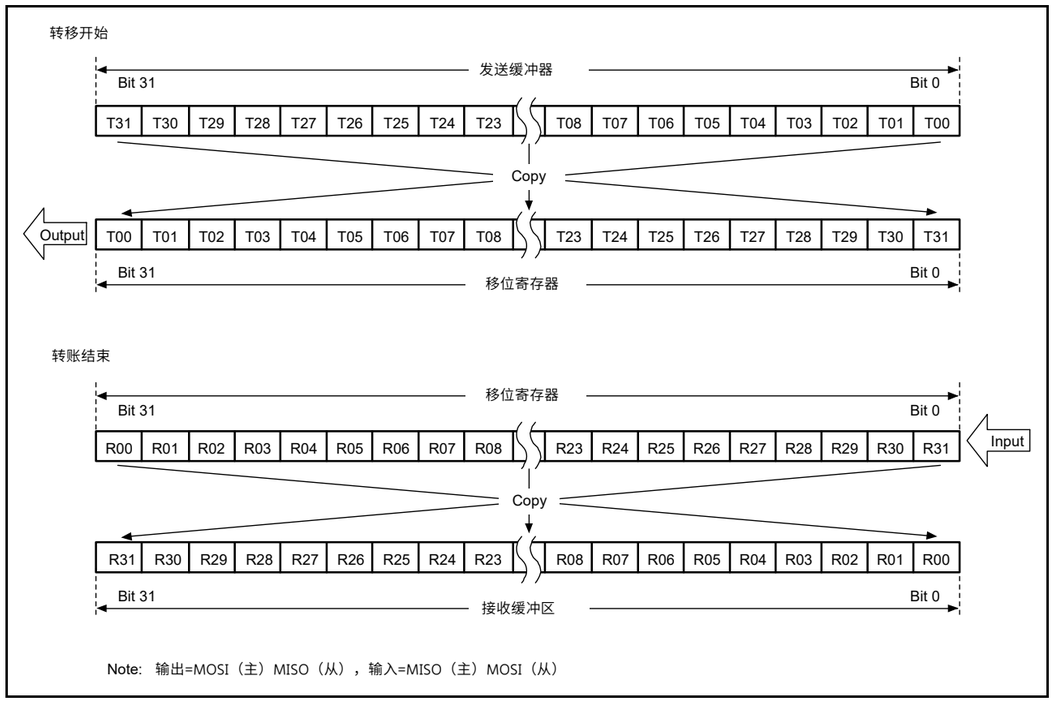
Figure 34.16 LSB-first transfer with 32-bit data and parity disabled

(4) LSB-first transfer with 24-bit data

Figure 34.17 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity disabled, an SPI data length of 24 bits, and LSB-first selected.

In transmission, the lower 24 bits (T23 to T00) from the current stage of the transmit buffer are reordered bit-by-bit to obtain the order T00 to T23 for copying to the shift register. Data for transmission is shifted out from the shift register from T00 to T01, and continuing to T23, in that order.

In reception, received data is shifted in bit-by-bit through bit [8] of the shift register. When the R00 to R23 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer. Writing 0 to the T31 to T24 bits at the time of transmission leads to 0 being inserted in the upper 8 bits of the receive buffer.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

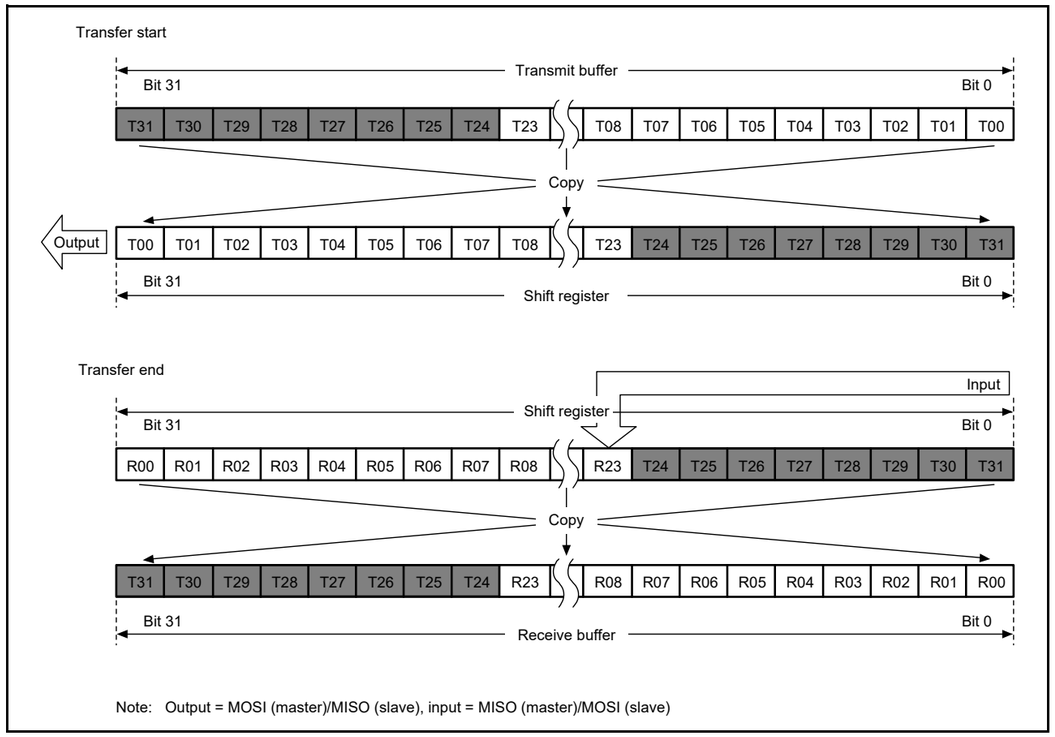
Figure 34.16 LSB优先传输，32位数据和奇偶校验禁用

(4) 24位数据的LSB优先传输

图34.17显示了SPI数据寄存器(SPDR)和禁用奇偶校验的移位寄存器的传输操作，
SPI数据长度为24位，并选择LSB优先。

发送时，将发送缓冲器当前级的低24位（T23到T00）逐位重新排序，得到T00到T23的顺序，用于复制到移位寄存器。用于发送的数据从移位寄存器移出，从T00移出到T01，并按此顺序继续移到T23。

在接收中，接收到的数据通过移位寄存器的位[8]逐位移位。在输入所需的RSPCK周期数后收集R00至R23位时，将移位寄存器中的值复制到接收缓冲区。发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送时将0写入T31到T24位会导致0被插入到接收缓冲区的高8位中。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

Figure 34.17 LSB-first transfer with 24-bit data and parity disabled

34.3.4.2 Operation when parity is enabled (SPCR2.SPPE = 1)

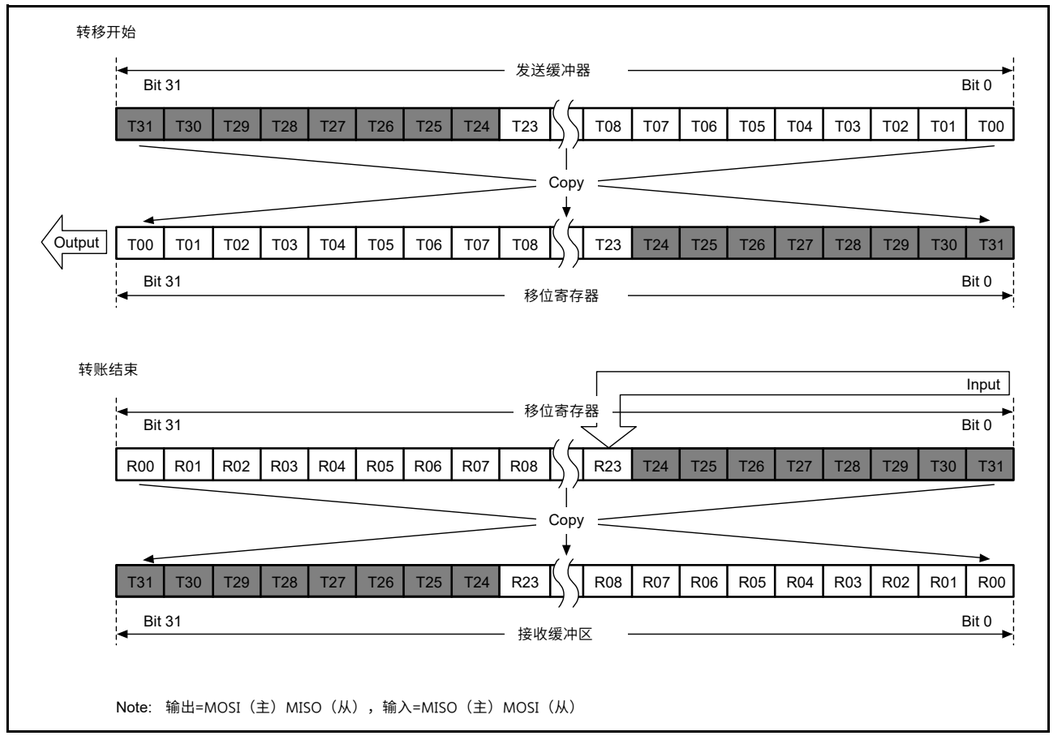
When parity is enabled, the lowest-order bit of the data for transmission becomes a parity bit. Hardware calculates the value of the parity bit.

(1) MSB-first transfer with 32-bit data

Figure 34.18 shows the transfer operation of the SPI Data Register (SPDR) and the shift register with parity enabled, an SPI data length of 32 bits, and MSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T31 to T01. This replaces the final bit, T00, and the whole value is copied to the shift register. Data is transmitted in the order T31, T30, …, T01, and P.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R31 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, data from R31 to P is checked for parity.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

Figure 34.17 LSB优先传输，24位数据和奇偶校验禁用

34.3.4.2 启用奇偶校验时的操作(SPCR2.SPPE=1)

启用奇偶校验时，传输数据的最低位变为奇偶校验位。硬件计算奇偶校验位的值。

(1) 32位数据的MSB优先传输

图34.18显示了SPI数据寄存器(SPDR)和启用奇偶校验的移位寄存器的传输操作，
SPI数据长度为32位，且MSB优先选择。

在传输中，奇偶校验位(P)的值是从位T31到T01计算的。这将替换最后一位T00，并将整个值复制到移位寄存器。数据按T31、T30、……、T01和P的顺序传输。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后收集R31至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，检查从R31到P的数据的奇偶性。

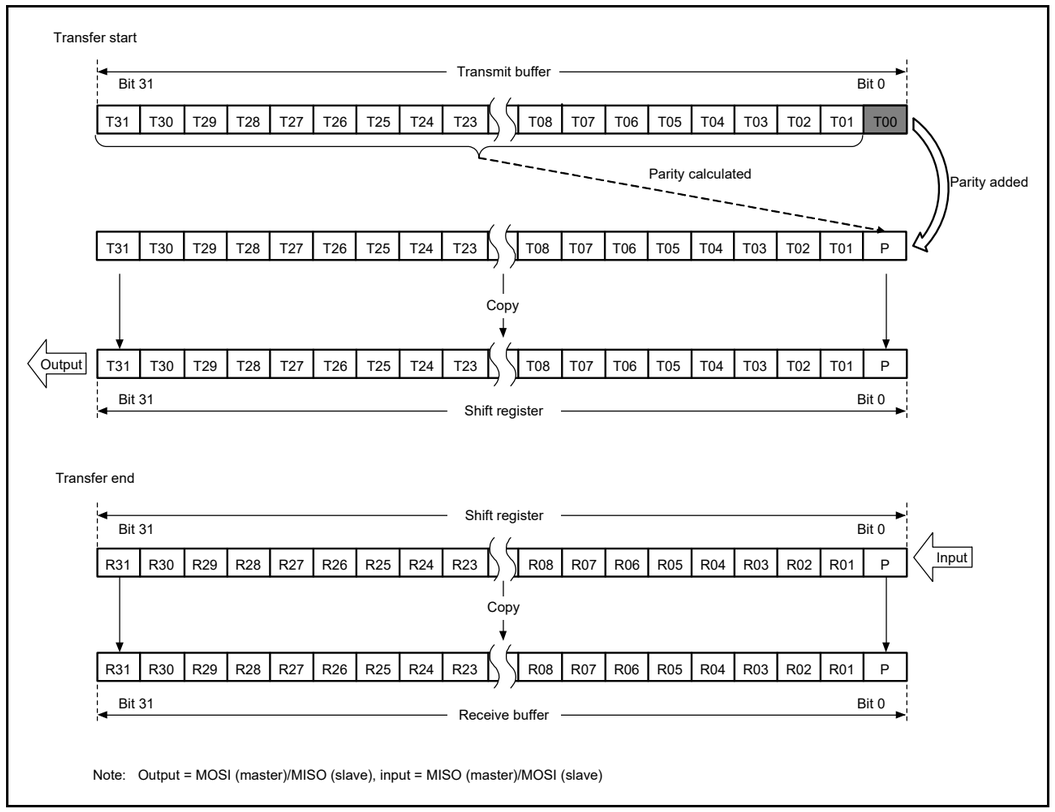


Figure 34.18 MSB-first transfer with 32-bit data and parity enabled

(2) MSB-first transfer with 24-bit data

Figure 34.19 shows the transfer operation of the SPI Data Register (SPDR) and the shift register with parity enabled, an SPI data length of 24 bits, and MSB-first selected.

In transmission, the value of the parity bits (P) is calculated from bits T23 to T01. This replaces the final bit, T00, and the whole value is copied to the shift register. Data is transmitted in the order T23, T22, …, T01, and P.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R23 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. After data is copied to the shift register, data from R23 to P is checked for parity. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer. Writing 0 to the T31 to T24 bits at the time of transmission leads to 0 being inserted in the upper 8 bits of the receive buffer.

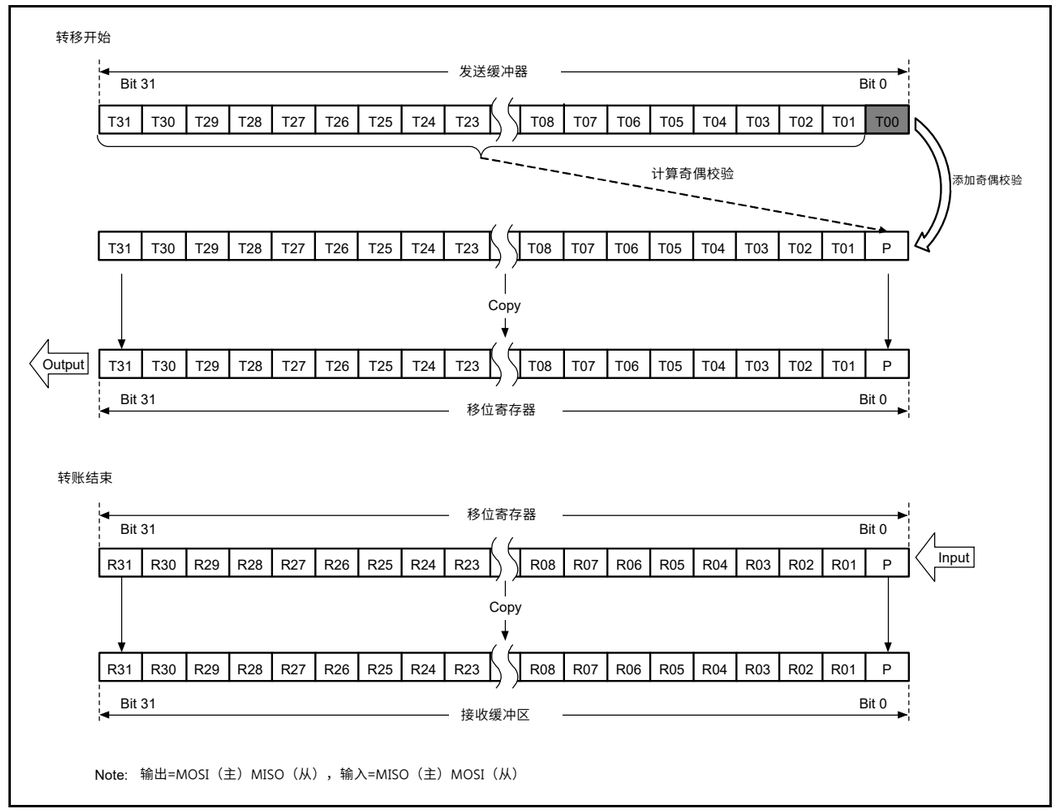

Figure 34.18 启用32位数据和奇偶校验的MSB优先传输

(2) 24位数据的MSB优先传输

图34.19显示了SPI数据寄存器(SPDR)和启用奇偶校验的移位寄存器的传输操作，SPI数据长度为24位，且MSB优先选择。

在传输中，奇偶校验位(P)的值是从位T23到T01计算的。这将替换最后一位T00，并将整个值复制到移位寄存器。数据按T23、T22、……、T01和P的顺序传输。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后收集R23至P位时，将移位寄存器中的值复制到接收缓冲区。将数据复制到移位寄存器后，对R23到P的数据进行奇偶校验。发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送时将0写入T31到T24位会导致0被插入到接收缓冲区的高8位中。

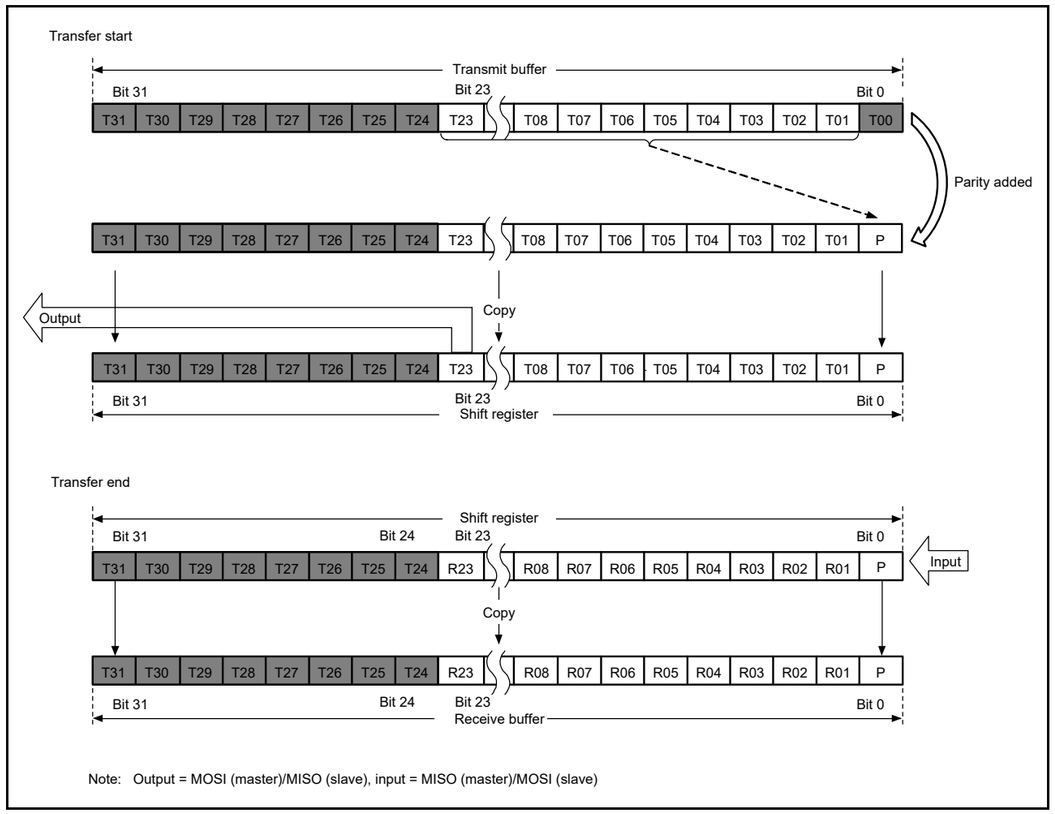

Figure 34.19 MSB-first transfer with 24-bit data and parity enabled

(3) LSB-first transfer with 32-bit data

Figure 34.20 shows the transfer operation of the SPI Data Register (SPDR) and the shift register with parity enabled, an SPI data length of 32 bits, and LSB-first selected.

In transmission, the value of the parity bit (P) is calculated from the T30 to T00 bits. This replaces the final bit, T31, and the whole value is copied to the shift register. Data is transmitted in the order T00, T01, …, T30, and P.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R00 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. After data is copied to the shift register, the data from R00 to P is checked for parity.

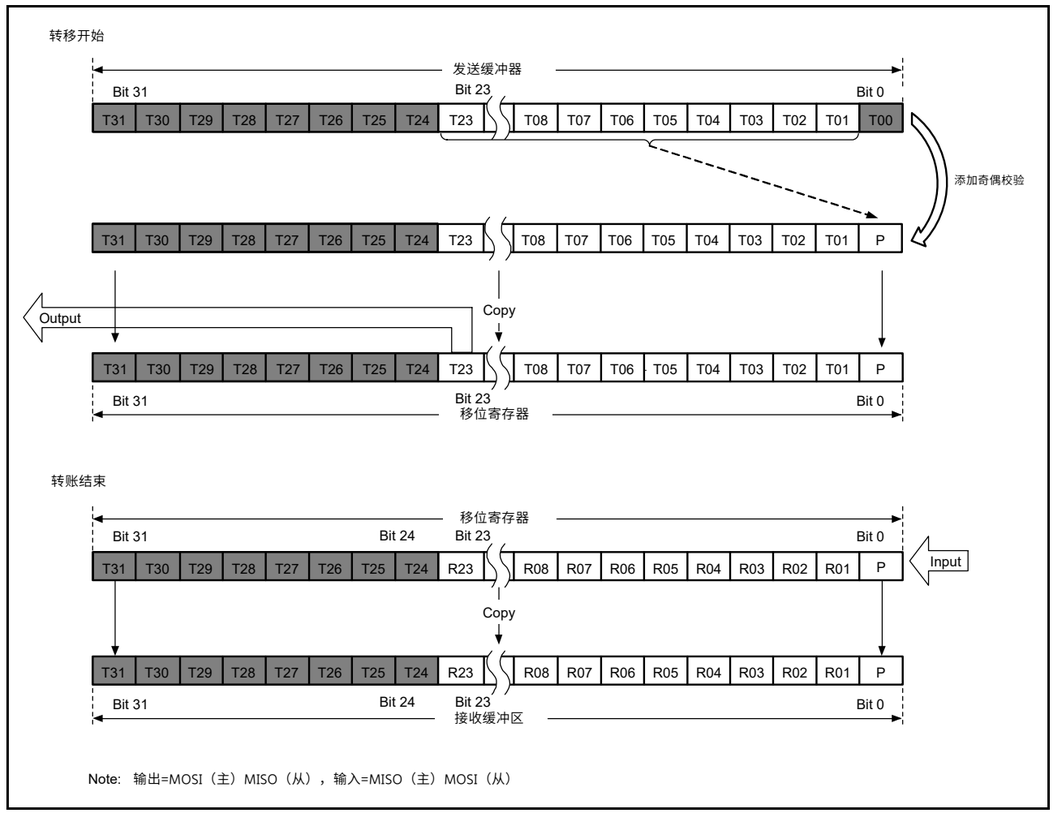

Figure 34.19 启用24位数据和奇偶校验的MSB优先传输

(3) 32位数据的LSB优先传输

图34.20显示了SPI数据寄存器(SPDR)和启用奇偶校验的移位寄存器的传输操作，
SPI数据长度为32位，并选择LSB-first。

在传输中，奇偶校验位(P)的值是从T30到T00位计算的。这将替换最后一位T31，并将整个值复制到移位寄存器。数据按T00、T01、……、T30和P的顺序传输。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后收集R00至P位时，将移位寄存器中的值复制到接收缓冲区。数据复制到移位寄存器后，对R00到P的数据进行奇偶校验。

RA生态工作室

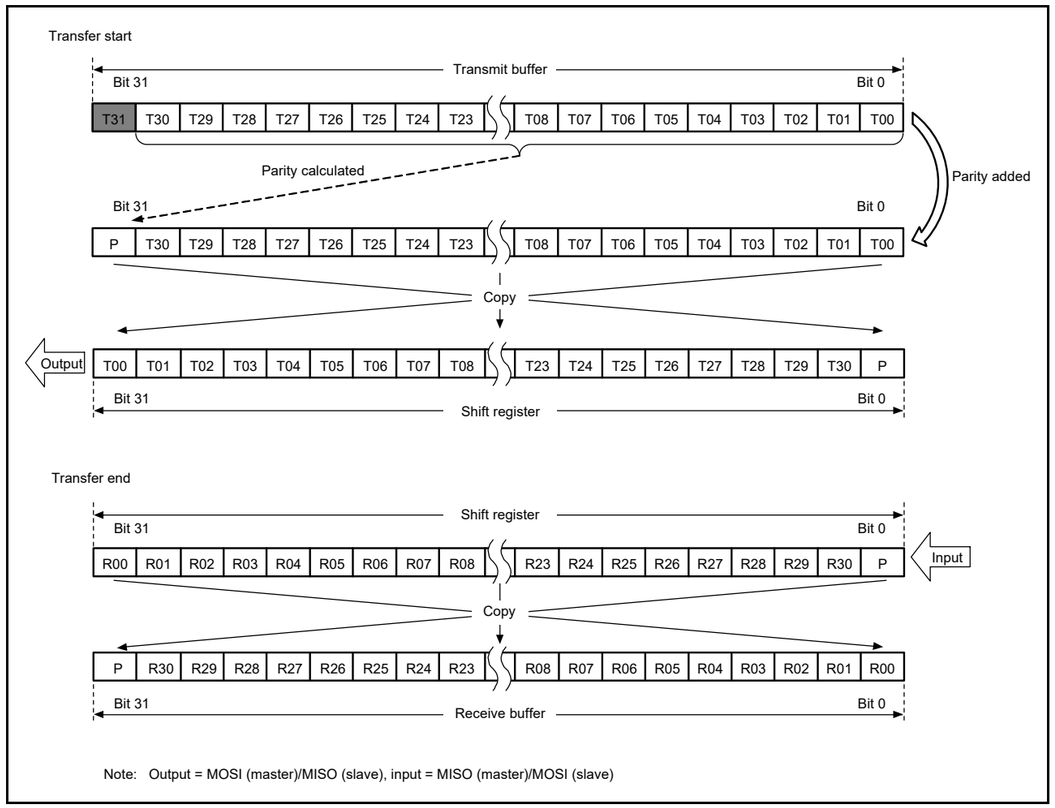

Figure 34.20 LSB-first transfer with 32-bit data and parity enabled

(4) LSB-first transfer with 24-bit data

Figure 34.21 shows the transfer operation of the SPI Data Register (SPDR) and the shift register with parity enabled, an SPI data length of 24 bits, and LSB-first selected.

In transmission, the value of the parity bit (P) is calculated from the T22 to T00 bits. This replaces the final bit, T23, and the whole is copied to the shift register. Data is transmitted in the order T00, T01, …, T22, and P.

In reception, received data is shifted in bit-by-bit through bit [8] of the shift register. When the R00 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R00 to P is checked for parity. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer. Writing 0 to the T31 to T24 bits at transmission leads to 0 being inserted in the upper 8 bits of the receive buffer.

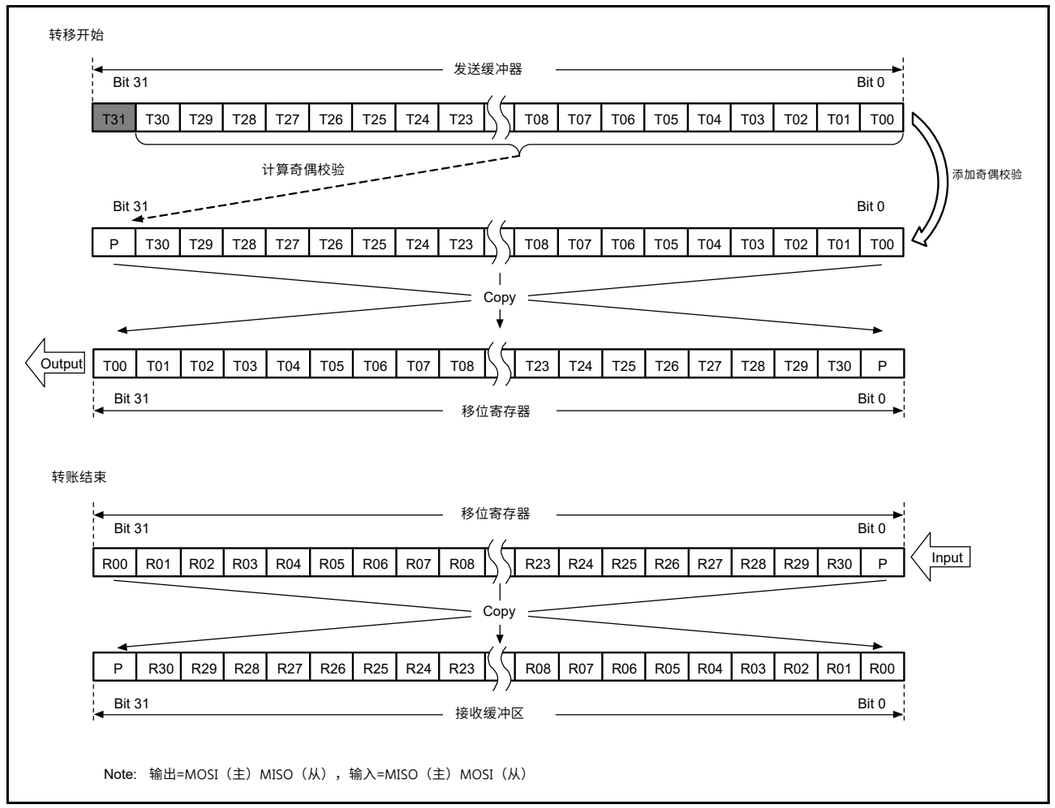

Figure 34.20 启用32位数据和奇偶校验的LSB优先传输

(4) 24位数据的LSB优先传输

图34.21显示了SPI数据寄存器(SPDR)和启用奇偶校验的移位寄存器的传输操作，
SPI数据长度为24位，并选择LSB优先。

在传输中，奇偶校验位(P)的值是从T22到T00位计算的。这将替换最后一位T23，并将整体复制到移位寄存器中。数据按T00、T01、……、T22和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的位[8]逐位移位。在输入所需数量的RSPCK周期后收集R00至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R00到P的数据的奇偶性。发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送时将0写入T31到T24位会导致将0插入接收缓冲区的高8位。

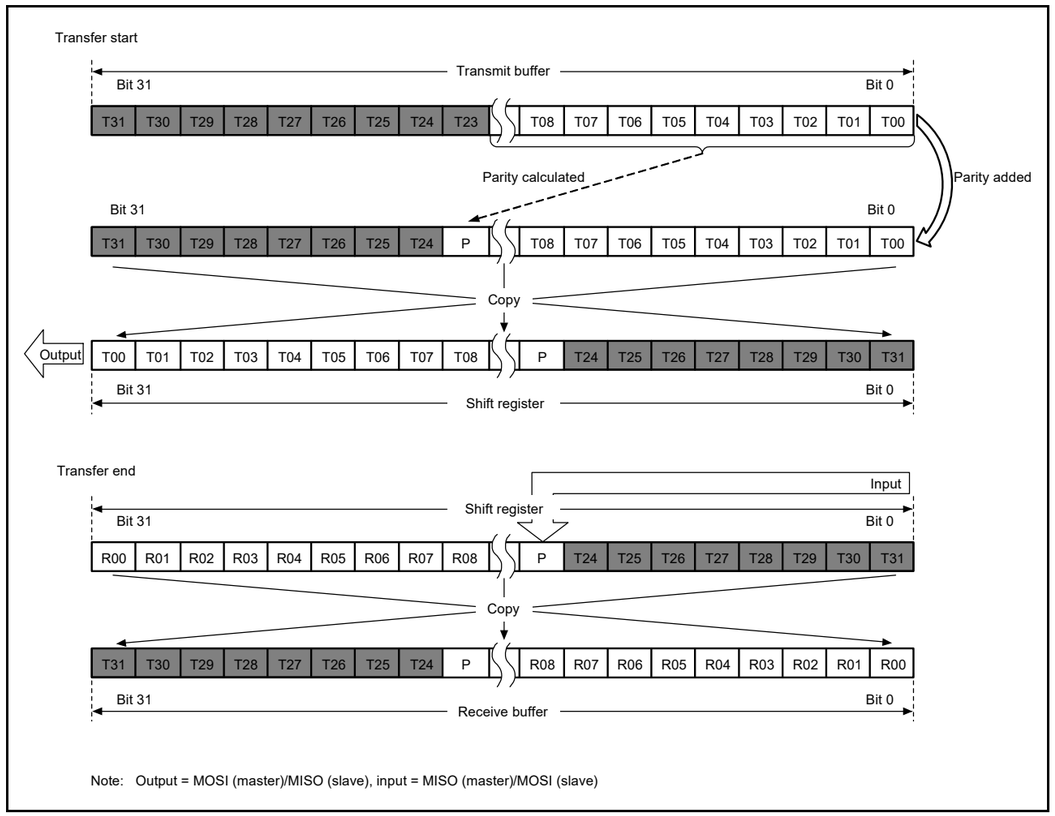

Figure 34.21 LSB-first transfer with 24-bit data and parity enabled

34.3.5 Transfer Format

34.3.5.1 Transfer format when CPHA = 0

Figure 34.22 shows an example transfer format for the serial transfer of 8-bit data when the SPCMDm.CPHA bit is 0. Do not perform clock synchronous operation (SPCR.SPMS = 1) when the SPI operates in slave mode (SPCR.MSTR = 0) and the CPHA bit is 0. In Figure 34.22, RSPCKn (CPOL = 0) indicates the RSPCKn signal waveform when the SPCMDm.CPOL bit is 0, and RSPCKn (CPOL = 1) indicates the RSPCKn signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which the SPI fetches serial transfer data into the shift register. The I/O directions of the signals depend on the SPI settings. For details, see section 34.3.2, Controlling the SPI Pins.

When the SPCMDm.CPHA bit is 0, the driving of valid data to the MOSIn and MISOn signals begins at an SSLni signal assertion. The first RSPCKn signal change that occurs after the SSLni signal assertion becomes the first transfer data fetch. After this, data is sampled every 1 RSPCK cycle. The change timing for the MOSIn and MISOn signals is 1/2 RSPCK cycles after the transfer data fetch timing. The CPOL bit setting does not affect the RSPCK signal operation timing as it only affects the signal polarity.

t1 denotes the RSPCK delay, the period from an SSLni signal assertion to RSPCKn oscillation. t2 denotes the SSL negation delay, the period from the termination of RSPCKn oscillation to an SSLni signal negation. t3 denotes the next-access delay, the period in which SSLni signal assertion is suppressed for the next transfer after the end of the serial transfer. t1, t2, and t3 are controlled by a master device running on the SPI system. For a description of t1, t2, and t3 when the SPI of the MCU is in master mode, see section 34.3.10.1, Master mode operation.

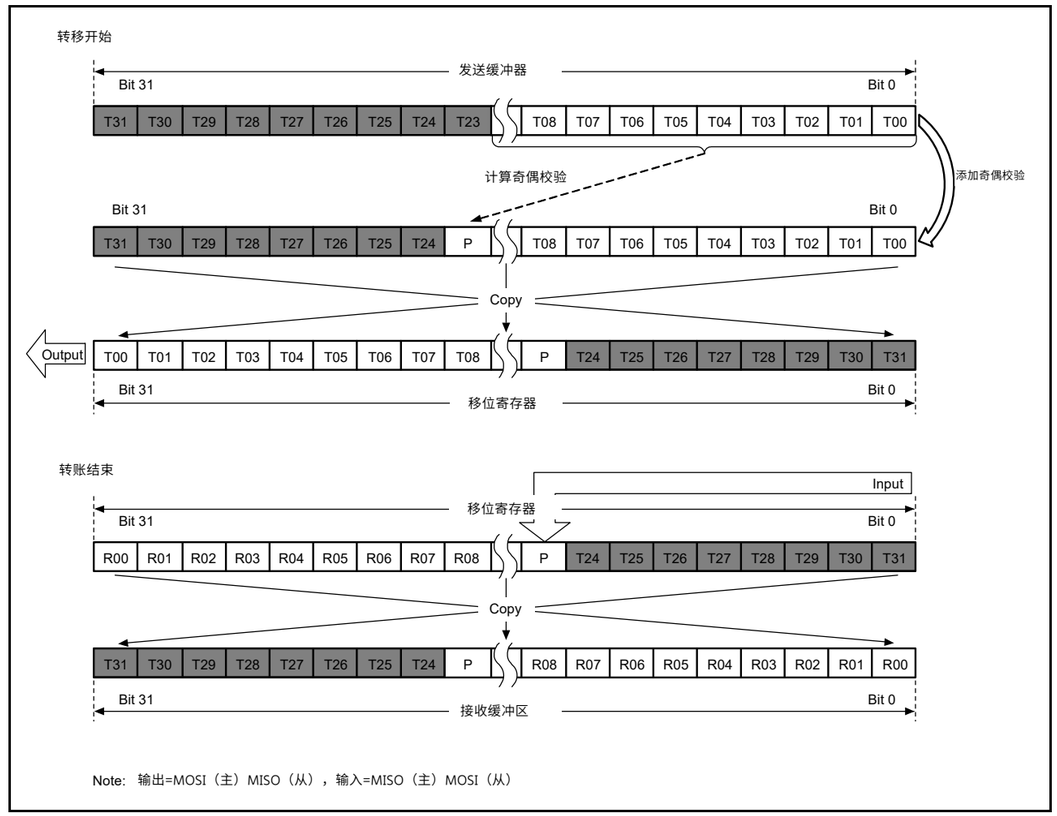

Figure 34.21 启用24位数据和奇偶校验的LSB优先传输

34.3.5 传输格式

34.3.5.1 CPHA=0时的传输格式

图34.22显示了当SPCMDm.CPHA位为0时串行传输8位数据的示例传输格式。当SPI在从机模式下运行时（SPCR.MSTR=0)且CPHA位为0。在图34.22中，RSPCKn(CPOL=0)表示SPCMDm.CPOL位为0时的RSPCKn信号波形，RSPCKn(CPOL=1)表示CPOL位为0时的RSPCKn信号波形1.采样时序表示SPI将串行传输数据取入移位寄存器的时序。信号的IO方向取决于SPI设置。有关详细信息，请参见第34.3.2节，控制SPI引脚。

当SPCMDm.CPHA位为0时，将有效数据驱动到MOSIn和MISOn信号开始于SSLni信号断言。在SSLni信号断言之后发生的第一个RSPCKn信号变化成为第一次传输数据获取。此后，每1个RSPCK周期对数据进行采样。MOSIn和MIOn信号的变化时序是传输数据获取时序之后的12RSPCK周期。CPOL位设置不影响RSPCK信号操作时序，因为它只影响信号极性。

t1表示RSPCK延迟，即从SSLni信号断言到RSPCKn振荡的周期。t2表示SSL否定延迟，即从RSPCKn振荡终止到SSLni信号否定的周期。t3表示下一次访问延迟，即在串行传输结束后为下一次传输抑制SSLni信号断言的时间段。t1、t2和t3由在SPI系统上运行的主设备控制。有关MCU的SPI处于主模式时的t1、t2和t3的说明，请参见第34.3.10.1节，主模式操作。

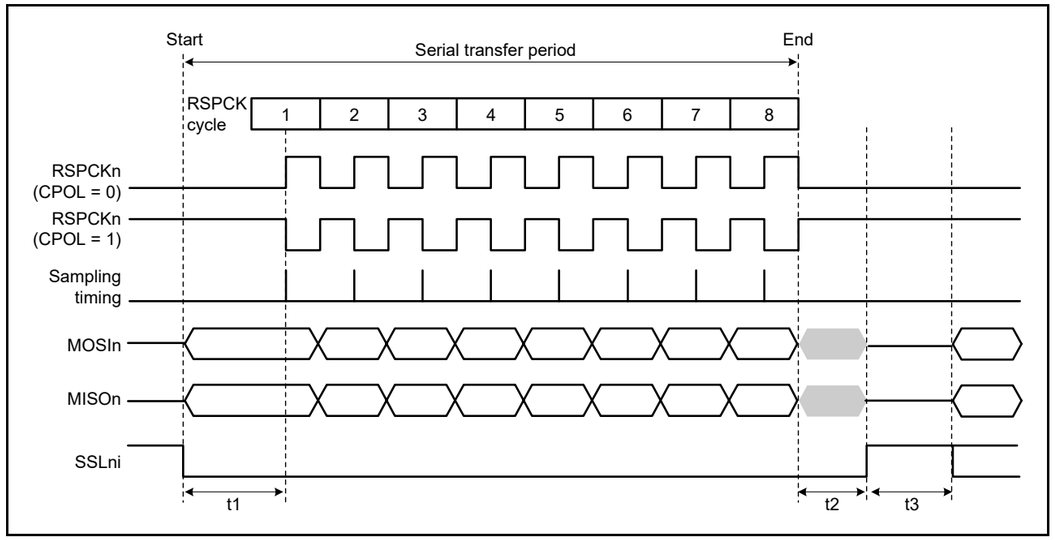

Figure 34.22 SPI transfer format when CPHA = 0

34.3.5.2 When CPHA = 1

Figure 34.23 shows an example transfer format for the serial transfer of 8-bit data when the SPCMDm.CPHA bit is 1. However, when the SPCR.SPMS bit is 1, the SSLni signals are not used, and only the three signals RSPCKn, MOSIn, and MISOn handle communications. In Figure 34.23, RSPCK (CPOL = 0) indicates the RSPCKn signal waveform when the SPCMDm.CPOL bit is 0, and RSPCK (CPOL = 1) indicates the RSPCKn signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which the SPI fetches serial transfer data into the shift register. The I/O directions of the signals depend on the SPI mode (master or slave). For details, see section 34.3.2, Controlling the SPI Pins.

When the SPCMDm.CPHA bit is 1, the driving of invalid data to the MISOn signal begins at an SSLni signal assertion. The output of valid data to the MOSIn and MISOn signals begins at the first RSPCKn signal change that occurs after the SSLni signal assertion. After this, data is updated every 1 RSPCK cycle. The transfer data fetch timing is 1/2 RSPCK cycles after the data update timing. The SPCMDm.CPOL bit setting does not affect the RSPCKn signal operation timing. It only affects the signal polarity.

t1, t2, and t3 are the same as those when CPHA = 0. For a description of t1, t2, and t3 when the SPI of the MCU is in master mode, see section 34.3.10.1, Master mode operation.

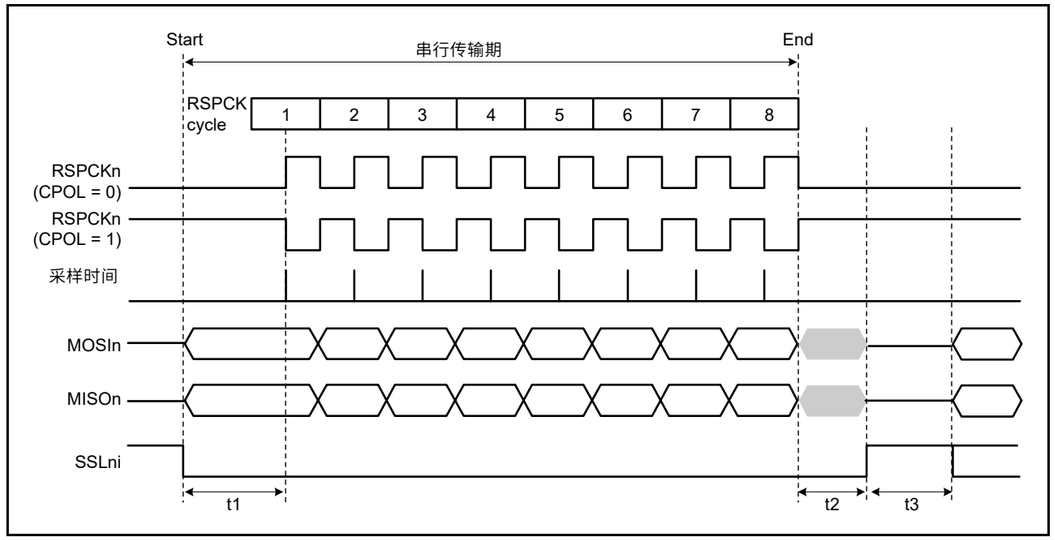

Figure 34.22 CPHA=0时的SPI传输格式

34.3.5.2 When CPHA = 1

图34.23显示了SPCMDm.CPHA位为1时串行传输8位数据的示例传输格式。然而，当SPCR.SPMS位为1时，不使用SSLni信号，仅使用三个信号RSPCKn，MOSIn和MISon处理通信。在图34.23中，RSPCK(CPOL=0)表示SPCMDm.CPOL位为0时的RSPCKn信号波形，RSPCK(CPOL=1)表示CPOL位为1时的RSPCKn信号波形。SPI将串行传输数据提取到移位寄存器中。信号的IO方向取决于SPI模式（主机或从机）。有关详细信息，请参见第34.3.2节，控制SPI引脚。

当SPCMDm.CPHA位为1时，将无效数据驱动到MIOn信号开始于SSLni信号断言。在SSLni信号置位后发生的第一个RSPCKn信号变化时，开始向MOSIn和MISOn信号输出有效数据。此后，每1个RSPCK周期更新一次数据。传输数据获取时序是数据更新时序之后的12个RSPCK周期。SPCMDm.CPOL位设置不影响RSPCKn信号操作时序。它只影响信号极性。

t1、t2、t3与CPHA=0时相同。关于MCU的SPI处于主机模式时的t1、t2和t3说明，请参见第34.3.10.1节，主机模式操作。

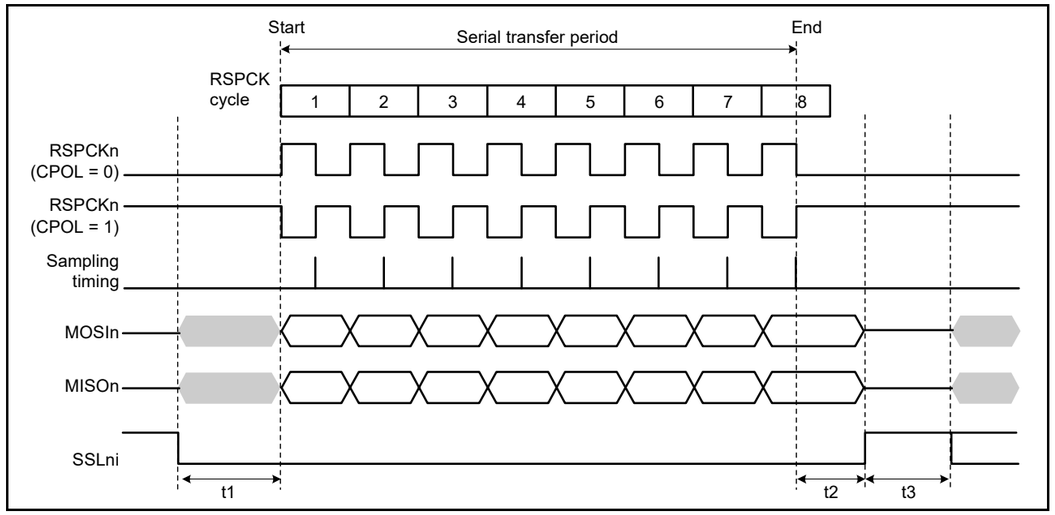

Figure 34.23 SPI transfer format when CPHA = 1

34.3.6 Data Transfer Modes

Full-duplex synchronous serial communications or transmit operations can only be selected in the Communications Operating Mode Select bit (SPCR.TXMD). The SPDR/SPDR_HA access shown in Figure 34.24 and Figure 34.25 indicate the condition of access to the register, where W denotes a write cycle.

34.3.6.1 Full-duplex synchronous serial communications (SPCR.TXMD = 0)

Figure 34.24 shows an example of operation where the Communications Operating Mode Select bit (SPCR.TXMD) is set to 0. In this example, the SPI performs an 8-bit serial transfer in which the SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

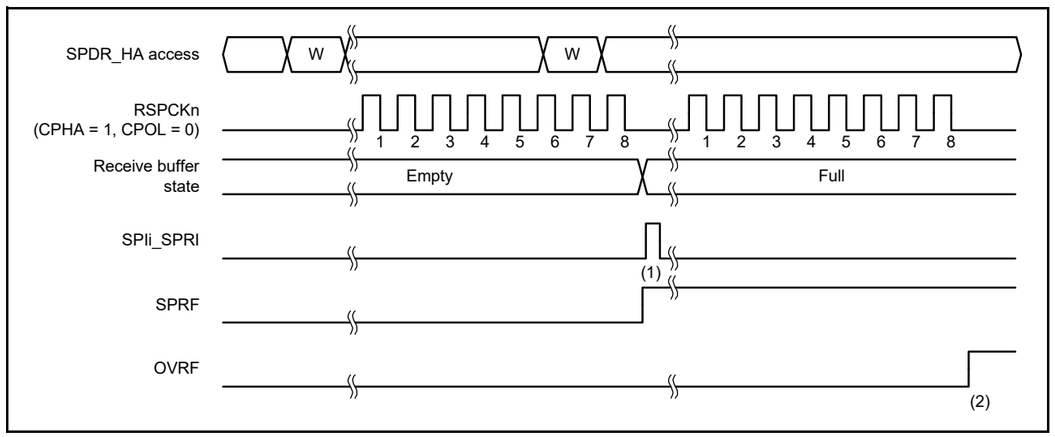

Figure 34.24 Operation example when SPCR.TXMD = 0

The operation of the flags at timings (1) and (2) in Figure 34.24 is as follows:

1. When a serial transfer ends with the SPDR_HA receive buffer empty, the SPI generates a receive buffer full interrupt request (SPIi_SPRI), the SPI sets the SPSR.SPRF flag to 1, and the received data is copied in the shift register to the receive buffer.

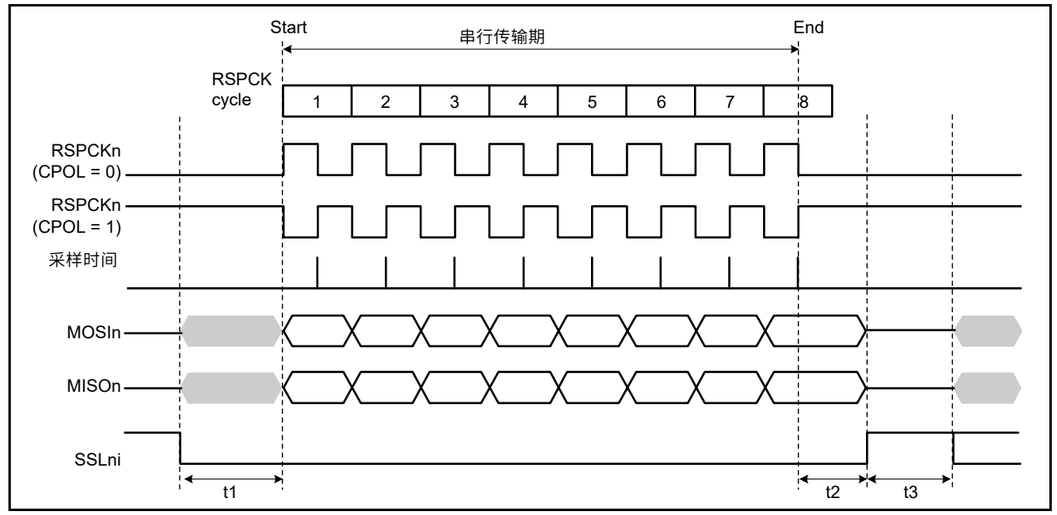

Figure 34.23 CPHA=1时的SPI传输格式

34.3.6 数据传输模式

全双工同步串行通信或发送操作只能在通信操作模式选择位(SPCR.TXMD)中选择。图34.24和图34.25所示的SPDRSPDR_HA访问表示访问寄存器的条件，其中W表示写周期。

34.3.6.1 全双工同步串行通信(SPCR.TXMD=0)

图34.24显示了通信操作模式选择位(SPCR.TXMD)设置为0的操作示例。在此示例中，SPI执行8位串行传输，其中SPDCR.SPFC[1:0]位为00b，SPCMDm.CPHA位为1，SPCMDm.CPOL位为0。波形中给RSPCKn的数字表示RSPCK周期数，例如传输的位数。

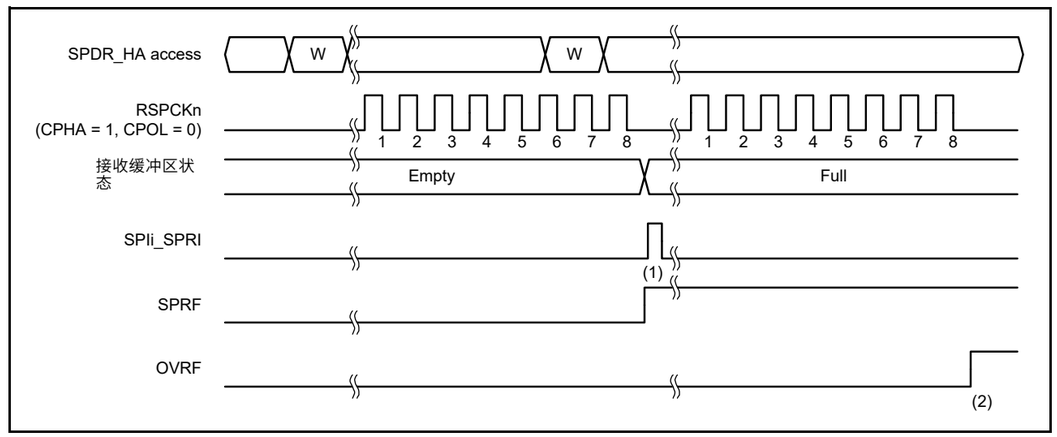

Figure 34.24 SPCR.TXMD=0时的操作示例

图34.24中时间(1)和(2)的标志操作如下：

1. 当串行传输结束且SPDR_HA接收缓冲区为空时，SPI产生接收缓冲区满中断请求（SPIi_SPRI），SPI将SPSR.SPRF标志设置为1，并将接收到的数据在移位寄存器中复制到接收缓冲区.

2. When a serial transfer ends with the SPDR_HA receive buffer holding data that was received in the previous serial transfer, the SPI sets the SPSR.OVRF flag to 1, and discards the received data in the shift register.

34.3.6.2 Transmit-only operations (SPCR.TXMD = 1)

Figure 34.25 shows an example of operation where the Communications Operating Mode Select bit (SPCR.TXMD) is set to 1. In this example, the SPI performs an 8-bit serial transfer in which the SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

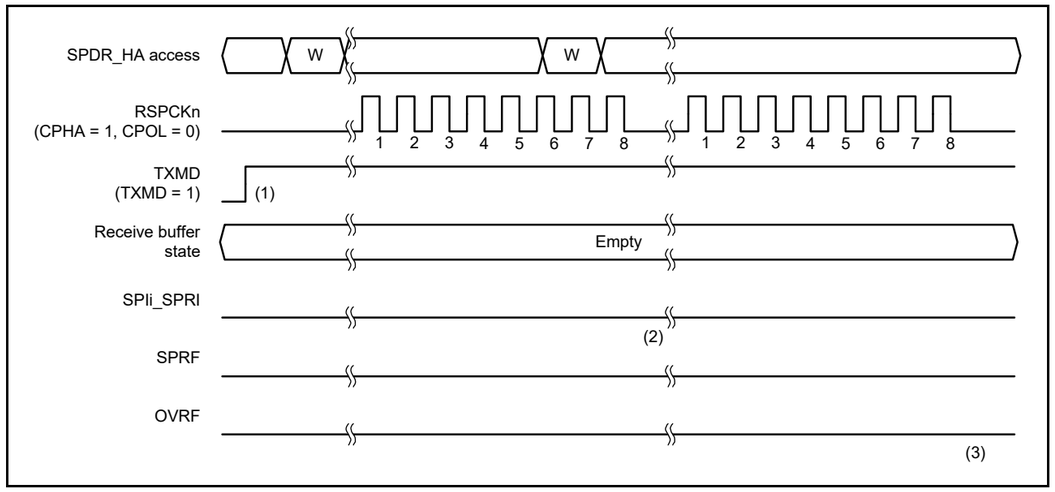

Figure 34.25 Operation example when SPCR.TXMD = 1

The operation of the flags at timings (1) to (3) in Figure 34.25 is as follows:

1. Make sure there is no data left in the receive buffer (SPSR.SPRF flag is 0) and the SPSR.OVRF flag is 0 before entering the transmit-only mode (SPCR.TXMD = 1).
2. When a serial transfer ends with the SPDR_HA receive buffer empty, if the transmit-only mode is selected (SPCR.TXMD = 1), the SPSR.SPRF flag remains 0, and the SPI does not copy the data in the shift register to the receive buffer.
3. Because the SPDR_HA receive buffer does not hold data that was received in the previous serial transfer, even when a serial transfer ends, the SPSR.OVRF flag remains 0, and the data in the shift register is not copied to the receive buffer.

In transmit-only mode (SPCR.TXMD = 1), the SPI transmits but does not receive data. Therefore, the SPSR.SPRF and SPSR.OVRF flags remain 0 at timings (1) to (3).

34.3.7 Transmit Buffer Empty and Receive Buffer Full Interrupts

Figure 34.26 and Figure 34.27 show operation examples of the transmit buffer empty interrupt (SPIi_SPTI) and the receive buffer full interrupt (SPIi_SPRI). The register accesses shown in these figures indicate the conditions of access to the SPDR_HA register, where W denotes a write cycle and R a read cycle. In Figure 34.26, the SPI performs an 8-bit serial transfer when SPCR.TXMD bit is 0, the SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 0, and the SPCMDm.CPOL bit is 0.

In Figure 34.27, the SPI performs an 8-bit serial transfer in which SPCR.TXMD bit is 0, the SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

2. 当串行传输结束时，SPDR_HA接收缓冲区保存了在先前串行传输中接收到的数据，SPI将SPSR.OVRF标志设置为1，并丢弃移位寄存器中的接收数据。

34.3.6.2 Transmit-only operations (SPCR.TXMD = 1)

图34.25显示了通信操作模式选择位(SPCR.TXMD)设置为1的操作示例。在此示例中，SPI执行8位串行传输，其中SPDCR.SPFC[1:0]位为00b，SPCMDm.CPHA位为1，SPCMDm.CPOL位为0。波形中给RSPCKn的数字表示RSPCK周期数，例如传输的位数。

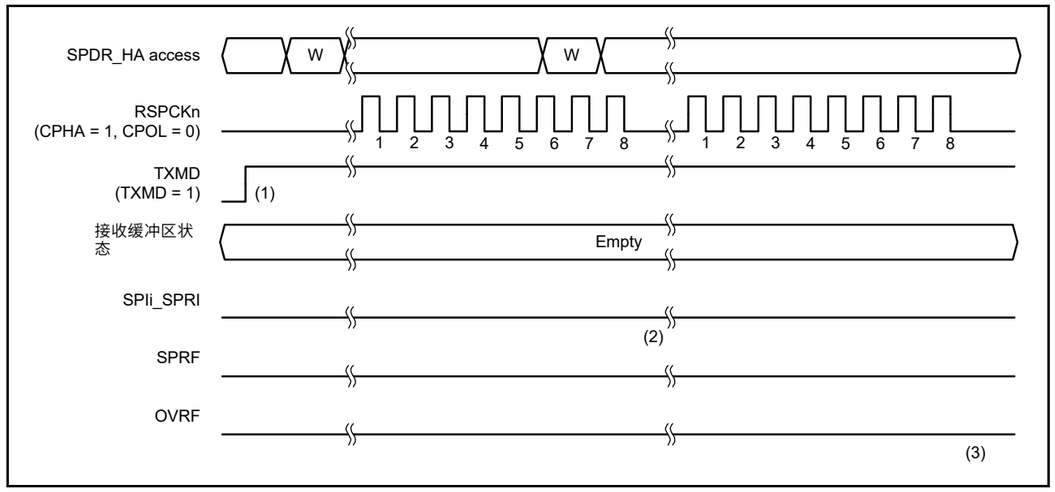

Figure 34.25 SPCR.TXMD=1时的操作示例

图34.25中时间(1)到(3)的标志操作如下：

1. 在进入仅发送模式（SPCR.TXMD=1）之前，确保接收缓冲区中没有剩余数据（SPSR.SPRF标志为0）并且SPSR.OVRF标志为0。
2. 当串行传输结束且SPDR_HA接收缓冲区为空时，如果选择了仅发送模式（SPCR.TXMD=1），则SPSR.SPRF标志保持为0，并且SPI不会将移位寄存器中的数据复制到接收缓冲区。
3. 因为SPDR_HA接收缓冲区不保存在先前串行传输中接收到的数据，所以即使串行传输结束，SPSR.OVRF标志仍保持为0，并且移位寄存器中的数据不会复制到接收缓冲区。

在仅发送模式（SPCR.TXMD=1）下，SPI发送但不接收数据。因此，SPSR.SPRF和SPSR.OVRF标志在时间(1)到(3)处保持为0。

34.3.7 发送缓冲区空和接收缓冲区满中断

图34.26和图34.27显示了发送缓冲区空中断(SPIi_SPTI)和接收缓冲区满中断(SPIi_SPRI)的操作示例。这些图中显示的寄存器访问表示访问SPDR_HA寄存器的条件，其中W表示写周期，R表示读周期。在图34.26中，当SPCR.TXMD位为0、SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为0、SPCMDm.CPOL位为0时，SPI执行8位串行传输.

在图34.27中，SPI执行8位串行传输，其中SPCR.TXMD位为0，SPDCR.SPFC[1:0]位为00b，SPCMDm.CPHA位为1，SPCMDm.CPOL位为0.波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的位数。

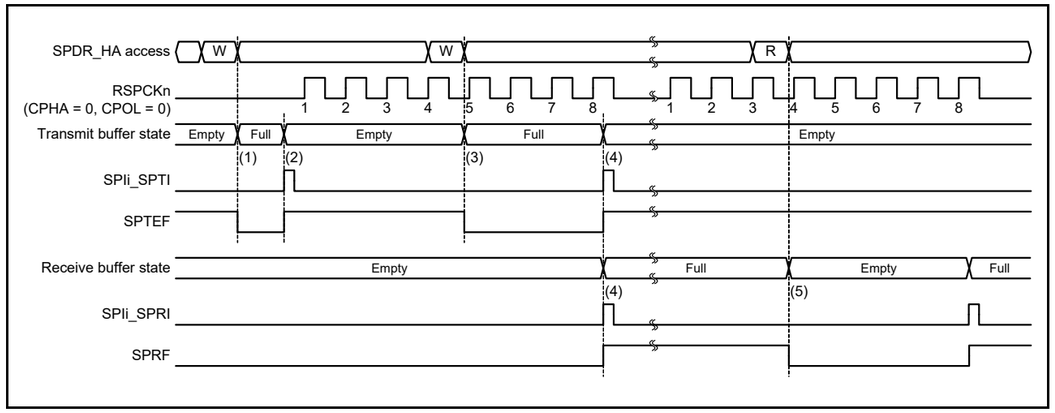

Figure 34.26 Operation example of SPIi_SPTI and SPIi_SPRI interrupts when CPHA = 0 and CPOL = 0

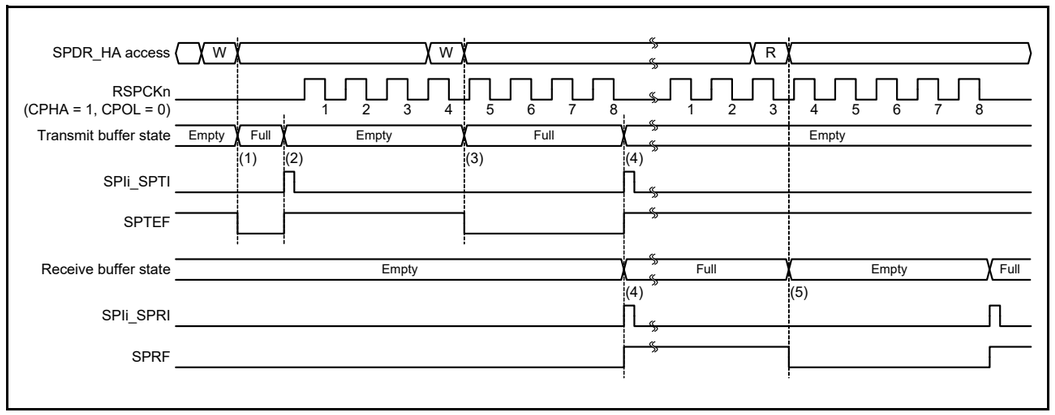

Figure 34.27 Operation example of SPIi_SPTI and SPIi_SPRI interrupts when CPHA = 1 and CPOL = 0

The operation of the SPI at timings (1) to (5) in Figure 34.27 is as follows:

1. When transmit data is written to SPDR_HA with the transmit buffer of SPDR_HA empty and data for the next transfer not set, the SPI writes data to the transmit buffer and clears the SPSR.SPTEF flag to 0.
2. If the shift register is empty, the SPI copies the data in the transmit buffer to the shift register, generates a transmit buffer empty interrupt request (SPIi_SPTI), and sets the SPSR.SPTEF flag to 1. How a serial transfer is started depends on the SPI mode. For details, see section 34.3.10, SPI Operation, and section 34.3.11, Clock Synchronous Operation.
3. When transmit data is written to SPDR_HA either by the transmit buffer empty interrupt routine, or by the processing of the transmit buffer empty using the SPTEF flag, the SPI writes data to the transmit buffer and clears the SPTEF flag to 0. Because the data being transferred serially is stored in the shift register, the SPI does not copy the data in the transmit buffer to the shift register.
4. When the serial transfer ends with the SPDR_HA receive buffer empty, the SPI copies the receive data in the shift register to the receive buffer, generates a receive buffer full interrupt request (SPIi_SPRI), and sets the SPRF flag to 1. Because the shift register becomes empty on completion of the serial transfer, if the transmit buffer is full before the serial transfer ended, the SPI sets the SPTEF flag to 1 and copies data in the transmit buffer to the shift register. Even when received data is not copied from the shift register to the receive buffer in an overrun error status, on completion of the serial transfer, the SPI determines that the shift register is empty, so data transfer from the transmit buffer to the shift register is enabled.

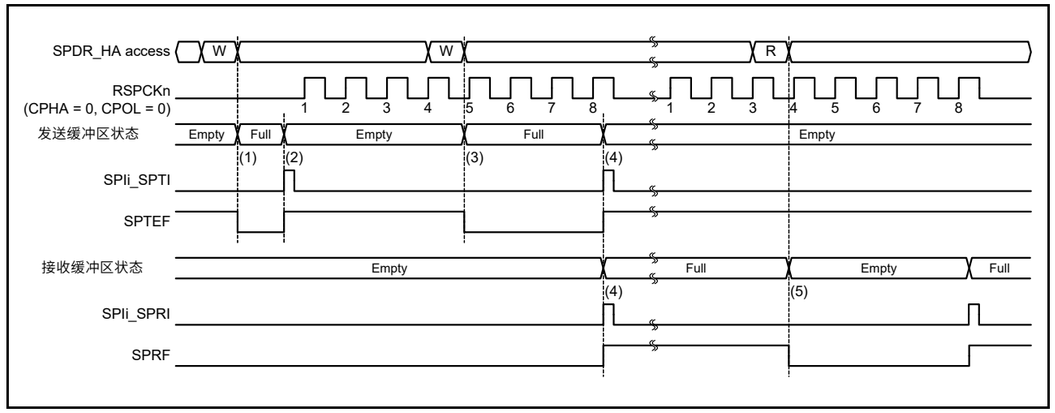

Figure 34.26 CPHA=0和CPOL=0时SPIi_SPTI和SPIi_SPRI中断的操作示例

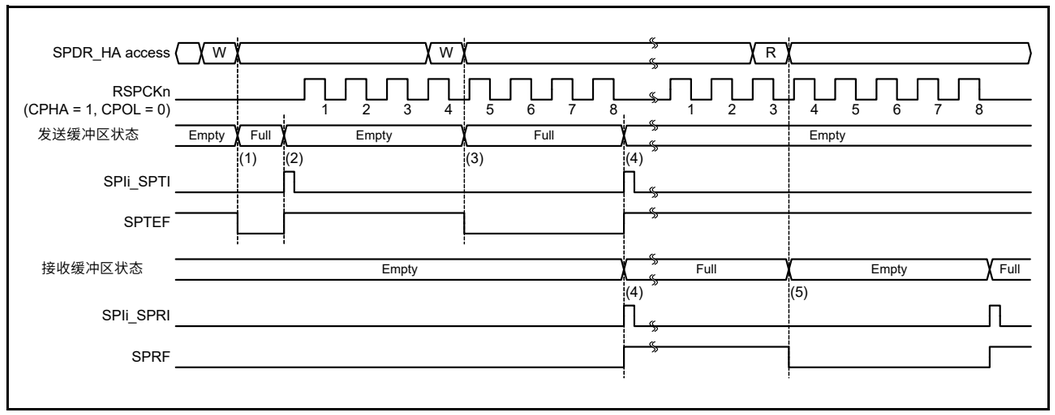

Figure 34.27 CPHA=1和CPOL=0时SPIi_SPTI和SPIi_SPRI中断的操作示例

SPI在图34.27中时序(1)到(5)的操作如下：

1. 当发送数据写入SPDR_HA且SPDR_HA的发送缓冲区为空且未设置下一次传输的数据时，SPI将数据写入发送缓冲区并将SPSR.SPTEF标志清除为0。
2. 如果移位寄存器为空，则SPI将发送缓冲区中的数据复制到移位寄存器，产生发送缓冲区空中断请求（SPIi_SPTI），并将SPSR.SPTEF标志设置为1。如何启动串行传输取决于SPI模式。有关详细信息，请参阅第34.3.10节，SPI操作和第34.3.11节，时钟同步操作。
3. 当发送数据被发送缓冲区空中断程序写入SPDR_HA时，或者通过使用SPTEF标志处理发送缓冲区空，SPI将数据写入发送缓冲区并将SPTEF标志清除为0。因为数据正在串行传输的数据存储在移位寄存器中，SPI不会将发送缓冲区中的数据复制到移位寄存器中。
4. 当串行传输结束且SPDR_HA接收缓冲区为空时，SPI将移位寄存器中的接收数据复制到接收缓冲区，产生接收缓冲区满中断请求（SPIi_SPRI），并将SPRF标志设置为1。因为移位寄存器串行传输完成后变为空，如果在串行传输结束之前发送缓冲区已满，则SPI将SPTEF标志设置为1，并将发送缓冲区中的数据复制到移位寄存器。即使在溢出错误状态下没有将接收到的数据从移位寄存器复制到接收缓冲区，在串行传输完成时，SPI会确定移位寄存器为空，因此从发送缓冲区到移位寄存器的数据传输是启用。

RA生态工作室

5. When SPDR_HA is read either by the receive buffer full interrupt routine or by the processing of the receive buffer full interrupt using the SPRF flag, the receive data can be read.

If SPDR_HA is written to when the transmit buffer holds untransmitted data (SPTEF flag is 0), the SPI does not update data in the transmit buffer. When writing to SPDR_HA, make sure to use either a transmit buffer empty interrupt request or to process a transmit buffer empty interrupt using the SPTEF flag. To use a transmit buffer empty interrupt, set the SPTIE bit in SPCR to 1. If the SPI function is disabled (SPCR.SPE bit is 0), set the SPTIE bit to 0.

When serial transfer ends with the receive buffer full (SPRF flag is 1), the SPI does not copy data from the shift register to the receive buffer, and detects an overrun error (see section 34.3.8, Error Detection). To prevent a receive data overrun error, read the received data using a receive buffer full interrupt request before the next serial transfer ends. To use an SPI receive buffer full interrupt, set the SPCR.SPRIE bit to 1.

Transmission and reception interrupts or the associated IELSRn.IR flags in the ICU, where n is the interrupt vector number, can be used to confirm the states of the transmit and receive buffers. Similarly, the SPTEF and SPRF flags can be used to confirm the states of the transmit and receive buffers. See section 14, Interrupt Controller Unit (ICU) for the interrupt vector numbers.

34.3.8 Error Detection

In normal SPI serial transfer, data written to the SPDR/SPDR_HA transmit buffer is transmitted, and received data can be read from the receive buffer of SPDR/SPDR_HA. If access is made to SPDR/SPDR_HA, an abnormal transfer might occur, depending on the status of the transmit or receive buffer, or the status of the SPI at the beginning or end of the serial transfer.

If an abnormal transfer occurs, the SPI detects the event as an underrun error, overrun error, parity error, or mode fault error. Table 34.8 lists the relationship between non-normal transfer operations and the SPI error detection function.

Table 34.8 Relationship between non-normal transfer operations and SPI error detection function

Operation	Occurrence condition	SPI operation	Error detection
1	SPDR/SPDR_HA is written when the transmit buffer is full	• The contents of the transmit buffer are kept • Write data is missing.	None
2	SPDR/SPDR_HA is read when the receive buffer is empty	The contents of the receive buffer and previously received data are output	None
3	Serial transfer is started in slave mode when the SPI is not able to transmit data	• Serial transfer is suspended • Transmit or receive data is missing • Driving of the MISOA output signal is stopped • SPI function is disabled.	Underrun error
4	Serial transfer terminates when the receive buffer is full	• The contents of the receive buffer are kept • Receive data is missing.	Overrun error
5	An incorrect parity bit is received during full-duplex synchronous serial communications with the parity function enabled	The parity error flag is asserted	Parity error
6	The SSLn0 input signal is asserted when the serial transfer is idle in multi-master mode	• Driving of the RSPCKn, MOSIn, SSLn1 to SSLn3 output signals is stopped • SPI function is disabled.	Mode fault error
7	The SSLn0 input signal is asserted during serial transfer in multi-master mode	• Serial transfer is suspended • Transmit or receive data is missing • Driving of the RSPCKn, MOSIn, SSLn1 to SSLn3 output signals is stopped • SPI function is disabled.	Mode fault error
8	The SSLn0 input signal is negated during serial transfer in slave mode	• Serial transfer is suspended • Missing transmit/receive data • Driving of the MISOn output signal is stopped • SPI function is disabled.	Mode fault error

In operation 1 described in Table 34.8, the SPI does not detect an error. To prevent data omission during writes to SPDR/SPDR_HA, the writes to SPDR/SPDR_HA must be executed using a transmit buffer empty interrupt request (when SPSR.SPTEF flag is 1). Similarly, the SPI does not detect an error in operation 2. To prevent extraneous data from

5. 当接收缓冲区满中断程序或使用SPRF标志处理接收缓冲区满中断读取SPDR_HA时，可以读取接收数据。

如果在发送缓冲区保存未发送数据（SPTEF标志为0）时写入SPDR_HA，则SPI不会更新发送缓冲区中的数据。写入SPDR_HA时，请确保使用发送缓冲区空中断请求或使用SPTEF标志处理发送缓冲区空中断。要使用发送缓冲区空中断，请将SPCR中的SPTIE位设置为1。如果禁用SPI功能（SPCR.SPE位为0），请将SPTIE位设置为0。

当串行传输以接收缓冲区满（SPRF标志为1）结束时，SPI不会将数据从移位寄存器复制到接收缓冲区，并检测到溢出错误（参见第34.3.8节，错误检测）。为防止接收数据溢出错误，请在下一次串行传输结束前使用接收缓冲区满中断请求读取接收数据。要使用SPI接收缓冲区满中断，请将SPCR.SPRIE位设置为1。

ICU中的发送和接收中断或相关的IELSRn.IR标志，其中n是中断向量号，可用于确认发送和接收缓冲区的状态。类似地，SPTEF和SPRF标志可用于确认发送和接收缓冲区的状态。有关中断向量编号，请参见第14节，中断控制器单元(ICU)。

34.3.8 错误检测

在正常的SPI串行传输中，写入到SPDRSPDR_HA发送缓冲区的数据被发送，接收到的数据可以从SPDRSPDR_HA的接收缓冲区中读取。如果访问SPDRSPDR_HA，可能会发生异常传输，具体取决于发送或接收缓冲区的状态，或者串行传输开始或结束时SPI的状态。

如果发生异常传输，SPI会将事件检测为欠载错误、溢出错误、奇偶校验错误或模式故障错误。表34.8列出了非正常传输操作和SPI错误检测功能之间的关系。

Table 34.8 非正常传输操作与SPI错误检测功能的关系

Operation	发生条件	SPI操作	错误检测
1	SPDRSPDR_HA在发送缓冲区已满时写入	发送缓冲区的内容被保留 写数据丢失。	None
2	SPDR接收缓冲区为空时读取SPDR_HA	输出接收缓冲区的内容和先前接收的数据	None
3	当SPI无法传输数据时，串行传输在从模式下启动	串行传输暂停 发送或接收数据丢失 MISOA输出信号的驱动已停止 SPI功能已禁用。	Underrun error
4	当接收缓冲区已满时串行传输终止	接收缓冲区的内容被保留 接收数据丢失。	溢出错误
5	在启用奇偶校验功能的全双工同步串行通信期间接收到错误的奇偶校验位	奇偶错误标志被置位	奇偶校验错误
6	当串行传输在多主模式下空闲时，SSLn0输入信号被置位	停止驱动RSPCKn、MOSIn、SSLn1至SSLn3输出信号 禁用SPI功能。	模式故障错误
7	SSLn0输入信号在多主机模式下的串行传输期间被置位	串行传输暂停 发送或接收数据丢失 RSPCK MOSIn、SSLn1至SSLn3输出信号的驱动已停止 SPI功能已禁用。	模式故障错误
8	SSLn0输入信号在从机模式下的串行传输期间被否定	串行传输暂停 缺少发送接收数据 停止MIOn输出信号的驱动 禁用SPI功能。	模式故障错误

在表34.8中描述的操作1中，SPI未检测到错误。为了防止写入过程中的数据遗漏SPDRSPDR_HA，必须使用发送缓冲区空中断请求（当SPSR.SPTEF标志为1时）执行对SPDRSPDR_HA的写入。同样，SPI不会检测到操作2中的错误。为了防止无关数据从

being read, SPDR/SPDR_HA reads must be executed using an SPI receive buffer full interrupt request (when SPSR.SPRF flag is 1).

For information on the other errors, see the following sections:

- Underrun errors, indicated in operation 3, see section 34.3.8.4, Underrun errors
- Overrun errors, indicated in operation 4, see section 34.3.8.1, Overrun errors
- Parity errors, indicated in operation 5, see section 34.3.8.2, Parity errors
- Mode fault error, indicated in operations 6 to 8, see section 34.3.8.3, Mode fault errors.

For the transmit and receive interrupts, see section 34.3.7, Transmit Buffer Empty and Receive Buffer Full Interrupts.

34.3.8.1 Overrun errors

If a serial transfer ends when the receive buffer of SPDR/SPDR_HA is full, the SPI detects an overrun error and sets the SPSR.OVRF flag to 1. When the OVRF flag is 1, the SPI does not copy data from the shift register to the receive buffer, so the data before the error occurrence is saved in the receive buffer. To set the OVRF flag to 0, write 0 to it after the CPU reads SPSR with the OVRF flag set to 1.

Figure 34.28 shows an example operation of the OVRF and SPRF flags. The SPSR and SPDR_HA accesses shown in Figure 34.28 indicate the condition of accesses to the register, where W denotes a write cycle and R a read cycle. In the example, the SPI performs an 8-bit serial transfer in which the SPCMDm.CPHA bit is 1 and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

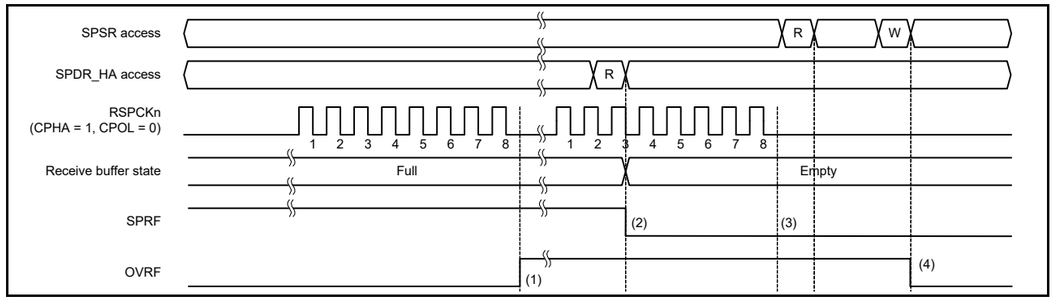

Figure 34.28 Operation example of OVRF and SPRF flags

The operation of the flags at timings (1) to (4) in Figure 34.28 is as follows:

1. If a serial transfer terminates with the SPRF flag set to 1 (receive buffer full), the SPI detects an overrun error, and sets the OVRF flag to 1. The SPI does not copy the data in the shift register to the receive buffer. Even when the SPPE bit is 1, parity errors are not detected. In master mode, the SPI copies the value of the SPCMDm pointer to the SPSSR.SPECM[2:0] bits.
2. When SPDR_HA is read, the SPI outputs the data in the receive buffer. The SPRF flag is then set to 0. The receive buffer becoming empty does not set the OVRF flag to 0.
3. If the serial transfer ends with the OVRF flag set to 1 (overrun error occurred), the SPI does not copy data in the shift register to the receive buffer (the SPRF flag is not set to 1). A receive buffer full interrupt is not generated. Even when the SPPE bit is 1, parity errors are not detected. In master mode, the SPI does not update the SPSSR.SPECM[2:0] bits. When an overrun error occurs and the SPI does not copy the received data from the shift register to the receive buffer, on termination of the serial transfer, the SPI determines that the shift register is empty. This enables data transfer from the transmit buffer to the shift register.
4. If 0 is written to the OVRF flag after SPSR is read when the OVRF flag is 1, the OVRF flag is set to 0.

The occurrence of an overrun can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. When executing a serial transfer, make sure that overrun errors are detected early, for instance, by reading SPSR immediately after SPDR_HA is read. In master mode, the value of the pointer to the SPCMDm register on the error occurrence can be checked by reading the SPSSR.SPECM[2:0] bits.

在读取时，必须使用SPI接收缓冲区满中断请求（当SPSR.SPRF标志为1时）执行SPDRSPDR_HA读取。

有关其他错误的信息，请参阅以下部分：

- 运行3中指示的欠载错误，请参阅第34.3.8.4节，欠载错误
- 操作4中指示的溢出错误，请参见第34.3.8.1节，溢出错误
- 奇偶校验错误，在操作5中指示，请参阅第34.3.8.2节，奇偶校验错误
- 模式故障错误，在操作6至8中指示，请参阅第34.3.8.3节，模式故障错误。

对于发送和接收中断，请参见第34.3.7节，发送缓冲区空和接收缓冲区满中断。

34.3.8.1 溢出错误

如果串行传输在SPDRSPDR_HA的接收缓冲区已满时结束，则SPI检测到溢出错误并将SPSR.OVRF标志设置为1。当OVRF标志为1时，SPI不会将数据从移位寄存器复制到接收缓冲区，因此错误发生前的数据保存在接收缓冲区中。要将OVRF标志设置为0，请在CPU读取OVRF标志设置为1的SPSR后向其写入0。

图34.28显示了OVRF和SPRF标志的示例操作。图34.28所示的SPSR和SPDR_HA访问表示访问寄存器的条件，其中W表示写周期，R表示读周期。在示例中，SPI执行8位串行传输，其中SPCMDm.CPHA位为1，SPCMDm.CPOL位为0。波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的位。

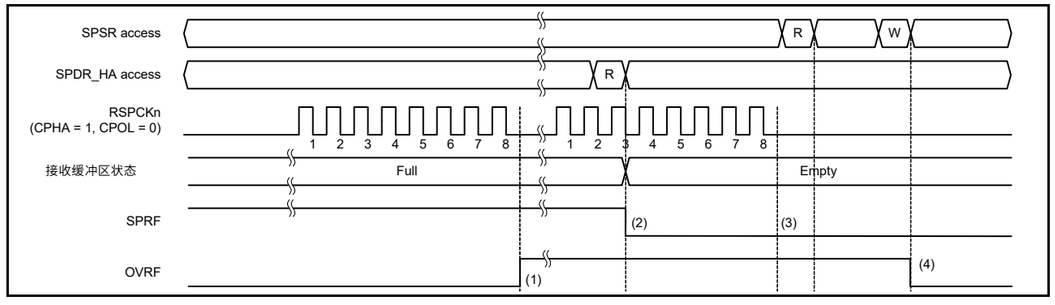

Figure 34.28 OVRF和SPRF标志的操作示例

图34.28中时间(1)到(4)的标志操作如下：

1. 如果串行传输终止且SPRF标志设置为1（接收缓冲区已满），则SPI检测到溢出错误，并将OVRF标志设置为1。SPI不会将移位寄存器中的数据复制到接收缓冲区。即使SPPE位为1，也不会检测到奇偶校验错误。在主机模式下，SPI将SPMDm指针的值复制到

   SPSSR.SPECM[2:0] bits.
2. 当读取SPDR_HA时，SPI输出接收缓冲区中的数据。然后SPRF标志设置为0。接收缓冲区变空不会将OVRF标志设置为0。
3. 如果串行传输结束时OVRF标志设置为1（发生溢出错误），则SPI不会将移位寄存器中的数据复制到接收缓冲区（SPRF标志未设置为1）。不产生接收缓冲区满中断。即使SPPE位为1，也不会检测到奇偶校验错误。在主模式下，SPI不更新

   SPSSR.SPECM[2:0]位。当发生溢出错误并且SPI没有将接收到的数据从移位寄存器复制到接收缓冲区时，在串行传输终止时，SPI确定移位寄存器为空。这使数据能够从发送缓冲器传输到移位寄存器。
4. 如果在OVRF标志为1时读取SPSR后将0写入OVRF标志，则OVRF标志设置为0。

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查溢出的发生。执行串行传输时，请确保及早检测到溢出错误，例如，在读取SPDR_HA后立即读取SPSR。在主模式下，可以通过读取SPSSR.SPECM[2:0]位来检查发生错误时指向SPCMDm寄存器的指针的值。

If an overrun error occurs and the OVRF flag is set to 1, normal reception operations cannot be performed until the OVRF flag is set to 0.

When the RSPCK auto-stop function is enabled in master mode, an overrun error does not occur. Figure 34.29 and Figure 34.30 show the clock stop waveform when a serial transfer continues while the receive buffer is full in master mode.

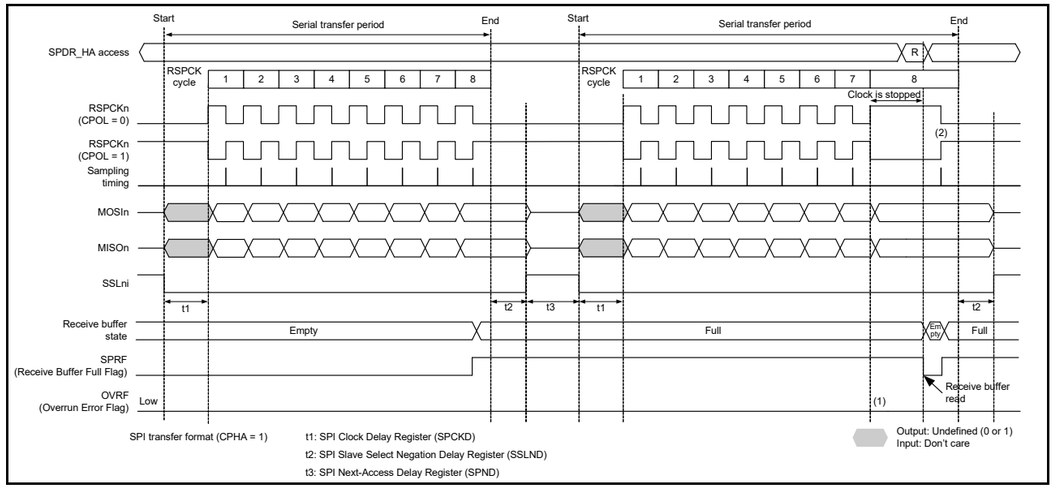

Figure 34.29 Clock stop waveform when serial transfer continues while receive buffer is full in master mode with CPHA = 1

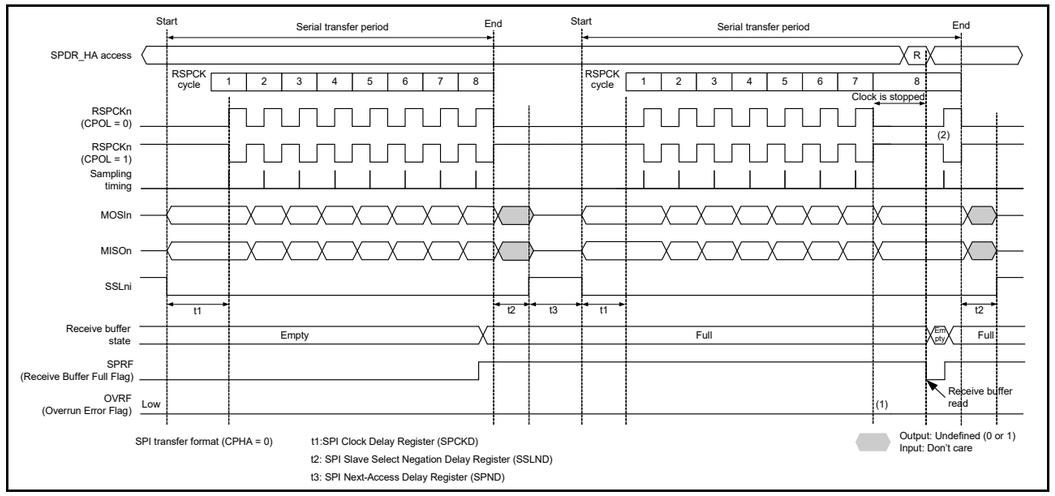

Figure 34.30 Clock stop waveform when serial transfer continues while receive buffer is full in master mode with CPHA = 0

The operation of the flags at timings (1) and (2) in Figure 34.29 and Figure 34.30 is as follows:

1. When the receive buffer is full, an overrun error does not occur because the RSPCK clock is stopped.
2. If SPDR_HA is read while the clock is stopped, data in the receive buffer can be read. The RSPCK clock restarts after reading the receive buffer (after SPSR.SPRF is set to 0).

如果发生溢出错误并且OVRF标志设置为1，则无法执行正常的接收操作，直到OVRF标志设置为0。

在主机模式下启用RSPCK自动停止功能时，不会发生溢出错误。图34.29和图34.30显示了在主机模式下接收缓冲区已满时串行传输继续时的时钟停止波形。

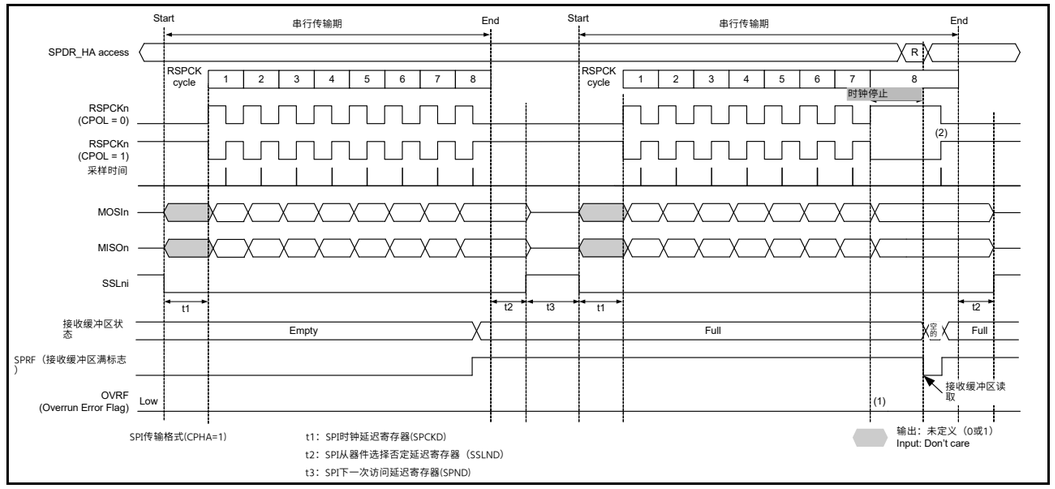

Figure 34.29 在CPHA=1的主模式下，当接收缓冲区已满时串行传输继续时的时钟停止波形

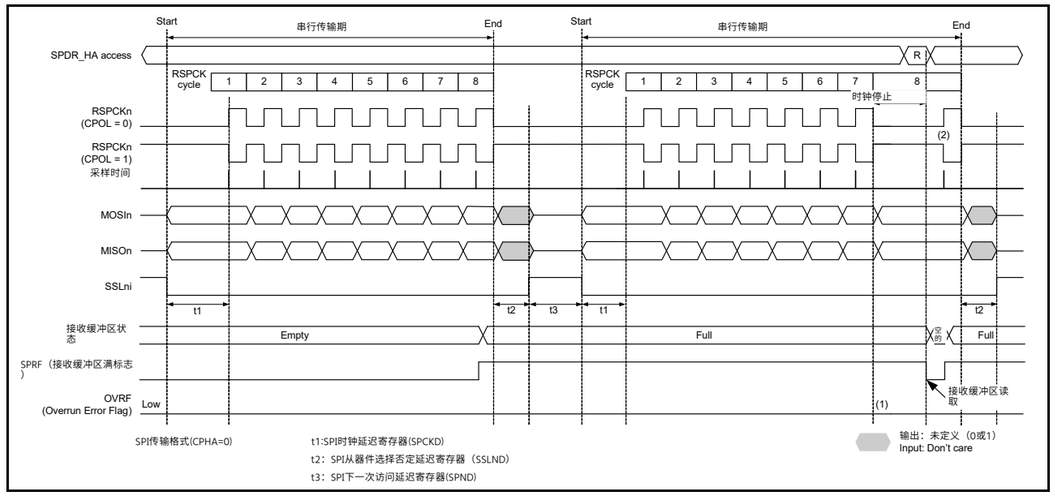

Figure 34.30 在CPHA=0的主模式下，当接收缓冲区已满时串行传输继续时的时钟停止波形

图34.29和图34.30中时间(1)和(2)的标志操作如下：

1. 当接收缓冲器已满时，不会发生溢出错误，因为RSPCK时钟已停止。
2. 如果在时钟停止时读取SPDR_HA，则可以读取接收缓冲区中的数据。RSPCK时钟在读取接收缓冲区后重新启动（在SPSR.SPRF设置为0之后）。

34.3.8.2 Parity errors

When full-duplex synchronous serial communication is performed with the SPCR.TXMD bit set to 0 and the SPCR2.SPPE bit set to 1, the SPI checks for parity errors when serial transfer ends. On detecting a parity error in the received data, the SPI sets the SPSR.PERF flag to 1. Because the SPI does not copy data in the shift register to the receive buffer when the SPSR.OVRF flag is set to 1, parity error detection is not performed for the received data. To set the PERF flag to 0, write 0 to the PERF flag after the SPSR register is read with the PERF flag set to 1.

Figure 34.31 shows an example operation of the OVRF and PERF flags. The SPSR access shown in Figure 34.31 indicates the condition of access to the SPSR register, where W denotes a write cycle, and R a read cycle. In the example, full-duplex synchronous serial communication is performed while the SPCR.TXMD bit is 0 and the SPCR2.SPPE bit is 1. The SPI performs an 8-bit serial transfer in which SPCMDm.CPHA bit is 1 and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

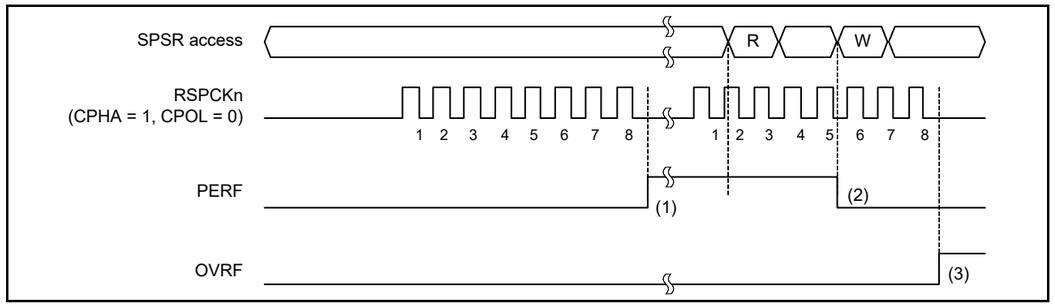

Figure 34.31 Operation example of the PERF flag

The operation of the flags at timings (1) to (3) in Figure 34.31 is as follows:

1. If a serial transfer terminates with the SPI not detecting an overrun error, the SPI copies the data in the shift register to the receive buffer. The SPI checks the received data at this time and sets the PERF flag to 1 if a parity error is detected. In master mode, the SPI copies the value of the SPCMDm pointer to the SPSSR.SPECM[2:0] bits.
2. If 0 is written to the PERF flag after the SPSR register is read when the PERF flag is 1, the PERF flag is set to 0.
3. When the SPI detects an overrun error and serial transfer is terminated, the data in the shift register is not copied to the receive buffer. The SPI does not perform parity error detection at this time.

Parity errors can be checked by reading the SPSR register or by using an SPI error interrupt and reading the SPSR register. When executing a serial transfer, make sure that parity errors are detected early, for instance by reading SPSR errors. When the SPI is in master mode, the pointer value to the SPCMDm register at the error occurrence can be checked by reading the SPSSR.SPECM[2:0] bits.

34.3.8.3 Mode fault errors

The SPI operates in multi-master mode when the SPCR.MSTR bit is 1, the SPCR.SPMS bit is 0, and the SPCR.MODFEN bit is 1. If the active level is input for the SSLn0 input signal of the SPI in multi-master mode, the SPI detects a mode fault error regardless of the status of the serial transfer, and sets the SPSR.MODF flag to 1. On detecting the mode fault error, the SPI copies the value of the SPCMDm pointer to the SPSSR.SPECM[2:0] bits. The active level of the SSLn0 signal is determined by the SSLP.SSL0P bit.

When the MSTR bit is 0, the SPI operates in slave mode. The SPI detects a mode fault error if the MODFEN bit of the SPI in slave mode is 1, and the SPMS bit is 0, and if the SSLn0 input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched).

On detecting a mode fault error, the SPI stops the driving of output signals and clears the SPCR.SPE bit to 0 (see section 34.3.9, Initializing the SPI). For multi-master configuration, detection of a mode fault error is used to stop the driving of output signals and the SPI function, which allows the master to be released.

The occurrence of a mode fault error can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. Detecting mode fault errors without using the SPI error interrupt requires polling of SPSR. When using

34.3.8.2 奇偶校验错误

当SPCR.TXMD位设置为0且
SPCR2.SPPE位设置为1，SPI在串行传输结束时检查奇偶校验错误。在接收到的数据中检测到奇偶校验错误时，SPI将SPSR.PERF标志设置为1。因为当SPSR.OVRF标志设置为1时，SPI不会将移位寄存器中的数据复制到接收缓冲区，所以奇偶校验错误检测不针对接收到的数据执行。要将PERF标志设置为0，请在读取SPSR寄存器并将PERF标志设置为1后将0写入PERF标志。

图34.31显示了OVRF和PERF标志的示例操作。图34.31所示的SPSR访问表示访问SPSR寄存器的条件，其中W表示写周期，R表示读周期。在示例中，当SPCR.TXMD位为0且SPCR2.SPPE位为1时执行全双工同步串行通信。SPI执行其中SPCMDm.CPHA位为1和SPCMDm的8位串行传输。CPOL位为0。波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的位数。

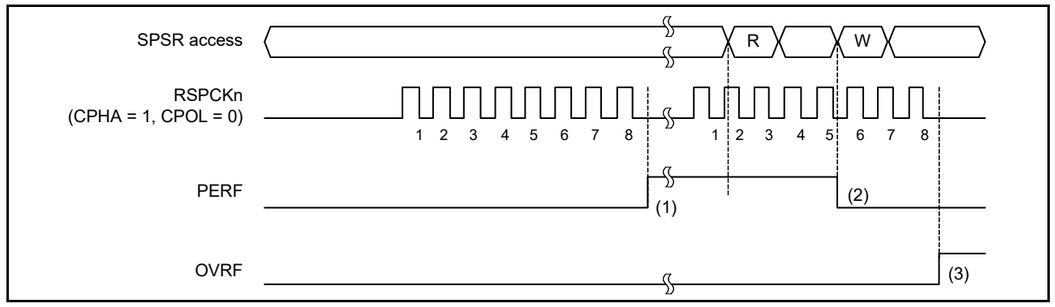

Figure 34.31 PERF标志的操作示例

图34.31中时序(1)到(3)的标志操作如下：

1. 如果串行传输因SPI未检测到溢出错误而终止，则SPI将移位寄存器中的数据复制到接收缓冲区。此时SPI会检查接收到的数据，如果检测到奇偶校验错误，则将PERF标志设置为1。在主模式下，SPI将SPCMDm指针的值复制到SPSSR.SPECM[2:0]位。
2. 如果在PERF标志为1时读取SPSR寄存器后将0写入PERF标志，则PERF标志设置为0。
3. 当SPI检测到溢出错误并终止串行传输时，移位寄存器中的数据不会复制到接收缓冲区。此时SPI不执行奇偶校验错误检测。

可以通过读取SPSR寄存器或使用SPI错误中断并读取SPSR寄存器来检查奇偶校验错误。执行串行传输时，请确保尽早检测到奇偶校验错误，例如通过读取SPSR错误。当SPI处于主机模式时，可以通过读取SPSSR.SPECM[2:0]位来检查发生错误时指向SPCMDm寄存器的指针值。

34.3.8.3 模式故障错误

当SPCR.MSTR位为1、SPCR.SPMS位为0且
SPCR.MODFEN位为1。如果在多主机模式下SPI的SSLn0输入信号输入有效电平，则无论串行传输的状态如何，SPI都会检测到模式故障错误，并设置SPSR.MODF标志为1.在检测到模式故障错误时，SPI将SPCMDm指针的值复制到SPSSR.SPECM[2:0]位。SSLn0信号的有效电平由SSLP.SSL0P位决定。

当MSTR位为0时，SPI工作在从机模式。如果从机模式下SPI的MODFEN位为1，SPMS位为0，并且在串行传输期间（从驱动有效数据开始开始到获取最终有效数据的时间）。

在检测到模式故障错误时，SPI会停止驱动输出信号并将SPCR.SPE位清除为0（请参阅第34.3.9节，初始化SPI）。对于多主机配置，检测到模式故障错误用于停止驱动输出信号和SPI功能，从而释放主机。

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查模式故障错误的发生。在不使用SPI错误中断的情况下检测模式故障错误需要轮询SPSR。使用时

the SPI in master mode, the value of the pointer to the SPCMDm register at the occurrence of the error can be checked by reading the SPSSR.SPECM[2:0] bits.

When the MODF flag is 1, writing 1 to the SPE bit is ignored by the SPI. To enable the SPI function after the detection of a mode fault error, the MODF flag must be set to 0.

34.3.8.4 Underrun errors

When a serial transfer begins with the SPCR.MSTR bit set to 0 (slave mode), the SPCR.SPE bit is set to 1 and the transmission data not prepared, the SPI detects an underrun error. The SPI then sets the SPSR.MODF and SPSR.UDRF flags to 1. On detecting an underrun error, the SPI stops the driving of output signals and clears the SPCR.SPE bit to 0 (see section 34.3.9, Initializing the SPI).

The occurrence of an underrun error can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. Detecting underrun errors without using the SPI error interrupt requires polling of SPSR.

When the MODF flag is 1, writing 1 to the SPE bit is ignored by the SPI. To enable the SPI function after the detection of an underrun error, the MODF flag must be set to 0.

34.3.9 Initializing the SPI

If 0 is written to the SPCR.SPE bit or if the SPI sets the SPE bit to 0 because it detected a mode fault error or an underrun error, the SPI disables the SPI function and initializes some of the module functions. When a system reset occurs, the SPI initializes all of the module functions. This section describes initialization by clearing of the SPCR.SPE bit, and by a system reset.

34.3.9.1 Initialization by clearing the SPE bit

When the SPCR.SPE bit is set to 0, the SPI initializes by:

- Suspending any serial transfer that is being executed
- Stopping the driving of output signals (Hi-Z) in slave mode
- Initializing the internal state of the SPI
- Initializing the transmit buffer of the SPI (SPSR.SPTEF flag is set to 1).

Initialization by clearing of the SPE bit does not initialize the control bits of the SPI. For this reason, the SPI can be started in the same transfer mode that is in use before initialization when the SPE bit is set to 1 again.

The SPRF, OVRF, MODF, PERF and UDRF flags in the SPSR register are not initialized, and the SPI Sequence Status Register (SPSSR) is not initialized. Therefore, even after the SPI is initialized, data from the receive buffer can be read to check the error status during an SPI transfer.

The transmit buffer is initialized to an empty state (SPSR.SPTEF flag is set to 1). Therefore, if the SPCR.SPTIE bit is set to 1 after SPI initialization, a transmit buffer empty interrupt is generated. When the SPI is initialized, to disable any transmit buffer empty interrupts, write 0 to the SPTIE bit simultaneously while writing 0 to the SPE bit.

34.3.9.2 Initialization by system reset

A system reset completely initializes the SPI by initializing all bits that control the SPI, the status bits, and the data registers, in addition to meeting the requirements described in section 34.3.9.1, Initialization by clearing the SPE bit.

34.3.10 SPI Operation

34.3.10.1 Master mode operation

The only difference between single-master mode and multi-master mode operation is the use of mode fault error detection (see section 34.3.8, Error Detection). In single-master mode, the SPI does not detect mode fault errors whereas in multi-master mode, it does. This section explains the operations that are common to both modes.

(1) Starting serial transfer

The SPI updates the data in the transmit buffer (SPTX) when data is written to the SPI Data Register (SPDR/SPDR_HA) with the SPI transmit buffer is empty, and data for the next transfer is not set (SPSR.SPTEF flag is 1). When the shift

SPI在主模式下，在发生错误时指向SPCMDm寄存器的指针的值可以通过读取SPSSR.SPECM[2:0]位来检查。

当MODF标志为1时，向SPE位写入1会被SPI忽略。要在检测到模式故障错误后启用SPI功能，MODF标志必须设置为0。

34.3.8.4 Underrun errors

当串行传输开始时SPCR.MSTR位设置为0（从模式），SPCR.SPE位设置为1且未准备好传输数据，SPI检测到欠载错误。然后SPI将SPSR.MODF和SPSR.UDRF标志设置为1。在检测到欠载错误时，SPI停止驱动输出信号并将SPCR.SPE位清除为0（参见第34.3.9节，初始化SPI）.

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查欠载错误的发生。在不使用SPI错误中断的情况下检测欠载错误需要轮询SPSR。

当MODF标志为1时，向SPE位写入1会被SPI忽略。要在检测到欠载错误后启用SPI功能，MODF标志必须设置为0。

34.3.9 初始化SPI

如果将0写入SPCR.SPE位，或者如果SPI由于检测到模式故障错误或欠载错误而将SPE位设置为0，则SPI将禁用SPI功能并初始化一些模块功能。发生系统复位时，SPI会初始化所有模块功能。本节介绍通过清除SPCR.SPE位和系统复位进行的初始化。

34.3.9.1 通过清除SPE位进行初始化

当SPCR.SPE位设置为0时，SPI通过以下方式初始化：

- 暂停正在执行的任何串行传输
- 在从模式下停止驱动输出信号(Hi-Z)
- 初始化SPI的内部状态
- 初始化SPI的发送缓冲区（SPSR.SPTEF标志设置为1）。

通过清除SPE位进行的初始化不会初始化SPI的控制位。因此，当SPE位再次设置为1时，SPI可以在初始化之前使用的相同传输模式下启动。

SPSR寄存器中的SPRF、OVRF、MODF、PERF和UDRF标志未初始化，SPI序列状态寄存器（SPSSR）未初始化。因此，即使在SPI初始化之后，也可以从接收缓冲区读取数据以检查SPI传输期间的错误状态。

发送缓冲区初始化为空状态（SPSR.SPTEF标志设置为1）。因此，如果SPCR.SPTIE位在SPI初始化后设置为1，则会产生发送缓冲区空中断。当SPI初始化时，要禁用任何发送缓冲区空中断，请同时将0写入SPTIE位，同时将0写入SPE位。

34.3.9.2 通过系统复位初始化

除了满足第34.3.9.1节中描述的要求之外，系统复位还通过初始化控制SPI的所有位、状态位和数据寄存器来完全初始化SPI，通过清除SPE位进行初始化。

34.3.10 SPI操作

34.3.10.1 主模式操作

单主机模式和多主机模式操作之间的唯一区别是使用模式故障错误检测（请参阅第34.3.8节，错误检测）。在单主机模式下，SPI不检测模式故障错误，而在多主机模式下，它可以。本节介绍两种模式共有的操作。

(1) 开始串行传输

当数据写入SPI数据寄存器(SPDRSPDR_HA)且SPI发送缓冲区为空且未设置下一次传输的数据（SPSR.SPTEF标志为1）时，SPI更新发送缓冲区(SPTX)中的数据.换班的时候

register is empty after the number of frames set in the SPDCR.SPFC[1:0] bits are written to the SPDR/SPDR_HA, the SPI copies data from the transmit buffer to the shift register and starts serial transfer. On copying transmit data to the shift register, the SPI changes the status of the shift register to full, and on termination of serial transfer, it changes the status of the shift register to empty. The status of the shift register cannot be referenced.

The polarity of the SSLni output pins depends on the SSLP register settings. For details on the SPI transfer format, see section 34.3.5, Transfer Format.

(2) Terminating a serial transfer

Regardless of the SPCMDm.CPHA bit setting, the SPI terminates a serial transfer after transmitting an RSPCKn edge associated with the final sampling timing. If free space is available in the receive buffer (SPRX) (SPSR.SPRF flag is 0), on termination of the serial transfer, the SPI copies data from the shift register to the receive buffer of the SPDR/SPDR_HA register.

The final sampling timing varies depending on the bit length of transfer data. In master mode, the SPI data length depends on the SPCMDm.SPB[3:0] bit setting. The polarity of the SSLni output pin depends on the SSLP register settings. For details on the SPI transfer format, see section 34.3.5, Transfer Format.

(3) Sequence control

The transfer format used in master mode is determined by the SPSCR, SPCMDm, SPBR, SPCKD, SSLND, and SPND registers.

The SPSCR register determines the sequence configuration for serial transfers that the SPI executes in master mode. The following parameters are set in the SPCMDm register:

- SSLni pin output signal value
- MSB- or LSB-first
- Data length
- Some of the bit rate settings
- RSPCK polarity/phase
- Whether SPCKD is to be referenced
- Whether SSLND is to be referenced
- Whether SPND is to be referenced.

SPBR holds some of the bit rate settings, such as the SPI clock delay value (SPCKD), the SSL negation delay value (SSLND), and the next-access delay value (SPND).

Based on the sequence length assigned in SPSCR, the SPI makes up a sequence comprised of a part or all of the SPCMDm register. The SPI contains a pointer to the SPCMDm register that makes up the sequence. The value of this pointer can be checked by reading the SPSSR.SPCP[2:0] bits. When the SPCR.SPE bit is set to 1 and the SPI function is enabled, the SPI loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. The SPI increments the pointer each time the next-access delay period for a data transfer ends. On completion of the serial transfer that corresponds to the final command in the sequence, the SPI sets the pointer to SPCMD0 to execute the sequence repeatedly.

将SPDCR.SPFC[1:0]位中设置的帧数写入SPDRSPDR_HA后，寄存器为空，SPI将数据从发送缓冲区复制到移位寄存器并开始串行传输。将发送数据复制到移位寄存器时，SPI将移位寄存器的状态更改为满，而在串行传输终止时，它将移位寄存器的状态更改为空。无法引用移位寄存器的状态。

SSLni输出引脚的极性取决于SSLP寄存器设置。有关SPI传输格式的详细信息，请参阅第34.3.5节，传输格式。

(2) 终止串行传输

无论SPMDm.CPHA位设置如何，SPI在发送与最终采样时序相关的RSPCKn边沿后终止串行传输。如果接收缓冲区(SPRX)中有可用空间（SPSR.SPRF标志为0），则在串行传输终止时，SPI将数据从移位寄存器复制到SPDRSPDR_HA寄存器的接收缓冲区。

最终的采样时序根据传输数据的位长而变化。在主机模式下，SPI数据长度取决于SPMDm.SPB[3:0]位设置。SSLni输出引脚的极性取决于SSLP寄存器设置。有关SPI传输格式的详细信息，请参阅第34.3.5节，传输格式。

(3) 顺序控制

主机模式中使用的传输格式由SPSCR、SPCMDm、SPBR、SPCKD、SSLND和SPND寄存器确定。

SPSCR寄存器确定SPI在主模式下执行的串行传输的序列配置。在SPCMDm寄存器中设置以下参数：

- SSLni管脚输出信号值
- MSB- or LSB-first
- 数据长度
- 一些比特率设置
- RSPCK polarity/phase
- 是否要引用SPCKD
- 是否要引用SSLND
- 是否要引用SPND。

SPBR保存一些比特率设置，例如SPI时钟延迟值(SPCKD)、SSL否定延迟值(SSLND)和下一次访问延迟值(SPND)。

基于在SPSCR中分配的序列长度，SPI组成一个序列，由部分或全部
SPMDm寄存器。SPI包含一个指向构成序列的SPCMDm寄存器的指针。该指针的值可以通过读取SPSSR.SPCP[2:0]位来检查。当SPCR.SPE位设置为1且SPI功能使能时，SPI加载指向SPCMD0中命令的指针，并在串行传输开始时将SPCMD0设置合并到传输格式中。每次数据传输的下一个访问延迟周期结束时，SPI都会递增指针。在完成对应于序列中最终命令的串行传输后，SPI将指针设置为SPMD0以重复执行序列。

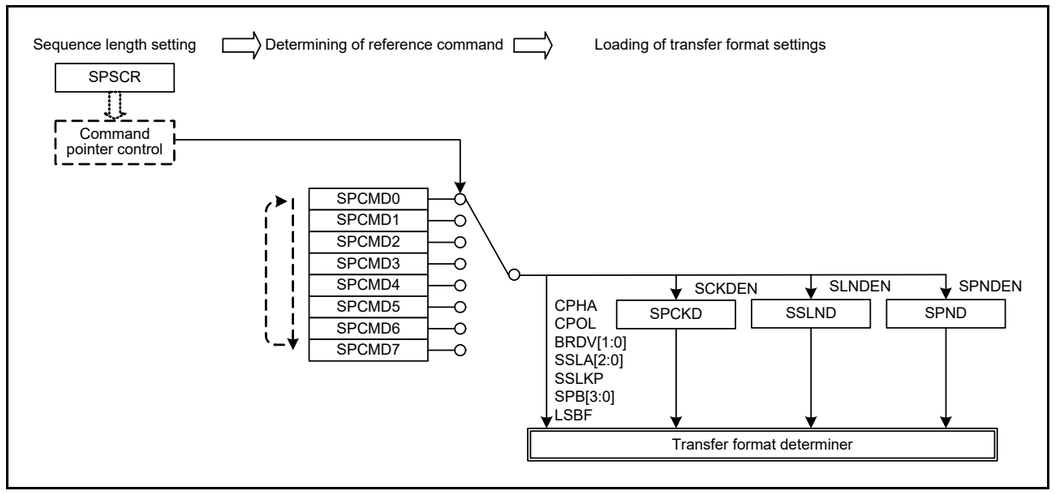

Figure 34.32 Procedure for determining serial transfer format in master mode

(4) Burst transfers

If the SPCMDm.SSLKP bit that the SPI references during the current serial transfer is 1, the SPI maintains the SSLni signal level during the serial transfer until the beginning of the SSLni signal assertion for the next serial transfer. If the SSLni signal level for the next serial transfer is the same as the SSLni signal level for the current serial transfer, the SPI can execute continuous serial transfers while keeping the SSLni signal assertion status (burst transfer).

Figure 34.35 shows an example of an SSLni signal operation for a burst transfer that is implemented using the SPCMD0 and SPCMD1 register settings. This section describes SPI operations (1) to (7) shown in Figure 34.35.

Note: The polarity of the SSLni output signal depends on the SSLP register settings.

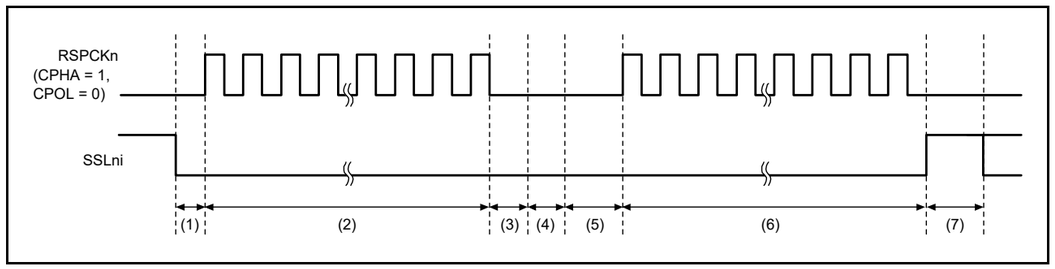

Figure 34.35 Example of burst transfer operation using the SSLKP bit

The SPI operation at timings (1) to (7) in Figure 34.35 is as follows:

1. Based on the SPCMD0 settings, the SPI asserts the SSLni signal and inserts RSPCK delays.
2. The SPI executes serial transfers according to the SPCMD0 settings.
3. The SPI inserts an SSL negation delay.
4. Because the SPCMD0.SSLKP bit is 1, the SPI keeps the SSLni signal value specified in SPCMD0. This period is sustained at a minimum for a period equal to the next-access delay in SPCMD0. If the shift register is empty after the passage of the minimum period, this period is sustained until the transmit data is stored in the shift register for the next transfer.
5. Based on the SPCMD1 settings, the SPI asserts the SSLni signal and inserts RSPCK delays.
6. The SPI executes serial transfers according to the SPCMD1 settings.
7. Because the SPCMD1.SSLKP bit is 0, the SPI negates the SSLni signal. In addition, a next-access delay is inserted according to SPCMD1.

If the SSLni signal output settings in the SPCMDm register where 1 is assigned to the SSLKP bit are different from the SSLni signal output settings in the SPCMDm register to be used in the next transfer, the SPI switches the SSLni signal status to SSLni signal assertion as shown in (5) in Figure 34.35. This corresponds to the command for the next transfer.

Note: If such an SSLni signal switching occurs, the slaves that drive the MISOn signal compete, and the collision of signal levels might occur.

The SPI in master mode references the SSLni signal operation within the module when the SSLKP bit is not used. When the SPCMDm.CPHA bit is 0, the SPI can accurately start serial transfers using the SSLni signal assertion for the next transfer that is detected internally.

(5) RSPCK delay (t1)

The RSPCK delay value of the SPI in master mode depends on the SPCMDm.SCKDEN bit setting and the SPCKD register setting. The SPI determines the SPCMDm register to be referenced during a serial transfer by pointer control, and determines the RSPCK delay value using the SPCMDm.SCKDEN bit and SPCKD, as listed in Table 34.9. For a definition of the RSPCK delay, see section 34.3.5, Transfer Format.

(4) 突发传输

如果SPI在当前串行传输期间引用的SPCMDm.SSLKP位为1，则SPI在串行传输期间保持SSLni信号电平，直到下一次串行传输的SSLni信号断言开始。如果下一次串行传输的SSLni信号电平与当前串行传输的SSLni信号电平相同，则SPI可以在保持SSLni信号断言状态（突发传输）的同时执行连续串行传输。

图34.35显示了使用SPCMD0和SPCMD1寄存器设置实现的突发传输的SSLni信号操作示例。本节介绍图34.35所示的SPI操作(1)至(7)。

Note: SSLni输出信号的极性取决于SSLP寄存器设置。

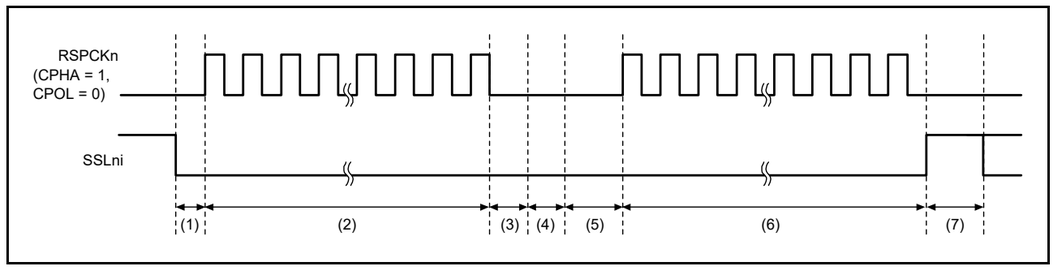

Figure 34.35 使用SSLKP位的突发传输操作示例

图34.35中时序(1)到(7)的SPI操作如下：

1. 基于SPCMD0设置，SPI断言SSLni信号并插入RSPCK延迟。
2. SPI根据SPMD0设置执行串行传输。
3. SPI插入SSL否定延迟。
4. 由于SPCMD0.SSLKP位为1，SPI保持SPCMD0中指定的SSLni信号值。该周期至少持续一段时间，等于SPMD0中的下一次访问延迟。如果在经过最小周期后移位寄存器为空，则该周期一直持续到发送数据存储在移位寄存器中以供下一次传输。
5. 基于SPCMD1设置，SPI断言SSLni信号并插入RSPCK延迟。
6. SPI根据SPMD1设置执行串行传输。
7. 因为SPCMD1.SSLKP位为0，SPI否定SSLni信号。此外，根据SPMD1插入下一个访问延迟。

如果SPCMDm寄存器中SSLKP位为1的SSLni信号输出设置与下次传输使用的SPCMDm寄存器中的SSLni信号输出设置不同，则SPI将SSLni信号状态切换为SSLni信号断言，如下所示如图34.35(5)所示。这对应于下一次传输的命令。

Note: 如果发生这样的SSLni信号切换，驱动MISon信号的从机竞争，可能会发生信号电平的冲突。

当不使用SSLKP位时，主模式下的SPI参考模块内的SSLni信号操作。当SPCMDm.CPHA位为0时，SPI可以使用SSLni信号断言准确启动串行传输，以进行内部检测到的下一次传输。

(5) RSPCK delay (t1)

主机模式下SPI的RSPCK延迟值取决于SPMDm.SCKDEN位设置和SPCKD寄存器设置。SPI通过指针控制确定串行传输期间要参考的SPCMDm寄存器，并使用SPCMDm.SCKDEN位和SPCKD确定RSPCK延迟值，如表34.9中所列。有关RSPCK延迟的定义，请参阅第34.3.5节，传输格式。

Table 34.9 Relationship between the SCKDEN bit, SPCKD register, and RSPCK delay

SPCMDm.SCKDEN bit	SPCKD.SCKDL[2:0] bits	RSPCK delay
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(6) SSL negation delay (t2)

The SSL negation delay value of the SPI in master mode depends on the SPCMDm.SLNDEN bit setting and the SSLND register setting. The SPI determines the SPCMDm register to be referenced by pointer control during a serial transfer, and determines the SSL negation delay by using the SPCMDm.SLNDEN bit and SSLND, as listed in Table 34.10. For a definition of the SSL negation delay, see section 34.3.5, Transfer Format.

Table 34.10 Relationship between the SLNDEN bit, SSLND, and SSL negation delay

SPCMDm.SLNDEN bit	SSLND.SLNDL[2:0] bits	SSL negation delay
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(7) Next-access delay (t3)

The next-access delay value of the SPI in master mode depends on the SPCMDm.SPNDEN bit setting and the SPND register setting. The SPI determines the SPCMDm register to be referenced by pointer control during serial transfer, and determines a next-access delay during serial transfer using the SPCMDm.SPNDEN bit and SPND.SPNDL[2:0] bits, as listed in Table 34.11. For a definition of the next-access delay, see section 34.3.5, Transfer Format.

Table 34.11 Relationship between the SPNDEN bit, SPND bit, and next-access delay

SPCMDm.SPNDEN bit	SPND.SPNDL[2:0] bits	Next-access delay
0	000b to 111b	1 RSPCK + 2 PCLKA
1	000b	1 RSPCK + 2 PCLKA
	001b	2 RSPCK + 2 PCLKA
	010b	3 RSPCK + 2 PCLKA
	011b	4 RSPCK + 2 PCLKA
	100b	5 RSPCK + 2 PCLKA
	101b	6 RSPCK + 2 PCLKA
	110b	7 RSPCK + 2 PCLKA
	111b	8 RSPCK + 2 PCLKA

Table 34.9 SCKDEN位、SPCKD寄存器和RSPCK延迟之间的关系

SPCMDm.SCKDEN bit	SPCKD.SCKDL[2:0] bits	RSPCK delay
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(6) SSL否定延迟(t2)

主模式下SPI的SSL否定延迟值取决于SPMDm.SLNDEN位设置和SSLND寄存器设置。SPI确定串行传输期间指针控制要引用的SPCMDm寄存器，并通过使用SPCMDm.SLNDEN位和SSLND确定SSL否定延迟，如表34.10中所列。有关SSL否定延迟的定义，请参阅第34.3.5节，传输格式。

Table 34.10 SLNDEN位、SSLND和SSL否定延迟之间的关系

SPCMDm.SLNDEN bit	SSLND.SLNDL[2:0] bits	SSL否定延迟
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(7) Next-access delay (t3)

主机模式下SPI的下一次访问延迟值取决于SPMDm.SPNDEN位设置和SPND寄存器设置。SPI确定串行传输期间指针控制要引用的SPCMDm寄存器，并使用SPCMDm.SPNDEN位和SPND.SPNDL[2:0]位确定串行传输期间的下一次访问延迟，如表34.11中所列。有关下一次访问延迟的定义，请参见第34.3.5节，传输格式。

Table 34.11 SPNDEN位、SPND位和下一次访问延迟之间的关系

SPCMDm.SPNDEN bit	SPND.SPNDL[2:0] bits	Next-access delay
0	000b to 111b	1 RSPCK + 2 PCLKA
1	000b	1 RSPCK + 2 PCLKA
	001b	2 RSPCK + 2 PCLKA
	010b	3 RSPCK + 2 PCLKA
	011b	4 RSPCK + 2 PCLKA
	100b	5 RSPCK + 2 PCLKA
	101b	6 RSPCK + 2 PCLKA
	110b	7 RSPCK + 2 PCLKA
	111b	8 RSPCK + 2 PCLKA

RA生态工作室

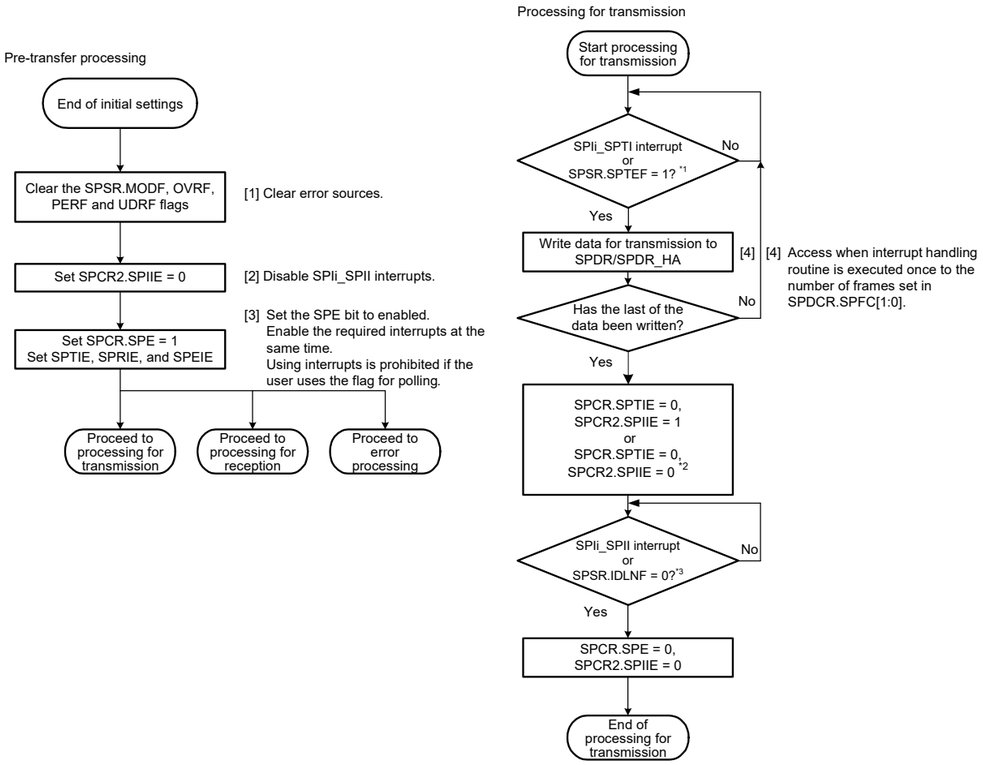
(9) Software processing flow

Figure 34.37 to Figure 34.39 show examples of the software processing flow.

(a) Transmit processing flow

When transmitting data, with the SPIi_SPII interrupt enabled, the CPU is notified of the completion of data transmission after the last data write for transmission.



Note 1. Before writing data for transmission to SPDR/SPDR_HA, check the transmit buffer empty interrupt by reading the SPSR.SPTEF flag, if the flag for polling is used.
Note 2. Setting the idle interrupt is prohibited (SPCR2.SPIIE = 0), if the flag for polling is used.
Note 3. Wait more than 1 PCLKA after writing data for transmission to SPDE and before starting to poll PSR.IDLNF, if the flag for polling is used.

Figure 34.37 Transmission flow in master mode

(b) Receive processing flow

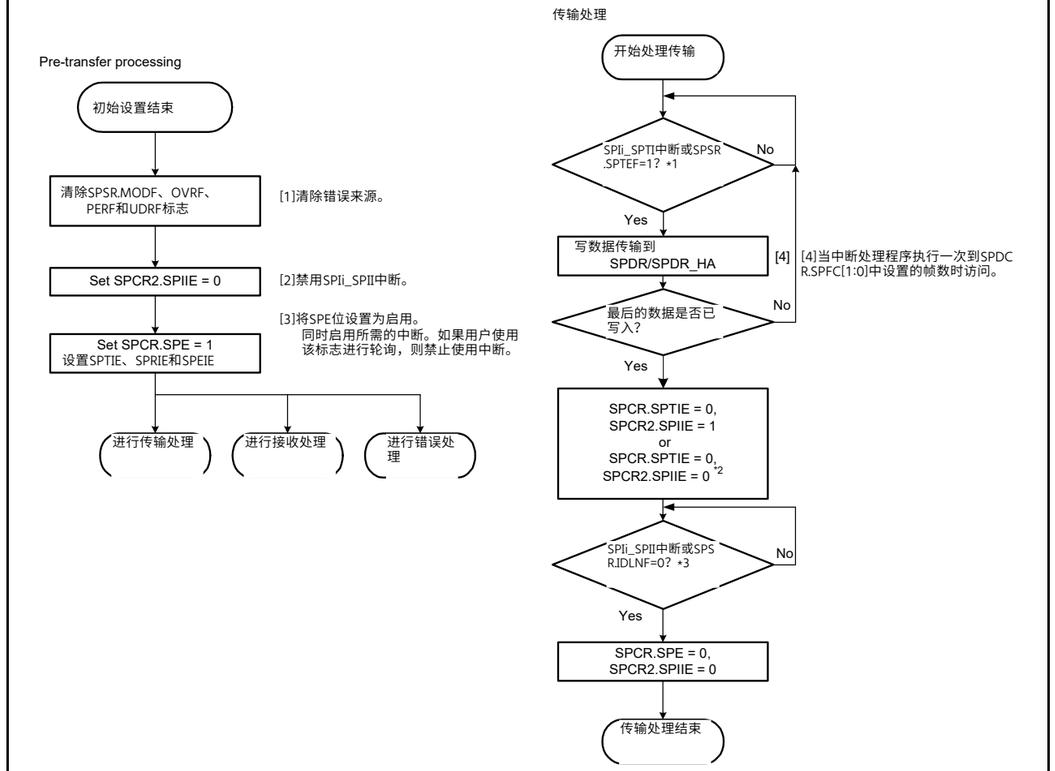
The SPI does not handle receive-only operations, so processing for transmission is required.

(9) 软件处理流程

图34.37至图34.39显示了软件处理流程的示例。

(a) 传输处理流程

发送数据时，SPIi_SPII中断使能，在最后一次数据写入发送后通知CPU数据发送完成。



Note 1. 在将数据写入SPDRSPDR_HA之前，如果使用轮询标志，则通过读取SPSR.SPTEF标志检查发送缓冲区空中断。
Note 2. 如果使用轮询标志，则禁止设置空闲中断(SPCR2.SPIIE=0)。
Note 3. 如果使用轮询标志，则在将数据写入传输到SPDE之后以及开始轮询PSR.IDLNF之前等待超过1个PCLKA。

Figure 34.37 主模式下的传输流

(b) 接收处理流程

SPI不处理只接收操作，因此需要处理传输。

RA生态工作室

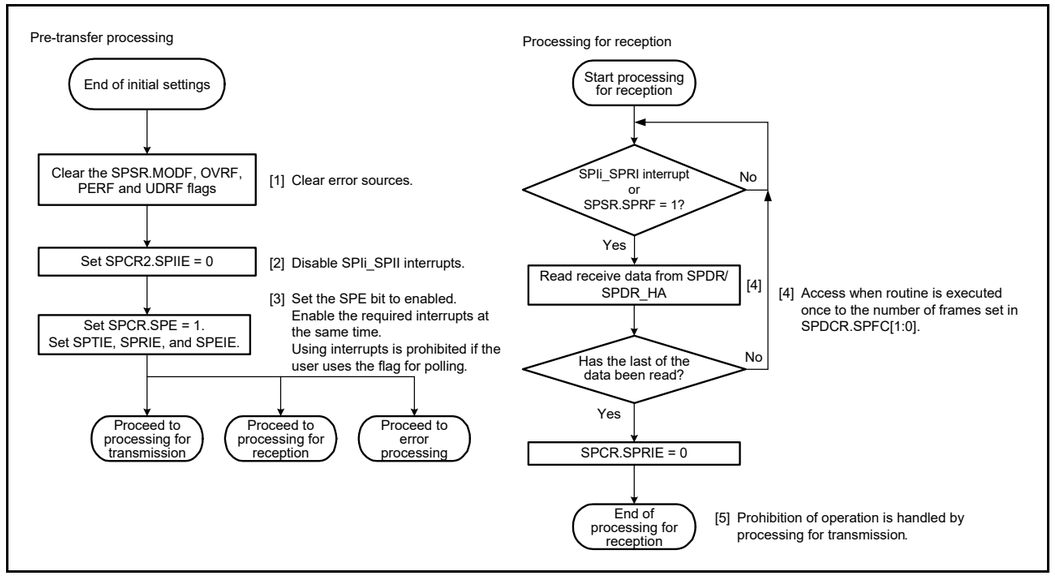


Figure 34.38 Reception flow in master mode

(c) Error processing flow

The SPI detects the following errors:

- Mode fault
- Underrun
- Overrun
- Parity.

When a mode fault error is generated, the SPCR.SPE bit is automatically cleared, stopping operations for transmission and reception. For errors from other sources, the SPCR.SPE bit is not cleared and operations for transmission and reception continue. Renesas recommends clearing the SPCR.SPE bit to stop operations for errors other than mode fault errors. Not doing so leads to updating of the SPSSR.SPECM[2:0] bits.

When an error is detected using an interrupt, clear the ICU.IELSRn.IR flag in the error processing routine. If this is not done, the ICU.IELSRn.IR flag might continue to indicate a SPIi_SPTI or SPIi_SPRI interrupt request. If an SPIi_SPRI interrupt request is indicated, read the receive buffer and initialize the sequencer in the SPI.

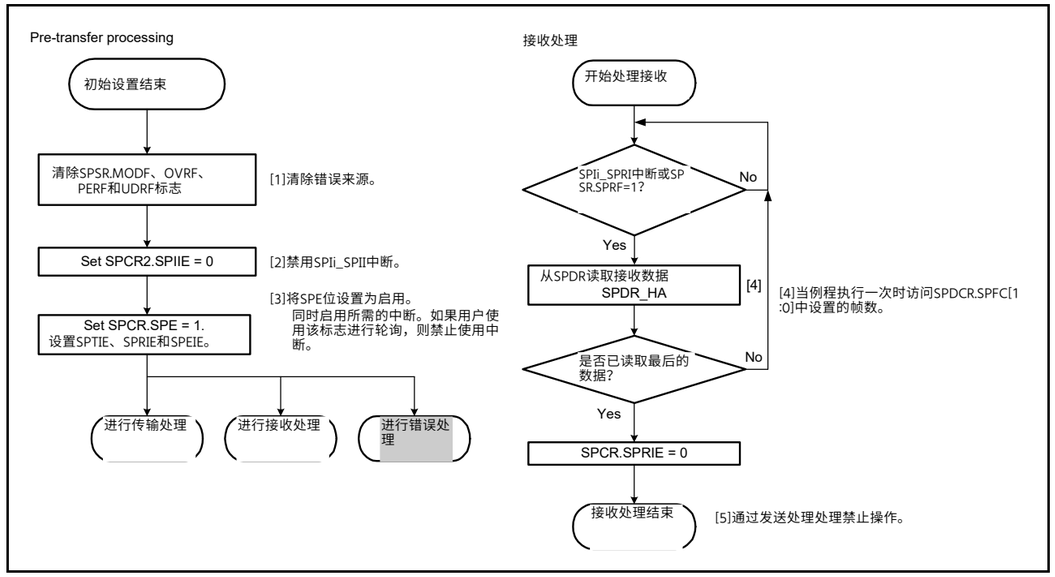

Figure 34.38 主模式下的接收流程

(c) 错误处理流程

SPI检测到以下错误：

- 模式故障
- Underrun
- Overrun
- Parity.

当产生模式故障错误时，SPCR.SPE位自动清零，停止发送和接收操作。对于其他来源的错误，SPCR.SPE位不会被清除，发送和接收操作会继续。Renesas建议清除SPCR.SPE位以停止除模式故障错误以外的错误操作。不这样做会导致更新SPSSR.SPECM[2:0]位。

当使用中断检测到错误时，清除错误处理例程中的ICU.IELSRn.IR标志。如果不这样做，ICU.IELSRn.IR标志可能会继续指示SPIi_SPTI或SPIi_SPRI中断请求。如果指示SPIi_SPRI中断请求，则读取接收缓冲区并初始化SPI中的定序器。

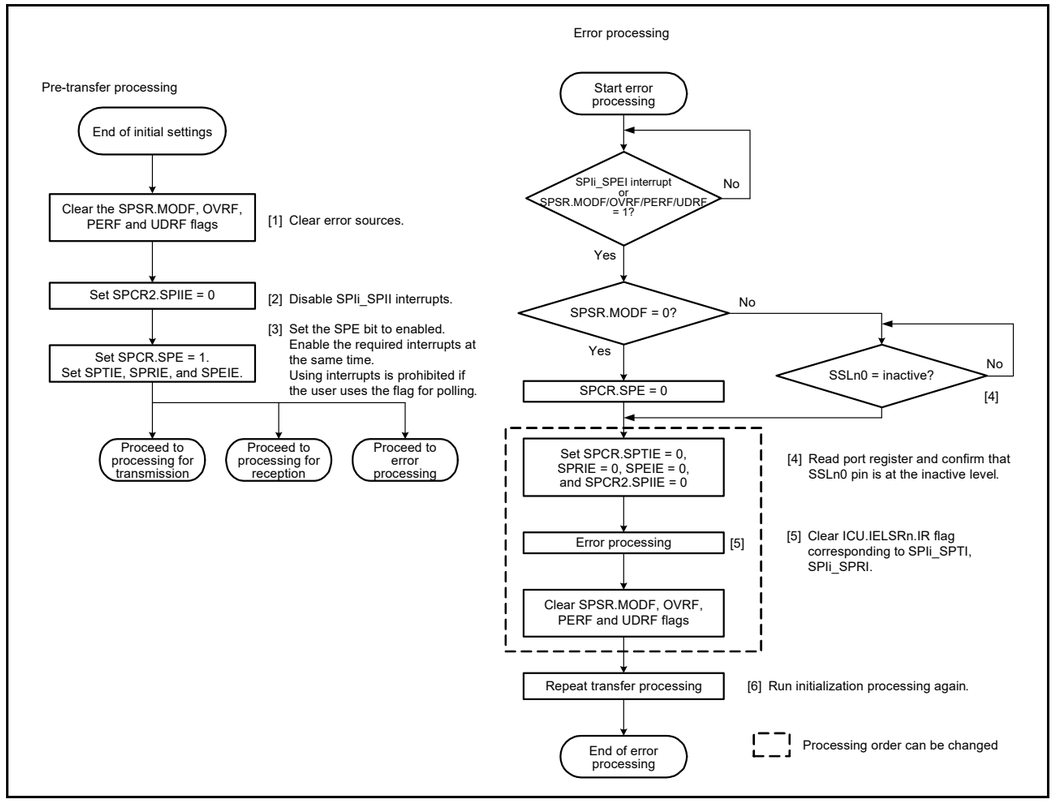

Figure 34.39 Error processing flow in master mode

34.3.10.2 Slave mode operation

(1) Starting a serial transfer

When the SPCMD0.CPHA bit is 0, if the SPI detects an SSLn0 input signal assertion, it must drive valid data to the MISOn output signal. For this reason, when the CPHA bit is 0, the assertion of the SSLn0 input signal triggers the start of a serial transfer.

When the CPHA bit is 1, if the SPI detects the first RSPCKn edge in an SSLn0 signal asserted condition, it must drive valid data to the MISOn output signal. So, when the CPHA bit is 1, the first RSPCKn edge in an SSLn0 signal asserted condition triggers the start of a serial transfer.

Regardless of the CPHA bit setting, the SPI drives the MISOn output signal on SSLn0 signal assertion. The data that is output by the SPI is either valid or invalid, depending on the CPHA bit setting.

The polarity of the SSLn0 input signal depends on the SSLP.SSL0P setting. For details on the SPI transfer format, see section 34.3.5, Transfer Format.

(2) Terminating a serial transfer

Regardless of the SPCMD0.CPHA bit setting, the SPI terminates the serial transfer after detecting an RSPCKn edge associated with the final sampling timing. When free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of a serial transfer, the SPI copies the received data from the shift register to the receive buffer of the SPDR/SPDR_HA register. On termination of a serial transfer, the SPI changes the status of the shift register to empty, regardless of the receive buffer state. A mode fault error occurs if the SPI detects an SSLn0 input signal negation from the beginning of the serial transfer to the end of the serial transfer (see section 34.3.8, Error Detection).

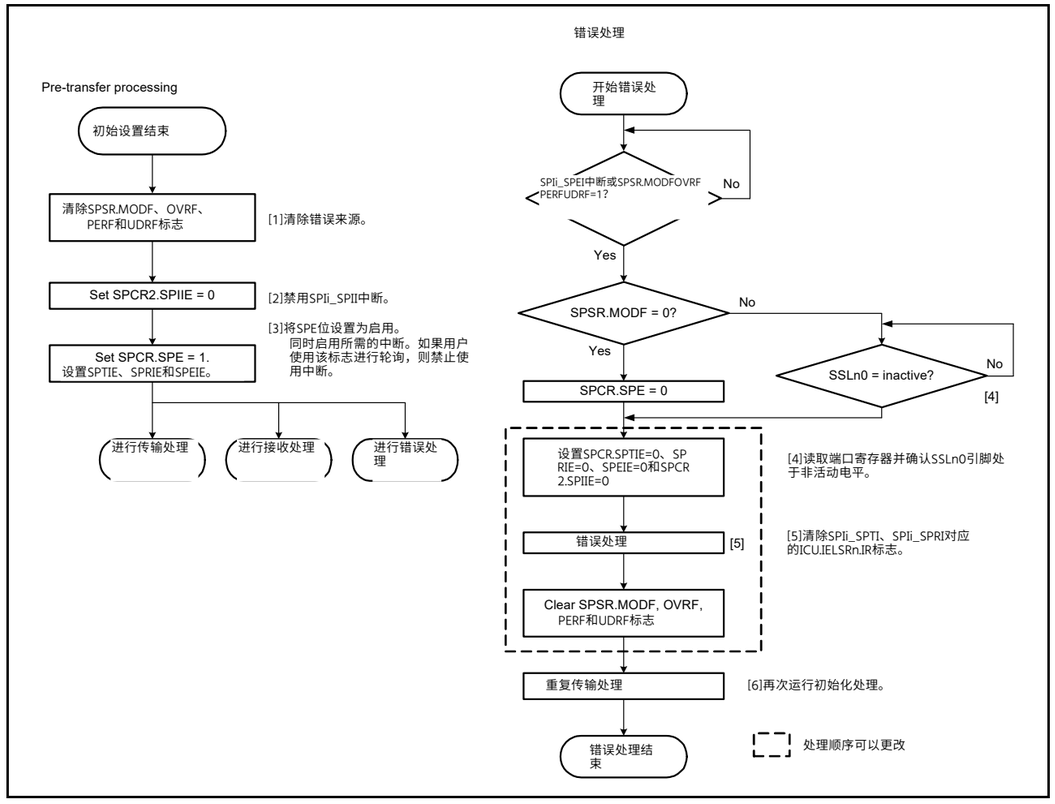

Figure 34.39 主模式下的错误处理流程

34.3.10.2 从模式操作

(1) 开始串行传输

当SPCMD0.CPHA位为0时，如果SPI检测到SSLn0输入信号断言，它必须将有效数据驱动到MISon输出信号。因此，当CPHA位为0时，SSLn0输入信号的断言触发串行传输的开始。

当CPHA位为1时，如果SPI在SSLn0信号置位条件下检测到第一个RSPCKn边沿，它必须将有效数据驱动到MISOn输出信号。因此，当CPHA位为1时，SSLn0信号置位条件中的第一个RSPCKn边沿触发串行传输的开始。

无论CPHA位设置如何，SPI都会在SSLn0信号置位时驱动MIOn输出信号。SPI输出的数据是有效还是无效，取决于CPHA位设置。

SSLn0输入信号的极性取决于SSLP.SSL0P设置。有关SPI传输格式的详细信息，请参阅第34.3.5节，传输格式。

(2) 终止串行传输

无论SPMD0.CPHA位设置如何，SPI在检测到与最终采样时序相关的RSPCKn边沿后都会终止串行传输。当接收缓冲区中有可用空间时（SPSR.SPRF标志为0），在串行传输终止时，SPI将接收到的数据从移位寄存器复制到SPDRSPDR_HA寄存器的接收缓冲区。在串行传输终止时，SPI将移位寄存器的状态更改为空，而与接收缓冲区状态无关。如果SPI从串行传输开始到串行传输结束检测到SSLn0输入信号取反，则会发生模式故障错误（请参阅第34.3.8节，错误检测）。

The final sampling timing changes depending on the bit length of the transfer data. In slave mode, the SPI data length is determined by the SPCMD0.SPB[3:0] bit setting. The polarity of the SSLn0 input signal is determined by the SSLP.SSL0P bit setting. For details on the SPI transfer format, see section 34.3.5, Transfer Format.

(3) Notes on single-slave operations

If the SPCMD0.CPHA bit is 0, the SPI starts serial transfers when it detects the assertion edge for an SSLn0 input signal. In the configuration example shown in Figure 34.7, if the SPI is in single-slave mode, the SSLn0 signal is fixed at an active state. Therefore, when the CPHA bit is set to 0, the SPI cannot correctly start a serial transfer. For the SPI to correctly execute transmit and receive operations in slave mode when the SSLn0 input signal is fixed at an active state, the CPHA bit must be set to 1. If the application requires setting the CPHA bit to 0, the SSLn0 input signal must not be fixed.

(4) Burst transfer

If the SPCMD0.CPHA bit is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSLn0 input signal. When the CPHA bit is 1, the serial transfer period is the period from the first RSPCKn edge to the sampling timing for the reception of the final bit in an SSLn0 signal active state. Even when the SSLn0 input signal remains at an active level, the SPI can accommodate burst transfers because it can detect the start of an access.

When the CPHA bit is 0, the second and subsequent serial transfers during burst transfer cannot be executed correctly.

(5) Initialization flow

Figure 34.40 shows an example of initialization flow for SPI operation when the SPI is in slave mode. For information on how to set up the ICU, DMAC, and I/O ports, see the individual block descriptions.

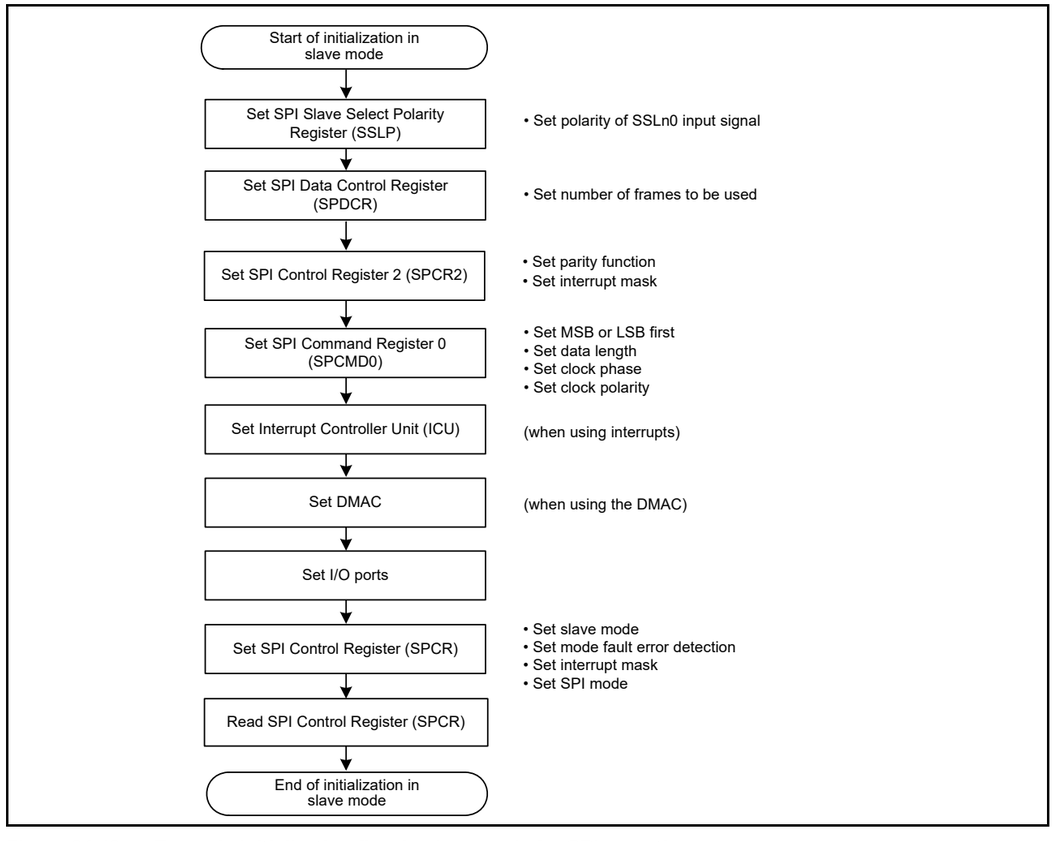

Figure 34.40 Example initialization flow in slave mode for SPI operation

最终的采样时序根据传输数据的位长而变化。在从机模式下，SPI数据长度由SPCMD0.SPB[3:0]位设置决定。SSLn0输入信号的极性由SSLP.SSL0P位设置决定。有关SPI传输格式的详细信息，请参阅第34.3.5节，传输格式。

(3) 单从操作注意事项

如果SPCMD0.CPHA位为0，则SPI在检测到SSLn0输入信号的断言边沿时开始串行传输。
在图34.7所示的配置示例中，如果SPI处于单从模式，则SSLn0信号固定在活动状态。因此，当CPHA位设置为0时，SPI无法正确启动串行传输。为使SPI在SSLn0输入信号固定为有效状态时在从机模式下正确执行发送和接收操作，必须将CPHA位设置为1。如果应用程序需要将CPHA位设置为0，则SSLn0输入信号必须不能固定。

(4) 突发传输

如果SPCMD0.CPHA位为1，则可以执行连续串行传输（突发传输），同时保持SSLn0输入信号的断言状态。当CPHA位为1时，串行传输周期是从第一个RSPCKn边沿到SSLn0信号有效状态下接收最后一个位的采样时序的周期。即使SSLn0输入信号保持有效电平，SPI也可以适应突发传输，因为它可以检测访问的开始。

当CPHA位为0时，突发传输期间的第二次和后续串行传输无法正确执行。

(5) 初始化流程

图34.40显示了SPI处于从模式时SPI操作的初始化流程示例。有关如何设置ICU、DMAC和IO端口的信息，请参阅各个模块说明。

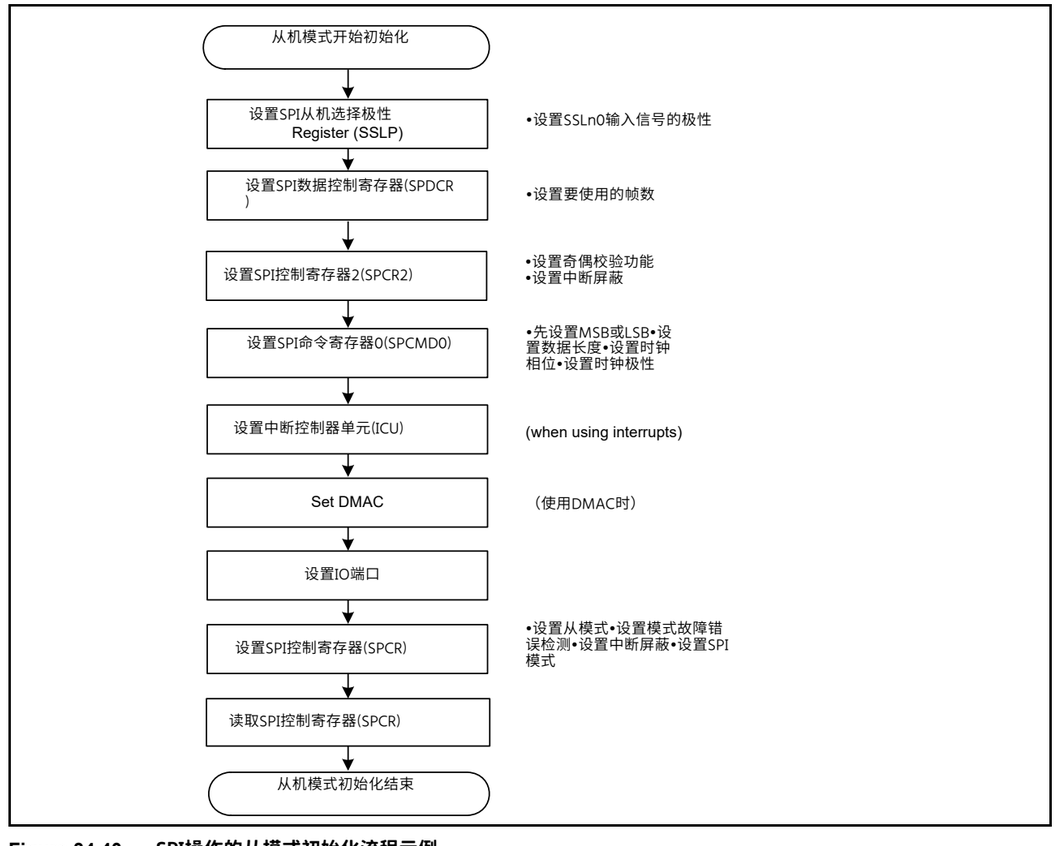

Figure 34.40 SPI操作的从模式初始化流程示例

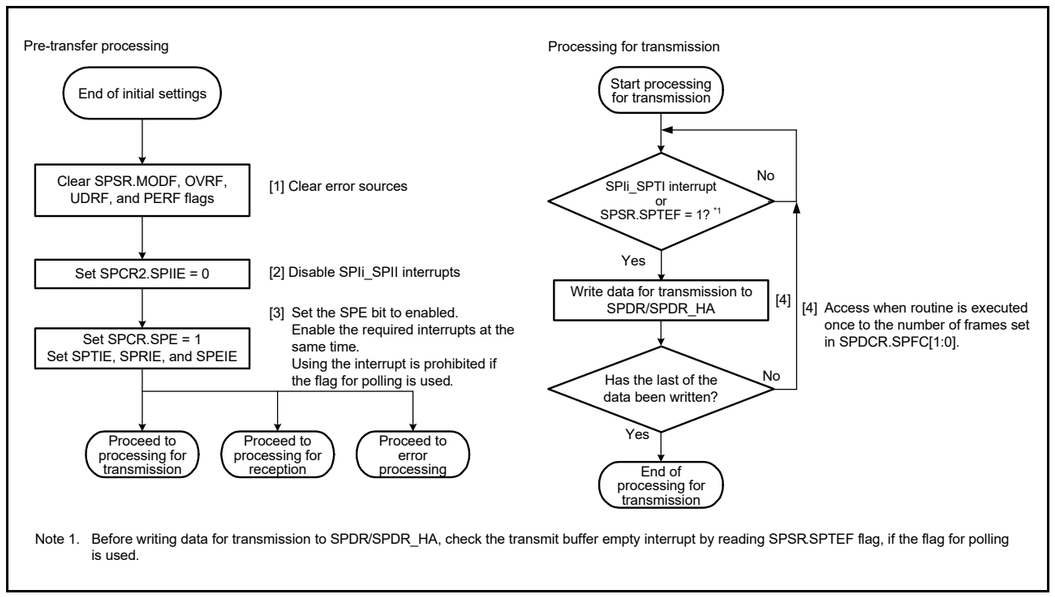
(6) Software processing flow

Figure 34.41 to Figure 34.43 show examples of the software processing flow.

(a) Transmit processing flow



Note 1. Before writing data for transmission to SPDR/SPDR_HA, check the transmit buffer empty interrupt by reading SPSR.SPTEF flag, if the flag for polling is used.

Figure 34.41 Transmission flow in slave mode

(b) Receive processing flow

The SPI does not handle receive-only operations, so processing for transmission is required.

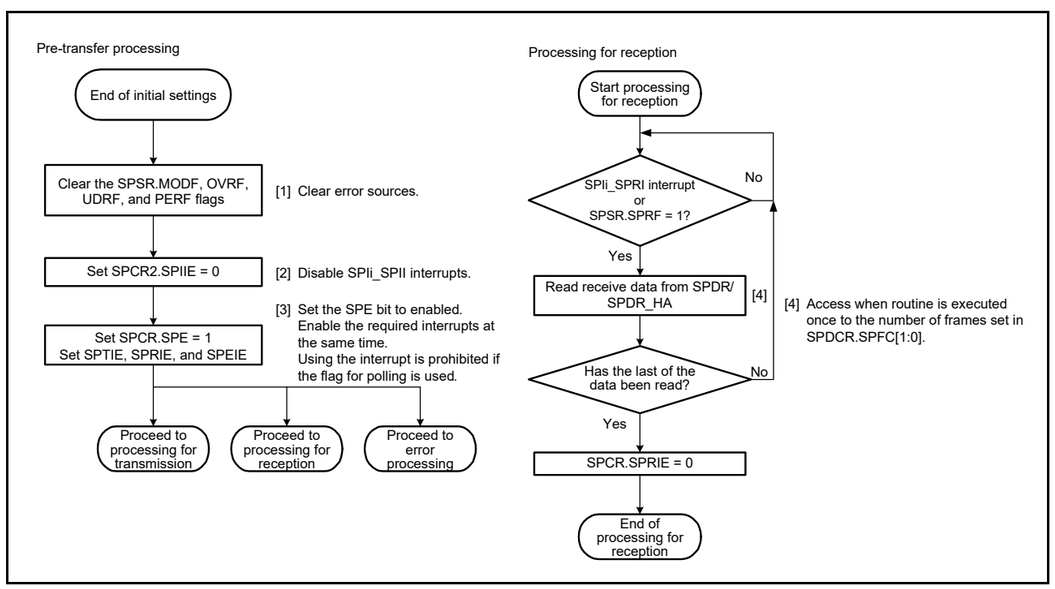


Figure 34.42 Reception flow in slave mode

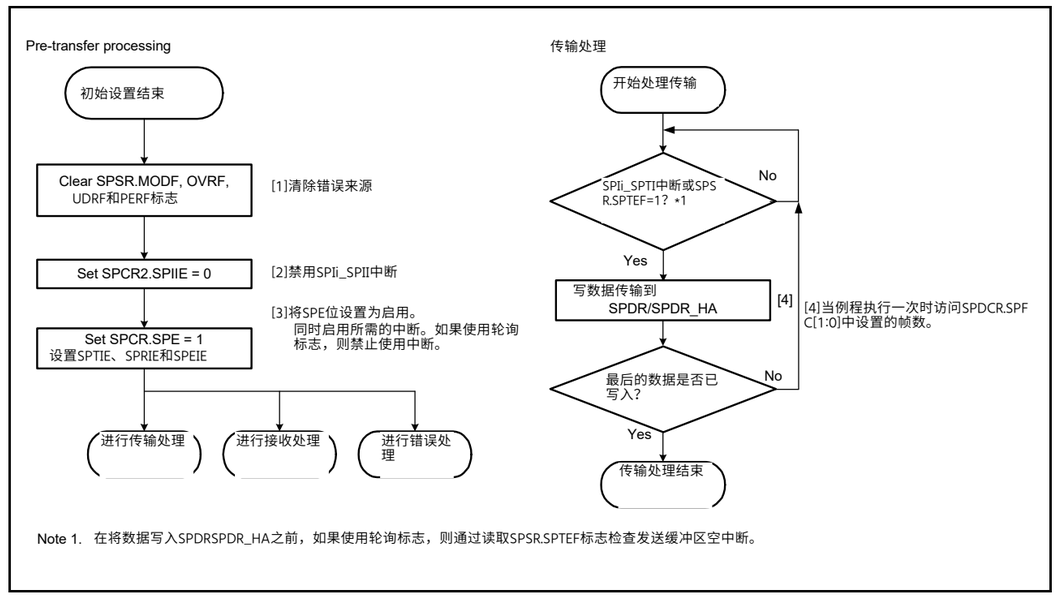
(6) 软件处理流程

图34.41至图34.43显示了软件处理流程的示例。

(a) 传输处理流程



Note 1. 在将数据写入SPDRSPDR_HA之前，如果使用轮询标志，则通过读取SPSR.SPTEF标志检查发送缓冲区空中断。

Figure 34.41 从模式下的传输流

(b) 接收处理流程

SPI不处理只接收操作，因此需要处理传输。

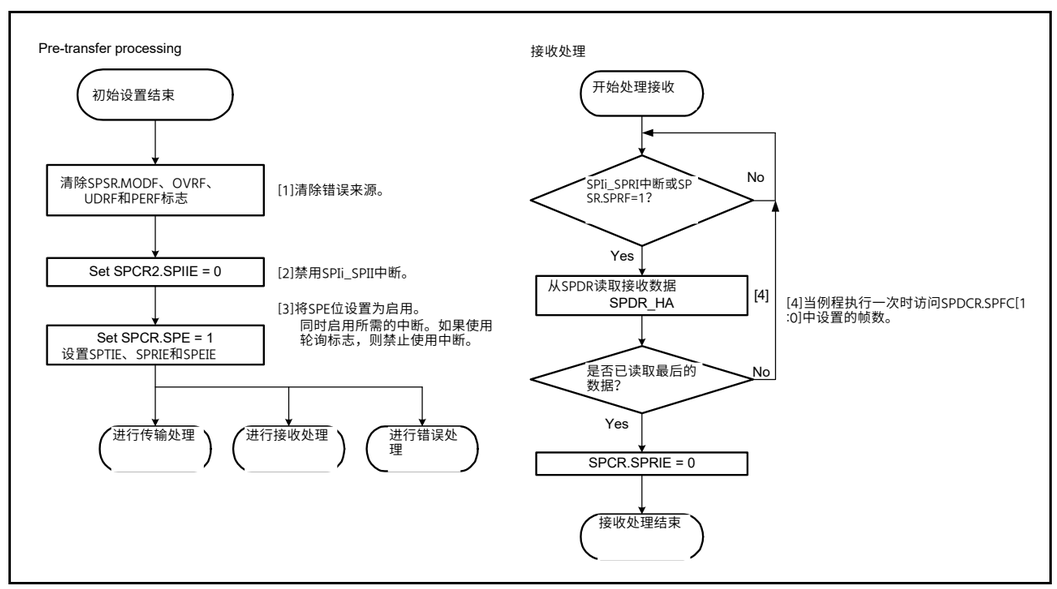


Figure 34.42 从机模式下的接收流程

(c) Error processing flow

In slave operation, even when a mode fault error is generated, the SPSR.MODF flag can be cleared regardless of the state of the SSLn0 pin.

When an error is detected by using an interrupt, clear the ICU.IELSRn.IR flag in the error processing routine. If this is not done, the ICU.IELSRn.IR flag might continue to indicate the SPIi_SPTI or SPIi_SPRI interrupt request. If the SPIi_SPRI interrupt request is indicated, read the receive buffer and initialize the sequencer in the SPI.

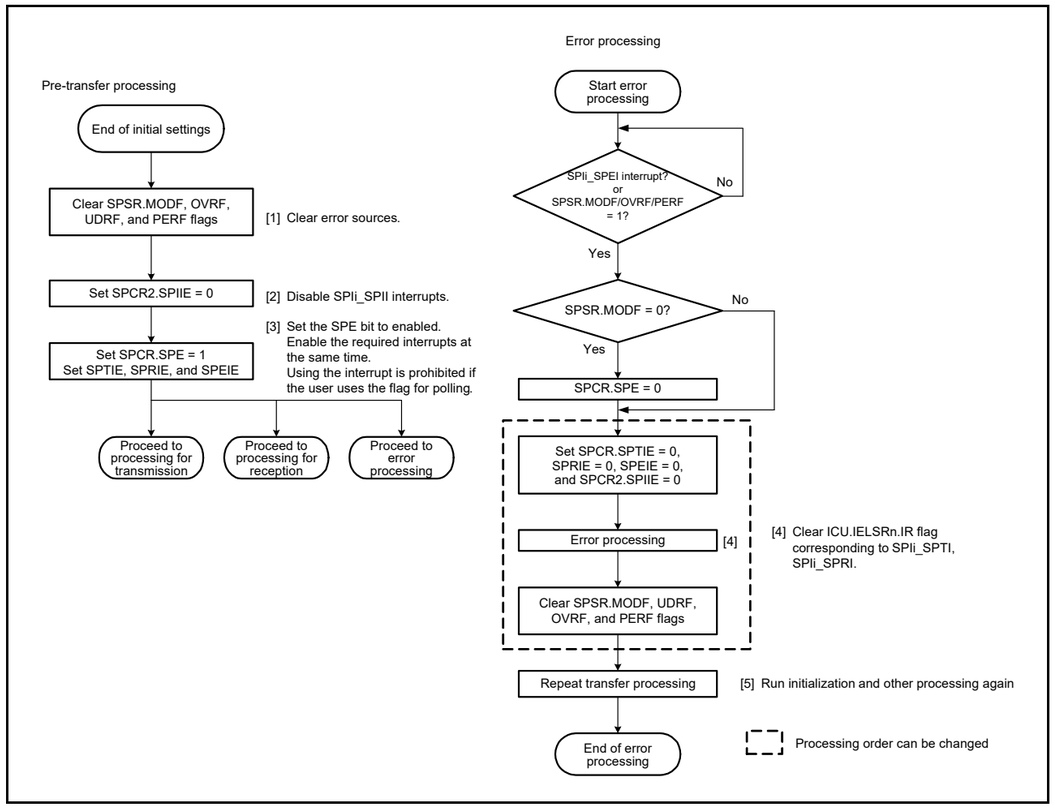

Figure 34.43 Error processing flow for slave mode

34.3.11 Clock Synchronous Operation

Setting the SPCR.SPMS bit to 1 selects clock synchronous operation of the SPI. In clock synchronous operation, the SSLni pin is not used, and the RSPCKn, MOSIn, and MISOn pins handle communication. All SSLni pins are available as I/O port pins.

Although clock synchronous operation does not require the use of the SSLni pin, operation of the module is the same as in SPI operation. In both master and slave operations, communications can be performed with the same flow as in SPI operation. However, mode fault errors are not detected because the SSLni pin is not used.

Additionally, do not perform operation if the clock synchronous operation is enabled when the SPCMDm.CPHA bit is set to 0 in slave mode (SPCR.MSTR = 0).

(c) 错误处理流程

在从机操作中，即使产生模式故障错误，SPSR.MODF标志也可以被清除，而与SSLn0引脚的状态无关。

当使用中断检测到错误时，清除错误处理例程中的ICU.IELSRn.IR标志。如果不这样做，ICU.IELSRn.IR标志可能会继续指示SPIi_SPTI或SPIi_SPRI中断请求。如果指示了SPIi_SPRI中断请求，则读取接收缓冲区并初始化SPI中的定序器。

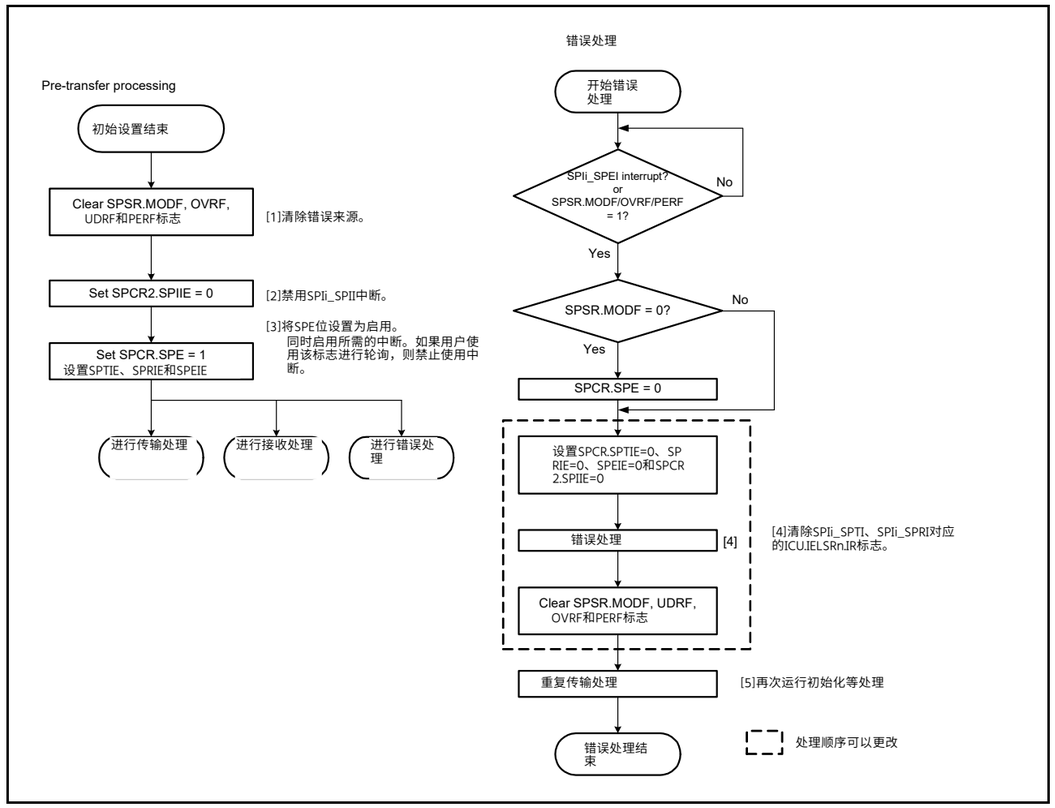

Figure 34.43 从机模式的错误处理流程

34.3.11 时钟同步操作

将SPCR.SPMS位设置为1可选择SPI的时钟同步操作。在时钟同步操作中，不使用SSLni引脚，而RSPCKn、MOSIn和MISOn引脚处理通信。所有SSLni引脚都可用作IO端口引脚。

虽然时钟同步操作不需要使用SSLni引脚，但模块的操作与SPI操作相同。在主机和从机操作中，可以使用与SPI操作相同的流程执行通信。但是，由于未使用SSLni引脚，因此未检测到模式故障错误。

此外，如果在从模式(SPCR.MSTR=0)下SPCMDm.CPHA位设置为0时使能时钟同步操作，则不要执行操作。

RA生态工作室

34.3.11.1 Master mode operation

(1) Starting serial transfer

The SPI updates the data in the transmit buffer (SPTX) of SPDR/SPDR_HA when data is written to the SPDR/SPDR_HA register with the transmit buffer empty, the data for the next transfer not set and the SPSR.SPTEF flag is 1. When the shift register is empty after the number of frames set in the SPDCR.SPFC[1:0] bits are written to the SPDR/SPDR_HA, the SPI copies data from the transmit buffer to the shift register and starts serial transmission. On copying transmit data to the shift register, the SPI changes the status of the shift register to full, and on termination of serial transfer, it changes the status of the shift register to empty. The status of the shift register cannot be referenced.

Transfer in clock synchronous operation is conducted without the SSLn0 output signal. For details on the SPI transfer format, see section 34.3.5, Transfer Format.

(2) Terminating serial transfer

The SPI terminates the serial transfer after transmitting an RSPCKn edge associated with the sampling timing. If free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies data from the shift register to the receive buffer of the SPI Data Register (SPDR/SPDR_HA).

The final sampling timing varies depending on the bit length of transfer data. In master mode, the SPI data length depends on the SPCMDm.SPB[3:0] bit setting. Transfer in clock synchronous operation is conducted without the SSLn0 output signal. For details on the SPI transfer format, see section 34.3.5, Transfer Format.

(3) Sequence control

The transfer format used in master mode is determined by the SPSCR, SPCMDm, SPBR, SPCKD, SSLND, and SPND registers. Although the SSLni signals are not output in clock synchronous operation, these settings are valid.

The SPSCR register determines the sequence configuration for serial transfers that are executed by the SPI in master mode. The following parameters are specified in the SPCMDm register:

- SSLni output signal value
- MSB- or LSB-first
- Data length
- Some of the bit rate settings
- RSPCKn polarity and phase
- Whether SPCKD is to be referenced
- Whether SSLND is to be referenced
- Whether SPND is to be referenced.

SPBR holds some of the bit rate settings such as the SPCKD (SPI clock delay), SSLND (SSL negation delay), and SPND (next-access delay).

Based on the sequence length that is assigned to SPSCR, the SPI makes up a sequence comprised of a part or all of SPCMDm register. The SPI contains a pointer to the SPCMDm register that makes up the sequence. The value of this pointer can be checked by reading the SPSSR.SPCP[2:0] bits. When the SPCR.SPE bit is set to 1 and the SPI function is enabled, the SPI loads the pointer to the commands in the SPCMD0 register, and incorporates the SPCMD0 register setting into the transfer format at the beginning of the serial transfer. The SPI increments the pointer each time the next-access delay period for a data transfer ends. On completion of the serial transfer that corresponds to the final command comprising the sequence, the SPI sets the pointer to the SPCMD0 register to execute the sequence repeatedly.

34.3.11.1 主模式操作

(1) 开始串行传输

SPI更新SPDRSPDR_HA的发送缓冲区(SPTX)中的数据
SPDRSPDR_HA寄存器，发送缓冲区为空，未设置下一次传输的数据，SPSR.SPTEF标志为1。当在SPDCR.SPFC[1:0]位中设置的帧数后移位寄存器为空时写入SPDRSPDR_HA，SPI将数据从发送缓冲区复制到移位寄存器并开始串行传输。将发送数据复制到移位寄存器时，SPI将移位寄存器的状态更改为满，而在串行传输终止时，它将移位寄存器的状态更改为空。无法引用移位寄存器的状态。

在没有SSLn0输出信号的情况下进行时钟同步操作的传输。有关SPI传输格式的详细信息，请参阅第34.3.5节，传输格式。

(2) 终止串行传输

SPI在发送与采样时序相关的RSPCKn边沿后终止串行传输。如果接收缓冲区中有可用空间（SPSR.SPRF标志为0），则在串行传输终止时，SPI将数据从移位寄存器复制到SPI数据寄存器(SPDRSPDR_HA)的接收缓冲区。

最终的采样时序根据传输数据的位长而变化。在主机模式下，SPI数据长度取决于SPMDm.SPB[3:0]位设置。在没有SSLn0输出信号的情况下进行时钟同步操作的传输。有关SPI传输格式的详细信息，请参阅第34.3.5节，传输格式。

(3) 顺序控制

主机模式中使用的传输格式由SPSCR、SPCMDm、SPBR、SPCKD、SSLND和SPND寄存器确定。虽然在时钟同步操作中不输出SSLni信号，但这些设置是有效的。

SPSCR寄存器确定由SPI在主模式下执行的串行传输的序列配置。SPCMDm寄存器中指定了以下参数：

- SSLni输出信号值
- MSB- or LSB-first
- 数据长度
- 一些比特率设置
- RSPCKn极性和相位
- 是否要引用SPCKD
- 是否要引用SSLND
- 是否要引用SPND。

SPBR保存一些比特率设置，例如SPCKD（SPI时钟延迟）、SSLND（SSL否定延迟）和SPND（下一次访问延迟）。

根据分配给SPSCR的序列长度，SPI组成一个序列，该序列由部分或全部
SPMDm寄存器。SPI包含一个指向构成序列的SPCMDm寄存器的指针。该指针的值可以通过读取SPSSR.SPCP[2:0]位来检查。当SPCR.SPE位设置为1且启用SPI功能时，SPI将指针加载到SPCMD0寄存器中的命令，并在串行传输开始时将SPCMD0寄存器设置合并到传输格式中。每次数据传输的下一个访问延迟周期结束时，SPI都会增加指针。完成对应于包含序列的最终命令的串行传输后，SPI将指针设置为SPMD0寄存器以重复执行序列。

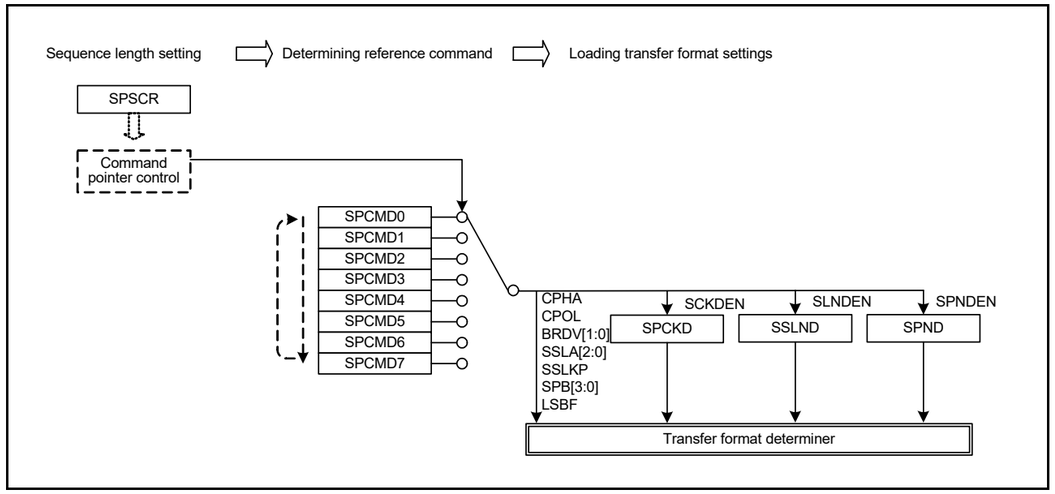

Figure 34.44 Procedure to determine the format of serial transmission in master mode

In this section, a frame is the combination of the SPDR/SPDR_HA data and SPCMDm settings.

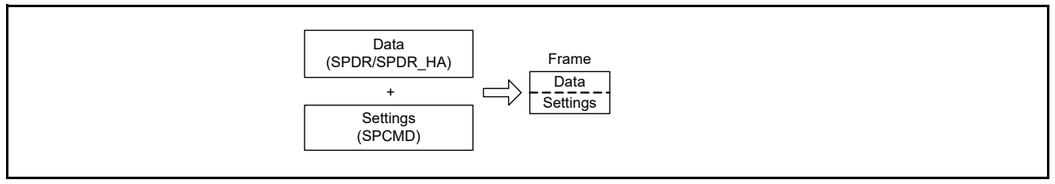

Figure 34.45 Conceptual diagram of frames

Figure 34.46 shows the relationship between the command and the transmit and receive buffers in the sequence of operations specified by the settings in Table 34.4.

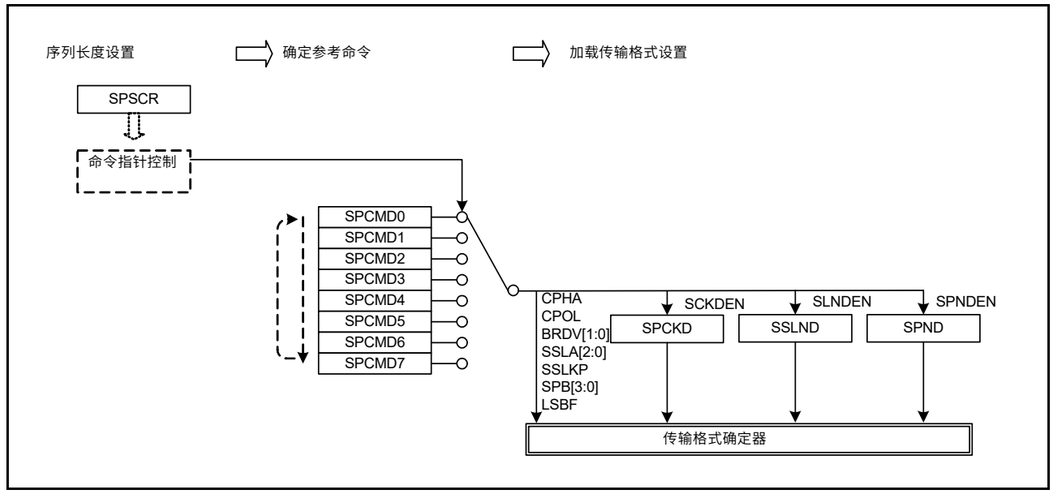

Figure 34.44 确定主机模式下串行传输格式的程序

在本节中，帧是SPDRSPDR_HA数据和SPMDm设置的组合。

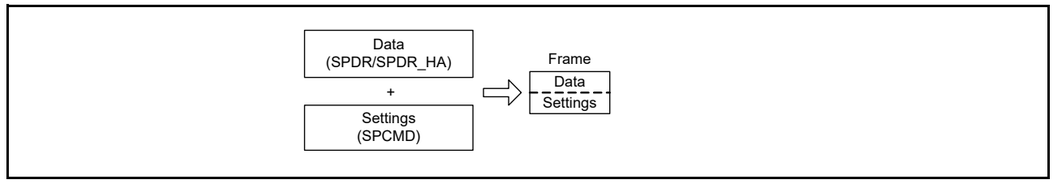

Figure 34.45 框架的概念图

图34.46显示了在表34.4中的设置指定的操作序列中命令与发送和接收缓冲区之间的关系。

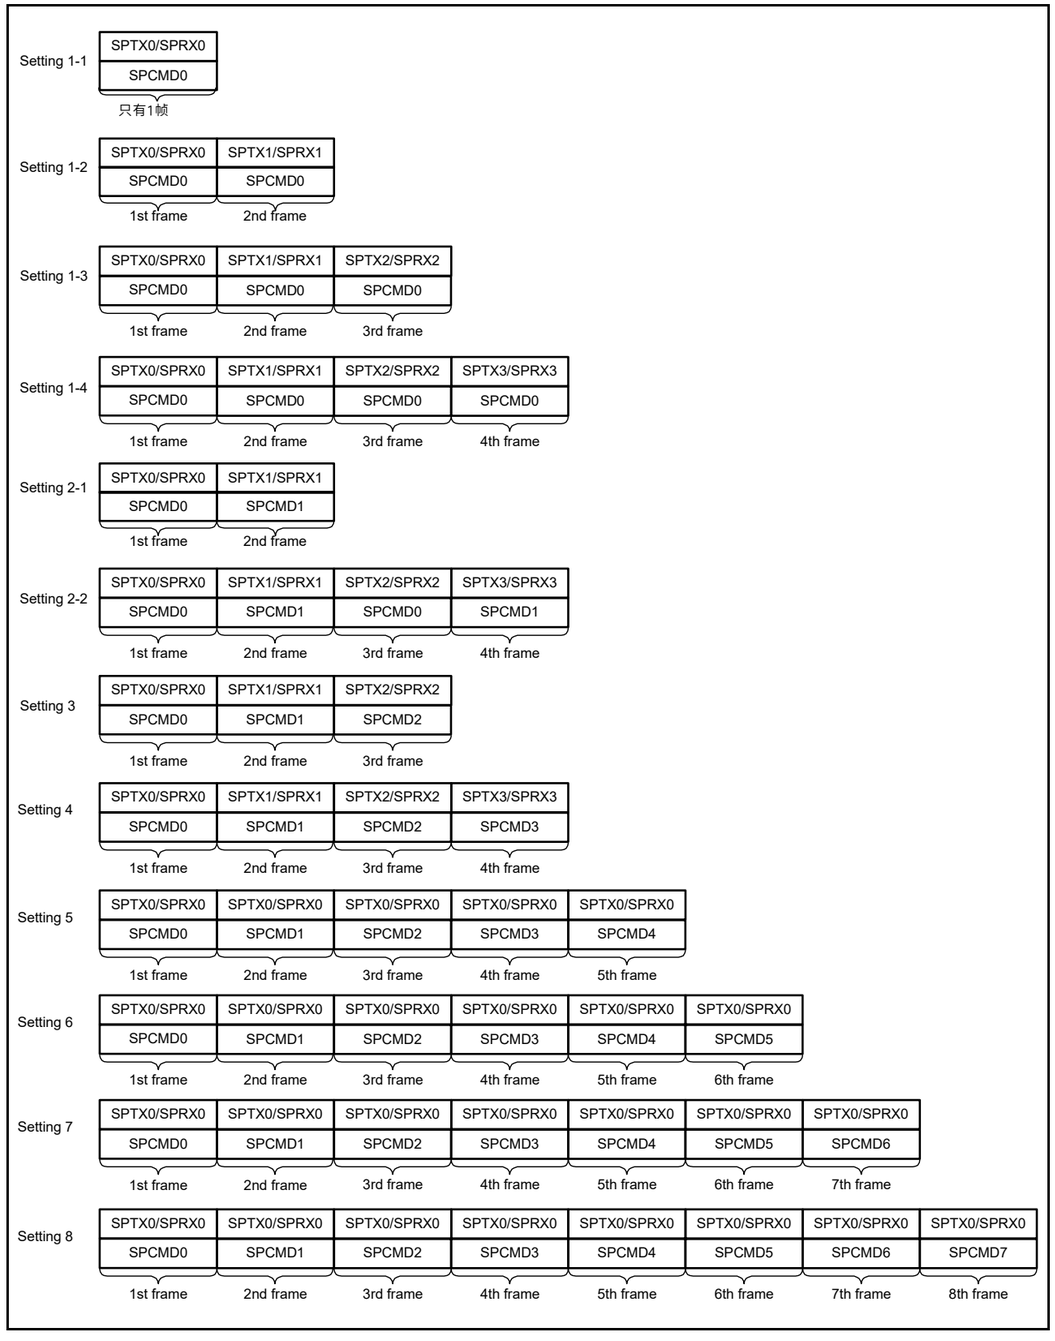

Figure 34.46 串行操作中SPI命令寄存器与发送和接收缓冲区的关系

(4) Initialization flow

Figure 34.47 shows an example of initialization flow for clock synchronous operation when the SPI is used in master mode. For information on how to set up the ICU, DMAC, and I/O ports, see the descriptions given in the individual blocks.

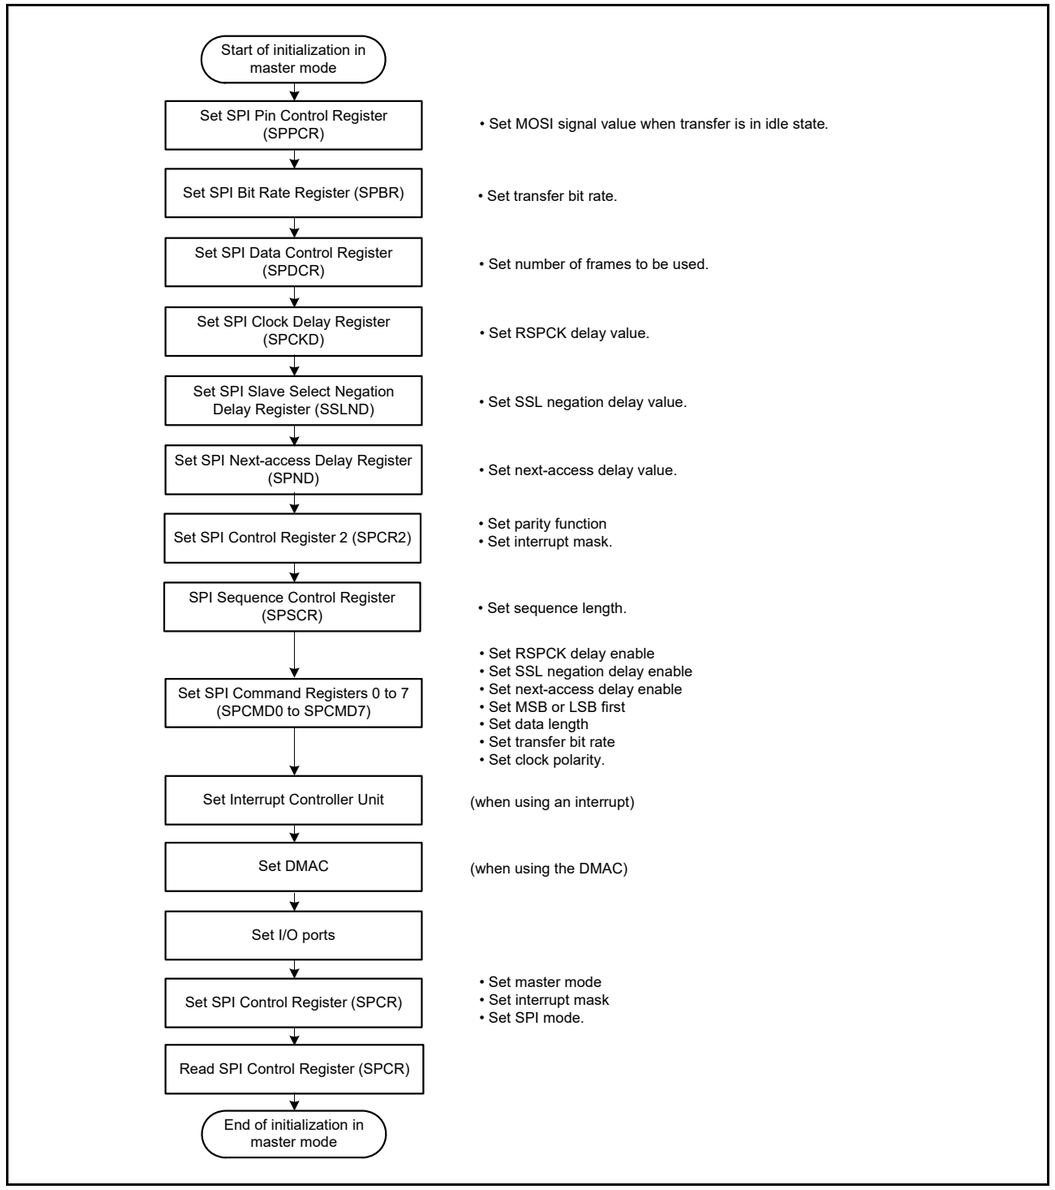

Figure 34.47 Example of initialization flow in master mode for clock synchronous operation

(5) Software processing flow

Software processing during clock synchronous master operation is the same as that for SPI master operation. For details, see section 34.3.10.1, (9) Software processing flow. Mode fault errors are not generated in clock synchronous operation.

(4) 初始化流程

图34.47显示了在主模式下使用SPI时时钟同步操作的初始化流程示例。有关如何设置ICU、DMAC和IO端口的信息，请参阅各个块中给出的说明。

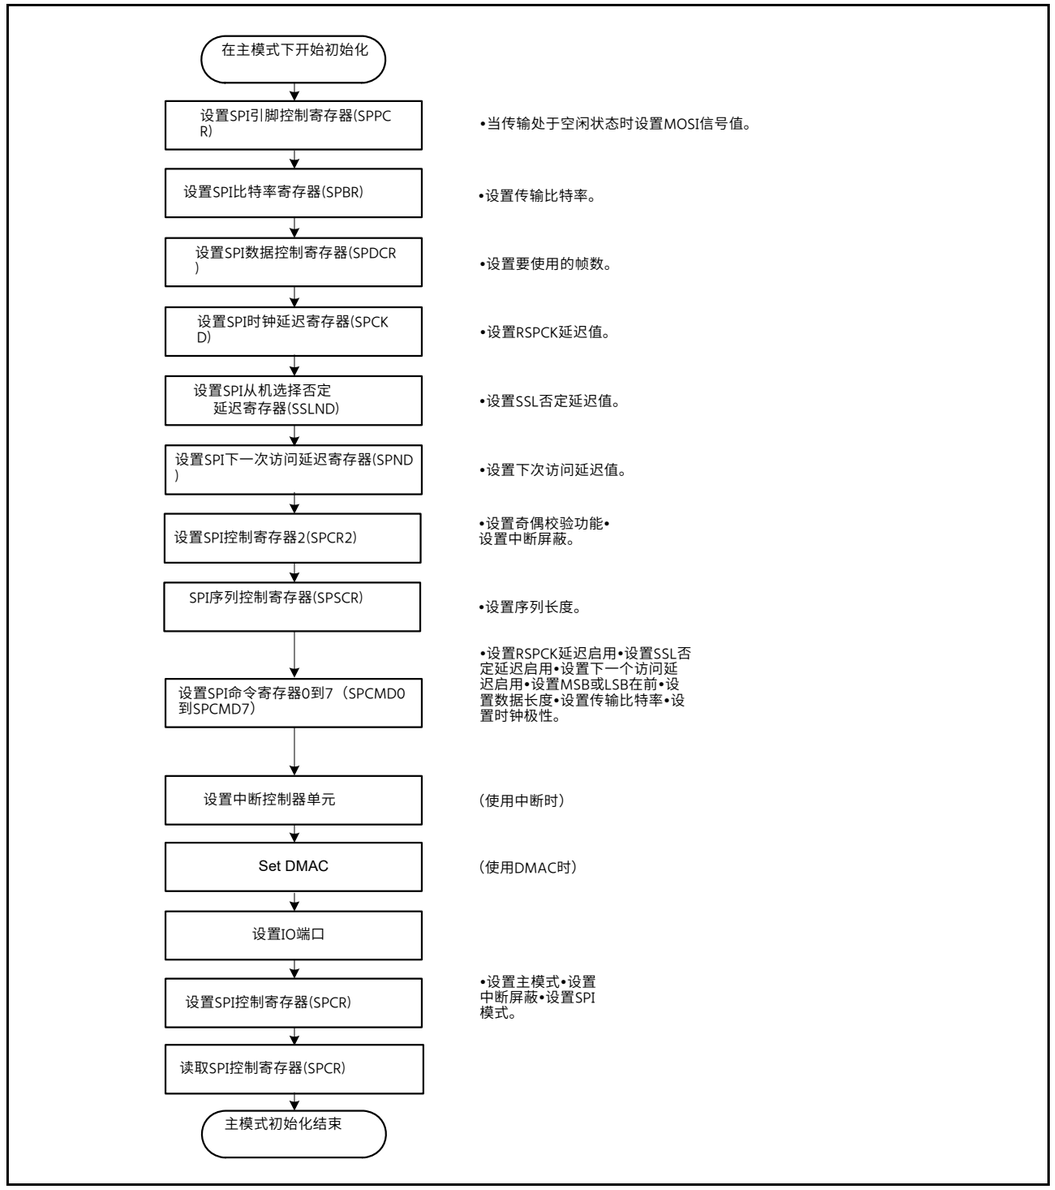

Figure 34.47 时钟同步操作的主模式初始化流程示例

(5) 软件处理流程

时钟同步主机操作期间的软件处理与SPI主机操作相同。详见34.3.10.1节，（9）软件处理流程。时钟同步操作中不会产生模式故障错误。

34.3.11.2 Slave mode operation

(1) Starting serial transfer

When the SPCR.SPMS bit is 1, the first RSPCKn edge triggers the start of a serial transfer in the SPI, and the SPI drives the MISOn output signal. The SSLn0 input signal is not used in clock synchronous operation. For details on the SPI transfer format, see section 34.3.5, Transfer Format.

(2) Terminating serial transfer

The SPI terminates the serial transfer after detecting an RSPCKn edge associated with the final sampling timing. When free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of a serial transfer, the SPI copies received data from the shift register to the receive buffer of the SPDR/SPDR_HA register. On termination of a serial transfer, the SPI changes the status of the shift register to empty regardless of the receive buffer.

The final sampling timing changes depending on the bit length of transfer data. In slave mode, the SPI data length is determined by the SPCMD0.SPB[3:0] bit setting. For details on the SPI transfer format, see section 34.3.5, Transfer Format.

(3) Initialization flow

Figure 34.48 shows an example of initialization flow for clock synchronous operation when the SPI is used in slave mode. For information on how to set up the ICU, DMAC, and I/O ports, see the descriptions given in the individual blocks.

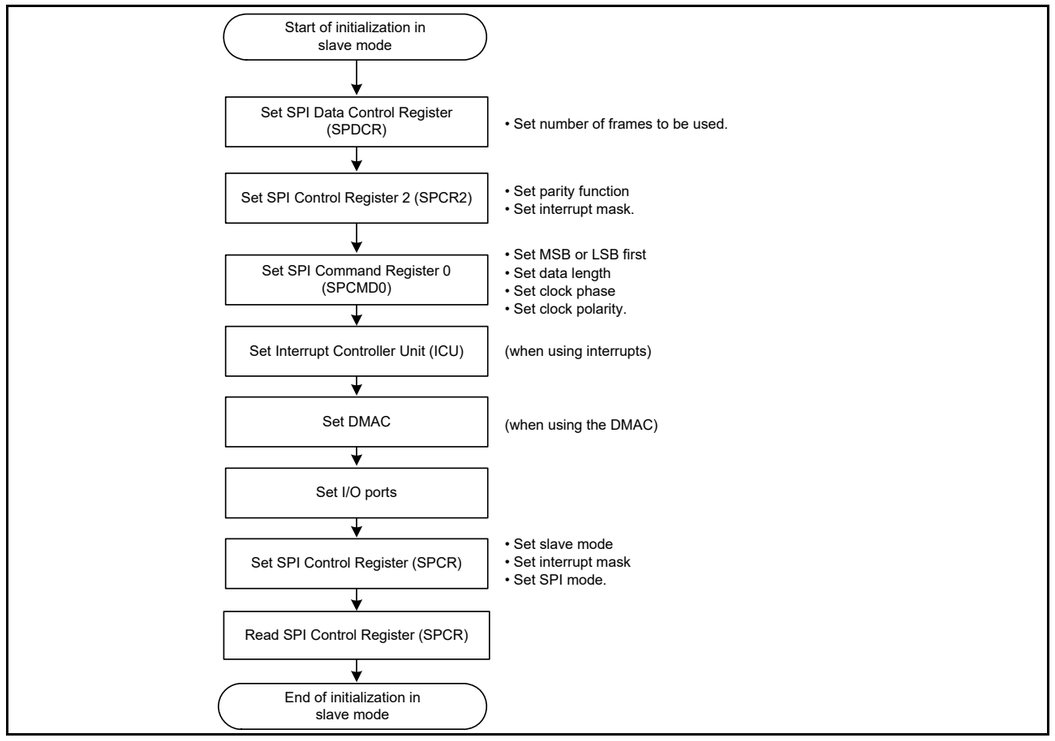

Figure 34.48 Example of initialization flow in slave mode for clock synchronous operation

(4) Software processing flow

Software processing during clock synchronous slave operation is the same as that for SPI slave operation. For details, see section 34.3.10.2, (6) Software processing flow.

Note: Mode fault errors are not generated in clock synchronous mode.

34.3.11.2 从模式操作

(1) 开始串行传输

当SPCR.SPMS位为1时，第一个RSPCKn边沿触发SPI中串行传输的开始，SPI驱动MISOn输出信号。SSLn0输入信号不用于时钟同步操作。有关SPI传输格式的详细信息，请参阅第34.3.5节，传输格式。

(2) 终止串行传输

SPI在检测到与最终采样时序相关的RSPCKn边沿后终止串行传输。当接收缓冲区中有可用空间（SPSR.SPRF标志为0）时，在串行传输终止时，SPI将接收到的数据从移位寄存器复制到SPDRSPDR_HA寄存器的接收缓冲区。在串行传输终止时，SPI将移位寄存器的状态更改为空，而与接收缓冲区无关。

最终的采样时序根据传输数据的位长而变化。在从机模式下，SPI数据长度由SPCMD0.SPB[3:0]位设置决定。有关SPI传输格式的详细信息，请参阅第34.3.5节，传输格式。

(3) 初始化流程

图34.48显示了在从模式下使用SPI时时钟同步操作的初始化流程示例。有关如何设置ICU、DMAC和IO端口的信息，请参阅各个块中给出的说明。

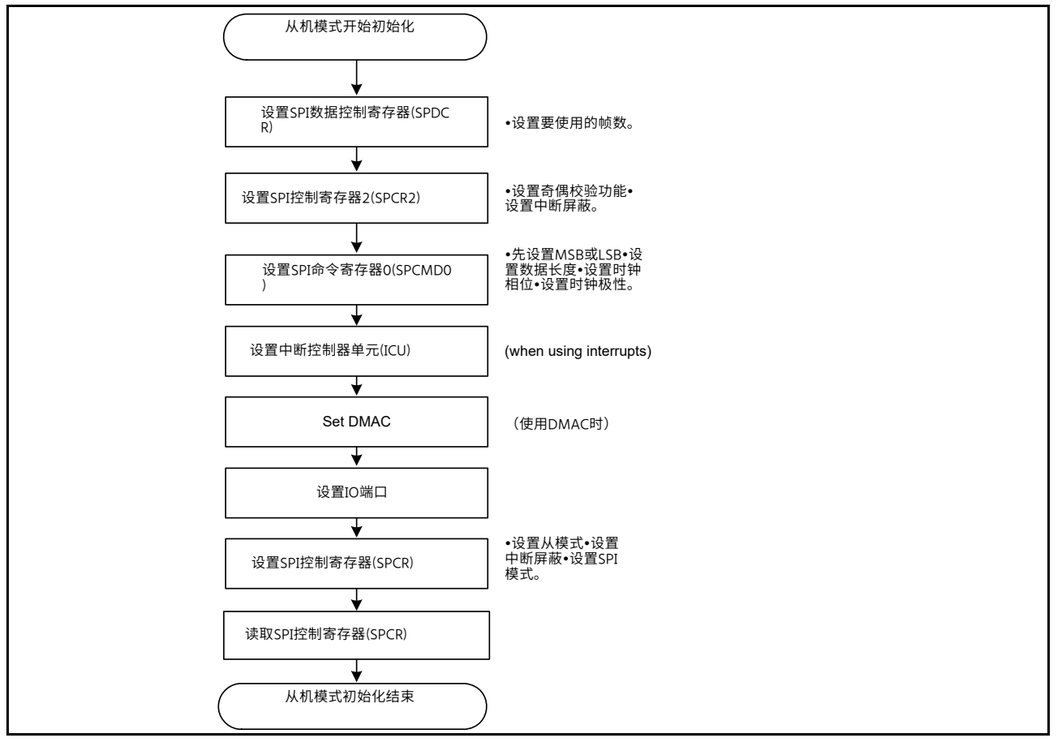

Figure 34.48 时钟同步操作的从模式初始化流程示例

(4) 软件处理流程

时钟同步从机操作期间的软件处理与SPI从机操作相同。详见34.3.10.2节，（6）软件处理流程。

Note: 时钟同步模式下不会产生模式故障错误。

RA生态工作室

34.3.12 Loopback Mode

When 1 is written to the SPPCR.SPLP2 bit or SPPCR.SPLP bit, the SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, or between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0, and connects the input and output paths of the shift register, establishing a loopback mode. The SPI does not shut off the path between the MOSIn pin and the shift register if the SPCR.MSTR bit is 1, or between the MISOn pin and the shift register if the SPCR.MSTR bit is 0. When a serial transfer is executed in loopback mode, the transmit data for the SPI or the reversed transmit data becomes the received data for the SPI.

Table 34.12 lists the relationship between the SPLP2 and SPLP bits and the received data. Figure 34.49 shows the configuration of the shift register I/O paths when the SPI in master mode is set to loopback mode (SPPCR.SPLP2 = 1, SPPCR.SPLP = 0 or 1).

Table 34.12 SPLP2 and SPLP bit settings and received data

SPPCR.SPLP2 bit	SPPCR.SPLP bit	Received data
0	0	Input data from the MOSIn pin or MISOn pin
0	1	Inverted transmit data
1	0	Transmit data
1	1	Transmit data

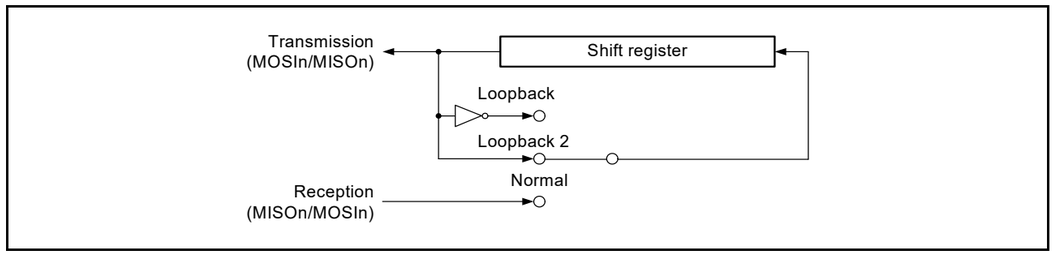

Figure 34.49 Configuration of Shift register I/O paths in loopback mode for master mode

34.3.13 Self-Diagnosis of Parity Bit Function

The parity circuit consists of a parity bit adding unit used for transmit data and an error detecting unit used for received data. To detect defects in these units, the parity circuit performs self-diagnosis as shown in Figure 34.50.

34.3.12 Loopback Mode

当向SPPCR.SPLP2位或SPPCR.SPLP位写入1时，如果SPCR.MSTR位为1，则SPI关闭MISOn引脚和移位寄存器之间的路径，或者如果SPCR.MSTR位为0，连接移位寄存器的输入和输出路径，建立环回模式。如果SPCR.MSTR位为1，SPI不关闭MOSIn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则SPI不关闭MOSIn引脚和移位寄存器之间的路径。环回模式下，SPI的发送数据或反向发送数据成为SPI的接收数据。

表34.12列出了SPLP2和SPLP位与接收数据之间的关系。图34.49显示了当主模式下的SPI设置为环回模式（SPPCR.SPLP2=1，SPPCR.SPLP=0或1）时移位寄存器IO路径的配置。

Table 34.12 SPLP2和SPLP位设置和接收数据

SPPCR.SPLP2 bit	SPPCR.SPLP bit	接收数据
0	0	从MOSIn引脚或MIOn引脚输入数据
0	1	反相传输数据
1	0	传输数据
1	1	传输数据

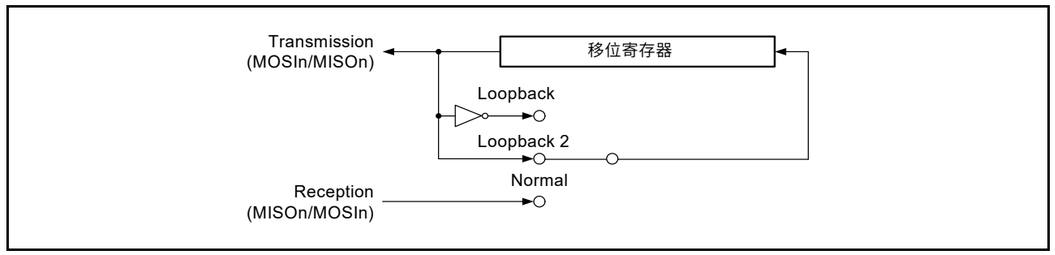

Figure 34.49 在主模式的环回模式下配置移位寄存器IO路径

34.3.13 奇偶校验位功能自诊断

奇偶校验电路由用于发送数据的奇偶校验位添加单元和用于接收数据的错误检测单元组成。为了检测这些单元中的缺陷，奇偶校验电路执行自诊断，如图34.50所示。

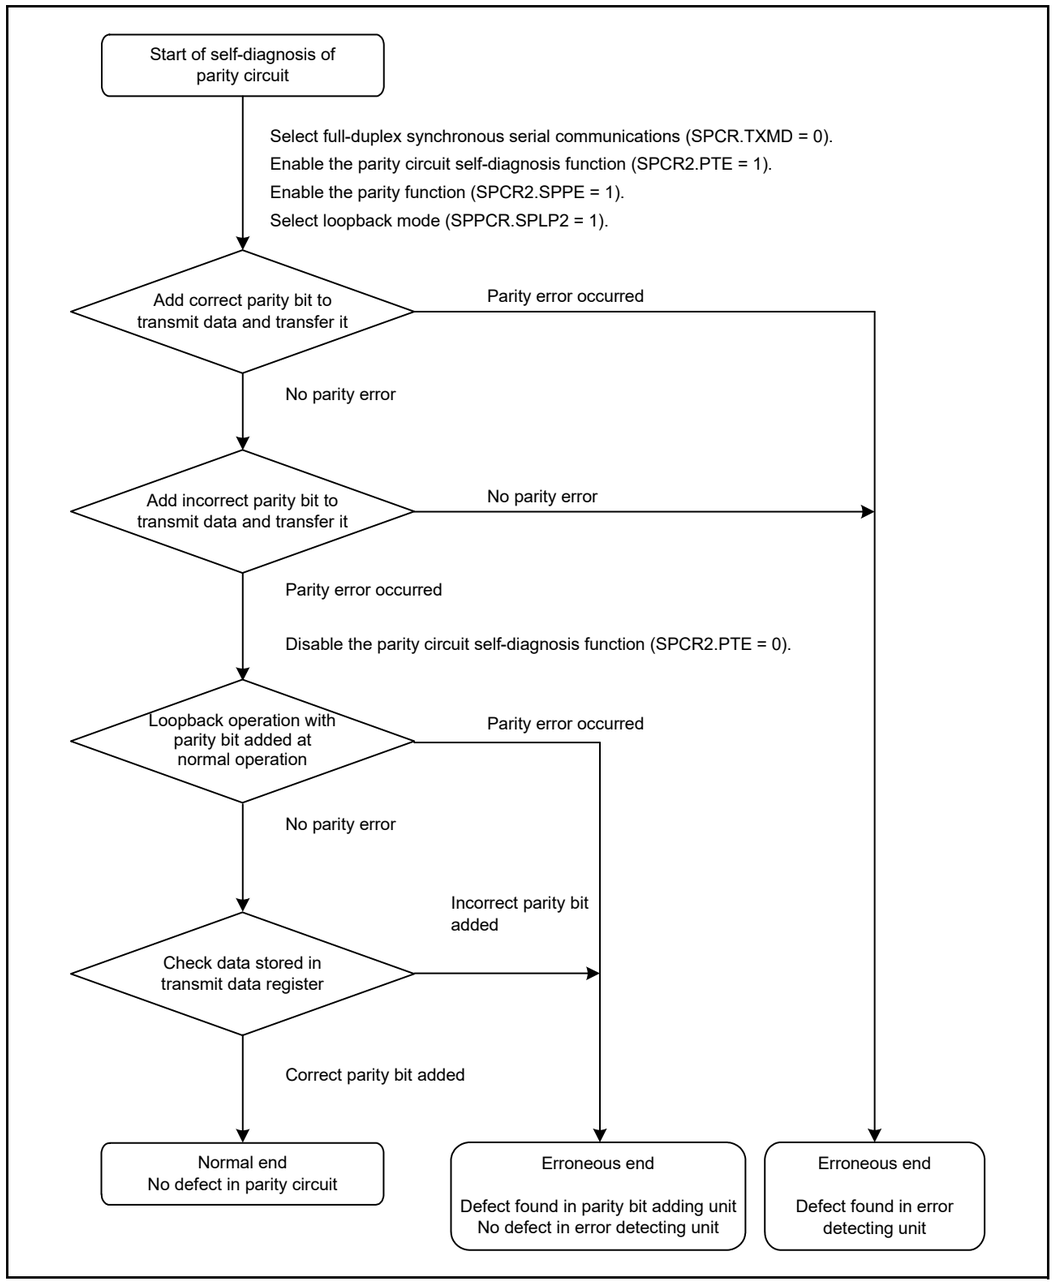

Figure 34.50 Self-diagnosis flow for parity circuit

34.3.14 Interrupt Sources

The SPI interrupt sources include:

- Receive buffer full
- Transmit buffer empty

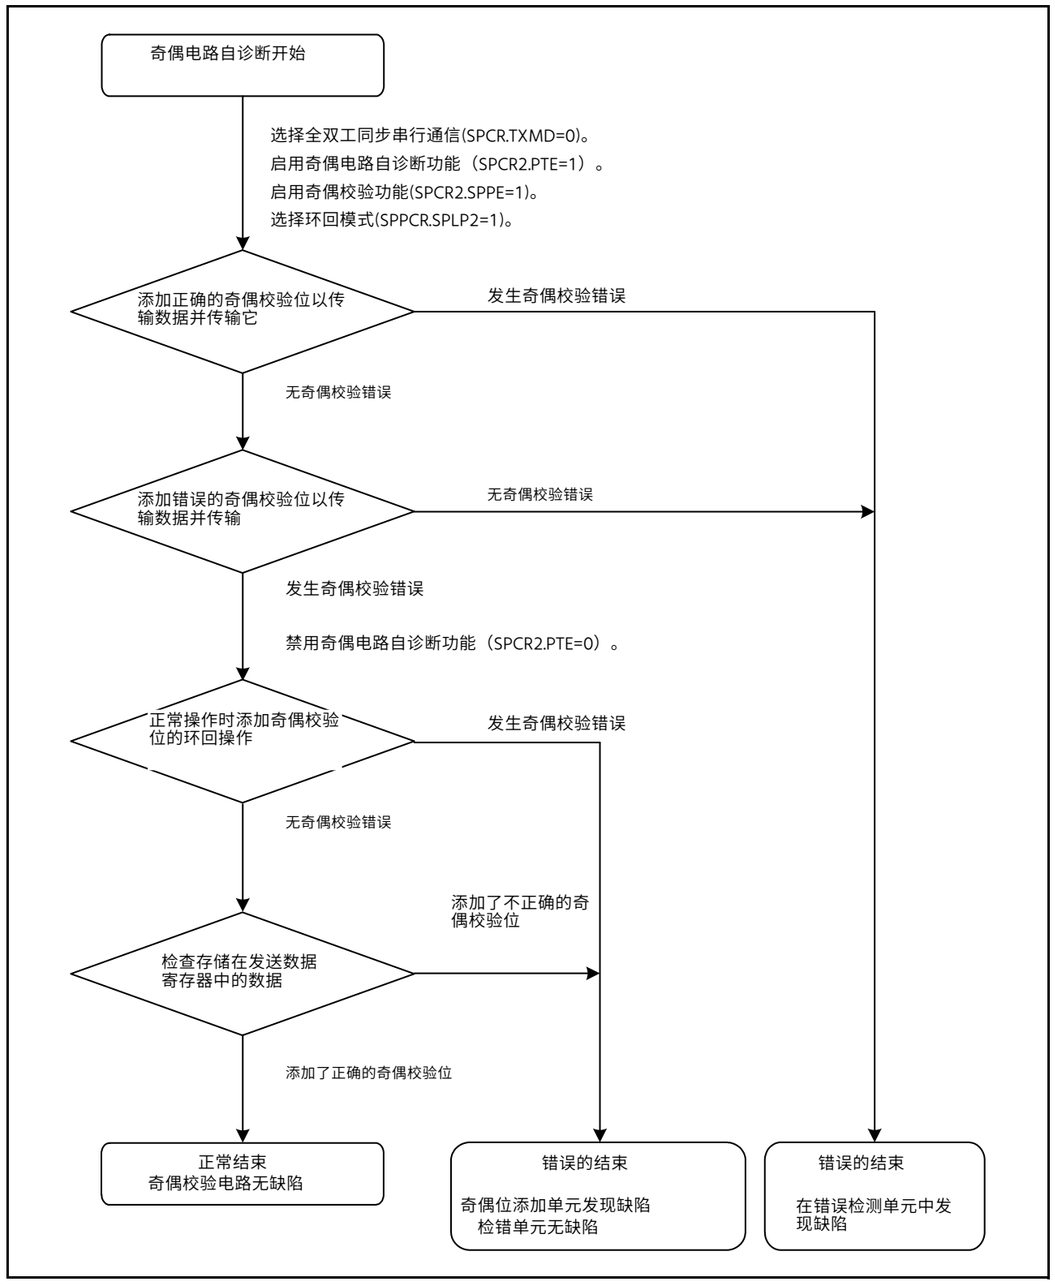

Figure 34.50 奇偶校验电路的自诊断流程

34.3.14 中断源

SPI中断源包括：

- 接收缓冲区已满
- 发送缓冲区为空

- SPI error (mode-fault, underrun, overrun, or parity error)
- SPI idle
- Transmission-complete.

The DTC or DMAC can be activated by the receive buffer full or transmit buffer empty interrupt to perform data transfer.

Because the vector address for the SPIi_SPEI (SPI error interrupt) is allocated to interrupt requests on mode-fault, underrun, overrun, and parity errors, the actual interrupt source must be determined from the flags. Table 34.13 lists the interrupt sources for the SPI. An interrupt is generated on satisfaction of one of the interrupt conditions in Table 34.13. Clear the receive buffer full and transmit buffer empty sources through a data transfer.

When using the DTC or DMAC to perform data transmission and reception, you must first set up the DTC or DMAC to be in a transfer-enabled status before setting the SPI. For information on setting up the DTC or DMAC, see section 17, DMA Controller (DMAC), or section 18, Data Transfer Controller (DTC).

If the conditions for generating a transmit buffer empty or receive buffer full interrupt occur while the ICU.IELSRn.IR flag is 1, the interrupt is not output as a request for the ICU but is saved internally (the capacity for retention is one request per source). A saved interrupt request is output when the ICU.IELSRn.IR flag becomes 0. A saved interrupt request is automatically discarded when it is output as an actual interrupt request. The interrupt enable bit (the SPCR.SPTIE or SPCR.SPRIE bit) for an internally saved interrupt request can also be set to 0.

Table 34.13 SPI interrupt sources

Interrupt source	Symbol	Interrupt condition	DMAC/DTC activation
Receive buffer full	SPIi_SPRI	The receive buffer becomes full (SPSR.SPRF flag is 1) while the SPCR.SPRIE bit is 1	Possible
Transmit buffer empty	SPIi_SPTI	The transmit buffer becomes empty (SPSR.SPTEF flag is 1) while the SPCR.SPTIE bit is 1	Possible
SPI errors (mode-fault, underrun, overrun, and parity error)	SPIi_SPEI	The SPSR.MODF, OVRF, PERF, or UDRF flag is set to 1 while the SPCR.SPEIE bit is 1	Impossible
SPI idle	SPIi_SPII	The SPSR.IDLNF flag is set to 0 while the SPCR2.SPIIE bit is 1	Impossible
Transmission-complete	SPIi_SPTEND	In master mode, an interrupt is generated when the IDLNF flag (SPI idle flag) changes from 1 to 0. In slave mode, an interrupt occurs on conditions shown in Table 34.15.	Impossible

34.4 Output to the Event Link Controller (ELC)

The ELC can produce the following event output signals:

- Receive buffer full event output
- Transmit buffer empty event output
- Mode-fault, underrun, overrun, or parity error event output
- SPI idle event output
- Transmission-completed event output.

The event link output signal is output regardless of the interrupt enable bit setting.

34.4.1 Receive Buffer Full Event Output

This event signal is output when received data is transferred from the shift register to the SPDR/SPDR_HA on completion of serial transfer.

34.4.2 Transmit Buffer Empty Event Output

This event signal is output when data for transmission is transferred from the transmit buffer to the shift register and when the value of the SPE bit changes from 0 to 1.

- SPI错误（模式错误、欠载、溢出或奇偶校验错误）
- SPI空闲
- Transmission-complete.

DTC或DMAC可以由接收缓冲区满或发送缓冲区空中断激活以执行数据传输。

由于SPIi_SPEI（SPI错误中断）的向量地址分配给模式错误、欠载、溢出和奇偶校验错误的中断请求，因此必须根据标志确定实际中断源。表34.13列出了SPI的中断源。满足表34.13中的中断条件之一时会产生中断。通过数据传输清除接收缓冲区满和发送缓冲区空源。

使用DTC或DMAC进行数据收发时，必须先将DTC或DMAC设置为传输使能状态，然后再设置SPI。有关设置DTC或DMAC的信息，请参阅第17节，DMA控制器(DMAC)或第18节，数据传输控制器(DTC)。

如果在ICU.IELSRn.IR标志为1时发生发送缓冲区空或接收缓冲区满中断的条件，则该中断不会作为对ICU的请求输出，而是在内部保存（保留容量为每个请求一个请求）资源）。当ICU.IELSRn.IR标志变为0时，输出保存的中断请求。保存的中断请求在作为实际中断请求输出时自动丢弃。内部保存的中断请求的中断使能位（SPCR.SPTIE或SPCR.SPRIE位）也可以设置为0。

Table 34.13 SPI中断源

中断源	Symbol	中断条件	DMAC/DTC activation
接收缓冲区已满	SPIi_SPRI	当SPCR.SPRIE位为1时，接收缓冲区变满（SPSR.SPRF标志为1）	Possible
发送缓冲区为空	SPIi_SPTI	当SPCR.SPTIE位为1时，发送缓冲区变为空（SPSR.SPTEF标志为1）	Possible
SPI错误（模式故障、欠载、溢出和奇偶校验错误）	SPIi_SPEI	SPSR.MODF、OVRF、PERF或UDRF标志设置为1，而SPCR.SPEIE位为1	Impossible
SPI空闲	SPIi_SPII	SPSR.IDLNF标志设置为0，而SPCR2.SPIIE位为1	Impossible
Transmission-complete	SPIi_SPTEND	在主机模式下，当 IDLNF标志（SPI空闲标志）从1变为0。 在从机模式下，中断发生在所示的条件 Table 34.15.	Impossible

34.4 输出到事件链接控制器(ELC)

ELC可以产生以下事件输出信号：

- 接收缓冲区满事件输出
- 发送缓冲区空事件输出
- 模式故障、欠载、溢出或奇偶校验错误事件输出
- SPI空闲事件输出
- 传输完成事件输出。

无论中断允许位设置如何，都会输出事件链接输出信号。

34.4.1 接收缓冲区满事件输出

串行传输完成后，当接收到的数据从移位寄存器传输到SPDRSPDR_HA时，输出此事件信号。

34.4.2 发送缓冲区空事件输出

当要发送的数据从发送缓冲器传送到移位寄存器时，以及SPE位的值从0变为1时，输出该事件信号。

34.4.3 Mode-Fault, Underrun, Overrun, or Parity Error Event Output

This event signal is output when mode-fault, underrun, overrun, or parity error is detected. See section 34.5.4, Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output if using this event signal.

(1) Mode-fault

Table 34.14 lists the conditions for occurrence of a mode-fault event.

Table 34.14 Conditions for mode-fault occurrence

Condition	SPCR.MODFEN bit	SSLn0 pin	Remarks
• SPI operation (SPMS = 0) • Slave (SPCR.MSTR bit = 0)	1	Not active	Event is output only when the pin is deactivated during transmission

(2) Underrun

This event signal is output in response to an underrun when a serial transfer starts while the transmission data is not ready, and the SPCR.MSTR bit is 0, and the SPCR.SPE bit is 1. Under these conditions, the MODF and UDRF flags are set to 1.

(3) Overrun

This event signal is output in response to an overrun when a serial transfer completes while the receive buffer contains unread data and the SPCR.TXMD bit is 0. Under these conditions, the OVRF flag is set to 1.

(4) Parity error

This event signal is output in response to a parity error detected on completion of a serial transfer while the value of the TXMD bit in SPCR is 0 and the SPPE bit in SPCR2 is 1.

34.4.4 SPI Idle Event Output

(1) In master mode

In master mode, an event is output when the condition for setting the IDLNF flag (SPI idle flag) to 0 is satisfied.

(2) In slave mode

In slave mode, an event is output when the SPCR.SPE bit is set to 0 (SPI is initialized).

34.4.5 Transmission-Completed Event Output

During both SPI and clock synchronous operations in master mode, an event is output when the IDLNF flag (SPI idle flag) changes from 1 to 0. Table 34.15 lists the conditions for occurrence of a transmission-completed event in slave mode.

Table 34.15 Conditions for generation of transmission-completed event in slave mode

Mode of operation	Transmit buffer state	Shift register state	Others
SPI operation (SPMS = 0)	Empty	Empty	Negation of SSLn0 input
Clock synchronous operation (SPMS = 1)	Empty	Empty	Edge detection of the last RSPCKn

Whether the operation is in master mode or slave mode, an event is not output if 0 is written to the SPCR.SPE bit in transmission or the SPCR.SPE bit is cleared by the mode-fault error or underrun error.

34.5 Usage Notes

34.5.1 Settings for the Module-Stop State

The Module Stop Control Register B (MSTPCRB) can enable or disable SPI operation. The SPI is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details on the Module Stop Control Register B, see section 11, Low Power Modes.

34.4.3 模式故障、欠载、溢出或奇偶校验错误事件输出

当检测到模式故障、欠载、溢出或奇偶校验错误时，输出此事件信号。见第34.5.4节，如果使用此事件信号，则对模式故障、欠载、溢出或奇偶校验错误事件输出的约束。

(1) Mode-fault

表34.14列出了发生模式故障事件的条件。

Table 34.14 模式故障发生的条件

Condition	SPCR.MODFEN bit	SSLn0 pin	Remarks
SPI操作（SPMS=0） SPCR.MSTR位=0）	从设备（1	不活跃	仅当在传输过程中禁用该引脚时才输出事件

(2) Underrun

当串行传输开始而传输数据尚未准备好，并且SPCR.MSTR位为0，SPCR.SPE位为1时，输出此事件信号以响应欠载。在这些条件下，MODF和UDRF标志设置为1。

(3) Overrun

当串行传输完成而接收缓冲区包含未读数据且SPCR.TXMD位为0时，输出此事件信号以响应溢出。在这些情况下，OVRF标志设置为1。

(4) 奇偶校验错误

该事件信号是响应在串行传输完成时检测到的奇偶校验错误而输出的，而SPCR中的TXMD位为0，SPCR2中的SPPE位为1。

34.4.4 SPI空闲事件输出

(1) 在主模式

在主机模式下，当将IDLNF标志（SPI空闲标志）设置为0的条件成立时输出事件。

(2) 在从模式

在从机模式下，当SPCR.SPE位设置为0（SPI初始化）时，会输出一个事件。

34.4.5 传输完成事件输出

在主机模式下的SPI和时钟同步操作期间，当IDLNF标志（SPI空闲标志）从1变为0时输出事件。表34.15列出了在从机模式下发生传输完成事件的条件。

Table 34.15 从机模式下发生传输完成事件的条件

操作模式	发送缓冲区状态	移位寄存器状态	Others
SPI操作(SPMS=0)	Empty	Empty	SSLn0输入的否定
时钟同步操作(SPMS=1)	Empty	Empty	最后一个RSPCKn的边缘检测

无论操作是在主机模式还是从机模式，如果在传输过程中向SPCR.SPE位写入0或SPCR.SPE位因模式故障错误或欠载错误而清零，则不输出事件。

34.5 使用说明

34.5.1 模块停止状态的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用SPI操作。SPI在复位后最初停止。释放模块停止状态可以访问寄存器。有关模块停止控制寄存器B的详细信息，请参见第11节，低功耗模式。

34.5.2 Constraints on Low Power Functions

When using the module-stop function and entering a low power mode other than Sleep mode, set the SPCR.SPE bit to 0 before completing communication.

34.5.3 Constraints on Starting Transfer

If the ICU.IELSRn.IR flag is 1 when transfer starts, the interrupt request is internally saved, which can lead to unanticipated behavior of the ICU.IELSRn.IR flag.

To prevent this, use the following procedure to clear interrupt requests before enabling operations (by setting the SPCR.SPE bit to 1):

1. Confirm that the transfer stopped (SPCR.SPE is 0).
2. Set the associated interrupt enable bit (SPCR.SPTIE or SPCR.SPRIE) to 0.
3. Read the associated interrupt enable bit (SPCR.SPTIE or SPCR.SPRIE) and confirm that its value is 0.
4. Set the ICU.IELSRn.IR flag to 0.

34.5.4 Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output

Using the mode-fault, underrun, overrun, or parity error event is prohibited if the SPI is in multi-master mode (when the SPCR.SPMS bit is 0, the SPCR.MSTR bit is 1, and the SPCR.MODFEN bit is 1).

34.5.5 Constraints on SPRF/SPTEF Flags

If the polling flags, SPRF and SPTEF, are used, interrupt usage is prohibited, and you must set the SPCR.SPRIE and SPCR.SPTIE bits to 0. Either the interrupts or the flags can be used, but not both.

34.5.2 对低功耗函数的约束

当使用模块停止功能并进入除休眠模式以外的低功耗模式时，在完成通信之前将SPCR.SPE位设置为0。

34.5.3 开始传输的限制

如果ICU.IELSRn.IR标志在传输开始时为1，则内部保存中断请求，这可能导致ICU.IELSRn.IR标志的意外行为。

为防止这种情况发生，请使用以下过程在启用操作之前清除中断请求（通过设置SPCR.SPE位为1）：

1. 确认传输已停止（SPCR.SPE为0）。
2. 将相关的中断使能位（SPCR.SPTIE或SPCR.SPRIE）设置为0。
3. 读取相关的中断使能位（SPCR.SPTIE或SPCR.SPRIE）并确认其值为0。
4. 将ICU.IELSRn.IR标志设置为0。

34.5.4 模式故障、欠载、溢出或奇偶校验错误事件输出的约束

如果SPI处于多主模式（当SPCR.SPMS位为0，SPCR.MSTR位为1，SPCR.MODFEN位为1）。

34.5.5 SPRFSPTEF标志的约束

如果使用轮询标志SPRF和SPTEF，则禁止使用中断，您必须设置SPCR.SPRIE和SPCR.SPTIE位为0。可以使用中断或标志，但不能同时使用。

RA生态工作室

35. Quad Serial Peripheral Interface (QSPI)

35.1 Overview

The Quad Serial Peripheral Interface (QSPI) module is a memory controller for connecting a serial ROM (nonvolatile memory, such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface.

Table 35.1 lists the QSPI specifications, Figure 35.1 shows a block diagram, and Table 35.2 lists the I/O pins.

Table 35.1 QSPI specifications

Parameter	Specifications
Number of channels	1 channel
SPI	• Support for extended SPI, dual SPI, and quad SPI protocols • Configurable to SPI mode 0 and SPI mode 3 • Address width selectable to 8, 16, 24, or 32 bits.
Timing adjustment function	Configurable to support a wide range of serial flash configurations
Flash read function	• Support for Read, Fast Read, Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, and Fast Read Quad I/O instructions • Substitutable instruction code • Adjustable number of dummy cycles • Prefetch function • Polling processing • SPI bus cycle extension function.
Direct communication function	Flexible support for a wide variety of serial flash instructions and functions through software control, including erase, write, ID read, and power-down control
Interrupt source	Error interrupts
Module-stop function	Module-stop state can be set to reduce power consumption

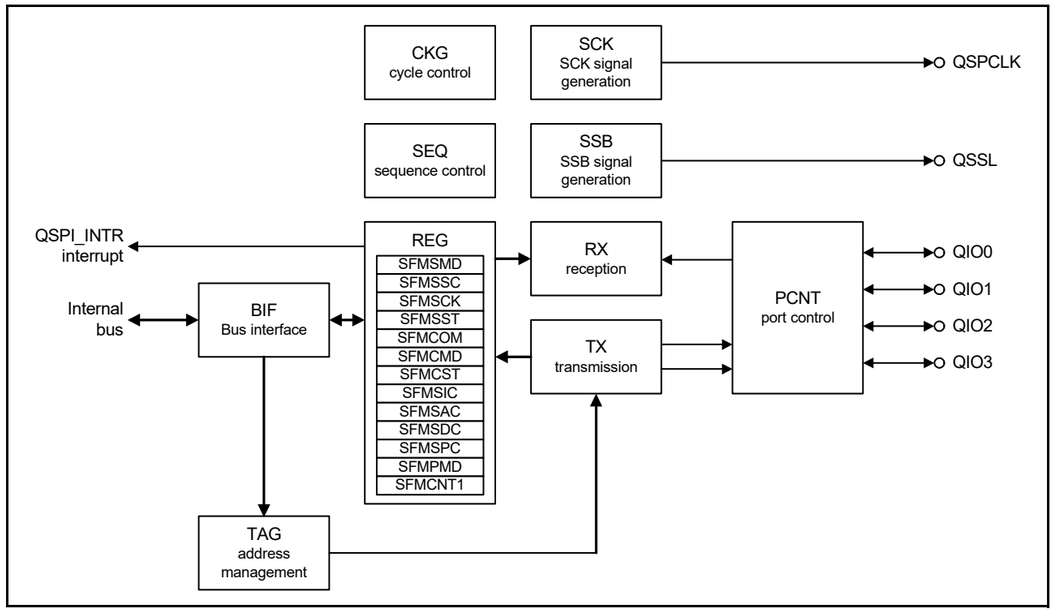

Figure 35.1 QSPI block diagram

35. 四路串行外设接口(QSPI)

35.1 Overview

QuadSerialPeripheralInterface(QSPI)模块是一种存储器控制器，用于连接具有SPI兼容接口的串行ROM（非易失性存储器，例如串行闪存、串行EEPROM或串行FeRAM）。

表35.1列出了QSPI规范，图35.1显示了框图，表35.2列出了IO引脚。

Table 35.1 QSPI specifications

Parameter	Specifications
通道数	1 channel
SPI	支持扩展SPI、双SPI和四SPI协议 可配置为SPI模式0和SPI模式3 地址宽度可选择为8、16、24或32位。
定时调整功能	可配置以支持各种串行闪存配置
闪存读取功能	支持读取、快速读取、快速读取双输出、快速读取双IO、快速读取四输出和快速读取四IO指令 可替换指令代码 可调整的虚拟周期数 预取功能 轮询处理 SPI总线周期扩展功能。
直接通讯功能	通过软件控制灵活支持各种串行闪存指令和功能，包括擦除、写入、ID读取和断电控制
中断源	错误中断
Module-stop function	可设置模块停止状态以降低功耗

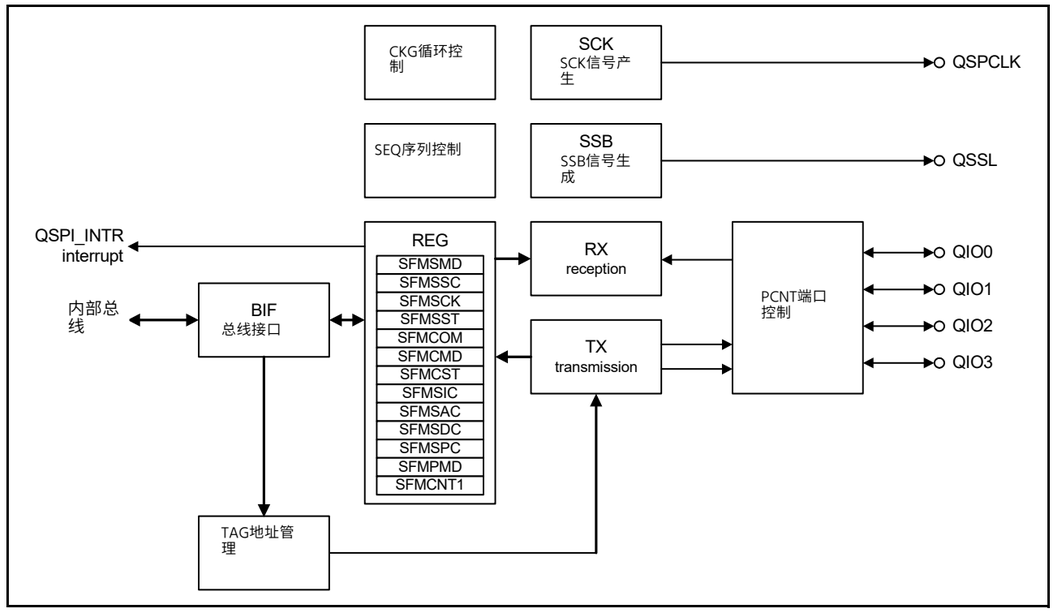

Figure 35.1 QSPI框图

35.3 内存映射

35.3.1 内部总线空间

AHB空间中串行闪存和控制寄存器的位置由配置区域的地址范围决定。

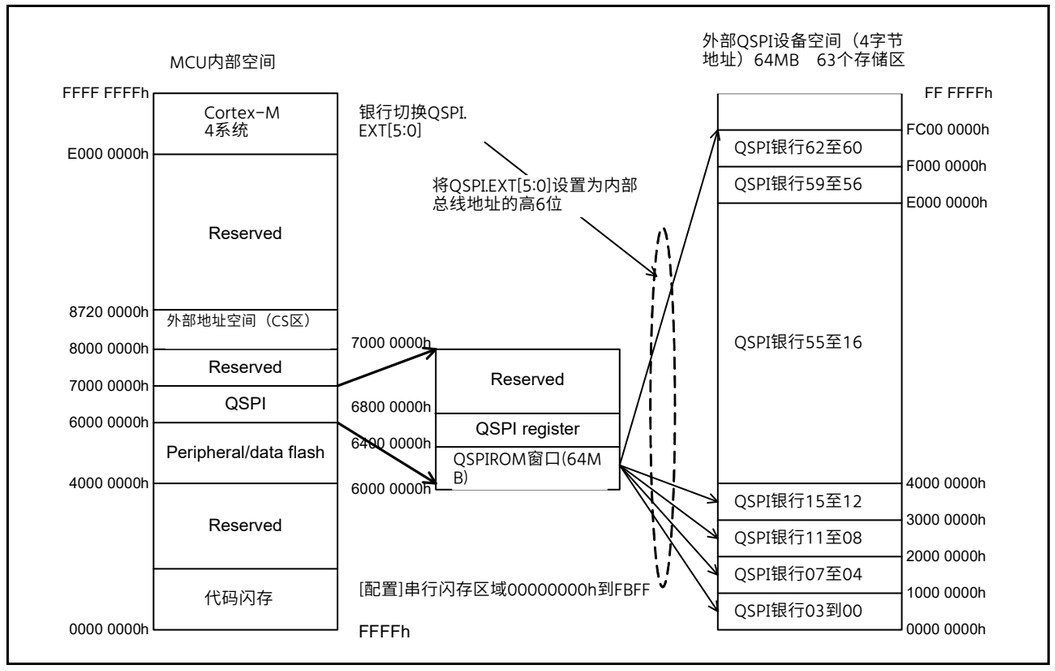

Figure 35.2 默认区域设置和AHB空间内存映射

35.3.2 Address Width of the SPI Space and SPI Bus

The SPI space has a 32-bit address width for referencing the serial flash. When the SPI space is accessed for a read, an SPI bus cycle starts automatically, and data read from the serial flash is returned.

The address width of the SPI space is fixed at 32 bits. However, the address width of the SPI bus is selectable to 8, 16, 24, or 32 bits in the SFMAS[1:0] bits in the SFMSAC register.

If the address width of the SPI bus is selected as 8, 16, or 24 bits, only the lower part of the address used to access the SPI space is posted to the serial flash through the SPI bus. As a result, the mirror image of the serial flash associated with the address width of the SPI bus repeatedly appears in the SPI space.

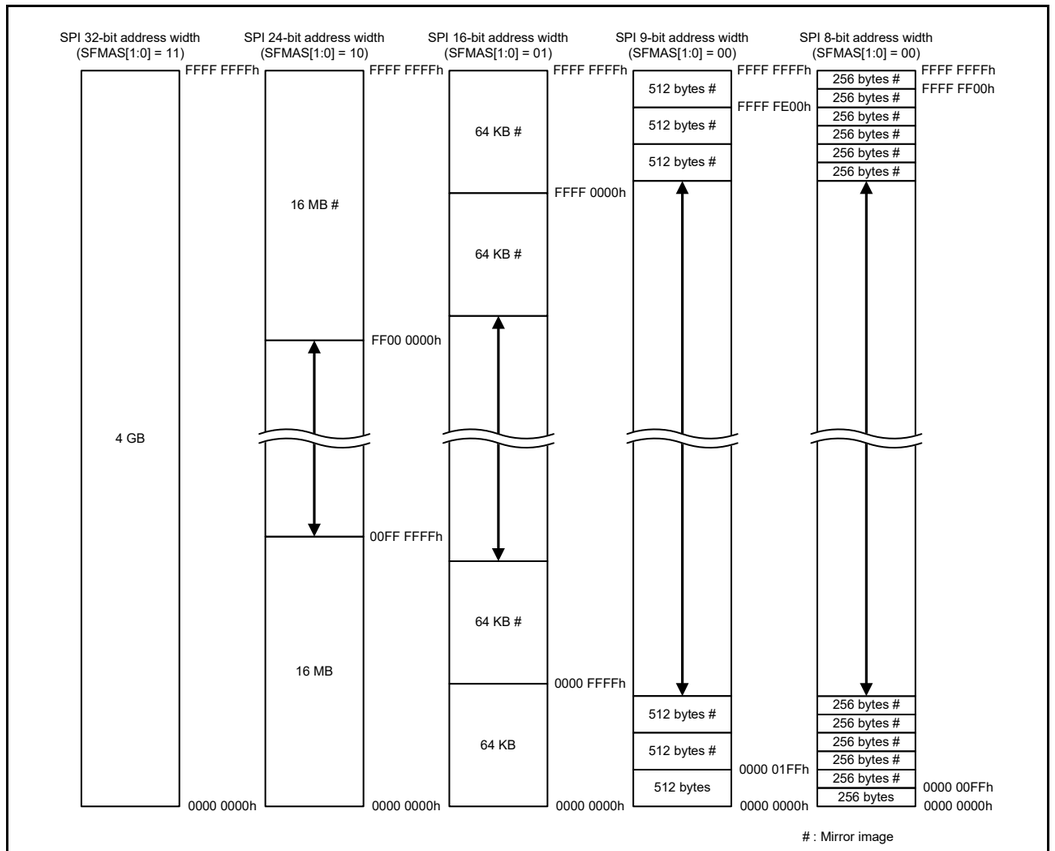

Figure 35.3 Memory map of SPI space

Note: The SPI bus address width is selectable to 8, 16, 24, or 32 bits in the SFMAS[1:0] bits in the SFMSAC register. When an 8-bit address width is selected, the address information of the 9th bit can be embedded in the Read instruction code. The address map in the figure is for the SPI 9-bit address width. For details on the Read instruction, see section 35.6.2, Standard Read Instruction.

35.3.2 SPI空间和SPI总线的地址宽度

SPI空间具有32位地址宽度，用于引用串行闪存。当SPI空间被访问以进行读取时，一个SPI总线周期自动启动，从串行闪存读取的数据返回。

SPI空间的地址宽度固定为32位。但是，SPI总线的地址宽度可选择为SFMSAC寄存器中的SFMAS[1:0]位中的8、16、24或32位。

如果SPI总线的地址宽度选择为8、16或24位，则只有用于访问SPI空间的地址的低部分通过SPI总线发布到串行闪存中。结果，与SPI总线地址宽度相关的串行闪存的镜像在SPI空间中反复出现。

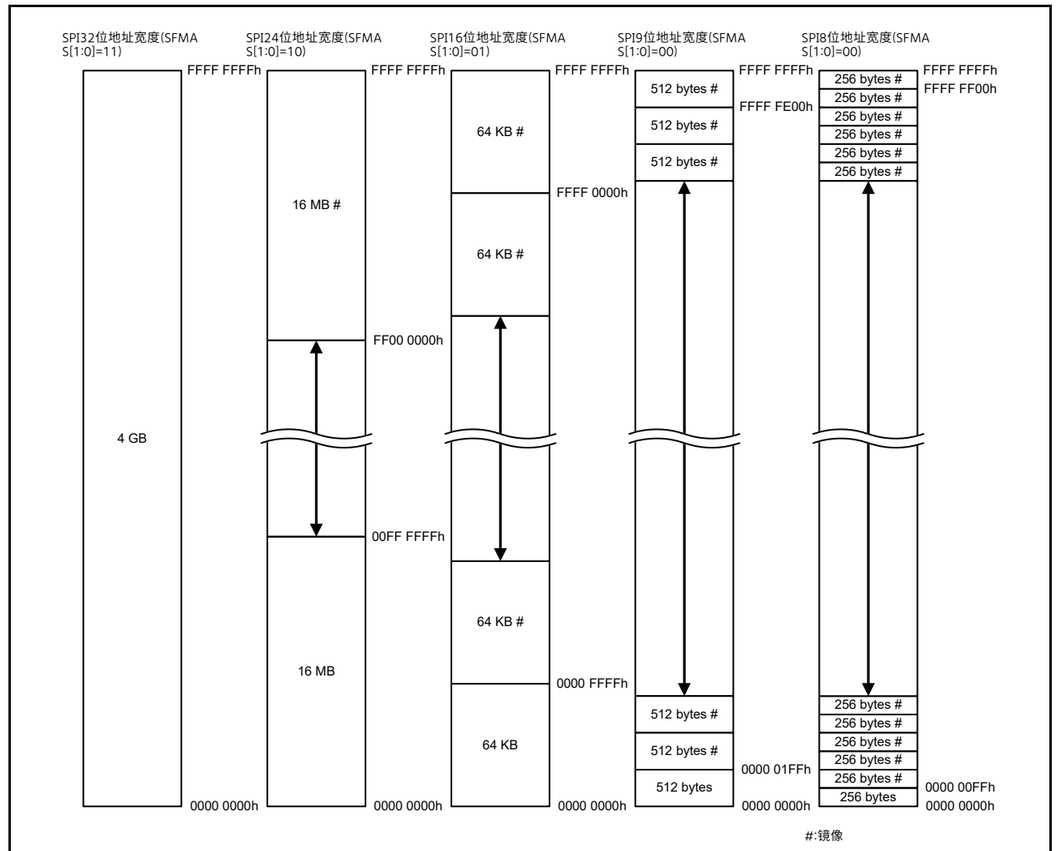

Figure 35.3 SPI空间的内存映射

Note: SPI总线地址宽度可在SFMSAC寄存器的SFMAS[1:0]位中选择为8、16、24或32位。
Whenan8-bitaddresswidthisselected theaddressinformationofthe9thbitcanbeembeddedintheReadinstructioncode.图中的地址映射是针对SPI9位地址宽度的。有关读取指令的详细信息，请参阅第35.6.2节，标准读取指令。

35.4 SPI Bus

35.4.1 SPI Protocol

The QSPI supports extended SPI, dual SPI, and quad SPI, in addition to the SPI protocol used for serial flash connection. The initial state of the SPI protocol is extended SPI. To change the protocol, set the SFMSPI bit in the SFMSPC register.

The extended SPI protocol always outputs instruction codes from a single QIO0 pin. It performs subsequent address and data I/O operation using one to four pins, depending on the instruction code format.

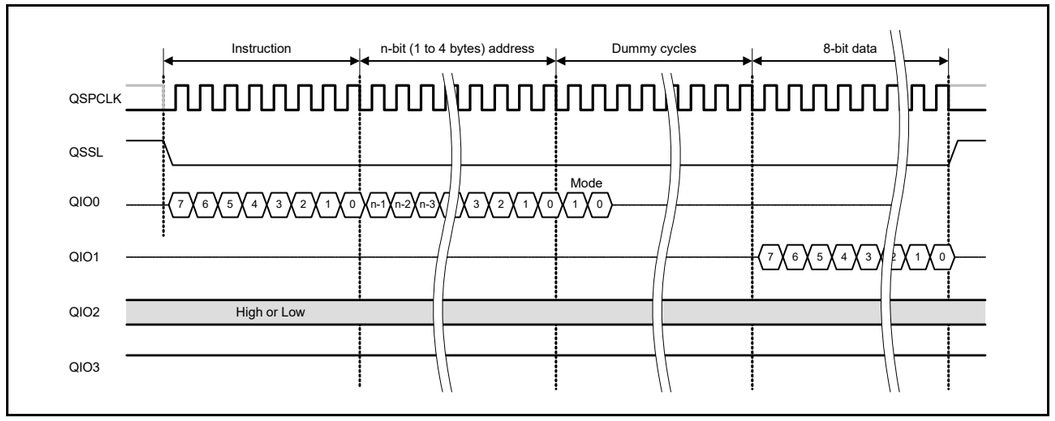

Figure 35.4 Extended SPI protocol example 1 for Fast Read

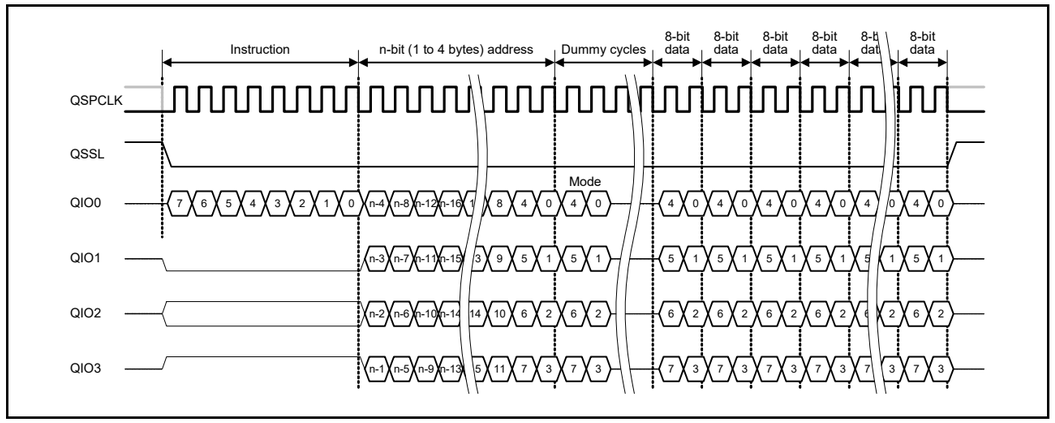

Figure 35.5 Extended SPI protocol example 2 for Fast Read Quad I/O

The dual SPI protocol performs the I/O operation of all signals such as instruction codes, addresses, and data using two pins, QIO0 and QIO1.

35.4 SPI总线

35.4.1 SPI协议

除了用于串行闪存连接的SPI协议外，QSPI还支持扩展SPI、双SPI和四通道SPI。SPI协议的初始状态是扩展SPI。要更改协议，请设置SFMSPC寄存器中的SFMSPI位。

扩展SPI协议始终从单个QIO0引脚输出指令代码。它使用一到四个引脚执行后续地址和数据IO操作，具体取决于指令代码格式。

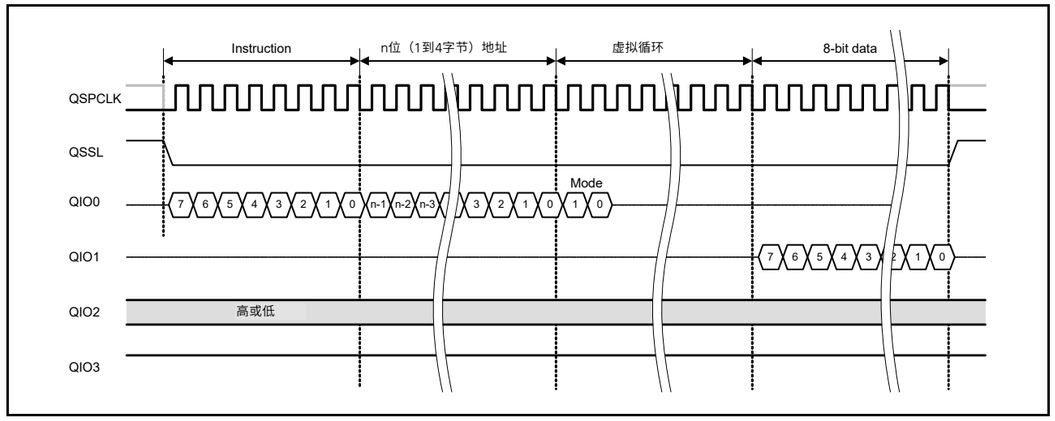

Figure 35.4 用于快速读取的扩展SPI协议示例1

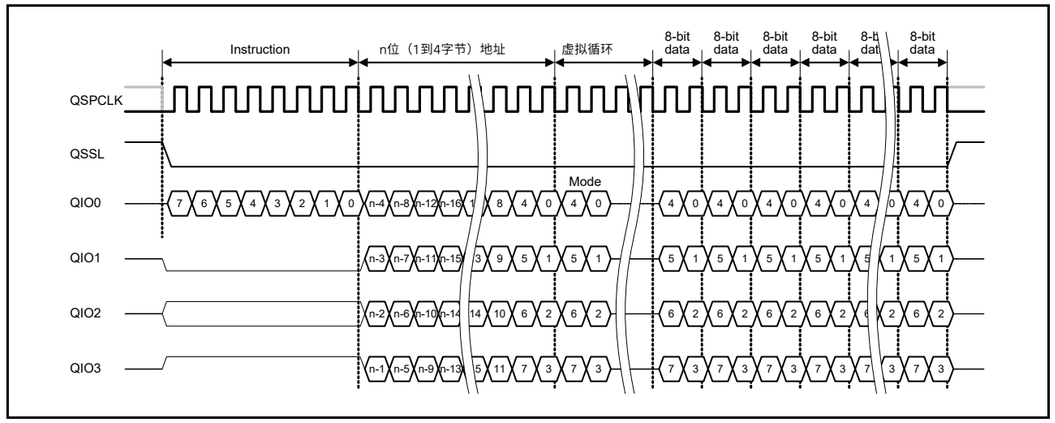

Figure 35.5 用于快速读取QuadIO的扩展SPI协议示例2

双SPI协议使用两个引脚QIO0和QIO1执行指令代码、地址和数据等所有信号的IO操作。

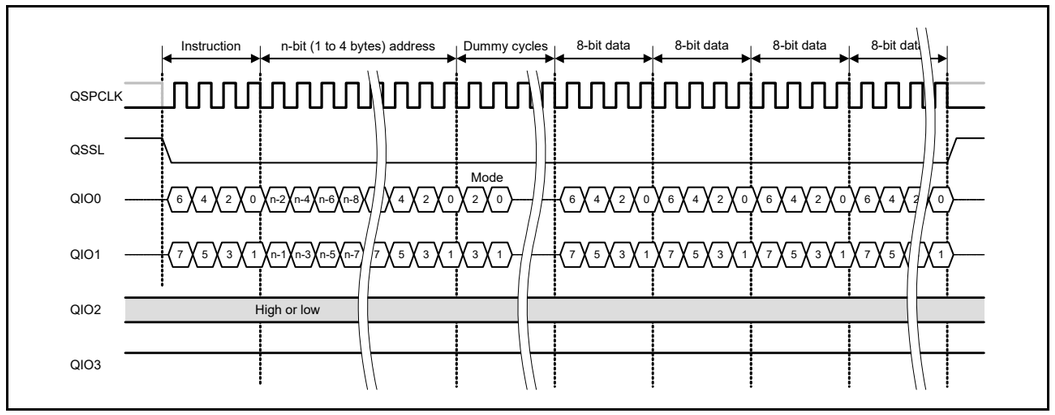

Figure 35.6 Dual SPI protocol example for Fast Read

The quad SPI protocol performs I/O operation of all signals such as instruction codes, addresses, and data using four pins, QIO0, QIO1, QIO2, and QIO3.

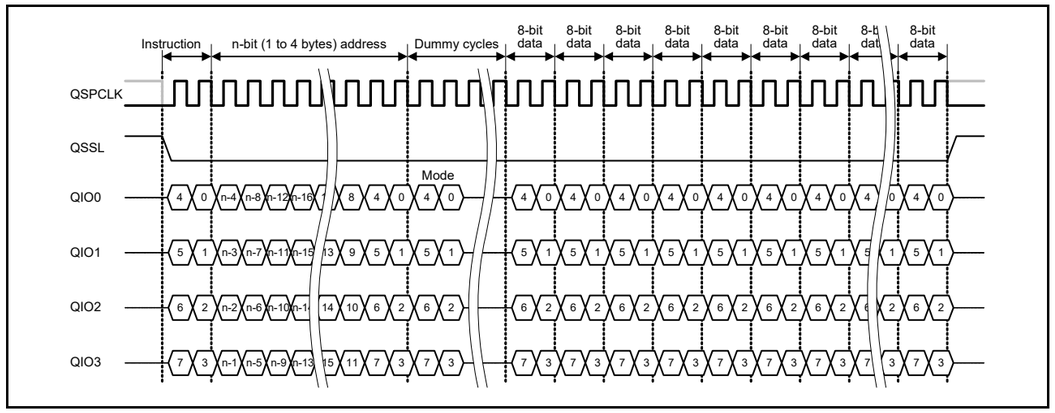

Figure 35.7 Quad SPI protocol example for Fast Read

35.4.2 SPI Mode

The initial SPI mode is set to SPI mode 0 or 3 by the CFGMD3 pin. This can be switched by changing the register setting during operation. The difference between SPI modes 0 and 3 is the standby level of the QSPCLK signal. The standby level of the QSPCLK signal is low in SPI mode 0, and high in SPI mode 3.

Serial data is output from the QSPI on a falling edge of the serial clock and is read into the external flash on a rising edge of the serial clock. Serial data is output from the external flash on a falling edge of the serial clock and is read into the QSPI on the next falling edge of the serial clock.

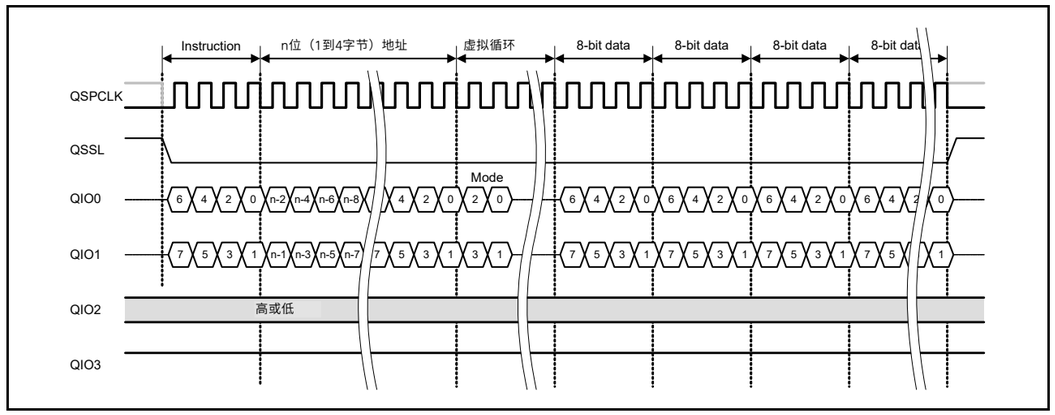

Figure 35.6 用于快速读取的双SPI协议示例

quadSPI协议使用四个引脚QIO0、QIO1、QIO2和QIO3对指令代码、地址和数据等所有信号执行IO操作。

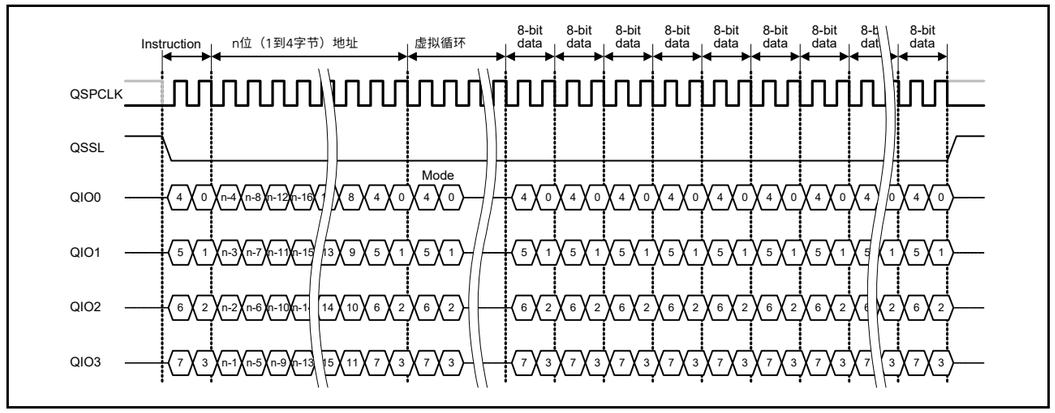

Figure 35.7 用于快速读取的QuadSPI协议示例

35.4.2 SPI模式

初始SPI模式由CFGMD3引脚设置为SPI模式0或3。这可以通过在操作期间更改寄存器设置来切换。SPI模式0和3的区别在于QSPCLK信号的待机电平。QSPCLK信号的待机电平在SPI模式0中为低，在SPI模式3中为高。

串行数据在串行时钟的下降沿从QSPI输出，并在串行时钟的上升沿读入外部闪存。串行数据在串行时钟的下降沿从外部闪存输出，并在串行时钟的下一个下降沿读入QSPI。

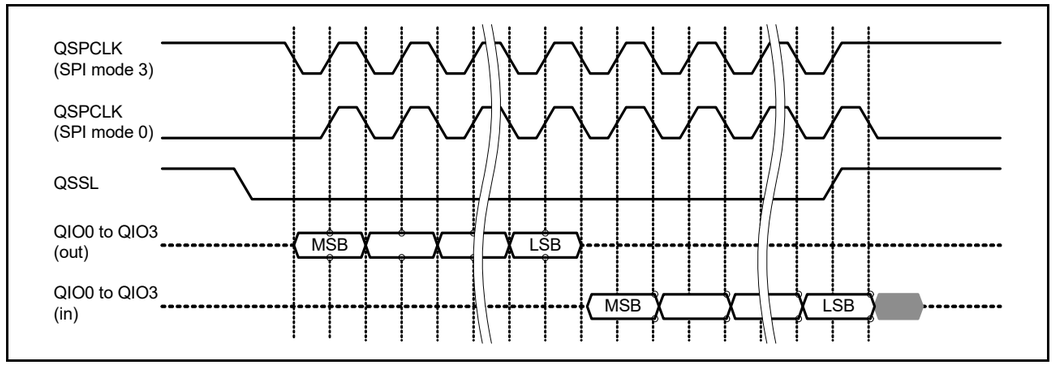

Figure 35.8 Basic serial interface timing

35.5 SPI Bus Timing Adjustment

The timing of the SPI bus signal can be adjusted in the registers. The configured timing is applied to all SPI bus accesses, for both ROM access and direct communication.

35.5.1 SPI Bus Reference Cycles

The SPI bus operates on reference cycles obtained by multiplying PCLKA by an integer. The reference cycles are selectable within the range of PCLKA multiplied by 2 to PCLKA multiplied by 48, by setting the SFMDV[4:0] bits in the SFMSKC register.

Table 35.3 Relationship between SFMDV[4:0] bits, cycle multiplier, and serial clock frequencies (1 of 2)

		PCLKA frequency (MHz)
SFMDV[4:0]	Cycle multiplier	120
11111	48	2.50
11110	46	2.61
11101	44	2.73
11100	42	2.86
11011	40	3.00
11010	38	3.16
11001	36	3.33

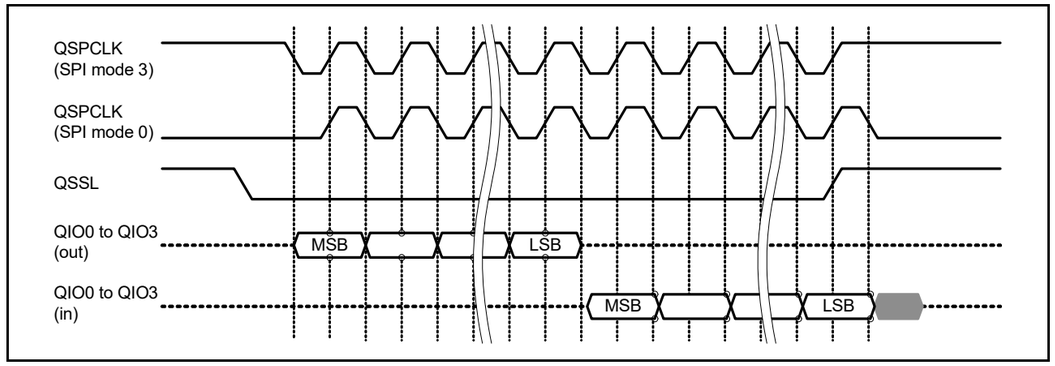

Figure 35.8 基本串行接口时序

35.5 SPI总线时序调整

SPI总线信号的时序可以在寄存器中调整。配置的时序适用于所有SPI总线访问，包括ROM访问和直接通信。

35.5.1 SPI总线参考周期

SPI总线在通过将PCLKA乘以一个整数获得的参考周期上运行。通过设置SFMSKC寄存器中的SFMDV[4:0]位，可以在PCLKA乘以2到PCLKA乘以48的范围内选择参考周期。

Table 35.3 SFMDV[4:0]位、周期乘数和串行时钟频率之间的关系（1of2）

		PCLKA frequency (MHz)
SFMDV[4:0]	循环乘数	120

00100	6	20.00
00011	5	24.00
00010	4	30.00
00001	3	40.00
00000	2	60.00

35.5.2 QSPCLK Signal Duty Ratio

When the reference clock is configured as PCLKA multiplied by an even number, the high- and low-level widths of the QSPCLK signal match each other. When PCLKA is multiplied by an odd number, the high-level width of the QSPCLK signal is longer than the low-level width by 1 PCLKA.

To make the duty ratio of the QSPCLK signal close to 50% when the reference clock is PCLKA multiplied by an odd number, set the SFMDTY bit in the SFMSKC register to 1. With this setting, the rising edge of the QSPCLK output signal is delayed by a half of 1 PCLKA cycle to perform an interface operation equivalent to a duty ratio of 50%.

When the reference clock is PCLKA multiplied by an even number, the SFMDTY setting in the SFMSKC register is ignored.

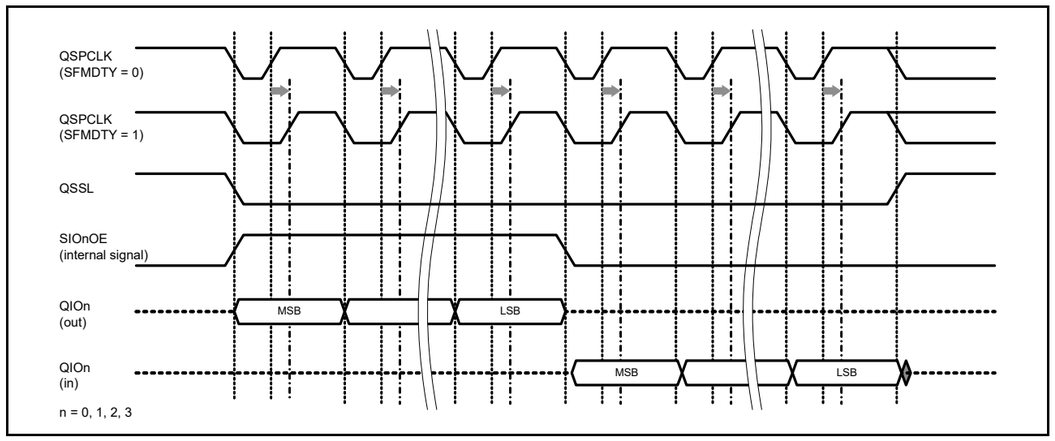

Figure 35.9 Example correction of the QSPCLK signal duty ratio using the SFMDTY bit when PCLKA is multiplied by 3

35.5.3 Minimum High-Level Width of QSSL Signal

Between adjacent SPI bus cycles, the QSSL signal must be held high (inactive) for a sufficient time to satisfy the deselect time required by the serial flash. The reference cycle multiplied by a number from 1 to 16 can be selected as the minimum high-level width of the QSSL output signal in the SFMSW[3:0] bits of the SFMSSC register.

35.5.4 QSSL Signal Setup Time

When the QSPCLK signal first rises after the QSSL signal is driven low, the QSSL signal setup time can be configured to

Table 35.3 SFMDV[4:0]位、周期乘数和串行时钟频率之间的关系(2of2)

SFMDV[4:0]	循环乘数	PCLKA frequency (MHz)
		120
01010	12	10.00
01001	11	10.91
01000	10	12.00
00111	9	13.33
00110	8	15.00
00101	7	17.14
00100	6	20.00
00011	5	24.00
00010	4	30.00
00001	3	40.00
00000	2	60.00

35.5.2 QSPCLK信号占空比

当参考时钟配置为PCLKA乘以偶数时，QSPCLK信号的高低电平宽度相互匹配。当PCLKA乘以奇数时，QSPCLK信号的高电平宽度比低电平宽度长1个PCLKA。

当参考时钟为PCLKA乘以奇数时，为了使QSPCLK信号的占空比接近50%，请将SFMSKC寄存器中的SFMDTY位设置为1。通过此设置，QSPCLK输出信号的上升沿被延迟1个PCLKA周期的一半以执行相当于50%占空比的接口操作。

当参考时钟是PCLKA乘以偶数时，SFMSKC寄存器中的SFMDTY设置将被忽略。

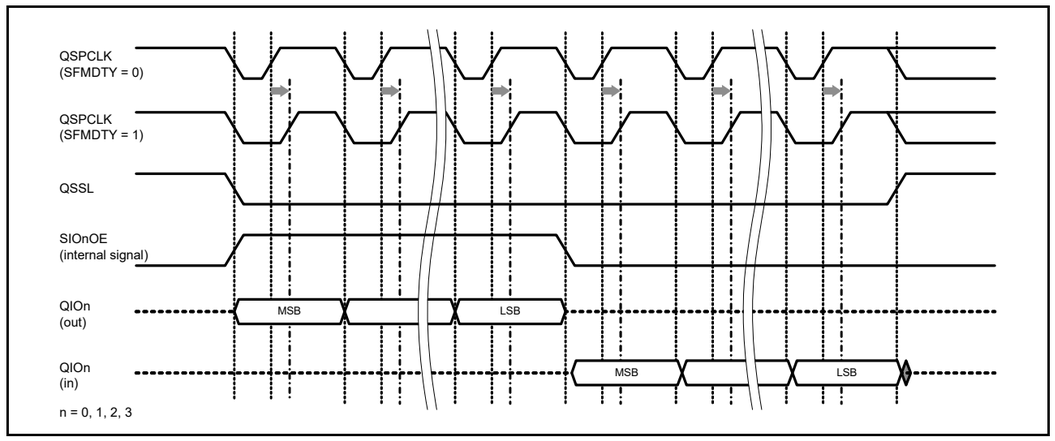

Figure 35.9 当PCLKA乘以3时，使用SFMDTY位校正QSPCLK信号占空比的示例

35.5.3 QSSL信号的最小高电平宽度

在相邻的SPI总线周期之间，QSSL信号必须保持高电平（无效）足够长的时间，以满足串行闪存所需的取消选择时间。在SFMSSC寄存器的SFMSW[3:0]位中，可以选择参考周期乘以1到16作为QSSL输出信号的最小高电平宽度。

35.5.4 QSSL信号建立时间

当QSPCLK信号在QSSL信号被驱动为低电平后首次上升时，QSSL信号建立时间可以配置为

satisfy the serial flash requirements. The setup time can be selected as 0.5 QSPCLK or 1.5 QSPCLK in the SFMSLD bit in the SFMSSC register.

The SFMSLD setting in the SFMSSC register is also used to allocate a setup time from the output of the serial data output enable signal (QIO0OE, QIO1OE, QIO2OE, or QIO3OE) until the first rising edge of the QSPCLK signal. Set a value that meets the most constrained timing condition for your application.

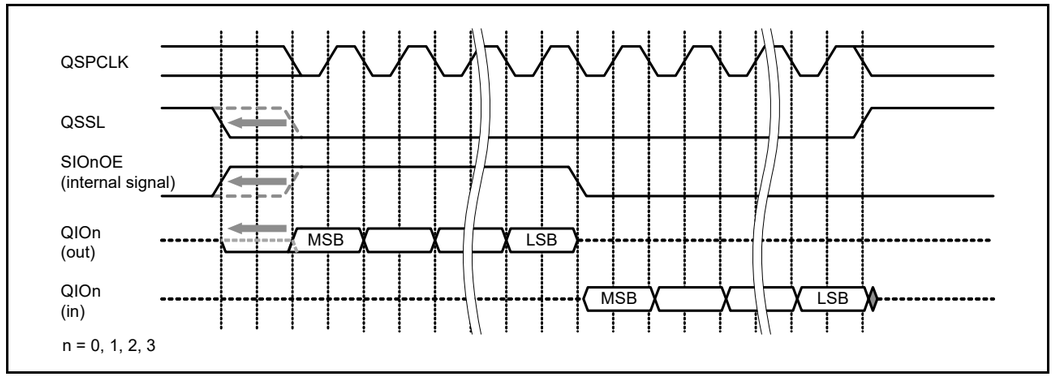

Figure 35.10 Setup time adjustment of the QSSL signal using the SFMSLD bit

35.5.5 QSSL Signal Hold Time

When the QSSL signal is driven high after the last rising edge of the QSPCLK signal, the QSSL signal hold time can be configured to satisfy the device requirements. The hold time is selectable as 0.5 QSPCLK or 1.5 QSPCLK in the SFMSHD bit in the SFMSSC register.

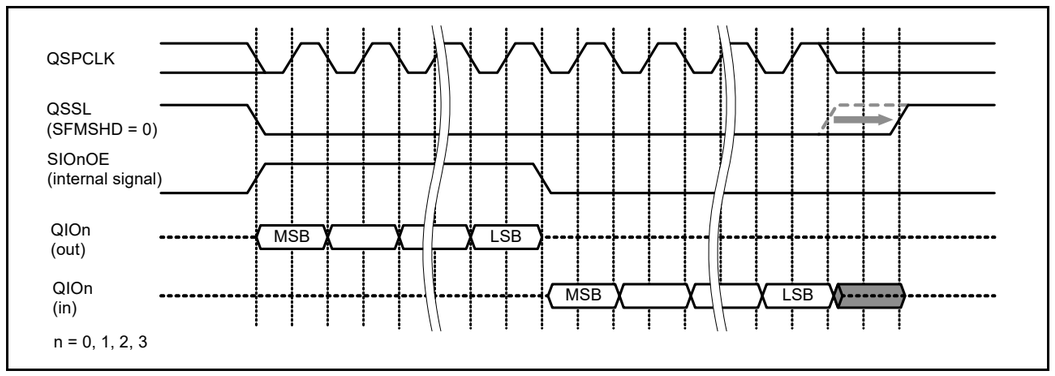

Figure 35.11 Hold time adjustment for the QSSL signal using the SFMSHD bit

35.5.6 Hold Time of the Serial Data Output Enable

The buffer output enable of the QIO0, QIO1, QIO2, or QIO3 pin can be extended by 1 QSPCLK using the SFMOEX bit in the SFMSMD register. The target extension signals include only the output enable signals, namely, the QIO0E, QIO1OE, QIO2OE, and QIO3OE signals. The signals do not include the output data signals QIO0O, QIO1O, QIO2O, and QIO3O.

满足串行闪存要求。设置时间可以在SFMSSC寄存器的SFMSLD位中选择为0.5QSPCLK或1.5QSPCLK。

SFMSSC寄存器中的SFMSLD设置也用于分配从串行数据输出使能信号（QIO0OE、QIO1OE、QIO2OE或QIO3OE）输出到QSPCLK信号的第一个上升沿的建立时间。为您的应用设置一个满足最受约束的时序条件的值。

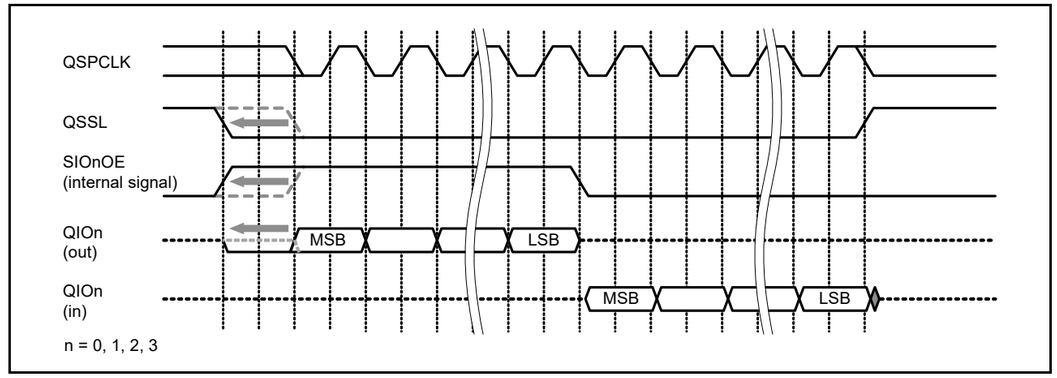

Figure 35.10 使用SFMSLD位调整QSSL信号的建立时间

35.5.5 QSSL信号保持时间

当QSSL信号在QSPCLK信号的最后一个上升沿后被驱动为高电平时，可以配置QSSL信号保持时间以满足器件要求。保持时间可在SFMSSC寄存器的SFMSHD位中选择为0.5QSPCLK或1.5QSPCLK。

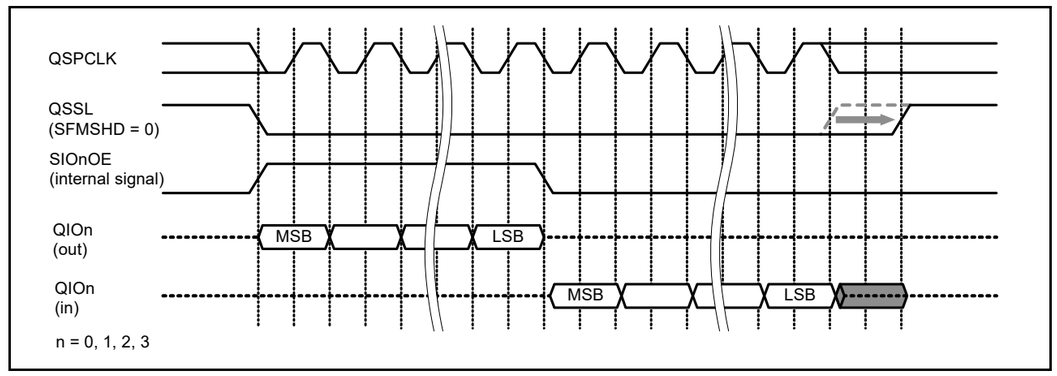

Figure 35.11 使用SFMSHD位调整QSSL信号的保持时间

35.5.6 串行数据输出使能的保持时间

可以使用SFMSMD寄存器中的SFMOEX位将QIO0、QIO1、QIO2或QIO3引脚的缓冲器输出使能扩展1个QSPCLK。目标扩展信号仅包括输出使能信号，即QIO0E、QIO1OE、QIO2OE和QIO3OE信号。这些信号不包括输出数据信号QIO0O、QIO1O、QIO2O和QIO3O。

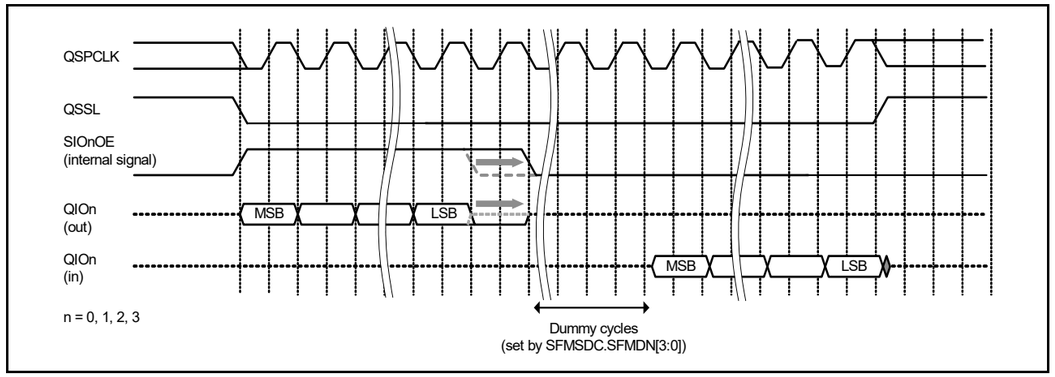

Figure 35.12 Hold time adjustment of output enable using the SFMOEX bit

35.5.7 Setup Time of Serial Data Output

When a command or address is transmitted to the serial flash, the setup time begins on serial data output and ends when the QSPCLK signal rises. If this setup time is insufficient, it can be extended by 1 PCLKA using the SFMOSW bit in the SFMSMD register. When SFMOSW is 1, the low-level width of QSPCLK during serial data transmission is extended by 1 PCLKA while data is being output from the QSPI. This function has no effect on serial data reception.

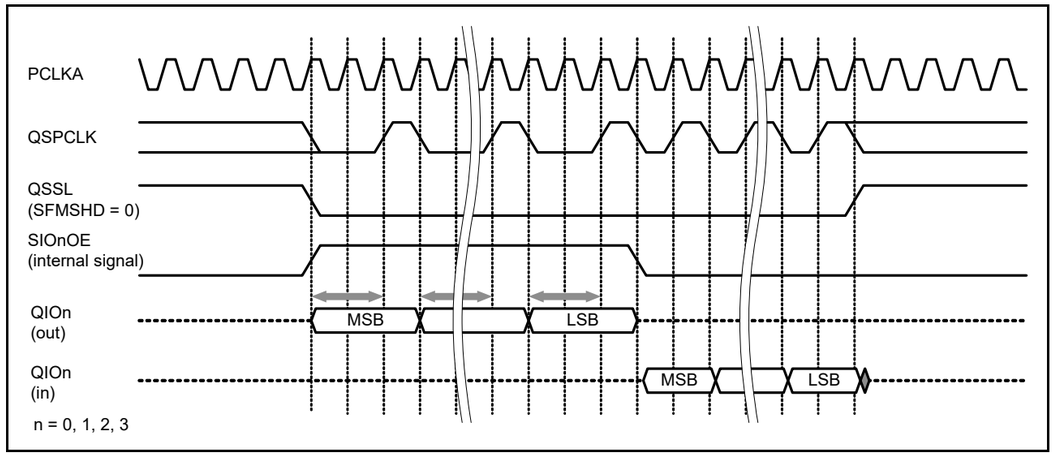

Figure 35.13 Setup time adjustment of serial data output using the SFMOSW bit

35.5.8 Hold Time for Serial Data Output

When a command or address is transmitted to the serial flash, the hold time begins on the rising edge of QSPCLK and ends when the serial data makes another transmission. If this hold time is insufficient, it can be extended by 1 PCLKA using the SFMOHW bit in the SFMSMD register. If the SFMOSW is 1, the high-level width of QSPCLK during serial data transmission is extended by 1 PCLKA while data is being output from the QSPI. This function has no effect on serial data reception.

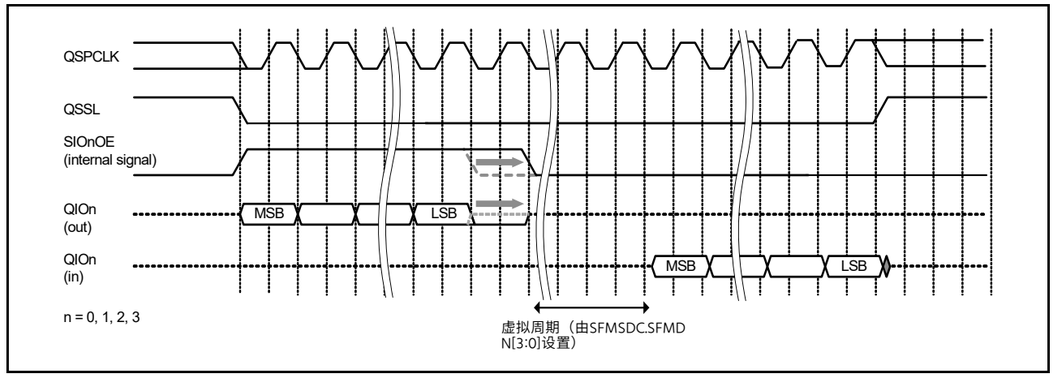

Figure 35.12 使用SFMOEX位调整输出使能的保持时间

35.5.7 串行数据输出的建立时间

当命令或地址传输到串行闪存时，设置时间从串行数据输出开始，到QSPCLK信号上升时结束。如果此建立时间不足，可以使用SFMSMD寄存器中的SFMOSW位将其延长1个PCLKA。当SFMOSW为1时，在从QSPI输出数据时，串行数据传输期间QSPCLK的低电平宽度扩展1PCLKA。该功能对串行数据接收没有影响。

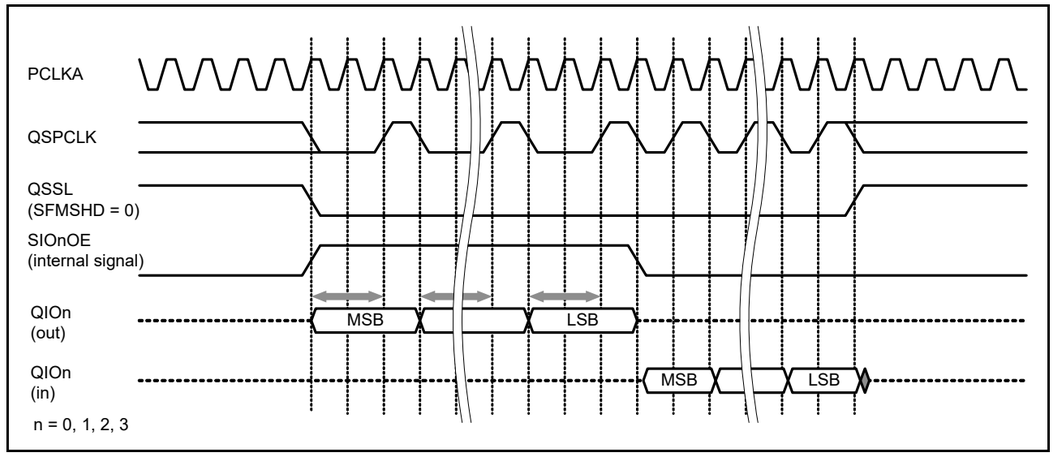

Figure 35.13 使用SFMOSW位调整串行数据输出的建立时间

35.5.8 串行数据输出的保持时间

当命令或地址传输到串行闪存时，保持时间从QSPCLK的上升沿开始，并在串行数据进行另一次传输时结束。如果该保持时间不足，可以使用SFMSMD寄存器中的SFMOHW位将其延长1个PCLKA。如果SFMOSW为1，则在从QSPI输出数据时，串行数据传输期间QSPCLK的高电平宽度扩展1PCLKA。该功能对串行数据接收没有影响。

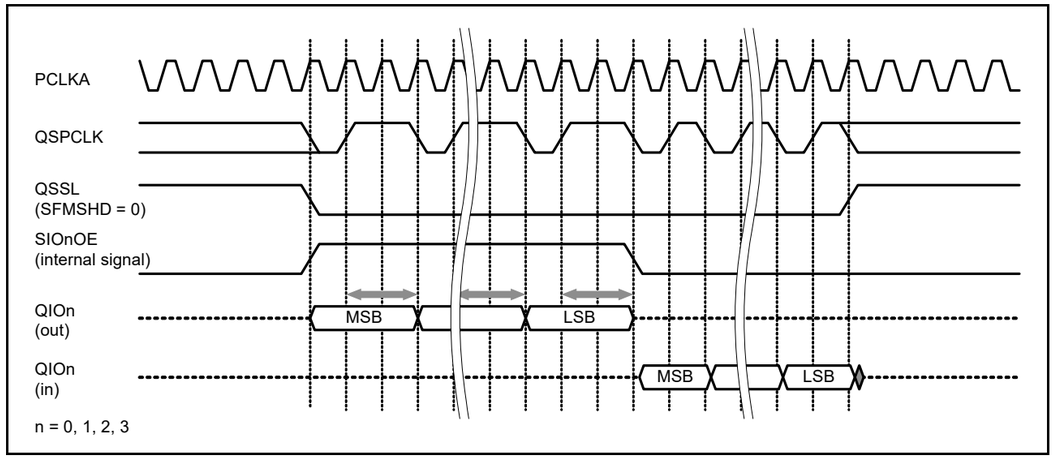

Figure 35.14 Hold time adjustment of serial data output using the SFMOHW bit

35.5.9 Serial Data Receiving Latency

The serial flash outputs data in synchronization with the falling edge of the QSPCLK signal. The QSPI receives that data in synchronization with the falling edge of the subsequent QSPCLK signal. The delay from when the serial flash starts outputting data until when the QSPI receives that data is called the receiving latency. The QSPI adds a latency adjustment cycle immediately before the first data reception cycle in the SPI bus cycle. From the serial flash side, this is seen as an increase in the number of data reception cycles. This added latency adjustment cycle is not generated in the SPI bus cycle without the accompanying data reception.

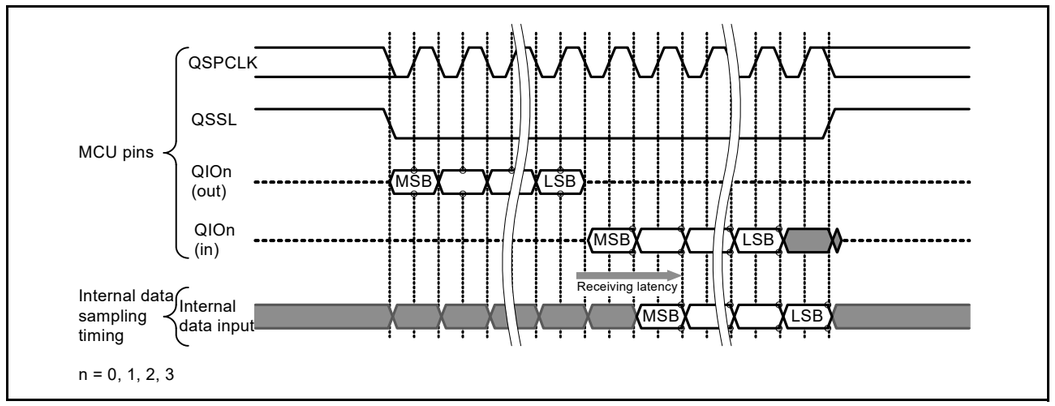

Figure 35.15 Receiving latency

35.6 SPI Instruction Set Used for Flash Access

35.6.1 Types of SPI Instructions Automatically Generated

When the serial flash is accessed, an SPI bus cycle using one of the instructions described in Table 35.4 to Table 35.8 is automatically generated based on the settings in the SFMAS[1:0] bits in the SFMSAC register, and settings in the SFMSMD register.

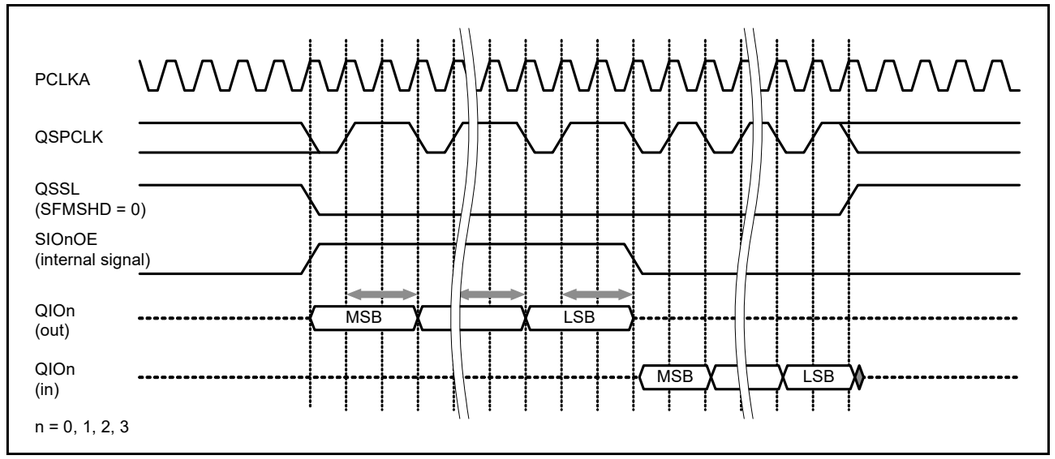

Figure 35.14 使用SFMOHW位调整串行数据输出的保持时间

35.5.9 串行数据接收延迟

串行闪存与QSPCLK信号的下降沿同步输出数据。QSPI与随后的QSPCLK信号的下降沿同步接收该数据。从串行闪存开始输出数据到QSPI接收到该数据的延迟称为接收延迟。QSPI在SPI总线周期的第一个数据接收周期之前添加一个延迟调整周期。从串行闪存方面来看，这被视为数据接收周期数的增加。如果没有伴随的数据接收，则不会在SPI总线周期中生成这个增加的延迟调整周期。

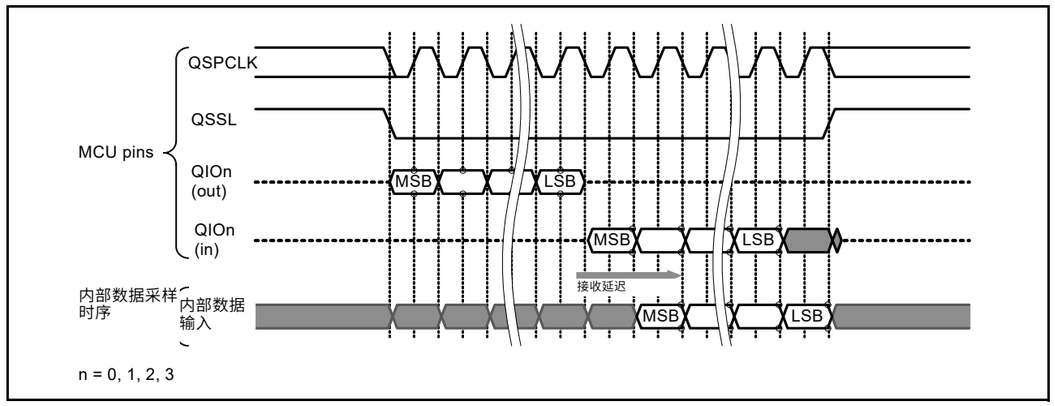

Figure 35.15 接收延迟

35.6 用于闪存访问的SPI指令集

35.6.1 自动生成的SPI指令类型

访问串行闪存时，会根据SFMSAC寄存器中的SFMAS[1:0]位的设置和SFMSMD寄存器中的设置自动生成使用表35.4至表35.8中描述的指令之一的SPI总线周期.

Table 35.4 SPI instruction set automatically generated when SFMAS[1:0] = 00

Note 2. The number of dummy cycles can be set in SFMSDC.SFMDN[3:0].

35.6.2 Standard Read Instruction

The Standard Read instruction is a common read instruction supported by most serial flash devices. When an SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (03h/13h)*1 is output. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted. Data is then received. This Standard Read instruction is selected in the initial QSPI settings.

Note 1. Many 4-Kb serial flash devices have an address field not larger than 1 byte (A7 to A0) to minimize the overhead and to receive A8 information from bit [3] of the Read instruction code. To support these devices, the QSPI only outputs A8 (address bit 8) to bit [3] of the Standard Read instruction code when an address width of 1 byte is specified (SFMAS[1:0] = 00). This means that 0Bh instead of 03h might be output as the Standard Read instruction code. This code duplicates the Fast Read instruction code. However, for most of the 2-Kb or smaller serial flash devices with an address width of 1 byte, bit [3] of a command is designed to be excluded from decoding as a *don't care* bit, so such a Read instruction code is recognized correctly as the Standard Read instruction code. In rare cases, some serial flash devices allow bit [3] to be decoded. When such a serial flash is connected, configure your application to avoid access resulting in A8 = 1.

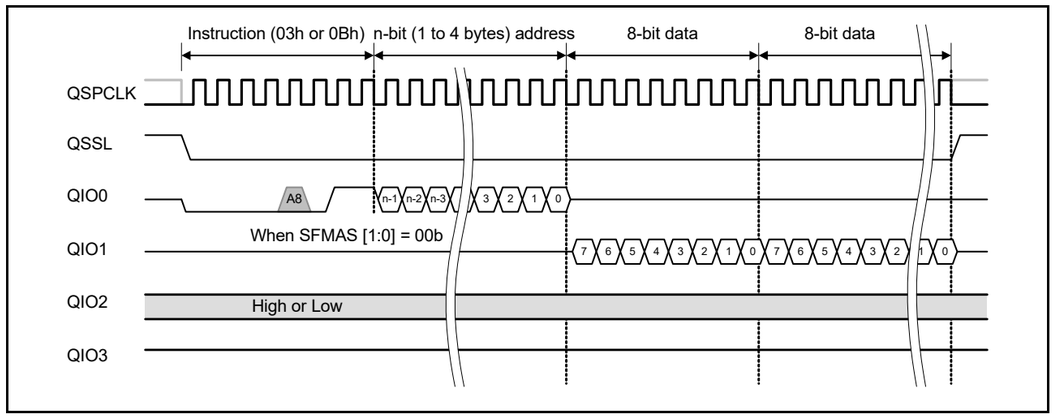

Figure 35.16 Standard Read bus cycle

35.6.3 Fast Read Instruction

The Fast Read instruction is a read instruction that supports a higher communication clock speed than the Standard Read instruction. When an SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (0Bh/0Ch) is output. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in SFMSAC, and a certain number of dummy cycles, specified in the SFMSDC register, are transmitted. Data is then received.

The first 2 dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction is applied to the next SPI bus cycle, and instruction code transmission of the next SPI bus cycle is skipped.

Table 35.8 当SFMAS[1:0]=11和SFM4BC=1(2of2)时自动生成SPI指令集

Note 1. 如果SFMSMD.SFMCCE位设置为1，则SFMSIC.SFMCIC[7:0]设置用作指令代码。
Note 2. 可以在SFMSDC.SFMDN[3:0]中设置虚拟周期数。

35.6.2 标准阅读说明

标准读取指令是大多数串行闪存设备支持的常见读取指令。当一个SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码(03h13h)*1。接下来，发送宽度为1到4字节的地址，在SFMSAC寄存器的SFMAS[1:0]位中指定。然后接收数据。在初始QSPI设置中选择此标准读取指令。

注1.许多4-Kb串行闪存设备的地址字段不大于1字节（A7到A0），以最大限度地减少开销并从读取指令代码的位[3]接收A8信息。为了支持这些器件，当指定1个字节的地址宽度(SFMAS[1:0]=00)时，QSPI仅将A8（地址位8）输出到标准读取指令代码的位[3]。这意味着可能会输出0Bh而不是03h作为标准读取指令代码。此代码复制了快速读取指令代码。但是，对于大多数地址宽度为1字节的2-Kb或更小的串行闪存设备，命令的位[3]被设计为作为无关位从解码中排除，因此这样的读取指令代码被正确识别为标准读取指令代码。在极少数情况下，一些串行闪存设备允许对位[3]进行解码。连接此类串行闪存时，配置您的应用程序以避免访问导致A8=1。

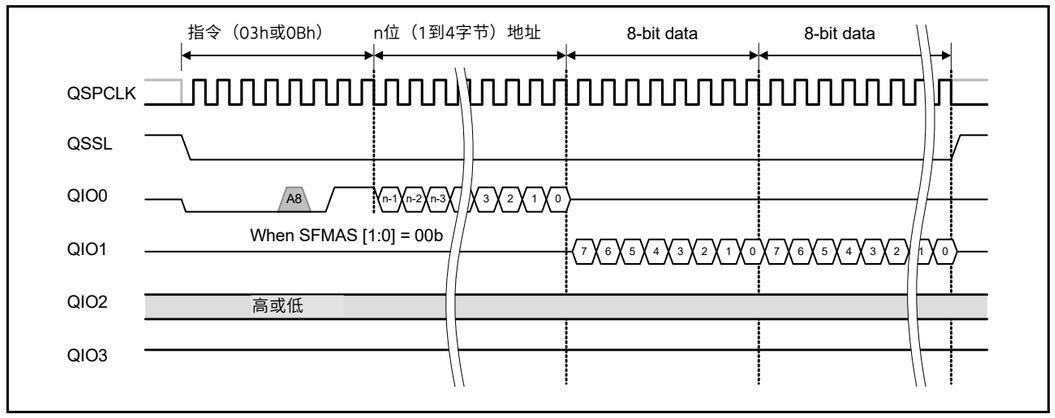

Figure 35.16 标准读总线周期

35.6.3 快速阅读说明

快速读取指令是一种读取指令，它支持比标准读取指令更高的通信时钟速度。当一个SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（0Bh0Ch）。接下来，发送宽度为1到4字节的地址，在SFMSAC中的SFMAS[1:0]位中指定，以及在SFMSDC寄存器中指定的一定数量的虚拟周期被发送。然后接收数据。

前2个虚拟周期用于选择或取消选择XIP模式。选择XIP模式后，将相同的指令应用于下一个SPI总线周期，并跳过下一个SPI总线周期的指令代码传输。

For details on the XIP mode, see section 35.8, XIP Control.

Switching to the Fast Read instruction is controlled in the SFMSMD register.

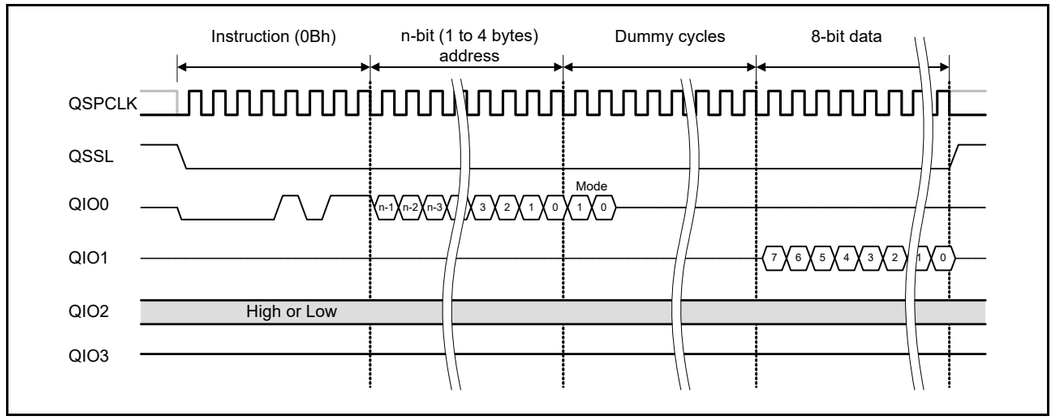

Figure 35.17 Fast Read bus cycle

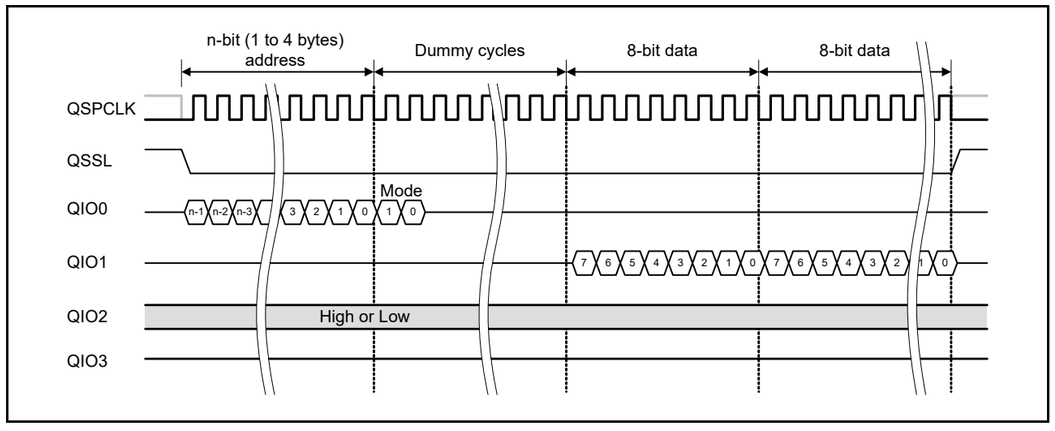

Figure 35.18 Fast Read bus cycle in XIP mode

Note: To use the Fast Read instruction, a serial flash device that supports Fast Read transfers is required.

35.6.4 Fast Read Dual Output Instruction

The Fast Read Dual Output instruction is a read instruction that uses two signal lines to receive data. When the SPI bus cycle starts, the serial flash select signal is asserted. The instruction code (3Bh/3Ch) and an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, are transmitted from the QIO0 pin. Next, a certain number of dummy cycles, specified in the SFMSDC register, is generated. Data is then received through the QIO0 and QIO1 pins. Even-bit data is received from the QIO0 pin and odd-bit data is received from the QIO1 pin.

The first 2 dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code transmission of the next SPI bus cycle is skipped. For details on the XIP mode, see section 35.8, XIP Control.

Switching to Fast Read Dual Output is controlled in the SFMSMD register.

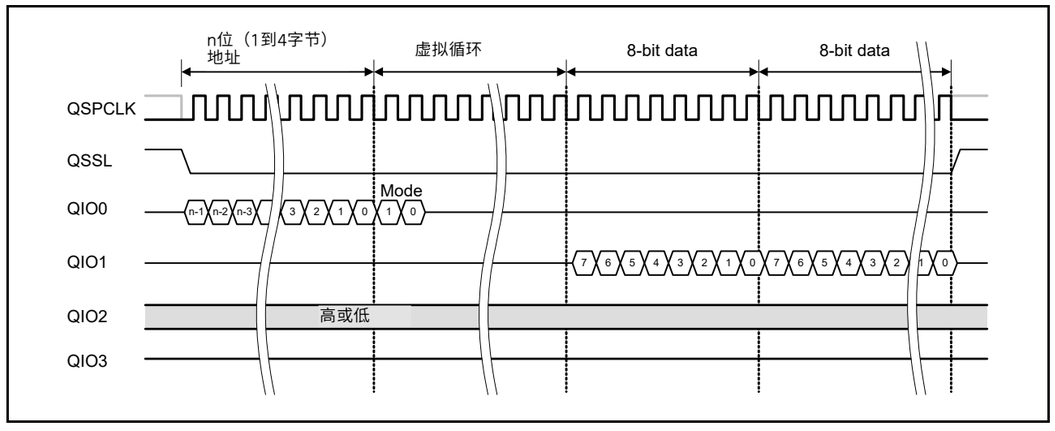

Figure 35.18 XIP模式下的快速读取总线周期

Note: 要使用快速读取指令，需要支持快速读取传输的串行闪存设备。

35.6.4 快速读取双输出指令

快速读取双输出指令是使用两条信号线接收数据的读取指令。当SPI总线周期开始时，串行闪存选择信号被置位。指令代码(3Bh3Ch)和宽度为1到4字节的地址，在SFMSAC寄存器的SFMAS[1:0]位中指定，从QIO0引脚发送。接下来，生成在SFMSDC寄存器中指定的一定数量的虚拟周期。然后通过QIO0和QIO1引脚接收数据。偶数位数据从QIO0引脚接收，奇数位数据从QIO1引脚接收。

前2个虚拟周期用于选择或取消选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并跳过了下一个SPI总线周期的指令代码传输。有关XIP模式的详细信息，请参阅第35.8节，XIP控制。

Note: To use the Fast Read Dual Output instruction, a serial flash device that supports Fast Read Dual Output transfers is required.

35.6.5 Fast Read Dual I/O Instruction

The Fast Read Dual I/O instruction is a read instruction that uses two signal lines to transmit an address and receive data. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (BBh/BCh) is output from the QIO0 pin. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted through the QIO0 and QIO1 pins, and a certain number of dummy cycles, specified in the SFMSDC register, is generated. Data is then is received through the QIO0 and QIO1 pins. Address and dummy cycle transmission and data reception are performed through the QIO0 pin for even bits and through the QIO1 pin for odd bits.

The first 2 dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code transmission is skipped for the next SPI bus cycle. For details on the XIP mode, see section 35.8, XIP Control.

Switching to Fast Read Dual I/O is controlled in the SFMSMD register.

Note: To use the Fast Read Dual I/O instruction, a serial flash device that supports Fast Read Dual I/O transfers is required.

35.6.6 Fast Read Quad Output Instruction

The Fast Read Quad Output instruction is a read instruction that uses four signal lines to receive data. When the SPI bus cycle starts, the serial flash select signal is asserted. The instruction code (6Bh/6Ch) and an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, are output from the QIO0 pin. Next, a certain number of dummy cycles, specified in the SFMDN[3:0] bits in the SFMSMD register, are generated. Data is then received through the QIO0, QIO1, QIO2, and QIO3 pins.

The first 2 dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code transmission of the next SPI bus cycle is skipped. For details on the XIP mode, see section 35.8, XIP Control.

Switching to Fast Read Quad Output is controlled in the SFMSMD register.

35.6.8 进入4字节模式指令

进入4字节模式指令将串行闪存地址宽度设置为4字节。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（B7h）。

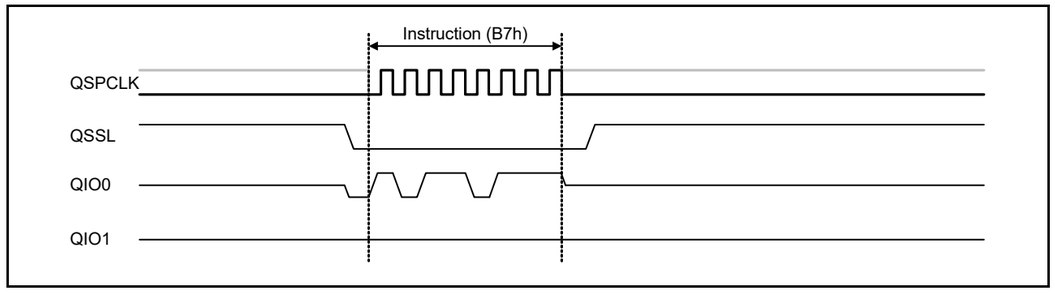

Figure 35.27 进入4字节模式总线周期

Note: The Enter 4-byte Mode instruction is issued regardless of whether the serial flash is in 3-byte or 4-byte mode.

35.6.9 Exit 4-byte Mode Instruction

The Exit 4-byte Mode instruction sets the serial flash address width to 3 bytes. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (E9h) is output.

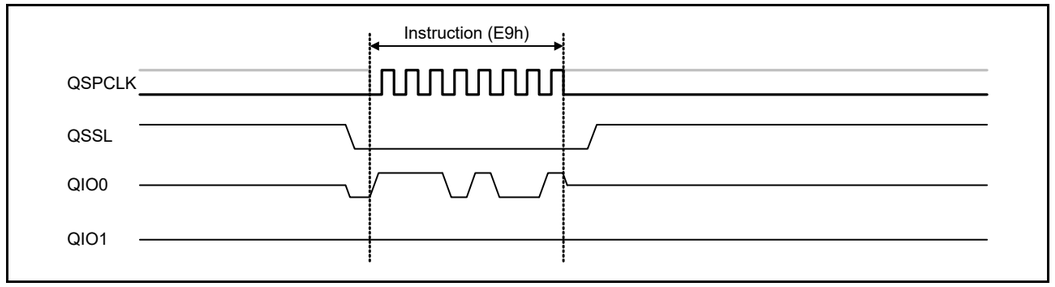

Figure 35.28 Exit 4-byte Mode bus cycle

Note: The Exit 4-byte Mode instruction is issued regardless of whether the serial flash is in 3-byte or 4-byte mode.

35.6.10 Write Enable Instruction

The Write Enable instruction enables changing of the serial flash address width. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (06h) is output.

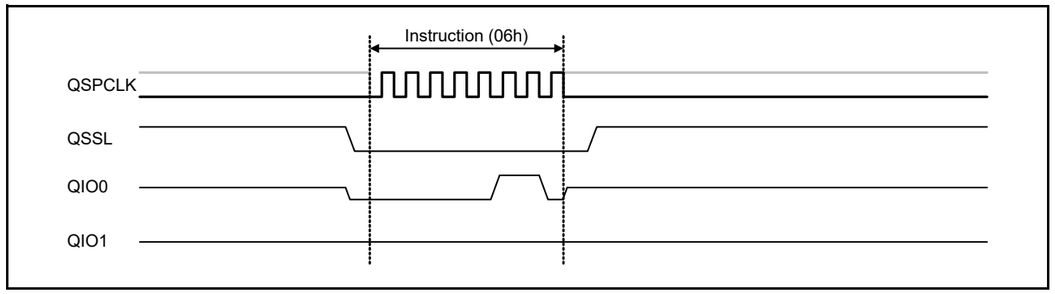

Figure 35.29 Write Enable bus cycle

35.7 SPI Bus Cycle Arrangement

35.7.1 Flash Read Based on Individual Conversion

ROM read internal bus cycles are individually converted to SPI bus cycles on a one-to-one basis. When a ROM read bus cycle is detected, the QSSL signal is asserted, and an SPI bus cycle starts. When data is received from the serial flash, the QSSL signal is deasserted, and the SPI bus cycle is complete.

When another ROM read bus cycle is detected, the QSSL signal is reasserted after ensuring that the minimum high-level width of the QSSL signal is reached. Then, another SPI bus cycle starts.

Note: 无论串行闪存处于3字节模式还是4字节模式，都会发出进入4字节模式指令。

35.6.9 退出4字节模式指令

退出4字节模式指令将串行闪存地址宽度设置为3字节。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（E9h）。

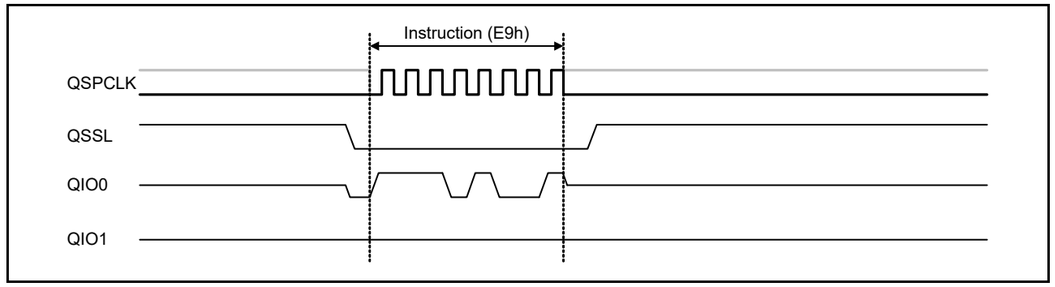

Figure 35.28 退出4字节模式总线周期

Note: 无论串行闪存处于3字节还是4字节模式，都会发出退出4字节模式指令。

35.6.10 写使能指令

写使能指令可以改变串行闪存地址宽度。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（06h）。

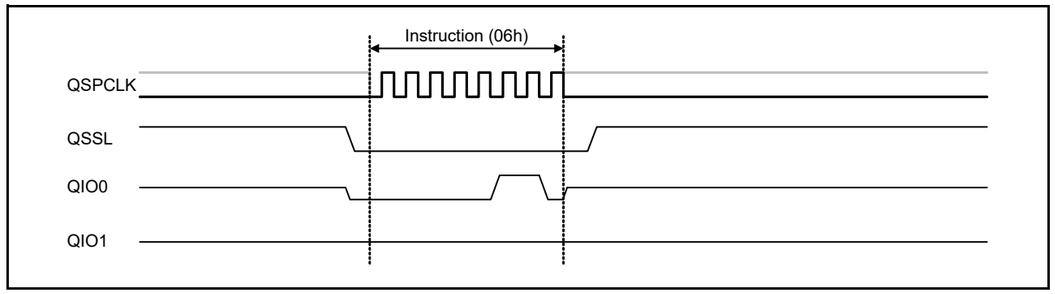

Figure 35.29 写使能总线周期

35.7 SPI总线周期安排

35.7.1 基于单个转换的闪存读取

ROM读取内部总线周期会以一对一的方式单独转换为SPI总线周期。当检测到ROM读取总线周期时，QSSL信号被置位，并且SPI总线周期开始。当从串行闪存接收到数据时，QSSL信号被置低，并且SPI总线周期完成。

当检测到另一个ROM读取总线周期时，在确保达到QSSL信号的最小高电平宽度后，重新置位QSSL信号。然后，另一个SPI总线周期开始。

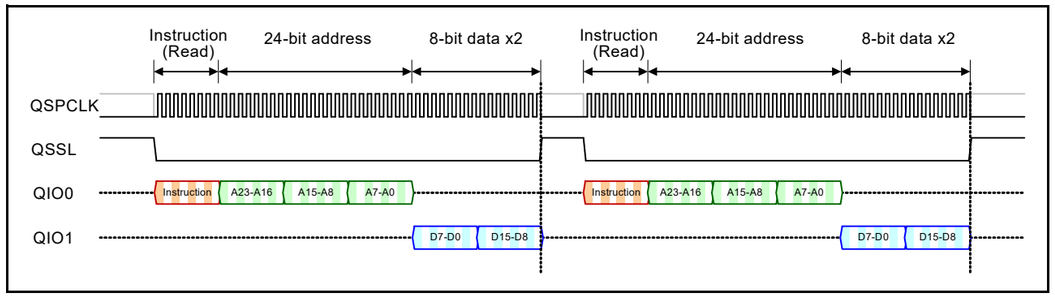

Figure 35.30 Successive data read operations based on individual conversion

35.7.2 Flash Read Using the Prefetch Function

In operations such as the CPU instruction execution and block data transfer, data is often read in ascending order from contiguous flash addresses. Serial flash provides the ability to repeat data reception without reissuing an instruction code and address. However, if bus cycles issued by the MCU are individually converted, the SPI bus cycles are separated from each other, resulting in a failure to take advantage of this feature of the serial flash. The QSPI has a prefetch function for continuous data reception.

To enable the prefetch function, set the SFMPFE bit in the SFMSMD register to 1. When the prefetch function is enabled, data is received continuously and stored in the buffer, without waiting for another flash read request. When the MCU performs a flash read operation, an address check is made. If an address match is confirmed, the data in the buffer is passed to the MCU. If an address mismatch is found, the data in the buffer is discarded, and a new SPI bus cycle is issued.

The prefetch buffer size is 18 bytes. When the prefetch buffer becomes full, the SPI bus cycle ends. When the buffer data is read to create free space, a new SPI bus cycle automatically starts to resume prefetching.

The prefetch function allows for efficient transfer operations when data is read in ascending order from contiguous addresses, as in instruction fetch and block data transfer.

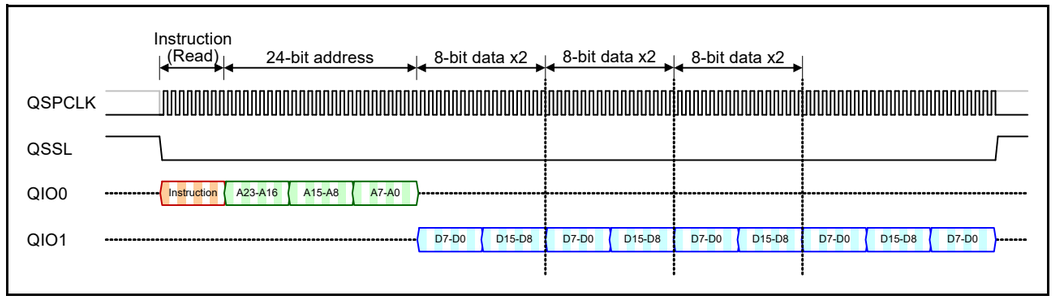

Figure 35.31 Successive data read operations using the prefetch function

35.7.3 Halt of Prefetching

If a ROM read bus cycle for reading from another address occurs during a serial transfer for prefetching, the unnecessary serial transfer is halted and a new SPI bus cycle is started. Usually, such a halt of serial transfer occurs on data reception byte boundaries. However, if the SFMPAE bit in the SFMSMD register is set to 1, the halt can occur on locations other than byte boundaries. To use this function, the serial flash device must support non-byte boundary halts.

35.7.4 Direct Specification of Prefetch Destination

When the SFMPFE bit is set and the QSPI receives internal bus write access to the QSPI window area, the system obtains it as a prefetch address and starts to prefetch. Internal bus write access to the QSPI window area can only be used to obtain prefetch address data. Writes to serial flash cannot be performed.

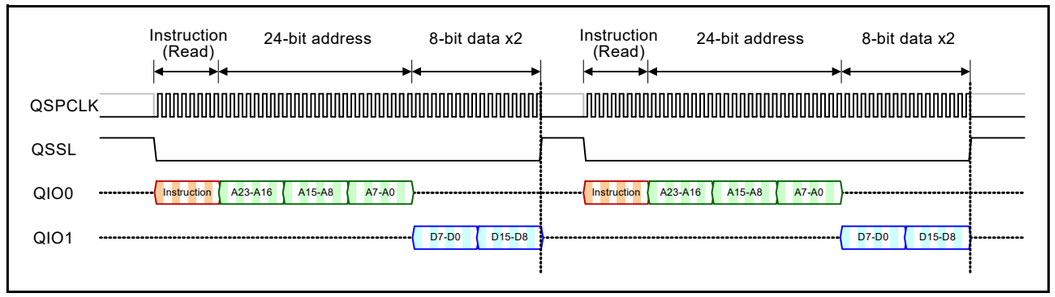

Figure 35.30 基于单独转换的连续数据读取操作

35.7.2 使用预取功能进行闪存读取

在CPU指令执行和块数据传输等操作中，数据通常是从连续的闪存地址按升序读取的。串行闪存提供了重复数据接收而无需重新发出指令代码和地址的能力。但是，如果将MCU发出的总线周期单独转换，则SPI总线周期会相互分离，导致无法利用串行闪存的这一特性。QSPI具有用于连续数据接收的预取功能。

要使能预取功能，请将SFMSMD寄存器中的SFMPFE位设置为1。当使能预取功能时，数据会连续接收并存储在缓冲区中，无需等待另一个flash读取请求。当MCU执行闪存读取操作时，会进行地址检查。如果确认地址匹配，则将缓冲区中的数据传递给MCU。如果发现地址不匹配，则丢弃缓冲区中的数据，并发出新的SPI总线周期。

预取缓冲区大小为18字节。当预取缓冲区满时，SPI总线周期结束。当缓冲区数据被读取以创建空闲空间时，新的SPI总线周期会自动开始恢复预取。

当从连续地址以升序读取数据时，预取功能允许有效的传输操作，如在指令取指和块数据传输中。

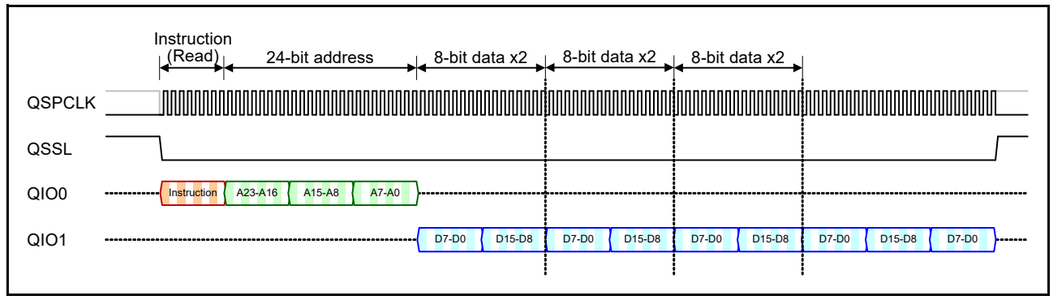

Figure 35.31 使用预取功能的连续数据读取操作

35.7.3 停止预取

如果在用于预取的串行传输期间发生用于从另一个地址读取的ROM读取总线周期，则停止不必要的串行传输并开始新的SPI总线周期。通常，这种串行传输的停止发生在数据接收字节边界上。但是，如果SFMSMD寄存器中的SFMPAE位设置为1，则停止可能发生在字节边界以外的位置。要使用此功能，串行闪存设备必须支持非字节边界暂停。

35.7.4 直接指定预取目的地

当SFMPFE位置位并且QSPI接收到对QSPI窗口区域的内部总线写访问时，系统将其作为预取地址并开始预取。对QSPI窗口区域的内部总线写访问只能用于获取预取地址数据。无法执行对串行闪存的写入。

Combining this function with the prefetch state polling function described in section 35, Prefetch State Polling, can reduce the load on the internal bus when data is read from a low-speed serial flash.

Note: When writing to the QSPI window area to indicate a prefetch destination, write to the first byte of the address where prefetching is to be started. Writing to the QSPI window area with a data size of 2 bytes or more returns an error response.

35.7.5 Prefetch State Polling

Reading data from a low-speed serial flash increases system load because the internal bus is placed in a wait state until the SPI reception bus cycle is complete. The prefetch state polling function is provided to reduce this load.

The PFOFF bit in the SFMSST register indicates the state of the prefetch function, and the PFCNT[4:0] bits in the SFMSST register indicate the number of data bytes already prefetched. This allows the prefetch status to be determined with a single CPU operation.

```
//
// copy 1K byte (32bit x 256 word) data from serial flash to external memory
//
unsigned long *sptr;                    // pointer for the serial flash
unsigned long *dptr;                    // pointer for the external memory
int i;

SFMSMD |= 0x0040;                       // set SFMPFE bit to enable prefetch
*( (volatile unsigned char *) sptr ) = 0;    // make the TAG valid to start prefetch

for ( i = 0 ; i < 256 ; i++ ){
while ( ( SFMSST & 0x00FF ) < 0x04 ){};   // waiting for 4-byte data to be received
*(dptr++) = *(sptr++);
}
```

Note: When executing a polling program, place the program outside of the serial flash or enable the instruction cache. If the polling program is executed when the program is on the serial flash or is executed without using the instruction cache, the prefetch target frequently switches to an instruction code. This eliminates the effect of polling, and an infinite loop can result because the prefetch buffer is not filled.

35.7.6 Flash Read Using the SPI Bus Cycle Extension Function

If the SFMSE[1:0] bits in the SFMSMD register are set to a value other than 00b, the QSPI waits for the next flash read, suspending the SPI bus cycle, while stopping the QSPCLK signal and holding the QSSL signal low even after data is obtained from the serial flash.

If the address of the next flash read is contiguous in ascending order, the toggling of the QSPCLK signal is restarted to continue reception of subsequent data. If the address of the next flash read is not contiguous in ascending order, the QSSL signal is driven high to end the suspended SPI bus cycle. A new SPI bus cycle is then started.

When data is read intermittently from ascending order contiguous addresses, this function enables an efficient transfer operation to be performed by reducing the overhead for instruction code and address transmission.

The SPI bus cycle extension time can be selected in the SFMSE[1:0] bits in the SFMSMD register. When the specified extension time elapses, the QSSL signal returns to the high level to automatically end the suspended SPI bus cycle.

If the SFMSE[1:0] bits are set to 11b, QSSL is extended infinitely. This increases the power consumption of the serial flash, so the system must be designed accordingly.

将此功能与第35节“预取状态轮询”中描述的预取状态轮询功能相结合，可以在从低速串行闪存读取数据时减少内部总线的负载。

Note: 当写入QSPI窗口区域以指示预取目标时，写入要开始预取的地址的第一个字节。写入数据大小为2字节或更大的QSPI窗口区域会返回错误响应。

35.7.5 预取状态轮询

从低速串行闪存读取数据会增加系统负载，因为内部总线处于等待状态，直到SPI接收总线周期完成。提供了预取状态轮询功能来减少这种负载。

SFMSST寄存器中的PFOFF位指示预取功能的状态，而寄存器中的PFCNT[4:0]位指示预取功能的状态。SFMSST寄存器指示已经预取的数据字节数。这允许通过单个CPU操作来确定预取状态。

```
将1K字节（32位x256字）数据从      串行闪存复制到外部存储器

无符号长*sptr;串行闪存指针unsignedlong*dptr;外部存储器inti的指针
;

SFMSMD=0x0040；设置SFMPFE位以启用预取*((volatileunsignedchar*)sptr)=
0;使TAG有效以开始预取

for(i=0;i<256;i++){而((SFMSST&0x00FF)<0x04){ ;等待接收4字节数据*(dptr++)=*(s
ptr++);

}
```

Note: 执行轮询程序时，将程序置于串行闪存之外或启用指令缓存。
如果轮询程序在程序在串行闪存上时执行或在不使用指令缓存的情况下执行，则预取目标频繁切换到指令代码。这消除了轮询的影响，并且由于未填充预取缓冲区可能导致无限循环。

35.7.6 使用SPI总线周期扩展功能读取Flash

如果SFMSMD寄存器中的SFMSE[1:0]位设置为00b以外的值，则QSPI等待下一次闪存读取，暂停SPI总线周期，同时停止QSPCLK信号并保持QSSL信号低，即使在数据是从串行闪存中获得的。

如果下一次闪存读取的地址按升序连续，则重新启动QSPCLK信号的翻转以继续接收后续数据。如果下一次闪存读取的地址在升序中不连续，则将QSSL信号驱动为高电平以结束暂停的SPI总线周期。然后开始一个新的SPI总线周期。

当从升序连续地址间歇性地读取数据时，该功能通过减少指令代码和地址传输的开销来实现高效的传输操作。

SPI总线周期延长时间可以在SFMSMD寄存器的SFMSE[1:0]位中选择。当指定的延长时间过去后，QSSL信号返回高电平，自动结束暂停的SPI总线周期。

如果SFMSE[1:0]位设置为11b，QSSL将无限扩展。这增加了串行闪存的功耗，因此必须对系统进行相应的设计。

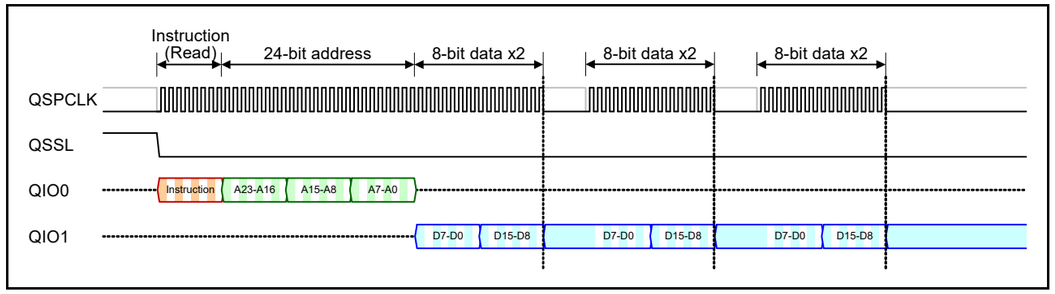

Figure 35.32 Successive data read operations using the SPI bus cycle extension

35.8 XIP Control

Some serial flash devices allow latencies to be reduced by skipping instruction code reception for flash reads. This instruction code skip function is selected with mode data received during the dummy cycle period of the previous serial bus cycle.

In the dummy cycle of the Fast Read instructions, the QSPI controls the XIP mode of the serial flash by using the serial data signal to send the mode data set in the SFMXD[7:0] bits in the SFMSDC register during the first 2 cycles, as shown in Figure 35.33.

The mode data to enable the XIP mode differs for each serial flash. Accordingly, set the appropriate mode data in the SFMXD[7:0] bits.

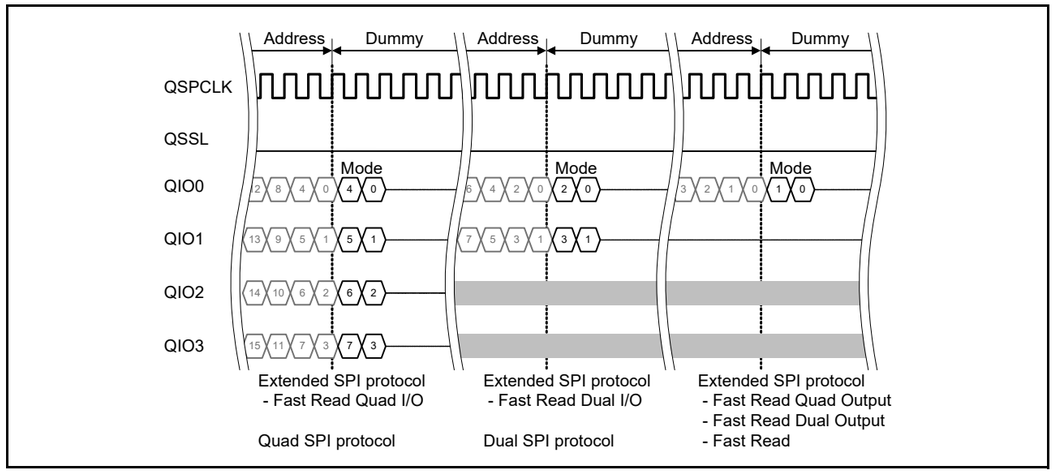

Figure 35.33 XIP mode control data

35.8.1 Selecting the XIP Mode

To select the XIP mode, specify the XIP mode configuration for the serial flash device in the SFMXD[7:0] bits in the SFMSDC register, and set the SFMXEN bit to 1. In the dummy cycle of the next Fast Read instruction, the mode data specified in the SFMXD[7:0] bits is transferred to the serial flash device. Then, the XIP mode is enabled in both the serial flash controller and the serial flash device. To confirm completion of the XIP mode select procedure, read 1 from the SFMXST bit in the SFMSDC register.

Note: Set the SFMXD[7:0] bits in the SFMSDC register to the XIP mode setting data specified for the actual serial flash device. The XIP mode of the serial flash controller is only enabled in the SFMXEN bit, regardless of the SFMXD[7:0] setting in the SFMSDC register.

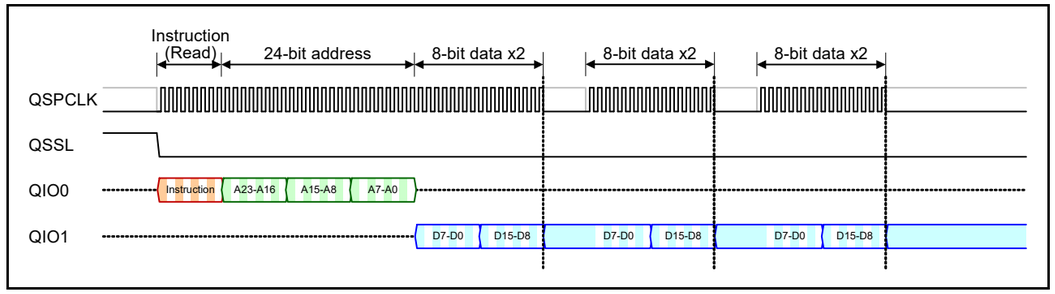

Figure 35.32 使用SPI总线周期扩展的连续数据读取操作

35.8 XIP Control

一些串行闪存设备允许通过跳过闪存读取的指令代码接收来减少延迟。该指令代码跳过功能通过在前一个串行总线周期的虚拟周期期间接收到的模式数据来选择。

在快速读取指令的空周期内，QSPI在前2个周期内通过串行数据信号发送SFMSDC寄存器中SFMXD[7:0]位中设置的模式数据来控制串行闪存的XIP模式，如图35.33所示。

启用XIP模式的模式数据因串行闪存而异。因此，在
SFMXD[7:0] bits.

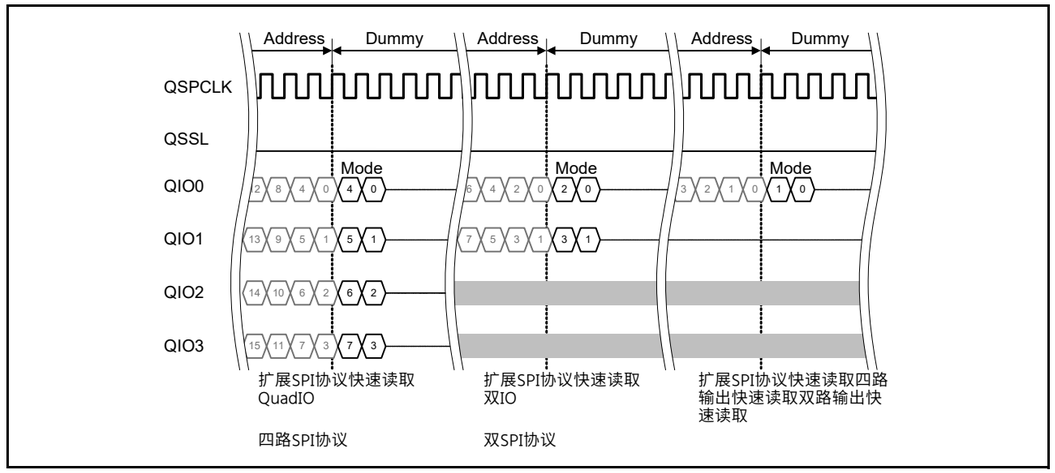

Figure 35.33 XIP模式控制数据

35.8.1 选择XIP模式

要选择XIP模式，请在SFMSDC寄存器的SFMXD[7:0]位中指定串行闪存设备的XIP模式配置，并将SFMXEN位设置为1。在下一条快速读取指令的虚拟周期中，SFMXD[7:0]位中指定的模式数据被传输到串行闪存设备。然后，串行闪存控制器和串行闪存设备都启用XIP模式。要确认XIP模式选择过程的完成，请从SFMSDC寄存器中的SFMXST位读取1。

Note: 将SFMSDC寄存器中的SFMXD[7:0]位设置为为实际串行闪存设备指定的XIP模式设置数据。串行闪存控制器的XIP模式仅在SFMXEN位中启用，与SFMSDC寄存器中的SFMXD[7:0]设置无关。

35.8.2 Releasing the XIP Mode

To release the XIP mode, specify the release configuration for the serial flash in the SFMXD[7:0] bits in the SFMSDC register, and set the SFMXEN bit to 0. In the dummy cycle of the next Fast Read instruction, the mode data specified in the SFMXD[7:0] bits is transferred to the serial flash during the first 2-cycle period. Then, the XIP mode is disabled in both the QSPI and the serial flash device. To confirm completion of the XIP mode release procedure, read 0 from the SFMXST bit in the SFMSDC register.

Note: Set the SFMXD[7:0] bits in the SFMSDC register to the XIP mode setting data specified for the actual serial flash device. The XIP mode of the serial flash controller is only disabled in the SFMXEN bit, regardless of the SFMXD[7:0] setting in the SFMSDC register.

35.9 QIO2 and QIO3 Pin States

The QIO2 and QIO3 pin states depend on the serial interface read mode specified in the SFMRM[2:0] bits in the SFMSMD register.

Table 35.9 QIO2 and QIO3 pin states

SFMSMD.SFMRM[2:0] bits	QIO2 pin state*1	QIO3 pin state*2	Remarks
111	Setting prohibited		
110			
101	Input or output as a serial data signal (standby level is Hi-Z)	Input or output as serial data signal (standby level is Hi-Z)	Fast Read Quad I/O
100			Fast Read Quad Output
011	Output SFMWPL bit variable of SFMPMD register (initial output variable is low level)	Output high level	Fast Read Dual I/O
010			Fast Read Dual Output
001			Fast Read
000			Read (initial state)

Note 1. The serial flash can also use the QIO2 pin for the WP function.
Note 2. The serial flash can also use the QIO3 pin for the HOLD or RESET function.

35.10 Direct Communication Mode

35.10.1 About Direct Communication

The QSPI can read the serial flash contents by automatically converting a ROM read bus cycle to an SPI bus cycle. However, serial flash devices have many different functions in addition to memory data read, including ID information read, erase, programming, and status information read. There is no standardized instruction set for using these functions, and more functions are being added rapidly by different vendors to different devices. It is difficult to support these functions through hardware control.

QSPI offers flexible support for these serial flash devices by providing a means for software to directly communicate with the serial flash so that software can create any SPI bus cycle as required.

35.10.2 Using Direct Communication Mode

To communicate directly with a serial flash device, transition to direct communication mode by setting the DCOM bit in the SFMCMD register to 1. While direct communication mode is selected, standard flash read operation is disabled. For standard flash access after direct communication, terminate direct communication mode by setting the DCOM bit in the SFMCMD register to 0.

Note: If the QSPI is set to the XIP mode, you must terminate the XIP mode before starting direct communication mode.

35.8.2 释放XIP模式

要释放XIP模式，请在SFMSDC寄存器的SFMXD[7:0]位中指定串行闪存的释放配置，并将SFMXEN位设置为0。在下一条快速读取指令的空周期中，模式数据SFMXD[7:0]位中指定的数据在前2个周期内传输到串行闪存。然后，在QSPI和串行闪存设备中禁用XIP模式。要确认XIP模式释放过程完成，请从SFMSDC寄存器中的SFMXST位读取0。

Note: 将SFMSDC寄存器中的SFMXD[7:0]位设置为为实际串行闪存设备指定的XIP模式设置数据。串行闪存控制器的XIP模式仅在SFMXEN位中被禁用，而与SFMSDC寄存器中的SFMXD[7:0]设置无关。

35.9 QIO2和QIO3引脚状态

QIO2和QIO3引脚状态取决于在SFMRM[2:0]位中指定的串行接口读取模式
SFMSMD register.

Table 35.9 QIO2和QIO3引脚状态

SFMSMD.SFMRM[2:0] bits	QIO2引脚状态*1	QIO3引脚状态*2	Remarks
111	禁止设置		
110			
101	作为串行数据信号输入或输出（待机电平为Hi-Z）	作为串行数据信号输入或输出（待机电平为Hi-Z）	快速读取四路IO
100			快速读取四路输出
011	输出SFMPMD寄存器的SFMWPL位变量（初始输出变量为低电平）	输出高电平	快速读取双IO
010			快速读取双输出
001			快速阅读
000			Read (initial state)

Note 1. 串行闪存也可以将QIO2引脚用于WP功能。
Note 2. 串行闪存也可以将QIO3引脚用于HOLD或RESET功能。

35.10 直接通讯方式

35.10.1 关于直接沟通

QSPI可以通过自动将ROM读取总线周期转换为SPI总线周期来读取串行闪存内容。
然而，串行闪存设备除了读取存储器数据外，还有许多不同的功能，包括ID信息读取、擦除、编程和状态信息读取。使用这些功能没有标准化的指令集，更多的功能正在由不同的供应商迅速添加到不同的设备中。很难通过硬件控制来支持这些功能。

QSPI为这些串行闪存设备提供了灵活的支持，它为软件提供了一种直接与串行闪存通信的方法，以便软件可以根据需要创建任何SPI总线周期。

35.10.2 使用直接通信模式

要与串行闪存设备直接通信，通过将SFMCMD寄存器中的DCOM位设置为1转换到直接通信模式。选择直接通信模式时，标准闪存读取操作被禁用。对于直接通信后的标准闪存访问，通过将SFMCMD寄存器中的DCOM位设置为0来终止直接通信模式。

Note: 如果QSPI设置为XIP模式，则必须在启动直接通信模式之前终止XIP模式。

35.10.3 Generating the SPI Bus Cycle during Direct Communication

The SPI bus cycle in direct communication starts on the first access to the SFMCOM port and ends with a write to the SFMCMD register, after a series of I/O operations is performed through the SFMCOM port. At that point, a write to the SFMCOM port is converted to a one-byte transmission to the SPI bus, and a read from the SFMCOM port is converted to a one-byte reception from the SPI bus.

During the period from the first access to the SFMCOM port to the last write operation to the SFMCMD register, the serial flash select signal is held active to notify the serial flash that a series of SPI bus cycles are in progress.

Note: In direct communication mode, all writes to registers other than SFMCMD, including SFMSMD, SFMSSC, SFMSKC, SFMSST, SFMCST, SFMSIC, SFMSAC, SFMSDC, SFMSPC, and SFMPMD are disabled. With this circuit configuration, writing to a register area other than the SFMCOM port terminates the SPI bus cycle. However, writing to a register area other than SFMCMD as a way to terminate the SPI bus cycle does not guarantee normal functioning.

The following is an example program for direct communication.

```
//### CAUTION! ### This code must be outside the serial flash that is going to be controlled.

// Define specific instruction codes of the target serial flash device.
#define  Instruction_FREAD  0x0B // Fast Read
#define  Instruction_RDSR   0x05 // Read Status register
#define  Instruction_RDID   0x9F // Read Identification
#define  Instruction_WREN   0x06 // Write Enable
#define  Instruction_CERA   0xC7 // Chip Erase

unsigned char  mfid, mtype, mcap, data, temp;

SFMCMD = 0x01; // Enable direct operation

// Get the device identification assigned by JEDEC.
SFMCOM = Instruction_RDID; // put “Read Identification” instruction (open SPI bus cycle)
mfid   = (unsigned char) SFMCOM; // get “Manufacturer Identification”
mtype  = (unsigned char) SFMCOM; // get “Memory Type”
mcap   = (unsigned char) SFMCOM; // get “Memory Capacity”
SFMCMD = 0x01h; // close SPI bus cycle

// Get one byte from the address 0x012345h.
SFMCOM = Instruction_FREAD; // put “Fast Read” instruction (open SPI bus cycle)
SFMCOM = 0x01; // put upper byte of the address 0x012345
SFMCOM = 0x23; // put middle byte of the target address 0x012345
SFMCOM = 0x45; // put lower byte of the target address 0x012345
temp   = (unsigned char) SFMCOM; // get one byte dummy code for FAST READ transaction
data   = (unsigned char) SFMCOM; // get the data
SFMCMD = 0x01; // close SPI bus cycle

// Erase All contents.
SFMCOM = Instruction_WREN; // put “Write Enable” instruction (open SPI bus cycle)
SFMCMD = 0x01; // close SPI bus cycle
SFMCOM = Instruction_CERA; // put “Chip Erase” instruction (open SPI bus cycle)
SFMCMD = 0x01; // close SPI bus cycle
SFMCOM = Instruction_RDSR; // put “Read Status Register” instruction (open SPI bus cycle)
while (SFMCOM & 0x01){}; // Polling “Write Progress Bit” until completion
SFMCMD = 0x01; // close SPI bus cycle

SFMCMD = 0x00; // Disable direct operation
```

35.10.3 在直接通信期间生成SPI总线周期

直接通信中的SPI总线周期从第一次访问SFMCOM端口开始，并以对SFMCOM端口的写入结束。
SFMCMD寄存器，通过SFMCOM端口进行一系列IO操作后。此时，对SFMCOM端口的写入将转换为向SPI总线发送的一字节，从SFMCOM端口读取的数据将转换为从SPI总线接收的一字节。

在从第一次访问SFMCOM端口到最后一次对SFMCMD寄存器的写操作期间，串行闪存选择信号保持有效，以通知串行闪存一系列SPI总线周期正在进行中。

Note: 在直接通信模式下，所有对除SFMCMD之外的寄存器（包括SFMSMD、SFMSSC、SFMSKC、SFMSST、SFMCST、SFMSIC、SFMSAC、SFMSDC、SFMSPC和SFMPMD）的写操作都被禁用。使用这种电路配置，写入SFMCOM端口以外的寄存器区域会终止SPI总线周期。但是，写入SFMCMD以外的寄存器区域作为终止SPI总线周期的一种方式并不能保证正常运行。

以下是直接通信的示例程序。

```
###注意！###此代码必须在要控制的串行闪存之外。

定义目标串行闪存设备的具体指令代码。#defineInstruction_FREA
D0x0B快速读取#defineInstruction_RDSR0x05读取状态寄存器#de
fineInstruction_RDID0x9F读取标识#defineInstruction_WREN0x06
写使能#defineInstruction_CERA0xC7芯片擦除

无符号字符mfid、mtype、mcap、数据、温度；

SFMCMD=0x01；启用直接操作

获取JEDEC分配的设备标识。SFMCOM=指令_RDID；放“读取标识”指令（打开SPI总线周期
）mfid=(unsignedchar)SFMCOM；获取“制造商标识”mtype=(unsignedchar)SFMCOM;获取“
内存类型”mcap=(unsignedchar)SFMCOM;获得“内存容量”SFMCMD=0x01h；关闭SPI总线
周期

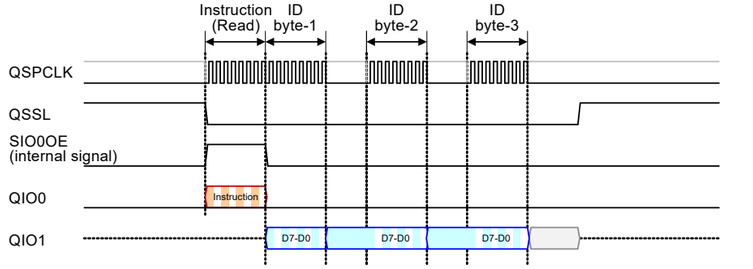
从地址0x012345h获取一个字节。SFMCOM=指令_FREAD；放“快速读取”指令（打
开SPI总线周期）
SFMCOM=0x01；把地址的高字节0x012345
SFMCOM=0x23；把目标地址的中间字节0x012345SFMCOM=0x45;把目标地址的低字节0x01
2345temp=(unsignedchar)SFMCOM;获取FASTREAD交易数据的一字节虚拟代码=(unsignedch
ar)SFMCOM;获取数据SFMCMD=0x01;关闭SPI总线周期

删除所有内容。SFMCOM=指令_WREN；放“写使能”指令（打开SPI总线周期）

SFMCMD=0x01；关闭SPI总线周期SFMCOM=Instruction_CERA;放“芯片擦除”指令（
打开SPI总线周期）
SFMCMD=0x01；关闭SPI总线周期
SFMCOM=指令_RDSR；将“读取状态寄存器”指令（打开SPI总线周期）while(SFMCOM&0x01){
;轮询“写进度位”直到完成SFMCMD=0x01;关闭SPI总线周期

SFMCMD=0x00；禁用直接操作
```

RA生态工作室



```
(1) SFMCMD = 01h;                    // Enable direct operation
                                     // Get the device identification assigned by JEDEC
(2) SFMCOM = Instruction_RDID;       // Put “Read Identification” instruction (open the transaction)
(3) mfid = (unsigned char) SFMCOM;   // Get ID byte-1 “Manufacturer Identification”
(4) mtype = (unsigned char)          // Get ID byte-2 “Memory Type”
    SFMCOM;
(5) mcap = (unsigned char) SFMCOM;   // Get ID byte-3 “Memory Capacity”
(6) SFMCMD = 01h;                    // Close the transaction
(7) SFMCMD = 00h;                    // Disable direct operation
```

Figure 35.34 Example of direct communication timing for ID read

Note: When extended SPI protocol is used in direct communication mode, the Standard Read or Fast Read instruction must be used to reference the contents of the serial flash. The QSPI does not support Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, or Fast Read Quad I/O transfers in this configuration. When these high-speed read operations are required, use standard flash access.

35.11 Operation

35.11.1 Procedure for Modifying Settings in Multiple Control Registers

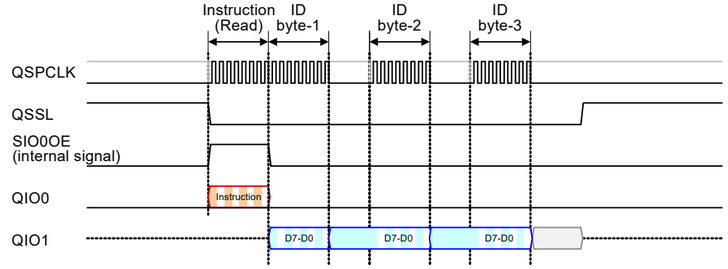
The settings of the QSPI control registers can be modified dynamically during system operation. However, when the settings of multiple control registers are modified sequentially, an SPI bus cycle might occur before all of the registers are updated. The register setting sequence must be carefully designed to satisfy the SPI bus timing specification at all stages of register setting modification.

```
//
// Making QSPCLK faster
//
SFMSMD = 0x0041; // SFMPAE: 0 SFMPFE: 1 SFMSE:00 SFMRM:01 (prefetch enable fast read)
SFMSSC = 0x04; // SFMSLD: 0 SFMSHD: 0 SFMSW:4 (minimum QSSL high width = 5 sck)
SFMSKC = 0x00; // SFMDTY: 0 SFMDV: 0 (1/2 mode)  ### switch clock speed last ###

//
// Making QSPCLK slower
//
SFMSKC = 0x06; // SFMDTY: 0 SFMDV:6 (1/8 mode)  ### switch clock speed first ###
SFMSSC = 0x01; // SFMSLD: 0 SFMSHD:0 SFMSW: 1 (minimum QSSL high width = 2 sck)
SFMSMD = 0x0040; // SFMPAE: 0 SFMPFE:1 SFMSE: 00 SFMRM:00 (prefetch enable, standard read)
```

35.12 Interrupts

When the EROMR bit in the SFMCST register is set to 1, the QSPI requests an interrupt. The EROMR bit is set to 1 when a ROM read access is detected in direct communication mode. Interrupt requests are saved until the EROMR bit is cleared by writing 0. For details, see section 14, Interrupt Controller Unit (ICU).



```
(1) SFMCMD = 01h;                    Enabledirectoperation获取JEDEC分配的设备标识
(2) SFMCOM = Instruction_RDID;       输入“读取标识”指令（打开交易）
(3) mfid = (unsigned char) SFMCOM;   获取IDbyte-1“制造商标识”
(4) mtype = (unsigned char)          获取IDbyte-2“内存类型”
    SFMCOM;
(5) mcap = (unsigned char) SFMCOM;   获取IDbyte-3“内存容量”
(6) SFMCMD = 01h;                    关闭交易
(7) SFMCMD = 00h;                    禁用直接操作
```

Figure 35.34 ID读取的直接通信时序示例

Note: 在直接通信模式下使用扩展SPI协议时，必须使用标准读取或快速读取指令来引用串行闪存的内容。在此配置中，QSPI不支持快速读取双输出、快速读取双IO、快速读取四输出或快速读取四IO传输。当需要这些高速读取操作时，请使用标准闪存访问。

35.11 Operation

35.11.1 修改多个控制寄存器中的设置的步骤

QSPI控制寄存器的设置可以在系统运行期间动态修改。但是，当多个控制寄存器的设置被顺序修改时，可能会在所有寄存器被更新之前发生一个SPI总线周期。必须仔细设计寄存器设置序列，以满足寄存器设置修改所有阶段的SPI总线时序规范。

```
使QSPCLK更快SFMSMD=0x0041;SFMPAE:0SFMPFE:1SFMSE:00SFMRM:01（预取使能快速读取）

SFMSSC=0x04；SFMSLD：0SFMSHD：0SFMSW：4（最小QSSL高宽度=5sck）
SFMSKC=0x00；SFMDTY:0SFMDV:0(12模式)###最后切换时钟速度###

使QSPCLK变慢SFMSKC=0x06;SFMDTY:0SFMDV:6(18模式)###先切换时钟速度###

SFMSSC=0x01；SFMSLD：0SFMSHD：0SFMSW：1（最小QSSL高宽度=2sck）
SFMSMD=0x0040；SFMPAE:0SFMPFE:1SFMSE:00SFMRM:00（预取使能，标准读取）
```

35.12 Interrupts

当SFMCST寄存器中的EROMR位设置为1时，QSPI请求中断。当在直接通信模式下检测到ROM读访问时，EROMR位设置为1。中断请求被保存，直到通过写入0清除EROMR位。有关详细信息，请参阅第14节，中断控制器单元(ICU)。

35.13 Usage Notes

35.13.1 Settings for the Module-Stop Function

The Module Stop Control Register B (MSTPCRB) can enable or disable QSPI operation. The QSPI is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

RA生态工作室

35.13 使用说明

35.13.1 模块停止功能的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用QSPI操作。QSPI在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

36. Cyclic Redundancy Check (CRC) Calculator

The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC generation polynomials are available. The snoop function allows monitoring of reads from and writes to specific addresses. This function is useful in applications that require the CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer.

36.1 Overview

Table 36.1 lists the CRC calculator specifications, and Figure 36.1 shows a block diagram.

Table 36.1 CRC calculator specifications

Parameter	Specifications for 8-bit data	Specifications for 32-bit data
Data size	8-bit	32-bit
Data for CRC calculation*1	CRC code generated for data in 8n-bit units (where n is a whole number)	CRC code generated for data in 32n-bit units (where n is a whole number)
CRC processor unit	Operation executed on 8 bits in parallel	Operation executed on 32 bits in parallel
CRC generating polynomial	One of three generating polynomials that is selectable: [8-bit CRC] • $X^8 + X^2 + X + 1$ (CRC-8) [16-bit CRC] • $X^{16} + X^{15} + X^2 + 1$ (CRC-16) • $X^{16} + X^{12} + X^5 + 1$ (CRC-CCITT).	One of two generating polynomials that is selectable: [32-bit CRC] • $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ (CRC-32) • $X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$ (CRC-32C).
CRC calculation switching	The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication	
Module-stop function	Module-stop state can be set to reduce power consumption	
CRC snoop	Monitor reads from and writes to a certain register address	-

Note 1. The circuit cannot divide data used in CRC calculations. Write data in 8-bit or 32-bit units.

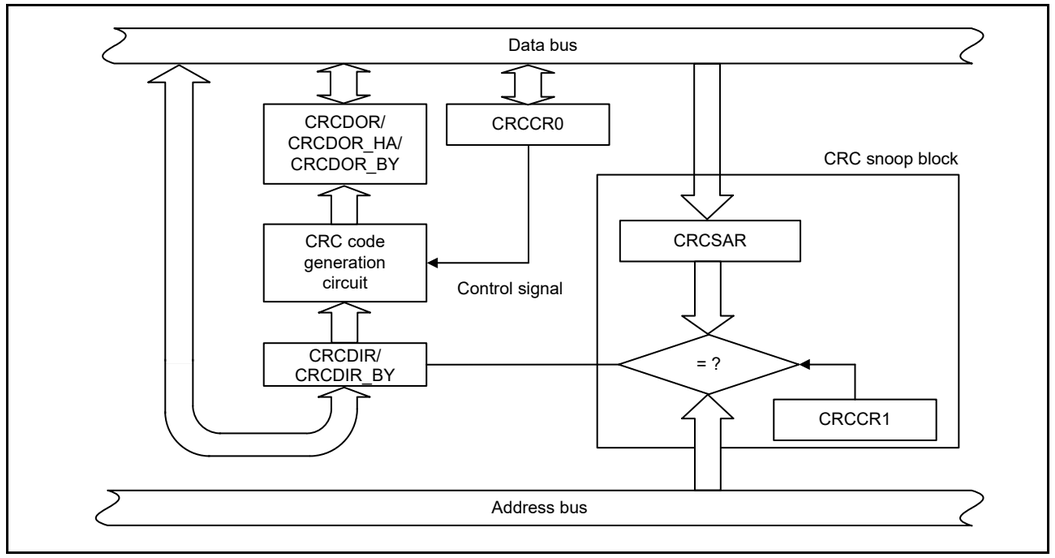


Figure 36.1 CRC calculator block diagram

36. 循环冗余校验(CRC)计算器

循环冗余校验(CRC)计算器生成CRC代码以检测数据中的错误。CRC计算结果的位顺序可以切换为LSB-first或MSB-first通信。此外，还可以使用各种CRC生成多项式。snoop功能允许监视对特定地址的读取和写入。此功能在需要在某些事件中自动生成CRC代码的应用中很有用，例如监视对串行发送缓冲区的写入和从串行接收缓冲区的读取。

36.1 Overview

表36.1列出了CRC计算器规格，图36.1显示了框图。

Table 36.1 CRC计算器规格

Parameter	8位数据规格	32位数据规格
数据大小	8-bit	32-bit
CRC计算数据*1	为8n位单元中的数据生成的CRC码（其中n是整数）	为32n位单元中的数据生成的CRC码（其中n是整数）
CRC处理器单元	在8位上并行执行的操作	在32位上并行执行的操作
CRC生成多项式	三个可选择的生成多项式之一：[8位CRC] X8+X2+X+1(CRC-8)[16位CRC] X16+X15+X2+1(CRC-16) X16+X12+X5+1(CRC-CCITT)。	可选择的两个生成多项式之一：[32位CRC] X32+X26+X23+X22+X16+X12+X11+X10+X8+X7+X5+X4+X2+X+1(CRC-32) X32+X28+X27+X26+X25+X23+X22+X20+X19+X18+X14+X13+X11+X10+X9+X8+X6+1(CRC-32C)。
CRC计算切换	CRC计算结果的位顺序可以切换为LSB-first或MSB-first通信	
Module-stop function	可设置模块停止状态以降低功耗	
CRC snoop	监视器读取和写入某个寄存器地址	-

Note 1. 该电路不能划分用于CRC计算的数据。以8位或32位为单位写入数据。

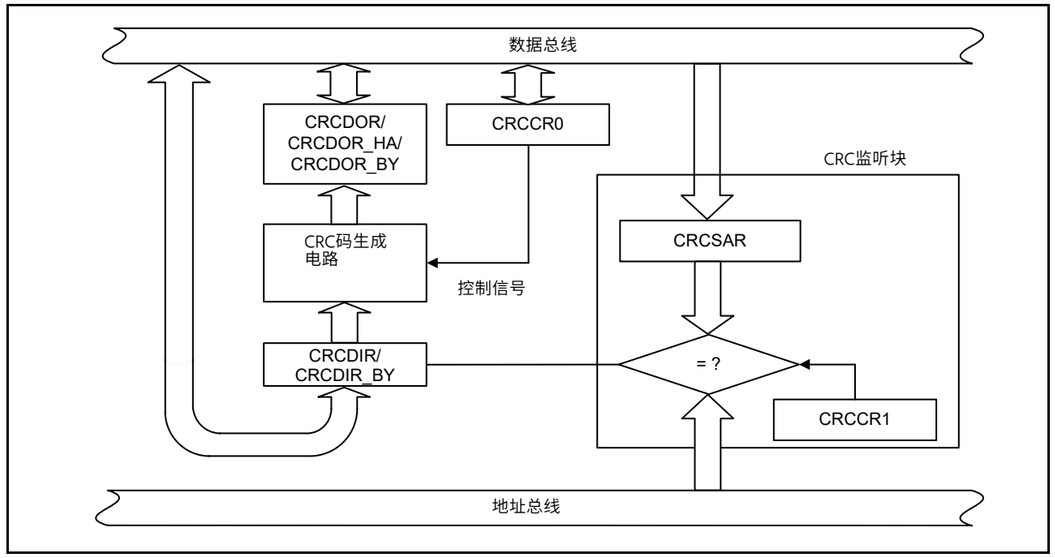

Figure 36.1 CRC计算器框图

36.2 Register Descriptions

36.2.1 CRC Control Register 0 (CRCCR0)

Address(es): CRC.CRCCR0 4007 4000h

	b7	b6	b5	b4	b3	b2	b1	b0
	DORCLR	LMS	—	—	—	GPS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

b7	DORCLR	CRCDOR/CRCDOR_HA/CRCDOR_BY Register Clear	1: Clear the CRCDOR/CRCDOR_HA/CRCDOR_BY register. This bit is read as 0.	W*1

Note 1. This bit must always be set to 1 when writing to this register.

GPS[2:0] bits (CRC Generating Polynomial Switching)

The GPS[2:0] bits select the CRC generating polynomial.

LMS bit (CRC Calculation Switching)

The LMS bit selects the bit order of generated CRC code. Transmit the lower byte of the CRC code first for LSB-first communication and the upper byte first for MSB-first communication. For details on transmitting and receiving CRC code, see section 36.3, Operation.

DORCLR bit (CRCDOR/CRCDOR_HA/CRCDOR_BY)

Write 1 to the DORCLR bit to set the CRCDOR/CRCDOR_HA/CRCDOR_BY register to 0000 0000h. This bit is read as 0. Only 1 can be written to it.

36.2.2 CRC Control Register 1 (CRCCR1)

Address(es): CRC.CRCCR1 4007 4001h

	b7	b6	b5	b4	b3	b2	b1	b0
	CRCSEN	CRCSWR	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W

b5 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	LMS	CRC计算切换	0：为LSB-first通信生成CRC1：为MSB-first通信生成CRC。	R/W
b7	DORCLR	CRCDOR/CRCDOR_HA/CRCDOR_BY寄存器清除	1：清除CRCDORCRCDOR_HACRCDOR_BY寄存器。该位读为0。	W*1

Note 1. 写入该寄存器时，该位必须始终设置为1。

GPS[2:0]位（CRC生成多项式切换）

GPS[2:0]位选择CRC生成多项式。

LMS位（CRC计算切换）

LMS位选择生成的CRC码的位顺序。对于LSB在先的通信，首先发送CRC码的低字节，对于MSB在先的通信，首先发送高字节。有关发送和接收CRC码的详细信息，请参阅第36.3节，操作。

DORCLR bit (CRCDOR/CRCDOR_HA/CRCDOR_BY)

将1写入DORCLR位以将CRCDORCRCDOR_HACRCDOR_BY寄存器设置为00000000h。该位读为0。只能写入1。

36.2.2 CRC控制寄存器1(CRCCR1)

Address(es): CRC.CRCCR1 4007 4001h

	b7	b6	b5	b4	b3	b2	b1	b0
	CRCSEN	CRCSWR	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	CRCSWR	Snoop-On-Write/Read Switch	0: Snoop-on-read 1: Snoop-on-write.	R/W

Bit	Symbol	Bit name	Description	R/W
b7	CRCSEN	Snoop Enable	0: Disabled 1: Enabled.	R/W

CRCSWR bit (Snoop-On-Write/Read Switch)

The CRCSWR bit selects the direction of access in the address monitoring function.

When this bit is set to 0 (initial value), the CRC snoop operation to read a specific register address is enabled. When the bit is set to 1, the CRC snoop operation to write to a specific register address is enabled.

CRCSEN bit (Snoop Enable)

When the CRCSEN bit is set to 1, the CRC snoop operation is enabled. When the bit is set to 0, CRC snoop operation is disabled.

36.2.3 CRC Data Input Register (CRCDIR/CRCDIR_BY)

Address(es): CRC.CRCDIR/CRCDIR_BY 4007 4004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRCDIR is a 32-bit read/write register to write data for CRC-32 or CRC-32C calculation. CRCDIR_BY is an 8-bit read/write register to write data for CRC-8, CRC-16, or CRC-CCITT calculation.

36.2.4 CRC Data Output Register (CRCDOR/CRCDOR_HA/CRCDOR_BY)

Address(es): CRC.CRCDOR/CRCDOR_HA/CRCDOR_BY 4007 4008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRCDOR is a 32-bit read/write register for CRC-32 or CRC-32C calculation. CRCDOR_HA is a 16-bit read/write register for CRC-16 or CRC-CCITT calculation. CRCDOR_BY is an 8-bit read/write register for CRC-8 calculation. Because its initial value is 0000 0000h, rewrite the CRCDOR/CRCDOR_HA/CRCDOR_BY register to perform the calculations using a value other than the initial value.

Data written to the CRCDIR/CRCDIR_BY register is CRC calculated and the result is stored in the CRCDOR/CRCDOR_HA/CRCDOR_BY register. If the CRC code is calculated following the transferred data and the result is 0000 0000h, there is no CRC error.

When an 8-bit CRC ($X^8 + X^2 + X + 1$ polynomial) is in use, the valid CRC code is obtained in CRCDOR_BY.

When a 16-bit CRC ($X^{16} + X^{15} + X^2 + 1$ or $X^{16} + X^{12} + X^5 + 1$ polynomial) is in use, the valid CRC code is obtained in CRCDOR_HA.

Bit	Symbol	位名称	Description	R/W
b7	CRCSEN	侦听启用	0：禁用1 ：启用。	R/W

CRCSWR位（Snoop-On-Write读开关）

CRCSWR位选择地址监控功能中的访问方向。

当该位设置为0（初始值）时，启用读取特定寄存器地址的CRC侦听操作。当该位设置为1时，将启用写入特定寄存器地址的CRC侦听操作。

CRCSEN位（侦听启用）

当CRCSEN位设置为1时，启用CRC侦听操作。当该位设置为0时，CRC侦听操作被禁用。

36.2.3 CRC数据输入寄存器(CRCDIRCRCDIR_BY)

Address(es): CRC.CRCDIR/CRCDIR_BY 4007 4004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRCDIR是一个32位读写寄存器，用于写入数据以进行CRC-32或CRC-32C计算。CRCDIR_BY是一个8位读写寄存器，用于为CRC-8、CRC-16或CRC-CCITT计算写入数据。

36.2.4 CRC数据输出寄存器(CRCDORCRCDOR_HACRCDOR_BY)

Address(es): CRC.CRCDOR/CRCDOR_HA/CRCDOR_BY 4007 4008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRCDOR是用于CRC-32或CRC-32C计算的32位读写寄存器。CRCDOR_HA是一个16位读写寄存器，用于CRC-16或CRC-CCITT计算。CRCDOR_BY是用于CRC-8计算的8位读写寄存器。由于其初始值为00000000h，因此重写CRCDORCRCDOR_HACRCDOR_BY寄存器以使用初始值以外的值执行计算。

写入CRCDIRCRCDIR_BY寄存器的数据经过CRC计算，结果存储在CRCDORCRCDOR_HACRCDOR_BY寄存器。如果在传输数据之后计算CRC码，结果为00000000h，则没有CRC错误。

当使用8位CRC（X8+X2+X+1多项式）时，在CRCDOR_BY中获得有效的CRC码。

当使用16位CRC（X16+X15+X2+1或X16+X12+X5+1多项式）时，有效的CRC码在CRCDOR_HA.

36.2.5 Snoop Address Register (CRCSAR)

Address(es): CRC.CRCSAR 4007 400Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CRCSA[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b13 to b0	CRCSA[13:0]	Register Snoop Address	These bits store the TDR or RDR address in the SCI module to snoop	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CRCSA[13:0] bits (Register Snoop Address)

The CRCSA[13:0] bits specify the lower 14 bits of the register address monitored by the CRC snoop operation.

Only the following addresses can be used for the CRCSA[13:0] bits:

- 4007 0003h: SCI0.TDR, 4007 0005h: SCI0.RDR
- 4007 0023h: SCI1.TDR, 4007 0025h: SCI1.RDR
- 4007 0043h: SCI2.TDR, 4007 0045h: SCI2.RDR
- 4007 0063h: SCI3.TDR, 4007 0065h: SCI3.RDR
- 4007 0083h: SCI4.TDR, 4007 0085h: SCI4.RDR
- 4007 0103h: SCI8.TDR, 4007 0105h: SCI8.RDR
- 4007 0123h: SCI9.TDR, 4007 0125h: SCI9.RDR
- 4007 000Fh: SCI0.FTDRL, 4007 0011h: SCI0.FRDRL
- 4007 002Fh: SCI1.FTDRL, 4007 0031h: SCI1.FRDRL

- 4007 012Fh: SCI9.FTDRL, 4007 0131h: SCI9.FRDRL.

36.3 Operation

36.3.1 Basic Operation

The CRC calculator generates CRC codes for use in LSB-first or MSB-first transfers.

The following examples illustrate CRC code generation for input data (F0h) using the 16-bit CRC-CCITT generating polynomial ($X^{16} + X^{12} + X^5 + 1$). In these examples, the value of the CRC Data Output Register (CRCDOR_HA) is cleared before CRC calculation.

When an 8-bit CRC (with the polynomial $X^8 + X^2 + X + 1$) is in use, the valid bits of the CRC code are obtained in CRCDOR_BY. When a 32-bit CRC is in use, the valid bits of the CRC code are obtained in CRCDOR.

Figure 36.2 and Figure 36.3 show the LSB-first and MSB-first data transmission examples respectively, and Figure 36.4 and Figure 36.5 show the LSB-first and MSB-first data reception examples.

36.2.5 监听地址寄存器(CRCSAR)

Address(es): CRC.CRCSAR 4007 400Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CRCSA[13:0]													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b13 to b0	CRCSA[13:0]	注册监听地址	这些位存储SCI模块中的TDR或RDR地址以进行监听	R/W
b15, b14	—	Reserved	这些位被读取为0。写入值应为0。	R/W

CRCSA[13:0]位（寄存器监听地址）

CRCSA[13:0]位指定由CRC侦听操作监视的寄存器地址的低14位。

CRCSA[13:0]位只能使用以下地址：

- 4007 0003h: SCI0.TDR, 4007 0005h: SCI0.RDR
- 4007 0023h: SCI1.TDR, 4007 0025h: SCI1.RDR
- 4007 0043h: SCI2.TDR, 4007 0045h: SCI2.RDR
- 4007 0063h: SCI3.TDR, 4007 0065h: SCI3.RDR
- 4007 0083h: SCI4.TDR, 4007 0085h: SCI4.RDR
- 4007 0103h: SCI8.TDR, 4007 0105h: SCI8.RDR
- 4007 0123h: SCI9.TDR, 4007 0125h: SCI9.RDR
- 4007 000Fh: SCI0.FTDRL, 4007 0011h: SCI0.FRDRL
- 4007 002Fh: SCI1.FTDRL, 4007 0031h: SCI1.FRDRL
- 4007 004Fh: SCI2.FTDRL, 4007 0051h: SCI2.FRDRL
- 4007 006Fh: SCI3.FTDRL, 4007 0071h: SCI3.FRDRL
- 4007 008Fh: SCI4.FTDRL, 4007 0091h: SCI4.FRDRL
- 4007 010Fh: SCI8.FTDRL, 4007 0111h: SCI8.FRDRL
- 4007 012Fh: SCI9.FTDRL, 4007 0131h: SCI9.FRDRL.

36.3 Operation

36.3.1 基本操作

CRC计算器生成用于LSB优先或MSB优先传输的CRC代码。

以下示例说明使用16位CRC-CCITT生成多项式(X16+X12+X5+1)为输入数据(F0h)生成CRC码。在这些示例中，CRC数据输出寄存器(CRCDOR_HA)的值在CRC计算之前被清除。

当使用8位CRC（多项式X8+X2+X+1）时，CRC码的有效位在CRCDOR_BY。使用32位CRC时，在CRCDOR中获取CRC码的有效位。

图36.2和图36.3分别显示了LSB-first和MSB-first数据传输示例，图36.4和图36.5显示了LSB-first和MSB-first数据接收示例。

Figure 36.3 MSB优先数据传输

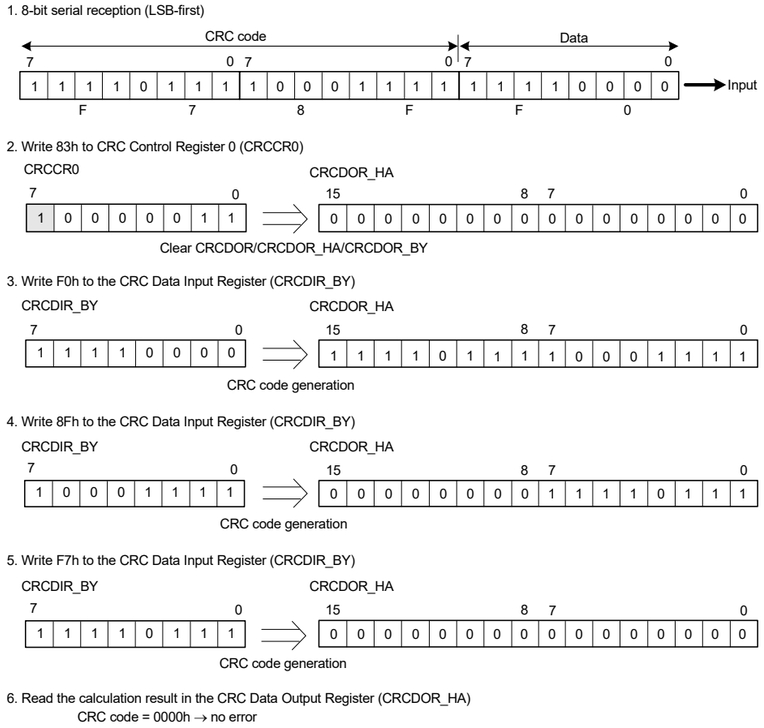

Figure 36.4 LSB-first data reception

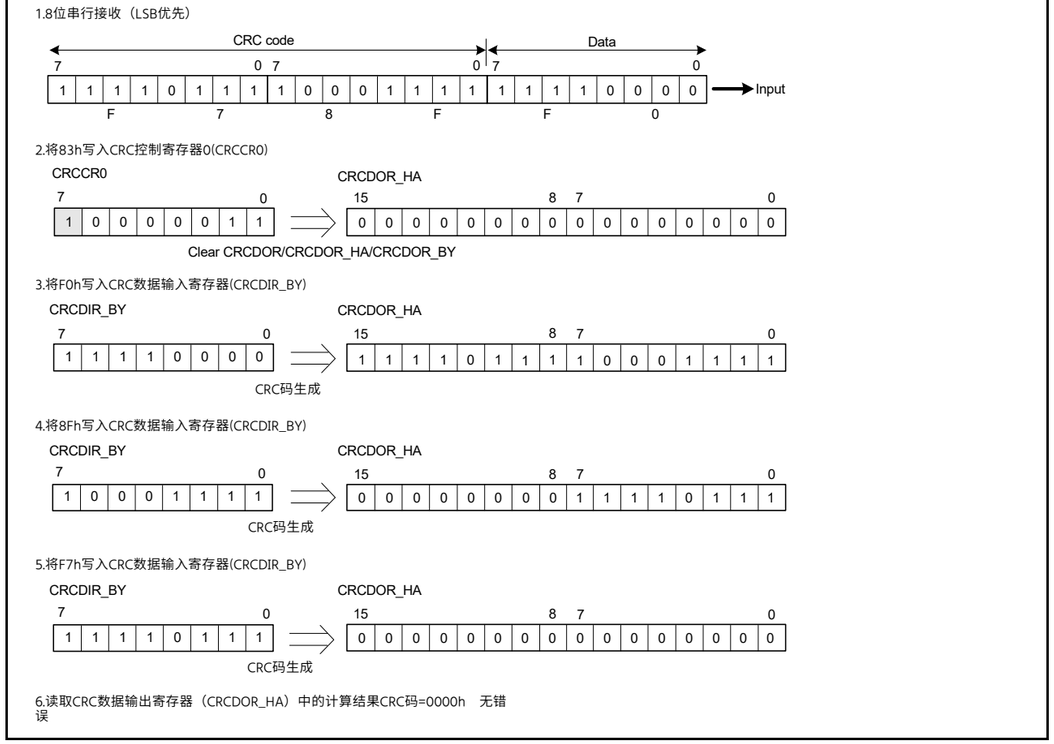

Figure 36.4 LSB−first数据接收

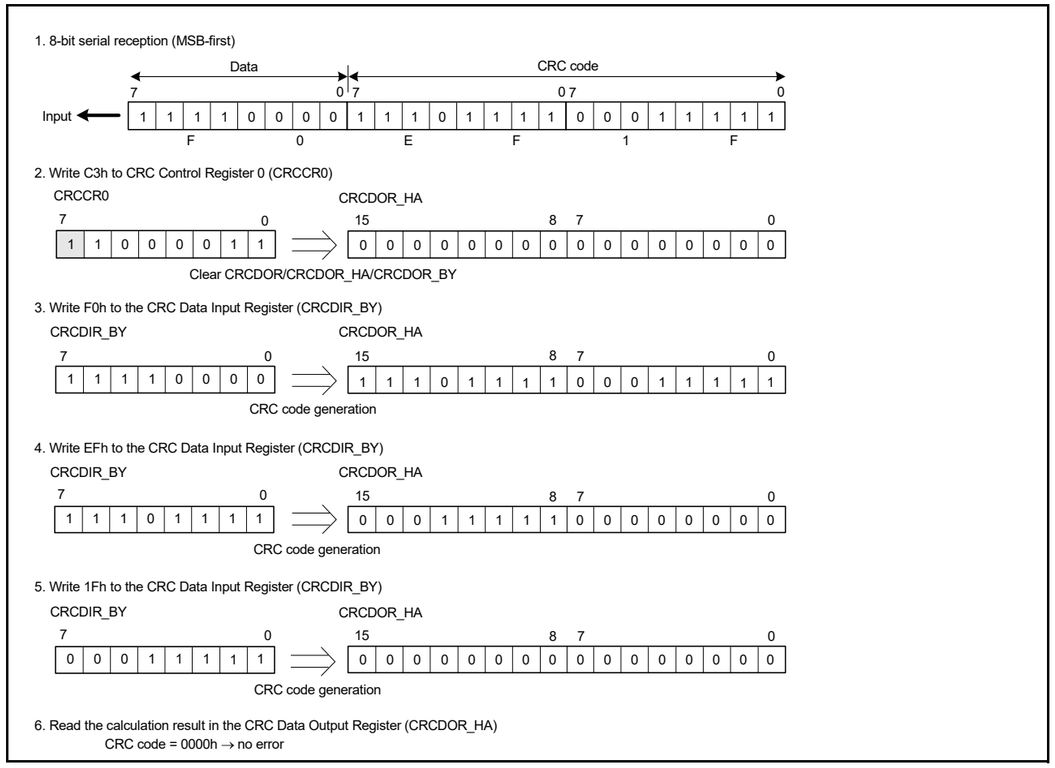

Figure 36.5 MSB-first data reception

36.3.2 CRC Snoop

The CRC snoop function monitors reads from and writes to a specific register address and performs CRC calculations on the data read from and written to the register address automatically. Because the CRC snoop recognizes writes to and reads from a specific register address as a trigger to automatically perform CRC calculations, there is no need to write data to the CRCDIR_BY register. All I/O register addresses specified in section 36.2.5, Snoop Address Register (CRCSAR) are subject to the CRC snoop. The CRC snoop is useful in monitoring writes to the serial transmit buffer, and reads from the serial receive buffer.

To use this function, write a target I/O register address to the CRCSA13 to CRCSA0 bits in the CRCSAR register, and set the CRCSEN bit in the CRCCR1 register to 1. Then, set the CRCSWR bit in the CRCCR1 register to 1 to enable snooping on the writes to the target address, or set the CRCSWR bit in the CRCCR1 register to 0 to enable snooping on the reads from the target address.

When both the CRCSEN and CRCSWR bits are set to 1, and data is written to a target I/O register address in a bus master module such as the CPU, DMAC, and DTC, the CRC calculator stores the data in the CRCDIR_BY register and performs CRC calculation. Similarly, when the CRCSEN bit is set to 1, CRCSWR bit is set to 0, and data is read from a target I/O register address in a bus master module such as the CPU, DMAC, and DTC, the CRC calculator stores the data in the CRCDIR_BY register and performs a CRC calculation.

CRC calculation is performed 1 byte at a time. When the target I/O register address is accessed in words (16 bits) or long words (32 bits), a CRC code is generated on the lower byte (1 byte) of data.

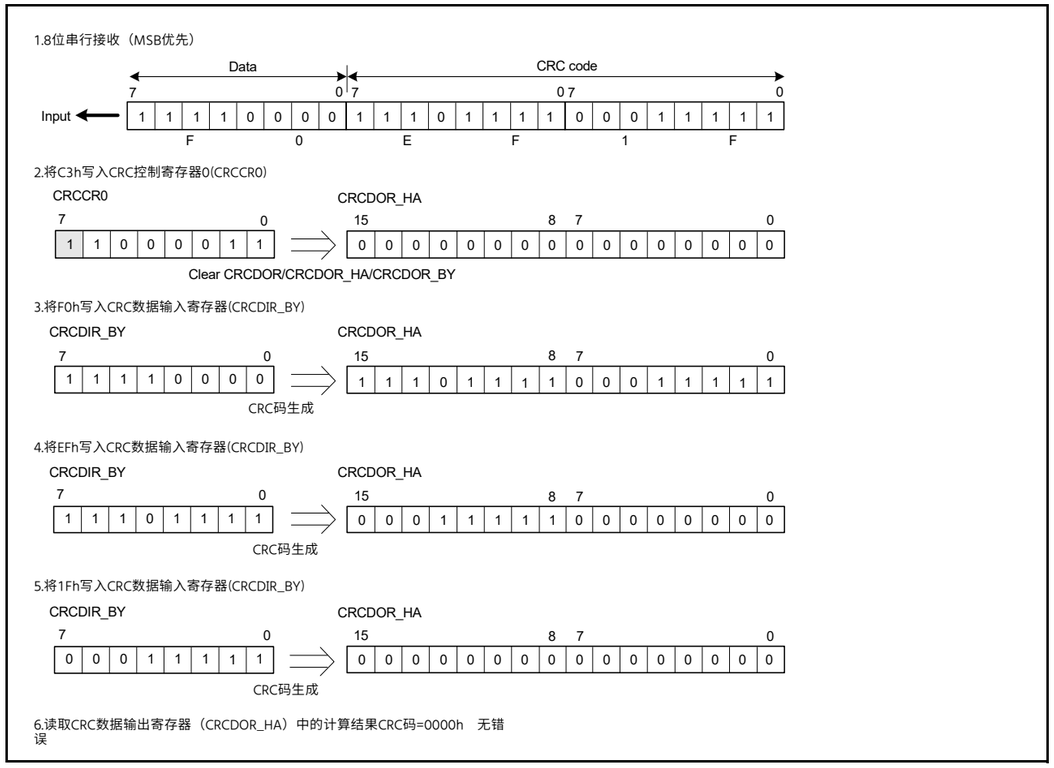

Figure 36.5 MSB优先数据接收

36.3.2 CRC Snoop

CRCsnoop功能监视对特定寄存器地址的读取和写入，并自动对从寄存器地址读取和写入的数据执行CRC计算。由于CRCsnoop将特定寄存器地址的写入和读取识别为触发以自动执行CRC计算，因此无需将数据写入CRCDIR_BY寄存器。在第36.2.5节，SnoopAddressRegister(CRCSAR)中指定的所有IO寄存器地址都受CRCsnoop的约束。CRCsnoop在监视对串行发送缓冲区的写入和从串行接收缓冲区读取时很有用。

要使用此功能，将目标IO寄存器地址写入CRCSA13到CRCSAR寄存器中的CRCSA0位，并将CRCCR1寄存器中的CRCSEN位设置为1。然后，将CRCCR1寄存器中的CRCSWR位设置为1以启用监听写入目标地址，或将CRCCR1寄存器中的CRCSWR位设置为0，以启用对目标地址读取的侦听。

当CRCSEN和CRCSWR位都设置为1，并且数据写入总线主模块（如CPU、DMAC和DTC）中的目标IO寄存器地址时，CRC计算器将数据存储在CRCDIR_BY寄存器中并执行CRC计算。同样，当CRCSEN位设置为1时，CRCSWR位设置为0，从CPU、DMAC、DTC等总线主控模块中的目标IO寄存器地址读取数据，CRC计算器将数据存储在CRCDIR_BY寄存器并执行CRC计算。

每次执行1个字节的CRC计算。当以字（16位）或长字（32位）访问目标IO寄存器地址时，会在数据的低字节（1字节）上生成CRC码。

RA生态工作室

36.4 Usage Notes

36.4.1 Settings for the Module-Stop State

The Module Stop Control Register C (MSTPCRC) can enable or disable the operation of the CRC calculator. The CRC calculator is stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

36.4.2 Note on Transmission

The transmission sequence for the CRC code differs depending on whether transmission is LSB-first or MSB-first. Figure 36.6 shows an LSB-first and MSB-first data transmission.

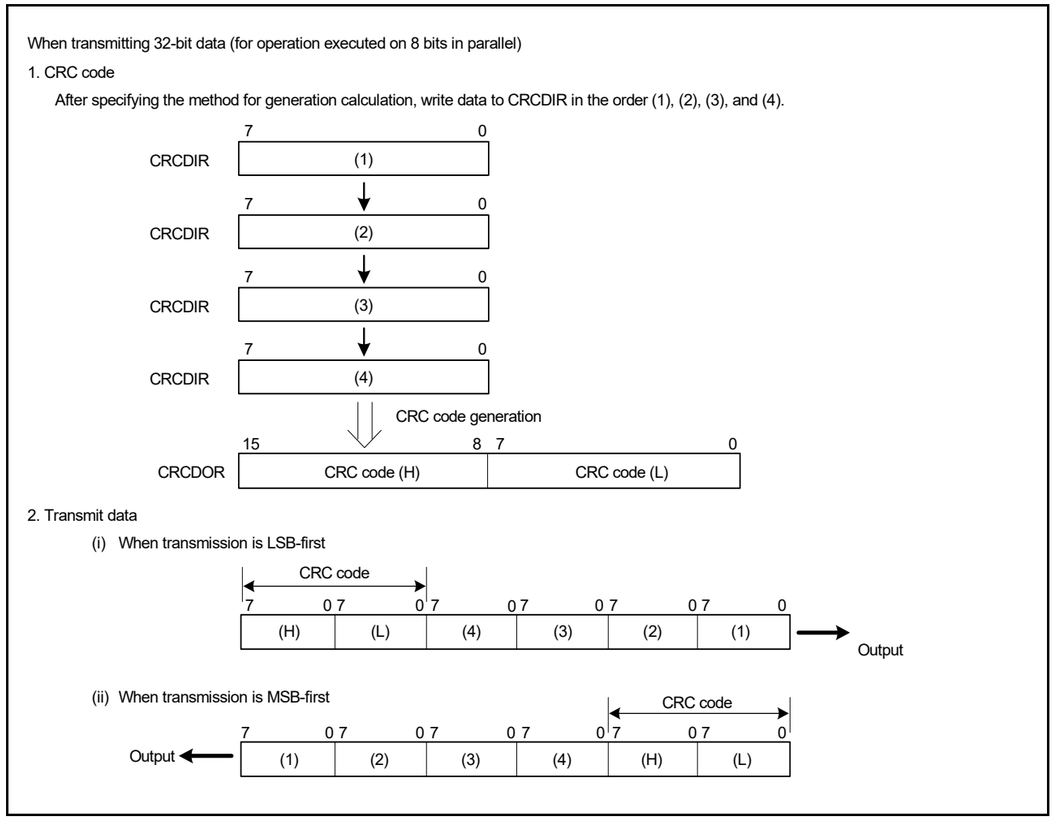

Figure 36.6 LSB-first and MSB-first data transmission

36.4 使用说明

36.4.1 模块停止状态的设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用CRC计算器的操作。CRC计算器在复位后停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

36.4.2 传输注意事项

CRC码的传输顺序根据传输是LSB优先还是MSB优先而有所不同。
图36.6显示了LSB优先和MSB优先的数据传输。

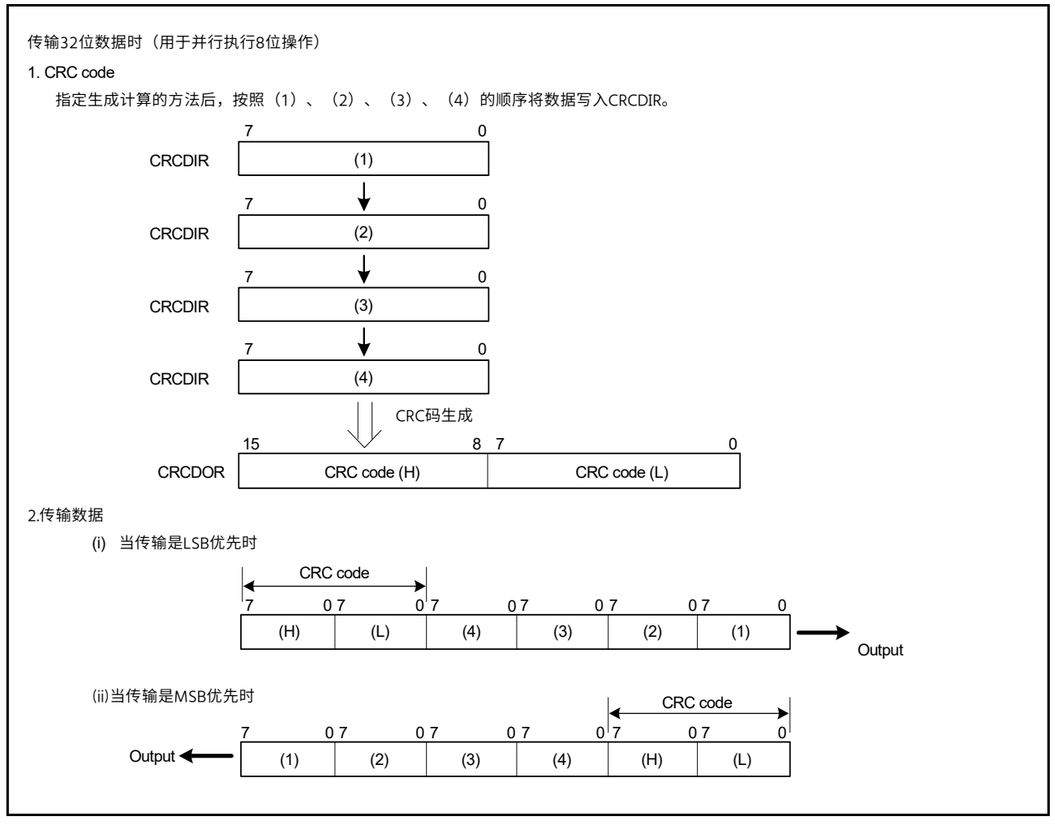

Figure 36.6 LSB−first和MSB−first数据传输

37. Serial Sound Interface Enhanced (SSIE)

37.1 Overview

The Serial Sound Interface Enhanced (SSIE) can transmit and receive audio data to and from multiple devices that support different audio data formats, such as the I²S, monaural, and TDM formats.

Table 37.1 lists the SSIE specifications, and Table 37.2 defines the communication format terms. Figure 37.1 shows the communication format, Figure 37.2 shows a block diagram, and Figure 37.3 shows the clock configuration.

Table 37.1 SSIE specifications

Parameter		Specifications
Number of channels		One channel, SSIE0
Communication mode		• Master/slave • Transmission/reception (full-duplex communication).
Communication format		• I²S format • Monaural format • TDM format.
Serial data		• MSB-first • Left-justified or right-justified data • Data delay (1 clock cycle) or no delay selectable for the period from SSILRCK/SSIFS to SSITXD0/SSIRXD0 • System word length: 8, 16, 24, 32, 48, 64, 128, or 256 bits • Data word length: 8, 16, 18, 20, 22, 24, or 32 bits • Padding polarity: Low or high.
Bit clock (SSIBCK)	In master mode	• Two clock sources: AUDIO_CLK, GTIOC1A (GPT output) • Clock source division ratio: 1/1, 1/2, 1/4, 1/6, 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, 1/64, 1/96, and 1/128 • Supply or stop is selectable while communication is halted.
	In master/slave mode	• Polarity (rising edge or falling edge) selectable
LR clock/frame synchronization (SSILRCK/SSIFS)	In master mode	• Polarity (low level or high level) selectable • Supply or stop is selectable while communication is halted.
Transmit data (SSITXD0) and receive data (SSIRXD0)	Transmission	• Muting method (transmission of transmit FIFO data or transmission of data fixed to 0) selectable
FIFO	Capacity	• Transmit FIFO or receive FIFO: 4 bytes × 32 stages
	Data alignment	• Data alignment method (left-justification or right-justification) selectable for the data transfer between FIFO and shift register
Interrupt source	Interrupt output	• Communication error/idle mode • Receive data full • Transmit data empty.
Low power consumption function		• Whether or not to supply the audio clock is selectable in master mode
Module-stop function		• Module-stop state can be set to reduce power consumption

Table 37.2 Definition of terms (1 of 2)

Term	Definition
Start trigger	First edge of the signal on the SSILRCK/SSIFS pin when the signal is set to the value specified in LRCKP to enable communication
Frame boundary	Point where SSIE starts transferring the first data of a frame or the point where SSIE ends transferring the last data of the frame
Frame word number	Number of sound channels per frame
System word length	Number of bits per channel
Data word length	Number of significant bits per channel

37. 串行声音接口增强(SSIE)

37.1 Overview

增强型串行声音接口(SSIE)可以向多个支持不同音频数据格式（例如I2S、单声道和TDM格式）的设备发送和接收音频数据。

表37.1列出了SSIE规范，表37.2定义了通信格式术语。图37.1显示了通信格式，图37.2显示了框图，图37.3显示了时钟配置。

Table 37.1 SSIE specifications

Parameter		Specifications
通道数		一个通道，SSIE0
通讯方式		• Master/slave • Transmission/reception (full-duplex communication).
通讯格式		• I²S format • Monaural format • TDM format.

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits is prohibited while SSIE is in a communication state (SSISR.IIRQ = 0). If the value of these bits is changed by rewriting, subsequent operation is unpredictable.

Note 2. If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the target status. If the value of the TEN or REN bit is changed by rewriting, subsequent operation is unpredictable. For example, when transmission or reception is enabled, check that SSISR.IIRQ is 0. When transmission or reception is disabled, check that SSISR.IIRQ is 1.

The SSICR register selects an audio clock, control interrupt requests, data formats, and operation mode.

TEN and REN bits (Transmission and Reception Enable)

The TEN and REN bits enable or disable transmission and reception. When 1 is written to one of these bits, the corresponding communication operation starts in synchronization with a start trigger in the SSILRCK/SSIFS signal. For details, see section 37.6.2, Transmission to section 37.6.4, Transmission and Reception. When 0 is written to these bits, the current communication operation stops at the next frame boundary. To use SSIE for both transmission and reception, simultaneously write 1 to these bits. When stopping communication using SSIE, always disable both transmission and reception by writing 0 to the TEN and REN bits. If you want to stop SSIE before a frame boundary is reached, perform a software reset.

MUEN bit (Mute Enable)

The MUEN bit enables or disables the mute function for the data output from the SSITXD0 pin. When this bit is set to 1 in the middle of a frame, the SSITXD0 output changes to 0 at the next frame boundary. When this bit is set to 0 in the middle of a frame, the SSITXD0 output changes to the data of the Transmit FIFO Data Register at the next frame boundary. This bit controls data only. Status flags and interrupt signals are generated normally.

Change this bit value only after setting the communication format to be used.

b31	—	Reserved	该位读取为0。写入值应为0。	R/W

Note 1. 当SSIE处于通信状态(SSISR.IIRQ=0)时，禁止写入这些位。如果这些位的值通过重写而改变，后续的操作是不可预知的。

Note 2. 如果TEN位或REN位被重写，请确保SSISR.IIRQ位处于目标状态。如果TEN或REN位的值因重写而改变，后续操作将无法预测。例如，启用发送或接收时，检查SSISR.IIRQ是否为0。禁用发送或接收时，检查SSISR.IIRQ是否为1。

SSICR寄存器选择音频时钟、控制中断请求、数据格式和操作模式。

TEN和REN位（发送和接收使能）

TEN和REN位启用或禁用发送和接收。当这些位之一写入1时，相应的通信操作与SSILRCKSSIFS信号中的开始触发同步开始。有关详细信息，请参阅第37.6.2节，传输到第37.6.4节，传输和接收。当向这些位写入0时，当前通信操作将在下一帧边界处停止。要将SSIE用于发送和接收，同时向这些位写入1。使用SSIE停止通信时，始终通过向TEN和REN位写入0来禁用发送和接收。如果要在达到帧边界之前停止SSIE，请执行软件复位。

MUEN位（静音使能）

MUEN位启用或禁用SSITXD0引脚数据输出的静音功能。当该位在帧中间设置为1时，SSITXD0输出在下一帧边界变为0。当该位在帧中间设置为0时，SSITXD0输出在下一帧边界变为发送FIFO数据寄存器的数据。该位仅控制数据。状态标志和中断信号正常产生。

仅在设置要使用的通信格式后更改该位值。

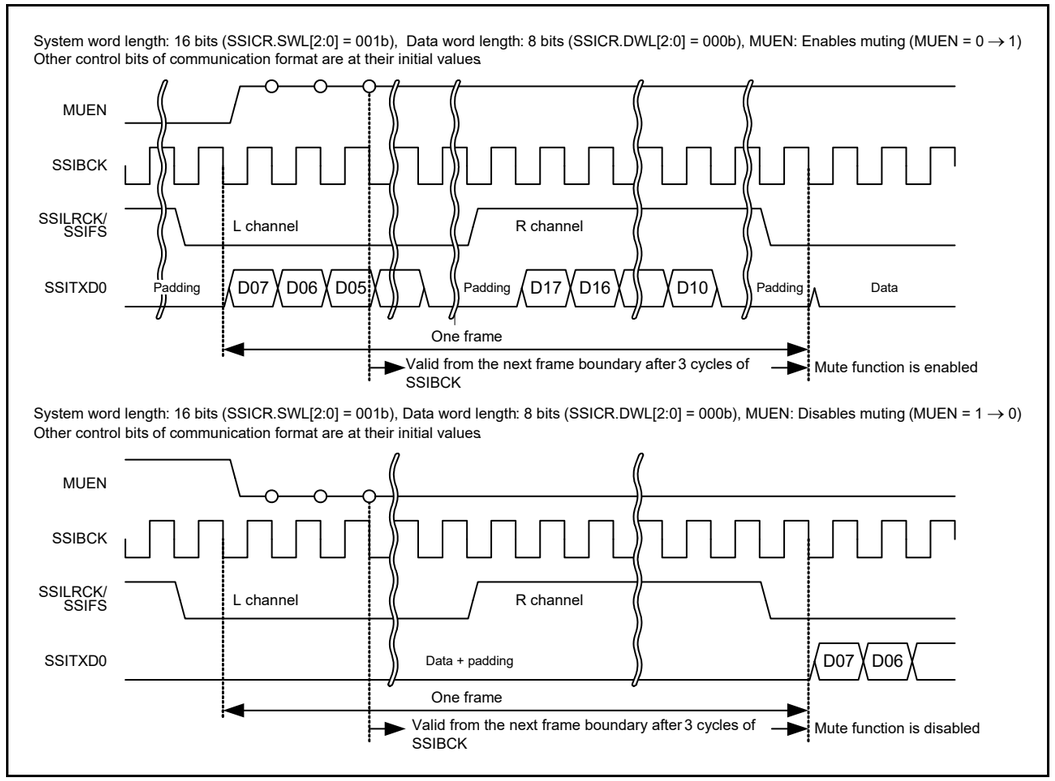

Figure 37.4 Transmit data with the mute function set

CKDV[3:0] bits (Selects Bit Clock Division Ratio)

The CKDV[3:0] bits set the division ratio of the bit clock based on AUDIO_MCK in master mode communication (MST = 1). In slave mode communication (MST = 0), setting of these bits is invalid.

Write to this bit when the supply of AUDIO_MCK is stopped. For timing details, see the detailed description of the AUCKE bit in SSIFCR.

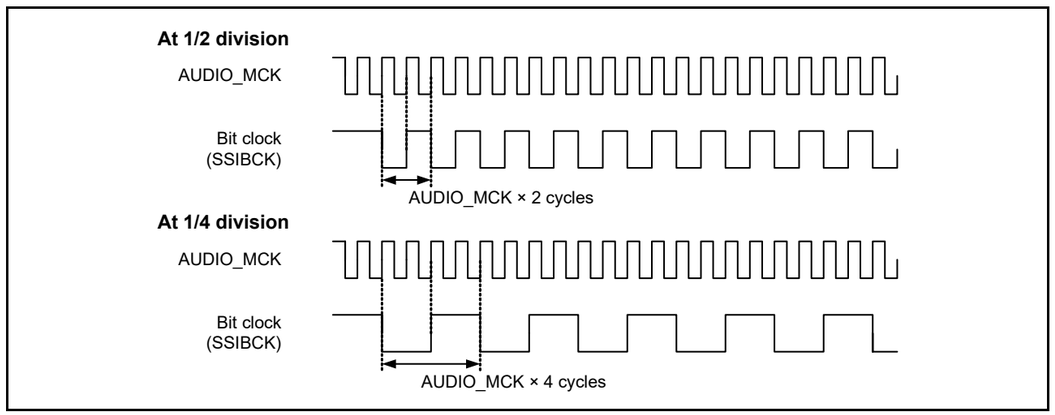

Figure 37.5 Sampling frequencies in master mode communication

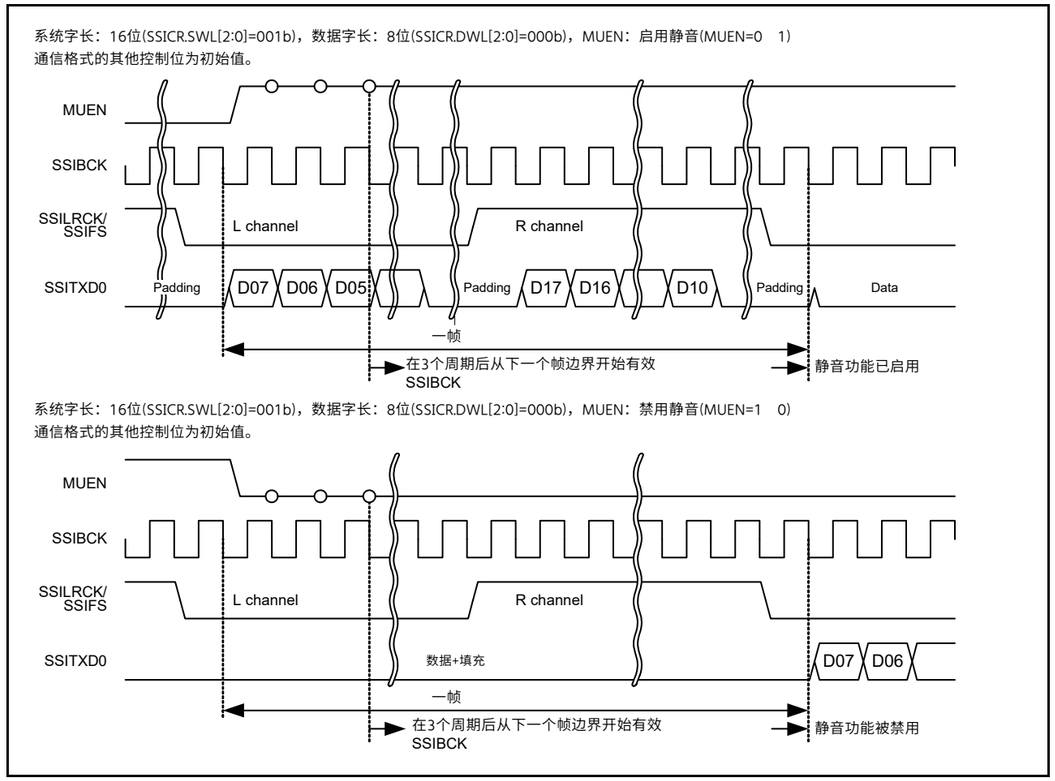

Figure 37.4 设置静音功能传输数据

CKDV[3:0]位（选择位时钟分频比）

CKDV[3:0]位在主模式通信(MST=1)中根据AUDIO_MCK设置位时钟的分频比。在从机模式通信(MST=0)中，这些位的设置无效。

当停止提供AUDIO_MCK时写入该位。有关时序的详细信息，请参阅详细说明
SSIFCR中的AUCKE位。

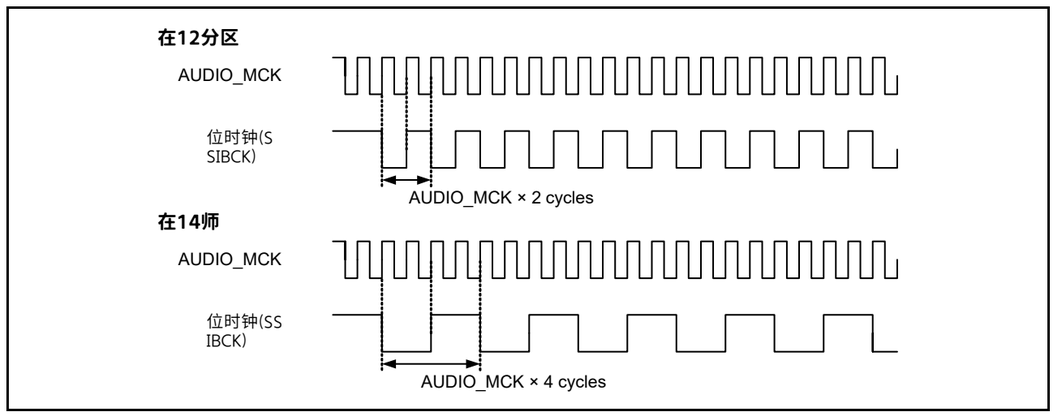

Figure 37.5 主模式通信中的采样频率

DEL bit (Select Serial Data Delay)

The DEL bit selects whether or not there is a delay between SSILRCK/SSIFS and SSITXD0/SSIRXD0.

For the I²S or TDM format, set the DEL bit to 0. When the monaural format is used, setting of this bit changes the high period width of SSILRCK/SSIFS. For details, see section 37.3.2, Monaural Format. When using a compatible communication format, specify a a DEL bit that enables communication.

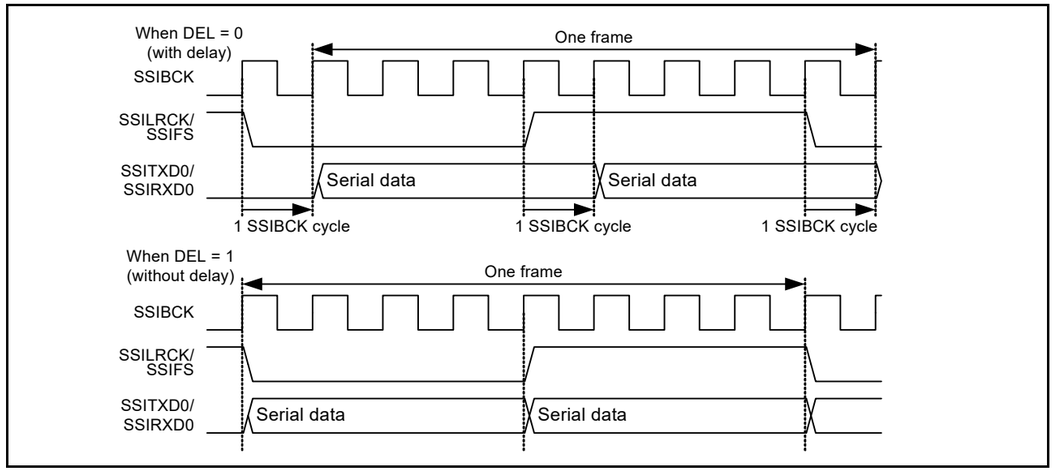

Figure 37.6 Setting of delay in serial data

PDTA bit (Select Placement Data Alignment)

The PDTA bit selects how to align the placement data. When a 32-bit word length is set (SSICR.DWL[2:0] = 110b), this bit is invalid. At transmission, see Figure 37.7.

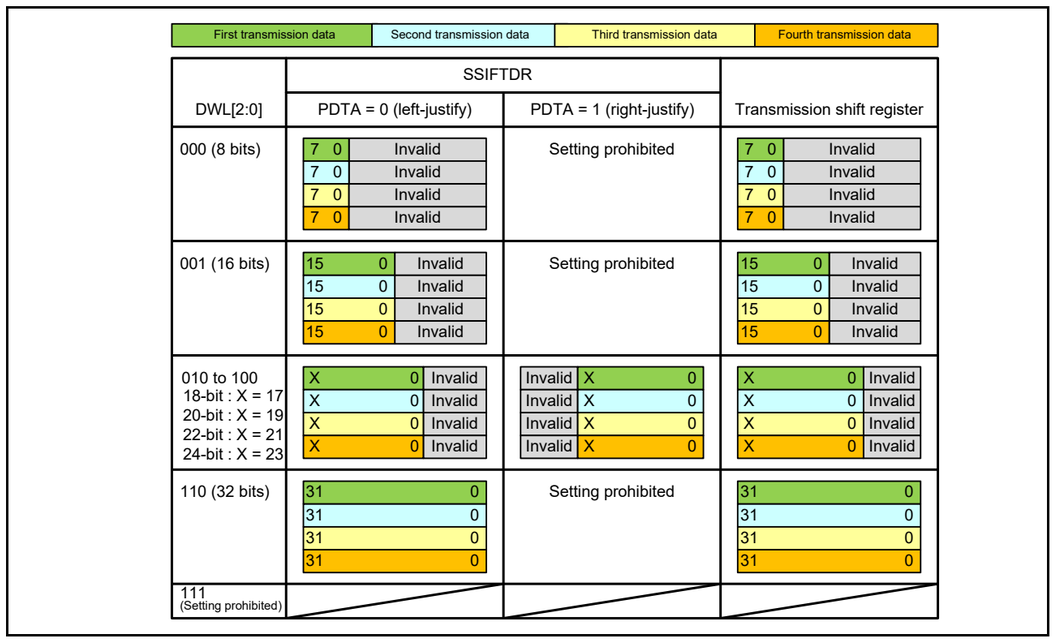

Figure 37.7 Alignment of placement data at transmission

DEL位（选择串行数据延迟）

DEL位选择SSILRCKSSIFS和SSITXD0SSIRXD0之间是否存在延迟。

对于I2S或TDM格式，将DEL位设置为0。当使用单声道格式时，该位的设置会改变SSILRCKSSIFS的高周期宽度。有关详细信息，请参阅第37.3.2节，单声道格式。当使用兼容的通信格式时，指定一个DEL位以启用通信。

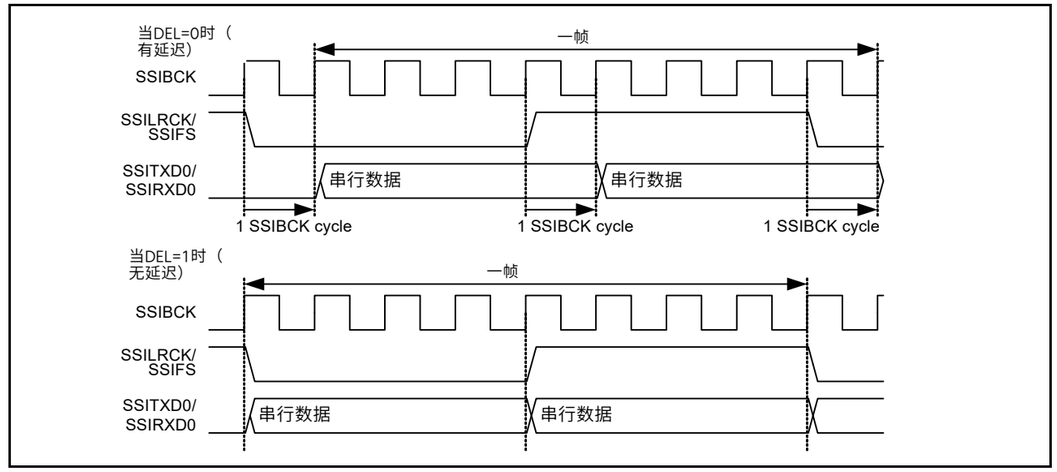

Figure 37.6 串行数据延迟设置

PDTA位（选择布局数据对齐）

PDTA位选择如何对齐布局数据。当设置32位字长时(SSICR.DWL[2:0]=110b)，该位无效。传输时，见图37.7。

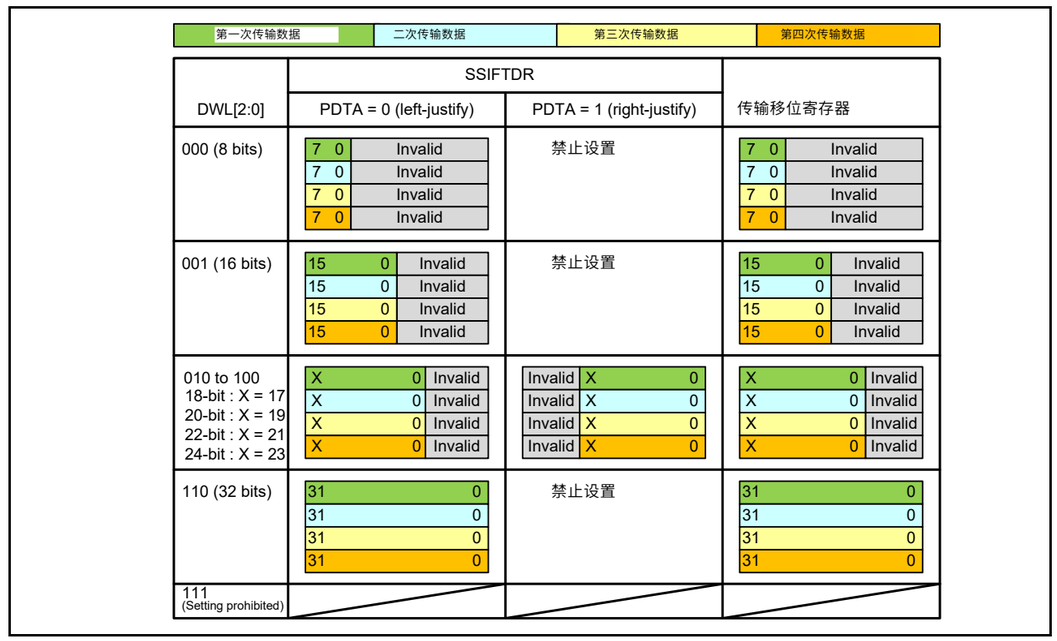

Figure 37.7 在传输时对齐放置数据

At reception, see Figure 37.8.

Figure 37.8 在接收时对齐放置数据

SDTA位（选择串行数据延迟）

SDTA位选择如何对齐串行数据和填充位。对于没有填充位的通信，该位无效。

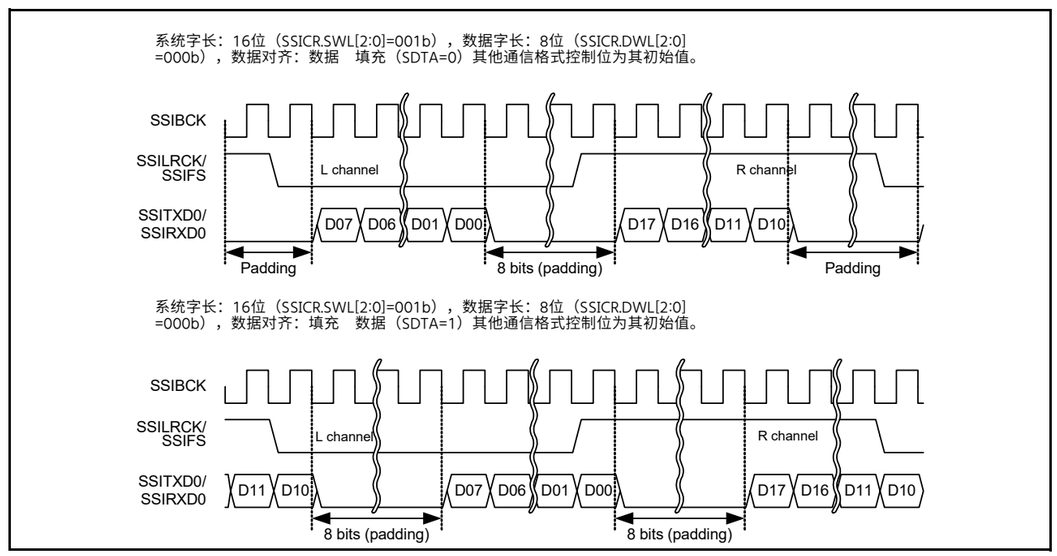

Figure 37.9 串行数据的对齐设置与填充位

SPDP bit (Select Serial Padding Polarity)

The SPDP bit selects the polarity of padding bits.

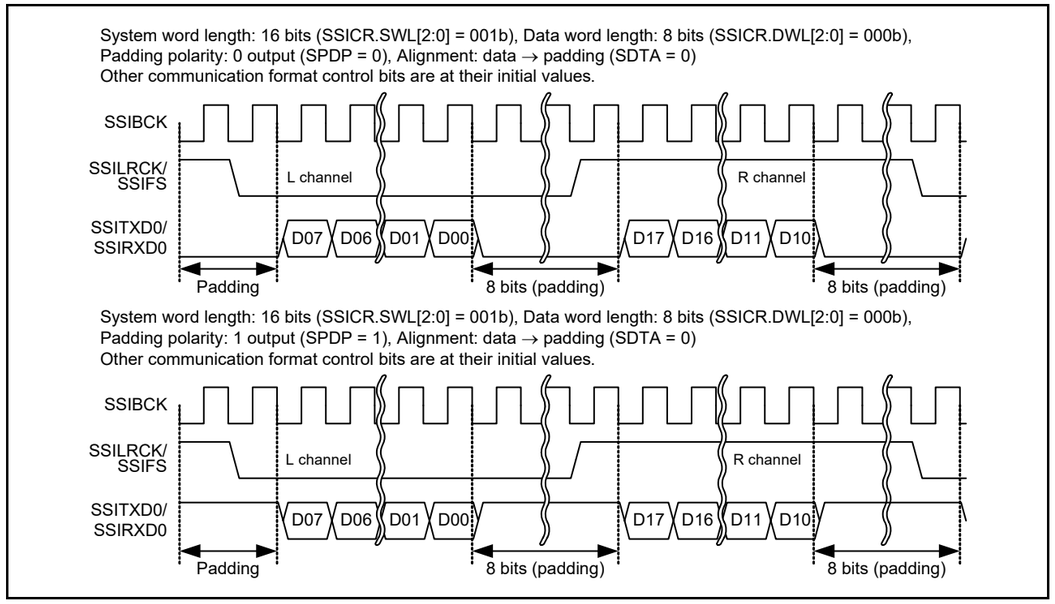

Figure 37.10 Padding bit polarity

LRCKP bit (Select the Initial Value and Polarity of LR Clock/Frame Synchronization Signal)

The LRCKP bit selects the initial value and polarity of SSILRCK/SSIFS. Set this bit based on the communication format to be used in SSIE. See Table 37.3, Initial output value and polarity of the SSILRCK/SSIFS pin. In slave mode communication (MST = 0), only the start trigger is used.

Write to these bits when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details on the output of the LR clock, see the description for the LRCONT bit in section 37.2.7, Audio Format Register (SSIOFR).

Table 37.3 Initial output value and polarity of the SSILRCK/SSIFS pin

Communication format	Expected initial state	Setting value of LRCKP
I²S	High	0
Monaural	Low	1
TDM	Low	1

Note: When the format to be used is compatible with the I²S, monaural, or TDM format, specify the settings to enable communication with the respective formats.

SPDP位（选择串行填充极性）

SPDP位选择填充位的极性。

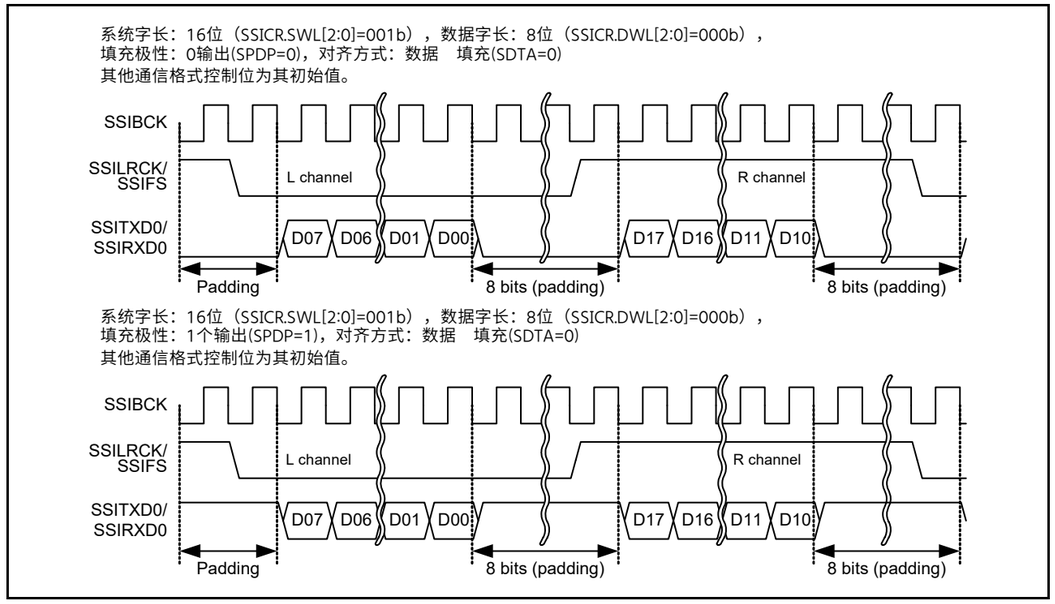

Figure 37.10 填充位极性

LRCKP位（选择LR时钟帧同步信号的初始值和极性）

LRCKP位选择SSILRCKSSIFS的初始值和极性。根据要在SSIE中使用的通信格式设置该位。请参见表37.3，SSILRCKSSIFS引脚的初始输出值和极性。在从模式通信(MST=0)中，仅使用启动触发器。

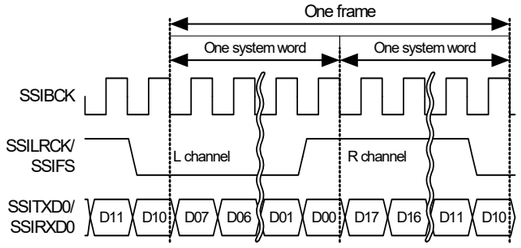
当停止向SSILRCKSSIFS引脚提供LR时钟时，写入这些位。有关LR时钟输出的详细信息，请参见第37.2.7节，音频格式寄存器(SSIOFR)中对LRCONT位的说明。

Table 37.3 SSILRCKSSIFS引脚的初始输出值和极性

通讯格式	预期的初始状态	LRCKP设定值
I²S	High	0
Monaural	Low	1
TDM	Low	1

Note: 当要使用的格式与I2S、单声道或TDM格式兼容时，指定设置以启用与相应格式的通信。

System word length: 8 bits (SSICR.SWL[2:0] = 000b), Data word length: 8 bits (SSICR.DWL[2:0] = 000b),
LR clock polarity: L channel = Low, R channel = High (LRCKP = 0)
Other communication format control bits are at their initial values.



System word length: 8 bits (SSICR.SWL[2:0] = 000b), Data word length: 8 bits (SSICR.DWL[2:0] = 000b),
LR clock polarity: L channel = High, R channel = Low (LRCKP = 1)
Other communication format control bits are at their initial values.

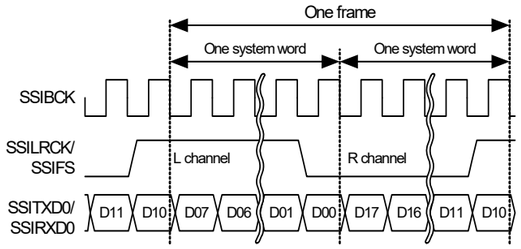


Figure 37.11 LR clock/frame synchronization polarity setting

BCKP bit (Select Bit Clock Polarity)

The BCKP bit selects the bit clock polarity.

Write to this bit when the supply of AUDIO_MCK is stopped. For timing details, see the description of the AUCKE bit in section 37.2.3, FIFO Control Register (SSIFCR).

Table 37.4 Bit clock polarity

Communication	Master/slave	Timing	BCKP = 0	BCKP = 1
Reception	Slave	At SSILRCK/SSIFS sampling	SSIBCK rising edge	SSIBCK falling edge
	Master/slave	At SSIRXD0 sampling	SSIBCK rising edge	SSIBCK falling edge
Transmission	Master	At change of SSILRCK/SSIFS output	SSIBCK falling edge	SSIBCK rising edge
	Master/slave	At change of SSITXD0 output	SSIBCK falling edge	SSIBCK rising edge

MST bit (Master Enable)

The MST bit selects the master or slave mode communication.

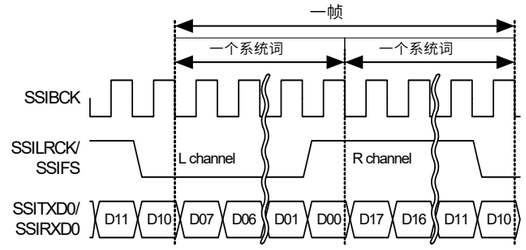
Write to this bit when the supply of AUDIO_MCK is stopped. For timing details, see the detailed description of the AUCKE bit in section 37.2.3, FIFO Control Register (SSIFCR).

SWL[2:0] bits (Select System Word Length)

The SWL[2:0] bits select the number of bits in one system word. Padding bits are sent and received in relation to one data word set in DWL[2:0]. For details, see Table 37.11.

Write to these bits when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details on LR clock output, see the description of the LRCONT bit in section 37.2.7, Audio Format Register (SSIOFR).

系统字长：8位（SSICR.SWL[2:0]=000b），数据字长：8位（SSICR.DWL[2:0]=000b），
LR时钟极性：L通道=低，R通道=高(LRCKP=0)其他通信格
式控制位为其初始值。



系统字长：8位（SSICR.SWL[2:0]=000b），数据字长：8位（SSICR.DWL[2:0]=000b），
LR时钟极性：L通道=高，R通道=低(LRCKP=1)其他通信格
式控制位为其初始值。

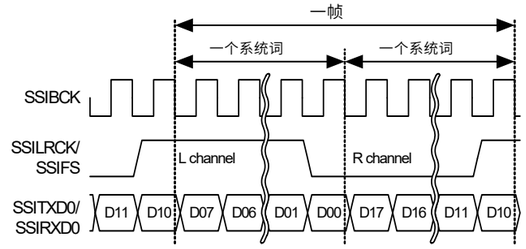


Figure 37.11 LR时钟帧同步极性设置

BCKP位（选择位时钟极性）

BCKP位选择位时钟极性。

当停止提供AUDIO_MCK时写入该位。有关时序的详细信息，请参见第37.2.3节，FIFO控制寄存器(SSIFCR)中对AUCKE位的描述。

Table 37.4 位时钟极性

Communication	Master/slave	Timing	BCKP = 0	BCKP = 1
Reception	Slave	在SSILRCKSSIFS采样	SSIBCK上升沿	SSIBCK下降沿
	Master/slave	在SSIRXD0采样	SSIBCK上升沿	SSIBCK下降沿
Transmission	Master	在改变SSILRCKSSIFS输出时	SSIBCK下降沿	SSIBCK上升沿
	Master/slave	改变SSITXD0输出时	SSIBCK下降沿	SSIBCK上升沿

MST位（主使能）

MST位选择主模式或从模式通信。

当停止提供AUDIO_MCK时写入该位。有关时序的详细信息，请参阅详细说明
第37.2.3节，FIFO控制寄存器(SSIFCR)中的AUCKE位。

SWL[2:0]位（选择系统字长）

SWL[2:0]位选择一个系统字中的位数。填充位的发送和接收与DWL[2:0]中设置的一个数据字相关。详见表37.11。

当停止向SSILRCKSSIFS引脚提供LR时钟时，写入这些位。有关LR时钟输出的详细信息，请参见第37.2.7节，音频格式寄存器(SSIOFR)中对LRCONT位的描述。

RA生态工作室

DWL[2:0] bits (Select Data Word Length)

The DWL[2:0] bits set the number of bits in one data word. The data word length (number of bits per data word) must not exceed the system word length (number of bits per system word). For details, see Table 37.11.

FRM[1:0] bits (Select Frame Word Number)

The FRM[1:0] bits set the frame word number in individual communication formats. Write to these bits when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details on LR clock output, see the description of the LRCONT bit in section 37.2.7, Audio Format Register (SSIOFR).

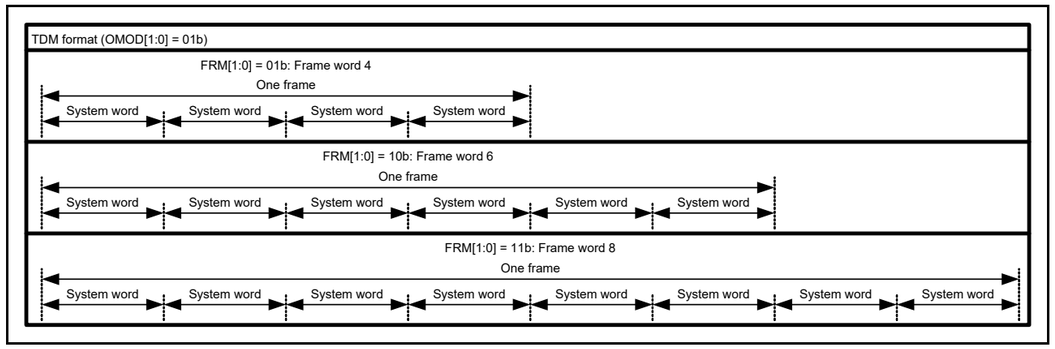

Figure 37.12 Frame word number

IIEN bit (Idle Mode Interrupt Output Enable)

The IIEN bit enables or disables the output of idle mode interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.IIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.IIRQ = 1.

ROIEN bit (Receive Overflow Interrupt Output Enable)

The ROIEN bit enables or disables the output of receive overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.ROIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.ROIRQ = 1.

RUIEN bit (Receive Underflow Interrupt Output Enable)

The RUIEN bit enables or disables the output of receive underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.RUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.RUIRQ = 1.

TOIEN bit (Transmit Overflow Interrupt Output Enable)

The TOIEN bit enables or disables the output of transmit overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TOIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TOIRQ = 1.

TUIEN bit (Transmit Underflow Interrupt Output Enable)

The TUIEN bit enables or disables the output of transmit underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TUIRQ = 1.

CKS bit (Select an Audio Clock for Master Mode Communication*1)

The CKS bit sets the audio clock in master mode communication (MST = 1). In slave mode communication (MST = 0), this bit setting is invalid.

Write to this bit when the supply of AUDIO_MCK is stopped. For timing details, see the description of the AUCKE bit in section 37.2.3, FIFO Control Register (SSIFCR).

DWL[2:0]位（选择数据字长）

DWL[2:0]位设置一个数据字中的位数。数据字长（每个数据字的位数）不得超过系统字长（每个系统字的位数）。详见表37.11。

FRM[1:0]位（选择帧字号）

FRM[1:0]位设置各个通信格式中的帧字号。当停止向SSILRCKSSIFS引脚提供LR时钟时，写入这些位。有关LR时钟输出的详细信息，请参见第37.2.7节，音频格式寄存器(SSIOFR)中对LRCONT位的描述。

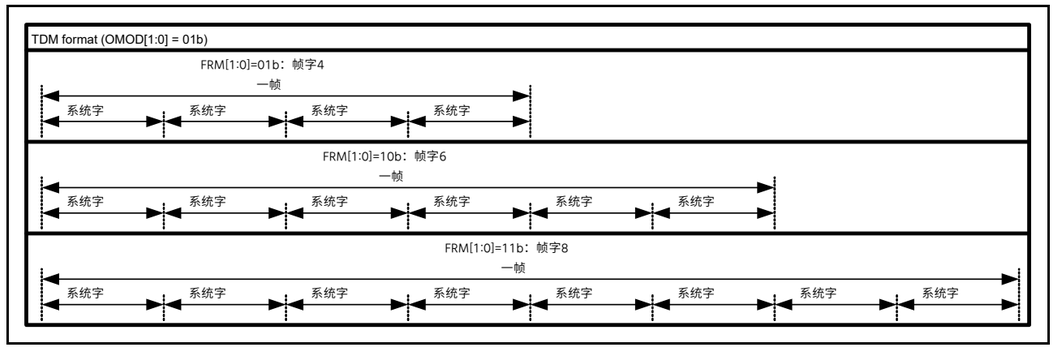

Figure 37.12 帧字数

IIEN位（空闲模式中断输出使能）

IIEN位启用或禁用空闲模式中断的输出。通过启用该位（将其设置为1），在SSISR.IIRQ=1的上升沿输出中断。当SSISR.IIRQ=1时该位从0变为1时也会输出中断。

ROIEN位（接收溢出中断输出使能）

ROIEN位启用或禁用接收溢出中断的输出。通过启用该位（将其设置为1），在SSISR.ROIRQ=1的上升沿输出中断。当SSISR.ROIRQ=1时该位从0变为1时也会输出中断。

RUIEN位（接收下溢中断输出使能）

RUIEN位启用或禁用接收下溢中断的输出。通过启用该位（将其设置为1），在SSISR.RUIRQ=1的上升沿输出中断。当SSISR.RUIRQ=1时该位从0变为1时也会输出中断。

TOIEN位（发送溢出中断输出使能）

TOIEN位启用或禁用发送溢出中断的输出。通过启用该位（将其设置为1），在SSISR.TOIRQ=1的上升沿输出中断。当SSISR.TOIRQ=1时该位从0变为1时也会输出中断。

TUIEN位（发送下溢中断输出使能）

TUIEN位启用或禁用发送下溢中断的输出。通过启用该位（将其设置为1），在SSISR.TUIRQ=1的上升沿输出中断。当SSISR.TUIRQ=1时该位从0变为1时也会输出中断。

CKS位（选择主模式通信的音频时钟*1）

CKS位设置主模式通信中的音频时钟(MST=1)。在从机模式通信（MST=0）中，该位设置无效。

当停止提供AUDIO_MCK时写入该位。有关时序的详细信息，请参见第37.2.3节，FIFO控制寄存器(SSIFCR)中对AUCKE位的描述。

RA生态工作室

37.2.2 Status Register (SSISR)

Address(es): SSIE0.SSISR 4004 E004h

b31, b30	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SSISR寄存器配置有指示SSIE操作状态的状态标志。

IIRQ标志（空闲模式状态标志）

IIRQ是一个状态标志，指示SSIE是处于空闲状态还是通信状态。详见图37.13和图37.14。

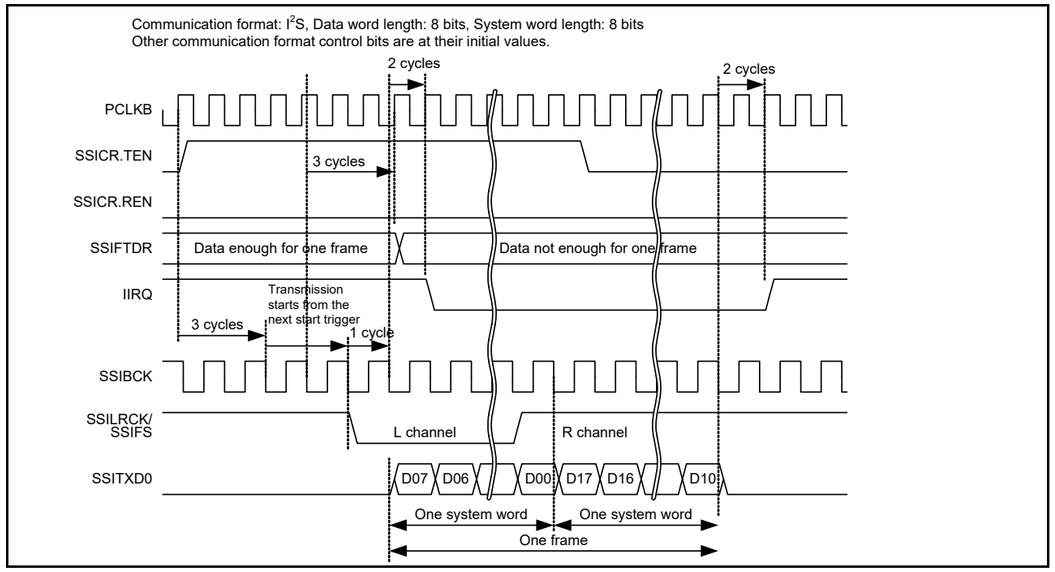

Figure 37.13 IIRQ setting timing (transmission)

For Transmitter (dedicated to transmission):

[Clearing condition]

- While transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0), the transmit data for a transmission frame is written to the SSIFTDR register, and a start trigger is generated by the SSILRCK/SSIFS signal.

[Clearing timing]

- 1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger, which is the clearing condition.

[Setting condition]

- While transmission and reception were disabled (SSICR.TEN = 0 and SSICR.REN = 0), transmission of one frame is complete.

[Setting timing]

- 2 PCLKB cycles after the end of transmission (at a frame boundary), which is the setting condition.

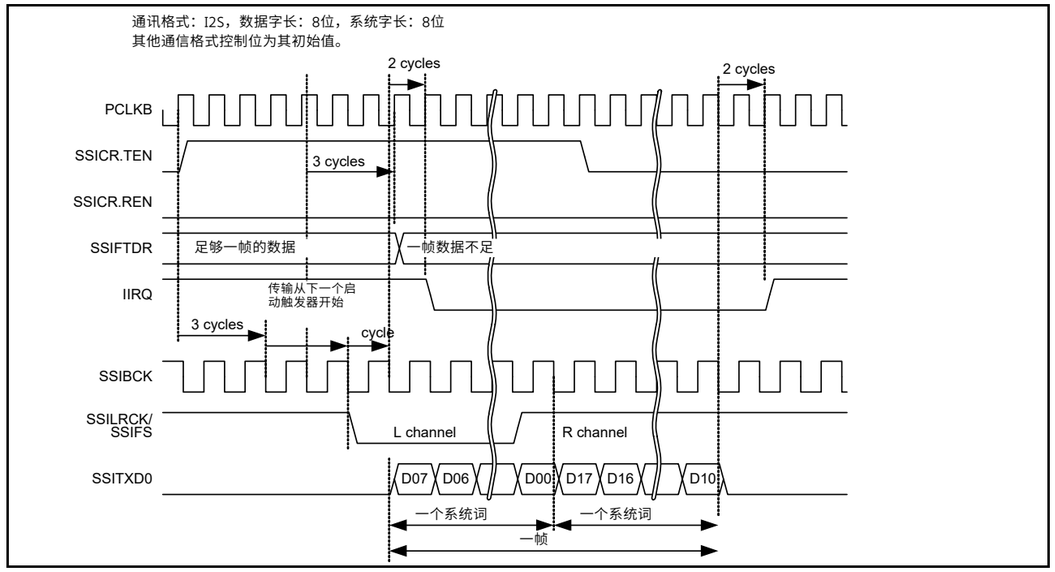

Figure 37.13 IIRQ设置时序（传输）

对于发射器（专用于传输）：

[Clearing condition]

- 使能传输时（SSICR.TEN=1和SSICR.REN=0），传输帧的传输数据被写入SSIFTDR寄存器，并由SSILRCKSSIFS信号生成启动触发。

[Clearing timing]

- 开始触发产生后1个SSIBCK周期+2个PCLKB周期，这是清除条件。

[Setting condition]

- 当发送和接收被禁用时（SSICR.TEN=0和SSICR.REN=0），一帧的发送完成。

[Setting timing]

- 传输结束后的2个PCLKB周期（在帧边界处），这是设置条件。

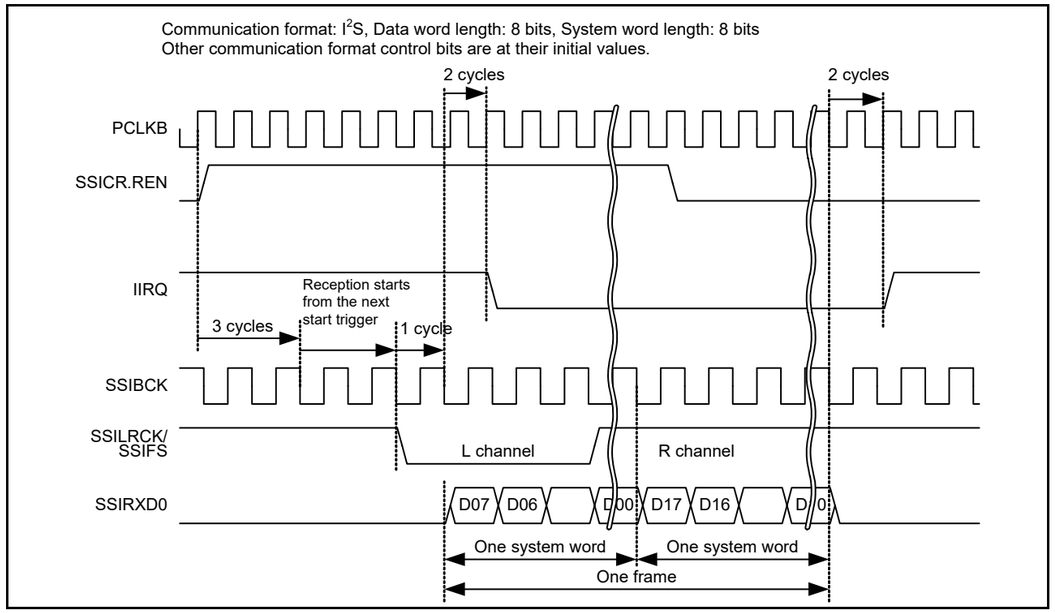

Figure 37.14 IIRQ setting timing (reception)

For the receiver (dedicated to reception):

[Clearing condition]

- While reception is enabled (SSICR.TEN = 0 and SSICR.REN = 01, a start trigger is generated by the SSILRCK/SSIFS signal.

[Clearing timing]

- 1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger, which is the clearing condition.

[Setting condition]

- While transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0), reception of one frame is complete.

[Setting timing]

- 2 PCLKB cycles after the end of reception (at a frame boundary), which is the setting condition.

For the transceiver (transmission and reception)

[Clearing condition]

- While transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1), the transmit data for a transmission frame is written to the SSIFTDR register, and a start trigger is generated by the SSILRCK/SSIFS signal.

[Clearing timing]

- 1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger, which is the clearing condition.

[Setting condition]

- While transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0), transmission of one frame is complete.

[Setting timing]

- 2 PCLKB cycles after the end of transmission (at a frame boundary), which is the setting condition.

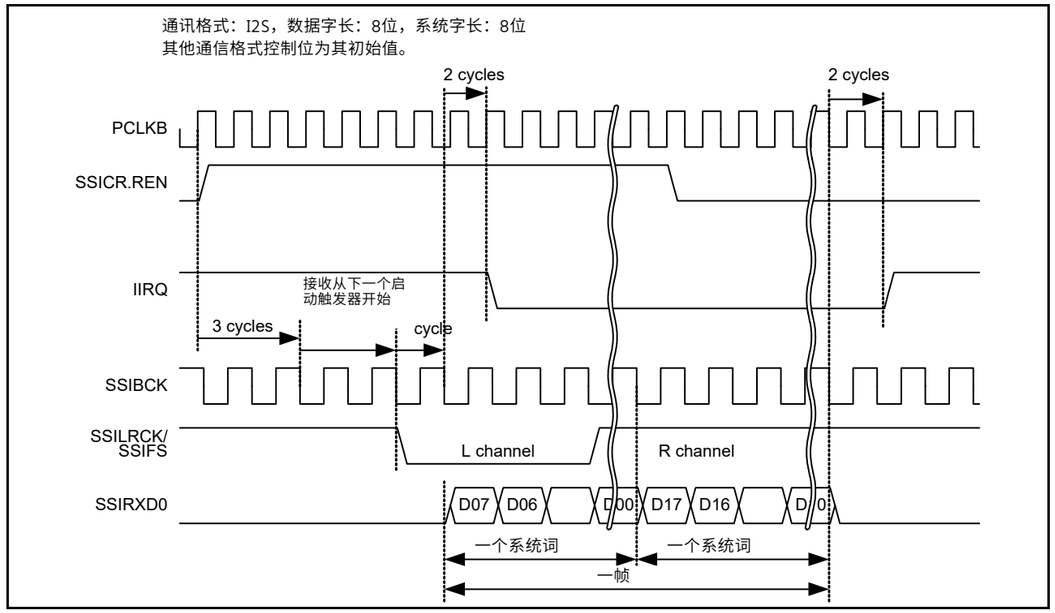

Figure 37.14 IIRQ设置时序（接收）

对于接收器（专用于接收）：

[Clearing condition]

- 使能接收时（SSICR.TEN=0和SSICR.REN=01，启动触发由 SSILRCK/SSIFS signal.

[Clearing timing]

- 开始触发产生后1个SSIBCK周期+2个PCLKB周期，这是清除条件。

[Setting condition]

- 当发送和接收被禁用时（SSICR.TEN=0和SSICR.REN=0），一帧的接收完成。

[Setting timing]

- 接收结束后的2个PCLKB周期（在帧边界处），这是设置条件。

对于收发器（发送和接收）

[Clearing condition]

- 在使能发送和接收时（SSICR.TEN=1和SSICR.REN=1），发送帧的发送数据被写入SSIFTDR寄存器，并由SSILRCKSSIFS信号生成开始触发。

[Clearing timing]

- 开始触发产生后1个SSIBCK周期+2个PCLKB周期，这是清除条件。

[Setting condition]

- 当发送和接收被禁用时（SSICR.TEN=0和SSICR.REN=0），一帧的发送完成。

[Setting timing]

- 传输结束后的2个PCLKB周期（在帧边界处），这是设置条件。

ROIRQ flag (Receive Overflow Error Status Flag)

The ROIRQ is a status flag that indicates a receive overflow error. This flag is set automatically but must be cleared by register access. This flag indicates that received data is supplied at a higher rate than requested. Data is not transferred from the Receive Shift Register to SSIFRDR where a receive overflow error is generated. For the procedure to recover from the overflow error, see section 37.6.6, Error Handling. This flag is not cleared by a Receive FIFO Data Register Reset (SSIFCR.RFRST).

[Priority order for setting and clearing]

- Setting is prioritized.*1

[Clearing condition]

When either of the following operations is performed:

1. On writing 0 to this bit after reading 1 from this bit.*2
2. On enabling communication (changing SSICR.REN from 0 to 1).

[Clearing timing]

Clearing timing associated with the specified clearing condition:

1. On writing 0 to this bit after reading 1 from this bit (same as the timing in Figure 37.18).
2. 1 PCLKB cycle after writing 1 to SSICR.REN.*3

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the specified clearing conditions.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:

- A software reset (SSIFCR.SSIRST = 1) is done
- After 1 is read, writing of 0 is complete
- 1 PCLKB cycle passes after 1 is written to SSICR.REN.

Note 3. After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags RUIRQ and ROIRQ in the SSISR register are cleared. However, if the SSISR register is read continuously, the cleared status of the reception error flags might be unreadable.

[Setting condition]

- On completion of receiving new data while SSIFRDR is full.

[Setting timing]

- 3 PCLKB cycles after reception is completed.

ROIRQ标志（接收溢出错误状态标志）

ROIRQ是指示接收溢出错误的状态标志。该标志自动设置，但必须通过寄存器访问清除。该标志表示接收到的数据以高于请求的速率提供。数据不会从接收移位寄存器传送到产生接收溢出错误的SSIFRDR。有关从溢出错误中恢复的过程，请参阅第37.6.6节，错误处理。接收FIFO数据寄存器复位(SSIFCR.RFRST)不会清除该标志。

[设置和清除的优先顺序]

- 设置优先。*1

[Clearing condition]

当执行以下任一操作时：

1. 在从该位读取1后向该位写入0。*2
2. 关于启用通信（将SSICR.REN从0更改为1）。

[Clearing timing]

与指定清算条件相关的清算时机：

1. 在从该位读取1后向该位写入0（与图37.18中的时序相同）。
2. 向SSICR.REN写入1后的1个PCLKB周期。*3

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于所有指定的清除条件。注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：

- 完成软件复位(SSIFCR.SSIRST=1)
- 读1后，写0完成
- 在将1写入SSICR.REN后经过1个PCLKB周期。

注3.启用通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志
SSISR寄存器中的RUIRQ和ROIRQ被清零。但是，如果连续读取SSISR寄存器，则接收错误标志的清除状态可能无法读取。

[Setting condition]

- 在SSIFRDR已满时完成接收新数据。

[Setting timing]

- 接收完成后的3个PCLKB周期。

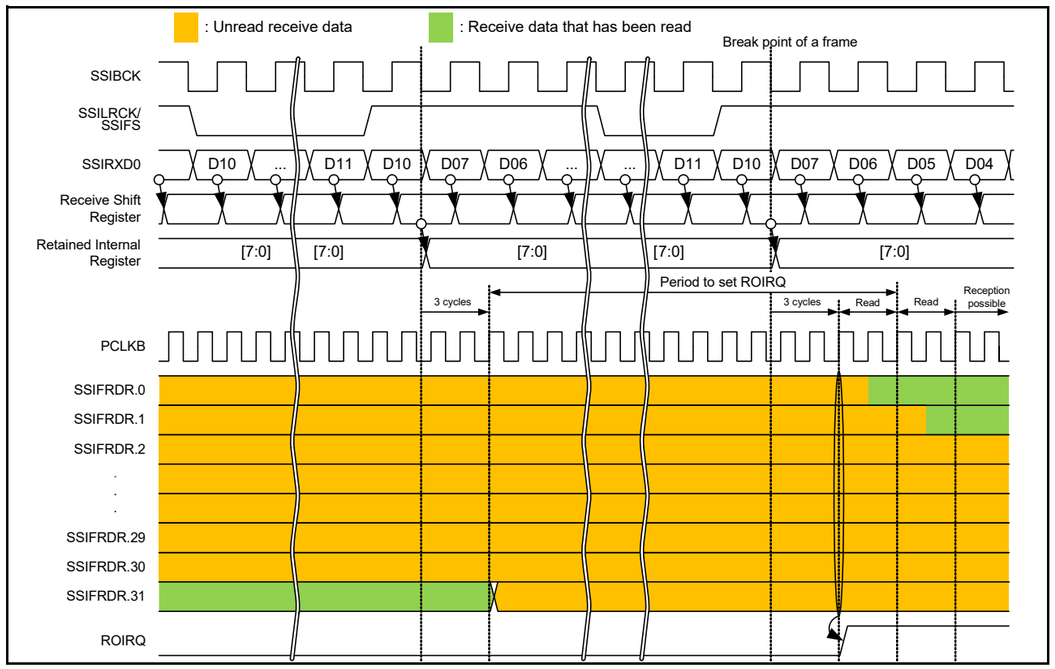

Figure 37.15 ROIRQ setting timing

RUIRQ flag (Receive Underflow Error Status Flag)

RUIRQ is a status flag that indicates a receive underflow error. This flag is set automatically but must be cleared through register access. This flag indicates that SSIFRDR is read while it is empty. Data read from SSIFRDR where a receive underflow error is generated is invalid. For the error recovery procedure, see section 37.6.6, Error Handling. This flag is not cleared by a Receive FIFO Data Register Reset (SSIFCR.RFRST). However, this flag is not set even if the SSIFRDR register is read while the Receive FIFO Data Register is reset (by setting SSIFCR.RFRST to 1).

[Priority order for setting and clearing]

- Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

1. On writing 0 to this bit after reading 1 from this bit.*2
2. On enabling communication (changing SSICR.REN from 0 to 1).

[Clearing timing]

Clearing timing associated with the specified clearing condition:

1. On writing 0 to this bit after reading 1 from this bit (same as the timing in Figure 37.18).
2. 1 PCLKB cycle after writing 1 to SSICR.REN.*3

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). Software reset has priority over all the specified clearing conditions.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:

- A software reset (SSIFCR.SSIRST = 1) is done
- After 1 is read, writing of 0 is complete
- 1 PCLKB cycle passes after 1 is written to SSICR.REN.

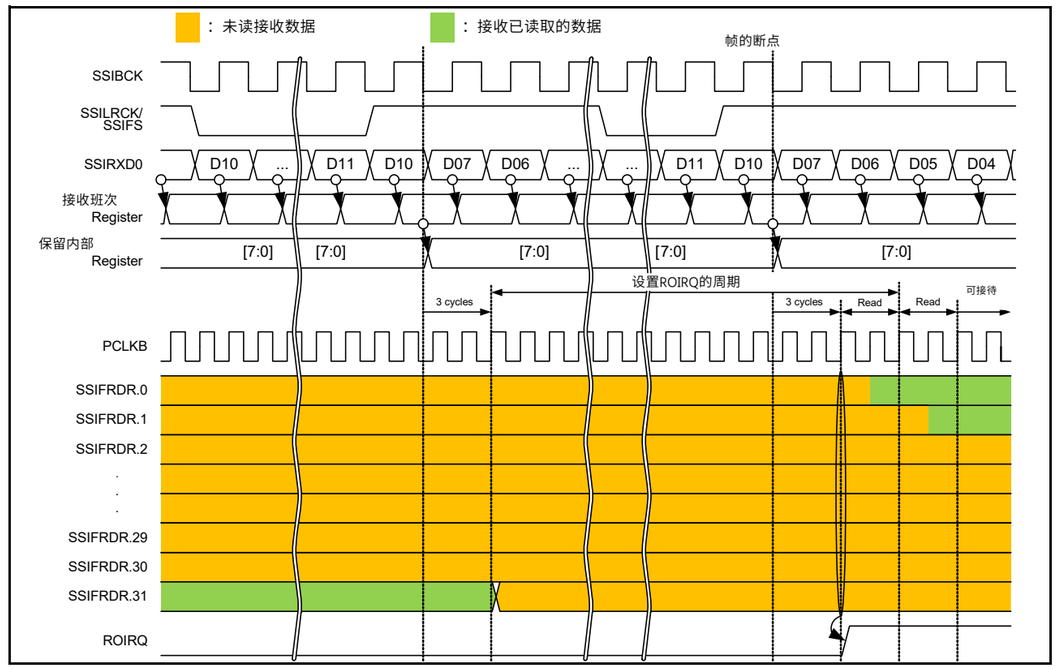

Figure 37.15 ROIRQ设置时序

RUIRQ标志（接收下溢错误状态标志）

RUIRQ是指示接收下溢错误的状态标志。该标志自动设置，但必须通过寄存器访问清除。此标志指示SSIFRDR在为空时被读取。从产生接收下溢错误的SSIFRDR读取的数据无效。有关错误恢复过程，请参阅第37.6.6节，错误处理。接收FIFO数据寄存器复位(SSIFCR.RFRST)不会清除该标志。但是，即使在接收FIFO数据寄存器复位（通过将SSIFCR.RFRST设置为1）时读取SSIFRDR寄存器，该标志也不会设置。

[设置和清除的优先顺序]

- 设置优先。*1

[Clearing condition]

完成以下任一操作时：

1. 在从该位读取1后向该位写入0。*2
2. 关于启用通信（将SSICR.REN从0更改为1）。

[Clearing timing]

与指定清算条件相关的清算时机：

1. 在从该位读取1后向该位写入0（与图37.18中的时序相同）。
2. 向SSICR.REN写入1后的1个PCLKB周期。*3

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于所有指定的清除条件。注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：

- 完成软件复位(SSIFCR.SSIRST=1)
- 读1后，写0完成
- 在将1写入SSICR.REN后经过1个PCLKB周期。

Note 3. After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags RUIRQ and ROIRQ in the SSISR register are cleared. However, if the SSISR register is read continuously, the cleared status of the reception error flags might be unreadable.

[Setting condition]

- Reading from SSIFRDR when it is empty.

[Setting timing]

- On completion of reading from SSIFRDR. See Figure 37.16.

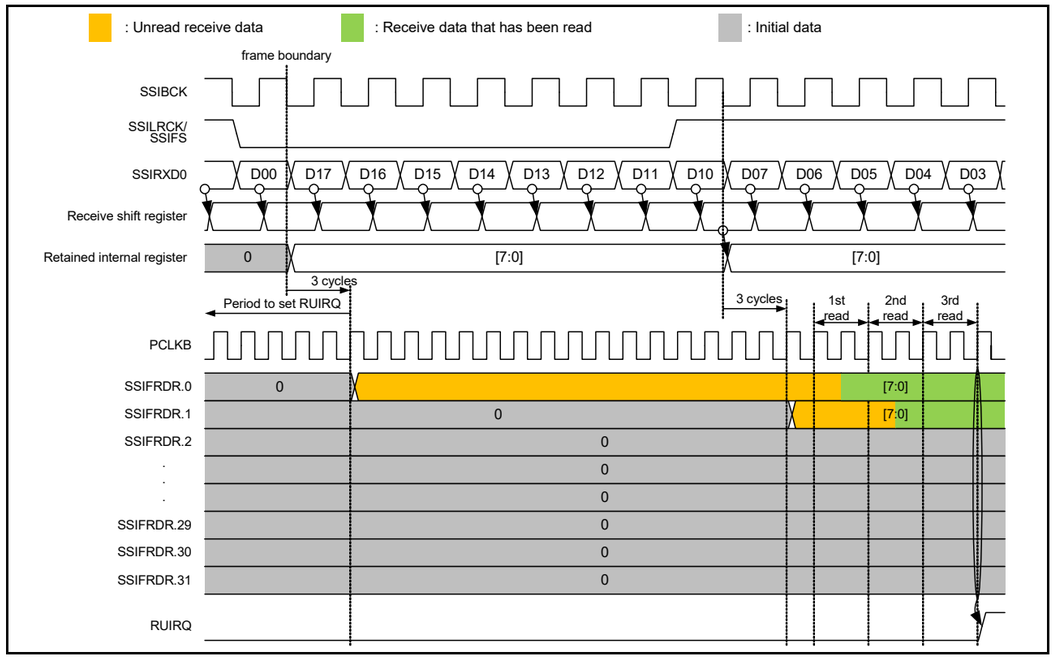

Figure 37.16 RUIRQ setting timing

TOIRQ bit (Transmit Overflow Error Status Flag)

TOIRQ is a status flag that indicates a transmit overflow error. This flag is set automatically but it must be cleared through register access. This flag indicates that an attempt was made to write data to the SSIFTDR register when the register is full. The data writing that causes a transmit overflow is ignored. For the procedure to recover from the overflow error, see section 37.6.6, Error Handling. This flag is not cleared by a Transmit FIFO Data Register Reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

- Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

1. On writing 0 to this bit after reading 1 from this bit.*2
2. On enabling communication (changing SSICR.TEN from 0 to 1).

注3.启用通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志
SSISR寄存器中的RUIRQ和ROIRQ被清零。但是，如果连续读取SSISR寄存器，则接收错误标志的清除状态可能无法读取。

[Setting condition]

- 为空时从SSIFRDR读取。

[Setting timing]

- 从SSIFRDR读取完成后。请参见图37.16。

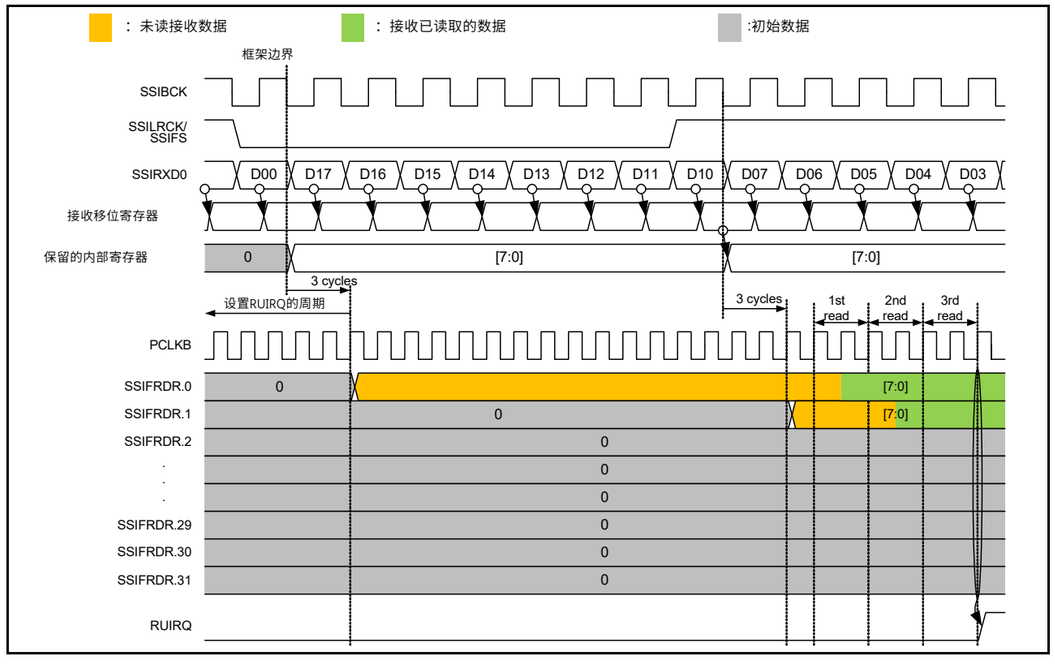

Figure 37.16 RUIRQ设置时序

TOIRQ位（发送溢出错误状态标志）

TOIRQ是指示传输溢出错误的状态标志。该标志自动设置，但必须通过寄存器访问清除。该标志表示当寄存器已满时尝试将数据写入SSIFTDR寄存器。导致发送溢出的数据写入将被忽略。有关从溢出错误中恢复的过程，请参阅第37.6.6节，错误处理。发送FIFO数据寄存器复位(SSIFCR.TFRST)不会清除该标志。

[设置和清除的优先顺序]

- 设置优先。*1

[Clearing condition]

完成以下任一操作时：

1. 在从该位读取1后向该位写入0。*2
2. 关于启用通信（将SSICR.TEN从0更改为1）。

RA生态工作室

[Clearing timing]

Clearing timing associated with the specified clearing condition:

1. On writing 0 to this bit after reading 1 from this bit (same as the timing in Figure 37.18).
2. After passage of 1 PCLKB cycle after writing 1 to SSICR.TEN.*3

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). Software reset has priority over all the specified clearing conditions.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:

- On a software reset (SSIFCR.SSIRST = 1)
- On writing 0 to this bit after reading 1 from this bit
- After passage of 1 PCLKB cycle after writing 1 to SSICR.TEN.

Note 3. After communication is enabled (by changing the value of the SSICR.TEN bit from 0 to 1), the transmission error flags, TOIRQ and TUIRQ in the SSISR register are cleared. However, if the SSISR register is read continuously, the cleared status of the transmission error flags might be unreadable.

[Setting condition]

- An attempt is made to write data to the SSIFTDR register when the register is full.

[Setting timing]

- On completion of writing to SSIFTDR. For details, see Figure 37.17.

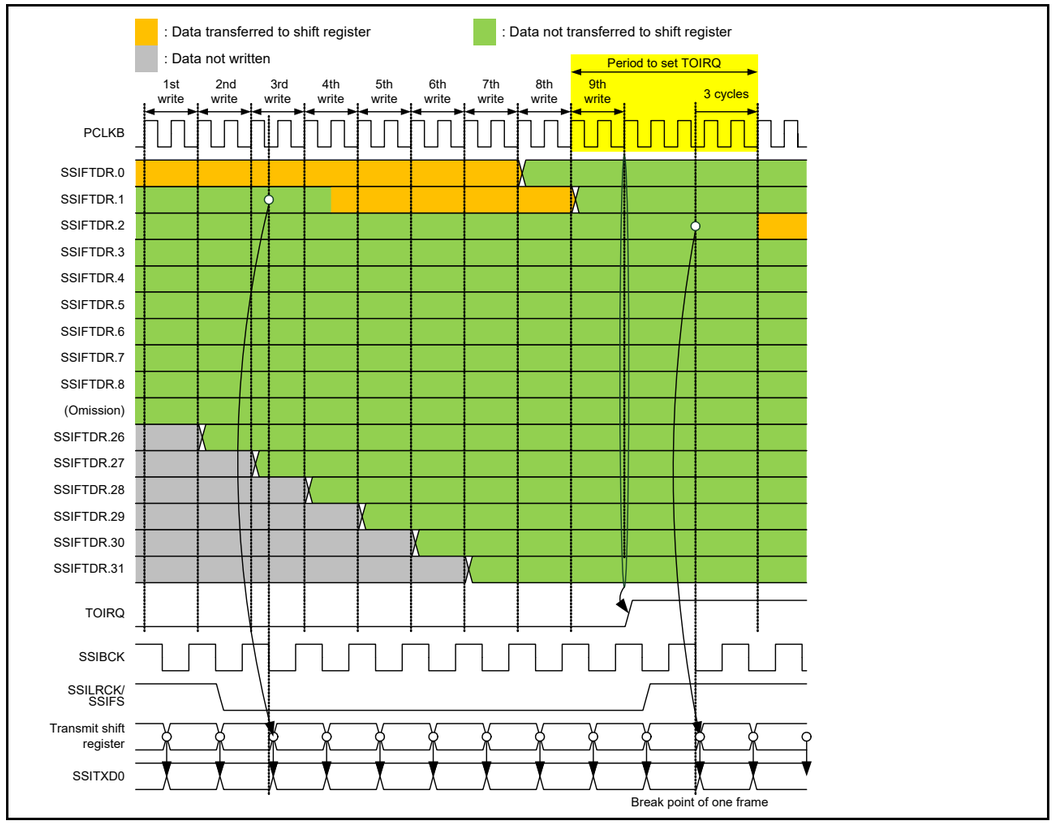

Figure 37.17 TOIRQ setting timing

[Clearing timing]

与指定清算条件相关的清算时机：

1. 在从该位读取1后向该位写入0（与图37.18中的时序相同）。
2. 在向SSICR.TEN写入1后经过1个PCLKB周期后。*3

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于所有指定的清除条件。注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：

- 软件复位时(SSIFCR.SSIRST=1)
- 从该位读取1后向该位写入0
- 在向SSICR.TEN写入1后经过1个PCLKB周期后。

注3.使能通信后（通过将SSICR.TEN位的值从0更改为1），SSISR寄存器中的传输错误标志TOIRQ和TUIRQ被清除。但是，如果连续读取SSISR寄存器，则传输错误标志的清除状态可能无法读取。

[Setting condition]

- 当寄存器已满时，将尝试将数据写入SSIFTDR寄存器。

[Setting timing]

- 完成对SSIFTDR的写入。详见图37.17。

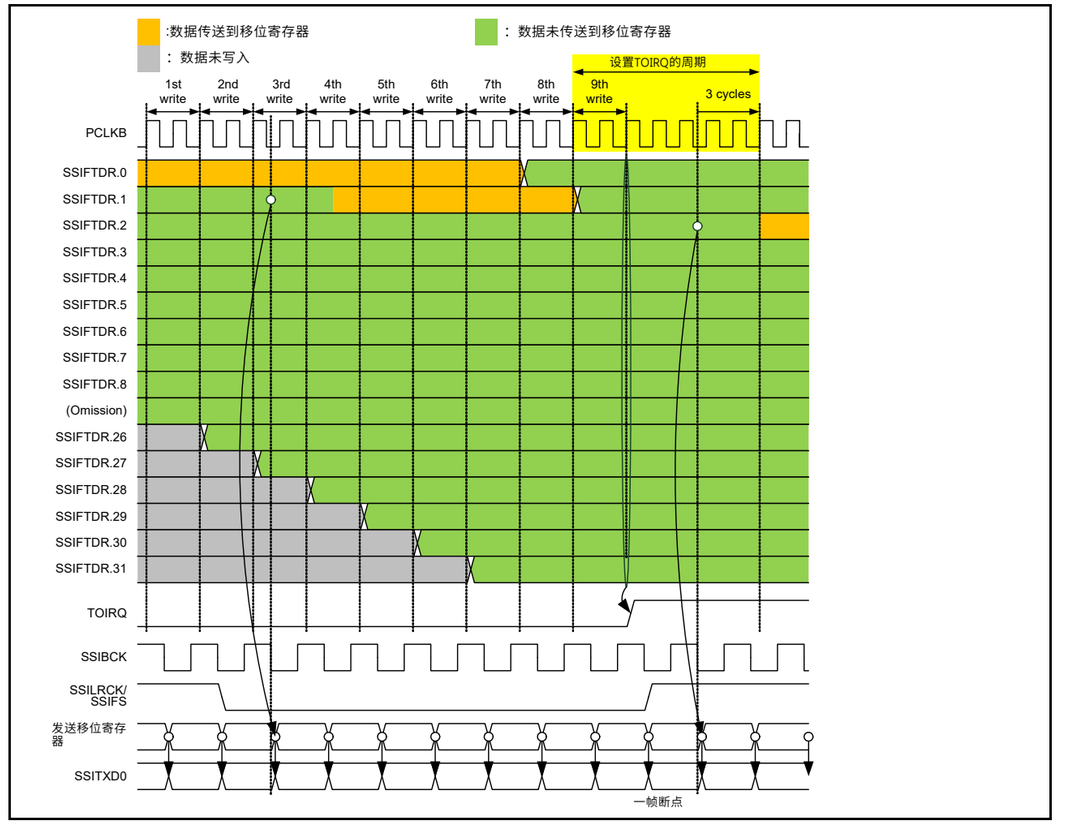

Figure 37.17 TOIRQ设置时序

TUIRQ flag (Transmit Underflow Error Status flag)

TUIRQ is a status flag that indicates a transmit underflow error. This flag is set automatically but must be cleared by register access. This flag indicates that writing the serial data required for a frame to SSIFTDR did not catch up with transmission of the frame. Even if this flag is cleared after it is set, the SSITXD0 output remains at 0. To output the data written to the Transmit FIFO Data Register (SSIFTDR) to the SSITXD0 pin, follow the communication stop procedure as shown in Figure 37.55 and the error-handling procedure in Figure 37.56. For the procedure to recover from an error, see section 37.6.6, Error Handling. This flag is not cleared by a Transmit FIFO Data Register Reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

1. On writing 0 to this bit after reading 1 from this bit.*2
2. Enabling communication (changing SSICR.TEN from 0 to 1).

[Clearing timing]

Clearing timing associated with the specified clearing condition:

1. On writing 0 to this bit after reading 1 from this bit.
2. After 1 PCLKB cycle elapses after writing 1 to SSICR.TEN.*3

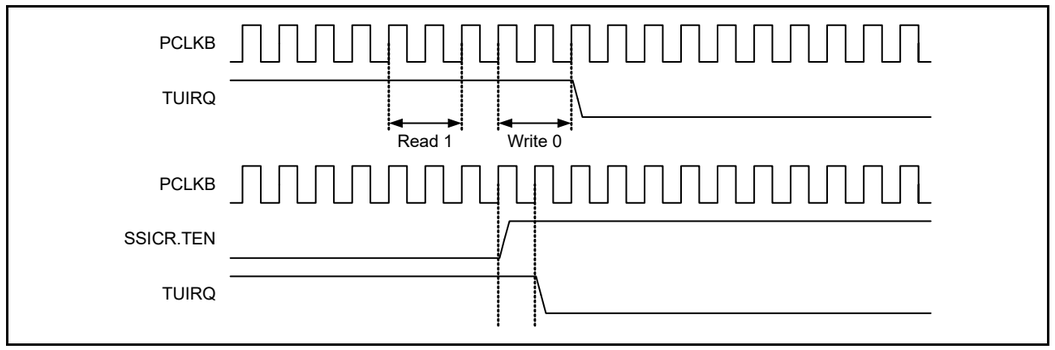

Figure 37.18 TUIRQ clearing timing

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). Software reset has priority over all the specified clearing conditions.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:

- A software reset (SSIFCR.SSIRST = 1) is done
- After 1 is read, writing of 0 is complete
- 1 PCLKB cycle elapses after writing 1 to SSICR.TEN.

Note 3. After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. However, if the SSISR register is read continuously, the cleared status of the transmission error flags might be unreadable.

[Setting condition]

- When the communication continues over a frame boundary, the transmit data required for the next frame has not been written to SSIFTDR. For details, see Figure 37.19 and Figure 37.20.

[Setting timing]

- 3 PCLKB cycles after the frame boundary. For details, see Figure 37.19.

TUIRQ标志（发送下溢错误状态标志）

TUIRQ是指示发送下溢错误的状态标志。该标志自动设置，但必须通过寄存器访问清除。该标志表示将帧所需的串行数据写入SSIFTDR没有赶上帧的传输。即使该标志在设置后被清除，SSITXD0输出仍保持为0。要将写入发送FIFO数据寄存器(SSIFTDR)的数据输出到SSITXD0引脚，请按照图37.55所示的通信停止程序和错误——处理过程如图37.56所示。有关从错误中恢复的过程，请参阅第37.6.6节，错误处理。发送FIFO数据寄存器复位(SSIFCR.TFRST)不会清除该标志。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

完成以下任一操作时：

1. 在从该位读取1后向该位写入0。*2
2. 启用通信（将SSICR.TEN从0更改为1）。

[Clearing timing]

与指定清算条件相关的清算时机：

1. 在从该位读取1后向该位写入0。
2. 在向SSICR.TEN写入1后经过1个PCLKB周期后。*3

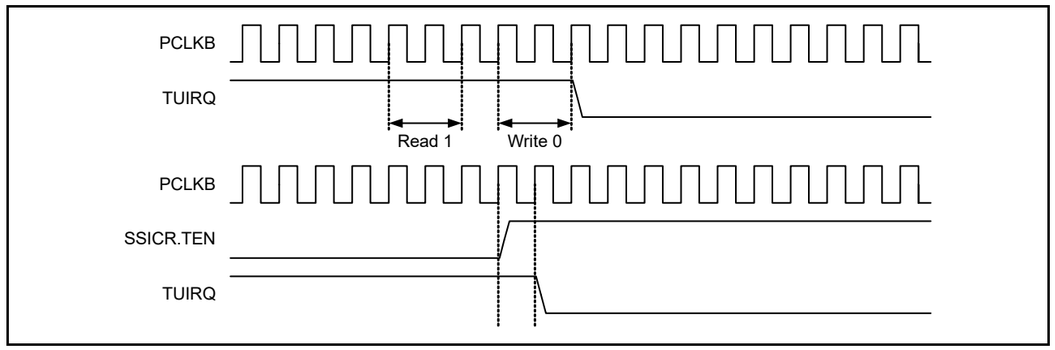

Figure 37.18 TUIRQ清零时机

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于所有指定的清除条件。注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：

- 完成软件复位(SSIFCR.SSIRST=1)
- 读1后，写0完成
- 向SSICR.TEN写入1后经过1个PCLKB周期。

注3.启用通讯后（通过将SSICR.TEN位的值从0更改为1），传输错误
标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则传输错误标志的清除状态可能无法读取。

[Setting condition]

- 当通信在帧边界上继续时，下一帧所需的传输数据尚未写入SSIFTDR。详见图37.19和图37.20。

[Setting timing]

- 帧边界后3个PCLKB周期。详见图37.19。

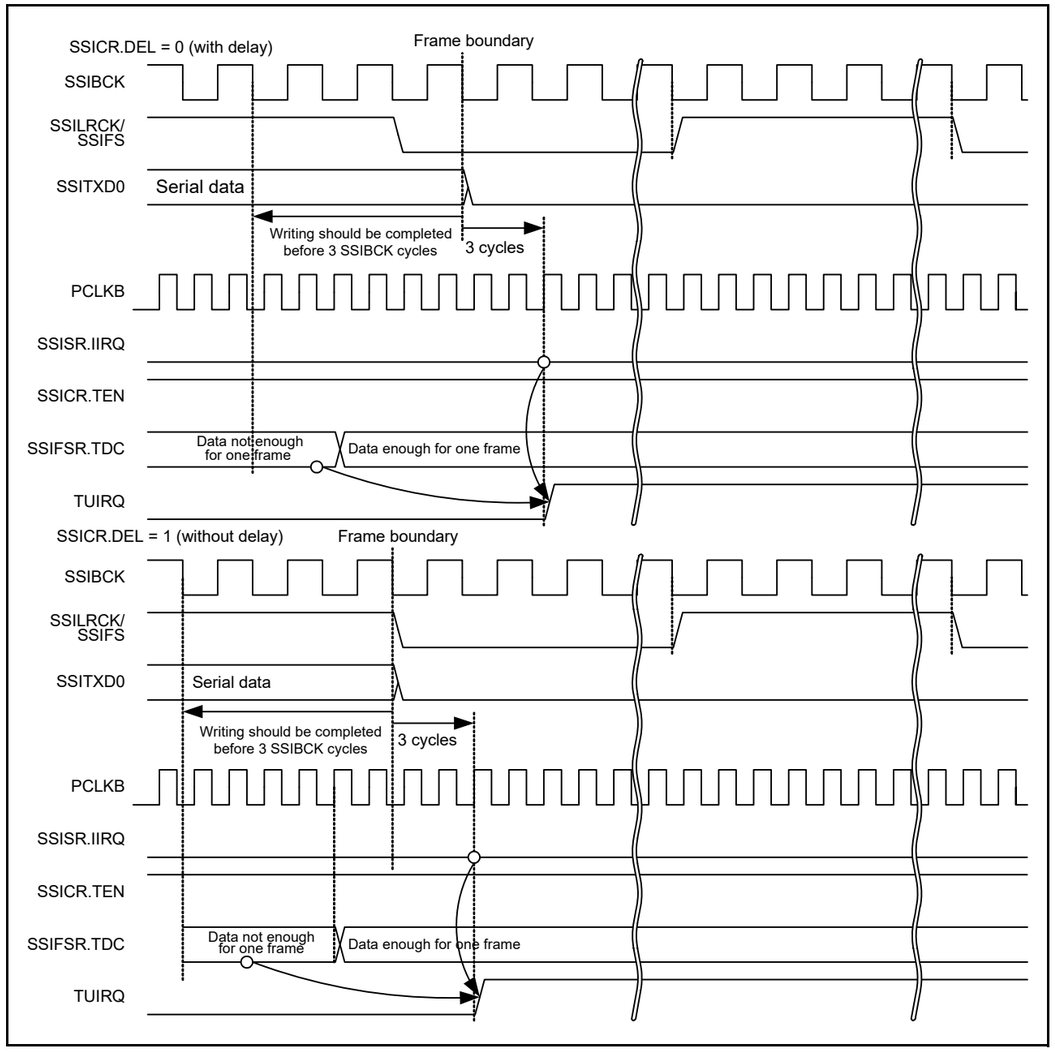

Figure 37.19 TUIRQ setting timing when communication continues

b30 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31	AUCKE	AUDIO_MCK Enable in Master Mode Communication*1	0: Disable supply of AUDIO_MCK 1: Enable supply of AUDIO_MCK.	R/W

Note 1. Writing to these bits is prohibited while SSIE is in a communication state (SSISR.IIRQ = 0). If the value of these bits is changed by rewriting, subsequent operation is unpredictable.

The SSIFCR register sets a software reset, byte swap, and enabling or disabling of interrupt requests.

RFRST bit (Receive FIFO Data Register Reset*1)

The RFRST bit sets a software reset of the Receive FIFO Data Register (SSIFRDR). Writing 1 to this bit initializes the internal state related to SSIFRDR. The register bits subject to the software reset triggered by this bit are indicated by the shading in Table 37.5. Because this bit is not automatically cleared after it is set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

This bit is subject to the software reset by the SSIRST bit. Because the software reset by the SSIRST bit has priority over the reset by this bit, setting this bit is ignored when the SSIRST bit is set.

注1.当SSIE处于通信状态(SSISR.IIRQ=0)时，禁止写入这些位。如果这些位的值通过重写而改变，后续的操作是不可预知的。SSIFCR寄存器设置软件复位、字节交换以及中断请求的启用或禁用。

RFRST位（接收FIFO数据寄存器复位*1）

RFRST位设置接收FIFO数据寄存器(SSIFRDR)的软件复位。向该位写入1初始化与SSIFRDR相关的内部状态。受该位触发的软件复位的寄存器位由表37.5中的阴影表示。由于该位在设置后不会自动清零，因此向该位写入0可解除软件复位中的寄存器位。向该位写入0后，请务必在开始下一个程序步骤之前检查该位是否为0。

该位受SSIRST位软件复位的影响。由于SSIRST位的软件复位优先于该位的复位，所以当SSIRST位置位时，该位的设置将被忽略。

TFRST bit (Transmit FIFO Data Register Reset*1)

The TFRST bit sets a software reset of the Transmit FIFO Data Register (SSIFTDR). Writing 1 to this bit initializes the internal state of the SSIFTDR register. The register bits subject to the software reset triggered by this bit are indicated by the shading in Table 37.6. Because this bit is not automatically cleared after it is set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that it is 0 before starting the next procedural step.

This bit is subject to a software reset by the SSIRST bit. Because the software reset by the SSIRST bit has priority over the reset by this bit, this bit setting is ignored when the SSIRST bit is set.

RIE bit (Receive Data Full Interrupt Output Enable)

The RIE bit enables or disables output of receive data full interrupts. Use a receive data full interrupt as an interrupt to trigger data reading from the Receive FIFO Data Register. Write 1 to this bit after specifying the setting condition for receive data full interrupt (using the SSISCR.RDFS[4:0] bit). Figure 37.21 shows the timing for generating the receive data full interrupt.

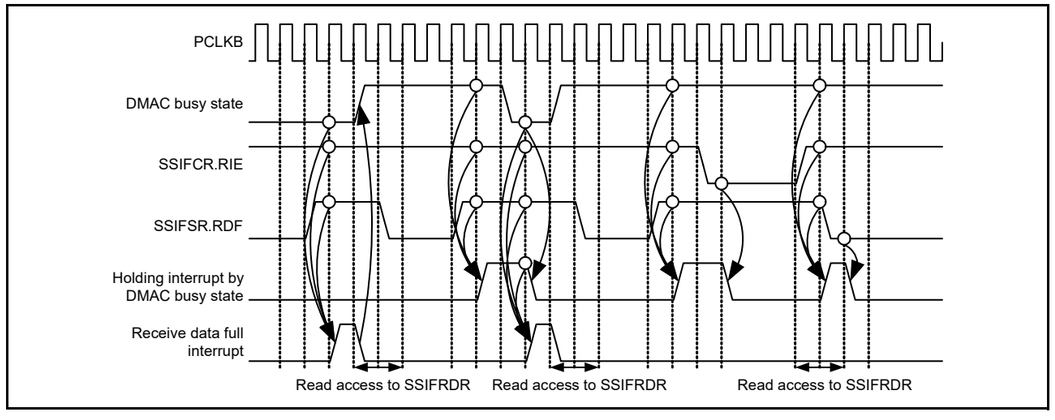

Figure 37.21 Timing of receive data full interrupt

		+2	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				

RIE位（接收数据满中断输出使能）

RIE位启用或禁用接收数据满中断的输出。使用接收数据满中断作为中断来触发从接收FIFO数据寄存器读取数据。在指定接收数据满中断的设置条件后（使用SSISCR.RDFS[4:0]位）向该位写入1。图37.21显示了产生接收数据满中断的时序。

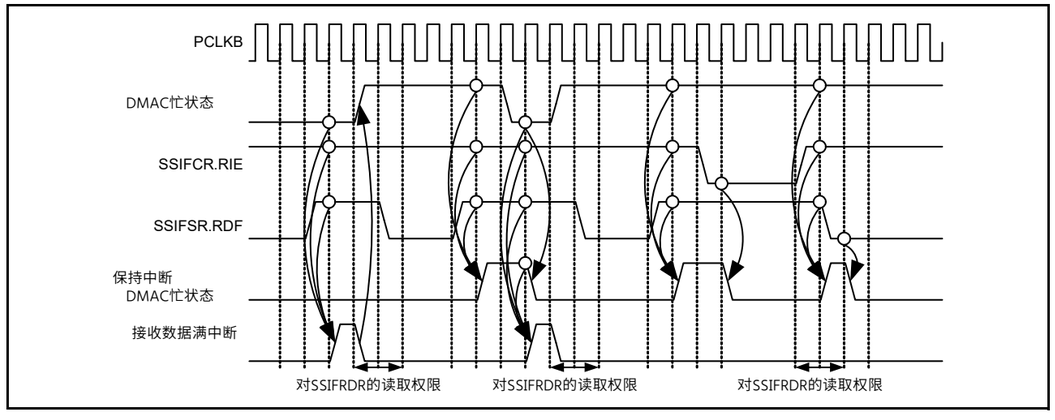

Figure 37.21 接收数据满中断的时序

TIE bit (Transmit Data Empty Interrupt Output Enable)

The TIE bit enables or disables the output of transmit data empty interrupts. Use a transmit data empty interrupt as an interrupt to trigger data writing to the transmit FIFO data register. Write 1 to this bit after specifying the setting condition for transmit data empty interrupt (using the SSISCR.TDES[4:0] bit). Figure 37.22 shows the timing for generating the transmit data empty interrupt.

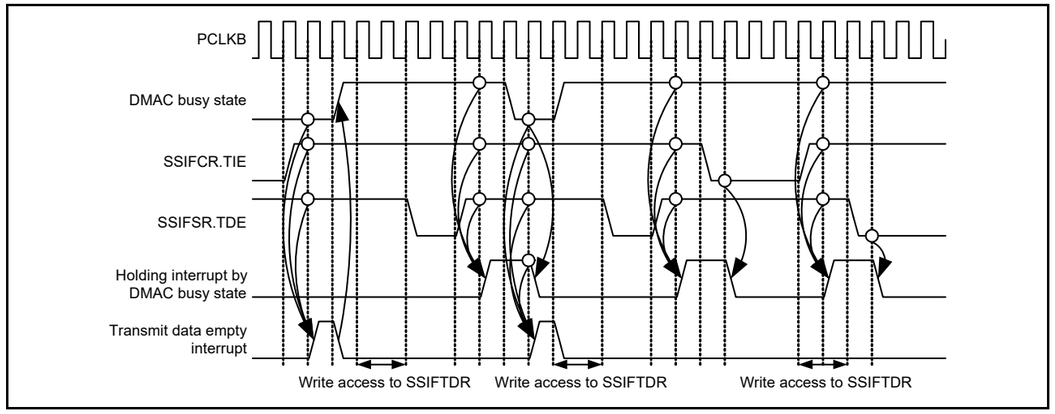

Figure 37.22 Timing of transmit data empty interrupt

BSW bit (Byte Swap Enable*1)

The BSW bit enables or disables the byte swap for register access to the Transmit FIFO Data Register (SSIFTDR) and the Receive FIFO Data Register (SSIFRDR). This bit is valid only with 16-bit access or 32-bit access to SSIFTDR and SSIFRDR. For details, see Figure 37.23.

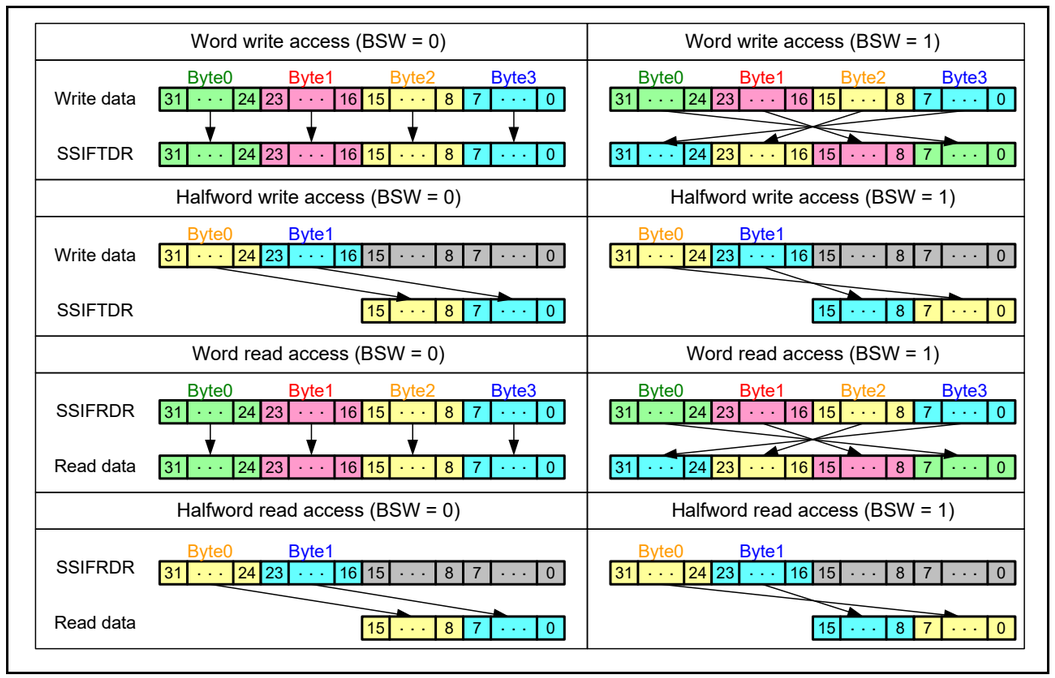

Figure 37.23 Operation example of byte swap

TIE位（发送数据空中断输出使能）

TIE位启用或禁用发送数据空中断的输出。使用发送数据空中断作为中断来触发数据写入发送FIFO数据寄存器。在指定发送数据空中断的设置条件后（使用SISSCR.TDES[4:0]位）向该位写入1。图37.22显示了产生发送数据空中断的时序。

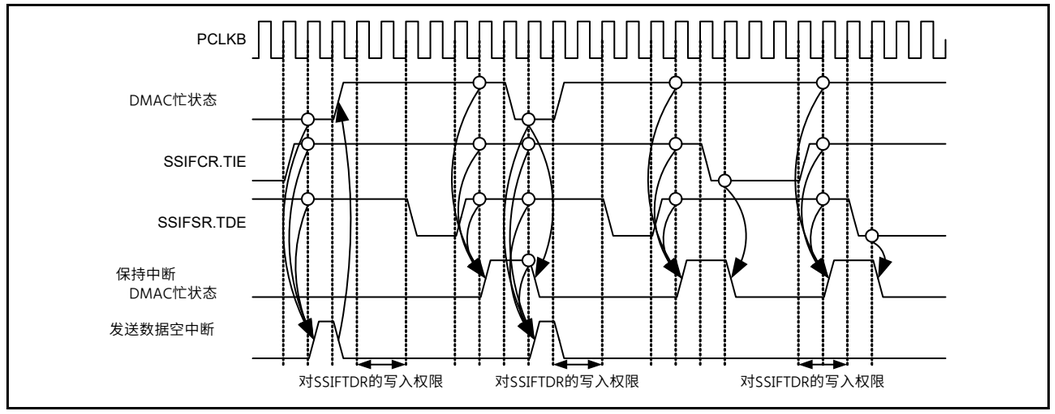

Figure 37.22 发送数据空中断的时序

BSW位（字节交换使能*1）

BSW位启用或禁用寄存器访问发送FIFO数据寄存器(SSIFTDR)和接收FIFO数据寄存器(SSIFRDR)的字节交换。该位仅对SSIFTDR和SSIFRDR的16位访问或32位访问有效。详见图37.23。

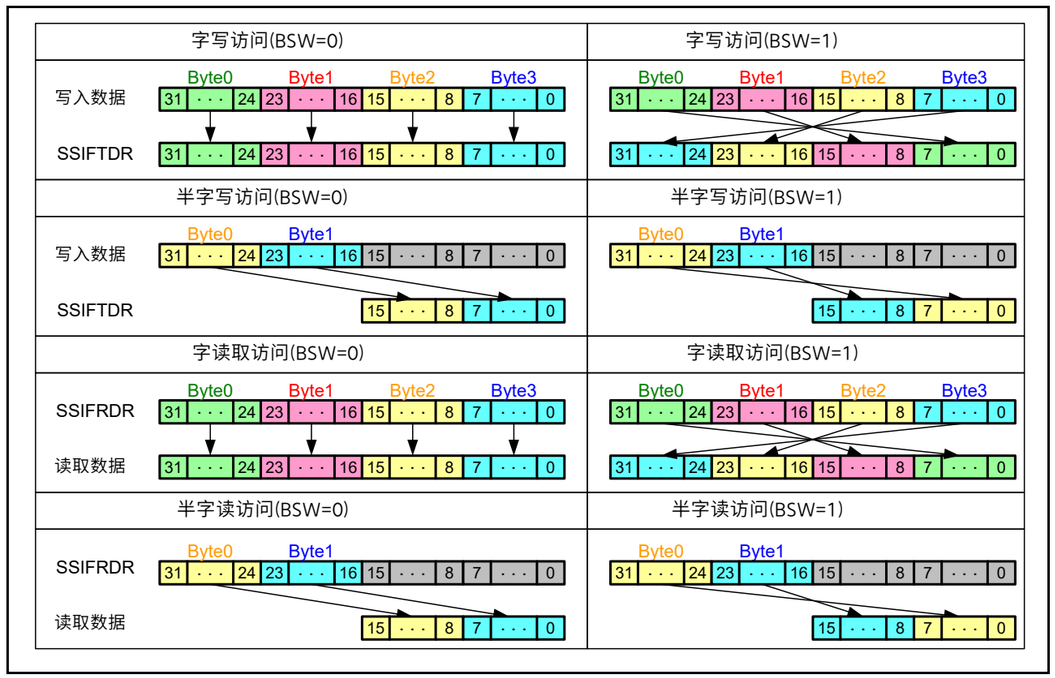

Figure 37.23 字节交换操作示例

SSIRST bit (Software Reset)

The SSIRST bit sets a software reset of the SSIE. Writing 1 to this bit initializes the internal state of the SSIE. The register bits subject to the software reset triggered by this bit are indicated by the shading in Table 37.7. Because this bit is not automatically cleared after it is set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that it is 0 before starting the next procedural step.

To stop SSIE communication immediately, after turning off the peripheral functions, write 1 to this bit. Initialization by a software reset is performed without any relation to the bit clock.

AUCKE bit (AUDIO_MCK Enable in Master Mode Communication*1)

The AUCKE bit enables or disables the supply to AUDIO_MCK while in master mode communication (MST = 1).

Changing the value of this bit must be performed only after specifying the settings related to AUDIO_MCK (using the CKS, MST, BCKP, and CKDV bits in the SSICR register).

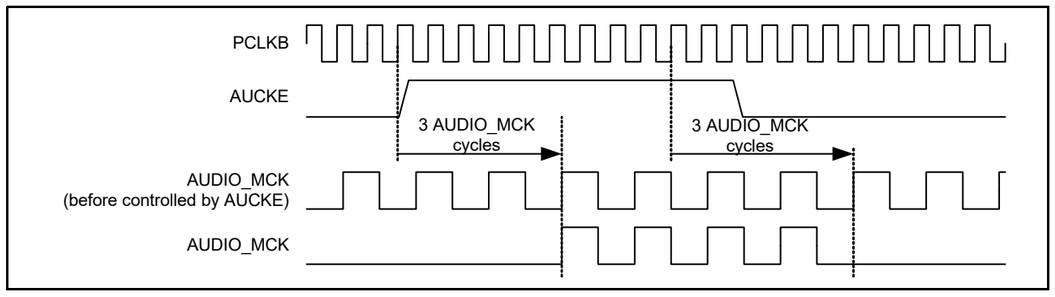

Figure 37.24 Stop/resume of AUDIO_MCK

SSIRST位（软件复位）

SSIRST位设置SSIE的软件复位。向该位写入1初始化SSIE的内部状态。受该位触发的软件复位的寄存器位由表37.7中的阴影表示。由于该位在设置后不会自动清零，因此向该位写入0可解除软件复位中的寄存器位。向该位写入0后，请务必在开始下一个程序步骤之前检查它是否为0。

要立即停止SSIE通信，请在关闭外设功能后，向该位写入1。通过软件复位进行的初始化与位时钟无关。

AUCKE位（AUDIO_MCK在主模式通信中启用*1）

在主模式通信(MST=1)时，AUCKE位启用或禁用对AUDIO_MCK的供电。

只有在指定与AUDIO_MCK相关的设置后才能更改该位的值（使用SSICR寄存器中的CKS、MST、BCKP和CKDV位）。

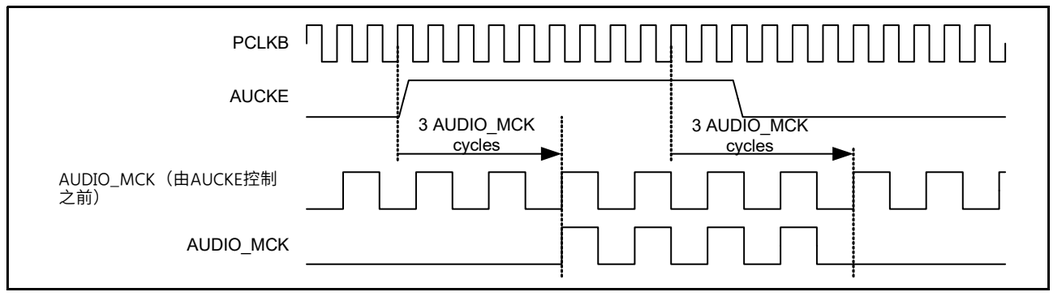

Figure 37.24 Stop/resume of AUDIO_MCK

RA生态工作室

Note: In slave mode communication (SSICR.MST = 0), SSIE requires the supply of SSIBCK. To stop BCK on the master side, make sure that SSIE is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIE becomes idle, use the procedure to start communication in Figure 37.51 or wait for an idle state using the procedure to resume communication in Figure 37.57.
In master mode communication (SSICR.MST = 1), SSIE operates with the audio clock (AUDIO_MCK). To stop SSIE completely, make sure that SSIE is in the idle state (SSISR.IIRQ = 1), then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIE becomes idle, use the procedure to start communication in Figure 37.51.

Figure 37.25 and Figure 37.26 show the timings of signal operation in the period from setting this bit to 1 to the output to the SSIBCK pin.

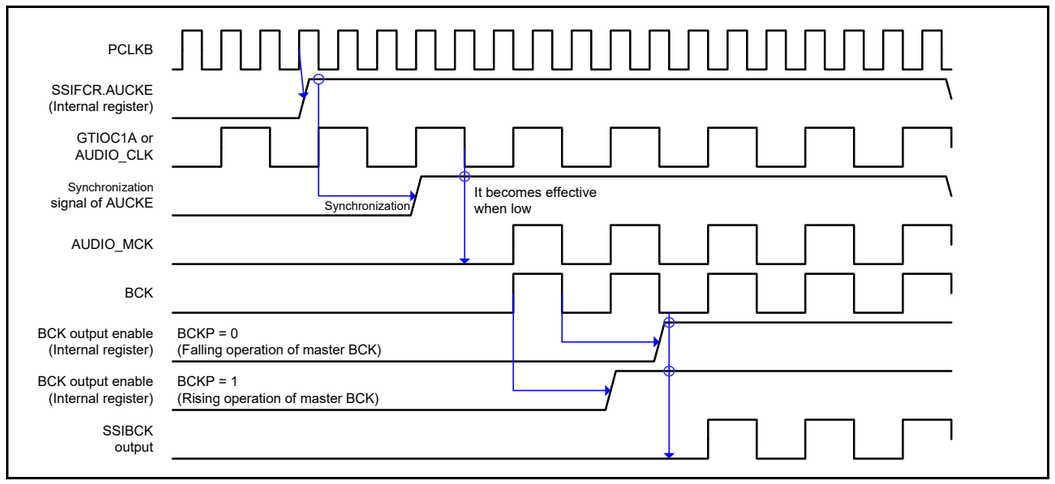

Figure 37.25 Timing diagram for operation from system reset to start of master mode communication

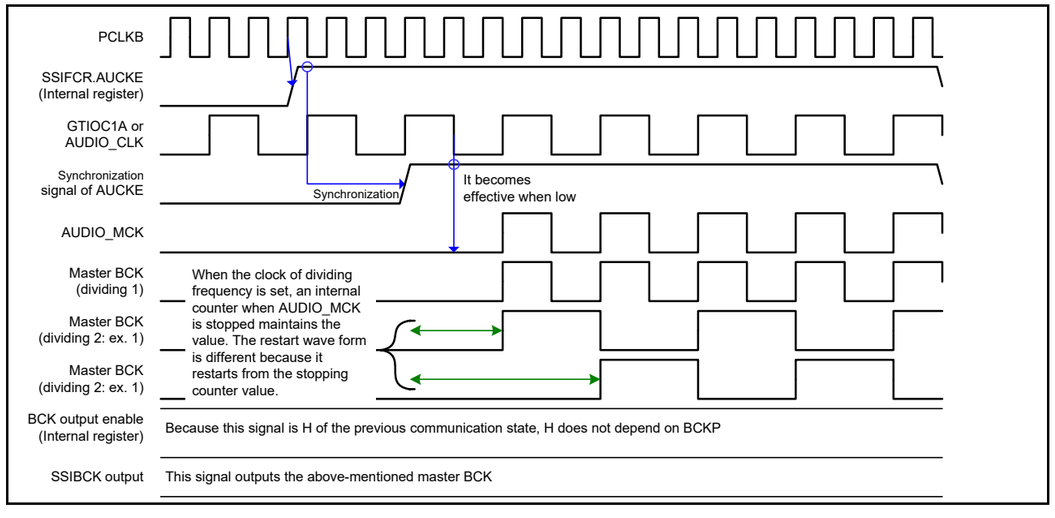

Figure 37.26 Timing diagram for operation from stopping communication to starting master mode communication

Note: If the supply of AUDIO_MCK stops, the value of the SSIBCK pin is held. Therefore, the SSIBCK signal might stop at the H (high-level) state.

Note: 在从机模式通信（SSICR.MST=0）中，SSIE需要提供SSIBCK。要在主设备端停止BCK，请确保SSIE处于空闲状态(SSISR.IIRQ=1)。如果BCK在SSIE空闲之前停止，则使用图37.51中的程序开始通信或使用图37.57中的程序恢复通信等待空闲状态。在主模式通信(SSICR.MST=1)中，SSIE使用音频时钟(AUDIO_MCK)运行。停止

SSIE完全，确保SSIE处于空闲状态（SSISR.IIRQ=1），然后将0写入SSIFCR.ADCKE。如果在SSIE空闲之前将0写入SSIFCR.ADCKE，则使用图37.51中的过程开始通信。

图37.25和图37.26显示了从将该位设置为1到输出到SSIBCK引脚期间的信号操作时序。

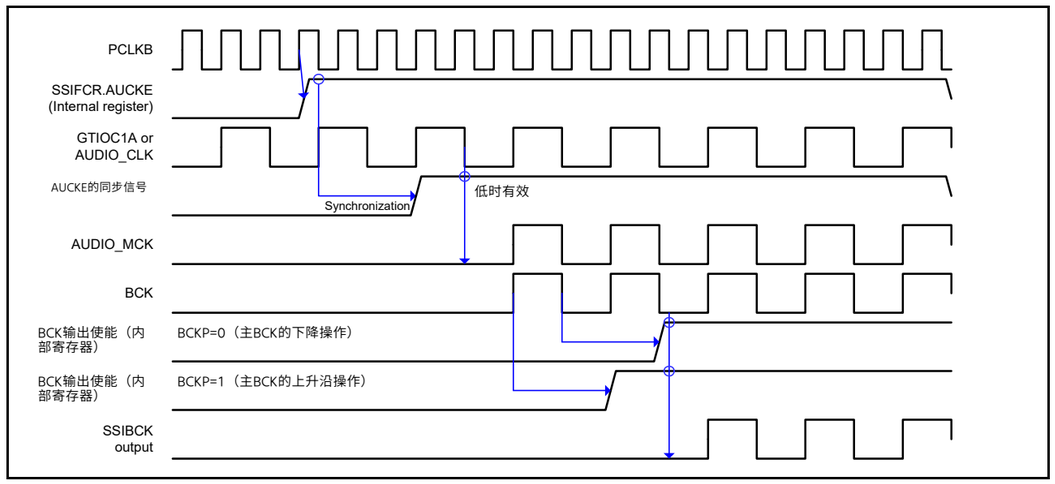

Figure 37.25 从系统复位到主模式通信开始的时序图

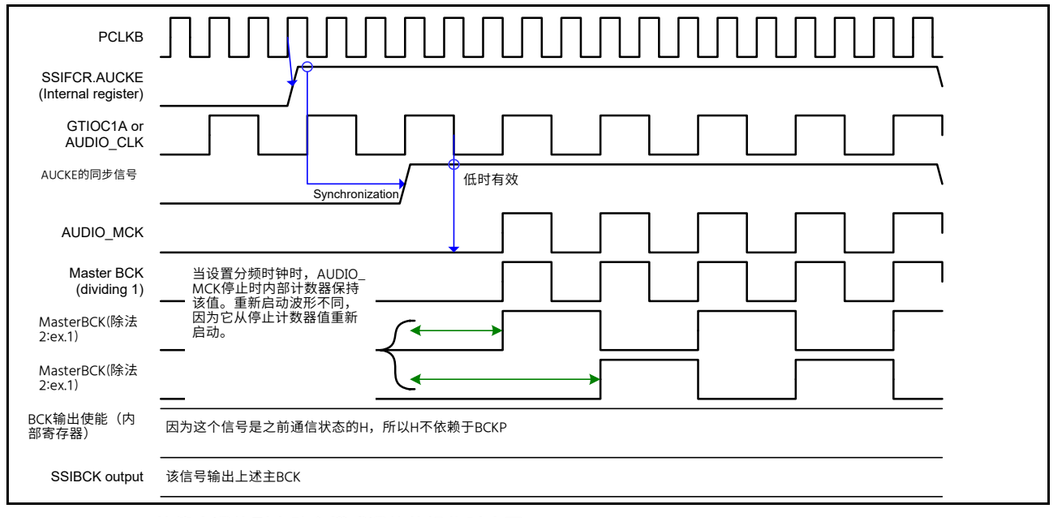

Figure 37.26 从停止通信到启动主模式通信的操作时序图

Note: 如果停止提供AUDIO_MCK，则保持SSIBCK引脚的值。因此，SSIBCK信号可能会停止在H（高电平）状态。

37.2.4 FIFO Status Register (SSIFSR)

b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SSIFSR register is configured with status flags that indicate the status of the Transmit FIFO Data Register and the Receive FIFO Data Register.

RDF flag (Receive Data Full Flag)

The RDF flag indicates that the Receive FIFO Data Register (SSIFRDR) has unread received data not less than the amount set in the SSISCR.RDFS[4:0] bit plus one. This flag is set automatically but must be cleared through register access.

[Priority order for setting and clearing]

- Clearing is prioritized.

[Clearing condition]

When either of the following two conditions are satisfied:*1

1. On writing 0 to this flag after 1 is read (CPU operation).*2
2. At the last access (DTC or DMAC operation) to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

[Clearing timing]

Clearing timing associated with the specified clearing condition:

1. On writing 0 to this flag after 1 is read (same as the timing in Figure 37.18).
2. After the PCLKB cycle in which the last access instruction is issued to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

37.2.4 FIFO状态寄存器(SSIFSR)

SSIFSR寄存器配置有状态标志，指示发送FIFO数据寄存器的状态和
接收FIFO数据寄存器。

RDF标志（接收数据满标志）

RDF标志表示接收FIFO数据寄存器(SSIFRDR)的未读接收数据不少于SSISCR.RDFS[4:0]位中设置的数量加一。
该标志自动设置，但必须通过寄存器访问清除。

[设置和清除的优先顺序]

- 清算优先。

[Clearing condition]

当满足以下两个条件之一时：*1

1. 在读取1后向该标志写入0（CPU操作）。*2
2. 在最后一次访问（DTC或DMAC操作）通过使用DTC的中断例程从SSIFRDR读取数据时，
DMAC.

[Clearing timing]

与指定清算条件相关的清算时机：

1. 在读取1后向该标志写入0（与图37.18中的时序相同）。
2. 在发出最后一个访问指令以通过使用DTC和DMAC的中断例程从SSIFRDR读取数据的PCLKB周期之后。

Note 1. These flags are cleared by a software reset (SSIFCR.SSIRST = 1) and Receive FIFO Data Register Reset (SSIFCR.RFRST = 1). In addition to the software reset and Receive FIFO Data Register reset, these flags can also be reset using the clearing conditions described in this section.

Note 2. After reading 1 from this flag, this flag is cleared when one of the following four conditions is met:
- On a software reset (SSIFCR.SSIRST = 1)
- On a Receive FIFO Data Register reset (SSIFCR.RFRST = 1)
- On writing 0 after 1 is read
- After the last access is performed to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

[Setting condition]

- SSIFRDR has data not less than the amount set in the SSISCR.RDFS[4:0] bit plus one.

[Setting timing]

- On completion of transfer from the shift register that results in SSIFRDR having data not less than the amount set in the SSISCR.RDFS[4:0] bit plus one.

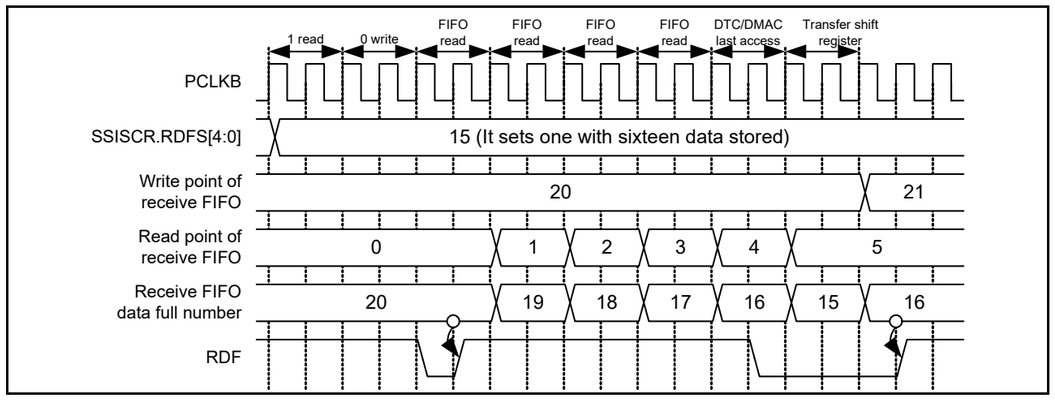

Figure 37.27 Timing diagram for setting and clearing RDF

RDC[5:0] flags (Number of Receive FIFO Data Indication Flag)

The RDC[5:0] flags indicate the amount of valid data stored in the Receive FIFO Data Register (SSIFRDR). When this flag is 0h, there is no received data. When this flag is 20h, the register is filled with received data and there is no free space.

TDE flag (Transmit Data Empty Flag)

The TDE flag indicates that the Transmit FIFO Data Register (SSIFTDR) has free space not less than the amount set with the SSIFCR.TTRG bit plus one. This flag is set automatically but must be cleared through register access.

[Priority order for setting and clearing]

- Clearing is prioritized.*1

[Clearing condition]

When either of the following two conditions are satisfied.

1. On writing 0 to this flag after 1 is read (CPU operation).*2
2. At the last access (DTC or DMAC operation) to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

[Clearing timing]

Clearing timing associated with the specified clearing condition:

1. On writing 0 to this flag after 1 is read (same as the timing in Figure 37.18).

注1.这些标志由软件复位(SSIFCR.SSIRST=1)和接收FIFO数据寄存器复位清除（SSIFCR.RFRST=1）。除了软件复位和接收FIFO数据寄存器复位，这些标志也可以使用本节中描述的清除条件进行复位。
注2.从该标志读取1后，当满足以下四个条件之一时，该标志被清除：在软件复位时(SSIFCR.SSIRST=1)在接收FIFO数据寄存器复位时(SSIFCR.RFRST=1)在在读取1后写入0在执行最后一次访问以通过使用DTC和DMAC的中断例程从SSIFRDR读取数据之后。

[Setting condition]

- SSIFRDR的数据不小于SISSCR.RDFS[4:0]位中设置的数量加一。

[Setting timing]

- 完成从移位寄存器的传输后，导致SSIFRDR的数据不小于SSISCR.RDFS[4:0]位中设置的数量加一。

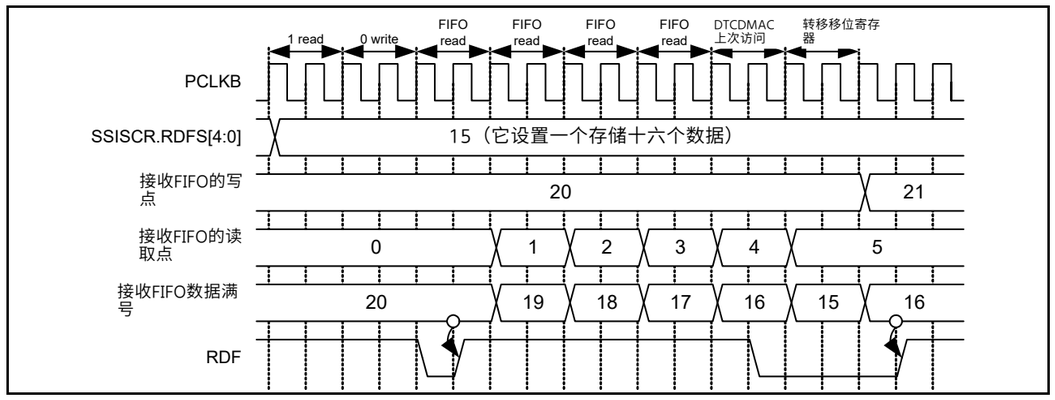

Figure 37.27 设置和清除RDF的时序图

RDC[5:0]flags（接收FIFO数据指示标志数）

RDC[5:0]标志指示存储在接收FIFO数据寄存器(SSIFRDR)中的有效数据量。当该标志为0h时，没有接收到数据。当该标志位为20h时，寄存器被接收到的数据填满，没有空闲空间。

TDE标志（传输数据空标志）

TDE标志表示发送FIFO数据寄存器(SSIFTDR)的可用空间不少于SSIFCR.TTRG位设置的数量加一。该标志自动设置，但必须通过寄存器访问清除。

[设置和清除的优先顺序]

- 清算优先。*1

[Clearing condition]

当满足以下两个条件之一时。

1. 在读取1后向该标志写入0（CPU操作）。*2
2. 在最后一次访问（DTC或DMAC操作）通过使用DTC的中断例程将数据写入SSIFTDR和DMAC.

[Clearing timing]

与指定清算条件相关的清算时机：

1. 在读取1后向该标志写入0（与图37.18中的时序相同）。

RA生态工作室

2. At the last access (DTC or DMAC operation) to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

Note 1. This flag is cleared by a software reset (SSIFCR.SSIRST = 1) and Transmit FIFO Data Register Reset (SSIFCR.TFRST = 1). The software reset and Transmit FIFO Data Register Reset have priority over all the specified clearing conditions.

Note 2. After reading 1 from this flag, this flag is cleared when one of the following four conditions is met:
- On a software reset (SSIFCR.SSIRST = 1)
- On a Transmit FIFO Data Register Reset (SSIFCR.TFRST = 1)
- On writing 0 after 1 is read
- At the last access to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

[Setting condition]

- SSIFTDR has free space that is not less than the amount set with the SSIFCR.TTRG bit plus one.

[Setting timing]

- While operating on PCLKB, SSIFTDR is found to have free space that is not less than the value set in the SSISCR.TDES[4:0] bits + 1.

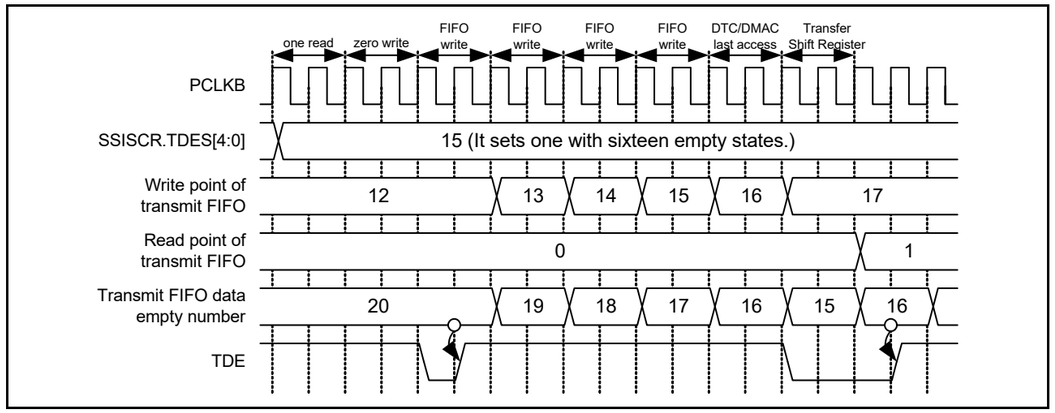

Figure 37.28 Timing diagram for setting and clearing TDE

TDC[5:0] flags (Number of Transmit FIFO Data Indication Flag)

The TDC[5:0] flags indicate the amount of valid data stored in the Transmit FIFO Data Register (SSIFTDR). When this flag is 0h, there is no data to be transmitted. When this flag is 20h, there is no space to write data.

2. 在最后一次访问（DTC或DMAC操作）通过使用DTC的中断例程将数据写入SSIFTDR和DMAC.

注1.该标志由软件复位(SSIFCR.SSIRST=1)和发送FIFO数据寄存器复位清除（SSIFCR.TFRST=1）。软件复位和发送FIFO数据寄存器复位优先于所有指定的清除条件。注2.从该标志读取1后，当满足以下四个条件之一时，该标志被清除：软件复位(SSIFCR.SSIRST=1)发送FIFO数据寄存器复位(SSIFCR.TFRST=1)在读取1后写入0在最后一次访问时，通过使用DTC和DMAC的中断例程将数据写入SSIFTDR。

[Setting condition]

- SSIFTDR的可用空间不小于用SSIFCR.TTRG位设置的数量加一。

[Setting timing]

- 在PCLKB上运行时，发现SSIFTDR具有不小于在SSISCR.TDES[4:0] bits + 1.

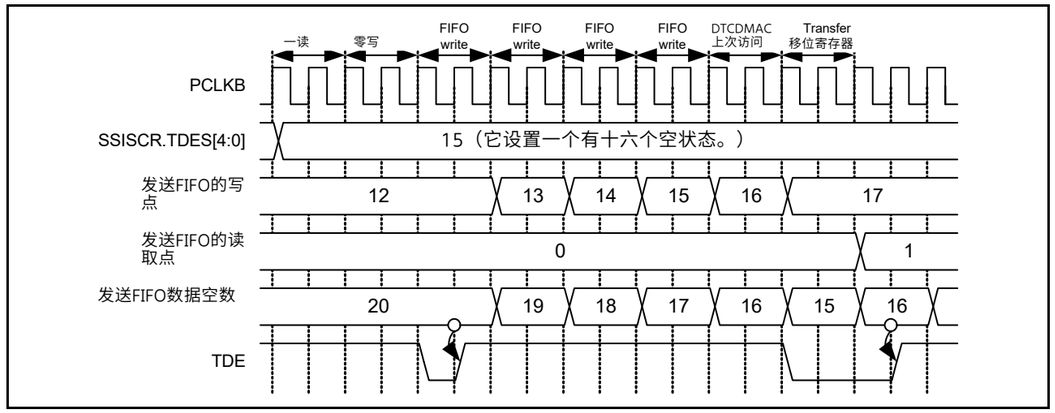

Figure 37.28 设置和清除TDE的时序图

TDC[5:0]flags（发送FIFO数据指示标志数）

TDC[5:0]标志指示存储在发送FIFO数据寄存器(SSIFTDR)中的有效数据量。当该标志为0h时，没有数据要发送。当该标志位为20h时，没有空间写入数据。

	—	—	—	—	—	—	BCKASTP	LRCONT	—	—	—	—	—	—	OMOD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	OMOD[1:0]	Audio Format Select*3, *4	00: I²S format 01: TDM format 10: Monaural format 11: Setting prohibited.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	LRCONT	Enable LRCK/FS Continuation *1, *2	0: Disable LRCK/FS continuation 1: Enable LRCK/FS continuation.	R/W
b9	BCKASTP	Enable Stopping BCK Output When SSIE is in Idle Status*1, *2	0: Always output BCK to the SSIBCK pin 1: Automatically control output of BCK to the SSIBCK pin.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is valid only in master mode communication (SSICR.MST = 1). The setting is invalid in slave mode communication (SSICR.MST = 0).
Note 2. The BCKASTP and LRCONT bits must not be set to 1 simultaneously.
Note 3. While SSIE is communicating (SSISR.IIRQ = 0), writing to these bits is prohibited. If the value in these bits is changed by writing, subsequent operation is unpredictable.
Note 4. When communicating with an other-party device that has an SSIE-compatible communication format, specify and use the communication format that enables communication.

The SSIOFR register sets an audio format, which involves the settings of communication format, LR clock/frame synchronization continuation mode, and BCK output stop.

OMOD[1:0] bits (Audio Format Select*3, *4)

The OMOD[1:0] bits select an audio format. Write to these bits when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details on LR clock output, see the description of the LRCONT bit in section 37.2.7, Audio Format Register (SSIOFR).

LRCONT bit (Enable LRCK/FS Continuation)

The LRCONT bit enables or disables the output from the SSILRCK/SSIFS pin in master mode (SSICR.MST = 1) when SSIE is in an idle state (SSISR.IIRQ = 1).

Even in the idle state, a signal can be output from the SSILRCK/SSIFS pin when this bit is set to 1 (to enable LR clock/frame synchronization continuation) in master mode (SSICR.MST = 1).

37.2.7 音频格式寄存器(SSIOFR)

Address(es): SSIE0.SSIOFR 4004 E020h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	BCKASTP	LRCONT	—	—	—	—	—	—	OMOD[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	OMOD[1:0]	音频格式选择*3 *4	00：I2S格式01：TDM格式10：单声道格式11：禁止设置。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	LRCONT	启用LRCKFS继续*1 *2	0：禁止LRCKFS延续1：使能LRCKFS延续。	R/W
b9	BCKASTP	当SSIE处于空闲状态时使能停止BCK输出*1 *2	0：始终向SSIBCK引脚输出BCK1：自动控制向SSIBCK引脚输出BCK。	R/W
b31 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 该位仅在主模式通信(SSICR.MST=1)中有效。从机模式通信(SSICR.MST=0)设置无效。
Note 2. BCKASTP和LRCONT位不得同时设置为1。
Note 3. 在SSIE通信时(SSISR.IIRQ=0)，禁止写入这些位。如果这些位中的值被写入改变，后续的操作是不可预知的。
Note 4. 与具有SSIE兼容通信格式的对方设备进行通信时，指定并使用可进行通信的通信格式。

SSIOFR寄存器设置音频格式，涉及到通信格式、LR时钟帧同步持续模式、BCK输出停止的设置。

OMOD[1:0]位（音频格式选择*3 *4）

OMOD[1:0]位选择音频格式。当停止向SSILRCKSSIFS引脚提供LR时钟时，写入这些位。有关LR时钟输出的详细信息，请参见第37.2.7节，音频格式寄存器(SSIOFR)中对LRCONT位的描述。

LRCONT位（启用LRCKFS继续）

LRCONT位在主机模式(SSICR.MST=1)时启用或禁用SSILRCKSSIFS引脚的输出
SSIE处于空闲状态(SSISR.IIRQ=1)。

即使在空闲状态下，在主机模式(SSICR.MST=1)下，当该位设置为1（以使LR时钟帧同步继续）时，也可以从SSILRCKSSIFS引脚输出信号。

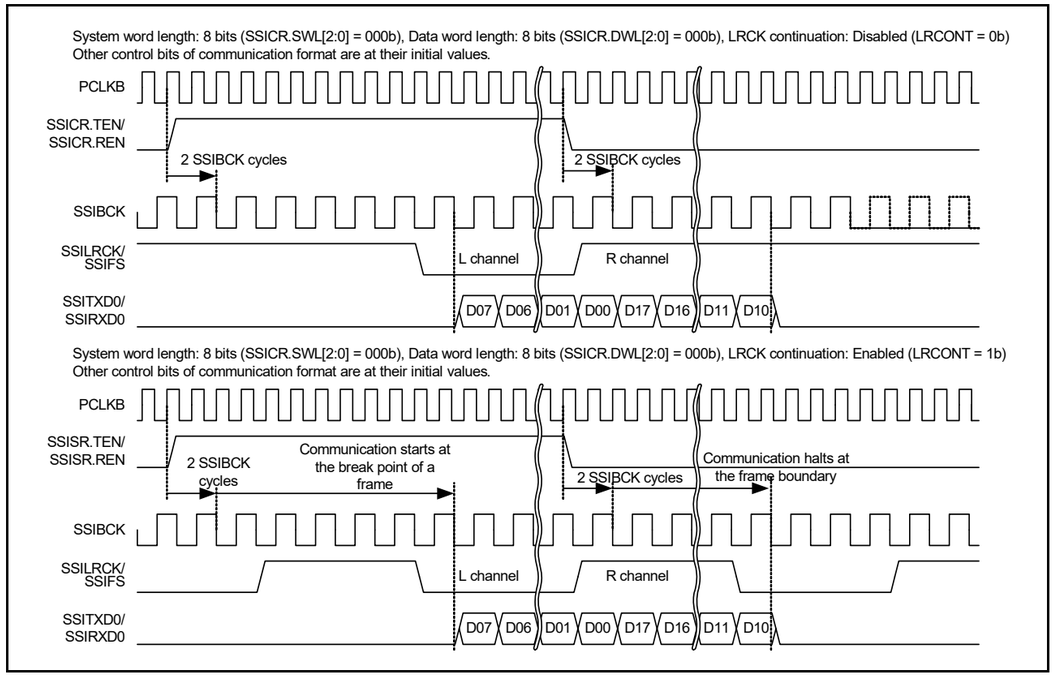

Figure 37.32 Example of LR clock/frame synchronization continuation operation

BCKASTP bit (Enable Stopping BCK Output When SSIE is in Idle Status*1, *2)

The BCKASTP bit turns on or off the function to output BCK to the SSIBCK pin according to the operation shown in Figure 37.33 and Figure 37.34 in master mode communication (SSICR.MST = 1).

Change the value of this bit only after setting the communication format to be used.

To use this bit:

- Write 0 to the BCKASTP bit, then start communication
- During communication, write 1 to the BCKASTP bit. The bit clock output to the SSIBCK pin stops automatically when communication stops.
- To resume communication, set SSIE to the idle state (SSICR.IIRQ = 1), enable the supply of AUDIO_MCK (SSIFCR.AUCKE = 1), then write 0 to the BCKASTP bit.

When the communication is in master mode (SSICR.MST = 1) and SSIE is in the idle state (SSICR.IIRQ = 1), the BCKASTP bit status and SSIBCK pin output are as shown in Table 37.9.

Table 37.9 BCKASTP bit status and SSIBCK pin output

BCKASTP bit	SSIBCK pin output status
0	Output
1	Stopped

Note: The BCKASTP bit cannot be used when the other-party device (a slave) requires the clock output from the SSIBCK pin before and during communication. In such case, use the BCKASTP bit to stop the clock only after communication. For the timing of enabling the clock stop function, see Figure 37.33.

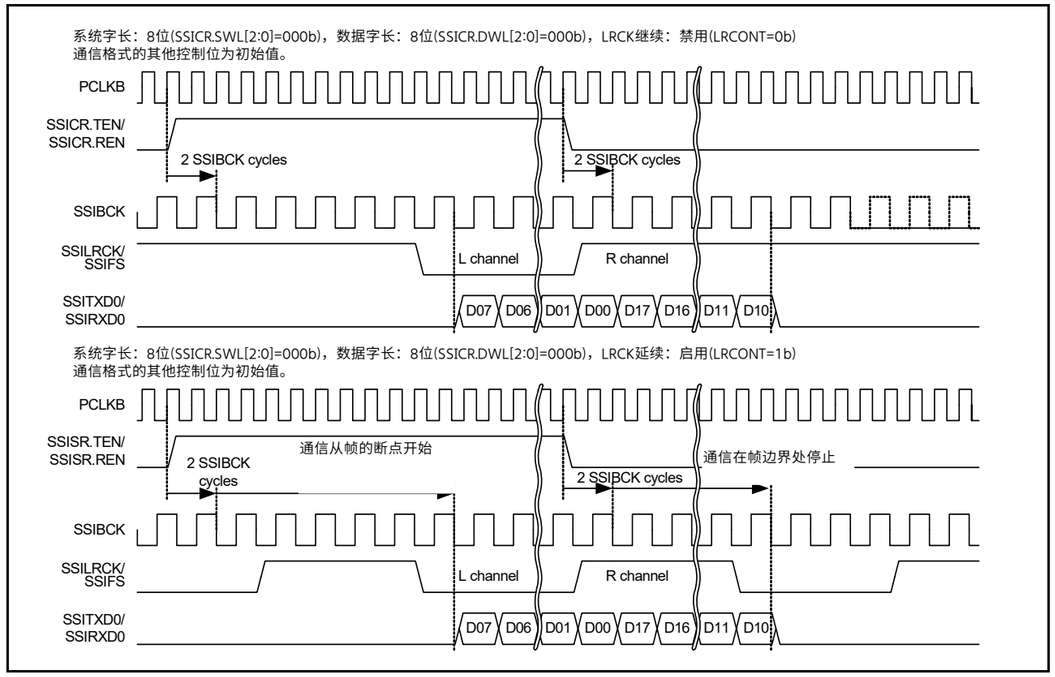

Figure 37.32 LR时钟帧同步继续操作示例

BCKASTP位（使能在SSIE处于空闲状态时停止BCK输出*1、*2）

BCKASTP位根据如下所示的操作打开或关闭将BCK输出到SSIBCK引脚的功能
图37.33和图37.34处于主模式通信(SSICR.MST=1)。

仅在设置要使用的通信格式后更改该位的值。

要使用该位：

- 将0写入BCKASTP位，然后开始通信
- 在通信期间，将1写入BCKASTP位。通信停止时，向SSIBCK引脚输出位时钟会自动停止。
- 要恢复通信，请将SSIE设置为空闲状态(SSICR.IIRQ=1)，启用AUDIO_MCK电源(SSIFCR.AUCKE=1)，然后将0写入BCKASTP位。

当通信处于主模式(SSICR.MST=1)且SSIE处于空闲状态(SSICR.IIRQ=1)时，
BCKASTP位状态和SSIBCK引脚输出如表37.9所示。

Table 37.9 BCKASTP位状态和SSIBCK引脚输出

BCKASTP bit	SSIBCK引脚输出状态
0	Output
1	Stopped

Note: 当对方设备（从机）在通信之前和通信期间需要从SSIBCK引脚输出时钟时，不能使用BCKASTP位。在这种情况下，仅在通信后使用BCKASTP位停止时钟。时钟停止功能的开启时序见图37.33。

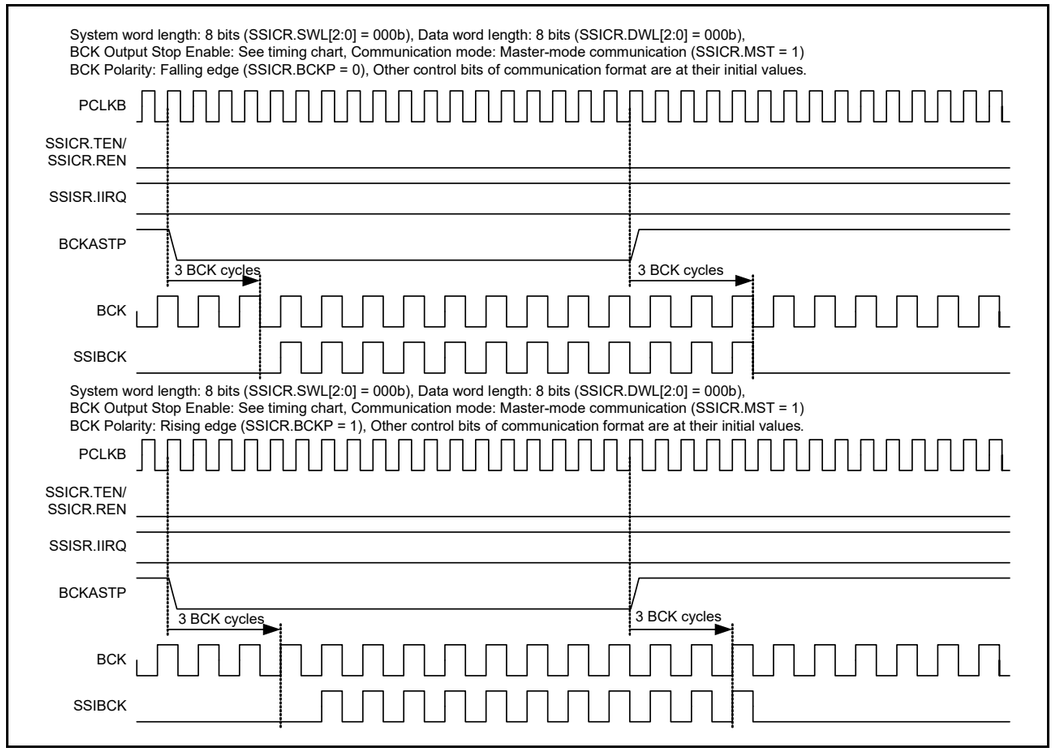

Figure 37.33 Example operation of the BCKASTP bit in idle state

In master mode (SSICR.MST = 1) with the BCK output stop function enabled (BCKASTP = 1), the BCK output to the SSIBCK pin is as follows:

- Output start timing: BCK is output at the appropriate timing so that a valid edge is generated when the LR clock/frame synchronization signal shifts to a valid value
- Output stop timing: 1 to 1.5 clock cycles after a frame boundary.

Figure 37.34 shows the timing details.

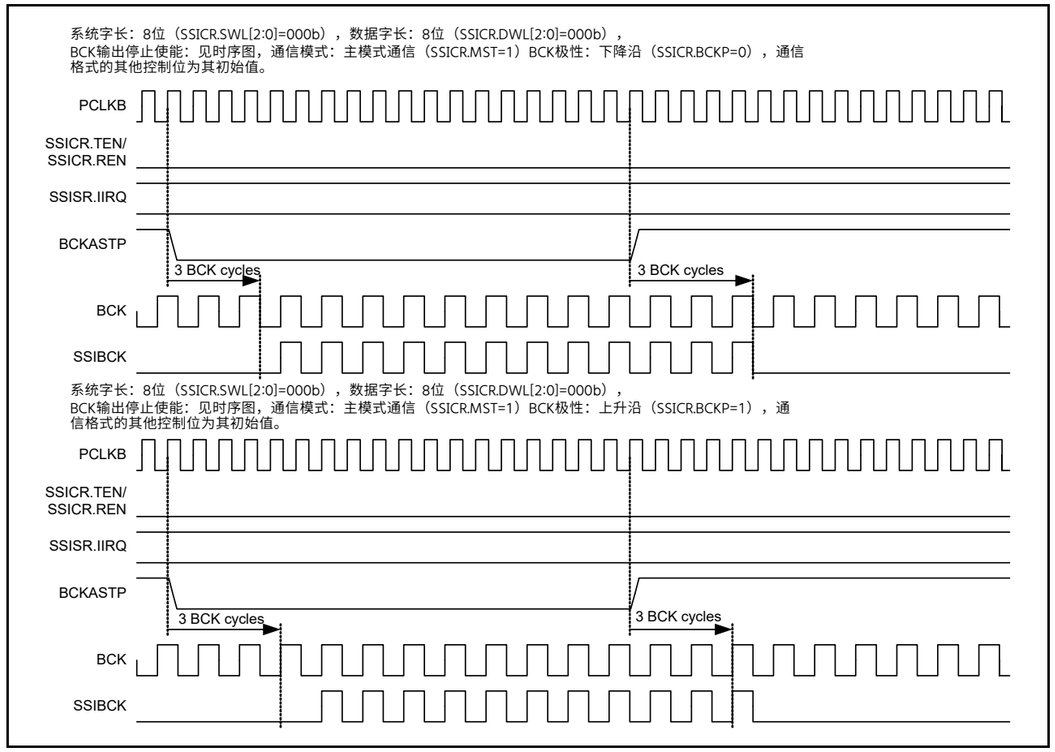

Figure 37.33 空闲状态下BCKASTP位的示例操作

在启用BCK输出停止功能(BCKASTP=1)的主模式(SSICR.MST=1)下，BCK输出到SSIBCK引脚如下：

- 输出开始时序：在适当的时序输出BCK，以便LR时钟帧同步信号移位到有效值时产生有效边沿
- 输出停止时序：帧边界后1到1.5个时钟周期。

图37.34显示了时序细节。

System word length: 8 bits (SSICR.SWL[2:0] = 000b), Data word length: 8 bits (SSICR.DWL[2:0] = 000b),
BCK output stop enable: Auto control (BCKASTP = 1b), Communication mode: Master mode communication (SSICR.MST = 1),

b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits is prohibited while SSIE is in a communication state (SSISR.IIRQ = 0). If written, the operation performed immediately after writing is not guaranteed.

RDFS[4:0] bits (RDF Setting Condition Select*1)

The RDFS[4:0] bits select the setting condition of the Receive Data Full Flag (RDF).

TDES[4:0] bits (TDE Setting Condition Select*1)

The TDES[4:0] bits select the setting condition of the Transmit Data Empty Flag (TDE).

37.3 Communication Formats

Table 37.10 lists the communication formats supported by the SSIE.

Table 37.10 Supported communication formats

Communication format	SSIOFR.OMOD[1:0]
I²S format	00
TDM format	01
Monaural format	10

This section describes the serial data structure shared by the communication formats. A serial data structure is defined by the system word length (set in SSICR.SWL[2:0]) and the data word length (set in SSICR.DWL[2:0]). If the data word length is shorter than the system word length, padding bits are transferred in the serial data. For details, see Figure 37.35.

b31 to b13	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 当SSIE处于通信状态(SSISR.IIRQ=0)时，禁止写入这些位。如果写入，则不保证写入后立即执行的操作。

RDFS[4:0]位（RDF设置条件选择*1）

RDFS[4:0]位选择接收数据满标志(RDF)的设置条件。

TDES[4:0]位（TDE设置条件选择*1）

TDES[4:0]位选择发送数据空标志(TDE)的设置条件。

37.3 通讯格式

表37.10列出了SSIE支持的通信格式。

Table 37.10 支持的通讯格式

通讯格式	SSIOFR.OMOD[1:0]
I²S format	00
TDM format	01
Monaural format	10

本节介绍通信格式共享的串行数据结构。串行数据结构由系统字长（在SSICR.SWL[2:0]中设置）和数据字长（在SSICR.DWL[2:0]中设置）定义。如果数据字长短于系统字长，则在串行数据中传输填充位。详见图37.35。

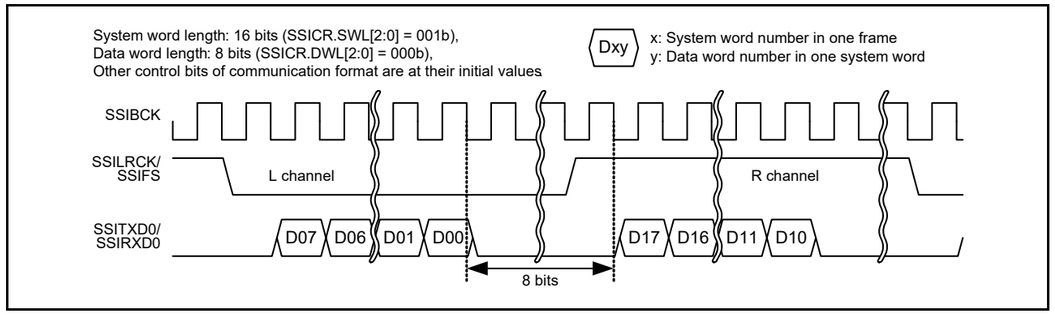

Figure 37.35 Example of padding bit transfer for I²S format, with system word length > data word length

Table 37.11 lists the number of padding bits to be transferred with each combination of system word length (SSICR.SWL[2:0]) and data word length (SSICR.DWL[2:0]).

Table 37.11 Number of padding bits

	SSICR.DWL[2:0]	000b	001b	010b	011b	100b	101b	110b	111b
SSICR.SWL[2:0]	System word length	8	16	18	20	22	24	32	Setting prohibited
000b	8	0	—	—	—	—	—	—	—
001b	16	8	0	—	—	—	—	—	—
010b	24	16	8	6	4	2	0	—	—
011b	32	24	16	14	12	10	8	0	—
100b	48	40	32	30	28	26	24	16	—
101b	64	56	48	46	44	42	40	32	—
110b	128	120	112	110	108	106	104	96	—
111b	256	248	240	238	236	234	232	224	—

— indicates that the setting is prohibited.

37.3.1 I²S Format

The I²S format is used for connecting with I²S-compatible serial devices. In this format setting (SSIOFR.OMOD[1:0] = 00b), one frame is configured with two system words, one for the channel L and the other for channel R. The SSILRCK/SSIFS signals are at a low level for channel L and at a high level for channel R. Set the polarity of the signals in the SSICR.LRCKP bit. Figure 37.36 shows the I²S format without padding, and Figure 37.35 shows the format with padding.

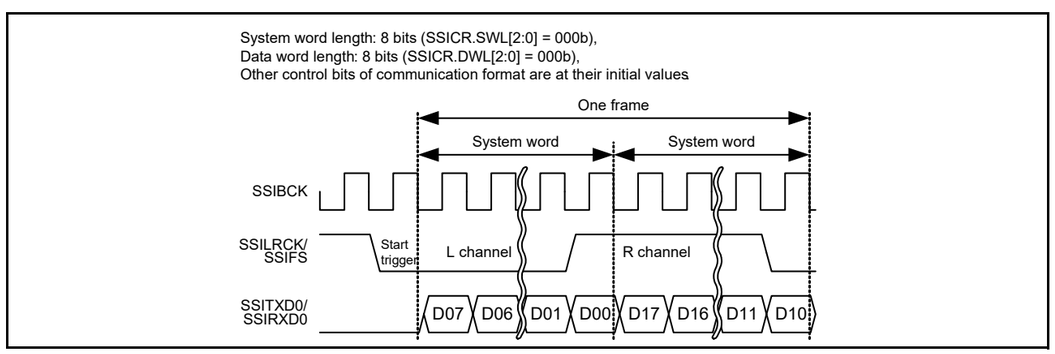

Figure 37.36 I²S format without padding, with system word length = data word length

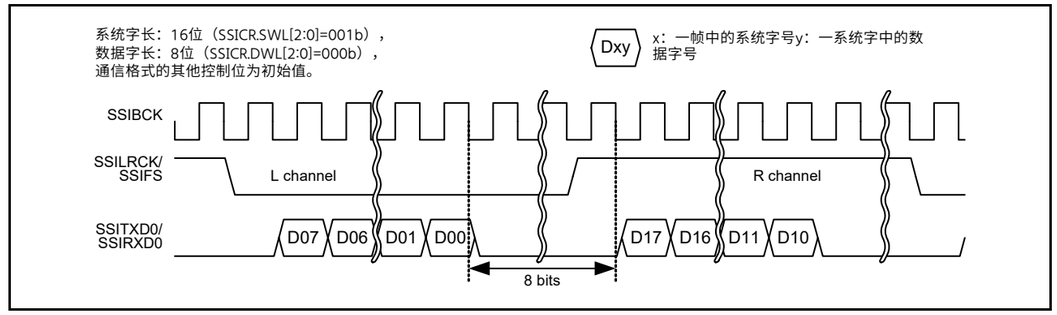

Figure 37.35 I2S格式的填充位传输示例，系统字长>数据字长

表37.11列出了使用系统字长(SSICR.SWL[2:0])和数据字长(SSICR.DWL[2:0])的每种组合传输的填充位数。

Table 37.11 填充位数

	SSICR.DWL[2:0]	000b	001b	010b	011b	100b	101b	110b	111b
SSICR.SWL[2:0]	系统字长	8	16	18	20	22	24	32	禁止设置
000b	8	0	—	—	—	—	—	—	—
001b	16	8	0	—	—	—	—	—	—
010b	24	16	8	6	4	2	0	—	—
011b	32	24	16	14	12	10	8	0	—
100b	48	40	32	30	28	26	24	16	—
101b	64	56	48	46	44	42	40	32	—
110b	128	120	112	110	108	106	104	96	—
111b	256	248	240	238	236	234	232	224	—

—表示禁止设置。

37.3.1 I²S Format

I2S格式用于连接I2S兼容的串行设备。在此格式设置(SSIOFR.OMOD[1:0]=00b)中，一帧配置有两个系统字，一个用于通道L，另一个用于通道R。SSILRCKSSIFS信号对于通道L处于低电平通道R为高电平。在SSICR.LRCKP位中设置信号的极性。图37.36显示了没有填充的I2S格式，图37.35显示了有填充的格式。

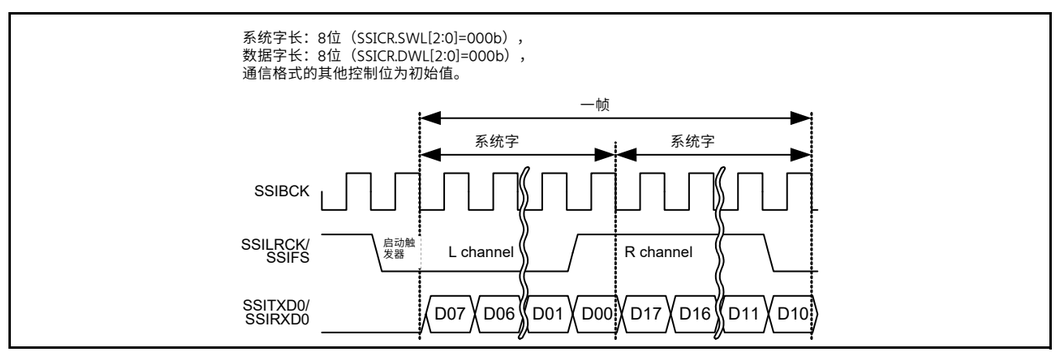

Figure 37.36 I2S格式无填充，系统字长=数据字长

For the state of external pins when SSIE is in the idle state, see section 37.5.1, Idle State.

Note: The SSILRCK/SSIFS pin in the SSIE indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the SSIE communication format must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

37.3.2 Monaural Format

The monaural format is used for connection with monaural-compatible serial devices. When the monaural format is specified (SSIOFR.OMOD[1:0] = 10b) for use, one frame consists of one system word. Also, a rising edge of the SSILRCK/SSIFS signal indicates a communication start trigger. Figure 37.37 and Figure 37.38 respectively show the monaural formats with and without padding.

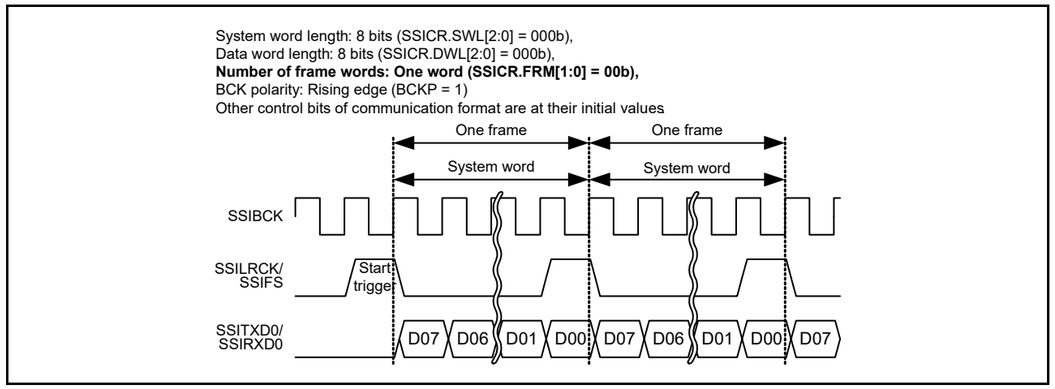

Figure 37.37 Short frame in monaural format without padding, with the system word length = data word length

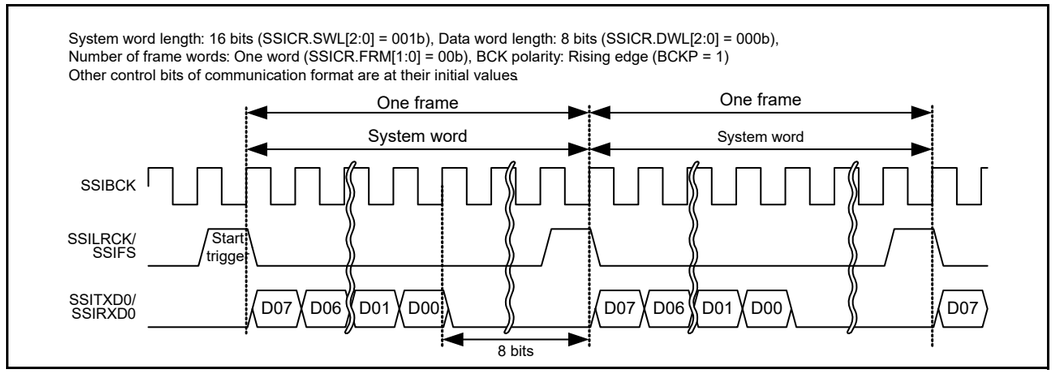

Figure 37.38 Short frame in monaural format with padding, with system word length > data word length

The monaural formats supported by SSIE consist of short frames and long frames. See section 37.3.2.1, Short frame and section 37.3.2.2, Long frame for the difference between these two frames.

For the state of external pins when SSIE is in the idle state, see section 37.5.1, Idle State.

Note: The SSILRCK/SSIFS pin in SSIE indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the SSIE communication format must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

37.3.2.1 Short frame

When a short frame is used (SSICR.DEL = 0), the SSILRCK/SSIFS signal indicating the start of serial data is set to high level only for 1 SSIBCK cycle. Data transfer starts at the falling edge of the signal.

关于SSIE处于空闲状态时外部引脚的状态，请参见第37.5.1节，空闲状态。

Note: SSIE中的SSILRCKSSIFS引脚指示通信的同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE通信格式必须与对方设备的通信格式匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

37.3.2 Monaural Format

单声道格式用于连接兼容单声道的串行设备。当指定使用单声道格式(SSIOFR.OMOD[1:0]=10b)时，一帧由一个系统字组成。此外，SSILRCKSSIFS信号的上升沿表示通信开始触发。图37.37和图37.38分别显示了带填充和不带填充的单声道格式。

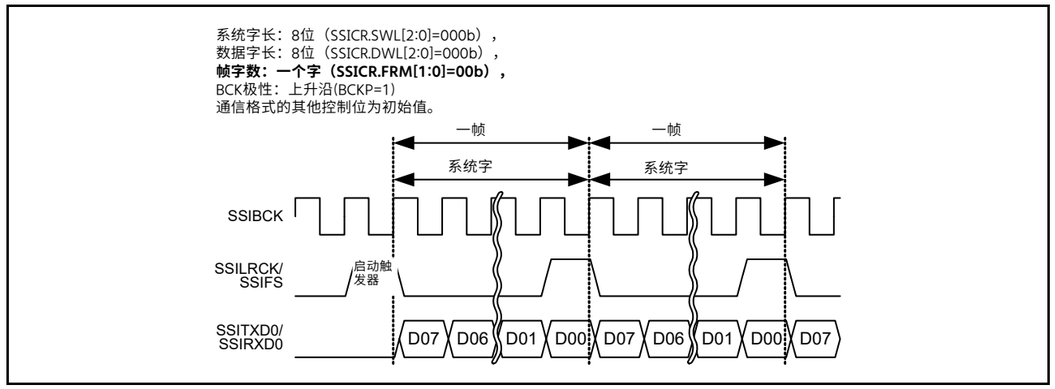

Figure 37.37 单声道格式的短帧，无填充，系统字长=数据字长

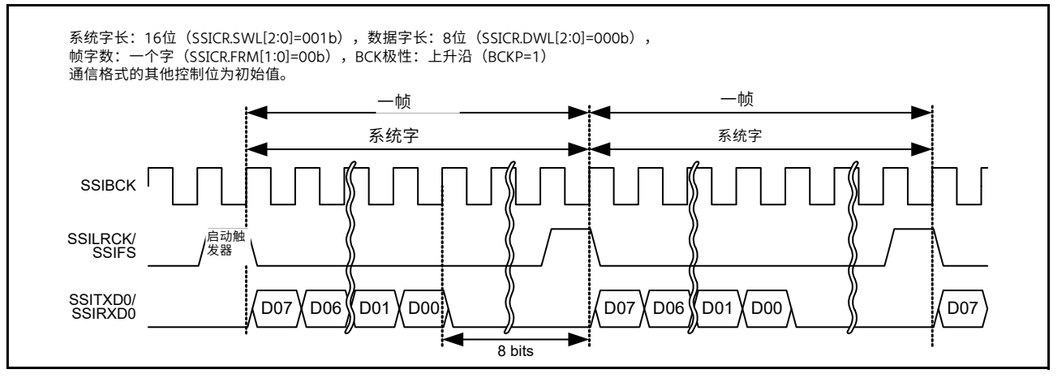

Figure 37.38 带填充的单声道格式短帧，系统字长>数据字长

SSIE支持的单声道格式包括短帧和长帧。有关这两个框架之间的区别，请参见第37.3.2.1节，短框架和第37.3.2.2节，长框架。

关于SSIE处于空闲状态时外部引脚的状态，请参见第37.5.1节，空闲状态。

Note: SSIE中的SSILRCKSSIFS引脚指示通信的同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE通信格式必须与对方设备的通信格式匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

37.3.2.1 短框

当使用短帧(SSICR.DEL=0)时，指示串行数据开始的SSILRCKSSIFS信号仅在1个SSIBCK周期内设置为高电平。数据传输从信号的下降沿开始。

37.3.2.2 Long frame

When a long frame is used (SSICR.DEL = 1), the SSILRCK/SSIFS signal indicating the start of serial data is set to high level only for 2 SSIBCK cycles. See Figure 37.39. Data transfer starts at the rising edge of the signal.

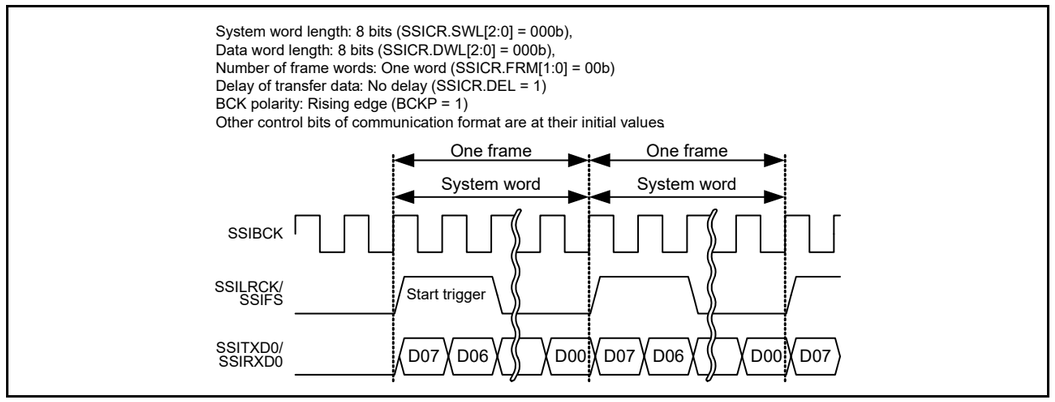

Figure 37.39 Long frame in monaural format without padding

37.3.3 TDM Format

The TDM communication format is used for connection with TDM-compatible multi-channel devices. With this format setting (SSIOFR.OMOD[1:0] = 01b), one frame is configured with four to eight system words set with the SSICR.FRM[1:0] bits. With this format, the SSILRCK/SSIFS signal is at a high level for the first one system word and at a low level for the rest. The pulse generated on the SSILRCK/SSIFS signal is defined as the SYNC pulse and its rising edge indicates the start of one frame. Figure 37.40 and Figure 37.41 show the TDM formats without and with padding, respectively.

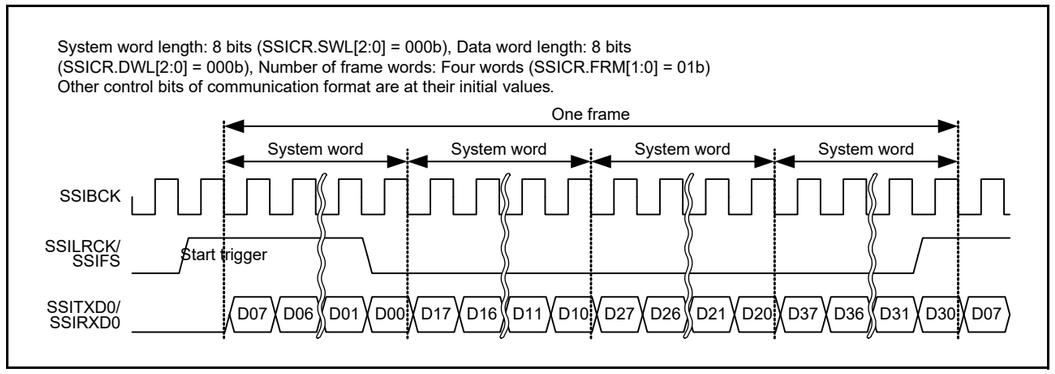

Figure 37.40 TDM format without padding, with system word length = data word length

37.3.2.2 长框

当使用长帧时（SSICR.DEL=1），指示串行数据开始的SSILRCKSSIFS信号仅在2个SSIBCK周期内设置为高电平。请参见图37.39。数据传输从信号的上升沿开始。

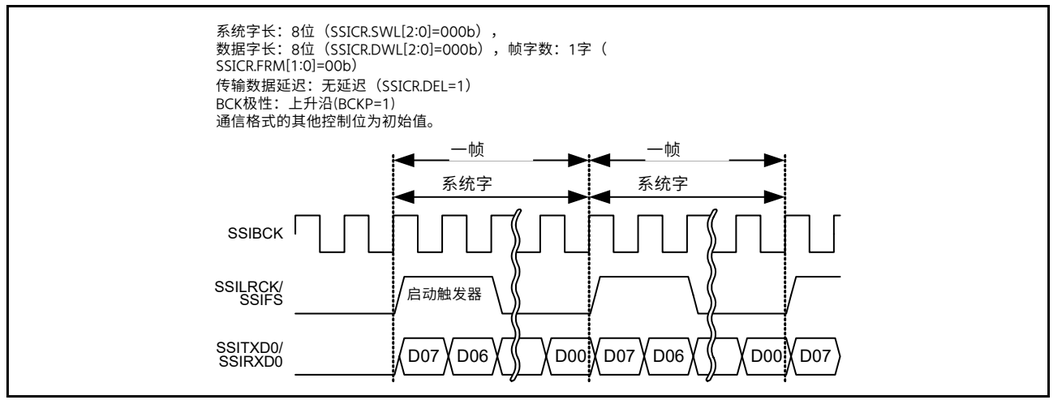

Figure 37.39 单声道格式的长帧，无填充

37.3.3 TDM Format

TDM通信格式用于连接与TDM兼容的多通道设备。使用此格式设置(SSIOFR.OMOD[1:0]=01b)，一帧配置有四到八个通过SSICR.FRM[1:0]位设置的系统字。使用这种格式，SSILRCKSSIFS信号对于第一个系统字处于高电平，而对于其余系统字处于低电平。SSILRCKSSIFS信号上产生的脉冲被定义为SYNC脉冲，其上升沿表示一帧的开始。图37.40和图37.41分别显示了没有和有填充的TDM格式。

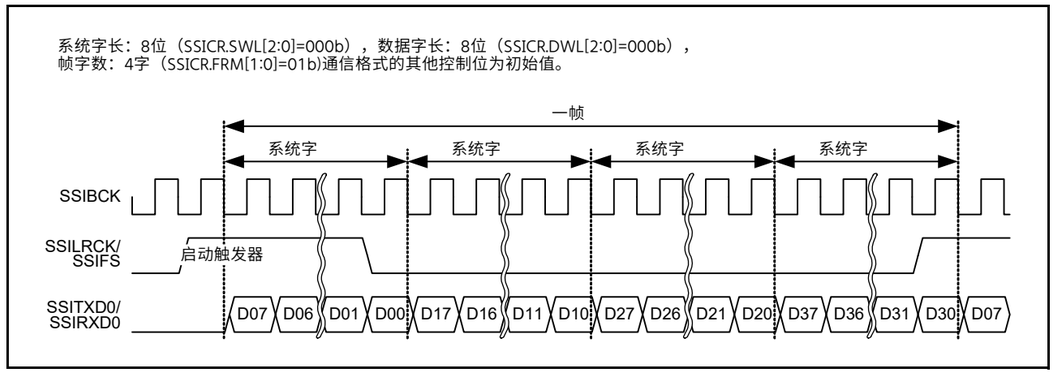

Figure 37.40 无填充的TDM格式，系统字长=数据字长

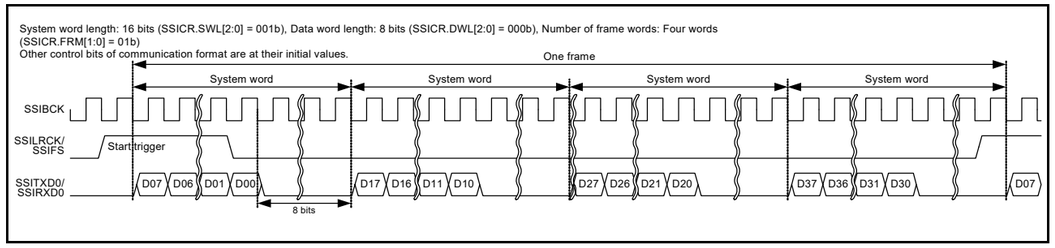

Figure 37.41 TDM format with padding, with system word length > data word length

For the state of external pins when SSIE is in the idle state, see section 37.5.1, Idle State.

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format that SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

37.4 Communication Modes

Table 37.12 lists the communication modes supported by the SSIE. Table 37.13 lists the control bits that are not available with each communication mode. For details on these communication modes, see section 37.4.1, Slave Mode Communication to section 37.4.5, Transmission and Reception.

Table 37.12 Communication modes

Communication mode	SSICR.MST bit	SSICR.REN bit	SSICR.TEN bit
Slave mode transmission	0	0	1
Slave mode reception	0	1	0
Slave mode transmission and reception	0	1	1
Master mode transmission	1	0	1
Master mode reception	1	1	0
Master mode transmission and reception	1	1	1

Table 37.13 Control bits that cannot be used in each communication mode (1 of 2)

	Communication mode

Control bit	Communication mode					
	Slave mode reception	Slave mode transmission	Slave mode transmission and reception	Master mode reception	Master mode transmission	Master mode transmission and reception
SSISCR.RDFS[4:0]	Available	Invalid	Available	Available	Invalid	Available

Note: Invalid means it has no effect on operation. Writing is possible.

37.4.1 Slave Mode Communication

When SSICR.MST = 0, SSIE operates in slave mode. The SSIBCK and SSILRCK/SSIFS signals used for serial data communication must be supplied from an external device. If the communication format of these signals does not match that of the SSIE, operation is unpredictable.

37.4.2 Master Mode Communication

When SSICR.MST = 1, SSIE operates in master mode. The SSIBCK and SSILRCK/SSIFS signals used for serial data communication must be internally generated from the audio clock. The signal format is dictated by the SSIE. If the communication format of the slave device does not match that of the SSIE, operation is unpredictable.

37.4.3 Transmission

SSIE transmits serial data to the other-party device when the SSICR.TEN bit is 1 and the SSICR.REN bit is 0. If the communication format of the other-party device does not match that of the SSIE, operation is unpredictable.

37.4.4 Reception

SSIE receives serial data from the other-party device when the SSICR.TEN bit is 0 and the SSICR.REN bit is 1. If the communication format of the other-party device does not match that of the SSIE, operation is unpredictable.

37.4.5 Transmission and Reception

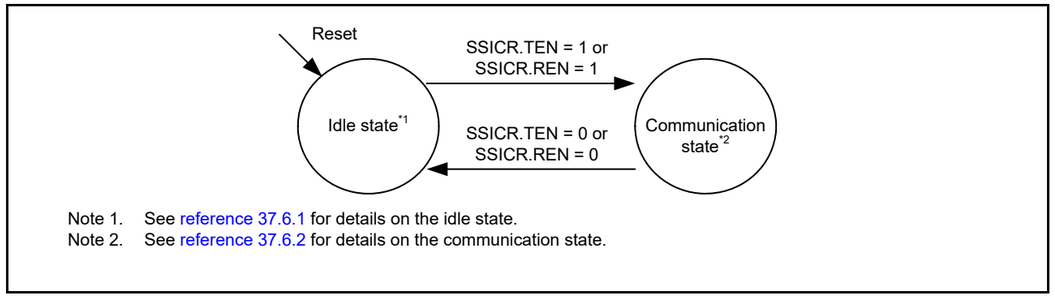
SSIE transmits and receives serial data to and from the other-party device when the SSICR.TEN bit is 1 and the SSICR.REN bit is 1. If the communication format of the other-party device does not match that of the SSIE, operation is unpredictable.

37.5 Operation

SSIE has the following two main operation states:

- Idle state (SSISR.IIRQ = 1)
- Communication state (SSISR.IIRQ = 0).

Figure 37.42 shows the SSIE state transition.



Note 1. See reference 37.6.1 for details on the idle state.
Note 2. See reference 37.6.2 for details on the communication state.

Figure 37.42 SSIE state transition

Table 37.13 不能在每种通信模式中使用的控制位（2个中的2个）

控制位	通讯方式					
	从模式接收	从模式传输	从模式发送和接收	主控模式接收	主模式传输	主模式发送和接收
SSISCR.RDFS[4:0]	Available	Invalid	Available	Available	Invalid	Available

Note: 无效表示对操作没有影响。写作是可能的。

37.4.1 从模式通信

当SSICR.MST=0时，SSIE在从模式下运行。用于串行数据通信的SSIBCK和SSILRCKSSIFS信号必须由外部设备提供。如果这些信号的通信格式与SSIE的通信格式不匹配，则操作是不可预测的。

37.4.2 主模式通信

当SSICR.MST=1时，SSIE在主机模式下运行。用于串行数据通信的SSIBCK和SSILRCKSSIFS信号必须由音频时钟在内部生成。信号格式由SSIE规定。如果从设备的通信格式与SSIE的通信格式不匹配，则操作是不可预知的。

37.4.3 Transmission

当SSICR.TEN位为1且SSICR.REN位为0时，SSIE向对方设备发送串行数据。如果对方设备的通信格式与SSIE的通信格式不匹配，则操作无法预测。

37.4.4 Reception

当SSICR.TEN位为0且SSICR.REN位为1时，SSIE从对方设备接收串行数据。如果对方设备的通信格式与SSIE的通信格式不匹配，则操作无法预测。

37.4.5 传输和接收

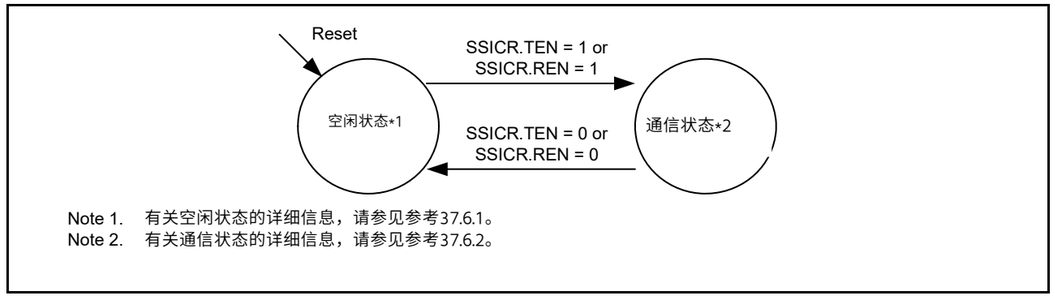
当SSICR.TEN位为1且
SSICR.REN位为1。如果对方设备的通信格式与SSIE的通信格式不匹配，则操作无法预测。

37.5 Operation

SSIE主要有以下两种运行状态：

- 空闲状态(SSISR.IIRQ=1)
- 通信状态(SSISR.IIRQ=0)。

图37.42显示了SSIE状态转换。



Note 1. 有关空闲状态的详细信息，请参见参考37.6.1。
Note 2. 有关通信状态的详细信息，请参见参考37.6.2。

Figure 37.42 SSIE状态转换

37.5.1 Idle State

In this state, SSIE communication is halted. However, if the SSICR.MST bit is 1, output of the BCK and LR clock/frame synchronization signals to the external pins can be controlled based on the settings of the SSIOFR.BCKASTP and SSIOFR.LRCONT bits. This function is common to all formats. For details, see Table 37.14.

Table 37.14 Output from external pins in the idle state

			Output from pins		
SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	SSIBCK	SSILRCK/SSIFS	SSITXD0
0	-	-	Stop	Stop	Stop
1	0	0	Supply	Stop	Stop
1	0	1	Supply	Supply	Stop
1	1	0	Stop	Stop	Stop
1	1	1	Stop	Supply	Stop

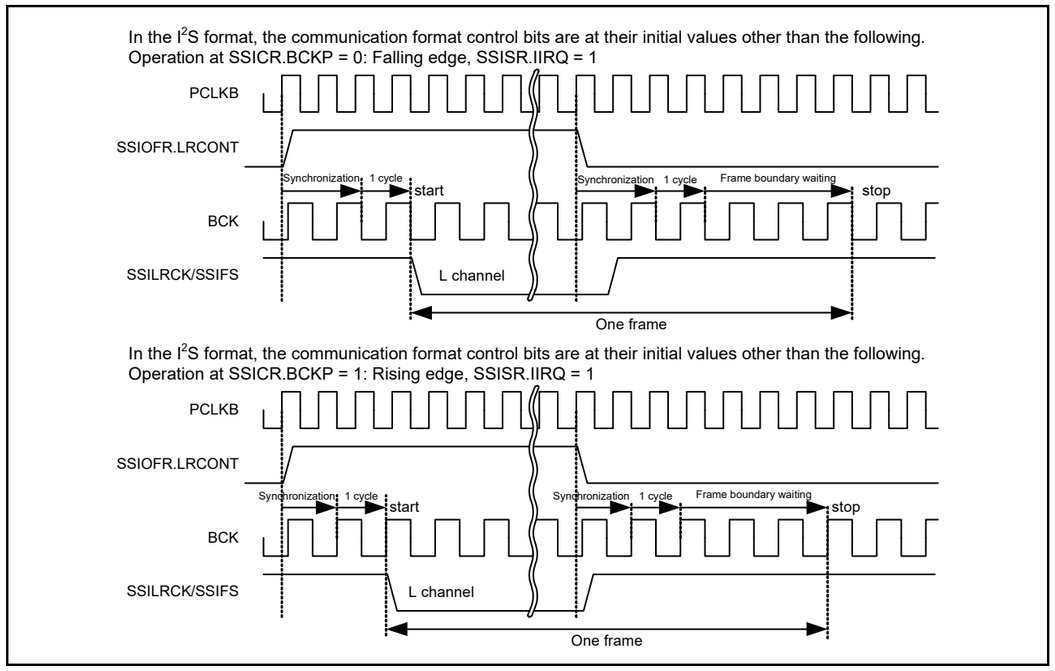


Figure 37.43 Example of disabling LR clock/frame synchronization continuation by SSIOFR.LRCONT

Note: In master mode communication (SSICR.MST = 1), when the SSIE is in the idle state, the output to the SSILRCK/SSIFS pin can be stopped by changing the value of the SSIOFR.LRCONT bit from 1 to 0. Make sure that the other-party device is not affected.

37.5.1 空闲状态

在这种状态下，SSIE通信停止。但是，如果SSICR.MST位为1，则可以根据SSIOFR.BCKASTP和SSIOFR.LRCONT位的设置来控制向外部引脚输出BCK和LR时钟帧同步信号。此功能适用于所有格式。详见表37.14。

Table 37.14 空闲状态下外部引脚的输出

			引脚输出		
SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	SSIBCK	SSILRCK/SSIFS	SSITXD0
0	-	-	Stop	Stop	Stop
1	0	0	Supply	Stop	Stop
1	0	1	Supply	Supply	Stop
1	1	0	Stop	Stop	Stop
1	1	1	Stop	Supply	Stop

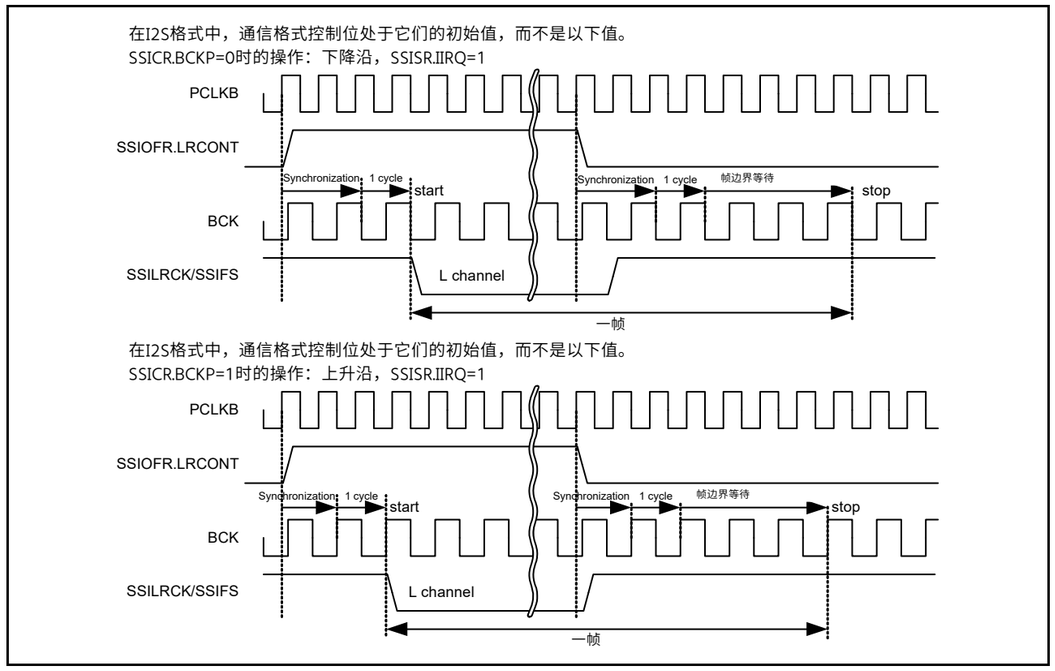

Figure 37.43 通过SSIOFR.LRCONT禁用LR时钟帧同步继续的示例

Note: 在主模式通信（SSICR.MST=1）中，当SSIE处于空闲状态时，输出到SSILRCKSSIFS引脚可以通过将SSIOFR.LRCONT位的值从1更改为0来停止。确保对方设备不受影响。

RA生态工作室

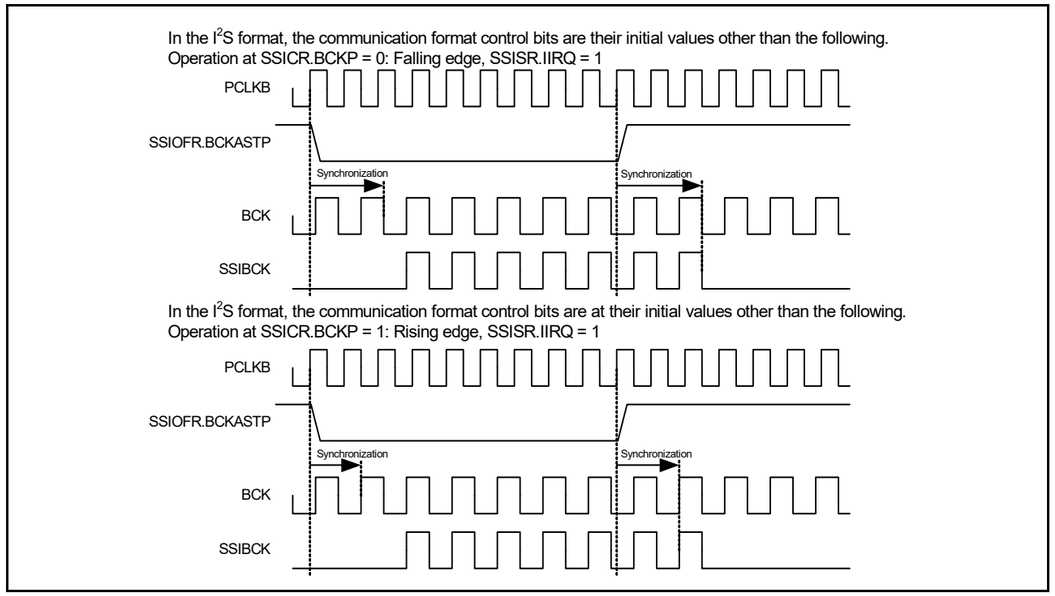

Figure 37.44 Example of stopping SSIBCK with SSIOFR.BCKASTP

Note: In master mode communication (SSICR.MST = 1) for SSIE in the idle state, the output to the SSIBCK pin stops when the value of the SSIOFR.BCKASTP bit is changed from 0 to 1. Make sure that the other-party device is not affected.

37.5.2 Communication States

Figure 37.45 shows transitions of communication states and Table 37.15 lists the conditions for transition. If the transition condition is not satisfied, the state does not transit.

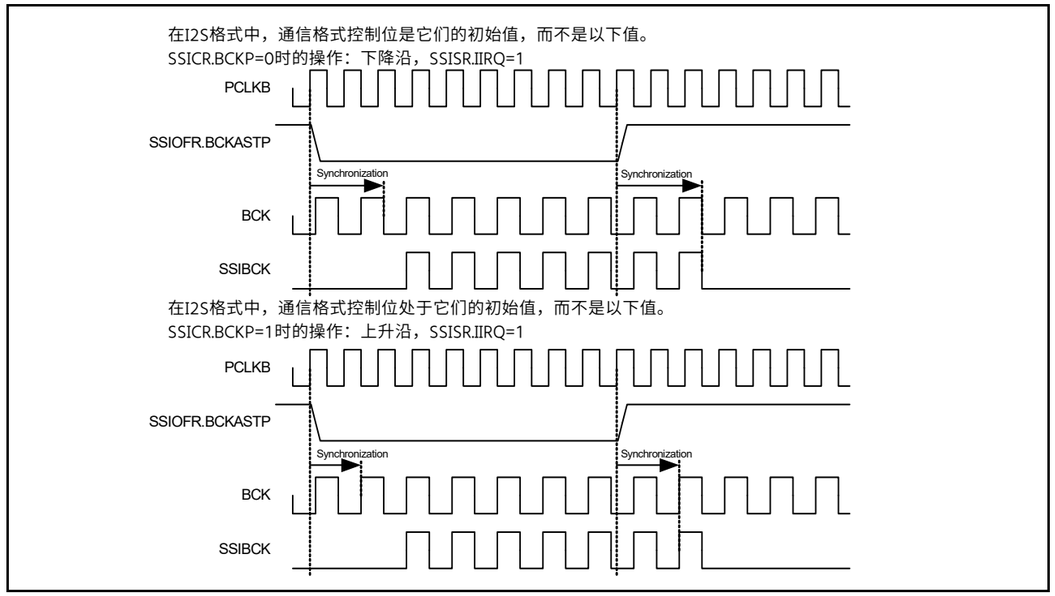

Figure 37.44 使用SSIOFR.BCKASTP停止SSIBCK的示例

Note: 在空闲状态下SSIE的主机模式通信(SSICR.MST=1)中，当SSIOFR.BCKASTP位的值从0变为1时，停止向SSIBCK引脚的输出。确保对方设备处于不受影响。

37.5.2 通讯状态

图37.45显示了通信状态的转换，表37.15列出了转换的条件。如果不满足转移条件，则状态不转移。

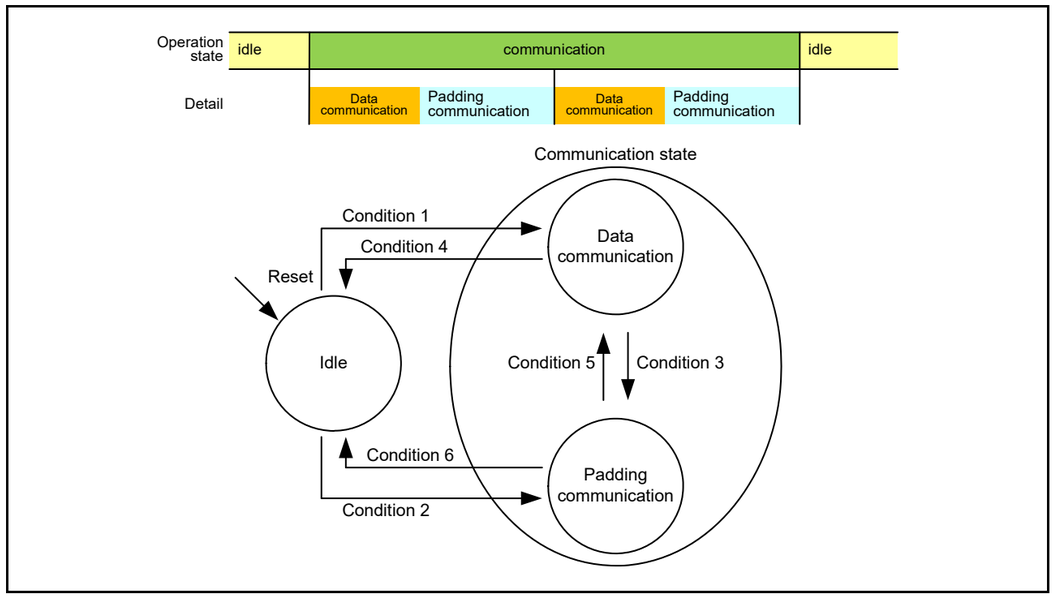

Figure 37.45 Communication state transition

Table 37.15 Conditions for communication state transition

Condition number	Condition for transition
1	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 0, or in the setting without padding bits
2	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 1, and in the setting with padding bits
3	The following three conditions are all met: • SSICR.TEN = 1 or SSICR.REN = 1 • In the setting with padding bits • The last bit of the data words is transferred.
4	Both the following conditions are met: • SSICR.SDTA = 1 or without padding bits • While SSICR.TEN = 0 and SSICR.REN = 0, the last bit of the data words in a frame is transferred.
5	Transfer of the last padding bit is complete while SSICR.TEN = 1 or SSICR.REN = 1
6	Both the following conditions are met: • SSICR.SDTA = 0 and with padding bits • While SSICR.TEN = 0 and SSICR.REN = 0, the last padding bit is transferred.

See Table 37.11 for the setting with or without padding bits.

37.5.2.1 Data communication state

In this state, SSIE is in communication. Data with the word length set in the SSICR.DWL[2:0] bits is transmitted, received, or transmitted and received.

- State transition in the setting without padding bits

During communication (SSISR.IIRQ = 0), SSIE is in data communication throughout. By disabling transmission and reception (SSICR.TEN = 0, SSICR.REN = 0), SSIE transits to the idle state. For details, see Figure 37.46 and Figure 37.47.

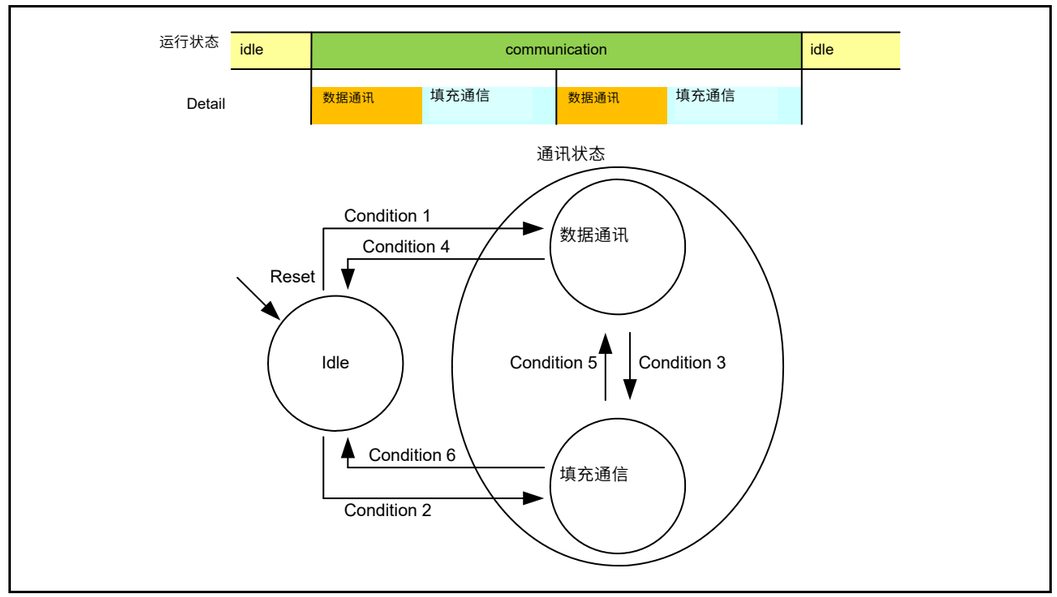

Figure 37.45 通信状态转换

Table 37.15 通信状态转换的条件

条件编号	过渡条件
1	在SSICR.SDTA=0时写入SSICR.TEN=1或SSICR.REN=1，或者在没有填充位的设置中
2	在SSICR.SDTA=1时写入SSICR.TEN=1或SSICR.REN=1，并在使用填充位的设置中
3	以下三个条件均满足： SSICR.TEN=1或SSICR.REN=1 在带有填充位的设置中 传输数据字的最后一位。
4	满足以下两个条件： SSICR.SDTA=1或没有填充位 当SSICR.TEN=0且SSICR.REN=0时，传输帧中数据字的最后一位。
5	当SSICR.TEN=1或SSICR.REN=1时，最后一个填充位的传输完成
6	满足以下两个条件： SSICR.SDTA=0和填充位 当SSICR.TEN=0和SSICR.REN=0时，传输最后一个填充位。

有关有或无填充位的设置，请参见表37.11。

37.5.2.1 数据通讯状态

在这种状态下，SSIE处于通信状态。在SSICR.DWL[2:0]位中设置字长的数据被发送、接收或发送和接收。

- 没有填充位的设置中的状态转换

在通信期间（SSISR.IIRQ=0），SSIE始终处于数据通信中。通过禁用发送和接收（SSICR.TEN=0，SSICR.REN=0），SSIE转换到空闲状态。详见图37.46和图37.47。

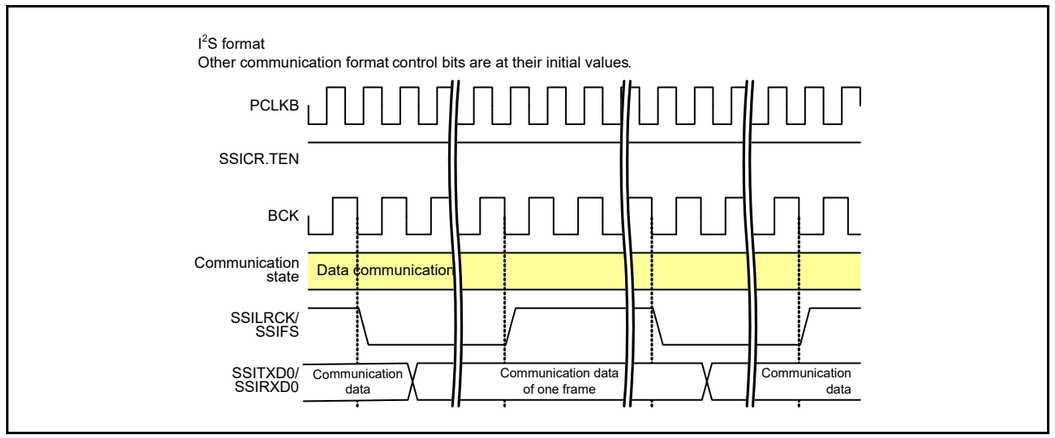

Figure 37.46 Continuation of data communication

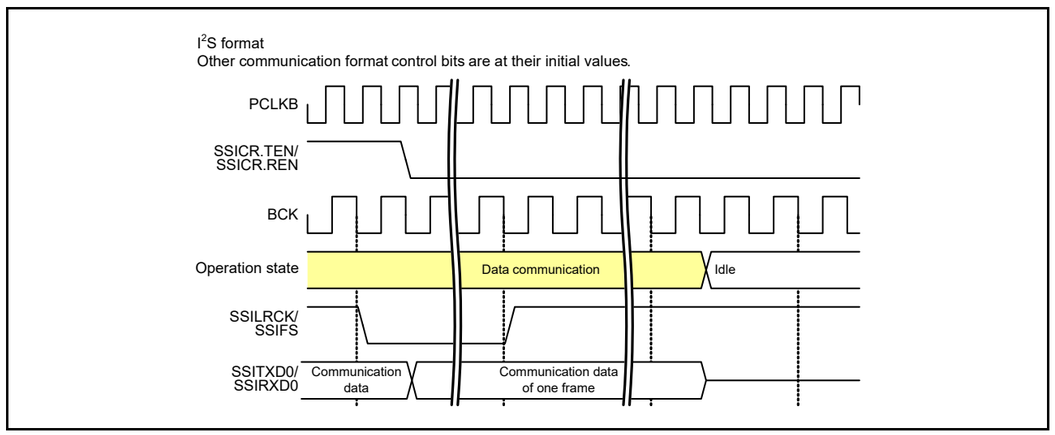

Figure 37.47 Halt from data communication without padding bits

- State transition in the setting with padding bits

When SSIE ends the transfer of the last bit of a data word during communication (SSISR.IIRQ = 0), SSIE transitions from the data communication state to the padding communication state as shown in Figure 37.48.

SSIE transitions from the data communication state to the idle state when it stops communication, except when SSICR.SDTA = 1 and transmission and reception is disabled (SSICR.TEN = 0 and SSICR.REN = 0), as shown in Figure 37.50.

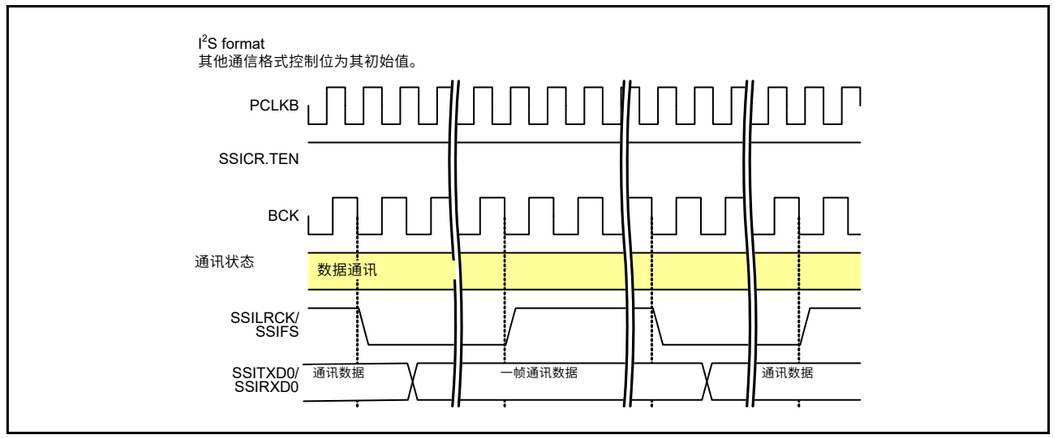

Figure 37.46 继续数据通信

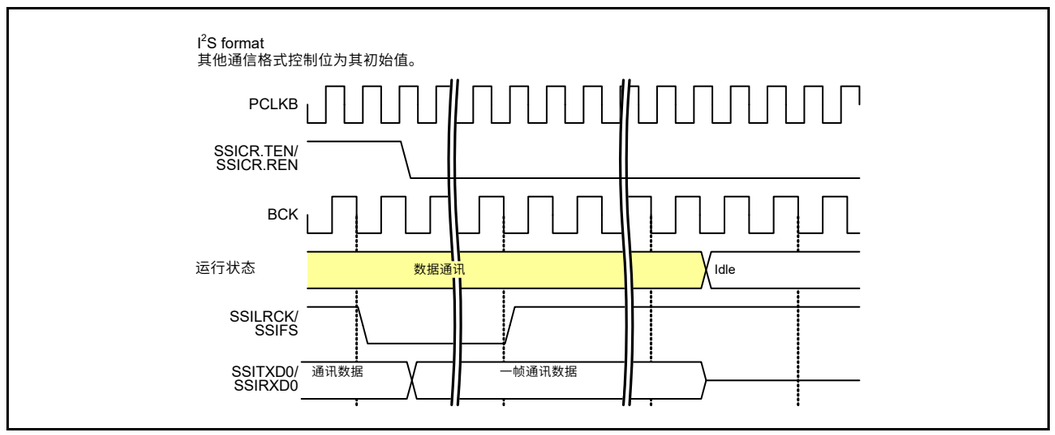

Figure 37.47 在没有填充位的情况下停止数据通信

- 具有填充位的设置中的状态转换

当SSIE在通信期间结束数据字的最后一位传输时（SSISR.IIRQ=0），SSIE从数据通信状态转换到填充通信状态，如图37.48所示。

SSIE在停止通信时从数据通信状态转换到空闲状态，除非当SSICR.SDTA=1并且发送和接收被禁用（SSICR.TEN=0和SSICR.REN=0），如图37.50所示。

RA生态工作室

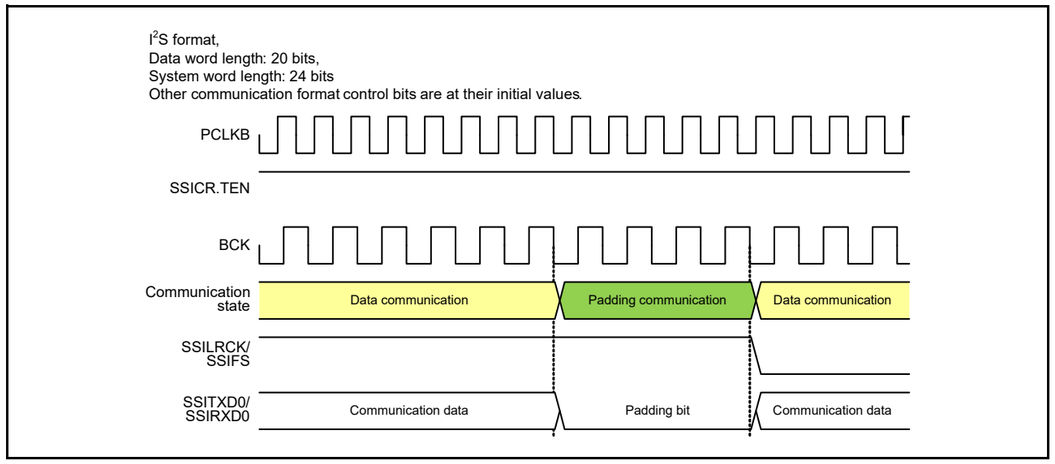

Figure 37.48 Transition from data communication to padding communication

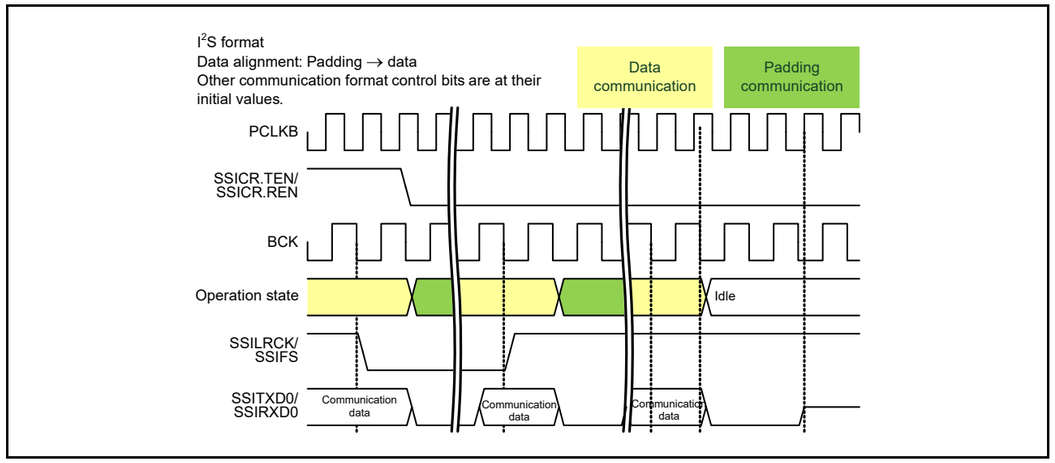

Figure 37.49 Halt from data communication with padding bits

37.5.2.2 Padding communication

In this state, SSIE is in communication. The padding bits set in SSICR.SWL[2:0] and SSICR.DWL[2:0] are transmitted, received, or transmitted and received.

- State transition in the setting with padding bits.

When SSIE ends transfer of the last padding bit during communication (SSISR.IIRQ = 0), SSIE transitions to the data communication state as shown in Figure 37.48. If SSICR.SDTA = 0, and transmission and reception are disabled (SSICR.TEN = 0 and SSICR.REN = 0), SSIE transitions from the padding communication state to the idle state when it stops communication in Figure 37.50.

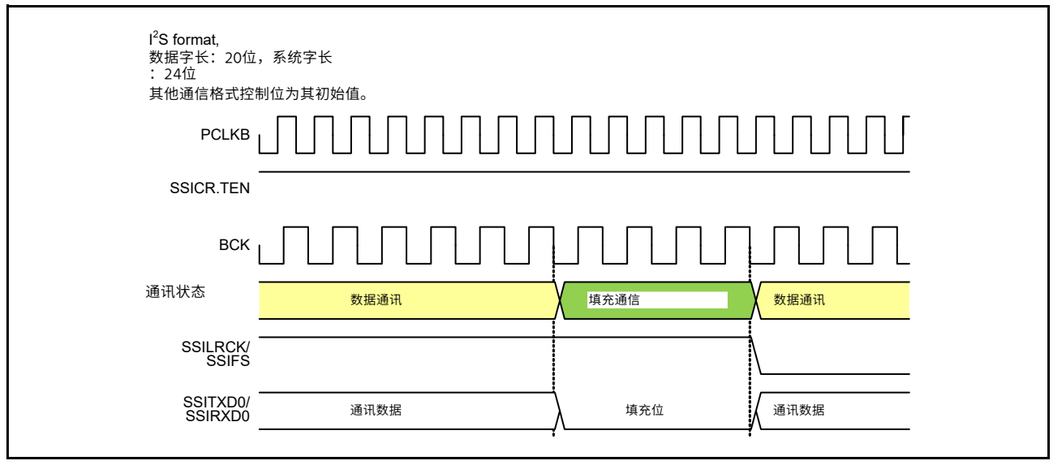

Figure 37.48 从数据通信过渡到填充通信

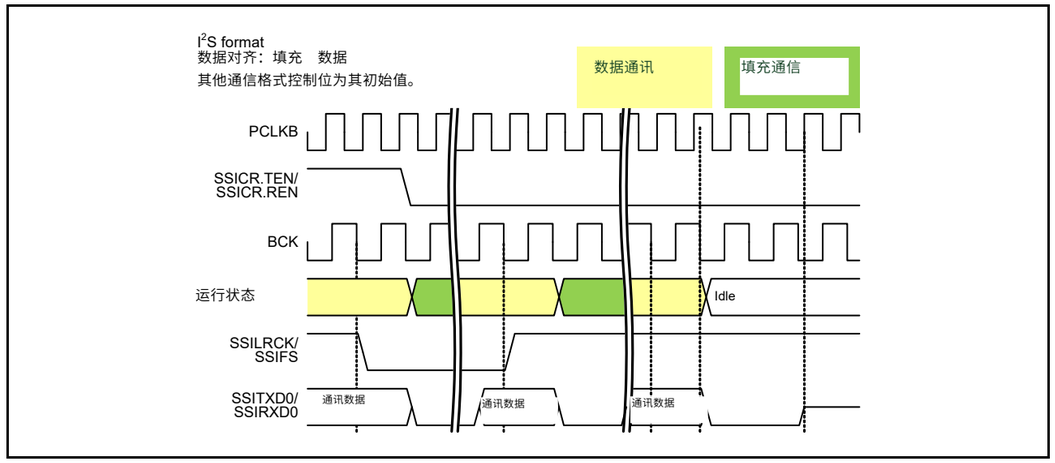

Figure 37.49 使用填充位停止数据通信

37.5.2.2 填充通信

在这种状态下，SSIE处于通信状态。在SSICR.SWL[2:0]和SSICR.DWL[2:0]中设置的填充位被发送、接收或发送和接收。

- 具有填充位的设置中的状态转换。

当SSIE在通信期间结束最后一个填充位的传输（SSISR.IIRQ=0）时，SSIE转换到数据通信状态，如图37.48所示。如果SSICR.SDTA=0，并且发送和接收被禁用（SSICR.TEN=0和SSICR.REN=0），则SSIE在图37.50中停止通信时从填充通信状态转换到空闲状态。

RA生态工作室

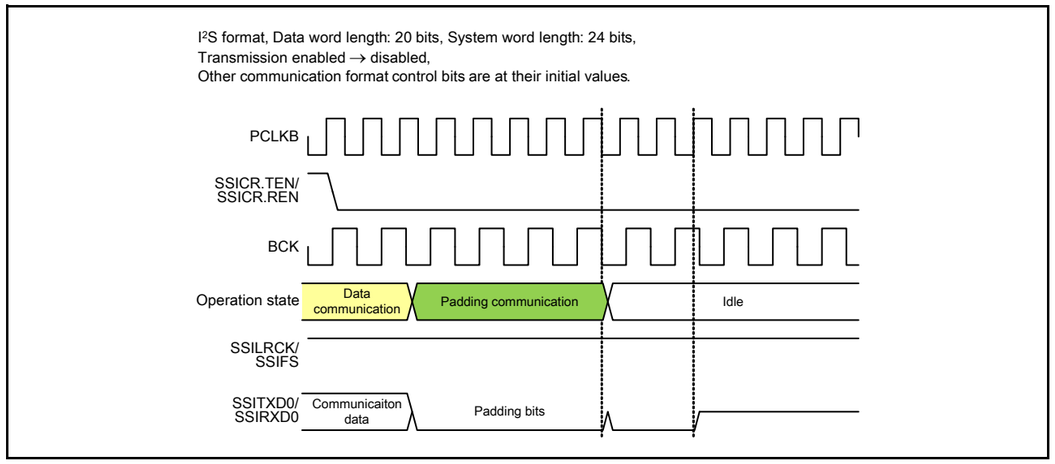

Figure 37.50 Halt from padding communication

37.6 Communication Operation

Figure 37.51 shows the communication flow of SSIE.

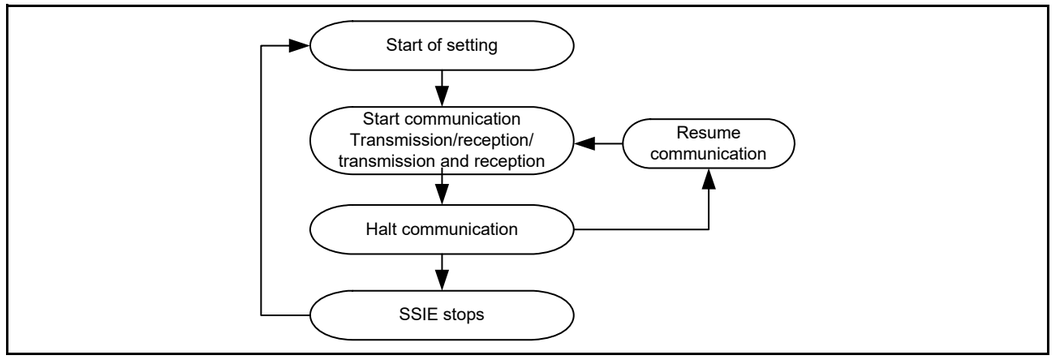

Figure 37.51 SSIE communication operation

Each operation procedure is described in section 37.6.1, Start Communication to section 37.6.7, Resume Communication.

37.6.1 Start Communication

This section describes how to start SSIE communication. To start communication, be sure to follow the procedure shown in Figure 37.52. For reception operation, see section 37.6.2, Transmission for transmission operation and section 37.6.3, Reception.

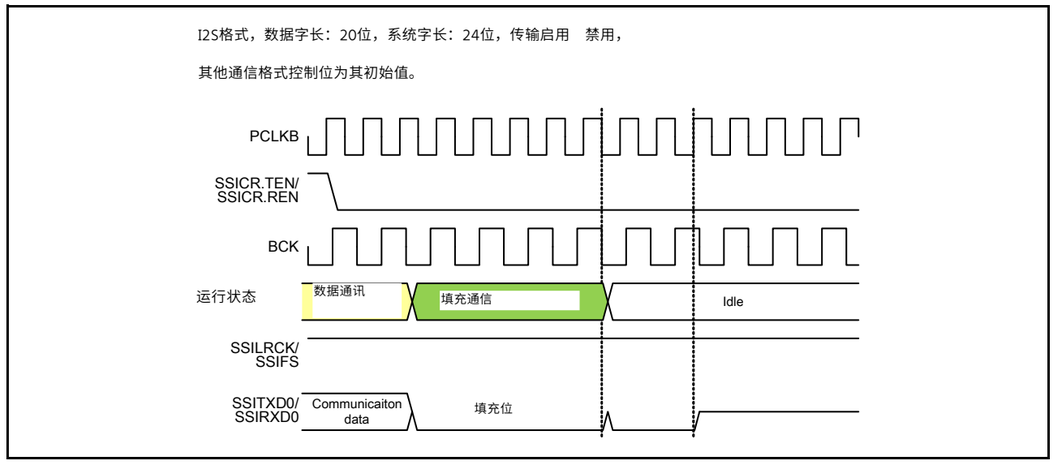

Figure 37.50 停止填充通信

37.6 通讯操作

图37.51显示了SSIE的通信流程。

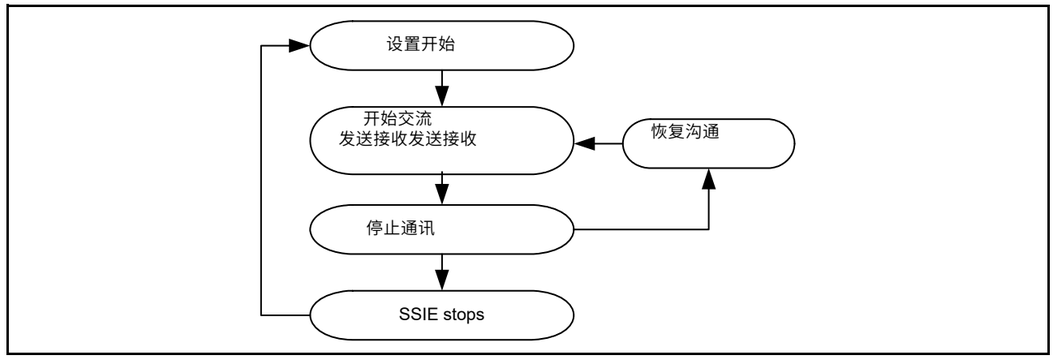

Figure 37.51 SSIE通信操作

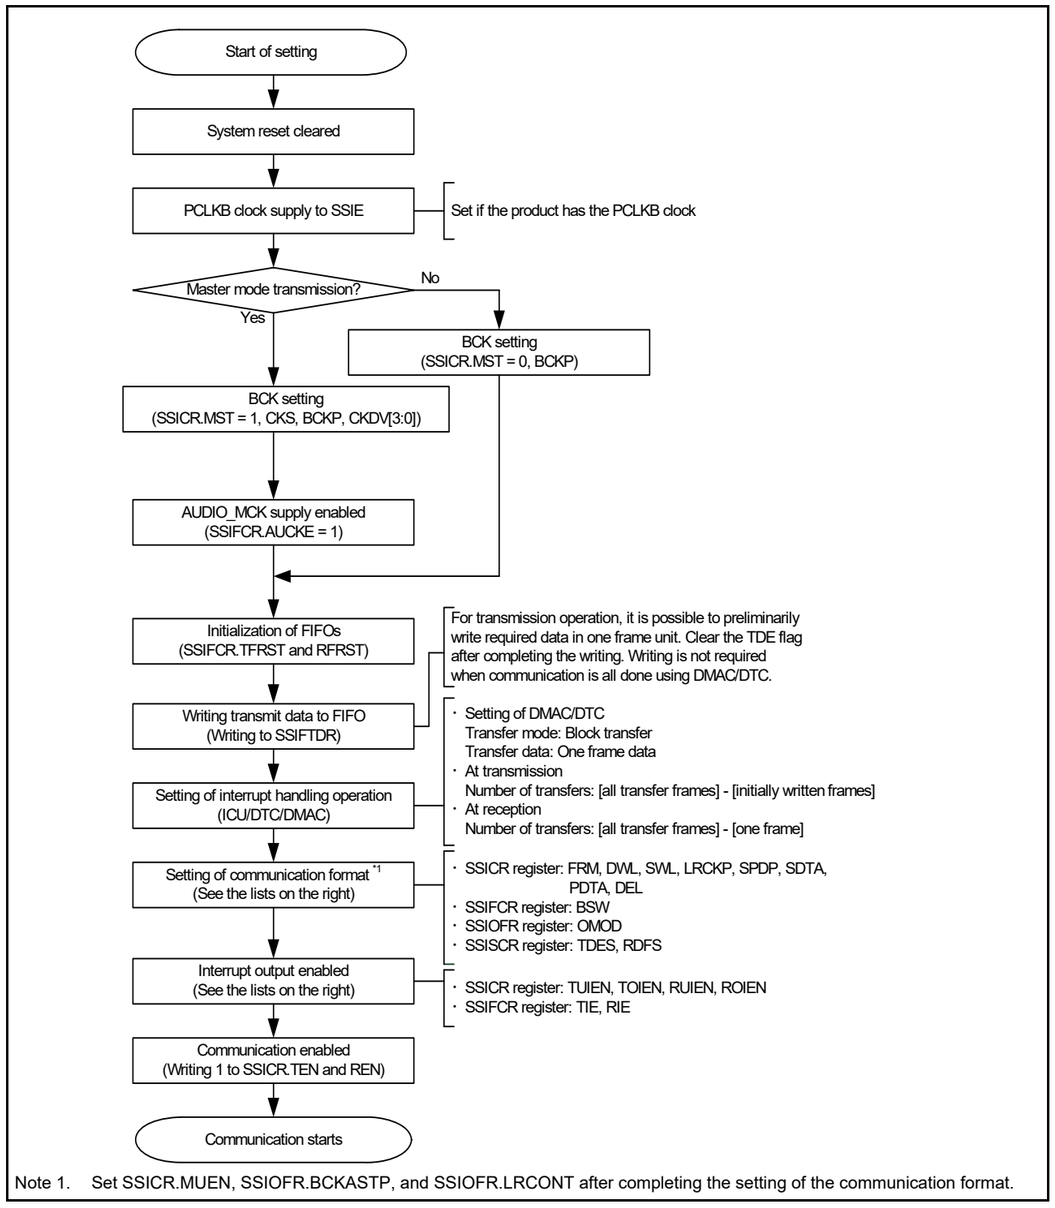
每个操作过程在第37.6.1节，开始通信到第37.6.7节，恢复中描述 Communication.

37.6.1 开始沟通

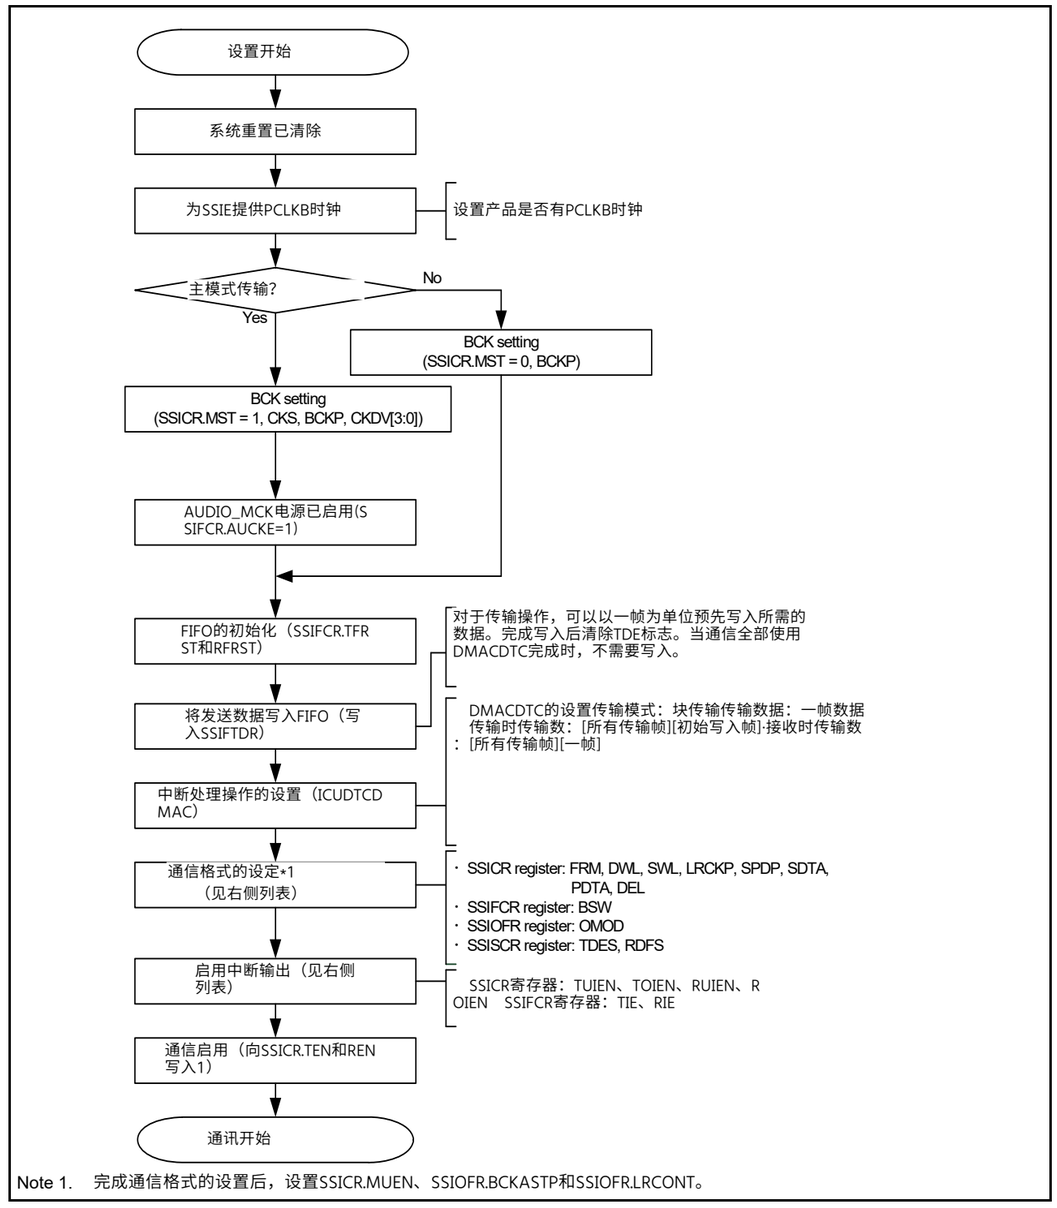
本节介绍如何启动SSIE通信。要开始通信，请务必遵循图37.52中所示的步骤。对于接收操作，请参阅第37.6.2节，传输操作和第37.6.3节，接收。



Note 1. Set SSICR.MUEN, SSIOFR.BCKASTP, and SSIOFR.LRCONT after completing the setting of the communication format.

Figure 37.52 Procedure to start communication (CPU operation procedure)

SSIE can perform continuous communication using interrupts by the DTC or DMAC. For transmission, write 1 to SSIFCR.TIE, SSICR.TUIEN, and SSICR.TOIEN. For reception, write 1 to SSIFCR.RIE, SSICR.RUIEN, and SSICR.ROIEN.



Note 1. 完成通信格式的设置后，设置SSICR.MUEN、SSIOFR.BCKASTP和SSIOFR.LRCONT。

Figure 37.52 开始通信的步骤（CPU操作步骤）

SSIE可以使用DTC或DMAC的中断来执行连续通信。对于传输，写入1到SSIFCR.TIE、SSICR.TUIEN和SSICR.TOIEN。对于接收，将1写入SSIFCR.RIE、SSICR.RUIEN和SSICR.ROIEN.

RA生态工作室

37.6.2 Transmission

The procedure to be followed for a transmission operation is shown in Figure 37.53.

After transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0), SSIE starts transmission when a start trigger is generated by SSILRCK/SSIFS with the serial data for at least a frame contained in the Transmit FIFO Data Register (SSIFTDR). SSIE outputs a transmit data empty interrupt to the DTC or DMAC according to the TDE setting condition (SSISCR.TDES[4:0]) and the status of Transmit Data Empty Interrupt Enable (SSIFCR.TIE) bit specified in the communication start procedure. This interrupt requests writing to the Transmit FIFO Data Register (SSIFTDR). In the communication start procedure, specify writing to the Transmit FIFO Data Register (SSIFTDR) as the DTC or DMAC operation in response to the transmit data empty interrupt. With this setting, SSIE can continuously transmit data not through the CPU. The transmit data empty interrupt is generated when the free space size of Transmit FIFO Data Register reaches the value set in SSISCR.TDES[4:0]. The number of times that data is written must be specified according to the free space size of the Transmit FIFO Data Register indicated by the transmit data empty interrupt. If an error occurs, perform the error-handling procedure as instructed in the communication stop procedure.

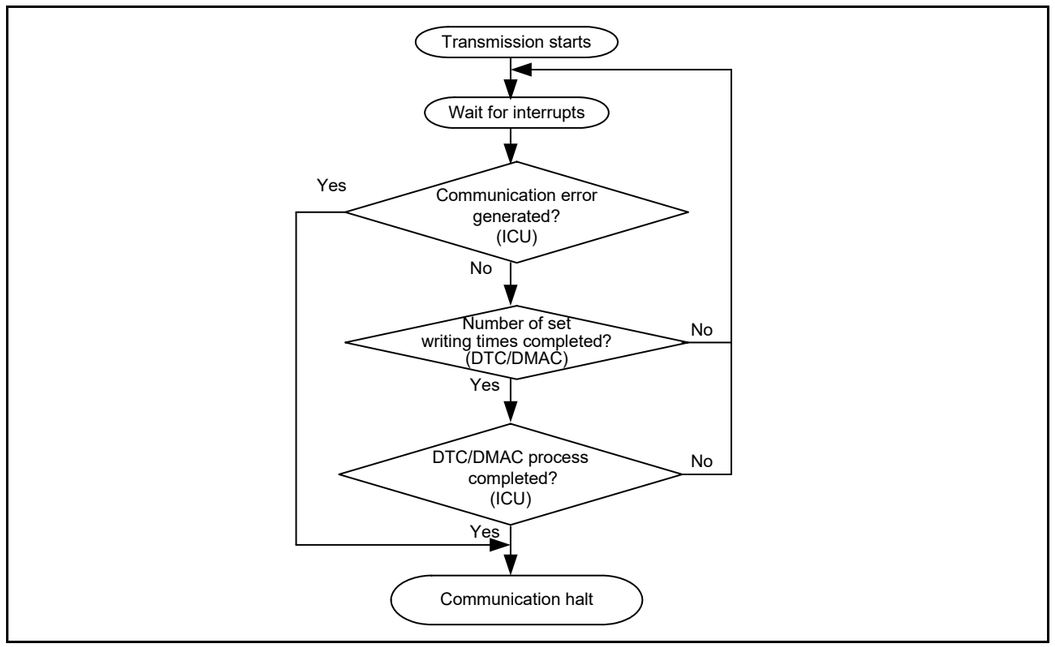


Figure 37.53 Transmission procedure

Note: The communication flow defined in the SSIE uses the DTC or DMAC. If you do not use the DTC or DMAC, poll the SSIFSR.TDE for a value of 1 to write data to SSIFTDR. The number of times data is written to SSIFTDR on detecting a 1 in SSIFSR.TDE must be in accordance with the free space size of the Transmit FIFO Data Register specified in SSISCR.TDES[4:0]. After as much transmit data as the free space size is written to SSIFTDR, the SSIFSR.TDE flag must be cleared. Continuous transmission is enabled by repeating data writing. If the SSIFSR.TDE flag is not cleared, the flag is not cleared automatically.

37.6.3 Reception

The reception procedure to be followed is shown in Figure 37.54.

After reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1), SSIE starts reception when a start trigger is generated by SSILRCK/SSIFS. SSIE outputs a receive data full interrupt to the DTC or DMAC based on the RDF Setting Condition Select (SSISCR.RDFS[4:0]) and the status of Receive Data Full Interrupt Enable (SSIFCR.RIE) bit specified in the communication start procedure. This interrupt requests reading of data from the Receive FIFO Data Register (SSIFRDR). In the communication start procedure, specify reading from the Receive FIFO Data Register (SSIFRDR) as

37.6.2 Transmission

图37.53显示了传输操作要遵循的过程。

使能传输后（SSICR.TEN=1和SSICR.REN=0），当SSILRCKSSIFS使用传输FIFO数据寄存器(SSIFTDR)中包含的至少一帧的串行数据生成启动触发时，SSIE开始传输。SSIE根据TDE设置条件(SSISCR.TDES[4:0])和通信启动过程中指定的发送数据空中断使能(SSIFCR.TIE)位的状态向DTC或DMAC输出发送数据空中断。该中断请求写入发送FIFO数据寄存器(SSIFTDR)。在通信开始过程中，将写入发送FIFO数据寄存器(SSIFTDR)指定为DTC或DMAC操作，以响应发送数据空中断。使用此设置，SSIE可以不通过CPU连续传输数据。当发送FIFO数据寄存器的可用空间大小达到SISSCR.TDES[4:0]中设置的值时，将产生发送数据空中断。数据写入的次数必须根据发送数据空中断指示的发送FIFO数据寄存器的空闲空间大小来指定。如果发生错误，请按照通信停止程序中的说明执行错误处理程序。

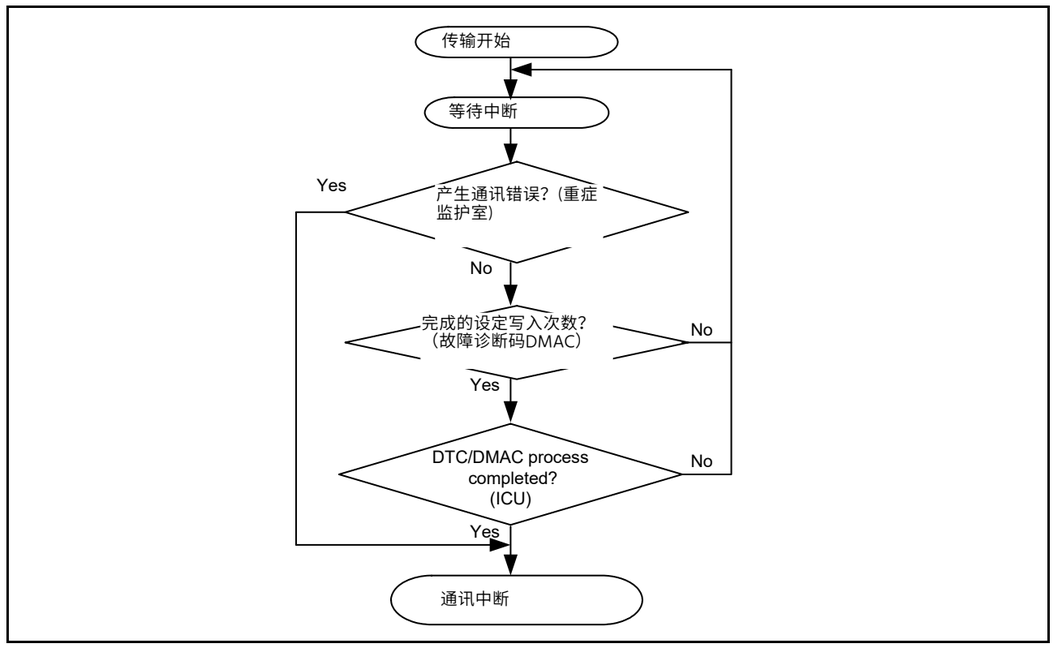

Figure 37.53 传输程序

Note: SSIE中定义的通信流使用DTC或DMAC。如果您不使用DTC或DMAC，则轮询SSIFSR.TDE的值1以将数据写入SSIFTDR。检测到SSIFSR.TDE中的1时数据写入SSIFTDR的次数必须与SISSCR.TDES[4:0]中指定的发送FIFO数据寄存器的可用空间大小一致。在将与可用空间大小一样多的传输数据写入SSIFTDR后，必须清除SSIFSR.TDE标志。通过重复数据写入启用连续传输。如果

SSIFSR.TDE标志不清除，该标志不会自动清除。

37.6.3 Reception

要遵循的接收过程如图37.54所示。

使能接收后（SSICR.TEN=0和SSICR.REN=1），当SSILRCKSSIFS产生一个开始触发信号时，SSIE开始接收。SSIE根据RDF设置条件选择(SSISCR.RDFS[4:0])和通信启动过程中指定的接收数据完全中断使能(SSIFCR.RIE)位的状态向DTC或DMAC输出接收数据完全中断.该中断请求从接收FIFO数据寄存器(SSIFRDR)读取数据。在通信启动过程中，指定从接收FIFO数据寄存器(SSIFRDR)读取为

the DTC or DMAC operation in response to the receive data full interrupt. With this setting, SSIE can continuously read data not through the CPU. The receive data full interrupt is generated when data equal to the capacity of the Receive FIFO Data Register has been stored. The number of times that data is read must be in accordance with the data size of the Receive FIFO Data Register indicated by the receive data full interrupt. If an error occurs, perform the error-handling procedure as described in the communication stop procedure.

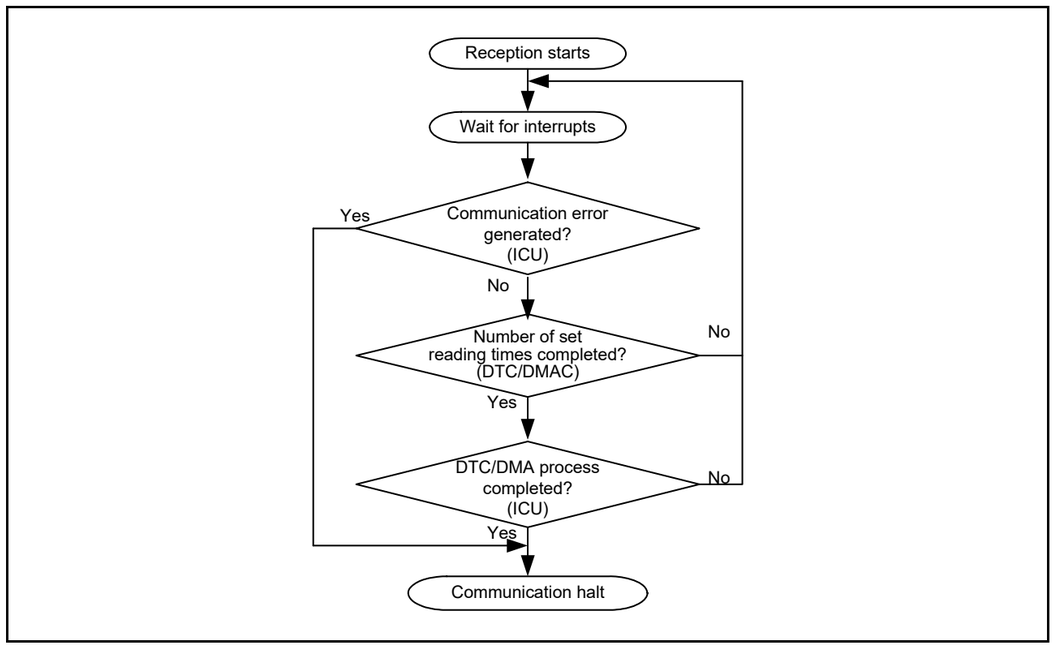

Figure 37.54 Reception procedure

Note: The communication flow defined in the SSIE uses the DTC or DMAC. If you do not use the DTC or DMAC, poll the SSIFSR.RDF for a value of 1 to read data from SSIFRDR. The number of times that data is read from SSIFRDR on detecting the value 1 in SSIFSR.RDF must be in accordance with the receive data storage capacity of the Receive FIFO Data Register specified in SSISCR.RDFS[4:0]. After received data is read from SSIFRDR, the SSIFSR.RDF flag must be cleared. Continuous reception is enabled by repeating data reading. If the SSIFSR.RDF flag is not cleared, the flag is not cleared automatically.

37.6.4 Transmission and Reception

After transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1), SSIE starts transmission and reception when a start trigger is generated by SSILRCK/SSIFS with the serial data for at least a frame contained in the Transmit FIFO Data Register (SSIFTDR). SSIE can continuously transmit and receive data by performing the procedures described in section 37.6.2, Transmission and section 37.6.3, Reception, respectively. For the procedure to stop transmission and reception, see section 37.6.5, Halt Communication.

37.6.5 Halt Communication

This section describes how to halt SSIE communication. Be sure to follow the procedure shown in Figure 37.55 to halt communication.

DTC或DMAC操作以响应接收数据完全中断。通过此设置，SSIE可以不通过CPU连续读取数据。当存储了与接收FIFO数据寄存器容量相等的数据时，将产生接收数据满中断。读取数据的次数必须与数据的大小一致

接收数据满中断指示的接收FIFO数据寄存器。如果发生错误，请按照通信停止程序中的说明执行错误处理程序。

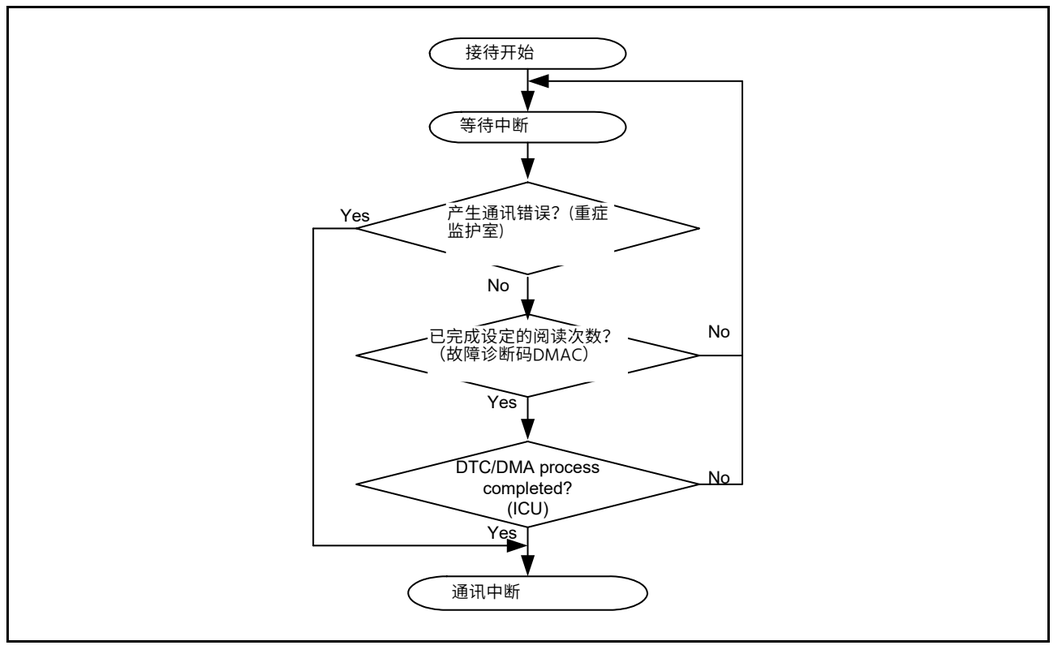

Figure 37.54 接待程序

Note: SSIE中定义的通信流使用DTC或DMAC。如果您不使用DTC或DMAC，请轮询SSIFSR.RDF以获取值1以从SSIFRDR读取数据。检测到SSIFSR.RDF值为1时从SSIFRDR读取数据的次数必须与SSISCR.RDFS[4:0]中指定的接收FIFO数据寄存器的接收数据存储容量一致。从SSIFRDR读取接收到的数据后，必须清除SSIFSR.RDF标志。通过重复数据读取启用连续接收。如果未清除SSIFSR.RDF标志，则不会自动清除该标志。

37.6.4 传输和接收

启用发送和接收后（SSICR.TEN=1和SSICR.REN=1），当SSILRCKSSIFS使用发送FIFO数据寄存器中包含的至少一帧的串行数据生成开始触发时，SSIE开始发送和接收(SSIFTDR)。SSIE可以通过分别执行第37.6.2节，传输和第37.6.3节，接收中描述的过程来连续发送和接收数据。有关停止发送和接收的步骤，请参阅第37.6.5节，停止通信。

37.6.5 停止通讯

本节介绍如何停止SSIE通信。请务必按照图37.55所示的步骤停止通信。

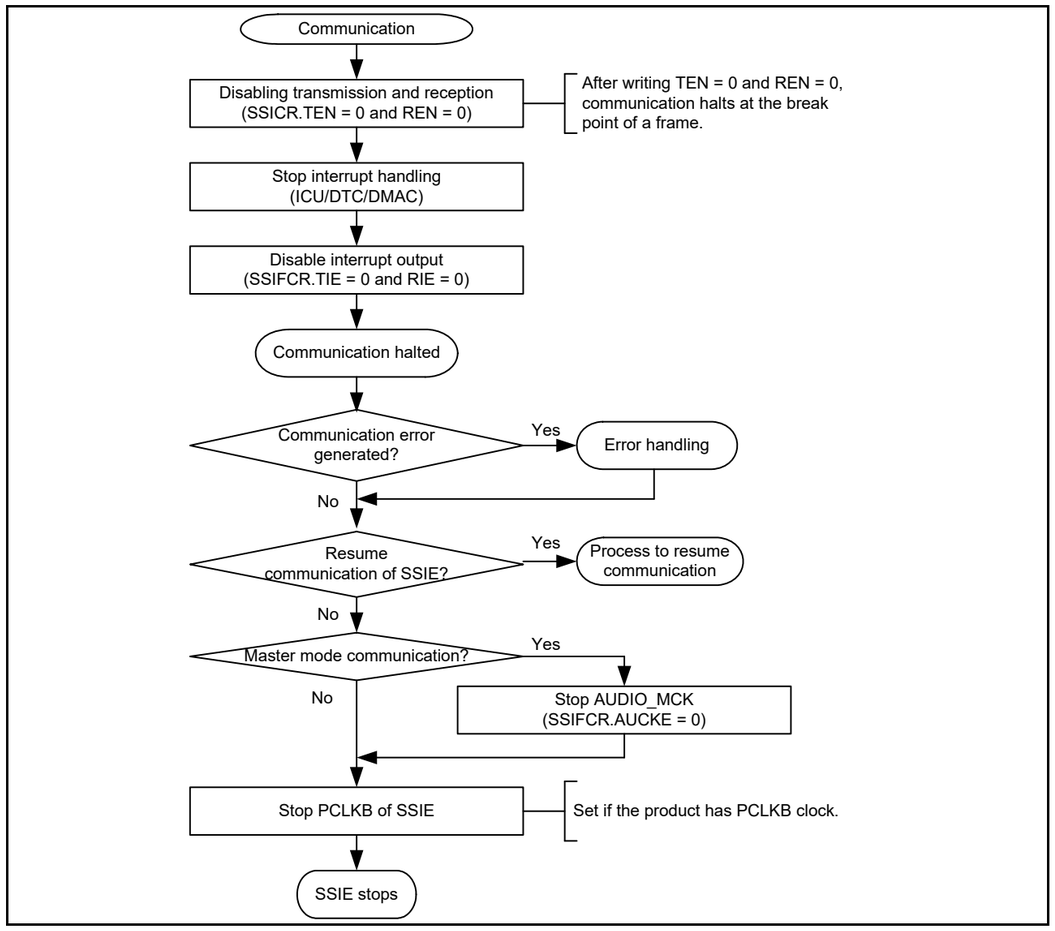

Figure 37.55 Procedure to halt communication (CPU operation)

To halt the SSIE communication, supply of the following clocks is required until the SSISR.IIRQ bit indicates an idle state:

- Input clock from the SSIBCK pin when SSICR.MST = 0
- AUDIO_MCK when SSICR.MST = 1.

  To resume SSIE communication in the previous setting, see section 37.6.7, Resume Communication.

Note: When SSIE communication is halted according to the procedure in Figure 37.55, resume the communication according to the procedure in Figure 37.57.

37.6.6 Error Handling

SSIE has four errors listed as follows:

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error.

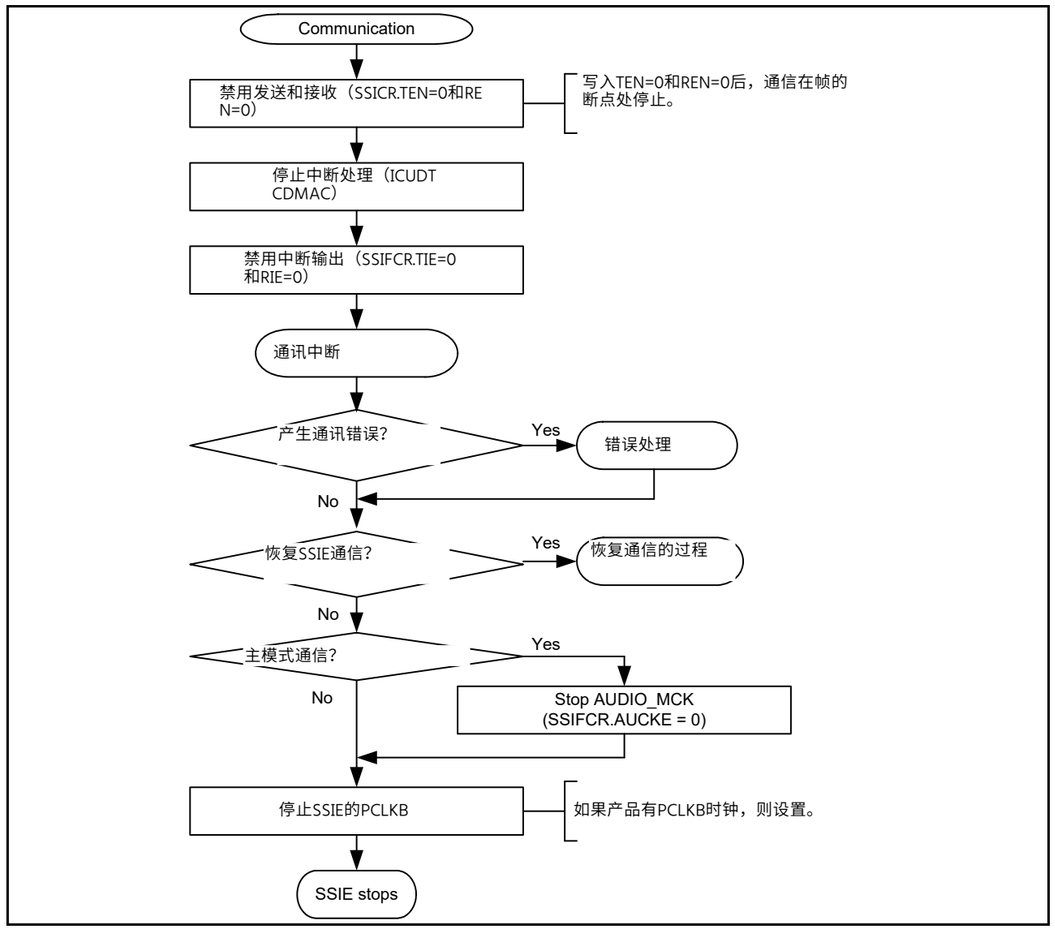

Figure 37.55 停止通信的步骤（CPU操作）

要停止SSIE通信，需要提供以下时钟，直到SSISR.IIRQ位指示空闲状态：

- 当SSICR.MST=0时，来自SSIBCK引脚的输入时钟
- AUDIO_MCK when SSICR.MST = 1.

  要在之前的设置中恢复SSIE通信，请参阅第37.6.7节，恢复通信。

Note: 当SSIE通信按照图37.55中的程序停止时，按照图37.57中的程序恢复通信。

37.6.6 错误处理

SSIE有以下四个错误：

- 发送下溢错误
- 传输溢出错误
- 接收下溢错误
- 接收溢出错误。

RA生态工作室

When an underflow error or overflow error is generated, SSIE must be restarted. Follow the procedure to halt communication in Figure 37.55 and the error-handling procedure in Figure 37.56.

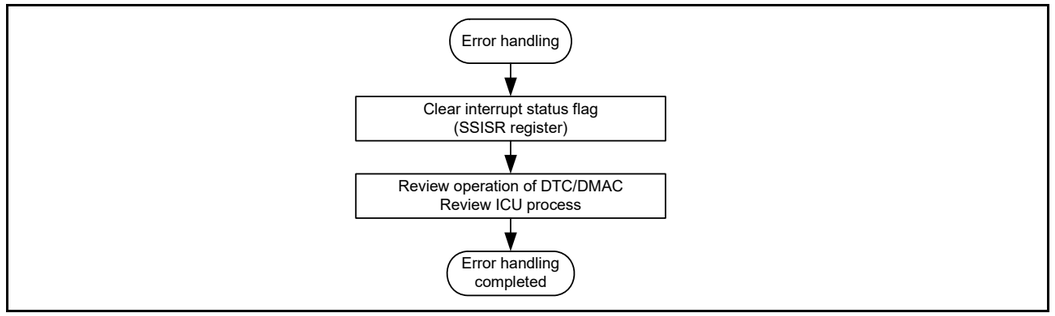

Figure 37.56 Error-handling procedure

This section describes the four error operations. When the Interrupt Output Enable bit of the SSICR register is enabled and the error flags are set, an error interrupt is generated. For the setting conditions of error flag, see the descriptions of flags in section 37.2.2, Status Register (SSISR).

(1) Transmit underflow error

If a transmit underflow error occurs, review the number of times that data is written to the Transmit FIFO Data Register (SSIFTDR) in response to a transmit data empty interrupt. After a transmit underflow error occurs, SSIE outputs 0s as data. To normally output the serial data written in the Transmit FIFO Data Register (SSIFTDR) to the SSITXD0 pin, follow the procedure to halt communication in Figure 37.55 and the error-handling procedure in Figure 37.56. After this error occurs, serial data is consumed as usual. If you resume communication, write the serial data from the beginning.

(2) Transmit overflow error

If a transmit overflow error occurs, review the number of times that data is written to the Transmit FIFO Data Register (SSIFTDR) in response to transmit data empty interrupts. The serial data written to the Transmit FIFO Data Register (SSIFTDR) that caused the transmit overflow error becomes invalid. This error can occur regardless of whether a transmission operation is being done. To recover from the error, follow the procedure to halt communication in Figure 37.55 and the error-handling procedure in Figure 37.56. When you resume communication, handle the invalid serial data appropriately.

(3) Receive underflow error

If a receive underflow error occurs, review the number of times that data is read from the Receive FIFO Data Register (SSIFRDR) in response to receive data full interrupts. The values read from the Receive FIFO Data Register (SSIFRDR) that caused the receive underflow error are undefined. This error can occur regardless of whether a reception operation is being done. To recover from the error, follow the procedure to halt communication in Figure 37.55 and the error-handling procedure in Figure 37.56.

(4) Receive overflow error

If a receive overflow error occurs, review the number of times that data is read from the Receive FIFO Data Register (SSIFRDR) in response to receive data full interrupts. The receive data that caused the receive overflow error cannot be stored in the Receive FIFO Data Register (SSIFRDR). To recover from the error, follow the procedure to halt communication in Figure 37.55 and the error-handling procedure in Figure 37.56.

37.6.7 Resume Communication

To resume SSIE communication, follow the procedure to resume communication shown in Figure 37.57. The procedure assumes that you resume communication stopped by the communication stop procedure without changing any settings. If you want to change the clock and slave/master settings, follow the communication start procedure in Figure 37.52. For details about the transmission and reception operations after starting communication, see section 37.6.2, Transmission and section 37.6.3, Reception, respectively.

当产生下溢错误或上溢错误时，必须重新启动SSIE。按照图37.55中的过程停止通信和图37.56中的错误处理过程。

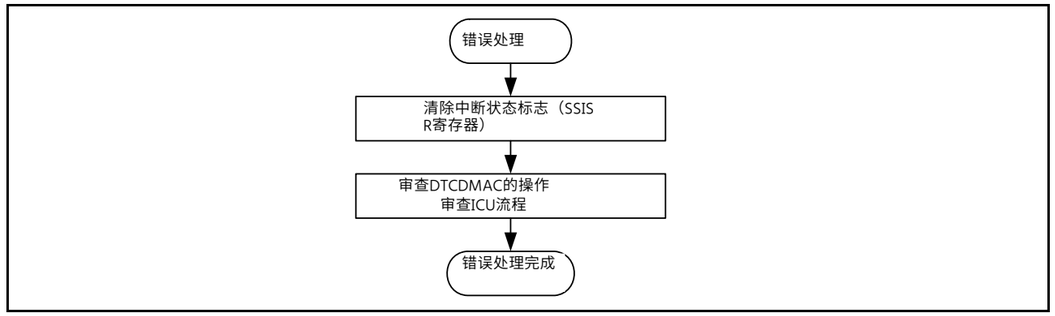

Figure 37.56 Error-handling procedure

本节介绍四种错误操作。当SSICR寄存器的中断输出使能位使能且错误标志置位时，将产生错误中断。关于错误标志的设置条件，请参见第37.2.2节，状态寄存器(SSISR)中的标志说明。

(1) 发送下溢错误

如果发生发送下溢错误，请查看数据写入发送FIFO数据寄存器(SSIFTDR)以响应发送数据空中断的次数。发生发送下溢错误后，SSIE输出0作为数据。要将写入发送FIFO数据寄存器(SSIFTDR)中的串行数据正常输出到SSITXD0引脚，请按照图37.55中的程序停止通信和图37.56中的错误处理程序。发生此错误后，串行数据将照常使用。如果您恢复通信，请从头开始写入串行数据。

(2) 传输溢出错误

如果发生发送溢出错误，请查看数据写入发送FIFO数据寄存器(SSIFTDR)以响应发送数据空中断的次数。导致发送溢出错误的写入发送FIFO数据寄存器(SSIFTDR)的串行数据变为无效。无论是否正在执行传输操作，都可能发生此错误。要从错误中恢复，请按照图37.55中的程序停止通信和图37.56中的错误处理程序。当您恢复通信时，请适当处理无效的串行数据。

(3) 接收下溢错误

如果发生接收下溢错误，请查看从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。从导致接收下溢错误的接收FIFO数据寄存器(SSIFRDR)读取的值未定义。无论是否正在执行接收操作，都可能发生此错误。要从错误中恢复，请按照图37.55中的程序停止通信和图37.56中的错误处理程序。

(4) 接收溢出错误

如果发生接收溢出错误，请查看从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收溢出错误的接收数据不能存储在接收FIFO数据寄存器(SSIFRDR)中。要从错误中恢复，请按照图37.55中的程序停止通信和图37.56中的错误处理程序。

37.6.7 恢复沟通

要恢复SSIE通信，请按照图37.57中所示的过程恢复通信。该过程假定您在不更改任何设置的情况下恢复由通信停止过程停止的通信。如果要更改时钟和从主机设置，请按照图37.52中的通信启动过程。有关开始通信后的发送和接收操作的详细信息，请分别参见第37.6.2节，发送和第37.6.3节，接收。

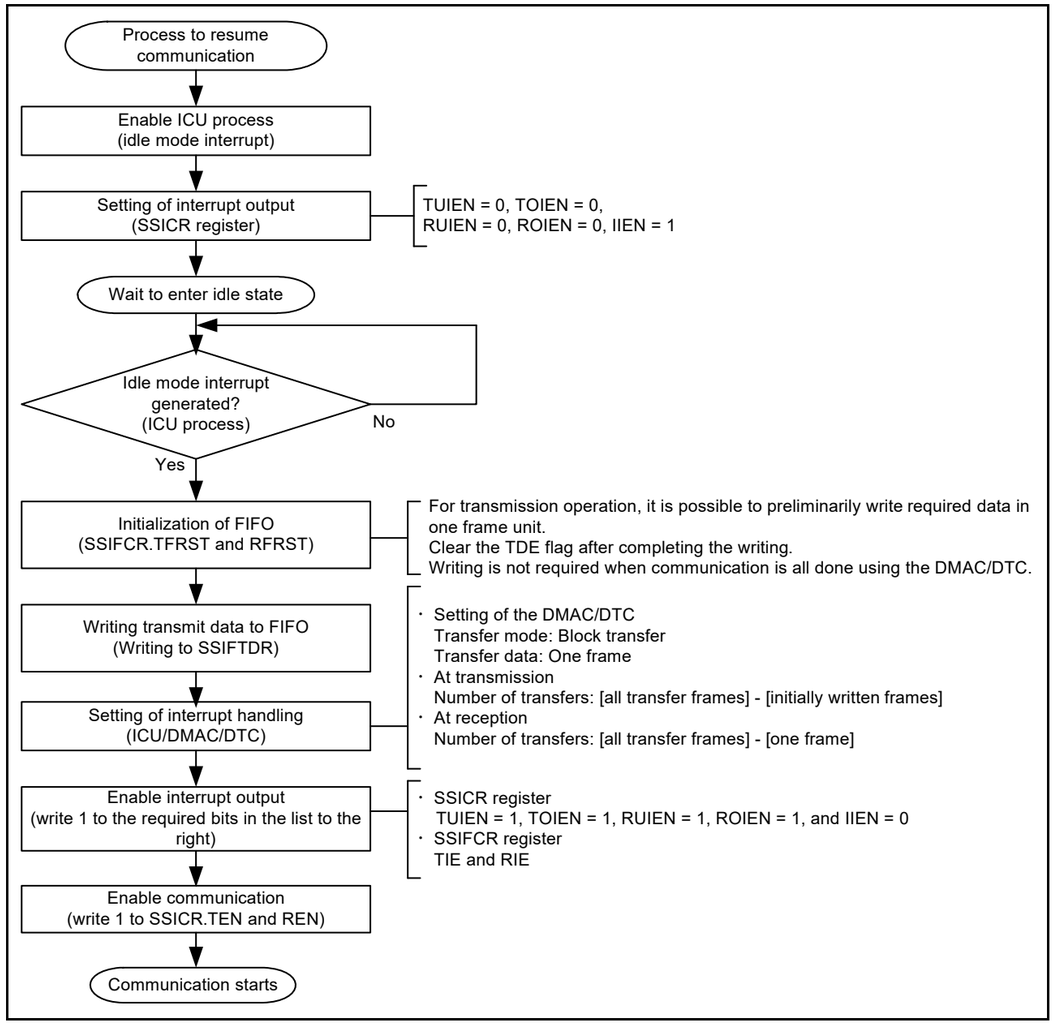

Figure 37.57 Procedure to resume communication (CPU operation)

37.7 Interrupts

Table 37.16 lists the interrupt sources. Enable or disable the interrupt output of each source in the TUIEN, TOIEN, RUIEN, ROIEN, and IIEN bits in the SSICR register, including the TIE and RIE bits in the SSIFCR register.

Table 37.16 SSIE interrupt sources

Channel	Interrupt source	Description	Interrupt flag	DMAC/DTC activation
SSIE0	SSIE0_SSIF	• Transmit underflow interrupt • Transmit overflow interrupt • Receive underflow interrupt • Receive overflow interrupt • Idle interrupt.	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	Not possible
	SSIE0_SSIRXI	Receive data full interrupt	SSIFSR.RDF	Possible
	SSIE0_SSITXI	Transmit data empty interrupt	SSIFSR.TDE	Possible

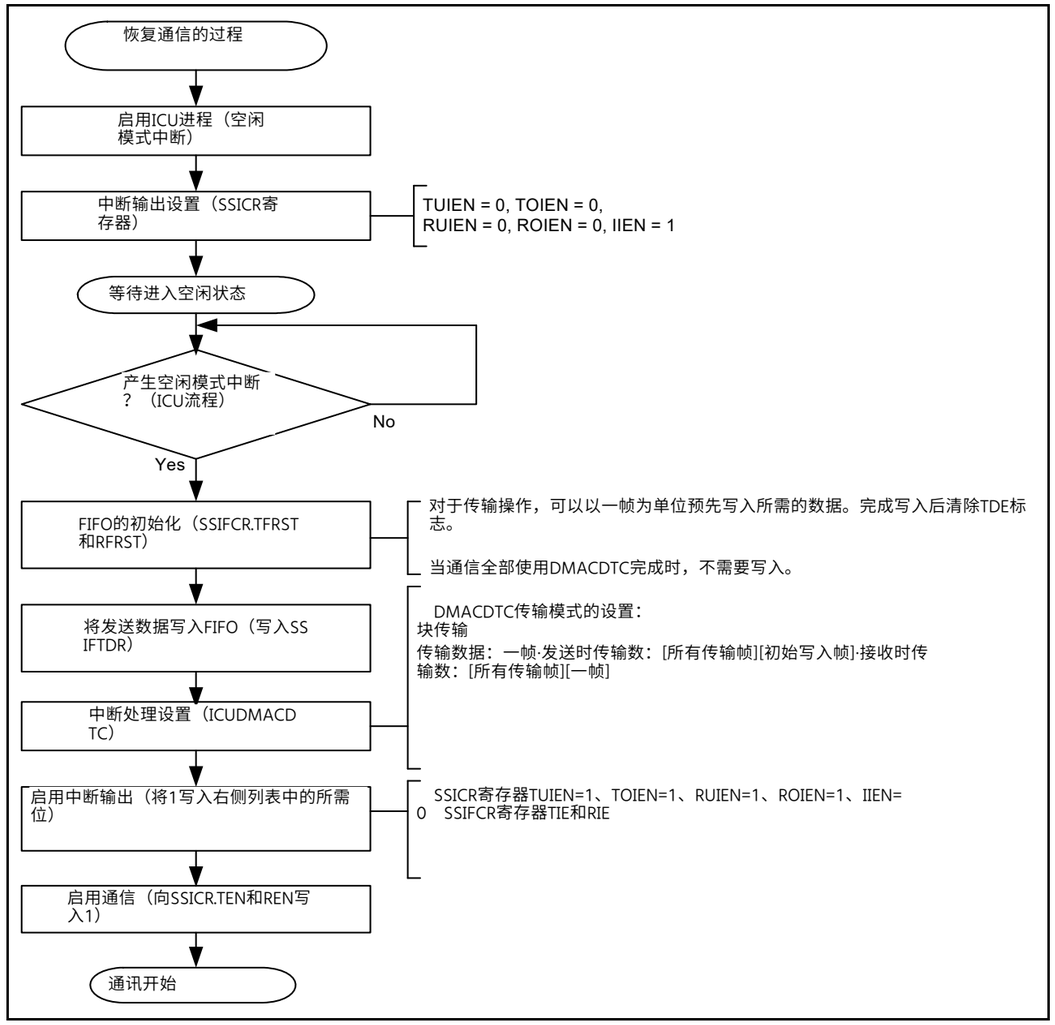

Figure 37.57 恢复通信的步骤（CPU操作）

37.7 Interrupts

表37.16列出了中断源。启用或禁用TUIEN、TOIEN、SSICR寄存器中的RUIEN、ROIEN和IIEN位，包括SSIFCR寄存器中的TIE和RIE位。

Table 37.16 SSIE中断源

Channel	中断源	Description	中断标志	DMAC/DTC activation
SSIE0	SSIE0_SSIF	发送下溢中断 发送上溢中断 接收下溢中断 接收上溢中断 空闲中断。	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	不可能
	SSIE0_SSIRXI	接收数据满中断	SSIFSR.RDF	Possible
	SSIE0_SSITXI	发送数据空中断	SSIFSR.TDE	Possible

37.7.1 SSIE0_SSIF Interrupt

This interrupt source combines five interrupts. Enable output of the required interrupts before using SSIE. The five interrupts are operated using the flags assigned to individual interrupts and the interrupt output enable bits. To clear an interrupt, set the interrupt enable to 0 or clear the interrupt flag to 0.

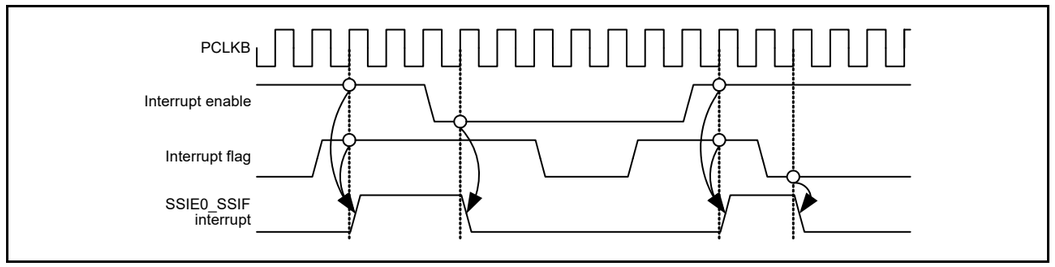

Figure 37.58 Timing diagram of the common interrupt source, SSIE0_SSIF

- Transmit underflow interrupt

As the transmit underflow interrupt, SSISR.TUIRQ is output while SSICR.TUIEN = 1. When you use SSIE for transmission, enable the output of this interrupt (SSICR.TUIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 37.55 and the error-handling procedure in Figure 37.56.

- Transmit overflow interrupt

As the transmit overflow interrupt, SSISR.TOIRQ is output while SSICR.TOIRQ = 1. When you use SSIE for transmission, enable the output of this interrupt (SSICR.TOIRQ = 1). If this interrupt occurs, follow the instructions in the procedure to halt communication in Figure 37.55 and the error-handling procedure in Figure 37.56.

- Receive underflow interrupt

As the receive underflow interrupt, SSISR.RUIRQ is output while SSICR.RUIRQ = 1. When you use SSIE for reception, enable the output of this interrupt (SSICR.RUIRQ = 1). If this interrupt occurs, follow the instructions in the procedure to halt communication in Figure 37.55 and the error-handling procedure in Figure 37.56.

- Receive overflow interrupt

As the receive overflow interrupt, SSISR.ROIRQ is output while SSICR.ROIRQ = 1. When you use SSIE for reception, enable the output of this interrupt (SSICR.ROIRQ = 1). If this interrupt occurs, follow the instructions in the procedure to halt communication in Figure 37.55 and error-handling procedure in Figure 37.56.

- Idle mode interrupt

As the idle mode interrupt, SSISR.IIRQ is output while SSICR.IIEN = 1. This interrupt is used to make sure that communication has stopped fully.

37.7.2 SSIE0_SSITXI Interrupt (Full-duplex communication)

The transmit data empty interrupt is a pulse interrupt that is output when the following condition is met:

- SSIFCR.TIE = 1 and SSIFSR.TDE = 1
  - SSIE operation: When the value of SSIFSR.TDE changes from 0 to 1, while the value of SSIFCR.TIE is 1
  - CPU instruction: When the value of SSIFCR.TIE changes from 0 to 1 while the value of SSIFSR.TDE is 1.

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC or DMAC is busy, that is, when the DTC or DMAC cannot accept interrupts, the interrupt suppression function holds the output of this interrupt. The held interrupt is output after the DTC or DMAC is enabled to accept interrupts. For details, see Figure 37.59.

37.7.1 SSIE0_SSIF Interrupt

该中断源结合了五个中断。在使用SSIE之前启用所需中断的输出。使用分配给各个中断的标志和中断输出使能位来操作五个中断。要清除中断，请将中断使能设置为0或将中断标志清除为0。

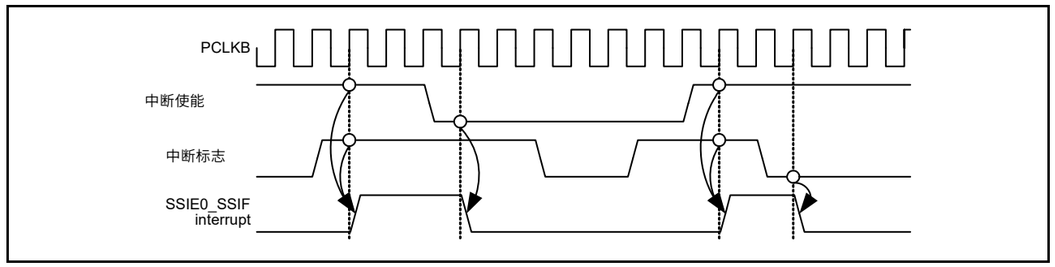

Figure 37.58 公共中断源的时序图，SSIE0_SSIF

- 发送下溢中断

作为发送下溢中断，在SSICR.TUIEN=1时输出SSISR.TUIRQ。当使用SSIE进行发送时，使能该中断的输出（SSICR.TUIRQ=1）。如果发生此中断，请按照图37.55中的停止通信过程和图37.56中的错误处理过程中的说明进行操作。

- 发送溢出中断

作为发送溢出中断，在SSICR.TOIRQ=1时输出SSISR.TOIRQ。当使用SSIE进行发送时，使能该中断的输出（SSICR.TOIRQ=1）。如果发生此中断，请按照图37.55中的停止通信过程和图37.56中的错误处理过程中的说明进行操作。

- 接收下溢中断

作为接收下溢中断，在SSICR.RUIRQ=1时输出SSISR.RUIRQ。当使用SSIE进行接收时，使能该中断的输出（SSICR.RUIRQ=1）。如果发生此中断，请按照图37.55中的停止通信过程和图37.56中的错误处理过程中的说明进行操作。

- 接收溢出中断

作为接收溢出中断，在SSICR.ROIRQ=1时输出SSISR.ROIRQ。当使用SSIE进行接收时，使能该中断的输出（SSICR.ROIRQ=1）。如果发生此中断，请按照图37.55中的过程中止通信和图37.56中的错误处理过程中的说明进行操作。

- 空闲模式中断

作为空闲模式中断，在SSICR.IIEN=1时输出SSISR.IIRQ。此中断用于确保通信已完全停止。

37.7.2 SSIE0_SSITXI Interrupt (Full-duplex communication)

发送数据空中断是一个脉冲中断，当满足以下条件时输出：

- SSIFCR.TIE = 1 and SSIFSR.TDE = 1
  - SSIE操作：当SSIFSR.TDE的值从0变为1，而SSIFCR.TIE的值为1
  - CPU指令：当SSIFCR.TIE的值从0变为1，而SSIFSR.TDE的值为1时。

该中断受中断抑制功能影响。如果在DTC或DMAC忙时出现此中断的中断条件，即DTC或DMAC不能接受中断时，中断抑制功能保持此中断的输出。在DTC或DMAC使能接受中断后输出保持的中断。详见图37.59。

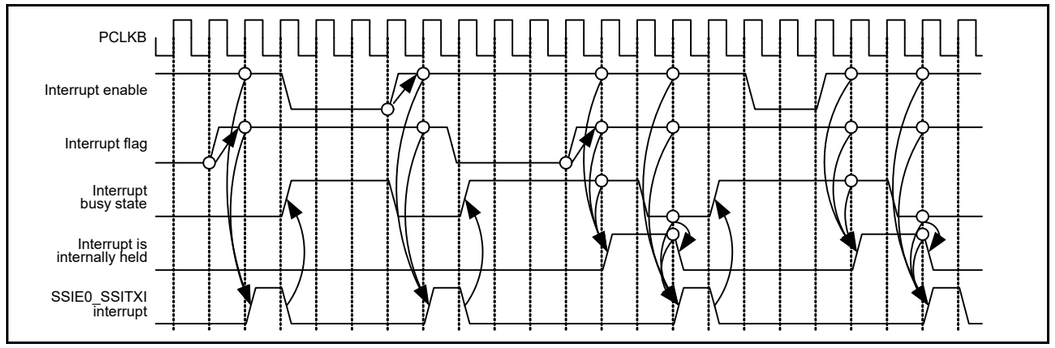

Figure 37.59 Timing diagram of SSIE0_SSITXI interrupt

37.7.3 SSIE0_SSIRXI Interrupt

The receive data full interrupt is a pulse interrupt that is output when the following condition is met:

- SSIFCR.RIE = 1 and SSIFSR.RDF = 1
  - SSIE operation: When the value of SSIFSR.RDF changes from 0 to 1, while the value of SSIFCR.RIE is 1
  - CPU instruction: When the value of SSIFCR.RIE changes from 0 to 1, while the value of SSIFSR.RDE is 1.

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC or DMAC is busy, that is, when the DTC/DMAC cannot accept interrupts, the interrupt suppression function holds the output of this interrupt. The held interrupt is output after the DTC or DMAC is enabled to accept interrupts. The behavior of this interrupt is the same as the behavior shown in Figure 37.59.

37.8 Software Resets

SSIE has three software reset bits:

- SSIE Software Reset (SSIFCR.SSIRST)
- Transmit FIFO Data Register Reset (SSIFCR.TFRST)
- Receive FIFO Data Register Reset (SSIFCR.RFRST).

This section describes the procedures for the three types of software resets.

37.8.1 Software Reset Procedure

(1) SSIE software reset

For the SSIE Software Reset (SSIFCR.SSIRST) bit, follow the procedure shown in Figure 37.60. After a reset occurs, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start communication in Figure 37.52. For details on transmission and reception after communication is resumed, see section 37.6.2, Transmission and section 37.6.3, Reception.

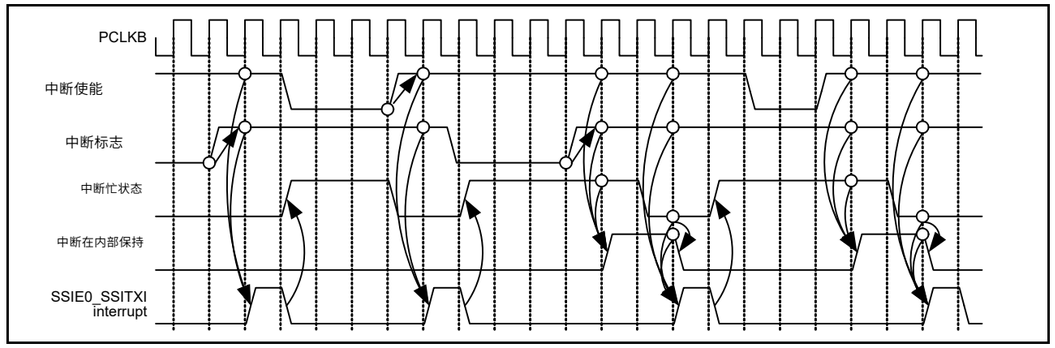

Figure 37.59 SSIE0_SSITXI中断时序图

37.7.3 SSIE0_SSIRXI Interrupt

接收数据满中断是一个脉冲中断，当满足以下条件时输出：

- SSIFCR.RIE = 1 and SSIFSR.RDF = 1
  - SSIE操作：当SSIFSR.RDF的值从0变为1，而SSIFCR.RIE的值为1
  - CPU指令：当SSIFCR.RIE的值从0变为1时，而SSIFSR.RDE的值为1。

该中断受中断抑制功能影响。如果在DTC或DMAC忙时发生此中断的中断条件，即DTCDMAC不能接受中断时，中断抑制函数保持此中断的输出。在DTC或DMAC使能接受中断后输出保持的中断。该中断的行为与图37.59中所示的行为相同。

37.8 软件复位

SSIE具有三个软件复位位：

- SSIE软件复位(SSIFCR.SSIRST)
- 发送FIFO数据寄存器复位(SSIFCR.TFRST)
- 接收FIFO数据寄存器复位(SSIFCR.RFRST)。

本节介绍三种软件复位的过程。

37.8.1 软件复位程序

(1) SSIE软件复位

对于SSIE软件复位(SSIFCR.SSIRST)位，请遵循图37.60中所示的过程。发生重置后，恢复时应用相同的设置。要更改时钟和从主模式的设置，请按照图37.52中的步骤开始通信。有关恢复通信后的发送和接收的详细信息，请参阅第37.6.2节，发送和第37.6.3节，接收。

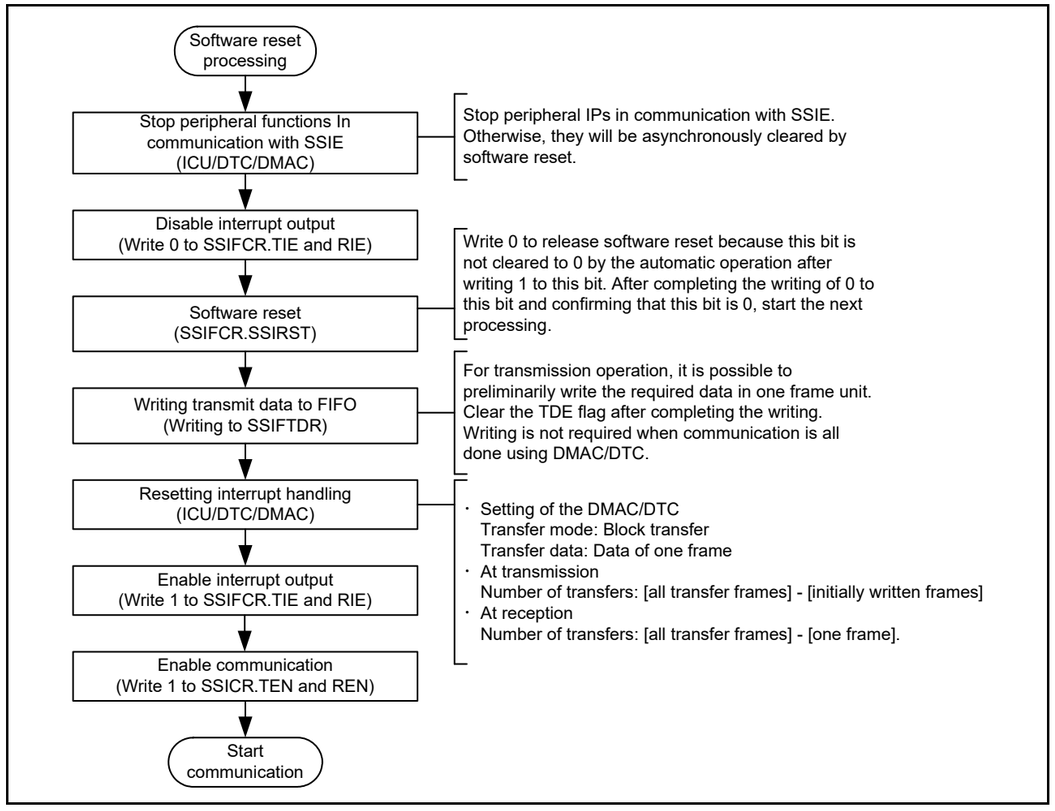

Figure 37.60 Software reset procedure (CPU operation procedure)

(2) Transmit FIFO Data Register reset

To perform a Transmit FIFO Data Register reset, follow the procedures to start communication as shown in Figure 37.52 and resume communication as shown in Figure 37.57.

(3) Receive FIFO Data Register reset

To perform a Receive FIFO Data Register reset, follow the procedures to start communication as shown in Figure 37.52 and resume communication as shown in Figure 37.57.

37.9 Usage Notes

37.9.1 Notes on Slave Mode Communication

37.9.1.1 ADCKE control

In slave mode communication (SSICR.MST = 0), SSIE requires the supply of SSIBCK. To stop BCK on the master side, make sure that SSIE is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIE becomes idle, use the procedure to start communication shown in Figure 37.52 or wait for an idle state using the procedure to resume communication shown in Figure 37.57.

37.9.1.2 SSILRCK/SSIFS pin

The SSILRCK/SSIFS pin indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the SSIE communication format must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

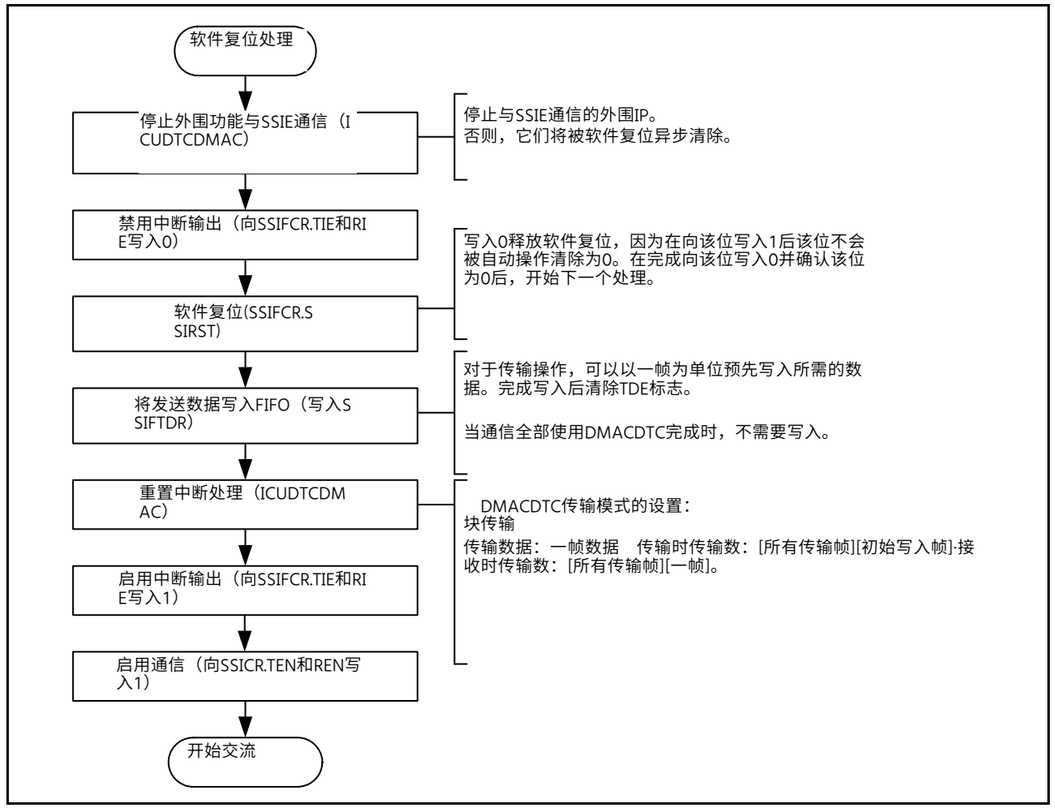

Figure 37.60 软件复位程序（CPU操作程序）

(2) 发送FIFO数据寄存器复位

要执行发送FIFO数据寄存器复位，请按照图37.52所示的程序开始通信并如图37.57所示恢复通信。

(3) 接收FIFO数据寄存器复位

要执行接收FIFO数据寄存器复位，请按照图37.52所示的程序开始通信并如图37.57所示恢复通信。

37.9 使用说明

37.9.1 从模式通信注意事项

37.9.1.1 ADCKE control

在从机模式通信（SSICR.MST=0）中，SSIE需要提供SSIBCK。要在主设备端停止BCK，请确保SSIE处于空闲状态(SSISR.IIRQ=1)。如果BCK在SSIE变为空闲之前停止，则使用图37.52所示的过程开始通信，或使用图37.57所示的恢复通信的过程等待空闲状态。

37.9.1.2 SSILRCK/SSIFS pin

SSILRCKSSIFS引脚指示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE通信格式必须与对方设备的通信格式匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

RA生态工作室

37.9.2 Notes on Master Mode Communication

37.9.2.1 ADCKE control

In master mode communication (SSICR.MST = 1), SSIE operates with the audio clock (AUDIO_MCK). To stop SSIE completely, make sure that SSIE is in the idle state (SSISR.IIRQ = 1), then write 0 to SSIFCR.ADCKE.

37.9.2.2 LRCONT control

When SSIE is in an idle state in master mode communication (SSICR.MST = 1), the output to the SSILRCK/SSIFS pin stops when the value of the SSIOFR.LRCONT bit is changed from 1 to 0. Make sure that the other-party device is not affected. For details, see Figure 37.43.

37.9.2.3 BCKASTP control

When the SSIE is in the idle state in master mode communication (SSICR.MST = 1), the output to the SSIBCK pin stops when the value of the SSIOFR.BCKASTP bit is changed from 0 to 1. Make sure that the other-party device is not affected. For details, see Figure 37.44.

The BCKASTP bit cannot be used when the other-party device (which is a slave) requires the clock output from the SSIBCK pin before and during communication.

37.9.3 Notes on Communication Flow

37.9.3.1 When an error interrupt is generated

SSIE has the following four errors:

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error.

When an underflow error or overflow error is generated, SSIE must be restarted. Follow the procedure to halt communication as shown in Figure 37.55 and the error-handling procedure as shown in Figure 37.56.

(1) Transmit underflow error

If a transmit underflow error occurs, review the number of times that data is written to the Transmit FIFO Data Register (SSIFTDR) in response to a transmit data empty interrupt. After a transmit underflow error occurs, SSIE outputs 0s as data. To normally output the serial data written to the Transmit FIFO Data Register (SSIFTDR) to the SSITXD0 pin, follow the procedure to halt communication as shown in Figure 37.55 and the error-handling procedure in Figure 37.56. After this error occurs, serial data is consumed as usual. If you resume communication, write the serial data from the beginning.

(2) Transmit overflow error

If a transmit overflow error occurs, review the number of times that data is written to the Transmit FIFO Data Register (SSIFTDR) in response to transmit data empty interrupts. The serial data written to the Transmit FIFO Data Register (SSIFTDR) that caused the transmit overflow error becomes invalid. This error can occur regardless of whether a transmission operation is performed. To recover from the error, follow the procedure to halt communication as shown in Figure 37.55 and the error-handling procedure as shown in Figure 37.56. When you resume communication, handle the invalid serial data appropriately.

(3) Receive underflow error

If a receive underflow error occurs, review the number of times that data is read from the Receive FIFO Data Register (SSIFRDR) in response to receive data full interrupts. The values read from the Receive FIFO Data Register (SSIFRDR) that caused the receive underflow error are undefined. This error can occur regardless of whether a reception operation is performed. To recover from the error, follow the procedure to halt communication as shown in Figure 37.55 and the error-handling procedure as shown in Figure 37.56.

37.9.2 主模式通信注意事项

37.9.2.1 ADCKE control

在主模式通信(SSICR.MST=1)中，SSIE使用音频时钟(AUDIO_MCK)运行。要完全停止SSIE，请确保SSIE处于空闲状态（SSISR.IIRQ=1），然后将0写入SSIFCR.ADCKE。

37.9.2.2 LRCONT control

当SSIE在主机模式通信中处于空闲状态时（SSICR.MST=1），当SSIOFR.LRCONT位的值从1变为0时，停止向SSILRCKSSIFS引脚的输出。确保对方设备不受影响。详见图37.43。

37.9.2.3 BCKASTP control

当SSIE在主机模式通信中处于空闲状态时（SSICR.MST=1），当SSIOFR.BCKASTP位的值从0变为1时停止向SSIBCK引脚的输出。确保对方设备不受影响。详见图37.44。

当对方设备（从设备）需要时钟输出时，不能使用BCKASTP位
SSIBCK引脚在通信之前和期间。

37.9.3 通讯流程注意事项

37.9.3.1 产生错误中断时

SSIE有以下四个错误：

- 发送下溢错误
- 传输溢出错误
- 接收下溢错误
- 接收溢出错误。

当产生下溢错误或上溢错误时，必须重新启动SSIE。按照图37.55中所示的过程停止通信和图37.56中所示的错误处理过程。

(1) 发送下溢错误

如果发生发送下溢错误，请查看数据写入发送FIFO数据寄存器(SSIFTDR)以响应发送数据空中断的次数。发生发送下溢错误后，SSIE输出0作为数据。要将写入发送FIFO数据寄存器(SSIFTDR)的串行数据正常输出到SSITXD0引脚，请按照图37.55中所示的程序停止通信和图37.56中的错误处理程序。发生此错误后，串行数据将照常使用。如果您恢复通信，请从头开始写入串行数据。

(2) 传输溢出错误

如果发生发送溢出错误，请查看数据写入发送FIFO数据寄存器(SSIFTDR)以响应发送数据空中断的次数。导致发送溢出错误的写入发送FIFO数据寄存器(SSIFTDR)的串行数据变为无效。无论是否执行传输操作，都可能发生此错误。要从错误中恢复，请按照图37.55中所示的程序停止通信和图37.56中所示的错误处理程序。当您恢复通信时，请适当处理无效的串行数据。

(3) 接收下溢错误

如果发生接收下溢错误，请查看从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。从导致接收下溢错误的接收FIFO数据寄存器(SSIFRDR)读取的值未定义。无论是否执行接收操作，都可能发生此错误。要从错误中恢复，请按照图37.55中所示的程序停止通信和图37.56中所示的错误处理程序。

(4) Receive Overflow Error

If a receive overflow error occurs, review the number of times that data is read from the Receive FIFO Data Register (SSIFRDR) in response to receive data full interrupts. The receive data that caused the receive overflow error cannot be stored in the Receive FIFO Data Register (SSIFRDR). To recover from the error, follow the procedure to halt communication as shown in Figure 37.55 and the error-handling procedure as shown in Figure 37.56.

37.9.3.2 Transmit data empty interrupt

The communication flow defined in SSIE uses the DTC or DMAC. If you do not use the DTC or DMAC, poll for 1 in SSIFSR.TDE to write data to SSIFTDR. The number of times that data is written to SSIFTDR on detecting 1 in SSIFSR.TDE must be in accordance with the free space size of the Transmit FIFO Data Register specified in SSISCR.TDES[4:0]. After as much transmit data as the free space size is written to SSIFTDR, the SSIFSR.TDE flag must be cleared. Continuous transmission is enabled by repeating data writing. If the SSIFSR.TDE flag is not cleared, the flag is not cleared automatically.

37.9.3.3 Receive data full interrupt

The communication flow defined in SSIE uses the DTC or DMAC. If you do not use the DTC or DMAC, poll for 1 in SSIFSR.RDF to read data from SSIFRDR. The number of times that data is read from SSIFRDR on detecting 1 in SSIFSR.RDF must be in accordance with the receive data storage capacity of the Receive FIFO Data Register specified in SSISCR.RDFS[4:0]. After received data is read from SSIFRDR, the SSIFSR.RDF flag must be cleared. Continuous reception is enabled by repeating data reading. If the SSIFSR.RDF flag is not cleared, the flag is not cleared automatically.

37.9.3.4 Switching transfer modes

Transfer modes can be switched as follows:

1. For state transition from transmission, reception, and transmission and reception, disable transmission and reception (SSICR.TEN = 0, SSICR.REN = 0).
2. Confirm SSIE is in the idle state (SSISR.IIRQ = 1).
3. In the idle state, set the SSICR.TEN bit and the SSICR.REN bit again and resume transfer.

37.9.3.5 Resume communication after halting SSIE

When SSIE communication is halted according to the procedure shown in Figure 37.55, resume communication using the procedure shown in Figure 37.57.

37.9.4 Write Access Restriction

37.9.4.1 SSICR register

If the TEN or REN bit is rewritten, make sure that the SSISR.IIRQ bit has the desired status. If the value of the TEN or REN bit is changed by rewriting, subsequent operation is unpredictable. For example, when transmission or reception is enabled, check that SSISR.IIRQ is 0, and when transmission or reception is disabled, check that SSISR.IIRQ is 1.

(1) TEN and REN bits

The TEN and REN bits enable or disable transmission and reception. When 1 is written to one of these bits, the corresponding communication operation starts in synchronization with a start trigger by the SSILRCK/SSIFS signal. For details, see section 37.6.2, Transmission, section 37.6.3, Reception, and section 37.6.4, Transmission and Reception. When 0 is written to this bit, the current communication operation stops at the next frame boundary. To use SSIE for both transmission and reception, simultaneously write 1 to these bits. When stopping the communication using SSIE, always disable both transmission and reception (write 0 to the TEN and REN bits).

(4) 接收溢出错误

如果发生接收溢出错误，请查看从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收溢出错误的接收数据不能存储在接收FIFO数据寄存器(SSIFRDR)中。要从错误中恢复，请按照图37.55中所示的程序停止通信和图37.56中所示的错误处理程序。

37.9.3.2 发送数据空中断

SSIE中定义的通信流使用DTC或DMAC。如果您不使用DTC或DMAC，请轮询1in
SSIFSR.TDE将数据写入SSIFTDR。检测到1时数据写入SSIFTDR的次数
SSIFSR.TDE必须与中指定的发送FIFO数据寄存器的可用空间大小一致
SISSCR.TDES[4:0]。在将与可用空间大小一样多的传输数据写入SSIFTDR后，必须清除SSIFSR.TDE标志。通过重复数据写入启用连续传输。如果未清除SSIFSR.TDE标志，则不会自动清除该标志。

37.9.3.3 接收数据满中断

SSIE中定义的通信流使用DTC或DMAC。如果您不使用DTC或DMAC，请轮询1in
SSIFSR.RDF从SSIFRDR读取数据。在检测到1时从SSIFRDR读取数据的次数
SSIFSR.RDF必须与SSISCR.RDFS[4:0]中指定的接收FIFO数据寄存器的接收数据存储容量一致。从SSIFRDR读取接收到的数据后，必须清除SSIFSR.RDF标志。通过重复数据读取启用连续接收。如果SSIFSR.RDF标志未清除，则该标志不会自动清除。

37.9.3.4 切换传输模式

传输模式可以如下切换：

1. 对于从发送、接收和发送和接收的状态转换，禁用发送和接收（SSICR.TEN=0，SSICR.REN=0）。
2. 确认SSIE处于空闲状态(SSISR.IIRQ=1)。
3. 在空闲状态下，再次设置SSICR.TEN位和SSICR.REN位并恢复传输。

37.9.3.5 停止SSIE后恢复通信

当根据图37.55所示过程停止SSIE通信时，使用图37.57所示过程恢复通信。

37.9.4 写访问限制

37.9.4.1 SSICR register

如果TEN或REN位被重写，请确保SSISR.IIRQ位具有所需的状态。如果TEN或REN位的值因重写而改变，后续操作将无法预测。例如，启用发送或接收时，检查SSISR.IIRQ是否为0，禁用发送或接收时，检查SSISR.IIRQ是否为1。

(1) 十位和REN位

TEN和REN位启用或禁用发送和接收。当这些位之一写入1时，相应的通信操作与SSILRCKSSIFS信号的开始触发同步开始。有关详细信息，请参阅第37.6.2节，传输，第37.6.3节，接收和第37.6.4节，传输和接收。当向该位写入0时，当前通信操作在下一帧边界处停止。要将SSIE用于发送和接收，同时向这些位写入1。使用SSIE停止通信时，始终禁用发送和接收（将0写入TEN和REN位）。

37.9.4.2 SSISR register

(1) Clearing TUIRQ and TOIRQ

After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags TOIRQ and TUIRQ in the SSISR register are cleared. If the SSISR register is read continuously, the cleared status of the transmission error flags might be unreadable.

(2) Clearing RUIRQ and ROIRQ

After communication is enabled (by changing the value of the SSICR.REN bit from 0 to 1), the reception error flags RUIRQ and ROIRQ in the SSISR register are cleared. However, if the SSISR register is read continuously, the cleared status of the reception error flags might be unreadable.

37.9.4.3 Communication state

Writing to the bits indicated with the shaded area in Table 37.17 is prohibited. If these bits are written to, the subsequent operation performed after the writing is not guaranteed.

Table 37.17 Bits protected from writing during communication

Symbol	Address (BASE+)		+0								+1

		+2	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				

37.9.4.2 SSISR register

(1) 清除TUIRQ和TOIRQ

启用通信后（通过将SSICR.TEN位的值从0更改为1），传输错误标志
SSISR寄存器中的TOIRQ和TUIRQ被清零。如果连续读取SSISR寄存器，则传输错误标志的清除状态可能无法读取。

(2) 清除RUIRQ和ROIRQ

启用通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志
SSISR寄存器中的RUIRQ和ROIRQ被清零。但是，如果连续读取SSISR寄存器，则接收错误标志的清除状态可能无法读取。

37.9.4.3 通讯状态

禁止写入表37.17中用阴影区域指示的位。如果写入这些位，则无法保证写入后执行的后续操作。

Table 37.17 通信期间防止写入的位

38. Sampling Rate Converter (SRC)

38.1 Overview

The Sampling Rate Converter (SRC) is used to convert the sampling rate of data produced by various audio decoders, including WMA, MP3, and AAC. Both 16-bit stereo and monaural data are supported. The sampling rate of the input signal can be one of the following (in kHz): 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, or 48. The sampling rate of the output signal can be one of the following (in kHz): 8, 16, 32, 44.1, or 48. Independent FIFOs are provided for input and output. In a typical application, a DMA controller can be used to transfer PCM audio data from the SRAM, for example, to the SRC. Sample-converted audio data from the SRC can then be transferred using the DMA controller to the SSIE interface, from where it can be transmitted to an external audio codec.

Table 38.1 shows the SRC specifications and Figure 38.1 shows a block diagram.

Table 38.1 SRC specifications

Parameter		Specifications
Data size		16 bits (stereo/monaural)
Sampling rates	Input	Selectable to 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, or 48 kHz
	Output	Selectable to 8*1, 16*1, 32, 44.1, or 48 kHz
Processing capacity		Maximum of 7.7 µs for one sample output interval (PCLKB = 60 MHz, 462 clocks)
SNR		80 db or higher
Interrupt sources		Five Input FIFO empty, output FIFO full, output FIFO overflow, output FIFO underflow, and conversion end
DMA transfer sources		Two Input FIFO empty and output FIFO full
Module-stop function		Module-stop state can be set to reduce power consumption

Note 1. Only when input of 44.1 kHz is selected.

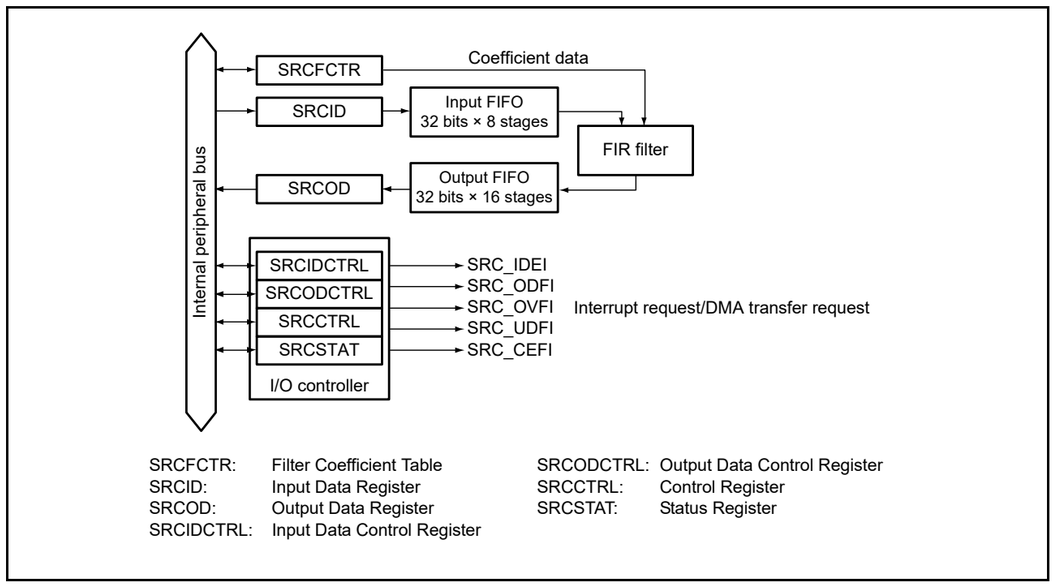

Figure 38.1 SRC block diagram

38. 采样率转换器(SRC)

38.1 Overview

采样率转换器(SRC)用于转换各种音频解码器（包括WMA、MP3和AAC）产生的数据的采样率。支持16位立体声和单声道数据。输入信号的采样率可以是以下之一（以kHz为单位）：8、11.025、12、16、22.05、24、32、44.1或48。输出信号的采样率可以是以下之一（以kHz为单位）：8、16、32、44.1或48。为输入和输出提供了独立的FIFO。在典型应用中，DMA控制器可用于将PCM音频数据从SRAM传输到SRC。然后，可以使用DMA控制器将来自SRC的样本转换后的音频数据传输到SSIE接口，然后再将其传输到外部音频编解码器。

表38.1显示了SRC规范，图38.1显示了框图。

Table 38.1 SRC specifications

Parameter		Specifications
数据大小		16 bits (stereo/monaural)
采样率	Input	可选择8、11.025、12、16、22.05、24、32、44.1或48kHz
	Output	可选择8*1、16*1、32、44.1或48kHz
处理能力		1个采样输出间隔的最大值为7.7µs（PCLKB=60MHz，462个时钟）
SNR		80分贝或更高
中断源		Five 输入FIFO空，输出FIFO满，输出FIFO上溢，输出FIFO下溢，转换结束
DMA传输源		Two 输入FIFO为空，输出FIFO已满
Module-stop function		可设置模块停止状态以降低功耗

Note 1. Onlywheninputof44.1kHzisselected.

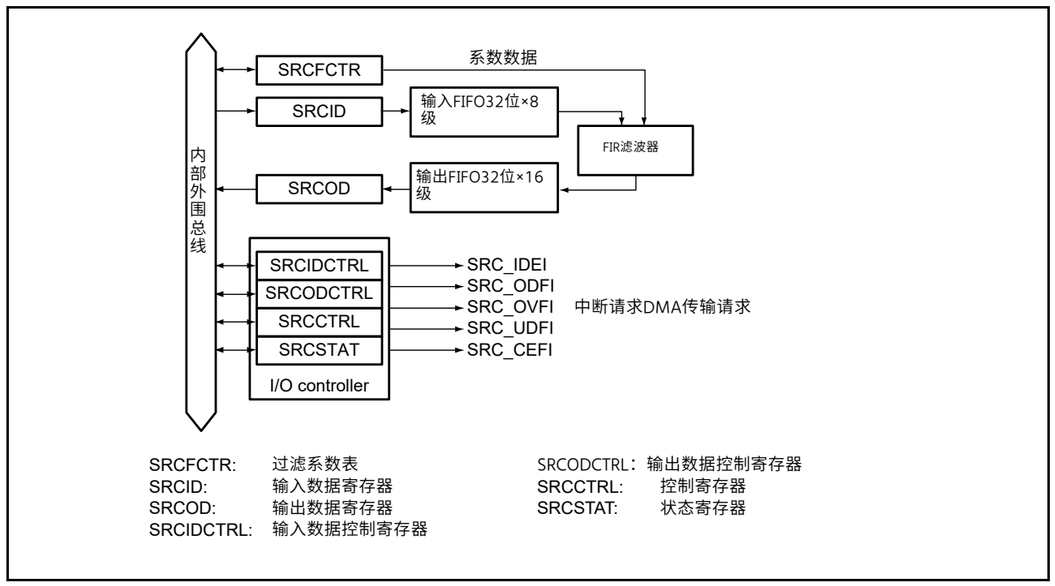

Figure 38.1 SRC框图

38.2 Register Descriptions

38.2.1 Input Data Register (SRCID)

Address(es): SRC.SRCID 4004 DFF0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The SRCID register is a 32-bit write-only register used to input the data before sampling rate conversion. All the bits are read as 0. The data input to SRCID is stored in the 8-stage input FIFO. When the number of data units in the input FIFO is 8, writing to SRCID has no effect.

For stereo data, bits [31:16] are for Lch data, and bits [15:0] are for Rch data. For monaural data, data in bits [31:16] is valid, and data in bits [15:0] is invalid.

The data subject to sampling rate conversion is aligned differently depending on the IED setting in SRCIDCTRL. Table 38.2 shows the association between the IED setting and data alignment.

Table 38.2 Data alignment before sampling rate conversion

IED	Lch[15:8]	Lch[7:0]	Rch[15:8]	Rch[7:0]
0	SRCID[31:24]	SRCID[23:16]	SRCID[15:8]	SRCID[7:0]
1	SRCID[23:16]	SRCID[31:24]	SRCID[7:0]	SRCID[15:8]

38.2.2 Output Data Register (SRCOD)

Address(es): SRC.SRCOD 4004 DFF4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The SRCOD register is a 32-bit read-only register used to output the data after sampling rate conversion. The data in the 16-stage output FIFO is read through SRCOD. When the output FIFO is empty after the start of conversion, the value previously read is read again.

The data in SRCOD is aligned differently depending on the OCH and OED settings in SRCODCTRL. Table 38.3 shows the association between the OCH and OED settings and data alignment in SRCOD.

Table 38.3 Data alignment in SRCOD (1 of 2)

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:8]	SRCOD[7:0]
0	0	Lch[15:8]	Lch[7:0]	Rch[15:8]*1	Rch[7:0]*1
	1	Lch[7:0]	Lch[15:8]	Rch[7:0]*1	Rch[15:8]*1

38.2 注册说明

38.2.1 输入数据寄存器(SRCID)

Address(es): SRC.SRCID 4004 DFF0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SRCID寄存器是一个32位只写寄存器，用于在采样率转换之前输入数据。所有位都读为0。输入到SRCID的数据存储在8级输入FIFO中。当输入FIFO中的数据单元数为8时，写入SRCID无效。

对于立体声数据，位[31:16]用于Lch数据，位[15:0]用于Rch数据。对于单声道数据，位[31:16]中的数据有效，位[15:0]中的数据无效。

根据SRCIDCTRL中的IED设置，进行采样率转换的数据的排列方式不同。表38.2显示了IED设置和数据对齐之间的关联。

Table 38.2 采样率转换前的数据对齐

IED	Lch[15:8]	Lch[7:0]	Rch[15:8]	Rch[7:0]
0	SRCID[31:24]	SRCID[23:16]	SRCID[15:8]	SRCID[7:0]
1	SRCID[23:16]	SRCID[31:24]	SRCID[7:0]	SRCID[15:8]

38.2.2 输出数据寄存器(SRCOD)

Address(es): SRC.SRCOD 4004 DFF4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SRCOD寄存器是一个32位只读寄存器，用于输出采样率转换后的数据。通过SRCOD读取16级输出FIFO中的数据。当转换开始后输出FIFO为空时，再次读取之前读取的值。

SRCOD中的数据根据 SRCODCTRL中的OCH和OED设置以不同方式对齐。表38.3显示了OCH和OED设置与SRCOD中数据对齐之间的关联。

Table 38.3 SRCOD中的数据对齐(1of2)

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:8]	SRCOD[7:0]
0	0	Lch[15:8]	Lch[7:0]	Rch[15:8]*1	Rch[7:0]*1
	1	Lch[7:0]	Lch[15:8]	Rch[7:0]*1	Rch[15:8]*1

Table 38.3 Data alignment in SRCOD (2 of 2)

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:8]	SRCOD[7:0]
1*2	0	Rch[15:8]	Rch[7:0]	Lch[15:8]	Lch[7:0]
	1	Rch[7:0]	Rch[15:8]	Lch[7:0]	Lch[15:8]

Note 1. When processing monaural data, the data in these bits is invalid. Discard the invalid data after reading from SRCOD in 32-bit units.
Note 2. When processing monaural data, the data in these bits is invalid.

38.2.3 Input Data Control Register (SRCIDCTRL)

Address(es): SRC.SRCIDCTRL 4004 DFF8h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	IED	IEN	—	—	—	—	—	—	IFTRG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	IFTRG[1:0]	Input FIFO Data Triggering Number	b1 b0 0 0: 0 0 1: 2 1 0: 4 1 1: 6.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	IEN	Input FIFO Empty Interrupt Enable	0: Disable input FIFO empty interrupts 1: Enable input FIFO empty interrupts.	R/W
b9	IED	Input Data Endian*1	0: Little endian 1: Big endian.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only rewrite this bit while the SRCCTRL.SRCEN bit is 0.

The SRCIDCTRL register is a 16-bit read/write register that specifies the endian format of input data, enables or disables the interrupt requests, and specifies the triggering number of data units.

IFTRG[1:0] bits (Input FIFO Data Triggering Number)

The IFTRG[1:0] bits specify the data unit count at which the IINT flag in the Status Register (SRCSTAT) is set to 1. When the number of data units stored in the input FIFO becomes equal to or less than the specified triggering number, the IINT flag is set to 1.

IEN bit (Input FIFO Empty Interrupt Enable)

The IEN bit enables or disables the issuing of the input FIFO empty interrupt request when the number of data units in the input FIFO becomes equal to or less than the triggering number specified in the IFTRG[1:0] bits, resulting in the IINT flag in the Status Register (SRCSTAT) setting to 1.

IED bit (Input Data Endian*1)

The IED bit specifies the endian format of the input data.

Table 38.3 SRCOD中的数据对齐(2of2)

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:8]	SRCOD[7:0]
1*2	0	Rch[15:8]	Rch[7:0]	Lch[15:8]	Lch[7:0]
	1	Rch[7:0]	Rch[15:8]	Lch[7:0]	Lch[15:8]

Note 1. 处理单声道数据时，这些位中的数据无效。以32位为单位从SRCOD读取后丢弃无效数据。

Note 2. 处理单声道数据时，这些位中的数据无效。

38.2.3 输入数据控制寄存器(SRCIDCTRL)

Address(es): SRC.SRCIDCTRL 4004 DFF8h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	IED	IEN	—	—	—	—	—	—	IFTRG[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	IFTRG[1:0]	输入FIFO数据触发数	b1 b0 0 0: 0 0 1: 2 1 0: 4 1 1: 6.	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	IEN	输入FIFO空中断使能	0：禁用输入FIFO空中断1：启用输入FIFO空中断。	R/W
b9	IED	输入数据字节序*1	0：小端1：大端。	R/W
b15 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 仅在SRCCTRL.SRCEN位为0时重写该位。

SRCIDCTRL寄存器是一个16位的读写寄存器，它指定输入数据的字节序格式，启用或禁用中断请求，并指定数据单元的触发数量。

IFTRG[1:0]位（输入FIFO数据触发数）

IFTRG[1:0]位指定状态寄存器(SRCSTAT)中的IINT标志设置为1的数据单元计数。
当输入FIFO中存储的数据单元数等于或小于指定的触发数时，IINT标志设置为1。

IEN位（输入FIFO空中断使能）

当输入FIFO中的数据单元数等于或小于IFTRG[1:0]位中指定的触发数时，IEN位启用或禁用输入FIFO空中断请求的发出，从而产生IINT标志在状态寄存器(SRCSTAT)设置为1。

IED位（输入数据字节序*1）

IED位指定输入数据的字节序格式。

38.2.4 Output Data Control Register (SRCODCTRL)

Address(es): SRC.SRCODCTRL 4004 DFFAh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	OCH	OED	OEN	—	—	—	—	—	—	OFTRG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	OFTRG[1:0]	Output FIFO Data Trigger Number	b1 b0 0 0: 1 0 1: 4 1 0: 8 1 1: 12.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	OEN	Output FIFO Full Interrupt Enable	0: Disable output FIFO full interrupts 1: Enable output FIFO full interrupts.	R/W
b9	OED	Output Data Endian	0: Little endian 1: Big endian.	R/W
b10	OCH	Output Data Channel Exchange *1	0: Do not exchange channels (use same order as data input) 1: Exchange channels (use opposite order from data input).	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only rewrite this bit while the SRCCTRL.SRCEN bit is 0.

The SRCODCTRL register is a 16-bit read/write register that specifies whether to exchange the channels for the output data, specifies the endian format of output data, enables or disables the interrupt requests, and specifies the triggering number of data units.

OFTRG[1:0] bits (Output FIFO Data Trigger Number)

The OFTRG[1:0] bits specify the data unit count at which the OINT flag in the Status Register (SRCSTAT) is set to 1. When the number of data units in the output FIFO becomes equal to or greater than the specified triggering number, the OINT flag is set to 1.

OEN bit (Output FIFO Full Interrupt Enable)

The OEN bit enables or disables issuing of the output FIFO full interrupt request when the number of data units in the output FIFO becomes equal to or greater than the number specified in the OFTRG[1:0] bits, resulting in the OINT flag in the Status Register (SRCSTAT) setting to 1.

OED bit (Output Data Endian)

The OED bit specifies the endian format of the output data.

OCH bit (Output Data Channel Exchange)

The OCH bit specifies whether to exchange the channels for the Output Data Register (SRCOD). Do not set this bit to 1 when processing monaural data.

38.2.4 输出数据控制寄存器(SRCODCTRL)

Address(es): SRC.SRCODCTRL 4004 DFFAh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	OCH	OED	OEN	—	—	—	—	—	—	OFTRG[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	OFTRG[1:0]	输出FIFO数据触发Number	b1 b0 0 0: 1 0 1: 4 1 0: 8 1 1: 12.	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	OEN	输出FIFO满中断Enable	0：禁止输出FIFO满中断1：使能输出FIFO满中断。	R/W
b9	OED	输出数据字节序	0：小端1：大端。	R/W
b10	OCH	输出数据通道交换*1	0：不交换通道（使用与数据输入相同的顺序）1：交换通道（使用与数据输入相反的顺序）。	R/W
b15 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 仅在SRCCTRL.SRCEN位为0时重写该位。

SRCODCTRL寄存器是一个16位读写寄存器，指定是否为输出数据交换通道，指定输出数据的字节序格式，启用或禁用中断请求，并指定数据单元的触发数量。

OFTRG[1:0]位（输出FIFO数据触发数）

OFTRG[1:0]位指定状态寄存器(SRCSTAT)中的OINT标志设置为1的数据单元计数。
当输出FIFO中的数据单元数等于或大于指定的触发数时，
OINT标志设置为1。

OEN位（输出FIFO完全中断使能）

当输出FIFO中的数据单元数等于或大于OFTRG[1:0]位中指定的数量时，OEN位使能或禁止发出输出FIFO满中断请求，从而在状态寄存器(SRCSTAT)设置为1。

OED位（输出数据字节序）

OED位指定输出数据的字节序格式。

OCH位（输出数据通道交换）

OCH位指定是否为输出数据寄存器(SRCOD)交换通道。处理单声道数据时不要将此位设置为1。

38.2.5 Control Register (SRCCTRL)

Address(es): SRC.SRCCTRL 4004 DFFCh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b8	CL	Internal Work Memory Clear	Writing 1 to this bit clears the input FIFO, output FIFO, input buffer memory, intermediate memory, and accumulator	R/W
b9	FL	Internal Work Memory Flush	Writing 1 to this bit starts conversion of the sampling rate for all data in the input FIFO, input buffer memory, and intermediate memory (flush processing)	R/W
b10	OVEN	Output FIFO Overflow Interrupt Enable	0: Disable output FIFO overflow interrupts 1: Enable output FIFO overflow interrupts.	R/W
b11	UDEN	Output FIFO Underflow Interrupt Enable	0: Disable output FIFO underflow interrupts 1: Enable output FIFO underflow interrupts.	R/W
b12	SRCEN	Module Enable	0: Disable SRC module operation 1: Enable SRC module operation.*2	R/W
b13	CEEN	Conversion End Interrupt Enable	0: Disable conversion end interrupts 1: Enable conversion end interrupts.	R/W
b14	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15	FICRAE	Filter Coefficient Table Access Enable	0: Disable reads to and writes from Filter Coefficient Table RAM 1: Enable reads to and writes from Filter Coefficient Table RAM.	R/W

Note 1. Only valid when the IFS[3:0] bits are 1001b.
Note 2. When SRCEN = 1, do not change the settings of the following bits:
IED bit in SRCIDCTRL, OED and OCH bits in SRCODCTRL, OFS[2:0], IFS[3:0], and FICRAE bits in SRCCTRL.

The SRCCTRL register is a 16-bit read/write register that enables or disables access to the Filter Coefficient Table, module operations, and interrupt requests, and specifies flush processing, clear processing of the internal work memory, and the input and output sampling rates.

OFS[2:0] bits (Output Sampling Rate)

The OFS[2:0] bits specify the output sampling rate.

38.2.5 控制寄存器(SRCCTRL)

Address(es): SRC.SRCCTRL 4004 DFFCh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b15	FICRAE	过滤系数表访问 Enable	0：禁用对过滤器系数表RAM的读取和写入1：启用对过滤器系数表RAM的读取和写入。	R/W

Note 1. 仅当IFS[3:0]位为1001b时有效。
Note 2. 当SRCEN=1时，请勿更改以下位的设置：
SRCIDCTRL中的IED位、SRCODCTRL中的OED和OCH位、SRCCTRL中的OFS[2:0]、IFS[3:0]和FICRAE位。

SRCCTRL寄存器是一个16位读写寄存器，用于启用或禁用对滤波器系数表的访问、模块操作和中断请求，并指定内部工作存储器的刷新处理、清除处理以及输入和输出采样率。

OFS[2:0]位（输出采样率）

OFS[2:0]位指定输出采样率。

IFS[3:0] bits (Input Sampling Rate)

The IFS[3:0] bits specify the input sampling rate.

CL bit (Internal Work Memory Clear)

Writing 1 to the CL bit clears the input FIFO, output FIFO, input buffer memory, intermediate buffer memory, and accumulator, and then clears the CL bit to 0. This bit is read as 0. Even if SRCEN is 0, writing 1 to this bit clears the processing.

FL bit (Internal Work Memory Flush)

Writing 1 to the FL bit initiates flush processing by starting the conversion of the sampling rate of all the data in the input FIFO, input buffer memory, and intermediate memory. This bit is read as 0. When SRCEN is 0, writing 1 to this bit does not trigger flush processing.

In addition, when 1 is written to the FL bit while the number of data units in the input buffer memory is less than the values shown in Table 38.6, valid output data cannot be received. The internal work memory is cleared without triggering the flush processing.

OVEN bit (Output FIFO Overflow Interrupt Enable)

The OVEN bit enables or disables the issuing of the output FIFO overflow interrupt request when the OVF flag in the Status Register (SRCSTAT) is set to 1.

When OVEN = 1, conversion processing stops until the OVF flag is cleared by the CPU accessing SRCSTAT when the output FIFO overflow interrupt is generated. Writing of conversion results to the output FIFO also stops.

When OVEN = 0, the OVF flag automatically clears when the output FIFO has space, and conversion processing can continue.

UDEN bit (Output FIFO Underflow Interrupt Enable)

The UDEN bit enables or disables the issuing of the output FIFO underflow interrupt request when the output FIFO is read and the UDF flag in the Status Register (SRCSTAT) is set to 1 while the number of data units in the output FIFO is 0.

SRCEN bit (Module Enable)

The SRCEN bit enables or disables SRC operation. Writing 1 to these bits while SRCEN is 0 clears the internal work memory.

CEEN bit (Conversion End Interrupt Enable)

The CEEN bit enables or disables issuing of a conversion end interrupt request when the CEF flag in the Status Register (SRCSTAT) is set to 1 after flush processing is complete and all the output data is read.

FICRAE bit (Filter Coefficient Table Access Enable)

The FICRAE bit enables or disables access to the Filter Coefficient Table RAM. After flush processing is complete, the number of output data units obtained as a result of the conversion can be calculated using the following formulas:

$$\frac{\text{Number of output data units} - 1}{\text{Output sampling rate}} = \frac{\text{Number of input data units} \times n - 1}{\text{Input sampling rate} \times n}$$

$$\text{Number of output data units} = \left[(\text{Number of input data units} \times n - 1) \times \frac{\text{Output sampling rate}}{\text{Input sampling rate} \times n} \right] + 1$$

IFS[3:0]位（输入采样率）

IFS[3:0]位指定输入采样率。

CL位（内部工作存储器清除）

向CL位写1清除输入FIFO、输出FIFO、输入缓冲存储器、中间缓冲存储器和累加器，然后将CL位清为0。该位读为0。即使SRCEN为0，也向该位清除处理。

FL位（内部工作内存刷新）

将1写入FL位通过开始转换输入FIFO、输入缓冲存储器和中间存储器中所有数据的采样率来启动刷新处理。该位读为0。当SRCEN为0时，向该位写入1不会触发刷新处理。

此外，当输入缓冲存储器中的数据单元数小于表38.6中所示的值时，如果将1写入FL位，则无法接收有效的输出数据。在不触发刷新处理的情况下清除内部工作内存。

OVEN位（输出FIFO溢出中断使能）

OVEN位启用或禁用输出FIFO溢出中断请求，当OVF标志在
状态寄存器(SRCSTAT)设置为1。

当OVEN=1时，转换处理停止，直到产生输出FIFO溢出中断时CPU访问SRCSTAT清除OVF标志。将转换结果写入输出FIFO也会停止。

当OVEN=0时，当输出FIFO有空间时，OVF标志自动清零，转换处理可以继续。

UDEN位（输出FIFO下溢中断使能）

当输出FIFO被读取并且状态寄存器(SRCSTAT)中的UDF标志设置为1而输出FIFO中的数据单元数为0时，UDEN位启用或禁用输出FIFO下溢中断请求的发出。

SRCEN位（模块使能）

SRCEN位启用或禁用SRC操作。当SRCEN为0时向这些位写入1会清除内部工作存储器。

CEEN位（转换结束中断使能）

在刷新处理完成并读取所有输出数据后，当状态寄存器(SRCSTAT)中的CEF标志设置为1时，CEEN位允许或禁止发出转换结束中断请求。

FICRAE位（滤波器系数表访问使能）

FICRAE位启用或禁用对滤波器系数表RAM的访问。在flush处理完成后，作为转换结果的输出数据单元的数量可以使用以下公式计算：

$$\frac{\text{输出数据单元数}1}{\text{输出采样率}} = \frac{\text{输入数据单元数}\times n1}{\text{输入采样率}\times n}$$

$$\text{输出数据单元数} = \left[(\text{输入数据单元数}\times n1) \times \frac{\text{输出采样率}}{\text{输入采样率}\times n} \right] + 1$$

The value of n can be obtained from Table 38.4. The number of input data units must be equal to or greater than the values in Table 38.5.

Table 38.4 Sampling rate settings and value of n

OFS[2:0] setting (output sampling rate [kHz])	IFS[3:0] setting (input sampling rate [kHz])								
	0000b (8.0)	0001b (11.025)	0010b (12.0)	0100b (16.0)	0101b (22.05)	0110b (24.0)	1000b (32.0)	1001b (44.1)	1010b (48.0)

101b (16.0)	-	-	-	-	-	-	-	-	-

Conversion processing does not start, and so output data is not obtained until the specified number of data units are input. The minimum number of input data units required for obtaining the first output data depends on the IFS and OFS bit settings. Table 38.5 shows the relation between the settings in the IFS and OFS bits and the number of initial input data required. Table 38.6 shows the relation between the settings in the IFS and OFS bits and the number of initial input data required for flush processing.

Table 38.5 Relation between sampling rate settings and number of initial input data units required

101b (16.0)	-	-	-	-	-	-	-	-	-

转换处理不会开始，因此在输入指定数量的数据单元之前不会获得输出数据。获得第一个输出数据所需的输入数据单元的最小数量取决于IFS和OFS位设置。表38.5显示了IFS和OFS位的设置与所需的初始输入数据数量之间的关系。表38.6显示了IFS和OFS位的设置与刷新处理所需的初始输入数据数之间的关系。

Table 38.5 采样率设置与所需的初始输入数据单元数之间的关系

38.2.6 Status Register (SRCSTAT)

Address(es): SRC.SRCSTAT 4004 DFFEh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OFDN[4:0]					IFDN[3:0]				—	CEF	FLF	UDF	OVF	IINT	OINT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Bit name	Description	R/W
b0	OINT	Output FIFO Full Interrupt Request Flag	0: Number of data units in output FIFO has not become equal to or greater than specified triggering number 1: Number of data units in output FIFO has become equal to or greater than specified triggering number.	R/(W) *1
b1	IINT	Input FIFO Empty Interrupt Request Flag	0: Number of data units in input FIFO has not become equal to or smaller than specified triggering number 1: Number of data units in input FIFO has become equal to or smaller than specified triggering number.	R/(W) *1
b2	OVF	Output FIFO Overflow Interrupt Request Flag	0: No output FIFO overflow occurred 1: Output FIFO overflow occurred.	R/(W) *1
b3	UDF	Output FIFO Underflow Interrupt Request Flag	0: No output FIFO underflow occurred 1: Output FIFO underflow occurred.	R/(W) *1
b4	FLF	Flush Processing Status Flag	0: Flush processing complete 1: Flush processing in progress.	R
b5	CEF	Conversion End Flag	0: Not all output data read 1: All output data read.	R/(W) *1
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b10 to b7	IFDN[3:0]	Input FIFO Data Count	Indicates the number of data units in the input FIFO	R
b15 to b11	OFDN[4:0]	Output FIFO Data Count	Indicates the number of data units in the output FIFO	R

Note 1. Only 0 can be written after 1 is read.

The SRCSTAT register is a 16-bit read/write register that indicates the number of data units in the input and output FIFOs, whether the various interrupt sources are generated, and the flush processing status.

OINT flag (Output FIFO Full Interrupt Request Flag)

The OINT flag indicates that the number of data units in the output FIFO becomes equal to or greater than the triggering number specified in the OFTRG[1:0] bits in the Output Data Control Register (SRCODCTRL).

[Setting condition]

- When the number of data units in the output FIFO becomes equal to or greater than the specified triggering number.

[Clearing conditions]

- Writing 0 to the OINT flag after 1 is read
- When the last DMA transfer is executed
- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

IINT flag (Input FIFO Empty Interrupt Request Flag)

The IINT flag indicates that the number of data units in the input FIFO becomes equal to or smaller than the triggering number specified in the IFTRG[1:0] bits in the Input Data Control Register (SRCIDCTRL).

[Setting conditions]

- When the number of data units in the input FIFO becomes equal to or smaller than the specified triggering number

38.2.6 状态寄存器(SRCSTAT)

Address(es): SRC.SRCSTAT 4004 DFFEh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OFDN[4:0]					IFDN[3:0]				—	CEF	FLF	UDF	OVF	IINT	OINT
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	位名称	Description	R/W
b0	OINT	输出FIFO满中断请求标志	0：输出FIFO中的数据单元数未等于或大于指定的触发数1：输出FIFO中的数据单元数已等于或大于指定的触发数。	R/(W) *1
b1	IINT	输入FIFO空中断请求标志	0：输入FIFO中的数据单元数未等于或小于指定的触发数1：输入FIFO中的数据单元数已等于或小于指定的触发数。	R/(W) *1
b2	OVF	输出FIFO溢出中断请求标志	0：未发生输出FIFO溢出1：发生输出FIFO溢出。	R/(W) *1
b3	UDF	输出FIFO下溢中断请求标志	0：未发生输出FIFO下溢1：发生输出FIFO下溢。	R/(W) *1
b4	FLF	刷新处理状态标志	0：冲洗处理完成1：冲洗处理中。	R
b5	CEF	转换结束标志	0：不读取所有输出数据1：读取所有输出数据。	R/(W) *1
b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b10 to b7	IFDN[3:0]	输入FIFO数据计数	表示输入FIFO中数据单元的数量	R
b15 to b11	OFDN[4:0]	输出FIFO数据计数	表示输出FIFO中的数据单元数	R

Note 1. 读取1后只能写入0。

SRCSTAT寄存器是一个16位读写寄存器，指示输入和输出中数据单元的数量FIFOs，各种中断源是否产生，flush处理状态。

OINT标志（输出FIFO满中断请求标志）

OINT标志表示输出FIFO中的数据单元数等于或大于输出数据控制寄存器(SRCODCTRL)中的OFTRG[1:0]位中指定的触发数。

[Setting condition]

- 当输出FIFO中的数据单元数等于或大于指定的触发数时。

[Clearing conditions]

- 读取1后将0写入OINT标志
- 执行最后一次DMA传输时
- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

IINT标志（输入FIFO空中断请求标志）

IINT标志表示输入FIFO中的数据单元数等于或小于输入数据控制寄存器(SRCIDCTRL)中的IFTRG[1:0]位中指定的触发数。

[Setting conditions]

- 当输入FIFO中的数据单元数等于或小于指定触发数时

- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

[Clearing conditions]

- Writing 0 to the IINT flag after 1 is read
- When the last DMA transfer is executed.

OVF flag (Output FIFO Overflow Interrupt Request Flag)

The OVF flag indicates that the sampling rate conversion for the next data completes when the output FIFO is full. The conversion stops until the OVF flag is cleared.

[Setting condition]

- When the sampling rate conversion for the next data completes when the output FIFO is full.

[Clearing conditions]

- Writing 0 to the OVF flag after 1 is read while the SRCCTRL.OVEN bit is 1
- When the number of data units in the output FIFO decreases after reading SRCOD while the SRCCTRL.OVEN bit is 0
- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

UDF flag (Output FIFO Underflow Interrupt Request Flag)

The UDF flag indicates that the output FIFO is read when the number of data units in the output FIFO is 0.

[Setting condition]

- When the output FIFO is read while the number of data units in the output FIFO is 0.

[Clearing conditions]

- Writing 0 to the UDF flag after reading it as 1
- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

FLF flag (Flush Processing Status Flag)

The FLF flag indicates whether flush processing is in progress or not.

[Setting condition]

- Writing 1 to the SRCCTRL.FL bit.
  When flush processing is not in progress, however, FLF is not set to 1.

[Clearing conditions]

- When flush processing completes
- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

CEF flag (Conversion End Flag)

The CEF flag indicates that all the output data is read after flush processing completes.

[Setting condition]

- When the number of data units in the output FIFO is 0 on completion of flush processing.

[Clearing conditions]

- Writing 0 to the CEF flag after 1 is read

- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

[Clearing conditions]

- 读取1后将0写入IINT标志
- 执行最后一次DMA传输时。

OVF标志（输出FIFO溢出中断请求标志）

OVF标志表示当输出FIFO已满时，下一个数据的采样率转换完成。转换停止，直到OVF标志被清除。

[Setting condition]

- 当输出FIFO已满时，下一个数据的采样率转换完成。

[Clearing conditions]

- SRCCTRL.OVEN位为1时读取1后将0写入OVF标志
- 当SRCCTRL.OVEN位为0时读取SRCOD后输出FIFO中的数据单元数减少
- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

UDF标志（输出FIFO下溢中断请求标志）

UDF标志表示当输出FIFO中的数据单元数为0时读取输出FIFO。

[Setting condition]

- 当输出FIFO中的数据单元数为0时读取输出FIFO。

[Clearing conditions]

- 读为1后将0写入UDF标志
- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

FLF标志（刷新处理状态标志）

FLF标志指示刷新处理是否正在进行。

[Setting condition]

- 将1写入SRCCTRL.FL位。
  但是，当刷新处理不在进行中时，FLF不设置为1。

[Clearing conditions]

- 刷新处理完成时
- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

CEF标志（转换结束标志）

CEF标志指示在刷新处理完成后读取所有输出数据。

[Setting condition]

- 刷新处理完成时，输出FIFO中的数据单元数为0时。

[Clearing conditions]

- 读取1后将0写入CEF标志

RA生态工作室

- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

IFDN[3:0] bits (Input FIFO Data Count)

The IFDN[3:0] bits indicate the number of data units in the input FIFO.

OFDN[4:0] bits (Output FIFO Data Count)

The OFDN[4:0] bits indicate the number of data units in the output FIFO.

38.2.7 Filter Coefficient Table n (SRCFCTRn) (n = 0 to 5551)

Address(es): SRCRAM.SRCFCTR0 to 5551 4004 8000h to 4004 D6BFh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	SRCFCOE[21:16]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SRCFCOE[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b21 to b0	SRCFCOE[21:0]	Filter Coefficient Table	Store the filter coefficient value	R/W
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SRCFCTR0 to SRCFCTR5551 are 32-bit read/write SRAM modules that store the filter coefficients to be used for sampling rate conversion. This SRAM can be read from and written to through the peripheral bus only when the FICRAE bit is 1 and the SRCEN bit is 0 in SRCCTRL. Bits [31:22] are reserved and are read as 0, and their write values should be 0. Bits [21:0] are used for storage of the filter coefficient values, whose initial values are undefined.

38.3 Operation

38.3.1 Initial Settings

Figure 38.2 shows an example flow for the initial settings. After the module-stop state is released, the filter coefficient data stored in the flash and other areas must be transferred to the Filter Coefficient Table (SRCFCTR) before the SRC conversion starts. When a filter coefficient value is already stored in the Filter Coefficient Table, skip this transfer and set the required parameters to start the conversion.

- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

IFDN[3:0]位（输入FIFO数据计数）

IFDN[3:0]位指示输入FIFO中数据单元的数量。

OFDN[4:0]位（输出FIFO数据计数）

OFDN[4:0]位指示输出FIFO中数据单元的数量。

38.2.7 滤波器系数表n(SRCFCTRn)（n=0至5551）

Address(es): SRCRAM.SRCFCTR0 to 5551 4004 8000h to 4004 D6BFh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	SRCFCOE[21:16]					
重置后的值：	0	0	0	0	0	0	0	0	0	0	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SRCFCOE[15:0]															
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

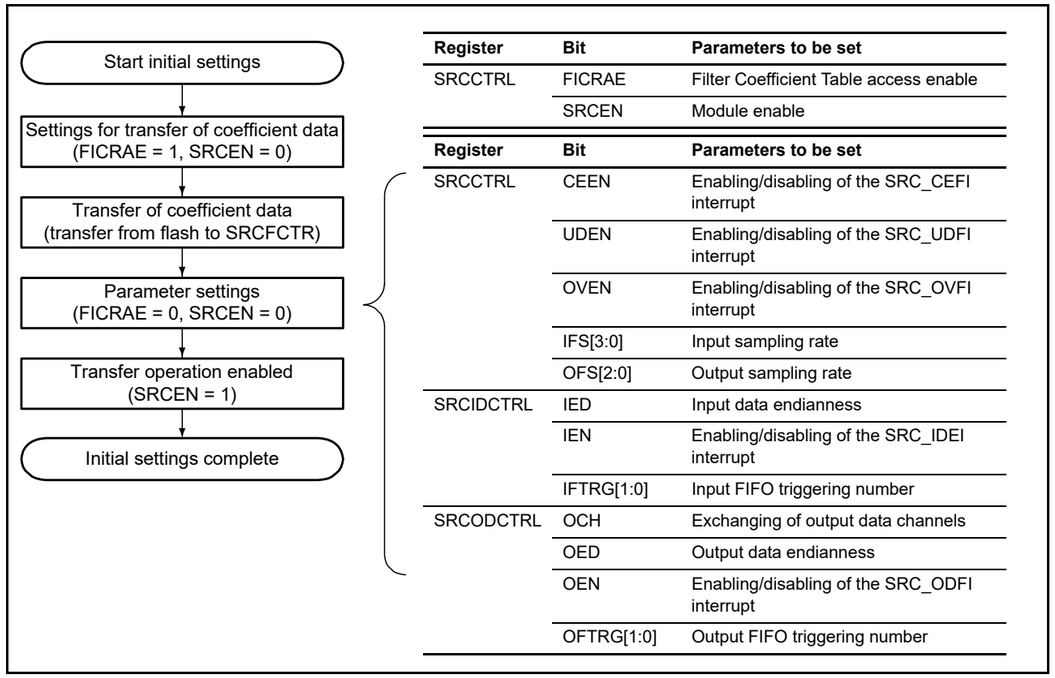
Bit	Symbol	位名称	Description	R/W
b21 to b0	SRCFCOE[21:0]	过滤系数表	存储滤波器系数值	R/W
b31 to b22	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SRCFCTR0至SRCFCTR5551是32位读写SRAM模块，用于存储用于采样率转换的滤波器系数。只有当SRCCTRL中的FICRAE位为1且SRCEN位为0时，该SRAM才能通过外设总线读写。[31:22]位保留，读为0，写入值应为0。[21:0]位用于存储滤波器系数值，初始值未定义。

38.3 Operation

38.3.1 初始设置

图38.2显示了初始设置的示例流程。模块停止状态释放后，存储在闪存和其他区域的滤波器系数数据必须在SRC转换开始之前传输到滤波器系数表(SRCFCTR)。当滤波器系数值已经存储在滤波器系数表中时，跳过此传输并设置所需的参数以开始转换。



Register	Bit	Parameters to be set

Figure 38.2 初始设置的示例流程

38.3.2 数据输入

图38.3显示了数据输入的示例流程。

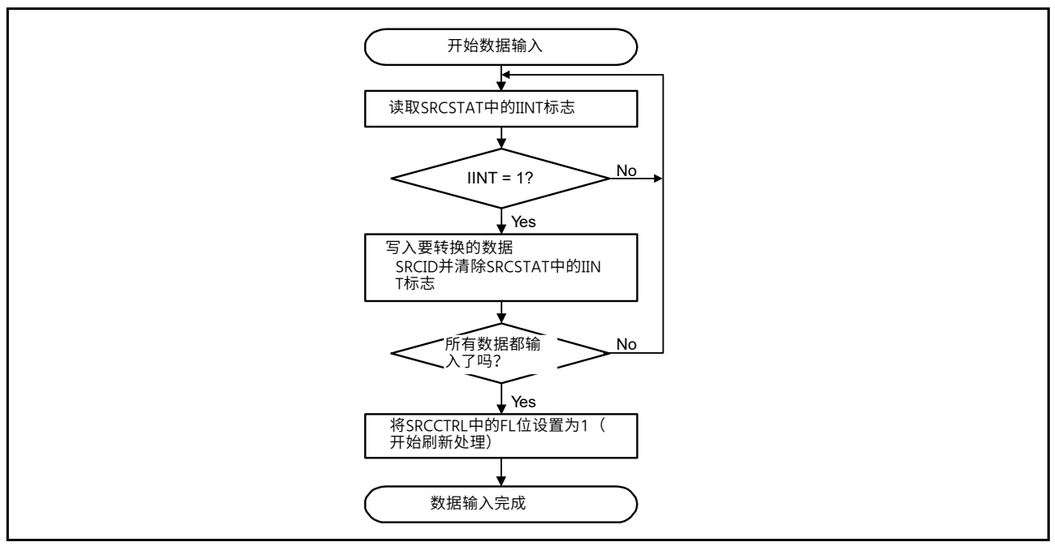

Figure 38.3 数据输入流程

(1) When issuing interrupts to the CPU

1. Set the IEN bit in SRCIDCTRL to 1.
2. When the IINT flag in SRCSTAT is set to 1, the IDEI interrupt request is issued. In the interrupt processing routine, read the IINT flag and confirm that it is 1, write data to SRCID, and write 0 to the IINT flag. Then return from the interrupt processing routine.
3. Repeat step 2. until all the data is input, and write 1 to the FL bit in SRCCTRL.

(2) When using interrupts to activate the DMAC

1. Assign the SRC_IDEI interrupt of the SRC to one channel of the DMAC.
2. Set the IEN bit in SRCIDCTRL to 1.
3. When the IINT flag in SRCSTAT is set to 1, the SRC_IDEI interrupt request is issued, activating the DMAC. When data is written to the SRCID register using DMA transfer, and when the number of data units in the input FIFO exceeds the triggering number specified in the IFTRG[1:0] bits in SRCIDCTRL, the IINT flag in SRCSTAT is set to 0.
4. Repeat step 3. until all the data is input, and write 1 to the FL bit in SRCCTRL.

(3) When using SSIE interface interrupts to activate the DMAC to transfer input data from the SSIE interface

1. Assign the SSIE interface to one channel of the DMAC as a DMA transfer request source. Set SSIFRDR of the SSIE interface as a transfer source and SRCID of the SRC as a transfer destination, and set the SSIE interface to enable reception operation.
2. When the RDF bit in SSIFSR is set to 1, the SSIE interface issues an interrupt request, activating the DMAC. The DMAC then reads data from SSIFRDR and writes the data to SRCID.
3. Repeat step 2. until all the data is input, and write 1 to the FL bit in SRCCTRL.

Note: The input FIFO has eight stages. The number of data units that can be transferred (the empty space in the FIFO) when an SRC_IDEI interrupt request is issued depends on the settings in the IFTRG[1:0] bits in SRCIDCTRL. Because the input FIFO is not equipped with a function to prevent or detect overflow, the transferred data is destroyed when overflow occurs. To prevent this, take the settings in the IFTRG[1:0] bits in SRCCTRL into consideration when setting the number of data units to be continuously transferred by the DMA.

38.3.3 Data Output

Figure 38.4 shows an example flow for data output.

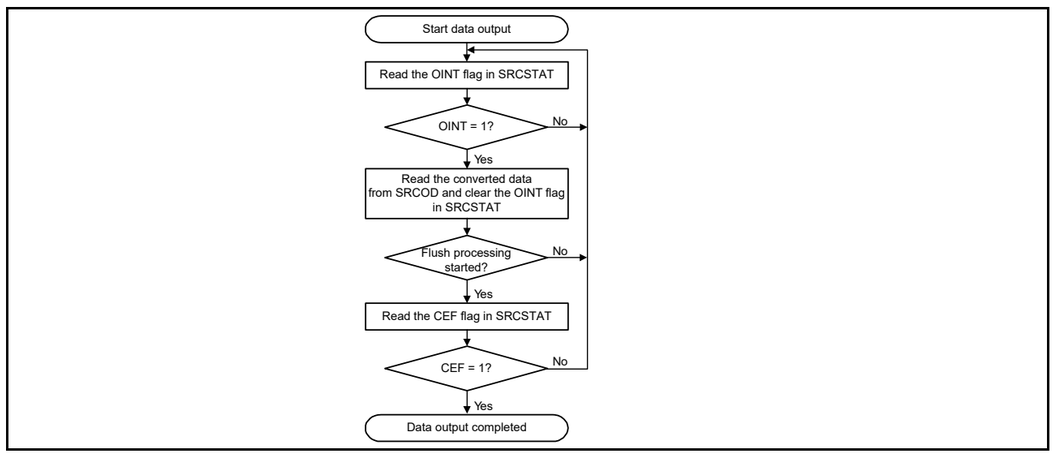

Figure 38.4 Data output flow

(1) 向CPU发出中断时

1. 将SRCIDCTRL中的IEN位设置为1。
2. 当SRCSTAT中的IINT标志设置为1时，会发出IDEI中断请求。在中断处理程序中，读取IINT标志并确认为1，将数据写入SRCID，将0写入IINT标志。然后从中断处理程序返回。
3. 重复第2步，直到输入所有数据，然后将1写入SRCCTRL中的FL位。

(2) 使用中断激活DMAC时

1. 将SRC的SRC_IDEI中断分配给DMAC的一个通道。
2. 将SRCIDCTRL中的IEN位设置为1。
3. 当SRCSTAT中的IINT标志设置为1时，发出SRC_IDEI中断请求，激活DMAC。当使用DMA传输将数据写入SRCID寄存器时，并且当输入FIFO中的数据单元数超过SRCIDCTRL中IFTRG[1:0]位中指定的触发数时，SRCSTAT中的IINT标志设置为0。
4. 重复第3步，直到输入所有数据，然后将1写入SRCCTRL中的FL位。

(3) 当使用SSIE接口中断激活DMAC以从SSIE interface

1. 将SSIE接口分配给DMAC的一个通道作为DMA传输请求源。将SSIE接口的SSIFRDR设置为传输源，将SRC的SRCID设置为传输目标，并设置SSIE接口使能接收操作。
2. 当SSIFSR中的RDF位设置为1时，SSIE接口发出中断请求，激活DMAC。这然后DMAC从SSIFRDR读取数据并将数据写入SRCID。
3. 重复第2步，直到输入所有数据，然后将1写入SRCCTRL中的FL位。

Note: 输入FIFO有8个阶段。发出SRC_IDEI中断请求时可传输的数据单元数（FIFO中的空白空间）取决于SRCIDCTRL中IFTRG[1:0]位的设置。由于输入FIFO没有配备防止或检测溢出的功能，所以当溢出发生时，传输的数据会被破坏。为防止这种情况，在设置DMA连续传输的数据单元数时，请考虑SRCCTRL中IFTRG[1:0]位的设置。

38.3.3 数据输出

图38.4显示了数据输出的示例流程。

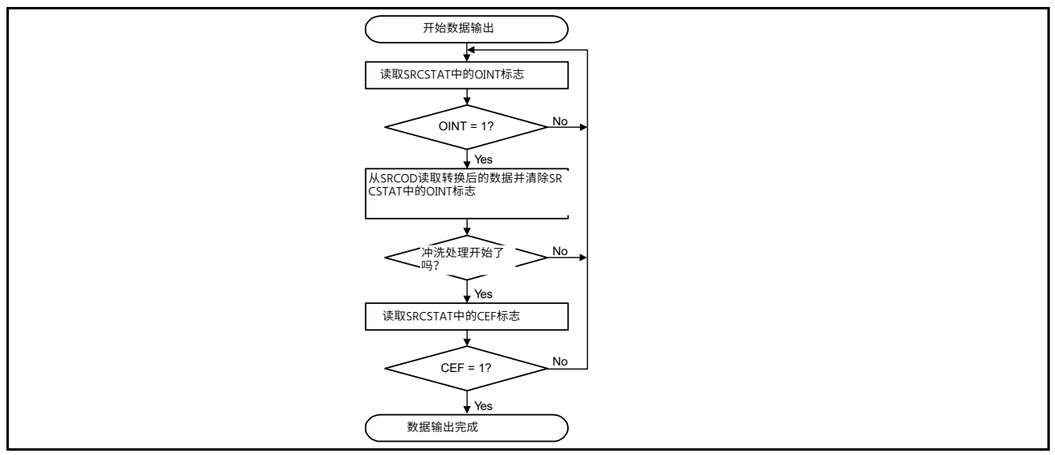

Figure 38.4 数据输出流

(1) When issuing interrupts to the CPU

1. Set the OEN bit in SRCODCTRL to 1.
2. When the OINT flag in SRCSTAT is set to 1, the SRC_ODFI interrupt request is issued. In the interrupt processing routine, read the OINT flag and confirm that it is 1, read data from SRCOD, and write 0 to the OINT flag. Then, return from the interrupt processing routine.
3. After flush processing starts, repeat step 2. until the CEF flag in SRCSTAT is read as 1.

(2) When using interrupts to activate the DMAC

1. Assign the SRC_ODFI interrupt of the SRC to one channel of the DMAC.
2. Set the OEN bit in SRCODCTRL to 1.
3. When the OINT flag in SRCSTAT is set to 1, the SRC_ODFI interrupt request is issued, activating the DMAC. When data is read from SRCOD using DMA transfer, and when the number of data units in the output data FIFO becomes equal to or less than the triggering number specified in the OFTRG[1:0] bits, the OINT flag in SRCSTAT clears to 0.
4. After flush processing starts, repeat step 3. until the FLF flag in SRCSTAT is read as 0.

(3) When using SSIE interface interrupts to activate the DMAC to transfer output data to the SSIE interface

1. Set the OVEN bit in SRCCTRL to 0 to disable SRC_OVFI interrupt request generation.
2. Assign the SSIE interface to one channel of the DMAC as a DMA transfer request source. Set SRCID of the SRC as a transfer source and SSIFTDR of the SSIE interface as a transfer destination, and set the SSIE interface to enable transmission operation.
3. When the TDE bit in SSIFSR is set to 1, the SSIE interface issues an interrupt request, activating the DMAC. The DMAC then reads data from SRCOD and writes the data to SSIFTDR.
4. After the flush processing starts, repeat step 3. until the CEF flag in SRCSTAT is read as 1.

Note 1. The output FIFO has 16 stages. The conversion stops when no data is read and an overflow occurs in the output FIFO. Even in an overflow state, data can be read from the output FIFO, but the procedure to restart conversion might be required depending on the settings. For details, see the OVEN bit in section 38.2.5, Control Register (SRCCTRL).

Note 2. When the number of data units in the output FIFO is zero, incorrect data is read. To prevent this, take the settings of the OFTRG[1:0] bits into consideration when setting the number of data units to be continuously transferred by the DMAC.

38.4 Interrupts

The SRC interrupt sources include:

- Input FIFO empty (SRC_IDEI)
- Output FIFO full (SRC_ODFI)
- Output FIFO overflow (SRC_OVFI)
- Output FIFO underflow (SRC_UDFI)
- Conversion end (SRC_CEFI).

Table 38.7 lists the interrupt request types and generation conditions.

Table 38.7 Interrupt requests and generation conditions (1 of 2)

Interrupt request	Abbreviation	Interrupt condition	DMAC activation
Input FIFO empty	SRC_IDEI	IINT = 1, IEN = 1, and SRCEN = 1	Possible
Output FIFO full	SRC_ODFI	OINT = 1, OEN = 1, and SRCEN = 1	Possible

(1) 向CPU发出中断时

1. 将SRCODCTRL中的OEN位设置为1。
2. 当SRCSTAT中的OINT标志设置为1时，将发出SRC_ODFI中断请求。在中断处理程序中，读取OINT标志并确认其为1，从SRCOD读取数据，并将0写入OINT标志。然后，从中断处理程序返回。
3. 刷新处理开始后，重复步骤2。直到SRCSTAT中的CEF标志被读取为1。

(2) 使用中断激活DMAC时

1. 将SRC的SRC_ODFI中断分配给DMAC的一个通道。
2. 将SRCODCTRL中的OEN位设置为1。
3. 当SRCSTAT中的OINT标志设置为1时，发出SRC_ODFI中断请求，激活DMAC。
   当使用DMA传输从SRCOD读取数据时，当输出数据FIFO中的数据单元数等于或小于OFTRG[1:0]位中指定的触发数时，SRCSTAT中的OINT标志清零.
4. 刷新处理开始后，重复步骤3。直到SRCSTAT中的FLF标志被读取为0。

(3) 当使用SSIE接口中断激活DMAC以将输出数据传输到SSIE接口时

1. 将SRCCTRL中的OVEN位设置为0以禁用SRC_OVFI中断请求生成。
2. 将SSIE接口分配给DMAC的一个通道作为DMA传输请求源。将SRC的SRCID设置为传输源，将SSIE接口的SSIFTDR设置为传输目标，并设置SSIE接口使能传输操作。
3. 当SSIFSR中的TDE位设置为1时，SSIE接口发出中断请求，激活DMAC。这然后DMAC从SRCOD读取数据并将数据写入SSIFTDR。
4. 刷新处理开始后，重复步骤3。直到SRCSTAT中的CEF标志被读取为1。

注1.输出FIFO有16个阶段。当没有数据被读取并且在输出中发生溢出时转换停止
先进先出。即使在溢出状态下，也可以从输出FIFO中读取数据，但根据设置，可能需要重新启动转换的过程。有关详细信息，请参见第38.2.5节，控制寄存器(SRCCTRL)中的OVEN位。注2.当输出FIFO中的数据单元数为零时，读取的数据不正确。为防止这种情况，在设置DMAC连续传输的数据单元数时，请考虑OFTRG[1:0]位的设置。

38.4 Interrupts

SRC中断源包括：

- 输入FIFO为空(SRC_IDEI)
- 输出FIFO已满(SRC_ODFI)
- 输出FIFO溢出(SRC_OVFI)
- Output FIFO underflow (SRC_UDFI)
- 转换结束(SRC_CEFI)。

表38.7列出了中断请求类型和产生条件。

Table 38.7 中断请求和生成条件(1of2)

中断请求	Abbreviation	中断条件	DMAC activation
输入FIFO为空	SRC_IDEI	IINT = 1, IEN = 1, and SRCEN = 1	Possible
输出FIFO已满	SRC_ODFI	OINT=1，OEN=1，SRCEN=1	Possible

Table 38.7 Interrupt requests and generation conditions (2 of 2)

Interrupt request	Abbreviation	Interrupt condition	DMAC activation
Output FIFO overflow	SRC_OVFI	OVF = 1, OVEN = 1, and SRCEN = 1	Not possible
Output FIFO underflow	SRC_UDFI	UDF = 1, UDEN = 1, and SRCEN = 1	Not possible
Conversion end	SRC_CEFI	CEF = 1, CEEN = 1, and SRCEN = 1	Not possible

When an interrupt condition is satisfied, the CPU executes the interrupt exception handling routine. Clear the interrupt source flags during this routine.

The SRC_IDEI and SRC_ODFI interrupts can activate the DMAC. If the DMAC is activated, the interrupts from the SRC are not sent to the CPU.

Do not clear the IINT and OINT flags through a write by the CPU (writing 0 after reading 1) during the DMA transfer.

38.5 Usage Notes

38.5.1 Notes on Accessing Registers

The following writes to SRCCTRL require 3 cycles of the peripheral clock (PCLKB) for the values to be updated in SRCSTAT:

- Writes of 1 to the FL bit in SRCCTRL, for the FLF flag in SRCSTAT to set
- Writes of 1 to the CL bit in SRCCTRL, for each bit in SRCSTAT to initialize
- Writes of 1 to the SRCEN bit in SRCCTRL while the SRCEN bit is 0, for each bit in SRCSTAT to be initialized.

However, because the CPU executes any subsequent instruction without waiting for the completion of writes to a register, the updated state of SRCSTAT cannot be correctly read by an instruction immediately after the write instruction to SRCCTRL. To check the updated state of SRCSTAT, perform a dummy read of SRCCTRL or SRCSTAT after the instruction used to write to SRCCTRL.

38.5.2 Notes on Flush Processing

When 1 is written to the FL bit in the SRC Control Register (SRCCTRL), the SRC continues conversion processing by adding 0-data to the input data endpoint. Because of this, only execute flush processing when the audio data endpoint is input and there is no subsequent data.

To perform conversion again after flush processing, clear the internal work memory using one of the following ways:

- Write 1 to the CL bit in SRCCTRL
- Write 0 and then 1 to the SRCEN bit in SRCCTRL.

38.5.3 Notes on DMAC or DTC Transfer

When the DMAC or DTC is used for data transfer to the I/O data registers (SRCID and SRCOD), do not clear the IINT and OINT flags in the Status Register (SRCSTAT) through the CPU (writing 0 after reading 1) during transfer by the DMAC or DTC.

38.5.4 Notes on SRC Operation

Do not access the Filter Coefficient Table while the SRC is operating (SRCCTRL.SRCEN = 1).

38.5.5 Settings for the Module-Stop State

The Module Stop Control Register C (MSTPCRC) can enable or disable SRC operation. The SRC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

Table 38.7 中断请求和生成条件(2of2)

中断请求	Abbreviation	中断条件	DMAC activation
输出FIFO溢出	SRC_OVFI	OVF=1，OVEN=1，SRCEN=1	不可能
Output FIFO underflow	SRC_UDFI	UDF = 1, UDEN = 1, and SRCEN = 1	不可能
转换结束	SRC_CEFI	CEF = 1, CEEN = 1, and SRCEN = 1	不可能

当满足中断条件时，CPU执行中断异常处理程序。在此例程中清除中断源标志。

SRC_IDEI和SRC_ODFI中断可以激活DMAC。如果DMAC被激活，则来自SRC不发送到CPU。

在DMA传输过程中，不要通过CPU写（读1后写0）清除IINT和OINT标志。

38.5 使用说明

38.5.1 访问寄存器的注意事项

以下对SRCCTRL的写入需要3个外设时钟(PCLKB)周期才能在SRCSTAT:

- 将1写入SRCCTRL中的FL位，以设置SRCSTAT中的FLF标志
- 将1写入SRCCTRL中的CL位，用于初始化SRCSTAT中的每个位
- 当SRCEN位为0时，将1写入SRCCTRL中的SRCEN位，以便初始化SRCSTAT中的每个位。

但是，由于CPU无需等待寄存器写入完成就执行任何后续指令，因此在向SRCCTRL写入指令之后的一条指令无法正确读取SRCSTAT的更新状态。要检查SRCSTAT的更新状态，请在用于写入SRCCTRL的指令之后执行SRCCTRL或SRCSTAT的虚拟读取。

38.5.2 冲洗处理注意事项

当将1写入SRC控制寄存器(SRCCTRL)中的FL位时，SRC通过将0数据添加到输入数据端点来继续进行转换处理。因此，只有在输入音频数据端点且没有后续数据时才执行flush处理。

要在刷新处理后再次执行转换，请使用以下方法之一清除内部工作内存：

- 将1写入SRCCTRL中的CL位
- 将0和1写入SRCCTRL中的SRCEN位。

38.5.3 关于DMAC或DTC传输的注意事项

当DMAC或DTC用于向IO数据寄存器（SRCID和SRCOD）传输数据时，在传输过程中不要通过CPU清除状态寄存器（SRCSTAT）中的IINT和OINT标志（读1后写0）。DMAC或DTC。

38.5.4 SRC操作注意事项

请勿在SRC运行时访问滤波器系数表(SRCCTRL.SRCEN=1)。

38.5.5 模块停止状态的设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用SRC操作。SRC模块在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

39. SD/MMC Host Interface (SDHI)

39.1 Overview

The Secure Digital Host Interface (SDHI) and MultiMediaCard (MMC) interface provide the functionality required to connect a variety of external memory cards with the MCU. The SDHI supports both 1-bit and 4-bit buses for connecting different memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA).

The MMC interface supports 1-bit and 4-bit buses that provide eMMC 4.51 (JEDEC Standard JESD 84-B451) device access. This interface also provides backward compatibility and support for high-speed SDR transfer modes.

Table 39.1 lists the SD/MMC Host Interface specifications and Figure 39.1 shows a block diagram.

Table 39.1 SD/MMC Host Interface specifications

Interface	Parameter	Specifications
SD	SD bus interface	• Compatible with SD memory card and SDIO card • Transfer bus mode selectable from 4-bit wide bus mode or 1-bit default bus mode • Compatible with SD, SDHC, and SDXC formats.
SD and MMC shared	SDHI clock frequency	SDHI clock is generated by dividing PCLKA by 2^n (n = 1 to 9)
	Error check functions	CRC7 (command/response), CRC16 (transfer data)
	Interrupt sources	• Card access interrupt (SDHI_MMCn_ACCS) • SDIO access interrupt (SDHI_MMCn_SDIO) • Card detection interrupt (SDHI_MMCn_CARD). (n = 0 to 1)
	DMA transfer sources	• DMAC and DTC triggerable by the SBFAI interrupt • SD buffer is read and write accessible using the DMAC.
	Other functions	• Card detect function • Write protect support.
MMC	MMC bus interface	Transfer bus mode selectable from 1-bit or 4-bit
	Transfer modes	Backward compatible mode or high-speed SDR mode selectable
	Other functions	eMMC device access supported

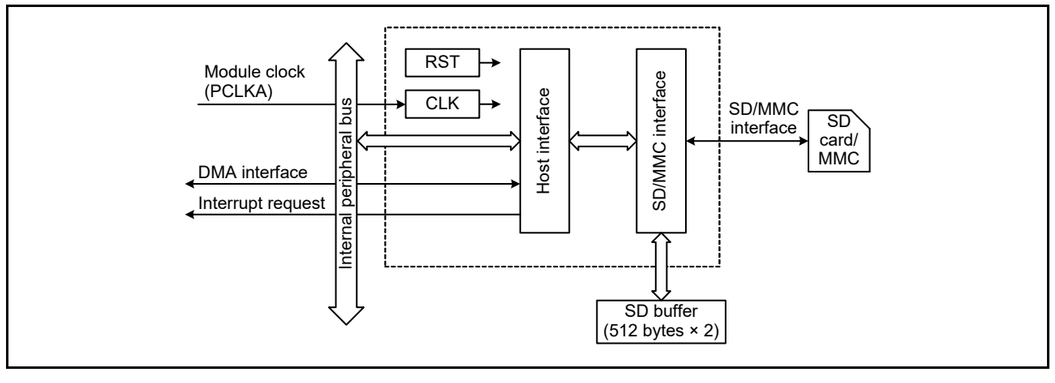

Figure 39.1 SD/MMC Host Interface block diagram

39. SDMMC主机接口(SDHI)

39.1 Overview

安全数字主机接口(SDHI)和多媒体卡(MMC)接口提供了将各种外部存储卡与MCU连接所需的功能。SDHI支持1位和4位总线，用于连接支持SD、SDHC和SDXC格式的不同存储卡。在开发符合SD规范的主机设备时，您必须遵守SD主机辅助产品许可协议(SDHALA)。

MMC接口支持提供eMMC4.51（JEDEC标准JESD84-B451）器件访问的1位和4位总线。该接口还提供向后兼容性并支持高速SDR传输模式。

表39.1列出了SDMMC主机接口规范，图39.1显示了框图。

Table 39.1 SDMMC主机接口规格

Interface	Parameter	Specifications
SD	SD总线接口	兼容SD存储卡和SDIO卡 传输总线模式可选择4位宽总线模式或1位默认总线模式 兼容SD、SDHC和SDXC格式。
SD和MMC共享	SDHI时钟频率	SDHI时钟由PCLKA除以2n(n=1到9)生成
	错误检查功能	CRC7 (command/response), CRC16 (transfer data)
	中断源	卡访问中断(SDHI_MMCn_ACCS) SDIO访问中断(SDHI_MMCn_SDIO) 卡检测中断(SDHI_MMCn_CARD)。（n=0到1）
	DMA传输源	DMAC和DTC可由SBFAI中断触发 SD缓冲区可使用DMAC进行读写访问。
	其他功能	卡检测功能 写保护支持。
MMC	MMC总线接口	传输总线模式可选择1位或4位
	传输模式	向后兼容模式或高速SDR模式可选
	其他功能	支持eMMC设备访问

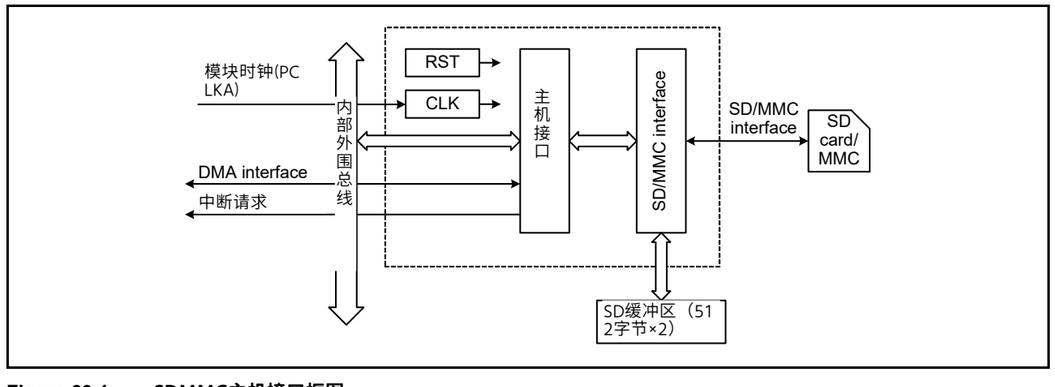

Figure 39.1 SDMMC主机接口框图

Table 39.2 SDHI I/O pins

Channel	Pin name	I/O	Description
Ch 0	SD0CLK	Output	SDHI clock
	SD0CMD	I/O	Command output, response input
	SD0DAT0	I/O	Data 0 (DAT0)
	SD0DAT1	I/O	Data 1 (DAT1), SDIO interrupt
	SD0DAT2	I/O	Data 2 (DAT2), SDIO read wait
	SD0DAT3	I/O	Data 3 (DAT3), SD card detect
	SD0CD	Input	SD card detection
	SD0WP	Input	SD card write protection
Ch 1	SD1CLK	Output	SDHI clock
	SD1CMD	I/O	Command output, response input
	SD1DAT0	I/O	Data 0 (DAT0)
	SD1DAT1	I/O	Data 1 (DAT1), SDIO interrupt
	SD1DAT2	I/O	Data 2 (DAT2), SDIO read wait
	SD1DAT3	I/O	Data 3 (DAT3), SD card detect

39.2 Register Descriptions

39.2.1 Command Type Register (SD_CMD)

Address(es): SDHI0.SD_CMD 4006 2000h, SDHI1.SD_CMD 4006 2400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CMD12AT[1:0]		TRSTP	CMDRW	CMDTP	RSPTP[2:0]			ACMD[1:0]		CMDIDX[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	CMDIDX[5:0]	Command Index Field Value Select	These bits configure the command index field value. The examples shown include the bit values for the ACMD[1:0] bits. b7 b0 0 0 0 0 0 1 1 0: CMD6 0 0 0 1 0 0 1 0: CMD18 0 1 0 0 1 1 0 1: ACMD13.	R/W

	SD1DAT0	I/O	Data 0 (DAT0)
	SD1DAT1	I/O	数据1(DAT1)，SDIO中断
	SD1DAT2	I/O	数据2(DAT2)，SDIO读取等待
	SD1DAT3	I/O	数据3（DAT3），SD卡检测

39.2 注册说明

39.2.1 命令类型寄存器(SD_CMD)

Address(es): SDHI0.SD_CMD 4006 2000h, SDHI1.SD_CMD 4006 2400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CMD12AT[1:0]		TRSTP	CMDRW	CMDTP	RSPTP[2:0]			ACMD[1:0]		CMDIDX[5:0]					
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	CMDIDX[5:0]	命令索引字段值选择	这些位配置命令索引字段值。所示示例包括ACMD[1:0]位的位值。 b7b000000110：CMD600010010：CMD1801001101：ACMD13。	R/W
b7, b6	ACMD[1:0]	命令类型选择	b7b600：CMD01：ACMD。 禁止其他设置。	R/W

Bit	Symbol	Bit name	Description	R/W
b10 to b8	RSPTP[2:0]	Response Type Select*1	b10 b8 0 0 0: Normal mode. Depending on the command, the response type and transfer method are selected in the ACMD[1:0] and CMDIDX[5:0] bits. At this time, the values for bits [15:11] in this register are invalid. 0 1 1: Extended mode and no response 1 0 0: Extended mode and R1, R5, R6, or R7 response 1 0 1: Extended mode and R1b response 1 1 0: Extended mode and R2 response 1 1 1: Extended mode and R3 or R4 response. Other settings are prohibited.	R/W
b11	CMDTP	Data Transfer Select*2	0: Do not include data transfer (bc, bcr, or ac) in command 1: Include data transfer (adtc) in command.	R/W
b12	CMDRW	Data Transfer Direction Select*3	0: Write (SD/MMC Host Interface → SD card/MMC) 1: Read (SD/MMC Host Interface ← SD card/MMC).	R/W
b13	TRSTP	Block Transfer Select*3	0: Single block transfer 1: Multiple block transfer.	R/W
b15, b14	CMD12AT[1:0]	CMD12 Automatic Issue Select*4	b15 b14 0 0: Automatically issue CMD12 during multi-block transfer 0 1: Do not automatically issue CMD12 during multi-block transfer. Other settings are prohibited.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Some commands cannot be used in normal mode.
Note 2. The CMDTP bit is only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b.
Note 3. CMDRW and TRSTP bits are only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b, and the CMDTP bit is 1.
Note 4. The CMD12AT[1:0] bits are only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b, and the TRSTP bit is 1.

The command type and response type are set in the SD_CMD register. The command type and transfer mode must be set when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b. The sequence starts when a value is written to this register. See Table 39.8 and Table 39.9 for setting examples. Do not write to the SD_CMD register when the SD_INFO2.CBSY flag is 1.

39.2.2 SD Command Argument Register (SD_ARG)

Address(es): SDHI0.SD_ARG 4006 2008h, SDHI1.SD_ARG 4006 2408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify command format[39:8] (argument)	R/W

The SD_ARG register is used for setting the argument field value. Set the SD_ARG register before setting the SD_CMD register. The automatically issued CMD12 has an argument field value of 0000 0000h regardless of the SD_ARG register value.

Bit	Symbol	位名称	Description	R/W
b10 to b8	RSPTP[2:0]	响应类型选择*1	b10 b8 0 0 0：正常模式。 根据命令，在ACMD[1:0]和CMDIDX[5:0]位中选择响应类型和传输方法。此时，该寄存器中位[15:11]的值无效。 0 1 1：扩展模式无响应 1 0 0：扩展模式和R1、R5、R6或R7响应 1 0 1：扩展模式和R1b响应 1 1 0：扩展模式和R2响应 11：扩展模式和R3或R4响应。禁止其他设置。	R/W
b11	CMDTP	数据传输选择*2	0：在命令中不包括数据传输（bc、bcr或ac）1：在命令中包括数据传输（adtc）。	R/W
b12	CMDRW	数据传输方向Select*3	0：写入（SDMMC主机接口→SD卡MMC）1：读取（SDMMC主机接口←SD卡MMC）。	R/W
b13	TRSTP	块传输选择*3	0：单块传输1：多块传输。	R/W
b15, b14	CMD12AT[1:0]	CMD12自动发行Select*4	b15 b14 0 0：多块传输时自动下发CMD12 01：在多块传输过程中不自动发出CMD12。禁止其他设置。	R/W
b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 有些命令不能在正常模式下使用。
Note 2. CMDTP位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b时有效。
Note 3. CMDRW和TRSTP位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b且CMDTP位为1时有效。
Note 4. CMD12AT[1:0]位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b且TRSTP位为1时有效。

命令类型和响应类型在SD_CMD寄存器中设置。当RSPTP[2:0]位为011b、100b、101b、110b或111b时，必须设置命令类型和传输模式。当一个值被写入该寄存器时，序列开始。设置示例见表39.8和表39.9。当SD_INFO2.CBSY标志为1时，不要写入SD_CMD寄存器。

39.2.2 SD命令参数寄存器(SD_ARG)

Address(es): SDHI0.SD_ARG 4006 2008h, SDHI1.SD_ARG 4006 2408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b31 to b0	—	—	这些位指定命令格式[39:8]（参数）	R/W

SD_ARG寄存器用于设置参数字段值。在设置SD_CMD寄存器之前设置SD_ARG寄存器。无论SD_ARG寄存器的值如何，自动发出的CMD12的参数字段值为00000000h。

39.2.3 SD Command Argument Register 1 (SD_ARG1)

Address(es): SDHI0.SD_ARG1 4006 200Ch, SDHI1.SD_ARG1 4006 240Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	—	These bits specify command format[39:24] (argument)	R/W
b31 to b16	—	Reserved	These bits are read as 0	R

The SD_ARG1 register is used for setting the argument field value. Set the SD_ARG1 register before setting the SD_CMD register. The argument field value of the automatically issued CMD12 is 0000 0000h regardless of the SD_ARG1 register value.

39.2.4 Data Stop Register (SD_STOP)

Address(es): SDHI0.SD_STOP 4006 2010h, SDHI1.SD_STOP 4006 2410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SEC	—	—	—	—	—	—	—	STP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	STP	Transfer Stop	Data transfer stops when this bit is set to 1	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	SEC	Block Count Register Value Select*1	0: SD_SECCNT register value is invalid 1: SD_SECCNT register value is valid.	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The SD_STOP register stops data transfer. During a multi-block transfer sequence, the SD_SECCNT register value (number of blocks to be transferred) can be set to valid or invalid by setting the SD_STOP register.

STP bit (Transfer Stop)

When the STP bit is set to 1 during a multi-block transfer, CMD12 is issued to halt the transfer through the SD host interface. However, if a command sequence is halted because of a communication error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP is set to 1, the buffer access error bit (ILR or ILW) in SD_INFO2 is set accordingly.

When STP is set to 1 during the transfer for a single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag sets on completion of reception of

39.2.3 SD命令参数寄存器1(SD_ARG1)

Address(es): SDHI0.SD_ARG1 4006 200Ch, SDHI1.SD_ARG1 4006 240Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	—	—	这些位指定命令格式[39:24]（参数）	R/W
b31 to b16	—	Reserved	这些位被读为0	R

SD_ARG1寄存器用于设置参数字段值。在设置SD_CMD寄存器之前设置SD_ARG1寄存器。自动发出的CMD12的参数字段值是00000000h与
SD_ARG1寄存器值。

39.2.4 数据停止寄存器(SD_STOP)

Address(es): SDHI0.SD_STOP 4006 2010h, SDHI1.SD_STOP 4006 2410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SEC	—	—	—	—	—	—	—	STP
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	STP	中转站	当该位设置为1时数据传输停止	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	SEC	块计数寄存器值 Select*1	0：SD_SECCNT寄存器值无效1：SD_SECCNT寄存器值有效。	R/W
b31 to b9	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 当SD_INFO2.CBSY标志为1时，不要重写该位。

SD_STOP寄存器停止数据传输。在多块传输序列期间，可以通过设置SD_STOP寄存器将SD_SECCNT寄存器值（要传输的块数）设置为有效或无效。

STP位（传输停止）

在多块传输期间STP位设置为1时，发出CMD12以停止通过SD主机接口的传输。但是，如果命令序列由于通信错误或超时而停止，则不会发出CMD12。尽管即使在STP设置为1后仍可以继续访问缓冲区，但缓冲区访问错误位（ILR或ILW）在
SD_INFO2相应设置。

如果在单块写入的传输过程中将STP设置为1，则当SD_BUF为空时设置访问结束标志，并且不发出CMD12。如果SD_BUF确实包含数据，则访问结束标志在完成接收时设置

the busy state without CMD12 being issued.

When STP is set to 1 during the transfer for a single block read, the access end flag is set immediately after the STP bit is set, and CMD12 is not issued.

When STP is set to 1 during reception of the busy state after an R1b response, the access end flag sets on completion of reception of the busy state without CMD12 being issued.

When STP is set to 1 after a command sequence is complete, CMD12 is not issued and the access end flag is not set.

Set STP to 1 after the response end flag sets. Set STP to 0 after the access end flag sets.

SEC bit (Block Count Register Value Select*1)

When SD_CMD is set to start the command sequence while the SEC bit is set to 1, CMD12 is automatically issued to stop multi-block transfer with the number of blocks set in SD_SECCNT as follows:

- CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000)
- SD_CMD[15:13] = 001b in extended mode (CMD12 is automatically issued, multiple block transfer).

When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.

39.2.5 Block Count Register (SD_SECCNT)

Address(es): SDHI0.SD_SECCNT 4006 2014h, SDHI1.SD_SECCNT 4006 2414h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The SD_SECCNT register is a read/write register that sets the number of blocks to be transferred when performing a multi-block transfer. For example, when the register value is 0000 0001h, 1 block is transferred. When the register value is 0000 FFFFh, 65535 blocks are transferred, and when the register value is FFFF FFFFh, 4,294,967,295 blocks are transferred. Do not set this register to 0000 0000h. Do not rewrite the SD_SECCNT register when the SD_INFO2.CBSY flag is 1.

没有发出CMD12的忙碌状态。

如果在单块读取传输期间将STP设置为1，则在设置STP位后立即设置访问结束标志，并且不发出CMD12。

当在R1b响应后的忙状态接收期间STP设置为1时，访问结束标志在忙状态接收完成时设置，而不发出CMD12。

当命令序列完成后STP设置为1时，不发出CMD12并且不设置访问结束标志。

设置响应结束标志后将STP设置为1。设置访问结束标志后将STP设置为0。

SEC位（块计数寄存器值选择*1）

当SD_CMD设置为启动命令序列而SEC位设置为1时，自动发出CMD12以停止多块传输，其中SD_SECCNT中设置的块数如下：

- 正常模式下的CMD18或CMD25(SD_CMD[10:8]=000)
- SD_CMD[15:13]=001b处于扩展模式（自动发出CMD12，多块传输）。

当命令序列由于通信错误或超时而停止时，不会自动发出CMD12。

39.2.5 块计数寄存器(SD_SECCNT)

Address(es): SDHI0.SD_SECCNT 4006 2014h, SDHI1.SD_SECCNT 4006 2414h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SD_SECCNT寄存器是一个读写寄存器，用于设置在执行多块传输时要传输的块数。例如，当寄存器值为00000001h时，传输1个块。当寄存器值为0000FFFFh时，传送65535个块，当寄存器值为FFFFFFFFh时，传送4 294 967 295个块。不要将此寄存器设置为00000000h。当SD_INFO2.CBSY标志为1时，不要重写SD_SECCNT寄存器。

39.2.6 SD Card Response Register 10 (SD_RSP10), SD Card Response Register 32 (SD_RSP32), SD Card Response Register 54 (SD_RSP54)

R7	[39:8]	-	-	-	-	-	-	-

Note 1. CMD18和CMD25的响应存储在SD_RSP10和SD_RSP54寄存器中。因此，即使SD_RSP10寄存器被自动发出的CMD12的响应覆盖，CMD18或CMD25的响应可以通过读取SD_RSP54寄存器来确认。

39.2.10 SD Card Interrupt Flag Register 1 (SD_INFO1)

Address(es): SDHI0.SD_INFO1 4006 2038h, SDHI1.SD_INFO1 4006 2438h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SDD3MON	SDD3IN	SDD3RM	SDWPMON	—	SDCDMON	SDCDIN	SDCDRM	ACEND	—	RSPEND
Value after reset:	0	0	0	0	0	x	0	0	x	0	x	0	0	0*1	0	0*1

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	RSPEND	Response End Detection Flag	0: Response end not detected 1: Response end detected.	R(/W)*2
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b2	ACEND	Access End Detection Flag	0: Access end not detected 1: Access end detected.	R(/W)*2
b3	SDCDRM*4	SD0CD Removal Flag	0: SD card/MMC removal not detected by the SD0CD pin 1: SD card/MMC removal detected by the SD0CD pin.	R(/W)*2
b4	SDCDIN*4	SD0CD Insertion Flag	0: SD card/MMC insertion not detected by the SD0CD pin 1: SD card/MMC insertion detected by the SD0CD pin.	R(/W)*2
b5	SDCDMON*4	SD0CD Pin Monitor Flag	0: SD0CD pin level is high*3 1: SD0CD pin level is low.*3	R
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	SDWPMON*5	SD0WP Pin Monitor Flag	0: SD0WP pin level is high 1: SD0WP pin level is low.	R
b8	SDD3RM	SDnDAT3 Removal Flag	0: SD card/MMC removal not detected by the SDnDAT3 pin 1: SD card/MMC removal detected by the SDnDAT3 pin.	R(/W)*2
b9	SDD3IN	SDnDAT3 Insertion Flag	0: SD card/MMC insertion not detected by the SDnDAT3 pin 1: SD card/MMC insertion detected by the SDnDAT3 pin.	R(/W)*2
b10	SDD3MON	SDnDAT3 Pin Monitor Flag	0: SDnDAT3 pin level is low 1: SDnDAT3 pin level is high.	R
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value is initialized by a reset and also on a reset triggered by the SOFT_RST.SDRST flag.
Note 2. The flag does not change even if set to 1. Writing 0 changes the flag value to 0.
Note 3. The flag changes when the pin level continues for the period set in the SD_OPTION.CTOP[3:0] bits or longer.
Note 4. SDCDRM, SDCDIN, and SDCDMON bits are supported only by SDHI0 (SD0CD). Bits [5:3] are reserved in SHDI1.
Note 5. SDWPMON bit is supported only by SDHI0 (SD0WP). Bit [7] is reserved in SHDI1.

The SD_INFO1 register indicates the detection of a response end or access end for a command sequence. The SD_INFO1 register also indicates the detection of SD card/MMC insertion/removal and the write protection status.

During a multi-block transfer sequence, if CMD12 or CMD52 (SDIO abort) is issued, the ACEND flag is set to 1, but the RSPEND flag remains set to 0.

If the command sequence is stopped because of a communication error or timeout, the ACEND flag or RSPEND flag is set to 1.

After a reset is canceled, the SDD3MON bit, SDD3IN flag, and SDD3RM flag values are changed according to the status of the SDnDAT3 (n = 0, 1) pin, and their values are changed when data is being transferred in wide bus mode. These 3 bits are used only for SD card. Set the flags to be cleared to 0. Set the flags that are not to be cleared to 1.

RSPEND flag (Response End Detection Flag)

The RSPEND flag indicates that a response end was detected.

39.2.10 SD卡中断标志寄存器1(SD_INFO1)

Address(es): SDHI0.SD_INFO1 4006 2038h, SDHI1.SD_INFO1 4006 2438h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SDD3MON	SDD3IN	SDD3RM	SDWPMON	—	SDCDMON	SDCDIN	SDCDRM	ACEND	—	RSPEND
重置后的值:	0	0	0	0	0	x	0	0	x	0	x	0	0	0*1	0	0*1

x: Undefined

Bit	Symbol	位名称	Description	R/W
b0	RSPEND	响应结束检测标志	0：未检测到响应结束1：检测 到响应结束。	R(/W)*2
b1	—	Reserved	该位读取为0。写入值应为0。	R/W
b2	ACEND	访问结束检测标志	0：未检测到访问结束1： 检测到访问结束。	R(/W)*2
b3	SDCDRM*4	SD0CD删除标志	0：SD0CD引脚未检测到SD卡MMC移除1：SD0CD引脚检测到SD卡MMC移除。	R(/W)*2
b4	SDCDIN*4	SD0CD插入标志	0：SD0CD引脚未检测到SD卡MMC插入1：SD0CD引脚检测到SD卡MMC插入。	R(/W)*2
b5	SDCDMON*4	SD0CD引脚监控标志	0：SD0CD引脚高电平*31： SD0CD引脚低电平*3	R
b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b7	SDWPMON*5	SD0WP引脚监控标志	0：SD0WP引脚电平为高电平1：S D0WP引脚电平为低电平。	R
b8	SDD3RM	SDnDAT3删除标志	0：SDnDAT3引脚未检测到SD卡MMC移除1：SDnDAT3引脚检测到SD卡MMC移除。	R(/W)*2
b9	SDD3IN	SDnDAT3插入标志	0：SDnDAT3引脚未检测到SD卡MMC插入1：SDnDAT3引脚检测到SD卡MMC插入。	R(/W)*2
b10	SDD3MON	SDnDAT3引脚监控标志	0：SDnDAT3引脚低电平1： SDnDAT3引脚高电平。	R
b31 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 该值由复位以及由SOFT_RST.SDRST标志触发的复位初始化。
Note 2. 即使设置为1，标志也不会改变。写入0会将标志值更改为0。
Note 3. 当引脚电平持续SD_OPTION.CTOP[3:0]位中设置的周期或更长时间时，该标志会发生变化。
Note 4. 只有SDHI0(SD0CD)支持SDCDRM、SDCDIN和SDCDMON位。位[5:3]在SHDI1中保留。
Note 5. 只有SDHI0(SD0WP)支持SDWPMON位。位[7]在SHDI1中保留。

SD_INFO1寄存器指示对命令序列的响应结束或访问结束的检测。这
SD_INFO1寄存器还指示检测到SD卡MMC插入移除和写保护状态。

在多块传输序列期间，如果发出CMD12或CMD52（SDIO中止），则ACEND标志设置为1，但
RSPEND标志保持设置为0。

如果命令序列由于通信错误或超时而停止，则ACEND标志或RSPEND标志设置为1。

复位取消后，SDD3MON位、SDD3IN标志和SDD3RM标志值根据SDnDAT3(n=0 1)引脚的状态而改变，并且在宽总线模式下传输数据时改变它们的值。这3位仅用于SD卡。将要清除的标志设置为0。将不清除的标志设置为1。

RSPEND标志（响应结束检测标志）

RSPEND标志表示检测到响应结束。

[Setting conditions]

- When reception of the response is complete
- When transmission of a command without response is complete
- When reception of the busy state after R1b response is complete
- When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is complete for the transfer of multiple block read
- When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is complete for the transfer of multiple block write
- This bit is set when a command sequence is halted because of a communication error or timeout.

[Clearing conditions]

- When 0 is written to RSPEND
- When a command without data is issued.

Note: When a command is issued without data transfer, the RSPEND flag becomes 1 after the command sequence ends.

ACEND flag (Access End Detection Flag)

The ACEND flag indicates that an access end was detected.

[Setting conditions]

- When read access to the buffer is complete for the transfer of a single block read
- When read access to the buffer for the last block of data is complete for the transfer of a multiple block read
- When read access to the buffer and reception of the response to CMD12 are complete for the transfer of a multiple block read with automatic issuing of CMD12
- When reception of the busy state after a reception of the CRC status is complete for transfer of a single block write
- When reception of the busy state after a reception of the CRC status of the last block of data is complete for the transfer of a multiple block write
- When reception of the response busy state for CMD12 is complete for the transfer of a multiple block write with automatic issuing of CMD12
- When reception of the response to CMD12 that was issued by setting the STP bit to1 is complete for transfer of a multiple block read
- When reception of the response busy state for CMD12 that was issued by setting the STP bit to 1 is complete for the transfer of a multiple block write
- When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is complete for transfer of a multiple block read
- When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is complete for transfer of a multiple block write
- This bit is set when a command sequence is halted because of a communications error or timeout.

[Clearing conditions]

- When 0 is written to the ACEND flag
- When the access end bit is set to 1.

Note: The ACEND flag becomes 1 after the command sequence ends.

SDCDRM flag (SD0CD Removal Flag)

The SDCDRM flag indicates that SD0CD was removed.

[Setting condition]

[Setting conditions]

- 响应接收完成时
- 无响应的命令传输完成时
- 当R1b响应后忙状态的接收完成时
- 多块读取传送的通过将C52PUB位设置为1发出的对CMD52的响应接收完成时
- 多块写入传送的通过将C52PUB位设置为1发出的对CMD52的响应的接收完成时
- 当命令序列由于通信错误或超时而停止时，该位被设置。

[Clearing conditions]

- 当0写入RSPEND时
- 发出没有数据的命令时。

Note: 如果在没有数据传输的情况下发出命令，则在命令序列结束后，RSPEND标志变为1。

ACEND标志（访问结束检测标志）

ACEND标志表示检测到访问结束。

[Setting conditions]

- 当对缓冲区的读取访问完成以传输单个块读取时
- 当完成对最后一个数据块的缓冲区的读取访问以传输多块读取时
- 当对缓冲区的读取访问和对CMD12的响应的接收完成时，用于传输多块读取并自动发出CMD12
- 接收CRC状态后的忙碌状态接收完成时，用于单块写入的传输
- 当接收到最后一个数据块的CRC状态后的繁忙状态接收完成时，用于传输多块写入
- 当CMD12的响应忙状态接收完成时，用于传输多块写入并自动发出CMD12
- 当通过将STP位设置为1发出的对CMD12的响应接收完成时，用于传输多块读取
- 当通过将STP位设置为1发出的CMD12的响应忙状态接收完成时，用于传输多块写入
- 当通过将IOABT位设置为1发出的对CMD52的响应的接收完成时，用于传输多块读取
- 当通过将IOABT位设置为1发出的对CMD52的响应的接收完成时，用于传输多块写入
- 当命令序列由于通信错误或超时而停止时，该位被设置。

[Clearing conditions]

- 当0被写入ACEND标志时
- 当访问结束位设置为1时。

Note: 命令序列结束后ACEND标志变为1。

SDCDRM标志（SD0CD移除标志）

SDCDRM标志表示SD0CD已被删除。

[Setting condition]

- After a change in SD0CD from 0 to 1, Mcycle elapses with SD0CD held at 1.

[Clearing conditions]

- When 0 is written to SDCDRM.

Note: Mcycle is set in bits [3:0] in SD_OPTION.

SDCDIN flag (SD0CD Insertion Flag)

The SDCDIN flag indicates that SD0CD was inserted.

[Setting condition]

- After a change in SD0CD from 1 to 0, Mcycle elapses with SD0CD held at 0.

[Clearing conditions]

- When 0 is written to SDCDIN.

Note: Mcycle is set in bits [3:0] in SD_OPTION.

SDD3RM flag (SDnDAT3 Removal Flag)

The SDD3RM flag indicates that SDnDAT3 was removed.

[Setting condition]

- After a change in SDnDAT3 from 1 to 0, 2 PCLKA cycles elapse with SDnDAT3 held at 0.

[Clearing condition]

- When 0 is written to SDD3RM.

SDD3IN flag (SDnDAT3 Insertion Flag)

The SDD3IN flag indicates that SDnDAT3 was inserted.

[Setting condition]

- After a change in SDnDAT3 from 0 to 1, 2 PCLKA cycles elapse with SDnDAT3 held at 1.

[Clearing condition]

- When 0 is written to SDD3IN.

39.2.11 SD Card Interrupt Flag Register 2 (SD_INFO2)

Address(es): SDHI0.SD_INFO2 4006 203Ch, SDHI1.SD_INFO2 4006 243Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ILA	CBSY	SD_CLK_CTRLEN	—	—	—	BWE	BRE	SDD0MON	RSPTO	ILR	ILW	DTO	ENDE	CRCE	CMDE
Value after reset:	0*1	0*1	1*1	0	0	0	0*1	0*1	x	0*1	0*1	0*1	0*1	0*1	0*1	0*1

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	CMDE	Command Error Detection Flag	0: Command error not detected 1: Command error detected.	R/W*1
b1	CRCE	CRC Error Detection Flag	0: CRC error not detected 1: CRC error detected.	R/W*1

- 在SD0CD从0变为1后，Mcycle过去，SD0CD保持在1。

[Clearing conditions]

- 当0写入SDCDRM时。

Note: Mcycle在SD_OPTION的位[3:0]中设置。

SDCDIN标志（SD0CD插入标志）

SDCDIN标志表明SD0CD已插入。

[Setting condition]

- 在SD0CD从1变为0后，Mcycle过去，SD0CD保持在0。

[Clearing conditions]

- 当0写入SDCDIN时。

Note: Mcycle在SD_OPTION的位[3:0]中设置。

SDD3RM标志（SDnDAT3移除标志）

SDD3RM标志表示SDnDAT3已被删除。

[Setting condition]

- SDnDAT3从1变为0后，经过2个PCLKA周期，SDnDAT3保持在0。

[Clearing condition]

- 当0写入SDD3RM时。

SDD3IN标志（SDnDAT3插入标志）

SDD3IN标志表示SDnDAT3已插入。

[Setting condition]

- SDnDAT3从0变为1后，经过2个PCLKA周期，SDnDAT3保持在1。

[Clearing condition]

- 当0写入SDD3IN时。

39.2.11 SD卡中断标志寄存器2(SD_INFO2)

Address(es): SDHI0.SD_INFO2 4006 203Ch, SDHI1.SD_INFO2 4006 243Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

x: Undefined

Bit	Symbol	位名称	Description	R/W
b0	CMDE	命令错误检测标志	0：未检测到命令错误1：检测到命令错误。	R/W*1
b1	CRCE	CRC错误检测标志	0：未检测到CRC错误1：检测到CRC错误。	R/W*1

Bit	Symbol	Bit name	Description	R/W
b2	ENDE	End Bit Error Detection Flag	0: End bit error not detected 1: End bit error detected.	R/W*1
b3	DTO	Data Timeout Detection Flag	0: Data timeout not detected 1: Data timeout detected.	R/W*1
b4	ILW	SD_BUF0 Illegal Write Access Detection Flag	0: Illegal write access to the SD_BUF0 register not detected 1: Illegal write access to the SD_BUF0 register detected.	R/W*1
b5	ILR	SD_BUF0 Illegal Read Access Detection Flag	0: Illegal read access to the SD_BUF0 register not detected 1: Illegal read access to the SD_BUF0 register detected.	R/W*1
b6	RSPTO	Response Timeout Detection Flag	0: Response timeout not detected 1: Response timeout detected.	R/W*1
b7	SDD0MON	SDHI_D0 Pin Status Flag	0: SDnDAT0 pin is low 1: SDnDAT0 pin is high.	R
b8	BRE	SD_BUF0 Read Enable Flag	0: Disable read access to the SD_BUF0 register 1: Enable read access to the SD_BUF0 register.	R/W*1
b9	BWE	SD_BUF0 Write Enable Flag	0: Disable write access to the SD_BUF0 register 1: Enable write access to the SD_BUF0 register.	R/W*1
b12 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	SD_CLK_CTRLEN	SD_CLK_CTRL Write Enable Flag	0: SD/MMC bus (CMD and DAT lines) is busy, so write access to the SD_CLK_CTRL.CLKEN and CLKSEL[7:0] bits is disabled 1: SD/MMC bus (CMD and DAT lines) is not busy, so write access to the SD_CLK_CTRL.CLKEN and CLKSEL[7:0] bits is enabled.	R
b14	CBSY	Command Sequence Status Flag	0: Command sequence complete 1: Command sequence in progress (busy).	R
b15	ILA	Illegal Access Error Detection Flag	0: Illegal access error not detected 1: Illegal access error detected.	R/W*1
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The flag does not change even if set to 1. Writing 0 changes the flag value to 0.

The SD_INFO2 register indicates the status of the SD buffer and the status of the SD card/MMC. Set the flags to be cleared to 0. Set the flags that are not being cleared to 1.

CMDE flag (Command Error Detection Flag)

The CMDE flag indicates that a command error was detected. The command sequence is stopped when a command error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not complete. Perform the error processing shown in section 39.3.12, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 39.3.13, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

- The command index of the transmitted command differs from the command index of the received response
- The command index of a command issued within a command sequence differs from the command index of the received response.

[Clearing condition]

- When 0 is written to CMDE.

CRCE flag (CRC Error Detection Flag)

The CRCE flag indicates that a CRC error was detected. The command sequence is stopped when a CRC error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not complete. Perform the error processing shown in section 39.3.12, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 39.3.13, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

Bit	Symbol	位名称	Description	R/W
b2	ENDE	结束位错误检测标志	0：未检测到结束位错误1： 检测到结束位错误。	R/W*1
b3	DTO	数据超时检测标志	0：未检测到数据超时1：检 测到数据超时。	R/W*1
b4	ILW	SD_BUF0非法写访问 检测标志	0：未检测到对SD_BUF0寄存器的非法写访问1：检测到对SD_BUF0寄存器的非法写访问。	R/W*1
b5	ILR	SD_BUF0非法读取访问 检测标志	0：未检测到对SD_BUF0寄存器的非法读访问1：检测到对SD_BUF0寄存器的非法读访问。	R/W*1
b6	RSPTO	响应超时检测 Flag	0：未检测到响应超时1：检测到 响应超时。	R/W*1
b7	SDD0MON	SDHI_D0引脚状态标志	0：SDnDAT0引脚为低电平1：SDnDAT0引脚为高电平。	R
b8	BRE	SD_BUF0读使能标志	0：禁用对SD_BUF0寄存器的读取访问1：启用对SD_BUF0寄存器的读取访问。	R/W*1
b9	BWE	SD_BUF0写使能标志	0：禁用对SD_BUF0寄存器的写访问1：启用对SD_BUF0寄存器的写访问。	R/W*1
b12 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b13	SD_CLK_CTRLEN	SD_CLK_CTRL写使能 Flag	0：SDMMC总线（CMD和DAT线）忙，所以写对SD_CLK_CTRL.CLKEN和CLKSEL[7:0]位的访问被禁用1：SDMMC总线（CMD和DAT线）不忙，因此对SD_CLK_CTRL.CLKEN和CLKSEL[7:0]位的写访问被启用。	R
b14	CBSY	命令序列状态 Flag	0：命令序列完成1：命令序列正在进行中（忙碌）。	R
b15	ILA	非法访问错误检测 Flag	0：未检测到非法访问错误1：检测到非法访问错误。	R/W*1
b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 即使设置为1，标志也不会改变。写入0会将标志值更改为0。

SD_INFO2寄存器指示SD缓冲区的状态和SD卡MMC的状态。将要清除的标志设置为0。将未清除的标志设置为1。

CMDE标志（命令错误检测标志）

CMDE标志指示检测到命令错误。发生命令错误时，命令序列停止。当SDIO_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行第39.3.12节，IO_RW_EXTENDED命令（SD：CMD53多块读取）或第39.3.13节，IO_RW_EXTENDED中所示的错误处理

命令（SD：CMD53MultipleBlockWrite），完成命令序列。

[Setting conditions]

- 发送命令的命令索引与接收响应的命令索引不同
- 在命令序列中发出的命令的命令索引与接收到的响应的命令索引不同。

[Clearing condition]

- 当0写入CMDE时。

CRCE标志（CRC错误检测标志）

CRCE标志表示检测到CRC错误。当发生CRC错误时，命令序列停止。
当SDIO_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行第39.3.12节，IO_RW_EXTENDED命令（SD：CMD53多块读取）或第39.3.13节，IO_RW_EXTENDED中所示的错误处理

命令（SD：CMD53MultipleBlockWrite），完成命令序列。

[Setting conditions]

- When an error occurs in the CRC status
- When a CRC error occurs in the read data
- When a CRC error occurs in the response
- When a CRC error in response to a command issued within a command sequence.

[Clearing condition]

- When 0 is written to CRCE.

ENDE flag (End Bit Error Detection Flag)

The ENDE flag indicates that an end bit error was detected. The command sequence is stopped when an end bit error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not complete. Perform the error processing shown in section 39.3.12, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 39.3.13, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

- When an error occurs in the response length (and the end bit is not detected)
- When an error occurs in the read data length (and the end bit is not detected among the valid bits)
- When an error occurs in the CRC status length (and the end bit is not detected)
- When an error occurs in the length of a response to a command issued within a command sequence, for example, when the end bit is not detected.

[Clearing condition]

- When 0 is written to ENDE.

DTO flag (Data Timeout Detection Flag)

The DTO flag indicates that a data timeout was detected. The command sequence stops when a data timeout occurs.

[Setting conditions]

- After R1b response, the busy state (SDnDAT0 = 0) continues for longer than Ncycle time
- After CRC status, the busy state (SDnDAT0 = 0) continues for longer than Ncycle time
- After write data, the CRC status is not received before the Ncycle time elapses
- After a read command, read data is not received before the Ncycle time elapses
- After CMD12 is issued within a command sequence, the busy state (SDnDAT0 = 0) continues for longer than the Ncycle time
- After the reception of read data, read data for the next block is not received before the Ncycle time elapses
- After release of the read wait state, read data for the next block are not received before the Ncycle time elapses.

Note: Ncycle is set in bits [7:4] in SD_OPTION.

[Clearing condition]

- When 0 is written to DTO.

ILW flag (SD_BUF0 Illegal Write Access Detection Flag)

The ILW flag indicates that an SD_BUF0 illegal write access was detected.

[Setting conditions]

- When data is written to SD_BUF0 while it is not in the data read/write command state
- When data is written to SD_BUF0 while SD_BUF is full
- When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length

- CRC状态发生错误时
- 当读取的数据发生CRC错误时
- 当响应中出现CRC错误时
- 当响应在命令序列中发出的命令时出现CRC错误。

[Clearing condition]

- 当0写入CRCE时。

ENDE标志（结束位错误检测标志）

ENDE标志表示检测到结束位错误。当发生结束位错误时，命令序列停止。当SDIO_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行第39.3.12节，IO_RW_EXTENDED命令（SD：CMD53多块读取）或第39.3.13节，IO_RW_EXTENDED中所示的错误处理

命令（SD：CMD53MultipleBlockWrite），完成命令序列。

[Setting conditions]

- 响应长度发生错误时（未检测到结束位）
- 读取数据长度出错时（有效位中未检测到结束位）
- CRC状态长度出错时（未检测到结束位）
- 当对命令序列中发出的命令的响应长度发生错误时，例如，当未检测到结束位时。

[Clearing condition]

- 当0写入ENDE时。

DTO标志（数据超时检测标志）

DTO标志表示检测到数据超时。当发生数据超时时，命令序列停止。

[Setting conditions]

- 在R1b响应后，忙碌状态(SDnDAT0=0)持续时间超过Ncycle时间
- CRC状态后，忙碌状态(SDnDAT0=0)持续时间超过Ncycle时间
- 写入数据后，在经过Ncycle时间之前未收到CRC状态
- 读取命令后，在Ncycle时间过去之前未接收到读取数据
- 在命令序列中发出CMD12后，忙碌状态(SDnDAT0=0)持续时间超过Ncycle time
- 接收到读取数据后，在经过Ncycle时间之前没有接收到下一个块的读取数据
- 在读取等待状态解除后，在经过Ncycle时间之前不会接收到下一个块的读取数据。

Note: Ncycle在SD_OPTION的位[7:4]中设置。

[Clearing condition]

- 当0写入DTO时。

ILW标志（SD_BUF0非法写访问检测标志）

ILW标志表示检测到SD_BUF0非法写访问。

[Setting conditions]

- 当数据写入SD_BUF0而不是数据读写命令状态时
- 当SD_BUF已满时将数据写入SD_BUF0
- 当数据写入SD_BUF0且CRC状态或CRC状态长度发生错误时

- When data is written to SD_BUF0 while a busy state after the CRC status continues for longer than Ncycle time.

Note: Ncycle is set in bits [7:4] in SD_OPTION.

[Clearing condition]

- When 0 is written to ILW.

ILR flag (SD_BUF0 Illegal Read Access Detection Flag)

The ILR flag indicates that an SD_BUF0 illegal read access was detected.

[Setting conditions]

- When SD_BUF is empty while SD_BUF0 is read
- When data with a CRC error or END error is read from SD_BUF0.

[Clearing condition]

- When 0 is written to ILR.

RSPTO flag (Response Timeout Detection Flag)

The RSPTO flag indicates that a response timeout was detected. The command sequence is stopped when a response timeout occurs. When the SDIOMD.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not complete. Perform the error processing shown in section 39.3.12, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 39.3.13, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting condition]

- When a response is not received though a time longer than 640 cycles of SD/MMC clock elapses (including a response to a command issued within a command sequence).

[Clearing condition]

- When 0 is written to RSPTO.

SDD0MON flag (SDHI_D0 Pin Status Flag)

The SDD0MON flag indicates the status of the SDHI_D0 pin. If the data timeout (DTO) is set but the response timeout (RSPTO) is not set after the Erase command is issued, the end of the Erase sequence (SDD0MON = 1) is confirmed by polling DAT0.

If a communication error or timeout occurs during a write sequence, the DAT0 bit might retain the value 0.

While the SD/MMC clock is stopped, the DAT0 bit retains the value before the clock is stopped.

BRE flag (SD_BUF0 Read Enable Flag)

The BRE flag indicates that SD_BUF0 is enabled for reading.

[Setting conditions]

- When data set in SD_SIZE is stored in SD_BUF0 for a single block transfer
- When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF0 for a multiple block transfer.

[Clearing conditions]

- When 0 is written to BRE
- On reading of a block of data from SD_BUF0 by DMA transfer.

When data is read from SD_BUF0 by the CPU, clear BRE, then read the amount of data specified in SD_SIZE. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF0 and BRE is set.

BWE flag (SD_BUF0 Write Enable Flag)

The BWE flag indicates that SD_BUF0 is enabled for writing.

[Setting conditions]

- 当数据写入SD_BUF0时，CRC状态后的忙碌状态持续时间超过Ncycle时间。

Note: Ncycle在SD_OPTION的位[7:4]中设置。

[Clearing condition]

- 当0写入ILW时。

ILR标志（SD_BUF0非法读访问检测标志）

ILR标志表示检测到SD_BUF0非法读取访问。

[Setting conditions]

- 当SD_BUF为空而SD_BUF0被读取时
- 当从SD_BUF0读取具有CRC错误或END错误的数据时。

[Clearing condition]

- 当0写入ILR时。

RSPTO标志（响应超时检测标志）

RSPTO标志表示检测到响应超时。当发生响应超时时，命令序列停止。当SDIOMD.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列不完整。执行39.3.12节，IO_RW_EXTENDED命令（SD：CMD53多块读取）或39.3.13节，IO_RW_EXTENDED命令（SD：CMD53多块写入）中所示的错误处理，并完成命令序列。

[Setting condition]

- 当经过超过640个SDMMC时钟周期的时间仍未收到响应时（包括对命令序列内发出的命令的响应）。

[Clearing condition]

- 当0写入RSPTO时。

SDD0MON标志（SDHI_D0引脚状态标志）

SDD0MON标志指示SDHI_D0引脚的状态。如果在发出擦除命令后设置了数据超时(DTO)但未设置响应超时(RSPTO)，则通过轮询DAT0确认擦除序列的结束(SDD0MON=1)。

如果在写入序列期间发生通信错误或超时，则DAT0位可能会保留值0。

SDMMC时钟停止时，DAT0位保持时钟停止前的值。

BRE标志（SD_BUF0读使能标志）

BRE标志指示SD_BUF0已启用读取。

[Setting conditions]

- 当SD_SIZE中设置的数据存储在SD_BUF0中以进行单块传输时
- 当SD_SIZE中的数据集存储在SD_BUF0的bank1或bank2中以进行多块传输时。

[Clearing conditions]

- 当0写入BRE
- 通过DMA传输从SD_BUF0读取数据块。

当CPU从SD_BUF0读取数据时，清除BRE，然后读取SD_SIZE中指定的数据量。即使一个读取块数据时发生CRC错误或END错误，数据存储在SD_BUF0中并设置BRE。

BWE标志（SD_BUF0写使能标志）

BWE标志指示SD_BUF0已启用写入。

[Setting conditions]

- When SD_BUF0 is empty at single block transfer
- When either bank 1 or bank 2 of SD_BUF0 is empty at multiple block transfer.

[Clearing conditions]

- When 0 is written to BWE
- On writing of a block of data to SD_BUF0 by DMA transfer.

When data is written to SD_BUF0 by the CPU, clear BWE, and then write the amount of data specified in SD_SIZE.

SD_CLK_CTRLEN flag (SD_CLK_CTRL Write Enable Flag)

When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SD_CLK_CTRLEN bit is set to 0. The SD_CLK_CTRLEN bit is set to 1 after 8 SDCLK cycles elapse after the CBSY bit sets to 0 on completion of the command sequence.

ILA flag (Illegal Access Error Detection Flag)

The ILA flag indicates that an illegal access error was detected.

[Setting conditions]

- When data is written to the SD_CMD register within a command sequence (CBSY = 1)
- When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000 1100b (CMD12) are set in SD_CMD.

[Clearing condition]

- When 0 is written to ILA.

39.2.12 SD INFO1 Interrupt Mask Register (SD_INFO1_MASK)

Address(es): SDHI0.SD_INFO1_MASK 4006 2040h, SDHI1.SD_INFO1_MASK 4006 2440h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	SDD3INM	SDD3RMM	—	—	—	SDCDINM	SDCDRMM	ACENDM	—	RSPENDM
Value after reset:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	0	1

Bit	Symbol	Bit name	Description	R/W
b0	RSPENDM	Response End Interrupt Request Mask	0: Do not mask response end interrupt request 1: Mask response end interrupt request.	R/W
b1	—	Reserved	This bit is read as 0 and cannot be modified	R
b2	ACENDM	Access End Interrupt Request Mask	0: Do not mask access end interrupt request 1: Mask access end interrupt request.	R/W
b3	SDCDRMM*1	SD0CD Removal Interrupt Request Mask	0: Do not mask SD card/MMC removal interrupt request by the SD0CD pin 1: Mask SD card/MMC removal interrupt request by the SD0CD pin.	R/W
b4	SDCDINM*1	SD0CD Insertion Interrupt Request Mask	0: Do not mask SD card/MMC insertion interrupt request by the SD0CD pin 1: Mask SD card/MMC insertion interrupt request by the SD0CD pin.	R/W
b7 to b5	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R

- 单块传输时SD_BUF0为空时
- 当SD_BUF0的bank1或bank2在多块传输中为空时。

[Clearing conditions]

- 当0写入BWE
- 通过DMA传输将数据块写入SD_BUF0。

当CPU将数据写入SD_BUF0时，清除BWE，然后写入SD_SIZE中指定的数据量。

SD_CLK_CTRLEN标志（SD_CLK_CTRL写使能标志）

当通过写入SD_CMD启动命令序列时，CBSY位设置为1，同时，SD_CLK_CTRLEN位设置为0。在命令序列完成后CBSY位设置为0之后，经过8个SDCLK 周期后，SD_CLK_CTRLEN位设置为1。

ILA标志（非法访问错误检测标志）

ILA标志表示检测到非法访问错误。

[Setting conditions]

- 当数据在命令序列中写入SD_CMD寄存器时(CBSY=1)
- 当SD_CMD[11]=1（带数据传输的命令）且SD_CMD[7:0]=00001100b(CMD12)设置为SD_CMD.

[Clearing condition]

- 当0写入ILA时。

39.2.12 SDINFO1中断屏蔽寄存器(SD_INFO1_MASK)

Address(es): SDHI0.SD_INFO1_MASK 4006 2040h, SDHI1.SD_INFO1_MASK 4006 2440h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

b7 to b5	—	Reserved	这些位被读取为0。写入这些位无效。	R

Bit	Symbol	Bit name	Description	R/W
b8	SDD3RMM	SDnDAT3 Removal Interrupt Request Mask	0: Do not mask SD card/MMC removal interrupt request by the SDnDAT3 pin 1: Mask SD card/MMC removal interrupt request by the SDnDAT3 pin.	R/W
b9	SDD3INM	SDnDAT3 Insertion Interrupt Request Mask	0: Do not mask SD card/MMC insertion interrupt request by the SDnDAT3 pin 1: Mask SD card/MMC insertion interrupt request by the SDnDAT3 pin.	R/W
b31 to b10	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R

Note 1. SDCDRMM and SDCDINM bits are supported only by SDHI0 (SD0CD). Bits [4:3] are reserved in SHDI1.

The SD_INFO1_MASK register enables or disables interrupt requests from the status flags in the SD_INFO1 register. For details on the relationship between the status flags and the requested interrupt source ,see Table 39.5, Interrupt sources.

39.2.13 SD INFO2 Interrupt Mask Register (SD_INFO2_MASK)

Address(es): SDHI0.SD_INFO2_MASK 4006 2044h, SDHI1.SD_INFO2_MASK 4006 2444h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

b6	RSPTOM	Response Timeout Interrupt Request Mask	0: Do not mask response timeout interrupt request 1: Mask response timeout interrupt request.	R/W
b7	—	Reserved	This bit is 0 when read and cannot be modified.	R
b8	BREM	BRE Interrupt Request Mask	0: Do not mask read enable interrupt request for the SD buffer 1: Mask read enable interrupt request for the SD buffer.	R/W
b9	BWEM	BWE Interrupt Request Mask	0: Do not mask write enable interrupt request for the SD_BUF0 register 1: Mask write enable interrupt request for the SD_BUF0 register.	R/W
b10	—	Reserved	This bit is read as 0	R
b11	—	Reserved	This bit is read as 1. The write value should be 1.	R/W

Bit	Symbol	位名称	Description	R/W
b8	SDD3RMM	SDnDAT3删除中断请求掩码	0：不通过SDnDAT3引脚屏蔽SD卡MMC移除中断请求1：通过SDnDAT3引脚屏蔽SD卡MMC移除中断请求。	R/W
b9	SDD3INM	SDnDAT3插入中断请求掩码	0：不通过SDnDAT3引脚屏蔽SD卡MMC插入中断请求1：通过SDnDAT3引脚屏蔽SD卡MMC插入中断请求。	R/W
b31 to b10	—	Reserved	这些位被读取为0。写入这些位无效。	R

Note 1. 只有SDHI0(SD0CD)支持SDCDRMM和SDCDINM位。位[4:3]在SHDI1中保留。

SD_INFO1_MASK寄存器启用或禁用来自SD_INFO1寄存器中状态标志的中断请求。
有关状态标志和请求的中断源之间关系的详细信息，请参见表39.5，中断源。

39.2.13 SDINFO2中断屏蔽寄存器(SD_INFO2_MASK)

Address(es): SDHI0.SD_INFO2_MASK 4006 2044h, SDHI1.SD_INFO2_MASK 4006 2444h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

重置后的值:	1	0	0	0	1	0	1	1	0	1	1	1	1	1	1	1

Bit	Symbol	位名称	Description	R/W
b0	CMDEM	命令错误中断请求掩码	0：不屏蔽命令错误中断请求1：屏蔽命令错误中断请求。	R/W
b1	CRCEM	CRC错误中断请求Mask	0：不屏蔽CRC错误中断请求1：屏蔽CRC错误中断请求。	R/W
b2	ENDEM	结束位错误中断请求Mask	0：不屏蔽结束位检测错误中断请求1：屏蔽结束位检测错误中断请求。	R/W
b3	DTOM	数据超时中断请求Mask	0：不屏蔽数据超时中断请求1：屏蔽数据超时中断请求。	R/W
b4	ILWM	SD_BUF0寄存器非法写入中断请求掩码	0：不屏蔽SD_BUF0寄存器的非法写检测中断请求1：屏蔽SD_BUF0寄存器的非法写检测中断请求。	R/W
b5	ILRM	SD_BUF0寄存器非法读取中断请求掩码	0：不屏蔽SD_BUF0寄存器的非法读检测中断请求1：屏蔽SD_BUF0寄存器的非法读检测中断请求。	R/W
b6	RSPTOM	响应超时中断请求掩码	0：不屏蔽响应超时中断请求1：屏蔽响应超时中断请求。	R/W
b7	—	Reserved	该位读取时为0，不能修改。	R
b8	BREM	BRE中断请求掩码	0：不屏蔽SD缓冲区的读使能中断请求1：屏蔽SD缓冲区的读使能中断请求。	R/W
b9	BWEM	BWE中断请求掩码	0：不屏蔽SD_BUF0寄存器的写使能中断请求1：屏蔽SD_BUF0寄存器的写使能中断请求。	R/W
b10	—	Reserved	该位读为0	R
b11	—	Reserved	该位读取为1。写入值应为1。	R/W

Bit	Symbol	Bit name	Description	R/W
b14 to b12	—	Reserved	These bits are read as 0	R
b15	ILAM	Illegal Access Error Interrupt Request Mask	0: Do not mask illegal access error interrupt request 1: Mask illegal access error interrupt request.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. When the SD_INFO2_MASK.BWEM bit is 0 or the SD_INFO2_MASK.BREM bit is 0, set the SD_DMAEN.DMAEN bit to 0.
When the SD_DMAEN.DMAEN bit is 1, set the SD_INFO2_MASK.BWEM bit and SD_INFO2_MASK.BREM bits to 1.

The SD_INFO2_MASK register enables or disables interrupt requests from the status flags in the SD_INFO2 register. For details on the relationship between the status flags and the requested interrupt source, see Table 39.5.

39.2.14 SD Clock Control Register (SD_CLK_CTRL)

Address(es): SDHI0.SD_CLK_CTRL 4006 2048h, SDHI1.SD_CLK_CTRL 4006 2448h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CLKCTRLEN	CLKEN	CLKSEL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CLKSEL[7:0]	SDHI Clock Frequency Select*1	b7 b0 0 0 0 0 0 0 0 0: PCLKA/2 0 0 0 0 0 0 0 1: PCLKA/4 0 0 0 0 0 0 1 0: PCLKA/8 0 0 0 0 0 1 0 0: PCLKA/16 0 0 0 0 1 0 0 0: PCLKA/32 0 0 0 1 0 0 0 0: PCLKA/64 0 0 1 0 0 0 0 0: PCLKA/128 0 1 0 0 0 0 0 0: PCLKA/256 1 0 0 0 0 0 0 0: PCLKA/512. Other settings are prohibited.	R/W
b8	CLKEN	SD/MMC Clock Output Control*1	0: Disable SD/MMC clock output (fix SDnCLK signal low) 1: Enable SD/MMC clock output.	R/W
b9	CLKCTRLEN	SD/MMC Clock Output Automatic Control Select	0: Disable automatic control of SD/MMC clock output 1: Enable automatic control of SD/MMC clock output.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Bits CLKSEL[7:0] and CLKEN cannot be write accessed when the SD_INFO2.SD_CLK_CTRLEN flag is 0.

The SDCLKCTRL register controls the SD/MMC clock frequency settings and output. Set the CLKEN bit to 1 before writing to the SD_CMD register to start a command sequence. Do not write to the SDCLKCTRL register when the SD_INFO2.SD_CLK_CTRLEN flag is 0.

CLKCTRLEN bit (SD/MMC Clock Output Automatic Control Select)

The CLKCTRLEN bit allows for automatic control of the SD/MMC clock output within a command sequence.

The timing with which SD/MMC clock output starts and stops is as follows:

- SD/MMC clock output starts after writing to SD_CMD
- SD/MMC clock output stops when 8 SD/MMC clock cycles elapse after the command sequence ends.

In addition, SD/MMC clock is fixed to 0 while CLKEN in SD_CLK_CTRL is 0, regardless of this bit value.

Bit	Symbol	位名称	Description	R/W
b14 to b12	—	Reserved	这些位被读为0	R
b15	ILAM	非法访问错误中断请求掩码	0：不屏蔽非法访问错误中断请求1：屏蔽非法访问错误中断请求。	R/W
b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R

Note 1. 当SD_INFO2_MASK.BWEM位为0或SD_INFO2_MASK.BREM位为0时，将SD_DMAEN.DMAEN位设置为0。
当SD_DMAEN.DMAEN位为1时，将SD_INFO2_MASK.BWEM位和SD_INFO2_MASK.BREM位设置为1。

SD_INFO2_MASK寄存器启用或禁用来自SD_INFO2寄存器中状态标志的中断请求。
状态标志与请求中断源的关系详见表39.5。

39.2.14 SD时钟控制寄存器(SD_CLK_CTRL)

Address(es): SDHI0.SD_CLK_CTRL 4006 2048h, SDHI1.SD_CLK_CTRL 4006 2448h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	CLKCTRLEN	CLKEN	CLKSEL[7:0]							
重置后的值：	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	CLKSEL[7:0]	SDHI时钟频率 Select*1	b7b000000000：PCLKA200 000001：PCLKA400000010 ：PCLKA800000100：PCLK A1600001000：PCLKA3200 010000：PCLKA640010000 0：PCLKA12801000000：P CLKA25610000000：PCLKA 512.禁止其他设置。	R/W
b8	CLKEN	SDMMC时钟输出 Control*1	0：禁用SDMMC时钟输出（固定SDnCLK信号为低电平） 1：启用SDMMC时钟输出。	R/W
b9	CLKCTRLEN	SDMMC时钟输出自动控制选择	0：禁止SDMMC时钟输出自动控制1：使能SDMMC时钟输出自动控制。	R/W
b31 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 当SD_INFO2.SD_CLK_CTRLEN标志为0时，不能写访问位CLKSEL[7:0]和CLKEN。

SDCLK CTRL寄存器控制SDMMC时钟频率设置和输出。在写入SD_CMD寄存器以启动命令序列之前，将CLKEN位设置为1。当SD_INFO2.SD_CLK_CTRLEN标志为0时，不要写入SDCLK CTRL寄存器。

CLKCTRLEN位（SDMMC时钟输出自动控制选择）

CLKCTRLEN位允许在命令序列内自动控制SDMMC时钟输出。

SDMMC时钟输出开始和停止的时序如下：

- SDMMC时钟输出在写入SD_CMD后开始
- 当命令序列结束后经过8个SDMMC时钟周期时，SDMMC时钟输出停止。

此外，SDMMC时钟固定为0，而SD_CLK_CTRL中的CLKEN为0，与该位值无关。

39.2.15 Transfer Data Length Register (SD_SIZE)

Address(es): SDHI0.SD_SIZE 4006 204Ch, SDHI1.SD_SIZE 4006 244Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	LEN[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b9 to b0	LEN[9:0]	Transfer Data Size Setting	These bits specify the transfer data size*1	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Do not rewrite these bits when the SD_INFO2.CBSY flag is 1.

The SD_SIZE register sets the transfer data size.

LEN[9:0] bits (Transfer Data Size Setting)

When using single block transfer, the transfer data size can be set from 1 byte to 512 bytes in the LEN[9:0] bits. When CMD12 is automatically issued during a multi-block transfer sequence (CMD18 and CMD25), the transfer data size can only be set to 512 bytes. When CMD12 is not automatically issued during a multi-block transfer sequence, the transfer data size can be set to 32, 64, 128, 256, or 512 bytes. However, a 32-, 64-, 128-, or 256-byte multi-block read transfer can only be performed during an SDIO multi-block transfer (CMD53). Do not set these bits to 0 when using a command that includes data transfer.

39.2.16 SD Card Access Control Option Register (SD_OPTION)

Address(es): SDHI0.SD_OPTION 4006 2050h, SDHI1.SD_OPTION 4006 2450h

b9 to b0	LEN[9:0]	传输数据大小设置	这些位指定传输数据大小*1	R/W
b31 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R

Note 1. 当SD_INFO2.CBSY标志为1时，不要重写这些位。

SD_SIZE寄存器设置传输数据大小。

LEN[9:0]位（传输数据大小设置）

使用单块传输时，传输数据大小可在LEN[9:0]位中设置为1字节至512字节。在多块传输序列（CMD18和CMD25）期间自动发出CMD12时，传输数据大小只能设置为512字节。当在多块传输序列期间不自动发出CMD12时，传输数据大小可以设置为32、64、128、256或512字节。但是，只能在SDIO多块传输(CMD53)期间执行32、64、128或256字节的多块读取传输。使用包含数据传输的命令时，请勿将这些位设置为0。

39.2.16 SD卡访问控制选项寄存器(SD_OPTION)

Bit	Symbol	Bit name	Description	R/W
b2	BSYTO0	Busy Timeout Flag 0	0: After R1b response is received, SD/MMC is released from the busy state during the specified period*3 1: After R1b response is received, SD/MMC is in the busy state after the specified period*3 elapsed.	R
b3	BSYTO1	Busy Timeout Flag 1	0: After CMD12 is automatically issued, SD/MMC is released from the busy state during the specified period*3 1: After CMD12 is automatically issued, SD/MMC is in the busy state after the specified period*3 elapsed (with SD_CMD.CMDIDX[5:0] setting, an error that occurs with CMD12 issue is indicated in the BSYTO0 flag).	R
b4	RDTO	Read Data Timeout Flag	When a read command is issued, this flag sets to 1 when read data is not received after the specified period*3 elapses. When read data is received, this flag sets to 1 when the next block of read data is not received after the specified period*3 elapses. After the SD/MMC exits the read wait state, this flag sets to 1 when the next block of read data is not received after the specified period*3 elapses.	R
b5	CRCTO	CRC Status Token Timeout Flag	0: After CRC data is written to the SD card/MMC, a CRC status token is received during the specified period*3 1: After CRC data is written to the SD card/MMC, a CRC status token is not received after the specified period*3 elapses.	R
b6	CRCBSYTO	CRC Status Token Busy Timeout Flag	0: After a CRC status token is received, the SD/MMC is released from the busy state during the specified period*3 1: After a CRC status token is received, the SD/MMC is in the busy state after the specified period*3 elapses.	R
b31 to b7	—	Reserved	These bits are read as 0	R

Note 1. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer in the SD_CMD register setting, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 2. CMD12 when automatic issuing is enabled for multiple block transfer in the SD_CMD register setting, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 3. Set the SD_OPTION.TOP[3:0] bits to select the number of *n* cycles.
Note 4. The initial value is applied at reset and when the SOFT_RST.SDRST flag is 0.

The SD_ERR_STS2 register indicates the timeout status.

39.2.19 SD Buffer Register (SD_BUF0)

Address(es): SDHI0.SD_BUF0 4006 2060h, SDHI1.SD_BUF0 4006 2460h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

When writing to the SD card, write data is written to this register. When reading from the SD card, read data is read from this register. This register is internally connected to two 512-byte buffers.

If both buffers are not empty when executing multiple block reads, the SD card/MMC clock is stopped to suspend receiving data. When one of the buffers is empty, the SD card/MMC clock is supplied to resume receiving data.

Bit	Symbol	位名称	Description	R/W
b2	BSYTO0	忙超时标志0	0：收到R1b响应后，SDMMC在指定时间段内从忙状态释放*31：收到R1b响应后，SDMMC在指定时间段后处于忙状态*3过去。	R
b3	BSYTO1	忙超时标志1	0：CMD12自动下发后，SDMMC在指定时间段内从忙状态释放*31：CMD12自动下发后，SDMMC在指定时间段后处于忙状态*3过去（带SD_CMD.CMDIDX[5:0]设置，在BSYTO0标志中指示CMD12问题发生的错误）。	R
b4	RDTO	读取数据超时标志	当发出读取命令时，如果在指定时间段*3过去后未接收到读取数据，则此标志设置为1。当接收到读取数据时，如果经过指定的时间*3后没有接收到下一个读取数据块，则此标志设置为1。SDMMC退出读取等待状态后，如果在指定的时间*3后没有接收到下一个读取数据块，则此标志设置为1。	R
b5	CRCTO	CRC状态令牌 超时标志	0：CRC数据写入SD卡MMC后，在指定周期内收到CRC状态令牌*31：CRC数据写入SD卡MMC后，在指定周期内未收到CRC状态令牌*3过去了。	R
b6	CRCBSYTO	CRC状态令牌忙 超时标志	0：收到CRC状态令牌后，SDMMC在指定时间段内从忙碌状态中释放*31：在收到CRC状态令牌后，SDMMC在指定时间段后处于忙碌状态*3过去.	R
b31 to b7	—	Reserved	这些位被读为0	R

Note 1. 在SD_CMD寄存器设置中为多块传输启用自动发布时的CMD12以外的CMD、当SD_STOP中的STP位设置为1时的CMD12或SDIO_MODE中的C52PUB或IOABT位设置为1时的CMD52。
Note 2. 在SD_CMD寄存器设置中为多块传输启用自动发送时为CMD12，当SD_STOP中的STP位设置为1时为CMD12，或者当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
Note 3. 设置SD_OPTION.TOP[3:0]位以选择n个周期数。
Note 4. 初始值在复位时和SOFT_RST.SDRST标志为0时应用。

SD_ERR_STS2寄存器指示超时状态。

39.2.19 SD缓冲寄存器(SD_BUF0)

Address(es): SDHI0.SD_BUF0 4006 2060h, SDHI1.SD_BUF0 4006 2460h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

写入SD卡时，写入数据写入该寄存器。从SD卡读取时，从该寄存器读取读取数据。该寄存器在内部连接到两个512字节的缓冲区。

如果执行多个块读取时两个缓冲区都不为空，则停止SD卡MMC时钟以暂停接收数据。当其中一个缓冲区为空时，提供SD卡MMC时钟以恢复接收数据。

39.2.20 SDIO Mode Control Register (SDIO_MODE)

Address(es): SDHI0.SDIO_MODE 4006 2068h, SDHI1.SDIO_MODE 4006 2468h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	C52PUB	IOABT	—	—	—	—	—	RWREQ	—	INTEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	INTEN	SDIO Interrupt Acceptance Enable*1	0: SDIO interrupt accept disabled 1: SDIO interrupt accept enabled.	R/W
b1	—	Reserved	This bit is read as 0	R
b2	RWREQ	Read Wait Request	0: SD/MMC exits read wait state 1: Request for SD/MMC to enter read wait state.	R/W
b7 to b3	—	Reserved	These bits are read as 0	R
b8	IOABT	SDIO Abort	If this bit is set to 1 during multi-block transfer triggered by CMD53, CMD52 is immediately issued, and the command sequence is aborted	R/W
b9	C52PUB	SDIO None Abort	If this bit is set to 1 during multi-block transfer triggered by CMD53, CMD52 is issued after the transfer process and the command sequence are complete	R/W
b31 to b10	—	Reserved	These bits are read as 0	R

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The SDIO_MODE register controls reception of the SDIO interrupt, CMD52 issuance during multi-block transfer, and the read wait request. Do not set C52PUB and IOABT bits to 1 at the same time.

RWREQ bit (Read Wait Request)

When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks.

[Read wait state release]

- When RWREQ is set to 0 in the read wait state
- When IOABT is set to 1 in the read wait state, and RWREQ is automatically set to 0 after CMD52 is issued
- When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence. Therefore, after the CMD52 response is received, clear RWREQ. Be sure to set RWREQ and C52PUB simultaneously.

When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting the end of access. Set RWREQ to 1 after the response end flag is set.

IOABT bit (SDIO Abort)

When the IOABT bit is set to 1 in a CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communication error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT is set to 1, the buffer access error bit (ILR or ILW) in SD_INFO2 is set accordingly. Set SD_ARG before setting IOABT to 1.

When IOABT is set to 1 during the transfer for a single block write, the access end flag is set when SD_BUF0 becomes empty, and CMD52 is not issued. If SD_BUF0 contains data, the access end flag sets on the completion of reception of the busy state without CMD52 being issued.

39.2.20 SDIO模式控制寄存器(SDIO_MODE)

Address(es): SDHI0.SDIO_MODE 4006 2068h, SDHI1.SDIO_MODE 4006 2468h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	C52PUB	IOABT	—	—	—	—	—	RWREQ	—	INTEN
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	INTEN	SDIO中断接受Enable*1	0：SDIO中断接受禁止1：SDIO中断接受使能。	R/W
b1	—	Reserved	该位读为0	R
b2	RWREQ	读取等待请求	0：SDMMC退出读等待状态1：请求SDMMC进入读等待状态。	R/W
b7 to b3	—	Reserved	这些位被读为0	R
b8	IOABT	SDIO Abort	如果在CMD53触发的多块传输期间该位设置为1，立即发出CMD52，命令序列中止	R/W
b9	C52PUB	SDIO无中止	如果在CMD53触发的多块传输期间该位设置为1，在传输过程和命令序列完成后发出CMD52	R/W
b31 to b10	—	Reserved	这些位被读为0	R

Note 1. 当SD_INFO2.CBSY标志为1时，不要重写该位。

SDIO_MODE寄存器控制SDIO中断的接收、多块传输期间的CMD52发布以及读取等待请求。不要同时将C52PUB和IOABT位设置为1。

RWREQ位（读取等待请求）

当CMD53（多块）读取序列中RWREQ设置为1时，块传输进入块之间的读取等待状态。

[读取等待状态释放]

- 在读等待状态下RWREQ设置为0时
- 当IOABT在读等待状态下设置为1，CMD52发出后RWREQ自动设置为0
- 当C52PUB和RWREQ在CMD53（多块）读取序列中同时设置为1时。因此，在收到CMD52响应后，清除RWREQ。请务必同时设置RWREQ和C52PUB。

当RWREQ在CMD53（多块）读取序列中的最后一个块被传输时设置为1时，不会进入读取等待状态，并且通过设置访问结束将RWREQ自动清除为0。设置响应结束标志后将RWREQ设置为1。

IOABT位（SDIO中止）

当CMD53（多块）序列中的IOABT位设置为1时，CMD53序列停止并发出CMD52。但是，如果命令序列由于通信错误或超时而停止，则不会发出CMD52。尽管即使在IOABT设置为1后仍可以继续访问缓冲区，但缓冲区访问错误位（ILR或ILW）在

SD_INFO2相应设置。在将IOABT设置为1之前设置SD_ARG。

当IOABT在单块写入传输期间设置为1时，当SD_BUF0为空时设置访问结束标志，并且不发出CMD52。如果SD_BUF0包含数据，则在没有发出CMD52的情况下完成接收忙碌状态时设置访问结束标志。

When IOABT is set to 1 during the transfer for a single block read, the access end flag is set immediately after IOABT is set, and CMD52 is not issued.

When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 being issued.

When IOABT is set to 1 after a command sequence is complete, CMD52 is not issued and the access end flag is not set.

Set IOABT to 1 after the response end flag sets. Set IOABT to 0 after the access end flag is set.

C52PUB bit (SDIO None Abort)

When the C52PUB bit is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF0 becomes empty. C52PUB is automatically cleared to 0 after the reception of response to CMD52 is complete. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically set to 0 after the access end flag is set to 1.

When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically set to 0 after the reception of the response to CMD52 is complete. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically set to 0 after the access end flag is set to 1.

If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 in addition to C52PUB.

Set SD_ARG before setting C52PUB to 1. Set C52PUB to 1 after the response end flag is set.

39.2.21 SDIO Interrupt Flag Register (SDIO_INFO1)

Address(es): SDHI0.SDIO_INFO1 4006 206Ch, SDHI1.SDIO_INFO1 4006 246Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EXWT	EXPUB52	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	IOIRQ	SDIO Interrupt Status Flag	0: SDIO interrupt is not detected 1: SDIO interrupt is detected.	R(/W)*1
b2, b1	—	Reserved	The read value is undefined. The write value should be 1.	R/W
b13 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	EXPUB52	EXPUB52 Status Flag	Indicate the status of the EXPUB52	R(/W)*1
b15	EXWT	EXWT Status Flag	Indicate the status of the EXWT	R(/W)*1
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the bit.

The SDIO_INFO1 register indicates the status of the SDIO card access. Set the flags to be cleared to 0. Set the flags that are not being cleared to 1.

IOIRQ flag (SDIO Interrupt Status Flag)

The IOIRQ flag indicates that an SDIO interrupt occurred.

[Setting condition]

- When an SDIO interrupt from an SDIO card is received while INTEN in SDIO_MODE is set to 1.

当IOABT在传输过程中为单个块读取设置为1时，在设置IOABT后立即设置访问结束标志，并且不发出CMD52。

如果在R1b响应后的忙状态接收期间IOABT设置为1，则在不发出CMD52的忙状态接收完成时设置访问结束标志。

当命令序列完成后IOABT设置为1时，不发出CMD52并且不设置访问结束标志。

设置响应结束标志后将IOABT设置为1。设置访问结束标志后将IOABT设置为0。

C52PUB位（SDIO无中止）

在CMD53（多块）写入序列中将C52PUB位设置为1时，如果SD_BUF0为空，则在块之间自动发出CMD52。C52PUB在接收到对CMD52的响应完成后自动清0。此外，如果在传输最后一个块时将C52PUB设置为1，则不会发出CMD52。

在这种情况下，访问结束标志设置为1后，C52PUB自动设置为0。

当CMD53（多块）读序列中C52PUB和RWREQ置1时，块传输进入块间读等待状态，自动发出CMD52。在接收到对CMD52的响应完成后，C52PUB自动设置为0。此外，如果在传输最后一个块时将C52PUB设置为1，则不会发出CMD52。在这种情况下，访问结束标志设置为1后，C52PUB自动设置为0。

如果在CMD53（多块）读取序列中将C52PUB设置为1，请务必在C52PUB之外将RWREQ设置为1。

在将C52PUB设置为1之前设置SD_ARG。在设置响应结束标志后将C52PUB设置为1。

39.2.21 SDIO中断标志 寄存器(SDIO_INFO1)

Address(es): SDHI0.SDIO_INFO1 4006 206Ch, SDHI1.SDIO_INFO1 4006 246Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EXWT	EXPUB52	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQ
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	0

x: Undefined

Bit	Symbol	位名称	Description	R/W
b0	IOIRQ	SDIO中断状态标志	0：未检测到SDIO中断1：检测到SDIO中断。	R(/W)*1
b2, b1	—	Reserved	读取值未定义。写入值应为1。	R/W
b13 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b14	EXPUB52	EXPUB52状态标志	指示EXPUB52的状态	R(/W)*1
b15	EXWT	EXWT状态标志	指示EXWT的状态	R(/W)*1
b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只能写入0以清除该位。

SDIO_INFO1寄存器指示SDIO卡访问的状态。将要清除的标志设置为0。将未清除的标志设置为1。

IOIRQ标志（SDIO中断状态标志）

IOIRQ标志表示发生了SDIO中断。

[Setting condition]

- 当SDIO_MODE中的INTEN设置为1时接收到来自SDIO卡的SDIO中断。

[Clearing condition]

- When 0 is written to IOIRQ.*1

Note 1. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit can be set again.

EXPUB52 flag (EXPUB52 Status Flag)

The EXPUB52 flag indicates the EXPUB52 status.

[Setting conditions]

- While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1
- While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred.

[Clearing condition]

- When 0 is written to EXPUB52.

EXWT flag (EXWT Status Flag)

The EXWT flag indicates the EXWT status.

[Setting condition]

- While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1.

[Clearing condition]

- When 0 is written to EXWT.

39.2.22 SDIO INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

Address(es): SDHI0.SDIO_INFO1_MASK 4006 2070h, SDHI1.SDIO_INFO1_MASK 4006 2470h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EXWTM	EXPUB52M	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQM
Value after reset:	1	1	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	Bit name	Description	R/W
b0	IOIRQM	IOIRQ Interrupt Mask Control	0: Do not mask IOIRQ interrupts 1: Mask IOIRQ interrupts.	R/W
b2, b1	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b13 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	EXPUB52M	EXPUB52 Interrupt Request Mask Control	0: Do not mask EXPUB52 interrupt requests 1: Mask EXPUB52 interrupt requests.	R/W
b15	EXWTM	EXWT Interrupt Request Mask Control	0: Do not mask EXWT interrupt requests 1: Mask EXWT interrupt requests.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SDIO_INFO1_MASK register enables or disables interrupt requests from the status flags in the SDIO_INFO1 register. For details on the relationship between the status flags and the requested interrupt source see Table 39.5, Interrupt sources.

[Clearing condition]

- 当0写入IOIRQ时。*1

注1.在清除该位之前，访问SDIO卡以否定来自SDIO卡的SDIO中断信号。如果中断信号没有被否定，这个位可以被重新设置。

EXPUB52标志（EXPUB52状态标志）

EXPUB52标志指示EXPUB52状态。

[Setting conditions]

- 在传输CMD53（多块）序列中的最后一个块时，SDIO_MODE中的C52PUB设置为1
- 当C52PUB在CMD53（多块）写入序列中设置为1时，传输最后一个块。

[Clearing condition]

- 当0写入EXPUB52时。

EXWT标志（EXWT状态标志）

EXWT标志指示EXWT状态。

[Setting condition]

- 在传输CMD53（多块）读取序列中的最后一个块时，SDIO_MODE中的RWREQ设置为1。

[Clearing condition]

- 当0写入EXWT时。

39.2.22 SDIOINFO1中断屏蔽寄存器(SDIO_INFO1_MASK)

b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7, b6	—	Reserved	These bits are read as 0	R
b9, b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b11, b10	—	Reserved	These bits are read as 0	R
b12	—	Reserved	This bit is read as 1	R
b31 to b13	—	Reserved	These bits are read as 0	R

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY bit is 1.
Note 2. When the SD_INFO2_MASK.BWEM bit is 0 or the SD_INFO2_MASK.BREM bit is 0, set the SD_DMAEN.DMAEN bit to 0. When the SD_DMAEN.DMAEN bit is 1, set the SD_INFO2_MASK.BWEM bit to 1 and the SD_INFO2_MASK.BREM bit to 1.

The SD_DMAEN register enables or disables DMA transfers.

DMAEN bit (DMA Transfer Enable)

When using DMA transfer to access the SD buffer, set the DMAEN bit to 1 before setting the SD_CMD register.

39.2.23 DMA模式使能寄存器(SD_DMAEN)

Address(es): SDHI0.SD_DMAEN 4006 21B0h, SDHI1.SD_DMAEN 4006 25B0h

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Bit	Symbol	Bit name	Description	R/W
b8	NOCHKCR	CRC Check Mask	CRC check mask bit for MMC test commands. Set when CRC16 or CRC status value check is not executed. 0: CRC check is enabled 1: CRC check is disabled. CRC16 value is ignored when reading and CRC status value is ignored when writing.	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

NOCHKCR bit (CRC Check Mask)

The NOCHKCR bit is used for MMC test commands. This bit is set when CRC16 or CRC status value check is not executed.

39.2.26 Swap Control Register (EXT_SWAP)

Address(es): SDHI0.EXT_SWAP 4006 21E0h, SDHI1.EXT_SWAP 4006 25E0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	BRSWP	BWSWP	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0 and cannot be modified	R
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b2	—	Reserved	This bit is read as 0 and cannot be modified	R
b4, b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	—	Reserved	This bit is read as 0 and cannot be modified	R
b6	BWSWP	SD_BUF0 Swap Write*1	0: Normal write operation 1: Swap the byte endian order before writing to SD_BUF0 register.	R/W
b7	BRSWP	SD_BUF0 Swap Read*1	0: Normal read operation 1: Swap the byte endian order before reading SD_BUF0 register.	R/W
b10 to b8	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14, b13	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b31 to b16	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The EXT_SWAP register selects whether or not the byte endian order is swapped when accessing the SD_BUF0 register. For details on the differences in accessing the SD_BUF0 register based on the EXT_SWAP register value, see section 39.3.1.

39.3 Operation

39.3.1 SD/MMC Interface

When data is read from the SD card/MMC, the process is as follows:

1. The SD/MMC Host Interface receives data from the SD card/MMC through the SDnDAT signal, as shown in Figure 39.2 and Figure 39.3.

Bit	Symbol	位名称	Description	R/W
b8	NOCHKCR	CRC校验掩码	MMC测试命令的CRC校验掩码位。不执行CRC16或CRC状态值检查时置位。0：启用CRC校验1：禁用CRC校验。读取时忽略CRC16值，写入时忽略CRC状态值。	R/W
b31 to b9	—	Reserved	这些位被读取为0。写入值应为0。	R/W

NOCHKCR位（CRC校验掩码）

NOCHKCR位用于MMC测试命令。当不执行CRC16或CRC状态值检查时，该位置位。

39.2.26 交换控制寄存器(EXT_SWAP)

Address(es): SDHI0.EXT_SWAP 4006 21E0h, SDHI1.EXT_SWAP 4006 25E0h

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	—	Reserved	该位读为0，不能修改	R
b1	—	Reserved	该位读取为0。写入值应为0。	R/W
b2	—	Reserved	该位读为0，不能修改	R
b4, b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b5	—	Reserved	该位读为0，不能修改	R
b6	BWSWP	SD_BUF0 Swap Write*1	0：正常写操作1：在写入SD_BUF0寄存器之前交换字节顺序。	R/W
b7	BRSWP	SD_BUF0 Swap Read*1	0：正常读取操作1：在读取SD_BUF0寄存器之前交换字节顺序。	R/W
b10 to b8	—	Reserved	这些位被读取为0。写入这些位无效。	R
b12, b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b14, b13	—	Reserved	这些位被读取为0。写入这些位无效。	R
b15	—	Reserved	该位读取为0。写入值应为0。	R/W
b31 to b16	—	Reserved	这些位被读取为0。写入这些位无效。	R

Note 1. 当SD_INFO2.CBSY标志为1时，不要重写该位。

EXT_SWAP寄存器选择在访问SD_BUF0寄存器时是否交换字节顺序。
有关根据EXT_SWAP寄存器值访问SD_BUF0寄存器的差异的详细信息，请参见第39.3.1节。

39.3 Operation

39.3.1 SD/MMC Interface

从SD卡MMC读取数据时，流程如下：

1. SDMMCHostInterface通过SDnDAT信号从SD卡MMC接收数据，如图
图39.2和图39.3。

RA生态工作室

2. The received data is stored in SD_BUF of the MMC host interface, as shown in Figure 39.4.
3. The data stored in SD_BUF is read from SD_BUF0, as shown in Figure 39.5.

When data is written to the SD card/MMC, the specified procedure is reversed.

When accessing SD_BUF0, pay attention to the transfer order in SDnDAT and the order of storage in SD_BUF. The byte endianness of the data read from or written to the SD_BUF0 register can be swapped using the SDSWAP register. See Figure 39.5.

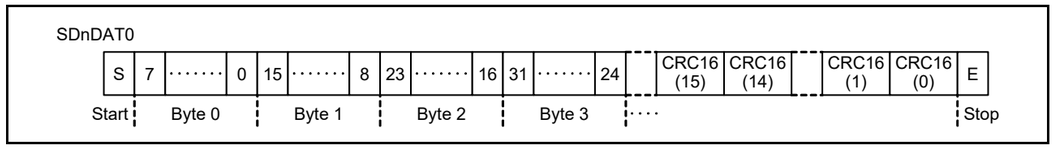

Figure 39.2 SDnDAT in 1-bit width mode

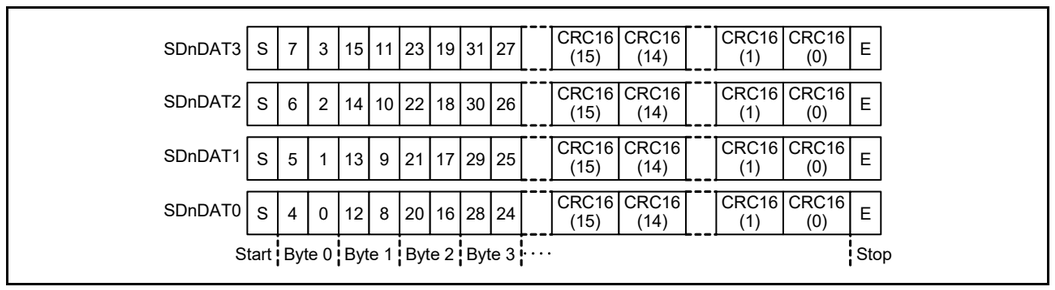

Figure 39.3 SDnDAT in 4-bit width mode

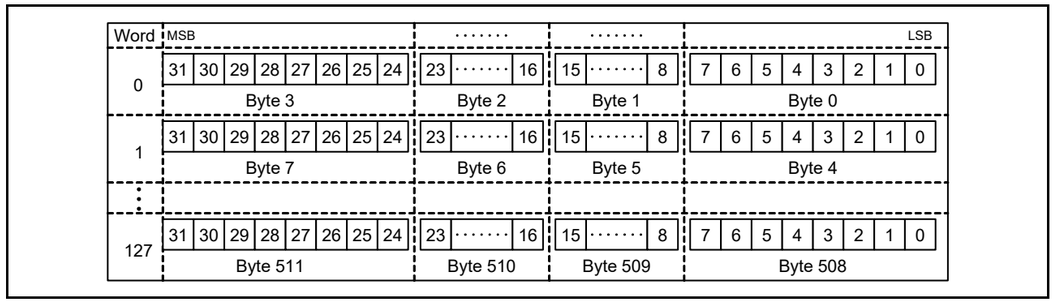

Figure 39.4 SD_BUF data storage

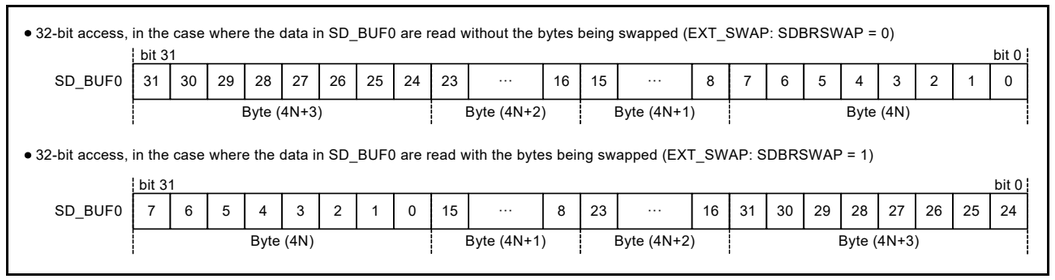

Figure 39.5 Reading from SD_BUF0

2. 接收到的数据存储在MMC主机接口的SD_BUF中，如图39.4所示。
3. SD_BUF中存储的数据从SD_BUF0中读取，如图39.5所示。

当数据写入SD卡MMC时，指定的过程相反。

访问SD_BUF0时，注意SDnDAT中的传输顺序和SD_BUF中的存储顺序。可以使用SDSWAP寄存器交换从SD_BUF0寄存器读取或写入数据的字节字节序。请参见图39.5。

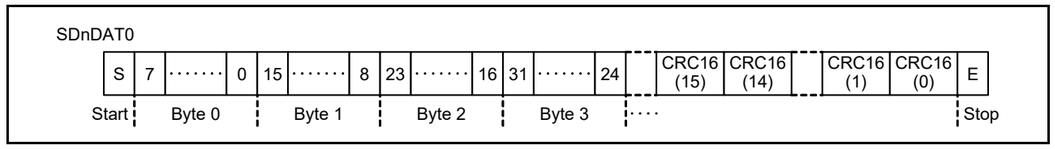

Figure 39.2 SDnDAT在1位宽模式下

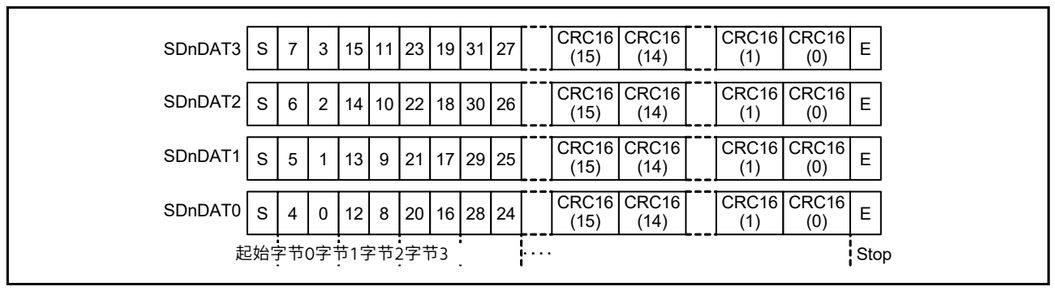

Figure 39.3 SDnDAT在4位宽模式下

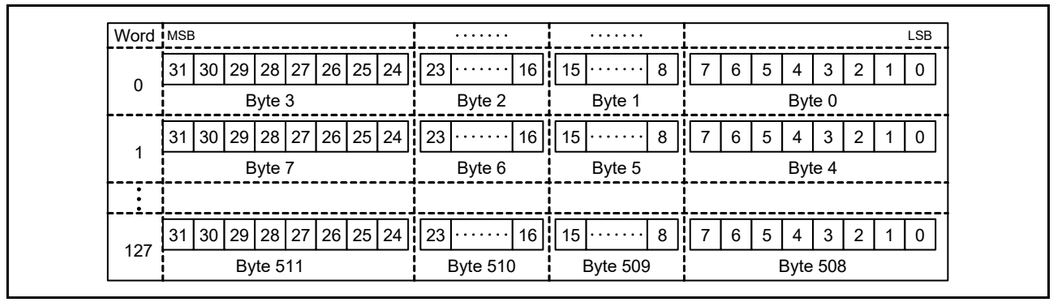

Figure 39.4 SD_BUF数据存储

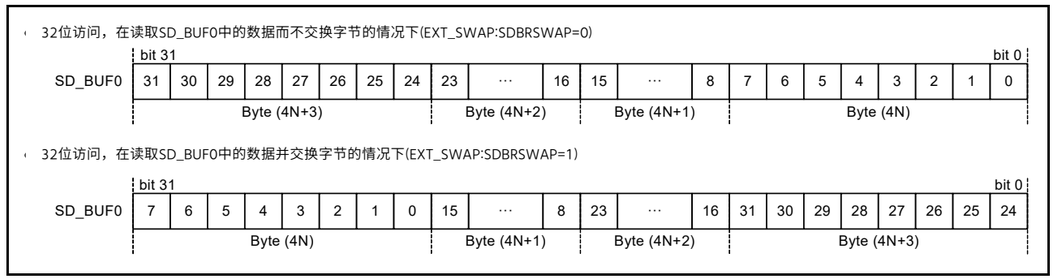

Figure 39.5 从SD_BUF0读取

39.3.2 Card Detect/Write Protect

39.3.2.1 Card detect

The SD/MMC host interface has two types of card detect functions.

(1) Card detect with SD0CD

Figure 39.6 shows the timing for card detect using the SD0CD pin. SD0CD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is determined by the specification of the SD/MMC host device.

(2) Card insertion

When a card is inserted, the SD0CD pin is pulled down. If SD0CD is pulled down for the Mcycle period (set in the SD_OPTION register), the SDCDIN bit in the SD_INFO1 register is set to 1. It is cleared by writing 0.

(3) Card removal

When a card is removed, the SD0CD pin is pulled up. If SD0CD is pulled up for the Mcycle period (set in SD_OPTION), the SDCDRM bit in the SD_INFO1 register is set to 1. It is cleared by writing 0.

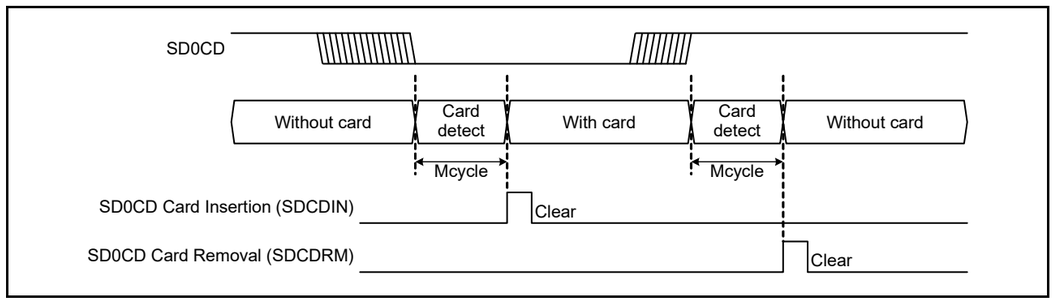

Figure 39.6 Example of card detect with SD0CD

(4) SD card detect with SDnDAT3 (n = 0, 1)

Figure 39.7 shows the timing when the SD card is detected with the SDnDAT3 pin. Also, SDnDAT3 is pulled down by the host device, and the pull-down resistance value is determined by the specification of the SD host device.

(5) Card insertion

When an SD card is inserted, SDnDAT3 is pulled up and SDD3IN in SD_INFO1 is set to 1. It is cleared by writing 0.

(6) Card removal

When an SD card is removed, SDnDAT3 is pulled down and SDD3RM in SD_INFO1 is set to 1. It is cleared by writing 0.

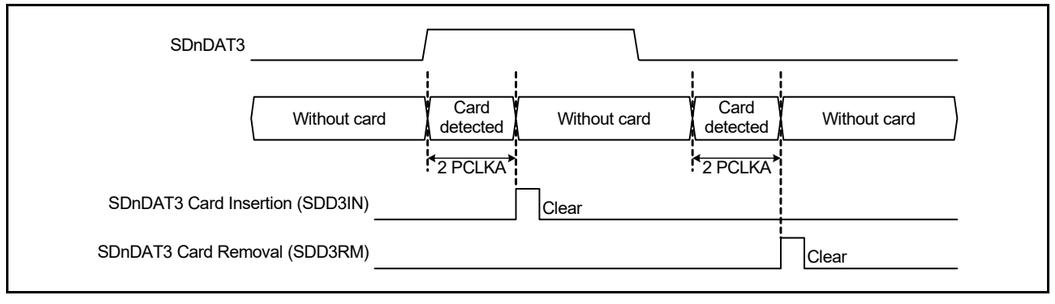

Figure 39.7 SD card detect with SDnDAT3

39.3.2 卡检测写保护

39.3.2.1 卡检测

SDMMC主机接口有两种类型的卡检测功能。

(1) SD0CD卡检测

图39.6显示了使用SD0CD引脚进行卡检测的时序。SD0CD连接到卡槽并在主机设备上拉高。上拉电阻的阻值由SDMMC主机设备的规格决定。

(2) 插卡

插入卡时，SD0CD引脚被拉低。如果SD0CD在Mcycle周期内被拉低（在SD_OPTION寄存器），SD_INFO1寄存器中的SDCDIN位设置为1，写入0清零。

(3) 取卡

取出卡时，SD0CD引脚被拉高。如果SD0CD在Mcycle周期内上拉（在SD_OPTION中设置），则SD_INFO1寄存器中的SDCDRM位设置为1。通过写入0将其清除。

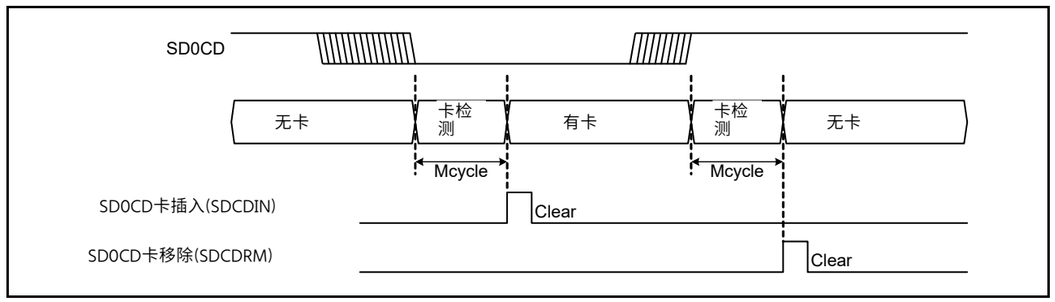

Figure 39.6 使用SD0CD检测卡的示例

(4) 使用SDnDAT3检测SD卡(n=0 1)

图39.7显示了使用SDnDAT3引脚检测到SD卡的时序。此外，SDnDAT3被主机设备下拉，下拉电阻值由SD主机设备的规格决定。

(5) 插卡

插入SD卡时，SDnDAT3上拉，SD_INFO1中的SDD3IN置1，写0清零。

(6) 取卡

拔出SD卡时，SDnDAT3被拉低，SD_INFO1中的SDD3RM置1，写入0清零。

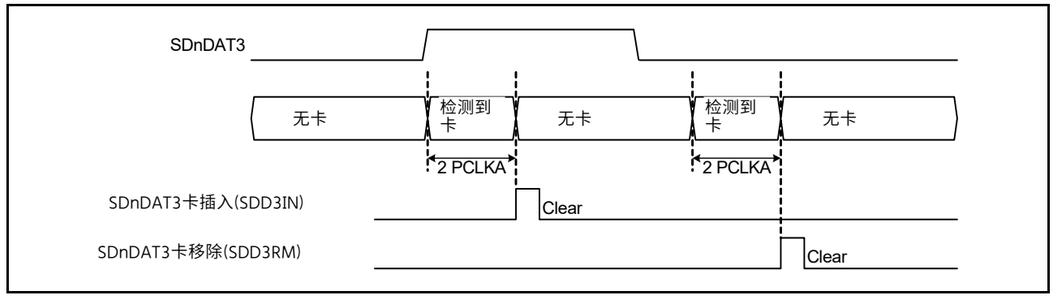

Figure 39.7 使用SDnDAT3检测SD卡

39.3.2.2 Write protect

The SD/MMC host interface has two types of write protect functions.

(1) Write protect with SD0WP

The SD0WP pin is connected to the card socket and pulled up or down by the card insertion. The selection to pull up or down and the resistance value is determined by the specification of the SD host device. When the SD0WP pin state is reflected to the SDWPMON bit in the SD_INFO1 register, the write protect state is set after the SD card is inserted.

(2) Write protect with command

The internal write protection of the card and the lock/unlock operation of the card are realized by the command.

39.3.3 Interrupt Request and DMA Transfer Request

39.3.3.1 Interrupts

Table 39.5 lists the SDHI interrupt sources. The SDHI requests an interrupt when:

- The status flags in SD_INFO1, SD_INFO2, and SDIO_INFO1 registers are set to 1
- The associated bits in the SD_INFO1_MASK, SD_INFO2_MASK, and SDIO_INFO1_MASK registers are 0.

When clearing the status flags in the SD_INFO1, SD_INFO2, and SDIO_INFO1 registers, write 0 to the status flags to be cleared, and write 1 to the status flags that are not being cleared.

Table 39.5 Interrupt sources

Interrupt sources	Status flag register		Interrupt mask register		Interrupt name	
	Register symbol	Bit symbol	Register symbol	Bit symbol	Ch 0	Ch 1
Card Access Interrupt (CACI)	SD_INFO1	ACEND	SD_INFO1_MASK	ACENDM	SDHI_MMC0_ACCS	SDHI_MMC1_ACCS
		RSPEND		RSPENDM

Card Detect Interrupt (CDETI)	SD_INFO1	SDD3IN	SD_INFO1_MASK	SDD3INM	SDHI_MMC0_CARD	SDHI_MMC1_CARD
		SDD3RM		SDD3RMM		
		SDCDIN		SDCDINM		
		SDCDRM		SDCDRMM		

39.3.3.2 DMA transfer requests (SDHI_MMCn_ODMSDBREQ, n = 0 to 1)

The SD/MMC host interface has two types of DMA transfer requests.

(1) SD_BUF write DMA transfer request

- When the BWE bit in SD_INFO2 is set to 1 while the DMAEN bit in SD_DMAEN is set to 1, the SD_BUF

39.3.2.2 写保护

SDMMC主机接口有两种类型的写保护功能。

(1) 使用SD0WP进行写保护

SD0WP引脚连接到卡座，通过插入卡进行上拉或下拉。上拉或下拉的选择和电阻值由SD主机设备的规格决定。当SD0WP引脚状态反映到SD_INFO1寄存器中的SDWPMON位时，插入SD卡后设置写保护状态。

(2) 用命令写保护

卡的内部写保护和卡的开锁操作都是通过命令实现的。

39.3.3 中断请求和DMA传输请求

39.3.3.1 Interrupts

表39.5列出了SDHI中断源。SDHI在以下情况下请求中断：

- SD_INFO1、SD_INFO2和SDIO_INFO1寄存器中的状态标志设置为1
- SD_INFO1_MASK、SD_INFO2_MASK和SDIO_INFO1_MASK寄存器中的相关位为0。

清除SD_INFO1、SD_INFO2和SDIO_INFO1寄存器中的状态标志时，将要清除的状态标志写入0，将未清除的状态标志写入1。

Table 39.5 中断源

中断源	状态标志寄存器		中断屏蔽寄存器		中断名称	
	注册符号	位符号	注册符号	位符号	Ch 0	Ch 1
卡访问 Interrupt (CACI)	SD_INFO1	ACEND	SD_INFO1_MASK	ACENDM	SDHI_MMC0_ACCS	SDHI_MMC1_ACCS

		SDD3RM		SDD3RMM		
		SDCDIN		SDCDINM		
		SDCDRM		SDCDRMM		

39.3.3.2 DMA传输请求（SDHI_MMCn_ODMSDBREQ，n=0到1）

SDMMC主机接口有两种类型的DMA传输请求。

(1) SD_BUF写DMA传输请求

- 当SD_INFO2中的BWE位设置为1而SD_DMAEN中的DMAEN位设置为1时，SD_BUF

RA生态工作

write DMA transfer request is asserted

- The SD_BUF write DMA transfer request is negated when the last data in one block, according to the transfer data size set in SD_SIZE, is transferred. The SD_BUF write DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. However, if a communication error or timeout occurs at the DMA transfer, the SD_BUF write DMA transfer request is not negated.
- The BWE bit in SD_INFO2 is cleared after the transfer of the last data in one block following a request for writing to SD_BUF by DMA transfer
- The number of DMA transfers must be n times one block, where n = integer, one block = the transfer data size set in SD_SIZE
- When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF write DMA transfer request is negated
- The DMA transfer request is also negated by clearing the DMAEN bit to 0. However, the DMA transfer request is asserted again when the DMAEN bit is set to 1 before writing to SD_CMD.
- Because the BWE bit in SD_INFO2 is not cleared in response to setting the STP/IOABT bit, or to a communications error or timeout, clear the bit to 0 before issuing the next command. The next request to write to SD_BUF by DMA transfer is not issued while the BWE bit is set.

(2) SD_BUF read DMA transfer request

- When the BRE bit in SD_INFO2 is set to 1 while the DMAEN bit in the SD_DMAEN register is set to 1, the SD_BUF read DMA transfer request is asserted
- The SD_BUF read DMA transfer request is negated when the last data in one block (according to the transfer data size set in SD_SIZE) is transferred. The SD_BUF read DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. However, if a communication error or timeout occurs at the DMA transfer, the SD_BUF read DMA transfer request is not negated.
- The BRE bit in SD_INFO2 is cleared after transfer of the last data in one block following a request to write to SD_BUF by DMA transfer
- The number of DMA transfers should be n times one block, where n = integer, one block = the transfer data size set in SD_SIZE
- When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF read DMA transfer request is negated
- The DMA transfer request is also negated by clearing the DMAEN bit to 0. However, the DMA transfer request is asserted again when the DMAEN bit is set to 1 before writing to SD_CMD.
- Because the BRE bit in SD_INFO2 is not cleared in response to setting the STP/IOABT bit or in response to a communication error or timeout, clear the bit to 0 before issuing the next command. The next request to write to SD_BUF by DMA transfer is not issued while the BRE bit is set.

39.3.4 Communication Errors and Timeouts

When a communication error or timeout error occurs, depending on the type of error, the associated status flag in the SD_INFO2 register is set to 1. Also, depending on the source of the error, the associated flag in the SD_ERR_STS1 or SD_ERR_STS2 register is set to 1.

The status flags in SD_ERR_STS1 and SD_ERR_STS2 registers become 0 by writing to the SD_CMD register, or by setting the SOFT_RST.SDRST bit to 0.

写DMA传输请求被置位

- 当根据SD_SIZE中设置的传输数据大小传输一个块中的最后一个数据时，取消SD_BUF写入DMA传输请求。SD_BUF写DMA传输请求也可以通过将SOFT_RST中的SDRST位清除为0或将SD_STOP中的STP位设置为1来取消。但是，如果DMA传输发生通信错误或超时，则SD_BUF写DMA传输请求不会否定。
- SD_INFO2中的BWE位在通过DMA传输写入SD_BUF的请求后传输一个块中的最后一个数据后被清除
- DMA传输的次数必须是n乘以一个块，其中n=整数，一个块=SD_SIZE中设置的传输数据大小
- 当SDIO_MODE中的IOABT位设置为1时，SD_BUF写DMA传输请求被否定
- DMA传输请求也可以通过将DMAEN位清除为0来取消。但是，当DMAEN位在写入SD_CMD之前设置为1时，DMA传输请求会再次有效。
- 因为SD_INFO2中的BWE位不会在设置STPIOABT位或通信错误或超时时被清除，所以在发出下一个命令之前将该位清除为0。当BWE位置位时，不会发出通过DMA传输写入SD_BUF的下一个请求。

(2) SD_BUF读取DMA传输请求

- 当SD_INFO2中的BRE位设置为1而SD_DMAEN寄存器中的DMAEN位设置为1时，SD_BUF读取DMA传输请求被断言
- 当一个块中的最后一个数据（根据SD_SIZE中设置的传输数据大小）被传输时，SD_BUF读取DMA传输请求被否定。SD_BUF读取DMA传输请求也可以通过将SOFT_RST中的SDRST位清除为0或将SD_STOP中的STP位设置为1来否定。但是，如果DMA传输时发生通信错误或超时，则不会执行SD_BUF读取DMA传输请求否定。
- SD_INFO2中的BRE位在一个块中的最后一个数据传输后被清除SD_BUF通过DMA传输
- DMA传输的次数应该是n乘以一个块，其中n=整数，一个块=在SD_SIZE中设置的传输数据大小
- 当SDIO_MODE中的IOABT位设置为1时，SD_BUF读DMA传输请求被否定
- DMA传输请求也可以通过将DMAEN位清除为0来取消。但是，当DMAEN位在写入SD_CMD之前设置为1时，DMA传输请求会再次有效。
- 因为SD_INFO2中的BRE位不会在设置STPIOABT位或响应通信错误或超时时被清除，所以在发出下一个命令之前将该位清除为0。当BRE位置位时，不会发出下一个通过DMA传输写入SD_BUF的请求。

39.3.4 通信错误和超时

当发生通信错误或超时错误时，根据错误类型，在SD_INFO2寄存器设置为1。此外，根据错误来源，SD_ERR_STS1或SD_ERR_STS2寄存器设置为1。

通过写入SD_CMD寄存器或将SOFT_RST.SDRST位设置为0，SD_ERR_STS1和SD_ERR_STS2寄存器中的状态标志变为0。

Table 39.6 Communication errors

Communication error	Interrupt flag register		Error status register		This occurs when...
	Register symbol	Bit symbol	Register symbol	Bit symbol	
End bit error	SD_INFO2	ENDE	SD_ERR_STS1	CRCLENE	The CRC status token length is in error
				RDLENE	The read data length is in error
				RSPLENE1	The response length is in error*1
				RSPLENE0	The response length is in error*2
CRC error		CRCE		CRCTKE	The CRC status token is in error
				RDCRCE	There is a CRC error in the read data
				RSPCRCE1	There is a CRC error in the response*1
				RSPCRCE0	There is a CRC error in the response*2
Command error		CMDE		CMDE1	The command index field value for the transmitted command and received response do not match*1
				CMDE0	The command index field value for the transmitted command and received response do not match*2

Note 1. CMD12 when automatic issuing is enabled for multiple block transfer in the SD_CMD register setting, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer in the SD_CMD register setting, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

Table 39.7 Timeouts

Timeout	Interrupt flag register		Error status register		This occurs when...
	Register symbol	Bit symbol	Register symbol	Bit symbol	
Response timeout	SD_INFO2	RSPTO	SD_ERR_STS2	RSPTO1	A response is not received even after a minimum of 640 SDHI clock cycles elapse*1
				RSPTO0	A response is not received even after a minimum of 640 SDHI clock cycles elapse*2
Data timeout (excluding response timeout)		DTO		CRCBSYTO	After the CRC status token is received, the SDHI is busy for at least the period set*3
				CRCTO	After the write data is transmitted, the CRC status token is not received even after at least the period set*3 elapses
				RDTO	After the read command is issued, the read data is not received even after at least the period set*3 elapses
					After the read data is received, the next block read data is not received even after at least the period set*3 elapses
					After the SDHI exits the read wait state, the next block read data is not received even after at least the period set*3 elapses
				BSYTO1	After CMD12 is issued during the command sequence, the SDHI is busy for at least the period set*3
				BSYTO0	After the R1b response is received, the SDHI is busy for at least the period set*3 (a command other than CMD12 is issued during the command sequence)

Note 1. CMD12 when automatic issuing is enabled for multiple block transfer in the SD_CMD register setting, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer in the SD_CMD register setting, CMD12 when the STP bit in SD_STOP bit is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 3. The period is set in the TOP[3:0] bits in the SD_OPTION register.

Table 39.6 通讯错误

通信故障	中断标志寄存器		错误状态寄存器		这发生在...
	注册符号	位符号	注册符号	位符号	
结束位错误	SD_INFO2	ENDE	SD_ERR_STS1	CRCLENE	CRC状态令牌长度错误
				RDLENE	读取数据长度错误
				RSPLENE1	响应长度错误*1
				RSPLENE0	响应长度错误*2
CRC error		CRCE		CRCTKE	CRC状态令牌错误
				RDCRCE	读取数据有CRC错误
				RSPCRCE1	响应中有CRC错误*1
				RSPCRCE0	响应中有CRC错误*2
命令错误		CMDE		CMDE1	发送命令和接收响应的命令索引字段值不匹配*1
				CMDE0	发送命令和接收响应的命令索引字段值不匹配*2

Note 1. 在SD_CMD寄存器设置中为多块传输启用自动发送时为CMD12，当SD_STOP中的STP位设置为1时为CMD12，或者当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
Note 2. 在SD_CMD寄存器设置中为多块传输启用自动发布时的CMD12以外的CMD、当SD_STOP中的STP位设置为1时的CMD12或SDIO_MODE中的C52PUB或IOABT位设置为1时的CMD52。

Table 39.7 Timeouts

Timeout	中断标志寄存器		错误状态寄存器		这发生在...
	注册符号	位符号	注册符号	位符号	
响应超时	SD_INFO2	RSPTO	SD_ERR_STS2	RSPTO1	即使经过至少640个SDHI时钟周期，也没有收到响应*1
				RSPTO0	即使经过至少640个SDHI时钟周期，也没有收到响应*2
数据超时（不包括响应超时）		DTO		CRCBSYTO	收到CRC状态令牌后，SDHI至少在设置的时间段内处于忙碌状态*3
				CRCTO	写入数据发送后，即使经过至少设置的周期*3后也未收到CRC状态令牌
				RDTO	发出读取命令后，即使经过至少设置的时间段*3也未接收到读取数据
					接收到读取数据后，即使经过至少设置的时间段*3也不会接收到下一个块读取数据
					SDHI退出读取等待状态后，即使经过至少设置的时间段*3也不会接收到下一个块读取数据
				BSYTO1	在命令序列期间发出CMD12后，SDHI至少在设置的时间段内处于忙碌状态*3
				BSYTO0	收到R1b响应后，SDHI至少忙了一段时间set*3（在命令序列期间发出CMD12以外的命令）

Note 1. 在SD_CMD寄存器设置中为多块传输启用自动发送时为CMD12，当SD_STOP中的STP位设置为1时为CMD12，或者当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
Note 2. 在SD_CMD寄存器设置中为多块传输启用自动发布时的CMD12以外的CMD、当SD_STOP位中的STP位设置为1时的CMD12或SDIO_MODE中的C52PUB或IOABT位设置为1时的CMD52。
Note 3. 该周期在SD_OPTION寄存器的TOP[3:0]位中设置。

39.3.5 Command without Data Transfer (SD/MMC)

W（寄存器名称，值）：写入寄存器

R（寄存器名称）：从寄存器中读取

该操作在下一节中描述。

RA生态工作室

(1) Command without response and data

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock and interrupt mask (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK).

c. Command issue
Set CMD argument in SD_ARG and write to SD_CMD to issue the command and start operation.

d. Flag clear
When transmission of a command is complete, RSPEND (response end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear the RSPEND flag to 0.

(2) Command without data

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock and interrupt mask (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK).

c. Command issue
Set CMD argument in the SD_ARG register and write to the SD_CMD register to issue the command and start operation.

d. Flag clear
When a response is received, RSPEND (response end) flag in the SD_INFO1 register is set to 1 to generate an interrupt. Clear the RSPEND flag to 0.

e. Read a response from the SD_RSP10 register. Additionally, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

39.3.6 Single Block Read (SD/MMC)

Figure 39.10 shows an example flow of a single block read operation.

(1) 没有响应和数据的命令

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟和中断屏蔽（SD_CLK_CTRL、SD_INFO1_MASK和SD_INFO2_MASK）。

C。命令问题
在SD_ARG中设置CMD参数并写入SD_CMD以发出命令并开始操作。

d。标志清除
当命令传输完成时，SD_INFO1中的RSPEND（响应结束）标志设置为1以产生中断。将RSPEND标志清除为0。

(2) 没有数据的命令

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟和中断屏蔽（SD_CLK_CTRL、SD_INFO1_MASK和SD_INFO2_MASK）。

C。命令问题
在SD_ARG寄存器中设置CMD参数并写入SD_CMD寄存器以发出命令并开始操作。

d。标志清除
当收到响应时，SD_INFO1寄存器中的RSPEND（响应结束）标志设置为1以产生中断。将RSPEND标志清除为0。

e.从SD_RSP10寄存器读取响应。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.6 单块读取(SDMMC)

图39.10显示了单块读取操作的示例流程。

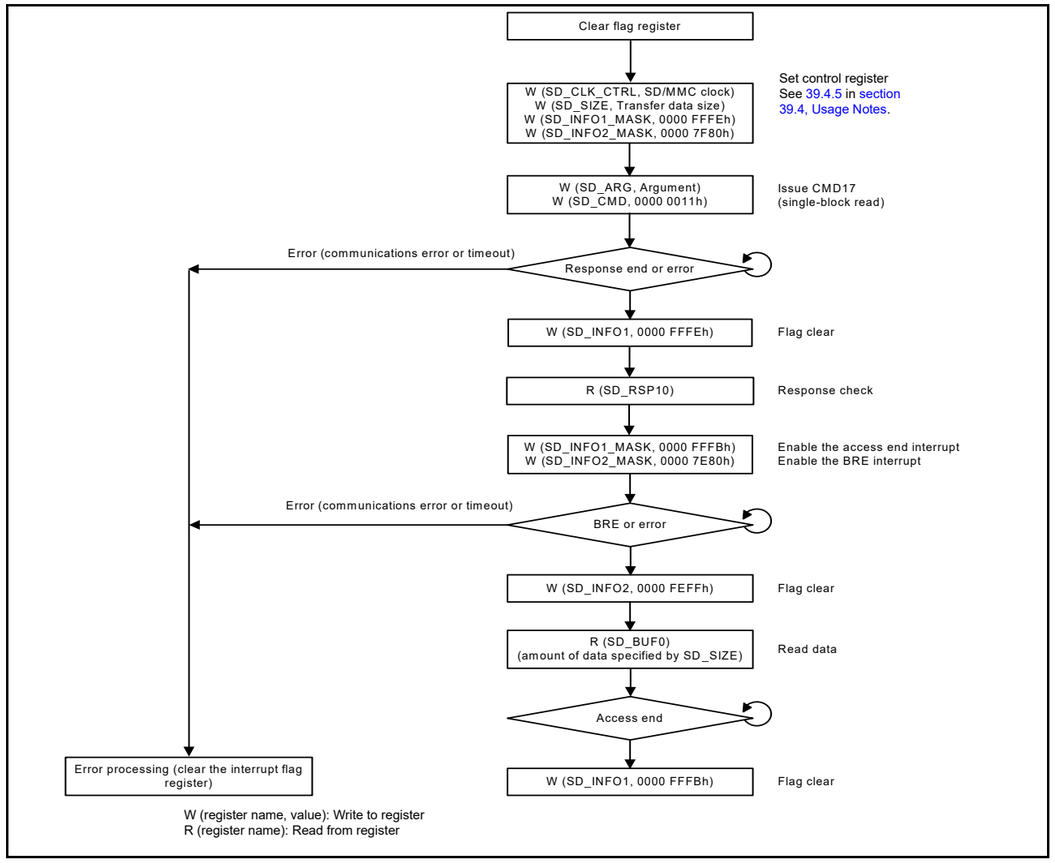

Figure 39.10 Example flow of single block read operation

39.3.6.1 Single block read operation

The operation of the single block read is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).

c. Command issue (CMD17)
Set CMD17 argument in SD_ARG and write 0000 0011h to SD_CMD. CMD17 is issued and the single block read operation is started.

d. Response check
On receiving the response, RSPEND (response end) flag in the SD_INFO1 register is set to 1 to generate an interrupt. Clear the RSPEND flag to 0 and read the response from the SD_RSP10 register. If the result of the response decoding is an error, the command sequence can be halted by setting the STP bit in the SD_STOP register or the IOABT bit in SDIO_MODE register to 1. In addition, this causes CMD12 and CMD52 to not be issued. If the ACEND (access end) flag in SD_INFO1 is set, halting the command sequence also leads to the generation of an interrupt.

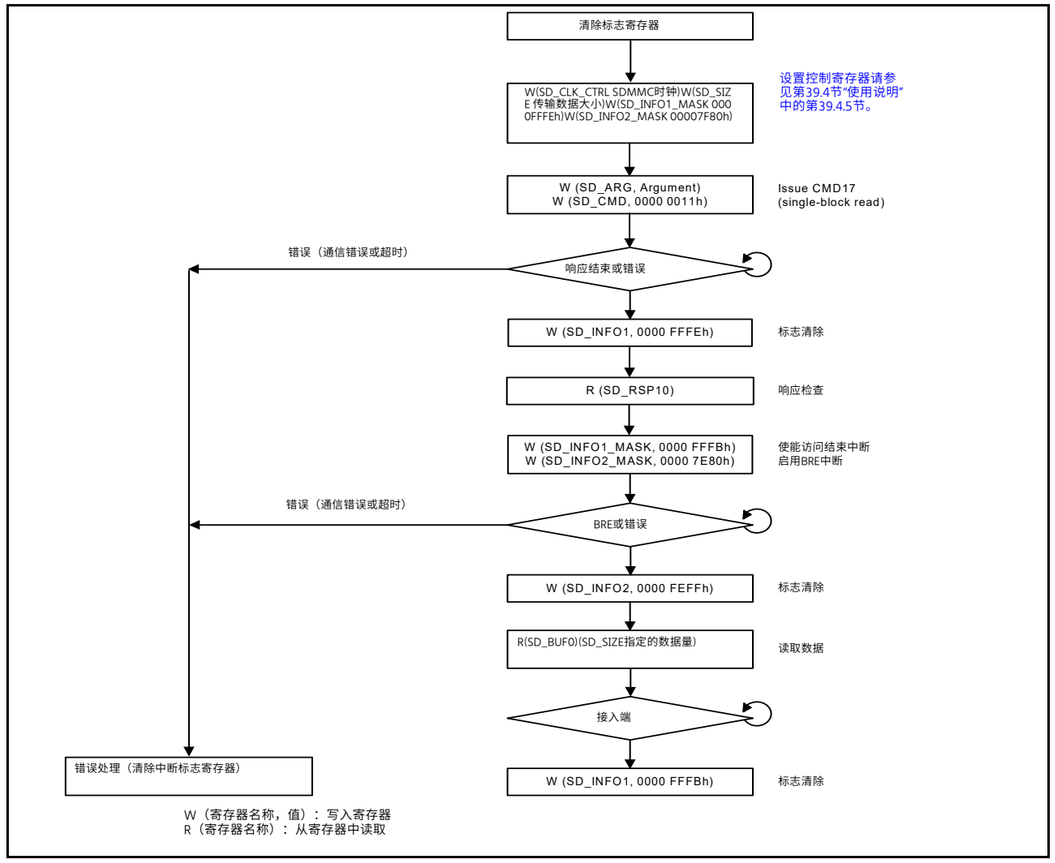

Figure 39.10 单块读操作示例流程

39.3.6.1 单块读操作

单块读取的操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).

C。命令问题(CMD17)
在SD_ARG中设置CMD17参数并将00000011h写入SD_CMD。发出CMD17并开始单块读取操作。

d。响应检查
收到响应后，SD_INFO1寄存器中的RSPEND（响应结束）标志置1以产生中断。将RSPEND标志清零并从SD_RSP10寄存器读取响应。如果响应解码的结果是错误的，可以通过将SD_STOP寄存器中的STP位或SDIO_MODE寄存器中的IOABT位设置为1来暂停命令序列。此外，这会导致CMD12和CMD52不发出。如果设置了SD_INFO1中的ACEND（访问结束）标志，则停止命令序列也会导致产生中断。

e. Data receive from SD card/MMC and data read
Write 0000 FFFBh to the SD_INFO1_MASK register to enable the access end interrupt. In addition, write 0000 7E80h to SD_INFO2_MASK to enable the BRE interrupt. When the data received from the SD card/MMC is complete, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD_SIZE from SD_BUF0.
A communication error or timeout might be generated if data is being received while the reading of SD_BUF0 is in progress.

f. Operation complete
When the data read from SD_BUF0 is complete, the ACEND (access end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND flag to 0 to end the single block read operation.
In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

39.3.7 Single Block Write (SD/MMC)

Figure 39.11 shows an example flow of a single block write operation.

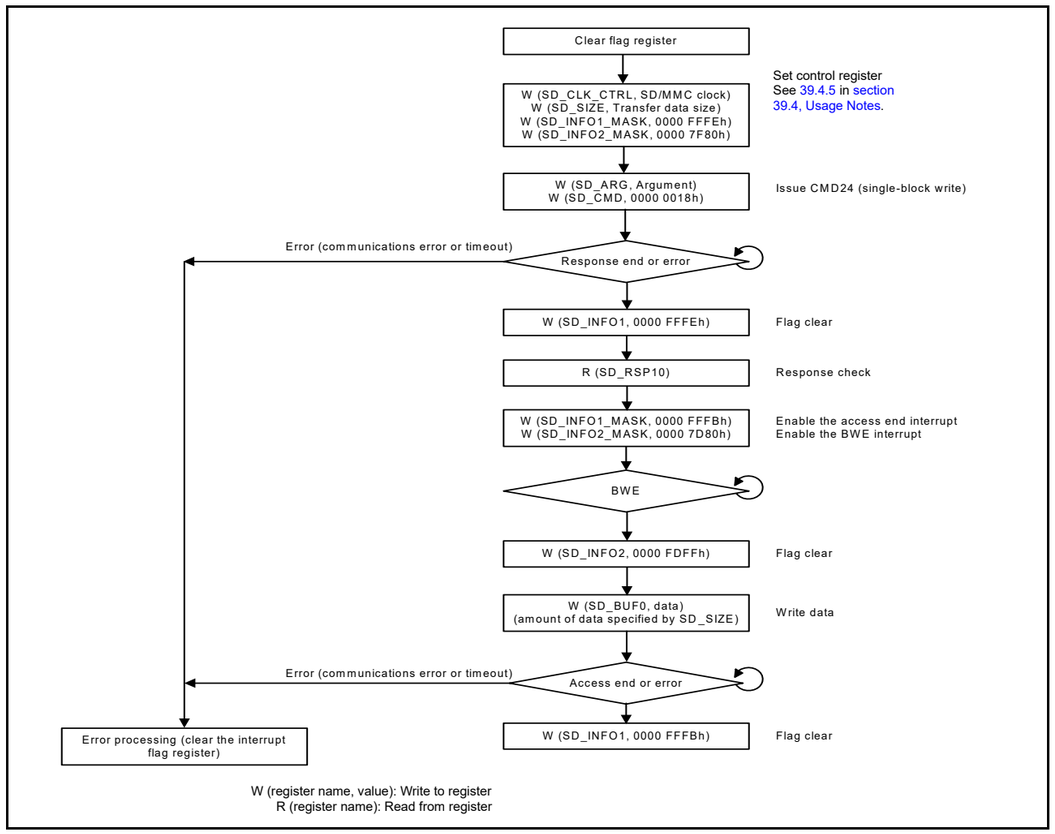

Figure 39.11 Example of single block write operation

e.从SD卡MMC接收数据并读取数据
将0000FFFBh写入SD_INFO1_MASK寄存器以使能访问结束中断。此外，将00007E80h写入SD_INFO2_MASK以启用BRE中断。当从SD卡MMC接收到数据完成时，SD_INFO2中的BRE位设置为1以产生中断。将BRE位清0并从SD_BUF0中读取SD_SIZE中指定的数据量。如果在读取SD_BUF0时正在接收数据，则可能会产生通信错误或超时。

F。操作完成
当从SD_BUF0读取数据完成后，SD_INFO1中的ACEND（访问结束）标志置1以产生中断。将ACEND标志清除为0以结束单块读取操作。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.7 单块写入(SDMMC)

图39.11显示了单个块写入操作的示例流程。

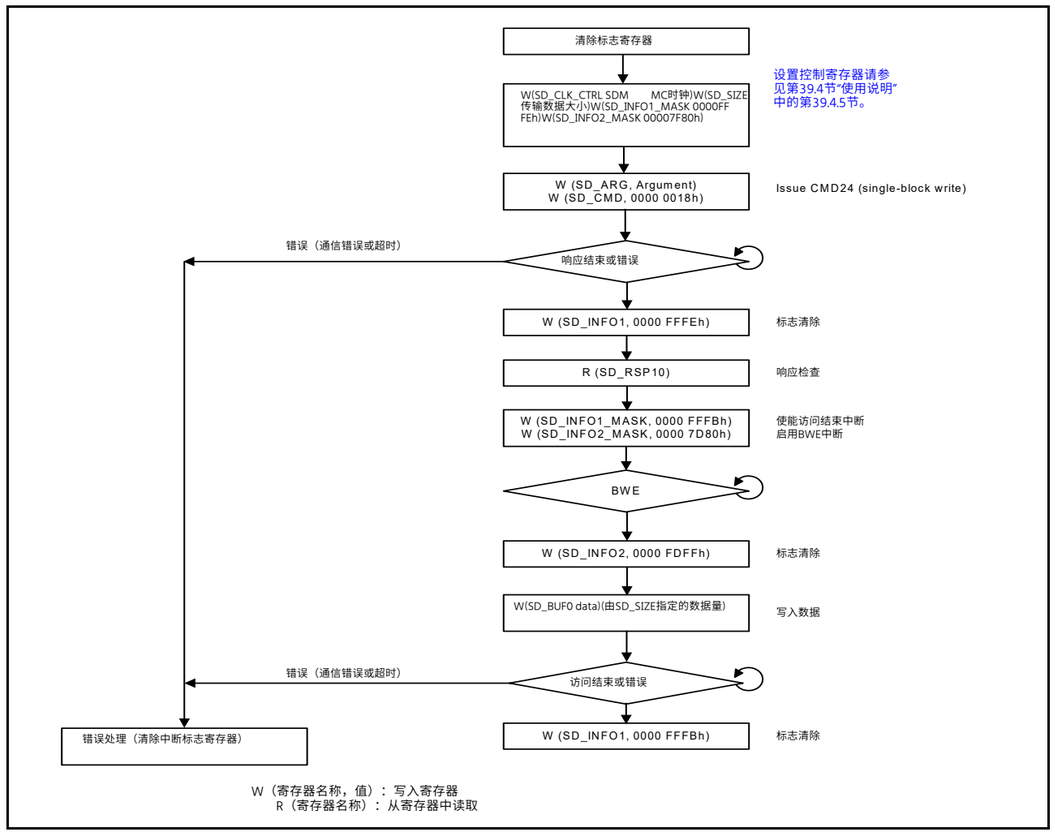

Figure 39.11 单块写操作示例

39.3.7.1 Single block write operation

The operation of the single block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).

c. Command issue (CMD24)
Set CMD24 argument in SD_ARG and write 0000 0018h to SD_CMD. CMD24 is issued and the single block write operation is started.

d. Response check
On receiving the response, RSPEND (response end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD_RSP10. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STOP or the IOABT bit in SDIO_MODE to 1. In addition, this causes CMD12 and CMD52 to not be issued. If the ACEND (access end) flag in SD_INFO is set, halting the command sequence also leads to the generation of an interrupt.

e. Data write and data transmit to SD card/MMC
Write 0000 FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000 7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is complete, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card/MMC.
However, a communications error or timeout might be generated if data is being transmitted after writing to SD_BUF0.

f. Operation complete
When the CRC status and busy state are received from the SD card/MMC, ACEND (access end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND flag to 0 to end the single block write operation.
In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

39.3.8 Multiple Block Read (SD/MMC)

Figure 39.12 shows an example flow of a multiple block read operation.

39.3.7.1 单块写操作

单块写操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).

C。命令问题(CMD24)
在SD_ARG中设置CMD24参数并将00000018h写入SD_CMD。发出CMD24并开始单块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）标志置1以产生中断。将RSPEND清零并从SD_RSP10读取响应。如果响应解码的结果是错误的，可以通过将SD_STOP中的STP位或SDIO_MODE中的IOABT位设置为1来停止命令序列。此外，这会导致CMD12和CMD52不发出。如果设置了SD_INFO中的ACEND（访问结束）标志，则暂停命令序列也会导致产生中断。

e.数据写入和数据传输到SD卡MMC
将0000FFFBh写入SD_INFO1_MASK以使能访问结束中断。此外，将00007D80h写入SD_INFO2_MASK启用BWE中断。当SD_BUF0准备好写入数据时，SD_INFO2中的BWE位设置为1以产生中断。将BWE位清除为0，并将SD_SIZE中指定的数据量写入SD_BUF0。当数据写入SD_BUF0完成后，数据将传输到SD卡。然后，从SD卡MMC接收CRC状态和忙状态。但是，如果在写入后正在传输数据，则可能会产生通信错误或超时

SD_BUF0.

F。操作完成
当从SD卡MMC接收到CRC状态和忙状态时，SD_INFO1中的ACEND（访问结束）标志设置为1以产生中断。将ACEND标志清除为0以结束单块写操作。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.8 多块读取(SDMMC)

图39.12显示了多块读取操作的示例流程。

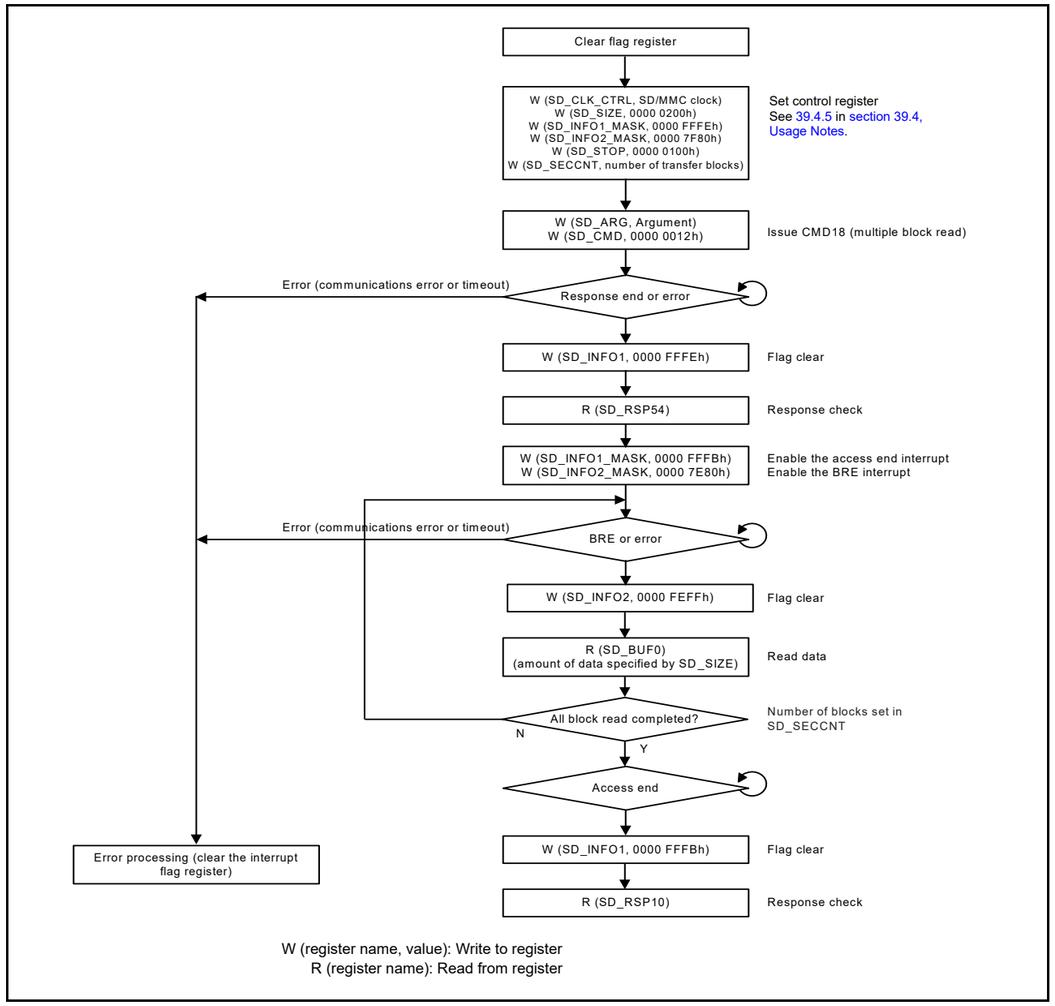

Figure 39.12 Example of multiple block read operation

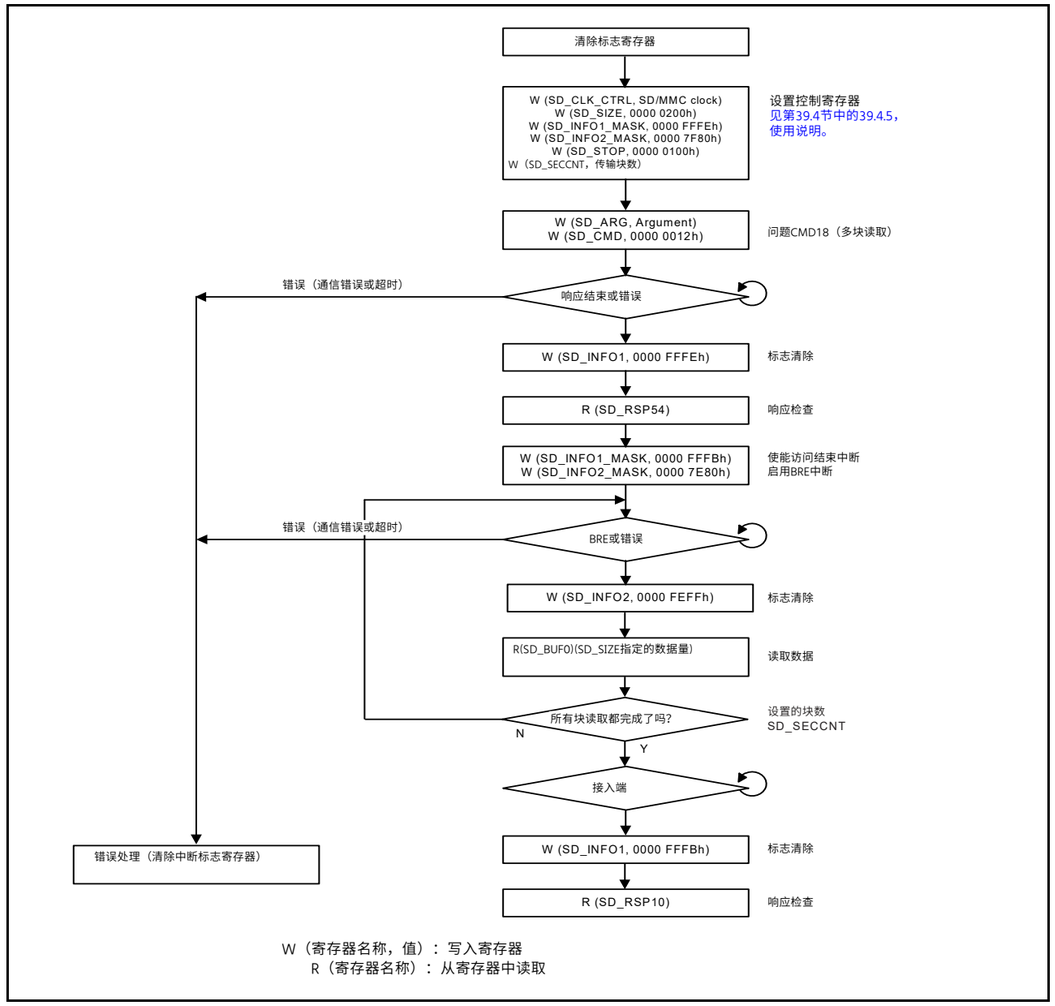

Figure 39.12 多块读取操作示例

39.3.8.1 Multiple block read operation

The operation of the multiple block read is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, and interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set SEC in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD18)
Set CMD18 argument in SD_ARG and write 0000 0012h to SD_CMD. CMD18 is issued and the multiple block read operation is started.

d. Response check
On receiving the response, RSPEND (response end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND flag to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STOP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated when the ACEND (access end) flag in SD_INFO1 is set to 1 on completion of response reception. Clear the ACEND flag to 0 and read the response.

e. Data receive from SD card/MMC and data read
Write 0000 FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000 7E80h to SD_INFO2_MASK to enable the BRE interrupt. When reception of one-block of data from the SD card/MMC is complete, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD_SIZE from SD_BUF0. Doing this repeats the transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop a multi-block transfer with the number of blocks that is set to SD_SECCNT, and the response is received. At this point, CMD12 argument is automatically set to 0000 0000h.

f. Operation complete
When all-block data read and the CMD12 response received are completed, the ACEND (access end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND flag to 0 to read the response. This is the end of a multiple block read operation. In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

39.3.9 Multiple Block Write (SD/MMC Using Internal Timer)

Figure 39.13 shows an example flow of a multiple block write using an internal timer.

39.3.8.1 多块读操作

多块读取的操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小和中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK）。将SD_STOP中的SEC设置为1，并在SD_SECCNT中设置传输块数。

C。命令问题(CMD18)
在SD_ARG中设置CMD18参数并将00000012h写入SD_CMD。发出CMD18并开始多块读取操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）标志置1以产生中断。清除RSPEND标志为0并从SD_RSP54读取响应。如果响应解码的结果是错误的，可以通过将SD_STOP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致发出CMD12并接收响应。如果由于访问结束中断使能而停止命令序列，则在完成响应接收时将SD_INFO1中的ACEND（访问结束）标志设置为1时产生中断。将ACEND标志清除为0并读取响应。

e.从SD卡MMC接收数据并读取数据
将0000FFFBh写入SD_INFO1_MASK以使能访问结束中断。此外，将00007E80h写入SD_INFO2_MASK启用BRE中断。当从SD卡MMC接收到1块数据完成时，SD_INFO2中的BRE位被设置为1以产生中断。将BRE位清0并从SD_BUF0中读取SD_SIZE中指定的数据量。这样做会重复传输SD_SECCNT中设置的块数。但是，如果在读取SD_BUF0时正在接收数据，则可能会产生通信错误或超时。自动发出CMD12以停止具有设置为SD_SECCNT的块数的多块传输，并接收响应。此时，CMD12参数自动设置为00000000h。

F。操作完成
当全块数据读取和收到的CMD12响应完成时，ACEND（访问结束）标志在SD_INFO1设置为1以产生中断。将ACEND标志清除为0以读取响应。这是多块读取操作的结束。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.9 多块写入（使用内部定时器的SDMMC）

图39.13显示了使用内部定时器进行多块写入的示例流程。

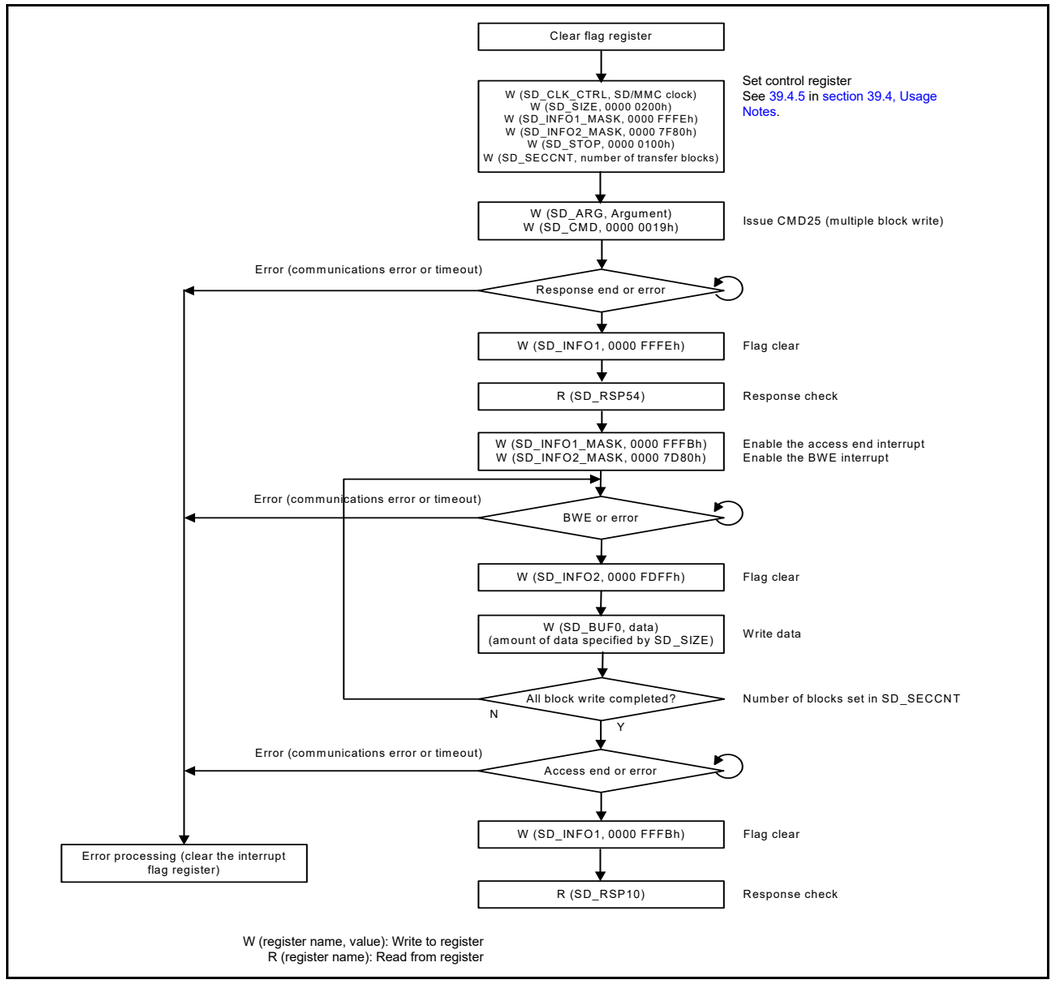

Figure 39.13 Example of multiple block write operation using internal timer

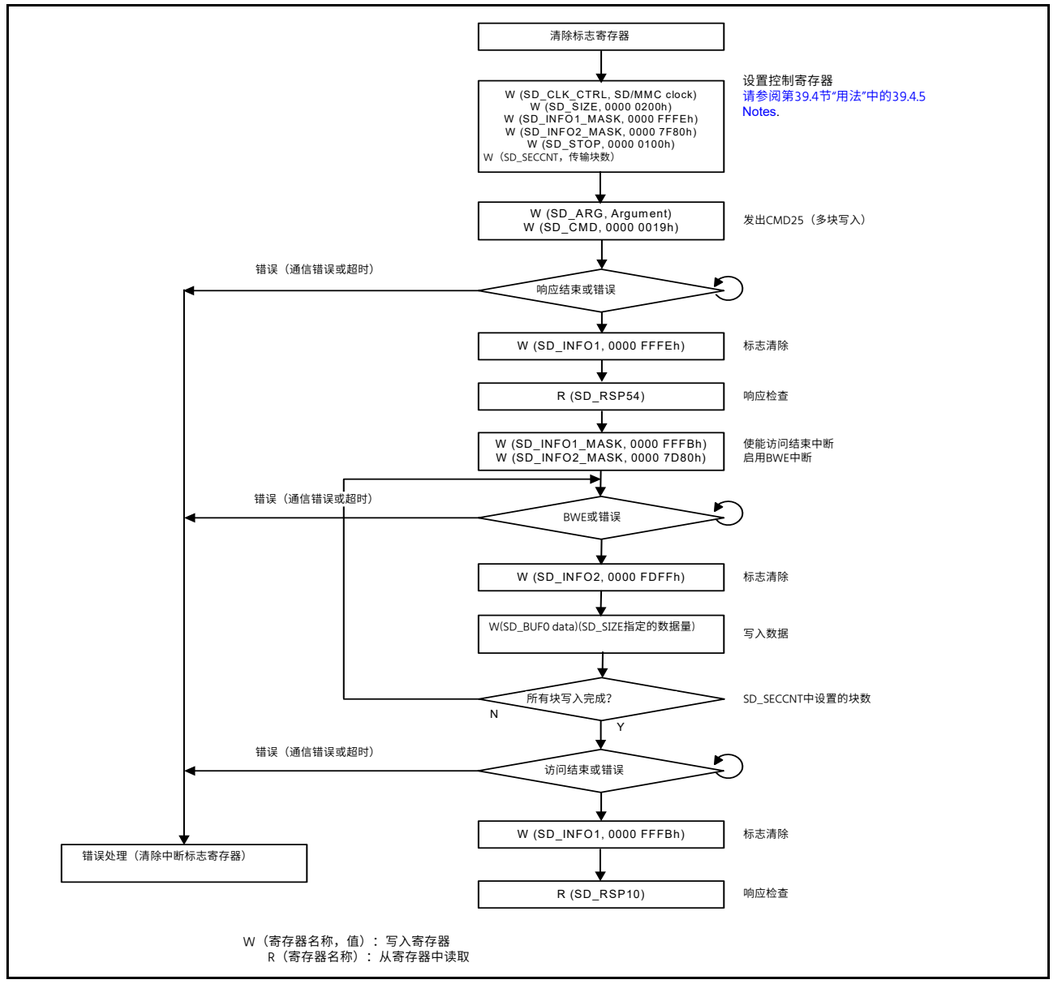

Figure 39.13 使用内部定时器的多块写入操作示例

39.3.9.1 Multiple block write operation using internal timer

The operation of a multiple block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, and interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD25)
Set the CMD25 argument in SD_ARG and write 0000 0019h to SD_CMD. CMD25 is issued and the multiple block write operation is started.

d. Response check
On receiving the response, the RSPEND (response end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear the RSPEND flag to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STOP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response is received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND (access end) flag in SD_INFO1 is set to 1 when reception of the response is complete. Clear the ACEND flag to 0 and read the response.

e. Data write and data transmit to SD card/MMC
Write 0000 FFFBh to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0000 7D80h to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is complete, data is transmitted to the SD card/MMC. The CRC status and busy state are received from the SD card/MMC. This repeats the transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is received while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi block transfer with the number of blocks set in SD_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0000 0000h.

f. Operation complete
When all-block data transmit and the CRC status receive are complete, the ACEND (access end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND flag to 0 to read the response. This is the end of a multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs.

39.3.10 Multiple Block Write (MMC using external timer)

Figure 39.14 shows an example flow of a multiple block write using an external timer.

39.3.9.1 使用内部定时器的多块写操作

多块写入的操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小和中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK）。将SD_STOP中的SEC位设置为1，并在SD_SECCNT中设置传输块数。

C。命令问题(CMD25)
在SD_ARG中设置CMD25参数并将00000019h写入SD_CMD。发出CMD25并开始多块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）标志置1以产生中断。
将RSPEND标志清零并从SD_RSP54读取响应。如果响应解码的结果是错误的，可以通过将SD_STOP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致发出CMD12并接收响应。如果由于访问结束中断使能而停止命令序列，则在响应接收完成时，当SD_INFO1中的ACEND（访问结束）标志设置为1时，将产生中断。将ACEND标志清除为0并读取响应。

e.数据写入和数据传输到SD卡MMC
将0000FFFBh写入SD_INFO1_MASK以使能访问结束中断。此外，将00007D80h写入SD_INFO2_MASK启用BWE中断。当SD_BUF0准备好写入数据时，SD_INFO2寄存器中的BWE位设置为1以产生中断。将BWE位清除为0，并将SD_SIZE中指定的数据量写入SD_BUF0。当数据写入SD_BUF0完成后，数据将传输到SD卡MMC。从SD卡MMC接收CRC状态和忙状态。这将重复传输SD_SECCNT中设置的块数。但是，如果在写入SD_BUF0的过程中接收到数据，则可能会产生通信错误或超时。自动发出CMD12以停止具有SD_SECCNT中设置的块数的多块传输并接收响应。此时，CMD12参数自动设置为00000000h。

F。操作完成
当全块数据发送和CRC状态接收完成时，ACEND（访问结束）标志
SD_INFO1设置为1以产生中断。将ACEND标志清除为0以读取响应。这是多块写入操作的结束。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.10 多块写入（使用外部定时器的MMC）

图39.14显示了使用外部定时器进行多块写入的示例流程。

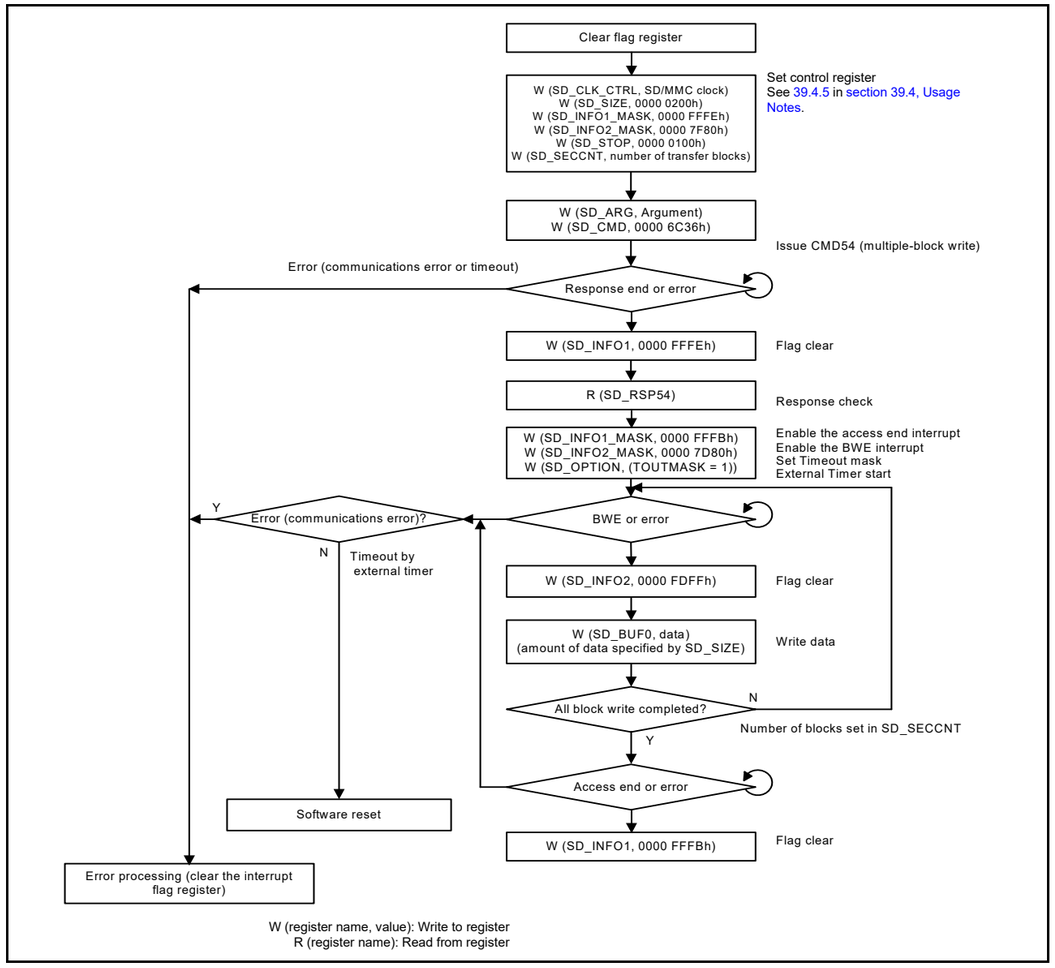

Figure 39.14 Example flow of multiple block write operation using an external timer

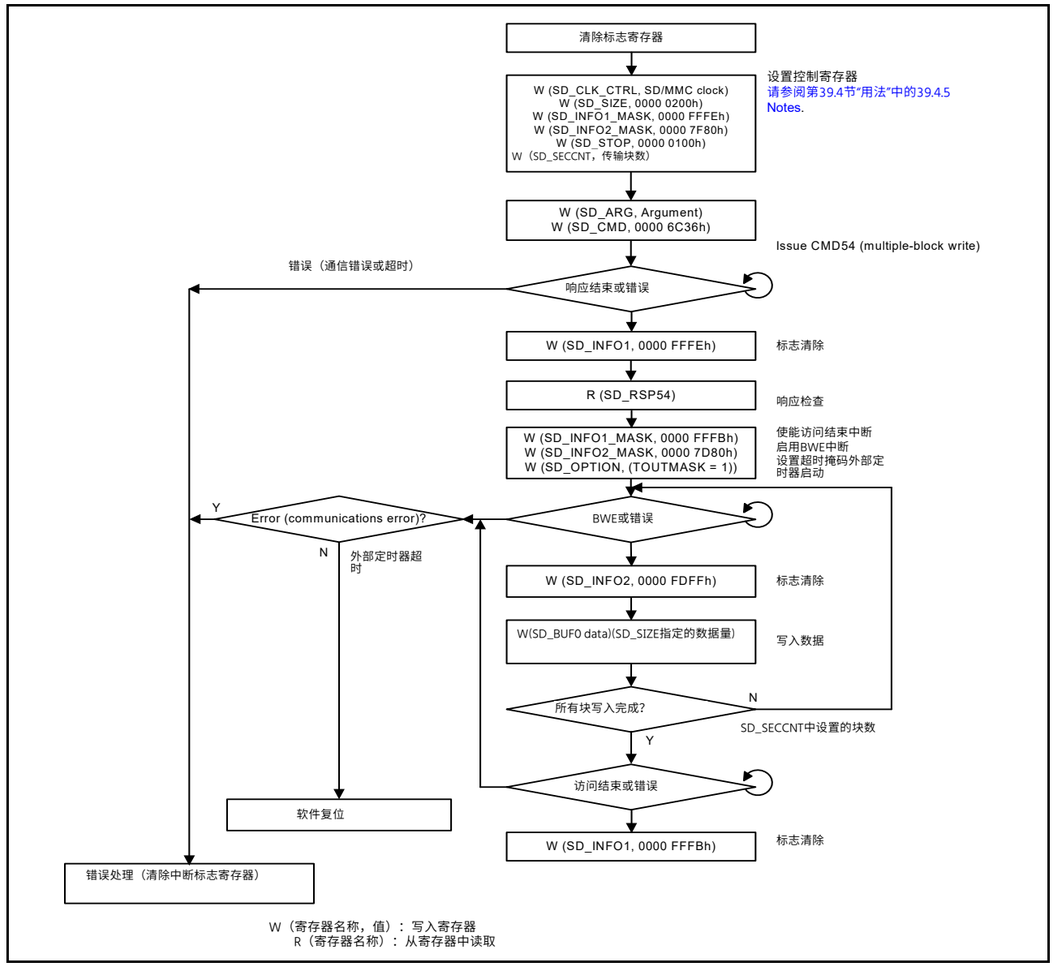

Figure 39.14 使用外部定时器的多块写入操作的示例流程

39.3.10.1 Multiple block write operation using external timer

The operation of a multiple block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set the SEC bit in the SD_STOP register to 1, and set the number of transfer blocks in the SD_SECCNT register.

c. Command issue (CMD54)
Set CMD54 argument in SD_ARG and write 0000 6C36h to SD_CMD. CMD54 is issued and the multiple block write operation is started.

d. Response check
On receiving the response, the RSPEND (response end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear the RSPEND flag to 0 and read the response from SD_RSP54. If the result of the response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STOP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response is received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND (access end) flag bit in SD_INFO1 is set to 1 when reception of the response is complete. Clear the ACEND flag to 0 and read the response.

e. Data write and data transmit to MMC
Write 0000 FFFBh to SD_INFO1_MASK to enable the access end interrupt, write 0000 7D80h to SD_INFO2_MASK to enable the BWE interrupt, and set 1 to TOUTMASK of SD_OPTION to deactivate the timeout. In addition, start the external timer. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is complete, data is transmitted to the MMC. The CRC status and busy state are received from the MMC. Doing this repeats the transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is received while writing to SD_BUF0 is in progress.

f. Operation complete
When an all-block data transmit and the CRC status receive are completed, the ACEND (access end) flag in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND flag to 0 to read the response. This is the end of a multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs when receiving a response. Execute software reset if a timeout by an external timer occurs when transmitting data.

39.3.11 IO_RW_DIRECT Command (SD: CMD52)

Figure 39.15 shows an example flow of an IO_DIRECT command (CMD52) operation.

39.3.10.1 使用外部定时器的多块写操作

多块写入的操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置MMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).
将SD_STOP寄存器中的SEC位设置为1，并在SD_SECCNT寄存器中设置传输块数。

C。命令问题(CMD54)
在SD_ARG中设置CMD54参数并将00006C36h写入SD_CMD。发出CMD54并开始多块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）标志置1以产生中断。
将RSPEND标志清零并从SD_RSP54读取响应。如果响应解码的结果是错误的，可以通过将SD_STOP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致发出CMD12并接收响应。如果命令序列因访问结束中断被使能而停止，则在响应接收完成时，当SD_INFO1中的ACEND（访问结束）标志位设置为1时产生中断。将ACEND标志清除为0并读取响应。

e.数据写入和数据传输到MMC
向SD_INFO1_MASK写入0000FFFBh使能访问结束中断，向SD_INFO1_MASK写入00007D80h
SD_INFO2_MASK启用BWE中断，并将SD_OPTION的TOUTMASK设置为1以停用超时。此外，启动外部定时器。当SD_BUF0准备好写入数据时，SD_INFO2寄存器中的BWE位设置为1以产生中断。将BWE位清除为0，并将SD_SIZE中指定的数据量写入SD_BUF0。当数据写入SD_BUF0完成后，数据被传输到MMC。从MMC接收CRC状态和忙碌状态。这样做会重复传输SD_SECCNT中设置的块数。但是，如果在写入SD_BUF0的过程中接收到数据，则可能会产生通信错误或超时。

F。操作完成
当全块数据发送和CRC状态接收完成时，SD_INFO1中的ACEND（访问结束）标志置1以产生中断。将ACEND标志清除为0以读取响应。这是多块写入操作的结束。此外，如果在接收响应时发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。如果在传输数据时发生外部定时器超时，则执行软件复位。

39.4 Usage Notes

39.4.1 SD_BUF Illegal Write Access (SD/MMC)

When writing data to the SD_BUF0 register after a single block write or multi-block write command is issued, data of the size specified in the SD_SIZE register must be written.

If data exceeding the size specified in SD_SIZE is written, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 might not be transmitted and the SD_CLK_CTRLEN bit in SD_INFO2 is held at the value of 0. If this occurs, clearing the SDRST bit in SOFT_RST to 0, then restoring its value to 1 clears the SD_CLK_CTRLEN bit to 1.

However, this does not apply to the single byte or three bytes when the SD_SIZE setting is odd, or to the fraction of bytes when the SD_SIZE setting is even (the 2 bytes that are not in a 4-byte unit), because the portion of dummy data writing is regarded as excess data and is ignored.

39.4.2 Block Number Constraint for Multiple Block Read (SD)]

When performing a multiple block read of one or two blocks, depending on the timing with which the SD card response register is read, the response value might not be read properly. To prevent this, do one of the following:

- When receiving one or two blocks of data, use single block reading
- Read the response to CMD18 from the SD_RSP54 register.

39.4.2.1 Mechanism of incorrect reading

Figure 39.24 shows the processing flows of the SDHI (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation in Figure 39.24, when an interrupt is generated on reception of the CMD18 response, and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response might be read. This problem does not occur for multiple block reads of three or more blocks, because CMD12 is not issued until the block of data is read. The problem also does not occur for multiple block writes, because the CMD25 response is read before the block of data is sent.

Table 39.9 MMC的示例SD_CMD寄存器设置（2个中的2个）

Type	Command	示例SD_CMD寄存器设置	Remark
CMD	CMD35	0000 0423h	-
	CMD36	0000 0424h	-
	CMD38	0000 0026h	-
	CMD39	0000 0427h	-
	CMD40	0000 0428h	-
	CMD42	0000 002Ah	-
	CMD49	0000 0C31h	-
	CMD53	0000 7C35h	-
	CMD54	0000 6C36h	-
	CMD55	0000 0037h	-
	CMD56	0000 0038h	-

39.4 使用说明

39.4.1 SD_BUF非法写访问(SDMMC)

在发出单块写入或多块写入命令后向SD_BUF0寄存器写入数据时，必须写入SD_SIZE寄存器中指定大小的数据。

如果写入的数据超过SD_SIZE中指定的大小，则SD_INFO2中的ERR4位设置为1。此外，写入SD_BUF0的数据可能不会被传输，并且SD_INFO2中的SD_CLK_CTRLEN位将保持为0。如果发生这种情况，将SOFT_RST中的SDRST位清除为0，然后将其值恢复为1会将SD_CLK_CTRLEN位清除为1。

但是，这不适用于SD_SIZE设置为奇数时的单个字节或三个字节，或适用于SD_SIZE设置为偶数时的字节部分（不在4字节单元中的2个字节），因为该部分虚拟数据写入的次数被视为多余数据并被忽略。

39.4.2 多块读取（SD）的块号约束]

执行1个或2个块的多块读取时，根据读取SD卡响应寄存器的时序，可能无法正确读取响应值。为防止这种情况，请执行以下操作之一：

- 接收一两块数据时，使用单块读取
- 从SD_RSP54寄存器读取对CMD18的响应。

39.4.2.1 误读机制

图39.24显示了对两个块执行多块读取时的SDHI（硬件）操作和软件操作的处理流程。如图39.24中的错误操作所示，当接收到CMD18响应时产生中断，并且中断读取SD卡响应寄存器（SD_RSP10）的时序延迟时，CMD12响应接收期间的数据或者可能会读取CMD12响应。对于三个或更多块的多个块读取不会出现此问题，因为在读取数据块之前不会发出CMD12。多次块写入也不会出现该问题，因为在发送数据块之前读取了CMD25响应。

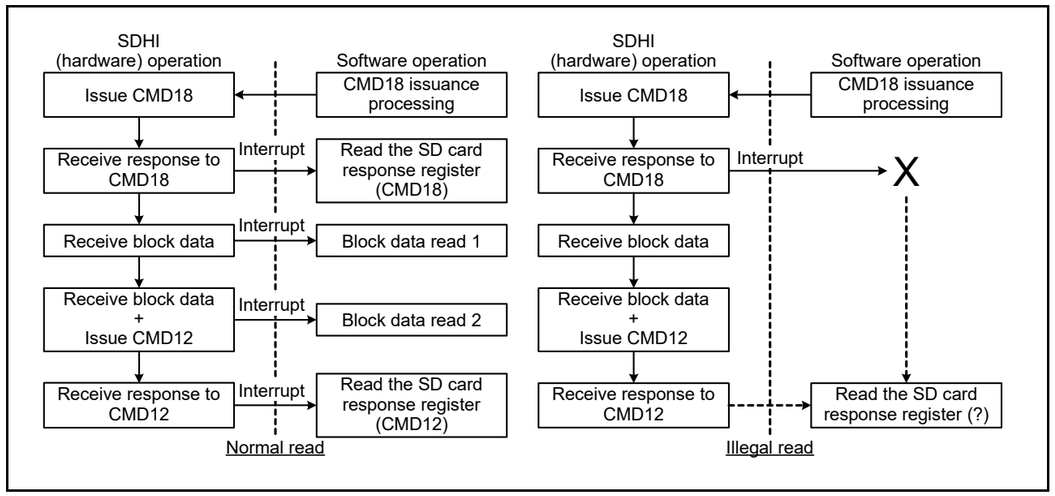

Figure 39.24 Multiple block read operation flow for two blocks

39.4.3 Automatic Control of SD/MMC Clock Output (SD/MMC)

In the SD card/MMC standard, 74 SD/MMC clock cycles must be output before initialization of the card. For this reason, use automatic control of SD/MMC clock output after 74 SD/MMC clock cycles are output. In addition, if automatic control of the SD/MMC clock output is in use, SD/MMC clock output is stopped on completion of the sequence for a communication error or timeout. When state transitions within the SD card/MMC are required after the completion of the sequence, release automatic control of the SD/MMC clock output and restart the supply of the SD/MMC clock to the SD card/MMC.

39.4.4 Control of the C52PUB Setting for Multiple Block Write (SD)

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block writes because of CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by using one of the following procedures, as appropriate:

(a) When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by setting SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the RSPEND interrupt processing in SD_INFO1 due to the issuing of CMD52 is complete, restart writing to SD_BUF by setting SD_INFO2 to enable BWE interrupts.

(b) When DMA transfer is in use

1. Every time a DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2,....) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 so that CMD52 is issued when SD_BUF becomes empty.
3. After the RSPEND interrupt processing in SD_INFO1 due to the issuing of CMD52 is complete, restart writing to SD_BUF by DMA transfer.

39.4.5 Notes on SD_CLK_CTRL Register Settings (SD/MMC)

When the SD_CLK_CTRLEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, check that the SD_CLK_CTRLEN bit in SD_INFO2 is 1.

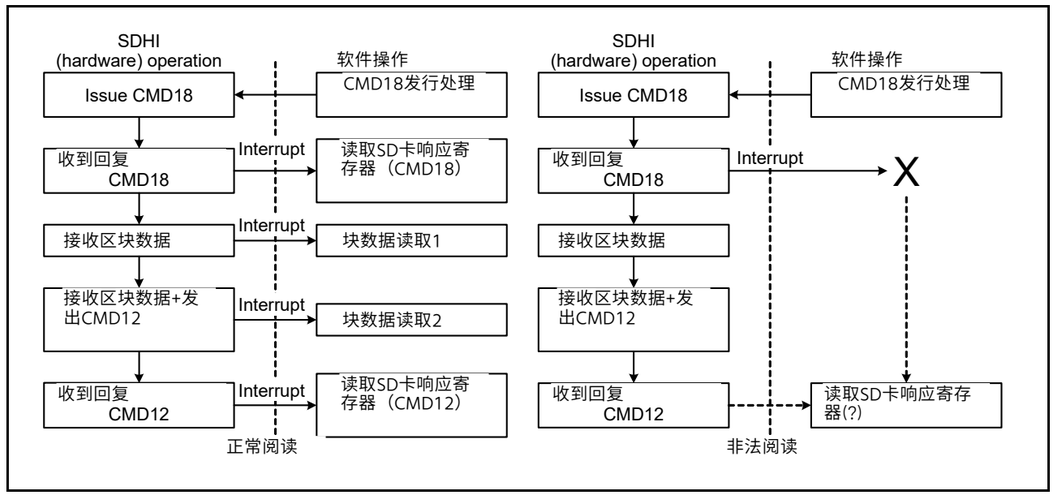

Figure 39.24 两个块的多块读操作流程

39.4.3 SDMMC时钟输出(SDMMC)的自动控制

在SD卡MMC标准中，必须在卡初始化之前输出74个SDMMC时钟周期。因此，在输出74个SDMMC时钟周期后使用SDMMC时钟输出的自动控制。此外，如果正在使用SDMMC时钟输出的自动控制，则SDMMC时钟输出会在完成通信错误或超时的序列时停止。当序列完成后需要SD卡MMC内的状态转换时，解除对SDMMC时钟输出的自动控制，并重新开始向SD卡MMC提供SDMMC时钟。

39.4.4 控制多块写入(SD)的C52PUB设置

如果由于CMD53在多个块写入序列期间SDIO_MODE中的C52PUB位设置为1，则在SD_BUF变空之前不会发出CMD52。因此，在暂停写入SD_BUF后，根据需要使用以下过程之一设置C52PUB位：

(a) 不使用DMA传输时

1. 在设置C52PUB位之前，通过设置SD_INFO2以禁用BWE中断来暂停写入SD_BUF。
2. 将SDIO_MODE中的C52PUB位设置为1（以便在SD_BUF为空时发出CMD52）。
3. 在SD_INFO1中因CMD52下发导致的RSPEND中断处理完成后，重新开始写入SD_BUF通过设置SD_INFO2来启用BWE中断。

(b) 使用DMA传输时

1. 每次对SD_SIZE n个块（其中n=1 2 ....）中设置的值进行DMA传输时，暂停写入SD_BUF在C52PUB位被置位之前由DMA传输。
2. 将SDIO_MODE中的C52PUB位设置为1，以便在SD_BUF为空时发出CMD52。
3. 在SD_INFO1中因CMD52下发导致的RSPEND中断处理完成后，重新开始写入SD_BUF通过DMA传输。

39.4.5 SD_CLK_CTRL寄存器设置注意事项(SDMMC)

当SD_INFO2中的SD_CLK_CTRLEN位为0时，无法写入SD_CLK_CTRL。在写信之前SD_CLK_CTRL，检查SD_INFO2中的SD_CLK_CTRLEN位是否为1。

39.4.6 Specification Limitations

1. The Suspend/Resume operation of the SDIO is not supported.
2. The SPI bus is not supported (SD/MMC).
3. The shared bus and 8-bit SD bus of the embedded SDIO are not supported.
4. Stream transfer of MMC is not supported.
5. High Priority Interrupt (HPI) of MMC is not supported.
6. Boot Operation/Alternative Boot Operation of MMC is not supported.
7. Open-ended multiple block transfer of MMC is not supported.

39.4.7 STP Bit Setting during Multiple Block Read (SD/MMC)

During the execution of a multiple block read with automatic CMD12 execution by setting the SEC bit in the SD_STOP register to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence might not stop, depending on the timing of setting of the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. Even when the SD_CLK_CTRLEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.

When the command sequence is not stopped because the SEC bit is not set to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, leave the SEC bit set to 1 in the SD_STOP register.

39.4.8 Register Setting Notes

1. All registers in section 39.2, Register Descriptions are accessed in 32-bit access-only.
2. When setting registers, set them after the I/O Port Register setting.

39.4.6 规格限制

1. 不支持SDIO的SuspendResume操作。
2. 不支持SPI总线(SDMMC)。
3. 不支持嵌入式SDIO的共享总线和8位SD总线。
4. 不支持MMC的流传输。
5. 不支持MMC的高优先级中断(HPI)。
6. 不支持MMC的引导操作替代引导操作。
7. 不支持MMC的开放式多块传输。

39.4.7 多块读取(SDMMC)期间的STP位设置

在通过将SD_STOP寄存器中的SEC位设置为1来执行自动CMD12执行的多块读取执行期间，即使SD_STOP中的STP位设置为1以强制停止执行，命令序列也可能不会停止，具体取决于STP位的设置时序。

为避免这种情况，在多块传输期间将SD_STOP中的STP位设置为1时，同时将SD_STOP中的SEC位清除为0。即使SD_INFO2中的SD_CLK_CTRLEN位为0，也将SEC位从1更改为0。

当由于SEC位未设置为0而未停止命令序列时，可通过将SOFT_RST中的SDRST位清0来停止命令序列。

通过SDIO_MODE中的IOABT位强制终止CMD53多块传输时，请将SD_STOP寄存器中的SEC位设置为1。

39.4.8 注册设置注意事项

1. 第39.2节，寄存器描述中的所有寄存器都以32位仅访问方式访问。
2. 设置寄存器时，请在设置IO端口寄存器之后设置。

40. Boundary Scan

40.1 Overview

The boundary scan function provides a serial I/O interface based on the JTAG (Joint Test Action Group), IEEE Std. 1149.1, and IEEE Standard Test Access Port, and Boundary Scan Architecture.

Table 40.1 lists the boundary scan specifications, Figure 40.1 shows a block diagram, and Table 40.2 lists the I/O pins.

Table 40.1 Boundary scan specifications

Parameter	Specifications
Execution condition	Boundary scan must be executed when the RES pin is driven low
Test modes	• BYPASS mode • EXTEST mode • SAMPLE/PRELOAD mode • CLAMP mode • HIGHZ mode • IDCODE mode.

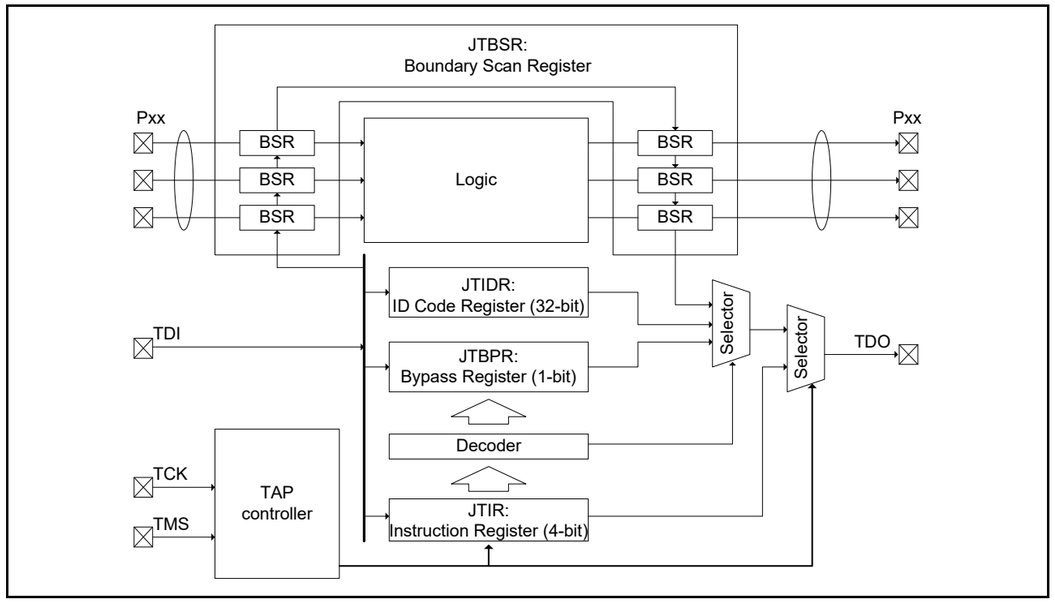

Figure 40.1 Boundary scan function block diagram

Table 40.2 Boundary scan I/O pins

Pin name	I/O	Description
TCK	Input	Test clock input pin. Clock signal for boundary scan. The input clock duty cycle is 50% when the boundary scan function is used.
TMS	Input	Test mode select pin
TDI	Input	Test data input pin
TDO	Output	Test data output pin

Note: This MCU does not support the TRST pin for the JTAG interface.

40. 边界扫描

40.1 Overview

边界扫描功能提供基于JTAG（联合测试行动组）、IEEEStd.的串行IO接口。1149.1、IEEE标准测试访问端口和边界扫描架构。

表40.1列出了边界扫描规范，图40.1显示了框图，表40.2列出了IO引脚。

Table 40.1 边界扫描规格

Parameter	Specifications
执行条件	当RES引脚被驱动为低电平时，必须执行边界扫描
测试模式	BYPASS模式 EXTEST模式 SAMPLEPRELOAD模式 CLAMP模式 HIGHZ模式 IDCODE模式。

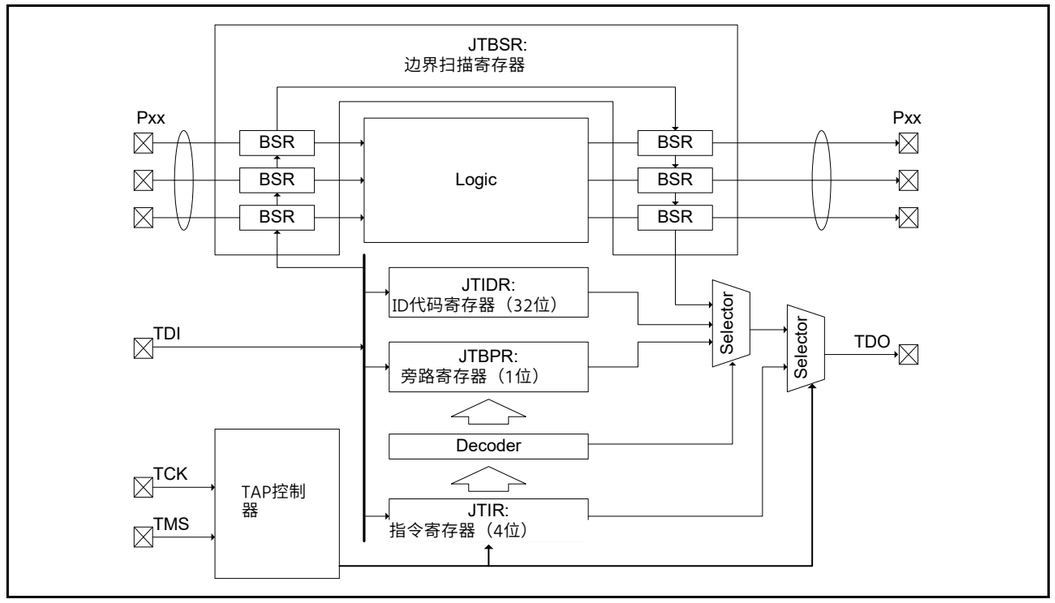

Figure 40.1 边界扫描功能框图

Table 40.2 边界扫描IO引脚

引脚名称	I/O	Description
TCK	Input	测试时钟输入引脚。 边界扫描的时钟信号。使用边界扫描功能时，输入时钟占空比为50%。
TMS	Input	测试模式选择引脚
TDI	Input	测试数据输入引脚
TDO	Output	测试数据输出引脚

Note: 此MCU不支持JTAG接口的TRST引脚。

40.2 Register Descriptions

Table 40.3 lists the boundary scan registers.

Table 40.3 Boundary scan registers

Register name	Symbol	Value after reset
Instruction Register	JTIR	Eh
ID Code Register	JTIDR	083D 8447h
Bypass Register	JTBPR	Undefined
Boundary Scan Register	JTBSR	Undefined

Usage notes for the boundary scan registers:

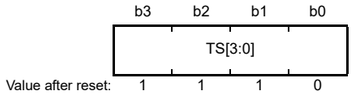
- Instructions can be input to the Instruction Register (JTIR) through the TDI pin by serial transfer
- The Bypass Register (JTBPR), which is a 1-bit register, is connected between the TDI and TDO pins in BYPASS mode
- The Boundary Scan Register (JTBSR), which is configured according to the BSDL description, is connected between the TDI and TDO pins when test data is being shifted in.

Table 40.4 shows the availability of serial transfer for the registers.

Table 40.4 Serial transfer for registers

Register name	Serial input	Serial output
Instruction Register (JTIR)	Available	Available
ID Code Register (JTIDR)	Available	Available
Bypass Register (JTBPR)	Available	Available
Boundary Scan Register (JTBSR)	Available	Available

40.2.1 Instruction Register (JTIR)



Bit	Symbol	Bit name	Description	R/W
b3 to b0	TS[3:0]	Test Bit Set	The command configuration for these bits is shown in Table 40.5	—

Table 40.5 Command configuration

TS3	TS2	TS1	TS0	Instruction
0	0	0	0	EXTEST
0	0	0	1	SAMPLE/PRELOAD
0	0	1	1	IDCODE (Renesas code)
0	1	0	1	CLAMP
0	1	1	0	HIGHZ
1	1	1	1	BYPASS
Other settings				Reserved

JTAG instructions can be transferred to the JTIR register by serial input from the TDI pin. The JTIR register is initialized when a power-on reset occurs, or when the TAP controller is in the Test-Logic-Reset state.

40.2 注册说明

表40.3列出了边界扫描寄存器。

Table 40.3 边界扫描寄存器

注册名称	Symbol	重置后的值
指令寄存器	JTIR	Eh
ID代码寄存器	JTIDR	083D 8447h
绕过寄存器	JTBPR	Undefined
边界扫描寄存器	JTBSR	Undefined

边界扫描寄存器的使用说明：

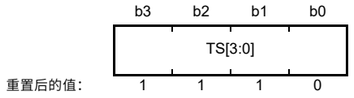
- 指令可以通过串行传输通过TDI引脚输入到指令寄存器(JTIR)
- Bypass寄存器(JTBPR)是一个1位寄存器，在BYPASS模式下连接在TDI和TDO引脚之间
- 根据BSDL描述配置的边界扫描寄存器(JTBSR)在移入测试数据时连接在TDI和TDO引脚之间。

表40.4显示了寄存器串行传输的可用性。

Table 40.4 寄存器的串行传输

注册名称	串行输入	串行输出
指令寄存器(JTIR)	Available	Available
ID代码寄存器(JTIDR)	Available	Available
旁路寄存器(JTBPR)	Available	Available
边界扫描寄存器(JTBSR)	Available	Available

40.2.1 指令寄存器(JTIR)



Bit	Symbol	位名称	Description	R/W
b3 to b0	TS[3:0]	测试位组	这些位的命令配置如表40.5所示	—

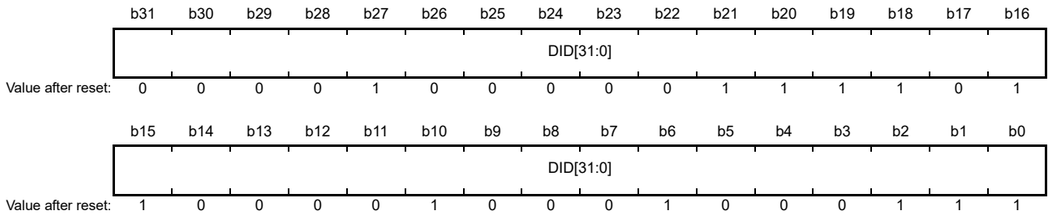
Table 40.5 命令配置

TS3	TS2	TS1	TS0	Instruction
0	0	0	0	EXTEST
0	0	0	1	SAMPLE/PRELOAD
0	0	1	1	IDCODE (Renesas code)
0	1	0	1	CLAMP
0	1	1	0	HIGHZ
1	1	1	1	BYPASS
其他设置				Reserved

JTAG指令可以通过TDI引脚的串行输入传输到JTIR寄存器。当发生上电复位或TAP控制器处于Test-Logic-Reset状态时，JTIR寄存器被初始化。

RA生态工作室

40.2.2 ID Code Register (JTIDR)



Bit	Symbol	Bit name	Description	R/W
b31 to b0	DID[31:0]	Device ID	These bits store the fixed value that indicates the device IDCODE	—

JTIDR data is output from the TDO pin when the IDCODE instruction is executed. After a reset release, the IDCODE of JTIDR changes into the Arm® debug code. See the *ARM® CoreSight™ SoC-400 Technical Reference Manual* (ARM DDI 0480F).

40.2.3 Bypass Register (JTBPR)

JTBPR is a 1-bit register and is connected between the TDI and TDO pins when the JTIR register is set to BYPASS mode. The JTBPR register cannot be read from or written to by the CPU.

40.2.4 Boundary Scan Register (JTBSR)

JTBSR is a shift register used for controlling the external input and output pins of the MCU, and is distributed across the pads. To apply the JTBSR register in boundary-scan testing, issue the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ instructions. The BSDL file describes the associations between the JTBSR bits and the MCU pins. The value after reset is undefined.

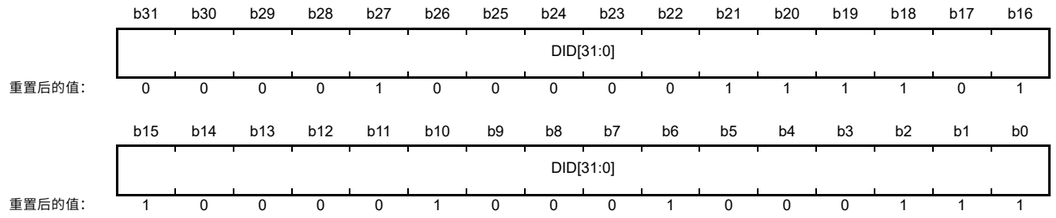
40.3 Operation

During a reset, the JTAG ports, TCK, TMS, TDI, and TDO, are assigned as default pin functions. The TCK, TMS, and TDI pins are pulled up by the pull-up resistors. Boundary scan testing can be executed after the setup time elapses, when POR is negated, and RES is driven low.

40.3.1 TAP Controller

Figure 40.2 shows the state transition diagram of the TAP controller. All transitions are controlled by the TMS signal.

40.2.2 ID代码寄存器(JTIDR)



Bit	Symbol	位名称	Description	R/W
b31 to b0	DID[31:0]	设备ID	这些位存储指示设备IDCODE的固定值	—

执行IDCODE指令时，从TDO引脚输出JTIDR数据。复位释放后，IDCODE JTIDR更改为Arm®调试代码。请参阅ARM®CoreSight SoC-400技术参考手册（ARM DDI 0480F).

40.2.3 旁路寄存器(JTBPR)

JTBPR是一个1位寄存器，当JTIR寄存器设置为BYPASS模式时，连接在TDI和TDO引脚之间。CPU无法读取或写入JTBPR寄存器。

40.2.4 边界扫描寄存器(JTBSR)

JTBSR是一个移位寄存器，用于控制MCU的外部输入和输出引脚，分布在各个焊盘上。要在边界扫描测试中应用JTBSR寄存器，请发出EXTEST、SAMPLEPRELOAD、CLAMP和HIGHZ指令。BSDL文件描述了JTBSR位和MCU引脚之间的关联。复位后的值未定义。

40.3 Operation

在复位期间，JTAG端口、TCK、TMS、TDI和TDO被分配为默认引脚功能。TCK、TMS和TDI引脚由上拉电阻上拉。边界扫描测试可以在设置时间过去后执行，当POR被否定，RES被驱动为低电平。

40.3.1 水龙头控制器

图40.2显示了TAP控制器的状态转换图。所有转换都由TMS信号控制。

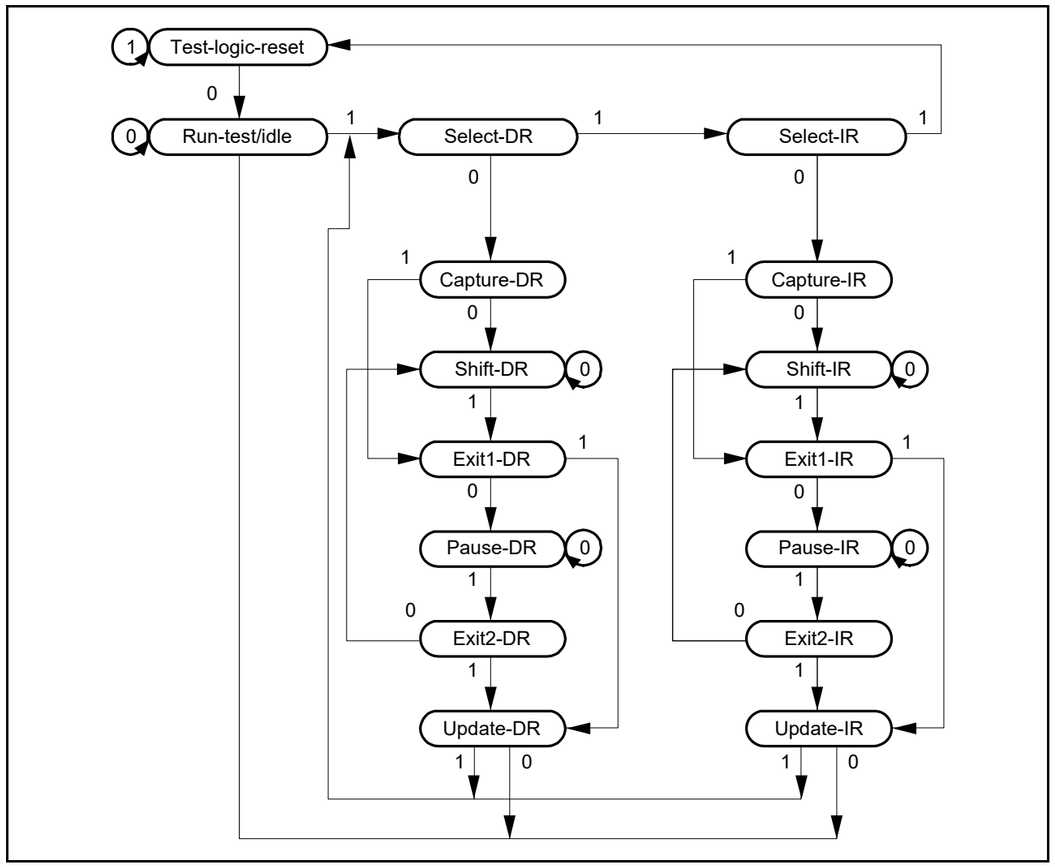


Figure 40.2 State transition diagram of TAP controller

40.3.2 Commands

(1) BYPASS

The BYPASS instruction drives the Bypass Register (JTBPR). This instruction shortens the shift path, facilitating the transfer of serial data to the other LSIs on a printed circuit board at higher speeds. While this instruction is being executed, the test circuit has no effect on the system circuits.

The Bypass Register (JTBPR) is connected between the TDI and TDO pins. Bypass operation is initiated from the Shift-DR operation. The TDO is low in the first clock cycle in the Shift-DR state. In the subsequent clock cycles, the TDI signal is output on the TDO pin.

(2) EXTEST

The EXTEST instruction is used to test external circuits when the MCU is installed on the printed circuit board. If this instruction is executed, the output pins are used to output test data (specified in the SAMPLE/PRELOAD instruction) from the Boundary Scan Register (JTBSR) to the print circuit board, and the input pins are used to input the test result.

(3) SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input data from the internal circuits of the MCU to the Boundary Scan Register (JTBSR), output data from the scan path, and reload the data to the scan path. While this instruction is executed, the input signals are directly input to the MCU and output signals are also directly output to the external circuits. The MCU system circuit is not affected by this instruction.

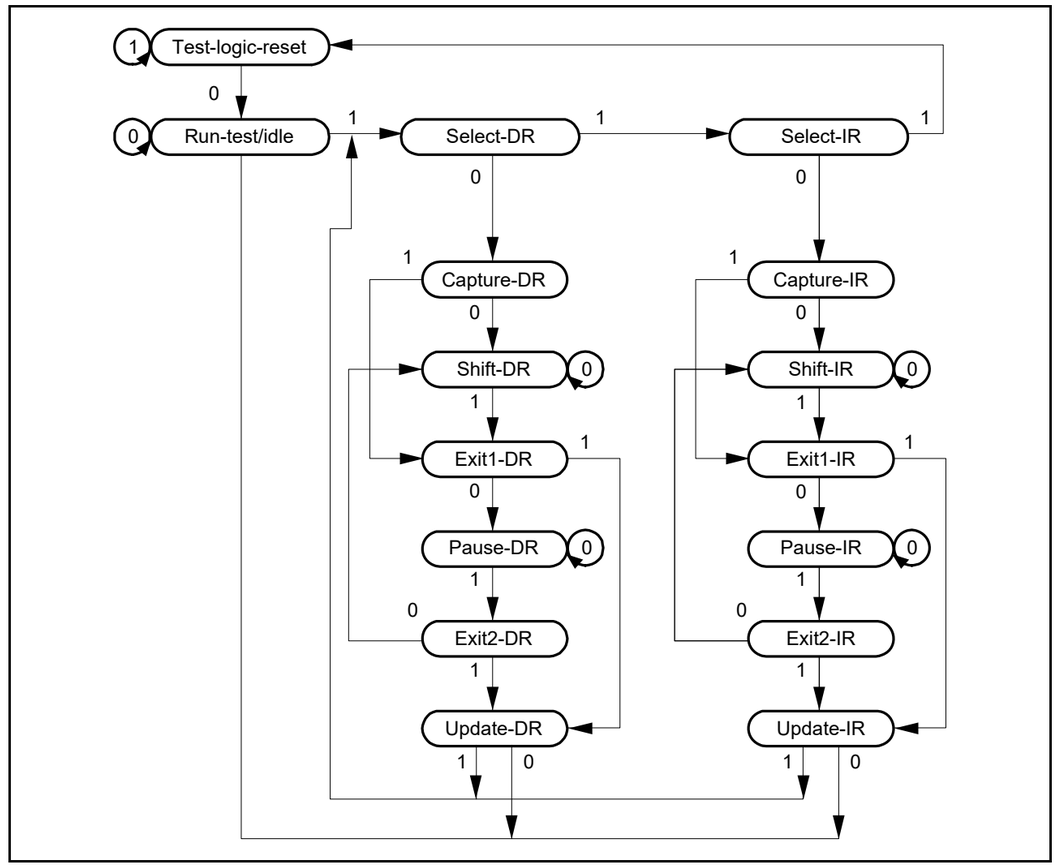

Figure 40.2 TAP控制器的状态转移图

40.3.2 Commands

(1) BYPASS

BYPASS指令驱动旁路寄存器(JTBPR)。该指令缩短了移位路径，便于将串行数据以更高的速度传输到印刷电路板上的其他LSI。在执行该指令时，测试电路对系统电路没有影响。

旁路寄存器(JTBPR)连接在TDI和TDO引脚之间。旁路操作从Shift启动
DR操作。TDO在Shift-DR状态的第一个时钟周期内为低电平。在随后的时钟周期中，TDI信号在TDO引脚上输出。

(2) EXTEST

EXTEST指令用于单片机安装在印刷电路板上时测试外部电路。如果执行该指令，输出引脚用于将测试数据（在SAMPLEPRELOAD指令中指定）从边界扫描寄存器（JTBSR）输出到印刷电路板，输入引脚用于输入测试结果。

(3) SAMPLE/PRELOAD

SAMPLEPRELOAD指令用于将数据从MCU内部电路输入到边界扫描寄存器（JTBSR），从扫描路径输出数据，并将数据重新加载到扫描路径。在执行该指令的同时，输入信号直接输入到MCU，输出信号也直接输出到外部电路。MCU系统电路不受该指令影响。

In SAMPLE operation, the Boundary Scan Register (JTBSR) latches a snapshot of the data transferred from the input pins to the internal circuit, or data transferred from the internal circuit to the output pins. The latched data is read from the scan path. The JTBSR register latches the data snapshot on the rising edge of the TCK pin in the Capture-DR state. The data snapshot is only transferred from the internal circuit to the output pins during a reset.

In PRELOAD operation, the initial value is written from the scan path to the parallel output latch of the Boundary Scan Register (JTBSR) prior to the EXTEST instruction execution. If EXTEST is executed without executing this PRELOAD operation, undefined values are output from the beginning of the EXTEST sequence to the end (transfer to the output latch). In the EXTEST instruction, output parallel latches are always output to the output pins.

(4) IDCODE

When the IDCODE instruction is selected, the ID Code Register (JTIDR) value is output to the TDO pin in the Shift-DR state of the TAP controller. In this case, the JTIDR register value is output LSB-first. During this instruction execution, the test circuit does not affect the system circuit.

(5) CLAMP

When the CLAMP instruction is selected, the output pins output the Boundary Scan Register (JTBSR) value that was specified in the SAMPLE/PRELOAD instruction in advance. While the CLAMP instruction is selected, the status of the JTBSR register is maintained regardless of the TAP controller state.

The Bypass Register (JTBPR) is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

(6) HIGHZ

When the HIGHZ instruction is selected, all output pins enter a high-impedance state. While the HIGHZ instruction is selected, the status of Boundary Scan Register (JTBSR) is maintained regardless of the state of the TAP controller.

The Bypass Register (JTBPR) is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

40.4 Usage Notes

The boundary scan function is subject to the following constraints:

- The boundary scan must be executed when the RES pin is driven low
- Serial data input/output is in LSB order, as shown in Figure 40.3.

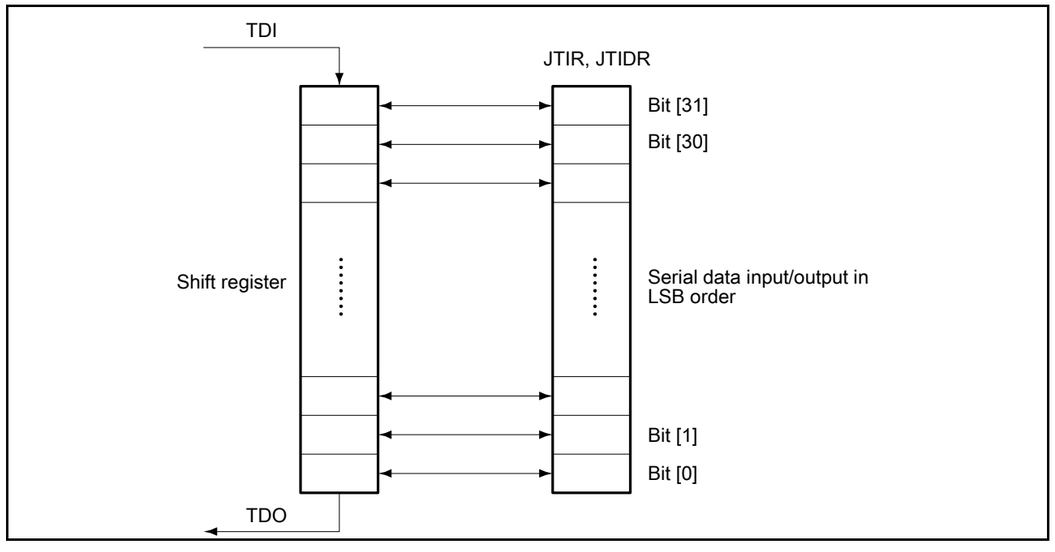

Figure 40.3 Serial data input/output

在SAMPLE操作中，边界扫描寄存器(JTBSR)锁存从输入引脚传输到内部电路的数据或从内部电路传输到输出引脚的数据的快照。从扫描路径读取锁存的数据。在Capture-DR状态下，JTBSR寄存器在TCK引脚的上升沿锁存数据快照。数据快照仅在复位期间从内部电路传输到输出引脚。

在PRELOAD操作中，在执行EXTEST指令之前，将初始值从扫描路径写入边界扫描寄存器(JTBSR)的并行输出锁存器。如果在不执行此PRELOAD操作的情况下执行EXTEST，则从EXTEST序列的开头到结尾输出未定义的值（传输到输出锁存器）。在EXTEST指令中，输出并行锁存器始终输出到输出引脚。

(4) IDCODE

WhentheIDCODEinstructionisselected theIDCodeRegister(JTIDR)valueisoutputtotheTDOpinintheShift-DRstateoftheTAPcontroller.在这种情况下，JTIDR寄存器值首先输出LSB。在该指令执行期间，测试电路不影响系统电路。

(5) CLAMP

选择CLAMP指令时，输出引脚输出预先在SAMPLEPRELOAD指令中指定的边界扫描寄存器(JTBSR)值。选择CLAMP指令时，无论TAP控制器状态如何，都将保持JTBSR寄存器的状态。

旁路寄存器(JTBPR)连接在TDI和TDO引脚之间，导致与当
选择了BYPASS指令。

(6) HIGHZ

选择Highz指令时，所有输出引脚都进入高阻抗状态。选择HIGHZ指令时，无论TAP控制器的状态如何，边界扫描寄存器(JTBSR)的状态都会保持不变。

旁路寄存器(JTBPR)连接在TDI和TDO引脚之间，导致与当
选择了BYPASS指令。

40.4 使用说明

边界扫描函数受以下约束：

- 当RES引脚驱动为低电平时，必须执行边界扫描
- 串行数据输入输出按LSB顺序排列，如图40.3所示。

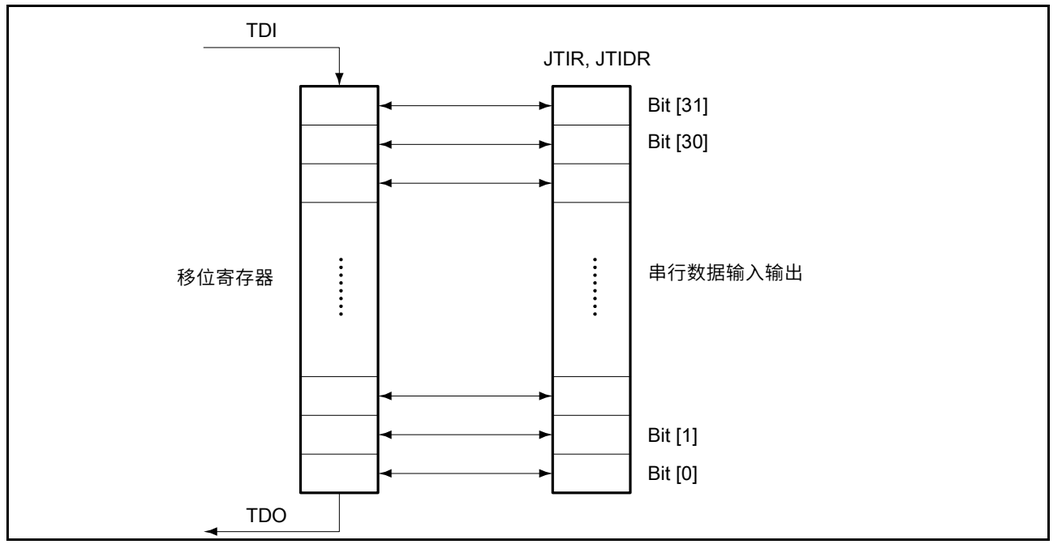

Figure 40.3 串行数据输入输出

The following pins cannot be boundary-scanned:

- Power supply pins (VCC, VCL, VCL0, VSS, VBATT, AVCC0, AVSS0, VCC_USB, and VSS_USB)
- Analog reference pins (VREFH0, VREFL0, VREFH, VREFL)
- Clock pins (EXTAL, XTAL, XCIN, and XCOUT)
- Reset signal (RES)
- USB-dedicated pins (USB_DP, USB_DM)
- Boundary-scan pins (TCK, TMS, TDI, and TDO).

以下引脚不能进行边界扫描：

- 电源引脚（VCC、VCL、VCL0、VSS、VBATT、AVCC0、AVSS0、VCC_USB和VSS_USB）
- 模拟参考引脚（VREFH0、VREFL0、VREFH、VREFL）
- 时钟引脚（EXTAL、XTAL、XCIN和XCOUT）
- 复位信号(RES)
- USB-dedicated pins (USB_DP, USB_DM)
- 边界扫描引脚（TCK、TMS、TDI和TDO）。

41. Secure Cryptographic Engine (SCE7)

41.1 Overview

The MCU incorporates a Secure Cryptographic Engine (SCE7) module to provide security functions. The module consists of an access management circuit, encryption engine, and random number generator.

Table 41.1 shows the SCE7 specifications and Figure 41.1 shows a block diagram.

Table 41.1 SCE7 specifications (1 of 2)

Parameter	Specifications
Access control	Access management circuit • In case of irregular access to the SCE7 due to a falsified program or runaway execution of a program, this circuit blocks all subsequent accesses and stops the output of data from the SCE7.
Encryption engine	Advanced Encryption Standard (AES): Compliant with NIST FIPS PUB 197 algorithm • Key sizes: 128, 192, or 256 bits • Block size: 128 bits • Chaining modes ECB, CBC, CTR: Compliant with NIST SP 800-38A GCM: Compliant with NIST SP 800-38D XTS: Compliant with NIST SP 800-38E. GCTR • Throughput for 128-bit data 11 PCLKB cycles for 128-bit key 15 PCLKB cycles for 256-bit key. AES-GCM • AES-GCM is realized by combining AES-GCTR and GHASH. Triple Data Encryption Standard (3DES) • 192-bit key length • Operates on a fixed 8-byte block of data • Used in legacy Secure Socket Layer (SSL) and Transport Layer Security (TLS) protocols. • Throughput for 64-bit data 16 PCLKB cycles for 56-bit key. Alleged RC4 (ARC4) • 2048-bit key length • Throughput for 128-bit data 16 PCLKB cycles for 2048-bit key. Key management • Wrapped keys are only valid within the SCE7.
Generation of random numbers	128-bit true random number generator
Signature generation and verification	RSA • Support for 1024-bit and 2048-bit key sizes • Signature generation, signature verification, public-key encryption, private-key decryption. DSA • Support for DSA key sizes: • (1024-bit, 160-bit) • (2048-bit, 224-bit) • (2048-bit, 256-bit). • Signature generation, signature verification. ECC • Support for curve P-192, P-224, P-256, and P-384 • Signature generation, signature verification • Scalar multiplication.
Message digest computation	HASH • SHA1, SHA224, SHA256, and MD5.

41. 安全加密引擎(SCE7)

41.1 Overview

MCU包含一个安全加密引擎(SCE7)模块以提供安全功能。该模块由访问管理电路、加密引擎和随机数发生器组成。

表41.1显示了SCE7规范，图41.1显示了框图。

Table 41.1 SCE7规范（2个中的1个）

Parameter	Specifications
访问控制	访问管理电路　如果由于伪造程序或程序执行失控导致对SCE7的非正常访问，该电路将阻止所有后续访问，并停止从SCE7输出数据。
加密引擎	高级加密标准(AES)：符合NISTFIPSPUB197算法　密钥大小：128、192或256位　块大小：128位　链接模式 ECB、CBC、CTR：符合NISTSP800-38A GCM：符合NISTSP800-38DXTS：符合NISTSP800-38E。 GCTR　128位数据的吞吐量 128位密钥的11个PCLKB周期256位密钥的15个PCLKB周期。 AES-GCM　AES-GCM是通过结合AES-GCTR和GHASH实现的。 三重数据加密标准(3DES)　192位密钥长度　对固定的8字节数据块进行操作　用于传统的安全套接字层(SSL)和传输层安全(TLS)协议。　64位数据的吞吐量 56位密钥的16个PCLKB周期。 所谓的RC4(ARC4)　2048位密钥长度　128位数据的吞吐量 2048位密钥的16个PCLKB周期。 密钥管理　封装的密钥仅在SCE7内有效。
随机数的产生	128位真随机数发生器
签名生成和验证	RSA　支持1024位和2048位密钥大小　签名生成、签名验证、公钥加密、私钥解密。 DSA　支持DSA密钥大小：　（1024位、160位）（2048位、224位）　（2048位、256位）。 签名生成、签名验证。 ECC 支持曲线P-192、P-224、P-256和P-384　签名生成、签名验证　标量乘法。
消息摘要计算	哈希　SHA1、SHA224、SHA256和MD5。

Table 41.1 SCE7 specifications (2 of 2)

Parameter	Specifications
Unique ID	• An ID unique to the MCU (unique ID) is accessible from the access management circuit through the dedicated bus • Combining the unique ID with the key generation information prevents illicit copying of data to another MCU.
Privileged mode	• The privileged mode signal is connected to the access management circuit and is used to limit control of the SCE7 module to privileged mode only.
Low power consumption	Setting of the module-stop state is possible

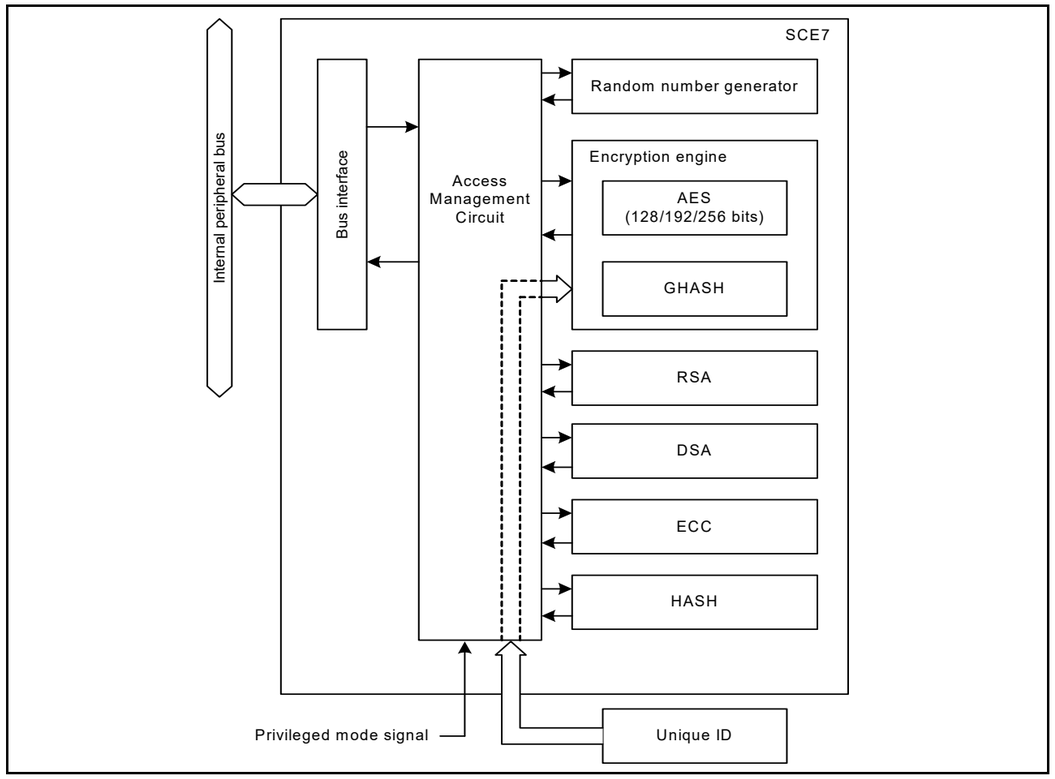

Figure 41.1 SCE7 block diagram

Table 41.1 SCE7规范（2个中的2个）

Parameter	Specifications
唯一身份	MCU唯一的ID（唯一ID）可通过专用总线从访问管理电路访问 将唯一ID与密钥生成信息相结合可防止将数据非法复制到另一个MCU。
特权模式	特权模式信号连接到访问管理电路，用于将SCE7模块的控制仅限于特权模式。
低功耗	可以设置模块停止状态

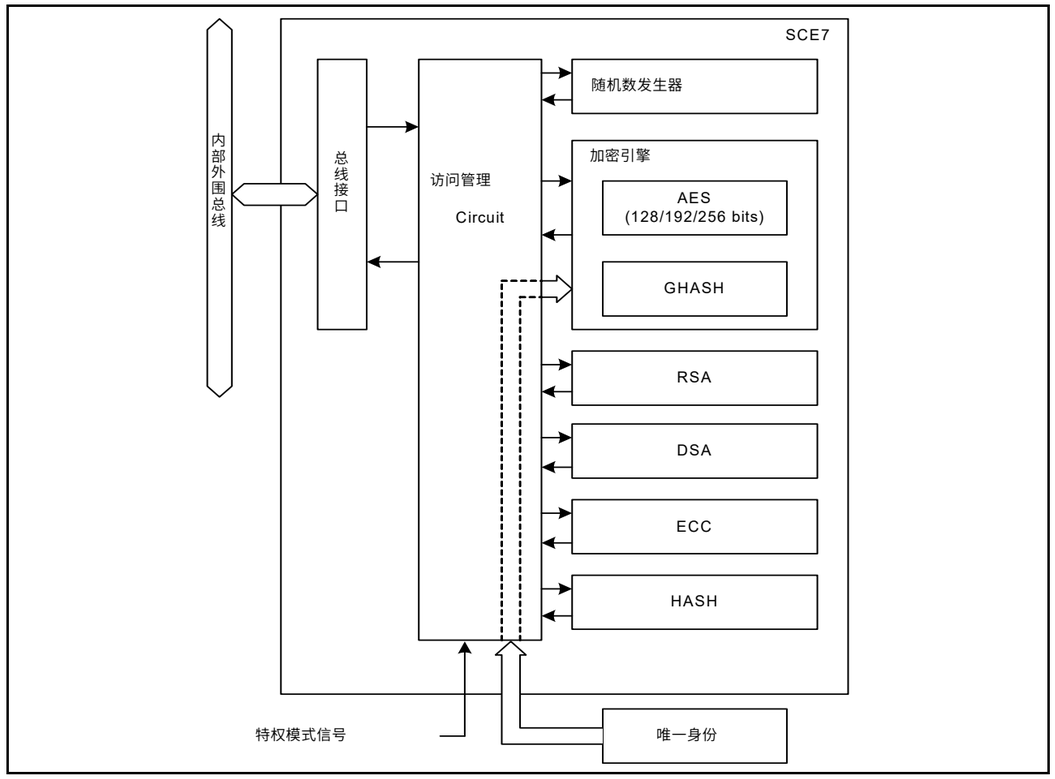

Figure 41.1 SCE7框图

RA生态工作室

41.2 Operation

41.2.1 Encryption Engine

The encryption engine performs the following operation in hardware, see Figure 41.2:

- Plaintext to ciphertext encryption
- Ciphertext to plaintext decryption.

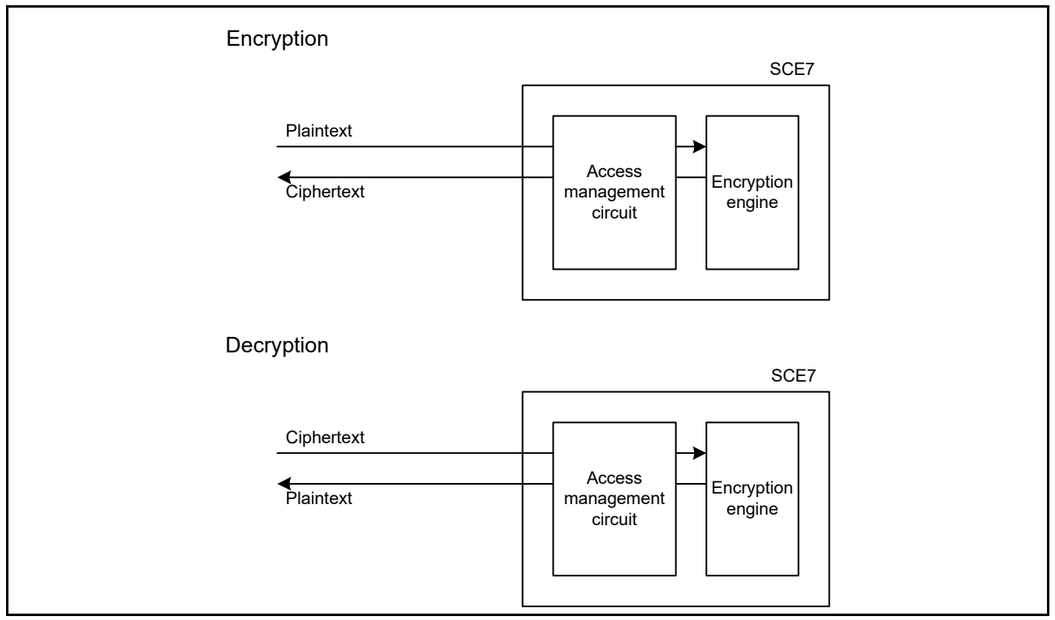

Figure 41.2 Encryption and decryption processes by encryption engine

41.2 Operation

41.2.1 加密引擎

加密引擎在硬件中执行以下操作，见图41.2：

- 明文到密文加密
- 密文转明文解密。

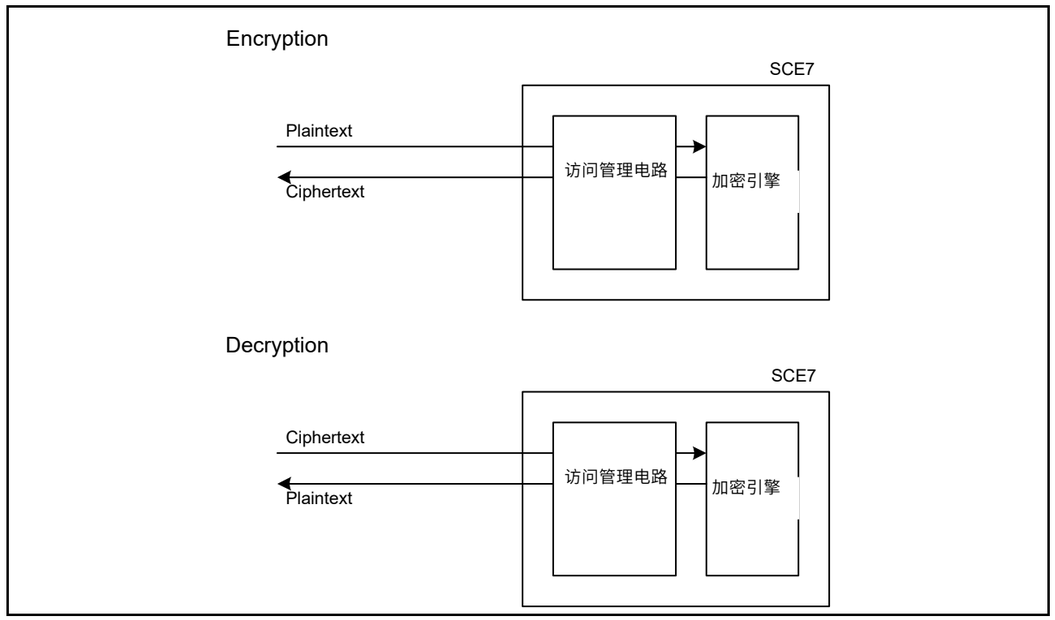

Figure 41.2 加密引擎的加解密过程

RA生态工作室

41.2.2 Encryption and Decryption

To encrypt or decrypt data:

1. Input the data to encrypt or decrypt in the SCE7.
   The SCE7 converts the plaintext data to ciphertext or ciphertext data to plaintext.
2. Read the converted data.

The encryption engine has an input buffer and an output buffer, enabling encryption/decryption to proceed in parallel with data input/output. Figure 41.3 shows the encryption and decryption engine timing.

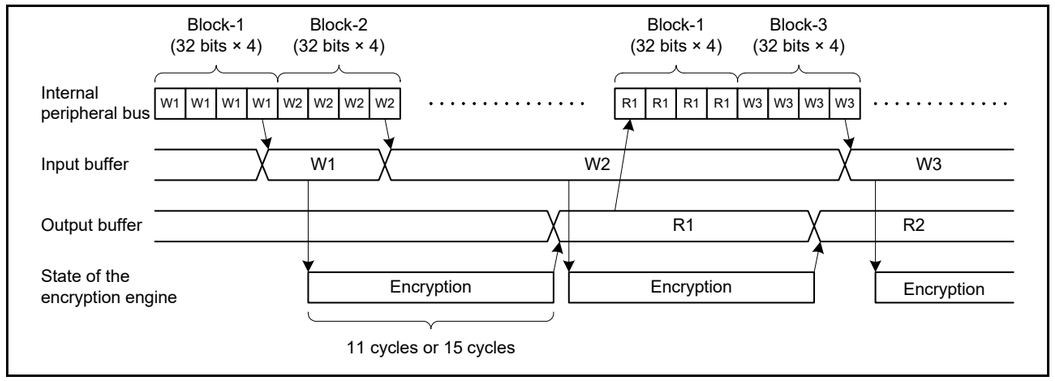

Figure 41.3 Encryption and decryption timing (AES)

41.3 Usage Notes

41.3.1 Software Standby Mode

When Software Standby mode is entered while the encryption engine is processing, proper processing cannot be resumed after exiting Software Standby mode. Software Standby mode should therefore be entered while the encryption engine is not running.

41.3.2 Settings for the Module-Stop Function

SCE7 operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The SCE7 module is initially stopped after reset. Releasing the module-stop state enables access to the registers.

41.2.2 加密和解密

要加密或解密数据：

1. 在SCE7中输入要加密或解密的数据。
   SCE7将明文数据转换为密文或将密文数据转换为明文。
2. 读取转换后的数据。

加密引擎有一个输入缓冲区和一个输出缓冲区，使加密解密与数据输入输出并行进行。图41.3显示了加密和解密引擎的时序。

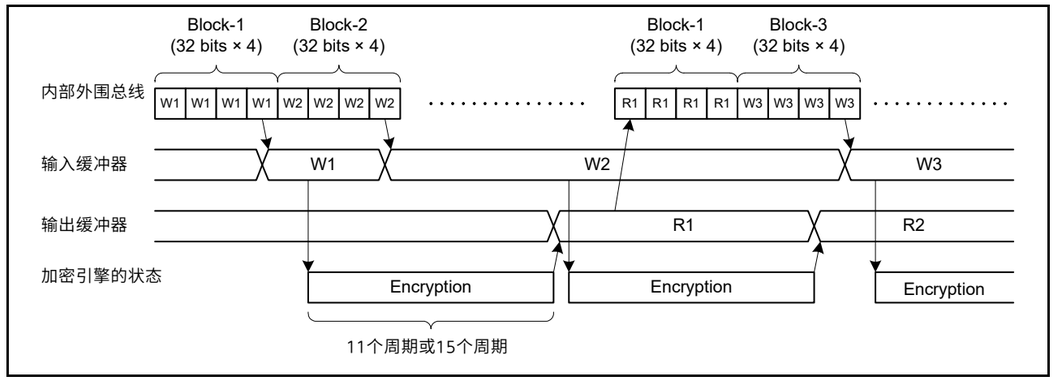

Figure 41.3 加密和解密时序（AES）

41.3 使用说明

41.3.1 软件待机模式

在加密引擎处理过程中进入软件待机模式时，退出软件待机模式后无法恢复正常处理。因此，应在加密引擎未运行时进入软件待机模式。

41.3.2 模块停止功能的设置

可以使用模块停止控制寄存器C(MSTPCRC)禁用或启用SCE7操作。SCE7模块在复位后最初停止。释放模块停止状态可以访问寄存器。

42. 12-Bit A/D Converter (ADC12)

42.1 Overview

The MCU provides two 12-bit successive approximation A/D converter (ADC12) units. In unit 0, up to 11 analog input channels are selectable. In unit 1, up to eight analog input channels, temperature sensor output, and internal reference voltage are selectable for conversion. The A/D conversion accuracy is selectable from 12-, 10-, and 8-bit conversion, making it possible to optimize the trade-off between speed and resolution in generating a digital value.

ADC12 features include:

- 11 channels (unit 0), 8 channels (unit 1)
- PCLKB = 60 MHz (maximum)
- PCLKC = 60 MHz (maximum)
- Analog channels: AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020 (unit 0), AN100 to AN102, AN105 to AN107, AN116, AN117 (unit 1)
- Resolution: 12-bit, 10-bit, 8-bit
- Dedicated sample-and-hold circuit embedded
- Programmable Gain Amplifier embedded.

The ADC12 supports the following operating modes:

- Single scan mode for converting analog inputs of arbitrarily selected channels in ascending order of channel number
- Continuous scan mode for sequentially converting analog inputs of arbitrarily selected channels continuously in ascending order of channel number
- Group scan mode for arbitrarily dividing the analog inputs of channels into two groups (A and B) and converting the analog input of the selected channel for each group in ascending order of channel number.

In group scan mode, you can start group A and group B A/D conversion at different times by individually selecting their scan start conditions. In addition, when a priority control operation for group A is set, ADC12 accepts group A scan starting during group B A/D conversion, suspending group B conversion. This allows you to assign higher priority to A/D conversion start for group A.

In double trigger mode, the analog input of an arbitrarily selected channel is converted in single scan mode or group scan mode (group A), and the data converted by the first and second A/D conversion start triggers are stored in different registers, providing duplexing of A/D-converted data.

Self-diagnosis is performed once at the beginning of each scan, and one of the three voltage values generated in ADC12 is A/D-converted.

The temperature sensor output and internal reference voltage are selectable at the same time as the analog input of the channel. A/D conversion is performed first for the analog input of the channel, next for the temperature sensor output, and then for the internal reference voltage.

The ADC12 provides a compare function (window A and window B). This compare function specifies the upper reference value for window A and lower reference value for window B, and outputs an interrupt request when the A/D-converted value of the selected channel meets the comparison conditions.

Table 42.1 lists the ADC12 specifications, Table 42.2 list the functions, and Table 42.3 lists the I/O pins. Figure 42.1 shows a block diagram of ADC12 unit 0, and Figure 42.2 shows a block diagram of ADC12 unit 1.

Table 42.1 ADC12 specifications (1 of 3)

Parameter	Specifications
Number of units	Two units, 0 and 1
Input channels	• Unit 0: Up to 11 channels • Unit 1: Up to 8 channels.

42. 12-Bit A/D Converter (ADC12)

42.1 Overview

MCU提供两个12位逐次逼近模数转换器(ADC12)单元。在单元0中，最多可选择11个模拟输入通道。在单元1中，最多可选择8个模拟输入通道、温度传感器输出和内部参考电压进行转换。AD转换精度可从12位、10位和8位转换中选择，从而可以在生成数字值时优化速度和分辨率之间的权衡。

ADC12 features include:

- 11 channels (unit 0), 8 channels (unit 1)
- PCLKB = 60 MHz (maximum)
- PCLKC = 60 MHz (maximum)
- 模拟通道：AN000到AN003、AN005到AN007、AN016到AN018、AN020（单元0）、AN100到AN102、AN105 to AN107, AN116, AN117 (unit 1)
- Resolution: 12-bit, 10-bit, 8-bit
- 嵌入式专用采样保持电路
- 嵌入式可编程增益放大器。

ADC12支持以下工作模式：

- 单次扫描模式，用于按通道编号升序转换任意选择通道的模拟输入
- 连续扫描模式，用于按通道编号升序连续转换任意选择通道的模拟输入
- 组扫描模式，用于将通道的模拟输入任意分成两组（A和B），并按通道编号的升序对每组所选通道的模拟输入进行转换。

在组扫描模式下，您可以通过单独选择它们的扫描开始条件，在不同的时间开始A组和B组AD转换。此外，当设置了A组的优先控制操作时，ADC12在B组AD转换期间接受A组扫描开始，暂停B组转换。这允许您为A组的AD转换启动分配更高的优先级。

在双触发模式下，任意选择通道的模拟输入转换为单扫描模式或组扫描模式（A组），第一次和第二次A/D转换开始触发转换的数据存储在不同的寄存器中，提供双工一个D转换数据。

每次扫描开始时执行一次自诊断，ADC12中生成的三个电压值之一进行AD转换。

温度传感器输出和内部参考电压可与通道的模拟输入同时选择。首先对通道的模拟输入执行D转换，然后对温度传感器输出执行D转换，然后对内部参考电压执行D转换。

ADC12提供比较功能（窗口A和窗口B）。该比较函数指定窗口A的上参考值和窗口B的下参考值，并在所选通道的AD转换值满足比较条件时输出中断请求。

表42.1列出了ADC12规格，表42.2列出了功能，表42.3列出了IO引脚。图42.1显示了ADC12单元0的框图，图42.2显示了ADC12单元1的框图。

Table 42.1 ADC12规格(1of3)

Parameter	Specifications
单位数量	两个单位，0和1
输入通道	单元0：最多11个通道 单元1：最多8个通道。

Table 42.1 ADC12 specifications (2 of 3)

Parameter	Specifications
Extended analog function	Temperature sensor output, internal reference voltage
A/D conversion method	Successive approximation method
Resolution	12 bits, selectable to 12-bit, 10-bit, or 8-bit conversion
Conversion time	0.4 µs/channel, when A/D conversion clock PCLKC (ADCLK) is operating at 60 MHz. See Table 52.33 and Table 52.34 about the condition.
A/D conversion clock	Peripheral module clock PCLKB*1 and A/D conversion clock PCLKC (ADCLK)*1 can be set with the following division ratios: PCLKB to PCLKC (ADCLK) frequency ratios = 1:1, 2:1, 4:1, 8:1, 1:2, 1:4
Data registers	• 19 registers for analog input (11 for unit 0, 8 for unit 1), one for A/D-converted data duplication in double trigger mode in each unit, and two for A/D-converted data duplication in extended operation in double trigger mode in each unit • One register for temperature sensor output • One register for internal reference voltage • One register for self-diagnosis • A/D conversion results are stored in A/D data registers • 8-, 10-, and 12-bit accuracy output for A/D conversion results • A/D-converted value addition mode, in which the sum of all A/D conversion results are stored in the A/D data registers as the conversion accuracy bit count + 2 bits.*4 • Double trigger mode (selectable in single scan and group scan modes): The first unit of A/D-converted analog-input data on one selected channel is stored in the data register for the channel, and the second unit is stored in the duplication register. • Extended operation in double trigger mode (available for specific triggers): A/D-converted analog-input data on one selected channel is stored in the duplication register provided for the associated trigger.
Operating modes	• Single scan mode: - A/D conversion is performed only once on the analog inputs of arbitrarily selected channels, the temperature sensor output, and the internal reference voltage. • Continuous scan mode: - A/D conversion is performed repeatedly on the analog inputs of arbitrarily selected channels, the temperature sensor output, and the internal reference voltage. • Group scan mode: -A/D conversion is performed only once on the analog inputs of arbitrarily selected channels divided into group A and group B, the temperature sensor output, and the internal reference voltage -The scan start conditions can be independently selected for group A and group B, allowing A/D conversion of group A and group B to be started independently. • Group scan mode (when group A is given priority): -If a group A trigger is input during A/D conversion on group B, the A/D conversion on group B stops and A/D conversion is processed on group A. -Restart (rescan) of group B conversion after completion of group A conversion can be set.
Conditions for A/D conversion start	• Software trigger • Synchronous trigger from the Event Link Controller (ELC) • Asynchronous trigger from the external trigger pins, ADTRG0 (unit 0) and ADTRG1 (unit 1).
Functions	• Dedicated sample-and-hold function with optional constant sampling and 3 channels in units 0 and 1 • Variable sampling state count • Self-diagnosis of ADC12 • Selectable A/D-converted value addition mode or average mode • Analog input disconnection detection function (discharge and precharge functions) • Double trigger mode (duplication of A/D conversion data) • Switching function for 8-, 10-, and 12-bit conversion*2 • Automatic clear function for A/D data registers • Digital comparison of values in the comparison and data registers, and between values in the data registers.
Programmable gain amplifier	• Amplification of analog input signals to enable A/D conversion, with 3 channels in units 0 and 1 • Compatible with single end input and differential input.
Interrupt sources and ELC events	• ADC12i_ADI: A/D scan end interrupt • ADC12i_GBADI: A/D scan end interrupt for group B • ADC12i_CMPAI: window A compare match • ADC12i_CMPBI: window B compare match • ADC12i_WCMPM: compare match • ADC12i_WCMPUM: compare mismatch.

Table 42.1 ADC12规格（2个，共3个）

Parameter	Specifications
扩展模拟功能	温度传感器输出，内部参考电压
AD转换方式	逐次逼近法
Resolution	12位，可选择12位、10位或8位转换
转换时间	0.4µs通道，当AD转换时钟PCLKC(ADCLK)以60MHz运行时。条件见表52.33和表52.34 。
AD转换时钟	外围模块时钟PCLKB*1和AD转换时钟PCLKC(ADCLK)*1可设置为以下分频比：PCLKB与PCLKC(ADCLK) 频率比=1:1、2:1、4:1、8:1、1:2 1:4
数据寄存器	19个用于模拟输入的寄存器（11个用于单元0，8个用于单元1），每个单元中双触发模式下的AD转换数据复制一个，双触发模式扩展操作中的AD转换数据复制两个每个单元中 一个寄存器用于温度传感器输出 一个寄存器用于内部参考电压 一个寄存器用于自诊断 AD转换结果存储在AD数据寄存器中 用于AD转换的8位、10位和12位精度输出结果 AD转换值加法模式，其中所有AD转换结果的总和作为转换精度位数+2位存储在AD数据寄存器中。*4 双触发模式（在单次扫描和组扫描中可选模式）： 一个选定通道上的AD转换模拟输入数据的第一个单元存储在该通道的数据寄存器中，第二个单元存储在复制寄存器中。 双触发模式下的扩展操作（适用于特定触发）： 一个选定通道上的D转换模拟输入数据存储在为相关触发提供的复制寄存器中。
操作模式	单次扫描模式： D转换仅在任意选择通道的模拟输入、温度传感器输出和内部参考电压上执行一次。 连续扫描模式： 对任意选择通道的模拟输入、温度传感器输出和内部参考电压重复执行D转换。 组扫描模式： -A/D转换仅对任意选择的A组和B组通道的模拟输入、温度传感器输出和内部参考电压执行一次-A组和B组的扫描开始条件可以独立选择，允许A组和B组的AD转换独立启动。 组扫描模式（当A组优先时）： -如果在B组的AD转换期间输入A组触发，则B组的AD转换将停止，并在A组上进行AD转换。-可以设置在A组转换完成后重新启动（重新扫描）B组转换。
AD转换开始的条件	软件触发 来自事件链接控制器(ELC)的同步触发 来自外部触发引脚ADTRG0（单元0）和ADTRG1（单元1）的异步触发。
Functions	专用采样保持功能，可选恒定采样和3个通道，单元0和1 可变采样状态计数 ADC12自诊断 可选择AD转换值加法模式或平均模式 模拟输入断开检测功能（放电和预充电功能） 双触发模式（AD转换数据的复制） 8位、10位和12位转换的切换功能*2 AD数据寄存器的自动清除功能 比较中的值的数字比较和数据寄存器，以及数据寄存器中的值之间。
可编程增益放大器	放大模拟输入信号以实现AD转换，单元0和1有3个通道 兼容单端输入和差分输入。
中断源和 ELC events	ADC12i_ADI：D扫描结束中断 ADC12i_GBADI：B组的AD扫描结束中断 ADC12i_CMPAI：窗口A比较匹配 ADC12i_CMPBI：窗口B比较匹配 ADC12i_WCMPM：比较匹配 ADC12i_WCMPUM：比较不匹配。

Table 42.1 ADC12 specifications (3 of 3)

Parameter	Specifications
ELC interface	Scan can be started by a trigger from the ELC
Bus interface	Bus clock synchronized with peripheral clock (PCLKB), maximum frequency = 60 MHz
Reference voltage	• Unit 0: - VREFH0 is the high potential reference voltage - VREFL0 is the low potential reference voltage. • Unit 1: - VREFH is the high potential reference voltage - VREFL is the low potential reference voltage.
Module-stop function	Module-stop state can be set to reduce power consumption*3

i = 0 for unit 0, and i = 1 for unit 1.

Note 1. Peripheral module clock PCLKB is specified in the SCKDIVCR.PCKB[2:0] bits, and A/D conversion clock ADCLK in the SCKDIVCR.PCKC[2:0] bits in units 0 and 1.
Note 2. Changing the A/D conversion accuracy also changes the A/D conversion time. For details, see section 42.3.6, Analog Input Sampling and Scan Conversion Time.
Note 3. For details, see section 11, Low Power Modes.
Note 4. The number of extended bits for addition varies with the A/D conversion accuracy and the number of addition times. A 2-bit extension is up to 4 times conversion (3 times addition) when the A/D conversion accuracy is 8, 10, or 12 bits. A 4-bit extension is 16 times conversion (15 times addition) when the A/D conversion accuracy is 12 bits.

Table 42.2 ADC12 functions

Parameter			Unit 0 (ADC120)	Unit 1 (ADC121)
Analog input channel			AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020 Internal reference voltage Temperature sensor output	AN100 to AN102, AN105 to AN107, AN116, AN117 Internal reference voltage Temperature sensor output
Conditions for A/D conversion start	Software	Software trigger	Enabled	Enabled
	External trigger	Trigger input pin	ADTRG0	ADTRG1
	Synchronous trigger (trigger from ELC)	ELC trigger	ELC_AD00, ELC_AD01	ELC_AD10, ELC_AD11
Channel-dedicated sample-and-hold function	Target channel		AN000 to AN002	AN100 to AN102
Programmable gain amplifier	Target channel		AN000 to AN002	AN100 to AN102
	Differential input pin		PGAVSS000	PGAVSS100
Interrupt			ADC120_ADI ADC120_GBADI ADC120_CMPAI ADC120_CMPBI	ADC121_ADI ADC121_GBADI ADC121_CMPAI ADC121_CMPBI
Output to ELC			ADC120_ADI ADC120_WCMPM ADC120_WCMPUM	ADC121_ADI ADC121_WCMPM ADC121_WCMPUM
Module-stop function settings*1, *2			MSTPCRD.MSTPD16 bit	MSTPCRD.MSTPD15 bit

Note 1. For details, see section 11, Low Power Modes.
Note 2. Wait for 1 µs or longer to start A/D conversion after release from the module-stop state.

Table 42.1 ADC12规格（3个中的3个）

Parameter	Specifications
ELC interface	扫描可以通过来自ELC的触发器启动
总线接口	与外设时钟(PCLKB)同步的总线时钟，最大频率=60MHz
参考电压	• Unit 0: VREFH0是高电位参考电压VREFL0是低电位参考电压。 单元1： VREFH是高电位参考电压VREFL是低电位参考电压。
Module-stop function	可设置模块停止状态以降低功耗*3

对于单元0，i=0，对于单元1，i=1。

Note 1. 外围模块时钟PCLKB在SCKDIVCR.PCKB[2:0]位中指定，AD转换时钟ADCLK在SCKDIVCR.PCKC[2:0]位在单元0和1中。
Note 2. 改变AD转换精度也会改变AD转换时间。有关详细信息，请参阅第42.3.6节，模拟输入采样和扫描转换时间。
Note 3. 有关详细信息，请参阅第11节，低功耗模式。
Note 4. 加法的扩展位数随AD转换精度和加法次数而变化。当AD转换精度为8、10或12位时，2位扩展最多可进行4次转换（3次加法）。当AD转换精度为12位时，4位扩展是16次转换（15次加法）。

Table 42.2 ADC12 functions

Parameter			Unit 0 (ADC120)	Unit 1 (ADC121)
模拟输入通道			AN000 to AN003, AN005 to AN007, AN016至AN018、AN020内部参考电压 温度传感器输出	AN100 to AN102, AN105 to AN107, AN116, AN117 内部参考电压 温度传感器输出
AD转换开始的条件	Software	软件触发	Enabled	Enabled
	外部触发	触发输入引脚	ADTRG0	ADTRG1
	同步触发（来自ELC的触发）	ELC trigger	ELC_AD00, ELC_AD01	ELC_AD10, ELC_AD11
Channel-dedicated sample-and-hold function	目标渠道		AN000 to AN002	AN100 to AN102
可编程增益放大器	目标渠道		AN000 to AN002	AN100 to AN102
	差分输入引脚		PGAVSS000	PGAVSS100

42.2 Register Descriptions

42.2.1 A/D Data Registers y (ADDRy), A/D Data Duplexing Register (ADDBLDR), A/D Data Duplexing Register A (ADDBLDRA), A/D Data Duplexing Register B (ADDBLDRB), A/D Temperature Sensor Data Register (ADTSDR), A/D Internal Reference Voltage Data Register (ADOCDR)

The data registers include:

- ADDRy registers (y = 0 to 3, 5 to 7, 16 to 18, 20 in unit 0, and y = 0 to 2, 5 to 7, 16, 17 in unit 1): 16-bit read-only registers for storing the A/D conversion results
- ADDBLDR register: 16-bit read-only register for storing the A/D conversion results in response to the second trigger in double trigger mode
- ADDBLDRA and ADDBLDRB registers: 16-bit read-only registers for storing the A/D conversion results in response to the respective triggers during extended operation in double trigger mode
- ADTSDR register: 16-bit read-only register for storing the A/D conversion result of the temperature sensor output
- ADOCDR register: 16-bit read-only register for storing the A/D result of the internal reference voltage.

The following conditions determine the formats for data in the preceding registers:

- The setting in the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right setting)
- The setting in the A/D Conversion Accuracy Specify bits (ADCER.ADPRC[1:0]) (8-, 10-, or 12-bit setting).

This section describes the data formats for these conditions in different modes.

(1) When A/D-converted value addition/average mode is not selected

The data formats for each condition are as follows:

Settings for flush-right data with 12-bit accuracy

Address(es): ADC120.ADDR0 4005 C020h to ADC120.ADDR3 4005 C026h, ADC120.ADDR5 4005 C02Ah to ADC120.ADDR7 4005 C02Eh, ADC120.ADDR16 4005 C040h to ADC120.ADDR18 4005 C044h, ADC120.ADDR20 4005 C048h, ADC120.ADDBLDR 4005 C018h, ADC120.ADDBLDRA 4005 C084h, ADC120.ADDBLDRB 4005 C086h, ADC120.ADTSDR 4005 C01Ah, ADC120.ADOCDR 4005 C01Ch, ADC121.ADDR0 4005 C220h to ADC121.ADDR2 4005 C224h, ADC121.ADDR5 4005 C22Ah to ADC121.ADDR7 4005 C22Eh, ADC121.ADDR16 4005 C240h, ADC121.ADDR17 4005 C242h, ADC121.ADDBLDR 4005 C218h, ADC121.ADDBLDRA 4005 C284h, ADC121.ADDBLDRB 4005 C286h, ADC121.ADTSDR 4005 C21Ah, ADC121.ADOCDR 4005 C21Ch

42.2 注册说明

42.2.1 AD数据寄存器y(ADDRy)、AD数据双工寄存器(ADDBLDR)、AD数据双工寄存器A(ADDBLDRA) AD数据双工寄存器B(ADDBLDRB) AD温度传感器数据寄存器(ADTSDR) AD内部参考电压数据寄存器(ADOCDR)

数据寄存器包括：

- ADDRy寄存器（单元0中y=0到3、5到7、16到18、20，单元1中y=0到2、5到7、16、17）：用于存储的16位只读寄存器AD转换结果
- ADDBLDR寄存器：16位只读寄存器，用于存储双触发模式下第二次触发的AD转换结果
- ADDBLDRA和ADDBLDRB寄存器：16位只读寄存器，用于存储双触发模式下扩展操作期间响应相应触发的AD转换结果
- ADTSDR寄存器：16位只读寄存器，用于存储温度传感器输出的A/D转换结果
- AOCDR寄存器：16位只读寄存器，用于存储内部参考电压的AD结果。

以下条件决定了上述寄存器中数据的格式：

- AD数据寄存器格式选择位(ADCER.ADRFMT)中的设置（左对齐或右对齐设置）
- AD转换精度指定位(ADCER.ADPRC[1:0])中的设置（8位、10位或12位设置）。

本节介绍不同模式下这些条件的数据格式。

(1) 未选择AD转换值加法平均模式时

每个条件的数据格式如下：

具有12位精度的右冲洗数据设置

Address(es): ADC120.ADDR0 4005 C020h to ADC120.ADDR3 4005 C026h, ADC120.ADDR5 4005 C02Ah to ADC120.ADDR7 4005 C02Eh, ADC120.ADDR16 4005 C040h to ADC120.ADDR18 4005 C044h, ADC120.ADDR20 4005 C048h, ADC120.ADDBLDR 4005 C018h, ADC120.ADDBLDRA 4005 C084h, ADC120.ADDBLDRB 4005 C086h, ADC120.ADTSDR 4005 C01Ah, ADC120.ADOCDR 4005 C01Ch, ADC121.ADDR0 4005 C220h to ADC121.ADDR2 4005 C224h, ADC121.ADDR5 4005 C22Ah to ADC121.ADDR7 4005 C22Eh, ADC121.ADDR16 4005 C240h, ADC121.ADDR17 4005 C242h, ADC121.ADDBLDR 4005 C218h, ADC121.ADDBLDRA 4005 C284h, ADC121.ADDBLDRB 4005 C286h, ADC121.ADTSDR 4005 C21Ah, ADC121.ADOCDR 4005 C21Ch

b15 to b8	AD[7:0]	Converted Value 7 to 0	8-bit A/D-converted value	R

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in A/D-converted value addition mode. When A/D-converted value average mode is selected, this register indicates the mean of the A/D-converted values on the specified channel. The value is stored in the A/D data register based on the setting in the A/D Data Register Format Select bit in the same way as in normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 8-, 10-, or 12-bit accuracy (ADPRC bit setting), 1, 2, 3 or 4 times can be selected for A/D-converted value addition. 16 times can also be selected for addition mode, but only with 12-bit accuracy selected. In addition mode, this register indicates the value that is obtained by adding the A/D-converted values on a specific channel. The conversion results sum is retained in the A/D data register as a 2-bit-extended value of the conversion accuracy specified. The value is stored in the A/D data register based on the setting in the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

When converting 1, 2, 3, or 4 times in addition mode with 8-, 10-, or 12-bit accuracy specified, the conversion result is stored in the A/D data register as a 2-bit-extended value with the specified accuracy.

When converting 16 times in addition mode with 12-bit accuracy specified, the conversion result is stored in the A/D data register as a 4-bit-extended value with the specified accuracy.

The data formats for each condition are as follows.

Settings for flush-right data with 12-bit accuracy in A/D-converted value addition mode

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AD[15:0]*1															
	—	—	AD[13:0]*2													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	AD[15:0]*1	Added Value 15 to 0	16-bit sum of A/D conversion results	R

Bit	Symbol	Bit name	Description	R/W
b13 to b0	AD[13:0]*2	Added Value 13 to 0	14-bit sum of A/D conversion results	R
b15, b14	—	Reserved	These bits are read as 0	R

Note 1. Used when 16 conversion times is specified in A/D-converted value addition mode.
Note 2. Used when 1, 2, 3, or 4 conversion times is specified in A/D-converted value addition mode.

8位精度的左对齐数据设置

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AD[7:0]								—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	—	Reserved	这些位被读为0	R
b15 to b8	AD[7:0]	将值7转换为0	8-bit A/D-converted value	R

(2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenAD-convertedvalueaveragemodeisselected thisregisterindicatesthemeanoftheAD-convertedvaluesonthespecifiedchannel.该值根据AD数据寄存器格式选择位中的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

(3) 选择AD转换值相加模式时

对于8位、10位或12位精度（ADPRC位设置），可以选择1、2、3或4次进行AD转换值相加。加法模式也可以选择16次，但只能选择12位精度。在加法模式下，该寄存器指示通过将特定通道上的AD转换值相加而获得的值。转换结果和作为指定转换精度的2位扩展值保留在AD数据寄存器中。该值根据AD数据寄存器格式选择位中的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

在指定精度为8、10或12位的加法模式下转换1、2、3或4次时，转换结果以指定精度的2位扩展值存储在AD数据寄存器中.

在指定精度为12位的加法模式下转换16次时，转换结果以指定精度的4位扩展值存储在AD数据寄存器中。

每个条件的数据格式如下。

在AD转换值相加模式下以12位精度设置刷新数据

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AD[15:0]*1															
	—	—	AD[13:0]*2													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	AD[15:0]*1	附加值15到0	AD转换结果的16位和	R

Bit	Symbol	位名称	Description	R/W

42.2.2 A/D Self-Diagnosis Data Register (ADRD)

ADRD is a 16-bit read-only register that holds the A/D conversion results based on the self-diagnosis of the ADC12. In addition to the AD[11:0] bits indicating the A/D-converted value, it includes the Self-diagnosis Status (DIAGST) bit.

The following conditions determine the formats for data in this register:

- Setting in the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right setting)
- Setting in the A/D Conversion Accuracy Specify bits (ADCER.ADPRC[1:0]) (8-, 10-, or 12-bit setting).

The A/D-converted value addition and average modes cannot be applied to the A/D self-diagnosis function. For details on self-diagnosis, see section 42.2.11, A/D Control Extended Register (ADCER).

This section describes the data formats for each condition.

42.2.2 AD自诊断数据寄存器(ADRD)

ADRD是一个16位只读寄存器，保存基于ADC12自诊断的AD转换结果。除了指示AD转换值的AD[11:0]位外，它还包括自诊断状态(DIAGST)位。

以下条件决定了该寄存器中数据的格式：

- AD数据寄存器格式选择位(ADCER.ADRFMT)中的设置（左对齐或右对齐设置）
- AD转换精度指定位(ADCER.ADPRC[1:0])中的设置（8位、10位或12位设置）。

AD转换值加法和平均模式不能应用于AD自诊断功能。有关自诊断的详细信息，请参阅第42.2.11节，AD控制扩展寄存器(ADCER)。

本节介绍每个条件的数据格式。

具有12位精度的右冲洗数据设置

i = 0 for unit 0, and i = 1 for unit 1.

Note 1. To start A/D conversion using an external pin (asynchronous trigger):
After a high-level signal is input to the external pin (ADTRG0 in unit 0; ADTRG1 in unit 1), write 1 to both the TRGE and EXTRG bits in ADCSR and drive the external pin signals low. With these settings, the scan conversion process starts on detection of the falling edge of ADTRG0 in unit 0 and ADTRG1 in unit 1. For this configuration, the pulse width of the low-level input must be at least 1.5 PCLKB clock cycles.

DBLANS[4:0] bits (Double Trigger Channel Select)

The DBLANS[4:0] bits select one of the channels for A/D conversion data duplication in double trigger mode. The A/D conversion results from the specified analog input channel are stored in A/D Data Register y when conversion is started by the first trigger, and in the A/D Data Duplexing Register when started by the second trigger. Table 42.4 shows the channel selection settings for double-triggered operation.

A/D-converted value addition/average mode can be set with double trigger mode for the channel selected in the DBLANS[4:0] bits by using the ADADS0 and ADADS1 registers. In double trigger mode, the channels selected in the ADANSA0 and ADANSA1 registers are invalid, and the channel selected in the DBLANS[4:0] bits is A/D-converted instead.

When double trigger mode is used in group scan mode, double-trigger control is only applied to group A and not to group B. This means that multi-channel analog input, temperature sensor output, and internal reference voltage can be selected for group B even in double trigger mode.

Only set the DBLANS[4:0] bits while the ADST bit is 0. Do not set them at the same time that you write 1 to the ADST bit.

To enter A/D-converted value addition/average mode when in double trigger mode, set the channel selected in the DBLANS[4:0] bits in the ADANSA0 and ADANSA1 registers.

Table 42.4 Relationship between DBLANS bit settings and double-trigger enabled channels

Unit 0		Unit 1	
DBLANS[4:0]	Duplication channel	DBLANS[4:0]	Duplication channel
00000	AN000	00000	AN100
00001	AN001	00001	AN101
00010	AN002	00010	AN102
00011	AN003	00011	-
00100	-	00100	-
00101	AN005	00101	AN105
00110	AN006	00110	AN106
00111	AN007	00111	AN107

Unit 0		Unit 1	
DBLANS[4:0]	Duplication channel	DBLANS[4:0]	Duplication channel
10000	AN016	10000	AN116
10001	AN017	10001	AN117
10010	AN018	10010	-
10011	-	10011	-
10100	AN020	10100	-

Note: A/D-converted data from the self-diagnosis function, temperature sensor output, and internal reference voltage cannot be used in double trigger mode.
Settings other than those listed in Table 42.4 are prohibited.

GBADIE bit (Group B Scan End Interrupt and ELC Event Enable)

The GBADIE bit enables or disables group B scan end interrupt (ADC12i_GBADI (i = 0, 1)) in group scan mode.

DBLE bit (Double Trigger Mode Select)

The DBLE bit selects or deselects double trigger mode. Double trigger mode can only be operated by the synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits.

对于单元0，i=0，对于单元1，i=1。

Note 1. 使用外部引脚（异步触发）启动AD转换：
在外部引脚（单元0中的ADTRG0；单元1中的ADTRG1）输入高电平信号后，将1写入ADCSR的TRGE和EXTRG位，并将外部引脚信号驱动为低电平。通过这些设置，扫描转换过程在检测到单元0中的ADTRG0和单元1中的ADTRG1的下降沿时开始。对于这种配置，低电平输入的脉冲宽度必须至少为1.5个PCLKB时钟周期。

DBLANS[4:0]位（双触发通道选择）

DBLANS[4:0]位选择通道之一，用于双触发模式下的AD转换数据复制。指定模拟输入通道的AD转换结果在第一次触发开始转换时存储在AD数据寄存器y中，在第二次触发开始时存储在AD数据双工寄存器中。表42.4显示了双触发操作的通道选择设置。

D转换值加法平均模式可以设置为双触发模式，用于在
DBLANS[4:0]位通过使用ADADS0和ADADS1寄存器。在双触发模式下，ADANSA0和ADANSA1寄存器中选择的通道无效，DBLANS[4:0]位中选择的通道改为AD转换。

在组扫描模式下使用双触发模式时，双触发控制只适用于A组，不适用于B组。这意味着B组可以选择多通道模拟输入、温度传感器输出和内部参考电压即使在双触发模式下。

仅在ADST位为0时设置DBLANS[4:0]位。不要在将1写入ADST位的同时设置它们。

要在双触发模式下进入AD转换值加法平均模式，请将
ADANSA0和ADANSA1寄存器中的DBLANS[4:0]位。

Table 42.4 DBLANS位设置与双触发启用通道之间的关系

Unit 0		Unit 1	
DBLANS[4:0]	复制通道	DBLANS[4:0]	复制通道
00000	AN000	00000	AN100
00001	AN001	00001	AN101

00011	AN003	00011	-
00100	-	00100	-
00101	AN005	00101	AN105
00110	AN006	00110	AN106
00111	AN007	00111	AN107

Unit 0		Unit 1	
DBLANS[4:0]	复制通道	DBLANS[4:0]	复制通道
10000	AN016	10000	AN116
10001	AN017	10001	AN117
10010	AN018	10010	-
10011	-	10011	-
10100	AN020	10100	-

Note: 自诊断功能、温度传感器输出和内部参考电压的D转换数据不能用于双触发模式。禁止在表42.4中列出以外的设置。

GBADIE位（B组扫描结束中断和ELC事件使能）

GBADIE位在组扫描模式下启用或禁用组B扫描结束中断(ADC12i_GBADI(i=0 1))。

DBLE位（双触发模式选择）

DBLE位选择或取消选择双触发模式。双触发模式只能通过在ADSTRGR.TRSA[5:0]位中选择的同步触发(ELC)操作。

Double-trigger operation is as follows:

1. The ADC12i_ADI (i = 0, 1) interrupt is not output on completion of the first conversion but on completion of the second conversion.
2. The A/D conversion results from the duplication channel (selected in DBLANS[4:0]) started by the first trigger are stored in A/D Data Register y and those started by the second trigger are stored in the A/D Data Duplexing Register.

When DBLE is set, selecting double trigger mode, the channels specified in the ADANSA0 and ADANSA1 registers are invalid. Double trigger mode is deselected by setting DBLE to 0. Setting DBLE to 1 again enables the same double-trigger operation described in 1. and 2. for first time scanning with the first trigger.

Do not select double trigger mode in continuous scan mode. Additionally, do not select double trigger mode for conversion of the temperature sensor output or internal reference voltage except for group B scan in group scan mode. Software triggering cannot be set in double trigger mode. Always clear the ADST bit to 0 before setting the DBLE bit. In other words, do not set the DBLE bit at that same time as writing 1 to the ADST bit.

EXTRG bit (Trigger Select)

The EXTRG bit selects the synchronous or asynchronous trigger as the trigger for starting A/D conversion.

TRGE bit (Trigger Start Enable)

The TRGE bit enables or disables A/D conversion by the synchronous and asynchronous triggers. In group scan mode, set this bit to 1.

ADCS[1:0] bits (Scan Mode Select)

The ADCS[1:0] bits select the scan mode.

In single scan mode, A/D conversion is performed for the analog inputs, up to a maximum of 11 channels in unit 0 and 8 channels in unit 1, and selected in the ADANSA0 and ADANSA1 registers in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, the scan conversion stops. When the temperature sensor output or internal reference voltage is selected, A/D conversion of the designated analog input channels is followed by A/D conversion of the temperature sensor output and the internal reference voltage, in that order.

In continuous scan mode, while the ADCSR.ADST bit is 1, A/D conversion is performed for the analog inputs selected in the ADANSA0 and ADANSA1 registers in ascending order of channel number, and when 1 cycle of A/D conversion completes for all the selected channels, A/D conversion is repeated from the first channel. If the ADCSR.ADST bit is set to 0 during continuous scan, A/D conversion stops even if scanning is in progress. When the temperature sensor output or internal reference voltage is selected, A/D conversion of the designated analog input channels is followed by A/D conversion of the temperature sensor output and the internal reference voltage, in that order.

In group scan mode, scanning is started by the synchronous trigger (ELC) selected in the TRSA[5:0] bits in ADSTRGR. A/D conversion is performed on the group A analog inputs, up to the maximum channels selected in the ADANSA0 and ADANSA1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion stops. On the same trigger, A/D conversion is also performed on the group B analog inputs, up to the maximum channels selected in the ADANSB0 and ADANSB1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion stops. If the conversion processes in group A and group B occur at the same time, those conversions cannot be controlled separately. In this case, set the Group A Priority Control Setting bit (ADGSPCR.PGS) in the A/D Group Scan Priority Control Register (ADGSPCR) to 1 to give priority to group A conversion. When the temperature sensor output or internal reference voltage is selected, A/D conversion of the designated analog input channels is followed by A/D conversion of the temperature sensor output and the internal reference voltage, in that order.

In group scan mode, select different channels and triggers for group A and group B. Clear the ADST bit to 0 before setting the ADCS[1:0] bits. In other words, do not set the ADCS[1:0] bits at the same time as writing 1 to the ADST bit.

双触发操作如下：

1. ADC12i_ADI(i=0 1)中断不会在第一次转换完成时输出，而是在第二次转换完成时输出。
2. 由第一个触发器启动的复制通道（在DBLANS[4:0]中选择）的AD转换结果存储在AD数据寄存器y中，由第二个触发器启动的数据存储在AD数据双工寄存器中。

设置DBLE时，选择双触发模式，ADANSA0和ADANSA1寄存器中指定的通道无效。通过将DBLE设置为0可以取消选择双触发模式。再次将DBLE设置为1可以启用与1.和2.中描述的相同的双触发操作，以使用第一个触发进行首次扫描。

在连续扫描模式下不要选择双触发模式。此外，不要选择双触发模式来转换温度传感器输出或内部参考电压，组扫描模式下的B组扫描除外。双触发模式下不能设置软件触发。在设置DBLE位之前，始终将ADST位清零。换言之，不要在将1写入ADST位的同时设置DBLE位。

EXTRG位（触发选择）

EXTRG位选择同步或异步触发作为启动AD转换的触发。

TRGE位（触发启动使能）

TRGE位通过同步和异步触发启用或禁用AD转换。在组扫描模式下，将此位设置为1。

ADCS[1:0]位（扫描模式选择）

ADCS[1:0]位选择扫描模式。

在单次扫描模式下，对模拟输入进行AD转换，单元0中最多11个通道，单元1中最多8个通道，并在ADANSA0和ADANSA1寄存器中按通道号的升序进行选择。当所有选定通道的1个AD转换周期完成时，扫描转换停止。WhenthetemperaturesensoroutputorinternalreferencevoltageisselectedADconversionofthedesignatedanaloginputchannelsisfollowedbyADconversionofthetemperaturesensoroutputandtheinternalreferencevoltage inthatorder.

在连续扫描模式下，当ADCSR.ADST位为1时，ADANSA0和ADANSA1寄存器中选择的模拟输入按通道编号升序执行AD转换，当所有选择的通道完成1个周期的AD转换时，从第一个通道重复D转换。如果在连续扫描期间ADCSR.ADST位设置为0，即使扫描正在进行，AD转换也会停止。WhenthetemperaturesensoroutputorinternalreferencevoltageisselectedADconversionofthedesignatedanaloginputchannelsisfollowedbyADconversionofthetemperaturesensoroutputandtheinternalreferencevoltage inthatorder.

在组扫描模式下，扫描由在ADSTRGR的TRSA[5:0]位中选择的同步触发(ELC)启动。AD转换在A组模拟输入上执行，直至在ADANSA0和ADANSA1寄存器中选择的最大通道，按通道编号的升序排列。当所有选定通道完成1个AD转换周期时，AD转换停止。在同一个触发器上，B组模拟输入也执行AD转换，直到ADANSB0和ADANSB1寄存器中选择的最大通道，按通道编号的升序排列。当所有选定通道完成1个AD转换周期时，AD转换停止。如果A组和B组中的转换过程同时发生，则不能单独控制这些转换。在这种情况下，设置AD组扫描优先级控制中的组A优先级控制设置位(ADGSPCR.PGS)

寄存器(ADGSPCR)为1以优先A组转换。WhenthetemperaturesensoroutputorinternalreferencevoltageisselectedADconversionofthedesignatedanaloginputchannelsisfollowedbyADconversionofthetemperaturesensoroutputandtheinternalreferencevoltage inthatorder.

在组扫描模式下，为A组和B组选择不同的通道和触发器。在设置ADCS[1:0]位之前将ADST位清零。换言之，不要在将1写入ADST位的同时设置ADCS[1:0]位。

Table 42.5 Selectable targets for A/D conversion depending on scan and double trigger mode settings

Scan mode setting	Double trigger mode setting	Targets for A/D conversion				
		Self-diagnosis	Analog input (including group A)	Analog input (group B)	Temperature sensor output	Internal reference voltage
Single scan	DBLE = 0	✓	✓	-	✓	✓
	DBLE = 1	-	✓ (1 ch only)	-	-	-
Continuous scan	DBLE = 0	✓	✓	-	✓	✓
	DBLE = 1	-	-	-	-	-
Group scan	DBLE = 0	✓	✓	✓	✓	✓
	DBLE = 1	-	✓ (1 ch only)	✓	✓	✓

✓: Selectable. -: Not selectable.

ADST bit (A/D Conversion Start)

The ADST bit starts or stops the A/D conversion process. Before setting the ADST bit to 1, set the A/D conversion clock, conversion mode, and analog input for the conversion target.

[Setting conditions]

- 1 is written by software
- The synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits is detected when ADCSR.EXTRG is 0 and ADCSR.TRGE is 1
- The synchronous trigger (ELC) selected in the ADSTRGR.TRSB[5:0] bits is detected when ADCSR.TRGE is set to 1 in group scan mode
- The asynchronous trigger is detected when the ADCSR.TRGE and ADCSR.EXTRG bits are set to 1 and the ADSTRGR.TRSA[5:0] bits are set to 000000b
- When group A priority control operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), the ADGSPCR.GBRP bit is set to 1, and each time A/D conversion of group B starts.

[Clearing conditions]

- 0 is written by software
- The A/D conversion of all the selected channels, the temperature sensor output or the internal reference voltage completes in single scan mode
- Group A scan completes in group scan mode
- Group B scan completes in group scan mode
- When group A priority control operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), the ADGSPCR.GBRP bit is set to 1, and each time a scanning of group B completes.

Note: When group A priority control operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), do not set the ADST bit to 1.

Note: When group A priority control operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), do not set the ADST bit to 0. When forcing A/D conversion to terminate, follow the procedure for clearing the ADST bit.

Note: If the single scan continuous function is used (ADGSPCR.GBRP = 1) when the group priority operation mode is enabled (ADCSR.ADCS[1:0] = 01b and ADGSPCR.PGS = 1), the ADST bit is retained to 1.

Table 42.5 AD转换的可选目标取决于扫描和双触发模式设置

扫描模式设置	双触发模式设置	AD转换的目标				
		Self-diagnosis	模拟量输入（包括A组）	模拟输入（B组）	温度传感器输出	内部参考电压
单次扫描	DBLE = 0	✓	✓	-	✓	✓
	DBLE = 1	-	✓ (1 ch only)	-	-	-
连续扫描	DBLE = 0	✓	✓	-	✓	✓
	DBLE = 1	-	-	-	-	-
组扫描	DBLE = 0	✓	✓	✓	✓	✓
	DBLE = 1	-	✓ (1 ch only)	✓	✓	✓

：可选择。-：不可选择。

ADST位（AD转换开始）

ADST位启动或停止AD转换过程。在将ADST位设置为1之前，设置转换目标的AD转换时钟、转换模式和模拟输入。

[Setting conditions]

- 1由软件编写
- 当ADCSR.EXTRG为0且ADCSR.TRGE为1时，检测到在ADSTRGR.TRSA[5:0]位中选择的同步触发(ELC)
- 在组扫描模式下，当ADCSR.TRGE设置为1时，检测到在ADSTRGR.TRSB[5:0]位中选择的同步触发(ELC)
- 当ADCSR.TRGE和ADCSR.EXTRG位设置为1并且ADSTRGR.TRSA[5:0]位设置为000000b
- 当A组优先控制操作模式使能时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），ADGSPCR.GBRP位设置为1，并且每次B组的AD转换开始。

[Clearing conditions]

- 0是软件写的
- 所有选定通道的AD转换、温度传感器输出或内部参考电压在单次扫描模式下完成
- A组扫描在组扫描模式下完成
- B组扫描在组扫描模式下完成
- 当启用A组优先控制操作模式时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），ADGSPCR.GBRP位设置为1，并且每次完成B组扫描。

Note: 当启用A组优先控制操作模式时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），请勿将ADST位设置为1。

Note: 当启用A组优先控制操作模式时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），请勿将ADST位设置为0。当强制AD转换终止时，请遵循以下步骤清除ADST位。

Note: 如果在启用组优先操作模式（ADCSR.ADCS[1:0]=01b和ADGSPCR.PGS=1）时使用单次扫描连续功能（ADGSPCR.GBRP=1），则ADST位保持为1。

RA生态工作室

42.2.4 A/D Channel Select Register A0 (ADANSA0)

Address(es): ADC120.ADANSA0 4005 C004h, ADC121.ADANSA0 4005 C204h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ANSA07	ANSA06	ANSA05	—	ANSA03	ANSA02	ANSA01	ANSA00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	ANSA03 to ANSA00	A/D Conversion Channels Select	0: Do not select associated input channel 1: Select associated input channel.	R/W
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b5	ANSA07 to ANSA05	A/D Conversion Channels Select	0: Do not select associated input channel 1: Select associated input channel.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

ANSAn bits (n = 00 to 03, 05 to 07) (A/D Conversion Channels Select)

The ADANSA0.ANSAn bits select or deselect the analog input channels for A/D conversion for AN000 to AN003, AN005 to AN007 (unit 0) and AN100 to AN102, AN105 to AN107 (unit 1). The channels and the number of channels can be set arbitrarily. In unit 0, the ANSA00 bit is associated with AN000 and the ANSA07 bit with AN007. In unit 1, the ANSA00 bit is associated with AN100 and the ANSA07 bit with AN107.

In double trigger mode, the channel selected in the ADANSA0 register is invalid, and the channel selected in the ADCSR.DBLANS[4:0] bits is selected in group A instead.

In group scan mode, do not select the channels specified in A/D Channel Select Register B0 (ADANSB0) and A/D Channel Select Register B1 (ADANSB1). Only set the ADANSA0 register while the ADCSR.ADST bit is 0.

42.2.5 A/D Channel Select Register A1 (ADANSA1)

Address(es): ADC120.ADANSA1 4005 C006h, ADC121.ADANSA1 4005 C206h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	ANSA20	—	ANSA18	ANSA17	ANSA16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W

b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	ANSA20	A/D Conversion Channel Select	0: Do not select associated input channel 1: Select associated input channel.	R/W
b15 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

ANSAn bits (n = 16 to 18, 20) (A/D Conversion Channels Select)

The ADANSA1.ANSAn bits select or deselect the analog input channels for A/D conversion for AN016 to AN018, AN020 (unit 0) and AN116, AN117 (unit 1). The channels and the number of channels can be set arbitrarily. In unit 0, the ANSA16 bit is associated with AN016 and the ANSA20 bit with AN020. In unit 1, the ANSA16 bit is associated with AN116 and the ANSA17 bit with AN117.

In double trigger mode, the ANSA1[15:0] bits are invalid, and the channel selected in the ADCSR.DBLANS[15:0] bits is selected in group A instead.

42.2.4 AD通道选择寄存器A0(ADANSA0)

Address(es): ADC120.ADANSA0 4005 C004h, ADC121.ADANSA0 4005 C204h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ANSA07	ANSA06	ANSA05	—	ANSA03	ANSA02	ANSA01	ANSA00
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	ANSA03 to ANSA00	AD转换通道选择	0：不选择关联输入通道1：选择关联输入通道。	R/W
b4	—	Reserved	该位读取为0。写入值应为0。	R/W
b7 to b5	ANSA07 to ANSA05	AD转换通道选择	0：不选择关联输入通道1：选择关联输入通道。	R/W
b15 to b8	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ANSAN位（n=00到03、05到07）（AD转换通道选择）

ADANSA0.ANSAN位选择或取消选择AN000到AN003的AD转换的模拟输入通道，AN005至AN007（单元0）和AN100至AN102、AN105至AN107（单元1）。通道和通道数可以任意设置。在单元0中，ANSA00位与AN000相关联，ANSA07位与AN007相关联。在单元1中，ANSA00位与AN100相关联，ANSA07位与AN107相关联。

双触发模式下，ADANSA0寄存器中选择的通道无效，在ADANSA0寄存器中选择的通道无效。改为在A组中选择ADCSR.DBLANS[4:0]位。

在组扫描模式下，不要选择AD通道选择寄存器B0(ADANSB0)和AD中指定的通道通道选择寄存器B1(ADANSB1)。仅在ADCSR.ADST位为0时设置ADANSA0寄存器。

42.2.5 AD通道选择寄存器A1(ADANSA1)

Address(es): ADC120.ADANSA1 4005 C006h, ADC121.ADANSA1 4005 C206h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

ANSBn位（n=16至18、20）（AD转换通道选择）

ADANSB1.ANSBn位在组扫描模式下选择B组中AN016到AN018、AN020（单元0）和AN116、AN117（单元1）的AD转换的模拟输入通道。ADANSB1寄存器仅用于组扫描模式，不用于任何其他模式。排除A组中指定的通道（与A组关联的通道，在ADANSA0和ADANSA1寄存器以及双触发模式下的ADCSR.DBLANS[4:0]位中选择），选择的通道和通道数都是放。

In unit 0, the ANSB16 bit is associated with AN016 and the ANSB20 bit with AN020. In unit 1, the ANSB16 bit is associated with AN116 and the ANSB17 bit with AN117. Only set the ADANSB1 register bits while the ADST bit is 0.

42.2.8 A/D-Converted Value Addition/Average Channel Select Register 0 (ADADS0)

Address(es): ADC120.ADADS0 4005 C008h, ADC121.ADADS0 4005 C208h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ADS07	ADS06	ADS05	—	ADS03	ADS02	ADS01	ADS00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	ADS03 to ADS00	A/D-Converted Value Addition/Average Channel Select	0: Do not select associated input channel 1: Select associated input channel.	R/W
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b5	ADS07 to ADS05	A/D-Converted Value Addition/Average Channel Select	0: Do not select associated input channel 1: Select associated input channel.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

ADSn bits (n = 00 to 03, 05 to 07) (A/D-Converted Value Addition/Average Channel Select)

When the ADSn bit with the same number as the A/D-converted channel selected in the ANSAn bits (n = 00 to 03, 05 to 07) in ADANSA0, or the ADCSR.DBLANS[4:0] bits and the ANSBn bits (n = 00 to 03, 05 to 07) in ADANSB0 is set to 1, A/D conversion of the analog input of the selected channels is performed successively 1 to 16 times, as specified in the ADC[2:0] bits in ADADC. When the ADADC.AVEE bit is 0, the value obtained by addition is stored in the A/D data register. When the ADADC.AVEE bit is 1, the mean value of the results obtained by addition is stored in the A/D data register. For A/D-converted channels for which addition or average mode is not selected, a normal one-time conversion is executed, and the conversion result is stored in the A/D data register.

In unit 0, the ADS00 bit is associated with AN000 and the ADS07 bit with AN007. In unit 1, the ADS00 bit is associated with AN100 and the ADS07 bit with AN107.

Only set the ADADS0 register bits while the ADCSR.ADST bit is 0.

42.2.9 A/D-Converted Value Addition/Average Channel Select Register 1 (ADADS1)

Address(es): ADC120.ADADS1 4005 C00Ah, ADC121.ADADS1 4005 C20Ah

b15 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ADSn位（n=16到18、20）（AD转换的增值平均通道选择）

当ADSn位与在ADANSA1的ANSAn位（n=16到18、20）或ADCSR.DBLANS[4:0]和ANSBn位（n=16到18 20)在ADANSB1中设置为1 AD转换

of the analog input of the selected channels is performed successively 1 to 16 times, as specified in the ADC[2:0] bits in ADADC. When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is stored in the A/D data register. When the ADADC.AVEE bit is 1, the mean value of the results obtained by addition is stored in the A/D data register. For A/D-converted channels for which addition/average mode is not selected, a normal one-time conversion is executed and the conversion result is stored in the A/D data register.

In unit 0, the ADS16 bit is associated with AN016 and the ADS20 bit with AN020. In unit 1, the ADS16 bit is associated with AN116 and the ADS17 bit with AN117. Only set the ADADS1 register while the ADCSR.ADST bit is 0.

Figure 42.3 shows a scanning operation sequence in which both the ADADS0.ADS02 and ADS07 bits are set to 1.

In this example, addition mode is selected (ADADS.AVEE = 0), the time conversion is set to 4 (ADADC.ADC[1:0] = 11b), and the AN000 to AN003 and AN005 to AN007 channels are selected (ADANSA0.ANSA0[15:0] = 00EFh) in continuous scan mode (ADCSR.ADCS[1:0] = 10b). The conversion process begins with AN000. The AN002 conversion is performed successively 4 times, and the added (integrated) value is returned to A/D data register ADDR2. Next, the AN003 conversion process starts. The AN007 conversion is performed successively 4 times and the added (integrated) value is returned to A/D data register, ADDR7. After conversion of AN007, the conversion operation is once again performed in the same sequence from AN000.

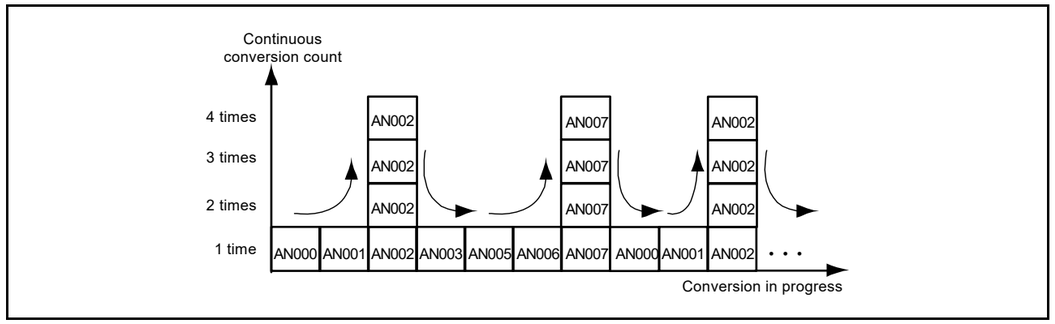

Figure 42.3 Scan conversion sequence with ADADC.ADC[2:0] = 011b, ADADS0.ADS02 = 1, and ADS07 = 1

42.2.10 A/D-Converted Value Addition/Average Count Select Register (ADADC)

Address(es): ADC120.ADADC 4005 C00Ch, ADC121.ADADC 4005 C20Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	AVEE	—	—	—	—	ADC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	ADC[2:0]	Count Select	b2 b0 0 0: 0: 1-time conversion (no addition, same as normal conversion) 0 0: 1: 2 time conversion (one addition) 0 1: 0: 3-time conversion (two additions) 0 1: 1: 4 time conversion (three additions) 1 0: 1: 16-time conversion (15 additions). Other settings are prohibited.	R/W
b6 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	AVEE	Average Mode Enable	0: Disable average mode*1 1: Enable average mode.*2	R/W

Note 1. When average mode is deselected by setting the ADADC.AVEE bit to 0, set addition count to 1, 2, 3, 4 or 16-time conversion. 16-time conversion can only be used with 12-bit accuracy selected.

Note 2. When average mode is selected by setting the ADADC.AVEE bit to 1, set the addition count to 1-, 2-, or 4-time conversion. Do not set the addition count to 3- or 16-time conversion (ADC[2:0] = 010b or 101b).

按照ADADC中的ADC[2:0]位的规定，对选定通道的模拟输入连续执行1到16次。当ADADC.AVEE位为0时，加法（积分）得到的值存储在AD数据寄存器中。当ADADC.AVEE位为1时，加法所得结果的平均值存储在AD数据寄存器中。对于未选择加法平均模式的AD转换通道，将执行正常的一次性转换，并将转换结果存储在AD数据寄存器中。

在单元0中，ADS16位与AN016相关联，ADS20位与AN020相关联。在单元1中，ADS16位与AN116相关联，ADS17位与AN117相关联。仅在ADCSR.ADST位为0时设置ADADS1寄存器。

图42.3显示了扫描操作序列，其中ADADS0.ADS02和ADS07位都设置为1。

在本例中，选择了加法模式（ADADS.AVEE=0），时间转换设置为4（ADADC.ADC[1:0]=11b），选择了AN000到AN003和AN005到AN007通道（ADANSA0.ANSA0[15:0]=00EFh)处于连续扫描模式(ADCSR.ADCS[1:0]=10b)。转换过程从AN000开始。AN002转换连续执行4次，相加（积分）的值返回到AD数据寄存器ADDR2。接下来，AN003转换过程开始。AN007转换连续执行4次，相加（积分）的值返回到AD数据寄存器ADDR7。在AN007转换后，转换操作从AN000以相同的顺序再次执行。

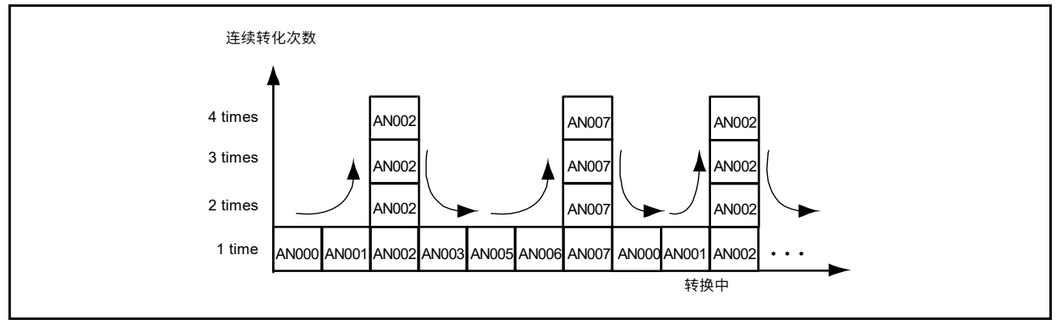

Figure 42.3 使用ADADC.ADC[2:0]=011b、ADADS0.ADS02=1和ADS07=1的扫描转换序列

42.2.10 D转换值加法平均计数选择寄存器(ADADC)

Address(es): ADC120.ADADC 4005 C00Ch, ADC121.ADADC 4005 C20Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	AVEE	—	—	—	—	ADC[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	ADC[2:0]	计数选择	b2 b0 0 0: 0：1次转换（不加，同普通转换） 0 0: 1：2时间转换（一加） 0 1: 0: 3-time conversion (two additions) 0 1: 1：4时间转换（三加法） 01：16次转换（15次加法）。禁止其他设置。	R/W
b6 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	AVEE	平均模式启用	0：禁用平均模式*11：启用平均模式。*2	R/W

Note 1. 当通过将ADADC.AVEE位设置为0取消选择平均模式时，将加法计数设置为1、2、3、4或16次转换。16次转换只能在选择12位精度的情况下使用。

Note 2. 当通过将ADADC.AVEE位设置为1来选择平均模式时，将加法计数设置为1次、2次或4次转换。不要将加法计数设置为3次或16次转换（ADC[2:0]=010b或101b）。

ADC[2:0] bits (Count Select)

The ADC[2:0] bits set the count for all channels for which A/D conversion and addition/average mode are selected, including the channels selected in double trigger mode in the ADCSR.DBLANS[4:0] bits. The count also applies to A/D conversion of temperature sensor output and internal reference voltage.

When average mode is selected by setting the ADADC.AVEE bit to 1, do not set the count to 3-time conversion (ADADC.ADC[2:0] = 010b). Additionally, the combination of 16-time conversion (ADADC.ADC[2:0] = 101b) with a conversion accuracy setting of 8 or 10 bits (ADCER.ADPRC[1:0] = 10b or 01b) is a prohibited setting, as described in section 42.2.2.

Only set the ADC[2:0] bits while the ADCSR.ADST bit is 0. When self-diagnosis is executed (ADCER.DIAGM = 1), do not set the ADC[2:0] bits to any value other than 000b. When the conversion accuracy is 8 or 10 bits (ADCER.ADPRC[1:0] = 10b or 01b), do not set the ADC[2:0] bits to 101b.

AVEE bit (Average Mode Enable)

The AVEE bit selects addition or average mode for all channels for which A/D conversion and addition/average mode are selected, including the channels selected in double trigger mode in the ADCSR.DBLANS[4:0] bits, temperature sensor output, and internal reference voltage.

When average mode is selected by setting the ADADC.AVEE bit to 1, do not set the addition count to 3-time conversion (ADADC.ADC[2:0] = 010b).

Only set the AVEE bits while the ADCSR.ADST bit is 0.

42.2.11 A/D Control Extended Register (ADCER)

Address(es): ADC120.ADCER 4005 C00Eh, ADC121.ADCER 4005 C20Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b15	ADRFMT	A/D Data Register Format Select	0: Select flush-right for the A/D data register format 1: Select flush-left for the A/D data register format.	R/W

Note 1. The reference voltage refers to VREFH0 for unit 0 and to VREFH for unit 1.

ADC[2:0]位（计数选择）

ADC[2:0]位设置选择AD转换和加法平均模式的所有通道的计数，包括在ADCSR.DBLANS[4:0]位中以双触发模式选择的通道。该计数也适用于温度传感器输出和内部参考电压的AD转换。

当通过将ADADC.AVEE位设置为1来选择平均模式时，不要将计数设置为3次转换(ADADC.ADC[2:0]=010b)。此外，16次转换(ADADC.ADC[2:0]=101b)与8位或10位转换精度设置(ADCER.ADPRC[1:0]=10b或01b)的组合是禁止设置，如第42.2.2节所述。

仅在ADCSR.ADST位为0时设置ADC[2:0]位。执行自诊断时(ADCER.DIAGM=1)，请勿将ADC[2:0]位设置为000b以外的任何值.当转换精度为8位或10位时（ADCER.ADPRC[1:0]=10b或01b），请勿将ADC[2:0]位设置为101b。

AVEE位（平均模式启用）

AVEE位为所有选择AD转换和加法平均模式的通道选择加法或平均模式，包括在ADCSR.DBLANS[4:0]位、温度传感器输出和内部参考电压中选择双触发模式的通道.

当通过将ADADC.AVEE位设置为1来选择平均模式时，不要将加法计数设置为3次转换(ADADC.ADC[2:0]=010b)。

仅在ADCSR.ADST位为0时设置AVEE位。

42.2.11 AD控制扩展寄存器(ADCER)

Address(es): ADC120.ADCER 4005 C00Eh, ADC121.ADCER 4005 C20Eh

b15	ADRFMT	AD数据寄存器格式选择	0：AD数据寄存器格式选择flush-right1：AD数据寄存器格式选择flush-left。	R/W

Note 1. 参考电压是指单元0的VREFH0和单元1的VREFH。

ADPRC[1:0] bits (A/D Conversion Accuracy Specify)

The ADPRC[1:0] bits set the A/D conversion accuracy to 8-, 10-, or 12-bit accuracy. Changing the A/D conversion accuracy also changes the bit width of valid data stored in the result register and the A/D conversion time. For details, see section 42.3.6, Analog Input Sampling and Scan Conversion Time.

Only set the ADPRC[1:0] bits while the ADCSR.ADST bit is 0.

ACE bit (A/D Data Register Automatic Clearing Enable)

The ACE bit enables or disables automatic clearing (all 0s) of ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, or ADOCDR after any of these registers is read by the CPU, DTC, or DMAC. Automatic clearing of the A/D data registers enables detection of failures that do not update the A/D data registers.

DIAGVAL[1:0] bits (Self-Diagnosis Conversion Voltage Select)

The DIAGVAL[1:0] bits select the voltage value used in self-diagnosis fixed voltage mode. For details, see the ADCER.DIAGLD bit description.

Do not execute self-diagnosis by setting the ADCER.DIAGLD bit to 1 when the ADCER.DIAGVAL[1:0] bits are set to 00b.

DIAGLD bit (Self-Diagnosis Mode Select)

The DIAGLD bit selects whether the three voltage values are rotated, or fixed voltage is used in self-diagnosis. Setting this bit to 0 allows conversion of the voltages in rotation mode where 0 V, the reference power supply × 1/2, and the reference power supply are converted, in that order. After reset, when the self-diagnosis voltage rotation mode is selected, self-diagnosis is executed from 0 V. The fixed voltage specified in the ADCER.DIAGVAL[1:0] bits is converted when self-diagnosis fixed voltage mode is selected. In self-diagnosis voltage rotation mode, the self-diagnosis voltage value does not return to 0 when scan conversion completes. When scan conversion restarts, rotation starts at the voltage value following the previous value. If fixed mode is switched to rotation mode, rotation starts at the fixed voltage value.

Only set the DIAGLD bit while the ADCSR.ADST bit is 0.

DIAGM bit (Self-Diagnosis Enable)

The DIAGM bit enables or disables self-diagnosis. Self-diagnosis is used to detect a failure of the ADC12. In self-diagnosis mode, one of the internally generated voltage values (0, the reference power supply × 1/2, or the reference power supply) is converted. When conversion completes, information on the converted voltage and the conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). ADRD can be read by software to determine whether the conversion result falls within the normal range (normal) or not (abnormal). Self-diagnosis is executed once at the beginning of each scan, and one of the three voltages is converted. When the double trigger mode is set (ADCSR.DBLE = 1), always deselect self-diagnosis (DIAGM = 0). When self-diagnosis is selected in group scan mode, self-diagnosis is executed separately on group A and group B.

Only set the DIAGM bit while the ADCSR.ADST bit is 0.

ADRFMT bit (A/D Data Register Format Select)

The ADRFMT bit specifies flush-right or flush-left for the data to be stored in ADDRy, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, ADOCDR, ADCMPDR0/1, ADWINLLB, ADWINULB, or ADRD.

Only set the ADRFMT bit when the ADCSR.ADST bit is 0.

ADPRC[1:0]位（AD转换精度指定）

ADPRC[1:0]位将AD转换精度设置为8位、10位或12位精度。更改AD转换精度也会更改存储在结果寄存器中的有效数据的位宽和AD转换时间。有关详细信息，请参见第42.3.6节，模拟输入采样和扫描转换时间。

仅在ADCSR.ADST位为0时设置ADPRC[1:0]位。

ACE位（AD数据寄存器自动清除使能）

ACE位启用或禁用ADDRy、ADRD、ADDBLDR、ADDBLDRA、
在CPU、DTC或DMAC读取任何这些寄存器之后的ADDBLDRB、ADTSDR或ADOCDR。自动清除AD数据寄存器可以检测不更新AD数据寄存器的故障。

DIAGVAL[1:0]位（自诊断转换电压选择）

DIAGVAL[1:0]位选择用于自诊断固定电压模式的电压值。有关详细信息，请参阅
ADCER.DIAGLD位描述。

当ADCER.DIAGVAL[1:0]位设置为00b时，不要通过将ADCER.DIAGLD位设置为1来执行自诊断。

DIAGLD位（自诊断模式选择）

DIAGLD位选择是轮换三个电压值，还是使用固定电压进行自诊断。将此位设置为0允许在旋转模式下转换电压，其中0V、参考电源×12和参考电源按此顺序转换。Afterreset whentheself-diagnosisvoltagerotationmodeisselected self-diagnosisisexecutedfrom0V.ThefixedvoltagespecifiedintheADCER.DIAGVAL[1:0]bitsisconvertedwhenself-diagnosisfixedvoltagemodeisselected.在自诊断电压旋转模式下，扫描转换完成时自诊断电压值不会返回0。扫描转换重新开始时，从前一个值之后的电压值开始旋转。如果将固定模式切换到旋转模式，则从固定电压值开始旋转。

仅在ADCSR.ADST位为0时设置DIAGLD位。

DIAGM位（自诊断使能）

DIAGM位启用或禁用自诊断。自诊断用于检测ADC12的故障。在自诊断模式下，转换内部产生的电压值之一（0，参考电源×12，或参考电源）。转换完成后，转换电压和转换结果的信息存储在AD自诊断数据寄存器(ADRD)中。ADRD可以通过软件读取来判断转换结果是否在正常范围内（正常）或不在（异常）范围内。自诊断在每次扫描开始时执行一次，并转换三个电压之一。当设置双触发模式(ADCSR.DBLE=1)时，始终取消选择自诊断(DIAGM=0)。在组扫描模式下选择自诊断时，对A组和B组分别进行自诊断。

仅在ADCSR.ADST位为0时设置DIAGM位。

ADRFMT位（AD数据寄存器格式选择）

ADRFMT位指定要存储在ADDRy、ADDBLDR、ADDBLDRA、
ADDBLDRB, ADTSDR, ADOCDR, ADCMPDR0/1, ADWINLLB, ADWINULB, or ADRD.

仅当ADCSR.ADST位为0时才设置ADRFMT位。

42.2.12 A/D Conversion Start Trigger Select Register (ADSTRGR)

Address(es): ADC120.ADSTRGR 4005 C010h, ADC121.ADSTRGR 4005 C210h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	TRSA[5:0]						—	—	TRSB[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	TRSB[5:0]	A/D Conversion Start Trigger Select for Group B	These bits specify the A/D conversion start trigger for group B in group scan mode	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13 to b8	TRSA[5:0]	A/D Conversion Start Trigger Select	These bits specify the A/D conversion start trigger in single scan mode and continuous mode. In group scan mode, the A/D conversion start trigger for group A is selected.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TRSB[5:0] bits (A/D Conversion Start Trigger Select for Group B)

The TRSB[5:0] bits select the trigger to start scanning of the analog input selected in group B. The TRSB[5:0] bits must only be set in group scan mode and are not used in any other scan mode. For the scan conversion start trigger for group B, setting a software trigger or an asynchronous trigger is prohibited. In group scan mode, set the TRSB[5:0] bits to a value other than 000000b, and set the ADCSR.TRGE bit to 1.

When group A is given priority in group scan mode, setting the ADGSPCR.GBRP bit to 1 allows group B to continuously operate in single scan mode. When setting the ADGSPCR.GBRP bit to 1, set the TRSB[5:0] bits to 3Fh. The issuance period for a conversion trigger must be more than or equal to the actual scan conversion time (t_{SCAN}). If the issuance period is less than t_{SCAN}, A/D conversion by the trigger might have no effect.

When the trigger from a module operated at 120 MHz (GPT) is selected as an A/D conversion start trigger, a delay for synchronization processing occurs. For details, see section 42.3.6, Analog Input Sampling and Scan Conversion Time.

Table 42.6 lists the A/D conversion startup sources selected in the TRSB[5:0] bits.

TRSA[5:0] bits (A/D Conversion Start Trigger Select)

The TRSA[5:0] bits select the trigger to start A/D conversion in single scan mode and continuous scan mode. In group scan mode, the trigger to start scanning of the analog input selected in group A is selected. When scanning is executed in group scan mode or double trigger mode, setting a software trigger or an asynchronous trigger is prohibited.

When using a synchronous trigger (ELC) as the A/D conversion start source, set the TRGE bit in ADCSR to 1 and the EXTRG bit in ADCSR to 0.

When using the asynchronous trigger (ADTRGn), set the TRGE bit in ADCSR to 1 and the EXTRG bit in ADCSR to 1.

The software trigger (ADCSR.ADST) is enabled regardless of the settings in the ADCSR.TRGE bit, the ADCSR.EXTRG bit, or the TRSA[5:0] bits. The issuance period for a conversion trigger must be more than or equal to the actual scan conversion time (t_{SCAN}). If the issuance period is less than t_{SCAN}, A/D conversion by the trigger might have no effect.

When the trigger from a module operated at 120 MHz (GPT) is selected as an A/D conversion start trigger, a delay period for synchronization processing occurs. For details, see section 42.3.6, Analog Input Sampling and Scan Conversion Time.

Table 42.7 lists the A/D conversion start sources selected in the TRSA[5:0] bits.

42.2.12 AD转换开始触发选择寄存器(ADSTRGR)

Address(es): ADC120.ADSTRGR 4005 C010h, ADC121.ADSTRGR 4005 C210h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	TRSA[5:0]						—	—	TRSB[5:0]					
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	TRSB[5:0]	B组的AD转换开始触发选择	这些位指定组扫描模式下B组的AD转换启动触发	R/W
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b13 to b8	TRSA[5:0]	AD转换开始触发选择	这些位指定单次扫描模式和连续模式下的AD转换启动触发。在组扫描模式下，选择A组的AD转换启动触发。	R/W
b15, b14	—	Reserved	这些位被读取为0。写入值应为0。	R/W

TRSB[5:0]位（B组的AD转换开始触发选择）

TRSB[5:0]位选择触发以开始扫描组B中选择的模拟输入。TRSB[5:0]位只能在组扫描模式下设置，不得用于任何其他扫描模式。对于B组的扫描转换开始触发，禁止设置软件触发或异步触发。在组扫描模式下，将TRSB[5:0]位设置为000000b以外的值，并将ADCSR.TRGE位设置为1。

当A组在组扫描模式下具有优先权时，将ADGSPCR.GBRP位设置为1允许B组在单次扫描模式下连续工作。将ADGSPCR.GBRP位设置为1时，将TRSB[5:0]位设置为3Fh。转换触发的发布周期必须大于或等于实际扫描转换时间(tSCAN)。如果发行周期小于tSCAN，触发器的AD转换可能无效。

当从120MHz（GPT）操作的模块中选择触发器作为AD转换启动触发器时，会发生同步处理的延迟。有关详细信息，请参见第42.3.6节，模拟输入采样和扫描转换时间。

表42.6列出了在TRSB[5:0]位中选择的AD转换启动源。

TRSA[5:0]位（AD转换开始触发选择）

TRSA[5:0]位选择触发以在单次扫描模式和连续扫描模式下启动AD转换。在组扫描模式下，选择触发开始扫描A组中选择的模拟输入。在组扫描模式或双触发模式下执行扫描时，禁止设置软件触发或异步触发。

当使用同步触发(ELC)作为AD转换启动源时，将ADCSR中的TRGE位设置为1，然后ADCSR中的EXTRG位为0。

使用异步触发(ADTRGn)时，将ADCSR中的TRGE位设置为1，并将ADCSR中的EXTRG位设置为1。

无论ADCSR.TRGE位的设置如何，软件触发(ADCSR.ADST)都被启用，ADCSR.EXTRG位或TRSA[5:0]位。转换触发的发布周期必须大于或等于实际扫描转换时间(tSCAN)。如果发行周期小于tSCAN，触发器的AD转换可能无效。

当从120MHz（GPT）操作的模块中选择触发器作为AD转换启动触发器时，会发生同步处理的延迟期。有关详细信息，请参见第42.3.6节，模拟输入采样和扫描转换时间。

表42.7列出了在TRSA[5:0]位中选择的AD转换起始源。

b11	OCSB	Internal Reference Voltage A/D Conversion Select for group B	Selection for group B in group scan mode: 0: Disable A/D conversion of internal reference voltage 1: Enable A/D conversion of internal reference voltage.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TSSAD bit (Temperature Sensor Output A/D-Converted Value Addition/Average Mode Select)

When the TSSAD bit is set to 1, A/D conversion of the temperature sensor output is selected and performed successively for the number of times specified in the ADC[2:0] bits in ADADC. The maximum addition count depends on the conversion accuracy, see section 42.2.2, A/D Self-Diagnosis Data Register (ADRD). When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is returned to the A/D Temperature sensor Data Register (ADTSDR). When the ADADC.AVEE bit is 1, the mean value is returned to ADTSDR.

Only set the TSSAD bit while the ADCSR.ADST bit is 0.

OCSAD bit (Internal Reference Voltage A/D-Converted Value Addition/Average Mode Select)

When the OCSAD bit is set to 1, A/D conversion of the internal reference voltage is selected and performed successively the number of times specified in the ADC[2:0] bits in ADADC. The maximum addition count differs depending on the conversion accuracy as seen in 42.2.2 A/D Self-Diagnosis Data Register (ADRD). When the ADADC.AVEE bit is 0, the value obtained by addition is returned to the A/D Internal Reference Voltage Data Register (ADOCDR). When the ADADC.AVEE bit is 1, the mean value is returned to ADOCDR.

Only set the OCSAD bit while the ADCSR.ADST bit is 0.

TSSA bit (Temperature Sensor Output A/D Conversion Select)

The TSSA bit selects A/D conversion of the temperature sensor output for group A in single scan mode, continuous scan mode, or group scan mode. When A/D conversion of the temperature sensor output is selected and performed, set the ADCSR.DBLE bit to 0.

Only set the TSSA bit when the ADCSR.ADST bit is 0.

OCSA bit (Internal Reference Voltage A/D Conversion Select)

The OCSA bit selects A/D conversion of the internal reference voltage for group A in single scan mode, continuous scan mode, or group scan mode. When A/D conversion of the internal reference voltage is selected and performed, set the ADCSR.DBLE bit to 0.

Only set the OCSA bit while the ADCSR.ADST bit is 0. In addition, wait for 400 ns or more after the OCSA bit is set to 1 before starting A/D conversion.

TSSB bit (Temperature Sensor Output A/D Conversion Select for group B)

The TSSB bit selects A/D conversion of the temperature sensor output for group B in group scan mode.

Only set the TSSB bit while the ADCSR.ADST bit is 0. Do not set the TSSB bit to 1 while the TSSA bit is 1.

OCSB bit (Internal Reference Voltage A/D Conversion Select for group B)

The OCSB bit selects A/D conversion of the internal reference voltage for group B in group scan mode.

Only set the OCSB bit while the ADCSR.ADST bit is 0. Do not set the OCSB bit to 1 while the OCSA bit is 1. In addition, start the A/D conversion after waiting for 400 ns or more after the OCSB bit is set to 1.

Bit	Symbol	位名称	Description	R/W
b11	OCSB	内部参考电压AD B组转换选择	组扫描模式下B组选择：0：禁止内部参考电压AD转换1 ：允许内部参考电压AD转换。	R/W
b15 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W

TSSAD位（温度传感器输出AD转换值加法平均模式选择）

当TSSAD位设置为1时，温度传感器输出的AD转换被选择并连续执行ADADC的ADC[2:0]位指定的次数。最大加法计数取决于转换精度，请参见第42.2.2节，AD自诊断数据寄存器(ADRD)。当ADADC.AVEE位为0时，通过加法（积分）获得的值返回到AD温度传感器数据寄存器(ADTSDR)。当ADADC.AVEE位为1时，平均值返回给ADTSDR。

仅在ADCSR.ADST位为0时设置TSSAD位。

OCSAD位（内部参考电压AD转换值加法平均模式选择）

当OCSAD位设置为1时，选择内部参考电压的AD转换，并按ADADC的ADC[2:0]位指定的次数连续执行。最大加法计数因转换精度而异，如42.2.2AD自诊断数据寄存器(ADRD)中所示。当ADADC.AVEE位为0时，加法得到的值返回到AD内部参考电压数据寄存器(ADOCDR)。当ADADC.AVEE位为1时，平均值返回给ADOCDR。

仅在ADCSR.ADST位为0时设置OCSAD位。

TSSA位（温度传感器输出AD转换选择）

TSSA位在单次扫描模式、连续扫描模式或组扫描模式下选择A组温度传感器输出的AD转换。WhenADconversionofthetemperaturesensoroutputisselectedandperformed settheADCSR.DBLEbitto0.

仅当ADCSR.ADST位为0时设置TSSA位。

OCSA位（内部参考电压AD转换选择）

OCSA位在单次扫描模式、连续扫描模式或组扫描模式下选择A组内部参考电压的AD转换。WhenADconversionoftheinternalreferencevoltageisselectedandperformed settheADCSR.DBLEbitto0.

仅在ADCSR.ADST位为0时设置OCSA位。此外，在OCSA位设置为1后等待400ns或更长时间，然后再开始AD转换。

TSSB位（B组温度传感器输出AD转换选择）

TSSB位选择组扫描模式下B组温度传感器输出的AD转换。

仅在ADCSR.ADST位为0时设置TSSB位。不要在TSSA位为1时将TSSB位设置为1。

OCSB位（B组的内部参考电压AD转换选择）

OCSB位选择组扫描模式下B组内部参考电压的AD转换。

仅在ADCSR.ADST位为0时设置OCSB位。不要在OCSA位为1时将OCSB位设置为1。此外，在OCSB位设置为0后等待400ns或更长时间后开始AD转换1.

42.2.14 A/D Sampling State Register n (ADSSTRn) (n = 00 to 03, 05 to 07, L, T, O)

Address(es): ADC120.ADSSTR00 4005 C0E0h to ADC120.ADSSTR03 4005 C0E3h, ADC120.ADSSTR05 4005 C0E5h to ADC120.ADSSTR07 4005 C0E7h, ADC120.ADSSTRL 4005 C0DDh, ADC120.ADSSTRT 4005 C0DEh, ADC120.ADSSTRO 4005 C0DFh, ADC121.ADSSTR00 4005 C2E0h to ADC121.ADSSTR02 4005 C2E2h, ADC121.ADSSTR05 4005 C2E5h to ADC121.ADSSTR07 4005 C2E7h, ADC121.ADSSTRL 4005 C2DDh, ADC121.ADSSTRT 4005 C2DEh, ADC121.ADSSTRO 4005 C2DFh

	b7	b6	b5	b4	b3	b2	b1	b0
	SST[7:0]							
Value after reset:	0	0	0	0	1	0	1	1

Bit	Symbol	Bit name	Description	R/W
b7 to b0	SST[7:0]	Sampling Time Setting	These bits set the sampling time in the range from 5 to 255 states	R/W

The ADSSTRn register sets the sampling time for analog input. If one state is 1 ADCLK (A/D conversion clock) cycle and the ADCLK clock is 60 MHz, one state is 16.7 ns. The initial value is 11 states.

The sampling time can be adjusted if the impedance of the analog input signal source is too high to secure sufficient sampling time, or if the ADCLK clock is slow.

Only set the SST[7:0] bits while the ADCSR.ADST bit is 0.

The lower limit of the sampling time setting depends on the frequency ratio, as follows:

- If the frequency ratio of PCLKB to PCLKC(ADCLK) = 1:1, 2:1, 4:1, or 8:1, the sampling time must be set to a value of more than 5 states
- If the frequency ratio of PCLKB to PCLKC(ADCLK) = 1:2 or 1:4, the sampling time must be set to a value of more than 6 states.

Table 42.8 shows the relationship between the A/D Sampling State Register and the associated channels. For details, see section 42.3.6, Analog Input Sampling and Scan Conversion Time.

Table 42.8 Relationship between A/D Sampling State Register and associated channels

	Associated channels	
Bit name	Unit 0	Unit 1

ADSSTR07.SST[7:0] bits	AN007	AN107
ADSSTRL.SST[7:0] bits	AN016 to AN018 and AN020	AN116 and AN117
ADSSTRT.SST[7:0] bits	Temperature sensor output	Temperature sensor output
ADSSTRO.SST[7:0] bits	Internal reference voltage	Internal reference voltage

Note 1. When the self-diagnosis function is selected, the sampling time set in the ADSSTR00.SST[7:0] bits is applied.

42.2.14 AD采样状态寄存器n(ADSSTRn)（n=00至03、05至07、L、T、O）

Address(es): ADC120.ADSSTR00 4005 C0E0h to ADC120.ADSSTR03 4005 C0E3h, ADC120.ADSSTR05 4005 C0E5h to ADC120.ADSSTR07 4005 C0E7h, ADC120.ADSSTRL 4005 C0DDh, ADC120.ADSSTRT 4005 C0DEh, ADC120.ADSSTRO 4005 C0DFh, ADC121.ADSSTR00 4005 C2E0h to ADC121.ADSSTR02 4005 C2E2h, ADC121.ADSSTR05 4005 C2E5h to ADC121.ADSSTR07 4005 C2E7h, ADC121.ADSSTRL 4005 C2DDh, ADC121.ADSSTRT 4005 C2DEh, ADC121.ADSSTRO 4005 C2DFh

	b7	b6	b5	b4	b3	b2	b1	b0
	SST[7:0]							
重置后的值：	0	0	0	0	1	0	1	1

Bit	Symbol	位名称	Description	R/W
b7 to b0	SST[7:0]	采样时间设置	这些位在5到255个状态范围内设置采样时间	R/W

ADSSTRn寄存器设置模拟输入的采样时间。如果一种状态是1个ADCLK（AD转换时钟）周期并且ADCLK时钟是60MHz，则一种状态是16.7ns。初始值为11个状态。

如果模拟输入信号源的阻抗太高而无法保证足够的采样时间，或者如果ADCLK时钟很慢，则可以调整采样时间。

仅在ADCSR.ADST位为0时设置SST[7:0]位。

采样时间设置的下限取决于频率比，如下：

- 如果PCLKB与PCLKC(ADCLK)的频率比=1:1、2:1、4:1或8:1，则必须将采样时间设置为5个以上状态的值
- 如果PCLKB与PCLKC(ADCLK)的频率比=1:2或1:4，则必须将采样时间设置为6个以上状态的值。

表42.8显示了AD采样状态寄存器和相关通道之间的关系。有关详细信息，请参见第42.3.6节，模拟输入采样和扫描转换时间。

42.2.15 A/D Sample and Hold Circuit Control Register (ADSHCR)

Address(es): ADC120.ADSHCR 4005 C066h, ADC121.ADSHCR 4005 C266h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SHANS[2:0]			SSTSH[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	SSTSH[7:0]	Channel-Dedicated Sample-and-Hold Circuit Sampling Time Setting	Sampling time (4 to 255 states)	R/W
b10 to b8	SHANS[2:0]	Channel-Dedicated Sample-and-Hold Circuit Bypass Select	Select whether to use or bypass channel-dedicated sample-and-hold circuits for AN000 to AN002 (unit 0) and AN100 to AN102 (unit 1). 0: Bypass the circuits 1: Use the circuits.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SSTSH[7:0] bits (Channel-Dedicated Sample-and-Hold Circuit Sampling Time Setting)

The SSTSH[7:0] bits set the sampling time for the channel-dedicated sample-and-hold circuits. If one state is 1 ADCLK (A/D conversion clock) cycle and the ADCLK clock is 60 MHz, one state is 16.7 ns. The initial value is 24 states. The sampling time can be adjusted if the impedance of the analog input signal source is too high to secure sufficient sampling time, or if the ADCLK clock is slow.

Only set the SSTSH[7:0] bits while the ADCSR.ADST bit is 0. The sampling time must be set to a value that is 4 states or more and 255 or less.

SHANS[2:0] bits (Channel-Dedicated Sample-and-Hold Circuit Bypass Select)

The SHANS[2:0] bits select whether to use or bypass the channel-dedicated sample-and-hold circuits for AN000 to AN002 (unit 0) and AN100 to AN102 (unit 1). In unit 0, the SHANS[0] bit is associated with AN000, the SHANS[1] bit with AN001, and the SHANS[2] bit with AN002. In unit 1, the SHANS[0] bit is associated with AN100, the SHANS[1] bit with AN101, and the SHANS[2] bit with AN102.

If any channel from AN000 to AN002 (unit 0) or AN100 to AD102 (unit 1) is selected for group B while operation is in group scan mode under group A priority control, use this setting to bypass the dedicated sample-and-hold circuit of the channel.

Only set the SHANS[2:0] bits while the ADCSR.ADST bit is 0 and the ADSHMSR.SHMD bit is 0.

42.2.16 A/D Sample and Hold Operation Mode Selection Register (ADSHMSR)

Address(es): ADC120.ADSHMSR 4005 C07Ch, ADC121.ADSHMSR 4005 C27Ch

	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SHMD	Sampling Operation Selection	0: Disable continuous sampling function 1: Enable continuous sampling function.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

42.2.15 AD采样保持电路控制寄存器(ADSHCR)

Address(es): ADC120.ADSHCR 4005 C066h, ADC121.ADSHCR 4005 C266h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SHANS[2:0]			SSTSH[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	SSTSH[7:0]	Channel-Dedicated Sample-and-Hold 电路采样时间设置	采样时间（4到255个状态）	R/W
b10 to b8	SHANS[2:0]	Channel-Dedicated Sample-and-Hold 电路旁路选择	选择是使用还是绕过AN000至AN002（单元0）和AN100至AN102（单元1）的通道专用采样保持电路。0：绕过电路1：使用电路。	R/W
b15 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SSTSH[7:0]位（通道专用采样保持电路采样时间设置）

SSTSH[7:0]位设置通道专用采样保持电路的采样时间。如果一种状态是1个ADCLK（AD转换时钟）周期并且ADCLK时钟是60MHz，则一种状态是16.7ns。初始值为24个状态。如果模拟输入信号源的阻抗太高而无法保证足够的采样时间，或者如果ADCLK时钟很慢，则可以调整采样时间。

仅当ADCSR.ADST位为0时设置SSTSH[7:0]位。采样时间必须设置为4个或更多状态且255或更少的值。

SHANS[2:0]位（通道专用采样保持电路旁路选择）

SHANS[2:0]位选择是使用还是绕过AN000的通道专用采样保持电路
AN002（单元0）和AN100到AN102（单元1）。在单元0中，SHANS[0]位与AN000相关联，SHANS[1]位与AN001相关联，SHANS[2]位与AN002相关联。在单元1中，SHANS[0]位与AN100相关联，SHANS[1]位与AN101相关联，SHANS[2]位与AN102相关联。

如果在A组优先控制下的组扫描模式下操作时为组B选择了从AN000到AN002（单元0）或AN100到AD102（单元1）的任何通道，则使用此设置绕过专用的采样保持电路的频道。

仅在ADCSR.ADST位为0且ADSHMSR.SHMD位为0时设置SHANS[2:0]位。

42.2.16 AD采样和保持操作模式选择寄存器(ADSHMSR)

Address(es): ADC120.ADSHMSR 4005 C07Ch, ADC121.ADSHMSR 4005 C27Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SHMD
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SHMD	采样操作选择	0：禁用连续采样功能1：启用连续采样功能。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SHMD bit (Sampling Operation Selection)

Setting SHMD to 1 enables the constant sampling function of the channel-dedicated sample-and-hold selected in the ADSHCR.SHANS[2:0] bits. Only set the SHMD bit while the ADCSR.ADST bit is 0.

When the sampling function is enabled, the sample-and-hold circuit operates sampling while the ADC12 is not operating, and operates holding while the ADC12 is operating.

Note: The ADCSR.ADST bit must become 1 after 400 ns or more elapses after the SHMD bit is set to 1 (when the permissible signal source impedance is 1 kΩ). The sampling period of the sample-and-hold circuit must be 400 ns or more (when the permissible signal source impedance is 1 kΩ).

42.2.17 A/D Disconnection Detection Control Register (ADDISCR)

Address(es): ADC120.ADDISCR 4005 C07Ah, ADC121.ADDISCR 4005 C27Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PCHG	ADNDIS[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	ADNDIS[3:0]	Disconnection Detection Assist Setting	b3 b0 0 0 0 0: Disconnection detection assist function is disabled 0 0 0 1: Setting prohibited Others : Number of states for the discharge or precharge period.	R/W
b4	PCHG	Precharge/discharge select	0: Discharge 1: Precharge.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ADDISCR register selects either precharge or discharge, and the period of precharge or discharge for the A/D disconnection detection assist function.

Only set the ADDISCR register when the ADCSR.ADST bit is 0.

If any of the following functions are used, the disconnection detection assist function should be disabled:

- Temperature sensor
- Internal reference voltage
- A/D self-diagnosis
- Programmable gain amplifier without bypass enabled.

ADNDIS[3:0] bits (Disconnection Detection Assist Setting)

The ADNDIS[3:0] bits specify the period of precharge or discharge. When ADNDIS[3:0] = 0000b, the disconnection detection assist function is disabled. Setting the ADNDIS[3:0] bits to 0001b is prohibited. Except when ADNDIS[3:0] = 0000b or 0001b, the specified value indicates the number of states for the period of precharge or discharge. When the ADNDIS[3:0] bits are set to any values other than 0000b or 0001b, the disconnection detection assistance function is enabled.

PCHG bit (Precharge/discharge select)

Setting the PCHG bit to 1 selects precharge and setting the PCHG bit to 0 selects discharge.

SHMD位（采样操作选择）

将SHMD设置为1启用在
ADSHCR.SHANS[2:0]位。仅在ADCSR.ADST位为0时设置SHMD位。

当采样功能使能时，采样保持电路在ADC12不工作时进行采样，在ADC12工作时进行保持。

Note: ADCSR.ADST位必须在SHMD位设置为1后经过400ns或更长时间后变为1（当允许的信号源阻抗为1kΩ时）。采样保持电路的采样周期必须为400ns或更长（当允许的信号源阻抗为1kΩ时）。

42.2.17 AD断线检测控制寄存器(ADDISCR)

Address(es): ADC120.ADDISCR 4005 C07Ah, ADC121.ADDISCR 4005 C27Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PCHG	ADNDIS[3:0]			
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	ADNDIS[3:0]	断线检测辅助Setting	b3 b0 0 0 0 0：断线检测辅助功能无效 0 0 0 1：禁止设置 Others ：放电或预充电期的状态数。	R/W
b4	PCHG	Precharge/discharge select	0: Discharge 1: Precharge.	R/W
b7 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ADDISCR寄存器选择预充电或放电，以及AD断线检测辅助功能的预充电或放电周期。

仅当ADCSR.ADST位为0时设置ADDISCR寄存器。

如果使用以下任一功能，应禁用断线检测辅助功能：

- 温度感应器
- 内部参考电压
- A/D self-diagnosis
- 不启用旁路的可编程增益放大器。

ADNDIS[3:0]位（断线检测辅助设置）

ADNDIS[3:0]位指定预充电或放电周期。当ADNDIS[3:0]=0000b时，断线检测辅助功能被禁用。禁止将ADNDIS[3:0]位设置为0001b。除了ADNDIS[3:0]=0000b或0001b时，指定值表示预充电或放电期间的状态数。当ADNDIS[3:0]位设置为0000b或0001b以外的任何值时，将启用断线检测辅助功能。

PCHG位（预充电放电选择）

将PCHG位设置为1选择预充电，将PCHG位设置为0选择放电。

42.2.18 A/D Group Scan Priority Control Register (ADGSPCR)

Address(es): ADC120.ADGSPCR 4005 C080h, ADC121.ADGSPCR 4005 C280h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GBRP	—	—	—	—	—	—	—	—	—	—	—	—	—	GBRSCN	PGS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PGS	Group A Priority Control Setting*1	0: Operate without group A priority control 1: Operate with group A priority control.	R/W
b1	GBRSCN	Group B Restart Setting	This bit is enabled only when PGS = 1. It is reserved when PGS = 0. 0: Do not restart group B scanning after it is stopped by group A priority control 1: Restart group B scanning after it is stopped by group A priority control.	R/W
b14 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	GBRP	Group B Single Scan Continuous Start*2	This bit is enabled only when PGS = 1. It is reserved when PGS = 0. 0: Do not continuously activate single scan for group B 1: Continuously activate single scan for group B.	R/W

Note 1. The ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode) before setting PGS to 1. Operation is not guaranteed if these bits are set to any other value.

Note 2. When the GBRP bit is set to 1, single scan is performed continuously for group B regardless of the setting in the GBRSCN bit.

PGS bit (Group A Priority Control Setting)

Set the PGS bit to 1 to give priority to operation on group A. The ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode) before setting the PGS bit to 1. Operation is not guaranteed if the bits are set to any other value.

When the PGS bit is set to 0, a clear operation must be performed by software as described in section 42.6.2, Constraints on Stopping A/D Conversion. When the PGS bit is set to 1, use the settings described in section 42.3.4.3, Operation with group A priority control.

GBRSCN bit (Group B Restart Setting)

The GBRSCN bit controls the restarting of scan operation on group B when operation on group A is given priority. If a scan operation on group B is stopped by a group A trigger input with the GBRSCN bit set to 1, the scan operation is restarted on completion of group A conversion. Also, if a group B trigger is input during A/D conversion on group A, the scan operation on group B is restarted on completion of group A conversion.

When the GBRSCN bit is set to 0, trigger inputs during A/D conversion are ignored. Only set the GBRSCN bit while the ADCSR.ADST bit is 0.

The setting in the GBRSCN bit is valid when the PGS bit is 1.

GBRP bit (Group B Single Scan Continuous Start)

The GBRP bit performs a single scan operation continuously on group B. Setting the GBRP bit to 1 starts a single scan on group B. On completion of the scan, another single scan on group B starts automatically. If a group B conversion stops because of an operation on group A, the group A operation takes priority, and single scan on group B restarts automatically on completion of the group A conversion.

Disable group B trigger input before setting the GBRP bit to 1. Setting the GBRP bit to 1 invalidates the setting in the GBRSCN bit. Only set the GBRP bit while the ADCSR.ADST is 0.

The setting in the GBRP bit is valid when the PGS bit is 1.

42.2.18 AD组扫描优先控制寄存器(ADGSPCR)

Address(es): ADC120.ADGSPCR 4005 C080h, ADC121.ADGSPCR 4005 C280h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GBRP	—	—	—	—	—	—	—	—	—	—	—	—	—	GBRSCN	PGS
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	PGS	A组优先控制 Setting*1	0：无A组优先控制运行1：有A组优先控制运行。	R/W
b1	GBRSCN	B组重启设置	该位仅在PGS=1时启用。 PGS=0。0：B组扫描被A组优先控制停止后不重新开始扫描1：B组扫描被A组优先控制停止后重新开始B组扫描。	R/W
b14 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b15	GBRP	B组单次扫描连续 Start*2	该位仅在PGS=1时启用。 PGS=0。0：不连续激活B组单次扫描1：连续激活B组单次扫描。	R/W

注1.ADCSR.ADCS[1:0]位必须在PGS设置为1之前设置为01b（组扫描模式）。如果这些位设置为任何其他值，则无法保证操作。注2.当GBRP位设置为1时，对B组连续执行单次扫描，而与

GBRSCN bit.

PGS位（A组优先控制设置）

将PGS位设置为1以优先对组A进行操作。在将PGS位设置为1之前，必须将ADCSR.ADCS[1:0]位设置为01b（组扫描模式）。如果这些位不保证操作设置为任何其他值。

当PGS位设置为0时，必须由软件执行清零操作，如第42.6.2节“停止AD转换的约束”中所述。当PGS位设置为1时，使用第42.3.4.3节“A组优先控制操作”中描述的设置。

GBRSCN位（B组重启设置）

当A组操作优先时，GBRSCN位控制B组扫描操作的重新启动。如果B组的扫描操作被GBRSCN位设置为1的A组触发输入停止，则扫描操作在A组转换完成后重新开始。此外，如果在A组的AD转换期间输入了B组触发，则在A组转换完成时重新开始对B组的扫描操作。

当GBRSCN位设置为0时，AD转换期间的触发输入将被忽略。仅设置GBRSCN位，而ADCSR.ADST位为0。

当PGS位为1时GBRSCN位中的设置有效。

GBRP位（B组单次扫描连续启动）

GBRP位在B组上连续执行单次扫描操作。将GBRP位设置为1将启动B组上的单次扫描。扫描完成后，自动开始B组上的另一次单次扫描。如果B组转换因A组操作而停止，则A组操作优先，B组单次扫描在A组转换完成后自动重新开始。

在将GBRP位设置为1之前禁用B组触发输入。将GBRP位设置为1会使GBRSCN位。仅在ADCSR.ADST为0时设置GBRP位。

GBRP位中的设置在PGS位为1时有效。

42.2.19 A/D Compare Function Control Register (ADCMPCR)

Address(es): ADC120.ADCMPCR 4005 C090h, ADC121.ADCMPCR 4005 C290h

b14	WCMPE	Window Function Setting	0: Disable window function. Window A and window B operate as a comparator to compare the single value on the lower side with the A/D conversion result. 1: Enable window function. Window A and window B operate as a comparator to compare the two values on the upper and lower sides with the A/D conversion result.	R/W
b15	CMPAIE	Compare A Interrupt Enable	0: Disable ADC12i_CMPAI interrupt when comparison conditions (window A) are met 1: Enable ADC12i_CMPAI interrupt when comparison conditions (window A) are met.	R/W

Note: i = 0: unit 0, i = 1: unit 1.

CMPAB[1:0] bits (Window A/B Composite Conditions Setting)

The CMPAB[1:0] bits are valid when both window A and window B are enabled (CMPAE = 1 and CMPBE = 1) in single scan mode. These bits specify the compare function match/mismatch event output conditions and monitoring conditions of ADWINMON.MONCONB.

Only set the CMPAB[1:0] bits when the ADCSR.ADST bit is 0.

CMPBE bit (Compare Window B Operation Enable)

The CMPBE bit enables or disables the compare window B operation. Set the CMPBE bit when the ADCSR.ADST bit is 0.

42.2.19 AD比较功能控制寄存器(ADCMPCR)

Note: i = 0: unit 0, i = 1: unit 1.

CMPAB[1:0]位（窗口AB复合条件设置）

当窗口A和窗口B在单次扫描模式下启用（CMPAE=1和CMPBE=1）时，CMPAB[1:0]位有效。这些位指定比较函数匹配不匹配事件输出条件和ADWINMON.MONCONB的监视条件。

仅当ADCSR.ADST位为0时设置CMPAB[1:0]位。

CMPBE位（比较窗口B操作使能）

CMPBE位启用或禁用比较窗口B操作。当ADCSR.ADST位为0时，设置CMPBE位。

Set this bit to 0 before setting the following registers:

- A/D Channel Select Registers A0, A1, B0, and B1 (ADANSA0, ADANSA1, ADANSB0, and ADANSB1)
- OCSB, TSSB, OCSA, or TSSA bits in the A/D Conversion Extended Input Control Register (ADEXICR)
- CMPCHB[5:0] bits in the Window B Channel Select Register (ADCMPBNSR).

CMPAE bit (Compare Window A Operation Enable)

The CMPAE bit enables or disables the compare window A operation. Set the CMPAE bit when the ADCSR.ADST bit is 0.

Set this bit to 0 before setting the following registers:

- A/D Channel Select Registers A0, A1, B0, and B1 (ADANSA0, ADANSA1, ADANSB0, and ADANSB1)
- OCSB, TSSB, OCSA, or TSSA bits in the A/D Conversion Extended Input Control Register (ADEXICR)
- Window A Channel Select Registers 0 and 1 (ADCMPANSR0 and ADCMPANSR1)
- Window A Extended Input Select Register (ADCMPANSER).

CMPBIE bit (Compare B Interrupt Enable)

The CMPBIE bit enables or disables the ADC12i_CMPBI (i = 0, 1) interrupt output when the comparison conditions (window B) are met.

WCMPE bit (Window Function Setting)

The WCMPE bit enables or disables the window function. Set the WCMPE bit when the ADCSR.ADST bit is 0.

CMPAIE bit (Compare A Interrupt Enable)

The CMPAIE bit enables or disables the ADC12i_CMPAI (i = 0, 1) interrupt output when the comparison conditions (window A) are met.

42.2.20 A/D Compare Function Window A Channel Select Register 0 (ADCMPANSR0)

b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CMPCHAn bits (n = 00 to 03, 05 to 07) (Compare Window A Channel Select)

The compare function is enabled by writing 1 to the CMPCHAn bit with the same number as the A/D conversion channel

在设置以下寄存器之前将此位设置为0：

- AD通道选择寄存器A0、A1、B0和B1（ADANSA0、ADANSA1、ADANSB0和ADANSB1）
- AD转换扩展输入控制寄存器(ADEXICR)中的OCSB、TSSB、OCSA或TSSA位
- 窗口B通道选择寄存器(ADCMPBNSR)中的CMPCHB[5:0]位。

CMPAE位（比较窗口A操作使能）

CMPAE位启用或禁用比较窗口A操作。当ADCSR.ADST位为0时，设置CMPAE位。

在设置以下寄存器之前将此位设置为0：

- AD通道选择寄存器A0、A1、B0和B1（ADANSA0、ADANSA1、ADANSB0和ADANSB1）
- AD转换扩展输入控制寄存器(ADEXICR)中的OCSB、TSSB、OCSA或TSSA位
- 窗口A通道选择寄存器0和1（ADCMPANSR0和ADCMPANSR1）
- 窗口A扩展输入选择寄存器(ADCMPANSER)。

CMPBIE位（比较B中断使能）

当满足比较条件（窗口B）时，CMPBIE位启用或禁用ADC12i_CMPBI(i=0 1)中断输出。

WCMPE位（窗口功能设置）

WCMPE位启用或禁用窗口功能。当ADCSR.ADST位为0时，设置WCMPE位。

CMPAIE位（比较中断使能）

当满足比较条件（窗口A）时，CMPAIE位启用或禁用ADC12i_CMPAI(i=0 1)中断输出。

42.2.20 AD比较功能窗口A通道选择寄存器0(ADCMPANSR0)

CMPLTSA bit (Compare Window A Temperature Sensor Output Comparison Condition Select)

The CMPLTSA bit specifies comparison conditions when the temperature sensor output is the target for the window A comparison condition. When the temperature sensor output comparison result meets the set condition, the ADCMPSER.CMPSTTSA flag is set to 1 and a compare interrupt (ADC12i_CMPAI (i = 0, 1)) is generated.

CMPLOCA bit (Compare Window A Internal Reference Voltage Comparison Condition Select)

The CMPLOCA bit specifies comparison conditions when the internal reference voltage is the target for the window A comparison condition. When the internal reference voltage comparison result meets the set condition, the ADCMPSER.CMPSTOCA flag is set to 1 and a compare interrupt (ADC12i_CMPAI) is generated.

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	—	Reference value	R/W

The ADCMPDRy (y = 0, 1) register specifies the reference data when the compare window A function is used. ADCMPDR0 sets the lower reference for window A, and ADCMPDR1 sets the upper reference for window A.

ADWINULB and ADWINLLB specify the reference data when the compare window B function is used. ADWINLLB sets the lower reference for window B, and ADWINULB sets the upper reference for window B. The ADCMPDRy, ADWINULB, and ADWINLLB are read/write registers.

ADCMPDRy, ADWINULB, and ADWINLLB can be written to, even during A/D conversion. The reference data can be dynamically changed by rewriting the register values during A/D conversion.

Set these registers so that the upper reference is not less than the lower reference (ADCMPDR1 ≥ ADCMPDR0 and ADWINULB ≥ ADWINLLB). ADCMPDR1 and ADWINULB are not used when the window function is disabled.

Note: The lower and upper references are changed when each register is written. For example, when the upper reference value changed and the lower reference value are changed, the MCU compares the upper reference (after a rewrite), and the lower reference (before a rewrite) with the A/D conversion result. See Figure 42.5. If the comparison during the rewriting of these two references is erroneous, then rewrite these reference values when both ADCSR.ADST and the associated compare window operation enable bit (ADCMPCR.CMPAE or ADCMPCR.CMPBE) are 0.

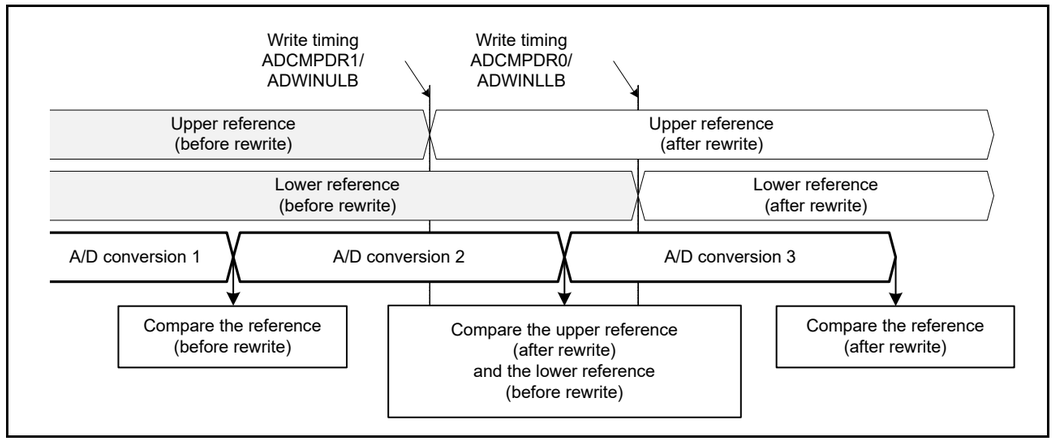

Figure 42.5 Comparison between upper and lower references before and after a rewrite

42.2.26 AD比较功能窗口A低端电平设置寄存器(ADCMPDR0) AD比较功能窗口A高端电平设置寄存器(ADCMPDR1) AD比较功能窗口B低端电平设置寄存器(ADWINLLB) AD比较功能窗口B上侧

电平设置寄存器(ADWINULB)

Address(es): ADC120.ADCMPDR0 4005 C09Ch, ADC120.ADCMPDR1 4005 C09Eh, ADC120.ADWINLLB 4005 C0A8h, ADC120.ADWINULB 4005 C0AAh, ADC121.ADCMPDR0 4005 C29Ch, ADC121.ADCMPDR1 4005 C29Eh, ADC121.ADWINLLB 4005 C2A8h, ADC121.ADWINULB 4005 C2AAh

Bit	Symbol	位名称	Description	R/W
b15 to b0	—	—	参考值	R/W

ADCMPDRy(y=0 1)寄存器指定使用比较窗口A功能时的参考数据。ADCMPDDR0设置窗口A的下参考值，而ADCMPDR1设置窗口A的上参考值。

ADWINULB和ADWINLLB指定使用比较窗口B函数时的参考数据。ADWINLLB设置窗口B的下参考，ADWINULB设置窗口B的上参考。ADCMPDRy、ADWINULB和ADWINLLB是读写寄存器。

ADCMPDRy、ADWINULB和ADWINLLB可以写入，即使在AD转换期间也是如此。参考数据可以通过在AD转换期间重写寄存器值来动态更改。

设置这些寄存器，使参考上限不小于参考下限（ADCMPDR1≥ADCMPDR0且ADWINULB≥ADWINLLB）。禁用窗口功能时不使用ACMPDDR1和ADWINULB。

Note: 写入每个寄存器时会更改下参考和上参考。例如，当上参考值改变和下参考值改变时，MCU将上参考（重写后）和下参考（重写前）与AD转换结果进行比较。请参见图42.5。如果在重写这两个参考时比较错误，则在ADCSR.ADST和相关的比较窗口操作使能位（ADCMPCR.CMPAE或ADCMPCR.CMPBE）都为0时重写这些参考值。

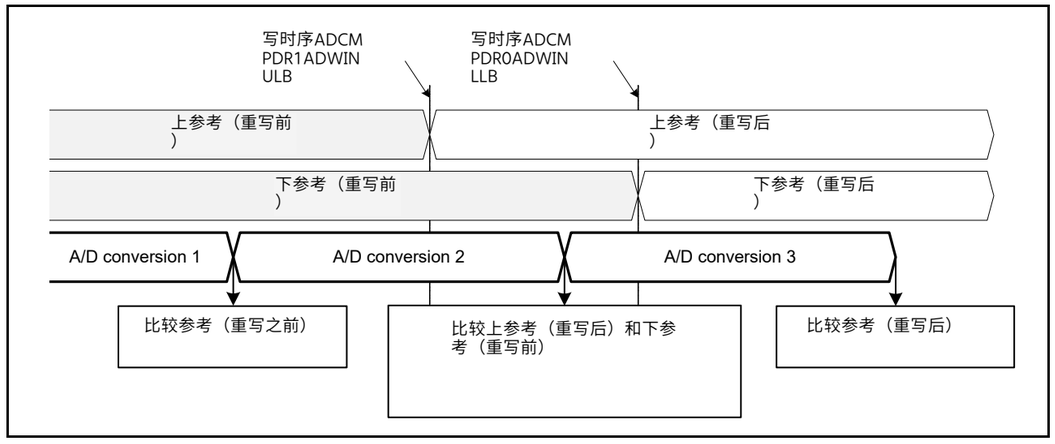

Figure 42.5 重写前后上下引用的比较

The ADCMPDRy, ADWINLLB, and ADWINULB registers use different formats depending on the following conditions:

- The value in the A/D Data Register Format Select bit (flush-right or flush-left)
- The value in the A/D Conversion Accuracy Specify bit (12-bit, 10-bit, or 8-bit)
- The value in the A/D-Converted Value Addition/Average Channel Select bits (A/D-converted value addition mode selected or not selected).

The data formats for each condition are described in this section.

(1) When A/D-converted value addition mode is not selected

- Flush-right data with 12-bit accuracy: Lower 12 bits ([11:0]) are valid
- Flush-right data with 10-bit accuracy: Lower 10 bits ([9:0]) are valid
- Flush-right data with 8-bit accuracy: Lower 8 bits ([7:0]) are valid
- Flush-left data with 12-bit accuracy: Upper 12 bits ([15:4]) are valid
- Flush-left data with 10-bit accuracy: Upper 10 bits ([15:6]) are valid
- Flush-left data with 8-bit accuracy: Upper 8 bits ([15:8]) are valid.

(2) When A/D-converted value addition mode is selected

- Flush-right data with 12-bit accuracy: Lower 14 bits ([13:0]) are valid
- Flush-right data with 10-bit accuracy: Lower 12 bits ([11:0]) are valid
- Flush-right data with 8-bit accuracy: Lower 10 bits ([9:0]) are valid
- Flush-left data with 12-bit accuracy: Upper 14 bits ([15:2]) are valid
- Flush-left data with 10-bit accuracy: Upper 12 bits ([15:4]) are valid
- Flush-left data with 8-bit accuracy: Upper 10 bits ([15:6]) are valid.

42.2.27 A/D Compare Function Window A Channel Status Register 0 (ADCMPSR0)

Address(es): ADC120.ADCMPSR0 4005 C0A0h, ADC121.ADCMPSR0 4005 C2A0h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	CMPSTCHA03 to CMPSTCHA00	Compare Window A Flag	When window A operation is enabled (ADCMPCR.CMPAE = 1b), these bits indicate the comparison result of the channels to which window A comparison conditions are applied, selected from AN000 to AN003 (unit 0) and AN100 to AN102 (unit 1). 0: Comparison conditions are not met 1: Comparison conditions are met.	R/W
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b5	CMPSTCHA07 to CMPSTCHA05	Compare Window A Flag	When window A operation is enabled (ADCMPCR.CMPAE = 1b), these bits indicate the comparison result of the channels to which window A comparison conditions are applied, selected from AN005 to AN007 (unit 0) and AN105 to AN107 (unit 1). 0: Comparison conditions are not met 1: Comparison conditions are met.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

ADCMPDRy、ADWINLLB和ADWINULB寄存器根据以下条件使用不同的格式：

- AD数据寄存器格式选择位中的值（右对齐或左对齐）
- AD转换精度指定位（12位、10位或8位）中的值
- AD转换值加法平均通道选择位中的值（选择或未选择AD转换值加法模式）。

本节描述了每个条件的数据格式。

(1) 未选择AD转换值相加模式时

- 12位精度的右冲洗数据：低12位([11:0])有效
- 10位精度的右冲洗数据：低10位([9:0])有效
- 8位精度的右冲洗数据：低8位([7:0])有效
- 12位精度的左刷新数据：高12位([15:4])有效
- 10位精度的左刷新数据：高10位([15:6])有效
- 8位精度的左刷新数据：高8位([15:8])有效。

(2) 选择AD转换值相加模式时

- 12位精度的右冲洗数据：低14位([13:0])有效
- 10位精度的右冲洗数据：低12位([11:0])有效
- 8位精度的右冲洗数据：低10位([9:0])有效
- 12位精度的左刷新数据：高14位([15:2])有效
- 10位精度的左刷新数据：高12位([15:4])有效
- 8位精度的左刷新数据：高10位([15:6])有效。

42.2.27 AD比较功能窗口A通道状态寄存器0(ADCMPSR0)

b15 to b8	—	Reserved	这些位被读取为0。写入值应为0。	R/W

CMPSTCHAn flags (n = 00 to 03, 05 to 07) (Compare Window A Flag)

The CMPSTCHAn flags indicate the comparison results for channels to which window A comparison conditions are applied, selected from AN000 to AN003, AN005 to AN007 (unit 0), and AN100 to AN102, AN105 to AN107 (unit 1). When a comparison condition set in ADCMPLR0.CMPLCHAn is met at the end of A/D conversion, the associated CMPSTCHAn flag is set to 1. When the ADCMPCR.CMPAIE bit is 1, a compare interrupt request (ADC12i_CMPAI (i = 0, 1)) is generated when this flag is set to 1. In unit 0, CMPSTCHA00 is associated with AN000, and CMPSTCHA07 with AN007. In unit 1, CMPSTCHA00 is associated with AN100, and CMPSTCHA07 with AN107.

Writing 1 to the CMPSTCHAn flags is invalid.

[Setting condition]

- The condition set in ADCMPLR0.CMPLCHAn is met when ADCMPCR.CMPAE = 1.

[Clearing condition]

- Writing 0 after reading 1.

42.2.28 A/D Compare Function Window A Channel Status Register1 (ADCMPSR1)

Address(es): ADC120.ADCMPSR1 4005 C0A2h, ADC121.ADCMPSR1 4005 C2A2h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	CMPSTCHA18 to CMPSTCHA16	Compare Window A Flag	When window A operation is enabled (ADCMPCR.CMPAE = 1), these bits indicate the comparison result of the channels to which window A comparison conditions are applied, selected from AN016 to AN018 (unit 0) and AN116, AN117 (unit 1). 0: Comparison conditions are not met 1: Comparison conditions are met.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	CMPSTCHA20	Compare Window A Flag	When window A operation is enabled (ADCMPCR.CMPAE = 1b), this bit indicates the comparison result of the channel to which window A comparison condition is applied, selected AN020(unit 0). 0: Comparison conditions are not met 1: Comparison conditions are met.	R/W
b15 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CMPSTCHAn flags (n = 16 to 18, 20) (Compare Window A Flag)

The CMPSTCHAn flags indicate the comparison results for channels to which window A comparison conditions are applied, selected from AN016 to AN018, AN020 (unit 0), and AN116, AN117 (unit 1). When the comparison condition set in ADCMPLR1.CMPLCHAn is met at the end of A/D conversion, the associated CMPSTCHAn flag is set to 1. When the ADCMPCR.CMPAIE bit is 1, a compare interrupt request (ADC12i_CMPAI (i = 0, 1)) is generated when this flag is set to 1. In unit 0, CMPSTCHA16 is associated with AN016, and CMPSTCHA20 with AN020. In unit 1, CMPSTCHA16 is associated with AN116, and CMPSTCHA17 with AN117.

Writing 1 to the CMPSTCHAn flags is invalid.

[Setting condition]

- The condition set in ADCMPLR1.CMPLCHAn is met when ADCMPCR.CMPAE = 1.

[Clearing condition]

- Writing 0 after reading 1.

CMPSTCHAn标志（n=00到03、05到07）（比较窗口A标志）

CMPSTCHAn标志指示应用窗口A比较条件的通道的比较结果，从AN000到AN003、AN005到AN007（单元0）和AN100到AN102、AN105到AN107（单元1）中选择。当ADCMPLR0.CMPLCHAn中设置的比较条件在AD转换结束时满足时，相关的

CMPSTCHAn标志设置为1。当ADCMPCR.CMPAIE位为1时，当该标志设置为1时，会产生比较中断请求(ADC12i_CMPAI(i=0 1))。在单元0中，CMPSTCHA00与AN000相关联，以及带有AN007的CMPSTHA07。在单元1中，CMPSTCHA00与AN100相关联，CMPSTCHA07与AN107相关联。

将1写入CMPSTCHAn标志是无效的。

[Setting condition]

- 当ADCMPCR.CMPAE=1时，满足ADCMPLR0.CMPLCHAn中设置的条件。

[Clearing condition]

- 读1后写0。

42.2.28 AD比较功能窗口A通道状态寄存器1(ADCMPSR1)

Address(es): ADC120.ADCMPSR1 4005 C0A2h, ADC121.ADCMPSR1 4005 C2A2h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	位名称	Description	R/W
b2 to b0	CMPSTCHA18 to CMPSTCHA16	比较窗口A标志	当窗口A操作使能（ADCMPCR.CMPAE=1）时，这些位指示应用窗口A比较条件的通道的比较结果，从AN016到AN018（单元0）和AN116、AN117（单元1）中选择。0：不满足比较条件1：满足比较条件。	R/W
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	CMPSTCHA20	比较窗口A标志	当窗口A操作使能时（ADCMPCR.CMPAE=1b），该位指示应用窗口A比较条件的通道的比较结果，选择AN020（单元0）。0：不满足比较条件1：满足比较条件。	R/W
b15 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

CMPSTCHAn标志（n=16到18、20）（比较窗口A标志）

CMPSTCHAn标志指示应用窗口A比较条件的通道的比较结果，从AN016到AN018、AN020（单元0）和AN116、AN117（单元1）中选择。当ADCMPLR1.CMPLCHAn中设置的比较条件在AD转换结束时满足，相关的CMPSTCHAn标志设置为1。当ADCMPCR.CMPAIE位为1时，一个比较中断请求（ADC12i_CMPAI(i=0 1)）此标志设置为1时生成。在单元0中，CMPSTTCHA16与AN016相关联，CMPSTTCHA20与AN020相关联。在单元1中，CMPSTCHA16与AN116相关联，CMPSTMHA17与AN117相关联。

将1写入CMPSTCHAn标志是无效的。

[Setting condition]

- 当ADCMPCR.CMPAE=1时，满足ADCMPLR1.CMPLCHAn中设置的条件。

[Clearing condition]

- 读1后写0。

42.2.29 A/D Compare Function Window A Extended Input Channel Status Register (ADCMPSER)

Address(es): ADC120.ADCMPSER 4005 C0A4h, ADC121.ADCMPSER 4005 C2A4h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CMPSTOCA	CMPSTTSA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CMPSTTSA	Compare Window A Temperature Sensor Output Compare Flag	When window A operation is enabled (ADCMPCR.CMPAE = 1), this bit indicates the temperature sensor output comparison result. 0: Comparison conditions are not met 1: Comparison conditions are met.	R/W
b1	CMPSTOCA	Compare Window A Internal Reference Voltage Compare Flag	When window A operation is enabled (ADCMPCR.CMPAE = 1), this bit indicates the internal reference voltage comparison result. 0: Comparison conditions are not met 1: Comparison conditions are met.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CMPSTTSA flag (Compare Window A Temperature Sensor Output Compare Flag)

The CMPSTTSA flag indicates the temperature sensor output comparison result. When the comparison condition set in ADCMPLER.CMPLTSA is met at the end of A/D conversion, this flag is set to 1. When the ADCMPCR.CMPAIE bit is 1, a compare interrupt request (ADC12i_CMPAI (i = 0, 1)) is generated when this flag is set to 1.

Writing 1 to the CMPSTTSA flag is invalid.

[Setting condition]

- The condition set in ADCMPLER.CMPLTSA is met when ADCMPCR.CMPAE = 1.

[Clearing condition]

- Writing 0 after reading 1.

CMPSTOCA flag (Compare Window A Internal Reference Voltage Compare Flag)

The CMPSTOCA flag indicates the internal reference voltage comparison result. When the comparison condition set in ADCMPLER.CMPLOCA is met at the end of A/D conversion, this flag is set to 1. When the ADCMPCR.CMPAIE bit is 1, a compare interrupt request (ADC12i_CMPAI) is generated when this flag is set to 1.

Writing 1 to the CMPSTOCA flag is invalid.

[Setting condition]

- The condition set in ADCMPLER.CMPLOCA is met when ADCMPCR.CMPAE = 1.

[Clearing condition]

- Writing 0 after reading 1.

42.2.29 AD比较功能窗口A扩展输入通道状态寄存器(ADCMPSER)

Address(es): ADC120.ADCMPSER 4005 C0A4h, ADC121.ADCMPSER 4005 C2A4h

	b7	b6	b5	b4	b3	b2	b1	b0

重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CMPSTTSA	比较窗口A 温度传感器输出 比较标志	当窗口A操作使能时（ADCMPCR.CMPAE=1），该位指示温度传感器输出比较结果。0：不满足比较条件1：满足比较条件。	R/W
b1	CMPSTOCA	比较窗口A内部参考电压比较 Flag	当窗口A操作使能时（ADCMPCR.CMPAE=1），该位指示内部参考电压比较结果。0：不满足比较条件1：满足比较条件。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

CMPSTTSA标志（比较窗口A温度传感器输出比较标志）

CMPSTTSA标志指示温度传感器输出比较结果。当ADCMPLER.CMPLTSA中设置的比较条件在AD转换结束时满足，该标志设置为1。当ADCMPCR.CMPAIE位为1时，产生比较中断请求(ADC12i_CMPAI(i=0 1))当此标志设置为1时。

将1写入CMPSTTSA标志无效。

[Setting condition]

- 当ADCMPCR.CMPAE=1时，满足ADCMPLER.CMPLTSA中设置的条件。

[Clearing condition]

- 读1后写0。

CMPSTOCA标志（比较窗口A内部参考电压比较标志）

CMPSTOCA标志指示内部参考电压比较结果。当ADCMPLER.CMPLOCA中设置的比较条件在AD转换结束时满足，该标志设置为1。当ADCMPCR.CMPAIE位为1时，当该标志设置为1时产生比较中断请求（ADC12i_CMPAI）.

将1写入CMPSTOCA标志无效。

[Setting condition]

- 当ADCMPCR.CMPAE=1时，满足ADCMPLER.CMPLOCA中设置的条件。

[Clearing condition]

- 读1后写0。

42.2.30 A/D Compare Function Window B Channel Select Register (ADCMPBNSR)

Address(es): ADC120.ADCMPBNSR 4005 C0A6h, ADC121.ADCMPBNSR 4005 C2A6h

	b7	b6	b5	b4	b3	b2	b1	b0
	CMPLB	—	CMPCHB[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	CMPCHB[5:0]	Compare Window B Channel Select	These bits select channels to be compared with the compare window B conditions. The maximum channel is AN020 in unit 0 and AN117 in unit 1. b5 b0 Unit 0 Unit 1 0 0 0 0 0 0: AN000 AN100 0 0 0 0 0 1: AN001 AN101 0 0 0 0 1 0: AN002 AN102 0 0 0 0 1 1: AN003 — 0 0 0 1 0 1: AN005 AN105 0 0 0 1 1 0: AN006 AN106 0 0 0 1 1 1: AN007 AN107 0 1 0 0 0 0: AN016 AN116 0 1 0 0 0 1: AN017 AN117 0 1 0 0 1 0: AN018 — 0 1 0 1 0 0: AN020 — 1 0 0 0 0 0: Temperature sensor 1 0 0 0 0 1: Internal reference voltage 1 1 1 1 1 1: Do no select. Other settings are prohibited.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	CMPLB	Compare Window B Comparison Condition Setting	This bit sets comparison conditions for the channels for window B. The comparison conditions are shown in Figure 42.6. • When window function is disabled (ADCMPCR.WCMPE = 0) 0: CMPLLB value > A/D-converted value 1: CMPLLB value < A/D-converted value. • When window function is enabled (ADCMPCR.WCMPE = 1) 0: A/D-converted value < CMPLLB value, or CMPULB value < A/D-converted value 1: CMPLLB value < A/D-converted value < CMPULB value.	R/W

CMPCHB[5:0] bits (Compare Window B Channel Select)

The CMPCHB[5:0] bits specify the channels to be compared with the compare window B conditions from AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020 (unit 0), AN100 to AN102, AN105 to AN107, AN116, AN117 (unit 1), the temperature sensor, and the internal reference voltage. The compare window B function is enabled by specifying the hexadecimal number of the A/D conversion channel selected in the following bits:

Unit 0

- ADANSA0.ANSA00 to ANSA03 bits
- ADANSA0.ANSA05 to ANSA07 bits
- ADANSA1.ANSA16 toANSA018, ANSA20 bits
- ADANSB0.ANSB00 to ANSB03 bits
- ADANSB0.ANSB05 to ANSB07 bits
- ADANSB1.ANSB16 to ANSB18, ANSB20 bits.

Unit 1

- ADANSA0.ANSA00 to ANSA02 bits

42.2.30 AD比较功能窗口B通道选择寄存器(ADCMPBNSR)

Address(es): ADC120.ADCMPBNSR 4005 C0A6h, ADC121.ADCMPBNSR 4005 C2A6h

	b7	b6	b5	b4	b3	b2	b1	b0
	CMPLB	—	CMPCHB[5:0]					
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	CMPCHB[5:0]	比较窗口B通道 Select	这些位选择要与比较窗口B条件进行比较的通道。最大通道为单元0中的AN020和单元1中的AN117。b5b0单元0单元1 0 0 0 0 0 0: AN000 AN100 0 0 0 0 0 1: AN001 AN101 0 0 0 0 1 0: AN002 AN102 0 0 0 0 1 1: AN003 — 0 0 0 1 0 1: AN005 AN105 0 0 0 1 1 0: AN006 AN106 0 0 0 1 1 1: AN007 AN107 0 1 0 0 0 0: AN016 AN116 0 1 0 0 0 1: AN017 AN117 0 1 0 0 1 0: AN018 — 0 1 0 1 0 0: AN020 — 1 0 0 0 0 0：温度传感器 1 0 0 0 0 1：内部参考电压 11：不选择。禁止其他设置。	R/W
b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b7	CMPLB	比较窗口B 比较条件设置	该位设置窗口B的通道比较条件。比较条件如图42.6所示。 禁用窗口功能时(ADCMPCR.WCMPE=0)0：CMPLLB值>AD转换值1：CMPLLB值<AD转换值。 启用窗口功能时(ADCMPCR.WCMPE=1)0：D转换值<CMPLLB值，或CMPULB值<AD转换值1：CMPLLB值<AD转换值<CMPULB值。	R/W

CMPCHB[5:0]位（比较窗口B通道选择）

CMPCHB[5:0]位指定要与比较窗口B条件比较的通道，从AN000到AN003、AN005到AN007、AN016到AN018、AN020（单元0）、AN100到AN102、AN105到AN107、AN116、AN117（单元1）、温度传感器和内部参考电压。通过指定在以下位中选择的AD转换通道的十六进制数来启用比较窗口B功能：

Unit 0

- ADANSA0.ANSA00到ANSA03位
- ADANSA0.ANSA05到ANSA07位
- ADANSA1.ANSA16 toANSA018, ANSA20 bits
- ADANSB0.ANSB00至ANSB03位

Set the CMPCHB[5:0] bits while the ADCSR.ADST bit is 0.

CMPLB bit (Compare Window B Comparison Condition Setting)

The CMPLB bit specifies the comparison conditions for the channels for window B. When the comparison result of an analog input meets the set condition, the associated ADCMPBSR.CMPSTB flag is set to 1, and a compare interrupt request (ADC12i_CMPBI (i = 0, 1)) is generated.

Compare conditions when the window function is disabled

CMPLB = 0		CMPLB = 1	
ADWINLLB value ≤ A/D converted value	Not met	ADWINLLB value < A/D converted value	Met
ADWINLLB value > A/D converted value	Met	ADWINLLB value ≥ A/D converted value	Not met

Compare conditions when the window function is enabled

CMPLB = 0

A/D converted value > ADWINULB value	Met
ADWINLLB value ≤ A/D converted value ≤ ADWINULB value	Not met
A/D converted value < ADWINLLB value	Met

CMPLB = 1

A/D converted value ≥ ADWINULB value	Not met
ADWINLLB value <A/D converted value < ADWINULB value	Met
A/D converted value ≤ ADWINLLB value	Not met

42.2.31 A/D Compare Function Window B Status Register (ADCMPBSR)

Address(es): ADC120.ADCMPBSR 4005 C0ACh, ADC121.ADCMPBSR 4005 C2ACh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPSTB
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CMPSTB	Compare Window B Flag	When window B operation is enabled (ADCMPCR.CMPBE = 1), this bit indicates the comparison result of the channels to which window B comparison conditions are applied, selected from AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020 (unit 0), AN100 to AN102, AN105 to AN107, and AN116, AN117 (unit 1), temperature sensor output, and internal reference voltage. 0: Comparison conditions are not met 1: Comparison conditions are met.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CMPSTB flag (Compare Window B Flag)

The CMPSTB flag indicates the comparison result of the channels to which window B comparison conditions are applied, selected from AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020 (unit 0), AN100 to AN102, AN105 to AN107, AN116, AN117 (unit 1), the temperature sensor, and the internal reference voltage. When the comparison condition set in ADCMPBNSR.CMPLB is met at the end of A/D conversion, this flag is set to 1. When the ADCMPCR.CMPBIE bit is 1, a compare interrupt request (ADC12i_CMPBI (i = 0, 1)) is generated when this flag is set to 1.

Writing 1 to the CMPSTB flag is invalid.

[Setting condition]

- The condition set in ADCMPBNSR.CMPLB is met when ADCMPCR.CMPBE = 1.

[Clearing condition]

- Writing 0 after reading 1.

42.2.32 A/D Compare Function Window A/B Status Monitor Register (ADWINMON)

Address(es): ADC120.ADWINMON 4005 C08Ch, ADC121.ADWINMON 4005 C28Ch

42.2.31 AD比较功能窗口B状态寄存器(ADCMPBSR)

Address(es): ADC120.ADCMPBSR 4005 C0ACh, ADC121.ADCMPBSR 4005 C2ACh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPSTB
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CMPSTB	比较窗口B标志	当窗口B操作使能时（ADCMPCR.CMPBE=1），该位指示应用窗口B比较条件的通道的比较结果，可选择AN000至AN003、AN005至AN007、AN016至AN018、AN020（单元0）、AN100至AN102、AN105至AN107和AN116、AN117（单元1）、温度传感器输出和内部参考电压。0：不满足比较条件1：满足比较条件。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

CMPSTB标志（比较窗口B标志）

CMPSTB标志表示应用窗口B比较条件的通道的比较结果，从AN000到AN003、AN005到AN007、AN016到AN018、AN020（单元0）、AN100到AN102、AN105到AN107、AN116、AN117中选择（单元1）、温度传感器和内部参考电压。当ADCMPBNSR.CMPLB中设置的比较条件在AD转换结束时满足，该标志设置为1。当ADCMPCR.CMPBIE位为1时，产生比较中断请求(ADC12i_CMPBI(i=0 1))当此标志设置为1时。

将1写入CMPSTB标志无效。

[Setting condition]

- 当ADCMPCR.CMPBE=1时，满足ADCMPBNSR.CMPLB中设置的条件。

[Clearing condition]

- 读1后写0。

42.2.32 AD比较功能窗口AB状态监控寄存器(ADWINMON)

Bit	Symbol	Bit name	Description	R/W
b7, b6	—	Reserved	These bits are read as 0	R

MONCOMB bit (Combination Result Monitor)

The read-only MONCOMB bit indicates the combined result of comparison condition results A and B based on the combination condition set in the ADCMPCR.CMPAB[1:0] bits.

[Setting condition]

- The combined result meets the combination condition set in the ADCMPCR.CMPAB[1:0] bits when ADCMPCR.CMPAE = 1 and ADCMPCR.CMPBE = 1.

[Clearing conditions]

- The combined result does not meet the combination condition set in the ADCMPCR.CMPAB[1:0] bits
- ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0.

MONCMPA bit (Comparison Result Monitor A)

The read-only MONCMPA bit is read as 1 when the A/D-converted value of the window A target channel meets the condition set in the ADCMPLR0/ADCMPLR1 and ADCMPLER registers. Otherwise, it is read as 0.

[Setting condition]

- The A/D-converted value meets the condition set in ADCMPLR0.CMPLCHAn when ADCMPCR.CMPAE = 1.

[Clearing conditions]

- The A/D-converted value does not meet the condition set in ADCMPLR0.CMPLCHAn when ADCMPCR.CMPAE = 1
- ADCMPCR.CMPAE = 0 (automatically cleared when the ADCMPCR.CMPAE value changes from 1 to 0).

MONCMPB bit (Comparison Result Monitor B)

The read-only MONCMPB bit is read as 1 when the A/D-converted value of the window B target channel meets the condition set in the ADCMPBNSR.CMPLB bit. Otherwise, it is read as 0.

[Setting condition]

- The A/D-converted value meets the condition set in ADCMPBNSR.CMPLB when ADCMPCR.CMPBE = 1.

[Clearing conditions]

- The A/D-converted value does not meet the condition set in ADCMPBNSR.CMPLB when ADCMPCR.CMPBE = 1
- ADCMPCR.CMPBE = 0 (automatically cleared when the ADCMPCR.CMPBE value changes from 1 to 0).

42.2.33 A/D Programmable Gain Amplifier Control Register (ADPGACR)

Address(es): ADC120.ADPGACR 4005 C1A0h, ADC121.ADPGACR 4005 C3A0h

Bit	Symbol	Bit name	Description	R/W
b0	P000SEL0	PGA P000 Amplifier Bypass Enable	0: Do not output the signal in a path bypassing the PGA amplifier 1: Output the signal in a path bypassing the PGA amplifier.	R/W
b1	P000SEL1	PGA P000 Amplifier Transit Enable	0: Do not output the signal in a path through the PGA amplifier 1: Output the signal in a path through the PGA amplifier.	R/W

Bit	Symbol	位名称	Description	R/W
b7, b6	—	Reserved	这些位被读为0	R

MONCOMB位（组合结果监视器）

只读MONCOMB位指示比较条件结果A和B基于ADCMPCR.CMPAB[1:0]位中设置的组合条件的组合结果。

[Setting condition]

- 当组合结果满足ADCMPCR.CMPAB[1:0]位中设置的组合条件时
  ADCMPCR.CMPAE = 1 and ADCMPCR.CMPBE = 1.

[Clearing conditions]

- 组合结果不满足ADCMPCR.CMPAB[1:0]位中设置的组合条件
- ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0.

MONCMPA位（比较结果监视器A）

当窗口A目标通道的AD转换值满足ADCMPLR0ADCMPLR1和ADCMPLER寄存器中设置的条件时，只读MONCMPA位被读取为1。否则，读为0。

[Setting condition]

- 当ADCMPCR.CMPAE=1时，AD转换后的值满足ADCMPLR0.CMPLCHAn中设置的条件。

[Clearing conditions]

- 当ADCMPCR.CMPAE=1时，AD转换后的值不满足ADCMPLR0.CMPLCHAn中设置的条件
- ADCMPCR.CMPAE=0（ADCMPCR.CMPAE值从1变为0时自动清零）。

MONCMPB位（比较结果监视器B）

当窗口B目标通道的AD转换值满足ADCMPBNSR.CMPLB位中设置的条件时，只读MONCMPB位被读取为1。否则，读为0。

[Setting condition]

- 当ADCMPCR.CMPBE=1时，AD转换后的值满足ADCMPBNSR.CMPLB中设置的条件。

[Clearing conditions]

- 当ADCMPCR.CMPBE=
  1
- ADCMPCR.CMPBE=0（ADCMPCR.CMPBE值从1变为0时自动清零）。

Note: See section 42.3.12, Programmable Gain Amplifiers, for details on setting these bits.

PnSEL0 bit (PGA Pn Amplifier Bypass Enable) (n = 000 to 002)

The PnSEL0 bit selects whether to output the signal in a path that bypasses the amplifier in the PGA for each programmable gain amplifier Pn.

PnSEL1 bit (PGA Pn Amplifier Transit Enable) (n = 000 to 002)

The PnSEL1 bit selects whether to output the signal in a path through the amplifier in the PGA for each programmable gain amplifier Pn.

PnENAMP bit (PGA Pn Amplifier Enable) (n = 000 to 002)

The PnENAMP bit selects whether to use the amplifier in the PGA for each programmable gain amplifier Pn.

PnGEN bit (PGA Pn Input Resistance Side Gain Selection Signal Enable) (n = 000 to 002)

The PnGEN bit enables or disables the gain setting for each programmable gain amplifier Pn.

Note: 有关设置这些位的详细信息，请参见第42.3.12节，可编程增益放大器。

PnSEL0位（PGAPn放大器旁路使能）（n=000至002）

PnSEL0位为每个可编程增益放大器Pn选择是否在绕过PGA中放大器的路径输出信号。

PnSEL1位（PGAPn放大器传输使能）（n=000至002）

PnSEL1位为每个可编程增益放大器Pn选择是否在通过PGA中的放大器的路径中输出信号。

PnENAMP位（PGAPn放大器启用）（n=000至002）

PnENAMP位为每个可编程增益放大器Pn选择是否使用PGA中的放大器。

PnGEN位（PGAPn输入电阻侧增益选择信号使能）（n=000至002）

PnGEN位启用或禁用每个可编程增益放大器Pn的增益设置。

b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: For details on setting these bits, see section 42.3.12, Programmable Gain Amplifiers.

PnDG[1:0] bits (Pn Differential Input Gain Setting) (n = 000 to 002)

The PnDG[1:0] bits specify the gain of each PGA amplifier Pn when differential inputs are used. These bits are only valid when the PnDEN bit is 1 and the PnGEN bit is 1.

To use the PGA for differential inputs, set the ADPGADCR0.PnDG[1:0] bits in conjunction with the ADPGAGS0.PnGAIN[3:0] bits.

Example: To set the gain to × 1.5 using P000 for differential input, set:
ADPGAGS0.P000GAIN[3:0] = 0001b
ADPGADCR0.P000DG[1:0] = 00b.

PnDEN bit (Pn Differential Input Enable) (n = 000 to 002)

The PnDEN bit enables or disables differential inputs for each PGA amplifier Pn.

42.3 Operation

42.3.1 Scanning Operation

In scanning, A/D conversion is performed sequentially on the analog inputs of the specified channels.

Scan conversion is performed in three operating modes:

- Single scan mode
- Continuous scan mode
- Group scan mode.

In single scan mode, one or more specified channels are scanned once. In continuous scan mode, one or more specified channels are scanned repeatedly until the ADCSR.ADST bit is cleared to 0 from 1 by software. In group scan mode, the selected channels in group A and the selected channels in group B are scanned once after scan starts in response to the respective synchronous trigger (ELC).

In single scan mode and continuous scan mode, A/D conversion is performed on the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n. In group scan mode, A/D conversion is performed for the ANn channels in group A selected in the ADANSA0 and ADANSA1 registers first, and then for the ANn channels in group B selected in the ADANSB0 and ADANSB1 registers, starting from the channel with the smallest number n.

b15 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 有关设置这些位的详细信息，请参见第42.3.12节，可编程增益放大器。

PnDG[1:0]位（Pn差分输入增益设置）（n=000至002）

当使用差分输入时，PnDG[1:0]位指定每个PGA放大器Pn的增益。这些位仅在PnDEN位为1且PnGEN位为1时有效。

要将PGA用于差分输入，请将ADPGADCR0.PnDG[1:0]位与ADPGAGS0.PnGAIN[3:0] bits.

示例：要使用P000差分输入将增益设置为 1.5，请设置：
ADPGAGS0.P000GAIN[3:0] = 0001b
ADPGADCR0.P000DG[1:0] = 00b.

PnDEN位（Pn差分输入使能）（n=000至002）

PnDEN位启用或禁用每个PGA放大器Pn的差分输入。

42.3 Operation

42.3.1 扫描操作

扫描时，对指定通道的模拟输入依次进行AD转换。

扫描转换在三种操作模式下执行：

- 单次扫描模式
- 连续扫描模式
- 组扫描模式。

在单次扫描模式下，一个或多个指定通道被扫描一次。在连续扫描模式下，重复扫描一个或多个指定通道，直到ADCSR.ADST位被软件从1清零为0。在组扫描模式下，A组中的选定通道和B组中的选定通道在扫描开始后扫描一次，以响应各自的同步触发(ELC)。

在单次扫描模式和连续扫描模式下，在ADANSA0和ADANSA1寄存器，从编号n最小的通道开始。在组扫描模式下，首先对ADANSA0和ADANSA1寄存器中选择的A组ANn通道进行AD转换，然后对ADANSB0和ADANSB1寄存器中选择的B组ANn通道进行AD转换，从编号最小的通道开始n.

When self-diagnosis is selected, it is executed once at the beginning of each scan, and one of the three voltages generated internally in the ADC12 is converted.

The temperature sensor output and internal reference voltage can be selected at the same time as the analog input of the channels, and A/D conversion is performed on the analog input of channels, temperature sensor output, and internal reference voltage, in that order.

Double trigger mode can be used with single scan mode or group scan mode. With double trigger mode enabled (ADCSR.DBLE = 1), A/D conversion data of a channel selected in the ADCSR.DBLANS[4:0] bits is duplicated only if the conversion is started by the synchronous trigger (ELC) selected in the TRSA[5:0] bits in ADSTRGR. Only group A in group scan mode can use the double trigger mode.

The extended operation of double trigger mode means the A/D conversion operation is generated from the synchronous trigger combination. This trigger combination is selected in ADSTRGR.TRSA[5:0] in double trigger mode. ELC_AD00 and ELC_AD01 are associated with unit 0. ELC_AD10 and ELC_AD11 are associated with unit 1.

In the extended operation of double trigger mode, in addition to normal double-trigger operation, A/D conversion data from the ELC_AD00 (unit 0) and ELC_AD10 (unit 1) triggers is stored in the A/D Data Duplexing Register A (ADDBLDRA), and A/D conversion data from the ELC_AD01 (unit 0) and ELC_AD11 (unit 1) triggers is stored in the A/D Data Duplexing Register B (ADDBLDRB). In the extended operation of double trigger mode, when a combination of triggers occurs at the same time, the data duplexing register settings for the specified triggers do not work, and A/D conversion data is stored in the A/D Data Duplexing Register B (ADDBLDRB).

When one synchronous trigger is input during the A/D conversion started by another synchronous trigger, the subsequent trigger is input when the other A/D conversion is canceled.

When any of the AN000 to AN002 (unit 0), and AN100 to AN102 (unit 1) channels are set as a channel-dedicated sample-and-hold circuit in the SHANS[2:0] bits in ADSHCR, the target analog input specified is sampled and held before the first A/D conversion of each scan.

42.3.2 Single Scan Mode

42.3.2.1 Basic operation without channel-dedicated sample-and-hold circuits

In basic operation of single scan mode, A/D conversion is performed once on the analog input of the specified channels. as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input, A/D conversion is performed on the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register (ADDRy).
3. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (without register setting).
4. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then the ADC12 enters a wait state.

选择自诊断时，在每次扫描开始时执行一次，并转换ADC12内部产生的三个电压之一。

温度传感器输出和内部参考电压可以与通道的模拟输入同时选择，通道的模拟输入、温度传感器输出和内部参考电压依次进行AD转换。

双触发模式可与单扫描模式或组扫描模式一起使用。启用双触发模式(ADCSR.DBLE=1)时，仅当转换由TRSA中选择的同步触发(ELC)启动时，ADCSR.DBLANS[4:0]位中选择的通道的AD转换数据才会被复制ADSTRGR中的[5:0]位。只有组扫描模式下的A组可以使用双触发模式。

双触发模式的扩展操作是指A/D转换操作是由同步触发组合产生的。在双触发模式下，此触发组合在ADSTRGR.TRSA[5:0]中选择。ELC_AD00和ELC_AD01与单元0关联。ELC_AD10和ELC_AD11与单元1关联。

在双触发模式的扩展操作中，除了正常的双触发操作外，来自ELC_AD00（单元0）和ELC_AD10（单元1）触发的AD转换数据存储在AD数据双工寄存器A（ADDBLDRA）中，而AD来自ELC_AD01（单元0）和ELC_AD11（单元1）触发器的转换数据存储在AD数据双工寄存器B(ADDBLDRB)中。在双触发模式的扩展操作中，当同时发生多个触发时，指定触发的数据双工寄存器设置不起作用，AD转换数据存储在AD数据双工寄存器B（ADDBLDRB）中。

在由另一个同步触发启动的AD转换期间输入一个同步触发时，在取消另一个AD转换时输入后续触发。

当任何AN000至AN002（单元0）和AN100至AN102（单元1）通道在ADSHCR的SHANS[2:0]位中设置为通道专用采样保持电路时，目标模拟输入指定在每次扫描的第一个AD转换之前被采样和保持。

42.3.2 单次扫描模式

42.3.2.1 无通道专用采样保持电路的基本操作

在单次扫描模式的基本操作中，对指定通道的模拟输入进行一次AD转换。如下：

1. 当ADCSR.ADST位通过软件触发、同步触发输入(ELC)或异步触发输入设置为1（AD转换开始）时，在ADANSA0和ADANSA1寄存器中选择的ANn通道上执行AD转换，从具有最小编号n的通道。
2. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器(ADDRy)。
3. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无需寄存器设置）。
4. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后ADC12进入等待状态。

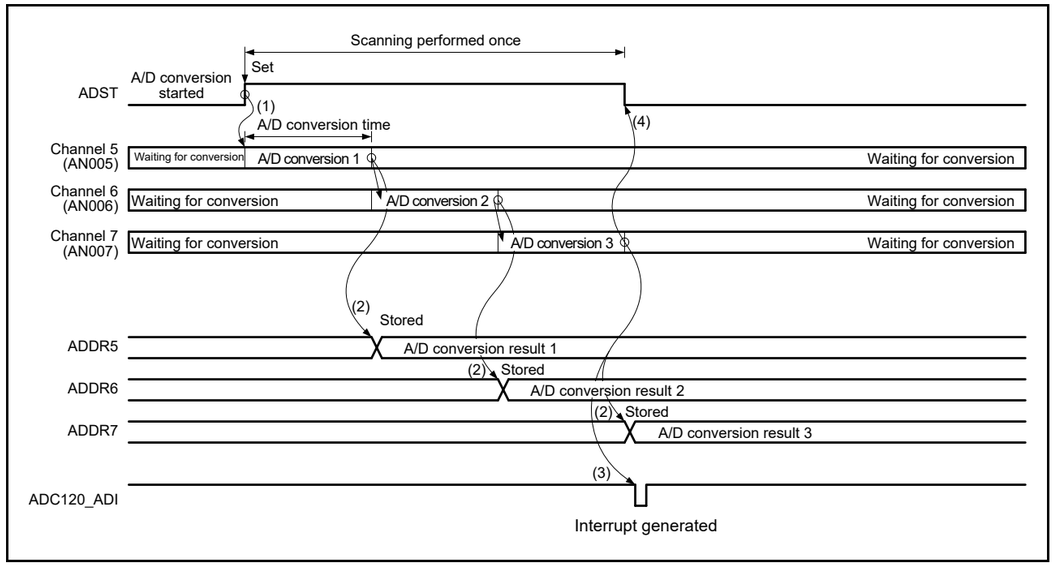

Figure 42.7 Example of basic operation in single scan mode when AN005 to AN007 are selected

42.3.2.2 Basic operation with channel-dedicated sample-and-hold circuits and continuous sampling disabled

When the channel-dedicated sample-and-hold circuit is used, sample-and-hold operation is first performed, and then A/D conversion is performed once on the analog input of all the specified channels. The channels whose dedicated sample-and-hold circuit is to be used can be selected in the SHANS[2:0] bits in ADSHCR.

The operation is as follows:

1. Analog input sampling of all channels whose dedicated sample-and-hold circuit is to be used starts when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. After sample-and-hold operation, A/D conversion is performed on the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then, the ADC12 enters a wait state.

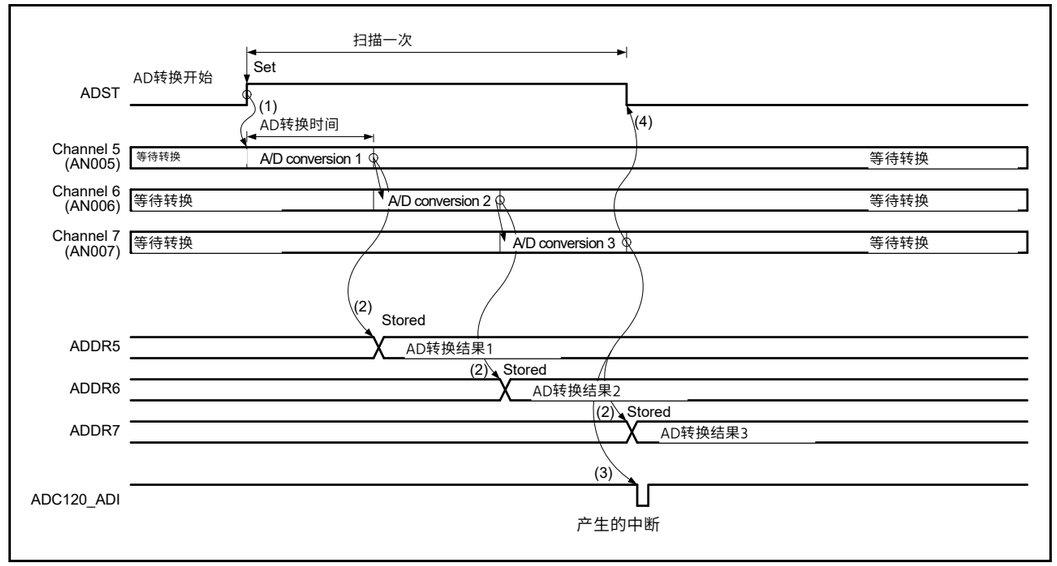

Figure 42.7 选择AN005至AN007时单次扫描模式的基本操作示例

42.3.2.2 通道专用采样保持电路和禁用连续采样的基本操作

当使用通道专用的采样保持电路时，首先进行采样保持操作，然后对所有指定通道的模拟输入进行一次A/D转换。可以在ADSHCR的SHANS[2:0]位中选择要使用专用采样保持电路的通道。

操作如下：

1. 将使用专用采样保持电路的所有通道的模拟输入采样在ADCSR.ADST位通过软件触发、同步触发输入(ELC)或异步触发输入设置为1（AD转换开始）。
2. 采样保持操作后，在ADANSA0中选择的ANn通道上执行AD转换，并ADANSA1寄存器，从编号n最小的通道开始。
3. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器(ADDRy)。
4. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
5. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后，ADC12进入等待状态。

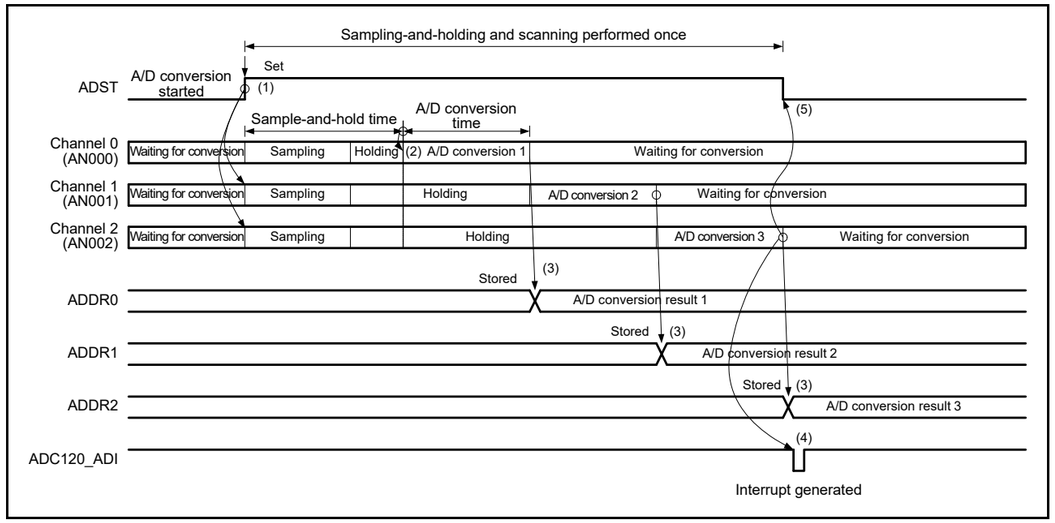

Figure 42.8 Example of operation in single scan mode when the channel-dedicated sample-and-hold circuits are used and AN000 to AN002 are selected

42.3.2.3 Basic operation with channel-dedicated sample-and-hold circuits and continuous sampling enabled

When a channel-dedicated sample-and-hold circuit is used while continuous sampling is enabled, sample-and-hold operation is performed first, followed by A/D conversion once on the analog inputs of all selected channels. The ADSHCR.SHANS[2:0] bits specify the channels for which the channel-dedicated sample-and-hold circuits are to be used.

The operation is as follows:

1. When the ADSHMSR.SHMD bit is set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
2. Analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, input of a synchronous trigger signal (ELC), or input of an asynchronous trigger.
3. After the stabilization time of the sample-and-hold circuits elapses, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register (ADDRy), and the sample-and-hold circuit restarts continuous sampling.
5. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (without register setting).
6. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then, the ADC12 enters a wait state. If this is followed by single scanning, set the continuous sampling time for the sample-and-hold circuits to at least 400 ns (when the permissible signal source impedance is 1 kΩ).
7. When the ADSHMSR.SHMD bit is set to 0, the sample-and-hold circuits stop.

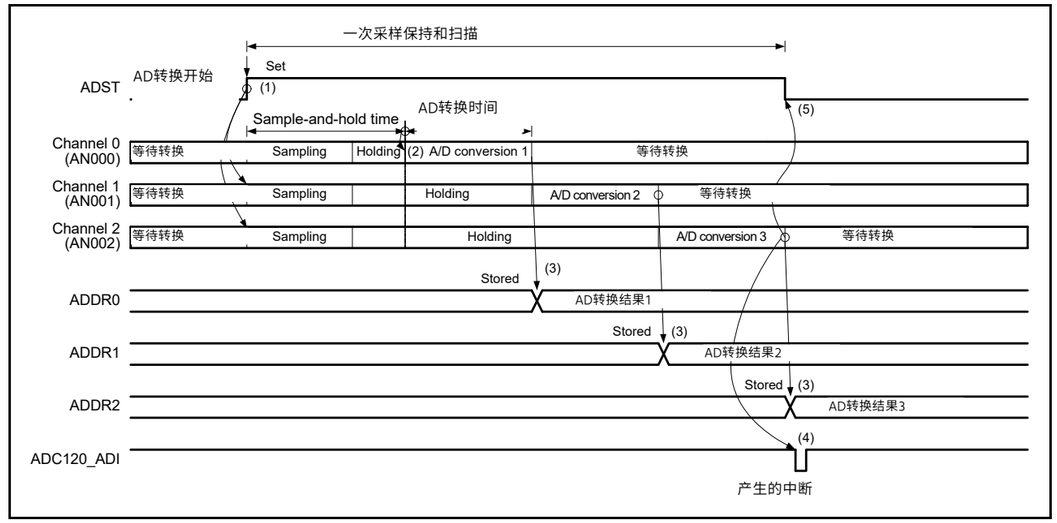

Figure 42.8 使用通道专用采样保持电路并选择AN000至AN002时单次扫描模式的操作示例

42.3.2.3 具有通道专用采样保持电路和连续采样的基本操作

如果在启用连续采样的情况下使用通道专用的采样保持电路，则首先执行采样保持操作，然后在所有选定通道的模拟输入上进行一次AD转换。ADSHCR.SHANS[2:0]位指定要使用通道专用采样保持电路的通道。

操作如下：

1. 当ADSHMSR.SHMD位设置为1时，在ADSHCR.SHANS[2:0]位中选择的采样保持电路开始连续采样。
2. 当ADCSR.ADST位通过软件触发设置为1（AD转换开始），同步触发信号的输入（ELC），或异步触发器的输入。
3. 经过采样保持电路的稳定时间后，从编号n最小的通道开始，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换。
4. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器（ADDRy），采样保持电路重新开始连续采样。
5. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无需寄存器设置）。
6. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后，ADC12进入等待状态。如果随后进行单次扫描，请将采样保持电路的连续采样时间设置为至少400ns（当允许的信号源阻抗为1kΩ时）。
7. 当ADSHMSR.SHMD位设置为0时，采样保持电路停止。

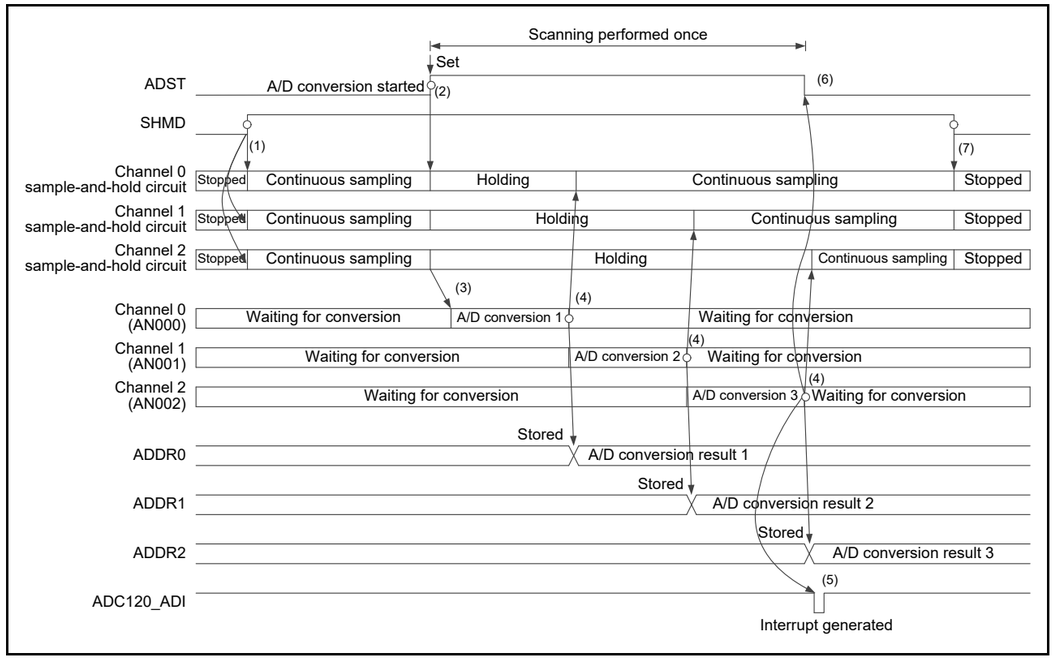

Figure 42.9 Example of operation in single scan mode when channel-dedicated sample-and-hold circuits are used, AN000 to AN002 are selected, and continuous sampling is enabled

42.3.2.4 Channel selection and self-diagnosis without channel-dedicated sample-and-hold circuits

When channels and self-diagnosis are selected, A/D conversion is first performed for the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (× 0, × 1/2, or × 1) supplied to the ADC12, and then A/D conversion is performed once on the analog input of the specified channels.

The operation is as follows:

1. A/D conversion for self-diagnosis is first started when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then, the ADC12 enters a wait state.

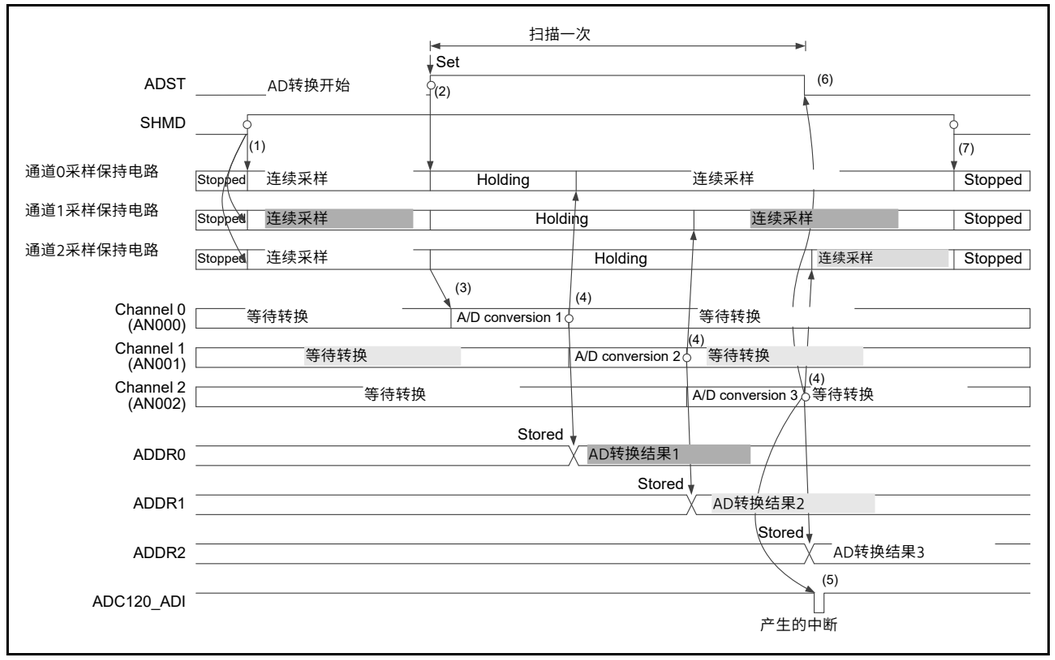

Figure 42.9 使用通道专用采样保持电路、选择AN000至AN002并启用连续采样时的单次扫描模式操作示例

42.3.2.4 通道选择和自诊断，无需通道专用的采样和保持电路

Whenchannelsandself-diagnosisareselected ADconversionisfirstperformedforthereferencevoltageVREFH0(unit0)orVREFH(unit1)(×0 ×12 or×1)suppliedtotheADC12 andthenADconversion在指定通道的模拟输入上执行一次。

操作如下：

1. 通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，首先启动用于自诊断的D转换。
2. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中
数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并
ADANSA1寄存器，从编号n最小的通道开始。
3. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中
数据寄存器(ADDRy)。
4. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
5. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后，ADC12进入等待状态。

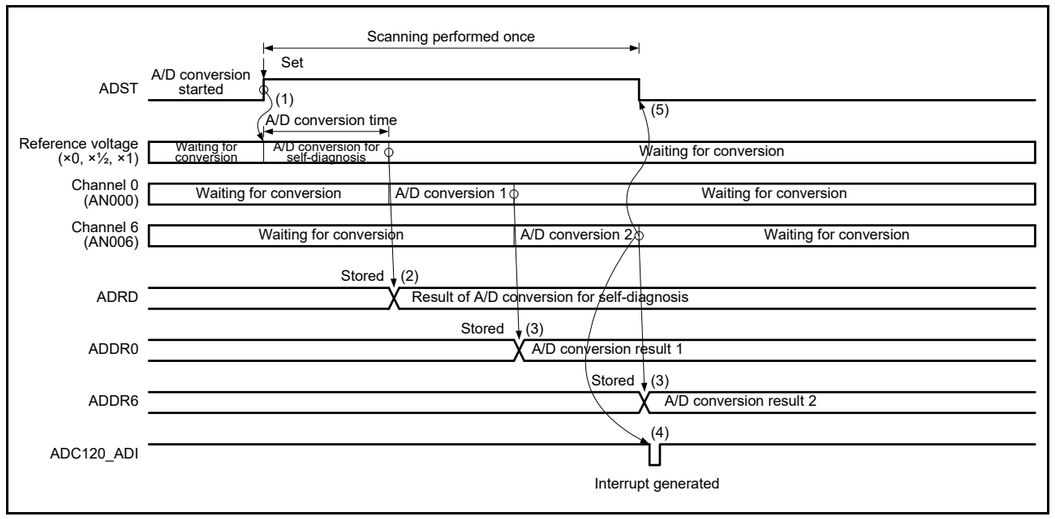

Figure 42.10 Example of basic operation in single scan mode when AN000 and AN006 are selected with self-diagnosis

42.3.2.5 Channel selection and self-diagnosis with channel-dedicated sample-and-hold circuits and continuous sampling disabled

When channels and self-diagnosis are selected and a channel-dedicated sample-and-hold circuit is used while continuous sampling is disabled, the sample-and-hold operation is performed first, and then A/D conversion is performed once for the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (×0, ×1/2, or ×1) supplied to the ADC12. After that, A/D conversion is performed only once on the analog input of the selected channels.

The operation is as follows:

1. Analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. After sample-and-hold operation, A/D conversion for self-diagnosis starts.
3. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
5. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (without register setting).
6. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then, the ADC12 enters a wait state.

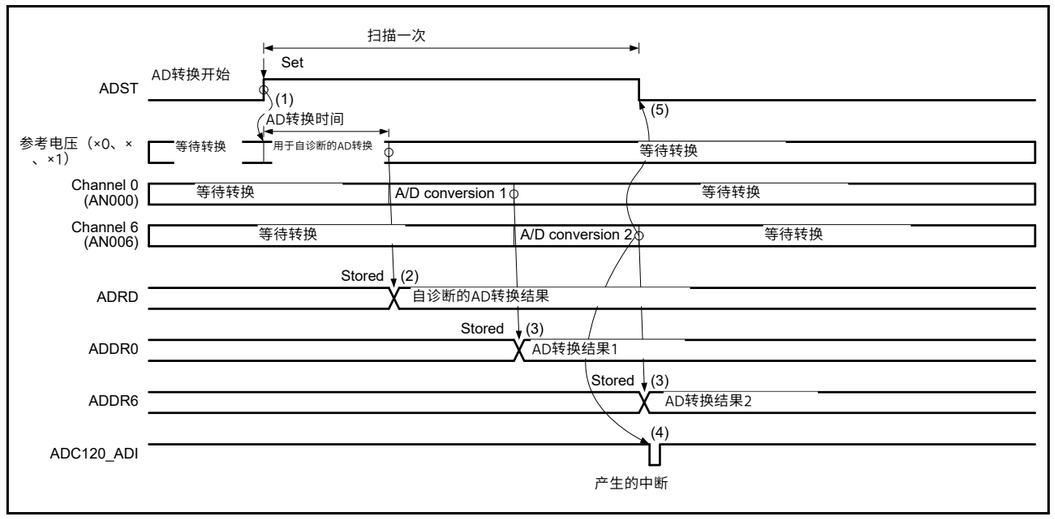

Figure 42.10 自诊断选择AN000和AN006时单次扫描模式的基本操作示例

42.3.2.5 通道专用采样保持电路和禁用连续采样的通道选择和自诊断

Whenchannelsandself-diagnosisareselectedandachannel-dedicatedsample-and-holdcircuitisusedwhilecontinuoussamplingisdisabled thesample-and-holdoperationisperformedfirst andthenADconversionisperformedonceforthereferencevoltageVREFH0（单元0）或VREFH（单元1）（×0、×12或×1）提供给ADC12。之后，仅对所选通道的模拟输入执行一次AD转换。

操作如下：

1. 模拟输入采样开始于其专用采样保持电路的所有通道，当ADCSR.ADST位通过软件触发、同步触发输入(ELC)或异步触发输入设置为1（AD转换开始）。
2. 采样保持操作后，用于自诊断的AD转换开始。
3. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并ADANSA1寄存器，从编号n最小的通道开始。
4. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
5. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无需寄存器设置）。
6. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后，ADC12进入等待状态。

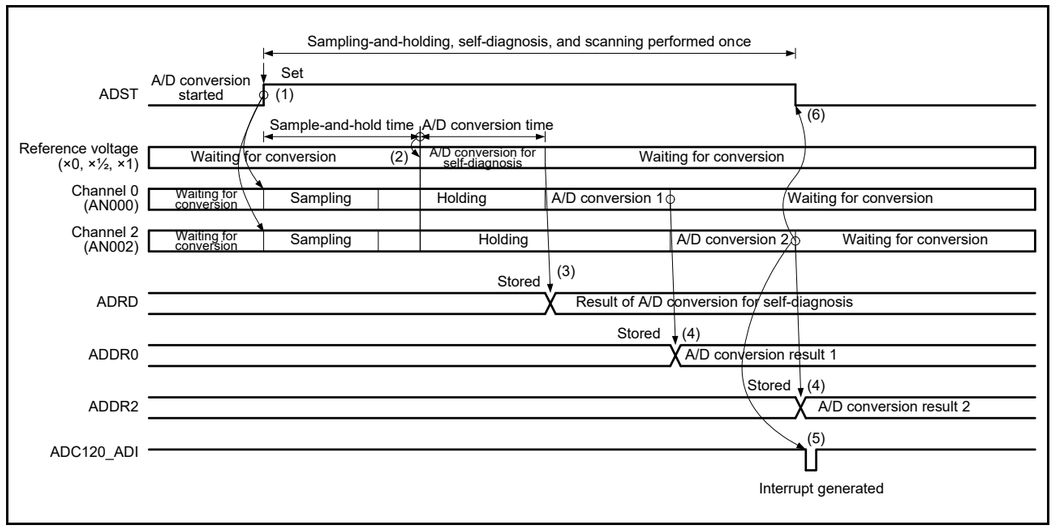

Figure 42.11 Example of operation in single scan mode when channel-dedicated sample-and-hold circuits are used, AN000 and AN002 are selected with self-diagnosis, and continuous sampling is disabled

42.3.2.6 Channel selection and self-diagnosis with channel-dedicated sample-and-hold circuits and continuous sampling enabled

When channels and self-diagnosis are selected and a channel-dedicated sample-and-hold circuit is used while continuous sampling is enabled, sample-and-hold operations are performed first, and this is followed by A/D conversion of the reference voltage VREFH0 (unit 0) or VREFH (unit 1) supplied to the ADC12. After that, A/D conversion is performed only once on the analog input of the selected channels.

The operation is as follows:

1. When the ADSHMSR.SHMD bit is set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
2. Analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, input of a synchronous trigger signal (ELC), or input of an asynchronous trigger. Set the ADCSR.ADST bit to 1 after at least 400 ns (when the permissible signal source impedance is 1 kΩ) elapse after the ADSHMSR.SHMD bit is set to 1.
3. After the stabilization time of the sample-and-hold circuits elapses, A/D conversion for self-diagnosis starts.
4. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
5. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy), and the sample-and-hold circuit restarts continuous sampling.
6. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (without register setting).
7. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then, the ADC12 enters a wait state. If this is followed by single scanning, set the continuous sampling time for the sample-and-hold circuits to at least 400 ns (when the permissible signal source impedance is 1 kΩ).
8. When the ADSHMSR.SHMD bit is set to 0, the sample-and-hold circuits stop.

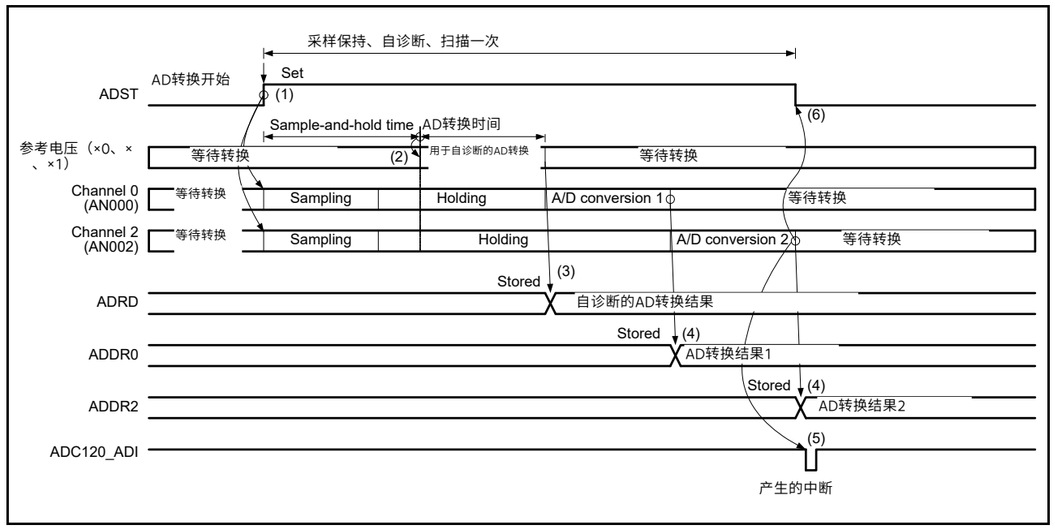

Figure 42.11 使用通道专用采样保持电路、AN000和AN002选择自诊断且禁用连续采样时的单次扫描模式操作示例

42.3.2.6 通道选择和自诊断，带有通道专用的采样保持电路和连续采样使能

Whenchannelsandself-diagnosisareselectedandachannel-dedicatedsample-and-holdcircuitisusedwhilecontinuoussamplingisenabled sample-and-holdoperationsareperformedfirst andthisisfollowedbyADconversionofthereferencevoltageVREFH0(单元0)或VREFH(单元1)提供给ADC12。之后，仅对所选通道的模拟输入执行一次AD转换。

操作如下：

1. 当ADSHMSR.SHMD位设置为1时，在ADSHCR.SHANS[2:0]位中选择的采样保持电路开始连续采样。
2. 当ADCSR.ADST位通过软件触发设置为1（AD转换开始），同步触发信号的输入（ELC），或异步触发器的输入。在ADSHMSR.SHMD位设置为1后至少经过400ns（当允许的信号源阻抗为1kΩ时）后，将ADCSR.ADST位设置为1。
3. 经过采样保持电路的稳定时间后，开始进行自诊断的A/D转换。
4. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并ADANSA1寄存器，从编号n最小的通道开始。
5. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)，采样保持电路重新开始连续采样。
6. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无需寄存器设置）。
7. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后，ADC12进入等待状态。如果随后进行单次扫描，请将采样保持电路的连续采样时间设置为至少400ns（当允许的信号源阻抗为1kΩ时）。
8. 当ADSHMSR.SHMD位设置为0时，采样保持电路停止。

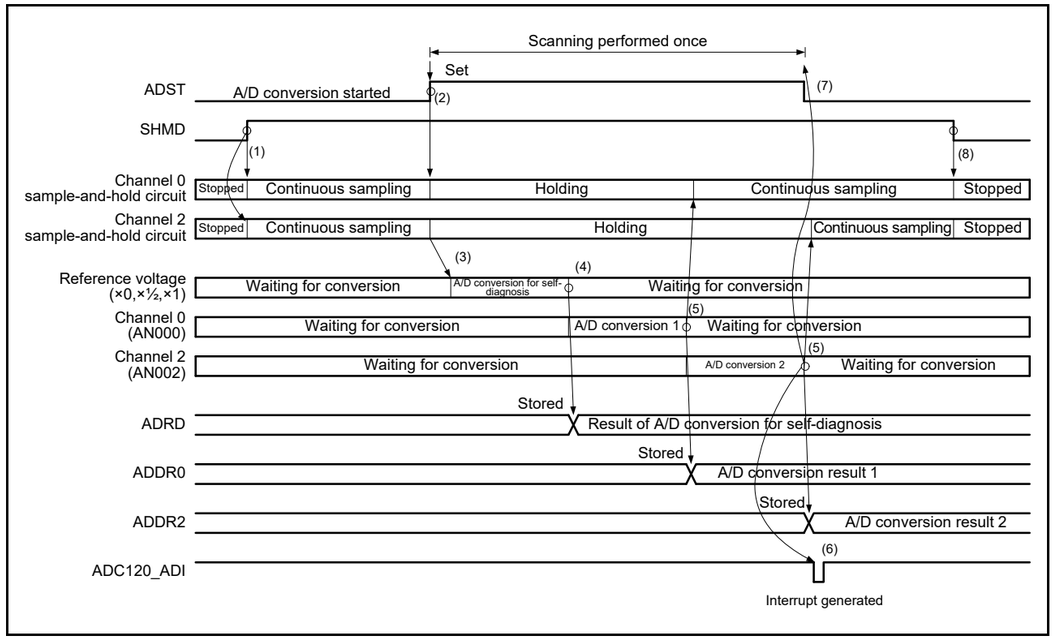

Figure 42.12 Example of operation in single scan mode when channel-dedicated sample-and-hold circuits are used, AN000 to AN002 are selected with self-diagnosis, and continuous sampling is enabled

42.3.2.7 A/D conversion of temperature sensor output or internal reference voltage

When the channels and temperature sensor output or internal reference voltage are selected at the same time, A/D conversion is first performed on the analog input of the selected channels, and then A/D conversion is performed once on the temperature sensor output or internal reference voltage. When both temperature sensor output and internal reference voltage are selected, A/D conversion of the temperature sensor output and internal reference voltage is performed, in that order. With the channels deselected, selecting only the temperature sensor output or internal reference voltage is also possible.

The operation is as follows:

1. When a software trigger, synchronous trigger (ELC), or asynchronous trigger sets the ADCSR.ADST bit to 1 (A/D conversion start), A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. On completion of A/D conversion on the channels, the result is stored in the associated A/D Data Register y (ADDRy), and then A/D conversion of the temperature sensor output starts.
3. On completion of A/D conversion of the temperature sensor output, the result is stored in the associated A/D Temperature Sensor Data Register (ADTSDR), and then A/D conversion of the internal reference voltage starts.
4. On completion of A/D conversion of the internal reference voltage, the result is stored in the associated A/D Internal Reference Voltage Data Register (ADOCDR), and an ADC12i_ADI (i = 0, 1) interrupt request is generated (without register setting).
5. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 on completion of A/D conversion. Then, the ADC12 enters a wait state.

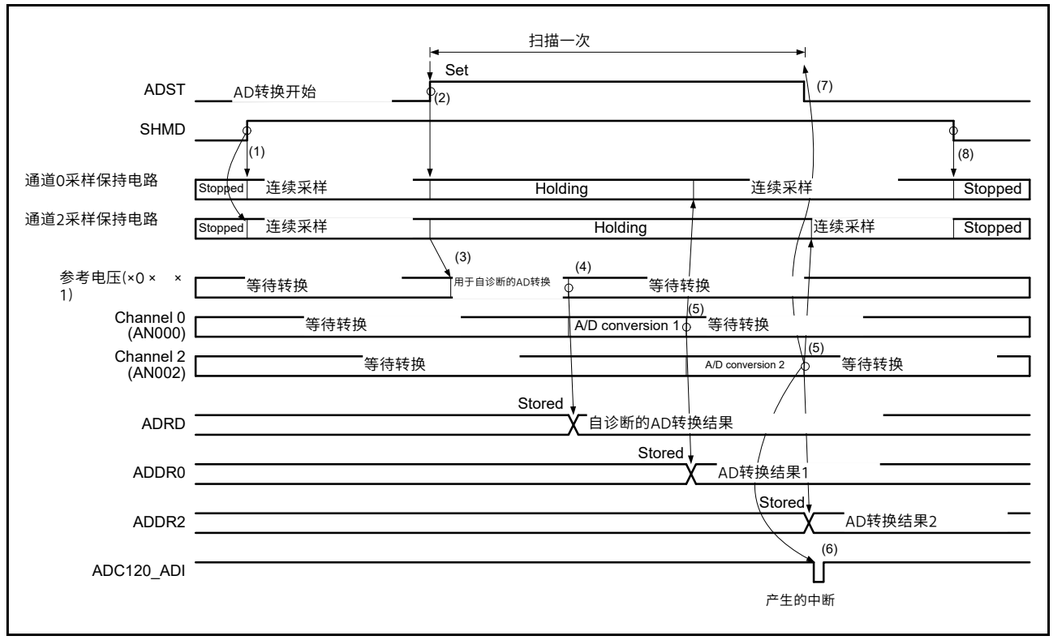

Figure 42.12 使用通道专用采样保持电路、AN000至AN002选择自诊断并启用连续采样时的单次扫描模式操作示例

42.3.2.7 温度传感器输出或内部参考电压的AD转换

当同时选择通道和温度传感器输出或内部参考电压时，首先对所选通道的模拟输入进行AD转换，然后对温度传感器输出或内部参考电压进行一次AD转换。当同时选择温度传感器输出和内部参考电压时，按顺序执行温度传感器输出和内部参考电压的AD转换。取消选择通道后，也可以仅选择温度传感器输出或内部参考电压。

操作如下：

1. 当软件触发、同步触发(ELC)或异步触发将ADCSR.ADST位设置为1（AD转换开始）时，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从具有最小的数n。
2. 在通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中，然后温度传感器输出的AD转换开始。
3. 温度传感器输出的AD转换完成后，结果存储在相关的AD中
温度传感器数据寄存器(ADTSDR)，然后内部参考电压的AD转换开始。
4. 内部参考电压的AD转换完成后，结果存储在相关的AD中
内部参考电压数据寄存器(AOCDR)，并产生一个ADC12i_ADI(i=0 1)中断请求（无需寄存器设置）。
5. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动清零。然后，ADC12进入等待状态。

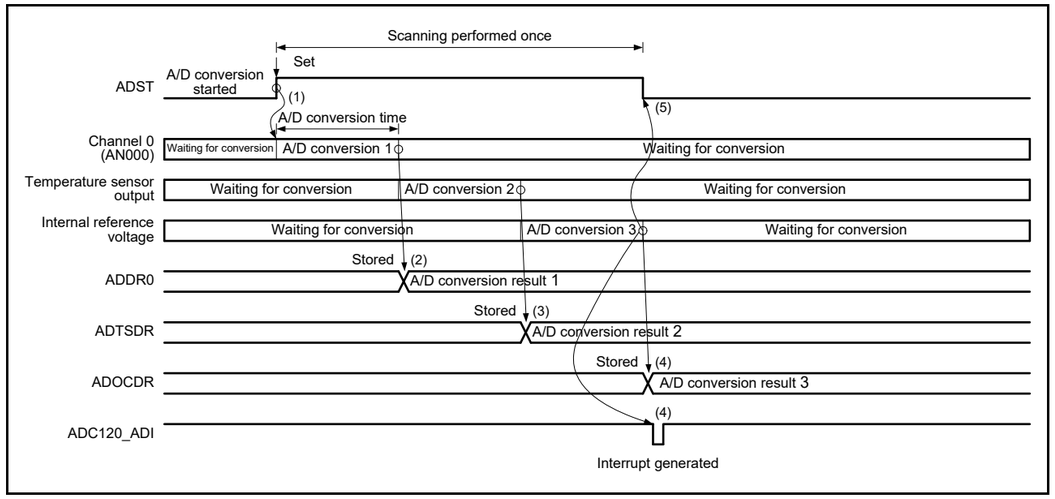

Figure 42.13 Example of basic operation in single scan mode when AN000 and temperature sensor output or internal reference voltage are selected

42.3.2.8 A/D conversion in double trigger mode

When double trigger mode is selected in single scan mode, two rounds of single scan operation started by a synchronous trigger (ELC) are performed in sequence.

Deselect self-diagnosis, and set the addition/average mode select bits for both temperature sensor output (ADEXICR.TSSA) and internal reference voltage (ADEXICR.OCSA) to 0.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated in the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE to 1. When the ADCSR.DBLE bit is set to 1, channel selection using the ADANSA0 and ADANSA1 registers is invalid.

In double trigger mode, select a synchronous trigger (ELC) using the ADSTRGR.TRSA[5:0] bits, and in ADCSR, set the EXTRG bit to 0 and the TRGE bit to 1. Do not use a software trigger.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a synchronous trigger input (ELC), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
3. The ADST bit is automatically cleared to 0 and the ADC12 enters a wait state. An ADC12i_ADI (i = 0, 1) interrupt request is not generated.
4. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by the second trigger input, A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
5. When A/D conversion completes, the result is stored in the A/D Data Duplexing Register (ADDBLDR), which is exclusively used in double trigger mode.
6. An ADC12i_ADI (i = 0, 1) interrupt request is generated (without register setting).
7. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion completes. Then, the ADC12 enters a wait state.

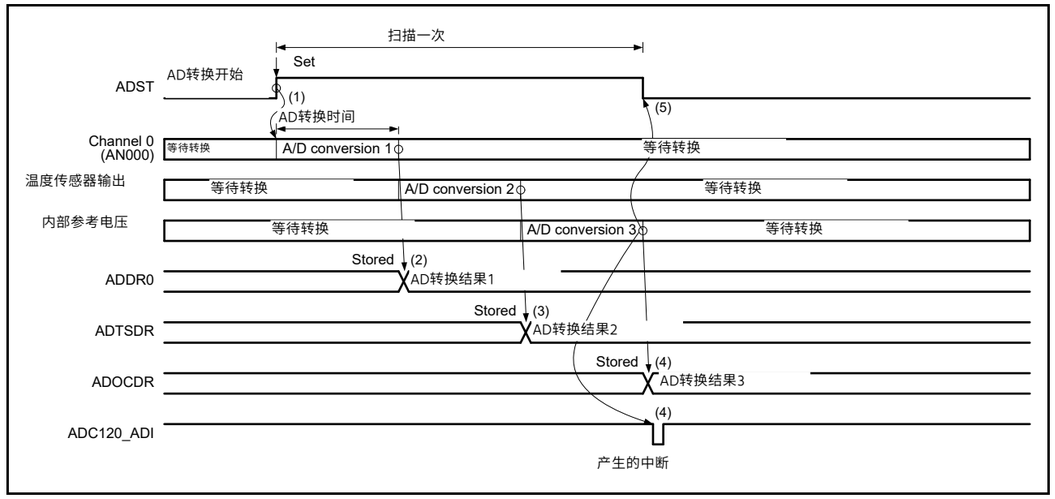

Figure 42.13 选择AN000和温度传感器输出或内部参考电压时单次扫描模式下的基本操作示例

42.3.2.8 双触发模式下的AD转换

在单扫描模式下选择双触发模式时，由同步触发(ELC)启动的两轮单扫描操作将依次执行。

取消选择自诊断，并将温度传感器输出(ADEXICR.TSSA)和内部参考电压(ADEXICR.OCSA)的加法平均模式选择位设置为0。

AD转换数据的复制通过在ADCSR.DBLANS[4:0]位并将ADCSR.DBLE设置为1。当ADCSR.DBLE位设置为1时，使用ADANSA0和ADANSA1寄存器的通道选择无效。

在双触发模式下，使用ADSTRGR.TRSA[5:0]位选择同步触发(ELC)，在ADCSR中，设置EXTRG位为0，TRGE位为1。不要使用软件触发。

操作如下：

1. 当同步触发输入(ELC)将ADCSR.ADST位设置为1（AD转换开始）时，AD转换在ADCSR.DBLANS[4:0]位中选择的单个通道上开始。
2. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
3. ADST位自动清零，ADC12进入等待状态。不会产生ADC12i_ADI(i=0 1)中断请求。
4. 当第二个触发输入将ADCSR.ADST位设置为1（AD转换开始）时，AD转换在ADCSR.DBLANS[4:0]位中选择的单个通道上开始。
5. 当AD转换完成时，结果存储在AD数据双工寄存器(ADDBLDR)中，该寄存器专用于双触发模式。
6. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
7. ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动清零。然后，ADC12进入等待状态。

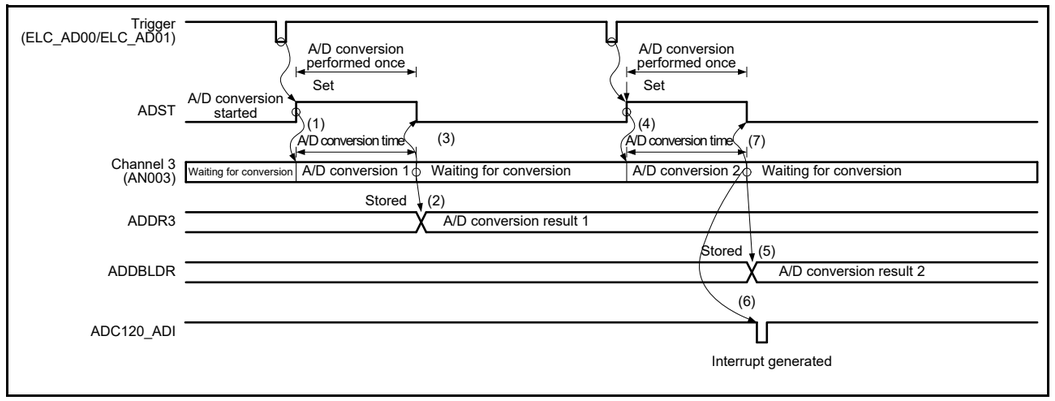

Figure 42.14 Example of operation in single scan mode when double trigger mode is selected and AN003 is duplicated

42.3.2.9 Extended operations when double trigger mode is selected

When double trigger mode is selected in single scan mode, and a synchronous trigger (ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1)) is selected as the trigger for the start of A/D conversion, two rounds of single scan operation are performed.

Deselect self-diagnosis, and set the addition/average mode select bits for both temperature sensor output (ADEXICR.TSSA and ADEXICR.TSSB) and internal reference voltage (ADEXICR.OCSA and ADEXICR.OCSB) to 0.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated in the ADCSR.DBLANS[4:0] bits, and setting the ADCSR.DBLE bit to 1. When the ADCSR.DBLE bit is set to 1, channel selection using the ADANSA0 and ADANSA1 registers is invalid.

In extended double trigger mode, select a synchronous trigger (ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1)) by setting the ADSTRGR.TRSA[5:0] bits to 0Bh, and in ADCSR, set the EXTRG bit to 0 and the TRGE bit to 1. Do not use a software trigger.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a synchronous trigger input (ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1)), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. When A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register y (ADDRy) and in A/D Data Duplexing Register A (ADDBLDRA) or A/D Data Duplexing Register B (ADDBLDRB) when the trigger of ELC_ADi0 or ELC_ADi1 is input respectively (i = 0, 1).
3. The ADCSR.ADST bit is automatically cleared to 0 and the ADC12 enters a wait state. An ADC12i_ADI (i = 0, 1) interrupt request is not generated.
4. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by the second trigger input (ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1)), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
5. When A/D conversion completes, the result is stored in the A/D Data Duplexing Register (ADDBLDR) and in A/D Data Duplexing Register A (ADDBLDRA) or A/D Data Duplexing Register B (ADDBLDRB) when the trigger of ELC_ADi0 or ELC_ADi1 is input respectively (i = 0, 1).
6. An ADC12i_ADI (i = 0, 1) interrupt request is generated (without register setting).
7. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion and is automatically cleared to 0 when A/D conversion completes. Then, the ADC12 enters a wait state.

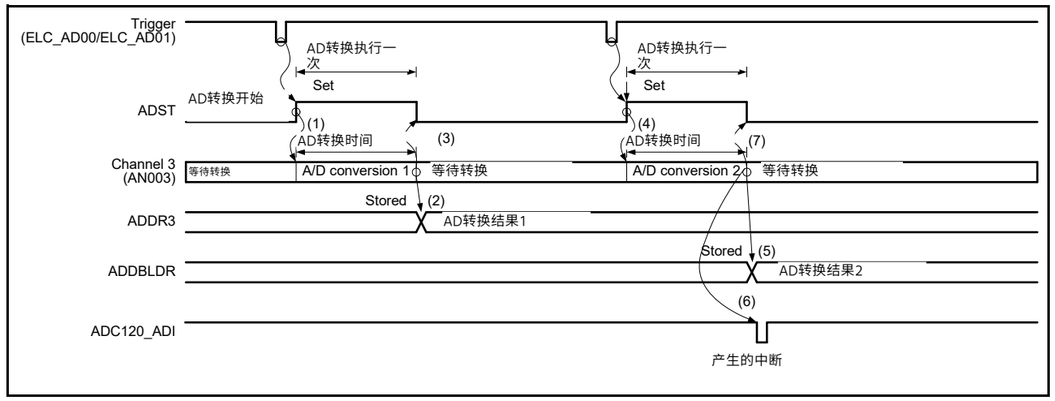

Figure 42.14 选择双触发模式并复制AN003时的单扫描模式操作示例

42.3.2.9 选择双触发模式时的扩展操作

当在单扫描模式下选择双触发模式，并且同步触发（ELC_AD00ELC_AD01（单元0），ELC_AD10ELC_AD11(unit1))被选为AD转换开始的触发器，执行两轮单次扫描操作。

取消选择自诊断，并将温度传感器输出（ADEXICR.TSSA和ADEXICR.TSSB）和内部参考电压（ADEXICR.OCSA和ADEXICR.OCSB）的加法平均模式选择位设置为0。

AD转换数据的复制通过在ADCSR.DBLANS[4:0]位，并将ADCSR.DBLE位设置为1。当ADCSR.DBLE位设置为1时，使用ADANSA0和ADANSA1寄存器的通道选择无效。

在扩展双触发模式下，选择同步触发（ELC_AD00ELC_AD01（单元0），ELC_AD10ELC_AD11(unit1))通过将ADSTRGR.TRSA[5:0]位设置为0Bh，并在ADCSR中将EXTRG位设置为0并将TRGE位设置为1。不要使用软件触发。

操作如下：

1. 当同步触发输入（ELC_AD00ELC_AD01（单元0）、ELC_AD10ELC_AD11（单元1））将ADCSR.ADST位设置为1（AD转换开始）时，ADCSR.DBLANS[中选择的单通道上开始AD转换4:0]位。
2. 当单通道AD转换完成时，当ELC_ADi0或ELC_ADi0或分别输入ELC_ADi1(i=0 1)。
3. ADCSR.ADST位自动清零，ADC12进入等待状态。不会产生ADC12i_ADI(i=0 1)中断请求。
4. 当第二个触发输入（ELC_AD00ELC_AD01（单元0）、ELC_AD10ELC_AD11（单元1））将ADCSR.ADST位设置为1（AD转换开始）时，ADCSR.DBLANS[中选择的单通道开始AD转换4:0]位。
5. 当AD转换完成时，结果存储在AD数据双工寄存器(ADDBLDR)和AD数据双工寄存器A(ADDBLDRA)或AD数据双工寄存器B(ADDBLDRB)中。
   分别输入ELC_ADi0或ELC_ADi1(i=0 1)。
6. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
7. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动清零。然后，ADC12进入等待状态。

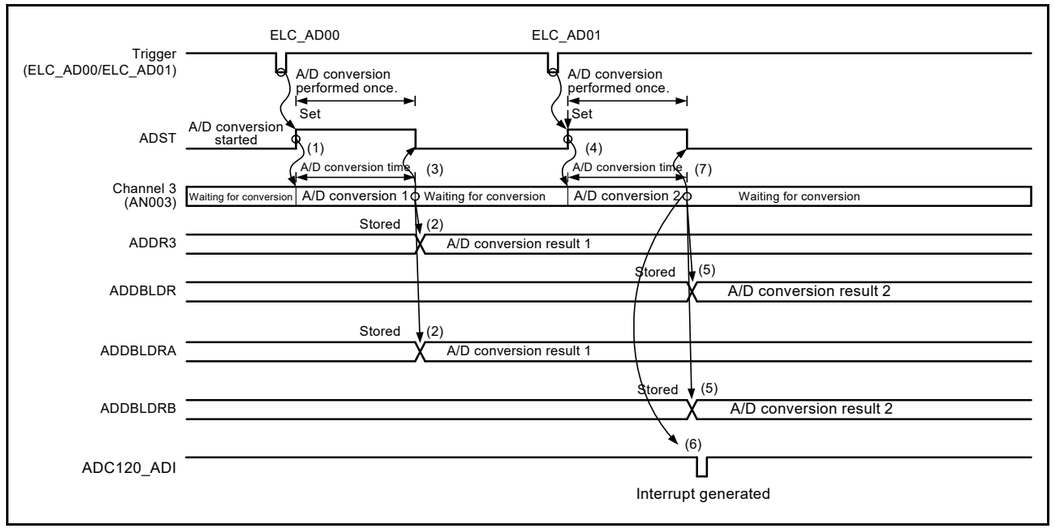

Figure 42.15 Example of extended operation in double trigger mode (1) when duplication is selected for AN003 and ELC_AD00/ELC_AD01 is selected

42.3.3 Continuous Scan Mode

42.3.3.1 Basic operation without channel-dedicated sample-and-hold circuits

In basic operation of continuous scan mode, A/D conversion is performed repeatedly on the analog input of the specified channels.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
3. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0,1) interrupt request is generated (without register setting). The ADC12 sequentially starts A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. The ADCSR.ADST bit is not automatically cleared, and steps 2. and 3. are repeated as long as the bit remains 1 (A/D conversion start). When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
5. When the ADST bit is set to 1 (A/D conversion start), A/D conversion starts again for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.

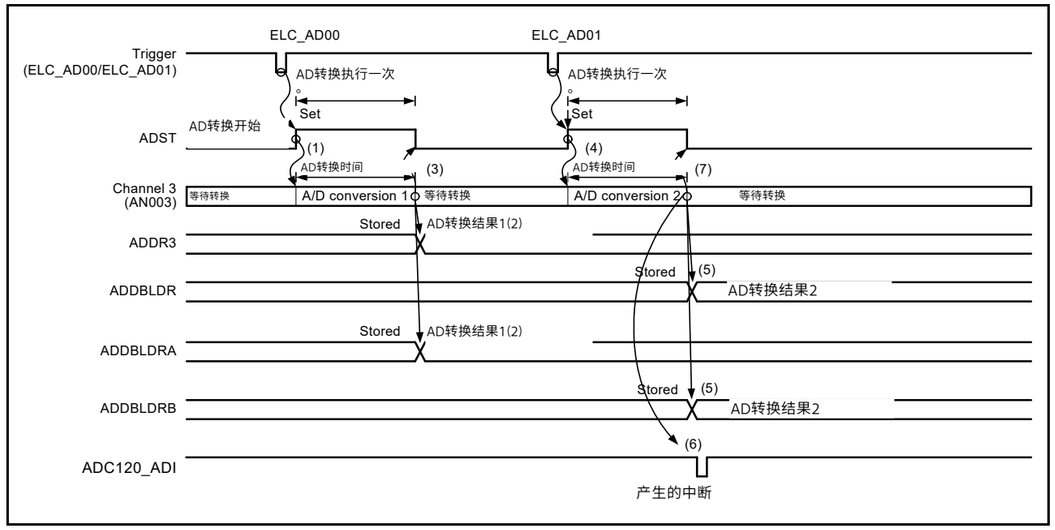

Figure 42.15 双触发模式下的扩展操作示例(1)为AN003选择了复制并选择了ELC_AD00ELC_AD01时

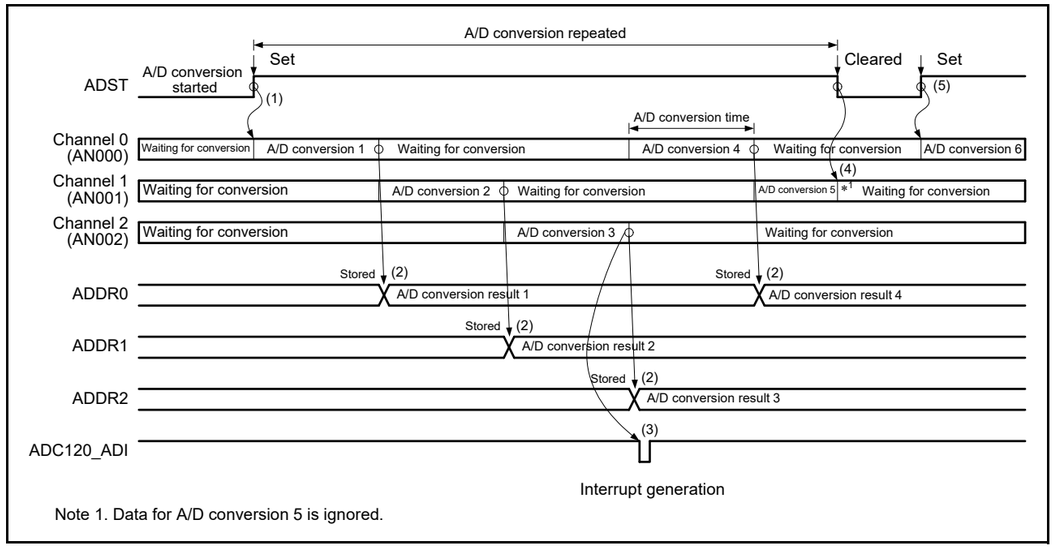
42.3.3 连续扫描模式

42.3.3.1 无通道专用采样保持电路的基本操作

在连续扫描模式的基本操作中，对指定通道的模拟输入重复进行AD转换。

操作如下：

1. 当通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，将从ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从具有最小编号n的通道。
2. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
3. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无需寄存器设置）。ADC12从编号n最小的通道开始依次启动ADANSA0和ADANSA1寄存器中选择的ANn通道的A/D转换。
4. ADCSR.ADST位不会自动清零，只要该位保持为1（AD转换开始），就会重复步骤2.和3.。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
5. 当ADST位设置为1（AD转换开始）时，AD转换再次开始在ADANSA0和ADANSA1寄存器中选择的ANn通道，从具有最小编号n的通道开始。



Note 1. Data for A/D conversion 5 is ignored.

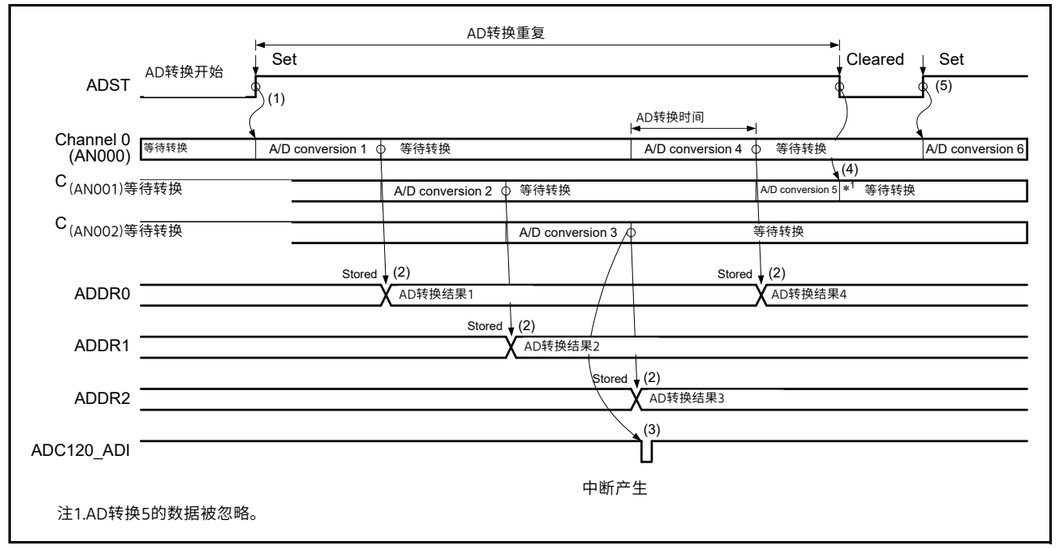
Figure 42.16 Example of basic operation in continuous scan mode when AN000 to AN002 are selected

42.3.3.2 Basic operation with channel-dedicated sample-and-hold circuits and continuous sampling disabled

When the channel-dedicated sample-and-hold circuit is used with continuous sampling disabled, sample-and-hold operation is first performed, and then A/D conversion is repeated on the analog input of all the specified channels. The channels whose dedicated sample-and-hold circuit is to be used can be selected in the SHANS[2:0] bits in ADSHCR.

The operation is as follows:

1. Analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. After sample-and-hold operation, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting). At the same time, analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used.
5. The ADST bit is not automatically cleared, and steps 2. to 4. are repeated as long as the bit remains at 1. When the ADST bit is set to 0 (A/D conversion stop), A/D conversion stops, and the ADC12 enters a wait state.
6. When the ADST bit is then set to 1 (A/D conversion start), analog input sampling starts again for all channels whose dedicated sample-and-hold circuit is to be used.



注1.AD转换5的数据被忽略。

Figure 42.16 选择AN000至AN002时连续扫描模式下的基本操作示例

42.3.3.2 通道专用采样保持电路和禁用连续采样的基本操作

当通道专用采样保持电路在连续采样禁用的情况下使用时，首先执行采样保持操作，然后在所有指定通道的模拟输入上重复AD转换。可以在ADSHCR的SHANS[2:0]位中选择要使用专用采样保持电路的通道。

操作如下：

1. 模拟输入采样开始于其专用采样保持电路的所有通道，当ADCSR.ADST位通过软件触发、同步触发输入(ELC)或异步触发输入设置为1（AD转换开始）。
2. 采样保持操作后，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从编号n最小的通道开始。
3. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
4. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。同时，对所有要使用专用采样保持电路的通道开始模拟输入采样。
5. ADST位不会自动清除，只要该位保持为1，就会重复步骤2.到4.。当ADST位设置为0（AD转换停止），AD转换停止，ADC12进入等待状态。
6. 当ADST位随后设置为1（AD转换开始）时，模拟输入采样将重新开始对所有要使用专用采样保持电路的通道进行。

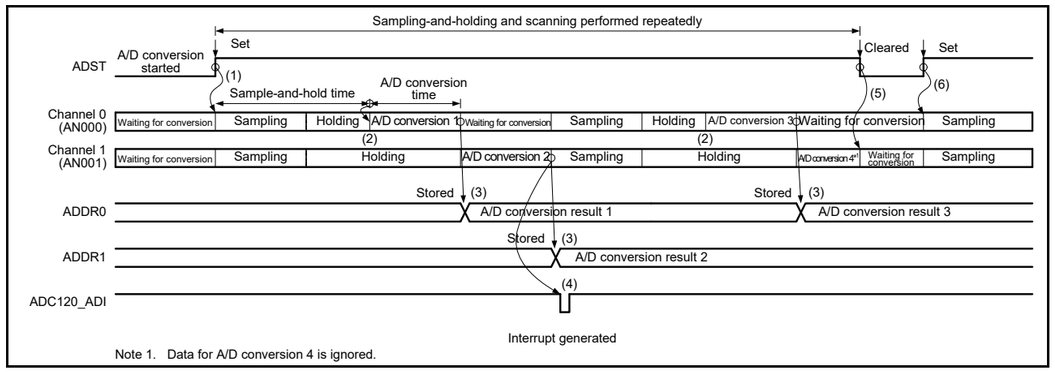


Figure 42.17 Example of operation in continuous scan mode when channel-dedicated sample-and-hold circuits are used and AN000 and AN001 are selected

42.3.3.3 Basic operation with channel-dedicated sample-and-hold circuits and continuous sampling enabled

When a channel-dedicated sample-and-hold circuit is used with continuous sampling enabled, sample-and-hold operations are performed first, after which the analog inputs on all selected channels are A/D-converted as described in this section. The channels for which the channel-dedicated sample-and-hold circuits are to be used can be selected in the ADSHCR.SHANS[2:0] bits.

The operation is as follows:

1. When the ADSHMSR.SHMD bit is set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
2. Analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, input of a synchronous trigger signal (ELC), or input of an asynchronous trigger. Set the ADCSR.ADST bit to 1 after at least 400 ns (when the permissible signal source impedance is 1 kΩ) elapse after the ADSHMSR.SHMD bit is set to 1.
3. After the stabilization time of the sample-and-hold circuits elapses, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy), and the sample-and-hold circuit restarts continuous sampling.
5. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (without register setting). Also, analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used.
6. The ADCSR.ADST bit is not automatically cleared, and steps 3. to 5. are repeated as long as the bit remains 1. When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
7. When the ADSHMSR.SHMD bit is set to 0, the sample-and-hold circuits stop.
8. When the ADSHMSR.SHMD bit is then set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
9. When the ADCSR.ADST bit is then set to 1 (A/D conversion start), analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used.

Note: If continuous scanning is performed when only the channels with the sample-and-hold circuits are selected, time for continuous sampling cannot be secured in the second and subsequent continuous scans. When continuous sampling by the channel-dedicated sample-and-hold circuits is enabled for continuous scanning, select one or more channels from AN003 to AN007, AN016 to AN018, AN020, temperature sensor output, and internal reference voltage for unit 0, and AN105 to AN107, AN116, AN117, temperature sensor output, and internal reference voltage for unit 1, and set the continuous sampling time for the sample-and-hold circuits to at least 400 ns (when the permissible signal source impedance is 1 kΩ).

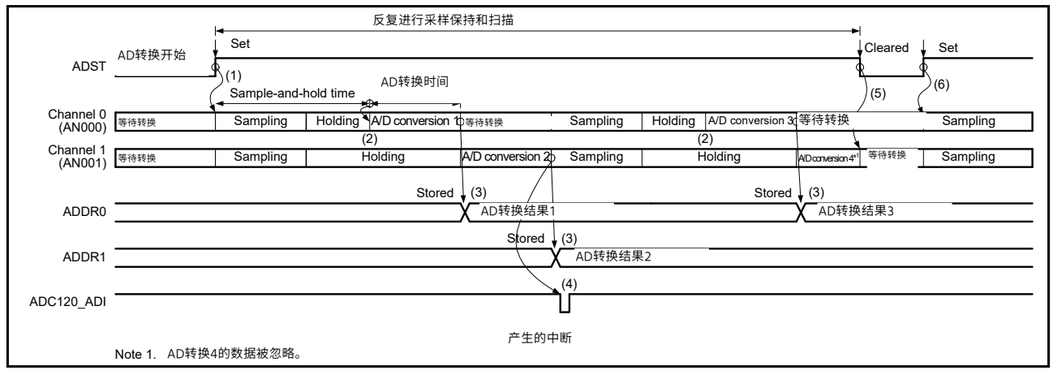

Figure 42.17 使用通道专用采样保持电路并选择AN000和AN001时连续扫描模式下的操作示例

42.3.3.3 具有通道专用采样保持电路和连续采样的基本操作

在启用连续采样的情况下使用通道专用的采样保持电路时，首先执行采样保持操作，然后按照本节所述对所有选定通道上的模拟输入进行AD转换。可以在ADSHCR.SHANS[2:0]位中选择要使用通道专用采样保持电路的通道。

操作如下：

1. 当ADSHMSR.SHMD位设置为1时，在ADSHCR.SHANS[2:0]位中选择的采样保持电路开始连续采样。
2. 当ADCSR.ADST位通过软件触发设置为1（AD转换开始），同步触发信号的输入（ELC），或异步触发器的输入。在ADSHMSR.SHMD位设置为1后至少经过400ns（当允许的信号源阻抗为1kΩ时）后，将ADCSR.ADST位设置为1。
3. 经过采样保持电路的稳定时间后，从编号n最小的通道开始，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换。
4. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)，采样保持电路重新开始连续采样。
5. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无需寄存器设置）。此外，对于要使用通道专用采样保持电路的所有通道，模拟输入保持开始。
6. ADCSR.ADST位不会自动清零，只要该位保持为1，就会重复步骤3到5。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
7. 当ADSHMSR.SHMD位设置为0时，采样保持电路停止。
8. 当ADSHMSR.SHMD位被设置为1时，在ADSHCR.SHANS[2:0]位开始连续采样。
9. 然后，当ADCSR.ADST位设置为1（AD转换开始）时，将开始使用通道专用采样保持电路的所有通道的模拟输入保持。

Note: 如果在仅选择带有采样保持电路的通道时执行连续扫描，则在第二次和随后的连续扫描中无法确保连续采样的时间。当启用通道专用采样保持电路的连续采样以进行连续扫描时，选择一个或多个通道，从AN003到AN007、AN016到AN018、AN020、温度传感器输出和单元0的内部参考电压和AN105AN107、AN116、AN117、温度传感器输出和单元1的内部参考电压，并将采样保持电路的连续采样时间设置为至少400ns（当允许的信号源阻抗为1kΩ时）。

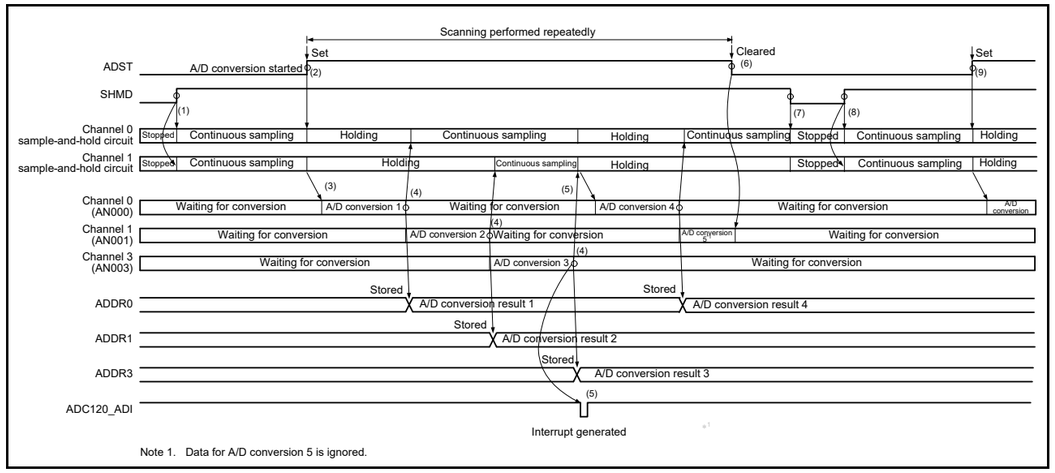

Figure 42.18 Example of operation in continuous scan mode when channel-dedicated sample-and-hold circuits are used, AN000, AN001, and AN003 are selected, and continuous sampling is enabled

42.3.3.4 Channel selection and self-diagnosis without channel-dedicated sample-and-hold circuits

When channels and self-diagnosis are selected at the same time, A/D conversion is first performed for the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (×0, ×1/2, or ×1) supplied to the ADC12, and then A/D conversion is performed on the analog input of the selected channels, this sequence is then repeated.

The operation is as follows:

1. A/D conversion for self-diagnosis is first started when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting). At the same time, the ADC12 starts A/D conversion for self-diagnosis and then starts A/D conversion on ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
5. The ADST bit is not automatically cleared, and steps 2 to 4 are repeated as long as the bit remains 1. When the ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then, the ADC12 enters a wait state.

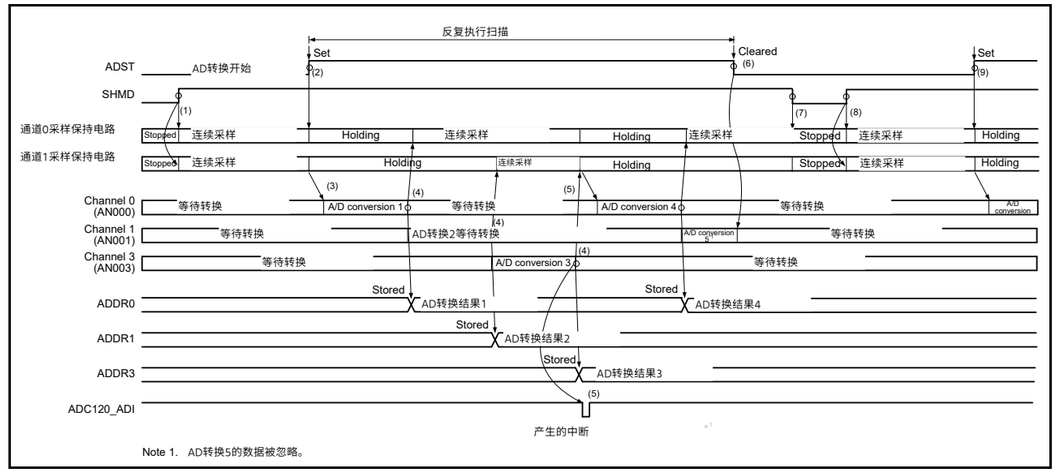

Figure 42.18 使用通道专用采样保持电路、选择AN000、AN001和AN003并启用连续采样时的连续扫描模式操作示例

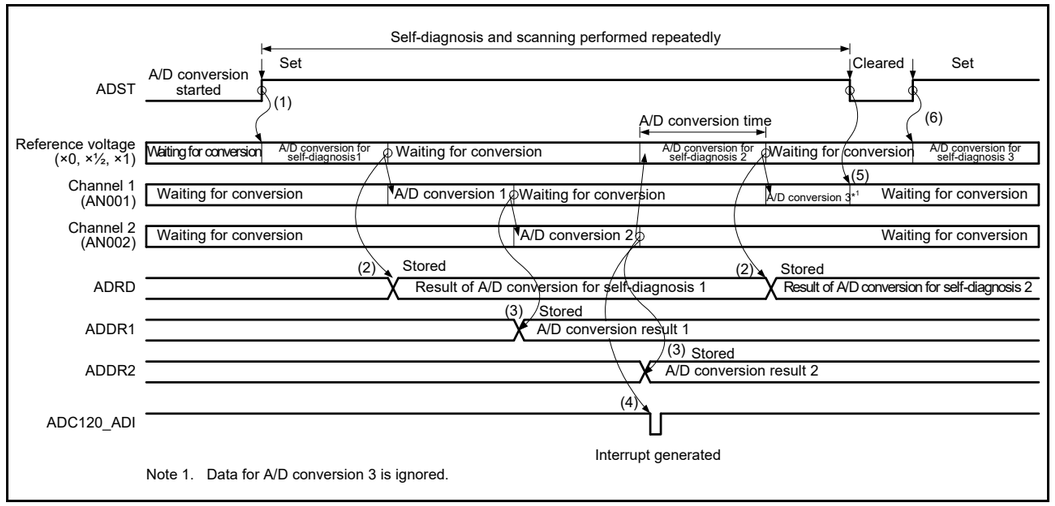
42.3.3.4 通道选择和自诊断，无需通道专用的采样和保持电路

当同时选择通道和自诊断时，首先对提供给ADC12的参考电压VREFH0（单元0）或VREFH（单元1）（×0、×12或×1）进行AD转换，然后在所选通道的模拟输入上执行AD转换，然后重复此序列。

操作如下：

1. 通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，首先启动用于自诊断的D转换。
2. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并ADANSA1寄存器，从编号n最小的通道开始。
3. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
4. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。同时，ADC12启动AD转换以进行自诊断，然后从编号n最小的通道开始对ADANSA0和ADANSA1寄存器中选择的ANn通道进行AD转换。
5. ADST位不会自动清零，只要该位保持为1，就会重复步骤2到4。当ADST位设置为0（AD转换停止），AD转换停止，ADC12进入等待状态。
6. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后，ADC12进入等待状态。



Note 1. Data for A/D conversion 3 is ignored.

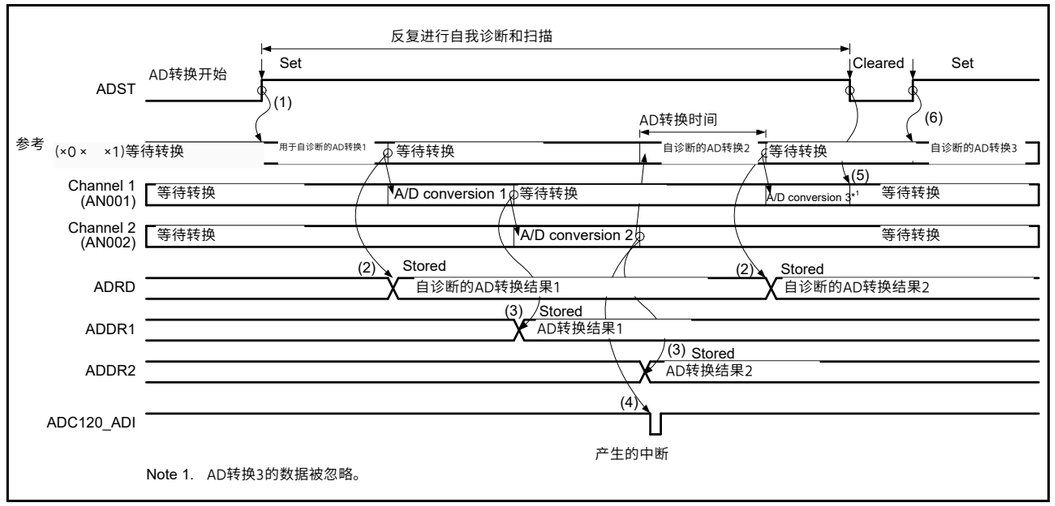
Figure 42.19 Example of basic operation in continuous scan mode when AN001 and AN002 are selected with self-diagnosis

42.3.3.5 Channel selection and self-diagnosis with channel-dedicated sample-and-hold circuits and continuous sampling disabled

When channels and self-diagnosis are selected and a channel-dedicated sample-and-hold circuit is used with continuous sampling disabled, sample-and- hold operation is first performed, and then A/D conversion is performed for the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (×0, ×1/2, or ×1) supplied to the ADC12. A/D conversion is then performed on the analog input of the selected channels, and this sequence is repeated.

The operation is as follows:

1. Analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. After sample-and-hold operation, A/D conversion for self-diagnosis starts.
3. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
5. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting). At the same time, analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used.
6. The ADST bit is not automatically cleared, and steps 2. to 5. are repeated as long as the bit remains 1. When the ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
7. When the ADST bit is then set to 1 (A/D conversion start), analog input sampling starts again for all channels whose dedicated sample-and-hold circuit is to be used.



Note 1. AD转换3的数据被忽略。

Figure 42.19 通过自诊断选择AN001和AN002时连续扫描模式下的基本操作示例

42.3.3.5 通道专用采样保持电路和禁用连续采样的通道选择和自诊断

Whenchannelsandself-diagnosisareselectedandachannel-dedicatedsample-and-holdcircuitisusedwithcontinuoussamplingdisabled sample-andholdoperationisfirstperformed andthenADconversionisperformedforthereferencevoltageVREFH0(unit0)or提供给ADC12的VREFH（单元1）（×0、×12或×1）。然后在所选通道的模拟输入上执行D转换，并重复此序列。

操作如下：

1. 模拟输入采样开始于其专用采样保持电路的所有通道，当ADCSR.ADST位通过软件触发、同步触发输入(ELC)或异步触发输入设置为1（AD转换开始）。
2. 采样保持操作后，用于自诊断的AD转换开始。
3. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并ADANSA1寄存器，从编号n最小的通道开始。
4. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
5. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。同时，对所有要使用专用采样保持电路的通道开始模拟输入采样。
6. ADST位不会自动清零，只要该位保持为1，就会重复步骤2到5。ADST位设置为0（AD转换停止），AD转换停止，ADC12进入等待状态。
7. 当ADST位随后设置为1（AD转换开始）时，模拟输入采样将重新开始对所有要使用专用采样保持电路的通道进行。

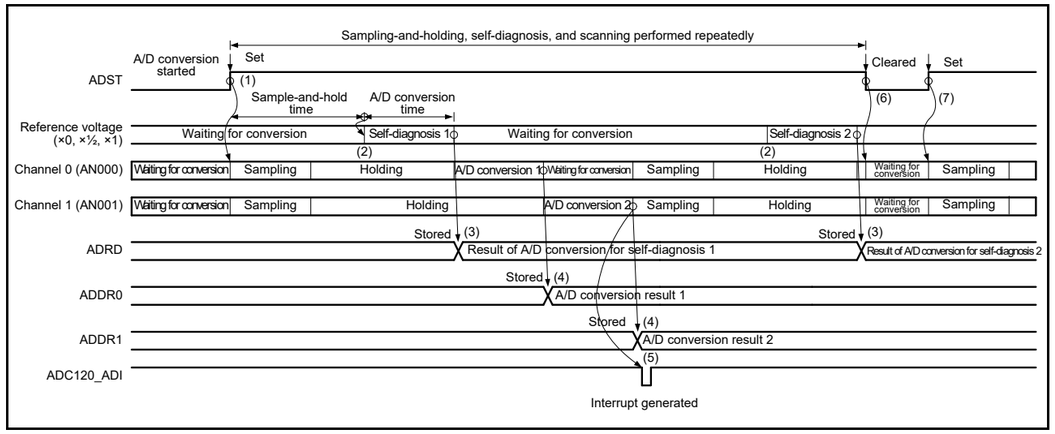


Figure 42.20 Example of operation in continuous scan mode when channel-dedicated sample-and-hold circuits are used, and AN000 and AN001 are selected with self-diagnosis

42.3.3.6 Channel selection and self-diagnosis with channel-dedicated sample-and-hold circuits and continuous sampling enabled

When channels and self-diagnosis are selected and a channel-dedicated sample-and-hold circuit is used with continuous sampling enabled, sample-and-hold operation is first performed, followed by A/D conversion of the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (×0, ×1/2, or ×1) supplied to the ADC12. A/D conversion is then performed on the analog input of the selected channels, and this sequence is repeated.

The operation is as follows:

1. When the ADSHMSR.SHMD bit is set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
2. Analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, input of a synchronous trigger signal (ELC), or input of an asynchronous trigger. Set the ADCSR.ADST bit to 1 after at least 400 ns (when the permissible signal source impedance is 1 kΩ) elapse after the ADSHMSR.SHMD bit is set to 1.
3. After the stabilization time of the sample-and-hold circuits elapses, A/D conversion for self-diagnosis starts.
4. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
5. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy), and the sample-and-hold circuit restarts continuous sampling.
6. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting). Also, analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used.
7. The ADCSR.ADST bit is not automatically cleared, and steps 3. to 6. are repeated as long as the bit remains 1. When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
8. When the ADSHMSR.SHMD bit is set to 0, the sample-and-hold circuits stop.
9. When the ADSHMSR.SHMD bit is then set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
10. When the ADCSR.ADST bit is then set to 1 (A/D conversion start), analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used.

操作如下：

1. 当ADSHMSR.SHMD位设置为1时，在ADSHCR.SHANS[2:0]位中选择的采样保持电路开始连续采样。
2. 当ADCSR.ADST位通过软件触发设置为1（AD转换开始），同步触发信号的输入（ELC），或异步触发器的输入。在ADSHMSR.SHMD位设置为1后至少经过400ns（当允许的信号源阻抗为1kΩ时）后，将ADCSR.ADST位设置为1。
3. 经过采样保持电路的稳定时间后，开始进行自诊断的A/D转换。
4. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并ADANSA1寄存器，从编号n最小的通道开始。
5. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)，采样保持电路重新开始连续采样。
6. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。此外，对于要使用通道专用采样保持电路的所有通道，模拟输入保持开始。
7. ADCSR.ADST位不会自动清零，只要该位保持1，就会重复步骤3.到6.。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
8. 当ADSHMSR.SHMD位设置为0时，采样保持电路停止。
9. 当ADSHMSR.SHMD位被设置为1时，在ADSHCR.SHANS[2:0]位开始连续采样。

10.当ADCSR.ADST位被设置为1（AD转换开始）时，所有通道的模拟输入保持开始，所有通道都将使用通道专用的采样保持电路。

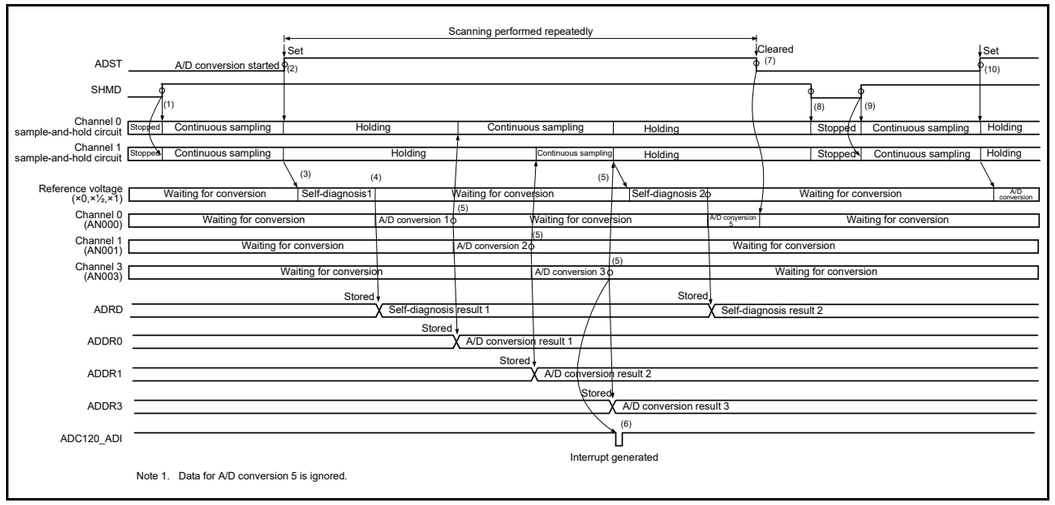

Figure 42.21 Example of operation in continuous scan mode when channel-dedicated sample-and-hold circuits are used, AN000, AN001, and AN003 are selected with self-diagnosis, and continuous sampling is enabled

42.3.3.7 A/D conversion of temperature sensor output or internal reference voltage

When the channels and temperature sensor output or internal reference voltage are selected at the same time, A/D conversion is first performed on the analog input of the selected channels, and then A/D conversion of the temperature sensor output or internal reference voltage is repeated. When both temperature sensor output and internal reference voltage are selected, A/D conversion of the temperature sensor output and internal reference voltage is performed, in that order.

With the channels deselected, selecting only the temperature sensor output or internal reference voltage is also possible.

The operation is as follows:

1. When a software trigger, synchronous trigger (ELC), or asynchronous trigger sets the ADCSR.ADST bit to 1 (A/D conversion start), A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. On completion of A/D conversion on the channels, the result is stored in the associated A/D Data Register y (ADDRy), and then A/D conversion of the temperature sensor output starts.
3. On completion of A/D conversion of the temperature sensor output, the result is stored in the associated A/D Temperature Sensor Data Register (ADTSDR), and then A/D conversion of the internal reference voltage starts.
4. On completion of A/D conversion of the internal reference voltage, the result is stored in the associated A/D Internal Reference Voltage Data Register (ADOCDR), and an ADC12i_ADI interrupt request is generated. In addition, the ADC12 continuously starts A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the lowest number n.
5. The ADCSR.ADST bit is not cleared automatically, and steps 2. to 4. are repeated as long as this bit remains set to 1. When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. When the ADCSR.ADST bit is then set to 1 (A/D conversion start), A/D conversion starts again for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the lowest number n.

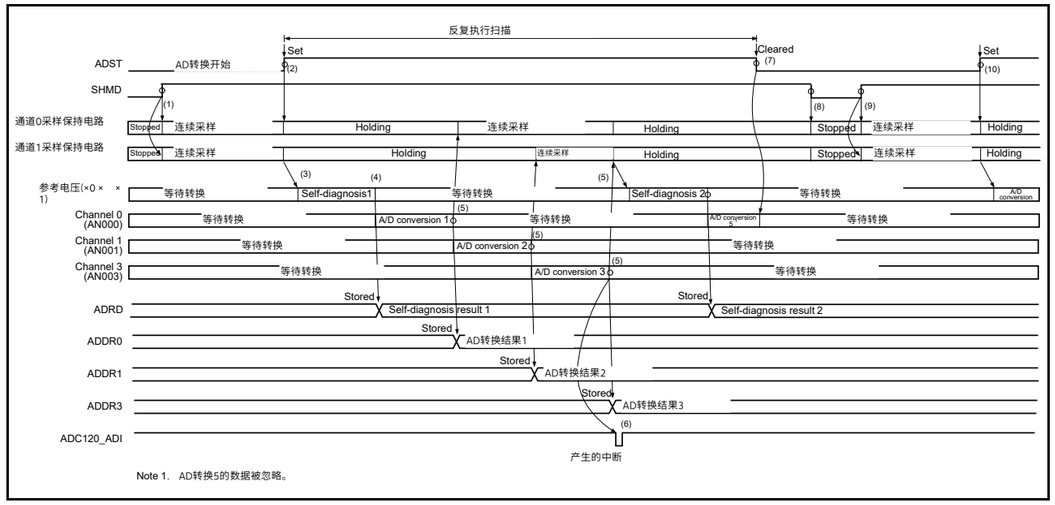

Figure 42.21 使用通道专用采样保持电路、AN000、AN001和AN003选择并进行自诊断并启用连续采样时的连续扫描模式操作示例

42.3.3.7 温度传感器输出或内部参考电压的AD转换

当同时选择通道和温度传感器输出或内部参考电压时，首先对所选通道的模拟输入进行AD转换，然后重复温度传感器输出或内部参考电压的AD转换。当同时选择温度传感器输出和内部参考电压时，按顺序执行温度传感器输出和内部参考电压的AD转换。

取消选择通道后，也可以仅选择温度传感器输出或内部参考电压。

操作如下：

1. 当软件触发、同步触发(ELC)或异步触发将ADCSR.ADST位设置为1（AD转换开始）时，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从具有最小的数n。
2. 在通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中，然后温度传感器输出的AD转换开始。
3. 温度传感器输出的AD转换完成后，结果存储在相关的AD中温度传感器数据寄存器(ADTSDR)，然后内部参考电压的AD转换开始。
4. 内部参考电压的AD转换完成后，结果存储在相关的AD中内部参考电压数据寄存器(AOCDR)，并产生ADC12i_ADI中断请求。此外，ADC12连续启动ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换，从编号最小的通道n开始。
5. ADCSR.ADST位不会自动清除，只要该位保持设置为1，就会重复步骤2到4。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
6. 当ADCSR.ADST位随后设置为1（AD转换开始）时，AD转换再次开始在ADANSA0和ADANSA1寄存器中选择的ANn通道，从编号最小的通道n开始。

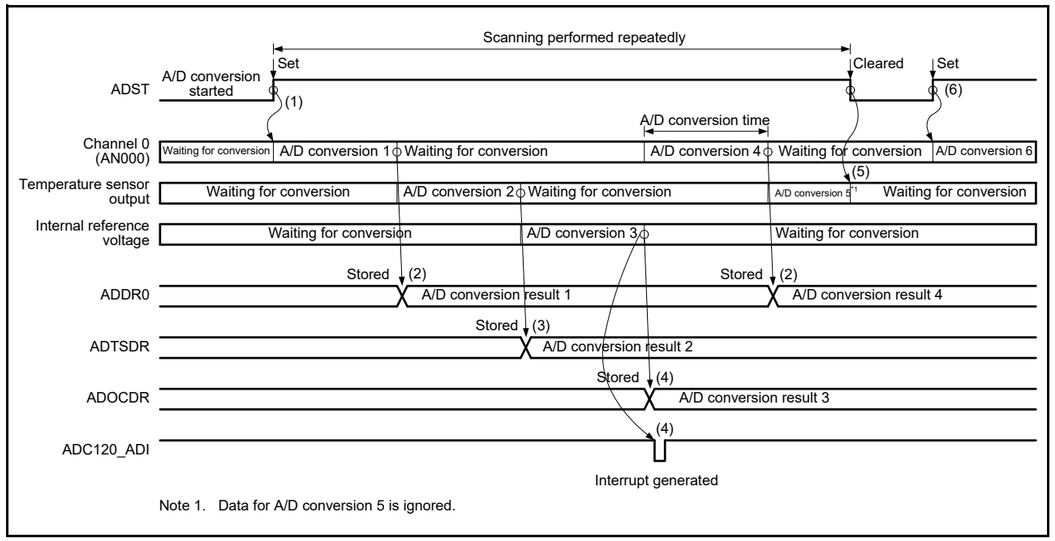

Figure 42.22 Example of basic operation in continuous scan mode when AN000 and temperature sensor output or internal reference voltage are selected

42.3.4 Group Scan Mode

42.3.4.1 Basic operation

In group scan mode, A/D conversion is performed once on the analog inputs of all the specified channels in group A and group B after scanning is started by a synchronous trigger (ELC). The scan operation of each group is similar to the scan operation in single scan mode.

The synchronous triggers can be selected in the ADSTRGR.TRSA[5:0] bits for group A and in the ADSTRGR.TRSB[5:0] bits for group B. Use different triggers for group A and group B to prevent simultaneous A/D conversion of the two groups. Do not use a software trigger.

The group A channels to be A/D-converted are selected using the ADANSA0 and ADANSA1 registers and the ADEXICR.TSSA and OCSA bits, while the group B channels to be A/D-converted are selected using the ADANSB0 and ADANSB1 registers and the ADEXICR.TSSB and OCSB bits. Group A and group B cannot use the same channels.

When self-diagnosis is selected in group scan mode, self-diagnosis is separately executed for group A and group B.

The following example describes operation in group scan mode using a synchronous trigger from the ELC. In this example, the ELC_AD00 and ELC_AD01 (unit 0), and ELC_AD10 and ELC_AD11 (unit 1) triggers from the ELC are used to start conversion of group A and group B, respectively. Also, ELC_AD00 and ELC_AD01 (unit 0), and ELC_AD10 and ELC_AD11 (unit 1) are selected for the GPT event in the associated ELC.ELSRn registers.

The operation is as follows:

1. Scanning of group A is started by ELC_AD00 (unit 0) or ELC_AD10 (unit 1).
2. When group A scanning completes, an ADC12i_ADI (i = 0, 1) interrupt is generated (no register setting).
3. Scanning of group B is started by ELC_AD01 (unit 0) or ELC_AD11 (unit 1).
4. When group B scanning completes, an ADC12i_GBADI interrupt is generated if the ADCSR.GBADIE bit is 1 (ADC12i_GBADI interrupt when scanning completion is enabled).

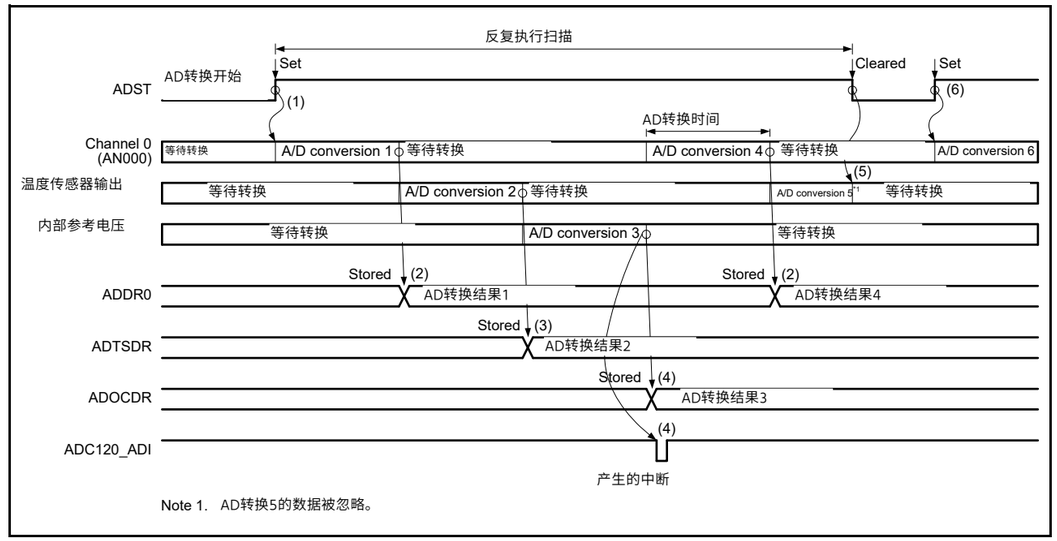

Figure 42.22 选择AN000和温度传感器输出或内部参考电压时连续扫描模式下的基本操作示例

42.3.4 组扫描模式

42.3.4.1 基本操作

在组扫描模式下，通过同步触发（ELC）开始扫描后，对A组和B组中所有指定通道的模拟输入进行一次A/D转换。每组的扫描操作类似于单次扫描模式下的扫描操作。

可以在A组的ADSTRGR.TRSA[5:0]位和
B组的ADSTRGR.TRSB[5:0]位。对A组和B组使用不同的触发，以防止两组同时进行AD转换。不要使用软件触发。

使用ADANSA0和ADANSA1寄存器选择要进行AD转换的A组通道
ADEXICR.TSSA和OCSA位，而要进行AD转换的B组通道使用ADANSB0和ADANSB1寄存器以及ADEXICR.TSSB和OCSB位进行选择。A组和B组不能使用相同的通道。

在组扫描模式下选择自诊断时，对A组和B组分别进行自诊断。

以下示例描述了使用来自ELC的同步触发器在组扫描模式下的操作。在此示例中，ELC_AD00和ELC_AD01（单元0）以及来自ELC的ELC_AD10和ELC_AD11（单元1）触发器分别用于启动A组和B组的转换。此外，ELC_AD00和ELC_AD01（单元0）以及ELC_AD10和ELC_AD11（单元1）被选择用于相关ELC.ELSRn寄存器中的GPT事件。

操作如下：

1. A组的扫描由ELC_AD00（单元0）或ELC_AD10（单元1）启动。
2. 当A组扫描完成时，会产生一个ADC12i_ADI(i=0 1)中断（无寄存器设置）。
3. B组的扫描由ELC_AD01（单元0）或ELC_AD11（单元1）启动。
4. 当B组扫描完成时，如果ADCSR.GBADIE位为1（使能扫描完成时ADC12i_GBADI中断），则产生ADC12i_GBADI中断。

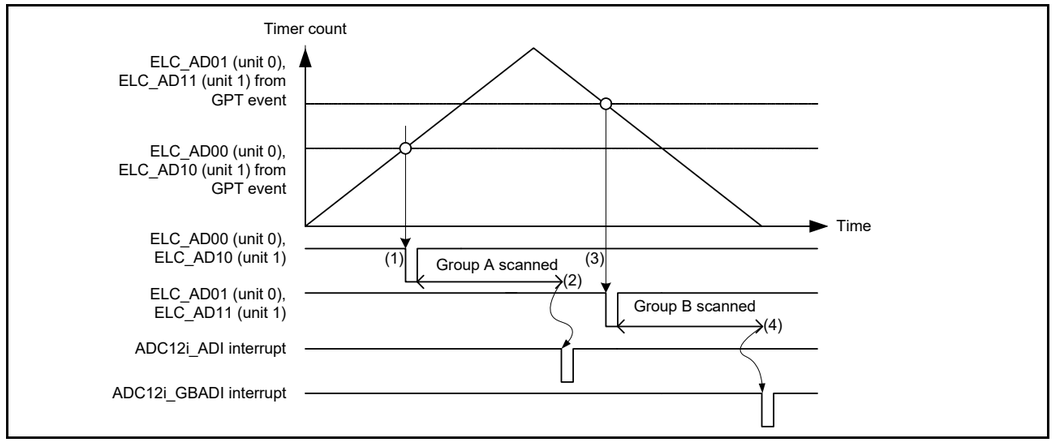

Figure 42.23 Example of basic operation in group scan mode when synchronous triggers from the ELC are used

42.3.4.2 A/D conversion in double trigger mode

When double trigger mode is selected in group scan mode, two rounds of single scan operation started by a synchronous trigger (ELC) are performed as a sequence for group A. For group B, single scan operation started by a synchronous trigger (ELC) is performed once.

In group scan mode, the synchronous triggers can be selected in the TRSA[5:0] bits in ADSTRGR for group A and in the TRSB[5:0] bits in ADSTRGR for group B. Use different triggers for group A and group B to prevent simultaneous A/D conversion of the two groups. Do not use a software trigger or an asynchronous trigger (ADTRGn).

When ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1) is selected as the group A synchronous triggers by setting the ADSTRGR.TRSA[5:0] bits to 0Bh, operation proceeds in extended double trigger mode.

The channels to be A/D-converted are selected in the DBLANS[4:0] bits in the ADCSR register for group A and in the ADANSB0 and ADANSB1 registers for group B. The same channels cannot be selected for both groups.

When double trigger mode is selected in group scan mode, set the A/D conversion select bits for both the temperature sensor output (ADEXICR.TSSA) and the internal reference voltage (ADEXICR.OCSA) to 0 (deselected). Self-diagnosis cannot be selected when double trigger mode is selected in group scan mode.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated to the ADCSR.DBLANS[4:0] bits and setting the DBLE bit in ADCSR to 1.

The following describes operation in group scan mode with double trigger mode using a synchronous trigger from the ELC. In this example, the ELC_AD00 and ELC_AD01 (unit 0), ELC_AD10 and ELC_AD11 (unit 1) triggers from the ELC are used to start conversion of group A and group B, respectively. Also, ELC_AD00 and ELC_AD01 (unit 0), ELC_AD10 and ELC_AD11 (unit 1) are selected for the GPT event in the associated ELC.ELSRn registers.

The operation is as follows:

1. Scanning of group B is started by the ELC_AD00 (unit 0) or ELC_AD10 (unit 1) trigger from the ELC.
2. When group B scanning completes, an ADC12i_GBADI (i = 0, 1) interrupt is generated if the GBADIE bit in ADCSR is 1 (ADC12i_GBADI interrupt when scanning completion is enabled).
3. The first scan of group A is started by the first ELC_AD01 (unit 0) or ELC_AD11 (unit 1) trigger.
4. When the first scan of group A completes, the conversion result is stored in the associated A/D Data Register y (ADDRy), an ADC12i_ADI interrupt request is not generated, regardless of the ADIE bit setting in ADCSR.
5. The second scan of group A is started by the second ELC_AD01 (unit 0) or ELC_AD11 (unit 1) trigger.
6. When the second scan of group A completes, the conversion result is stored in ADDBLDR. An ADC12i_ADI interrupt is generated.

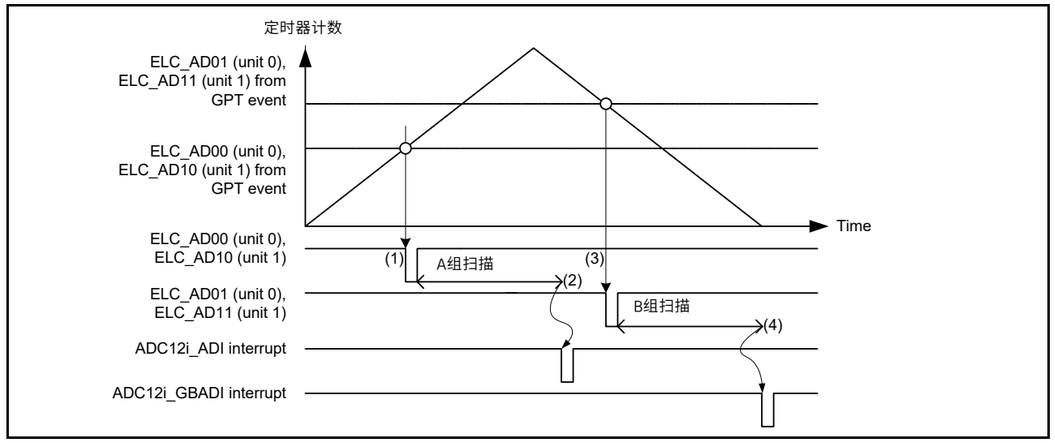

Figure 42.23 使用来自ELC的同步触发时组扫描模式下的基本操作示例

42.3.4.2 双触发模式下的AD转换

在组扫描模式中选择双触发模式时，由同步触发(ELC)启动的两轮单扫描操作作为A组的顺序执行。对于B组，由同步触发(ELC)启动的单扫描操作是执行一次。

在组扫描模式下，可以在A组的ADSTRGR的TRSA[5:0]位和B组的ADSTRGR的TRSB[5:0]位中选择同步触发。A组和B组使用不同的触发以防止两组同时进行AD转换。不要使用软件触发或异步触发(ADTRGn)。

当通过将ADSTRGR.TRSA[5:0]位设置为0Bh来选择ELC_AD00ELC_AD01（单元0）、ELC_AD10ELC_AD11（单元1）作为A组同步触发时，操作在扩展双触发模式下进行。

要进行AD转换的通道在A组的ADCSR寄存器的DBLANS[4:0]位和B组的ADANSB0和ADANSB1寄存器。不能为两个组选择相同的通道。

在组扫描模式下选择双触发模式时，将温度传感器输出(ADEXICR.TSSA)和内部参考电压(ADEXICR.OCSA)的AD转换选择位设置为0（取消选择）。在组扫描模式下选择双触发模式时，不能选择自诊断。

AD转换数据的复制通过将要复制的通道号设置为ADCSR.DBLANS[4:0]位并将ADCSR中的DBLE位设置为1。

下面介绍使用来自ELC的同步触发的双触发模式的组扫描模式下的操作。在本例中，ELC_AD00和ELC_AD01（单元0）、ELC_AD10和ELC_AD11（单元1）从ELC分别用于启动A组和B组的转换。此外，ELC_AD00和ELC_AD01（单元0），在关联的ELC.ELSRn寄存器中为GPT事件选择ELC_AD10和ELC_AD11（单元1）。

操作如下：

1. B组的扫描由来自ELC的ELC_AD00（单元0）或ELC_AD10（单元1）触发器启动。
2. 当B组扫描完成时，如果GBADIE位在ADCSR为1（启用扫描完成时ADC12i_GBADI中断）。
3. A组的第一次扫描由第一个ELC_AD01（单元0）或ELC_AD11（单元1）触发器启动。
4. 当A组的第一次扫描完成时，转换结果存储在相关的AD数据寄存器y(ADDRy)中，无论ADCSR中的ADIE位设置如何，都不会产生ADC12i_ADI中断请求。
5. A组的第二次扫描由第二个ELC_AD01（单元0）或ELC_AD11（单元1）触发器启动。
6. 当A组的第二次扫描完成时，转换结果存储在ADDBLDR中。产生一个ADC12i_ADI中断。

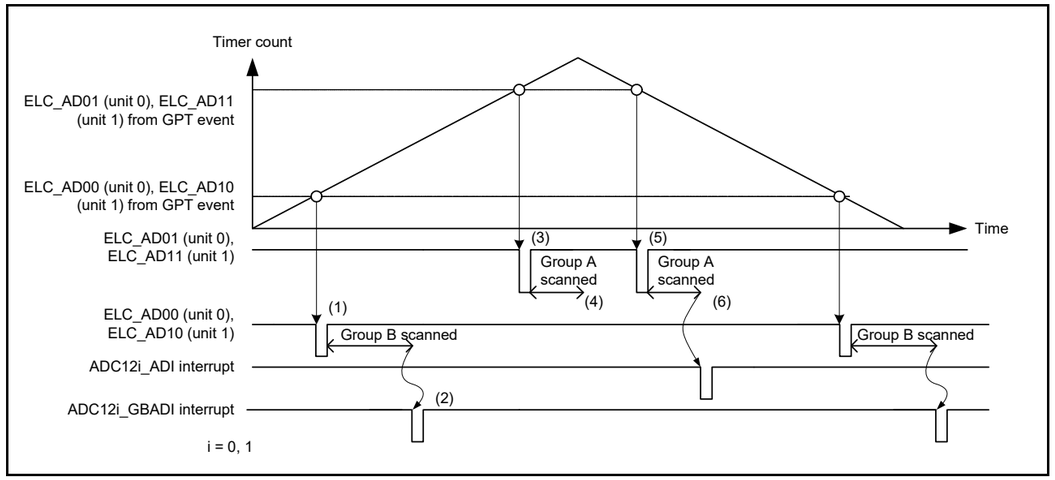

Figure 42.24 Example of basic operation in group scan mode with double trigger mode when synchronous triggers from the ELC are used

42.3.4.3 Operation with group A priority control

Setting the ADGSPCR.PGS bit to 1 in group scan mode enables operation to proceed under group A priority control. When setting the PGS bit in the ADGSPCR register to 1, follow the procedure shown in Figure 42.25. If the procedure is not followed, A/D conversion operation and stored data are not guaranteed.

In basic group scan mode, while A/D conversion is underway for group A or group B, input of the trigger for A/D conversion for the other group is ignored. Under group A priority control, if a group A trigger is input during A/D conversion for group B, A/D conversion for group B is discontinued and A/D conversion for group A proceeds. If the setting in the ADGSPCR.GBRSCN bit is 0, the ADC12 enters wait state on completion of the A/D conversion for group A. If the setting in the ADGSPCR.GBRSCN bit is 1, the ADC12 automatically restarts scanning for group B from the head of the group after completion of the A/D conversion for group A. Table 42.9 summarizes operations in response to the input of a trigger during A/D conversion with the settings in the ADGSPCR.GBRSCN bit.

Scan operations in group A or group B are the same in single scan mode. Additionally, single scanning continues to proceed if the ADGSPCR.GBRP bit is set to 1 during scanning operations for group B.

For the trigger settings in group scan mode, select a synchronous trigger for group A using the ADSTRGR.TRSA[5:0] bits, and select a synchronous trigger for group B, different from that of group A, using the ADSTRGR.TRSB[5:0] bits. Set the ADSTRGR.TRSB[5:0] bits to 3Fh when setting the ADGSPCR.GBRP bit to 1.

Additionally, as targets for A/D conversion, select channels for group A using the ADANSA0 and ADANSA1 registers and the ADEXICR.TSSA and OCSA bits, and for group B, select channels different from those for group A using the ADANSB0 and ADANSB1 registers, and the ADEXICR.TSSB and OCSB bits.

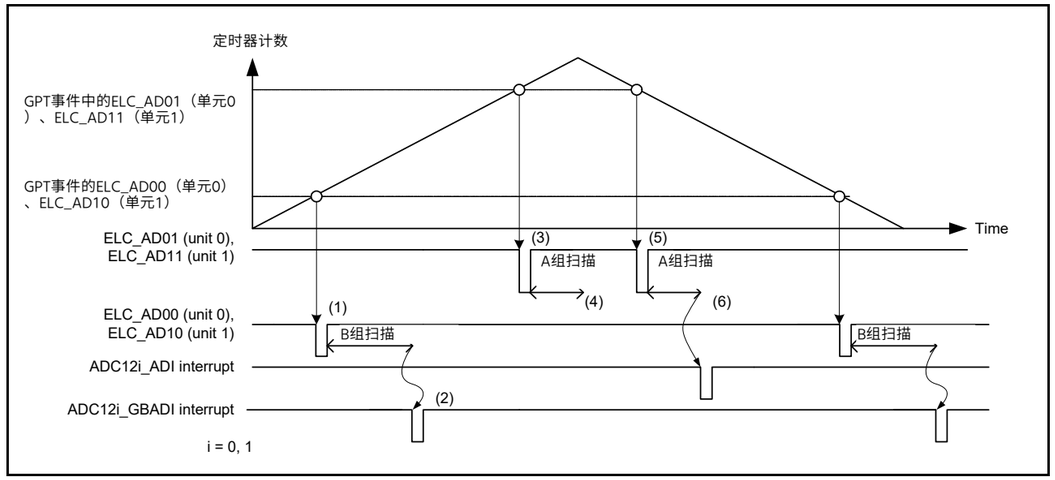

Figure 42.24 使用来自ELC的同步触发时，双触发模式下组扫描模式的基本操作示例

42.3.4.3 A组优先控制操作

在组扫描模式下将ADGSPCR.PGS位设置为1可使操作在A组优先级控制下进行。
将ADGSPCR寄存器中的PGS位设置为1时，请按照图42.25中所示的步骤进行操作。如果不遵循该程序，则无法保证AD转换操作和存储数据。

在基本组扫描模式下，当A组或B组正在进行AD转换时，忽略其他组的AD转换触发输入。在A组优先控制下，如果在B组AD转换期间输入A组触发，则B组AD转换中断，A组AD转换继续。如果ADGSPCR.GBRSCN位设置为0，ADC12在A组AD转换完成时进入等待状态。如果ADGSPCR.GBRSCN位设置为1，ADC12自动从头部重新开始扫描B组完成A组的AD转换后的组。表42.9总结了在ADGSPCR.GBRSCN位中设置的AD转换期间响应触发输入的操作。

A组或B组的扫描操作在单次扫描模式下是相同的。此外，如果在B组的扫描操作期间ADGSPCR.GBRP位设置为1，则单次扫描会继续进行。

对于组扫描模式下的触发设置，使用ADSTRGR.TRSA[5:0]位为A组选择一个同步触发，并使用ADSTRGR.TRSB[为B组选择一个不同于A组的同步触发5:0]位。将ADGSPCR.GBRP位设置为1时，将ADSTRGR.TRSB[5:0]位设置为3Fh。

此外，作为AD转换的目标，使用ADANSA0和ADANSA1寄存器以及ADEXICR.TSSA和OCSA位为A组选择通道，对于B组，使用ADANSB0和ADANSB1寄存器选择与A组不同的通道，以及ADXICR.TSSB和OCSB位。

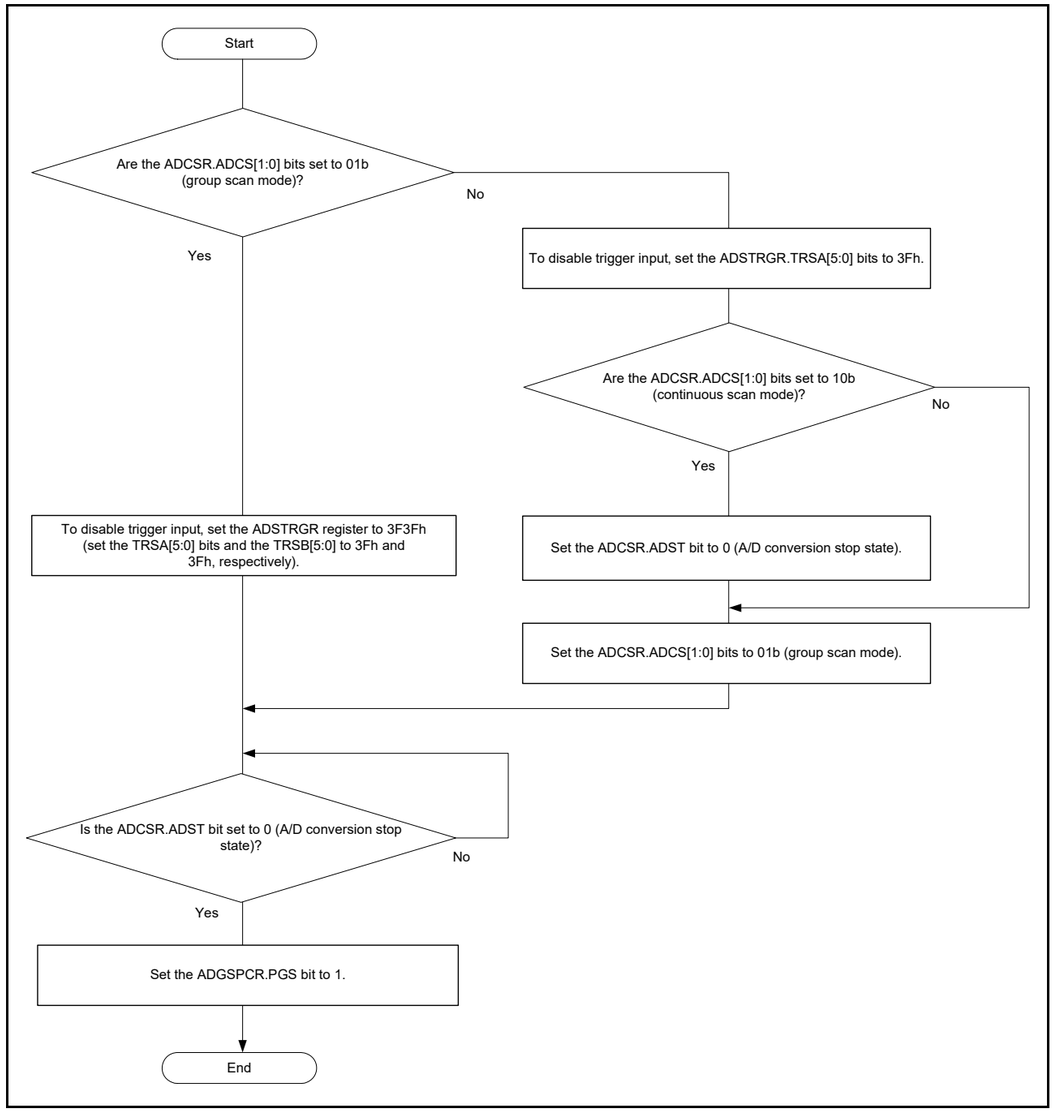

Figure 42.25 Flow for ADGSPCR.PGS bit setting

Table 42.9 Control of A/D conversion operations based on the ADGSPCR.GBRSCN bit settings

A/D conversion operation	Trigger input	ADGSPCR.GBRSCN = 0	ADGSPCR.GBRSCN = 1
When A/D conversion for group A is in progress	Input of group A trigger	Trigger input is invalid	Trigger input is invalid
	Input of group B trigger	Trigger input is invalid	Group B is converted after group A conversion completes
When A/D conversion for group B is in progress	Input of group A trigger	Group B conversion stops and group A conversion starts	• Group B conversion stops and group A conversion starts • Group B Conversion starts after group A conversion completes
	Input of group B trigger	Trigger input is invalid	Trigger input is invalid

Table 42.9 根据ADGSPCR.GBRSCN位设置控制AD转换操作

AD转换操作	触发输入	ADGSPCR.GBRSCN = 0	ADGSPCR.GBRSCN = 1
正在进行A组的AD转换时	A组触发器输入	触发器输入无效	触发器输入无效
	B组触发输入	触发器输入无效	B组在组后转换 一次转换完成
正在进行B组的AD转换时	A组触发器输入	B组转换停止，A组转换开始	B组转换停止，A组转换开始 B组转换在A组转换完成后开始
	B组触发输入	触发器输入无效	触发器输入无效

RA生态工作室

The following example describes the operations in group scan mode under group A priority control (ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0) when channel 0 is selected for group A and channels 1 to 3 are selected for group B.

The operation is as follows:

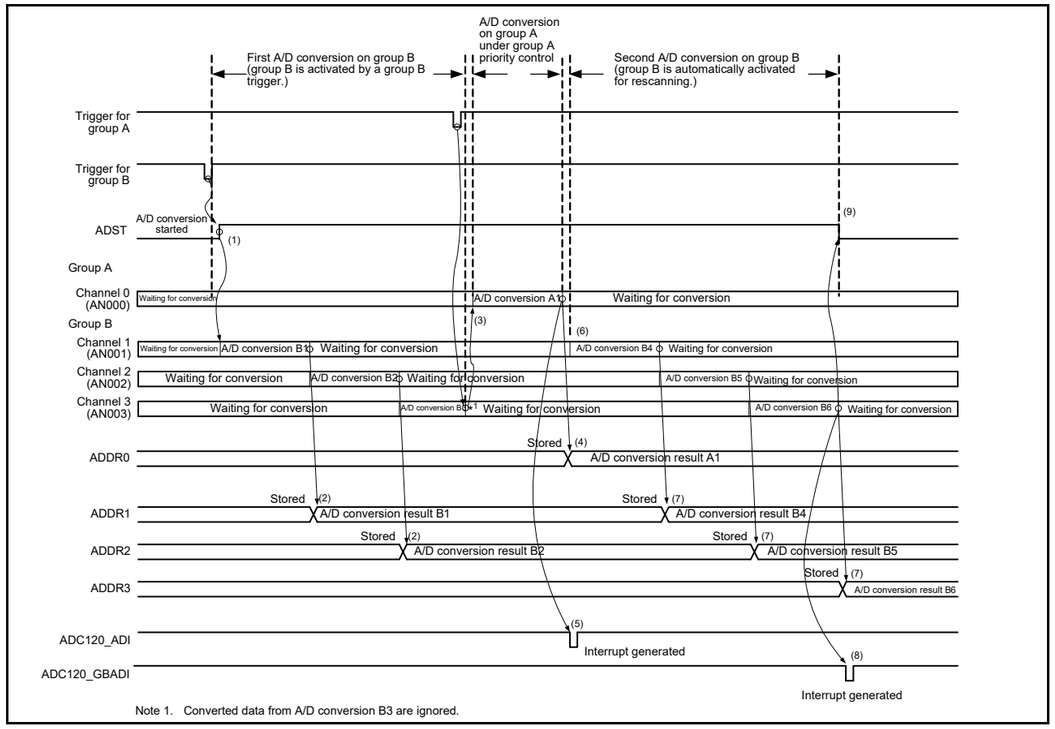
1. When input of a trigger for group B sets the ADCSR.ADST bit to 1 (A/D conversion start), conversion for the ANn channels selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
2. On completion of A/D conversion, the result is stored in the associated A/D Data Register y (ADDRy).
3. When a group A trigger is input while A/D conversion for group B is in progress, and A/D conversion for group B is discontinued with the ADCSR.ADST bit remaining 1, A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n. If A/D conversion is not complete when the AD conversion of group B is interrupted, A/D conversion result is not stored in the A/D Data Register (ADDRy).
4. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
5. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
6. A/D conversion for the ANn channels in group B selected in the ADANSB0 and ADANSB1 registers restarts in order from the channel with the smallest number n with the ADCSR.ADST bit remaining 1.
7. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
8. An ADC12i_GBADI interrupt request is generated if the setting in the ADCSR.GBADIE bit is 1 (ADC12i_GBADI interrupt when group B scanning completion is enabled).
9. The ADCSR.ADST bit is automatically cleared, and the ADC12 enters the wait state when A/D conversion is completed.

以下示例描述了在A组优先级控制（ADGSPCR.GBRSCN=1和ADGSPCR.GBRP=0）下的组扫描模式下，当A组选择通道0，B组选择通道1到3时的操作。

操作如下：

1. 当B组的触发输入将ADCSR.ADST位设置为1（AD转换开始）时，ADANSB0和ADANSB1寄存器中选择的ANn通道的转换从编号n最小的通道开始按顺序开始。
2. 完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 如果在B组的AD转换正在进行时输入A组触发，并且在ADCSR.ADST位保持为1的情况下中断B组的AD转换，则在ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换按顺序开始从具有最小编号n的通道。如果B组的AD转换中断时AD转换未完成，则AD转换结果不会存储在AD数据寄存器（ADDRy）中。
4. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
5. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
6. 在ADANSB0和ADANSB1寄存器中选择的B组ANn通道的AD转换从具有最小编号n的通道开始按顺序重新启动，ADCSR.ADST位保持为1。
7. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
8. 如果ADCSR.GBADIE位中的设置为1（启用B组扫描完成时的ADC12i_GBADI中断），则会产生ADC12i_GBADI中断请求。
9. ADCSR.ADST位自动清零，ADC12在AD转换完成后进入等待状态。

RA生态工作室



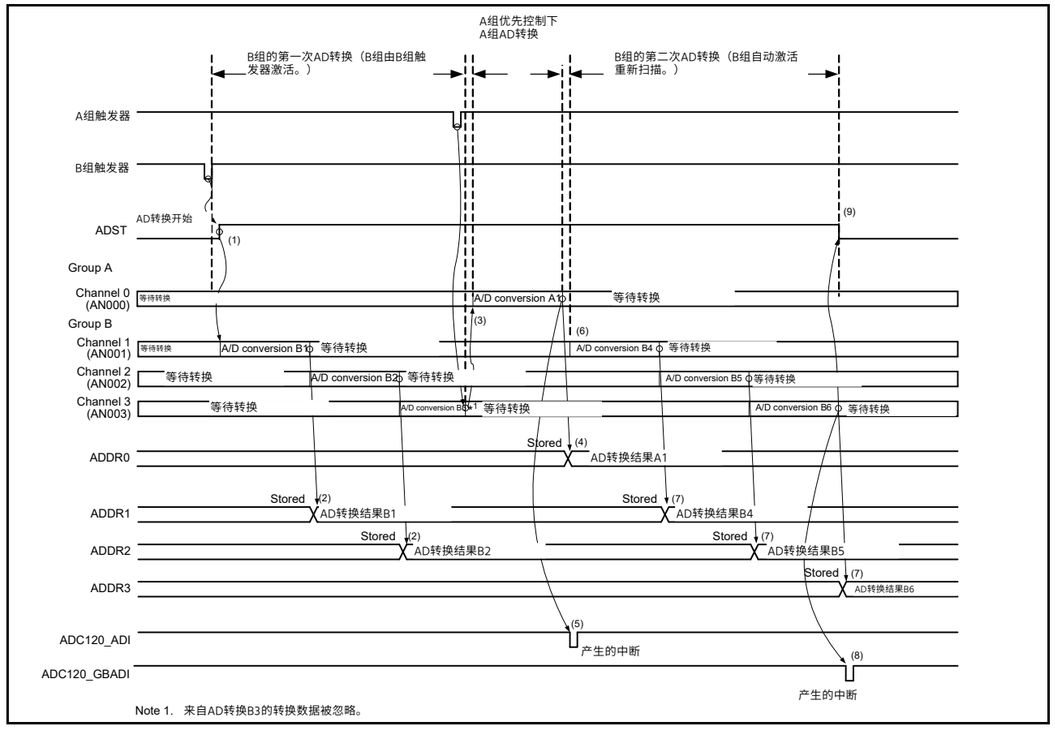
Note 1. Converted data from A/D conversion B3 are ignored.

Figure 42.26 Example of operation with group A priority control (1), when ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0

This section provides an example of operation when a group A trigger is input again during rescanning operation on group B. In this example, channel 0 is selected for group A and channels 1 to 3 are selected for group B when operation on group A is given priority (ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0).

The operation is as follows:

1. When a group B trigger input sets the ADCSR.ADST bit to 1 (A/D conversion start), conversion for the ANn channels in group B selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
2. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
3. When a group A trigger is input while A/D conversion for group B is in progress, and A/D conversion for group B is discontinued with the ADCSR.ADST bit remaining 1. If A/D conversion is not complete when the AD conversion of group B is interrupted, A/D conversion result is not stored in the A/D Data Register (ADDRy).
4. The A/D conversion for the ANn group A channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
5. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
6. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
7. If the ADGSPCR.GBRSCN bit is 1, when the A/D conversion of group A is complete, the ADCSR.ADST bit remains 1 and the group B is rescanned. A/D conversion for the ANn group B channels selected in the ADANSB0 and ADANSB1 registers starts again in order from the channel with the smallest number n.
8. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).



Note 1. 来自AD转换B3的转换数据被忽略。

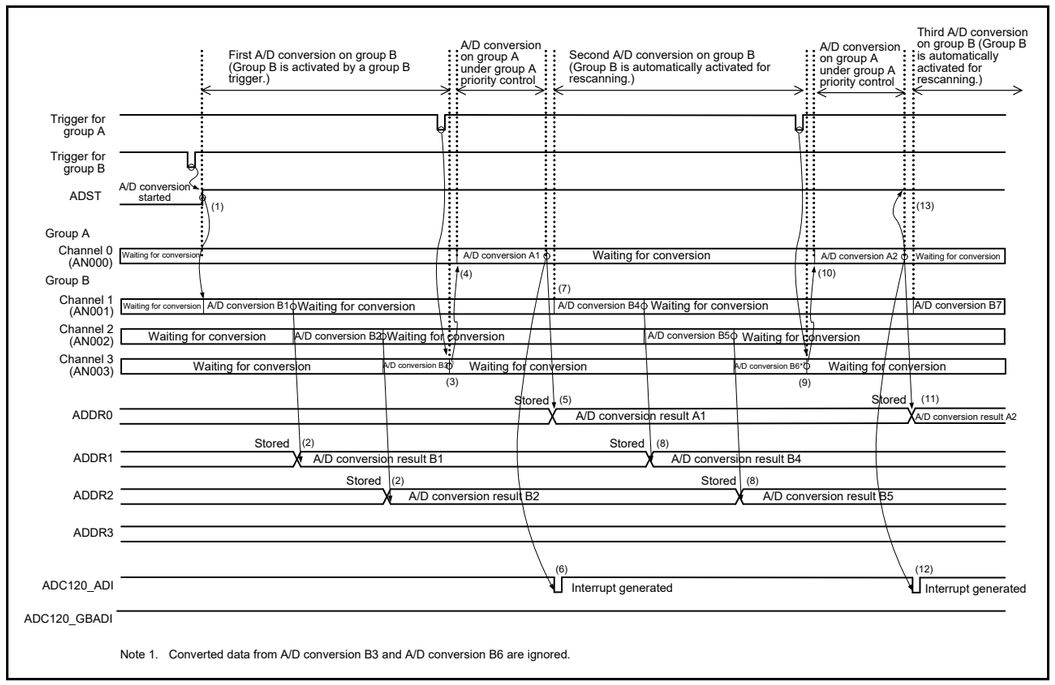
Figure 42.26 使用A组优先级控制(1)的操作示例，当ADGSPCR.GBRSCN=1并且ADGSPCR.GBRP = 0

本节提供在B组重新扫描操作期间再次输入A组触发时的操作示例。在此示例中，当对A组进行操作时，为A组选择通道0，为B组选择通道1至3优先级（ADGSPCR.GBRSCN=1和ADGSPCR.GBRP=0）。

操作如下：

1. 当B组触发输入将ADCSR.ADST位设置为1（AD转换开始）时，在ADANSB0和ADANSB1寄存器中选择的B组ANn通道的转换从编号n最小的通道开始按顺序开始。
2. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 当B组的AD转换正在进行时输入A组触发，并且B组的AD转换中断且ADCSR.ADST位保持为1。如果B组的AD转换中断时AD转换未完成，AD转换结果不存储在AD数据寄存器(ADDRy)中。
4. 在ADANSA0和ADANSA1寄存器中选择的ANn组A通道的AD转换从编号n最小的通道开始。
5. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
6. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
7. 如果ADGSPCR.GBRSCN位为1，则当A组的AD转换完成时，ADCSR.ADST位保持为1，并重新扫描B组。ADANSB0和ADANSB1寄存器中选择的ANnB组通道的AD转换从编号n最小的通道重新开始。
8. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。

9. If a group A trigger is input during A/D conversion on group B for rescanning, the ADCSR.ADST bit remains 1 and the ongoing A/D conversion on group B is discontinued.
10. The A/D conversion for the ANn group A channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
11. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
12. An ADC12i_ADI interrupt request is generated (no register setting).
13. If the ADGSPCR.GBRSCN bit is 1, when the A/D conversion of group A is complete, the ADCSR.ADST bit remains 1 and the group B is rescanned. A/D conversion for the ANn group B channels selected in the ADANSB0 and ADANSB1 registers starts again in order from the channel with the smallest number n.
14. If a group A trigger is input during A/D conversion on group B for rescanning, steps 9. to 13. are repeated. If a group A trigger is not input, the ADCSR.ADST bit is cleared automatically on completion of A/D conversion on group B, and the ADC12 enters a wait state.



Note 1. Converted data from A/D conversion B3 and A/D conversion B6 are ignored.

Figure 42.27 Example of operation with group A priority control (2), when ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0

The following sequence is an example of a rescanning operation in which a group B trigger is input during A/D conversion on group A. In this example, channels 1 to 3 are selected for group A and channel 0 is selected for group B when operation on group A is given priority (ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0):

1. When input of a trigger for group A sets the ADCSR.ADST bit to 1 (A/D conversion start), conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
2. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
3. If a group B trigger is input during A/D conversion on group A, A/D conversion on group B can be performed after the A/D conversion on group A completes. However, if group A triggers are input continuously, the scan operation on group B is canceled by group A and is not performed.

9. 如果在B组的AD转换期间输入A组触发以进行重新扫描，则ADCSR.ADST位保持为1，并且停止B组正在进行的AD转换。

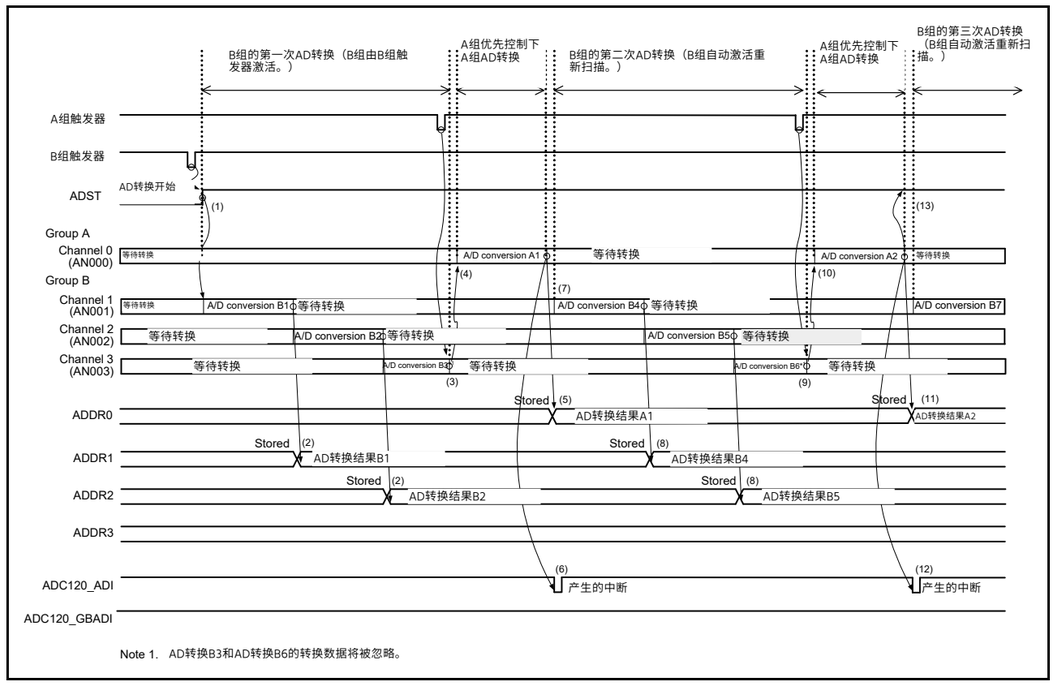
10.在ADANSA0和ADANSA1寄存器中选择的ANn组A通道的AD转换从编号n最小的通道开始。

11.在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。

12.产生一个ADC12i_ADI中断请求（无寄存器设置）。

13.如果ADGSPCR.GBRSCN位为1，当A组AD转换完成时，ADCSR.ADST位保持为1并且B组被重新扫描。ADANSB0和ADANSB1寄存器中选择的ANnB组通道的AD转换从编号n最小的通道重新开始。

14.如果在B组的AD转换期间输入A组触发以重新扫描，则重复步骤9.至13.。如果没有输入A组触发，ADCSR.ADST位在B组AD转换完成后自动清零，ADC12进入等待状态。



Note 1. AD转换B3和AD转换B6的转换数据将被忽略。

Figure 42.27 使用A组优先级控制(2)的操作示例，当ADGSPCR.GBRSCN=1并且ADGSPCR.GBRP = 0

以下序列是重新扫描操作的示例，其中在A组上进行AD转换期间输入B组触发。在此示例中，为组A选择通道1至3，在组上操作时为组B选择通道0A被赋予优先级（ADGSPCR.GBRSCN=1，ADGSPCR.GBRP=0）：

1. 当A组的触发输入将ADCSR.ADST位设置为1（AD转换开始）时，ADANSA0和ADANSA1寄存器中选择的ANn通道的转换从编号n最小的通道开始按顺序开始。
2. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 如果在A组AD转换期间输入B组触发，则可以在A组AD转换完成后执行B组AD转换。但是，如果连续输入A组触发，则B组的扫描操作被A组取消，不执行。

RA生态工作室

4. On completion of the A/D conversion on group A, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. On completion of the group A conversion, the ADCSR.ADST bit remains 1 and the group B is rescanned. Next, A/D conversion for the ANn channels of group B selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
6. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
7. On completion of the rescanning operation on group B, an ADC12i_GBADI interrupt request is generated if the setting in the ADCSR.GBADIE bit is 1 (ADC12i_GBADI interrupt when scanning completion is enabled).
8. The ADCSR.ADST bit is automatically cleared and the ADC12 enters the wait state when A/D conversion is complete.

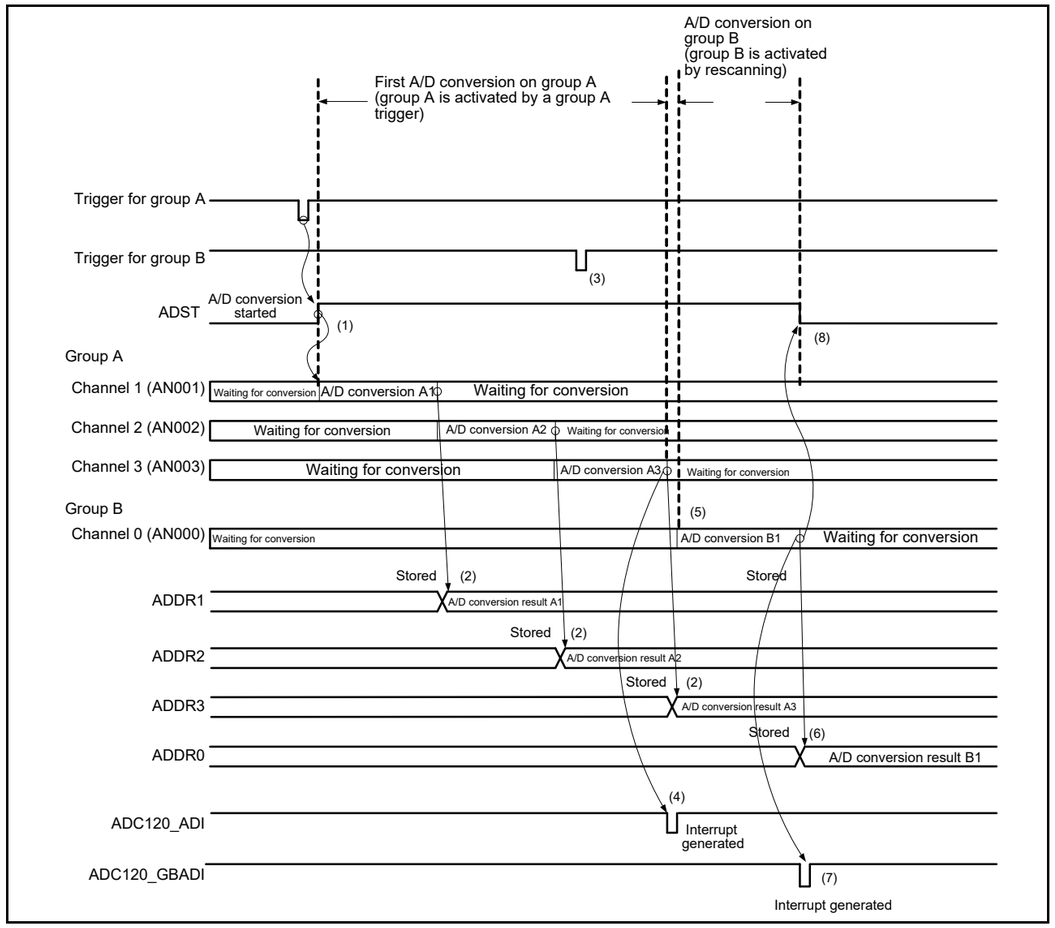


Figure 42.28 Example of operation with group A priority control (3), when ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0

The following sequence is an example of operation under group A priority control in which channel 0 is selected for group A and channels 1 to 3 are selected for group B (ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0):

1. When input of a trigger for group B sets the ADCSR.ADST bit to 1 (A/D conversion start), conversion for the ANn channels selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.

4. 完成A组的AD转换后，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
5. 完成A组转换后，ADCSR.ADST位保持为1，并重新扫描B组。下一个，ADANSB0和ADANSB1寄存器中选择的B组ANn通道的AD转换从编号n最小的通道开始。
6. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
7. 完成对B组的重新扫描操作后，如果ADCSR.GBADIE位中的设置为1（使能扫描完成时的ADC12i_GBADI中断），则会产生ADC12i_GBADI中断请求。
8. ADCSR.ADST位自动清零，ADC12在AD转换完成后进入等待状态。

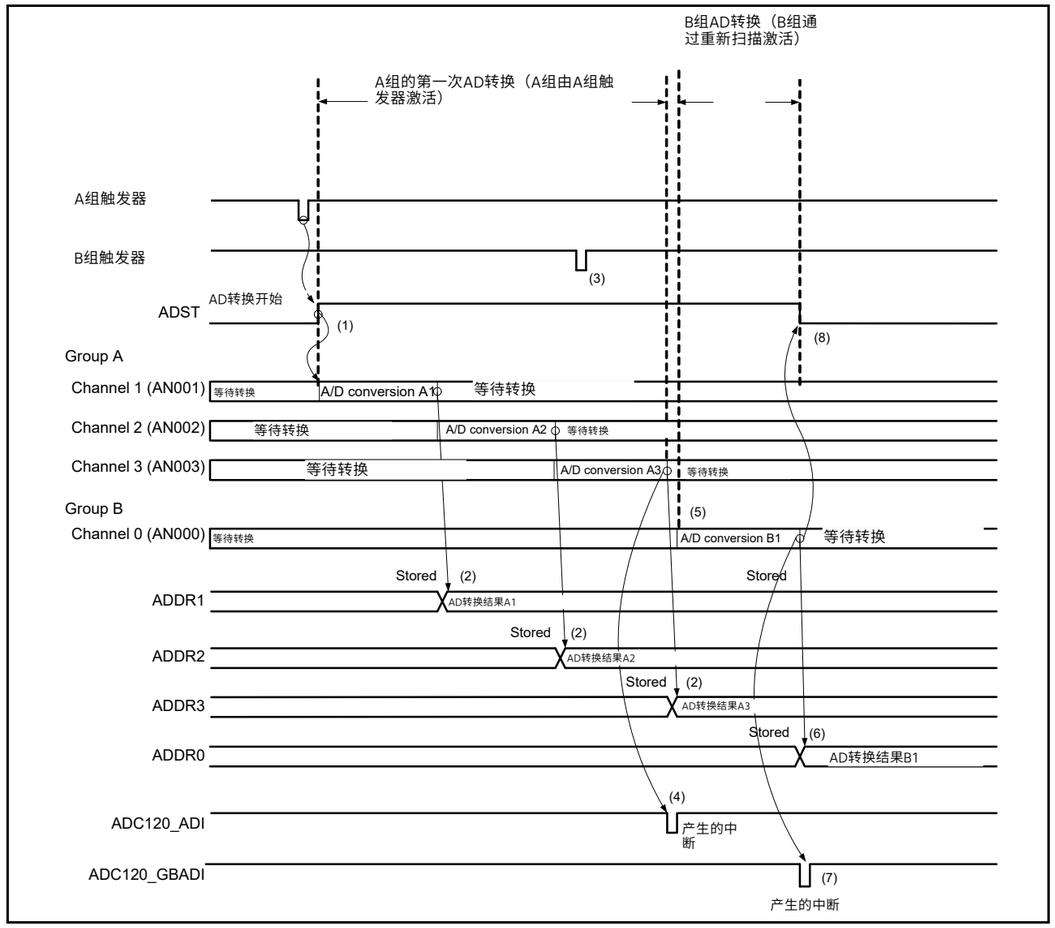

Figure 42.28 当ADGSPCR.GBRSCN=1且A组优先级控制(3)的操作示例 ADGSPCR.GBRP = 0

以下序列是A组优先级控制下的操作示例，其中为A组选择通道0，为B组选择通道1至3（ADGSPCR.GBRSCN =0，ADGSPCR.GBRP=0）：

1. 当B组的触发输入将ADCSR.ADST位设置为1（AD转换开始）时，ADANSB0和ADANSB1寄存器中选择的ANn通道的转换从编号n最小的通道开始按顺序开始。

RA生态工作室

2. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
3. If a group A trigger is input while A/D conversion for group B is in progress, and A/D conversion for group B is discontinued with the ADCSR.ADST bit remaining 1, A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
4. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
5. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
6. The ADCSR.ADST bit is automatically cleared and ADC12 enters the wait state when A/D conversion is complete.

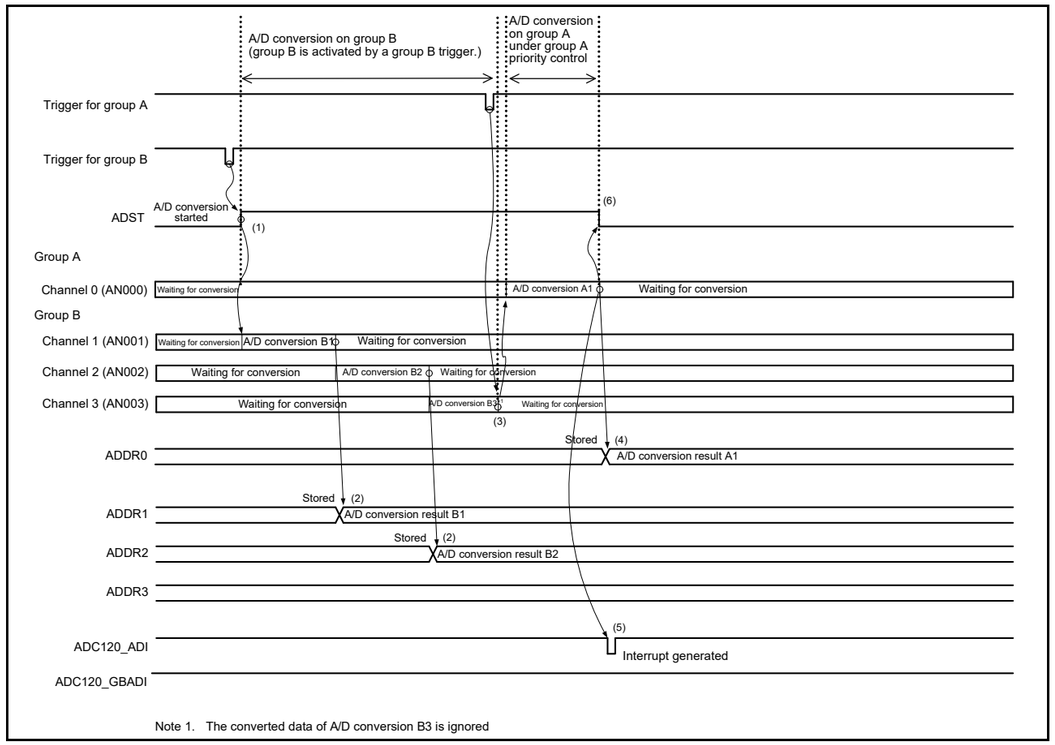

Figure 42.29 Example of operation with group A priority control (4), when ADGSPCR.GBRSCN = 0 and ADGSPCR.GBRP = 0

The following sequence is an example of operation under group A priority control in which channel 0 is selected for group A and channels 1 to 3 are selected for group B (ADGSPCR.GBRP = 1):

1. The ADCSR.ADST bit is set to 1 (A/D conversion start) when ADGSPCR.GBRP is set to 1, and conversion for the ANn channels selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
2. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
3. If a group A trigger is input while A/D conversion for group B is in progress, and A/D conversion for group B is discontinued with the ADCSR.ADST bit remaining 1, A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
4. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).

2. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 如果在B组的AD转换正在进行时输入A组触发，并且B组的AD转换中断且ADCSR.ADST位保持为1，则在ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换按顺序开始从具有最小编号n的通道。
4. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
5. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
6. 当AD转换完成时，ADCSR.ADST位自动清零，ADC12进入等待状态。

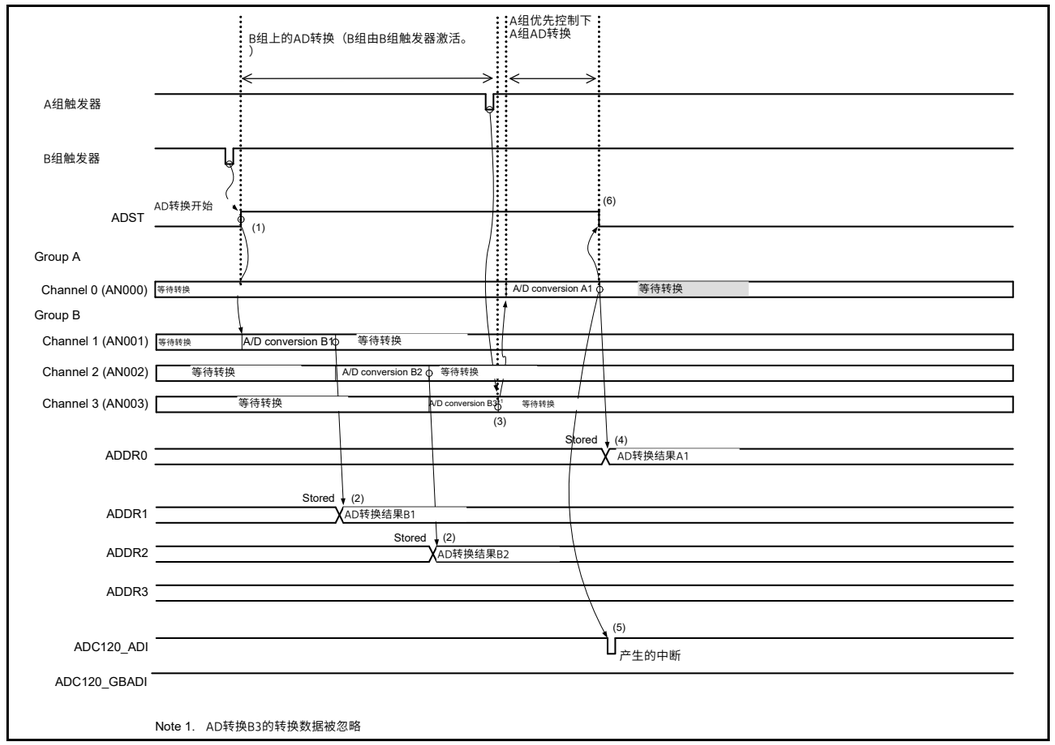

Figure 42.29 使用A组优先级控制(4)的操作示例，当ADGSPCR.GBRSCN=0且ADGSPCR.GBRP = 0

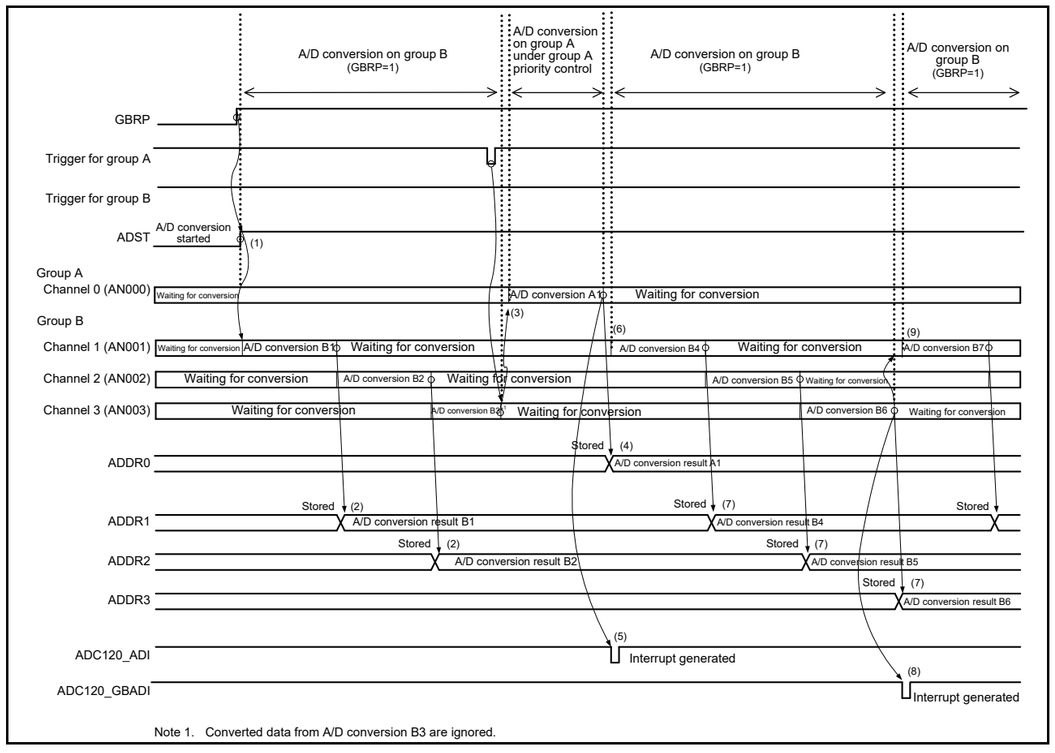
以下序列是A组优先级控制下的操作示例，其中为A组选择通道0，为B组选择通道1到3(ADGSPCR.GBRP=1)：

1. 当ADGSPCR.GBRP设置为1时，ADCSR.ADST位设置为1（AD转换开始），并且ADANSB0和ADANSB1寄存器中选择的ANn通道的转换从编号最小的通道开始按顺序开始。
2. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 如果在B组的AD转换正在进行时输入A组触发，并且B组的AD转换中断且ADCSR.ADST位保持为1，则在ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换按顺序开始从具有最小编号n的通道。
4. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。

5. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
6. A/D conversion for the ANn channels in group B selected in the ADANSB0 and ADANSB1 registers restarts in order from the channel with the smallest number n, with the ADCSR.ADST bit remaining 1.
7. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
8. An ADC12i_GBADI interrupt request is generated if the setting in the ADCSR.GBADIE bit is 1.
9. A/D conversion for the ANn channels selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n. Steps 6. to 9. are repeated as long as the ADGSPCR.GBRP bit remains 1. Clearing of the ADCSR.ADST bit to 0 is prohibited while the ADGSPCR.GBRP bit is set to 1. Follow the procedure shown in Figure 42.40 for clearing the ADCSR.ADST bit operation through software, to force A/D conversion to stop while ADGSPCR.GBRP = 1.



Note 1. Converted data from A/D conversion B3 are ignored.

Figure 42.30 Example of operation with group A priority control (5), when ADGSPCR.GBRP = 1

42.3.5 Compare Function for Windows A and B

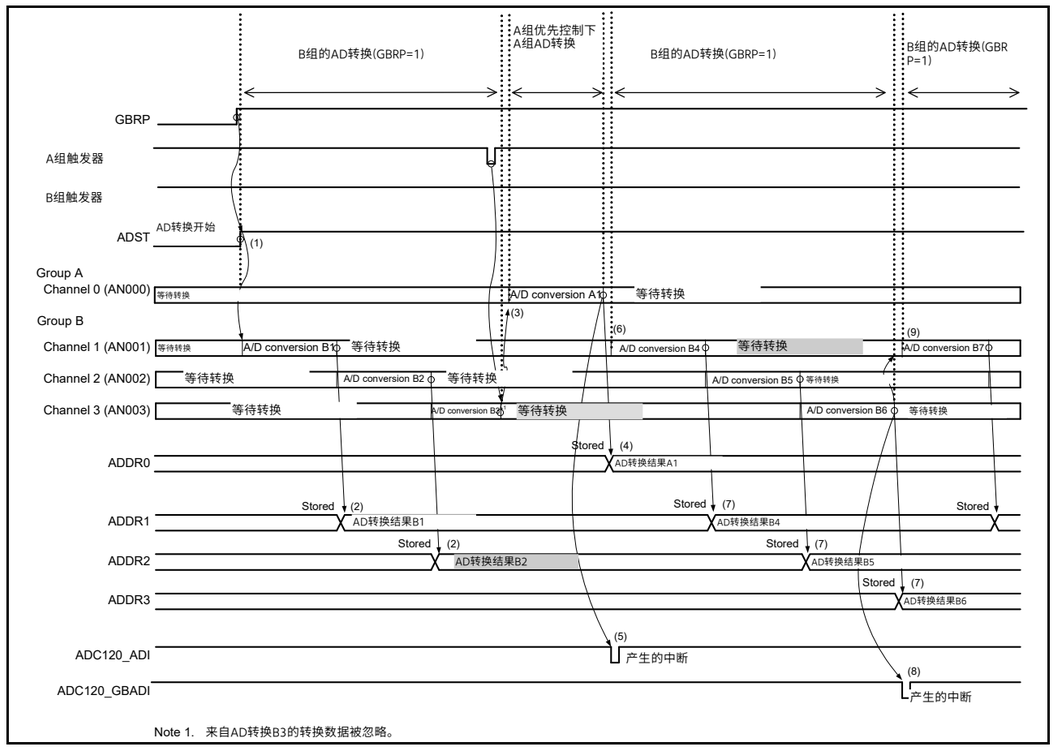
42.3.5.1 Compare function

The compare function compares a reference value with the A/D conversion result. The reference value can be set for window A and window B independently. When the compare function is in use, the self-diagnosis function and double trigger mode cannot be used. The main differences between window A and window B are their different interrupt output signals and the constraint on window B of only one selectable channel.

The following sequence is an example of operation that combines continuous scan mode and the compare function:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by software, a synchronous trigger (ELC) or an asynchronous trigger, A/D conversion starts for the selected channels, temperature sensor, and internal reference voltage.

5. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
6. ADANSB0和ADANSB1寄存器中选择的B组ANn通道的AD转换从编号n最小的通道开始按顺序重新启动，ADCSR.ADST位保持为1。
7. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
8. 如果ADCSR.GBADIE位中的设置为1，则会产生ADC12i_GBADI中断请求。
9. ADANSB0和ADANSB1寄存器中选择的ANn通道的D转换从编号n最小的通道开始按顺序开始。只要ADGSPCR.GBRP位保持为1，就重复步骤6到9。当ADGSPCR.GBRP位设置为1时，禁止将ADCSR.ADST位清除为0。按照图42.40中所示的过程进行清除通过软件对ADCSR.ADST位进行操作，在ADGSPCR.GBRP=1时强制停止AD转换。



Note 1. 来自AD转换B3的转换数据被忽略。

Figure 42.30 当ADGSPCR.GBRP=1时，A组优先级控制(5)的操作示例

42.3.5 比较WindowsA和B的函数

42.3.5.1 比较功能

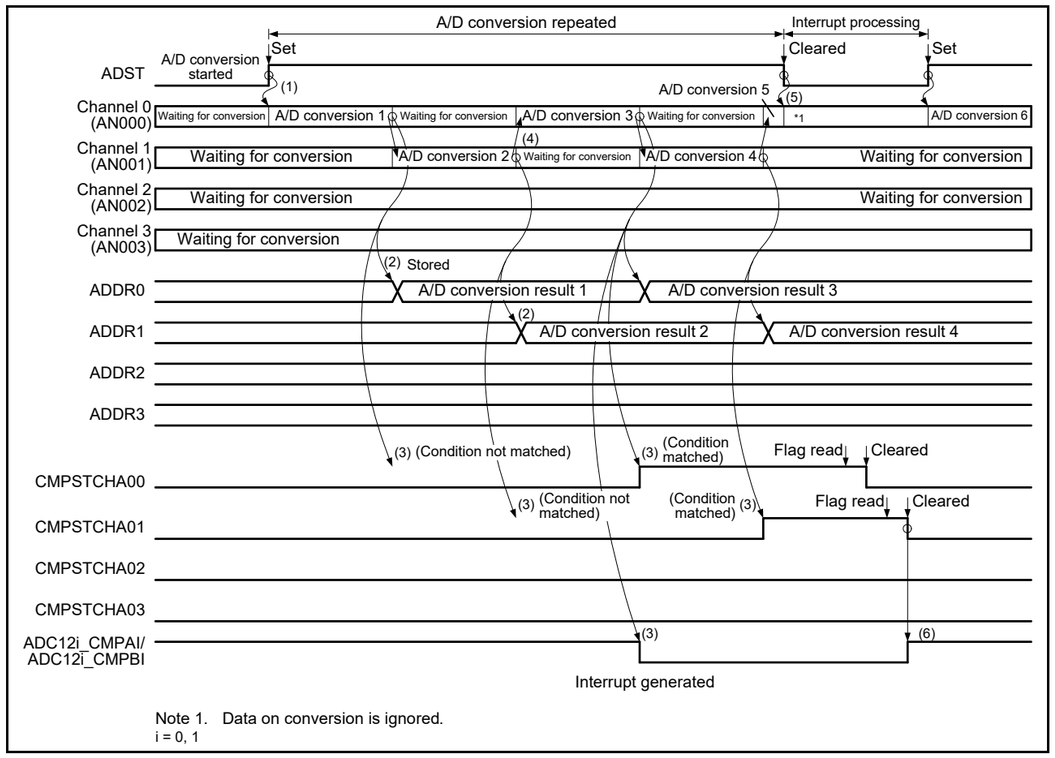
比较功能将参考值与AD转换结果进行比较。可以分别为窗口A和窗口B设置参考值。使用比较功能时，不能使用自诊断功能和双触发模式。窗口A和窗口B的主要区别在于它们不同的中断输出信号以及对窗口B的限制只有一个可选通道。

以下序列是结合连续扫描模式和比较功能的操作示例：

1. 当ADCSR.ADST位通过软件、同步触发(ELC)或异步触发设置为1（AD转换开始）时，所选通道、温度传感器和内部参考电压的AD转换开始。

RA生态工作室

2. On completion of A/D conversion, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy, ADTSDR, or ADOCDR). When ADCMPCR.CMPAE = 1, if bits in the ADCMPANSRy register or the ADCMPANSER register are set for window A, the A/D conversion result is compared with the set ADCMPDR0/1 register value. When ADCMPCR.CMPBE = 1, if bits in the ADCMPBNSR register are set for window B, the A/D conversion result is compared with the ADWINULB/ADWINLLB register setting.
3. As a result of the comparison, when window A meets the condition set in ADCMPLR0/1 or ADCMPLER, the Compare Window A Flag (ADCMPSR0.CMPSTCHA0n, ADCMPSR1.CMPSTCHA1n, ADCMPSER.CMPSTTSA, or ADCMPSER.CMPSTOCA) is set to 1. At this time, if the ADCMPCR.CMPAIE bit is 1, an ADC12i_CMPAI (i = 0, 1) interrupt request is generated. In the same way, when window B meets the condition set in ADCMPBNSR.CMPLB, the Compare Window B Flag (ADCMPBSR.CMPSTB) is set to 1. At this time, if the ADCMPCR.CMPBIE bit is 1, an ADC12i_CMPBI interrupt request is generated.
4. On completion of all selected A/D conversions and comparisons, scan restarts.
5. After the ADC12i_CMPAI and ADC12i_CMPBI interrupts are accepted, the ADCSR.ADST bit is set to 0 (A/D conversion stop) and processing is performed for channels for which the compare flag is set to 1.
6. When all compare flags of window A are cleared, the ADC12i_CMPAI interrupt request is canceled. Similarly, when all compare flags of window B are cleared, the ADC12i_CMPBI interrupt request is reset. To perform comparison again, restart the A/D conversion.



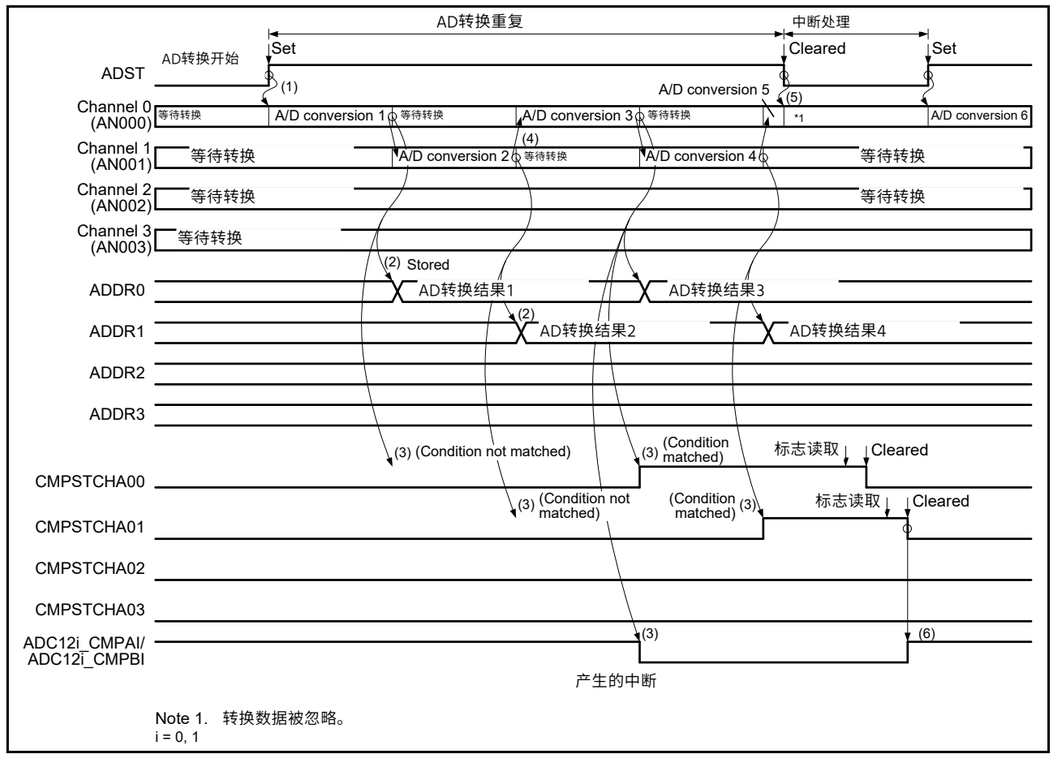
Note 1. Data on conversion is ignored.
i = 0, 1

Figure 42.31 Example of compare function operation, when AN000 to AN003 are compared

42.3.5.2 Event output of compare function

Event output of the compare function specifies the upper reference voltage value for window A and the lower reference voltage value for window B, compares the A/D-converted value of the selected channel with the upper and lower reference voltage values, and then outputs the ADC12i_WCMPM and ADC12i_WCMPUM (i = 0, 1) events based on the event conditions (A OR B, A AND B, A XOR B) and comparison results of window A and window B.

2. 完成AD转换后，AD转换结果存储在相关的AD数据寄存器y（ADDRy、ADTSDR或ADOCDR）中。当ADCMPCR.CMPAE=1时，如果ADCMPANSRy寄存器或ADCMPANSER寄存器中的位为窗口A设置，则AD转换结果与设置的ADCMPDR01寄存器值进行比较。当ADCMPCR.CMPBE=1时，如果ADCMPBNSR寄存器中的位为窗口B设置，则将AD转换结果与ADWINULBADWINLLB寄存器设置进行比较。
3. 作为比较的结果，当窗口A满足ADCMPLR01或ADCMPLER中设置的条件时，比较窗口A标志（ADCMPSR0.CMPSTCHA0n、ADCMPSR1.CMPSTCHA1n、ADCMPSER.CMPSTTSA，或ADCMPSER.CMPSTOCA)设置为1。此时，如果ADCMPCR.CMPAIE位为1，则产生ADC12i_CMPAI(i=0 1)中断请求。同理，当窗口B满足ADCMPBNSR.CMPLB中设置的条件时，比较窗口B标志（ADCMPBSR.CMPSTB）设置为1。此时，如果ADCMPCR.CMPBIE位为1，则产生ADC12i_CMPBI中断请求生成。
4. 完成所有选定的AD转换和比较后，扫描重新开始。
5. 接受ADC12i_CMPAI和ADC12i_CMPBI中断后，ADCSR.ADST位设置为0（AD转换停止），并对比较标志设置为1的通道执行处理。
6. 当窗口A的所有比较标志被清除时，ADC12i_CMPAI中断请求被取消。同样，当窗口B的所有比较标志都被清除时，ADC12i_CMPBI中断请求被复位。要再次进行比较，请重新开始AD转换。



Note 1. 转换数据被忽略。
i = 0, 1

Figure 42.31 比较功能操作示例，当比较AN000和AN003时

42.3.5.2 比较函数的事件输出

比较函数的事件输出指定窗口A的参考电压上限和窗口B的参考电压下限，将所选通道的AD转换值与上下参考电压值进行比较，然后输出ADC12i_WCMPM和ADC12i_WCMPUM(i=0 1)事件基于事件条件（AORB、AANDB、AXORB）和窗口A和窗口B的比较结果。

RA生态工作室

If more than one channel is selected for window A, and even one channel in window A meets the comparison condition, the comparison result of window A is met. When using this function, perform A/D conversion in single scan mode. Any channels from AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020 (unit 0), and AN100 to AN102, AN105 to AN107, AN116, AN117 (unit 1), internal reference voltage, and temperature sensor output are selectable for window A.

The following sequence is an example of how to set up and use the event output of the compare function:

1. Confirm that the value in the ADCSR.ADCS bits is 00b (single scan mode).
2. Select the channel for window A in ADCMPANSR0/1 and ADCMPANSER. Set window comparison conditions in the ADCMPLR0/1 and ADCMPLER registers. Set the upper and lower reference values in the ADCMPDR0 and ADCMPDR1 registers.
3. Select the channel and comparison conditions for window B in the ADCMPBNSR register, and set the upper and lower reference values in the ADWINULB and ADWINLLB registers.
4. Set composite conditions for window A/B, window A/B operation enable, and interrupt output enable in ADCMPCR.

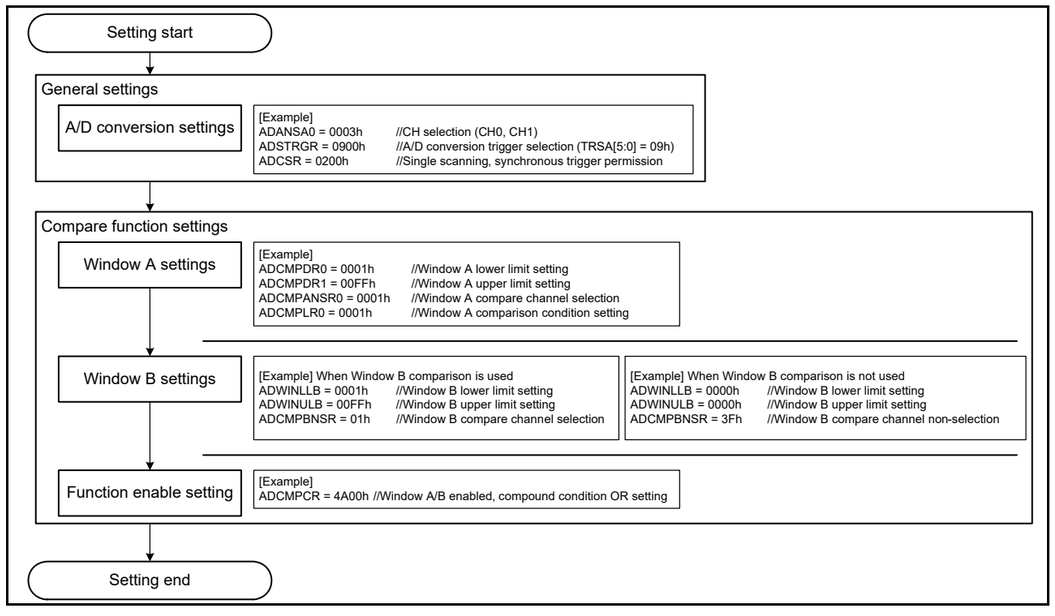


Figure 42.32 Setting example when using the event output of the compare function

Notes on the event output usage when using only window A for the compare function:

- Enable both window A and window B (ADCMPCR.CMPAE = 1, ADCMPCR.CMPBE = 1)
- Set the compound condition of window A and window B to “OR condition” (ADCMPCR.CMPAB[1:0] = 00b)
- Set the compared channel of window B to “Do not select” (ADCMPBNSR.CMPCHB[5:0] = 111111b)
- Set the compare condition of window B to “0 < results < 0 always means mismatch” (ADCMPCR.WCMPE = 1, ADWINLLB.CMPLLB[15:0] = ADWINULB.CMPULB[15:0] = 0000h, and ADCMPBNSR.CMPLB = 1).

Figure 42.33 shows the event output operation example of compare function.

A scan end event (ADC12i_ADI) is output with the same timing of one time single scan completion. A match or mismatch event (ADC12i_WCMPM or ADC12i_WCMPUM) is output delayed by 1 PCLKB depending on ADCMPCR.CMPAB[1:0] settings.

Note: The match and mismatch events are exclusive, so both events are never output simultaneously.

如果为窗口A选择了多个通道，即使窗口A中的一个通道满足比较条件，也满足窗口A的比较结果。使用此功能时，请在单次扫描模式下进行AD转换。从AN000到AN003、AN005到AN007、AN016到AN018、AN020（单元0）和AN100到AN102、AN105到AN107、AN116、AN117（单元1）的任何通道、内部参考电压和温度传感器输出均可用于窗口一个。

以下序列是如何设置和使用比较函数的事件输出的示例：

1. 确认ADCSR.ADCS位中的值为00b（单次扫描模式）。
2. 在ADCMPANSR01和ADCMPANSER中选择窗口A的通道。在ADCMPLR01和ADCMPLER寄存器中设置窗口比较条件。在ADCMPDR0和ADCMPDR1寄存器中设置参考值上限和下限。
3. 在ADCMPBNSR寄存器中选择窗口B的通道和比较条件，并在ADWINULB和ADWINLLB寄存器中设置上下参考值。
4. 设置窗口AB、窗口AB操作使能和中断输出使能的复合条件
ADCMPCR.

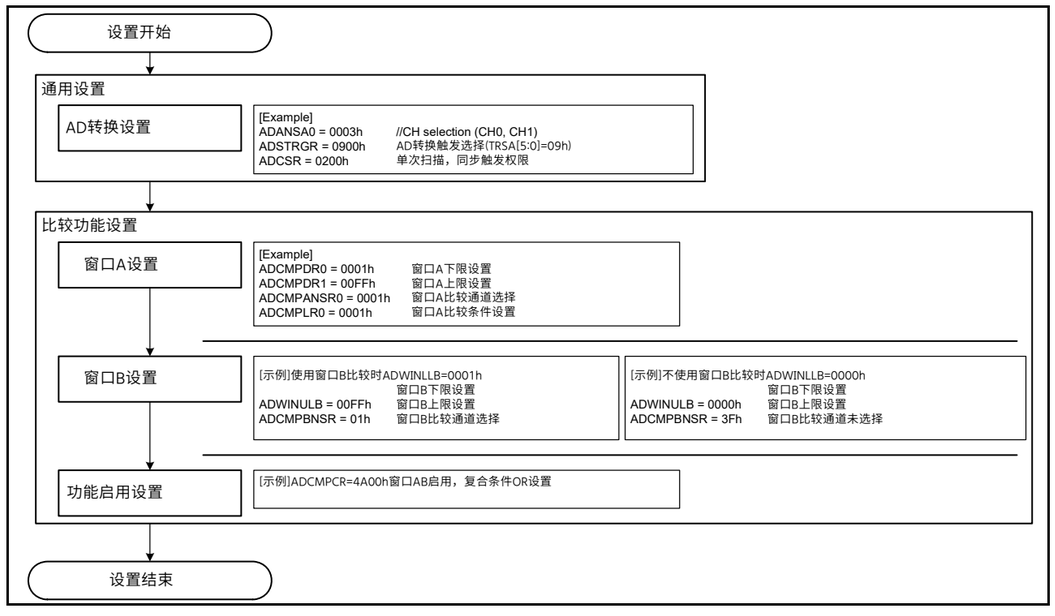

Figure 42.32 使用比较功能的事件输出时的设置示例

仅使用窗口A进行比较功能时的事件输出使用注意事项：

- 启用窗口A和窗口B(ADCMPCR.CMPAE=1 ADCMPCR.CMPBE=1)
- 将窗口A和窗口B的复合条件设置为“或条件”（ADCMPCR.CMPAB[1:0]=00b）
- 将窗口B的比较通道设置为“不选择”（ADCMPBNSR.CMPCHB[5:0]=111111b）
- 将窗口B的比较条件设置为“0<结果<0始终表示不匹配”（ADCMPCR.WCMPE=1，ADWINLLB.CMPLLB[15:0] = ADWINULB.CMPULB[15:0] = 0000h, and ADCMPBNSR.CMPLB = 1).

图42.33显示了比较功能的事件输出操作示例。

扫描结束事件(ADC12i_ADI)以与一次单次扫描完成相同的时序输出。匹配或不匹配事件（ADC12i_WCMPM或ADC12i_WCMPUM）输出延迟1个PCLKB，具体取决于ADCMPCR.CMPAB[1:0]设置。

Note: match和mismatch事件是互斥的，因此这两个事件永远不会同时输出。

RA生态工作室

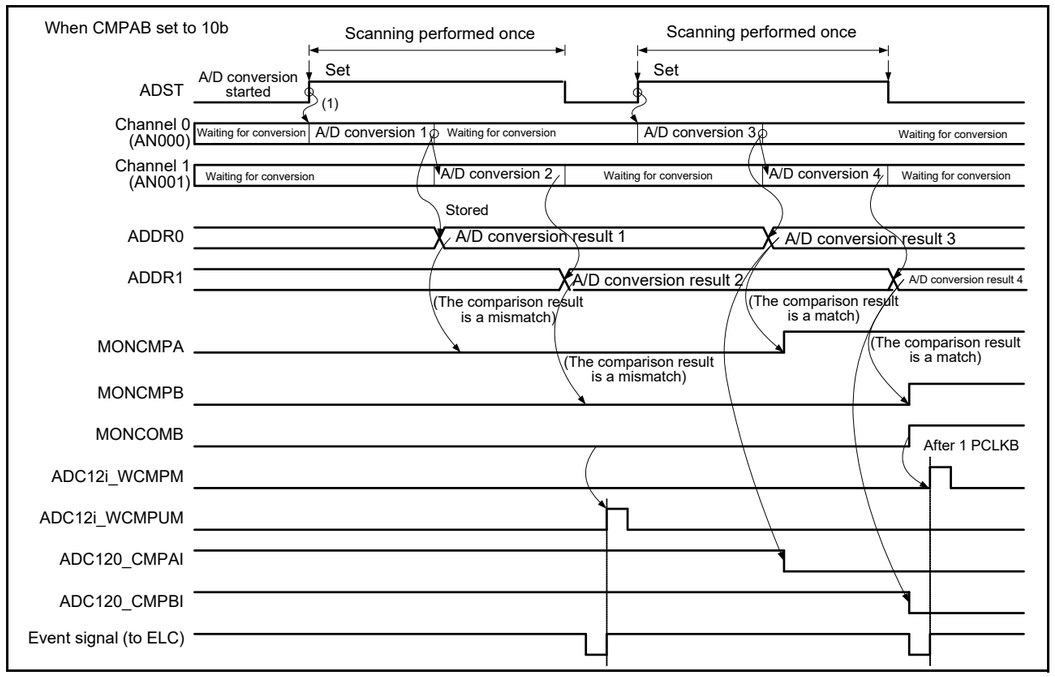

Figure 42.33 Example of the compare function event output when AN000 to AN001 are compared

Note 1. Event output of compare function outputs match/mismatch from the comparison results of window A and window B, based on the ADCMPCR.CMPAB[1:0] settings.

Note 2. The comparison result of window A is the logical addition of the comparison results of the comparison target channels of window A. The comparison results of window A and window B are updated by each A/D conversion, and are kept even when single scan ends. Set ADCMPCR.CMPAE and ADCMPCR.CMPBE to 0 to clear the comparison results to 0.

42.3.5.3 Constraints on the compare function

The following constraints apply for the compare function:

- The compare function cannot be used together with the self-diagnosis function or double trigger mode (the compare function is not available for ADRD, ADDBLDR, ADDBLDRA, and ADDBLDRB)
- Specify single scan mode when using match/mismatch event outputs
- When the temperature sensor output or internal reference voltage is selected for window A, and window B operations are disabled
- When the temperature sensor output or internal reference voltage is selected for window B, and window A operations are disabled
- Setting the same channel for window A and window B is prohibited
- Set the reference voltage values so that the high-potential reference voltage value is equal to or larger than the low-potential reference voltage value.

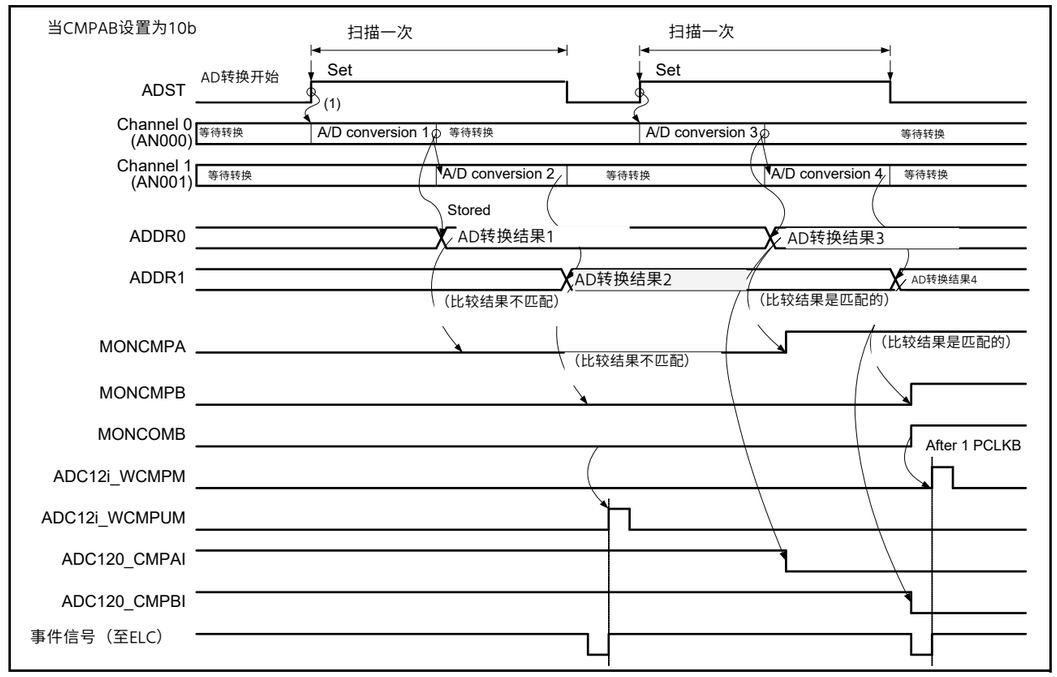

Figure 42.33 比较AN000和AN001时的比较功能事件输出示例

注1.比较函数输出的事件输出matchmismatch来自窗口A和窗口的比较结果
B、基于ADCMPCR.CMPAB[1:0]设置。

注2.窗口A的比较结果是比较对象的比较结果的逻辑相加
窗口A的通道。窗口A和窗口B的比较结果在每次AD转换时更新，即使在单次扫描结束时也保持不变。将ADCMPCR.CMPAE和ADCMPCR.CMPBE设置为0，将比较结果清除为0。

42.3.5.3 比较函数的约束

以下约束适用于比较功能：

- 比较功能不能与自诊断功能或双触发模式一起使用（比较功能不适用于ADRD、ADDBLDR、ADDBLDRA和ADDBLDRB）
- 使用匹配不匹配事件输出时指定单次扫描模式
- 当窗口A选择温度传感器输出或内部参考电压时，窗口B操作被禁用
- 当窗口B选择温度传感器输出或内部参考电压时，窗口A操作被禁用
- 禁止将窗口A和窗口B设置为同一通道
- 设置参考电压值，使高电位参考电压值等于或大于低电位参考电压值。

42.3.6 Analog Input Sampling and Scan Conversion Time

Scan conversion can be activated by a software trigger, a synchronous trigger (ELC), or an asynchronous trigger (ADTRGn). After the start-of-scanning-delay (t_D) elapses, processing by the channel-dedicated sample-and-hold circuits, processing for disconnection detection assistance, and processing of conversion for self-diagnosis all proceed, followed by processing for A/D conversion.

Figure 42.34 shows the scan conversion timing, in which scan conversion is activated by a software trigger or a synchronous trigger (ELC). Figure 42.35 shows the scan conversion timing, in which scan conversion is activated by an asynchronous trigger, ADTRGn. The scan conversion time (t_{SCAN}) includes the start-of-scanning-delay (t_D), channel-dedicated sample-and-hold circuit processing time (t_{SPLSH}),*1 disconnection detection assistance processing time (t_{DIS}),*2 self-diagnosis A/D conversion processing time (t_{DIAG}),*3 A/D conversion processing time (t_{CONV} and t_{DSD}), channel-dedicated sample-and-hold circuit end time (t_{SHED}),*4 and end-of-scanning-delay (t_{ED}).

The A/D conversion processing time (t_{CONV}) consists of the input sampling time (t_{SPL}) and time for conversion by successive approximation (t_{SAM}). The sampling time (t_{SPL}) is used to charge sample-and-hold circuits in the ADC12. If there is not sufficient sampling time because of the high impedance of an analog input signal source, or if the A/D conversion clock (ADCLK) is slow, sampling time can be adjusted using the ADSSTR register.

The time for conversion by successive approximation (t_{SAM}) is 13 ADCLK states with 12-bit accuracy selected, 11 ADCLK states with 10-bit accuracy selected, and 9 ADCLK states with 8-bit accuracy selected.

The scan conversion time (t_{SCAN}) in single scan mode for which the number of selected channels is n can be determined as follows:

$$t_{SCAN} = t_D + t_{SPLSH} + (t_{DIS} \times n) + t_{DIAG} + (t_{CONV} \times n)\ *5 + t_{ED}$$

The scan conversion time for the first cycle in continuous scan mode is t_{SCAN} for single scan minus t_{ED} plus t_{SHED}.

The scan conversion time for the second and subsequent cycles in continuous scan mode is fixed at $t_{SPLSH} + (t_{DIS} \times n) + t_{DIAG} + t_{DSD} + (t_{CONV} \times n)\ *5 + t_{SHED}$.

Note 1. When no channel-dedicated sample-and-hold circuits are used, $t_{SPLSH} = 0$.
Note 2. When disconnection detection assistance is not selected, $t_{DIS} = 0$.
Note 3. When the self-diagnosis function is not used, $t_{DIAG} = 0$, $t_{DSD} = 0$.
Note 4. When no channel-dedicated sample-and-hold circuits are used, $t_{SHED} = 0$, assuming continuous scan mode is active. In single scan mode and group scan mode, t_{SHED} is included in the end-of-scanning-delay (t_{ED}).
Note 5. When input sampling times (t_{SPL}) of all selected channels are the same, this element equals $t_{CONV} \times n$. If each channel has a different sampling time, this element equals that of t_{SPL} and t_{SAM} set to each selected channel.

42.3.6 模拟输入采样和扫描转换时间

扫描转换可以通过软件触发、同步触发(ELC)或异步触发(ADTRGn)来激活。在经过扫描开始延迟(tD)之后，通道专用采样保持电路的处理、断线检测辅助处理、自诊断转换处理全部进行，接着进行AD处理转换。

图42.34显示了扫描转换时序，其中扫描转换由软件触发或同步触发(ELC)激活。图42.35显示了扫描转换时序，其中扫描转换由异步触发器ADTRGn激活。扫描转换时间(tSCAN)包括扫描开始延迟(tD)、通道专用采样保持电路处理时间(tSPLSH)、*1断线检测辅助处理时间(tDIS)、*2自诊断AD转换处理时间(tDIAG)、*3AD转换处理时间(tCONV和tDSD)、通道专用采样保持电路结束时间(tSHED)、*4和扫描结束–延迟（tED）。

AD转换处理时间(tCONV)由输入采样时间(tSPL)和逐次逼近转换时间(tSAM)组成。采样时间(tSPL)用于为ADC12中的采样保持电路充电。如果由于模拟输入信号源的高阻抗而没有足够的采样时间，或者如果AD转换时钟(ADCLK)很慢，可以使用ADSSTR寄存器调整采样时间。

逐次逼近转换时间(tSAM)为13个ADCLK状态，选择12位精度，11
选择了10位精度的ADCLK状态，以及选择了8位精度的9个ADCLK状态。

选择通道数为n的单次扫描模式下的扫描转换时间(tSCAN)可以确定如下：

$$tSCAN=tD+tSPLSH+(tDIS\times n)+tDIAG+(tCONV\times n)*5+tED$$

连续扫描模式下第一个周期的扫描转换时间是单次扫描的tSCAN减去tED加上tSHED。

连续扫描模式中第二个和后续周期的扫描转换时间固定为tSPLSH+(tDIS×n)+tDIAG+tDSD+(tCONV×n)*5+tSHED。

注1.当不使用通道专用采样保持电路时，tSPLSH=0。
注2.未选择断线检测辅助时，tDIS=0。
注3.不使用自诊断功能时，tDIAG=0，tDSD=0。
注4.当不使用通道专用的采样保持电路时，tSHED=0，假设连续扫描模式为积极的。在单扫描模式和组扫描模式中，tSHED包含在扫描结束延迟（tED）中。
注5.当所有选定通道的输入采样时间(tSPL)相同时，该元素等于tCONV×n。如果每个通道具有不同的采样时间，该元素等于为每个选定通道设置的tSPL和tSAM。

Table 42.10 Conversion times during scanning (in numbers of ADCLK and PCLKB cycles)

Parameter			Symbol		Type/conditions: Synchronous trigger*4	Type/conditions: Asynchronous trigger	Type/conditions: Software trigger	Unit
Scan start processing time*1, *2	A/D conversion on group A under group A priority control	Group B is to be stopped. (group A is activated after group B is stopped by an A/D conversion source from group A).	t_D		3 PCLKB + 6 ADCLK 5 PCLKB + 3 ADCLK *5	-	-	Cycles
		Group B is not to be stopped (activation by an A/D conversion source from group A)			2 PCLKB + 4 ADCLK	-	-	
	A/D conversion when self-diagnosis is enabled	A/D conversion for self-diagnosis is to be started			2 PCLKB + 6 ADCLK	4 PCLKB + 6 ADCLK	6 ADCLK	
	All other				2 PCLKB + 4 ADCLK	2 PCLKB + 4 ADCLK	4 ADCLK	
Channel-dedicated sample-and-hold processing time*1	Sampling time		t_{SPLSH}	t_{SH}	Without continuous sampling: setting in ADSHCR.SSTSH[7:0] (initial value = 18h × ADCLK) With continuous sampling: 0			
	Wait time between sampling and A/D conversion			t_W	12			
Disconnection detection assistance processing time			t_{DIS}		Setting in ADNDIS[3:0] (initial value = 0h) × ADCLK			
Self-diagnosis conversion processing time*1	Sampling time		t_{DIAG}	t_{SPL}	Setting in ADSSTR00 (initial value = 0Bh) × ADCLK*3	-	-	
	Time for conversion by successive approximation	12-bit conversion accuracy		t_{SAM}	15 ADCLK	-	-	
		10-bit conversion accuracy			13 ADCLK	-	-	
		8-bit conversion accuracy			11 ADCLK	-	-	
	Wait time between self-diagnosis conversion end and analog channel sampling start			t_{DED}	2 ADCLK			
	Wait time between last channel conversion end and self-diagnosis sampling start in continuous scan mode		t_{DSD}		2 ADCLK			
A/D conversion processing time*1	Sampling time		t_{CONV}	t_{SPL}	Setting in ADSSTRn (n = 00 to 03, 05 to 07, L, T, O) (initial value = 0Bh) × ADCLK + 0.5 ADCLK			
	Time for conversion by successive approximation	12-bit conversion accuracy		t_{SAM}	13 ADCLK			
		10-bit conversion accuracy			11 ADCLK			
		8-bit conversion accuracy			9 ADCLK			
Channel-dedicated sample-and-hold end processing time			t_{SHED}		2 ADCLK			
Scan end processing time*1			t_{ED}		1 PCLKB + 3 ADCLK 2 PCLKB + 3 ADCLK*5			

Note 1. See Figure 42.34 and Figure 42.35 for an illustration of times t_D, t_{SPLSH}, t_{DIAG}, t_{CONV}, and t_{ED}.
Note 2. This is the maximum time required from software writing or trigger input to A/D conversion start.
Note 3. The sampling time setting must satisfy the electrical characteristics.
Note 4. This does not include the time consumed in the path from timer output to trigger input.
Note 5. If ADCLK is faster than PCLKB (PCLKB to ADCLK frequency ratio = 1:2 or 1:4), the scan end processing time changes.

Table 42.10 扫描期间的转换时间（以ADCLK和PCLKB周期数为单位）

Parameter			Symbol		Type/conditions: Synchronous trigger*4	Type/conditions: 异步触发	Type/conditions: 软件触发	Unit
扫描开始处理时间*1、*2	A组优先控制下A组AD转换	B组将被停止。（A组的AD转换源停止B组后激活A组）。	t_D		3 PCLKB + 6 ADCLK 5 PCLKB + 3 ADCLK *5	-	-	Cycles
		不停止B组（由A组的AD转换源激活）			2 PCLKB + 4 ADCLK	-	-	
	启用自诊断时的AD转换	将启动用于自诊断的D转换			2 PCLKB + 6 ADCLK	4 PCLKB + 6 ADCLK	6 ADCLK

	采样和AD转换之间的等待时间			t_W	12			
断线检测辅助处理时间			t_{DIS}		ADNDIS[3:0]中的设置（初始值=0h）×ADCLK			
自诊断转换处理时间*1	采样时间		t_{DIAG}	t_{SPL}	在ADSSTR00中设置（初始值=0Bh）×ADCLK *3	-	-	
	逐次逼近转换时间	12位转换精度		t_{SAM}	15 ADCLK	-	-	
		10位转换精度			13 ADCLK	-	-	
		8位转换精度			11 ADCLK	-	-	
	自诊断转换结束与模拟通道采样开始之间的等待时间			t_{DED}	2 ADCLK			
	连续扫描模式下最后一次通道转换结束和自诊断采样开始之间的等待时间		t_{DSD}		2 ADCLK			
AD转换处理时间*1	采样时间		t_{CONV}	t_{SPL}	ADSSTRn中的设置（n=00至03、05至07、L、T、O）（初始值=0Bh）×ADCLK+0.5ADCLK			
	逐次逼近转换时间	12位转换精度		t_{SAM}	13 ADCLK			
		10位转换精度			11 ADCLK			
		8位转换精度			9 ADCLK			
通道专用的采样保持结束处理时间			t_{SHED}		2 ADCLK			
扫描结束处理时间*1			t_{ED}		1 PCLKB + 3 ADCLK 2 PCLKB + 3 ADCLK*5			

Note 1. 有关时间tD、tSPLSH、tDIAG、tCONV和tED的说明，请参见图42.34和图42.35。
Note 2. 这是从软件写入或触发输入到AD转换开始所需的最长时间。
Note 3. 采样时间设置必须满足电气特性。
Note 4. 这不包括从定时器输出到触发输入的路径中消耗的时间。
Note 5. 如果ADCLK比PCLKB快（PCLKB与ADCLK频率比=1:2或1:4），则扫描结束处理时间会发生变化。

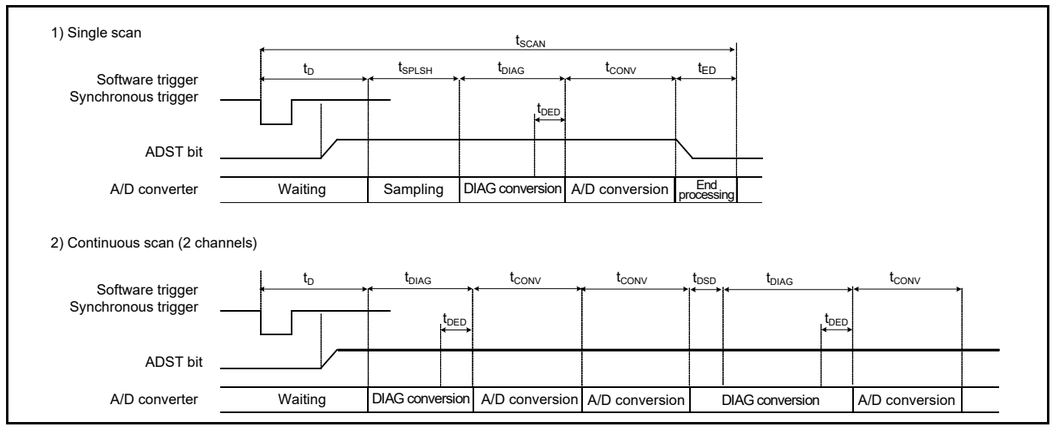

Figure 42.34 Scan conversion timing when activated by software or a synchronous trigger input (ELC)

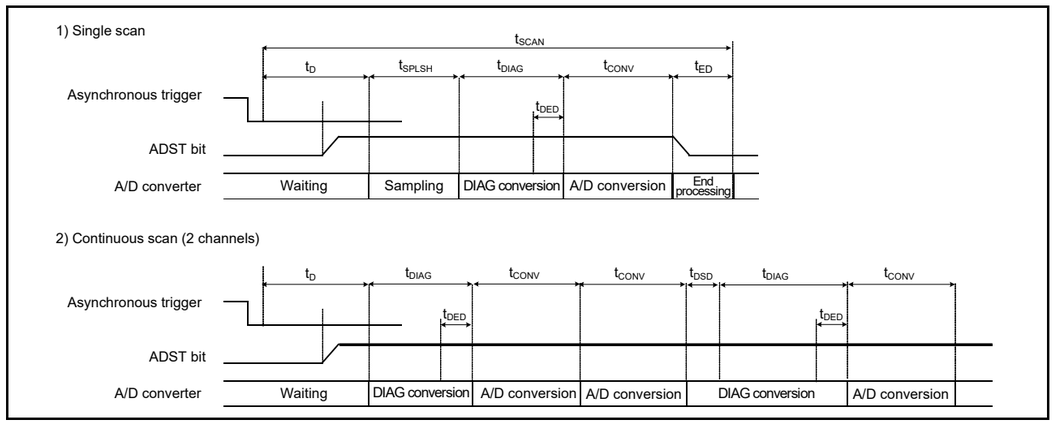

Figure 42.35 Scan conversion timing when activated by an asynchronous trigger input (ADTRG0)

42.3.7 Usage Example of A/D Data Register Automatic Clearing Function

A/D-converted value addition/average mode can be used when A/D conversion of the analog input of the selected channels, temperature sensor output, or internal reference voltage is selected.

Setting the ACE bit in ADCER to 1 automatically clears the data registers (ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, and ADOCDR) to 0000h when the data registers are read by the CPU, DTC, or DMAC. This function enables detection of update failures by the data registers.

In the following examples, the function to automatically clear the ADDRy register is enabled and disabled:

- If the ACE bit in ADCER is 0 (automatic clearing disabled), and for some reason, the A/D conversion result (0222h) is not written to the ADDRy register, the ADDRy value retains the old data (0111h). In addition, if this ADDRy value is read into a general-purpose register using an A/D scan end interrupt, the old data (0111h) can be saved in the general-purpose register. When checking whether there is an update failure, it is necessary to frequently save the old data in SRAM or in a general-purpose register.
- If the ACE bit in ADCER is 1 (automatic clearing enabled), when ADDRy = 0111h is read by the CPU, DTC, or DMAC, ADDRy is automatically cleared to 0000h. Next, if the A/D conversion result 0222h cannot be transferred to ADDRy for some reason, the cleared data (0000h) remains as the ADDRy value. If this ADDRy value is read into a general-purpose register using an A/D scan end interrupt at this point, 0000h is saved in the general-purpose register. Occurrence of an ADDRy update failure can be determined by checking that the read data value is 0000h.

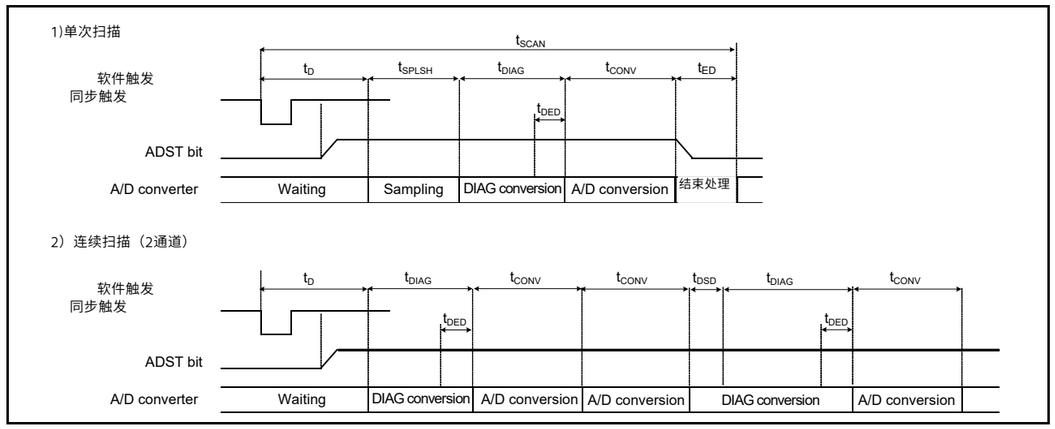

Figure 42.34 由软件或同步触发输入(ELC)激活时的扫描转换时序

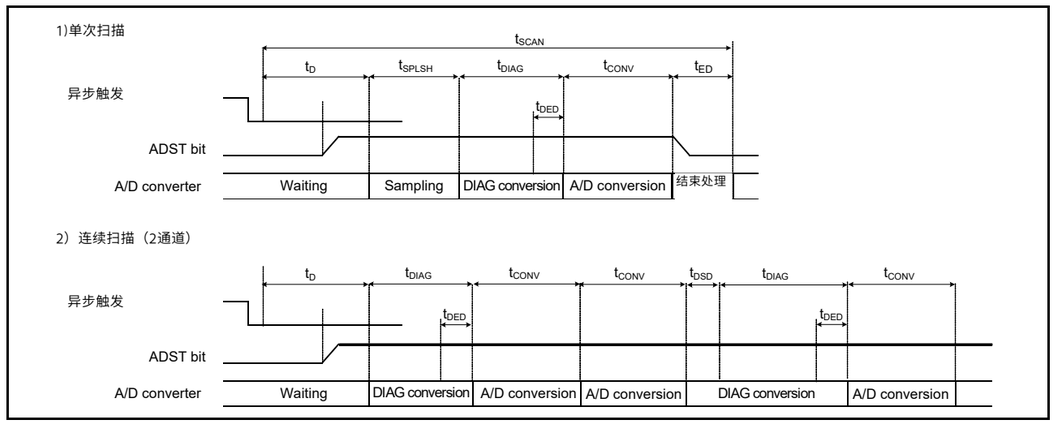

Figure 42.35 由异步触发输入(ADTRG0)激活时的扫描转换时序

42.3.7 AD数据寄存器自动清除功能的使用示例

选择通道的模拟输入、温度传感器输出或内部参考电压的AD转换时，可以使用D转换值加法平均模式。

当CPU、DTC或DMAC读取数据寄存器时，将ADCER中的ACE位设置为1会自动将数据寄存器（ADDRy、ADRD、ADDBLDR、ADDBLDRA、ADDBLDRB、ADTSDR和ADOCDR）清除为0000h。该功能可以通过数据寄存器检测更新失败。

在以下示例中，自动清除ADDRy寄存器的功能被启用和禁用：

- 如果ADCER中的ACE位为0（禁止自动清除），并且由于某种原因，AD转换结果（0222h）没有写入ADDRy寄存器，则ADDRy值保留旧数据（0111h）。此外，如果使用AD扫描结束中断将该ADDRy值读入通用寄存器，则可以将旧数据（0111h）保存在通用寄存器中。在检查是否有更新失败时，需要经常将旧数据保存在SRAM或通用寄存器中。
- 如果ADCER中的ACE位为1（使能自动清除），当ADDRy=0111h时，CPU、DTC或DMAC ADDRy自动清零为0000h。接下来，如果AD转换结果0222h由于某种原因无法传送到ADDRy，则清除的数据(0000h)仍保留为ADDRy值。如果此时使用AD扫描结束中断将该ADDRy值读入通用寄存器，则将0000h保存在通用寄存器中。ADDRy更新失败的发生可以通过检查读取的数据值为0000h来确定。

42.3.8 A/D-Converted Value Addition/Average Mode

In A/D-converted value addition mode, the same channel is A/D-converted 1, 2, 3, 4, or 16*1 consecutive times, and the sum of the converted values is stored in the data register. In A/D-converted value average mode, the same channel is A/D-converted 2 or 4 consecutive times, and the mean of the converted values is stored in the data register. The use of the average of these results can improve the accuracy of A/D conversion, depending on the types of noise components that are present. However, this function cannot always guarantee an improvement in A/D conversion accuracy.

The A/D-converted value addition or average mode can be specified for A/D conversion of the channel select analog input, temperature sensor output, or internal reference voltage.

Note 1. The addition count can be set to 16 only when 12-bit accuracy is selected.

42.3.9 Disconnection Detection Assist Function

This converter incorporates a function that fixes the charge for sampling capacitance to the specified state (VREFH0 or VREFL0 for unit 0, VREFH or VREFL for unit 1) before the start of A/D conversion. This function enables disconnection detection in wiring of analog inputs.

When using the disconnection detection assist function for the channel-dedicated sample-and-hold circuit, select ADSHMSR.SHMD bit to 0 (select disable continuous sampling function).

If any of the following functions are used, the disconnection detection assist function should be disabled:

- Temperature sensor
- Internal reference voltage
- A/D self-diagnosis
- Programmable gain amplifier without bypass enabled.

Figure 42.36 shows the A/D conversion operation when the disconnection detection assist function is used. Figure 42.37 shows an example of disconnection detection when precharge is selected. Figure 42.38 shows an example of disconnection detection when discharge is selected.

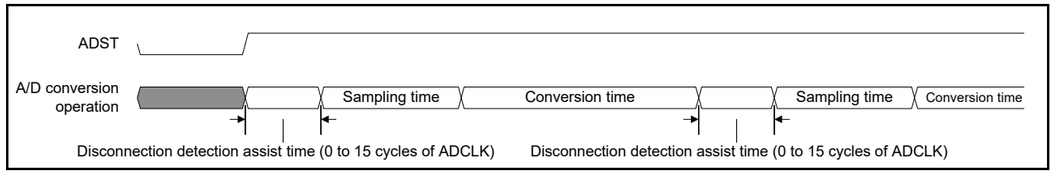

Figure 42.36 A/D conversion operation when the disconnection detection assist function is used

42.3.8 一种D转换的增值平均模式

在AD转换值加法模式下，同一通道连续进行1、2、3、4或16*1次AD转换，转换值的总和存储在数据寄存器中。在AD转换值平均模式下，同一通道连续进行2或4次AD转换，转换值的平均值存储在数据寄存器中。根据存在的噪声成分的类型，使用这些结果的平均值可以提高AD转换的精度。但是，该功能不能始终保证AD转换精度的提高。

可以为通道选择模拟输入、温度传感器输出或内部参考电压的AD转换指定AD转换值加法或平均模式。

注1.只有选择12位精度时，才能将加法计数设置为16。

42.3.9 断线检测辅助功能

该转换器包含一个功能，可将采样电容的电荷固定到指定状态（VREFH0或单元0的VREFL0，单元1的VREFH或VREFL）在AD转换开始之前。此功能可在模拟输入接线中进行断线检测。

使用通道专用采样保持电路的断线检测辅助功能时，选择ADSHMSR.SHMD位为0（选择禁用连续采样功能）。

如果使用以下任一功能，应禁用断线检测辅助功能：

- 温度感应器
- 内部参考电压
- A/D self-diagnosis
- 不启用旁路的可编程增益放大器。

图42.36显示了使用断线检测辅助功能时的AD转换操作。图42.37显示了选择预充电时的断线检测示例。图42.38显示了选择放电时的断线检测示例。

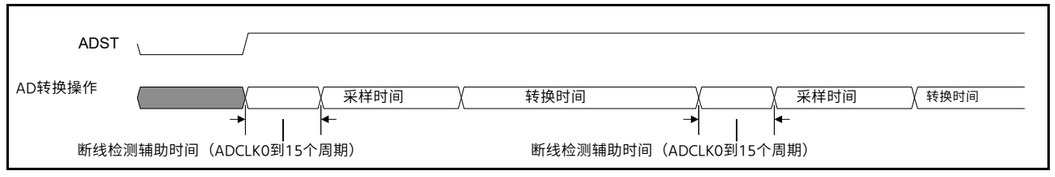

Figure 42.36 使用断线检测辅助功能时的D转换动作

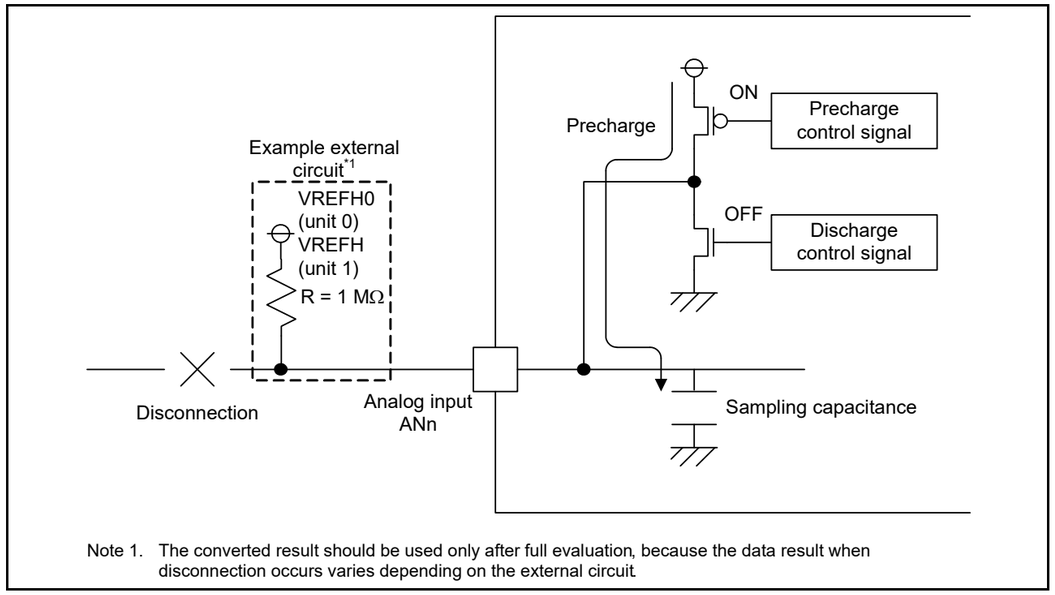
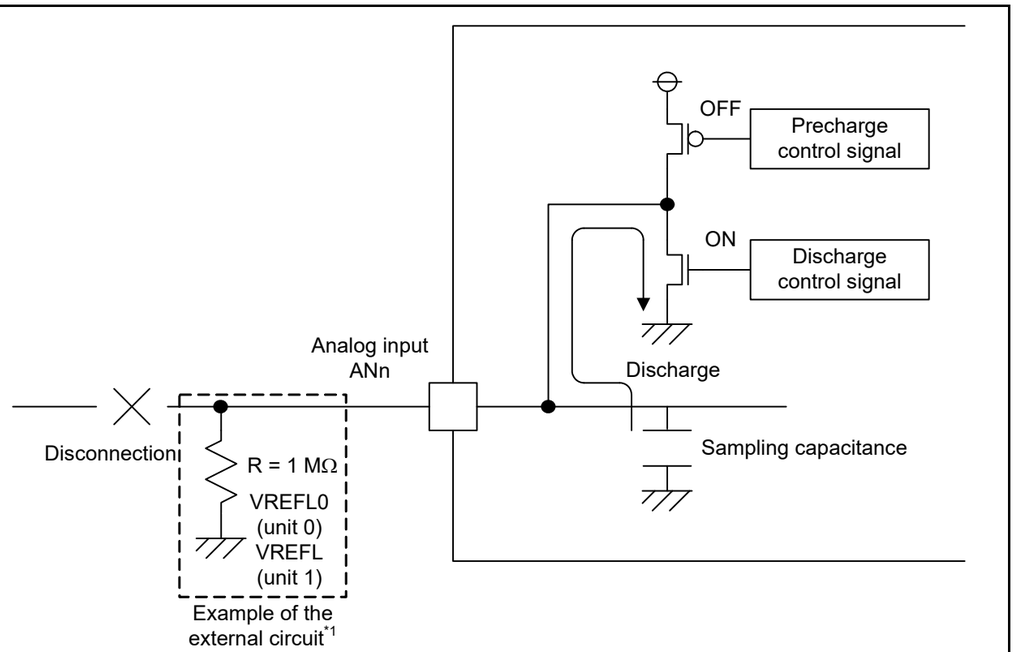


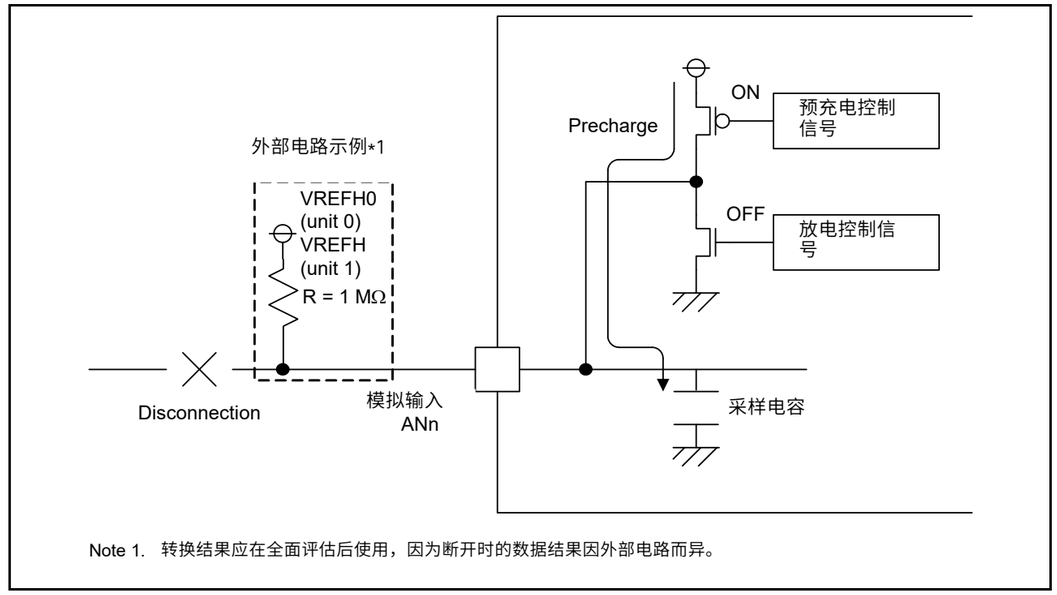
Note 1. The converted result should be used only after full evaluation, because the data result when disconnection occurs varies depending on the external circuit.

Figure 42.37 Example of disconnection detection when precharge is selected



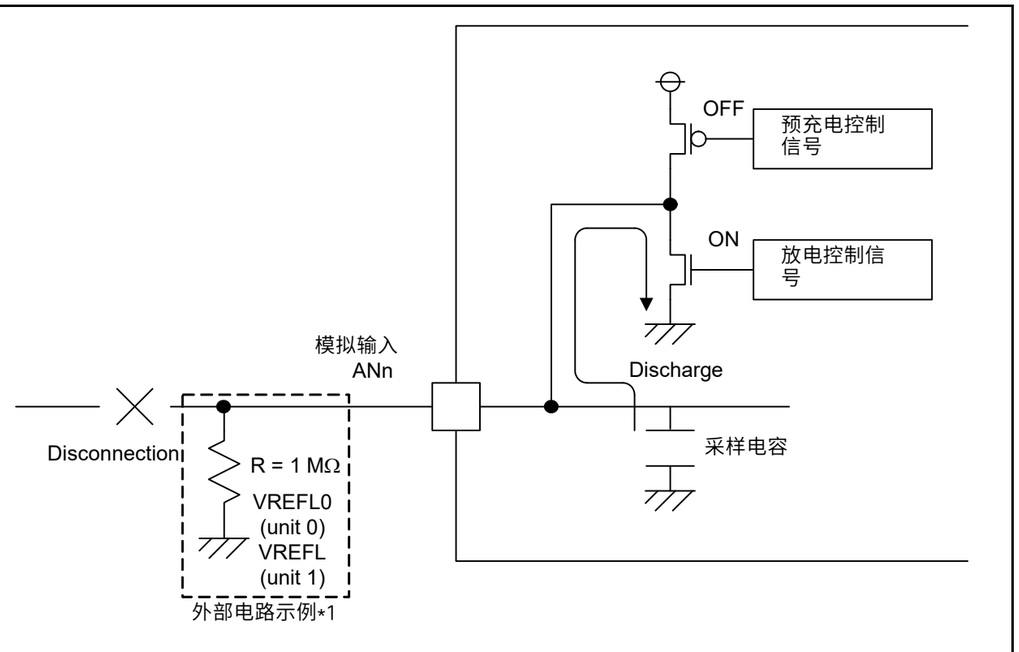
Note 1. The converted result should be used only after full evaluation, because the data result when disconnection occurs varies depending on the external circuit.

Figure 42.38 Example of disconnection detection when discharge is selected



Note 1. 转换结果应在全面评估后使用，因为断开时的数据结果因外部电路而异。

Figure 42.37 选择预充电时的断线检测示例



Note 1. 转换结果应在全面评估后使用，因为断开时的数据结果因外部电路而异。

Figure 42.38 选择放电时的断线检测示例

42.3.10 Starting A/D Conversion with an Asynchronous Trigger

A/D conversion can be started by the input of an asynchronous trigger. To start the A/D conversion by an asynchronous trigger, first set the pin function in the PmnPFS register, next set the A/D Conversion Start Trigger Select bits (ADSTRGR.TRSA[5:0]) to 000000b, then input a high-level signal to the asynchronous trigger (ADTRGn pin). Finally, set both the ADCSR.TRGE and ADCSR.EXTRG bits to 1. Figure 42.39 shows timing of the asynchronous trigger input.

An asynchronous trigger cannot be selected in the A/D Conversion Start Trigger Select bits (ADSTRGR.TRSB[5:0]) for group B in group scan mode. For details on setting the pin function, see section 20, I/O Ports.

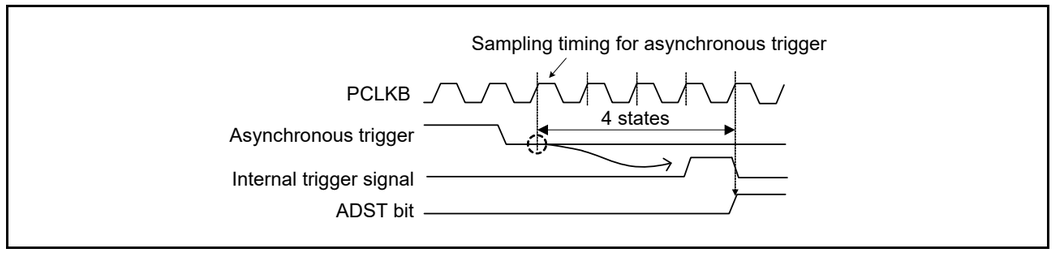


Figure 42.39 Asynchronous trigger input timing

42.3.11 Starting A/D Conversion with a Synchronous Trigger from a Peripheral Module

A/D conversion can be started by a synchronous trigger (ELC). To start the A/D conversion by a synchronous trigger, set the ADCSR.TRGE bit to 1, clear the ADCSR.EXTRG bit to 0, and select the relevant sources in the ADSTRGR.TRSA[5:0] and ADSTRGR.TRSB[5:0] bits.

42.3.12 Programmable Gain Amplifiers

Up to three programmable gain amplifiers (PGAs) can be used in each unit. Select a gain in the ADPGAGS.PnGAIN[3:0] bits (n = 000 to 002) and select an operational amplifier to be used in the ADPGACR.PnSEL bits.

These PGAs accept differential inputs. Pins that accept differential inputs are PGAVSS000 for AN000 to AN002 (unit 0), PGAVSS100 for AN100 to AN102 (unit 1). To use differential inputs, set the differential input gain in the ADPGADCR0.PnDG[2:0] bits, enable the differential input gain setting in the ADPGADCR0.PnGEN bits, and then select the differential input amplifier in the ADPGADCR0.PnDEN bits. The PGA register is selectable as shown in Table 42.11.

Table 42.11 Setting of PGA register and available related functions

Selectable value for each condition	Setting of corresponding register				Related function ✓: available x: unavailable			
	PmnPFS	ADPGACR	ADPGAGS0	ADPGADCR0		ACMPHS*2		
	ASEL*3	PGA P002: bits [11:8] PGA P001: bits [7:4] PGA P000: bit [3:0]	bits [11:8] bits [7:4] bit [3:0]	bits [11:8] bits [7:4] bit [3:0]	Ports*1	IVCMP2	IVCMP3	ADC12
When using ports	0	Leave these bits with initial values			✓	x	x	x
When using ACMPHS or ADC12(PGA bypass)*4	1	9	0	0	x	✓	x	✓
When using PGA Differential input disabled	1	Eh	0 to Eh	0	x	✓	✓	✓
When using PGA Differential input enabled	1	Eh	1, 5, 9, Bh	8 to Bh	x	x	✓	✓

Note 1. Ports: When using input ports.
Note 2. ACMPHS IVCMP2: When using input through the PGA. ACMPHS IVCMP3: When using input of PGA output.
Note 3. For detail on the configuration of PmnPFS registers, see section 20, I/O Ports.
Note 4. Ports and ACMPHS cannot be used at the same time. Ports and ADC12 cannot be used at the same time.

Table 42.12 shows the calculation formula for the PGA output voltage.

42.3.10 使用异步触发启动AD转换

可以通过输入异步触发器来启动D转换。要通过异步触发启动AD转换，首先在PmnPFS寄存器中设置引脚功能，然后将AD转换启动触发选择位(ADSTRGR.TRSA[5:0])设置为000000b，然后输入高电平信号到异步触发（ADTRGn引脚）。最后，将ADCSR.TRGE和ADCSR.EXTRG位都设置为1。图42.39显示了异步触发输入的时序。

在组扫描模式下，无法在组B的AD转换开始触发选择位(ADSTRGR.TRSB[5:0])中选择异步触发。有关设置引脚功能的详细信息，请参见第20节，IO端口。

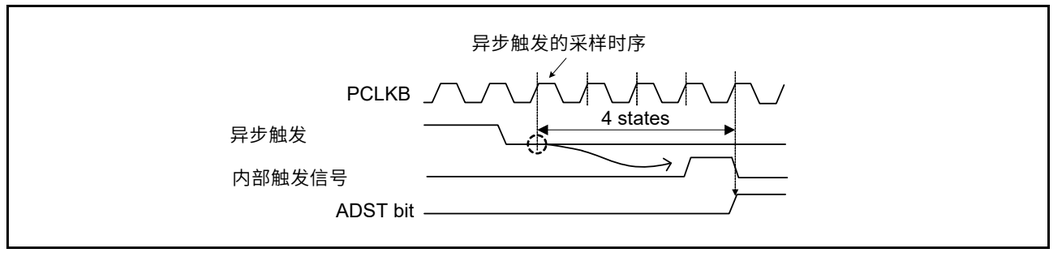

Figure 42.39 异步触发输入时序

42.3.11 使用来自外设模块的同步触发启动AD转换

D转换可以通过同步触发器(ELC)启动。要通过同步触发启动AD转换，请将ADCSR.TRGE位设置为1，将ADCSR.EXTRG位清除为0，并在ADSTRGR.TRSA[5:0]和ADSTRGR.TRSB[5]中选择相关源：0]位。

42.3.12 可编程增益放大器

每个单元最多可使用三个可编程增益放大器(PGA)。选择增益ADPGAGS.PnGAIN[3:0]位（n=000到002）并选择要在ADPGACR.PnSEL位中使用的运算放大器。

这些PGA接受差分输入。接受差分输入的引脚是PGAVSS000，用于AN000到AN002（单元0），PGAVSS100用于AN100至AN102（单元1）。要使用差分输入，设置差分输入增益ADPGADCR0.PnDG[2:0]位，使能ADPGADCR0.PnGEN位中的差分输入增益设置，然后在ADPGADCR0.PnDEN位中选择差分输入放大器。PGA寄存器是可选的，如表42.11所示。

Table 42.11 PGA寄存器的设置和可用的相关功能

每个条件的可选值	对应寄存器的设置				相关功能 ：可用x ：不可用			
	PmnPFS	ADPGACR	ADPGAGS0	ADPGADCR0		ACMPHS*2		
	ASEL*3	PGAP002：位[11:8] PGAP001：位[7:4] PGAP000：位[3:0]	bits [11:8] bits [7:4] bit [3:0]	bits [11:8] bits [7:4] bit [3:0]	Ports*1	IVCMP2	IVCMP3	ADC12
使用端口时	0	将这些位保留为初始值			✓	x	x	x
使用ACMPHS或ADC12（PGA旁路）时*4	1	9	0	0	x	✓	x	✓
使用PGA时 差分输入禁用	1	Eh	0到呃	0	x	✓	✓	✓
使用PGA时 启用差分输入	1	Eh	1, 5, 9, Bh	8 to Bh	x	x	✓	✓

Note 1. 端口：使用输入端口时。
Note 2. ACMPHSIVCMP2：通过PGA使用输入时。ACMPHSIVCMP3：使用PGA输出的输入时。
Note 3. 有关PmnPFS寄存器配置的详细信息，请参见第20节，IO端口。
Note 4. 端口和ACMPHS不能同时使用。端口和ADC12不能同时使用。

PGA输出电压的计算公式如表42.12所示。

Table 42.12 PGA output voltage

Mode	PGA output voltage
Single	Gain × Vin
Differential	Gain (Vin - Vs) + 0.5 × AVCC

Vin: AN000 to AN002, AN100 to AN102
Vs: PGAVSS00, PGAVSS001

42.4 Vs: PGAVSS00, PGAVSS001Interrupt Sources and DTC/DMAC Transfer Requests

42.4.1 Interrupt Requests

The ADC12 can send scan end interrupt requests, ADC12i_ADI (i = 0, 1) and ADC12i_GBADI, to the CPU. The ADC12 also generates the ADC12i_CMPAI and ADC12i_CMPBI interrupts to the CPU in response to matches with a comparison condition.

An ADC12i_ADI interrupt is always generated. An ADC12i_GBADI interrupt can be generated by setting the ADCSR.GBADIE bit to 1. Similarly, ADC12i_CMPAI and ADC12i_CMPBI interrupts can be generated by setting the ADCMPCR.CMPAIE and ADCMPCR.CMPBIE bits to 1.

In addition, the DTC or DMAC can be started when an ADC12i_ADI or ADC12i_GBADI interrupt, or ADC12i_WCMPM or ADC12i_WCMPUM event is generated. Using these interrupts or events to allow the DTC or DMAC to read the converted data enables continuous conversion without burdening the software.

For details on the DTC settings, see section 18, Data Transfer Controller (DTC), and for details on the DMAC settings, see section 17, DMA Controller (DMAC).

Table 42.13 describes the interrupt sources and ELC events available for the ADC12.

Table 42.12 PGA输出电压

Mode	PGA输出电压 增益 Vin
Single	
Differential	Gain (Vin - Vs) + 0.5 × AVCC

Vin: AN000 to AN002, AN100 to AN102
Vs: PGAVSS00, PGAVSS001

42.4 对比：PGAVSS00、PGAVSS001中断源和DTCDMAC传输请求

42.4.1 中断请求

ADC12可以向CPU发送扫描结束中断请求ADC12i_ADI(i=0 1)和ADC12i_GBADI。这
ADC12还向CPU生成ADC12i_CMPAI和ADC12i_CMPBI中断，以响应与比较条件的匹配。

始终会产生ADC12i_ADI中断。ADC12i_GBADI中断可以通过设置
ADCSR.GBADIE位为1。类似地，ADC12i_CMPAI和ADC12i_CMPBI中断可以通过设置
ADCMPCR.CMPAIE和ADCMPCR.CMPBIE位为1。

此外，当ADC12i_ADI或ADC12i_GBADI中断时，可以启动DTC或DMAC，或者
生成ADC12i_WCMPM或ADC12i_WCMPUM事件。使用这些中断或事件来允许DTC或
读取转换数据的DMAC可以实现连续转换，而不会增加软件负担。

有关DTC设置的详细信息，请参阅第18节，数据传输控制器(DTC)，有关DMAC设置的详细信息，请参阅第17节，DMA控制器(DMAC)。

表42.13描述了ADC12可用的中断源和ELC事件。

RA生态工作室

Table 42.13 ADC12 events (1 of 2)

✓: Available x: Unavailable

Operation		Interrupt request or ELC event			Inter-rupt re-quest	DTC/ DMAC activa-tion	ELC event re-quest	Function

Note: i = 0: unit 0, i = 1: unit 1.

42.5 Event Link Function

42.5.1 Event Output to the ELC

The ELC uses an ADC12i_ADI interrupt request signal as an event signal, enabling link operation for the preset module. The ADC12i_GBADI interrupt and ADC12i_CMPAI/ADC12i_CMPBI interrupts cannot be used as event signals. For details, see Table 42.13.

42.5.2 ADC12 Operation through an Event from the ELC

The ADC12 can start A/D conversion by the preset event specified in the ELSRn settings for the ELC as follows:

- Select the ELC_AD00 (unit 0) signal in the ELC.ELSR8 register
- Select the ELC_AD01 (unit 0) signal in the ELC.ELSR9 register
- Select the ELC_AD10 (unit 1) signal in the ELC.ELSR10 register
- Select the ELC_AD11 (unit 1) signal in the ELC.ELSR11 register.

If an ELC_ADi0 or ELC_ADi1 event occurs during A/D conversion, the event is disabled.

42.6 Usage Notes

42.6.1 Constraints on Reading the Data Registers

The following registers must be read in halfword units:

- A/D Data Registers
- A/D Data Duplexing Register
- A/D Data Duplexing Register A
- A/D Data Duplexing Register B
- A/D Temperature Sensor Data Register
- A/D Internal Reference Voltage Register
- A/D Self-Diagnosis Data Register.

If a register is read twice in byte units, that is, the upper byte and lower byte are read separately, the A/D-converted value initially read might not match with the A/D-converted value subsequently read. To prevent this, never read the data registers in byte units.

42.6.2 Constraints on Stopping A/D Conversion

To stop A/D conversion when an asynchronous trigger or a synchronous trigger is selected as the condition for starting A/D conversion, follow the procedure shown in Figure 42.40.

42.5 事件链接功能

42.5.1 事件输出到ELC

ELC使用ADC12i_ADI中断请求信号作为事件信号，为预设模块启用链接操作。
ADC12i_GBADI中断和ADC12i_CMPAIADC12i_CMPBI中断不能用作事件信号。详见表42.13。

42.5.2 ADC12通过来自ELC的事件进行操作

ADC12可以通过ELC的ELSRn设置中指定的预设事件启动AD转换，如下所示：

- 选择ELC.ELSR8寄存器中的ELC_AD00（单元0）信号
- 选择ELC.ELSR9寄存器中的ELC_AD01（单元0）信号
- 选择ELC.ELSR10寄存器中的ELC_AD10（单元1）信号
- 选择ELC.ELSR11寄存器中的ELC_AD11（单元1）信号。

如果在AD转换期间发生ELC_ADi0或ELC_ADi1事件，则该事件被禁用。

42.6 使用说明

42.6.1 读取数据寄存器的限制

以下寄存器必须以半字为单位读取：

- AD数据寄存器
- AD数据双工寄存器
- AD数据双工寄存器A
- AD数据双工寄存器B
- AD温度传感器数据寄存器
- AD内部参考电压寄存器
- AD自诊断数据寄存器。

如果以字节为单位读取寄存器两次，即分别读取高字节和低字节，则最初读取的AD转换值可能与随后读取的AD转换值不匹配。为防止这种情况，切勿以字节为单位读取数据寄存器。

42.6.2 停止AD转换的约束

选择异步触发或同步触发作为启动条件时停止AD转换
AD转换，按照图42.40所示的步骤进行。

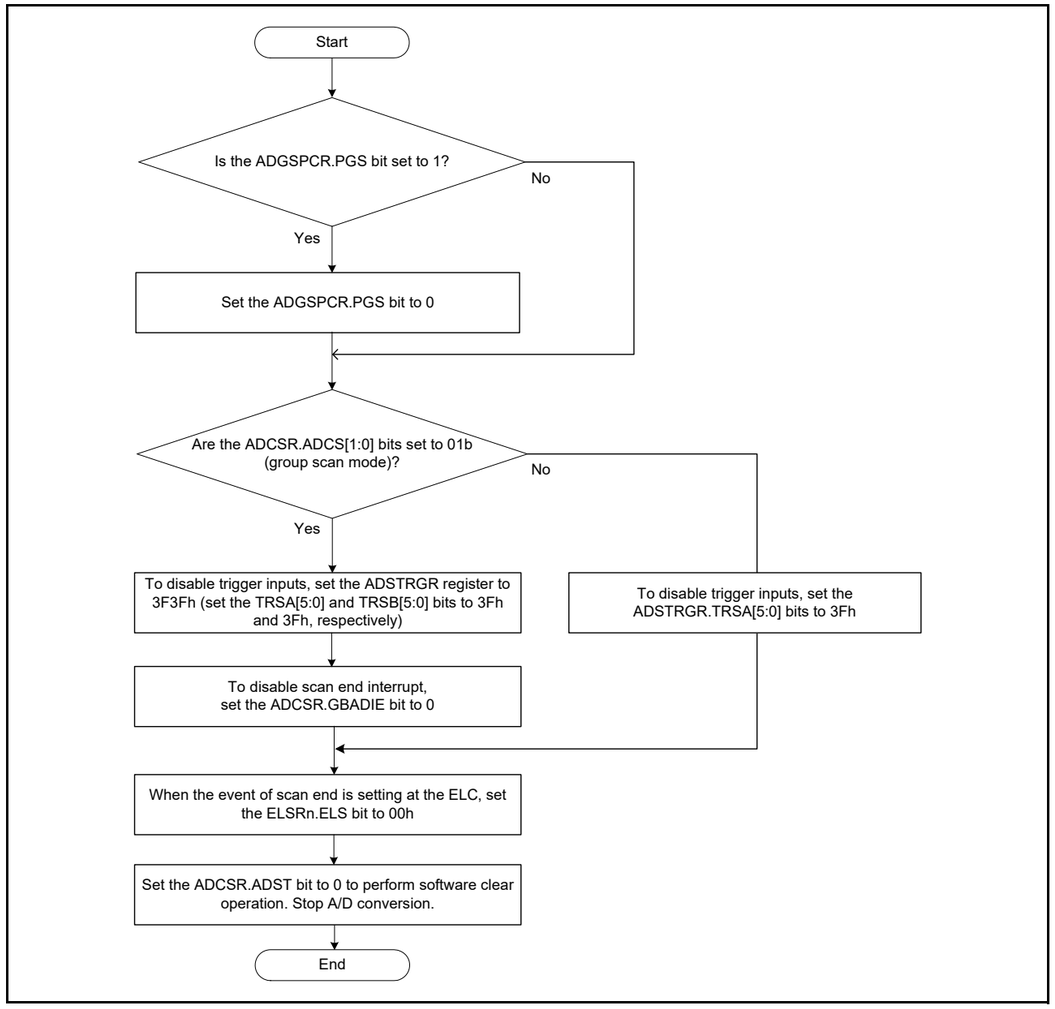

Figure 42.40 Procedure for clearing the ADCSR.ADST bit by software

42.6.3 A/D Conversion Restart and Termination Timing

A maximum of 6 ADCLK cycles is required for the idle analog unit of the ADC12 to restart on setting the ADCSR.ADST bit to 1. A maximum of 2 ADCLK cycles is required for the operating analog unit of the ADC12 to be terminate on setting the ADCSR.ADST bit to 0.

42.6.4 Constraints on Scan End Interrupt Handling

When scanning the same analog input twice using any trigger, the first A/D-converted data is overwritten with the second A/D-converted data if the CPU does not finish reading the A/D-converted data by the time the A/D conversion of the first analog input for the second scan ends after the first scan end interrupt is generated.

42.6.5 Settings for the Module-Stop Function

The Module Stop Control Register can enable or disable ADC12 operation. The ADC12 is initially stopped after reset. Releasing the module-stop state enables access to the registers. After release from the module-stop state, wait for at least 1 µs before starting A/D conversion. For details, see section 11.4, Module-Stop Function.

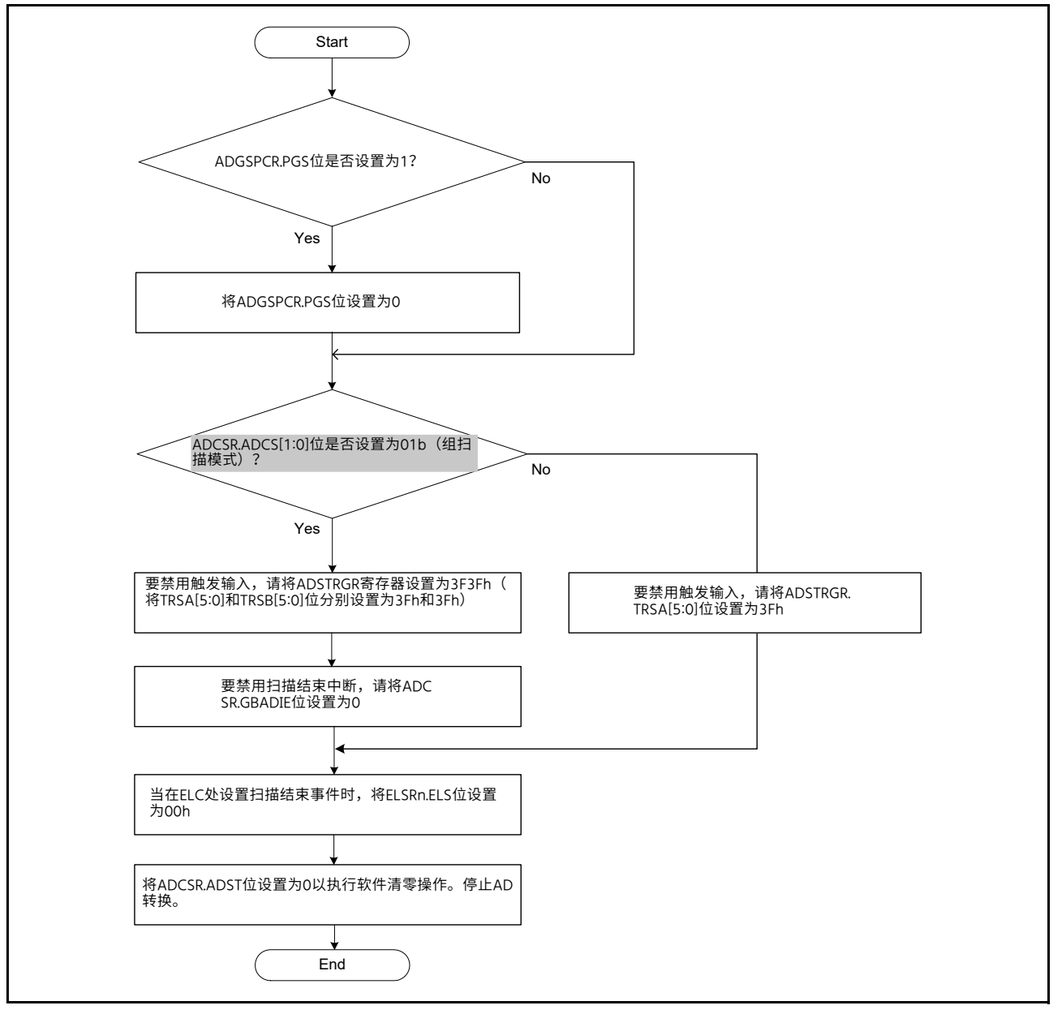

Figure 42.40 通过软件清除ADCSR.ADST位的过程

42.6.3 AD转换重启和终止时序

ADC12的空闲模拟单元最多需要6个ADCLK周期才能在设置时重新启动ADCSR.ADST位为1。ADC12的操作模拟单元最多需要2个ADCLK周期才能在将ADCSR.ADST位设置为0时终止。

42.6.4 扫描结束中断处理的约束

当使用任何触发器扫描相同的模拟输入两次时，如果CPU在第一个AD转换之前没有完成读取AD转换的数据，则第一个AD转换的数据将被第二个AD转换的数据覆盖第二次扫描的模拟输入在第一次扫描结束中断产生后结束。

42.6.5 模块停止功能的设置

模块停止控制寄存器可以启用或禁用ADC12操作。ADC12在复位后最初停止。
释放模块停止状态可以访问寄存器。从模块停止状态释放后，在开始AD转换之前至少等待1微秒。有关详细信息，请参阅第11.4节，模块停止功能。

42.6.6 Notes on Entering the Low Power States

Before entering the module-stop state or Software Standby mode, you must stop A/D conversion. Set the ADCSR.ADST bit to 0 and secure a period of time until the analog unit of the ADC12 stops.

To secure this time, follow the procedure shown in Figure 42.40 for clearing the ADCSR.ADST bit through software. Then, wait for 2 clock cycles of ADCLK before entering the module-stop state or Software Standby mode.

42.6.7 Error in Absolute Accuracy when Disconnection Detection Assistance Is in Use

Using disconnection detection assistance leads to an error in the absolute accuracy of the ADC12. This error arises because an erroneous voltage is input to the analog input pins because of the resistive voltage division between the pull-up or pull-down resistor (Rp) and the resistance of the signal source (Rs). This error in absolute accuracy is calculated from the following formula:

Maximum error in absolute accuracy (LSB) = $(2^{\text{Resolution - 1}}) \times Rs / (Rs + Rp)$, where Resolution = 12, 10, 8

Only use disconnection detection assistance after thorough evaluation.

42.6.8 Available functions and register settings of AN000 to AN002, AN007, AN100 to AN102, and AN107

Table 42.14 shows the available functions and register settings of AN000 to AN002, AN007, AN100 to AN102 and AN107, and Figure 42.41 shows the setting procedure of registers. To use each function, set the register value shown in Table 42.14.

When the PGA is used with differential input enabled, a negative voltage can be input for AN000 to AN002 and PGAVSS000 for unit 0, and AN100 to AN102 and PGAVSS100 for unit 1 after setting the registers.

When the PGA is used with differential input enabled, all PGA amplifiers in each unit must be set to differential input in the ADPGADCR0 register.

When the PGA is used with differential input disabled, the associated PGAVSS pin must be connected to AVSS0. When the PGA is not used, the associated PGAVSS can be used as an input port or analog input.

When transitioning to the ADC module-stop state or Software Standby mode from the state of using PGA or sample-and-hold circuit, if the corresponding bit in ADPGACR or ADSHCR register of each ADC12 is set to 0 before transitioning, power consumption can be reduced.

The initial value of the ASEL bit of P003 and P007 is 1. When these pins are not used as an analog function, to reduce the input leakage current, the ASEL bit should be set to 0.

When using a 64-pin product, the P007PFS.ASEL bit should be set to 0.

Table 42.14 Available functions and register setting

Available functions						Register setting				
						P0nPFS*6		PGA		S/H*3
Ports*1	IRQ*2	S/H*3	PGA-S*4	PGA-D*5	ADC12	ASEL	ISEL	ADPGADCR0*7	ADPGACR*8	ADSHCR*9
✓						0	0	x	x	x
	✓					0	1	x	x	x
					✓*10	1	x	0	9h	0
					✓*11	1	x	0*11	0 or 9h	0
		✓			✓	1	x	0	9h	1 (0*13)
		✓	✓		✓	1	x	0	Eh (0h*12)	1 (0*13)
		✓		✓	✓	1	x	1	Eh (0h*12)	1 (0*13)
			✓		✓	1	x	0	Eh (0h*12)	0
				✓	✓	1	x	1	Eh (0h*12)	0

✓: Available
x: Don't care

Note 1. Ports: P000 to P007 can be used as port inputs.

42.6.6 进入低功耗状态的注意事项

在进入模块停止状态或软件待机模式之前，您必须停止AD转换。将ADCSR.ADST位设置为0并确保一段时间，直到ADC12的模拟单元停止。

为确保该时间，请按照图42.40中所示的过程通过软件清除ADCSR.ADST位。
然后，在进入模块停止状态或软件待机模式之前等待ADCLK的2个时钟周期。

42.6.7 使用断线检测辅助时的绝对精度误差

使用断开检测辅助会导致ADC12的绝对精度出现误差。由于上拉或下拉电阻(Rp)与信号源电阻(Rs)之间的电阻分压，导致错误电压输入到模拟输入引脚，因此会出现此错误。该绝对精度误差由以下公式计算得出：

绝对精度的最大误差(LSB)=(2分辨率1)×Rs(Rs+Rp)，其中分辨率=12、10、8

仅在全面评估后使用断线检测辅助。

42.6.8 AN000至AN002、AN007、AN100至AN000的可用功能和寄存器设置 AN102, and AN107

表42.14显示了AN000至AN002、AN007、AN100至AN102和
AN107和图42.41显示了寄存器的设置过程。要使用每个功能，请设置如下所示的寄存器值
Table 42.14.

当PGA与差分输入使能时，AN000到AN002可以输入负电压，并且
设置寄存器后，单元0为PGAVSS000，单元1为AN100到AN102和PGAVSS100。

当PGA在差分输入使能的情况下使用时，每个单元中的所有PGA放大器都必须在ADPADCR0寄存器中设置为差分输入。

当PGA在差分输入禁用的情况下使用时，相关的PGAVSS引脚必须连接到AVSS0。不使用PGA时，关联的PGAVSS可用作输入端口或模拟输入。

当从使用PGA或采样保持电路的状态转换到ADC模块停止状态或软件待机模式时，如果在转换前将每个ADC12的ADPGACR或ADSHCR寄存器中的相应位设置为0，则可以降低功耗。

P003和P007的ASEL位初始值为1。当这些引脚不用作模拟功能时，为减少输入漏电流，应将ASEL位设置为0。

使用64引脚产品时，P007PFS.ASEL位应设置为0。

Table 42.14 可用功能和寄存器设置

可用功能						注册设置				
						P0nPFS*6		PGA		S/H*3
Ports*1	IRQ*2	S/H*3	PGA-S*4	PGA-D*5	ADC12	ASEL	ISEL	ADPGADCR0*7	ADPGACR*8	ADSHCR*9

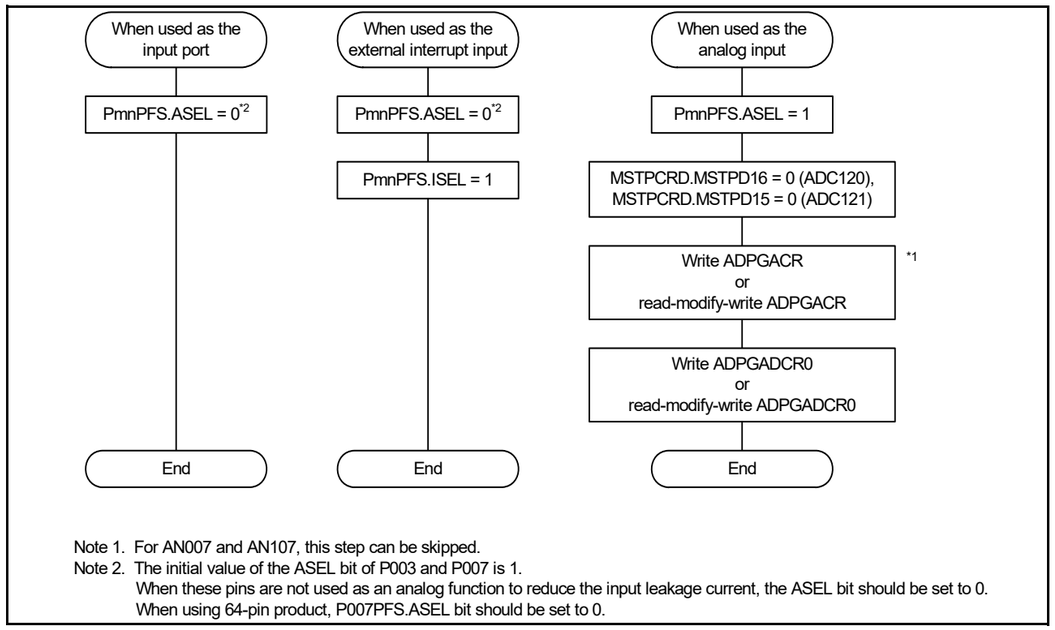
					✓*10	1	x	0	9h	0
					✓*11	1	x	0*11	0 or 9h	0
		✓			✓	1	x	0	9h	1 (0*13)
		✓	✓		✓	1	x	0	Eh (0h*12)	1 (0*13)
		✓		✓	✓	1	x	1	Eh (0h*12)	1 (0*13)
			✓		✓	1	x	0	Eh (0h*12)	0
				✓	✓	1	x	1	Eh (0h*12)	0

:可用x:不关心

Note 1. 端口：P000至P007可用作端口输入。

Note 2. IRQ: P000 to P002 and P003 to P005 can be used as IRQ pins.
Note 3. S/H: sample-and-hold circuit.
Note 4. PGA-S: When the PGA setting is “Differential input disabled”. Corresponding PGAVSS must be set as ASEL set to 1, and connected to AVSS0.
Note 5. PGA-D: When the PGA setting is “Differential input enabled”. Corresponding PGAVSS must be set as ASEL to 1.
Note 6. P0nPFS: Port 0n Pin Function Select register (n = 00 to 07) corresponding to the analog input pin.
Note 7. Indicates the corresponding ADPGADCR0 register, Differential Input Enable bit (bit [11] or bit [7] or bit [3]).
Note 8. Indicates the corresponding ADPGACR register, Amplifier Control bits (bits [11:8] or bits [7:4] or bits [3:0]).
Note 9. Indicates the corresponding ADSHCR register, Bypass Select bit (bit [10] or bit [9] or bit [8]).
Note 10. When using AN000 to AN002 or AN100 to AN102.
Note 11. When using AN007 or AN107. Set all corresponding bits (bit [11], [7], and [3] in ADPGADCR0) to 0.
Note 12. Power consumption of the PGA can be reduced by setting the corresponding bit in the ADPGACR register to 0 before transitioning to the ADC12 module-stop state or Software Standby mode.
Note 13. Power consumption of the S/H can be reduced by setting the corresponding bit in the ADSHCR register to 0 before transitioning to the ADC12 module-stop state or Software Standby mode.



Note 1. For AN007 and AN107, this step can be skipped.
Note 2. The initial value of the ASEL bit of P003 and P007 is 1.
When these pins are not used as an analog function to reduce the input leakage current, the ASEL bit should be set to 0.
When using 64-pin product, P007PFS.ASEL bit should be set to 0.

Figure 42.41 Setting procedure of registers

42.6.9 Notes on Operating Modes and Status Bits

Initialize or set again individually, if necessary, the voltage values in self-diagnosis, the determination of the first scan or second scan in double-trigger mode, the data buffer pointer, and the status monitor in the compare function.

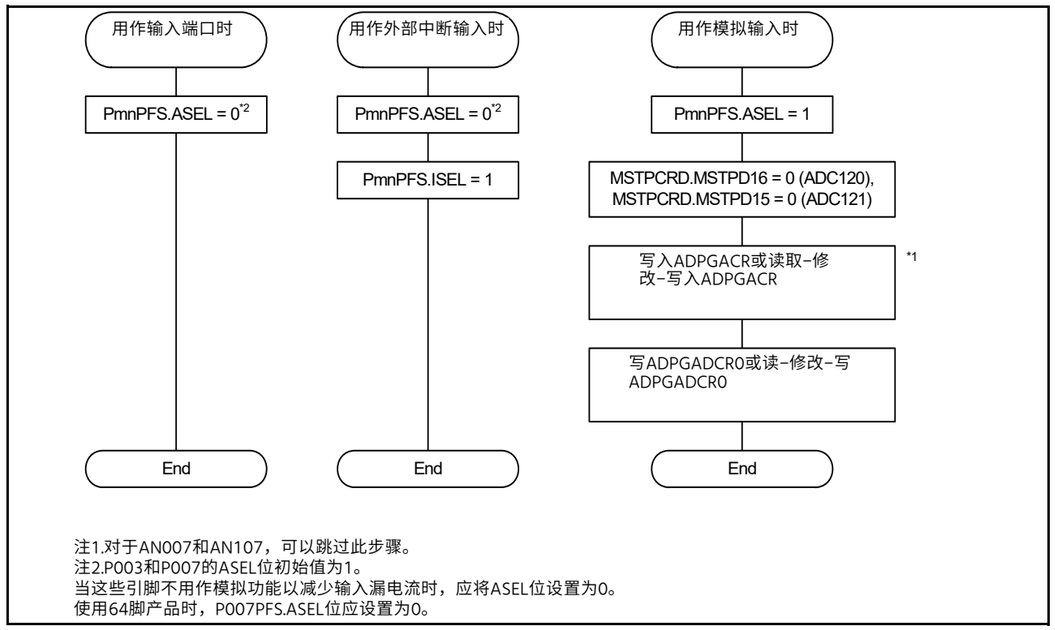
- Select the voltage values in self-diagnosis (ADCER.DIAGVAL[1:0]) after setting ADCER.DIAGLD to 1
- Double trigger mode operates as the first scan after setting ADCSR.DBLE to 1 from 0
- The status monitor bits (MONCMPA, MONCMPB, and MONCOMB) in the compare function are initialized after ADCMPCR.CMPAE and ADCMPCR.CMPBE are set to 0
- The constant sampling function (ADSHMSR.SHMD = 1) is initialized after ADSHMSR.SHMD is set to 0. When the constant sampling function is used (setting ADSHMSR.SHMD = 1) again, wait 1 ADCLK cycle or more.

42.6.10 Notes on Board Design

The board should be designed so that digital circuits and analog circuits are separated from each other as far as possible. In addition, digital circuit signal lines and analog circuit signal lines should not intersect or be placed near each other. If these rules are not followed, noise can occur on analog signals and A/D conversion accuracy is affected. The analog

Note 2. IRQ：P000到P002和P003到P005可用作IRQ引脚。
Note 3. S/H: sample-and-hold circuit.
Note 4. PGA-S：当PGA设置为“差分输入禁用”时。对应的PGAVSS必须设置为ASEL设置为1，并连接到AVSS0。

Note 5. PGA-D：当PGA设置为“差分输入启用”时。对应的PGAVSS必须设置为ASEL为1。
Note 6. P0nPFS：与模拟输入引脚对应的端口0n引脚功能选择寄存器（n=00至07）。
Note 7. 表示对应的ADPADCR0寄存器，差分输入使能位（位[11]或位[7]或位[3]）。
Note 8. 指示相应的ADPGACR寄存器，放大器控制位（位[11:8]或位[7:4]或位[3:0]）。
Note 9. 表示对应的ADSHCR寄存器，旁路选择位（位[10]或位[9]或位[8]）。
注10.使用AN000至AN002或AN100至AN102时。
注11.使用AN007或AN107时。将所有相应位（ADPGADCR0中的位[11]、[7]和[3]）设置为0。
注12.PGA的功耗可以通过在转换到ADC12模块停止状态或软件待机模式之前将ADPGACR寄存器中的相应位设置为0来降低。注13.在转换到ADC12模块停止状态或软件待机模式之前，可以通过将ADSHCR寄存器中的相应位设置为0来降低SH的功耗。



注1.对于AN007和AN107，可以跳过此步骤。
注2.P003和P007的ASEL位初始值为1。
当这些引脚不用作模拟功能以减少输入漏电流时，应将ASEL位设置为0。
使用64脚产品时，P007PFS.ASEL位应设置为0。

Figure 42.41 寄存器的设置步骤

42.6.9 操作模式和状态位注意事项

必要时单独初始化或重新设置自诊断中的电压值、双触发模式下第一次扫描或第二次扫描的确定、数据缓冲区指针和比较功能中的状态监视器。

- 设置ADCER.DIAGLD为1后，选择自诊断中的电压值（ADCER.DIAGVAL[1:0]）
- 双触发模式在将ADCSR.DBLE从0设置为1后作为第一次扫描运行
- 比较函数中的状态监控位（MONCMPA、MONCMPB和MONCOMB）在之后初始化ADCMPCR.CMPAE和ADCMPCR.CMPBE设置为0
- 恒定采样功能（ADSHMSR.SHMD=1）在ADSHMSR.SHMD设置为0后初始化。当再次使用恒定采样功能（设置ADSHMSR.SHMD=1）时，等待1个ADCLK周期或更长时间。

42.6.10 电路板设计注意事项

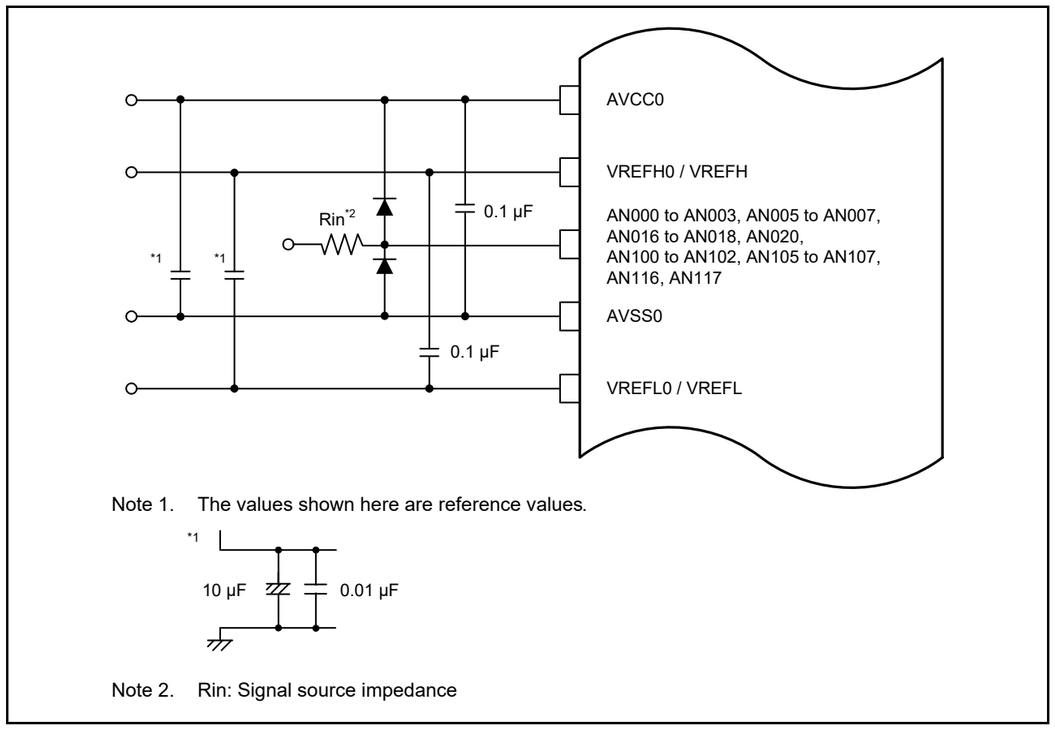
电路板的设计应使数字电路和模拟电路尽可能分开。此外，数字电路信号线和模拟电路信号线不应交叉或靠近。如果不遵守这些规则，模拟信号上可能会出现噪声，影响AD转换精度。模拟

RA生态工作室

input pins (AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020, AN100 to AN102, AN105 to AN107, AN116, AN117), reference power supply pin (VREFH0/VREFH), reference ground pin (VREFL0/VREFL), and analog power supply (AVCC0) should be separated from digital circuits using the analog ground (AVSS0). The analog ground (AVSS0) should be connected to a stable digital ground (VSS) on the board (single-point ground plane connection).

42.6.11 Constraints on Noise Prevention

To prevent the analog input pins (AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020, AN100 to AN102, AN105 to AN107, AN116, AN117) from being destroyed by abnormal voltage such as excessive surges, insert a capacitor between AVCC0 and AVSS0, between VREFH0 and VREFL0, and between VREFH and VREFL, and connect a protection circuit to protect the analog input pins (AN000 to AN003, AN005 to AN007, AN016 to AN018, AN020, AN100 to AN102, AN105 to AN107, AN116, AN117) as shown Figure 42.42.



Note 1. The values shown here are reference values.

Note 2. Rin: Signal source impedance

Figure 42.42 Example protection circuit for analog inputs

42.6.12 Port Settings when Using the ADC12 Input

When using the high-precision channels, do not use PORT 0 as a digital output port. Renesas also recommends not using the digital output that is also used as the A/D analog input, if normal precision channels are used. If the digital output that is also used as the A/D analog input is used for output signals, perform A/D conversion several times, eliminate the maximum and minimum values, and obtain the average of the other results.

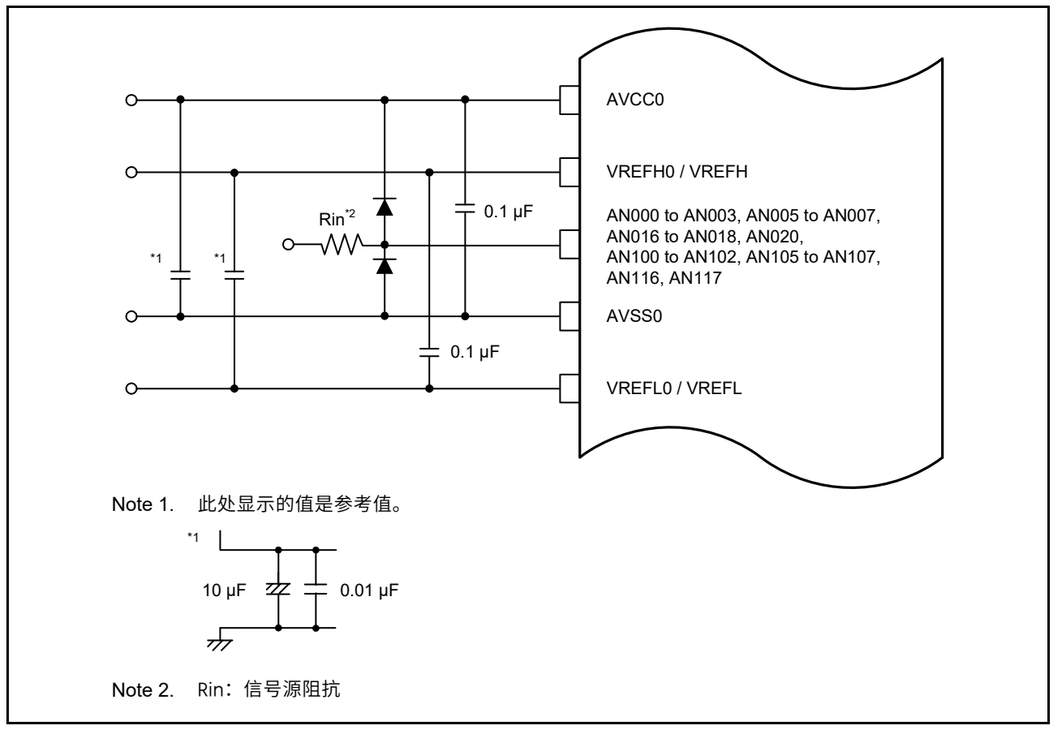
42.6.13 Relationship between ADC12 Units 0 and 1 and the ACMPHS

For the A/D conversion targets in Table 42.15, unit 0 and 1 cannot perform A/D conversion at the same time.

输入引脚（AN000至AN003、AN005至AN007、AN016至AN018、AN020、AN100至AN102、AN105至AN107、AN116、AN117）、参考电源引脚（VREFH0VREFH）、参考接地引脚（VREFL0VREFL）和模拟电源电源(AVCC0)应使用模拟地(AVSS0)与数字电路分开。模拟接地(AVSS0)应连接到板上的稳定数字接地(VSS)（单点接地层连接）。

42.6.11 防止噪音的限制

为了防止模拟输入引脚（AN000到AN003、AN005到AN007、AN016到AN018、AN020、AN100到AN102、AN105至AN107、AN116、AN117)以免被过大浪涌等异常电压破坏，在AVCC0和AVSS0之间、VREFH0和VREFL0之间以及VREFH和VREFL之间插入一个电容器，并连接一个保护电路以保护模拟输入引脚(AN000到AN003、AN005到AN007、AN016到AN018、AN020、AN100到AN102、AN105到AN107、AN116、AN117），如图42.42所示。



Note 1. 此处显示的值是参考值。

Note 2. Rin：信号源阻抗

Figure 42.42 模拟输入保护电路示例

42.6.12 使用ADC12输入时的端口设置

使用高精度通道时，请勿将PORT0用作数字输出端口。如果使用普通精密通道，瑞萨还建议不要使用也用作AD模拟输入的数字输出。如果将同时用作AD模拟输入的数字输出用于输出信号，则进行几次AD转换，消除最大值和最小值，取其他结果的平均值。

42.6.13 ADC12单元0和1与ACMPHS之间的关系

对于表42.15中的AD转换目标，单元0和1不能同时进行AD转换。

43. 12-Bit D/A Converter (DAC12)

43.1 Overview

The MCU provides a 12-bit D/A Converter (DAC12) with an output amplifier.

Table 43.1 lists the DAC12 specifications, Figure 43.1 shows a block diagram, and Table 43.2 lists the I/O pins.

Table 43.1 DAC12 specifications

Parameter	Specifications
Resolution	12 bits
Output channels	2 channels
Interference reduction between analog modules	Methods provided to minimize interference between D/A and A/D conversion: • D/A converted data update timing is controlled by the ADC12 synchronous D/A conversion enable input signal from the ADC12 (unit 1) • Degradation of A/D conversion accuracy caused by interference is reduced by controlling the DAC12 inrush current generation timing with the enable signal
Module-stop function	Module-stop state can be set to reduce power consumption
Event link function (input)	DA0 and DA1 conversion can be started when an event signal is input
D/A output amplifier control function	Controls whether the output amplifier (for both amplifier-through and amplifier-bias controls) is used

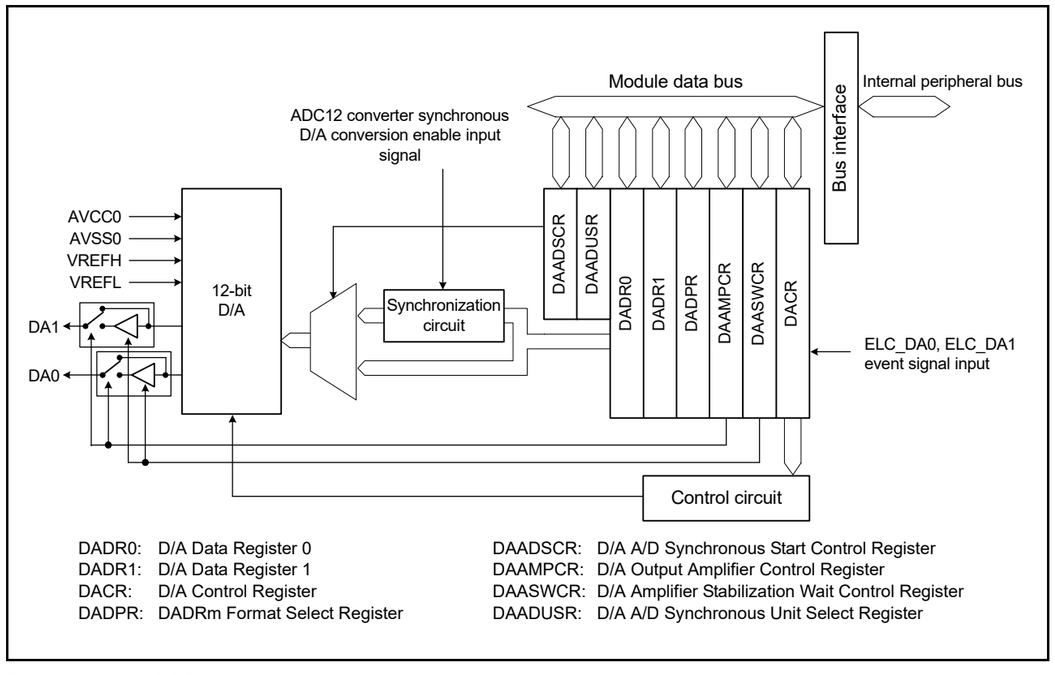

Figure 43.1 DAC12 block diagram

Table 43.2 DAC12 I/O pins (1 of 2)

Pin name	I/O	Function
AVCC0	Input	Analog power supply pin for ADC12, DAC12, and comparator. Connect to VCC when these modules are not used.

43. 12-Bit D/A Converter (DAC12)

43.1 Overview

MCU提供带输出放大器的12位DA转换器(DAC12)。

表43.1列出了DAC12规格，图43.1显示了框图，表43.2列出了IO引脚。

Table 43.1 DAC12 specifications

Parameter	Specifications
Resolution	12 bits
输出通道	2 channels
减少模拟模块之间的干扰	提供的用于将DA和AD转换之间的干扰降至最低的方法： DA转换数据更新时序由来自ADC12（单元1）的ADC12同步DA转换启用输入信号控制 通过控制DAC12可以减少由干扰引起的AD转换精度下降使用使能信号的浪涌电流产生时序
Module-stop function	可设置模块停止状态以降低功耗
事件链接功能（输入）	输入事件信号时可启动DA0和DA1转换
DA输出放大器控制功能	控制是否使用输出放大器（用于放大器直通和放大器偏置控制）

Table 43.2 DAC12 I/O pins (2 of 2)

Pin name	I/O	Function
AVSS0	Input	Analog ground pin for ADC12, DAC12, and comparator. Connect to VSS when these modules are not used.
VREFH	Input	Analog reference top voltage supply pin for the ADC12 (unit 1) and the DAC12
VREFL	Input	Analog reference ground pin for the ADC12 (unit 1) and the DAC12
DA0	Output	Channel 0 analog output pin
DA1	Output	Channel 1 analog output pin

43.2 Register Descriptions

43.2.1 D/A Data Register m (DADRm) (m = 0, 1)

Address(es): DAC12.DADR0 4005 E000h, DAC12.DADR1 4005 E002h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DADRm registers are 16-bit read/write registers that store data for D/A conversion. When an analog output is enabled, the values in DADRm are converted and output to the analog output pins.

12-bit data can be formatted as left- or right-justified in the DADPR.DPSEL bit setting. In right-justified format (DADPR.DPSEL = 0), the lower 12 bits, [11:0], are valid. In left-justified format (DADPR.DPSEL = 1), the upper 12 bits, [15:4], are valid.

For information on using the output amplifier, see section 43.6.5, Initialization Procedure with the Output Amplifier.

43.2.2 D/A Control Register (DACR)

Address(es): DAC12.DACR 4005 E004h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAOE1	DAOE0	DAE	—	—	—	—	—
Value after reset:	0	0	0	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b4 to b0	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b5	DAE	D/A Enable*1	0: Control D/A conversion of channels 0 and 1 individually 1: Control D/A conversion of channels 0 and 1 collectively.	R/W
b6	DAOE0	D/A Output Enable 0	0: Disable analog output of channel 0 (DA0) 1: Enable D/A conversion of channel 0 (DA0).	R/W
b7	DAOE1	D/A Output Enable 1	0: Disable analog output of channel 1 (DA1) 1: Enable D/A conversion of channel 1 (DA1).	R/W

Note 1. This bit controls D/A conversion in combination with the DAOEi bit (i = 0, 1), which controls the output of the conversion results. For details, see Table 43.3.

Table 43.2 DAC12IO引脚（2个中的2个）

引脚名称	I/O	Function
AVSS0	Input	ADC12、DAC12和比较器的模拟接地引脚。 不使用这些模块时连接到VSS。
VREFH	Input	ADC12（单元1）和DAC12的模拟参考最高电压电源引脚
VREFL	Input	ADC12（单元1）和DAC12的模拟参考接地引脚
DA0	Output	通道0模拟输出引脚
DA1	Output	通道1模拟输出引脚

43.2 注册说明

43.2.1 DA数据寄存器m(DADRm)(m=0 1)

Address(es): DAC12.DADR0 4005 E000h, DAC12.DADR1 4005 E002h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DADRm寄存器是16位读写寄存器，用于存储用于DA转换的数据。当启用模拟输出时，DADRm中的值将被转换并输出到模拟输出引脚。

在DADPR.DPSEL位设置中，12位数据可以被格式化为左对齐或右对齐。在右对齐格式(DADPR.DPSEL=0)中，低12位[11:0]有效。在左对齐格式(DADPR.DPSEL=1)中，高12位[15:4]有效。

有关使用输出放大器的信息，请参阅第43.6.5节，使用输出放大器的初始化过程。

43.2.2 DA控制寄存器(DACR)

Address(es): DAC12.DACR 4005 E004h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAOE1	DAOE0	DAE	—	—	—	—	—
重置后的值：	0	0	0	1	1	1	1	1

Bit	Symbol	位名称	Description	R/W
b4 to b0	—	Reserved	这些位被读取为1。写入值应为1。	R/W
b5	DAE	D/A Enable*1	0：分别控制通道0和1的DA转换1：控制通道0和1的DA转换。	R/W
b6	DAOE0	DA输出使能0	0：禁用通道0（DA0）的模拟输出1：启用通道0（DA0）的DA转换。	R/W
b7	DAOE1	DA输出使能1	0：禁用通道1（DA1）的模拟输出1：启用通道1（DA1）的DA转换。	R/W

Note 1. 该位与DAOEi位(i=0 1)一起控制DA转换，DAOEi位控制转换结果的输出。
详见表43.3。

Table 43.3 D/A conversion controls

b5	b7	b6	
DAE	DAOE1	DAOE0	Description
0	0	0	Disable D/A conversion and analog output pins (DA0, DA1)*1
		1	• Enable D/A conversion of channel 0 and disable D/A conversion of channel 1 • Enable analog output of channel 0 (DA0) and disable analog output of channel 1 (DA1)*1.
	1	0	• Disable D/A conversion of channel 0 and enable D/A conversion of channel 1 • Disable analog output of channel 0 (DA0)*1 and enable analog output of channel 1 (DA1).
		1	• Enable D/A conversion of channels 0 and 1 • Enable analog output of channels 0 and 1 (DA0, DA1).
1	x	x	• Enable D/A conversion of channels 0 and 1 • Collective enable analog output of channels 0 and 1 (DA0, DA1).

x: Don't care

Note 1. When analog output is disabled, the analog output signal is placed in the Hi-Z state.

Only set this register while the ADC12 is halted when the DAADSCR.DAADST bit is 1 (interference prevention between D/A and A/D conversion is enabled). Only set DACR while the ADCSR.ADST bit is 0 and after selecting the software trigger, for the ADC12 trigger to securely stop the ADC12. This MCU only supports ADC12 unit 1.

DAE bit (D/A Enable)

The DAE bit controls D/A conversion, amplifier operation, and analog output in combination with the DAOEi bit (i = 0, 1) and the DAMMPCR.DAAMPi bit (i = 0, 1). See Table 43.4.

When interference prevention between D/A and A/D conversions is enabled (DAADSCR.DAADST = 1), set the ADCSR.ADST bit of the ADC12 to 0. Then, select the software trigger for the ADC12 trigger to securely stop the ADC12.

DAOEi bit (D/A Output Enable i)

The DAOEi bit (i = 0, 1) controls D/A conversion, amplifier operation, and analog output in combination with the DAE bit and DAMMPCR.DAAMPi bit (i = 0, 1). See Table 43.4.

When both the DAOEi (i = 0, 1) and DAE bits are 0, D/A conversion of channel i (i = 0, 1) is not processed, and no conversion result is output.

When interference prevention between D/A and A/D conversions is enabled (DAADSCR.DAADST = 1), set the DAOEi bit while the ADCSR.ADST bit of the ADC12 is 0. Then, select the software trigger for the ADC12 trigger to securely stop the ADC12.

The event link function can be used to set the DAOEi bit to 1. The DAOE0 bit is set to 1 when the event specified in the ELSR12 register of the ELC (ELC_DA0 event) occurs, and output of the D/A conversion results starts. The DAOE1 bit is set to 1 when the event specified in the ELSR13 register of the ELC (ELC_DA1 event) occurs, and output of the D/A conversion results starts.

Table 43.4 D/A conversion and analog output control (1 of 2)

DACR		DAAMPCR			
DAE	DAOEi	DAAMPi	Channel i operation	Amplifier operation of channel i	Analog output of channel i
0	0	0	Stop	Stop	Hi-Z
		1	Stop	Stop	Hi-Z
	1	0	Run	Stop	Amplifier-through
		1	Run	Run	Amplifier output

Table 43.3 DA转换控制

b5	b7	b6	
DAE	DAOE1	DAOE0	Description
0	0	0	禁用DA转换和模拟输出引脚（DA0、DA1）*1
		1	启用通道0的DA转换并禁用通道1的DA转换 启用通道0(DA0)的模拟输出并禁用通道1(DA1)*1的模拟输出。
	1	0	禁用通道0的DA转换并启用通道1的DA转换 禁用通道0(DA0)*1的模拟输出并启用通道1(DA1)的模拟输出。
		1	启用通道0和1的DA转换 启用通道0和1（DA0、DA1）的模拟输出。
1	x	x	启用通道0和1的DA转换 共同启用通道0和1（DA0、DA1）的模拟输出。

x: Don't care

Note 1. 禁用模拟输出时，模拟输出信号置于Hi-Z状态。

仅当DAADSCR.DAADST位为1（启用DA和AD转换之间的干扰防止）时ADC12停止时设置该寄存器。只有在ADCSR.ADST位为0且选择软件触发后设置DACR，ADC12触发才能安全停止ADC12。此MCU仅支持ADC12单元1。

DAE位（DA启用）

DAE位与DAOEi位(i=0 1)和DAMMPCR.DAAMPi位(i=0 1)一起控制DA转换、放大器操作和模拟输出。见表43.4。

当启用DA和AD转换之间的干扰防止(DAADSCR.DAADST=1)时，设置ADC12的ADCSR.ADST位为0。然后，选择ADC12触发的软件触发以安全停止ADC12。

DAOEi位（DA输出使能i）

DAOEi位(i=0 1)与DAE位和DAMMPCR.DAAMPi位(i=0 1)一起控制DA转换、放大器操作和模拟输出。见表43.4。

当DAOEi(i=0 1)和DAE位均为0时，通道i(i=0 1)的DA转换不进行处理，不输出转换结果。

当DA和AD转换之间的干扰防止启用时（DAADSCR.DAADST=1），在ADC12的ADCSR.ADST位为0时设置DAOEi位。然后，选择ADC12触发的软件触发以安全地停止ADC12。

事件链接功能可用于将DAOEi位设置为1。当ELC的ELSR12寄存器中指定的事件（ELC_DA0事件）发生时，DAOE0位设置为1，并开始输出DA转换结果。当发生ELC的ELSR13寄存器中指定的事件（ELC_DA1事件）时，DAOE1位设置为1，并开始输出DA转换结果。

Table 43.4 DA转换和模拟输出控制(1of2)

1	0	0	Run	Stop	Amplifier-through
		1	Run	Run	Amplifier output
	1	0	Run	Stop	Amplifier-through
		1	Run	Run	Amplifier output

i = 0, 1

43.2.3 DADRm Format Select Register (DADPR)

Address(es): DAC12.DADPR 4005 E005h

	b7	b6	b5	b4	b3	b2	b1	b0
	DPSEL	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	DPSEL	DADRm Format Select	0: Right-justified format 1: Left-justified format.	R/W

43.2.4 D/A A/D Synchronous Start Control Register (DAADSCR)

Address(es): DAC12.DAADSCR 4005 E006h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAADST	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	DAADST	D/A A/D Synchronous Conversion	0: Do not synchronize DAC12 operation with ADC12 (unit 1) operation (disable interference prevention between D/A and A/D conversion) 1: Synchronize DAC12 operation with ADC12 (unit 1) operation (enable interference prevention between D/A and A/D conversion).	R/W

To minimize interference between D/A and A/D conversion, the DAADSCR register enables synchronization of the start timing of D/A conversion with the ADC12 synchronous D/A conversion enable input signal.

Note: This MCU only supports ADC12 unit 1.

Only set this register while the ADC12 is halted, that is, while the ADCSR.ADST bit is 0 after selecting the software trigger as the ADC12 trigger.

Select unit 1 as the target ADC12 unit before setting the DAADST bit to 1. Set bit [1] in the DAADUSR register to 1 to select unit 1.

DAADST bit (D/A A/D Synchronous Conversion)

Setting the DAADST bit to 0 allows the DADRm register value to be converted into analog data at any time. Setting the DAADST bit to 1 allows synchronous D/A conversion with the ADC12 synchronous D/A conversion enable input signal from the ADC12. With this bit set, D/A conversion does not start until the ADC12 completes A/D conversion, even if the

Table 43.4 DA转换和模拟输出控制(2of2)

DAE	DAOEi	DAAMPi	通道i操作	通道i的放大器操作	通道i的模拟输出
1	0	0	Run	Stop	Amplifier-through
		1	Run	Run	放大器输出
	1	0	Run	Stop	Amplifier-through
		1	Run	Run	放大器输出

i = 0, 1

43.2.3 DADRm格式选择寄存器(DADPR)

Address(es): DAC12.DADPR 4005 E005h

	b7	b6	b5	b4	b3	b2	b1	b0
	DPSEL	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b6 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	DPSEL	DADRm格式选择	0: Right-justified format 1: Left-justified format.	R/W

43.2.4 DAAD同步启动控制寄存器(DAADSCR)

Address(es): DAC12.DAADSCR 4005 E006h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAADST	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b6 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	DAADST	D/A A/D Synchronous Conversion	0：不将DAC12操作与ADC12（单元1）操作同步（禁用DA和AD转换之间的防干扰）1：将DAC12操作与ADC12（单元1）操作同步（启用DA和AD转换之间的防干扰）。	R/W

为了尽量减少DA和AD转换之间的干扰，DAADSCR寄存器使DA转换的开始时序与ADC12同步DA转换使能输入信号同步。

Note: 此MCU仅支持ADC12单元1。

仅在ADC12停止时设置该寄存器，即选择软件触发作为ADC12触发后ADCSR.ADST位为0。

在将DAADST位设置为1之前选择单元1作为目标ADC12单元。将DAADUSR寄存器中的位[1]设置为1以选择单元1。

DAADST位（DAAD同步转换）

将DAADST位设置为0可以随时将DADRm寄存器值转换为模拟数据。将DAADST位设置为1允许使用来自ADC12的ADC12同步DA转换使能输入信号进行同步DA转换。设置该位后，直到ADC12完成AD转换，DA转换才会开始，即使

DADRm register value is changed.

Set this bit while the ADCSR.ADST bit is set to 0. Then, select the software trigger for the ADC12 trigger to securely stop the ADC12. Set bit [1] in the DAADUSR register to 1 before setting the DAADST bit to 1.

The event link function cannot be used when the DAADST bit is set to 1. Stop the event link function by setting the ELSR12 and ELSR13 registers of the ELC. The setting of the DAADST bit is shared by channels 0 and 1 of the DAC12.

43.2.5 D/A Output Amplifier Control Register (DAAMPCR)

Address(es): DAC12.DAAMPCR 4005 E008h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAAMP1	DAAMP0	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	DAAMP0	Amplifier Control 0	0: Do not use channel 0 output amplifier 1: Use channel 0 output amplifier.	R/W
b7	DAAMP1	Amplifier Control 1	0: Do not use channel 1 output amplifier 1: Use channel 1 output amplifier.	R/W

The DAAMPCR register selects D/A output with or without using the amplifier.

DAAMP0 bit (Amplifier Control 0)

When the DAAMP0 bit is 0, analog values are output for D/A output of channel 0 without using the amplifier. When the DAAMP0 bit is 1, analog values are output for D/A output of channel 0 through the amplifier.

When both the DAE and DAOE0 bits are 0, the amplifier is not used regardless of the setting of the DAAMP0 bit. See Table 43.4 for details.

DAAMP1 bit (Amplifier Control 1)

When the DAAMP1 bit is 0, analog values are output for D/A output of channel 1 without using the amplifier. When the DAAMP1 bit is 1, analog values are output for D/A output of channel 1 through the amplifier.

When both the DAE and DAOE1 bits are 0, the amplifier is not used regardless of the setting of the DAAMP1 bit. See Table 43.4 for details.

43.2.6 D/A Amplifier Stabilization Wait Control Register (DAASWCR)

Address(es): DAC12.DAASWCR 4005 E01Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	DAASW1	DAASW0	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	DAASW0	D/A Amplifier Stabilization Wait 0	0: Amplifier stabilization wait off (output) for channel 0 1: Amplifier stabilization wait on (Hi-Z) for channel 0.	R/W
b7	DAASW1	D/A Amplifier Stabilization Wait 1	0: Amplifier stabilization wait off (output) for channel 1 1: Amplifier stabilization wait on (Hi-Z) for channel 1.	R/W

The DAASWCR register controls D/A output with the output amplifier. This register is used in the initialization

DADRm寄存器值被更改。

在ADCSR.ADST位设置为0时设置该位。然后，选择ADC12触发的软件触发以安全地停止ADC12。在将DAADST位设置为1之前，将DAADUSR寄存器中的位[1]设置为1。

当DAADST位设置为1时，不能使用事件链接功能。通过设置ELC的ELSR12和ELSR13寄存器。DAADST位的设置由DAC12的通道0和1共享。

43.2.5 DA输出放大器控制寄存器(DAAMPCR)

Address(es): DAC12.DAAMPCR 4005 E008h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAAMP1	DAAMP0	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	DAAMP0	放大器控制0	0：不使用通道0输出放大器1：使用通道0输出放大器。	R/W
b7	DAAMP1	放大器控制1	0：不使用通道1输出放大器1：使用通道1输出放大器。	R/W

DAAMPCR寄存器选择使用或不使用放大器的DA输出。

DAAMP0位（放大器控制0）

当DAAMP0位为0时，模拟值输出通道0的DA输出，而不使用放大器。当。。。的时候DAAMP0位为1，模拟值通过放大器输出通道0的DA输出。

当DAE和DAOE0位都为0时，无论DAAMP0位的设置如何，都不会使用放大器。看详细信息见表43.4。

DAAMP1位（放大器控制1）

当DAAMP1位为0时，模拟值输出通道1的DA输出，而不使用放大器。当。。。的时候DAAMP1位为1，模拟值通过放大器输出到通道1的DA输出。

当DAE和DAOE1位都为0时，无论DAAMP1位的设置如何，都不会使用放大器。看详细信息见表43.4。

43.2.6 DA放大器稳定等待控制寄存器(DAASWCR)

Address(es): DAC12.DAASWCR 4005 E01Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	DAASW1	DAASW0	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	DAASW0	DA放大器稳定等待0	0：通道0的放大器稳定等待关闭（输出）1：通道0的放大器稳定等待打开（Hi-Z）。	R/W
b7	DAASW1	DA放大器稳定等待1	0：通道1的放大器稳定等待关闭（输出）1：通道1的放大器稳定等待打开（Hi-Z）。	R/W

DAASWCR寄存器通过输出放大器控制DA输出。该寄存器用于初始化

procedure to wait for stabilization of the D/A output amplifier. Each bit in DAASWCR should be set to 1 when both the DAE and the DAOEi (i = 0, 1) bits in the DACR register are 0. See section 43.6.5, Initialization Procedure with the Output Amplifier.

DAASW0 bit (D/A Amplifier Stabilization Wait 0)

Set the DAASW0 bit to 1 in the initialization procedure to wait for the stabilization of the D/A channel 0 output amplifier. When DAASW0 is set to 1, D/A conversion operates, but the conversion result of D/A is not output from channel 0. When the DAASW0 bit is 0, the stabilization wait time stops, and the D/A conversion result of channel 0 is output through the output amplifier.

DAASW1 bit (D/A Amplifier Stabilization Wait 1)

Set the DAASW1 bit to 1 in the initialization procedure to wait for the stabilization of the D/A channel 1 output amplifier. When DAASW1 is set to 1, D/A conversion operates, but the conversion result of D/A is not output from channel 1. When the DAASW1 bit is 0, the stabilization wait time stops, and the D/A conversion result of channel 1 is output through the output amplifier.

43.2.7 D/A A/D Synchronous Unit Select Register (DAADUSR)

Address(es): DAC12.DAADUSR 4005 F0C0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	AMADSEL1	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b1	AMADSEL1	A/D Unit 1 Select	0: Do not select unit 1 1: Select unit 1.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The DAADUSR register selects the target ADC12 unit for D/A and A/D synchronous conversions. Set bit [1] to 1 to select unit 1 as the target synchronous unit for the MCU. When setting the DAADSCR.DAADST bit to 1 for synchronous conversions, select the target unit in this register in advance.

Only set the DAADUSR register while the ADCSR.ADST bit of the ADC12 is 0 and the DAADSCR.DAADST bit is set to 0.

43.3 Operation

DAC12 includes D/A conversion circuits for two channels, each of which can operate independently. When the DAOEn bit (n = 0, 1) in DACR is set to 1, DAC12 is enabled and the conversion result is output.

The following example shows D/A conversion on channel 0. Figure 43.2 shows the timing of this operation.

To process D/A conversion on channel 0:

1. Set the data for D/A conversion in the DADPR.DPSEL bit and the DADR0 register.
2. Set the DACR.DAOE0 bit to 1 to start D/A conversion. The conversion result is output from the analog output pin DA0 after the conversion time tDCONV elapses. The conversion result continues to be output until DADR0 is written to again or the DAOE0 bit is set to 0. The output value (reference) is expressed by the following formula:

$$\frac{\text{Setting in DADRm}}{4096} \times \text{VREFH}$$

3. To start another conversion, write another value to DADR0. The conversion result is output after the conversion time t_{DCONV} elapses.
When the DAADSCR.DAADST bit is 1 (interference reduction between D/A and A/D conversion is enabled), a

程序等待DA输出放大器稳定。当DACR寄存器中的DAE和DAOEi(i=0 1)位都为0时，DAASWCR中的每个位都应设置为1。请参见第43.6.5节，使用
输出放大器。

DAASW0位（DA放大器稳定等待0）

在初始化过程中将DAASW0位设置为1，以等待DA通道0输出放大器稳定。当DAASW0设置为1时，DA转换进行，但DA的转换结果不从通道0输出。当DAASW0位为0时，稳定等待时间停止，通过输出输出通道0的DA转换结果放大器。

DAASW1位（DA放大器稳定等待1）

在初始化过程中将DAASW1位设置为1，以等待DA通道1输出放大器稳定。当DAASW1设置为1时，DA转换进行，但DA的转换结果不从通道1输出。当DAASW1位为0时，稳定等待时间停止，通道1的DA转换结果通过输出输出放大器。

43.2.7 DAAD同步单元选择寄存器(DAADUSR)

Address(es): DAC12.DAADUSR 4005 F0C0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	AMADSEL1	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	—	Reserved	该位读取为0。写入值应为0。	R/W
b1	AMADSEL1	AD单元1选择	0：不选择单元11： 选择单元1。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

DAADUSR寄存器为DA和AD同步转换选择目标ADC12单元。将位[1]设置为1以选择单元1作为MCU的目标同步单元。将DAADSCR.DAADST位设置为1以进行同步转换时，请预先在该寄存器中选择目标单位。

仅当ADC12的ADCSR.ADST位为0且DAADSCR.DAADST位设置为0时才设置DAADUSR寄存器。

43.3 Operation

DAC12包含两个通道的DA转换电路，每个通道都可以独立工作。当DACR中的DAOEn位(n=0 1)设置为1时，DAC12使能并输出转换结果。

以下示例显示通道0上的DA转换。图43.2显示了此操作的时序。

在通道0上处理DA转换：

1. 在DADPR.DPSEL位和DADR0寄存器中设置用于DA转换的数据。
2. 将DACR.DAOE0位设置为1以启动DA转换。转换结果从模拟输出引脚输出
转换时间tDCONV过后的DA0。转换结果继续输出，直到再次写入DADR0或将DAOE0位设置为0。输出值（参考值）由以下公式表示：

$$\frac{\text{DADRm4096中的设置}}{} \times \text{VREFH}$$

3. 要开始另一次转换，请将另一个值写入DADR0。在经过转换时间tDCONV后输出转换结果。当DAADSCR.DAADST位为1（启用DA和AD转换之间的干扰降低）时，a

maximum of one A/D conversion time is required for D/A conversion to start. When ADCLK is faster than the peripheral clock, a longer time period might be required.

4. To disable analog output, set the DAOE0 bit to 0.

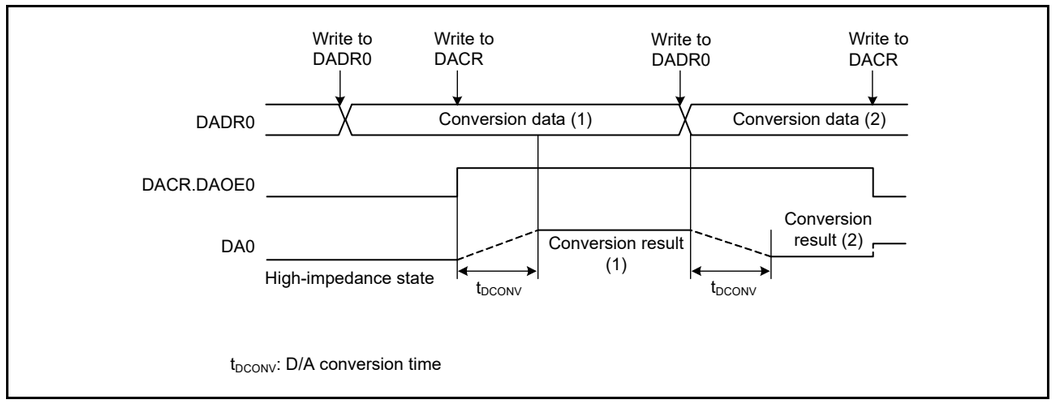

Figure 43.2 Example of DAC12 operation

43.3.1 Reducing Interference between D/A and A/D Conversion

When D/A conversion starts, the DAC12 generates inrush current. Because the DAC12 and ADC12 share the same analog power supply, the generated inrush current can interfere with ADC12 operation.

While the DAADSCR.DAADST bit is 1, even if the DADRm register data is changed during ADC12 operation, D/A conversion does not start immediately but starts synchronously with A/D conversion completion. A maximum of one A/D conversion time is required for the DADRm register data update to be reflected as the D/A conversion circuit input. Before reflection, the DADRm register value does not correspond to the analog output value.

When this function is enabled, it is not possibles to check through software whether the DADRm register value was D/A converted. When the DADRm register data is changed while the ADC12 is halted, D/A conversion starts in 1 PCLKB cycle, even if DAADSCR.DAADST is 1.

The following sequence provides an example of channel 0 D/A conversion, in which the DAC12 operates synchronously with the ADC12.

To perform D/A conversion on channel 0 in synchronization with the ADC12:

1. Confirm that the ADC12 is halted and set the DAADUSR.AMADSEL1 bit to 1.
2. Confirm that the ADC12 is halted and set the DAADSCR.DAADST bit to 1.
3. Confirm that the ADC12 is halted and set the DACR.DAOE0 bit to 1.
4. Set the DADR0 register. If ADCLK is faster than the peripheral clock, a period longer than one A/D conversion time might be required.

- If the 12-bit A/D conversion is halted (ADCSR.ADST bit = 0) when the DADR0 register is modified, D/A conversion starts in 1 PCLKB cycle
- If the 12-bit A/D conversion is in progress (ADCSR.ADST bit = 1) when the DADR0 register is modified, D/A conversion starts on A/D conversion completion. If the DADR0 register is modified twice during A/D conversion, the first update might not be converted.

DA转换开始最多需要一个AD转换时间。当ADCLK比外设时钟快时，可能需要更长的时间周期。

4. 要禁用模拟输出，请将DAOE0位设置为0。

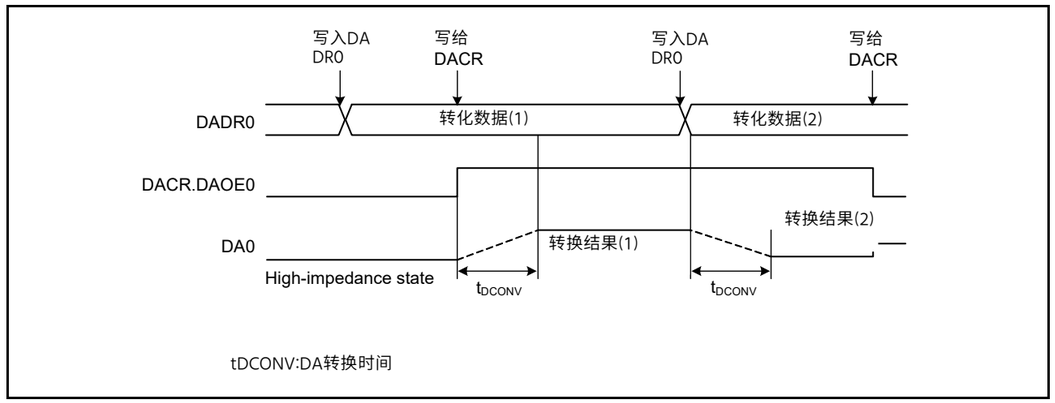

Figure 43.2 DAC12操作示例

43.3.1 减少DA和AD转换之间的干扰

当DA转换开始时，DAC12会产生浪涌电流。由于DAC12和ADC12共用同一个模拟电源，产生的浪涌电流会干扰ADC12的运行。

当DAADSCR.DAADST位为1时，即使在ADC12操作期间更改DADRm寄存器数据，DA转换也不会立即开始，而是与AD转换完成同步开始。DADRm寄存器数据更新最多需要一个AD转换时间才能反映为DA转换电路输入。

反射前，DADRm寄存器值与模拟输出值不对应。

当此功能使能时，无法通过软件检查DADRm寄存器值是否经过DA转换。如果在ADC12停止时更改DADRm寄存器数据，即使DAADSCR.DAADST为1，DA转换也会在1个PCLKB周期内开始。

以下序列提供了通道0DA转换的示例，其中DAC12与ADC12同步运行。

与ADC12同步在通道0上执行DA转换：

1. 确认ADC12已停止并将DAADUSR.AMADSEL1位设置为1。
2. 确认ADC12已停止并将DAADSCR.DAADST位设置为1。
3. 确认ADC12已停止并将DACR.DAOE0位设置为1。
4. 设置DADR0寄存器。如果ADCLK比外设时钟快，则可能需要比一个AD转换时间更长的周期。

- 如果在修改DADR0寄存器时停止12位AD转换（ADCSR.ADST位=0），则DA转换在1个PCLKB周期内开始
- 如果修改DADR0寄存器时12位AD转换正在进行（ADCSR.ADST位=1），则DA转换在AD转换完成时开始。如果在AD转换期间DADR0寄存器被修改两次，第一次更新可能不会被转换。

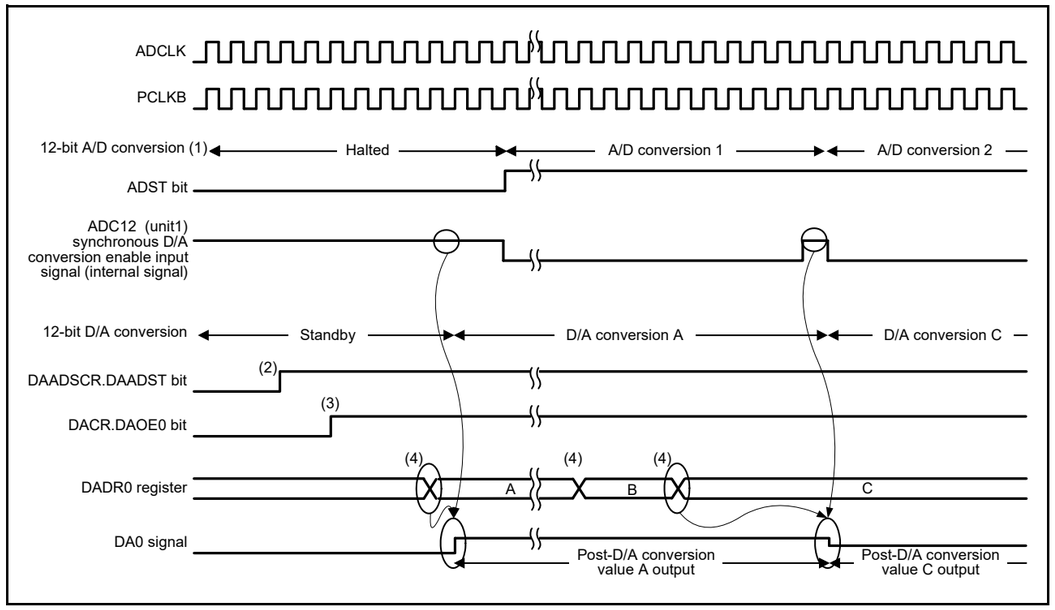

Figure 43.3 Example of conversion when the DAC12 is synchronized with the ADC12

When ADCLK is faster than PCLKB, the DAC12 might not be able to capture an ADC12 synchronous D/A conversion enable input signal during the 1 ADCLK cycle that is output between A/D conversion 1 and A/D conversion 2, as shown in Figure 43.4. In this case, post-D/A conversion value A is continuously output as the DA0 signal.

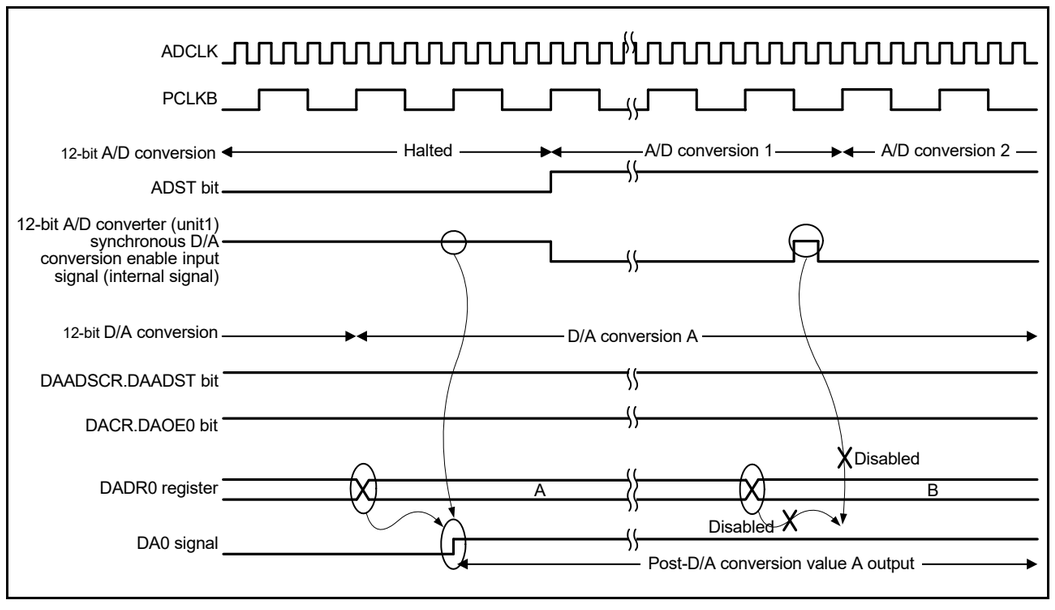

Figure 43.4 Example when the DAC12 cannot capture the synchronous D/A conversion enable input signal from the ADC12 (unit 1)

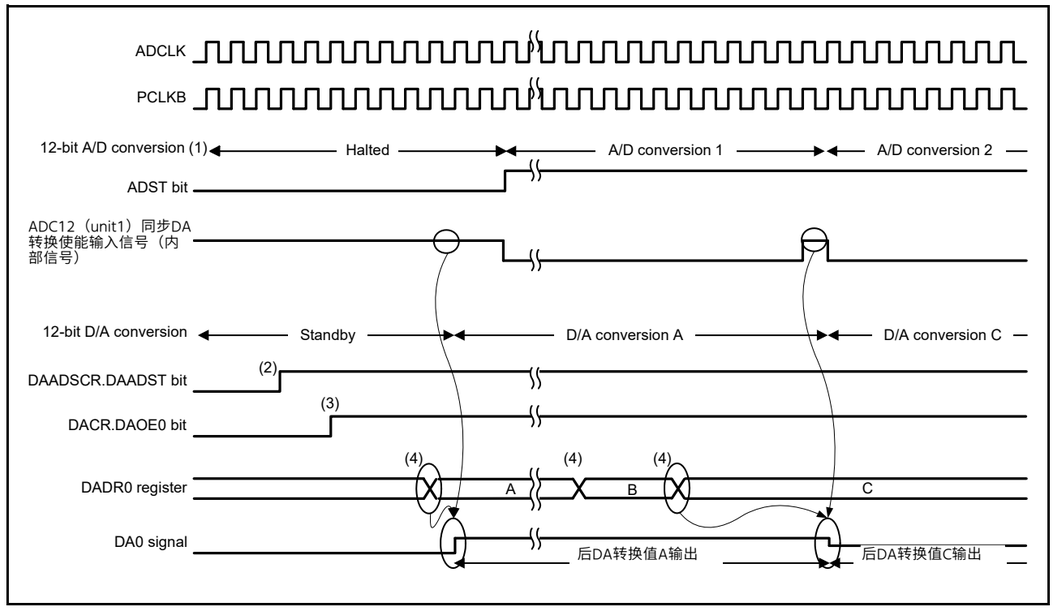

Figure 43.3 DAC12与ADC12同步时的转换示例

当ADCLK比PCLKB快时，DAC12可能无法在AD转换1和AD转换2之间输出的1个ADCLK周期内捕获ADC12同步DA转换使能输入信号，如图43.4所示。在这种情况下，后DA转换值A作为DA0信号连续输出。

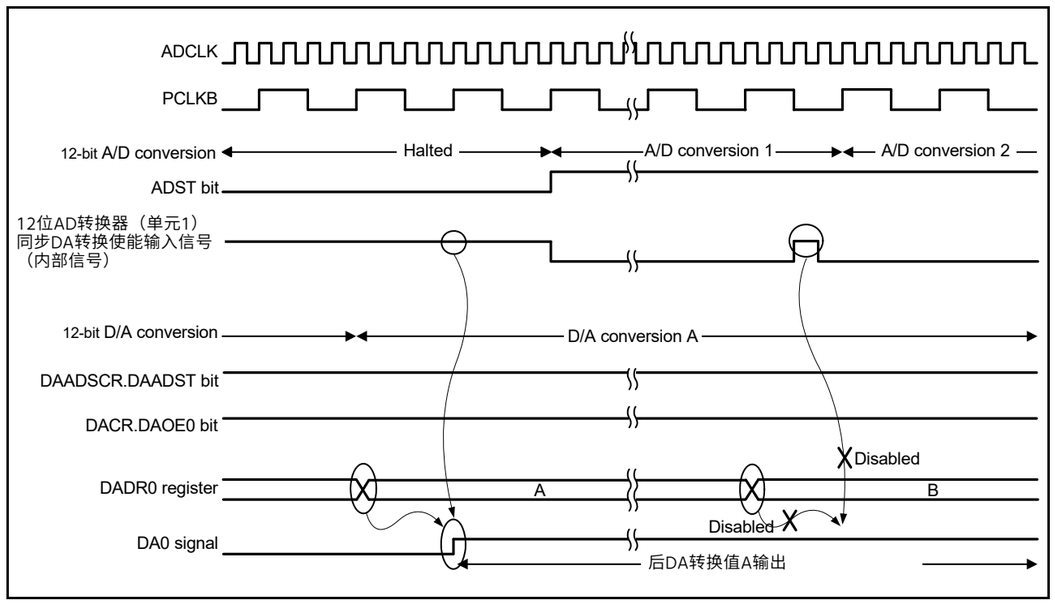

Figure 43.4 DAC12无法捕获来自ADC12（单元1）的同步DA转换使能输入信号时的示例

43.4 Event Link Operation Setting Procedure

This section describes the procedures used in event link operation.

43.4.1 DA0 Event Link Operation Setting Procedure

To set up DA0 event link operation:

1. Set the DADPR.DPSEL bit and the data for D/A conversion in the DADR0 register.
2. Set the ELC_DA0 event signal to be linked to each peripheral module in the ELSR12 register.
3. Set the ELCR.ELCON bit to 1. This enables event link operation for all modules with the event link function selected.
4. Set the event output source module to activate the event link. After the event is output from the module, the DACR.DAOE0 bit is set to 1, and D/A conversion starts on channel 0.
5. Set the ELSR12.ELS[8:0] bits to 000h to stop event link operation on DAC12 channel 0. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

43.4.2 DA1 Event Link Operation Setting Procedure

To set up DA1 event link operation:

1. Set the DADPR.DPSEL bit and set the data for D/A conversion in the DADR1 register.
2. Set the ELC_DA1 event signal to be linked to each peripheral module in the ELSR13 register.
3. Set the ELCR.ELCON bit to 1. This enables the event link operation for all modules with the event link function selected.
4. Set the event output source module to activate the event link. After the event is output from the module, the DACR.DAOE1 bit is set to 1, and D/A conversion starts on channel 1.
5. Set the ELSR13.ELS[8:0] bits to 000h to stop event link operation on DAC12 channel 1. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

43.5 Usage Notes on Event Link Operation

- When the event link function is used, do not use the amplifier output function.
- When the event link function is used, set the DACR.DAE bit to 0.
- When the event specified for the ELC_DA0 event signal is generated while a write to the DACR.DAOE0 bit is performed, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- When the event specified for the ELC_DA1 event signal is generated while a write to the DACR.DAOE1 bit is performed, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- Use of the event link function is prohibited when the DAADSCR.DAADST bit is set to 1 to reduce interference between D/A and A/D conversions.

43.6 Usage Notes

43.6.1 Settings for the Module-Stop Function

The Module Stop Control Register can enable or disable DAC12 operation. The DAC12 is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

43.6.2 DAC12 Operation in the Module-Stop State

When the MCU enters the module-stop state with D/A conversion enabled, the D/A outputs is saved, and the analog power supply current is the same as during D/A conversion. To reduce the analog power supply current in the module-stop state, disable D/A conversion by setting the DACR.DAOE1, DAOE0, and DAE bits to 0.

43.4 事件链接操作设置步骤

本节介绍事件链接操作中使用的过程。

43.4.1 DA0事件链接操作设置步骤

设置DA0事件链接操作：

1. 在DADR0寄存器中设置DADPR.DPSEL位和用于DA转换的数据。
2. 将ELC_DA0事件信号设置为链接到ELSR12寄存器中的每个外围模块。
3. 将ELCR.ELCON位设置为1。这将为所有选择了事件链接功能的模块启用事件链接操作。
4. 设置事件输出源模块以激活事件链接。事件从模块输出后，DACR.DAOE0位设置为1，DA转换从通道0开始。
5. 将ELSR12.ELS[8:0]位设置为000h以停止DAC12通道0上的事件链接操作。当ELCR.ELCON位设置为0时，将停止所有事件链接操作。

43.4.2 DA1事件链接操作设置步骤

设置DA1事件链接操作：

1. 设置DADPR.DPSEL位并在DADR1寄存器中设置用于DA转换的数据。
2. 设置ELC_DA1事件信号链接到ELSR13寄存器中的每个外围模块。
3. 将ELCR.ELCON位设置为1。这将为所有选择了事件链接功能的模块启用事件链接操作。
4. 设置事件输出源模块以激活事件链接。事件从模块输出后，DACR.DAOE1位设置为1，DA转换从通道1开始。
5. 将ELSR13.ELS[8:0]位设置为000h以停止DAC12通道1上的事件链接操作。当ELCR.ELCON位设置为0时，将停止所有事件链接操作。

43.5 事件链接操作使用说明

- 使用事件链接功能时，请勿使用放大器输出功能。
- 使用事件链接功能时，将DACR.DAE位设置为0。
- 如果在执行对DACR.DAOE0位的写入时生成了为ELC_DA0事件信号指定的事件，则写入周期停止，并且生成的事件优先将该位设置为1。
- 如果在执行对DACR.DAOE1位的写入时生成了为ELC_DA1事件信号指定的事件，则写入周期停止，并且生成的事件优先将该位设置为1。
- 当DAADSCR.DAADST位设置为1以减少DA和AD转换之间的干扰时，禁止使用事件链接功能。

43.6 使用说明

43.6.1 模块停止功能的设置

模块停止控制寄存器可以启用或禁用DAC12操作。DAC12在复位后最初停止。
释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

43.6.2 DAC12在模块停止状态下的操作

当单片机进入模组停止状态并开启数模转换时，数模输出被保存，模拟电源电流与数模转换时相同。要降低模块停止状态下的模拟电源电流，请通过将DACR.DAOE1、DAOE0和DAE位设置为0来禁用DA转换。

RA生态工作室

43.6.3 DAC12 Operation in Software Standby Mode

When the MCU enters Software Standby mode with D/A conversion enabled, the D/A outputs are saved, and the analog power supply current is the same as during D/A conversion. To reduce the analog power supply current in Software Standby mode, disable D/A conversion by setting the DACR.DAOE1, DAOE0, and DAE bits to 0.

43.6.4 Restriction on Entering Deep Software Standby Mode

When the MCU enters Deep Software Standby mode with D/A conversion enabled, the outputs of DAC12 are placed in a high impedance state.

43.6.5 Initialization Procedure with the Output Amplifier

Use the following initialization procedures with the output amplifier. The example shows the case for channel 0.

To initialize the DAC12 with the output amplifier:

1. Write 000h to the DADR0 register.
2. Set the DAASWCR.DAASW0 bit to 1.
3. Set the DAAMPCR.DAAMP0 bit to 1.
4. Set the DACR.DAE bit or the DACR.DAOE0 bit to 1 to start operation of the amplifier.
5. Set the DAASWCR.DAASW0 bit to 0 after waiting for the duration of D/A conversion time t_{CONV}.
6. Write the value to be converted in the DADR0 register.

While the amplifier is running, setting the DACR.DAE and DACR.DAOE0 bits to 0 allows the amplifier to stop operation. To use the amplifier again, repeat steps 1. to 6.

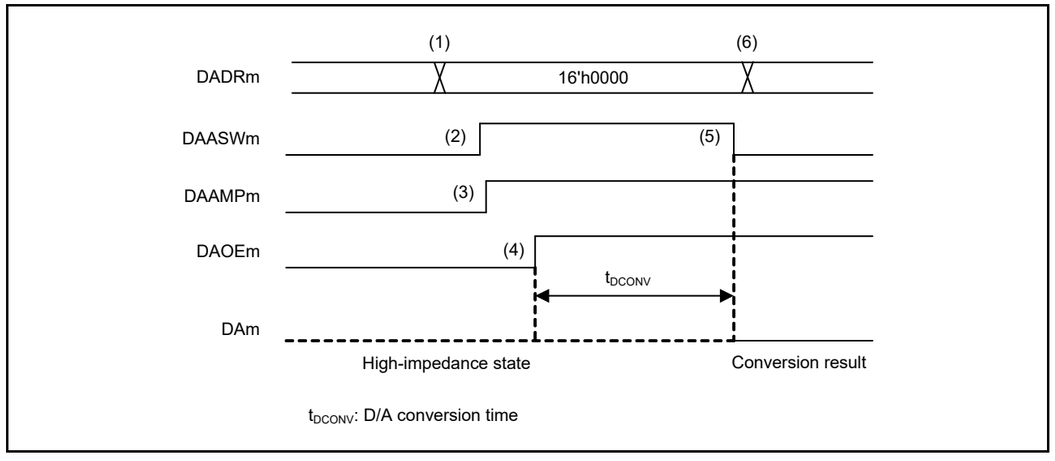

Figure 43.5 Example of the initial flow with the output amplifier in DAC12

43.6.6 Restriction on Usage when Interference Reduction between D/A and A/D Conversion is Enabled

When the DAADSCR.DAADST bit is 1, enabling interference prevention between D/A and A/D conversion, do not place the ADC12 in the module-stop state. Doing so can halt D/A conversion in addition to A/D conversion.

43.6.3 DAC12在软件待机模式下的操作

当MCU进入软件待机模式并启用DA转换时，DA输出被保存，模拟电源电流与DA转换期间相同。要降低软件待机模式下的模拟电源电流，请通过将DACR.DAOE1、DAOE0和DAE位设置为0来禁用DA转换。

43.6.4 进入深度软件待机模式的限制

当MCU进入深度软件待机模式并启用DA转换时，DAC12的输出置于高阻抗状态。

43.6.5 输出放大器的初始化程序

对输出放大器使用以下初始化程序。该示例显示了通道0的情况。

使用输出放大器初始化DAC12：

1. 将000h写入DADR0寄存器。
2. 将DAASWCR.DAASW0位设置为1。
3. 将DAAMPCR.DAAMP0位设置为1。
4. 将DACR.DAE位或DACR.DAOE0位设置为1以启动放大器的操作。
5. 在等待DA转换时间tCONV的持续时间后，将DAASWCR.DAASW0位设置为0。
6. 将要转换的值写入DADR0寄存器。

在放大器运行时，将DACR.DAE和DACR.DAOE0位设置为0可使放大器停止运行。要再次使用放大器，请重复步骤1.至6。

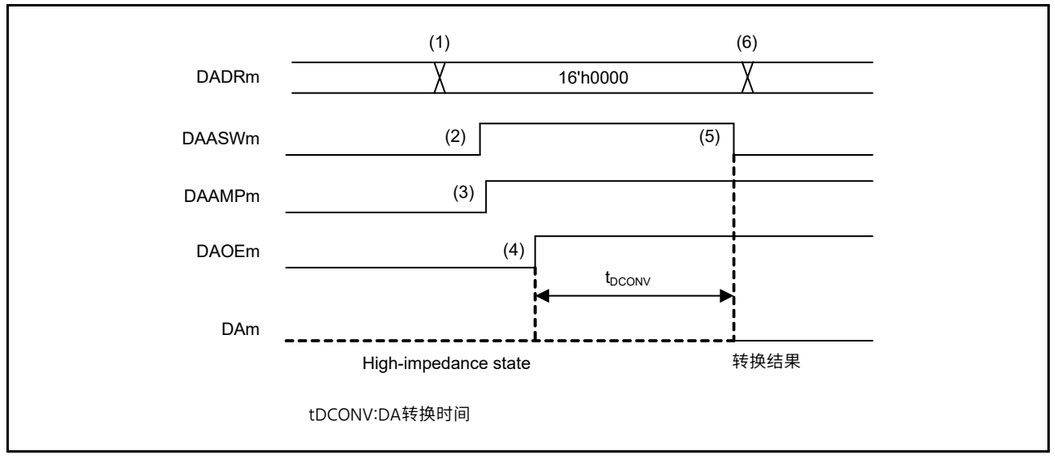

Figure 43.5 DAC12中输出放大器的初始流程示例

43.6.6 DA和AD之间减少干扰时的使用限制转换已启用

当DAADSCR.DAADST位为1时，使能DA和AD转换之间的干扰防止，不要将ADC12置于模块停止状态。除了AD转换之外，这样做还可以停止DA转换。

44. Temperature Sensor (TSN)

44.1 Overview

The on-chip temperature sensor determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC12 for conversion and can also be used by the end application.

Table 44.1 lists the temperature sensor specifications and Figure 44.1 shows a block diagram.

Table 44.1 Temperature sensor specifications

Parameter	Specifications
Temperature sensor voltage output	Temperature sensor outputs a voltage to the 12-Bit A/D Converter (ADC12)
Module-stop function	Module-stop state can be set to reduce power consumption
Temperature Sensor Calibration Data	Reference data measured for each chip at factory shipment is stored

	—	—	—	—												
Value after reset:	0	0	0	0	Unique value for each chip											

The TSCDR register stores temperature sensor calibration data measured for each MCU at factory shipment.

Temperature sensor calibration data is a digital value obtained using the 12-bit A/D converter unit 0 to convert the voltage output by the temperature sensor under the condition $T_a = T_j = 127°C$ and AVCC0 = 3.3 V.

The TSCDR register is a 32-bit read-only register and should be read in 32-bit units.

44.3 Using the Temperature Sensor

The temperature sensor outputs a voltage that varies with the temperature. This voltage is converted to a digital value by the ADC12. To obtain the die temperature, convert this value into the temperature.

44.3.1 Preparation for Using the Temperature Sensor

The temperature (T) is proportional to the sensor voltage output (Vs), so temperature is calculated with the following formula:

T = (Vs - V1) / slope + T1

T: Measured temperature (°C)

Vs: Voltage output by the temperature sensor when temperature is measured (V)

T1: Temperature experimentally measured at one point (°C)

V1: Voltage output by the temperature sensor when T1 is measured (V)

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—												
重置后的值：	0	0	0	0	每个芯片的独特价值											

TSCDR寄存器存储在出厂时为每个MCU测量的温度传感器校准数据。

温度传感器校准数据是在Ta=Tj=127°C和AVCC0=3.3V条件下，使用12位AD转换器单元0对温度传感器输出的电压进行转换得到的数字值。

TSCDR寄存器是一个32位只读寄存器，应该以32位为单位读取。

44.3 使用温度传感器

温度传感器输出随温度变化的电压。该电压由ADC12转换为数字值。要获得芯片温度，请将该值转换为温度。

44.3.1 使用温度传感器的准备工作

温度(T)与传感器电压输出(Vs)成正比，因此使用以下公式计算温度：

T = (Vs - V1) / slope + T1

T:测量温度(°C)

Vs：测量温度时温度传感器输出的电压（V）

T1：在某一点实验测量的温度(°C)

V1：测量T1时温度传感器输出的电压（V）

T2: Temperature experimentally measured at a second point (°C)

V2: Voltage output by the temperature sensor when T2 is measured (V)

Slope: Temperature gradient of the temperature sensor (V /°C), slope = (V2 - V1) / (T2 - T1)

Characteristics vary between sensors. Therefore, Renesas recommends measuring two different sample temperatures as follows:

1. Use the ADC12 to measure the voltage V1 output by the temperature sensor at temperature T1.
2. Use the ADC12 to measure the voltage V2 output by the temperature sensor at a different temperature T2. Obtain the temperature gradient (slope = (V2 - V1) / (T2 - T1)) from these results.
3. Subsequently, obtain temperatures by substituting the slope into the formula for the temperature characteristic (T = (Vs - V1) / slope + T1).

If you are using the temperature slope given in Table 52.38 of section 52, Electrical Characteristics, use the ADC12 converter unit 0 to measure the voltage V1 output by the temperature sensor at temperature T1, then calculate the temperature characteristic using the following formula:

T = (Vs - V1) / slope + T1

T: Measured temperature (°C)

Vs: Voltage output by the temperature sensor when the temperature is measured (V)

T1: Sample temperature measurement at first point (°C)

V1: Voltage output by the temperature sensor when T1 is measured (V)

Slope: Temperature slope given in Table 52.38 ÷ 1000 (V / °C)

In this MCU, the TSCDR register stores the temperature value (CAL127) of the temperature sensor measured under the condition $T_a = T_j = 127°C$ and AVCC0 = 3.3 V. By using this value as the sample measurement result at the first point, you can omit the preparation before using the temperature sensor.

V1 is calculated from CAL127 as follows:

V1 = 3.3 × CAL127 / 4096 [V]

Using this value, the measured temperature can be calculated according to the following formula:

T = (Vs - V1) / slope + 127 [°C]

T: Measured temperature (°C)

Vs: Voltage output by the temperature sensor when the temperature is measured (V)

V1: Voltage output by the temperature sensor when $T_a = T_j = 127°C$ and AVCC0 = 3.3 V (V)

Slope: Temperature slope given in Table 52.38 ÷ 1000 (V / °C)

44.3.2 Procedure for Using the Temperature Sensor

Figure 44.2 shows the procedure for using the temperature sensor. For the procedure to configure the ADC12, see section 42, 12-Bit A/D Converter (ADC12).

T2：在第二点实验测量的温度(°C)

V2：测量T2时温度传感器输出的电压（V）

斜率：温度传感器的温度梯度（V/°C），斜率=（V2V1）（T2T1）

特性因传感器而异。因此，瑞萨推荐测量两种不同的样品温度，如下所示：

1. 使用ADC12测量温度传感器在温度T1时输出的电压V1。
2. 使用ADC12测量温度传感器在不同温度T2下输出的电压V2。从这些结果中获得温度梯度（斜率=(V2V1)(T2T1)）。
3. 随后，通过将斜率代入温度特性公式(T=(VsV1)斜率+T1)来获得温度。

如果您使用第52节"电气特性"的表52.38中给出的温度斜率，请使用ADC12转换器单元0测量温度传感器在温度T1下输出的电压V1，然后使用以下公式计算温度特性：

T = (Vs - V1) / slope + T1

T:测量温度(°C)

Vs：测温时温度传感器输出的电压（V）

T1：第一点的样品温度测量(°C)

V1：测量T1时温度传感器输出的电压（V）

斜率：表52.38中给出的温度斜率÷1000(V°C)

在此MCU中，TSCDR寄存器存储在条件Ta=Tj=127°C和AVCC0=3.3V下测量的温度传感器的温度值(CAL127)。将此值用作第一点的样本测量结果，您可以省略使用温度传感器前的准备工作。

V1从CAL127计算如下：

V1 = 3.3 × CAL127 / 4096 [V]

使用该值，可根据以下公式计算测得的温度：

T = (Vs - V1) / slope + 127 [°C]

T:测量温度(°C)

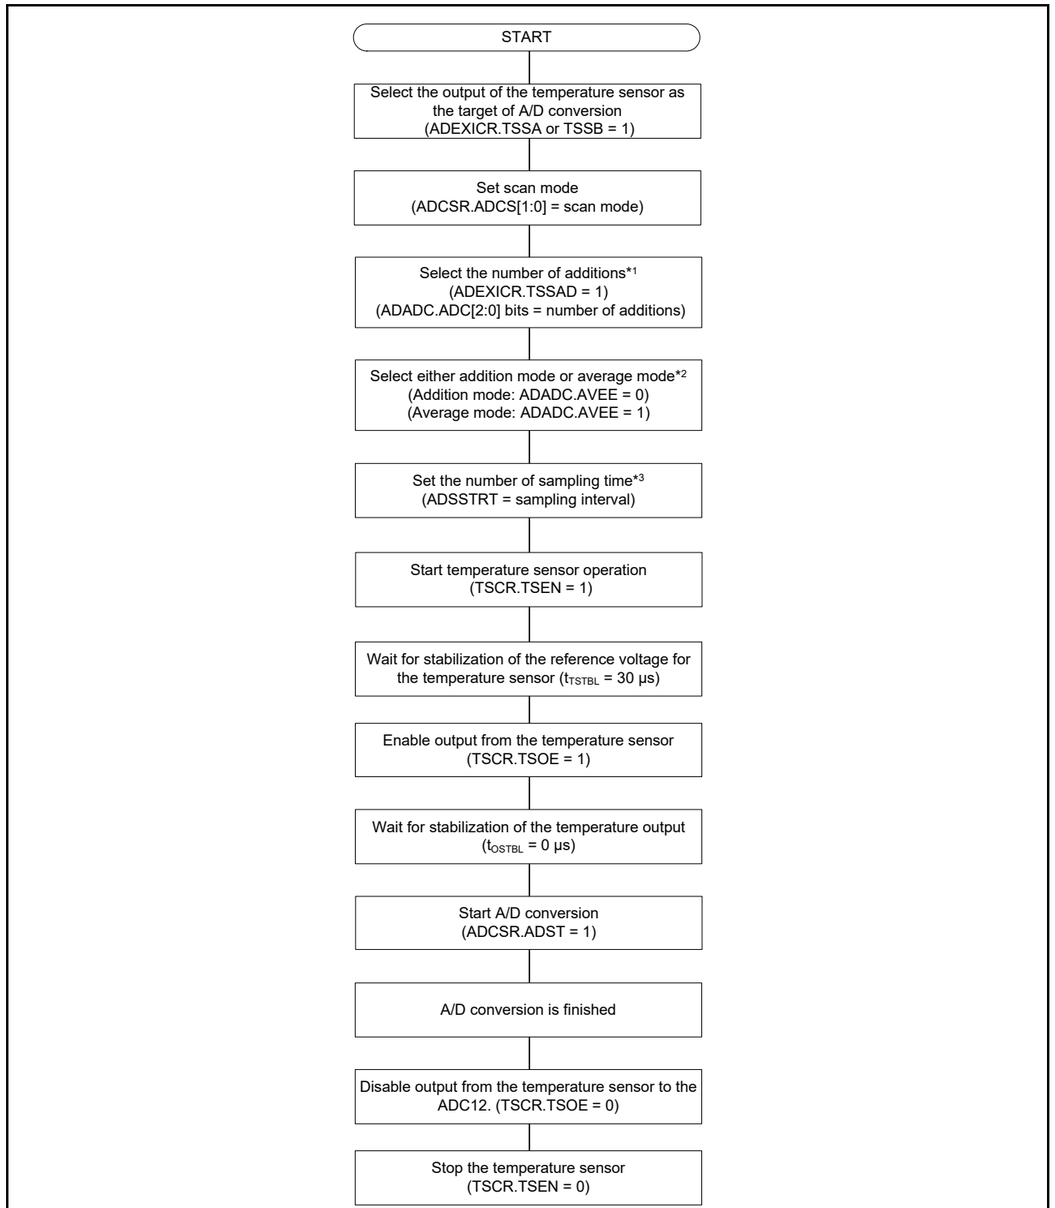
Vs：测温时温度传感器输出的电压（V）

V1：温度传感器在Ta=Tj=127°C和AVCC0=3.3V(V)时输出的电压

斜率：表52.38中给出的温度斜率÷1000(V°C)

44.3.2 使用温度传感器的步骤

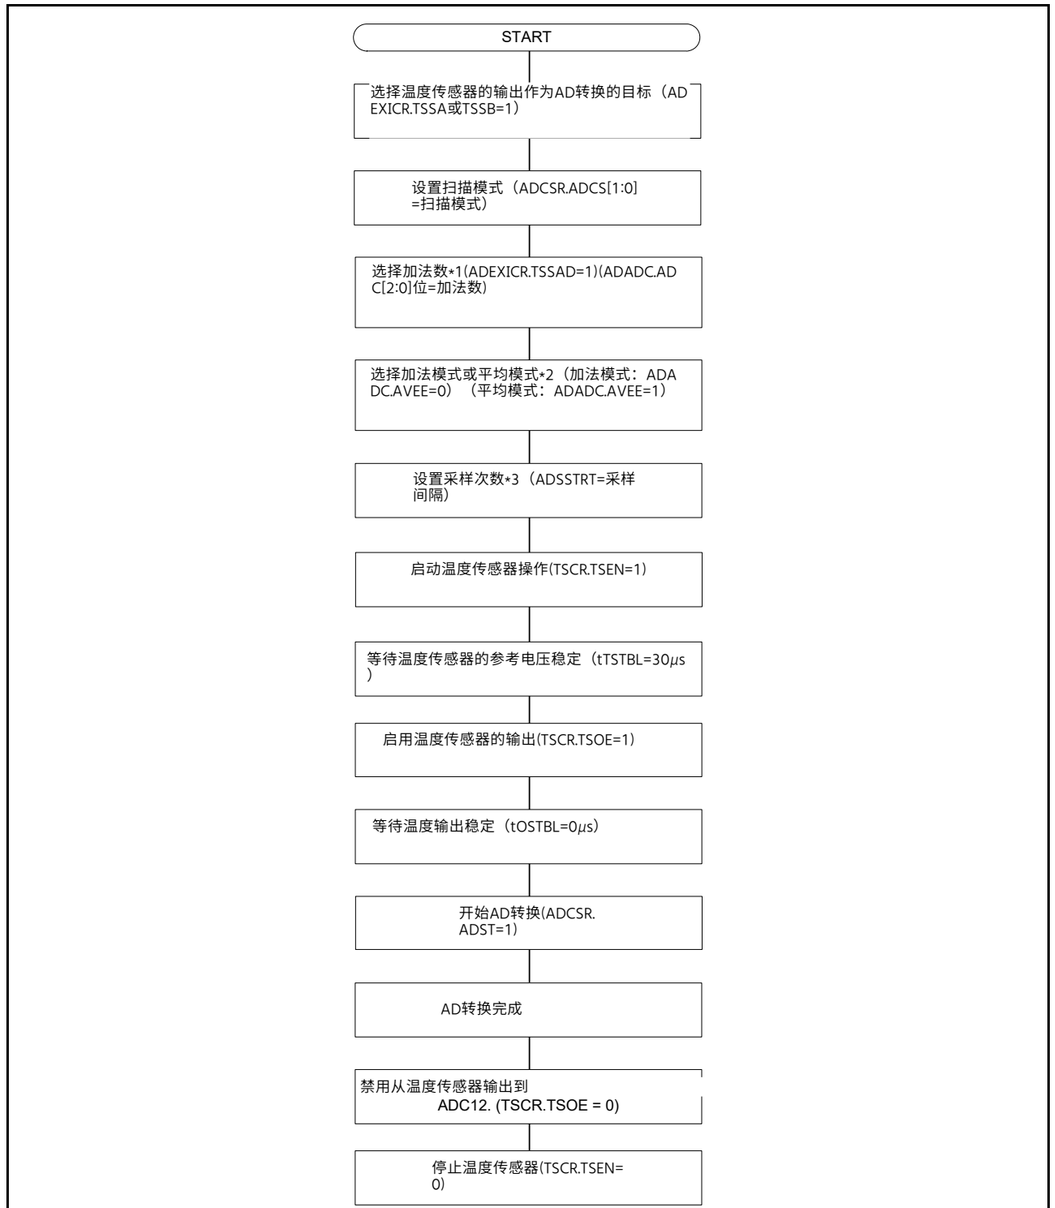
图44.2显示了使用温度传感器的步骤。有关配置ADC12的过程，请参阅第42节，12位AD转换器(ADC12)。



Note 1. The ADADC.ADC[2:0] setting is limited to some values in average mode. For details on the available ADADC.ADC[2:0] settings in average mode, see section 42.2.10, A/D-Converted Value Addition/Average Count Select Register (ADADC).
Note 2. This setting is not required if addition/average mode is not set.
Note 3. Set the sampling time to more than the value described in section 52.7, TSN Characteristics.

Figure 44.2 Procedure for using the temperature sensor

Figure 44.3 shows the timing from the start of temperature sensor operation until the completion of A/D conversion when the ADC12 is in single scan mode (the conversion target is the temperature sensor output only). The times shown in the figure are described in Table 44.2.



Note 1. ADADC.ADC[2:0]设置仅限于平均模式下的某些值。有关平均模式下可用ADADC.ADC[2:0]设置的详细信息，请参阅第42.2.10节，D转换值加法平均计数选择寄存器(ADADC)。
Note 2. 如果未设置加法平均模式，则不需要此设置。
Note 3. 将采样时间设置为大于第52.7节，TSN特性中描述的值。

Figure 44.2 温度传感器的使用步骤

图44.3显示了当ADC12处于单次扫描模式（转换目标仅为温度传感器输出）时，从温度传感器操作开始到AD转换完成的时序。图中显示的时间在表44.2中描述。

RA生态工作室

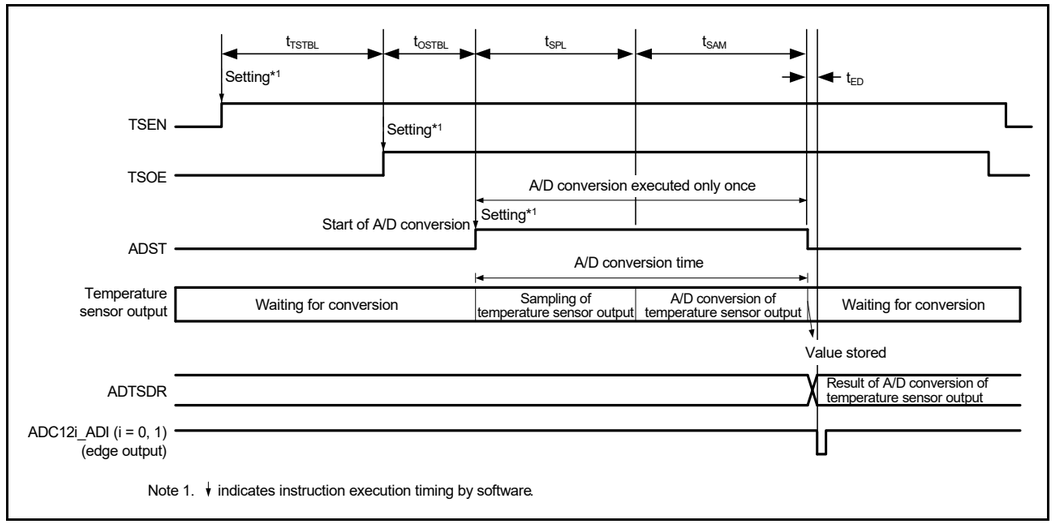


Figure 44.3 Timing from start of temperature sensor operation until completion of A/D conversion

Table 44.2 Time until completion of A/D conversion after start of temperature sensor operation

Parameter	Symbol	Time
Wait time for temperature sensor reference voltage stabilization	t_{TSTBL}	30 µs (min)
Wait time for temperature sensor output stabilization	t_{OSTBL}	0 µs (min)
ADC12 input sampling time	t_{SPL}	ADSSTRT setting × ADCLK cycles
A/D conversion time	t_{SAM}	See Table 42.10, Conversion times during scanning (in numbers of ADCLK and PCLKB cycles)
Scan conversion end delay	t_{ED}	

44.4 Usage Notes

44.4.1 Settings for the Module-Stop Function

The Module Stop Control Register D (MSTPCRD) can enable or disable temperature sensor operation. The temperature sensor is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

44.4.2 Constraints

It is prohibited to use both channels of the ADC12 simultaneously for temperature sensor measurement.

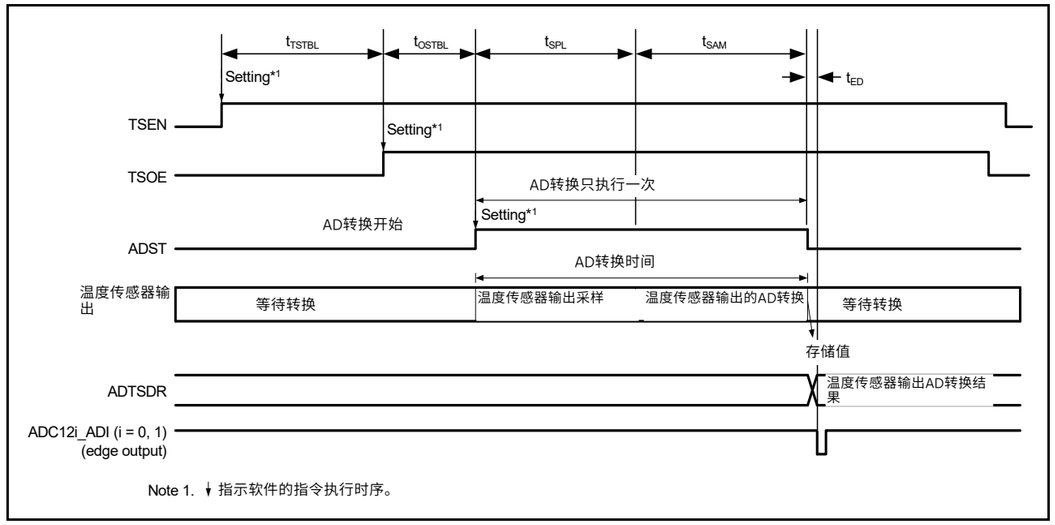

Figure 44.3 从温度传感器操作开始到AD转换完成的时间

Table 44.2 温度传感器动作开始后到AD转换完成的时间

Parameter	Symbol	Time
温度传感器参考电压稳定的等待时间	t_{TSTBL}	30 µs (min)
温度传感器输出稳定的等待时间	t_{OSTBL}	0 µs (min)
ADC12输入采样时间	t_{SPL}	ADSTRT设置×ADCLK周期
AD转换时间	t_{SAM}	请参见表42.10，扫描期间的转换时间（以ADCLK和PCLKB周期数为单位）
扫描转换结束延迟	t_{ED}	

44.4 使用说明

44.4.1 模块停止功能的设置

模块停止控制寄存器D(MSTPCRD)可以启用或禁用温度传感器操作。温度传感器在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

44.4.2 Constraints

禁止同时使用ADC12的两个通道进行温度传感器测量。

45. High-Speed Analog Comparator (ACMPHS)

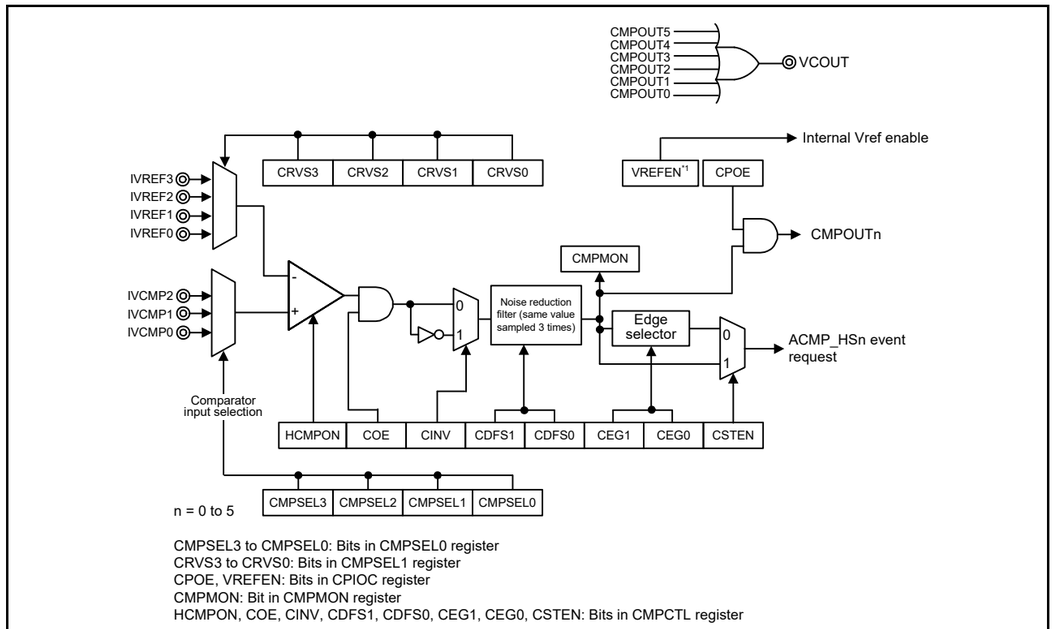
45.1 Overview

The High-Speed Analog Comparator (ACMPHS) compares a test voltage with a reference voltage and provides a digital output based on the result of conversion. Both the test voltage and the reference voltage can be provided to the ACMPHS from internal sources (D/A converter output and internal reference voltage) and an external source (with or without an internal PGA). Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion.

Table 45.1 lists the ACMPHS specifications, Figure 45.1 shows a block diagram, and Table 45.2 shows the input source configuration of the ACMPHS.

Table 45.1 ACMPHS 0 to 5 specifications

Parameter	Specifications
Number of channels	6 channels: ACMPHS 0 to ACMPHS 5
Analog input voltage	• Output from internal PGA • Output from internal D/A converter • Input from internal A/D converter input pin (one selectable).
Reference voltage	• Internal reference voltage (Vref) • Output from internal D/A converter • Input from internal A/D converter input pin (one selectable).
ACMPHS output	• Comparison result • Generation of ELC event output • Monitor output from register.
Interrupt request signal	• Interrupt request generated on valid edge detection from comparison result • Rising edge, falling edge, or both edges can be selected.
Digital filter function	• One of three sampling frequencies can be selected • Not using the filter function can be selected.



Note: VREFEN exists only in ACMPHS0.

Figure 45.1 ACMPHS block diagram

45. 高速模拟比较器(ACMPHS)

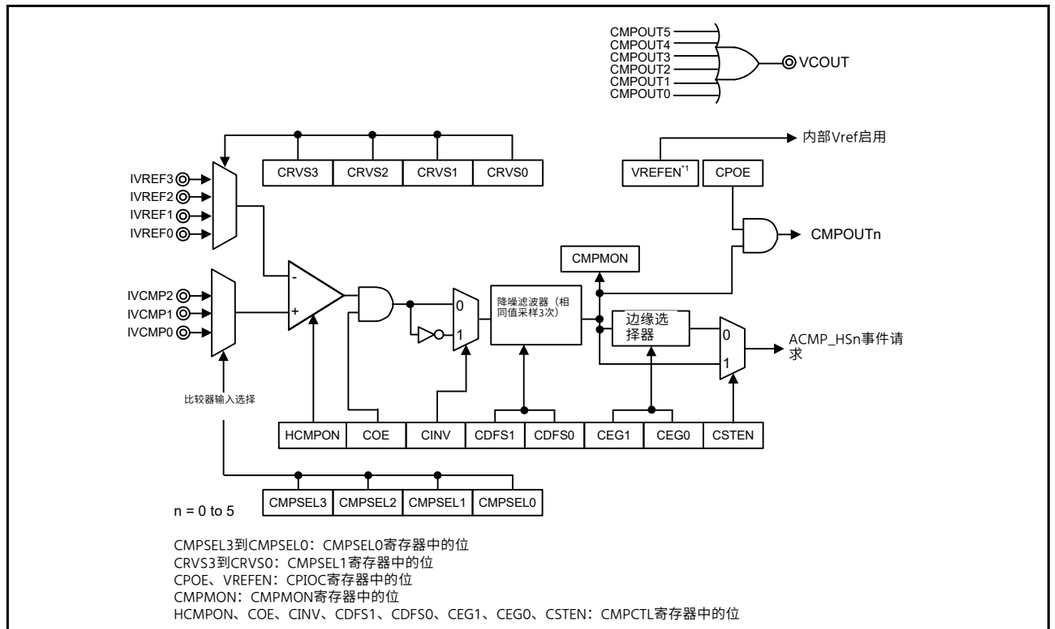
45.1 Overview

高速模拟比较器(ACMPHS)将测试电压与参考电压进行比较，并根据转换结果提供数字输出。测试电压和参考电压都可以从内部源（DA转换器输出和内部参考电压）和外部源（带或不带内部PGA）提供给ACMPHS。这种灵活性在需要在模拟信号之间执行go-no-go比较而不一定需要AD转换的应用中很有用。

表45.1列出了ACMPHS规范，图45.1显示了框图，表45.2显示了ACMPHS的输入源配置。

Table 45.1 ACMPHS0到5规格

Parameter	Specifications
通道数	6 channels: ACMPHS 0 to ACMPHS 5
模拟输入电压	来自内部PGA的输出 来自内部DA转换器的输出 来自内部AD转换器输入引脚的输入（一个可选）。
参考电压	内部参考电压(Vref) 来自内部DA转换器的输出 从内部AD转换器输入引脚输入（一个可选）。
ACMPHS output	比较结果 生成ELC事件输出 监控寄存器的输出。
中断请求信号	从比较结果中检测到有效边沿时产生中断请求 可以选择上升沿、下降沿或两个沿。
数字滤波功能	可以选择三个采样频率之一。 可以选择不使用过滤器功能。



Note: VREFEN仅存在于ACMPHS0中。

Figure 45.1 ACMPHS框图

Table 45.2 Input source configuration of the ACMPHS

Comparator	Reference voltage input source				Analog voltage input source				Optput pin
	IVREF3	IVREF2	IVREF1	IVREF0	IVCMP3	IVCMP2	IVCMP1	IVCMP0	
ACMPHS0	DA0*1	Vref*2	AN116	AN016	PGA0 output*6	AN000*3,*6	DA1*4	AN017	VCOUT*5
ACMPHS1	DA0*1	Vref*2	AN116	AN016	PGA1 output*6	AN001*3,*6	DA1*4	AN017	
ACMPHS2	DA0*1	Vref*2	AN116	AN016	PGA2 output*6	AN002*3,*6	DA1*4	AN017	
ACMPHS3	DA0*1	Vref*2	AN116	AN016	PGA3 output*6	AN100*3,*6	DA1*4	AN017	
ACMPHS4	DA0*1	Vref*2	AN116	AN016	PGA4 output*6	AN101*3,*6	DA1*4	AN017	
ACMPHS5	DA0*1	Vref*2	AN116	AN016	PGA5 output*6	AN102*3,*6	DA1*4	AN017	

Note 1. When D/A converter 0 output is not used, the signal can be used as AN005/AN105 analog input.
Note 2. Internal voltage reference.
Note 3. Because input is through PGA, the corresponding module-stop bit, MSTPCRD.MSTPD16 (unit 0) or MSTPCRD.MSTPD15 (unit 1) should be set to 0.
Note 4. When D/A converter 1 output is not used, the signal can be used as AN006/AN106 analog input.
Note 5. ACMPHS0 to ACMPHS5 compare outputs are bundled with the VCOUT pin.
Note 6. Setting of ADC12 is required. For details, see section 42.6.8, Available functions and register settings of AN000 to AN002, AN007, AN100 to AN102, and AN107.

45.2 Register Descriptions

45.2.1 Comparator Control Register (CMPCTL)

Address(es): ACMPHS0.CMPCTL 4008 5000h,ACMPHS1.CMPCTL 4008 5100h, ACMPHS2.CMPCTL 4008 5200h, ACMPHS3.CMPCTL 4008 5300h, ACMPHS4.CMPCTL 4008 5400h, ACMPHS5.CMPCTL 4008 5500h

	b7	b6	b5	b4	b3	b2	b1	b0
	HCMPON	CDFS[1:0]		CEG1	CEG0	CSTEN	COE	CINV
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CINV	Comparator Output Polarity Selection*2, *3	0: Do not invert comparator output 1: Invert comparator output.	R/W
b1	COE	Comparator Output Enable	0: Disable comparator output (output signal is low level) 1: Enable comparator output.	R/W
b2	CSTEN	Interrupt Select*1	0: Output through the edge selector 1: Output directly.	R/W
b4, b3	CEG1/CEG0	Selection of Valid Edge (Edge Selector)	b4 b3 0 0: Do not detect edge 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges.	R/W
b6, b5	CDFS[1:0]	Noise Filter Selection*1, *2, *3, *4	b6 b5 0 0: Do not use noise filter. 0 1: Use noise filter sampling frequency of PCLKB/2^3 1 0: Use noise filter sampling frequency of PCLKB/2^4 1 1: Use noise filter sampling frequency of PCLKB/2^5.	R/W
b7	HCMPON	Comparator Operation Control*5	0: Stop operation (comparator outputs a low-level signal) 1: Enable operation (enables input to the comparator pins).	R/W

Note 1. Set the CSTEN bit to 1 and the CDFS[1:0] bits to 00b if the ACMPHS interrupt causes the release of Software Standby or Snooze modes. CTSEN is supported only by the ACMPHS0. ACMPHSn.CMPCTL.CTESN (n = 1 to 5) must be set to 0.
Note 2. Disable the ACMPHS output (COE = 0) before changing the CDFS[1:0] and CINV bits.
Note 3. If the CDFS[1:0] and CINV bits are changed, an ACMPHS interrupt request and an ELC event might be generated. Before changing these bits, set the ELSRn register to 0 (the ACMPHS output is not linked). After changing these bits, clear the IR flag in the IELSRn register to 0 to clear the interrupt status.
Note 4. If the CDFS[1:0] bits are changed from 00b (noise filter not used) to a value other than 00b (noise filter used), perform sampling

Table 45.2 ACMPHS的输入源配置

Comparator	参考电压输入源				模拟电压输入源				Optput pin

Note 1. 当不使用DA转换器0输出时，该信号可用作AN005AN105模拟输入。
Note 2. 内部参考电压。
Note 3. 因为通过PGA输入，所以相应的模块停止位MSTPCRD.MSTPD16（单元0）或MSTPCRD.MSTPD15（单元1）应设置为0。
Note 4. 当不使用DA转换器1输出时，该信号可用作AN006AN106模拟输入。
Note 5. ACMPHS0到ACMPHS5比较输出与VCOUT引脚捆绑在一起。
Note 6. 需要设置ADC12。有关详细信息，请参阅第42.6.8节，AN000到AN002的可用功能和寄存器设置，AN007、AN100至AN102和AN107。

45.2 注册说明

45.2.1 比较器控制寄存器(CMPCTL)

Address(es): ACMPHS0.CMPCTL 4008 5000h,ACMPHS1.CMPCTL 4008 5100h, ACMPHS2.CMPCTL 4008 5200h, ACMPHS3.CMPCTL 4008 5300h, ACMPHS4.CMPCTL 4008 5400h, ACMPHS5.CMPCTL 4008 5500h

	b7	b6	b5	b4	b3	b2	b1	b0
	HCMPON	CDFS[1:0]		CEG1	CEG0	CSTEN	COE	CINV
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CINV	比较器输出极性 Selection*2, *3	0：不反转比较器输出1：反转比较器输出。	R/W
b1	COE	比较器输出使能	0：禁止比较器输出（输出信号为低电平）1：使能比较器输出。	R/W
b2	CSTEN	Interrupt Select*1	0：通过边沿选择器输出1：直接输出。	R/W
b4, b3	CEG1/CEG0	有效边的选择（边 Selector)	b4b300：不检测边沿01：检测上升沿10：检测下降沿11：检测两个边沿。	R/W
b6, b5	CDFS[1:0]	噪声滤波器选择*1、*2、*3、*4	b6b500：不使用噪声滤波器。01：使用PCLKB231的噪声滤波器采样频率0：使用PCLKB241的噪声滤波器采样频率1：使用PCLKB25的噪声滤波器采样频率。	R/W
b7	HCMPON	比较器操作控制*5	0：停止操作（比较器输出低电平信号）1：使能操作（使能输入到比较器引脚）。	R/W

Note 1. 如果ACMPHS中断导致软件待机或贪睡模式。只有ACMPHS0支持CTSEN。ACMPHSn.CMPCTL.CTESN（n=1到5）必须设置为0。
Note 2. 在更改CDFS[1:0]和CINV位之前禁用ACMPHS输出(COE=0)。
Note 3. 如果CDFS[1:0]和CINV位发生变化，可能会产生ACMPHS中断请求和ELC事件。在更改这些位之前，将ELSRn寄存器设置为0（ACMPHS输出未链接）。更改这些位后，将IELSRn寄存器中的IR标志清零以清除中断状态。
Note 4. 如果CDFS[1:0]位从00b（未使用噪声滤波器）更改为00b（使用噪声滤波器）以外的值，则执行采样

four times and update the filter output, then use the ACMPHS interrupt request or the ELC event.

Note 5. A stabilization wait time is required to permit ACMPHS operation after enabling it (HCMPON = 1). The operation stabilization wait time for ACMPHS modules 0 to 5 is 300 ns.

The CMPCTL register controls the ACMPHS operation, enables or disables the ACMPHS output, selects the noise filter, selects the valid edge of the interrupt signal, and selects the interrupt. A reset clears this register to 00h.

45.2.2 Comparator Input Select Register (CMPSEL0)

Address(es): ACMPHS0.CMPSEL0 4008 5004h, ACMPHS1.CMPSEL0 4008 5104h, ACMPHS2.CMPSEL0 4008 5204h, ACMPHS3.CMPSEL0 4008 5304h, ACMPHS4.CMPSEL0 4008 5404h, ACMPHS5.CMPSEL0 4008 5504h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CMPSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	CMPSEL[3:0]	Comparator Input Selection*1	b3 b0 0 0 0 0: Do not input 0 0 0 1: Select IVCMP0*2 0 0 1 0: Select IVCMP1*2 0 1 0 0: Select IVCMP2*2 1 0 0 0: Select IVCMP3*2. Other settings are prohibited.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Use the following procedure to change the CMPSEL[3:0] bits. Writing a value other than 0000 0000b while the value of the CMPSEL0 register is not 0000 0000b is invalid. Writing 1 to two or more bits is also invalid. In both cases, the previous value is retained.
To change the CMPSEL[3:0] bits:
1. Set the CMPCTL.COE bit to 0.
2. Set the CMPSEL0 register to 0000 0000b.
3. Set a new value in the CMPSEL[3:0] bits, with 1 set in only one of the bits.
4. Wait for the input switching stabilization wait time (200 ns).
5. Set the CMPCTL.COE bit to 1.
6. Clear the IR flag in the IELSRn register to clear the interrupt status.

Note 2. For details, see Table 45.2.

45.2.3 Comparator Reference Voltage Select Register (CMPSEL1)

Address(es): ACMPHS0.CMPSEL1 4008 5008h, ACMPHS1.CMPSEL1 4008 5108h, ACMPHS2.CMPSEL1 4008 5208h, ACMPHS3.CMPSEL1 4008 5308h, ACMPHS4.CMPSEL1 4008 5408h, ACMPHS5.CMPSEL1 4008 5508h

	b7	b6	b5	b4	b3	b2	b1	b0

b3 to b0	CRVS[3:0]	Reference Voltage Selection*1	b3 b0 0 0 0 0: Do not input 0 0 0 1: Select IVREF0*2 0 0 1 0: Select IVREF1*2 0 1 0 0: Select IVREF2*2 1 0 0 0: Select IVREF3*2. Other settings are prohibited.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Use the following procedure to change the CRVS[3:0] bits. Writing a value other than 0000 0000b while the value of the CMPSEL1 register is not 0000 0000b is invalid. Writing 1 to two or more bits is also invalid. In both cases, the previous value is

四次更新滤波器输出，然后使用ACMPHS中断请求或ELC事件。

Note 5. 在启用ACMPHS后，需要一个稳定等待时间来允许其运行(HCMPON=1)。ACMPHS模块0到5的操作稳定等待时间为300ns。

CMPCTL寄存器控制ACMPHS操作，使能或禁用ACMPHS输出，选择噪声滤波器，选择中断信号的有效边沿，选择中断。复位将该寄存器清除为00h。

45.2.2 比较器输入选择寄存器(CMPSEL0)

Address(es): ACMPHS0.CMPSEL0 4008 5004h, ACMPHS1.CMPSEL0 4008 5104h, ACMPHS2.CMPSEL0 4008 5204h, ACMPHS3.CMPSEL0 4008 5304h, ACMPHS4.CMPSEL0 4008 5404h, ACMPHS5.CMPSEL0 4008 5504h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CMPSEL[3:0]			
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	CMPSEL[3:0]	比较器输入选择*1	b3b00000：不输入0001：选择IVCMP0*20010：选择IVCMP1*20100：选择IVCMP2*21000：选择IVCMP3*2。禁止其他设置。	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 使用以下程序更改CMPSEL[3:0]位。写入00000000b以外的值，而CMPSEL0寄存器不是00000000b无效。将1写入两位或更多位也是无效的。在这两种情况下，都会保留先前的值。要更改CMPSEL[3:0]位：1.将CMPCTL.COE位设置为0。2.将CMPSEL0寄存器设置为00000000b。3.在CMPSEL[3:0]位中设置一个新值，其中一个位设置为1。4.等待输入切换稳定等待时间（200ns）。5.将CMPCTL.COE位设置为1。6.清除IELSRn寄存器中的IR标志以清除中断状态。

Note 2. 详见表45.2。

45.2.3 比较器参考电压选择寄存器(CMPSEL1)

Address(es): ACMPHS0.CMPSEL1 4008 5008h, ACMPHS1.CMPSEL1 4008 5108h, ACMPHS2.CMPSEL1 4008 5208h, ACMPHS3.CMPSEL1 4008 5308h, ACMPHS4.CMPSEL1 4008 5408h, ACMPHS5.CMPSEL1 4008 5508h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CRVS[3:0]			
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	CRVS[3:0]	参考电压选择*1	b3b00000：不输入0001：选择IVREF0*20010：选择IVREF1*20100：选择IVREF2*21000：选择IVREF3*2。禁止其他设置。	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 使用以下过程更改CRVS[3:0]位。写入00000000b以外的值，而CMPSEL1寄存器不是00000000b无效。将1写入两位或更多位也是无效的。在这两种情况下，先前的值都是

retained.
To change the CRVS[3:0] bits:
1. Set the CMPCTL.COE bit to 0.
2. Set the CMPSEL1 register to 0000 0000b.
3. Set a new value to the CRVS[3:0] bits, with 1 set in only one of the bits.
4. Wait for the input switching stabilization wait time (200 ns)
5. Set the CMPCTL.COE bit to 1.
6. Clear the IR flag in the IELSRn register to clear the interrupt status.

Note 2. For details, see Table 45.2.

45.2.4 Comparator Output Monitor Register (CMPMON)

Address(es): ACMPHS0.CMPMON 4008 500Ch, ACMPHS1.CMPMON 4008 510Ch, ACMPHS2.CMPMON 4008 520Ch, ACMPHS3.CMPMON 4008 530Ch, ACMPHS4.CMPMON 4008 540Ch, ACMPHS5.CMPMON 4008 550Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPMON
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CMPMON	Comparator Output Monitor*1	0: Comparator output is low 1: Comparator output is high.	R
b7 to b1	—	Reserved	These bits are read as 0.	R

Note 1. When ACMPHS operation is enabled (HCMPON = COE = 1) but the noise filter is not in use (CDFS[1:0] = 00b), design the software application so that the CMPMON bit is read twice and the values are only used after the two consecutive values match.

45.2.5 Comparator Output Control Register (CPIOC)

Address(es): ACMPHS0.CPIOC 4008 5010h, ACMPHS1.CPIOC 4008 5110h, ACMPHS2.CPIOC 4008 5210h, ACMPHS3.CPIOC 4008 5310h, ACMPHS4.CPIOC 4008 5410h, ACMPHS5.CPIOC 4008 5510h

	b7	b6	b5	b4	b3	b2	b1	b0
	VREFEN	—	—	—	—	—	—	CPOE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CPOE	Comparator Output Selection	0: Disable VCOUT pin output of the comparator (output signal is low) 1: Enable VCOUT pin output of the comparator.	R/W
b6 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	VREFEN	Internal Vref Enable*1	0: Disable internal Vref 1: Enable internal Vref.	R/W

Note 1. For ACMPHS modules 0 to 5, VREFEN exists only in ACMPHS0.CPIOC. When using the internal Vref in COMP0 to COMP5, set the VREFEN bit in ACMPHS0.CPIOC to 1. Bit [7] in ACMPHS1.CPIOC to ACMPHS5.CPIOC registers should be 0 regardless of whether or not the internal Vref is used.

45.3 Operation

The ACMPHS compares a reference voltage to an analog input voltage. Operation is not guaranteed when the values of registers are changed during ACMPHS operation. Table 45.3 shows the procedure for setting the registers associated with ACMPHS.

保留。要更改CRVS[3:0]位：1.将CMPCTL.COE位设置为0。2.将CMPSEL1寄存器设置为00000000b。3.为CRVS[3:0]位设置一个新值，其中一个位设置为1。4.等待输入切换稳定等待时间（200ns）5.将CMPCTL.COE位设置为1。6.清除IELSRn寄存器中的IR标志以清除中断状态。

Note 2. 详见表45.2。

45.2.4 比较器输出监控寄存器(CMPMON)

Address(es): ACMPHS0.CMPMON 4008 500Ch, ACMPHS1.CMPMON 4008 510Ch, ACMPHS2.CMPMON 4008 520Ch, ACMPHS3.CMPMON 4008 530Ch, ACMPHS4.CMPMON 4008 540Ch, ACMPHS5.CMPMON 4008 550Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPMON
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CMPMON	比较器输出监视器*1	0：比较器输出低1：比较器输出高。	R
b7 to b1	—	Reserved	这些位读为0。	R

Note 1. 当启用ACMPHS操作(HCMPON=COE=1)但未使用噪声滤波器(CDFS[1:0]=00b)时，设计软件应用程序，以便读取CMPMON位两次并且仅在之后使用这些值两个连续的值匹配。

45.2.5 比较器输出控制寄存器(CPIOC)

Address(es): ACMPHS0.CPIOC 4008 5010h, ACMPHS1.CPIOC 4008 5110h, ACMPHS2.CPIOC 4008 5210h, ACMPHS3.CPIOC 4008 5310h, ACMPHS4.CPIOC 4008 5410h, ACMPHS5.CPIOC 4008 5510h

	b7	b6	b5	b4	b3	b2	b1	b0
	VREFEN	—	—	—	—	—	—	CPOE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CPOE	比较器输出选择	0：禁止比较器的VCOUT引脚输出（输出信号为低电平）1：使能比较器的VCOUT引脚输出。	R/W
b6 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	VREFEN	Internal Vref Enable*1	0：禁用内部Vref1：启用内部Vref。	R/W

Note 1. 对于ACMPHS模块0到5，VREFEN仅存在于ACMPHS0.CPIOC中。当使用COMP0至COMP5的内部Vref时，将ACMPHS0.CPIOC中的VREFEN位设置为1。无论是否使用内部Vref，ACMPHS1.CPIOC至ACMPHS5.CPIOC寄存器中的位[7]都应为0。

45.3 Operation

ACMPHS将参考电压与模拟输入电压进行比较。如果在ACMPHS操作期间更改寄存器的值，则无法保证操作。表45.3显示了设置与ACMPHS相关的寄存器的过程。

Table 45.3 Procedure for setting registers associated with ACMPHSn (n = 0 to 5)

Step	Register	Bit	Setting
1	Associated MSTPCRD register	MSTPD28 to MSTPD23	0: Input clock supply.
2	Associated Pin Function Control Register (PFS)	ASEL	1: Select the function of pins IVREF and IVCMP.
3	ACMPHS0.CPIOC	VREFEN	1: When using the internal Vref.
4	Associated D/A converter		When using the D/A converter, select in the register
5	CMPSEL0, CMPSEL1	CMPSEL0 to CMPSEL3, CRVS0 to CRVS3	Select the ACMPHSn input, with 1 set in only one of the bits
6	CMPCTL	CDFS[1:0], CEG1, CEG0, and CINV	Set up ACMPHSn control
		HCMPON	1: Enable ACMPHSn operation.
7	Waiting for the ACMPHS stabilization time (minimum 300 ns).		
8	CMPCTL	COE	1: Enable ACMPHSn output.
9	CPIOC	CPOE	Set the VCOUT output
	Associated Port mn Pin Function Select register (PmnPFS)	PSEL, PMR	Select the VCOUT port function
10	IELSRn	IR, IELS[8:0]	When using an interrupt, select the interrupt status flag and the ICU event link*1
11	ELSRn	ELS[8:0]	When using an ELC, select the event link*2
12	Operation started		
13	CMPCTL	COE	0: When changing IVREF or IVCMP, to disable ACMPHSn output.
14	CMPSEL1	CRVS0 to CRVS3	Change the CMPSEL1 bits as follows: 1. Set bits CMPSEL1 to 0000 0000b. 2. Set a new value to the CMPSEL1 bits, with 1 set in only one of the bits.
	CMPSEL0	CMPSEL0 to CMPSEL3	Change the CMPSEL0 bits as follows: 1. Set bits CMPSEL0 to 0000 0000b. 2. Set a new value to the CMPSEL0 bits, with 1 set in only one of the bits.
15	Waiting for the ACMPHS switching stabilization time (minimum 200 ns)		
16	CMPCTL	COE	1: Enable ACMPHSn output.
17	Operation restarted		

Note 1. After ACMPHSn is set, an unnecessary interrupt might occur until operation becomes stable, so initialize the interrupt flag.
Note 2. After ACMPHSn is set, an unnecessary interrupt might occur until operation becomes stable, so initialize the event link select.

Figure 45.2 shows an example of ACMPHS operation. The VCOUT output becomes 1 when the analog input voltage is higher than the ACMPHS reference input voltage, and the VCOUT output becomes 0 when the analog input voltage is lower than the reference voltage. When the ACMPHS output changes, an interrupt request and an ELC event are output.

Table 45.3 设置与ACMPHSn相关的寄存器的过程（n=0到5）

Step	Register	Bit	Setting
1	相关的MSTPCRD寄存器	MSTPD28 to MSTPD23	0：输入时钟电源。
2	相关引脚功能控制 Register (PFS)	ASEL	1：选择引脚IVREF和IVCMP的功能。
3	ACMPHS0.CPIOC	VREFEN	1：使用内部Vref时。
4	相关数模转换器		使用DA转换器时，在寄存器中选择
5	CMPSEL0, CMPSEL1	CMPSEL0 to CMPSEL3, CRVS0 to CRVS3	选择ACMPHSn输入，仅其中一位设置为1
6	CMPCTL	CDFS[1:0], CEG1, CEG0, and CINV	设置ACMPHSn控制
		HCMPON	1：使能ACMPHSn操作。
7	等待ACMPHS稳定时间（最少300ns）。		
8	CMPCTL	COE	1：使能ACMPHSn输出。
9	CPIOC	CPOE	设置VCOUT输出
	关联端口mn引脚功能 选择寄存器(PmnPFS)	PSEL, PMR	选择VCOUT端口功能
10	IELSRn	IR, IELS[8:0]	使用中断时，选择中断状态标志和ICU事件链接*1
11	ELSRn	ELS[8:0]	使用ELC时，请选择活动链接*2
12	操作开始		
13	CMPCTL	COE	0：改变IVREF或IVCMP时，禁用ACMPHSn输出。
14	CMPSEL1	CRVS0 to CRVS3	如下更改CMPSEL1位：1.将CMPSEL1位设置为00000000b。2.为CMPSEL1位设置一个新值，其中一个位设置为1。
	CMPSEL0	CMPSEL0 to CMPSEL3	如下更改CMPSEL0位：1.将CMPSEL0位设置为00000000b。2.为CMPSEL0位设置一个新值，其中一个位设置为1。
15	等待ACMPHS开关稳定时间（最少200ns）		
16	CMPCTL	COE	1：使能ACMPHSn输出。
17	操作重新开始		

Note 1. 设置ACMPHSn后，可能会发生不必要的中断，直到运行稳定为止，因此请初始化中断标志。
Note 2. 设置ACMPHSn后，在操作稳定之前可能会发生不必要的中断，因此初始化事件链接选择。

图45.2显示了ACMPHS操作的示例。当模拟输入电压高于ACMPHS参考输入电压时，VCOUT输出变为1，当模拟输入电压低于参考电压时，VCOUT输出变为0。当ACMPHS输出改变时，会输出一个中断请求和一个ELC事件。

RA生态工作室

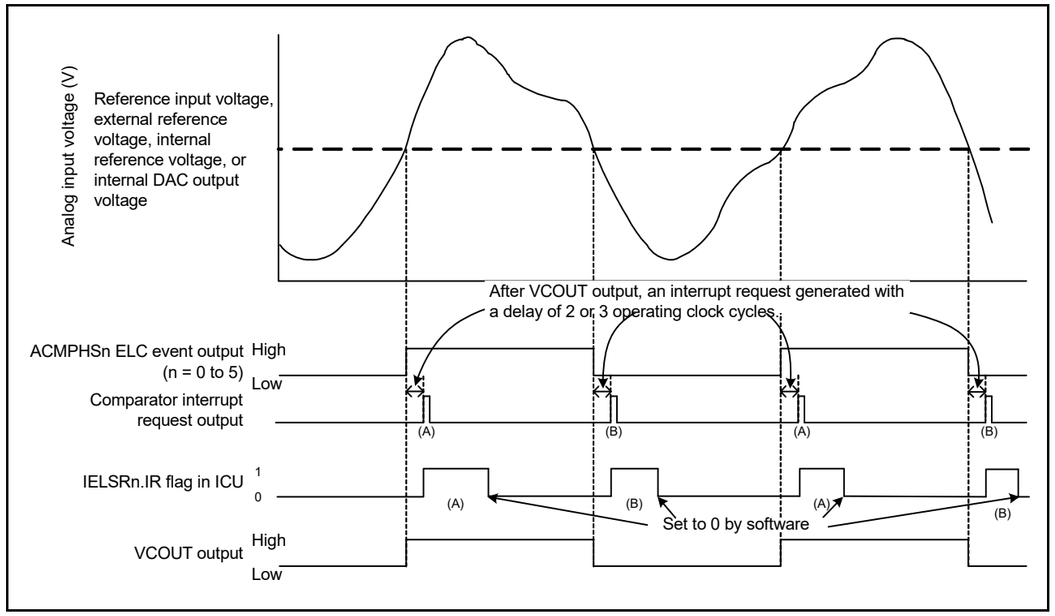

Figure 45.2 ACMPHS operation example

Figure 45.2 applies when CPOE = 1 (pin output enabled), CDFS[1:0] = 00b (filter not used), and CEG1 = CEG0 = 1 (both-edge detection selected). When CINV = 0, CEG0 = 1, and CEG1 = 0 (rising-edge detection selected for non-inversion output signal from the ACMPHS), the IELSR.IR flag changes as shown by (A) only. When CINV = 0, CEG0 = 0, and CEG1 = 1 (falling-edge detection selected for non-inversion output signal from the ACMPHS), the IR flag changes as shown by (B) only. When CPOE = 1, VCOUT directly outputs the ELC event output.

45.4 Noise Filter

The ACMPHS contains a noise filter. The sampling clock can be selected in the CMPCTL.CDFS[1:0] bits. The ACMPHS signal is sampled every sampling clock, and if the same value is sampled three times, the noise filter output at the next sampling clock cycle is used as the ACMPHS output.

Figure 45.3 shows the configuration of the noise filter and edge detector, and Figure 45.4 shows an example of the noise filter and interrupt operation.

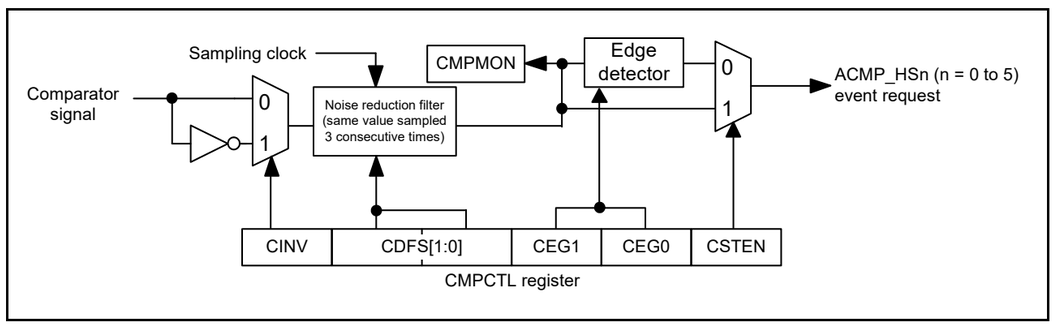

Figure 45.3 Noise filter and edge detection configuration

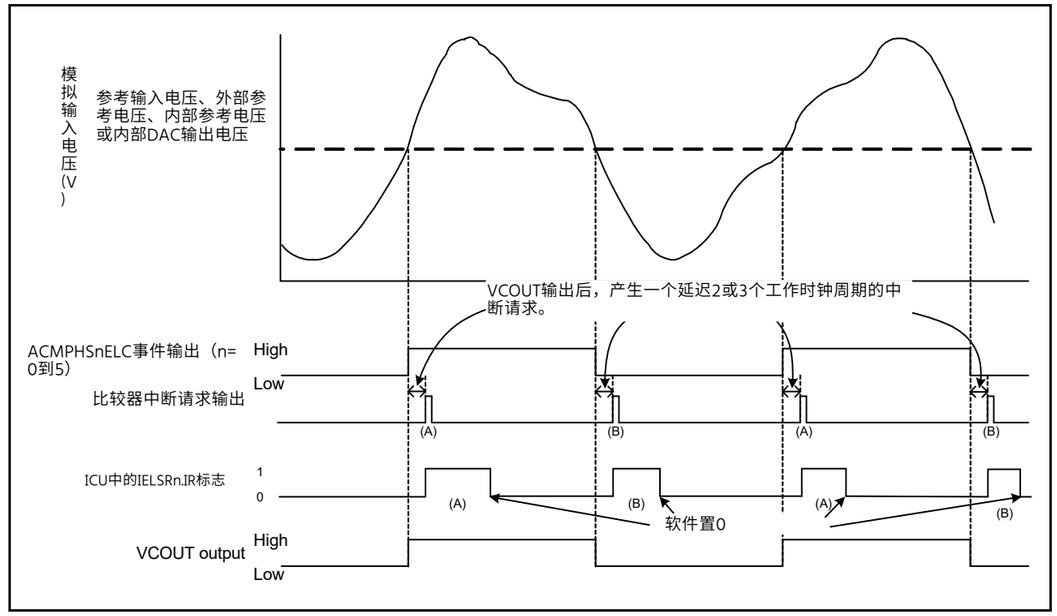

Figure 45.2 ACMPHS操作示例

图45.2适用于CPOE=1（使能引脚输出）、CDFS[1:0]=00b（未使用滤波器）和CEG1=CEG0=1（选择双沿检测）时。当CINV=0、CEG0=1和CEG1=0（为来自ACMPHS的同相输出信号选择上升沿检测）时，IELSR.IR标志仅如(A)所示变化。当CINV=0、CEG0=0和CEG1=1（为来自ACMPHS的非反相输出信号选择下降沿检测）时，IR标志仅如(B)所示变化。当CPOE=1时，VCOUT直接输出ELC事件输出。

45.4 噪声过滤器

ACMPHS包含一个噪声滤波器。可以在CMPCTL.CDFS[1:0]位中选择采样时钟。这
每个采样时钟对ACMPHS信号进行采样，如果采样3次相同的值，则将下一个采样时钟周期的噪声滤波器输出作为ACMPHS输出。

图45.3显示了噪声滤波器和边缘检测器的配置，图45.4显示了噪声滤波器和中断操作的示例。

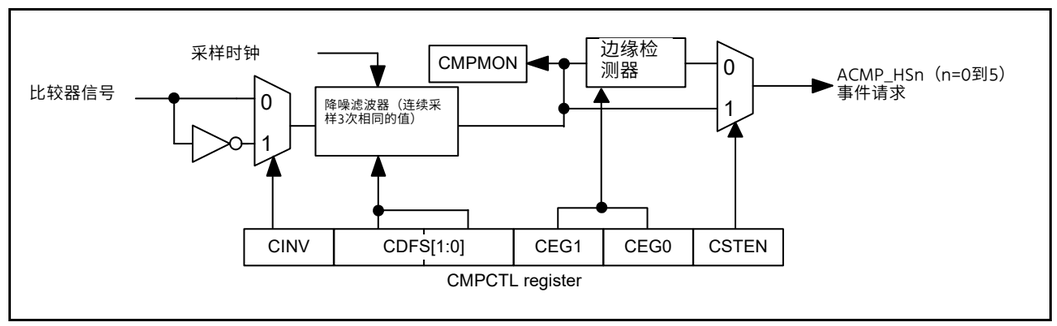

Figure 45.3 噪声过滤器和边缘检测配置

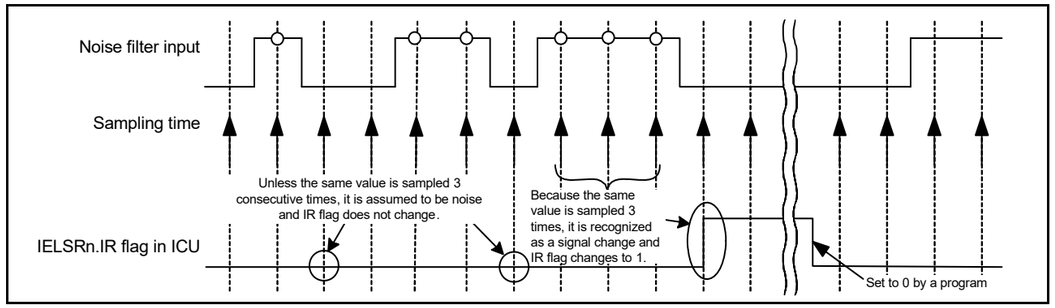

Figure 45.4 Noise filter and interrupt operation example

The operation example in Figure 45.4 applies when the CMPCTL.CDFS[1:0] bits are 01b, 10b, or 11b (noise filter used).

45.5 ACMPHS Interrupts

The ACMPHS generates six interrupt requests from sources ACMPHS0 to ACMPHS5. To use an ACMPHS interrupt, select it in the IELSR register in the Interrupt Controller Unit (ICU). Select the interrupt request in the CMPCTL.CSTEN bit, either through the edge selector, or not.

When using the ACMPHS interrupt through the edge selector, set at least one of the CMPCTL.CEG0 and CMPCTL.CEG1 bits to 1 (a value other than 00b for no edge selection). In most cases, set the CMPCTL.CSTEN bit to 0 (output through the edge selector). Set this bit to 1 only to release Software Standby mode or Snooze mode.

To use the ACMPHS interrupt in Software Standby mode or Snooze mode, set the CMPCTL.CSTEN bit to 1 (direct output), set the CMPCTL.CDFS[1:0] bits to 00b (digital noise filter not used), and set CMPCTL.CINV as follows:

- When detecting compare result 1 to 0, set CMPCTL.CINV to 0 (comparator output not inverted)
- When detecting compare result 0 to 1, set CMPCTL.CINV to 1 (comparator output inverted).

An ACMPHS0 interrupt request can be used to release Software Standby mode or Snooze mode. ACMPHS1 to ACMPHS5 cannot be used. For details on the register settings related to ACMPHS interrupt requests, see section 45.2.1, Comparator Control Register (CMPCTL).

45.6 ACMPHS Output to the Event Link Controller (ELC)

The ELC uses the ACMPHS interrupt request signal as an ELC event signal, enabling link operation for the preset module. To use the ACMPHS ELC event, select it in the ELSRn register in the ELC. When using the ELC event request, set the CMPCTL.CSTEN bit to 0 (output through the edge selector). Also, set at least one of the CMPCTL.CEG0 and CMPCTL.CEG1 bits to 1 (a value other than 00b for no edge selection).

45.7 ACMPHS Pin Output

The comparison result from the ACMPHS can be output to external pins. Use the CMPCTL.CINV and CPIOC.CPOE bits to set the output polarity (non-inverted or inverted output) and enable or disable output. To output the ACMPHS comparison result to the VCOUT output pin, set the associated Port mn Pin Function Select register (PmnPFS) in the I/O register.

45.8 Usage Notes

45.8.1 Settings for the Module-Stop Function

The Module Stop Control Register can enable or disable ACMPHS operation. The ACMPHS is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

45.8.2 Relationship with the ADC12

Restrictions apply on the simultaneous use of the ACMPHS analog input and ADC12 analog input. For details, see section 42, Relationship between ADC12 Units 0 and 1 and the ACMPHS.

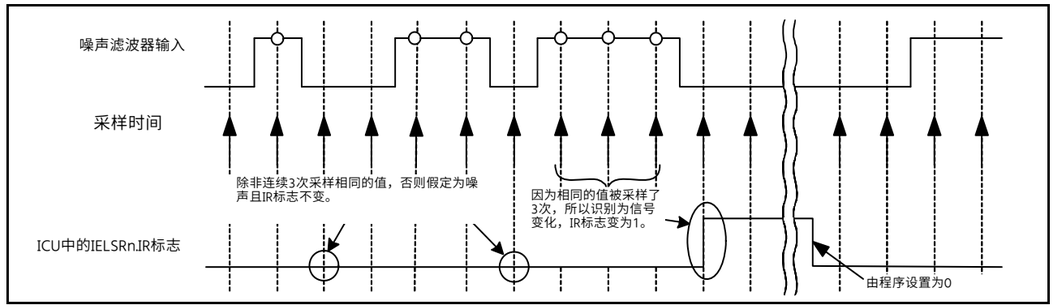

Figure 45.4 噪声滤波器和中断操作示例

图45.4中的操作示例适用于CMPCTL.CDFS[1:0]位为01b、10b或11b（使用噪声滤波器）时。

45.5 ACMPHS Interrupts

ACMPHS从源ACMPHS0到ACMPHS5产生六个中断请求。要使用ACMPHS中断，请在中断控制器单元(ICU)的IELSR寄存器中选择它。通过边沿选择器选择CMPCTL.CSTEN位中的中断请求，或者不选择。

通过边沿选择器使用ACMPHS中断时，至少设置CMPCTL.CEG0和CMPCTL.CEG1位为1（00b以外的值，用于无边沿选择）。在大多数情况下，将CMPCTL.CSTEN位设置为0（通过边沿选择器输出）。将此位设置为1仅用于释放软件待机模式或贪睡模式。

要在软件待机模式或贪睡模式下使用ACMPHS中断，请将CMPCTL.CSTEN位设置为1（直接输出），将CMPCTL.CDFS[1:0]位设置为00b（未使用数字噪声滤波器），并将CMPCTL设置为.CINV如下：

- 检测比较结果1到0时，将CMPCTL.CINV设置为0（比较器输出不反转）
- 当检测到比较结果0到1时，将CMPCTL.CINV设置为1（比较器输出反转）。

ACMPHS0中断请求可用于释放软件待机模式或贪睡模式。ACMPHS1至不能使用ACMPHS5。有关与ACMPHS中断请求相关的寄存器设置的详细信息，请参见第45.2.1节，比较器控制寄存器(CMPCTL)。

45.6 ACMPHS输出到事件链接控制器(ELC)

ELC使用ACMPHS中断请求信号作为ELC事件信号，为预设模块启用链接操作。要使用ACMPHSELC事件，请在ELC的ELSRn寄存器中选择它。使用ELC事件请求时，将CMPCTL.CSTEN位设置为0（通过边沿选择器输出）。此外，将CMPCTL.CEG0和CMPCTL.CEG1位中的至少一个设置为1（不选择边沿时为00b以外的值）。

45.7 ACMPHS引脚输出

ACMPHS的比较结果可以输出到外部引脚。使用CMPCTL.CINV和CPIOC.CPOE位设置输出极性（非反相或反相输出）并启用或禁用输出。要将ACMPHS比较结果输出到VCOUT输出引脚，请在IO寄存器中设置相关的端口mn引脚功能选择寄存器(PmnPFS)。

45.8 使用说明

45.8.1 模块停止功能的设置

模块停止控制寄存器可以启用或禁用ACMPHS操作。ACMPHS在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

45.8.2 与ADC12的关系

同时使用ACMPHS模拟输入和ADC12模拟输入有限制。有关详细信息，请参阅第42节，ADC12单元0和1与ACMPHS之间的关系。

46. Capacitive Touch Sensing Unit (CTSU)

46.1 Overview

The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software that enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical insulator so that a finger does not come into direct contact with the electrode.

As Figure 46.1 shows, electrostatic capacitance (parasitic capacitance) exists between the electrode and the surrounding insulators. Because the human body is an electrical conductor, when a finger is placed close to the electrode, the value of electrostatic capacitance increases.

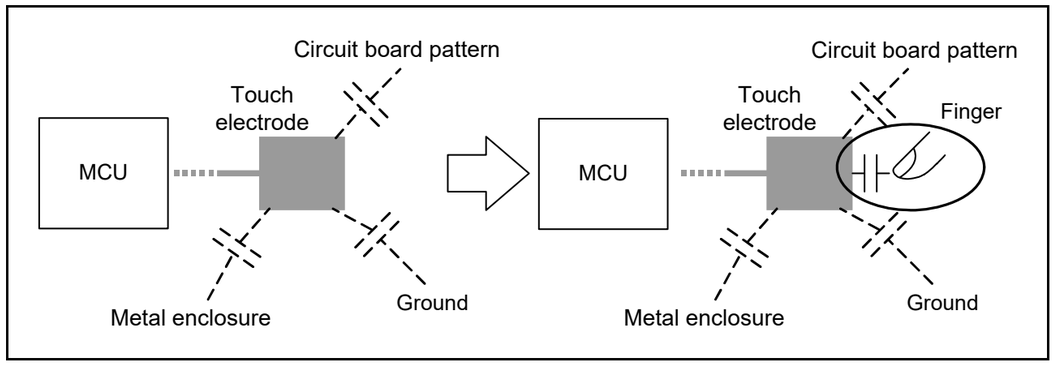

Figure 46.1 Increased electrostatic capacitance because of the presence of a finger

Electrostatic capacitance is detected by the self-capacitance and mutual-capacitance methods. In the self-capacitance method, the CTSU detects electrostatic capacitance generated between a finger and a single electrode. In the mutual-capacitance method, two electrodes are used, one as a transmit electrode and the other as a receive electrode, and the CTSU detects the change in the electrostatic capacitance generated between the two when a finger is placed close to them.

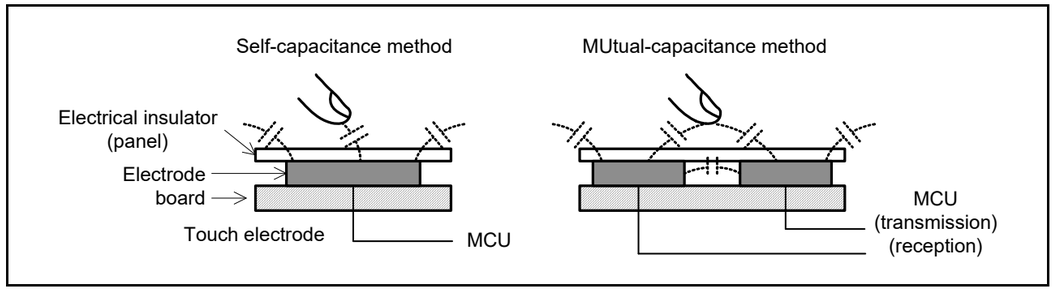

Figure 46.2 Self-capacitance and mutual-capacitance methods

Electrostatic capacitance is measured by counting a clock signal whose frequency changes according to the amount of charged or discharged current, for a specified period. For details on the measurement principles of the CTSU, see section 46.3.1, Principles of Measurement Operation.

Table 46.1 lists the CTSU specifications and Figure 46.3 shows a block diagram.

Table 46.1 CTSU specifications (1 of 2)

Parameter	Description
Operating clock	PCLKB, PCLKB/2, or PCLKB/4

46. 电容式触控感应单元(CTSU)

46.1 Overview

电容式触摸传感单元(CTSU)测量触摸传感器的静电电容。静电电容的变化由软件确定，该软件使CTSU能够检测手指是否与触摸传感器接触。触摸传感器的电极表面通常被电绝缘体包围，因此手指不会直接接触电极。

如图46.1所示，静电电容（寄生电容）存在于电极和周围绝缘体之间。因为人体是电导体，当手指靠近电极时，静电电容值会增加。

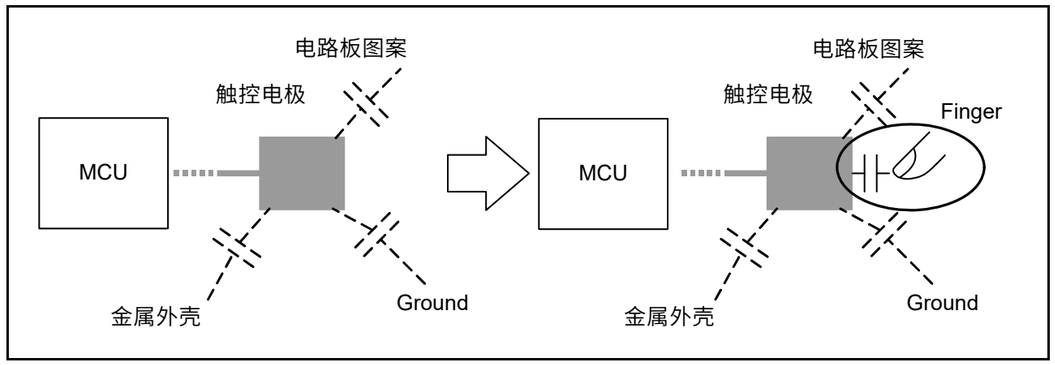

Figure 46.1 由于手指的存在而增加了静电电容

静电电容的检测方法有自电容法和互电容法。在自电容法中，CTSU检测手指和单个电极之间产生的静电电容。在互电容法中，使用两个电极，一个作为发射电极，另一个作为接收电极，当手指靠近它们时，CTSU会检测两者之间产生的静电电容的变化。

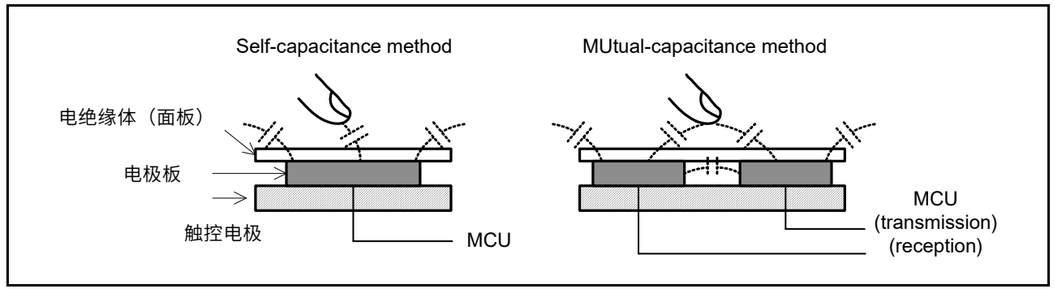

Figure 46.2 自电容和互电容方法

静电电容是通过对时钟信号进行计数来测量的，该时钟信号的频率根据充电或放电电流的大小而变化，在指定的时间段内。有关CTSU测量原理的详细信息，请参见第46.3.1节“测量操作原理”。

表46.1列出了CTSU规格，图46.3显示了框图。

Table 46.1 CTSU规格(1of2)

Parameter	Description
工作时钟	PCLKB, PCLKB/2, or PCLKB/4

Table 46.1 CTSU specifications (2 of 2)

Parameter		Description
Pins	Electrostatic capacitance measurement	12 channels (TS01 to TS12)
	TSCAP	Low Pass Filter (LPF) connection pin
Measurement modes	Self-capacitance single scan mode	Electrostatic capacitance is measured on one channel using the self-capacitance method
	Self-capacitance multi-scan mode	Electrostatic capacitance is measured successively on multiple channels using the self-capacitance method
	Mutual-capacitance full scan mode	Electrostatic capacitance is measured successively on multiple channels using the mutual-capacitance method
Noise prevention		Synchronous noise prevention, high-pass noise prevention
Measurement start conditions		• Software trigger • External trigger (ELC_CTSU from the Event Link Controller (ELC))

As Figure 46.3 shows, the CTSU consists of the following components:

- Status control block
- Trigger control block
- Clock control block
- Channel control block
- Port control block
- Sensor drive pulse generator
- Measurement block
- Interrupt block
- I/O registers.

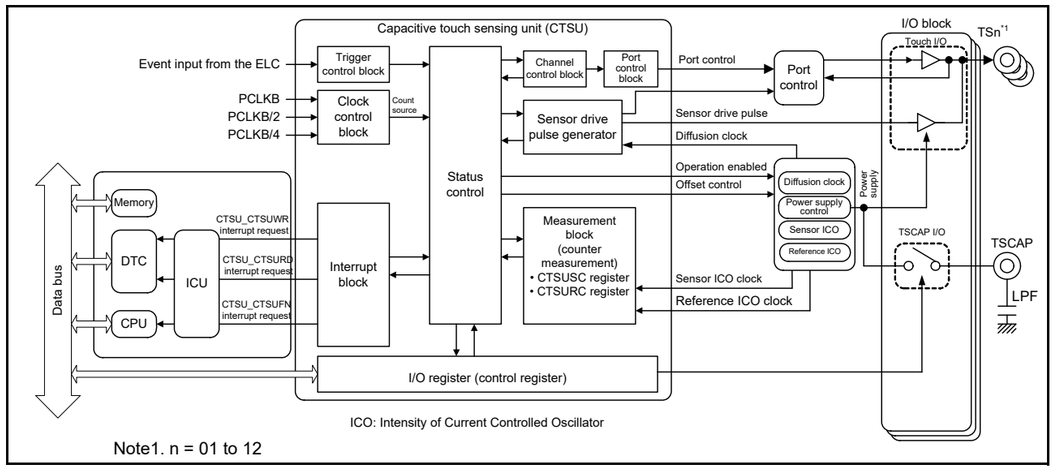

Figure 46.3 CTSU block diagram

	TSCAP	低通滤波器(LPF)连接引脚
测量模式	自电容单次扫描模式	使用自电容法在一个通道上测量静电电容
	Self-capacitance multi-scan mode	使用自电容法在多个通道上连续测量静电电容
	互电容全扫描模式	使用互电容法在多个通道上连续测量静电电容
噪音预防		同步防噪、防高通防噪
测量开始条件		软件触发 外部触发（来自事件链接控制器(ELC)的ELC_CTSU）

如图46.3所示，CTSU由以下组件组成：

- 状态控制块
- 触发控制块
- 时钟控制块
- 通道控制块
- 端口控制块
- 传感器驱动脉冲发生器
- 测量块
- 中断块
- I/O registers.

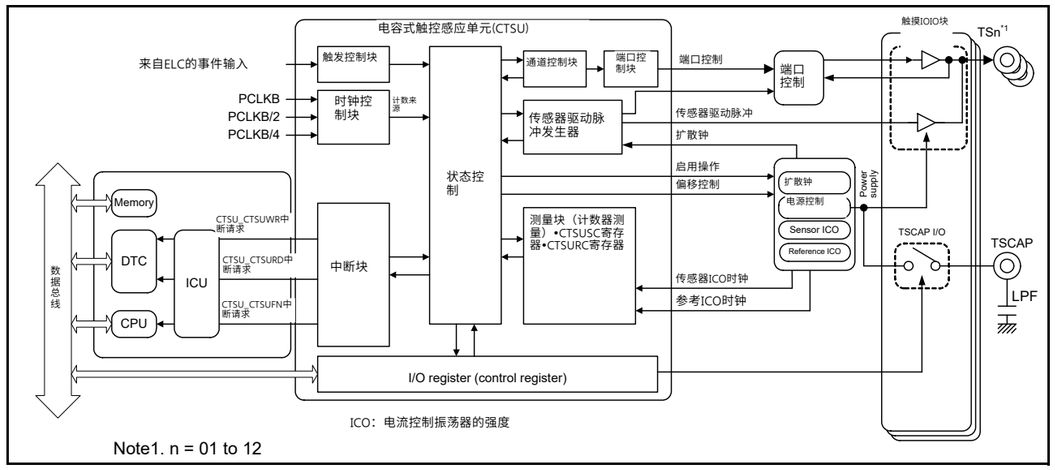

Figure 46.3 CTSU框图

Table 46.2 CTSU I/O pins

引脚名称	I/O	Function
TS01 to TS12	Input	静电电容测量引脚（触摸引脚）
TSCAP	-	LPF连接引脚

46.2 Register Descriptions

46.2.1 CTSU Control Register 0 (CTSUCR0)

Address(es): CTSU.CTSUCR0 4008 1000h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUTXVSEL	—	—	CTSUINIT	—	CTSUSNZ	CTSUCAP	CTSUSTRT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CTSUSTRT	CTSU Measurement Operation Start	0: Stop measurement operation*1 1: Start measurement operation.	R/W
b1	CTSUCAP	CTSU Measurement Operation Start Trigger Select	0: Software trigger 1: External trigger.	R/W
b2	CTSUSNZ	CTSU Wait State Power-Saving Enable	0: Disable power-saving function during wait state 1: Enable power-saving function during wait state.	R/W
b3	—	Reserved	This bit read as 0. The write value should be 0.	R/W
b4	CTSUINIT	CTSU Control Block Initialization	Writing 1 to this bit initializes the CTSU control block and the CTSUSC, CTSURC, CTSUMCH0, CTSUMCH1, and CTSUST registers. This bit is read as 0.	W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	CTSUTXVSEL	CTSU Transmission Power Supply Select	0: VCC selected 1: Internal logic power supply selected.	R/W

Note 1. When the CTSU is not used, set this bit to 0.

Only set the CTSUCAP and CTSUSNZ bits when the CTSUSTRT bit is 0. These bits can be set at the same time that the measurement operation starts.

CTSUSTRT bit (CTSU Measurement Operation Start)

The CTSUSTRT bit specifies whether the CTSU operation starts or stops.

When the CTSUCAP bit is 0, measurement starts when software writes 1 to the CTSUSTRT bit (software trigger) and stops when the hardware clears the CTSUSTRT bit to 0. When the CTSUCAP bit is 1, the CTSU waits for an external trigger by writing 1 to the CTSUSTRT bit, and measurement starts on the rising edge of the external trigger. When measurement is stopped, the CTSU waits for the next external trigger, and operation continues.

Table 46.3 lists the CTSU states.

Table 46.3 CTSU states

CTSUSTRT bit	CTSUCAP bit	CTSU state
0	0	Stopped
0	1	Stopped
1	0	Measurement in progress
1	1	Measurement in progress and waiting for an external trigger*1

Note 1. The state can be read from the CTSUST.CTSUSTC[2:0] flags as follows:
- During measurement: CTSUST.CTSUSTC[2:0] flags ≠ 000b
- While waiting for an external trigger: CTSUST.CTSUSTC[2:0] flags are 000b.

If software sets the CTSUSTRT bit to 1 when the bit is already 1, the write is ignored and operation continues. To force operation to stop through software when the CTSUSTRT bit is 1, set the CTSUSTRT bit to 0 and the CTSUINIT bit to 1 at the same time.

46.2 注册说明

46.2.1 CTSU控制寄存器0(CTSUCR0)

Address(es): CTSU.CTSUCR0 4008 1000h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUTXVSEL	—	—	CTSUINIT	—	CTSUSNZ	CTSUCAP	CTSUSTRT
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CTSUSTRT	CTSU测量操作 Start	0：停止测量操作*11：开始测量操作。	R/W
b1	CTSUCAP	CTSU测量操作 开始触发选择	0：软件触发1： 外部触发。	R/W
b2	CTSUSNZ	CTSU等待状态省电 Enable	0：等待状态下禁用省电功能1：等待状态下启用省电功能。	R/W
b3	—	Reserved	该位读为0。写入值应为0。	R/W
b4	CTSUINIT	CTSU控制块 Initialization	向该位写入1初始化CTSU控制块和CTSUSC, CTSURC, CTSUMCH0, CTSUMCH1, and CTSUST注册。该位读为0。	W
b6, b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	CTSUTXVSEL	CTSU传输功率 供应选择	0：选择VCC1：选择内部逻辑电源。	R/W

Note 1. 不使用CTSU时，将该位设为0。

仅当CTSUSTRT位为0时设置CTSUCAP和CTSUSNZ位。这些位可以在测量操作开始的同时设置。

CTSUSTRT位（CTSU测量操作开始）

CTSUSTRT位指定CTSU操作是开始还是停止。

当CTSUCAP位为0时，软件将1写入CTSUSTRT位（软件触发）时开始测量，并在硬件将CTSUSTRT位清为0时停止测量。当CTSUCAP位为1时，CTSU通过写入1等待外部触发到CTSUSTRT位，并在外部触发的上升沿开始测量。当测量停止时，CTSU等待下一个外部触发，然后继续操作。

表46.3列出了CTSU状态。

Table 46.3 CTSU states

CTSUSTRT bit	CTSUCAP bit	CTSU state
0	0	Stopped
0	1	Stopped
1	0	测量中
1	1	正在进行测量并等待外部触发*1

注1.可以从CTSUST.CTSUSTC[2:0]标志读取状态，如下所示：
- 测量期间：CTSUST.CTSUSTC[2:0]flags≠000b
- 等待外部触发时：CTSUST.CTSUSTC[2:0]标志为000b。

如果在CTSUSTRT位已经为1时软件将该位设置为1，则忽略写入并继续操作。要在CTSUSTRT位为1时通过软件强制停止操作，请同时将CTSUSTRT位设置为0并将CTSUINIT位设置为1。

CTSUCAP bit (CTSU Measurement Operation Start Trigger Select)

The CTSUCAP bit specifies the measurement start condition. For details, see CTSUSTRT bit (CTSU Measurement Operation Start).

CTSUSNZ bit (CTSU Wait State Power-Saving Enable)

The CTSUSNZ bit enables or disables the power-saving operation during a wait state. It can also suspend the CTSU power supply, which decreases power consumption during the wait state. In the suspended state, the CTSU power supply is turned off while the external TSCAP is still charged.

Table 46.4 shows the CTSU power supply state control.

Table 46.4 CTSU power supply state control

CTSUCR1.CTSUPON bit	CTSUSNZ bit	CTSUCAP bit	CTSUSTRT bit	CTSU power supply state
0	0	0	0	Stopped
1	0	-	-	Operating
1	1	0	0	Suspended

Note: Settings other than those listed in the table are prohibited.

To start measurement from the suspended state, set the CTSUSNZ bit to 0, then set the CTSUSTRT bit to 1. To suspend the module after measurement stops, set the CTSUSNZ bit to 1.

CTSUINIT bit (CTSU Control Block Initialization)

Write 1 to the CTSUINIT bit to initialize the internal control registers. To force the current operation to stop, set the CTSUSTRT bit to 0 and the CTSUINIT bit to 1 at the same time. This stops the operation and initializes the internal control registers.

Do not write 1 to the CTSUINIT bit when the CTSUSTRT bit is 1.

CTSUTXVSEL bit (CTSU Transmission Power Supply Select)

The CTSUTXVSEL bit is used to switch the power supply for the transmit buffer in mutual-capacitance full scan mode. Set this bit to 0 for any other mode or when the VCC voltage is lower than 2.7 V. This bit switches the power supply for touch I/O, which is set for transmission by the CTSUCHTRCn registers. Table 46.5 lists the power supply for the TSm pin. When the VCC voltage fluctuates greatly due to switching of the output buffer, switching to the internal logic power supply can reduce the effect on the voltage fluctuation.

Table 46.5 Power supplied to the TSm pins

Setting of CTSUCHTRCn register	CTSUTXVSEL bit	Power supply of TSm pins
0 (Reception)	*	VCC
1 (Transmission)	0 (VCC)	
	1 (Internal logic power supply)	Internal logic power supply

CTSUCAP位（CTSU测量操作开始触发选择）

CTSUCAP位指定测量开始条件。有关详细信息，请参阅CTSUSTRT位（CTSU测量
Operation Start).

CTSUSNZ位（CTSU等待状态省电使能）

CTSUSNZ位在等待状态期间启用或禁用省电操作。它还可以暂停CTSU电源，从而降低等待状态下的功耗。在挂起状态下，CTSU电源关闭，而外部TSCAP仍在充电。

CTSU电源状态控制如表46.4所示。

Table 46.4 CTSU电源状态控制

CTSUCR1.CTSUPON bit	CTSUSNZ bit	CTSUCAP bit	CTSUSTRT bit	CTSU供电状态
0	0	0	0	Stopped
1	0	-	-	Operating
1	1	0	0	Suspended

Note: 禁止在表中列出以外的设置。

要从暂停状态开始测量，请将CTSUSNZ位设置为0，然后将CTSUSTRT位设置为1。要在测量停止后暂停模块，请将CTSUSNZ位设置为1。

CTSUINIT位（CTSU控制块初始化）

向CTSUINIT位写入1以初始化内部控制寄存器。要强制停止当前操作，同时将CTSUSTRT位设置为0并将CTSUINIT位设置为1。这将停止操作并初始化内部控制寄存器。

当CTSUSTRT位为1时，不要将1写入CTSUINIT位。

CTSUTXVSEL位（CTSU发射电源选择）

CTSUTXVSEL位用于切换互电容全扫描模式下发送缓冲器的电源。对于任何其他模式或当VCC电压低于2.7V时，将该位设置为0。该位切换触摸IO的电源，由CTSUCHTRCn寄存器设置为发送。表46.5列出了TSm引脚的电源。当VCC电压因输出缓冲器的切换而大幅波动时，切换到内部逻辑电源可以减少对电压波动的影响。

Table 46.5 为TSm引脚供电

CTSUCHTRn寄存器的设置	CTSUTXVSEL bit	TSm管脚电源
0 (Reception)	*	VCC
1 (Transmission)	0 (VCC)	
	1（内部逻辑电源）	内部逻辑电源

46.2.2 CTSU Control Register 1 (CTSUCR1)

Address(es): CTSU.CTSUCR1 4008 1001h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUMD[1:0]		CTSUCLK[1:0]		CTSUATUNE1	—	CTSUCSW	CTSUPON
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CTSUPON	CTSU Power Supply Enable	This bit controls the CTSU power supply: 0: Power off the CTSU 1: Power on the CTSU.	R/W
b1	CTSUCSW	CTSU LPF Capacitance Charging Control	This bit controls charging of the LPF capacitance connected to the TSCAP pin: 0: Turn off the capacitance switch 1: Turn on the capacitance switch.	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	CTSUATUNE1	CTSU Power Supply Capacity Adjustment	0: Normal output 1: High-current output.	R/W
b5, b4	CTSUCLK[1:0]	CTSU Operating Clock Select	These bits select the operating clock: b5 b4 0 0: PCLKB 0 1: PCLKB/2 (PCLKB divided by 2) 1 0: PCLKB/4 (PCLKB divided by 4) 1 1: Setting prohibited.	R/W
b7, b6	CTSUMD[1:0]	CTSU Measurement Mode Select	These bits select the measurement mode: b7 b6 0 0: Self-capacitance single scan mode 0 1: Self-capacitance multi-scan mode 1 0: Setting prohibited 1 1: Mutual-capacitance full scan mode.	R/W

Only set the CTSUCR1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUPON bit (CTSU Power Supply Enable)

The CTSUPON bit controls the power supply to the CTSU. Set the CTSUPON and CTSUCSW bits to the same value.

CTSUCSW bit (CTSU LPF Capacitance Charging Control)

The CTSUCSW bit controls charging of the LPF capacitor connected to the TSCAP pin by turning the capacitance switch on or off. After the capacitance switch is turned on, wait until the capacitance connected to the TSCAP pin is charged for the specified time before starting measurement by setting CTSUCR0.CTSUSTRT to 1. Before starting measurement, use an I/O port to output low to the TSCAP pin, and discharge the existing LPF capacitance. Set the CTSUPON and CTSUCSW bits to the same value.

CTSUATUNE1 bit (CTSU Power Supply Capacity Adjustment)

The CTSUATUNE1 bit sets the capacity of the CTSU power supply. Normally, set this bit to 0.

CTSUCLK[1:0] bits (CTSU Operating Clock Select)

The CTSUCLK[1:0] bits select the operating clock.

CTSUMD[1:0] bits (CTSU Measurement Mode Select)

The CTSUMD[1:0] bits set the measurement mode. For details, see section 46.3.2, Measurement Modes.

46.2.2 CTSU控制寄存器1(CTSUCR1)

Address(es): CTSU.CTSUCR1 4008 1001h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUMD[1:0]		CTSUCLK[1:0]		CTSUATUNE1	—	CTSUCSW	CTSUPON
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CTSUPON	CTSU电源使能	该位控制CTSU电源：0：关闭CTSU1：打开CTSU。	R/W
b1	CTSUCSW	CTSULPF电容充电Control	该位控制连接到TSCAP引脚的LPF电容的充电：0：关闭电容开关1：打开电容开关。	R/W
b2	—	Reserved	该位读取为0。写入值应为0。	R/W
b3	CTSUATUNE1	CTSU电源容量Adjustment	0：正常输出1：大电流输出。	R/W
b5, b4	CTSUCLK[1:0]	CTSU工作时钟选择	这些位选择工作时钟：b5b4 0 0: PCLKB 0 1：PCLKB2（PCLKB除以2） 1 0：PCLKB4（PCLKB除以4） 1 1：禁止设置。	R/W
b7, b6	CTSUMD[1:0]	CTSU测量模式选择	这些位选择测量模式：b7b6 0 0：自电容单扫描模式 0 1: Self-capacitance multi-scan mode 1 0：禁止设定 1 1：互电容全扫描模式。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCR1寄存器。

CTSUPON位（CTSU电源使能）

CTSUPON位控制CTSU的电源。将CTSUPON和CTSUCSW位设置为相同的值。

CTSUCSW位（CTSULPF电容充电控制）

CTSUCSW位通过打开或关闭电容开关来控制连接到TSCAP引脚的LPF电容的充电。电容开关打开后，通过将CTSUCR0.CTSUSTRT设置为1，等到连接到TSCAP引脚的电容充电指定时间后再开始测量。开始测量之前，使用IO端口向TSCAP引脚输出低电平，并对现有的LPF电容进行放电。将CTSUPON和CTSUCSW位设置为相同的值。

CTSUATUNE1位（CTSU电源容量调整）

CTSUATUNE1位设置CTSU电源的容量。通常，将此位设置为0。

CTSUCLK[1:0]位（CTSU工作时钟选择）

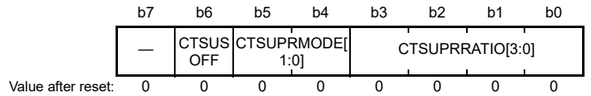
CTSUCLK[1:0]位选择工作时钟。

CTSUMD[1:0]位（CTSU测量模式选择）

CTSUMD[1:0]位设置测量模式。有关详细信息，请参阅第46.3.2节，测量模式。

46.2.3 CTSU Synchronous Noise Reduction Setting Register (CTSUSDPRS)

Address(es): CTSU.CTSUSDPRS 4008 1002h



Bit	Symbol	Bit name	Description	R/W
b3 to b0	CTSUPRRATIO[3:0]	CTSU Measurement Time and Pulse Count Adjustment	These bits set the measurement time and measurement pulse count. Recommended setting is 3 (0011b).	R/W
b5, b4	CTSUPRMODE[1:0]	CTSU Base Period and Pulse Count Setting	These bits set the base pulse count: b5 b4 0 0: 510 pulses 0 1: 126 pulses 1 0: 62 pulses (recommended setting) 1 1: Setting prohibited.	R/W
b6	CTSUSOFF	CTSU High-Pass Noise Reduction Function Off Setting	This bit turns spectrum diffusion on or off to reduce high-pass noise: 0: Turn spectrum diffusion on 1: Turn spectrum diffusion off.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Only set the CTSUSDPRS register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUPRRATIO[3:0] bits (CTSU Measurement Time and Pulse Count Adjustment)

The CTSUPRRATIO[3:0] bits determine the measurement time and the measurement pulse count using the following formulas, where the base pulse count is determined by the CTSUPRMODE[1:0] setting:

Measurement pulse count = base pulse count × (CTSUPRRATIO[3:0] bits + 1)
Measurement time = (base pulse count × (CTSUPRRATIO[3:0] bits + 1) + base pulse count - 2) × 0.25 × base clock cycle.

Note: For details on the base clock cycle, see section 46.2.15, CTSU Sensor Offset Register 1 (CTSUSO1).

CTSUPRMODE[1:0] bits (CTSU Base Period and Pulse Count Setting)

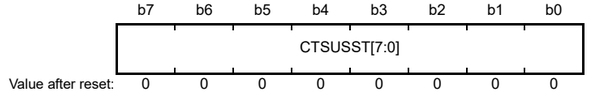
The CTSUPRMODE[1:0] bits select the number of base pulses that occur during measurement.

CTSUSOFF bit (CTSU High-Pass Noise Reduction Function Off Setting)

The CTSUSOFF bit turns on or off the function for reducing high-pass noise. Set this bit to 1 to turn the function off.

46.2.4 CTSU Sensor Stabilization Wait Control Register (CTSUSST)

Address(es): CTSU.CTSUSST 4008 1003h

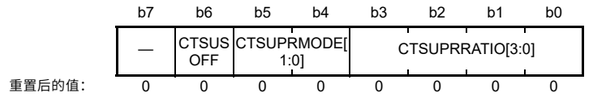


Bit	Symbol	Bit name	Description	R/W
b7 to b0	CTSUSST[7:0]	CTSU Sensor Stabilization Wait Control	Set these bits to 00010000b	R/W

Only set the CTSUSST register when the CTSUCR0.CTSUSTRT bit is 0.

46.2.3 CTSU同步降噪设置寄存器(CTSUSDPRS)

Address(es): CTSU.CTSUSDPRS 4008 1002h



Bit	Symbol	位名称	Description	R/W
b3 to b0	CTSUPRRATIO[3:0]	CTSU测量时间和脉冲计数调整	这些位设置测量时间和测量脉冲计数。推荐设置为3(0011b)。	R/W
b5, b4	CTSUPRMODE[1:0]	CTSU基本周期和脉冲计数Setting	这些位设置基本脉冲计数：b5b4 0 0: 510 pulses 0 1: 126 pulses 1 0: 62 pulses (recommended setting) 1 1：禁止设置。	R/W
b6	CTSUSOFF	CTSU高通降噪功能关闭设置	该位打开或关闭频谱扩散以降低高通噪声：0：打开频谱扩散1：关闭频谱扩散。	R/W
b7	—	Reserved	该位读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSDPRS寄存器。

CTSURRATIO[3:0]位（CTSU测量时间和脉冲计数调整）

CTSUPRATIO[3:0]位使用以下公式确定测量时间和测量脉冲计数，其中基本脉冲计数由CTSUPRMODE[1:0]设置确定：

测量脉冲数=基本脉冲数×(CTSUPRRATIO[3:0]位+1)
测量时间=(基准脉冲计数×(CTSUPRRATIO[3:0]位+1)+基准脉冲计数2)×0.25×基准时钟周期。

Note: 有关基本时钟周期的详细信息，请参见第46.2.15节，CTSU传感器偏移寄存器1(CTSUSO1)。

CTSUPRMODE[1:0]位（CTSU基本周期和脉冲计数设置）

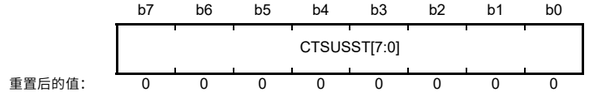
CTSUPRMODE[1:0]位选择测量期间出现的基本脉冲数。

CTSUSOFF位（CTSU高通降噪功能关闭设置）

CTSUSOFF位打开或关闭降低高通噪声的功能。将此位设置为1可关闭该功能。

46.2.4 CTSU传感器稳定等待控制寄存器(CTSUSST)

Address(es): CTSU.CTSUSST 4008 1003h



Bit	Symbol	位名称	Description	R/W
b7 to b0	CTSUSST[7:0]	CTSU传感器稳定等待Control	将这些位设置为00010000b	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSST寄存器。

CTSUSST[7:0] bits (CTSU Sensor Stabilization Wait Control)

The CTSUSST[7:0] bits set the stabilization wait time for the TSCAP pin voltage. Always set these bits to 00010000b. If these bits are not set, the TSCAP voltage becomes unstable at the start of measurement, and the CTSU is unable to obtain correct touch measurement results.

46.2.5 CTSU Measurement Channel Register 0 (CTSUMCH0)

Address(es): CTSU.CTSUMCH0 4008 1004h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CTSUMCH0[4:0]				
Value after reset:	0	0	0	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b4 to b0	CTSUMCH0 [4:0]	CTSU Measurement Channel 0	In self-capacitance single scan mode, these bits set the channel to be measured: b4 b0 0 0 0 0 1:TS01 0 0 0 1 0:TS02 0 0 0 1 1:TS03 0 0 1 0 0:TS04 0 0 1 0 1:TS05 0 0 1 1 0:TS06 0 0 1 1 1:TS07 0 1 0 0 0:TS08 0 1 0 0 1:TS09 0 1 0 1 0:TS10 0 1 0 1 1:TS11 0 1 1 0 0:TS12. Other than when specified, starting the measurement by setting CTSUCR0.CTSUSTRT to 1 is prohibited after these bits are set. In other measurement modes, these bits indicate the channel that is currently being measured. b4 b0 0 0 0 0 1:TS01 0 0 0 1 0:TS02 0 0 0 1 1:TS03 0 0 1 0 0:TS04 0 0 1 0 1:TS05 0 0 1 1 0:TS06 0 0 1 1 1:TS07 0 1 0 0 0:TS08 0 1 0 0 1:TS09 0 1 0 1 0:TS10 0 1 0 1 1:TS11 0 1 1 0 0:TS12 1 1 1 1 1:Measurement is being stopped.	R/W*1
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits is only enabled in self-capacitance single scan mode (CTSUCR1.CTSUMD[1:0] bits = 00b).

Only set the CTSUMCH0 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUMCH0[4:0] bits (CTSU Measurement Channel 0)

In self-capacitance single scan mode, the CTSUMCH0[4:0] bits set the channel to be measured. In this mode, only specify the enabled channels (00001b to 01100b). In all other modes, these bits indicate the receive channel that is being measured, and writing to these bits has no effect.

CTSUSST[7:0]位（CTSU传感器稳定等待控制）

CTSUSST[7:0]位设置TSCAP引脚电压的稳定等待时间。始终将这些位设置为00010000b。如果未设置这些位，则TSCAP电压在测量开始时变得不稳定，CTSU无法获得正确的触摸测量结果。

46.2.5 CTSU测量通道寄存器0(CTSUCH0)

Address(es): CTSU.CTSUMCH0 4008 1004h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CTSUMCH0[4:0]				
重置后的值：	0	0	0	1	1	1	1	1

Bit	Symbol	位名称	Description	R/W
b4 to b0	CTSUMCH0 [4:0]	CTSU测量通道0	在自电容单次扫描模式下，这些位设置要测量的通道：b4b000001:TS0100010:TS0200011:TS0300100:TS0400101:TS0500110:TS0600111:TS0701000:TS0801001:TS0901010:TS1001011:TS1101100：TS12。除非指定，否则在设置这些位后禁止通过将CTSUCR0.CTSUSTRT设置为1来启动测量。 在其他测量模式下，这些位指示当前正在测量的通道。b4b000001:TS0100010:TS0200011:TS0300100:TS0400101:TS0500110:TS0600111:TS0701000:TS0801001:TS0901010:TS1001011:TS1101100:TS1211111:测量正在停止。	R/W*1
b7 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只有在自电容单次扫描模式下才能写入这些位（CTSUCR1.CTSUMD[1:0]位=00b）。

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUMCH0寄存器。

CTSUCH0[4:0]位（CTSU测量通道0）

在自电容单次扫描模式下，CTSUMCH0[4:0]位设置要测量的通道。在此模式下，仅指定启用的通道（00001b到01100b）。在所有其他模式下，这些位指示正在测量的接收通道，写入这些位无效。

46.2.6 CTSU Measurement Channel Register 1 (CTSUMCH1)

Address(es): CTSU.CTSUMCH1 4008 1005h

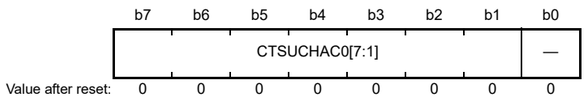
Bit	Symbol	Bit name	Description	R/W
b4 to b0	CTSUMCH1[4:0]	CTSU Measurement Channel 1	b4 b0 0 0 0 0 1:TS01 0 0 0 1 0:TS02 0 0 0 1 1:TS03 0 0 1 0 0:TS04 0 0 1 0 1:TS05 0 0 1 1 0:TS06 0 0 1 1 1:TS07 0 1 0 0 0:TS08 0 1 0 0 1:TS09 0 1 0 1 0:TS10 0 1 0 1 1:TS11 0 1 1 0 0:TS12 1 1 1 1 1:Measurement is being stopped.	R
b7 to b5	—	Reserved	These bits are read as 0.	R

CTSUMCH1[4:0] bits (CTSU Measurement Channel 1)

In full scan mode, the CTSUMCH1[4:0] bits indicate the transmit channel that is being measured. The value of these bits is 11111b when measurement is stopped, or when in self-capacitance single scan or multi-scan mode.

46.2.7 CTSU Channel Enable Control Register 0 (CTSUCHAC0)

Address(es): CTSU.CTSUCHAC0 4008 1006h



Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b1	CTSUCHAC0[7:1]	CTSU Channel Enable Control 0	These bits select whether the associated TS pin is measured: 0: Do not measure 1: Measure. These bits specify the TS01 to TS07 pins.	R/W

Only set the CTSUCHAC0 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHAC0[7:1] bits (CTSU Channel Enable Control 0)

The CTSUCHAC0[7:1] bits select the receive and transmit pins whose electrostatic capacitance is to be measured. CTSUCHAC0[1] is associated with TS01, and CTSUCHAC0[7] with TS07.

46.2.6 CTSU测量通道寄存器1(CTSUCH1)

Address(es): CTSU.CTSUMCH1 4008 1005h

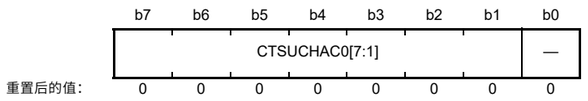
Bit	Symbol	位名称	Description	R/W
b4 to b0	CTSUMCH1[4:0]	CTSU测量通道1	b4b000001:TS0100010:TS0200011:TS0300100:TS0400101:TS0500110:TS0600111:TS0701000:TS0801001:TS0901010:TS1001011:TS1101100:TS1211111:测量正在停止。	R
b7 to b5	—	Reserved	这些位读为0。	R

CTSUCH1[4:0]位（CTSU测量通道1）

在全扫描模式下，CTSUMCH1[4:0]位指示正在测量的发送通道。当测量停止时，或在自电容单次扫描或多次扫描模式下，这些位的值为11111b。

46.2.7 CTSU通道使能控制寄存器0(CTSUCHAC0)

Address(es): CTSU.CTSUCHAC0 4008 1006h



Bit	Symbol	位名称	Description	R/W
b0	—	Reserved	该位读取为0。写入值应为0。	R/W
b7 to b1	CTSUCHAC0[7:1]	CTSU通道使能控制0	这些位选择是否测量相关的TS引脚：0：不测量1：测量。这些位指定TS01到TS07引脚。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHAC0寄存器。

CTSUCHAC0[7:1]位（CTSU通道使能控制0）

CTSUCHAC0[7:1]位选择要测量其静电电容的接收和发送引脚。
CTSUCHAC0[1]与TS01相关联，CTSUCHAC0[7]与TS07相关联。

46.2.8 CTSU Channel Enable Control Register 1 (CTSUCHAC1)

Address(es): CTSU.CTSUCHAC1 4008 1007h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CTSUCHAC1[4:0]				
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	CTSUCHAC1[4:0]	CTSU Channel Enable Control 1	These bits select whether the associated TS pin is measured: 0: Do not measure 1: Measure. These bits specify the TS08 to TS12 pins.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Only set the CTSUCHAC1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHAC1[4:0] bits (CTSU Channel Enable Control 1)

The CTSUCHAC1[4:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured. CTSUCHAC1[0] is associated with TS08, and CTSUCHAC1[4] with TS12.

46.2.9 CTSU Channel Transmit/Receive Control Register 0 (CTSUCHTRC0)

Address(es): CTSU.CTSUCHTRC0 4008 100Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUCHTRC0[7:1]							—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b1	CTSUCHTRC0[7:1]	CTSU Channel Transmit/Receive Control 0	0: Reception 1: Transmission. These bits specify the TS01 to TS07 pins.	R/W

Only set the CTSUCHTRC0 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHTRC0[7:1] bits (CTSU Channel Transmit/Receive Control 0)

In full scan mode, the CTSUCHTRC0[7:1] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multi-scan modes. CTSUCHTRC0[1] is associated with TS01, and CTSUCHTRC0[7] with TS07.

46.2.8 CTSU通道使能控制寄存器1(CTSUCHAC1)

Address(es): CTSU.CTSUCHAC1 4008 1007h

b0	—	Reserved	该位读取为0。写入值应为0。	R/W
b7 to b1	CTSUCHTRC0[7:1]	CTSU Channel Transmit/Receive Control 0	0：接收1：发送。这些位指定TS01到TS07引脚。	R/W

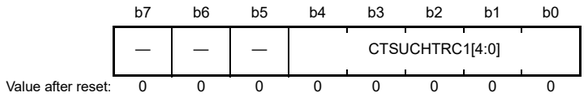
仅在CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC0寄存器。

CTSUCHTRC0[7:1]位（CTSU通道发送接收控制0）

在全扫描模式下，CTSUCHTRC0[7:1]位将接收或发送分配给相关的TS引脚。在自电容单次扫描和多次扫描模式下，该设置被忽略。CTSUCHTRC0[1]与TS01相关联，CTSUCHTRC0[7]与TS07相关联。

46.2.10 CTSU Channel Transmit/Receive Control Register 1 (CTSUCHTRC1)

Address(es): CTSU.CTSUCHTRC1 4008 100Ch



Bit	Symbol	Bit name	Description	R/W
b4 to b0	CTSUCHTRC1[4:0]	CTSU Channel Transmit/Receive Control 1	0: Reception 1: Transmission. These bits specify the TS08 to TS12 pins.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

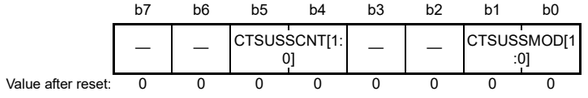
Only set the CTSUCHTRC1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHTRC1[4:0] bits (CTSU Channel Transmit/Receive Control 1)

In full scan mode, the CTSUCHTRC1[4:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multi-scan modes. CTSUCHTRC1[0] is associated with TS08, and CTSUCHTRC1[4] with TS12.

46.2.11 CTSU High-Pass Noise Reduction Control Register (CTSUDCLKC)

Address(es): CTSU.CTSUDCLKC 4008 1010h



Bit	Symbol	Bit name	Description	R/W
b1, b0	CTSUSSMOD[1:0]	CTSU Diffusion Clock Mode Select	Set these bits to 00b	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	CTSUSSCNT[1:0]	CTSU Diffusion Clock Mode Control	Set these bits to 11b	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Only set the CTSUDCLKC register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUSSMOD[1:0] bits (CTSU Diffusion Clock Mode Select)

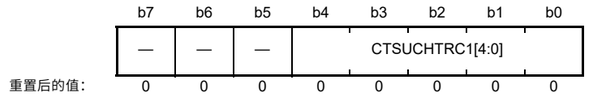
The CTSUSSMOD[1:0] bits set the mode of the spectrum diffusion clock for high-pass noise reduction. When using the high-pass function, always set these bits to 00b. If these bits are not set, the CTSU is unable to effectively reduce high-pass noise.

CTSUSSCNT[1:0] bits (CTSU Diffusion Clock Mode Control)

The CTSUSSCNT[1:0] bits adjust the amount of spectrum diffusion applied to reduce high-pass noise. When using the high-pass noise reduction function, always set these bits to 11b. If these bits are not set, touch measurement might be performed incorrectly.

46.2.10 CTSU通道发送接收控制寄存器1(CTSUCHTRC1)

Address(es): CTSU.CTSUCHTRC1 4008 100Ch



Bit	Symbol	位名称	Description	R/W
b4 to b0	CTSUCHTRC1[4:0]	CTSU Channel Transmit/Receive Control 1	0：接收1：发送。这些位指定TS08到TS12引脚。	R/W
b7 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

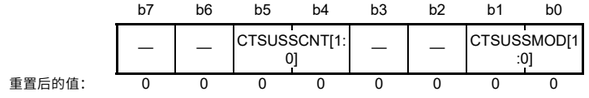
仅在CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC1寄存器。

CTSUCHTRC1[4:0]位（CTSU通道发送接收控制1）

在全扫描模式下，CTSUCHTRC1[4:0]位将接收或发送分配给相关的TS引脚。在自电容单次扫描和多次扫描模式下，该设置被忽略。CTSUCHTRC1[0]与TS08相关联，CTSUCHTRC1[4]与TS12相关联。

46.2.11 CTSU高通降噪控制寄存器(CTSUDCLKC)

Address(es): CTSU.CTSUDCLKC 4008 1010h



Bit	Symbol	位名称	Description	R/W
b1, b0	CTSUSSMOD[1:0]	CTSU扩散时钟模式选择	将这些位设置为00b	R/W
b3, b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b5, b4	CTSUSSCNT[1:0]	CTSU扩散时钟模式控制	将这些位设置为11b	R/W
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUDCLKC寄存器。

CTSUSSMOD[1:0]位（CTSU扩散时钟模式选择）

CTSUSSMOD[1:0]位设置频谱扩散时钟的模式以降低高通噪声。使用高通功能时，请始终将这些位设置为00b。如果未设置这些位，则CTSU无法有效降低高通噪声。

CTSUSSCNT[1:0]位（CTSU扩散时钟模式控制）

CTSUSSCNT[1:0]位调整应用的频谱扩散量以减少高通噪声。使用高通降噪功能时，请始终将这些位设置为11b。如果未设置这些位，则可能会错误地执行触摸测量。

46.2.12 CTSU Status Register (CTSUST)

Address(es): CTSU.CTSUST 4008 1011h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUPS	CTSUROVF	CTSUSOVF	CTSUDTSR	—	CTSUSTC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	CTSUSTC[2:0]	CTSU Measurement Status Counter	These counters indicate the current measurement status: b2 b0 0 0 0: Status 0 0 0 1: Status 1 0 1 0: Status 2 0 1 1: Status 3 1 0 0: Status 4 1 0 1: Status 5.	R
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	CTSUDTSR	CTSU Data Transfer Status Flag	This flag indicates whether the measurement result stored in the sensor counter and the reference counter was read: 0: Read 1: Not read.	R
b5	CTSUSOVF	CTSU Sensor Counter Overflow Flag	This flag indicates an overflow on the sensor counter: 0: No overflow occurred 1: Overflow occurred.	R/W
b6	CTSUROVF	CTSU Reference Counter Overflow Flag	This flag indicates an overflow on the reference counter: 0: No overflow occurred 1: Overflow occurred.	R/W
b7	CTSUPS	CTSU Mutual Capacitance Status Flag	This flag indicates the measurement status in mutual-capacitance full scan mode: 0: First measurement 1: Second measurement.	R

When using the CTSUCR0.CTSUINIT bit to clear an overflow flag, make sure the CTSUCR0.CTSUSTRT bit is 0.

CTSUSTC[2:0] flags (CTSU Measurement Status Counter)

The CTSUSTC[2:0] flags are counters indicating the current measurement status. For details on each status, see section 46.3.2.2, Status counter.

CTSUDTSR flag (CTSU Data Transfer Status Flag)

The CTSUDTSR flag indicates whether the measurement result stored in the sensor counter and the reference counter was read. This flag is set to 1 when measurement completes and to 0 when the reference counter is read by software or the DTC. This flag can also be cleared using the CTSUCR0.CTSUINIT bit.

CTSUSOVF flag (CTSU Sensor Counter Overflow Flag)

The CTSUSOVF flag is set to 1 when the sensor counter, CTSUSC, overflows. On overflow, the counter value reads as FFFFh. Measurement processing continues for the specified period.

No interrupt occurs on an overflow. To determine the channel on which the overflow occurred, read the measurement result of each channel after measurement completes, signaled by a measurement end interrupt.

This flag is cleared when 0 is written after 1 is read by software. This flag can also be cleared using the CTSUCR0.CTSUINIT bit.

46.2.12 CTSU状态寄存器(CTSUST)

Address(es): CTSU.CTSUST 4008 1011h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUPS	CTSUROVF	CTSUSOVF	CTSUDTSR	—	CTSUSTC[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	CTSUSTC[2:0]	CTSU测量状态计数器	这些计数器指示当前测量状态：b2 0 0 0: Status 0 0 0 1: Status 1 0 1 0: Status 2 0 1 1: Status 3 1 0 0: Status 4 1 0 1: Status 5.	R
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	CTSUDTSR	CTSU数据传输状态标志	该标志指示存储在传感器计数器和参考计数器中的测量结果是否被读取：0：读取1：未读取。	R
b5	CTSUSOVF	CTSU传感器计数器溢出标志	该标志表示传感器计数器发生溢出：0：未发生溢出1：发生溢出。	R/W
b6	CTSUROVF	CTSU参考计数器溢出Flag	该标志表示参考计数器发生溢出：0：未发生溢出1：发生溢出。	R/W
b7	CTSUPS	CTSU互电容状态Flag	该标志指示互电容全扫描模式下的测量状态：0：第一次测量1：第二次测量。	R

使用CTSUCR0.CTSUINIT位清除溢出标志时，请确保CTSUCR0.CTSUSTRT位为0。

CTSUSTC[2:0]标志（CTSU测量状态计数器）

CTSUSTC[2:0]标志是指示当前测量状态的计数器。有关每个状态的详细信息，请参阅第46.3.2.2节，状态计数器。

CTSUDTSR标志（CTSU数据传输状态标志）

CTSUDTSR标志指示存储在传感器计数器和参考计数器中的测量结果是否被读取。该标志在测量完成时设置为1，当参考计数器由软件或DTC读取时设置为0。该标志也可以使用CTSUCR0.CTSUINIT位清零。

CTSUSOVF标志（CTSU传感器计数器溢出标志）

当传感器计数器CTSUSC溢出时，CTSUSOVF标志设置为1。溢出时，计数器值读取为FFFFh。测量处理持续指定的时间。

溢出时不发生中断。要确定发生溢出的通道，请在测量完成后读取每个通道的测量结果，由测量结束中断发出信号。

当软件读取1后写入0时清除该标志。该标志也可以使用清除CTSUCR0.CTSUINIT bit.

CTSUROVF flag (CTSU Reference Counter Overflow Flag)

The CTSUROVF flag is set to 1 when the reference counter, CTSURC, overflows. On overflow, the counter value reads as FFFFh. Measurement processing continues for the specified period.

No interrupt occurs on an overflow. To determine the channel on which the overflow occurred, read the measurement result of each channel after measurement completes, signaled by a measurement end interrupt.

This flag is cleared when 0 is written after 1 is read by software. This flag can also be cleared with the CTSUCR0.CTSUINIT bit.

CTSUPS flag (CTSU Mutual Capacitance Status Flag)

In mutual-capacitance full scan mode, when CTSUCR1.CTSUMD[1:0] = 11b, the CTSUPS flag indicates whether the measurement is the first or second of the two measurements for each channel. When measurement is stopped, or when in other measurement modes, this flag is always 0.

46.2.13 CTSU High-Pass Noise Reduction Spectrum Diffusion Control Register (CTSUSSC)

Address(es): CTSU.CTSUSSC 4008 1012h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CTSUSSDIV[3:0]				—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b11 to b8	CTSUSSDIV[3:0]	CTSU Spectrum Diffusion Frequency Division Setting	These bits specify the spectrum diffusion frequency division setting based on the base clock frequency division setting	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CTSUSSDIV[3:0] bits (CTSU Spectrum Diffusion Frequency Division Setting)

The CTSUSSDIV[3:0] bits specify the spectrum diffusion frequency derived from the base clock frequency division setting. To calculate the correct setting for CTSUSSDIV[3:0], see the relationship between the base clock frequencies and the settings in Table 46.6.

Table 46.6 Relationship between base clock frequencies and CTSUSSDIV[3:0] bit settings (1 of 2)

Base clock frequency fb (MHz)	CTSUSSDIV[3:0] bit setting
4.00 ≤ fb	0000b
2.00 ≤ fb < 4.00	0001b
1.33 ≤ fb < 2.00	0010b
1.00 ≤ fb < 1.33	0011b
0.80 ≤ fb < 1.00	0100b
0.67 ≤ fb < 0.80	0101b

0.50 ≤ fb < 0.57	0111b
0.44 ≤ fb < 0.50	1000b
0.40 ≤ fb < 0.44	1001b
0.36 ≤ fb < 0.40	1010b
0.33 ≤ fb < 0.36	1011b
0.31 ≤ fb < 0.33	1100b

CTSUROVF标志（CTSU参考计数器溢出标志）

当参考计数器CTSURC溢出时，CTSUROVF标志设置为1。溢出时，计数器值读取为FFFFh。测量处理持续指定的时间。

溢出时不发生中断。要确定发生溢出的通道，请在测量完成后读取每个通道的测量结果，由测量结束中断发出信号。

当软件读取1后写入0时清除该标志。这个标志也可以用
CTSUCR0.CTSUINIT bit.

CTSUPS标志（CTSU互电容状态标志）

在互电容全扫描模式下，当CTSUCR1.CTSUMD[1:0]=11b时，CTSUPS标志指示测量是每个通道的两个测量中的第一个还是第二个。停止测量或处于其他测量模式时，该标志始终为0。

46.2.13 CTSU高通降噪频谱扩散控制寄存器(CTSUSSC)

Address(es): CTSU.CTSUSSC 4008 1012h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

46.2.14 CTSU Sensor Offset Register 0 (CTSUSO0)

Address(es): CTSU.CTSUSO0 4008 1014h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUSNUM[5:0]						CTSUSO[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b9 to b0	CTSUSO[9:0]	CTSU Sensor Offset Adjustment	These bits adjust the electronic capacitance when the electrode is not being touched: b9 b0 0 0 0 0 0 0 0 0 0 0: Current offset is 0 0 0 0 0 0 0 0 0 0 1: Current offset is 1 0 0 0 0 0 0 0 0 1 0: Current offset is 2 : : 1 1 1 1 1 1 1 1 1 0: Current offset is 1022 1 1 1 1 1 1 1 1 1 1: Current offset is maximum.	R/W
b15 to b10	CTSUSNUM[5:0]	CTSU Measurement Count Setting	These bits set the number of measurements	R/W

CTSUSO[9:0] bits (CTSU Sensor Offset Adjustment)

The CTSUSO[9:0] bits offset the sensor ICO input current generated from electrostatic capacitance during touch measurement, when the electrode is not being touched. This prevents the CTSU sensor counter from overflowing.

Set the TS pin that is to be measured next after a CTSU_CTSUWR interrupt is generated.

CTSUSNUM[5:0] bits (CTSU Measurement Count Setting)

The CTSUSNUM[5:0] bits specify how many times the measurement pulse count specified in the CTSUSDPRS.CTSUPRRATIO[3:0] and CTSUSDPRS.CTSUPRMODE[1:0] bits is repeated during the measurement time. The measurement pulse count is repeated (CTSUSNUM[5:0] bits + 1) times.

Set the TS pin that is to be measured next after a CTSU_CTSUWR interrupt is generated.

Table 46.6 基本时钟频率和CTSUSSDIV[3:0]位设置之间的关系(2of2)

基本时钟频率fb(MHz)	CTSUSSDIV[3:0]位设置
0.29 ≤ fb < 0.31	1101b
0.27 ≤ fb < 0.29	1110b
fb < 0.27	1111b

46.2.14 CTSU传感器偏移寄存器0(CTSUSO0)

Address(es): CTSU.CTSUSO0 4008 1014h

	CTSUSNUM[5:0]						CTSUSO[9:0]									
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b9 to b0	CTSUSO[9:0]	CTSU传感器偏移调整	这些位在电极未被触摸 时调整电子电容：b9 b000000000000：当前偏移量为000000000001：当前偏移量为10000000010：当前偏移量为2::1111111110：当前偏移为1022111111111 1：当前偏移最大。	R/W
b15 to b10	CTSUSNUM[5:0]	CTSU测量计数	这些位设置测量次数	R/W

CTSUSO[9:0]位（CTSU传感器偏移调整）

CTSUSO[9:0]位在没有触摸电极时，在触摸测量期间抵消由静电电容产生的传感器ICO输入电流。这可以防止CTSU传感器计数器溢出。

在产生CTSU_CTSUWR中断后设置接下来要测量的TS引脚。

CTSUSNUM[5:0]位（CTSU测量计数设置）

CTSUSNUM[5:0]位指定测量脉冲计数的次数
CTSUSDPRS.CTSUPRRATIO[3:0]和CTSUSDPRS.CTSUPRMODE[1:0]位在测量期间重复。测量脉冲计数重复(CTSUSNUM[5:0]位+1)次。

在产生CTSU_CTSUWR中断后设置接下来要测量的TS引脚。

46.2.15 CTSU Sensor Offset Register 1 (CTSUSO1)

Address(es): CTSU.CTSUSO1 4008 1016h

Note 1. 在互电容全扫描模式（CTSUCR1.CTSUMD[1:0]位=11b）。

RA生态工作室

After a CTSU_CTSUWR interrupt is generated, write first to the CTSUSSC register, next to the CTSUSO0 register, and then to the CTSUSO1 register. The write to the CTSUSO1 register causes a transition to Status 3, see Table 46.7 and Table 46.8. Set all of the bits in a single operation when writing to the CTSUSO1 register.

CTSURICOA[7:0] bits (CTSU Reference ICO Current Adjustment)

The CTSURICOA[7:0] bits adjust the oscillation frequency using the input current of the reference ICO.

CTSUSDPA[4:0] bits (CTSU Base Clock Setting)

The CTSUSDPA[4:0] bits select the base clock used as the source for the sensor drive pulse by dividing the operating clock. For details on the setting procedure, see section 46.3.2.1, Initial settings flow.

CTSUICOG[1:0] bits (CTSU ICO Gain Adjustment)

The CTSUICOG[1:0] bits adjust the output frequency gain of the sensor ICO and the reference ICO. In general, set these bits to 00b for the maximum gain. If changes in the capacitance between when the electrode is touched and when it is not touched greatly exceed the dynamic range of the sensor ICO, adjust the gain appropriately with this setting.

46.2.16 CTSU Sensor Counter (CTSUSC)

Address(es): CTSU.CTSUSC 4008 1018h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUSC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	CTSUSC[15:0]	CTSU Sensor Counter	These bits indicate the measurement result of the sensor ICO. They read FFFFh when an overflow occurs.	R

After a CTSU_CTSURD interrupt occurs, read first from the CTSUSC counter, then from the CTSURC counter.

CTSUSC[15:0] bits (CTSU Sensor Counter)

The CTSUSC[15:0] bits are configured as an increment counter for the sensor ICO clock.

Read these bits after a CTSU_CTSURD interrupt occurs. After the CTSURC counter is read, these bits are immediately cleared before the CTSU measurement status counter value changes to Status 4 (the CTSUST.CTSUSTC[2:0] flags change to 100b) in the next measurement. They can also be cleared using the CTSUCR0.CTSUINIT bit.

46.2.17 CTSU Reference Counter (CTSURC)

Address(es): CTSU.CTSURC 4008 101Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSURC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	CTSURC[15:0]	CTSU Reference Counter	These bits indicate the measurement result of the reference ICO. They read FFFFh when an overflow occurs.	R

After a CTSU_CTSURD interrupt occurs, read first from the CTSUSC counter, then from the CTSURC counter. Status 3 continues until the CTSURC counter is read, even if the stabilization time specified for Status 3 elapses.

产生CTSU_CTSUWR中断后，先写入CTSUSSC寄存器，然后写入CTSUSO0寄存器，然后写入CTSUSO1寄存器。写入CTSUSO1寄存器会导致转换到状态3，请参见表46.7和表46.8。写入CTSUSO1寄存器时，在一次操作中设置所有位。

CTSURICOA[7:0]位（CTSU参考ICO电流调整）

CTSURICOA[7:0]位使用参考ICO的输入电流调整振荡频率。

CTSUSDPA[4:0]位（CTSU基本时钟设置）

CTSUSDPA[4:0]位通过对工作时钟进行分频来选择用作传感器驱动脉冲源的基本时钟。有关设置步骤的详细信息，请参阅第46.3.2.1节，初始设置流程。

CTSUICOG[1:0]位（CTSUICO增益调整）

CTSUICOG[1:0]位调整传感器ICO和参考ICO的输出频率增益。通常，将这些位设置为00b以获得最大增益。如果触摸电极和未触摸电极之间的电容变化大大超过传感器ICO的动态范围，请使用此设置适当调整增益。

46.2.16 CTSU传感器计数器(CTSUSC)

Address(es): CTSU.CTSUSC 4008 1018h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUSC[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	CTSUSC[15:0]	CTSU传感器计数器	这些位表示传感器ICO的测量结果。它们在发生溢出时读取FFFFh。	R

发生CTSU_CTSURD中断后，首先从CTSUSC计数器读取，然后从CTSURC计数器读取。

CTSUSC[15:0]位（CTSU传感器计数器）

CTSUSC[15:0]位配置为传感器ICO时钟的增量计数器。

在CTSU_CTSURD中断发生后读取这些位。读取CTSURC计数器后，这些位会在CTSU测量状态计数器值在下一次测量中变为状态4（CTSUST.CTSUSTC[2:0]标志变为100b）之前立即清零。它们也可以使用CTSUCR0.CTSUINIT位清零。

46.2.17 CTSU参考计数器(CTSURC)

Address(es): CTSU.CTSURC 4008 101Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSURC[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	CTSURC[15:0]	CTSU参考计数器	这些位表示参考ICO的测量结果。它们在发生溢出时读取FFFFh。	R

发生CTSU_CTSURD中断后，首先从CTSUSC计数器读取，然后从CTSURC计数器读取。状态3一直持续到读取CTSURC计数器为止，即使为状态3指定的稳定时间已过。

CTSURC[15:0] bits (CTSU Reference Counter)

The CTSURC[15:0] bits are configured as an increment counter for the reference ICO clock.

The reference ICO optimizes touch measurement performed by the sensor ICO. There is some deviation depending on the internal sensor ICO and the reference ICO in the CTSU, but both ICOs have almost the same characteristics, including the dynamic range and the current-to-frequency characteristics. The range of current amount that can be set in the reference ICO current adjustment bits is about the same as the dynamic range of both ICOs, and the current amount input to the sensor ICO must be within this dynamic range. To ensure this, use the reference ICO to check the differences between the ICOs and measure the current-to-oscillation frequency characteristics. Because the reference ICO oscillation frequency can be obtained from the reference ICO counter, the ICO oscillation frequency (counter value/measurement time) for the input current amount can be measured by setting the value in the reference ICO current adjustment bits and measuring the reference ICO counter. The reference ICO counter value measured using the maximum value in the reference ICO current adjustment bits is the maximum value of the ICO dynamic range. The current to the sensor ICO must be offset in the offset adjustment bits so that the sensor ICO counter value does not exceed this value.

Read the CTSURC[15:0] bits after a CTSU_CTSURD interrupt occurs. After these bits are read, they are immediately cleared before the CTSU measurement status counter value changes to Status 4 (the CTSUST.CTSUSTC[2:0] flags change to 100b) in the next measurement. They can also be cleared using the CTSUCR0.CTSUINIT bit.

46.2.18 CTSU Error Status Register (CTSUERRS)

Address(es): CTSU.CTSUERRS 4008 101Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUICOMP	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b14 to b0	—	Reserved	These bits are read as 0	R
b15	CTSUICOMP	TSCAP Voltage Error Monitor	This bit monitors the error status of the TSCAP voltage: 0: Normal TSCAP voltage 1: Abnormal TSCAP voltage.*1	R

Note 1. When CTSUCR1.CTSUPON bit is 0, this bit is set to 1.

CTSUICOMP bit (TSCAP Voltage Error Monitor)

The CTSUICOMP bit monitors the TSCAP voltage and it is set to 1 if the voltage becomes abnormal.

If the offset current specified in the CTSUSO1 register exceeds the sensor ICO input current during touch measurement, the TSCAP voltage becomes abnormal and touch measurement cannot be correctly performed.

If the TSCAP voltage becomes abnormal, the sensor ICO counter value becomes undefined, but touch measurement completes normally, so it is difficult to detect an abnormality by reading the sensor ICO counter value. If the CTSU reference ICO current adjustment bits (CTSURICOA[7:0]) in the CTSUSO1 register are set to any value other than 0, always check this bit when touch measurement completes.

This bit is cleared by writing 0 to the CTSUCR1.CTSUPON bit and turning off the power supply.

CTSURC[15:0]位（CTSU参考计数器）

CTSURC[15:0]位配置为参考ICO时钟的增量计数器。

参考ICO优化了传感器ICO执行的触摸测量。CTSU中的内部传感器ICO和参考ICO存在一些偏差，但两种ICO具有几乎相同的特性，包括动态范围和电流频率特性。参考ICO电流调整位可设置的电流量范围与两个ICO的动态范围大致相同，输入到传感器ICO的电流量必须在此动态范围内。为确保这一点，请使用参考ICO检查ICO之间的差异并测量电流–振荡频率特性。因为可以从参考ICO计数器获得参考ICO振荡频率，所以可以通过设置参考ICO电流调整位中的值并测量参考ICO计数器来测量输入电流量的ICO振荡频率（计数器值测量时间）.使用参考ICO电流调整位中的最大值测量的参考ICO计数器值是ICO动态范围的最大值。传感器ICO的电流必须在偏移调整位中进行偏移，以使传感器ICO计数器值不超过此值。

在CTSU_CTSURD中断发生后读取CTSURC[15:0]位。读取这些位后，它们会在CTSU测量状态计数器值在下一次测量中变为状态4（CTSUST.CTSUSTC[2:0]标志变为100b）之前立即被清除。它们也可以使用CTSUCR0.CTSUINIT位清零。

46.2.18 CTSU错误状态寄存器(CTSUERRS)

Address(es): CTSU.CTSUERRS 4008 101Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUICOMP	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	位名称	Description	R/W
b14 to b0	—	Reserved	这些位被读为0	R
b15	CTSUICOMP	TSCAP电压错误监视器	该位监控TSCAP电压的错误状态：0：正常TSCAP电压1：异常TSCAP电压。*1	R

Note 1. 当CTSUCR1.CTSUPON位为0时，该位设置为1。

CTSUICOMP位（TSCAP电压错误监视器）

CTSUICOMP位监控TSCAP电压，如果电压异常，则设置为1。

如果CTSUSO1寄存器中指定的偏移电流在触摸测量期间超过传感器ICO输入电流，则TSCAP电压会变得异常，并且无法正确执行触摸测量。

如果TSCAP电压异常，则传感器ICO计数器值变得不确定，但触摸测量正常完成，因此很难通过读取传感器ICO计数器值来检测异常。如果CTSUSO1寄存器中的CTSU参考ICO电流调整位(CTSURICOA[7:0])设置为0以外的任何值，则在触摸测量完成时始终检查该位。

通过向CTSUCR1.CTSUPON位写入0并关闭电源来清除该位。

46.3 Operation

46.3.1 Principles of Measurement Operation

Figure 46.4 shows the measurement circuit.

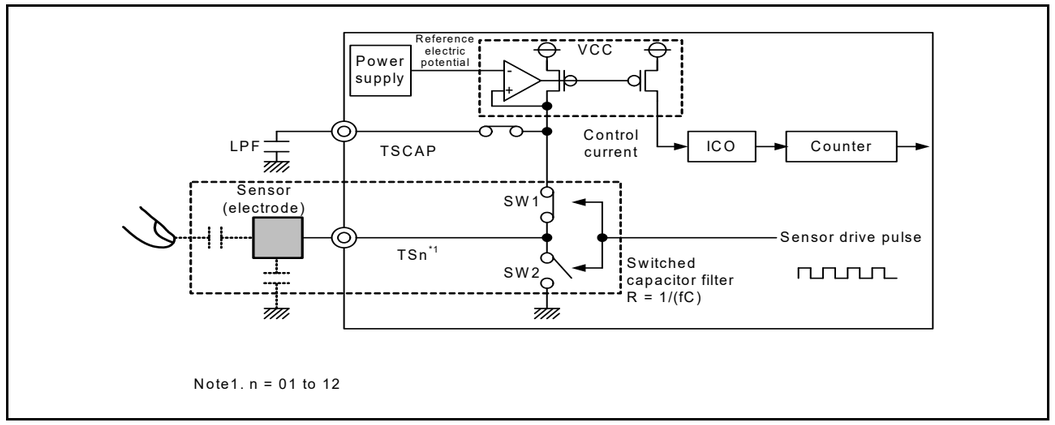

Figure 46.4 Measurement circuit

Figure 46.5 to Figure 46.7 explain the electrostatic capacitance measurement operation principles of the CTSU current frequency conversion method. The operation is as follows:

1. The electrostatic capacitance of the electrode is charged by turning SW1 on and SW2 off (Figure 46.5).
2. The charged capacitance is discharged by turning SW1 off and SW2 on (Figure 46.6).
3. Current flows to the switched capacitor filter by repeatedly charging and discharging the electrodes as in steps 1. and 2. At this point, if a finger is in close proximity, the capacitance and the flowing current change. A clock is generated by supplying the control current, which is proportional to the amount of current flowing through the switched capacitor filter, from the circuit that generates the TSCAP power supply to the ICO. The counter measures the clock frequency that changes depending on whether a finger is in close proximity. Software uses the value read from the counter to determine contact with a finger (Figure 46.7).

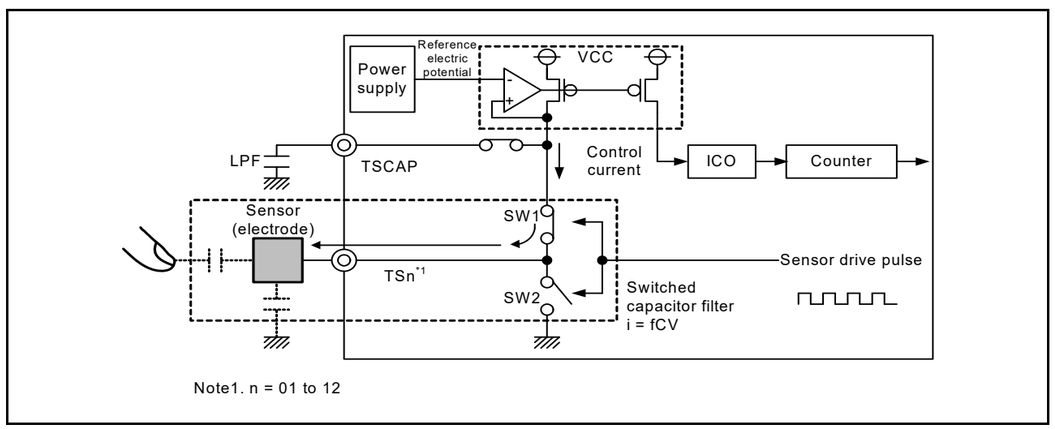

Figure 46.5 Charging operation

46.3 Operation

46.3.1 测量操作原理

图46.4显示了测量电路。

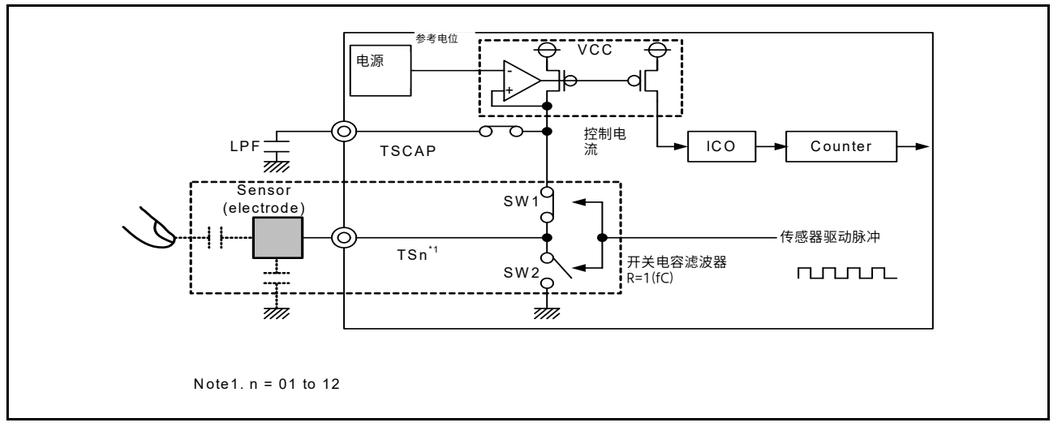

Figure 46.4 测量电路

图46.5至图46.7说明了CTSU电流变频方式的静电电容测量操作原理。操作如下：

1. 通过打开SW1和关闭SW2对电极的静电电容进行充电（图46.5）。
2. 通过关闭SW1和打开SW2对充电的电容进行放电（图46.6）。
3. 电流通过如步骤1和2中的电极反复充电和放电而流向开关电容器滤波器。此时，如果手指靠近，则电容和流动电流会发生变化。通过从产生TSCAP电源的电路向ICO提供与流过开关电容滤波器的电流量成比例的控制电流来产生时钟。计数器测量时钟频率，该频率根据手指是否靠近而变化。软件使用从计数器读取的值来确定与手指的接触（图46.7）。

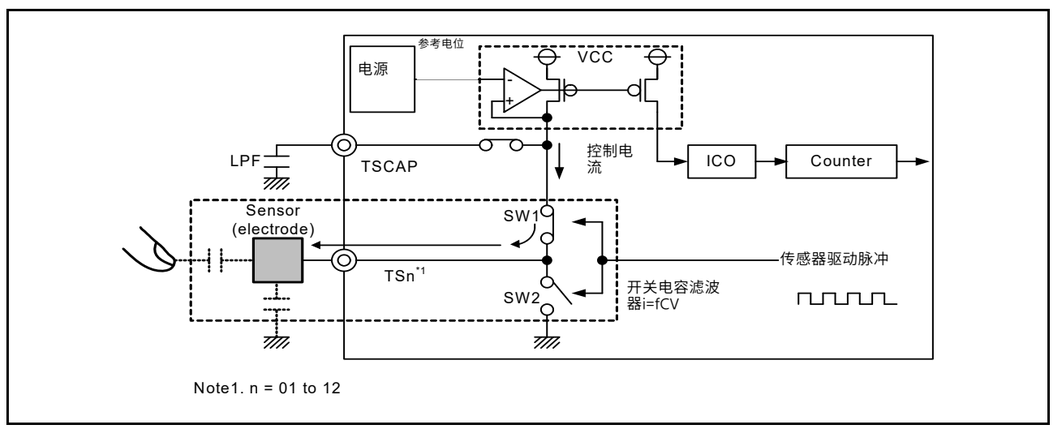

Figure 46.5 充电操作

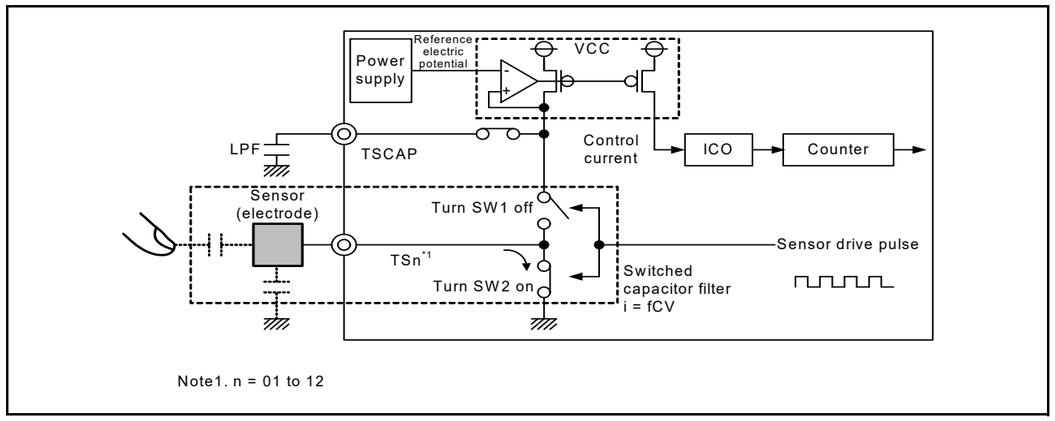

Figure 46.6 Discharging operation

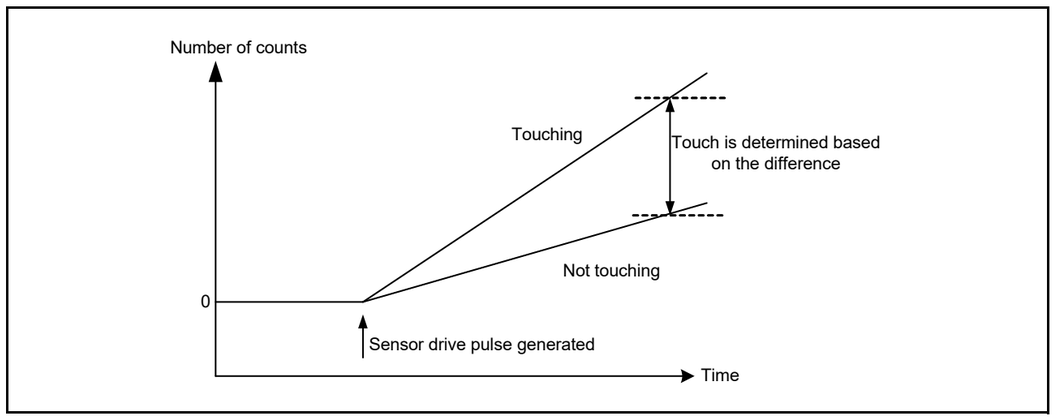

Figure 46.7 Change in measured value when finger is touching and not touching

46.3.2 Measurement Modes

The CTSU supports self-capacitance and mutual-capacitance methods. Figure 46.8 shows these methods.

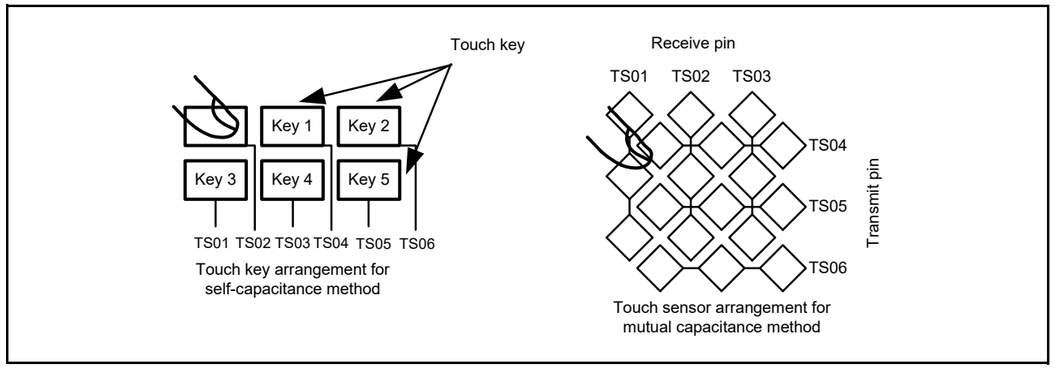

Figure 46.8 Overview of self-capacitance method and mutual-capacitance method

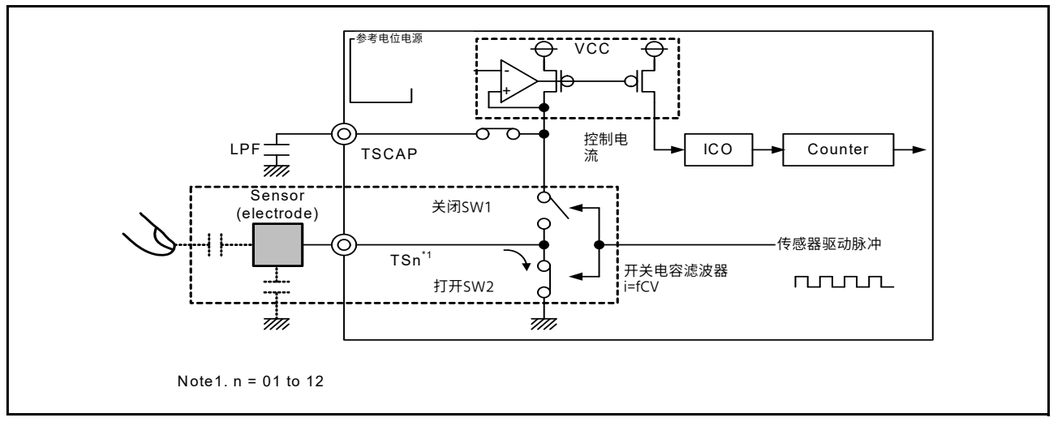

Figure 46.6 卸料作业

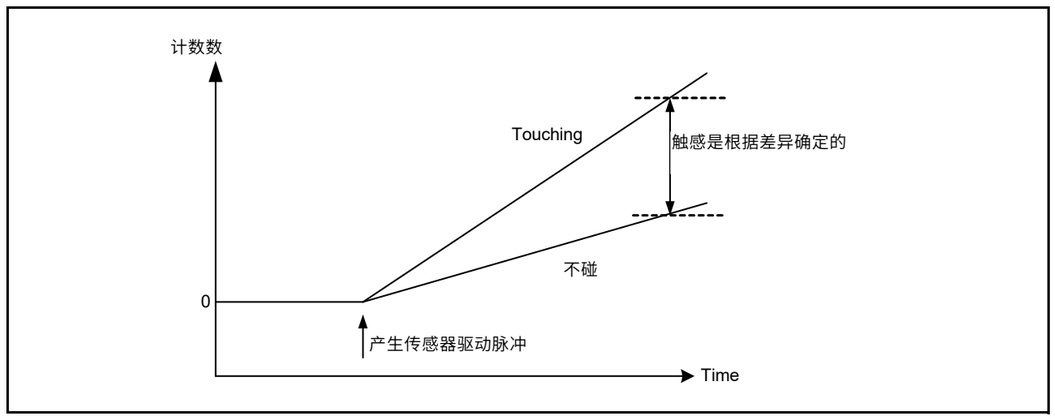

Figure 46.7 手指接触和不接触时测量值的变化

46.3.2 测量模式

CTSU支持自电容和互电容方法。图46.8显示了这些方法。

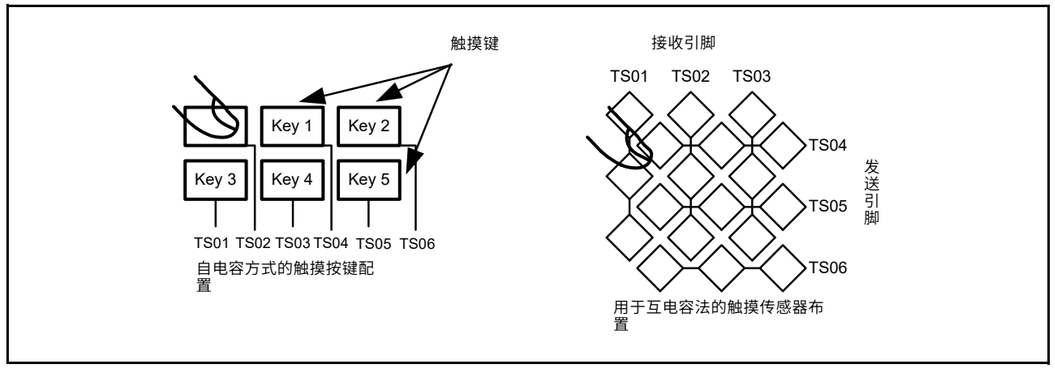

Figure 46.8 自电容法和互电容法概述

In the self-capacitance method, a single touch pin is allocated to a single touch key to measure the individual electrostatic capacitance when a finger is in close proximity. In this method, capacitance can be measured in both single scan and multi-scan modes. In the mutual-capacitance method, the capacitance between two opposing electrodes (transmit and receive pins) is measured.

46.3.2.1 Initial settings flow

Figure 46.9 shows the flow for the CTSU initial settings.

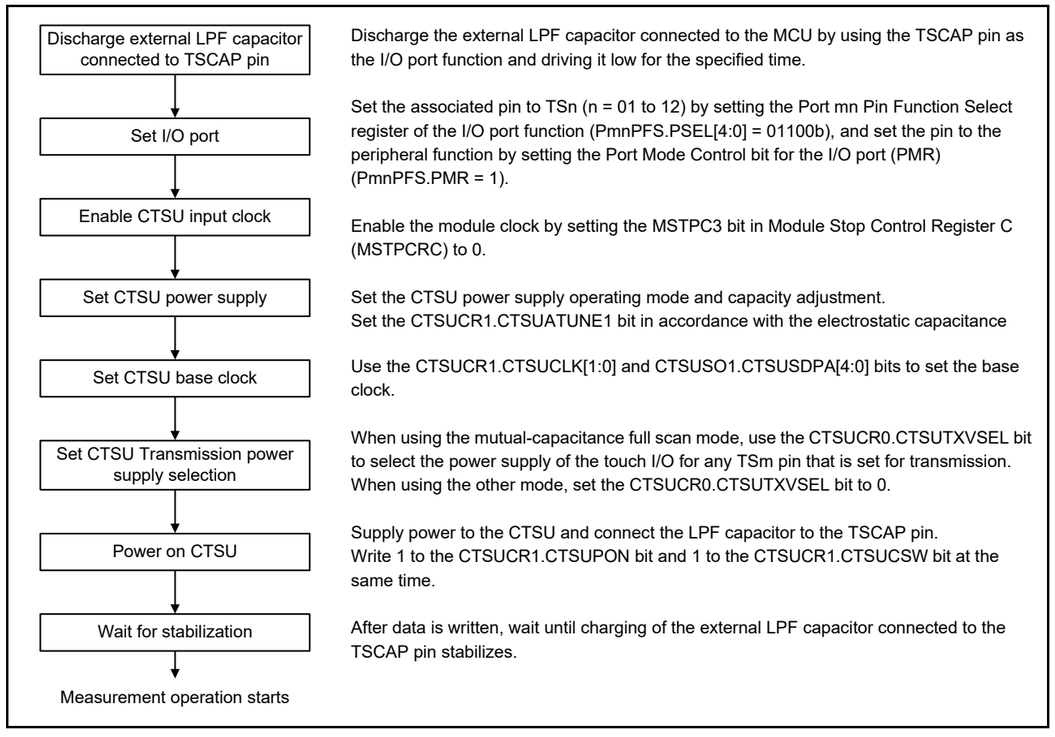

Figure 46.9 CTSU initial settings flow

Figure 46.10 shows the flow for stopping CTSU operation and invoking the standby state.

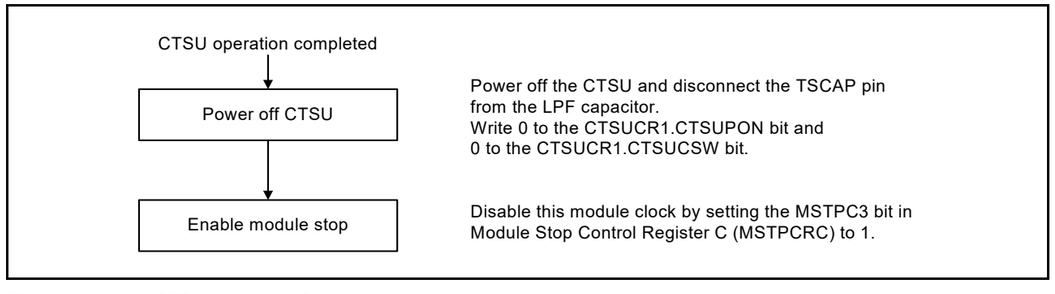

Figure 46.10 CTSU stopping flow

To restart operation, follow the initial setting flow shown in Figure 46.9.

在自电容法中，将单个触摸引脚分配给单个触摸键，以测量手指靠近时的单个静电电容。在这种方法中，可以在单扫描和多扫描模式下测量电容。在互电容法中，测量两个相对电极（发送和接收引脚）之间的电容。

46.3.2.1 初始设置流程

图46.9显示了CTSU初始设置的流程。

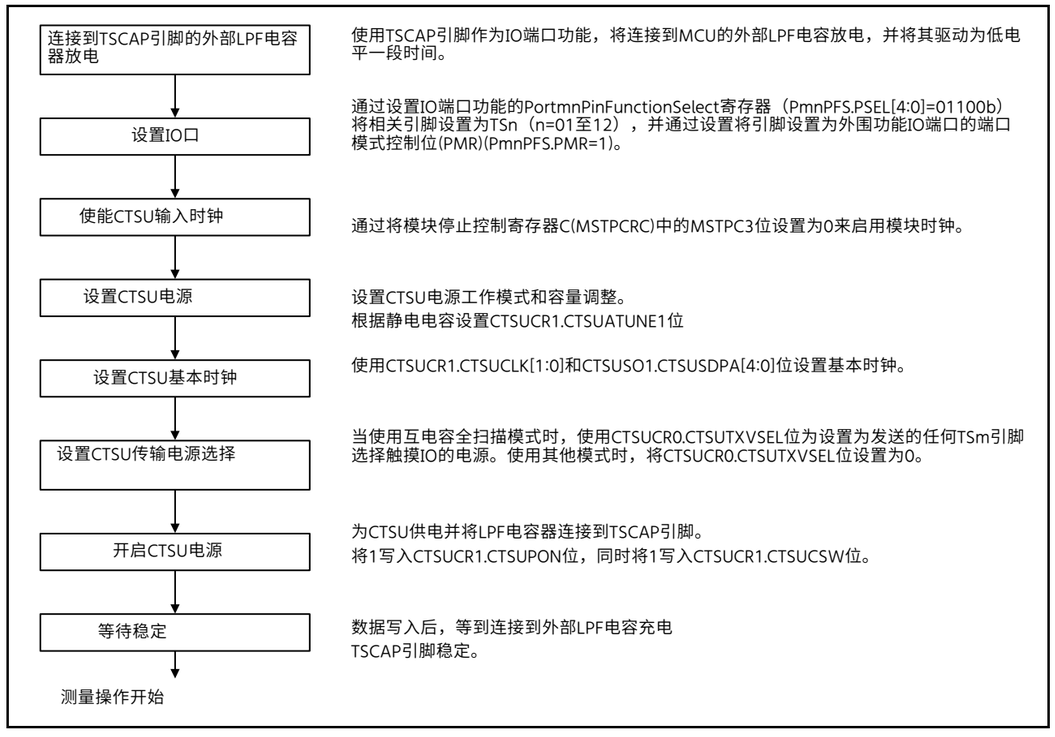

Figure 46.9 CTSU初始设置流程

图46.10显示了停止CTSU操作并调用待机状态的流程。

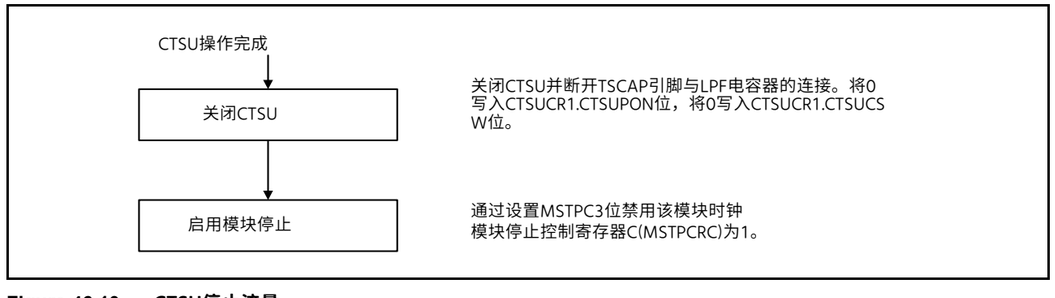

Figure 46.10 CTSU停止流量

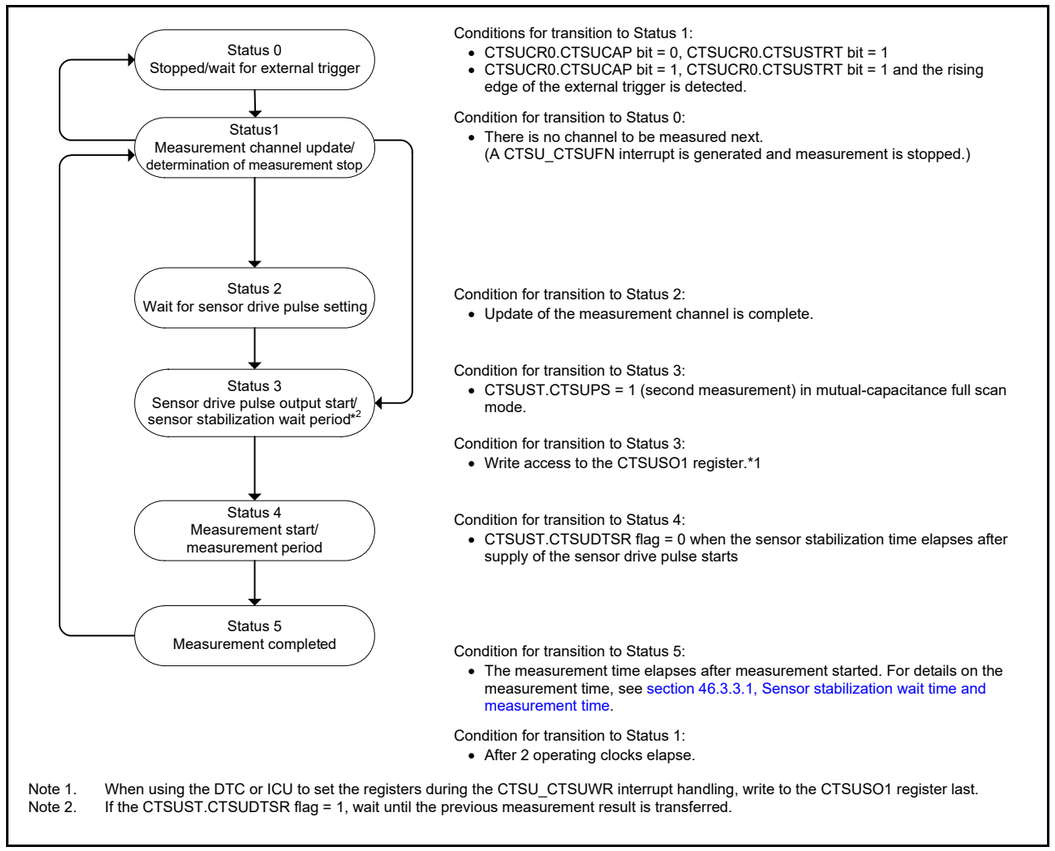
要重新开始运行，请按照图46.9所示的初始设置流程进行操作。

46.3.2.2 Status counter

The CTSU Status Register (CTSUST) indicates the current measurement status, which applies to all three modes. Figure 46.11 shows the status operation transitions.



Note 1. When using the DTC or ICU to set the registers during the CTSU_CTSUWR interrupt handling, write to the CTSUSO1 register last.
Note 2. If the CTSUST.CTSUDTSR flag = 1, wait until the previous measurement result is transferred.

Figure 46.11 Status operation transitions

The status counter transitions to Status 0 when all of the specified measurement channels are measured.

The CTSUCR0.CTSUSTRT bit is set to 0 by hardware when a software trigger is used. When an external trigger is used, the value 1 is retained, and the CTSU waits for the next trigger.

When operation is forced to stop during measurement or the trigger wait state, by a simultaneous 0 write to the CTSUCR0.CTSUSTRT bit and a 1 write to the CTSUCR0.CTSUINIT bit, the status transitions to Status 0 and measurement stops.

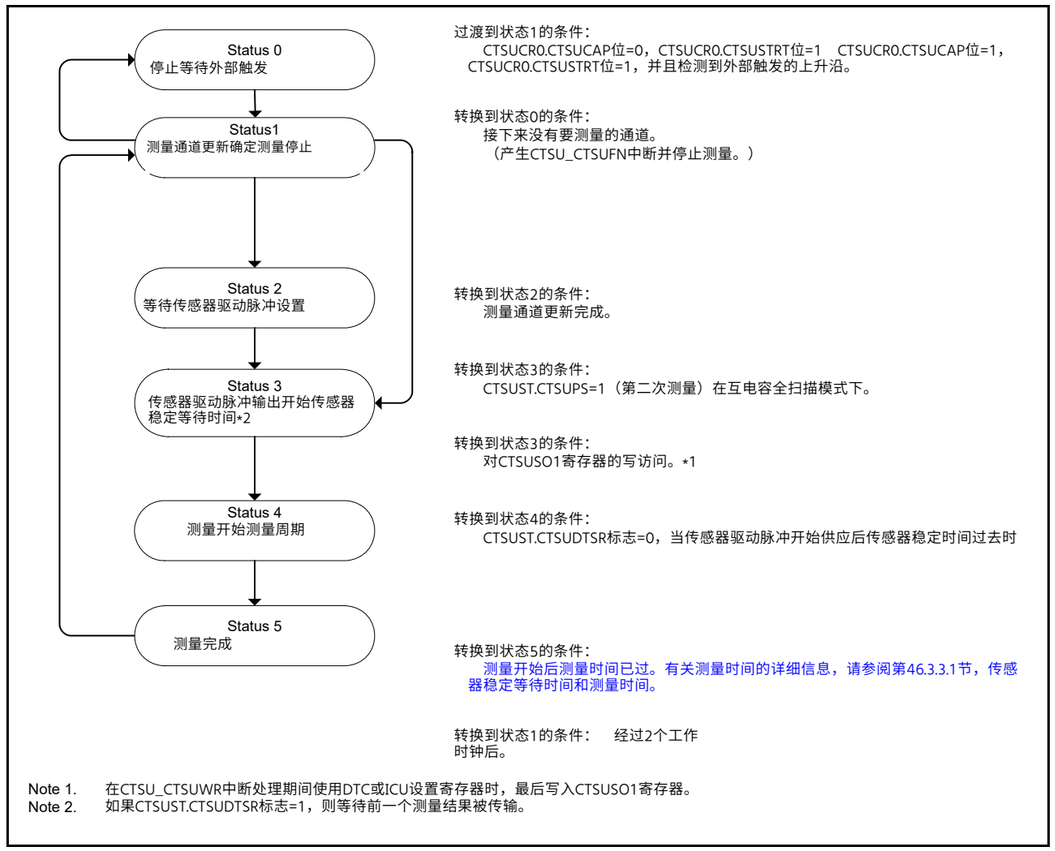
The following are cases when there is no channel to be measured:

- No measurement target channel is specified in the CTSUCHAC0 to CTSUCHAC1 registers
- In self-capacitance single scan mode, the channel specified in the CTSUMCH0 register is not a measurement target in the CTSUCHAC0 to CTSUCHAC1 registers
- In full scan modes, there is no transmit channel or receive channel to be measured based on the combined settings of the CTSUCHAC0 to CTSUCHAC1 and CTSUCHTRC0 to CTSUCHTRC1 registers.

If there is no channel to be measured based on these settings, a CTSU_CTSUFN interrupt occurs immediately after a transition to Status 1, and the counter status transitions to Status 0.

46.3.2.2 状态计数器

CTSU状态寄存器(CTSUST)指示当前测量状态，适用于所有三种模式。图46.11显示了状态操作转换。



Note 1. 在CTSU_CTSUWR中断处理期间使用DTC或ICU设置寄存器时，最后写入CTSUSO1寄存器。
Note 2. 如果CTSUST.CTSUDTSR标志=1，则等待前一个测量结果被传输。

Figure 46.11 状态操作转换

当测量所有指定的测量通道时，状态计数器转换为状态0。

当使用软件触发时，CTSUCR0.CTSUSTRT位由硬件设置为0。当使用外部触发时，值1保持不变，CTSU等待下一次触发。

在测量或触发等待状态期间强制停止操作时，通过同时向CTSUCR0.CTSUSTRT位写入0和向CTSUCR0.CTSUINIT位写入1，状态转换为状态0并停止测量。

以下是没有要测量的通道的情况：

- 在CTSUCHAC0至CTSUCHAC1寄存器中未指定测量目标通道
- 在自电容单次扫描模式下，CTSUCH0寄存器中指定的通道不是CTSUCHAC0至CTSUCHAC1寄存器中的测量目标
- 在全扫描模式下，根据CTSUCHAC0至CTSUCHAC1和CTSUCHAC0至CTSUCHAC1寄存器的组合设置，没有要测量的发送通道或接收通道。

如果根据这些设置没有要测量的通道，则在转换到状态1后立即发生CTSU_CTSUFN中断，并且计数器状态转换到状态0。

46.3.2.3 Self-capacitance single scan mode operation

In self-capacitance single scan mode, electrostatic capacitance is measured on one channel. Figure 46.12 shows the software flow and an operation example, and Figure 46.13 shows the timing.

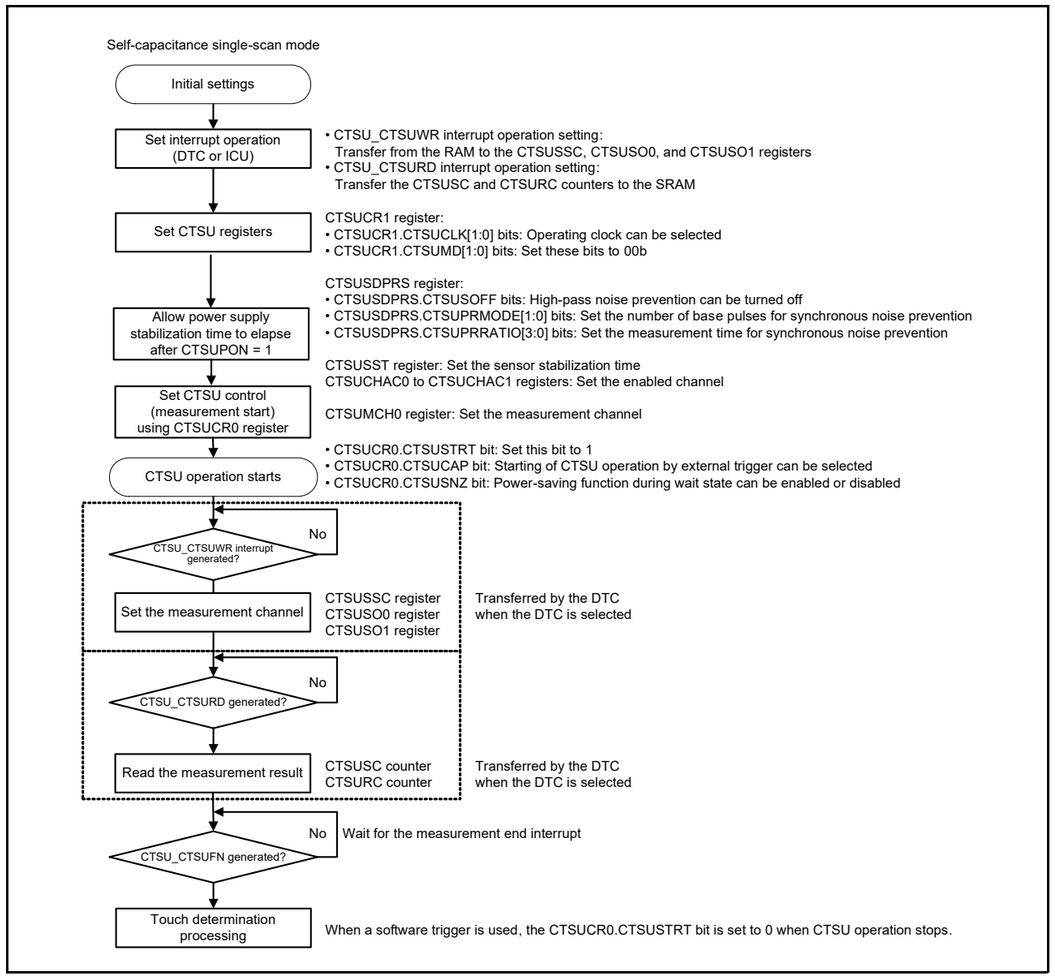


Figure 46.12 Software flow and operation example for self-capacitance single scan mode

46.3.2.3 自电容单次扫描模式操作

在自电容单次扫描模式下，在一个通道上测量静电电容。图46.12显示了软件流程和操作示例，图46.13显示了时序。

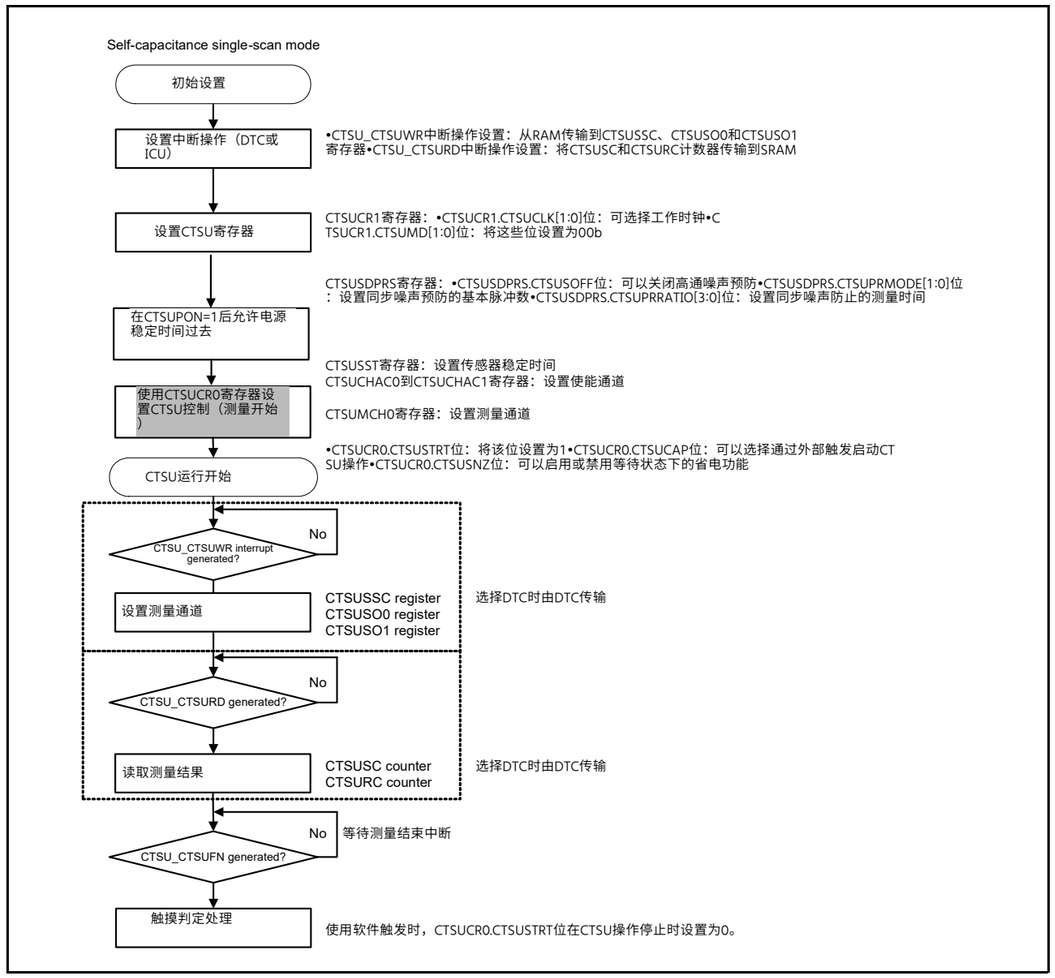

Figure 46.12 自电容单次扫描模式的软件流程和操作示例

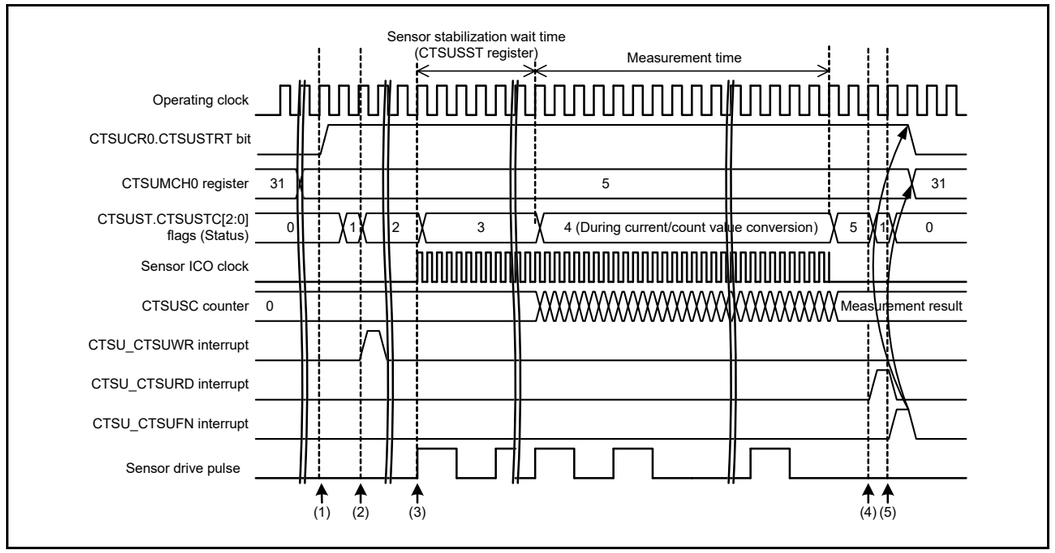

Figure 46.13 Timing of self-capacitance single scan mode when the measurement start condition is a software trigger

The following sequence describes the operation shown in Figure 46.13:

1. After the initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined according to the preset conditions, a request to set the associated channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output, and the sensor ICO clock and reference ICO clock operate.
4. After the sensor stabilization wait time and the measurement time elapse and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. A measurement end interrupt (CTSU_CTSUFN) is output and measurement stops (transition to Status 0).

Table 46.7 lists the touch pin states in self-capacitance single scan mode.

Table 46.7 Touch pin states in self-capacitance single scan mode

	Touch pin	
Status	Measured channel	Non-measured channel
0	Low	Low
1	Low	Low
2	Low	Low
3	Pulse	Low
4	Pulse	Low
5	Low	Low

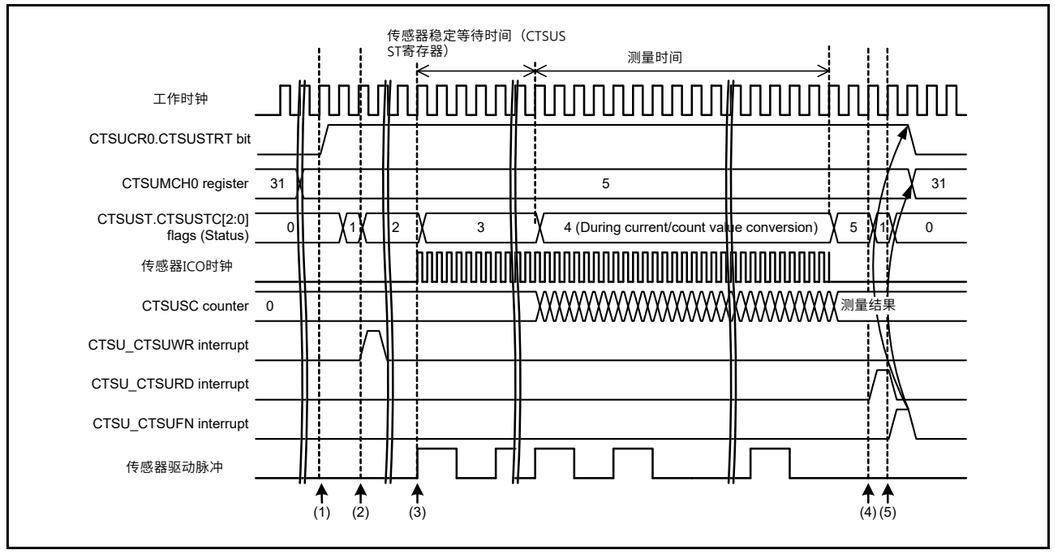

Figure 46.13 测量开始条件为软件触发时的自电容单次扫描模式时序

以下序列描述了图46.13所示的操作：

1. 完成初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。
2. 根据预设条件确定待测通道后，输出关联通道设置请求（CTSU_CTSUWR）。
3. 写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，并且传感器ICO时钟和参考ICO时钟运行。
4. 在传感器稳定等待时间和测量时间过去并停止测量后，输出测量结果读取请求(CTSU_CTSURD)。
5. 输出测量结束中断(CTSU_CTSUFN)并停止测量（转换到状态0）。

46.3.2.4 Self-capacitance multi-scan mode operation

In self-capacitance multi-scan mode, electrostatic capacitance on all channels that are specified as measurement targets in the CTSUCHAC0 to CTSUCHAC1 registers, is measured sequentially in ascending order. Figure 46.14 shows the software flow and an operation example, and Figure 46.15 shows the timing.

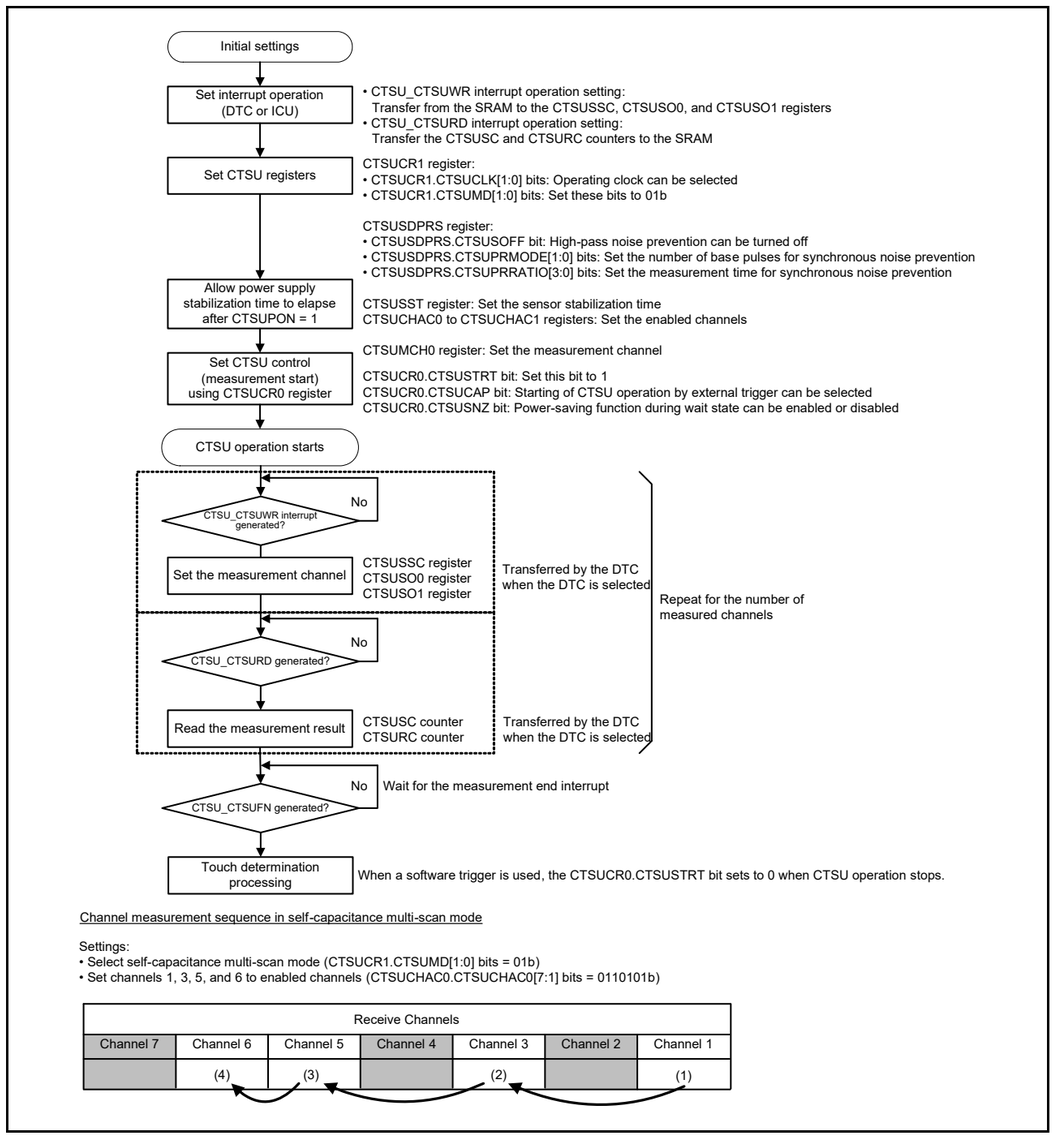

Figure 46.14 Software flow and operation example of self-capacitance multi-scan mode

46.3.2.4 自电容多扫描模式操作

在自电容多重扫描模式下，CTSUCHAC0至CTSUCHAC1寄存器中指定为测量目标的所有通道上的静电电容按升序顺序测量。图46.14显示了软件流程和操作示例，图46.15显示了时序。

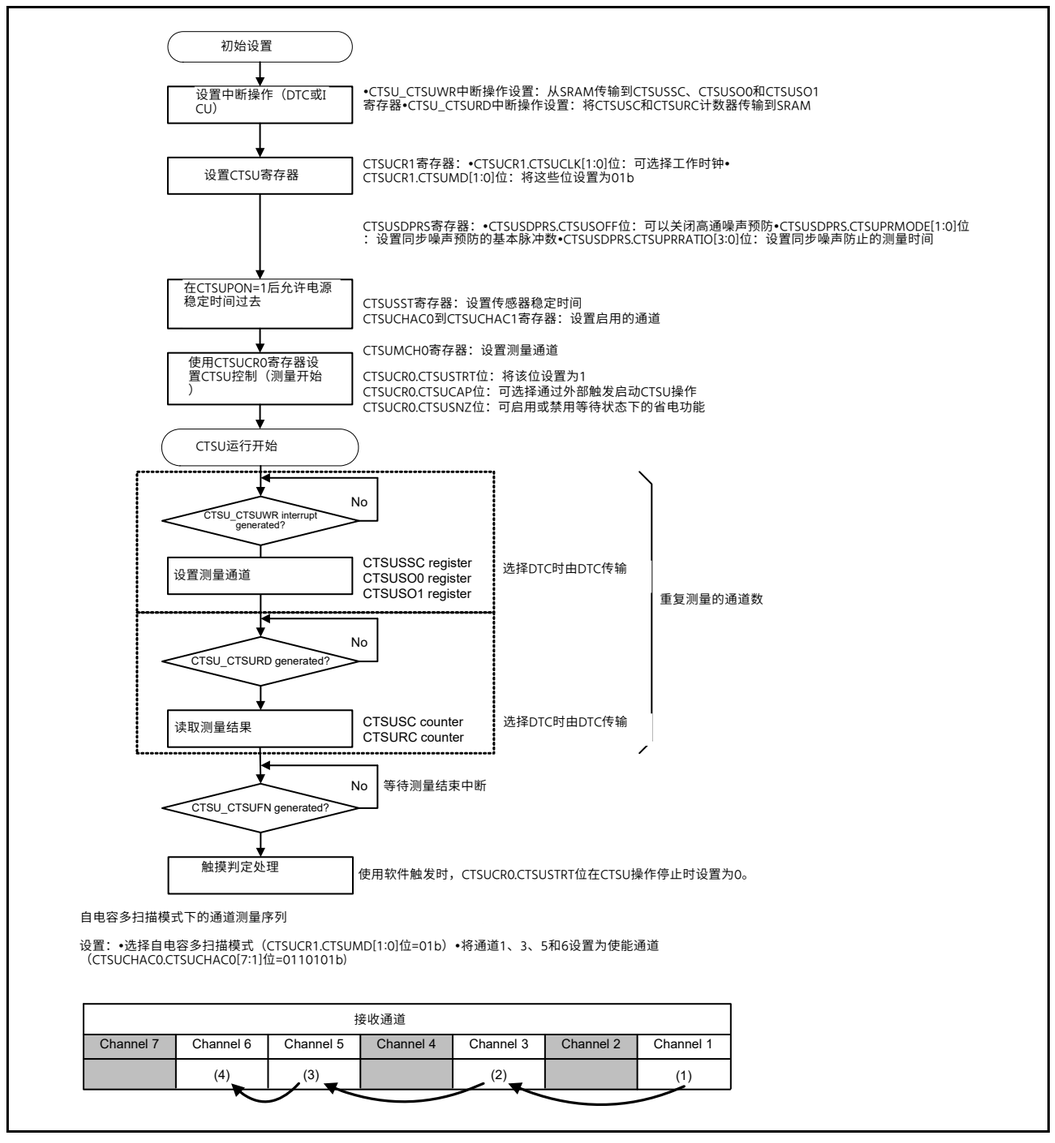

Figure 46.14 自电容多扫描模式软件流程及操作示例

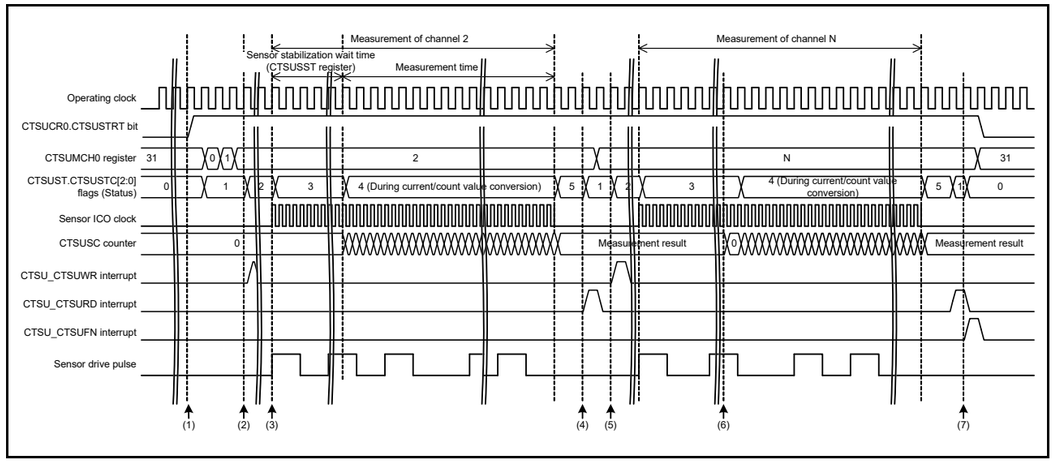

Figure 46.15 Timing of self-capacitance multi-scan mode when the measurement start condition is a software trigger

The following sequence describes the operation shown in Figure 46.15:

1. After the initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined according to the preset conditions, a request to set the channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output, and the sensor ICO clock, and the reference ICO clock operate.
4. After the sensor stabilization wait time and the measurement time elapse and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. After the channel to be measured next is determined, a request to set the associated channel (CTSU_CTSUWR) is output.
6. After the stabilization wait time elapses and when the previous measurement is read, the result is cleared and measurement starts.
7. On completion of all measurement channels, a measurement end interrupt (CTSU_CTSUFN) is output and measurement stops (transition to Status 0).

Table 46.8 lists the touch pin states in self-capacitance multi-scan mode.

2	Low	Low
3	Pulse	Low
4	Pulse	Low
5	Low	Low

46.3.2.5 Mutual-capacitance full scan mode operation

In mutual-capacitance full scan mode, measurement is performed during the high-level period of the sensor drive pulse on the receive channel by applying the edge to the target transmit channel to be measured. A single measurement target is measured twice, on the rising and falling edges. The difference between the data of these two measurements determines whether or not the electrode was touched, which results in a higher touch sensitivity.

Electrostatic capacitance is measured sequentially on channels set to transmission or reception in the CTSUCHTRC0 to CTSUCHTRC1 registers, and specified as measurement targets in the CTSUCHAC0 to CTSUCHAC1 registers. The capacitance is measured by combining these signals. Figure 46.16 shows the software flow and an operation example, and Figure 46.17 shows the timing.

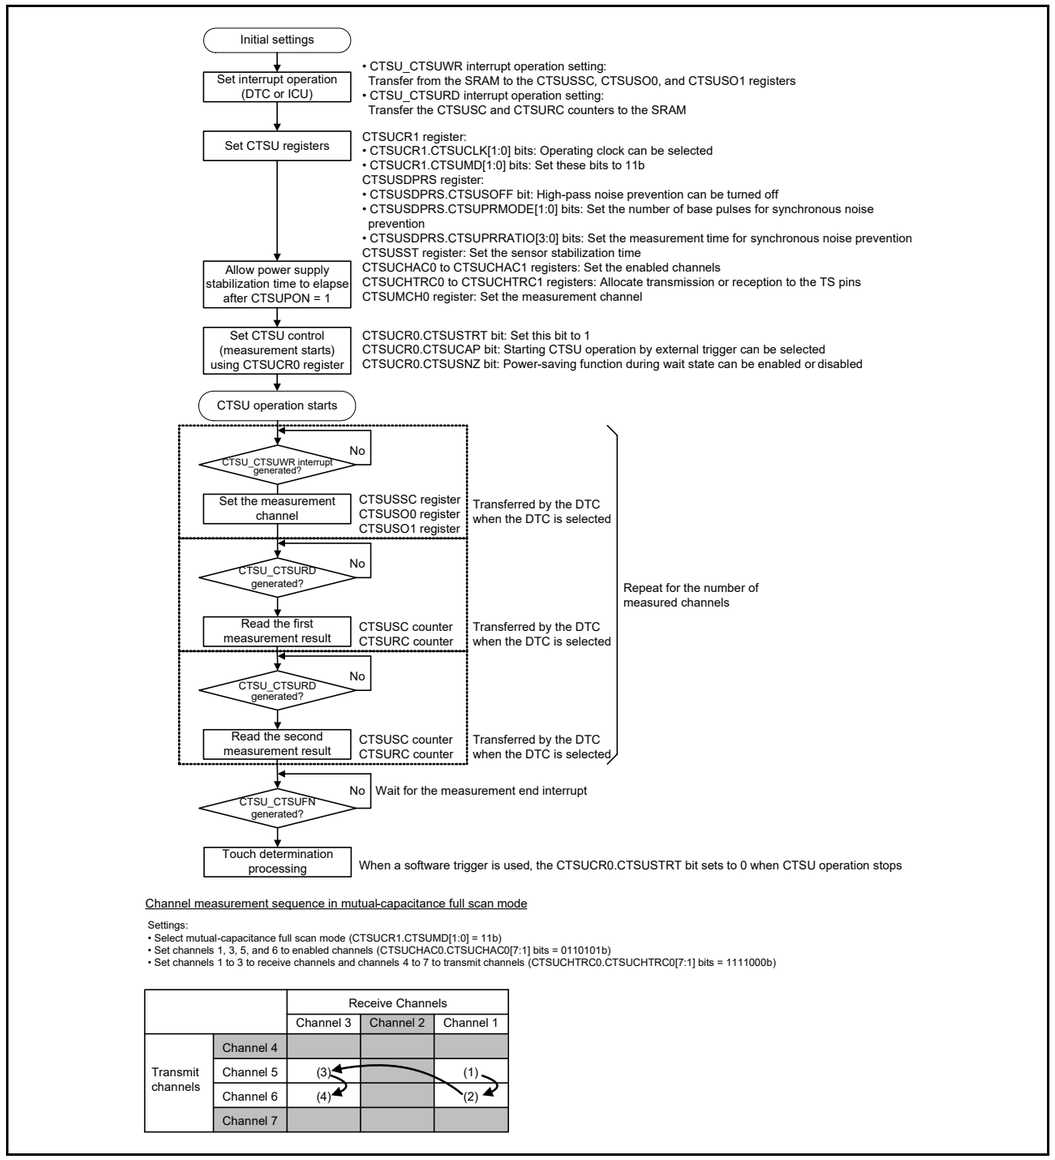

Figure 46.16 Software flow and operation example for mutual-capacitance full scan mode

46.3.2.5 互电容全扫描模式操作

在互电容全扫描模式下，通过将边沿施加到要测量的目标发送通道，在接收通道上的传感器驱动脉冲的高电平期间执行测量。在上升沿和下降沿对单个测量目标进行两次测量。这两次测量的数据之间的差异决定了电极是否被触摸，从而导致更高的触摸灵敏度。

在CTSUCHTRC0中设置为发送或接收的通道上依次测量静电电容
CTSUCHAC1寄存器，并在CTSUCHAC0至CTSUCHAC1寄存器中指定为测量目标。通过组合这些信号来测量电容。图46.16显示了软件流程和操作示例，图46.17显示了时序。

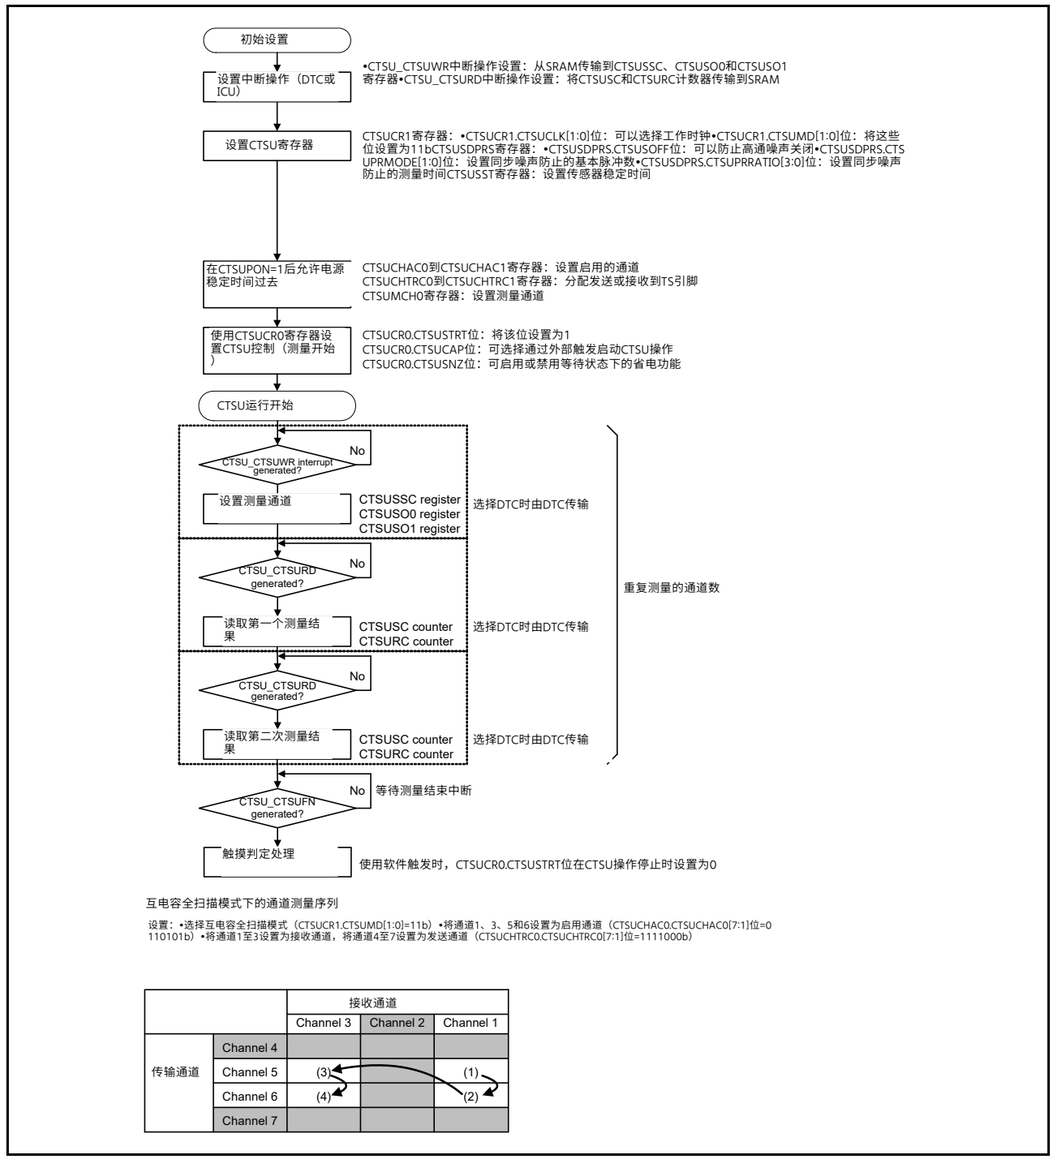

Figure 46.16 互电容全扫描模式的软件流程和操作示例

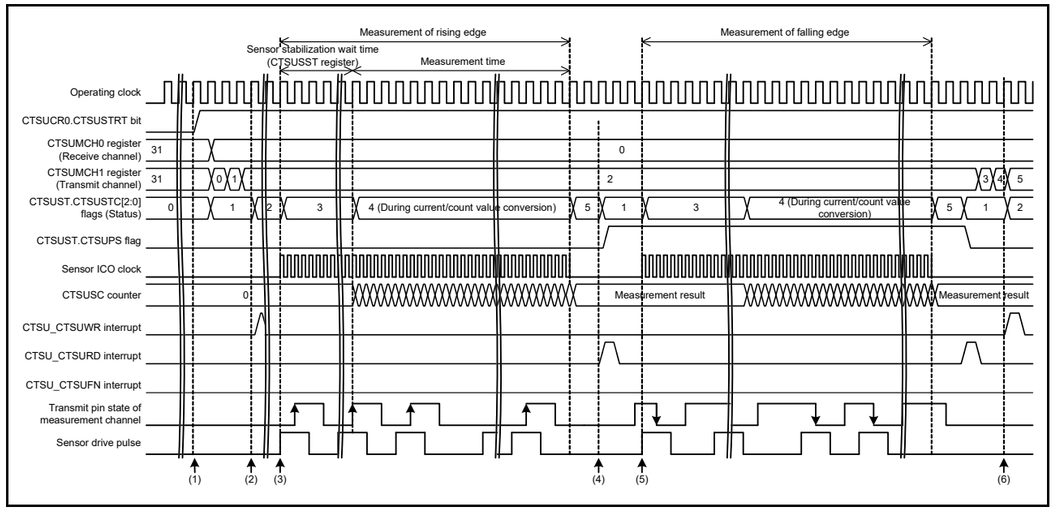

Figure 46.17 Timing of mutual-capacitance full scan mode when the measurement start condition is a software trigger

The following sequence describes the operation shown in Figure 46.17.

1. After the initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined according to the preset conditions, a request for setting the channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and the reference ICO clock operate. At the same time, a pulse detected on the rising edge is output to the transmit pin on the measurement channel during the high-level period of the sensor drive pulse.
4. After the sensor stabilization wait time and the measurement time elapse and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. The same channel is measured by outputting a pulse detected on the falling edge during the high-level period of the sensor drive pulse.
6. After the same channel is measured twice, the channel to be measured next is determined and measured in the same way.
7. On completion of all measurement channels, a measurement end interrupt (CTSU_CTSUFN) is output and measurement stops (transition to Status 0).

The CTSU Mutual Capacitance Status Flag (CTSUST.CTSUPS bit) changes when Status 5 transitions to Status 1.

Table 46.9 lists the touch pin states in mutual-capacitance full scan mode.

Table 46.9 Touch pin states in mutual-capacitance full scan mode (1 of 2)

Status	Touch pins for receive channels		Touch pins for transmit channels		Remarks
	Measured channel	Non-measured channel	Measured channel	Non-measured channel	
0	Low	Low	Low	Low	-
1	Low	Low	Low/high	Low	-
2	Low	Low	Low	Low	-

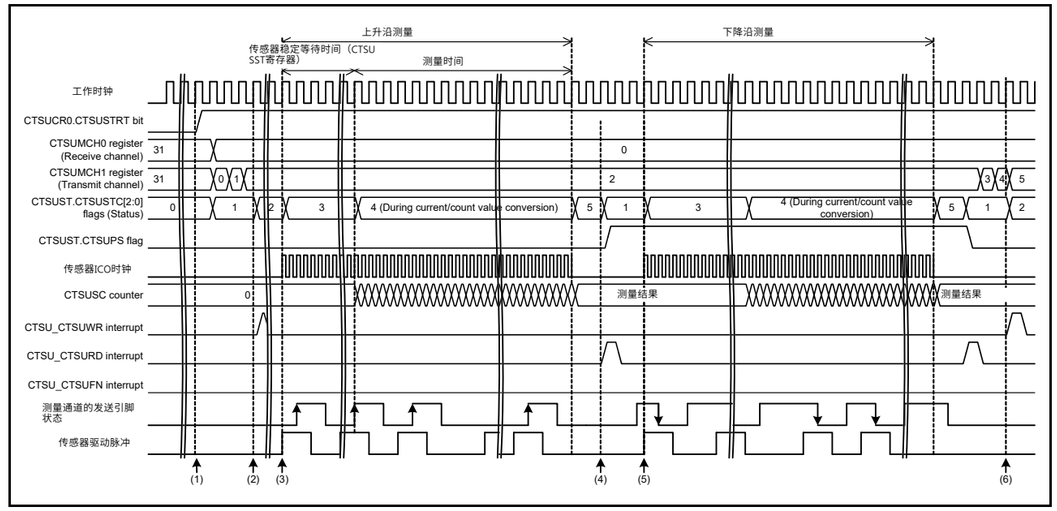

Figure 46.17 测量开始条件为软件触发时的互电容全扫描模式时序

以下序列描述了图46.17所示的操作。

1. 完成初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。
2. 根据预设条件确定待测通道后，输出通道设置请求（CTSU_CTSUWR）。
3. 写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。同时，在传感器驱动脉冲的高电平期间，将在上升沿检测到的脉冲输出到测量通道的发送引脚。
4. 在传感器稳定等待时间和测量时间过去并停止测量后，输出测量结果读取请求(CTSU_CTSURD)。
5. 通过在传感器驱动脉冲的高电平期间输出在下降沿检测到的脉冲来测量同一通道。
6. 同一通道测量两次后，确定下一个要测量的通道，以同样的方式进行测量。
7. 所有测量通道完成后，将输出测量结束中断(CTSU_CTSUFN)并停止测量（转换到状态0）。

当状态5转换为状态1时，CTSU互电容状态标志（CTSUST.CTSUPS位）发生变化。

表46.9列出了互电容全扫描模式下的触摸引脚状态。

Table 46.9 互电容全扫描模式下的触摸引脚状态（1of2）

Status	接收通道的触摸引脚		用于传输通道的触摸引脚		Remarks
	测量通道	Non-measured channel	测量通道	Non-measured channel	
0	Low	Low	Low	Low	-
1	Low	Low	Low/high	Low	-
2	Low	Low	Low	Low	-

Table 46.9 Touch pin states in mutual-capacitance full scan mode (2 of 2)

Status	Touch pins for receive channels		Touch pins for transmit channels		Remarks
	Measured channel	Non-measured channel	Measured channel	Non-measured channel	
3	Pulse	Low	Pulse	Low	The transmit pulse phase is the same as that of the receive channel on the first measurement and opposite on the second measurement
4	Pulse	Low	Pulse	Low	-
5	Low	Low	Low	Low	-

46.3.3 Parameters Common to Multiple Modes

46.3.3.1 Sensor stabilization wait time and measurement time

Figure 46.18 shows the timing of the sensor stabilization wait and measurement.

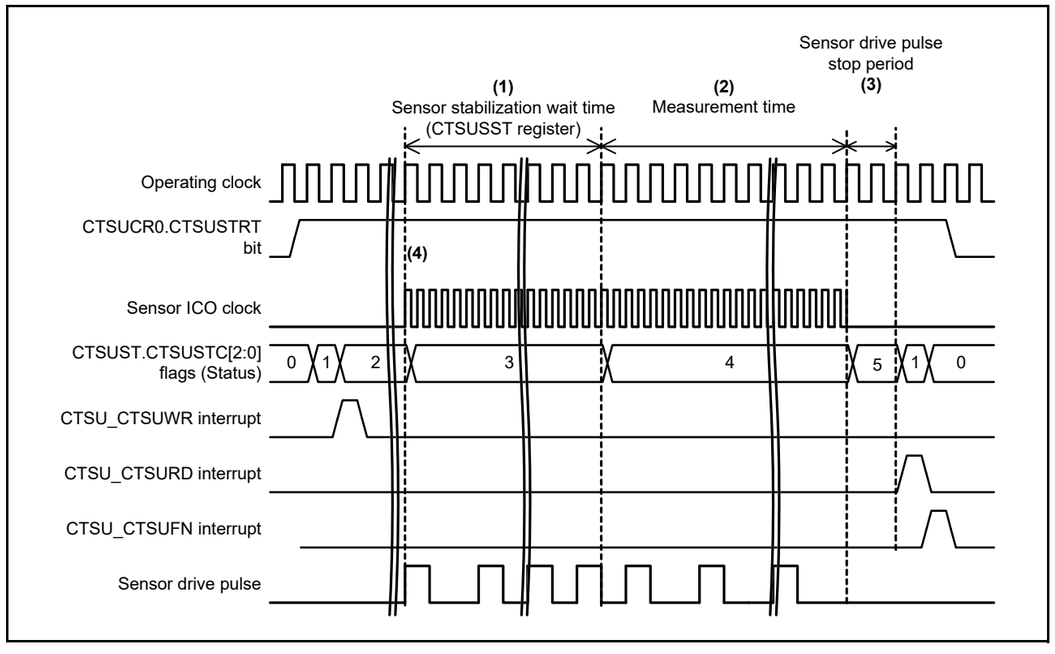

Figure 46.18 Sensor stabilization wait and measurement timing

The following sequence describes the operation shown in Figure 46.18:

1. In response to the CTSU_CTSUWR interrupt request, output of the sensor drive pulse is started by a write access to the CTSUSO1 register. The CTSU waits for the stabilization time set in the CTSUSST register.
2. When the sensor stabilization time elapses and the CTSUST.CTSUDTSR flag is set to 0, measurement starts on transition to Status 4. The measurement time is determined by the base clock cycle setting and the CTSUSDPRS.CTSUPRMODE[1:0], CTSUPRRATIO[3:0], and CTSUSO0.CTSUSNUM[5:0] bits. When the measurement time elapses, measurement of the associated channel stops.
3. After the measurement time elapses, the status transitions to Status 1 after 2 operating clock cycles, and a CTSU_CTSURD interrupt occurs. Read the data from the CTSUSC and CTSURC counters. At this time, the sensor drive pulse is output low. When measurement of all specified channels completes, the CTSUCR0.CTSUSTRT bit is set to 0.
4. The sensor ICO clock oscillates while the CTSUST.CTSUSTC[2:0] flags are 011b (Status 3) or 100b (Status 4).

Table 46.9 互电容全扫描模式下的触摸引脚状态（2个中的2个）

Status	接收通道的触摸引脚		用于传输通道的触摸引脚		Remarks
	测量通道	Non-measured channel	测量通道	Non-measured channel	
3	Pulse	Low	Pulse	Low	发射脉冲相位在第一次测量时与接收通道的相位相同，在第二次测量时相反
4	Pulse	Low	Pulse	Low	-
5	Low	Low	Low	Low	-

46.3.3 多种模式共有的参数

46.3.3.1 传感器稳定等待时间和测量时间

图46.18显示了传感器稳定等待和测量的时序。

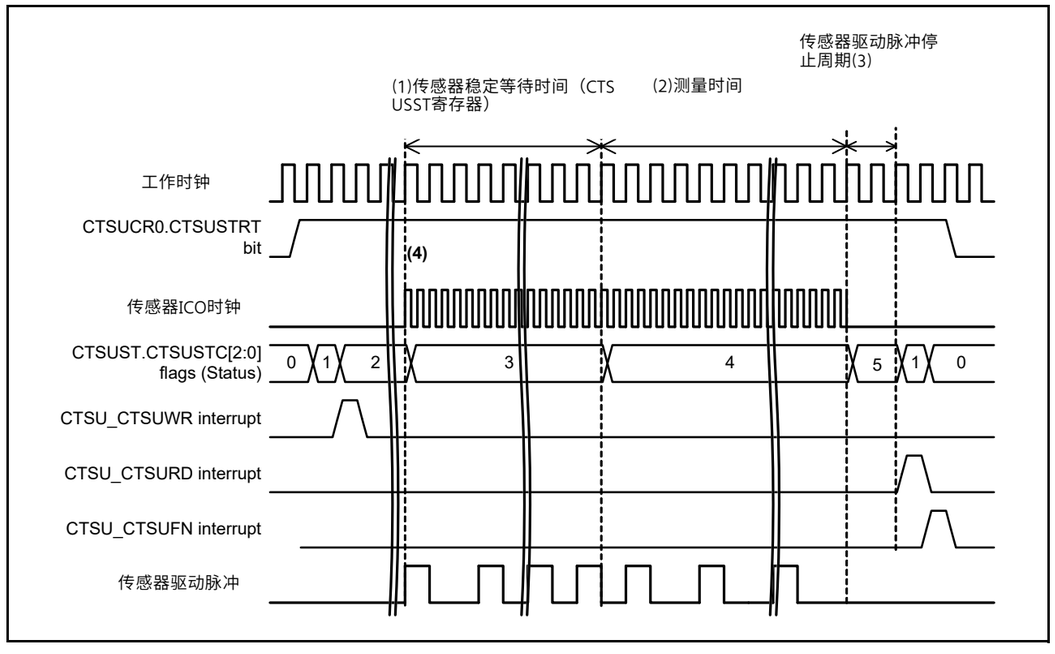

Figure 46.18 传感器稳定等待和测量定时

以下序列描述了图46.18所示的操作：

1. 响应CTSU_CTSUWR中断请求，通过对CTSUSO1寄存器的写访问开始输出传感器驱动脉冲。CTSU等待CTSUSST寄存器中设置的稳定时间。
2. 当传感器稳定时间过去且CTSUST.CTSUDTSR标志设置为0时，测量开始转换到状态4。测量时间由基本时钟周期设置和CTSUSDPRS.CTSUPRMODE[1:0]、CTSUPRATIO[3:0]和CTSUSO0.CTSUSNUM[5:0]位。当测量时间过去时，相关通道的测量将停止。
3. 测量时间过去后，状态在2个工作时钟周期后转换为状态1，并且CTSU_CTSURD中断发生。从CTSUSC和CTSURC计数器读取数据。此时，传感器驱动脉冲输出低电平。当所有指定通道的测量完成时，CTSUCR0.CTSUSTRT位设置为0。
4. 当CTSUST.CTSUSTC[2:0]标志为011b（状态3）或100b（状态4）时，传感器ICO时钟振荡。

RA生态工作室

46.3.3.2 Interrupts

The CTSU supports the following interrupts:

- Write request interrupt for setting registers for each channel (CTSU_CTSUWR)
- Measurement data transfer request interrupt (CTSU_CTSURD)
- Measurement end interrupt (CTSU_CTSUFN).

(1) Write request interrupt for setting registers for each channel (CTSU_CTSUWR)

Store the settings for each measurement channel in the SRAM, and set up the DTC or ICU transfer associated with the CTSU_CTSUWR interrupt in advance. The CTSU_CTSUWR interrupt is output when Status 1 transitions to Status 2. Write the settings for the selected channel from the SRAM to the CTSUSSC, CTSUSO0, and CTSUSO1 registers (Figure 46.19). Because write access to the CTSUSO1 register controls the transition to the next status, be sure to set this register last.

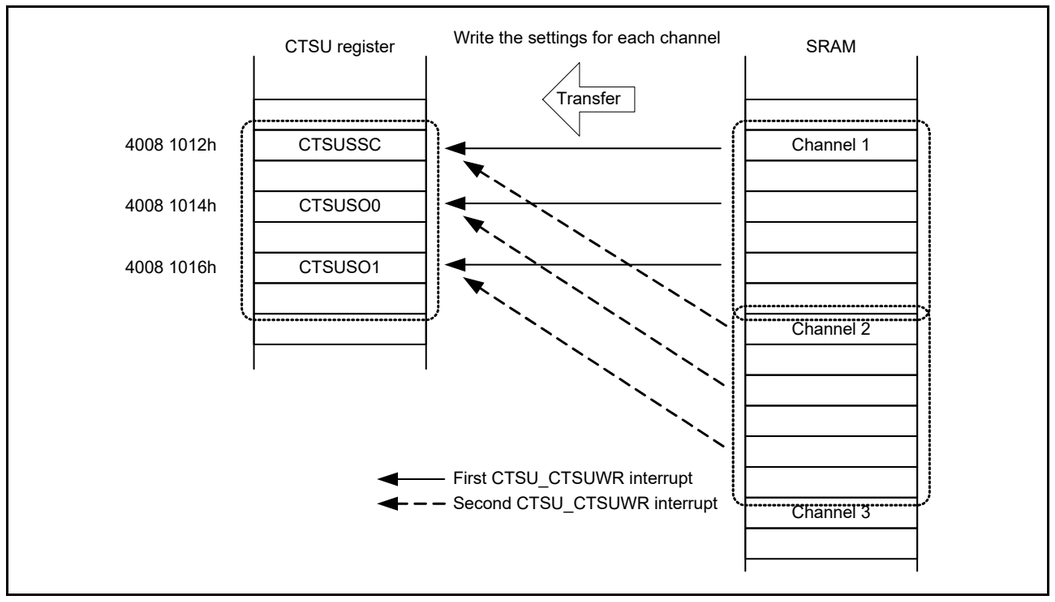

Figure 46.19 Example of DTC transfer operation using the CTSU_CTSUWR interrupt

The registers to be set (CTSUSSC, CTSUSO0, and CTSUSO1) are allocated at sequential addresses. On CTSU_CTSUWR interrupt generation, set up the operation as follows:

- Transfer destination address: CTSUSSC register address
- Handling at the transfer destination address: Transfer 2-byte data three times for a single interrupt. The address of the start byte is fixed.
- Transfer source address: CTSUSSC register data storage address for the lowest number channel in the settings stored in the SRAM
- Handling at the transfer source address: Transfer 2-byte data three times for a single interrupt. The address of the first byte is continued from the previous interrupt handling.
- Number of transfers per interrupt: Specify the number of measurements.

(2) Measurement data transfer request interrupt (CTSU_CTSURD)

Set up the DTC or ICU transfer associated with the CTSU_CTSURD interrupt in advance. The CTSU_CTSURD interrupt is output when Status 5 transitions to Status 1. Read the measurement result from the CTSUSC and CTSURC counters (Figure 46.20).

46.3.3.2 Interrupts

CTSU支持以下中断：

- 为每个通道设置寄存器的写请求中断(CTSU_CTSUWR)
- 测量数据传输请求中断(CTSU_CTSURD)
- 测量结束中断(CTSU_CTSUFN)。

(1) 为每个通道设置寄存器的写请求中断(CTSU_CTSUWR)

将每个测量通道的设置存储在SRAM中，并提前设置与CTSU_CTSUWR中断相关的DTC或ICU传输。当状态1转换到状态2时输出CTSU_CTSUWR中断。
将所选通道的设置从SRAM写入CTSUSSC、CTSUSO0和CTSUSO1寄存器（图46.19）。因为对CTSUSO1寄存器的写访问控制到下一个状态的转换，所以一定要最后设置这个寄存器。

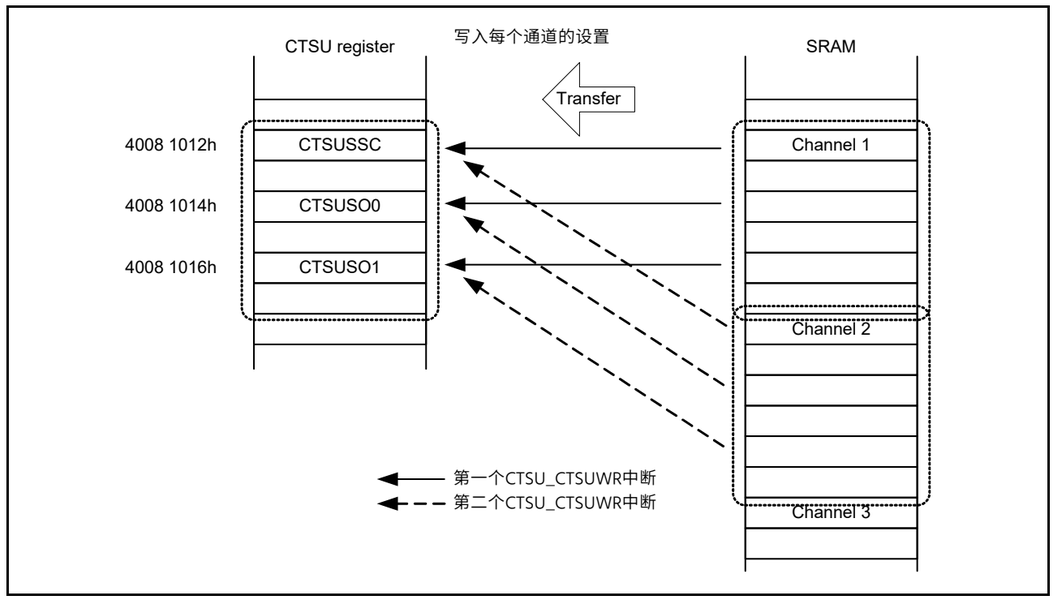

Figure 46.19 使用CTSU_CTSUWR中断的DTC传输操作示例

要设置的寄存器（CTSUSSC、CTSUSO0和CTSUSO1）分配在顺序地址。上
CTSU_CTSUWR中断产生，设置操作如下：

- 传输目标地址：CTSUSSC寄存器地址
- 传送目标地址处的处理：一次中断传送3次2字节数据。起始字节的地址是固定的。
- 传输源地址：CTSUSSC寄存器数据存储地址，用于SRAM中存储的设置中编号最小的通道
- 在传输源地址处处理：一次中断传输3次2字节数据。第一个字节的地址从先前的中断处理继续。
- 每次中断的传输次数：指定测量次数。

(2) 测量数据传输请求中断(CTSU_CTSURD)

提前设置与CTSU_CTSURD中断相关的DTC或ICU传输。当状态5转换为状态1时输出CTSU_CTSURD中断。从CTSUSC和CTSURC计数器读取测量结果（图46.20）。

RA生态工作室

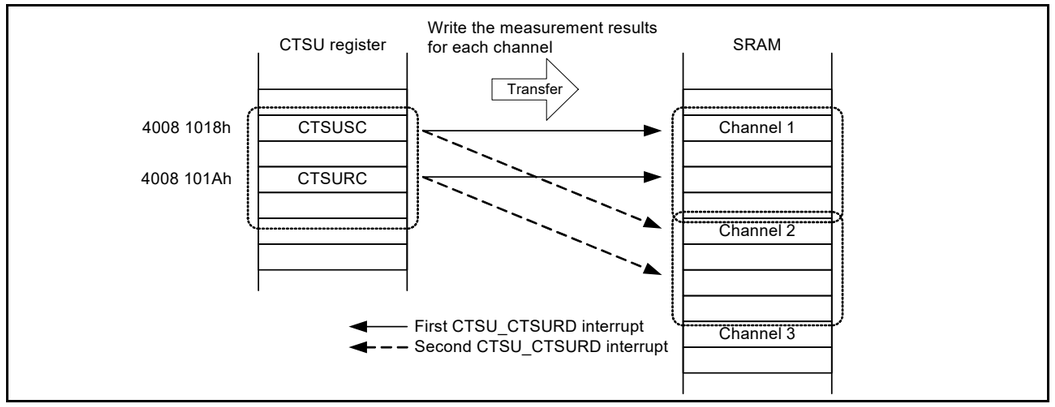

Figure 46.20 Example of DTC transfer operation using the CTSU_CTSURD interrupt

The measurement result registers, CTSUSC and CTSURC counters, used as transfer sources, are allocated at sequential addresses. On CTSU_CTSURD interrupt generation, set up the operation as follows:

- Transfer source address: CTSUSC counter address
- Handling at the transfer source address: Transfer 2-byte data twice for a single interrupt. The start address is fixed.
- Transfer destination address: CTSUSC counter data storage address for the lowest number channel in the settings stored in the SRAM
- Handling at the transfer destination address: Transfer 2-byte data twice for a single interrupt. The start address continues from the previous interrupt handling
- Number of transfers per interrupt: Specify the number of measurements.

(3) Measurement end interrupt (CTSU_CTSUFN)

When all channels are measured, an interrupt occurs when Status 1 transitions to Status 0. In the software, check the overflow flags (CTSUST.CTSUSOVF and CTSUROVF flags) and read the measurement results to determine whether or not the electrode was touched. Interrupt requests are accepted or disabled in the interrupt control block.

46.4 Usage Notes

46.4.1 Measurement Result Data (CTSUSC and CTSURC Counters)

Read access during measurement is prohibited. If the measurement result data is accessed, an incorrect value might be read because of an asynchronous operation.

46.4.2 Constraint on Software Trigger

When 10b (PCLKB/4) is selected in the CTSUCR1.CTSUCLK[1:0] bits, to restart measurement by writing 1 to the CTSUR0.CTSUSTRT bit after measurement is complete, wait for at least 3 cycles to elapse after an interrupt occurs, then write to the CTSUCR0.CTSUSTRT bit.

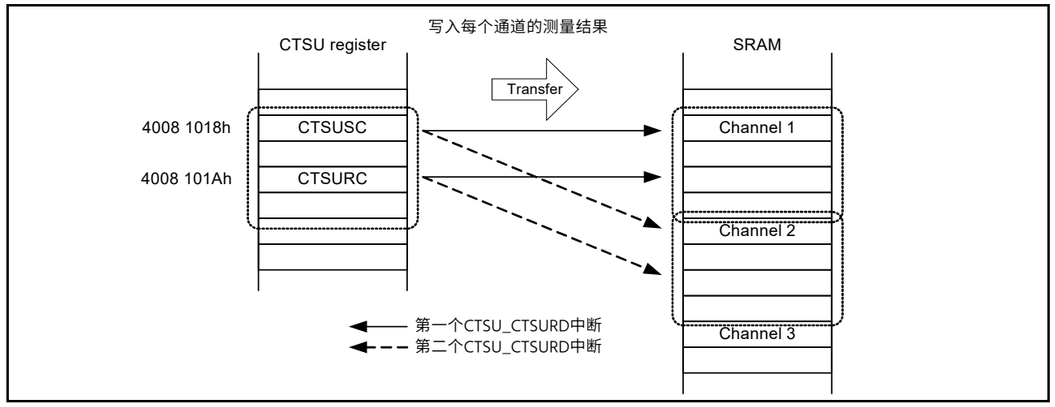

Figure 46.20 使用CTSU_CTSURD中断的DTC传输操作示例

用作传输源的测量结果寄存器CTSUSC和CTSURC计数器被分配在顺序地址中。在CTSU_CTSURD中断生成时，按如下方式设置操作：

- 传输源地址：CTSUSC计数器地址
- 传输源地址处的处理：一次中断传输2字节数据两次。起始地址是固定的。
- 传送目标地址：SRAM中存储的设置中最小编号通道的CTSUSC计数器数据存储地址
- 传送目标地址处的处理：一次中断传送2字节数据两次。起始地址从之前的中断处理继续
- 每次中断的传输次数：指定测量次数。

(3) 测量结束中断(CTSU_CTSUFN)

测量所有通道时，状态1转换为状态0时发生中断。在软件中，检查溢出标志（CTSUST.CTSUSOVF和CTSUROVF标志）并读取测量结果以确定电极是否被触摸。在中断控制块中接受或禁用中断请求。

46.4 使用说明

46.4.1 测量结果数据（CTSUSC和CTSURC计数器）

禁止在测量期间进行读取访问。如果访问测量结果数据，可能会因为异步操作而读取到不正确的值。

46.4.2 软件触发约束

在CTSUCR1.CTSUCLK[1:0]位中选择10b(PCLKB4)时，要在测量完成后通过向CTSUR0.CTSUSTRT位写入1来重新开始测量，请在发生中断后至少等待3个周期，然后写入CTSUCR0.CTSUSTRT位。

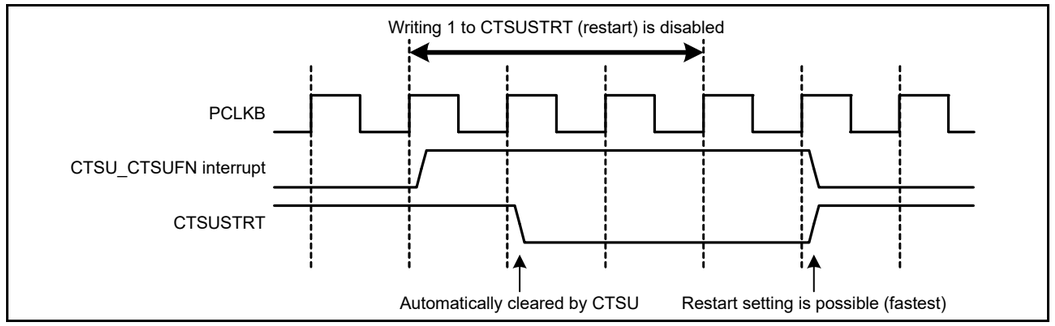

Figure 46.21 Notes on restarting measurement

46.4.3 Constraints on External Triggers

- If an external trigger is input during the measurement time, measurement does not start. The next external event is enabled after 1 operating clock cycle when a CTSU_CTSUFN interrupt is generated.
- To stop external trigger mode, write 0 to the CTSUCR0.CTSUSTRT bit and 0 to the CTSUCR0.CTSUINIT bit at the same time (forced stop).

46.4.4 Constraints on Forced Stops

To force the current operation to stop, write 0 to the CTSUCR0.CTSUSTRT bit and 1 to the CTSUCR0.CTSUINIT bit at the same time. After this setting, the operation is stopped and the internal control registers are initialized.

When the CTSUCR0.CTSUINIT bit is used for initialization, the following registers are initialized in addition to the initialization of the internal measurement state:

- CTSUMCH0 register
- CTSUMCH1 register
- CTSUST register
- CTSUSC counter
- CTSURC counter.

If operation is forced to stop, an interrupt request might be generated depending on the internal state. After a forced stop, also perform the processing for stopping and disabling the DTC or ICU. If a DTC transfer is stopped in an installed system for some reason, also perform the processing to force the stop and to initialize the CTSU.

46.4.5 TSCAP Pin

The TSCAP pin requires an external decoupling capacitor to stabilize the CTSU internal voltage. The traces between the TSCAP pin and the capacitor, and the capacitor and ground should be as short and wide as physically possible.

The capacitor connected to the TSCAP pin should be fully discharged using the I/O port control to output low, before turning on the switch (CTSUCR1.CTSUCSW bit = 1) to establish a connection.

46.4.6 Constraints on Measurement Operation (CTSUCR0.CTSUSTRT bit = 1)

During measurement (CTSUCR0.CTSUSTRT bit = 1), do not use the settings for stopping the peripheral clock or changing the port settings related to the touch pins (TSn and TSCAP pins) and transmission power supply selection (CTSUCR0.CTSUTXVSEL) in the higher layers of the system.

If control settings non-compliant with these constraints are made, and operation is forced to stop (CTSUCR0.CTSUSTRT bit = 0 and CTSUCR0.CTSUINIT bit = 1), write 0 to the CTSUCR1.CTSUPON bit and 0 to the CTSUCR1.CTSUCSW bit at the same time, and set the CTSUCR0.CTSUSNZ bit to 0. Then, restart from the initial settings flow shown in Figure 46.9.

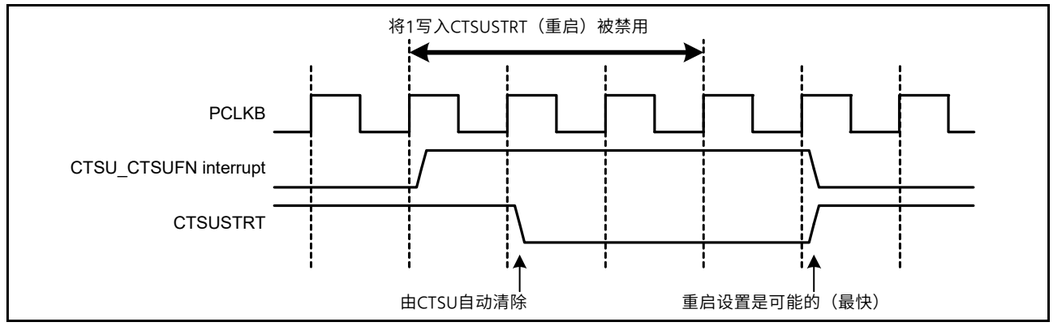

Figure 46.21 重新开始测量的注意事项

46.4.3 外部触发器的约束

- 如果在测量期间输入外部触发，测量不会开始。当产生CTSU_CTSUFN中断时，下一个外部事件在1个工作时钟周期后启用。
- 要停止外部触发模式，同时向CTSUCR0.CTSUSTRT位写入0和向CTSUCR0.CTSUINIT位写入0（强制停止）。

46.4.4 强制停止的约束

要强制停止当前操作，请同时向CTSUCR0.CTSUSTRT位写入0，向CTSUCR0.CTSUINIT位写入1。设置完成后，操作停止，内部控制寄存器初始化。

当使用CTSUCR0.CTSUINIT位进行初始化时，除了初始化内部测量状态之外，还会初始化以下寄存器：

- CTSUMCH0 register
- CTSUMCH1 register
- CTSUST register
- CTSUSC counter
- CTSURC counter.

如果操作被强制停止，根据内部状态可能会产生中断请求。强制停止后，还要执行停止和禁用DTC或ICU的处理。如果由于某种原因在已安装的系统中停止了DTC传输，则还要执行强制停止和初始化CTSU的处理。

46.4.5 TSCAP Pin

TSCAP引脚需要一个外部去耦电容来稳定CTSU内部电压。之间的痕迹
TSCAP引脚和电容器，以及电容器和地线应尽可能短且宽。

在打开开关（CTSUCR1.CTSUCSW位=1）建立连接之前，应使用IO端口控制将连接到TSCAP引脚的电容器完全放电以输出低电平。

46.4.6 测量操作的限制（CTSUCR0.CTSUSTRT位=1）

在测量期间（CTSUCR0.CTSUSTRT位=1），请勿使用高位中用于停止外设时钟或更改与触摸引脚（TSn和TSCAP引脚）和发送电源选择（CTSUCR0.CTSUTXVSEL）相关的端口设置的设置系统的层次。

如果进行了不符合这些约束的控制设置，并强制停止操作（CTSUCR0.CTSUSTRT位=0且CTSUCR0.CTSUINIT位=1），则将0写入CTSUCR1.CTSUPON位并将0写入CTSUCR1.CTSUCSW位同时，将CTSUCR0.CTSUSNZ位设置为0。然后，从图46.9所示的初始设置流程重新开始。

47. Data Operation Circuit (DOC)

47.1 Overview

The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. When a selected condition applies, 16-bit data is compared and an interrupt can be generated.

Table 47.1 lists the DOC specifications, and Figure 47.1 shows a block diagram.

Table 47.1 DOC specifications

Parameter	Specifications
Data operation function	16-bit data comparison, addition, and subtraction
Module-stop function	Module-stop state can be set to reduce power consumption
Interrupts and event link function (DOC_DOPCI)	An interrupt is generated on the following conditions: • Compared values either match or mismatch • The result of data addition is greater than FFFFh • The result of data subtraction is less than 0000h.

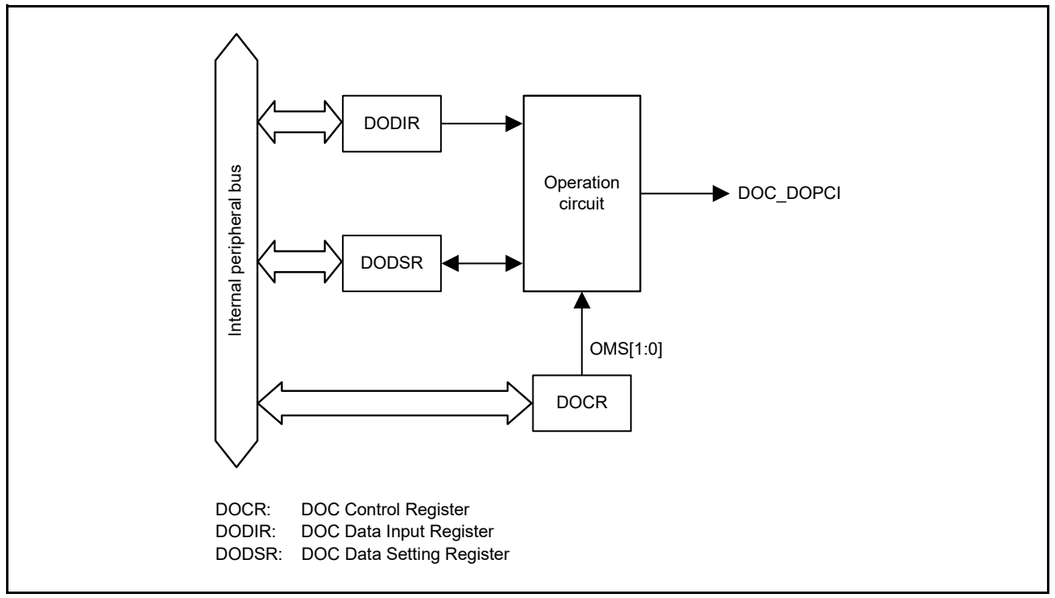

Figure 47.1 DOC block diagram

47. 数据运算电路(DOC)

47.1 Overview

数据运算电路(DOC)对16位数据进行比较、加法和减法。当适用选定条件时，比较16位数据并可以生成中断。

表47.1列出了DOC规范，图47.1显示了框图。

Table 47.1 文档规范

Parameter	Specifications
数据运算功能	16位数据比较、加法和减法
Module-stop function	可设置模块停止状态以降低功耗
中断和事件链接功能（DOC_DOPCI）	在以下情况下会产生中断： 比较值匹配或不匹配 数据加法的结果大于FFFFh 数据减法的结果小于0000h。

47.2 Register Descriptions

47.2.1 DOC Control Register (DOCR)

Address(es): DOC.DOCR 4005 4100h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	DOPCFCL	DOPCF	—	—	DCSEL	OMS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	OMS[1:0]	Operating Mode Select	b1 b0 0 0: Data comparison mode 0 1: Data addition mode 1 0: Data subtraction mode 1 1: Setting prohibited.	R/W
b2	DCSEL*1	Detection Condition Select	0: Set DOPCF when data mismatch is detected 1: Set DOPCF when data match is detected.	R/W
b4, b3	—	Reserved	There bits are read as 0. The write value should be 0.	R/W
b5	DOPCF	Data Operation Circuit Flag	Indicates the result of an operation	R
b6	DOPCFCL	DOPCF Clear	0: Save DOPCF flag state 1: Clear DOPCF flag.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Only valid when data comparison mode is selected.

OMS[1:0] bits (Operating Mode Select)

The OMS[1:0] bits select the operating mode of the DOC.

DCSEL bit (Detection Condition Select)

The DCSEL bit selects the detection condition in data comparison mode. This bit is only valid when data comparison mode is selected.

DOPCF flag (Data Operation Circuit Flag)

The DOPCF flag indicates the result of an operation.

[Setting conditions]

- The condition selected in the DCSEL bit is met
- A data addition result is greater than FFFFh
- A data subtraction result is less than 0000h.

[Clearing condition]

- Writing 1 to the DOPCFCL bit.

DOPCFCL bit (DOPCF Clear)

Setting the DOPCFCL bit to 1 clears the DOPCF flag. This bit is read as 0.

47.2 注册说明

47.2.1 DOC控制寄存器(DOCR)

Address(es): DOC.DOCR 4005 4100h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	DOPCFCL	DOPCF	—	—	DCSEL	OMS[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W

b2	DCSEL*1	检测条件选择	0：检测到数据不匹配时置位DOPCF1：检测到 数据匹配时置位DOPCF。	R/W
b4, b3	—	Reserved	有位被读取为0。写入值应为0。	R/W
b5	DOPCF	数据运算电路标志	表示操作的结果	R
b6	DOPCFCL	DOPCF Clear	0：保存DOPCF标志状态1 ：清除DOPCF标志。	R/W
b7	—	Reserved	该位读取为0。写入值应为0。	R/W

Note 1. 仅在选择数据比较模式时有效。

OMS[1:0]位（操作模式选择）

OMS[1:0]位选择DOC的工作模式。

DCSEL位（检测条件选择）

DCSEL位选择数据比较模式下的检测条件。该位仅在选择数据比较模式时有效。

DOPCF标志（数据操作电路标志）

DOPCF标志指示操作的结果。

[Setting conditions]

- 满足在DCSEL位中选择的条件
- 数据相加结果大于FFFFh
- 数据减法结果小于0000h。

[Clearing condition]

- 将1写入DOPCFCL位。

DOPCFCL位（DOPCF清除）

将DOPCFCL位设置为1会清除DOPCF标志。该位读为0。

47.2.2 DOC Data Input Register (DODIR)

Address(es): DOC.DODIR 4005 4102h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DODIR is a 16-bit read/write register that stores 16-bit data used in all operations.

47.2.3 DOC Data Setting Register (DODSR)

Address(es): DOC.DODSR 4005 4104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DODSR is a 16-bit read/write register that stores 16-bit data used as a reference in data comparison mode. This register also stores the results of operations in data addition and subtraction modes.

47.3 Operation

47.3.1 Data Comparison Mode

Figure 47.2 shows an example DOC operation in data comparison mode. The following sequence is an example of operation when DCSEL is set to 0 (data mismatch is detected as a result of data comparison):

1. Write 00b to the DOCR.OMS[1:0] bits to select data comparison mode.
2. Set 16-bit reference data in DODSR.
3. Write 16-bit data for comparison to DODIR.
4. Continue writing 16-bit data until all data to be compared is written to DODIR.
5. If a value written to DODIR does not match that in DODSR,*1 the DOCR.DOPCF flag is set to 1.

Note 1. When DOCR.DCSEL = 0

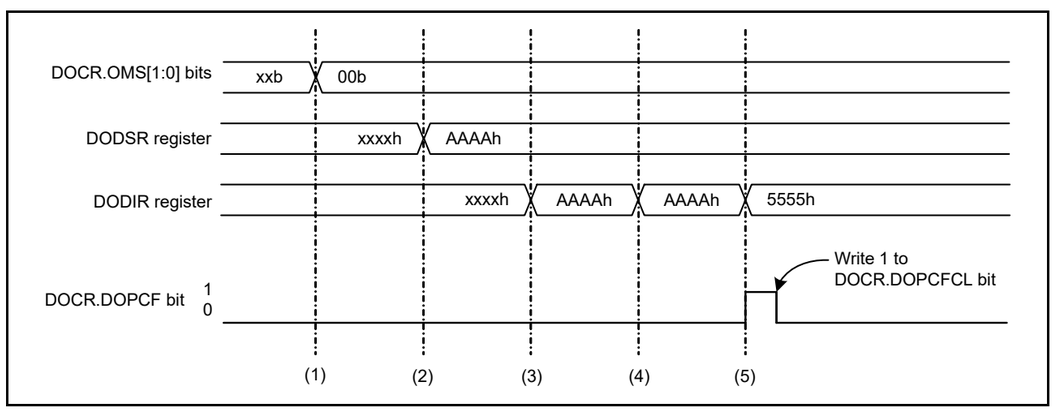

Figure 47.2 Example of operation in data comparison mode

47.2.2 DOC数据输入寄存器(DODIR)

Address(es): DOC.DODIR 4005 4102h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DODIR是一个16位读写寄存器，用于存储所有操作中使用的16位数据。

47.2.3 DOC数据设置寄存器(DODSR)

Address(es): DOC.DODSR 4005 4104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DODSR是一个16位读写寄存器，用于存储16位数据，在数据比较模式下用作参考。该寄存器还存储数据加法和减法模式下的运算结果。

47.3 Operation

47.3.1 数据比较模式

图47.2显示了数据比较模式下的示例DOC操作。以下序列是DCSEL设置为0时的操作示例（通过数据比较检测到数据不匹配）：

1. 将00b写入DOCR.OMS[1:0]位以选择数据比较模式。
2. 在DODSR中设置16位参考数据。
3. 写入16位数据以与DODIR进行比较。
4. 继续写入16位数据，直到所有要比较的数据都写入DODIR。
5. 如果写入DODIR的值与DODSR中的值不匹配，*1DOCR.DOPCF标志设置为1。

注1.当DOCR.DCSEL=0时

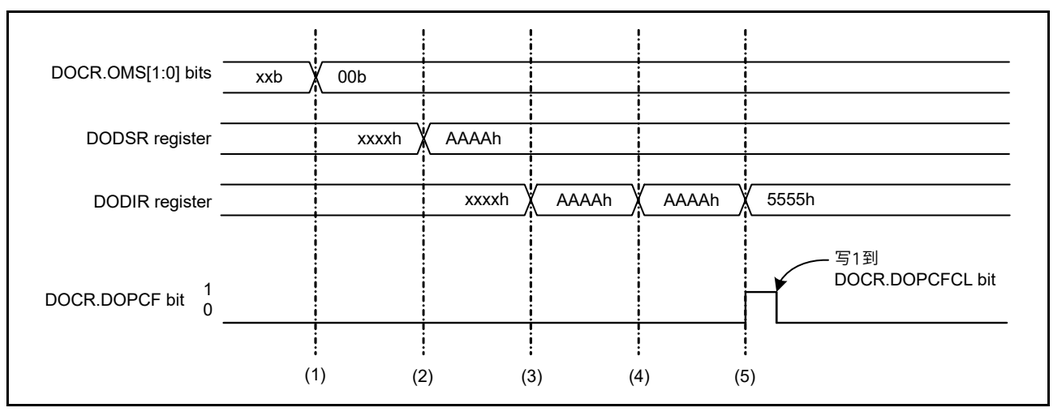

Figure 47.2 数据比较模式的操作示例

47.3.2 Data Addition Mode

Figure 47.3 shows an example for DOC operation in data addition mode. The steps are as follows:

1. Write 01b to the DOCR.OMS[1:0] bits to select data addition mode.
2. Set 16-bit data in the DODSR register as the initial value.
3. Write 16-bit data to be added to the DODIR register. The result of the operation is stored in DODSR.
4. Continue writing 16-bit data until all data to be added is written to DODIR.
5. If the result of an operation is greater than FFFFh, the DOCR.DOPCF flag is set to 1.

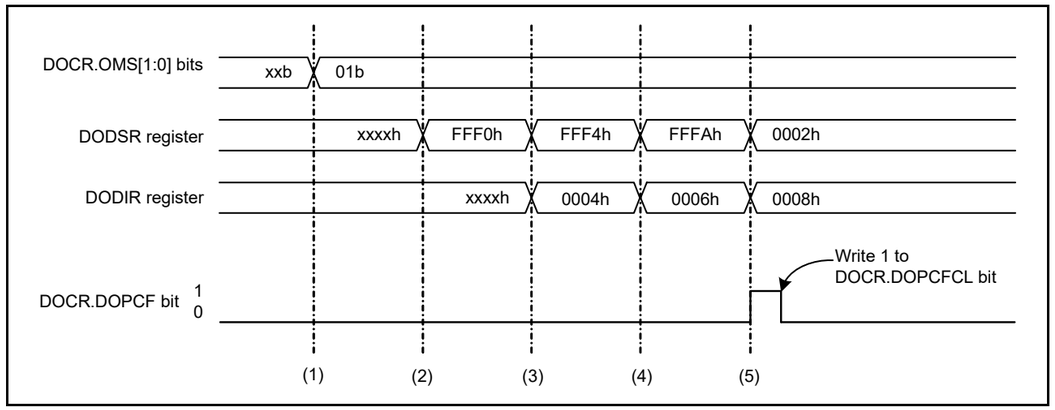

Figure 47.3 Example of operation in data addition mode

47.3.3 Data Subtraction Mode

Figure 47.4 shows an example for DOC operation in data subtraction mode. The steps are as follows:

1. Write 10b to the DOCR.OMS[1:0] bits to select data subtraction mode.
2. Set 16-bit data as the initial value in the DODSR register.
3. Write 16-bit data to be subtracted to the DODIR register. The result of the operation is stored in DODSR.
4. Continue writing 16-bit data to DODIR until all data for subtraction is written.
5. If the result of an operation is less than 0000h, the DOCR.DOPCF flag is set to 1.

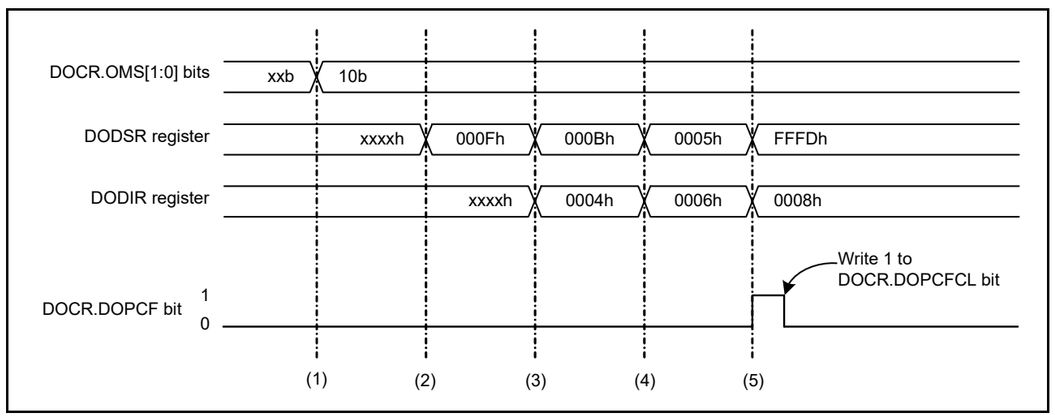

Figure 47.4 Example of operation in data subtraction mode

47.3.2 数据加法模式

图47.3显示了数据添加模式下的DOC操作示例。步骤如下：

1. 将01b写入DOCR.OMS[1:0]位以选择数据添加模式。
2. 将DODSR寄存器中的16位数据设置为初始值。
3. 写入要添加到DODIR寄存器的16位数据。操作结果存储在DODSR中。
4. 继续写入16位数据，直到所有要添加的数据都写入DODIR。
5. 如果运算结果大于FFFFh，则DOCR.DOPCF标志设置为1。

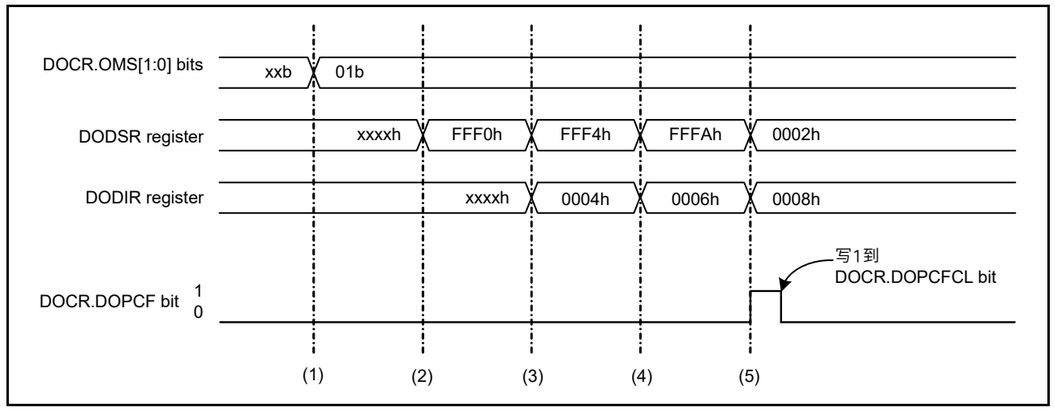

Figure 47.3 数据添加模式中的操作示例

47.3.3 数据减法模式

图47.4显示了数据减法模式下的DOC操作示例。步骤如下：

1. 将10b写入DOCR.OMS[1:0]位以选择数据减法模式。
2. 在DODSR寄存器中设置16位数据作为初始值。
3. 将要减去的16位数据写入DODIR寄存器。操作结果存储在DODSR中。
4. 继续向DODIR写入16位数据，直到写入所有减法数据。
5. 如果运算结果小于0000h，则DOCR.DOPCF标志设置为1。

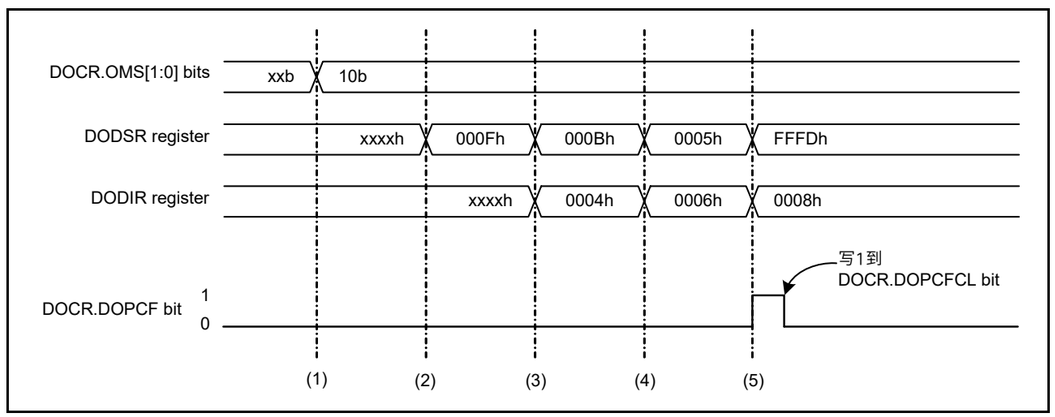

Figure 47.4 数据减法模式下的操作示例

47.4 Interrupt Request and Output to the Event Link Controller (ELC)

The DOC outputs an event signal for the ELC under the following conditions:

- The compared values either match or mismatch
- The data addition result is greater than FFFFh
- The data subtraction result is less than 0000h.

This signal can be used to initiate operations by other modules selected in advance and can also be used as an interrupt request. When an event signal is generated, the Data Operation Circuit Flag (DOCR.DOPCF) is set to 1.

47.5 Usage Notes

47.5.1 Settings for the Module-Stop State

The Module Stop Control Register C (MSTPCRC) can enable or disable DOC operation. The DOC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

47.4 中断请求和输出到事件链接控制器(ELC)

DOC在以下条件下为ELC输出事件信号：

- 比较的值匹配或不匹配
- 数据相加结果大于FFFFh
- 数据减法结果小于0000h。

该信号可用于启动其他预先选择的模块的操作，也可用作中断请求。产生事件信号时，数据操作电路标志(DOCR.DOPCF)设置为1。

47.5 使用说明

47.5.1 模块停止状态的设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用DOC操作。DOC在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

RA生态工作室

48. SRAM

48.1 Overview

The MCU provides on-chip high-speed SRAM modules with either parity-bit checking or Error Correction Code (ECC). The first 32-KB area of SRAM0 is subject to ECC. Parity check is performed on other areas.

Table 48.1 lists the SRAM specifications.

Table 48.1 SRAM specifications

Parameter	Specifications without ECC	Specifications with ECC	SRAMHS specifications
SRAM capacity	SRAM0: 96 KB	SRAM0 (ECC area): 32 KB	SRAMHS: 128 KB
SRAM address*2	SRAM0: 2000 8000h to 2001 FFFFh	SRAM0 (ECC area): 2000 0000h to 2000 7FFFh	SRAMHS: 1FFE 0000h to 1FFF FFFFh
Access*1	Wait states are inserted into the read cycle by default. If the ICLK frequency is faster than 60 (up to 120) MHz, a wait state is required. If the ICLK frequency is 60 MHz or less, a wait state is not required. For details, see section 48.4, Usage Notes.	Wait states are inserted into the read cycle by default. If the ICLK frequency is faster than 60 (up to 120) MHz, a wait state is required. If the ICLK frequency is 60 MHz or less, a wait state is not required. For details, see section 48.4, Usage Notes.	Access to the SRAMHS is always a no wait state
Data retention	Not available in Deep Software Standby mode		
Module-stop function	Module-stop state can be set to reduce power consumption		
Parity	Even-parity (data: 8 bits, parity: 1 bit)	No parity	Even-parity (data: 8 bits, parity: 1 bit)
Error checking	Even-parity error check	Detection up to 2-bit errors	Even-parity error check

Note 1. For details, see section 48.3.7, Access Cycles.
Note 2. The Cortex-M4 processor supports Armv7 unaligned accesses. In this product, SRAMHS and SRAM0 are adjacent to each other and there is a boundary between them in terms of access. Therefore, when SRAMHS and SRAM0 are used as a continuous area of memory space, access that straddles the boundary is not permitted. Such action may lead to accessing unintended data.
For details, see the *ARM® Cortex-M4 Processor Technical Reference Manual*.

48.2 Register Descriptions

48.2.1 SRAM Parity Error Operation After Detection Register (PARIOAD)

Address(es): SRAM.PARIOAD 4000 2000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OAD	Operation after Detection	1: Reset 0: Non-maskable interrupt.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PARIOAD register controls the operation on detection of a parity error. The SRAM Protection Register (SRAMPRCR) protects this register against writes. Always set the SRAMPRCR bit in SRAMPRCR to enabled before writing to this register. Do not write to the PARIOAD register while accessing the SRAM.

48. SRAM

48.1 Overview

MCU提供带有奇偶校验位检查或纠错码(ECC)的片上高速SRAM模块。
SRAM0的第一个32-KB区域受ECC约束。在其他区域执行奇偶校验。

表48.1列出了SRAM规格。

Table 48.1 SRAM specifications

Parameter	不带ECC的规格	带ECC的规格	SRAMHS specifications
SRAM capacity	SRAM0: 96 KB	SRAM0 (ECC area): 32 KB	SRAMHS: 128 KB
SRAM address*2	SRAM0: 2000 8000h to 2001 FFFFh	SRAM0 (ECC area): 2000 0000h to 2000 7FFFh	SRAMHS: 1FFE 0000h to 1FFF FFFFh
Access*1	默认情况下，等待状态被插入到读取周期中。如果ICLK频率高于60（最高120）MHz，则需要等待状态。如果ICLK频率为60MHz或更低，则不需要等待状态。有关详细信息，请参阅第48.4节，使用说明。	默认情况下，等待状态被插入到读取周期中。如果ICLK频率高于60（最高120）MHz，则需要等待状态。如果ICLK频率为60MHz或更低，则不需要等待状态。有关详细信息，请参阅第48.4节，使用说明。	访问SRAMHS始终是无等待状态
数据保留	在深度软件待机模式下不可用		
Module-stop function	可设置模块停止状态以降低功耗		
Parity	Even-parity (data: 8 bits, parity: 1 bit)	无平价	Even-parity (data: 8 bits, parity: 1 bit)
错误检查	偶校验错误检查	检测多达2位错误	偶校验错误检查

Note 1. 有关详细信息，请参阅第48.3.7节，访问周期。
Note 2. Cortex-M4处理器支持Armv7非对齐访问。在本产品中，SRAMHS和SRAM0是相邻的，它们之间在访问上是有界限的。因此，当SRAMHS和SRAM0用作存储空间的连续区域时，不允许跨越边界的访问。此类操作可能会导致访问意外数据。

有关详细信息，请参阅ARM®Cortex-M4处理器技术参考手册。

48.2 注册说明

48.2.1 检测寄存器后的SRAM奇偶校验错误操作(PARIOAD)

Address(es): SRAM.PARIOAD 4000 2000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OAD
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	OAD	检测后的操作	1：复位0：不可屏蔽中断 。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

PARIOAD寄存器控制检测奇偶校验错误时的操作。SRAM保护寄存器(SRAMPRCR)保护该寄存器不被写入。在写入该寄存器之前，始终将SRAMPRCR中的SRAMPRCR位设置为启用。访问SRAM时不要写入PARIOAD寄存器。

OAD bit (Operation after Detection)

The OAD bit specifies the generation of either a reset or a non-maskable interrupt when a parity error is detected. The OAD bit in the PARIOAD register is shared by SRAM0 (without ECC), SRAMHS, and the Standby SRAM.

48.2.2 SRAM Protection Register (SRAMPRCR)

Address(es): SRAM.SRAMPRCR 4000 2004h

	b7	b6	b5	b4	b3	b2	b1	b0
	KW[6:0]							SRAMPRCR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SRAMPRCR	Register Write Control	0: Disable writes to protected registers 1: Enable writes to protected registers.	R/W
b7 to b1	KW[6:0]	Write Key Code	These bits enable or disable writes to the SRAMPRCR bit	R/W

SRAMPRCR bit (Register Write Control)

The SRAMPRCR bit controls the write mode of the SRAMWTSC and PARIOAD registers. When this bit is set to 1, writing to the SRAMWTSC and PARIOAD registers is enabled. When you write to this bit, write 78h to the KW[6:0] bits simultaneously.

KW[6:0] bits (Write Key Code)

The KW[6:0] bits enable or disable writes to the SRAMPRCR bit. When you write to the SRAMPRCR bit, write 78h to the KW[6:0] bits simultaneously. When a value other than 78h is written to KW[6:0], the SRAMPRCR bit is not updated. The KW[6:0] bits are always read as 00h.

48.2.3 SRAM Wait State Control Register (SRAMWTSC)

Address(es): SRAM.SRAMWTSC 4000 2008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SRAM0WTEN	SRAM0ERDWTEN	—
Value after reset:	0	0	0	0	1	1	1	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b1	SRAM0ERDWTEN	SRAM0 (ECC area) Read Wait Enable	1: Add wait state in read access cycle to SRAM0 (ECC area) 0: Do not add wait state in read access cycle to SRAM0 (ECC area).	R/W
b2	SRAM0WTEN	SRAM0 Wait Enable	1: Add wait state in read access cycle to SRAM0 0: Do not add wait state in read access cycle to SRAM0.	R/W
b3	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SRAMWTSC register controls the wait states in the SRAM modules. The SRAM Protection Register (SRAMPRCR) protects this register against writes. Set the SRAMPRCR bit in the SRAMPRCR register to enabled before writing to this register. Do not write to the SRAMWTSC register while accessing the SRAM.

OAD位（检测后操作）

OAD位指定在检测到奇偶校验错误时产生复位或不可屏蔽中断。这
PARIOAD寄存器中的OAD位由SRAM0（无ECC）、SRAMHS和备用SRAM共享。

48.2.2 SRAM保护寄存器(SRAMPRCR)

Address(es): SRAM.SRAMPRCR 4000 2004h

	b7	b6	b5	b4	b3	b2	b1	b0
	KW[6:0]							SRAMPRCR
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SRAMPRCR	寄存器写控制	0：禁止写入受保护寄存器1：允许写入受保护寄存器。	R/W
b7 to b1	KW[6:0]	编写关键代码	这些位启用或禁用对SRAMPRCR位的写入	R/W

SRAMPRCR位（寄存器写控制）

SRAMPRCR位控制SRAMWTSC和PARIOAD寄存器的写模式。当该位设置为1时，允许写入SRAMWTSC和PARIOAD寄存器。写入该位时，同时将78h写入KW[6:0]位。

KW[6:0]位（写入密钥代码）

KW[6:0]位启用或禁用对SRAMPRCR位的写入。写入SRAMPRCR位时，同时将78h写入KW[6:0]位。当78h以外的值写入KW[6:0]时，SRAMPRCR位不会更新。KW[6:0]位总是读为00h。

48.2.3 SRAM等待状态控制寄存器(SRAMWTSC)

Address(es): SRAM.SRAMWTSC 4000 2008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SRAM0WTEN	SRAM0ERDWTEN	—
重置后的值：	0	0	0	0	1	1	1	0

Bit	Symbol	位名称	Description	R/W
b0	—	Reserved	该位读取为0。写入值应为0。	R/W
b1	SRAM0ERDWTEN	SRAM0 (ECC area) Read 等待启用	1：将读访问周期中的等待状态添加到SRAM0（ECC区域）0：不将读访问周期中的等待状态添加到SRAM0（ECC区域）。	R/W
b2	SRAM0WTEN	SRAM0等待使能	1：将读访问周期中的等待状态添加到SRAM00：不将读访问周期中的等待状态添加到SRAM0。	R/W
b3	—	Reserved	该位读取为1。写入值应为1。	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SRAMWTSC寄存器控制SRAM模块中的等待状态。SRAM保护寄存器(SRAMPRCR)保护该寄存器不被写入。在写入该寄存器之前，将SRAMPRCR寄存器中的SRAMPRCR位设置为使能。访问SRAM时不要写入SRAMWTSC寄存器。

SRAM0ERDWTEN bit (SRAM0 (ECC area) Read Wait Enable)

The SRAM0ERDWTEN bit enables the wait cycle for reads from the ECC area in SRAM0. When this bit is set to 1, 1 wait cycle is inserted into the read cycle of the ECC area in SRAM0. When the read access frequency is more than 60 MHz, this wait cycle should be set to 1.

SRAM0WTEN bit (SRAM0 Wait Enable)

The SRAM0WTEN bit enables the wait cycle for reads from SRAM0. When this bit is set to 1, 1 wait cycle is inserted into the read cycle of SRAM0. When the read access frequency is more than 60 MHz, this wait cycle should be set to 1.

48.2.4 ECC Operating Mode Control Register (ECCMODE)

Address(es): SRAM.ECCMODE 4000 20C0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	ECCMOD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	ECCMOD[1:0]	ECC Operating Mode Select	b1 b0 0 0: Disable ECC function 0 1: Setting prohibited 1 0: Enable ECC function without error checking 1 1: Enable ECC function with error checking.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ECCMODE register specifies the ECC operating mode. The ECC Protection Register (ECCPRCR) protects this register against writes. Set the ECCPRCR bit in the ECCPRCR register to enabled before writing to this register. Do not write to the ECCMODE register while accessing the SRAM.

ECCMOD[1:0] bits (ECC Operating Mode Select)

The ECCMOD[1:0] bits set the access mode for the ECC area in SRAM0.

48.2.5 ECC 2-Bit Error Status Register (ECC2STS)

Address(es): SRAM.ECC2STS 4000 20C1h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ECC2ERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ECC2ERR	ECC 2-Bit Error Status	0: No 2-bit ECC error occurred 1: 2-bit ECC error occurred.	R(/W)*1
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the bit.

ECC2ERR bit (ECC 2-Bit Error Status)

The ECC2ERR bit indicates whether a 2-bit ECC error occurred in the ECC area of the SRAM. When ECC operations are enabled and error correction is selected, this bit is set to 1 if a 2-bit error is detected. The SRAM error signal is also asserted. Writing 0 to the ECC2ERR bit negates the SRAM error signal triggered by the 2-bit ECC error.

The SRAM error can be specified as a non-maskable interrupt or a reset in the ECCOAD register. Do not access the ECC area in the SRAM while writing 0 to this register.

SRAM0ERDWTEN位（SRAM0（ECC区域）读取等待使能）

SRAM0ERDWTEN位使能从SRAM0中的ECC区域读取的等待周期。当该位设置为1时，会在SRAM0的ECC区域的读取周期中插入1个等待周期。当读访问频率超过60MHz时，该等待周期应设置为1。

SRAM0WTEN位（SRAM0等待使能）

SRAM0WTEN位使能从SRAM0读取的等待周期。当该位设置为1时，会在SRAM0的读取周期中插入1个等待周期。当读访问频率超过60MHz时，该等待周期应设置为1。

48.2.4 ECC操作模式控制寄存器(ECCMODE)

Address(es): SRAM.ECCMODE 4000 20C0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	ECCMOD[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	ECCMOD[1:0]	ECC操作模式选择	b1b000：禁用ECC功能01：设置禁止10：启用ECC功能不进行错误检查11：启用ECC功能并进行错误检查。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ECCMODE寄存器指定ECC工作模式。ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该寄存器之前，将ECPCRR寄存器中的ECPCRR位设置为使能。访问SRAM时不要写入ECCMODE寄存器。

ECCMOD[1:0]位（ECC操作模式选择）

ECCMOD[1:0]位设置SRAM0中ECC区域的访问模式。

48.2.5 ECC2位错误状态寄存器(ECC2STS)

Address(es): SRAM.ECC2STS 4000 20C1h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ECC2ERR
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	ECC2ERR	ECC2位错误状态	0：未发生2位ECC错误1：发生2位ECC错误。	R(/W)*1
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只能写入0以清除该位。

ECC2ERR位（ECC2位错误状态）

ECC2ERR位指示SRAM的ECC区域是否发生2位ECC错误。当启用ECC操作并选择纠错时，如果检测到2位错误，则该位设置为1。SRAM错误信号也被置位。将0写入ECC2ERR位会否定由2位ECC错误触发的SRAM错误信号。

SRAM错误可以指定为不可屏蔽中断或ECCOAD寄存器中的复位。向该寄存器写入0时不要访问SRAM中的ECC区域。

48.2.6 ECC 1-Bit Error Information Update Enable Register (ECC1STSEN)

Address(es): SRAM.ECC1STSEN 4000 20C2h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	E1STSEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	E1STSEN	ECC 1-Bit Error Information Update Enable	0: Disable updating of 1-bit ECC error information 1: Enable updating of 1-bit ECC error information.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ECC1STSEN register enables or disables updating of the ECC 1-Bit Error Status Register (ECC1STS) in response to a 1-bit ECC error in the SRAM (ECC area). The ECC Protection Register (ECCPRCR) protects this register against writes. Before writing to this bit, set the ECCPRCR bit in the ECCPRCR register to 1 to disable write protection.

E1STSEN bit (ECC 1-Bit Error Information Update Enable)

The E1STSEN bit enables or disables updating of the SRAM (ECC area) 1-Bit Error Status Register (ECC1STS) in response to a 1-bit error in the ECC area of SRAM. The register also functions as an interrupt or a reset mask.

48.2.7 ECC 1-Bit Error Status Register (ECC1STS)

Address(es): SRAM.ECC1STS 4000 20C3h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ECC1ERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ECC1ERR	ECC 1-Bit Error Status	0: No 1-bit ECC error occurred 1: 1-bit ECC error occurred.	R(/W)*1
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the bit.

ECC1ERR bit (ECC 1-Bit Error Status)

The ECC1ERR bit indicates whether a 1-bit ECC error occurred in the ECC area of the SRAM. When ECC operations are enabled and error correction is selected, and updating of the 1-bit error information is enabled, this bit is set to 1 if a 1-bit error is detected. The SRAM error signal is also asserted. Writing 0 to the ECC1ERR bit negates the SRAM error signal triggered by the 1-bit ECC error.

The SRAM error can be specified as a non-maskable interrupt or reset in the ECCOAD register. Do not access the ECC area in the SRAM while writing 0 to this register.

48.2.6 ECC1位错误信息更新使能寄存器(ECC1STSEN)

Address(es): SRAM.ECC1STSEN 4000 20C2h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	E1STSEN
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	E1STSEN	ECC1位错误信息更新 Enable	0：禁止更新1-bitECC错误信息1：允许更新1-bit ECC错误信息。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ECC1STSEN寄存器启用或禁用ECC1位错误状态寄存器(ECC1STS)的更新，以响应SRAM（ECC区域）中的1位ECC错误。ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该位之前，将ECPCRR寄存器中的ECPCRR位设置为1以禁用写保护。

E1STSEN位（ECC1位错误信息更新使能）

E1STSEN位启用或禁用SRAM（ECC区域）1位错误状态寄存器(ECC1STS)的更新，以响应SRAM的ECC区域中的1位错误。该寄存器还用作中断或复位掩码。

48.2.7 ECC1位错误状态寄存器(ECC1STS)

Address(es): SRAM.ECC1STS 4000 20C3h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ECC1ERR
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	ECC1ERR	ECC1位错误状态	0：未发生1位ECC错误1：发生1位ECC错误。	R(/W)*1
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只能写入0以清除该位。

ECC1ERR位（ECC1位错误状态）

ECC1ERR位指示SRAM的ECC区域是否发生1位ECC错误。当启用ECC操作并选择纠错并启用1位错误信息的更新时，如果检测到1位错误，则该位设置为1。SRAM错误信号也被置位。将0写入ECC1ERR位会否定由1位ECC错误触发的SRAM错误信号。

SRAM错误可以在ECCOAD寄存器中指定为不可屏蔽中断或复位。向该寄存器写入0时不要访问SRAM中的ECC区域。

48.2.8 ECC Protection Register (ECCPRCR)

Address(es): SRAM.ECCPRCR 4000 20C4h

	b7	b6	b5	b4	b3	b2	b1	b0
	KW[6:0]							ECCPRCR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ECCPRCR	Register Write Control	0: Disable writes to protected registers 1: Enable writes to protected registers.	R/W
b7 to b1	KW[6:0]	Write Key Code	These bits enable or disable writes to the ECCPRCR bit.	R/W

ECCPRCR bit (Register Write Control)

The ECCPRCR bit controls the write mode of the ECCMODE, ECC1STSEN, and ECCOAD registers. When this bit is set to 1, writing to the ECCMODE, ECC1STSEN, and ECCOAD registers is enabled. When writing to this bit, write 78h to the KW[6:0] bits simultaneously.

KW[6:0] bits (Write Key Code)

The KW[6:0] bits enable or disable writes to the ECCPRCR bit. When writing to the ECCPRCR bit, write 78h to the KW[6:0] bits simultaneously. When a value other than 78h is written to KW[6:0], the ECCPRCR bit is not updated. The KW[6:0] bits are always read as 00h.

48.2.9 ECC Test Control Register (ECCETST)

Address(es): SRAM.ECCETST 4000 20D4h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TSTBYP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TSTBYP	ECC Bypass Select	0: Disable ECC bypass 1: Enable ECC bypass.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ECC Protection Register 2 (ECCPRCR2) protects this register against writes. Before writing to this bit, set the ECCPRCR2 bit in the ECCPRCR2 register to 1 (write protection disabled). Do not write to the ECCETST register while accessing the SRAM.

TSTBYP bit (ECC Bypass Select)

The TSTBYP bit enables direct access to the ECC code by bypassing the ECC function. When the ECC bypass function is used, the ECCMOD[1:0] bits in the ECCMODE register are set to 00b. The ECC must be accessed in 32 bits using the same address for 32-bit data. The ECC code is assigned to the lower 7 bits of the 32-bit data. The upper 25 bits in the write data are ignored. The upper 25 bits in the read data are undefined.

Note: For details of ECC test, see section 48.3.4, ECC Decoder Testing.

48.2.8 ECC保护寄存器(ECPCRR)

Address(es): SRAM.ECCPRCR 4000 20C4h

	b7	b6	b5	b4	b3	b2	b1	b0
	KW[6:0]							ECCPRCR
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	ECCPRCR	寄存器写控制	0：禁止写入受保护寄存器1：允许写入受保护寄存器。	R/W
b7 to b1	KW[6:0]	编写关键代码	这些位启用或禁用写入ECCPRCR bit.	R/W

ECPCRR位（寄存器写控制）

ECPCRR位控制ECCMODE、ECC1STSEN和ECCOAD寄存器的写模式。当该位设置为1时，允许写入ECCMODE、ECC1STSEN和ECCOAD寄存器。写入该位时，同时将78h写入KW[6:0]位。

KW[6:0]位（写入密钥代码）

KW[6:0]位启用或禁用对ECPCRR位的写入。当写入ECPCRR位时，将78h写入KW[6:0]位同时进行。当向KW[6:0]写入78h以外的值时，不会更新ECPCRR位。这KW[6:0]位总是读为00h。

48.2.9 ECC测试控制寄存器(ECCETST)

Address(es): SRAM.ECCETST 4000 20D4h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TSTBYP
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	TSTBYP	ECC旁路选择	0：禁用ECC旁路1：启用ECC旁路。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ECC保护寄存器2(ECCPRCR2)保护该寄存器不被写入。在写入该位之前，将ECPCRR2寄存器中的ECPCRR2位为1（写保护禁用）。访问SRAM时不要写入ECCETST寄存器。

TSTBYP位（ECC旁路选择）

TSTBYP位允许通过绕过ECC功能直接访问ECC代码。使用ECC旁路功能时，ECCMODE寄存器中的ECCMOD[1:0]位设置为00b。必须使用32位数据的相同地址以32位访问ECC。ECC代码分配给32位数据的低7位。写入数据的高25位被忽略。读取数据的高25位未定义。

Note: 有关ECC测试的详细信息，请参阅第48.3.4节，ECC解码器测试。

48.2.10 SRAM ECC Error Operation After Detection Register (ECCOAD)

Address(es): SRAM.ECCOAD 4000 20D8h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OAD	Operation after Detection	1: Reset 0: Non-maskable interrupt.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ECCOAD register controls the operation on detection of a ECC error. The ECC Protection Register (ECCPRCR) protects this register against writes. Before writing to this bit, set the ECCPRCR bit in the ECCPRCR register to 1. Do not write to the ECCOAD register while accessing the SRAM.

OAD bit (Operation after Detection)

The OAD bit specifies the generation of either a reset or a non-maskable interrupt when an ECC error is detected. The OAD bit in the ECCOAD register is used for the SRAM (ECC area).

48.3 Operation

48.3.1 Low-Power Functions

Power consumption can be reduced by setting the Module Stop Control Register A (MSTPCRA) to stop the supply of the clock signal to the SRAM. The control bits for each module are as follows:

- Setting both the MSTPA0 and MSTPA6 bits in the MSTPCRA to 1 stops the supply of the clock signal to SRAM0*1
- Setting the MSTPA5 bit in MSTPCRA to 1 stops the supply of the clock signal to SRAMHS
- Setting the MSTPA7 bit in MSTPCRA to 1 stops the supply of the clock signal to Standby SRAM.

Stopping the clock signal supply places the SRAM in the module-stop state. The SRAM operates after a reset.

The SRAM is not accessible in the module-stop state. Do not transition to the module-stop state while accessing the SRAM. Access to the SRAM in the module-stop state is prohibited. If access is attempted, correct operation is not guaranteed. For details on the MSTPCRA register, see section 11, Low Power Modes.

Note 1. The MSTPA0 and MSTPA6 bits in the MSTPCRA register must be set to the same value.

48.3.2 ECC Function

You can enable or disable the ECC function by setting the ECCMODE register. By default, the ECC function is disabled and the ECC check type is SEC-DED (Single-Error Correction and Double-Error Detection).

When the ECC function is enabled, 7-bit check bits are appended to the 32-bit data for writes. For reads, 39-bit data (32-bit data and 7-bit check bits) is read from the SRAM (ECC area).

When the ECC function and error checking are both enabled, error correction is performed if a 1-bit error occurs, and the ECC1ERR bit in the ECC1STS register is set to 1 if the E1STSEN bit in the ECC1STSEN register is 1. If a 2-bit error occurs, the error is detected without error correction, and the ECC2ERR bit in the ECC2STS register is set to 1.

When the ECC function is enabled and error checking is disabled, error correction is performed if a 1-bit error occurs but the ECC1ERR bit in the ECC1STS register is not updated even if the E1STSEN bit in the ECC1STSEN register is 1. If a 2-bit error occurs, the error is detected but the ECC2ERR bit in the ECC2STS register is not updated, and error correction is not performed.

48.2.10 SRAMECC检测后错误操作寄存器(ECCOAD)

Address(es): SRAM.ECCOAD 4000 20D8h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OAD
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	OAD	检测后的操作	1：复位0：不可屏蔽中断 。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ECCOAD寄存器控制检测到ECC错误时的操作。ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该位之前，将ECPCRR寄存器中的ECPCRR位设置为1。访问SRAM时不要写入ECCOAD寄存器。

OAD位（检测后操作）

OAD位指定在检测到ECC错误时生成复位或不可屏蔽中断。这
ECCOAD寄存器中的OAD位用于SRAM（ECC区域）。

48.3 Operation

48.3.1 Low-Power Functions

通过设置模块停止控制寄存器A(MSTPCRA)以停止向SRAM提供时钟信号，可以降低功耗。每个模块的控制位如下：

- 将MSTPCRA中的MSTPA0和MSTPA6位都设置为1会停止向
  SRAM0*1
- 将MSPCRA中的MSTPA5位设置为1会停止向SRAMHS提供时钟信号
- 将MSPTCRA中的MSTPA7位设置为1会停止向待机SRAM提供时钟信号。

停止时钟信号供应会将SRAM置于模块停止状态。SRAM在复位后运行。

SRAM在模块停止状态下不可访问。访问时不要转换到模块停止状态
SRAM。禁止在模块停止状态下访问SRAM。如果尝试访问，则无法保证正确操作。有关MSTPCRA寄存器的详细信息，请参见第11节，低功耗模式。

注1.MSTPCRA寄存器中的MSTPA0和MSTPA6位必须设置为相同的值。

48.3.2 ECC Function

您可以通过设置ECCMODE寄存器来启用或禁用ECC功能。默认情况下，ECC功能关闭，ECC检查类型为SEC-DED（Single-ErrorCorrectionandDouble-ErrorDetection）。

当ECC功能使能时，7位校验位会附加到32位数据以进行写入。对于读取，从SRAM（ECC区域）读取39位数据（32位数据和7位校验位）。

当ECC功能和错误检查都使能时，如果发生1位错误，则执行错误纠正，并且
如果ECC1STSEN寄存器中的E1STSEN位为1，则ECC1STS寄存器中的ECC1ERR位设置为1。如果发生2位错误，则无需纠错即可检测到错误，并且ECC2STS寄存器中的ECC2ERR位设置为1。

当启用ECC功能且禁用错误检查时，如果发生1位错误但即使ECC1STSEN寄存器中的E1STSEN位为1，ECC1STS寄存器中的ECC1ERR位也不会更新，则执行纠错。如果2-发生位错误，检测到错误但ECC2STS寄存器中的ECC2ERR位不更新，不进行纠错。

RA生态工作室

When the ECC function is disabled, neither error correction nor error detection is done even when a 1-bit or 2-bit error occurs. Therefore, the ECC1ERR and ECC2ERR bits are not updated.

It is not possible to confirm the location where the error is detected. Therefore, after an error occurs, update all the data. by writing 32-bit data to the SRAM.

Because the SRAM data is undefined after power on and release from Deep Software Standby mode, accessing the SRAM when the ECC function is enabled and error checking is selected, causes an ECC error. To avoid this, write 32-bit data to the area to be used in the SRAM before using the ECC function.

When a read access is performed consecutively after a write access, the read access has priority. Therefore, during initialization, do not perform the read access successively after a write access.

48.3.3 ECC Error Generation

When the ECC function is enabled and error checking is applied to the SRAM (ECC area), an ECC error occurs when the ECC2ERR bit in the ECC2STS register or the ECC1ERR bit in the ECC1STS register becomes 1 to indicate that the ECC checking revealed a 2-bit error or a 1-bit error, respectively.

An ECC error is output with a pulse width of ICLK. To mask ECC 1-bit errors, set the ECC1STSEN.E1STSEN bit to 0 to disable updating of the ECC1ERR bit. An ECC error is not generated when the ECC function is disabled or enabled and error checking is not selected.

An ECC error can be a non-maskable interrupt or a reset, as specified in the ECCOAD register. When the OAD bit in the ECCOAD register is set to 1, an ECC error is output to the reset function. When the OAD bit in the ECCOAD register is set to 0, an ECC error interrupt is output to the ICU as a non-maskable interrupt.

48.3.4 ECC Decoder Testing

Figure 48.1 shows the ECC decoder testing.

禁用ECC功能时，即使发生1位或2位错误，也不会进行纠错或错误检测。因此，ECC1ERR和ECC2ERR位不会更新。

无法确认检测到错误的位置。因此，发生错误后，更新所有数据。通过将32位数据写入SRAM。

由于SRAM数据在上电并从深度软件待机模式释放后未定义，因此访问
当启用ECC功能并选择错误检查时，SRAM会导致ECC错误。为避免这种情况，请在使用ECC功能之前将32位数据写入SRAM中要使用的区域。

当在写访问之后连续执行读访问时，读访问具有优先权。因此，在初始化过程中，不要在写访问之后再进行读访问。

48.3.3 ECC错误生成

当启用ECC功能并对SRAM（ECC区域）应用错误检查时，当
ECC2STS寄存器中的ECC2ERR位或ECC1STS寄存器中的ECC1ERR位变为1表示
ECC检查分别显示2位错误或1位错误。

以ICLK脉冲宽度输出ECC错误。要屏蔽ECC1位错误，请将ECC1STSEN.E1STSEN位设置为0以禁用ECC1ERR位的更新。禁用或启用ECC功能且未选择错误检查时，不会产生ECC错误。

ECC错误可以是不可屏蔽的中断或复位，如ECCOAD寄存器中所指定。当ECCOAD寄存器中的OAD位设置为1时，向复位功能输出ECC错误。当ECCOAD寄存器中的OAD位设置为0时，ECC错误中断作为不可屏蔽中断输出到ICU。

48.3.4 ECC解码器测试

图48.1显示了ECC解码器测试。

RA生态工作室

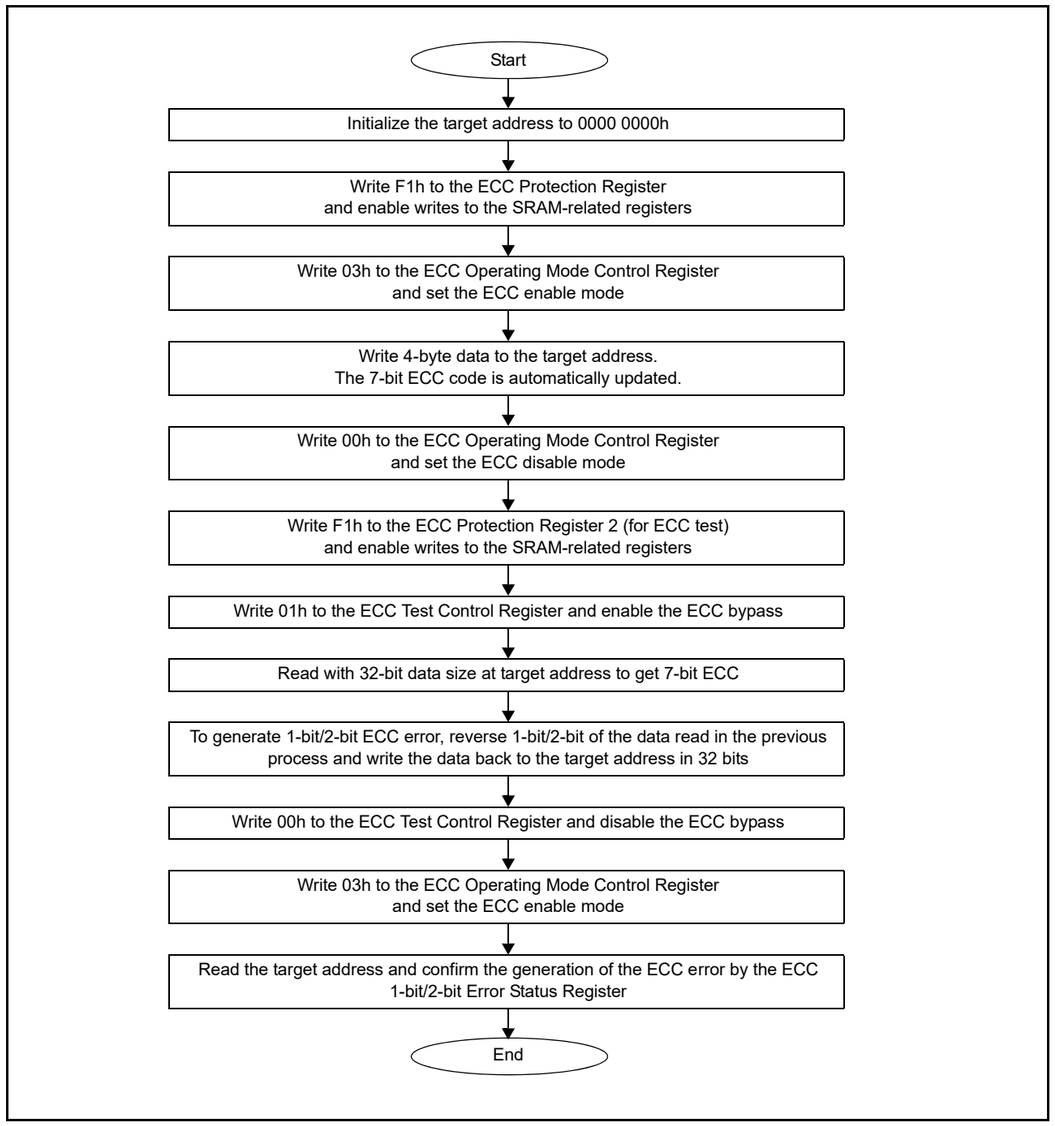

Figure 48.1 ECC decoder testing

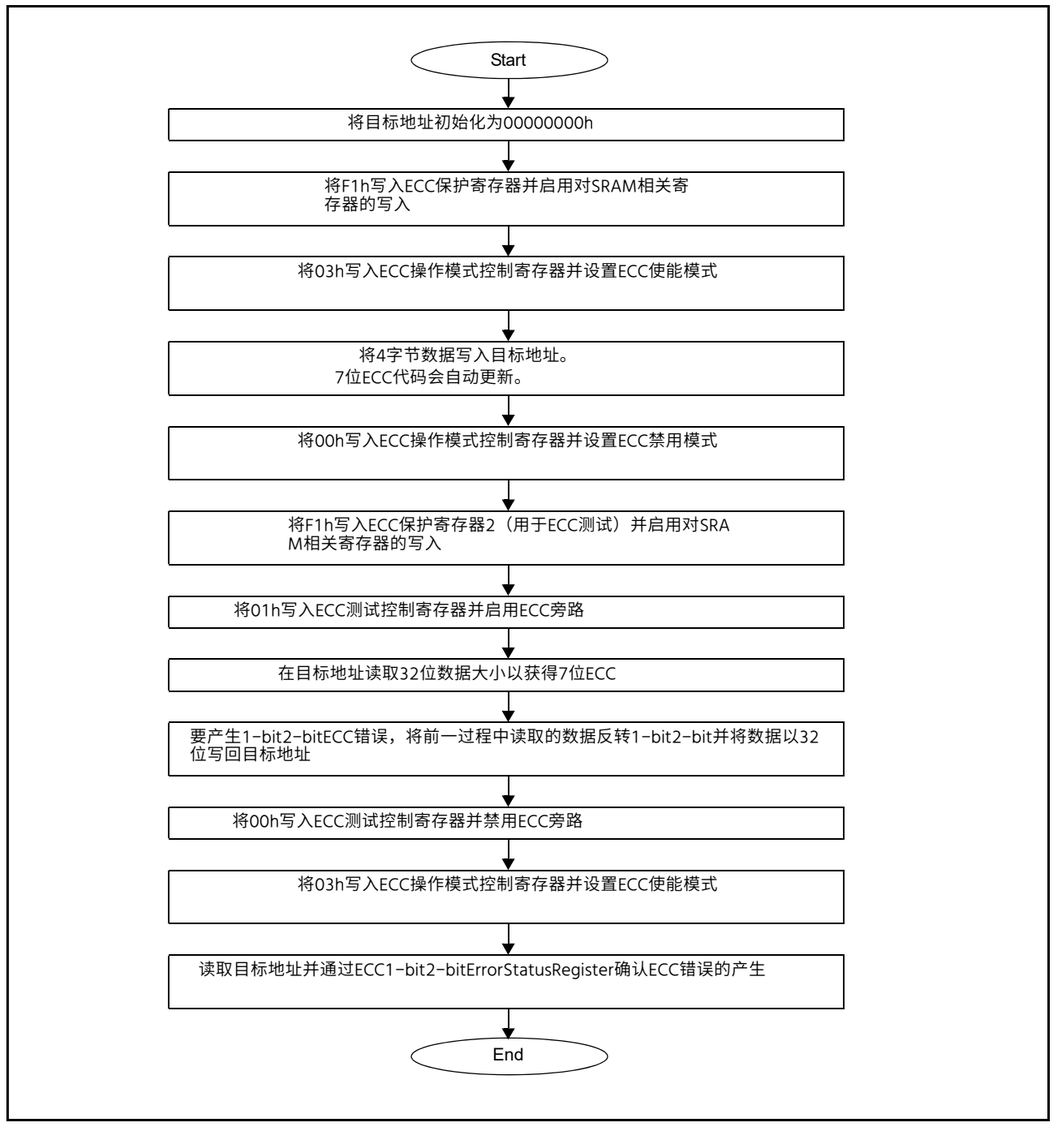

Figure 48.1 ECC解码器测试

48.3.5 Parity Calculation Function

The IEC60730 standard requires the checking of SRAM data. When data is written, a parity bit is added to every 8-bit data in the SRAM which has a 32-bit data width, and when data is read, the parity is checked. When a parity error occurs, a parity-error notification is generated. This function can also be used to trigger a reset. The specification for SRAM0 without ECC, SRAMHS, and Standby SRAM is even parity.

Parity error notification can be specified as a non-maskable interrupt or a reset in the OAD bit in the PARIOAD register. When the OAD bit in the PARIOAD register is set to 1, a parity error is output to the reset function. When the OAD bit is set to 0, a parity error is output to the ICU as a non-maskable interrupt.

Parity errors often occur because of noise. To confirm whether the cause of the parity error is noise or corruption, see the parity check flows in Figure 48.2 and Figure 48.3.

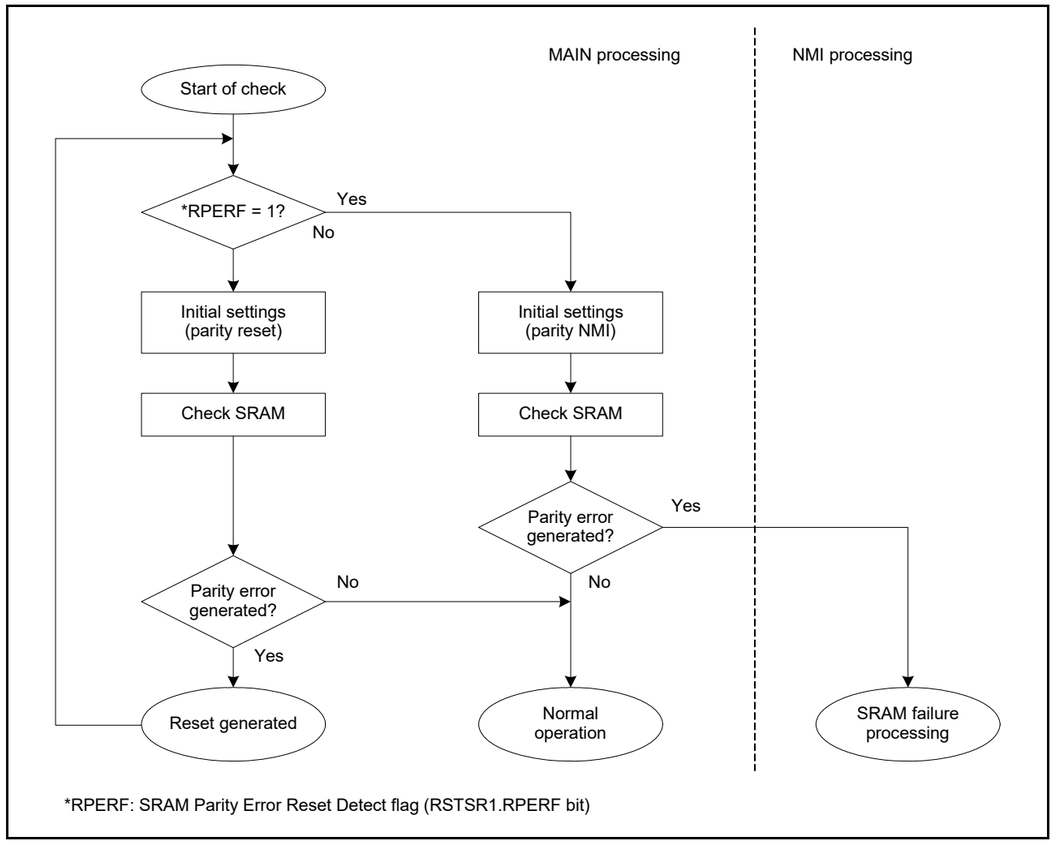

Figure 48.2 Flow of SRAM parity check when SRAM parity reset is enabled

48.3.5 奇偶校验计算功能

IEC60730标准要求检查SRAM数据。写入数据时，对32位数据宽度的SRAM中的每8位数据添加一个奇偶校验位，读取数据时检查奇偶校验位。发生奇偶校验错误时，会生成奇偶校验错误通知。此功能也可用于触发复位。没有ECC、SRAMHS和备用SRAM的SRAM0的规格是偶校验。

奇偶校验错误通知可以在PARIOAD寄存器的OAD位中指定为不可屏蔽中断或复位。当PARIOAD寄存器中的OAD位设置为1时，将向复位功能输出奇偶校验错误。当OAD位设置为0时，奇偶校验错误作为不可屏蔽中断输出到ICU。

奇偶校验错误经常因噪声而发生。要确认奇偶校验错误的原因是噪声还是损坏，请参见图48.2和图48.3中的奇偶校验流程。

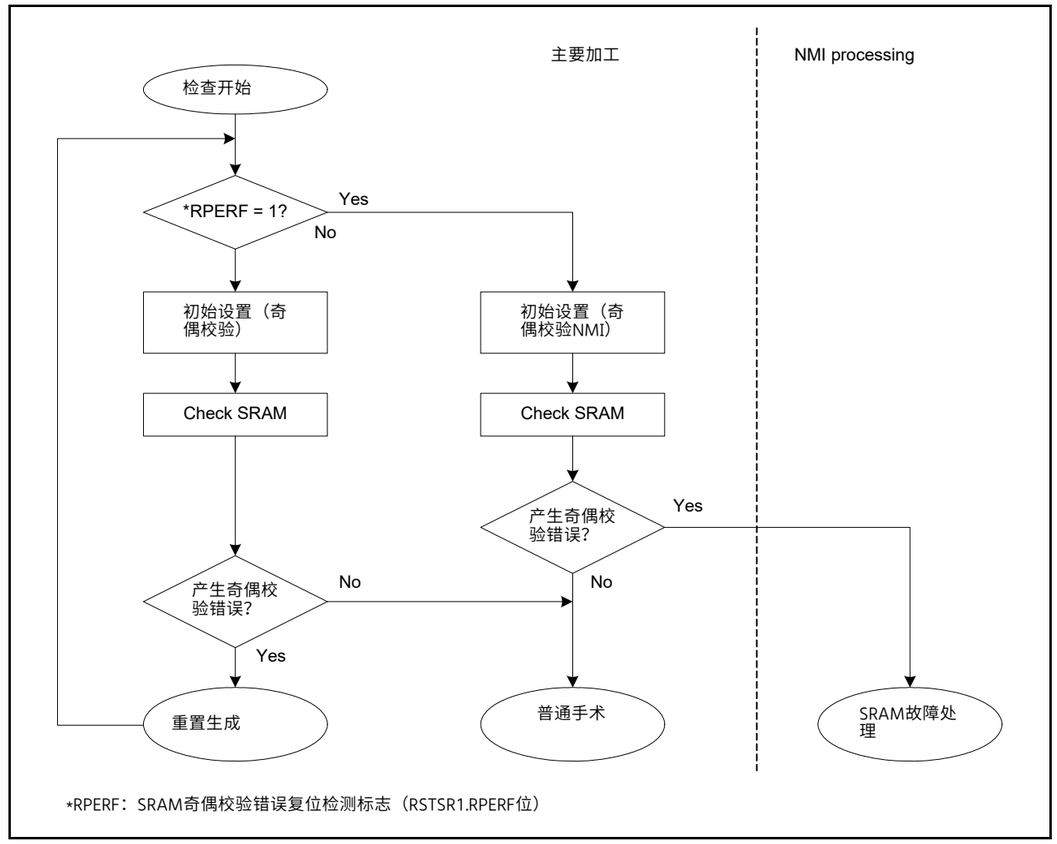

Figure 48.2 启用SRAM奇偶校验复位时的SRAM奇偶校验流程

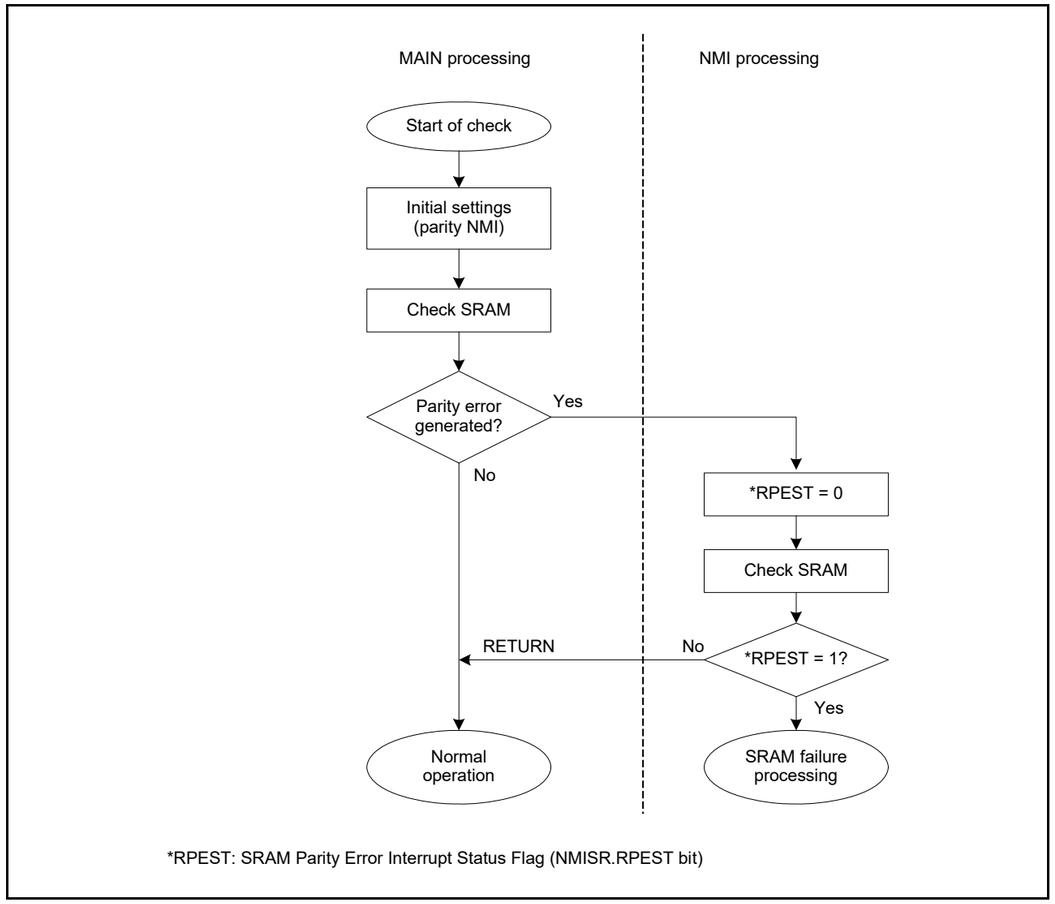

Figure 48.3 Flow of SRAM parity check when SRAM parity interrupt is enabled

48.3.6 SRAM Error Sources

An SRAM error source is either an ECC error or a parity error. ECC error and parity error can generate either a non-maskable interrupt or a reset, as selected with the OAD bit in the ECCOAD register for ECC error, or in the PARIOAD register for parity error.

Table 48.2 SRAM error sources

Interrupt source	DTC activation	DMAC activation
ECC error (SRAM0 area with ECC)	Not possible	Not possible
Parity error (SRAM0 area without ECC, SRAMHS)	Not possible	Not possible

48.3.7 Access Cycles

Table 48.3 SRAMHS (parity area 1FFE 0000h to 1FFF FFFFh)

Read (cycles)		Write (cycles)	
Word access	Halfword/byte access	Word access	Halfword/byte access
2		2	

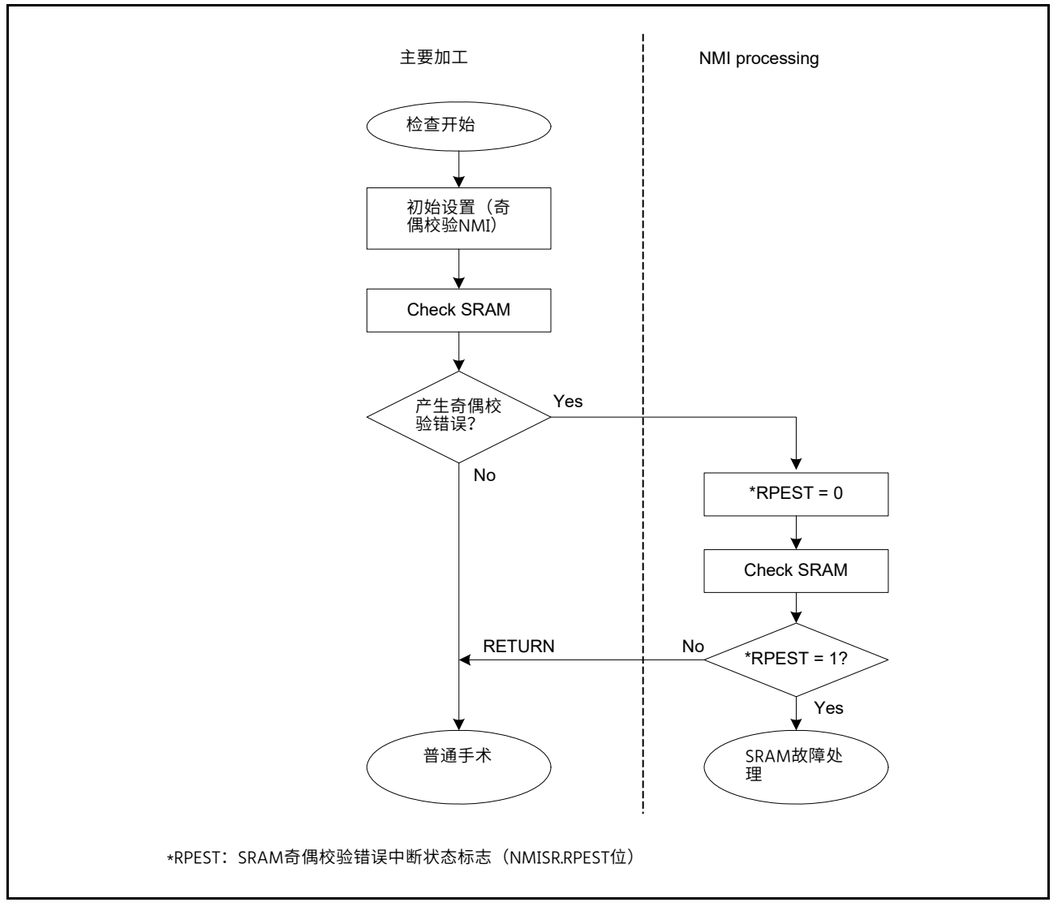

Figure 48.3 启用SRAM奇偶校验中断时的SRAM奇偶校验流程

48.3.6 SRAM错误源

SRAM错误源是ECC错误或奇偶校验错误。ECC错误和奇偶校验错误可以产生不可屏蔽的中断或复位，由ECCOAD寄存器中的OAD位选择用于ECC错误，或在PARIOAD寄存器中选择用于奇偶校验错误。

Table 48.2 SRAM错误源

中断源	DTC activation	DMAC activation
ECC错误（带ECC的SRAM0区域）	不可能	不可能
奇偶校验错误（无ECC、SRAMHS的SRAM0区域）	不可能	不可能

48.3.7 访问周期

Table 48.3 SRAMHS（奇偶校验区1FFE0000h至1FFFFFFFh）

Read (cycles)		Write (cycles)	
字访问	Halfword/byte access	字访问	Halfword/byte access
2		2	

Table 48.4 SRAM0 (ECC area 2000 0000h to 2000 7FFFh)

Bit settings		Read (cycles)		Write (cycles)	
		Word access	Halfword or byte access	Word access	Halfword or byte access
ECC Off ECCMOD[1] = 0	SRAM0ERDWTEN = 0	2		2	
	SRAM0ERDWTEN = 1	3		2	
ECC On ECCMOD[1] = 1	SRAM0ERDWTEN = 0	2		2	4
	SRAM0ERDWTEN = 1	3		2	4

Table 48.5 SRAM0 (parity area 2000 8000h to 2001 FFFFh)

Bit settings	Read (cycles)		Write (cycles)	
	Word access	Halfword or byte access	Word access	Halfword or byte access
SRAM0WTEN = 0	2		2	
SRAM0WTEN = 1	3		2	

48.4 Usage Notes

48.4.1 Wait State Insertion

Set the number of SRAM wait cycles in the SRAMWTSC register based on the following:

- SRAM0
  1 wait: 60 MHz < ICLK ≤ 120 MHz
  No wait: ICLK ≤ 60 MHz

48.4.2 Instruction Fetch from SRAM Area

When using SRAM0 or the SRAMHS to operate a program, initialize the SRAM area so that the CPU can correctly prefetch data. If the CPU prefetches data from an SRAM area that is not initialized, an ECC error or a parity error might occur. Initialize the additional 12-byte area from the end address of a program with a 4-byte boundary. Renesas recommends using the NOP instruction for data initialization.

48.4.3 Store Buffer of SRAM

For fast access between the SRAM and CPU, a store buffer is used. When a load instruction is executed from the same address after a store instruction to the SRAM, the load instruction might read data from the buffer instead of data from the SRAM. To read data on the SRAM correctly, use either of the following procedures:

- After writing to the SRAM (address = A), use the NOP instruction, then read the SRAM (address = A)
- After writing to the SRAM (address = A), read data from an area other than SRAM (address = A), then read the SRAM (address = A).

Table 48.4 SRAM0（ECC区域20000000h至20007FFFh）

位设置		Read (cycles)		Write (cycles)	
		字访问	半字或字节访问	字访问	半字或字节访问
ECC Off ECCMOD[1] = 0	SRAM0ERDWTEN = 0	2		2	
	SRAM0ERDWTEN = 1	3		2	
ECC On ECCMOD[1] = 1	SRAM0ERDWTEN = 0	2		2	4
	SRAM0ERDWTEN = 1	3		2	4

Table 48.5 SRAM0（奇偶校验区20008000h到2001FFFFh）

位设置	Read (cycles)		Write (cycles)	
	字访问	半字或字节访问	字访问	半字或字节访问
SRAM0WTEN = 0	2		2	
SRAM0WTEN = 1	3		2	

48.4 使用说明

48.4.1 等待状态插入

根据以下内容在SRAMWTSC寄存器中设置SRAM等待周期数：

- SRAM0
  1 wait: 60 MHz < ICLK ≤ 120 MHz
  No wait: ICLK ≤ 60 MHz

48.4.2 从SRAM区域取指令

当使用SRAM0或SRAMHS操作程序时，初始化SRAM区域，以便CPU可以正确预取数据。如果CPU从未初始化的SRAM区域预取数据，则可能会发生ECC错误或奇偶校验错误。用4字节边界从程序的结束地址初始化额外的12字节区域。瑞萨推荐使用NOP指令进行数据初始化。

48.4.3 SRAM的存储缓冲区

为了在SRAM和CPU之间进行快速访问，使用了存储缓冲区。当在对SRAM执行存储指令之后从同一地址执行加载指令时，加载指令可能会从缓冲区读取数据，而不是从SRAM读取数据。要正确读取SRAM上的数据，请使用以下任一过程：

- 写入SRAM（地址=A）后，使用NOP指令，然后读取SRAM（地址=A）
- 写入SRAM（地址=A）后，从SRAM（地址=A）以外的区域读取数据，然后读取SRAM (address = A).

49. Standby SRAM

49.1 Overview

An on-chip SRAM is provided to retain data in Deep Software Standby mode.

Table 49.1 lists the Standby SRAM specifications.

Table 49.1 Standby SRAM specifications

Parameter	Specifications
SRAM capacity	8 KB
SRAM address	200F E000h to 200F FFFFh
Access	The number of accesses depends on the frequency between ICLK and PCLKB. See section 49.2.4, Access Cycle for details.
Data retention	Data can be retained in Deep Software Standby mode
Parity	Even parity (data: 8 bits, parity: 1 bit)
Module-stop function	Module-stop state can be set to reduce power consumption

49.2 Operation

49.2.1 Data Retention

The power supply to the Standby SRAM in Deep Software Standby mode is enabled by the DPSBYCR.DEEPCUT[1:0] bits. If the DPSBYCR.DEEPCUT[1:0] bits are set to 00b, data in the Standby SRAM is retained in Deep Software Standby mode. For details on the DPSBYCR.DEEPCUT[1:0] bits, see section 11, Low Power Modes.

49.2.2 Low Power Function

Power consumption can be reduced by setting the Module Stop Control Register A (MSTPCRA) to stop supply of the clock signal to the SRAM. Setting the MSTPA7 bit in MSTPCRA to 1 stops supply of the clock signal to the Standby SRAM. The Standby SRAM is then placed in the module-stop state by stopping supply of the clock signals. The Standby SRAM operates after a reset. The Standby SRAM is not accessible if it is in the module-stop state. Do not transition to the module-stop state while accessing the Standby SRAM. For details on the MSTPCRA register, see section 11, Low Power Modes.

49.2.3 Parity Calculation Function

The parity calculation function for Standby SRAM is the same as for SRAM0 without Error Correction Code (ECC). The function of the OAD bit in the PARIOAD register and the flow of the SRAM parity check are shared by the Standby SRAM modules. For details, see section 48.3.5, Parity Calculation Function and section 48.3.6, SRAM Error Sources.

49.2.4 Access Cycle

Table 49.2 Standby SRAM access cycle

	Read (cycles)		Write (cycles)	
Frequency	Word access	Halfword/byte access	Word access	Halfword/byte access
Same Frequency ICLK = PCLKB	3 ICLK		2 ICLK	
Different Frequency ICLK > PCLKB	1 ICLK + 2 to 3 PCLKB		1 ICLK + 1 to 2 PCLKB	

49. Standby SRAM

49.1 Overview

提供片上SRAM以在深度软件待机模式下保留数据。

表49.1列出了备用SRAM规格。

Table 49.1 备用SRAM规格

Parameter	Specifications
SRAM capacity	8 KB
SRAM address	200F E000h to 200F FFFFh
Access	访问次数取决于ICLK和PCLKB之间的频率。请参阅第49.2.4节，访问循环了解详情。
数据保留	数据可以在深度软件待机模式下保留
Parity	偶校验（数据：8位，奇偶校验：1位）
Module-stop function	可设置模块停止状态以降低功耗

49.2 Operation

49.2.1 数据保留

深度软件待机模式下的待机SRAM电源由DPSBYCR.DEEPCUT[1:0]位启用。如果DPSBYCR.DEEPCUT[1:0]位设置为00b，则待机SRAM中的数据将保留在深度软件待机模式中。有关DPSBYCR.DEEPCUT[1:0]位的详细信息，请参见第11节，低功耗模式。

49.2.2 低功耗功能

通过设置模块停止控制寄存器A(MSTPCRA)以停止向SRAM提供时钟信号，可以降低功耗。将MSPTCRA中的MSTPA7位设置为1会停止向待机SRAM提供时钟信号。然后通过停止提供时钟信号将待机SRAM置于模块停止状态。待命

SRAM在复位后运行。如果处于模块停止状态，则无法访问备用SRAM。访问待机SRAM时不要转换到模块停止状态。有关MSTPCRA寄存器的详细信息，请参见第11节，低功耗模式。

49.2.3 奇偶校验计算功能

StandbySRAM的奇偶校验计算功能与无纠错码(ECC)的SRAM0相同。PARIOAD寄存器中OAD位的功能和SRAM奇偶校验流程由备用SRAM模块共享。有关详细信息，请参阅第48.3.5节，奇偶校验计算函数和第48.3.6节，SRAM错误源。

49.2.4 访问周期

Table 49.2 待机SRAM访问周期

	Read (cycles)		Write (cycles)	
Frequency	字访问	Halfword/byte access	字访问	Halfword/byte access
同频 ICLK = PCLKB	3 ICLK		2 ICLK	
不同频率 ICLK > PCLKB	1 ICLK + 2 to 3 PCLKB		1 ICLK + 1 to 2 PCLKB	

49.3 Usage Notes

49.3.1 Instruction Fetch from the Standby SRAM area

When using Standby SRAM to operate a program, initialize the Standby SRAM area so that the CPU can correctly prefetch data. A parity error might occur if the CPU prefetches from an area that is not initialized. Initialize the additional 12-byte area from the end address of a program with a 4-byte boundary. Renesas recommends using the NOP instruction for data initialization.

49.3 使用说明

49.3.1 从备用SRAM区域取指令

使用StandbySRAM操作程序时，初始化StandbySRAM区域，以便CPU可以正确预取数据。如果CPU从未初始化的区域预取，则可能发生奇偶校验错误。用4字节边界从程序的结束地址初始化额外的12字节区域。瑞萨推荐使用NOP指令进行数据初始化。

50. Flash Memory

50.1 Overview

The MCU provides 512-KB code flash memory and 8-KB data flash memory. The Flash Control Unit (FCU) controls the programming and erasure of the flash memory. The Flash Application Command Interface (FACI) controls the FCU in accordance with the specified FACI commands.

Table 50.1 lists the specifications of the code flash memory and data flash memory, and Figure 50.1 shows a block diagram of the related modules. Figure 50.2 shows the configuration of the code flash memory, and Figure 50.3 shows the configuration of the data flash memory.

Table 50.1 Code flash memory and data flash memory specifications

Parameter	Code flash memory	Data flash memory
Memory capacity	• 512 KB of user area	8 KB of data area
Read cycle	• 80 MHz < ICLK frequency ≤ 120 MHz Cache hit: 1 cycle Cache miss: 3 cycles • 40 MHz < ICLK frequency ≤ 80 MHz Cache hit: 1 cycle Cache miss: 2 cycles • ICLK frequency ≤ 40 MHz Cache hit: 1 cycle Cache miss: 1 cycle.	A read operation takes 7 FCLK cycles in words or bytes (FCLK frequency is up to 60 MHz)
Value after erasure	FFh	Undefined
Programming/erasing methods	• Programming and erasure of code and data flash memory through the FACI commands specified in the FACI command issuing area (407E 0000h) • Programming by dedicated flash-memory programmer transfer through a serial interface (serial programming) • Programming of flash memory by user program (self-programming)	
Security function	Protection against illicit tampering or reading of data in flash memory	
Protection	Protection against erroneous overwriting of flash memory	
Background operations (BGOs)	• Code flash memory can be read during data flash memory programming • Data flash memory can be read during code flash memory programming	
Units of programming and erasure	• 128-byte units for programming in user area • Block units for erasure in user area	• 4/8/16-byte units for programming in data area • 64/128/256-byte units for erasure in data area
Other functions	Interrupts accepted during self-programming	
	An expansion area of flash memory (option bytes) can be set in the initial MCU settings	
On-board programming (four types)	Programming in serial programming mode (SCI boot mode): • Asynchronous serial interface (SCI9) used • Transfer rate adjusted automatically. Programming in serial programming mode (USB boot mode): • USBFS used • Dedicated hardware not required, so direct connection to a PC is possible. Programming in on-chip debug mode: • JTAG or SWD interface used • Dedicated hardware not required. Programming by a routine for code and data flash memory programming within the user program: • Allows code and data flash memory programming without resetting the system.	

50. 闪存

50.1 Overview

MCU提供512-KB代码闪存和8-KB数据闪存。闪存控制单元(FCU)控制闪存的编程和擦除。Flash应用命令接口(FACI)根据指定的FACI命令控制FCU。

表50.1列出了代码闪存和数据闪存的规格，图50.1给出了相关模块的框图。图50.2显示了代码闪存的配置，图50.3显示了数据闪存的配置。

Table 50.1 代码闪存和数据闪存规格

Parameter	代码闪存	数据闪存
内存容量	512KB的用户区	8KB数据区
读周期	80MHz<ICLK频率≤120MHz高速缓存命中：1个周期 缓存未命中：3个周期 40MHz<ICLK频率≤80MHz缓存命中：1个周期 缓存未命中：2个周期 ICLK频率≤40MHz缓存命中：1个周期 缓存未命中：1个周期。	读取操作需要7个FCLK周期（以字或字节为单位）（FCLK频率高达60MHz）
擦除后的值	FFh	Undefined
Programming/erasing methods	通过FACI命令发出区域(407E0000h)中指定的FACI命令对代码和数据闪存进行编程和擦除（自编程）	
安全功能	防止非法篡改或读取闪存中的数据	
Protection	防止错误覆盖闪存	
后台操作(BGO)	在数据闪存编程期间可以读取代码闪存 在代码闪存编程期间可以读取数据闪存	
编程和擦除单元	128字节单元，用于用户区中的编程 块单元，用于用户区中的擦除	48个16字节单元，用于数据区中的编程 64128256字节单元，用于数据区中的擦除
其他功能	自编程期间接受的中断	
	可在初始MCU设置中设置闪存的扩展区域（选项字节）	
On-board programming (four types)	在串行编程模式（SCI引导模式）下编程： 使用异步串行接口(SCI9) 自动调整传输速率。 在串行编程模式（USB引导模式）下编程： 使用USBFS 不需要专用硬件，因此可以直接连接到PC。 在片上调试模式下编程： 使用JTAG或SWD接口 不需要专用硬件。 通过用户程序中的代码和数据闪存编程例程进行编程： 允许在不复位系统的情况下对代码和数据闪存进行编程。	

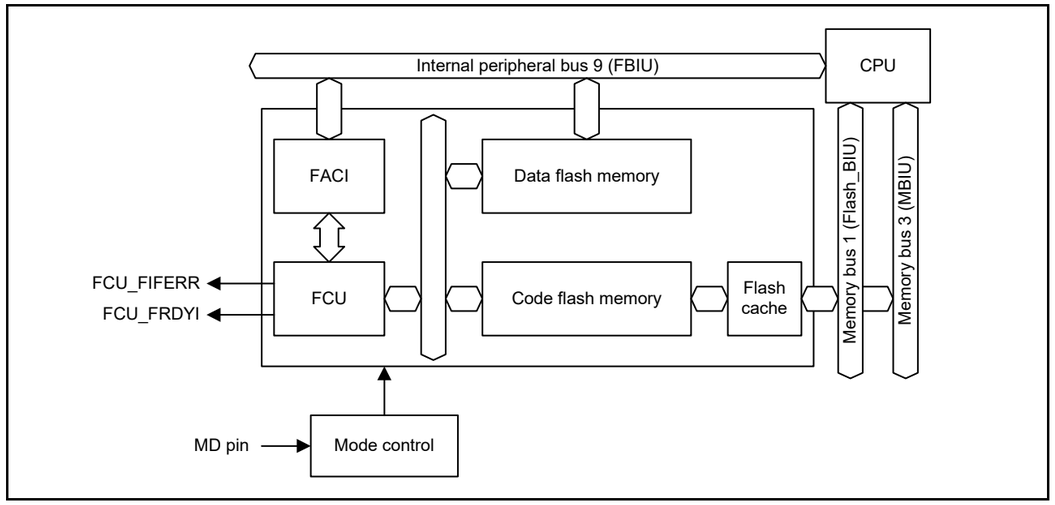

Figure 50.1 Flash memory-related modules block diagram

50.2 Memory Structure

Figure 50.2 shows the mapping of the code flash memory, and Table 50.2 shows the read and programming/erasure addresses of the code flash memory. The user space of the code flash memory is divided into 8- and 32-KB blocks, which serve as the units of erasure. The user area is available for storing the user program.

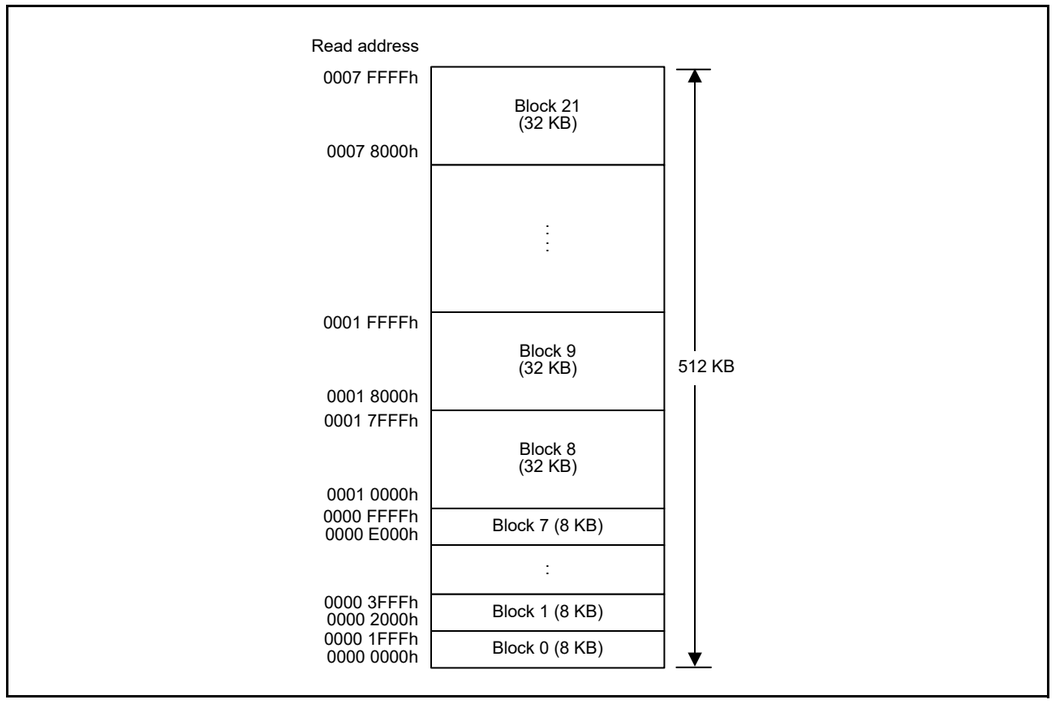

Figure 50.2 Mapping of the code flash memory

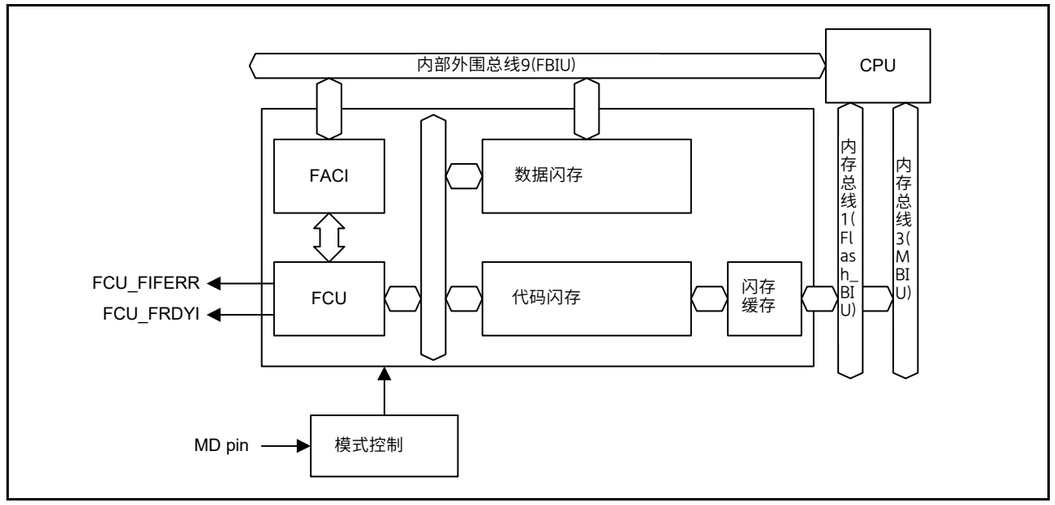

Figure 50.1 闪存相关模块框图

50.2 内存结构

图50.2显示了代码闪存的映射，表50.2显示了代码闪存的读取和编程擦除地址。代码闪存的用户空间分为8KB和32KB块，作为擦除单位。用户区可用于存储用户程序。

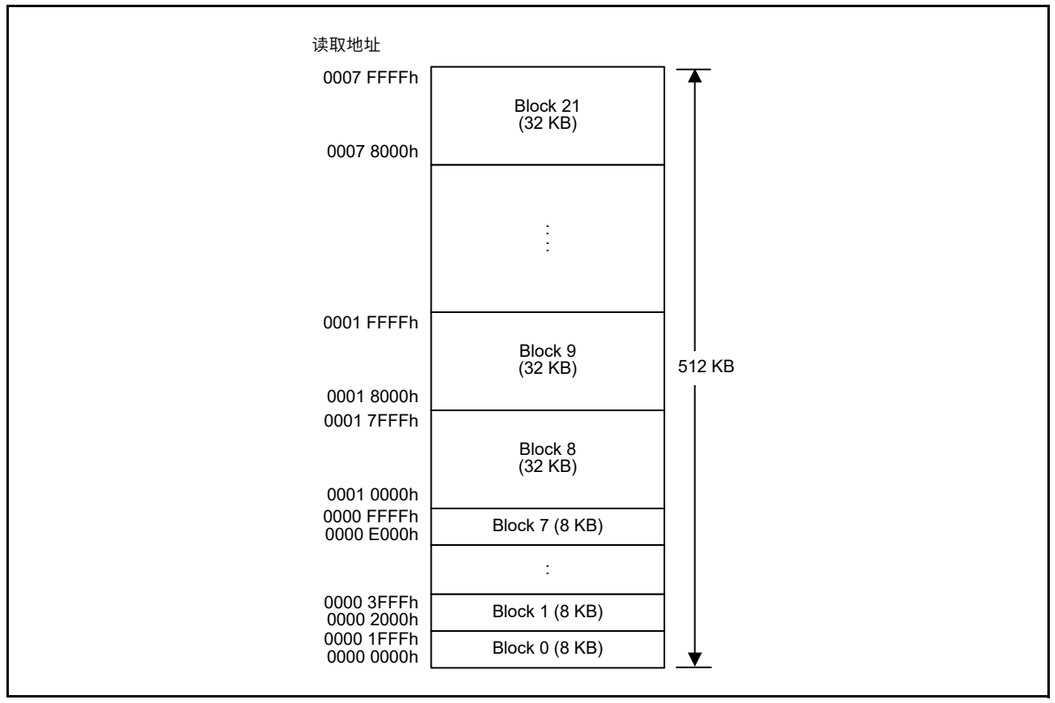

Figure 50.2 代码闪存的映射

Table 50.2 Read and P/E addresses of the code flash memory

Size of code flash memory	Read address	P/E address	Number of blocks
512 KB	0000 0000h to 0007 FFFFh	0000 0000h to 0007 FFFFh	0 to 21

The data area of the data flash memory is divided into 64-byte blocks, with each being a unit for erasure. Figure 50.3 shows the mapping of the data flash memory.

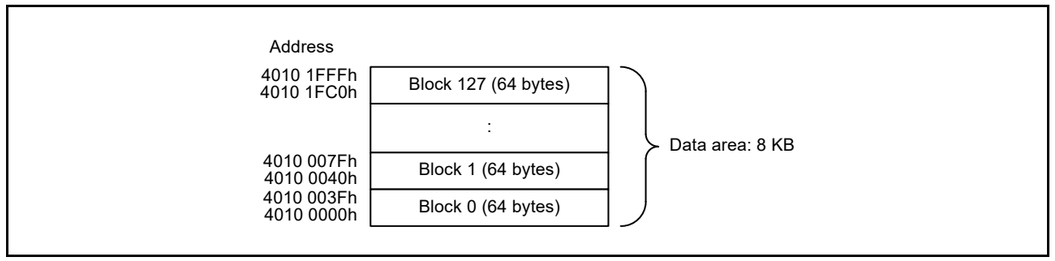

Figure 50.3 Mapping of the data flash memory

50.3 Flash Cache

50.3.1 Overview

The flash cache (FCACHE) speeds up read access from the bus master to the flash memory. The FCACHE includes:

- FCACHE1, for CPU instruction fetches
- FCACHE2, for CPU operand access and DMA
- FLPF, for the prefetch access in CPU instruction fetches.

Table 50.3 Flash cache overview

Parameter	Flash cache 1 (FCACHE1)	Flash cache 2 (FCACHE2)	Prefetch buffer (FLPF)
Cache target region	0000 0000h - 0007 FFFFh	0000 0000h - 0007 FFFFh	0000 0000h - 0007 FFFFh
Target bus master	CPU instruction fetch	CPU operand access and access from other than CPU	FLPF
Capacity	256 bytes	16 bytes	32 bytes
Associativity	• 8-way set associative • 128 bits/entry (128-bit aligned data) • 2 entries/way	• Fully associative • 128 bits/entry (128-bit aligned data) • 1 entry for FCACHE2	• Fully associative • 128 bits/entry (128-bit aligned data) • 2 entries
Access cycles	• Cache hit: 0 wait • Cache miss: Number of waits set in Flash Wait Cycle Register	• Cache hit: 0 wait • Cache miss: Number of waits set in Flash Wait Cycle Register	• Cache hit: 0 wait • Cache miss: Number of waits set in Flash Wait Cycle Register

Table 50.2 代码闪存的读取和PE地址

代码闪存大小	读取地址	P/E address	块数
512 KB	0000 0000h to 0007 FFFFh	0000 0000h to 0007 FFFFh	0 to 21

数据闪存的数据区被划分为64个字节的块，每个块为一个擦除单元。图50.3显示了数据闪存的映射。

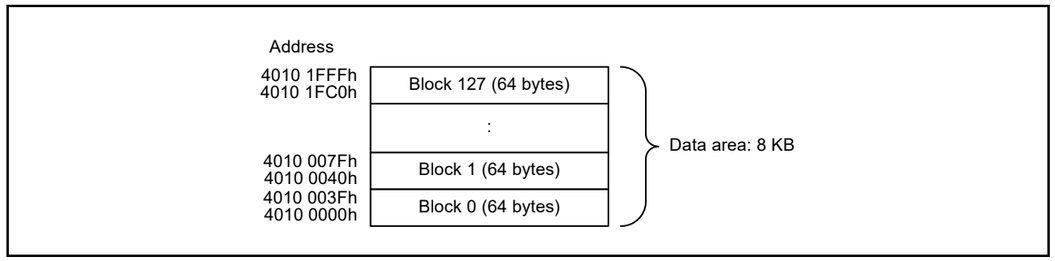

Figure 50.3 数据闪存的映射

50.3 闪存缓存

50.3.1 Overview

闪存高速缓存(FCACHE)加快了从总线主机到闪存的读取访问。FCACHE包括：

- FCACHE1，用于CPU指令取指
- FCACHE2，用于CPU操作数访问和DMA
- FLPF，用于CPU取指中的预取访问。

Table 50.3 闪存缓存概述

Parameter	闪存缓存1(FCACHE1)	闪存缓存2(FCACHE2)	Prefetch buffer (FLPF)
缓存目标区域	0000 0000h - 0007 FFFFh	0000 0000h - 0007 FFFFh	0000 0000h - 0007 FFFFh
目标总线主机	CPU指令获取	CPU操作数访问和非CPU访问	FLPF
Capacity	256 bytes	16 bytes	32 bytes
Associativity	8路组关联 128位条目（128位对齐数据） 2项方式	完全关联 128位条目（128位对齐数据） FCACHE2的1个条目	完全关联 128位条目（128位对齐数据） 2个条目
访问周期	缓存命中：0次等待 缓存未命中Flash等待周期寄存器中设置的等待数	缓存命中：0次等待 缓存未命中Flash等待周期寄存器中设置的等待数	缓存命中：0次等待 缓存未命中：Flash等待周期寄存器中设置的等待数

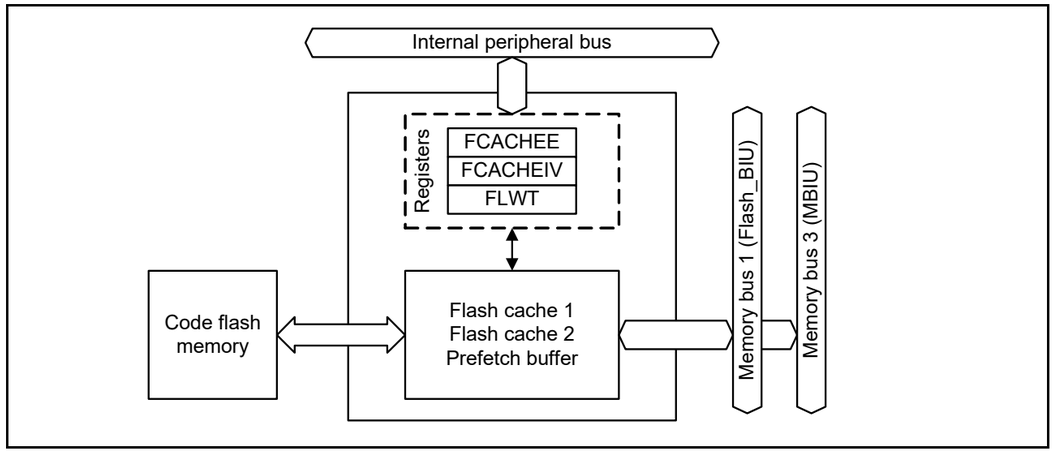

Figure 50.4 FCACHE block diagram

50.3.2 Register Descriptions

50.3.2.1 Flash Cache Enable Register (FCACHEE)

Address(es): FCACHE.FCACHEE 4001 C100h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FCACHEEN	FCACHE Enable	0: Disable FCACHE 1: Enable FCACHE.	R/W
b15 to b1	—	Reserved	These bits are read as 0.	R

The FCACHEE.FCACHEEN bit enables or disables the flash cache function for FCACHE1, FCACHE2, and FLPF. This bit does not affect FCACHEIV.FCACHEIV. When FCACHE is enabled, the HPROT[3] bit setting determines whether it is cacheable or non-cacheable. See section 15.7 for details on HPROT[3].

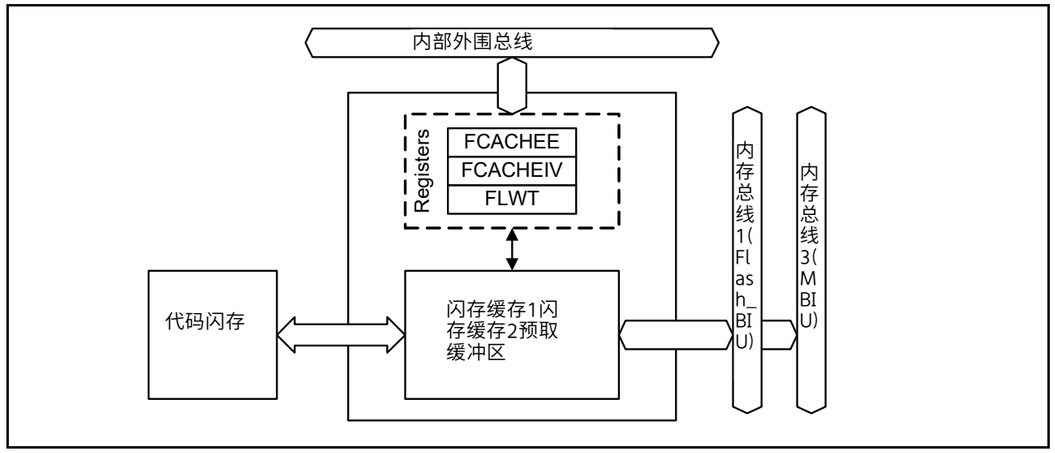

Figure 50.4 FCACHE框图

50.3.2 注册说明

50.3.2.1 闪存缓存启用寄存器(FCACHEE)

Address(es): FCACHE.FCACHEE 4001 C100h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEEN
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	FCACHEEN	FCACHE Enable	0：禁用FCACHE1： 启用FCACHE。	R/W
b15 to b1	—	Reserved	这些位读为0。	R

FCACHEE.FCACHEEN位启用或禁用FCACHE1、FCACHE2和FLPF的闪存缓存功能。该位不影响FCACHEIV.FCACHEIV。当启用FCACHE时，HPROT[3]位设置确定它是可缓存的还是不可缓存的。有关HPROT[3]的详细信息，请参见第15.7节。

50.3.2.2 Flash Cache Invalidate Register (FCACHEIV)

Address(es): FCACHE.FCACHEIV 4001 C104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEIV
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FCACHEIV	Flash Cache Invalidate	• Reads: 0: Do not invalidate 1: Invalidate. • Writes: When write value is 1, FCACHE is invalidated. When write value is 0, this setting is ignored.	R/W
b15 to b1	—	Reserved	These bits are read as 0	R

When 1 is written to the FCACHEIV.FCACHEIV bit, the flash cache data in FCACHE1, FCACHE2, and FLPF is invalidated.

50.3.2.3 Flash Wait Cycle Register (FLWT)

Address(es): FCACHE.FLWT 4001 C11Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	FLWT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	FLWT[2:0]*1	Flash Wait Cycle	b2 b0 0 0 0: 0 wait (ICLK ≤ 40 MHz) 0 0 1: 1 wait (40 MHz < ICLK ≤ 80 MHz) 0 1 0: 2 waits (80 MHz < ICLK ≤ 120 MHz). Other settings are reserved.	R/W
b15 to b3	—	Reserved	These bits are read as 0.	R

Note 1. Settings other than 000b are prohibited in the Subosc-speed mode.

The Flash Wait Cycle Register (FLWT) sets the access wait count for the flash memory. For faster clock frequencies, set FLWT.FLWT before changing the clock frequency. For slower clock frequencies, set FLWT.FLWT after changing the clock frequency.

50.4 Operation

Use the FCACHEE register to set up and enable flash operation. To set up the flash cache and prepare to rewrite the flash memory:

1. Disable the flash cache by resetting FCACHEE.FCACHEEN.*1
2. Invalidate the flash cache by setting FCACHEIV.FCACHEIV.
3. Check that FCACHEIV.FCACHEIV is 0.
4. Enable the flash cache by setting FCACHEE.FCACHEEN.

Note 1. It is not necessary to disable the flash cache on the first setup after reset.

50.3.2.2 闪存缓存无效寄存器(FCACHEIV)

Address(es): FCACHE.FCACHEIV 4001 C104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEIV
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	FCACHEIV	闪存缓存失效	读取：0：不无效1：无效。 写入：当写入值为1时，CACHE无效。当写入值为0时，忽略此设置。	R/W
b15 to b1	—	Reserved	这些位被读为0	R

当FCACHEIV.FCACHEIV位写入1时，FCACHE1、FCACHE2和FLPF中的闪存缓存数据无效。

50.3.2.3 闪存等待周期寄存器(FLWT)

Address(es): FCACHE.FLWT 4001 C11Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	FLWT[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	FLWT[2:0]*1	闪存等待周期	b2b0000：0等待（ICLK≤40MHz）001：1等待（40MHz<ICLK≤80MHz）010：2等待（80MHz<ICLK≤120MHz）。保留其他设置。	R/W
b15 to b3	—	Reserved	这些位读为0。	R

Note 1. 在Subosc-speed模式中禁止设置000b以外的设置。

闪存等待周期寄存器(FLWT)设置闪存的访问等待计数。对于更快的时钟频率，设置更改时钟频率之前的FLWT.FLWT。对于较慢的时钟频率，请在更改时钟频率后设置FLWT.FLWT。

50.4 Operation

使用FCACHEE寄存器设置和启用闪存操作。设置闪存缓存并准备重写闪存：

1. 通过重置FCACHEE.FCACHEEN禁用闪存缓存。*1
2. 通过设置FCACHEIV.FCACHEIV使闪存缓存无效。
3. 检查FCACHEIV.FCACHEIV是否为0。
4. 通过设置FCACHEE.FCACHEEN启用闪存缓存。

注1.复位后第一次设置时无需禁用闪存缓存。

50.4.1 Notice to use Flash Cache

When accessing the flash cache from the CPU, Arm® MPU should also be set to cacheable.

See the *ARM®v7-M Architecture Reference Manual* and the *ARM® Cortex®-M4 Devices Generic User Guide*.

50.5 Operating Modes Associated with the Flash Memory

Figure 50.5 shows a diagram of the mode transitions associated with the flash memory. For information on setting up the modes, see section 3, Operating Modes.

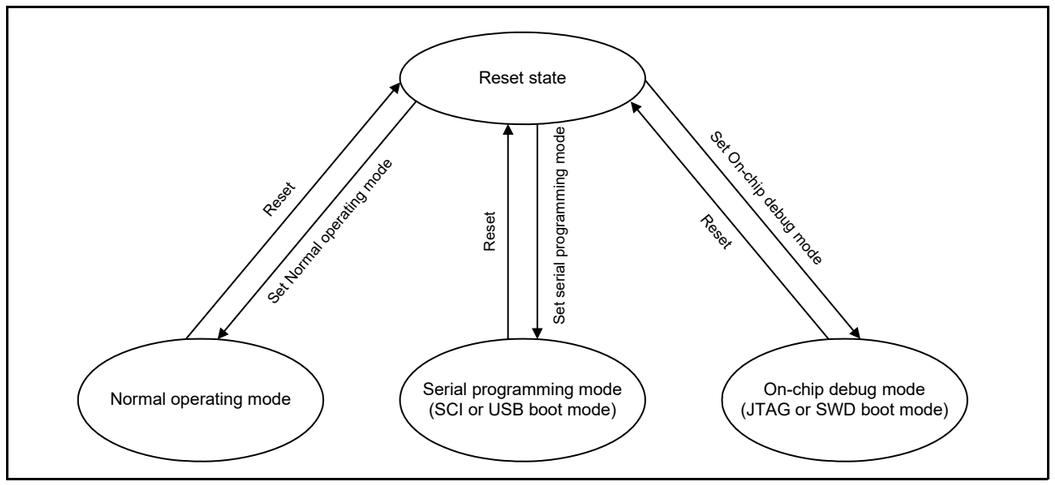

Figure 50.5 Mode transitions associated with flash memory

The flash memory areas where programming and erasure are permitted and where the boot program executes at a reset, differ with the mode. Table 50.4 shows the differences between the modes.

Table 50.4 Difference between modes

Parameter	Normal operating mode	Serial programming mode (SCI or USB boot mode)	On-chip debug mode (JTAG or SWD boot mode)
Programmable and erasable areas	• Code flash memory • Data flash memory	• Code flash memory • Data flash memory	• Code flash memory • Data flash memory
Erasure in block units	Possible	Possible	Possible
Boot program at a reset	User area program	Embedded program for serial programming	Depends on debug command

50.5.1 ID Code Protection

The ID code protection function prohibits programming and on-chip debugging. When ID code protection is enabled, the device validates or invalidates the ID code sent from the host by comparing it with the ID code stored in the flash memory. Programming and on-chip debugging are enabled only when the two match.

The ID code in flash memory consists of four 32-bit words. ID code bits [127] and [126] determine whether ID code protection is enabled and the authentication method to use with the host.

Table 50.5 shows how the ID code determines the authentication method.

50.4.1 使用FlashCache的注意事项

从CPU访问闪存缓存时，Arm®MPU也应设置为可缓存。

请参阅ARM®v7-M架构参考手册和ARM®Cortex®-M4设备通用用户指南。

50.5 与闪存相关的操作模式

图50.5显示了与闪存相关的模式转换图。有关设置模式的信息，请参阅第3节，操作模式。

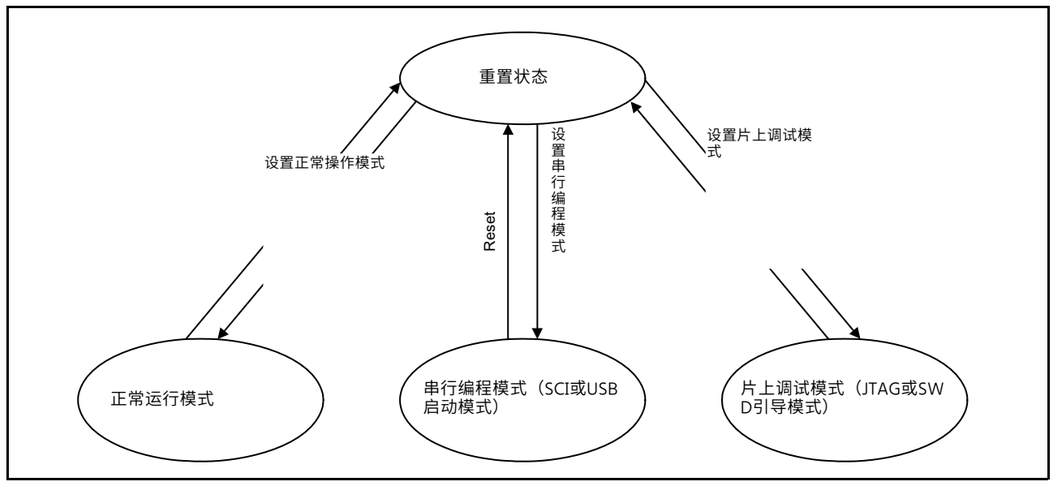

Figure 50.5 与闪存相关的模式转换

允许编程和擦除以及在复位时执行引导程序的闪存区域因模式而异。表50.4显示了这些模式之间的差异。

Table 50.4 模式之间的差异

Parameter	正常运行模式	串行编程模式（SCI或USB启动模式）	片上调试模式（JTAG或SWD引导模式）
可编程和可擦除区域	代码闪存 数据闪存	代码闪存 数据闪存	代码闪存 数据闪存
以块为单位擦除	Possible	Possible	Possible
复位时的引导程序	用户区程序	用于串行编程的嵌入式程序	取决于调试命令

50.5.1 ID码保护

ID码保护功能禁止编程和片上调试。启用ID代码保护时，设备通过将主机发送的ID代码与存储在闪存中的ID代码进行比较来使该ID代码有效或无效。编程和片上调试仅在两者匹配时才启用。

闪存中的ID代码由四个32位字组成。ID代码位[127]和[126]确定是否启用ID代码保护以及与主机一起使用的身份验证方法。

表50.5显示了ID代码如何确定身份验证方法。

Table 50.5 Specifications for ID code protection

Operating mode on boot up	ID code	State of protection	Operations on connection with the programmer or on-chip debugger
Serial programming mode (SCI/USB boot mode) On-chip debug mode (JTAG/SWD boot mode)	FFh, …, FFh (All bytes are FFh)	Protection disabled	ID code validation is not performed, the ID code always matches, and connection to the programmer or the on-chip debugger is permitted
	Bit [127] = 1, bit [126] = 1, and at least one of the 16 bytes is not FFh	Protection enabled	Matching ID code: Authentication ends and connection to the programmer or on-chip debugger is permitted. Mismatching ID code: Additional transition to the ID code protection waiting state. When the ID code sent from the programmer or the on-chip debugger is ALeRASE in ASCII code (414C_6552_4153_45FF_FFFF_FFFF_FFFF_FFFFh), the contents of the user flash (code and data) area and configuration area are erased. However, forced erasure is not performed when the AWS.FSPR*1 bit is 0.
	Bit [127] = 1 and bit [126] = 0	Protection enabled	Matching ID code: Authentication ends and connection to the programmer or the on-chip debugger is permitted. Mismatching ID code: Additional transition to the ID code protection waiting state.
	Bit [127] = 0	Protection enabled	ID code validation is not performed, the ID code is always mismatching, and connection to the programmer or the on-chip debugger is prohibited.

Note 1. For details on the AWS.FSPR bit, see section 7.2.3, Access Window Setting Register (AWS).

50.6 Overview of Functions

By using a dedicated flash-memory programmer to program the on-chip flash memory through a serial interface (serial programming) or JTAG/SWD interface (on-chip debug mode), the device can be programmed before or after it is mounted on the target system. Additionally, security functions to prohibit overwriting of the user program written to the on-chip flash memory are incorporated to prevent tampering by third parties.

Programming by the user program (self-programming) is available for applications that might require updating after system manufacturing or shipment. Protection features for safely overwriting the flash memory area are also provided. Additionally, interrupt processing during self-programming is supported so that the programming can proceed while processing external communications and other functions. Table 50.6 lists the programming methods and the associated operating modes.

Table 50.6 Programming methods (1 of 2)

Programming method	Functional overview	Operating mode
Serial programming	A dedicated flash-memory programmer connected through the SCI or USBFS interface enables on-board programming of the flash memory after the device is mounted on the target system	Serial programming mode
	A dedicated flash-memory programmer connected through the SCI or USBFS interface and a dedicated programming adapter board allow off-board programming of the flash memory, before it is mounted on the target system	

Table 50.5 ID码保护规范

启动时的操作模式	身份证号码	保护状态	与编程器或片上调试器连接的操作
串行编程模式（SCIUSB启动模式） 片上调试模式（JTAGSWD启动模式）	FFh … FFh（所有字节均为FFh）	保护已禁用	不执行ID代码验证，ID代码始终匹配，并且允许连接到编程器或片上调试器
	位[127]=1，位[126]=1，16个字节中至少有一个不是FFh	启用保护	匹配ID代码：验证结束并允许连接到编程器或片上调试器。不匹配的ID代码：额外转换到ID代码保护等待状态。 当编程器或片上调试器发送的ID码为ASCII码（414C_6552_4153_45FF_FFFF_FFFF_FFFF_FFFFh）的ALeRASE时，用户闪存（代码和数据）区和配置区的内容被擦除。但是，当AWS.FSPR*1位为0时，不执行强制擦除。
	位[127]=1和位[126]=0	启用保护	匹配ID代码：验证结束，允许连接到编程器或片上调试器。不匹配的ID代码：向 ID码保护等待状态。
	Bit [127] = 0	启用保护	不执行ID代码验证，ID代码总是不匹配，并且禁止连接到编程器或片上调试器。

Note 1. 有关AWS.FSPR位的详细信息，请参阅第7.2.3节，访问窗口设置寄存器(AWS)。

50.6 功能概述

通过使用专用闪存编程器通过串行接口（串行编程）或JTAGSWD接口（片上调试模式）对片上闪存进行编程，可以在器件安装到目标之前或之后对其进行编程系统。此外，还集成了禁止覆盖写入片上闪存的用户程序的安全功能，以防止第三方篡改。

用户程序编程（自编程）可用于在系统制造或发货后可能需要更新的应用程序。还提供了用于安全覆盖闪存区域的保护功能。此外，支持自编程期间的中断处理，以便在处理外部通信和其他功能的同时进行编程。表50.6列出了编程方法和相关的操作模式。

Table 50.6 编程方法(1of2)

编程方法	功能概览	操作模式
串行编程	通过SCI或USBFS接口连接的专用闪存编程器可在器件安装到目标系统后对闪存进行板载编程	串行编程模式
	通过SCI或USBFS接口连接的专用闪存编程器和专用编程适配器板允许在将闪存安装到目标系统之前对其进行离线编程	

Table 50.6 Programming methods (2 of 2)

Programming method	Functional overview	Operating mode
Self-programming	A user program written to memory in advance of serial programming execution can also program the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data from the code flash memory while the data flash memory is programmed. As a result, a program resident in the code flash memory can program the data flash memory. For background operations that are not possible, instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being programmed by self-programming. In such cases, a program for programming from the internal SRAM or external memory must be transferred in advance and executed.	Normal operating mode
JTAG or SWD programming	A dedicated flash-memory programmer or an on-chip debugger connected through JTAG or SWD enables on-board programming of the flash memory after the device is mounted on the target system	On-chip debug mode
	A dedicated flash-memory programmer or an on-chip debugger connected through JTAG or SWD and a dedicated programming adapter board allow off-board programming of the flash memory, for example, programming of the device, before it is mounted on the target system	

Table 50.7 lists the functions of the on-chip flash memory.

Use serial programmer commands for serial programming. For self-programming, use the FACI commands to read the on-chip flash memory or run the user program.

Table 50.7 Basic functions

Function	Functional overview	Availability	
		Serial programming	Self-programming
Blank check	Checks a specified block to ensure that writing to it has not already proceeded. Results of reading from data flash memory to which nothing is written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	Not supported	Supported (data flash programming only)
Block erasure	Erases the memory contents in the specified block	Supported	Supported
Programming	Writes to the specified address	Supported	Supported
Read	Reads data programmed in the flash memory	Supported	Not supported (read by user program is possible)
ID code check	Compares the ID code sent by the host with the code stored in the ROM. If the two match, the FCU enters the wait state for programming and erasure commands from the host.	Supported	Not supported (ID authentication is not performed)
Security configuration	Configures the security function for serial programming	Supported with conditions (only allows switching from enabled to disabled)	Supported with conditions (only allows switching from enabled to disabled)
Protection configuration	Configures the access window for flash area protection in the code flash memory	Supported	Supported

The on-chip flash memory supports the ID code security function. Authentication of ID codes is a security function for use with serial programming and with JTAG or SWD programming. Table 50.8 lists the security functions supported by the on-chip flash memory, and Table 50.9 lists the available operations and security settings.

Table 50.6 编程方法（2之2）

编程方法	功能概览	操作模式
Self-programming	在串行编程执行之前写入存储器的用户程序也可以对闪存进行编程。后台操作能力使得在对数据闪存进行编程时，可以从代码闪存中获取指令或以其他方式读取数据。结果，驻留在代码闪存中的程序可以对数据闪存进行编程。对于无法进行的后台操作，在通过自编程对代码闪存进行编程时，无法获取代码闪存中的指令并且无法访问数据。在这种情况下，必须预先传输并执行从内部SRAM或外部存储器进行编程的程序。	正常运行模式
JTAG或SWD编程	通过JTAG或SWD连接的专用闪存编程器或片上调试器可在器件安装到目标系统后对闪存进行板载编程	片上调试模式
	专用闪存编程器或通过JTAG或SWD连接的片上调试器和专用编程适配器板允许在安装到目标系统之前对闪存进行板外编程，例如对器件进行编程	

表50.7列出了片上闪存的功能。

使用串行编程器命令进行串行编程。对于自编程，使用FACI命令读取片上闪存或运行用户程序。

Table 50.7 基本功能

Function	功能概览	Availability	
		串行编程	Self-programming

50.6.1 配置区位图

用于身份验证、启动区域选择、访问窗口保护和安全配置功能的位映射在图50.6中。引导程序必须使用这些位作为十六进制数据。

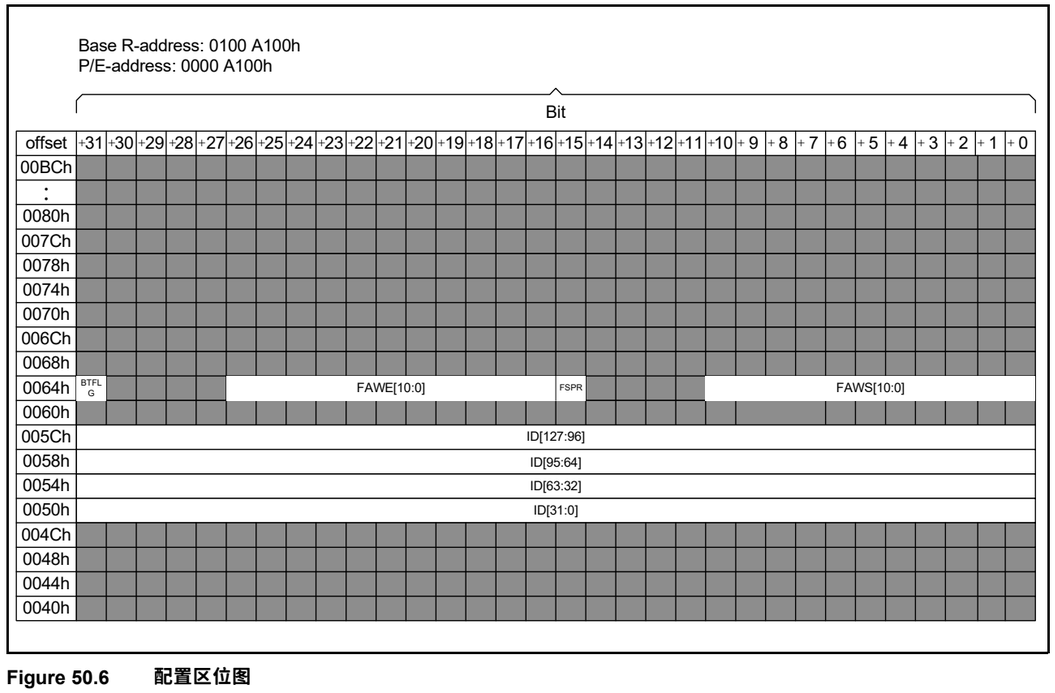

Figure 50.6 配置区位图

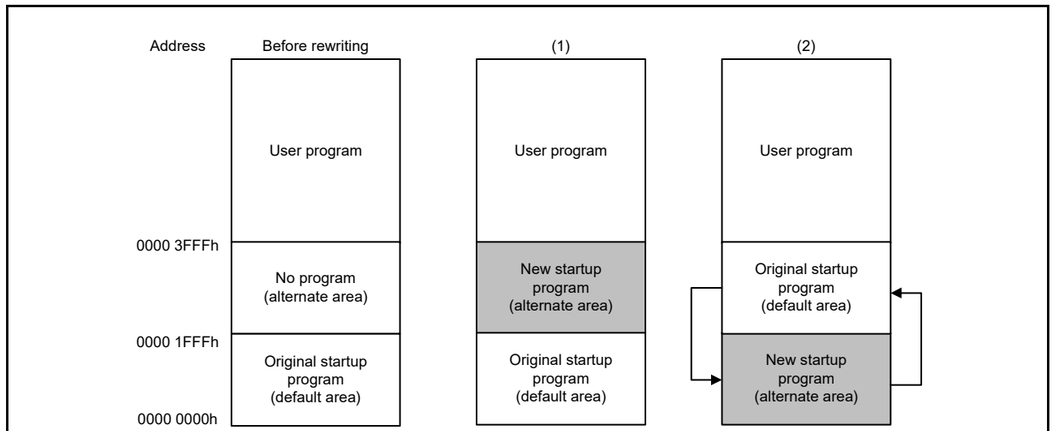
50.6.2 Startup Area Select

The startup area select function allows the boot program to be safely updated. The startup area is 8 KB of space located in the user area. The FACI controls the address of the startup area based on the Startup Area Select flag (AWS.BTFLG) that is located in the configuration area. The startup area can be locked by the AWS.FSPR*1 bit.

Note 1. For the AWS.FSPR bit, see section 7.2.3, Access Window Setting Register (AWS).

Figure 50.7 shows an overview of the startup program protection.



(1) Program a new startup program in the alternate area. If the alternate area fails to be rewritten, the new startup program can be rewritten again after starting up using the default area, because the original startup program is in the default area.
(2) After the alternate area is successfully rewritten, the default area and the alternate area are switched using the self-programming library. After that, the program in the alternate area starts after a reset.

Figure 50.7 Overview of startup program protection

50.6.3 Protection by Access Window

Issuing the program or block erase command to a flash memory area outside of the access window results in the command-locked state. The access window is only valid in the user area of the code flash memory. The access window provides protection in self-programming, serial programming, and on-chip debug modes.

The access window is specified in both the AWS.FAWS[10:0] and AWS.FAWE[10:0] bits*1.

Setting of the FAWS[10:0] and the FAWE[10:0] bits in various conditions is described as follows:

- FAWE[10:0] = FAWS[10:0]: The P/E command can execute anywhere in the user area of the code flash memory
- FAWE[10:0] > FAWS[10:0]: The P/E command can only execute in the window from the block pointed to by the FAWS[10:0] bits to one block lower than the one pointed to by the FAWE bits
- FAWE[10:0] < FAWS[10:0]: The P/E command cannot execute anywhere in the user area of the code flash memory.

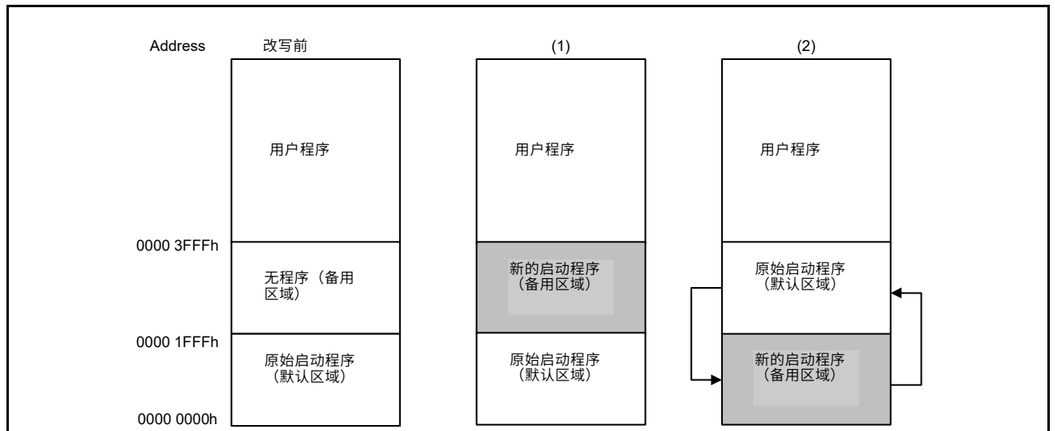
Note 1. For information on the AWS.FAWS[10:0] and AWS.FAWE[10:0] bits, see section 7.2.3, Access Window Setting Register (AWS).

50.6.2 启动区域选择

启动区域选择功能允许安全更新引导程序。启动区是位于用户区的8KB空间。FACI根据位于配置区域中的启动区域选择标志(AWS.BTFLG)控制启动区域的地址。启动区域可以通过AWS.FSPR*1位锁定。

注1.关于AWS.FSPR位，请参见第7.2.3节，访问窗口设置寄存器(AWS)。

图50.7显示了启动程序保护的概述。



(1)在备用区编写一个新的启动程序。如果替换区改写失败，新的启动程序可以在使用默认区启动后重新改写，因为原来的启动程序在默认区。(2)备用区改写成功后，使用自编程库切换默认区和备用区。之后，备用区域中的程序在重置后启动。

Figure 50.7 启动程序保护概述

50.6.3 通过访问窗口保护

向访问窗口之外的闪存区域发出程序或块擦除命令会导致命令锁定状态。访问窗口仅在代码闪存的用户区有效。访问窗口在自编程、串行编程和片上调试模式下提供保护。

访问窗口在AWS.FAWS[10:0]和AWS.FAWE[10:0]位*1中指定。

各种条件下FAWS[10:0]和FAWE[10:0]位的设置说明如下：

- FAWE[10:0]=FAWS[10:0]：PE命令可以在代码闪存用户区的任何地方执行
- FAWE[10:0]>FAWS[10:0]：PE命令只能在窗口中执行
  FAWS[10:0]位比FAWE位指向的块低一个块
- FAWE[10:0]<FAWS[10:0]：PE命令不能在代码闪存用户区的任何地方执行。

注1.有关AWS.FAWS[10:0]和AWS.FAWE[10:0]位的信息，请参阅第7.2.3节，访问窗口设置
Register (AWS).

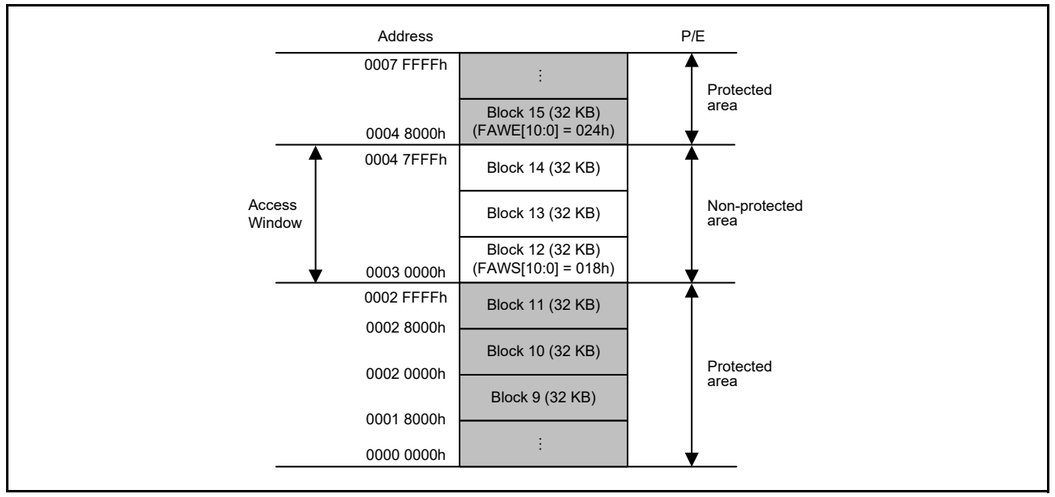

Figure 50.10 Start block address (FAWS) and end block address (FAWE) of access window when the access window only includes the 32-KB block size

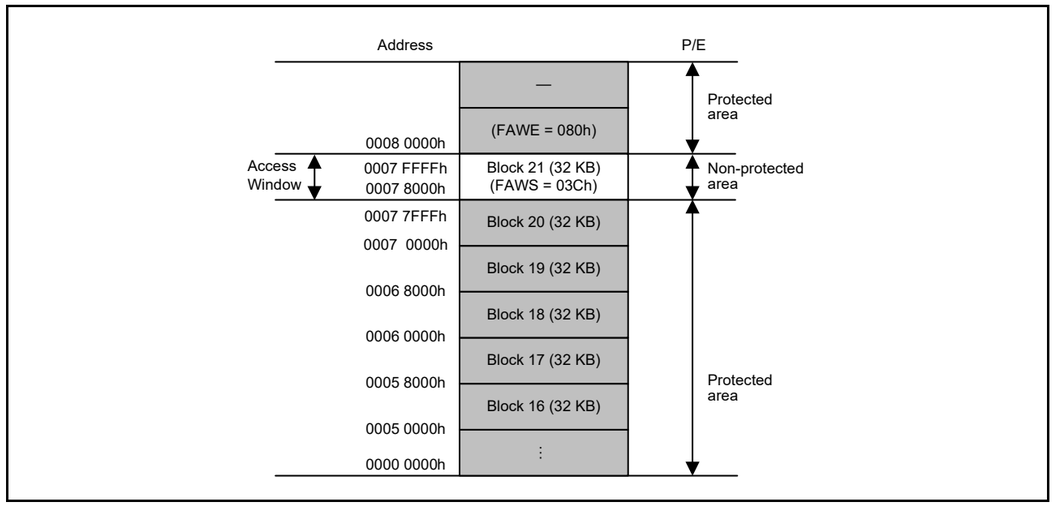

Figure 50.11 Start block address (FAWS) and end block address (FAWE) of access window when the access window only includes the final block

50.7 Programming Commands

The FACI controls the FCU in accordance with the specified FACI commands.

50.8 Suspend Operation

Reading from the code or data flash memory is not possible during programming or erasure when the address ranges do not satisfy the conditions for background operation. When a P/E suspend command is issued to suspend the programming or erasure of the code or data flash memory, reading from memory is enabled. One suspend command mode is available for programming and two suspend command modes are available for erasure (suspension priority mode and erasure priority mode). The P/E resume command is available for resuming suspended programming or erasure.

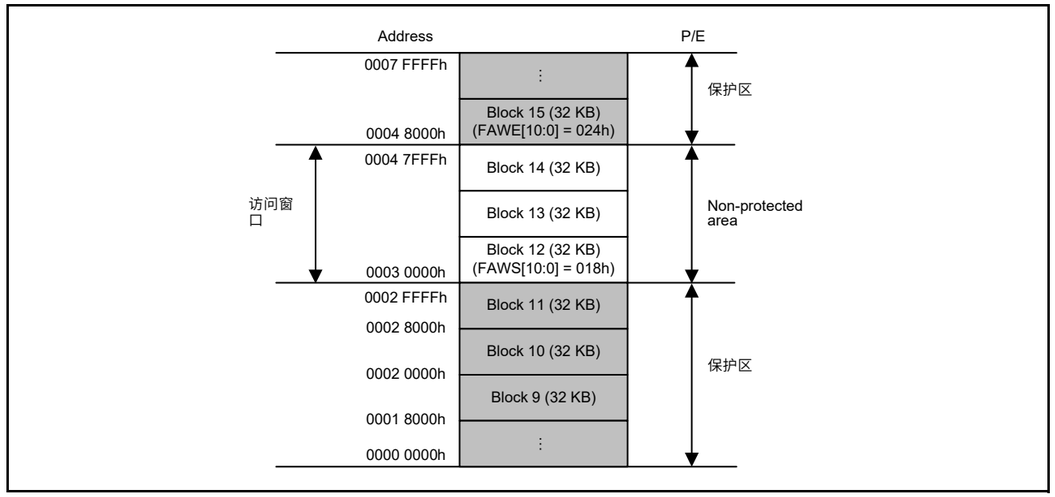

Figure 50.10 当访问窗口仅包含32−KB块大小时访问窗口的起始块地址(FAWS)和结束块地址(FAWE)

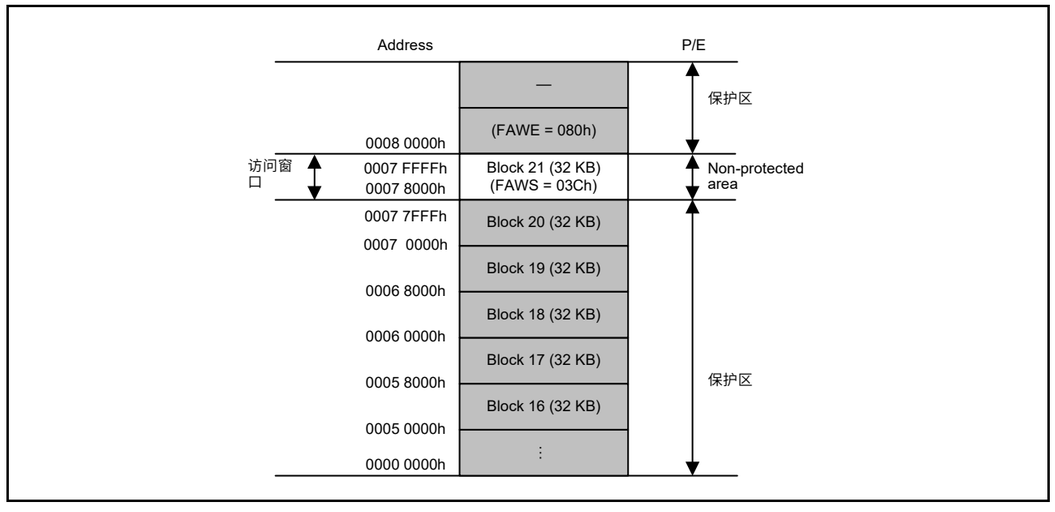

Figure 50.11 访问窗口只包含最终块时访问窗口的起始块地址（FAWS）和结束块地址（FAWE）

50.7 编程命令

FACI根据指定的FACI命令控制FCU。

50.8 暂停操作

当地址范围不满足后台操作条件时，在编程或擦除期间无法读取代码或数据闪存。当发出PE暂停命令以暂停代码或数据闪存的编程或擦除时，将启用从存储器读取。一种挂起命令模式可用于编程，两种挂起命令模式可用于擦除（挂起优先模式和擦除优先模式）。PEresume命令可用于恢复暂停的编程或擦除。

RA生态工作室

50.9 Protection

The types of protection provided include:

- Software protection
- Error protection
- Boot program protection.

50.10 Serial Programming Mode

The serial programming modes include:

- Boot mode with SCI9
- USB boot mode with the USBFS.

Table 50.10 lists the I/O pins of the flash memory-related modules.

Table 50.10 I/O pins of flash memory-related modules

Pin name	I/O	Applicable modes	Function
MD	Input	SCI boot mode USB boot mode (serial programming mode)	Selection of operating mode
P110/RXD9	Input	SCI boot mode	For host communication, to receive data through SCI
P109/TXD9	Output		For host communication, to transmit data through SCI
USB_DP, USB_DM	I/O	USB boot mode	USB data I/O
USB_VBUS	Input		Detection of connection and disconnection of USB cables

50.10.1 SCI Boot Mode

In boot mode, the host sends control commands and data for programming, and the code and data flash memory area are programmed or erased accordingly. An on-chip SCI handles transfer between the host and the MCU in asynchronous mode. Tools for transmission of control commands and the data for programming must be prepared in the host.

When the MCU is activated in boot mode, the embedded program for serial programming is executed. This program automatically adjusts the bit rate of the SCI and controls programming and erasure by receiving control commands from the host. The USB cable must not be connected on reset release.

Figure 50.12 shows the system configuration for operation in boot mode.

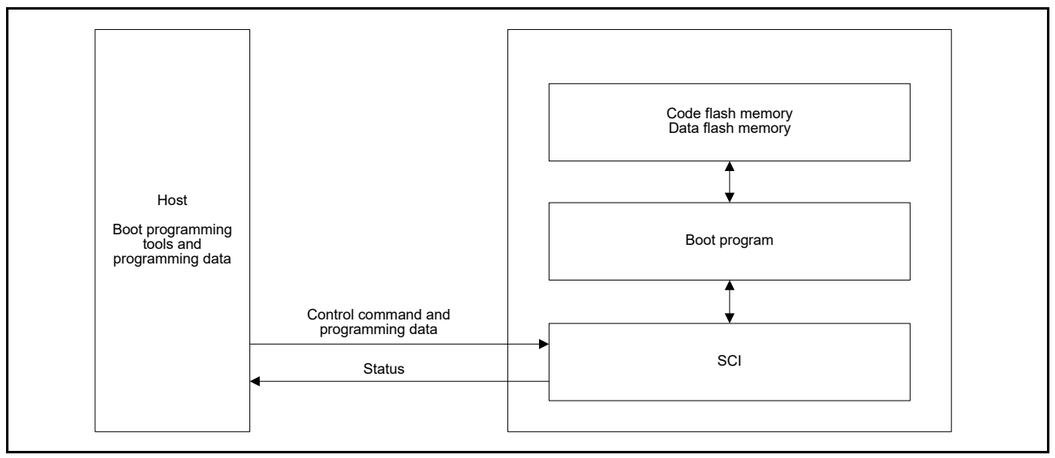

Figure 50.12 System configuration in SCI boot mode

50.9 Protection

提供的保护类型包括：

- 软件保护
- 错误保护
- 引导程序保护。

50.10 串行编程模式

串行编程模式包括：

- 带有SCI9的引导模式
- USB引导模式与USBFS。

表50.10列出了闪存相关模块的IO引脚。

Table 50.10 闪存相关模块的IO管脚

引脚名称	I/O	适用模式	Function
MD	Input	SCI启动模式USB启动模式（串行编程模式）	操作模式的选择
P110/RXD9	Input	SCI开机模式	用于主机通信，通过SCI接收数据
P109/TXD9	Output		用于主机通信，通过SCI传输数据
USB_DP, USB_DM	I/O	USB启动模式	USB数据输入输出
USB_VBUS	Input		检测USB电缆的连接和断开

50.10.1 SCI启动模式

在引导模式下，主机发送控制命令和数据进行编程，代码和数据闪存区域被相应地编程或擦除。片上SCI以异步模式处理主机和MCU之间的传输。主机中必须准备好用于传输控制命令和编程数据的工具。

当MCU在引导模式下激活时，将执行用于串行编程的嵌入式程序。该程序通过接收来自主机的控制命令自动调整SCI的比特率并控制编程和擦除。复位释放时不得连接USB电缆。

图50.12显示了在引导模式下运行的系统配置。

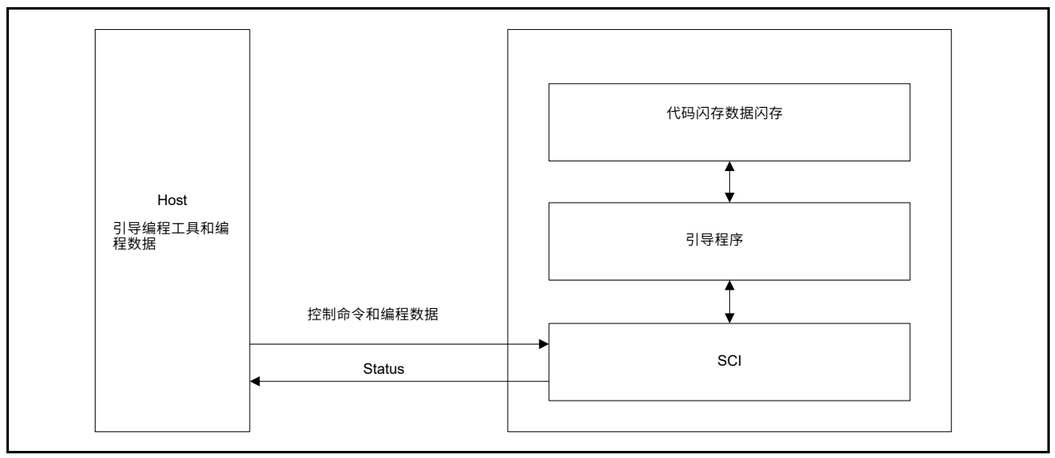

Figure 50.12 SCI引导模式下的系统配置

50.10.2 USB Boot Mode

In USB boot mode, the code and data flash memory are programmed or erased by control commands and data for programming transmitted from an externally connected host through the USB interface.

Using USB boot mode requires preparation on the host side of the tools for transmitting control commands and data for programming. Figure 50.13 shows the configuration of a system in USB boot mode. The USB cable must be connected on reset release.

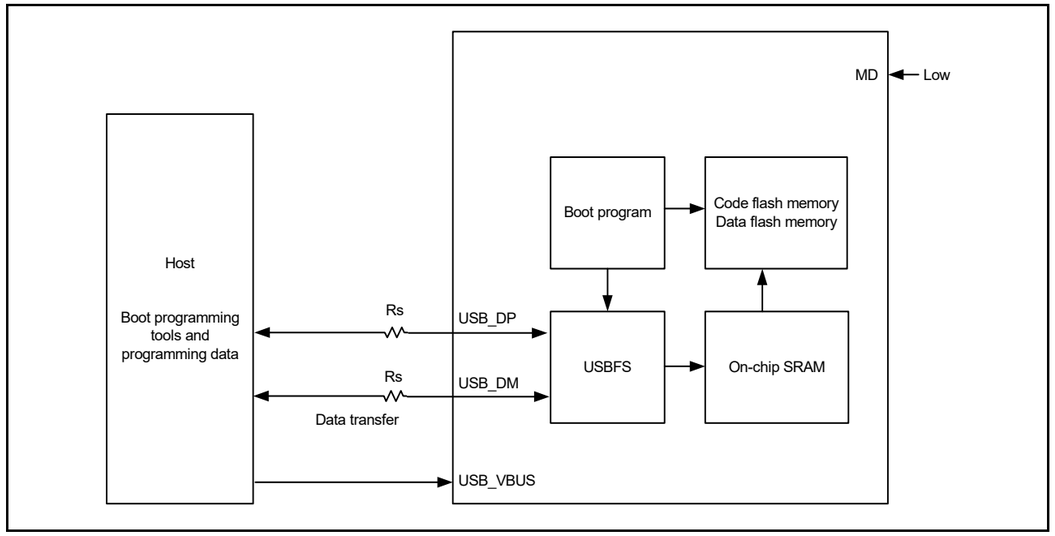

Figure 50.13 System configuration in USB boot mode

50.11 Using a Serial Programmer

A dedicated flash memory programmer can be used to program the flash memory in serial programming mode.

50.11.1 Serial Programming

The MCU is mounted on the system board for serial programming. A connector to the board allows programming by the flash memory programmer.

50.11.2 Programming Environments

Figure 50.14 shows the environments recommended by Renesas for programming the flash memory of the MCU with data.

50.10.2 USB启动模式

在USB引导模式下，代码和数据闪存通过USB接口从外部连接的主机传输的控制命令和用于编程的数据进行编程或擦除。

使用USB启动模式需要在主机端准备用于传输控制命令和数据以进行编程的工具。图50.13显示了USB引导模式下的系统配置。USB电缆必须在复位释放时连接。

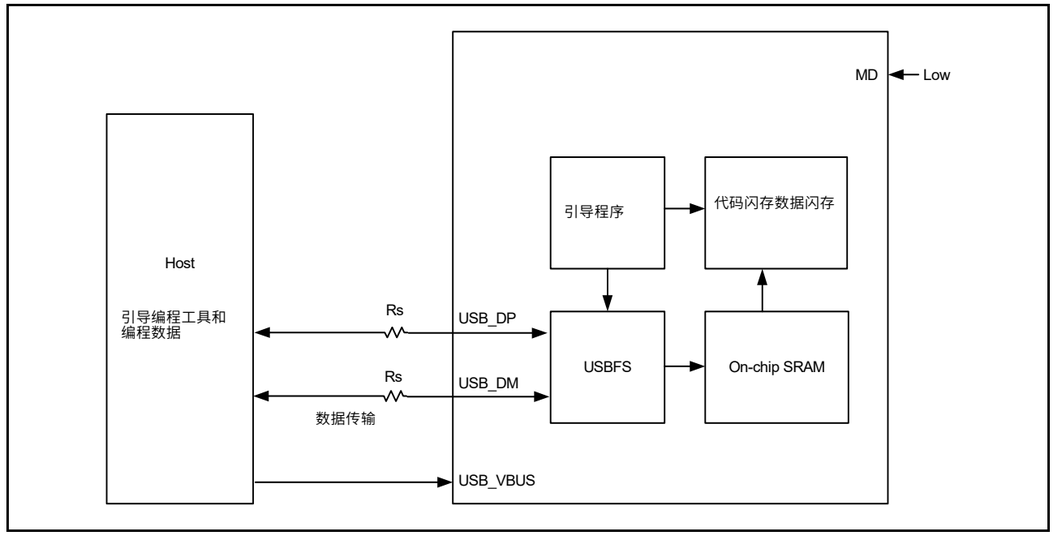

Figure 50.13 USB引导模式下的系统配置

50.11 使用串行编程器

可以使用专用的闪存编程器在串行编程模式下对闪存进行编程。

50.11.1 串行编程

MCU安装在系统板上，用于串行编程。板上的连接器允许闪存编程器进行编程。

50.11.2 编程环境

图50.14显示了瑞萨推荐的使用数据对MCU闪存进行编程的环境。

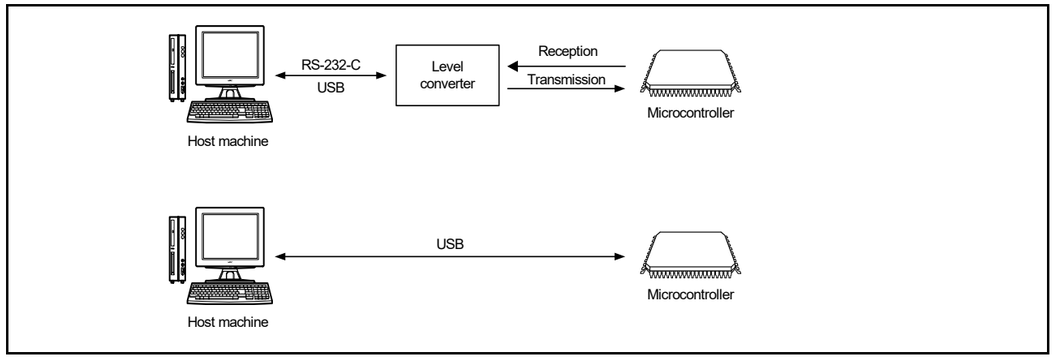

Figure 50.14 Environments for writing programs to the flash memory

50.12 Self-Programming

50.12.1 Overview

The MCU supports programming of the flash memory by the user program. The programming commands can be used with user programs for writing to the code and data flash memory. This enables upgrading of user programs and overwriting of constant data fields.

The background operation facility makes it possible to execute a program from the code flash memory to program the data flash memory under the conditions shown in Table 50.11. This program can also be copied in advance to and executed from the internal SRAM or external memory. When executing from the internal SRAM or external memory, this program can also program the code flash memory area.

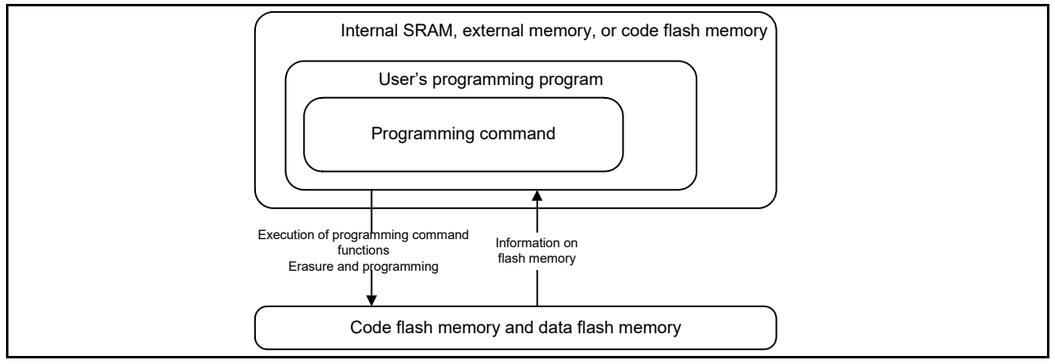

Figure 50.15 Schematic view of self-programming

50.12.2 Background Operation

Background operation can be used when a combination of the flash memory for writing and reading is as listed in Table 50.11.

Table 50.11 Conditions under which background operation is available

Product	Writable range	Readable range
All products	Data flash memory	Code flash memory
	Code flash memory	Data flash memory

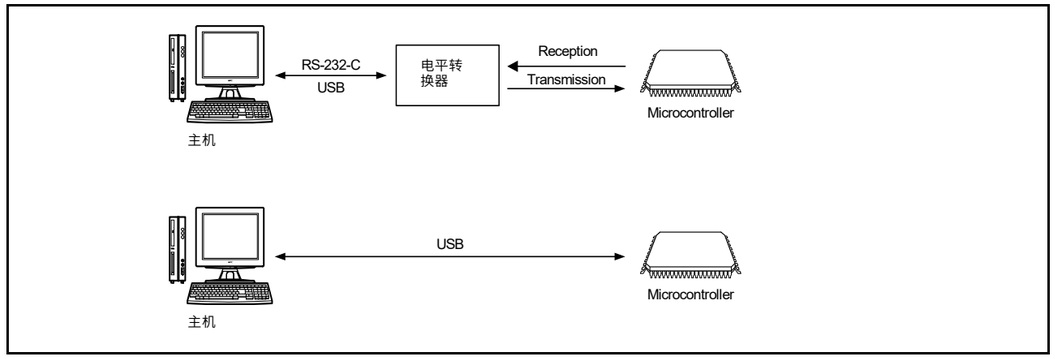

Figure 50.14 将程序写入闪存的环境

50.12 Self-Programming

50.12.1 Overview

MCU支持通过用户程序对闪存进行编程。编程命令可与用户程序一起用于写入代码和数据闪存。这使得用户程序的升级和常量数据字段的覆盖成为可能。

后台操作工具可以在表50.11所示的条件下从代码闪存执行程序以对数据闪存进行编程。该程序也可以预先复制到内部SRAM或外部存储器中并从中执行。当从内部SRAM或外部存储器执行时，该程序还可以对代码闪存区域进行编程。

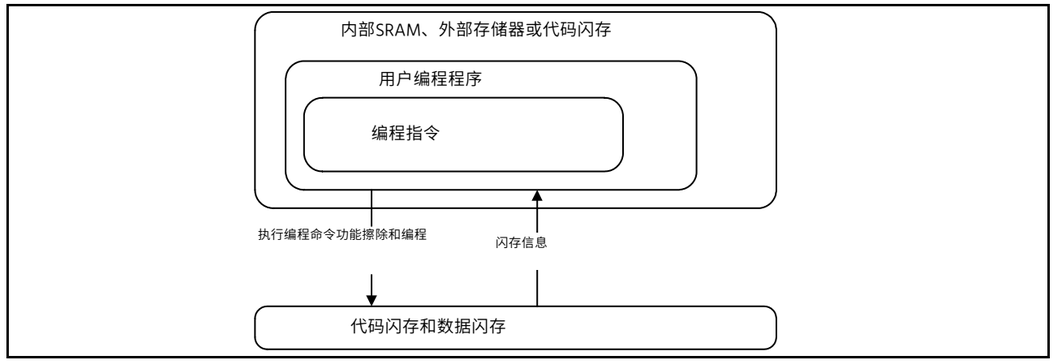

Figure 50.15 自编程示意图

50.12.2 后台操作

当用于写入和读取的闪存组合如表50.11中所列时，可以使用后台操作。

Table 50.11 后台操作可用的条件

Product	Writable range	可读范围
所有产品	数据闪存	代码闪存
	代码闪存	数据闪存

50.13 Reading the Flash Memory

50.13.1 Reading the Code Flash Memory

No special settings are required to read the code flash memory in Normal mode. Data can be read by accessing addresses in the code flash memory. When reading code flash memory that was erased but not yet reprogrammed, such as code flash memory in the non-programmed state, all bits are read as 1s.

50.13.2 Reading the Data Flash Memory

No special settings are required to read the data flash memory in Normal mode. Data can be read by accessing addresses in the data flash memory. Values read from data flash memory that was erased but not yet reprogrammed, such as data flash memory in the non-programmed state, are undefined. Use the blank check function to confirm that an area is in the non-programmed state.

50.14 Usage Notes

50.14.1 Reading Areas where Programming or Erasure was Interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area becomes undefined. To avoid reading undefined data, which can be a source of faulty operation, do not fetch instructions or read data from areas where programming or erasure was interrupted.

50.14.2 Restrictions on Additional Writes

Other than the configuration area, no other area can be written to twice. After a write to a flash memory area is complete, erase the area before attempting to overwrite data in that area. The configuration area can be overwritten.

50.14.3 Reset during Programming and Erasure

If inputting a reset from the RES pin, release the reset after a reset input time of at least t_{RESW} (see section 52.3.3, Reset Timing) within the range of the operating voltage defined in the electrical characteristics.

50.14.4 Allocation of Vectors for Interrupts and Other Exceptions during Programming and Erasure

Generation of an interrupt or other exception during programming or erasure might lead to fetching of the vector from the code flash memory. If the vector allocation does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.

50.14.5 Restrictions during Programming and Erasure

During programming and erasure, do not:

- Permit the operating voltage from the power supply to go beyond the allowed range
- Change the frequency of the peripheral clock.

50.14.6 Abnormal Termination of Programming and Erasure

When programming or erasure ends abnormally because of the generation of a reset by the RES pin, the programming or erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming or erasure ends abnormally, the blank check function cannot determine whether the area was erased successfully. Erase the area again to ensure that the corresponding area is completely erased before use.

50.13 读取闪存

50.13.1 读取代码闪存

在正常模式下读取代码闪存不需要特殊设置。可以通过访问代码闪存中的地址来读取数据。当读取已擦除但尚未重新编程的代码闪存时，例如处于未编程状态的代码闪存，所有位都被读取为1。

50.13.2 读取数据闪存

在正常模式下读取数据闪存不需要特殊设置。可以通过访问数据闪存中的地址来读取数据。从已擦除但尚未重新编程的数据闪存（例如处于未编程状态的数据闪存）读取的值是未定义的。使用空白检查功能确认某个区域处于非编程状态。

50.14 使用说明

50.14.1 编程或擦除被中断的阅读区域

当闪存区域的编程或擦除被中断时，存储在该区域中的数据变得不确定。
为避免读取可能导致错误操作的未定义数据，请勿从编程或擦除中断的区域获取指令或读取数据。

50.14.2 额外写入的限制

除配置区域外，其他区域不能写入两次。对闪存区域的写入完成后，请先擦除该区域，然后再尝试覆盖该区域中的数据。配置区域可以被覆盖。

50.14.3 在编程和擦除期间复位

如果从RES引脚输入复位，则在至少tRESW的复位输入时间后释放复位（参见第52.3.3节，复位时序)在电气特性中定义的工作电压范围内。

50.14.4 在编程和擦除期间为中断和其他异常分配向量

在编程或擦除期间产生中断或其他异常可能会导致从代码闪存中获取向量。如果向量分配不满足使用后台操作的条件，则将取向量的地址设置为不在代码闪存中的地址。

50.14.5 编程和擦除期间的限制

在编程和擦除期间，不要：

- 允许来自电源的工作电压超出允许范围
- 改变外设时钟的频率。

50.14.6 烧写异常终止和擦除

当由于RES引脚产生复位而导致编程或擦除异常结束时，无法验证或检查具有未定义数据的闪存的编程或擦除状态。对于编程或擦除异常结束的区域，空白检查功能无法确定该区域是否擦除成功。再次擦除该区域，以确保在使用前将相应区域完全擦除。

51. Internal Voltage Regulator

51.1 Overview

The MCU includes a linear regulator (LDO) that supplies voltage to the internal circuits and memory, except for I/O, analog, USB, and battery backup power domain.

51.2 Operation

Table 51.1 lists the LDO mode pin settings, and Figure 51.1 shows the LDO mode settings. In LDO mode, the internal voltage is generated from VCC.

Table 51.1 LDO mode pin settings

Pin	Description
All VCC pins	• Connect each pin to the system power supply • Connect each pin to VSS through a 0.1-µF multilayer ceramic capacitor. Place the capacitor close to the pin.
VCL and VCL0 pins	Connect each pin to VSS through a 0.1-µF multilayer ceramic capacitor. Place the capacitor close to the pin.

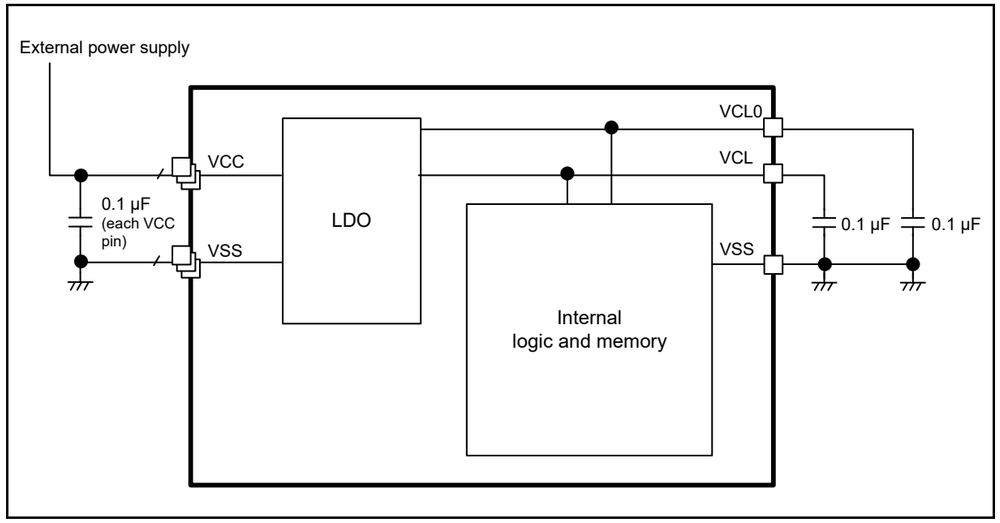

Figure 51.1 LDO mode settings

51. 内部稳压器

51.1 Overview

MCU包含一个线性稳压器(LDO)，可为内部电路和存储器提供电压，IO、模拟、USB和电池备用电源域除外。

51.2 Operation

表51.1列出了LDO模式引脚设置，图51.1显示了LDO模式设置。在LDO模式下，内部电压由VCC产生。

Table 51.1 LDO模式引脚设置

Pin	Description
所有VCC引脚	将每个引脚连接到系统电源 通过一个0.1µF多层陶瓷电容器将每个引脚连接到VSS。将电容器靠近引脚放置。
VCL和VCL0引脚	通过一个0.1µF多层陶瓷电容器将每个引脚连接到VSS。将电容器靠近引脚放置。

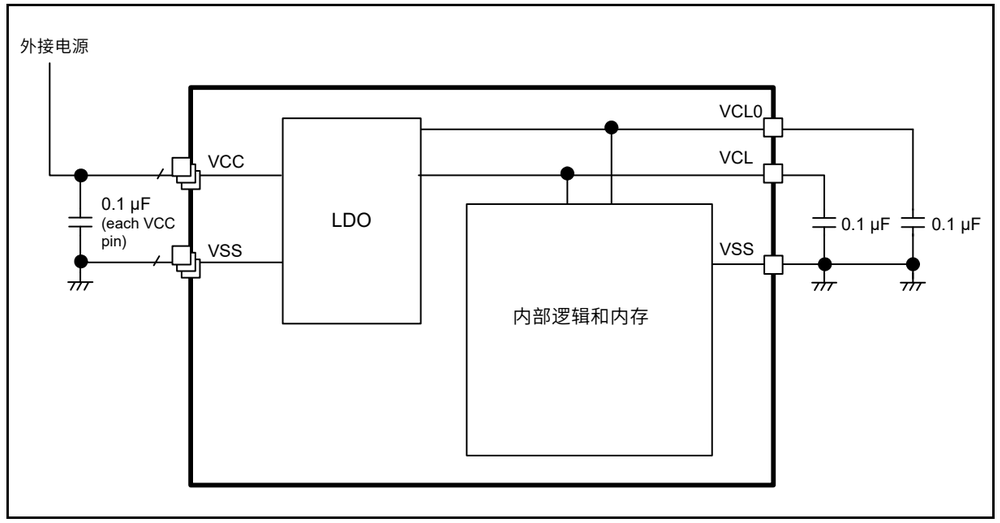

Figure 51.1 LDO模式设置

RA生态工作室

52. Electrical Characteristics

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

- VCC = AVCC0 = VCC_USB = VBATT = 2.7 to 3.6 V
- 2.7 ≤ VREFH0/VREFH ≤ AVCC0
- VSS = AVSS0 = VREFL0/VREFL = VSS_USB = 0 V
- $T_a = T_{opr}$.

Figure 52.1 shows the timing conditions.

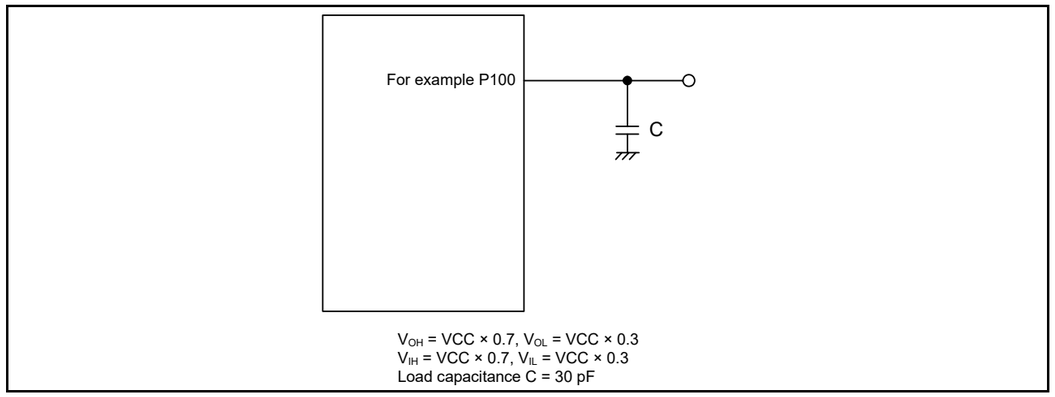

Figure 52.1 Input or output timing measurement conditions

The measurement conditions for the timing specification of each peripheral are recommended for the best peripheral operation. However, make sure to adjust the driving abilities of each pin to meet the conditions of your system.

Each function pin used for the same function must select the same drive ability. If the I/O drive ability of each function pin is mixed, the A/C specification of each function is not guaranteed.

52.1 Absolute Maximum Ratings

Table 52.1 Absolute maximum ratings

Parameter	Symbol	Value	Unit
Power supply voltage	VCC, VCC_USB *2	-0.3 to +4.0	V
VBATT power supply voltage	VBATT	-0.3 to +4.0	V
Input voltage (except for 5 V-tolerant ports*1)	V_{in}	-0.3 to VCC + 0.3	V
Input voltage (5 V-tolerant ports*1)	V_{in}	-0.3 to + VCC + 4.0 (max. 5.8)	V
Reference power supply voltage	VREFH/VREFH0	-0.3 to AVCC0 + 0.3	V
Analog power supply voltage	AVCC0 *2	-0.3 to +4.0	V
Analog input voltage (except for P000 to P007)	V_{AN}	-0.3 to AVCC0 + 0.3	V
Analog input voltage (P000 to P007) when PGA differential input is disabled	V_{AN}	-0.3 to AVCC0 + 0.3	V
Analog input voltage (P000 to P002, P004 to P006) when PGA differential input is enabled	V_{AN}	-1.3 to AVCC0 + 0.3	V
Analog input voltage (P003, P007) when PGA differential input is enabled	V_{AN}	-0.8 to AVCC0 + 0.3	V
Operating temperature*3, *4, *5	T_{opr}	-40 to +85 -40 to +105	°C
Storage temperature	T_{stg}	-55 to +125	°C

Caution: Permanent damage to the MCU might result if absolute maximum ratings are exceeded.

52. 电气特性

除非另有规定，MCU的电气特性在以下条件下定义：

- VCC = AVCC0 = VCC_USB = VBATT = 2.7 to 3.6 V
- 2.7 ≤ VREFH0/VREFH ≤ AVCC0
- VSS = AVSS0 = VREFL0/VREFL = VSS_USB = 0 V
- $T_a = T_{opr}$.

图52.1显示了时序条件。

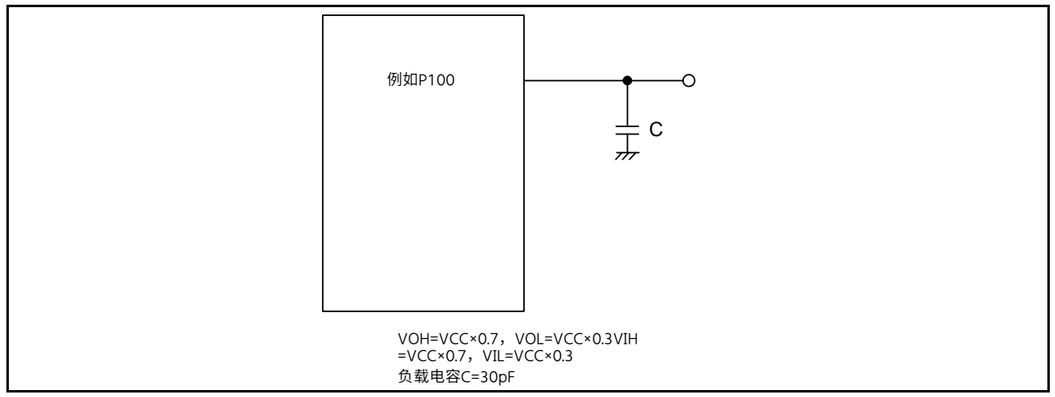

Figure 52.1 输入或输出定时测量条件

推荐每个外设时序规范的测量条件，以实现最佳外设操作。但是，请确保调整每个引脚的驱动能力以满足您系统的条件。

用于相同功能的每个功能引脚必须选择相同的驱动能力。如果各功能管脚的IO驱动能力混用，则无法保证各功能的AC规格。

52.1 绝对最大额定值

Table 52.1 绝对最大额定值

Parameter	Symbol	Value	Unit
电源电压	VCC, VCC_USB *2	-0.3 to +4.0	V
VBATT电源电压	VBATT	-0.3 to +4.0	V
输入电压（除了5V容限端口*1）	V_{in}	-0.3 to VCC + 0.3	V
输入电压（5V容限端口*1）	V_{in}	-0.3 to + VCC + 4.0 (max. 5.8)	V
参考电源电压	VREFH/VREFH0	-0.3 to AVCC0 + 0.3	V
模拟电源电压	AVCC0 *2	-0.3 to +4.0	V
模拟输入电压（P000至P007除外）	V_{AN}	-0.3 to AVCC0 + 0.3	V
PGA差分输入禁用时的模拟输入电压（P000至P007）	V_{AN}	-0.3 to AVCC0 + 0.3	V
启用PGA差分输入时的模拟输入电压（P000至P002、P004至P006）	V_{AN}	-1.3 to AVCC0 + 0.3	V
PGA差分输入启用时的模拟输入电压(P003 P007)	V_{AN}	-0.8 to AVCC0 + 0.3	V
Operating temperature*3, *4, *5	T_{opr}	-40 to +85 -40 to +105	°C
贮存温度	T_{stg}	-55 to +125	°C

Caution: 如果超过绝对最大额定值，可能会对MCU造成永久性损坏。

Note 1. Ports P205, P206, P400, P401, P407 to P415, and P708 are 5 V tolerant.
Note 2. Connect AVCC0 and VCC_USB to VCC.
Note 3. See section 52.2.1, T_j/T_a Definition.
Note 4. Contact Renesas Electronics sales office for information on derating operation when Ta = +85°C to +105°C. Derating is the systematic reduction of load for improved reliability.
Note 5. The upper limit of operating temperature is +85°C or +105°C, depending on the product. For details, see section 1.3, Part Numbering.

Table 52.2 Recommended operating conditions

Parameter	Symbol	Value	Min	Typ	Max	Unit
Power supply voltages	VCC	When USB is not used	2.7	-	3.6	V
		When USB is used	3.0	-	3.6	V
	VSS		-	0	-	V
USB power supply voltages	VCC_USB		-	VCC	-	V
	VSS_USB		-	0	-	V
VBATT power supply voltage	VBATT		1.8	-	3.6	V
Analog power supply voltages	AVCC0*1		-	VCC	-	V
	AVSS0		-	0	-	V

Note 1. Connect AVCC0 to VCC. When the A/D converter, the D/A converter, or the comparator are not in use, do not leave the AVCC0, VREFH/VREFH0, AVSS0, and VREFL/VREFL0 pins open. Connect the AVCC0 and VREFH/VREFH0 pins to VCC, and the AVSS0 and VREFL/VREFL0 pins to VSS, respectively.

52.2 DC Characteristics

52.2.1 T_j/T_a Definition

Table 52.3 DC characteristics
Conditions: Products with operating temperature (T_a) -40 to +105°C.

Parameter		Symbol	Typ	Max	Unit	Test conditions
Permissible junction temperature	100-pin LQFP 64-pin LQFP	T_j	-	125	°C	High-speed mode Low-speed mode Subosc-speed mode.
	64-pin QFN			117		
	100-pin LGA			105		

Note: Make sure that $T_j = T_a + \theta ja \times$ total power consumption (W),
where total power consumption = $(VCC - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + I_{CC}max \times VCC$.
The upper limit of operating temperature is +85°C or +105°C, depending on the product. For details, see section 1.3, Part Numbering.

52.2.2 I/O V_{IH}, V_{IL}

Table 52.4 I/O V_{IH}, V_{IL} (1 of 2)

Parameter			Symbol	Min	Typ	Max	Unit
Input voltage (except for Schmitt trigger input pins)	Peripheral function pin	EXTAL(external clock input), WAIT, SPI (except RSPCK)	V_{IH}	VCC × 0.8	-	-	V
			V_{IL}	-	-	VCC × 0.2	
		D00 to D07	V_{IH}	VCC × 0.7	-	-	
			V_{IL}	-	-	VCC × 0.3	
		IIC (SMBus)*1	V_{IH}	2.1	-	-	
			V_{IL}	-	-	0.8	
		IIC (SMBus)*2	V_{IH}	2.1	-	VCC + 3.6 (max 5.8)	
			V_{IL}	-	-	0.8	

Note 1. 端口P205、P206、P400、P401、P407至P415和P708可承受5V电压。
Note 2. 将AVCC0和VCC_USB连接到VCC。
Note 3. 请参阅第52.2.1节，TjTa定义。
Note 4. 有关Ta=+85°C至+105°C时降额操作的信息，请联系瑞萨电子销售办事处。降额是系统地减少负载以提高可靠性。
Note 5. 工作温度上限为+85°C或+105°C，具体取决于产品。有关详细信息，请参阅第1.3节，部分Numbering.

Table 52.2 推荐工作条件

Parameter	Symbol	Value	Min	Typ	Max	Unit
电源电压	VCC	不使用USB时	2.7	-	3.6	V
		使用USB时	3.0	-	3.6	V
	VSS		-	0	-	V
USB电源电压	VCC_USB		-	VCC	-	V
	VSS_USB		-	0	-	V
VBATT电源电压	VBATT		1.8	-	3.6	V
模拟电源电压	AVCC0*1		-	VCC	-	V
	AVSS0		-	0	-	V

Note 1. 将AVCC0连接到VCC。不使用AD转换器、DA转换器或比较器时，请勿离开AVCC0、VREFHVREFH0、AVSS0和VREFLVREFL0引脚打开。将AVCC0和VREFHVREFH0引脚分别连接到VCC，将AVSS0和VREFLVREFL0引脚分别连接到VSS。

52.2 DC Characteristics

52.2.1 T_j/T_a Definition

Table 52.3 DC characteristics
条件：工作温度(Ta)-40至+105°C的产品。

Parameter		Symbol	Typ	Max	Unit	测试条件
允许结温	100-pin LQFP 64-pin LQFP	T_j	-	125	°C	High-speed mode Low-speed mode Subosc-speed mode.
	64-pin QFN			117		
	100-pin LGA			105		

Note: 确保Tj=Ta+θja×总功耗(W)，其中总功耗=(VCCVOH)×ΣIOH+VOL×ΣIOL+ICCmax×VCC。工作温度上限为+85°C或+105°C，具体取决于产品。有关详细信息，请参阅第1.3节，部分Numbering.

52.2.2 I O V I H

Table 52.4 IOVIH VIL(1of2)

Parameter			Symbol	Min	Typ	Max	Unit
输入电压（施密特触发器输入引脚除外）	外设功能引脚	EXTAL（外部时钟输入）、WAIT、SPI（RSPCK除外）	V_{IH}	VCC × 0.8	-	-	V
			V_{IL}	-	-	VCC × 0.2	
		D00 to D07	V_{IH}	VCC × 0.7	-	-	
			V_{IL}	-	-	VCC × 0.3	
		IIC (SMBus)*1	V_{IH}	2.1	-	-	
			V_{IL}	-	-	0.8	
		IIC (SMBus)*2	V_{IH}	2.1	-	VCC + 3.6 (max 5.8)	
			V_{IL}	-	-	0.8	

Table 52.4 I/O V_{IH}, V_{IL} (2 of 2)

Parameter					Symbol	Min	Typ	Max	Unit
Schmitt trigger input voltage	Peripheral function pin	IIC (except for SMBus)*1			V_{IH}	VCC × 0.7	-	-	V
					V_{IL}	-	-	VCC × 0.3	
					ΔV_T	VCC × 0.05	-	-	
		IIC (except for SMBus)*2			V_{IH}	VCC × 0.7	-	VCC + 3.6 (max 5.8)	V
					V_{IL}	-	-	VCC × 0.3	
					ΔV_T	VCC × 0.05	-	-	
		5 V-tolerant ports*3, *7			V_{IH}	VCC × 0.8	-	VCC + 3.6 (max 5.8)	
					V_{IL}	-	-	VCC × 0.2	
					ΔV_T	VCC × 0.05	-	-	
		RTCIC0, RTCIC1, RTCIC2	When using the battery backup function	When VBATT power supply is selected	V_{IH}	VBATT × 0.8	-	VBATT + 0.3	
					V_{IL}	-	-	VBATT × 0.2	
					ΔV_T	VBATT × 0.05	-	-	
				When VCC power supply is selected	V_{IH}	VCC × 0.8	-	Higher voltage either VCC + 0.3 V or VBATT + 0.3 V	
					V_{IL}	-	-	VCC × 0.2	
					ΔV_T	VCC × 0.05	-	-	
			When not using the battery backup function		V_{IH}	VCC × 0.8	-	VCC + 0.3	
					V_{IL}	-	-	VCC × 0.2	
					ΔV_T	VCC × 0.05	-	-	
		Other input pins*4			V_{IH}	VCC × 0.8	-	-	
					V_{IL}	-	-	VCC × 0.2	
					ΔV_T	VCC × 0.05	-	-	
	Ports	5 V-tolerant ports*5, *7			V_{IH}	VCC × 0.8	-	VCC + 3.6 (max 5.8)	V
					V_{IL}	-	-	VCC × 0.2	
		Other input pins*6			V_{IH}	VCC × 0.8	-	-	
					V_{IL}	-	-	VCC × 0.2	

Note 1. SCL1_B, SDA1_B (total 2 pins).
Note 2. SCL0_A, SDA0_A, SCL0_B, SDA0_B, SCL1_A, SDA1_A (total 6 pins).
Note 3. RES and peripheral function pins associated with P205, P206, P400, P401, P407 to P415, P708 (total 15 pins).
Note 4. All input pins except for the peripheral function pins already described in the table.
Note 5. P205, P206, P400, P401, P407 to P415, P708 (total 14 pins).
Note 6. All input pins except for the ports already described in the table.
Note 7. When VCC is less than 2.7 V, the input voltage of 5 V-tolerant ports should be less than 3.6 V, otherwise breakdown may occur because 5 V-tolerant ports are electrically controlled so as not to violate the breakdown voltage.

Table 52.4 IOVIH VIL(2of2)

Parameter					Symbol	Min	Typ	Max	Unit
施密特触发器输入电压	外设功能引脚	IIC (except for SMBus)*1			V_{IH}	VCC × 0.7	-	-	V
					V_{IL}	-	-	VCC × 0.3	
					ΔV_T	VCC × 0.05	-	-	
		IIC (except for SMBus)*2			V_{IH}	VCC × 0.7	-	VCC + 3.6 (max 5.8)	V
					V_{IL}	-	-	VCC × 0.3	
					ΔV_T	VCC × 0.05	-	-	
		5 V-tolerant ports*3, *7			V_{IH}	VCC × 0.8	-	VCC + 3.6 (max 5.8)	
					V_{IL}	-	-	VCC × 0.2	
					ΔV_T	VCC × 0.05	-	-	
		RTCIC0, RTCIC1, RTCIC2	使用电池备份功能时	选择VBATT电源时	V_{IH}	VBATT × 0.8	-	VBATT + 0.3	
					V_{IL}	-	-	VBATT × 0.2	
					ΔV_T	VBATT × 0.05	-	-	
				选择VCC电源时	V_{IH}	VCC × 0.8	-	更高的电压VCC+0.3V或VBATT+0.3 V	
					V_{IL}	-	-	VCC × 0.2	
					ΔV_T	VCC × 0.05	-	-	
			不使用电池备份功能时		V_{IH}	VCC × 0.8	-	VCC + 0.3	
					V_{IL}	-	-	VCC × 0.2	
					ΔV_T	VCC × 0.05	-	-	
		其他输入引脚*4			V_{IH}	VCC × 0.8	-	-	
					V_{IL}	-	-	VCC × 0.2	
					ΔV_T	VCC × 0.05	-	-	
	Ports	5 V-tolerant ports*5, *7			V_{IH}	VCC × 0.8	-	VCC + 3.6 (max 5.8)	V
					V_{IL}	-	-	VCC × 0.2	
		其他输入引脚*6			V_{IH}	VCC × 0.8	-	-	
					V_{IL}	-	-	VCC × 0.2	

Note 1. SCL1_B, SDA1_B (total 2 pins).
Note 2. SCL0_A, SDA0_A, SCL0_B, SDA0_B, SCL1_A, SDA1_A (total 6 pins).
Note 3. RES和与P205、P206、P400、P401、P407到P415、P708相关的外围功能引脚（共15个引脚）。
Note 4. 除表中已描述的外围功能引脚外的所有输入引脚。
Note 5. P205, P206, P400, P401, P407 to P415, P708 (total 14 pins).
Note 6. 除表中已描述的端口外的所有输入引脚。
Note 7. 当VCC小于2.7V时，耐5V端口的输入电压应小于3.6V，否则可能发生击穿，因为5V耐压端口是电控的，不会违反击穿电压。

52.2.3 I/O I_{OH}, I_{OL}

Table 52.5 I/O I_{OH}, I_{OL}

Parameter			Symbol	Min	Typ	Max	Unit
Permissible output current (average value per pin)	Ports P008, P201	-	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
	Ports P014, P015	-	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
	Ports P205, P206, P407 to P415, P602, P708 (total 13 pins)	Low drive*1	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
		Middle drive*2	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		High drive*3	I_{OH}	-	-	-20	mA
			I_{OL}	-	-	20	mA
	Other output pins*4	Low drive*1	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
		Middle drive*2	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		High drive*3	I_{OH}	-	-	-16	mA
			I_{OL}	-	-	16	mA
Permissible output current (max value per pin)	Ports P008, P201	-	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
	Ports P014, P015	-	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
	Ports P205, P206, P407 to P415, P602, P708 (total 13 pins)	Low drive*1	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		Middle drive*2	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
		High drive*3	I_{OH}	-	-	-40	mA
			I_{OL}	-	-	40	mA
	Other output pins*4	Low drive*1	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		Middle drive*2	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
		High drive*3	I_{OH}	-	-	-32	mA
			I_{OL}	-	-	32	mA
Permissible output current (max value of total of all pins)	Maximum of all output pins		ΣI_{OH} (max)	-	-	-80	mA
			ΣI_{OL} (max)	-	-	80	mA

Caution: To protect the reliability of the MCU, the output current values should not exceed the values in this table. The average output current indicates the average value of current measured during 100 µs.

Note 1. This is the value when low driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 2. This is the value when middle driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 3. This is the value when high driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 4. Except for P000 to P007, P200, which are input ports.

52.2.3 我爱我哦

Table 52.5 我爱我哦

Parameter			Symbol	Min	Typ	Max	Unit
允许输出电流（每个引脚的平均值）	Ports P008, P201	-	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
	Ports P014, P015	-	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
	端口P205、P206、P407至P415、P602, P708 (total 13 pins)	Low drive*1	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
		Middle drive*2	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		High drive*3	I_{OH}	-	-	-20	mA
			I_{OL}	-	-	20	mA
	其他输出引脚*4	Low drive*1	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
		Middle drive*2	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		High drive*3	I_{OH}	-	-	-16	mA
			I_{OL}	-	-	16	mA
允许输出电流（每个引脚的最大值）	Ports P008, P201	-	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
	Ports P014, P015	-	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
	端口P205、P206、P407至P415、P602, P708 (total 13 pins)	Low drive*1	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		Middle drive*2	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
		High drive*3	I_{OH}	-	-	-40	mA
			I_{OL}	-	-	40	mA
	其他输出引脚*4	Low drive*1	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		Middle drive*2	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
		High drive*3	I_{OH}	-	-	-32	mA
			I_{OL}	-	-	32	mA
允许输出电流（所有引脚总和的最大值）	所有输出引脚的最大值		ΣI_{OH} (max)	-	-	-80	mA
			ΣI_{OL} (max)	-	-	80	mA

Caution: 为保护单片机的可靠性，输出电流值不应超过此表中的值。平均输出电流是指在100µs内测得的电流平均值。

Note 1. 这是在PmnPFS寄存器的端口驱动能力位中选择低驱动能力时的值。在深度软件待机模式下会保留所选的驾驶能力。
Note 2. 这是在PmnPFS寄存器的端口驱动能力位中选择中等驱动能力时的值。在深度软件待机模式下会保留所选的驾驶能力。
Note 3. 这是在PmnPFS寄存器的端口驱动能力位中选择高驱动能力时的值。在深度软件待机模式下会保留所选的驾驶能力。
Note 4. 除了P000至P007、P200为输入端口。

Table 52.7 Operating and standby current (2 of 2)

Parameter			Symbol	Min	Typ	Max	Unit	Test conditions
USB operating current	Low speed	USB	$I_{CCUSBLS}$	-	3.5	6.5	mA	VCC_USB
	Full speed	USB	$I_{CCUSBFS}$	-	4.0	10.0	mA	VCC_USB

Note 1. Supply current values are with all output pins unloaded and all input pull-up MOS transistors in the off state.
Note 2. Measured with clocks supplied to the peripheral functions. This does not include the BGO operation.
Note 3. I_{CC} depends on f (ICLK) as follows. (ICLK:PCLKA:PCLKB:PCLKC:PCLKD:BCK:EBCLK = 2:2:1:1:2:1:1)
I_{CC} Max. = 0.53 x f + 23 (maximum operation in High-speed mode)
I_{CC} Typ. = 0.08 x f + 2.4 (normal operation in High-speed mode)
I_{CC} Typ. = 0.1 x f + 1.1 (Low-speed mode)
I_{CC} Max. = 0.09 x f + 23 (Sleep mode).
Note 4. This does not include the BGO operation.
Note 5. Supply of the clock signal to peripherals is stopped in this state. This does not include the BGO operation.
Note 6. FCLK, BCLK, PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (3.75 MHz).
Note 7. When the MCU is in Software Standby mode or the MSTPCRD.MSTPD16 (12-bit A/D Converter 0 Module Stop bit) and MSTPCRD.MSTPD15 (12-bit A/D Converter 1 Module Stop bit) are in the module-stop state.
See section 42.6.8, Available functions and register settings of AN000 to AN002, AN007, AN100 to AN102, and AN107.

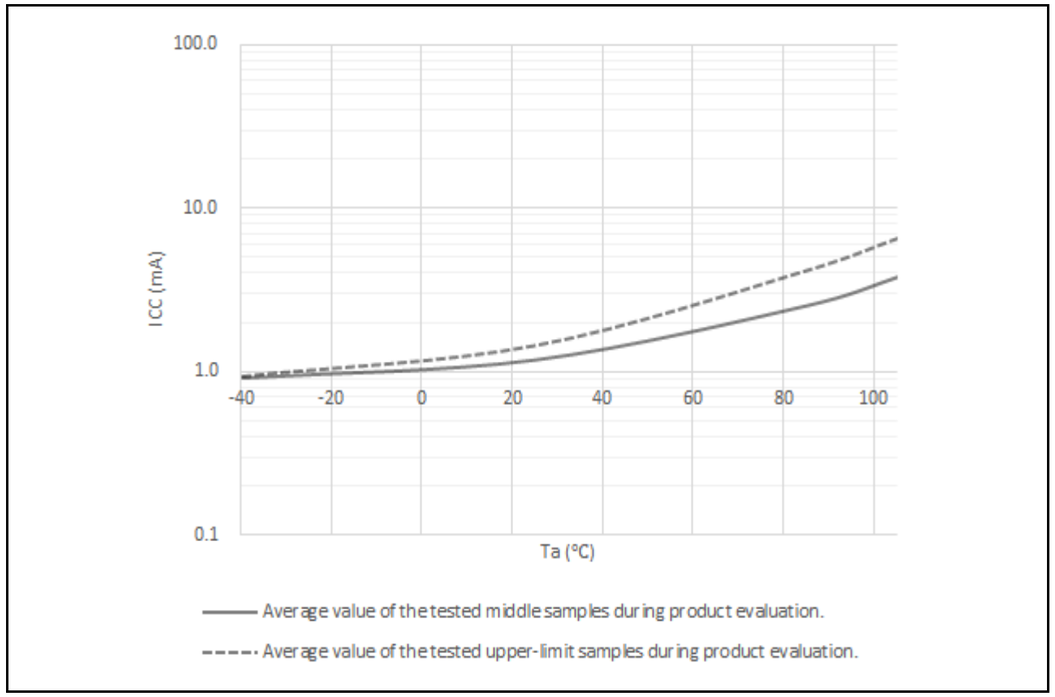

Figure 52.2 Temperature dependency in Software Standby mode (reference data)

Table 52.7 工作和待机电流(2of2)

Parameter			Symbol	Min	Typ	Max	Unit	测试条件
USB工作电流	低速	USB	$I_{CCUSBLS}$	-	3.5	6.5	mA	VCC_USB
	全速	USB	$I_{CCUSBFS}$	-	4.0	10.0	mA	VCC_USB

Note 1. 电源电流值是在所有输出引脚空载且所有输入上拉MOS晶体管处于关闭状态的情况下。
Note 2. 使用提供给外围功能的时钟进行测量。这不包括BGO操作。
Note 3. ICC取决于f(ICLK)如下。（ICLK:PCLKA:PCLKB:PCLKC:PCLKD:BCK:EBCLK=2:2:1:1:2:1:1）
我CC最大。=0.53xf+23（高速模式下的最大操作）
我CC典型。=0.08xf+2.4（高速模式下的正常操作）
I_{CC} Typ. = 0.1 x f + 1.1 (Low-speed mode)
I_{CC} Max. = 0.09 x f + 23 (Sleep mode).
Note 4. 这不包括BGO操作。
Note 5. 在该状态下停止向外围设备提供时钟信号。这不包括BGO操作。
Note 6. FCLK、BCLK、PCLKA、PCLKB、PCLKC和PCLKD设置为64分频(3.75MHz)。
Note 7. 当MCU处于软件待机模式或MSTPCRD.MSTPD16（12位AD转换器0模块停止位）和MSTPCRD.MSTPD15（12位AD转换器1模块停止位）处于模块停止状态时。
请参阅第42.6.8节，AN000至AN002、AN007、AN100至AN102和AN107的可用功能和寄存器设置。

52.2.6 VCC Rise and Fall Gradient and Ripple Frequency

Table 52.8 Rise and fall gradient characteristics

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
VCC rising gradient	Voltage monitor 0 reset disabled at startup	SrVCC	0.0084	-	20	ms/V	-
	Voltage monitor 0 reset enabled at startup		0.0084	-	-		-
	SCI/USB boot mode*1		0.0084	-	20		-
VCC falling gradient*2		SfVCC	0.0084	-	-	ms/V	-

Note 1. At boot mode, the reset from voltage monitor 0 is disabled regardless of the value of the OFS1.LVDAS bit.
Note 2. This applies when VBATT is used.

Table 52.9 Rise and fall gradient and ripple frequency characteristics
The ripple voltage must meet the allowable ripple frequency $f_{r(VCC)}$ within the range between the VCC upper limit (3.6 V) and lower limit (2.7 V). When the VCC change exceeds VCC ±10%, the allowable voltage change rising and falling gradient dt/dVCC must be met.

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Allowable ripple frequency	$f_{r(VCC)}$	-	-	10	kHz	Figure 52.6 $V_{r(VCC)} \leq VCC \times 0.2$
		-	-	1	MHz	Figure 52.6 $V_{r(VCC)} \leq VCC \times 0.08$
		-	-	10	MHz	Figure 52.6 $V_{r(VCC)} \leq VCC \times 0.06$
Allowable voltage change rising and falling gradient	dt/dVCC	1.0	-	-	ms/V	When VCC change exceeds VCC ±10%

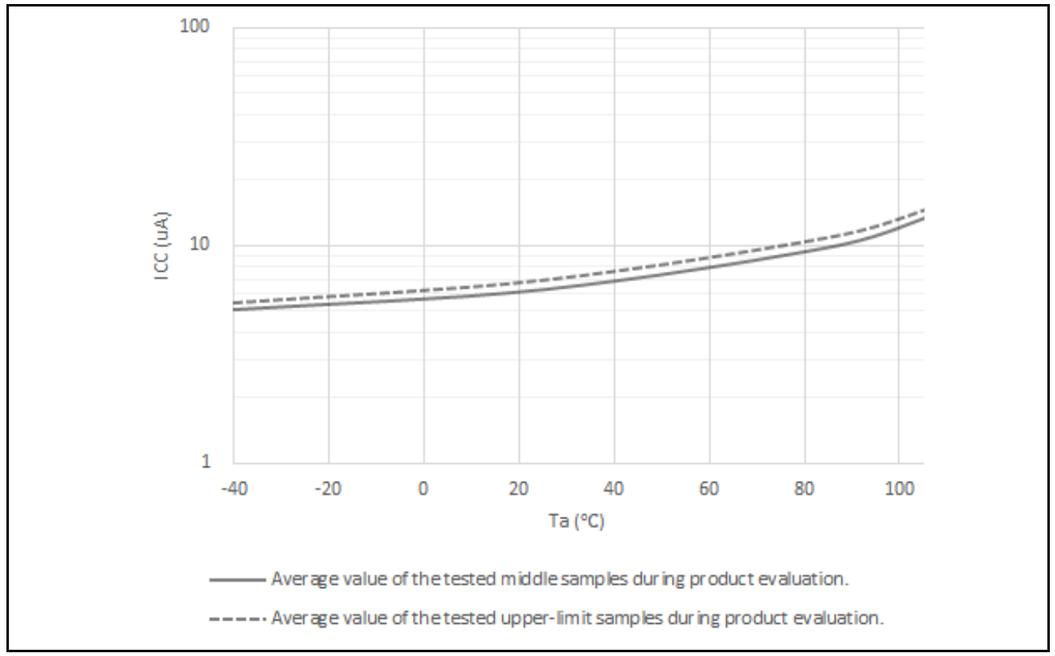

Figure 52.5 深度软件待机模式下的温度依赖性、未向SRAM或USB恢复检测单元供电、启用上电复位电路低功耗功能（参考数据）

52.2.6 VCC上升和下降梯度和纹波频率

Table 52.8 上升和下降梯度特性

Parameter		Symbol	Min	Typ	Max	Unit	测试条件
VCC上升梯度	启动时禁用电压监视器0复位	SrVCC	0.0084	-	20	ms/V	-
	启动时启用电压监视器0复位		0.0084	-	-		-
	SCI/USB boot mode*1		0.0084	-	20		-
VCC falling gradient*2		SfVCC	0.0084	-	-	ms/V	-

Note 1. 在引导模式下，无论OFS1.LVDAS位的值如何，都禁止从电压监视器0进行的复位。
Note 2. 这适用于使用VBATT时。

Table 52.9 升降梯度和纹波频率特性
纹波电压必须在VCC上限(3.6V)和下限(2.7V)之间的范围内满足允许的纹波频率fr(VCC)。当VCC变化超过VCC±10%时，必须满足允许的电压变化上升和下降梯度dtdVCC。

Parameter	Symbol	Min	Typ	Max	Unit	测试条件
允许纹波频率	$f_{r(VCC)}$	-	-	10	kHz	Figure 52.6 $V_{r(VCC)} \leq VCC \times 0.2$
		-	-	1	MHz	Figure 52.6 $V_{r(VCC)} \leq VCC \times 0.08$
		-	-	10	MHz	Figure 52.6 $V_{r(VCC)} \leq VCC \times 0.06$
允许电压变化上升下降梯度	dt/dVCC	1.0	-	-	ms/V	当VCC变化超过VCC±10%

RA生态工作室

Table 52.13 Clock timing except for sub-clock oscillator (2 of 2)

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
PLL clock oscillation stabilization wait time	t_{PLLWT}	-	-	174.9	µs	Figure 52.11

Note 1. When setting up the main clock oscillator, ask the oscillator manufacturer for an oscillation evaluation, and use the results as the recommended oscillation stabilization time. Set the MOSCWTCR register to a value equal to or greater than the recommended value.
After changing the setting in the MOSCCR.MOSTP bit to start main clock operation, read the OSCSF.MOSCSF flag to confirm that it is 1, and then start using the main clock oscillator.

Note 2. This is the time from release from reset state until the HOCO oscillation frequency (fHOCO) reaches the range for guaranteed operation.

Table 52.14 Clock timing for the sub-clock oscillator

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Sub-clock frequency	f_{SUB}	-	32.768	-	kHz	-
Sub-clock oscillation stabilization wait time	$t_{SUBOSCWT}$	-	-	-*1	s	Figure 52.12

Note 1. When setting up the sub-clock oscillator, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time.
After changing the setting in the SOSCCR.SOSTP bit to start sub-clock operation, only start using the sub-clock oscillator after the sub-clock oscillation stabilization time elapses with an adequate margin. A value that is two times the value shown is recommended.

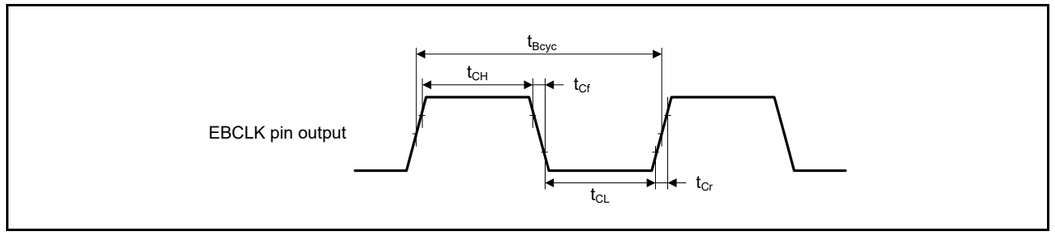

Figure 52.7 EBCLK output timing

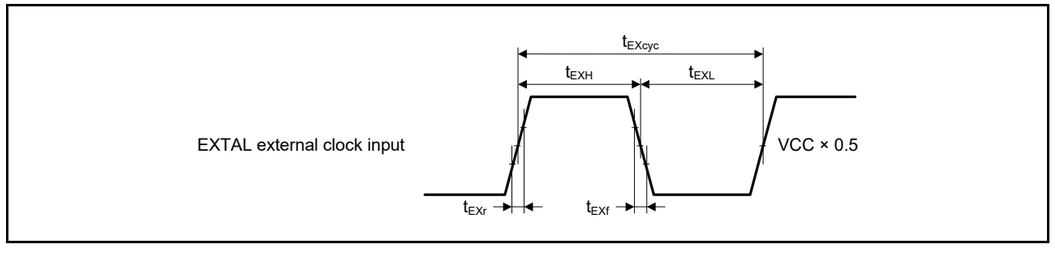

Figure 52.8 EXTAL external clock input timing

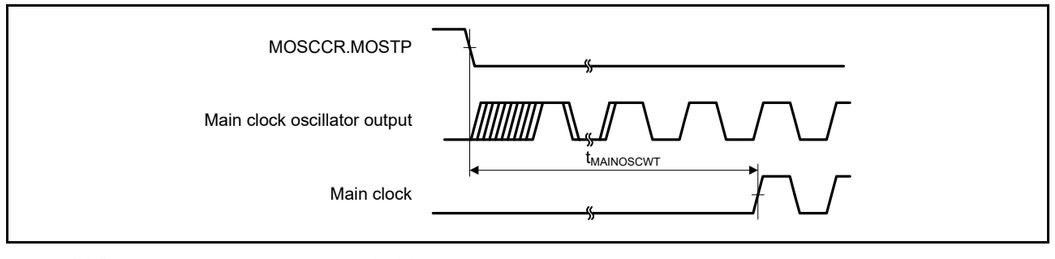

Figure 52.9 Main clock oscillation start timing

Table 52.13 除副时钟振荡器外的时钟时序(2of2)

Parameter	Symbol	Min	Typ	Max	Unit	测试条件
PLL时钟振荡稳定等待时间	t_{PLLWT}	-	-	174.9	µs	Figure 52.11

Note 1. 设置主时钟振荡器时，请向振荡器制造商索取振荡评估，并将结果作为推荐的振荡稳定时间。将MOSCWTCR寄存器设置为等于或大于推荐值的值。更改MOSCCR.MOSTP位的设置以启动主时钟操作后，读取OSCSF.MOSCSF标志以确认其为1，然后开始使用主时钟振荡器。

Note 2. 这是从复位状态释放到HOCO振荡频率(fHOCO)达到保证工作范围的时间。

Table 52.14 副时钟振荡器的时钟时序

Parameter	Symbol	Min	Typ	Max	Unit	测试条件
Sub-clock frequency	f_{SUB}	-	32.768	-	kHz	-
副时钟振荡稳定等待时间	$t_{SUBOSCWT}$	-	-	-*1	s	Figure 52.12

Note 1. 设置副时钟振荡器时，请向振荡器制造商索取振荡评估，并将结果作为推荐的振荡稳定时间。更改SOSCCR.SOSTP位的设置以启动副时钟操作后，只有在副时钟振荡稳定时间过去并留有足够余量后才开始使用副时钟振荡器。建议使用两倍于显示值的值。

RA生态工作室

Table 52.16 Timing of recovery from low power modes (2 of 2)

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
Recovery time from Deep Software Standby mode		t_{DSBY}	-	0.65	1.0	ms	Figure 52.16
Wait time after cancellation of Deep Software Standby mode		t_{DSBYWT}	34	-	35	t_{cyc}	
Recovery time from Software Standby mode to Snooze mode	High-speed mode when system clock source is HOCO (20 MHz)	t_{SNZ}	-	35*9, *10	70 *9, *10	µs	Figure 52.17
	High-speed mode when system clock source is MOCO (8 MHz)	t_{SNZ}	-	11*9	14*9	µs	

Note 1. The recovery time is determined by the system clock source. When multiple oscillators are active, the recovery time can be determined with the following equation:
Total recovery time = recovery time for an oscillator as the system clock source + the longest oscillation stabilization time of any oscillators requiring longer stabilization times than the system clock source + 2 LOCO cycles (when LOCO is operating) + 3 SOSC cycles (when Subosc is oscillating and MSTPC0 = 0 (CAC module stop)).

Note 2. When the frequency of the crystal is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 05h). For other settings (MOSCWTCR is set to Xh), the recovery time can be determined with the following equation:
t_{SBYMC} (MOSCWTCR = Xh) = t_{SBYMC} (MOSCWTCR = 05h) + ($t_{MAINOSCWT}$ (MOSCWTCR = Xh) - $t_{MAINOSCWT}$ (MOSCWTCR = 05h))

Note 3. When the frequency of PLL is 240 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 05h). For other settings (MOSCWTCR is set to Xh), the recovery time can be determined with the following equation:
t_{SBYMC} (MOSCWTCR = Xh) = t_{SBYMC} (MOSCWTCR = 05h) + ($t_{MAINOSCWT}$ (MOSCWTCR = Xh) - $t_{MAINOSCWT}$ (MOSCWTCR = 05h))

Note 4. When the frequency of the external clock is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 00h). For other settings (MOSCWTCR is set to Xh), the recovery time can be determined with the following equation:
t_{SBYMC} (MOSCWTCR = Xh) = t_{SBYMC} (MOSCWTCR = 00h) + ($t_{MAINOSCWT}$ (MOSCWTCR = Xh) - $t_{MAINOSCWT}$ (MOSCWTCR = 00h))

Note 5. When the frequency of PLL is 240 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 00h). For other settings (MOSCWTCR is set to Xh), the recovery time can be determined with the following equation:
t_{SBYMC} (MOSCWTCR = Xh) = t_{SBYMC} (MOSCWTCR = 00h) + ($t_{MAINOSCWT}$ (MOSCWTCR = Xh) - $t_{MAINOSCWT}$ (MOSCWTCR = 00h))

Note 6. The HOCO frequency is 20 MHz.

Note 7. The MOCO frequency is 8 MHz.

Note 8. In Subosc-speed mode, the sub-clock oscillator or LOCO continues oscillating in Software Standby mode.

Note 9. When the SNZCR.RXDREQEN bit is set to 0, the following time is added as the power supply recovery time:
STCONR.STCON[1:0] = 00b:16 µs (typical), 34 µs (maximum)
STCONR.STCON[1:0] = 11b:16 µs (typical), 104 µs (maximum).

Note 10. When the SNZCR.RXDREQEN bit is set to 0, 16 µs (typical) or 18 µs (maximum) is added as the HOCO wait time.

Table 52.16 从低功耗模式恢复的时间（2个中的2个）

Parameter		Symbol	Min	Typ	Max	Unit	测试条件
从深度软件待机模式恢复时间		t_{DSBY}	-	0.65	1.0	ms	Figure 52.16
取消深度软件待机模式后的等待时间		t_{DSBYWT}	34	-	35	t_{cyc}	
从软件待机模式恢复到	系统时钟源为HOCO(20MHz)时的高速模式	t_{SNZ}	-	35*9, *10	70 *9, *10	µs	Figure 52.17
贪睡模式	系统时钟源为MOCO(8MHz)时的高速模式	t_{SNZ}	-	11*9	14*9	µs	

Note 1. 恢复时间由系统时钟源决定。当多个振荡器处于活动状态时，恢复时间可以通过以下公式确定：总恢复时间=振荡器作为系统时钟源的恢复时间+任何需要比系统时钟源更长稳定时间的振荡器的最长振荡稳定时间+2个LOCO周期（当LOCO运行时）+3个SOSC周期（当Subosc正在振荡且MSTPC0=0（CAC模块停止）时）。

Note 2. 当晶振频率为24MHz时（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为05h）。对于其他设置（MOSCWTCR设置为Xh），可以使用以下公式确定恢复时间：tSBYMC(MOSCWTCR=Xh)=tSBYMC(MOSCWTCR=05h)+(tMAINOSCWT(MOSCWTCR=Xh)tMAINOSCWT(MOSCWTCR=05h))

Note 3. 当PLL的频率为240MHz时（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为05h）。对于其他设置（MOSCWTCR设置为Xh），可以使用以下公式确定恢复时间：tSBYMC(MOSCWTCR=Xh)=tSBYMC(MOSCWTCR=05h)+(tMAINOSCWT(MOSCWTCR=Xh)tMAINOSCWT(MOSCWTCR=05h))

Note 4. 当外部时钟频率为24MHz时（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为00h）。对于其他设置（MOSCWTCR设置为Xh），可以使用以下公式确定恢复时间：tSBYMC(MOSCWTCR=Xh)=tSBYMC(MOSCWTCR=00h)+(tMAINOSCWT(MOSCWTCR=Xh)tMAINOSCWT(MOSCWTCR=00h))

Note 5. 当PLL的频率为240MHz时（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为00h）。对于其他设置（MOSCWTCR设置为Xh），可以使用以下公式确定恢复时间：tSBYMC(MOSCWTCR=Xh)=tSBYMC(MOSCWTCR=00h)+(tMAINOSCWT(MOSCWTCR=Xh)tMAINOSCWT(MOSCWTCR=00h))

Note 6. HOCO频率为20MHz。

Note 7. MOCO频率为8MHz。

Note 8. 在Subosc速度模式下，副时钟振荡器或LOCO在软件待机模式下继续振荡。

Note 9. 当SNZCR.RXDREQEN位设置为0时，添加以下时间作为电源恢复时间：
STCONR.STCON[1:0] = 00b:16 µs (typical), 34 µs (maximum)
STCONR.STCON[1:0] = 11b:16 µs (typical), 104 µs (maximum).

注10.当SNZCR.RXDREQEN位设置为0时，添加16µs（典型值）或18µs（最大值）作为HOCO等待时间。

52.3.7 IO端口、POEG、GPT32、AGT、KINT和ADC12触发时序

Table 52.19 IO端口、POEG、GPT32、AGT、KINT和ADC12触发时序（1of2）
GPT32条件：在PmnPFS寄存器的端口驱动能力位中选择高驱动输出。AGT条件：在PmnPFS寄存器的端口驱动能力位中选择中间驱动输出。

Parameter			Symbol	Min	Max	Unit	测试条件
I/O ports	输入数据脉冲宽度		t_{PRW}	1.5	-	t_{Pcyc}	Figure 52.27
POEG	POEG输入触发脉冲宽度		t_{POEW}	3	-	t_{Pcyc}	Figure 52.28
GPT32	输入捕捉脉冲宽度	单边	t_{GTICW}	1.5	-	t_{PDcyc}	Figure 52.29
		双刃		2.5	-		
	GTIOCxY输出偏移（x=0到7，Y=A或B）	中间驱动缓冲器	t_{GTISK}*1	-	4	ns	Figure 52.30
		高驱动缓冲器		-	4		
	GTIOCxY输出偏差（x=8到12，Y=A或B）	中间驱动缓冲器		-	4		
		高驱动缓冲器		-	4		
	GTIOCxY输出偏移（x=0到12，Y=A或B）	中间驱动缓冲器		-	6		
		高驱动缓冲器		-	6		
	OPS输出偏差 GTOUUP, GTOULO, GTOVUP, GTOVLO, GTOWUP, GTOWLO		t_{GTOSK}	-	5	ns	Figure 52.31
GPT（PWM延迟生成 Circuit)	GTIOCxY_Z输出偏移（x=0到3，Y=A或B，Z=A）		t_{HRSK}*2	-	2.0	ns	Figure 52.32

Table 52.19 I/O ports, POEG, GPT32, AGT, KINT, and ADC12 trigger timing (2 of 2)
GPT32 conditions: High drive output is selected in the Port Drive Capability bit in the PmnPFS register.
AGT conditions: Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	Min	Max	Unit	Test conditions
AGT	AGTIO, AGTEE input cycle	t_{ACYC}*3	100	-	ns	Figure 52.33
	AGTIO, AGTEE input high width, low width	t_{ACKWH}, t_{ACKWL}	40	-	ns	
	AGTIO, AGTO, AGTOA, AGTOB output cycle	t_{ACYC2}	62.5	-	ns	
ADC12	ADC12 trigger input pulse width	t_{TRGW}	1.5	-	t_{Pcyc}	Figure 52.34
KINT	KRn(n = 00 to 07) pulse width	t_{KR}	250	-	ns	Figure 52.35

Note: t_{Pcyc}: PCLKB cycle, t_{PDcyc}: PCLKD cycle.
Note 1. This skew applies when the same driver I/O is used. If the I/O of the middle and high drivers is mixed, operation is not guaranteed.
Note 2. The load is 30 pF.
Note 3. Constraints on input cycle:
When not switching the source clock: $t_{Pcyc} \times 2 < t_{ACYC}$ should be satisfied.
When switching the source clock: $t_{Pcyc} \times 6 < t_{ACYC}$ should be satisfied.

Table 52.27 IIC timing (1) (2 of 2)

(1) Conditions: Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register for the following pins: SDA0_B, SCL0_B, SDA1_A, SCL1_A, SDA1_B, SCL1_B.
(2) The following pins do not require setting: SCL0_A, SDA0_A.
(3) Use pins that have a letter appended to their names, for instance "_A" or "_B", to indicate group membership. For the IIC interface, the AC portion of the electrical characteristics is measured for each group.

Parameter		Symbol	Min*1	Max	Unit	Test conditions*3
IIC (Fast mode)	SCL input cycle time	t_{SCL}	6 (12) × t_{IICcyc} + 600	-	ns	Figure 52.53
	SCL input high pulse width	t_{SCLH}	3 (6) × t_{IICcyc} + 300	-	ns	
	SCL input low pulse width	t_{SCLL}	3 (6) × t_{IICcyc} + 300	-	ns	
	SCL, SDA input rise time	t_{Sr}	20 × (external pullup voltage/5.5V)*2	300	ns	
	SCL, SDA input fall time	t_{Sf}	20 × (external pullup voltage/5.5V)*2	300	ns	
	SCL, SDA input spike pulse removal time	t_{SP}	0	1 (4) × t_{IICcyc}	ns	
	SDA input bus free time when wakeup function is disabled	t_{BUF}	3 (6) × t_{IICcyc} + 300	-	ns	
	SDA input bus free time when wakeup function is enabled	t_{BUF}	3 (6) × t_{IICcyc} + 4 × t_{Pcyc} + 300	-	ns	
	START condition input hold time when wakeup function is disabled	t_{STAH}	t_{IICcyc} + 300	-	ns	
	START condition input hold time when wakeup function is enabled	t_{STAH}	1 (5) × t_{IICcyc} + t_{Pcyc} + 300	-	ns	
	Repeated START condition input setup time	t_{STAS}	300	-	ns	
	STOP condition input setup time	t_{STOS}	300	-	ns	
	Data input setup time	t_{SDAS}	t_{IICcyc} + 50	-	ns	
	Data input hold time	t_{SDAH}	0	-	ns	
	SCL, SDA capacitive load	C_b	-	400	pF	

Note: t_{IICcyc}: IIC internal reference clock (IICφ) cycle, t_{Pcyc}: PCLKB cycle.
Note 1. Values in parentheses apply when ICMR3.NF[1:0] is set to 11b while the digital filter is enabled with ICFER.NFE set to 1.
Note 2. Only supported for SCL0_A, SDA0_A.
Note 3. Must use pins that have a letter appended to their name, for instance "_A", "_B", to indicate group membership. For the IIC interface, the AC portion of the electrical characteristics is measured for each group.

表52.27IIC时序(1)(2of2)(1)条件：在PmnPFS寄存器的端口驱动能力位中为以下引脚选择中间驱动输出：SDA0_B、SCL0_B、SDA1_A、SCL1_A、SDA1_B、SCL1_B。(2)以下引脚不需要设置：SCL0_A、SDA0_A。(3)使用名称后附有字母的图钉，例如"_A"或"_B"，表示组成员身份。对于IIC接口，测量每组的电气特性的交流部分。

Parameter		Symbol	Min*1	Max	Unit	Test conditions*3

Note: These specification values apply when there is no access to the external bus during A/D conversion. If access occurs during A/D conversion, the values might not fall within the indicated ranges.
The use of ports 0 as digital outputs is not allowed when the 12-bit A/D converter is used.
The characteristics apply when AVCC0, AVSS0, VREFH0, VREFH, VREFL0, VREFL, and 12-bit A/D converter input voltage are stable.

Note 1. The conversion time includes the sampling and comparison times. The number of sampling states is indicated for the test conditions.
Note 2. Values in parentheses indicate the sampling time.
Note 3. When simultaneously using channel-dedicated sample-and-hold circuits in unit 0 and unit 1, see Table 52.35.

RA生态工作室

Table 52.35 A/D conversion characteristics for simultaneous use of channel-dedicated sample-and-hold circuits in unit 0 and unit 1

Conditions: PCLKC = 30/60 MHz

Parameter		Min	Typ	Max	Test conditions
Channel-dedicated sample-and-hold circuits in use with continious sampling function enabled (AN000 to AN002)	Offset error	-	±1.5	±5.0	• PCLKC = 60 MHz • Sampling in 15 states
	Full-scale error	-	±2.5	±5.0	
	Absolute accuracy	-	±4.0	±8.0	
Channel-dedicated sample-and-hold circuits in use with continious sampling function enabled (AN100 to AN102)	Offset error	-	±1.5	±5.0	
	Full-scale error	-	±2.5	±5.0	
	Absolute accuracy	-	±4.0	±8.0	
Channel-dedicated sample-and-hold circuits in use with continious sampling function enabled (AN000 to AN002)	Offset error	-	±1.5	±3.5	• PCLKC = 30 MHz • Sampling in 7 states
	Full-scale error	-	±1.5	±3.5	
	Absolute accuracy	-	±3.0	+4.5/-6.5	
Channel-dedicated sample-and-hold circuits in use with continious sampling function enabled (AN100 to AN102)	Offset error	-	±1.5	±3.5	
	Full-scale error	-	±1.5	±3.5	
	Absolute accuracy	-	±3.0	+4.5/-6.5	

Note: When simultaneously using channel-dedicated sample-and-hold circuits in unit 0 and unit 1, setting the ADSHMSR.SHMD bit to 1 is recommended.

Table 52.36 A/D internal reference voltage characteristics

Parameter	Min	Typ	Max	Unit	Test conditions
A/D internal reference voltage	1.13	1.18	1.23	V	-
Sampling time	4.15	-	-	µs	-

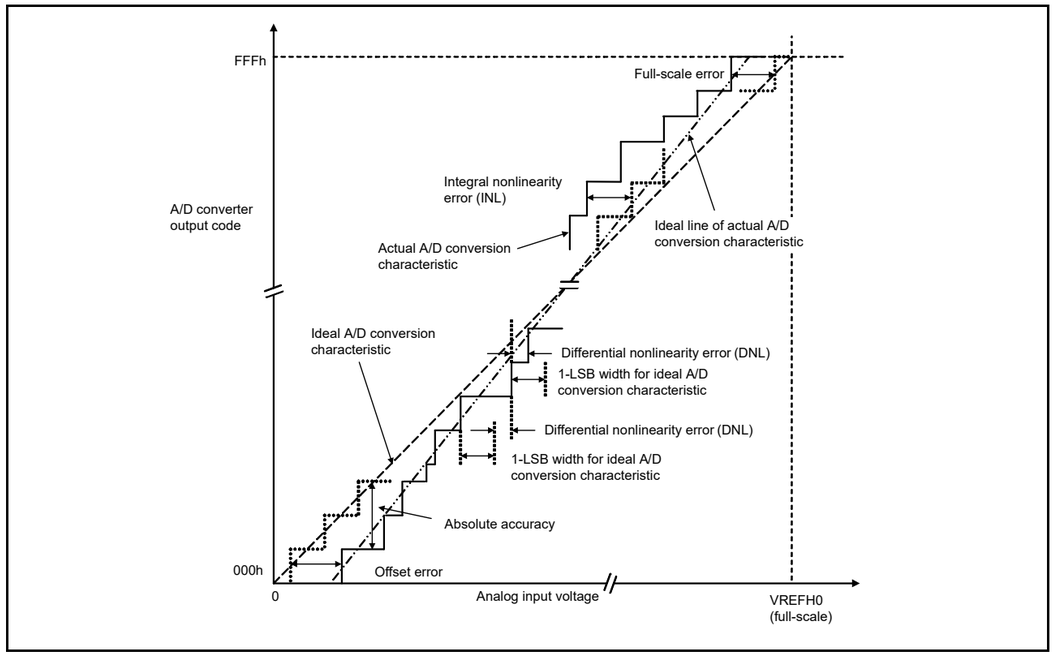

Figure 52.64 Illustration of ADC12 characteristic terms

表52.35在单元0和单元1中同时使用通道专用采样和保持电路的AD转换特性条件：PCLKC=3060MHz

Parameter		Min	Typ	Max	测试条件
启用连续采样功能的通道专用采样保持电路（AN000至AN002）	偏移误差	-	±1.5	±5.0	PCLKC=60MHz 15种状态采样
	Full-scale error	-	±2.5	±5.0	
	绝对精度	-	±4.0	±8.0	
启用连续采样功能的通道专用采样保持电路（AN100至AN102）	偏移误差	-	±1.5	±5.0	
	Full-scale error	-	±2.5	±5.0	
	绝对精度	-	±4.0	±8.0	
启用连续采样功能的通道专用采样保持电路（AN000至AN002）	偏移误差	-	±1.5	±3.5	PCLKC=30MHz 7种状态采样
	Full-scale error	-	±1.5	±3.5	
	绝对精度	-	±3.0	+4.5/-6.5	
启用连续采样功能的通道专用采样保持电路（AN100至AN102）	偏移误差	-	±1.5	±3.5	
	Full-scale error	-	±1.5	±3.5	
	绝对精度	-	±3.0	+4.5/-6.5	

Note: 在单元0和单元1中同时使用通道专用采样保持电路时，建议将ADSHMSR.SHMD位设置为1。

Table 52.36 AD内部参考电压特性

Parameter	Min	Typ	Max	Unit	测试条件
AD内部参考电压	1.13	1.18	1.23	V	-
采样时间	4.15	-	-	µs	-

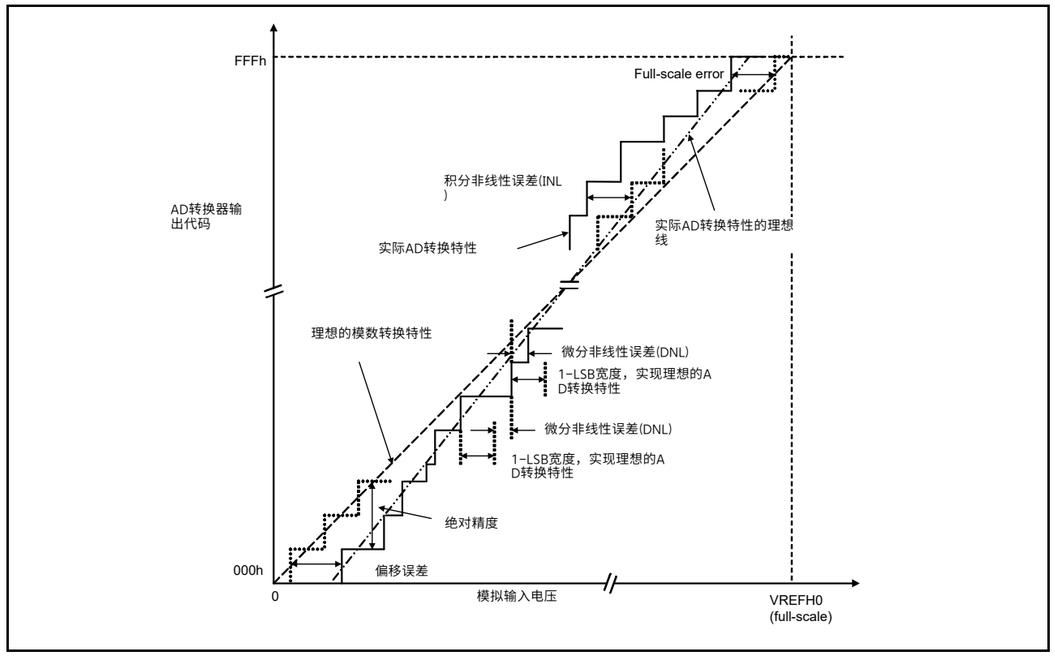

Figure 52.64 ADC12特征项说明

Absolute accuracy

Absolute accuracy is the difference between output code based on the theoretical A/D conversion characteristics, and the actual A/D conversion result. When measuring absolute accuracy, the voltage at the midpoint of the width of the analog input voltage (1-LSB width), which can meet the expectation of outputting an equal code based on the theoretical A/D conversion characteristics, is used as the analog input voltage. For example, if 12-bit resolution is used and the reference voltage VREFH0 is 3.072 V, then the 1-LSB width becomes 0.75 mV, and 0 mV, 0.75 mV, and 1.5 mV are used as the analog input voltages. If the analog input voltage is 6 mV, an absolute accuracy of ±5 LSB means that the actual A/D conversion result is in the range of 003h to 00Dh, though an output code of 008h can be expected from the theoretical A/D conversion characteristics.

Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal line when the measured offset and full-scale errors are zeroed, and the actual output code.

Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between the 1-LSB width based on the ideal A/D conversion characteristics and the width of the actual output code.

Offset error

Offset error is the difference between the transition point of the ideal first output code and the actual first output code.

Full-scale error

Full-scale error is the difference between the transition point of the ideal last output code and the actual last output code.

52.6 DAC12 Characteristics

Table 52.37 D/A conversion characteristics

Parameter	Min	Typ	Max	Unit	Test conditions
Resolution	-	-	12	Bits	-
Without output amplifier					
Absolute accuracy	-	-	±24	LSB	Resistive load 2 MΩ
INL	-	±2.0	±8.0	LSB	Resistive load 2 MΩ
DNL	-	±1.0	±2.0	LSB	-
Output impedance	-	8.5	-	kΩ	-
Conversion time	-	-	3.0	µs	Resistive load 2 MΩ, Capacitive load 20 pF
Output voltage range	0	-	VREFH	V	-
With output amplifier					
INL	-	±2.0	±4.0	LSB	-
DNL	-	±1.0	±2.0	LSB	-
Conversion time	-	-	4.0	µs	-
Resistive load	5	-	-	kΩ	-
Capacitive load	-	-	50	pF	-
Output voltage range	0.2	-	VREFH - 0.2	V	-

绝对精度

绝对精度是基于理论AD转换特性的输出代码与实际AD转换结果之间的差异。测量绝对精度时，将模拟输入电压宽度（1-LSB宽度）的中点电压作为模拟输入电压，该电压在理论上可以满足输出等码的期望。.例如，如果使用12位分辨率且参考电压VREFH0为3.072V，则1-LSB宽度变为0.75mV，并且使用0mV、0.75mV和1.5mV作为模拟输入电压。如果模拟输入电压为6mV，±5LSB的绝对精度意味着实际的AD转换结果在003h到00Dh的范围内，尽管从理论上的AD转换特性可以预期输出码为008h。

积分非线性误差(INL)

积分非线性误差是测量的偏移和满量程误差为零时的理想线与实际输出代码之间的最大偏差。

微分非线性误差(DNL)

微分非线性误差是基于理想AD转换特性的1-LSB宽度与实际输出码的宽度之差。

偏移误差

偏移误差是理想的第一个输出代码的转换点与实际的第一个输出代码之间的差异。

Full-scale error

满量程误差是理想的最后输出代码的转换点与实际的最后输出代码之间的差异。

52.14 Flash Memory Characteristics

52.14.1 Code Flash Memory Characteristics

Table 52.46 Code flash memory characteristics
Conditions: Program or erase: FCLK = 4 to 60 MHz
Read: FCLK ≤ 60 MHz

Parameter		Symbol	FCLK = 4 MHz			20 MHz ≤ FCLK ≤ 60 MHz			Unit	Test conditions
			Min	Typ	Max	Min	Typ	Max		
Programming time $N_{PEC} \leq 100$ times	128-byte	t_{P128}	-	0.75	13.2	-	0.34	6.0	ms	
	8-KB	t_{P8K}	-	49	176	-	22	80	ms	
	32-KB	t_{P32K}	-	194	704	-	88	320	ms	
Programming time $N_{PEC} > 100$ times	128-byte	t_{P128}	-	0.91	15.8	-	0.41	7.2	ms	
	8-KB	t_{P8K}	-	60	212	-	27	96	ms	
	32-KB	t_{P32K}	-	234	848	-	106	384	ms	
Erasure time $N_{PEC} \leq 100$ times	8-KB	t_{E8K}	-	78	216	-	43	120	ms	
	32-KB	t_{E32K}	-	283	864	-	157	480	ms	
Erasure time $N_{PEC} > 100$ times	8-KB	t_{E8K}	-	94	260	-	52	144	ms	
	32-KB	t_{E32K}	-	341	1040	-	189	576	ms	
Reprogramming/erasure cycle*4		N_{PEC}	10000*1	-	-	10000*1	-	-	Times	
Suspend delay during programming		t_{SPD}	-	-	264	-	-	120	µs	
First suspend delay during erasure in suspend priority mode		t_{SESD1}	-	-	216	-	-	120	µs	
Second suspend delay during erasure in suspend priority mode		t_{SESD2}	-	-	1.7	-	-	1.7	ms	
Suspend delay during erasure in erasure priority mode		t_{SEED}	-	-	1.7	-	-	1.7	ms	
Forced stop command		t_{FD}	-	-	32	-	-	20	µs	
Data hold time*2		t_{DRP}	10*2, *3	-	-	10*2, *3	-	-	Years	
			30*2, *3	-	-	30*2, *3	-	-		Ta = +85°C

Note 1. This is the minimum number of times to guarantee all the characteristics after reprogramming. The guaranteed range is from 1 to the minimum value.
Note 2. This indicates the minimum value of the characteristic when reprogramming is performed within the specified range.
Note 3. This result is obtained from reliability testing.
Note 4. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 10000), erasing can be performed n times for each block. For example, when 128-byte programming is performed 64 times for different addresses in 8-KB blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address several times as one erasure is not enabled. Overwriting is prohibited.

Table 52.45 差模下的PGA特性(2of2)

挂起优先模式下擦除期间的第二挂起延迟		t_{SESD2}	-	-	1.7	-	-	1.7	ms	
擦除优先模式下擦除期间的挂起延迟		t_{SEED}	-	-	1.7	-	-	1.7	ms	
强制停止命令		t_{FD}	-	-	32	-	-	20	µs	
数据保持时间*2		t_{DRP}	10*2, *3	-	-	10*2, *3	-	-	Years	
			30*2, *3	-	-	30*2, *3	-	-		Ta = +85°C

Note 1. 这是重新编程后保证所有特性的最少次数。保证范围是从1到最小值。
Note 2. 这表示在指定范围内执行重新编程时特性的最小值。
Note 3. 这个结果是从可靠性测试中获得的。
Note 4. 重新编程擦除周期是每个块的擦除次数。当重新编程擦除周期为n次（n=10000）时，可以对每个块执行n次擦除。例如，当对8KB块中的不同地址执行64次128字节编程，然后擦除整个块时，重新编程擦除周期计为1。但是，不能将同一地址多次编程为一次擦除。禁止覆盖。

	128-byte		-	-	390	-	-	390		
	256-byte		-	-	570	-	-	570		
Suspend delay during erasing in erasure priority mode	64-byte	t_{DSEED}	-	-	300	-	-	300	µs	
	128-byte		-	-	390	-	-	390		
	256-byte		-	-	570	-	-	570		
Forced stop command		t_{FD}	-	-	32	-	-	20	µs	
Data hold time*3		t_{DRP}	10*3,*4	-	-	10*3,*4	-	-	Year	
			30*3,*4	-	-	30*3,*4	-	-		Ta = +85°C

Note 1. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 125000), erasing can be performed n times for each block. For example, when 4-byte programming is performed 16 times for different addresses in 64-byte blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address several times as one erasure is not enabled. Overwriting is prohibited.
Note 2. This is the minimum number of times to guarantee all the characteristics after reprogramming. The guaranteed range is from 1 to the minimum value.
Note 3. This indicates the minimum value of the characteristic when reprogramming is performed within the specified range.
Note 4. This result is obtained from reliability testing.

USB_DP	Hi-Z	Keep-O*4		Hi-Z*3	Hi-Z	
USB_DM	Hi-Z	Keep-O*4		Hi-Z*3	Hi-Z	

H: High-level
L: Low-level
Hi-Z: High-impedance
Keep-O: Output pins retain their previous values. Input pins go to high-impedance.
Keep: Pin states are retained during periods in Software Standby mode.

Note 1. Retains the I/O port state until the DPSBYCR.IOKEEP bit is set to 0.
Note 2. Input is enabled if the pin is specified as the Software Standby canceling source while it is used as an external interrupt pin.
Note 3. Input is enabled if the pin is specified as the Deep Software Standby canceling source.
Note 4. Input is enabled while the pin is used as an input.

H: High-level
L: Low-level
Hi-Z: High-impedance
Keep-O：输出引脚保留其先前的值。输入引脚变为高阻抗。
保持：在软件待机模式期间保持引脚状态。

Note 1. 保持IO端口状态，直到DPSBYCR.IOKEEP位设置为0。
Note 2. 如果引脚被指定为软件待机取消源，同时它被用作外部中断引脚，则输入被启用。
Note 3. 如果将引脚指定为深度软件待机取消源，则启用输入。
Note 4. 当引脚用作输入时，输入被启用。

Appendix 3. I/O Registers

This appendix describes I/O register addresses, access cycles, and reset values by function.

3.1 Peripheral Base Addresses

This section provides the base addresses for peripherals described in this manual.

Table 3.1 shows the name, description, and the base address of each peripheral.

Table 3.1 Peripheral base address (1 of 3)

Name	Description	Base address
MMPU	Bus Master MPU	0x40000000
SMPU	Bus Slave MPU	0x40000C00
SPMON	CPU Stack Pointer Monitor	0x40000D00
MMF	Memory Mirror Function	0x40001000
SRAM	SRAM Control	0x40002000
BUS	BUS Control	0x40003000
DMAC0	Direct Memory Access Controller 0	0x40005000
DMAC1	Direct Memory Access Controller 1	0x40005040
DMAC2	Direct Memory Access Controller 2	0x40005080
DMAC3	Direct Memory Access Controller 3	0x400050C0
DMAC4	Direct Memory Access Controller 4	0x40005100
DMAC5	Direct Memory Access Controller 5	0x40005140
DMAC6	Direct Memory Access Controller 6	0x40005180
DMAC7	Direct Memory Access Controller 7	0x400051C0
DMA	DMAC Module Activation	0x40005200
DTC	Data Transfer Controller	0x40005400
ICU	Interrupt Controller	0x40006000
DBG	Debug Function	0x4001B000
FCACHE	Flash Cache	0x4001C000
SYSTEM	System Control	0x4001E000
PORT0	Port 0 Control Registers	0x40040000
PORT1	Port 1 Control Registers	0x40040020
PORT2	Port 2 Control Registers	0x40040040
PORT3	Port 3 Control Registers	0x40040060
PORT4	Port 4 Control Registers	0x40040080
PORT5	Port 5 Control Registers	0x400400A0
PORT6	Port 6 Control Registers	0x400400C0
PORT7	Port 7 Control Registers	0x400400E0
PFS	Pmn Pin Function Control Register	0x40040800
PMISC	Miscellaneous Port Control Register	0x40040D00
ELC	Event Link Controller	0x40041000
POEG	Port Output Enable Module for GPT	0x40042000
RTC	Realtime Clock	0x40044000
WDT	Watchdog Timer	0x40044200
IWDT	Independent Watchdog Timer	0x40044400
CAC	Clock Frequency Accuracy Measurement Circuit	0x40044600
MSTP	Module Stop Control B, C, D	0x40047000
SRCRAM	Sampling Rate Converter RAM	0x40048000

附录3.IO寄存器

本附录按功能描述了IO寄存器地址、访问周期和复位值。

3.1 外设基地址

本节提供本手册中描述的外设的基地址。

表3.1显示了每个外设的名称、描述和基地址。

Table 3.1 外设基地址(1of3)

Name	Description	基址
MMPU	总线主控MPU	0x40000000
SMPU	总线从MPU	0x40000C00
SPMON	CPU堆栈指针监视器	0x40000D00
MMF	内存镜像功能	0x40001000
SRAM	SRAM Control	0x40002000
BUS	总线控制	0x40003000
DMAC0	直接内存访问控制器0	0x40005000
DMAC1	直接内存访问控制器1	0x40005040
DMAC2	直接内存访问控制器2	0x40005080
DMAC3	直接内存访问控制器3	0x400050C0
DMAC4	直接内存访问控制器4	0x40005100
DMAC5	直接内存访问控制器5	0x40005140
DMAC6	直接内存访问控制器6	0x40005180
DMAC7	直接内存访问控制器7	0x400051C0
DMA	DMAC模块激活	0x40005200
DTC	数据传输控制器	0x40005400
ICU	中断控制器	0x40006000
DBG	调试功能	0x4001B000
FCACHE	闪存缓存	0x4001C000
SYSTEM	系统控制	0x4001E000
PORT0	端口0控制寄存器	0x40040000
PORT1	端口1控制寄存器	0x40040020
PORT2	端口2控制寄存器	0x40040040
PORT3	端口3控制寄存器	0x40040060
PORT4	端口4控制寄存器	0x40040080
PORT5	端口5控制寄存器	0x400400A0
PORT6	端口6控制寄存器	0x400400C0
PORT7	端口7控制寄存器	0x400400E0
PFS	Pmn引脚功能控制寄存器	0x40040800
PMISC	杂项端口控制寄存器	0x40040D00
ELC	事件链接控制器	0x40041000
POEG	GPT端口输出使能模块	0x40042000
RTC	实时时钟	0x40044000
WDT	看门狗定时器	0x40044200
IWDT	独立看门狗定时器	0x40044400
CAC	时钟频率精度测量电路	0x40044600
MSTP	模块停止控制B、C、D	0x40047000
SRCRAM	采样率转换器RAM	0x40048000

Description = Peripheral functionality
Base address = Lowest reserved address or address used by the peripheral

3.2 Access Cycles

This section provides access cycle information for the I/O registers described in this manual.

The following information applies to Table 3.2:

- Registers are grouped by associated module
- The number of access cycles indicates the number of cycles based on the specified reference clock
- In the internal I/O area, reserved addresses that are not allocated to registers must not be accessed, otherwise operations cannot be guaranteed
- The number of I/O access cycles depends on bus cycles of the internal peripheral bus, divided clock synchronization cycles, and wait cycles of each module. Divided clock synchronization cycles differ depending on the frequency ratio between ICLK and PCLK.
- When the frequency of ICLK is equal to that of PCLK, the number of divided clock synchronization cycles is always constant.
- When the frequency of ICLK is greater than that of PCLK, at least 1 PCLK cycle is added to the number of divided clock synchronization cycles.

Note: This applies to the number of cycles when access from the CPU does not conflict with the instruction fetching to the external memory or bus access from other bus master such as DMAC or DTC.

Table 3.2 shows the access cycles for the I/O registers.

Table 3.2 Access cycles for I/O registers (1 of 2)

Peripherals	Address		Number of access cycles				Cycle unit	Related function
			ICLK = PCLK		ICLK > PCLK*1			
	From	To	Read	Write	Read	Write

3.2 访问周期

本节提供本手册中描述的IO寄存器的访问周期信息。

以下信息适用于表3.2：

- 寄存器按相关模块分组
- 访问周期数表示基于指定参考时钟的周期数
- 在内部IO区，不能访问未分配给寄存器的保留地址，否则无法保证操作
- IO访问周期数取决于内部外设总线的总线周期、分频时钟同步周期和每个模块的等待周期。分频时钟同步周期取决于ICLK和PCLK之间的频率比。
- 当ICLK的频率等于PCLK的频率时，分频时钟同步周期的数量始终是恒定的。
- 当ICLK的频率大于PCLK的频率时，分频时钟同步周期数至少增加1个PCLK周期。

Note: 这适用于当来自CPU的访问与从外部存储器获取指令或来自其他总线主控器（例如DMAC或DTC）的总线访问不冲突时的周期数。

表3.2显示了IO寄存器的访问周期。

Table 3.2 IO寄存器的访问周期(1of2)

Peripherals	Address		访问周期数				循环单元	相关功能
			ICLK = PCLK		ICLK > PCLK*1			
	From	To	Read	Write	Read	Write

注1.如果PCLK周期数为非整数（例如1.5），则最小值不带小数点，最大值四舍五入到小数点。例如，1.5到2。5是1到3。
注2.访问16位寄存器（FTDRHL、FRDRHL、FCR、FDR、LSR和CDR）时，访问比2个周期多

RA生态工作室

the value shown in Table 3.2. When accessing an 8-bit register (FTDRH, FTDRL, FRDRH, and FRDRL), the access cycles are as shown in Table 3.2.

Note 3. When accessing the 32-bit register (SPDR), access is 2 cycles more than the value in Table 3.2. When accessing an 8-bit or 16-bit register (SPDR_HA), the access cycles are as shown in Table 3.2.

Note 4. The access cycles depend on the QSPI bus cycles.

3.3 Register Descriptions

This section provides information associated with registers described in this manual.

Table 3.3 shows a list of registers including address offsets, address sizes, access rights, and reset values.

Table 3.3 Register description (1 of 40)

Peripheral	Dim	Dim incr.	Dim index	Register name	Description	Address offset	Size	Access	Reset value	Reset mask
MMPU	-	-	-	MMPUCTLA	Bus Master MPU Control Register	0x000	16	read-write	0x0000	0xFFFF
				MMPUPTA	Group A Protection of Register	0x102	16	read-write	0x0000	0xFFFF
	32	0x010	0-31	MMPUACA%s	Group A Region %s Access Control Register	0x200	16	read-write	0x0000	0xFFFF
	32	0x010	0-31	MMPUSA%s	Group A Region %s Start Address Register	0x204	32	read-write	0x0000 0000	0x00000 003
	32	0x010	0-31	MMPUEA%s	Group A Region %s End Address Register	0x208	32	read-write	0x0000 0003	0x00000 003
SMPU	-	-	-	SMPUCTL	Slave MPU Control Register	0x00	16	read-write	0x0000	0xFFFF
				SMPUMBIU	Access Control Register for MBIU	0x10	16	read-write	0x2000	0xFFFF
				SMPUFBIU	Access Control Register for FBIU	0x14	16	read-write	0x0000	0xFFFF
SMPU	2	0x4	0,1	SMPUSRAM%s	Access Control Register for SRAM%s	0x18	16	read-write	0x0000	0xFFFF
	3	0x4	0,2,6	SMPUP%sBIU	Access Control Register for P%sBIU	0x20	16	read-write	0x0000	0xFFFF
	-	-	-	SMPUEXBIU	Access Control Register for EXBIU	0x30	16	read-write	0x0000	0xFFFF
				SMPUEXBIU2	Access Control Register for EXBIU2	0x34	16	read-write	0x0000	0xFFFF

值见表3.2。访问8位寄存器（FTDRH、FTDRL、FRRDH和FRDRL）时，访问周期如表3.2所示。注3.访问32位寄存器(SPDR)时，访问比表3.2中的值多2个周期。访问8位或16位寄存器（SPDR_HA）时，访问周期如表3.2所示。注4.访问周期取决于QSPI总线周期。

3.3 注册说明

本节提供与本手册中描述的寄存器相关的信息。

表3.3显示了寄存器列表，包括地址偏移、地址大小、访问权限和复位值。

Table 3.3 寄存器说明（40个中的1个）

				SFMCMD	Communication Mode Control Register	0x014	32	read-write	0x0000 0000	0xFFFF FFFF
				SFMCST	Communication Status Register	0x018	32	read-write	0x0000 0000	0xFFFF FFFF
				SFMSIC	Instruction Code Register	0x020	32	read-write	0x0000 0000	0xFFFF FFFF
				SFMSAC	Address Mode Control Register	0x024	32	read-write	0x0000 0002	0xFFFF FFFF
				SFMSDC	Dummy Cycle Control Register	0x028	32	read-write	0x0000 FF00	0xFFFF FFFF
				SFMSPC	SPI Protocol Control Register	0x030	32	read-write	0x0000 0010	0xFFFF FFFF
				SFMPMD	Port Control Register	0x034	32	read-write	0x0000 0000	0xFFFF FFFF
				SFMCNT1	External QSPI Address Register 1	0x804	32	read-write	0x0000 0000	0xFFFF FFFF

Peripheral name = Name of peripheral
Dim = Number of elements in an array of registers
Dim inc = Address increment between two simultaneous registers of a register array in the address map
Dim index = Sub string that replaces the %s placeholder within the register name
Register name = Name of register
Description = Register description
Address offset = Address of the register relative to the base address defined by the peripheral of the register
Size = Bit width of the register
Access = Register access rights:
Read-only: Read access is permitted. Write operations have undefined results.
Write-only: Write access is permitted. Read operations have undefined results.
Read-write: Both read and write accesses are permitted. Writes affect the state of the register and reads return a value related to the register.
Reset value = Default reset value of a register
Reset mask = Identifies which register bits have a defined reset value

Table 3.3 寄存器描述（40的40）

Peripheral	Dim	昏暗的增量。	暗淡指数	注册名称	Description	地址偏移	Size	Access	重置值	重置蒙版
QSPI	-	-	-	SFMCOM	通讯端口 Register	0x010	32	读写	0x0000 0000	0xFFFF FF00
				SFMCMD	通讯方式 控制寄存器	0x014	32	读写	0x0000 0000	0xFFFF FFFF
				SFMCST	通讯状态 Register	0x018	32	读写	0x0000 0000	0xFFFF FFFF
				SFMSIC	指令代码 Register	0x020	32	读写	0x0000 0000	0xFFFF FFFF
				SFMSAC	地址模式控制 Register	0x024	32	读写	0x0000 0002	0xFFFF FFFF
				SFMSDC	虚拟循环控制 Register	0x028	32	读写	0x0000 FF00	0xFFFF FFFF
				SFMSPC	SPI协议控制 Register	0x030	32	读写	0x0000 0010	0xFFFF FFFF
				SFMPMD	端口控制寄存器	0x034	32	读写	0x0000 0000	0xFFFF FFFF
				SFMCNT1	外部QSPI地址 Register 1	0x804	32	读写	0x0000 0000	0xFFFF FFFF

外设名称=外设名称
Dim=寄存器数组中的元素数
Diminc=地址映射中寄存器阵列的两个同时寄存器之间的地址增量
暗淡索引=替换寄存器名称中的%s占位符的子字符串
寄存器名称=寄存器名称描述=寄存器描述
地址偏移量=相对于寄存器外设定义的基地址的寄存器地址
大小=寄存器的位宽
访问=注册访问权限：
只读：允许读访问。写操作有未定义的结果。只写：允许写访问。读取操作具有未定义的结果。
读写：允许读写访问。写入会影响寄存器的状态，读取会返回与寄存器相关的值。复位值=寄存器的默认复位值

复位掩码=标识哪些寄存器位具有定义的复位值
