This function causes arbitration to be lost if the internal SDA output level does not match the level on the SDAn line (high output as the internal SDA output, meaning the SDAn pin is in the high-impedance state) and the low level is detected on the SDAn line during transmission of NACK in receive mode. Arbitration is lost because of a conflict of NACK and ACK transmission when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such conflict occurs when multiple master devices send or receive the same information through a single slave device. Figure 36.43 shows an example of arbitration-lost detection during transmission of NACK.

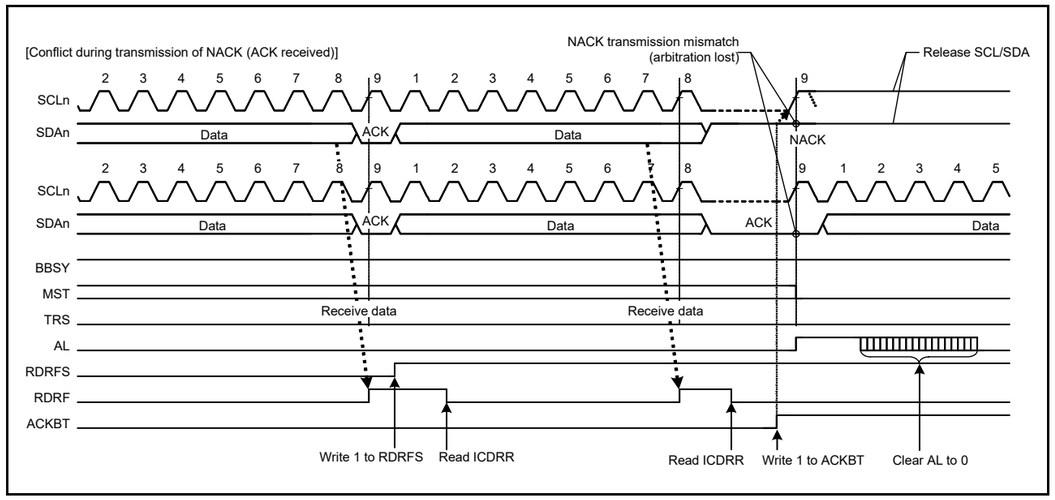

Figure 36.43 Example of arbitration-lost detection during transmission of NACK when NALE = 1

The following explains arbitration-lost detection using an example where two master devices (masters A and B) and a single slave device are connected through the bus. In this example, master A receives 2 bytes of data from the slave device, and master B receives 4 bytes of data from the slave device.

If masters A and B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in either master A or B during access to the slave device. Both masters A and B recognize that they obtained the bus mastership and operate as such. Here, master A sends NACK when it has received 2 final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received the necessary 4 bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like this occurs, master A cannot detect the ACK transmitted by master B and issues a stop condition. The issuance of the stop condition conflicts with the SCL clock output of master B, which disrupts communication.

When the IIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost. If arbitration is lost during transmission of NACK, the IIC immediately cancels the slave match condition and enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

Similarly, in the ARP command processing of SMBus, the function to detect loss of arbitration during transmission of NACK is also available for eliminating the extra clock cycle processing, such as FFh transmission processing, necessary if the UDID (Unique Device Identifier) of the assigned address does not match in the Get UDID general processing after the Assign Address command.

The IIC detects arbitration-lost during transmission of NACK when the following condition is met with the NALE bit in ICFER set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

- When the internal SDA output level does not match the SDAn line (ACK is received) during transmission of NACK (ACKBT bit = 1 in ICMR3)

36.10.2 在NACK传输期间检测仲裁丢失的功能（NALE位）

如果内部SDA输出电平与SDAn线上的电平不匹配（高输出作为内部SDA输出，意味着SDAn引脚处于高阻抗状态）并且在上检测到低电平，此功能会导致仲裁丢失在接收模式下发送NACK期间的SDAn线。在多主系统中，当两个或多个主设备同时从同一从设备接收数据时，由于NACK和ACK传输冲突，导致仲裁丢失。当多个主设备通过单个从设备发送或接收相同的信息时，就会发生这种冲突。图36.43显示了在NACK传输期间检测仲裁丢失的示例。

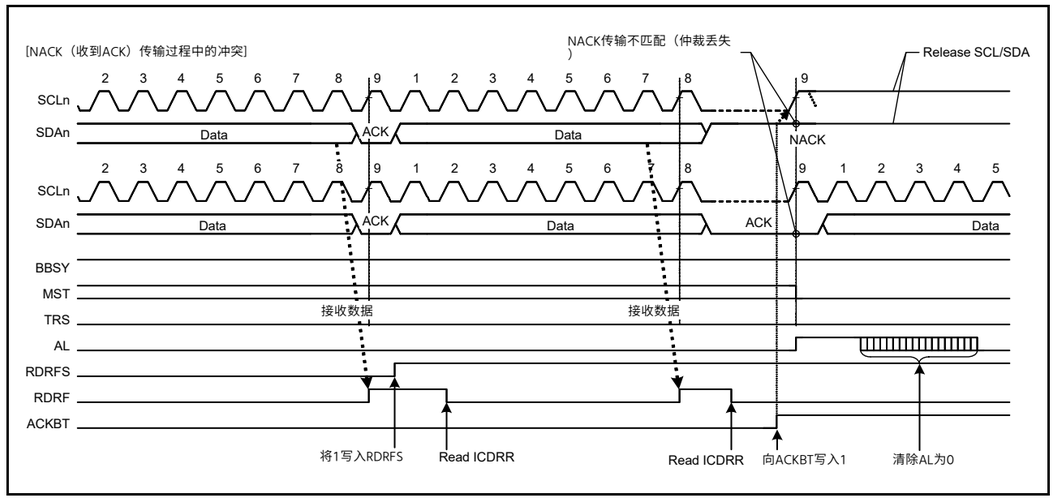

Figure 36.43 NALE=1时NACK传输期间仲裁丢失检测的示例

下面以两个主设备（主设备A和B）和一个从设备通过总线连接的示例来说明仲裁丢失检测。在本例中，主设备A从从设备接收2个字节的数据，主设备B从从设备接收4个字节的数据。

如果主设备A和B同时访问从设备，因为从设备地址相同，所以在访问从设备期间，主设备A或B都不会丢失仲裁。主控A和B都承认他们获得了总线主控权并以此进行操作。此处，主设备A在从从设备接收到最后2个字节的数据时发送NACK。同时，masterB发送ACK，因为它没有收到必要的4字节数据。此时，来自masterA的NACK传输和来自masterB的ACK传输冲突。一般来说，如果发生这样的冲突，masterA无法检测到masterB发送的ACK并发出停止条件。停止条件的发出与主机B的SCL时钟输出冲突，从而中断通信。

当IIC在NACK传输过程中收到ACK时，它会检测到与其他主设备冲突的失败并导致仲裁丢失。如果在NACK传输过程中仲裁丢失，IIC立即取消从机匹配条件并进入从机接收模式。这可以防止发出停止条件，从而防止总线上的通信故障。

同样，在SMBus的ARP命令处理中，检测传输过程中仲裁丢失的功能
NACK也可用于消除额外的时钟周期处理，例如FFh传输处理，如果分配地址的UDID（唯一设备标识符）在分配地址命令之后的获取UDID常规处理中不匹配，则这是必要的。

IIC在NACK传输期间检测到仲裁丢失，当满足以下条件时
ICFER设置为1（启用NACK传输期间的仲裁丢失检测）。

[在NACK传输期间仲裁丢失的条件]

- 在NACK传输期间内部SDA输出电平与SDAn线不匹配（接收到ACK）时（ICMR3中的ACKBT位=1）

36.10.3 Slave Arbitration-Lost Detection (SALE Bit)

This function causes arbitration to be lost if the transmit data (internal SDA output level) and the level on the SDAn line do not match (high output as the internal SDA output, meaning the SDAn pin is in the high-impedance state), and the low level is detected on the SDAn line in slave transmit mode. This arbitration-lost detection function is mainly used when transmitting a UDID (Unique Device Identifier) over an SMBus.

When it loses slave arbitration, the IIC is immediately released from the slave-matched state and enters slave receive mode. This function can detect conflicts of data during transmission of UDIDs over an SMBus and eliminates subsequent redundant processing for the transmission of FFh.

The IIC detects slave arbitration-lost when the following condition is met with the SALE bit in ICFER set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

- When transmit data excluding acknowledge (internal SDA output level) does not match the SDAn line in slave transmit mode (MST and TRS bits = 01b in ICCR2).

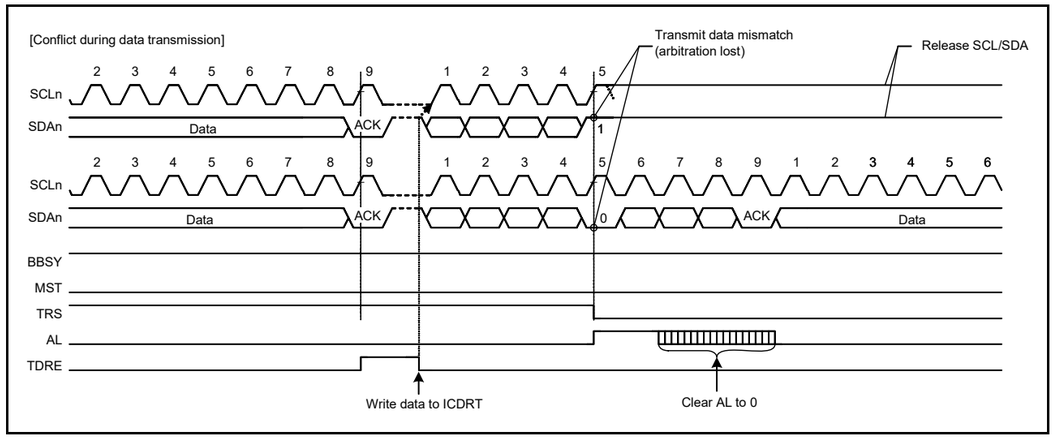

Figure 36.44 Example of slave arbitration-lost detection when SALE = 1

36.11 Start, Restart, and Stop Condition Issuing Function

36.11.1 Issuing a Start Condition

The IIC issues a start condition when the ST bit in ICCR2 is set to 1. When the ST bit is set to 1, a start condition request is made, and the IIC issues a start condition when the BBSY flag in ICCR2 is 0 (bus free state). When a start condition is issued normally, the IIC automatically shifts to the master transmit mode.

To issue a start condition:

1. Drive the SDAn line low (high level to low level).
2. Ensure that the time set in ICBRH and the start condition hold time elapse.
3. Drive the SCLn line low (high level to low level).
4. Detect low level on the SCLn line and ensure the low-level period of the SCLn line set in ICBRL elapses.

36.10.3 从设备仲裁丢失检测（SALE位）

如果发送数据（内部SDA输出电平）和SDAn线上的电平不匹配（高输出作为内部SDA输出，意味着SDAn引脚处于高阻状态），此功能会导致仲裁丢失，并且在从机发送模式下，SDAn线上检测到低电平。这种仲裁丢失检测功能主要用于通过SMBus传输UDID（唯一设备标识符）时。

当它失去从机仲裁时，IIC立即从从机匹配状态释放并进入从机接收模式。此功能可以检测在SMBus上传输UDID期间的数据冲突，并消除后续传输FFh的冗余处理。

当ICFER中的SALE位设置为1（启用从设备仲裁丢失检测）满足以下条件时，IIC检测从设备仲裁丢失。

[从机仲裁失败的条件]

- 当发送数据不包括确认（内部SDA输出电平）与从发送模式下的SDAn线不匹配时（MST和TRS位=ICCR2中的01b）。

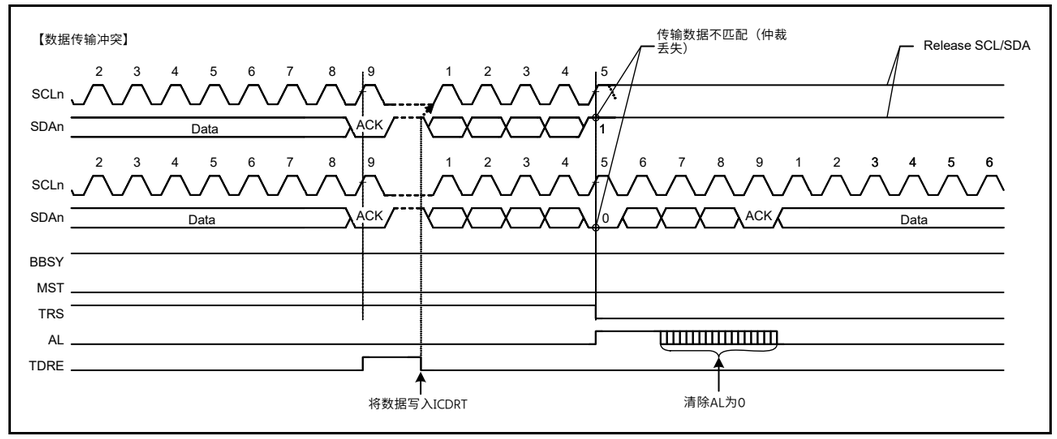

Figure 36.44 SALE=1时从设备仲裁丢失检测示例

36.11 启动、重启和停止条件发布功能

36.11.1 发出开始条件

当ICCR2中的ST位设置为1时，IIC发出启动条件。 当ST位设置为1时，发出启动条件请求，当ICCR2中的BBSY标志为0时，IIC发出启动条件（总线自由状态）。当启动条件正常发出时，IIC自动切换到主机发送模式。

发出开始条件：

1. 将SDAn线驱动为低电平（高电平到低电平）。
2. 确保ICBRH中设置的时间和启动条件保持时间已过。
3. 将SCLn线驱动为低电平（高电平到低电平）。
4. 检测SCLn线上的低电平，确保经过ICBRL中设置的SCLn线的低电平周期。

36.11.2 Issuing a Restart Condition

The IIC issues a restart condition when the RS bit in ICCR2 is set to 1. When the RS bit is set to 1, a restart condition request is made, and the IIC issues a restart condition when the BBSY flag in ICCR2 is 1 (bus busy state) and the MST bit in ICCR2 is 1 (master mode).

To issue a restart condition:

1. Release the SDAn line.
2. Ensure the low-level period of the SCLn line set in ICBRL elapses.
3. Release the SCLn line (low level to high level).
4. Detect a high level on the SCLn line and ensure the time set in ICBRL and the restart condition setup time elapse.
5. Drive the SDAn line low (high level to low level).
6. Ensure the time set in ICBRH and the restart condition hold time elapse.
7. Drive the SCLn line low (high level to low level).
8. Detect a low level on the SCLn line and ensure the low-level period of the SCLn line set in ICBRL elapses.

Note: When issuing restart condition requests, write the slave address to ICDRT after confirming that ICCR2.RS = 0. Data written while ICCR2.RS = 1 is not forwarded because of the retransmission condition before the occurrence.

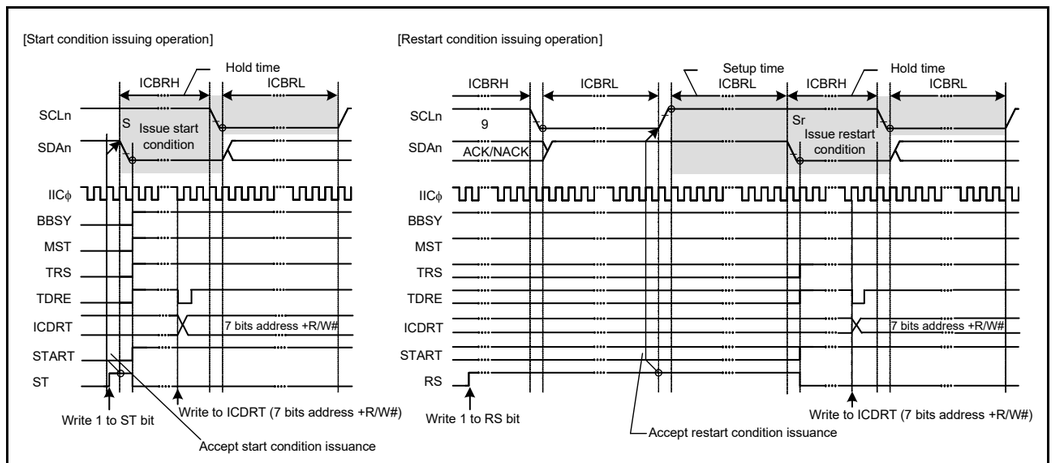

Figure 36.45 Start and restart condition issue timing using the ST and RS bits

Figure 36.46 shows the operation timing when a restart condition is issued after the master transmission.

[Restart condition issuance after the master transmission]

1. Initial setting. For details, refer to section 36.3.2, Initial Settings.
2. Read the BBSY flag in IICR2 to check that the bus is free, and then set the ST bit in ICCR2 to 1 (start condition issuance request). Upon receiving the request, the IIC issues a start condition. At the same time, the BBSY flag and the START flag in ICSR2 are automatically set to 1 and the ST bit is automatically set to 0. At this time, if the start condition is detected and the internal levels for the SDA output state and the levels on the SDAn line have matched while the ST bit is 1, the IIC recognizes that issuing of the start condition as requested by the ST bit has been successfully completed, and MST and TRS bits in ICCR2 are automatically set to 1, placing the IIC in master transmit mode. The TDRE flag in ICSR2 is also automatically set to 1 in response to setting of the TRS bit to 1.
3. Check that the TDRE flag in ICSR2 is 1, and then write the value for transmission (the slave address and the R/W# bit) to ICDRT. Once the data for transmission are written to ICDRT, the TDRE flag is automatically set to 0, the data are transferred from ICDRT to ICDRS, and the TDRE flag is again set to 1. After the byte containing the slave

36.11.2 发出重启条件

当ICCR2中的RS位设置为1时，IIC发出重启条件。当RS位设置为1时，发出重启条件请求，当ICCR2中的BBSY标志为1时，IIC发出重启条件（总线忙状态）并且ICCR2中的MST位为1（主模式）。

发出重启条件：

1. 释放SDAn线。
2. 确保ICBRL中设置的SCLn线的低电平周期已过。
3. 释放SCLn线（低电平到高电平）。
4. 检测SCLn线上的高电平并确保ICBRL中设置的时间和重启条件设置时间已过。
5. 将SDAn线驱动为低电平（高电平到低电平）。
6. 确保ICBRH中设置的时间和重启条件保持时间已过。
7. 将SCLn线驱动为低电平（高电平到低电平）。
8. 检测SCLn线上的低电平，确保经过ICBRL中设置的SCLn线的低电平周期。

Note: 发出重启条件请求时，确认ICCR2.RS=0后，将从机地址写入ICDRT。ICCR2.RS=1时写入的数据由于发生前的重发条件而不会转发。

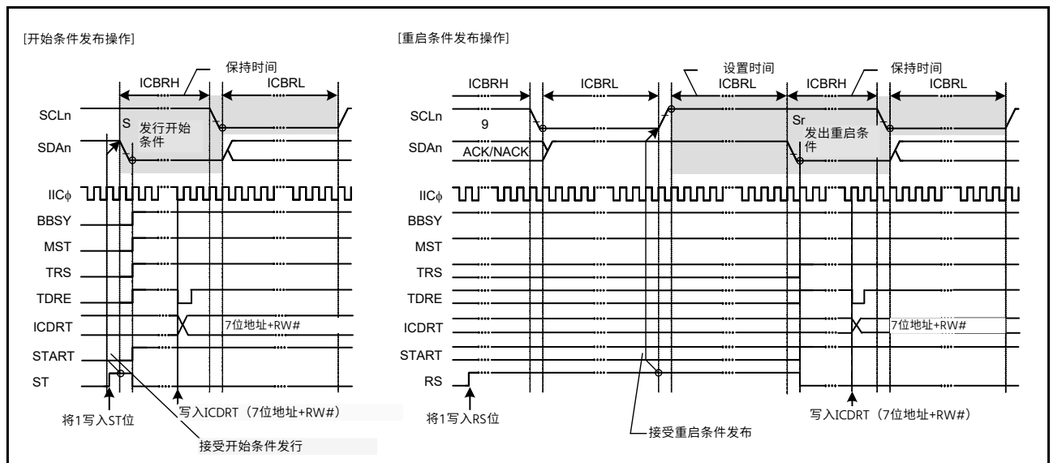

Figure 36.45 使用ST和RS位的启动和重启条件发出时序

图36.46显示了在主机发送后发出重新启动条件时的操作时序。

[主传输后的重启条件发布]

1. 初始设定。有关详细信息，请参阅第36.3.2节，初始设置。
2. 读取IICR2中的BBSY标志以检查总线是否空闲，然后将ICCR2中的ST位设置为1（开始条件发出请求）。收到请求后，IIC发出启动条件。同时，ICSR2中的BBSY标志和START标志自动置1，ST位自动置0。此时，如果检测到启动条件，内部电平为SDA输出状态和当ST位为1时SDAn线上的电平已匹配，IIC识别出ST位请求的启动条件的发布已成功完成，并且ICCR2中的MST和TRS位自动设置为1，将IIC在主发送模式。ICSR2中的TDRE标志也自动设置为1，以响应TRS位设置为1。
3. 检查ICSR2中的TDRE标志是否为1，然后将要发送的值（从机地址和RW#位）写入ICDRT。一旦将要传输的数据写入ICDRT，TDRE标志自动设置为0，数据从ICDRT传输到ICDRS，TDRE标志再次设置为1。在包含从机的字节之后

address and R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode in accord with the value of the transmitted R/W# bit. If the value of the R/W# bit was 0, the IIC continues in master transmit mode. Since the ICSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to ICCR2.SP bit to issue a stop condition. For data transmission with an address in the 10-bit format, start by writing 1111 0b, the 2 higher-order bits of the slave address, and W to ICDRT as the first address transmission. Then, as the second address transmission, write the 8 lower-order bits of the slave address to ICDRT.

4. After confirming that the TDRE flag in ICSR2 is 1, write the data for transmission to the ICDRT register. The IIC automatically holds the SCLn line low until the data for transmission are ready, a restart condition is issued or a stop condition is issued.
5. After all bytes of data for transmission have been written to the ICDRT register, wait until the value of the TEND flag in ICSR2 returns to 1, and then, after check that the START flag in ICSR2 is 1, set the START flag in ICSR2 to 0.
6. Set the RS bit in ICCR2 to 1 (restart condition issuance request). Upon receiving the request, the IIC issues a restart condition.
7. After check that the START flag in ICSR2 is 1, write the value for transmission (the slave address and the R/W# bit) to ICDRT.

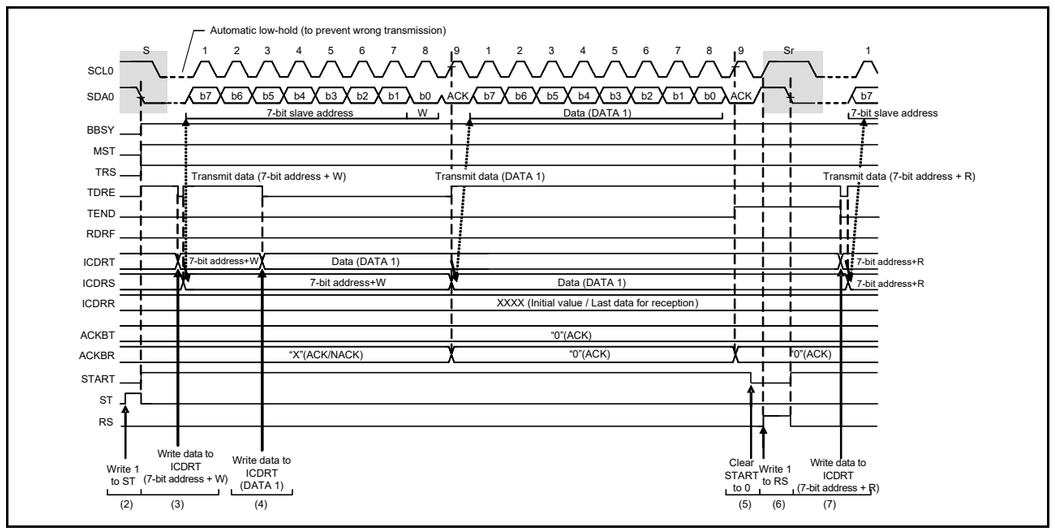

Figure 36.46 Restart condition issue timing after master transmission.

36.11.3 Issuing a Stop Condition

The IIC issues a stop condition when the SP bit in ICCR2 is set to 1. When the SP bit is set to 1, a stop condition request is made, and the IIC issues a stop condition when the BBSY flag in ICCR2 is 1 (bus busy state) and the MST bit in ICCR2 is 1 (master mode).

To issue a stop condition:

1. Drive the SDAn line low (high level to low level).
2. Ensure the low-level period of the SCLn line set in ICBRL elapses.
3. Release the SCLn line (low level to high level).
4. Detect a high level on the SCLn line and ensure the time set in ICBRH and the stop condition setup time elapse.
5. Release the SDAn line (low level to high level).
6. Ensure the time set in ICBRL and the bus free time elapse.

地址和RW#位已发送，TRS位的值会自动更新以根据发送的RW#位的值选择主机发送或主机接收模式。如果RW#位的值为0，则IIC继续处于主机发送模式。由于此时ICSR2.NACKF标志为1表示没有从设备识别该地址或通信出现错误，因此向ICCR2.SP位写入1以发出停止条件。对于地址为10位格式的数据传输，首先将11110b、从机地址的高2位和W写入ICDRT作为第一个地址传输。然后，作为第二次地址传输，将从地址的低8位写入ICDRT。

4. 确认ICSR2中的TDRE标志为1后，将要发送的数据写入ICDRT寄存器。IIC自动将SCLn线保持为低电平，直到传输数据准备好、发出重启条件或发出停止条件。
5. 待发送的所有字节数据写入ICDRT寄存器后，等待ICSR2中的TEND标志的值返回1，然后检查ICSR2中的START标志为1后，将ICSR2中的START标志设置为0。
6. 将ICCR2中的RS位设置为1（重新启动条件发布请求）。收到请求后，IIC发出重启条件。
7. 检查ICSR2中的START标志是否为1后，将要发送的值（从机地址和RW#位）写入ICDRT。

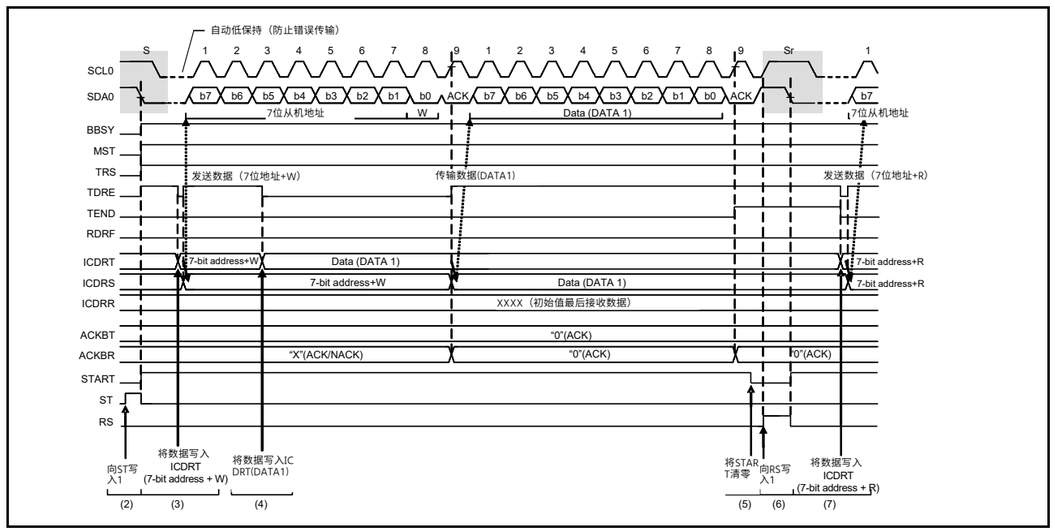

Figure 36.46 主传输后重启条件发出时序。

36.11.3 发出停止条件

当ICCR2中的SP位设置为1时，IIC发出停止条件。当SP位设置为1时，发出停止条件请求，当ICCR2中的BBSY标志为1时，IIC发出停止条件（总线忙状态）并且ICCR2中的MST位为1（主模式）。

发出停止条件：

1. 将SDAn线驱动为低电平（高电平到低电平）。
2. 确保ICBRL中设置的SCLn线的低电平周期已过。
3. 释放SCLn线（低电平到高电平）。
4. 检测SCLn线上的高电平并确保ICBRH中设置的时间和停止条件设置时间已过。
5. 释放SDAn线（低电平到高电平）。
6. 确保ICBRL中设置的时间和巴士空闲时间已过。

7. Clear the BBSY flag to 0 to release the bus mastership.

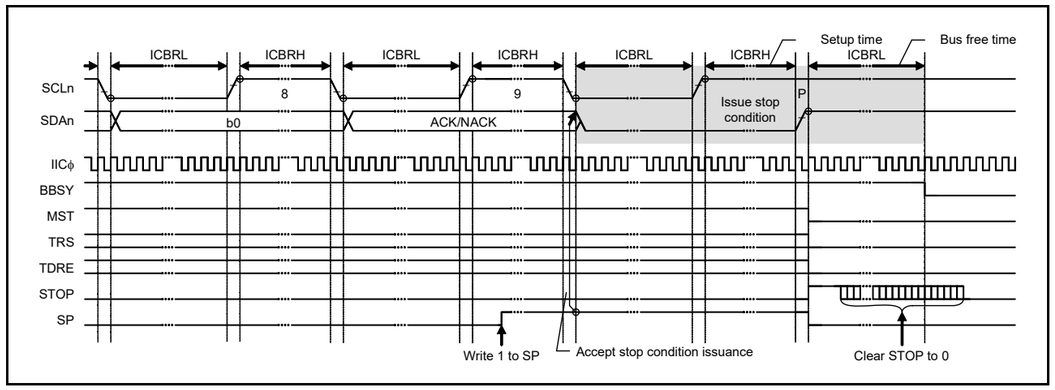

Figure 36.47 Stop condition issue timing using the SP bit

36.12 Bus Hanging

If the clock signals from the master and slave devices go out of synchronization because of noise or other factors, the I2C bus might hang with a fixed level on the SCLn or SDAn line.

To manage bus hanging, the IIC has:

- A timeout function to detect hanging by monitoring the SCLn line
- A function for the output of an extra SCL clock cycle to release the bus from a hung state because of clock signals being out of synchronization
- The IIC reset function
- An internal reset function.

By checking the SCLO, SDAO, SCLI, and SDAI bits in ICCR1, it is possible to see whether the IIC or its communicating partner is placing the low level on the SCLn or SDAn line.

36.12.1 Timeout Function

The timeout function can detect when the SCLn line is stuck longer than the predetermined time. The IIC can detect an abnormal bus state by monitoring that the SCLn line is stuck low or high for a predetermined time.

The timeout function monitors the SCLn line state and counts the low- or high-level period using the internal counter. The timeout function resets the internal counter each time the SCLn line changes (rises or falls), but continues to count unless the SCLn line changes. If the internal counter overflows because no SCLn line changes, the IIC can detect the timeout and report the bus hung state.

This timeout function is enabled when the ICFER.TMOE bit is 1. It detects a hung state when the SCLn line is stuck low or high during the following conditions:

- The bus is busy (ICCR2.BBSY flag is 1) in master mode (ICCR2.MST bit is 1)
- The IIC slave address is detected (ICSR1 register is not 00h) and the bus is busy (ICCR2.BBSY flag is 1) in slave mode (ICCR2.MST bit is 0)
- The bus is free (ICCR2.BBSY flag is 0) while a start condition is requested (ICCR2.ST bit is 1).

The internal counter of the timeout function uses the internal reference clock (IICϕ) set in the CKS[2:0] bits in ICMR1 as a count source. It functions as a 16-bit counter when long mode is selected (TMOS bit = 0 in ICMR2) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCLn line level (low, high, or both levels) during which this counter is activated can be selected in the TMOH and TMOL bits in ICMR2. If both TMOL and TMOH bits are set to 0, the internal counter does not work.

7. 将BBSY标志清除为0以释放总线主控权。

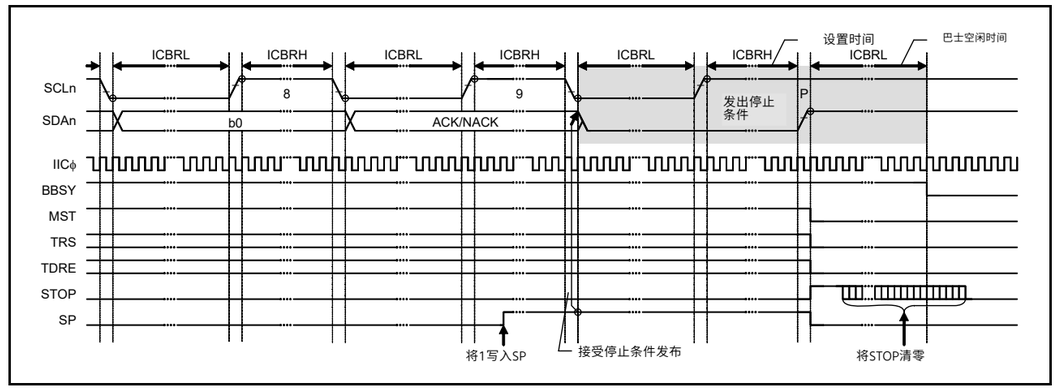

Figure 36.47 使用SP位的停止条件发出时序

36.12 巴士挂

如果来自主设备和从设备的时钟信号由于噪声或其他因素而失去同步，则I2C总线可能会在SCLn或SDAn线上以固定电平挂起。

为了管理总线挂起，IIC具有：

- 通过监控SCLn线路来检测挂起的超时功能
- 由于时钟信号不同步而输出额外SCL时钟周期以将总线从挂起状态中释放的功能
- IIC复位功能
- 内部复位功能。

通过检查ICCR1中的SCLO、SDAO、SCLI和SDAI位，可以查看IIC或其通信伙伴是否将SCLn或SDAn线置于低电平。

36.12.1 超时功能

超时功能可以检测SCLn线路何时卡住超过预定时间。IIC可以通过监视SCLn线在预定时间内保持低电平或高电平来检测异常总线状态。

超时功能监控SCLn线路状态并使用内部计数器计算低电平或高电平周期。每次SCLn线改变（上升或下降）时，超时功能都会复位内部计数器，但除非SCLn线改变，否则会继续计数。如果内部计数器因为SCLn线没有变化而溢出，IIC可以检测到超时并报告总线挂起状态。

此超时功能在ICFER.TMOE位为1时启用。在以下情况下，当SCLn线卡在低电平或高电平时，它会检测到挂起状态：

- 总线繁忙（ICCR2.BBSY标志为1）处于主模式（ICCR2.MST位为1）
- 检测到IIC从机地址（ICSR1寄存器不是00h）并且在从机模式下总线忙（ICCR2.BBSY标志为1）（ICCR2.MST位为0）
- 当请求启动条件时（ICCR2.ST位为1），总线空闲（ICCR2.BBSY标志为0）。

超时功能的内部计数器使用ICMR1的CKS[2:0]位中设置的内部参考时钟(IIC)作为计数源。Itfunctionsasa16-bitcounterwhenlongmodeisselected(TMOSbit=0inICMR2)ora14-bitcounterwhenshortmodeisselected(TMOSbit=1).

可以在TMOH和
ICMR2中的TMOL位。如果TMOL和TMOH位都设置为0，则内部计数器不工作。

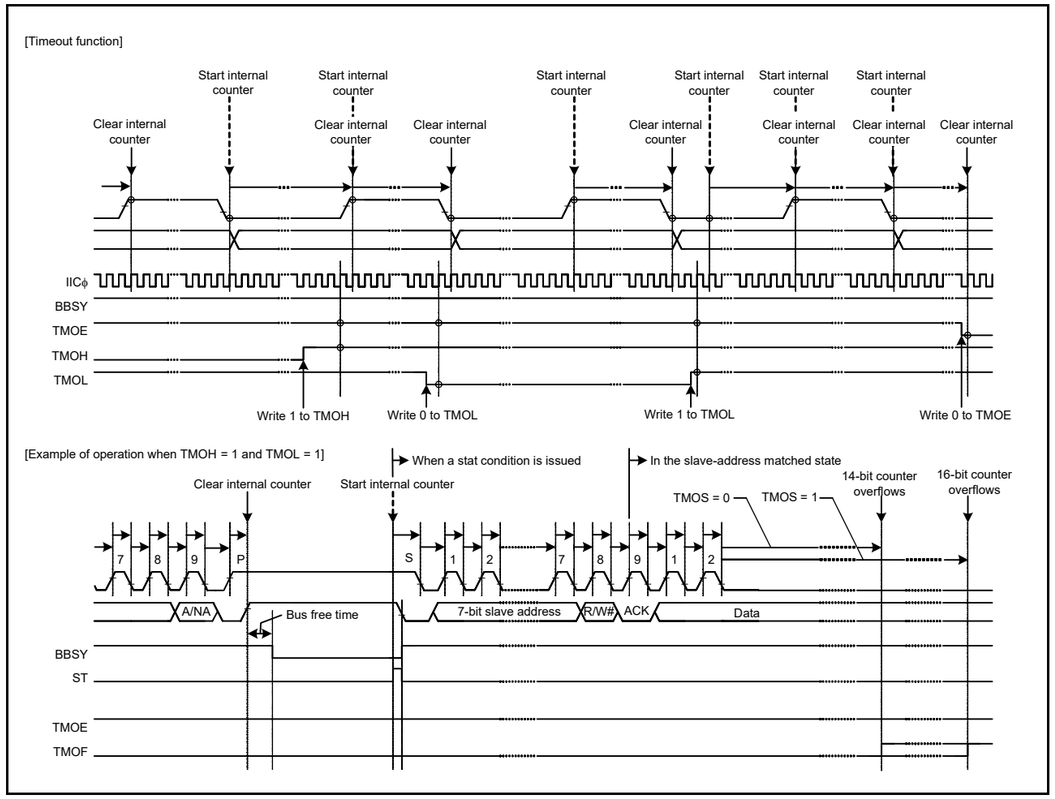

Figure 36.48 Timeout function using the TMOE, TMOS, TMOH, and TMOL bits

36.12.2 Extra SCL Clock Cycle Output Function

In master mode, this function outputs extra SCL clock cycles to release the SDAn line of the slave device from being held at the low level because the master is out of synchronization with the slave device. This function is mainly used in master mode to release the SDAn line of the slave device from being fixed low by including extra cycles of SCL output from the IIC. It uses single cycles of the SCL clock for a bus error where the IIC cannot issue a stop condition because the slave device is holding the SDAn line at the low level. Do not use this function in normal situations. Using it when communications are proceeding correctly leads to malfunctions.

When the CLO bit in ICCR1 is set to 1 in master mode, a single cycle of the SCL clock at the transfer rate specified in the CKS[2:0] bits in ICMR1, and in the ICBRH and ICBRL registers, is output as an extra clock cycle. After output of this single cycle of the SCL clock, the CLO bit automatically is set to 0. If the BBSY flag is 1, SCL terminal keeps low output, if BBSY flag is 0, SCL terminal keeps high output. Additional clock cycles can be output consecutively by writing 1 to the CLO bit with software after reading the bit as 0.

When the IIC module is in master mode and the slave device is holding the SDAn line at the low level because synchronization with the slave device was lost because of noise or other effects, the output of a stop condition is not possible. This function can be used to output extra cycles of SCL one by one to make the slave device release the SDAn line from being held at the low level, and so recovering the bus from an unusable state. Release of the SDAn line by the slave device can be monitored by reading the SDAI bit in ICCR1. After confirming release of the SDAn line by the slave device, complete communications by reissuing the stop condition.

[Output conditions for using the CLO bit in ICCR1]

- When the bus is free (BBSY flag in ICCR2 = 0) or in master mode (MST bit = 1 and BBSY flag = 1 in ICCR2)
- When the communication device does not hold the SCLn line low.

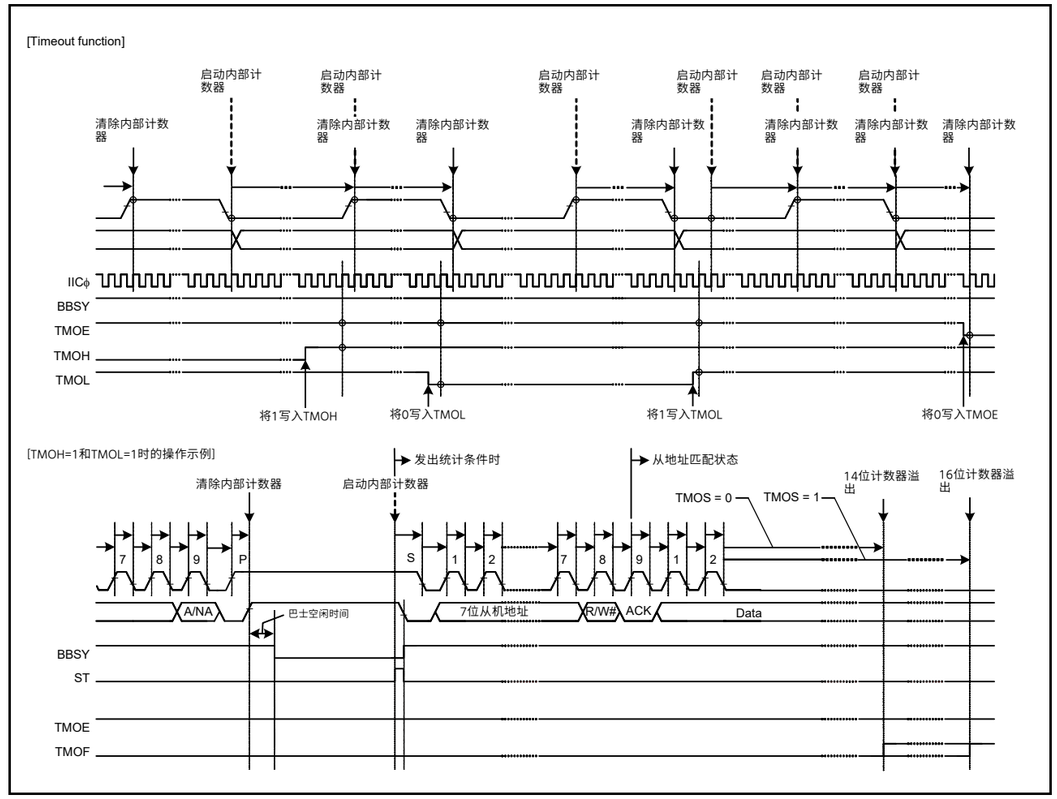

Figure 36.48 使用TMOE、TMOS、TMOH和TMOL位的超时功能

36.12.2 额外的SCL时钟周期输出功能

在主模式下，该函数输出额外的SCL时钟周期，以释放从设备的SDAn线保持在低电平，因为主设备与从设备不同步。该功能主要用于主机模式，通过包含IIC的额外SCL输出周期来释放从机设备的SDAn线固定为低电平。它使用SCL时钟的单个周期来处理IIC无法发出停止条件的总线错误，因为从设备将SDAn线保持在低电平。在正常情况下不要使用此功能。在通信正常进行时使用它会导致故障。

当ICCR1中的CLO位在主机模式下设置为1时，以ICMR1中的CKS[2:0]位以及ICBRH和ICBRL寄存器中指定的传输速率输出一个SCL时钟周期作为额外的时钟周期。在SCL时钟的这个单周期输出后，CLO位自动置0。如果BBSY标志为1，SCL端保持低电平输出，如果BBSY标志为0，SCL端保持高电平输出。将CLO位读为0后，用软件将1写入CLO位，可以连续输出额外的时钟周期。

当IIC模块处于主机模式并且从机由于噪声或其他影响而失去与从机的同步而将SDAn线保持在低电平时，停止条件的输出是不可能的。该功能可用于逐个输出额外的SCL周期，使从设备释放SDAn线保持在低电平，从而使总线从不可用状态恢复。从设备释放SDAn线可以通过读取ICCR1中的SDAI位来监控。确认从设备释放SDAn线后，通过重新发出停止条件完成通信。

[使用ICCR1中CLO位的输出条件]

- 当总线空闲（ICCR2中的BBSY标志=0）或处于主机模式（ICCR2中的MST位=1且BBSY标志=1）时
- 当通信设备不保持SCLn线为低电平时。

Figure 36.49 shows the operation timing of the extra SCL clock cycle output function (CLO bit).

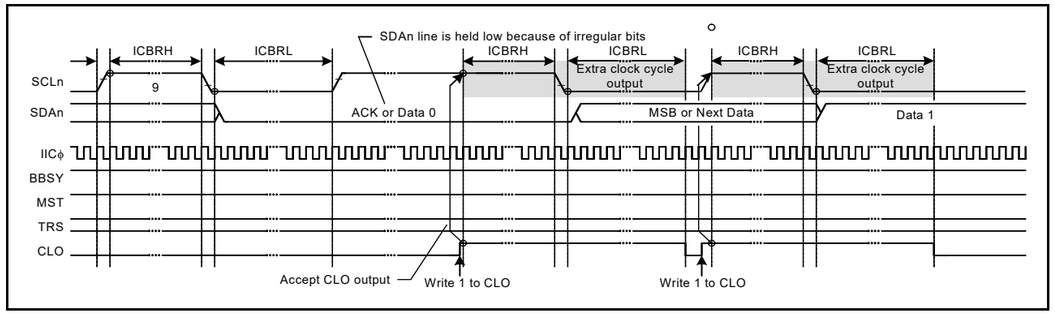

Figure 36.49 Extra SCL clock cycle output function using the CLO bit

36.12.3 IIC Reset and Internal Reset

The IIC module incorporates a function for resetting itself. It uses two types of resets: an IIC reset, which initializes all registers, including the BBSY flag in ICCR2, and an internal reset, which releases the IIC from the slave-address matched state and initializes the internal counter while saving other settings. After issuing a reset, always set the IICRST bit in ICCR1 to 0.

Both types of resets are valid for release from bus-hung states, because both restore the output state of the SCLn and SDAn pins to the high-impedance state.

Issuing a reset during slave operation might lead to a loss of synchronization between the master device clock and the slave device clock, so avoid this when possible. In addition, monitoring of the bus state, such as for the presence of a start condition, is not possible during an IIC reset (ICE and IICRST bits = 01b in ICCR1).

For a detailed description of the IIC and internal resets, see section 36.15, State of Registers when Issuing each Condition.

36.13 SMBus Operation

The IIC is available for data communication conforming to the SMBus Specification (version 2.0). To perform SMBus communication, set the SMBS bit in ICMR3 to 1. To use the transfer rate within a range of 10 to 100 kbps of the SMBus standard, set the CKS[2:0] bits in ICMR1, ICBRH, and ICBRL. In addition, specify the values in the DLCS bit in ICMR2 and the SDDL[2:0] bits in ICMR2 to meet the data hold time specification of 300 ns or more. When the IIC is used only as a slave device, the transfer rate setting is not required, but ICBRL must be set to a value longer than the data setup time (250 ns).

For the SMBus device default address (1100 001b), use one of the slave address registers L0 to L2 (SARL0, SARL1, and SARL2), and set the associated FS bit (7- or 10-bit address format select) in SARUy (y = 0 to 2) to 0 (7-bit address format).

When transmitting the UDID (Unique Device Identifier), set the SALE bit in ICFER to 1 to enable the slave arbitration-lost detection function.

图36.49显示了额外SCL时钟周期输出功能（CLO位）的操作时序。

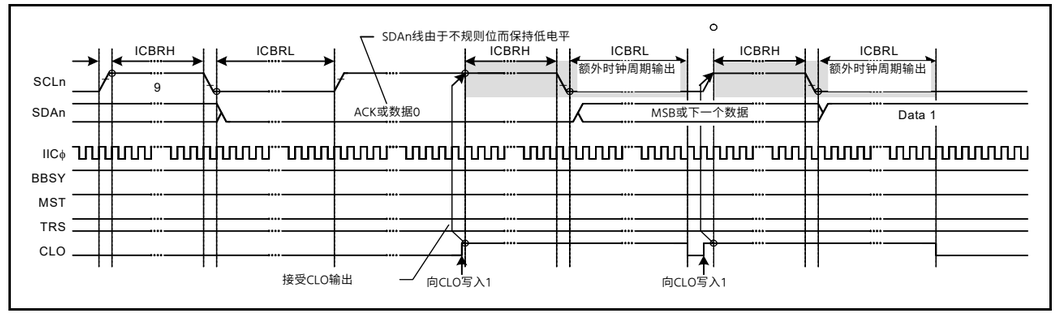

Figure 36.49 使用CLO位的额外SCL时钟周期输出功能

36.12.3 IIC复位和内部复位

IIC模块包含一个自我复位功能。它使用两种类型的复位：IIC复位，初始化所有寄存器，包括ICCR2中的BBSY标志，以及内部复位，将IIC从从地址匹配状态释放并初始化内部计数器，同时保存其他设置。发出复位后，始终将ICCR1中的IICRST位设置为0。

这两种类型的复位对于从总线挂起状态中释放都是有效的，因为两者都恢复了SCLn的输出状态和SDAn引脚处于高阻抗状态。

在从机操作期间发出复位可能会导致主设备时钟和从设备时钟之间失去同步，因此请尽可能避免这种情况。此外，在IIC复位（ICE和IICRST位=ICCR1中的01b）期间无法监控总线状态，例如是否存在启动条件。

有关IIC和内部复位的详细说明，请参阅第36.15节，发出每个寄存器时的状态Condition.

36.13 SMBus Operation

IIC可用于符合SMBus规范（2.0版）的数据通信。要进行SMBus通信，请将ICMR3中的SMBS位设置为1。要使用SMBus标准的10至100kbps范围内的传输速率，请设置ICMR1、ICBRH和ICBRL中的CKS[2:0]位。此外，请指定ICMR2中的DLCS位和ICMR2中的SDDL[2:0]位中的值，以满足300ns或更长的数据保持时间规范。当IIC仅用作从设备时，不需要设置传输速率，但必须将ICBRL设置为比数据建立时间（250ns）更长的值。

对于SMBus器件默认地址(1100001b)，使用从地址寄存器L0到L2之一（SARL0、SARL1和SARL2），并将SARUy(y=0to2)中相关的FS位（7位或10位地址格式选择）设置为0（7位地址格式）。

发送UDID（UniqueDeviceIdentifier）时，将ICFER中的SALE位设置为1，以使能从机仲裁丢失检测功能。

36.13.1 SMBus Timeout Measurement

(1) Measuring slave device timeout

The following period (timeout interval: $T_{LOW: SEXT}$) must be measured for slave devices in SMBus communication:

- From start condition to stop condition.

To measure timeout for slave devices, measure the period from start condition detection to stop condition detection with the GPT using the IIC start condition detection interrupt (STIn) and stop condition detection interrupt (SPIn). The measured timeout period must be within the total clock low-level period [slave device] $T_{LOW: SEXT}$: 25 ms (maximum) of the SMBus standard.

If the time measured with the GPT exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (minimum) of the SMBus standard, the slave device must release the bus by writing 1 to the IICRST bit in ICCR1 to issue an internal reset of the IIC. When an internal reset is issued, the IIC stops driving the bus for the SCLn and SDAn pins, making them output high-impedance, which releases the bus.

(2) Measuring master device timeout

The following periods (timeout interval: $T_{LOW: MEXT}$) must be measured for master devices in SMBus communication:

- From start condition to acknowledge bit
- Between acknowledge bits
- From acknowledge bit to stop condition.

To measure timeout for master devices, measure these periods with the GPT using the IIC start condition detection interrupt (STIn), stop condition detection interrupt (SPIn), transmit end interrupt (IICn_TEI), or receive data full interrupt (IICn_RXI). The measured timeout period must be within the total clock low-level extended period (master device) $T_{LOW: MEXT}$: 10 ms (maximum) of the SMBus standard, and the total of all $T_{LOW: MEXT}$ values from start condition to stop condition must be within $T_{LOW: SEXT}$: 25 ms (maximum).

For the ACK receive timing (rising edge of the ninth SCL clock cycle), monitor the TEND flag in ICSR2 in master transmit mode (master transmitter) and the RDRF flag in ICSR2 in master receive mode (master receiver). Perform byte-wise transmit operations in master transmit mode, and hold the RDRFS bit in ICMR3 at 0 until the byte immediately before reception of the final byte in master receive mode. While the RDRFS bit is 0, the RDRF flag is set to 1 on the rising edge of the ninth SCL clock cycle.

If the period measured with the GPT exceeds the total clock low-level extended period (master device) $T_{LOW: MEXT}$: 10 ms (maximum) of the SMBus standard or the total of measured periods exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (minimum) of the SMBus standard, the master device must stop the transaction by issuing a stop condition. In master transmit mode, immediately stop the transmit operation (writing data to ICDRT).

36.13.1 SMBus超时测量

(1) 测量从设备超时

对于SMBus通信中的从设备，必须测量以下周期（超时间隔：TLOW:SEXT）：

- 从开始条件到停止条件。

要测量从设备的超时，请使用GPT使用IIC启动条件检测中断(STIn)和停止条件检测中断(SPIn)测量从启动条件检测到停止条件检测的周期。测得的超时周期必须在总时钟低电平周期[从设备]TLOW:SEXT:SMBus标准的25ms（最大值）内。

如果用GPT测量的时间超过时钟低电平检测超时TTIMEOUT:25ms（最小值）
SMBus标准，从设备必须通过向ICCR1中的IICRST位写入1来释放总线，以发出IIC的内部复位。当发出内部复位时，IIC停止驱动SCLn和SDAn引脚的总线，使它们输出高阻抗，从而释放总线。

(2) 测量主设备超时

对于SMBus通信中的主设备，必须测量以下周期（超时间隔：TLOW:MEXT）：

- 从开始条件到确认位
- 确认位之间
- 从确认位到停止条件。

要测量主设备的超时，请使用GPT使用IIC开始条件检测中断(STIn)、停止条件检测中断(SPIn)、发送结束中断(IICn_TEI)或接收数据完整中断(IICn_RXI)来测量这些周期。测量的超时周期必须在总时钟低电平扩展周期（主设备）TLOW：MEXT：SMBus标准的10毫秒（最大值）内，以及所有TLOW：从启动条件到停止条件的MEXT值的总和必须在TLOW内：SEXT：25毫秒（最大值）。

对于ACK接收时序（第9个SCL时钟周期的上升沿），在主机发送模式（主机发送器）监视ICSR2中的TEND标志，在主机接收模式（主机接收器）监视ICSR2中的RDRF标志。在主机发送模式下执行逐字节发送操作，并将ICMR3中的RDRFS位保持为0，直到在主机接收模式下接收到最后一个字节之前的字节。当RDRFS位为0时，RDRF标志在第9个SCL时钟周期的上升沿设置为1。

如果用GPT测量的周期超过总时钟低电平延长周期（主设备）TLOW:MEXT:SMBus标准的10ms（最大值）或总测量周期超过时钟低电平检测超时TTIMEOUT：SMBus标准的25ms（最小值），主设备必须通过发出停止条件来停止事务。在主机发送模式下，立即停止发送操作（将数据写入ICDRT）。

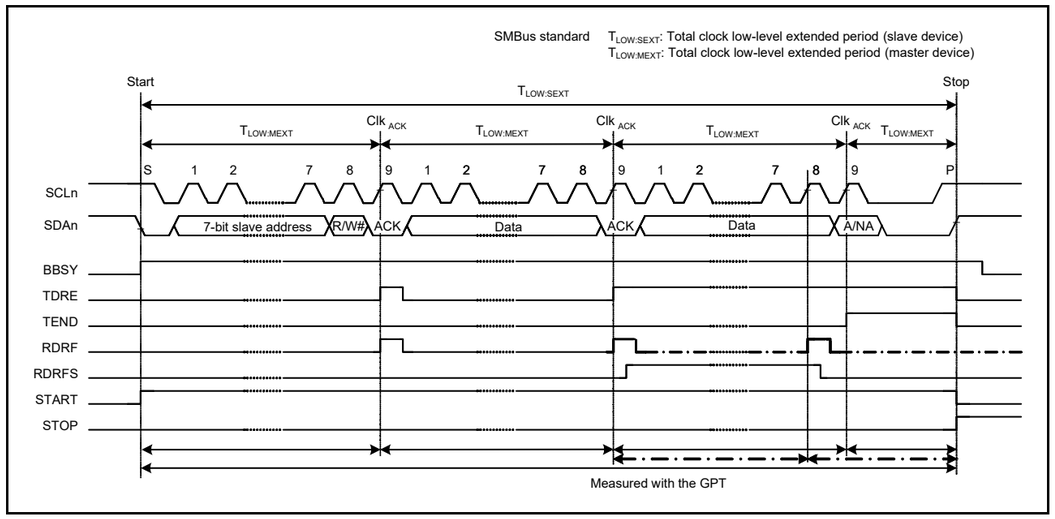

Figure 36.50 SMBus timeout measurement

36.13.2 Packet Error Code (PEC)

The MCU incorporates a CRC calculator, which enables transmission of a packet error code (PEC) or allows checking of the received data in SMBus data communication for the IIC. For the CRC-generating polynomials of the CRC calculator, see section 40, Cyclic Redundancy Check (CRC) Calculator.

In master transmit mode, the PEC data can be invoked by writing all transmit data to the CRC data input register (CRCDIR) in the CRC calculator.

In master receive mode, the PEC data can be checked by writing all receive data to CRCDIR in the CRC calculator and comparing the obtained value in the CRC Data Output Register (CRCDOR) with the received PEC data.

To send ACK or NACK based on the match or mismatch result when the final byte is received as a result of the PEC code check, set the RDRFS bit in ICMR3 to 1 before the rising edge of the eighth SCL clock cycle during reception of the final byte, and hold the SCLn line low on the falling edge of the eighth clock cycle.

36.13.3 SMBus Host Notification Protocol (Notify ARP Master Command)

In communicating on an SMBus, a slave device can temporarily act as a master device to notify the SMBus host or ARP master of, or request the SMBus host for, its own slave address or request its own slave address from the SMBus host.

For a product using the MCU to operate as an SMBus host or ARP master, the host address (0001 000b) sent from the slave device must be detected as a slave address, so the IIC provides a function for detecting the host address. To detect the host address as a slave address, set the SMBS bit in ICMR3 and the HOAE bit in ICSER to 1. Operation after the host address is detected is the same as normal slave operation.

36.14 Interrupt Sources

The IIC issues four types of interrupt requests: transfer error or event occurrence (detection of arbitration-lost, NACK, timeout, start or restart condition, or stop condition), receive data full, transmit data empty, and transmit end. Table 36.10 lists details about the interrupt requests. The receive data full and transmit data empty interrupts are both capable of activating data transfer by the DTC or DMAC.

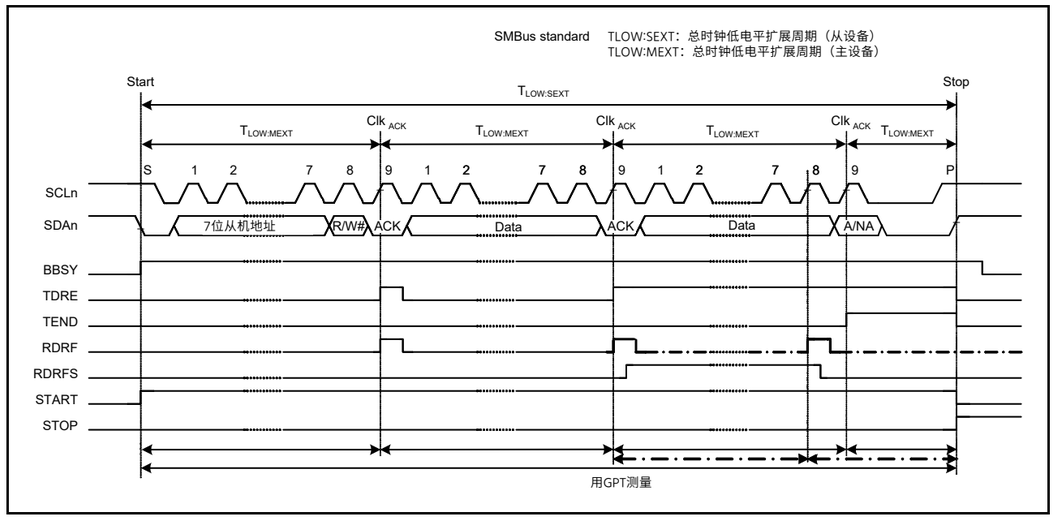

Figure 36.50 SMBus超时测量

36.13.2 数据包错误代码(PEC)

MCU包含一个CRC计算器，它可以传输数据包错误代码(PEC)或允许检查IIC的SMBus数据通信中接收到的数据。有关CRC计算器的CRC生成多项式，请参阅第40节，循环冗余校验(CRC)计算器。

在主机发送模式下，可以通过将所有发送数据写入CRC计算器中的CRC数据输入寄存器(CRCDIR)来调用PEC数据。

在主机接收模式下，可以通过将所有接收数据写入CRC计算器中的CRCDIR并将CRC数据输出寄存器(CRCDOR)中获得的值与接收到的PEC数据进行比较来检查PEC数据。

在接收到作为PEC代码检查的结果的最后一个字节时，要根据匹配或不匹配结果发送ACK或NACK，在接收最后一个字节期间，在第8个SCL时钟周期的上升沿之前将ICMR3中的RDRFS位设置为1字节，并在第八个时钟周期的下降沿保持SCLn线为低电平。

36.13.3 SMBus主机通知协议（通知ARP主机命令）

在SMBus上进行通信时，从设备可以临时充当主设备来通知SMBus主机或ARP主机，或向SMBus主机请求其自己的从地址，或从SMBus主机请求其自己的从地址。

对于使用MCU作为SMBus主机或ARP主机的产品，从机发送的主机地址（0001000b）必须被检测为从机地址，因此IIC提供了主机地址检测功能。要将主机地址检测为从机地址，请将ICMR3中的SMBS位和ICSER中的HOAE位设置为1。检测到主机地址后的操作与正常从机操作相同。

36.14 中断源

IIC发出四种类型的中断请求：传输错误或事件发生（检测仲裁丢失、NACK、超时、开始或重新启动条件或停止条件）、接收数据满、发送数据空和发送结束。表36.10列出了有关中断请求的详细信息。接收数据满和发送数据空中断都能够通过DTC或DMAC激活数据传输。

Table 36.10 Interrupt sources

Symbol	Interrupt source	Interrupt flag	DMAC/DTC activation	Interrupt condition
IICn_EEI*5	Transfer error or event occurrence	AL	Not possible	AL = 1, ALIE = 1
		NACKF		NACKF = 1, NAKIE = 1
		TMOF		TMOF = 1, TMOIE = 1
		START		START = 1, STIE = 1
		STOP		STOP = 1, SPIE = 1
IICn_RXI*2, *5	Receive data full	RDRF	Possible	RDRF = 1, RIE = 1
IICn_TXI*1, *5	Transmit data empty	TDRE	Possible	TDRE = 1, TIE = 1
IICn_TEI*3, *5	Transmit end	TEND	Not possible	TEND = 1, TEIE = 1
IIC0_WUI*4	Slave address match during wakeup function	WUF	Not possible	Slave address match Slave receive complete RWAK operation ASY0 = 1 WUIE = 1

Note: There is a delay between the execution of a write instruction for a peripheral module by the CPU and the actual writing to the module. When an interrupt flag is cleared or masked, read the relevant flag again to check whether clearing or masking is complete, and then return from interrupt handling. Not doing so creates the possibility of repeated processing of the same interrupt.
Note 1. Because IICn_TXI is edge-detected, it does not require clearing. Additionally, the TDRE flag in ICSR2 (condition for IICn_TXI) automatically is set to 0 when transmit data is written to ICDRT or a stop condition is detected (STOP flag = 1 in ICSR2).
Note 2. Because IICn_RXI is edge-detected, it does not require clearing. Additionally, the RDRF flag in ICSR2 (condition for IICn_RXI) automatically is set to 0 when data is read from ICDRR.
Note 3. When using the IICn_TEI interrupt, clear the TEND flag in ICSR2 in the IICn_TEI interrupt handling. The TEND flag in ICSR2 automatically is set to 0 when transmit data is written to ICDRT or a stop condition is detected (STOP flag = 1 in ICSR2).
Note 4. Only channel 0 has a wakeup function, so IIC0_WUI is for channel 0 only.
Note 5. Channel number (n = 0 to 2).

Clear or mask each flag during interrupt handling.

36.14.1 Buffer Operation for IICn_TXI and IICn_RXI Interrupts

If the conditions for generating an IICn_TXI or IICn_RXI interrupt are satisfied while the associated IR flag is 1, the interrupt request is not output for the ICU but saved internally. One request per source can be saved internally.

An interrupt request that was being saved in the ICU is output when the ICU.IELSRn.IR flag is set to 0. Internally saved interrupt requests are automatically cleared under normal conditions. They can also be cleared by writing 0 to the interrupt enable bit within the given peripheral module.

36.15 State of Registers when Issuing each Condition

The IIC has two dedicated resets, IIC reset and internal reset. Table 36.11 shows the register states when issuing each condition.

Table 36.11 Register states when issuing each condition (1 of 2)

Registers		Reset	IIC reset (ICE = 0, IICRST = 1)	Internal reset (ICE = 1, IICRST = 1)	Start or restart condition detection	Stop condition detection
ICCR1	ICE, IICRST	In reset	Saved	Saved	Saved	Saved
	SCLO, SDAO		In reset	In reset		
	Others			Saved		
ICCR2	BBSY	In reset	In reset	Saved	Set	In reset
	ST, RS			In reset	In reset	Saved
	SP					In reset
	TRS				Set or saved	
	MST					

Table 36.10 中断源

Symbol	中断源	中断标志	DMAC/DTC activation	中断条件
IICn_EEI*5	传输错误或事件发生	AL	不可能	AL = 1, ALIE = 1
		NACKF		NACKF = 1, NAKIE = 1
		TMOF		TMOF = 1, TMOIE = 1
		START		START = 1, STIE = 1
		STOP		STOP = 1, SPIE = 1
IICn_RXI*2, *5	接收数据已满	RDRF	Possible	RDRF = 1, RIE = 1
IICn_TXI*1, *5	传输数据为空	TDRE	Possible	TDRE = 1, TIE = 1
IICn_TEI*3, *5	发射端	TEND	不可能	TEND = 1, TEIE = 1
IIC0_WUI*4	唤醒功能期间的从机地址匹配	WUF	不可能	从地址匹配 从机接收完成 RWAK operation ASY0 = 1 WUIE = 1

Note: CPU执行外围模块的写指令与实际写入模块之间存在延迟。当一个中断标志被清除或屏蔽时，再次读取相关标志，检查清除或屏蔽是否完成，然后从中断处理返回。不这样做会产生重复处理同一中断的可能性。

Note 1. 因为IICn_TXI是边沿检测，所以不需要清零。此外，当发送数据写入ICDRT或检测到停止条件（ICSR2中的STOP标志=1）时，ICSR2中的TDRE标志（IICn_TXI的条件）自动设置为0。
Note 2. 因为IICn_RXI是边沿检测，所以不需要清零。此外，从ICDRR读取数据时，ICSR2中的RDRF标志（IICn_RXI的条件）自动设置为0。
Note 3. 使用IICn_TEI中断时，在IICn_TEI中断处理中清除ICSR2中的TEND标志。当发送数据写入ICDRT或检测到停止条件（ICSR2中的STOP标志=1）时，ICSR2中的TEND标志自动设置为0。
Note 4. 只有通道0有唤醒功能，所以IIC0_WUI仅适用于通道0。
Note 5. 通道号（n=0到2）。

在中断处理期间清除或屏蔽每个标志。

36.14.1 IICn_TXI和IICn_RXI中断的缓冲区操作

如果在相关的IR标志为1时满足产生IICn_TXI或IICn_RXI中断的条件，则中断请求不会输出给ICU，而是在内部保存。每个源的一个请求可以在内部保存。

当ICU.IELSRn.IR标志设置为0时，会输出保存在ICU中的中断请求。在正常情况下，内部保存的中断请求会自动清除。也可以通过将0写入给定外设模块中的中断使能位来清除它们。

36.15 发布每个条件时的注册状态

IIC有两个专用复位，IIC复位和内部复位。表36.11显示了发出每个条件时的寄存器状态。

Table 36.11 发出每个条件时注册状态（2个中的1个）

Registers		Reset	IIC reset (ICE = 0, IICRST = 1)	内部复位（ICE=1，IICRST=1）	启动或重启条件检测	停止条件检测

36.16 Output to the Event Link Controller (ELC)

The IIC0 to IIC2 modules handle event output for the ELC for the following sources:

(1) Transfer error event

When a transfer error event occurs, the associated event signal can be output to another module by the ELC.

(2) Receive data full

When a receive data register becomes full, the associated event signal can be output to another module by the ELC.

(3) Transmit data empty

When a transmit data register becomes empty, the associated event signal can be output to another module by the ELC.

(4) Transmit end

On completion of transfer, the associated event signal can be output to another module by the ELC.

36.16.1 Interrupt Handling and Event Linking

Each of the IIC interrupt types (see Table 36.10) has an enable bit to control enabling and disabling of the associated interrupt signal. An interrupt request signal is output to the CPU when an interrupt source condition is satisfied while the associated enable bit is set.

The associated event link output signals are sent to other modules as event signals by the ELC when the interrupt source

Table 36.11 发布每个条件时注册状态（2个中的2个）

36.16 输出到事件链接控制器(ELC)

IIC0到IIC2模块为以下源处理ELC的事件输出：

(1) 传输错误事件

当发生传输错误事件时，ELC可以将相关事件信号输出到另一个模块。

(2) 接收数据已满

当接收数据寄存器变满时，ELC可以将相关的事件信号输出到另一个模块。

(3) 传输数据为空

当发送数据寄存器变为空时，ELC可以将相关的事件信号输出到另一个模块。

(4) 发射端

传输完成后，ELC可以将相关的事件信号输出到另一个模块。

36.16.1 中断处理和事件链接

每种IIC中断类型（见表36.10）都有一个启用位来控制相关中断信号的启用和禁用。当相关的使能位设置时，中断源条件成立时，将向CPU输出中断请求信号。

当中断源发生时，关联的事件链接输出信号由ELC作为事件信号发送到其他模块

conditions are satisfied, regardless of the interrupt enable bit settings. For details on interrupt sources, see Table 36.10.

36.17 Usage Notes

36.17.1 Settings for the Module-Stop Function

IIC operation can be disabled or enabled using Module Stop Control Register B (MSTPCRB). The IIC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

36.17.2 Starting Transfer after an Interrupt Occurrence

If the IR flag associated with the IIC interrupt is 1 when transfer is started (ICCR1.ICE bit = 1), follow the procedure shown here to clear interrupts before enabling operations. Starting transfer with the IR flag set to 1 while the ICCR1.ICE bit is 1 leads to an interrupt request being internally saved after transfer starts, and this can lead to unanticipated behavior of the IR flag.

To clear interrupts before starting transfer:

1. Confirm that the ICCR1.ICE bit is 0.
2. Set the relevant interrupt enable bits, such as ICIER.TIE, in the peripheral function to 0.
3. Read the relevant interrupt enable bits, such as ICIER.TIE, in the peripheral function and confirm that their value is 0.
4. Set the IR flag to 0.

无论中断使能位设置如何，条件都满足。有关中断源的详细信息，请参见表36.10。

36.17 使用说明

36.17.1 模块停止功能的设置

可以使用模块停止控制寄存器B(MSTPCRB)禁用或启用IIC操作。IIC在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

36.17.2 发生中断后开始传输

如果在传输开始时与IIC中断相关的IR标志为1（ICCR1.ICE位=1），请按照此处所示的步骤在使能操作之前清除中断。在ICCR1.ICE位为1时将IR标志设置为1开始传输会导致在传输开始后内部保存中断请求，这可能导致IR标志的意外行为。

在开始传输之前清除中断：

1.确认ICCR1.ICE位为0。

2.设置外设功能中相关的中断使能位，如ICIER.TIE为0。

3.读取外设功能中相关的中断使能位，如ICIER.TIE，确认其值为0。

4.将IR标志设置为0。

37. Controller Area Network (CAN) Module

37.1 Overview

The Controller Area Network (CAN) module uses a message-based protocol to receive and transmit data between multiple slaves and masters in electromagnetically noisy applications. The module complies with the ISO 11898-1 (CAN 2.0A/CAN 2.0B) standard and supports up to 32 mailboxes, which can be configured for transmission or reception in normal mailbox and FIFO modes. Both standard (11-bit) and extended (29-bit) messaging formats are supported.

Table 37.1 lists the CAN module specifications and Figure 37.1 shows a block diagram. The CAN module requires an additional external CAN transceiver.

Table 37.1 CAN module specifications (1 of 2)

Parameter	Specifications
Data transfer rate	ISO11898-1-compliant for standard and extended frames
Bit rate	Data transfer rate programmable up to 1 Mbps (fCAN ≥ 8 MHz) fCAN: CAN clock source
Message box	32 mailboxes, with two selectable mailbox modes • Normal mode: 32 mailboxes independently configurable for either transmission or reception • FIFO mode: 24 mailboxes independently configurable for either transmission or reception, with remaining mailboxes used for receive and transmit 4-stage FIFOs.
Reception	• Support for data frame and remote frame reception • Reception ID format selectable to only standard ID, only extended ID, or mixed IDs • Programmable one-shot reception function • Selectable between overwrite mode (unread message overwritten) and overrun mode (unread message saved) • Reception complete interrupt independently enabled or disabled for each mailbox.
Acceptance filter	• Eight acceptance masks (one for every four mailboxes) • Masks independently enabled or disabled for each mailbox.
Transmission	• Support for data frame and remote frame transmission • Transmission ID format selectable to only standard ID, only extended ID, or mixed IDs) • Programmable one-shot transmission function • Broadcast messaging function • Priority mode selectable based on message ID or mailbox number • Support for transmission request abort, with abort completion comfirmable in status flag • Transmission complete interrupt independently enabled or disabled for each mailbox.
Mode transition for bus-off recovery	Mode transition for the recovery from the bus-off state selectable to: • ISO11898-1 specification-compliant • Automatic invoking of CAN halt mode on bus-off entry • Automatic invoking of CAN halt mode on bus-off end • Invoking of CAN halt mode through the software • Transition to error-active state through the software.
Error status monitoring	• Monitoring of CAN bus errors, including stuff error, form error, ACK error, 15-bit CRC error, bit error, and ACK delimiter error • Detection of transition to error states, including error-warning, error-passive, bus-off entry, and bus-off recovery • Supports reading of error counters.
Time stamping	• Time stamp function using a 16-bit counter • Reference clock selectable to 1-bit, 2-bit, 4-bit, and 8-bit time periods.
Interrupt function	Supports five interrupt sources: reception complete, transmission complete, receive FIFO, transmit FIFO, and error interrupts
CAN sleep mode	CAN clock stopped to reduce power consumption
Software support unit	Three software support units: • Acceptance filter support • Mailbox search support, including receive mailbox search, transmit mailbox search, and message lost search • Channel search support.
CAN clock source	PCLKB or CANMCLK

37. 控制器局域网(CAN)模块

37.1 Overview

控制器局域网(CAN)模块使用基于消息的协议在电磁噪声应用中的多个从机和主机之间接收和传输数据。该模块符合ISO11898-1(CAN2.0ACAN2.0B)标准，最多支持32个邮箱，可配置为普通邮箱和FIFO模式下的发送或接收。支持标准（11位）和扩展（29位）消息格式。

表37.1列出了CAN模块规格，图37.1显示了框图。CAN模块需要额外的外部CAN收发器。

Table 37.1 CAN模块规格(1of2)

Parameter	Specifications
数据传输率	标准和扩展框架符合ISO11898-1
比特率	数据传输速率可编程高达1Mbps(fCAN 8MHz)fCAN：CAN时钟源
消息框	32个邮箱，有两种可选择的邮箱模式 普通模式：32个邮箱可独立配置为发送或接收 FIFO模式：24个邮箱可独立配置为发送或接收，其余邮箱用于接收和发送4级FIFO。
Reception	支持数据帧和远程帧接收 接收ID格式可选择仅标准ID、仅扩展ID或混合ID 可编程一次性接收功能可选择覆盖模式（未读消息覆盖）和溢出模式（未读消息已保存）） 为每个邮箱独立启用或禁用接收完成中断。
验收过滤器	八个接受掩码（每四个邮箱一个） 为每个邮箱独立启用或禁用掩码。
Transmission	支持数据帧和远程帧传输 传输ID格式可选择仅标准ID、仅扩展ID或混合ID） 可编程一次性传输功能 广播消息功能 可根据消息ID或邮箱号选择优先模式 支持传输请求中止，状态标志中可确认中止完成 为每个邮箱独立启用或禁用传输完成中断。
总线关闭恢复的模式转换	从总线关闭状态恢复的模式转换可选择： 符合ISO11898-1规范 在总线关闭进入时自动调用CAN暂停模式 在总线关闭结束时自动调用CAN暂停模式 调用CAN暂停通过软件模式 通过软件转换到错误激活状态。
错误状态监控	监控CAN总线错误，包括填充错误、格式错误、ACK错误、15位CRC错误、位错误和ACK分隔符错误 检测到错误状态的转换，包括错误警告、错误被动、总线关闭入口和总线关闭恢复 支持读取错误计数器。
时间戳	使用16位计数器的时间戳功能 可选择1位、2位、4位和8位时间周期的参考时钟。
中断功能	支持五种中断源：接收完成、发送完成、接收FIFO、发送FIFO、错误中断
CAN睡眠模式	CAN时钟停止以降低功耗
软件支持单位	三个软件支持单元： 接受过滤器支持 邮箱搜索支持，包括接收邮箱搜索、发送邮箱搜索和邮件丢失搜索渠道搜索支持。
CAN时钟源	PCLKB or CANMCLK

Table 37.1 CAN module specifications (2 of 2)

Parameter	Specifications
Test mode	Three test modes available for evaluation purposes: • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback).
Module-stop function	Module-stop state can be set to reduce power consumption

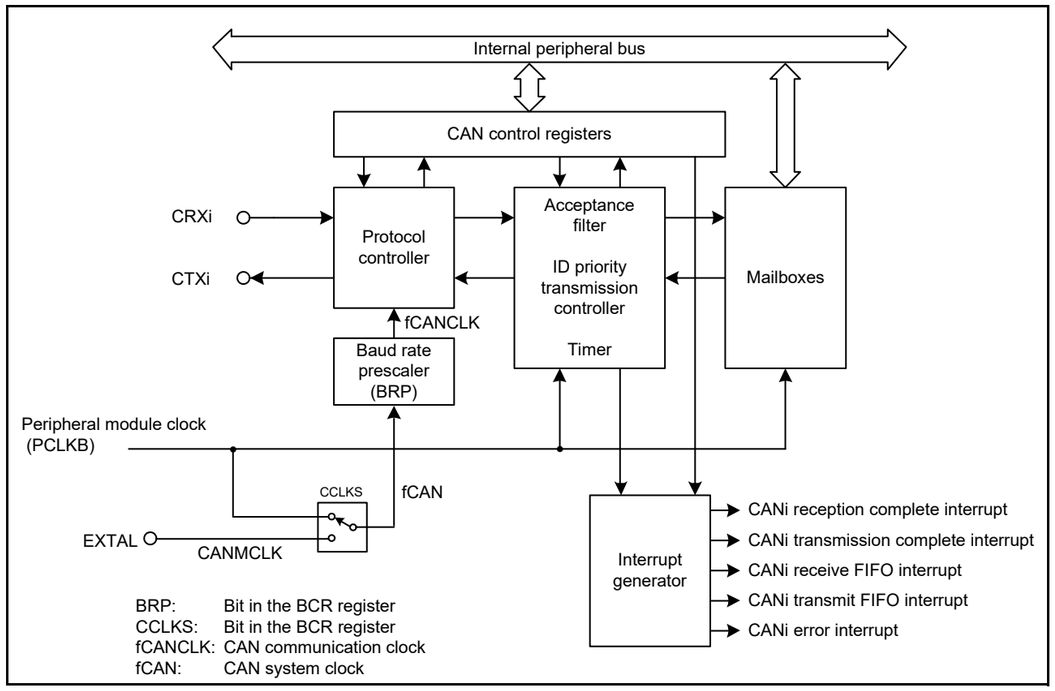

Figure 37.1 CAN module block diagram (i = 0, 1)

The CAN module includes the following blocks:

- CAN input and output pins
  CRXi and CTXi, where i = 0, 1
- Protocol controller
  Handles CAN protocol processing such as bus arbitration, bit timing during transmission and reception, stuffing, and error handling.
- Mailboxes
  Consists of 32 mailboxes, which can be configured as either transmit or receive. Each mailbox has an individual ID, data length code (DLC), data field (8 bytes), and time stamp.
- Acceptance filter
  Performs filtering of received messages. MKR0 to MKR7 are used for the filtering process.
- Timer
  Used for the time stamp function. The timer value when a message is stored in the mailbox is written as the time stamp value.
- Interrupt generator
  Generates five types of interrupts:
  - CANi reception complete interrupt

Table 37.1 CAN模块规格（2个中的2个）

Parameter	Specifications
测试模式	三种测试模式可用于评估目的： 只听模式 自测模式0（外部环回） 自测模式1（内部环回）。
Module-stop function	可设置模块停止状态以降低功耗

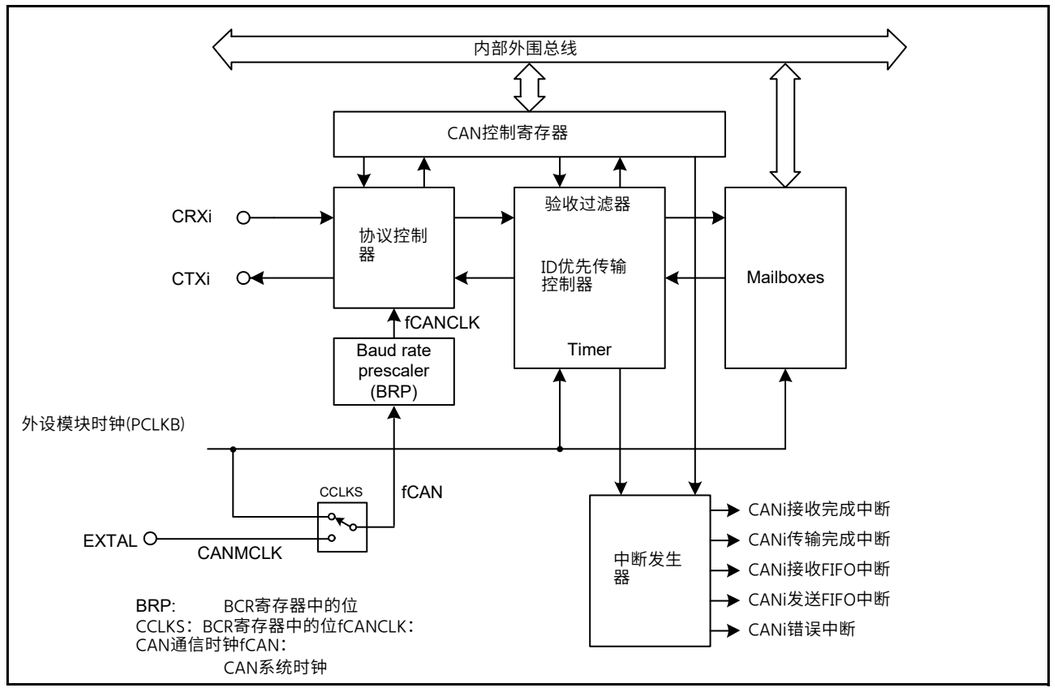

Figure 37.1 CAN模块框图(i=0 1)

CAN模块包括以下模块：

- CAN输入和输出引脚
  CRXi和CTXi，其中i=0 1
- 协议控制器处理CAN协议处理，例如总线仲裁、发送和接收期间的位时序、填充和错误处理。
- Mailboxes
  包含32个邮箱，可配置为发送或接收。每个邮箱都有一个单独的ID、数据长度代码(DLC)、数据字段（8个字节）和时间戳。
- 验收过滤器
  对收到的消息执行过滤。MKR0到MKR7用于过滤过程。
- Timer
  用于时间戳功能。将消息存储在邮箱中时的计时器值作为时间戳值写入。
- 中断发生器
  产生五种类型的中断：
  - CANi接收完成中断

- CANi transmission complete interrupt
- CANi receive FIFO interrupt
- CANi transmit FIFO interrupt
- CANi error interrupt.

The CAN module communicates on the pins listed in Table 37.2. These pins are multiplexed with other signals on the MCU. For details, see section 20, I/O Ports.

Table 37.2 CAN module I/O pins

Pin name	I/O	Function
CRX0	Input	Data receive pin
CTX0	Output	Data transmit pin
CRX1	Input	Data receive pin
CTX1	Output	Data transmit pin

37.2 Register Descriptions

37.2.1 Control Register (CTLR)

Address(es): CAN0.CTLR 4005 0840h, CAN1.CTLR 4005 1840h

Bit	Symbol	Bit name	Description	R/W
b9, b8	CANM[1:0]	CAN Operating Mode Select*5	b9 b8 0 0: CAN operation mode 0 1: CAN reset mode 1 0: CAN halt mode 1 1: CAN reset mode (forced transition).	R/W
b10	SLPM	CAN Sleep Mode*5,*6	0: All other modes 1: CAN sleep mode.	R/W
b12, b11	BOM[1:0]	Bus-Off Recovery Mode*1	b12 b11 0 0: Normal mode (ISO11898-1-compliant) 0 1: Enter CAN halt mode automatically on entering bus-off state 1 0: Enter CAN halt mode automatically on end of bus-off state 1 1: Enter CAN halt mode during bus-off recovery period through a software request.	R/W
b13	RBOC	Forcible Return from Bus-Off*2	0: Nothing occurred 1: Forced return from bus-off state.*3	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Write to the BOM[1:0], TSPS[1:0], TPM, MLM, IDFM[1:0], and MBM bits in CAN reset mode.
Note 2. Set the RBOC bit to 1 in the bus-off state.
Note 3. This bit automatically is set to 0 after being set to 1. It should read as 0.
Note 4. Set the TSRC bit to 1 in CAN operation mode.
Note 5. When the CANM[1:0] and SLPM bits are changed, check STR to ensure that the mode is switched. Do not change the CANM[1:0] bits or SLPM bit until the mode is switched.
Note 6. Write to the SLPM bit in CAN reset mode or CAN halt mode. When changing the SLPM bit, write 0 or 1 to only the SLPM bit.

MBM bit (CAN Mailbox Mode Select)

When the MBM bit is 0 (normal mailbox mode), mailboxes 0 to 31 are configured as transmit or receive mailboxes.
When the MBM bit is 1 (FIFO mailbox mode), mailboxes 0 to 23 are configured as transmit or receive mailboxes. Mailboxes 24 to 27 are configured as a transmit FIFO, and mailboxes 28 to 31 are configured as a receive FIFO. Transmit data is written into mailbox 24, the window mailbox for the transmit FIFO. Receive data is read from mailbox 28, the window mailbox for the receive FIFO.

Table 37.3 lists the mailbox configuration.

IDFM[1:0] bits (ID Format Mode Select)

The IDFM[1:0] bits specify the ID format.

MLM bit (Message Lost Mode Select)

The MLM bit specifies the operation when a new message is captured in the unread mailbox. Overwrite mode or overrun mode can be selected. In both cases, the mode applies to all mailboxes, including the receive FIFO.

When the MLM bit is 0, all mailboxes are set to overwrite mode. Any new message received overwrites the pre-existing message.

When the MLM bit is 1, all mailboxes are set to overrun mode. Any new message received does not overwrite the pre-existing message, and it is discarded.

TPM bit (Transmission Priority Mode Select)

The TPM bit specifies the priority when transmitting messages. ID priority transmit mode or mailbox number transmit mode can be selected. All mailboxes are set for either ID priority transmission or mailbox number priority transmission.

When TPM is 0, ID priority transmit mode is selected and transmission priority is arbitrated as defined in the ISO11898-1 CAN specification. In ID priority transmit mode, mailboxes 0 to 31 (in normal mailbox mode), and mailboxes 0 to 23 (in FIFO mailbox mode), and the transmit FIFO are compared for the IDs of mailboxes configured for transmission. If two or more mailbox IDs are the same, the mailbox with the smaller number has higher priority.

Only the next message to be transmitted from the transmit FIFO is included in the transmission arbitration. If a FIFO message is being transmitted, the next pending message within the transmit FIFO is included in the transmission arbitration.

When TPM is 1, mailbox number transmit mode is selected and the transmit mailbox with the smallest mailbox number

Bit	Symbol	位名称	Description	R/W
b9, b8	CANM[1:0]	CAN操作模式 Select*5	b9b800：CAN操作模式01：CAN复位模式10：CAN暂停模式11：CAN复位模式（强制转换）。	R/W
b10	SLPM	CAN睡眠模式*5 *6	0：所有其他模式1 ：CAN睡眠模式。	R/W
b12, b11	BOM[1:0]	Bus-Off Recovery Mode*1	b12b1100：正常模式（符合ISO11898-1）01：进入总线关闭状态时自动进入CAN停止模式10：在总线关闭状态结束时自动进入CAN停止模式11：进入CAN停止模式在总线关闭恢复期间通过软件请求。	R/W
b13	RBOC	强行返回 Bus-Off*2	0：什么都没有发生1：从总线关闭状态强制返回。*3	R/W
b15, b14	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 在CAN复位模式下写入BOM[1:0]、TSPS[1:0]、TPM、MLM、IDFM[1:0]和MBM位。
Note 2. 在总线关闭状态下将RBOC位设置为1。
Note 3. 该位在设置为1后自动设置为0。它应该读为0。
Note 4. 在CAN操作模式下将TSRC位设置为1。
Note 5. 当CANM[1:0]和SLPM位改变时，检查STR以确保模式切换。不要改变CANM[1:0]位或SLPM位，直到模式切换。
Note 6. 在CAN复位模式或CAN暂停模式下写入SLPM位。更改SLPM位时，仅向SLPM位写入0或1。

MBM位（CAN邮箱模式选择）

当MBM位为0（正常邮箱模式）时，邮箱0到31被配置为发送或接收邮箱。
当MBM位为1（FIFO邮箱模式）时，邮箱0到23被配置为发送或接收邮箱。
邮箱24到27配置为发送FIFO，邮箱28到31配置为接收FIFO。
发送数据写入邮箱24，即发送FIFO的窗口邮箱。接收数据从邮箱28中读取，该邮箱是接收FIFO的窗口邮箱。

表37.3列出了邮箱配置。

IDFM[1:0]位（ID格式模式选择）

IDFM[1:0]位指定ID格式。

MLM位（消息丢失模式选择）

MLM位指定在未读邮箱中捕获新消息时的操作。可以选择覆盖模式或溢出模式。在这两种情况下，该模式都适用于所有邮箱，包括接收FIFO。

当MLM位为0时，所有邮箱都设置为覆盖模式。收到的任何新消息都会覆盖先前存在的消息。

当MLM位为1时，所有邮箱都设置为溢出模式。收到的任何新消息都不会覆盖先前存在的消息，并且会被丢弃。

TPM位（传输优先模式选择）

TPM位指定传输消息时的优先级。可选择ID优先传输模式或邮箱号码传输模式。所有信箱都设置为ID优先传输或信箱号码优先传输。

当TPM为0时，选择ID优先传输模式，传输优先级按照ISO118981CAN规范中的定义进行仲裁。在ID优先传输模式下，邮箱0到31（在普通邮箱模式下）和邮箱0到23（在FIFO邮箱模式下）和传输FIFO会针对配置为传输的邮箱ID进行比较。如果两个或多个邮箱ID相同，则编号较小的邮箱优先级较高。

只有从发送FIFO发送的下一条消息包含在发送仲裁中。如果正在发送FIFO消息，则发送FIFO中的下一个待处理消息将包含在发送仲裁中。

TPM为1时，选择邮箱号发送方式，发送邮箱号最小的邮箱

has the highest priority. In FIFO mailbox mode, the transmit FIFO has lower priority than normal mailboxes (0 to 23).

TSRC bit (Time Stamp Counter Reset Command)

The TSRC bit resets the time stamp counter. When it is set to 1, TSR is set to 0000h. TSRC is set to 0 automatically.

TSPS[1:0] bits (Time Stamp Prescaler Select)

The TSPS[1:0] bits select the prescaler for the time stamp. The reference clock for the time stamp can be selected to 1-bit, 2-bit, 4-bit, or 8-bit time periods.

CANM[1:0] bits (CAN Operating Mode Select)

The CANM[1:0] bits select one of the following modes for the CAN module: CAN operation mode, CAN reset mode, or CAN halt mode. CAN sleep mode is set in the SLPM bit. For details, see section 37.3, Operation Modes.

When the CAN module enters CAN halt mode based on the BOM[1:0] setting, the CANM[1:0] bits are automatically set to 10b.

SLPM bit (CAN Sleep Mode)

When the SLPM bit is set to 1, the CAN module enters CAN sleep mode. When the SLPM bit is set to 0, the CAN module exits CAN sleep mode. For details, see section 37.3, Operation Modes.

BOM[1:0] bits (Bus-Off Recovery Mode)

The BOM[1:0] bits select bus-off recovery mode for the CAN module.

When the BOM[1:0] bits are 00b, the recovery from bus-off is compliant with the ISO11898-1 specification. The CAN module recovers CAN communication (error-active state) after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request occurs when recovering from bus-off.

When the BOM[1:0] bits are 01b and the CAN module reaches the bus-off state, the CANM[1:0] bits in CTLR set 10b to enter CAN halt mode. No bus-off recovery interrupt request occurs when recovering from bus-off, and TECR and RECR are set to 00h.

When the BOM[1:0] bits are 10b, the CANM[1:0] bits are set to 10b as soon as the CAN module reaches the bus-off state. The CAN module enters CAN halt mode after the recovery from the bus-off state, and after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request occurs when recovering from bus-off, and TECR and RECR are set to 00h.

When the BOM[1:0] bits are 11b, the CAN module enters CAN halt mode by setting the CANM[1:0] bits to 10b while the CAN module is still in the bus-off state. No bus-off recovery interrupt request occurs when recovering from bus-off, and TECR and RECR are set to 00h. However, the interrupt does occur if the CAN module recovers from bus-off after detecting 11 consecutive recessive bits 128 times before the CANM[1:0] bits are set to 10b.

If the CPU requests an entry to CAN reset mode at the same time as the CAN module attempts to enter CAN halt mode (at bus-off entry when the BOM[1:0] bits are 01b, or at bus-off end when the BOM[1:0] bits are 10b), then the CPU request has higher priority.

RBOC bit (Forcible Return from Bus-Off)

When the RBOC bit is set to 1 in the bus-off state, the CAN module forcibly exits bus-off. It is set to 0 automatically, and the error state changes from bus-off to error-active. When the RBOC bit is set to 1, RECR and TECR clear to 00h and the BOST bit in STR is set to 0, indicating no bus-off state. The other registers remain unchanged when RBOC is set to 1. No bus-off recovery interrupt request occurs. Use the RBOC bit only when the BOM[1:0] bits are 00b (normal mode).

Table 37.3 Mailbox configuration

Mailbox	MBM bit = 0 (normal mailbox mode)	MBM bit = 1 (FIFO mailbox mode)*1 to *5
Mailboxes 0 to 23	Normal mailbox	Normal mailbox
Mailboxes 24 to 27		Transmit FIFO
Mailboxes 28 to 31		Receive FIFO

Note 1. The transmit FIFO is controlled by TFCR. The MCTL_TXj registers associated with mailboxes 24 to 27 are disabled. MCTL_TX24 to MCTL_TX27 cannot be used by the transmit FIFO.

具有最高优先级。在FIFO邮箱模式下，发送FIFO的优先级低于普通邮箱（0到23）。

TSRC位（时间戳计数器复位命令）

TSRC位复位时间戳计数器。当它设置为1时，TSR设置为0000h。TSRC自动设置为0。

TSPS[1:0]位（时间戳预分频器选择）

TSPS[1:0]位选择时间戳的预分频器。时间戳的参考时钟可以选择为1位、2位、4位或8位时间段。

CANM[1:0]位（CAN操作模式选择）

CANM[1:0]位为CAN模块选择以下模式之一：CAN操作模式、CAN复位模式或CAN暂停模式。CAN睡眠模式在SLPM位中设置。有关详细信息，请参阅第37.3节，操作模式。

当CAN模块根据BOM[1:0]设置进入CAN暂停模式时，CANM[1:0]位自动设置为10b。

SLPM位（CAN休眠模式）

当SLPM位设置为1时，CAN模块进入CAN睡眠模式。当SLPM位设置为0时，CAN模块退出CAN睡眠模式。有关详细信息，请参阅第37.3节，操作模式。

BOM[1:0]位（总线关闭恢复模式）

BOM[1:0]位选择CAN模块的总线关闭恢复模式。

当BOM[1:0]位为00b时，从总线关闭中恢复符合ISO11898-1规范。CAN模块在检测到11个连续隐性位128次后恢复CAN通信（错误激活状态）。从总线关闭中恢复时会出现总线关闭恢复中断请求。

当BOM[1:0]位为01b且CAN模块达到总线关闭状态时，CTLR中的CANM[1:0]位设置10b以进入CAN停止模式。总线关闭恢复时不产生总线关闭恢复中断请求，TECR和RECR设置为00h。

当BOM[1:0]位为10b时，CAN模块一到达总线关闭状态，CANM[1:0]位就会设置为10b。CAN模块从总线关闭状态恢复后，并在检测到11个连续的隐性位128次后进入CAN停止模式。总线关闭恢复时产生总线关闭恢复中断请求，TECR和RECR设置为00h。

当BOM[1:0]位为11b时，CAN模块通过将CANM[1:0]位设置为10b进入CAN停止模式，同时CAN模块仍处于总线关闭状态。总线关闭恢复时不产生总线关闭恢复中断请求，TECR和RECR设置为00h。但是，如果CAN模块在CANM[1:0]位设置为10b之前128次检测到11个连续隐性位后从总线关闭中恢复，则确实会发生中断。

如果CPU在CAN模块尝试进入CAN暂停模式的同时请求进入CAN复位模式（当BOM[1:0]位为01b时在总线关闭进入，或者当BOM[1:0]位为10b），则CPU请求具有更高的优先级。

RBOC位（从总线关闭强制返回）

当RBOC位在总线关闭状态下设置为1时，CAN模块强制退出总线关闭。它自动设置为0，错误状态从总线关闭变为错误激活。当RBOC位设置为1时，RECR和TECR清除为00h，并且STR中的BOST位设置为0，表示没有总线关闭状态。当RBOC设置为1时，其他寄存器保持不变。没有总线关闭恢复中断请求发生。仅当BOM[1:0]位为00b（正常模式）时才使用RBOC位。

Table 37.3 邮箱配置

Mailbox	MBM位=0（正常邮箱模式）	MBM位=1（FIFO邮箱模式）*1到*5
邮箱0到23	普通邮箱	普通邮箱
邮箱24至27		Transmit FIFO
邮箱28至31		Receive FIFO

Note 1. 发送FIFO由TFCR控制。与邮箱24到27关联的MCTL_TXj寄存器被禁用。发送FIFO不能使用MCTL_TX24到MCTL_TX27。

Note 2. The receive FIFO is controlled by RFCR. The MCTL_RXj registers associated with mailboxes 28 to 31 are disabled. MCTL_RX28 to MCTL_RX31 cannot be used by the receive FIFO.
Note 3. See the MIER_FIFO description for information on the FIFO interrupts.
Note 4. The bits in MKIVLR associated with mailboxes 24 to 31 are disabled. Set 0 to these bits.
Note 5. The transmit and receive FIFOs can be used for both data frames and remote frames.

37.2.2 Bit Configuration Register (BCR)

Address(es): CAN0.BCR 4005 0844h, CAN1.BCR 4005 1844h

b27, b26	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b31 to b28	TSEG1[3:0]	时间段1控制	b31b280000：禁止设置0001：禁止设置0010：禁止设置0011：4Tq0100：5Tq0101：6Tq0110：7Tq0111：8Tq1000：9Tq1001：10Tq1010：11Tq1011：12Tq1100：13Tq1101：14Tq1110：15Tq1111：16Tq。	R/W

Tq：时间量子

Note 1. Do not select a value less than or equal to 1 while the SCKSCR.CKSEL[2:0] bits are 011b (selecting the main clock oscillator).

For setting the bit timing, see section 37.4, Data Transfer Rate Configuration. Set BCR before entering CAN halt or operation mode from reset mode. After the setting is made once, this register can be written to in CAN reset or CAN halt mode. 32-bit read/write accesses must be performed carefully so as not to change bits [7:0].

CCLKS bit (CAN Clock Source Selection)

When the CCLKS bit is 0, the peripheral module clock (PCLKB) produced by the PLL frequency synthesizer is used as the CAN clock source (fCAN). When the CCLKS bit is 1, CANMCLK produced externally by the EXTAL pins is used as the CAN clock source (fCAN).

TSEG2[2:0] bits (Time Segment 2 Control)

The TSEG2[2:0] bits specify the length of phase buffer segment 2 (PHASE_SEG2) with a Tq value. A value from 2 to 8 Tq can be set. Set a value smaller than that of the TSEG1[3:0] bits.

SJW[1:0] bits (Synchronization Jump Width Control)

The SJW[1:0] bits specify the synchronization jump width with a Tq value. A value from 1 to 4 Tq can be set. Set a value smaller than or equal to that of the TSEG2[2:0] bits.

BRP[9:0] bits (Baud Rate Prescaler Select)

The BRP[9:0] bits set the frequency of the CAN communication clock (fCANCLK). The fCANCLK cycle is 1 Tq. If the setting is P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

TSEG1[3:0] bits (Time Segment 1 Control)

The TSEG1[3:0] bits specify the total length of the propagation time segment (PROP_SEG) and phase buffer segment 1 (PHASE_SEG1) with a time quantum (Tq) value. A value from 4 to 16 Tq can be set.

37.2.3 Mask Register k (MKRk) (k = 0 to 7)

Address(es): CAN0.MKR[0] 4005 0400h to CAN0.MKR[7] 4005 041Ch, CAN1.MKR[0] 4005 1400h to CAN1.MKR[7] 4005 141Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	SID[10:0]											EID[17:0]	
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EID[17:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b17 to b0	EID[17:0]	Extended ID	0: Do not compare associated EID[17:0] bits 1: Compare associated EID[17:0] bits.	R/W
b28 to b18	SID[10:0]	Standard ID	0: Do not compare associated SID[10:0] bits 1: Compare associated SID[10:0] bits.	R/W
b31 to b29	—	Reserved	The read value is undefined. The write value should be 0.	R/W

For the mask function in FIFO mailbox mode, see section 37.6, Acceptance Filtering and Masking Functions.

Write to MKR0 to MKR7 in CAN reset mode or CAN halt mode.

EID[17:0] bits (Extended ID)

The EID[17:0] bits are the filter mask bits associated with the CAN extended ID bits. They are used to receive extended ID messages. When an EID[17:0] bit is set to 0, the received ID is not compared with the associated mailbox ID. When the EID[17:0] bits are set to 1, the received ID is compared with the associated mailbox ID.

Note 1. 当SCKSCR.CKSEL[2:0]位为011b（选择主时钟振荡器）时，请勿选择小于或等于1的值。

有关设置位时序，请参见第37.4节，数据传输速率配置。在从复位模式进入CAN停止或操作模式之前设置BCR。设置一次后，可在CAN复位或CAN停止模式下写入该寄存器。必须小心执行32位读写访问，以免更改位[7:0]。

CCLKS位（CAN时钟源选择）

当CCLKS位为0时，PLL频率合成器产生的外设模块时钟（PCLKB）用作CAN时钟源（fCAN）。当CCLKS位为1时，由EXTAL引脚从外部产生的CANMCLK用作CAN时钟源(fCAN)。

TSEG2[2:0]位（时间段2控制）

TSEG2[2:0]位用Tq值指定相位缓冲段2(PHASE_SEG2)的长度。一个从2到8的值可以设置Tq。设置一个小于TSEG1[3:0]位的值。

SJW[1:0]位（同步跳转宽度控制）

SJW[1:0]位用Tq值指定同步跳转宽度。可以设置1到4Tq的值。设置小于或等于TSEG2[2:0]位的值。

BRP[9:0]位（波特率预分频器选择）

BRP[9:0]位设置CAN通信时钟(fCANCLK)的频率。fCANCLK周期为1Tq。如果设置为P（0到1023），则波特率预分频器将fCAN除以P+1。

TSEG1[3:0]位（时间段1控制）

TSEG1[3:0]位用时间量(Tq)值指定传播时间段(PROP_SEG)和相位缓冲段1(PHASE_SEG1)的总长度。可以设置4到16Tq的值。

37.2.3 屏蔽寄存器k(MKRk)(k=0到7)

Address(es): CAN0.MKR[0] 4005 0400h to CAN0.MKR[7] 4005 041Ch, CAN1.MKR[0] 4005 1400h to CAN1.MKR[7] 4005 141Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	位名称	Description	R/W
b17 to b0	EID[17:0]	扩展ID	0：不比较关联的EID[17:0]位1：比较关联的EID[17:0]位。	R/W
b28 to b18	SID[10:0]	标准标识	0：不比较关联的SID[10:0]位1：比较关联的SID[10:0]位。	R/W
b31 to b29	—	Reserved	读取值未定义。写入值应为0。	R/W

对于FIFO邮箱模式下的屏蔽功能，请参见第37.6节，接受过滤和屏蔽功能。

在CAN复位模式或CAN暂停模式下写入MKR0至MKR7。

EID[17:0]位（扩展ID）

EID[17:0]位是与CAN扩展ID位相关的过滤器掩码位。它们用于接收扩展ID消息。当EID[17:0]位设置为0时，接收到的ID不会与关联的邮箱ID进行比较。当EID[17:0]位设置为1时，接收到的ID将与关联的邮箱ID进行比较。

SID[10:0] bits (Standard ID)

The SID[10:0] bits are the filter mask bits associated with the CAN standard ID bits. They are used to receive both standard ID and extended ID messages. When the SID[10:0] bits are set to 0, the received ID is not compared with the associated mailbox ID. When the SID[10:0] bits are set to 1, the received ID is compared with the associated mailbox ID.

37.2.4 FIFO Received ID Compare Registers 0 and 1 (FIDCR0 and FIDCR1)

Address(es): CAN0.FIDCR0 4005 0420h, CAN0.FIDCR1 4005 0424h, CAN1.FIDCR0 4005 1420h, CAN1.FIDCR1 4005 1424h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EID[17:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b17 to b0	EID[17:0]	Extended ID	Extended ID of the data and remote frames	R/W
b28 to b18	SID[10:0]	Standard ID	Standard ID of the data and remote frames	R/W
b29	—	Reserved	The read value is undefined. The write value should be 0.	R/W
b30	RTR	Remote Transmission Request	0: Data frame 1: Remote frame.	R/W
b31	IDE	ID Extension*1	0: Standard ID 1: Extended ID.	R/W

Note 1. The IDE bit is enabled when the CTLR.IDFM[1:0] bits are 10b (mixed ID mode). When the IDFM[1:0] bits are not 10b, only write 0 to IDE. It reads as 0.

FIDCR0 and FIDCR1 are enabled when the MBM bit in CTLR is set to 1 (FIFO mailbox mode). In this mode, the EID[17:0], SID[10:0], RTR, and IDE bits in mailbox 28 to mailbox 31 are disabled. Write to FIDCR0 and FIDCR1 in CAN reset mode or CAN halt mode. For information on using FIDCR0 and FIDCR1, see section 37.6, Acceptance Filtering and Masking Functions.

EID[17:0] bits (Extended ID)

The EID[17:0] bits set the extended ID of data frames and remote frames. They are used to receive extended ID messages.

SID[10:0] bits (Standard ID)

The SID[10:0] bits set the standard ID of data frames and remote frames. They are used to receive both standard ID and extended ID messages.

RTR bit (Remote Transmission Request)

The RTR bit sets the frame format to data frames or remote frames:

- When both RTR bits in FIDCR0 and FIDCR1 are set to 0, only data frames are received
- When both RTR bits in FIDCR0 and FIDCR1 are set to 1, only remote frames are received
- When the RTR bits in FIDCR0 and FIDCR1 are set to different values, both data frames and remote frames are received.

IDE bit (ID Extension)

The IDE bit sets the ID format to standard ID or extended ID. The IDE bit is enabled when the IDFM[1:0] bits in CTLR

SID[10:0]位（标准ID）

SID[10:0]位是与CAN标准ID位相关的过滤器掩码位。它们用于接收标准ID和扩展ID消息。当SID[10:0]位设置为0时，接收到的ID不会与关联的邮箱ID进行比较。当SID[10:0]位设置为1时，接收的ID将与关联的邮箱ID进行比较。

37.2.4 FIFO接收ID比较寄存器0和1（FIDCR0和FIDCR1）

Address(es): CAN0.FIDCR0 4005 0420h, CAN0.FIDCR1 4005 0424h, CAN1.FIDCR0 4005 1420h, CAN1.FIDCR1 4005 1424h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	IDE	RTR	—	SID[10:0]											EID[17:0]	
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EID[17:0]															
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	位名称	Description	R/W
b17 to b0	EID[17:0]	扩展ID	数据和远程帧的扩展ID	R/W
b28 to b18	SID[10:0]	标准标识	数据和远程帧的标准ID	R/W
b29	—	Reserved	读取值未定义。写入值应为0。	R/W
b30	RTR	远程传输 Request	0：数据帧1：远程帧。	R/W
b31	IDE	身份扩展 *1	0：标准ID1：扩展ID。	R/W

Note 1. 当CTLR.IDFM[1:0]位为10b（混合ID模式）时，IDE位被使能。当IDFM[1:0]位不是10b时，只向IDE写入0。它读作0。

当CTLR中的MBM位设置为1（FIFO邮箱模式）时，FIDCR0和FIDCR1被使能。在此模式下，邮箱28到邮箱31中的EID[17:0]、SID[10:0]、RTR和IDE位被禁用。写入FIDCR0和FIDCR1中CAN复位模式或CAN暂停模式。有关使用FIDCR0和FIDCR1的信息，请参阅第37.6节，验收过滤和屏蔽功能。

EID[17:0]位（扩展ID）

EID[17:0]位设置数据帧和远程帧的扩展ID。它们用于接收扩展ID消息。

SID[10:0]位（标准ID）

SID[10:0]位设置数据帧和远程帧的标准ID。它们用于接收标准ID和扩展ID消息。

RTR位（远程传输请求）

RTR位将帧格式设置为数据帧或远程帧：

- 当FIDCR0和FIDCR1中的RTR位都设置为0时，只接收数据帧
- 当FIDCR0和FIDCR1中的RTR位都设置为1时，只接收远程帧
- 当FIDCR0和FIDCR1中的RTR位设置为不同的值时，数据帧和远程帧都被接收。

IDE位（ID扩展）

IDE位将ID格式设置为标准ID或扩展ID。当CTLR中的IDFM[1:0]位使能IDE位

are 10b (mixed ID mode):

- When both IDE bits in FIDCR0 and FIDCR1 are set to 0, only standard ID frames are received
- When both IDE bits in FIDCR0 and FIDCR1 are set to 1, only extended ID frames are received
- When the IDE bits in FIDCR0 and FIDCR1 are set to different values, both standard ID and extended ID frames are received.

37.2.5 Mask Invalid Register (MKIVLR)

Address(es): CAN0.MKIVLR 4005 0428h, CAN1.MKIVLR 4005 1428h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	MB31	MB30	MB29	MB28	MB27	MB26	MB25	MB24	MB23	MB22	MB21	MB20	MB19	MB18	MB17	MB16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b31 to b0	MB31 to MB0	Mask Invalid	0: Mask valid 1: Mask invalid.	R/W

Each bit in MKIVLR is associated with a mailbox of the same number. Bit [0] in MKIVLR corresponds to mailbox 0 (MB0), and bit [31] corresponds to mailbox 31 (MB31).*1

When a bit is set to 1, the associated acceptance mask register becomes invalid for the associated mailbox. When a mask invalid bit is set to 1, a message is received by the associated mailbox only if the receive message ID matches the mailbox ID exactly.

Write to MKIVLR in CAN reset or halt mode.

Note 1. Set bits [31:24] to 0 in FIFO mailbox mode.

37.2.6 Mailbox Register j (MBj_ID, MBj_DL, MBj_Dm, MBj_TS) (j = 0 to 31; m = 0 to 7)

Table 37.4 lists the CANi mailbox memory mapping, and Table 37.5 lists the CAN data frame configuration.

The value after reset of the CANi mailbox is undefined.

Write to MBj_ID, MBj_DL, MBj_Dm, and MBj_TS only when the related MCTL_TXj or MCTL_RXj register (j = 0 to 31) is 00h and the associated mailbox is not processing an abort request.

See Table 37.4 for detailed register addresses.

Table 37.4 CANi mailbox memory mapping (1 of 2)

Address		Message content
CAN0	CAN1	Memory mapping
4005 0200h + 16 × j + 0	4005 1200h + 16 × j + 0	IDE, RTR, SID10 to SID6
4005 0200h + 16 × j + 1	4005 1200h + 16 × j + 1	SID5 to SID0, EID17, EID16
4005 0200h + 16 × j + 2	4005 1200h + 16 × j + 2	EID15 to EID8
4005 0200h + 16 × j + 3	4005 1200h + 16 × j + 3	EID7 to EID0
4005 0200h + 16 × j + 4	4005 1200h + 16 × j + 4	—

是10b（混合ID模式）：

- 当FIDCR0和FIDCR1中的IDE位都设置为0时，只接收标准ID帧
- 当FIDCR0和FIDCR1中的IDE位都设置为1时，只接收扩展ID帧
- 当FIDCR0和FIDCR1中的IDE位设置为不同的值时，标准ID和扩展ID帧都会被接收。

37.2.5 屏蔽无效寄存器(MKIVLR)

Address(es): CAN0.MKIVLR 4005 0428h, CAN1.MKIVLR 4005 1428h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	位名称	Description	R/W
b31 to b0	MB31 to MB0	掩码无效	0：屏蔽有效1 ：屏蔽无效。	R/W

MKIVLR中的每个位都与一个相同号码的邮箱相关联。MKIVLR中的位[0]对应邮箱0(MB0)，位[31]对应邮箱31(MB31)。*1

当某个位设置为1时，相关联的接受屏蔽寄存器对于相关联的邮箱变得无效。当掩码无效位设置为1时，只有当接收消息ID与邮箱ID完全匹配时，相关邮箱才会接收消息。

在CAN复位或暂停模式下写入MKIVLR。

注1.在FIFO邮箱模式下将位[31:24]设置为0。

37.2.6 邮箱寄存器j（MBj_ID、MBj_DL、MBj_Dm、MBj_TS）（j=0到31；m=0到7）

表37.4列出了CANi邮箱内存映射，表37.5列出了CAN数据帧配置。

CANi邮箱复位后的值未定义。

仅当相关的MCTL_TXj或MCTL_RXj寄存器（j=0到31）为00h且相关邮箱未处理中止请求时才写入MBj_ID、MBj_DL、MBj_Dm和MBj_TS。

有关详细的寄存器地址，请参见表37.4。

	TSH[7:0]								TSL[7:0]							
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b7 to b0	TSL[7:0]	Time Stamp Lower Byte	The TSH[7:0] and TSL[7:0] bits store the counter value of the time stamp when received messages are stored in the mailbox.	R/W
b15 to b8	TSH[7:0]	Time Stamp Higher Byte		R/W

EID[17:0] bits (Extended ID)

The EID[17:0] bits set the extended ID of data frames and remote frames. They are used to transmit or receive extended ID messages.

SID[10:0] bits (Standard ID)

The SID[10:0] bits set the standard ID of data frames and remote frames. They are used to transmit or receive both standard ID and extended ID messages.

RTR bit (Remote Transmission Request)

The RTR bit sets the frame format to data frames or remote frames.

- The receive mailbox only receives frames with the format specified in the RTR bit
- The transmit mailbox transmits with the frame format specified in the RTR bit
- The receive FIFO mailbox receives the data frame, remote frame, or both frames specified in the RTR bit in FIDCR0 and FIDCR1
- The transmit FIFO mailbox transmits the data frame or remote frame specified in the RTR bit in the transmit message.

IDE bit (ID Extension)

The IDE bit sets the ID format to standard IDs or extended IDs. The IDE bit is enabled when the IDFM[1:0] bits in CTLR are 10b (mixed ID mode).

- The receive mailbox only receives the ID format specified in the IDE bit
- The transmit mailbox transmits with the ID format specified in the IDE bit
- The receive FIFO mailbox receives messages with the standard ID and extended ID settings specified in the IDE bit in FIDCR0 and FIDCR1
- The transmit FIFO mailbox transmits messages with the standard ID or extended ID settings specified in the IDE bit in the transmit message.

Bit	Symbol	位名称	Description	R/W
b7 to b0	DATA0 to DATA7	数据字节0到7*1 *2	DATA0到DATA7存储发送或接收的CAN报文数据。发送或接收从DATA0开始。CAN总线上的位顺序是MSB优先，发送或接收从位[7]开始。	R/W

Note 1. 如果邮箱收到n字节小于8字节的消息，邮箱中DATAn到DATA7的值是未定义的。
Note 2. 如果邮箱接收到远程帧，则邮箱中DATA0到DATA7的先前值被保存。

Address(es): CAN0.MB0_TS 4005 020Eh to CAN0.MB31_TS 4005 03FEh, CAN1.MB0_TS 4005 120Eh to CAN1.MB31_TS 4005 13FEh

x: Undefined

Bit	Symbol	位名称	Description	R/W
b7 to b0	TSL[7:0]	时间戳低字节	当收到的消息存储在邮箱中时，TSH[7:0]和TSL[7:0]位存储时间戳的计数器值。	R/W
b15 to b8	TSH[7:0]	时间戳高字节		R/W

EID[17:0]位（扩展ID）

EID[17:0]位设置数据帧和远程帧的扩展ID。它们用于发送或接收扩展身份信息。

SID[10:0]位（标准ID）

SID[10:0]位设置数据帧和远程帧的标准ID。它们用于发送或接收标准ID和扩展ID消息。

RTR位（远程传输请求）

RTR位将帧格式设置为数据帧或远程帧。

- 接收邮箱只接收RTR位指定格式的帧
- 发送邮箱以RTR位中指定的帧格式发送
- 接收FIFO邮箱接收在RTR位中指定的数据帧、远程帧或两个帧 FIDCR0 and FIDCR1
- 发送FIFO邮箱发送发送报文中RTR位指定的数据帧或远程帧。

IDE位（ID扩展）

IDE位将ID格式设置为标准ID或扩展ID。当IDFM[1:0]位在CTLR为10b（混合ID模式）。

- 接收邮箱只接收IDE位指定的ID格式
- 发送邮箱以IDE位中指定的ID格式发送
- 接收FIFO邮箱接收具有FIDCR0和FIDCR1中的IDE位指定的标准ID和扩展ID设置的消息
- 发送FIFO邮箱使用发送消息的IDE位中指定的标准ID或扩展ID设置发送消息。

DLC[3:0] bits (Data Length Code)

The DLC[3:0] bits specify the data length to be transmitted in data frames. When a remote frame is used to request data, this field specifies the requested data length.

When a data frame is received, the received data length is stored in this field. When a remote frame is received, this field stores the requested data length.

37.2.7 Mailbox Interrupt Enable Register (MIER)

Address(es): CAN0.MIER 4005 042Ch, CAN1.MIER 4005 142Ch

Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b31 to b0	MB31 to MB0	Interrupt Enable	0: Disable interrupt 1: Enable interrupt. Bit [31] is associated with mailbox 31 (MB31), and bit [0] with mailbox 0 (MB0).	R/W

MIER can enable interrupts for each mailbox independently. This register is available in normal mailbox mode. Do not access this register in FIFO mailbox mode.

Each bit is associated with the mailbox having the same number. These bits enable or disable transmission and reception complete interrupts for the associated mailboxes:

- Bit [0] in MIER corresponds to mailbox 0 (MB0)
- Bit [31] in MIER corresponds to mailbox 31 (MB31).

Write to MIER only when the associated MCTL_TXj or MCTL_RXj register (j = 0 to 31) is 00h and the associated mailbox is not processing a transmission or reception abort request.

DLC[3:0]位（数据长度代码）

DLC[3:0]位指定要在数据帧中传输的数据长度。当使用远程帧请求数据时，该字段指定请求的数据长度。

当接收到一个数据帧时，接收到的数据长度存储在该字段中。当接收到远程帧时，该字段存储请求的数据长度。

37.2.7 邮箱中断使能寄存器(MIER)

Address(es): CAN0.MIER 4005 042Ch, CAN1.MIER 4005 142Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	位名称	Description	R/W
b31 to b0	MB31 to MB0	中断使能	0：禁用中断1：启用中断。位[31]与邮箱31(MB31)相关联，位[0]与邮箱0(MB0)相关联。	R/W

MIER可以独立为每个邮箱启用中断。该寄存器在正常邮箱模式下可用。不要在FIFO邮箱模式下访问该寄存器。

每个位与具有相同编号的邮箱相关联。这些位启用或禁用相关邮箱的发送和接收完成中断：

- MIER中的位[0]对应邮箱0(MB0)
- MIER中的位[31]对应邮箱31(MB31)。

仅当相关的MCTL_TXj或MCTL_RXj寄存器（j=0到31）为00h且相关邮箱未处理发送或接收中止请求时才写入MIER。

37.2.8 Mailbox Interrupt Enable Register for FIFO Mailbox Mode (MIER_FIFO)

Address(es): CAN0.MIER_FIFO 4005 042Ch, CAN1.MIER_FIFO 4005 142Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	MB29	MB28	—	—	MB25	MB24	MB23	MB22	MB21	MB20	MB19	MB18	MB17	MB16
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b23 to b0	MB23 to MB0	Interrupt Enable	0: Disable interrupt 1: Enable interrupt. Bit [23] is associated with mailbox 23 (MB23), and bit [0] with mailbox 0 (MB0).	R/W
b24	MB24	Transmit FIFO Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b25	MB25	Transmit FIFO Interrupt Generation Timing Control	0: Generate every time transmission completes 1: Generate when the transmit FIFO empties on transmission completion.	R/W
b27, b26	—	Reserved	The read value is undefined. The write value should be 0.	R/W
b28	MB28	Receive FIFO Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b29	MB29	Receive FIFO Interrupt Generation Timing Control*1	0: Generate every time reception completes 1: Generate when the receive FIFO becomes a buffer warning*2 on reception completion.	R/W
b31, b30	—	Reserved	The read value is undefined. The write value should be 0.	R/W

Note 1. No interrupt request occurs when the receive FIFO becomes buffer warning because it is full.
Note 2. “Buffer warning” indicates a state in which the third message is stored in the receive FIFO.

MIER_FIFO can individually enable interrupts for each mailbox and FIFO. This register is available in normal mailbox mode and FIFO mailbox mode. Do not access it in normal mailbox mode.

The MB0 to MB23 bits are associated with the mailbox having the same number. These bits enable or disable transmission and reception complete interrupts for the associated mailboxes:

- Bit [0] in MIER_FIFO is associated with mailbox 0 (MB0)
- Bit [23] in MIER_FIFO is associated with mailbox 23 (MB23).

MB24, MB25, MB28, and MB29 specify whether transmit and receive FIFO interrupts are enabled or disabled, and the timing of interrupt requests.

Write to MIER_FIFO only when the associated MCTL_TXj or MCTL_RXj register (j = 0 to 31) is 00h and the associated mailbox is not processing a transmission or reception abort request. In addition, change the bits in MIER_FIFO for the associated FIFO only when the TFE bit in TFCR is 0 and the TFEST bit is 1, and the RFE bit in RFCR is 0 and the RFEST bit in RFCR is 1.

37.2.8 FIFO邮箱模式的邮箱中断使能寄存器(MIER_FIFO)

Address(es): CAN0.MIER_FIFO 4005 042Ch, CAN1.MIER_FIFO 4005 142Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	MB29	MB28	—	—	MB25	MB24	MB23	MB22	MB21	MB20	MB19	MB18	MB17	MB16
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	位名称	Description	R/W
b23 to b0	MB23 to MB0	中断使能	0：禁用中断1：启用中断。位[23]与邮箱23(MB23)相关联，位[0]与邮箱0(MB0)相关联。	R/W
b24	MB24	发送FIFO中断 Enable	0：禁用中断1：启用中断。	R/W
b25	MB25	发送FIFO中断 发电时序控制	0：每次发送完成时产生1：发送完成时发送FIFO清空时产生。	R/W
b27, b26	—	Reserved	读取值未定义。写入值应为0。	R/W
b28	MB28	接收FIFO中断 Enable	0：禁用中断1：启用中断。	R/W
b29	MB29	接收FIFO中断 发电时序控制*1	0：每次接收完成时生成1：当接收FIFO变为缓冲区警告时生成*2接收完成时生成。	R/W
b31, b30	—	Reserved	读取值未定义。写入值应为0。	R/W

Note 1. 当接收FIFO因已满而变为缓冲区警告时，不会发生中断请求。
Note 2. “缓冲区警告”表示第三个消息存储在接收FIFO中的状态。

MIER_FIFO可以为每个邮箱和FIFO单独启用中断。该寄存器在普通邮箱模式和FIFO邮箱模式下可用。不要在普通邮箱模式下访问它。

MB0到MB23位与具有相同编号的邮箱相关联。这些位启用或禁用相关邮箱的发送和接收完成中断：

- MIER_FIFO中的位[0]与邮箱0(MB0)相关联
- MIER_FIFO中的位[23]与邮箱23(MB23)相关联。

MB24、MB25、MB28和MB29指定是启用还是禁用发送和接收FIFO中断，以及中断请求的时序。

仅当相关的MCTL_TXj或MCTL_RXj寄存器（j=0到31）为00h且相关邮箱未处理发送或接收中止请求时才写入MIER_FIFO。此外，仅当TFCR中的TFE位为0且TFEST位为1且RFE位为

RFCR为0，RFCR中的RFEST位为1。

37.2.9 Message Control Register for Transmit (MCTL_TXj) (j = 0 to 31)

- Transmit mode (when the TRMREQ bit is 1 and the RECREQ bit is 0)

Address(es): CAN0.MCTL_TX[0] 4005 0820h to CAN0.MCTL_TX[31] 4005 083Fh, CAN1.MCTL_TX[0] 4005 1820h to CAN1.MCTL_TX[31] 4005 183Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TRMREQ	RECREQ	—	ONESHOT	—	TRMABT	TRMACTIVE	SENTDATA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SENTDATA	Transmission Complete Flag *1,*2	0: Transmission not complete 1: Transmission complete.	R/W
b1	TRMACTIVE	Transmission-in-Progress Status Flag	0: Transmission pending or not requested 1: Transmission in progress.	R
b2	TRMABT	Transmission Abort Complete Flag*1,*2	0: Transmission started, transmission abort failed because transmission completed, or transmission abort not requested 1: Transmission abort complete.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	ONESHOT	One-Shot Enable*2,*3	0: Disable one-shot transmission 1: Enable one-shot transmission.	R/W
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6	RECREQ	Receive Mailbox Request *2,*3,*4,*5	0: Do not configure for reception 1: Configure for reception.	R/W
b7	TRMREQ	Transmit Mailbox Request *2,*4	0: Do not configure for transmission 1: Configure for transmission.	R/W

Note 1. Write 0 only. Writing 1 has no effect.
Note 2. When writing to bits of this register, write 1 to SENTDATA and TRMABT if these bits are not the write target.
Note 3. To enter one-shot transmit mode, write 1 to the ONESHOT bit at the same time as setting the TRMREQ bit to 1. To exit one-shot transmit mode, write 0 to the ONESHOT bit after the message is transmitted or aborted.
Note 4. Do not set both the RECREQ and TRMREQ bits to 1.
Note 5. When setting the RECREQ bit to 0, set the SENTDATA, TRMACTIVE, and TRMABT flags to 0 simultaneously.

MCTL_TXj sets mailbox j to transmit mode or receive mode. In transmit mode, MCTL_TXj also controls and indicates the transmission status. Do not access MCTL_TXj if mailbox j is in receive mode. Only write to MCTL_TXj in CAN operation or halt mode. Do not use MCTL_TX24 to MCTL_TX31 in FIFO mailbox mode.

SENTDATA flag (Transmission Complete Flag)

The SENTDATA flag is set to 1 when data transmission from the associated mailbox is complete. The SENTDATA flag is set to 0 through a software write. To set it to 0, first set the TRMREQ bit to 0. The SENTDATA and TRMREQ flags cannot be set to 0 simultaneously. To transmit a new message from the associated mailbox, set the SENTDATA flag to 0.

TRMACTIVE flag (Transmission-in-Progress Status Flag)

The TRMACTIVE flag is set to 1 when the associated mailbox of the CAN module begins transmitting a message. It is set to 0 when the CAN module loses CAN bus arbitration, a CAN bus error occurs, or data transmission completes.

TRMABT flag (Transmission Abort Complete Flag)

The TRMABT flag is set to 1 in the following cases:

- Following a transmission abort request, when the transmission abort is complete before starting transmission
- Following a transmission abort request, when the CAN module detects CAN bus arbitration-lost or a CAN bus error
- In one-shot transmission mode (RECREQ = 0, TRMREQ = 1, and ONESHOT = 1), when the CAN module detects a CAN bus arbitration-lost or a CAN bus error.

37.2.9 用于发送的消息控制寄存器(MCTL_TXj)(j=0到31)

发送模式（当TRMREQ位为1且RECREQ位为0时）

Address(es): CAN0.MCTL_TX[0] 4005 0820h to CAN0.MCTL_TX[31] 4005 083Fh, CAN1.MCTL_TX[0] 4005 1820h to CAN1.MCTL_TX[31] 4005 183Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TRMREQ	RECREQ	—	ONESHOT	—	TRMABT	TRMACTIVE	SENTDATA
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SENTDATA	传输完成标志*1 *2	0：传输未完成1：传输完成 。	R/W
b1	TRMACTIVE	Transmission-in-Progress 状态标志	0：传输未决或未请求1：传输中。	R
b2	TRMABT	传输中止完成 Flag*1,*2	0：传输开始，传输中止失败，因为 传输完成，或未请求传输中止1：传输中止完成。	R/W
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	ONESHOT	One-Shot Enable*2,*3	0：禁止一次性发送1：允许一次 性发送。	R/W
b5	—	Reserved	该位读取为0。写入值应为0。	R/W
b6	RECREQ	接收邮箱请求*2 *3 *4 *5	0：不配置接收1：配置接收。	R/W
b7	TRMREQ	发送邮箱请求*2 *4	0：不配置传输1：配置传输。	R/W

Note 1. 只写0。写1无效。
Note 2. 写入该寄存器的位时，如果这些位不是写入目标，则向SENTDATA和TRMABT写入1。
Note 3. 要进入一次性发送模式，请在将TRMREQ位设置为1的同时将1写入ONESHOT位。要退出一次性发送模式，请在发送或中止消息后向ONESHOT位写入0。
Note 4. 不要将RECREQ和TRMREQ位都设置为1。
Note 5. 将RECREQ位设置为0时，同时将SENTDATA、TRMACTIVE和TRMABT标志设置为0。

MCTL_TXj将邮箱j设置为发送模式或接收模式。在传输模式下，MCTL_TXj也控制和指示传输状态。如果邮箱j处于接收模式，则不要访问MCTL_TXj。仅在CAN操作或暂停模式下写入MCTL_TXj。不要在FIFO邮箱模式下使用MCTL_TX24到MCTL_TX31。

SENTDATA标志（传输完成标志）

当来自相关邮箱的数据传输完成时，SENTDATA标志设置为1。SENTDATA标志通过软件写入设置为0。要将其设置为0，首先将TRMREQ位设置为0。SENTDATA和TRMREQ标志不能同时设置为0。要从关联邮箱发送新消息，请将SENTDATA标志设置为0。

TRMACTIVE标志（传输中状态标志）

当CAN模块的相关邮箱开始发送消息时，TRMACTIVE标志设置为1。当CAN模块失去CAN总线仲裁、出现CAN总线错误或数据传输完成时设置为0。

TRMABT标志（传输中止完成标志）

在以下情况下，TRMABT标志设置为1：

- 在传输中止请求之后，当传输中止在开始传输之前完成时
- 在发送中止请求之后，当CAN模块检测到CAN总线仲裁丢失或CAN总线错误时
- 在一次性传输模式下（RECREQ=0、TRMREQ=1和ONESHOT=1），当CAN模块检测到CAN总线仲裁丢失或CAN总线错误时。

The TRMABT flag does not set to 1 when data transmission is complete. The SENTDATA flag is set to 1. The TRMABT flag is set to 0 through a software write.

ONESHOT bit (One-Shot Enable)

When the ONESHOT bit is set to 1 in transmit mode (RECREQ = 0 and TRMREQ = 1), the CAN module transmits a message only one time. The CAN module does not transmit the message again if a CAN bus error or CAN bus arbitration-lost occurs. When transmission is complete, the SENTDATA flag is set to 1. If transmission does not complete because of a CAN bus error or CAN bus arbitration-lost error, the TRMABT flag is set to 1. Set the ONESHOT bit to 0 after the SENTDATA or TRMABT flag is set to 1.

RECREQ bit (Receive Mailbox Request)

The RECREQ bit selects the receive modes listed in Table 37.10.

When the RECREQ bit is set to 1, the associated mailbox is configured for reception of a data or remote frame.

When the RECREQ bit is set to 0, the associated mailbox is not configured for reception of a data or remote frame.

Due to hardware protection, the RECREQ bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from the acceptance filter processing (the beginning of the CRC field)
- Hardware protection is released:
  - For the mailbox that is specified to receive the incoming message, after the received data is stored in the mailbox or a CAN bus error occurs. This means that the maximum period of hardware protection is from the beginning of CRC field to the end of the 7th bit of EOF.
  - For the other mailboxes, after acceptance filter processing
  - If no mailbox is specified to receive the message, after acceptance filter processing.

When setting the RECREQ bit to 1, do not set the TRMREQ bit to 1. To change the configuration of a mailbox from transmission to reception, first abort the transmission and then set the SENTDATA and TRMABT flags to 0 before changing to reception.

Note: MCTL_TXj.RECREQ is the mirror bit of MCTL_RXj.RECREQ.

TRMREQ bit (Transmit Mailbox Request)

The TRMREQ bit selects the transmit modes listed in Table 37.10.

When the TRMREQ bit is set to 1, the associated mailbox is configured for transmission of a data or remote frame.

When the TRMREQ bit is set to 0, the associated mailbox is not configured for transmission of a data or remote frame.

If the TRMREQ bit is changed from 1 to 0 to cancel the associated transmission request, either the TRMABT or SENTDATA flag is set to 1. When setting the TRMREQ bit to 1, do not set the RECREQ bit to 1. To change the configuration of a mailbox from reception to transmission, first abort the reception, and then set the NEWDATA and MSGLOST bits to 0 before changing to transmission.

Note: MCTL_TXj.TRMREQ is the mirror bit of MCTL_RXj.TRMREQ.

数据传输完成时，TRMABT标志不设置为1。SENTDATA标志设置为1。TRMABT标志通过软件写入设置为0。

ONESHOT位（一次性启用）

在发送模式下（RECREQ=0且TRMREQ=1）将ONESHOT位设置为1时，CAN模块仅发送一次报文。如果发生CAN总线错误或CAN总线仲裁失败，CAN模块不会再次发送消息。当传输完成时，SENTDATA标志设置为1。如果由于CAN总线错误或CAN总线仲裁丢失错误导致传输未完成，则TRMABT标志设置为1。在SENTDATA或TRMABT标志设置为1。

RECREQ位（接收邮箱请求）

RECREQ位选择表37.10中列出的接收模式。

当RECREQ位设置为1时，相关邮箱配置为接收数据或远程帧。

当RECREQ位设置为0时，相关邮箱未配置为接收数据或远程帧。

由于硬件保护，RECREQ位在以下期间不能通过软件写入设置为0：

- 硬件保护从验收过滤器处理开始（CRC字段的开始）
- 硬件保护发布：
  - 对于指定接收传入报文的邮箱，在接收到的数据存入邮箱后或出现CAN总线错误。这意味着硬件保护的最大周期是从CRC字段的开始到EOF的第7位结束。
  - 对于其他邮箱，接受过滤处理后
  - 如果没有指定邮箱接收邮件，则经过接受过滤处理。

将RECREQ位设置为1时，不要将TRMREQ位设置为1。要将邮箱配置从发送更改为接收，首先中止发送，然后在更改为接收之前将SENTDATA和TRMABT标志设置为0。

Note: MCTL_TXj.RECREQ是MCTL_RXj.RECREQ的镜像位。

TRMREQ位（发送邮箱请求）

TRMREQ位选择表37.10中列出的发送模式。

当TRMREQ位设置为1时，相关邮箱配置为传输数据或远程帧。

当TRMREQ位设置为0时，相关邮箱未配置为传输数据或远程帧。

如果TRMREQ位从1更改为0以取消相关的发送请求，则TRMABT或SENTDATA标志设置为1。将TRMREQ位设置为1时，不要将RECREQ位设置为1。要更改一个邮箱从接收到发送，首先中止接收，然后将NEWDATA和MSGLOST位设置为0，然后再更改为发送。

Note: MCTL_TXj.TRMREQ是MCTL_RXj.TRMREQ的镜像位。

37.2.10 Message Control Register for Receive (MCTL_RXj) (j = 0 to 31)

- Receive mode (when the TRMREQ bit is 0 and the RECREQ bit is 1)

Address(es): CAN0.MCTL_RX[0] 4005 0820h to CAN0.MCTL_RX[31] 4005 083Fh, CAN1.MCTL_RX[0] 4005 1820h to CAN1.MCTL_RX[31] 4005 183Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TRMREQ	RECREQ	—	ONESHOT	—	MSGLOST	INVALDATA	NEWDATA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	NEWDATA	Reception Complete Flag*1,*2	0: No data received, or 0 was written to the bit 1: New message being stored or was stored in the mailbox.	R/W
b1	INVALDATA	Reception-in-Progress Status Flag	0: Message valid 1: Message being updated.	R
b2	MSGLOST	Message Lost Flag*1,*2	0: Message not overwritten or overrun 1: Message overwritten or overrun.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	ONESHOT	One-Shot Enable*2,*3	0: Disable one-shot reception 1: Enable one-shot reception.	R/W
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b6	RECREQ	Receive Mailbox Request *2,*3,*4,*5	0: Do not configure for reception 1: Configure for reception.	R/W
b7	TRMREQ	Transmit Mailbox Request *2,*4	0: Do not configure for transmission 1: Configure for transmission.	R/W

Note 1. Write 0 only. Writing 1 has no effect.
Note 2. When writing to bits of this register, write 1 to the NEWDATA and MSGLOST bits if they are not the write target.
Note 3. To enter one-shot receive mode, write 1 to the ONESHOT bit at the same time as setting the RECREQ bit to 1. To exit one-shot receive mode, write 0 to the ONESHOT bit after writing 0 to the RECREQ bit and confirming that it is 0.
Note 4. Do not set both the RECREQ and TRMREQ bits to 1.
Note 5. When setting the RECREQ bit to 0, set the MSGLOST, NEWDATA, and RECREQ bits to 0 simultaneously.

MCTL_RXj sets mailbox j to transmit or receive mode. In receive mode, MCTL_RXj also controls and indicates the reception status. Do not access MCTL_RXj if mailbox j is in transmit mode. Only write to the MCTL_RXj in CAN operation or halt mode. Do not use MCTL_RX24 to MCTL_RX31 in FIFO mailbox mode.

NEWDATA flag (Reception Complete Flag)

The NEWDATA flag is set to 1 when a new message is being stored or was stored in the mailbox. Always set this bit to 1 simultaneously with the INVALDATA flag. The NEWDATA flag is cleared to 0 through a software write. The NEWDATA flag cannot be set to 0 through a software write while the associated INVALDATA flag is 1.

INVALDATA flag (Reception-in-Progress Status Flag)

After the completion of a message reception, the INVALDATA flag is set to 1 while the received message is being updated into the associated mailbox. The INVALDATA flag is set to 0 immediately after the message is stored. If the mailbox is read while the INVALDATA flag is 1, the data is undefined.

MSGLOST flag (Message Lost Flag)

The MSGLOST flag is set to 1 when the mailbox is overwritten or overrun by a new received message while the NEWDATA flag is 1. The MSGLOST flag is set to 1 at the end of the 6th bit of EOF. The MSGLOST flag is set to 0 through a software write.

In both overwrite and overrun modes, the MSGLOST flag cannot be set to 0 through a software write during the 5 PCLKB cycles following the 6th bit of EOF.

37.2.10 接收消息控制寄存器(MCTL_RXj)(j=0to31)

接收模式（当TRMREQ位为0且RECREQ位为1时）

Address(es): CAN0.MCTL_RX[0] 4005 0820h to CAN0.MCTL_RX[31] 4005 083Fh, CAN1.MCTL_RX[0] 4005 1820h to CAN1.MCTL_RX[31] 4005 183Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TRMREQ	RECREQ	—	ONESHOT	—	MSGLOST	INVALDATA	NEWDATA
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	NEWDATA	接收完成标志*1 *2	0：未接收到数据，或向该位写入01：新消息正在存储或已存储在邮箱中。	R/W
b1	INVALDATA	Reception-in-Progress Status Flag	0：消息有效1：消息正在更新。	R
b2	MSGLOST	消息丢失标志*1 *2	0：信息未被覆盖或溢出1：信息被覆盖或溢出。	R/W
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	ONESHOT	One-Shot Enable*2,*3	0：关闭一键接收1：打开一键接收。	R/W
b5	—	Reserved	该位读取为0。写入值应为0。	R/W
b6	RECREQ	接收邮箱请求*2 *3 *4 *5	0：不配置接收1：配置接收。	R/W
b7	TRMREQ	发送邮箱请求*2 *4	0：不配置传输1：配置传输。	R/W

Note 1. 只写0。写1无效。
Note 2. 写入该寄存器的位时，如果NEWDATA和MSGLOST位不是写入目标，则向它们写入1。
Note 3. 要进入一次性接收模式，请在将RECREQ位设置为1的同时向ONESHOT位写入1。要退出一次性接收模式，请在向RECREQ位写入0并确认后向ONESHOT位写入0它是0。
Note 4. 不要将RECREQ和TRMREQ位都设置为1。
Note 5. 将RECREQ位设置为0时，同时将MSGLOST、NEWDATA和RECREQ位设置为0。

MCTL_RXj将邮箱j设置为发送或接收模式。在接收模式下，MCTL_RXj还控制和指示接收状态。如果邮箱j处于传输模式，则不要访问MCTL_RXj。仅在CAN操作或暂停模式下写入MCTL_RXj。不要在FIFO邮箱模式下使用MCTL_RX24到MCTL_RX31。

NEWDATA标志（接收完成标志）

当新消息正在存储或已存储在邮箱中时，NEWDATA标志设置为1。始终将此位与INVALDATA标志同时设置为1。NEWDATA标志通过软件写入清除为0。当相关的INVALDATA标志为1时，不能通过软件写入将NEWDATA标志设置为0。

INVALDATA标志（接收进行中状态标志）

消息接收完成后，INVALDATA标志设置为1，同时接收到的消息正在更新到相关邮箱中。INVALDATA标志在消息存储后立即设置为0。如果在INVALDATA标志为1时读取邮箱，则数据未定义。

MSGLOST标志（消息丢失标志）

当邮箱被新收到的消息覆盖或溢出时，MSGLOST标志设置为1，而NEWDATA标志为1。MSGLOST标志在EOF的第6位末尾设置为1。MSGLOST标志通过软件写入设置为0。

在覆盖和溢出模式下，MSGLOST标志不能在5期间通过软件写入设置为0EOF的第6位之后的PCLKB周期。

ONESHOT bit (One-Shot Enable)

When the ONESHOT bit is set to 1 in receive mode (RECREQ = 1 and TRMREQ = 0), the mailbox receives a message only one time. The mailbox does not behave as a receive mailbox after having received a message one time. The behavior of the NEWDATA and INVALDATA flags is the same as in normal receive mode. In one-shot receive mode, the MSGLOST flag does not set to 1. To set the ONESHOT bit to 0, first write 0 to the RECREQ bit and ensure that it is 0.

RECREQ bit (Receive Mailbox Request)

The RECREQ bit selects receive modes listed in Table 37.10.

When the RECREQ bit is set to 1, the associated mailbox is configured for reception of a data or remote frame.

When the RECREQ bit is set to 0, the associated mailbox is not configured for reception of a data or remote frame.

Due to hardware protection, the RECREQ bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from the acceptance filter processing (the beginning of the CRC field)
- Hardware protection is released:
  - For the mailbox that is specified to receive the incoming message, after the received data is stored in the mailbox or a CAN bus error occurs. This means that the maximum period of hardware protection is from the beginning of the CRC field to the end of the 7th bit of EOF.
  - For the other mailboxes, after acceptance filter processing
  - If no mailbox is specified to receive the message, after acceptance filter processing.

When setting the RECREQ bit to 1, do not set the TRMREQ bit to 1. To change the configuration of a mailbox from transmission to reception, first abort the transmission and then set the SENTDATA and TRMABT flags to 0 before changing to reception.

Note: MCTL_RXj.RECREQ is the mirror bit of MCTL_TXj.RECREQ.

TRMREQ bit (Transmit Mailbox Request)

The TRMREQ bit selects the transmit modes listed in Table 37.10.

When the TRMREQ bit is set to 1, the associated mailbox is configured for transmission of a data or remote frame.

When the TRMREQ bit is set to 0, the associated mailbox is not configured for transmission of a data or remote frame.

If the TRMREQ bit is changed from 1 to 0 to cancel the associated transmission request, either the TRMABT or SENTDATA flag is set to 1. When setting the TRMREQ bit to 1, do not set the RECREQ bit to 1. To change the configuration of a mailbox from reception to transmission, first abort the reception and then set the NEWDATA and MSGLOST bits to 0 before changing to transmission.

Note: MCTL_RXj.TRMREQ is the mirror bit of MCTL_TXj.TRMREQ.

37.2.11 Receive FIFO Control Register (RFCR)

Address(es): CAN0.RFCR 4005 0848h, CAN1.RFCR 4005 1848h

	b7	b6	b5	b4	b3	b2	b1	b0
	RFEST	RFWST	RFFST	RFMLF	RFUST[2:0]			RFE
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RFE	Receive FIFO Enable	0: Disable receive FIFO 1: Enable receive FIFO.	R/W

ONESHOT位（一次性启用）

在接收模式下（RECREQ=1和TRMREQ=0）将ONESHOT位设置为1时，邮箱只接收一次消息。邮箱在收到一次消息后不再充当接收邮箱。NEWDATA和INVALDATA标志的行为与正常接收模式相同。在单次接收模式下，MSGLOST标志不设置为1。要将ONESHOT位设置为0，首先将0写入RECREQ位并确保其为0。

RECREQ位（接收邮箱请求）

RECREQ位选择表37.10中列出的接收模式。

当RECREQ位设置为1时，相关邮箱配置为接收数据或远程帧。

当RECREQ位设置为0时，相关邮箱未配置为接收数据或远程帧。

由于硬件保护，RECREQ位在以下期间不能通过软件写入设置为0：

- 硬件保护从验收过滤器处理开始（CRC字段的开始）
- 硬件保护发布：
  - 对于指定接收传入报文的邮箱，在接收到的数据存入邮箱后或出现CAN总线错误。这意味着硬件保护的最大周期是从CRC字段的开始到EOF的第7位结束。
  - 对于其他邮箱，接受过滤处理后
  - 如果没有指定邮箱接收邮件，则经过接受过滤处理。

将RECREQ位设置为1时，不要将TRMREQ位设置为1。要将邮箱配置从发送更改为接收，首先中止发送，然后在更改为接收之前将SENTDATA和TRMABT标志设置为0。

Note: MCTL_RXj.RECREQ是MCTL_TXj.RECREQ的镜像位。

TRMREQ位（发送邮箱请求）

TRMREQ位选择表37.10中列出的发送模式。

当TRMREQ位设置为1时，相关邮箱配置为传输数据或远程帧。

当TRMREQ位设置为0时，相关邮箱未配置为传输数据或远程帧。

如果TRMREQ位从1更改为0以取消相关的发送请求，则TRMABT或SENTDATA标志设置为1。将TRMREQ位设置为1时，不要将RECREQ位设置为1。要更改邮箱从接收到发送，首先中止接收，然后将NEWDATA和MSGLOST位设置为0，然后再更改为发送。

Note: MCTL_RXj.TRMREQ是MCTL_TXj.TRMREQ的镜像位。

37.2.11 接收FIFO控制寄存器(RFCR)

Address(es): CAN0.RFCR 4005 0848h, CAN1.RFCR 4005 1848h

	b7	b6	b5	b4	b3	b2	b1	b0
	RFEST	RFWST	RFFST	RFMLF	RFUST[2:0]			RFE
重置后的值：	1	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	RFE	接收FIFO使能	0：禁用接收FIFO1：启用接收FIFO。	R/W

Bit	Symbol	Bit name	Description	R/W
b3 to b1	RFUST[2:0]	Receive FIFO Unread Message Number Status	b3 b1 0 0 0: No unread message 0 0 1: 1 unread message 0 1 0: 2 unread messages 0 1 1: 3 unread messages 1 0 0: 4 unread messages 1 0 1: Reserved 1 1 0: Reserved 1 1 1: Reserved.	R
b4	RFMLF	Receive FIFO Message Lost Flag	0: Receive FIFO message not lost 1: Receive FIFO message lost.	R/W
b5	RFFST	Receive FIFO Full Status Flag	0: Receive FIFO not full 1: Receive FIFO full (4 unread messages).	R
b6	RFWST	Receive FIFO Buffer Warning Status Flag	0: Receive FIFO is not buffer warning 1: Receive FIFO is buffer warning (3 unread messages).	R
b7	RFEST	Receive FIFO Empty Status Flag	0: Unread message in receive FIFO 1: No unread message in receive FIFO.	R

Write to RFCR in CAN operation or halt mode.

RFE bit (Receive FIFO Enable)

When the RFE bit is set to 1, the receive FIFO is enabled.

When the RFE bit is set to 0, the receive FIFO is disabled for reception and becomes empty (RFEST bit = 1). Write 0 to the RFE bit simultaneously with setting the RFMLF flag.

Do not set this bit to 1 in normal mailbox mode (MBM bit in CTLR = 0). Due to hardware protection, the RFE bit cannot be set to 0 through a software write during the following period:

- Hardware protection is started from acceptance filter processing (the beginning of the CRC field)
- When hardware protection is released:
  - If the receive FIFO is specified to receive the incoming message, after the received data is stored in the receive FIFO or a CAN bus error occurs. This means that the maximum period of hardware protection is from the beginning of the CRC field to the end of the 7th bit of EOF.
  - If the receive FIFO is not specified to receive the message, after acceptance filter processing.

RFUST[2:0] bits (Receive FIFO Unread Message Number Status)

The RFUST[2:0] bits indicate the number of unread messages in the receive FIFO. The value of the RFUST[2:0] bits initializes to 000b when the RFE bit is set to 0.

RFMLF flag (Receive FIFO Message Lost Flag)

The RFMLF flag is set to 1 (receive FIFO message lost) when the receive FIFO receives a new message and is full. It is set to 1 at the end of the 6th bit of EOF.

The RFMLF flag is set to 0 through a software write. Writing 1 has no effect. In both overwrite and overrun modes, if the receive FIFO is full and determined to have received a message, the RFMLF flag cannot be set to 0 (receive FIFO message was not lost) through a software write because of hardware protection during the 5 PCLKB cycles following the 6th bit of EOF.

RFFST flag (Receive FIFO Full Status Flag)

The RFFST flag is set to 1 (receive FIFO is full) when the number of unread messages in the receive FIFO is 4. It is 0 (receive FIFO is not full) when the number of unread messages in the receive FIFO is less than 4. The flag is set to 0 when the RFE bit is 0.

RFWST flag (Receive FIFO Buffer Warning Status Flag)

The RFWST flag is set to 1 (receive FIFO is a buffer warning) when the number of unread messages in the receive FIFO is 3. It is 0 (receive FIFO is not a buffer warning) when the number of unread messages in the receive FIFO is less than 3

Bit	Symbol	位名称	Description	R/W
b3 to b1	RFUST[2:0]	接收FIFO未读消息号码状态	b3b1000：没有未读消息00 1：1条未读消息010：2条未读消息011：3条未读消息10 0：4条未读消息101：保留1 10：保留111：预订的。	R
b4	RFMLF	接收FIFO消息丢失标志	0：接收FIFO报文不丢失1：接收FIFO报文丢失。	R/W
b5	RFFST	接收FIFO满状态标志	0：接收FIFO未满1：接收FIFO已满（4个未读消息）。	R
b6	RFWST	接收FIFO缓冲区警告状态标志	0：接收FIFO不是缓冲区警告1：接收FIFO是缓冲区警告（3个未读消息）。	R
b7	RFEST	接收FIFO空状态标志	0：接收FIFO中未读消息1：接收FIFO中没有未读消息。	R

在CAN操作或暂停模式下写入RFCR。

RFE位（接收FIFO使能）

当RFE位设置为1时，启用接收FIFO。

当RFE位设置为0时，接收FIFO禁止接收并变为空（RFEST位=1）。在设置RFMLF标志的同时将0写入RFE位。

在正常邮箱模式下不要将此位设置为1（CTLR中的MBM位=0）。由于硬件保护，RFE位在以下期间不能通过软件写入设置为0：

- 硬件保护从验收过滤器处理开始（CRC字段的开始）
- 硬件保护解除时：
  - 如果指定接收FIFO接收进来的报文，接收到的数据存入receive出现FIFO或CAN总线错误。这意味着硬件保护的最大周期是从CRC字段的开始到EOF的第7位结束。
  - 如果接收FIFO没有指定接收报文，接受过滤后处理。

RFUST[2:0]位（接收FIFO未读消息编号状态）

RFUST[2:0]位指示接收FIFO中未读消息的数量。当RFE位设置为0时，RFUST[2:0]位的值初始化为000b。

RFMLF标志（接收FIFO消息丢失标志）

当接收FIFO接收到新消息并已满时，RFMLF标志设置为1（接收FIFO消息丢失）。它在EOF的第6位末尾设置为1。

RFMLF标志通过软件写入设置为0。写1无效。在覆盖和溢出模式下，如果接收FIFO已满并确定已接收到消息，则RFMLF标志不能通过软件写入设置为0（接收FIFO消息未丢失），因为在5个PCLKB周期内有硬件保护在EOF的第6位之后。

RFFST标志（接收FIFO满状态标志）

当接收FIFO中未读报文数为4时，RFFST标志设置为1（接收FIFO已满）。当接收FIFO中未读报文数小于4时，该标志为0（接收FIFO未满）.当RFE位为0时，该标志设置为0。

RFWST标志（接收FIFO缓冲区警告状态标志）

当接收FIFO中的未读消息数为3时，RFWST标志设置为1（接收FIFO为缓冲区警告）。当接收FIFO中的未读消息数为0（接收FIFO不是缓冲区警告）时小于3

or equal to 4. The RFWST flag is set to 0 when the RFE bit is 0.

RFEST flag (Receive FIFO Empty Status Flag)

The RFEST flag is set to 1 (no unread message in receive FIFO) when the number of unread messages in the receive FIFO is 0. It is set to 1 when the RFE bit is set to 0. The flag is set to 0 (unread message in receive FIFO) when the number of unread messages in the receive FIFO is one or more. Figure 37.2 shows the receive FIFO mailbox operation.

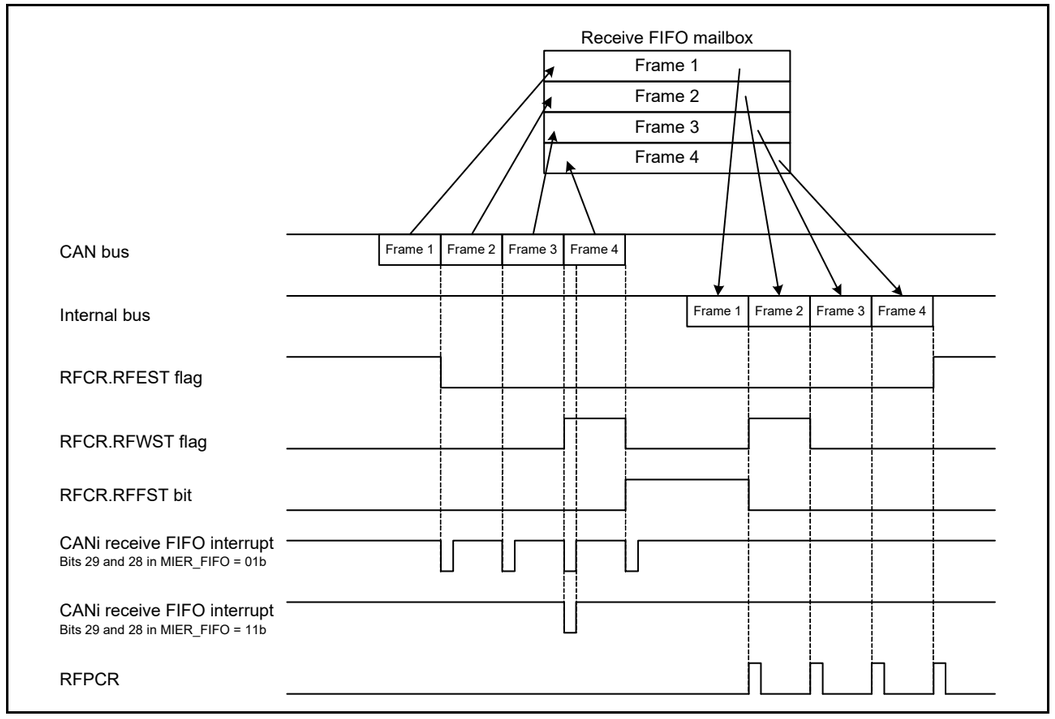

Figure 37.2 Receive FIFO mailbox operation when bits [29] and [28] in MIER_FIFO = 01b or 11b

37.2.12 Receive FIFO Pointer Control Register (RFPCR)

Address(es): CAN0.RFPCR 4005 0849h, CAN1.RFPCR 4005 1849h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	The CPU-side pointer for the receive FIFO is incremented by writing FFh to RFPCR.	W

When the receive FIFO is not empty, write FFh to RFPCR through the software to increment the CPU pointer to the next mailbox location. Do not write to RFPCR when the RFE bit in RFCR is 0 (receive FIFO disabled).

Both the CAN and CPU pointers increment when a new message is received and the RFFST flag is 1 (receive FIFO is full) in overwrite mode. When the RFMLF flag is 1 in this state, the CPU pointer does not increment on a software write to RFPCR.

或等于4。当RFE位为0时，RFWST标志设置为0。

RFEST标志（接收FIFO空状态标志）

RFEST标志设置为1（接收FIFO中没有未读消息），当接收中的未读消息数FIFO为0。当RFE位设置为0时设置为1。当接收FIFO中的未读报文数为1或更多时，该标志设置为0（接收FIFO中的未读报文）。图37.2显示了接收FIFO邮箱操作。

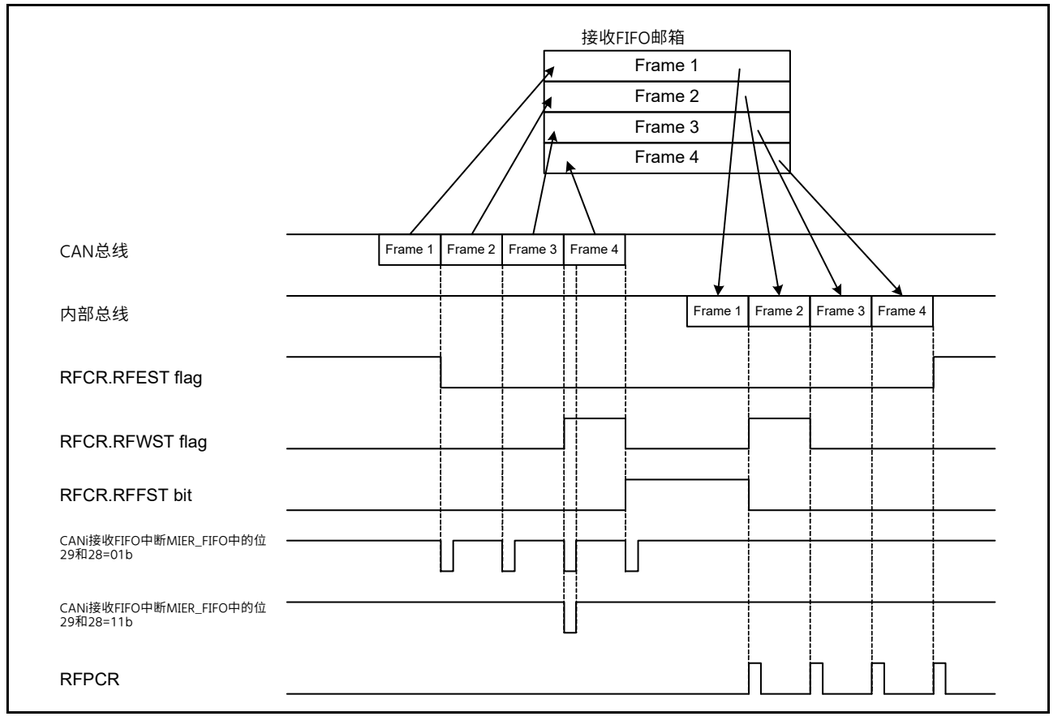

Figure 37.2 当MIER_FIFO中的位[29]和[28]=01b或11b时接收FIFO邮箱操作

37.2.12 接收FIFO指针控制寄存器(RFPCR)

Address(es): CAN0.RFPCR 4005 0849h, CAN1.RFPCR 4005 1849h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	通过将FFh写入RFPCR，接收FIFO的CPU端指针递增。	W

当接收FIFO不为空时，通过软件将FFh写入RFPCR，使CPU指针递增到下一个邮箱位置。当RFCR中的RFE位为0（禁用接收FIFO）时，不要写入RFPCR。

当接收到新消息并且在覆盖模式下RFFST标志为1（接收FIFO已满）时，CAN和CPU指针都会递增。在此状态下，当RFMLF标志为1时，CPU指针不会在软件写入RFPCR时递增。

37.2.13 Transmit FIFO Control Register (TFCR)

Address(es): CAN0.TFCR 4005 084Ah, CAN1.TFCR 4005 184Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	TFEST	TFFST	—	—	TFUST[2:0]			TFE
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TFE	Transmit FIFO Enable	0: Disable transmit FIFO 1: Enable transmit FIFO.	R/W
b3 to b1	TFUST[2:0]	Transmit FIFO Unsent Message Number Status	b3 b1 0 0 0: 0 unsent messages 0 0 1: 1 unsent message 0 1 0: 2 unsent messages 0 1 1: 3 unsent messages 1 0 0: 4 unsent messages 1 0 1: Reserved 1 1 0: Reserved 1 1 1: Reserved.	R
b5, b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	TFFST	Transmit FIFO Full Status	0: Transmit FIFO not full 1: Transmit FIFO full (4 unsent messages).	R
b7	TFEST	Transmit FIFO Empty Status	0: Unsent message in transmit FIFO 1: No unsent message in transmit FIFO.	R

Write to TFCR in CAN operation or halt mode.

TFE bit (Transmit FIFO Enable)

Setting the TFE bit set to 1 enables the transmit FIFO. Setting the TFE bit to 0 empties the transmit FIFO (TFEST bit = 1), and unsent messages in the transmit FIFO are lost in the following ways:

- Immediately if a message from the transmit FIFO is not scheduled for the next transmission or is already in transmission
- On completion of transmission, on a CAN bus error, CAN bus arbitration-lost, or entry to CAN halt mode, if a message from the transmit FIFO is scheduled for the next transmission or is already in transmission.

Before setting the TFE bit to 1 again, ensure that the TFEST bit is set to 1. After setting the TFE bit to 1, write transmit data to mailbox 24.

Do not set the TFE bit to 1 in normal mailbox mode (MBM bit in CTLR = 0).

TFUST[2:0] bits (Transmit FIFO Unsent Message Number Status)

The TFUST[2:0] bits indicate the number of unsent messages in the transmit FIFO. They are set to 000b after TFE bit is set to 0 and transmission aborts or completes.

TFFST bit (Transmit FIFO Full Status)

The TFFST bit is set to 1 (transmit FIFO is full) when the number of unsent messages in the transmit FIFO is 4. The TFFST bit is set to 0 (transmit FIFO is not full) when the number of unsent messages in the transmit FIFO is less than 4. The TFFST bit is set to 0 when transmission from the transmit FIFO is aborted.

TFEST bit (Transmit FIFO Empty Status)

The TFEST bit is set to 1 (no message in transmit FIFO) when the number of unsent messages in the transmit FIFO is 0. The TFEST bit is set to 1 when transmission from the transmit FIFO is aborted. The TFEST bit is set to 0 (message in transmit FIFO) when the number of unsent messages in the transmit FIFO is not 0.

Figure 37.3 shows the transmit FIFO mailbox operation.

37.2.13 发送FIFO控制寄存器(TFCR)

Address(es): CAN0.TFCR 4005 084Ah, CAN1.TFCR 4005 184Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	TFEST	TFFST	—	—	TFUST[2:0]			TFE
重置后的值：	1	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	TFE	发送FIFO使能	0：禁用发送FIFO1：启用发送FIFO。	R/W
b3 to b1	TFUST[2:0]	发送FIFO未发送消息号码状态	b3b1000：0条未发送消息001：1条未发送消息010：2条未发送消息011：3条未发送消息100：4条未发送消息101：保留110：保留111：预订的。	R
b5, b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	TFFST	发送FIFO满状态	0：发送FIFO未满1：发送FIFO已满（4个未发送消息）。	R
b7	TFEST	发送FIFO空状态	0：发送FIFO中未发送消息1：发送FIFO中没有未发送消息。	R

在CAN操作或暂停模式下写入TFCR。

TFE位（发送FIFO使能）

将TFE位设置为1会启用发送FIFO。将TFE位设置为0会清空发送FIFO（TFEST位=1），发送FIFO中未发送的消息会通过以下方式丢失：

- 如果来自发送FIFO的消息未安排下一次发送或已在发送中，则立即
- 在传输完成、CAN总线错误、CAN总线仲裁丢失或进入CAN暂停模式时，如果来自传输FIFO的消息被安排用于下一次传输或已经在传输中。

再次将TFE位设置为1之前，请确保TFEST位设置为1。将TFE位设置为1后，将发送数据写入邮箱24。

不要在正常邮箱模式下将TFE位设置为1（CTLR中的MBM位=0）。

TFUST[2:0]位（发送FIFO未发送消息编号状态）

TFUST[2:0]位指示发送FIFO中未发送消息的数量。在TFE位设置为0并且传输中止或完成后，它们设置为000b。

TFFST位（发送FIFO满状态）

当发送FIFO中未发送的消息数为4时，TFFST位设置为1（发送FIFO已满）。
当发送FIFO中未发送消息的数量小于4时，TFFST位设置为0（发送FIFO未满）。
当来自发送FIFO的发送被中止时，TFFST位设置为0。

TFEST位（发送FIFO空状态）

当发送FIFO中未发送消息的数量为0时，TFEST位设置为1（发送FIFO中没有消息）。
当来自发送FIFO的发送被中止时，TFEST位设置为1。当发送FIFO中未发送消息的数量不为0时，TFEST位设置为0（发送FIFO中的消息）。

图37.3显示了发送FIFO邮箱操作。

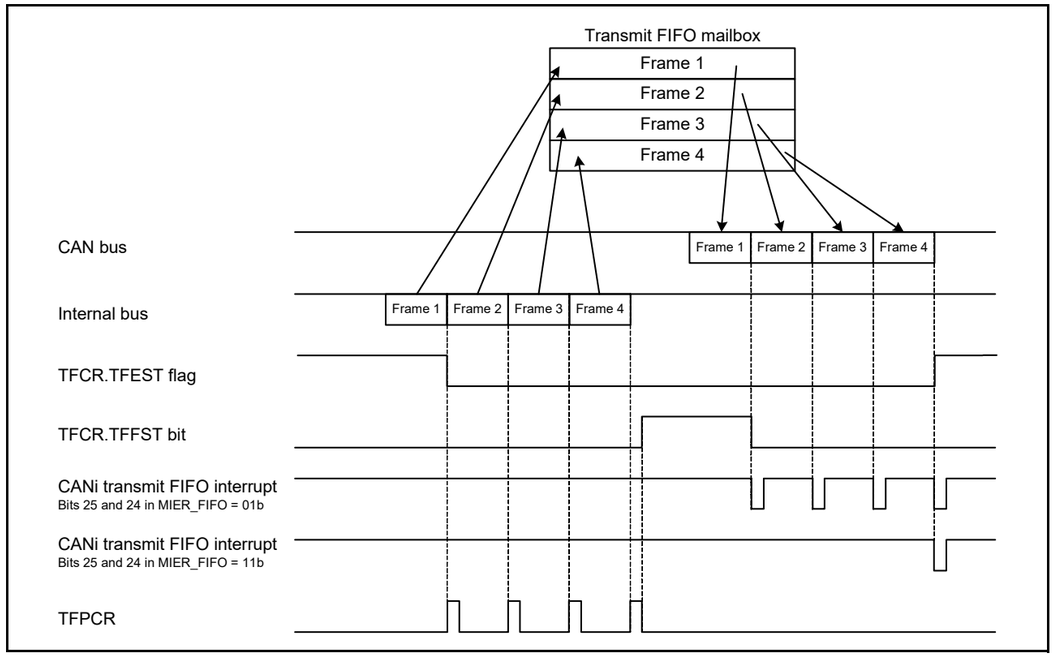

Figure 37.3 Transmit FIFO mailbox operation when bits [25] and [24] in MIER_FIFO = 01b or 11b

37.2.14 Transmit FIFO Pointer Control Register (TFPCR)

Address(es): CAN0.TFPCR 4005 084Bh, CAN1.TFPCR 4005 184Bh

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	The CPU pointer for the transmit FIFO is incremented by writing FFh to TFPCR.	W

When the transmit FIFO is not full, write FFh to TFPCR through the software to increment the CPU pointer for the transmit FIFO to the next mailbox location.

Do not write to TFPCR when the TFE bit in TFCR is 0 (transmit FIFO disabled).

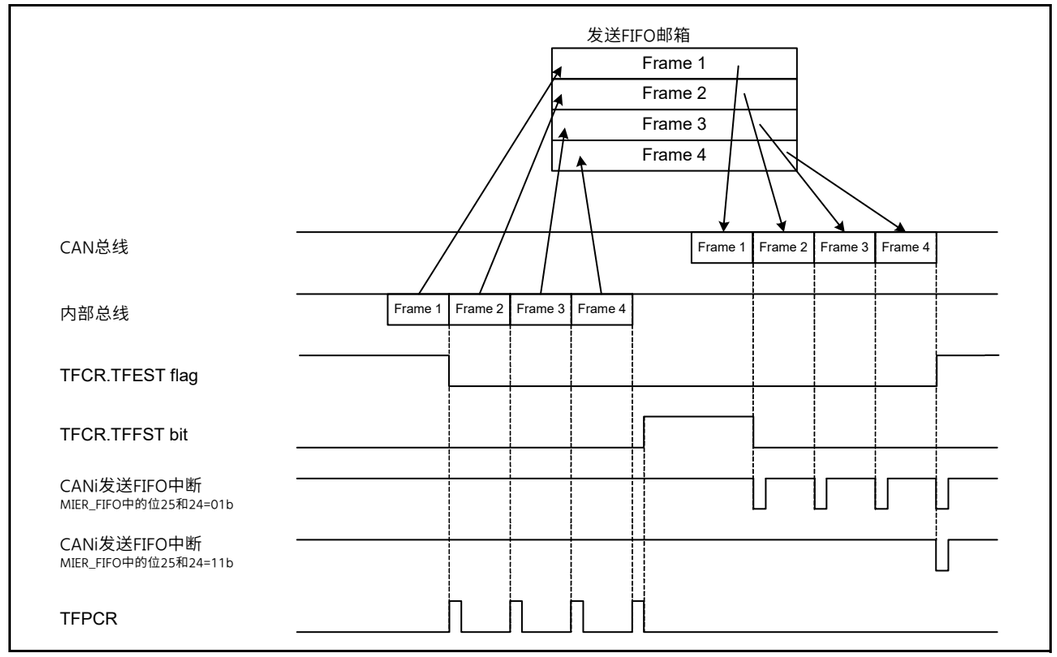

Figure 37.3 当MIER_FIFO中的位[25]和[24]=01b或11b时发送FIFO邮箱操作

37.2.14 发送FIFO指针控制寄存器(TFPCR)

Address(es): CAN0.TFPCR 4005 084Bh, CAN1.TFPCR 4005 184Bh

NDST flag (NEWDATA Status Flag)

The NDST flag is set to 1 when at least one NEWDATA flag in MCTL_RXj (j = 0 to 31) is 1, regardless of the value of MIER or MIER_FIFO. It is set to 0 when all NEWDATA flags are 0.

SDST flag (SENTDATA Status Flag)

The SDST flag is set to 1 when at least one SENTDATA flag in MCTL_TXj (j = 0 to 31) is 1, regardless of the value of MIER or MIER_FIFO. It is set to 0 when all SENTDATA flags are 0.

RFST flag (Receive FIFO Status Flag)

The RFST flag is set to 1 when the receive FIFO is not empty. It is set to 0 when the receive FIFO is empty or normal mailbox mode is selected.

37.2.15 状态寄存器(STR)

Address(es): CAN0.STR 4005 0842h, CAN1.STR 4005 1842h

b15	—	Reserved	该位读为0。	R

NDST标志（NEWDATA状态标志）

当MCTL_RXj(j=0to31)中的至少一个NEWDATA标志为1时，NDST标志设置为1，无论MIER或MIER_FIFO。当所有NEWDATA标志为0时，它设置为0。

SDST标志（SENTDATA状态标志）

当MCTL_TXj(j=0to31)中的至少一个SENTDATA标志为1时，SDST标志设置为1，无论MIER或MIER_FIFO。当所有SENTDATA标志为0时，它设置为0。

RFST标志（接收FIFO状态标志）

当接收FIFO不为空时，RFST标志设置为1。当接收FIFO为空或选择正常邮箱模式时，它设置为0。

TFST flag (Transmit FIFO Status Flag)

The TFST flag is set to 1 when the transmit FIFO is not full. It is set to 0 when the transmit FIFO is full or normal mailbox mode is selected.

NMLST flag (Normal Mailbox Message Lost Status Flag)

The NMLST flag is set to 1 when at least one MSGLOST flag in MCTL_RXj (j = 0 to 31) is 1, regardless of the value of MIER or MIER_FIFO. It is set to 0 when all MSGLOST flags are 0.

FMLST flag (FIFO Mailbox Message Lost Status Flag)

The FMLST flag is set to 1 when the RFMLF flag in RFCR is 1, regardless of the value of MIER_FIFO. It is set to 0 when the RFMLF flag is 0.

TABST flag (Transmission Abort Status Flag)

The TABST flag is set to 1 when at least one TRMABT flag in MCTL_TXj (j = 0 to 31) is 1, regardless of the value of MIER or MIER_FIFO. It is set to 0 when all TRMABT flags are 0.

EST flag (Error Status Flag)

The EST flag is set to 1 when at least one error is detected by EIFR, regardless of the value of EIER. It is set to 0 when no error is detected by EIFR.

RSTST flag (CAN Reset Status Flag)

The RSTST flag is set to 1 when the CAN module is in CAN reset mode. It is 0 when the CAN module is not in CAN reset mode. It remains 1, even when the state changes from CAN reset to sleep mode.

HLTST flag (CAN Halt Status Flag)

The HLTST flag is set to 1 when the CAN module is in CAN halt mode. It is set to 0 when the CAN module is not in CAN halt mode. It remains 1, even when the state changes from CAN halt to sleep mode.

SLPST flag (CAN Sleep Status Flag)

The SLPST flag is set to 1 when the CAN module is in CAN sleep mode. It is set to 0 when the CAN module is not in CAN sleep mode.

EPST flag (Error-Passive Status Flag)

The EPST flag is set to 1 when the value of TECR or RECR exceeds 127 and the CAN module is in an error-passive state ($128 \leq TEC < 256$ or $128 \leq REC < 256$). It is set to 0 when the CAN module is not in the error-passive state.

BOST flag (Bus-Off Status Flag)

The BOST flag is set to 1 when the value of TECR exceeds 255 and the CAN module is in the bus-off state ($TEC \geq 256$). It is set to 0 when the CAN module is not in the bus-off state.

TRMST flag (Transmit Status Flag)

The TRMST flag is set to 1 when the CAN module performs as a transmitter node or is in the bus-off state. It is set to 0 when the CAN module performs as a receiver node or is in the bus-idle state.

RECST flag (Receive Status Flag)

The RECST flag is set to 1 when the CAN module performs as a receiver node. It is set to 0 when the CAN module performs as a transmitter node or is in the bus-idle state.

TFST标志（发送FIFO状态标志）

当发送FIFO未满时，TFST标志设置为1。当发送FIFO已满或选择正常邮箱模式时，它设置为0。

NMLST标志（正常邮箱消息丢失状态标志）

当MCTL_RXj(j=0to31)中的至少一个MSGLOST标志为1时，NMLST标志设置为1，无论MIER或MIER_FIFO。当所有MSGLOST标志为0时，它设置为0。

FMLST标志（FIFO邮箱消息丢失状态标志）

当RFCR中的RFMLF标志为1时，无论MIER_FIFO的值如何，FMLST标志都设置为1。当RFMLF标志为0时，它设置为0。

TABST标志（传输中止状态标志）

当MCTL_TXj(j=0到31)中的至少一个TRMABT标志为1时，TABST标志设置为1，无论MIER或MIER_FIFO。当所有TRMABT标志为0时，它设置为0。

EST标志（错误状态标志）

当EIFR检测到至少一个错误时，无论EIER的值如何，EST标志设置为1。当EIFR未检测到错误时，它设置为0。

RSTST标志（CAN复位状态标志）

当CAN模块处于CAN复位模式时，RSTST标志设置为1。CAN模块不处于CAN复位模式时为0。即使状态从CAN复位变为睡眠模式，它仍保持为1。

HLTST标志（CAN停止状态标志）

当CAN模块处于CAN暂停模式时，HLTST标志设置为1。CAN模块不在时设置为0
CAN暂停模式。即使状态从CAN停止变为睡眠模式，它仍保持为1。

SLPST标志（CAN睡眠状态标志）

当CAN模块处于CAN睡眠模式时，SLPST标志设置为1。CAN模块不在时设置为0
CAN睡眠模式。

EPST标志（错误被动状态标志）

当TECR或RECR的值超过127并且CAN模块处于错误被动状态（128≤TEC<256或128≤REC<256）时，EPST标志设置为1。当CAN模块不处于被动错误状态时，它设置为0。

BOST标志（总线关闭状态标志）

当TECR的值超过255并且CAN模块处于总线关闭状态（TEC≥256）时，BOST标志设置为1。
CAN模块不处于总线关闭状态时设置为0。

TRMST标志（发送状态标志）

当CAN模块作为发送器节点运行或处于总线关闭状态时，TRMST标志设置为1。当CAN模块作为接收器节点或处于总线空闲状态时，它设置为0。

RECST标志（接收状态标志）

当CAN模块作为接收器节点运行时，RECST标志设置为1。当CAN模块作为发送器节点或处于总线空闲状态时，它设置为0。

Bit	Symbol	Bit name	Description	R/W
b1, b0	MBSM[1:0]	Mailbox Search Mode Select	b1 b0 0 0: Receive mailbox search mode 0 1: Transmit mailbox search mode 1 0: Message lost search mode 1 1: Channel search mode.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Write to MSMR in CAN operation or halt mode.

MBSM[1:0] bits (Mailbox Search Mode Select)

The MBSM[1:0] bits select the search mode for the mailbox search function.

When the MBSM[1:0] bits are 00b, receive mailbox search mode is selected. In this mode, the search targets are the NEWDATA flag in MCTL_RXj (j = 0 to 31) for the normal mailbox and the RFEST bit in RFCR.

When the MBSM[1:0] bits are 01b, transmit mailbox search mode is selected. In this mode, the search target is the SENTDATA flag in MCTL_TXj.

When the MBSM[1:0] bits are 10b, message lost search mode is selected. In this mode, the search targets are the MSGLOST flag in MCTL_RXj for the normal mailbox and the RFMLF flag in RFCR.

When the MBSM[1:0] bits are 11b, channel search mode is selected. In this mode, the search target is CSSR. See section 37.2.18, Channel Search Support Register (CSSR).

37.2.17 Mailbox Search Status Register (MSSR)

Address(es): CAN0.MSSR 4005 0852h, CAN1.MSSR 4005 1852h

	b7	b6	b5	b4	b3	b2	b1	b0
	SEST	—	—	MBNST[4:0]				
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	MBNST[4:0]	Search Result Mailbox Number Status	These bits output the smallest mailbox number that is found in each mode of MSMR.	R
b6, b5	—	Reserved	These bits are read as 0.	R
b7	SEST	Search Result Status	0: Search result found 1: No search result.	R

MBNST[4:0] bits (Search Result Mailbox Number Status)

In all MSMR modes, the MBNST[4:0] bits output the smallest found mailbox number. In receive mailbox search mode, transmit mailbox search mode, and message lost search mode, the value of the mailbox (the search result to be output) is updated under the following conditions:

- When the NEWDATA, SENTDATA, or MSGLOST flag for a mailbox output by MBNST is set to 0
- When the NEWDATA, SENTDATA, or MSGLOST flag for a mailbox with a smaller number than of MBNST is

37.2.16 邮箱搜索模式寄存器(MSMR)

Address(es): CAN0.MSMR 4005 0853h, CAN1.MSMR 4005 1853h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MBSM[1:0]

b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

在CAN操作或暂停模式下写入MSMR。

MBSM[1:0]位（邮箱搜索模式选择）

MBSM[1:0]位选择邮箱搜索功能的搜索模式。

当MBSM[1:0]位为00b时，选择接收邮箱搜索模式。在这种模式下，搜索目标是MCTL_RXj中的NEWDATA标志（j=0到31）用于普通邮箱和RFCR中的RFEST位。

当MBSM[1:0]位为01b时，选择发送邮箱搜索模式。在这种模式下，搜索目标是MCTL_TXj中的SENTDATA标志。

当MBSM[1:0]位为10b时，选择消息丢失搜索模式。在这种模式下，搜索目标是正常邮箱的MCTL_RXj中的MSGLOST标志和RFCR中的RFMLF标志。

当MBSM[1:0]位为11b时，选择频道搜索模式。在这种模式下，搜索目标是CSSR。请参阅第37.2.18节，频道搜索支持寄存器(CSSR)。

37.2.17 邮箱搜索状态寄存器(MSSR)

Address(es): CAN0.MSSR 4005 0852h, CAN1.MSSR 4005 1852h

	b7	b6	b5	b4	b3	b2	b1	b0
	SEST	—	—	MBNST[4:0]				
重置后的值：	1	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b4 to b0	MBNST[4:0]	搜索结果邮箱号码状态	这些位输出在MSMR的每个模式中找到的最小邮箱号。	R
b6, b5	—	Reserved	这些位读为0。	R
b7	SEST	搜索结果状态	0：找到搜索结果1：没有搜索结果。	R

MBNST[4:0]位（搜索结果邮箱号码状态）

在所有MSMR模式下，MBNST[4:0]位输出找到的最小邮箱号。在接收邮箱搜索模式、发送邮箱搜索模式和消息丢失搜索模式下，邮箱的值（要输出的搜索结果）在以下条件下更新：

- 当MBNST输出的邮箱的NEWDATA、SENTDATA或MSGLOST标志设置为0时
- 当邮箱的NEWDATA、SENTDATA或MSGLOST标志为小于MBNST的邮箱时

set to 1.

If the MBSM[1:0] bits are set to 00b (receive mailbox search mode) or 10b (message lost search mode), the receive FIFO (mailbox 28) is output when it is not empty and there are no unread received messages and no lost messages in any of the normal mailboxes (0 to 23). If the MBSM[1:0] bits are set to 01b (transmit mailbox search mode), the transmit FIFO (mailbox 24) is not output. Table 37.6 lists the behavior of the MBNST[4:0] bits in FIFO mailbox mode.

In channel search mode, the MBNST[4:0] bits output the associated channel number. After MSSR is read by software, the next target channel number is output.

SEST bit (Search Result Status)

The SEST bit is set to 1 (no search result) when no associated mailbox is found after searching all mailboxes. For example, in transmit mailbox search mode, the SEST bit is set to 1 when no SENTDATA flag for the mailboxes is 1. The SEST bit is set to 0 when at least one SENTDATA flag is 1. When the SEST bit is 1, the value of the MBNST[4:0] bits is undefined.

Table 37.6 Behavior of MBNST[4:0] bits in FIFO mailbox mode

MBSM[1:0] bits	Mailbox 24 (transmit FIFO)	Mailbox 28 (receive FIFO)
00b	Mailbox 24 is not output.	Mailbox 28 is output when no MCTL_RXj.NEWDATA flag for the normal mailboxes is set to 1 (new message is being stored or was stored in the mailbox) and the receive FIFO is not empty.
01b		Mailbox 28 is not output.
10b		Mailbox 28 is output when no MCTL_RXj.MSGLOST flag for the normal mailboxes is set to 1 (message is overwritten or overrun) and the RFCR.RFMLF flag is set to 1 (receive FIFO message lost) in the receive FIFO.
11b		Mailbox 28 is not output.

37.2.18 Channel Search Support Register (CSSR)

Address(es): CAN0.CSSR 4005 0851h, CAN1.CSSR 4005 1851h

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	When the value for the channel search is input, the channel number is output to MSSR.	R/W

The bits in CSSR, which are set to 1, are encoded by an 8/3 encoder (the LSB position has the higher priority) and output to the MBNST[4:0] bits in MSSR. MSSR outputs the updated value whenever MSSR is read by software.

Write to CSSR only when the MSMR.MBSM[1:0] bits are 11b (channel search mode). Write to CSSR in CAN operation mode or CAN halt mode.

Figure 37.4 shows writes to and reads from CSSR and MSSR.

设置为1。

如果MBSM[1:0]位设置为00b（接收邮箱搜索模式）或10b（邮件丢失搜索模式），则在接收FIFO（邮箱28）不为空且没有未读接收到的消息时输出在任何普通邮箱（0到23）中都没有丢失消息。如果MBSM[1:0]位设置为01b（发送邮箱搜索模式），则不输出发送FIFO（邮箱24）。表37.6列出了MBNST[4:0]位在FIFO邮箱模式下的行为。

在频道搜索模式下，MBNST[4:0]位输出相关的频道号。软件读取MSSR后，输出下一个目标通道号。

SEST位（搜索结果状态）

当搜索所有邮箱后未找到相关邮箱时，SEST位设置为1（无搜索结果）。例如，在发送邮箱搜索模式中，当邮箱没有SENTDATA标志为1时，SEST位设置为1。当至少一个SENTDATA标志为1时，SEST位设置为0。当SEST位为1时，MBNST[4:0]位的值未定义。

Table 37.6 FIFO邮箱模式下MBNST[4:0]位的行为

MBSM[1:0] bits	Mailbox 24 (transmit FIFO)	Mailbox 28 (receive FIFO)
00b	邮箱24不输出。	当正常邮箱的MCTL_RXj.NEWDATA标志未设置为1（新消息正在存储或已存储在邮箱中）且接收FIFO不为空时，输出邮箱28。
01b		邮箱28不输出。
10b		当正常邮箱的MCTL_RXj.MSGLOST标志未设置为1（消息被覆盖或溢出）且接收FIFO中的RFCR.RFMLF标志设置为1（接收FIFO消息丢失）时，输出邮箱28。
11b		邮箱28不输出。

37.2.18 频道搜索支持寄存器(CSSR)

Address(es): CAN0.CSSR 4005 0851h, CAN1.CSSR 4005 1851h

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b7 to b0	输入频道搜索的值时，频道号将输出到MSSR。	R/W

CSSR中设置为1的位由83编码器（LSB位置具有较高优先级）编码并输出到MSSR中的MBNST[4:0]位。每当MSSR被软件读取时，MSSR就会输出更新的值。

仅当MSMR.MBSM[1:0]位为11b（通道搜索模式）时才写入CSSR。在CAN操作模式或CAN暂停模式下写入CSSR。

图37.4显示了对CSSR和MSSR的写入和读取。

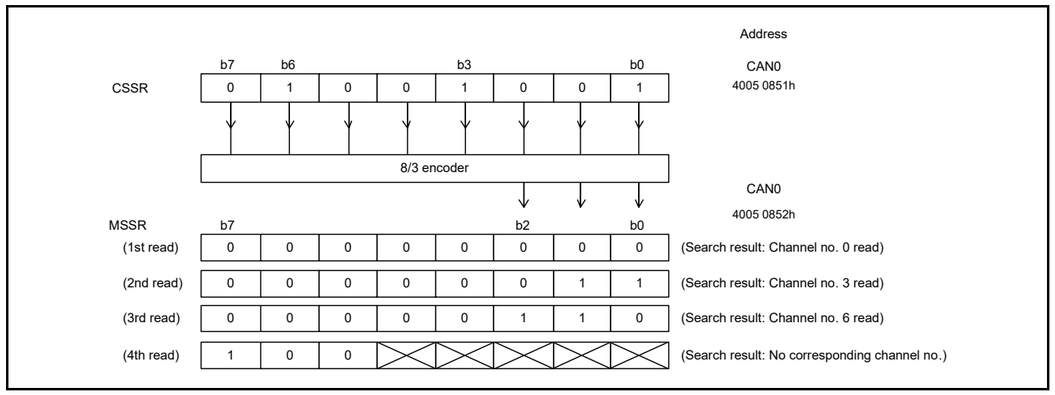

Figure 37.4 Writes to and reads from CSSR and MSSR

The value of CSSR is also updated whenever MSSR is read. On this read, the value prior to conversion by the 8/3 encoder can be read.

37.2.19 Acceptance Filter Support Register (AFSR)

Address(es): CAN0.AFSR 4005 0856h, CAN1.AFSR 4005 1856h

b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b15 to b0	After the standard ID of a received message is written, the value converted for data table search can be read.	R/W

Note: Write to AFSR in CAN operation mode or CAN halt mode.

The acceptance filter support unit (ASU) can be used for data table (8 bits × 256) searches. In the data table, all standard IDs that you create are set as valid or invalid in bit units. When AFSR is written with data in 16-bit units including the SID[10:0] bits in MBj_ID (j = 0 to 31), in which a received standard ID is stored, a decoded row (byte offset) position and column (bit) position for data table search can be read. The ASU can be used for standard (11-bit) IDs only.

The ASU is enabled in the following cases:

- When the ID to be received cannot be masked by the acceptance filter. For example, if IDs to be received are 078h, 087h, and 111h
- When there are too many IDs to receive, and the software filtering time is expected to be shortened.

Note: AFSR cannot be set in CAN reset mode.

Figure 37.5 shows the writes to and reads from AFSR.

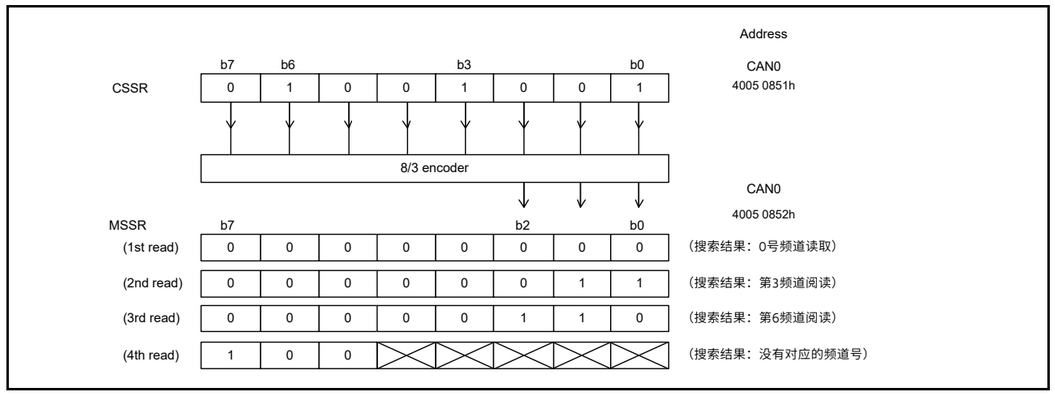

Figure 37.4 读写CSSR和MSSR

每当读取MSSR时，CSSR的值也会更新。在此读取中，可以读取83编码器转换之前的值。

37.2.19 接受过滤器支持寄存器(AFSR)

Address(es): CAN0.AFSR 4005 0856h, CAN1.AFSR 4005 1856h

b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Description	R/W
b15 to b0	将接收到的消息的标准ID写入后，就可以读取为数据查表转换的值了。	R/W

Note: 在CAN操作模式或CAN暂停模式下写入AFSR。

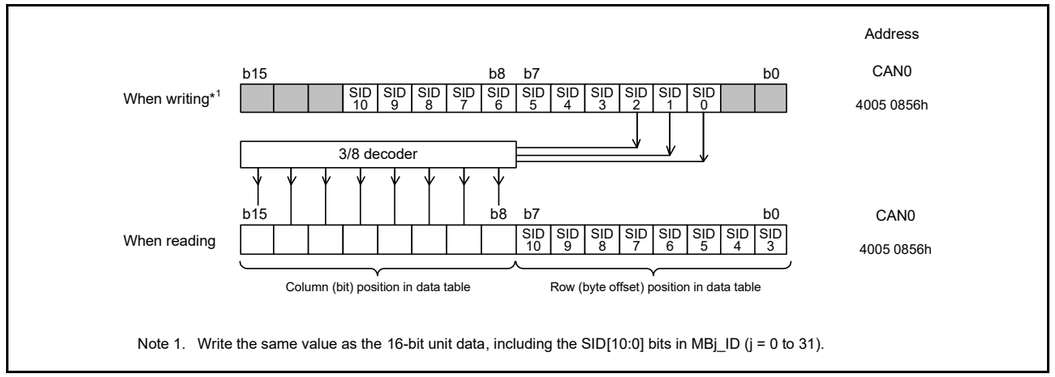
验收滤波器支持单元(ASU)可用于数据表（8位×256）搜索。在数据表中，所有标准
您创建的ID以位为单位设置为有效或无效。当AFSR以16位单元写入数据时，包括MBj_ID(j=0到31)中的SID[10:0]位，其中存储了接收到的标准ID，解码的行（字节偏移）位置和列（位）数据表搜索的位置可以被读取。ASU只能用于标准（11位）ID。

ASU在以下情况下启用：

- 当接受过滤器不能屏蔽要接收的ID时。例如，如果要接收的ID是078h、087h和111h
- 当接收的ID太多时，预计软件过滤时间会缩短。

Note: CAN复位模式下不能设置AFSR。

图37.5显示了对AFSR的写入和读取。



Note 1. Write the same value as the 16-bit unit data, including the SID[10:0] bits in MBj_ID (j = 0 to 31).

Figure 37.5 Writes to and reads from AFSR

37.2.20 Error Interrupt Enable Register (EIER)

Address(es): CAN0.EIER 4005 084Ch, CAN1.EIER 4005 184Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	BLIE	OLIE	ORIE	BORIE	BOEIE	EPIE	EWIE	BEIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BEIE	Bus Error Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b1	EWIE	Error-Warning Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b2	EPIE	Error-Passive Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b3	BOEIE	Bus-Off Entry Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b4	BORIE	Bus-Off Recovery Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b5	ORIE	Overrun Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b6	OLIE	Overload Frame Transmit Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W
b7	BLIE	Bus Lock Interrupt Enable	0: Disable interrupt 1: Enable interrupt.	R/W

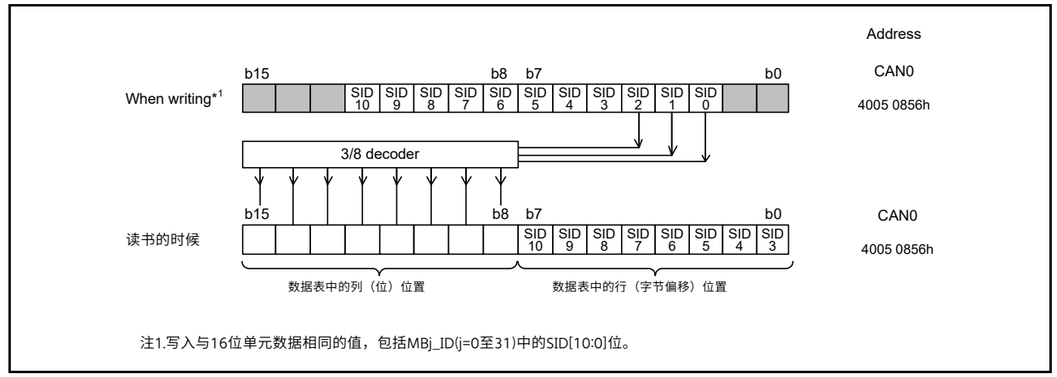
EIER enables or disables each error interrupt source independently in EIFR. Write to EIER in CAN reset mode.

BEIE bit (Bus Error Interrupt Enable)

When the BEIE bit is 0, no error interrupt request occurs even if the BEIF bit in EIFR is 1. When the BEIE bit is 1, an error interrupt request occurs if the BEIF bit is set to 1.

EWIE bit (Error-Warning Interrupt Enable)

When the EWIE bit is 0, no error interrupt request occurs even if the EWIF bit in EIFR is 1. When the EWIE bit is 1, an error interrupt request is generated if the EWIF bit is set to 1.



注1.写入与16位单元数据相同的值，包括MBj_ID(j=0至31)中的SID[10:0]位。

Figure 37.5 写入和读取AFSR

37.2.20 错误中断使能寄存器(EIER)

Address(es): CAN0.EIER 4005 084Ch, CAN1.EIER 4005 184Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	BLIE	OLIE	ORIE	BORIE	BOEIE	EPIE	EWIE	BEIE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	BEIE	总线错误中断使能	0：禁用中断1：启用中断。	R/W
b1	EWIE	错误警告中断使能	0：禁用中断1：启用中断。	R/W
b2	EPIE	错误被动中断使能	0：禁用中断1：启用中断。	R/W
b3	BOEIE	总线关闭进入中断使能	0：禁用中断1：启用中断。	R/W
b4	BORIE	总线关闭恢复中断使能	0：禁用中断1：启用中断。	R/W
b5	ORIE	溢出中断使能	0：禁用中断1：启用中断。	R/W
b6	OLIE	过载帧发送中断 Enable	0：禁用中断1：启用中断。	R/W
b7	BLIE	总线锁定中断使能	0：禁用中断1：启用中断。	R/W

EIER在EIFR中独立启用或禁用每个错误中断源。在CAN复位模式下写入EIER。

BEIE位（总线错误中断使能）

当BEIE位为0时，即使EIFR中的BEIF位为1，也不会发生错误中断请求。当BEIE位为1时，如果BEIF位设置为1，则会发生错误中断请求。

EWIE位（错误警告中断使能）

当EWIE位为0时，即使EIFR中的EWIF位为1，也不会产生错误中断请求。当EWIE位为1时，如果EWIF位被设置为1，则产生错误中断请求。

EPIE bit (Error-Passive Interrupt Enable)

When the EPIE bit is 0, no error interrupt request occurs even if the EPIF bit in EIFR is 1. When the EPIE bit is 1, an error interrupt request occurs if the EPIF bit is set to 1.

BOEIE bit (Bus-Off Entry Interrupt Enable)

When the BOEIE bit is 0, no error interrupt request occurs even if the BOEIF bit in EIFR is 1. When the BOEIE bit is 1, an error interrupt request occurs if the BOEIF bit is set to 1.

BORIE bit (Bus-Off Recovery Interrupt Enable)

When the BORIE bit is 0, no error interrupt request occurs even if the BORIF bit in EIFR is 1. When the BORIE bit is 1, an error interrupt request occurs if the BORIF bit is set to 1.

ORIE bit (Overrun Interrupt Enable)

When the ORIE bit is 0, no error interrupt request occurs even if the ORIF bit in EIFR is 1. When the ORIE bit is 1, an error interrupt request occurs if the ORIF bit is set to 1.

OLIE bit (Overload Frame Transmit Interrupt Enable)

When the OLIE bit is 0, no error interrupt request occurs even if the OLIF bit in EIFR is 1. When the OLIE bit is 1, an error interrupt request occurs if the OLIF bit is set to 1.

BLIE bit (Bus Lock Interrupt Enable)

When the BLIE bit is 0, no error interrupt request occurs even if the BLIF bit in EIFR is 1. When the BLIE bit is 1, an error interrupt request occurs if the BLIF bit is set to 1.

37.2.21 Error Interrupt Factor Judge Register (EIFR)

Address(es): CAN0.EIFR 4005 084Dh, CAN1.EIFR 4005 184Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	BLIF	OLIF	ORIF	BORIF	BOEIF	EPIF	EWIF	BEIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BEIF	Bus Error Detect Flag	0: No bus error detected 1: Bus error detected.	R/W
b1	EWIF	Error-Warning Detect Flag	0: No error-warning detected 1: Error-warning detected.	R/W
b2	EPIF	Error-Passive Detect Flag	0: No error-passive detected 1: Error-passive detected.	R/W
b3	BOEIF	Bus-Off Entry Detect Flag	0: No bus-off entry detected 1: Bus-off entry detected.	R/W
b4	BORIF	Bus-Off Recovery Detect Flag	0: No bus-off recovery detected 1: Bus-off recovery detected.	R/W
b5	ORIF	Receive Overrun Detect Flag	0: No receive overrun detected 1: Receive overrun detected.	R/W
b6	OLIF	Overload Frame Transmission Detect Flag	0: No overload frame transmission detected 1: Overload frame transmission detected.	R/W
b7	BLIF	Bus Lock Detect Flag	0: No bus lock detected 1: Bus lock detected.	R/W

If an event associated with one of these bits occurs, the associated bit in EIFR is set to 1, regardless of the setting of EIER.

Clear the bits to 0 through a software write. If a bit is set to 1 at the same time that the software clears it, it becomes 1. When setting a single bit to 0 in the software, use the transfer instruction (MOV) to ensure that only the specified bit is

EPIE位（错误被动中断使能）

当EPIE位为0时，即使EIFR中的EPIF位为1，也不会产生错误中断请求。当EPIE位为1时，如果EPIF位被设置为1，则会产生错误中断请求。

BOEIE位（总线关闭进入中断使能）

当BOEIE位为0时，即使EIFR中的BOEIF位为1，也不会产生错误中断请求。当BOEIE位为1时，如果将BOEIF位设置为1，则会产生错误中断请求。

BORIE位（总线关闭恢复中断使能）

当BORIE位为0时，即使EIFR中的BORIF位为1，也不会发生错误中断请求。当BORIE位为1时，如果BORIF位设置为1，则会发生错误中断请求。

ORIE位（溢出中断使能）

当ORIE位为0时，即使EIFR中的ORIF位为1，也不会发生错误中断请求。当ORIE位为1时，如果ORIF位设置为1，则会发生错误中断请求。

OLIE位（过载帧发送中断使能）

当OLIE位为0时，即使EIFR中的OLIF位为1，也不会发生错误中断请求。当OLIE位为1时，如果OLIF位设置为1，则会发生错误中断请求。

BLIE位（总线锁定中断使能）

当BLIE位为0时，即使EIFR中的BLIF位为1，也不会产生错误中断请求。当BLIE位为1时，如果BLIF位被设置为1，则会产生错误中断请求。

37.2.21 错误中断因素判断寄存器（EIFR）

Address(es): CAN0.EIFR 4005 084Dh, CAN1.EIFR 4005 184Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	BLIF	OLIF	ORIF	BORIF	BOEIF	EPIF	EWIF	BEIF
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	BEIF	总线错误检测标志	0：未检测到总线错误1 ：检测到总线错误。	R/W
b1	EWIF	错误警告检测标志	0：未检测到错误警告1：检 测到错误警告。	R/W

b7	BLIF	总线锁定检测标志	0：未检测到总线锁定1 ：检测到总线锁定。	R/W

如果发生与这些位之一相关的事件，则EIFR中的相关位设置为1，而不管EIER.

通过软件写入将这些位清除为0。如果某位在软件清零的同时置1，则变为1。在软件中设置单个位为0时，使用传输指令（MOV）确保只有指定位为

set to 0 and the other bits are set to 1. Writing 1 has no effect to these bit values.

BEIF flag (Bus Error Detect Flag)

The BEIF flag is set to 1 when a bus error is detected.

EWIF flag (Error-Warning Detect Flag)

The EWIF flag is set to 1 when the value of the receive error counter (REC) or transmit error counter (TEC) exceeds 95. It is set to 1 only when REC or TEC initially exceeds 95. If 0 is written to the EWIF flag by software while REC or TEC remains greater than 95, the EWIF flag does not set to 1 until REC or TEC goes below 95 and then exceeds 95 again.

EPIF flag (Error-Passive Detect Flag)

The EPIF flag is set to 1 when the CAN error state becomes error-passive, when the receive error counter (REC) or transmit error counter (TEC) value exceeds 127. It is set to 1 only when REC or TEC initially exceeds 127. If 0 is written to the EPIF flag by software while REC or TEC remains greater than 127, the flag does not set to 1 until REC or TEC goes below 127 and then exceeds 127 again.

BOEIF flag (Bus-Off Entry Detect Flag)

The BOEIF flag is set to 1 when the CAN error state becomes bus-off, when the transmit error counter (TEC) value exceeds 255. It also is set to 1 when the BOM[1:0] bits in CTLR are 01b (automatic entry to CAN halt mode on bus-off entry) and the CAN module becomes the bus-off state.

BORIF flag (Bus-Off Recovery Detect Flag)

The BORIF flag is set to 1 when the CAN module recovers from the bus-off state normally by detecting 11 consecutive recessive bits 128 times in the following conditions:

- When the BOM[1:0] bits in CTLR are 00b
- When the BOM[1:0] bits in CTLR are 10b
- When the BOM[1:0] bits in CTLR are 11b.

However, the BORIF flag does not set to 1 if the CAN module recovers from the bus-off state in the following conditions:

- When the CANM[1:0] bits in CTLR are set to 01b or 11b (CAN reset mode)
- When the RBOC bit in CTLR is set to 1 (forced return from bus-off)
- When the BOM[1:0] bits in CTLR are set to 01b
- When the BOM[1:0] bits in CTLR are set to 11b and the CANM[1:0] bits in CTLR are set to 10b (CAN halt mode) before normal recovery occurs.

Table 37.7 lists the behavior of the BOEIF and BORIF bits for each CTLR.BOM[1:0] bit setting.

Table 37.7 Behavior of BOEIF and BORIF flags for each CTLR.BOM[1:0] setting

BOM[1:0] bits	BOEIF bit	BORIF bit
00b	Set to 1 on entry to the bus-off state	Sets to 1 on exit from the bus-off state
01b		Does not set to 1
10b		Sets to 1 on exit from the bus-off state
11b		Sets to 1 if normal bus-off recovery occurs before the CANM[1:0] bits are set to 10b (CAN halt mode)

ORIF flag (Receive Overrun Detect Flag)

The ORIF flag is set to 1 when a receive overrun occurs. It does not set to 1 in overwrite mode.

In overwrite mode, a reception complete interrupt request occurs if an overwrite condition occurs and the ORIF bit is not set to 1.

设置为0，其他位设置为1。写入1对这些位值没有影响。

BEIF标志（总线错误检测标志）

当检测到总线错误时，BEIF标志设置为1。

EWIF标志（错误警告检测标志）

当接收错误计数器(REC)或发送错误计数器(TEC)的值超过95时，EWIF标志设置为1。仅当REC或TEC最初超过95时设置为1。如果将0写入EWIF标志通过软件，当REC或TEC保持大于95时，EWIF标志不会设置为1，直到REC或TEC低于95，然后再次超过95。

EPIF标志（错误被动检测标志）

当CAN错误状态变为被动错误，当接收错误计数器(REC)或发送错误计数器(TEC)值超过127时，EPIF标志设置为1。仅当REC或TEC最初超过127时，它才设置为1。如果0被软件写入EPIF标志，而REC或TEC保持大于127，则标志不会设置为1，直到REC或TEC低于127，然后再次超过127。

BOEIF标志（总线关闭进入检测标志）

当CAN错误状态变为总线关闭时，当发送错误计数器(TEC)值超过255时，BOEIF标志设置为1。当CTLR中的BOM[1:0]位为01b（自动进入总线关闭时进入CAN暂停模式）并且CAN模块变为总线关闭状态。

BORIF标志（总线关闭恢复检测标志）

当CAN模块在以下情况下通过检测11个连续的隐性位128次从总线关闭状态正常恢复时，BORIF标志设置为1：

- CTLR的BOM[1:0]位为00b时
- CTLR中BOM[1:0]位为10b时
- 当CTLR的BOM[1:0]位为11b时。

但是，如果CAN模块在以下情况下从总线关闭状态恢复，则BORIF标志不会设置为1：

- 当CTLR中的CANM[1:0]位设置为01b或11b时（CAN复位模式）
- 当CTLR的RBOC位设置为1时（从总线关闭强制返回）
- 当CTLR中的BOM[1:0]位设置为01b
- 当CTLR中的BOM[1:0]位设置为11b且CTLR中的CANM[1:0]位设置为10b（CAN停止模式）时，才会发生正常恢复。

表37.7列出了每个CTLR.BOM[1:0]位设置的BOEIF和BORIF位的行为。

Table 37.7 每个CTLR.BOM[1:0]设置的BOEIF和BORIF标志的行为

BOM[1:0] bits	BOEIF bit	BORIF bit
00b	进入总线关闭状态时设置为1	退出总线关闭状态时设置为1
01b		不设置为1
10b		退出总线关闭状态时设置为1
11b		如果在CANM[1:0]位设置为10b（CAN停止模式）之前发生正常的总线关闭恢复，则设置为1

ORIF标志（接收溢出检测标志）

当发生接收溢出时，ORIF标志设置为1。在覆盖模式下它不会设置为1。

在覆盖模式下，如果出现覆盖条件且ORIF位未设置为1，则会产生接收完成中断请求。

In overrun mode with normal mailbox mode, if an overrun occurs in any of mailboxes 0 to 31, this flag is set to 1. In overrun mode with FIFO mailbox mode, if an overrun occurs in any of mailboxes 0 to 23 or the receive FIFO, this bit is set to 1.

OLIF flag (Overload Frame Transmission Detect Flag)

The OLIF flag is set to 1 if the transmitting condition of an overload frame is detected when the CAN module is transmitting or receiving.

BLIF flag (Bus Lock Detect Flag)

The BLIF flag is set to 1 if 32 consecutive dominant bits are detected on the CAN bus while the CAN module is in CAN operation mode. After the BLIF flag is set to 1, 32 consecutive dominant bits are detected again under either of the following conditions:

- Recessive bits are detected after this flag changes to 0 from 1
- The CAN module enters CAN reset or halt mode and then enters CAN operation mode again after this flag changes to 0 from 1.

37.2.22 Receive Error Count Register (RECR)

Address(es): CAN0.RECR 4005 084Eh, CAN1.RECR 4005 184Eh

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Description	R/W
b7 to b0	Receive error count function RECR increments or decrements the counter value based on the error status of the CAN module during reception.	R

RECR indicates the value of the receive error counter. See the CAN specification (ISO11898-1) for the increment and decrement conditions of the receive error counter. The value of RECR in the bus-off state is undefined.

37.2.23 Transmit Error Count Register (TECR)

Address(es): CAN0.TECR 4005 084Fh, CAN1.TECR 4005 184Fh

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Description	R/W
b7 to b0	Transmit error count function TECR increments or decrements the counter value based on the error status of the CAN module during transmission.	R

TECR indicates the value of the transmit error counter. See the CAN specification (ISO11898-1) for the increment and decrement conditions of the transmit error counter. The value of TECR in the bus-off state is undefined.

在具有正常邮箱模式的溢出模式中，如果在任何邮箱0到31中发生溢出，则该标志设置为1。在具有FIFO邮箱模式的溢出模式中，如果在任何邮箱0到23或接收FIFO中发生溢出，该位设置为1。

OLIF标志（过载帧传输检测标志）

如果在CAN模块发送或接收时检测到过载帧的发送条件，则OLIF标志设置为1。

BLIF标志（总线锁定检测标志）

如果在CAN模块处于CAN操作模式时在CAN总线上检测到32个连续显性位，则BLIF标志设置为1。将BLIF标志设置为1后，在以下任一条件下再次检测到32个连续显性位：

- 此标志从1变为0后检测到隐性位
- CAN模块进入CAN复位或停止模式，然后在该标志由1变为0后再次进入CAN操作模式。

37.2.22 接收错误计数寄存器(RECR)

Address(es): CAN0.RECR 4005 084Eh, CAN1.RECR 4005 184Eh

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0

Bit	Description	R/W
b7 to b0	接收错误计数功能 RECR根据接收期间CAN模块的错误状态递增或递减计数器值。	R

RECR指示接收错误计数器的值。有关接收错误计数器的递增和递减条件，请参见CAN规范(ISO11898-1)。总线关闭状态下RECR的值未定义。

37.2.23 发送错误计数寄存器(TECR)

Address(es): CAN0.TECR 4005 084Fh, CAN1.TECR 4005 184Fh

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0

Bit	Description	R/W
b7 to b0	发送错误计数功能 TECR根据CAN模块在传输过程中的错误状态递增或递减计数器值。	R

TECR指示发送错误计数器的值。有关发送错误计数器的递增和递减条件，请参见CAN规范(ISO11898-1)。总线关闭状态下的TECR值未定义。

37.2.24 Error Code Store Register (ECSR)

Address(es): CAN0.ECSR 4005 0850h, CAN1.ECSR 4005 1850h

	b7	b6	b5	b4	b3	b2	b1	b0
	EDPM	ADEF	BE0F	BE1F	CEF	AEF	FEF	SEF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SEF	Stuff Error Flag*1,*2	0: No stuff error detected 1: Stuff error detected.	R/W
b1	FEF	Form Error Flag*1,*2	0: No form error detected 1: Form error detected.	R/W
b2	AEF	ACK Error Flag*1,*2	0: No ACK error detected 1: ACK error detected.	R/W
b3	CEF	CRC Error Flag*1,*2	0: No CRC error detected 1: CRC error detected.	R/W
b4	BE1F	Bit Error (recessive) Flag*1,*2	0: No bit error (recessive) detected 1: Bit error (recessive) detected.	R/W
b5	BE0F	Bit Error (dominant) Flag*1,*2	0: No bit error (dominant) detected 1: Bit error (dominant) detected.	R/W
b6	ADEF	ACK Delimiter Error Flag*1,*2	0: No ACK delimiter error detected 1: ACK delimiter error detected.	R/W
b7	EDPM	Error Display Mode Select*3,*4	0: Output first detected error code 1: Output accumulated error code.	R/W

Note 1. Writing 1 has no effect on these bit values.
Note 2. To write 0 to the SEF, FEF, AEF, CEF, BE1F, BE0F, and ADEF bits, use the transfer (MOV) instruction to ensure that only the specified bit is set to 0 and the other bits are set to 1.
Note 3. Write to the EDPM bit in CAN reset or halt mode.
Note 4. If more than one error condition is detected simultaneously, all related bits are set to 1.

ECSR indicates whether an error occurs on the CAN bus. See the CAN specification (ISO11898-1) for the conditions when each error occurs.

Clear all of the bits except for the EDPM bit to 0 through a software write. If a bit is set to 1 at the same time that the software clears it, it becomes 1.

SEF flag (Stuff Error Flag)

The SEF flag is set to 1 when a stuff error is detected.

FEF flag (Form Error Flag)

The FEF flag is set to 1 when a form error is detected.

AEF flag (ACK Error Flag)

The AEF flag is set to 1 when an ACK error is detected.

CEF flag (CRC Error Flag)

The CEF flag is set to 1 when a CRC error is detected.

BE1F flag (Bit Error (recessive) Flag)

The BE1F flag is set to 1 when a recessive bit error is detected.

BE0F flag (Bit Error (dominant) Flag)

The BE0F flag is set to 1 when a dominant bit error is detected.

37.2.24 错误代码存储寄存器(ECSR)

Address(es): CAN0.ECSR 4005 0850h, CAN1.ECSR 4005 1850h

	b7	b6	b5	b4	b3	b2	b1	b0
	EDPM	ADEF	BE0F	BE1F	CEF	AEF	FEF	SEF
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SEF	填充错误标志 *1,*2	0：未检测到填充错误1 ：检测到填充错误。	R/W
b1	FEF	表单错误标志 *1,*2	0：未检测到表单错误1 ：检测到表单错误。	R/W
b2	AEF	ACK错误标志 *1,*2	0：未检测到ACK错误1： 检测到ACK错误。	R/W
b3	CEF	CRC错误标志 *1,*2	0：未检测到CRC错误1： 检测到CRC错误。	R/W
b4	BE1F	位错误（隐性）标志 *1,*2	0：未检测到位错误（隐性）1：检 测到位错误（隐性）。	R/W
b5	BE0F	位错误（显性）标志 *1,*2	0：未检测到位错误（显性）1：检 测到位错误（显性）。	R/W
b6	ADEF	ACK定界符错误标志 *1,*2	0：未检测到ACK分隔符错误1：检 测到ACK分隔符错误。	R/W
b7	EDPM	错误显示模式选择 *3,*4	0：输出第一个检测到的错误代码 1：输出累积错误代码。	R/W

Note 1. 写1对这些位值没有影响。
Note 2. 要将0写入SEF、FEF、AEF、CEF、BE1F、BE0F和ADEF位，请使用传输(MOV)指令确保仅将指定位设置为0，而将其他位设置为1。
Note 3. 在CAN复位或暂停模式下写入EDPM位。
Note 4. 如果同时检测到多个错误条件，则所有相关位都设置为1。

ECSR指示CAN总线上是否发生错误。有关每个错误发生的条件，请参见CAN规范(ISO11898-1)。

通过软件写入将除EDPM位之外的所有位清零。如果在软件清零的同时将某个位设置为1，则该位变为1。

SEF标志（东西错误标志）

当检测到填充错误时，SEF标志设置为1。

FEF标志（表单错误标志）

当检测到表单错误时，FEF标志设置为1。

AEF标志（ACK错误标志）

当检测到ACK错误时，AEF标志设置为1。

CEF标志（CRC错误标志）

当检测到CRC错误时，CEF标志设置为1。

BE1F标志（位错误（隐性）标志）

当检测到隐性位错误时，BE1F标志设置为1。

BE0F标志（位错误（显性）标志）

当检测到显性位错误时，BE0F标志设置为1。

ADEF flag (ACK Delimiter Error Flag)

The ADEF flag is set to 1 when a form error is detected with the ACK delimiter during transmission.

EDPM bit (Error Display Mode Select)

The EDPM bit selects the output mode of ECSR. When the EDPM bit is set to 0, ECSR outputs the first error code. When the EDPM bit is set to 1, ECSR outputs the accumulated error code.

37.2.25 Time Stamp Register (TSR)

Address(es): CAN0.TSR 4005 0854h, CAN1.TSR 4005 1854h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	R/W
b15 to b0	Free-running counter value for the time stamp function	R

Note: Read TSR in 16-bit units.

When TSR is read, the value of the time stamp counter (16-bit free-running counter) at that moment is read. The time stamp counter reference clock is configured in the TSPS[1:0] bits in CTLR. The counter stops in CAN sleep and halt modes, and is initialized in CAN reset mode. Its value is stored in the TSL[7:0] and TSH[7:0] bits in MBj_TS when a received message is stored in a receive mailbox.

37.2.26 Test Control Register (TCR)

Address(es): CAN0.TCR 4005 0858h, CAN1.TCR 4005 1858h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TSTM[1:0]		TSTE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	TSTE	CAN Test Mode Enable	0: Disable CAN test mode 1: Enable CAN test mode.	R/W
b2, b1	TSTM[1:0]	CAN Test Mode Select	b2 b1 0 0: Not CAN test mode 0 1: Listen-only mode 1 0: Self-test mode 0 (external loopback) 1 1: Self-test mode 1 (internal loopback).	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TCR controls the CAN test mode. Write to TCR in CAN halt mode only.

(1) Listen-only mode

The CAN specification (ISO11898-1) recommends an optional bus monitoring mode. In listen-only mode, valid data frames and valid remote frames can be received. However, only recessive bits can be sent on the CAN bus. The ACK bit, overload flag, and active error flag cannot be sent.

Listen-only mode can be used for baud rate detection.

Do not request transmission from any mailboxes in listen-only mode.

Figure 37.6 shows the connection when listen-only mode is selected.

ADEF标志（ACK分隔符错误标志）

当在传输过程中使用ACK定界符检测到格式错误时，ADEF标志设置为1。

EDP M位（错误显示模式选择）

EDP M位选择ECSR的输出模式。当EDPM位设置为0时，ECSR输出第一个错误代码。
当EDPM位设置为1时，ECSR输出累积的错误代码。

37.2.25 时间戳寄存器(TSR)

Address(es): CAN0.TSR 4005 0854h, CAN1.TSR 4005 1854h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Description	R/W
b15 to b0	时间戳功能的自由运行计数器值	R

Note: 以16位为单位读取TSR。

读取TSR时，读取当时的时间戳计数器（16位自由运行计数器）的值。时间戳计数器参考时钟在CTLR的TSPS[1:0]位中配置。计数器在CAN睡眠和暂停模式下停止，并在CAN复位模式下初始化。当接收到的消息存储在接收邮箱中时，其值存储在MBj_TS中的TSL[7:0]和TSH[7:0]位中。

37.2.26 测试控制寄存器(TCR)

Address(es): CAN0.TCR 4005 0858h, CAN1.TCR 4005 1858h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TSTM[1:0]		TSTE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	TSTE	CAN测试模式启用	0：禁用CAN测试模式1： 启用CAN测试模式。	R/W
b2, b1	TSTM[1:0]	CAN测试模式选择	b2b100：非CAN测试模式01：只听模式1 0：自测模式0（外部环回）11：自测模式 1（内部环回）。	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

TCR控制CAN测试模式。仅在CAN停止模式下写入TCR。

(1) Listen-only mode

CAN规范(ISO11898-1)推荐一种可选的总线监控模式。在只听模式下，可以接收到有效的数据帧和有效的远程帧。但是，只能在CAN总线上发送隐性位。不能发送ACK位、过载标志和活动错误标志。

只听模式可用于波特率检测。

不要在只听模式下从任何邮箱请求传输。

图37.6显示了选择只听模式时的连接。

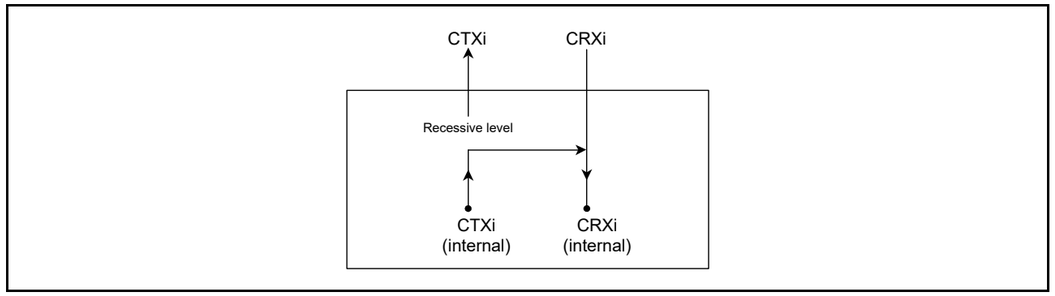

Figure 37.6 Connection when listen-only mode is selected (i = 0, 1)

(2) Self-test mode 0 (external loopback)

Self-test mode 0 is provided for CAN transceiver tests. In this mode, the protocol module treats its own transmitted messages as those received by the CAN transceiver and stores them into the receive mailbox. To be independent from external stimulation, the protocol module generates the ACK bit.

Connect the CTXi and CRXi pins to the transceiver.

Figure 37.7 shows the connection when self-test mode 0 is selected.

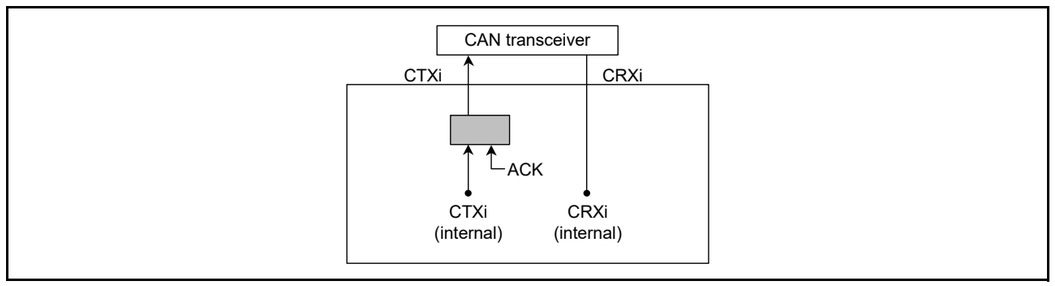

Figure 37.7 Connection when self-test mode 0 is selected (i = 0, 1)

(3) Self-test mode 1 (internal loopback)

Self-test mode 1 is provided for self-test functions.

In self-test mode 1, the protocol controller treats its transmitted messages as received messages and stores them into the receive mailbox. To be independent from external stimulation, the protocol controller generates the ACK bit.

In self-test mode 1, the protocol controller performs an internal feedback from the internal CTXi pin to the internal CRXi pin. The input value of the external CRXi pin is ignored. The external CTXi pin outputs only recessive bits. The CTXi and CRXi pins are not required to be connected to the CAN bus or any external device.

Figure 37.8 shows the connection when self-test mode 1 is selected.

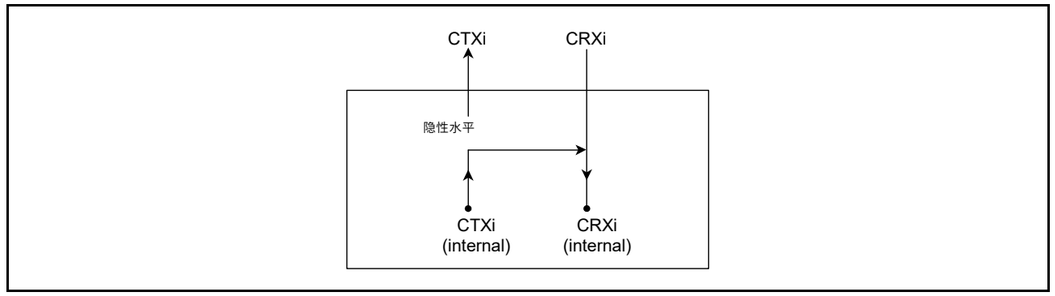

Figure 37.6 选择只听模式时的连接(i=0 1）

(2) Self-test mode 0 (external loopback)

自测模式0用于CAN收发器测试。在该模式下，协议模块将自己发送的报文视为CAN收发器接收到的报文，并将其存储到接收邮箱中。为独立于外部刺激，协议模块生成ACK位。

将CTXi和CRXi引脚连接到收发器。

图37.7显示了选择自检模式0时的连接。

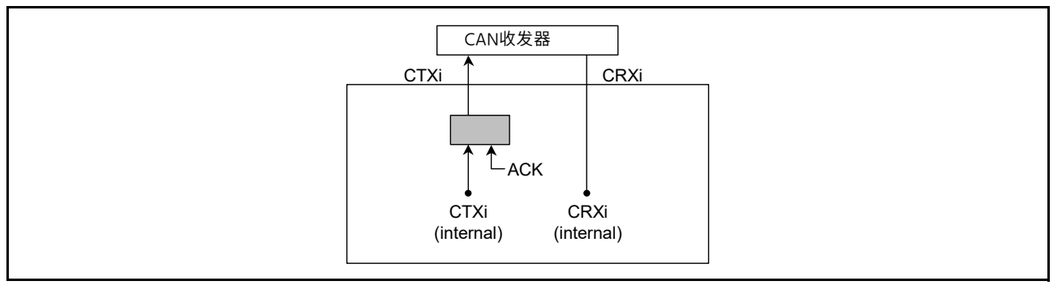

Figure 37.7 选择自检模式0时的连接(i=0 1）

(3) Self-test mode 1 (internal loopback)

自检模式1用于自检功能。

在自检模式1中，协议控制器将其发送的消息视为收到的消息，并将它们存储到接收邮箱中。为了独立于外部刺激，协议控制器生成ACK位。

在自检模式1中，协议控制器执行从内部CTXi引脚到内部CRXi引脚的内部反馈。外部CRXi引脚的输入值被忽略。外部CTXI引脚仅输出隐性位。CTXi和CRXi引脚不需要连接到CAN总线或任何外部设备。

图37.8显示了选择自检模式1时的连接。

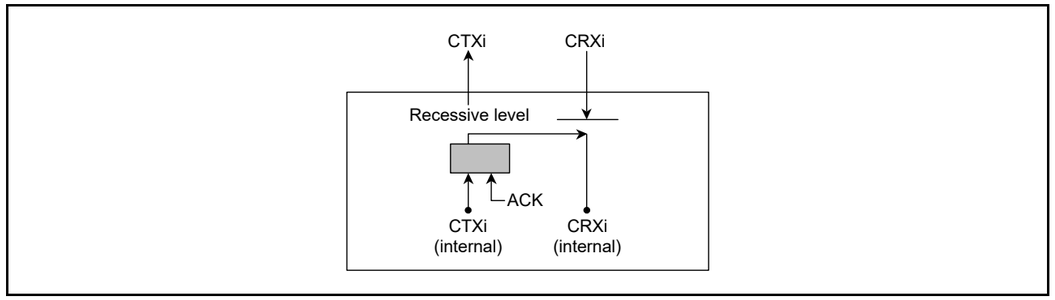

Figure 37.8 Connection when self-test mode 1 is selected (i = 0, 1)

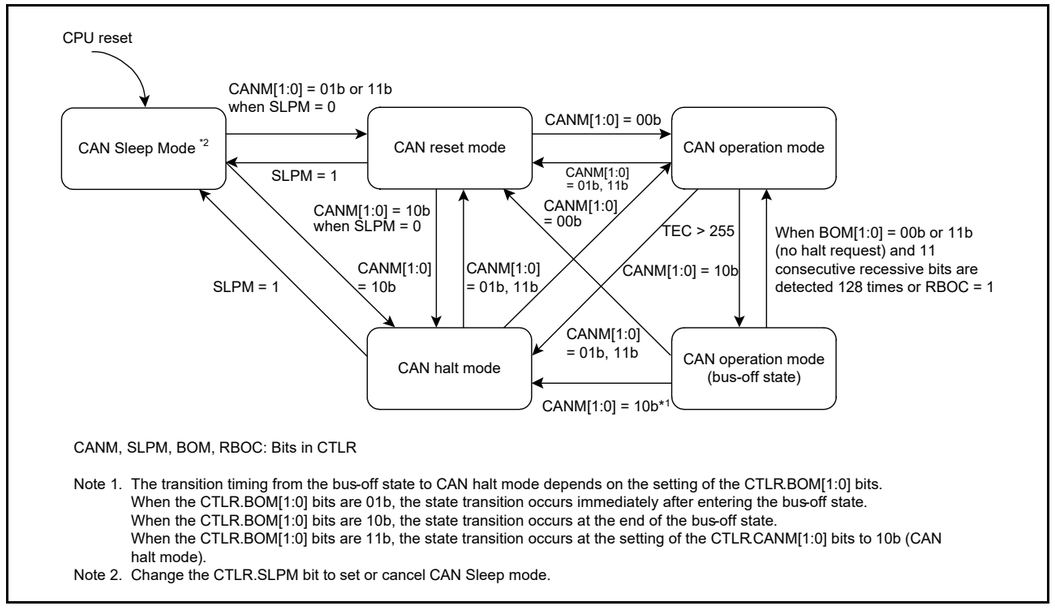
37.3 Operation Modes

The CAN module operation modes include:

- CAN reset mode
- CAN halt mode
- CAN operation mode
- CAN sleep mode.

Figure 37.9 shows the transitions between the operation modes.



Note 1. The transition timing from the bus-off state to CAN halt mode depends on the setting of the CTLR.BOM[1:0] bits.
When the CTLR.BOM[1:0] bits are 01b, the state transition occurs immediately after entering the bus-off state.
When the CTLR.BOM[1:0] bits are 10b, the state transition occurs at the end of the bus-off state.
When the CTLR.BOM[1:0] bits are 11b, the state transition occurs at the setting of the CTLR.CANM[1:0] bits to 10b (CAN halt mode).
Note 2. Change the CTLR.SLPM bit to set or cancel CAN Sleep mode.

Figure 37.9 Transition between different operation modes

37.3.1 CAN Reset Mode

CAN reset mode is provided for CAN communication configuration. When the CTLR.CANM[1:0] bits are set to 01b or 11b, the CAN module enters CAN reset mode. The STR.RSTST bit then is set to 1. Do not change the CTLR.CANM[1:0] bits until the RSTST bit is 1. Set BCR before exiting CAN reset mode to any other modes.

The following registers are initialized to their reset values after entering CAN reset mode, and their initial values are

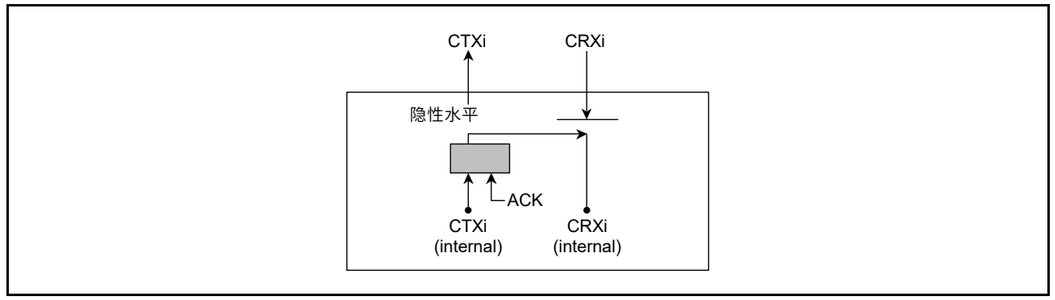


Figure 37.8 选择自检模式1时的连接(i=0 1）

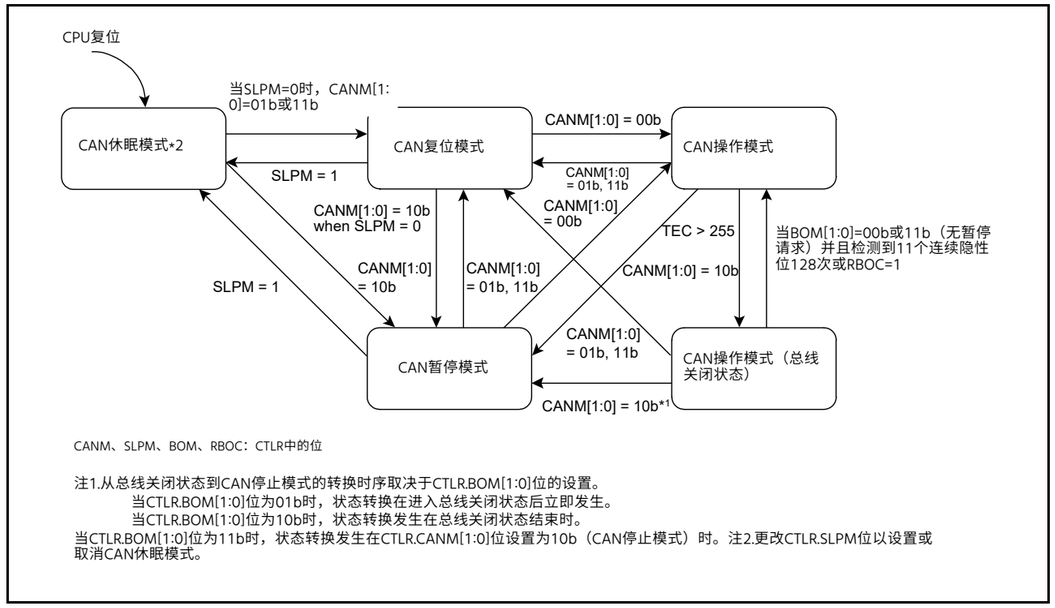
37.3 操作模式

CAN模块操作模式包括：

- CAN复位模式
- CAN暂停模式
- CAN操作模式
- CAN睡眠模式。

图37.9显示了操作模式之间的转换。



注1.从总线关闭状态到CAN停止模式的转换时序取决于CTLR.BOM[1:0]位的设置。
当CTLR.BOM[1:0]位为01b时，状态转换在进入总线关闭状态后立即发生。
当CTLR.BOM[1:0]位为10b时，状态转换发生在总线关闭状态结束时。
当CTLR.BOM[1:0]位为11b时，状态转换发生在CTLR.CANM[1:0]位设置为10b（CAN停止模式）时。注2.更改CTLR.SLPM位以设置或取消CAN休眠模式。

Figure 37.9 不同操作模式之间的转换

37.3.1 CAN复位模式

CAN复位模式用于CAN通信配置。当CTLR.CANM[1:0]位设置为01b或11b时，CAN模块进入CAN复位模式。然后将STR.RSTST位设置为1。在RSTST位为1之前不要更改CTLR.CANM[1:0]位。在退出CAN复位模式到任何其他模式之前设置BCR。

以下寄存器在进入CAN复位模式后初始化为其复位值，其初始值为

saved during CAN reset mode:

- MCTL_TXj and MCTL_RXj
- STR (except for the SLPST and TFST bits)
- EIFR
- RECR
- TECR
- TSR
- MSSR
- MSMR
- RFCR
- TFCR
- TCR
- ECSR (except for the EDPM bit).

The following registers retain their previous values even after entering CAN reset mode:

- CTLR
- STR (only the SLPST and TFST bits)
- MIER and MIER_FIFO
- EIER
- BCR
- CSSR
- ECSR (only the EDPM bit)
- MBj_ID, MBj_DL, MBj_Dm and MBj_TS
- MKRk
- FIDCR0 and FIDCR1
- MKIVLR
- AFSR
- RFPCR
- TFPCR.

37.3.2 CAN Halt Mode

CAN halt mode is used for mailbox configuration and test mode setting.

When the CTLR.CANM[1:0] bits are set to 10b, CAN halt mode is selected. Then the STR.HLTST bit is set to 1. Do not change the CTLR.CANM[1:0] bits until the HLTST bit is 1.

See Table 37.8 for the state transition conditions when transmitting or receiving.

All registers except for the RSTST, HLTST, and SLPST bits in STR remain unchanged when the CAN enters CAN halt mode.

Do not change CTLR (except for the CANM[1:0] and SLPM bits) and EIER in CAN halt mode. BCR can be changed in CAN halt mode only when listen-only mode is selected for automatic baud rate detection.

在CAN复位模式下保存：

- MCTL_TXj and MCTL_RXj
- STR（SLPST和TFST位除外）
- EIFR
- RECR
- TECR
- TSR
- MSSR
- MSMR
- RFCR
- TFCR
- TCR
- ECSR（EDPM位除外）。

即使在进入CAN复位模式后，以下寄存器仍保留其先前的值：

- CTLR
- STR（仅SLPST和TFST位）
- MIER and MIER_FIFO
- EIER
- BCR
- CSSR
- ECSR (only the EDPM bit)
- MBj_ID, MBj_DL, MBj_Dm and MBj_TS
- MKRk
- FIDCR0 and FIDCR1
- MKIVLR
- AFSR
- RFPCR
- TFPCR.

37.3.2 CAN暂停模式

CAN暂停模式用于邮箱配置和测试模式设置。

当CTLR.CANM[1:0]位设置为10b时，选择CAN暂停模式。然后将STR.HLTST位设置为1。在HLTST位为1之前不要更改CTLR.CANM[1:0]位。

发送或接收时的状态转换条件见表37.8。

当CAN进入CAN暂停模式时，除STR中的RSTST、HLTST和SLPST位之外的所有寄存器都保持不变。

不要在CAN暂停模式下更改CTLR（CANM[1:0]和SLPM位除外）和EIER。BCR可以在仅当为自动波特率检测选择只听模式时，才可以暂停模式。

Table 37.8 Operation in CAN reset and halt modes

Operation mode	Receiver	Transmitter	Bus-off
CAN reset mode (forced transition) CANM[1:0] = 11b	CAN module enters CAN reset mode without waiting for the end of message reception.	CAN module enters CAN reset mode without waiting for the end of message transmission.	CAN module enters CAN reset mode without waiting for the end of bus-off recovery.
CAN reset mode CANM[1:0] = 01b	CAN module enters CAN reset mode without waiting for the end of message reception.	CAN module enters CAN reset mode after waiting for the end of message transmission.*1,*4	CAN module enters CAN reset mode without waiting for the end of bus-off recovery.
CAN halt mode	CAN module enters CAN halt mode after waiting for the end of message reception.*2,*3	CAN module enters CAN halt mode after waiting for the end of message transmission.*1,*4	When the BOM[1:0] bits are 00b: A halt request from software is accepted only after bus-off recovery. When the BOM[1:0] bits are 01b: CAN module automatically enters CAN halt mode without waiting for the end of bus-off recovery, regardless of a halt request from the software. When the BOM[1:0] bits are 10b: CAN module automatically enters CAN halt mode after waiting for the end of bus-off recovery, regardless of a halt request from software. When the BOM[1:0] bits are 11b: CAN module enters CAN halt mode without waiting for the end of bus-off recovery, if a halt is requested by software during bus-off.

BOM[1:0] bits: Bits in CTLR

Note 1. If transmission of multiple messages is requested, a mode transition occurs on completion of the first transmission. If the CAN reset mode is being requested during suspend transmission, mode transition occurs when the bus is idle, the next transmission ends, or the CAN module becomes a receiver.
Note 2. If the CAN bus is locked at the dominant level, the program can detect this state by monitoring the BLIF bit in EIFR.
Note 3. If a CAN bus error occurs during reception after CAN halt mode is requested, the CAN module transitions to CAN halt mode.
Note 4. If a CAN bus error or arbitration-lost occurs during transmission after CAN reset mode or CAN halt mode is requested, the CAN module transits to the requested CAN mode.

37.3.3 CAN Sleep Mode

CAN sleep mode reduces power consumption by stopping the clock supply to the CAN module. After a reset from an MCU pin or a software reset, the CAN module starts from CAN sleep mode.

When the SLPM bit in CTLR is set to 1, the CAN module enters CAN sleep mode. Then the SLPST bit in STR is set to 1. Do not change the value of the SLPM bit until the SLPST bit is 1. The other registers remain unchanged when the CAN module enters CAN sleep mode.

Write to the SLPM bit in CAN reset mode and CAN halt mode. Do not change any registers (except for the SLPM bit) during CAN sleep mode. Read operation is still allowed.

When the SLPM bit is set to 0, the CAN module is released from CAN sleep mode. When the CAN module exits CAN sleep mode, the other registers remain unchanged.

37.3.4 CAN Operation Mode (Excluding Bus-Off State)

CAN operation mode is used for CAN communication.

When the CANM[1:0] bits in CTLR are set to 00b, the CAN module enters CAN operation mode. Then the RSTST and HLTST bits in STR set to 0. Do not change the value of the CANM[1:0] bits until the RSTST and HLTST bits are 0.

If 11 consecutive recessive bits are detected after entering CAN operation mode, the following occurs:

- The CAN module becomes an active node on the network, which enables transmission and reception of CAN

Table 37.8 CAN复位和暂停模式下的操作

操作模式	Receiver	Transmitter	Bus-off
CAN复位模式（强制转换）CANM[1:0]=11b	CAN模块无需等待报文接收结束即可进入CAN复位模式。	CAN模块无需等待报文传输结束就进入CAN复位模式。	CAN模块无需等待总线关闭恢复结束即可进入CAN复位模式。
CAN复位模式CANM[1:0]=01b	CAN模块无需等待报文接收结束即可进入CAN复位模式。	CAN模块等待报文传输结束后进入CAN复位模式。*1 *4	CAN模块无需等待总线关闭恢复结束即可进入CAN复位模式。
CAN暂停模式	CAN模块等待报文接收结束后进入CAN暂停模式。*2 *3	CAN模块等待报文传输结束后进入CAN停止模式。*1 *4	当BOM[1:0]位为00b时： 仅在总线关闭恢复后才接受来自软件的暂停请求。 当BOM[1:0]位为01b时： CAN模块自动进入CAN停止模式，无需等待总线关闭恢复结束，无论来自软件的停止请求如何。 当BOM[1:0]位为10b时： CAN模块在等待总线关闭恢复结束后自动进入CAN停止模式，无论软件是否有停止请求。 当BOM[1:0]位为11b时： 如果在总线关闭期间软件请求停止，CAN模块无需等待总线关闭恢复结束即可进入CAN停止模式。

BOM[1:0] bits: CTLR中的位

Note 1. 如果请求传输多个消息，则在第一次传输完成时发生模式转换。如果在暂停传输期间请求CAN复位模式，则在总线空闲、下一次传输结束或CAN模块成为接收器时发生模式转换。
Note 2. 如果CAN总线被锁定在显性电平，程序可以通过监控EIFR中的BLIF位来检测该状态。
Note 3. 如果在请求CAN暂停模式后接收期间发生CAN总线错误，则CAN模块将转换到CAN暂停模式。
Note 4. 如果在请求CAN复位模式或CAN暂停模式后的传输过程中发生CAN总线错误或仲裁丢失，则CAN模块将转换到请求的CAN模式。

37.3.3 CAN睡眠模式

CAN睡眠模式通过停止向CAN模块提供时钟来降低功耗。从一个复位后MCU引脚或软件复位，CAN模块从CAN睡眠模式启动。

当CTLR中的SLPM位设置为1时，CAN模块进入CAN休眠模式。然后将STR中的SLPST位设置为1。在SLPST位为1之前不要更改SLPM位的值。当CAN模块进入CAN休眠模式时，其他寄存器保持不变。

在CAN复位模式和CAN暂停模式下写入SLPM位。在CAN睡眠模式期间不要更改任何寄存器（SLPM位除外）。仍然允许读取操作。

当SLPM位设置为0时，CAN模块从CAN睡眠模式中释放。当CAN模块退出CAN休眠模式时，其他寄存器保持不变。

37.3.4 CAN操作模式（不包括总线关闭状态）

CAN操作模式用于CAN通信。

当CTLR中的CANM[1:0]位设置为00b时，CAN模块进入CAN操作模式。然后RSTST和STR中的HLTST位设置为0。在RSTST和HLTST位为0之前，不要更改CANM[1:0]位的值。

如果在进入CAN操作模式后检测到11个连续的隐性位，则会发生以下情况：

- CAN模块成为网络上的一个有源节点，使CAN的传输和接收成为可能

messages

- Error monitoring of the CAN bus, such as receive and transmit error counters, is performed.

During CAN operation mode, the CAN module might be in one of the following three sub-modes, depending on the status of the CAN bus.

- Idle mode: No transmission or reception occurs
- Receive mode: A CAN message sent by another node is being received
- Transmit mode: A CAN message is being transmitted. The CAN module receives a message transmitted by the local node simultaneously when self-test mode 0 (TSTM[1:0] bits in TCR = 10b) or self-test mode 1 (TSTM[1:0] bits = 11b) is selected.

Figure 37.10 demonstrates the sub-modes in CAN operation mode.

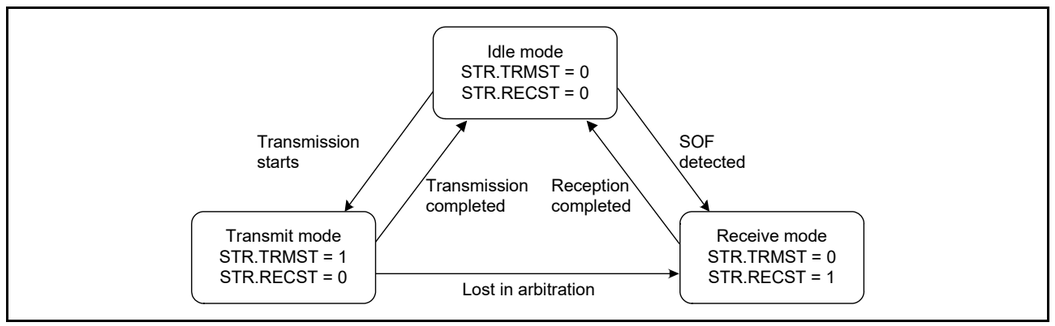


Figure 37.10 Sub-modes of CAN operation mode

37.3.5 CAN Operation Mode (Bus-Off State)

The CAN module enters the bus-off state based on the incrementing decrementing rules for the transmit and error counters defined in the CAN Specifications. The following cases apply when the CAN module is recovering from the bus-off state. When the CAN module is in the bus-off state, the values of the CAN-related registers remain unchanged, except for those in STR, EIFR, RECR, TECR, and TSR.

(1) When CTLR.BOM[1:0] = 00b (normal mode)

The CAN module enters the error-active state after it completes recovery from the bus-off state and CAN communication is enabled. The BORIF flag in EIFR is set to 1 (bus-off recovery detected) at this time.

(2) When CTLR.RBOC = 1 (forced return from bus-off)

The CAN module enters the error-active state when it is in the bus-off state and the RBOC bit is 1. CAN communication is enabled again after 11b consecutive recessive bits are detected. The BORIF bit does not set to 1 at this time.

(3) When CTLR.BOM[1:0] = 01b (automatic transition to CAN halt mode on bus-off)

The CAN module enters CAN halt mode when it reaches the bus-off state. The BORIF flag does not set to 1 at this time.

(4) When CTLR.BOM[1:0] = 10b (automatic transition to CAN halt mode on bus-off end)

The CAN module enters CAN halt mode when it completes recovery from bus-off. The BORIF flag is set to 1 at this time.

(5) When CTLR.BOM[1:0] = 11b (automatic transition to CAN halt mode through software) and CTLR.CANM[1:0] = 10b (CAN halt mode) during bus-off state

The CAN module enters CAN halt mode when it is in the bus-off state and the CANM[1:0] bits are set to 10b (CAN halt mode). The BORIF flag does not set to 1 at this time.

If the CANM[1:0] bits are not set to 10b during bus-off, the same behavior as (1) applies.

messages

- 执行CAN总线的错误监控，例如接收和发送错误计数器。

在CAN操作模式下，CAN模块可能处于以下三种子模式之一，具体取决于CAN总线的状态。

- 空闲模式：没有发送或接收发生
- 接收模式：正在接收另一个节点发送的CAN报文
- 传输模式：正在传输CAN消息。选择自测模式0（TCR中的TSTM[1:0]位=10b）或自测模式1（TSTM[1:0]位=11b）时，CAN模块同时接收本地节点发送的消息.

图37.10展示了CAN操作模式下的子模式。

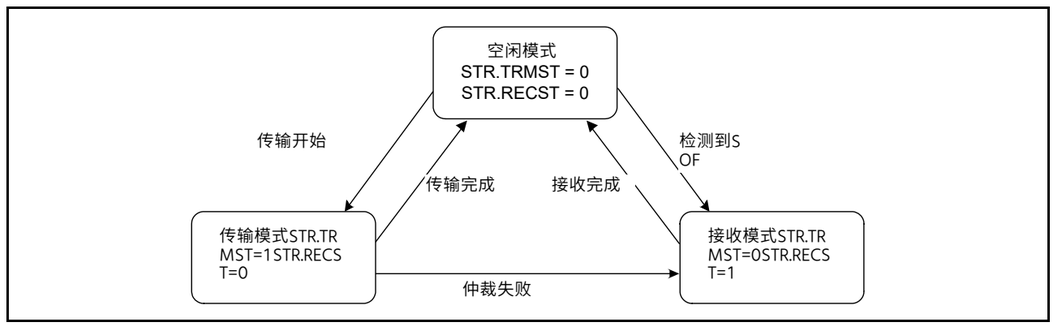

Figure 37.10 CAN操作模式的子模式

37.3.5 CAN操作模式（总线关闭状态）

CAN模块根据CAN规范中定义的发送和错误计数器的递增递减规则进入总线关闭状态。以下情况适用于CAN模块从总线关闭状态恢复时。当CAN模块处于总线关闭状态时，CAN相关寄存器的值保持不变，除了STR、EIFR、RECR、TECR和TSR中的值。

(1) When CTLR.BOM[1:0] = 00b (normal mode)

CAN模块在完成从总线关闭状态恢复并启用CAN通信后进入错误激活状态。此时EIFR中的BORIF标志设置为1（检测到总线关闭恢复）。

(2) 当CTLR.RBOC=1时（从总线关闭强制返回）

当CAN模块处于总线关闭状态且RBOC位为1时，进入错误激活状态。在检测到11b个连续的隐性位后再次启用CAN通信。此时BORIF位不设置为1。

(3) 当CTLR.BOM[1:0]=01b时（总线关闭时自动转换到CAN暂停模式）

CAN模块在达到总线关闭状态时进入CAN停止模式。BORIF标志此时不设置为1。

(4) 当CTLR.BOM[1:0]=10b时（在总线关闭结束时自动转换到CAN暂停模式）

CAN模块在完成总线关闭恢复后进入CAN暂停模式。此时BORIF标志设置为1。

(5) 当CTLR.BOM[1:0]=11b（通过软件自动转换到CAN暂停模式）并且总线关闭状态期间CTLR.CANM[1:0]=10b（CAN停止模式）

CAN模块在总线关闭状态且CANM[1:0]位设置为10b（CAN停止模式）时进入CAN停止模式。BORIF标志此时不设置为1。

如果在总线关闭期间CANM[1:0]位未设置为10b，则适用与(1)相同的行为。

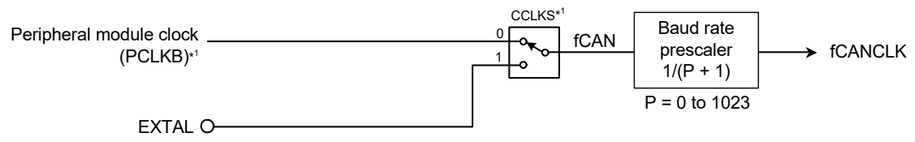
37.4 Data Transfer Rate Configuration

This section describes how to configure the data transfer rate.

37.4.1 Clock Setting

The CAN module has a CAN clock generator that can be set by the CCLKS and the BRP[9:0] bits in the BCR register.

Figure 37.11 shows a block diagram of the CAN clock generator.



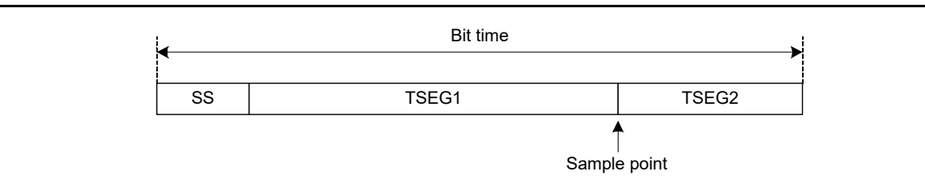
CCLKS: Bit in the BCR register
fCAN: CAN system clock
P: Value selected in BRP[9:0] bits in BCR (P = 0 to 1023)
fCANCLK: CAN communication clock (fCANCLK = fCAN/(P + 1))

Note 1. See section 9, Clock Generation Circuit. When using the CAN module while the CCLKS bit is cleared to 0, PLL must be selected as the source of the peripheral module clock.

Figure 37.11 Block diagram of CAN clock generator

37.4.2 Bit Timing Setting

The bit time consists of the following three segments shown in Figure 37.12.



The range of each segment: Bit time = 8 Tq to 25 Tq
SS = 1 Tq
TSEG1 = 4 Tq to 16 Tq
TSEG2 = 2 Tq to 8 Tq
SJW = 1 Tq to 4 Tq
Setting of TSEG1 and TSEG2: TSEG1 > TSEG2 ≥ SJW

Figure 37.12 Bit timing

37.4.3 Data Transfer Rate

The data transfer rate depends on the division value of fCAN (CAN system clock), the division value of the baud rate prescaler, and the Tq count for 1 bit time.

$$\text{Data transfer rate (bps)} = \frac{\text{fCAN}}{\text{Baud rate prescaler division value*1 x number of Tq of 1 bit time}} = \frac{\text{fCANCLK}}{\text{Tq count for 1 bit time}}$$

Note 1. Division value of baud rate prescaler = P + 1 (P: 0 to 1023), where P is the BRP[9:0] setting in BCR.

Table 37.9 lists data transfer rate examples.

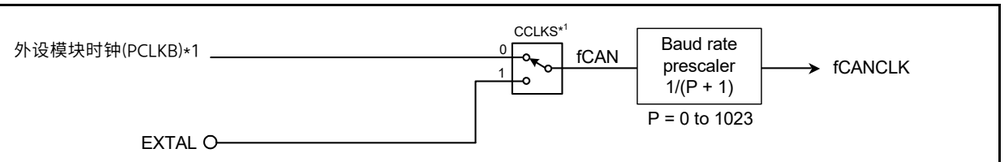
37.4 数据传输率配置

本节介绍如何配置数据传输速率。

37.4.1 时钟设置

CAN模块有一个CAN时钟发生器，可以通过BCR寄存器中的CCLKS和BRP[9:0]位进行设置。

图37.11显示了CAN时钟发生器的框图。



CCLKS: BCR寄存器中的位
fCAN: CAN系统时钟
P：在BCR中的BRP[9:0]位中选择的值（P=0到1023）fCANCLK：
CAN通信时钟（fCANCLK=fCAN(P+1)）

注1.见第9节，时钟生成电路。在CCLKS位清0时使用CAN模块时，必须选择PLL作为外设模块时钟源。

Figure 37.11 CAN时钟发生器框图

37.4.2 位时序设置

位时间由图37.12所示的以下三个部分组成。

每个段的范围： 位时间=8Tq到25TqSS=
1Tq
TSEG1 = 4 Tq to 16 Tq
TSEG2 = 2 Tq to 8 Tq
SJW = 1 Tq to 4 Tq
TSEG1和TSEG2的设置：TSEG1>TSEG2 SJW

Figure 37.12 位时序

37.4.3 数据传输率

数据传输速率取决于fCAN（CAN系统时钟）的分频值、波特率预分频器的分频值和1位时间的Tq计数。

$$\text{数据传输率(bps)} = \frac{\text{fCAN}}{\text{波特率预分频器分频值*1x1位时间的Tq数}} = \frac{\text{fCANCLK}}{\text{1位时间的Tq计数}}$$

注1.波特率预分频器的分频值=P+1(P:0to1023)，其中P是BCR中的BRP[9:0]设置。

表37.9列出了数据传输率示例。

Table 37.9 Data transfer rate examples

fCAN	50 MHz		48 MHz		40 MHz		32 MHz	
Data transfer rate	Tq count	P + 1	Tq count	P + 1	Tq count	P + 1	Tq count	P + 1
1 Mbps	10 Tq 25 Tq	5 2	8 Tq 12 Tq 16 Tq	6 4 3	10 Tq 20 Tq	4 2	8 Tq 16 Tq	4 2

37.5 邮箱和掩码寄存器结构

图37.13显示了32个邮箱寄存器的结构：MBj_ID、MBj_DL、MBj_Dm和MBj_TS。

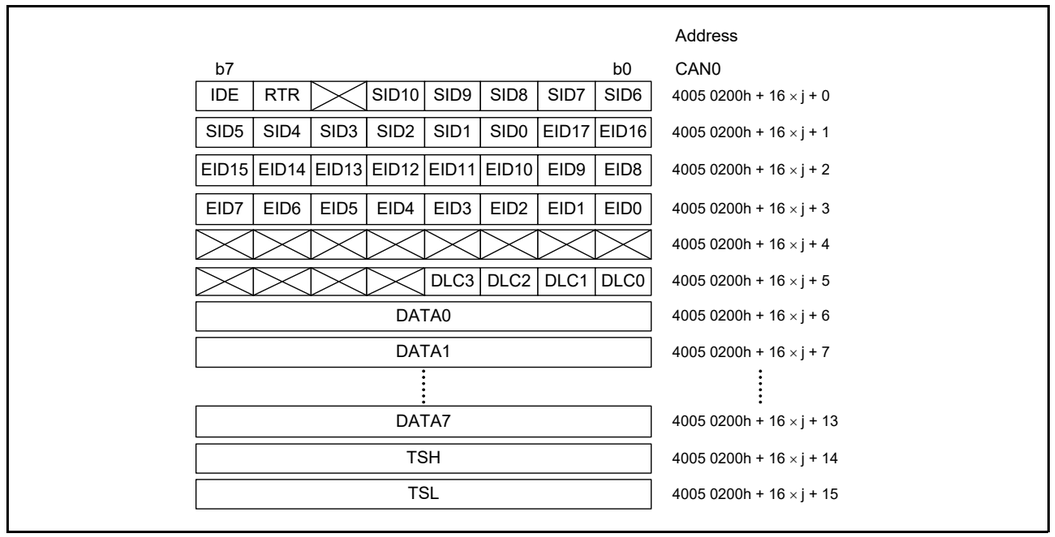

Figure 37.13 邮箱寄存器的结构（j=0到31）

图37.14显示了八个屏蔽寄存器的结构：MKRk。

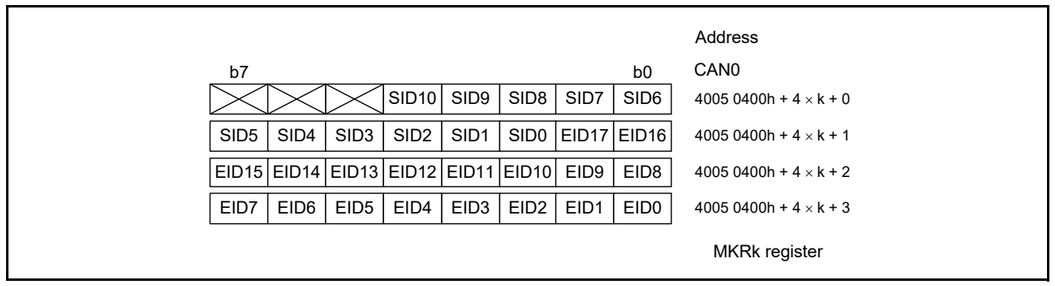

Figure 37.14 Structure of the MKRk registers (k = 0 to 7)

Figure 37.15 shows the structure of the two FIFO receive ID compare registers: FIDCR0 and FIDCR1.

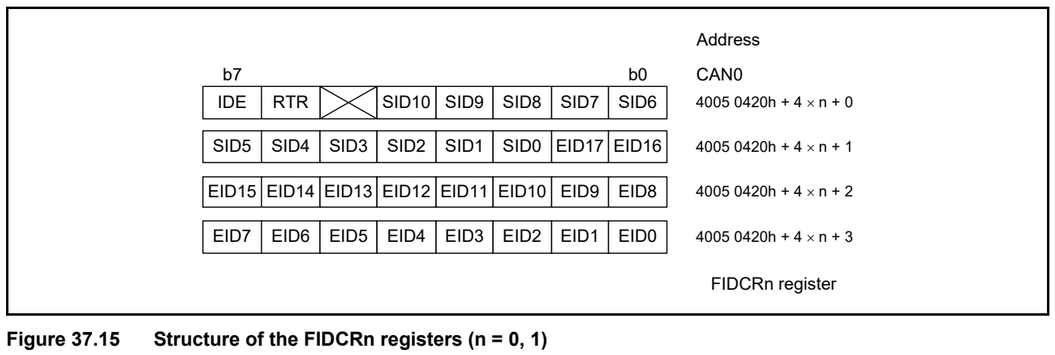

Figure 37.15 Structure of the FIDCRn registers (n = 0, 1)

37.6 Acceptance Filtering and Masking Functions

The acceptance filtering and masking functions allow you to select and receive messages with multiple IDs for mailboxes within a specified range.

The MKRk registers can mask the standard ID and the extended ID for 29 bits.

- MKR0 controls mailboxes 0 to 3
- MKR1 controls mailboxes 4 to 7
- MKR2 controls mailboxes 8 to 11
- MKR3 controls mailboxes 12 to 15
- MKR4 controls mailboxes 16 to 19
- MKR5 controls mailboxes 20 to 23
- MKR6 controls mailboxes 24 to 27 in normal mailbox mode and the receive FIFO mailboxes 28 to 31 in FIFO mailbox mode
- MKR7 controls mailboxes 28 to 31 in normal mailbox mode and the receive FIFO mailboxes 28 to 31 in FIFO mailbox mode.

MKIVLR disables acceptance filtering independently for each mailbox.

The IDE bit in MBj_ID is valid when the IDFM[1:0] bits in CTLR are 10b (mixed ID mode).

The RTR bit in MBj_ID selects a data or remote frame.

In FIFO mailbox mode, the normal mailboxes (0 to 23) use one associated register from MKR0 to MKR5 for acceptance filtering. The receive FIFO mailboxes (28 to 31) use two registers, MKR6 and MKR7, for acceptance filtering.

The receive FIFO also uses two registers, FIDCR0 and FIDCR1, for ID comparison. The EID[17:0], SID[10:0], RTR,

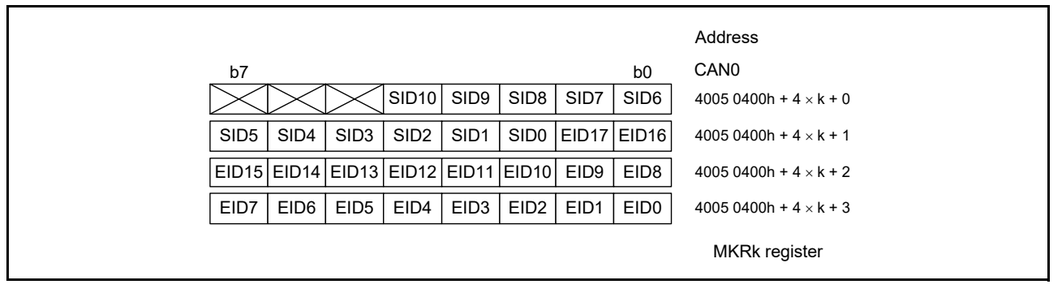

Figure 37.14 MKRk寄存器的结构（k=0到7）

图37.15显示了两个FIFO接收ID比较寄存器的结构：FIDCR0和FIDCR1。

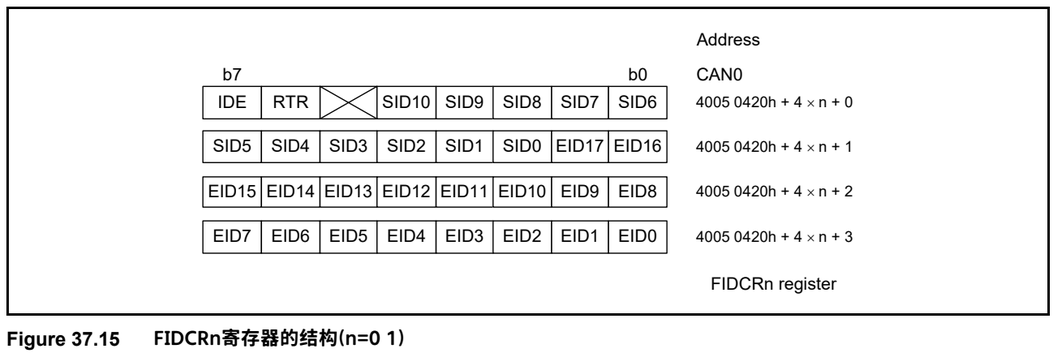

Figure 37.15 FIDCRn寄存器的结构(n=0 1)

37.6 接受过滤和屏蔽功能

接受过滤和屏蔽功能允许您为指定范围内的邮箱选择和接收具有多个ID的消息。

MKRk寄存器可以屏蔽29位的标准ID和扩展ID。

- MKR0控制邮箱0到3
- MKR1控制邮箱4到7
- MKR2控制邮箱8到11
- MKR3控制邮箱12到15
- MKR4控制邮箱16到19
- MKR5控制邮箱20到23
- MKR6在正常邮箱模式下控制邮箱24到27，在FIFO邮箱模式下控制接收FIFO邮箱28到31
- MKR7在正常邮箱模式下控制邮箱28到31，在FIFO邮箱模式下控制接收FIFO邮箱28到31。

MKIVLR为每个邮箱单独禁用接受过滤。

当CTLR中的IDFM[1:0]位为10b（混合ID模式）时，MBj_ID中的IDE位有效。

MBj_ID中的RTR位选择数据或远程帧。

在FIFO邮箱模式下，普通邮箱（0到23）使用一个从MKR0到MKR5的关联寄存器进行接受过滤。接收FIFO邮箱（28到31）使用两个寄存器MKR6和MKR7，用于接受过滤。

接收FIFO还使用两个寄存器FIDCR0和FIDCR1进行ID比较。EID[17:0]、SID[10:0]、RTR、

and IDE bits in mailbox28 to mailbox31 for the receive FIFO are disabled. As acceptance filtering depends on the result of two logic OR operations, two ranges of IDs can be received into the receive FIFO.

MKIVLR is disabled for the receive FIFO.

If different standard ID and extended ID values are set in the IDE bits in FIDCR0 and FIDCR1, both ID formats are received.

If different data frame and remote frame values are set in the RTR bits in FIDCR0 and FIDCR1, both data and remote frames are received.

When a combination of two ranges of IDs is not necessary, set the same mask value and the same ID into both the FIFO ID and mask registers.

Figure 37.16 shows the associations between the mask registers and mailboxes. Figure 37.17 shows the acceptance filtering.

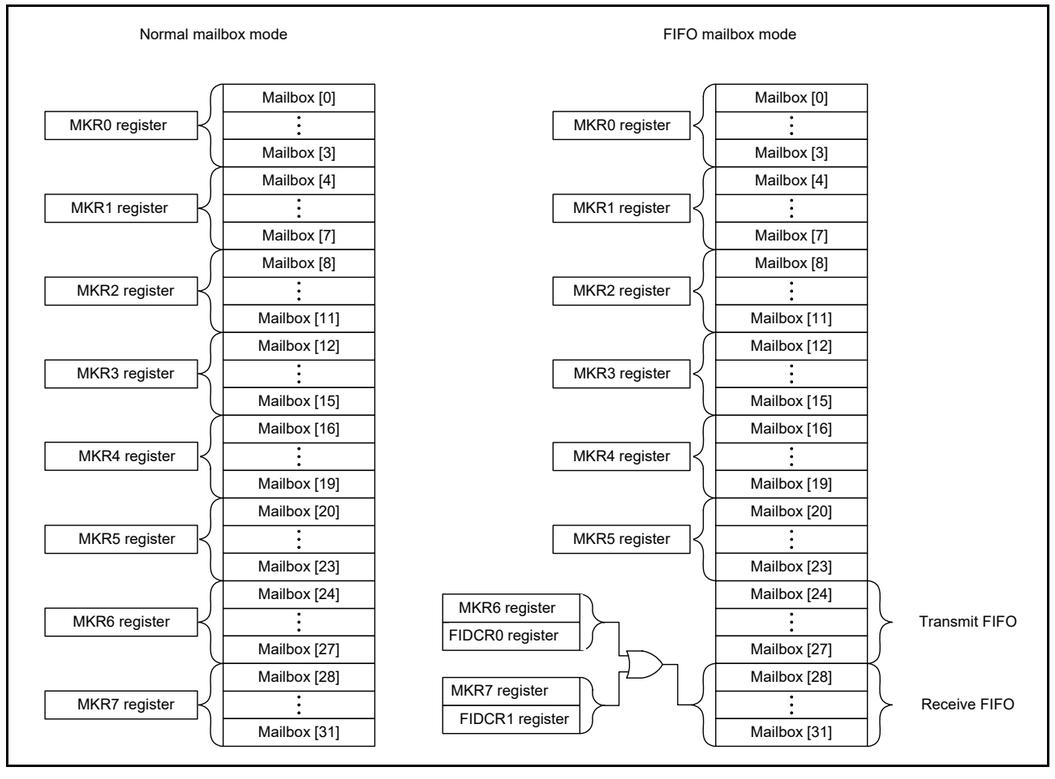

Figure 37.16 Associations between mask registers and mailboxes

接收FIFO的邮箱28到邮箱31中的IDE位被禁用。由于接受过滤取决于两个逻辑或运算的结果，因此可以将两个范围的ID接收到接收FIFO中。

MKIVLR对接收FIFO禁用。

如果在FIDCR0和FIDCR1的IDE位中设置了不同的标准ID和扩展ID值，则会接收两种ID格式。

如果在FIDCR0和FIDCR1的RTR位中设置了不同的数据帧和远程帧值，则数据帧和远程帧都被接收。

当不需要组合两个范围的ID时，将相同的掩码值和相同的ID设置到两个FIFO中
ID和掩码寄存器。

图37.16显示了掩码寄存器和邮箱之间的关联。图37.17显示了接受过滤。

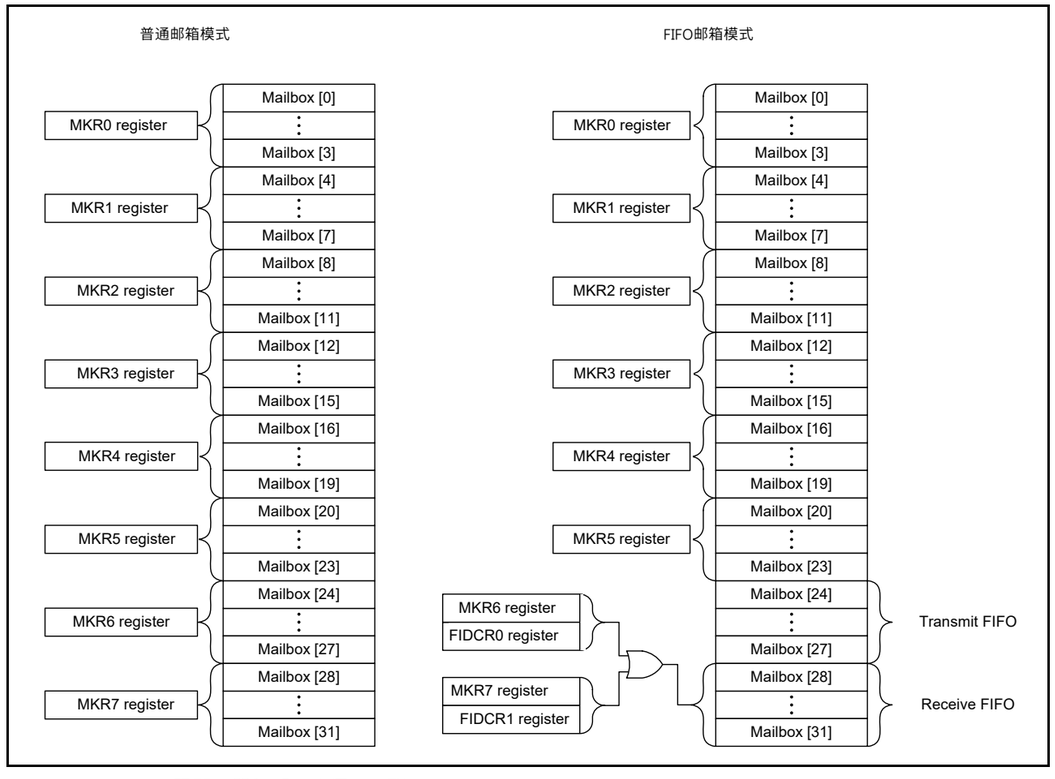

Figure 37.16 掩码寄存器和邮箱之间的关联

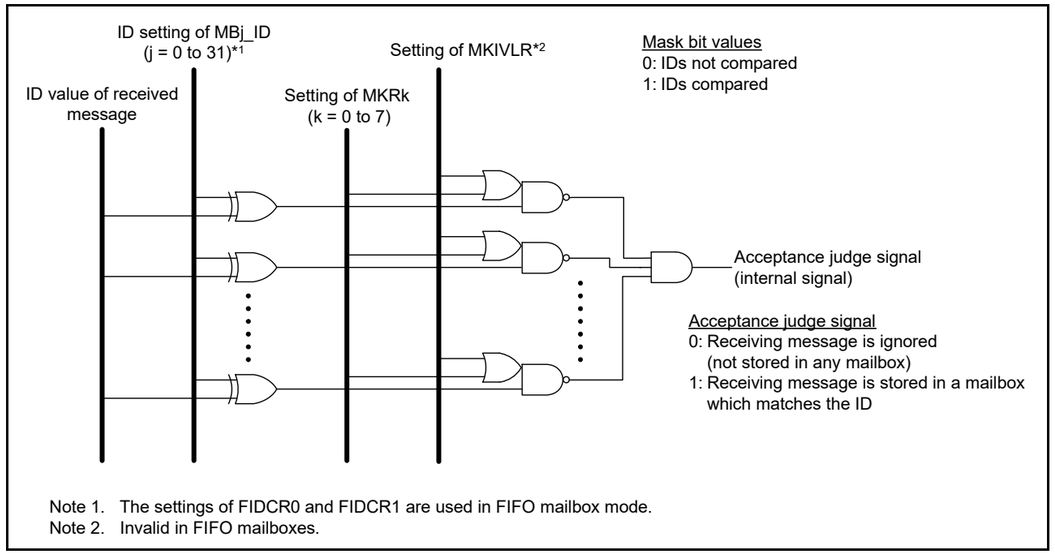

Figure 37.17 Acceptance filtering

37.7 Reception and Transmission

Table 37.10 lists the CAN communication mode settings.

Table 37.10 Settings for CAN receive and transmit modes

MCTL_TXj.TRMREQ and MCTL_RXj.TRMREQ	MCTL_TXj.RECREQ and MCTL_RXj.RECREQ	MCTL_TXj.ONESHOT and MCTL_RXj.ONESHOT	Mailbox communication mode
0	0	0	Mailbox disabled or transmission being aborted
0	0	1	Can be configured only when transmission or reception from a mailbox programmed in one-shot mode is aborted
0	1	0	Configured as a receive mailbox for a data or remote frame
0	1	1	Configured as a one-shot receive mailbox for a data or remote frame.
1	0	0	Configured as a transmit mailbox for a data or remote frame.
1	0	1	Configured as a one-shot transmit mailbox for a data or remote frame.
1	1	0	Do not set.
1	1	1	Do not set.

j = 0 to 31

When a mailbox is configured as a receive mailbox or a one-shot receive mailbox, the following restrictions apply:

- Before configuring the mailbox, set MCTL_RXj to 00h.
- A received message is stored in the first mailbox that matches the condition resulting from the receive mode settings and acceptance filtering. The matching mailbox with the smallest number takes priority for storing the received message.
- In CAN operation mode, the CAN module does not receive its own transmitted data even if the ID is a match. In self-test mode, however, the CAN module receives its own transmitted data and returns ACK.

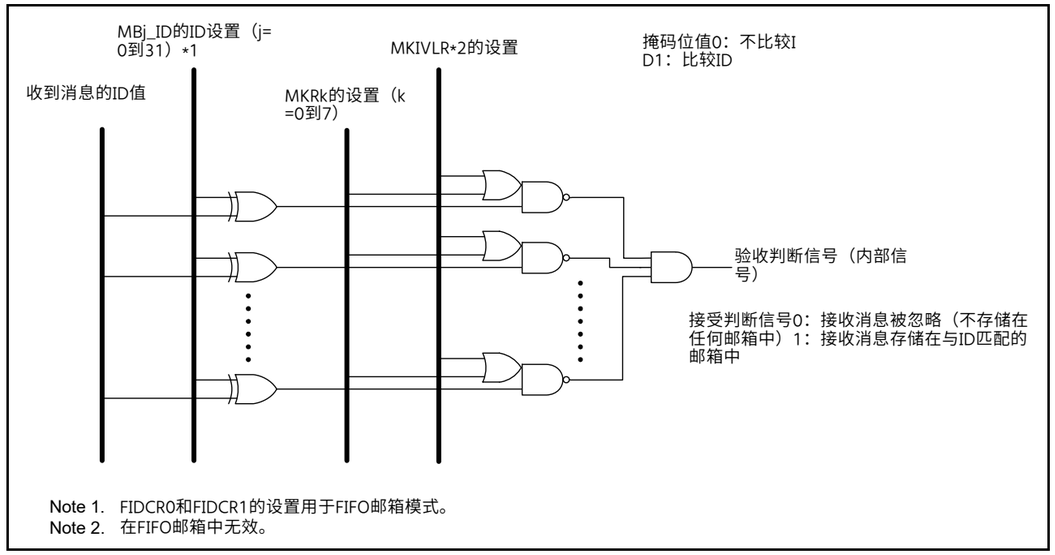

Figure 37.17 验收过滤

37.7 接收和传输

表37.10列出了CAN通信模式设置。

Table 37.10 CAN接收和发送模式的设置

MCTL_TXj.TRMREQ and MCTL_RXj.TRMREQ	MCTL_TXj.RECREQ and MCTL_RXj.RECREQ	MCTL_TXj.ONESHOT and MCTL_RXj.ONESHOT	邮箱通讯方式
0	0	0	邮箱禁用或传输被中止
0	0	1	只有在一次性模式中编程的邮箱的发送或接收被中止时才可以配置
0	1	0	配置为数据或远程帧的接收邮箱
0	1	1	配置为数据或远程帧的一次性接收邮箱。
1	0	0	配置为数据或远程帧的传输邮箱。
1	0	1	配置为数据或远程帧的一次性发送邮箱。
1	1	0	不要设置。
1	1	1	不要设置。

j = 0 to 31

当邮箱配置为接收邮箱或一次性接收邮箱时，以下限制适用：

- 在配置邮箱之前，将MCTL_RXj设置为00h。
- 收到的消息存储在与接收模式设置和接受过滤产生的条件匹配的第一个邮箱中。编号最小的匹配邮箱优先存储收到的消息。
- 在CAN操作模式下，即使ID匹配，CAN模块也不会接收到自己发送的数据。然而，在自检模式下，CAN模块接收自己发送的数据并返回ACK。

When configuring a mailbox as a transmit mailbox or a one-shot transmit mailbox, the following constraint applies:

- Before configuring a mailbox, ensure that MCTL_TXj is 00h and that there is no pending abort process.

37.7.1 Reception

Figure 37.18 shows an operation example of data frame reception in overwrite mode. The example shows the overwriting of the first message when the CAN module receives two consecutive CAN messages that match the receiving conditions in MCTL_RXj (j = 0 to 31).

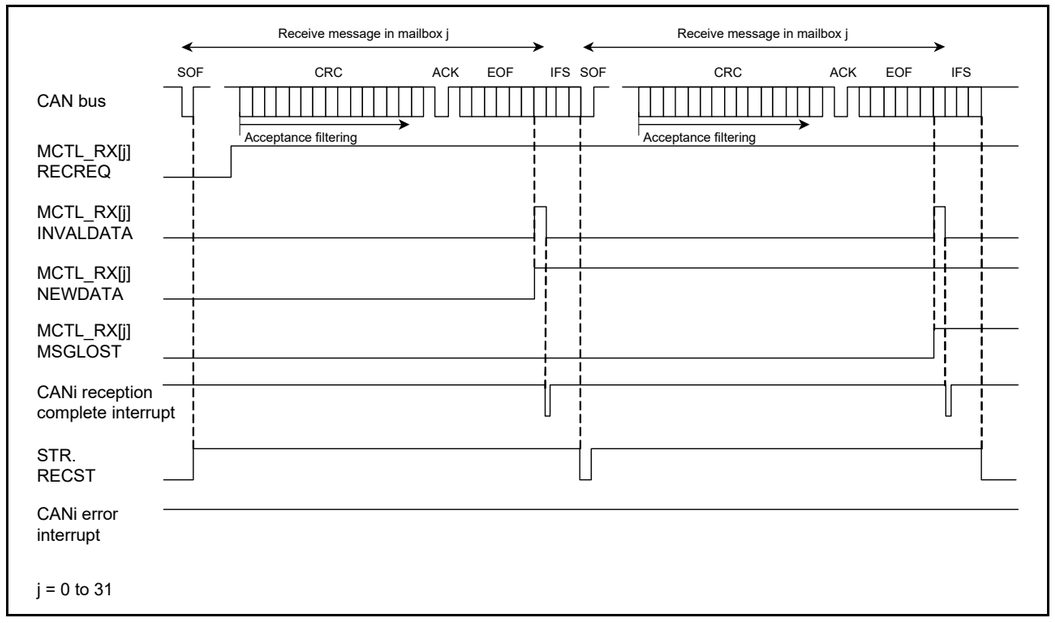

Figure 37.18 Operation example of data frame reception in overwrite mode

1. When an SOF is detected on the CAN bus, the RECST bit in STR is set to 1 (reception in progress) if the CAN module has no message ready to start transmission.
2. Acceptance filtering starts at the beginning of the CRC field to select the receive mailbox.
3. After a message is received, the NEWDATA flag in MCTL_RXj for the receive mailbox is set to 1 (new message is being stored or was stored in the mailbox). The INVALDATA flag in MCTL_RXj is set to 1 (message is being updated) at the same time, and then the INVALDATA flag is set to 0 (message valid) again after the complete message is transferred to the mailbox.
4. When the interrupt enable bit in MIER for the receive mailbox is 1 (interrupt enabled), the INVALDATA flag is set to 0, which triggers a CAN0 reception complete interrupt request.
5. After reading the message from the mailbox, the NEWDATA flag must be set to 0 by software.
6. In overwrite mode, if the next CAN message is received while the NEWDATA flag in MCTL_RXj is set to 1, the MSGLOST flag in MCTL_RXj is set to 1 (message was overwritten). The new received message is transferred to the mailbox. The CAN0 reception complete interrupt request occurs the same as in step 4.

Figure 37.19 shows an operation example of data frame reception in overrun mode. The example shows the overrunning of the second message when the CAN module receives two consecutive CAN messages that match the receiving conditions in MCTL_RXj (j = 0 to 31).

将邮箱配置为传输邮箱或一次性传输邮箱时，适用以下约束：

- 在配置邮箱之前，请确保MCTL_TXj为00h并且没有挂起的中止进程。

37.7.1 Reception

图37.18显示了覆盖模式下数据帧接收的操作示例。该示例显示当CAN模块接收到与MCTL_RXj（j=0到31）中的接收条件匹配的两个连续CAN报文时，第一条报文的覆盖。

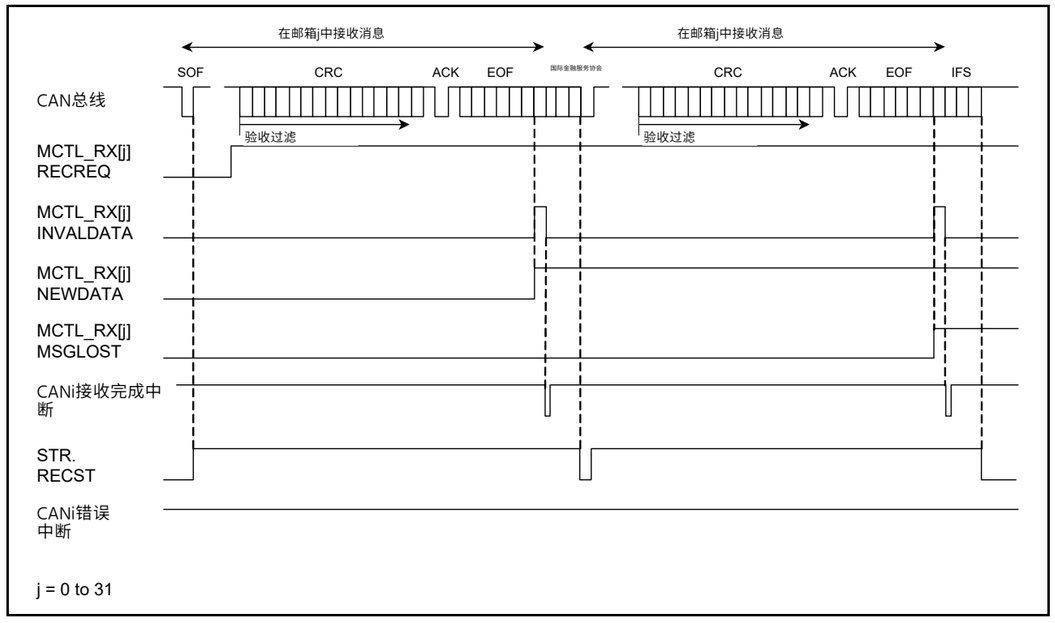

Figure 37.18 覆盖模式下数据帧接收的操作示例

1. 当在CAN总线上检测到SOF时，如果CAN模块没有准备好开始发送的消息，则STR中的RECST位设置为1（正在接收）。
2. 接受过滤从CRC字段的开头开始，以选择接收邮箱。
3. 收到消息后，接收邮箱的MCTL_RXj中的NEWDATA标志设置为1（新消息正在存储或已存储在邮箱中）。MCTL_RXj中的INVALDATA标志同时设置为1（消息正在更新），然后在完整的消息传送到邮箱后再次将INVALDATA标志设置为0（消息有效）。
4. 当接收邮箱的MIER中的中断使能位为1（使能中断）时，INVALDATA标志设置为0，从而触发CAN0接收完成中断请求。
5. 从邮箱读取消息后，NEWDATA标志必须由软件设置为0。
6. 在覆盖模式下，如果在MCTL_RXj中的NEWDATA标志设置为1时接收到下一条CAN消息，则MCTL_RXj中的MSGLOST标志设置为1（消息被覆盖）。新收到的消息被传送到邮箱。CAN0接收完成中断请求的发生与步骤4相同。

图37.19显示了溢出模式下数据帧接收的操作示例。该示例显示当CAN模块接收到与MCTL_RXj（j=0到31）中的接收条件匹配的两个连续CAN报文时，第二条报文的溢出。

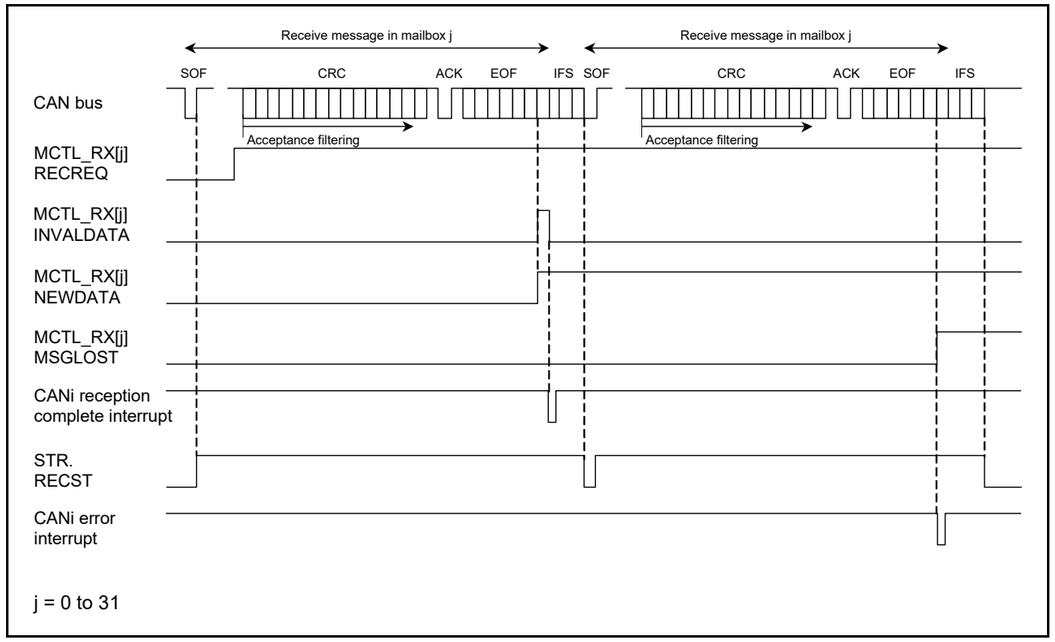

Figure 37.19 Operation example of data frame reception in overrun mode

Steps 1 to 5 are the same as in overwrite mode.

6. In overrun mode, if the next CAN message is received before the NEWDATA flag in MCTL_RXj is set to 0, the MSGLOST flag in MCTL_RXj is set to 1 (message overrun). The new received message is discarded and a CANi error interrupt request occurs if the associated interrupt enable bit in EIER is set to 1 (interrupt enabled).

37.7.2 Transmission

Figure 37.20 shows an operation example of data frame transmission.

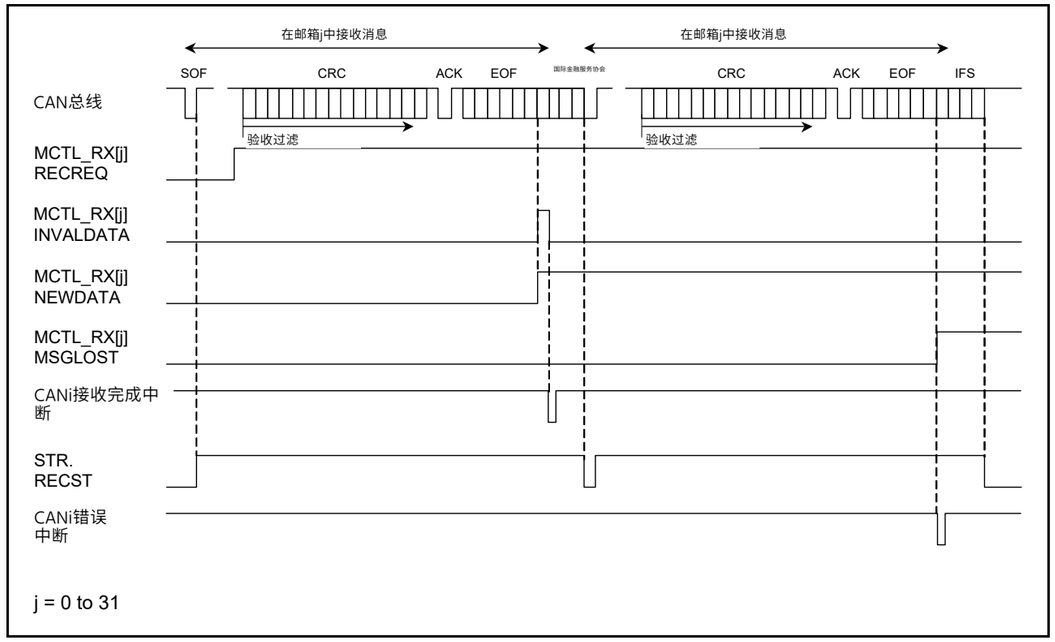

Figure 37.19 溢出模式下数据帧接收的操作示例

步骤1至5与覆盖模式相同。

6. 在溢出模式下，如果在MCTL_RXj中的NEWDATA标志设置为0之前接收到下一个CAN报文，则MCTL_RXj中的MSGLOST标志设置为1（消息溢出）。如果EIER中的相关中断使能位设置为1（中断使能），则丢弃新接收到的消息并产生CANi错误中断请求。

37.7.2 Transmission

图37.20显示了数据帧传输的操作示例。

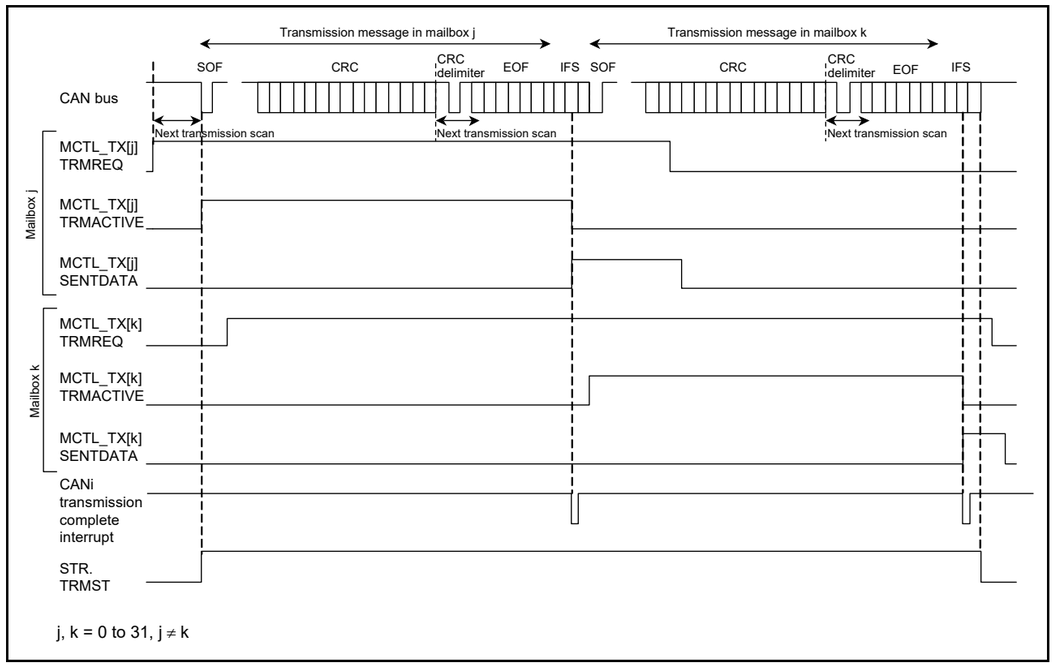

Figure 37.20 Operation example of data frame transmission

1. When a TRMREQ bit in MCTL_TXj (j = 0 to 31) is set to 1 (transmit mailbox) in the bus-idle state, mailbox scanning starts to decide the highest-priority mailbox for transmission. When the transmit mailbox is decided, the TRMACTIVE flag in MCTL_TXj is set to 1 (from acceptance of transmission request to completion of transmission, or error or arbitration-lost), the TRMST bit in STR is set to 1 (transmission in progress), and the CAN module starts transmission.*1
2. If other TRMREQ bits are set, the transmission scanning starts with the CRC delimiter for the next transmission.
3. If transmission is completed without losing arbitration, the SENTDATA flag in MCTL_TXj is set to 1 (transmission complete) and the TRMACTIVE flag is set to 0 (transmission is pending or transmission is not requested). If the interrupt enable bit in MIER is 1 (interrupt enabled), the CANi transmission complete interrupt request is generated.
4. When requesting the next transmission from the same mailbox, set the SENTDATA flag and TRMREQ bit to 0, and then set the TRMREQ bit to 1 after checking that the SENTDATA flag and TRMREQ bit are set to 0.

Note 1. If arbitration is lost after the CAN module starts transmission, the TRMACTIVE flag is set to 0. Transmission scanning is performed again to search for the highest-priority transmit mailbox from the beginning of the CRC delimiter. If an error occurs either during transmission or following arbitration-lost, transmission scanning is performed again to search for the highest-priority transmit mailbox from the start of the error delimiter.

37.8 Interrupts

The CAN module provides the following interrupts for each channel. Table 37.11 lists the CAN interrupts.

- CANi reception complete interrupt for mailboxes 0 to 31 (CANi_RXM)
- CANi transmission complete interrupt for mailboxes 0 to 31 (CANi_TXM)
- CANi receive FIFO interrupt (CANi_RXF)
- CANi transmit FIFO interrupt (CANi_TXF)
- CANi error interrupt (CANi_ERS).

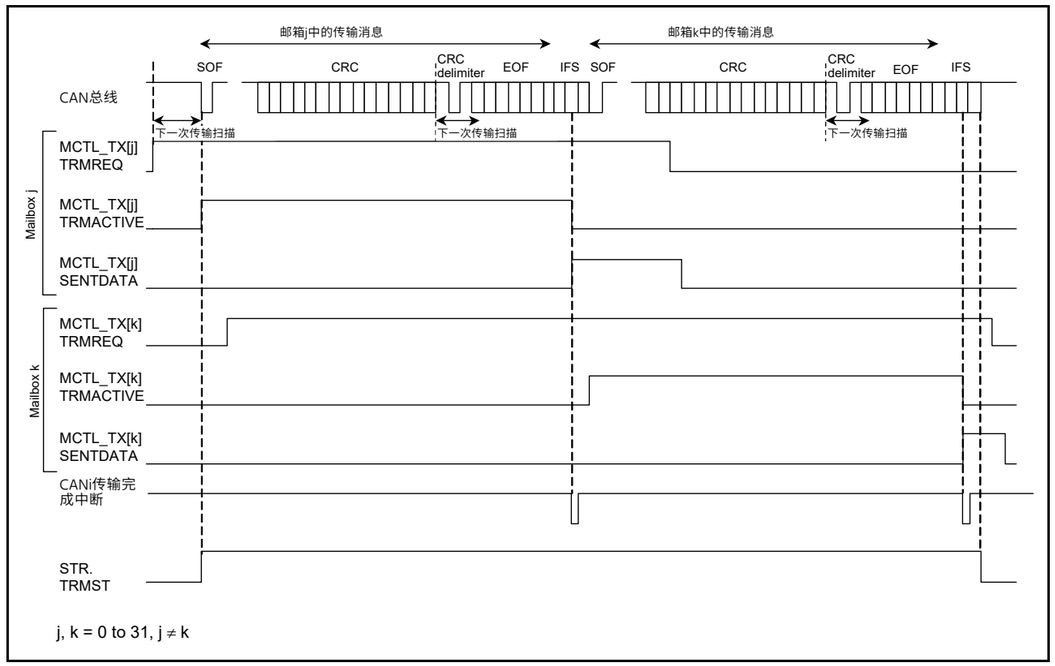

Figure 37.20 数据帧传输的操作示例

1. 当MCTL_TXj（j=0到31）中的TRMREQ位在总线空闲状态下设置为1（发送邮箱）时，邮箱扫描开始决定发送的最高优先级邮箱。当确定发送邮箱时，MCTL_TXj中的TRMACTIVE标志设置为1（从接受发送请求到发送完成，或错误或仲裁丢失），STR中的TRMST位设置为1（正在发送），CAN模块开始传输。*1
2. 如果设置了其他TRMREQ位，则传输扫描以CRC定界符开始，以进行下一次传输。
3. 如果传输完成且没有丢失仲裁，则MCTL_TXj中的SENTDATA标志设置为1（传输完成），TRMACTIVE标志设置为0（传输未决或未请求传输）。如果MIER中的中断使能位为1（中断使能），则产生CANi传输完成中断请求。
4. 从同一邮箱请求下一次发送时，将SENTDATA标志和TRMREQ位设置为0，然后在检查SENTDATA标志和TRMREQ位设置为0后将TRMREQ位设置为1。

注1.如果CAN模块开始发送后仲裁丢失，则TRMACTIVE标志设置为0。再次执行发送扫描以从CRC分隔符的开头搜索优先级最高的发送邮箱。如果在传输过程中或仲裁丢失后发生错误，则再次执行传输扫描以从错误分隔符的开头搜索最高优先级的传输邮箱。

37.8 Interrupts

CAN模块为每个通道提供以下中断。表37.11列出了CAN中断。

- 邮箱0到31(CANi_RXM)的CANi接收完成中断
- 邮箱0到31(CANi_TXM)的CANi传输完成中断
- CANi接收FIFO中断(CANi_RXF)
- CANi发送FIFO中断(CANi_TXF)
- CANi错误中断(CANi_ERS)。

Eight interrupt sources are available for CANi error interrupts. Check EIFR to determine whether these sources were triggered:

- Bus error
- Error-warning
- Error-passive
- Bus-off entry
- Bus-off recovery
- Receive overrun
- Overload frame transmission
- Bus lock.

Table 37.11 CAN interrupts

Module	Interrupt name	Interrupt source	Source flag
CANi i = 0, 1	CANi_ERS	Bus lock detected	EIFR.BLIF
		Overload frame transmission detected	EIFR.OLIF
		Overrun detected	EIFR.ORIF
		Bus-off recovery detected	EIFR.BORIF
		Bus-off entry detected	EIFR.BOEIF
		Error-passive detected	EIFR.EPIF
		Error-warning detected	EIFR.EWIF
		Bus error detected	EIFR.BEIF
	CANi_RXF	Receive FIFO message received (MIER_FIFO.MB29 = 0)	RFCR.RFUST[2:0]
		Receive FIFO warning (MIER_FIFO.MB29 = 1)	
	CANi_TXF	Transmit FIFO message transmission completed (MIER_FIFO.MB25 = 0)	TFCR.TFUST[2:0]
		FIFO last message transmission completed (MIER_FIFO.MB25 = 1)	
	CANi_RXM	Mailbox 0 to 31 message received	MCTL_RX0.NEWDATA to MCTL_RX31.NEWDATA
	CANi_TXM	Mailbox 0 to 31 message transmission completed	MCTL_TX0.SENTDATA to MCTL_TX31.SENTDATA

37.9 Usage Notes

37.9.1 Settings for the Module-Stop Function

CAN operation can be disabled or enabled using Module Stop Control Register B (MSTPCRB). The CAN module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

37.9.2 Settings for the Operating Clock

The settings for the operating clock can be made as follows:

- The following clock constraint must be satisfied for the CAN module when the CCLKS bit is 1:

  fPCLKB ≥ fCANMCLK

- The source of the peripheral module clock must be PLL for the CAN module when the CCLKS bit is 0.

八个中断源可用于CANi错误中断。检查EIFR以确定是否触发了这些源：

- 总线错误
- Error-warning
- Error-passive
- Bus-off entry
- Bus-off recovery
- 接收溢出
- 过载帧传输
- 巴士锁。

Table 37.11 CAN中断

Module	中断名称	中断源	源标志
CANi i = 0, 1	CANi_ERS	检测到总线锁	EIFR.BLIF
		检测到过载帧传输	EIFR.OLIF
		检测到溢出	EIFR.ORIF
		检测到总线关闭恢复	EIFR.BORIF
		检测到总线关闭条目	EIFR.BOEIF
		Error-passive detected	EIFR.EPIF
		Error-warning detected	EIFR.EWIF
		检测到总线错误	EIFR.BEIF
	CANi_RXF	接收接收到的FIFO消息(MIER_FIFO.MB29=0)	RFCR.RFUST[2:0]
		接收FIFO警告(MIER_FIFO.MB29=1)	
	CANi_TXF	传输FIFO消息传输完成(MIER_FIFO.MB25=0)	TFCR.TFUST[2:0]
		FIFO最后一条消息传输完成(MIER_FIFO.MB25=1)	
	CANi_RXM	邮箱0到31收到消息	MCTL_RX0.NEWDATA to MCTL_RX31.NEWDATA
	CANi_TXM	邮箱0到31消息传输完成	MCTL_TX0.SENTDATA to MCTL_TX31.SENTDATA

37.9 使用说明

37.9.1 模块停止功能的设置

可以使用模块停止控制寄存器B(MSTPCRB)禁用或启用CAN操作。CAN模块在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

37.9.2 工作时钟设置

工作时钟的设置可按如下方式进行：

- 当CCLKS位为1时，CAN模块必须满足以下时钟约束：

  fPCLKB ≥ fCANMCLK

- 当CCLKS位为0时，外设模块时钟源必须是CAN模块的PLL。

38. Serial Peripheral Interface (SPI)

38.1 Overview

The MCU provides two independent channels for the Serial Peripheral Interface (SPI). The SPI channels are capable of high-speed, full-duplex, synchronous serial communications with multiple processors and peripheral devices. Table 38.1 lists the SPI specifications, Figure 38.1 shows a block diagram, and Table 38.2 lists the I/O pins.

In this section, *n* indicates A or B, and *i* indicates 0 or 1. A lower-case letter *i* in pin and signal names indicates a value from 0 to 3, and a lower-case letter *m* in SPI Command Register m (SPCMDm) indicates a value from 0 to 7.

Table 38.1 SPI specifications (1 of 2)

Parameter	Specifications
Number of channels	Two channels
SPI transfer functions	• Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows serial communications through SPI operation (4-wire method) or clock synchronous operation (3-wire method) • Transmit-only operation available • Communication mode selectable to full-duplex or transmit-only • RSPCK polarity switching • RSPCK phase switching
Data format	• MSB-first or LSB-first selectable • Transfer bit length selectable to 8, 9, 10, 11, 12, 13, 14, 15, 16, 20, 24, or 32 bits • 128-bit transmit and receive buffers • Up to four frames transferrable in one round of transmission or reception (each frame consisting of up to 32 bits) • Byte swap operating function
Bit rate	• In master mode, the on-chip baud rate generator generates RSPCK by frequency-dividing PCLKA (the division ratio ranges from divided by 2 to divided by 4096) • In slave mode, the minimum PCLKA clock divided by 4 can be input as RSPCK (PCLKA divided by 4 is the maximum RSPCK frequency) Width at high level: 2 PCLKA cycles; width at low level: 2 PCLKA cycles
Buffer configuration	• Double buffer configuration for the transmit and receive buffers • 128 bits for the transmit and receive buffers
Error detection	• Mode fault error detection • Underrun error detection • Overrun error detection*1 • Parity error detection
SSL control function	• Four SSL pins (SSLn0 to SSLn3) for each channel • In single master mode, SSLn0 to SSLn3 pins are output. • In multi-master mode, SSLn0 pin for input, and SSLn1 to SSLn3 pins either for output or unused • In slave mode, SSLn0 pin for input, and SSLn1 to SSLn3 pins unused • Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable delay from RSPCK stop to SSL output negation (SSL negation delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable wait for next-access SSL output assertion (next-access delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Function for changing SSL polarity
Control in master transfer	• Transfers of up to eight commands each can be executed sequentially in looped execution • For each command, the following can be set: SSL signal value, bit rate, RSPCK polarity and phase, transfer data length, MSB- or LSB-first, burst, RSPCK delay, SSL negation delay, and next-access delay • Transfers can be initiated by writing to the transmit buffer • MOSI signal value specifiable in SSL negation • RSPCK auto-stop function
Interrupt sources	Interrupt sources: • Receive buffer full interrupt • Transmit buffer empty interrupt • SPI error interrupt (mode fault, overrun, parity error) • SPI idle interrupt (SPI idle) • Transmission-complete interrupt

38. 串行外设接口(SPI)

38.1 Overview

MCU为串行外设接口(SPI)提供两个独立通道。SPI通道能够与多个处理器和外围设备进行高速、全双工、同步串行通信。表38.1列出了SPI规格，图38.1显示了框图，表38.2列出了IO引脚。

在本节中，n表示A或B，i表示0或1。引脚和信号名称中的小写字母i表示从0到3的值，SPI命令寄存器m(SPCMDm)中的小写字母m)表示从0到7的值。

Table 38.1 SPI规格（2个中的1个）

Parameter	Specifications
通道数	两个通道
SPI传输函数	使用MOSI（主输出从输入）、MISO（主输入从输出）、SSL（从选择）和RSPCK（SPI时钟）信号允许通过SPI操作（4线方法）或时钟同步操作（3线法） 仅传输操作可用 通信模式可选择为全双工或仅传输 RSPCK极性切换 RSPCK相位切换
数据格式	可选择MSB优先或LSB优先 传输位长度可选择为8、9、10、11、12、13、14、15、16、20、24或32位 128位发送和接收缓冲区 向上在一轮发送或接收中可传输到四帧（每帧最多由32位组成） 字节交换操作功能
比特率	在主机模式下，片内波特率发生器通过对PCLKA分频产生RSPCK（分频比范围从2分频到4096分频） 在从机模式下，可以输入最小PCLKA时钟4分频作为RSPCK（PCLKA除以4为最大RSPCK频率）高电平宽度：2个PCLKA周期；低电平宽度：2个PCLKA周期
缓冲区配置	发送和接收缓冲区的双缓冲区配置 发送和接收缓冲区为128位
错误检测	模式故障错误检测 欠载错误检测 溢出错误检测*1 奇偶校验错误检测
SSL控制功能	每个通道有四个SSL引脚（SSLn0到SSLn3） 在单主模式下，输出SSLn0到SSLn3引脚。 在多主模式下，SSLn0引脚用于输入，SSLn1至SSLn3引脚用于输出或未使用 从模式下，SSLn0引脚用于输入，SSLn1至SSLn3引脚未使用 从SSL输出断言到RSPCK操作的可控延迟（RSPCK延迟）范围：1到8个RSPCK周期（以RSPCK周期为单位设置） 从RSPCK停止到SSL输出否定的可控延迟（SSL否定延迟）范围：1到8个RSPCK周期（以RSPCK周期为单位设置） 可控等待用于下一次访问SSL输出断言（下一次访问延迟）范围：1到8个RSPCK周期（以RSPCK周期为单位设置） 更改SSL极性的功能
主传输中的控制	最多可以在循环执行中顺序执行8个命令的传输 对于每个命令，可以设置以下内容： SSL信号值、比特率、RSPCK极性和相位、传输数据长度、MSB或LSB优先、突发、RSPCK延迟、SSL否定延迟和下一次访问延迟 可以通过写入传输缓冲区来启动传输 在SSL否定中指定MOSI信号值 RSPCK自动停止功能
中断源	中断源： 接收缓冲区满中断 发送缓冲区空中断 SPI错误中断（模式错误、溢出、奇偶校验错误） SPI空闲中断（SPI空闲） 传输完成中断

Table 38.1 SPI specifications (2 of 2)

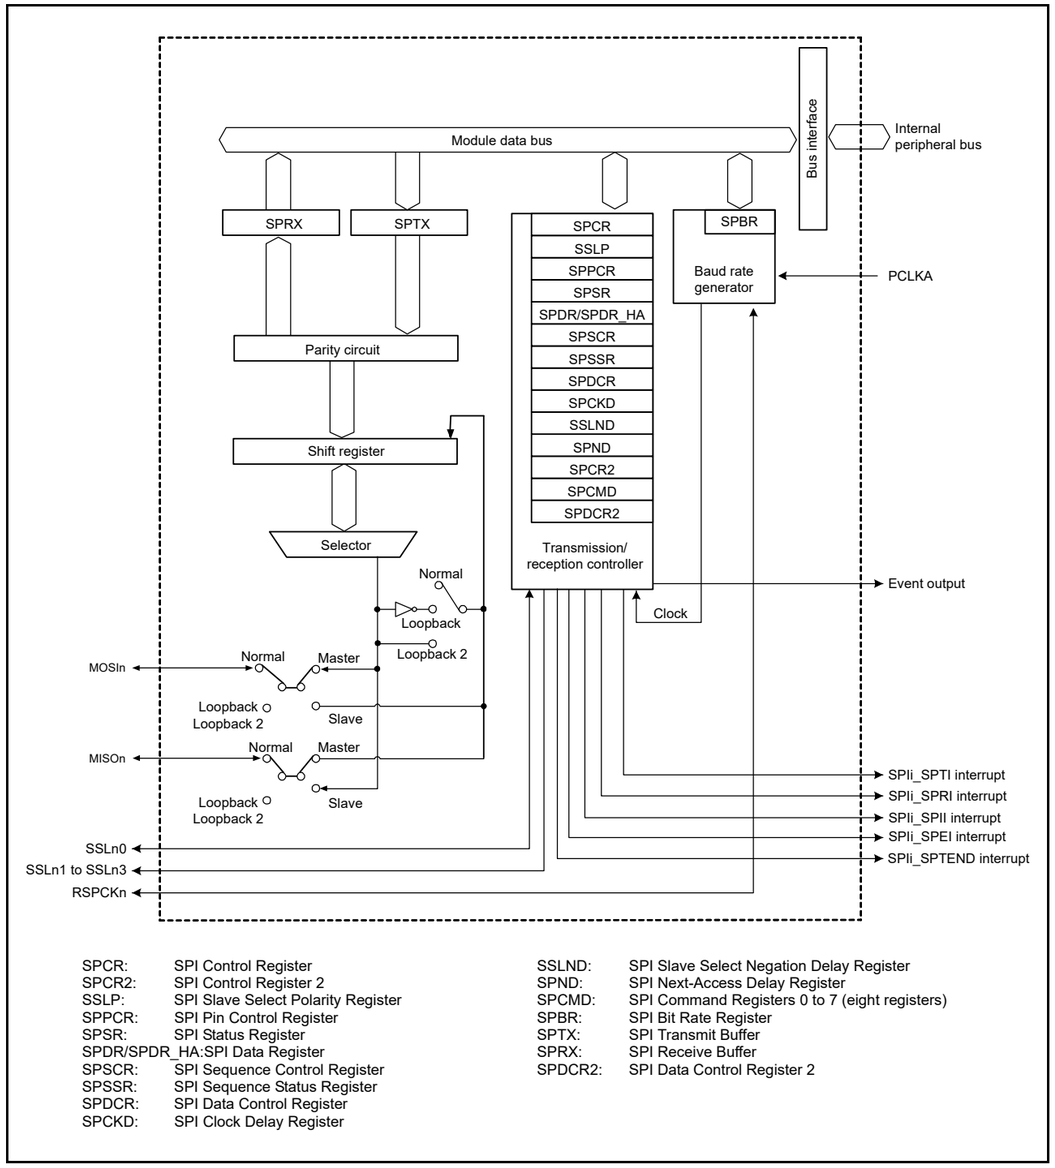
Parameter	Specifications
Event link function (output)	The following events can be output to the Event Link Controller (ELC): • Receive buffer full signal • Transmit buffer empty signal • Mode fault, underrun, overrun, or parity error signal • SPI idle signal • Transmission-complete signal
Other functions	• Switching between CMOS output and open-drain output • SPI initialization function • Loopback mode
Module-stop function	Module-stop state can be set to reduce power consumption

Note 1. In master reception and when the RSPCK auto-stop function is enabled, an overrun error does not occur because the transfer clock is stopped on overrun error detection.

Table 38.1 SPI规范（2个中的2个）

Parameter	Specifications
事件链接功能（输出）	以下事件可以输出到事件链接控制器(ELC)： 接收缓冲区满信号 发送缓冲区空信号 模式错误、欠载、溢出或奇偶校验错误信号 SPI空闲信号 传输完成信号
其他功能	在CMOS输出和开漏输出之间切换 SPI初始化功能 Loopback模式
Module-stop function	可设置模块停止状态以降低功耗

Note 1. 在主机接收和启用RSPCK自动停止功能时，不会发生溢出错误，因为传输时钟在检测到溢出错误时停止。



SPCR: SPI Control Register
SPCR2: SPI Control Register 2

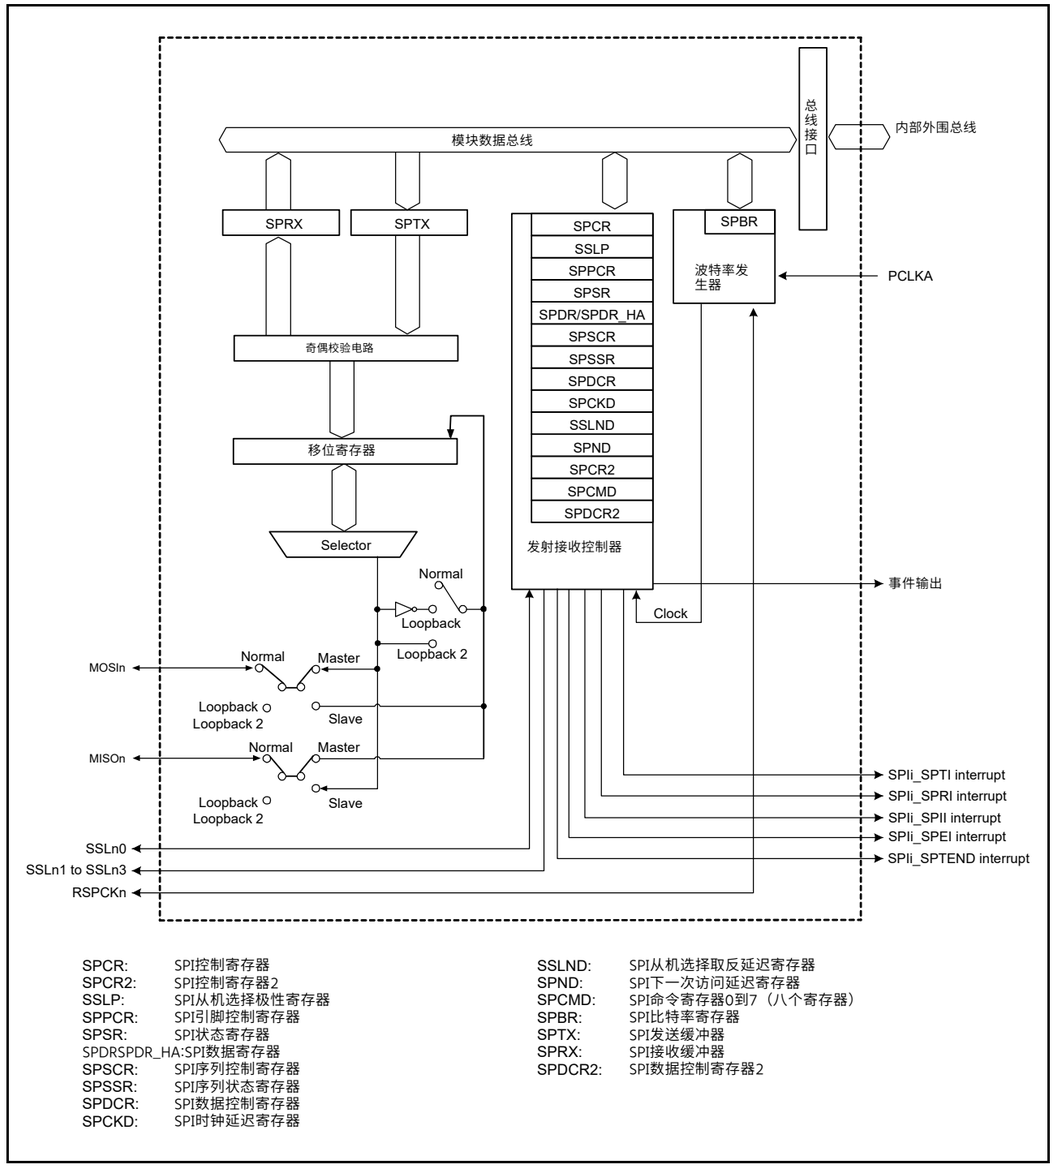
SPCMD: SPI Command Registers 0 to 7 (eight registers)
SPBR: SPI Bit Rate Register
SPTX: SPI Transmit Buffer
SPRX: SPI Receive Buffer
SPDCR2: SPI Data Control Register 2

Figure 38.1 SPI block diagram

Table 38.2 lists the I/O pins used in the SPI. The SPI automatically switches the I/O direction of the SSLn0 pin. SSLn0 is set as an output when the SPI is a single master and as an input when the SPI is a multi-master or a slave. The RSPCKn, MOSIn, and MISOn pins are automatically set as inputs or outputs based on the master or slave setting and the level input on the SSLn0 pin. For details, see section 38.3.2, Controlling the SPI Pins.



SPCR: SPI控制寄存器

Figure 38.1 SPI框图

表38.2列出了SPI中使用的IO引脚。SPI自动切换SSLn0引脚的IO方向。当SPI为单主机时SSLn0设置为输出，当SPI为多主机或从机时设置为输入。RSPCKn、MOSIn和MISOn引脚会根据主机或从机设置以及SSLn0引脚上的电平输入自动设置为输入或输出。有关详细信息，请参见第38.3.2节，控制SPI引脚。

Table 38.2 SPI I/O pins

Channel	Pin name	I/O	Function
SPI0	RSPCKA	I/O	Clock input/output
	MOSIA	I/O	Master transmit data input/output
	MISOA	I/O	Slave transmit data input/output
	SSLA0	I/O	Slave selection input/output
	SSLA1	Output	Slave selection output
	SSLA2	Output	Slave selection output
	SSLA3	Output	Slave selection output
SPI1	RSPCKB	I/O	Clock input/output
	MOSIB	I/O	Master transmit data input/output
	MISOB	I/O	Slave transmit data input/output
	SSLB0	I/O	Slave selection input/output
	SSLB1	Output	Slave selection output
	SSLB2	Output	Slave selection output
	SSLB3	Output	Slave selection output

38.2 Register Descriptions

38.2.1 SPI Control Register (SPCR)

Address(es): SPI0.SPCR 4007 2000h, SPI1.SPCR 4007 2100h

	b7	b6	b5	b4	b3	b2	b1	b0
	SPRIE	SPE	SPTIE	SPEIE	MSTR	MODF EN	TXMD	SPMS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SPMS	SPI Mode Select	0: Select SPI operation (4-wire method) 1: Select clock synchronous operation (3-wire method).	R/W
b1	TXMD	Communications Operating Mode Select	0: Select full-duplex synchronous serial communications 1: Select serial communications with transmit-only.	R/W
b2	MODFEN	Mode Fault Error Detection Enable	0: Disable detection of mode fault errors 1: Enable detection of mode fault errors.	R/W
b3	MSTR	SPI Master/Slave Mode Select	0: Select slave mode 1: Select master mode.	R/W
b4	SPEIE	SPI Error Interrupt Enable	0: Disable SPI error interrupt requests 1: Enable SPI error interrupt requests.	R/W
b5	SPTIE	Transmit Buffer Empty Interrupt Enable	0: Disable transmit buffer empty interrupt requests 1: Enable transmit buffer empty interrupt requests.	R/W
b6	SPE	SPI Function Enable	0: Disable SPI function 1: Enable SPI function.	R/W
b7	SPRIE	SPI Receive Buffer Full Interrupt Enable	0: Disable SPI receive buffer full interrupt requests 1: Enable SPI receive buffer full interrupt requests.	R/W

If the SPCR.MSTR, SPCR.MODFEN, or SPCR.TXMD bit is changed while the SPCR.SPE bit is 1, do not perform subsequent operations.

SPMS bit (SPI Mode Select)

The SPMS bit selects SPI operation (4-wire method) or clock synchronous operation (3-wire method).

Table 38.2 SPIIO引脚

Channel	引脚名称	I/O	Function
SPI0	RSPCKA	I/O	Clock input/output
	MOSIA	I/O	主机发送数据输入输出
	MISOA	I/O	从机发送数据输入输出
	SSLA0	I/O	从机选择输入输出
	SSLA1	Output	从机选择输出
	SSLA2	Output	从机选择输出
	SSLA3	Output	从机选择输出
SPI1	RSPCKB	I/O	Clock input/output
	MOSIB	I/O	主机发送数据输入输出
	MISOB	I/O	从机发送数据输入输出
	SSLB0	I/O	从机选择输入输出
	SSLB1	Output	从机选择输出
	SSLB2	Output	从机选择输出
	SSLB3	Output	从机选择输出

38.2 注册说明

38.2.1 SPI控制寄存器(SPCR)

Address(es): SPI0.SPCR 4007 2000h, SPI1.SPCR 4007 2100h

	b7	b6	b5	b4	b3	b2	b1	b0
	SPRIE	SPE	SPTIE	SPEIE	MSTR	MODF EN	TXMD	SPMS
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SPMS	SPI模式选择	0：选择SPI操作（4线方式）1：选择时钟同步操作（3线方式）。	R/W
b1	TXMD	通讯操作模式 Select	0：选择全双工同步串行通信1：选择仅发送的串行通信。	R/W
b2	MODFEN	模式故障错误检测启用	0：禁用模式故障错误检测1：启用模式故障错误检测。	R/W
b3	MSTR	SPI主从模式选择	0：选择从模式1：选择主模式。	R/W
b4	SPEIE	SPI错误中断使能	0：禁用SPI错误中断请求1：启用SPI错误中断请求。	R/W
b5	SPTIE	发送缓冲区空中断 Enable	0：禁止发送缓冲区空中断请求1：使能发送缓冲区空中断请求。	R/W
b6	SPE	SPI功能使能	0：禁用SPI功能1：启用SPI功能。	R/W
b7	SPRIE	SPI接收缓冲器满中断 Enable	0：禁止SPI接收缓冲区满中断请求1：使能SPI接收缓冲区满中断请求。	R/W

如果在SPCR.SPE位为1时更改了SPCR.MSTR、SPCR.MODFEN或SPCR.TXMD位，则不要执行后续操作。

SPMS位（SPI模式选择）

SPMS位选择SPI操作（4线方法）或时钟同步操作（3线方法）。

The SSLn0 to SSLn3 pins are not used in clock synchronous operation. The RSPCKn, MOSIn, and MISOn pins handle communications. For clock synchronous operation in master mode (SPCR.MSTR = 1), the SPCMDm.CPHA bit can be set to either 0 or 1. For clock synchronous operation in slave mode (SPCR.MSTR = 0), always set the CPHA bit to 1. Do not perform operations if the CPHA bit is set to 0 for clock synchronous operation in slave mode (SPCR.MSTR = 0).

TXMD bit (Communications Operating Mode Select)

The TXMD bit selects full-duplex synchronous serial communications or transmit-only operations. When this bit is set to 1, the SPI only performs transmit operations and not receive operations (see section 38.3.6, Data Transfer Modes), and receive buffer full interrupt requests cannot be used.

MODFEN bit (Mode Fault Error Detection Enable)

The MODFEN bit enables or disables the detection of mode fault errors (see section 38.3.8, Error Detection). In addition, the SPI determines the I/O direction of the SSLn0 to SSLn3 pins based on combination of the MODFEN and MSTR bits (see section 38.3.2, Controlling the SPI Pins).

MSTR bit (SPI Master/Slave Mode Select)

The MSTR bit selects master or slave mode for the SPI. Based on the MSTR bit settings, the SPI determines the direction of the RSPCKn, MOSIn, MISOn, and SSLn0 to SSLn3 pins.

SPEIE bit (SPI Error Interrupt Enable)

The SPEIE bit enables or disables the generation of SPI error interrupt requests when one of the following occurs:

- The SPI detects a mode fault error or underrun error and sets the SPSR.MODF flag to 1
- The SPI detects an overrun error and sets the SPSR.OVRF flag to 1
- The SPI detects a parity error and sets the SPSR.PERF flag to 1.

For details, see section 38.3.8, Error Detection.

SPTIE bit (Transmit Buffer Empty Interrupt Enable)

The SPTIE bit enables or disables the generation of transmit buffer empty interrupt requests when the SPI detects that the transmit buffer is empty. To generate a transmit buffer empty interrupt request when transmission starts, set the SPE and SPTIE bits to 1 at the same time or set the SPE bit to 1 after setting the SPTIE bit to 1.

When the SPTIE bit is 1, transmit buffer interrupts are generated even when the SPI function is disabled (when the SPE bit is changed to 0).

SPE bit (SPI Function Enable)

The SPE bit enables or disables the SPI function. The SPE bit cannot be set to 1 when the SPSR.MODF flag is 1. For details, see section 38.3.8, Error Detection.

Setting the SPE bit to 0 disables the SPI function and initializes a part of the module function. For details, see section 38.3.9, Initializing the SPI. In addition, a transmit buffer empty interrupt request is generated when the SPE bit is changed from 0 to 1 or from 1 to 0.

SPRIE bit (SPI Receive Buffer Full Interrupt Enable)

The SPRIE bit enables or disables the generation of an SPI receive buffer full interrupt request when the SPI detects a receive buffer full write after completion of a serial transfer.

SSLn0到SSLn3引脚不用于时钟同步操作。RSPCKn、MOSIn和MIOn引脚处理通信。对于主机模式下的时钟同步操作(SPCR.MSTR=1)，SPCMDm.CPHA位可以设置为0或1。对于从机模式下的时钟同步操作(SPCR.MSTR=0)，始终将CPHA位设置为1.如果CPHA位设置为0以在从机模式下进行时钟同步操作（SPCR.MSTR=0），则不要执行操作。

TXMD位（通信操作模式选择）

TXMD位选择全双工同步串行通信或仅发送操作。当该位设置为1时，SPI只执行发送操作而不执行接收操作（参见第38.3.6节，数据传输模式），并且无法使用接收缓冲区满中断请求。

MODFEN位（模式故障错误检测使能）

MODFEN位启用或禁用模式故障错误检测（参见第38.3.8节，错误检测）。此外，SPI根据MODFEN和MSTR位的组合确定SSLn0到SSLn3引脚的IO方向（请参见第38.3.2节，控制SPI引脚）。

MSTR位（SPI主从模式选择）

MSTR位选择SPI的主模式或从模式。根据MSTR位设置，SPI确定RSPCKn、MOSIn、MISOn和SSLn0到SSLn3引脚的方向。

SPEIE位（SPI错误中断使能）

当发生以下情况之一时，SPEIE位启用或禁用SPI错误中断请求的生成：

- SPI检测到模式故障错误或欠载错误并将SPSR.MODF标志设置为1
- SPI检测到溢出错误并将SPSR.OVRF标志设置为1
- SPI检测到奇偶校验错误并将SPSR.PERF标志设置为1。

有关详细信息，请参阅第38.3.8节，错误检测。

SPTIE位（发送缓冲区空中断使能）

当SPI检测到发送缓冲区为空时，SPTIE位使能或禁止生成发送缓冲区空中断请求。要在发送开始时产生发送缓冲区空中断请求，请将SPE和SPTIE位同时设置为1，或在将SPTIE位设置为1后将SPE位设置为1。

当SPTIE位为1时，即使禁用SPI功能（当SPE位变为0时）也会产生发送缓冲区中断。

SPE位（SPI功能使能）

SPE位启用或禁用SPI功能。当SPSR.MODF标志为1时，SPE位不能设置为1。有关详细信息，请参阅第38.3.8节，错误检测。

将SPE位设置为0将禁用SPI功能并初始化部分模块功能。有关详细信息，请参阅第38.3.9节，初始化SPI。此外，当SPE位从0变为1或从1变为0时，会产生发送缓冲区空中断请求。

SPRIE位（SPI接收缓冲区满中断使能）

当SPI在串行传输完成后检测到接收缓冲区已满写入时，SPRIE位启用或禁用SPI接收缓冲区已满中断请求的生成。

38.2.2 SPI Slave Select Polarity Register (SSLP)

Address(es): SPI0.SSLP 4007 2001h, SPI1.SSLP 4007 2101h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	SSL3P	SSL2P	SSL1P	SSL0P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SSL0P	SSL0 Signal Polarity Setting	0: Set SSL0 signal to active low 1: Set SSL0 signal to active high.	R/W
b1	SSL1P	SSL1 Signal Polarity Setting	0: Set SSL1 signal to active low 1: Set SSL1 signal to active high.	R/W
b2	SSL2P	SSL2 Signal Polarity Setting	0: Set SSL2 signal to active low 1: Set SSL2 signal to active high.	R/W
b3	SSL3P	SSL3 Signal Polarity Setting	0: Set SSL3 signal to active low 1: Set SSL3 signal to active high.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

If the contents of SSLP are changed while the SPCR.SPE bit is 1, do not perform subsequent operations.

38.2.3 SPI Pin Control Register (SPPCR)

Address(es): SPI0.SPPCR 4007 2002h, SPI1.SPPCR 4007 2102h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	MOIFE	MOIFV	—	—	SPLP2	SPLP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SPLP	SPI Loopback	0: Normal mode 1: Loopback mode (data is inverted for transmission).	R/W
b1	SPLP2	SPI Loopback 2	0: Normal mode 1: Loopback mode (data is not inverted for transmission).	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	MOIFV	MOSI Idle Fixed Value	0: Set level output on MOSIn pin during MOSI idling to correspond to low 1: Set level output on MOSIn pin during MOSI idling to correspond to high.	R/W
b5	MOIFE	MOSI Idle Value Fixing Enable	0: Set MOSI output value to equal final data from previous transfer 1: Set MOSI output value to equal value set in the MOIFV bit.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

If the contents of SPPCR are changed while the SPCR.SPE bit is 1, do not perform subsequent operations.

SPLP bit (SPI Loopback)

The SPLP bit selects the mode of the SPI pins. When this bit is set to 1, the SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, and between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0. The SPI then connects the input path and output path for the shift register (loopback mode).

SPLP2 bit (SPI Loopback 2)

The SPLP2 bit selects the mode of the SPI pins. When this bit is set to 1, the SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, and between the MOSIn pin and the shift register if the

38.2.2 SPI从机选择极性寄存器(SSLP)

Address(es): SPI0.SSLP 4007 2001h, SPI1.SSLP 4007 2101h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	SSL3P	SSL2P	SSL1P	SSL0P
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SSL0P	SSL0信号极性设置	0：将SSL0信号设置为低电平有效1： 将SSL0信号设置为高电平有效。	R/W
b1	SSL1P	SSL1信号极性设置	0：将SSL1信号设置为低电平有效1： 将SSL1信号设置为高电平有效。	R/W
b2	SSL2P	SSL2信号极性设置	0：将SSL2信号设置为低电平有效1： 将SSL2信号设置为高电平有效。	R/W
b3	SSL3P	SSL3信号极性设置	0：将SSL3信号设置为低电平有效1： 将SSL3信号设置为高电平有效。	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

如果SPCR.SPE位为1时SSLP的内容发生了变化，请不要进行后续操作。

38.2.3 SPI引脚控制寄存器(SPPCR)

Address(es): SPI0.SPPCR 4007 2002h, SPI1.SPPCR 4007 2102h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	MOIFE	MOIFV	—	—	SPLP2	SPLP
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SPLP	SPI Loopback	0：正常模式1：环回模式（数据反转传输）。	R/W
b1	SPLP2	SPI Loopback 2	0：正常模式1：环回模式（数据不反转传输）。	R/W
b3, b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b4	MOIFV	MOSI空闲固定值	0：在MOSI空闲期间将MOSIn引脚上的电平输出设置为对应于低电平1：在MOSI空闲期间将MOSIn引脚上的电平输出设置为对应于高电平。	R/W
b5	MOIFE	MOSI空闲值修复Enable	0：设置MOSI输出值等于上次传输的最终数据1：设置MOSI输出值等于MOIFV位中设置的值。	R/W
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W

如果在SPCR.SPE位为1时改变了SPPCR的内容，则不要执行后续操作。

SPLP位（SPI环回）

SPLP位选择SPI引脚的模式。当该位设置为1时，如果SPCR.MSTR位为1，则SPI关闭MIOn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则关闭MOSIn引脚和移位寄存器之间的路径。然后SPI连接移位寄存器的输入路径和输出路径（环回模式）。

SPLP2位（SPI环回2）

SPLP2位选择SPI引脚的模式。当该位设置为1时，如果SPCR.MSTR位为1，则SPI关闭MISOn引脚和移位寄存器之间的路径，如果该位为1，则SPI关闭MOSIn引脚和移位寄存器之间的路径。

SPCR.MSTR bit is 0. The SPI then connects the input path and output path for the shift register (loopback mode).

MOIFV bit (MOSI Idle Fixed Value)

If the MOIFE bit is 1 in master mode, the MOIFV bit determines the MOSIn pin output value during the SSL negation period, including the SSL retention period during a burst transfer.

MOIFE bit (MOSI Idle Value Fixing Enable)

The MOIFE bit fixes the MOSIn output value when the SPI is in master mode and in an SSL negation period, including the SSL retention period during a burst transfer. When the MOIFE bit is 0, the SPI outputs the last data from the previous serial transfer during the SSL negation period to the MOSIn pin. When the MOIFE bit is 1, the SPI outputs the fixed value set in the MOIFV bit to the MOSIn pin.

38.2.4 SPI Status Register (SPSR)

Address(es): SPI0.SPSR 4007 2003h, SPI1.SPSR 4007 2103h

	b7	b6	b5	b4	b3	b2	b1	b0
	SPRF	—	SPTEF	UDRF	PERF	MODF	IDLNF	OVRF
Value after reset:	0	0	1	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OVRF	Overrun Error Flag	0: No overrun error occurred 1: Overrun error occurred.	R/(W)*1
b1	IDLNF	SPI Idle Flag	0: SPI is in the idle state 1: SPI is in the transfer state.	R
b2	MODF	Mode Fault Error Flag	0: No mode fault or underrun error occurred 1: Mode fault error or underrun error occurred.	R/(W)*1
b3	PERF	Parity Error Flag	0: No parity error occurred 1: Parity error occurred.	R/(W)*1
b4	UDRF	Underrun Error Flag	0: Mode fault error occurred (MODF = 1) 1: Underrun error occurred (MODF = 1). This bit is invalid when MODF flag is 0.	R/W*1,*2
b5	SPTEF	SPI Transmit Buffer Empty Flag	0: Data is in the transmit buffer 1: No data is in the transmit buffer.	R/(W)*3
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	SPRF	SPI Receive Buffer Full Flag	0: No valid data is in SPDR/SPDR_HA 1: Valid data is in SPDR/SPDR_HA.	R/(W)*3

Note 1. Only 0 can be written to clear the flag after reading 1.
Note 2. The UDRF flag clears at the same time that the software clears the MODF flag.
Note 3. The write value should be 1.

OVRF flag (Overrun Error Flag)

The OVRF flag indicates the occurrence of an overrun error. In master mode (SPCR.MSTR bit = 1) and when the RSPCK clock auto-stop function is enabled (SPCR2.SCKASE bit = 1), overrun errors do not occur. This flag does not set to 1. For details, see section 38.3.8.1, Overrun errors.

[Setting condition]

- When the next serial transfer ends while the SPCR.TXMD bit is 0 and the receive buffer is full.

[Clearing condition]

- When 0 is written to the OVRF flag after the OVRF flag is confirmed to be 1 by a read of SPSR.

IDLNF flag (SPI Idle Flag)

The IDLNF flag indicates the transfer status of the SPI.

SPCR.MSTR位为0。然后SPI连接移位寄存器的输入路径和输出路径（环回模式）。

MOIFV位（MOSI空闲固定值）

如果MOIFE位在主模式下为1，则MOIFV位确定SSL否定期间的MOSIn引脚输出值，包括突发传输期间的SSL保持期间。

MOIFE位（MOSI空闲值固定使能）

MOIFE位在SPI处于主模式和SSL否定周期（包括突发传输期间的SSL保留周期）时固定MOSIn输出值。当MOIFE位为0时，SPI将SSL否定期间上次串行传输的最后一个数据输出到MOSIn引脚。当MOIFE位为1时，SPI将MOIFV位中设置的固定值输出到MOSIn引脚。

38.2.4 SPI状态寄存器(SPSR)

Address(es): SPI0.SPSR 4007 2003h, SPI1.SPSR 4007 2103h

	b7	b6	b5	b4	b3	b2	b1	b0
	SPRF	—	SPTEF	UDRF	PERF	MODF	IDLNF	OVRF
重置后的值：	0	0	1	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	OVRF	溢出错误标志	0：未发生溢出错误1：发生溢出错误。	R/(W)*1
b1	IDLNF	SPI空闲标志	0：SPI处于空闲状态1：SPI处于传输状态。	R
b2	MODF	模式故障错误标志	0：未发生模式故障或欠载错误1：发生模式故障错误或欠载错误。	R/(W)*1
b3	PERF	奇偶校验错误标志	0：未发生奇偶校验错误1：发生奇偶校验错误。	R/(W)*1
b4	UDRF	欠载错误标志	0：发生模式故障错误（MODF=1）1：发生欠载错误（MODF=1）。当MODF标志为0时，该位无效。	R/W*1,*2
b5	SPTEF	SPI发送缓冲区空标志	0：发送缓冲区中有数据1：发送缓冲区中没有数据。	R/(W)*3
b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b7	SPRF	SPI接收缓冲区满标志	0：SPDRSPDR_HA中没有有效数据1：SPDRSPDR_HA中有有效数据。	R/(W)*3

Note 1. 读1后只能写0清除标志。
Note 2. UDRF标志在软件清除MODF标志的同时清除。
Note 3. 写入值应为1。

OVRF标志（溢出错误标志）

OVRF标志指示发生溢出错误。在主机模式（SPCR.MSTR位=1）和当RSPCK时钟自动停止功能使能（SPCR2.SCKASE位=1），不会发生溢出错误。此标志不设置为1。有关详细信息，请参阅第38.3.8.1节，溢出错误。

[Setting condition]

- 当SPCR.TXMD位为0且接收缓冲区已满时，下一次串行传输结束。

[Clearing condition]

- 在通过读取SPSR确认OVRF标志为1后将0写入OVRF标志时。

IDLNF标志（SPI空闲标志）

IDLNF标志指示SPI的传输状态。

[Setting conditions]

Master mode

- When conditions 1. and 2. in the master mode [Clearing conditions] are not satisfied.

Slave mode

- When the SPCR.SPE bit is 1, enabling the SPI function.

[Clearing conditions]

Master mode

- When condition 1. OR conditions 2., 3., and 4. are satisfied.

1. The SPCR.SPE bit is 0, indicating the SPI is initialized.
2. The transmit buffer (SPTX) is empty, indicating that data for the next transfer is not set.
3. The SPSSR.SPCP[2:0] bits are 000b, indicating the beginning of sequence control.
4. The SPI internal sequencer enters the idle state, indicating that operations up to the next-access delay are complete.

Slave mode

- When condition 1. is satisfied.

MODF flag (Mode Fault Error Flag)

The MODF flag indicates the occurrence of a mode fault error or an underrun error. Use the UDRF flag to identify which error occurred.

[Setting conditions]

Multi-master mode

- When the input level of the SSLni pin changes to the active level while the SPCR.MSTR bit is 1 (master mode) and the SPCR.MODFEN bit is 1 (mode fault error detection is enabled). The SPI detects a mode fault error.

Slave mode

- When condition 1. OR 2. is satisfied.

1. The SSLni pin is negated before the RSPCK cycle necessary for data transfer ends while the SPCR.MSTR bit is 0 (slave mode) and the SPCR.MODFEN bit is 1 (mode fault error detection is enabled). The SPI detects a mode fault error.
2. The serial transfer begins while the SPCR.MSTR bit is 0 (slave mode), the SPCR.SPE bit is 1, and the transmission data is not prepared. The SPI detects an underrun error.

The active level of the SSLni signal is determined by the SSLP.SSLiP bit (SSLi signal polarity setting bit).

[Clearing condition]

- When 0 is written to the MODF flag after the MODF flag is confirmed to be 1 by a read of SPSR.

PERF flag (Parity Error Flag)

The PERF flag indicates the occurrence of a parity error.

[Setting condition]

- When a serial transfer ends while the SPCR.TXMD bit is 0 and the SPCR2.SPPE bit is 1. The SPI detects a parity error.

[Clearing condition]

- When 0 is written to the PERF flag after the PERF flag is confirmed to be 1 by a read of SPSR.

UDRF flag (Underrun Error Flag)

The UDRF flag indicates the occurrence of an underrun error.

[Setting conditions]

主模式

- 不满足主模式[清除条件]中的条件1.和2.时。

从机模式

- 当SPCR.SPE位为1时，使能SPI功能。

[Clearing conditions]

主模式

- 当条件1.OR条件2. 3. 和4.满足时。

1. SPCR.SPE位为0，表示SPI已初始化。
2. 发送缓冲区(SPTX)为空，表示未设置下一次传输的数据。
3. SPSSR.SPCP[2:0]位为000b，表示序列控制的开始。
4. SPI内部定序器进入空闲状态，表示直到下一次访问延迟的操作已完成。

从机模式

- 当条件1.满足时。

MODF标志（模式故障错误标志）

MODF标志指示发生模式故障错误或欠载错误。使用UDRF标志来识别发生了哪个错误。

[Setting conditions]

Multi-master mode

- 当SPCR.MSTR位为1（主模式）且SPCR.MODFEN位为1（启用模式故障错误检测）时SSLni引脚的输入电平变为有效电平。SPI检测到模式故障错误。

从机模式

- 当条件1.OR2.满足时。

1. 在SPCR.MSTR位为0（从模式）和SPCR.MODFEN位为1（启用模式故障错误检测）时，SSLni引脚在数据传输所需的RSPCK周期结束之前被取消。SPI检测到模式故障错误。
2. 当SPCR.MSTR位为0（从模式）、SPCR.SPE位为1且未准备传输数据时，串行传输开始。SPI检测到欠载错误。

SSLni信号的有效电平由SSLP.SSLiP位（SSLi信号极性设置位）决定。

[Clearing condition]

- 在通过读取SPSR确认MODF标志为1后，向MODF标志写入0时。

PERF标志（奇偶校验错误标志）

PERF标志指示奇偶校验错误的发生。

[Setting condition]

- 当SPCR.TXMD位为0且SPCR2.SPPE位为1时串行传输结束。SPI检测到奇偶校验错误。

[Clearing condition]

- 在通过读取SPSR确认PERF标志为1后，将0写入PERF标志时。

UDRF标志（欠载错误标志）

UDRF标志指示发生了欠载错误。

[Setting condition]

- When the serial transfer begins while the SPCR.MSTR bit is 0 (slave mode), the SPCR.SPE bit is 1, and the transmission data is not prepared. The SPI detects an underrun error.

[Clearing condition]

- When 0 is written to the UDRF flag after the UDRF flag is confirmed to be 1 by a read of SPSR.

SPTEF flag (SPI Transmit Buffer Empty Flag)

The SPTEF flag indicates the status of the transmit buffer for the SPI Data Register (SPDR/SPDR_HA).

[Setting conditions]

- When condition 1. OR 2. is satisfied.

1. The SPCR.SPE bit is 0 (the SPI is initialized).
2. Transmit data was transferred from the transmit buffer to the shift register.

[Clearing condition]

- When data written to SPDR/SPDR_HA equals the number of frames set in the SPFC[1:0] bits in the SPI Data Control Register (SPDCR).

Data can only be written to SPDR/SPDR_HA when the SPTEF flag is 1. If data is written to the transmit buffer of SPDR/SPDR_HA when the SPTEF flag is 0, the data in the transmit buffer is not updated.

SPRF flag (SPI Receive Buffer Full Flag)

The SPRF flag indicates the status of the receive buffer for the SPI Data Register (SPDR/SPDR_HA).

[Setting condition]

- When a serial transfer ends while the communication operating mode select bit (TXMD) in the SPI Control Register (SPCR) is 0, the SPRF flag is 0, and the SPI transfers the receive data from the shift register to SPDR/SPDR_HA. However, when the OVRF flag is 1, the SPRF flag does not change from 0 into 1.

[Clearing condition]

- When received data is read from the SPDR/SPDR_HA.

38.2.5 SPI Data Register (SPDR/SPDR_HA)

Address(es): SPI0.SPDR 4007 2004h, SPI1.SPDR 4007 2104h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Address(es): SPI0.SPDR_HA 4007 2004h, SPI1.SPDR_HA 4007 2104h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SPDR/SPDR_HA is the interface with the buffers that hold data for transmission and reception by the SPI. When accessing this register in words (the SPLW bit is 1), access SPDR. When accessing it in halfwords (the SPLW bit is 0), access SPDR_HA.

[Setting condition]

- 当SPCR.MSTR位为0（从模式）时串行传输开始时，SPCR.SPE位为1，不准备传输数据。SPI检测到欠载错误。

[Clearing condition]

- 在通过读取SPSR确认UDRF标志为1后，将0写入UDRF标志时。

SPTEF标志（SPI发送缓冲区空标志）

SPTEF标志指示SPI数据寄存器(SPDRSPDR_HA)的发送缓冲区的状态。

[Setting conditions]

- 当条件1.OR2.满足时。

1. SPCR.SPE位为0（SPI已初始化）。
2. 发送数据从发送缓冲器传送到移位寄存器。

[Clearing condition]

- 当写入SPDR的数据SPDR_HA等于SPI数据中SPFC[1:0]位中设置的帧数时控制寄存器(SPDCR)。

只有当SPTEF标志为1时，才能将数据写入SPDRSPDR_HA。如果将数据写入SPDRSPDR_HA当SPTEF标志为0时，发送缓冲区中的数据不更新。

SPRF标志（SPI接收缓冲区满标志）

SPRF标志指示SPI数据寄存器(SPDRSPDR_HA)的接收缓冲区的状态。

[Setting condition]

- 当串行传输结束且SPI控制寄存器(SPCR)中的通信操作模式选择位(TXMD)为0时，SPRF标志为0，SPI将接收数据从移位寄存器传输到SPDRSPDR_HA。但是，当OVRF标志为1时，SPRF标志不会从0变为1。

[Clearing condition]

- 从SPDRSPDR_HA读取接收到的数据时。

SPDRSPDR_HA是与保存数据以供SPI发送和接收的缓冲区的接口。以字访问该寄存器时（SPLW位为1），访问SPDR。当以半字访问时（SPLW位为0），访问SPDR_HA。

The transmit buffer (SPTX) and receive buffer (SPRX) are independent but are both mapped to SPDR/SPDR_HA. Figure 38.2 shows the configuration.

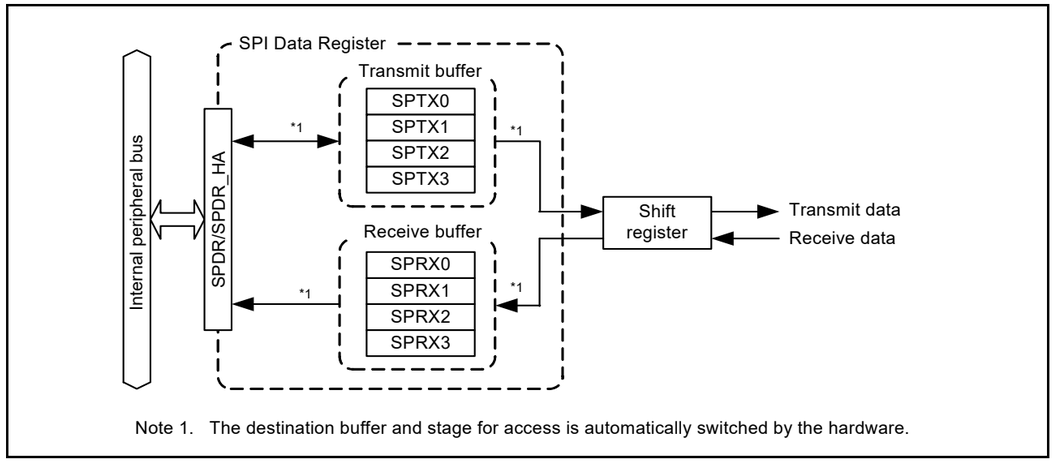

Figure 38.2 Configuration of SPDR/SPDR_HA

The transmit and receive buffers each have four stages. The number of stages to be used is selectable in the number of frames specification bits in the SPI Data Control Register (SPDCR.SPFC[1:0]). The eight stages of the buffer are all mapped to the single address of SPDR/SPDR_HA.

Data written to SPDR/SPDR_HA is written to a transmit-buffer stage (SPTXn) (n = 0 to 3) and then transmitted from the buffer. The receive buffer holds received data on completion of reception. The receive buffer is not updated if an overrun is generated.

Additionally, if the data length is other than 32 bits, bits not referred to in SPTXn (n = 0 to 3) are stored in the associated bits in SPRXn (n = 0 to 3). For example, if the data length is 9 bits, the received data is stored in the SPRXn[8:0] bits, and the SPTXn[31:9] bits are stored in the SPRXn[31:9] bits.

(1) Bus interface

SPDR/SPDR_HA is an interface with 32-bit wide transmit and receive buffers, each of which has four stages, for a total of 32 bytes. In other words, the 32 bytes are mapped to the 4-byte address space for SPDR/SPDR_HA. Additionally, the unit of access for SPDR/SPDR_HA is selected by the SPI word access/halfword access specification bit in the SPI Data Control Register (SPDCR.SPLW). Other case, make an access to SPDR with the access size specified by the SPI byte access bit in the SPI Data Control Register (SPDCR.SPBYT).

Flush transmission data at the LSB end of the register, and store received data at the LSB end.

This section describes the operations involved in writing to and reading from SPDR/SPDR_HA.

(a) Writing

Data written to SPDR/SPDR_HA is written to a transmit buffer (SPTXn). This is not affected by the value of the SPDCR.SPRDTD bit, unlike when reading from SPDR/SPDR_HA. The transmit buffer includes a transmit buffer write pointer that is automatically updated to reference the next stage each time data is written to SPDR/SPDR_HA.

Figure 38.3 shows the configuration of the bus interface with the transmit buffer when writing to SPDR.

发送缓冲区(SPTX)和接收缓冲区(SPRX)是独立的，但都映射到SPDRSPDR_HA。
图38.2显示了配置。

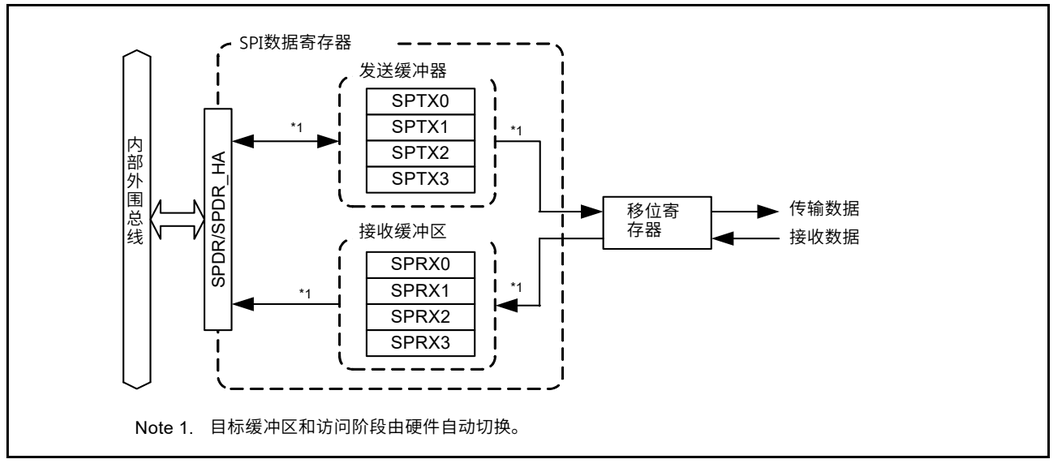

Figure 38.2 SPDRSPDR_HA的配置

发送和接收缓冲器各有四个阶段。要使用的级数可在SPI数据控制寄存器(SPDCR.SPFC[1:0])中的帧数规范位中选择。缓冲区的八个阶段都映射到SPDRSPDR_HA的单个地址。

写入SPDRSPDR_HA的数据被写入发送缓冲器级(SPTXn)（n=0到3），然后从缓冲器发送。接收缓冲器在接收完成时保存接收到的数据。如果产生溢出，接收缓冲区不会更新。

此外，如果数据长度不是32位，SPTXn(n=0到3)中未引用的位将存储在SPRXn(n=0到3)的相关位中。例如，如果数据长度为9位，则接收到的数据存储在SPRXn[8:0]位中，SPTXn[31:9]位存储在SPRXn[31:9]位中。

(1) 总线接口

SPDRSPDR_HA是一个具有32位宽的发送和接收缓冲区的接口，每个缓冲区有四个阶段，总共32个字节。换句话说，这32个字节映射到SPDRSPDR_HA的4字节地址空间。此外，SPDRSPDR_HA的访问单元由SPI数据控制寄存器(SPDCR.SPLW)中的SPI字访问半字访问规范位选择。其他情况下，使用SPI数据控制寄存器(SPDCR.SPBYT)中的SPI字节访问位指定的访问大小访问SPDR。

在寄存器的LSB端刷新发送数据，在LSB端存储接收到的数据。

本节介绍写入和读取SPDRSPDR_HA所涉及的操作。

(a) Writing

写入SPDRSPDR_HA的数据被写入发送缓冲器(SPTXn)。这不受价值的影响
SPDCR.SPRDTD位，与从SPDRSPDR_HA读取时不同。发送缓冲区包括一个发送缓冲区写指针，每次将数据写入SPDRSPDR_HA时，该写指针会自动更新以引用下一阶段。

图38.3显示了写入SPDR时带有发送缓冲器的总线接口的配置。

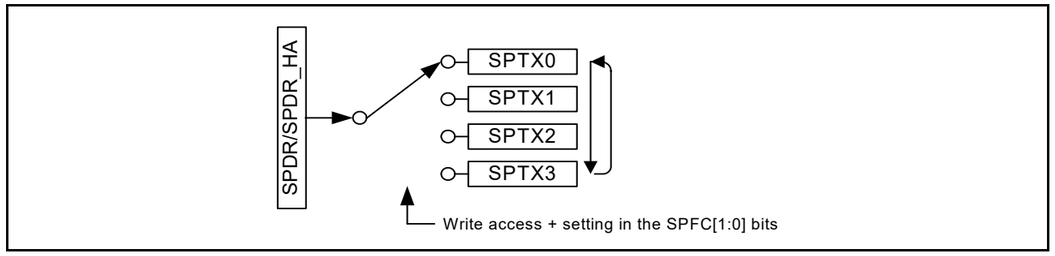

Figure 38.3 Configuration of SPDR/SPDR_HA for write access

The sequence for switching the transmit buffer write pointer differs with the setting of the number of frames specification bits in the SPI Data Control Register (SPDCR.SPFC[1:0]). The relationship of the SPFC[1:0] setting and the sequence of pointer switching among SPTX0 to SPTX3 is as follows:

- When SPFC[1:0] = 00b: SPTX0 → SPTX0 → SPTX0 → …
- When SPFC[1:0] = 01b: SPTX0 → SPTX1 → SPTX0 → SPTX1 → …
- When SPFC[1:0] = 10b: SPTX0 → SPTX1 → SPTX2 → SPTX0 → SPTX1 → …
- When SPFC[1:0] = 11b: SPTX0 → SPTX1 → SPTX2 → SPTX3 → SPTX0 → SPTX1 → …

When 1 is written to the SPI function enable bit in the SPI Control Register (SPCR.SPE) while the value of the bit is 0, SPTX0 is the destination the next time writing proceeds.

When writing to the transmit buffer (SPTXn) after generating the transmit buffer empty interrupt (when SPSR.SPTEF is 1), write the number of frames set in SPFC[1:0] in the SPI Data Control Register (SPDCR). Even when the specified number of frames is written to the transmit buffer (SPTXn), the value of the buffer is not updated after completion of the writing and before the next transmit buffer empty interrupt is generated (when SPTEF is 0).

(b) Reading

SPDR/SPDR_HA can be accessed to read the value of a receive buffer (SPRXn) or a transmit buffer (SPTXn). The setting in the SPI receive/transmit data select bit in the SPI Data Control Register (SPDCR.SPRDTD) selects whether reading is of the receive or transmit buffer. The sequence of reading the SPDR/SPDR_HA register is controlled by the independent receive buffer and transmit buffer read pointers.

Figure 38.4 shows the configuration of the bus interface with the receive and transmit buffers for a read from SPDR/SPDR_HA.

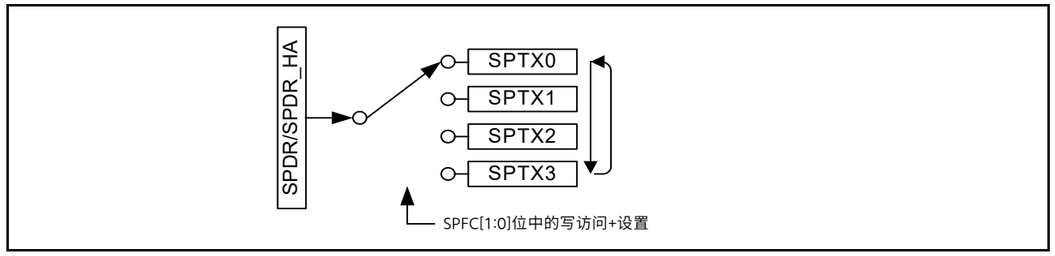

Figure 38.3 为写访问配置SPDRSPDR_HA

发送缓冲区写指针的切换顺序因SPI数据控制寄存器(SPDCR.SPFC[1:0])中帧数规范位的设置而异。SPFC[1:0]设置与SPTX0到SPTX3指针切换顺序的关系如下：

- When SPFC[1:0] = 00b: SPTX0 → SPTX0 → SPTX0 → …
- When SPFC[1:0] = 01b: SPTX0 → SPTX1 → SPTX0 → SPTX1 → …
- When SPFC[1:0] = 10b: SPTX0 → SPTX1 → SPTX2 → SPTX0 → SPTX1 → …
- When SPFC[1:0] = 11b: SPTX0 → SPTX1 → SPTX2 → SPTX3 → SPTX0 → SPTX1 → …

当SPI控制寄存器(SPCR.SPE)中的SPI功能使能位写入1而该位的值为0时，
SPTX0是下一次写入的目的地。

在产生发送缓冲区空中断后写入发送缓冲区(SPTXn)时（当SPSR.SPTEF为1时），将SPFC[1:0]中设置的帧数写入SPI数据控制寄存器(SPDCR)。即使将指定数量的帧写入发送缓冲区(SPTXn)，缓冲区的值在写入完成后和下一个发送缓冲区空中断产生之前（SPTEF为0时）也不会更新。

(b) Reading

SPDR可以访问SPDR_HA以读取接收缓冲区(SPRXn)或发送缓冲区(SPTXn)的值。SPI数据控制寄存器(SPDCR.SPRDTD)中SPI接收发送数据选择位的设置选择读取接收缓冲区还是发送缓冲区。读取SPDRSPDR_HA寄存器的顺序由独立的接收缓冲区和发送缓冲区读取指针控制。

图38.4显示了带有用于读取的接收和发送缓冲区的总线接口的配置
SPDR/SPDR_HA.

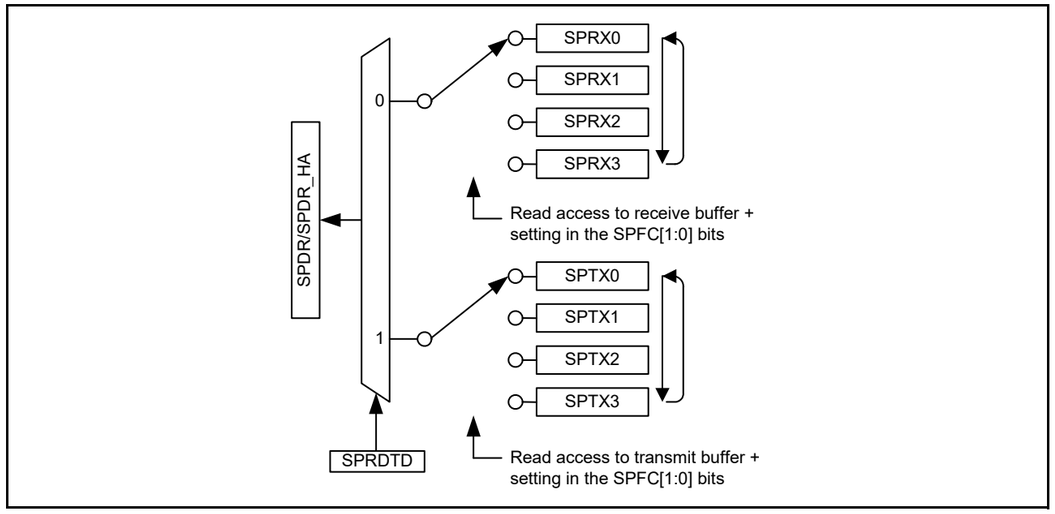

Figure 38.4 Configuration of SPDR/SPDR_HA for read access

Reading the receive buffer switches the receive buffer read pointer to the next buffer automatically. The switching sequence for the receive buffer read pointer is the same as that for the transmit buffer write pointer. However, when 1 is written to the SPI function enable bit in the SPI Control Register (SPCR.SPE) while the value of the bit is 1, SPRX0 is referenced by the buffer read pointer the next time reading proceeds.

The transmit buffer read pointer is updated when writing to SPDR/SPDR_HA, and not updated when reading from the transmit buffer. When reading from the transmit buffer, the value most recently written to SPDR/SPDR_HA is read. However, after generation of the transmit buffer empty interrupt, the values read from the transmit buffer are all 0s in the interval after completion of writing the number of frames of data specified in the SPDCR.SPFC[1:0] bits and before generation of the next buffer empty interrupt (when SPTEF is 0).

38.2.6 SPI Sequence Control Register (SPSCR)

Address(es): SPI0.SPSCR 4007 2008h, SPI1.SPSCR 4007 2108h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPSLN[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SPSLN[2:0]	SPI Sequence Length Specification	b2 b0: Sequence Length — Referenced SPCMD0 to SPCMD7 (No.) 0 0 0: 1 — 0→0→… 0 0 1: 2 — 0→1→0→… 0 1 0: 3 — 0→1→2→0→… 0 1 1: 4 — 0→1→2→3→0→… 1 0 0: 5 — 0→1→2→3→4→0→… 1 0 1: 6 — 0→1→2→3→4→5→0→… 1 1 0: 7 — 0→1→2→3→4→5→6→0→… 1 1 1: 8 — 0→1→2→3→4→5→6→7→0→… The sequence length that is set in these bits determines the order in which the SPCMD0 to SPCMD07 registers are referenced. The setting defines the relationship between the sequence length and the SPCMD0 to SPCMD7 registers referenced by the SPI. In slave mode, the SPI references SPCMD0.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

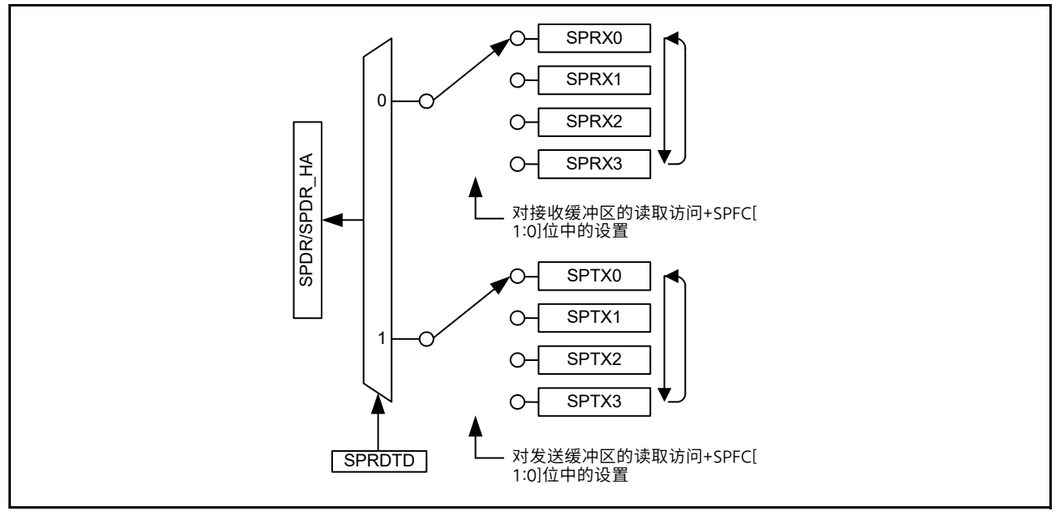

Figure 38.4 为读取访问配置SPDRSPDR_HA

读取接收缓冲区会自动将接收缓冲区读取指针切换到下一个缓冲区。接收缓冲区读指针的切换顺序与发送缓冲区写指针的切换顺序相同。但是，当1写入SPI控制寄存器(SPCR.SPE)中的SPI功能使能位且该位的值为1时，下次读取继续时，缓冲区读取指针将引用SPRX0。

发送缓冲区读指针在写入SPDRSPDR_HA时更新，而在从发送缓冲区读取时不更新。从发送缓冲区读取时，会读取最近写入SPDRSPDR_HA的值。但是，在产生发送缓冲区空中断后，从发送缓冲区读取的值在完成写入SPDCR.SPFC[1:0]位中指定的数据帧数之后和产生之前的间隔内全为0。下一个缓冲区空中断（当SPTEF为0时）。

38.2.6 SPI序列控制寄存器(SPSCR)

Address(es): SPI0.SPSCR 4007 2008h, SPI1.SPSCR 4007 2108h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPSLN[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W

b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SPSCR specifies the sequence length when the SPI operates in master mode. Before changing the SPSCR.SPSLN[2:0] bits while both the SPCR.MSTR and SPCR.SPE bits are 1, always check that the SPSR.IDLNF flag is 0.

SPSLN[2:0] bits (SPI Sequence Length Specification)

The SPSLN[2:0] bits specify the sequence length when the SPI in master mode performs sequential operations. The SPI in master mode changes the SPCMD0 to SPCMD7 registers to be referenced, and the order in which they are referenced is based on this sequence length setting. In slave mode, SPCMD0 is referenced.

38.2.7 SPI Sequence Status Register (SPSSR)

Address(es): SPI0.SPSSR 4007 2009h, SPI1.SPSSR 4007 2109h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	SPECM[2:0]			—	SPCP[2:0]

b6 to b4	SPECM[2:0]	SPI Error Command	b6 b4 0 0 0: SPCMD0 0 0 1: SPCMD1 0 1 0: SPCMD2 0 1 1: SPCMD3 1 0 0: SPCMD4 1 0 1: SPCMD5 1 1 0: SPCMD6 1 1 1: SPCMD7.	R
b7	—	Reserved	This bit is read as 0.	R

SPSSR indicates the sequence control status when the SPI operates in master mode. Any writes to SPSSR are ignored.

SPCP[2:0] bits (SPI Command Pointer)

The SPCP[2:0] bits indicate the SPCMDm register that is referenced to by the pointer during sequence control by the SPI. For the SPI sequence control, see section 38.3.10.1, Master mode operation.

SPECM[2:0] bits (SPI Error Command)

The SPECM[2:0] bits indicate the SPCMDm register that is specified in the SPCP[2:0] bits when an error is detected during sequence control by the SPI. The SPI updates the SPECM[2:0] bits only when an error is detected. If both the SPSR.OVRF and SPSR.MODF flags are 0 and there is no error, the values of the SPECM[2:0] bits have no meaning.

For the SPI error detection function, see section 38.3.8, Error Detection. For the SPI sequence control, see section 38.3.10.1, Master mode operation.

SPSCR指定SPI在主模式下工作时的序列长度。在SPCR.MSTR和SPCR.SPE位均为1时更改SPSCR.SPSLN[2:0]位之前，请始终检查SPSR.IDLNF标志是否为0。

SPSLN[2:0]位（SPI序列长度规范）

SPSLN[2:0]位指定SPI在主模式下执行顺序操作时的序列长度。主机模式下的SPI将SPCMD0到SPCMD7寄存器更改为被引用，它们被引用的顺序基于此序列长度设置。在从模式下，以SPMD0为参考。

38.2.7 SPI序列状态寄存器(SPSSR)

Address(es): SPI0.SPSSR 4007 2009h, SPI1.SPSSR 4007 2109h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	SPECM[2:0]			—	SPCP[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	SPCP[2:0]	SPI命令指针	b2 b0 0 0 0: SPCMD0 0 0 1: SPCMD1 0 1 0: SPCMD2 0 1 1: SPCMD3 1 0 0: SPCMD4 1 0 1: SPCMD5 1 1 0: SPCMD6 1 1 1: SPCMD7.	R

b7	—	Reserved	该位读为0。	R

SPSSR指示SPI在主模式下工作时的序列控制状态。对SPSSR的任何写入都将被忽略。

SPCP[2:0]位（SPI命令指针）

SPCP[2:0]位指示在序列控制期间由指针引用的SPCMDm寄存器
SPI。对于SPI序列控制，请参见第38.3.10.1节，主模式操作。

SPECM[2:0]位（SPI错误命令）

SPECM[2:0]位指示在SPI序列控制期间检测到错误时在SPCP[2:0]位中指定的SPCMDm寄存器。SPI仅在检测到错误时更新SPECM[2:0]位。如果SPSR.OVRF和SPSR.MODF标志均为0且没有错误，则SPECM[2:0]位的值没有意义。

关于SPI错误检测功能，请参见第38.3.8节，错误检测。对于SPI序列控制，请参见第38.3.10.1节，主模式操作。

38.2.8 SPI Bit Rate Register (SPBR)

Address(es): SPI0.SPBR 4007 200Ah, SPI1.SPBR 4007 210Ah

	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1

SPBR sets the bit rate in master mode. If the contents of SPBR are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

When the SPI is used in slave mode, the bit rate depends on the bit rate of the input clock regardless of the settings in SPBR and the SPCMDm.BRDV[1:0] bits (bit rate division setting). Use bit rates that satisfy the electrical characteristics.

The bit rate is determined by combinations of the SPBR and SPCMDm.BRDV[1:0] settings. The equation for calculating the bit rate is as follows:

$$\text{Bit rate} = \frac{f(\text{PCLKA})}{2 \times (n + 1) \times 2^N}$$

In the equation, n denotes an SPBR setting (0, 1, 2, …, 255), and N denotes a BRDV[1:0] setting (0, 1, 2, 3).

Table 38.3 lists examples of the relationship among the SPBR settings, the BRDV[1:0] settings, and bit rates.

Table 38.3 Relationship among SPBR settings, BRDV[1:0] settings, and bit rates

SPBR (n)	BRDV[1:0] bits (N)	Division ratio	Bit rate							
			PCLKA = 32 MHz	PCLKA = 36 MHz	PCLKA = 40 MHz	PCLKA = 50 MHz	PCLKA = 60 MHz	PCLKA = 80 MHz	PCLKA = 100 MHz	PCLKA = 120 MHz

38.2.8 SPI比特率寄存器（SPBR）

Address(es): SPI0.SPBR 4007 200Ah, SPI1.SPBR 4007 210Ah

	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	1	1	1	1	1	1	1	1

SPBR在主模式下设置比特率。如果在SPCR.MSTR和SPCR.SPE位都为1时SPBR的内容发生了变化，则不要执行后续操作。

当SPI在从机模式下使用时，比特率取决于输入时钟的比特率，与SPBR和SPCMDm.BRDV[1:0]位（比特率划分设置）。使用满足电气特性的比特率。

比特率由SPBR和SPMDm.BRDV[1:0]设置的组合决定。比特率的计算公式如下：

$$\text{比特率} = \frac{f(\text{PCLKA})}{2 \times (n + 1) \times 2^N}$$

在等式中，n表示SPBR设置(0 1 2 … 255)，N表示BRDV[1:0]设置(0 1 2 3)。

表38.3列出了SPBR设置、BRDV[1:0]设置和比特率之间的关系示例。

Table 38.3 SPBR设置、BRDV[1:0]设置和比特率之间的关系

SPBR (n)	BRDV[1:0] bits (N)	分工比	比特率							
			PCLKA = 32 MHz	PCLKA = 36 MHz	PCLKA = 40 MHz	PCLKA = 50 MHz	PCLKA = 60 MHz	PCLKA = 80 MHz	PCLKA = 100 MHz	PCLKA = 120 MHz

b4	SPRDTD	SPI Receive/Transmit Data Select	0: Read SPDR/SPDR_HA values from receive buffer 1: Read SPDR/SPDR_HA values from transmit buffer, but only if the transmit buffer is empty.	R/W
b5	SPLW	SPI Word Access/Halfword Access Specification	0: Set SPDR_HA to valid for halfword access 1: Set SPDR to valid for word access.	R/W
b6	SPBYT	SPI Byte Access Specification	0: SPDR is accessed in halfword or word (SPLW is valid) 1: SPDR is accessed in byte (SPLW is invalid).	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Up to four frames can be transmitted or received in one round of transmission or reception. The amount of data in each transfer is controlled by the combination of the SPCMDm.SPB[3:0] bits, the SPSCR.SPSLN[2:0] bits, and the SPDCR.SPFC[1:0] bits.

When changing the SPDCR.SPFC[1:0] bits while the SPCR.SPE bit is 1, always check that the SPSR.IDLNF flag is 0.

SPFC[1:0] bits (Number of Frames Specification)

The SPFC[1:0] bits specify the number of frames that can be stored in SPDR/SPDR_HA per transfer activation. Up to four frames can be transmitted or received in one round of transmission or reception.

When the number of transmission data frames specified in the SPFC[1:0] bits is written to the SPDR/SPDR_HA register, SPI clears the SPSR.SPTEF flag to 0 and begins transmitting. After that, when the number of transmission data frames specified in the SPFC[1:0] bits is transmitted to the shift register, the SPI generates the transmit buffer empty interrupt (SPSR.SPTEF sets to 1).

When the number of data frames specified in the SPFC[1:0] bits is received, the SPI generates the receive buffer full interrupt (SPSR.SPRF sets to 1).

Table 38.4 Settable combinations of the SPSLN[2:0] and SPFC[1:0] bits (1 of 2)

Setting	SPSLN[2:0]	SPFC[1:0]	Number of frames in a single sequence	Number of frames at which transmission or receive buffer is filled

b5	SPLW	SPI字访问半字 访问规范	0：将SPDR_HA设置为对半字访问有效1：将SPDR设置为对字访问有效。	R/W
b6	SPBYT	SPI字节访问规范	0：SPDR按半字或字访问（SPLW有效）1：SPDR按字节访问（SPLW无效）。	R/W
b7	—	Reserved	该位读取为0。写入值应为0。	R/W

在一轮发送或接收中最多可以发送或接收四帧。每次传输中的数据量由SPCMDm.SPB[3:0]位、SPSCR.SPSLN[2:0]位和SPDCR.SPFC[1:0]位的组合控制。

在SPCR.SPE位为1时更改SPDCR.SPFC[1:0]位时，请始终检查SPSR.IDLNF标志是否为0。

SPFC[1:0]位（帧数规范）

SPFC[1:0]位指定每次传输激活时可以存储在SPDRSPDR_HA中的帧数。在一轮发送或接收中最多可以发送或接收四帧。

当SPFC[1:0]位中指定的发送数据帧数写入SPDRSPDR_HA寄存器时，SPI将SPSR.SPTEF标志清零并开始发送。之后，当SPFC[1:0]位中指定的发送数据帧数被发送到移位寄存器时，SPI产生发送缓冲区空中断（SPSR.SPTEF设置为1）。

当接收到SPFC[1:0]位中指定的数据帧数时，SPI产生接收缓冲区满中断（SPSR.SPRF设置为1）。

Table 38.4 SPSLN[2:0]和SPFC[1:0]位的可设置组合（2个中的1个）

Setting	SPSLN[2:0]	SPFC[1:0]	单个序列中的帧数	填充传输或接收缓冲区的帧数

6	101b	00b	6	1
7	110b	00b	7	1
8	111b	00b	8	1

SPRDTD bit (SPI Receive/Transmit Data Select)

The SPRDTD bit selects whether the SPDR/SPDR_HA reads values from the receive buffer or from the transmit buffer. If reading is from the transmit buffer, the value written to SPDR/SPDR_HA register immediately beforehand is read. When reading the transmit buffer, do so before writing of the number of frames set in the SPFC[1:0] bits is finished and after generation of the transmit buffer empty interrupt (when SPSR.SPTEF is 1).

For details, see section 38.2.5, SPI Data Register (SPDR/SPDR_HA).

SPLW bit (SPI Word Access/Halfword Access Specification)

The SPLW bit specifies the access width for SPDR. Access to SPDR_HA in halfwords is valid when the SPLW bit is 0 and access to SPDR in words is valid when the SPLW bit is 1. Also, when this bit is 0, set the SPCMDm.SPB[3:0] bits (SPI data length setting) from 8 to 16 bits. Do not perform any operations when 20, 24, or 32 bits is specified.

SPBYT bit (SPI Byte Access Specification)

This bit is used to set the data width of access to the SPI Data Register (SPDR). When SPBYT = 0, use word or half word access to SPDR. When SPBYT = 1 (in that case, SPLW is invalid), use byte access to SPDR.

When SPBYT = 1, set the SPI data length bits (SPB[3:0]) in the SPI Command Register n (SPCMDn) to 0 bits. If SPB[3:0] are set to 9 to 16, 20, 24, or 32 bit, subsequent operation is not guaranteed.

38.2.10 SPI Clock Delay Register (SPCKD)

Address(es): SPI0.SPCKD 4007 200Ch, SPI1.SPCKD 4007 210Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCKDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SCKDL[2:0]	RSPCK Delay Setting	b2 b0 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SPCKD specifies the RSPCK delay, the period from the beginning of SSLni signal assertion to RSPCK oscillation, when the SPCMDm.SCKDEN bit is 1. If the contents of SPCKD are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

SCKDL[2:0] bits (RSPCK Delay Setting)

The SCKDL[2:0] bits specify an RSPCK delay value when the SPCMDm.SCKDEN bit is 1. When using the SPI in slave mode, set the SCKDL[2:0] bits to 000b.

Table 38.4 SPSLN[2:0]和SPFC[1:0]位的可设置组合（2个中的2个）

Setting	SPSLN[2:0]	SPFC[1:0]	单个序列中的帧数	填充传输或接收缓冲区的帧数
6	101b	00b	6	1
7	110b	00b	7	1
8	111b	00b	8	1

SPRDTD位（SPI接收发送数据选择）

SPRDTD位选择SPDRSPDR_HA是从接收缓冲区还是从发送缓冲区读取值。如果从发送缓冲区读取，则读取之前立即写入SPDRSPDR_HA寄存器的值。

读取发送缓冲区时，在SPFC[1:0]位中设置的帧数写入完成之前和发送缓冲区空中断产生之后（当SPSR.SPTEF为1时）执行此操作。

有关详细信息，请参阅第38.2.5节，SPI数据寄存器(SPDRSPDR_HA)。

SPLW位（SPI字访问半字访问规范）

SPLW位指定SPDR的访问宽度。当SPLW位为0时，以半字访问SPDR_HA有效，当SPLW位为1时，以字访问SPDR有效。此外，当该位为0时，设置SPCMDm.SPB[3:0]位（SPI数据长度设置）从8到16位。指定20、24或32位时不要执行任何操作。

SPBYT位（SPI字节访问规范）

该位用于设置访问SPI数据寄存器(SPDR)的数据宽度。当SPBYT=0时，使用字或半字访问SPDR。当SPBYT=1时（在这种情况下，SPLW无效），使用字节访问SPDR。

当SPBYT=1时，将SPI命令寄存器n(SPCMDn)中的SPI数据长度位(SPB[3:0])设置为0位。如果SPB[3:0]设置为9至16、20、24或32位，不保证后续操作。

38.2.10 SPI时钟延迟寄存器(SPCKD)

Address(es): SPI0.SPCKD 4007 200Ch, SPI1.SPCKD 4007 210Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SCKDL[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	SCKDL[2:0]	RSPCK延迟设置	b2 b0 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK.	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SPCKD指定RSPCK延迟，即从SSLni信号断言开始到RSPCK振荡的周期，当SPCMDm.SCKDEN位为1时。如果SPCKD的内容在SPCR.MSTR和SPCR.SPE位都为1时改变，请不进行后续操作。

SCKDL[2:0]位（RSPCK延迟设置）

当SPCMDm.SCKDEN位为1时，SCKDL[2:0]位指定RSPCK延迟值。在从机模式下使用SPI时，将SCKDL[2:0]位设置为000b。

38.2.11 SPI Slave Select Negation Delay Register (SSLND)

Address(es): SPI0.SSLND 4007 200Dh, SPI1.SSLND 4007 210Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SLNDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SLNDL[2:0]	SSL Negation Delay Setting	b2 b0 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SSLND specifies the SSL negation delay, the period from the transmission of a final RSPCK edge to the negation of the SSLni signal during a serial transfer by the SPI in master mode. If the contents of SSLND are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

SLNDL[2:0] bits (SSL Negation Delay Setting)

The SLNDL[2:0] bits specify an SSL negation delay value when the SPI is in master mode. When using the SPI in slave mode, set the SLNDL[2:0] bits to 000b.

38.2.12 SPI Next-Access Delay Register (SPND)

Address(es): SPI0.SPND 4007 200Eh, SPI1.SPND 4007 210Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPNDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	SPNDL[2:0]	SPI Next-Access Delay Setting	b2 b0 0 0 0: 1 RSPCK + 2 PCLKA 0 0 1: 2 RSPCK + 2 PCLKA 0 1 0: 3 RSPCK + 2 PCLKA 0 1 1: 4 RSPCK + 2 PCLKA 1 0 0: 5 RSPCK + 2 PCLKA 1 0 1: 6 RSPCK + 2 PCLKA 1 1 0: 7 RSPCK + 2 PCLKA 1 1 1: 8 RSPCK + 2 PCLKA.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SPND specifies the next-access delay, the non-active period of the SSLni signal after termination of a serial transfer, when the SPCMDm.SPNDEN bit is 1. If the contents of SPND are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

SPNDL[2:0] bits (SPI Next-Access Delay Setting)

The SPNDL[2:0] bits specify a next-access delay when the SPCMDm.SPNDEN bit is 1. When using the SPI in slave mode, set the SPNDL[2:0] bits to 000b.

38.2.11 SPI从机选择否定延迟寄存器(SSLND)

Address(es): SPI0.SSLND 4007 200Dh, SPI1.SSLND 4007 210Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SLNDL[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	SLNDL[2:0]	SSL否定延迟设置	b2 b0 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK.	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SSLND指定SSL否定延迟，从传输最终RSPCK边缘到否定
SPI在主模式下进行串行传输期间的SSLni信号。如果SSLND的内容发生更改，而
SPCR.MSTR和SPCR.SPE位为1，不执行后续操作。

SLNDL[2:0]位（SSL否定延迟设置）

当SPI处于主模式时，SLNDL[2:0]位指定SSL否定延迟值。在从机模式下使用SPI时，将SLNDL[2:0]位设置为000b。

38.2.12 SPI下一次访问延迟寄存器(SPND)

Address(es): SPI0.SPND 4007 200Eh, SPI1.SPND 4007 210Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SPNDL[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	SPNDL[2:0]	SPI下一次访问延迟设置	b2 b0 0 0 0: 1 RSPCK + 2 PCLKA 0 0 1: 2 RSPCK + 2 PCLKA 0 1 0: 3 RSPCK + 2 PCLKA 0 1 1: 4 RSPCK + 2 PCLKA 1 0 0: 5 RSPCK + 2 PCLKA 1 0 1: 6 RSPCK + 2 PCLKA 1 1 0: 7 RSPCK + 2 PCLKA 1 1 1: 8 RSPCK + 2 PCLKA.	R/W
b7 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W

当SPCMDm.SPNDEN位为1时，SPND指定下一次访问延迟，即串行传输终止后SSLni信号的非活动周期。如果在SPCR.MSTR和SPCR.SPE都更改了SPND的内容时位为1，不执行后续操作。

SPNDL[2:0]位（SPI下一次访问延迟设置）

当SPMDm.SPNDEN位为1时，SPNDL[2:0]位指定下一次访问延迟。在从机模式下使用SPI时，将SPNDL[2:0]位设置为000b。

38.2.13 SPI Control Register 2 (SPCR2)

Address(es): SPI0.SPCR2 4007 200Fh, SPI1.SPCR2 4007 210Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SCKASE	PTE	SPIIE	SPOE	SPPE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SPPE	Parity Enable	0: Do not add parity bit to transmit data and do not check parity bit of receive data 1: When SPCR.TXMD = 0: Add parity bit to transmit data and check parity bit of receive data When SPCR.TXMD = 1: Add parity bit to transmit data but do not check parity bit of receive data.	R/W
b1	SPOE	Parity Mode	0: Select even parity for transmission and reception 1: Select odd parity for transmission and reception.	R/W
b2	SPIIE	SPI Idle Interrupt Enable	0: Disable idle interrupt requests 1: Enable idle interrupt requests.	R/W
b3	PTE	Parity Self-Testing	0: Disable self-diagnosis function of the parity circuit 1: Enable self-diagnosis function of the parity circuit.	R/W
b4	SCKASE	RSPCK Auto-Stop Function Enable	0: Disable RSPCK auto-stop function 1: Enable RSPCK auto-stop function.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

If the SPPE, SPOE, or SCKASE bit in SPCR2 is changed while the SPCR.SPE bit is 1, do not perform subsequent operations.

SPPE bit (Parity Enable)

The SPPE bit enables or disables the parity function.

When the SPCR.TXMD bit is 0 and this bit is 1, the parity bit is added to transmit data and parity checking is performed for receive data.

When the SPCR.TXMD bit is 1 and this bit is 1, the parity bit is added to transmit data but parity checking is not performed for receive data.

SPOE bit (Parity Mode)

The SPOE bit specifies odd or even parity.

When even parity is set, parity bit addition is performed so that the total number of 1-bits in the transmit or receive character plus the parity bit is even. Similarly, when odd parity is set, parity bit addition is performed so that the total number of 1-bits in the transmit or receive character plus the parity bit is odd.

The SPOE bit is only valid when the SPPE bit is 1.

SPIIE bit (SPI Idle Interrupt Enable)

The SPIIE bit enables or disables the generation of SPI idle interrupt requests when an idle state is detected in the SPI and the SPSR.IDLNF flag clears to 0.

PTE bit (Parity Self-Testing)

The PTE bit enables self-diagnosis of the parity circuit to check whether the parity function is operating correctly.

SCKASE bit (RSPCK Auto-Stop Function Enable)

The SCKASE bit enables or disables the RSPCK auto-stop function. When this function is enabled, the RSPCK clock is stopped before an overrun error occurs when data is received in master mode. For details, see section 38.3.8.1, Overrun errors.

38.2.13 SPI控制寄存器2(SPCR2)

Address(es): SPI0.SPCR2 4007 200Fh, SPI1.SPCR2 4007 210Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	SCKASE	PTE	SPIIE	SPOE	SPPE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SPPE	奇偶校验使能	0：发送数据不添加奇偶校验位，接收数据不校验校验位1：当SPCR.TXMD=0：发送数据添加校验位，接收数据校验校验位当SPCR.TXMD=1：添加校验位位发送数据，但不检查接收数据的奇偶校验位。	R/W
b1	SPOE	奇偶校验模式	0：发送和接收选择偶校验1：发送和接收选择奇校验。	R/W
b2	SPIIE	SPI空闲中断使能	0：禁用空闲中断请求1：启用空闲中断请求。	R/W
b3	PTE	Parity Self-Testing	0：禁用奇偶电路自诊断功能1：启用奇偶电路自诊断功能。	R/W
b4	SCKASE	RSPCK Auto-Stop Function Enable	0：禁用RSPCK自动停机功能1：启用RSPCK自动停机功能。	R/W
b7 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

如果SPCR.SPE位为1时SPCR2中的SPPE、SPOE或SCKASE位发生变化，则不要执行后续操作。

SPPE位（奇偶校验使能）

SPPE位启用或禁用奇偶校验功能。

当SPCR.TXMD位为0且该位为1时，发送数据添加奇偶校验位，接收数据执行奇偶校验。

当SPCR.TXMD位为1且该位为1时，发送数据添加奇偶校验位，但接收数据不执行奇偶校验。

SPOE位（奇偶校验模式）

SPOE位指定奇校验或偶校验。

设置偶校验时，执行奇偶校验位相加，使发送或接收字符中的1位总数加上奇偶校验位为偶数。类似地，当设置奇校验时，执行奇偶校验位相加，以使发送或接收字符中的1位加上奇偶校验位的总数为奇数。

SPOE位仅在SPPE位为1时有效。

SPIIE位（SPI空闲中断使能）

当在SPI中检测到空闲状态并且SPSR.IDLNF标志清零时，SPIIE位启用或禁用SPI空闲中断请求的生成。

PTE位（奇偶自检）

PTE位启用奇偶校验电路的自诊断，以检查奇偶校验功能是否正常运行。

SCKASE位（RSPCK自动停止功能使能）

SCKASE位启用或禁用RSPCK自动停止功能。当此功能使能时，在主机模式下接收数据时，在发生溢出错误之前停止RSPCK时钟。有关详细信息，请参阅第38.3.8.1节，溢出错误。

38.2.14 SPI Command Registers 0 to 7 (SPCMD0 to SPCMD7)

Address(es): SPI0.SPCMD0 4007 2010h, SPI0.SPCMD1 4007 2012h, SPI0.SPCMD2 4007 2014h, SPI0.SPCMD3 4007 2016h, SPI0.SPCMD4 4007 2018h, SPI0.SPCMD5 4007 201Ah, SPI0.SPCMD6 4007 201Ch, SPI0.SPCMD7 4007 201Eh, SPI1.SPCMD0 4007 2110h, SPI1.SPCMD1 4007 2112h, SPI1.SPCMD2 4007 2114h, SPI1.SPCMD3 4007 2116h, SPI1.SPCMD4 4007 2118h, SPI1.SPCMD5 4007 211Ah, SPI1.SPCMD6 4007 211Ch, SPI1.SPCMD7 4007 211Eh

The SPCMDm registers specify the transfer format for the SPI in master mode. Each channel has eight SPI Command Registers (SPCMD0 to SPCMD7). Some of the bits in the SPCMD0 register are used to set the transfer mode for the SPI in slave mode. The SPI in master mode sequentially references the SPCMDm registers based on the settings in the

38.2.14 SPI命令寄存器0到7(SPCMD0到SPCMD7)

b15	SCKDEN	RSPCK延迟设置启用	0：选择RSPCK延迟为1RSPCK1：选择RSPCK延迟等于SPI时钟延迟寄存器(SPCKD)中的设置。	R/W

SPCMDm寄存器指定主模式下SPI的传输格式。每个通道有8个SPI命令寄存器（SPCMD0到SPCMD7）。SPCMD0寄存器中的一些位用于设置SPI在从机模式下的传输模式。主模式下的SPI根据

SPSCR.SPSLN[2:0] bits and executes the serial transfer that is set in the referenced SPCMDm register.

Set the SPCMDm registers while the transmit buffer is empty (SPSR.SPTEF is 1 and data for the next transfer is not set) and before the setting of the data to be transmitted when that SPCMDm register is referenced.

The SPCMDm register referenced by the SPI in master mode can be checked by means of the SPSSR.SPCP[2:0] bits. If the contents of SPCMDm are changed while the SPCR.MSTR bit is 0 and the SPCR.SPE bit is 1, do not perform subsequent operations.

CPHA bit (RSPCK Phase Setting)

The CPHA bit selects the RSPCK phase of the SPI in master or slave mode. Data communications between SPI modules require the same RSPCK phase setting between the modules.

CPOL bit (RSPCK Polarity Setting)

The CPOL bit selects the RSPCK polarity of the SPI in master or slave mode. Data communications between SPI modules require the same RSPCK polarity setting between the modules.

BRDV[1:0] bits (Bit Rate Division Setting)

The BRDV[1:0] bits determine the bit rate. The bit rate is determined by the combination of the settings in the BRDV[1:0] bits and SPBR (see section 38.2.8, SPI Bit Rate Register (SPBR)). The SPBR settings determine the base bit rate. The BRDV[1:0] setting selects the bit rate obtained by dividing the base bit rate by 1, 2, 4, or 8. Different BRDV[1:0] bit settings can be specified in the SPCMDm registers. This enables execution of serial transfers at different bit rates for each command.

SSLA[2:0] bits (SSL Signal Assertion Setting)

The SSLA[2:0] bits control the SSLni signal assertion when the SPI performs serial transfers in master mode. When an SSLni signal is asserted, its polarity is determined by the value set in the associated SSLP. When the SSLA[2:0] bits are set to 000b in multi-master mode, serial transfers are performed with all the SSL signals in the negated state (as the SSLn0 pin acts as input).

When using the SPI in slave mode, set the SSLA[2:0] bits to 000b.

SSLKP bit (SSL Signal Level Keeping)

When the SPI in master mode performs a serial transfer, the SSLKP bit specifies whether the SSLni signal level for the current command is to be kept or negated between the SSL negation associated with the current command and the SSL assertion associated with the next command. Setting the SSLKP bit to 1 enables a burst transfer. For details, see section 38.3.10.1, Master mode operation. When using the SPI in slave mode, set the SSLKP bit to 0.

SPB[3:0] bits (SPI Data Length Setting)

The SPB[3:0] bits specify the transfer data length for the SPI in master or slave mode. When the SPLW bit is 0, set these bits from 8 to 16 bits.

LSBF bit (SPI LSB First)

The LSBF bit specifies the data format of the SPI in master or slave mode to MSB-first or LSB-first.

SPNDEN bit (SPI Next-Access Delay Enable)

The SPNDEN bit specifies the next-access delay, the period from the time the SPI in master mode terminates a serial transfer and sets the SSLni signal inactive until the SPI enables the SSLni signal assertion for the next access. If the SPNDEN bit is 0, the SPI sets the next-access delay to 1 RSPCK + 2 PCLKA. If the SPNDEN bit is 1, the SPI inserts a next-access delay in accordance with the SPND setting.

When using the SPI in slave mode, set the SPNDEN bit to 0.

SLNDEN bit (SSL Negation Delay Setting Enable)

The SLNDEN bit specifies the SSL negation delay, the period from the time the SPI in master mode stops RSPCK oscillation until the SPI sets the SSLni signal to inactive. If the SLNDEN bit is 0, the SPI sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, the SPI negates the SSL signal at the SSL negation delay determined by the SSLND setting.

SPSCR.SPSLN[2:0]位并执行在引用的SPMDm寄存器中设置的串行传输。

在发送缓冲区为空时（SPSR.SPTEF为1且未设置下一次传输的数据）以及在引用该SPCMDm寄存器时设置要发送的数据之前设置SPCMDm寄存器。

SPI在主机模式下引用的SPCMDm寄存器可以通过SPSSR.SPCP[2:0]位进行检查。如果在SPCR.MSTR位为0且SPCR.SPE位为1时改变了SPCMDm的内容，则不要执行后续操作。

CPHA位（RSPCK相位设置）

CPHA位在主模式或从模式下选择SPI的RSPCK相位。SPI模块之间的数据通信需要模块之间相同的RSPCK相位设置。

CPOL位（RSPCK极性设置）

CPOL位在主模式或从模式下选择SPI的RSPCK极性。SPI模块之间的数据通信要求模块之间的RSPCK极性设置相同。

BRDV[1:0]位（比特率划分设置）

BRDV[1:0]位决定比特率。比特率由BRDV[1:0]位和SPBR中的设置组合确定（参见第38.2.8节，SPI比特率寄存器(SPBR)）。SPBR设置决定了基本比特率。BRDV[1:0]设置选择通过将基本比特率除以1、2、4或8获得的比特率。可以在SPCMDm寄存器中指定不同的BRDV[1:0]位设置。这使得每个命令能够以不同的比特率执行串行传输。

SSLA[2:0]位（SSL信号断言设置）

当SPI在主模式下执行串行传输时，SSLA[2:0]位控制SSLni信号断言。当SSLni信号被置位时，其极性由相关SSLP中设置的值确定。当SSLA[2:0]位在多主模式下设置为000b时，串行传输将在所有SSL信号处于否定状态时执行（因为SSLn0引脚用作输入）。

在从机模式下使用SPI时，将SSLA[2:0]位设置为000b。

SSLKP位（SSL信号电平保持）

当主模式的SPI执行串行传输时，SSLKP位指定当前命令的SSLni信号电平是在与当前命令关联的SSL否定和与下一个命令关联的SSL断言之间保持还是否定。将SSLKP位设置为1可启用突发传输。有关详细信息，请参阅第38.3.10.1节，主模式操作。在从机模式下使用SPI时，将SSLKP位设置为0。

SPB[3:0]位（SPI数据长度设置）

SPB[3:0]位指定SPI在主模式或从模式下的传输数据长度。当SPLW位为0时，将这些位设置为8至16位。

LSBF位（SPILSB优先）

LSBF位指定SPI在主模式或从模式下的数据格式为MSB优先或LSB优先。

SPNDEN位（SPI下一次访问延迟使能）

SPNDEN位指定下一次访问延迟，即从主模式下的SPI终止串行传输并将SSLni信号设置为无效到SPI为下一次访问启用SSLni信号断言的时间段。如果SPNDEN位为0，则SPI将下一次访问延迟设置为1RSPCK+2PCLKA。如果SPNDEN位为1，则SPI根据SPND设置插入下一次访问延迟。

在从机模式下使用SPI时，将SPNDEN位设置为0。

SLNDEN位（SSL否定延迟设置启用）

SLNDEN位指定SSL否定延迟，即从主模式下的SPI停止RSPCK振荡到SPI将SSLni信号设置为无效的时间段。如果SLNDEN位为0，则SPI将SSL否定延迟设置为1RSPCK。如果SLNDEN位为1，则SPI在SSL否定延迟由SSLND设置确定时否定SSL信号。

When using the SPI in slave mode, set the SLNDEN bit to 0.

SCKDEN bit (RSPCK Delay Setting Enable)

The SCKDEN bit specifies the SPI clock delay, the period from the point when the SPI in master mode asserts the SSLni signal until the RSPCK starts oscillation. If the SCKDEN bit is 0, the SPI sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, the SPI starts the oscillation of RSPCK at the RSPCK delay determined by the SPCKD setting.

When using the SPI in slave mode, set the SCKDEN bit to 0.

38.2.15 SPI Data Control Register 2 (SPDCR2)

Address(es): SPI0.SPDCR2 4007 2020h, SPI1.SPDCR2 4007 2120h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BYSW
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	BYSW	Byte Swap Operating Mode Select	0: Byte Swap OFF 1: Byte Swap ON	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SPI Data Control Register2 (SPDCR2) is the setting register, that is to swap a transmit/receive data in byte units. When a data of transmit buffers copies to a shift register, it is to swap in byte units. When a data of shift register copies to a receive buffers, it is to swap in byte units.

BYSW bit (Byte Swap Operating Mode Select)

It is a setting bit, that is to swap a transmit/receive data in byte units. When byte access is valid (SPDCR.SPBYT = 1), byte swap is invalid. When byte swap is valid, parity function must be invalid (SPCR2.SPPE bit = 0). Setting change of BYSW bit must be SPCR.SPE bit = 0.

A data after byte swap is different by a data length (setting of SPCMD.SPB[3:0]).

When byte swap, A data length (setting of SPB[3:0]) must be set to 32 bit or 16bit. Other case of data length (that is 8 to 15, 20, 24 bit length), byte swap is not guaranteed. Before swap and after swap are shown below (length data (32 bit/16 bit)).

- Length data 32bit (SPB[3:0] = 0010 or 0011)

  Before swap: [31:24] [23:16] [15:8] [7:0]

  After swap: [7:0] [15:8] [23:16] [31:24]

- Length data 16bit (SPB[3:0] = 1111)

  Before swap: [31:24] [23:16]

  After swap: [23:16] [31:24].

When byte access mode (SPDCR.SPBT = 1), byte swap setting is invalid.

When byte swap is valid, set parity function to invalid (SPCR2.SPPE = 0). When the parity function set to valid, the behavior is not guaranteed.

38.3 Operation

In this section, the serial transfer period refers to the period from the beginning of driving valid data to the fetching of the final valid data.

38.3.1 Overview of SPI Operation

The SPI is capable of synchronous serial transfers in the following modes:

在从机模式下使用SPI时，将SLNDEN位设置为0。

SCKDEN位（RSPCK延迟设置使能）

SCKDEN位指定SPI时钟延迟，即从主模式下的SPI断言SSLni信号到RSPCK开始振荡的周期。如果SCKDEN位为0，则SPI将RSPCK延迟设置为1RSPCK。如果SCKDEN位为1，则SPI以由SPCKD设置确定的RSPCK延迟启动RSPCK的振荡。

在从机模式下使用SPI时，将SCKDEN位设置为0。

38.2.15 SPI数据控制寄存器2(SPDCR2)

Address(es): SPI0.SPDCR2 4007 2020h, SPI1.SPDCR2 4007 2120h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	BYSW
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	BYSW	字节交换操作模式选择	0：字节交换关闭 1：字节交换开启	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SPI数据控制寄存器2(SPDCR2)是设置寄存器，即以字节为单位交换一个发送接收数据。当发送缓冲区的数据复制到移位寄存器时，是以字节为单位进行交换。当移位寄存器的数据复制到接收缓冲区时，是以字节为单位进行交换。

BYSW位（字节交换操作模式选择）

它是一个设置位，即以字节为单位交换一个发送接收数据。当字节访问有效时（SPDCR.SPBYT=1），字节交换无效。当字节交换有效时，奇偶校验功能必须无效（SPCR2.SPPE位=0）。BYSW位的设置更改必须是SPCR.SPE位=0。

字节交换后的数据因数据长度不同（SPCMD.SPB[3:0]的设置）。

字节交换时，A数据长度（SPB[3:0]的设置）必须设置为32位或16位。其他数据长度情况（即8到15、20、24位长度），不保证字节交换。交换前和交换后如下所示（长度数据（32位16位））。

- 长度数据32bit(SPB[3:0]=0010or0011)

  Before swap: [31:24] [23:16] [15:8] [7:0]

  After swap: [7:0] [15:8] [23:16] [31:24]

- 长度数据16bit(SPB[3:0]=1111)

  Before swap: [31:24] [23:16]

  After swap: [23:16] [31:24].

当字节访问模式（SPDCR.SPBT=1）时，字节交换设置无效。

当字节交换有效时，将奇偶校验功能设置为无效（SPCR2.SPPE=0）。当奇偶校验函数设置为有效时，行为不被保证。

38.3 Operation

在本节中，串行传输周期是指从开始驱动有效数据到获取最终有效数据的周期。

38.3.1 SPI操作概述

SPI能够在以下模式下进行同步串行传输：

- Slave mode (SPI operation)
- Single master mode (SPI operation)
- Multi-master mode (SPI operation)
- Slave mode (clock synchronous operation)
- Master mode (clock synchronous operation).

The SPI mode can be selected by using the MSTR, MODFEN, and SPMS bits in SPCR. Table 38.5 lists the relationship between SPI modes and SPCR settings, and a description of each mode.

Table 38.5 Relationship between SPCR settings and SPI modes (1 of 2)

Mode	Slave (SPI operation)	Single master (SPI operation)	Multi-master (SPI operation)	Slave (clock synchronous operation)	Master (clock synchronous operation)
MSTR bit setting	0	1	1	0	1
MODFEN bit setting	0 or 1	0	1	0	0
SPMS bit setting	0	0	0	1	1
RSPCKn signal	Input	Output	Output/Hi-Z	Input	Output
MOSIn signal	Input	Output	Output/Hi-Z	Input	Output
MISOn signal	Output/Hi-Z	Input	Input	Output	Input
SSLn0 signal	Input	Output	Input	Hi-Z*1	Hi-Z*1
SSLn1 to SSLn3 signals	Hi-Z*1	Output	Output/Hi-Z	Hi-Z*1	Hi-Z*1
SSL polarity change function	Supported	Supported	Supported	-	-
Max transfer rate	PCLKA/4	PCLKA/2	PCLKA/2	PCLKA/4	PCLKA/2
Clock source	RSPCKn input	On-chip baud rate generator	On-chip baud rate generator	RSPCKn input	On-chip baud rate generator
Clock polarity	Two				
Clock phase	Two	Two	Two	One (CPHA = 1)	Two
First transfer bit	MSB/LSB				
Transfer data length	8 to 16, 20, 24, 32 bits				
Burst transfer	Possible (CPHA = 1)	Possible (CPHA = 0,1)	Possible (CPHA = 0,1)	-	-

Receive buffer full detection	Supported*2				
Overrun error detection	Supported*2	Supported*2, *4	Supported*2, *4	Supported*2	Supported*2
Parity error detection	Supported*2,*3				
Mode fault error detection	Supported (MODFEN = 1)	Not supported	Supported	Not supported	Not supported

- 从机模式（SPI操作）
- 单主模式（SPI操作）
- Multi-master mode (SPI operation)
- 从机模式（时钟同步操作）
- 主模式（时钟同步操作）。

可以使用SPCR中的MSTR、MODFEN和SPMS位选择SPI模式。表38.5列出了SPI模式和SPCR设置之间的关系，以及每种模式的说明。

Table 38.5 SPCR设置和SPI模式之间的关系(1of2)

Mode	Slave (SPI operation)	单主机（SPI操作）	Multi-master (SPI operation)	从机（时钟同步操作）	主控（时钟同步操作）
MSTR位设置	0	1	1	0	1
MODFEN位设置	0 or 1	0	1	0	0
SPMS位设置	0	0	0	1	1
RSPCKn signal	Input	Output	Output/Hi-Z	Input	Output
MOSIn signal	Input	Output	Output/Hi-Z	Input	Output
MISOn signal	Output/Hi-Z	Input	Input	Output	Input
SSLn0 signal	Input	Output	Input	Hi-Z*1	Hi-Z*1
SSLn1到SSLn3信号	Hi-Z*1	Output	Output/Hi-Z	Hi-Z*1	Hi-Z*1
SSL极性改变功能	Supported	Supported	Supported	-	-
最大传输率	PCLKA/4	PCLKA/2	PCLKA/2	PCLKA/4	PCLKA/2
时钟源	RSPCKn input	片上波特率发生器	片上波特率发生器	RSPCKn input	片上波特率发生器
时钟极性	Two				
时钟相位	Two	Two	Two	One (CPHA = 1)	Two
第一个传输位	MSB/LSB				
传输数据长度	8至16、20、24、32位				
突发传输	Possible (CPHA = 1)	Possible (CPHA = 0,1)	Possible (CPHA = 0,1)	-	-
RSPCK延迟控制	不支持	Supported	Supported	不支持	Supported
SSL否定延迟控制	不支持	Supported	Supported	不支持	Supported
下一次访问延迟控制	不支持	Supported	Supported	不支持	Supported
转移触发	SSL输入有效或RSPCK振荡	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)	RSPCK oscillation	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)
顺序控制	不支持	Supported	Supported	不支持	Supported
发送缓冲区空检测	Supported				
接收缓冲区满检测	Supported*2				
溢出错误检测	Supported*2	Supported*2, *4	Supported*2, *4	Supported*2	Supported*2
奇偶校验错误检测	Supported*2,*3				
模式故障错误检测	Supported (MODFEN = 1)	不支持	Supported	不支持	不支持

Table 38.5 Relationship between SPCR settings and SPI modes (2 of 2)

Mode	Slave (SPI operation)	Single master (SPI operation)	Multi-master (SPI operation)	Slave (clock synchronous operation)	Master (clock synchronous operation)
Underrun error detection	Supported	Not supported	Not supported	Supported	Not supported

Note 1. This function is not supported in this mode.
Note 2. When the SPCR.TXMD bit is 1, receiver buffer full detection, overrun error detection, and parity error detection are not performed.
Note 3. When the SPCR2.SPPE bit is 0, parity error detection is not performed.
Note 4. When the SPCR2.SCKASE bit is 1, overrun error detection is not performed.

38.3.2 Controlling the SPI Pins

The SPI can switch pin states based on the settings in the MSTR, MODFEN, and SPMS bits in SPCR and the PmnPFS.NCODR bit for the I/O ports. Table 38.6 lists the relationship between the pin states and bit settings. Setting the PmnPFS.NCODR bit for an I/O port to 0 selects CMOS output. Setting it to 1 selects open-drain output. The I/O port settings must follow this relationship.

Table 38.6 Relationship between pin states and bit settings

Mode	Pin	Pin state*2	
		PmnPFS.NCODR bit for I/O ports = 0	PmnPFS.NCODR bit for I/O ports = 1
Single master mode (SPI operation) (MSTR = 1, MODFEN = 0, SPMS = 0)	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3	CMOS output	Open-drain output
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Multi-master mode (SPI operation) (MSTR = 1, MODFEN = 1, SPMS = 0)	RSPCKn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	SSLn0	Input	Input
	SSLn1 to SSLn3*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MOSIn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MISOn	Input	Input
Slave mode (SPI operation) (MSTR = 0, SPMS = 0)	RSPCKn	Input	Input
	SSLn0	Input	Input
	SSLn1 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn*4	CMOS output/Hi-Z	Open-drain output/Hi-Z
Master mode (clock synchronous operation) (MSTR = 1, MODFEN = 0, SPMS = 1)	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Slave mode (clock synchronous operation) (MSTR = 0, SPMS = 1)	RSPCKn	Input	Input
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn	CMOS output	Open-drain output

Note 1. This function is not supported in this mode.
Note 2. SPI settings are not reflected in multiplexed pins for which the SPI function is not selected.
Note 3. When SSLn0 is at the active level, the pin state is Hi-Z.
Note 4. When SSLn0 is at the non-active level or the SPCR.SPE bit is 0, the pin state is Hi-Z.
Note 5. These pins are available for use as I/O port pins.

The SPI in single master mode (SPI operation) or multi-master mode (SPI operation) determines the MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) based on the MOIFE and

Table 38.5 SPCR设置和SPI模式之间的关系(2of2)

Mode	Slave (SPI operation)	单主机（SPI操作）	Multi-master (SPI operation)	从机（时钟同步操作）	主控（时钟同步操作）
欠载错误检测	Supported	不支持	不支持	Supported	不支持

Note 1. 此模式不支持此功能。
Note 2. 当SPCR.TXMD位为1时，不执行接收缓冲区满检测、溢出错误检测和奇偶校验错误检测。

Note 3. 当SPCR2.SPPE位为0时，不执行奇偶校验错误检测。
Note 4. 当SPCR2.SCKASE位为1时，不执行溢出错误检测。

38.3.2 控制SPI引脚

SPI可以根据SPCR中的MSTR、MODFEN和SPMS位的设置来切换引脚状态，以及IO端口的PmnPFS.NCODR位。表38.6列出了引脚状态和位设置之间的关系。设置IO端口的PmnPFS.NCODR位为0选择CMOS输出。将其设置为1选择开漏输出。IO端口设置必须遵循这种关系。

Table 38.6 引脚状态和位设置之间的关系

Mode	Pin	Pin state*2	
		IO端口的PmnPFS.NCODR位=0	IO端口的PmnPFS.NCODR位=1
单主模式（SPI操作）（MSTR=1，MODFEN=0，SPMS=0）	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3	CMOS output	Open-drain output
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Multi-master mode (SPI operation) (MSTR = 1, MODFEN = 1, SPMS = 0)	RSPCKn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	SSLn0	Input	Input
	SSLn1 to SSLn3*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MOSIn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MISOn	Input	Input
从机模式（SPI操作）（MSTR=0，SPMS=0）	RSPCKn	Input	Input
	SSLn0	Input	Input
	SSLn1 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn*4	CMOS output/Hi-Z	Open-drain output/Hi-Z
主模式（时钟同步操作）（MSTR=1，MODFEN=0，SPMS=1）	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
从机模式（时钟同步操作）（MSTR=0，SPMS=1）	RSPCKn	Input	Input
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn	CMOS output	Open-drain output

Note 1. 此模式不支持此功能。
Note 2. SPI设置不会反映在未选择SPI功能的复用引脚中。
Note 3. 当SSLn0处于有效电平时，引脚状态为Hi-Z。
Note 4. 当SSLn0处于非活动电平或SPCR.SPE位为0时，引脚状态为Hi-Z。
Note 5. 这些引脚可用作IO端口引脚。

单主机模式（SPI操作）或多主机模式（SPI操作）的SPI根据MOIFE和

MOIFV bit settings in SPPCR, as listed in Table 38.7.

Table 38.7 MOSI signal value determination during SSL negation

MOIFE bit	MOIFV bit	MOSIn signal value during SSL negation
0	0, 1	Final data from previous transfer
1	0	Low
1	1	High

38.3.3 SPI System Configuration Examples

38.3.3.1 Single master and single slave with the MCU as a master

Figure 38.5 shows a single-master and single-slave SPI system configuration example where the MCU is a master. In the single-master/single-slave configuration, the SSLn0 to SSLn3 outputs of the MCU (master) are not used. The SSL input of the SPI slave is fixed to the low level, and the SPI slave is maintained in the selected state.*1

The MCU (master) drives the RSPCKn and MOSIn signals. The SPI slave drives the MISO signal.

Note 1. In the transfer format configured when the SPCMDm.CPHA bit is 0, the SSL signal cannot be fixed to the active level for some slave devices. In situations where the SSL signal cannot be fixed, the SSLni output of the MCU must be connected to the SSL input of the slave device.

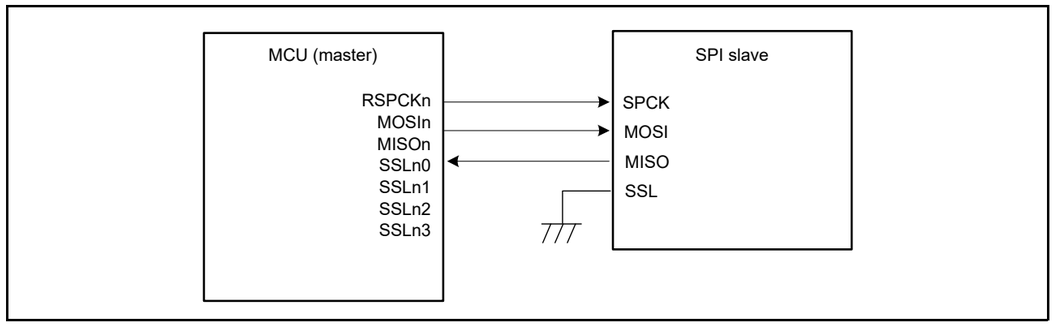

Figure 38.5 Single-master/single-slave configuration example with the MCU as a master

38.3.3.2 Single master and single slave with the MCU as a slave

Figure 38.6 shows a single-master/single-slave SPI system configuration example where the MCU is a slave. When the MCU is a slave, the SSLn0 pin is used as SSL input. The SPI master drives the RSPCK and MOSI signals. The MCU (slave) drives the MISOn signal.*1

In the single-slave configuration when the SPCMDm.CPHA bit is set to 1, the SSLn0 input of the MCU (slave) is fixed to the low level and the MCU (slave) stays selected. This enables serial transfer execution (Figure 38.7).

Note 1. When SSLn0 is at the non-active level, the pin state is Hi-Z.

SPPCR中的MOIFV位设置，如表38.7中所列。

Table 38.7 SSL否定期间的MOSI信号值确定

MOIFE bit	MOIFV bit	SSL否定期间的MOSIn信号值
0	0, 1	上次传输的最终数据
1	0	Low
1	1	High

38.3.3 SPI系统配置示例

38.3.3.1 单主单从，单片机为主

图38.5显示了单主单从SPI系统配置示例，其中MCU为主。在单主单从配置中，不使用MCU（主）的SSLn0到SSLn3输出。SPI从机的SSL输入固定为低电平，SPI从机保持在选中状态。*1

MCU（主控）驱动RSPCKn和MOSIn信号。SPI从机驱动MISO信号。

注1.在SPCMDm.CPHA位为0时配置的传输格式中，对于某些从设备，SSL信号不能固定为有效电平。在SSL信号无法固定的情况下，MCU的SSLni输出必须连接到从设备的SSL输入。

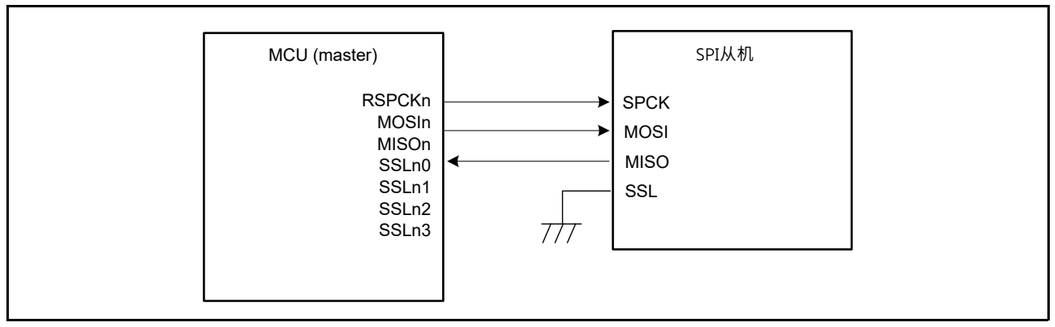

Figure 38.5 MCU为主的单主单从配置示例

38.3.3.2 单主单从单片机作为从机

图38.6显示了单主单从SPI系统配置示例，其中MCU为从设备。当。。。的时候
MCU为从机，SSLn0引脚用作SSL输入。SPI主机驱动RSPCK和MOSI信号。MCU（从机）驱动MIOn信号。*1

在单从配置中，当SPCMDm.CPHA位设置为1时，MCU（从）的SSLn0输入固定为低电平，MCU（从）保持选择状态。这将启用串行传输执行（图38.7）。

注1.当SSLn0处于非活动电平时，引脚状态为Hi-Z。

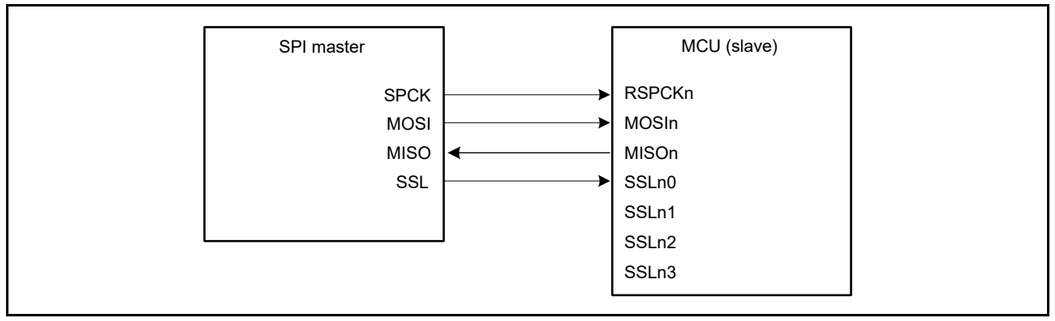

Figure 38.6 Single-master/single-slave configuration example with the MCU as a slave and CPHA = 0

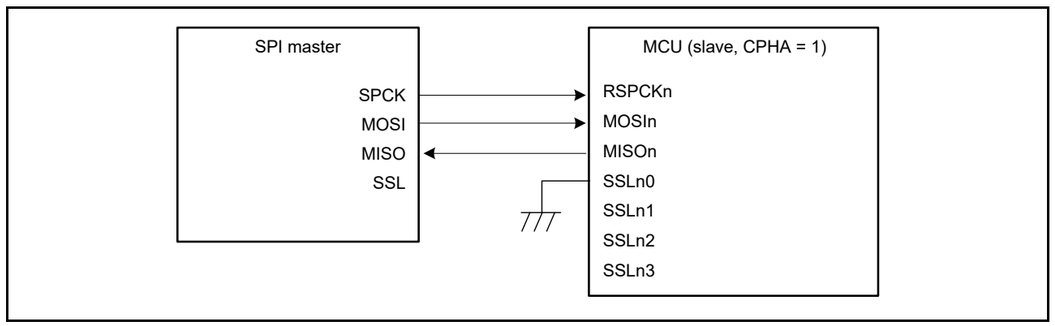

Figure 38.7 Single-master/single-slave configuration example with the MCU as a slave and CPHA = 1

38.3.3.3 Single master and multi slave with the MCU as a master

Figure 38.8 shows a single-master/multi-slave SPI system configuration example where the MCU is a master. In this example, the SPI system includes the MCU (master) and four slaves (SPI slave 0 to SPI slave 3).

The RSPCKn and MOSIn outputs of the MCU (master) are connected to the RSPCK and MOSI inputs of SPI slaves 0 to 3. The MISO outputs of SPI slaves 0 to 3 are all connected to the MISOn input of the MCU (master). The SSLn0 to SSLn3 outputs of the MCU (master) are connected to the SSL inputs of SPI slaves 0 to 3, respectively.

The MCU (master) drives the RSPCKn, MOSIn, and SSLn0 to SSLn3 signals. Of the SPI slaves 0 to 3, the slave that receives low-level input into the SSL input drives the MISO signal.

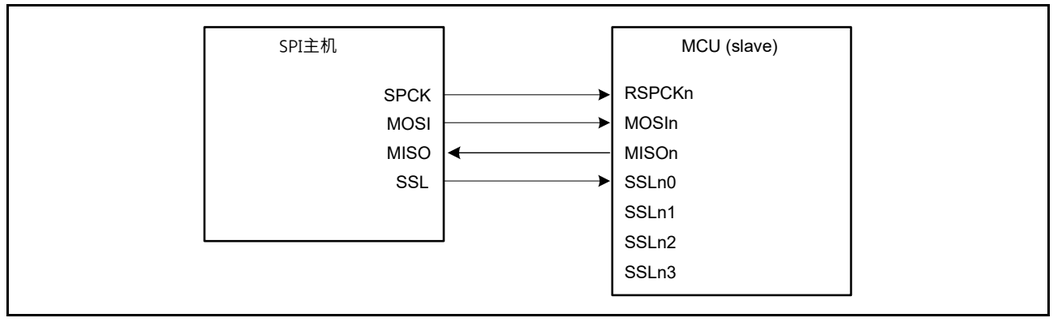

Figure 38.6 单主单从配置示例，单片机作为从机，CPHA=0

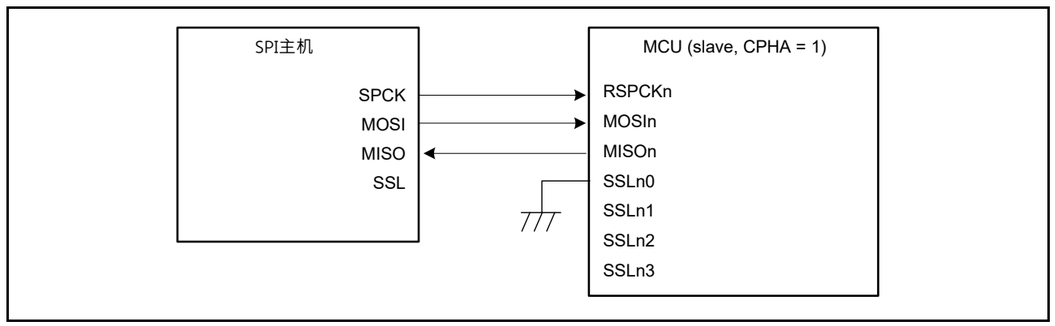

Figure 38.7 MCU作为从机且CPHA=1的单主单从配置示例

38.3.3.3 单主多从，单片机为主

图38.8显示了单主多从SPI系统配置示例，其中MCU为主。在本例中，SPI系统包括MCU（主机）和四个从机（SPI从机0到SPI从机3）。

MCU（主机）的RSPCKn和MOSIn输出连接到SPI从机0到3的RSPCK和MOSI输入。SPI从机0到3的MISO输出都连接到MCU（主机）的MISOn输入。MCU（主机）的SSLn0到SSLn3输出分别连接到SPI从机0到3的SSL输入。

MCU（主控）驱动RSPCKn、MOSIn和SSLn0到SSLn3信号。在SPI从机0到3中，接收到SSL输入的低电平输入的从机驱动MISO信号。

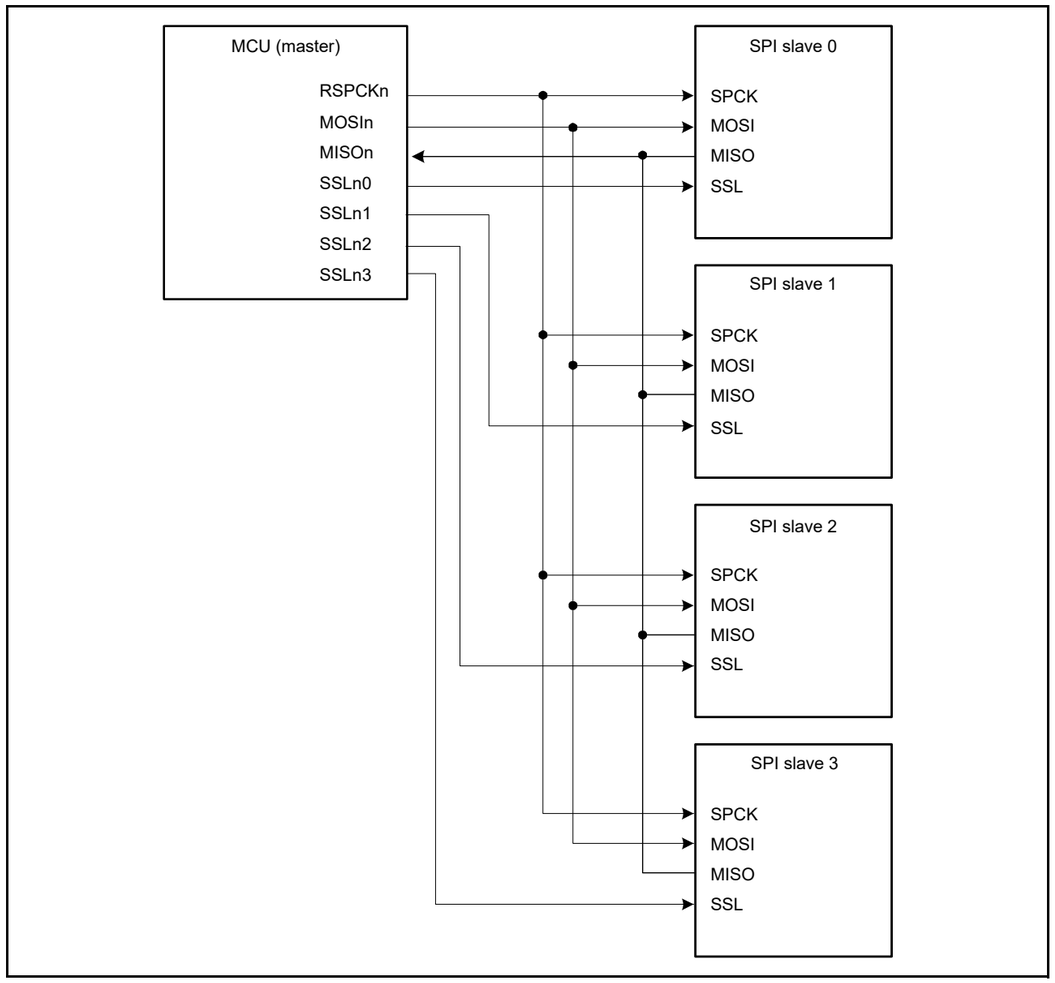

Figure 38.8 Single master/multi-slave configuration example with the MCU as a master

38.3.3.4 Single master and multi slave with the MCU as a slave

Figure 38.9 shows a single-master and multi-slave SPI system configuration example where the MCU is a slave. In this example, the SPI system includes an SPI master and two MCUs (slaves X and Y).

The SPCK and MOSI outputs of the SPI master are connected to the RSPCKn and MOSIn inputs of the MCUs (slaves X and Y). The MISOn outputs of the MCUs (slaves X and Y) are all connected to the MISO input of the SPI master. The SSLX and SSLY outputs of the SPI master are connected to the SSLn0 inputs of the MCUs (slaves X and Y, respectively).

The SPI master drives the SPCK, MOSI, SSLX, and SSLY signals. Of the MCUs (slaves X and Y), the slave that receives low-level input into the SSLn0 input drives the MISOn signal.

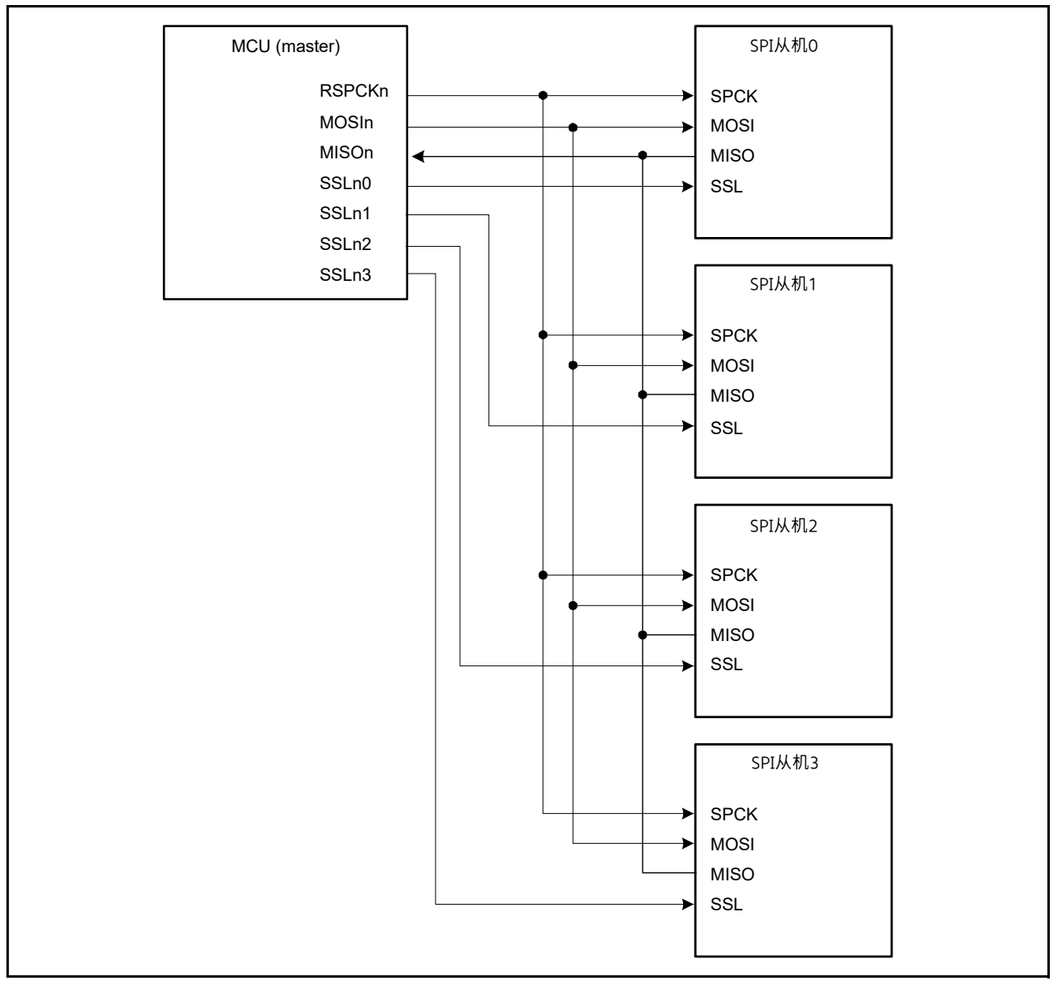

Figure 38.8 MCU为主的单主多从配置示例

38.3.3.4 单主多从，单片机作为从机

图38.9显示了单主多从SPI系统配置示例，其中MCU是从设备。在本例中，SPI系统包括一个SPI主控和两个MCU（从属X和Y）。

SPI主机的SPCK和MOSI输出连接到MCU（从机X和Y）的RSPCKn和MOSIn输入。MCU（从机X和Y）的MISOn输出都连接到SPI主机的MISO输入。SPI主机的SSLX和SSLY输出连接到MCU的SSLn0输入（分别为从机X和Y）。

SPI主机驱动SPCK、MOSI、SSLX和SSLY信号。在MCU（从机X和Y）中，接收到SSLn0输入的低电平输入的从机驱动MISOn信号。

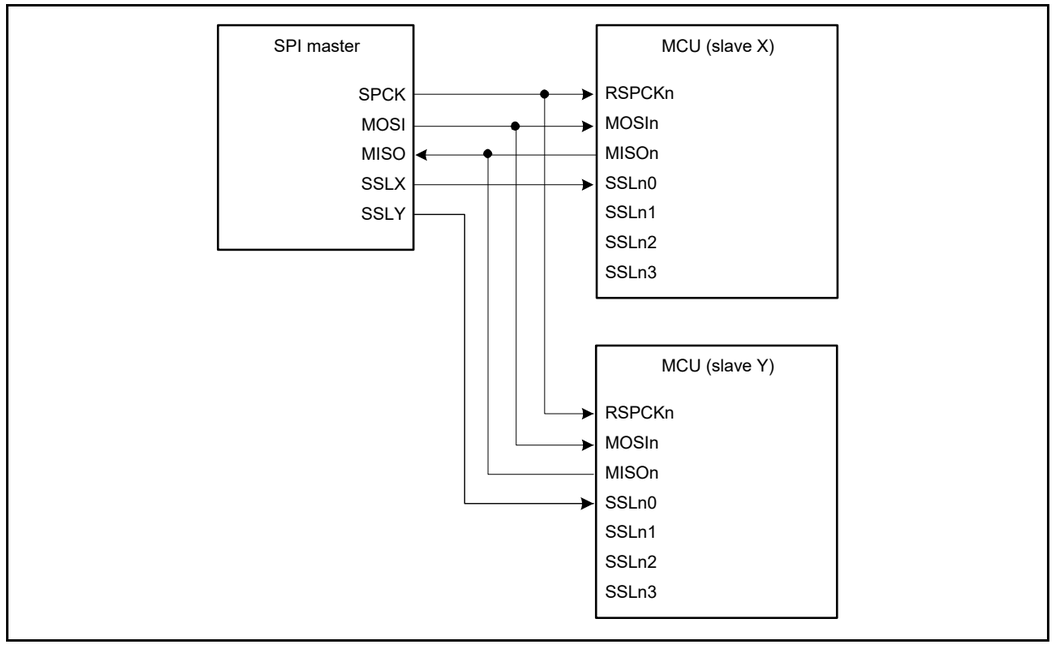

Figure 38.9 Single-master/multi-slave configuration example with the MCU as a slave

38.3.3.5 Multi master and multi slave with the MCU as a master

Figure 38.10 shows a multi-master/multi-slave SPI system configuration example where the MCU is a master. In this example, the SPI system includes two MCUs (masters X and Y) and two SPI slaves (SPI slaves 1 and 2).

The RSPCKn and MOSIn outputs of the MCUs (masters X and Y) are connected to the RSPCK and MOSI inputs of SPI slaves 1 and 2. The MISO outputs of SPI slaves 1 and 2 are connected to the MISOn inputs of the MCUs (masters X and Y). Any generic port Y output from the MCU (master X) is connected to the SSLn0 input of the MCU (master Y). Any generic port X output of the MCU (master Y) is connected to the SSLn0 input of the MCU (master X). The SSLn1 and SSLn2 outputs of the MCUs (masters X and Y) are connected to the SSL inputs of the SPI slaves 1 and 2. In this configuration example, because the system can be comprised solely of SSLn0 input, and SSLn1 and SSLn2 outputs for slave connections, the SSLn3 output of the MCU is not required.

The MCU drives the RSPCKn, MOSIn, SSLn1, and SSLn2 signals when the SSLn0 input level is high. When the SSLn0 input level is low, the MCU detects a mode fault error, sets RSPCKn, MOSIn, SSLn1, and SSLn2 to Hi-Z, and releases the SPI bus directly to the other master. Of the SPI slaves 1 and 2, the slave that receives low-level input into the SSL input drives the MISO signal.

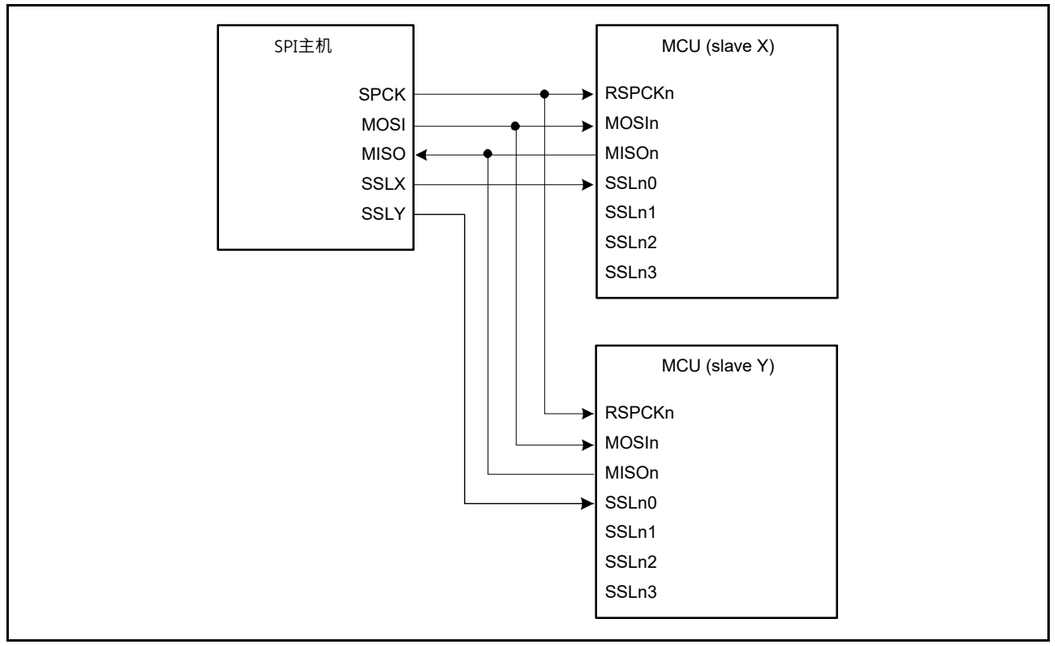

Figure 38.9 MCU作为从机的单主多从配置示例

38.3.3.5 以单片机为主的多主多从

图38.10显示了一个多主多从SPI系统配置示例，其中MCU为主。在此示例中，SPI系统包括两个MCU（主X和Y）和两个SPI从机（SPI从机1和2）。

MCU（主机X和Y）的RSPCKn和MOSIn输出连接到SPI从机1和2的RSPCK和MOSI输入。SPI从机1和2的MISO输出连接到MCU（主机X）的MISOn输入和Y)。来自MCU（主X）的任何通用端口Y输出都连接到MCU（主Y）的SSLn0输入。MCU（主设备Y）的任何通用端口X输出都连接到MCU（主设备X）的SSLn0输入。MCU（主机X和Y）的SSLn1和SSLn2输出连接到SPI从机1和2的SSL输入。在此配置示例中，因为系统可以仅由SSLn0输入和SSLn1和SSLn2输出组成从连接，不需要MCU的SSLn3输出。

当SSLn0输入电平为高电平时，MCU驱动RSPCKn、MOSIn、SSLn1和SSLn2信号。当SSLn0输入电平为低时，MCU检测到模式故障错误，将RSPCKn、MOSIn、SSLn1和SSLn2设置为Hi-Z，并将SPI总线直接释放到另一个主控。在SPI从机1和2中，接收到SSL输入的低电平输入的从机驱动MISO信号。

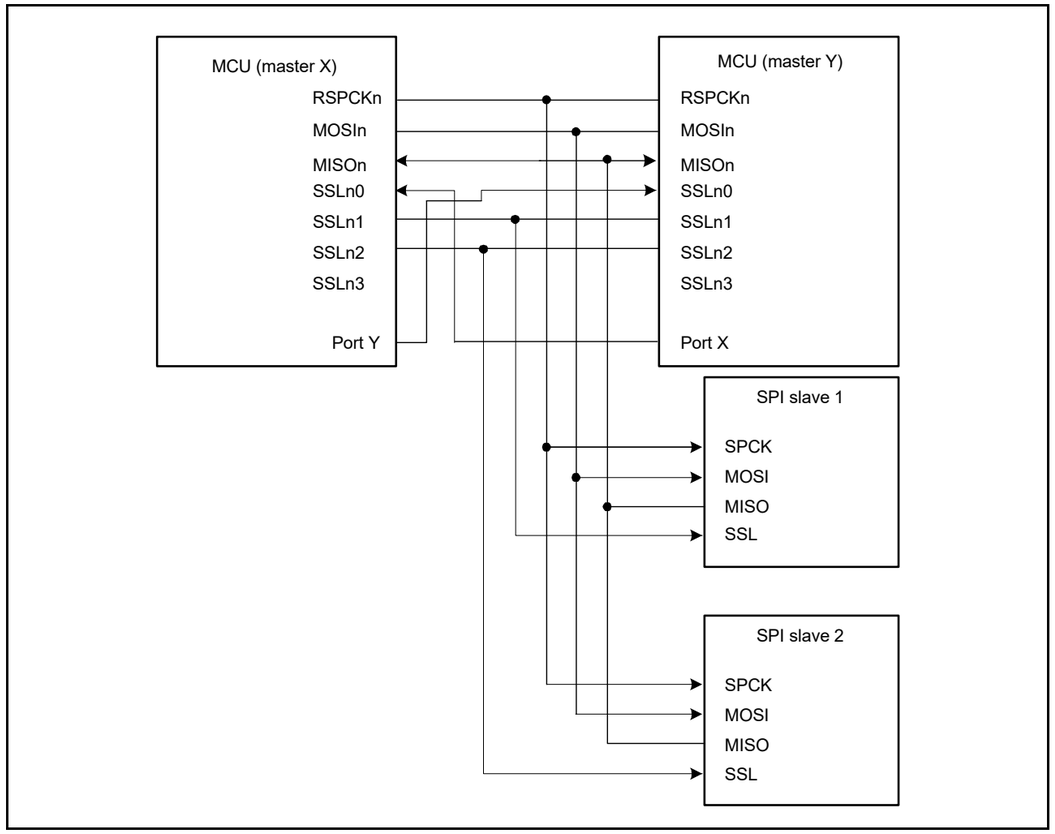

Figure 38.10 Multi-master/multi-slave configuration example with the MCU as a master

38.3.3.6 Master and slave in clock synchronous mode with the MCU as a master

Figure 38.11 shows master and slave in clock synchronous mode where the MCU is a master. In this configuration, SSLn0 to SSLn3 of the MCU (master) are not used.

The MCU (master) drives the RSPCKn and MOSIn signals. The SPI slave drives the MISO signal.

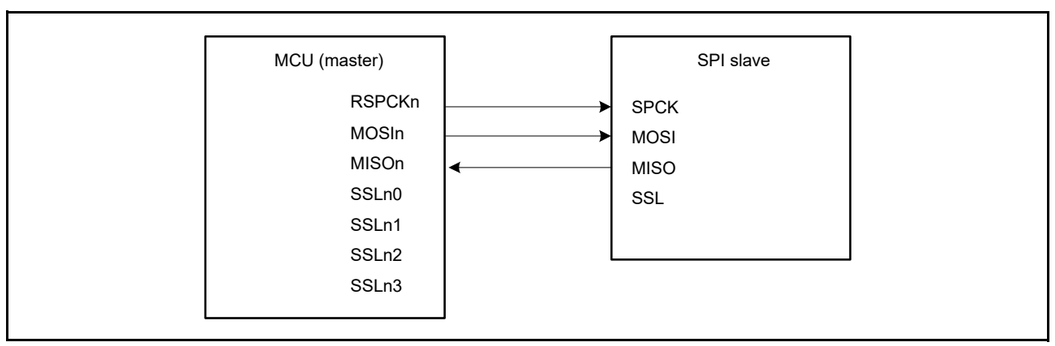

Figure 38.11 Configuration example of master/slave in clock synchronous mode with the MCU as a master

38.3.3.6 主从时钟同步模式，单片机作为主控

图38.11显示了时钟同步模式下的主机和从机，其中MCU是主机。在这种配置中，不使用MCU（主）的SSLn0到SSLn3。

MCU（主控）驱动RSPCKn和MOSIn信号。SPI从机驱动MISO信号。

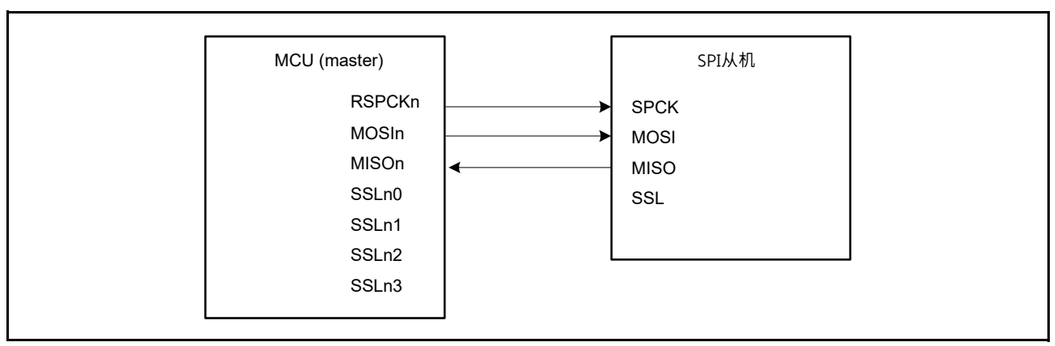

Figure 38.11 MCU作为主控时钟同步模式主从配置示例

38.3.3.7 Master and slave in clock synchronous mode with the MCU as a slave

Figure 38.12 shows a master and slave in clock synchronous mode configuration where the MCU is a slave. When the MCU operates as a slave in clock synchronous mode, the MCU (slave) drives the MISOn signal and the SPI master drives the SPCK and MOSI signals. In addition, SSLn0 to SSLn3 of the MCU (slave) are not used.

The MCU (slave) can only execute serial transfers in the single slave configuration when the SPCMDm.CPHA bit is set to 1.

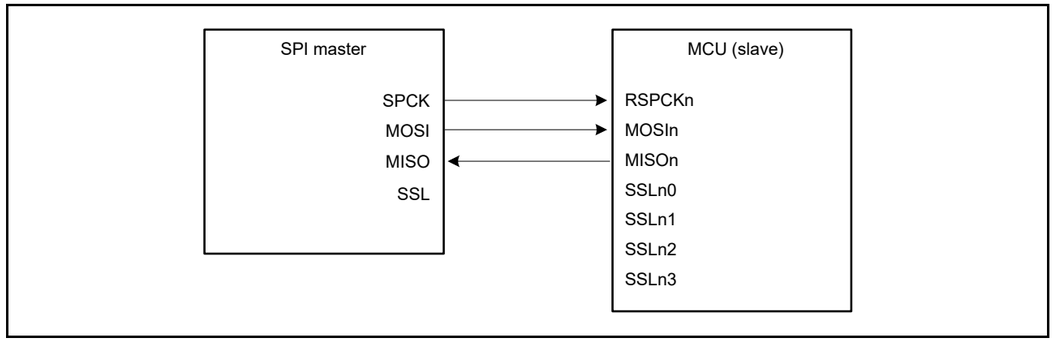

Figure 38.12 Configuration example of master and slave in clock synchronous mode with the MCU as a slave and CPHA = 1

38.3.4 Data Formats

The data format of the SPI depends on the settings in SPI Command Register m (SPCMDm) (m = 0 to 7) and the parity enable bit in SPI Control Register 2 (SPCR2.SPPE). Regardless of whether the MSB or LSB is first, the SPI treats the range from the LSB bit in the SPI Data Register (SPDR/SPDR_HA) to the bit corresponding to the selected data length, as transfer data.

This section shows the format of one frame of data before or after transfer.

(a) Data format with parity disabled

When parity is disabled, transmission or reception of data proceeds with the length in bits selected in the SPI data length setting in SPI Command Register m (SPCMDm.SPB[3:0]).

(b) Data format with parity enabled

When parity is enabled, transmission or reception of data proceeds with the length in bits selected in the SPI data length setting in SPI Command Register m (SPCMDm.SPB[3:0]). In this case, however, the last bit is a parity bit.

38.3.3.7 主从时钟同步模式，单片机作为从机

图38.12显示了时钟同步模式配置中的主机和从机，其中MCU是从机。当。。。的时候
MCU在时钟同步模式下作为从机运行，MCU（从机）驱动MISON信号，SPI主机驱动SPCK和MOSI信号。此外，不使用MCU（从机）的SSLn0到SSLn3。

当SPMDm.CPHA位设置为1时，MCU（从机）只能在单从机配置中执行串行传输。

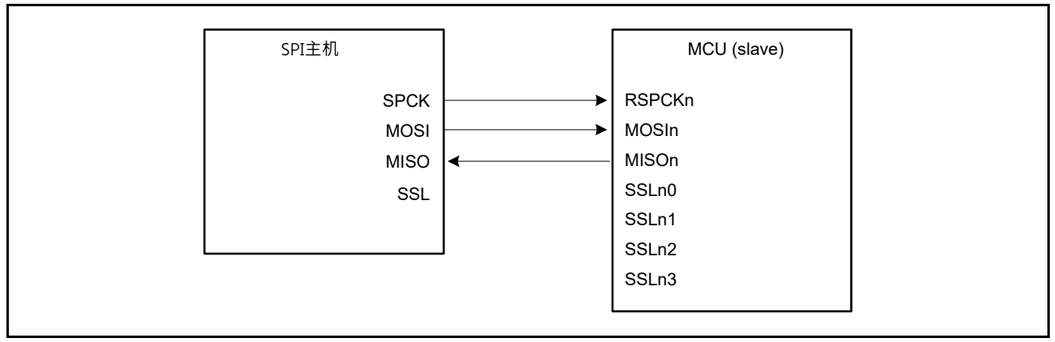

Figure 38.12 单片机作为从机，CPHA=1，时钟同步模式的主从配置示例

38.3.4 数据格式

SPI的数据格式取决于SPI命令寄存器m(SPCMDm)(m=0to7)中的设置和SPI控制寄存器2(SPCR2.SPPE)中的奇偶校验使能位。无论是MSB还是LSB在前，SPI都将SPI数据寄存器(SPDRSPDR_HA)中的LSB位到所选数据长度对应的位的范围视为传输数据。

本节显示传输前后一帧数据的格式。

(a) 禁用奇偶校验的数据格式

当奇偶校验被禁用时，数据的发送或接收将按照在SPI命令寄存器m(SPCMDm.SPB[3:0])的SPI数据长度设置中选择的位长度进行。

(b) 启用奇偶校验的数据格式

当奇偶校验使能时，数据的发送或接收按照在SPI命令寄存器m(SPCMDm.SPB[3:0])的SPI数据长度设置中选择的位长度进行。然而，在这种情况下，最后一位是奇偶校验位。

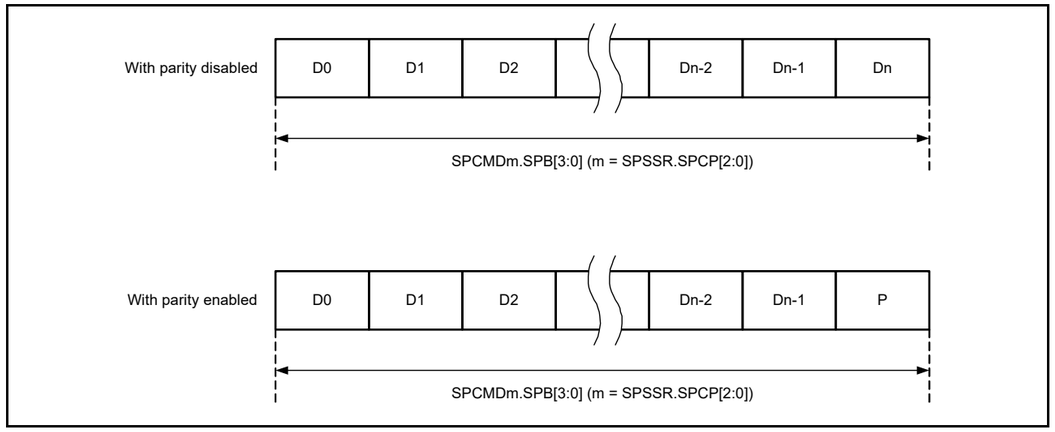

Figure 38.13 Data format with parity disabled and enabled

38.3.4.1 Operation when parity is disabled (SPCR2.SPPE = 0)

When parity is disabled, data for transmission is copied to the shift register with no pre-processing. This section describes the connection between the SPI Data Register (SPDR/SPDR_HA) and the shift register in terms of the combination of MSB- or LSB-first order and data length.

(1) MSB-first transfer with 32-bit data

Figure 38.14 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity disabled, an SPI data length of 32 bits, and MSB-first selected.

In transmission, bits T31 to T00 from the current stage of the transmit buffer are copied to the shift register. Data for transmission is shifted out from the shift register from T31 to T30, and continuing to T00, in that order.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R31 to R00 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.

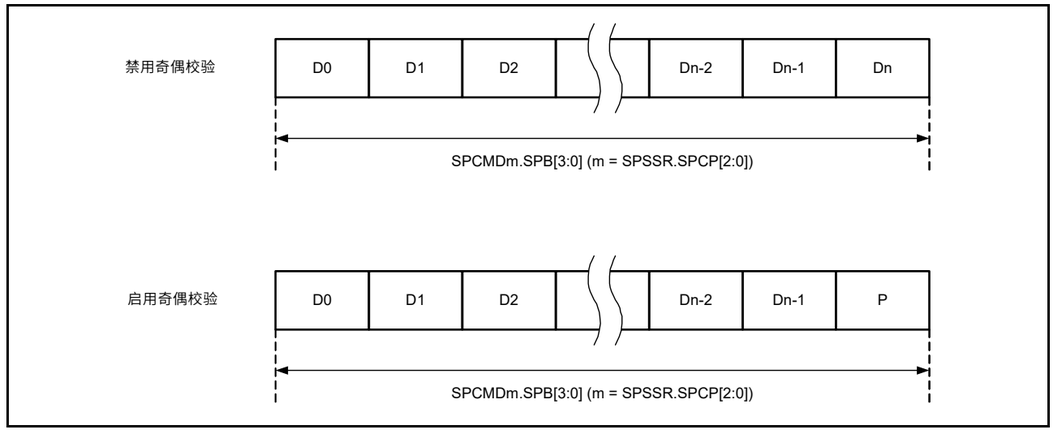

Figure 38.13 禁用和启用奇偶校验的数据格式

38.3.4.1 禁用奇偶校验时的操作(SPCR2.SPPE=0)

当奇偶校验被禁用时，用于传输的数据被复制到移位寄存器而不进行预处理。本节从MSB或LSB-firstorder和数据长度的组合来描述SPI数据寄存器(SPDRSPDR_HA)和移位寄存器之间的连接。

(1) 32位数据的MSB优先传输

图38.14显示了SPI数据寄存器(SPDR)和禁用奇偶校验的移位寄存器的传输操作，SPI数据长度为32位，且MSB优先选择。

在发送过程中，发送缓冲器当前级的T31到T00位被复制到移位寄存器。用于发送的数据从移位寄存器中移出，从T31移出到T30，并按此顺序继续移到T00。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需的RSPCK周期数后收集R31至R00位时，将移位寄存器中的值复制到接收缓冲区。

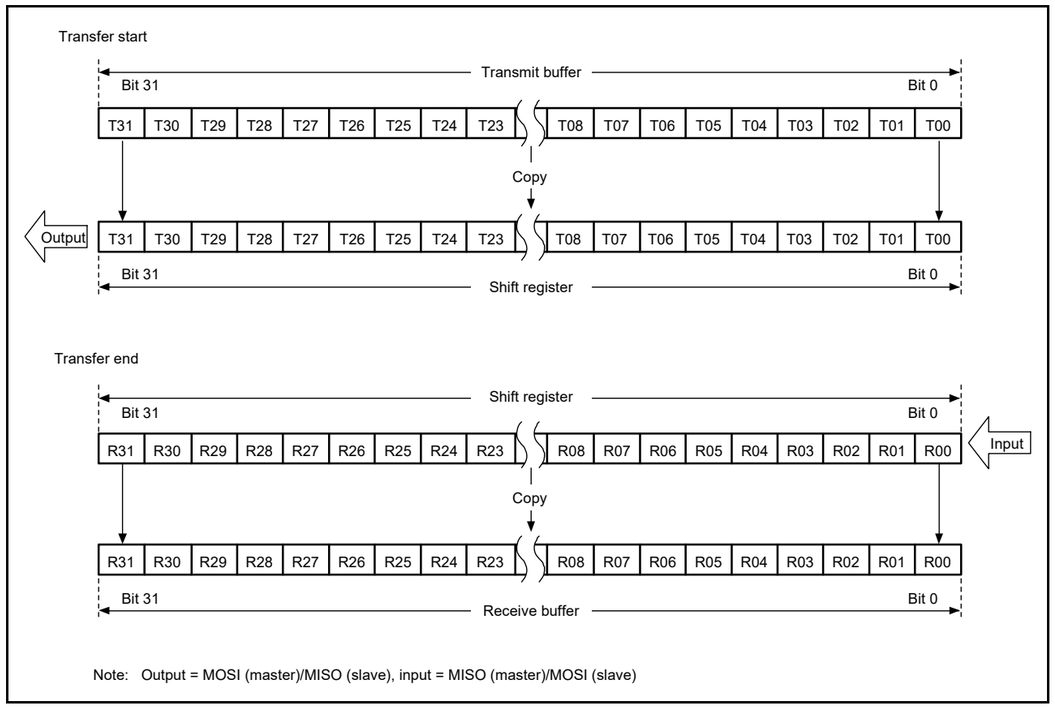

Figure 38.14 MSB-first transfer with 32-bit data and parity disabled

(2) MSB-first transfer with 24-bit data

Figure 38.15 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity disabled, an SPI data length of 24 bits, and MSB-first selected.

In transmission, the lower 24 bits (T23 to T00) from the current stage of the transmit buffer are copied to the shift register. Data for transmission is shifted out from the shift register from T23 to T22, and continuing to T00, in that order.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R23 to R00 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer. Writing 0 to bits T31 to T24 at the time of transmission leads to 0 being inserted in the upper 8 bits of the receive buffer.

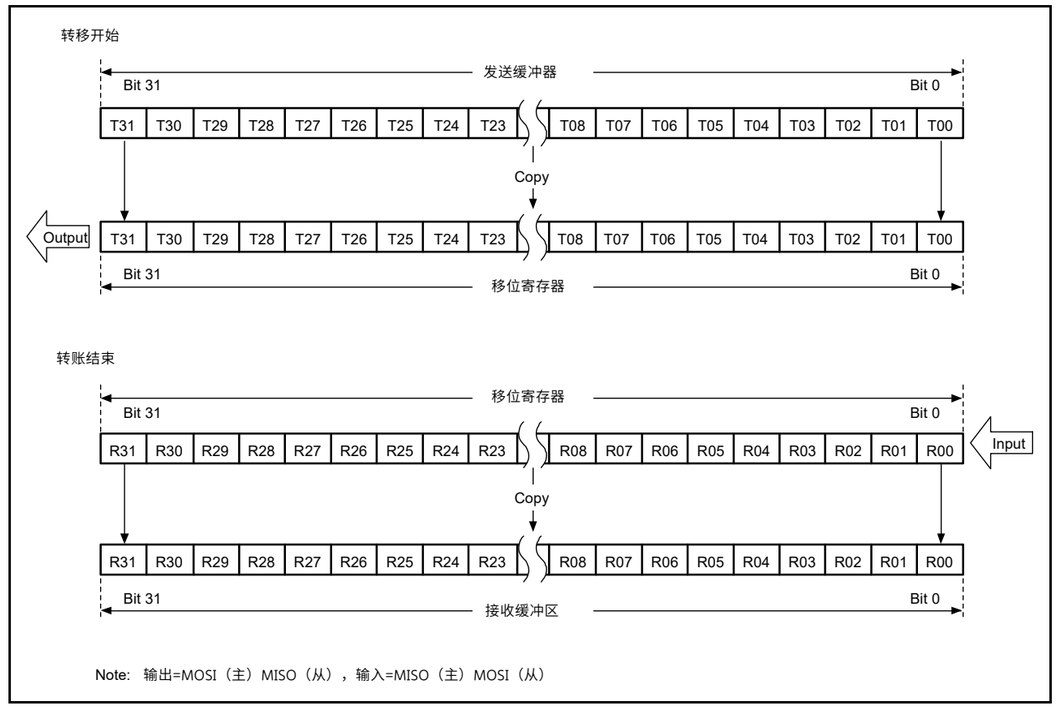

Figure 38.14 禁用32位数据和奇偶校验的MSB优先传输

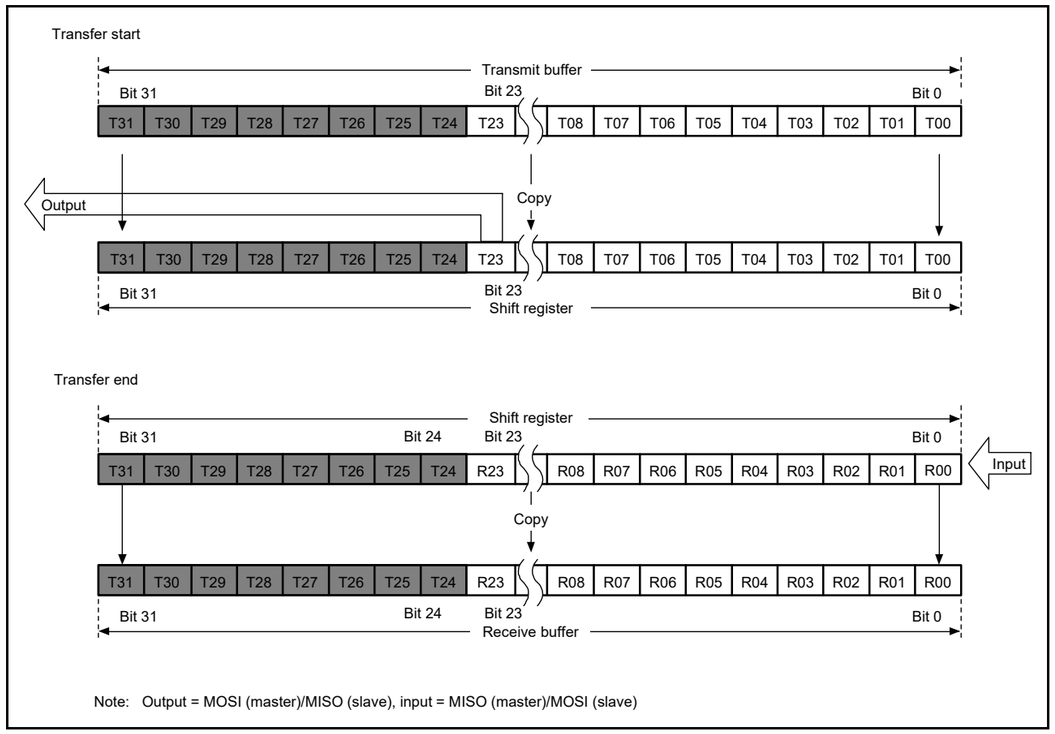
(2) 24位数据的MSB优先传输

图38.15显示了SPI数据寄存器(SPDR)和禁用奇偶校验的移位寄存器的传输操作，
SPI数据长度为24位，且MSB优先选择。

在发送过程中，来自发送缓冲器当前阶段的低24位（T23到T00）被复制到移位寄存器。用于发送的数据从移位寄存器中从T23移出到T22，并按此顺序继续移到T00。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后，当R23到R00位被收集时，移位寄存器中的值被复制到接收缓冲区。发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送时将0写入位T31至T24会导致将0插入接收缓冲区的高8位。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

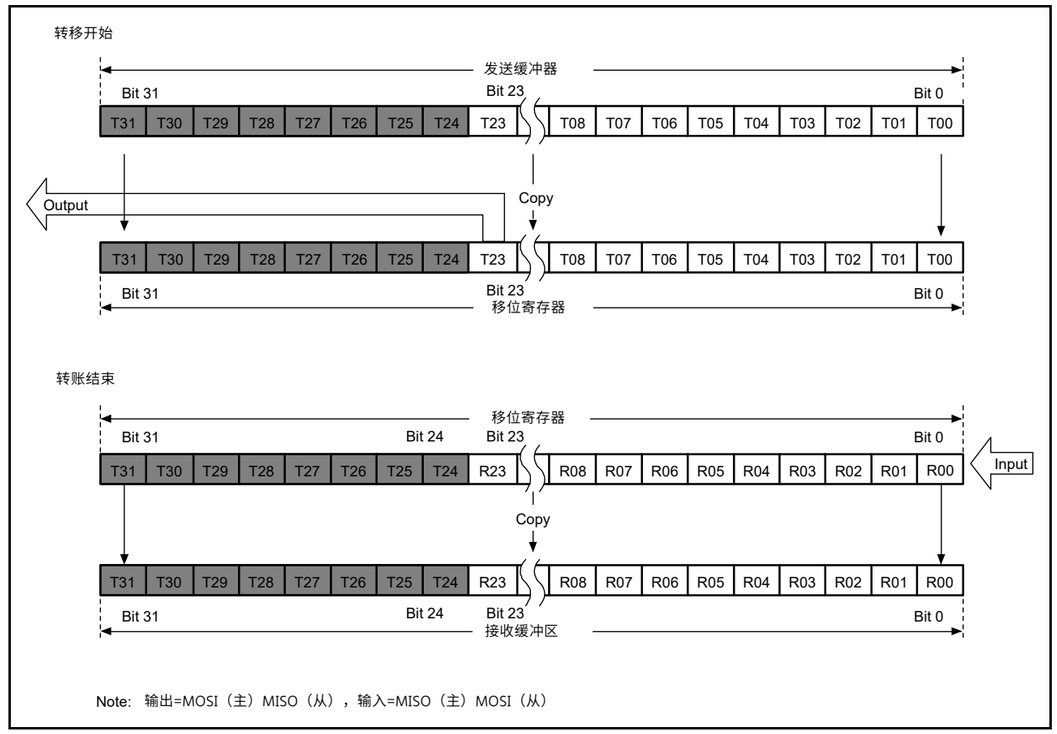
Figure 38.15 MSB-first transfer with 24-bit data and parity disabled

(3) LSB-first transfer with 32-bit data

Figure 38.16 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity disabled, an SPI data length of 32 bits, and LSB-first selected.

In transmission, bits T31 to T00 from the current stage of the transmit buffer are reordered bit-by-bit to obtain the order T00 to T31 for copying to the shift register. Data for transmission is shifted out from the shift register from T00 to T01, and continuing to T31, in that order.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R00 to R31 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

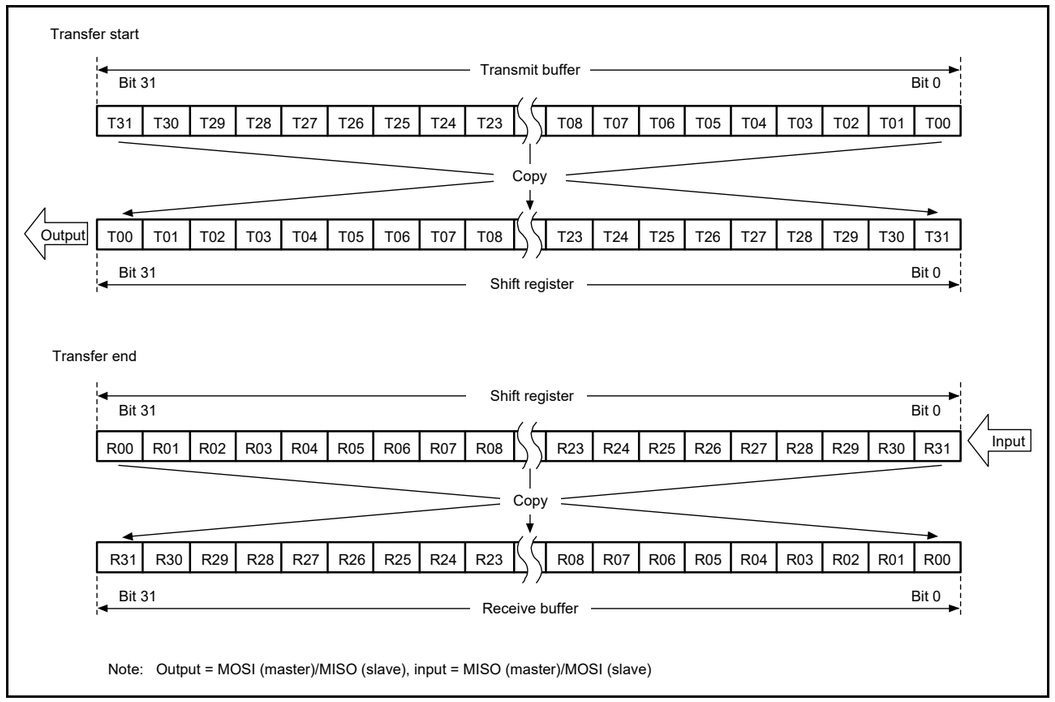
Figure 38.15 禁用24位数据和奇偶校验的MSB优先传输

(3) 32位数据的LSB优先传输

图38.16显示了SPI数据寄存器(SPDR)和禁用奇偶校验的移位寄存器的传输操作，
SPI数据长度为32位，并选择LSB-first。

在传输过程中，传输缓冲器当前级的位T31到T00被逐位重新排序，以获得用于复制到移位寄存器的顺序T00到T31。用于发送的数据从移位寄存器中从T00移出到T01，并按此顺序继续到T31。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后收集R00至R31位时，将移位寄存器中的值复制到接收缓冲区。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

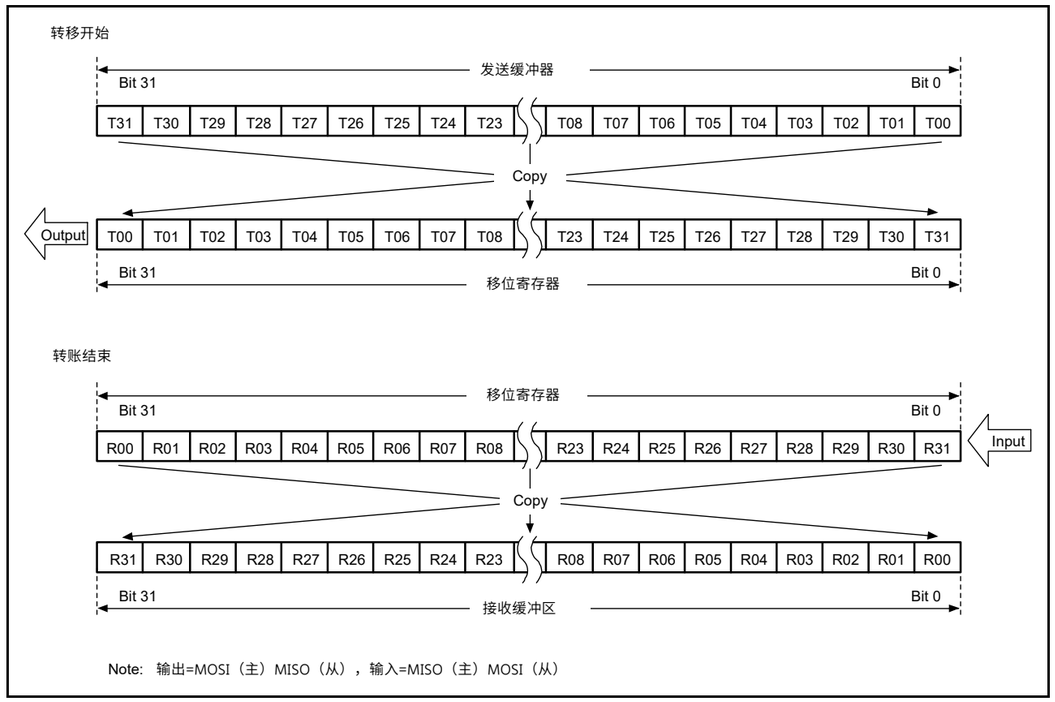
Figure 38.16 LSB-first transfer with 32-bit data and parity disabled

(4) LSB-first transfer with 24-bit data

Figure 38.17 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity disabled, an SPI data length of 24 bits, and LSB-first selected.

In transmission, the lower 24 bits (T23 to T00) from the current stage of the transmit buffer are reordered bit-by-bit to obtain the order T00 to T23 for copying to the shift register. Data for transmission is shifted out from the shift register from T00 to T01, and continuing to T23, in that order.

In reception, received data is shifted in bit-by-bit through bit [8] of the shift register. When the R00 to R23 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer. Writing 0 to bits T31 to T24 at the time of transmission leads to 0 being inserted in the upper 8 bits of the receive buffer.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

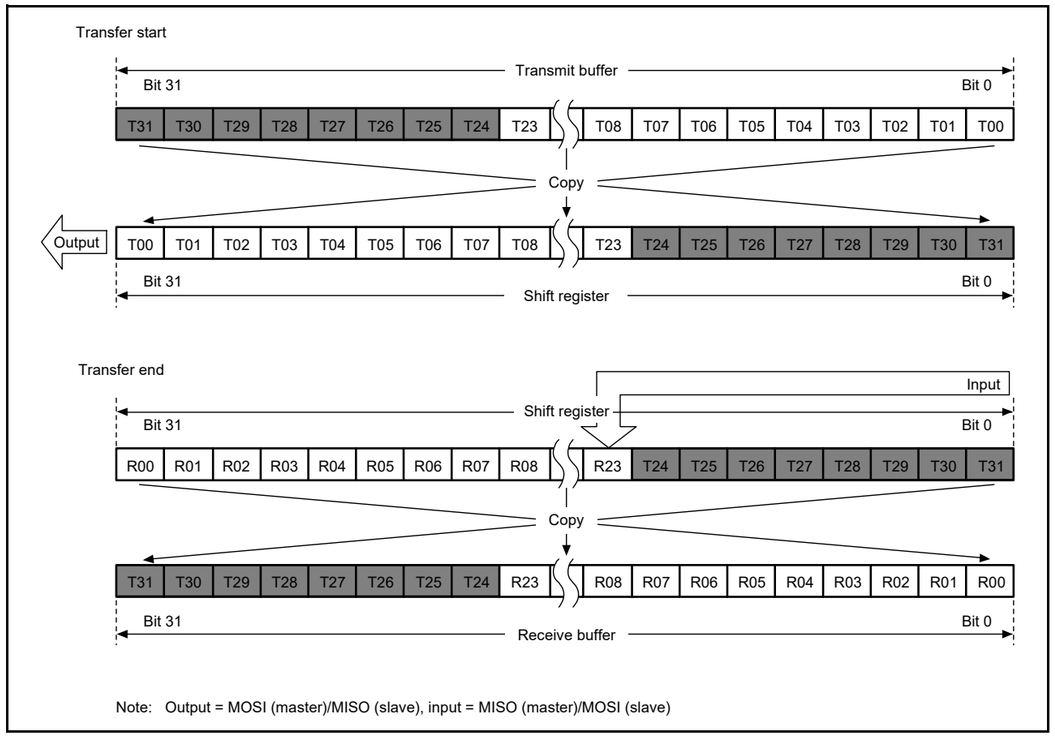
Figure 38.16 LSB优先传输，32位数据和奇偶校验禁用

(4) 24位数据的LSB优先传输

图38.17显示了SPI数据寄存器(SPDR)和禁用奇偶校验的移位寄存器的传输操作，
SPI数据长度为24位，并选择LSB优先。

发送时，将发送缓冲器当前级的低24位（T23到T00）逐位重新排序，得到T00到T23的顺序，用于复制到移位寄存器。用于发送的数据从移位寄存器移出，从T00移出到T01，并按此顺序继续移到T23。

在接收中，接收到的数据通过移位寄存器的位[8]逐位移位。在输入所需的RSPCK周期数后收集R00至R23位时，将移位寄存器中的值复制到接收缓冲区。发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送时将0写入位T31至T24会导致将0插入接收缓冲区的高8位。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

Figure 38.17 LSB-first transfer with 24-bit data and parity disabled

38.3.4.2 Operation when parity is enabled (SPCR2.SPPE = 1)

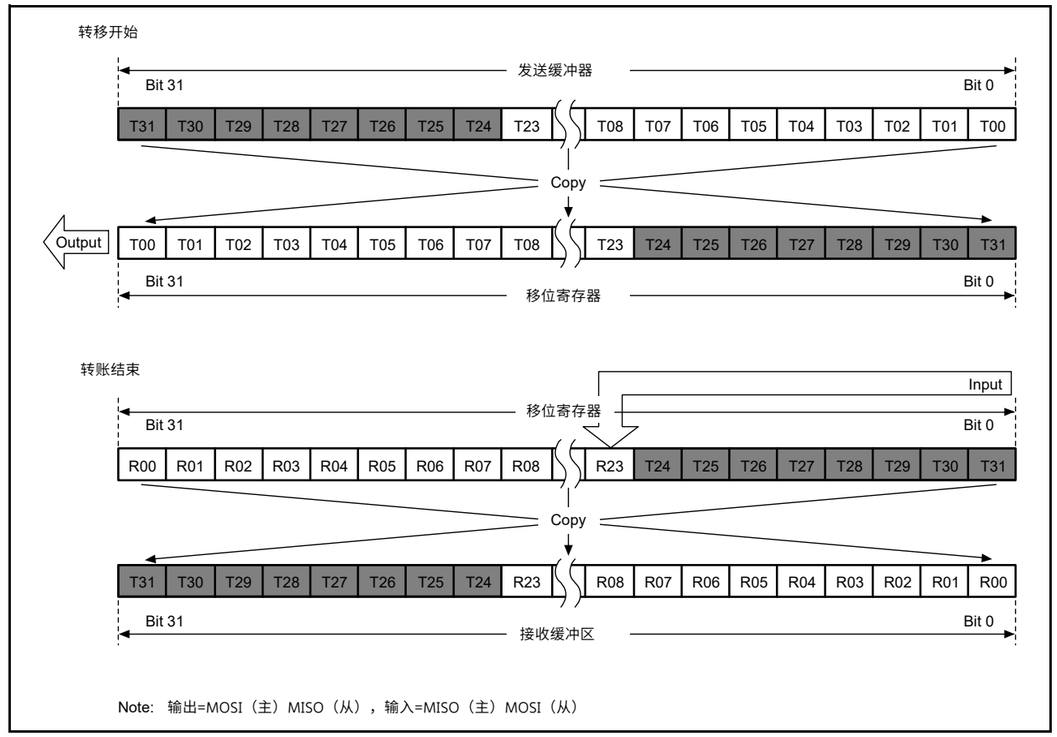
When parity is enabled, the lowest-order bit of the data for transmission becomes a parity bit. Hardware calculates the value of the parity bit.

(1) MSB-first transfer with 32-bit data

Figure 38.18 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity enabled, an SPI data length of 32 bits, and MSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T31 to T01. This replaces the final bit, T00, and the whole is copied to the shift register. Data is transmitted in the order T31, T30, …, T01, and P.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R31 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, data from R31 to P is checked for parity.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

Figure 38.17 LSB优先传输，24位数据和奇偶校验禁用

38.3.4.2 启用奇偶校验时的操作(SPCR2.SPPE=1)

启用奇偶校验时，传输数据的最低位变为奇偶校验位。硬件计算奇偶校验位的值。

(1) 32位数据的MSB优先传输

图38.18显示了SPI数据寄存器(SPDR)和启用奇偶校验的移位寄存器的传输操作，
SPI数据长度为32位，且MSB优先选择。

在传输中，奇偶校验位(P)的值是从位T31到T01计算的。这将替换最后一位T00，并将整体复制到移位寄存器中。数据按T31、T30、……、T01和P的顺序传输。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后收集R31至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，检查从R31到P的数据的奇偶性。

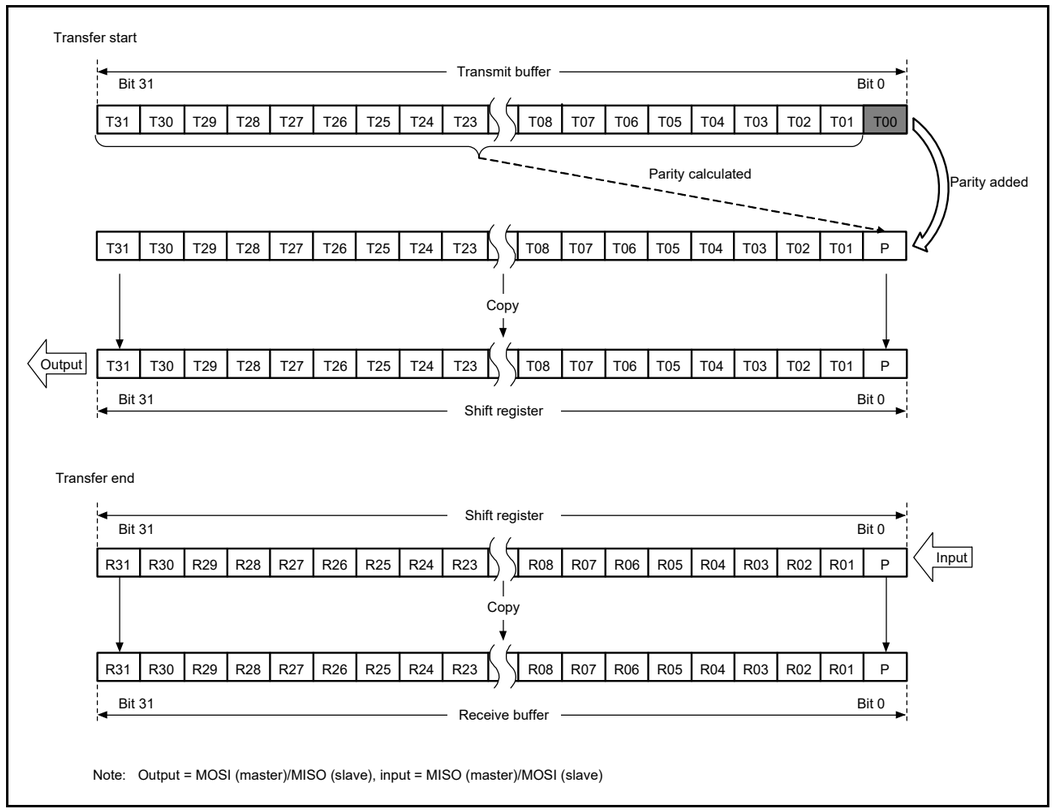


Figure 38.18 MSB-first transfer with 32-bit data and parity enabled

(2) MSB-first transfer with 24-bit data

Figure 38.19 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity enabled, an SPI data length of 24 bits and MSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T23 to T01. This replaces the final bit, T00, and the whole is copied to the shift register. Data is transmitted in the order T23, T22, …, T01, and P.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R23 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, data from R23 to P is checked for parity. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer. Writing 0 to bits T31 to T24 at the time of transmission leads to 0 being inserted in the upper 8 bits of the receive buffer.

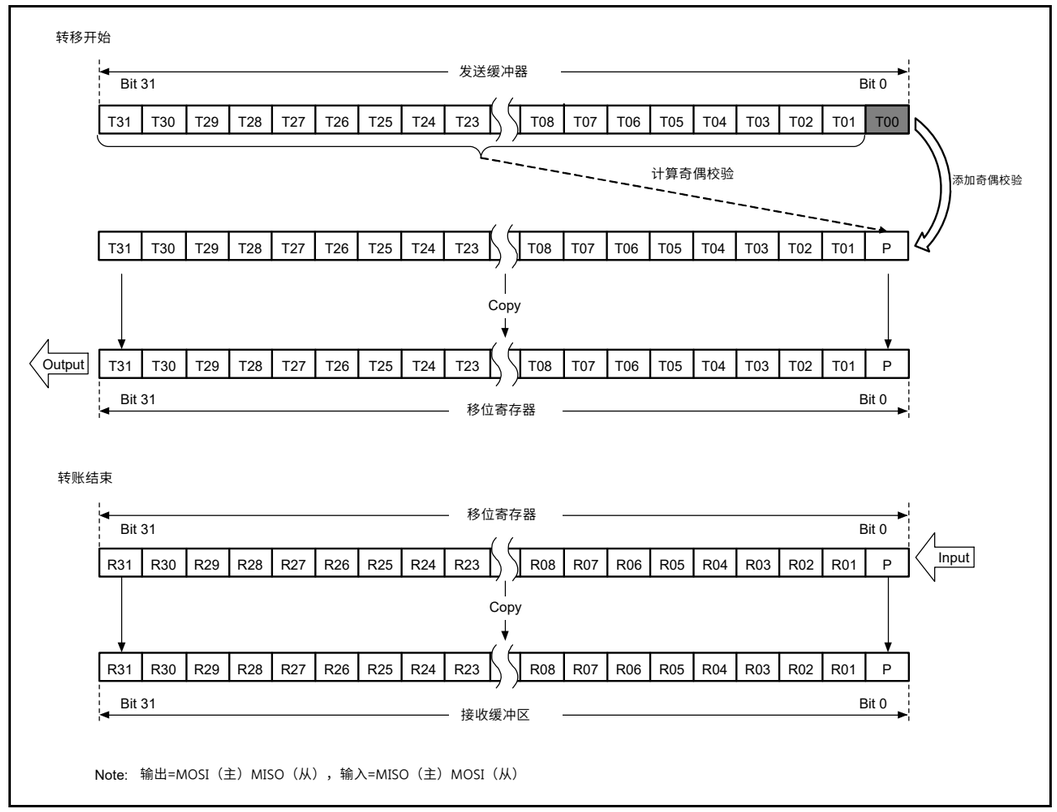

Figure 38.18 启用32位数据和奇偶校验的MSB优先传输

(2) 24位数据的MSB优先传输

图38.19显示了SPI数据寄存器(SPDR)和启用奇偶校验的移位寄存器的传输操作，
SPI数据长度为24位，选择MSB优先。

在传输中，奇偶校验位(P)的值是从位T23到T01计算的。这将替换最后一位T00，并将整体复制到移位寄存器中。数据按T23、T22、……、T01和P的顺序传输。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后收集R23至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R23到P的数据是否有奇偶性。发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送时将0写入位T31至T24会导致将0插入接收缓冲区的高8位。

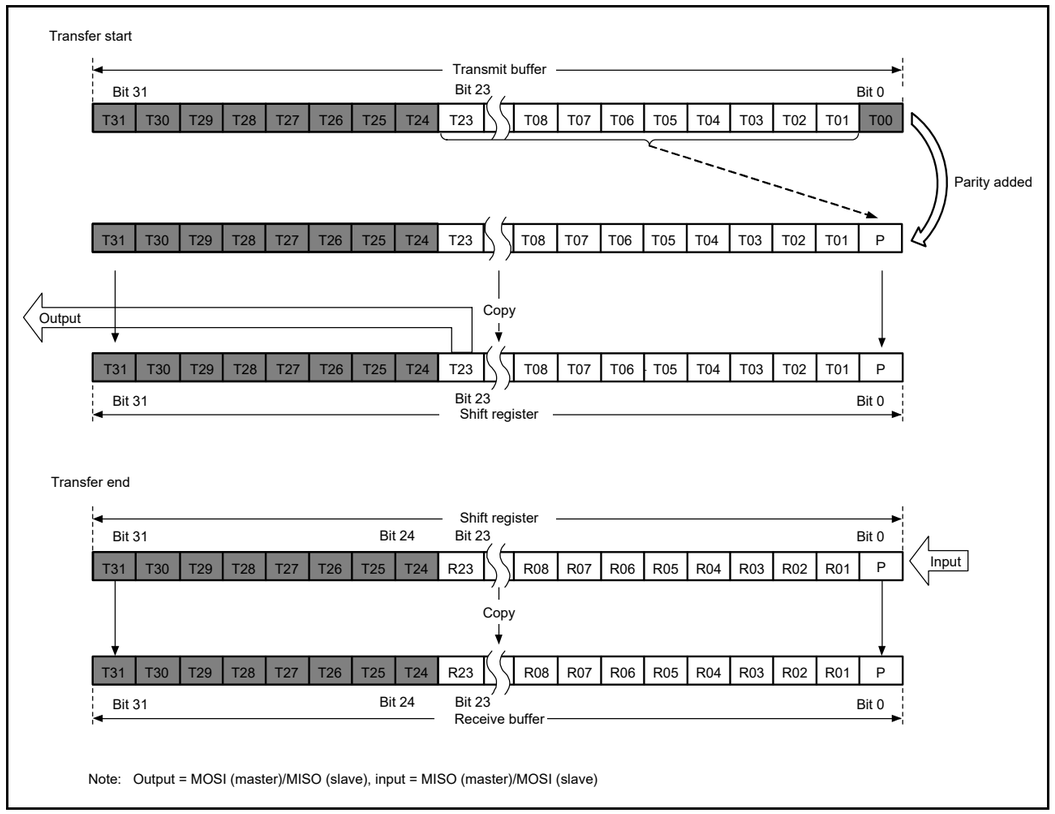

Figure 38.19 MSB-first transfer with 24-bit data and parity enabled

(3) LSB-first transfer with 32-bit data

Figure 38.20 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity enabled, an SPI data length of 32 bits, and LSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T30 to T00. This replaces the final bit, T31, and the whole is copied to the shift register. Data is transmitted in the order T00, T01, …, T30, and P.

In reception, received data is shifted in bit-by-bit through bit [0] of the shift register. When the R00 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, data from R00 to P is checked for parity.

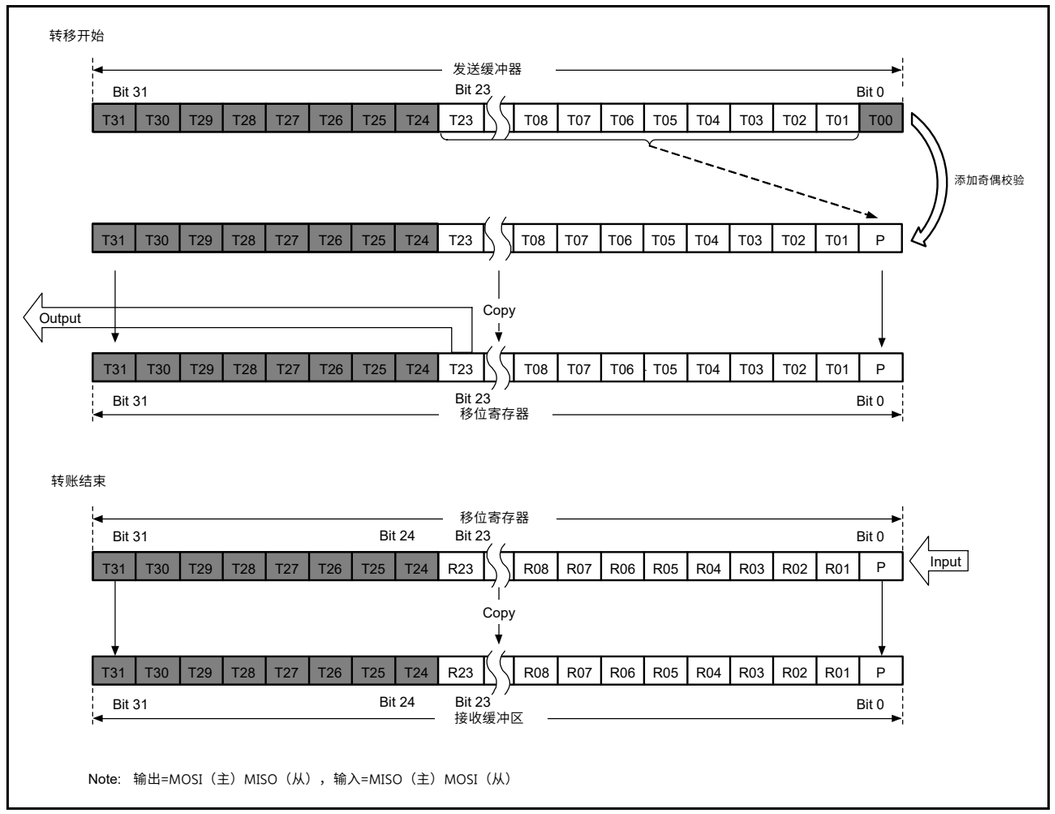

Figure 38.19 启用24位数据和奇偶校验的MSB优先传输

(3) 32位数据的LSB优先传输

图38.20显示了SPI数据寄存器(SPDR)和启用奇偶校验的移位寄存器的传输操作，
SPI数据长度为32位，并选择LSB-first。

在传输中，奇偶校验位(P)的值是从位T30到T00计算的。这将替换最后一位T31，并将整体复制到移位寄存器。
数据按T00、T01、……、T30和P的顺序传输。

在接收时，接收到的数据通过移位寄存器的位[0]逐位移位。在输入所需数量的RSPCK周期后收集R00至P位时，
将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，检查从R00到P的数据的奇偶性。

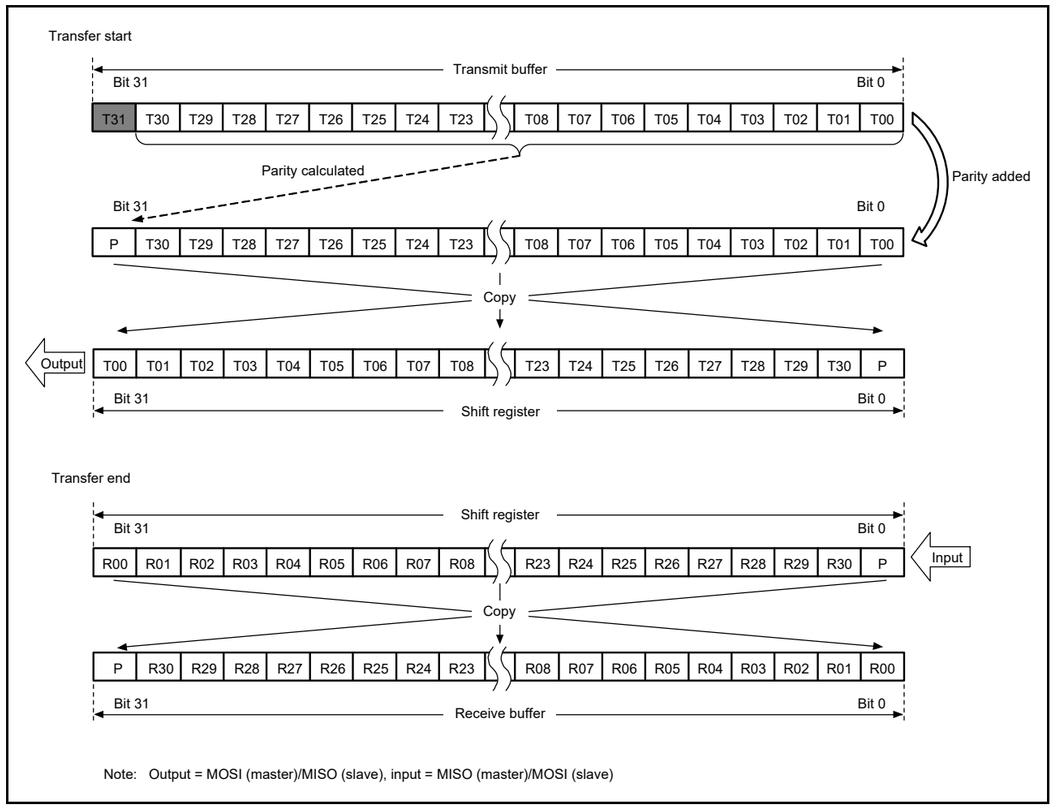

Figure 38.20 LSB-first transfer with 32-bit data and parity enabled

(4) LSB-first transfer with 24-bit data

Figure 38.21 shows the transfer operations of the SPI Data Register (SPDR) and the shift register with parity enabled, an SPI data length of 24 bits, and LSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T22 to T00. This replaces the final bit, T23, and the whole is copied to the shift register. Data is transmitted in the order T00, T01, …, T22, and P.

In reception, received data is shifted in bit-by-bit through bit [8] of the shift register. When the R00 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, data from R00 to P is checked for parity. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer. Writing 0 to bits T31 to T24 at the time of transmission leads to 0 being inserted in the upper 8 bits of the receive buffer.

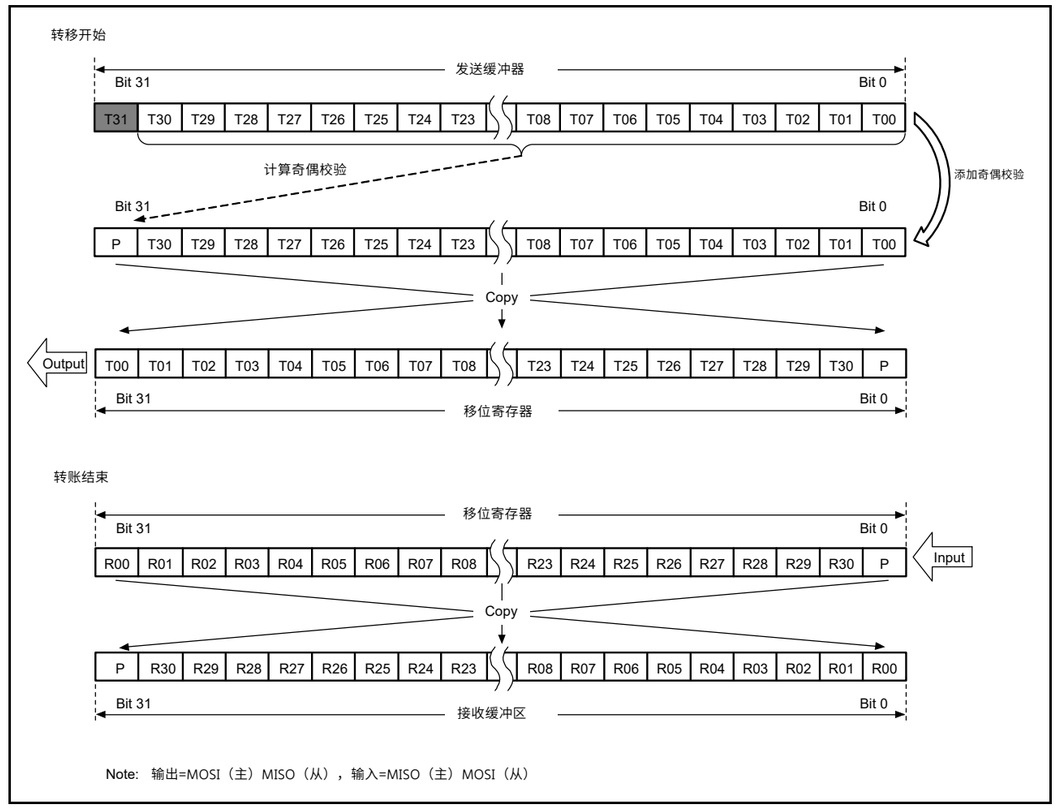

Figure 38.20 启用32位数据和奇偶校验的LSB优先传输

(4) 24位数据的LSB优先传输

图38.21显示了SPI数据寄存器(SPDR)和启用奇偶校验的移位寄存器的传输操作，SPI数据长度为24位，并选择LSB优先。

在传输中，奇偶校验位(P)的值是从位T22到T00计算的。这将替换最后一位T23，并将整体复制到移位寄存器中。数据按T00、T01、……、T22和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的位[8]逐位移位。在输入所需数量的RSPCK周期后收集R00至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，检查从R00到P的数据的奇偶性。发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送时将0写入位T31至T24会导致将0插入接收缓冲区的高8位。

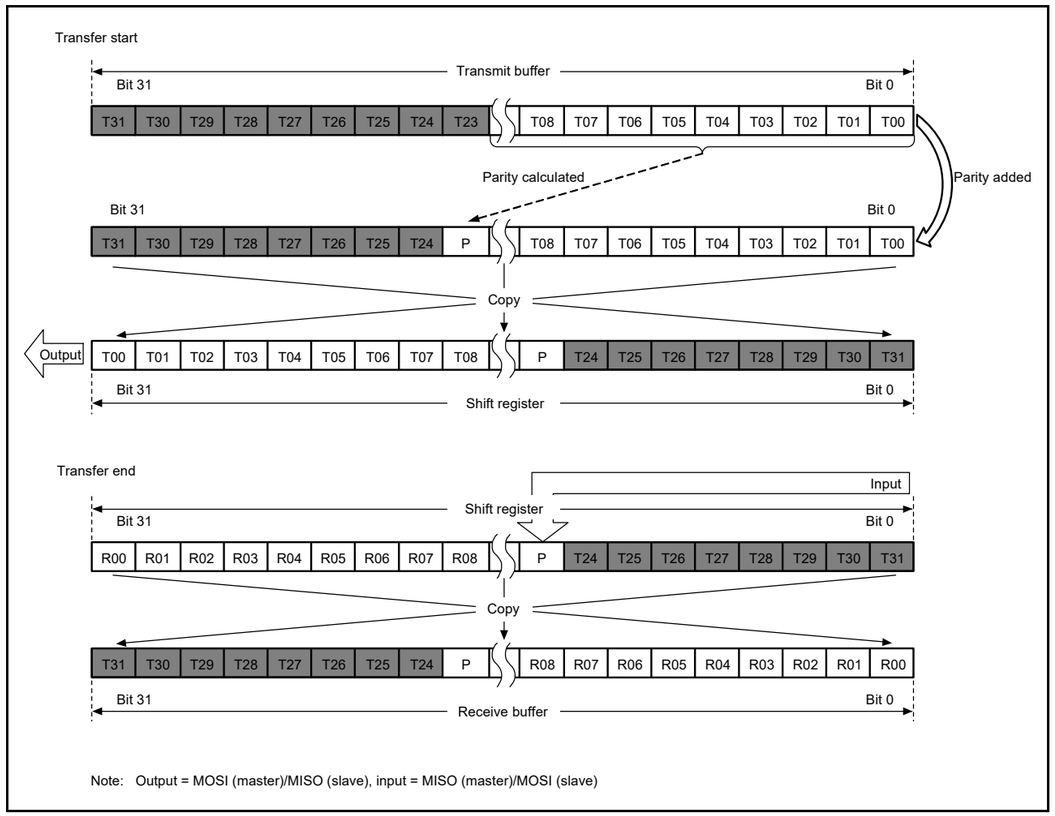

Figure 38.21 LSB-first transfer with 24-bit data and parity enabled

38.3.5 Transfer Formats

38.3.5.1 Transfer format when CPHA = 0

Figure 38.22 shows an example transfer format for the serial transfer of 8-bit data when the SPCMDm.CPHA bit is 0. Do not perform clock synchronous operation (SPCR.SPMS = 1) when the SPI operates in slave mode (SPCR.MSTR = 0) and the CPHA bit is 0. In the figure, RSPCKn (CPOL = 0) indicates the RSPCKn signal waveform when the SPCMDm.CPOL bit is 0, and RSPCKn (CPOL = 1) indicates the RSPCKn signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which the SPI fetches serial transfer data into the shift register. The I/O directions of the signals depend on the SPI settings. For details, see section 38.3.2, Controlling the SPI Pins.

When the SPCMDm.CPHA bit is 0, the driving of valid data to the MOSIn and MISOn signals commences on an SSLni signal assertion. The first RSPCKn signal change that occurs after the SSLni signal assertion becomes the first transfer data fetch. After this, data is sampled every 1 RSPCK cycle. The change timing for MOSIn and MISOn signals is 1/2 RSPCK cycles after the transfer data fetch timing. The CPOL bit setting does not affect the RSPCK signal operation timing as it only affects the signal polarity.

t1 denotes the period from an SSLni signal assertion to RSPCKn oscillation (RSPCK delay). t2 denotes the period from the termination of RSPCKn oscillation to an SSLni signal negation (SSL negation delay). t3 denotes the period in which SSLni signal assertion is suppressed for the next transfer after the end of serial transfer (next-access delay). t1, t2, and t3 are controlled by a master device running on the SPI system. For a description of t1, t2, and t3 when the SPI is in master mode, see section 38.3.10.1, Master mode operation.

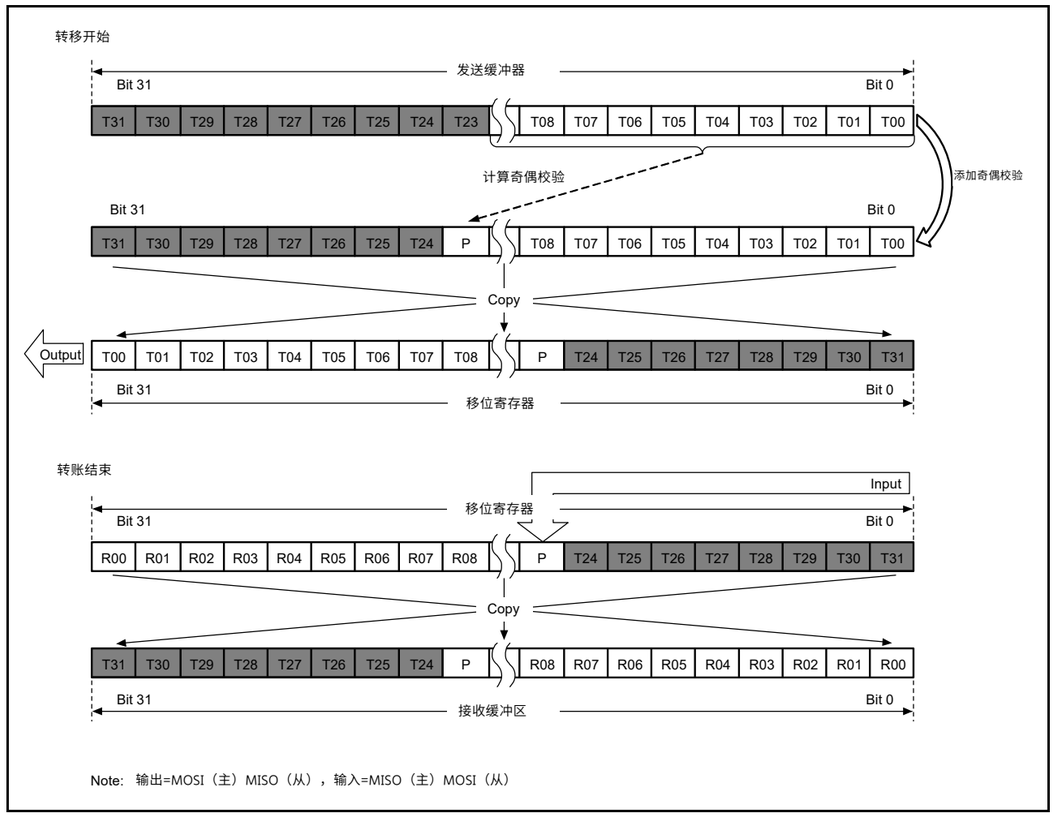

Figure 38.21 启用24位数据和奇偶校验的LSB优先传输

38.3.5 传输格式

38.3.5.1 CPHA=0时的传输格式

图38.22显示了当SPCMDm.CPHA位为0时串行传输8位数据的示例传输格式。当SPI在从机模式下运行时（SPCR.MSTR=0），CPHA位为0。图中，RSPCKn(CPOL=0)表示SPCMDm.CPOL位为0时的RSPCKn信号波形，RSPCKn(CPOL=1)表示CPOL位为0时的RSPCKn信号波形1.采样时序表示SPI将串行传输数据取入移位寄存器的时序。信号的IO方向取决于SPI设置。有关详细信息，请参见第38.3.2节，控制SPI引脚。

当SPCMDm.CPHA位为0时，有效数据驱动到MOSIn和MISOn信号在SSLni信号断言时开始。在SSLni信号断言之后发生的第一个RSPCKn信号变化成为第一次传输数据获取。此后，每1个RSPCK周期对数据进行采样。MOSIn和MISOn信号的变化时序是传输数据获取时序之后的12RSPCK周期。CPOL位设置不影响RSPCK信号操作时序，因为它只影响信号极性。

t1表示从SSLni信号断言到RSPCKn振荡（RSPCK延迟）的周期。t2表示从RSPCKn振荡终止到SSLni信号否定（SSL否定延迟）的周期。t3表示在串行传输结束后（下一次访问延迟）为下一次传输抑制SSLni信号断言的时间段。t1、t2和t3由在SPI系统上运行的主设备控制。有关SPI处于主机模式时的t1、t2和t3的说明，请参阅第38.3.10.1节，主机模式操作。

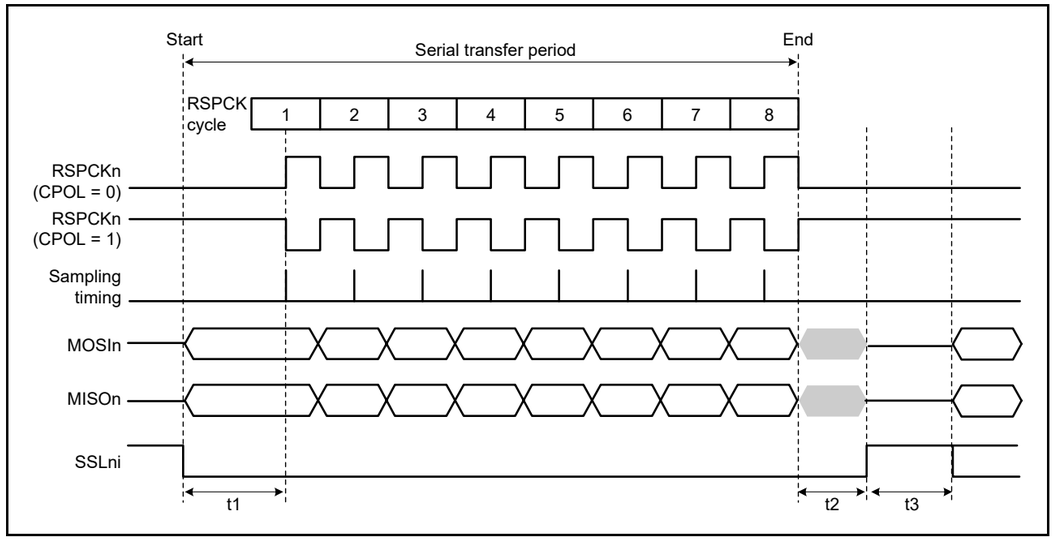

Figure 38.22 SPI transfer format when CPHA = 0

38.3.5.2 When CPHA = 1

Figure 38.23 shows an example transfer format for the serial transfer of 8-bit data when the SPCMDm.CPHA bit is 1. However, when the SPCR.SPMS bit is 1, the SSLni signals are not used, and only the three signals RSPCKn, MOSIn, and MISOn handle communications. In Figure 38.23, RSPCK (CPOL = 0) indicates the RSPCKn signal waveform when the SPCMDm.CPOL bit is 0; RSPCK (CPOL = 1) indicates the RSPCKn signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which the SPI fetches serial transfer data into the shift register. The I/O directions of the signals depend on the SPI mode (master or slave). For details, see section 38.3.2, Controlling the SPI Pins.

When the SPCMDm.CPHA bit is 1, the driving of invalid data to the MISOn signal commences on an SSLni signal assertion. The output of valid data to the MOSIn and MISOn signals commences at the first RSPCKn signal change that occurs after the SSLni signal assertion. After this, data is updated every 1 RSPCK cycle. The transfer data fetch timing is 1/2 RSPCK cycles after the data update timing. The SPCMDm.CPOL bit setting does not affect the RSPCKn signal operation timing; it only affects the signal polarity.

t1, t2, and t3 are the same as those when CPHA = 0. For a description of t1, t2, and t3 when the SPI of the MCU is in master mode, see section 38.3.10.1, Master mode operation.

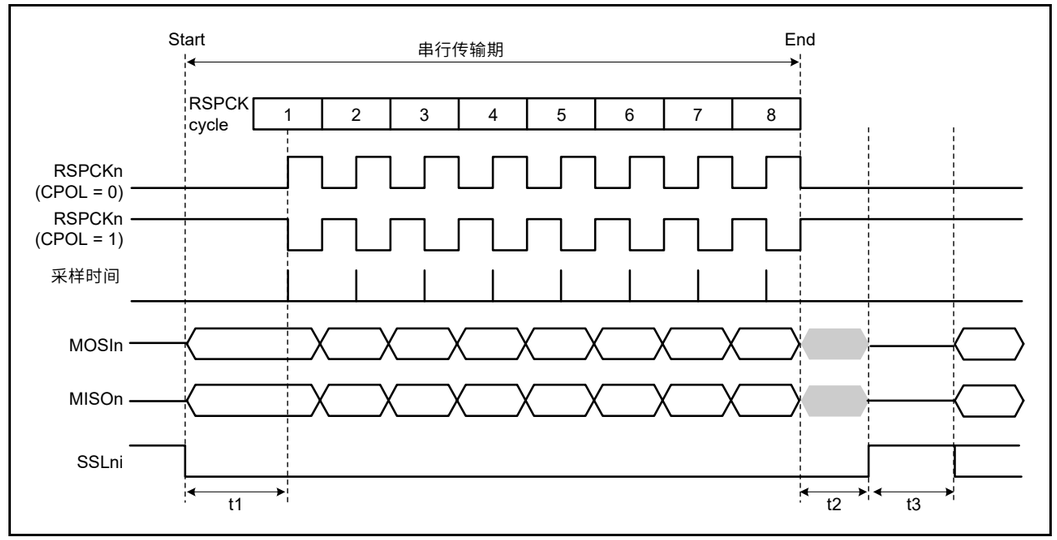

Figure 38.22 CPHA=0时的SPI传输格式

38.3.5.2 When CPHA = 1

图38.23显示了SPCMDm.CPHA位为1时串行传输8位数据的示例传输格式。然而，当SPCR.SPMS位为1时，不使用SSLni信号，仅使用三个信号RSPCKn，MOSIn和MISon处理通信。图38.23中，RSPCK(CPOL=0)表示SPCMDm.CPOL位为0时的RSPCKn信号波形；RSPCK(CPOL=1)表示CPOL位为1时的RSPCKn信号波形。采样时序表示SPI将串行传输数据取入移位寄存器的时序。信号的IO方向取决于SPI模式（主机或从机）。有关详细信息，请参见第38.3.2节，控制SPI引脚。

当SPCMDm.CPHA位为1时，在SSLni信号断言时开始将无效数据驱动到MIOn信号。在SSLni信号断言之后发生的第一个RSPCKn信号变化时，开始向MOSIn和MISOn信号输出有效数据。此后，每1个RSPCK周期更新一次数据。传输数据获取时序是数据更新时序之后的12个RSPCK周期。SPCMDm.CPOL位设置不影响RSPCKn信号操作时序；它只影响信号极性。

t1、t2、t3与CPHA=0时相同。关于MCU的SPI处于主机模式时的t1、t2和t3说明，请参见第38.3.10.1节，主机模式操作。

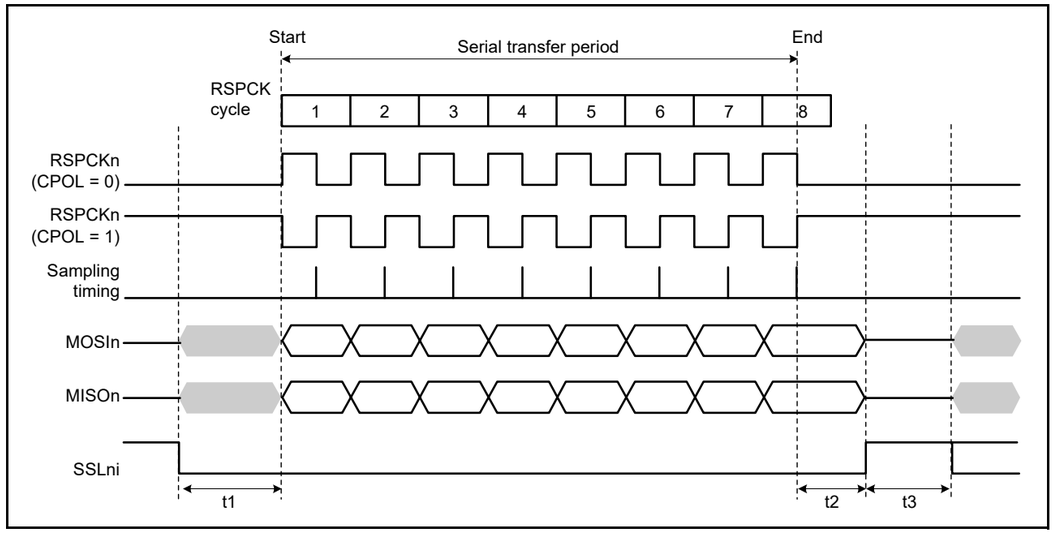

Figure 38.23 SPI transfer format when CPHA = 1

38.3.6 Data Transfer Modes

Full-duplex synchronous serial communications or transmit operations can only be selected in the communications operating mode select bit (SPCR.TXMD). The SPDR/SPDR_HA access shown in Figure 38.24 and Figure 38.25 indicate the condition of access to the register, where W denotes a write cycle.

38.3.6.1 Full-duplex synchronous serial communications (SPCR.TXMD = 0)

Figure 38.24 shows an example of operation where the communications operating mode select bit (SPCR.TXMD) is set to 0. In this example, the SPI performs an 8-bit serial transfer when SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, indicating the number of transferred bits.

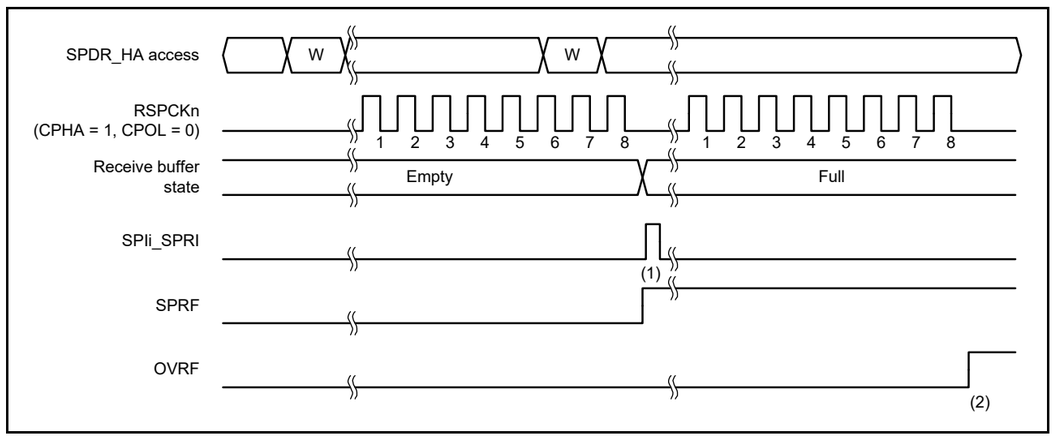

Figure 38.24 Operation example when SPCR.TXMD = 0

The operation of the flags at times (1) and (2) in the figure is as follows:

1. When a serial transfer ends with the receive buffer of SPDR_HA empty, the SPI generates a receive buffer full interrupt request (SPIi_SPRI) (the SPI sets the SPSR.SPRF flag to 1) and copies the received data in the shift

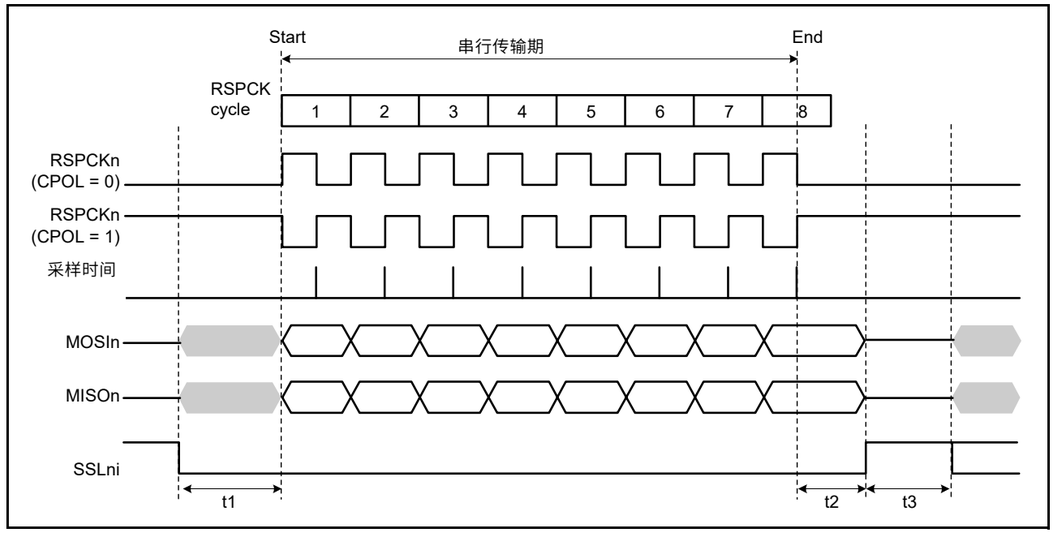

Figure 38.23 CPHA=1时的SPI传输格式

38.3.6 数据传输模式

全双工同步串行通信或发送操作只能在通信操作模式选择位(SPCR.TXMD)中选择。图38.24和图38.25所示的SPDRSPDR_HA访问表示访问寄存器的条件，其中W表示写周期。

38.3.6.1 全双工同步串行通信(SPCR.TXMD=0)

图38.24显示了通信操作模式选择位(SPCR.TXMD)设置为0的操作示例。在此示例中，当SPDCR.SPFC[1:0]位为00b时，SPI执行8位串行传输，SPCMDm.CPHA位为1，SPCMDm.CPOL位为0。波形中为RSPCKn给出的数字表示RSPCK周期数，表示传输的位数。

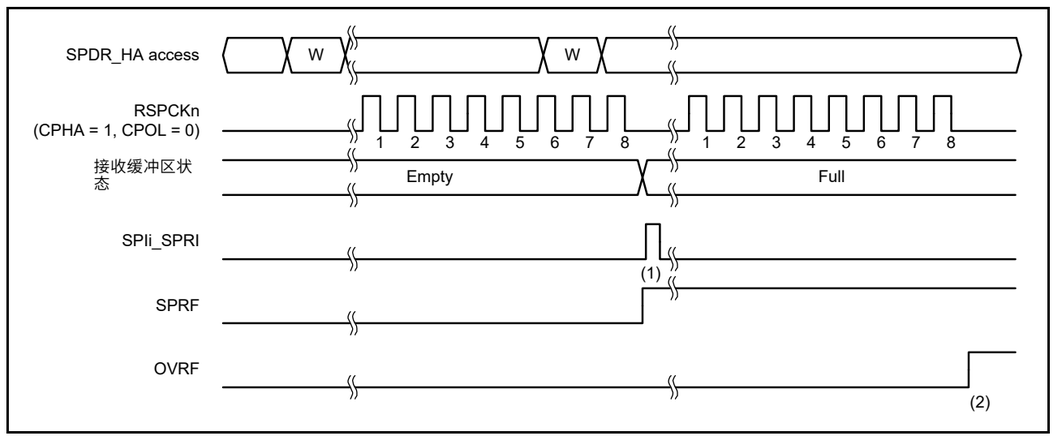

Figure 38.24 SPCR.TXMD=0时的操作示例

图中（1）和（2）时刻flags的操作如下：

1. 当串行传输结束且SPDR_HA的接收缓冲区为空时，SPI产生接收缓冲区满中断请求（SPIi_SPRI）（SPI将SPSR.SPRF标志设置为1）并将接收到的数据复制到移位中

register to the receive buffer.

2. When a serial transfer ends with the receive buffer of SPDR_HA holding data that was received in the previous serial transfer, the SPI sets the SPSR.OVRF flag to 1 and discards the received data in the shift register.

38.3.6.2 Transmit operations only (SPCR.TXMD = 1)

Figure 38.25 shows an example of operation where the communications operating mode select bit (SPCR.TXMD) is set to 1. In this example, the SPI performs an 8-bit serial transfer when SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, indicating the number of transferred bits.

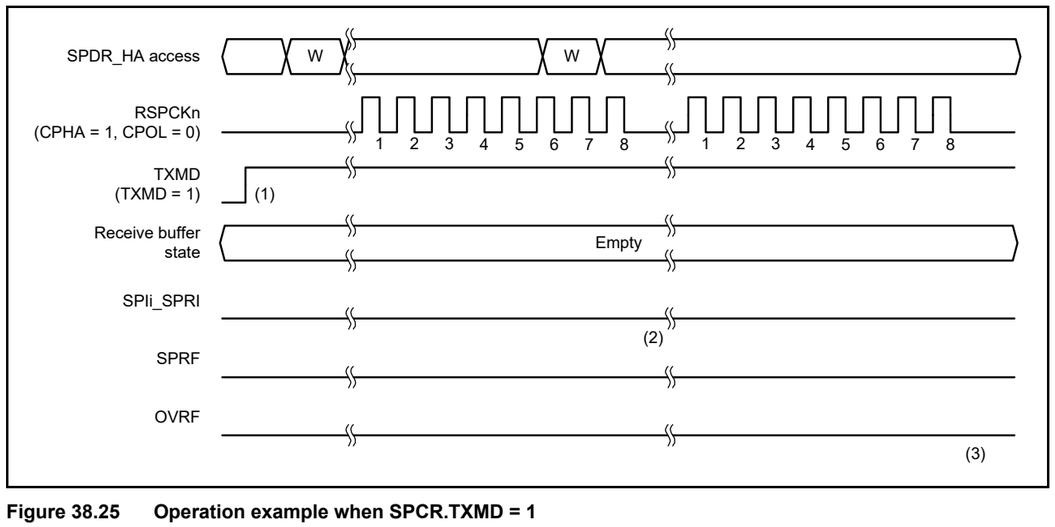

Figure 38.25 Operation example when SPCR.TXMD = 1

The operation of the flags at times (1) to (3) in the figure is as follows:

1. Make sure there is no data left in the receive buffer (the SPSR.SPRF flag is 0) and the SPSR.OVRF flag is 0 before entering transmit-only mode (SPCR.TXMD = 1).
2. When a serial transfer ends with the receive buffer of SPDR_HA empty, if the transmit-only mode is selected (SPCR.TXMD = 1), the SPSR.SPRF flag retains the value of 0, and the SPI does not copy the data in the shift register to the receive buffer.
3. Because the receive buffer of SPDR_HA does not hold data that was received in the previous serial transfer, even when a serial transfer ends, the SPSR.OVRF flag retains the value of 0, and the data in the shift register is not copied to the receive buffer.

In transmit-only mode (SPCR.TXMD = 1), the SPI transmits data but does not receive data. Therefore, the SPSR.SPRF and SPSR.OVRF flags remain 0 at times (1) to (3).

38.3.7 Transmit Buffer Empty and Receive Buffer Full Interrupts

Figure 38.26 and Figure 38.27 show examples of operation of the transmit buffer empty interrupt (SPIi_SPTI) and the receive buffer full interrupt (SPIi_SPRI). The SPDR_HA register accesses shown in these figures indicate the condition of access to the register, where W denotes a write cycle and R a read cycle. In the example in Figure 38.26, the SPI performs an 8-bit serial transfer when SPCR.TXMD bit is 0, the SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 0, and the SPCMDm.CPOL bit is 0. In the example in Figure 38.27, the SPI performs an 8-bit serial transfer when SPCR.TXMD bit is 0, the SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, indicating the number of transferred bits.

注册到接收缓冲区。

2. 当串行传输结束时，SPDR_HA的接收缓冲区保存了前一次串行传输中接收到的数据，SPI将SPSR.OVRF标志设置为1，并丢弃移位寄存器中接收到的数据。

38.3.6.2 仅发送操作(SPCR.TXMD=1)

图38.25显示了通信操作模式选择位(SPCR.TXMD)设置为1的操作示例。在此示例中，当SPDCR.SPFC[1:0]位为00b时，SPI执行8位串行传输，SPCMDm.CPHA位为1，SPCMDm.CPOL位为0。波形中为RSPCKn给出的数字表示RSPCK周期数，表示传输的位数。

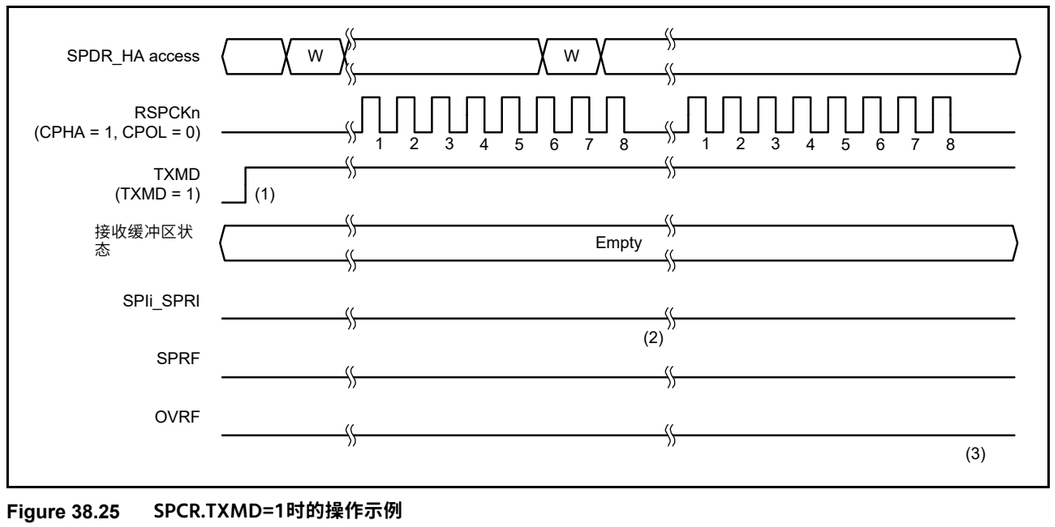

Figure 38.25 SPCR.TXMD=1时的操作示例

图中（1）到（3）时刻flags的操作如下：

1. 在进入仅发送模式（SPCR.TXMD=1）之前，确保接收缓冲区中没有数据（SPSR.SPRF标志为0）且SPSR.OVRF标志为0。
2. 当串行传输结束且SPDR_HA的接收缓冲区为空时，如果选择了仅发送模式（SPCR.TXMD=1），则SPSR.SPRF标志保持值为0，SPI不会复制移位寄存器到接收缓冲器。
3. 因为SPDR_HA的接收缓冲区不保存之前串行传输中接收到的数据，所以即使串行传输结束，SPSR.OVRF标志保持值0，移位寄存器中的数据不会复制到接收缓冲。

在仅发送模式（SPCR.TXMD=1）下，SPI发送数据但不接收数据。因此，SPSR.SPRF和SPSR.OVRF标志在时间(1)到(3)处保持为0。

38.3.7 发送缓冲区空和接收缓冲区满中断

图38.26和图38.27显示了发送缓冲区空中断(SPIi_SPTI)和接收缓冲区满中断(SPIi_SPRI)的操作示例。这些图中显示的SPDR_HA寄存器访问表示对寄存器的访问条件，其中W表示写周期，R表示读周期。在图38.26的示例中，当SPCR.TXMD位为0、SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为0、SPCMDm.CPOL时SPI执行8位串行传输bit为0。在图38.27的示例中，当SPCR.TXMD位为0、SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为1时，SPI执行8位串行传输，并且SPCMDm.CPOL位为0。波形中为RSPCKn给出的数字表示RSPCK周期数，表示传输的位数。

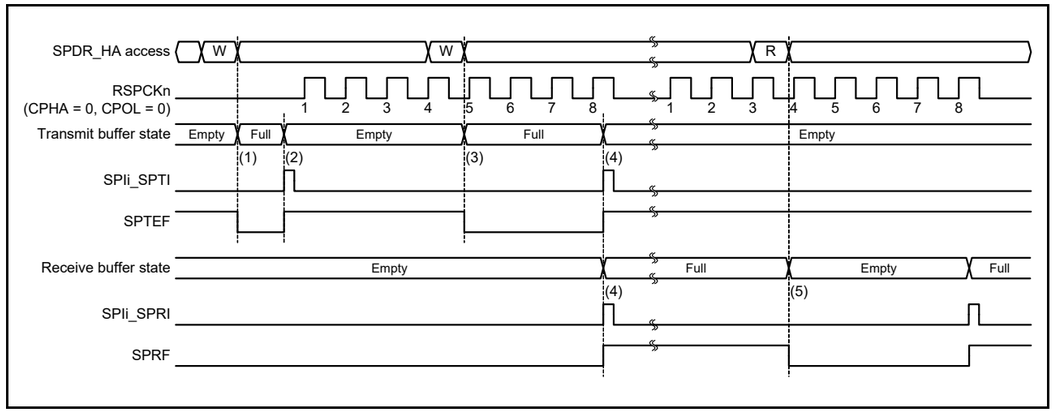

Figure 38.26 Operation example of the SPIi_SPTI and SPIi_SPRI interrupts when CPHA = 0 and CPOL = 0

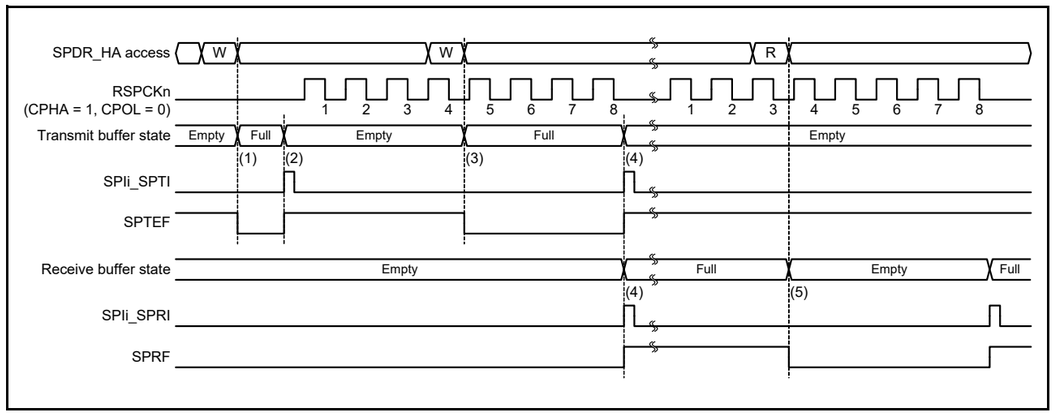

Figure 38.27 Operation example of the SPIi_SPTI and SPIi_SPRI interrupts when CPHA = 1 and CPOL = 0

The operation of the SPI at times (1) to (5) in the figure is as follows:

1. When transmit data is written to SPDR_HA and when the transmit buffer of SPDR_HA is empty (data for the next transfer is not set), the SPI writes data to the transmit buffer and clears the SPSR.SPTEF flag to 0.
2. If the shift register is empty, the SPI copies the data in the transmit buffer to the shift register, generates a transmit buffer empty interrupt request (SPIi_SPTI), and sets the SPSR.SPTEF flag to 1. How a serial transfer is started depends on the mode of the SPI. For details, see section 38.3.10, SPI Operation, and section 38.3.11, Clock Synchronous Operation.
3. When transmit data is written to SPDR_HA either by the transmit buffer empty interrupt routine, or by the processing of the transmit buffer empty state using the SPTEF flag, the SPI writes data to the transmit buffer and clears the SPTEF flag to 0. Because the data being transferred serially is stored in the shift register, the SPI does not copy the data in the transmit buffer to the shift register.
4. When the serial transfer ends and the receive buffer of SPDR_HA is empty, the SPI copies the receive data in the shift register to the receive buffer, generates a receive buffer full interrupt request (SPIi_SPRI), and sets the SPRF flag to 1. Because the shift register becomes empty on completion of the serial transfer, when the transmit buffer is full before the serial transfer ended, the SPI sets the SPTEF flag to 1 and copies data in the transmit buffer to the shift register. Even when received data is not copied from the shift register to the receive buffer in an overrun error status, on completion of the serial transfer, the SPI determines that the shift register is empty, so data transfer from the transmit buffer to the shift register is enabled.

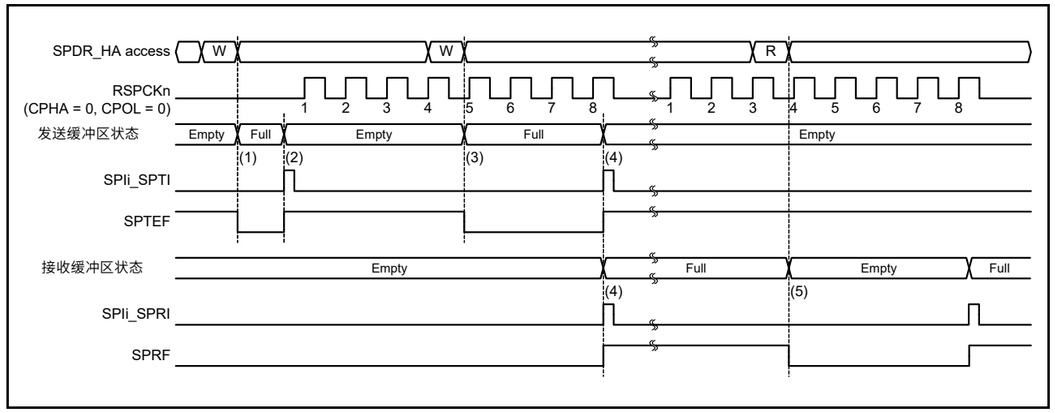

Figure 38.26 CPHA=0和CPOL=0时SPIi_SPTI和SPIi_SPRI中断的操作示例

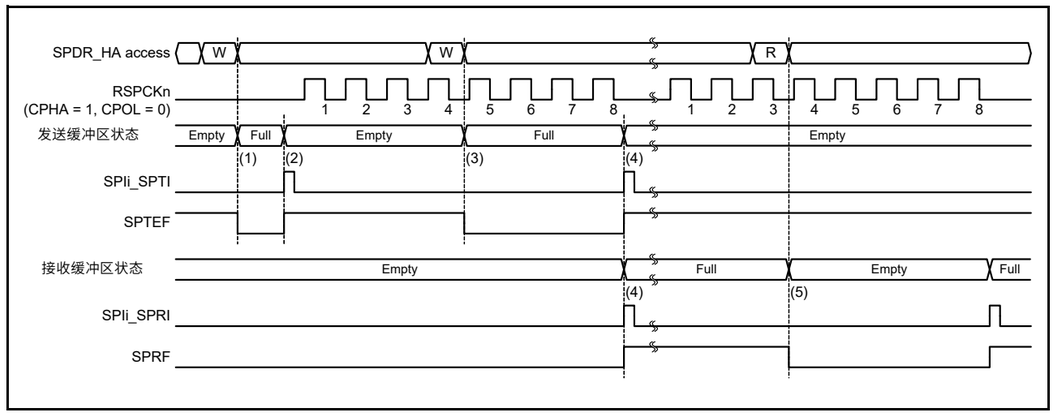

Figure 38.27 CPHA=1和CPOL=0时SPIi_SPTI和SPIi_SPRI中断的操作示例

图中（1）到（5）时刻SPI的操作如下：

1. 当发送数据写入SPDR_HA且SPDR_HA的发送缓冲区为空（未设置下一次传输的数据）时，SPI将数据写入发送缓冲区并将SPSR.SPTEF标志清除为0。
2. 如果移位寄存器为空，则SPI将发送缓冲区中的数据复制到移位寄存器，产生发送缓冲区空中断请求（SPIi_SPTI），并将SPSR.SPTEF标志设置为1。如何启动串行传输取决于SPI的模式。有关详细信息，请参见第38.3.10节，SPI操作和第38.3.11节，时钟同步操作。
3. 当发送数据被发送缓冲区空中断程序或使用SPTEF标志处理发送缓冲区空状态写入SPDR_HA时，SPI将数据写入发送缓冲区并将SPTEF标志清除为0。因为数据串行传输的数据存储在移位寄存器中，SPI不会将发送缓冲区中的数据复制到移位寄存器中。
4. 当串行传输结束且SPDR_HA的接收缓冲区为空时，SPI将移位寄存器中的接收数据复制到接收缓冲区，产生接收缓冲区满中断请求（SPIi_SPRI），并将SPRF标志设置为1。串行传输完成后移位寄存器变为空，当串行传输结束前发送缓冲区已满时，SPI将SPTEF标志设置为1，并将发送缓冲区中的数据复制到移位寄存器。即使在溢出错误状态下没有将接收到的数据从移位寄存器复制到接收缓冲区，在串行传输完成时，SPI会确定移位寄存器为空，因此从发送缓冲区到移位寄存器的数据传输是启用。

5. When SPDR_HA is read either by the receive buffer full interrupt routine or processing of the receive buffer full state using the SPRF flag, the receive data can be read.

If SPDR_HA is written to when the transmit buffer holds data that is not yet transmitted (the SPTEF flag is 0), the SPI does not update data in the transmit buffer. When writing to SPDR_HA, always use either a transmit buffer empty interrupt request or processing of the transmit buffer empty interrupt using the SPTEF flag. To use a transmit buffer empty interrupt, set the SPTIE bit in SPCR to 1. If the SPI function is disabled (the SPCR.SPE bit is 0), set the SPTIE bit to 0.

When serial transfer ends and the receive buffer is full (the SPRF flag is 1), the SPI does not copy data from the shift register to the receive buffer, and it detects an overrun error (see section 38.3.8, Error Detection). To prevent a receive data overrun error, read the received data using a receive buffer full interrupt request before the next serial transfer ends. To use an SPI receive buffer full interrupt, set the SPCR.SPRIE bit to 1.

Transmission and reception interrupts or the associated IELSRn.IR flags (where n is the interrupt vector number) in the ICU can be used to confirm the states of the transmit and receive buffers.

Similarly, the SPTEF and SPRF flags can be used to confirm the states of the transmit and receive buffers. See section 14, Interrupt Controller Unit (ICU) for the interrupt vector numbers.

38.3.8 Error Detection

In normal SPI serial transfers, data written to the transmit buffer of SPDR/SPDR_HA is transmitted, and received data can be read from the receive buffer of SPDR/SPDR_HA. In some cases non-normal transfers can be executed when SPDR/SPDR_HA is accessed, depending on the status of the transmit or receive buffer or the status of the SPI at the beginning or end of serial transfer.

If a non-normal transfer operation occurs, the SPI detects the event as an underrun error, overrun error, parity error, or mode fault error. Table 38.8 lists the relationship between non-normal transfer operations and the SPI error detection function.

Table 38.8 Relationship between non-normal transfer operations and SPI error detection

Operation	Occurrence condition	SPI operation	Error detection
1	SPDR/SPDR_HA is written when the transmit buffer is full.	• Keeps the contents of the transmit buffer • Missing write data.	None
2	SPDR/SPDR_HA is read when the receive buffer is empty.	Outputs the contents of the receive buffer and previously received data.	None
3	Serial transfer is started in slave mode when the SPI is not able to transmit data.	• Suspends serial transfer • Missing transmit and receive data • Stops driving of the MISOA output signal • Disables the SPI function.	Underrun error
4	Serial transfer terminates when the receive buffer is full.	• Keeps the contents of the receive buffer • Missing receive data.	Overrun error
5	An incorrect parity bit is received when performing full-duplex synchronous serial communications with the parity function enabled.	Asserts the parity error flag.	Parity error
6	The SSLn0 input signal is asserted when the serial transfer is idle in multi-master mode.	• Stops driving of the RSPCKn, MOSIn, SSLn1 to SSLn3 output signals • Disables the SPI function.	Mode fault error
7	The SSLn0 input signal is asserted during serial transfer in multi-master mode.	• Suspends serial transfer • Missing transmit and receive data • Stops driving of the RSPCKn, MOSIn, SSLn1 to SSLn3 output signals • Disables the SPI function.	Mode fault error
8	The SSLn0 input signal is negated during serial transfer in slave mode.	• Suspends serial transfer • Missing transmit and receive data • Stops driving of the MISOn output signal • Disables the SPI function.	Mode fault error

In operation 1 described in Table 38.8, the SPI does not detect an error. To prevent data omission during the writing to SPDR/SPDR_HA, write operations to SPDR/SPDR_HA must be executed using a transmit buffer empty interrupt

5. 当接收缓冲区满中断例程或使用SPRF标志处理接收缓冲区满状态读取SPDR_HA时，可以读取接收数据。

如果在发送缓冲区保存尚未发送的数据时写入SPDR_HA（SPTEF标志为0），则SPI不会更新发送缓冲区中的数据。写入SPDR_HA时，始终使用发送缓冲区空中断请求或使用SPTEF标志处理发送缓冲区空中断。要使用发送缓冲区空中断，请将SPCR中的SPTIE位设置为1。如果禁用SPI功能（SPCR.SPE位为0），请将SPTIE位设置为0。

当串行传输结束且接收缓冲区已满（SPRF标志为1）时，SPI不会将数据从移位寄存器复制到接收缓冲区，它会检测到溢出错误（参见第38.3.8节，错误检测）。为防止接收数据溢出错误，请在下一次串行传输结束前使用接收缓冲区满中断请求读取接收数据。要使用SPI接收缓冲区满中断，请将SPCR.SPRIE位设置为1。

发送和接收中断或相关的IELSRn.IR标志（其中n是中断向量号）在
ICU可用于确认发送和接收缓冲区的状态。

类似地，SPTEF和SPRF标志可用于确认发送和接收缓冲区的状态。有关中断向量编号，请参见第14节，中断控制器单元(ICU)。

38.3.8 错误检测

在正常的SPI串行传输中，写入到SPDRSPDR_HA的发送缓冲区的数据被发送，接收到的数据可以从SPDRSPDR_HA的接收缓冲区中读取。在某些情况下，访问SPDRSPDR_HA时可能会执行非正常传输，具体取决于发送或接收缓冲区的状态或串行传输开始或结束时SPI的状态。

如果发生非正常传输操作，SPI会将事件检测为欠载错误、溢出错误、奇偶校验错误或模式故障错误。表38.8列出了非正常传输操作和SPI错误检测功能之间的关系。

Table 38.8 非正常传输操作与SPI错误检测的关系

Operation	发生条件	SPI操作	错误检测
1	SPDRSPDR_HA在发送缓冲区已满时写入。	保留发送缓冲区的内容 缺少写入数据。	None
2	SPDRSPDR_HA在接收缓冲区为空时读取。	输出接收缓冲区的内容和先前接收的数据。	None
3	当SPI无法传输数据时，串行传输在从模式下启动。	暂停串行传输 缺少发送和接收数据 停止驱动MISOA输出信号 禁用SPI功能。	Underrun error
4	当接收缓冲区已满时，串行传输终止。	保留接收缓冲区的内容 缺少接收数据。	溢出错误
5	在启用奇偶校验功能的情况下执行全双工同步串行通信时收到错误的奇偶校验位。	断言奇偶校验错误标志。	奇偶校验错误
6	当串行传输在多主模式下空闲时，SSLn0输入信号被置位。	停止驱动RSPCKn、MOSIn、SSLn1到SSLn3输出信号 禁用SPI功能。	模式故障错误
7	SSLn0输入信号在多主机模式下的串行传输期间被置位。	暂停串行传输 缺少发送和接收数据 停止驱动RSPCKn、MOSIn、SSLn1到SSLn3输出信号 禁用SPI功能。	模式故障错误
8	SSLn0输入信号在从模式下的串行传输期间被否定。	暂停串行传输 缺少发送和接收数据 停止驱动MIOn输出信号 禁用SPI功能。	模式故障错误

在表38.8中描述的操作1中，SPI未检测到错误。为了防止写入过程中的数据遗漏SPDRSPDR_HA，对SPDRSPDR_HA的写操作必须使用发送缓冲区空中断执行

request (when the SPSR.SPTEF flag is 1).

Similarly, the SPI does not detect an error in operation 2. To prevent extraneous data from being read, SPDR/SPDR_HA read operations must be executed with an SPI receive buffer full interrupt request (when the SPSR.SPRF flag is 1).

For the other errors in the figure, see the following sections:

- Underrun error (operation 3): section 38.3.8.4, Underrun errors
- Overrun error (operation 4): section 38.3.8.1, Overrun errors
- Parity error (operation 5): section 38.3.8.2, Parity errors
- Mode fault error (operations 6 to 8): section 38.3.8.3, Mode fault errors.

For the transmit and receive interrupts, see section 38.3.7, Transmit Buffer Empty and Receive Buffer Full Interrupts.

38.3.8.1 Overrun errors

If a serial transfer ends when the receive buffer of SPDR/SPDR_HA is full, the SPI detects an overrun error and sets the SPSR.OVRF flag to 1. When the OVRF flag is 1, the SPI does not copy data from the shift register to the receive buffer, so the data prior to the error occurrence is retained in the receive buffer. To set the OVRF flag to 0, write 0 to the OVRF flag after the CPU reads SPSR with the OVRF flag set to 1.

Figure 38.28 shows an example of operation of the OVRF and SPRF flags. The SPSR and SPDR_HA accesses shown in the figure indicate the condition of access to the register, where W denotes a write cycle and R a read cycle. In this example, the SPI performs an 8-bit serial transfer when SPCMDm.CPHA bit is 1 and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, indicating the number of transferred bits.

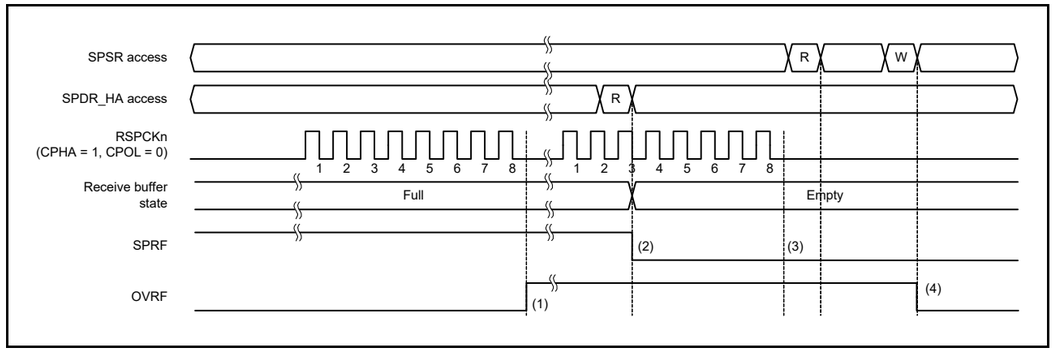

Figure 38.28 Operation example of the OVRF and SPRF flags

The operation of the flags at times (1) to (4) in the figure is as follows:

1. If a serial transfer terminates with the SPRF flag set to 1 (receive buffer full), the SPI detects an overrun error, and sets the OVRF flag to 1. The SPI does not copy the data in the shift register to the receive buffer. Even when the SPPE bit is 1, parity errors are not detected. In master mode, the SPI copies the value of the SPCMDm pointer to the SPSSR.SPECM[2:0] bits.
2. When SPDR_HA is read, the SPI outputs the data in the receive buffer. The SPRF flag is then set to 0. The receive buffer becoming empty does not set the OVRF flag to 0.
3. If the serial transfer ends with the OVRF flag set to 1 (overrun error occurred), the SPI does not copy data in the shift register to the receive buffer (the SPRF flag does not set to 1). A receive buffer full interrupt is not generated. Even when the SPPE bit is 1, parity errors are not detected. In master mode, the SPI does not update the SPSSR.SPECM[2:0] bits. In an overrun error state when the SPI does not copy the received data from the shift register to the receive buffer, on termination of the serial transfer, the SPI determines that the shift register is empty. This enables data transfer from the transmit buffer to the shift register.
4. If 0 is written to the OVRF flag after SPSR is read when the OVRF flag is 1, the OVRF flag clears to 0.

请求（当SPSR.SPTEF标志为1时）。

同样，SPI不会检测到操作2中的错误。为防止读取无关数据，必须使用SPI接收缓冲区满中断请求（当SPSR.SPRF标志为1时）执行SPDRSPDR_HA读取操作。

对于图中的其他错误，请参见以下部分：

- 欠载错误（操作3）：第38.3.8.4节，欠载错误
- 溢出错误（操作4）：第38.3.8.1节，溢出错误
- 奇偶校验错误（操作5）：第38.3.8.2节，奇偶校验错误
- 模式故障错误（操作6到8）：第38.3.8.3节，模式故障错误。

对于发送和接收中断，请参见第38.3.7节，发送缓冲区空和接收缓冲区满中断。

38.3.8.1 溢出错误

如果串行传输在SPDRSPDR_HA的接收缓冲区已满时结束，则SPI检测到溢出错误并将SPSR.OVRF标志设置为1。当OVRF标志为1时，SPI不会将数据从移位寄存器复制到接收缓冲区，因此错误发生之前的数据保留在接收缓冲区中。要将OVRF标志设置为0，请在CPU读取OVRF标志设置为1的SPSR后将0写入OVRF标志。

图38.28显示了OVRF和SPRF标志的操作示例。图中所示的SPSR和SPDR_HA访问表示访问寄存器的条件，其中W表示写周期，R表示读周期。在本例中，当SPCMDm.CPHA位为1且SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形中为RSPCKn给出的数字表示RSPCK周期数，表示传输的位数.

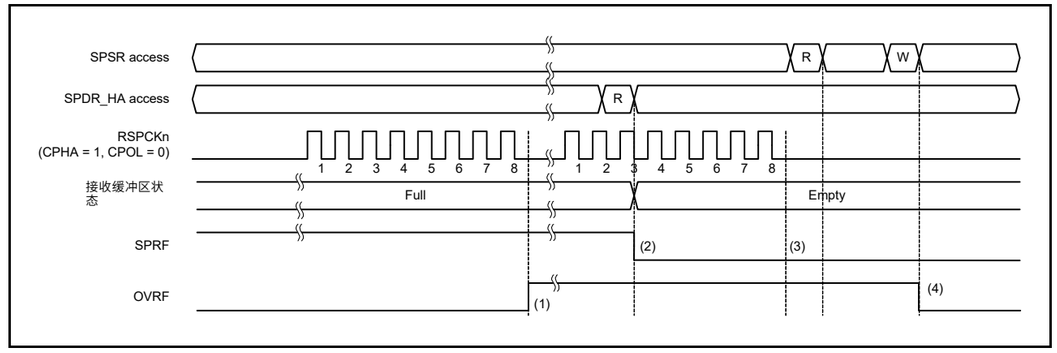

Figure 38.28 OVRF和SPRF标志的操作示例

图中（1）到（4）时刻flags的操作如下：

1. 如果串行传输终止且SPRF标志设置为1（接收缓冲区已满），则SPI检测到溢出错误，并将OVRF标志设置为1。SPI不会将移位寄存器中的数据复制到接收缓冲区。即使SPPE位为1，也不会检测到奇偶校验错误。在主机模式下，SPI将SPMDm指针的值复制到

   SPSSR.SPECM[2:0] bits.
2. 当读取SPDR_HA时，SPI输出接收缓冲区中的数据。然后SPRF标志设置为0。接收缓冲区变空不会将OVRF标志设置为0。
3. 如果串行传输结束时OVRF标志设置为1（发生溢出错误），则SPI不会将移位寄存器中的数据复制到接收缓冲区（SPRF标志不设置为1）。不产生接收缓冲区满中断。即使SPPE位为1，也不会检测到奇偶校验错误。在主模式下，SPI不更新

   SPSSR.SPECM[2:0]位。在SPI未将接收到的数据从移位寄存器复制到接收缓冲区的溢出错误状态下，在串行传输终止时，SPI确定移位寄存器为空。这使数据能够从发送缓冲器传输到移位寄存器。
4. 如果在OVRF标志为1时读取SPSR后将0写入OVRF标志，则OVRF标志清除为0。

The occurrence of an overrun can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. When executing a serial transfer, you must ensure that overrun errors are detected early, for example by reading SPSR immediately after SPDR_HA is read. In master mode, the value of the SPCMDm pointer at the error occurrence can be checked by reading the SPSSR.SPECM[2:0] bits.

If an overrun error occurs and the OVRF flag sets to 1, normal reception operations cannot be performed until the OVRF flag is cleared to 0.

When the RSPCK auto-stop function is enabled in master mode, an overrun error does not occur. Figure 38.29 and Figure 38.30 show the clock stop waveform when a serial transfer continues while the receive buffer is full in master mode.

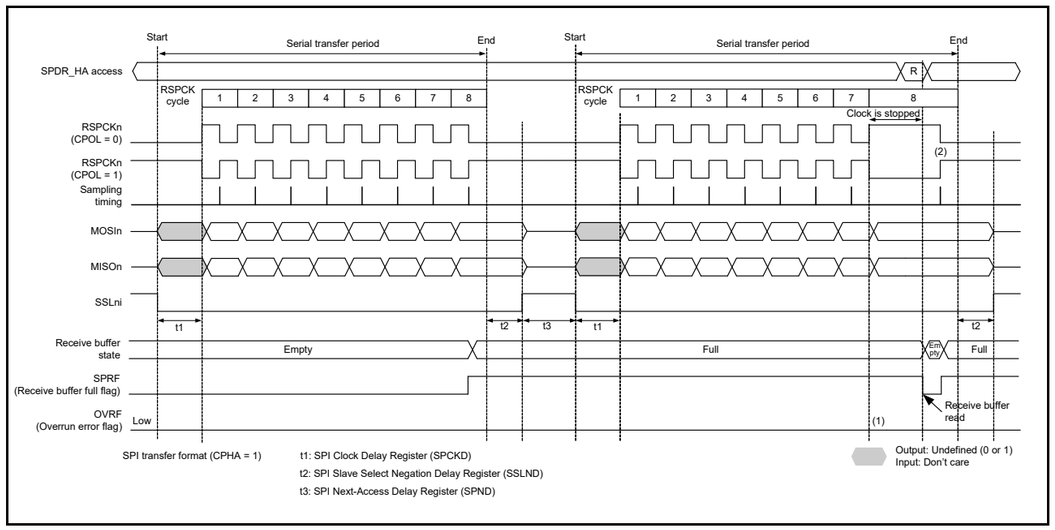

Figure 38.29 Clock stop waveform when serial transfer continues while receive buffer is full in master mode (CPHA = 1)

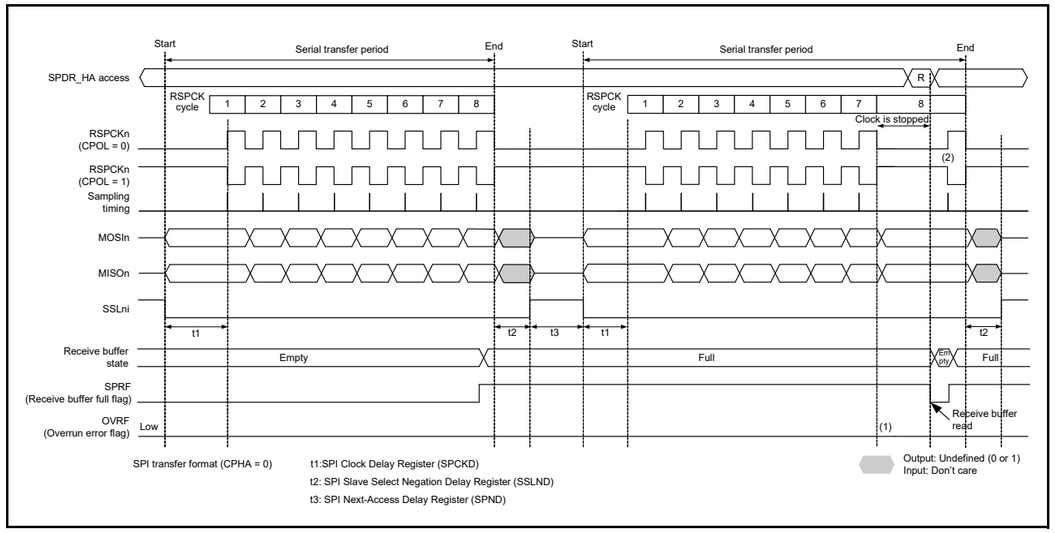

Figure 38.30 Clock stop waveform when serial transfer continues while receive buffer is full in master mode (CPHA = 0)

溢出的发生可以通过读取SPSR或使用SPI错误中断和读取来检查SPSR。执行串行传输时，必须确保及早检测到溢出错误，例如在读取SPDR_HA后立即读取SPSR。在主模式下，可以通过读取SPSSR.SPECM[2:0]位来检查发生错误时的SPCMDm指针的值。

如果发生溢出错误并且OVRF标志设置为1，则在OVRF标志被清除为0之前无法执行正常接收操作。

在主机模式下启用RSPCK自动停止功能时，不会发生溢出错误。图38.29和图38.30显示了在主机模式下接收缓冲器满时串行传输继续时的时钟停止波形。

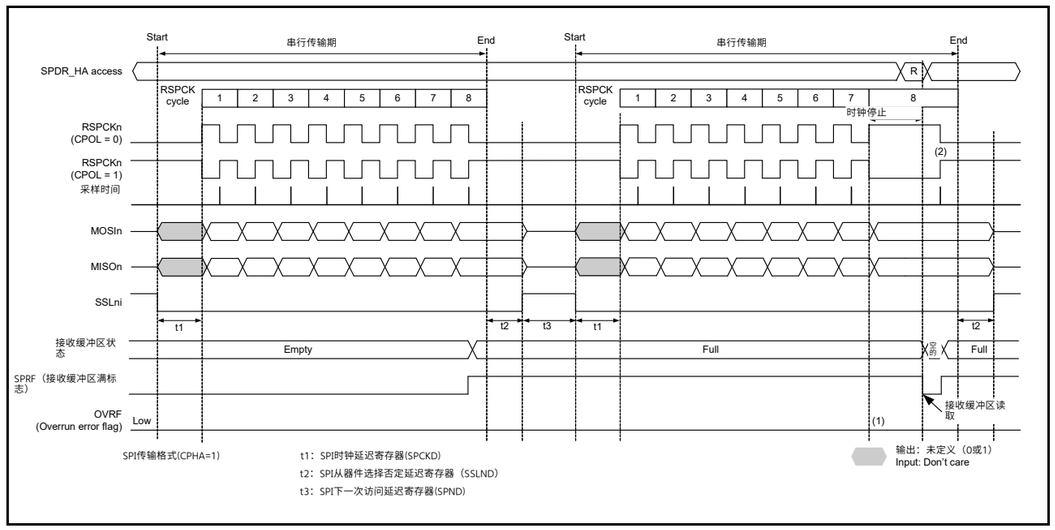

Figure 38.29 主机模式下接收缓冲器满时串行传输继续时的时钟停止波形(CPHA=1)

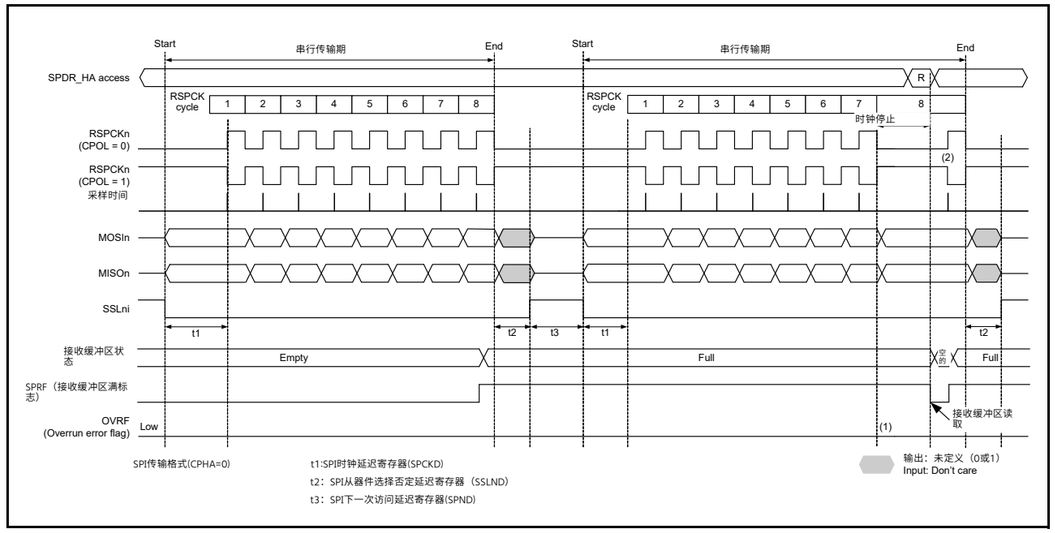

Figure 38.30 主机模式下接收缓冲器满时串行传输继续时的时钟停止波形(CPHA=0)

The operation of the flags at times (1) and (2) in the figure is as follows:

1. When the receive buffer is full, an overrun error does not occur because the RSPCK clock is stopped.
2. If SPDR_HA is read while the clock is stopped, data in the receive buffer can be read. The RSPCK clock restarts after reading the receive buffer (after the SPSR.SPRF flag clears to 0).

38.3.8.2 Parity errors

When full-duplex synchronous serial communication is performed with the SPCR.TXMD bit set to 0 and the SPCR2.SPPE bit set to 1, the SPI checks for parity errors when serial transfer ends. On detecting a parity error in the received data, the SPI sets the SPSR.PERF flag to 1. Because the SPI does not copy data in the shift register to the receive buffer when the SPSR.OVRF flag sets to 1, parity error detection is not performed for the received data. To set the PERF flag to 0, write 0 to the PERF flag after the SPSR register is read with the PERF flag set to 1.

Figure 38.31 shows an example of operation of the OVRF and PERF flags. The SPSR access shown in Figure 38.31 indicates the condition of access to the register, where W denotes a write cycle and R a read cycle. In this example, full-duplex synchronous serial communication is performed while the SPCR.TXMD bit is 0 and the SPCR2.SPPE bit is 1. The SPI performs an 8-bit serial transfer when SPCMDm.CPHA bit is 1 and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, meaning the number of transferred bits.

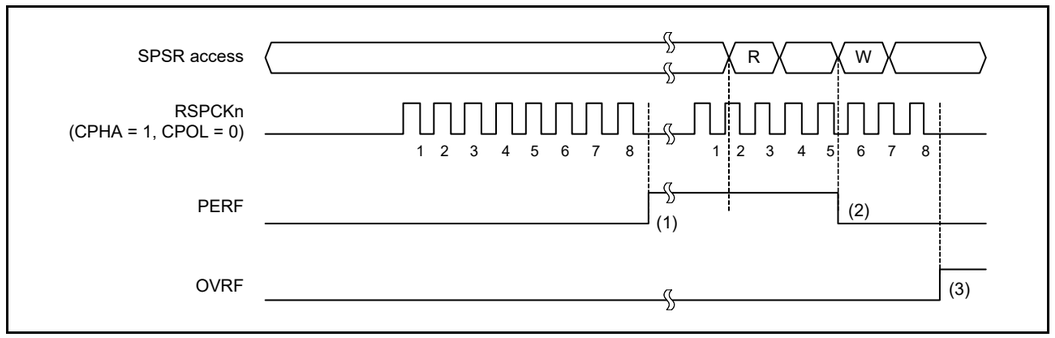

Figure 38.31 Operation example of the PERF flag

The operation of the flags at times (1) to (3) in the figure is as follows:

1. If a serial transfer terminates with the SPI not detecting an overrun error, the SPI copies the data in the shift register to the receive buffer. The SPI checks the received data at this timing and sets the PERF flag to 1 if a parity error is detected. In master mode, the SPI copies the value of the SPCMDm pointer to the SPSSR.SPECM[2:0] bits.
2. If 0 is written to the PERF flag after the SPSR register is read when the PERF flag is 1, the PERF flag clears to 0.
3. When the SPI detects an overrun error and serial transfer is terminated, the data in the shift register is not copied to the receive buffer. The SPI does not perform parity error detection at this time.

Parity errors can be checked for by either reading the SPSR register or using an SPI error interrupt and reading the SPSR register. When executing a serial transfer, such checks are required to ensure early detection of parity errors. When the SPI is used in master mode, the pointer value to the SPCMDm register at the occurrence of the error can be checked by reading the SPSSR.SPECM[2:0] bits.

38.3.8.3 Mode fault errors

The SPI operates in multi-master mode when the SPCR.MSTR bit is 1, the SPCR.SPMS bit is 0, and the SPCR.MODFEN bit is 1. If the active level is input for the SSLn0 input signal of the SPI in multi-master mode, the SPI detects a mode fault error regardless of the status of the serial transfer, and sets the SPSR.MODF flag to 1. On detecting the mode fault error, the SPI copies the value of the SPCMDm pointer to the SPSSR.SPECM[2:0] bits. The active level of the SSLn0 signal is determined by the SSLP.SSL0P bit.

When the MSTR bit is 0, the SPI operates in slave mode. The SPI detects a mode fault error if the MODFEN bit of the SPI in slave mode is 1, and the SPMS bit is 0, and if the SSLn0 input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched).

图中（1）和（2）时刻flags的操作如下：

1. 当接收缓冲器已满时，不会发生溢出错误，因为RSPCK时钟已停止。
2. 如果在时钟停止时读取SPDR_HA，则可以读取接收缓冲区中的数据。RSPCK时钟在读取接收缓冲区后重新启动（在SPSR.SPRF标志清除为0后）。

38.3.8.2 奇偶校验错误

当SPCR.TXMD位设置为0且
SPCR2.SPPE位设置为1，SPI在串行传输结束时检查奇偶校验错误。在接收到的数据中检测到奇偶校验错误时，SPI将SPSR.PERF标志设置为1。因为当SPSR.OVRF标志设置为1时，SPI不会将移位寄存器中的数据复制到接收缓冲区，所以奇偶校验错误检测是不为接收到的数据执行。要将PERF标志设置为0，请在读取SPSR寄存器并将PERF标志设置为1后将0写入PERF标志。

图38.31显示了OVRF和PERF标志的操作示例。图38.31所示的SPSR访问表示访问寄存器的条件，其中W表示写周期，R表示读周期。在本例中，当SPCR.TXMD位为0且SPCR2.SPPE位为1时执行全双工同步串行通信。当SPCMDm.CPHA位为1且SPCMDm.CPOL位为1时，SPI执行8位串行传输0.波形中为RSPCKn给出的数字表示RSPCK周期数，即传输的位数。

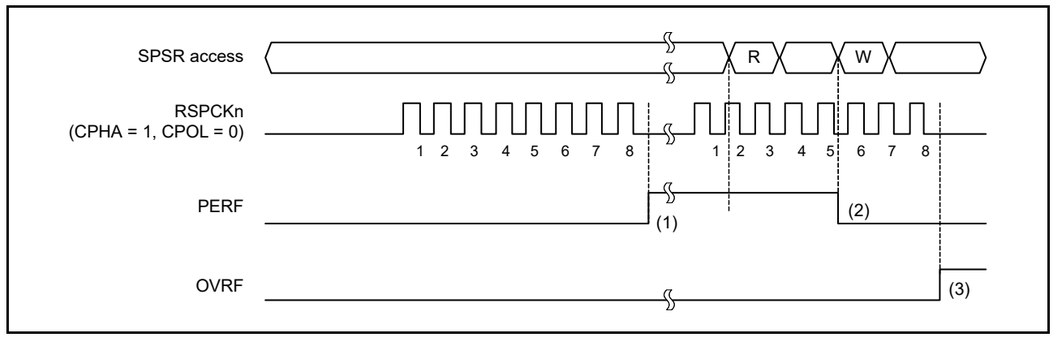

Figure 38.31 PERF标志的操作示例

图中（1）到（3）时刻flags的操作如下：

1. 如果串行传输因SPI未检测到溢出错误而终止，则SPI将移位寄存器中的数据复制到接收缓冲区。SPI在此时检查接收到的数据，如果检测到奇偶校验错误，则将PERF标志设置为1。在主模式下，SPI将SPCMDm指针的值复制到SPSSR.SPECM[2:0]位。
2. 如果在PERF标志为1时读取SPSR寄存器后将0写入PERF标志，则PERF标志清除为0。
3. 当SPI检测到溢出错误并终止串行传输时，移位寄存器中的数据不会复制到接收缓冲区。此时SPI不执行奇偶校验错误检测。

可以通过读取SPSR寄存器或使用SPI错误中断并读取SPSR寄存器来检查奇偶校验错误。在执行串行传输时，需要进行此类检查以确保及早发现奇偶校验错误。当SPI用于主机模式时，可以通过读取SPSSR.SPECM[2:0]位来检查发生错误时指向SPCMDm寄存器的指针值。

38.3.8.3 模式故障错误

当SPCR.MSTR位为1、SPCR.SPMS位为0且
SPCR.MODFEN位为1。如果在多主机模式下为SPI的SSLn0输入信号输入有效电平，则无论串行传输的状态如何，SPI都会检测到模式故障错误，并设置SPSR.MODF标志为1.在检测到模式故障错误时，SPI将SPCMDm指针的值复制到SPSSR.SPECM[2:0]位。SSLn0信号的有效电平由SSLP.SSL0P位决定。

当MSTR位为0时，SPI工作在从机模式。如果从机模式下SPI的MODFEN位为1，SPMS位为0，并且在串行传输期间（从驱动有效数据开始开始到获取最终有效数据的时间）。

On detecting a mode fault error, the SPI stops the driving of output signals and clears the SPCR.SPE bit to 0 (see section 38.3.9, Initializing the SPI). For multi-master configuration, detection of a mode fault error is used to stop the driving of output signals and the SPI function, which allows the master to be released.

The occurrence of a mode fault error can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. SPSR polling is required for detecting mode fault errors if the SPI error interrupt is not used. When using the SPI in master mode, the value of the SPCMDm pointer at the error occurrence can be checked by reading the SPSSR.SPECM[2:0] bits.

When the MODF flag is 1, writing 1 to the SPE bit is ignored by the SPI. To enable the SPI function after the detection of a mode fault error, the MODF flag must be set to 0.

38.3.8.4 Underrun errors

When the serial transfer begins while the SPCR.MSTR bit is 0 (slave mode), SPCR.SPE bit is 1 and the transmission data not prepared, the SPI detects an underrun error. Then, SPI sets the SPSR.MODF and SPSR.UDRF flags to 1.

On detecting an underrun error, the SPI stops the driving of output signals and clears the SPCR.SPE bit to 0 (see section 38.3.9, Initializing the SPI).

The occurrence of an underrun error can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. SPSR polling is required for detecting underrun errors if the SPI error interrupt is not used.

When the MODF flag is 1, writing 1 to the SPE bit is ignored by the SPI. To enable the SPI function after the detection of an underrun error, the MODF flag must be cleared to 0.

38.3.9 Initializing the SPI

If 0 is written to the SPCR.SPE bit or the SPI sets the SPE bit to 0 because of the detection of a mode fault error or an underrun error, the SPI disables the SPI function and initializes some of the module functions. When a system reset is generated, the SPI initializes all of the module functions. This section describes initialization by clearing of the SPCR.SPE bit and by a system reset.

38.3.9.1 Initialization by clearing of the SPE bit

When the SPCR.SPE bit is set to 0, the SPI performs the following initialization:

- Suspends any serial transfer that is being executed
- Stops the driving of output signals (Hi-Z) in slave mode
- Initializes the internal state of the SPI
- Initializes the transmit buffer of the SPI (the SPSR.SPTEF flag sets to 1).

Initialization by clearing of the SPE bit does not initialize the control bits of the SPI. For this reason, the SPI can be started in the same transfer mode in use prior to initialization when the SPE bit is set to 1 again.

The SPSR.SPRF, SPSR.OVRF, SPSR.MODF, SPSR.PERF, and SPSR.UDRF flags are not initialized, and the value of the SPI Sequence Status Register (SPSSR) is not initialized. Therefore, even after the SPI is initialized, data from the receive buffer can be read to check the status of error occurrence during an SPI transfer.

The transmit buffer is initialized to an empty state (the SPSR.SPTEF flag sets to 1). Therefore, if the SPCR.SPTIE bit is set to 1 after SPI initialization, a transmit buffer empty interrupt is generated. To disable any transmit buffer empty interrupts when the SPI is initialized, write 0 to the SPTIE bit at the same time as writing 0 to the SPE bit.

38.3.9.2 System reset

An initialization by a system reset completely initializes the SPI by initializing all SPI control bits, status bits, and data registers, in addition to meeting the requirements described in section 38.3.9.1, Initialization by clearing of the SPE bit.

38.3.10 SPI Operation

38.3.10.1 Master mode operation

The only difference between single- and multi-master mode operation lies in mode fault error detection (see section

在检测到模式故障错误时，SPI会停止驱动输出信号并将SPCR.SPE位清除为0（请参阅第38.3.9节，初始化SPI）。对于多主机配置，检测到模式故障错误用于停止驱动输出信号和SPI功能，从而释放主机。

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查模式故障错误的发生。如果不使用SPI错误中断，则需要SPSR轮询来检测模式错误。在主模式下使用SPI时，可以通过读取SPSSR.SPECM[2:0]位来检查发生错误时SPCMDm指针的值。

当MODF标志为1时，向SPE位写入1会被SPI忽略。要在检测到模式故障错误后启用SPI功能，MODF标志必须设置为0。

38.3.8.4 Underrun errors

当SPCR.MSTR位为0（从模式）、SPCR.SPE位为1且未准备好传输数据时串行传输开始时，SPI检测到欠载错误。然后，SPI将SPSR.MODF和SPSR.UDRF标志设置为1。

检测到欠载错误时，SPI停止驱动输出信号并将SPCR.SPE位清零（请参见第38.3.9节，初始化SPI）。

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查欠载错误的发生。如果不使用SPI错误中断，则需要SPSR轮询来检测欠载错误。

当MODF标志为1时，向SPE位写入1会被SPI忽略。要在检测到欠载错误后启用SPI功能，必须将MODF标志清零。

38.3.9 初始化SPI

如果向SPCR.SPE位写入0或SPI由于检测到模式故障错误或欠载错误而将SPE位设置为0，则SPI将禁用SPI功能并初始化一些模块功能。当产生系统复位时，SPI初始化所有模块功能。本节介绍通过清除SPCR.SPE位和系统复位进行的初始化。

38.3.9.1 通过清除SPE位进行初始化

当SPCR.SPE位设置为0时，SPI执行以下初始化：

- 暂停任何正在执行的串行传输
- 在从模式下停止驱动输出信号(Hi-Z)
- 初始化SPI的内部状态
- 初始化SPI的发送缓冲区（SPSR.SPTEF标志设置为1）。

通过清除SPE位进行的初始化不会初始化SPI的控制位。因此，当SPE位再次设置为1时，SPI可以在初始化之前以相同的传输模式启动。

SPSR.SPRF、SPSR.OVRF、SPSR.MODF、SPSR.PERF和SPSR.UDRF标志未初始化，SPI序列状态寄存器(SPSSR)的值未初始化。因此，即使在SPI初始化之后，也可以从接收缓冲区读取数据，以检查SPI传输期间发生错误的状态。

发送缓冲区初始化为空状态（SPSR.SPTEF标志设置为1）。因此，如果SPCR.SPTIE位在SPI初始化后设置为1，则会产生发送缓冲区空中断。要在SPI初始化时禁用任何发送缓冲区空中断，请在向SPE位写入0的同时向SPTIE位写入0。

38.3.9.2 系统重置

除了满足第38.3.9.1节，通过清除SPE位进行的初始化中描述的要求之外，系统复位的初始化还通过初始化所有SPI控制位、状态位和数据寄存器来完全初始化SPI。

38.3.10 SPI操作

38.3.10.1 主模式操作

单主机模式和多主机模式操作之间的唯一区别在于模式故障错误检测（参见章节

38.3.8, Error Detection). The SPI does not detect mode fault errors in single master mode and does in multi-master mode. This section explains operations that are the same for single- and multi-master modes.

(1) Starting a serial transfer

The SPI updates the data in the transmit buffer (SPTX) when data is written to the SPI Data Register (SPDR/SPDR_HA) and the SPI transmit buffer is empty (data for the next transfer is not set and the SPSR.SPTEF flag is 1). When the shift register is empty after the number of frames set in the SPDCR.SPFC[1:0] bits are written to the SPDR/SPDR_HA, the SPI copies data from the transmit buffer to the shift register and starts serial transfer. On copying transmit data to the shift register, the SPI changes the status of the shift register to full. On termination of the serial transfer, it changes the status of the shift register to empty. The status of the shift register cannot be referenced.

The polarity of the SSLni output pins depends on the SSLP register settings. For details on the SPI transfer format, see section 38.3.5, Transfer Formats.

(2) Terminating a serial transfer

Regardless of the SPCMDm.CPHA bit setting, the SPI terminates the serial transfer after transmitting an RSPCKn edge corresponding to the final sampling timing. If free space is available in the receive buffer (SPRX) (the SPSR.SPRF flag is 0), on termination of the serial transfer, the SPI copies data from the shift register to the receive buffer of the SPDR/SPDR_HA register.

The final sampling timing varies depending on the bit length of transfer data. In master mode, the SPI data length depends on the SPCMDm.SPB[3:0] bit setting. The polarity of the SSLni output pin depends on the SSLP register settings. For details on the SPI transfer format, see section 38.3.5, Transfer Formats.

(3) Sequence control

The transfer format used in master mode is determined by the SPSCR, SPCMDm, SPBR, SPCKD, SSLND, and SPND registers.

The SPSCR register determines the sequence configuration for serial transfers that are executed by the SPI in master mode. The following Parameters are set in the SPCMDm register:

- SSLni pin output signal value
- MSB- or LSB-first
- Data length
- Some of the bit rate settings
- RSPCK polarity and phase
- Whether SPCKD is to be referenced
- Whether SSLND is to be referenced
- Whether SPND is to be referenced.

SPBR holds some of the bit rate settings, including SPCKD (SPI clock delay), SSLND (SSL negation delay), and SPND (next-access delay).

Based on the sequence length assigned in SPSCR, the SPI makes up a sequence comprised of a part or all of the SPCMDm register. The SPI contains a pointer to the SPCMDm register that makes up the sequence. The value of this pointer can be checked by reading the SPSSR.SPCP[2:0] bits. When the SPCR.SPE bit is set to 1 and the SPI function is enabled, the SPI loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. The SPI increments the pointer each time the next-access delay period for a data transfer ends. On completion of the serial transfer that corresponds to the final command in the sequence, the SPI sets the pointer to SPCMD0, and in this way the sequence is executed repeatedly.

38.3.8，错误检测）。SPI在单主模式下不检测模式故障错误，而在多主模式下检测。本节说明单主机模式和多主机模式的相同操作。

(1) 开始串行传输

当数据写入SPI数据寄存器(SPDRSPDR_HA)且SPI发送缓冲区为空（未设置下一次传输的数据且SPSR.SPTEF标志为1）时，SPI更新发送缓冲区(SPTX)中的数据.当SPDCR.SPFC[1:0]位中设置的帧数写入SPDRSPDR_HA后移位寄存器为空时，SPI将数据从发送缓冲区复制到移位寄存器并开始串行传输。在将发送数据复制到移位寄存器时，SPI将移位寄存器的状态更改为已满。在串行传输终止时，它将移位寄存器的状态更改为空。无法引用移位寄存器的状态。

SSLni输出引脚的极性取决于SSLP寄存器设置。有关SPI传输格式的详细信息，请参阅第38.3.5节，传输格式。

(2) 终止串行传输

无论SPMDm.CPHA位设置如何，SPI在发送对应于最终采样时序的RSPCKn边沿后终止串行传输。如果接收缓冲区(SPRX)中有可用空间（SPSR.SPRF标志为0），则在串行传输终止时，SPI将数据从移位寄存器复制到SPDRSPDR_HA寄存器的接收缓冲区。

最终的采样时序根据传输数据的位长而变化。在主机模式下，SPI数据长度取决于SPMDm.SPB[3:0]位设置。SSLni输出引脚的极性取决于SSLP寄存器设置。有关SPI传输格式的详细信息，请参阅第38.3.5节，传输格式。

(3) 顺序控制

主机模式中使用的传输格式由SPSCR、SPCMDm、SPBR、SPCKD、SSLND和SPND寄存器确定。

SPSCR寄存器确定由SPI在主模式下执行的串行传输的序列配置。在SPMDm寄存器中设置以下参数：

- SSLni管脚输出信号值
- MSB- or LSB-first
- 数据长度
- 一些比特率设置
- RSPCK极性和相位
- 是否要引用SPCKD
- 是否要引用SSLND
- 是否要引用SPND。

SPBR保存一些比特率设置，包括SPCKD（SPI时钟延迟）、SSLND（SSL否定延迟）和SPND（下一次访问延迟）。

基于在SPSCR中分配的序列长度，SPI组成一个序列，由部分或全部SPMDm寄存器。SPI包含一个指向构成序列的SPCMDm寄存器的指针。该指针的值可以通过读取SPSSR.SPCP[2:0]位来检查。当SPCR.SPE位设置为1且SPI功能使能时，SPI加载指向SPCMD0中命令的指针，并在串行传输开始时将SPCMD0设置合并到传输格式中。每次数据传输的下一个访问延迟周期结束时，SPI都会递增指针。在完成对应于序列中最后一个命令的串行传输后，SPI将指针设置为SPCMD0，并以此方式重复执行序列。

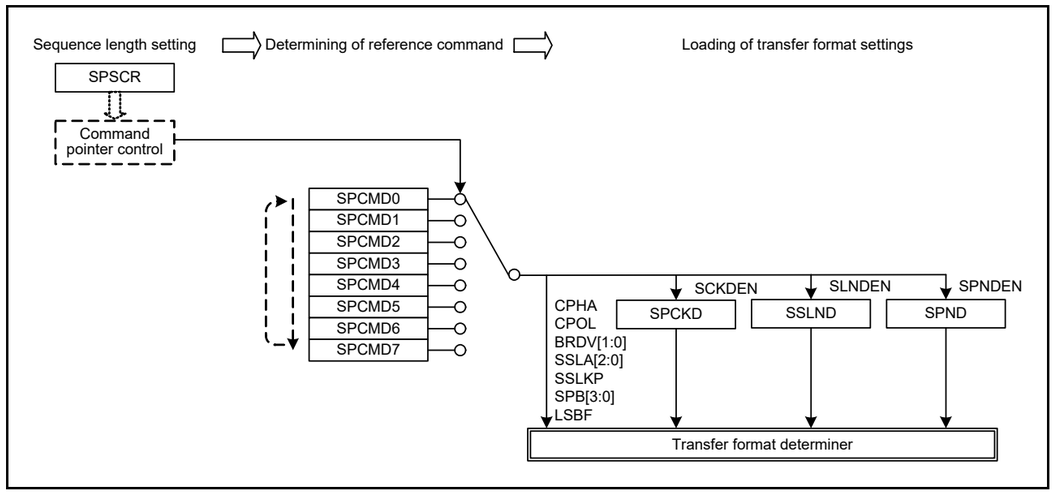

Figure 38.32 Procedure for determining the form of a serial transfer in master mode

In this section, a frame is the combination of the data in SPDR/SPDR_HA and the settings in SPCMDm.

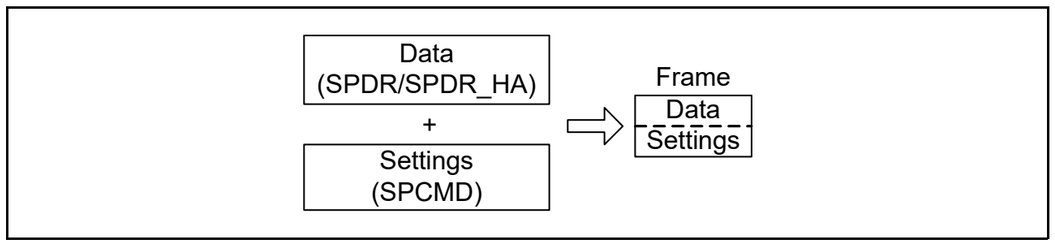

Figure 38.33 Conceptual diagram of frames

Figure 38.34 shows the correspondence between the commands and the transmit and receive buffers in the sequence of operations specified by the settings in Table 38.4.

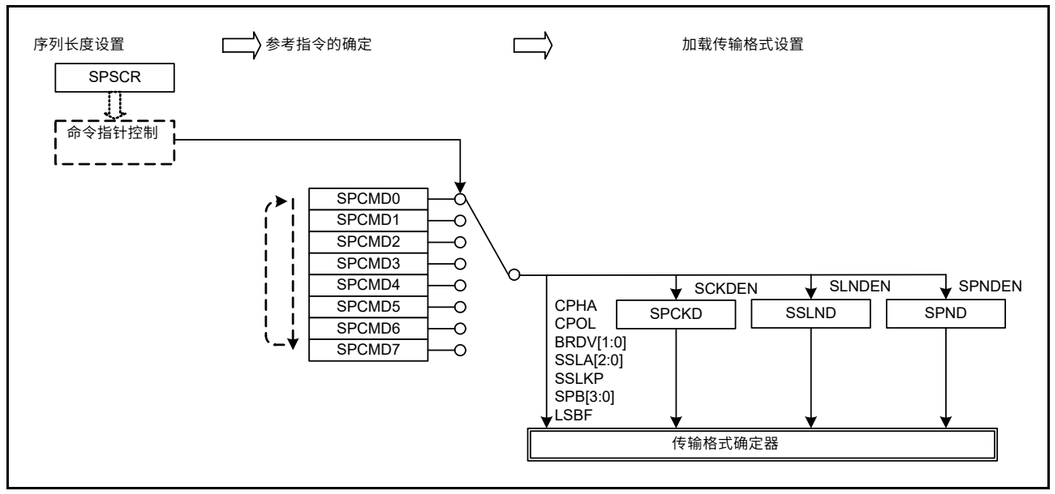

Figure 38.32 确定主模式下串行传输形式的过程

在本节中，帧是SPDRSPDR_HA中的数据和SPMDm中的设置的组合。

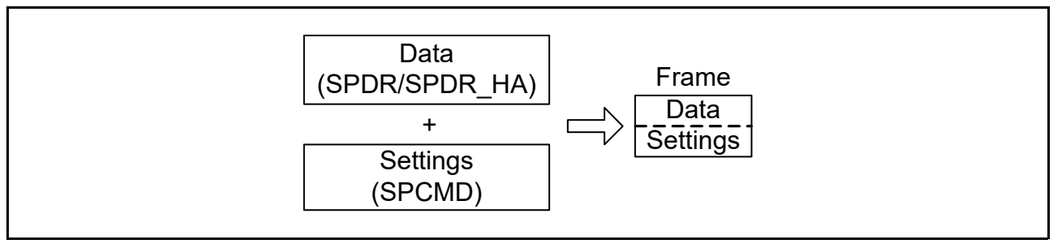

Figure 38.33 框架的概念图

图38.34显示了在表38.4中的设置指定的操作序列中命令与发送和接收缓冲区之间的对应关系。

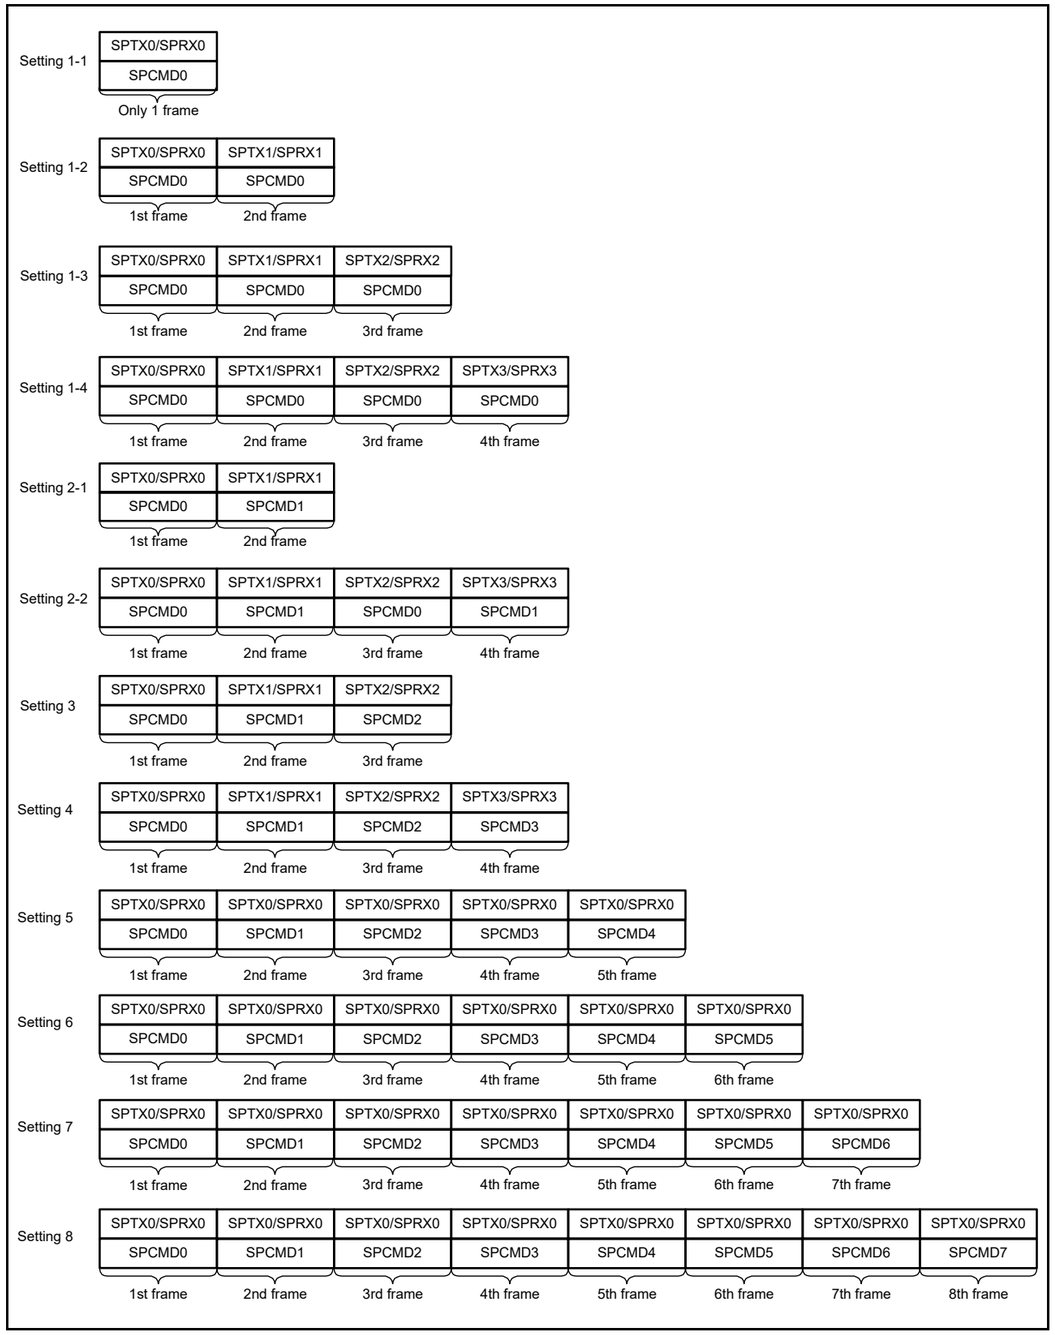

Figure 38.34 Correspondence between SPI Command Register and transmit and receive buffers in sequence operations

(4) Burst transfers

If the SPCMDm.SSLKP bit that the SPI references during the current serial transfer is 1, the SPI maintains the SSLni

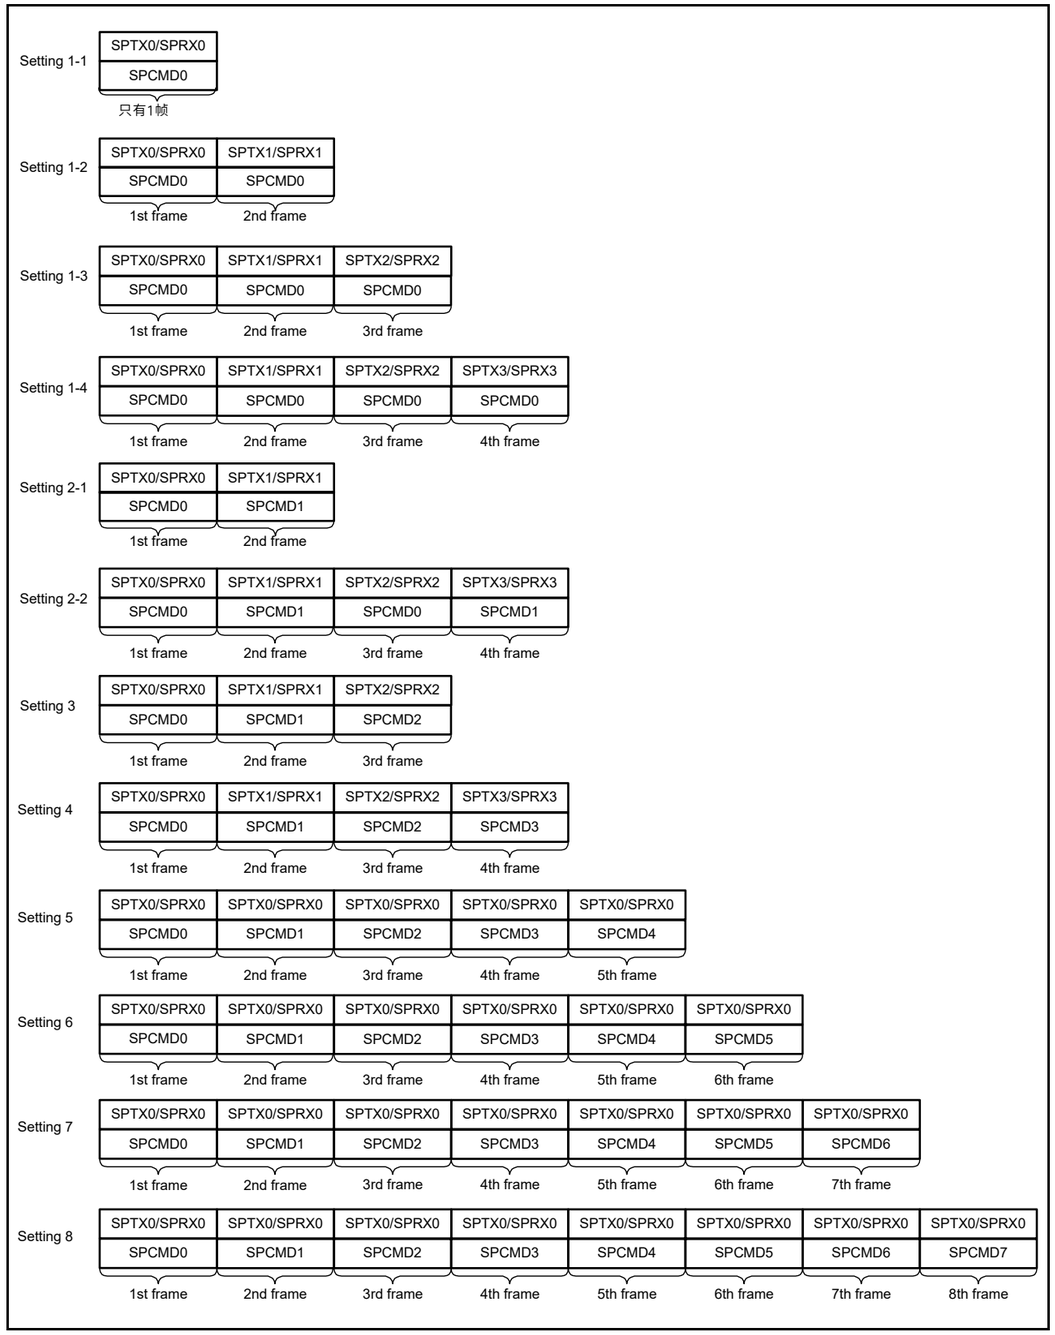

Figure 38.34 顺序操作中SPI命令寄存器与发送接收缓冲区的对应关系

(4) 突发传输

如果SPI在当前串行传输期间引用的SPCMDm.SSLKP位为1，则SPI维护SSLni

signal level during the serial transfer until the beginning of the SSLni signal assertion for the next serial transfer. If the SSLni signal level for the next serial transfer is the same as the SSLni signal level for the current serial transfer, the SPI can execute continuous serial transfers while keeping the SSLni signal assertion status (burst transfer).

Figure 38.35 shows an example of an SSLni signal operation for a burst transfer that is implemented using the SPCMD0 and SPCMD1 register settings. This section describes SPI operations (1) to (7) shown in Figure 38.35.

Note: The polarity of the SSLni output signal depends on the SSLP register settings.

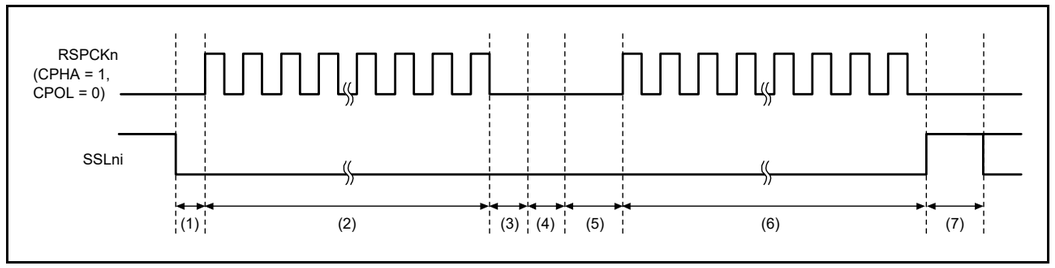

Figure 38.35 Example of burst transfer operation using the SSLKP bit

The SPI operation at times (1) to (7) in the figure is as follows:

1. Based on the SPCMD0 settings, the SPI asserts the SSLni signal and inserts RSPCK delays.
2. The SPI executes serial transfers in accordance with the SPCMD0 settings.
3. The SPI inserts an SSL negation delay.
4. Because the SPCMD0.SSLKP bit is 1, the SPI keeps the SSLni signal value specified in SPCMD0. This period is sustained at a minimum for a period equal to the next-access delay in SPCMD0. If the shift register is empty after the passage of the minimum period, this period is sustained until the transmit data is stored in the shift register for the next transfer.
5. Based on the SPCMD1 settings, the SPI asserts the SSLni signal and inserts RSPCK delays.
6. The SPI executes serial transfers in accordance with the SPCMD1 settings.
7. Because the SPCMD1.SSLKP bit is 0, the SPI negates the SSLni signal. In addition, a next-access delay is inserted in accordance with SPCMD1.

If the SSLni signal output settings in the SPCMDm register where 1 is assigned to the SSLKP bit are different from the SSLni signal output settings in the SPCMDm register to be used in the next transfer, the SPI switches the SSLni signal status to SSLni signal assertion as shown in (5) in Figure 38.35. This corresponds to the command for the next transfer.

Note: If such an SSLni signal switching occurs, the slaves that drive the MISOn signal compete, and collision of signal levels might occur.

The SPI in master mode references the SSLni signal operation within the module when the SSLKP bit is not used. When the SPCMDm.CPHA bit is 0, the SPI can accurately start serial transfers by using the SSLni signal assertion for the next transfer that is detected internally.

(5) RSPCK delay (t1)

The RSPCK delay value of the SPI in master mode depends on the SPCMDm.SCKDEN bit setting and the SPCKD register setting. The SPI determines the SPCMDm register to be referenced during a serial transfer by pointer control, and determines the RSPCK delay value by using the SPCMDm.SCKDEN bit and SPCKD, as listed in Table 38.9. For a definition of the RSPCK delay, see section 38.3.5, Transfer Formats.

Table 38.9 Relationship among the SCKDEN bit, SPCKD register, and RSPCK delay (1 of 2)

SPCMDm.SCKDEN bit	SPCKD.SCKDL[2:0] bits	RSPCK delay
0	000b to 111b	1 RSPCK

串行传输期间的信号电平，直到下一次串行传输的SSLni信号断言开始。如果下一次串行传输的SSLni信号电平与当前串行传输的SSLni信号电平相同，则SPI可以在保持SSLni信号断言状态（突发传输）的同时执行连续串行传输。

图38.35显示了使用SPCMD0和SPCMD1寄存器设置实现的突发传输的SSLni信号操作示例。本节介绍图38.35所示的SPI操作(1)至(7)。

Note: SSLni输出信号的极性取决于SSLP寄存器设置。

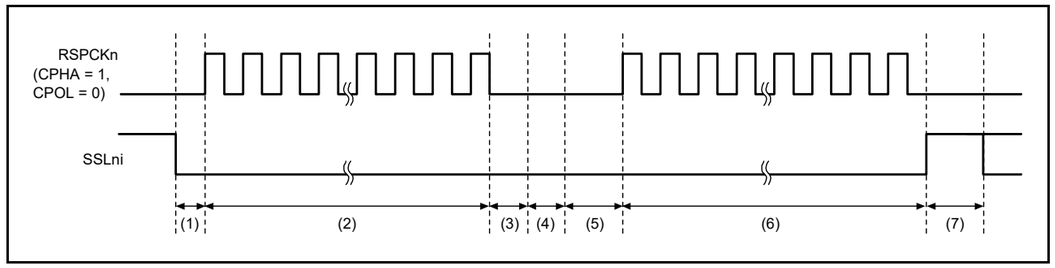

Figure 38.35 使用SSLKP位的突发传输操作示例

图中（1）到（7）时刻的SPI操作如下：

1. 基于SPCMD0设置，SPI断言SSLni信号并插入RSPCK延迟。
2. SPI根据SPMD0设置执行串行传输。
3. SPI插入SSL否定延迟。
4. 由于SPCMD0.SSLKP位为1，SPI保持SPCMD0中指定的SSLni信号值。该周期至少持续一段时间，等于SPMD0中的下一次访问延迟。如果在经过最小周期后移位寄存器为空，则该周期一直持续到发送数据存储在移位寄存器中以供下一次传输。
5. 基于SPCMD1设置，SPI断言SSLni信号并插入RSPCK延迟。
6. SPI根据SPMD1设置执行串行传输。
7. 因为SPCMD1.SSLKP位为0，SPI否定SSLni信号。此外，根据SPMD1插入下一个访问延迟。

如果SPCMDm寄存器中SSLKP位为1的SSLni信号输出设置与下次传输使用的SPCMDm寄存器中的SSLni信号输出设置不同，则SPI将SSLni信号状态切换为SSLni信号断言，如下所示如图38.35(5)所示。这对应于下一次传输的命令。

Note: 如果发生这种SSLni信号切换，驱动MISon信号的从机竞争，可能会发生信号电平冲突。

当不使用SSLKP位时，主模式下的SPI参考模块内的SSLni信号操作。当SPCMDm.CPHA位为0时，SPI可以通过使用SSLni信号断言来准确启动串行传输，以进行内部检测到的下一次传输。

(5) RSPCK delay (t1)

主机模式下SPI的RSPCK延迟值取决于SPMDm.SCKDEN位设置和SPCKD寄存器设置。SPI通过指针控制确定串行传输期间要引用的SPCMDm寄存器，并通过使用SPCMDm.SCKDEN位和SPCKD确定RSPCK延迟值，如表38.9中所列。有关RSPCK延迟的定义，请参阅第38.3.5节，传输格式。

Table 38.9 SCKDEN位、SPCKD寄存器和RSPCK延迟之间的关系（1of2）

SPCMDm.SCKDEN bit	SPCKD.SCKDL[2:0] bits	RSPCK delay
0	000b to 111b	1 RSPCK

Table 38.9 Relationship among the SCKDEN bit, SPCKD register, and RSPCK delay (2 of 2)

SPCMDm.SCKDEN bit	SPCKD.SCKDL[2:0] bits	RSPCK delay
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(6) SSL negation delay (t2)

The SSL negation delay value of the SPI in master mode depends on the SPCMDm.SLNDEN bit setting and the SSLND register setting. The SPI determines the SPCMDm register to be referenced by pointer control during a serial transfer, and determines the SSL negation delay by using the SPCMDm.SLNDEN bit and SSLND, as listed in Table 38.10. For a definition of the SSL negation delay, see section 38.3.5, Transfer Formats.

Table 38.10 Relationship among the SLNDEN bit, SSLND, and SSL negation delay

SPCMDm.SLNDEN bit	SSLND.SLNDL[2:0] bits	SSL negation delay
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(7) Next-access delay (t3)

The next-access delay value of the SPI in master mode depends on the SPCMDm.SPNDEN bit setting and the SPND register setting. The SPI determines the SPCMDm register to be referenced during serial transfer by pointer control, and determines the next-access delay during serial transfer by using the SPCMDm.SPNDEN bit and SPND, as listed in Table 38.11. For a definition of the next-access delay, see section 38.3.5, Transfer Formats.

Table 38.11 Relationship among the SPNDEN bit, SPND, and next-access delay

SPCMDm.SPNDEN bit	SPND.SPNDL[2:0] bits	Next-access delay
0	000b to 111b	1 RSPCK + 2 PCLKA
1	000b	1 RSPCK + 2 PCLKA
	001b	2 RSPCK + 2 PCLKA
	010b	3 RSPCK + 2 PCLKA
	011b	4 RSPCK + 2 PCLKA
	100b	5 RSPCK + 2 PCLKA
	101b	6 RSPCK + 2 PCLKA
	110b	7 RSPCK + 2 PCLKA
	111b	8 RSPCK + 2 PCLKA

(8) Initialization flow

Figure 38.36 shows an example of initialization flow for SPI operation when the SPI is used in master mode. For a

Table 38.9 SCKDEN位、SPCKD寄存器和RSPCK延迟之间的关系(2of2)

SPCMDm.SCKDEN bit	SPCKD.SCKDL[2:0] bits	RSPCK delay
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(6) SSL否定延迟(t2)

主模式下SPI的SSL否定延迟值取决于SPMDm.SLNDEN位设置和SSLND寄存器设置。SPI确定串行传输期间指针控制要引用的SPCMDm寄存器，并通过使用SPCMDm.SLNDEN位和SSLND确定SSL否定延迟，如表38.10中所列。有关SSL否定延迟的定义，请参阅第38.3.5节，传输格式。

Table 38.10 SLNDEN位、SSLND和SSL否定延迟之间的关系

SPCMDm.SLNDEN bit	SSLND.SLNDL[2:0] bits	SSL否定延迟
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(7) Next-access delay (t3)

主机模式下SPI的下一次访问延迟值取决于SPMDm.SPNDEN位设置和SPND寄存器设置。SPI通过指针控制确定串行传输过程中要引用的SPCMDm寄存器，并通过使用SPCMDm.SPNDEN位和SPND确定串行传输过程中的下一次访问延迟，如表38.11所示。有关下一次访问延迟的定义，请参阅第38.3.5节，传输格式。

Table 38.11 SPNDEN位、SPND和下一次访问延迟之间的关系

SPCMDm.SPNDEN bit	SPND.SPNDL[2:0] bits	Next-access delay
0	000b to 111b	1 RSPCK + 2 PCLKA
1	000b	1 RSPCK + 2 PCLKA
	001b	2 RSPCK + 2 PCLKA
	010b	3 RSPCK + 2 PCLKA
	011b	4 RSPCK + 2 PCLKA
	100b	5 RSPCK + 2 PCLKA
	101b	6 RSPCK + 2 PCLKA
	110b	7 RSPCK + 2 PCLKA
	111b	8 RSPCK + 2 PCLKA

(8) 初始化流程

图38.36显示了当SPI用于主机模式时SPI操作的初始化流程示例。为一个

description of how to set up the Interrupt Controller Unit (ICU), DMAC, and I/O ports, see the descriptions given in the individual blocks.

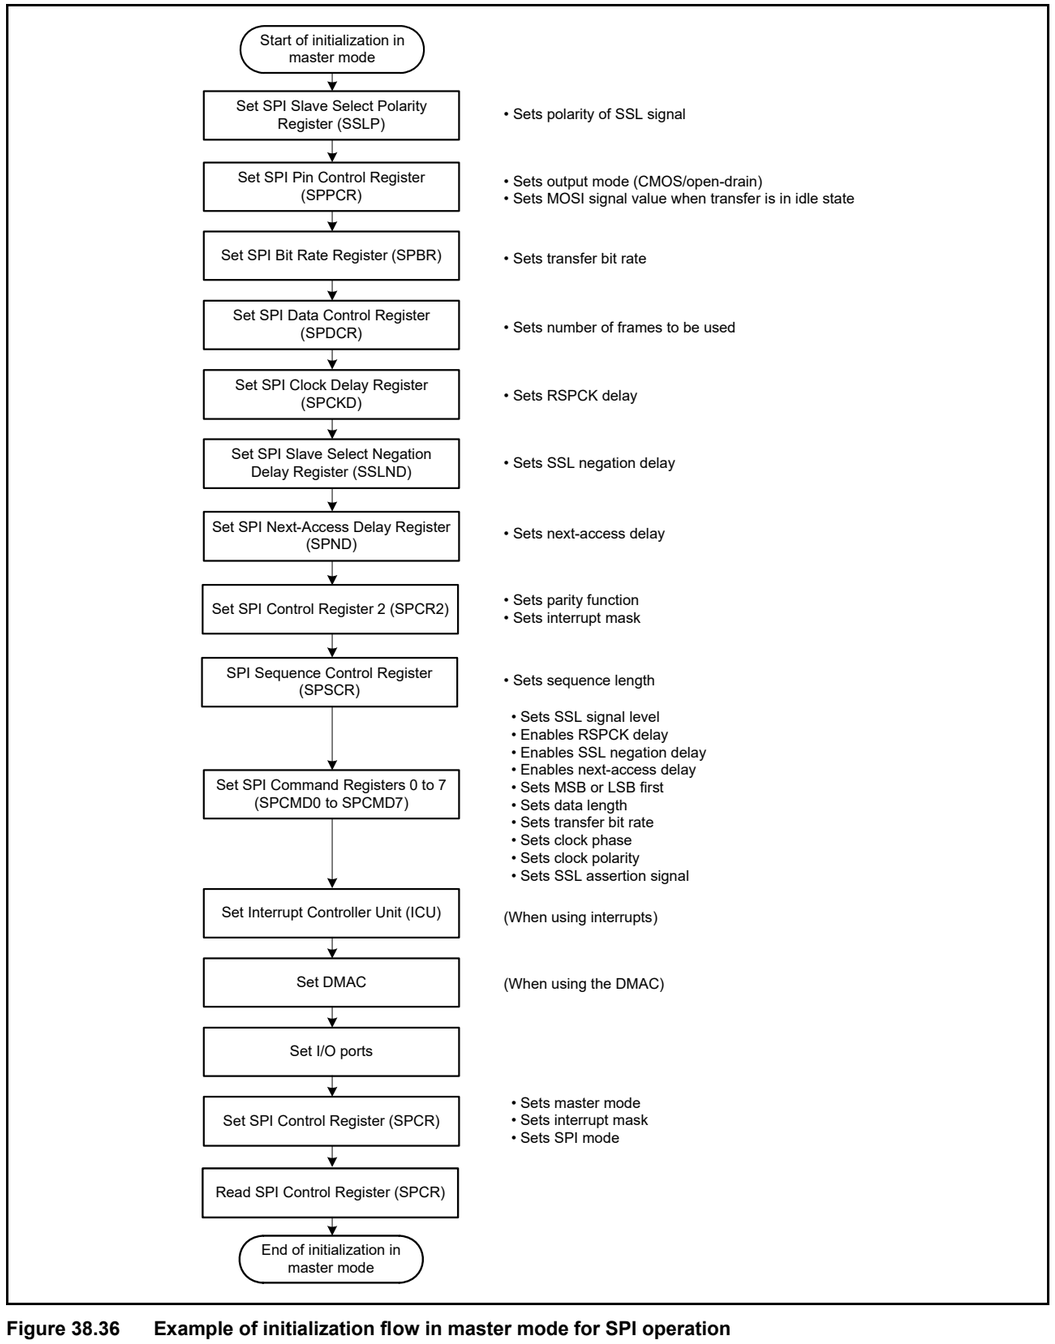

Figure 38.36 Example of initialization flow in master mode for SPI operation

(9) Software processing flow

Figure 38.37 to Figure 38.39 show examples of the software processing flow.

有关如何设置中断控制器单元(ICU)、DMAC和IO端口的说明，请参见各个块中给出的说明。

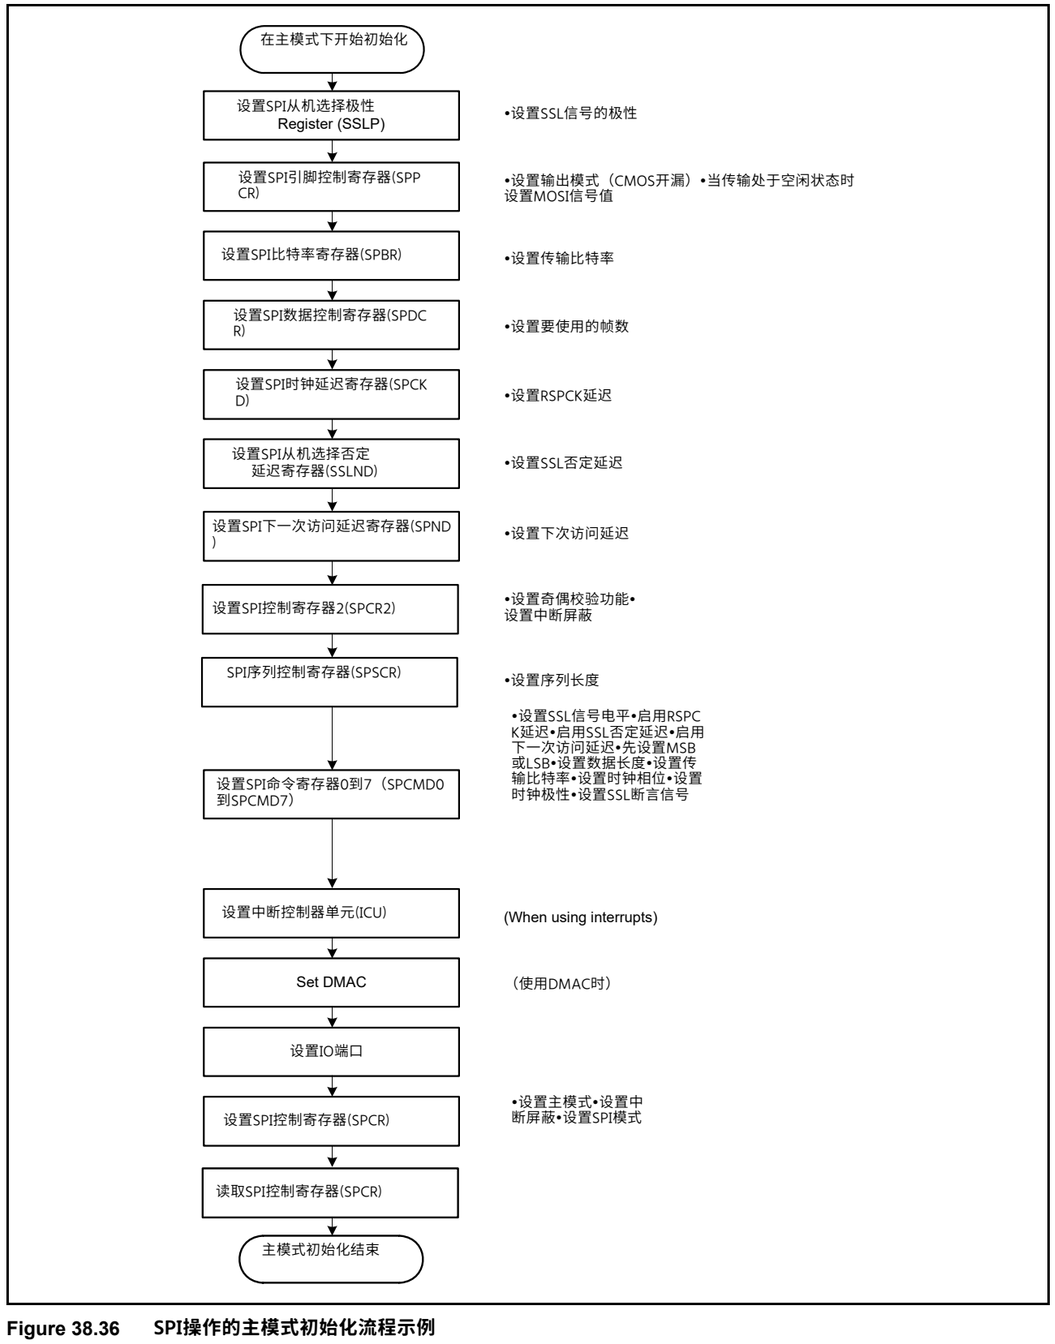

Figure 38.36 SPI操作的主模式初始化流程示例

(9) 软件处理流程

图38.37至图38.39显示了软件处理流程的示例。

(a) Transmit processing flow

When transmitting data and when the SPIi_SPII interrupt is enabled, the CPU is notified of the completion of data transmission after the last writing of data for transmission.

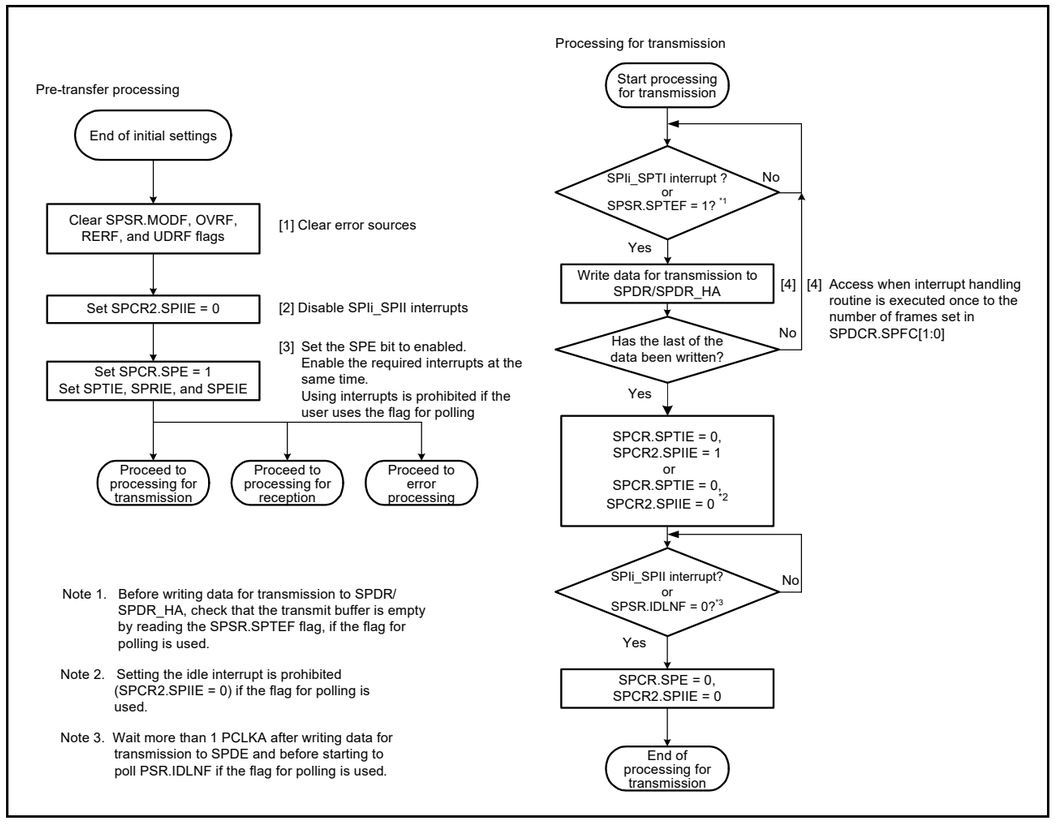

Figure 38.37 Transmission flow in master mode transmission

(b) Receive processing flow

The SPI does not handle receive-only operation, so processing for transmission is required.

(a) 传输处理流程

发送数据时和SPIi_SPII中断使能时，在最后一次写入发送数据后通知CPU数据发送完成。

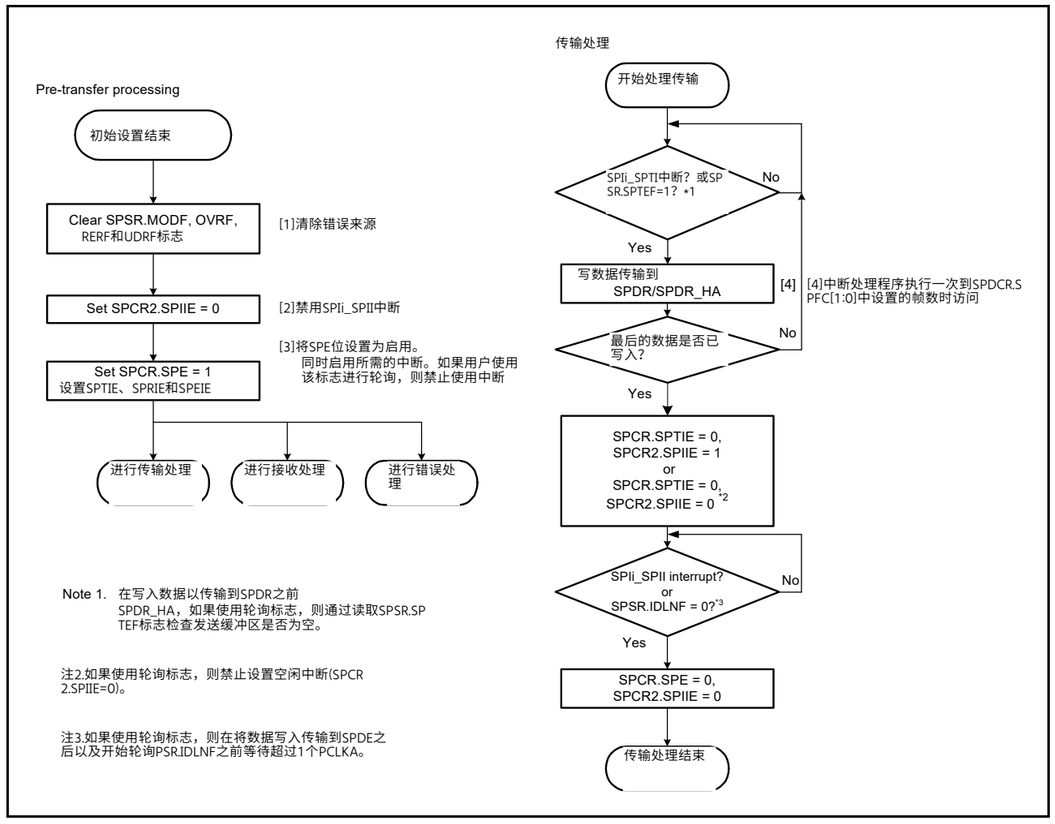

Figure 38.37 主模式传输中的传输流程

(b) 接收处理流程

SPI不处理只接收操作，因此需要处理传输。

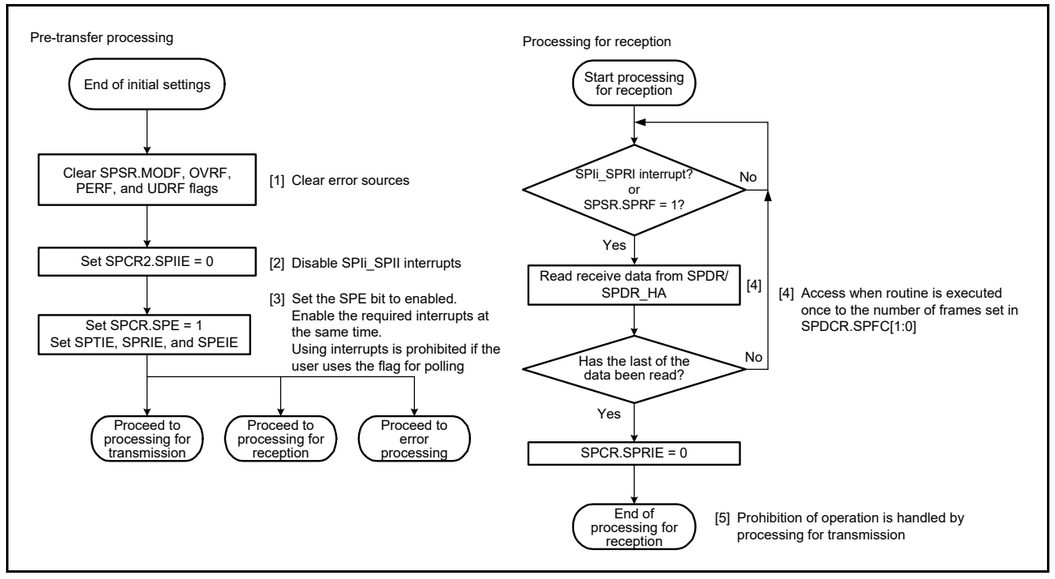

Figure 38.38 Reception flow in master mode

(c) Error processing flow

The SPI detects mode fault errors, underrun errors, overrun errors, and parity errors. When a mode fault error is generated, the SPCR.SPE bit is automatically cleared, stopping operations for transmission and reception. For errors from other sources, the SPCR.SPE bit is not cleared and operations for transmission and reception continue. Therefore, Renesas recommends clearing the SPCR.SPE bit to stop operations for errors other than mode fault errors. Not doing so leads to updating of the SPSSR.SPECM[2:0] bits.

When an error is detected by using an interrupt, clear the ICU.IELSRn.IR flag in the error processing routine. If this is not done, the ICU.IELSRn.IR flag might continue to indicate the SPIi_SPTI or SPIi_SPRI interrupt request. If the SPIi_SPRI interrupt request is indicated, read the receive buffer and initialize the sequencer in the SPI.

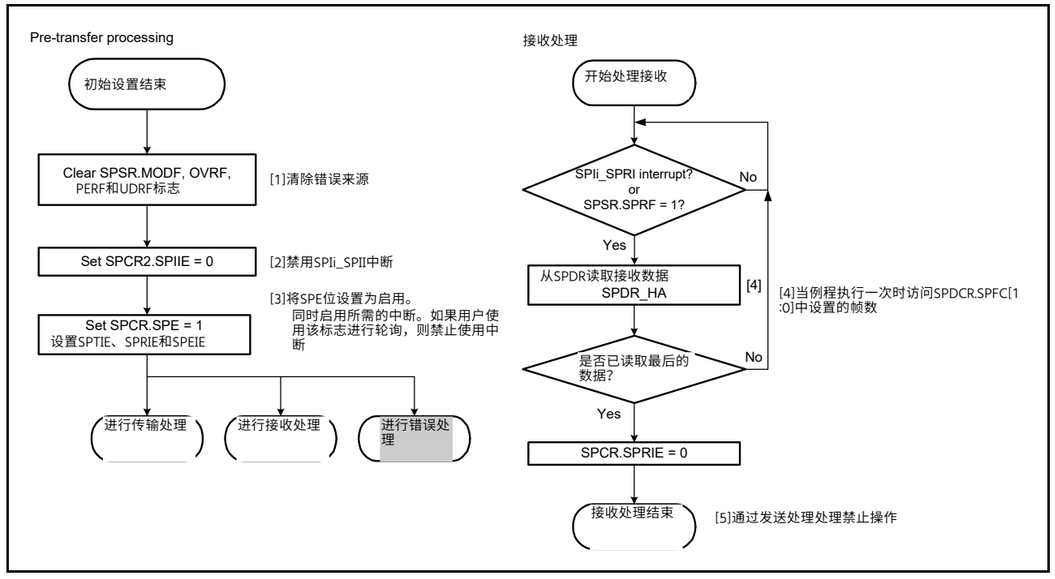

Figure 38.38 主模式下的接收流程

(c) 错误处理流程

SPI检测模式故障错误、欠载错误、溢出错误和奇偶校验错误。当产生模式故障错误时，SPCR.SPE位自动清零，停止发送和接收操作。对于其他来源的错误，SPCR.SPE位不会被清除，发送和接收操作会继续。因此，瑞萨建议清除SPCR.SPE位以停止除模式故障错误以外的错误操作。不这样做会导致更新SPSSR.SPECM[2:0]位。

当使用中断检测到错误时，清除错误处理例程中的ICU.IELSRn.IR标志。如果不这样做，ICU.IELSRn.IR标志可能会继续指示SPIi_SPTI或SPIi_SPRI中断请求。如果指示了SPIi_SPRI中断请求，则读取接收缓冲区并初始化SPI中的定序器。

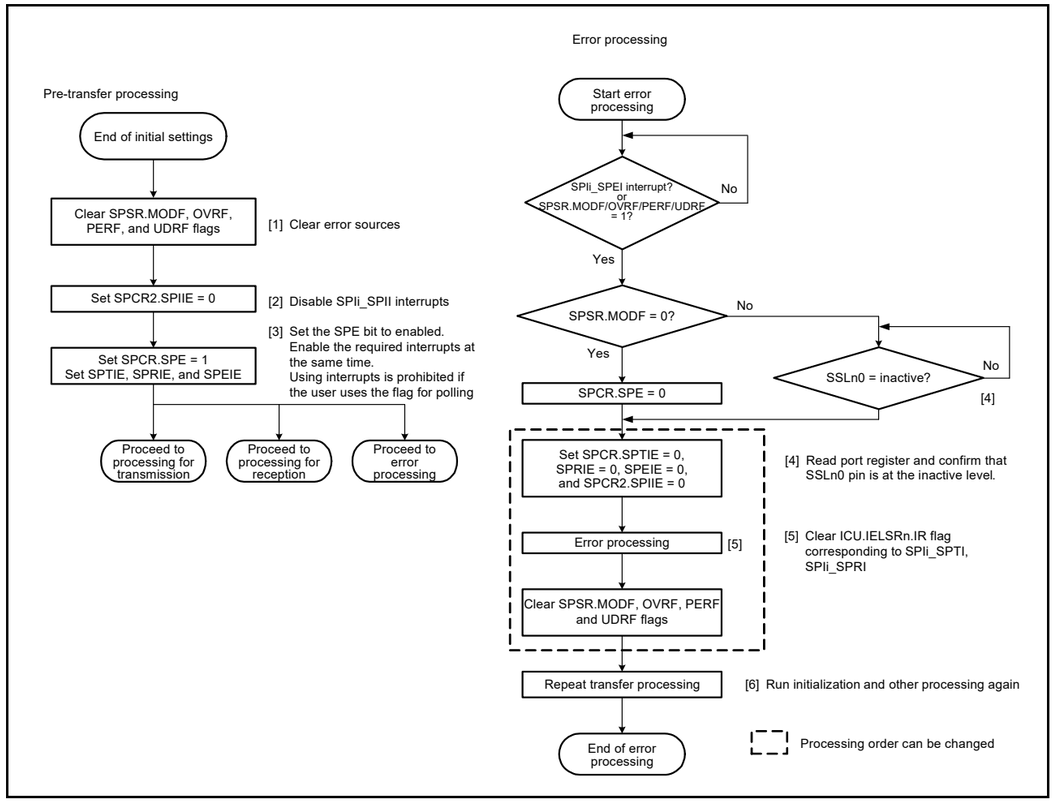

Figure 38.39 Error processing flow for master mode

38.3.10.2 Slave mode operation

(1) Starting a serial transfer

When the SPCMD0.CPHA bit is 0, if the SPI detects an SSLn0 input signal assertion, it must drive valid data to the MISOn output signal. For this reason, when the CPHA bit is 0, the assertion of the SSLn0 input signal triggers the start of a serial transfer.

When the CPHA bit is 1, if the SPI detects the first RSPCKn edge in an SSLn0 signal asserted condition, it must drive valid data to the MISOn output signal. For this reason, when the CPHA bit is 1, the first RSPCKn edge in an SSLn0 signal asserted condition triggers the start of a serial transfer.

Regardless of the CPHA bit setting, the SPI drives the MISOn output signal on SSLn0 signal assertion. The data that is output by the SPI is either valid or invalid, depending on the CPHA bit setting.

For details on the SPI transfer format, see section 38.3.5, Transfer Formats. The polarity of the SSLn0 input signal depends on the SSLP.SSL0P setting.

(2) Terminating a serial transfer

Regardless of the SPCMD0.CPHA bit setting, the SPI terminates the serial transfer after detecting an RSPCKn edge corresponding to the final sampling timing. When free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies received data from the shift register to the receive buffer of the SPDR/SPDR_HA register. On termination of a serial transfer, the SPI changes the status of the shift register to empty, regardless of the receive buffer state. A mode fault error occurs if the SPI detects an SSLn0 input signal negation from the beginning of serial transfer to the end of serial transfer (see section 38.3.8, Error Detection).

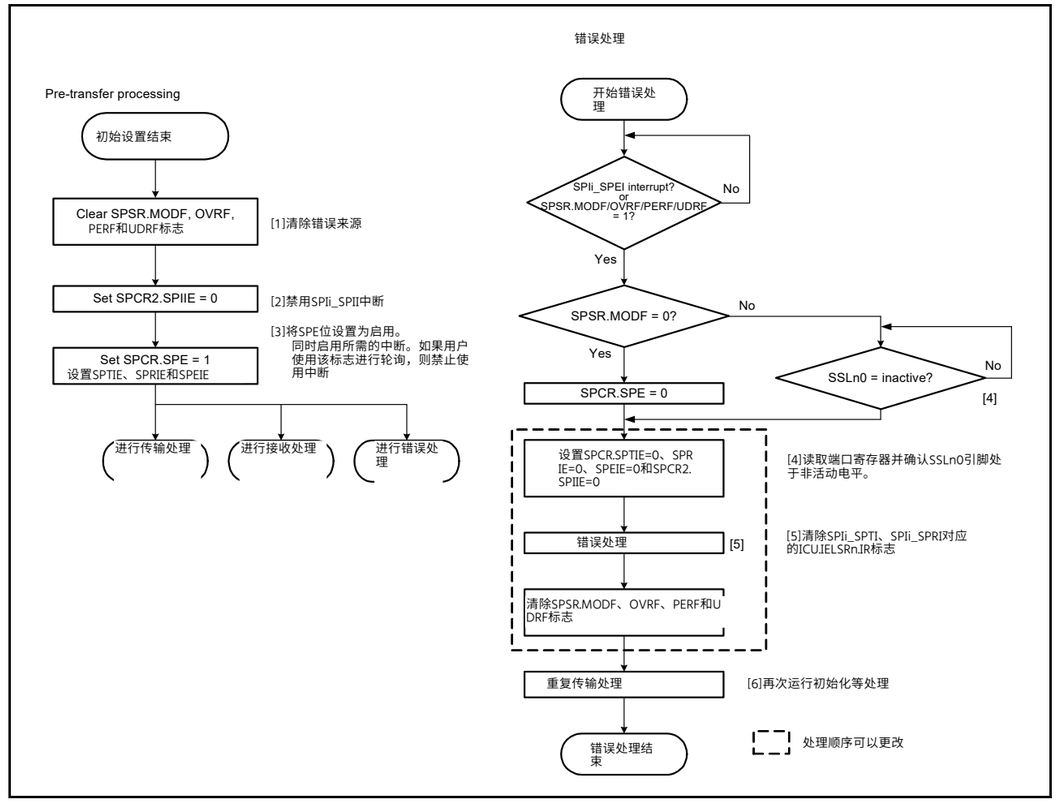

Figure 38.39 主模式的错误处理流程

38.3.10.2 从模式操作

(1) 开始串行传输

当SPCMD0.CPHA位为0时，如果SPI检测到SSLn0输入信号断言，它必须将有效数据驱动到MISon输出信号。因此，当CPHA位为0时，SSLn0输入信号的断言触发串行传输的开始。

当CPHA位为1时，如果SPI在SSLn0信号置位条件下检测到第一个RSPCKn边沿，它必须将有效数据驱动到MISOn输出信号。因此，当CPHA位为1时，SSLn0信号断言条件中的第一个RSPCKn边沿触发串行传输的开始。

无论CPHA位设置如何，SPI都会在SSLn0信号置位时驱动MIOn输出信号。SPI输出的数据是有效还是无效，取决于CPHA位设置。

有关SPI传输格式的详细信息，请参阅第38.3.5节，传输格式。SSLn0输入信号的极性取决于SSLP.SSL0P设置。

(2) 终止串行传输

无论SPCMD0.CPHA位设置如何，SPI在检测到对应于最终采样时序的RSPCKn边沿后终止串行传输。当接收缓冲区中有可用空间（SPSR.SPRF标志为0）时，串行传输终止时，SPI将接收到的数据从移位寄存器复制到SPDR/SPDR_HA寄存器的接收缓冲区。在串行传输终止时，SPI将移位寄存器的状态更改为空，而与接收缓冲区状态无关。如果SPI从串行传输开始到串行传输结束检测到SSLn0输入信号取反，则会发生模式故障错误（请参阅第38.3.8节，错误检测）。

The final sampling timing changes depending on the bit length of transfer data. In slave mode, the SPI data length is determined by the SPCMD0.SPB[3:0] bit setting. The polarity of the SSLn0 input signal is determined by the SSLP.SSL0P bit setting. For details on the SPI transfer format, see section 38.3.5, Transfer Formats.

(3) Notes on single slave operations

If the SPCMD0.CPHA bit is 0, the SPI starts serial transfers when it detects the assertion edge for an SSLn0 input signal. In the type of configuration shown in Figure 38.7, for example, if the SPI is used in single slave mode, the SSLn0 signal is fixed at the active state. Therefore, when the CPHA bit is set to 0, the SPI cannot correctly start a serial transfer. To correctly execute transmit and receive operations by the SPI in slave mode when the SSLn0 input signal is fixed at the active state, the CPHA bit must be set to 1. Do not fix the SSLn0 input signal if there is a requirement for setting the CPHA bit to 0.

(4) Burst transfer

If the SPCMD0.CPHA bit is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSLn0 input signal. When the CPHA bit is 1, the serial transfer period is the period from the first RSPCKn edge to the sampling timing for the reception of the final bit in an SSLn0 signal active state. Even when the SSLn0 input signal remains at the active level, the SPI can accommodate burst transfers, because it can detect the start of an access.

When the CPHA bit is 0, the second and subsequent serial transfers during burst transfer cannot be executed correctly.

(5) Initialization flow

Figure 38.40 shows an example of initialization flow for SPI operation when the SPI is used in slave mode. For a description of how to set up the ICU, DMAC, and I/O ports, see the descriptions given in the individual blocks.

最终的采样时序根据传输数据的位长而变化。在从机模式下，SPI数据长度由SPCMD0.SPB[3:0]位设置决定。SSLn0输入信号的极性由SSLP.SSL0P位设置决定。有关SPI传输格式的详细信息，请参阅第38.3.5节，传输格式。

(3) 单从操作注意事项

如果SPCMD0.CPHA位为0，则SPI在检测到SSLn0输入信号的断言边沿时开始串行传输。例如，在图38.7所示的配置类型中，如果SPI用于单从模式，则SSLn0信号固定在活动状态。因此，当CPHA位设置为0时，SPI无法正确启动串行传输。当SSLn0输入信号固定为激活状态时，为了在从机模式下正确执行SPI的发送和接收操作，CPHA位必须设置为1。如果需要设置CPHA，请不要固定SSLn0输入信号位为0。

(4) 突发传输

如果SPCMD0.CPHA位为1，则可以执行连续串行传输（突发传输），同时保持SSLn0输入信号的断言状态。当CPHA位为1时，串行传输周期是从第一个RSPCKn边沿到SSLn0信号有效状态下接收最后一个位的采样时序的周期。即使SSLn0输入信号保持在有效电平，SPI也可以适应突发传输，因为它可以检测访问的开始。

当CPHA位为0时，突发传输期间的第二次和后续串行传输无法正确执行。

(5) 初始化流程

图38.40显示了当SPI用于从机模式时SPI操作的初始化流程示例。有关如何设置ICU、DMAC和IO端口的说明，请参见各个块中给出的说明。

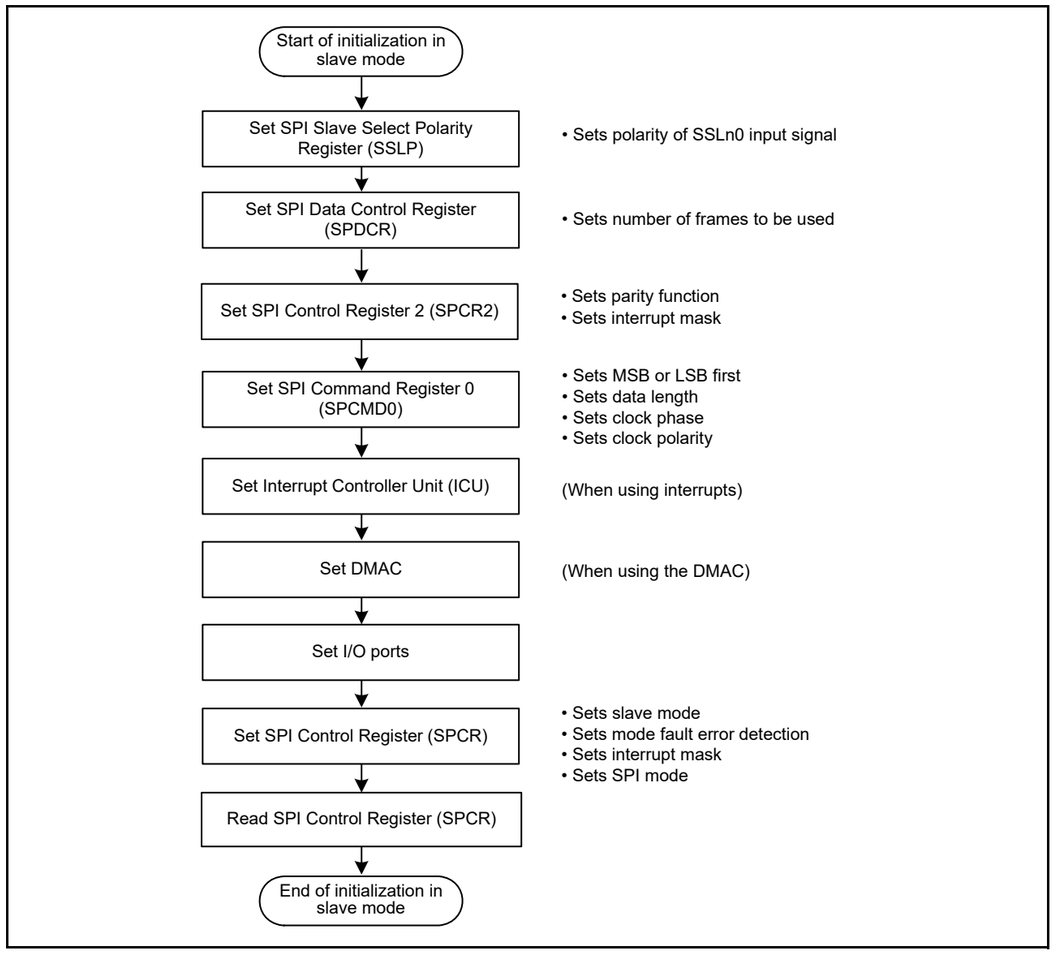

Figure 38.40 Example initialization flow in slave mode for SPI operation

(6) Software processing flow

Figure 38.41 to Figure 38.43 show examples of the flow of software processing.

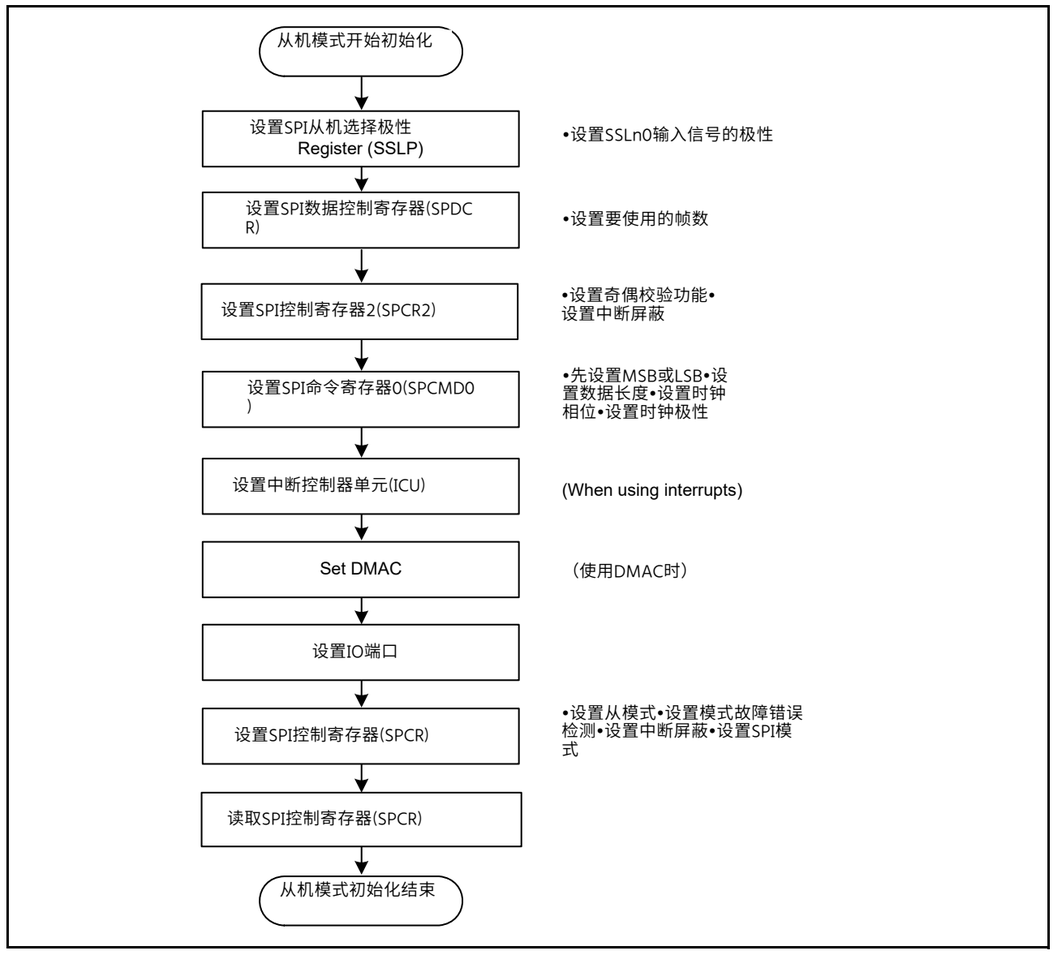

Figure 38.40 SPI操作的从模式初始化流程示例

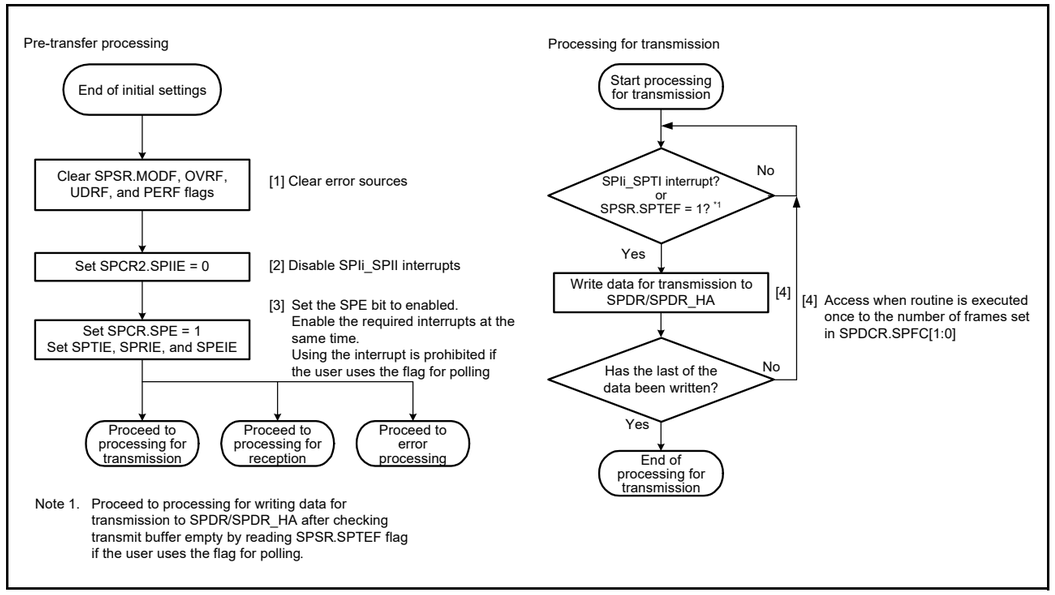
(6) 软件处理流程

图38.41至图38.43显示了软件处理流程的示例。

(a) Transmit processing flow



Note 1. Proceed to processing for writing data for transmission to SPDR/SPDR_HA after checking transmit buffer empty by reading SPSR.SPTEF flag if the user uses the flag for polling.

Figure 38.41 Transmission flow in slave mode

(b) Receive processing flow

The SPI does not handle receive-only operation, so processing for transmission is required.

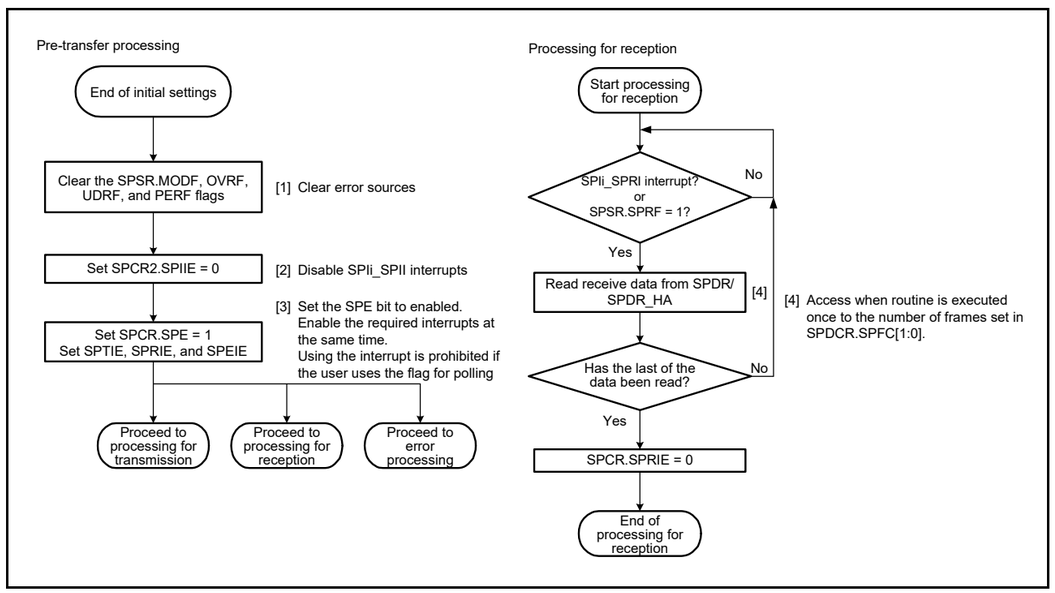


Figure 38.42 Reception flow in slave mode

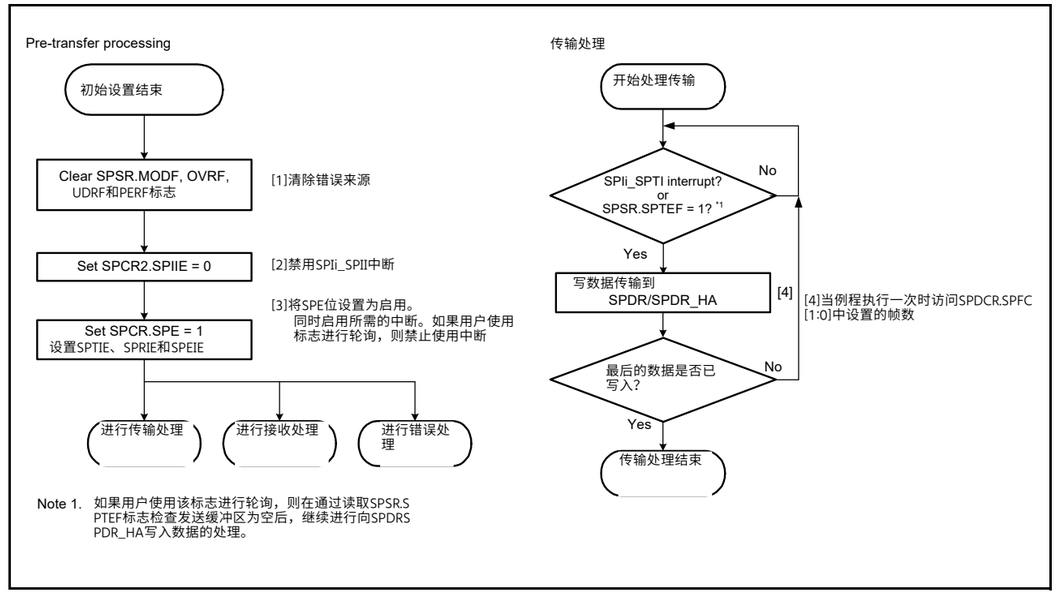
(a) 传输处理流程



Note 1. 如果用户使用该标志进行轮询，则在通过读取SPSR.SPTEF标志检查发送缓冲区为空后，继续进行向SPDRSPDR_HA写入数据的处理。

Figure 38.41 从模式下的传输流

(b) 接收处理流程

SPI不处理只接收操作，因此需要处理传输。

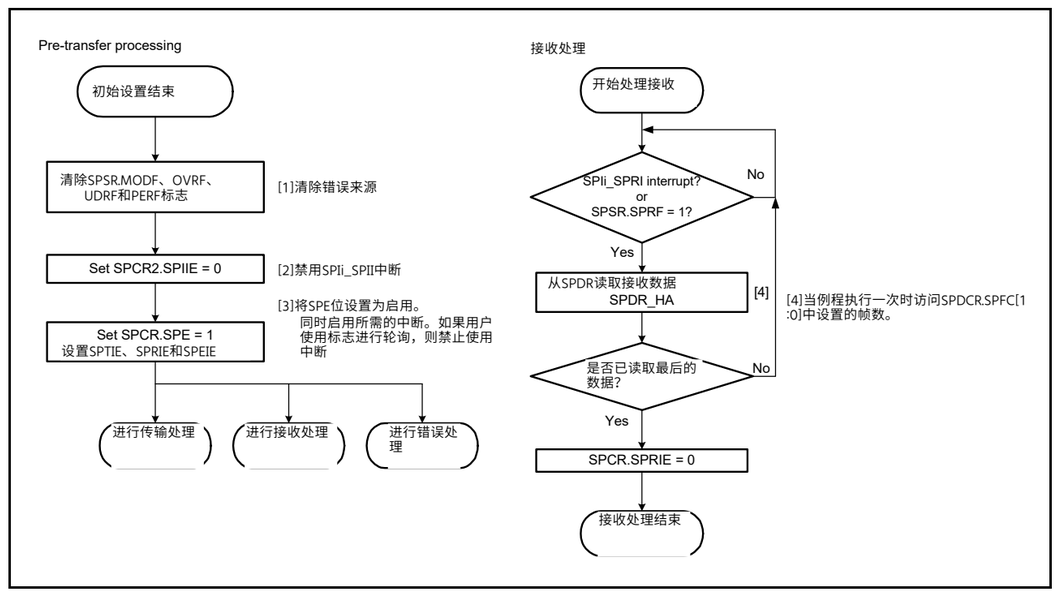


Figure 38.42 从机模式下的接收流程

(c) Error processing flow

In slave operation, even when a mode fault error is generated, the SPSR.MODF flag can be cleared regardless of the state of the SSLn0 pin.

When an error is detected by using an interrupt, clear the ICU.IELSRn.IR flag in the error processing routine. If this is not done, the ICU.IELSRn.IR flag might continue to indicate the SPIi_SPTI or SPIi_SPRI interrupt request. If the SPIi_SPRI interrupt request is indicated, read the receive buffer and initialize the sequencer in the SPI.

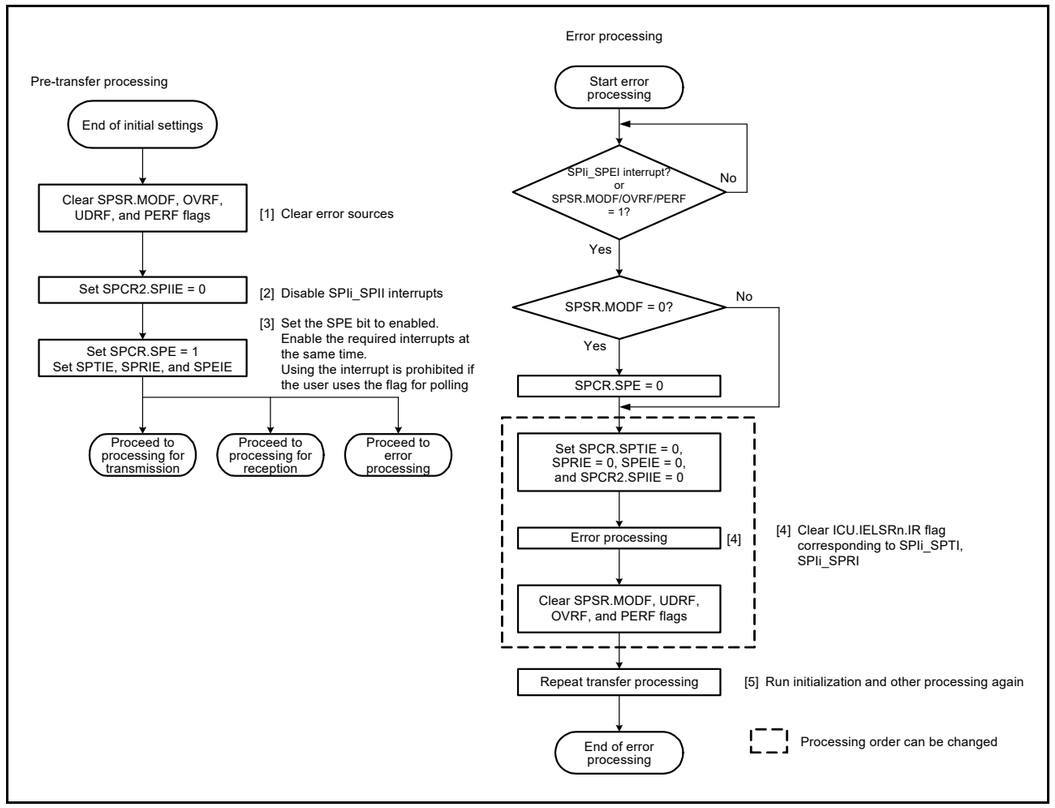

Figure 38.43 Error processing flow for slave mode

38.3.11 Clock Synchronous Operation

Setting the SPCR.SPMS bit to 1 selects clock synchronous operation of the SPI. In clock synchronous operation, the SSLni pin is not used, and the RSPCKn, MOSIn, and MISOn pins handle communications. All SSLni pins are available as I/O port pins.

Although clock synchronous operation does not require the use of the SSLni pin, operation of the module is the same as in SPI operation. In both master and slave operations, communications can be performed with the same flow as in SPI operation. However, mode fault errors are not detected, because the SSLni pin is not used.

Additionally, do not perform operation if clock synchronous operation enabled when the SPCMDm.CPHA bit is set to 0 in slave mode (SPCR.MSTR = 0).

(c) 错误处理流程

在从机操作中，即使产生模式故障错误，SPSR.MODF标志也可以被清除，而与SSLn0引脚的状态无关。

当使用中断检测到错误时，清除错误处理例程中的ICU.IELSRn.IR标志。如果不这样做，ICU.IELSRn.IR标志可能会继续指示SPIi_SPTI或SPIi_SPRI中断请求。如果指示了SPIi_SPRI中断请求，则读取接收缓冲区并初始化SPI中的定序器。

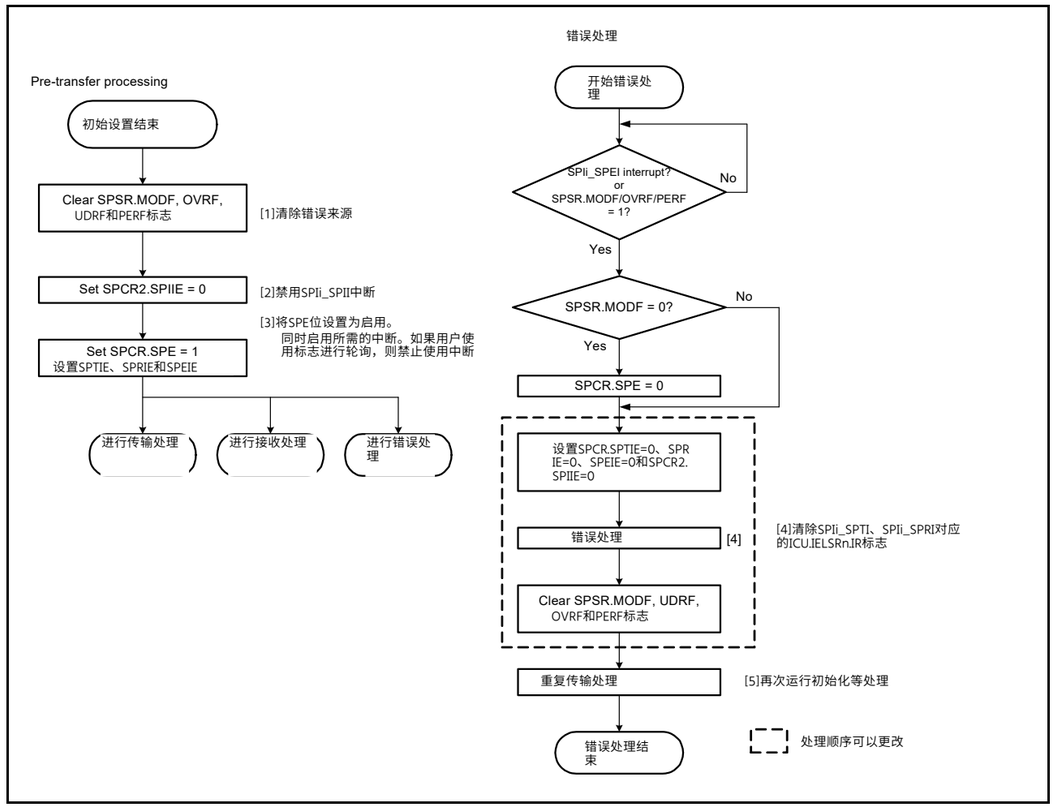

Figure 38.43 从机模式的错误处理流程

38.3.11 时钟同步操作

将SPCR.SPMS位设置为1可选择SPI的时钟同步操作。在时钟同步操作中，不使用SSLni引脚，而RSPCKn、MOSIn和MISOn引脚处理通信。所有SSLni引脚都可用作IO端口引脚。

虽然时钟同步操作不需要使用SSLni引脚，但模块的操作与SPI操作相同。在主机和从机操作中，可以使用与SPI操作相同的流程执行通信。但是，未检测到模式故障错误，因为未使用SSLni引脚。

此外，如果在从模式(SPCR.MSTR=0)下SPCMDm.CPHA位设置为0时时钟同步操作使能，则不要执行操作。

38.3.11.1 Master mode operation

(1) Starting serial transfer

The SPI updates the data in the transmit buffer (SPTX) of SPDR/SPDR_HA when data is written to the SPDR/SPDR_HA register and the transmit buffer is empty (data for the next transfer is not set and the SPSR.SPTEF flag is 1). When the shift register is empty after the number of frames set in the SPDCR.SPFC[1:0] bits are written to the SPDR/SPDR_HA, the SPI copies data from the transmit buffer to the shift register and starts serial transmission. On copying transmit data to the shift register, the SPI changes the status of the shift register to full, and on termination of serial transfer, it changes the status of the shift register to empty. The status of the shift register cannot be referenced.

Transfer in clock synchronous operation is conducted without the SSLn0 output signal. For details on the SPI transfer format, see section 38.3.5, Transfer Formats.

(2) Terminating serial transfer

The SPI terminates the serial transfer after transmitting an RSPCKn edge corresponding to the sampling timing. If free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies data from the shift register to the receive buffer of the SPI Data Register (SPDR/SPDR_HA).

The final sampling timing varies depending on the bit length of transfer data. In master mode, the SPI data length depends on the SPCMDm.SPB[3:0] bit setting. Transfer in clock synchronous operation is conducted without the SSLn0 output signal. For details on the SPI transfer format, see section 38.3.5, Transfer Formats.

(3) Sequence control

The transfer format used in master mode is determined by the SPSCR, SPCMDm, SPBR, SPCKD, SSLND, and SPND registers. Although the SSLni signals are not output in clock synchronous operation, these settings are valid.

The SPSCR register determines the sequence configuration for serial transfers that are executed by the SPI in master mode. The following parameters are specified in the SPCMDm register:

- SSLni output signal value
- MSB or LSB first
- Data length
- Some of the bit rate settings
- RSPCKn polarity and phase
- Whether SPCKD is to be referenced
- Whether SSLND is to be referenced
- Whether SPND is to be referenced.

SPBR holds some of the bit rate settings such as SPCKD, an SPI clock delay value, SSLND, an SSL negation delay, and SPND, a next-access delay value.

Based on the sequence length that is assigned to SPSCR, the SPI makes up a sequence comprised of a part or all of SPCMDm register. The SPI contains a pointer to the SPCMDm register that makes up the sequence. The value of this pointer can be checked by reading the SPSSR.SPCP[2:0] bits. When the SPCR.SPE bit is set to 1 and the SPI function is enabled, the SPI loads the pointer to the commands in SPCMD0 register, and incorporates the SPCMD0 register setting into the transfer format at the beginning of serial transfer. The SPI increments the pointer each time the next-access delay period for a data transfer ends. On completion of the serial transfer that corresponds to the final command comprising the sequence, the SPI sets the pointer to the SPCMD0 register, and in this manner the sequence is executed repeatedly.

38.3.11.1 主模式操作

(1) 开始串行传输

SPI更新SPDRSPDR_HA的发送缓冲区(SPTX)中的数据
SPDRSPDR_HA寄存器且发送缓冲区为空（未设置下一次传输的数据且SPSR.SPTEF标志为1）。当SPDCR.SPFC[1:0]位中设置的帧数写入SPDRSPDR_HA后移位寄存器为空时，SPI将数据从发送缓冲区复制到移位寄存器并开始串行传输。将发送数据复制到移位寄存器时，SPI将移位寄存器的状态更改为满，而在串行传输终止时，它将移位寄存器的状态更改为空。无法引用移位寄存器的状态。

在没有SSLn0输出信号的情况下进行时钟同步操作的传输。有关SPI传输格式的详细信息，请参阅第38.3.5节，传输格式。

(2) 终止串行传输

SPI在发送对应于采样时序的RSPCKn边沿后终止串行传输。如果接收缓冲区中有可用空间（SPSR.SPRF标志为0），则在串行传输终止时，SPI将数据从移位寄存器复制到SPI数据寄存器(SPDRSPDR_HA)的接收缓冲区。

最终的采样时序根据传输数据的位长而变化。在主机模式下，SPI数据长度取决于SPMDm.SPB[3:0]位设置。在没有SSLn0输出信号的情况下进行时钟同步操作的传输。有关SPI传输格式的详细信息，请参阅第38.3.5节，传输格式。

(3) 顺序控制

主机模式中使用的传输格式由SPSCR、SPCMDm、SPBR、SPCKD、SSLND和SPND寄存器确定。虽然在时钟同步操作中不输出SSLni信号，但这些设置是有效的。

SPSCR寄存器确定由SPI在主模式下执行的串行传输的序列配置。SPCMDm寄存器中指定了以下参数：

- SSLni输出信号值
- MSB或LSB在前
- 数据长度
- 一些比特率设置
- RSPCKn极性和相位
- 是否要引用SPCKD
- 是否要引用SSLND
- 是否要引用SPND。

SPBR保存一些比特率设置，例如SPCKD、SPI时钟延迟值、SSLND、SSL否定延迟和
SPND，下一次访问延迟值。

根据分配给SPSCR的序列长度，SPI组成一个序列，该序列由部分或全部
SPMDm寄存器。SPI包含一个指向构成序列的SPCMDm寄存器的指针。该指针的值可以通过读取SPSSR.SPCP[2:0]位来检查。当SPCR.SPE位设置为1且SPI功能使能时，SPI将指针加载到SPCMD0寄存器中的命令，并在串行传输开始时将SPCMD0寄存器设置合并到传输格式中。每次数据传输的下一个访问延迟周期结束时，SPI都会递增指针。在完成对应于包含序列的最终命令的串行传输后，SPI将指针设置为SPMD0寄存器，并以这种方式重复执行序列。

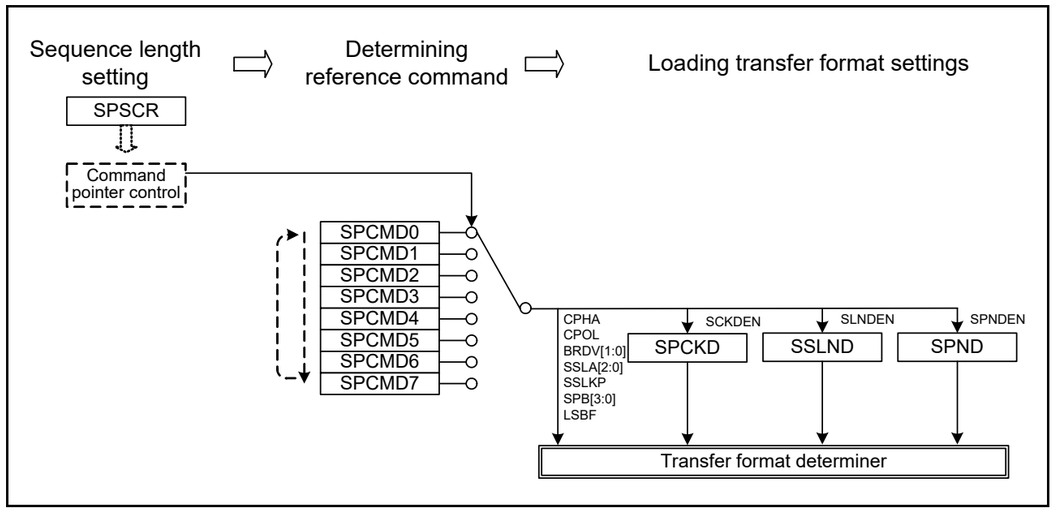

Figure 38.44 Procedure for determining the form of serial transmission in master mode

In this section, a frame is the combination of the data (SPDR/SPDR_HA) and the settings (SPCMDm).

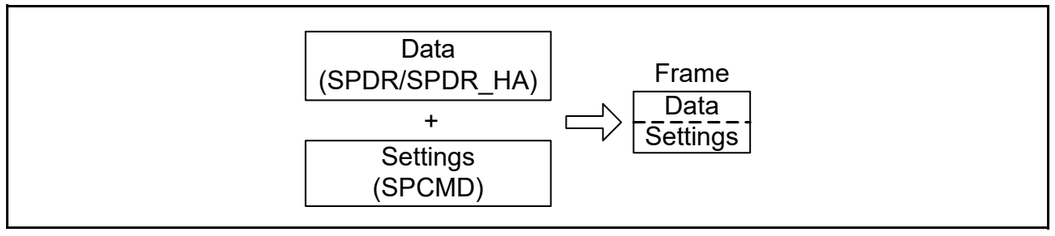

Figure 38.45 Conceptual diagram of frames

Figure 38.46 shows the relationship between the command and the transmit and receive buffers in the sequence of operations specified by the settings in Table 38.4.

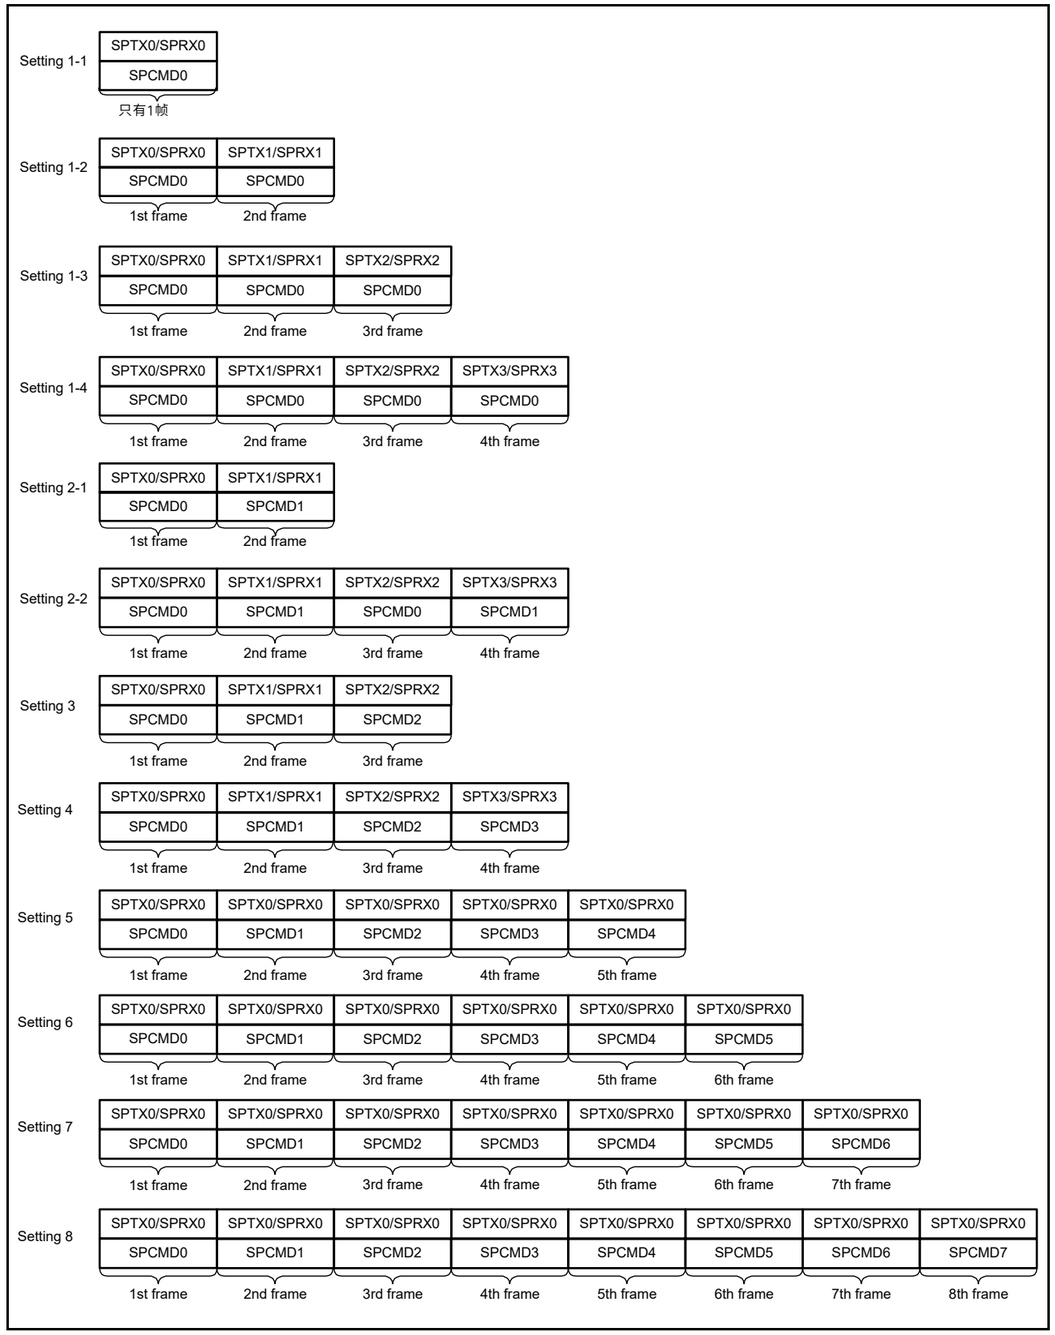

Figure 38.46 顺序操作中SPI命令寄存器与发送接收缓冲区的对应关系

(4) Initialization flow

Figure 38.47 shows an example of initialization flow for clock synchronous operation when the SPI is used in master mode. For a description of how to set up the ICU, DMAC, and I/O ports, see the descriptions given in the individual blocks.

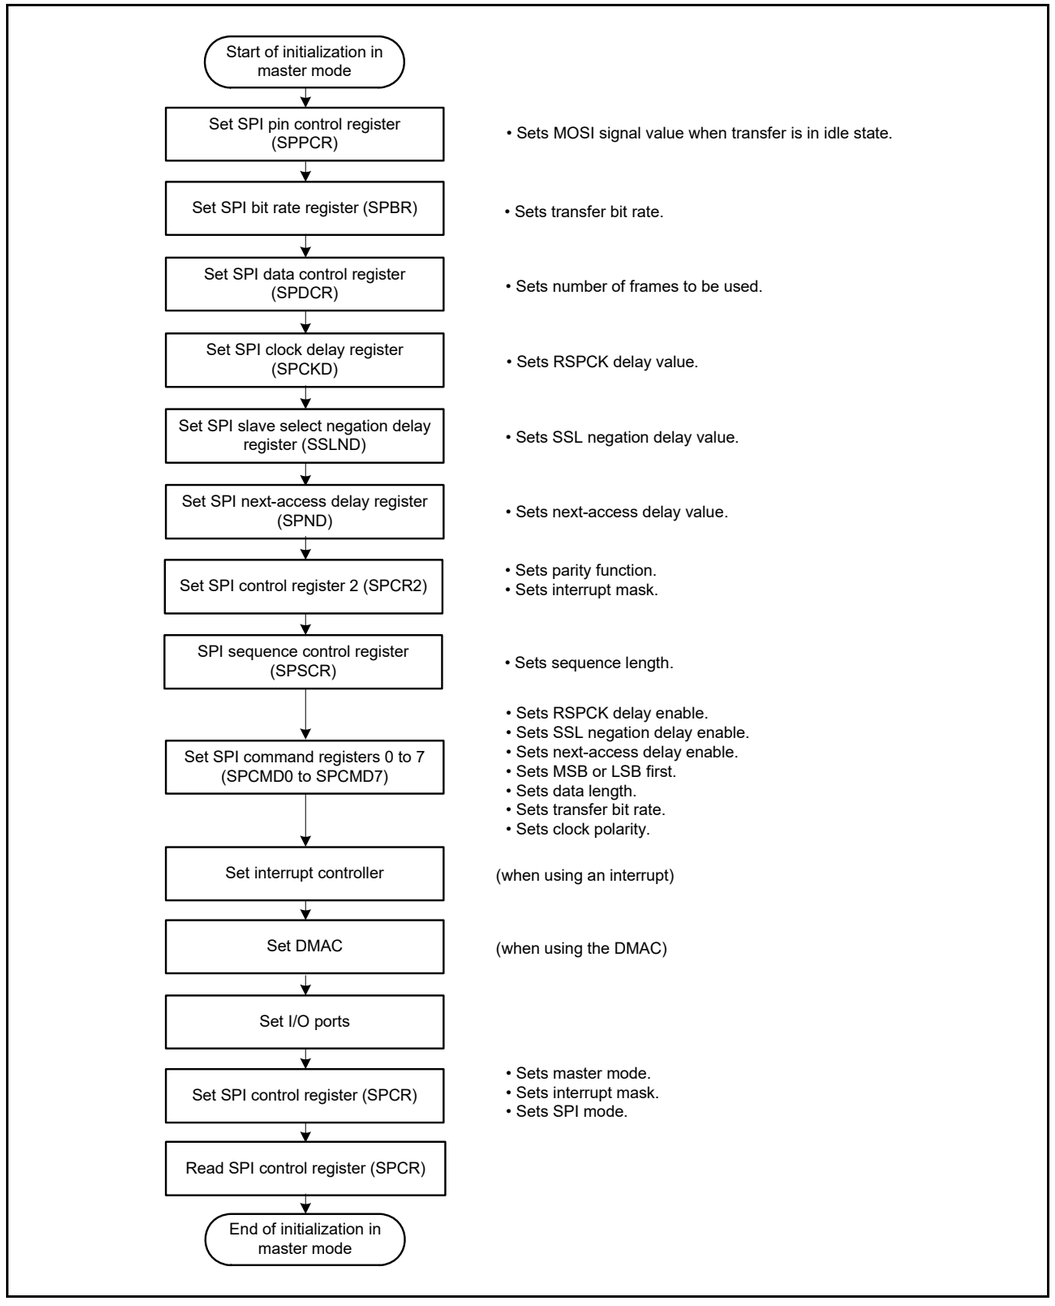

Figure 38.47 Example of initialization flow in master mode for clock synchronous operation

(4) 初始化流程

图38.47显示了在主模式下使用SPI时时钟同步操作的初始化流程示例。有关如何设置ICU、DMAC和IO端口的说明，请参见各个块中给出的说明。

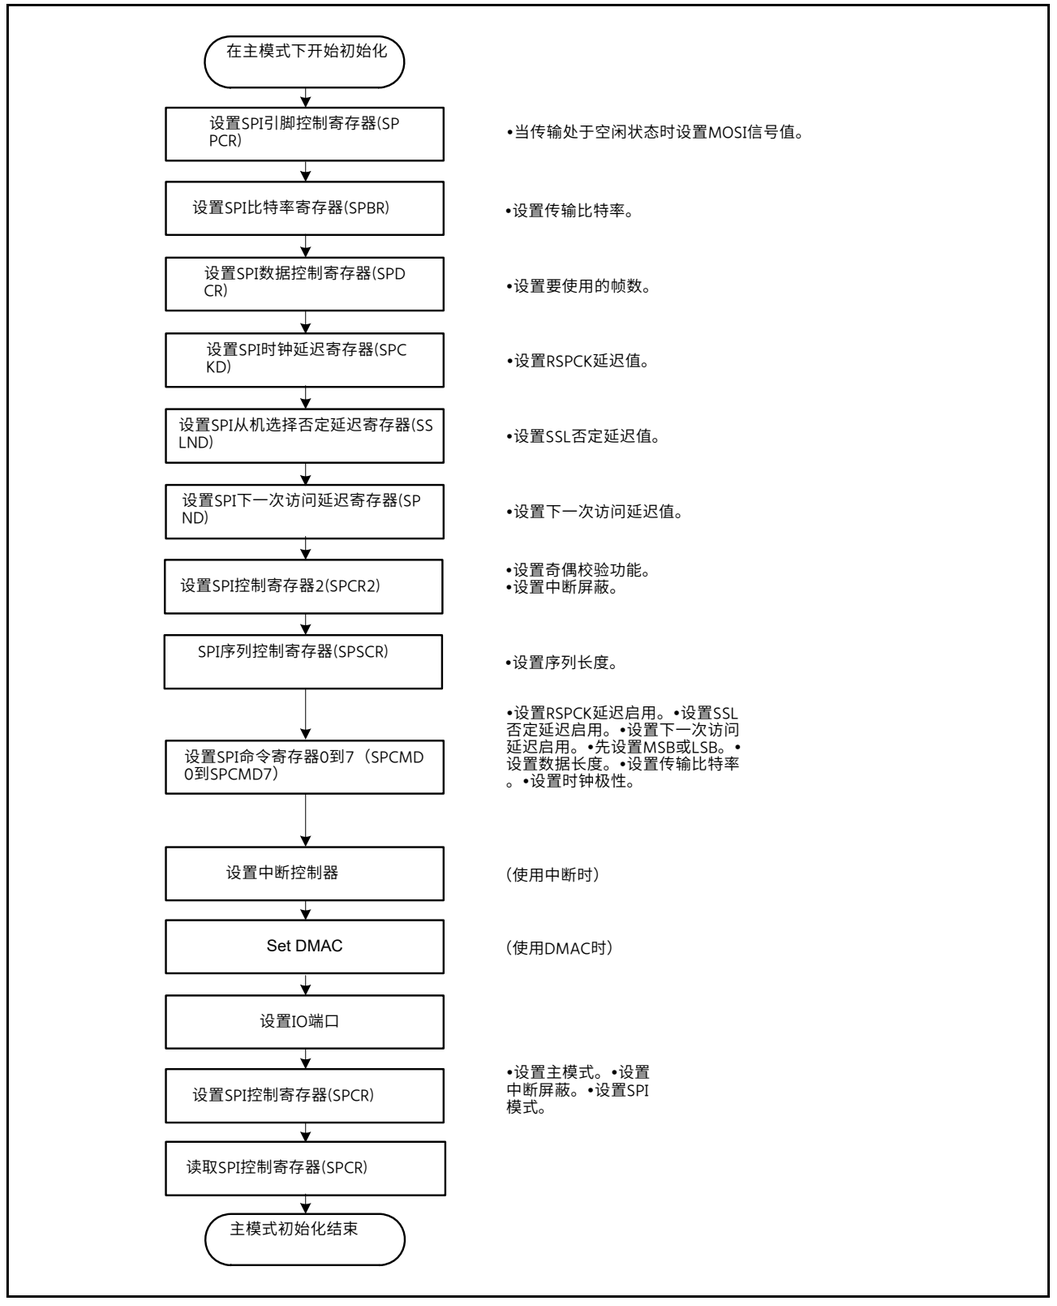

Figure 38.47 时钟同步操作的主模式初始化流程示例

(5) Software processing flow

Software processing during clock synchronous master operation is the same as that for SPI master operation. For details, see section 38.3.10.1, (9) Software processing flow. Mode fault errors do not occur in clock synchronous operation.

38.3.11.2 Slave mode operation

(1) Starting serial transfer

When the SPCR.SPMS bit is 1, the first RSPCKn edge triggers the start of a serial transfer in the SPI, and the SPI drives the MISOn output signal. The SSLn0 input signal is not used in clock synchronous operation. For details on the SPI transfer format, see section 38.3.5, Transfer Formats.

(2) Terminating serial transfer

The SPI terminates the serial transfer after detecting an RSPCKn edge corresponding to the final sampling timing. When free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer the SPI copies received data from the shift register to the receive buffer of the SPDR/SPDR_HA register. On termination of a serial transfer the SPI changes the status of the shift register to empty regardless of the receive buffer.

The final sampling timing changes depending on the bit length of transfer data. In slave mode, the SPI data length depends on the SPCMD0.SPB[3:0] bit setting. For details on the SPI transfer format, see section 38.3.5, Transfer Formats.

(3) Initialization flow

Figure 38.48 shows an example of initialization flow for clock synchronous operation when the SPI is used in slave mode. For a description of how to set up the ICU, DMAC, and I/O ports, see the descriptions given in the individual blocks.

(5) 软件处理流程

时钟同步主机操作期间的软件处理与SPI主机操作相同。详见38.3.10.1节，（9）软件处理流程。时钟同步操作中不会发生模式故障错误。

38.3.11.2 从模式操作

(1) 开始串行传输

当SPCR.SPMS位为1时，第一个RSPCKn边沿触发SPI中串行传输的开始，SPI驱动MISOn输出信号。SSLn0输入信号不用于时钟同步操作。有关SPI传输格式的详细信息，请参阅第38.3.5节，传输格式。

(2) 终止串行传输

SPI在检测到对应于最终采样时序的RSPCKn边沿后终止串行传输。当接收缓冲区中有可用空间时（SPSR.SPRF标志为0），在串行传输终止时，SPI将接收到的数据从移位寄存器复制到SPDRSPDR_HA寄存器的接收缓冲区。在串行传输终止时，SPI将移位寄存器的状态更改为空，而与接收缓冲区无关。

最终的采样时序根据传输数据的位长而变化。在从机模式下，SPI数据长度取决于SPCMD0.SPB[3:0]位设置。有关SPI传输格式的详细信息，请参阅第38.3.5节，传输格式。

(3) 初始化流程

图38.48显示了在从模式下使用SPI时时钟同步操作的初始化流程示例。有关如何设置ICU、DMAC和IO端口的说明，请参见各个块中给出的说明。

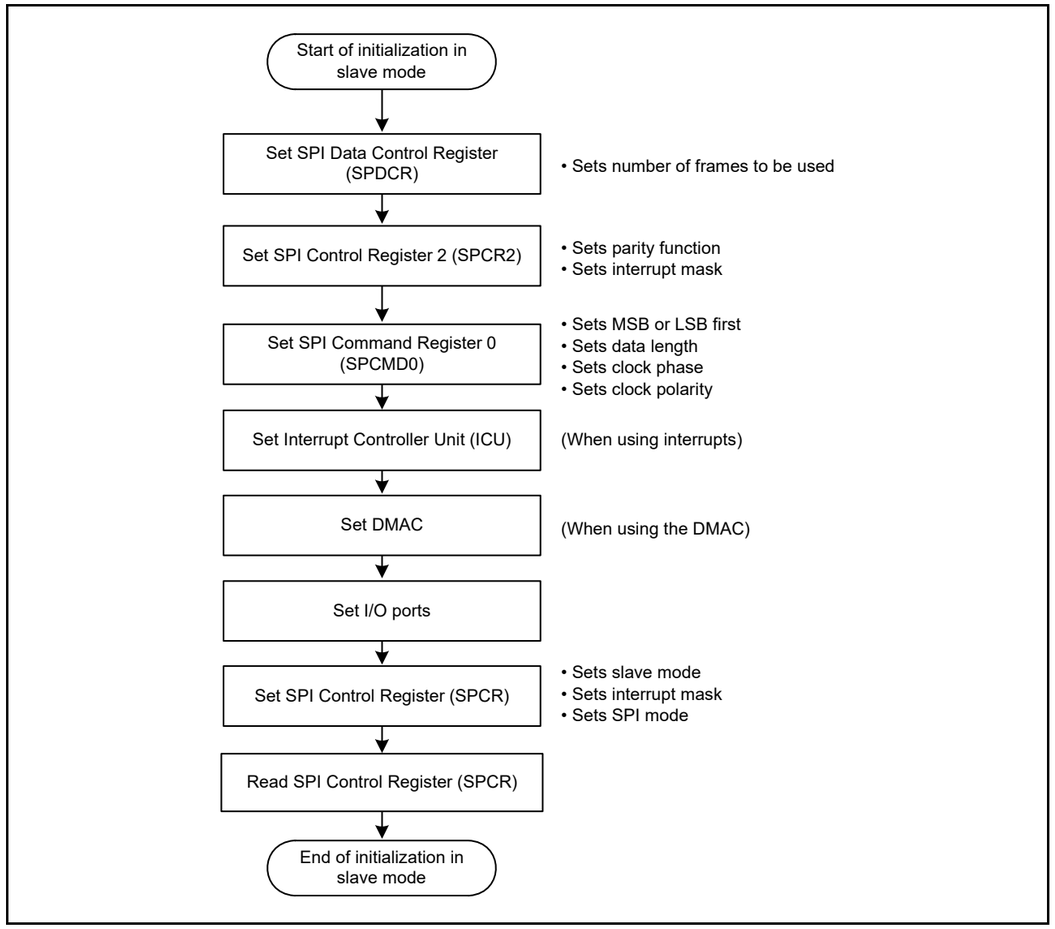

Figure 38.48 Example of initialization flow in slave mode for clock synchronous operation

(4) Software processing flow

Software processing during clock synchronous slave operation is the same as that for SPI slave operation. For details, see section 38.3.10.2, (6) Software processing flow. Mode fault errors do not occur in clock synchronous mode.

38.3.12 Loopback Mode

When 1 is written to the SPPCR.SPLP2 bit or SPPCR.SPLP bit, the SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, or between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0, and connects the input and output paths of the shift register. The SPI does not shut off the path between the MOSIn pin and the shift register if the SPCR.MSTR bit is 1, or between the MISOn pin and the shift register if the SPCR.MSTR bit is 0. This is called loopback mode. When a serial transfer is executed in loopback mode, the transmit data for the SPI or the reversed transmit data becomes the received data for the SPI.

Table 38.12 lists the relationship between the SPLP2 and SPLP bits and the received data. Figure 38.49 shows the configuration of the shift register I/O paths when the SPI in master mode is set to loopback mode (SPPCR.SPLP2 = 1, SPPCR.SPLP = 0 or 1).

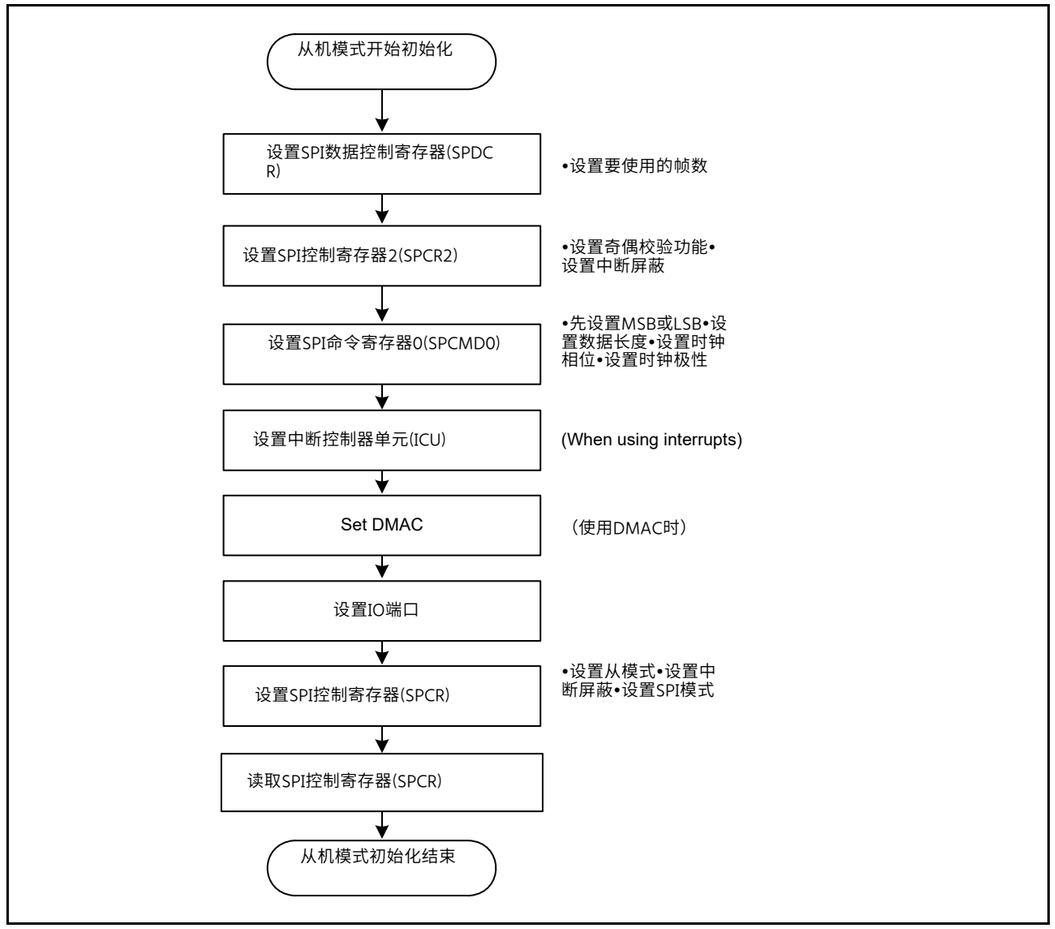

Figure 38.48 时钟同步操作的从模式初始化流程示例

(4) 软件处理流程

时钟同步从机操作期间的软件处理与SPI从机操作相同。详见38.3.10.2节，（6）软件处理流程。时钟同步模式下不会发生模式故障错误。

38.3.12 Loopback Mode

当向SPPCR.SPLP2位或SPPCR.SPLP位写入1时，如果SPCR.MSTR位为1，则SPI关闭MISOn引脚和移位寄存器之间的路径，或者如果SPCR.MSTR位为0，连接移位寄存器的输入和输出路径。如果SPCR.MSTR位为1，SPI不关闭MOSIn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则SPI不关闭MISOn引脚和移位寄存器之间的路径。这称为环回模式。当在环回模式下执行串行传输时，SPI的发送数据或反向发送数据将成为SPI的接收数据。

表38.12列出了SPLP2和SPLP位与接收数据之间的关系。图38.49显示了当主模式下的SPI设置为环回模式（SPPCR.SPLP2=1，SPPCR.SPLP=0或1）时移位寄存器IO路径的配置。

Table 38.12 SPLP2 and SPLP bit settings and received data

SPPCR.SPLP2 bit	SPPCR.SPLP bit	Received data
0	0	Input data from the MOSIn pin or MISOn pin
0	1	Inverted transmit data
1	0	Transmit data
1	1	Transmit data

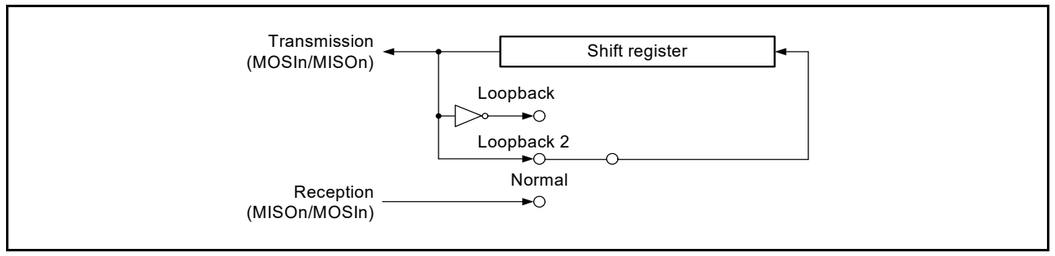

Figure 38.49 Configuration of Shift register I/O paths in loopback mode for master mode

38.3.13 Self-Diagnosis of Parity Bit Function

The parity circuit consists of a parity bit adding unit used for transmit data and an error detecting unit used for received data. To detect defects in the parity bit adding unit and error detecting unit of the parity circuit, self-diagnosis is executed for the parity circuit following the flow shown in Figure 38.50.

Table 38.12 SPLP2和SPLP位设置和接收数据

SPPCR.SPLP2 bit	SPPCR.SPLP bit	接收数据
0	0	从MOSIn引脚或MIOn引脚输入数据
0	1	反相传输数据
1	0	传输数据
1	1	传输数据

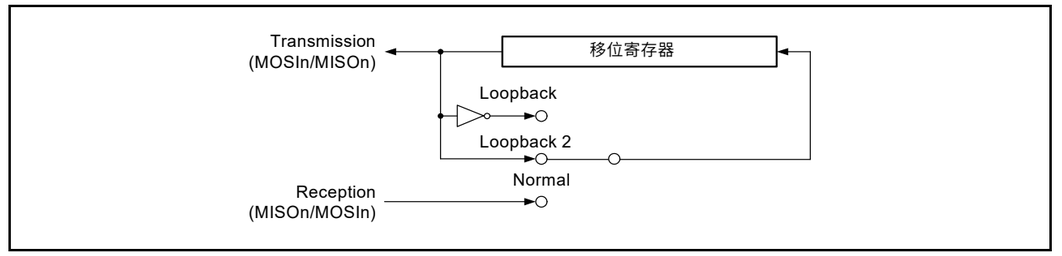

Figure 38.49 在主模式的环回模式下配置移位寄存器IO路径

38.3.13 奇偶校验位功能自诊断

奇偶校验电路由用于发送数据的奇偶校验位添加单元和用于接收数据的错误检测单元组成。为了检测奇偶校验电路的奇偶校验位添加单元和错误检测单元的缺陷，按照图38.50所示的流程对奇偶校验电路执行自诊断。

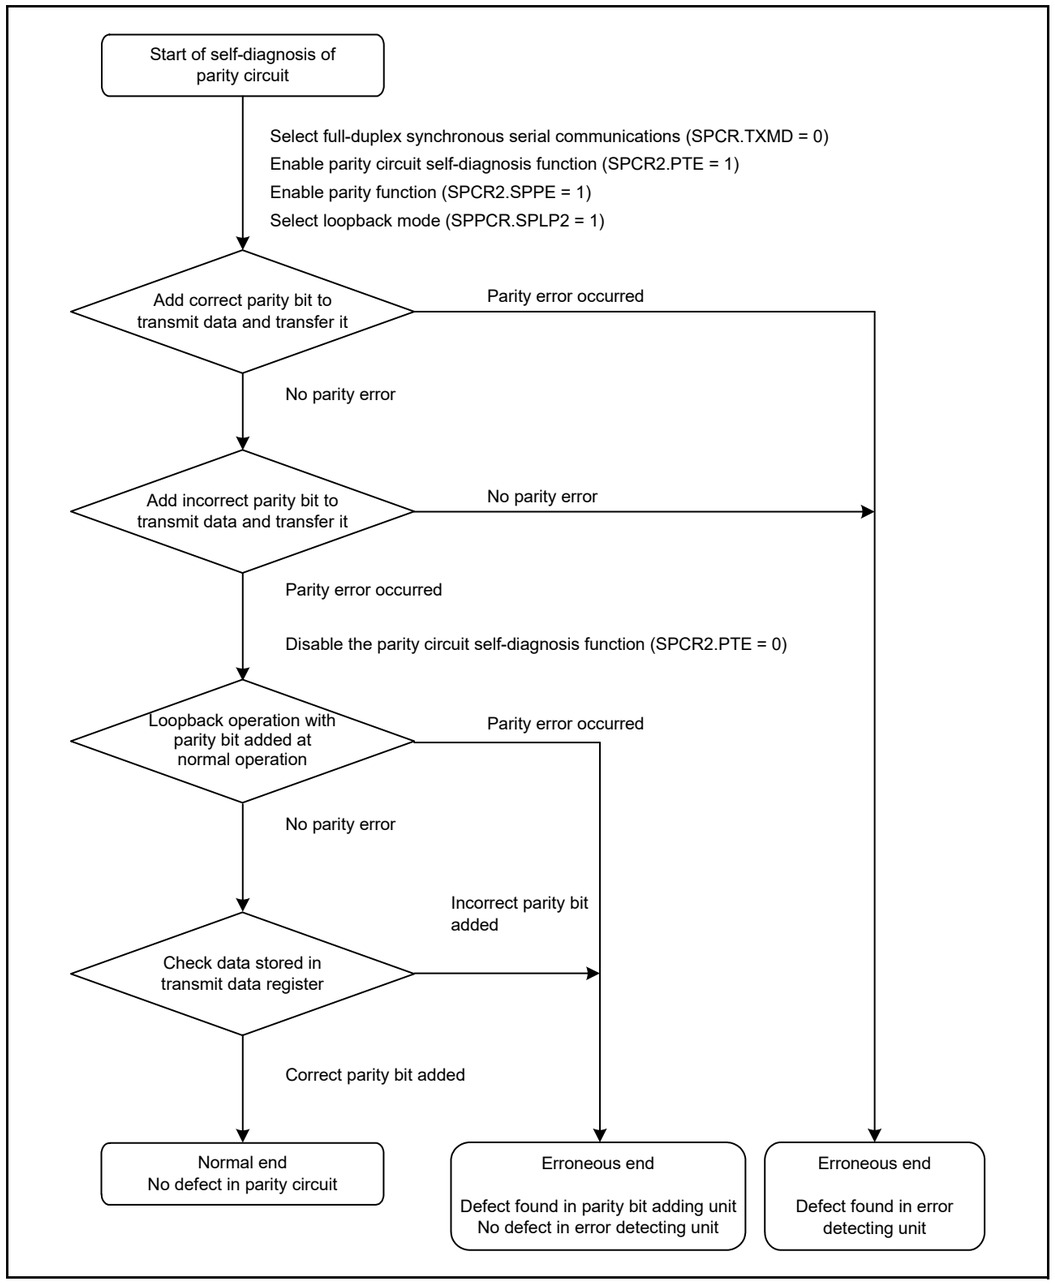

Figure 38.50 Self-diagnosis flow for parity circuit

38.3.14 Interrupt Sources

The SPI interrupt sources include:

- Receive buffer full
- Transmit buffer empty

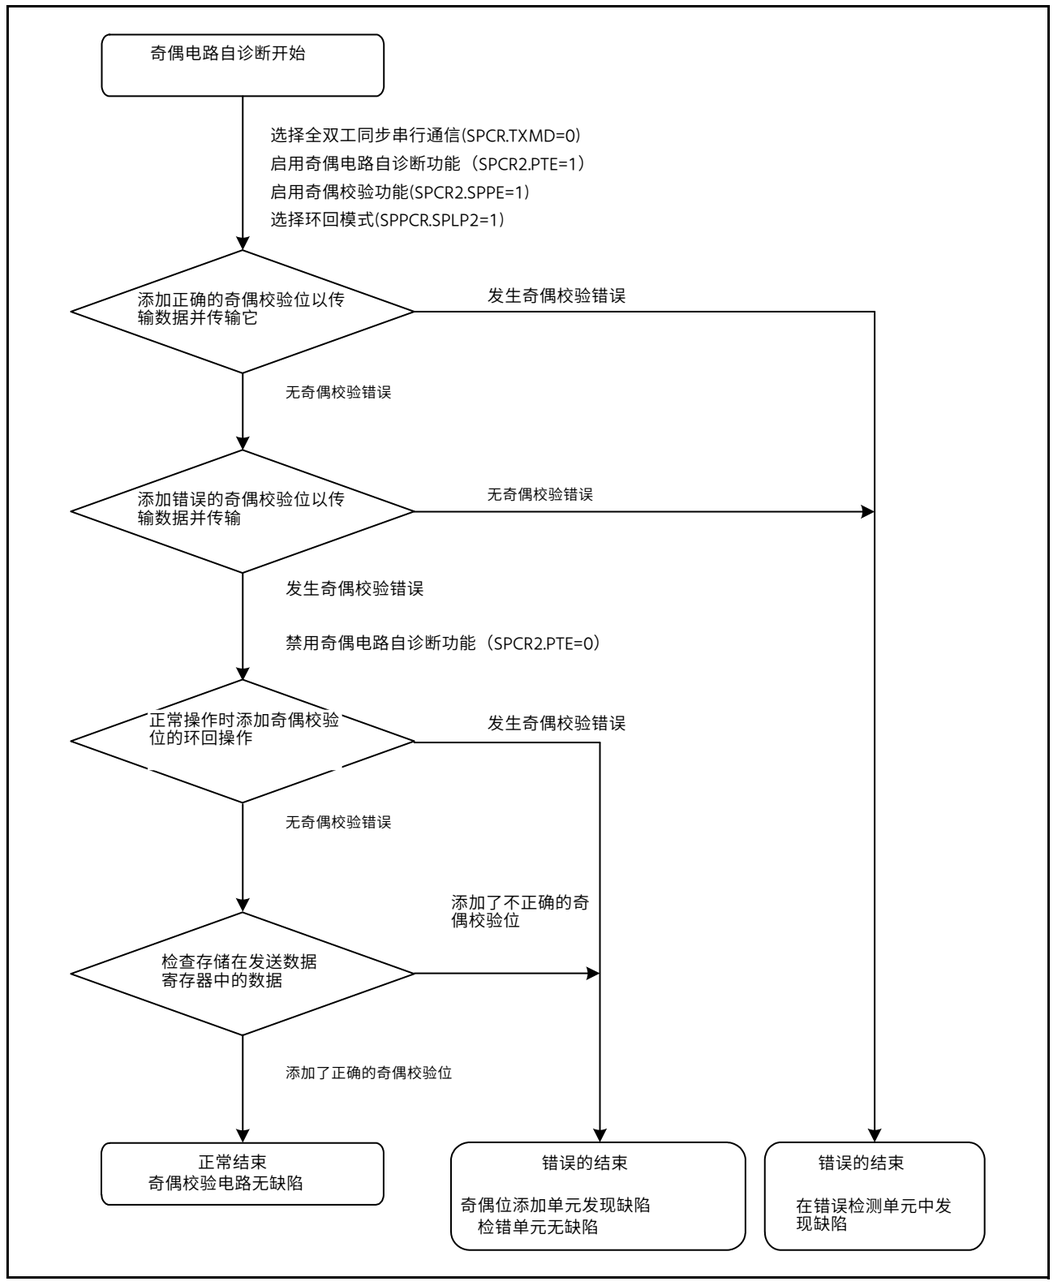

Figure 38.50 奇偶校验电路的自诊断流程

38.3.14 中断源

SPI中断源包括：

- 接收缓冲区已满
- 发送缓冲区为空

- SPI error (mode fault, underrun, overrun, or parity error)
- SPI idle
- Transmission-complete

The DTC or DMAC can be activated by the receive buffer full or transmit buffer empty interrupt to perform data transfer.

Because the vector address for the SPIi_SPEI (SPI error interrupt) is allocated to interrupt requests on mode fault, underrun, overrun, and parity errors, the actual interrupt source must be determined from the flags. Interrupt sources for the SPI are listed in Table 38.13. An interrupt is generated on satisfaction of one of the interrupt conditions in Table 38.13. Clear the receive buffer full and transmit buffer empty sources through a data transfer.

When using the DTC or DMAC to perform data transmission and reception, the DTC or DMAC must be set up first to a transfer-enabled status before making the SPI settings. For information on setting up the DTC or DMAC, see section 17, DMA Controller (DMAC), or section 18, Data Transfer Controller (DTC).

If the conditions for generating a transmit buffer empty or receive buffer full interrupt occur while the ICU.IELSRn.IR flag is 1, the interrupt is not output as a request for the ICU but is retained internally (the capacity for retention is one request per source). A retained interrupt request is output when the ICU.IELSRn.IR flag clears to 0. A retained interrupt request is automatically discarded when it is output as an actual interrupt request. The interrupt enable bit (the SPCR.SPTIE or SPCR.SPRIE bit) for an internally retained interrupt request can also be cleared to 0.

Table 38.13 SPI interrupt sources

Interrupt source	Symbol	Interrupt condition	DMAC or DTC activation
Receive buffer full	SPIi_SPRI	Receive buffer becomes full (SPSR.SPRF flag is 1) while the SPCR.SPRIE bit is 1	Possible
Transmit buffer empty	SPIi_SPTI	Transmit buffer becomes empty (SPSR.SPTEF flag is 1) while the SPCR.SPTIE bit is 1	Possible
SPI error (mode fault, underrun, overrun, or parity error)	SPIi_SPEI	SPSR.MODF, OVRF, PERF, or UDRF flag sets to 1 while the SPCR.SPEIE bit is 1	Impossible
SPI idle	SPIi_SPII	SPSR.IDLNF flag clears to 0 while the SPCR2.SPIIE bit is 1	Impossible
Transmission-complete	SPIi_SPTEND	• Master mode: Interrupt is generated when the IDLNF flag (SPI idle flag) changes from 1 to 0 • Slave mode: interrupt occurs on conditions shown in Table 38.15	Impossible

38.4 Output to the Event Link Controller (ELC)

The ELC can produce the following event output signals:

- Receive buffer full event output
- Transmit buffer empty event output
- Mode-fault, underrun, overrun, or parity error event output
- SPI idle event output
- Transmission-completed event output.

The event link output signal is output regardless of the interrupt enable bit setting.

38.4.1 Receive Buffer Full Event Output

This event signal is output when received data is transferred from the shift register to the SPDR/SPDR_HA on completion of serial transfer.

38.4.2 Transmit Buffer Empty Event Output

This event signal is output when data for transmission is transferred from the transmit buffer to the shift register and when the value of the SPE bit changes from 0 to 1.

- SPI错误（模式故障、欠载、溢出或奇偶校验错误）
- SPI空闲
- Transmission-complete

DTC或DMAC可以由接收缓冲区满或发送缓冲区空中断激活以执行数据传输。

因为SPIi_SPEI（SPI错误中断）的向量地址分配给模式错误、欠载、溢出和奇偶校验错误的中断请求，所以必须根据标志确定实际中断源。SPI的中断源在表38.13中列出。满足表38.13中的中断条件之一时会产生中断。通过数据传输清除接收缓冲区满和发送缓冲区空源。

使用DTC或DMAC进行数据传输和接收时，必须先将DTC或DMAC设置为传输使能状态，然后再进行SPI设置。有关设置DTC或DMAC的信息，请参阅第17节，DMA控制器(DMAC)或第18节，数据传输控制器(DTC)。

如果在ICU.IELSRn.IR标志为1时发生发送缓冲区空或接收缓冲区满中断的条件，则该中断不会作为对ICU的请求输出，而是在内部保留（保留容量为每个请求一个请求）资源）。当ICU.IELSRn.IR标志清除为0时，输出保留中断请求。当作为实际中断请求输出时，自动丢弃保留中断请求。内部保留中断请求的中断使能位（SPCR.SPTIE或SPCR.SPRIE位）也可以清零。

Table 38.13 SPI中断源

中断源	Symbol	中断条件	DMAC或DTC激活
接收缓冲区已满	SPIi_SPRI	当SPCR.SPRIE位为1时，接收缓冲区变满（SPSR.SPRF标志为1）	Possible
发送缓冲区为空	SPIi_SPTI	当SPCR.SPTIE位为1时，发送缓冲区变为空（SPSR.SPTEF标志为1）	Possible
SPI错误（模式故障、欠载、溢出或奇偶校验错误）	SPIi_SPEI	SPSR.MODF、OVRF、PERF或UDRF标志设置为1，而SPCR.SPEIE位为1	Impossible
SPI空闲	SPIi_SPII	SPSR.IDLNF标志在SPCR2.SPIIE位为1时清除为0	Impossible
Transmission-complete	SPIi_SPTEND	主模式：当IDLNF标志（SPI空闲标志）从1变为0时产生中断 从模式：在所示条件下发生中断 Table 38.15	Impossible

38.4 输出到事件链接控制器(ELC)

ELC可以产生以下事件输出信号：

- 接收缓冲区满事件输出
- 发送缓冲区空事件输出
- 模式故障、欠载、溢出或奇偶校验错误事件输出
- SPI空闲事件输出
- 传输完成事件输出。

无论中断允许位设置如何，都会输出事件链接输出信号。

38.4.1 接收缓冲区满事件输出

串行传输完成后，当接收到的数据从移位寄存器传输到SPDRSPDR_HA时，输出此事件信号。

38.4.2 发送缓冲区空事件输出

当要发送的数据从发送缓冲器传送到移位寄存器时，以及SPE位的值从0变为1时，输出该事件信号。

38.4.3 Mode-Fault, Underrun, Overrun, or Parity Error Event Output

This event signal is output when mode fault, underrun, overrun, or parity error is detected. See section 38.5.4, Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output if using this event signal.

(1) Mode-fault

Table 38.14 lists the conditions for occurrence of a mode-fault event.

Table 38.14 Conditions for mode fault occurrence

SPI mode	SPCR.MODFEN bit	SSLn0 pin	Remarks
SPI operation (SPMS = 0) Slave (SPCR.MSTR bit = 0)	1	Not active	Event is output only when the pin is deactivated during transmission

(2) Underrun

This event signal is output in response to an underrun when a serial transfer starts while the transmission data is not ready, and the value of the SPCR.MSTR bit is 0 and the SPCR.SPE bit is 1. Under these conditions, the MODF and UDRF flags set to 1.

(3) Overrun

This event signal is output in response to an overrun when a serial transfer completes while the receive buffer contains unread data and the value of the SPCR.TXMD bit is 0. Under these conditions, the OVRF flag sets to 1.

(4) Parity error

This event signal is output in response to a parity error detected on completion of a serial transfer while the value of the TXMD bit in SPCR is 0 and the value of the SPPE bit in SPCR2 is 1.

38.4.4 SPI Idle Event Output

(1) In master mode

In master mode, an event is output when the condition for setting the IDLNF flag (SPI idle flag) to 0 is satisfied.

(2) In slave mode

In slave mode, an event is output when the SPCR.SPE bit is set to 0 (SPI is initialized).

38.4.5 Transmission-Completed Event Output

During both SPI operation and clock synchronous operation in master mode, an event is output when the IDLNF flag (SPI idle flag) changes from 1 to 0. Table 38.15 lists the conditions for occurrence of a transmission-completed event.

Table 38.15 Conditions for generation of transmission-complete event in slave mode

SPI mode	Transmit buffer state	Shift register state	Other
SPI operation (SPMS = 0)	Empty	Empty	Negation of SSLn0 input
Clock synchronous operation (SPMS = 1)	Empty	Empty	Edge detection of the last RSPCKn

Whether the operation is in master mode or slave mode, an event is not output if 0 is written to the SPCR.SPE bit in transmission or the SPCR.SPE bit is cleared by the mode-fault error or the underrun error.

38.5 Usage Notes

38.5.1 Settings for the Module-Stop Function

The Module Stop Control Register B (MSTPCRB) can enable or disable SPI operation. The SPI is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

38.4.3 模式故障、欠载、溢出或奇偶校验错误事件输出

当检测到模式故障、欠载、溢出或奇偶校验错误时，输出该事件信号。见第38.5.4节，如果使用此事件信号，则对模式故障、欠载、溢出或奇偶校验错误事件输出的约束。

(1) Mode-fault

表38.14列出了模式故障事件发生的条件。

Table 38.14 模式故障发生的条件

SPI模式	SPCR.MODFEN bit	SSLn0 pin	Remarks
SPI操作(SPMS=0) 从机（SPCR.MSTR位=0）	1	不活跃	仅当在传输过程中禁用该引脚时才输出事件

(2) Underrun

当串行传输开始而传输数据未准备好，并且SPCR.MSTR位的值为0和SPCR.SPE位为1时，输出该事件信号以响应欠载。在这些条件下，MODF和UDRF标志设置为1。

(3) Overrun

当串行传输完成而接收缓冲区包含未读数据且SPCR.TXMD位的值为0时，输出此事件信号以响应溢出。在这些情况下，OVRF标志设置为1。

(4) 奇偶校验错误

该事件信号是响应在串行传输完成时检测到的奇偶校验错误而输出的，而SPCR中的TXMD位为0，SPCR2中的SPPE位的值为1。

38.4.4 SPI空闲事件输出

(1) 在主模式

在主机模式下，当将IDLNF标志（SPI空闲标志）设置为0的条件成立时输出事件。

(2) 在从模式

在从机模式下，当SPCR.SPE位设置为0（SPI初始化）时，会输出一个事件。

38.4.5 传输完成事件输出

在主机模式下的SPI操作和时钟同步操作期间，当IDLNF标志（SPI空闲标志）从1变为0时输出事件。表38.15列出了发生传输完成事件的条件。

Table 38.15 从机模式下产生传输完成事件的条件

SPI模式	发送缓冲区状态	移位寄存器状态	Other
SPI操作(SPMS=0)	Empty	Empty	SSLn0输入的否定
时钟同步操作(SPMS=1)	Empty	Empty	最后一个RSPCKn的边缘检测

无论操作是主模式还是从模式，如果在传输过程中向SPCR.SPE位写入0或SPCR.SPE位因模式故障错误或欠载错误而清零，则不输出事件。

38.5 使用说明

38.5.1 模块停止功能的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用SPI操作。SPI在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

38.5.2 Constraint on Low Power Functions

When using the module-stop function and entering a low power mode other than Sleep, set the SPCR.SPE bit to 0 before completing communication.

38.5.3 Constraints on Starting Transfer

If the ICU.IELSRn.IR flag is 1 when transfer starts, the interrupt request is internally saved, which can lead to unanticipated behavior of the ICU.IELSRn.IR flag.

To prevent this, use the following procedure to clear interrupt requests before enabling operations (by setting the SPCR.SPE bit to 1):

1. Confirm that transfer stopped (the SPCR.SPE bit is 0).
2. Set the associated interrupt enable bit (SPCR.SPTIE or SPCR.SPRIE) to 0.
3. Read the associated interrupt enable bit (SPCR.SPTIE or SPCR.SPRIE) and confirm that its value is 0.
4. Set the ICU.IELSRn.IR flag to 0.

38.5.4 Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output

Using the mode-fault, underrun, overrun or parity error event is prohibited if the SPI is in multi-master mode (when the SPCR.SPMS bit is 0, the SPCR.MSTR bit is 1, and the SPCR.MODFEN bit is 1).

38.5.5 Constraints on the SPRF and SPTEF Flags

If the polling flags, SPRF and SPTEF, are used, interrupt usage is prohibited, and you must set the SPCR.SPRIE and SPCR.SPTIE bits to 0. Either the interrupts or the flags can be used, but not both.

38.5.2 对低功耗函数的约束

当使用模块停止功能并进入除睡眠以外的低功耗模式时，在完成通信之前将SPCR.SPE位设置为0。

38.5.3 开始传输的限制

如果ICU.IELSRn.IR标志在传输开始时为1，则内部保存中断请求，这可能导致ICU.IELSRn.IR标志的意外行为。

为防止这种情况发生，请使用以下过程在启用操作之前清除中断请求（通过设置SPCR.SPE位为1）：

1. 确认传输停止（SPCR.SPE位为0）。
2. 将相关的中断使能位（SPCR.SPTIE或SPCR.SPRIE）设置为0。
3. 读取相关的中断使能位（SPCR.SPTIE或SPCR.SPRIE）并确认其值为0。
4. 将ICU.IELSRn.IR标志设置为0。

38.5.4 模式故障、欠载、溢出或奇偶校验错误事件输出的约束

如果SPI处于多主模式（当SPCR.SPMS位为0，SPCR.MSTR位为1，SPCR.MODFEN位为1）。

38.5.5 SPRF和SPTEF标志的约束

如果使用轮询标志SPRF和SPTEF，则禁止使用中断，您必须设置SPCR.SPRIE和SPCR.SPTIE位为0。可以使用中断或标志，但不能同时使用。

39. Quad Serial Peripheral Interface (QSPI)

39.1 Overview

The Quad Serial Peripheral Interface (QSPI) module is a memory controller for connecting serial ROM that has an SPI-compatible interface. This includes nonvolatile memory, such as a serial flash memory, serial EEPROM, or serial FeRAM. Table 39.1 lists the QSPI specifications, Figure 39.1 shows a block diagram, and Table 39.2 lists the I/O pins.

Table 39.1 QSPI specifications

Parameter	Specifications
Number of channels	1 channel
SPI	• Support for Extended SPI, Dual SPI, and Quad SPI protocols • Configurable to SPI mode 0 and SPI mode 3 • Address width selectable to 8, 16, 24, or 32 bits.
Timing adjustment function	Configurable to support a wide range of serial flash
Flash read function	• Support for Read, Fast Read, Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, and Fast Read Quad I/O instructions • Substitutable instruction code • Adjustable number of dummy cycles • Prefetch function • Polling processing • SPI bus cycle extension function.
Direct communication function	Flexible support for a wide variety of serial flash instructions and functions through software control, including erase, write, ID read, and power-down control
Interrupt source	Error interrupts
Module-stop function	Module-stop state can be set to reduce power consumption

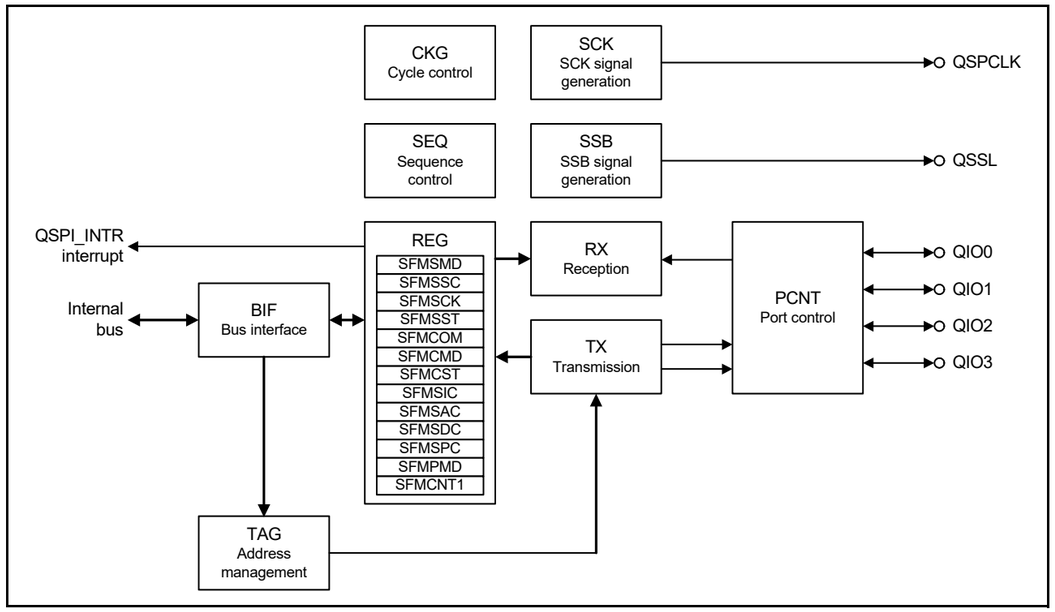

Figure 39.1 QSPI block diagram

39. 四路串行外设接口(QSPI)

39.1 Overview

QuadSerialPeripheralInterface(QSPI)模块是一种存储器控制器，用于连接具有SPI兼容接口的串行ROM。这包括非易失性存储器，例如串行闪存、串行EEPROM或串行FeRAM。表39.1列出了QSPI规范，图39.1显示了框图，表39.2列出了IO引脚。

Table 39.1 QSPI specifications

Parameter	Specifications
通道数	1 channel
SPI	支持扩展SPI、双SPI和QuadSPI协议 可配置为SPI模式0和SPI模式3 地址宽度可选择为8、16、24或32位。
定时调整功能	可配置以支持各种串行闪存
闪存读取功能	支持读取、快速读取、快速读取双输出、快速读取双IO、快速读取四输出和快速读取四IO指令可替换指令代码 可调整的虚拟周期数 预取功能 轮询处理 SPI总线周期扩展功能。
直接通讯功能	通过软件控制灵活支持各种串行闪存指令和功能，包括擦除、写入、ID读取和断电控制
中断源	错误中断
Module-stop function	可设置模块停止状态以降低功耗

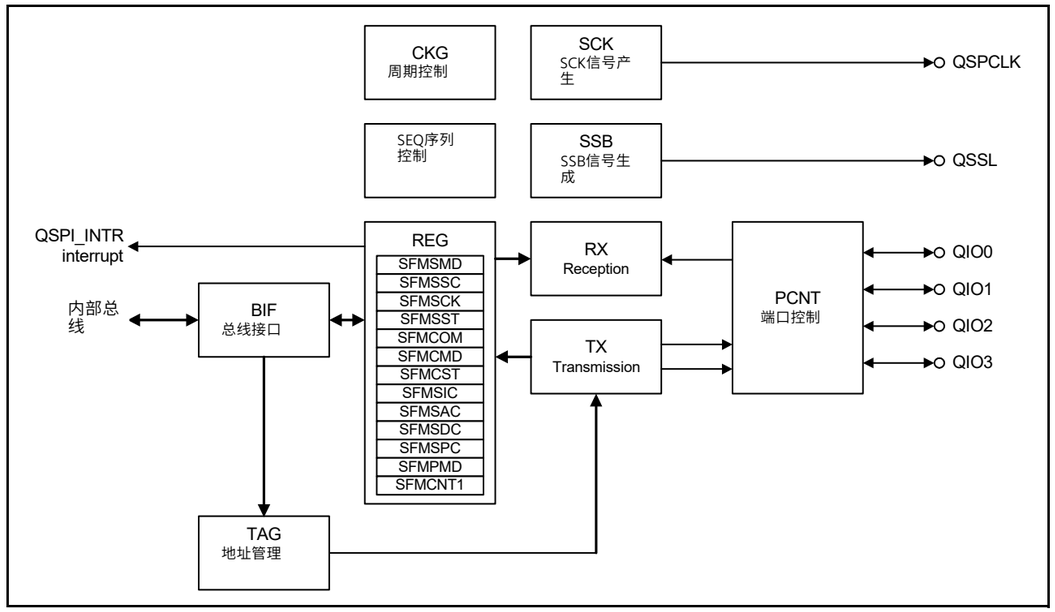

Figure 39.1 QSPI框图

Table 39.2 QSPI I/O pins

Pin name	I/O	Function
QSPCLK	Output	QSPI clock output pin
QSSL	Output	QSPI slave select pin

39.3 内存映射

39.3.1 内部总线空间

AHB空间中串行闪存和控制寄存器的位置由配置区域的地址范围决定。

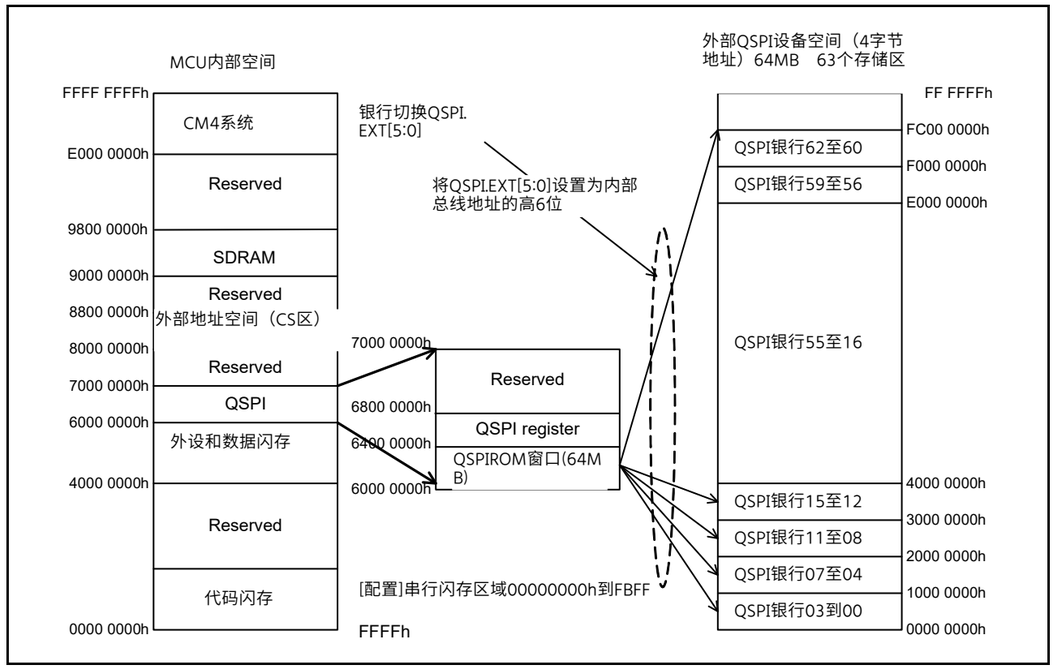

Figure 39.2 默认区域设置和AHB空间内存映射

39.3.2 Address Width of the SPI Space and SPI Bus

The SPI space has a 32-bit address width for referencing the serial flash. When the SPI space is accessed for a read, an SPI bus cycle starts automatically, and data read from the serial flash is returned.

The address width of the SPI space is fixed at 32 bits. However, the address width of the SPI bus is selectable to 8, 16, 24, or 32 bits in the SFMAS[1:0] bits in the SFMSAC register. If 8, 16, or 24 bits is selected as the address width of the SPI bus, only the lower part of the address used to access the SPI space is posted to the serial flash through the SPI bus. As a result, the mirror image of the serial flash corresponding to the address width of the SPI bus repeatedly appears in the SPI space.

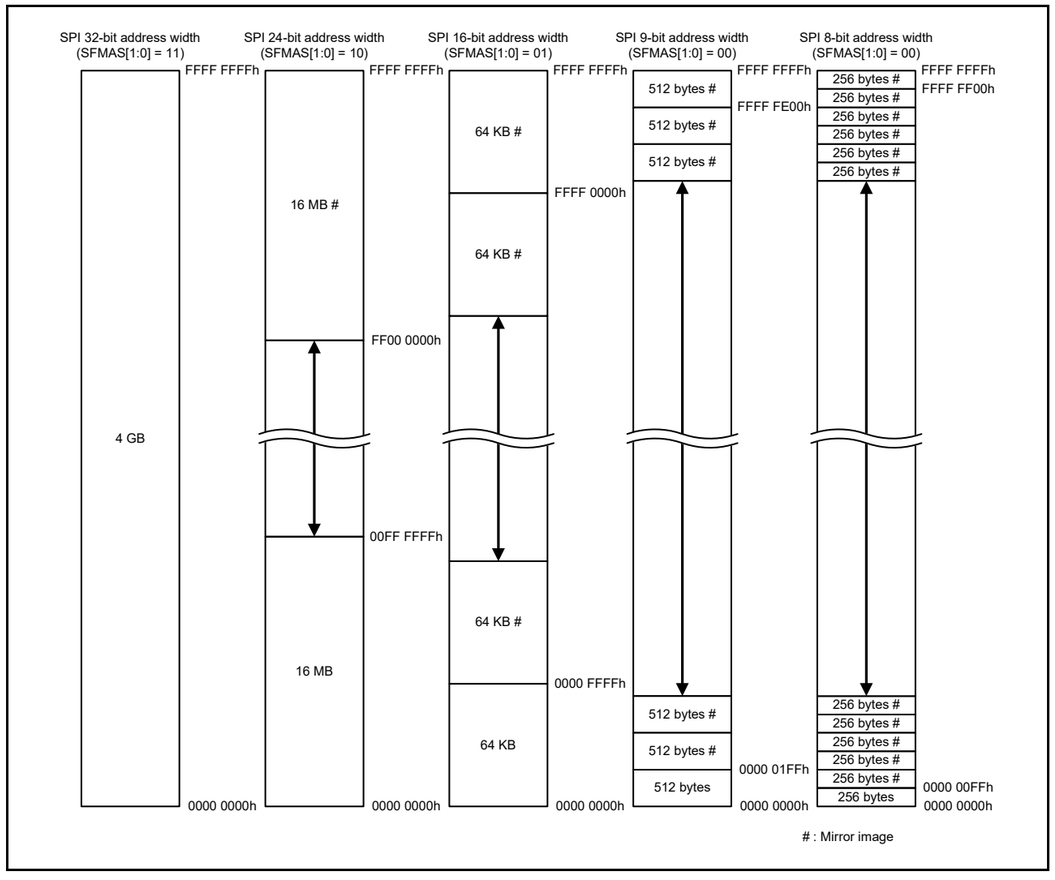

Figure 39.3 Memory map of SPI space

Note: The SPI bus address width is selectable to 8, 16, 24, or 32 bits in the SFMAS[1:0] bits in the SFMSAC register. When an 8-bit address width is selected, the address information of the ninth bit can be embedded in the Read instruction code. The address map in the figures is for the SPI 9-bit address width. For details on the Read instruction, see section 39.6.2, Standard Read Instruction.

39.4 SPI Bus

39.4.1 SPI Protocol

The QSPI supports Extended SPI, Dual SPI, and Quad SPI, in addition to the SPI protocol used for serial flash connection. The initial state is Extended SPI. To change the protocol, set the SFMSPI bit in the SFMSPC register. The Extended SPI protocol always outputs instruction codes from a single QIO0 pin. It performs subsequent address and data

39.3.2 SPI空间和SPI总线的地址宽度

SPI空间具有32位地址宽度，用于引用串行闪存。当SPI空间被访问以进行读取时，一个SPI总线周期自动启动，并返回从串行闪存读取的数据。

SPI空间的地址宽度固定为32位。但是，SPI总线的地址宽度可以在SFMSAC寄存器的SFMAS[1:0]位中选择为8、16、24或32位。如果选择8、16或24位作为SPI总线的地址宽度，则只有用于访问SPI空间的地址的低部分通过SPI总线发布到串行闪存。结果，对应于SPI总线地址宽度的串行闪存的镜像在SPI空间中反复出现。

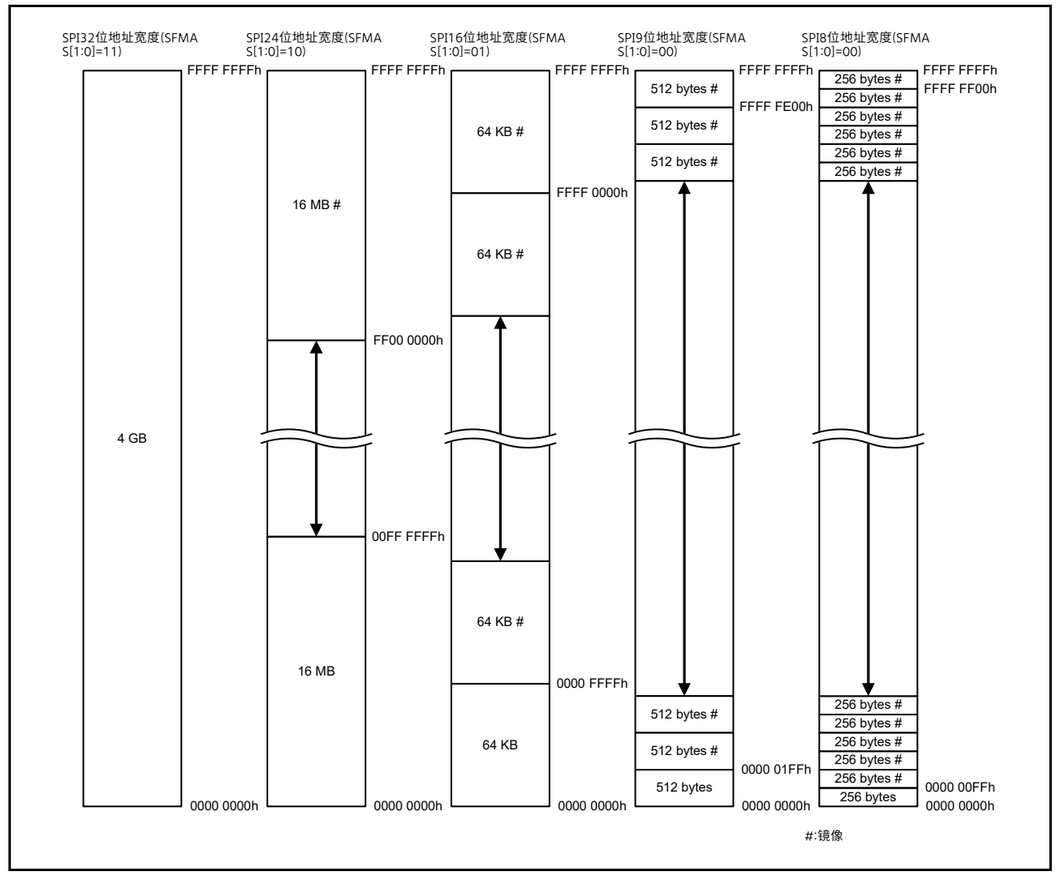

Figure 39.3 SPI空间的内存映射

Note: SPI总线地址宽度可在SFMSAC寄存器的SFMAS[1:0]位中选择为8、16、24或32位。Whenan8-bitaddresswidthis selected theaddressinformationoftheninthbitcanbeembeddedintheReadinstructioncode.图中的地址映射是针对SPI9位地址宽度的。有关读取指令的详细信息，请参阅第39.6.2节，标准读取指令。

39.4 SPI总线

39.4.1 SPI协议

除了用于串行闪存连接的SPI协议外，QSPI还支持扩展SPI、双SPI和四通道SPI。初始状态是扩展SPI。要更改协议，请设置SFMSPC寄存器中的SFMSPI位。扩展SPI协议始终从单个QIO0引脚输出指令代码。它执行后续的地址和数据

I/O operations using one to four pins, depending on the instruction code format.

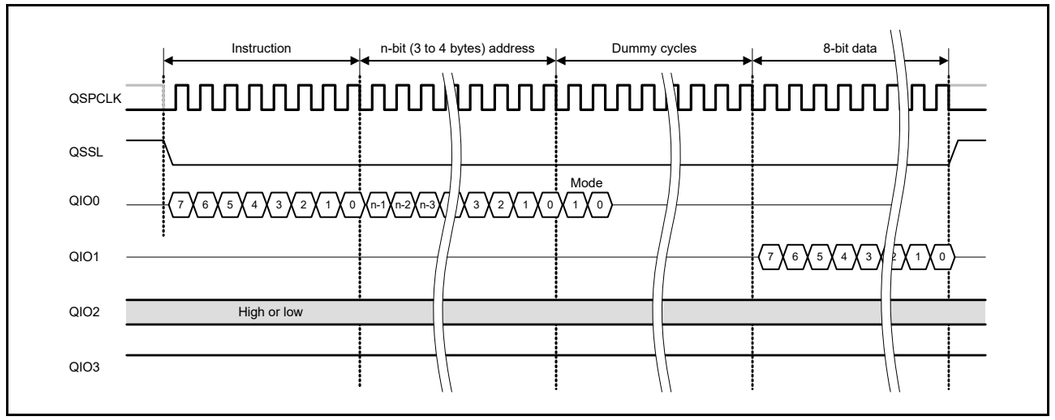

Figure 39.4 Extended SPI protocol example 1 for Fast Read

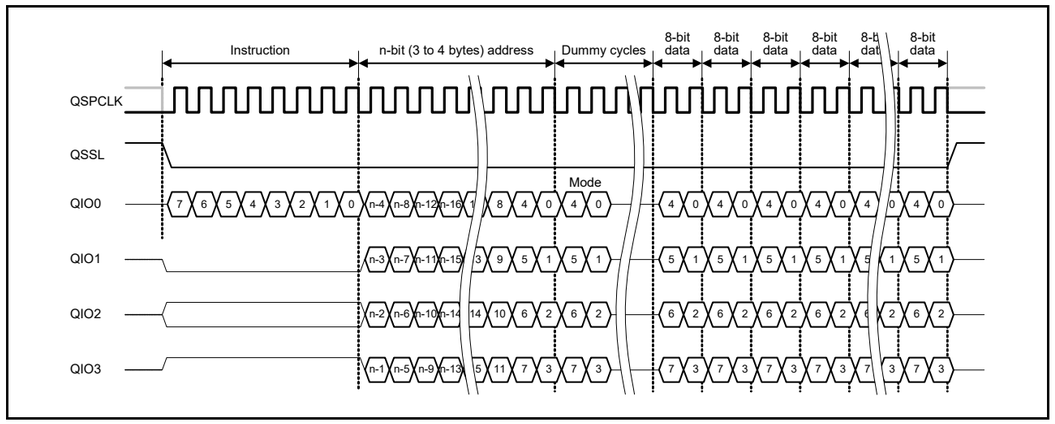

Figure 39.5 Extended SPI protocol example 2 for Fast Read Quad I/O

The Dual SPI protocol performs I/O operation of all signals such as instruction codes, addresses, and data using two pins, QIO0 and QIO1.

IO操作使用一到四个引脚，具体取决于指令代码格式。

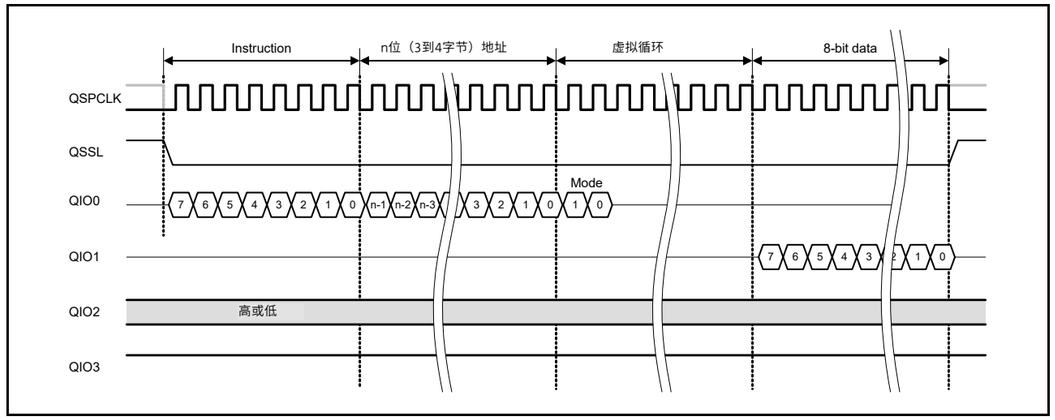

Figure 39.4 用于快速读取的扩展SPI协议示例1

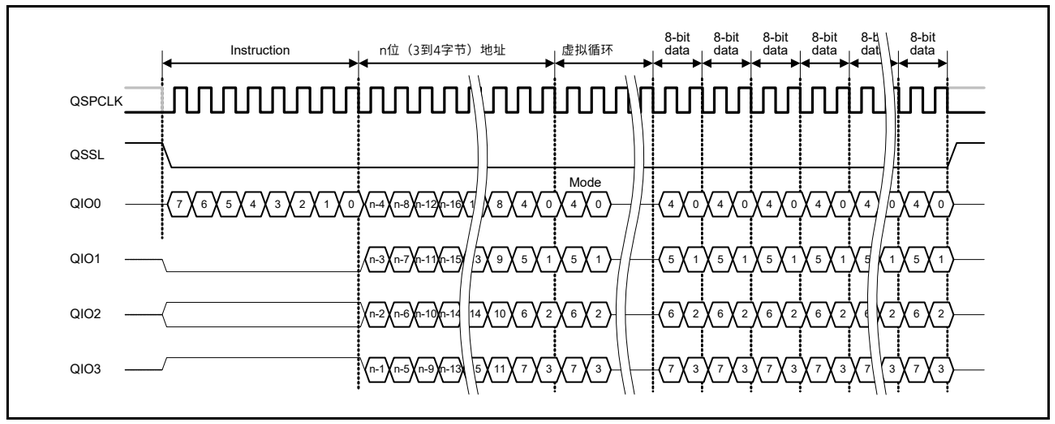

Figure 39.5 用于快速读取QuadIO的扩展SPI协议示例2

DualSPI协议使用两个引脚执行指令代码、地址和数据等所有信号的IO操作，
QIO0 and QIO1.

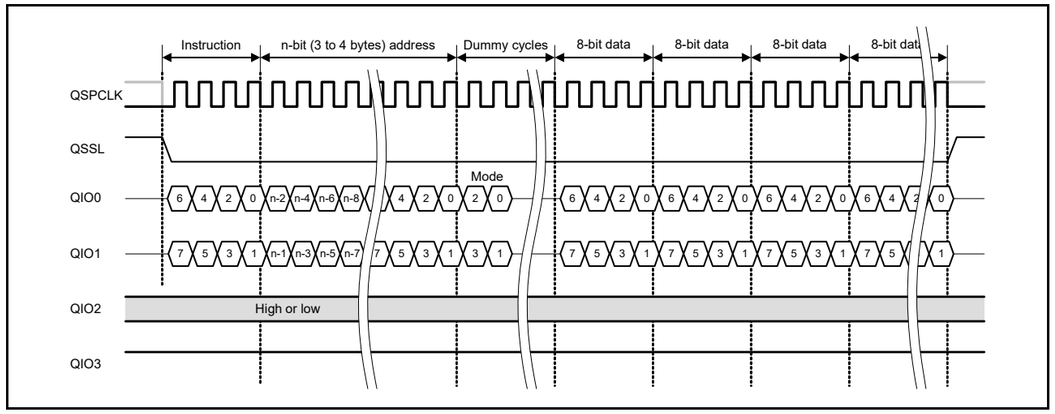

Figure 39.6 Dual SPI protocol example for Fast Read

The Quad SPI protocol performs I/O operation of all signals such as instruction codes, addresses, and data using four pins, QIO0, QIO1, QIO2, and QIO3.

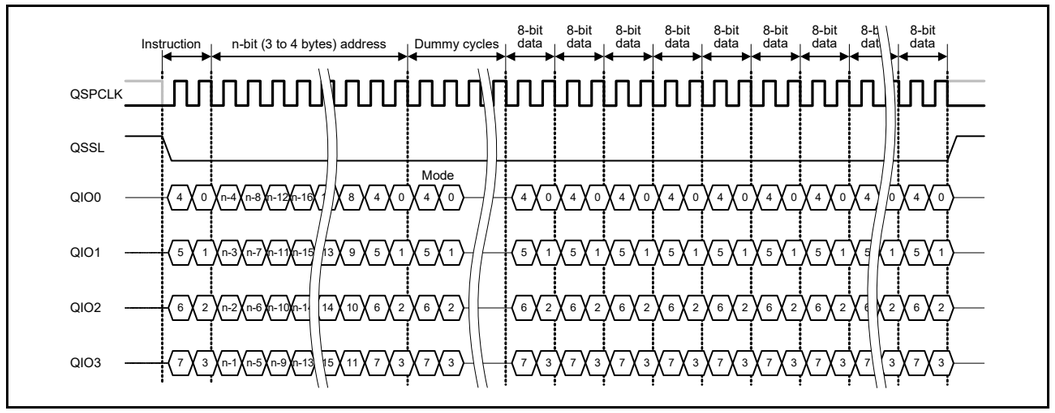

Figure 39.7 Quad SPI protocol example for Fast Read

39.4.2 SPI Mode

Either SPI mode 0 or SPI mode 3 can be selected as the SPI mode. This can be switched by changing the register setting during operation. The difference between SPI modes 0 and 3 is the standby level of the QSPCLK signal. The standby level of the QSPCLK signal in SPI mode 0 is low, and high in SPI mode 3.

Serial data is output from the QSPI on a falling edge of the serial clock and is read into the external flash on a rising edge of the serial clock. Serial data is output from the external flash on a falling edge of the serial clock and is read into the QSPI on the next falling edge of the serial clock.

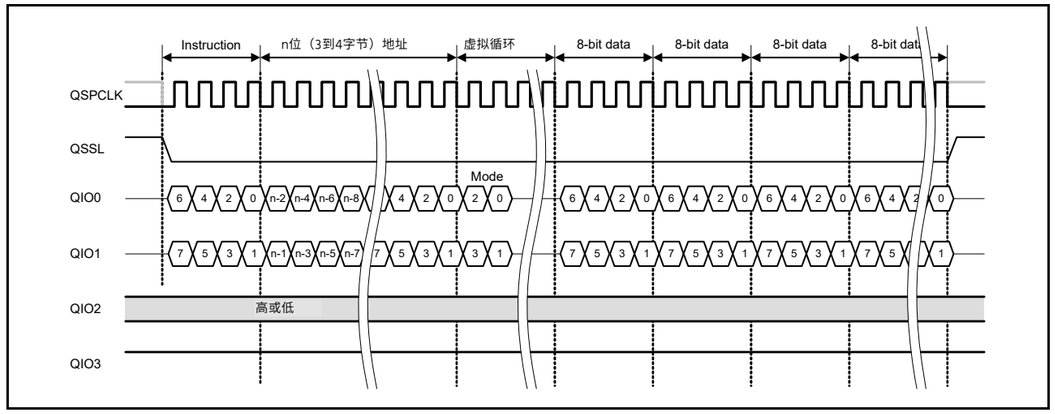

Figure 39.6 用于快速读取的双SPI协议示例

QuadSPI协议使用四个引脚QIO0、QIO1、QIO2和QIO3对指令代码、地址和数据等所有信号执行IO操作。

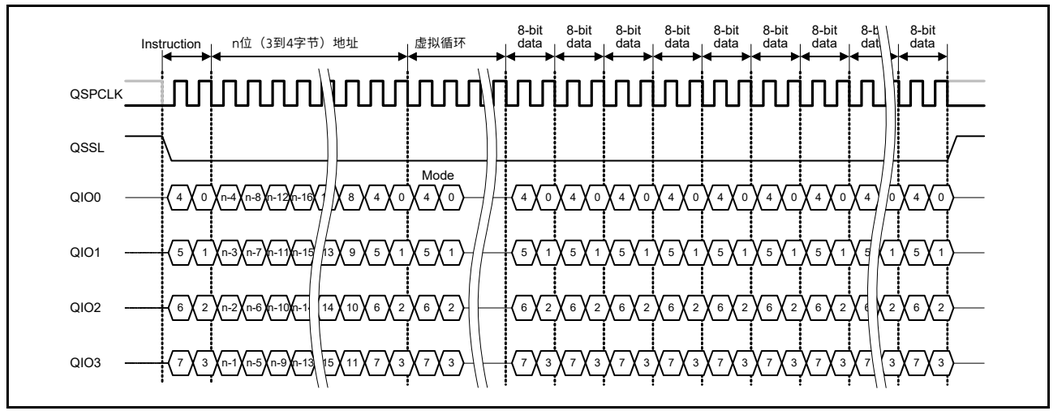

Figure 39.7 用于快速读取的QuadSPI协议示例

39.4.2 SPI模式

SPI模式0或SPI模式3均可选择为SPI模式。这可以通过在操作期间更改寄存器设置来切换。SPI模式0和3的区别在于QSPCLK信号的待机电平。QSPCLK信号在SPI模式0中的待机电平为低，在SPI模式3中为高。

串行数据在串行时钟的下降沿从QSPI输出，并在串行时钟的上升沿读入外部闪存。串行数据在串行时钟的下降沿从外部闪存输出，并在串行时钟的下一个下降沿读入QSPI。

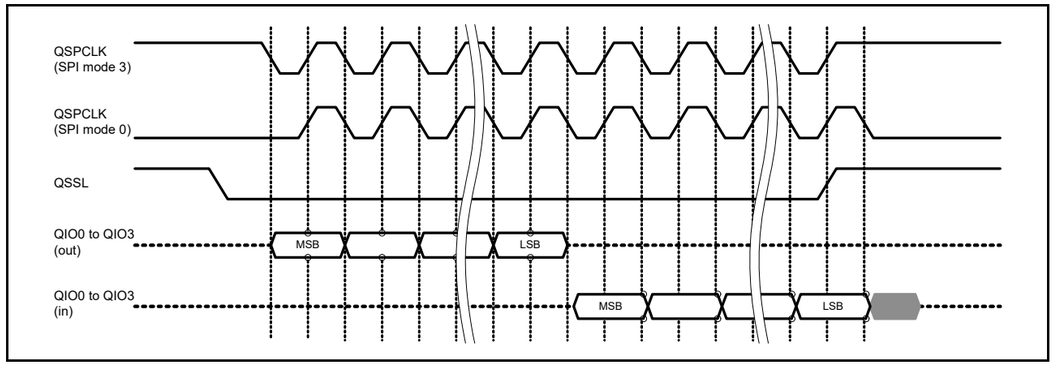

Figure 39.8 Basic serial interface timing

39.5 SPI Bus Timing Adjustment

The timing of the SPI bus signal can be adjusted in the registers. The configured timing is applied to all SPI bus accesses, for both ROM access and direct communication.

39.5.1 SPI Bus Reference Cycles

The SPI bus operates on reference cycles obtained by multiplying PCLKA by an integer. The reference cycles are selectable within the range of PCLKA multiplied by 2 to 48 in the SFMDV[4:0] bits in the SFMSKC register.

Table 39.3 Relationship among SFMDV[4:0] bits, cycle multiplier, and serial clock frequencies (1 of 2)

SFMDV[4:0]	Cycle multiplier	PCLKA frequency (MHz)
		120
11111	48	2.50
11110	46	2.61
11101	44	2.73

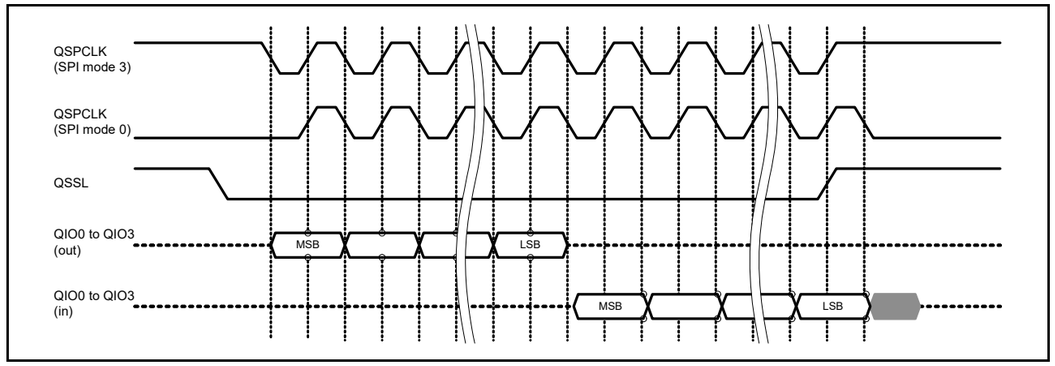

Figure 39.8 基本串行接口时序

39.5 SPI总线时序调整

SPI总线信号的时序可以在寄存器中调整。配置的时序适用于所有SPI总线访问，包括ROM访问和直接通信。

39.5.1 SPI总线参考周期

SPI总线在通过将PCLKA乘以一个整数获得的参考周期上运行。参考周期可在SFMSKC寄存器的SFMDV[4:0]位中的PCLKA乘以2到48的范围内选择。

Table 39.3 SFMDV[4:0]位、周期乘数和串行时钟频率之间的关系（1of2）

SFMDV[4:0]	循环乘数	PCLKA frequency (MHz)
		120
11111	48	2.50
11110	46	2.61
11101	44	2.73

01100	14	8.57
01011	13	9.23
01010	12	10.00

Table 39.3 Relationship among SFMDV[4:0] bits, cycle multiplier, and serial clock frequencies (2 of 2)

SFMDV[4:0]	Cycle multiplier	PCLKA frequency (MHz)
		120
01001	11	10.91
01000	10	12.00
00111	9	13.33
00110	8	15.00
00101	7	17.14
00100	6	20.00
00011	5	24.00
00010	4	30.00
00001	3	40.00
00000	2	60.00

39.5.2 QSPCLK Signal Duty Ratio

When the reference clock is configured as PCLKA multiplied by an even number, the high- and low-level widths of the QSPCLK signal match each other. When PCLKA is multiplied by an odd number, however, the high-level width is longer than the low-level width by 1 PCLKA.

To make the duty ratio of the QSPCLK signal close to 50% when PCLKA multiplied by an odd number is the reference clock, set the SFMDTY bit in the SFMSKC register to 1. With this setting, the rising edge of the QSPCLK output signal is delayed by one-half PCLKA cycle to perform an interface operation equivalent to a duty ratio of 50%.

When the reference clock is PCLKA multiplied by an even number, the SFMDTY setting in the SFMSKC register is ignored.

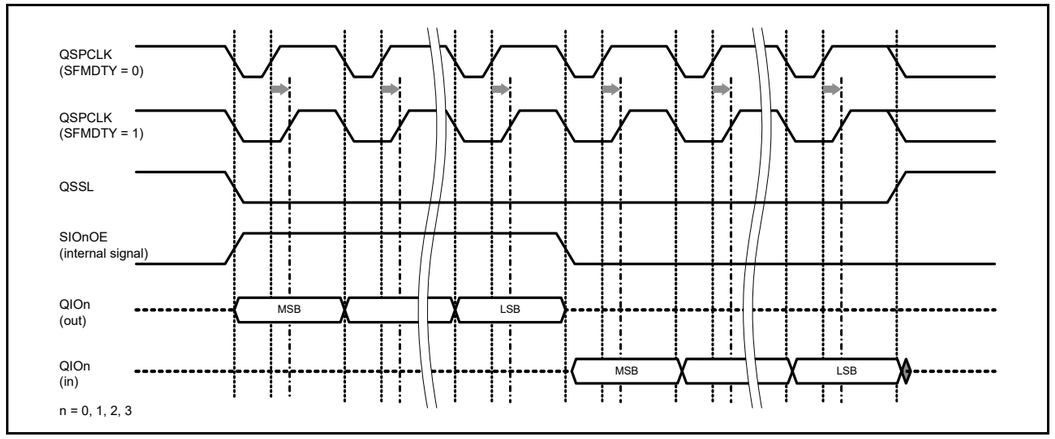

Figure 39.9 Example correction of the QSPCLK signal duty ratio using the SFMDTY bit, when PCLKA is multiplied by 3

39.5.3 Minimum High-Level Width for the QSSL Signal

Between adjacent SPI bus cycles, the QSSL signal must be held high (inactive) for a sufficient time to satisfy the deselect time required by the serial flash. The minimum high-level width of the QSSL output signal is selectable as the reference cycle multiplied by an integer from 1 to 16 in the SFMSW[3:0] bits in the SFMSSC register.

39.5.4 QSSL Signal Setup Time

When the QSPCLK signal first rises after the QSSL signal is driven low, the QSSL signal setup time can be configured to satisfy the serial flash requirements. The setup time can be selectable as 0.5 QSPCLK or 1.5 QSPCLK in the SFMSLD

Table 39.3 SFMDV[4:0]位、周期乘数和串行时钟频率之间的关系(2of2)

SFMDV[4:0]	循环乘数	PCLKA frequency (MHz)
		120
01001	11	10.91
01000	10	12.00
00111	9	13.33
00110	8	15.00
00101	7	17.14
00100	6	20.00
00011	5	24.00
00010	4	30.00
00001	3	40.00
00000	2	60.00

39.5.2 QSPCLK信号占空比

当参考时钟配置为PCLKA乘以偶数时，
QSPCLK信号相互匹配。然而，当PCLKA乘以奇数时，高电平宽度比低电平宽度长1个PCLKA。

当PCLKA乘以奇数作为参考时钟时，为了使QSPCLK信号的占空比接近50%，请将SFMSKC寄存器中的SFMDTY位设置为1。通过此设置，QSPCLK输出信号的上升沿被延迟通过半个PCLKA周期来执行相当于50%占空比的接口操作。

当参考时钟是PCLKA乘以偶数时，SFMSKC寄存器中的SFMDTY设置将被忽略。

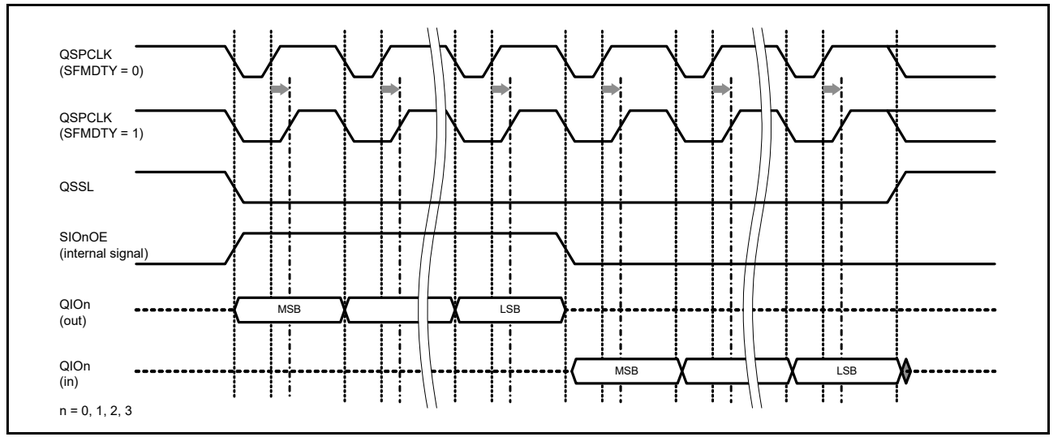

Figure 39.9 当PCLKA乘以3时，使用SFMDTY位校正QSPCLK信号占空比的示例

39.5.3 QSSL信号的最小高电平宽度

在相邻的SPI总线周期之间，QSSL信号必须保持高电平（无效）足够长的时间，以满足串行闪存所需的取消选择时间。QSSL输出信号的最小高电平宽度可选择为参考周期乘以SFMSSC寄存器中SFMSW[3:0]位中1到16的整数。

39.5.4 QSSL信号建立时间

当QSSL信号被驱动为低电平后QSPCLK信号首次上升时，可以配置QSSL信号建立时间以满足串行闪存的要求。建立时间可以在SFMSLD中选择为0.5QSPCLK或1.5QSPCLK

bit in the SFMSSC register.

The SFMSLD setting in the SFMSSC register is also applied to the allocate a setup time from the output of the serial data output enable signal (QIO0OE, QIO1OE, QIO2OE, or QIO3OE) until the first rising edge of the QSPCLK signal. Set a value that meets the most constrained timing condition for your application.

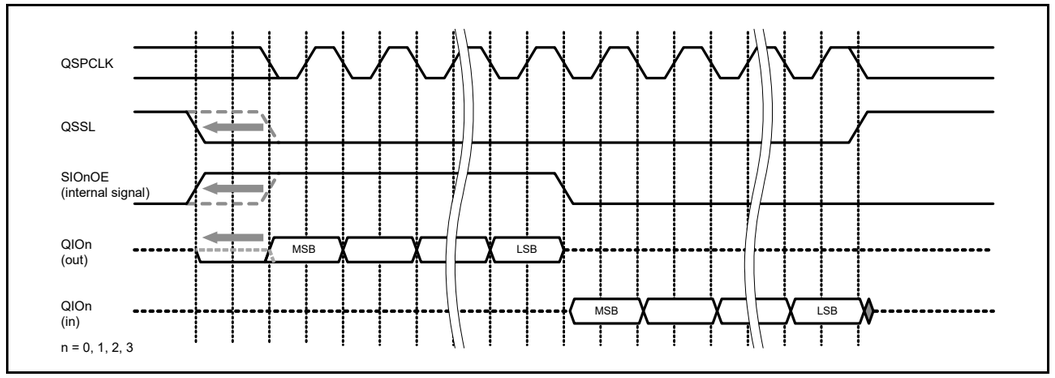

Figure 39.10 Setup time adjustment for the QSSL signal using the SFMSLD bit

39.5.5 QSSL Signal Hold Time

When the QSSL signal is driven high after the last rising edge of the QSPCLK signal, the QSSL signal hold time can be configured to satisfy the device requirements. The hold time is selectable as 0.5 QSPCLK or 1.5 QSPCLK in the SFMSHD bit in the SFMSSC register.

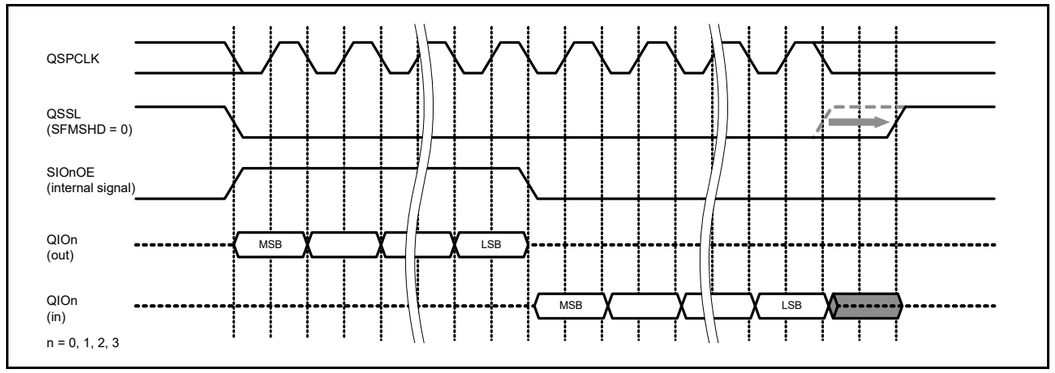

Figure 39.11 Hold time adjustment for the QSSL signal using the SFMSHD bit

39.5.6 Hold Time of the Serial Data Output Enable

The buffer output enable of the QIO0, QIO1, QIO2, or QIO3 pin can be extended by 1 QSPCLK using the SFMOEX bit in the SFMSMD register. The target extension signals include only the output enable signals: QIO0E, QIO1OE, QIO2OE, and QIO3OE. They do not include the output data signals: QIO0O, QIO1O, QIO2O, or QIO3O.

SFMSSC寄存器中的位。

SFMSSC寄存器中的SFMSLD设置也用于分配从串行数据输出使能信号（QIO0OE、QIO1OE、QIO2OE或QIO3OE）输出到QSPCLK信号的第一个上升沿的建立时间。为您的应用设置一个满足最受约束的时序条件的值。

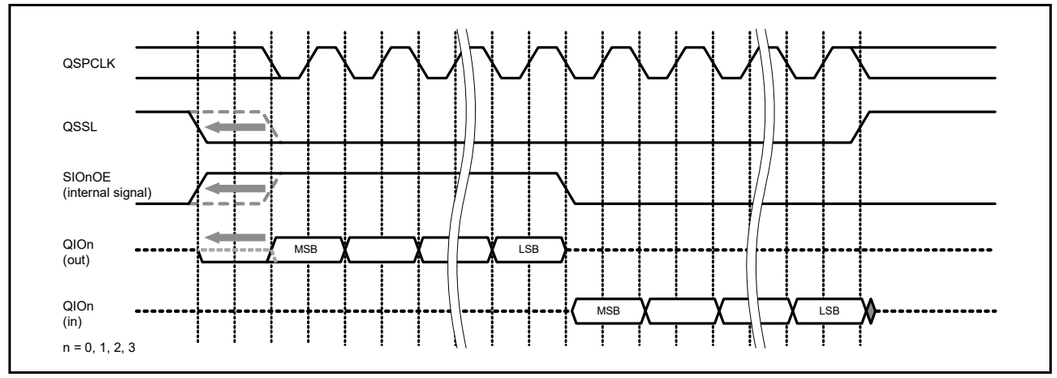

Figure 39.10 使用SFMSLD位调整QSSL信号的建立时间

39.5.5 QSSL信号保持时间

当QSSL信号在QSPCLK信号的最后一个上升沿后被驱动为高电平时，可以配置QSSL信号保持时间以满足器件要求。保持时间可在SFMSSC寄存器的SFMSHD位中选择为0.5QSPCLK或1.5QSPCLK。

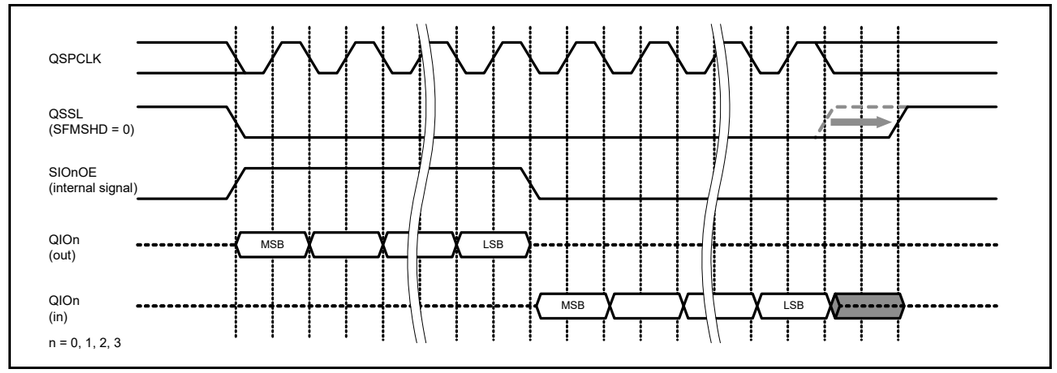

Figure 39.11 使用SFMSHD位调整QSSL信号的保持时间

39.5.6 串行数据输出使能的保持时间

可以使用SFMSMD寄存器中的SFMOEX位将QIO0、QIO1、QIO2或QIO3引脚的缓冲器输出使能扩展1个QSPCLK。目标扩展信号仅包括输出使能信号：QIO0E、QIO1OE、QIO2OE和QIO3OE。它们不包括输出数据信号：QIO0O、QIO1O、QIO2O或QIO3O。

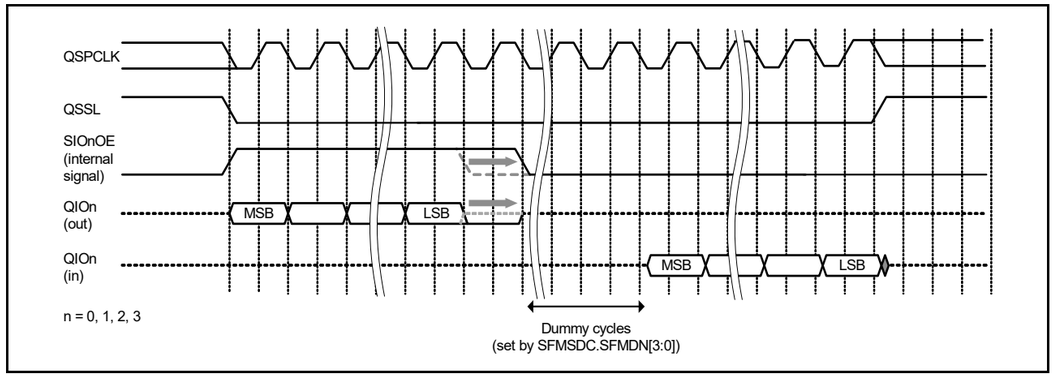

Figure 39.12 Hold time adjustment for output enable using the SFMOEX bit

39.5.7 Setup Time for Serial Data Output

When a command or address is transmitted to the serial flash, the setup time begins on serial data output and ends when the QSPCLK signal rises. If this setup time is insufficient, it can be extended by 1 PCLKA using the SFMOSW bit in the SFMSMD register. When SFMOSW is 1, the low-level width of QSPCLK during serial data transmission is extended by 1 PCLKA while data is being output from the QSPI. This function has no effect on serial data reception.

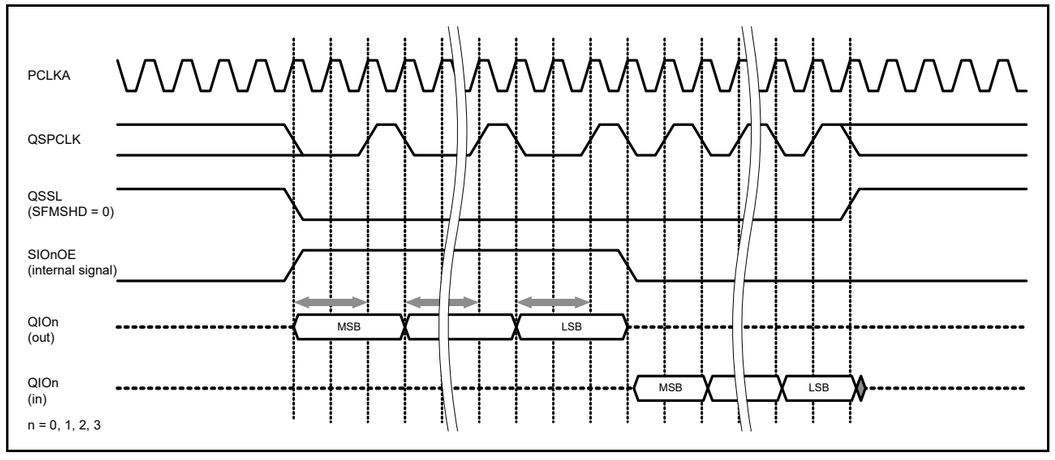

Figure 39.13 Setup time adjustment for serial data output using the SFMOSW bit

39.5.8 Hold Time for Serial Data Output

When a command or address is transmitted to the serial flash, the hold time begins on the rising edge of QSPCLK and ends when the serial data makes another transmission. If this hold time is insufficient, it can be extended by 1 PCLKA using the SFMOHW bit in the SFMSMD register. When SFMOSW is 1, the high-level width of QSPCLK during serial data transmission is extended by 1 PCLKA while data is being output from the QSPI. This function has no effect on serial data reception.

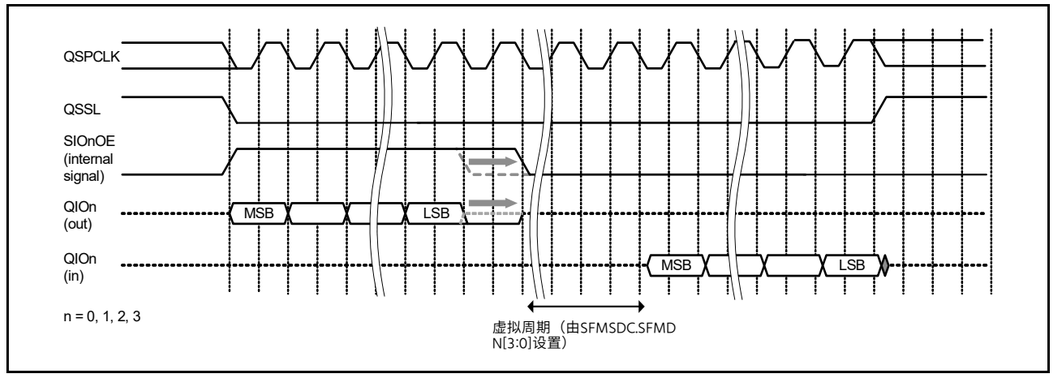

Figure 39.12 使用SFMOEX位调整输出使能的保持时间

39.5.7 串行数据输出的建立时间

当命令或地址传输到串行闪存时，设置时间从串行数据输出开始，到QSPCLK信号上升时结束。如果此建立时间不足，可以使用SFMSMD寄存器中的SFMOSW位将其延长1个PCLKA。当SFMOSW为1时，在从QSPI输出数据时，串行数据传输期间QSPCLK的低电平宽度扩展1PCLKA。该功能对串行数据接收没有影响。

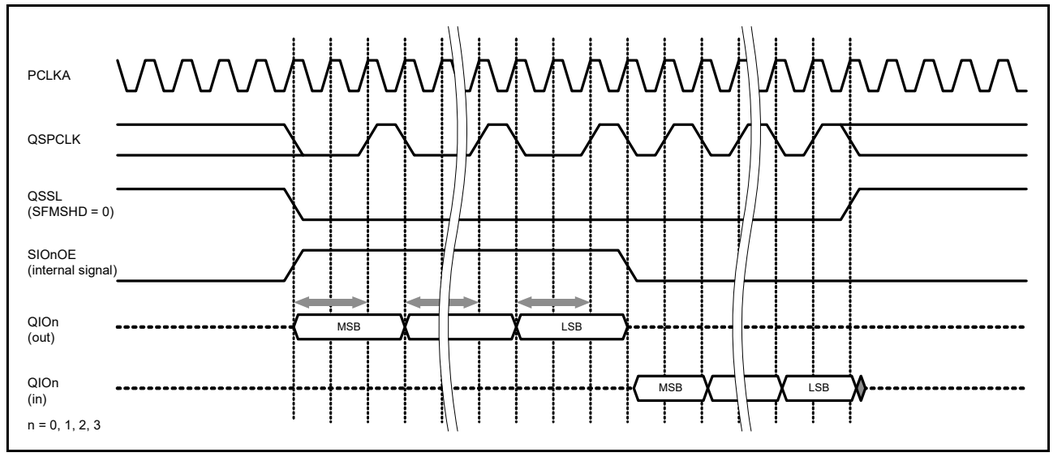

Figure 39.13 使用SFMOSW位调整串行数据输出的建立时间

39.5.8 串行数据输出的保持时间

当命令或地址传输到串行闪存时，保持时间从QSPCLK的上升沿开始，并在串行数据进行另一次传输时结束。如果该保持时间不足，可以使用SFMSMD寄存器中的SFMOHW位将其延长1个PCLKA。当SFMOSW为1时，在从QSPI输出数据时，串行数据传输期间QSPCLK的高电平宽度扩展1PCLKA。该功能对串行数据接收没有影响。

Note 1. If the SFMSMD.SFMCCE bit is set to 1, the SFMSIC.SFMCIC[7:0] setting is used as an instruction code.
Note 2. The number of dummy cycles is configurable in SFMSDC.SFMDN[3:0].

39.6.2 Standard Read Instruction

The standard Read instruction is a common read instruction supported by most serial flash. When an SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (03h/13h)*1 is output. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted. Data is then received.

This standard Read instruction is selected in the initial QSPI settings.

Note 1. Many 4-Kb serial flash devices have an address field not larger than 1 byte (A7-A0) to minimize the overhead and to receive A8 information from bit 3 of the Read instruction code. To support these devices, the QSPI only outputs A8 (address bit 8) to bit [3] of the standard Read instruction code when an address width of 1 byte is specified (SFMAS[1:0] = 00). This means that 0Bh might be output instead of 03h as the standard Read instruction code. This code duplicates the Fast Read instruction code. However, for most of the 2-Kb or smaller serial flash devices, with an address width of 1 byte, bit 3 of a command is designed to be excluded from

Table 39.6 当SFMAS[1:0]=10b(2of2)时自动生成SPI指令

Note 2. 虚拟周期数可在SFMSDC.SFMDN[3:0]中配置。

39.6.2 标准阅读说明

标准读指令是大多数串行闪存支持的常见读指令。当一个SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码(03h13h)*1。接下来，发送宽度为1到4字节的地址，在SFMSAC寄存器的SFMAS[1:0]位中指定。然后接收数据。

在初始QSPI设置中选择此标准读取指令。

注1.许多4-Kb串行闪存设备具有不大于1字节(A7-A0)的地址字段，以最大限度地减少开销并从读取指令代码的第3位接收A8信息。为了支持这些器件，当指定地址宽度为1字节（SFMAS[1:0]=00）时，QSPI仅将A8（地址位8）输出到标准读指令代码的位[3]。这意味着可能会输出0Bh而不是03h作为标准读取指令代码。此代码复制了快速读取指令代码。但是，对于大多数2-Kb或更小的串行闪存设备，地址宽度为1字节，命令的第3位被设计为从

decoding as a don't-care bit, so such a Read instruction code is recognized correctly as the standard Read instruction code. In rare cases, some serial flash devices allow bit 3 to be decoded. When such a serial flash is connected, configure your application to avoid access resulting in A8 = 1.

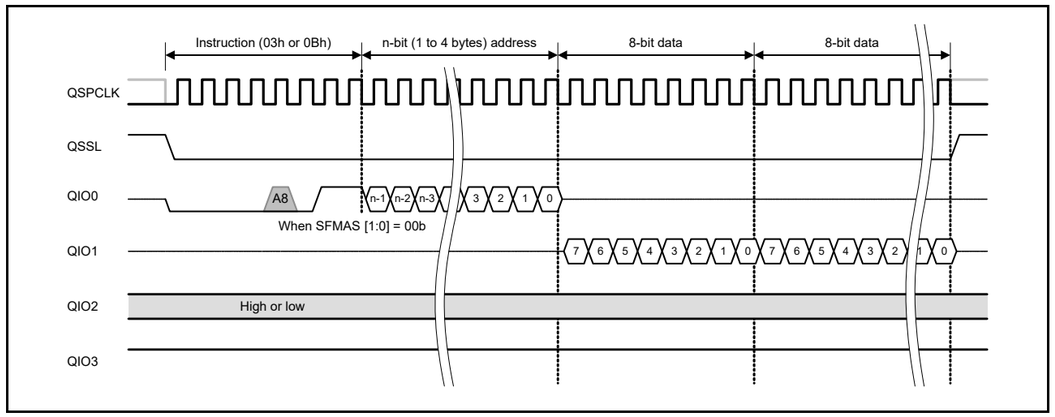

Figure 39.15 Standard Read bus cycle

39.6.3 Fast Read Instruction

The Fast Read instruction is a read instruction that supports a higher communication clock speed than the standard Read instruction. When an SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (0Bh/0Ch) is output. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in SFMSAC, and a certain number of dummy cycles, specified in the SFMSDC register, are transmitted. Data is then received.

The first two dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 39.8, XIP Control.

Switching to the Fast Read instruction is controlled in the SFMSMD register.

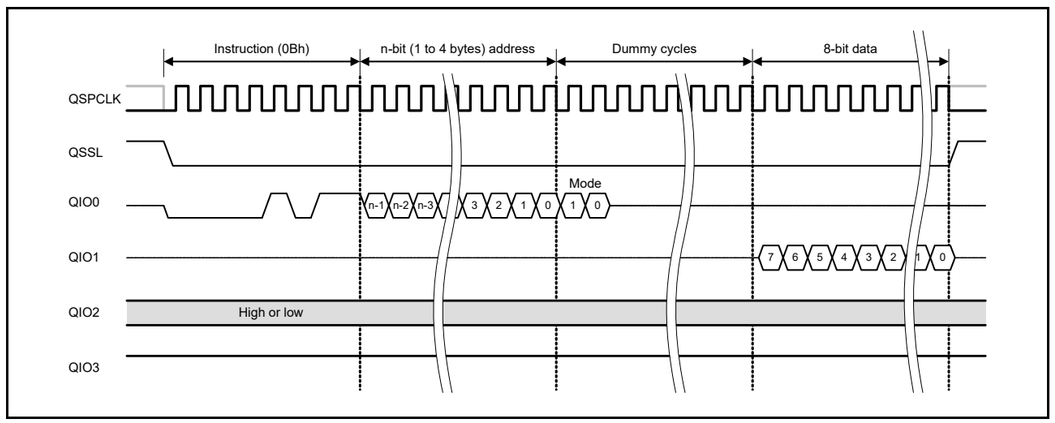

Figure 39.16 Fast Read bus cycle

解码为无关位，因此这样的读取指令代码被正确识别为标准读取指令代码。在极少数情况下，一些串行闪存设备允许对第3位进行解码。连接此类串行闪存时，配置您的应用程序以避免访问导致A8=1。

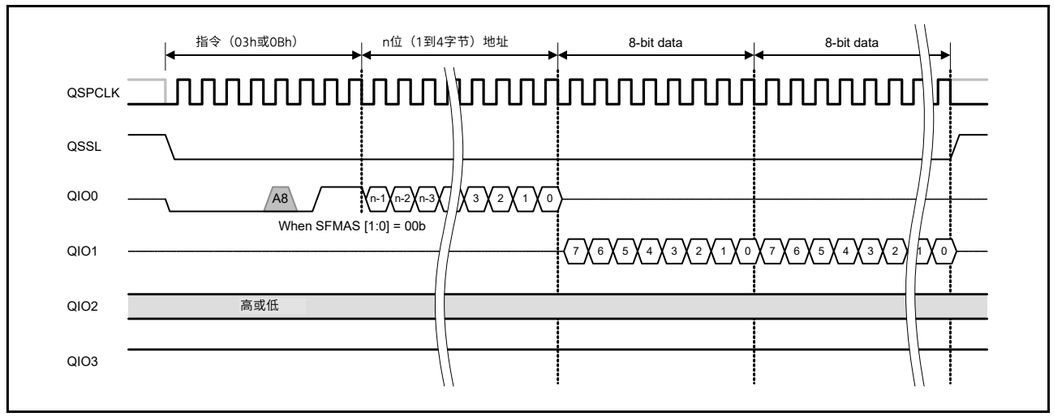

Figure 39.15 标准读总线周期

39.6.3 快速阅读说明

快速读取指令是一种读取指令，它支持比标准读取指令更高的通信时钟速度。当一个SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（0Bh0Ch）。接下来，发送宽度为1到4字节的地址，在SFMSAC中的SFMAS[1:0]位中指定，以及在SFMSDC寄存器中指定的一定数量的虚拟周期被发送。然后接收数据。

前两个虚拟周期用于选择或取消选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPIBUS周期。有关XIP模式的详细信息，请参阅第39.8节，XIP控制。

切换到快速读取指令在SFMSMD寄存器中进行控制。

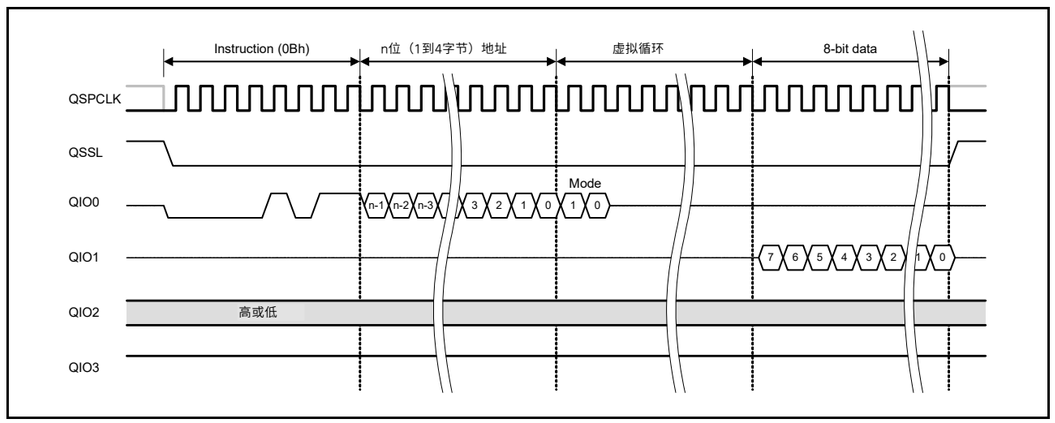

Figure 39.16 快速读取总线周期

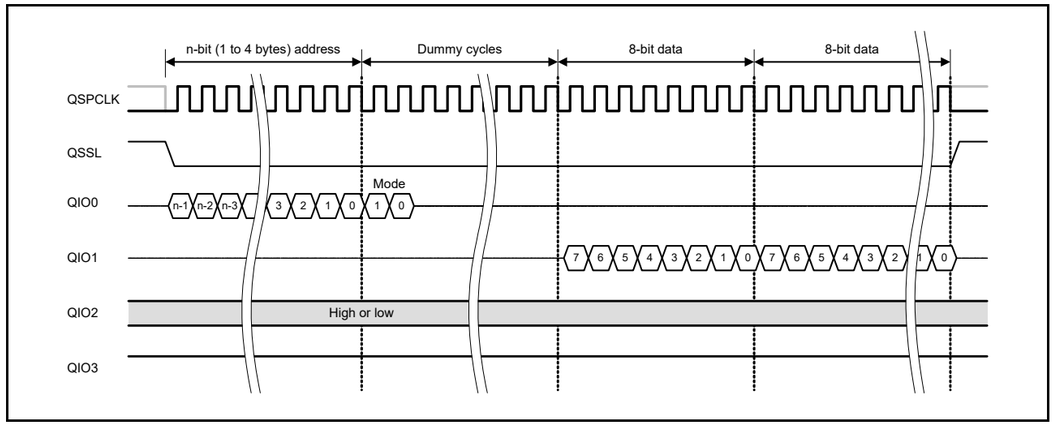

Figure 39.17 Fast Read bus cycle in XIP mode

Note: To use the Fast Read instruction, a serial flash device that supports Fast Read transfers is required.

39.6.4 Fast Read Dual Output Instruction

The Fast Read Dual Output instruction is a read instruction that uses two signal lines to receive data. When the SPI bus cycle starts, the serial flash select signal is asserted. The instruction code (3Bh/3Ch) and an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, are transmitted from the QIO0 pin. Next, a certain number of dummy cycles, specified in the SFMSDC register, is generated. Data is then received through the QIO0 and QIO1 pins. Even bit data is received from the QIO0 pin and odd bit data is received from the QIO1 pin.

The first two dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 39.8, XIP Control.

Switching to Fast Read Dual Output is controlled in the SFMSMD register.

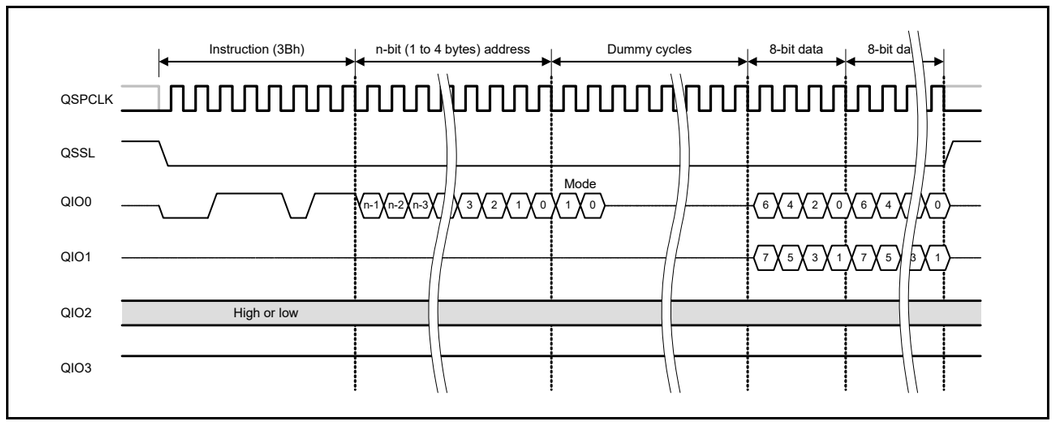

Figure 39.18 Fast Read Dual Output bus cycle

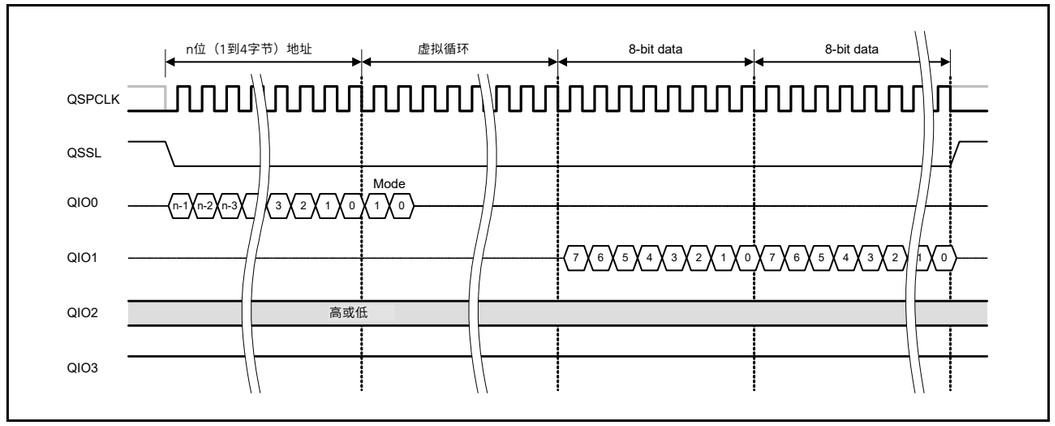

Figure 39.17 XIP模式下的快速读取总线周期

Note: 要使用快速读取指令，需要支持快速读取传输的串行闪存设备。

39.6.4 快速读取双输出指令

快速读取双输出指令是使用两条信号线接收数据的读取指令。当SPI总线周期开始时，串行闪存选择信号被置位。指令代码(3Bh3Ch)和宽度为1到4字节的地址，在SFMSAC寄存器的SFMAS[1:0]位中指定，从QIO0引脚发送。接下来，生成在SFMSDC寄存器中指定的一定数量的虚拟周期。然后通过QIO0和QIO1引脚接收数据。从QIO0引脚接收偶数位数据，从QIO1引脚接收奇数位数据。

前两个虚拟周期用于选择或取消选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPIBUS周期。有关XIP模式的详细信息，请参阅第39.8节，XIP控制。

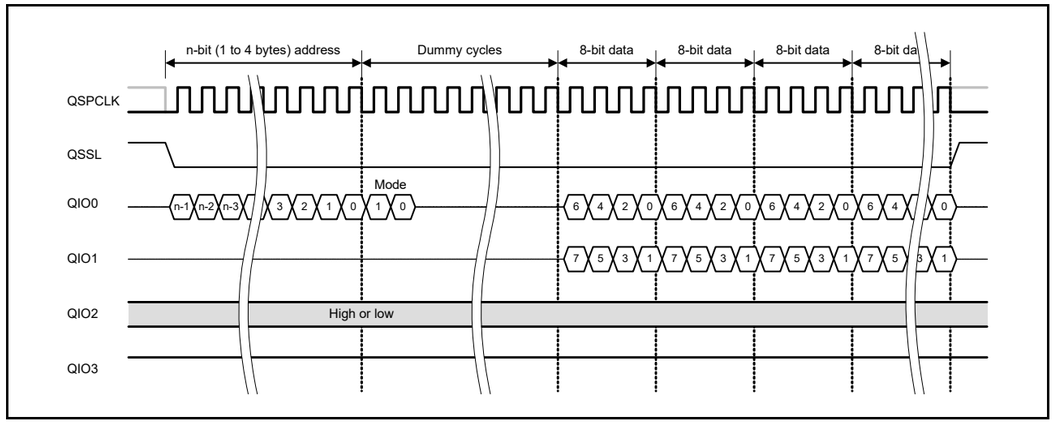

Figure 39.19 Fast Read Dual Output bus cycle in XIP mode

Note: To use the Fast Read Dual Output instruction, a serial flash device that supports Fast Read Dual Output transfers is required.

39.6.5 Fast Read Dual I/O Instruction

The Fast Read Dual I/O instruction is a read instruction that uses two signal lines to transmit an address and receive data. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (BBh/BCh) is output from the QIO0 pin. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted through the QIO0 and QIO1 pins, and a certain number of dummy cycles, specified in the SFMSDC register, is generated. Data is then is received through the QIO0 and QIO1 pins. Address and dummy cycle transmission and data reception are performed through the QIO0 pin for even bits and through the QIO1 pin for odd bits.

The first two dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 39.8, XIP Control.

Switching to Fast Read Dual I/O is controlled in the SFMSMD register.

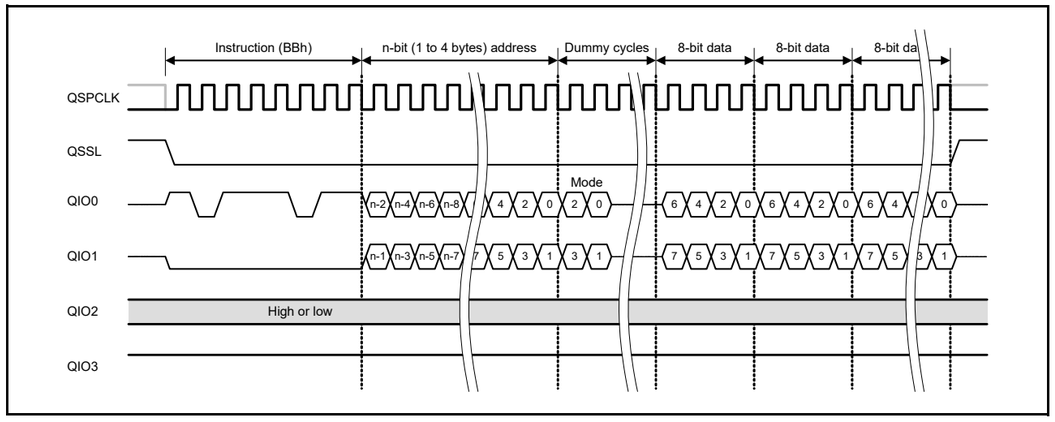

Figure 39.20 Fast Read Dual I/O bus cycle

Note: To use the Fast Read Dual I/O instruction, a serial flash device that supports Fast Read Dual I/O transfers is required.

39.6.6 Fast Read Quad Output Instruction

The Fast Read Quad Output instruction is a read instruction that uses four signal lines to receive data. When the SPI bus cycle starts, the serial flash select signal is asserted. The instruction code (6Bh/6Ch) and an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, are output from the QIO0 pin. Next, a certain number of dummy cycles, specified in the SFMDN[3:0] bits in the SFMSMD register, are generated. Data is then received through the QIO0, QIO1, QIO2, and QIO3 pins.

The first two dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 39.8, XIP Control.

Switching to Fast Read Quad Output is controlled in the SFMSMD register.

Note: To use Fast Read Quad Output, a serial flash that supports Fast Read Quad Output transfer is required.

39.6.7 Fast Read Quad I/O Instruction

The Fast Read Quad I/O instruction is a read instruction that uses four signal lines to transmit an address and receive data. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (EBh/ECh) is output. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted through the QIO0, QIO1, QIO2, and QIO3 pins, and a certain number of dummy cycles, specified in the SFMDN[3:0] bits in the SFMSMD register, is generated. Data is then received through the QIO0, QIO1, QIO2, and QIO3 pins.

The first two dummy cycles are used to select or deselect the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 39.8, XIP Control.

Switching to Fast Read Quad I/O is controlled in the SFMSMD register.

Note: 要使用FastReadQuadIO指令，需要支持FastReadQuadIO传输的串行闪存设备。

39.6.8 进入4字节模式指令

进入4字节模式指令将串行闪存地址宽度设置为4字节。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（B7h）。

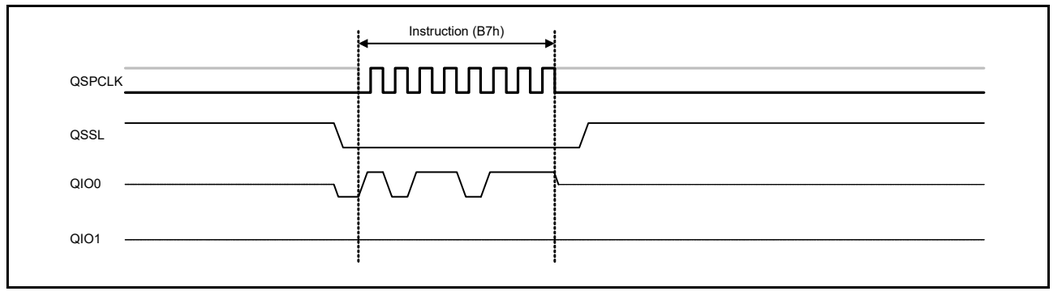

Figure 39.26 进入4字节模式总线周期

Note: 无论串行闪存是处于3字节模式还是4字节模式，都会发出进入4字节模式指令。

39.6.9 退出4字节模式指令

退出4字节模式指令将串行闪存地址宽度设置为3字节。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（E9h）。

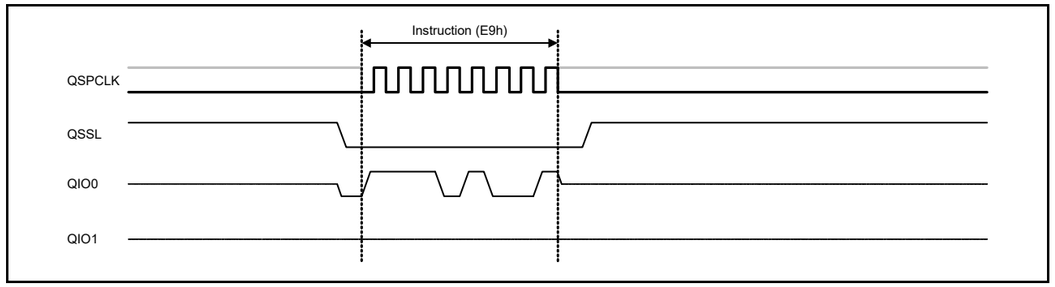

Figure 39.27 Exit 4-Byte Mode bus cycle

Note: The Exit 4-Byte Mode instruction is issued regardless of whether the serial flash is in 3- or 4-byte mode.

39.6.10 Write Enable Instruction

The Write Enable instruction enables changing of the serial flash address width. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (06h) is output.

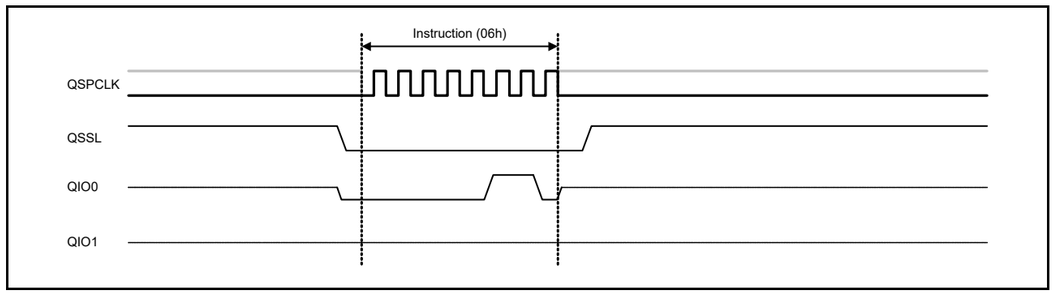

Figure 39.28 Write Enable bus cycle

39.7 SPI Bus Cycle Arrangement

39.7.1 Flash Read Based on Individual Conversion

ROM read internal bus cycles are individually converted to SPI bus cycles on a one-to-one basis. When a ROM read bus cycle is detected, the QSSL signal is asserted, and an SPI bus cycle starts. When data is received from the serial flash, the QSSL signal is deasserted, and the SPI bus cycle is complete.

When another ROM read bus cycle is detected, the QSSL signal is reasserted after ensuring the minimum high-level width of the QSSL signal is reached. Then another SPI bus cycle starts.

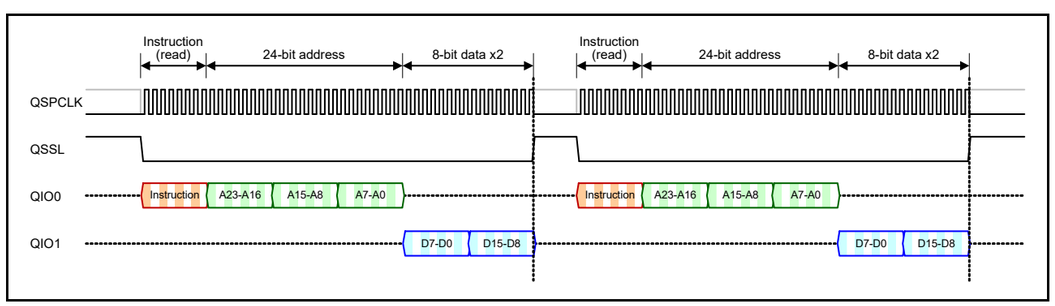

Figure 39.29 Successive data read operations based on individual conversion

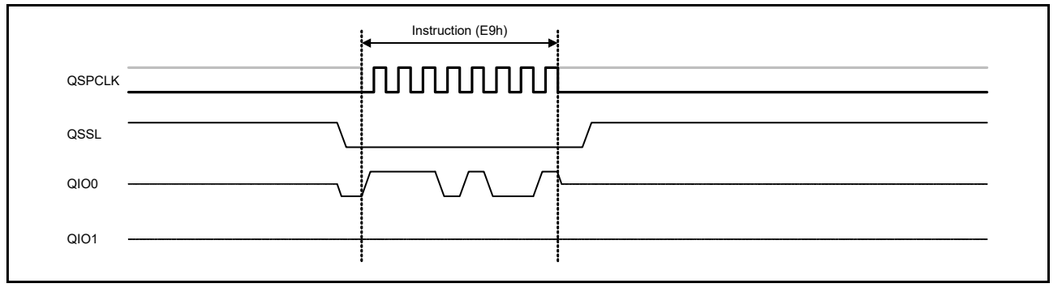

Figure 39.27 退出4字节模式总线周期

Note: 无论串行闪存是处于3字节模式还是4字节模式，都会发出退出4字节模式指令。

39.6.10 写使能指令

写使能指令可以改变串行闪存地址宽度。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（06h）。

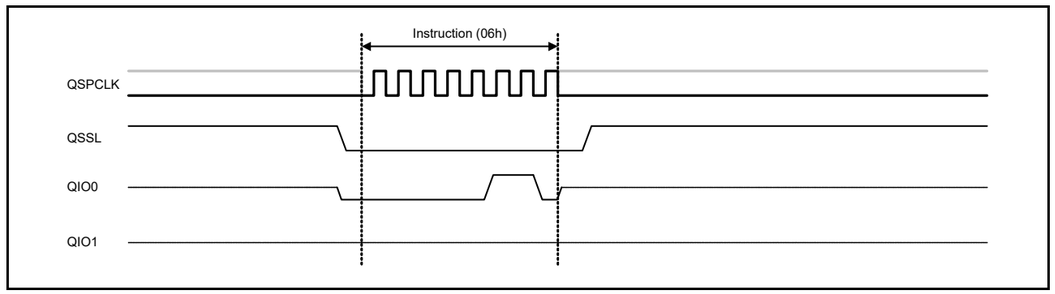

Figure 39.28 写使能总线周期

39.7 SPI总线周期安排

39.7.1 基于单个转换的闪存读取

ROM读取内部总线周期会以一对一的方式单独转换为SPI总线周期。当检测到ROM读取总线周期时，QSSL信号被置位，并且SPI总线周期开始。当从串行闪存接收到数据时，QSSL信号被置低，并且SPI总线周期完成。

当检测到另一个ROM读取总线周期时，在确保达到QSSL信号的最小高电平宽度后，重新置位QSSL信号。然后另一个SPI总线周期开始。

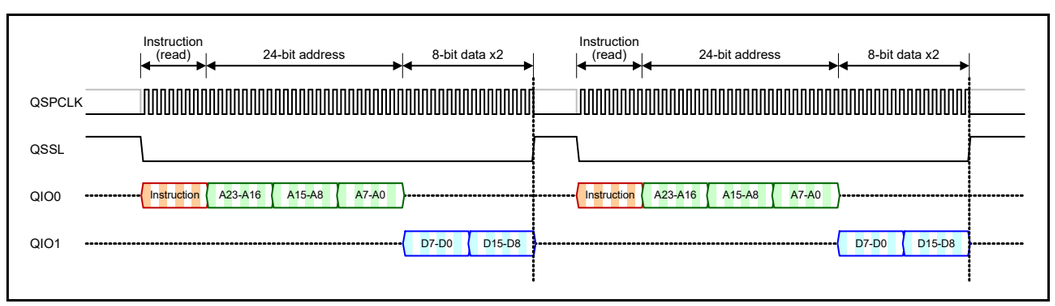

Figure 39.29 基于单独转换的连续数据读取操作

39.7.2 Flash Read Using the Prefetch Function

In operations such as CPU instruction execution and block data transfer, data is often read in ascending order from contiguous flash addresses. Serial flash provides the ability to repeat data reception without reissuing an instruction code and address. However, if bus cycles issued by the MCU are individually converted, SPI bus cycles are separated from each other, resulting in a failure to take advantage of this feature of serial flash. The QSPI contains a prefetch function to ensure the use of this capability.

To enable the prefetch function, set the SFMPFE bit in the SFMSMD register to 1. When the prefetch function is enabled, data is received continuously and stored in the buffer, without waiting for another flash read request. When the MCU performs a flash read operation, an address check is made. If an address match is confirmed, the data in the buffer is passed to the MCU. If an address mismatch is found, the data in the buffer is discarded, and a new SPI bus cycle is issued.

The buffer for prefetching is 18 bytes long. When this buffer is full, the SPI bus cycle is ended. When the buffer data is read to create free space, a new SPI bus cycle is automatically started to resume prefetching.

The prefetch function allows for efficient transfer operations when data is read in ascending order from contiguous addresses, as in instruction fetch and block data transfer.

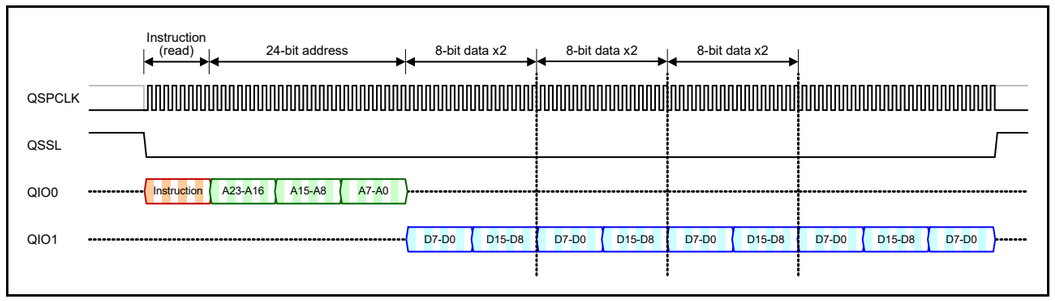

Figure 39.30 Successive data read operations using the prefetch function

39.7.3 Halt of Prefetching

If a ROM read bus cycle for reading from another address occurs during a serial transfer for prefetching, the unnecessary serial transfer being made is halted and a new SPI bus cycle is started. Usually, such a halt of serial transfer occurs on data reception byte boundaries. However, if the SFMPAE bit in the SFMSMD register is set to 1, the halt can occur on locations other than byte boundaries. To use this function, the serial flash device must support halts not on byte boundaries.

39.7.4 Direct Specification of Prefetch Destination

When the SFMPFE bit is set and the QSPI receives internal bus write access to the QSPI window area, the system obtains it as a prefetch address and starts to prefetch. Internal bus write access to the QSPI window area can only be used to obtain prefetch address data. Writes to serial flash cannot be performed.

Combining this function with the prefetch state polling function described in section 39, Prefetch State Polling, can reduce the load on the internal bus when data is read from a low-speed serial flash.

Note: When writing to the QSPI window area to indicate a prefetch destination, write to the first byte of the address where prefetching is to be started. Writes to the QSPI window area with a data size of 2 bytes or more return an ERROR response.

39.7.5 Prefetch State Polling

Reading data from a low-speed serial flash increases system load, because the internal bus enters a wait state until the SPI reception bus cycle is complete. The prefetch state polling function is provided to reduce this load.

The PFOFF bit in the SFMSST register indicates the state of the prefetch function, and the PFCNT[4:0] bits in the SFMSST register indicate the number of data bytes already prefetched. This allows the prefetch status to be determined

39.7.2 使用预取功能进行闪存读取

在CPU指令执行和块数据传输等操作中，通常会从连续的闪存地址以升序读取数据。串行闪存提供了重复数据接收而无需重新发出指令代码和地址的能力。但是，如果将MCU发出的总线周期单独转换，则SPI总线周期会相互分离，导致无法利用串行闪存的这一特性。QSPI包含一个预取功能以确保使用此功能。

要使能预取功能，请将SFMSMD寄存器中的SFMPFE位设置为1。当使能预取功能时，数据会连续接收并存储在缓冲区中，而无需等待另一个flash读取请求。当MCU执行闪存读取操作时，会进行地址检查。如果确认地址匹配，则将缓冲区中的数据传递给MCU。如果发现地址不匹配，则丢弃缓冲区中的数据，并发出新的SPI总线周期。

用于预取的缓冲区为18字节长。当此缓冲区满时，SPI总线周期结束。当缓冲区数据被读取以创建空闲空间时，会自动启动一个新的SPI总线周期以恢复预取。

当从连续地址以升序读取数据时，预取功能允许有效的传输操作，如在指令取指和块数据传输中。

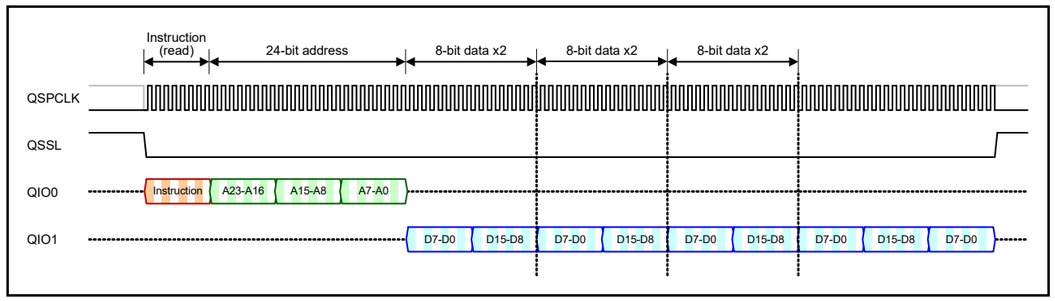

Figure 39.30 使用预取功能的连续数据读取操作

39.7.3 停止预取

如果在用于预取的串行传输期间发生用于从另一个地址读取的ROM读取总线周期，则停止进行的不必要的串行传输并开始新的SPI总线周期。通常，这种串行传输的停止发生在数据接收字节边界上。但是，如果SFMSMD寄存器中的SFMPAE位设置为1，则停止可能发生在字节边界以外的位置。要使用此功能，串行闪存设备必须支持不在字节边界上的暂停。

39.7.4 直接指定预取目的地

当SFMPFE位置位并且QSPI接收到对QSPI窗口区域的内部总线写访问时，系统将其作为预取地址并开始预取。对QSPI窗口区域的内部总线写访问只能用于获取预取地址数据。无法执行对串行闪存的写入。

将此功能与第39节“预取状态轮询”中描述的预取状态轮询功能相结合，可以在从低速串行闪存读取数据时减少内部总线的负载。

Note: 当写入QSPI窗口区域以指示预取目标时，写入要开始预取的地址的第一个字节。写入数据大小为2字节或更多字节的QSPI窗口区域会返回ERROR响应。

39.7.5 预取状态轮询

从低速串行闪存读取数据会增加系统负载，因为内部总线进入等待状态，直到SPI接收总线周期完成。提供了预取状态轮询功能来减少这种负载。

SFMSST寄存器中的PFOFF位指示预取功能的状态，而寄存器中的PFCNT[4:0]位指示预取功能的状态。SFMSST寄存器指示已经预取的数据字节数。这允许确定预取状态

with a single CPU operation.

```
//
// copy 1K byte (32bit x 256 word) data from serial flash to SDRAM
//
unsigned long *sptr;                    // pointer for the serial flash
unsigned long *dptr;                    // pointer for the SDRAM
int i;

SFMSMD |= 0x0040;                       // set SFMPFE bit to enable prefetch
*( (volatile unsigned char *) sptr ) = 0;    // make the TAG valid to start prefetch

for ( i = 0 ; i < 256 ; i++ ){
while ( ( SFMSST & 0x00FF ) < 0x04 ){};   // waiting for 4-byte data to be received
*(dptr++) = *(sptr++);
}
```

Note: When executing a polling program, place the program outside of the serial flash or enable the instruction cache. If the polling program is executed when the program is on the serial flash or is executed without using the instruction cache, the prefetch target frequently switches to an instruction code. This eliminates the effect of polling, and an infinite loop can result because the prefetch buffer is not filled.

39.7.6 Flash Read Using the SPI Bus Cycle Extension Function

If the SFMSE[1:0] bits in the SFMSMD register are set to a value other than 00b, the QSPI waits for next flash read, suspending the SPI bus cycle, while stopping the QSPCLK signal and holding the QSSL signal low even after data is obtained from the serial flash.

If the address of the next flash read is contiguous in ascending order, the toggling of the QSPCLK signal is restarted to continue reception of subsequent data. If the address of the next flash read is not contiguous in ascending order, the QSSL signal is driven high once to end the SPI bus cycle being suspended. A new SPI bus cycle is then started.

When data is read intermittently from ascending order contiguous addresses, this function enables an efficient transfer operation to be performed by reducing the overhead for instruction code and address transmission.

The SPI bus cycle extension time is selectable in the SFMSE[1:0] bits in the SFMSMD register. When the specified extension time elapses, the QSSL signal returns to the high level to automatically end the SPI bus cycle being suspended. If the SFMSE[1:0] bits are set to 11b, QSSL is extended infinitely. This increases the power consumption of the serial flash, so the system must be designed accordingly.

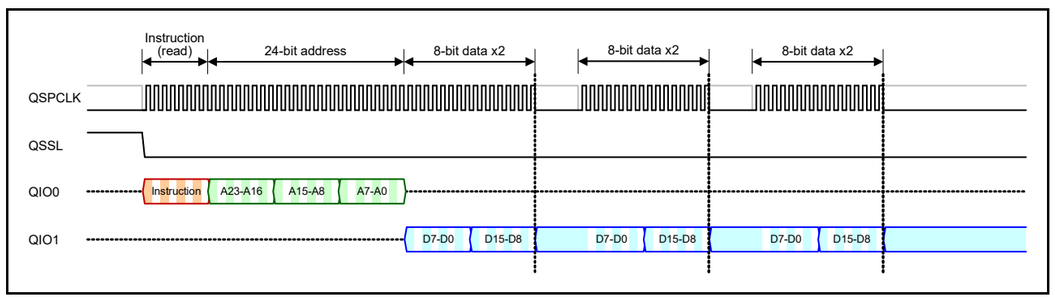

Figure 39.31 Successive data read operations using the SPI bus cycle extension

39.8 XIP Control

Some serial flash devices allow latencies to be reduced by skipping instruction code reception for flash reads. This instruction code skip function is selected in mode data received during the dummy cycle period of the previous serial bus cycle.

In the dummy cycle of the Fast Read instructions, the QSPI controls the XIP mode of the serial flash by using the serial data signal to send the mode data set in the SFMXD[7:0] bits in the SFMSDC register during the first 2 cycles, as shown

单CPU操作。

```
将1K字节（32位x256字）数据从      串行闪存复制到SDRAM

无符号长*sptr;串行闪存指针unsignedlong*dptr;SDRAMinti的指
针;

SFMSMD=0x0040；设置SFMPFE位以启用预取*((volatileunsignedchar*)sptr)=
0;使TAG有效以开始预取

for(i=0;i<256;i++){而((SFMSST&0x00FF)<0x04){ ;等待接收4字节数据*(dptr++)=*(s
ptr++);

}
```

Note: 执行轮询程序时，将程序置于串行闪存之外或启用指令缓存。
如果轮询程序在程序在串行闪存上时执行或在不使用指令缓存的情况下执行，则预取目标频繁切换到指令代码。这消除了轮询的影响，并且由于未填充预取缓冲区可能导致无限循环。

39.7.6 使用SPI总线周期扩展功能读取Flash

如果SFMSMD寄存器中的SFMSE[1:0]位设置为00b以外的值，则QSPI等待下一次闪存读取，暂停SPI总线周期，同时停止QSPCLK信号并将QSSL信号保持在低电平，即使在数据之后是从串行闪存中获得的。

如果下一次闪存读取的地址按升序连续，则重新启动QSPCLK信号的翻转以继续接收后续数据。如果下一次flash读取的地址升序不连续，则QSSL信号被驱动一次高电平以结束暂停的SPI总线周期。然后开始一个新的SPI总线周期。

当从升序连续地址间歇性地读取数据时，该功能通过减少指令代码和地址传输的开销来实现高效的传输操作。

SPI总线周期延长时间可在SFMSMD寄存器的SFMSE[1:0]位中选择。当指定的延长时间过去后，QSSL信号返回高电平，自动结束暂停的SPI总线周期。如果SFMSE[1:0]位设置为11b，QSSL将无限扩展。这增加了串行闪存的功耗，因此必须对系统进行相应的设计。

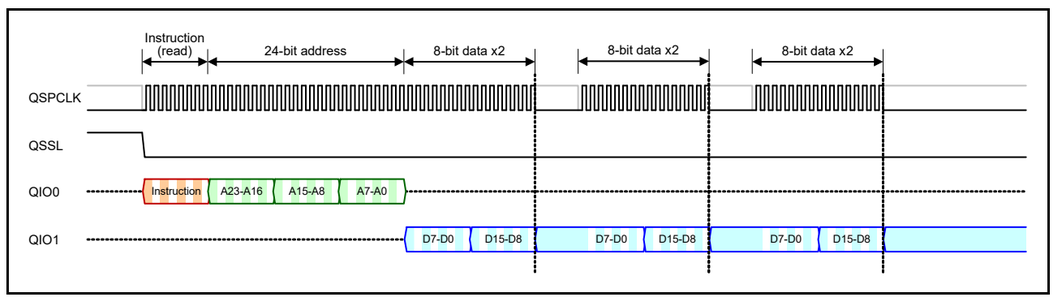

Figure 39.31 使用SPI总线周期扩展的连续数据读取操作

39.8 XIP Control

一些串行闪存设备允许通过跳过闪存读取的指令代码接收来减少延迟。在前一个串行总线周期的虚拟周期期间接收到的模式数据中选择此指令代码跳过功能。

在快速读取指令的空周期内，QSPI在前2个周期内通过串行数据信号发送SFMSDC寄存器的SFMXD[7:0]位中设置的模式数据来控制串行闪存的XIP模式，如图所示

in Figure 39.32.

The mode data to enable the XIP mode differs for each serial flash. Accordingly, set the appropriate mode data in the SFMXD[7:0] bits.

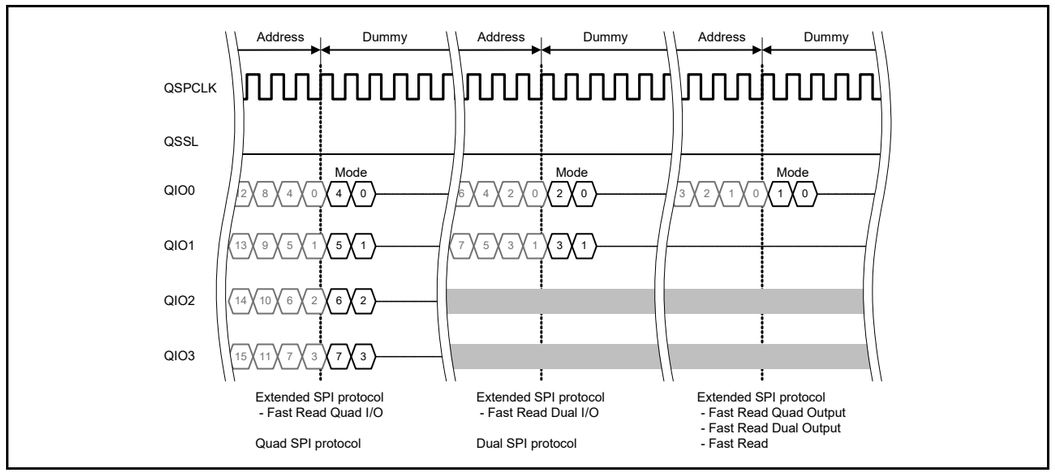

Figure 39.32 XIP mode control data

39.8.1 Selecting the XIP Mode

To select the XIP mode, specify the XIP mode configuration for the serial flash device in the SFMXD[7:0] bits in the SFMSDC register, and set the SFMXEN bit to 1. In the dummy cycle of the next Fast Read instruction, the mode data specified in the SFMXD[7:0] bits is transferred to the serial flash device. From that point, the XIP mode is enabled in both the serial flash controller and the serial flash device. To confirm completion of the XIP mode select procedure, read 1 from the SFMXST bit in the SFMSDC register.

Note: Set the SFMXD[7:0] bits in the SFMSDC register to the XIP mode setting data specified for the actual serial flash device. The XIP mode of the serial flash controller is only enabled in the SFMXEN bit, regardless of the SFMXD[7:0] setting in the SFMSDC register.

39.8.2 Releasing the XIP Mode

To release the XIP mode, specify the release configuration for the serial flash in the SFMXD[7:0] bits in the SFMSDC register, and clear the SFMXEN bit to 0. In the dummy cycle of the next Fast Read instruction, the mode data specified in the SFMXD[7:0] bits is transferred to the serial flash during the first two-cycle period. From that point, the XIP mode is disabled in both the QSPI and the serial flash device. To confirm completion of the XIP mode release procedure, read 0 from the SFMXST bit in the SFMSDC register

Note: Set the SFMXD[7:0] bits in the SFMSDC register to the XIP mode setting data specified for the actual serial flash device. The XIP mode of the serial flash controller is only disabled in the SFMXEN bit, regardless of the SFMXD[7:0] setting in the SFMSDC register.

39.9 QIO2 and QIO3 Pin States

The QIO2 and QIO3 pin states depend on the serial interface read mode specified in the SFMRM[2:0] bits in the SFMSMD register.

在图39.32中。

启用XIP模式的模式数据因串行闪存而异。因此，在
SFMXD[7:0] bits.

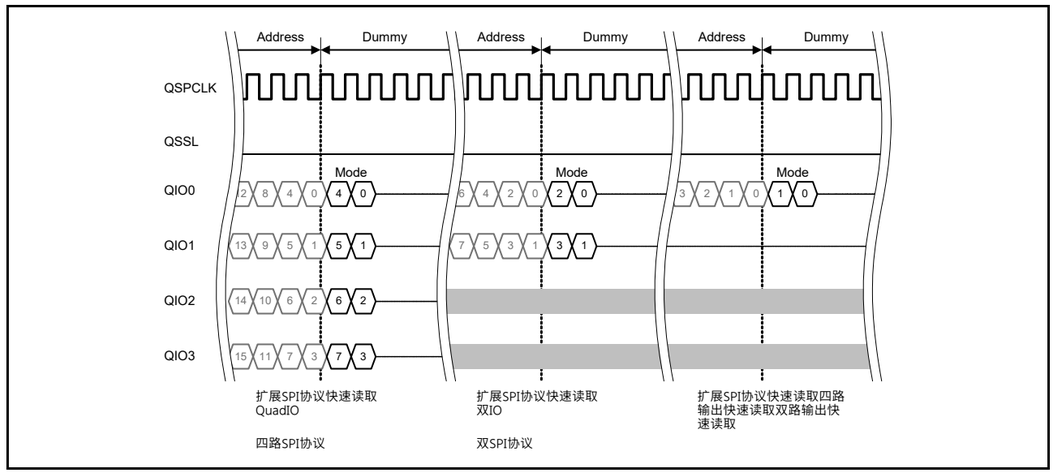

Figure 39.32 XIP模式控制数据

39.8.1 选择XIP模式

要选择XIP模式，请在SFMSDC寄存器的SFMXD[7:0]位中指定串行闪存设备的XIP模式配置，并将SFMXEN位设置为1。在下一条快速读取指令的空周期中，SFMXD[7:0]位中指定的模式数据被传输到串行闪存设备。从那时起，串行闪存控制器和串行闪存设备都启用了XIP模式。要确认XIP模式选择过程的完成，请从SFMSDC寄存器中的SFMXST位读取1。

Note: 将SFMSDC寄存器中的SFMXD[7:0]位设置为为实际串行闪存设备指定的XIP模式设置数据。串行闪存控制器的XIP模式仅在SFMXEN位中启用，与SFMSDC寄存器中的SFMXD[7:0]设置无关。

39.8.2 释放XIP模式

要释放XIP模式，请在SFMSDC寄存器的SFMXD[7:0]位中指定串行闪存的释放配置，并将SFMXEN位清除为0。在下一条快速读取指令的空周期中，模式数据在前两个周期期间，SFMXD[7:0]位中指定的数据被传输到串行闪存。从那时起，XIP模式在QSPI和串行闪存设备中都被禁用。要确认XIP模式释放过程完成，请从SFMSDC寄存器中的SFMXST位读取0

Note: 将SFMSDC寄存器中的SFMXD[7:0]位设置为为实际串行闪存设备指定的XIP模式设置数据。串行闪存控制器的XIP模式仅在SFMXEN位中被禁用，而与SFMSDC寄存器中的SFMXD[7:0]设置无关。

39.9 QIO2和QIO3引脚状态

QIO2和QIO3引脚状态取决于在SFMRM[2:0]位中指定的串行接口读取模式
SFMSMD register.

Table 39.9 QIO2 and QIO3 pin states

SFMSMD.SFMRM[2:0] bits	QIO2 pin state*1	QIO3 pin state*2	Remarks
111	Setting prohibited		
110			
101	Input or output as a serial data signal (standby level is Hi-Z)	Input or output as serial data signal (standby level is Hi-Z)	Fast Read Quad I/O
100			Fast Read Quad Output
011	Output SFMWPL bit variable of SFMPMD register (initial output variable is low level)	Output high level	Fast Read Dual I/O
010			Fast Read Dual Output
001			Fast Read
000			Read (Initial State)

Note 1. The serial flash can also use the QIO2 pin for the WP function.
Note 2. The serial flash can also use the QIO3 pin for the HOLD or RESET function.

39.10 Direct Communication Mode

39.10.1 About Direct Communication

The QSPI can read the serial flash contents by automatically converting a ROM read bus cycle to an SPI bus cycle. However, serial flash devices have many different functions in addition to memory data read, including ID information read, erase, programming, and status information read. There is no standardized instruction set for using these functions, and more functions are being added rapidly by different vendors to different devices. It is difficult to support these functions by hardware control.

The QSPI flexibly supports these serial flash devices by providing a means for the software to directly communicate with the serial flash, so that the software can create any SPI bus cycle required.

39.10.2 Using Direct Communication Mode

To communicate directly with serial flash, transition to direct communication mode by setting the DCOM bit in the SFMCMD register to 1. While direct communication mode is selected, ordinary flash read operation is disabled. For ordinary flash access after direct communication, terminate direct communication mode by setting the DCOM bit in the SFMCMD register to 0.

Note: If the QSPI is set to the XIP mode, you must terminate the XIP mode before starting direct communication mode.

39.10.3 Generating the SPI Bus Cycle during Direct Communication

The SPI bus cycle in direct communication starts on the first access to the SFMCOM port and ends with a write to the SFMCMD register, after a series of I/O operations is performed through the SFMCOM port. At that point, a write to the SFMCOM port is converted to a one-byte transmission to the SPI bus, and a read from the SFMCOM port is converted to a one-byte reception from the SPI bus.

During the period from the first access to the SFMCOM port to the last write operation to the SFMCMD register, the serial flash select signal is held active to notify the serial flash that a series of SPI bus cycles is in progress.

Note: In direct communication mode, all writes to registers other than SFMCMD and SFMCOM (including SFMSMD, SFMSSC, SFMSKC, SFMSST, SFMCST, SFMSIC, SFMSAC, SFMSDC, SFMSPC, and SFMPMD) are disabled, and setting value are invalid. With this circuit configuration, writing to a register area other than the SFMCOM port terminates the SPI bus cycle. However, do not write to a register area other than SFMCMD as a way to terminate the SPI bus cycle. This operation is not guaranteed as a normal function.

The following is an example program for direct communication.

Table 39.9 QIO2和QIO3引脚状态

SFMSMD.SFMRM[2:0] bits	QIO2引脚状态*1	QIO3引脚状态*2	Remarks
111	禁止设定		
110			
101	作为串行数据信号输入或输出（待机电平为Hi-Z）	作为串行数据信号输入或输出（待机电平为Hi-Z）	快速读取四路IO
100			快速读取四路输出
011	输出SFMPMD寄存器的SFMWPL位变量（初始输出变量为低电平）	输出高电平	快速读取双IO
010			快速读取双输出
001			快速阅读
000			Read (Initial State)

Note 1. 串行闪存也可以将QIO2引脚用于WP功能。
Note 2. 串行闪存也可以将QIO3引脚用于HOLD或RESET功能。

39.10 直接通讯方式

39.10.1 关于直接沟通

QSPI可以通过自动将ROM读取总线周期转换为SPI总线周期来读取串行闪存内容。
然而，串行闪存设备除了读取存储器数据外，还有许多不同的功能，包括ID信息读取、擦除、编程和状态信息读取。使用这些功能没有标准化的指令集，更多的功能正在由不同的供应商迅速添加到不同的设备中。很难通过硬件控制来支持这些功能。

QSPI通过为软件提供一种直接与串行闪存通信的方法来灵活地支持这些串行闪存设备，以便软件可以创建所需的任何SPI总线周期。

39.10.2 使用直接通信模式

要与串行闪存直接通信，通过将SFMCMD寄存器中的DCOM位设置为1转换到直接通信模式。选择直接通信模式时，普通闪存读取操作被禁用。对于直接通信后的普通闪存访问，通过将SFMCMD寄存器中的DCOM位设置为0来终止直接通信模式。

Note: 如果QSPI设置为XIP模式，则必须在启动直接通信模式之前终止XIP模式。

39.10.3 在直接通信期间生成SPI总线周期

直接通信中的SPI总线周期从第一次访问SFMCOM端口开始，并以对SFMCOM端口的写入结束。
SFMCMD寄存器，通过SFMCOM端口进行一系列IO操作后。此时，对SFMCOM端口的写入将转换为向SPI总线发送的一字节，从SFMCOM端口读取的数据将转换为从SPI总线接收的一字节。

在从第一次访问SFMCOM端口到最后一次对SFMCMD寄存器的写操作期间，串行闪存选择信号保持有效，以通知串行闪存一系列SPI总线周期正在进行中。

Note: 在直接通信模式下，所有写入除SFMCMD和SFMCOM以外的寄存器（包括SFMSMD、SFMSSC SFMSKC SFMSST SFMCST SFMSIC SFMSAC SFMSDC SFMSPC SFMPMD)无效，设定值无效。使用这种电路配置，写入SFMCOM端口以外的寄存器区域会终止SPI总线周期。但是，不要将写入SFMCMD以外的寄存器区域作为终止SPI总线周期的方法。此操作不能保证为正常功能。

以下是直接通信的示例程序。

```
//### CAUTION! ### This code must be outside the serial flash that is going to be controlled.

// Define specific instruction codes of the target serial flash device.

Figure 39.33 Example of direct communication timing for ID read

Note: When Extended SPI protocol is used in direct communication mode, the standard Read or Fast Read instruction must be used to reference the contents of the serial flash. The QSPI does not support Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, or Fast Read Quad I/O transfers in this configuration. When these high-speed read operations are required, use ordinary flash access.

39.11 Operation

39.11.1 Procedure for Changing Settings in Multiple Control Registers

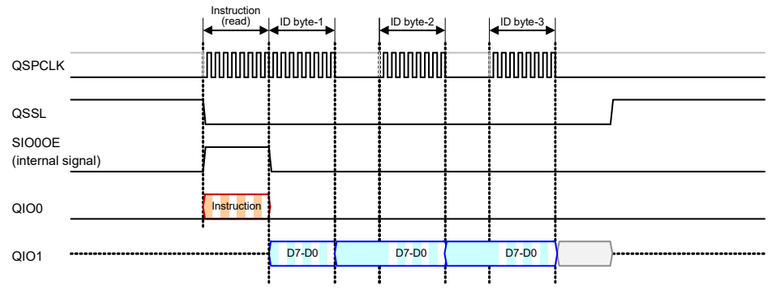
The settings of the QSPI control registers can be changed dynamically during system operation. However, when the settings of multiple control registers are changed sequentially, an SPI bus cycle might occur before all of the registers are updated. The register setting sequence must be carefully designed so that the SPI bus timing specification is satisfied at all stages of register setting changes.

```
//
// Making QSPCLK faster
//
SFMSMD = 0x0041; // SFMPAE: 0 SFMPFE: 1 SFMSE:00 SFMRM:01 (prefetch enable fast read)
SFMSSC = 0x04; // SFMSLD: 0 SFMSHD: 0 SFMSW:4 (minimum QSSL high width = 5 sck)
SFMSKC = 0x00; // SFMDTY: 0 SFMDV: 0 (1/2 mode)  ### switch clock speed last ###

//
// Making QSPCLK slower
//
SFMSKC = 0x06; // SFMDTY: 0 SFMDV:6 (1/8 mode)  ### switch clock speed first ###
SFMSSC = 0x01; // SFMSLD: 0 SFMSHD:0 SFMSW: 1 (minimum QSSL high width = 2 sck)
SFMSMD = 0x0040; // SFMPAE: 0 SFMPFE:1 SFMSE: 00 SFMRM:00 (prefetch enable, standard read)
```

39.12 Interrupts

When the EROMR bit in the SFMCST register sets to 1, the QSPI requests an interrupt. The EROMR bit sets to 1 when a ROM read access is detected in direct communication mode. Interrupt requests are retained until the EROMR bit is cleared by a 0 write. For details, see section 14, Interrupt Controller Unit (ICU).



```
(1) SFMCMD = 01h;                  Enabledirectoperation获取JEDEC分配的设备标识
(2) SFMCOM = Instruction_RDID;     输入“读取标识”指令（打开交易）
(3) mfid = (unsigned char) SFMCOM; 获取IDbyte-1“制造商标识”
(4) mtype = (unsigned char)
    SFMCOM;                        获取IDbyte-2“内存类型”
(5) mcap = (unsigned char) SFMCOM; 获取IDbyte-3“内存容量”
(6) SFMCMD = 01h;                  关闭交易
(7) SFMCMD = 00h;                  禁用直接操作
```

Figure 39.33 ID读取的直接通信时序示例

Note: 在直接通信模式下使用扩展SPI协议时，必须使用标准读取或快速读取指令来引用串行闪存的内容。在此配置中，QSPI不支持快速读取双输出、快速读取双IO、快速读取四输出或快速读取四IO传输。当需要这些高速读取操作时，请使用普通闪存访问。

39.11 Operation

39.11.1 更改多个控制寄存器中的设置的步骤

QSPI控制寄存器的设置可以在系统运行期间动态更改。但是，当多个控制寄存器的设置依次更改时，可能会在所有寄存器更新之前发生一个SPI总线周期。必须仔细设计寄存器设置顺序，以便在寄存器设置更改的所有阶段都满足SPI总线时序规范。

```
使QSPCLK更快SFMSMD=0x0041;SFMPAE:0SFMPFE:1SFMSE:00SFMRM:01（预取使能快速读取）

SFMSSC=0x04；SFMSLD：0SFMSHD：0SFMSW：4（最小QSSL高宽度=5sck）
SFMSKC=0x00；SFMDTY:0SFMDV:0(12模式)###最后切换时钟速度###

使QSPCLK变慢SFMSKC=0x06;SFMDTY:0SFMDV:6(18模式)###先切换时钟速度###

SFMSSC=0x01；SFMSLD：0SFMSHD：0SFMSW：1（最小QSSL高宽度=2sck）
SFMSMD=0x0040；SFMPAE:0SFMPFE:1SFMSE:00SFMRM:00（预取使能，标准读取）
```

39.12 Interrupts

当SFMCST寄存器中的EROMR位设置为1时，QSPI请求中断。当在直接通信模式下检测到ROM读访问时，EROMR位设置为1。中断请求被保留，直到EROMR位被0写入清除。有关详细信息，请参阅第14节，中断控制器单元(ICU)。

39.13 Usage Notes

39.13.1 Settings for the Module-Stop Function

QSPI operation can be disabled or enabled using Module Stop Control Register B (MSTPCRB). The QSPI is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

39.13 使用说明

39.13.1 模块停止功能的设置

可以使用模块停止控制寄存器B(MSTPCRB)禁用或启用QSPI操作。QSPI在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

40. Cyclic Redundancy Check (CRC) Calculator

40.1 Overview

The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB- or MSB-first communication. Additionally, various CRC generation polynomials are available for your application. The snoop function allows monitoring of reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer.

Table 40.1 lists the CRC calculator specifications and Figure 40.1 shows a block diagram.

Table 40.1 CRC calculator specifications

Parameter	Specifications for 8-bit data	Specifications for 32-bit data
Data size	8-bit	32-bit
Data for CRC calculation*1	CRC code generated for data in 8n-bit units (where n is a whole number)	CRC code generated for data in 32n-bit units (where n is a whole number)
CRC processor unit	Operation executed on 8 bits in parallel	Operation executed on 32 bits in parallel
CRC generating polynomial	One of three generating polynomials selectable [8-bit CRC] • $X^8 + X^2 + X + 1$ (CRC-8) [16-bit CRC] • $X^{16} + X^{15} + X^2 + 1$ (CRC-16) • $X^{16} + X^{12} + X^5 + 1$ (CRC-CCITT)	One of two generating polynomials selectable [32-bit CRC] • $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ (CRC-32) • $X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$ (CRC-32C)
CRC calculation switching	The bit order of CRC calculation results can be switched for LSB- or MSB-first communication	
Module-stop function	Module-stop state can be set to reduce power consumption	
CRC snoop	Monitor reads from and writes to a certain register address	—

Note 1. The circuit cannot divide data used in CRC calculations. Write data in 8-bit or 32-bit units.

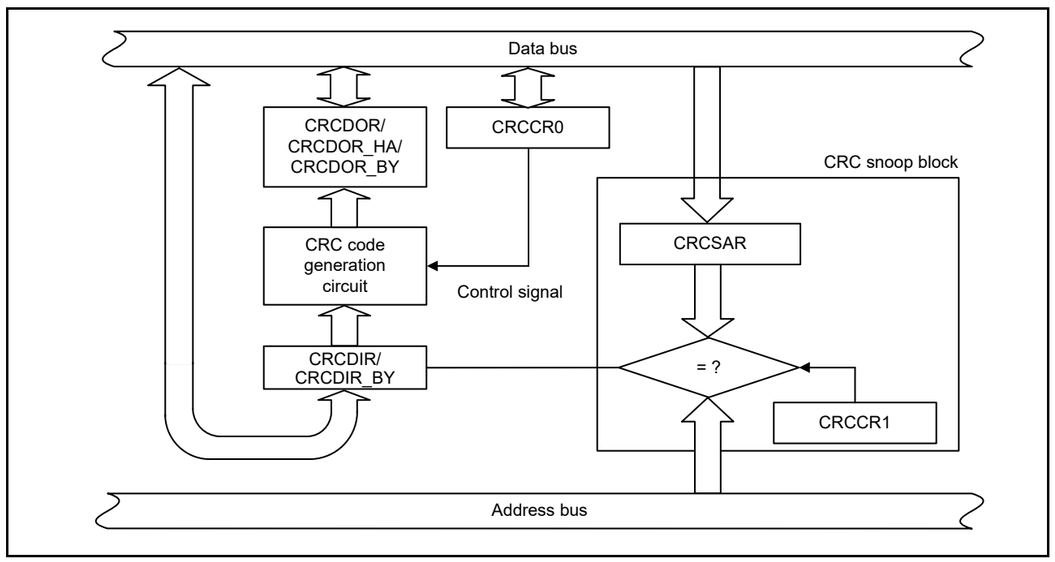


Figure 40.1 CRC calculator block diagram

40. 循环冗余校验(CRC)计算器

40.1 Overview

循环冗余校验(CRC)计算器生成CRC代码以检测数据中的错误。对于LSB或MSB优先的通信，可以切换CRC计算结果的位顺序。此外，您的应用程序还可以使用各种CRC生成多项式。snoop功能允许监视对特定地址的读取和写入。此功能在需要在某些事件中自动生成CRC代码的应用中很有用，例如监视对串行发送缓冲区的写入和从串行接收缓冲区的读取。

表40.1列出了CRC计算器规格，图40.1显示了框图。

Table 40.1 CRC计算器规格

Parameter	8位数据规格	32位数据规格
数据大小	8-bit	32-bit
CRC计算数据*1	为8n位单元中的数据生成的CRC码（其中n是整数）	为32n位单元中的数据生成的CRC码（其中n是整数）
CRC处理器单元	在8位上并行执行的操作	在32位上并行执行的操作
CRC生成多项式	三个生成多项式之一可选[8位CRC] X8+X2+X+1(CRC-8)[16位CRC] X16+X15+X2+1(CRC-16) X+X12+X5+1(CRC-CCITT)	可选的两个生成多项式之一[32位CRC] X32+X26+X23+X22+X16+X12+X11+X10+X8+X7+X5+X4+X2+X+1(CRC-32) X32+X28+X27+X26+X25+X23+X22+X20+X19+X18+X14+X13+X11+X10+X9+X8+X6+1(CRC-32C)
CRC计算切换	CRC计算结果的位顺序可以切换为LSB或MSB优先的通信	
Module-stop function	可设置模块停止状态以降低功耗	
CRC snoop	监视器读取和写入某个寄存器地址	—

Note 1. 该电路不能划分用于CRC计算的数据。以8位或32位为单位写入数据。

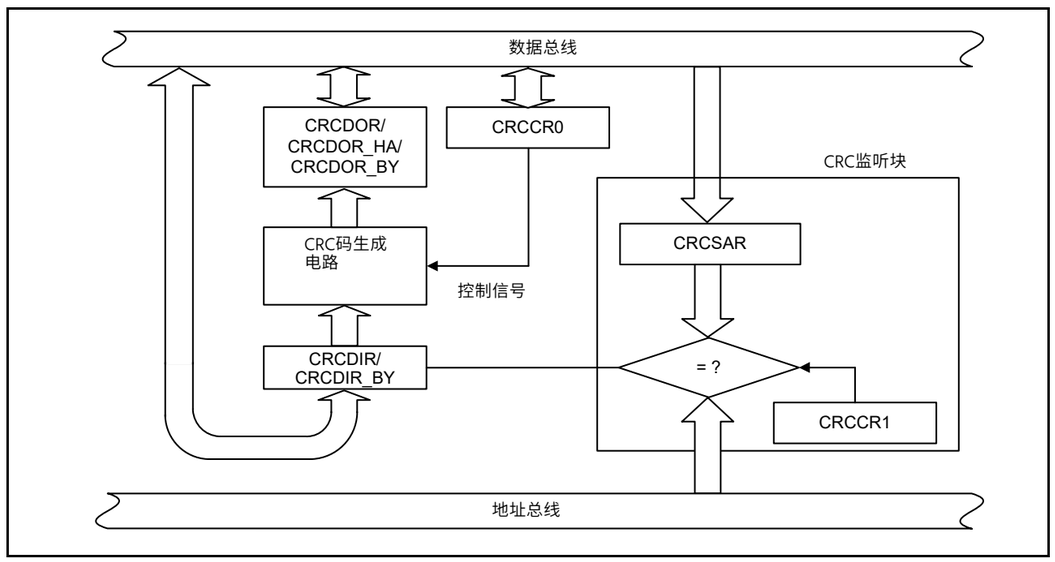

Figure 40.1 CRC计算器框图

40.2 Register Descriptions

40.2.1 CRC Control Register 0 (CRCCR0)

Address(es): CRC.CRCCR0 4007 4000h

	b7	b6	b5	b4	b3	b2	b1	b0
	DORCLR	LMS	—	—	—	GPS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	GPS[2:0]	CRC Generating Polynomial Switching	b2 b0 0 0 0: Do not calculate 0 0 1: 8-bit CRC-8 ($X^8 + X^2 + X + 1$) 0 1 0: 16-bit CRC-16 ($X^{16} + X^{15} + X^2 + 1$) 0 1 1: 16-bit CRC-CCITT ($X^{16} + X^{12} + X^5 + 1$) 1 0 0: 32-bit CRC-32 ($X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$) 1 0 1: 32-bit CRC-32C ($X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$) Other: Do not calculate.	R/W
b5 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	LMS	CRC Calculation Switching	0: Generate CRC for LSB-first communication 1: Generate CRC for MSB-first communication.	R/W
b7	DORCLR	CRCDOR/CRCDOR_HA/CRCDOR_BY Register Clear	1: Clear the CRCDOR/CRCDOR_HA/CRCDOR_BY register. This bit is read as 0.	W*1

Note 1. This bit must always be set to 1 when writing to this register.

DORCLR bit (CRCDOR/CRCDOR_HA/CRCDOR_BY)

Write 1 to the DORCLR bit to clear the CRCDOR/CRCDOR_HA/CRCDOR_BY register to 0000_0000h. This bit is read as 0. Only 1 can be written.

LMS bit (CRC Calculation Switching)

The LMS bit selects the bit order of generated CRC code. Transmit the lower-order byte of the CRC code first for LSB-first communication and the higher-order byte first for MSB-first communication. For details on transmitting and receiving CRC code, see section 40.3, Operation.

GPS[2:0] bits (CRC Generating Polynomial Switching)

The GPS[2:0] bits select the CRC generating polynomial.

40.2.2 CRC Control Register 1 (CRCCR1)

Address(es): CRC.CRCCR1 4007 4001h

	b7	b6	b5	b4	b3	b2	b1	b0
	CRCSEN	CRCSWR	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	CRCSWR	Snoop-On-Write/Read Switch	0: Snoop-on-read 1: Snoop-on-write.	R/W

40.2 注册说明

40.2.1 CRC控制寄存器0(CRCCR0)

Address(es): CRC.CRCCR0 4007 4000h

	b7	b6	b5	b4	b3	b2	b1	b0
	DORCLR	LMS	—	—	—	GPS[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	GPS[2:0]	CRC生成多项式Switching	b2 b0 0 0 0：不计算 0 0 1: 8-bit CRC-8 ($X^8 + X^2 + X + 1$) 0 1 0: 16-bit CRC-16 ($X^{16} + X^{15} + X^2 + 1$) 0 1 1: 16-bit CRC-CCITT ($X^{16} + X^{12} + X^5 + 1$) 1 0 0: 32-bit CRC-32 ($X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$) 1 0 1: 32-bit CRC-32C ($X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$) 其他：不计算。	R/W
b5 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	LMS	CRC计算切换	0：为LSB-first通信生成CRC1：为MSB-first通信生成CRC。	R/W
b7	DORCLR	CRCDOR/CRCDOR_HA/CRCDOR_BY寄存器清除	1：清除CRCDORCRCDOR_HACRCDOR_BY寄存器。该位读为0。	W*1

Note 1. 写入该寄存器时，该位必须始终设置为1。

DORCLR bit (CRCDOR/CRCDOR_HA/CRCDOR_BY)

向DORCLR位写入1可将CRCDORCRCDOR_HACRCDOR_BY寄存器清零为0000_0000h。该位读为0。只能写入1。

LMS位（CRC计算切换）

LMS位选择生成的CRC码的位顺序。对于LSBfirst通信，首先发送CRC码的低位字节，对于MSBfirst通信，首先发送高位字节。有关发送和接收CRC码的详细信息，请参阅第40.3节，操作。

GPS[2:0]位（CRC生成多项式切换）

GPS[2:0]位选择CRC生成多项式。

40.2.2 CRC控制寄存器1(CRCCR1)

Address(es): CRC.CRCCR1 4007 4001h

	b7	b6	b5	b4	b3	b2	b1	b0
	CRCSEN	CRCSWR	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	CRCSWR	Snoop-On-Write/Read Switch	0: Snoop-on-read 1: Snoop-on-write.	R/W

Bit	Symbol	Bit name	Description	R/W
b7	CRCSEN	Snoop Enable	0: Disabled 1: Enabled.	R/W

CRCSWR bit (Snoop-On-Write/Read Switch)

The CRCSWR bit selects the direction of the access in the address monitoring function. When the bit is set to 0 (initial value), the CRC snoop operation to read a specific register address is enabled. When the bit is set to 1, the CRC snoop operation to write to a specific register address is enabled.

CRCSEN bit (Snoop Enable)

When the CRCSEN bit is set to 1, CRC snoop operation is enabled. When the bit is set to 0, CRC snoop operation is disabled.

40.2.3 CRC Data Input Register (CRCDIR/CRCDIR_BY)

Address(es): CRC.CRCDIR/CRCDIR_BY 4007 4004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRCDIR is a 32-bit read/write register to write data to for CRC-32 or CRC-32C calculation. CRCDIR_BY is an 8-bit read/write register to write data to for CRC-8, CRC-16, or CRC-CCITT calculation.

40.2.4 CRC Data Output Register (CRCDOR/CRCDOR_HA/CRCDOR_BY)

Address(es): CRC.CRCDOR/CRCDOR_HA/CRCDOR_BY 4007 4008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRCDOR is a 32-bit read/write register for CRC-32 or CRC-32C. CRCDOR_HA is a 16-bit read/write register for CRC-16 or CRC-CCITT. CRCDOR_BY is an 8-bit read/write register for CRC-8. Because its initial value is 0000_0000h, rewrite the CRCDOR/CRCDOR_HA/CRCDOR_BY register to perform the calculations using a value other than the initial value.

Data written to the CRCDIR/CRCDIR_BY register is CRC-calculated, and the result is stored in the CRCDOR/CRCDOR_HA/CRCDOR_BY register. If the CRC code is calculated following transferred data and the result is 0000_0000h, there is no CRC error.

When an 8-bit CRC ($X^8 + X^2 + X + 1$ polynomial) is in use, the valid CRC code is obtained in CRCDOR_BY.

When a 16-bit CRC ($X^{16} + X^{15} + X^2 + 1$ or $X^{16} + X^{12} + X^5 + 1$ polynomial) is in use, the valid CRC code is obtained in CRCDOR_HA.

Bit	Symbol	位名称	Description	R/W
b7	CRCSEN	侦听启用	0：禁用1 ：启用。	R/W

CRCSWR位（Snoop-On-Write读开关）

CRCSWR位选择地址监控功能中的访问方向。当该位设置为0（初始值）时，启用读取特定寄存器地址的CRC监听操作。当该位设置为1时，将启用写入特定寄存器地址的CRC侦听操作。

CRCSEN位（侦听启用）

当CRCSEN位设置为1时，启用CRC侦听操作。当该位设置为0时，CRC侦听操作被禁用。

40.2.3 CRC数据输入寄存器(CRCDIRCRCDIR_BY)

Address(es): CRC.CRCDIR/CRCDIR_BY 4007 4004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRCDIR是一个32位读写寄存器，用于写入数据以进行CRC-32或CRC-32C计算。CRCDIR_BY是一个8位读写寄存器，用于写入数据以进行CRC-8、CRC-16或CRC-CCITT计算。

40.2.4 CRC数据输出寄存器(CRCDORCRCDOR_HACRCDOR_BY)

Address(es): CRC.CRCDOR/CRCDOR_HA/CRCDOR_BY 4007 4008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRCDOR是CRC-32或CRC-32C的32位读写寄存器。CRCDOR_HA是CRC16或CRC-CCITT的16位读写寄存器。CRCDOR_BY是CRC-8的8位读写寄存器。由于其初始值为0000_0000h，因此重写CRCDORCRCDOR_HACRCDOR_BY寄存器以使用初始值以外的值执行计算。

写入CRCDIRCRCDIR_BY寄存器的数据经过CRC计算，结果存储在CRCDORCRCDOR_HACRCDOR_BY寄存器。如果在传输数据后计算CRC码，结果为0000_0000h，则没有CRC错误。

当使用8位CRC（X8+X2+X+1多项式）时，在CRCDOR_BY中获得有效的CRC码。

当使用16位CRC（X16+X15+X2+1或X16+X12+X5+1多项式）时，有效的CRC码在CRCDOR_HA.

40.2.5 Snoop Address Register (CRCSAR)

Address(es): CRC.CRCSAR 4007 400Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CRCSA[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b13 to b0	CRCSA[13:0]	Register Snoop Address	These bits store the TDR or RDR address in the SCI module to snoop.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CRCSA[13:0] bits (Register Snoop Address)

The CRCSA[13:0] bits specify the lower 14 bits of the register address monitored by the CRC snoop operation. Only the following addresses can be used for the CRCSA[13:0] bits:

- 4007 0003h: SCI0.TDR, 4007 0005h: SCI0.RDR
- 4007 0023h: SCI1.TDR, 4007 0025h: SCI1.RDR
- 4007 0043h: SCI2.TDR, 4007 0045h: SCI2.RDR
- 4007 0063h: SCI3.TDR, 4007 0065h: SCI3.RDR
- 4007 0083h: SCI4.TDR, 4007 0085h: SCI4.RDR
- 4007 00A3h: SCI5.TDR, 4007 00A5h: SCI5.RDR
- 4007 00C3h: SCI6.TDR, 4007 00C5h: SCI6.RDR
- 4007 00E3h: SCI7.TDR, 4007 00E5h: SCI7.RDR
- 4007 0103h: SCI8.TDR, 4007 0105h: SCI8.RDR
- 4007 0123h: SCI9.TDR, 4007 0125h: SCI9.RDR
- 4007 000Fh: SCI0.FTDRL, 4007 0011h: SCI0.FRDRL
- 4007 002Fh: SCI1.FTDRL, 4007 0031h: SCI1.FRDRL
- 4007 004Fh: SCI2.FTDRL, 4007 0051h: SCI2.FRDRL
- 4007 006Fh: SCI3.FTDRL, 4007 0071h: SCI3.FRDRL
- 4007 008Fh: SCI4.FTDRL, 4007 0091h: SCI4.FRDRL
- 4007 00AFh: SCI5.FTDRL, 4007 00B1h: SCI5.FRDRL
- 4007 00CFh: SCI6.FTDRL, 4007 00D1h: SCI6.FRDRL
- 4007 00EFh: SCI7.FTDRL, 4007 00F1h: SCI7.FRDRL
- 4007 010Fh: SCI8.FTDRL, 4007 0111h: SCI8.FRDRL
- 4007 012Fh: SCI9.FTDRL, 4007 0131h: SCI9.FRDRL.

40.3 Operation

40.3.1 Basic Operation

The CRC calculator generates CRC codes for use in LSB- or MSB-first transfers.

The following examples illustrate CRC code generation for input data (F0h) using the 16-bit CRC-CCITT-generating polynomial ($X^{16} + X^{12} + X^5 + 1$). In these examples, the value of the CRC Data Output Register (CRCDOR_HA) is

40.2.5 监听地址寄存器(CRCSAR)

Address(es): CRC.CRCSAR 4007 400Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CRCSA[13:0]													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b13 to b0	CRCSA[13:0]	注册监听地址	这些位存储SCI模块中的TDR或RDR地址以进行监听。	R/W
b15, b14	—	Reserved	这些位被读取为0。写入值应为0。	R/W

CRCSA[13:0]位（寄存器监听地址）

CRCSA[13:0]位指定由CRC侦听操作监视的寄存器地址的低14位。CRCSA[13:0]位只能使用以下地址：

- 4007 0003h: SCI0.TDR, 4007 0005h: SCI0.RDR
- 4007 0023h: SCI1.TDR, 4007 0025h: SCI1.RDR
- 4007 0043h: SCI2.TDR, 4007 0045h: SCI2.RDR

40.3 Operation

40.3.1 基本操作

CRC计算器生成用于LSB或MSB优先传输的CRC代码。

以下示例说明了使用16位CRC-CCITT生成多项式(X16+X12+X5+1)为输入数据(F0h)生成CRC码。在这些示例中，CRC数据输出寄存器(CRCDOR_HA)的值为

cleared before CRC calculation.

When an 8-bit CRC (with the polynomial $X^8 + X^2 + X + 1$) is in use, the valid bits of the CRC code are obtained in CRCDOR_BY. When an 32-bit CRC is in use, the valid bits of the CRC code are obtained in CRCDOR.

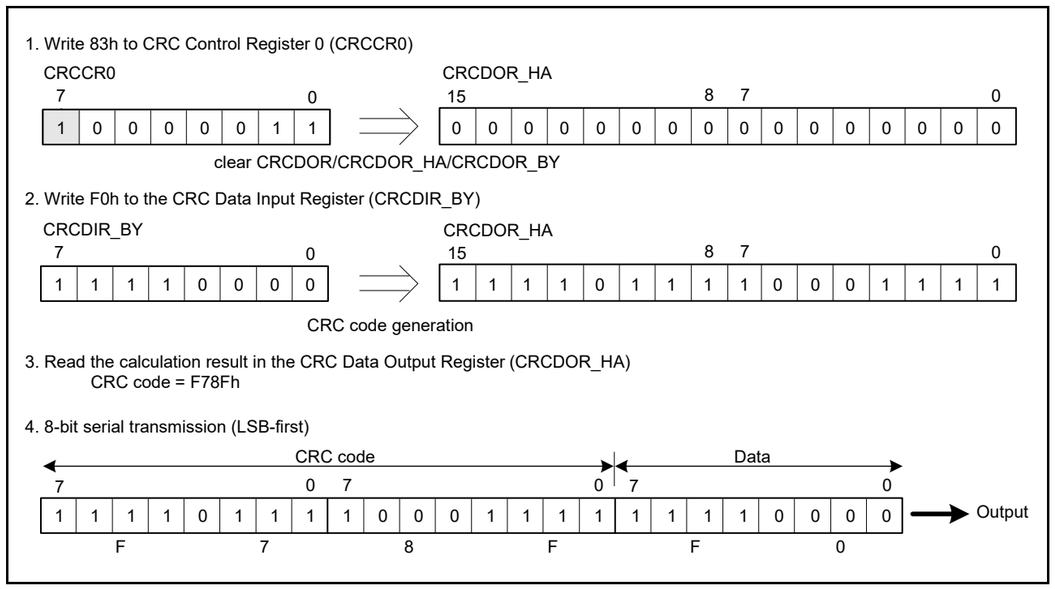

Figure 40.2 LSB-first data transmission

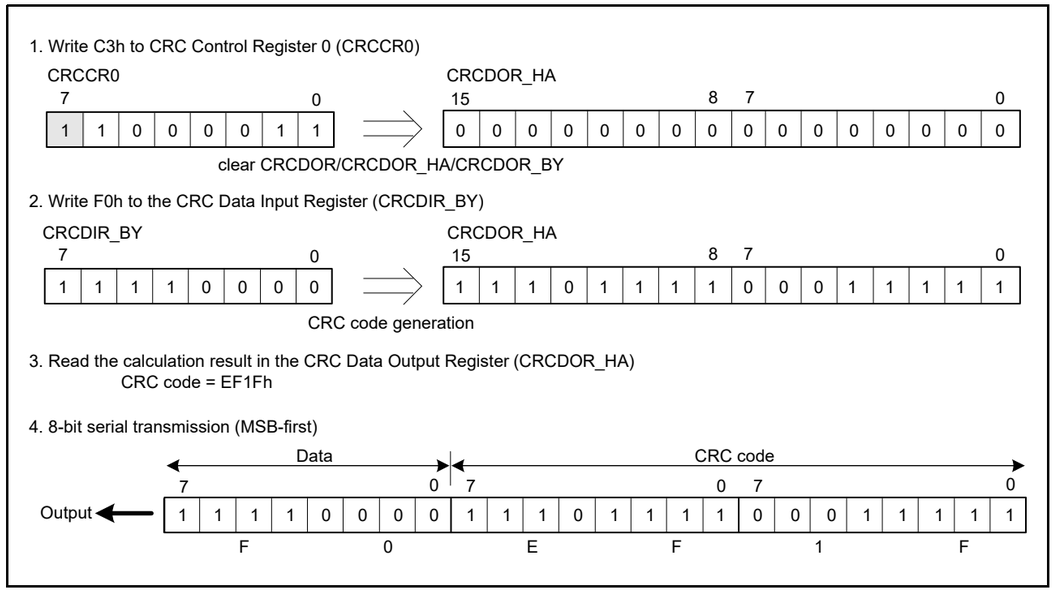

Figure 40.3 MSB-first data transmission

CRC计算前清零。

当使用8位CRC（多项式X8+X2+X+1）时，CRC码的有效位在CRCDOR_BY。当使用32位CRC时，在CRCDOR中获取CRC码的有效位。

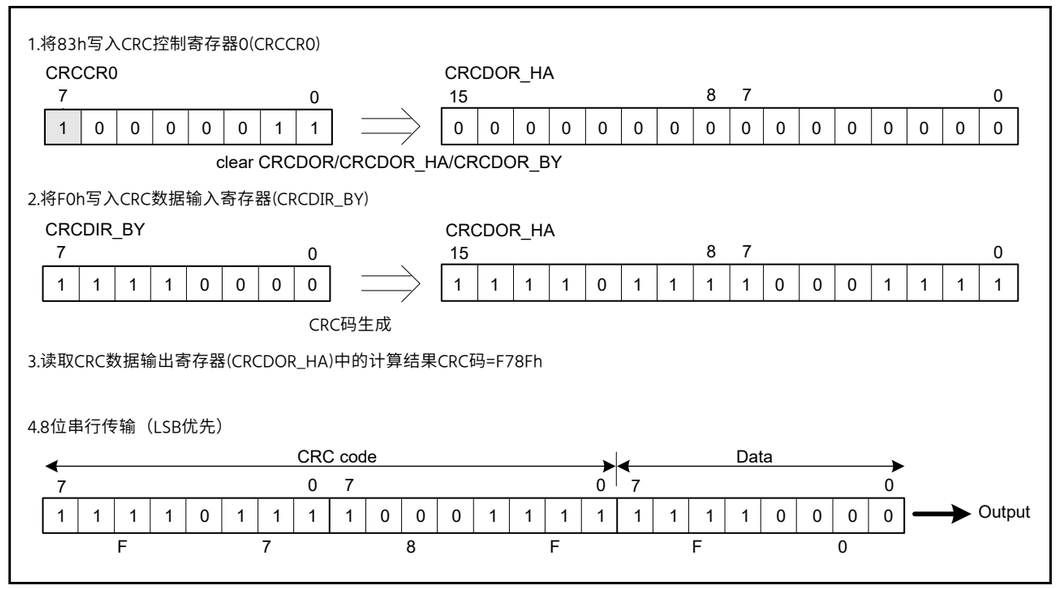

Figure 40.2 LSB−first数据传输

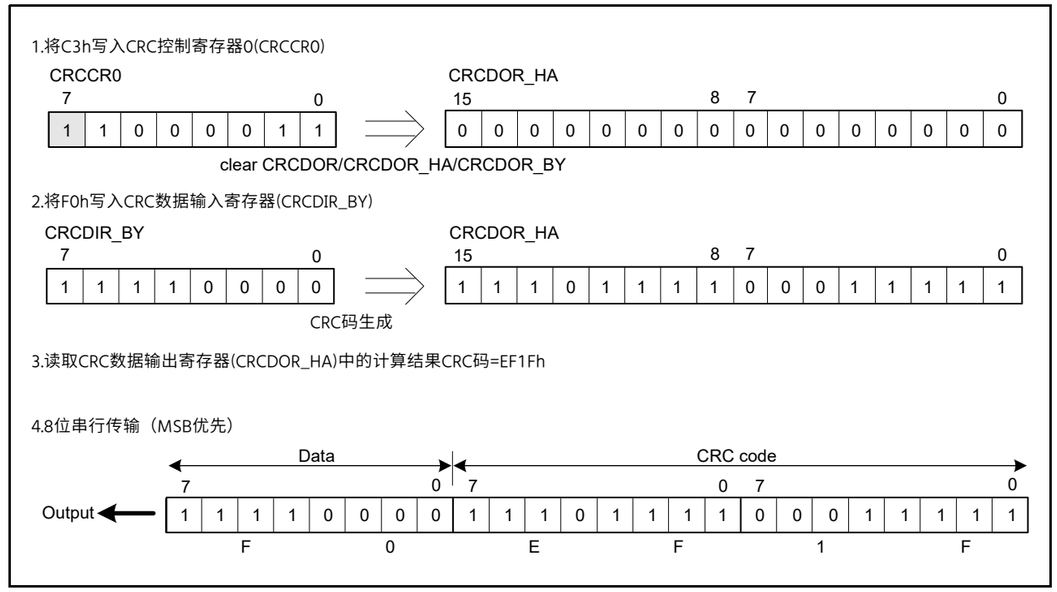

Figure 40.3 MSB优先数据传输

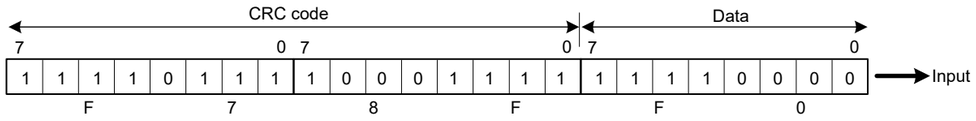
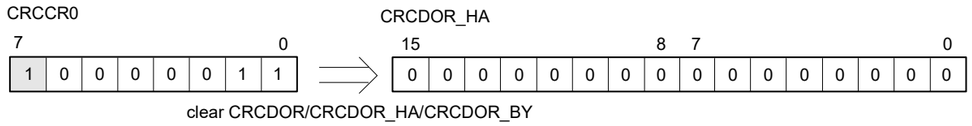
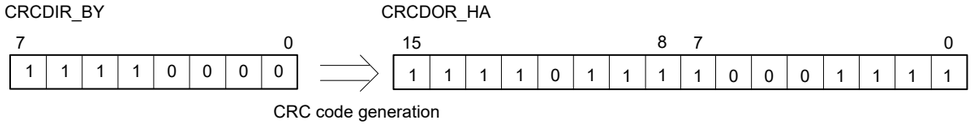
1. 8-bit serial reception (LSB-first)



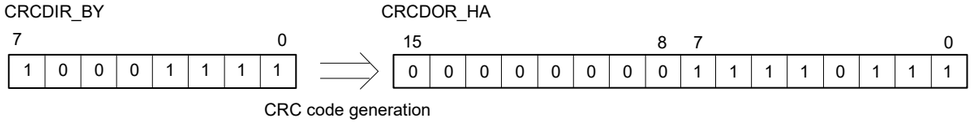
2. Write 83h to CRC Control Register 0 (CRCCR0)



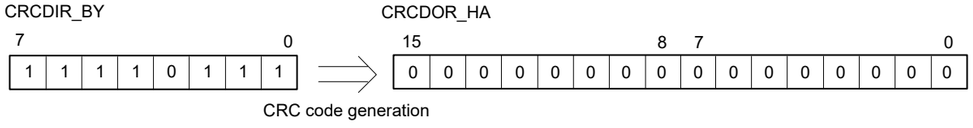
3. Write F0h to the CRC Data Input Register (CRCDIR_BY)



4. Write 8Fh to the CRC Data Input Register (CRCDIR_BY)



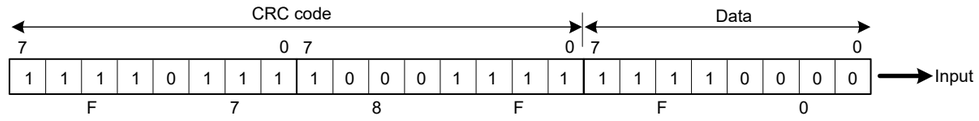
5. Write F7h to the CRC Data Input Register (CRCDIR_BY)



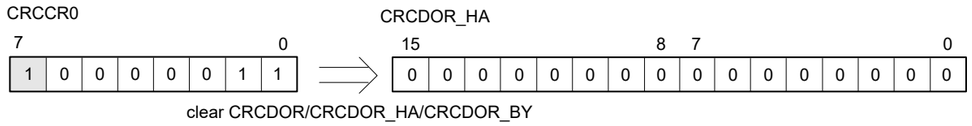
6. Read the calculation result in the CRC Data Output Register (CRCDOR_HA)
CRC code = 0000h → no error

Figure 40.4 LSB-first data reception

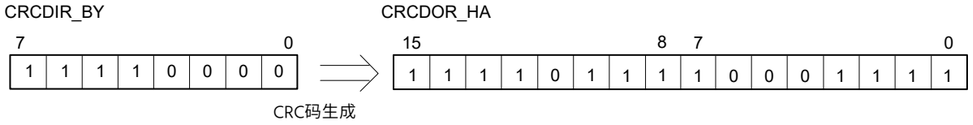
1.8位串行接收（LSB优先）



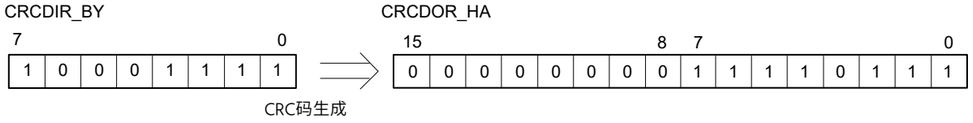
2.将83h写入CRC控制寄存器0(CRCCR0)



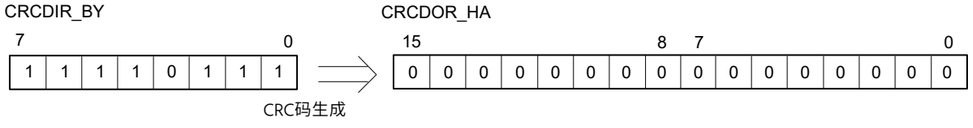
3.将F0h写入CRC数据输入寄存器(CRCDIR_BY)



4.将8Fh写入CRC数据输入寄存器(CRCDIR_BY)



5.将F7h写入CRC数据输入寄存器(CRCDIR_BY)



6.读取CRC数据输出寄存器（CRCDOR_HA）中的计算结果CRC码=0000h 无错误

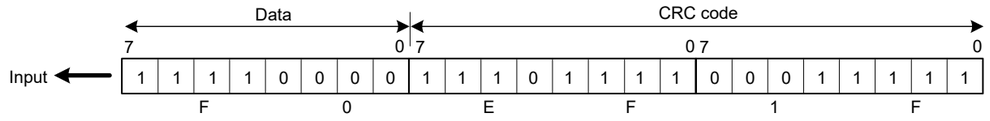
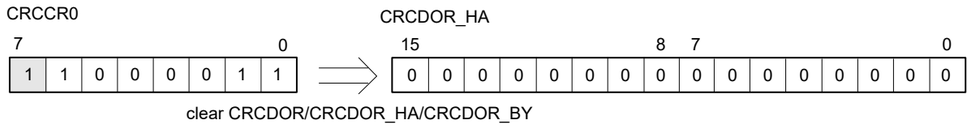
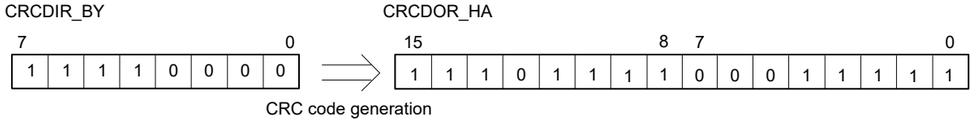
1. 8-bit serial reception (MSB-first)



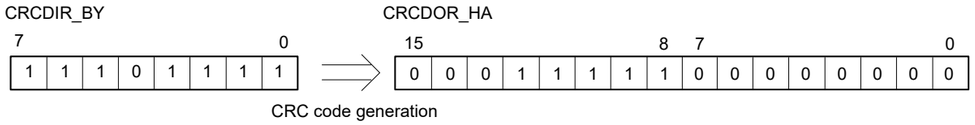
2. Write C3h to CRC Control Register 0 (CRCCR0)



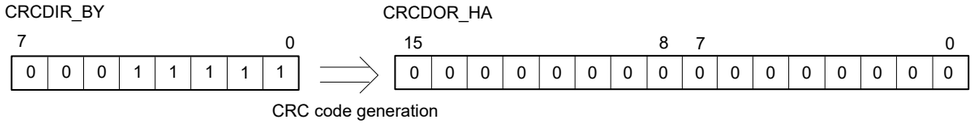
3. Write F0h to the CRC Data Input Register (CRCDIR_BY)



4. Write EFh to the CRC Data Input Register (CRCDIR_BY)



5. Write 1Fh to the CRC Data Input Register (CRCDIR_BY)



6. Read the calculation result in the CRC Data Output Register (CRCDOR_HA)
CRC code = 0000h → no error

Figure 40.5 MSB-first data reception

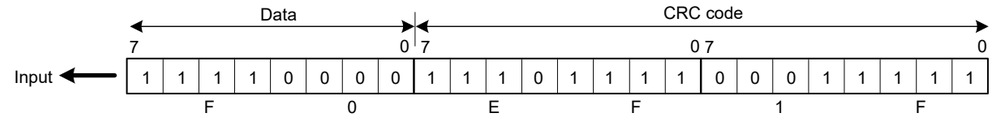
40.3.2 CRC Snoop

The CRC snoop function monitors reads from and writes to a specified I/O register address and performs CRC calculation on the data read from and written to the register address automatically. Because the CRC snoop recognizes writes to and reads from a specific register address as a trigger to automatically perform CRC calculation, writing data to the CRCDIR_BY register is not required. All I/O register addresses specified in section 40.2.5, Snoop Address Register (CRCSAR) are subject to the CRC snoop. The CRC snoop is useful in monitoring writes to the serial transmit buffer, and reads from the serial receive buffer.

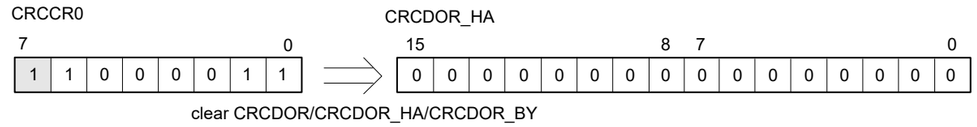
To use this function, write a target I/O register address to the CRCSA13 to CRCSA0 bits in the CRCSAR register, and set the CRCSEN bit in the CRCCR1 register to 1. Then set the CRCSWR bit in the CRCCR1 register to 1 to enable snooping on writes to the target address, or set the CRCSWR bit in the CRCCR1 register to 0 to enable snooping on reads from the target address.

When both the CRCSEN and CRCSWR bits are set to 1 and data is written to a target I/O register address in a bus master module (including the CPU, DMAC, and DTC), the CRC calculator stores the data in the CRCDIR_BY register and performs CRC calculation. Similarly, when the CRCSEN bit is set to 1 and the CRCSWR bit to 0, and data is read from

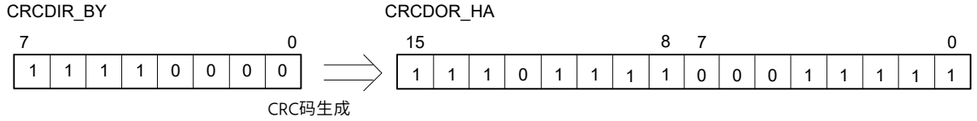
1.8位串行接收（MSB优先）



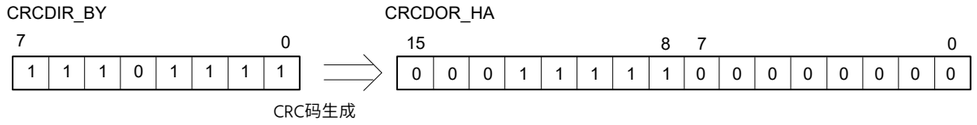
2.将C3h写入CRC控制寄存器0(CRCCR0)



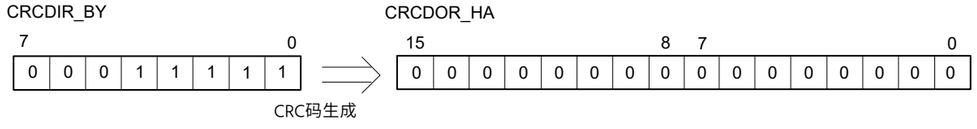
3.将F0h写入CRC数据输入寄存器(CRCDIR_BY)



4.将EFh写入CRC数据输入寄存器(CRCDIR_BY)



5.将1Fh写入CRC数据输入寄存器(CRCDIR_BY)



6.读取CRC数据输出寄存器（CRCDOR_HA）中的计算结果CRC码=0000h 无错误

Figure 40.5 MSB优先数据接收

40.3.2 CRC Snoop

CRCsnoop功能监视对指定IO寄存器地址的读取和写入，并自动对读取和写入该寄存器地址的数据进行CRC计算。由于CRCsnoop将特定寄存器地址的写入和读取识别为触发以自动执行CRC计算，因此不需要将数据写入CRCDIR_BY寄存器。第40.2.5节中指定的所有IO寄存器地址，侦听地址寄存器(CRCSAR)均受CRC侦听。CRCsnoop在监视对串行发送缓冲区的写入和从串行接收缓冲区读取时很有用。

要使用此功能，请将目标IO寄存器地址写入CRCSAR寄存器中的CRCSA13到CRCSA0位，并将CRCCR1寄存器中的CRCSEN位设置为1。然后将CRCCR1寄存器中的CRCSWR位设置为1，以启用写监听到目标地址，或将CRCCR1寄存器中的CRCSWR位设置为0，以启用对目标地址读取的侦听。

当CRCSEN和CRCSWR位都设置为1并且数据写入总线主控模块（包括CPU、DMAC和DTC）中的目标IO寄存器地址时，CRC计算器将数据存储在CRCDIR_BY寄存器中并执行CRC计算。同样，当CRCSEN位设置为1且CRCSWR位设置为0时，从

a target I/O register address in a bus master module (including the CPU, DMAC, and DTC), the CRC calculator stores the data in the CRCDIR_BY register and performs CRC calculation.

CRC calculation is performed 1 byte at a time. When the target I/O register address is accessed in words (16 bits) or long words (32 bits), CRC code is generated on the lower byte (1 byte) of data.

40.4 Usage Notes

40.4.1 Settings for the Module-Stop Function

CRC calculator operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The CRC calculator is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

40.4.2 Note on Transmission

The transmission sequence for the CRC code differs depending on whether transmission is LSB-first or MSB-first.

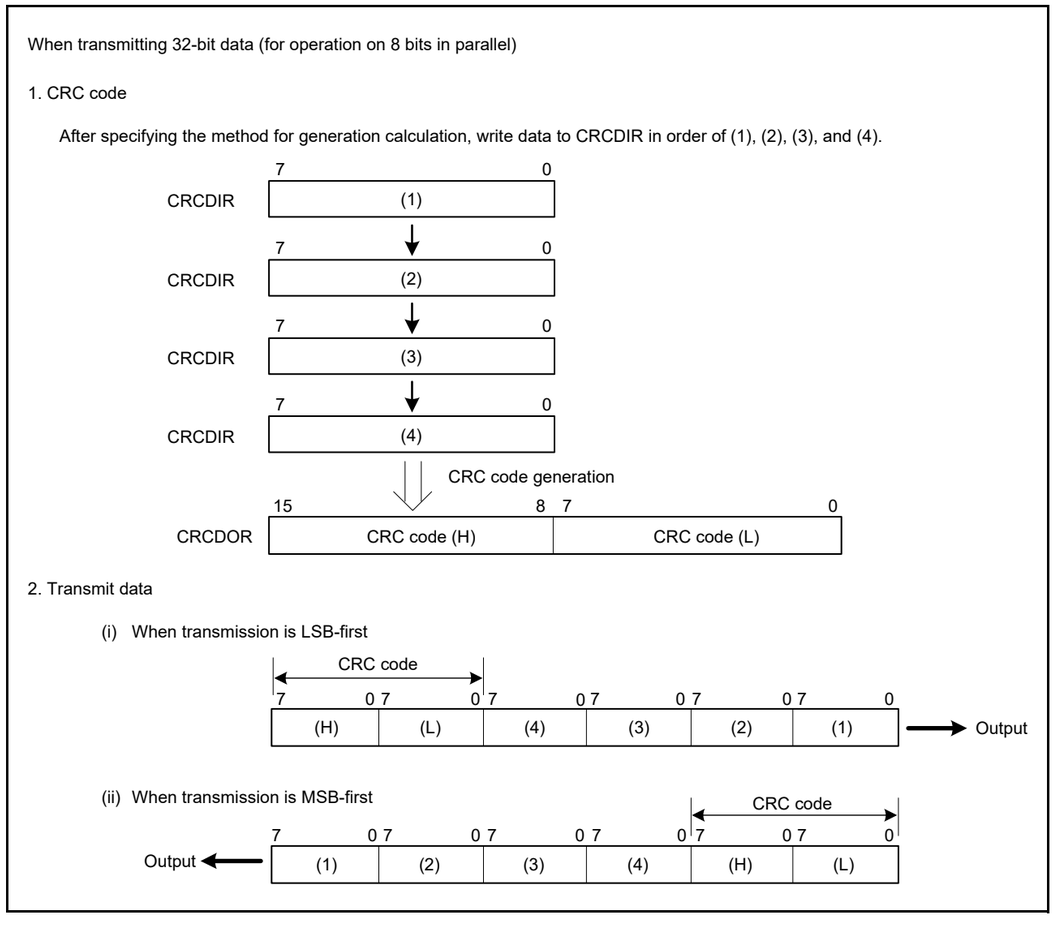


Figure 40.6 LSB-first and MSB-first data transmission

总线主控模块（包括CPU、DMAC和DTC）中的目标IO寄存器地址，CRC计算器将数据存储在CRCDIR_BY寄存器中并进行CRC计算。

每次执行1个字节的CRC计算。当以字（16位）或长字（32位）访问目标IO寄存器地址时，会在数据的低字节（1字节）上生成CRC码。

40.4 使用说明

40.4.1 模块停止功能的设置

可以使用模块停止控制寄存器C(MSTPCRC)禁用或启用CRC计算器操作。CRC计算器在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

40.4.2 传输注意事项

CRC码的传输顺序根据传输是LSB优先还是MSB优先而有所不同。

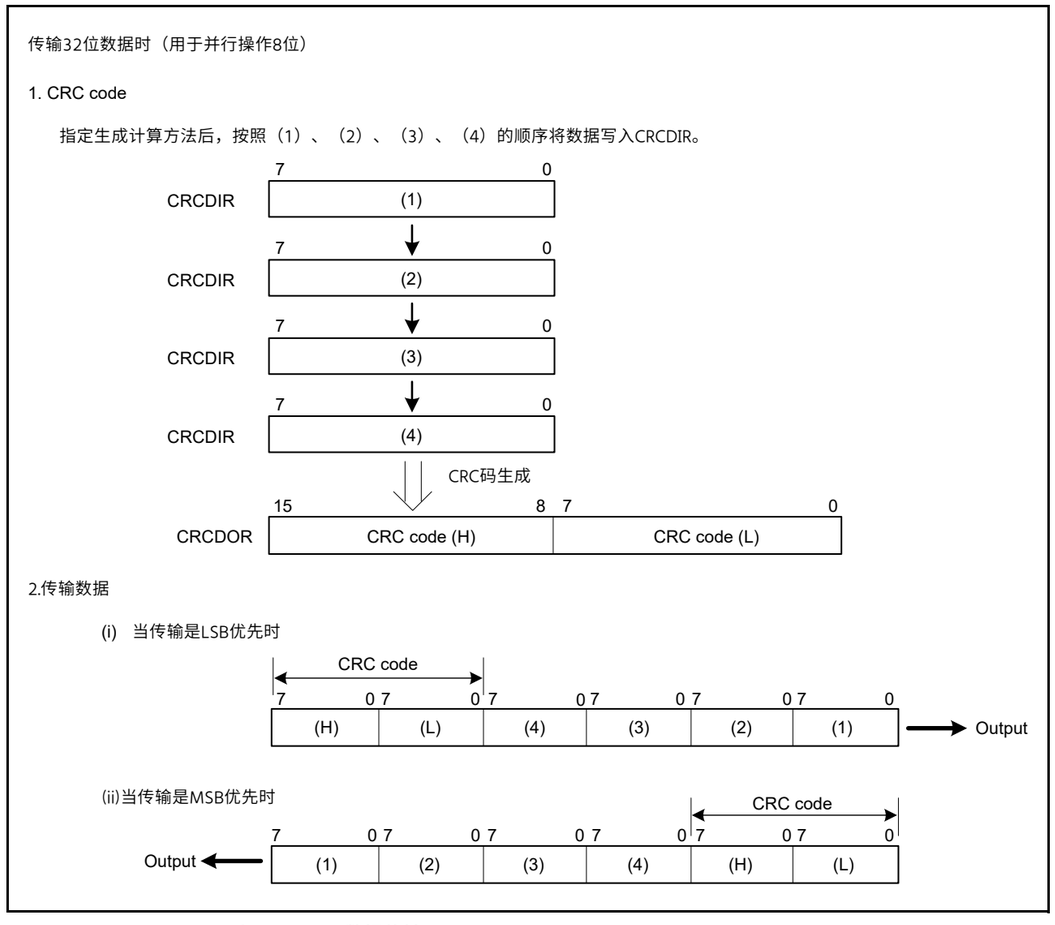

Figure 40.6 LSB−first和MSB−first数据传输

41. Serial Sound Interface Enhanced (SSIE)

41.1 Overview

The Serial Sound Interface Enhanced (SSIE) can transmit and receive audio data to and from various devices that support any of audio data formats, such as I2S, monaural, and TDM.

41.2 Features

Table 41.1 Features of SSIE

Parameter		Description
Number of channels		Two channels, SSIE0 and SSIE1
Communication mode		• Master/slave • Transmission/reception(SSIE0 full-duplex communication) • Transmission/reception(SSIE1 half-duplex communication)
Communication format		• I2S format • Monaural format • TDM format
Serial data		• MSB first • Data can be left-justified or right-justified. • Data delay (1 clock cycle) or no delay selectable for the period from SSILRCK/SSIFS to SSITXD0/SSIRXD0/SSIDATA1 • System word length: 8, 16, 24, 32, 48, 64, 128, or 256 bits • Data word length: 8, 16, 18, 20, 22, 24, or 32 bits • Padding polarity: Low or high
Bit clock (SSIBCK)	In master mode	• Two clock sources available (AUDIO_CLK/GPT output (GTIOC1A)) • Clock source division ratio: 1/1, 1/2, 1/4, 1/6, 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, 1/64, 1/96, and 1/128. • Supply/stop is selectable while communication is halted.
	In master/slave mode	• Polarity (rising edge or falling edge) selectable
LR clock/frame synchronization (SSILRCK/SSIFS)	In master mode	• Polarity (low level or high level) selectable • Supply/stop is selectable while communication is halted.
Transmit data (SSITXD0/SSIDATA1) and receive data (SSIRXD0/SSIDATA1)	Transmission	• Muting method (transmission of transmit FIFO data or transmission of data fixed to 0) selectable
FIFO	Capacity	• Transmit FIFO/receive FIFO: 4 bytes × 32 stages
	Data alignment	• Data alignment method (left-justification or right-justification) selectable for the data transfer between FIFO and shift register
Interrupt	Interrupt output	• Communication error/idle mode • Receive data full • Transmit data empty
Low power consumption function		• Whether to supply the audio clock selectable in master mode
Module stop function		• Module stop state can be set to reduce power consumption.

The following table lists and defines the terms used for the communication formats SSIE can use:

Table 41.2 Definition of terms

Term	Definition
Start trigger	First edge of the signal on the SSILRCK/SSIFS pin when the signal is set to the value specified in LRCKP to enable communication
Frame boundary	Point where SSIE starts transferring the first data of a frame or the point where SSIE ends transferring the last data of the frame

41. 串行声音接口增强(SSIE)

41.1 Overview

增强型串行声音接口(SSIE)可以向各种支持任何音频数据格式（例如I2S、单声道和TDM）的设备发送和接收音频数据。

41.2 Features

Table 41.1 SSIE的特点

Parameter		Description
通道数		两个通道，SSIE0和SSIE1
通讯方式		• Master/slave • Transmission/reception(SSIE0 full-duplex communication) • Transmission/reception(SSIE1 half-duplex communication)
通讯格式		• I2S format • Monaural format • TDM format
串行数据		MSB优先 数据可以左对齐或右对齐。 从SSILRCKSSIFS到SSITXD0SSIRXD0SSIDATA1期间可选择数据延迟（1个时钟周期）或无延迟 系统字长：8、16、24、32、48、64、128或256位 数据字长：8、16、18、20、22、24或32位 填充极性：低或高
位时钟(SSIBCK)	在主模式	两个时钟源可用（AUDIO_CLKGPT输出(GTIOC1A)） 时钟源分频比：11、12、14、16、18、112、116、124、132、148、164、196和1128。 通信停止时可选择停止供电。
	在主从模式	极性（上升沿或下降沿）可选
LR clock/frame synchronization (SSILRCK/SSIFS)	在主模式	极性（低电平或高电平）可选 通信停止时可选择停止供电。
发送数据(SSITXD0SSIDATA1)和接收数据(SSIRXD0SSIDATA1)	Transmission	可选择静音方法（传输传输FIFO数据或传输固定为0的数据）
FIFO	Capacity	发送FIFO接收FIFO：4字节×32级
	数据对齐	数据对齐方式（左对齐或右对齐）可选择用于FIFO和移位寄存器之间的数据传输
Interrupt	中断输出	通信错误空闲模式 接收数据已满 传输数据空
低功耗功能		是否提供在主模式下可选择的音频时钟
模块停止功能		可设置模块停止状态以降低功耗。

下表列出并定义了用于SSIE可以使用的通信格式的术语：

Table 41.2 术语定义

Term	Definition
启动触发器	当信号设置为LRCKP中指定的值以启用通信时，SSILRCKSSIFS引脚上的信号的第一个边沿
框架边界	SSIE开始传输帧的第一个数据的点或SSIE结束传输帧的最后一个数据的点

Table 41.2 Definition of terms

Term	Definition
Frame word number	Number of sound channels per frame
System word length	Number of bits per channel
Data word length	Number of significant bits per channel
Control bits for communication formats	• SSICR register: FRM, DWL, SWL, LRCKP, SPDP, SDTA, PDTA, and DEL bits • SSIFCR register: BSW bit • SSIOFR register: OMOD bit • SSISCR register: TDES and RDFS bits

b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If the value of these bits is changed by rewriting, subsequent operation is unpredictable.

Note 2. If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If the value of the TEN or REN bit is changed by rewriting, subsequent operation is unpredictable. For example, when transmission or reception is enabled, check that SSISR.IIRQ is 0; when transmission or reception is disabled, check that SSISR.IIRQ is 1.

With this register, select an audio clock, control interrupt requests, select data formats, and set an operation mode.

TEN and REN bits (Transmission and Reception Enable)

These bits enable/disable transmission and reception. When 1 is written to one of these bits, the corresponding communication operation starts in synchronization with a start trigger by the SSILRCK/SSIFS signal. For details, see section 41.8.2 to section 41.8.4. When 0 is written to this bit, the current communication operation stops at the next frame boundary. To use SSIE for both transmission and reception, always write 1 to these bits together. When stopping the communication using SSIE, always disable both transmission and reception (write 0 to the TEN and REN bits).

If you want to stop SSIE before a frame boundary is reached, perform a software reset procedure.

MUEN bit (Mute Enable)

This bit sets/clears the mute function for the data output from the SSITXD0/SSIDATA1 pin. When this bit is set to 1 in the middle of a frame, the SSITXD0/SSIDATA1 output changes to 0 at the next frame boundary. When this bit is set to 0 in the middle of a frame, the SSITXD0/SSIDATA1 output changes to the data of transmit FIFO data register at the next frame boundary. Note that this bit controls data only. Status flags and interrupt signals are normally generated.

Changing the value of this bit must be performed only after setting the communication format to be used.

Bit	Symbol	位名称	Description	R/W
b23, b22	FRM[1:0]	选择帧字数*1		R/W

	通讯格式（SSIOFR.OMOD[1:0]）		
FRM[1:0]	I²S (00b)	Monaural (10b)	TDM (01b)
00b	2	1	禁止设定
01b	禁止设定	禁止设定	4
10b			6
11B			8

b24	—	Reserved	该位读取为0。写入值应为0。	R/W
b25	IIEN	空闲模式中断输出 Enable	0：禁用空闲模式中断输出1：启用空闲模式中断输出。	R/W
b26	ROIEN	接收溢出中断输出使能	0：禁止接收溢出中断输出1：使能接收溢出中断输出。	R/W
b27	RUIEN	接收下溢中断输出使能	0：禁止接收下溢中断输出1：使能接收下溢中断输出。	R/W
b28	TOIEN	发送溢出中断输出使能	0：禁止发送溢出中断输出1：使能发送溢出中断输出。	R/W
b29	TUIEN	发送下溢中断输出使能	0：禁止发送下溢中断输出1：使能发送下溢中断输出。	R/W
b30	CKS	选择一个音频时钟 Master-mode Communication *1	0：选择AUDIO_CLK输入1：选择GTIOC1A（GPT输出）。	R/W
b31	—	Reserved	该位读取为0。写入值应为0。	R/W

Note 1. 禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果这些位的值通过重写而改变，后续的操作是不可预知的。

Note 2. 如果TEN位或REN位被重写，请确保SSISR.IIRQ位处于所需状态。如果TEN或REN位的值因重写而改变，后续操作将无法预测。例如，启用发送或接收时，检查SSISR.IIRQ是否为0；当发送或接收被禁用时，检查SSISR.IIRQ是否为1。

使用该寄存器，选择音频时钟、控制中断请求、选择数据格式和设置操作模式。

TEN和REN位（发送和接收使能）

这些位启用禁用发送和接收。当这些位之一写入1时，相应的通信操作与SSILRCKSSIFS信号的开始触发同步开始。有关详细信息，请参阅第41.8.2节至第41.8.4节。当向该位写入0时，当前通信操作在下一帧边界处停止。要同时使用SSIE进行发送和接收，请始终将1一起写入这些位。使用SSIE停止通信时，始终禁用发送和接收（将0写入TEN和REN位）。

如果要在达到帧边界之前停止SSIE，请执行软件复位程序。

MUEN位（静音使能）

该位设置清除SSITXD0SSIDATA1引脚数据输出的静音功能。当该位在帧中间设置为1时，SSITXD0SSIDATA1输出在下一帧边界变为0。当该位在帧中间设置为0时，SSITXD0SSIDATA1输出在下一帧边界变为发送FIFO数据寄存器的数据。请注意，该位仅控制数据。通常会产生状态标志和中断信号。

只有在设置要使用的通信格式后才能更改该位的值。

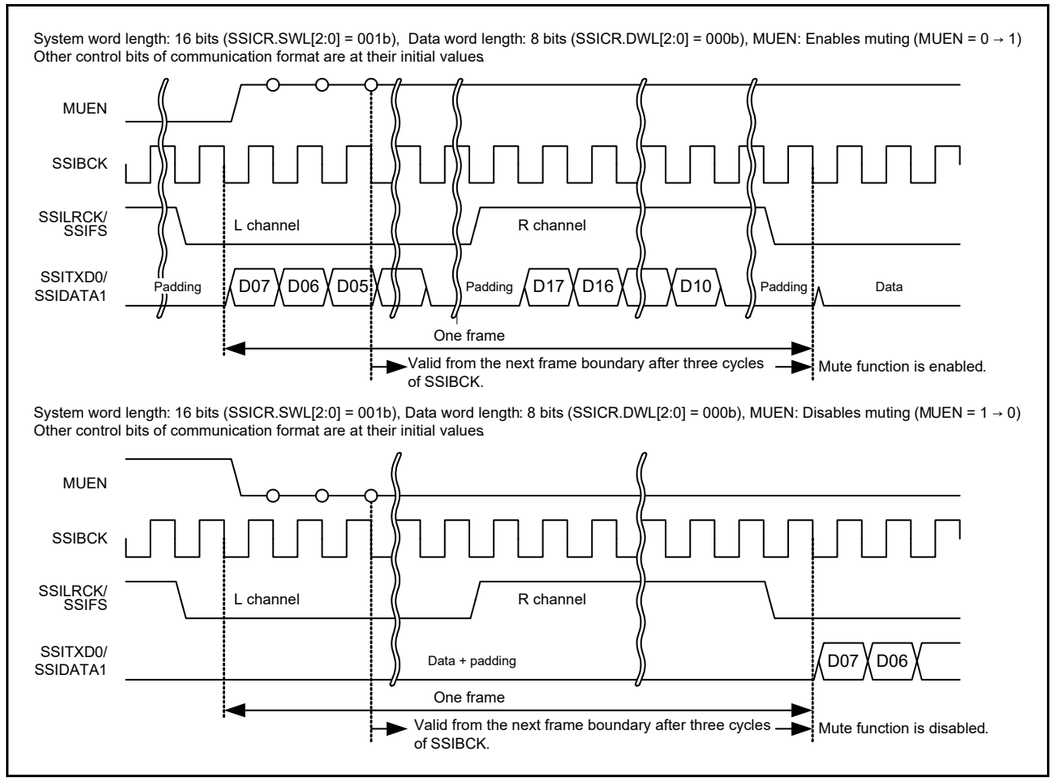

Figure 41.5 Transmit data with the mute function set

CKDV[3:0] bits (Selects Bit Clock Division Ratio)

These bits set the division ratio of the bit clock based on AUDIO_MCK in master-mode communication (MST = 1). In slave-mode communication (MST = 0), setting of these bits are invalid.

Writing to this bit must be performed when the supply of AUDIO_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in SSIFCR.

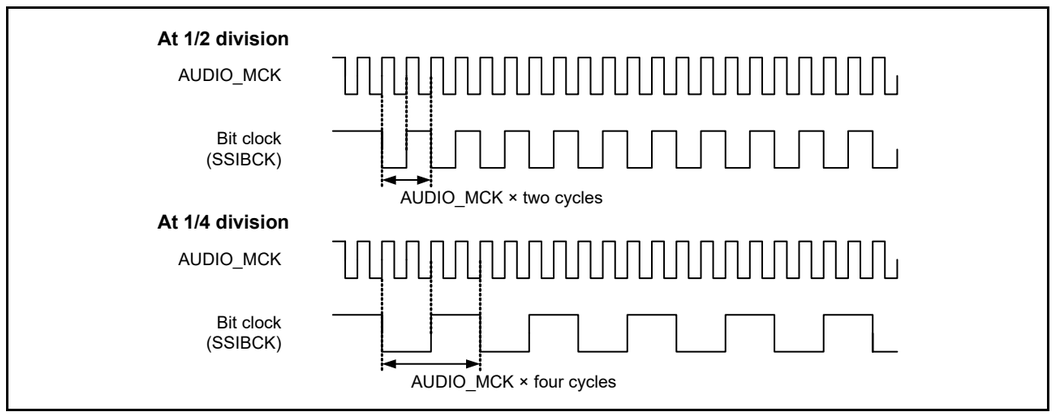

Figure 41.6 Sampling frequencies in master-mode communication

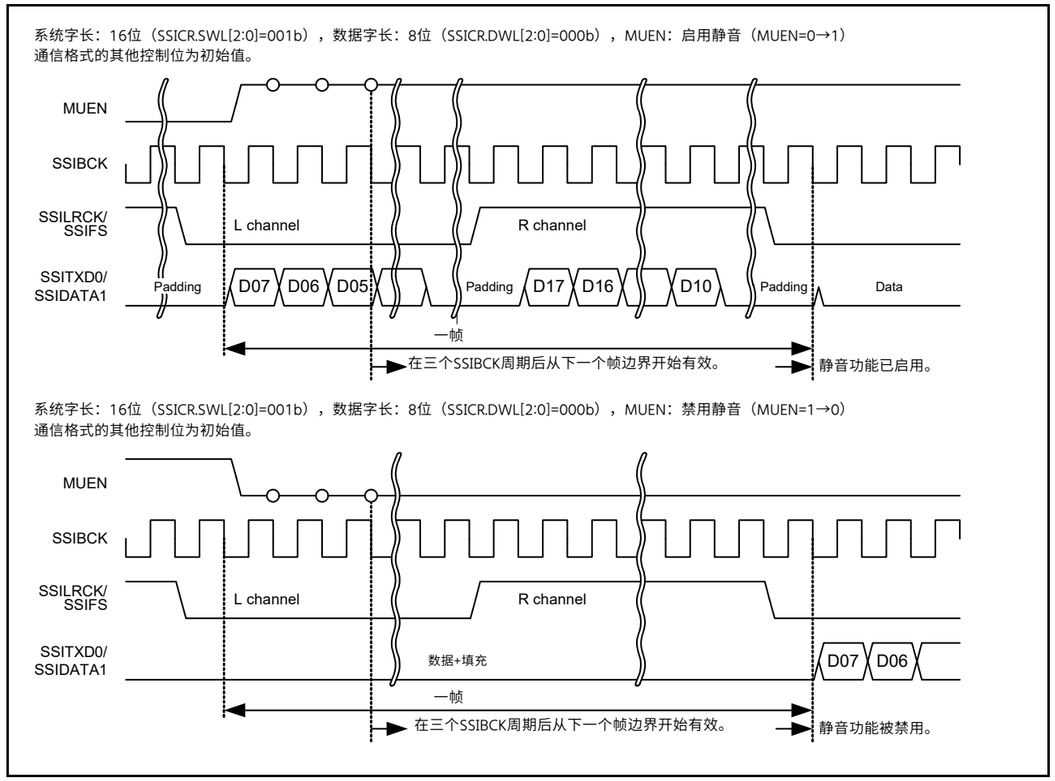

Figure 41.5 设置静音功能传输数据

CKDV[3:0]位（选择位时钟分频比）

这些位在主模式通信(MST=1)中根据AUDIO_MCK设置位时钟的分频比。在从机模式通信(MST=0)中，这些位的设置无效。

当停止提供AUDIO_MCK时，必须执行写入该位。有关时序的详细信息，请参见SSIFCR中AUCKE位的详细说明。

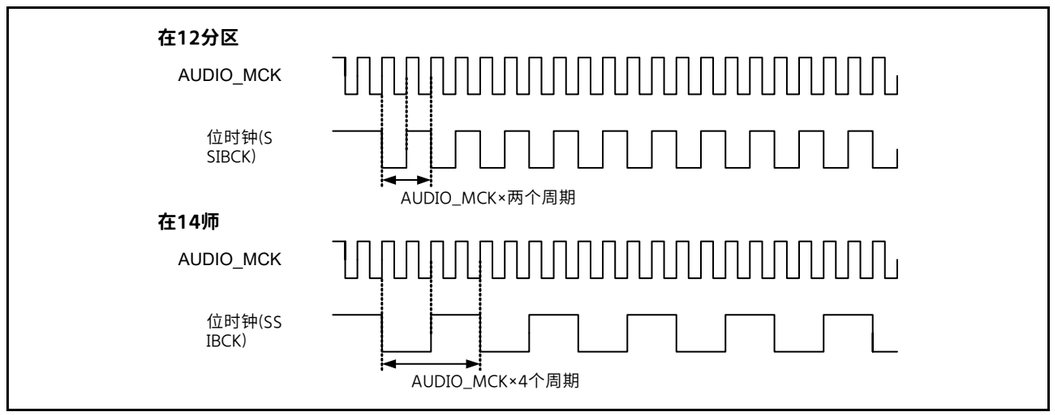

Figure 41.6 主模式通信中的采样频率

DEL bit (Selects Serial Data Delay)

This bit sets whether or not there will be a delay between SSILRCK/SSIFS and SSITXD0/SSIRXD0/SSIDATA1.

For the I²S or TDM format, set the DEL bit to 0. When the monaural format is used, setting of this bit changes the high period width of SSILRCK/SSIFS. For details, see section 41.5.2, Monaural Format. When using a compatible communication format, specify a setting of this bit that enables communication.

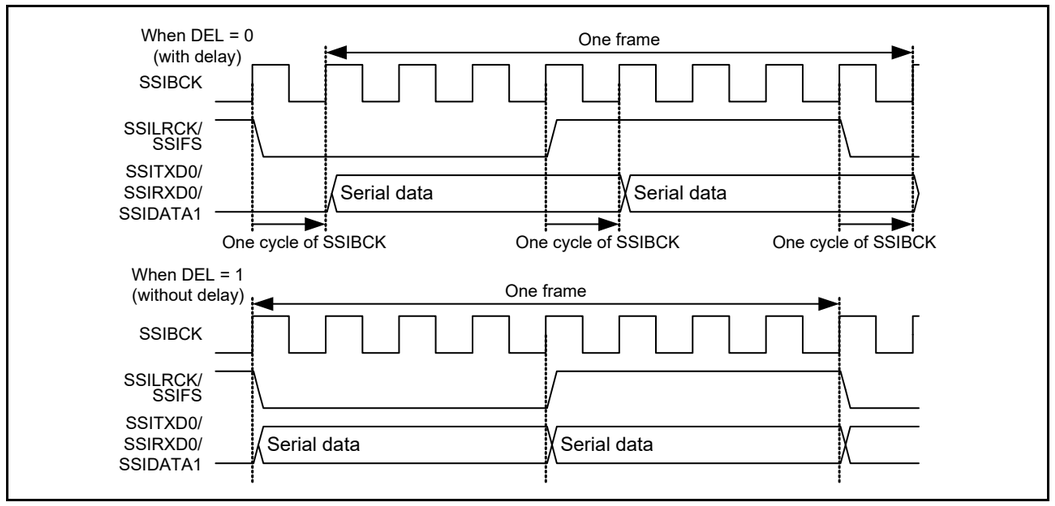

Figure 41.7 Setting of delay in serial data

PDTA bit (Selects Placement Data Alignment)

This bit sets how to align placement data. With the setting of data word length as 32 bits (SSICR.DWL[2:0] = 110b), this bit is invalid.

At transmission, see Figure 41.8.

DEL位（选择串行数据延迟）

该位设置SSILRCKSSIFS和SSITXD0SSIRXD0SSIDATA1之间是否会有延迟。

对于I2S或TDM格式，将DEL位设置为0。当使用单声道格式时，该位的设置会改变SSILRCKSSIFS的高周期宽度。有关详细信息，请参阅第41.5.2节，单声道格式。使用兼容的通信格式时，指定该位的设置以启用通信。

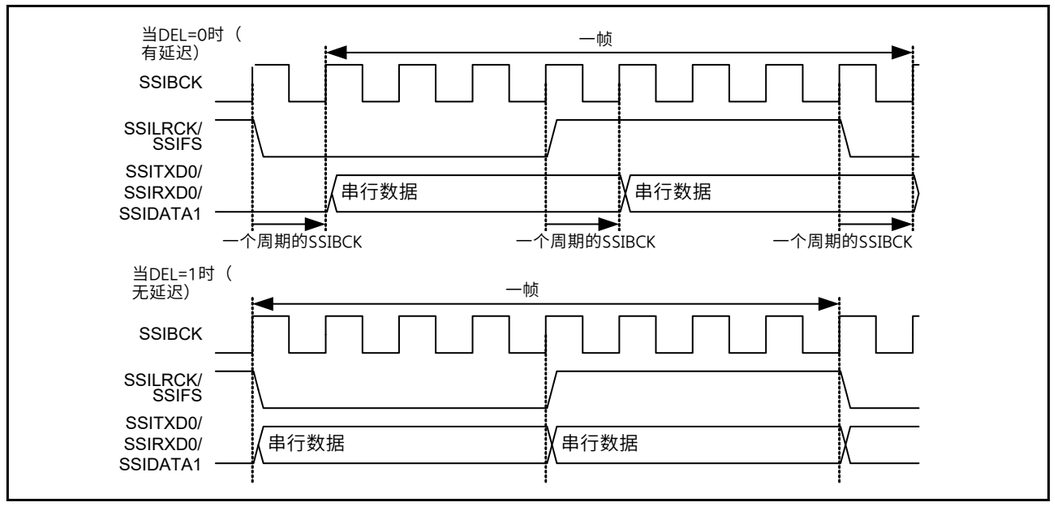

Figure 41.7 串行数据延迟设置

PDTA位（选择布局数据对齐）

该位设置如何对齐布局数据。数据字长设置为32位（SSICR.DWL[2:0]=110b）时，该位无效。

传输时，见图41.8。

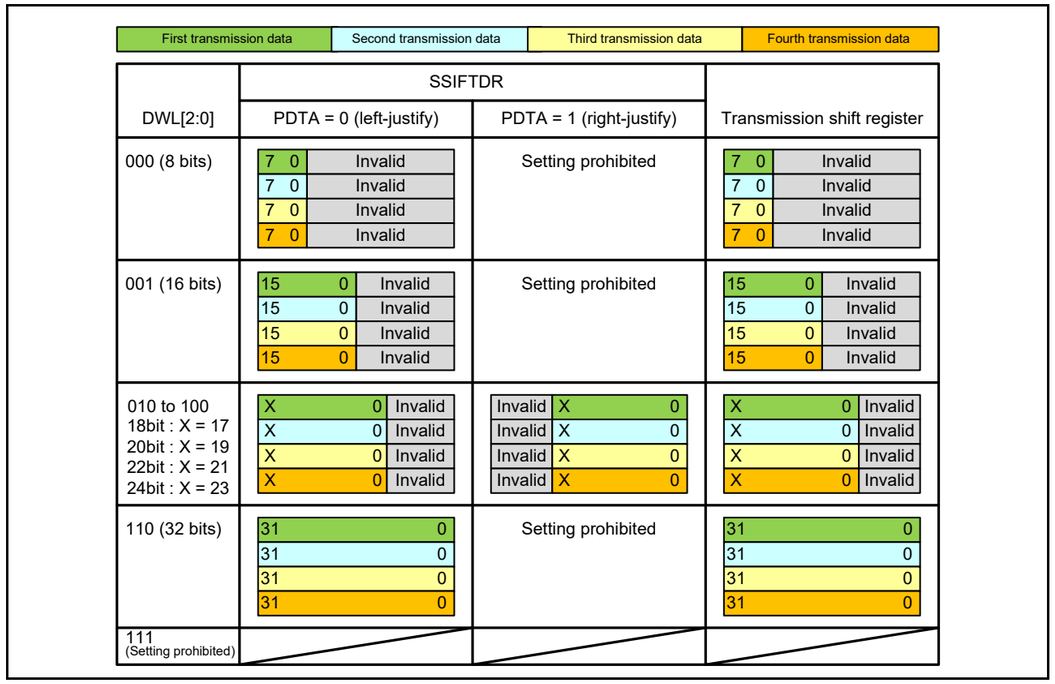

Figure 41.8 Alignment of placement data at transmission

At reception, see Figure 41.9.

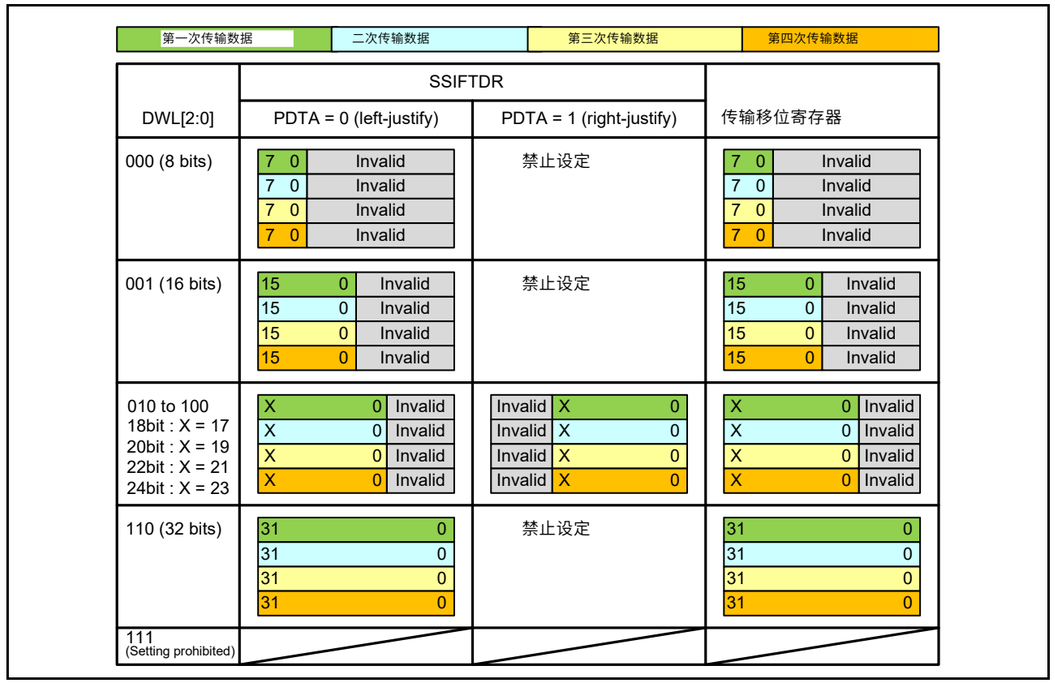

Figure 41.8 在传输时对齐放置数据

在接待处，见图41.9。

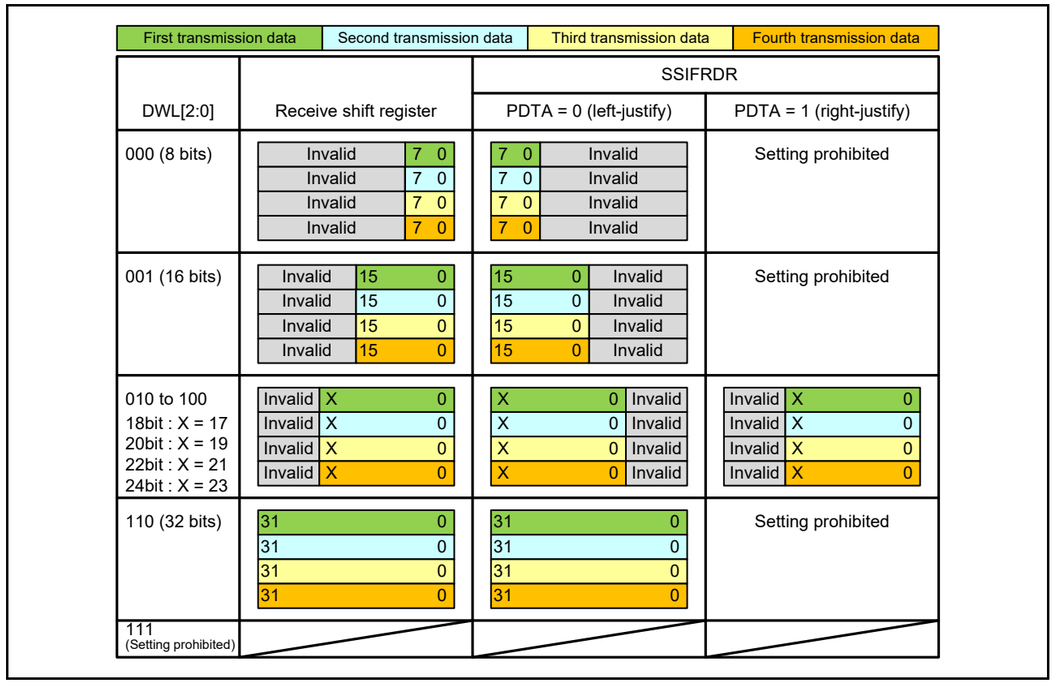

Figure 41.9 Alignment of placement data at reception

SDTA bit (Selects Serial Data Delay)

This bit sets how to align serial data and padding bits. For communication without padding bits, this bit is invalid.

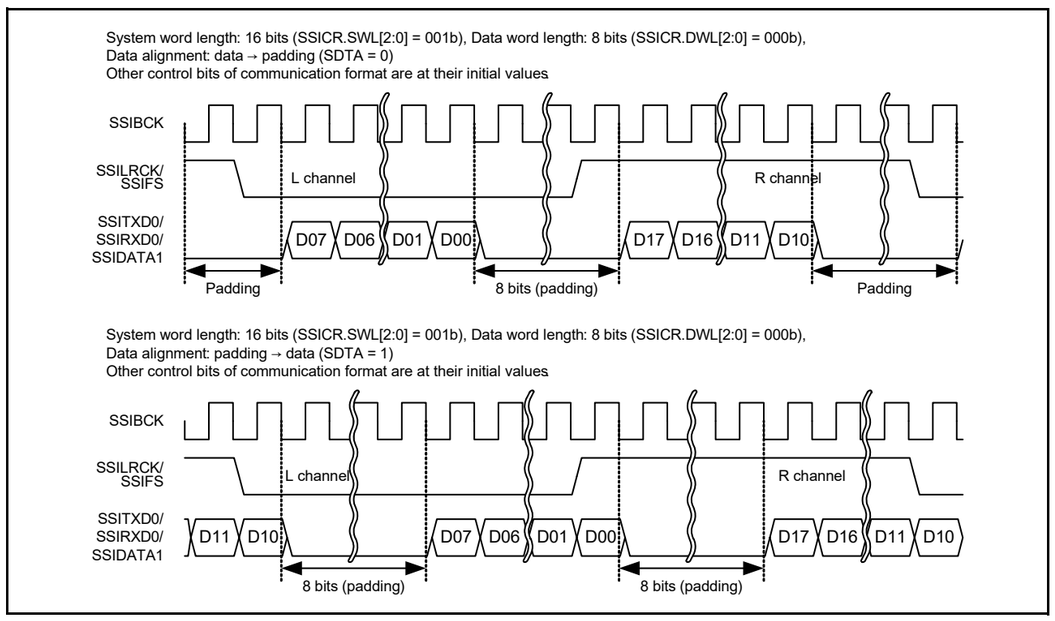

Figure 41.10 Alignment setting of serial data with padding bits

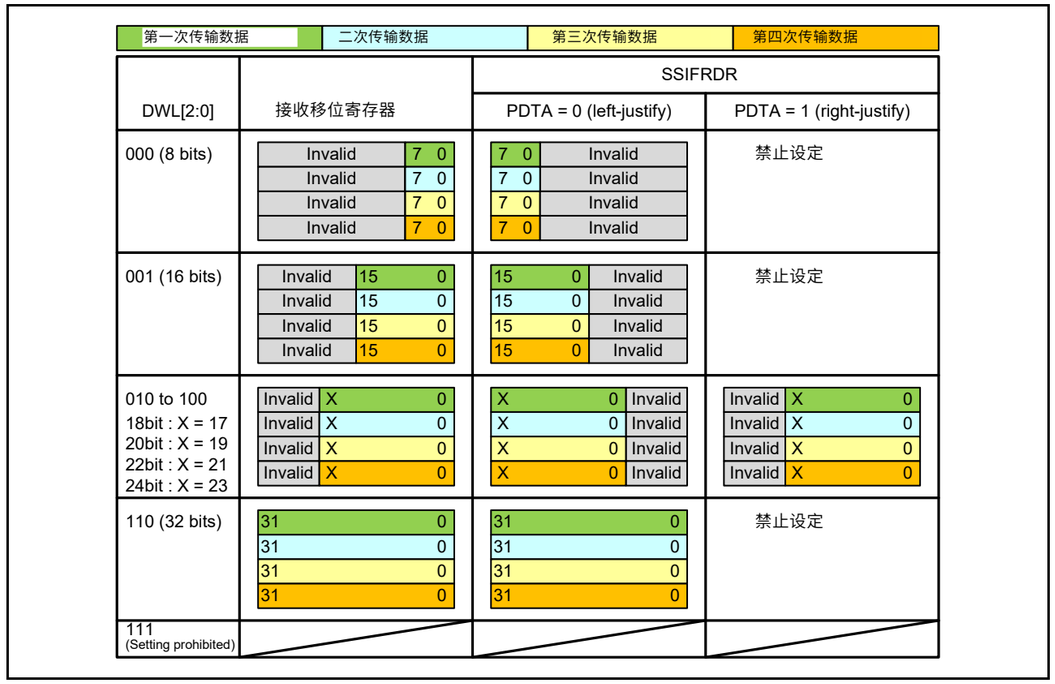

Figure 41.9 在接收时对齐放置数据

SDTA位（选择串行数据延迟）

该位设置如何对齐串行数据和填充位。对于没有填充位的通信，该位无效。

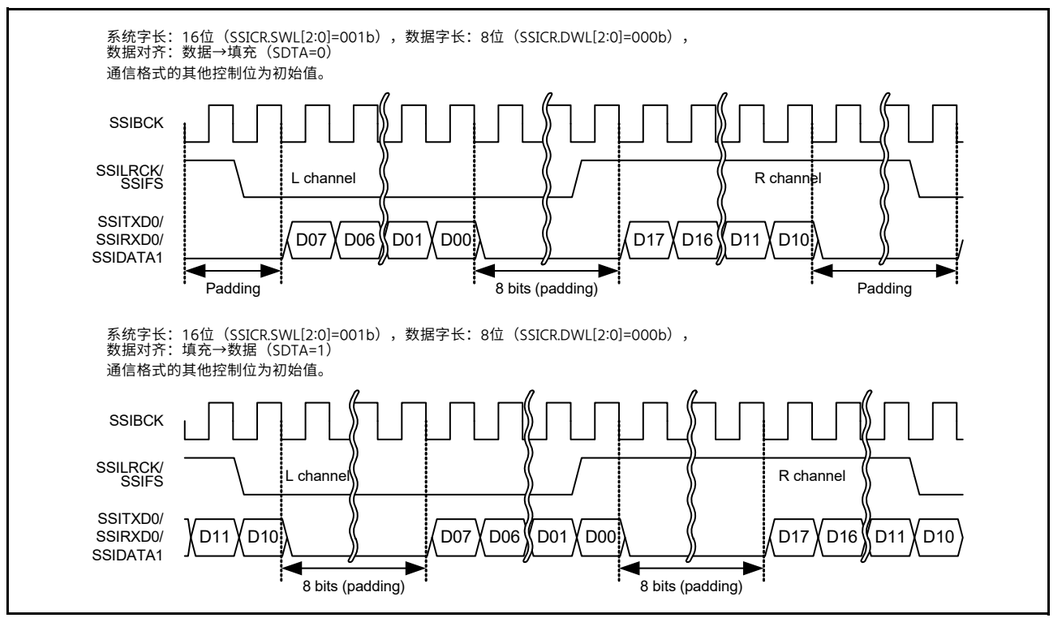

Figure 41.10 串行数据的对齐设置与填充位

SPDP bit (Selects Serial Padding Polarity)

This bit sets polarity of padding bits.

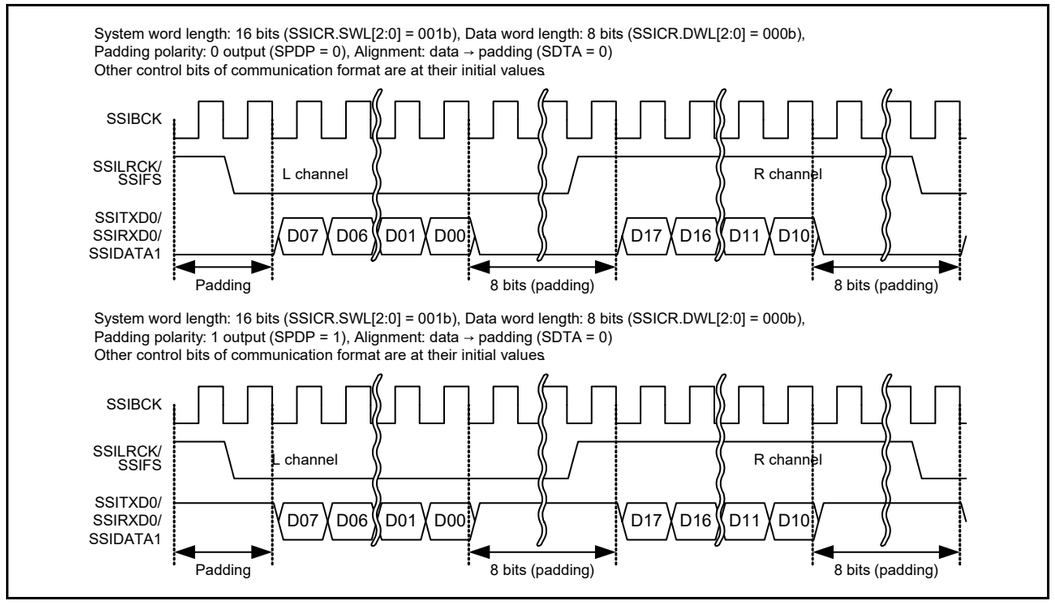

Figure 41.11 Padding bit polarity

LRCKP bit (Selects the Initial Value and Polarity of LR Clock/Frame Synchronization Signal)

This bit sets the initial value and polarity of SSILRCK/SSIFS. Set this bit according to the communication format to be used in SSIE. See Table 41.3 Initial output value and polarity of SSILRCK/SSIFS pin. For the slave-mode communication (MST = 0), only the start trigger is used.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in SSIOFR.

Table 41.3 Initial output value and polarity of SSILRCK/SSIFS pin

Communication Format	Expected Initial State	Setting Value of LRCKP
I^2S	High	0
Monaural	Low	1
TDM	Low	1

Note: When the format to be used is compatible with the I^2S, monaural, or TDM format, specify settings to enable communication with the respective formats.

SPDP位（选择串行填充极性）

该位设置填充位的极性。

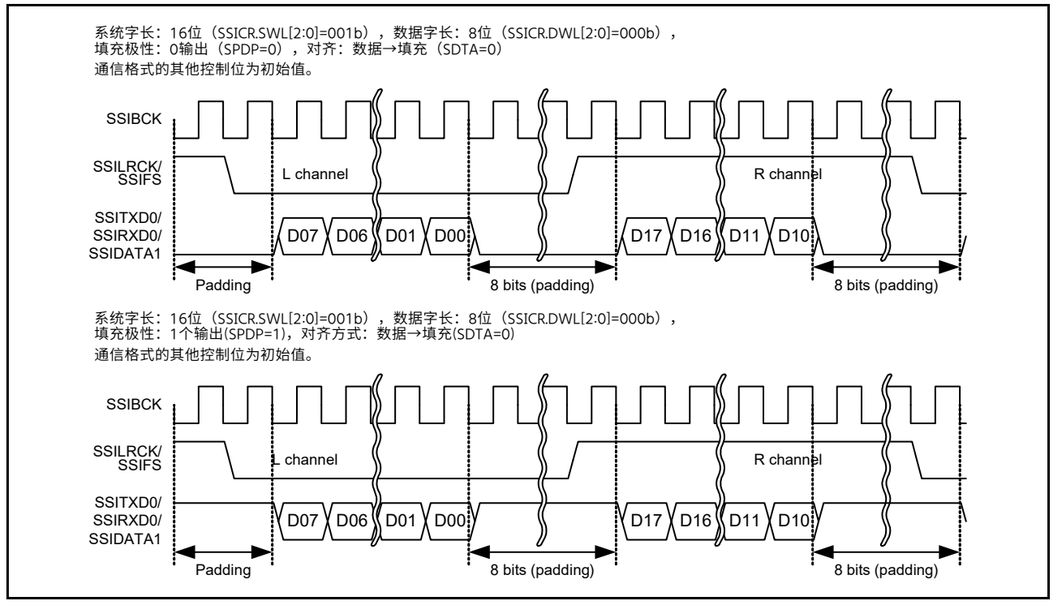

Figure 41.11 填充位极性

LRCKP位（选择LR时钟帧同步信号的初始值和极性）

该位设置SSILRCKSSIFS的初始值和极性。根据要在SSIE中使用的通信格式设置该位。请参见表41.3SSILRCKSSIFS引脚的初始输出值和极性。对于从模式通信(MST=0)，仅使用启动触发器。

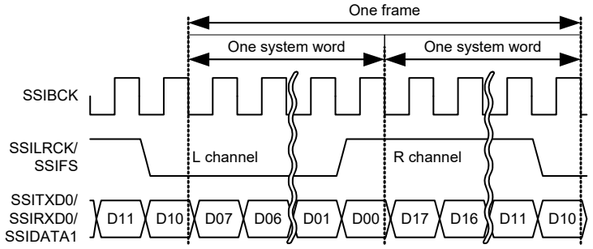
当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。LR时钟的输出详见SSIOFR中LRCONT位的详细说明。

Table 41.3 SSILRCKSSIFS管脚的初始输出值和极性

通讯格式	预期的初始状态	LRCKP设定值
I^2S	High	0
Monaural	Low	1
TDM	Low	1

Note: 当要使用的格式与I2S、单声道或TDM格式兼容时，指定设置以启用与相应格式的通信。

System word length: 8 bits (SSICR.SWL[2:0] = 000b), Data word length: 8 bits (SSICR.DWL[2:0] = 000b),
LR clock polarity: L channel = Low, R channel = High (LRCKP = 0)
Other control bits of communication format are at their initial values.



System word length: 8 bits (SSICR.SWL[2:0] = 000b), Data word length: 8 bits (SSICR.DWL[2:0] = 000b),
LR clock polarity: L channel = High, R channel = Low (LRCKP = 1)
Other control bits of communication format are at their initial values.

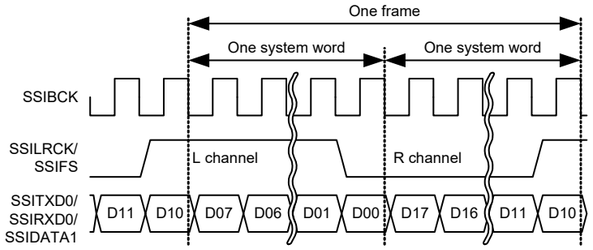


Figure 41.12 LR clock/frame synchronization polarity setting

BCKP bit (Selects Bit Clock Polarity)

This bit sets the bit clock polarity.

Writing to this bit must be performed when the supply of AUDIO_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in section 41.4.3, FIFO Control Register (SSIFCR).

Table 41.4 Bit clock polarity

Communication	Master/Slave	Timing	BCKP = 0	BCKP = 1
Reception	Slave	At SSILRCK/SSIFS sampling	SSIBCK rising edge	SSIBCK falling edge
	Master/slave	At SSIRXD0/SSIDATA1 sampling	SSIBCK rising edge	SSIBCK falling edge
Transmission	Master	At change of SSILRCK/SSIFS output	SSIBCK falling edge	SSIBCK rising edge
	Master/slave	At change of SSITXD0/SSIDATA1 output	SSIBCK falling edge	SSIBCK rising edge

MST bit (Master Enable)

This bit sets master-/slave-mode communication.

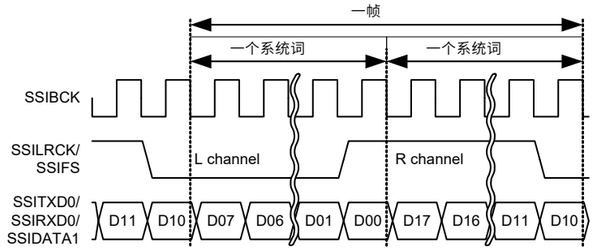
Writing to this bit must be performed when the supply of AUDIO_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in section 41.4.3, FIFO Control Register (SSIFCR).

SWL[2:0] bits (Selects System Word Length)

These bits set the number of bits in one system word. Padding bits are sent and received in relation with one data word set with DWL[2:0]. See Table 41.11 for details.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in section 41.4.7, Audio Format Register (SSIOFR).

系统字长：8位（SSICR.SWL[2:0]=000b），数据字长：8位（SSICR.DWL[2:0]=000b），
LR时钟极性：L通道=低，R通道=高（LRCKP=0）通信格式的其他控
制位为其初始值。



系统字长：8位（SSICR.SWL[2:0]=000b），数据字长：8位（SSICR.DWL[2:0]=000b），
LR时钟极性：L通道=高，R通道=低（LRCKP=1）通信格式的其他控
制位为其初始值。

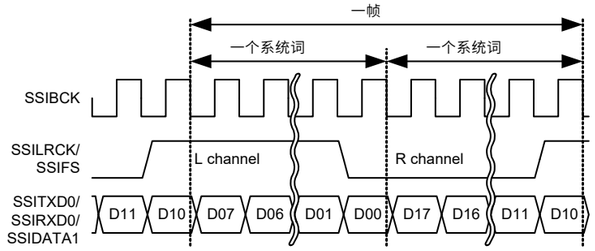


Figure 41.12 LR时钟帧同步极性设置

BCKP位（选择位时钟极性）

该位设置位时钟极性。

当停止提供AUDIO_MCK时，必须执行写入该位。有关时序的详细信息，请参见第41.4.3节FIFO控制寄存器(SSIFCR)中对AUCKE位的详细说明。

Table 41.4 位时钟极性

Communication	Master/Slave	Timing	BCKP = 0	BCKP = 1
Reception	Slave	在SSILRCKSSIFS采样	SSIBCK上升沿	SSIBCK下降沿
	Master/slave	在SSIRXD0SSIDATA1采样	SSIBCK上升沿	SSIBCK下降沿
Transmission	Master	在改变SSILRCKSSIFS输出时	SSIBCK下降沿	SSIBCK上升沿
	Master/slave	在SSITXD0SSIDATA1输出变化时	SSIBCK下降沿	SSIBCK上升沿

MST位（主使能）

该位设置主从模式通信。

当停止提供AUDIO_MCK时，必须执行写入该位。有关时序的详细信息，请参见第41.4.3节FIFO控制寄存器(SSIFCR)中对AUCKE位的详细说明。

SWL[2:0]位（选择系统字长）

这些位设置一个系统字中的位数。填充位的发送和接收与使用DWL[2:0]设置的一个数据字相关。详见表41.11
。

当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。关于LR时钟输出的详细信息，请参见第41.4
.7节，音频格式寄存器(SSIOFR)中对LRCONT位的详细说明。

DWL[2:0] bits (Selects Data Word Length)

These bits set the number of bits in one data word. The data word length (number of bits per data word) must not exceed the system word length (number of bits per system word). For details, see Table 41.11.

FRM[1:0] bits (Selects Frame Word Number)

These bits set the frame word number in individual communication formats.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in SSIOFR.

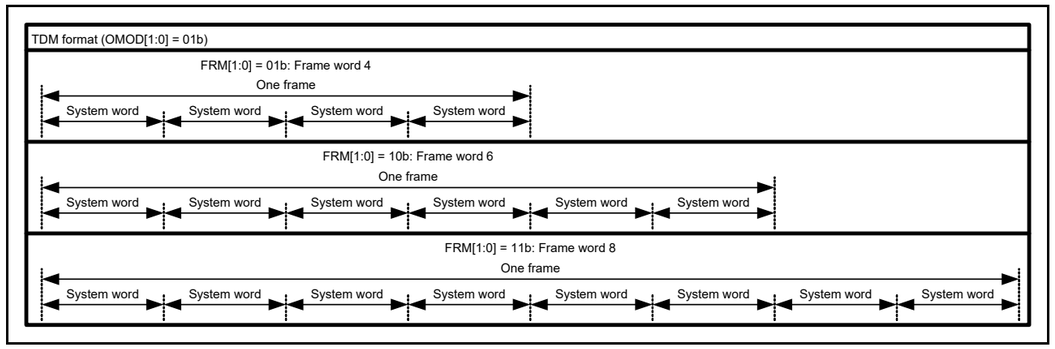

Figure 41.13 Frame word number

IIEN bit (Idle Mode Interrupt Output Enable)

This bit enables/disables output of idle mode interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.IIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.IIRQ = 1.

ROIEN bit (Receive Overflow Interrupt Output Enable)

This bit enables/disables output of receive overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.ROIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.ROIRQ = 1.

RUIEN bit (Receive Underflow Interrupt Output Enable)

This bit enables/disables output of receive underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.RUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.RUIRQ = 1.

TOIEN bit (Transmit Overflow Interrupt Output Enable)

This bit enables/disables output of transmit overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TOIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TOIRQ = 1.

TUIEN bit (Transmit Underflow Interrupt Output Enable)

This bit enables/disables output of transmit underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TUIRQ = 1.

CKS bit (Selects an Audio Clock for Master-mode Communication)

This bit sets the audio clock in master-mode communication (MST = 1). In slave-mode communication (MST = 0), setting of this bit is invalid.

Writing to this bit must be performed when the supply of AUDIO_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in SSIFCR.

DWL[2:0]位（选择数据字长）

这些位设置一个数据字中的位数。数据字长（每个数据字的位数）不得超过系统字长（每个系统字的位数）。详见表41.11。

FRM[1:0]位（选择帧字号）

这些位设置各个通信格式中的帧字号。

当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。LR时钟的输出详见SSIOFR中LRCONT位的详细说明。

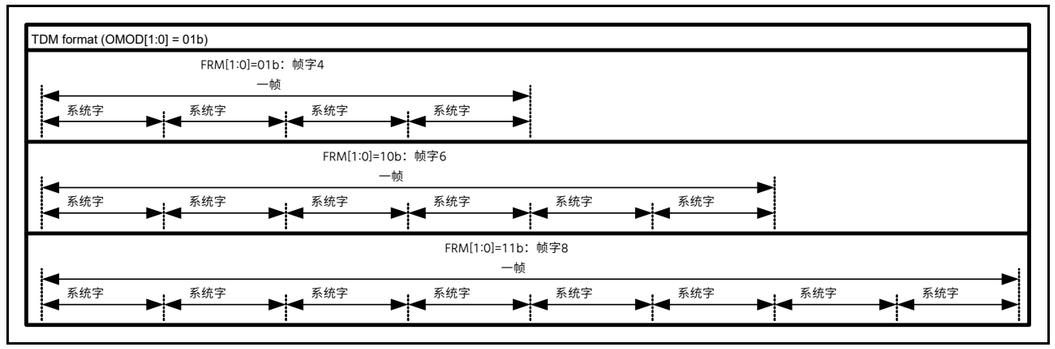

Figure 41.13 帧字数

IIEN位（空闲模式中断输出使能）

该位使能禁用空闲模式中断的输出。通过启用该位（将其设置为1），在SSISR.IIRQ=1的上升沿输出中断。当SSISR.IIRQ=1时该位从0变为1时也会输出中断。

ROIEN位（接收溢出中断输出使能）

该位使能禁止接收溢出中断的输出。通过启用该位（将其设置为1），在SSISR.ROIRQ=1的上升沿输出中断。当SSISR.ROIRQ=1时该位从0变为1时也会输出中断。

RUIEN位（接收下溢中断输出使能）

该位使能禁用接收下溢中断的输出。通过启用该位（将其设置为1），在SSISR.RUIRQ=1的上升沿输出中断。当SSISR.RUIRQ=1时该位从0变为1时也会输出中断。

TOIEN位（发送溢出中断输出使能）

该位使能禁用发送溢出中断的输出。通过启用该位（将其设置为1），在SSISR.TOIRQ=1的上升沿输出中断。当SSISR.TOIRQ=1时该位从0变为1时也会输出中断。

TUIEN位（发送下溢中断输出使能）

该位使能禁用发送下溢中断的输出。通过启用该位（将其设置为1），在SSISR.TUIRQ=1的上升沿输出中断。当SSISR.TUIRQ=1时该位从0变为1时也会输出中断。

CKS位（选择主模式通信的音频时钟）

该位设置主模式通信（MST=1）中的音频时钟。在从机模式通信(MST=0)中，该位的设置无效。

当停止提供AUDIO_MCK时，必须执行写入该位。有关时序的详细信息，请参见SSIFCR中AUCKE位的详细说明。

41.4.2 Status Register (SSISR)

Address(es): SSIE0.SSISR 4004 E004h, SSIE1.SSISR 4004 E104h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register is configured with status flags that indicate SSIE operational state.

IIRQ bit (Idle Mode Status Flag)

This is a status flag that indicates the idle state. It indicates whether SSIE is in the idle state or communication state.

For details, see Figure 41.14 and Figure 41.15.

41.4.2 状态寄存器(SSISR)

Address(es): SSIE0.SSISR 4004 E004h, SSIE1.SSISR 4004 E104h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b29	TUIRQ	发送下溢错误状态标志	0：不产生发送下溢错误1：产生发送下溢错误。	R/W
b31, b30	—	Reserved	这些位被读取为0。写入值应为0。	R/W

该寄存器配置有指示SSIE操作状态的状态标志。

IIRQ位（空闲模式状态标志）

这是指示空闲状态的状态标志。它指示SSIE是处于空闲状态还是通信状态。

详见图41.14和图41.15。

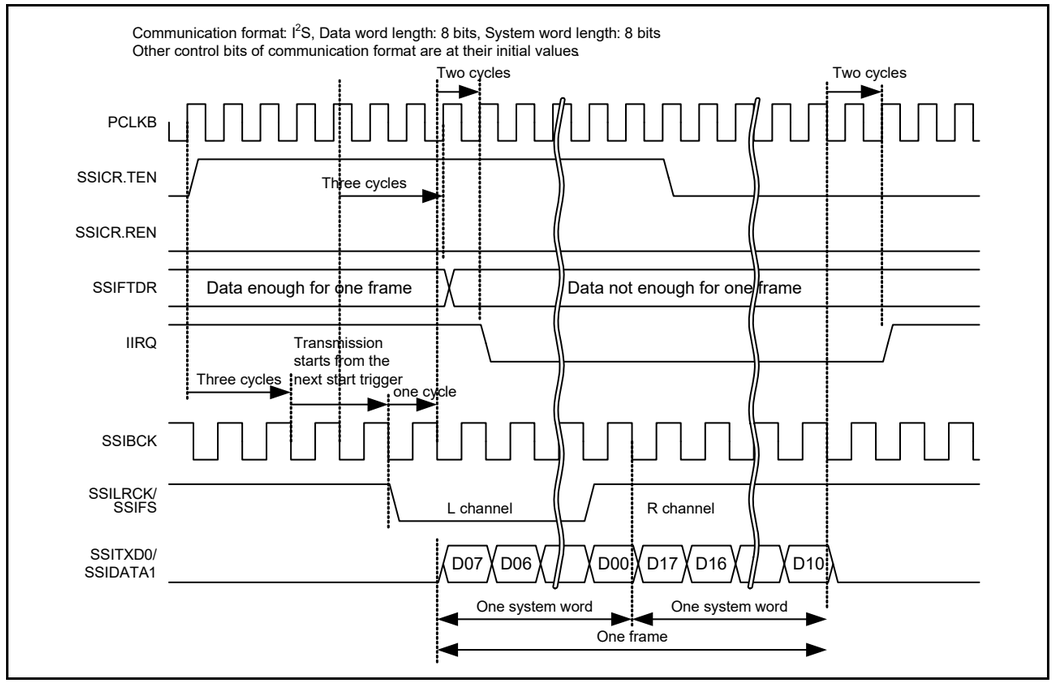

Figure 41.14 IIRQ setting timing (transmission)

- Transmitter (dedicated to transmission)

[Clearing condition]

While transmission was enabled (SSICR.TEN = 1 and SSICR.REN = 0), the transmit data for a transmission frame was written to the SSIFTDR register, and a start trigger was generated by the SSILRCK/SSIFS signal.

[Clearing timing]

1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger that is the clearing condition.

[Setting condition]

While transmission and reception were disabled (SSICR.TEN = 0 and SSICR.REN = 0), transmission of one frame was complete.

[Setting timing]

2 PCLKB cycles after the end of transmission (at a frame boundary) that is the setting condition.

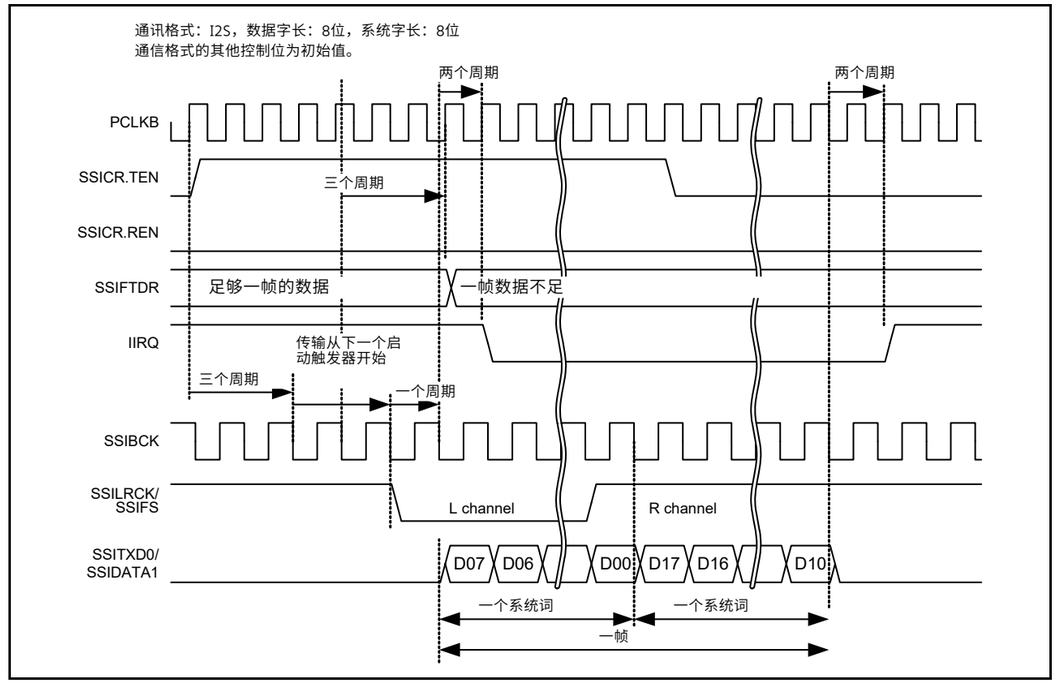

Figure 41.14 IIRQ设置时序（传输）

- 发射器（专用于传输）

[Clearing condition]

启用传输时（SSICR.TEN=1和SSICR.REN=0），传输帧的传输数据被写入SSIFTDR寄存器，并由SSILRCKSSIFS信号生成启动触发。

[Clearing timing]

1个SSIBCK周期+2个PCLKB周期在产生作为清除条件的启动触发之后。

[Setting condition]

当发送和接收被禁用时（SSICR.TEN=0和SSICR.REN=0），一帧的发送完成。

[Setting timing]

在作为设置条件的传输结束后（在帧边界处）的2个PCLKB周期。

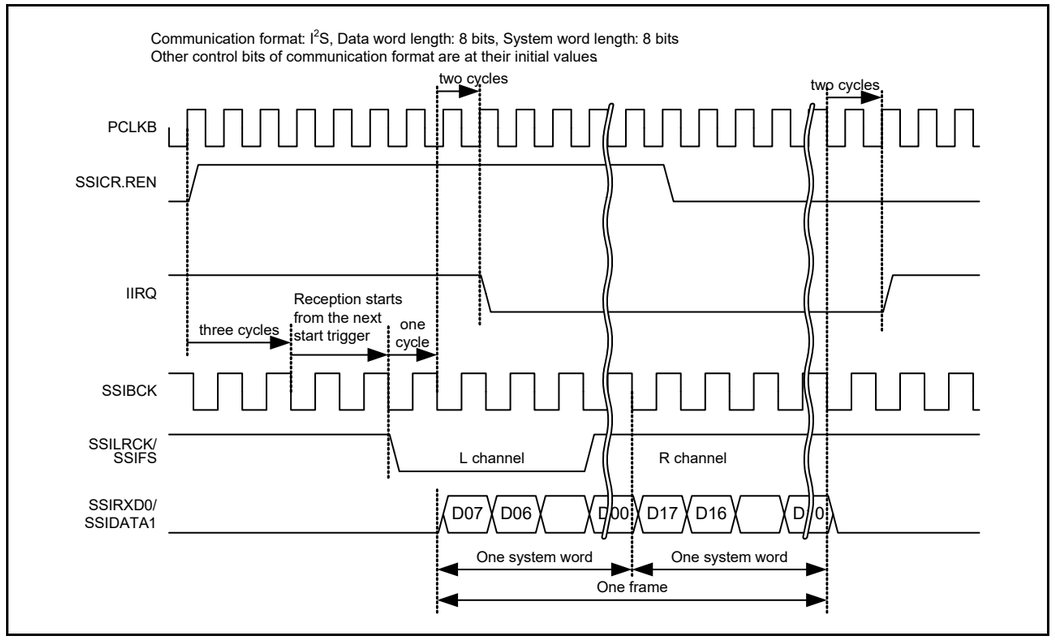

Figure 41.15 IIRQ setting timing (reception)

[Clearing condition]

启用接收时（SSICR.TEN=0和SSICR.REN=01，启动触发由
SSILRCK/SSIFS signal.

[Clearing timing]

1个SSIBCK周期+2个PCLKB周期在产生作为清除条件的启动触发之后。

[Setting condition]

当发送和接收被禁用时（SSICR.TEN=0和SSICR.REN=0），一帧的接收完成。

[Setting timing]

在作为设置条件的接收结束（在帧边界）之后的2个PCLKB周期。

- 收发器（发送和接收）

[Clearing condition]

在使能发送和接收时（SSICR.TEN=1和SSICR.REN=1），发送帧的发送数据被写入SSIFTDR寄存器，并由SSILRC KSSIFS信号生成开始触发。

[Clearing timing]

1个SSIBCK周期+2个PCLKB周期在产生作为清除条件的启动触发之后。

[Setting condition]

当发送和接收被禁用时（SSICR.TEN=0和SSICR.REN=0），一帧的发送完成。

[Setting timing]

在作为设置条件的传输结束后（在帧边界处）的2个PCLKB周期。

ROIRQ bit (Receive Overflow Error Status Flag)

This is a status flag that indicates a receive overflow error. This flags is set by automatic determination but it must be cleared by register access. This flag indicates that received data is supplied at a higher rate than requested. Data is not transferred from the receive shift register to SSIFRDR where a receive overflow error is generated. For the procedure to recover from the overflow error, see section 41.8.6, Error Handling. This flag is not cleared by a receive FIFO data register reset (SSIFCR.RFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit*2
2. Enabling communication (changing SSICR.REN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition:

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 41.19)
2. 1 PCLKB cycle after writing 1 to SSICR.REN.*3

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.
Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.REN.
Note 3. After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

[Setting condition]

At completion of receiving new data while SSIFRDR is full.

[Setting timing]

3 cycles of PCLKB after reception is completed.

ROIRQ位（接收溢出错误状态标志）

这是指示接收溢出错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表示接收到的数据以高于请求的速率提供。数据不会从接收移位寄存器传送到产生接收溢出错误的SSIFRDR。有关从溢出错误中恢复的过程，请参阅第41.8.6节，错误处理。该标志不会被接收FIFO数据寄存器复位(SSIFCR.RFRST)清除。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

完成以下任一操作时：

1. 从该位读取1后向该位写入0*2
2. 启用通信（将SSICR.REN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机：

1. 当从该位读取1后向该位写入0时（与图41.19中的时序相同）
2. 向SSICR.REN写入1后的1个PCLKB周期。*3

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：软件复位(SSIFCR.SSIRST=1)完成。读取1后，写入0完成。在将1写入SSICR.REN后经过1个PCLKB周期。注3.使能通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

[Setting condition]

在SSIFRDR已满时完成接收新数据。

[Setting timing]

接收完成后的3个PCLKB周期。

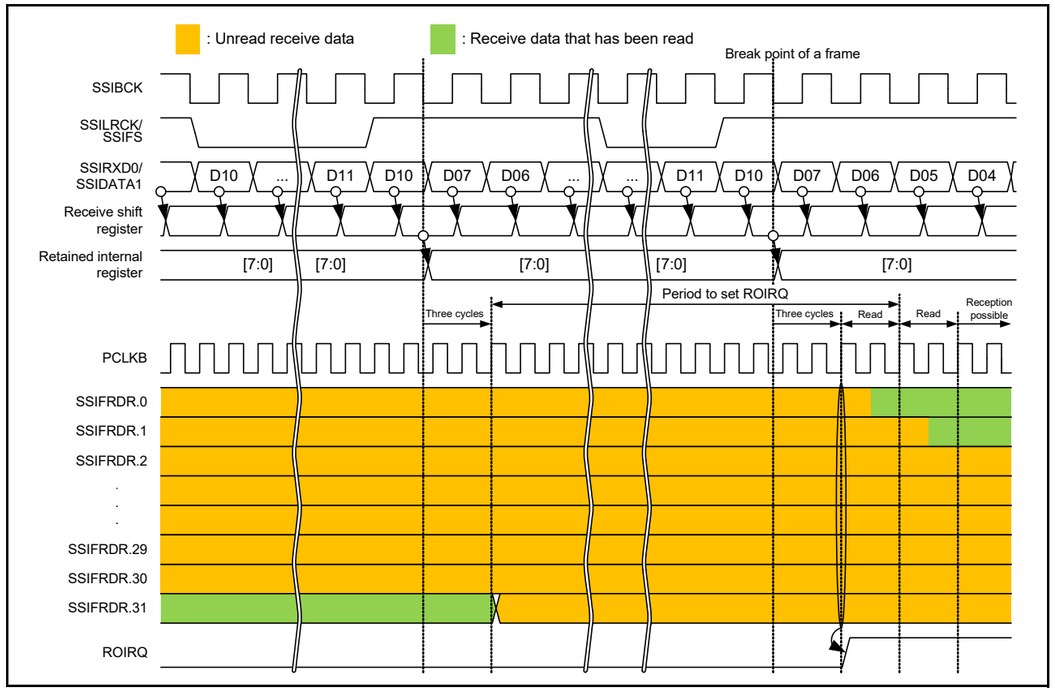

Figure 41.16 ROIRQ setting timing

RUIRQ bit (Receive Underflow Error Status Flag)

This is a status flag that indicates a receive underflow error. This flags is set by automatic determination but it must be cleared by register access. This flag indicates that SSIFRDR is read while it is empty. Data read from SSIFRDR where a receive underflow error is generated is invalid. See section 41.8.6, Error Handling for the error recovery procedure. This flag is not cleared by a receive FIFO data register reset (SSIFCR.RFRST). Note, however, that this flag is not set even if the SSIFRDR register is read while the receive FIFO data register is reset (by setting SSIFCR.RFRST to 1).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit*2
2. Enabling communication (changing SSICR.REN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 41.19)
2. 1 PCLKB cycle after writing 1 to SSICR.REN.*3

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.REN.

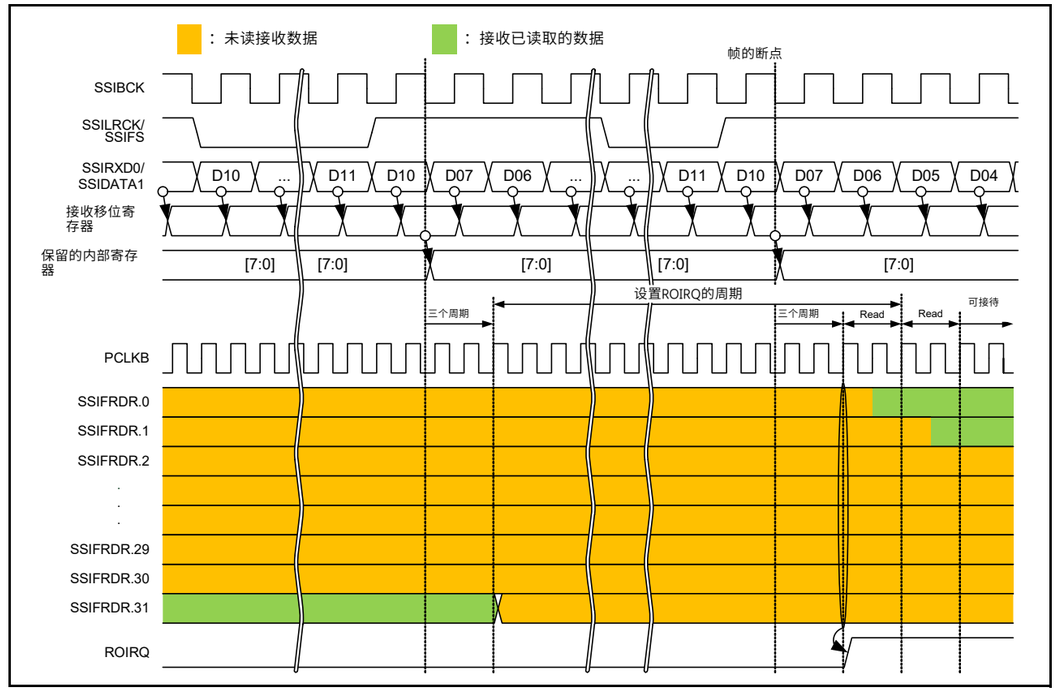

Figure 41.16 ROIRQ设置时序

RUIRQ位（接收下溢错误状态标志）

这是指示接收下溢错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。此标志指示SSIFRDR在为空时被读取。从产生接收下溢错误的SSIFRDR读取的数据无效。有关错误恢复过程，请参见第41.8.6节，错误处理。该标志不会被接收FIFO数据寄存器复位(SSIFCR.RFRST)清除。但是请注意，即使在接收FIFO数据寄存器复位（通过将SSIFCR.RFRST设置为1）时读取SSIFRDR寄存器，该标志也不会设置。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

完成以下任一操作时：

1. 从该位读取1后向该位写入0*2
2. 启用通信（将SSICR.REN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机

1. 当从该位读取1后向该位写入0时（与图41.19中的时序相同）
2. 向SSICR.REN写入1后的1个PCLKB周期。*3

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：软件复位(SSIFCR.SSIRST=1)完成。读取1后，写入0完成。在将1写入SSICR.REN后经过1个PCLKB周期。

Note 3. After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

[Setting condition]

Reading from SSIFRDR while it is empty.

[Setting timing]

At completion of reading from SSIFRDR. See Figure 41.17.

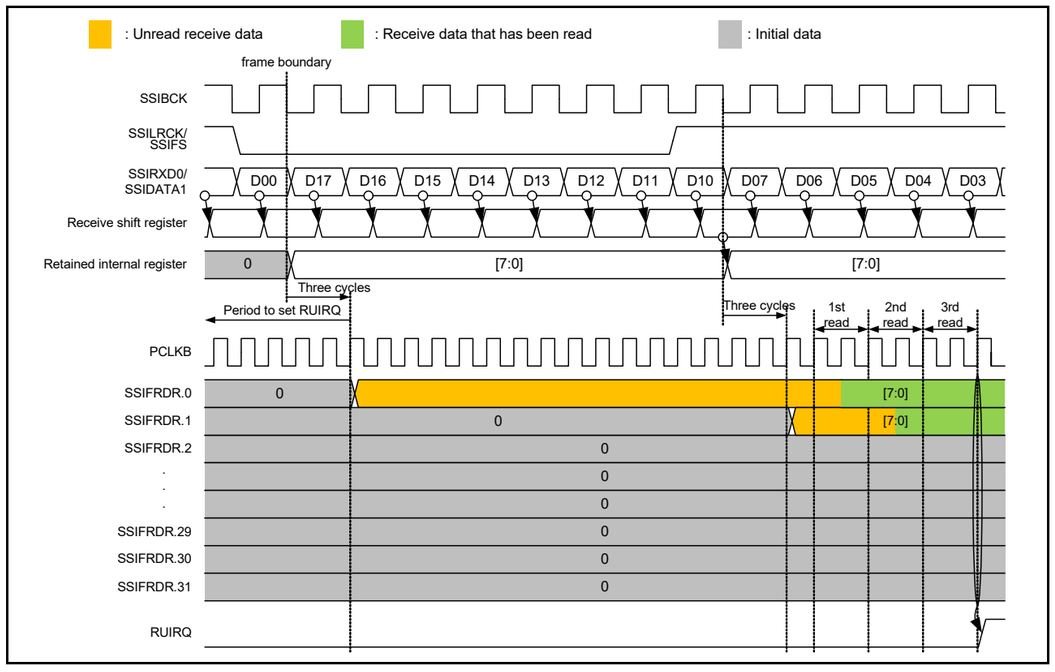

Figure 41.17 RUIRQ setting timing

TOIRQ bit (Transmit Overflow Error Status Flag)

This is a status flag that indicates a transmit overflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that an attempt has been made to write data to the SSIFTDR register when the register is full of data. The data writing that causes a transmit overflow is ignored. For the procedure to recover from the overflow error, see section 41.8.6, Error Handling. This flag is not cleared by a transmit FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

(1) Writing 0 to this bit after reading 1 from this bit*2

(2) Enabling communication (changing SSICR.TEN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition

注3.使能通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

[Setting condition]

在SSIFRDR为空时读取。

[Setting timing]

从SSIFRDR读取完成时。请参见图41.17。

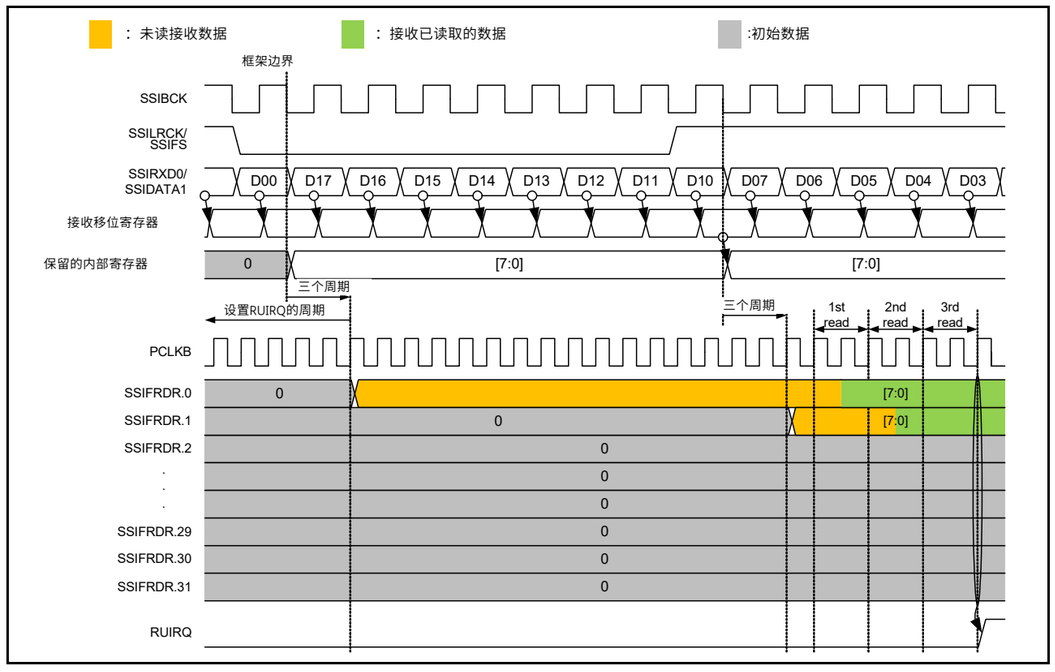

Figure 41.17 RUIRQ设置时序

TOIRQ位（发送溢出错误状态标志）

这是指示传输溢出错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表明当寄存器已满时尝试将数据写入SSIFTDR寄存器。导致发送溢出的数据写入将被忽略。有关从溢出错误中恢复的过程，请参阅第41.8.6节，错误处理。该标志不会被发送FIFO数据寄存器复位(SSIFCR.TFRST)清除。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

完成以下任一操作时：

(1)从该位读取1后向该位写入0*2

(2)启用通信（将SSICR.TEN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机

(1) When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 41.19)

(2) 1 PCLKB cycle after writing 1 to SSICR.TEN.*3

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.TEN.

Note 3. After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

[Setting condition]

An attempt was made to write data to the SSIFTDR register when the register is full of data.

[Setting timing]

At completion of writing to SSIFTDR. For details, see Figure 41.18.

(1)从该位读取1后向该位写入0时（与图41.19中的时序相同）

(2)向SSICR.TEN写入1后的1个PCLKB周期。*3

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：软件复位(SSIFCR.SSIRST=1)完成。读取1后，写入0完成。在将1写入SSICR.TEN之后经过1个PCLKB周期。注3.启用通讯后（通过将SSICR.TEN位的值从0更改为1），传输错误

标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

[Setting condition]

当寄存器已满时，尝试将数据写入SSIFTDR寄存器。

[Setting timing]

完成对SSIFTDR的写入。详见图41.18。

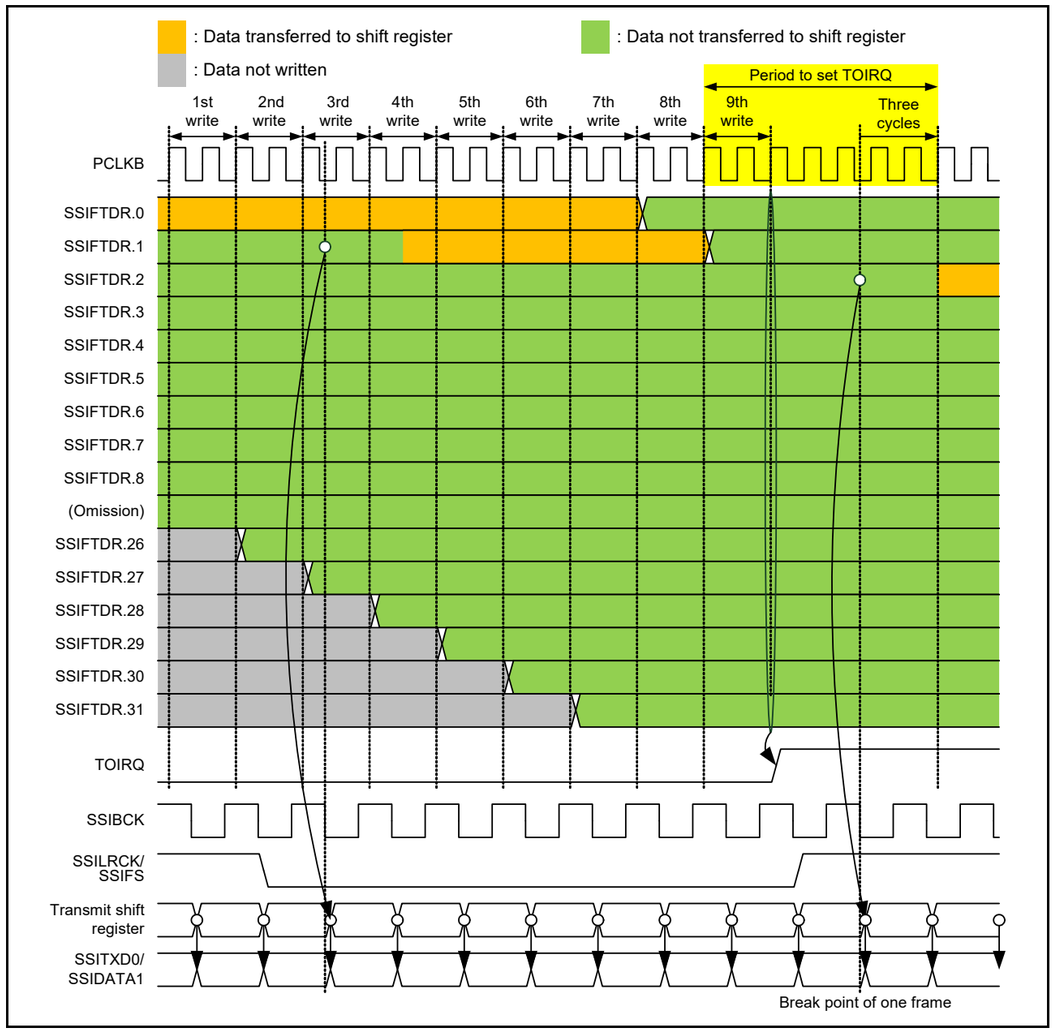

Figure 41.18 TOIRQ setting timing

TUIRQ bit (Transmit Underflow Error Status flag)

This is a status flag that indicates a transmit underflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that writing the serial data required for a frame to SSIFTDR did not catch up with transmission of the frame. Even if this flag is cleared after it has been set, the SSITXD0/SSIDATA1 output remains to be 0. To output the data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA1 pin, follow the communication stop procedure in Figure 41.56 and error-handling procedure in Figure 41.57. For the procedure to recover from an error, see section 41.8.6, Error Handling. This flag is not cleared by a reset of transmit FIFO data register (by the SSIFCR.TFRST signal).

[Priority order for setting and clearing]

Setting is prioritized.*1

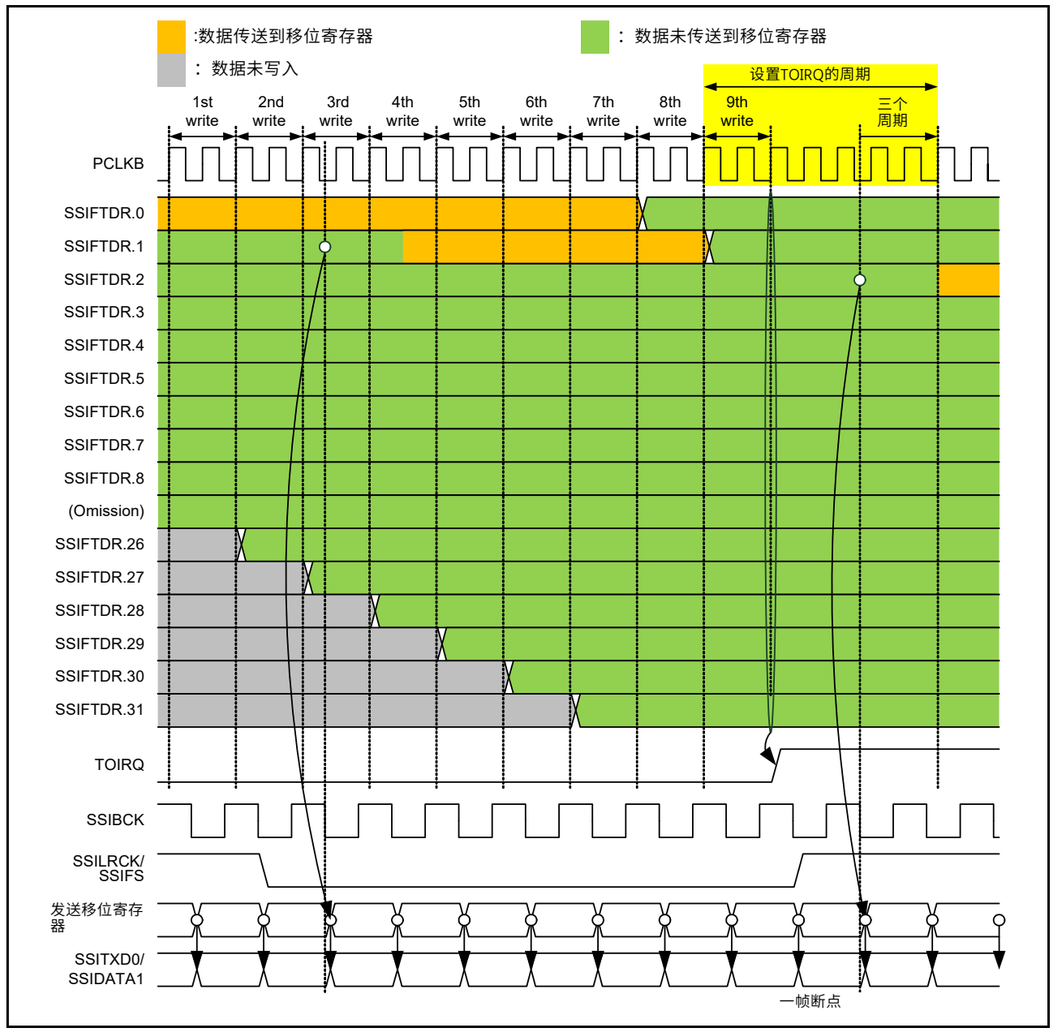

Figure 41.18 TOIRQ设置时序

TUIRQ位（发送下溢错误状态标志）

这是指示发送下溢错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表示将帧所需的串行数据写入SSIFTDR没有赶上帧的传输。即使该标志在设置后被清除，SSITXD0SSIDATA1输出仍保持为0。要将写入发送FIFO数据寄存器(SSIFTDR)的数据输出到SSITXD0SSIDATA1引脚，请遵循图41.56中的通信停止程序并图41.57中的错误处理过程。有关从错误中恢复的过程，请参阅第41.8.6节，错误处理。该标志不会通过发送FIFO数据寄存器的复位（通过SSIFCR.TFRST信号）清除。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit*2
2. Enabling communication (changing SSICR.TEN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit
2. 1 PCLKB cycle after writing 1 to SSICR.TEN.*3

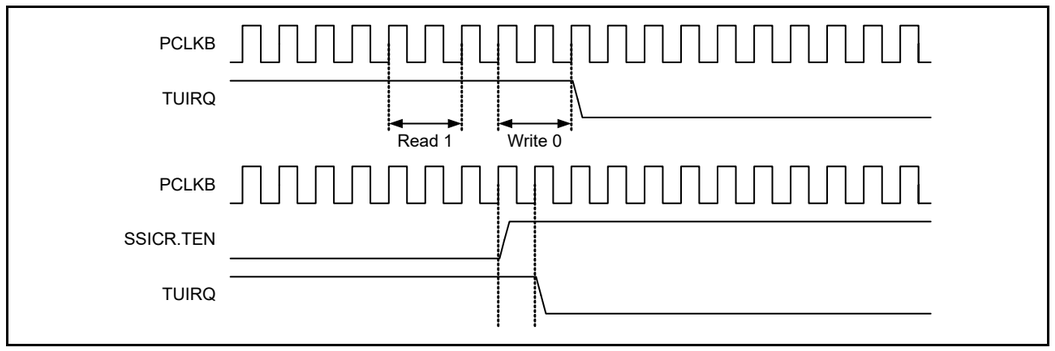

Figure 41.19 TUIRQ clearing timing

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.TEN.

Note 3. After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

[Setting condition]

When communication continues over a frame boundary, the transmit data required for the next frame has not been written to SSIFTDR. For details, see Figure 41.20 and Figure 41.21.

[Setting timing]

3 PCLKB cycles after the frame boundary. For details, see Figure 41.20.

[Clearing condition]

完成以下任一操作时：

1. 从该位读取1后向该位写入0*2
2. 启用通信（将SSICR.TEN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机

1. 当从该位读取1后向该位写入0
2. 向SSICR.TEN写入1后的1个PCLKB周期。*3

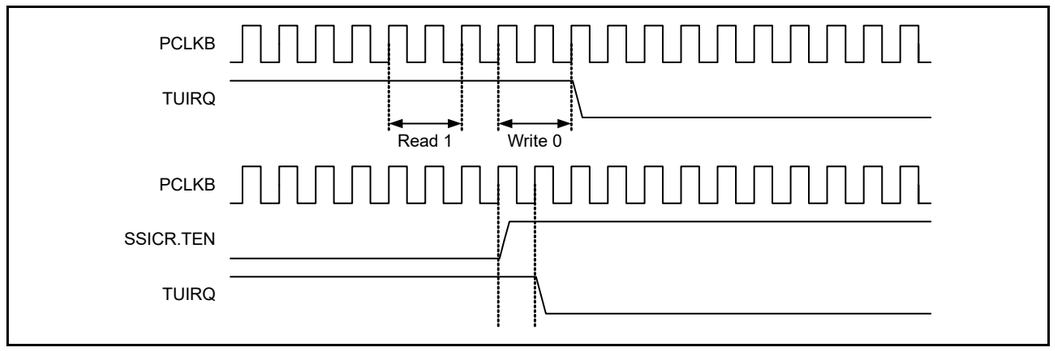

Figure 41.19 TUIRQ清零时机

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：软件复位(SSIFCR.SSIRST=1)完成。读取1后，写入0完成。在将1写入SSICR.TEN之后经过1个PCLKB周期。注3.启用通讯后（通过将SSICR.TEN位的值从0更改为1），传输错误

标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

[Setting condition]

当通信继续通过帧边界时，下一帧所需的传输数据尚未写入SSIFTDR。详见图41.20和图41.21。

[Setting timing]

帧边界后3个PCLKB周期。详见图41.20。

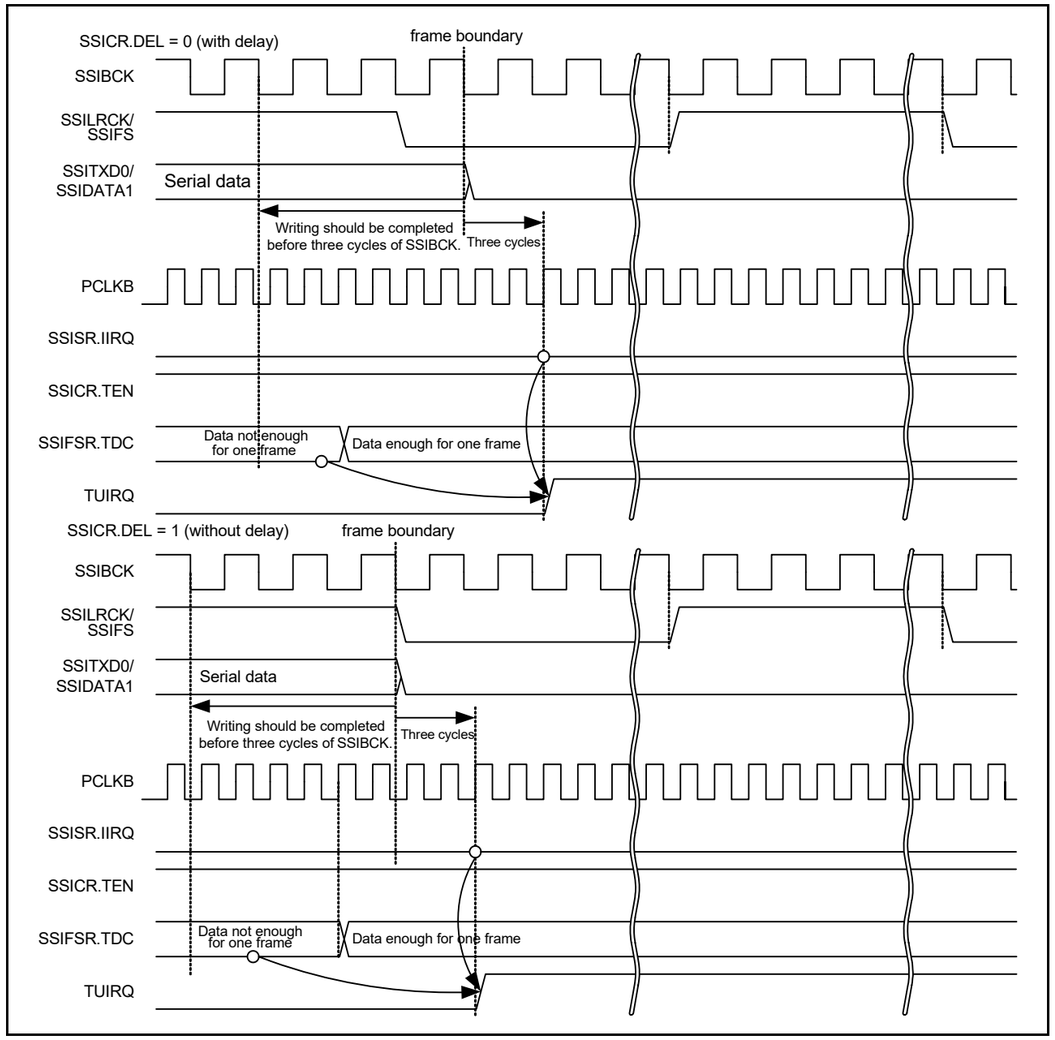

Figure 41.20 TUIRQ setting timing (when communication continues)

b30 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31	AUCKE	AUDIO_MCK Enable in Master-mode Communication*1	0: Disables supply of AUDIO_MCK 1: Enables supply of AUDIO_MCK.	R/W

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If the value of these bits is changed by rewriting, subsequent operation is unpredictable.

This register sets a software reset, byte swap, and enable/disable of interrupt requests.

RFRST bit (Receive FIFO Data Register Reset)

This bit sets a software reset of the receive FIFO data register (SSIFRDR). Writing 1 to this bit initializes the internal state related to SSIFRDR. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 41.5. Because this bit is not automatically cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

This bit is subject to the software reset by the SSIRST bit. Because the software reset by the SSIRST bit has priority over the reset by this bit, setting this bit is ignored when the SSIRST bit is set.

Note 1. 禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果这些位的值通过重写而改变，后续的操作是不可预知的。

该寄存器设置软件复位、字节交换和中断请求的启用禁用。

RFRST位（接收FIFO数据寄存器复位）

该位设置接收FIFO数据寄存器(SSIFRDR)的软件复位。向该位写入1初始化与SSIFRDR相关的内部状态。受该位触发的软件复位的寄存器位在表41.5中用阴影表示。由于该位在被设置后不会自动清零，因此向该位写入0以从软件复位中释放寄存器位。向该位写入0后，请务必在开始下一个程序步骤之前检查该位是否为0。

该位受SSIRST位软件复位的影响。由于SSIRST位的软件复位优先于该位的复位，所以当SSIRST位置位时，该位的设置将被忽略。

TFRST bit (Transmit FIFO Data Register Reset)

This bit sets a software reset of the transmit FIFO data register (SSIFTDR). Writing 1 to this bit initializes the internal state related to SSIFTDR. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 41.6. Because this bit is not automatically cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

This bit is subject to the software reset by the SSIRST bit. Because the software reset by the SSIRST bit has priority over the reset by this bit, setting this bit is ignored when the SSIRST bit is set.

RIE bit (Receive Data Full Interrupt Output Enable)

This bit enables/disables output of receive data full interrupts. Use a receive data full interrupt as an interrupt to trigger data reading from the receive FIFO data register. Write 1 to this bit after specifying the setting condition for receive data full interrupt (by using the SSISCR.RDFS bit). Figure 41.22 shows the timing of generating the receive data full interrupt.

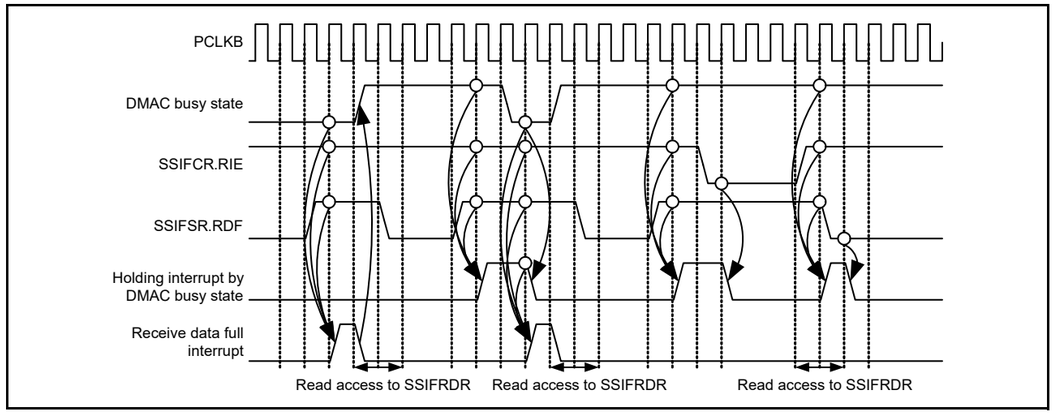

Figure 41.22 Timing of receive data full interrupt

TIE bit (Transmit Data Empty Interrupt Output Enable)

This bit enables/disables output of transmit data empty interrupts. Use a transmit data empty interrupt as an interrupt to

RIE位（接收数据满中断输出使能）

该位使能禁用接收数据满中断的输出。使用接收数据满中断作为中断来触发从接收FIFO数据寄存器读取数据。指定接收数据满中断的设置条件后（通过使用SISSCR.RDFS位）向该位写入1。图41.22显示了产生接收数据满中断的时序。

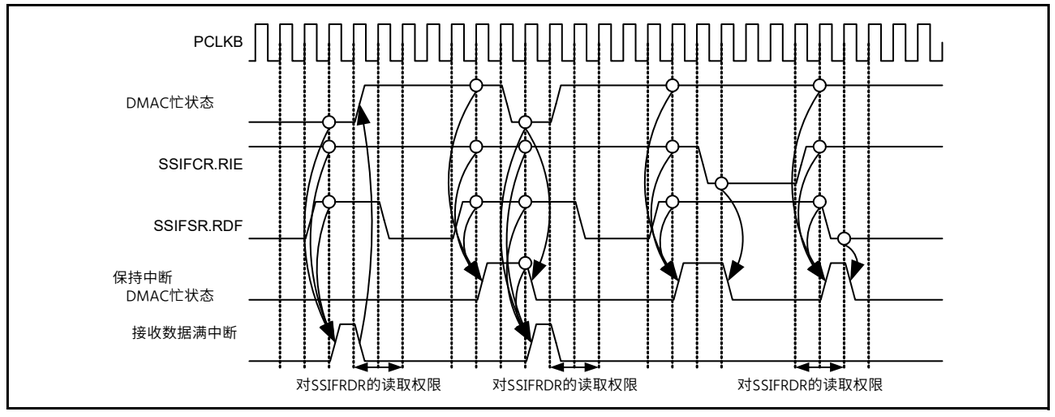

Figure 41.22 接收数据满中断的时序

TIE位（发送数据空中断输出使能）

该位使能禁用发送数据空中断的输出。使用发送数据空中断作为中断

trigger data writing to the transmit FIFO data register. Write 1 to this bit after specifying the setting condition for transmit data empty interrupt (by using the SSISCR.TDES bit). Figure 41.23 shows the timing of generating the transmit data empty interrupt.

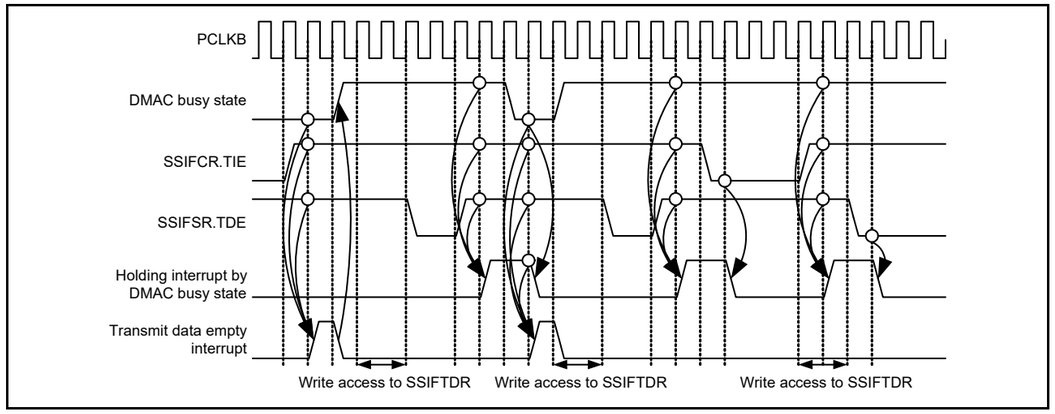

Figure 41.23 Timing of transmit data empty interrupt

BSW bit (Byte Swap Enable)

This bit enables/disables byte swap of register access for the transmit FIFO data register (SSIFTDR) and the receive FIFO data register (SSIFRDR). This bit is valid only with 16-bit access or 32-bit access to SSIFTDR and SSIFRDR. For details, see Figure 41.24.

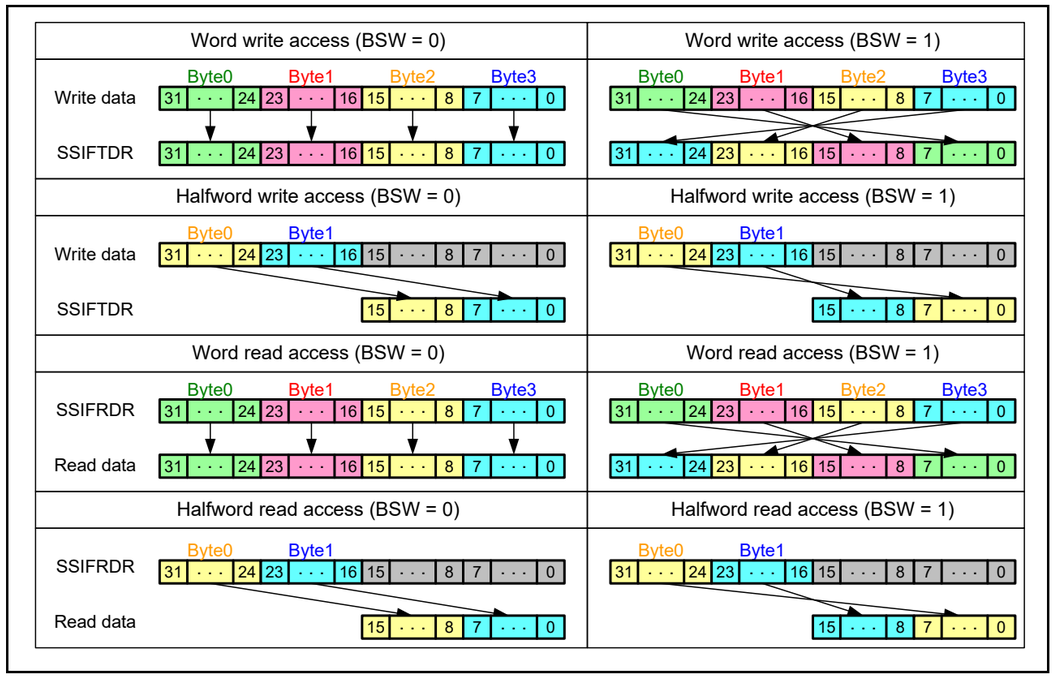

Figure 41.24 Operation example of byte swap

触发数据写入发送FIFO数据寄存器。在指定发送数据空中断的设置条件后（通过使用SISSCR.TDES位）向该位写入1。图41.23显示了产生发送数据空中断的时序。

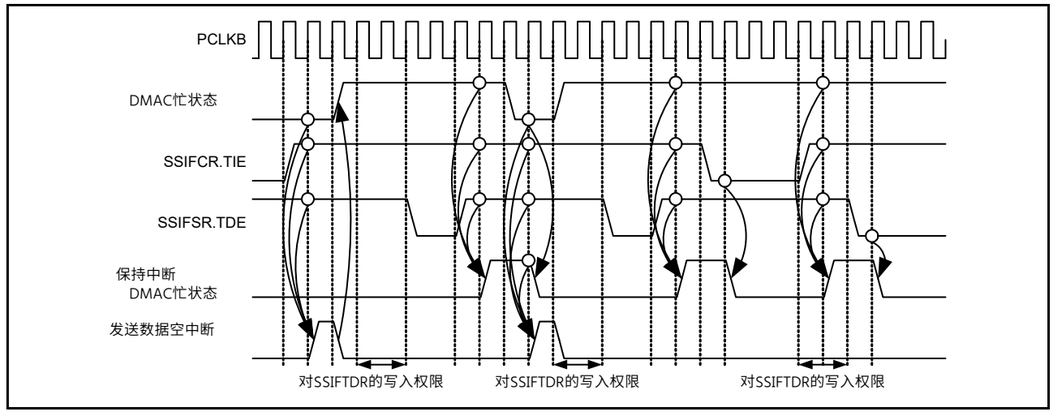

Figure 41.23 发送数据空中断的时序

BSW位（字节交换使能）

该位启用禁用发送FIFO数据寄存器(SSIFTDR)和接收寄存器访问的字节交换
FIFO数据寄存器(SSIFRDR)。该位仅对SSIFTDR和SSIFRDR的16位访问或32位访问有效。详见图41.24。

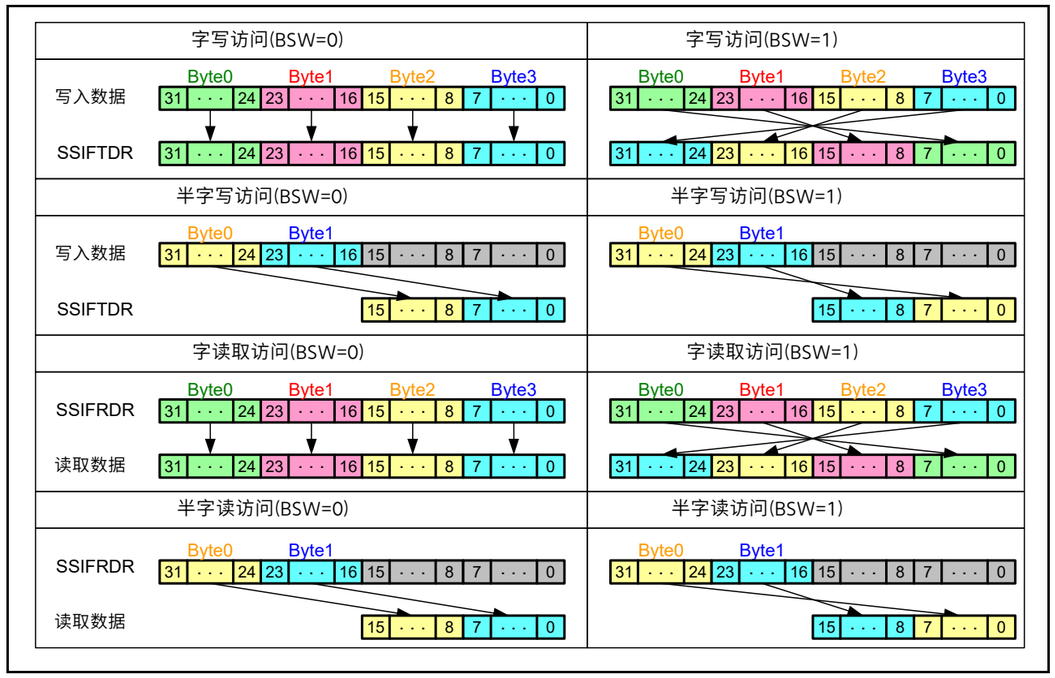

Figure 41.24 字节交换操作示例

SSIRST bit (Software Reset)

This bit sets a software reset of SSIE. Writing 1 to this bit initializes the internal state of SSIE. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 41.7. Because this bit is not automatically cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

To stop communication of SSIE immediately, after turning off the peripheral functions, write 1 to this bit. Initialization by a software reset is performed without any relation with the bit clock.

AUCKE bit (AUDIO_MCK Enable in Master-mode Communication)

This bit enables/disables supply to AUDIO_MCK while in master-mode communication (MST = 1).

Changing the value of this bit must be performed only after specifying the settings related to AUDIO_MCK (by using the CKS, MST, BCKP, and CKDV bits in the SSICR register).

SSIRST位（软件复位）

该位设置SSIE的软件复位。向该位写入1初始化SSIE的内部状态。受该位触发的软件复位的寄存器位在表41.7中用阴影表示。由于该位在被设置后不会自动清零，因此向该位写入0以从软件复位中释放寄存器位。向该位写入0后，请务必在开始下一个程序步骤之前检查该位是否为0。

要立即停止SSIE通信，请在关闭外围功能后，向该位写入1。通过软件复位进行的初始化与位时钟没有任何关系。

Table 41.7 受SSIRST位软件复位的位

AUCKE位（在主模式通信中启用AUDIO_MCK）

在主模式通信(MST=1)时，该位使能禁用对AUDIO_MCK的供电。

只有在指定与AUDIO_MCK相关的设置后才能更改该位的值（通过使用SSICR寄存器中的CKS、MST、BCKP和CKDV位）。

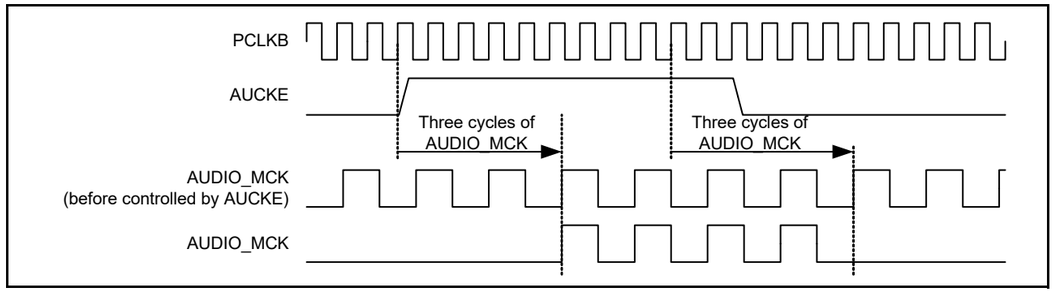

Figure 41.25 Stop/resume of AUDIO_MCK

Note: In slave-mode communication (SSICR.MST = 0), SSIE needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIE is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIE becomes idle, take the procedure to start communication in Figure 41.52 or wait for an idle state by taking the procedure to resume communication in Figure 41.58.
In master-mode communication (SSICR.MST = 1), SSIE operates with the audio clock (AUDIO_MCK). To stop SSIE completely, make sure that SSIE is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIE becomes idle, take the procedure to start communication in Figure 41.52.

Figure 41.26 and Figure 41.27 show the timings of signal operation in the period from setting this bit to 1 to the output to the SSIBCK pin.

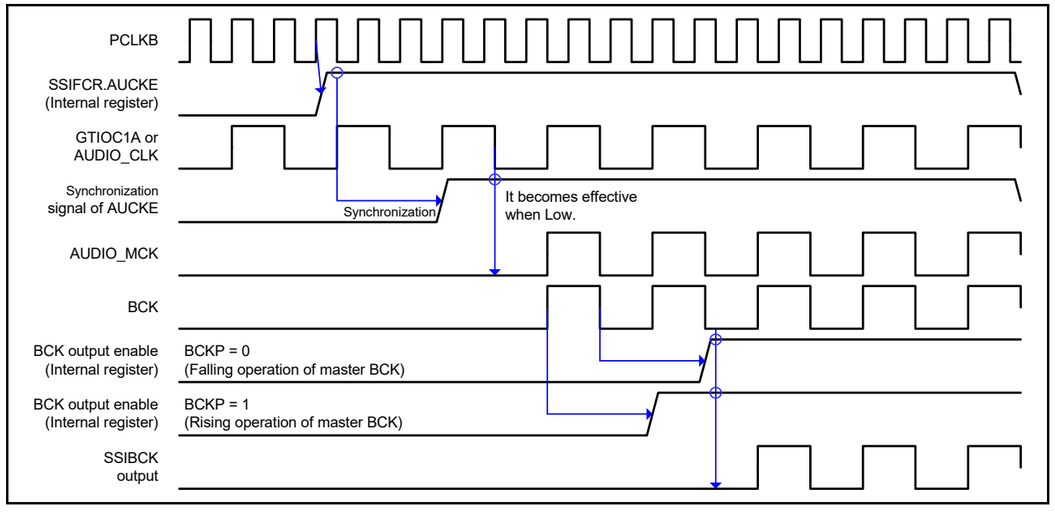

Figure 41.26 Timing diagram for the operation from system reset to start of master-mode communication

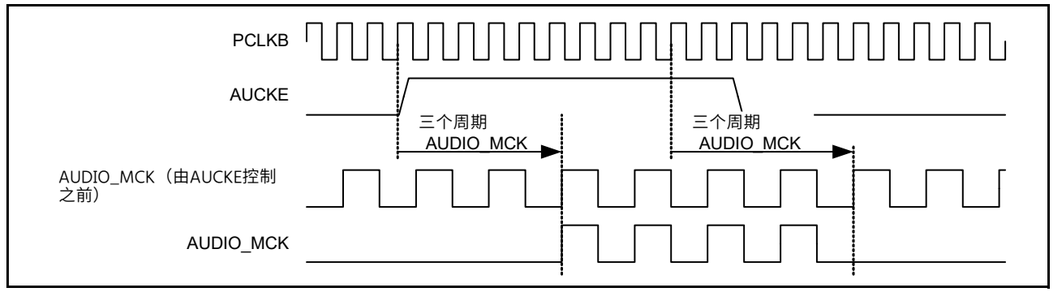

Figure 41.25 Stop/resume of AUDIO_MCK

Note: 在从模式通信(SSICR.MST=0)中，SSIE需要提供SSIBCK。要在主设备端停止BCK，请确保SSIE处于空闲状态(SSISR.IIRQ=1)。如果BCK在SSIE变为空闲之前停止，则按照图41.52中的程序开始通信或按照图41.58中的程序恢复通信等待空闲状态。在主模式通信(SSICR.MST=1)中，SSIE使用音频时钟(AUDIO_MCK)运行。要完全停止SSIE，请确保SSIE处于空闲状态(SSISR.IIRQ=1)，然后将0写入SSIFCR.ADCKE。如果在SSIE空闲之前将0写入SSIFCR.ADCKE，则按照图41.52中的过程开始通信。

图41.26和图41.27显示了从将该位设置为1到输出到SSIBCK引脚期间的信号操作时序。

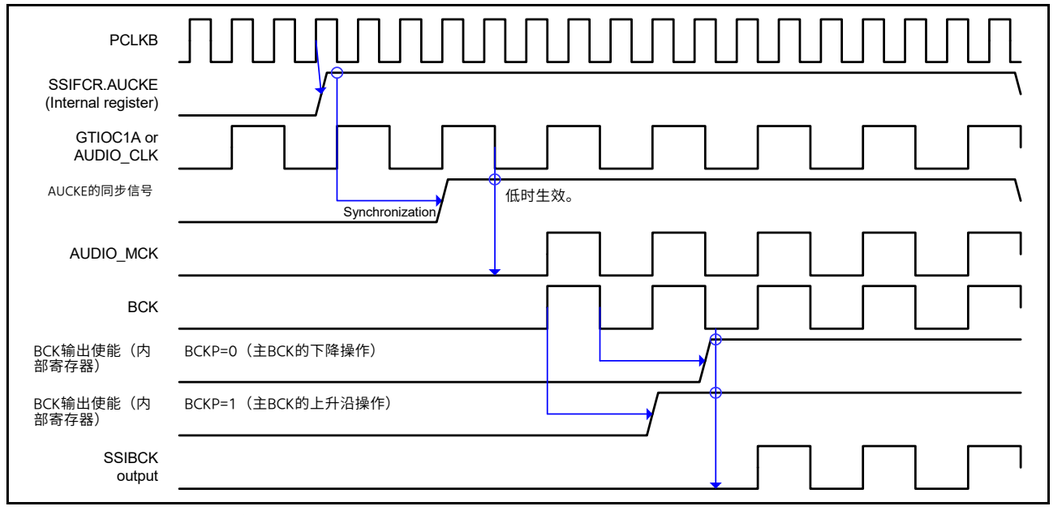

Figure 41.26 从系统复位到主模式通信开始的时序图

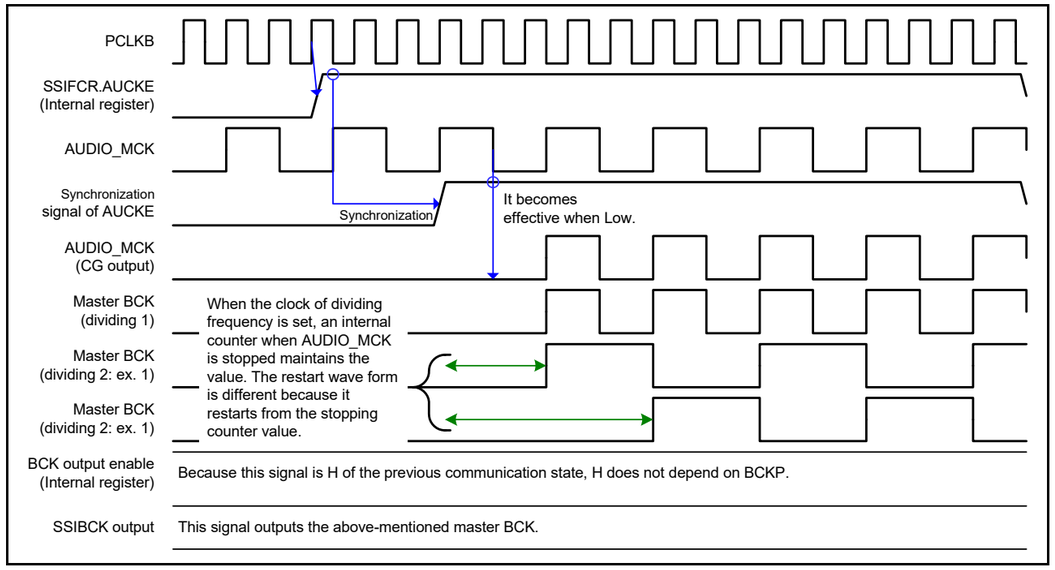

Figure 41.27 Timing diagram for the operation from stop of communication to start of master-mode communication

Note: If the supply of AUDIO_MCK stops, the value of the SSIBCK pin is held. Therefore, the SSIBCK signal might stop in the H (high level) state.

b31, b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

This register is configured with status flags that indicate the status of the transmit FIFO data register and the receive FIFO data register.

RDF bit (Receive Data Full Flag)

This bit indicates that the receive FIFO data register (SSIFRDR) has unread received data not less than the amount set with the SSISCR.RDFS bit plus one. This flag is set by automatic determination but it must be cleared by register access.

[Priority order for setting and clearing]

Clearing is prioritized.

[Clearing condition]

Either of the following two:*1

1. Writing 0 to this bit after reading 1 from this bit (CPU operation)*2
2. Last access (DTC/DMAC operation) to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 41.19)
2. After the PCLKB cycle in which the last access instruction is issued to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

Note 1. These bits are cleared by a software reset (SSIFCR.SSIRST = 1) and receive FIFO data register reset (SSIFCR.RFRST = 1). Reset conditions available for these bits are the software reset and receive FIFO data register reset as well as the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following four conditions is met:
- A software reset is done (SSIFCR.SSIRST = 1).
- A receive FIFO data register reset is done (SSIFCR.RFRST = 1).
- After 1 has been read, writing of 0 is complete.
- Last access is performed to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

[Setting condition]

SSIFRDR has data not less than the amount set with the SSISCR.RDFS bit plus one.

[Setting timing]

At completion of transfer from the shift register that results in SSIFRDR having data not less than the amount set with the SSISCR.RDFS bit plus one.

Bit	Symbol	位名称	Description	R/W
b29 to b24	TDC[5:0]	发送FIFO数据的数量指示标志	发送FIFO数据指示标志的数量。	R
b31, b30	—	Reserved	这些位被读取为0。写入值应为0。	R/W

该寄存器配置有状态标志，指示发送FIFO数据寄存器和接收
先进先出数据寄存器。

RDF位（接收数据满标志）

该位指示接收FIFO数据寄存器(SSIFRDR)的未读接收数据不少于SSISCR.RDFS位设置的数量加一。该标志由自动确定设置，但必须通过寄存器访问清除。

[设置和清除的优先顺序]

清算优先。

[Clearing condition]

以下两种之一：*1

1. 从该位读取1后向该位写入0（CPU操作）*2
2. 最后一次访问（DTCDMAC操作）通过使用DTC的中断例程从SSIFRDR读取数据和DMAC.

[Clearing timing]

与上述清零条件对应的清零时机

1. 当从该位读取1后向该位写入0时（与图41.19中的时序相同）
2. 在发出最后一个访问指令以通过使用DTC和DMAC的中断例程从SSIFRDR读取数据的PCLKB周期之后。

注1.这些位通过软件复位(SSIFCR.SSIRST=1)和接收FIFO数据寄存器复位清零
（SSIFCR.RFRST=1）。这些位可用的复位条件是软件复位和接收FIFO数据寄存器复位以及上述清除条件。注2.从该位读取1后，当满足以下四个条件之一时，该位被清除：软件复位完成(SSIFCR.SSIRST=1)。完成接收FIFO数据寄存器复位(SSIFCR.RFRST=1)。读取1后，写入0完成。通过使用DTC和DMAC的中断例程执行最后一次访问以从SSIFRDR读取数据。

[Setting condition]

SSIFRDR的数据量不少于用SISSCR.RDFS位加一设置的数量。

[Setting timing]

在完成从移位寄存器的传输时，导致SSIFRDR的数据不少于由SSISCR.RDFS位设置的数量加一。

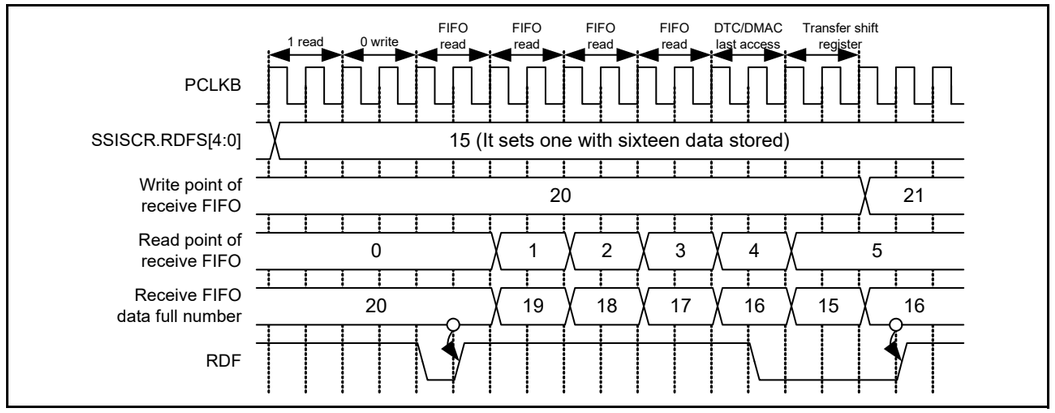

Figure 41.28 Timing diagram for setting and clearing RDF

RDC[5:0] bits (Number of Receive FIFO Data Indication Flag)

These bits indicate the number of valid data that are stored in the receive FIFO data register (SSIFRDR). With this flag as 0h, there is no received data. With 20h, the register is filled with received data and there is no free space.

TDE bit (Transmit Data Empty Flag)

This bit indicates that the transmit FIFO data register (SSIFTDR) has free space not less than the amount set with the SSIFCR.TTRG bit plus one. This flag is set by automatic determination but it must be cleared by register access.

[Priority order for setting and clearing]

Clearing is prioritized.*1

[Clearing condition]

Either of the following two:

1. Writing 0 to this bit after reading 1 from this bit (CPU operation)*2
2. Last access (DTC/DMAC operation) to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

[Clearing timing]

Clearing timing corresponding to the above clearing condition

(1) When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 41.19)

(2) Last access (DTC/DMAC operation) to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1) and transmit FIFO data register reset (SSIFCR.TFRST = 1). The software reset and transmit FIFO data register reset have priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following four conditions is met:
- A software reset is done (SSIFCR.SSIRST = 1).
- A transmit FIFO data register reset is done (SSIFCR.TFRST = 1).
- After 1 has been read, writing of 0 is complete.
- Last access is performed to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

[Setting condition]

SSIFTDR has free space not less than the amount set with the SSIFCR.TTRG bit plus one.

[Setting timing]

While operating on PCLKB, SSIFTDR is found to have free space not less than “size set in the SSISCR.TDES bits + 1.”

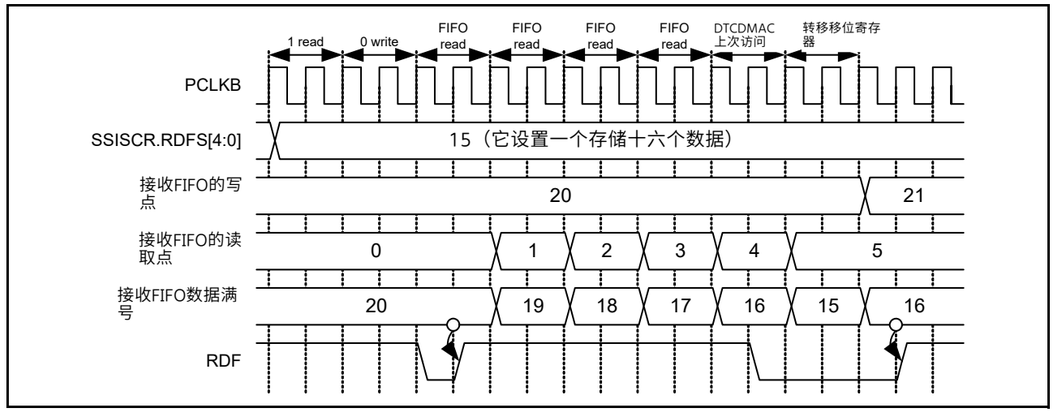

Figure 41.28 设置和清除RDF的时序图

RDC[5:0]位（接收FIFO数据指示标志数）

这些位指示存储在接收FIFO数据寄存器(SSIFRDR)中的有效数据的数量。此标志为0h时，没有接收到数据。20h，寄存器被接收到的数据填满，没有空闲空间。

TDE位（发送数据空标志）

该位表示发送FIFO数据寄存器(SSIFTDR)的可用空间不小于用
SSIFCR.TTRG位加一。该标志由自动确定设置，但必须通过寄存器访问清除。

[设置和清除的优先顺序]

清算优先。*1

[Clearing condition]

以下两种之一：

1. 从该位读取1后向该位写入0（CPU操作）*2
2. 最后一次访问（DTCDMAC操作）通过使用DTC和DMAC的中断例程将数据写入SSIFTDR。

[Clearing timing]

与上述清零条件对应的清零时机

(1)从该位读取1后向该位写入0时（与图41.19中的时序相同）

(2)最后访问（DTCDMAC操作）通过使用DTC和DMAC的中断例程将数据写入SSIFTDR。

注1.该位通过软件复位(SSIFCR.SSIRST=1)和发送FIFO数据寄存器复位清零
（SSIFCR.TFRST=1）。软件复位和发送FIFO数据寄存器复位优先于上述所有清除条件。注2.从该位读取1后，当满足以下四个条件之一时，该位被清除：软件复位完成(SSIFCR.SSIRST=1)。发送FIFO数据寄存器复位完成(SSIFCR.TFRST=1)。读取1后，写入0完成。通过使用DTC和DMAC的中断例程执行最后一次访问以将数据写入SSIFTDR。

[Setting condition]

SSIFTDR的可用空间不小于SSIFCR.TTRG位设置的数量加一。

[Setting timing]

在PCLKB上运行时，发现SSIFTDR的可用空间不小于“SSISCR.TDES位中设置的大小+1”。

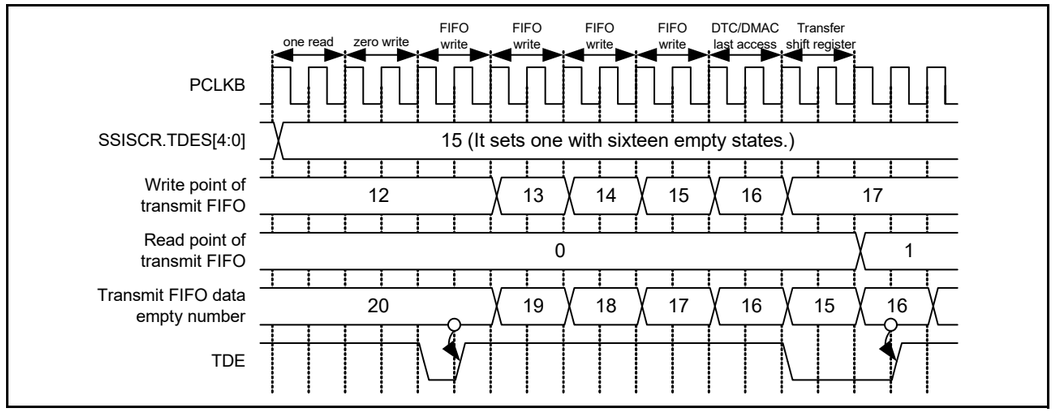

Figure 41.29 Timing diagram for setting and clearing TDE

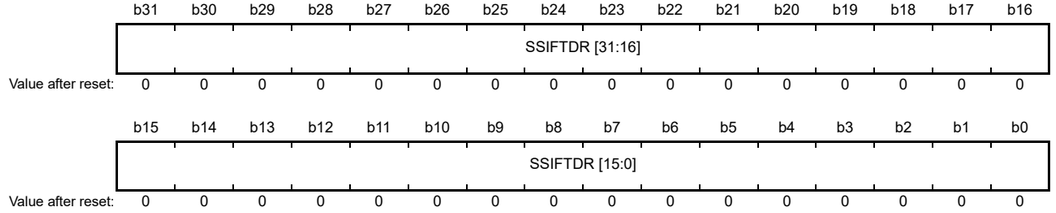
TDC[5:0] bits (Number of Transmit FIFO Data Indication Flag)

These bits indicate the number of valid data that are stored in the transmit FIFO data register (SSIFTDR). With this flag as 0h, there is no data to be transmitted. With 20h, there is no space to write data.

41.4.5 Transmit FIFO Data Register (SSIFTDR)

Address(es): SSIE0.SSIFTDR 4004 E018h, SSIE1.SSIFTDR 4004 E118h



Bit	Symbol	Bit name	Description	R/W
b31 to b0	SSIFTDR[31:0]	Transmit FIFO Data	Transmit FIFO data.	W

This register stores data to be serially transmitted. 0 is returned when this register is read.

When you use this register for transmission, specify data writing to this register as the DTC/DMAC operation that is triggered by a transmit data empty interrupt. Determine the access size to this register according to the data word length to be communicated in Table 41.8.

Table 41.8 Register access restriction to FIFOs

		Access Size		
SSICR.DWL[2:0]	Data Word Length	Byte	Halfword	Word
000b	8	√	—	—
001b	16	—	√	—
010b	18	—	—	√
011b	20	—	—	√
100b	22	—	—	√
101b	24	—	—	√

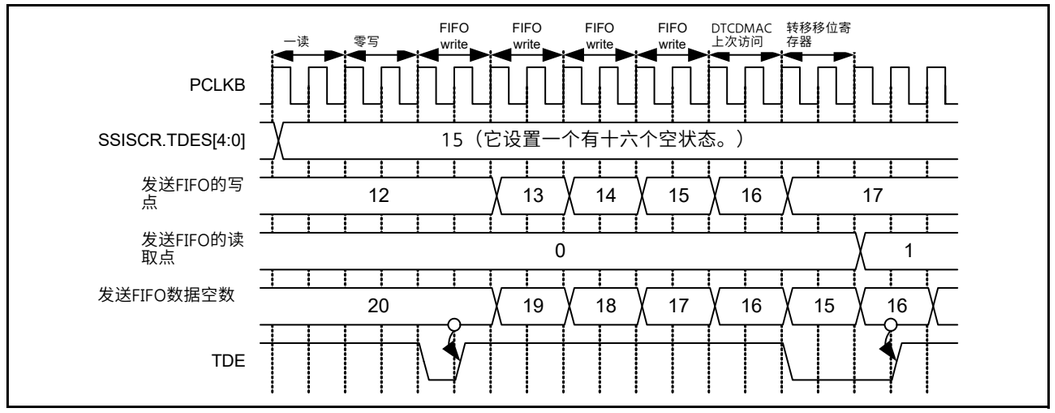


Figure 41.29 设置和清除TDE的时序图

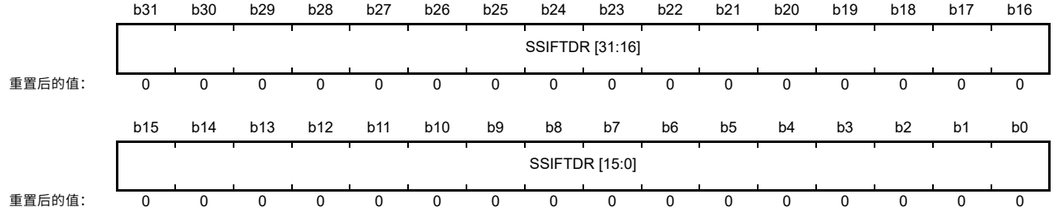
TDC[5:0]位（发送FIFO数据指示标志数）

这些位指示存储在发送FIFO数据寄存器(SSIFTDR)中的有效数据的数量。该标志为0h时，没有要发送的数据。有了20h，就没有写数据的空间了。

41.4.5 发送FIFO数据寄存器(SSIFTDR)

Address(es): SSIE0.SSIFTDR 4004 E018h, SSIE1.SSIFTDR 4004 E118h



Bit	Symbol	位名称	Description	R/W
b31 to b0	SSIFTDR[31:0]	发送FIFO数据	发送FIFO数据。	W

该寄存器存储要串行传输的数据。读取该寄存器时返回0。

当您使用该寄存器进行传输时，将数据写入该寄存器指定为由传输数据空中断触发的DTCDMAC操作。根据表41.8中要通信的数据字长确定对该寄存器的访问大小。

Table 41.8 寄存器对FIFO的访问限制

		访问大小		
SSICR.DWL[2:0]	数据字长	Byte	Halfword	Word
000b	8	√	—	—
001b	16	—	√	—
010b	18	—	—	√

Bit	Symbol	Bit name	Description	R/W
b31 to b0	SSIFRDR[31:0]	Receive FIFO Data	Receive FIFO data.	R

When you use this register for reception, specify data reading from this register as the DTC/DMAC operation that is triggered by a receive data full interrupt. Determine the access size to this register according to the data word length to be communicated in Table 41.8.

Register access to the receive FIFO data register is same as for the transmit FIFO data register.

Figure 41.31 shows the configurations and operation examples of the receive FIFO data register and receive shift register.

41.4.6 接收FIFO数据寄存器(SSIFRDR)

Address(es): SSIE0.SSIFRDR 4004 E01Ch, SSIE1.SSIFRDR 4004 E11Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	位名称	Description	R/W
b31 to b0	SSIFRDR[31:0]	接收FIFO数据	接收FIFO数据。	R

当您使用该寄存器进行接收时，将从该寄存器读取的数据指定为由接收数据满中断触发的DTCDMAC操作。根据表41.8中要通信的数据字长确定对该寄存器的访问大小。

对接收FIFO数据寄存器的寄存器访问与对发送FIFO数据寄存器的访问相同。

图41.31显示了接收FIFO数据寄存器和接收移位寄存器的配置和操作示例。

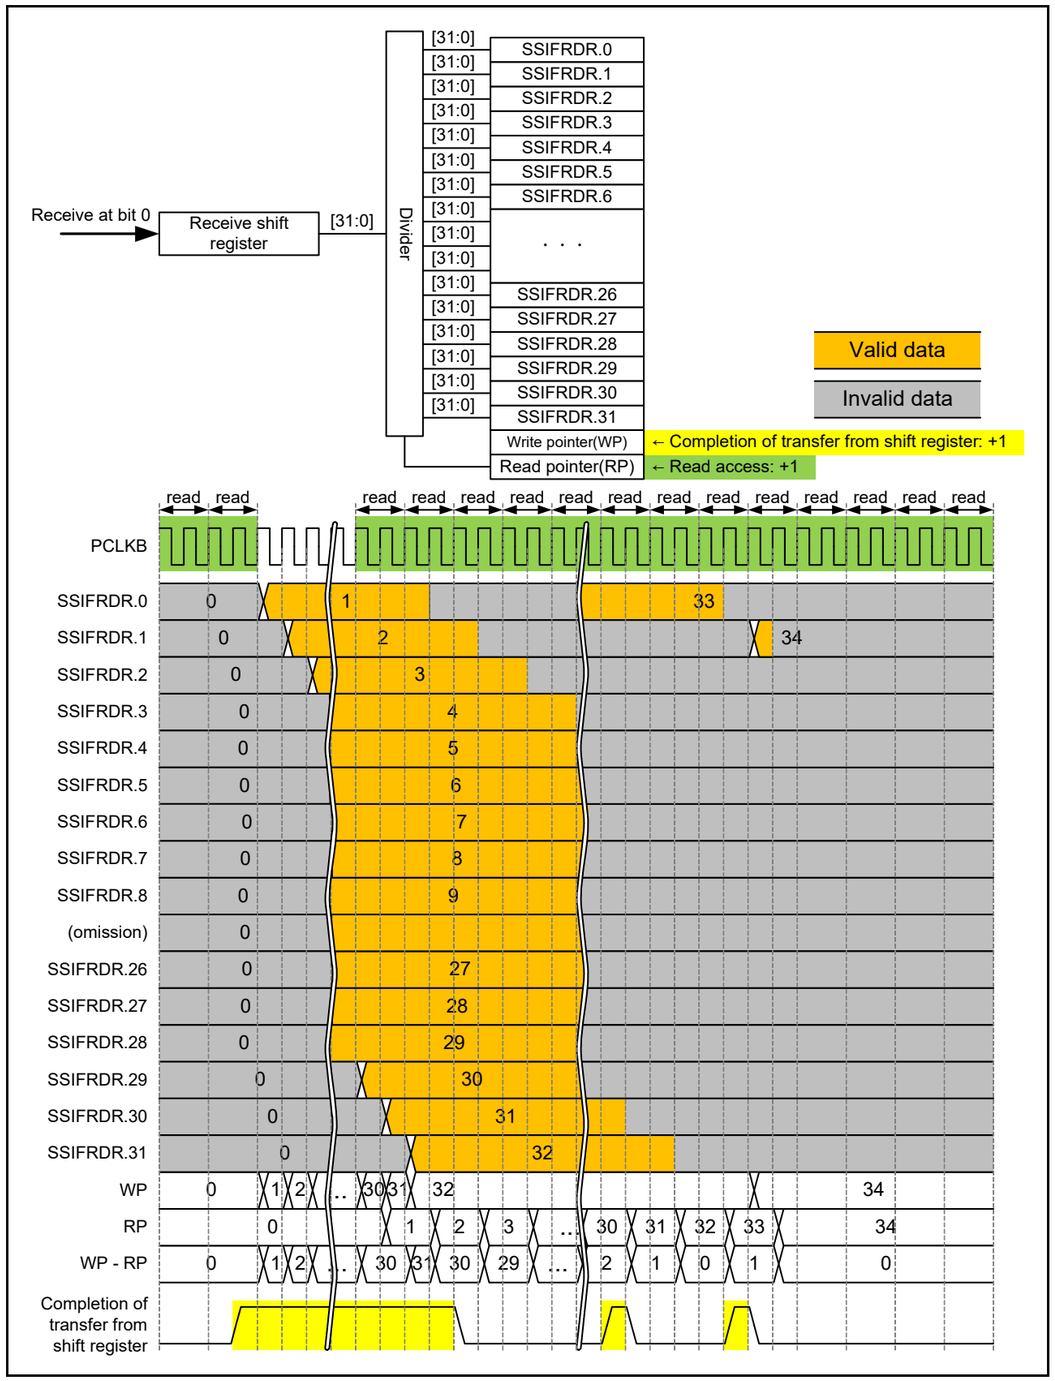

Figure 41.32 Configuration of the transmit FIFO data register and transmit shift register, and FIFO operation example

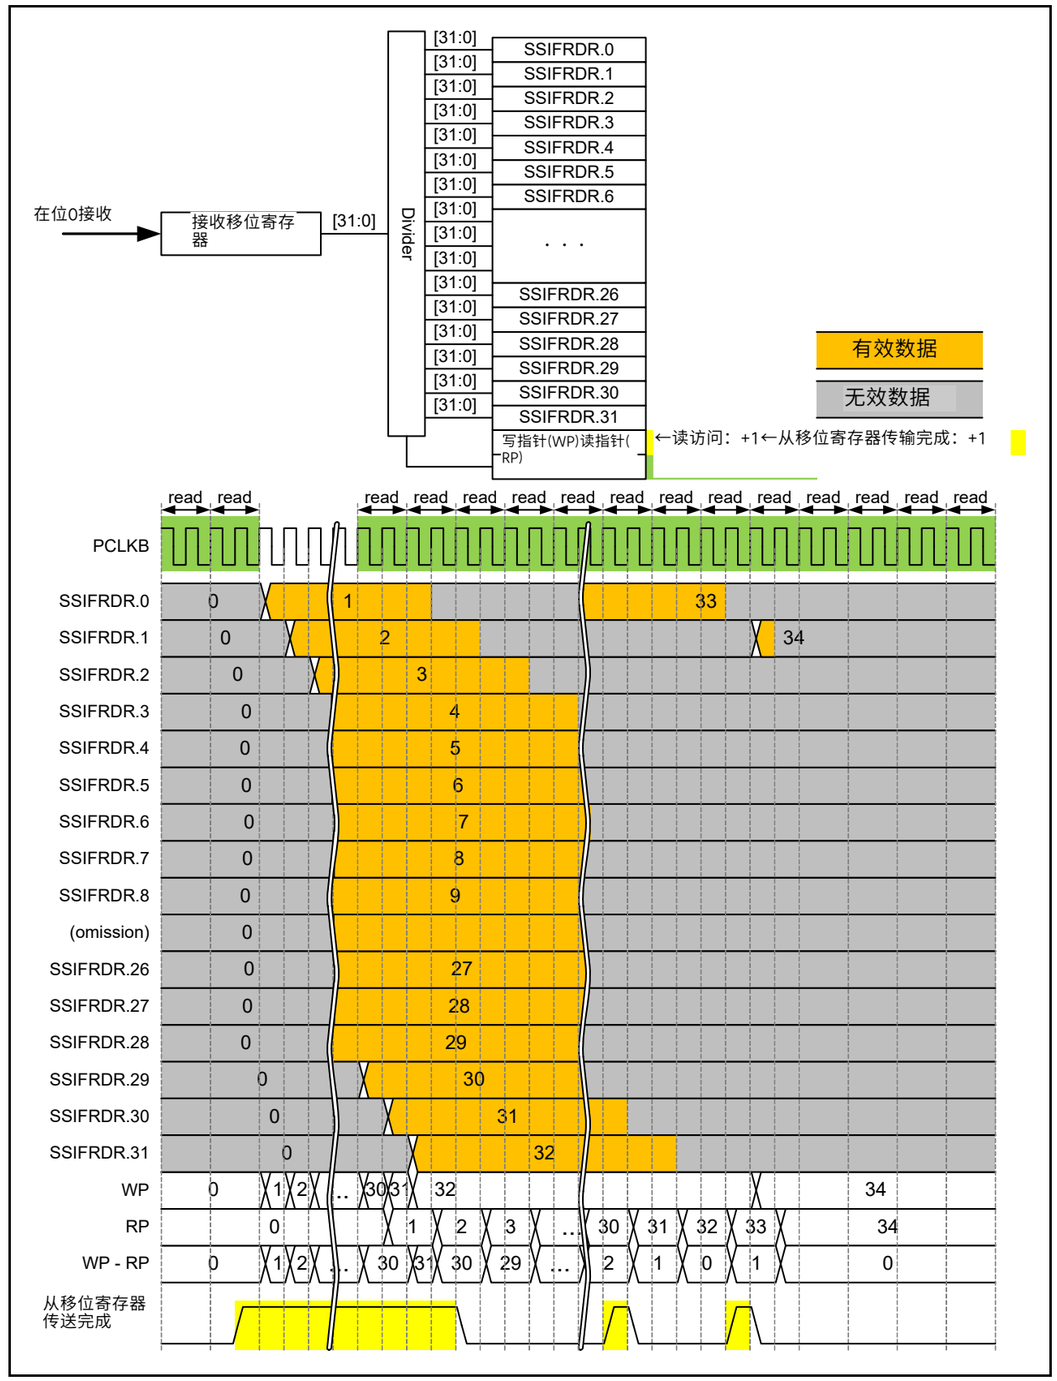

Figure 41.32 发送FIFO数据寄存器和发送移位寄存器的配置，以及FIFO操作示例

41.4.7 Audio Format Register (SSIOFR)

Address(es): SSIE0.SSIOFR 4004 E020h, SSIE1.SSIOFR 4004 E120h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	BCKASTP	LRCONT	—	—	—	—	—	—	OMOD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	OMOD[1:0]	Audio Format Select*3, *4	00: I²S format 01: TDM format 10: Monaural format 11: Setting prohibited.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	LRCONT	Whether to Enable LRCK/FS Continuation*1, *2	0: Disables LRCK/FS continuation 1: Enables LRCK/FS continuation.	R/W
b9	BCKASTP	Whether to Enable Stopping BCK Output When SSIE is in Idle Status*1, *2	0: Always outputs BCK to the SSIBCK pin 1: Automatically controls output of BCK to the SSIBCK pin.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is valid only in master-mode communication (SSICR.MST = 1). The setting is invalid in slave-mode communication (SSICR.MST = 0).
Note 2. The BCKASTP and LRCONT bits must not be set to 1 together.
Note 3. While SSIE is communicating (SSISR.IIRQ = 0), writing to these bits is prohibited. If the value of these bits is changed by writing, subsequent operation is unpredictable.
Note 4. If the communication format of other-party device is compatible with a communication format of SSIE, specify and use the communication format that enables communication with the other-party device.

This register is used to set an audio format (which involves the settings of communication format, LR clock/frame synchronization continuation mode, and BCK output stop).

OMOD[1:0] bits (Audio Format Select)

These bits set an audio format. Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in reference 41.4.7.

LRCONT bit (Whether to Enable LRCK/FS Continuation)

This bit enables or disables the output from SSILRCK/SSIFS pin when the communication mode is master-mode communication (SSICR.MST = 1) and SSIE is in the idle state (SSISR.IIRQ = 1).

Even in the idle state, a signal can output from the SSILRCK/SSIFS pin when this bit is set to 1 (to enable LR clock/frame synchronization continuation) in master mode (SSICR.MST = 1).

41.4.7 音频格式寄存器(SSIOFR)

Address(es): SSIE0.SSIOFR 4004 E020h, SSIE1.SSIOFR 4004 E120h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	BCKASTP	LRCONT	—	—	—	—	—	—	OMOD[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	OMOD[1:0]	音频格式选择*3 *4	00：I2S格式01：TDM格式10：单声道格式11：禁止设置。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	LRCONT	是否开启LRCKFS Continuation*1, *2	0：禁用LRCKFS延续1：启用LRCKFS延续。	R/W
b9	BCKASTP	SSIE时是否使能停止BCK输出 Idle Status*1, *2	0：始终向SSIBCK引脚输出BCK1：自动控制向SSIBCK引脚输出BCK。	R/W
b31 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 该位仅在主模式通信(SSICR.MST=1)中有效。该设置在从模式通信中无效(SSICR.MST=0)。
Note 2. BCKASTP和LRCONT位不能一起设置为1。
Note 3. 在SSIE通信时(SSISR.IIRQ=0)，禁止写入这些位。如果这些位的值通过写来改变，后续的操作是不可预知的。
Note 4. 如果对方设备的通信格式与SSIE的通信格式兼容，请指定并使用能够与对方设备进行通信的通信格式。

该寄存器用于设置音频格式（涉及通信格式、LR时钟帧同步持续模式、BCK输出停止的设置）。

OMOD[1:0]位（音频格式选择）

这些位设置音频格式。当LR时钟提供给SSILRCKSSIFS引脚停止。LR时钟输出的详细信息请参见参考文献41.4.7中LRCONT位的详细说明。

LRCONT位（是否启用LRCKFSContinuation）

当通信模式为主机模式通信(SSICR.MST=1)且SSIE处于空闲状态(SSISR.IIRQ=1)时，该位启用或禁用SSILRCKSSIFS引脚的输出。

即使在空闲状态下，当该位在主模式(SSICR.MST=1)下设置为1（以启用LR时钟帧同步继续）时，也可以从SSILRCKSSIFS引脚输出信号。

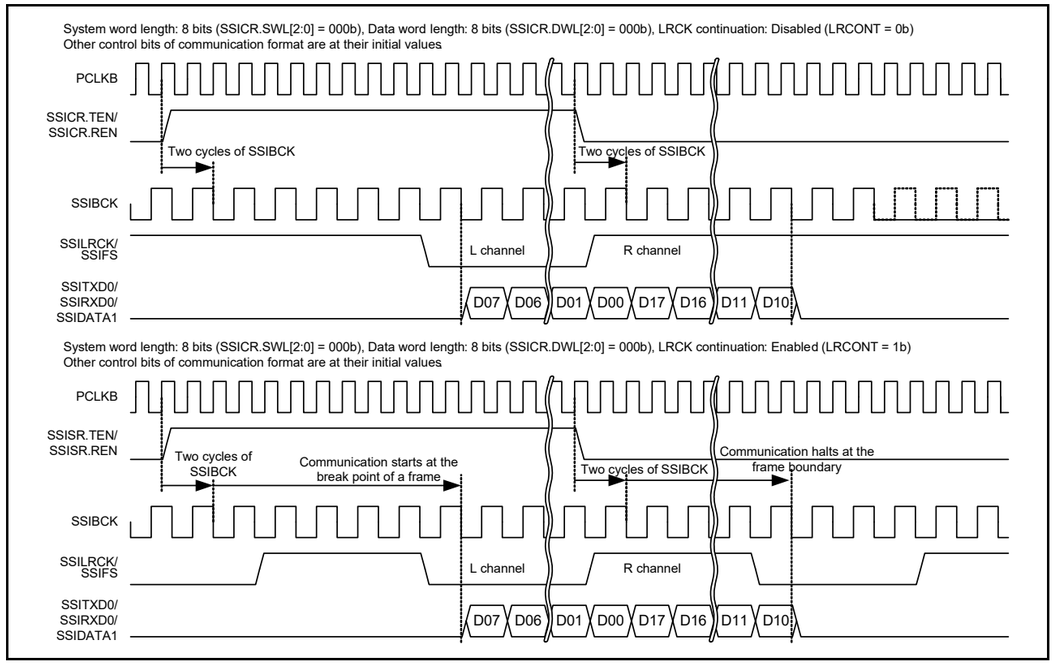

Figure 41.33 Example of LR clock/frame synchronization continuation operation

BCKASTP bit (Whether to Enable Stopping BCK Output When SSIE is in Idle Status)

This bit turns on or off the function to output BCK to the SSIBCK pin according to the communication shown in Figure 41.34 and Figure 41.35 in master-mode communication (SSICR.MST = 1).

Changing the value of this bit must be performed only after setting the communication format to be used.

This bit must be used in the following way:

Write 0 to the BCKASTP bit, and then start communication. During the communication, write 1 to the BCKASTP bit. By this operation, the bit clock output to the SSIBCK pin stops automatically when the communication stops. To resume the communication, set SSIE to the idle state (SSICR.IIRQ = 1), enable the supply of AUDIO_MCK (SSIFCR.AUCKE = 1), and then write 0 to the BCKASTP bit.

When the communication mode is master-mode communication (SSICR.MST = 1) and SSIE is in the idle state (SSICR.IIRQ = 1):

Table 41.9 BCKASTP bit status and SSIBCK pin output

BCKASTP Bit	SSIBCK Pin Output Status
0	Output
1	Stopped

Note: The BCKASTP bit cannot be used when the other-party device (which is a slave) requires the clock output from the SSIBCK pin before and during communication. In such a case, use the BCKASTP bit to stop the clock only after communication. For the timing of enabling the clock stop function, see Figure 41.34.

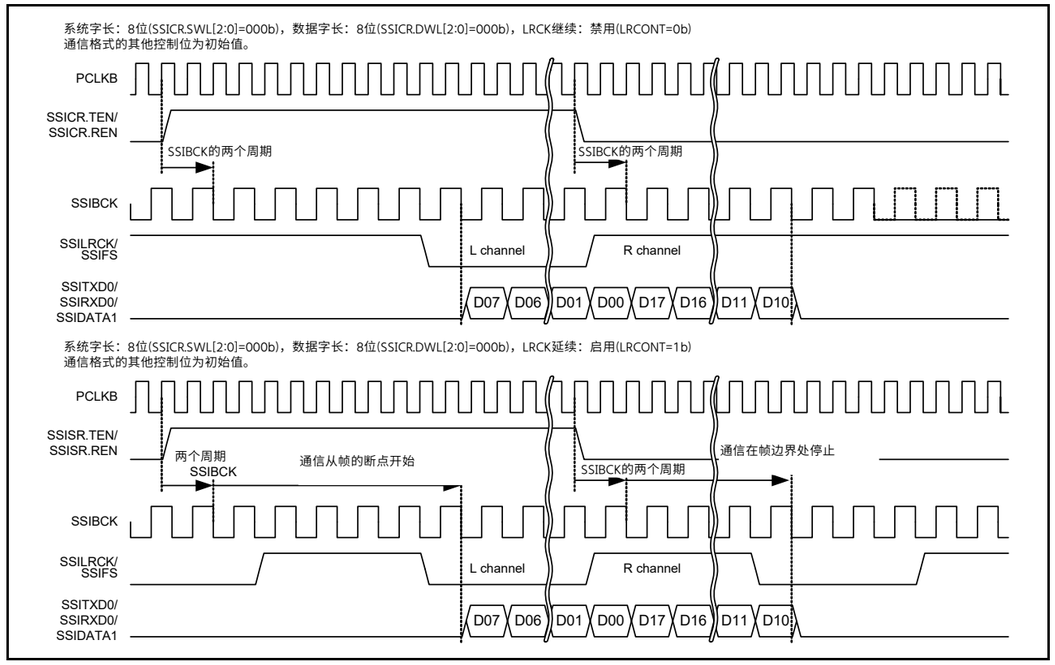

Figure 41.33 LR时钟帧同步继续操作示例

BCKASTP位（SSIE空闲时是否使能停止BCK输出）

该位根据图41.34和图41.35所示的通信在主模式通信(SSICR.MST=1)中打开或关闭将BCK输出到SSIBCK引脚的功能。

只有在设置要使用的通信格式后才能更改该位的值。

该位必须按以下方式使用：

将0写入BCKASTP位，然后开始通信。在通信期间，将1写入BCKASTP位。
通过该操作，当通信停止时，向SSIBCK引脚输出的位时钟自动停止。要恢复通信，请将SSIE设置为空闲状态(SSICR.IIRQ=1)，启用AUDIO_MCK电源(SSIFCR.AUCKE=1)，然后将0写入BCKASTP位。

当通信模式为主模式通信（SSICR.MST=1）且SSIE处于空闲状态（SSICR.IIRQ=1）时：

Table 41.9 BCKASTP位状态和SSIBCK引脚输出

BCKASTP Bit	SSIBCK引脚输出状态
0	Output
1	Stopped

Note: 当对方设备（作为从设备）在通信之前和通信期间需要从SSIBCK引脚输出时钟时，不能使用BCKASTP位。在这种情况下，仅在通信后使用BCKASTP位停止时钟。时钟停止功能的开启时序见图41.34。

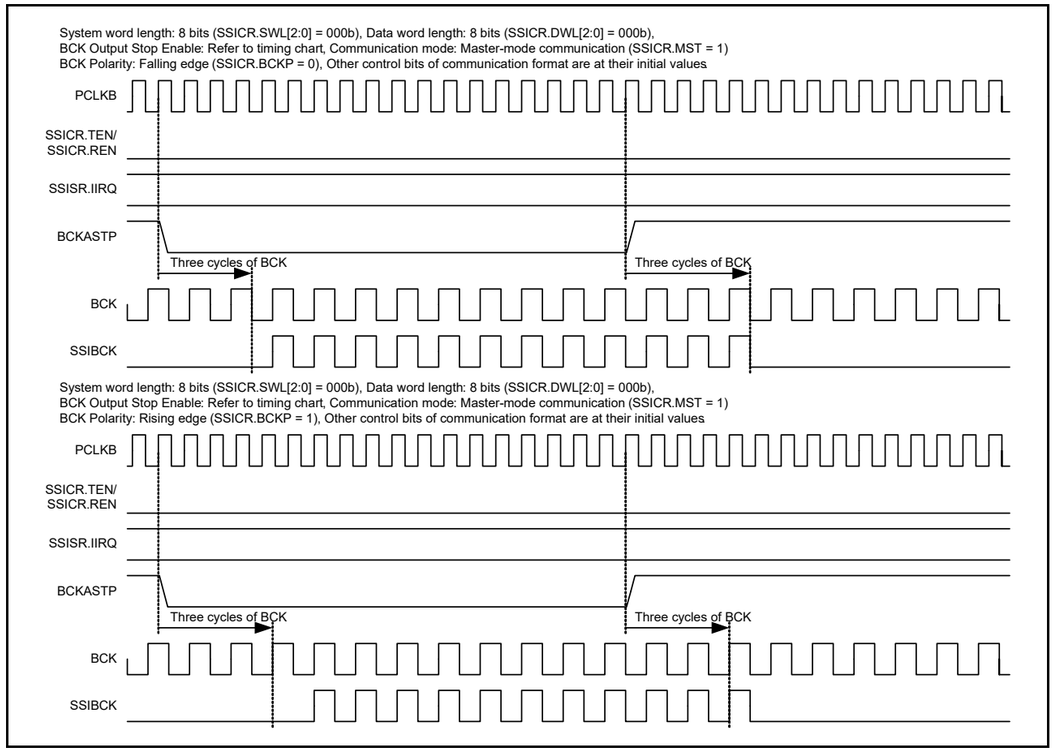

Figure 41.34 Example operation of the BCKASTP bit (idle state)

When the communication mode is master-mode communication (SSICR.MST = 1) and the BCK output stop function is enabled (BCKASTP = 1):

Details of the BCK output to the SSIBCK pin are as follows:

Output start timing: BCK is output in appropriate timing so that a valid edge is generated when the LR clock/frame synchronization signal shifts to a valid value.

Output stop timing: 1 to 1.5 clock cycles after a frame boundary.

For details about the timings, see the timing diagram in Figure 41.35.

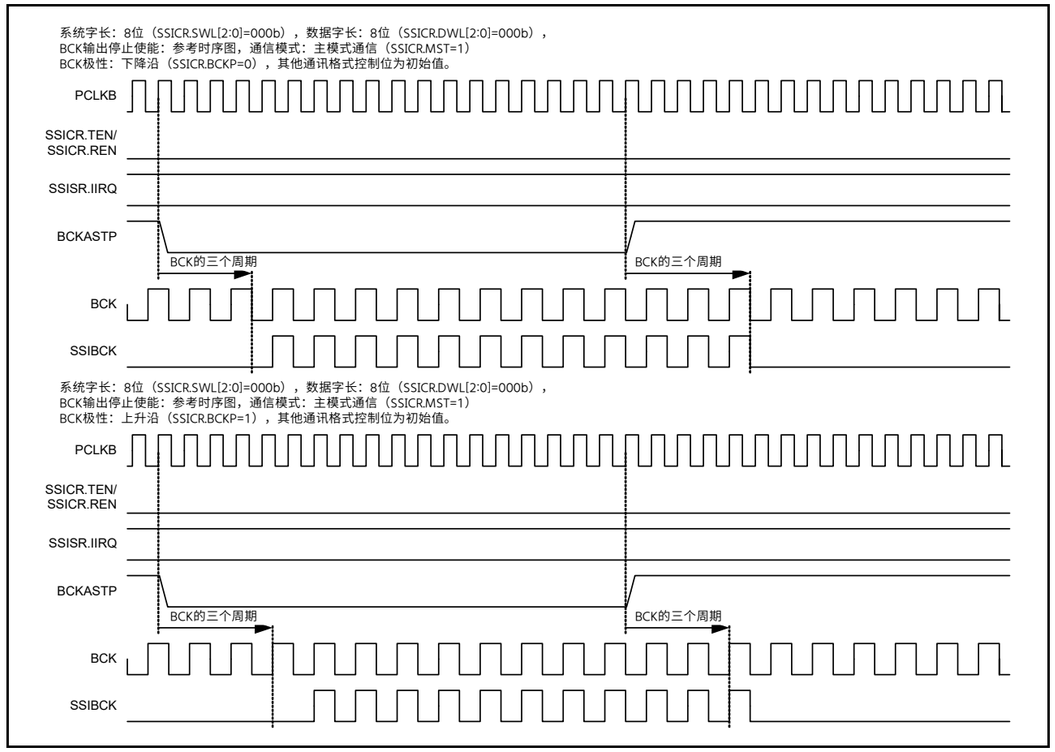

Figure 41.34 BCKASTP位的示例操作（空闲状态）

当通信模式为主机模式通信(SSICR.MST=1)且BCK输出停止功能启用(BCKASTP=1)时：

BCK输出到SSIBCK引脚的详细信息如下：

输出开始时序：在适当的时序输出BCK，以便在LR时钟帧同步信号移位到有效值时产生有效边沿。

输出停止时序：帧边界后1到1.5个时钟周期。

有关时序的详细信息，请参见图41.35中的时序图。

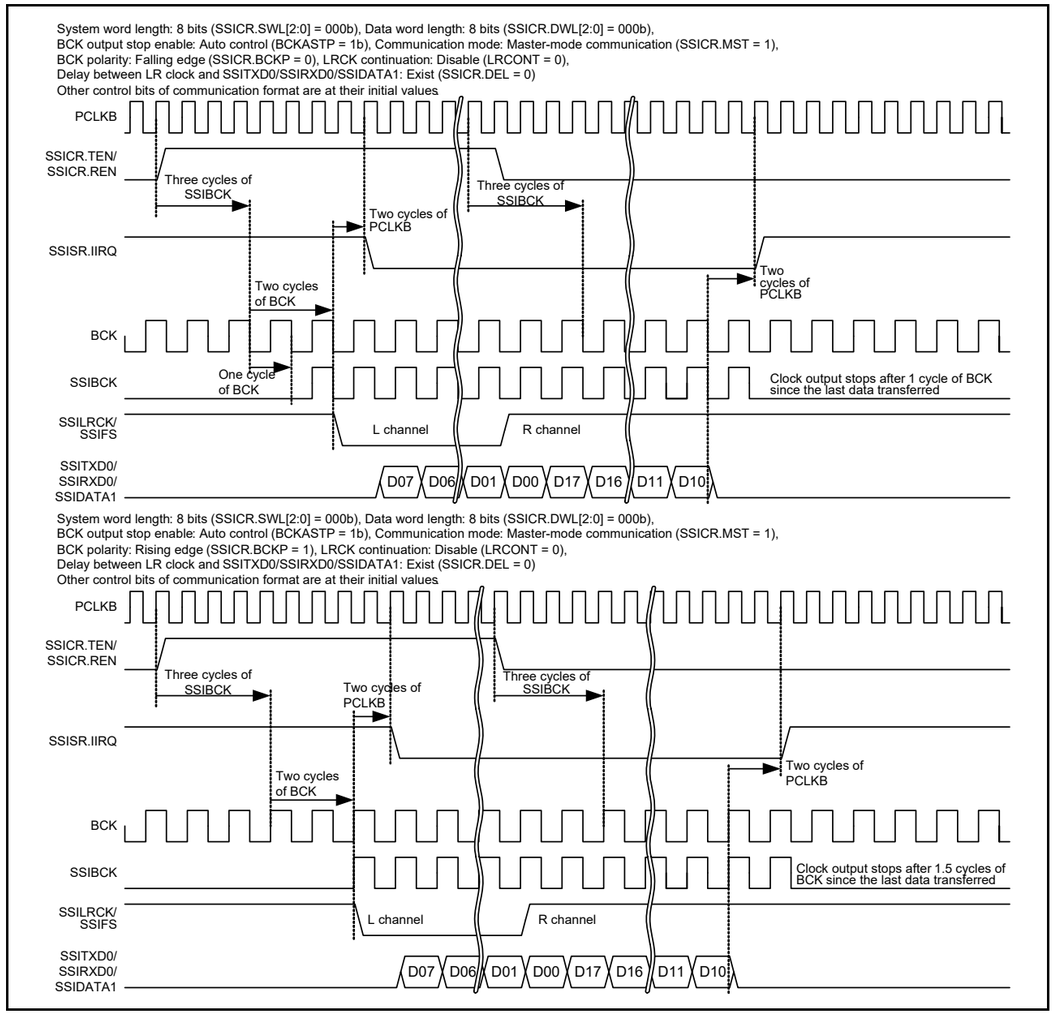

Figure 41.35 Example operation of the BCKASTP bit (communication operation with BCKASTP = 1)

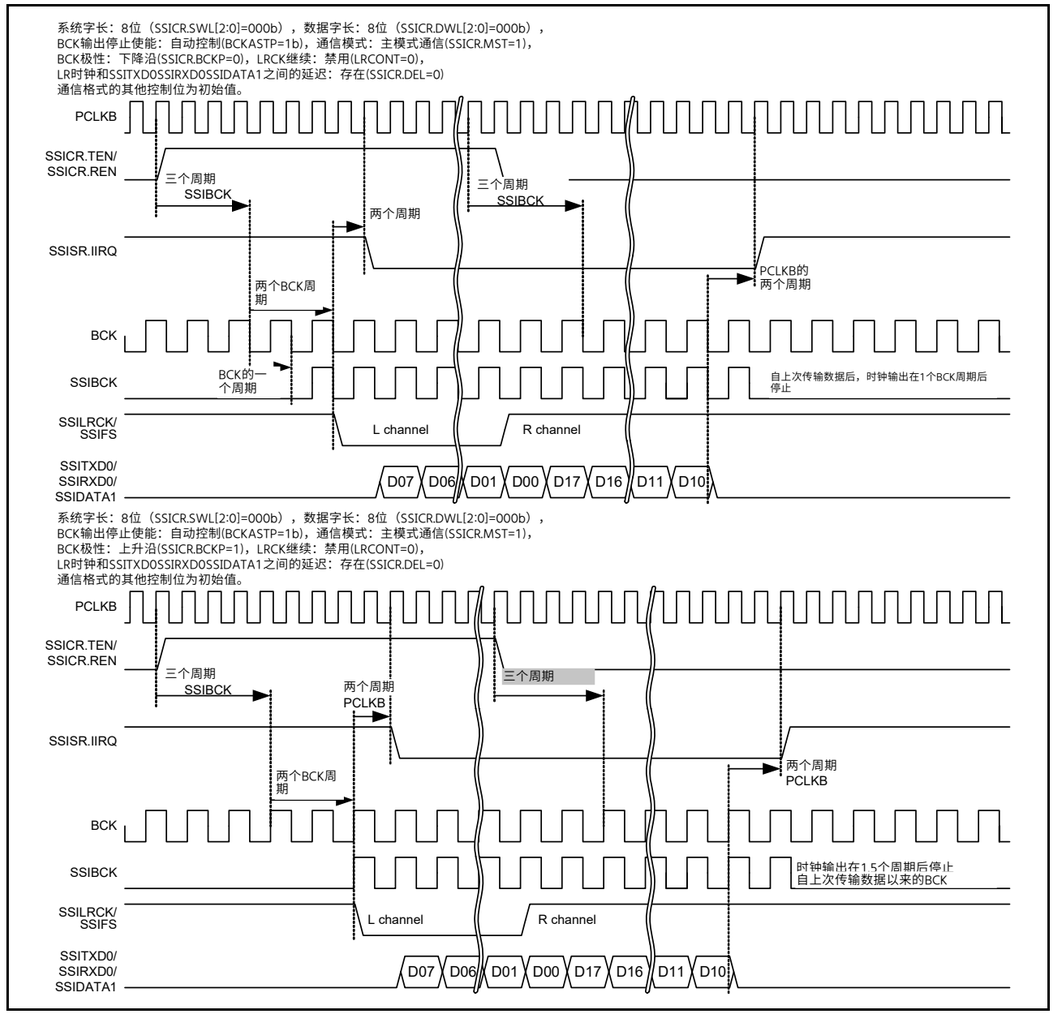

Figure 41.35 BCKASTP位的示例操作（BCKASTP=1的通信操作）

41.4.8 Status Control Register (SSISCR)

Address(es): SSIE0.SSISCR 4004 E024h, SSIE1.SSISCR 4004 E124h

b4 to b0	RDFS[4:0]	RDF Setting Condition Select*1	b4 b0 0 0 0 0 0: SSIFRDR has one stage or more data size 0 0 0 0 1: SSIFRDR has two stages or more data size (snip) … 1 1 1 1 0: SSIFRDR has thirty-one stages or more data size 1 1 1 1 1: SSIFRDR has thirty-two stages or more data size.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12 to b8	TDES[4:0]	TDE Setting Condition Select*1	b12 b8 0 0 0 0 0: SSIFTDR has one stage or more free space 0 0 0 0 1: SSIFTDR has two stages or more free space (snip) … 1 1 1 1 0: SSIFTDR has thirty-one stages or more free space 1 1 1 1 1: SSIFTDR has thirty-two stages or more free space.	R/W
b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

RDFS[4:0] bits (RDF Setting Condition Select)

These bits set the setting condition of the receive data full flag (RDF).

TDES[4:0] bits (TDE Setting Condition Select)

These bits set the setting condition of the transmit data empty flag (TDE).

41.5 Communication Formats

SSIE supports three communication formats. Table 41.10 shows supported communication formats.

Table 41.10 Supported communication formats

Communication Format	SSIOFR.OMOD[1:0]
I²S format	00
TDM format	01
Monaural format	10

The following describes the serial data structure shared by communication formats. A serial data structure is defined by the system word length (set in SSICR.SWL[2:0]) and the data word length (set in SSICR.DWL[2:0]). If the data word length is shorter than the system word length, padding bits are transferred in the serial data. For details, see Figure 41.36.

41.4.8 状态控制寄存器(SISSCR)

Address(es): SSIE0.SSISCR 4004 E024h, SSIE1.SSISCR 4004 E124h

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b4 to b0	RDFS[4:0]	RDF设置条件 Select*1	b4b000000：SSIFRDR具有一级或更多数据大小00001：SSIFRDR具有两级或更多数据大小（片段）……11110：SSIFRDR具有三十一级或更多数据大小11111：SSIFRDR具有32级或更多数据大小。	R/W
b7 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b12 to b8	TDES[4:0]	TDE设定条件 Select*1	b12b800000：SSIFTDR有1级或更多可用空间00001：SSIFTDR有2级或更多可用空间(snip)…11110：SSIFTDR有31级或更多可用空间11111：SSIFTDR有32级或更多可用空间。	R/W
b31 to b13	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果写入，则不保证写入后立即执行的操作。

RDFS[4:0]位（RDF设置条件选择）

这些位设置接收数据满标志(RDF)的设置条件。

TDES[4:0]位（TDE设置条件选择）

这些位设置发送数据空标志(TDE)的设置条件。

41.5 通讯格式

SSIE支持三种通信格式。表41.10显示了支持的通信格式。

Table 41.10 支持的通讯格式

通讯格式	SSIOFR.OMOD[1:0]
I²S format	00
TDM format	01
Monaural format	10

下面介绍通信格式共享的串行数据结构。串行数据结构由系统字长（在SSICR.SWL[2:0]中设置）和数据字长（在SSICR.DWL[2:0]中设置）定义。如果数据字长短于系统字长，则在串行数据中传输填充位。详见图41.36。

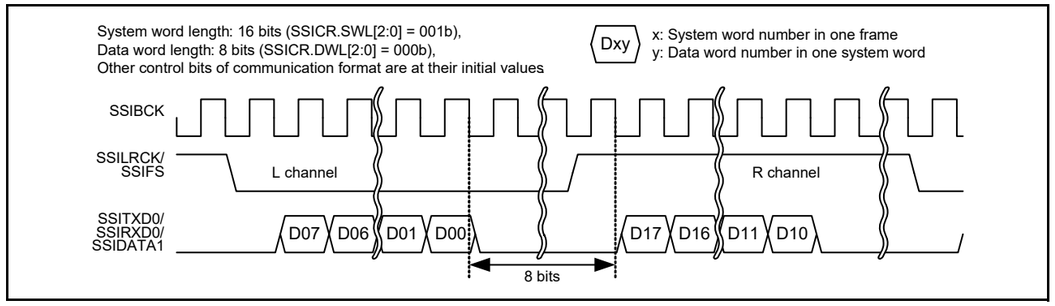

Figure 41.36 Example of padding bit transfer (I²S format: system word length > data word length)

Table 41.11 lists the number of padding bits to be transferred with each combination of system word length (SSICR.SWL[2:0]) and data word length (SSICR.DWL[2:0]). "-" indicates that the setting is prohibited.

Table 41.11 Number of padding bits

	SSICR.DWL[2:0]	000b	001b	010b	011b	100b	101b	110b	111b
SSICR.SWL[2:0]	System Word Length	8	16	18	20	22	24	32	Setting prohibited
000b	8	0	—	—	—	—	—	—	—
001b	16	8	0	—	—	—	—	—	—
010b	24	16	8	6	4	2	0	—	—
011b	32	24	16	14	12	10	8	0	—

111b	256	248	240	238	236	234	232	224	—

41.5.1 I²S Format

The I²S format is a communication format used for connection with I²S-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 00b), one frame is configured with two system words, one for the channel L and the other for channel R. The SSILRCK/SSIFS signals are at a low level for the channel L and at a high level for the channel R. Set the polarity of the signals with the SSICR.LRCKP bit. Figure 41.37 shows the I²S format without padding. See Figure 41.36 for the format with padding.

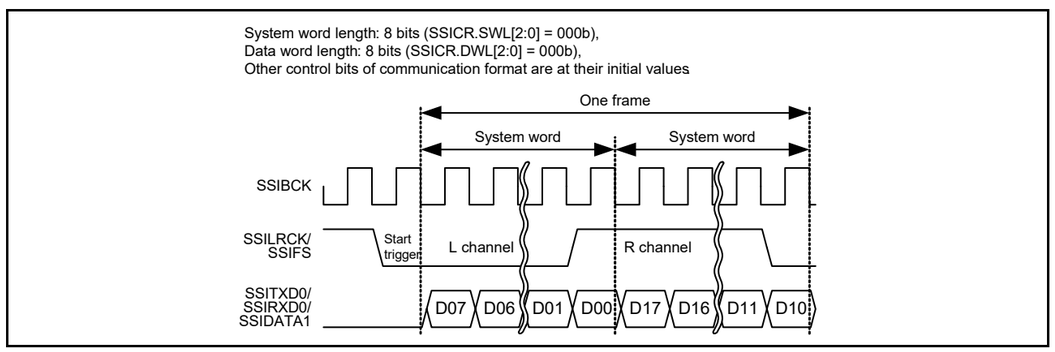

Figure 41.37 I²S format (without padding: system word length = data word length)

For the state of external pins when SSIE is in the idle state, see reference 41.7.1.

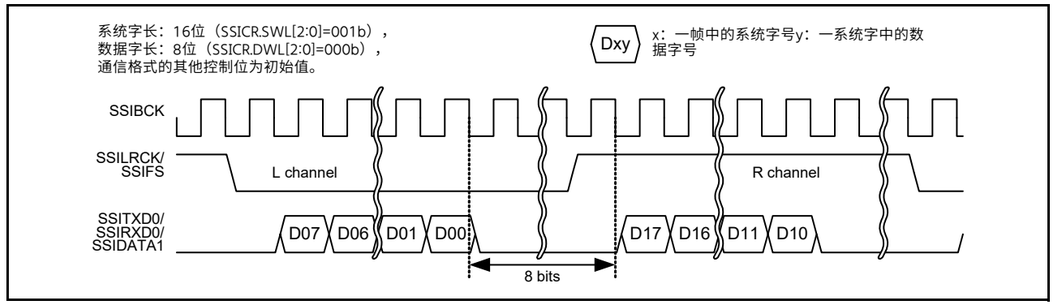

Figure 41.36 填充位传输示例（I2S格式：系统字长>数据字长）

表41.11列出了使用系统字长(SSICR.SWL[2:0])和数据字长(SSICR.DWL[2:0])的每种组合传输的填充位数。"–"表示禁止设置。

Table 41.11 填充位数

	SSICR.DWL[2:0]	000b	001b	010b	011b	100b	101b	110b	111b
SSICR.SWL[2:0]	系统字 Length	8	16	18	20	22	24	32	禁止设置
000b	8	0	—	—	—	—	—	—	—
001b	16	8	0	—	—	—	—	—	—
010b	24	16	8	6	4	2	0	—	—
011b	32	24	16	14	12	10	8	0	—

110b	128	120	112	110	108	106	104	96	—
111b	256	248	240	238	236	234	232	224	—

41.5.1 I²S Format

I2S格式是用于连接I2S兼容串行设备的通信格式。使用此格式设置(SSIOFR.OMOD[1:0]=00b)，一帧配置有两个系统字，一个用于通道L，另一个用于通道R。SSILRCKSSIFS信号对于通道处于低电平L和通道R为高电平。使用SSICR.LRCKP位设置信号的极性。图41.37显示了没有填充的I2S格式。看

图41.36为带有填充的格式。

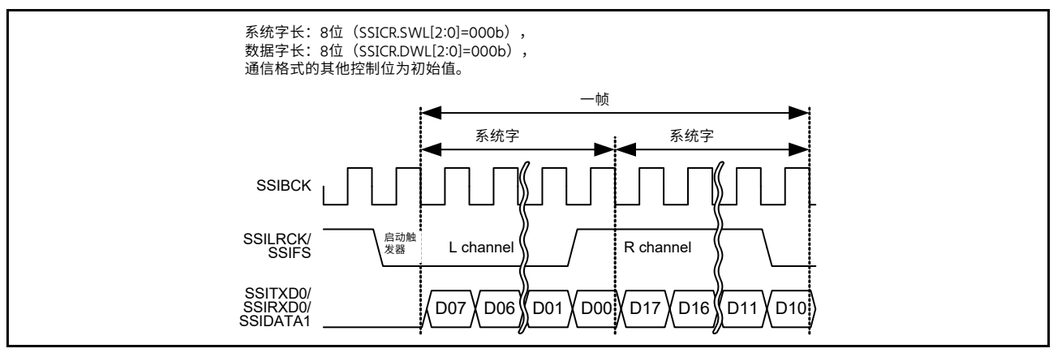

Figure 41.37 I2S格式（无填充：系统字长=数据字长）

SSIE处于空闲状态时外部管脚的状态见参考41.7.1。

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

41.5.2 Monaural Format

The monaural format is a communication format used for connection with monaural-compatible serial devices. When the monaural format is specified (SSIOFR.OMOD[1:0] = 10b) for use, one frame consists of one system word. Also, a rising edge of the SSILRCK/SSIFS signal indicates a communication start trigger. Figure 41.38 and Figure 41.39 respectively show the monaural formats without and with padding.

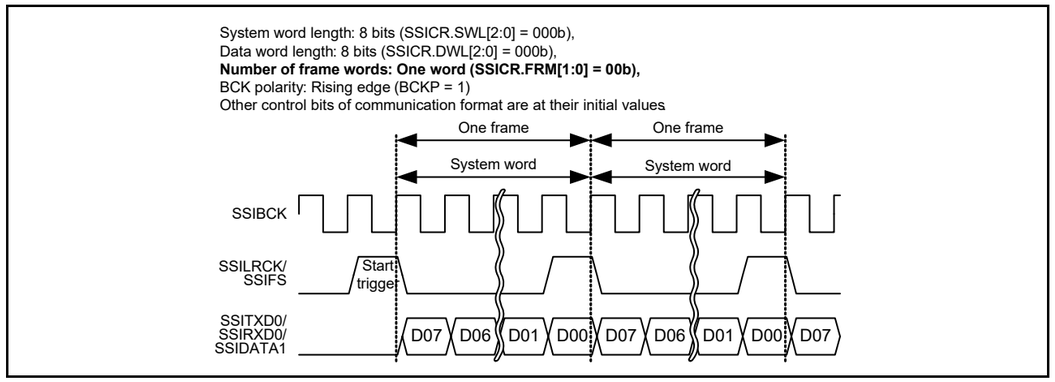

Figure 41.38 Short frame in monaural format (without padding: system word length = data word length)

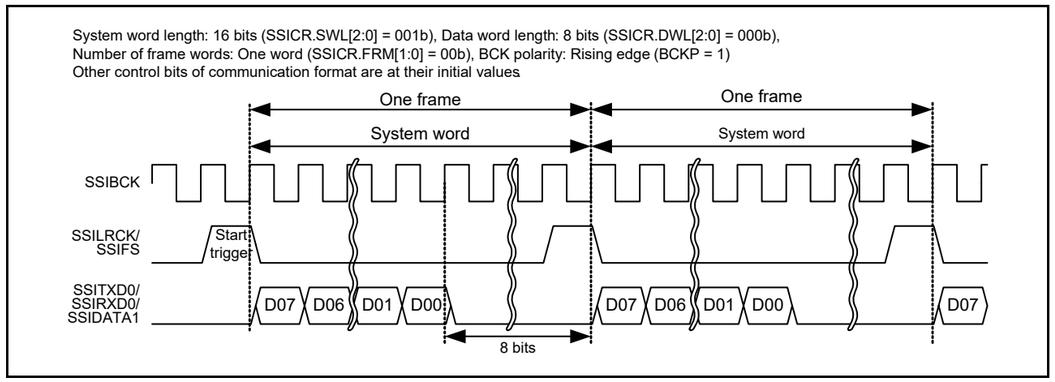

Figure 41.39 Short frame in monaural format (with padding: system word length > data word length)

The monaural formats supported by SSIE consist of short frames and long frames. See reference 41.5.2.1 and reference 41.5.2.2 for the difference between these two frames.

For the state of external pins state when SSIE is in the idle state, see reference 41.7.1.

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

41.5.2.1 Short frame

When a short frame is used (SSICR.DEL = 0), the SSILRCK/SSIFS signal indicating the start of serial data is set to high level only for 1 cycle of SSIBCK. Data transfer starts at the falling edge of the signal.

Note: SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

41.5.2 Monaural Format

单声道格式是用于连接单声道兼容串行设备的通信格式。当指定使用单声道格式(SSIOFR.OMOD[1:0]=10b)时，一帧由一个系统字组成。此外，SSILRCKSSIFS信号的上升沿表示通信开始触发。图41.38和图41.39分别显示了没有和有填充的单声道格式。

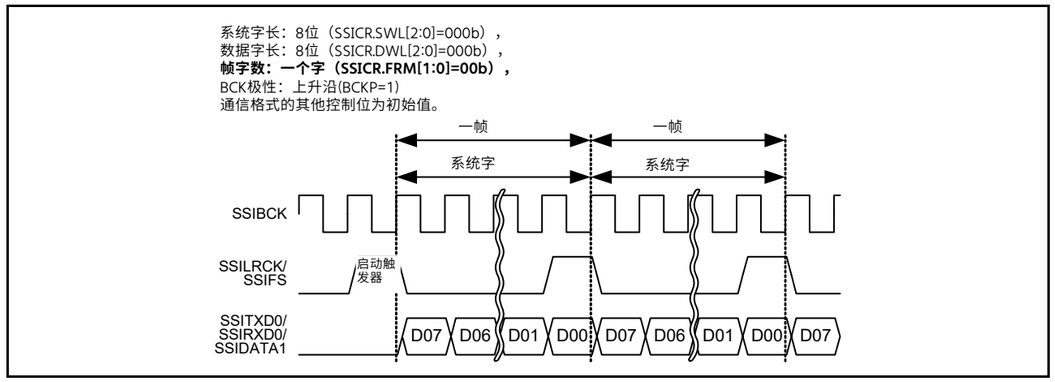

Figure 41.38 单声道格式的短帧（无填充：系统字长=数据字长）

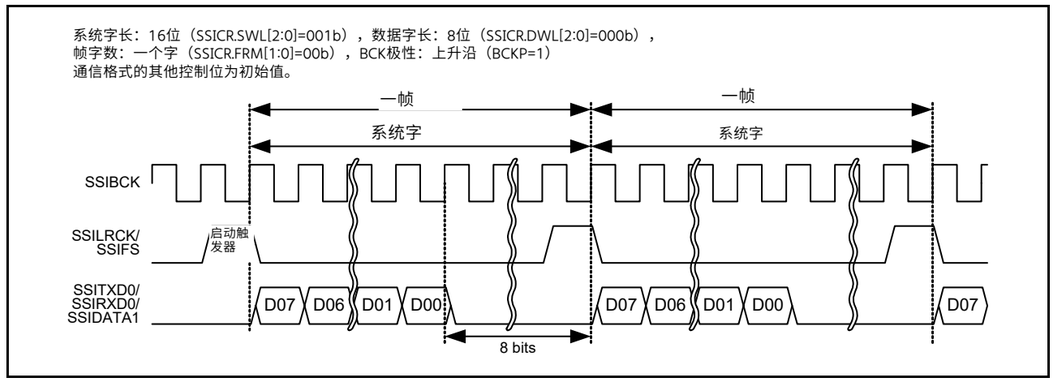

Figure 41.39 单声道格式的短帧（带填充：系统字长>数据字长）

SSIE支持的单声道格式包括短帧和长帧。这两个帧之间的区别参见参考41.5.2.1和参考41.5.2.2。

SSIE处于空闲状态时外部管脚状态的状态见参考41.7.1。

Note: SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

41.5.2.1 短框

当使用短帧时（SSICR.DEL=0），指示串行数据开始的SSILRCKSSIFS信号仅在SSIBCK的1个周期内设置为高电平。数据传输从信号的下降沿开始。

41.5.2.2 Long frame

When a long frame is used (SSICR.DEL = 1), the SSILRCK/SSIFS signal indicating the start of serial data is set to high level only for 2 cycles of SSIBCK. See Figure 41.40. Data transfer starts at the rising edge of the signal.

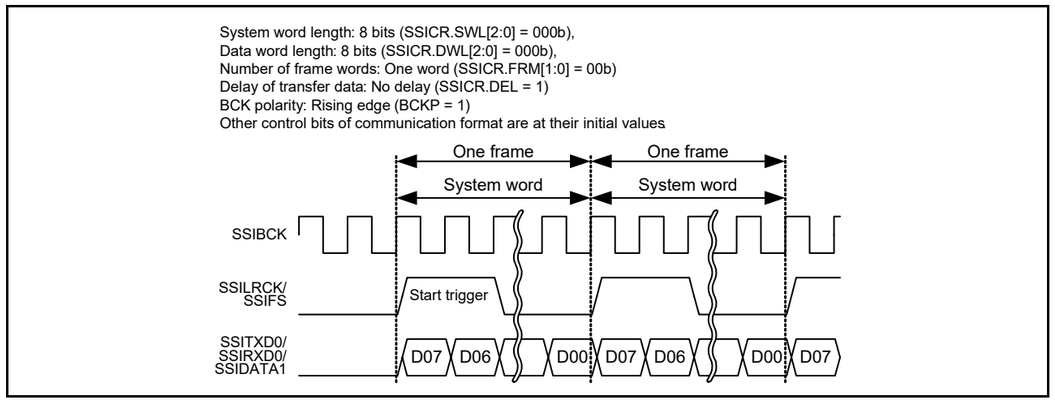

Figure 41.40 Long frame in monaural format (without padding)

41.5.3 TDM Format

The TDM format is a communication format used for connection with TDM-compatible multi-channel devices. With this format setting (SSIOFR.OMOD[1:0] = 01b), one frame is configured with four to eight system words set with the SSICR.FRM[1:0] bits. With this format, the SSILRCK/SSIFS signal is at a high level for the first one system word and at a low level for the rest. The pulse generated on the SSILRCK/SSIFS signal is defined as the SYNC pulse and its rising edge means a start of one frame. Figure 41.41 and Figure 41.42 respectively show the TDM formats without and with padding.

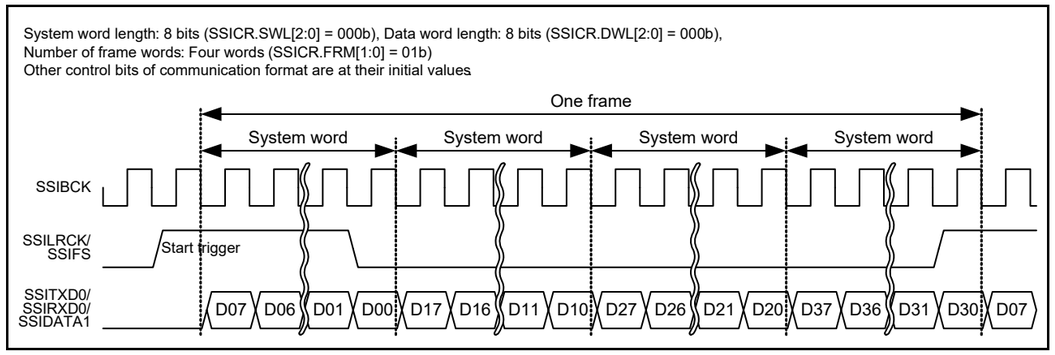

Figure 41.41 TDM format (without padding: system word length = data word length)

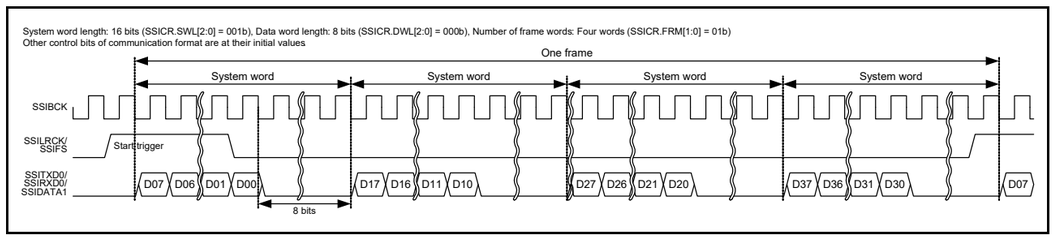

Figure 41.42 TDM format (with padding: system word length > data word length)

41.5.2.2 长框

当使用长帧时（SSICR.DEL=1），指示串行数据开始的SSILRCKSSIFS信号仅在SSIBCK的2个周期内设置为高电平。请参见图41.40。数据传输从信号的上升沿开始。

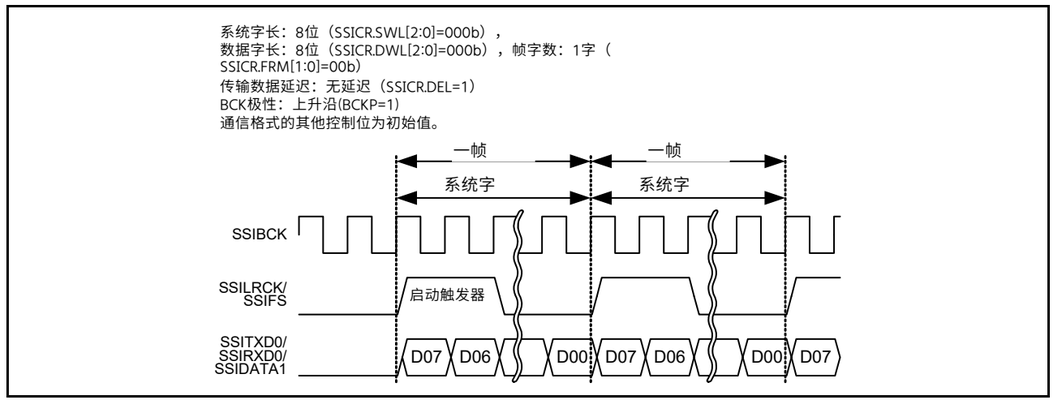

Figure 41.40 单声道格式的长帧（无填充）

41.5.3 TDM Format

TDM格式是一种用于与兼容TDM的多通道设备连接的通信格式。使用此格式设置(SSIOFR.OMOD[1:0]=01b)，一帧配置有四到八个通过SSICR.FRM[1:0]位设置的系统字。使用这种格式，SSILRCKSSIFS信号对于第一个系统字处于高电平，而对于其余系统字处于低电平。SSILRCKSSIFS信号上产生的脉冲被定义为SYNC脉冲，其上升沿表示一帧的开始。图41.41和图41.42分别显示了没有和有填充的TDM格式。

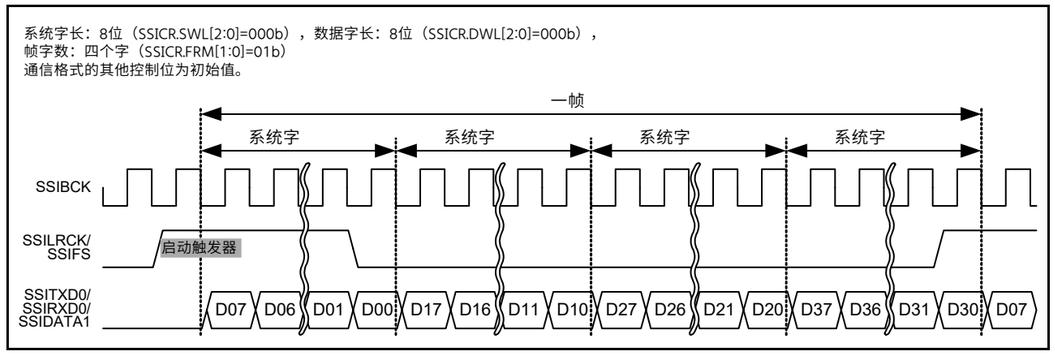

Figure 41.41 TDM格式（无填充：系统字长=数据字长）

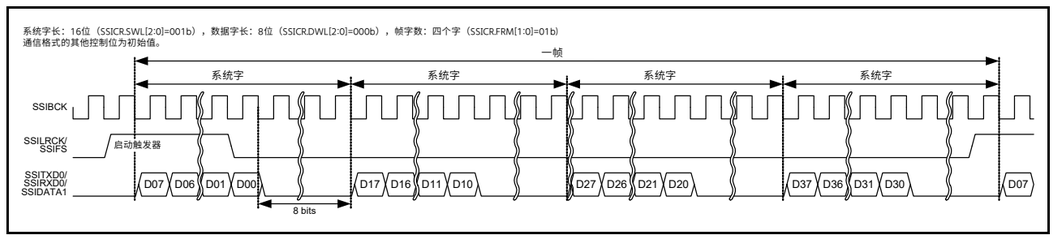

Figure 41.42 TDM格式（带填充：系统字长>数据字长）

For the state of external pins when SSIE is in the idle state, see reference 41.7.1.

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

41.6 Communication Modes

SSIE supports the following communication modes. Table 41.13 lists the control bits that are not available with each communication mode. See reference 41.6.1 to reference 41.6.5 for details of these communication modes.

Table 41.12 Communication modes

Communication Mode	SSICR.MST Bit	SSICR.REN Bit	SSICR.TEN Bit
Slave-mode transmission	0	0	1
Slave-mode reception	0	1	0
Slave-mode transmission and reception	0	1	1
Master-mode transmission	1	0	1
Master-mode reception	1	1	0
Master-mode transmission and reception	1	1	1

Table 41.13 Control bits that cannot be used in each communication mode

Communication Mode / Control Bit	Slave-mode Reception	Slave-mode Transmission	Slave-mode Transmission and Reception	Master-mode Reception	Master-mode Transmission	Master-mode Transmission and Reception
SSICR.CKS	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.CKDV	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.MUEN	Invalid	Available	Available	Invalid	Available	Available
SSICR.TEN	Invalid	Available	Available	Invalid	Available	Available
SSICR.REN	Available	Invalid	Available	Available	Invalid	Available
SSIFCR.AUCKEN	Invalid	Invalid	Invalid	Available	Available	Available
SSIFCR.TIE	Invalid	Available	Available	Invalid	Available	Available
SSIFCR.RIE	Available	Invalid	Available	Available	Invalid	Available
SSIFCR.TFRST	Invalid	Available	Available	Invalid	Available	Available
SSIFCR.RFRST	Available	Invalid	Available	Available	Invalid	Available
SSIOFR.BCKASTP	Invalid	Invalid	Invalid	Available	Available	Available
SSIOFR.LRCONT	Invalid	Invalid	Invalid	Available	Available	Available
SSIOFR.OMOD	Available	Available	Available	Available	Available	Available
SSISCR.TDES	Invalid	Available	Available	Invalid	Available	Available
SSISCR.RDFS	Available	Invalid	Available	Available	Invalid	Available

“Invalid” means it has no effect on operation. Writing is possible.

41.6.1 Slave-mode Communication

SSIE operates in slave mode with SSICR.MST = 0. The SSIBCK and SSILRCK/SSIFS signals to be used for serial-data communication must be supplied from an external device. If these signals do not match the communication format set for SSIE, operation is not guaranteed.

SSIE处于空闲状态时外部管脚的状态见参考41.7.1。

Note: SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

41.6 通讯方式

SSIE支持以下通信模式。表41.13列出了每种通信模式不可用的控制位。有关这些通信模式的详细信息，请参见参考41.6.1至参考41.6.5。

Table 41.12 通讯方式

通讯方式	SSICR.MST Bit	SSICR.REN Bit	SSICR.TEN Bit
Slave-mode transmission	0	0	1
Slave-mode reception	0	1	0
从模式发送和接收	0	1	1
Master-mode transmission	1	0	1
Master-mode reception	1	1	0
主模式传输和接收	1	1	1

Table 41.13 不能在每种通信模式下使用的控制位

通讯方式 / 控制位	Slave-mode Reception	Slave-mode Transmission	Slave-mode 传输和接收	Master-mode Reception	Master-mode Transmission	主模式传输和接收
SSICR.CKS	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.CKDV	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.MUEN	Invalid	Available	Available	Invalid	Available	Available
SSICR.TEN	Invalid	Available	Available	Invalid	Available	Available
SSICR.REN	Available	Invalid	Available	Available	Invalid	Available

SSIFCR.RFRST	Available	Invalid	Available	Available	Invalid	Available
SSIOFR.BCKASTP	Invalid	Invalid	Invalid	Available	Available	Available
SSIOFR.LRCONT	Invalid	Invalid	Invalid	Available	Available	Available
SSIOFR.OMOD	Available	Available	Available	Available	Available	Available
SSISCR.TDES	Invalid	Available	Available	Invalid	Available	Available
SSISCR.RDFS	Available	Invalid	Available	Available	Invalid	Available

“无效”是指对操作没有影响。写作是可能的。

41.6.1 Slave-mode Communication

SSIE在SSICR.MST=0的从机模式下运行。用于串行数据通信的SSIBCK和SSILRCKSSIFS信号必须由外部设备提供。如果这些信号与为SSIE设置的通信格式不匹配，则无法保证操作。

41.6.2 Master-mode Communication

SSIE operates in master mode with SSICR.MST = 1. The SSIBCK and SSILRCK/SSIFS signals to be used for serial-data communication must be internally generated from the audio clock. These signals use the format according to the setting of SSIE. If the communication format the slave device uses does not match the communication format set for SSIE, the operation is unpredictable.

41.6.3 Transmission

SSIE transmits serial data to the other-party device when the SSICR.TEN bit is 1 and the SSICR.REN bit is 0. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

41.6.4 Reception

SSIE receives serial data from the other-party device when the SSICR.TEN bit is 0 and the SSICR.REN bit is 1. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

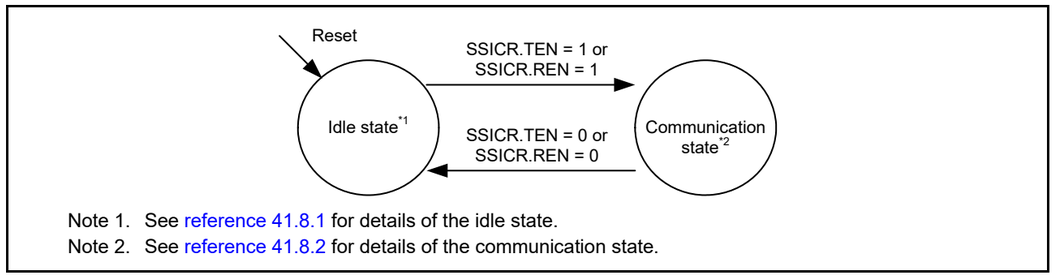
41.6.5 Transmission and Reception

SSIE transmits and receives serial data to and from the other-party device when the SSICR.TEN bit is 1 and the SSICR.REN bit is 1. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

41.7 Operation

SSIE has the following two main operation states Figure 41.43 shows SSIE state transition.

- Idle state (SSISR.IIRQ = 1)
- Communication state (SSISR.IIRQ = 0).



Note 1. See reference 41.8.1 for details of the idle state.
Note 2. See reference 41.8.2 for details of the communication state.

Figure 41.43 SSIE state transition

41.7.1 Idle State

In this state, communication of SSIE is halted. If, however, the SSICR.MST bit is 1, output of the BCK and LR clock/frame synchronization signals to external pins can be controlled according to the settings of SSIOFR.BCKASTP and SSIOFR.LRCONT bits. This function is common to all formats. For details, see Table 41.14.

Table 41.14 Output from external pins in the idle state

SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	Output from Pins		
			SSIBCK	SSILRCK/SSIFS	SSITXD0/SSIDATA1
0	—	—	Stop	Stop	Stop
1	0	0	Supply	Stop	Stop
1	0	1	Supply	Supply	Stop
1	1	0	Stop	Stop	Stop

41.6.2 Master-mode Communication

SSIE在SSICR.MST=1的主模式下运行。用于串行数据通信的SSIBCK和SSILRCKSSIFS信号必须由音频时钟在内部生成。这些信号根据SSIE的设置使用格式。如果从设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作是不可预测的。

41.6.3 Transmission

当SSICR.TEN位为1且SSICR.REN位为0时，SSIE向对方设备发送串口数据。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作为不可预料的。

41.6.4 Reception

当SSICR.TEN位为0且SSICR.REN位为1时，SSIE从对方设备接收串行数据。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作为不可预料的。

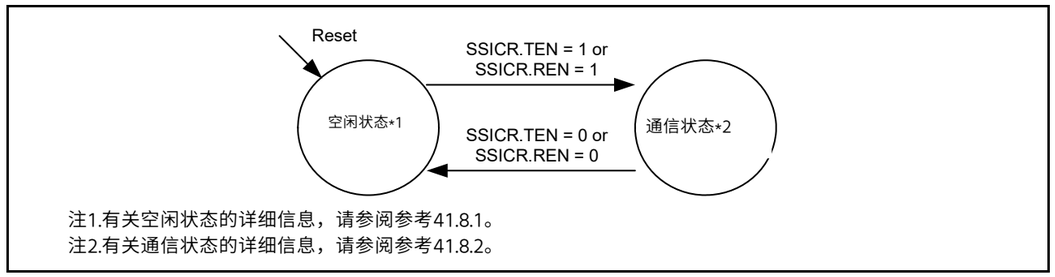
41.6.5 传输和接收

当SSICR.TEN位为1且
SSICR.REN位为1。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作不可预知。

41.7 Operation

SSIE有以下两个主要操作状态图41.43显示了SSIE状态转换。

- 空闲状态(SSISR.IIRQ=1)
- 通信状态(SSISR.IIRQ=0)。



注1.有关空闲状态的详细信息，请参阅参考41.8.1。
注2.有关通信状态的详细信息，请参阅参考41.8.2。

Figure 41.43 SSIE状态转换

41.7.1 空闲状态

在这种状态下，SSIE的通信停止。但是，如果SSICR.MST位为1，则可以根据SSIOFR.BCKASTP和SSIOFR.LRCONT位的设置来控制向外部引脚输出BCK和LR时钟帧同步信号。此功能适用于所有格式。详见表41.14。

Table 41.14 空闲状态下外部引脚的输出

SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	引脚输出		
			SSIBCK	SSILRCK/SSIFS	SSITXD0/SSIDATA1
0	—	—	Stop	Stop	Stop
1	0	0	Supply	Stop	Stop
1	0	1	Supply	Supply	Stop
1	1	0	Stop	Stop	Stop

Table 41.14 Output from external pins in the idle state

			Output from Pins		
SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	SSIBCK	SSILRCK/SSIFS	SSITXD0/SSIDATA1
1	1	1	Stop	Supply	Stop

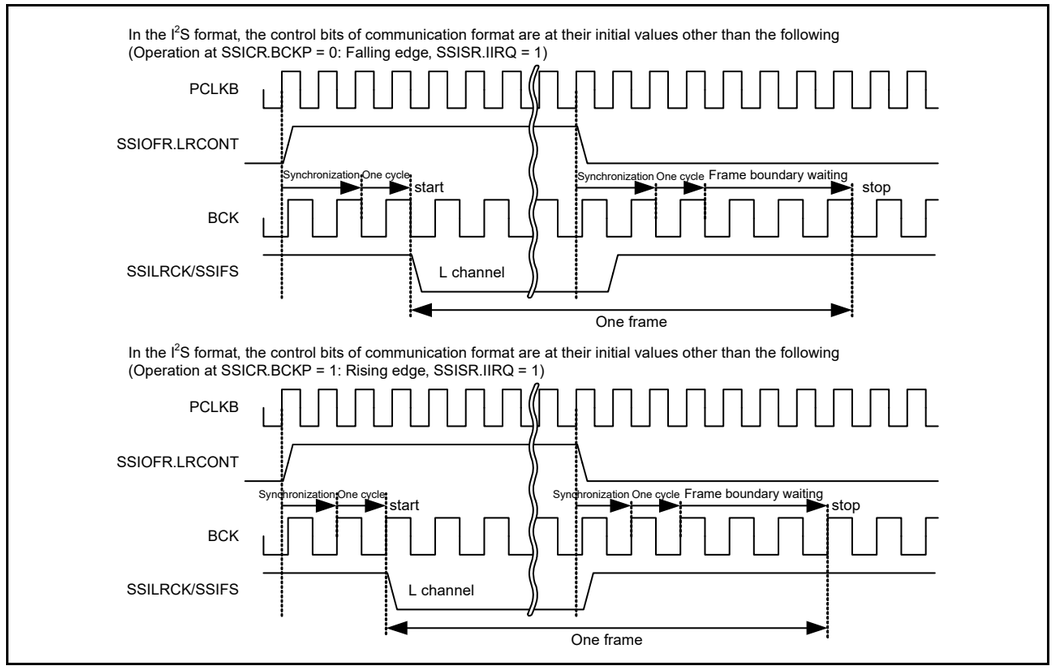


Figure 41.44 Example of disabling LR clock/frame synchronization continuation by SSIOFR.LRCONT

Note: To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIE is in the idle state in master-mode communication (SSICR.MST = 1), note the following: The output stops when the value of the SSIOFR.LRCONT bit is changed from 1 to 0. Make sure that the other-party device is not affected.

Table 41.14 空闲状态下外部引脚的输出

			引脚输出		
SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	SSIBCK	SSILRCK/SSIFS	SSITXD0/SSIDATA1
1	1	1	Stop	Supply	Stop

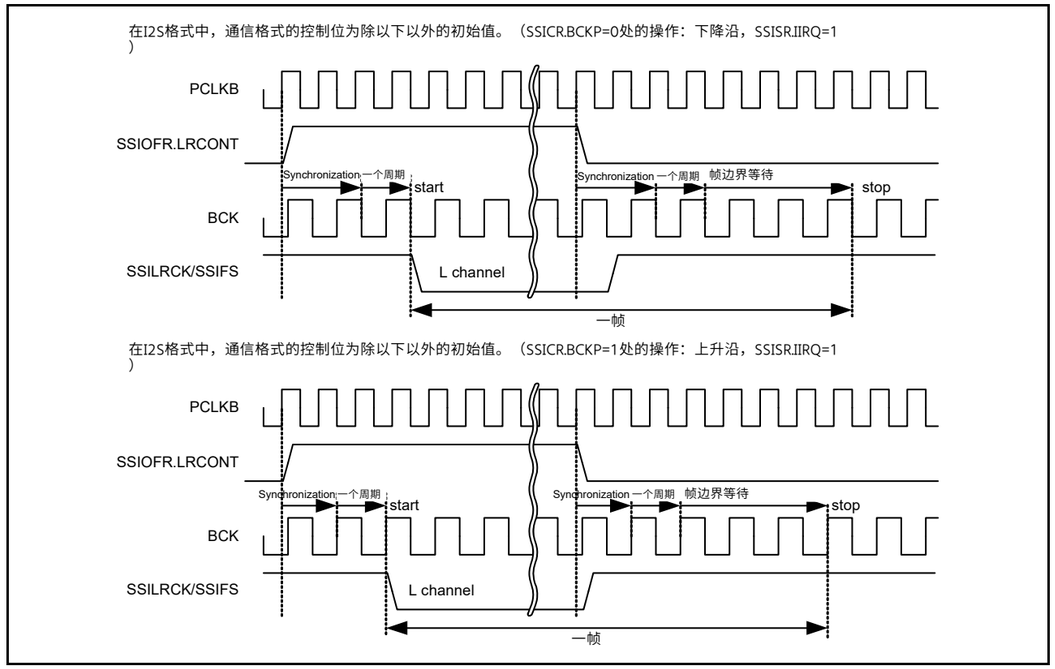

Figure 41.44 通过SSIOFR.LRCONT禁用LR时钟帧同步继续的示例

Note: 要在主模式通信(SSICR.MST=1)中SSIE处于空闲状态时使用SSIOFR.LRCONT停止向SSILRCKSSIFS引脚的输出，请注意以下几点：更改SSIOFR.LRCONT位的值时停止输出从1到0。确保对方设备不受影响。

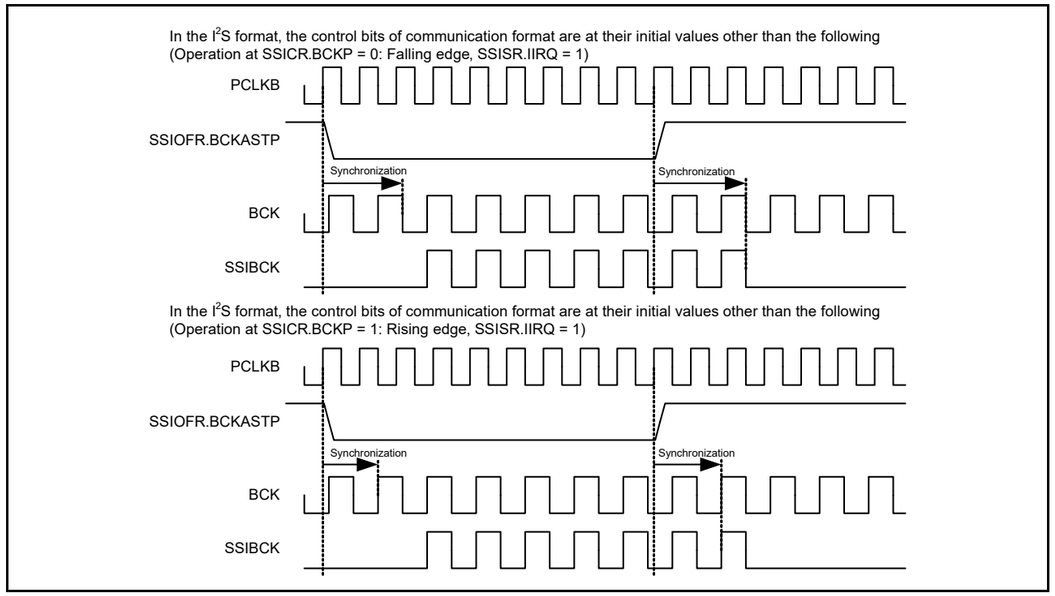

Figure 41.45 Example of stopping SSIBCK with SSIOFR.BCKASTP

Note: To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIE is in the idle state, note the following: The output stops when the value of the SSIOFR.BCKASTP bit is changed from 0 to 1. So, make sure that the other-party device is not affected.

41.7.2 Communication States

In this state, SSIE is during communication. Figure 41.46 shows transitions of communication states and Table 41.15 lists the conditions for transition. If the transition condition is not satisfied, the state does not transit.

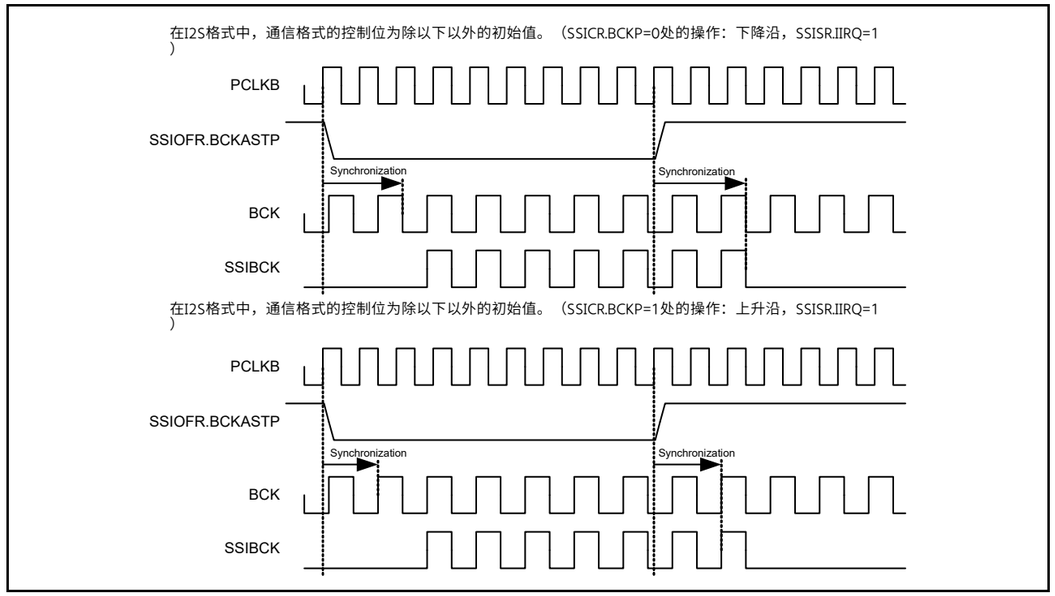

Figure 41.45 使用SSIOFR.BCKASTP停止SSIBCK的示例

Note: 要在主模式通信(SSICR.MST=1)和SSIE处于空闲状态时使用SSIOFR.BCKASTP停止向SSIBCK引脚的输出，请注意以下事项：当SSIOFR.BCKASTP位的值为从0变为1。因此，请确保对方设备不受影响。

41.7.2 通讯状态

在此状态下，SSIE处于通信过程中。图41.46显示了通信状态的转换，表41.15列出了转换的条件。如果不满足转移条件，则状态不转移。

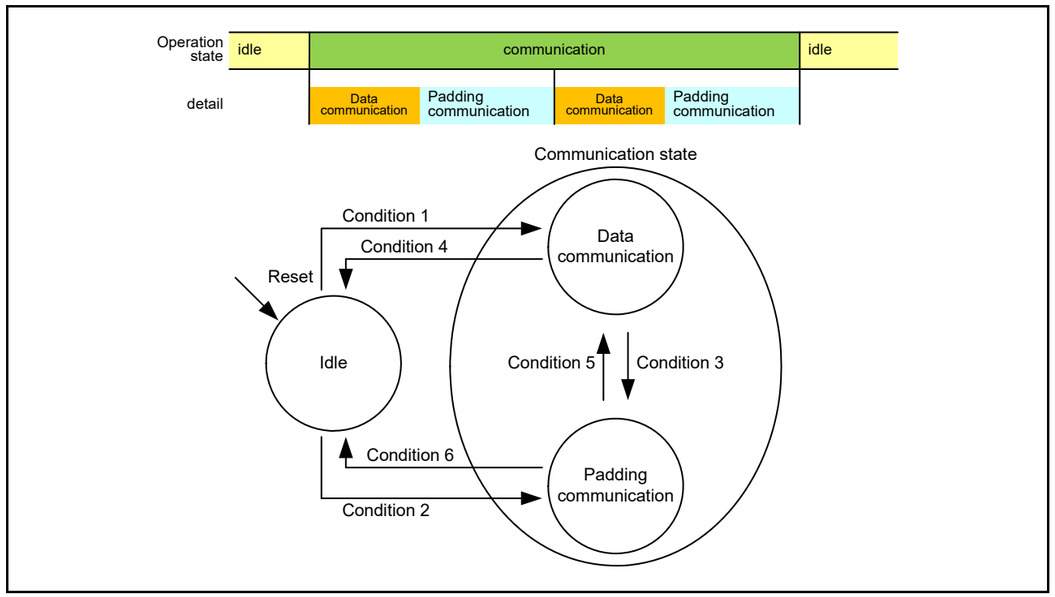

Figure 41.46 Communication state transition

Table 41.15 Condition for communication state transition

Condition Number	Condition for Transition
1	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 0 or in the setting without padding bits.
2	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 1 and in the setting with padding bits.
3	The following three conditions are all met: • SSICR.TEN = 1 or SSICR.REN = 1 • In the setting with padding bits • The last bit of the data words has been transferred.
4	Both the following two conditions are met: • SSICR.SDTA = 1 or without padding bits • While SSICR.TEN = 0 and SSICR.REN = 0, the last bit of the data words in a frame has been transferred.
5	Transfer of the last padding bit is completed while SSICR.TEN = 1 or SSICR.REN = 1
6	Both the following two conditions are met: • SSICR.SDTA = 0 and with padding bits • While SSICR.TEN = 0 and SSICR.REN = 0, the last padding bit has been transferred.

See Table 41.11 for the setting with/without padding bits.

41.7.2.1 Data communication state

In this state, SSIE is during communication. Data of the data word length set with the SSICR.DWL[2:0] bits is transmitted, received, or transmitted and received.

- State Transition in the Setting without Padding Bits

During communication (SSISR.IIRQ = 0), SSIE is during data communication for all the time. By disabling transmission and reception (SSICR.TEN = 0, SSICR.REN = 0), SSIE transits to the idle state. For details, see Figure 41.47 and Figure 41.48.

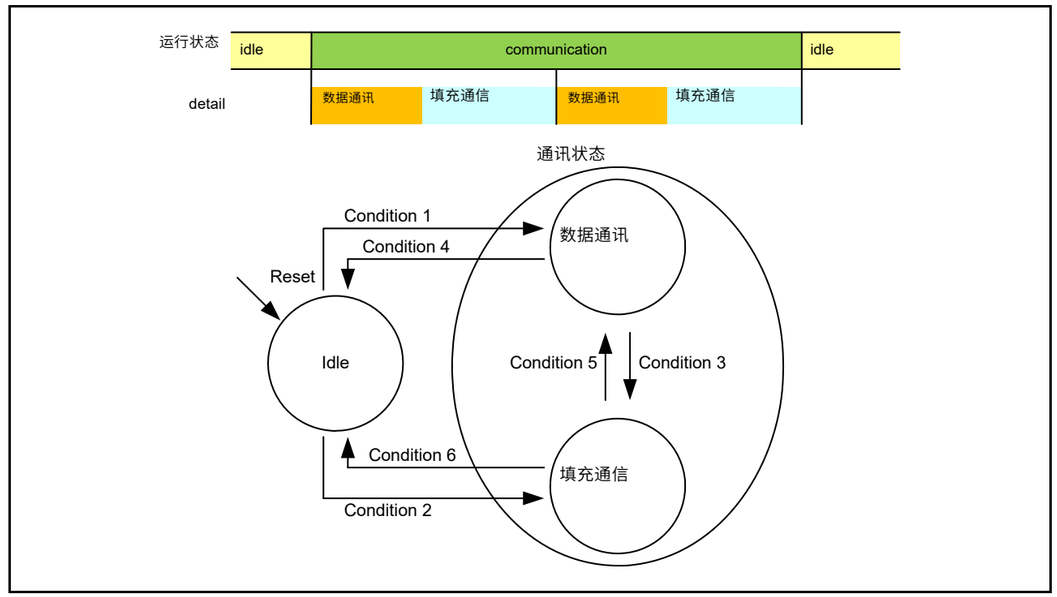

Figure 41.46 通信状态转换

Table 41.15 通信状态转移的条件

Condition Number	过渡条件
1	在SSICR.SDTA=0或在没有填充位的设置中写入SSICR.TEN=1或SSICR.REN=1。
2	写入SSICR.TEN=1或SSICR.REN=1而SSICR.SDTA=1并在设置中使用填充位。
3	以下三个条件都满足： SSICR.TEN=1或SSICR.REN=1 在带有填充位的设置中 数据字的最后一位已传输。
4	满足以下两个条件： SSICR.SDTA=1或没有填充位 当SSICR.TEN=0和SSICR.REN=0时，帧中数据字的最后一位已传输。
5	当SSICR.TEN=1或SSICR.REN=1时，最后一个填充位的传输完成
6	满足以下两个条件： SSICR.SDTA=0和填充位 当SSICR.TEN=0和SSICR.REN=0时，已传输最后一个填充位。

有关不带填充位的设置，请参见表41.11。

41.7.2.1 数据通讯状态

在此状态下，SSIE处于通信过程中。使用SSICR.DWL[2:0]位设置的数据字长的数据被发送、接收或发送和接收。

- 没有填充位的设置中的状态转换

在通信期间（SSISR.IIRQ=0），SSIE一直处于数据通信期间。通过禁用发送和接收（SSICR.TEN=0，SSICR.REN=0），SSIE转换到空闲状态。详见图41.47和图41.48。

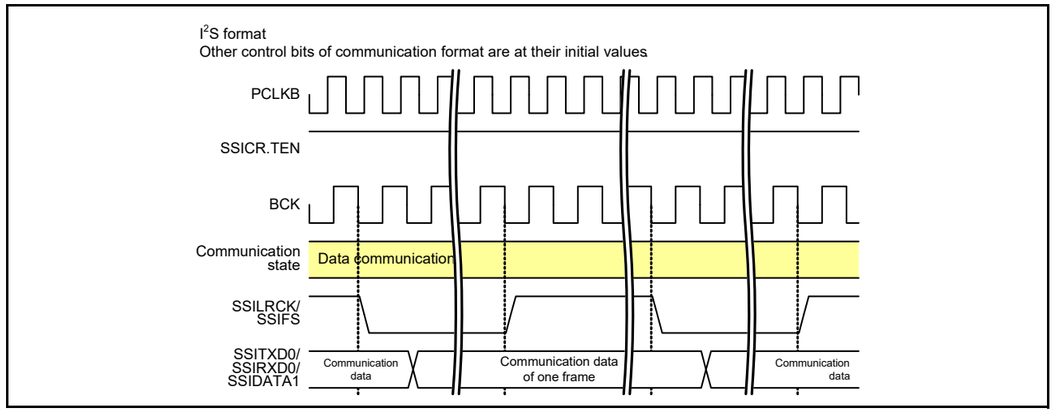

Figure 41.47 Continuation of the data communication

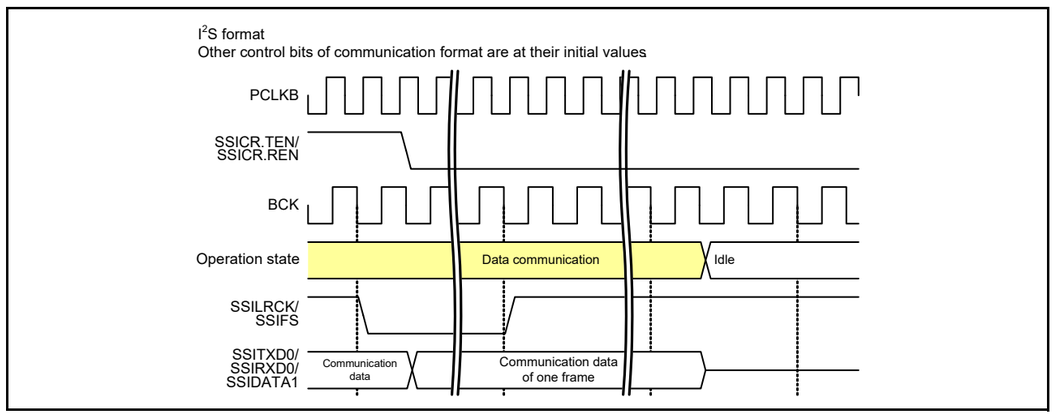

Figure 41.48 Halt from the data communication (without padding bits)

- State Transition in the Setting with Padding Bits

When SSIE ends transfer of the last bit of a data word during communication (SSISR.IIRQ = 0), SSIE transitions from the data communication state to the padding communication state in Figure 41.49. Except in the status with SSICR.SDTA = 1 and transmission and reception disabled (SSICR.TEN = 0 and SSICR.REN = 0), SSIE transitions from the data communication state to the idle state when it stops communication in Figure 41.51.

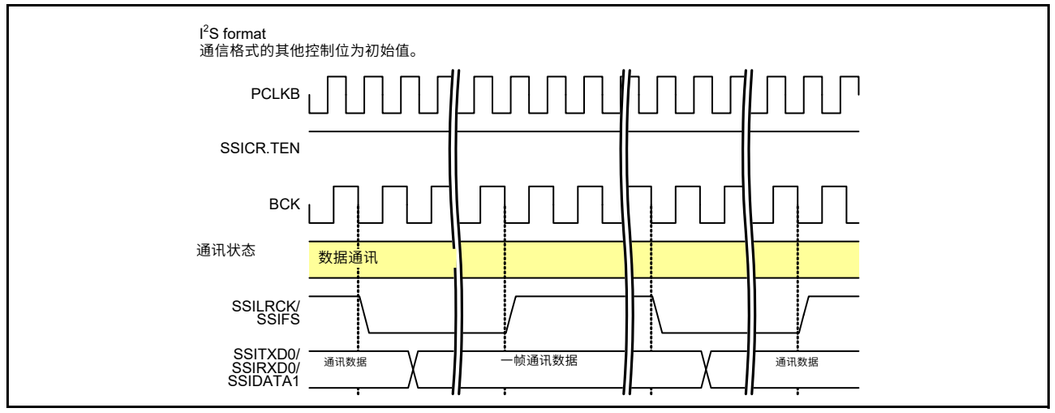

Figure 41.47 继续数据通信

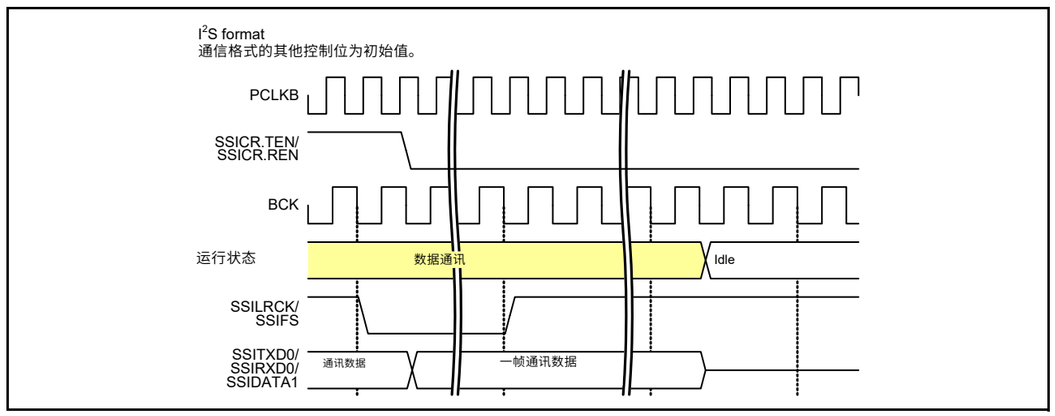

Figure 41.48 停止数据通信（无填充位）

- 具有填充位的设置中的状态转换

当SSIE在通信期间结束数据字的最后一位传输时（SSISR.IIRQ=0），SSIE从数据通信状态转换到图41.49中的填充通信状态。除了在SSICR.SDTA=1和发送和接收禁用的状态下（SSICR.TEN=0和SSICR.REN=0），SSIE在图41.51中停止通信时会从数据通信状态转换到空闲状态。

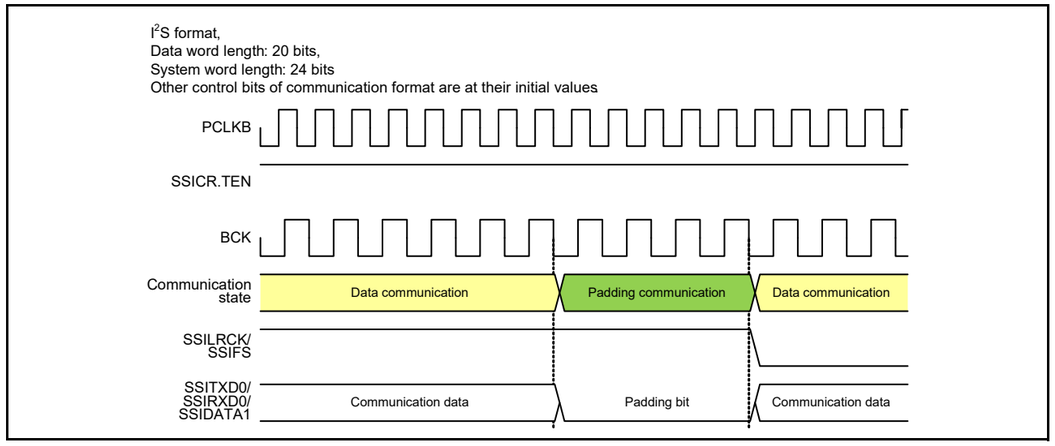

Figure 41.49 Transition from data communication to padding communication

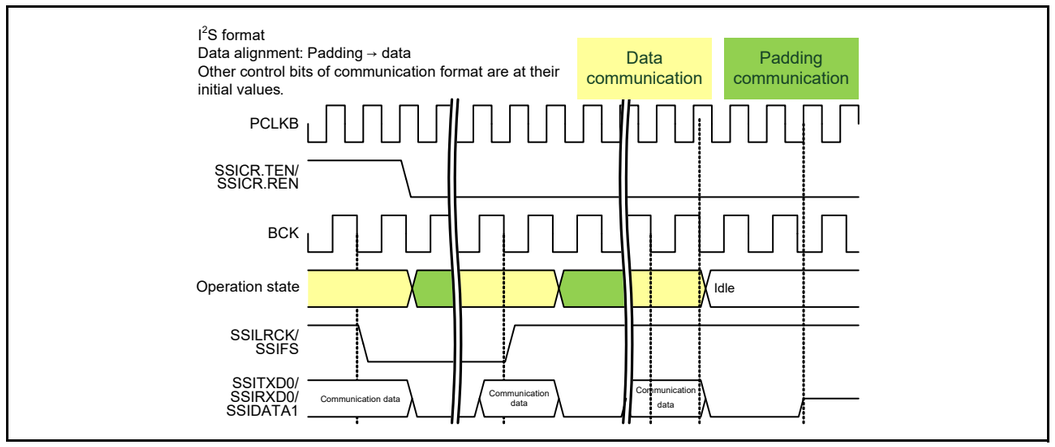

Figure 41.50 Halt from data communication (with padding bits)

41.7.2.2 Padding communication

In this state, SSIE is during communication. The padding bits set with the SSICR.SWL[2:0] bits and SSICR.DWL[2:0] bits are transmitted, received, or transmitted and received.

- State Transition in the Setting with Padding Bits

When SSIE ends transfer of the last padding bit during communication (SSISR.IIRQ = 0), SSIE transitions to the data communication state in Figure 41.49. If SSIE is in the status with SSICR.SDTA = 0 and transmission and reception disabled (SSICR.TEN = 0 and SSICR.REN = 0), SSIE transitions from the padding communication state to the idle state when it stops communication in Figure 41.51.

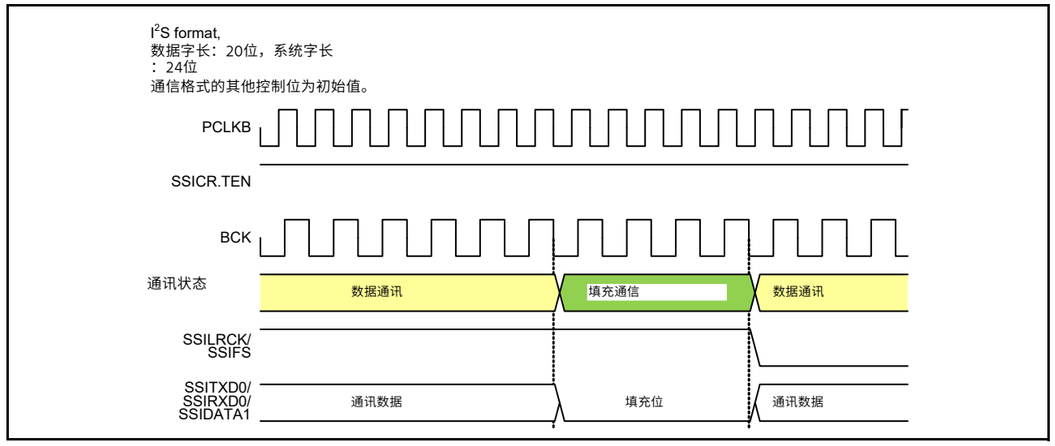

Figure 41.49 从数据通信过渡到填充通信

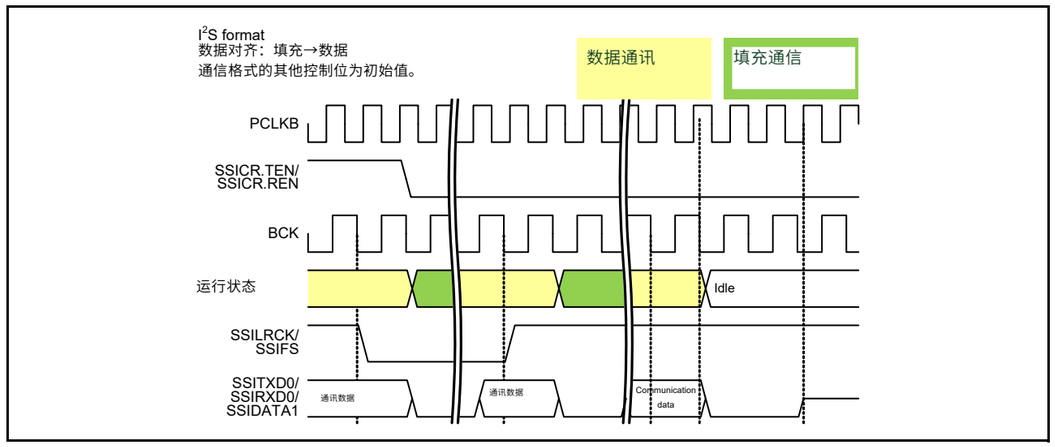

Figure 41.50 停止数据通信（使用填充位）

41.7.2.2 填充通信

在此状态下，SSIE处于通信过程中。使用SSICR.SWL[2:0]位和SSICR.DWL[2:0]位设置的填充位被发送、接收或发送和接收。

- 具有填充位的设置中的状态转换

当SSIE在通信期间结束最后一个填充位的传输（SSISR.IIRQ=0）时，SSIE转换到图41.49中的数据通信状态。如果SSIE处于SSICR.SDTA=0且发送和接收禁用的状态（SSICR.TEN=0和SSICR.REN=0），则SSIE在图41.51中停止通信时从填充通信状态转换为空闲状态。

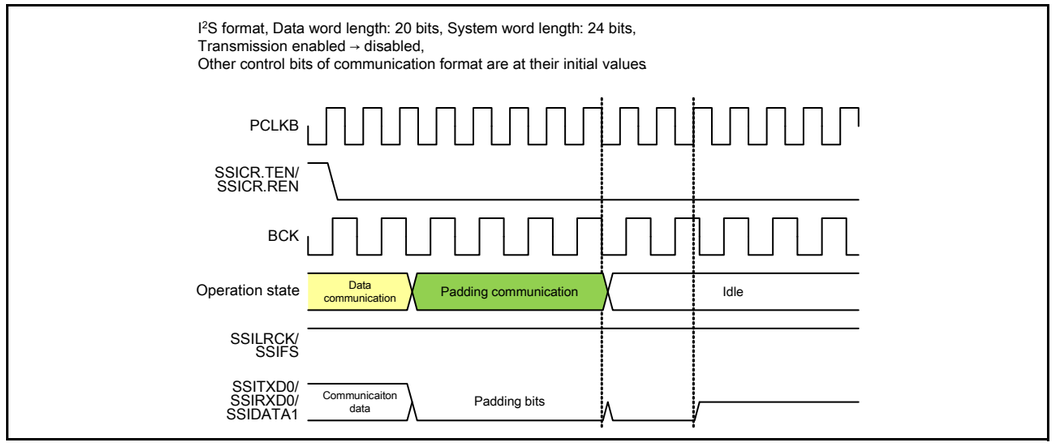

Figure 41.51 Halt from the padding communication

41.8 Communication Operation

Figure 41.52 shows the communication flow of SSIE.

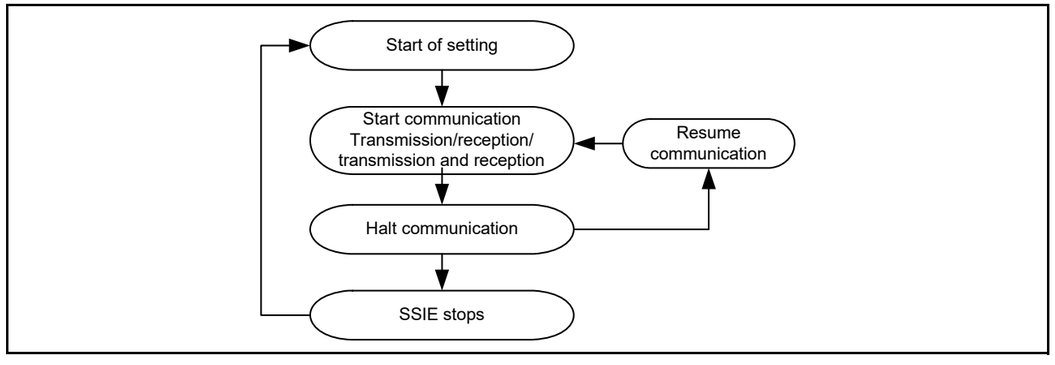

Figure 41.52 SSIE communication operation

The procedure of each operation is described from reference 41.8.1 to reference 41.8.7.

41.8.1 Start Communication

This section describes how to start communication of SSIE. Figure 41.53 shows the procedure to start communication. Be sure to follow the procedure. See reference 41.8.2 for transmission operation and reference 41.8.3 for reception operation.

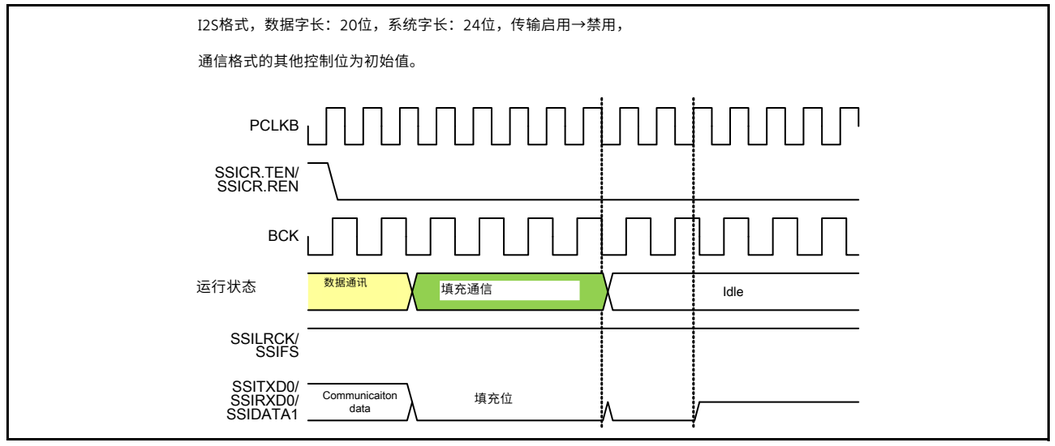

Figure 41.51 从填充通信中停止

41.8 通讯操作

图41.52显示了SSIE的通信流程。

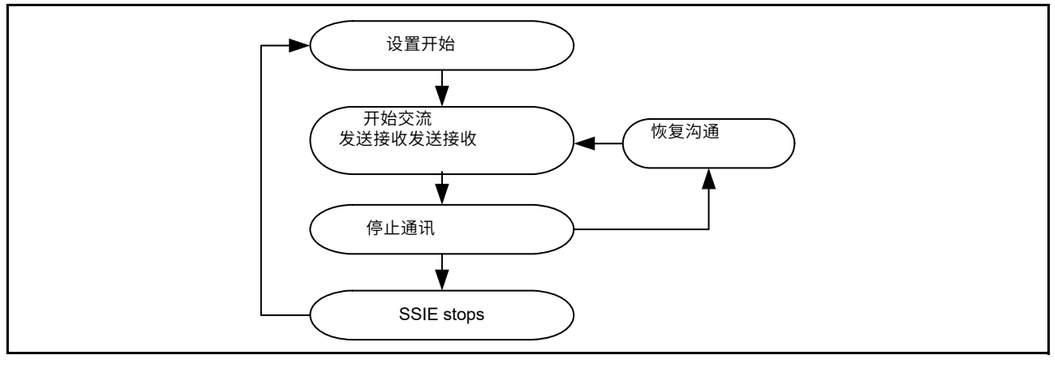

Figure 41.52 SSIE通信操作

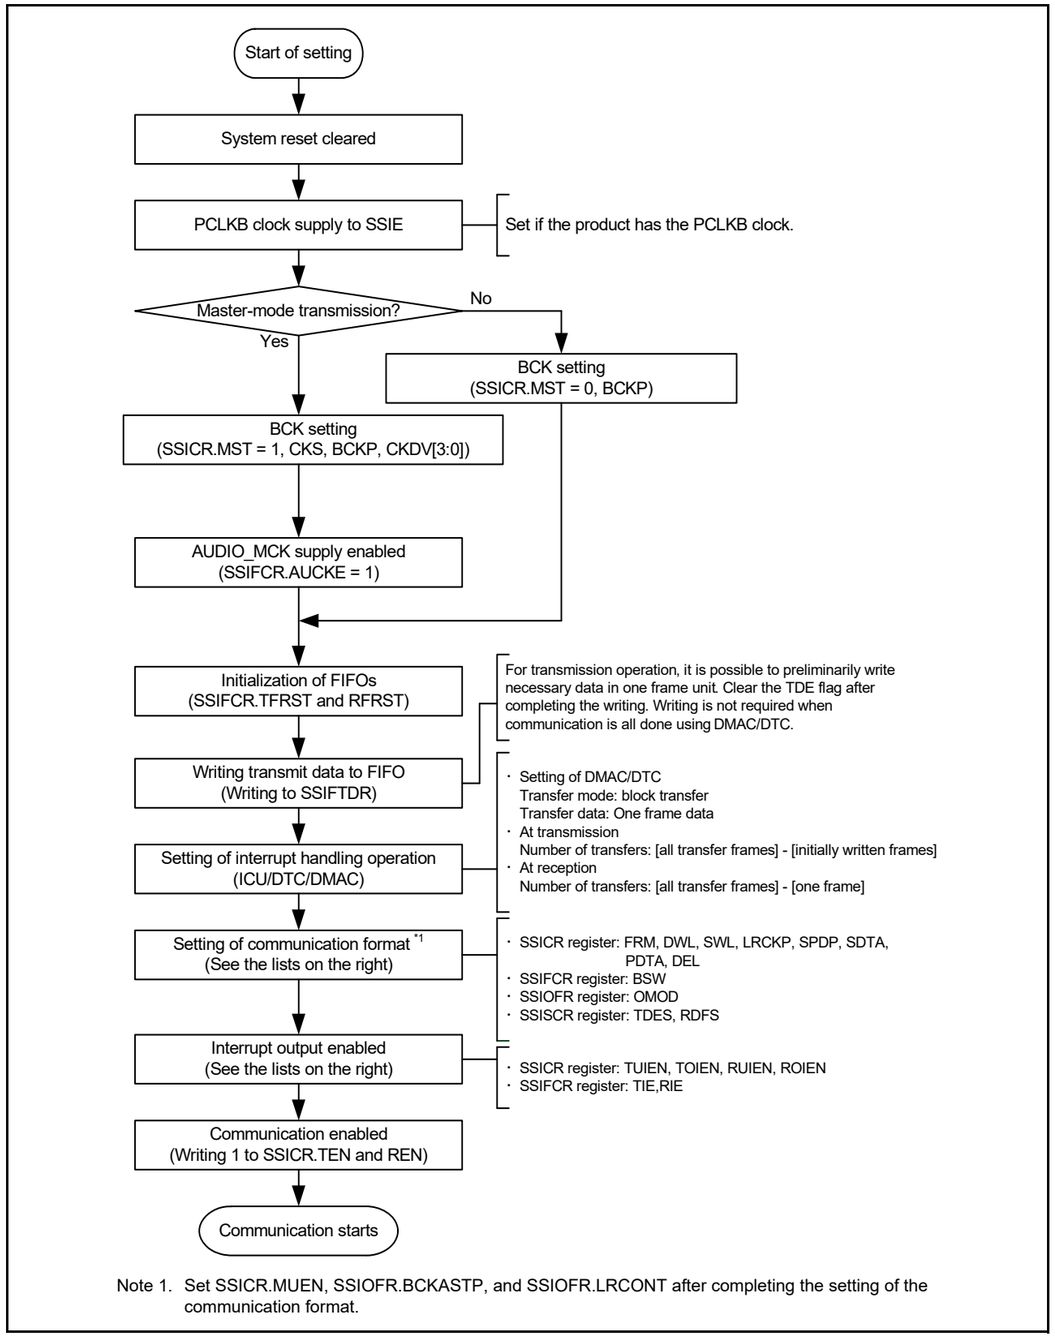
从参考41.8.1到参考41.8.7描述了每个操作的过程。

41.8.1 开始沟通

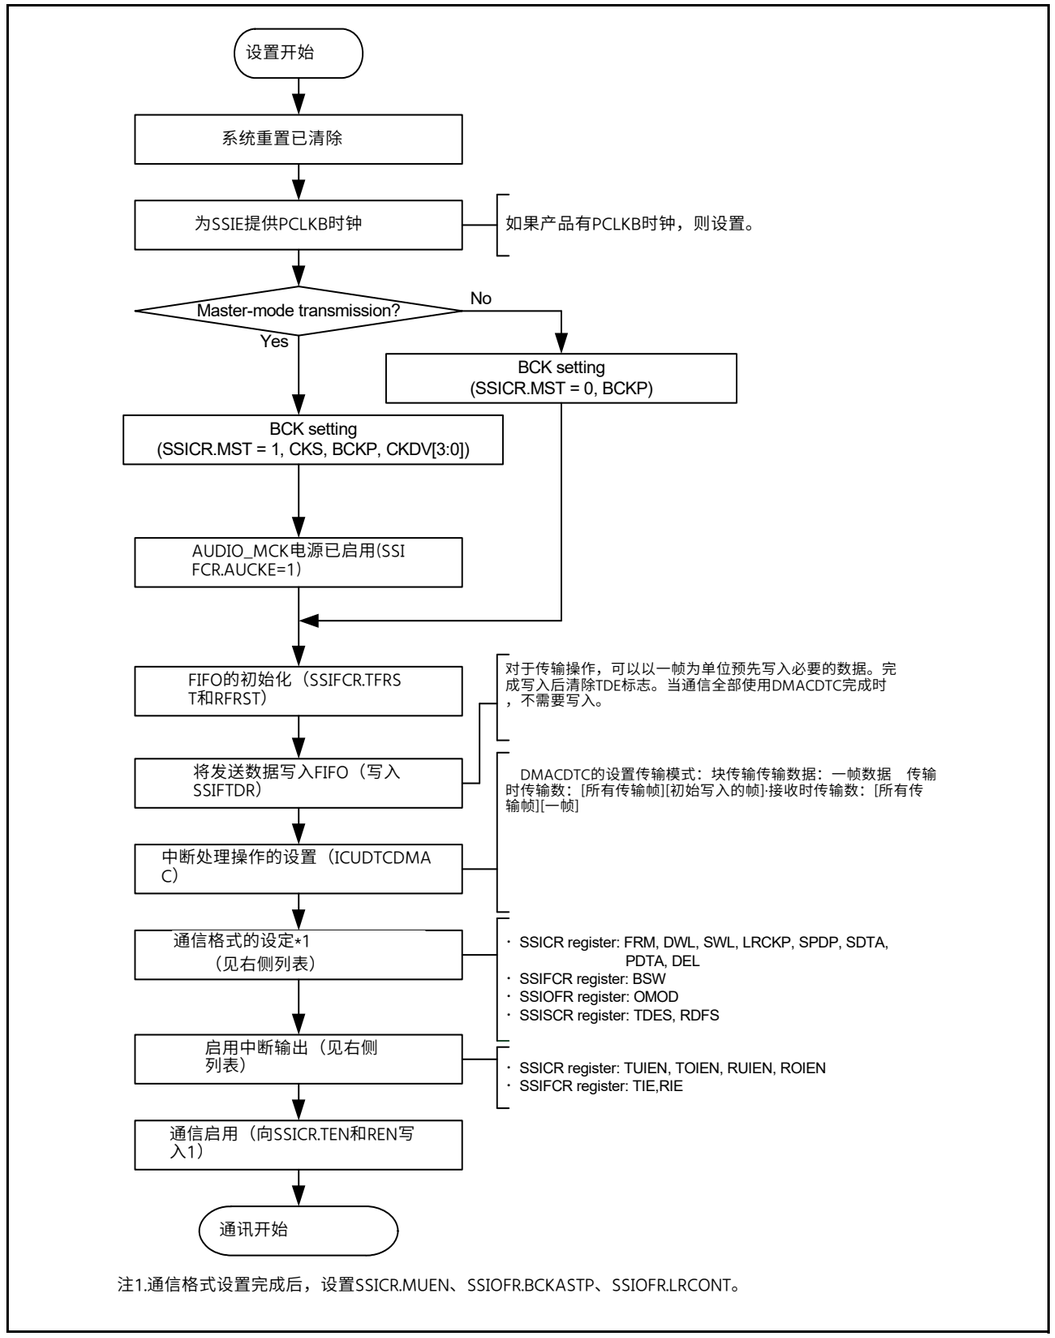
本节介绍如何启动SSIE通信。图41.53显示了开始通信的过程。
请务必遵守程序。发送操作参见参考41.8.2，接收操作参见参考41.8.3。



Note 1. Set SSICR.MUEN, SSIOFR.BCKASTP, and SSIOFR.LRCONT after completing the setting of the communication format.

Figure 41.53 Procedure to start communication (CPU operation procedure)

SSIE can perform continuous communication based on interrupts by the DTC/DMAC. For transmission, write 1 to SSIFCR.TIE, SSICR.TUIEN, and SSICR.TOIEN. For reception, write 1 to SSIFCR.RIE, SSICR.RUIEN, and SSICR.ROIEN.



注1.通信格式设置完成后，设置SSICR.MUEN、SSIOFR.BCKASTP、SSIOFR.LRCONT。

Figure 41.53 开始通信的步骤（CPU操作步骤）

SSIE可以根据DTCDMAC的中断执行连续通信。对于传输，写入1到SSIFCR.TIE、SSICR.TUIEN和SSICR.TOIEN。对于接收，将1写入SSIFCR.RIE、SSICR.RUIEN和SSICR.ROIEN.

41.8.2 Transmission

The transmission procedure in Figure 41.54 must be followed throughout a transmission operation.

After transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0), SSIE starts transmission when a start trigger is generated by SSILRCK/SSIFS with the serial data for at least a frame contained in the transmit FIFO data register (SSIFTDR). SSIE outputs a transmit data empty interrupt to the DTC/DMAC according to the TDE setting condition (SSISCR.TDES) and the status of transmit data empty interrupt enable (SSIFCR.TIE) bit specified in the communication start procedure. This interrupt requests writing to the transmit FIFO data register (SSIFTDR). In the communication start procedure, specify writing to the transmit FIFO data register (SSIFTDR) as the DTC/DMAC operation in response to the transmit data empty interrupt. With this setting, SSIE can continuously transmit data not through the CPU. The transmit data empty interrupt is generated when the free space size of transmit FIFO data register reaches the value set in SSISCR.TDES. The number of times of writing must be specified in accordance with the free space size of the transmit FIFO data register indicated by the transmit data empty interrupt. If an error occurs, perform the error-handling procedure as instructed in the communication stop procedure.

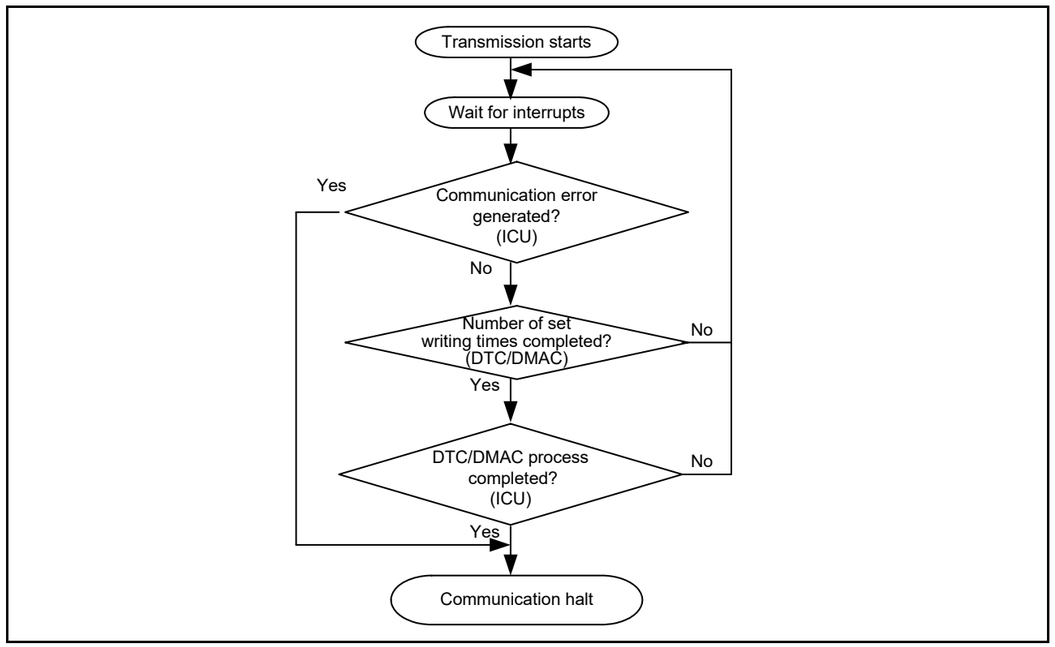


Figure 41.54 Transmission procedure

Note: The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.TDE to write data to SSIFTDR. The number of times of writing data to SSIFTDR by detecting the value 1 of SSIFSR.TDE must be in accordance with the free space size of the transmit FIFO data register specified by SSISCR.TDES. After as much transmit data as the free space size is written to SSIFTDR, the SSIFSR.TDE flag must be cleared. Continuous transmission is enabled by repeating data writing. If the SSIFSR.TDE flag is not cleared, the flag is not cleared automatically.

41.8.3 Reception

The reception procedure in Figure 41.55 must be followed throughout a reception operation.

After reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1), SSIE starts reception when a start trigger is generated by SSILRCK/SSIFS. SSIE outputs a receive data full interrupt to the DTC/DMAC according to the RDF setting condition (SSISCR.RDFS) and the status of receive data full interrupt enable (SSIFCR.RIE) bit specified in the communication start procedure. This interrupt requests data reading from the receive FIFO data register (SSIFRDR). In the communication start procedure, specify reading from the receive FIFO data register (SSIFRDR) as the DTC/DMAC

41.8.2 Transmission

在整个传输操作中必须遵循图41.54中的传输过程。

使能传输后（SSICR.TEN=1和SSICR.REN=0），当SSILRCKSSIFS使用包含在传输FIFO数据寄存器(SSIFTDR)中的至少一帧的串行数据生成启动触发时，SSIE开始传输。SSIE根据通信启动过程中指定的TDE设置条件(SSISCR.TDES)和发送数据空中断使能(SSIFCR.TIE)位的状态，向DTCDMAC输出一个发送数据空中断。该中断请求写入发送FIFO数据寄存器(SSIFTDR)。在通信开始过程中，将写入发送FIFO数据寄存器(SSIFTDR)指定为DTCDMAC操作以响应发送数据空中断。使用此设置，SSIE可以不通过CPU连续传输数据。当发送FIFO数据寄存器的可用空间大小达到SISSCR.TDES中设置的值时，将产生发送数据空中断。必须根据发送的空闲空间大小指定写入次数

FIFO数据寄存器由发送数据空中断指示。如果发生错误，请按照通信停止程序中的说明执行错误处理程序。

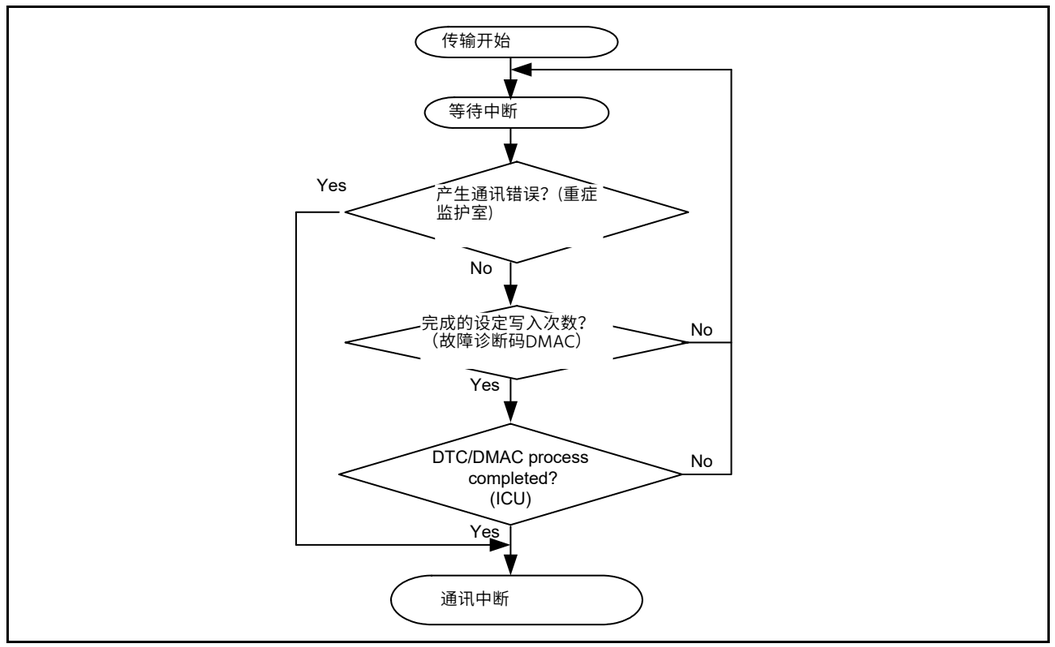

Figure 41.54 传输程序

Note: SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.TDE的值1以将数据写入SSIFTDR。通过检测SSIFSR.TDE的值为1向SSIFTDR写入数据的次数必须与SSIFSR.TDES指定的发送FIFO数据寄存器的空闲空间大小一致。在将与可用空间大小一样多的传输数据写入SSIFTDR后，必须清除SSIFSR.TDE标志。通过重复数据写入启用连续传输。如果未清除SSIFSR.TDE标志，则不会自动清除该标志。

41.8.3 Reception

在整个接收操作中必须遵循图41.55中的接收程序。

使能接收后（SSICR.TEN=0和SSICR.REN=1），当SSILRCKSSIFS产生一个开始触发信号时，SSIE开始接收。SSIE根据RDF设置条件(SSISCR.RDFS)和通信开始过程中指定的接收数据满中断使能(SSIFCR.RIE)位的状态向DTCDMAC输出一个接收数据满中断。该中断请求从接收FIFO数据寄存器(SSIFRDR)读取数据。在通信开始过程中，指定从接收FIFO数据寄存器(SSIFRDR)读取作为DTCDMAC

operation in response to the receive data full interrupt. With this setting, SSIE can continuously read data not through the CPU. The receive data full interrupt is generated when data as much as the capacity of receive FIFO data register has been stored. The number of times of reading must be specified in accordance with the data size of the receive FIFO data register indicated by the receive data full interrupt. If an error occurs, perform the error-handling procedure as instructed in the communication stop procedure.

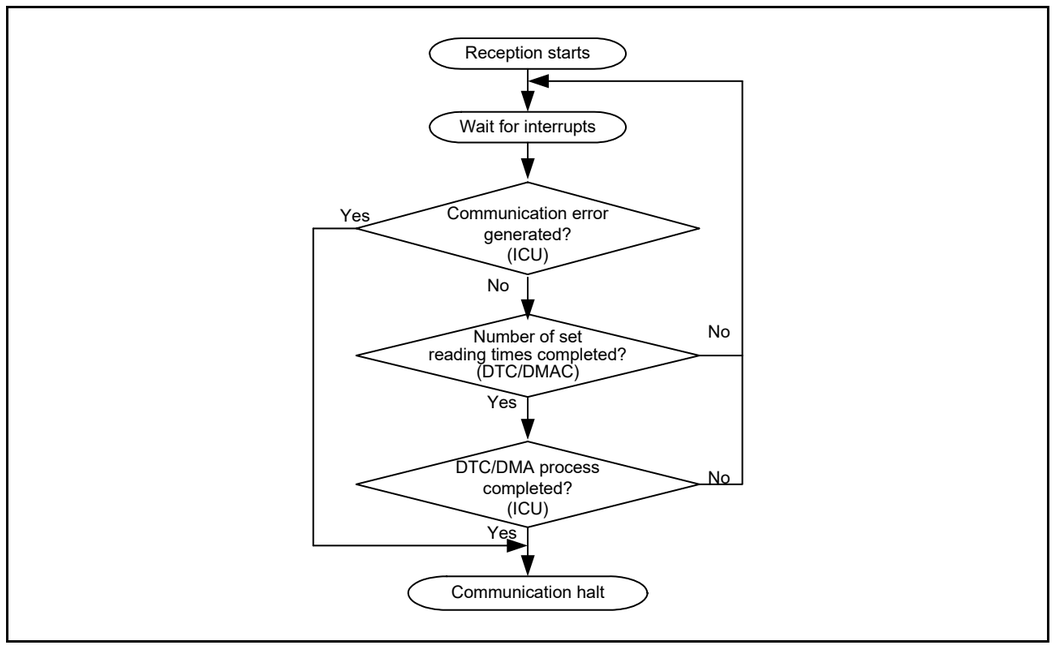

Figure 41.55 Reception procedure

Note: The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.RDF to read data from SSIFRDR. The number of times of reading data from SSIFRDR by detecting the value 1 of SSIFSR.RDF must be in accordance with the receive data storage capacity of the receive FIFO data register specified by SSISCR.RDFS. After received data is read from SSIFRDR, the SSIFSR.RDF flag must be cleared. Continuous reception is enabled by repeating data reading. If the SSIFSR.RDF flag is not cleared, the flag is not cleared automatically.

41.8.4 Transmission and Reception

After transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1), SSIE starts transmission and reception when a start trigger is generated by SSILRCK/SSIFS with the serial data for at least a frame contained in the transmit FIFO data register (SSIFTDR). SSIE can continuously transmit and receive data by performing the procedures described in reference 41.8.2 and reference 41.8.3, respectively. For how to stop transmission and reception, see reference 41.8.5.

41.8.5 Halt Communication

This section describes how to halt communication of SSIE. Figure 41.56 shows the procedure to halt communication. Be sure to follow the procedure.

操作以响应接收数据完全中断。通过此设置，SSIE可以不通过CPU连续读取数据。当数据达到接收FIFO数据寄存器的容量时，产生接收数据满中断。读取次数必须根据接收数据满中断指示的接收FIFO数据寄存器的数据大小来指定。如果发生错误，请按照通信停止程序中的说明执行错误处理程序。

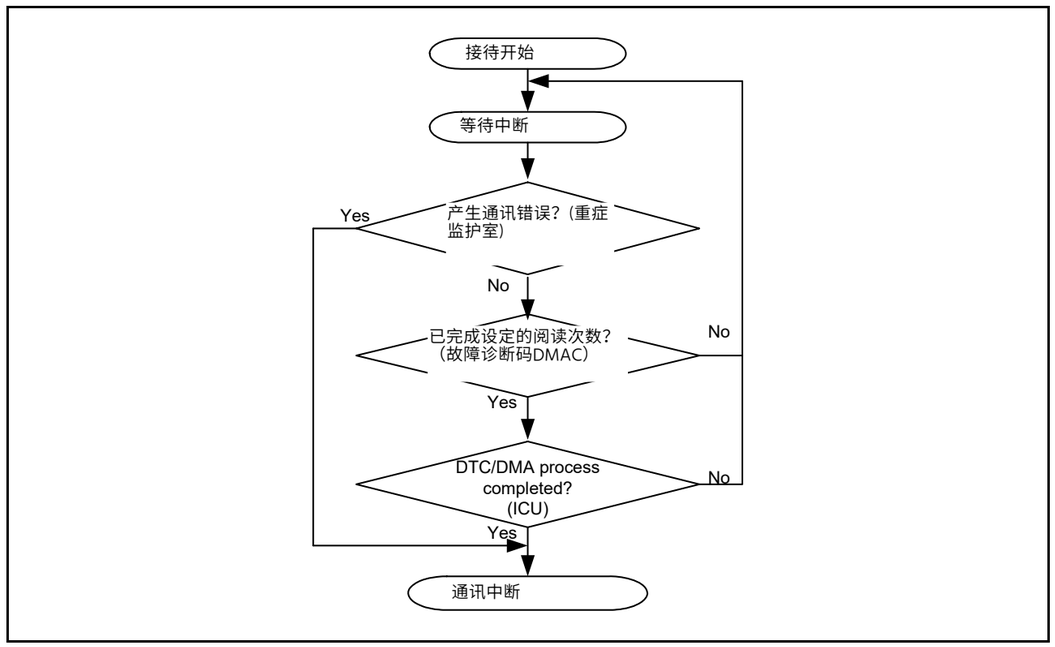

Figure 41.55 接待程序

Note: SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.RDF的值1以从SSIFRDR读取数据。通过检测SSIFSR.RDF的值为1从SSIFRDR读取数据的次数必须与SSISCR.RDFS指定的接收FIFO数据寄存器的接收数据存储容量一致。从SSIFRDR读取接收到的数据后，必须清除SSIFSR.RDF标志。通过重复数据读取启用连续接收。如果

SSIFSR.RDF标志不清除，该标志不会自动清除。

41.8.4 传输和接收

启用发送和接收后（SSICR.TEN=1和SSICR.REN=1），当SSILRCKSSIFS使用发送FIFO数据寄存器中包含的至少一帧的串行数据产生开始触发时，SSIE开始发送和接收(SSIFTDR)。SSIE可以通过分别执行参考41.8.2和参考41.8.3中描述的过程来连续发送和接收数据。关于如何停止发送和接收，请参见参考41.8.5。

41.8.5 停止通讯

本节介绍如何停止SSIE的通信。图41.56显示了停止通信的过程。请务必遵守程序。

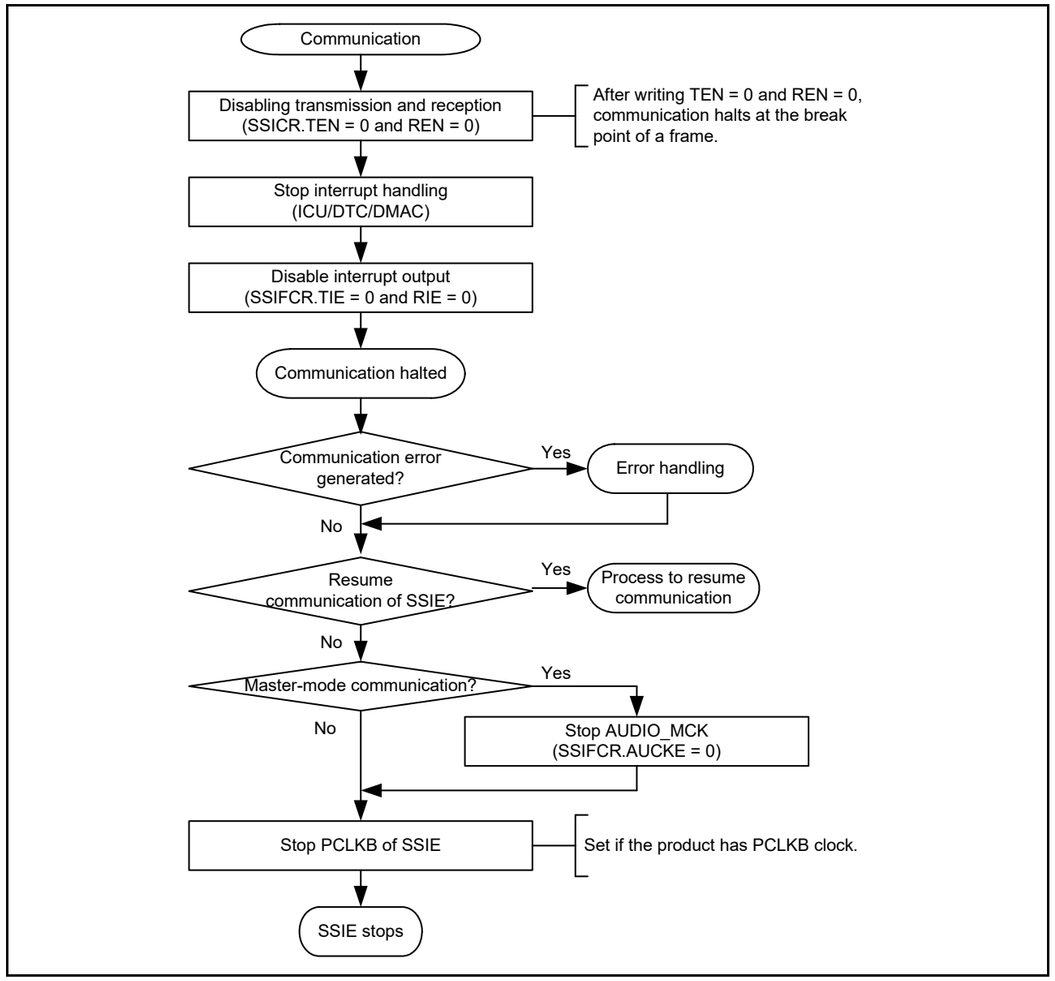

Figure 41.56 Procedure to halt communication (CPU operation procedure)

To halt the communication of SSIE, supply of the following clocks are required until the SSISR.IIRQ bit indicates an idle state.

- Input clock from the SSIBCK pin when SSICR.MST = 0
- AUDIO_MCK when SSICR.MST = 1

  To resume communication of SSIE in the previous setting, see reference 41.8.7.

Note: When communication of SSIE is halted according to the procedure to halt communication in Figure 41.56, resume communication according to the procedure to resume communication in Figure 41.58.

41.8.6 Error Handling

SSIE has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error

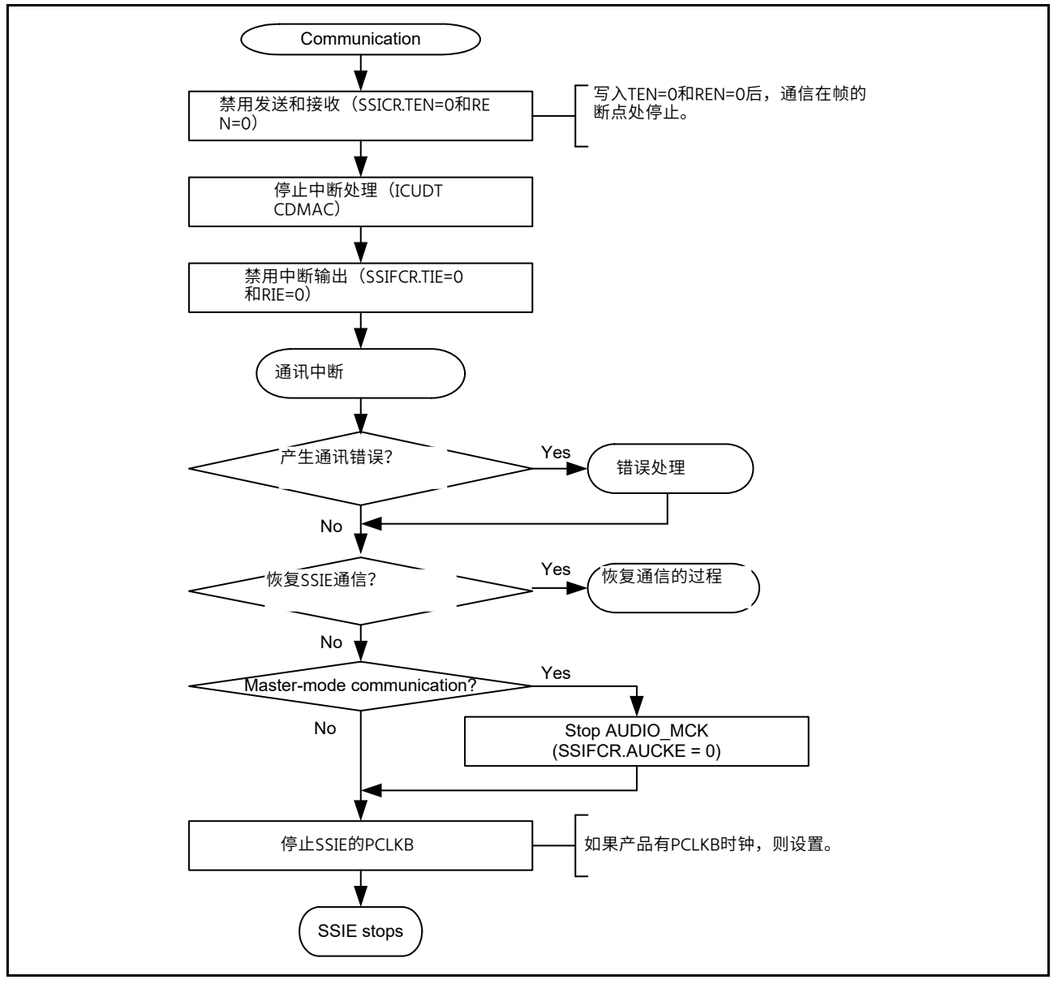

Figure 41.56 停止通信的步骤（CPU操作步骤）

要停止SSIE的通信，需要提供以下时钟，直到SSISR.IIRQ位指示空闲状态。

- 当SSICR.MST=0时，来自SSIBCK引脚的输入时钟
- AUDIO_MCK when SSICR.MST = 1

  要在之前的设置中恢复SSIE通信，请参阅参考41.8.7。

Note: 当SSIE的通信按照图41.56中的停止通信程序停止时，按照图41.58中的恢复通信程序恢复通信。

41.8.6 错误处理

SSIE有以下四个错误。

- 发送下溢错误
- 传输溢出错误
- 接收下溢错误

- Receive overflow error.

When an underflow error or overflow error is generated, SSIE need to be restarted. Follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

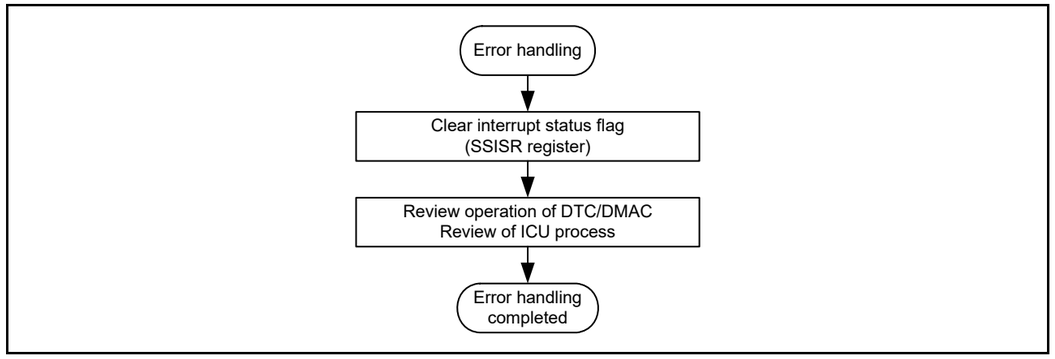

Figure 41.57 Error-handling procedure

Four error operations are described as follows. When the interrupt output enable bit of the SSICR register is enabled and error flags are set, an error interrupt is generated. See descriptions of flags in reference 41.4.2 for the setting conditions of error flags.

(1) Transmit Underflow Error

If a transmit underflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to a transmit data empty interrupt. After a transmit underflow error occurs, SSIE outputs 0s as data. To normally output the serial data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA1 pin, follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57. After this error occurs, serial data is consumed as usual. If you resume communication, write the serial data from the beginning.

(2) Transmit Overflow Error

If a transmit overflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to transmit data empty interrupts. The serial data written to the transmit FIFO data register (SSIFTDR) that caused the transmit overflow error becomes invalid. This error can occur regardless of whether a transmission operation is being done. To recover from the error, follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57. When you resume communication, deal with the invalid serial data appropriately.

(3) Receive Underflow Error

If a receive underflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The values read from the receive FIFO data register (SSIFRDR) that caused the receive underflow error are undefined. This error can occur regardless of whether a reception operation is being done. To recover from the error, follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

(4) Receive Overflow Error

If a receive overflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The receive data that caused the receive overflow error cannot be stored in the receive FIFO data register (SSIFRDR). To recover from the error, follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

41.8.7 Resume Communication

When you resume the communication using SSIE, follow the communication resume procedure in Figure 41.58. The communication resume procedure is designed on the assumption that you resume the communication stopped by the

- 接收溢出错误。

当产生下溢错误或上溢错误时，需要重启SSIE。按照图41.56中的程序停止通信和图41.57中的错误处理程序。

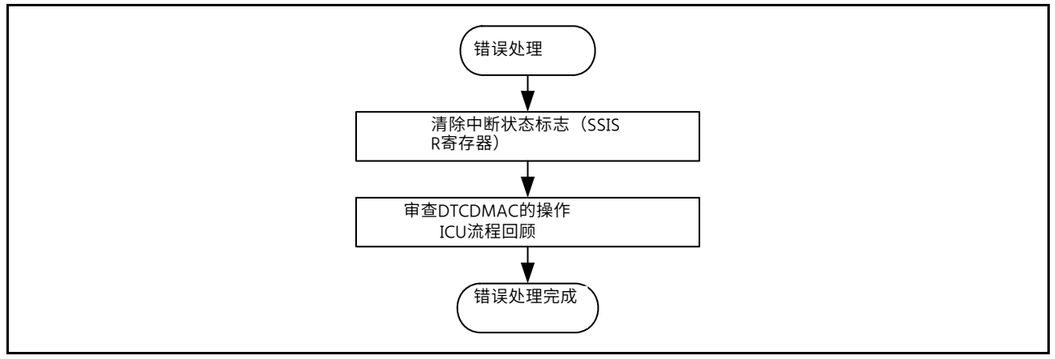

Figure 41.57 Error-handling procedure

四种错误操作描述如下。当SSICR寄存器的中断输出使能位使能且错误标志置位时，将产生错误中断。错误标志的设置条件见参考41.4.2中标志的描述。

(1) 发送下溢错误

如果发生发送下溢错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。发生发送下溢错误后，SSIE输出0作为数据。要将写入发送FIFO数据寄存器(SSIFTDR)的串行数据正常输出到SSITXD0 SSIDATA1引脚，请按照图41.56中的程序停止通信和图41.57中的错误处理程序进行操作。发生此错误后，串行数据将照常使用。如果您恢复通信，请从头开始写入串行数据。

(2) 传输溢出错误

如果发生发送溢出错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。写入导致发送溢出错误的发送FIFO数据寄存器(SSIFTDR)的串行数据变为无效。无论是否正在执行传输操作，都可能发生此错误。要从错误中恢复，请按照图41.56中的程序停止通信和图41.57中的错误处理程序。当您恢复通信时，请适当处理无效的串行数据。

(3) 接收下溢错误

如果发生接收下溢错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。从导致接收下溢错误的接收FIFO数据寄存器(SSIFRDR)读取的值未定义。无论是否正在执行接收操作，都可能发生此错误。要从错误中恢复，请按照图41.56中的程序停止通信和图41.57中的错误处理程序。

(4) 接收溢出错误

如果发生接收溢出错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收溢出错误的接收数据不能存储在接收FIFO数据寄存器(SSIFRDR)中。要从错误中恢复，请按照图41.56中的程序停止通信和图41.57中的错误处理程序。

41.8.7 恢复沟通

当您使用SSIE恢复通信时，请遵循图41.58中的通信恢复过程。通信恢复过程的设计假设您恢复了由

communication stop procedure without changing any settings. If you want to change clock and slave/master settings, use and follow the communication start procedure in Figure 41.53. For details about the transmission operation and reception operation after starting communication, see reference 41.8.2 and reference 41.8.3, respectively.

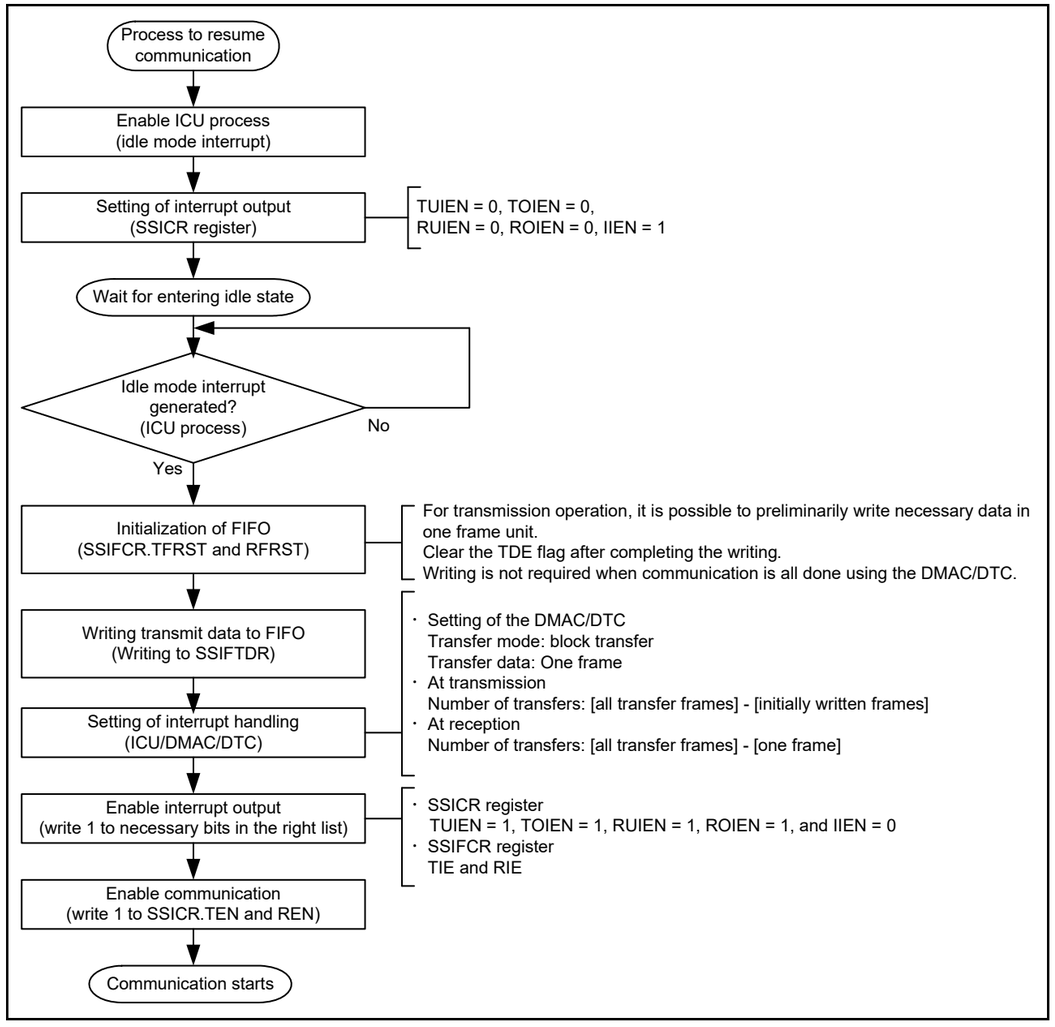

Figure 41.58 Procedure to resume communication (CPU operation procedure)

41.9 Interrupts

Table 41.16 lists the interrupt sources. Set enable/disable of interrupt output of each source with the TUIEN, TOIEN, RUIEN, ROIEN, and IIEN bits in the SSICR register and the TIE and RIE bits in the SSIFCR register.

通信停止程序，无需更改任何设置。如果要更改时钟和从主机设置，请使用并遵循图41.53中的通信启动程序。关于开始通信后的发送操作和接收操作的详细信息，请分别参见参考41.8.2和参考41.8.3。

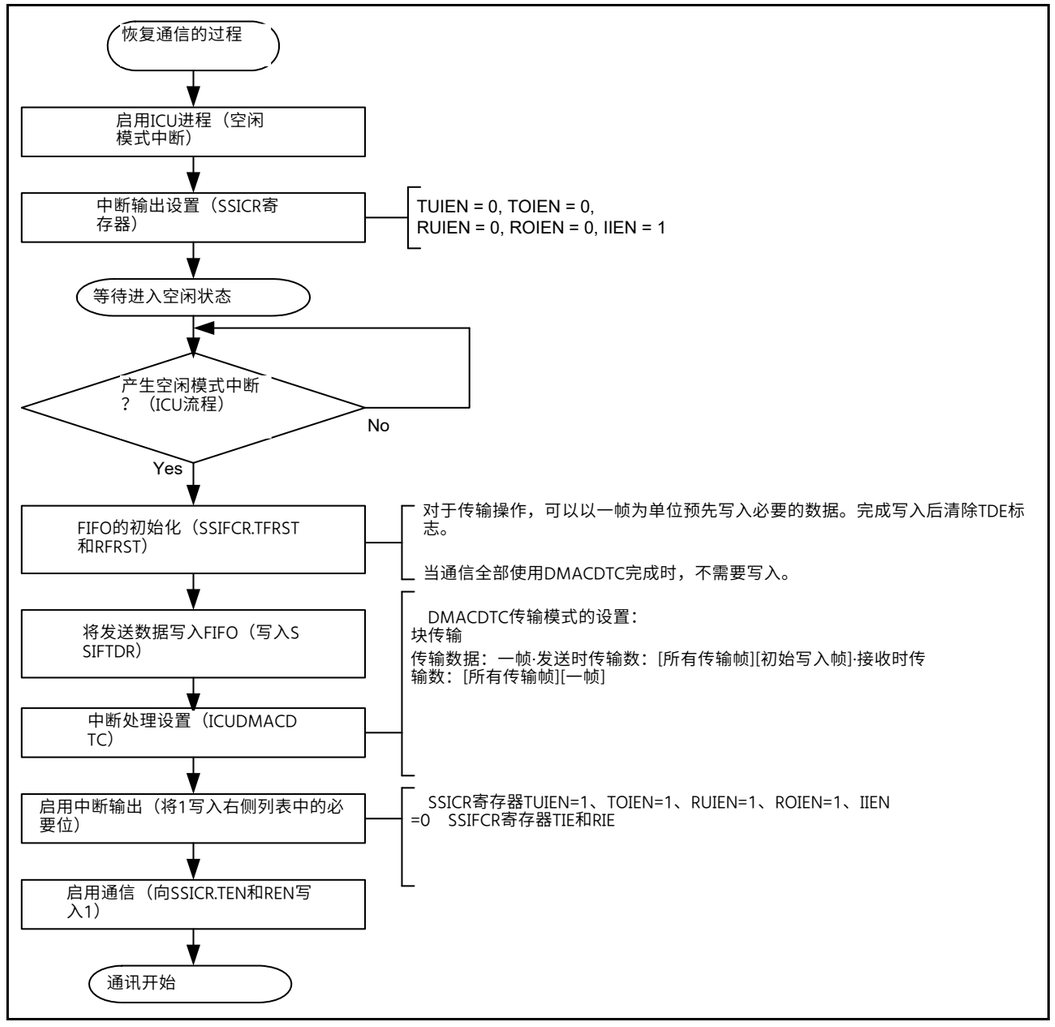

Figure 41.58 恢复通信的步骤（CPU操作步骤）

41.9 Interrupts

表41.16列出了中断源。使用TUIEN、TOIEN、SSICR寄存器中的RUIEN、ROIEN和IIEN位以及SSIFCR寄存器中的TIE和RIE位。

Table 41.16 SSIE interrupt sources

Channel	Interrupt source	Description	Interrupt flag	DMAC/DTC activation
SSIE0	SSIE0_SSIF	• Transmit underflow interrupt • Transmit overflow interrupt • Receive underflow interrupt • Receive overflow interrupt • Idle interrupt	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	Not possible
	SSIE0_SSIRXI	Receive data full interrupt	SSIFSR.RDF	Possible
	SSIE0_SSITXI	Transmit data empty interrupt	SSIFSR.TDE	Possible
SSIE1	SSIE1_SSIF	• Transmit underflow interrupt • Transmit overflow interrupt • Receive underflow interrupt • Receive overflow interrupt • Idle interrupt	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	Not possible
	SSIE1_SSIRT	• Receive data full interrupt • Transmit data empty interrupt	SSIFSR.RDF/ SSIFSR.TDE	Possible

41.9.1 SSIEn_SSIF Interrupt

This interrupt source combines five interrupts. Enable output of necessary interrupts before using SSIE. The five interrupts are operated by using the flags assigned to individual interrupts and interrupt output enable bits. To clear an interrupt, set the interrupt enable to 0 or clear the interrupt flag to 0.

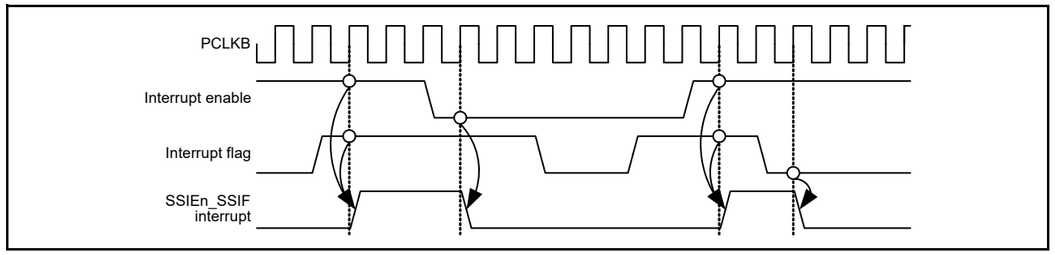

Figure 41.59 Timing Diagram of the common interrupt source, SSIEn_SSIF

- Transmit underflow interrupt

As the transmit underflow interrupt, SSISR.TUIRQ is output while SSICR.TUIEN = 1. When you use SSIE for transmission, enable the output of this interrupt (SSICR.TUIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

- Transmit overflow interrupt

As the transmit overflow interrupt, SSISR.TOIRQ is output while SSICR.TOIRQ = 1. When you use SSIE for transmission, enable the output of this interrupt (SSICR.TOIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

- Receive underflow interrupt

As the receive underflow interrupt, SSISR.RUIRQ is output while SSICR.RUIRQ = 1. When you use SSIE for reception, enable the output of this interrupt (SSICR.RUIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

- Receive overflow interrupt

As the receive overflow interrupt, SSISR.ROIRQ is output while SSICR.ROIRQ = 1. When you use SSIE for reception, enable the output of this interrupt (SSICR.ROIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

- Idle mode interrupt

Table 41.16 SSIE中断源

Channel	中断源	Description	中断标志	DMAC/DTC activation
SSIE0	SSIE0_SSIF	发送下溢中断 发送上溢中断 接收下溢中断 接收上溢中断 空闲中断	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	不可能
	SSIE0_SSIRXI	接收数据满中断	SSIFSR.RDF	Possible
	SSIE0_SSITXI	发送数据空中断	SSIFSR.TDE	Possible
SSIE1	SSIE1_SSIF	发送下溢中断 发送上溢中断 接收下溢中断 接收上溢中断 空闲中断	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	不可能
	SSIE1_SSIRT	接收数据满中断 发送数据空中断	SSIFSR.RDF/ SSIFSR.TDE	Possible

41.9.1 SSIEn_SSIF Interrupt

该中断源结合了五个中断。在使用SSIE之前启用必要中断的输出。通过使用分配给各个中断的标志和中断输出使能位来操作五个中断。要清除中断，请将中断使能设置为0或将中断标志清除为0。

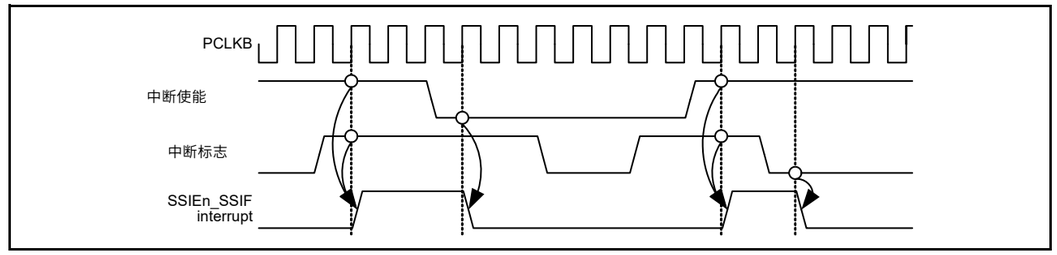

Figure 41.59 公共中断源SSIEn_SSIF的时序图

- 发送下溢中断

作为发送下溢中断，在SSICR.TUIEN=1时输出SSISR.TUIRQ。当使用SSIE进行发送时，使能该中断的输出（SSICR.TUIRQ=1）。如果发生此中断，请按照图41.56中的停止通信过程和图41.57中的错误处理过程中的说明进行操作。

- 发送溢出中断

作为发送溢出中断，在SSICR.TOIRQ=1时输出SSISR.TOIRQ。当使用SSIE进行发送时，使能该中断的输出（SSICR.TOIRQ=1）。如果发生此中断，请按照图41.56中的停止通信过程和图41.57中的错误处理过程中的说明进行操作。

- 接收下溢中断

作为接收下溢中断，在SSICR.RUIRQ=1时输出SSISR.RUIRQ。当使用SSIE进行接收时，使能该中断的输出（SSICR.RUIRQ=1）。如果发生此中断，请按照图41.56中的停止通信过程和图41.57中的错误处理过程中的说明进行操作。

- 接收溢出中断

作为接收溢出中断，在SSICR.ROIRQ=1时输出SSISR.ROIRQ。当使用SSIE进行接收时，使能该中断的输出（SSICR.ROIRQ=1）。如果发生此中断，请按照图41.56中的停止通信过程和图41.57中的错误处理过程中的说明进行操作。

- 空闲模式中断

As the idle mode interrupt, SSISR.IIRQ is output while SSICR.IIEN = 1. This interrupt is used to make sure that communication has stopped fully.

41.9.2 SSIE0_SSITXI Interrupt [Full-duplex communication]

The transmit data empty interrupt is a pulse interrupt that is output when the following condition is met:

- SSIFCR.TIE = 1 and SSIFSR.TDE = 1

  SSIE operation: When the value of SSIFSR.TDE changes from 0 to 1 while the value of SSIFCR.TIE is 1
  CPU instruction: When the value of SSIFCR.TIE changes from 0 to 1 while the value of SSIFSR.TDE is 1

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC/DMAC is busy (when the DTC/DMAC cannot accept interrupts), the interrupt suppression function holds the output of this interrupt. The held interrupt will be output after the DTC/DMAC is enabled to accept interrupts. For details, see Figure 41.60.

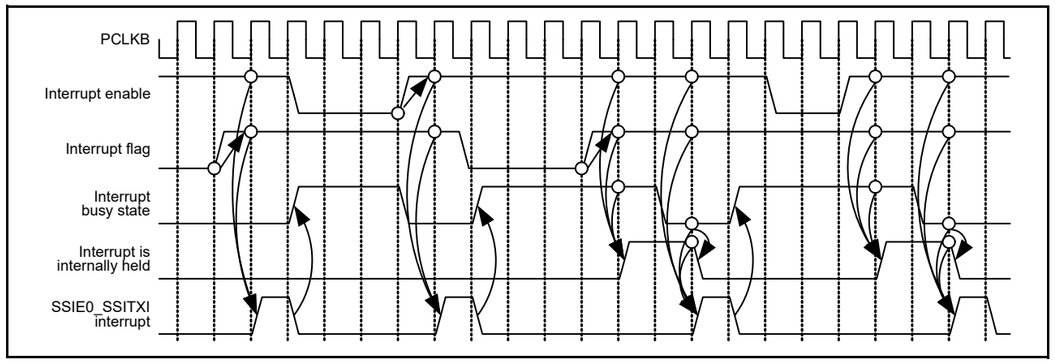

Figure 41.60 SSIE0_SSITXI interrupt timing diagram

41.9.3 SSIE0_SSIRXI Interrupt [Full-duplex communication]

The receive data full interrupt is a pulse interrupt that is output when the following condition is met:

- SSIFCR.RIE = 1 and SSIFSR.RDF = 1.

  SSIE operation: When the value of SSIFSR.RDF changes from 0 to 1 while the value of SSIFCR.RIE is 1
  CPU instruction: When the value of SSIFCR.RIE changes from 0 to 1 while the value of SSIFSR.RDE is 1

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC/DMAC is busy (when the DTC/DMAC cannot accept interrupts), the interrupt suppression function holds the output of this interrupt. The held interrupt will be output after the DTC/DMAC is enabled to accept interrupts. The behavior of this interrupt is the same as the behavior shown in Figure 41.60.

41.9.4 SSIE1_SSIRT Interrupt [Half-duplex communication]

This interrupt is output by two sources, transmit data empty interrupt and receive data full interrupt. When this interrupt is generated, read the interrupt flag and specify the interrupt source.

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC/DMAC is busy (when the DTC/DMAC cannot accept interrupts), the interrupt suppression function holds the output of this interrupt. The held interrupt will be output after the DTC/DMAC is enabled to accept interrupts. For details, see Figure 41.61.

作为空闲模式中断，在SSICR.IIEN=1时输出SSISR.IIRQ。此中断用于确保通信已完全停止。

41.9.2 SSIE0_SSITXI Interrupt [Full-duplex communication]

发送数据空中断是一个脉冲中断，当满足以下条件时输出：

- SSIFCR.TIE = 1 and SSIFSR.TDE = 1

  SSIE操作：当SSIFSR.TDE的值从0变为1且SSIFCR.TIE的值为1时CPU指令：当SSIFCR.TIE的值从0变为1且SSIFSR.TDE的值为1时

该中断受中断抑制功能影响。如果此中断的中断条件发生时，
DTCDMAC忙（当DTCDMAC不能接受中断时），中断抑制功能保持该中断的输出。在DTCDMAC使能接受中断后，将输出保持的中断。详见图41.60。

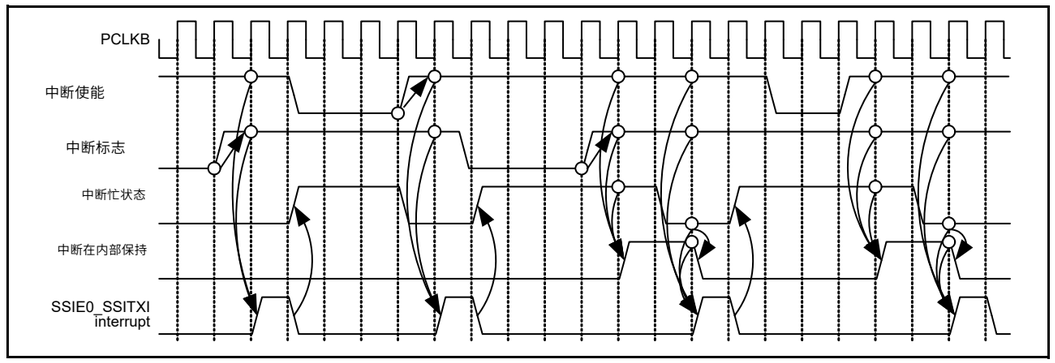

Figure 41.60 SSIE0_SSITXI中断时序图

41.9.3 SSIE0_SSIRXI Interrupt [Full-duplex communication]

接收数据满中断是一个脉冲中断，当满足以下条件时输出：

- SSIFCR.RIE = 1 and SSIFSR.RDF = 1.

  SSIE操作：当SSIFSR.RDF的值从0变为1且SSIFCR.RIE的值为1时CPU指令：当SSIFCR.RIE的值从0变为1且SSIFSR.RDE的值为1时

该中断受中断抑制功能影响。如果此中断的中断条件发生时，
DTCDMAC忙（当DTCDMAC不能接受中断时），中断抑制功能保持该中断的输出。在DTCDMAC使能接受中断后，将输出保持的中断。此中断的行为与图41.60中所示的行为相同。

41.9.4 SSIE1_SSIRT Interrupt [Half-duplex communication]

该中断由两个源输出，发送数据空中断和接收数据满中断。当该中断产生时，读取中断标志并指定中断源。

该中断受中断抑制功能影响。如果此中断的中断条件发生时，
DTCDMAC忙（当DTCDMAC不能接受中断时），中断抑制功能保持该中断的输出。在DTCDMAC使能接受中断后，将输出保持的中断。详见图41.61。

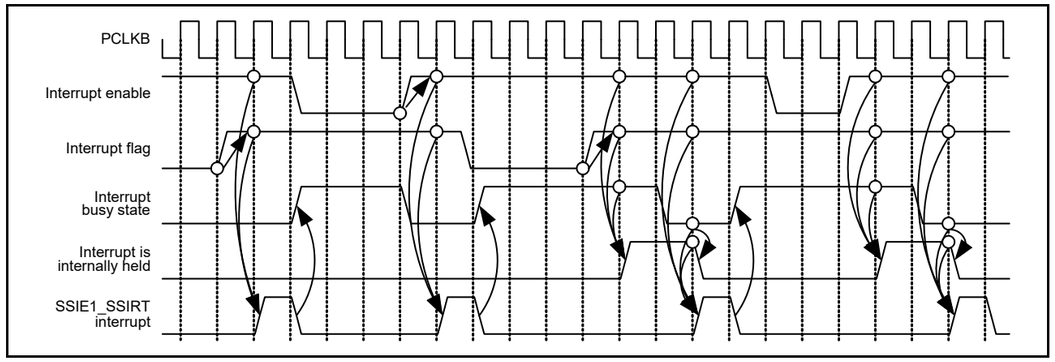

Figure 41.61 SSIE1_SSIRT interrupt timing diagram

41.10 Software Resets

SSIE has three software reset bits to reset its states.

- SSIE software reset (SSIFCR.SSIRST)
- Transmit FIFO data register reset (SSIFCR.TFRST)
- Receive FIFO data register reset (SSIFCR.RFRST).

This section describes the procedures for the three types of software resets.

41.10.1 Software Reset Procedure

(1) SSIE Software Reset

For the SSIE software reset bit (SSIFCR.SSIRST), follow the procedure shown in Figure 41.62. After a reset, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start communication in Figure 41.53. See reference 41.8.2 and reference 41.8.3 respectively for transmission and reception after communication is resumed.

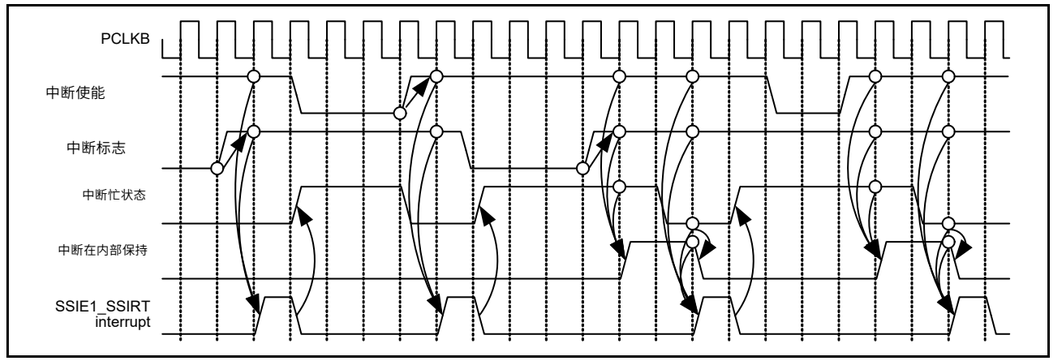

Figure 41.61 SSIE1_SSIRT中断时序图

41.10 软件复位

SSIE具有三个软件复位位来复位其状态。

- SSIE软件复位(SSIFCR.SSIRST)
- 发送FIFO数据寄存器复位(SSIFCR.TFRST)
- 接收FIFO数据寄存器复位(SSIFCR.RFRST)。

本节介绍三种软件复位的过程。

41.10.1 软件复位程序

(1) SSIE软件复位

对于SSIE软件复位位(SSIFCR.SSIRST)，请按照图41.62中所示的过程。重置后，恢复时应用相同的设置。要更改时钟和从主模式的设置，请按照图41.53中的步骤开始通信。恢复通信后的发送和接收分别参见参考41.8.2和参考41.8.3。

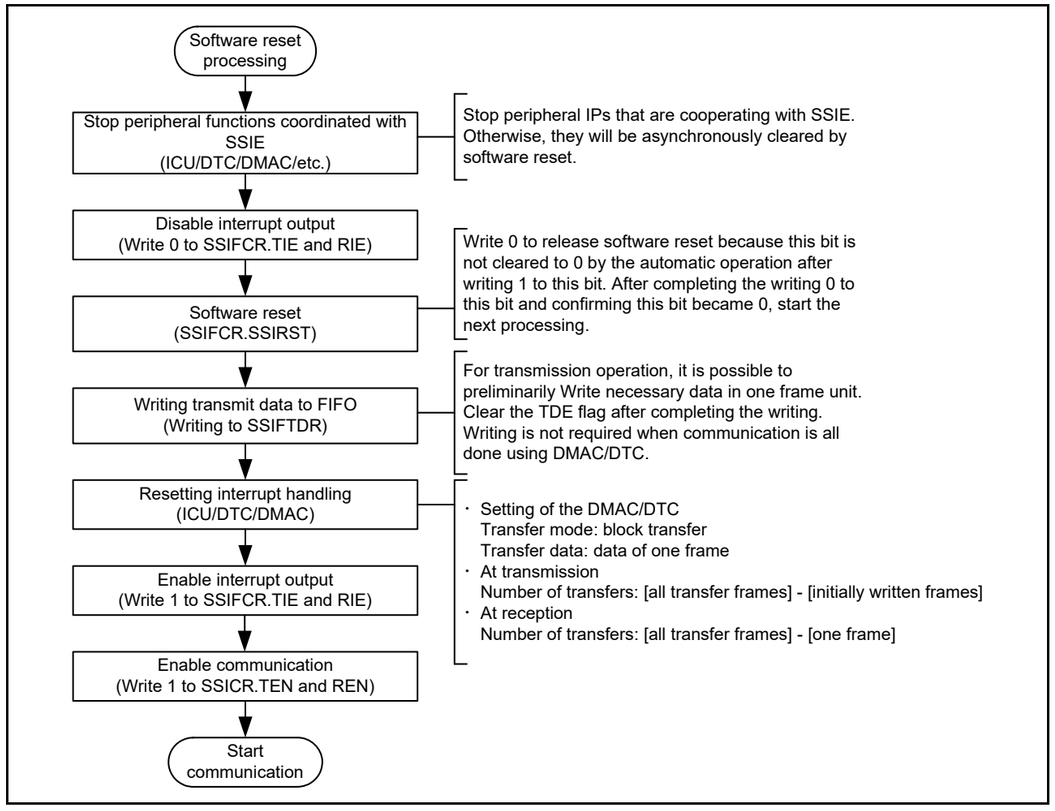

Figure 41.62 Software reset procedure (CPU operation procedure)

(2) Transmit FIFO data register reset

To perform a transmit FIFO data register reset, follow instructions in the procedure to start communication in Figure 41.53 and procedure to resume communication in Figure 41.58.

(3) Receive FIFO data register reset

To perform a receive FIFO data register reset, follow instructions in the procedure to start communication in Figure 41.53 and procedure to resume communication in Figure 41.58.

41.11 Notes

41.11.1 Notes for Slave-mode Communication

41.11.1.1 ADCKE control

In slave-mode communication (SSICR.MST = 0), SSIE needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIE is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIE becomes idle, take the procedure to start communication in Figure 41.53 or wait for an idle state by taking the procedure to resume communication in Figure 41.58.

41.11.1.2 SSILRCK/SSIFS pin

SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

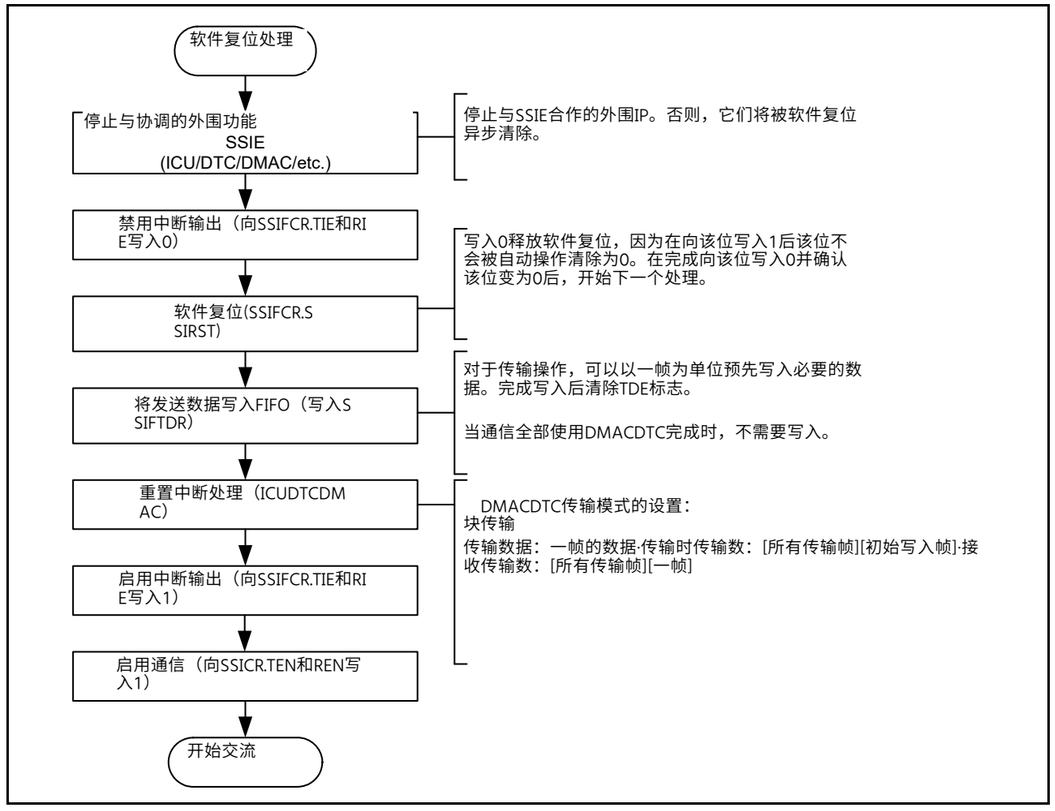

Figure 41.62 软件复位程序（CPU操作程序）

(2) 发送FIFO数据寄存器复位

要执行发送FIFO数据寄存器复位，请按照图41.53中的开始通信过程和图41.58中恢复通信的过程中的说明进行操作。

(3) 接收FIFO数据寄存器复位

要执行接收FIFO数据寄存器复位，请按照图41.53中的开始通信过程和图41.58中恢复通信的过程中的说明进行操作。

41.11 Notes

41.11.1 从模式通信注意事项

41.11.1.1 ADCKE control

在从模式通信(SSICR.MST=0)中，SSIE需要提供SSIBCK。要在主设备端停止BCK，请确保SSIE处于空闲状态(SSISR.IIRQ=1)。如果BCK在SSIE空闲之前停止，则按照图41.53中的程序开始通信，或者按照图41.58中的程序恢复通信等待空闲状态。

41.11.1.2 SSILRCK/SSIFS pin

SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

41.11.2 Notes for Master-mode Communication

41.11.2.1 ADCKE control

In master-mode communication (SSICR.MST = 1), SSIE operates with the audio clock (AUDIO_MCK). To stop SSIE completely, make sure that SSIE is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE.

41.11.2.2 LRCONT control

To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIE is in the idle state in master-mode communication (SSICR.MST = 1), note the following: The output stops when the value of the SSIOFR.LRCONT bit is changed from 1 to 0. Make sure that the other-party device is not affected. For details, see Figure 41.44.

41.11.2.3 BCKASTP control

To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIE is in the idle state, note the following: The output stops when the value of the SSIOFR.BCKASTP bit is changed from 0 to 1. So, make sure that the other-party device is not affected. For details, see Figure 41.45.

The BCKASTP bit cannot be used when the other-party device (which is a slave) requires the clock output from the SSIBCK pin before and during communication.

41.11.3 Notes for Communication Flow

41.11.3.1 When an error interrupt is generated

SSIE has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error.

When an underflow error or overflow error is generated, SSIE need to be restarted. Follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

(1) Transmit Underflow Error

If a transmit underflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to a transmit data empty interrupt. After a transmit underflow error occurs, SSIE outputs 0s as data. To normally output the serial data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA1 pin, follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57. After this error occurs, serial data is consumed as usual. If you resume communication, write the serial data from the beginning.

(2) Transmit Overflow Error

If a transmit overflow error occurs, review the number of times of writing data to the Transmit FIFO Data Register (SSIFTDR) in response to transmit data empty interrupts. The serial data written to the Transmit FIFO Data Register (SSIFTDR) that caused the transmit overflow error becomes invalid. This error can occur regardless of whether a transmission operation is being done. To recover from the error, follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57. When you resume communication, deal with the invalid serial data appropriately.

(3) Receive Underflow Error

If a receive underflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The values read from the receive FIFO data register (SSIFRDR) that caused the receive underflow error are undefined. This error can occur regardless of whether a reception operation is being done. To recover from the error, follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

41.11.2 主模式通信注意事项

41.11.2.1 ADCKE control

在主模式通信(SSICR.MST=1)中，SSIE使用音频时钟(AUDIO_MCK)运行。要完全停止SSIE，请确保SSIE处于空闲状态(SSISR.IIRQ=1)，然后将0写入SSIFCR.ADCKE。

41.11.2.2 LRCONT control

当SSIE处于主模式通信中的空闲状态（SSICR.MST=1）时，要使用SSIOFR.LRCONT停止向SSILRCKSSIFS引脚的输出，请注意以下几点：当SSIOFR.LRCONT位的值为从1变为0。确保对方设备不受影响。详见图41.44。

41.11.2.3 BCKASTP control

要在主模式通信(SSICR.MST=1)和SSIE处于空闲状态时使用SSIOFR.BCKASTP停止向SSIBCK引脚的输出，请注意以下事项：当SSIOFR.BCKASTP位的值为从0变为1。因此，请确保对方设备不受影响。详见图41.45。

当对方设备（从设备）需要时钟输出时，不能使用BCKASTP位
SSIBCK引脚在通信之前和期间。

41.11.3 通信流程注意事项

41.11.3.1 产生错误中断时

SSIE有以下四个错误。

- 发送下溢错误
- 传输溢出错误
- 接收下溢错误
- 接收溢出错误。

当产生下溢错误或上溢错误时，需要重启SSIE。按照图41.56中的程序停止通信和图41.57中的错误处理程序。

(1) 发送下溢错误

如果发生发送下溢错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。发生发送下溢错误后，SSIE输出0作为数据。要将写入发送FIFO数据寄存器(SSIFTDR)的串行数据正常输出到SSITXD0 SSIDATA1引脚，请按照图41.56中的程序停止通信和图41.57中的错误处理程序进行操作。发生此错误后，串行数据将照常使用。如果您恢复通信，请从头开始写入串行数据。

(2) 传输溢出错误

如果发生发送溢出错误，请检查向发送FIFO数据寄存器(SSIFTDR)写入数据以响应发送数据空中断的次数。导致发送溢出错误的写入发送FIFO数据寄存器(SSIFTDR)的串行数据变为无效。无论是否正在执行传输操作，都可能发生此错误。要从错误中恢复，请按照图41.56中的程序停止通信和图41.57中的错误处理程序。当您恢复通信时，请适当处理无效的串行数据。

(3) 接收下溢错误

如果发生接收下溢错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。从导致接收下溢错误的接收FIFO数据寄存器(SSIFRDR)读取的值未定义。无论是否正在执行接收操作，都可能发生此错误。要从错误中恢复，请按照图41.56中的程序停止通信和图41.57中的错误处理程序。

(4) Receive Overflow Error

If a receive overflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The receive data that caused the receive overflow error cannot be stored in the receive FIFO data register (SSIFRDR). To recover from the error, follow the procedure to halt communication in Figure 41.56 and error-handling procedure in Figure 41.57.

41.11.3.2 Transmit data empty interrupt

The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.TDE to write data to SSIFTDR. The number of times of writing data to SSIFTDR by detecting the value 1 of SSIFSR.TDE must be in accordance with the free space size of the transmit FIFO data register specified by SSISCR.TDES. After as much transmit data as the free space size is written to SSIFTDR, the SSIFSR.TDE flag must be cleared. Continuous transmission is enabled by repeating data writing. If the SSIFSR.TDE flag is not cleared, the flag is not cleared automatically.

41.11.3.3 Receive data full interrupt

The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.RDF to read data from SSIFRDR. The number of times of reading data from SSIFRDR by detecting the value 1 of SSIFSR.RDF must be in accordance with the receive data storage capacity of the receive FIFO data register specified by SSISCR.RDFS. After received data is read from SSIFRDR, the SSIFSR.RDF flag must be cleared. Continuous reception is enabled by repeating data reading. If the SSIFSR.RDF flag is not cleared, the flag is not cleared automatically.

41.11.3.4 Switching transfer modes

1. For state transition from transmission, reception, and transmission and reception, disable transmission and reception (SSICR.TEN = 0, SSICR.REN = 0).
2. Confirm it is in the idle state (SSISR.IIRQ = 1).
3. In the idle state, set the SSICR.TEN bit and the SSICR.REN bit again and resume transfer.

41.11.3.5 Resume communication after halting SSIE

When communication of SSIE is halted according to the procedure to halt communication in Figure 41.56, resume communication according to the procedure to resume communication in Figure 41.58.

41.11.4 Write Access Restriction

41.11.4.1 SSICR register

If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If the value of the TEN or REN bit is changed by rewriting, subsequent operation is unpredictable. For example, when transmission or reception is enabled, check that SSISR.IIRQ is 0; when transmission or reception is disabled, check that SSISR.IIRQ is 1.

(1) TEN Bit and REN Bit

These bits enable/disable transmission and reception. When 1 is written to one of these bits, the corresponding communication operation starts in synchronization with a start trigger by the SSILRCK/SSIFS signal. For details, see reference 41.8.2, reference 41.8.3, and reference 41.8.4. When 0 is written to this bit, the current communication operation stops at the next frame boundary. To use SSIE for both transmission and reception, always write 1 to these bits together. When stopping the communication using SSIE, always disable both transmission and reception (write 0 to the TEN and REN bits).

41.11.4.2 SSISR register

(1) Clearing TUIRQ and TOIRQ

After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

(4) 接收溢出错误

如果发生接收溢出错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收溢出错误的接收数据不能存储在接收FIFO数据寄存器(SSIFRDR)中。要从错误中恢复，请按照图41.56中的程序停止通信和图41.57中的错误处理程序。

41.11.3.2 发送数据空中断

SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.TDE的值1以将数据写入SSIFTDR。通过检测SSIFSR.TDE的值为1向SSIFTDR写入数据的次数必须与SSIFSR.TDES指定的发送FIFO数据寄存器的空闲空间大小一致。在将与可用空间大小一样多的传输数据写入SSIFTDR后，必须清除SSIFSR.TDE标志。通过重复数据写入启用连续传输。如果未清除SSIFSR.TDE标志，则不会自动清除该标志。

41.11.3.3 接收数据满中断

SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.RDF的值1以从SSIFRDR读取数据。检测SSIFSR.RDF的值为1从SSIFRDR读取数据的次数必须与SSISCR.RDFS指定的接收FIFO数据寄存器的接收数据存储容量一致。从SSIFRDR读取接收到的数据后，必须清除SSIFSR.RDF标志。通过重复数据读取启用连续接收。如果SSIFSR.RDF标志未清除，则该标志不会自动清除。

41.11.3.4 切换传输模式

1. 对于从发送、接收和发送和接收的状态转换，禁用发送和接收（SSICR.TEN=0，SSICR.REN=0）。
2. 确认它处于空闲状态(SSISR.IIRQ=1)。
3. 在空闲状态下，再次设置SSICR.TEN位和SSICR.REN位并恢复传输。

41.11.3.5 停止SSIE后恢复通信

当SSIE的通信按照图41.56中的停止通信程序停止时，按照图41.58中的恢复通信程序恢复通信。

41.11.4 写访问限制

41.11.4.1 SSICR register

如果TEN位或REN位被重写，请确保SSISR.IIRQ位处于所需状态。如果TEN或REN位的值因重写而改变，后续操作将无法预测。例如，启用发送或接收时，检查SSISR.IIRQ是否为0；当发送或接收被禁用时，检查SSISR.IIRQ是否为1。

(1) 十位和仁位

这些位启用禁用发送和接收。当这些位之一写入1时，相应的通信操作与SSILRCKSSIFS信号的开始触发同步开始。有关详细信息，请参阅参考41.8.2、参考41.8.3和参考41.8.4。当向该位写入0时，当前通信操作在下一帧边界处停止。要同时使用SSIE进行发送和接收，请始终将1一起写入这些位。使用SSIE停止通信时，始终禁用发送和接收（将0写入TEN和REN位）。

41.11.4.2 SSISR register

(1) 清除TUIRQ和TOIRQ

启用通信后（通过将SSICR.TEN位的值从0更改为1），传输错误标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

(2) Clearing RUIRQ and ROIRQ

After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

41.11.4.3 Communication state

Writing to the bits with orange-shaded area in Table 41.17 is prohibited. If written, the operation performed immediately after writing is not guaranteed.

(2) 清除RUIRQ和ROIRQ

启用通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

41.11.4.3 通讯状态

禁止写入表41.17中橙色阴影区域的位。如果写入，则不保证写入后立即执行的操作。

42. Sampling Rate Converter (SRC)

42.1 Overview

The Sampling Rate Converter (SRC) is used to convert the sampling rate of data produced by various audio decoders, including WMA, MP3, and AAC. Both 16-bit stereo and monaural data are supported. The sampling rate of the input signal can be one of the following (in kHz): 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, or 48 kHz. The sampling rate of the output signal can be one of the following (in kHz): 8, 16, 32, 44.1, or 48 kHz. Independent FIFOs are provided for input and output. In a typical application, a DMA controller can be used to transfer PCM audio data from the SRAM (for example) to the SRC. Sample-converted audio data from the SRC can then be transferred using the DMA Controller to the SSIE interface, from where it can be transmitted to an external audio codec.

Table 42.1 shows the SRC specifications and Figure 42.1 shows a block diagram.

Table 42.1 SRC specifications

Parameter		Specifications
Data size		16 bits (stereo/monaural)
Sampling rates	Input	Selectable to 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, or 48 kHz
	Output	Selectable to 8*1, 16*1, 32, 44.1, or 48 kHz
Processing capacity		Maximum of 7.7 µs for one sample output interval (PCLKB = 60 MHz, 462 clocks)
SNR		80 db or higher
Interrupt sources		Five Input FIFO empty, output FIFO full, output FIFO overflow, output FIFO underflow, and conversion end
DMA transfer sources		Two Input FIFO empty and output FIFO full
Module-stop function		Module-stop state can be set to reduce power consumption

Note 1. Only when input of 44.1 kHz is selected.

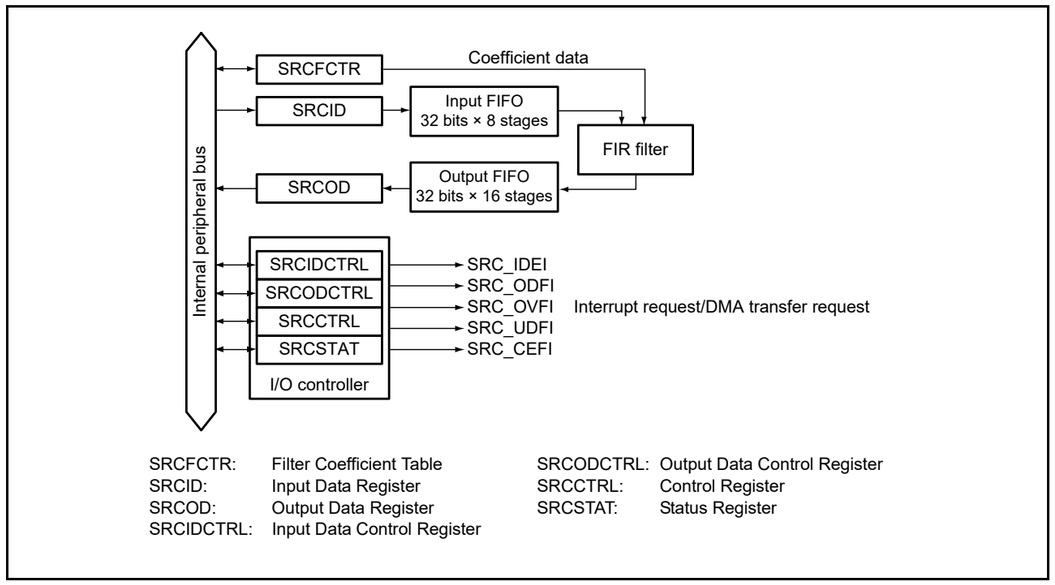

Figure 42.1 SRC block diagram

42. 采样率转换器(SRC)

42.1 Overview

采样率转换器(SRC)用于转换各种音频解码器（包括WMA、MP3和AAC）产生的数据的采样率。支持16位立体声和单声道数据。输入信号的采样率可以是以下之一（以kHz为单位）：8、11.025、12、16、22.05、24、32、44.1或48kHz。输出信号的采样率可以是以下之一（以kHz为单位）：8、16、32、44.1或48kHz。为输入和输出提供了独立的FIFO。在典型应用中，DMA控制器可用于将PCM音频数据从SRAM（例如）传输到SRC。然后，可以使用DMA控制器将来自SRC的样本转换音频数据传输到SSIE接口，然后再将其传输到外部音频编解码器。

表42.1显示了SRC规范，图42.1显示了框图。

Table 42.1 SRC specifications

Parameter		Specifications
数据大小		16 bits (stereo/monaural)
采样率	Input	可选择8、11.025、12、16、22.05、24、32、44.1或48kHz
	Output	可选择8*1、16*1、32、44.1或48kHz
处理能力		1个采样输出间隔的最大值为7.7µs（PCLKB=60MHz，462个时钟）
SNR		80分贝或更高
中断源		Five 输入FIFO空，输出FIFO满，输出FIFO上溢，输出FIFO下溢，转换结束
DMA传输源		Two 输入FIFO为空，输出FIFO已满
Module-stop function		可设置模块停止状态以降低功耗

Note 1. Onlywheninputof44.1kHzisselected.

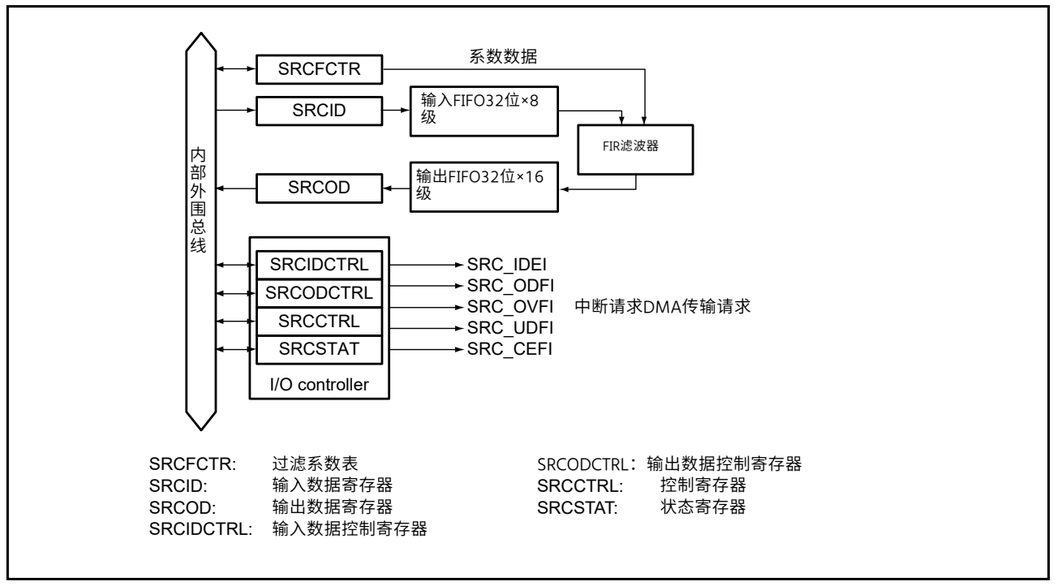

Figure 42.1 SRC框图

42.2 Register Descriptions

42.2.1 Input Data Register (SRCID)

Address(es): SRC.SRCID 4004 DFF0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The SRCID register is a 32-bit write-only register used to input the data before sampling rate conversion. All the bits are read as 0. The data input to SRCID is stored in the 8-stage input FIFO. When the number of data units in the input FIFO is 8, writing to SRCID has no effect.

For stereo data, bits [31:16] are for Lch data, and bits [15:0] are for Rch data. For monaural data, data in bits [31:16] is valid, and data in bits 15 to 0 is invalid.

The data subject to sampling rate conversion is aligned differently depending on the IED setting in SRCIDCTRL. Table 42.2 shows the correspondence between the IED setting and data alignment.

Table 42.2 Data alignment before sampling rate conversion

IED	Lch[15:8]	Lch[7:0]	Rch[15:8]	Rch[7:0]
0	SRCID[31:24]	SRCID[23:16]	SRCID[15:8]	SRCID[7:0]
1	SRCID[23:16]	SRCID[31:24]	SRCID[7:0]	SRCID[15:8]

42.2.2 Output Data Register (SRCOD)

Address(es): SRC.SRCOD 4004 DFF4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The SRCOD register is a 32-bit read-only register used to output the data after sampling rate conversion. The data in the 16-stage output FIFO is read through SRCOD. When the output FIFO is empty after the start of conversion, the value previously read is read again.

The data in SRCOD is aligned differently depending on the OCH and OED settings in SRCODCTRL. Table 42.3 shows the correspondence between the OCH and OED settings and data alignment in SRCOD.

Table 42.3 Data alignment in SRCOD (1 of 2)

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:8]	SRCOD[7:0]
0	0	Lch[15:8]	Lch[7:0]	Rch[15:8]*1	Rch[7:0]*1
	1	Lch[7:0]	Lch[15:8]	Rch[7:0]*1	Rch[15:8]*1

42.2 注册说明

42.2.1 输入数据寄存器(SRCID)

Address(es): SRC.SRCID 4004 DFF0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SRCID寄存器是一个32位只写寄存器，用于在采样率转换之前输入数据。所有位都读为0。输入到SRCID的数据存储在8级输入FIFO中。当输入FIFO中的数据单元数为8时，写入SRCID无效。

对于立体声数据，位[31:16]用于Lch数据，位[15:0]用于Rch数据。对于单声道数据，bits[31:16]中的数据有效，bits15到0中的数据无效。

根据SRCIDCTRL中的IED设置，进行采样率转换的数据的排列方式不同。表42.2显示了IED设置和数据对齐之间的对应关系。

Table 42.2 采样率转换前的数据对齐

IED	Lch[15:8]	Lch[7:0]	Rch[15:8]	Rch[7:0]
0	SRCID[31:24]	SRCID[23:16]	SRCID[15:8]	SRCID[7:0]
1	SRCID[23:16]	SRCID[31:24]	SRCID[7:0]	SRCID[15:8]

42.2.2 输出数据寄存器(SRCOD)

Address(es): SRC.SRCOD 4004 DFF4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SRCOD寄存器是一个32位只读寄存器，用于输出采样率转换后的数据。通过SRCOD读取16级输出FIFO中的数据。当转换开始后输出FIFO为空时，再次读取之前读取的值。

SRCOD中的数据根据 SRCODCTRL中的OCH和OED设置以不同方式对齐。表42.3显示了OCH和OED设置与SRCOD中数据对齐之间的对应关系。

Table 42.3 SRCOD中的数据对齐(1of2)

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:8]	SRCOD[7:0]
0	0	Lch[15:8]	Lch[7:0]	Rch[15:8]*1	Rch[7:0]*1
	1	Lch[7:0]	Lch[15:8]	Rch[7:0]*1	Rch[15:8]*1

Table 42.3 Data alignment in SRCOD (2 of 2)

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:8]	SRCOD[7:0]
1*2	0	Rch[15:8]	Rch[7:0]	Lch[15:8]	Lch[7:0]
	1	Rch[7:0]	Rch[15:8]	Lch[7:0]	Lch[15:8]

Note 1. When processing monaural data, the data in these bits is invalid. Discard the invalid data after reading from SRCOD in 32-bit units.
Note 2. When processing monaural data, the data in these bits is invalid.

42.2.3 Input Data Control Register (SRCIDCTRL)

Address(es): SRC.SRCIDCTRL 4004 DFF8h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	IED	IEN	—	—	—	—	—	—	IFTRG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	IFTRG[1:0]	Input FIFO Data Triggering Number	b1 b0 0 0: 0 0 1: 2 1 0: 4 1 1: 6.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	IEN	Input FIFO Empty Interrupt Enable	0: Disable input FIFO empty interrupts 1: Enable input FIFO empty interrupts.	R/W
b9	IED	Input Data Endian*1	0: Little endian 1: Big endian.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only rewrite this bit while the SRCCTRL.SRCEN bit is 0.

The SRCIDCTRL register is a 16-bit read/write register that specifies the endian format of input data, enables or disables the interrupt requests, and specifies the triggering number of data units.

IFTRG[1:0] bits (Input FIFO Data Triggering Number)

The IFTRG[1:0] bits specify the data unit count at which the IINT flag in the Status Register (SRCSTAT) sets to 1. When the number of data units stored in the input FIFO becomes equal to or less than the specified triggering number, the IINT flag sets to 1.

IEN bit (Input FIFO Empty Interrupt Enable)

The IEN bit enables or disables issuing of the input FIFO empty interrupt request when the number of data units in the input FIFO becomes equal to or less than the triggering number specified in the IFTRG[1:0] bits, resulting in the IINT flag in the Status Register (SRCSTAT) setting to 1.

IED bit (Input Data Endian)

The IED bit specifies the endian format of the input data.

Table 42.3 SRCOD中的数据对齐(2of2)

OCH	OED	SRCOD[31:24]	SRCOD[23:16]	SRCOD[15:8]	SRCOD[7:0]
1*2	0	Rch[15:8]	Rch[7:0]	Lch[15:8]	Lch[7:0]
	1	Rch[7:0]	Rch[15:8]	Lch[7:0]	Lch[15:8]

Note 1. 处理单声道数据时，这些位中的数据无效。以32位为单位从SRCOD读取后丢弃无效数据。

Note 2. 处理单声道数据时，这些位中的数据无效。

42.2.3 输入数据控制寄存器(SRCIDCTRL)

Address(es): SRC.SRCIDCTRL 4004 DFF8h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	IED	IEN	—	—	—	—	—	—	IFTRG[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	IFTRG[1:0]	输入FIFO数据触发数	b1 b0 0 0: 0 0 1: 2 1 0: 4 1 1: 6.	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	IEN	输入FIFO空中断使能	0：禁用输入FIFO空中断1：启用输入FIFO空中断。	R/W
b9	IED	输入数据字节序 *1	0：小端1：大端。	R/W
b15 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 仅在SRCCTRL.SRCEN位为0时重写该位。

SRCIDCTRL寄存器是一个16位的读写寄存器，指定输入数据的字节序格式，启用或禁用中断请求，并指定数据单元的触发数量。

IFTRG[1:0]位（输入FIFO数据触发数）

IFTRG[1:0]位指定状态寄存器(SRCSTAT)中的IINT标志设置为1时的数据单元计数。当存储在输入FIFO中的数据单元数等于或小于指定的触发数时，IINT标志设置为1。

IEN位（输入FIFO空中断使能）

当输入FIFO中的数据单元数等于或小于IFTRG[1:0]位中指定的触发数时，IEN位启用或禁用输入FIFO空中断请求的发出，从而导致IINT标志状态寄存器(SRCSTAT)设置为1。

IED位（输入数据字节序）

IED位指定输入数据的字节序格式。

42.2.4 Output Data Control Register (SRCODCTRL)

Address(es): SRC.SRCODCTRL 4004 DFFAh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	OCH	OED	OEN	—	—	—	—	—	—	OFTRG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	OFTRG[1:0]	Output FIFO Data Trigger Number	b1 b0 0 0: 1 0 1: 4 1 0: 8 1 1: 12.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	OEN	Output FIFO Full Interrupt Enable	0: Disable output FIFO full interrupts 1: Enable output FIFO full interrupts.	R/W
b9	OED	Output Data Endian	0: Little endian 1: Big endian.	R/W
b10	OCH	Output Data Channel Exchange *1	0: Do not exchange channels (use same order as data input) 1: Exchange channels (use opposite order from data input).	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only rewrite this bit while the SRCCTRL.SRCEN bit is 0.

The SRCODCTRL register is a 16-bit read/write register that specifies whether to exchange the channels for the output data, specifies the endian format of output data, enables or disables the interrupt requests, and specifies the triggering number of data units.

OFTRG[1:0] bits (Output FIFO Data Trigger Number)

The OFTRG[1:0] bits specify the data unit count at which the OINT flag in the Status Register (SRCSTAT) sets to 1. When the number of data units in the output FIFO becomes equal to or greater than the specified triggering number, the OINT flag sets to 1.

OEN bit (Output FIFO Full Interrupt Enable)

The OEN bit enables or disables issuing of the output FIFO full interrupt request when the number of data units in the output FIFO becomes equal to or greater than the number specified in the OFTRG[1:0] bits, resulting in the OINT flag in the Status Register (SRCSTAT) setting to 1.

OED bit (Output Data Endian)

The OED bit specifies the endian format of the output data.

OCH bit (Output Data Channel Exchange)

The OCH bit specifies whether to exchange the channels for the Output Data Register (SRCOD). Do not set this bit to 1 when processing monaural data.

42.2.4 输出数据控制寄存器(SRCODCTRL)

Address(es): SRC.SRCODCTRL 4004 DFFAh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	OCH	OED	OEN	—	—	—	—	—	—	OFTRG[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	OFTRG[1:0]	输出FIFO数据触发Number	b1 b0 0 0: 1 0 1: 4 1 0: 8 1 1: 12.	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	OEN	输出FIFO满中断Enable	0：禁止输出FIFO满中断1：使能输出FIFO满中断。	R/W
b9	OED	输出数据字节序	0：小端1：大端。	R/W
b10	OCH	输出数据通道交换*1	0：不交换通道（使用与数据输入相同的顺序）1：交换通道（使用与数据输入相反的顺序）。	R/W
b15 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 仅在SRCCTRL.SRCEN位为0时重写该位。

SRCODCTRL寄存器是一个16位读写寄存器，指定是否为输出数据交换通道，指定输出数据的字节序格式，启用或禁用中断请求，并指定数据单元的触发数量。

OFTRG[1:0]位（输出FIFO数据触发数）

OFTRG[1:0]位指定状态寄存器(SRCSTAT)中的OINT标志设置为1的数据单元计数。
当输出FIFO中的数据单元数等于或大于指定的触发数时，
OINT标志设置为1。

OEN位（输出FIFO完全中断使能）

当输出FIFO中的数据单元数等于或大于OFTRG[1:0]位中指定的数量时，OEN位使能或禁止发出输出FIFO满中断请求，从而在状态寄存器(SRCSTAT)设置为1。

OED位（输出数据字节序）

OED位指定输出数据的字节序格式。

OCH位（输出数据通道交换）

OCH位指定是否为输出数据寄存器(SRCOD)交换通道。处理单声道数据时不要将此位设置为1。

42.2.5 Control Register (SRCCTRL)

Address(es): SRC.SRCCTRL 4004 DFFCh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	OFS[2:0]	Output Sampling Rate	b2 b0 0 0 0: 44.1 kHz 0 0 1: 48.0 kHz 0 1 0: 32.0 kHz 0 1 1: Setting prohibited 1 0 0: 8.0 kHz*1 1 0 1: 16.0 kHz.*1 Other settings are prohibited.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7 to b4	IFS[3:0]	Input Sampling Rate	b7 b4 0 0 0 0: 8.0 kHz 0 0 0 1: 11.025 kHz 0 0 1 0: 12.0 kHz 0 0 1 1: Setting prohibited 0 1 0 0: 16.0 kHz 0 1 0 1: 22.05 kHz 0 1 1 0: 24.0 kHz 0 1 1 1: Setting prohibited 1 0 0 0: 32.0 kHz 1 0 0 1: 44.1 kHz 1 0 1 0: 48.0 kHz. Other settings are prohibited.	R/W
b8	CL	Internal Work Memory Clear	Writing 1 to this bit clears the input FIFO, output FIFO, input buffer memory, intermediate memory, and accumulator.	R/W
b9	FL	Internal Work Memory Flush	Writing 1 to this bit starts conversion of the sampling rate for all data in the input FIFO, input buffer memory, and intermediate memory (flush processing).	R/W
b10	OVEN	Output FIFO Overflow Interrupt Enable	0: Disable output FIFO overflow interrupts 1: Enable output FIFO overflow interrupts.	R/W
b11	UDEN	Output FIFO Underflow Interrupt Enable	0: Disable output FIFO underflow interrupts 1: Enable output FIFO underflow interrupts.	R/W
b12	SRCEN	Module Enable	0: Disable SRC module operation 1: Enable SRC module operation.*2	R/W
b13	CEEN	Conversion End Interrupt Enable	0: Disable conversion end interrupts 1: Enable conversion end interrupts.	R/W
b14	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15	FICRAE	Filter Coefficient Table Access Enable	0: Disable reads to and writes from filter coefficient table RAM 1: Enable reads to and writes from filter coefficient table RAM.	R/W

Note 1. Only valid when the IFS[3:0] bits are 1001b.
Note 2. When SRCEN = 1, do not change the settings of the following bits:
IED bit in SRCIDCTRL, OED and OCH bits in SRCODCTRL, OFS[2:0], IFS[3:0], and FICRAE bits in SRCCTRL.

The SRCCTRL register is a 16-bit read/write register that enables or disables access to the Filter Coefficient Table, module operations, and interrupt requests, and specifies flush processing, clear processing of the internal work memory, and the input and output sampling rates.

OFS[2:0] bits (Output Sampling Rate)

The OFS[2:0] bits specify the output sampling rate.

42.2.5 控制寄存器(SRCCTRL)

Address(es): SRC.SRCCTRL 4004 DFFCh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b8	CL	内部工作记忆清除	向该位写入1将清除输入FIFO、输出FIFO、输入缓冲存储器、中间存储器和累加器。	R/W
b9	FL	内部工作记忆刷新	向该位写入1开始转换输入FIFO、输入缓冲存储器和中间存储器中所有数据的采样率（刷新处理）。	R/W
b10	OVEN	输出FIFO溢出中断Enable	0：禁止输出FIFO溢出中断1：使能输出FIFO溢出中断。	R/W
b11	UDEN	输出FIFO下溢中断Enable	0：禁止输出FIFO下溢中断1：使能输出FIFO下溢中断。	R/W
b12	SRCEN	模块启用	0：禁用SRC模块操作1：启用SRC模块操作。*2	R/W
b13	CEEN	转换结束中断Enable	0：禁止转换结束中断1：使能转换结束中断。	R/W
b14	—	Reserved	该位读取为0。写入值应为0。	R/W
b15	FICRAE	过滤系数表访问Enable	0：禁止对滤波器系数表RAM进行读写。1：允许对滤波器系数表RAM进行读写。	R/W

Note 1. 仅当IFS[3:0]位为1001b时有效。
Note 2. 当SRCEN=1时，请勿更改以下位的设置：
SRCIDCTRL中的IED位、SRCODCTRL中的OED和OCH位、SRCCTRL中的OFS[2:0]、IFS[3:0]和FICRAE位。

SRCCTRL寄存器是一个16位读写寄存器，用于启用或禁用对滤波器系数表的访问、模块操作和中断请求，并指定内部工作存储器的刷新处理、清除处理以及输入和输出采样率。

OFS[2:0]位（输出采样率）

OFS[2:0]位指定输出采样率。

IFS[3:0] bits (Input Sampling Rate)

The IFS[3:0] bits specify the input sampling rate.

CL bit (Internal Work Memory Clear)

Writing 1 to the CL bit clears the input FIFO, output FIFO, input buffer memory, intermediate buffer memory, and accumulator, and then the CL bit clears to 0. This bit is read as 0. Even if SRCEN = 0, writing 1 to this bit clears the processing.

FL bit (Internal Work Memory Flush)

Writing 1 to the FL bit initiates flush processing by starting conversion of the sampling rate of all the data in the input FIFO, input buffer memory, and intermediate memory. This bit is read as 0. When SRCEN = 0, writing 1 to this bit does not trigger flush processing.

In addition, when 1 is written to the FL bit while the number of data units in the input buffer memory is less than the values shown in Table 42.6, valid output data cannot be received. The internal work memory is cleared without triggering the flush processing.

OVEN bit (Output FIFO Overflow Interrupt Enable)

The OVEN bit enables or disables issuing of the output FIFO overflow interrupt request when the OVF flag in the Status Register (SRCSTAT) is set to 1.

When OVEN = 1: Conversion processing stops until the OVF flag is cleared by the CPU accessing SRCSTAT when the output FIFO overflow interrupt is generated. Writing of conversion results to the output FIFO also stops.

When OVEN = 0: The OVF flag automatically clears when the output FIFO has space, and conversion processing can be continued.

UDEN bit (Output FIFO Underflow Interrupt Enable)

The UDEN bit enables or disables issuing of the output FIFO underflow interrupt request when the output FIFO is read and the UDF flag in the Status Register (SRCSTAT) sets to 1 while the number of data units in the output FIFO is zero.

SRCEN bit (Module Enable)

The SRCEN bit enables or disables SRC operation. Writing 1 to these bits while SRCEN = 0 clears the internal work memory.

CEEN bit (Conversion End Interrupt Enable)

The CEEN bit enables or disables issuing of a conversion end interrupt request when the CEF flag in the Status Register (SRCSTAT) sets to 1 after flush processing is complete and all the output data is read.

FICRAE bit (Filter Coefficient Table Access Enable)

The FICRAE bit enables or disables access to the filter coefficient table RAM. After flush processing is complete, the number of output data units obtained as a result of conversion can be calculated using the following formulas:

$$\frac{\text{Number of output data units} - 1}{\text{Output sampling rate}} = \frac{\text{Number of input data units} \times n - 1}{\text{Input sampling rate} \times n}$$

$$\text{Number of output data units} = \left[(\text{Number of input data units} \times n - 1) \times \frac{\text{Output sampling rate}}{\text{Input sampling rate} \times n} \right] + 1$$

The value of n can be obtained from Table 42.4. The number of input data units must be equal to or greater than the values in Table 42.5.

IFS[3:0]位（输入采样率）

IFS[3:0]位指定输入采样率。

CL位（内部工作存储器清除）

向CL位写入1清除输入FIFO、输出FIFO、输入缓冲存储器、中间缓冲存储器和累加器，然后CL位清除为0。该位读为0。即使SRCEN=0，写入1到该位清除处理。

FL位（内部工作内存刷新）

将1写入FL位通过开始转换输入中所有数据的采样率来启动刷新处理
FIFO、输入缓冲存储器和中间存储器。该位读为0。当SRCEN=0时，向该位写入1不会触发刷新处理。

此外，当输入缓冲存储器中的数据单元数小于表42.6中所示的值时，当向FL位写入1时，将无法接收有效的输出数据。在不触发刷新处理的情况下清除内部工作内存。

OVEN位（输出FIFO溢出中断使能）

当状态中的OVF标志位时，OVEN位启用或禁用输出FIFO溢出中断请求的发出
寄存器(SRCSTAT)设置为1。

当OVEN=1时：转换处理停止，直到产生输出FIFO溢出中断时CPU访问SRCSTAT清除OVF标志。将转换结果写入输出FIFO也会停止。

当OVEN=0时：当输出FIFO有空间时，OVF标志自动清零，可以继续进行转换处理。

UDEN位（输出FIFO下溢中断使能）

当读取输出FIFO并且状态寄存器(SRCSTAT)中的UDF标志设置为1而输出FIFO中的数据单元数为零时，UDEN位启用或禁用输出FIFO下溢中断请求的发出。

SRCEN位（模块使能）

SRCEN位启用或禁用SRC操作。当SRCEN=0时向这些位写入1会清除内部工作存储器。

CEEN位（转换结束中断使能）

在刷新处理完成并读取所有输出数据后，当状态寄存器(SRCSTAT)中的CEF标志设置为1时，CEEN位允许或禁止发出转换结束中断请求。

FICRAE位（滤波器系数表访问使能）

FICRAE位启用或禁用对滤波器系数表RAM的访问。在flush处理完成后，转换后得到的输出数据单元个数可以用以下公式计算：

$$\frac{\text{输出数据单元数}-1}{\text{输出采样率}} = \frac{\text{输入数据单元数}\times n-1}{\text{输入采样率}\times n}$$

$$\text{输出数据单元数} = \left[(\text{输入数据单元数}\times n-1) \times \frac{\text{输出采样率}}{\text{输入采样率}\times n} \right] + 1$$

n的值可以从表42.4中获得。输入数据单元的数量必须等于或大于表42.5中的值。

Table 42.4 Sampling rate settings and value of n

OFS[2:0] setting (output sampling rate [kHz])	IFS[3:0] setting (input sampling rate [kHz])								
	0000b (8.0)	0001b (11.025)	0010b (12.0)	0100b (16.0)	0101b (22.05)	0110b (24.0)	1000b (32.0)	1001b (44.1)	1010b (48.0)
000b (44.1)	6	4	4	3	2	2	3	—	1
001b (48.0)	6	4	4	3	2	2	3	1	—
010b (32.0)	4	8	4	2	4	2	—	2	1
100b (8.0)	—	—	—	—	—	—	—	1	—
101b (16.0)	—	—	—	—	—	—	—	1	—

Conversion processing does not start, and so output data is not obtained, until the specified number of data units are input. The minimum number of input data units necessary for obtaining the first output data depends on the IFS and OFS bit settings. Table 42.5 shows the relation between the settings in the IFS and OFS bits and the number of initial input data required. Table 42.6 shows the relation between the settings in the IFS and OFS bits and the number of initial input data required for processing.

Table 42.5 Relation between sampling rate settings and number of initial input data units required

b3	UDF	Output FIFO Underflow Interrupt Request Flag	0: No output FIFO underflow occurred 1: Output FIFO underflow occurred.	R/(W) *1
b4	FLF	Flush Processing Status Flag	0: Flush processing complete 1: Flush processing in progress.	R
b5	CEF	Conversion End Flag	0: Not all output data read 1: All output data read.	R/(W) *1
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b10 to b7	IFDN[3:0]	Input FIFO Data Count	Indicates the number of data units in the input FIFO.	R
b15 to b11	OFDN[4:0]	Output FIFO Data Count	Indicates the number of data units in the output FIFO.	R

Note 1. Only 0 can be written after having read as 1.

The SRCSTAT register is a 16-bit read/write register that indicates the number of data units in the input and output FIFOs, whether the various interrupt sources were generated, and the flush processing status.

OINT flag (Output FIFO Full Interrupt Request Flag)

The OINT flag indicates that the number of data units in the output FIFO has become equal to or greater than the triggering number specified in the OFTRG[1:0] bits in the Output Data Control Register (SRCODCTRL).

[Setting condition]

- When the number of data units in the output FIFO becomes equal to or greater than the specified triggering number.

[Clearing conditions]

- Writing 0 to the OINT flag after reading it as 1
- When the last DMA transfer is executed
- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

IINT flag (Input FIFO Empty Interrupt Request Flag)

The IINT flag indicates that the number of data units in the input FIFO has become equal to or smaller than the triggering number specified in the IFTRG[1:0] bits in the Input Data Control Register (SRCIDCTRL).

[Setting conditions]

- When the number of data units in the input FIFO becomes equal to or smaller than the specified triggering number

b0	OINT	输出FIFO满中断请求标志	0：输出FIFO中的数据单元数未等于或大于指定的触发数1：输出FIFO中的数据单元数已等于或大于指定的触发数。	R/(W) *1
b1	IINT	输入FIFO空中断请求标志	0：输入FIFO中的数据单元数未等于或小于指定的触发数1：输入FIFO中的数据单元数已等于或小于指定的触发数。	R/(W) *1
b2	OVF	输出FIFO溢出中断请求标志	0：未发生输出FIFO溢出1：发生输出FIFO溢出。	R/(W) *1
b3	UDF	输出FIFO下溢中断请求标志	0：未发生输出FIFO下溢1：发生输出FIFO下溢。	R/(W) *1
b4	FLF	刷新处理状态标志	0：冲洗处理完成1：冲洗处理中。	R
b5	CEF	转换结束标志	0：不读取所有输出数据1：读取所有输出数据。	R/(W) *1
b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b10 to b7	IFDN[3:0]	输入FIFO数据计数	指示输入FIFO中的数据单元数。	R
b15 to b11	OFDN[4:0]	输出FIFO数据计数	指示输出FIFO中的数据单元数。	R

Note 1. 读为1后只能写0。

SRCSTAT寄存器是一个16位读写寄存器，指示输入和输出中数据单元的数量FIFO，是否产生了各种中断源，以及刷新处理状态。

OINT标志（输出FIFO满中断请求标志）

OINT标志表示输出FIFO中的数据单元数已等于或大于输出数据控制寄存器(SRCODCTRL)中的OFTRG[1:0]位中指定的触发数。

[Setting condition]

- 当输出FIFO中的数据单元数等于或大于指定的触发数时。

[Clearing conditions]

- 读取为1后将0写入OINT标志
- 执行最后一次DMA传输时
- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

IINT标志（输入FIFO空中断请求标志）

IINT标志表示输入FIFO中的数据单元数已等于或小于输入数据控制寄存器(SRCIDCTRL)中IFTRG[1:0]位中指定的触发数。

[Setting conditions]

- 当输入FIFO中的数据单元数等于或小于指定触发数时

- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

[Clearing conditions]

- Writing 0 to the IINT flag after reading is as 1
- When the last DMA transfer is executed.

OVF flag (Output FIFO Overflow Interrupt Request Flag)

The OVF flag indicates that the sampling rate conversion for the next data completes when the output FIFO is full. The conversion stops until the OVF flag is cleared.

[Setting condition]

- When the sampling rate conversion for the next data completes when the output FIFO is full.

[Clearing conditions]

- Writing 0 to the OVF flag after reading it as 1 while the SRCCTRL.OVEN bit is 1
- When the number of data units in the output FIFO decreases after reading SRCOD while the SRCCTRL.OVEN bit is 0
- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

UDF flag (Output FIFO Underflow Interrupt Request Flag)

The UDF flag indicates that the output FIFO is read when the number of data units in the output FIFO is zero.

[Setting condition]

- When the output FIFO is read while the number of data units in the output FIFO is zero.

[Clearing conditions]

- Writing 0 to the UDF flag after reading it as 1
- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

FLF flag (Flush Processing Status Flag)

The FLF flag indicates whether flush processing is in progress or not.

[Setting condition]

- Writing 1 to the SRCCTRL.FL bit
  (When flush processing is not in progress, however, FLF does not set to 1.)

[Clearing conditions]

- When flush processing completes
- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

CEF flag (Conversion End Flag)

The CEF flag indicates that all the output data is read after flush processing completes.

[Setting condition]

- When the number of data units in the output FIFO is zero on completion of flush processing.

[Clearing conditions]

- Writing 0 to the CEF flag after reading it as 1.

- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

[Clearing conditions]

- 读取后向IINT标志写入0为1
- 执行最后一次DMA传输时。

OVF标志（输出FIFO溢出中断请求标志）

OVF标志表示当输出FIFO已满时，下一个数据的采样率转换完成。转换停止，直到OVF标志被清除。

[Setting condition]

- 当输出FIFO已满时，下一个数据的采样率转换完成。

[Clearing conditions]

- 在SRCCTRL.OVEN位为1时将OVF标志读取为1后写入0
- 当SRCCTRL.OVEN位为0时读取SRCOD后输出FIFO中的数据单元数减少
- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

UDF标志（输出FIFO下溢中断请求标志）

UDF标志表示当输出FIFO中的数据单元数为零时读取输出FIFO。

[Setting condition]

- 当输出FIFO中的数据单元数为零时读取输出FIFO。

[Clearing conditions]

- 读为1后将0写入UDF标志
- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

FLF标志（刷新处理状态标志）

FLF标志指示刷新处理是否正在进行。

[Setting condition]

- 将1写入SRCCTRL.FL位（但是，当未进行刷新处理时，FLF不会设置为1。）

[Clearing conditions]

- 刷新处理完成时
- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

CEF标志（转换结束标志）

CEF标志指示在刷新处理完成后读取所有输出数据。

[Setting condition]

- 当刷新处理完成时输出FIFO中的数据单元数为零时。

[Clearing conditions]

- 读为1后将0写入CEF标志。

- Writing 1 to the SRCCTRL.CL bit
- Writing 1 to the SRCCTRL.SRCEN bit while it is 0.

IFDN[3:0] bits (Input FIFO Data Count)

The IFDN[3:0] bits indicate the number of data units in the input FIFO.

OFDN[4:0] bits (Output FIFO Data Count)

The OFDN[4:0] bits indicate the number of data units in the output FIFO.

42.2.7 Filter Coefficient Table n (SRCFCTRn) (n = 0 to 5551)

Address(es): SRCRAM.SRCFCTR0 to 5551 4004 8000h to 4004 D6BFh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	SRCFCOE[21:16]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SRCFCOE[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b21 to b0	SRCFCOE[21:0]	Filter Coefficient Table	Stores the filter coefficient value.	R/W
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SRCFCTR0 to SRCFCTR5551 are 32-bit read/write SRAM modules that store the filter coefficients to be used for sampling rate conversion. This SRAM can be read from and written to through the peripheral bus only when the FICRAE bit is 1 and the SRCEN bit is 0 in SRCCTRL. Bits 31 to 22 are reserved and are read as 0, and their write values should be 0. Bits 21 to 0 are used for storage of the filter coefficient values, whose initial values are undefined.

42.3 Operation

42.3.1 Initial Settings

Figure 42.2 shows an example flow for the initial settings. After the module-stop state is released, the filter coefficient data stored in the flash and other areas must be transferred to the Filter Coefficient Table (SRCFCTR) before SRC conversion starts. When a filter coefficient value is already stored in the Filter Coefficient Table, skip this transfer and set the required parameters to start the conversion.

- 将1写入SRCCTRL.CL位
- SRCCTRL.SRCEN位为0时写入1。

IFDN[3:0]位（输入FIFO数据计数）

IFDN[3:0]位指示输入FIFO中数据单元的数量。

OFDN[4:0]位（输出FIFO数据计数）

OFDN[4:0]位指示输出FIFO中数据单元的数量。

42.2.7 滤波器系数表n(SRCFCTRn)（n=0至5551）

Address(es): SRCRAM.SRCFCTR0 to 5551 4004 8000h to 4004 D6BFh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	SRCFCOE[21:16]					
重置后的值：	0	0	0	0	0	0	0	0	0	0	x	x	x	x	x	x

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SRCFCOE[15:0]															
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

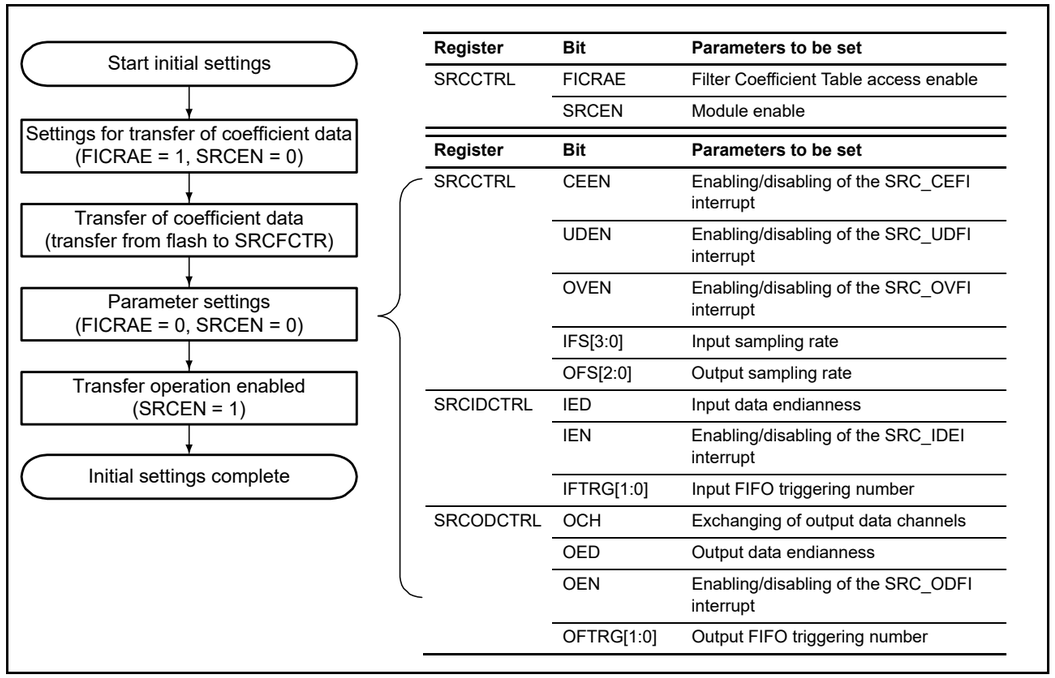
Bit	Symbol	位名称	Description	R/W
b21 to b0	SRCFCOE[21:0]	过滤系数表	存储滤波器系数值。	R/W
b31 to b22	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SRCFCTR0至SRCFCTR5551是32位读写SRAM模块，用于存储用于采样率转换的滤波器系数。只有当SRCCTRL中的FICRAE位为1且SRCEN位为0时，该SRAM才能通过外设总线读写。第31到22位保留，读为0，写入值应为0。第21到0位用于存储滤波器系数值，初始值未定义。

42.3 Operation

42.3.1 初始设置

图42.2显示了初始设置的示例流程。模块停止状态释放后，存储在闪存和其他区域的滤波器系数数据必须在SRC转换开始前传输到滤波器系数表(SRCFCTR)。当滤波器系数值已经存储在滤波器系数表中时，跳过此传输并设置所需的参数以开始转换。



Register	Bit	Parameters to be set
SRCCTRL	FICRAE	Filter Coefficient Table access enable
	SRCEN	Module enable

Register	Bit	Parameters to be set
SRCCTRL	CEEN	Enabling/disabling of the SRC_CEFI interrupt
	UDEN	Enabling/disabling of the SRC_UDFI interrupt
	OVEN	Enabling/disabling of the SRC_OVFI interrupt
	IFS[3:0]	Input sampling rate
	OFS[2:0]	Output sampling rate
SRCIDCTRL	IED	Input data endianness
	IEN	Enabling/disabling of the SRC_IDEI interrupt
	IFTRG[1:0]	Input FIFO triggering number
SRCODCTRL	OCH	Exchanging of output data channels
	OED	Output data endianness
	OEN	Enabling/disabling of the SRC_ODFI interrupt
	OFTRG[1:0]	Output FIFO triggering number

Figure 42.2 Example flow for initial settings

42.3.2 Data Input

Figure 42.3 shows an example flow for data input.

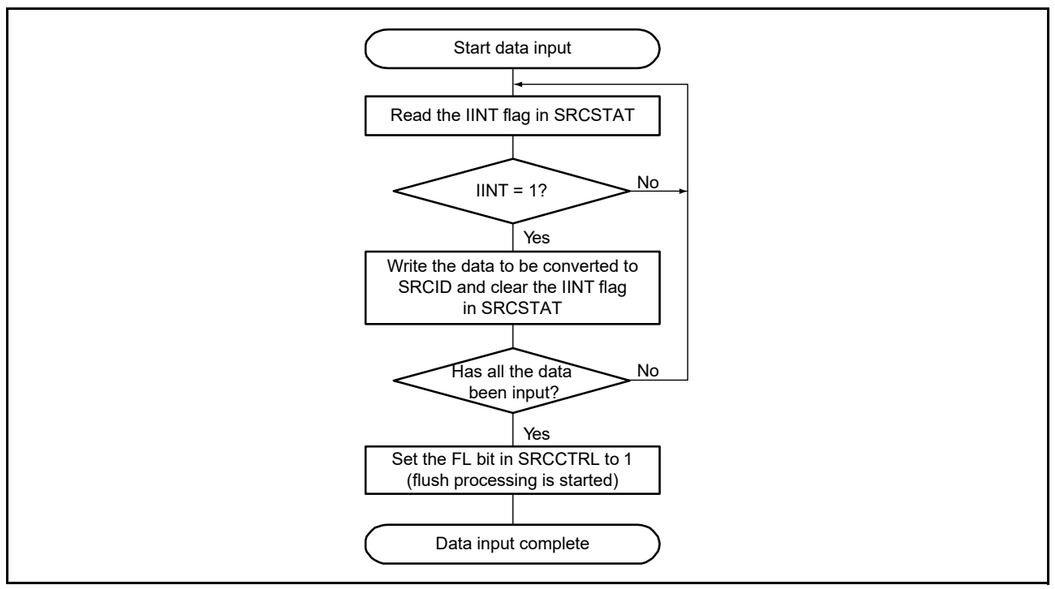


Figure 42.3 Data input flow

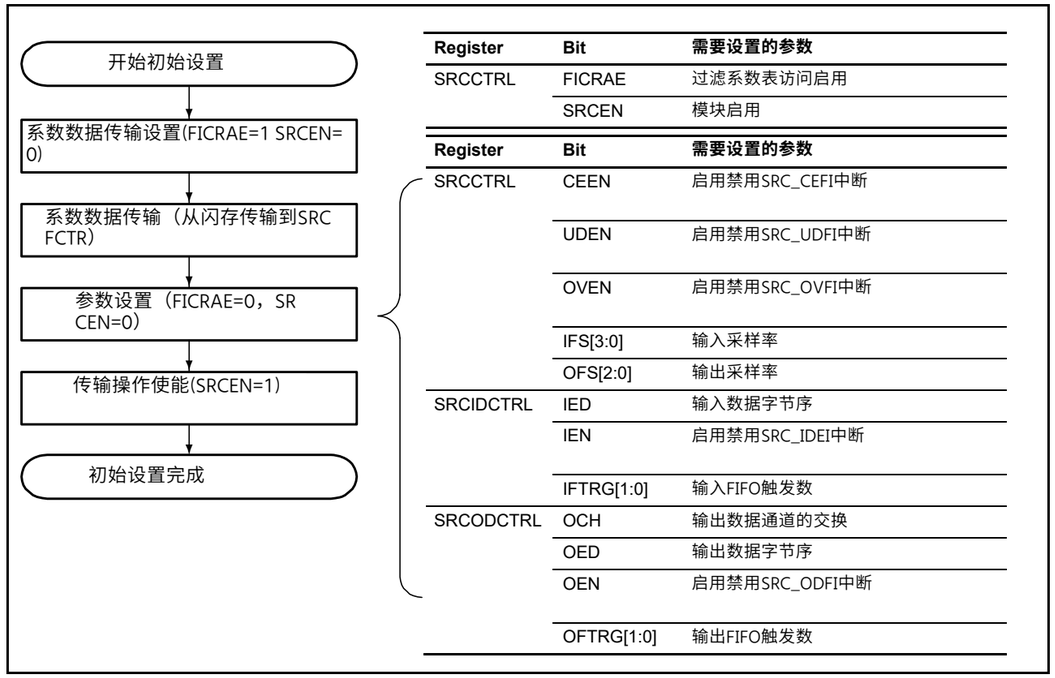

Register	Bit	需要设置的参数

	OEN	启用禁用SRC_ODFI中断
	OFTRG[1:0]	输出FIFO触发数

Figure 42.2 初始设置的示例流程

42.3.2 数据输入

图42.3显示了数据输入的示例流程。

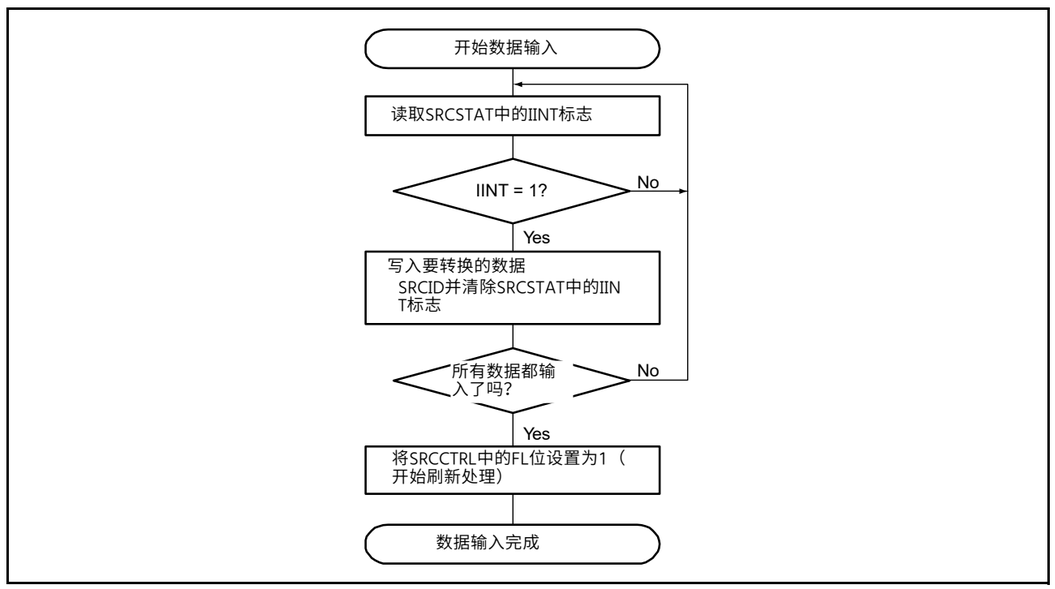

Figure 42.3 数据输入流程

(1) When issuing interrupts to the CPU

1. Set the IEN bit in SRCIDCTRL to 1.
2. When the IINT flag in SRCSTAT sets to 1, the IDEI interrupt request is issued. In the interrupt processing routine, read the IINT flag and confirm that it is 1, write data to SRCID, and write 0 to the IINT flag. Then return from the interrupt processing routine.
3. Repeat step 2 until all the data is input, and write 1 to the FL bit in SRCCTRL.

(2) When using interrupts to activate the DMAC

1. Assign the SRC_IDEI interrupt of the SRC to one channel of the DMAC.
2. Set the IEN bit in SRCIDCTRL to 1.
3. When the IINT flag in SRCSTAT sets to 1, the SRC_IDEI interrupt request is issued, activating the DMAC. When data is written to the SRCID register using DMA transfer, and when the number of data units in the input FIFO exceeds the triggering number specified in the IFTRG[1:0] bits in SRCIDCTRL, the IINT flag in SRCSTAT clears to 0.
4. Repeat step 3 until all the data is input, and write 1 to the FL bit in SRCCTRL.

(3) When using SSIE interface interrupts to activate the DMAC to transfer input data from the SSIE interface

1. Assign the SSIE interface to one channel of the DMAC as a DMA transfer request source. Set SSIFRDR of the SSIE interface as a transfer source and SRCID of the SRC as a transfer destination, and set the SSIE interface to enable reception operation.
2. When the RDF bit in SSIFSR sets to 1, the SSIE interface issues an interrupt request, activating the DMAC. The DMAC then reads data from SSIFRDR and writes the data to SRCID.
3. Repeat step 2 until all the data is input, and write 1 to the FL bit in SRCCTRL.

Note: The input FIFO has eight stages. The number of data units that can be transferred (the empty space in the FIFO) when an SRC_IDEI interrupt request is issued depends on the settings in the IFTRG[1:0] bits in SRCIDCTRL. Because the input FIFO is not equipped with a function to prevent or detect overflow, the transferred data is destroyed when overflow occurs. To prevent this, take the settings in the IFTRG[1:0] bits in SRCCTRL into consideration when setting the number of data units to be continuously transferred by the DMA.

42.3.3 Data Output

Figure 42.4 shows an example flow for data output.

(1) 向CPU发出中断时

1. 将SRCIDCTRL中的IEN位设置为1。
2. 当SRCSTAT中的IINT标志设置为1时，会发出IDEI中断请求。在中断处理程序中，读取IINT标志并确认为1，将数据写入SRCID，将0写入IINT标志。然后从中断处理程序返回。
3. 重复步骤2直到输入所有数据，然后将1写入SRCCTRL中的FL位。

(2) 使用中断激活DMAC时

1. 将SRC的SRC_IDEI中断分配给DMAC的一个通道。
2. 将SRCIDCTRL中的IEN位设置为1。
3. 当SRCSTAT中的IINT标志设置为1时，发出SRC_IDEI中断请求，激活DMAC。当使用DMA传输将数据写入SRCID寄存器时，并且当输入FIFO中的数据单元数超过SRCIDCTRL中的IFTRG[1:0]位中指定的触发数时，SRCSTAT中的IINT标志清零。
4. 重复步骤3直到输入所有数据，然后将1写入SRCCTRL中的FL位。

(3) 当使用SSIE接口中断激活DMAC以从SSIE interface

1. 将SSIE接口分配给DMAC的一个通道作为DMA传输请求源。将SSIE接口的SSIFRDR设置为传输源，将SRC的SRCID设置为传输目标，并设置SSIE接口使能接收操作。
2. 当SSIFSR中的RDF位设置为1时，SSIE接口发出中断请求，激活DMAC。这然后DMAC从SSIFRDR读取数据并将数据写入SRCID。
3. 重复步骤2直到输入所有数据，然后将1写入SRCCTRL中的FL位。

Note: 输入FIFO有8个阶段。发出SRC_IDEI中断请求时可传输的数据单元数（FIFO中的空白空间）取决于SRCIDCTRL中IFTRG[1:0]位的设置。由于输入FIFO没有配备防止或检测溢出的功能，所以当溢出发生时，传输的数据会被破坏。为防止这种情况，在设置DMA连续传输的数据单元数时，请考虑SRCCTRL中IFTRG[1:0]位的设置。

42.3.3 数据输出

图42.4显示了数据输出的示例流程。

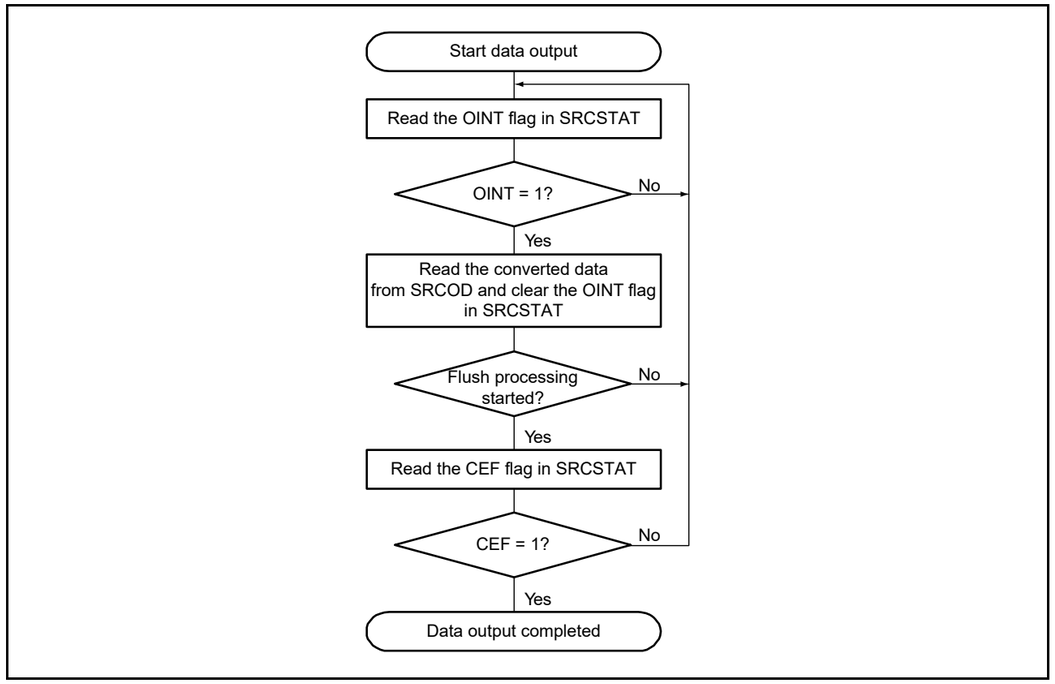

Figure 42.4 Data output flow

(1) When issuing interrupts to the CPU

1. Set the OEN bit in SRCODCTRL to 1.
2. When the OINT flag in SRCSTAT sets to 1, the SRC_ODFI interrupt request is issued. In the interrupt processing routine, read the OINT flag and confirm that it is 1, read data from SRCOD, and write 0 to the OINT flag. Then return from the interrupt processing routine.
3. After flush processing starts, repeat step 2 until the CEF flag in SRCSTAT is read as 1.

(2) When using interrupts to activate the DMAC

1. Assign the SRC_ODFI interrupt of the SRC to one channel of the DMAC.
2. Set the OEN bit in SRCODCTRL to 1.
3. When the OINT flag in SRCSTAT sets to 1, the SRC_ODFI interrupt request is issued, activating the DMAC. When data is read from SRCOD using DMA transfer, and when the number of data units in the output data FIFO becomes equal to or less than the triggering number specified in the OFTRG[1:0] bits, the OINT flag in SRCSTAT clears to 0.
4. After flush processing starts, repeat step 3 until the FLF flag in SRCSTAT is read as 0.

(3) When using SSIE interface interrupts to activate the DMAC to transfer output data to the SSIE interface

1. Set the OVEN bit in SRCCTRL to 0 to disable SRC_OVFI interrupt request generation.
2. Assign the SSIE interface to one channel of the DMAC as a DMA transfer request source. Set SRCID of the SRC as a transfer source and SSIFTDR of the SSIE interface as a transfer destination, and set the SSIE interface to enable transmission operation.
3. When the TDE bit in SSIFSR sets to 1, the SSIE interface issues an interrupt request, activating the DMAC. The DMAC then reads data from SRCOD and writes the data to SSIFTDR.

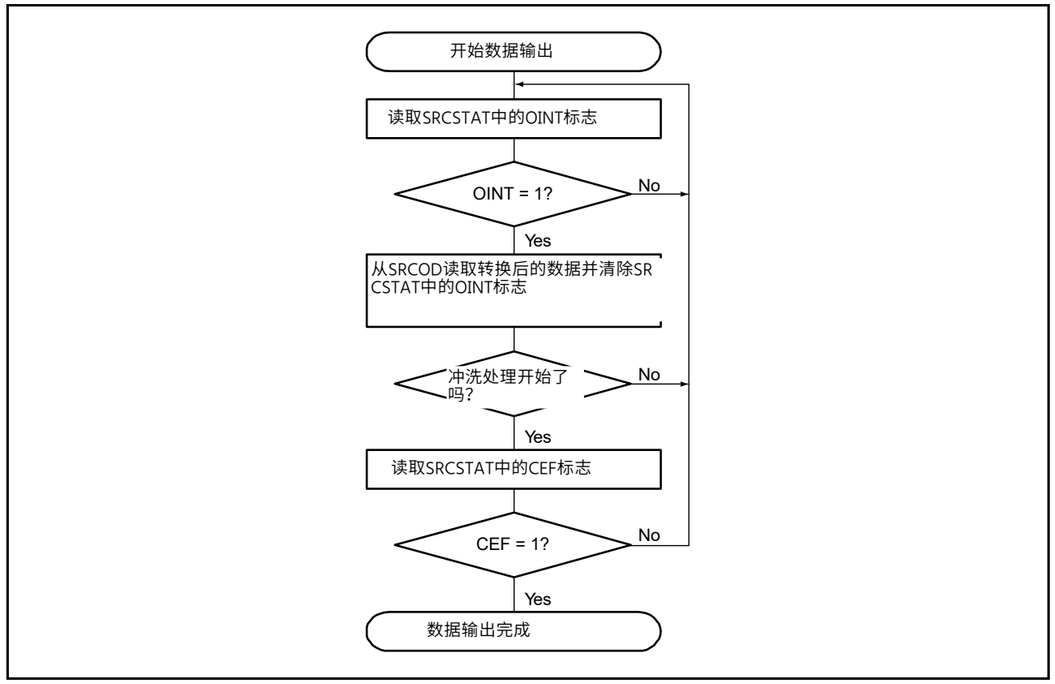

Figure 42.4 数据输出流

(1) 向CPU发出中断时

1. 将SRCODCTRL中的OEN位设置为1。
2. 当SRCSTAT中的OINT标志设置为1时，发出SRC_ODFI中断请求。在中断处理程序中，读取OINT标志并确认其为1，从SRCOD读取数据，并将0写入OINT标志。然后从中断处理程序返回。
3. 刷新处理开始后，重复步骤2，直到SRCSTAT中的CEF标志被读取为1。

(2) 使用中断激活DMAC时

1. 将SRC的SRC_ODFI中断分配给DMAC的一个通道。
2. 将SRCODCTRL中的OEN位设置为1。
3. 当SRCSTAT中的OINT标志设置为1时，发出SRC_ODFI中断请求，激活DMAC。当使用DMA传输从SRCOD读取数据时，当输出数据FIFO中的数据单元数等于或小于OFTRG[1:0]位中指定的触发数时，SRCSTAT中的OINT标志清零.
4. 刷新处理开始后，重复步骤3，直到SRCSTAT中的FLF标志被读取为0。

(3) 当使用SSIE接口中断激活DMAC以将输出数据传输到SSIE接口时

1. 将SRCCTRL中的OVEN位设置为0以禁用SRC_OVFI中断请求生成。
2. 将SSIE接口分配给DMAC的一个通道作为DMA传输请求源。将SRC的SRCID设置为传输源，将SSIE接口的SSIFTDR设置为传输目标，并设置SSIE接口使能传输操作。
3. 当SSIFSR中的TDE位设置为1时，SSIE接口发出中断请求，激活DMAC。这然后DMAC从SRCOD读取数据并将数据写入SSIFTDR。

4. After flush processing starts, repeat step 3 until the CEF flag in SRCSTAT is read as 1.

Note 1. The output FIFO has 16 stages. The conversion stops when no data is read and an overflow occurs in the output FIFO. Even in an overflow state, data can be read from the output FIFO, but the procedure to restart conversion might be required depending on the settings. (For details, see the OVEN bit in SRCCTRL.)

Note 2. When the number of data units in the output FIFO is zero, incorrect data is read. To prevent this, take the settings of the OFTRG[1:0] bits into consideration when setting the number of data units to be continuously transferred by the DMAC.

42.4 Interrupts

The SRC interrupt sources include:

- Input FIFO empty (SRC_IDEI)
- Output FIFO full (SRC_ODFI)
- Output FIFO overflow (SRC_OVFI)
- Output FIFO underflow (SRC_UDFI)
- Conversion end (SRC_CEFI).

Table 42.7 lists the interrupt request types and generation conditions.

Table 42.7 Interrupt requests and generation conditions

Interrupt request	Abbreviation	Interrupt condition	DMAC activation
Input FIFO empty	SRC_IDEI	IINT = 1, IEN = 1, and SRCEN = 1	Possible
Output FIFO full	SRC_ODFI	OINT = 1, OEN = 1, and SRCEN = 1	Possible
Output FIFO overflow	SRC_OVFI	OVF = 1, OVEN = 1, and SRCEN = 1	Not possible
Output FIFO underflow	SRC_UDFI	UDF = 1, UDEN = 1, and SRCEN = 1	Not possible
Conversion end	SRC_CEFI	CEF = 1, CEEN = 1, and SRCEN = 1	Not possible

When an interrupt condition is satisfied, the CPU executes the interrupt exception handling routine. Clear the interrupt source flags during this routine.

The SRC_IDEI and SRC_ODFI interrupts can activate the DMAC. If the DMAC is activated, the interrupts from the SRC are not sent to the CPU.

Do not clear the IINT and OINT flags through a write by the CPU (writing 0 after reading 1) during the DMA transfer.

42.5 Usage Notes

42.5.1 Notes on Accessing Registers

The following writes to SRCCTRL require 3 cycles of the peripheral clock (PCLKB) for the values to be updated in SRCSTAT:

- Writes of 1 to the FL bit in SRCCTRL, for the FLF flag in SRCSTAT to set
- Writes of 1 to the CL bit in SRCCTRL, for each bit in SRCSTAT to initialize
- Writes of 1 to the SRCEN bit in SRCCTRL while the SRCEN bit is 0, for each bit in SRCSTAT to initialized.

However, because the CPU executes any subsequent instruction without waiting for the completion of writes to a register, the updated state of SRCSTAT cannot be correctly read by an instruction immediately after the write instruction to SRCCTRL. To check the updated state of SRCSTAT, perform a dummy read of SRCCTRL or SRCSTAT after the instruction used to write to SRCCTRL.

42.5.2 Notes on Flush Processing

When 1 is written to the FL bit in the SRC Control Register (SRCCTRL), the SRC continues conversion processing by adding 0-data to the input data endpoint. Because of this, only execute flush processing when the audio data endpoint is

4. 刷新处理开始后，重复步骤3，直到SRCSTAT中的CEF标志被读取为1。

注1.输出FIFO有16个阶段。当没有数据被读取并且在输出中发生溢出时转换停止
先进先出。即使在溢出状态下，也可以从输出FIFO中读取数据，但根据设置，可能需要重新启动转换的过程。（详见SRCCTRL中的OVEN位。）注2.当输出FIFO中的数据单元数为零时，读取的数据不正确。为防止这种情况，在设置DMAC连续传输的数据单元数时，请考虑OFTRG[1:0]位的设置。

42.4 Interrupts

SRC中断源包括：

- 输入FIFO为空(SRC_IDEI)
- 输出FIFO已满(SRC_ODFI)
- 输出FIFO溢出(SRC_OVFI)
- Output FIFO underflow (SRC_UDFI)
- 转换结束(SRC_CEFI)。

表42.7列出了中断请求类型和产生条件。

Table 42.7 中断请求和生成条件

中断请求	Abbreviation	中断条件	DMAC activation
输入FIFO为空	SRC_IDEI	IINT = 1, IEN = 1, and SRCEN = 1	Possible
输出FIFO已满	SRC_ODFI	OINT=1，OEN=1，SRCEN=1	Possible
输出FIFO溢出	SRC_OVFI	OVF=1，OVEN=1，SRCEN=1	不可能
Output FIFO underflow	SRC_UDFI	UDF = 1, UDEN = 1, and SRCEN = 1	不可能
转换结束	SRC_CEFI	CEF = 1, CEEN = 1, and SRCEN = 1	不可能

当满足中断条件时，CPU执行中断异常处理程序。在此例程中清除中断源标志。

SRC_IDEI和SRC_ODFI中断可以激活DMAC。如果DMAC被激活，则来自
SRC不发送到CPU。

在DMA传输过程中，不要通过CPU写（读1后写0）清除IINT和OINT标志。

42.5 使用说明

42.5.1 访问寄存器的注意事项

以下对SRCCTRL的写入需要3个外设时钟(PCLKB)周期才能在
SRCSTAT:

- 将1写入SRCCTRL中的FL位，以设置SRCSTAT中的FLF标志
- 将1写入SRCCTRL中的CL位，用于初始化SRCSTAT中的每个位
- 当SRCEN位为0时，将1写入SRCCTRL中的SRCEN位，以初始化SRCSTAT中的每个位。

但是，由于CPU无需等待寄存器写入完成就执行任何后续指令，因此在向SRCCTRL写入指令后立即执行的指令无法正确读取SRCSTAT的更新状态。要检查SRCSTAT的更新状态，请在用于写入SRCCTRL的指令之后执行SRCCTRL或SRCSTAT的虚拟读取。

42.5.2 冲洗处理注意事项

当将1写入SRC控制寄存器(SRCCTRL)中的FL位时，SRC通过将0数据添加到输入数据端点来继续进行转换处理。因此，仅在音频数据端点为

input and there is no subsequent data.

To perform conversion again after flush processing, clear the internal work memory in either of the following ways.

- Write 1 to the CL bit in SRCCTRL
- Write 0 and then 1 to the SRCEN bit in SRCCTRL.

42.5.3 Notes on DMAC or DTC Transfer

When the DMAC or DTC is used for data transfer to the I/O data registers (SRCID and SRCOD), do not clear the IINT and OINT flags in the Status Register (SRCSTAT) by the CPU (writing 0 after reading 1) during transfer by the DMAC or DTC.

42.5.4 Notes on SRC Operation

Do not access the Filter Coefficient Table while the SRC is operating (SRCCTRL.SRCEN = 1).

42.5.5 Settings for the Module-Stop Function

SRC operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The SRC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

输入，没有后续数据。

要在刷新处理后再次执行转换，请通过以下任一方式清除内部工作存储器。

- 将1写入SRCCTRL中的CL位
- 将0和1写入SRCCTRL中的SRCEN位。

42.5.3 关于DMAC或DTC传输的注意事项

当DMAC或DTC用于向IO数据寄存器（SRCID和SRCOD）传输数据时，CPU在传输过程中不要清除状态寄存器（SRCSTAT）中的IINT和OINT标志（读1后写0）。DMAC或DTC。

42.5.4 SRC操作注意事项

请勿在SRC运行时访问滤波器系数表(SRCCTRL.SRCEN=1)。

42.5.5 模块停止功能的设置

可以使用模块停止控制寄存器C(MSTPCRC)禁用或启用SRC操作。SRC模块在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

43. SD/MMC Host Interface (SDHI)

43.1 Overview

The Secure Digital Host Interface (SDHI) and MultiMediaCard (MMC) Interface provide the functionality required to connect a variety of external memory cards with the MCU. The SDHI supports both 1-bit and 4-bit buses for connecting different memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD Specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA).

The MMC interface supports 1-bit, 4-bit, and 8-bit MMC buses that provide eMMC 4.51 (JEDEC Standard JESD 84-B451) device access. This interface also provides backward compatibility and supports for high-speed SDR transfer modes.

Table 43.1 lists the SD/MMC Host Interface specifications and Figure 43.1 shows a block diagram.

Table 43.1 SD/MMC Host Interface specifications

Interface	Parameter	Specifications
SD	SD bus interface	• Compatible with SD memory card and SDIO card • Transfer bus mode selectable from 4-bit wide bus mode or 1-bit default bus mode • Compatible with SD, SDHC, and SDXC formats
SD and MMC shared	SDHI clock frequency	The SDHI clock is generated by dividing PCLKA by 2^n (n = 1 to 9).
	Error check functions	CRC7 (command/response), CRC16 (transfer data)
	Interrupt sources	Card access interrupt (SDHI_MMCn_ACCS), SDIO access interrupt (SDHI_MMCn_SDIO), Card detection interrupt (SDHI_MMCn_CARD) (n = 0 to 1)
	DMA transfer sources	DMAC and DTC triggerable by the SBFAI interrupt SD buffer is read and write accessible using the DMAC
	Other functions	• Card detect function • Write protect support
MMC	MMC bus interface	Transfer bus mode selectable from 1-bit, 4-bit, or 8-bit
	Transfer modes	Backward compatible mode or high-speed SDR mode selectable
	Other functions	e.MMC device access supported

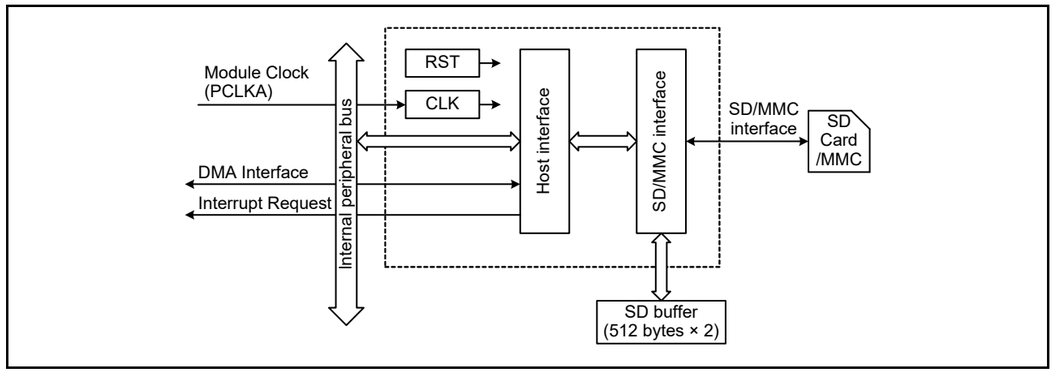

Figure 43.1 SD/MMC Host Interface block diagram

43. SDMMC主机接口(SDHI)

43.1 Overview

安全数字主机接口(SDHI)和多媒体卡(MMC)接口提供了将各种外部存储卡与MCU连接所需的功能。SDHI支持1位和4位总线，用于连接支持SD、SDHC和SDXC格式的不同存储卡。在开发符合SD规范的主机设备时，您必须遵守SD主机辅助产品许可协议(SDHALA)。

MMC接口支持提供eMMC4.51（JEDEC标准JESD84B451）器件访问的1位、4位和8位MMC总线。该接口还提供向后兼容性并支持高速SDR传输模式。

表43.1列出了SDMMC主机接口规范，图43.1显示了框图。

Table 43.1 SDMMC主机接口规格

Interface	Parameter	Specifications
SD	SD总线接口	兼容SD存储卡和SDIO卡 传输总线模式可选择4位宽总线模式或1位默认总线模式 兼容SD、SDHC和SDXC格式
SD和MMC共享	SDHI时钟频率	SDHI时钟是通过将PCLKA除以2n(n=1到9)生成的。
	错误检查功能	CRC7 (command/response), CRC16 (transfer data)
	中断源	卡访问中断(SDHI_MMCn_ACCS)、SDIO访问中断(SDHI_MMCn_SDIO)、卡检测中断(SDHI_MMCn_CARD)(n=0to1)
	DMA传输源	SBFAI中断可触发DMAC和DTC SD缓冲区可使用DMAC进行读写访问
	其他功能	卡检测功能 写保护支持
MMC	MMC总线接口	传输总线模式可选择1位、4位或8位
	传输模式	向后兼容模式或高速SDR模式可选
	其他功能	支持e.MMC设备访问

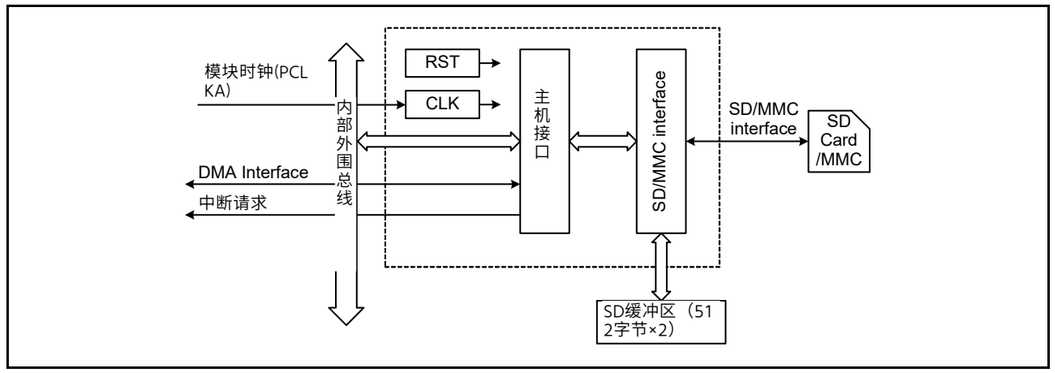

Figure 43.1 SDMMC主机接口框图

Table 43.2 SDHI I/O pins

Channel	Pin name	I/O	Description
Ch 0	SD0CLK	Output	SDHI clock
	SD0CMD	I/O	Command output, response input
	SD0DAT0	I/O	Data 0 (DAT0)
	SD0DAT1	I/O	Data 1 (DAT1), SDIO interrupt
	SD0DAT2	I/O	Data 2 (DAT2), SDIO Read wait
	SD0DAT3	I/O	Data 3 (DAT3), SD Card detect
	SD0DAT4	I/O	MMC Data 4 (DAT4)
	SD0DAT5	I/O	MMC Data 5 (DAT5)
	SD0DAT6	I/O	MMC Data 6 (DAT6)
	SD0DAT7	I/O	MMC Data 7 (DAT7)
	SD0CD	Input	SD card detection
	SD0WP	Input	SD card write protection
Ch 1	SD1CLK	Output	SDHI clock
	SD1CMD	I/O	Command output, response input
	SD1DAT0	I/O	Data 0 (DAT0)
	SD1DAT1	I/O	Data 1 (DAT1), SDIO interrupt
	SD1DAT2	I/O	Data 2 (DAT2), SDIO Read wait
	SD1DAT3	I/O	Data 3 (DAT3), SD Card detect
	SD1DAT4	I/O	MMC Data 4 (DAT4)
	SD1DAT5	I/O	MMC Data 5 (DAT5)
	SD1DAT6	I/O	MMC Data 6 (DAT6)
	SD1DAT7	I/O	MMC Data 7 (DAT7)
	SD1CD	Input	SD card detection
	SD1WP	Input	SD card write protection

43.2 Register Descriptions

43.2.1 Command Type Register (SD_CMD)

Address(es): SDHI0.SD_CMD 4006 2000h, SDHI1.SD_CMD 4006 2400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CMD12AT[1:0]		TRSTP	CMDRW	CMDTP	RSPTP[2:0]			ACMD[1:0]		CMDIDX[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	CMDIDX[5:0]	Command Index Field Value Select	These bits configure the command index field value. The examples shown include the bit values for the ACMD[1:0] bits. b7 b0 0 0 0 0 0 1 1 0: CMD6 0 0 0 1 0 0 1 0: CMD18 0 1 0 0 1 1 0 1: ACMD13	R/W

Table 43.2 SDHI I/O pins

Channel	引脚名称	I/O	Description
Ch 0	SD0CLK	Output	SDHI clock
	SD0CMD	I/O	命令输出，响应输入
	SD0DAT0	I/O	Data 0 (DAT0)
	SD0DAT1	I/O	数据1(DAT1)，SDIO中断
	SD0DAT2	I/O	数据2(DAT2)，SDIO读取等待
	SD0DAT3	I/O	数据3(DAT3)，SD卡检测
	SD0DAT4	I/O	MMC Data 4 (DAT4)
	SD0DAT5	I/O	MMC Data 5 (DAT5)
	SD0DAT6	I/O	MMC Data 6 (DAT6)
	SD0DAT7	I/O	MMC Data 7 (DAT7)
	SD0CD	Input	SD卡检测
	SD0WP	Input	SD卡写保护
Ch 1	SD1CLK	Output	SDHI clock
	SD1CMD	I/O	命令输出，响应输入
	SD1DAT0	I/O	Data 0 (DAT0)
	SD1DAT1	I/O	数据1(DAT1)，SDIO中断
	SD1DAT2	I/O	数据2(DAT2)，SDIO读取等待
	SD1DAT3	I/O	数据3(DAT3)，SD卡检测
	SD1DAT4	I/O	MMC Data 4 (DAT4)
	SD1DAT5	I/O	MMC Data 5 (DAT5)
	SD1DAT6	I/O	MMC Data 6 (DAT6)
	SD1DAT7	I/O	MMC Data 7 (DAT7)
	SD1CD	Input	SD卡检测
	SD1WP	Input	SD卡写保护

43.2 注册说明

43.2.1 命令类型寄存器(SD_CMD)

Address(es): SDHI0.SD_CMD 4006 2000h, SDHI1.SD_CMD 4006 2400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CMD12AT[1:0]		TRSTP	CMDRW	CMDTP	RSPTP[2:0]			ACMD[1:0]		CMDIDX[5:0]					
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	CMDIDX[5:0]	命令索引字段值选择	这些位配置命令索引字段值。所示示例包括ACMD[1:0]位的位值。 b7b000000110：CMD600010010：CMD18 01001101：ACMD13	R/W

Bit	Symbol	Bit name	Description	R/W
b7, b6	ACMD[1:0]	Command Type Select	b7 b6 0 0: CMD 0 1: ACMD. Other settings are prohibited.	R/W
b10 to b8	RSPTP[2:0]	Response Type Select*1	b10 b8 0 0 0: Normal mode Depending on the command, the response type and transfer method are selected in the ACMD[1:0] and CMDIDX[5:0] bits. At this time, the values for b15 to b11 in this register are invalid. 0 1 1: Extended mode and no response 1 0 0: Extended mode and R1, R5, R6, or R7 response 1 0 1: Extended mode and R1b response 1 1 0: Extended mode and R2 response 1 1 1: Extended mode and R3 or R4 response. Other settings are prohibited.	R/W
b11	CMDTP	Data Transfer Select*2	0: Do not include data transfer (bc, bcr, or ac) in command 1: Include data transfer (adtc) in command.	R/W
b12	CMDRW	Data Transfer Direction Select*3	0: Write (SD/MMC Host Interface → SD card/MMC) 1: Read (SD/MMC Host Interface ← SD card/MMC).	R/W
b13	TRSTP	Block Transfer Select*3	0: Single block transfer 1: Multiple blocks transfer.	R/W
b15, b14	CMD12AT[1:0]	CMD12 Automatic Issue Select*4	b15 b14 0 0: Automatically issue CMD12 during multiblock transfer 0 1: Do not automatically issue CMD12 during multiblock transfer. Other settings are prohibited.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Some commands cannot be used in normal mode.
Note 2. The CMDTP bit is only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b.
Note 3. Bits CMDRW and TRSTP are only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b, and the CMDTP bit is 1.
Note 4. The CMD12AT[1:0] bits are only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b, and the TRSTP bit is 1.

The command type and response type are set in the SD_CMD register. The command type and transfer mode must be set when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b. The sequence starts when a value is written to this register. See Table 43.8 and Table 43.9 for setting examples. Do not write to the SD_CMD register when the SD_INFO2.CBSY flag is 1.

43.2.2 SD Command Argument Register (SD_ARG)

Address(es): SDHI0.SD_ARG 4006 2008h, SDHI1.SD_ARG 4006 2408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	—	—	These bits specify command format[39:8] (argument).	R/W

The SD_ARG register is used for setting the argument field value. Set the SD_ARG register before setting the SD_CMD register. The argument field value of the automatically issued CMD12 is 0000_0000h regardless of the SD_ARG register value.

Bit	Symbol	位名称	Description	R/W
b7, b6	ACMD[1:0]	命令类型选择	b7b600：CMD01：ACMD。 禁止其他设置。	R/W
b10 to b8	RSPTP[2:0]	响应类型选择*1	b10 b8 0 0 0：正常模式 根据命令，在ACMD[1:0]和CMDIDX[5:0]位中选择响应类型和传输方法。此时，该寄存器中b15到b11的值无效。 0 1 1：扩展模式无响应 1 0 0：扩展模式和R1、R5、R6或R7响应 1 0 1：扩展模式和R1b响应 1 1 0：扩展模式和R2响应 11：扩展模式和R3或R4响应。禁止其他设置。	R/W
b11	CMDTP	数据传输选择*2	0：在命令中不包括数据传输（bc、bcr或ac）1：在命令中包括数据传输（adtc）。	R/W
b12	CMDRW	数据传输方向Select*3	0：写入（SDMMC主机接口→SD卡MMC）1：读取（SDMMC主机接口←SD卡MMC）。	R/W
b13	TRSTP	块传输选择*3	0：单块传输1：多块传输 。	R/W
b15, b14	CMD12AT[1:0]	CMD12自动发行Select*4	b15 b14 0 0：在多块传输过程中自动发出CMD12 01：在多块传输期间不自动发出CMD12。禁止其他设置。	R/W
b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 有些命令不能在正常模式下使用。
Note 2. CMDTP位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b时有效。
Note 3. 仅当RSPTP[2:0]位为011b、100b、101b、110b或111b且CMDTP位为1时，位CMDRW和TRSTP才有效。
Note 4. CMD12AT[1:0]位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b且TRSTP位为1时有效。

命令类型和响应类型在SD_CMD寄存器中设置。当RSPTP[2:0]位为011b、100b、101b、110b或111b时，必须设置命令类型和传输模式。当一个值被写入该寄存器时，序列开始。设置示例见表43.8和表43.9。当SD_INFO2.CBSY标志为1时，不要写入SD_CMD寄存器。

43.2.2 SD命令参数寄存器(SD_ARG)

Address(es): SDHI0.SD_ARG 4006 2008h, SDHI1.SD_ARG 4006 2408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b31 to b0	—	—	这些位指定命令格式[39:8]（参数）。	R/W

SD_ARG寄存器用于设置参数字段值。在设置SD_CMD寄存器之前设置SD_ARG寄存器。无论SD_ARG寄存器的值如何，自动发出的CMD12的参数字段值为0000_0000h。

43.2.3 SD Command Argument Register 1 (SD_ARG1)

Address(es): SDHI0.SD_ARG1 4006 200Ch, SDHI1.SD_ARG1 4006 240Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	—	These bits specify command format[39:24] (argument).	R/W
b31 to b16	—	Reserved	These bits are read as 0.	R

The SD_ARG1 register is used for setting the argument field value. Set the SD_ARG1 register before setting the SD_CMD register. The argument field value of the automatically issued CMD12 is 0000_0000h regardless of the SD_ARG1 register value.

43.2.4 Data Stop Register (SD_STOP)

Address(es): SDHI0.SD_STOP 4006 2010h, SDHI1.SD_STOP 4006 2410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SEC	—	—	—	—	—	—	—	STP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	STP	Transfer Stop	Data transfer stops when this bit is set to 1.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	SEC	Block Count Register Value Select *1	0: Disable SD_SECCNT register value 1: Enable SD_SECCNT register value.	R/W
b31 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The SD_STOP register stops data transfer. During a multiblock transfer sequence, the SD_SECCNT register value (number of blocks to be transferred) can be set to valid or invalid by setting the SD_STOP register.

STP bit (Transfer Stop)

When the STP bit is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SDHI. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP is set to 1, the buffer access error bit (ILR or ILW) in SD_INFO2 is set accordingly.

When STP is set to 1 during transfer for single block write, the access end flag sets when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag sets on completion of reception of the busy state

43.2.3 SD命令参数寄存器1(SD_ARG1)

Address(es): SDHI0.SD_ARG1 4006 200Ch, SDHI1.SD_ARG1 4006 240Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	—	—	这些位指定命令格式[39:24]（参数）。	R/W
b31 to b16	—	Reserved	这些位读为0。	R

SD_ARG1寄存器用于设置参数字段值。在设置SD_CMD寄存器之前设置SD_ARG1寄存器。自动发出的CMD12的参数字段值是0000_0000h与
SD_ARG1寄存器值。

43.2.4 数据停止寄存器(SD_STOP)

Address(es): SDHI0.SD_STOP 4006 2010h, SDHI1.SD_STOP 4006 2410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SEC	—	—	—	—	—	—	—	STP
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	STP	中转站	当该位设置为1时，数据传输停止。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b8	SEC	块计数寄存器值选择*1	0：禁用SD_SECCNT寄存器值1：启用SD_SECCNT寄存器值。	R/W
b31 to b9	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 当SD_INFO2.CBSY标志为1时，不要重写该位。

SD_STOP寄存器停止数据传输。在多块传输序列期间，可以通过设置SD_STOP寄存器将SD_SECCNT寄存器值（要传输的块数）设置为有效或无效。

STP位（传输停止）

在多块传输期间STP位设置为1时，发出CMD12以停止通过SDHI的传输。但是，如果命令序列由于通信错误或超时而停止，则不会发出CMD12。
尽管即使在STP设置为1后仍可以继续访问缓冲区，但缓冲区访问错误位（ILR或ILW）在SD_INFO2相应设置。

在单块写入的传输过程中将STP设置为1时，当SD_BUF为空时设置访问结束标志，并且不发出CMD12。如果SD_BUF确实包含数据，则在完成接收繁忙状态时设置访问结束标志

without CMD12 being issued.

When STP is set to 1 during transfer for single block read, the access end flag sets immediately after the STP bit is set, and CMD12 is not issued.

When STP is set to 1 during reception of the busy state after an R1b response, the access end flag sets on completion of reception of the busy state without CMD12 being issued.

When STP is set to 1 after a command sequence is completed, CMD12 is not issued and the access end flag does not set.

Set STP to 1 after the response end flag sets.

Set STP to 0 after the access end flag sets.

SEC bit (Block Count Register Value Select)

When SD_CMD is set in the following section to start the command sequence while the SEC bit is set to 1, CMD12 is automatically issued to stop multiblock transfer with the number of blocks set in SD_SECCNT.

CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000)

SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer)

When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.

43.2.5 Block Count Register (SD_SECCNT)

Address(es): SDHI0.SD_SECCNT 4006 2014h, SDHI1.SD_SECCNT 4006 2414h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

When performing a multiblock transfer, SD_SECCNT is a read/write register used to set the number of blocks to be transferred. For example, when the register value is 0000_0001h, 1 block is transferred. When the register value is 0000_FFFFh, 65,535 blocks are transferred and when the register value is FFFF_FFFFh, 4,294,967,295 blocks are transferred. Do not set this register to 0000_0000h. Do not rewrite the SD_SECCNT register when the SD_INFO2.CBSY flag is 1.

43.2.6 SD Card Response Register 10 (SD_RSP10), SD Card Response Register 32 (SD_RSP32), SD Card Response Register 54 (SD_RSP54)

Address(es): SDHI0.SD_RSP10 4006 2018h, SDHI1.SD_RSP10 4006 2418h, SDHI0.SD_RSP32 4006 2020h, SDHI1.SD_RSP32 4006 2420h SDHI0.SD_RSP54 4006 2028h, SDHI1.SD_RSP54 4006 2428h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

没有发出CMD12。

在单块读取传输期间STP设置为1时，在设置STP位后立即设置访问结束标志，并且不发出CMD12。

当在R1b响应后的忙状态接收期间STP设置为1时，访问结束标志在忙状态接收完成时设置，而不发出CMD12。

当命令序列完成后STP设置为1时，不发出CMD12并且不设置访问结束标志。

设置响应结束标志后将STP设置为1。

设置访问结束标志后将STP设置为0。

SEC位（块计数寄存器值选择）

当在以下部分中设置SD_CMD以启动命令序列而SEC位设置为1时，将自动发出CMD12以停止多块传输，其中块数在SD_SECCNT中设置。

正常模式下的CMD18或CMD25(SD_CMD[10:8]=000)

SD_CMD[15:13]=001扩展模式（CMD12自动下发，多块传输）

当命令序列由于通信错误或超时而停止时，不会自动发出CMD12。

43.2.5 块计数寄存器(SD_SECCNT)

Address(es): SDHI0.SD_SECCNT 4006 2014h, SDHI1.SD_SECCNT 4006 2414h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

执行多块传输时，SD_SECCNT是一个读写寄存器，用于设置要传输的块数。例如，当寄存器值为0000_0001h时，传输1个块。当寄存器值为0000_FFFFh时，传送65 535个块，当寄存器值为FFFF_FFFFh时，传送4 294 967 295个块。不要将此寄存器设置为0000_0000h。当SD_INFO2.CBSY标志为1时，不要重写SD_SECCNT寄存器。

43.2.6 SD卡响应寄存器10(SD_RSP10)、SD卡响应寄存器32(SD_RSP32)、SD卡响应寄存器54(SD_RSP54)

SD_RSP10, SD_RSP32, SD_RSP54, SD_RSP1, SD_RSP3, SD_RSP5, SD_RSP76, and SD_RSP7 are read-only registers that store the response from the SD card/MMC. Depending on the type of response from the SD card/MMC, the SD/MMC Host Interface divides and stores the response among the four registers.

Table 43.3 lists the correspondence between the response type and its storage destination.

Table 43.3 Correspondence between response type and storage destination

Response type	SD_RSP10 register	SD_RSP32 register	SD_RSP54 register	SD_RSP1 register	SD_RSP3 register	SD_RSP5 register	SD_RSP76 register	SD_RSP7 register
R1	[39:8]	—	[39:8]*1	—	—	—	—	—
R1b	[39:8]	—	[39:8]*1	—	—	—	—	—
R2	[39:8]	[71:40]	[103:72]	—	—	—	[127:104]	—
R3	[39:8]	—	—	—	—	—	—	—
R4	[39:8]	—	—	—	—	—	—	—
R5	[39:8]	—	—	—	—	—	—	—
R6	[39:8]	—	—	—	—	—	—	—
R7	[39:8]	—	—	—	—	—	—	—

Note 1. The responses for CMD18 and CMD25 are stored in registers SD_RSP10 and SD_RSP54. Therefore, even if the SD_RSP10 register is overwritten with the response for the automatically issued CMD12, the response for CMD18 or CMD25 can be confirmed by reading the SD_RSP54 register.

43.2.10 SD Card Interrupt Flag Register 1 (SD_INFO1)

Address(es): SDHI0.SD_INFO1 4006 2038h, SDHI1.SD_INFO1 4006 2438h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SDD3MON	SDD3IN	SDD3RM	SDWPMON	—	SDCDMON	SDCDIN	SDCDRM	ACEND	—	RSPENDD
Value after reset:	0	0	0	0	0	x	0	0	x	0	x	0	0	0*1	0	0*1

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	RSPEND	Response End Detection Flag	0: Response end not detected 1: Response end detected.	R(/W)*2
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b2	ACEND	Access End Detection Flag	0: Access end not detected 1: Access end detected.	R(/W)*2
b3	SDCDRM	SDnCD Removal Flag	0: SD card/MMC removal not detected by the SDnCD pin 1: SD card/MMC removal detected by the SDnCD pin.	R(/W)*2
b4	SDCDIN	SDnCD Insertion Flag	0: SD card/MMC insertion not detected by the SDnCD pin 1: SD card/MMC insertion detected by the SDnCD pin.	R(/W)*2
b5	SDCDMON	SDnCD Pin Monitor Flag	0: SDnCD pin level is high*3 1: SDnCD pin level is low.*3	R
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	SDWPMON	SDnWP Pin Monitor Flag	0: SDnWP pin level is high 1: SDnWP pin level is low.	R

Bit	Symbol	位名称	Description	R/W
b31 to b8	—	Reserved	这些位读为0。	R

SD_RSP10、SD_RSP32、SD_RSP54、SD_RSP1、SD_RSP3、SD_RSP5、SD_RSP76和SD_RSP7是只读寄存器，用于存储来自SD卡MMC的响应。根据SD卡MMC的响应类型，SDMMC主机接口在四个寄存器之间划分和存储响应。

表43.3列出了响应类型与其存储目的地的对应关系。

Table 43.3 响应类型与存储目的地的对应关系

响应类型	SD_RSP10 register	SD_RSP32 register	SD_RSP54 register	SD_RSP1 register	SD_RSP3 register	SD_RSP5 register	SD_RSP76 register	SD_RSP7 register
R1	[39:8]	—	[39:8]*1	—	—	—	—	—
R1b	[39:8]	—	[39:8]*1	—	—	—	—	—
R2	[39:8]	[71:40]	[103:72]	—	—	—	[127:104]	—
R3	[39:8]	—	—	—	—	—	—	—
R4	[39:8]	—	—	—	—	—	—	—
R5	[39:8]	—	—	—	—	—	—	—
R6	[39:8]	—	—	—	—	—	—	—
R7	[39:8]	—	—	—	—	—	—	—

Note 1. CMD18和CMD25的响应存储在寄存器SD_RSP10和SD_RSP54中。因此，即使SD_RSP10寄存器被自动发出的CMD12的响应覆盖，CMD18或CMD25的响应也可以通过读取SD_RSP54寄存器来确认。

43.2.10 SD卡中断标志寄存器1(SD_INFO1)

Address(es): SDHI0.SD_INFO1 4006 2038h, SDHI1.SD_INFO1 4006 2438h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SDD3MON	SDD3IN	SDD3RM	SDWPMON	—	SDCDMON	SDCDIN	SDCDRM	ACEND	—	RSPENDD
重置后的值:	0	0	0	0	0	x	0	0	x	0	x	0	0	0*1	0	0*1

x: Undefined

Bit	Symbol	位名称	Description	R/W
b0	RSPEND	响应结束检测标志	0：未检测到响应结束1：检测到响应结束。	R(/W)*2
b1	—	Reserved	该位读取为0。写入值应为0。	R/W
b2	ACEND	访问结束检测标志	0：未检测到访问结束1：检测到访问结束。	R(/W)*2
b3	SDCDRM	SDnCD删除标志	0：SDnCD引脚未检测到SD卡MMC移除1：SDnCD引脚检测到SD卡MMC移除。	R(/W)*2
b4	SDCDIN	SDnCD插入标志	0：SDnCD引脚未检测到SD卡MMC插入1：SDnCD引脚检测到SD卡MMC插入。	R(/W)*2
b5	SDCDMON	SDnCD引脚监控标志	0：SDnCD引脚高电平*31：SDnCD引脚低电平*3	R
b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b7	SDWPMON	SDnWP引脚监控标志	0：SDnWP引脚高电平1：SDnWP引脚低电平。	R

Bit	Symbol	Bit name	Description	R/W
b8	SDD3RM	SDnDAT3 Removal Flag	0: SD card/MMC removal not detected by the SDnDAT3 pin 1: SD card/MMC removal detected by the SDnDAT3 pin.	R(/W)*2
b9	SDD3IN	SDnDAT3 Insertion Flag	0: SD card/MMC insertion not detected by the SDnDAT3 pin 1: SD card/MMC insertion detected by the SDnDAT3 pin.	R(/W)*2
b10	SDD3MON	SDnDAT3 Pin Monitor Flag	0: SDnDAT3 pin level is low 1: SDnDAT3 pin level is high.	R
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.
Note 2. The flag does not change even if set to 1. Writing 0 changes the flag value to 0.
Note 3. The flag changes when the pin level continues for the period set in the SD_OPTION.CTOP[3:0] bits or longer.

The SD_INFO1 register indicates the detection of a response end or access end for a command sequence. The SD_INFO1 register also indicates the detection SD card/MMC insertion/removal and the write protection status.

During a multiblock transfer sequence, if CMD12 or CMD52 (SDIO abort) is issued, the ACEND flag sets to 1, but the RSPEND flag remains set to 0.

If the command sequence is stopped because of a communication error or timeout, the ACEND flag or RSPEND flag sets to 1.

After a reset is canceled, the SDD3MON bit, SDD3IN flag, and SDD3RM flag values are changed in accordance with the status of the SDnDAT3 (n = 0, 1) pin, and their values are changed when data is being transferred in wide bus mode. These 3 bits are used only for SD card. Set flags to be cleared to 0. Set flags that are not being cleared to 1.

RSPEND flag (Response End Detection Flag)

The RSPEND flag indicates that a response end was detected.

[Setting conditions]

- When reception of the response is completed
- When transmission of a command without response is completed
- When reception of the busy state after R1b response is completed
- When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed for transfer of multiple block read
- When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed for transfer of multiple block write
- This bit is set when a command sequence is halted because of a communications error or timeout.

[Clearing conditions]

- When 0 is written to RSPEND
- When a command without data is issued.

Note: When a command is issued in absence of data transfer, the RSPEND flag becomes 1 after the command sequence ends.

ACEND flag (Access End Detection Flag)

The ACEND flag indicates that an access end was detected.

[Setting conditions]

- When read access to the buffer is completed for transfer of single block read
- When read access to the buffer for the last block of data is completed for transfer of multiple block read
- When read access to the buffer and reception of the response to CMD12 are completed for transfer of multiple block read with automatic issuing of CMD12
- When reception of the busy state after reception of the CRC status is completed for transfer of single block write

Bit	Symbol	位名称	Description	R/W
b8	SDD3RM	SDnDAT3删除标志	0：SDnDAT3引脚未检测到SD卡MMC移除1：SDnDAT3引脚检测到SD卡MMC移除。	R(/W)*2
b9	SDD3IN	SDnDAT3插入标志	0：SDnDAT3引脚未检测到SD卡MMC插入1：SDnDAT3引脚检测到SD卡MMC插入。	R(/W)*2
b10	SDD3MON	SDnDAT3引脚监控标志	0：SDnDAT3引脚低电平1： SDnDAT3引脚高电平。	R
b31 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 该值由复位初始化，也由SOFT_RST.SDRST标志触发复位。
Note 2. 即使设置为1，标志也不会改变。写入0会将标志值更改为0。
Note 3. 当引脚电平持续SD_OPTION.CTOP[3:0]位中设置的周期或更长时间时，该标志会发生变化。

SD_INFO1寄存器指示对命令序列的响应结束或访问结束的检测。这
SD_INFO1寄存器还指示检测SD卡MMC插入移除和写保护状态。

在多块传输序列期间，如果发出CMD12或CMD52（SDIO中止），则ACEND标志设置为1，但
RSPEND标志保持设置为0。

如果命令序列由于通信错误或超时而停止，则ACEND标志或RSPEND标志设置为1。

复位取消后，SDD3MON位、SDD3IN标志和SDD3RM标志值根据SDnDAT3(n=0 1)引脚的状态而改变，并且在宽总线模式下传输数据时改变它们的值.这3位仅用于SD卡。将要清除的标志设置为0。将未清除的标志设置为1。

RSPEND标志（响应结束检测标志）

RSPEND标志表示检测到响应结束。

[Setting conditions]

- 响应接收完成时
- 当无响应的命令传输完成时
- 当R1b响应后忙状态的接收完成时
- 将C52PUB位设置为1发出的对CMD52的响应的接收完成时，用于传输多块读取
- 多块写入传送的C52PUB位为1的CMD52响应接收完成时
- 当命令序列由于通信错误或超时而停止时，该位被设置。

[Clearing conditions]

- 当0写入RSPEND时
- 发出没有数据的命令时。

Note: 当在没有数据传输的情况下发出命令时，RSPEND标志在命令序列结束后变为1。

ACEND标志（访问结束检测标志）

ACEND标志表示检测到访问结束。

[Setting conditions]

- 当完成对缓冲区的读取访问以传输单块读取时
- 当完成对最后一个数据块的缓冲区的读取访问以传输多块读取时
- 当对缓冲区的读取访问和对CMD12的响应的接收完成时，通过自动发出CMD12传输多块读取
- 接收CRC状态后的忙碌状态接收完成时，用于单块写入的传输

- When reception of the busy state after reception of the CRC status of the last block of data is completed for transfer of multiple block write
- When reception of the response busy state for CMD12 is completed for transfer of multiple block write with automatic issuing of CMD12
- When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed for transfer of multiple block read
- When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed for transfer of multiple block write
- When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed for transfer of multiple block read
- When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed for transfer of multiple block write
- This bit is set when a command sequence is halted because of a communications error or timeout.

[Clearing conditions]

- When 0 is written to ACEND
- When the access end bit is set to 1.

Note: The ACEND flag becomes 1 after the command sequence ends.

SDCDRM flag (SDnCD Removal Flag)

The SDCDRM flag indicates that SDnCD was removed.

[Setting condition]

- After a change in SDnCD from 0 to 1, Mcycle elapsed with SDnCD held at 1.

[Clearing conditions]

- When 0 is written to SDCDRM.

Note: Mcycle is set in bits [3:0] in SD_OPTION.

SDCDIN flag (SDnCD Insertion Flag)

The SDCDIN flag indicates that SDnCD was inserted.

[Setting condition]

- After a change in SDnCD from 1 to 0, Mcycle elapsed with SDnCD held at 0.

[Clearing conditions]

- When 0 is written to SDCDIN.

Note: Mcycle is set in bits [3:0] in SD_OPTION.

SDD3RM flag (SDnDAT3 Removal Flag)

The SDD3RM flag indicates that SDnDAT3 was removed.

[Setting condition]

- After a change in SDnDAT3 from 1 to 0, two cycles of PCLKA elapsed with SDnDAT3 held at 0.

[Clearing condition]

- When 0 is written to SDD3RM.

SDD3IN flag (SDnDAT3 Insertion Flag)

The SDD3IN flag indicates that SDnDAT3 was inserted.

[Setting condition]

- 当接收到最后一个数据块的CRC状态后的忙碌状态接收完成时，用于传输多块写入
- 当CMD12的响应忙状态接收完成时，用于传输多块写入并自动发出CMD12
- 当通过将STP位设置为1发出的对CMD12的响应的接收完成时，用于传输多块读取
- 当通过将STP位设置为1发出的CMD12的响应忙状态接收完成时，用于传输多块写入
- 将IOABT位设置为1发出的对CMD52的响应的接收完成时，用于传输多块读取
- 将IOABT位设置为1发出的对CMD52的响应的接收完成时，用于传输多块写入
- 当命令序列由于通信错误或超时而停止时，该位被设置。

[Clearing conditions]

- 当0写入ACEND时
- 当访问结束位设置为1时。

Note: 命令序列结束后ACEND标志变为1。

SDCDRM标志（SDnCD移除标志）

SDCDRM标志表明SDnCD已被删除。

[Setting condition]

- 在SDnCD从0变为1后，Mcycle过去了，而SDnCD保持在1。

[Clearing conditions]

- 当0写入SDCDRM时。

Note: Mcycle在SD_OPTION的位[3:0]中设置。

SDCDIN标志（SDnCD插入标志）

SDCDIN标志表明SDnCD已插入。

[Setting condition]

- 在SDnCD从1变为0后，Mcycle过去了，而SDnCD保持在0。

[Clearing conditions]

- 当0写入SDCDIN时。

Note: Mcycle在SD_OPTION的位[3:0]中设置。

SDD3RM标志（SDnDAT3移除标志）

SDD3RM标志表示SDnDAT3已被删除。

[Setting condition]

- 在SDnDAT3从1变为0后，经过两个PCLKA周期，SDnDAT3保持在0。

[Clearing condition]

- 当0写入SDD3RM时。

SDD3IN标志（SDnDAT3插入标志）

SDD3IN标志表示SDnDAT3已插入。

[Setting condition]

- After a change in SDnDAT3 from 0 to 1, two cycles of PCLKA elapsed with SDnDAT3 held at 1.

[Clearing condition]

- When 0 is written to SDD3IN.

43.2.11 SD Card Interrupt Flag Register 2 (SD_INFO2)

Address(es): SDHI0.SD_INFO2 4006 203Ch, SDHI1.SD_INFO2 4006 243Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	CMDE	Command Error Detection Flag	0: Command error not detected 1: Command error detected.	R/W*1
b1	CRCE	CRC Error Detection Flag	0: CRC error not detected 1: CRC error detected.	R/W*1
b2	ENDE	End Bit Error Detection Flag	0: End bit error not detected 1: End bit error detected.	R/W*1
b3	DTO	Data Timeout Detection Flag	0: Data timeout not detected 1: Data timeout detected.	R/W*1
b4	ILW	SD_BUF0 Illegal Write Access Detection Flag	0: Illegal write access to the SD_BUF0 register not detected 1: Illegal write access to the SD_BUF0 register detected.	R/W*1
b5	ILR	SD_BUF0 Illegal Read Access Detection Flag	0: Illegal read access to the SD_BUF0 register not detected 1: Illegal read access to the SD_BUF0 register detected.	R/W*1
b6	RSPTO	Response Timeout Detection Flag	0: Response timeout not detected 1: Response timeout detected.	R/W*1
b7	SDD0MON	SDHI_D0 Pin Status Flag	0: SDnDAT0 pin is low 1: SDnDAT0 pin is high.	R
b8	BRE	SD_BUF0 Read Enable Flag	0: Disable read access to the SD_BUF0 register 1: Enable read access to the SD_BUF0 register.	R/W*1
b9	BWE	SD_BUF0 Write Enable Flag	0: Disable write access to the SD_BUF0 register 1: Enable write access to the SD_BUF0 register.	R/W*1
b12 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13	SD_CLK_CTRLEN	SD_CLK_CTRL Write Enable Flag	0: SD/MMC bus (CMD and DAT lines) is busy, so write access to the SD_CLK_CTRL.CLKEN and CLKSEL[7:0] bits is disabled 1: SD/MMC bus (CMD and DAT lines) is not busy, so write access to the SD_CLK_CTRL.CLKEN and CLKSEL[7:0] bits is enabled.	R
b14	CBSY	Command Sequence Status Flag	0: Command sequence complete 1: Command sequence in progress (busy).	R
b15	ILA	Illegal Access Error Detection Flag	0: Illegal access error not detected 1: Illegal access error detected.	R/W*1
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The flag does not change even if set to 1. Writing 0 changes the flag value to 0.

The SD_INFO2 register indicates the status of the SD buffer and the status of the SD card/MMC. Set flags to be cleared

- 在SDnDAT3从0变为1后，经过两个PCLKA周期，SDnDAT3保持在1。

[Clearing condition]

- 当0写入SDD3IN时。

43.2.11 SD卡中断标志寄存器2(SD_INFO2)

Address(es): SDHI0.SD_INFO2 4006 203Ch, SDHI1.SD_INFO2 4006 243Ch

b13	SD_CLK_CTRLEN	SD_CLK_CTRL写使能Flag	0：SDMMC总线（CMD和DAT线）忙，所以写对SD_CLK_CTRL.CLKEN和CLKSEL[7:0]位的访问被禁用1：SDMMC总线（CMD和DAT线）不忙，因此对SD_CLK_CTRL.CLKEN和CLKSEL[7:0]位的写访问被启用。	R
b14	CBSY	命令序列状态Flag	0：命令序列完成1：命令序列正在进行中（忙碌）。	R
b15	ILA	非法访问错误检测Flag	0：未检测到非法访问错误1：检测到非法访问错误。	R/W*1
b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 即使设置为1，标志也不会改变。写入0会将标志值更改为0。

SD_INFO2寄存器指示SD缓冲区的状态和SD卡MMC的状态。设置要清除的标志

to 0. Set flags that are not being cleared to 1.

CMDE flag (Command Error Detection Flag)

The CMDE flag indicates that a command error was detected. The command sequence stops when a command error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section section 43.3.12, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 43.3.13, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

- The command index of the transmitted command differs from the command index of the received response.
- The command index of a command issued within a command sequence differs from the command index of the received response.

[Clearing condition]

- When 0 is written to CMDE.

CRCE flag (CRC Error Detection Flag)

The CRCE flag indicates that a CRC error was detected. The command sequence stops when a CRC error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section 43.3.12, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 43.3.13, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

- When an error occurs in the CRC status.
- When a CRC error occurs in the read data.
- When a CRC error occurs in the response.
- A CRC error in the response to a command issued within a command sequence.

[Clearing condition]

- When 0 is written to CRCE.

ENDE flag (End Bit Error Detection Flag)

The ENDE flag indicates that an end bit error was detected. The command sequence is stopped when an end bit error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section 43.3.12, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 43.3.13, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

- When an error occurs in the response length (and the end bit is not detected).
- When an error occurs in the read data length (and the end bit is not detected among the valid bits).
- When an error occurs in the CRC status length (and the end bit is not detected).
- An error in the length of a response to a command issued within a command sequence, for example when the end bit is not detected.

[Clearing condition]

- When 0 is written to ENDE.

DTO flag (Data Timeout Detection Flag)

The DTO flag indicates that a data timeout was detected. The command sequence stops when a data timeout occurs.

[Setting conditions]

为0。将未清除的标志设置为1。

CMDE标志（命令错误检测标志）

CMDE标志指示检测到命令错误。发生命令错误时命令序列停止。当SDIO_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行第43.3.12节，IO_RW_EXTENDED命令（SD：CMD53多块读取）或43.3.13节，IO_RW_EXTENDED命令（SD：CMD53多块写入）中所示的错误处理，并完成命令序列。

[Setting conditions]

- 发送命令的命令索引与接收响应的命令索引不同。
- 在命令序列中发出的命令的命令索引与接收到的响应的命令索引不同。

[Clearing condition]

- 当0写入CMDE时。

CRCE标志（CRC错误检测标志）

CRCE标志表示检测到CRC错误。当发生CRC错误时，命令序列停止。当SDIO_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行第43.3.12节，IO_RW_EXTENDED命令（SD：CMD53多块读取）或第43.3.13节，IO_RW_EXTENDED中所示的错误处理

命令（SD：CMD53MultipleBlockWrite），完成命令序列。

[Setting conditions]

- CRC状态发生错误时。
- 当读取的数据发生CRC错误时。
- 当响应中出现CRC错误时。
- 对命令序列中发出的命令的响应中的CRC错误。

[Clearing condition]

- 当0写入CRCE时。

ENDE标志（结束位错误检测标志）

ENDE标志表示检测到结束位错误。当发生结束位错误时，命令序列停止。当SDIO_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行43.3.12节，IO_RW_EXTENDED命令（SD：CMD53多块读取）或43.3.13节，IO_RW_EXTENDED命令（SD：CMD53多块写入）中所示的错误处理，并完成命令序列。

[Setting conditions]

- 响应长度发生错误时（未检测到结束位）。
- 当读取数据长度发生错误时（有效位中未检测到结束位）。
- CRC状态长度发生错误时（未检测到结束位）。
- 对命令序列中发出的命令的响应长度错误，例如未检测到结束位时。

[Clearing condition]

- 当0写入ENDE时。

DTO标志（数据超时检测标志）

DTO标志表示检测到数据超时。当发生数据超时时，命令序列停止。

[Setting conditions]

- After R1b response, the busy state (SDnDAT0 = 0) continues for longer than Ncycle.
- After CRC status, the busy state (SDnDAT0 = 0) continues for longer than Ncycle.
- After write data, the CRC status is not received though Ncycle has elapsed.
- After read command, read data is not received though a time longer than Ncycle has elapsed.
- After CMD12 is issued within a command sequence, the busy state (SDnDAT0 = 0) for longer than Ncycle continues.
- After the reception of read data, read data for the next block are not received though a time longer than Ncycle has elapsed.
- After release of the read wait state, read data for the next block are not received though a time longer than Ncycle has elapsed.

Note: Ncycle is set in bits [7:4] in SD_OPTION.

[Clearing condition]

- When 0 is written to DTO.

ILW flag (SD_BUF0 Illegal Write Access Detection Flag)

The ILW flag indicates that an SD_BUF0 illegal write access was detected.

[Setting conditions]

- When data is written to SD_BUF0 while it is not in the data read/write command state.
- When data is written to SD_BUF0 while SD_BUF is full.
- When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length.
- When data is written to SD_BUF0 while a busy state after the CRC status continues for longer than Ncycle.

Note: Ncycle is set in bits [7:4] in SD_OPTION.

[Clearing condition]

- When 0 is written to ILW.

ILR flag (SD_BUF0 Illegal Read Access Detection Flag)

The ILR flag indicates that an SD_BUF0 illegal read access was detected.

[Setting conditions]

- When SD_BUF is empty while SD_BUF0 is read.
- When data with a CRC error or END error is read from SD_BUF0.

[Clearing condition]

- When 0 is written to ILR.

RSPTO flag (Response Timeout Detection Flag)

The RSPTO flag indicates that a response timeout was detected. The command sequence is stopped when a response timeout occurs. When the SDIOMD.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section 43.3.12, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 43.3.13, IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting condition]

- When a response is not received though a time longer than 640 cycles of SD/MMC clock has elapsed (including a response to a command issued within a command sequence).

[Clearing condition]

- When 0 is written to RSPTO.

- 在R1b响应后，忙碌状态(SDnDAT0=0)持续时间超过Ncycle。
- 在CRC状态之后，忙碌状态(SDnDAT0=0)持续时间超过Ncycle。
- 写入数据后，虽然Ncycle已过，但未收到CRC状态。
- 在读取命令之后，虽然经过了超过Ncycle的时间，但没有接收到读取数据。
- 在命令序列内发出CMD12后，忙碌状态(SDnDAT0=0)持续时间超过Ncycle。
- 在接收到读取数据后，虽然经过了Ncycle以上的时间，但没有接收到下一个块的读取数据。
- 读取等待状态解除后，虽然经过了Ncycle以上的时间，但未接收到下一个块的读取数据。

Note: Ncycle在SD_OPTION的位[7:4]中设置。

[Clearing condition]

- 当0写入DTO时。

ILW标志（SD_BUF0非法写访问检测标志）

ILW标志表示检测到SD_BUF0非法写访问。

[Setting conditions]

- 当数据写入SD_BUF0而不是数据读写命令状态时。
- 当SD_BUF已满时将数据写入SD_BUF0。
- 当数据写入SD_BUF0且CRC状态或CRC状态长度发生错误时。
- 当数据写入SD_BUF0时，CRC状态后的忙碌状态持续时间超过Ncycle。

Note: Ncycle在SD_OPTION的位[7:4]中设置。

[Clearing condition]

- 当0写入ILW时。

ILR标志（SD_BUF0非法读访问检测标志）

ILR标志表示检测到SD_BUF0非法读取访问。

[Setting conditions]

- 当SD_BUF为空而SD_BUF0被读取时。
- 当从SD_BUF0读取具有CRC错误或END错误的数据时。

[Clearing condition]

- 当0写入ILR时。

RSPTO标志（响应超时检测标志）

RSPTO标志表示检测到响应超时。当发生响应超时时，命令序列停止。当SDIOMD.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行43.3.12节，IO_RW_EXTENDED命令（SD：CMD53多块读取）或43.3.13节，IO_RW_EXTENDED命令（SD：CMD53多块写入）中所示的错误处理，并完成命令序列。

[Setting condition]

- 超过640个SDMMC时钟周期后仍未收到响应时（包括对命令序列内发出的命令的响应）。

[Clearing condition]

- 当0写入RSPTO时。

SDD0MON flag (SDHI_D0 Pin Status Flag)

The SDD0MON flag indicates the status of the SDHI_D0 pin. If the data timeout (DTO) is set but the response timeout (RSPTO) is not set after the Erase command is issued, the end of the Erase sequence (SDD0MON = 1) is confirmed by polling DAT0.

If a communication error or timeout occurs during a write sequence, the DAT0 bit might retain the value 0.

While the SD/MMC clock is stopped, the DAT0 bit retains the value before the clock is stopped.

BRE flag (SD_BUF0 Read Enable Flag)

The BRE flag indicates that SD_BUF0 is enabled for reading.

[Setting conditions]

- When data set in SD_SIZE is stored in SD_BUF0 at single block transfer.
- When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF0 at multiple block transfer.

[Clearing conditions]

- When 0 is written to BRE
- Reading of a block of data from SD_BUF0 by DMA transfer

When data is read from SD_BUF0 by the CPU, clear BRE then read the amount of data specified in SD_SIZE.

Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF0 and BRE is set.

BWE flag (SD_BUF0 Write Enable Flag)

The BWE flag indicates that SD_BUF0 is enabled for writing.

[Setting conditions]

- When SD_BUF0 is empty at single block transfer.
- When either bank 1 or bank 2 of SD_BUF0 is empty at multiple block transfer.

[Clearing conditions]

- When 0 is written to BWE.
- Writing of a block of data to SD_BUF0 by DMA transfer.

When data is written to SD_BUF0 by the CPU, clear BWE and then write the amount of data specified in SD_SIZE.

SD_CLK_CTRLEN flag (SD_CLK_CTRL Write Enable Flag)

When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SD_CLK_CTRLEN bit is set to 0. The SD_CLK_CTRLEN bit is set to 1 after 8 cycles of SDCLK have elapsed after the CBSY bit clears to 0 on completion of the command sequence.

ILA flag (Illegal Access Error Detection Flag)

The ILA flag indicates that an illegal access error was detected.

[Setting conditions]

- Writing of data to SD_CMD within a command sequence (CBSY = 1).
- When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000 1100b (CMD12) are set in SD_CMD.

[Clearing condition]

- When 0 is written to ILA.

SDD0MON标志（SDHI_D0引脚状态标志）

SDD0MON标志指示SDHI_D0引脚的状态。如果在发出擦除命令后设置了数据超时(DTO)但未设置响应超时(RSPTO)，则通过轮询DAT0确认擦除序列的结束(SDD0MON=1)。

如果在写入序列期间发生通信错误或超时，则DAT0位可能会保留值0。

SDMMC时钟停止时，DAT0位保持时钟停止前的值。

BRE标志（SD_BUF0读使能标志）

BRE标志指示SD_BUF0已启用读取。

[Setting conditions]

- 当SD_SIZE中设置的数据在单块传输时存储在SD_BUF0中时。
- 当SD_SIZE中设置的数据在多块传输时存储在SD_BUF0的bank1或bank2中时。

[Clearing conditions]

- 当0写入BRE
- 通过DMA传输从SD_BUF0读取数据块

当CPU从SD_BUF0读取数据时，清除BRE，然后读取SD_SIZE中指定的数据量。

即使在读取块数据时发生CRC错误或END错误，数据也会存储在SD_BUF0中并设置BRE。

BWE标志（SD_BUF0写使能标志）

BWE标志指示SD_BUF0已启用写入。

[Setting conditions]

- 当SD_BUF0在单块传输时为空时。
- 当SD_BUF0的bank1或bank2在多块传输中为空时。

[Clearing conditions]

- 当0写入BWE时。
- 通过DMA传输将数据块写入SD_BUF0。

当CPU将数据写入SD_BUF0时，清除BWE，然后写入SD_SIZE中指定的数据量。

SD_CLK_CTRLEN标志（SD_CLK_CTRL写使能标志）

当通过写入SD_CMD启动命令序列时，CBSY位设置为1，同时，SD_CLK_CTRLEN位设置为0。SD_CLK_CTRLEN位在SDCLK 的8个周期后设置为1。CBSY位在命令序列完成时清零。

ILA标志（非法访问错误检测标志）

ILA标志表示检测到非法访问错误。

[Setting conditions]

- 在命令序列(CBSY=1)内将数据写入SD_CMD。
- 当SD_CMD[11]=1（带数据传输的命令）且SD_CMD[7:0]=00001100b(CMD12)设置为SD_CMD.

[Clearing condition]

- 当0写入ILA时。

43.2.12 SD INFO1 Interrupt Mask Register (SD_INFO1_MASK)

Address(es): SDHI0.SD_INFO1_MASK 4006 2040h, SDHI1.SD_INFO1_MASK 4006 2440h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R

Note 1. 当SD_INFO2_MASK.BWEM位为0或SD_INFO2_MASK.BREM位为0时，将SD_DMAEN.DMAEN位设置为0。当SD_DMAEN.DMAEN位为1时，将SD_INFO2_MASK.BWEM位设置为1，SD_INFO2_MASK.BREM位设置为1.

SD_INFO2_MASK寄存器启用或禁用来自SD_INFO2寄存器中状态标志的中断请求。
有关状态标志和请求中断源之间关系的详细信息，请参见表43.5。

43.2.14 SD Clock Control Register (SD_CLK_CTRL)

Address(es): SDHI0.SD_CLK_CTRL 4006 2048h, SDHI1.SD_CLK_CTRL 4006 2448h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CLKCTRLEN	CLKEN	CLKSEL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CLKSEL[7:0]	SDHI Clock Frequency Select*1	b7 b0 0 0 0 0 0 0 0 0: PCLKA/2 0 0 0 0 0 0 0 1: PCLKA/4 0 0 0 0 0 0 1 0: PCLKA/8 0 0 0 0 0 1 0 0: PCLKA/16 0 0 0 0 1 0 0 0: PCLKA/32 0 0 0 1 0 0 0 0: PCLKA/64 0 0 1 0 0 0 0 0: PCLKA/128 0 1 0 0 0 0 0 0: PCLKA/256 1 0 0 0 0 0 0 0: PCLKA/512. Other settings are prohibited.	R/W
b8	CLKEN	SD/MMC Clock Output Control*1	0: Disable SD/MMC clock output (fix SDnCLK signal low) 1: Enable SD/MMC clock output.	R/W
b9	CLKCTRLEN	SD/MMC Clock Output Automatic Control Select	0: Disable automatic control of SD/MMC clock output 1: Enable automatic control of SD/MMC clock output.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Bits CLKSEL[7:0] and CLKEN cannot be write accessed when the SD_INFO2.SD_CLK_CTRLEN flag is 0.

The SDCLKCTRL register controls the SD/MMC clock frequency settings and output. Set the CLKEN bit to 1 before writing to the SD_CMD register to start a command sequence. Do not write to the SDCLKCTRL register when the SD_INFO2.SD_CLK_CTRLEN flag is 0.

CLKCTRLEN bit (SD/MMC Clock Output Automatic Control Select)

The CLKCTRLEN bit enables or disables the automatic control function for SD/MMC clock output, which causes the SD/MMC clock to output only within a command sequence.

The timing with which SD/MMC clock output starts and stops is as follows:

- SD/MMC clock output starts after writing to SD_CMD
- SD/MMC clock output stops when 8 cycles of SD/MMC clock have elapsed after the end of the command sequence.

In addition, SD/MMC clock is fixed to 0 while CLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.

43.2.14 SD时钟控制寄存器(SD_CLK_CTRL)

Address(es): SDHI0.SD_CLK_CTRL 4006 2048h, SDHI1.SD_CLK_CTRL 4006 2448h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CLKCTRLEN	CLKEN	CLKSEL[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	CLKSEL[7:0]	SDHI时钟频率 Select*1	b7b000000000：PCLKA200 000001：PCLKA400000010 ：PCLKA800000100：PCLK A1600001000：PCLKA3200 010000：PCLKA640010000 0：PCLKA12801000000：P CLKA25610000000：PCLKA 512.禁止其他设置。	R/W
b8	CLKEN	SDMMC时钟输出 Control*1	0：禁用SDMMC时钟输出（固定SDnCLK信号为低电平） 1：启用SDMMC时钟输出。	R/W
b9	CLKCTRLEN	SDMMC时钟输出自动控制选择	0：禁止SDMMC时钟输出自动控制1：使能SDMMC时钟输出自动控制。	R/W
b31 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 当SD_INFO2.SD_CLK_CTRLEN标志为0时，不能写访问位CLKSEL[7:0]和CLKEN。

SDCLK CTRL寄存器控制SDMMC时钟频率设置和输出。在写入SD_CMD寄存器以启动命令序列之前，将CLKEN位设置为1。当SD_INFO2.SD_CLK_CTRLEN标志为0时，不要写入SDCLK CTRL寄存器。

CLKCTRLEN位（SDMMC时钟输出自动控制选择）

CLKCTRLEN位启用或禁用SDMMC时钟输出的自动控制功能，这会导致SDMMC时钟仅在命令序列内输出。

SDMMC时钟输出开始和停止的时序如下：

- SDMMC时钟输出在写入SD_CMD后开始
- 在命令序列结束后经过8个SDMMC时钟周期时，SDMMC时钟输出停止。

此外，SDMMC时钟固定为0，而SD_CLK_CTRL的CLKEN为0，与该位的值无关。

43.2.15 Transfer Data Length Register (SD_SIZE)

Address(es): SDHI0.SD_SIZE 4006 204Ch, SDHI1.SD_SIZE 4006 244Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	LEN[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b9 to b0	LEN[9:0]	Transfer Data Size Setting	These bits specify the transfer data size.*1	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Do not rewrite these bits when the SD_INFO2.CBSY flag is 1.

The SD_SIZE register sets the transfer data size.

LEN[9:0] bits (Transfer Data Size Setting)

When using single block transfer, the transfer data size can be set in the LEN[9:0] bits from 1 byte to 512 bytes. When CMD12 is automatically issued during a multiblock transfer sequence (CMD18 and CMD25), the transfer data size can only be set to 512 bytes. When CMD12 is not automatically issued during a multiblock transfer sequence, the transfer data size can be set to 32, 64, 128, 256, or 512 bytes. However, a 32-, 64-, 128-, or 256-byte multiblock read transfer can only be performed during an SDIO multiblock transfer (CMD53). Do not set these bits to 0 when using a command that includes data transfer.

43.2.16 SD Card Access Control Option Register (SD_OPTION)

Address(es): SDHI0.SD_OPTION 4006 2050h, SDHI1.SD_OPTION 4006 2450h

Bit	Symbol	位名称	Description	R/W
b9 to b0	LEN[9:0]	传输数据大小设置	这些位指定传输数据大小。*1	R/W
b31 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R

Note 1. 当SD_INFO2.CBSY标志为1时，不要重写这些位。

SD_SIZE寄存器设置传输数据大小。

LEN[9:0]位（传输数据大小设置）

使用单块传输时，传输数据大小可以在LEN[9:0]位中设置，从1字节到512字节。在多块传输序列（CMD18和CMD25）期间自动发出CMD12时，传输数据大小只能设置为512字节。在多块传输序列期间未自动发出CMD12时，传输数据大小可设置为32、64、128、256或512字节。但是，只能在SDIO多块传输(CMD53)期间执行32、64、128或256字节的多块读取传输。使用包含数据传输的命令时，请勿将这些位设置为0。

43.2.16 SD卡访问控制选项寄存器(SD_OPTION)

Address(es): SDHI0.SD_OPTION 4006 2050h, SDHI1.SD_OPTION 4006 2450h

x: Undefined

When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers.

If both buffers are not empty when executing multiple block read, the SD card/MMC clock is stopped to suspend receiving data. When one of the buffers is empty, the SD card/MMC clock is supplied to resume receiving data.

Bit	Symbol	位名称	Description	R/W
b2	BSYTO0	忙超时标志0	0：收到R1b响应后，SDMMC在指定时间段内从忙状态释放*31：收到R1b响应后，SDMMC在指定时间段后处于忙状态*3过去。	R

重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

x: Undefined

写入SD卡时，写入数据写入该寄存器。从SD卡读取时，从该寄存器读取读取的数据。该寄存器在内部连接到两个512字节的缓冲区。

如果执行多块读取时两个缓冲区都不为空，则停止SD卡MMC时钟以暂停接收数据。当其中一个缓冲区为空时，提供SD卡MMC时钟以恢复接收数据。

43.2.20 SDIO Mode Control Register (SDIO_MODE)

Address(es): SDHI0.SDIO_MODE 4006 2068h, SDHI1.SDIO_MODE 4006 2468h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	C52PUB	IOABT	—	—	—	—	—	RWREQ	—	INTEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	INTEN	SDIO Interrupt Acceptance Enable*1	0: Disable SDIO interrupt acceptance 1: Enable SDIO interrupt acceptance.	R/W
b1	—	Reserved	This bit is read as 0.	R
b2	RWREQ	Read Wait Request	0: Allow SD/MMC to exit read wait state 1: Request for SD/MMC to enter read wait state.	R/W
b7 to b3	—	Reserved	These bits are read as 0.	R
b8	IOABT	SDIO Abort	If this bit is set to 1 during multiblock transfer triggered by CMD53, CMD52 is immediately issued, and the command sequence is aborted.	R/W
b9	C52PUB	SDIO None Abort	If this bit is set to 1 during multiblock transfer triggered by CMD53, CMD52 is issued after the transfer process is complete, and the command sequence is completed.	R/W
b31 to b10	—	Reserved	These bits are read as 0.	R

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The SDIO_MODE register controls reception of the SDIO interrupt, CMD52 issuance during multiblock transfer, and read wait request. Do not set bits C52PUB and IOABT to 1 at the same time.

RWREQ bit (Read Wait Request)

When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks.

[Read wait state releasing]

- The read wait state is released, when RWREQ is cleared to 0 in the read wait state.
- When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 is issued, and then the read wait state is released.
- When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. You must set RWREQ and C52PUB simultaneously.

When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag sets.

IOABT bit (SDIO Abort)

When the IOABT bit is set to 1 in a CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communication error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT is set to 1, the buffer access error bit (ILR or ILW) in SD_INFO2 is set accordingly. Set SD_ARG before setting IOABT to 1.

43.2.20 SDIO模式控制寄存器(SDIO_MODE)

Address(es): SDHI0.SDIO_MODE 4006 2068h, SDHI1.SDIO_MODE 4006 2468h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	C52PUB	IOABT	—	—	—	—	—	RWREQ	—	INTEN
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	INTEN	SDIO中断接受Enable*1	0：禁止SDIO中断接受1：使能SDIO中断接受。	R/W
b1	—	Reserved	该位读为0。	R
b2	RWREQ	读取等待请求	0：允许SDMMC退出读取等待状态1：请求SDMMC进入读取等待状态。	R/W
b7 to b3	—	Reserved	这些位读为0。	R
b8	IOABT	SDIO Abort	如果在CMD53触发的多块传输期间该位设置为1，立即发出CMD52，并中止命令序列。	R/W
b9	C52PUB	SDIO无中止	如果在CMD53触发的多块传输期间该位设置为1，传输过程完成后发出CMD52，命令序列完成。	R/W
b31 to b10	—	Reserved	这些位读为0。	R

Note 1. 当SD_INFO2.CBSY标志为1时，不要重写该位。

SDIO_MODE寄存器控制SDIO中断的接收、多块传输期间CMD52的发布和读取等待请求。不要同时将位C52PUB和IOABT设置为1。

RWREQ位（读取等待请求）

当CMD53（多块）读取序列中RWREQ设置为1时，块传输进入块之间的读取等待状态。

[读取等待状态释放]

- 当RWREQ在读等待状态下被清除为0时，读等待状态被释放。
- 当IOABT在读等待状态下置1时，RWREQ在发出CMD52后自动清0，然后解除读等待状态。
- 当C52PUB和RWREQ在CMD53（多块）读取序列中同时设置为1时，读取等待状态不会自动释放。因此，在收到CMD52响应后，清除RWREQ。您必须同时设置RWREQ和C52PUB。

当RWREQ设置为1时CMD53（多块）读取序列中的最后一个块被传输时，不会进入读取等待状态，并且通过设置访问结束将RWREQ自动清除为0。设置响应结束标志后将RWREQ设置为1。

IOABT位（SDIO中止）

当CMD53（多块）序列中的IOABT位设置为1时，CMD53序列停止并发出CMD52。但是，如果命令序列由于通信错误或超时而停止，则不会发出CMD52。尽管即使在IOABT设置为1后仍可以继续访问缓冲区，但缓冲区访问错误位（ILR或ILW）在

SD_INFO2相应设置。在将IOABT设置为1之前设置SD_ARG。

When IOABT is set to 1 during transfer for a single block write, the access end flag sets when SD_BUF0 becomes empty, and CMD52 is not issued. If SD_BUF0 contains data, the access end flag sets on completion of reception of the busy state without CMD52 being issued.

When IOABT is set to 1 during transfer for single block read, the access end flag sets immediately after IOABT is set, and CMD52 is not issued.

When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag sets on completion of reception of the busy state without CMD52 being issued.

When IOABT is set to 1 after a command sequence is completed, CMD52 is not issued and the access end flag does not set.

Set IOABT to 1 after the response end flag sets.

Set IOABT to 0 after the access end flag sets.

C52PUB bit (SDIO None Abort)

When the C52PUB bit is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF0 becomes empty. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag sets to 1.

When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag sets to 1.

If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, you must set RWREQ to 1 in addition to C52PUB.

Set SD_ARG before setting C52PUB to 1.

Set C52PUB to 1 after the response end flag sets.

43.2.21 SDIO Interrupt Flag Register (SDIO_INFO1)

Address(es): SDHI0.SDIO_INFO1 4006 206Ch, SDHI1.SDIO_INFO1 4006 246Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EXWT	EXPUB52	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	IOIRQ	SDIO Interrupt Status Flag	0: No SDIO interrupt detected 1: SDIO interrupt detected.	R(/W)*1
b2, b1	—	Reserved	The read value is undefined. The write value should be 1.	R/W
b13 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	EXPUB52	EXPUB52 Status Flag	Indicates the status of the EXPUB52.	R(/W)*1
b15	EXWT	EXWT Status Flag	Indicates the status of the EXWT.	R(/W)*1
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the bit.

The SDIO_INFO1 register indicates the status of the SDIO card access. Set flags to be cleared to 0. Set flags that are not

当IOABT在单块写入传输期间设置为1时，SD_BUF0变为空时设置访问结束标志，并且不发出CMD52。如果SD_BUF0包含数据，则在未发出CMD52的忙状态接收完成时设置访问结束标志。

当IOABT在单块读取传输期间设置为1时，在设置IOABT后立即设置访问结束标志，并且不发出CMD52。

如果在R1b响应后接收忙碌状态期间将IOABT设置为1，则在没有发出CMD52的情况下完成忙碌状态接收时设置访问结束标志。

当命令序列完成后IOABT设置为1时，不发出CMD52并且不设置访问结束标志。

设置响应结束标志后将IOABT设置为1。

设置访问结束标志后将IOABT设置为0。

C52PUB位（SDIO无中止）

在CMD53（多块）写入序列中将C52PUB位设置为1时，如果SD_BUF0为空，则在块之间自动发出CMD52。C52PUB在接收到对CMD52的响应完成后自动清零。此外，如果在传输最后一个块时将C52PUB设置为1，则不会发出CMD52。

在这种情况下，访问结束标志设置为1后，C52PUB自动清零。

当CMD53（多块）读序列中C52PUB和RWREQ置1时，块传输进入块间读等待状态，自动发出CMD52。C52PUB在接收到对CMD52的响应完成后自动清零。此外，如果在传输最后一个块时将C52PUB设置为1，则不会发出CMD52。在这种情况下，访问结束标志设置为1后，C52PUB自动清零。

如果在CMD53（多块）读取序列中将C52PUB设置为1，则除了C52PUB之外，还必须将RWREQ设置为1。

在将C52PUB设置为1之前设置SD_ARG。

在响应结束标志设置后将C52PUB设置为1。

43.2.21 SDIO中断标志 寄存器(SDIO_INFO1)

Address(es): SDHI0.SDIO_INFO1 4006 206Ch, SDHI1.SDIO_INFO1 4006 246Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	0

x: Undefined

Bit	Symbol	位名称	Description	R/W
b0	IOIRQ	SDIO中断状态标志	0：未检测到SDIO中断1：检测到SDIO中断。	R(/W)*1
b2, b1	—	Reserved	读取值未定义。写入值应为1。	R/W
b13 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b14	EXPUB52	EXPUB52状态标志	指示EXPUB52的状态。	R(/W)*1
b15	EXWT	EXWT状态标志	指示EXWT的状态。	R(/W)*1
b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只能写入0以清除该位。

SDIO_INFO1寄存器指示SDIO卡访问的状态。将要清除的标志设置为0。设置未清除的标志

being cleared to 1.

IOIRQ flag (SDIO Interrupt Status Flag)

The IOIRQ flag indicates that an SDIO interrupt occurred.

[Setting condition]

- When SDIO interrupt from an SDIO card is received while INTEN in SDIO_MODE is set to 1.

[Clearing condition]

- When 0 is written to IOIRQ.*1

Note 1. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit can be set again.

EXPUB52 flag (EXPUB52 Status Flag)

The EXPUB52 flag indicates the EXPUB52 status.

[Setting conditions]

- While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1.
- While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred.

[Clearing condition]

- When 0 is written to EXPUB52.

EXWT flag (EXWT Status Flag)

The EXWT flag indicates the EXWT status.

[Setting condition]

- While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1.

[Clearing condition]

- When 0 is written to EXWT.

43.2.22 SDIO INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

Address(es): SDHI0.SDIO_INFO1_MASK 4006 2070h, SDHI1.SDIO_INFO1_MASK 4006 2470h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EXWTM	EXPUB52M	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQM
Value after reset:	1	1	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	Bit name	Description	R/W
b0	IOIRQM	IOIRQ Interrupt Mask Control	0: Do not mask IOIRQ interrupts 1: Mask IOIRQ interrupts.	R/W
b2, b1	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b13 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14	EXPUB52M	EXPUB52 Interrupt Request Mask Control	0: Do not mask EXPUB52 interrupt requests 1: Mask EXPUB52 interrupt requests.	R/W

被清除为1。

IOIRQ标志（SDIO中断状态标志）

IOIRQ标志表示发生了SDIO中断。

[Setting condition]

- 当SDIO_MODE中的INTEN设置为1时接收到来自SDIO卡的SDIO中断。

[Clearing condition]

- 当0写入IOIRQ时。*1

注1.在清除该位之前，访问SDIO卡以否定来自SDIO卡的SDIO中断信号。如果中断信号没有被否定，这个位可以被重新设置。

EXPUB52标志（EXPUB52状态标志）

EXPUB52标志指示EXPUB52状态。

[Setting conditions]

- 在传输CMD53（多块）序列中的最后一个块时，SDIO_MODE中的C52PUB设置为1。
- 当C52PUB在CMD53（多块）写入序列中设置为1时，传输最后一个块。

[Clearing condition]

- 当0写入EXPUB52时。

EXWT标志（EXWT状态标志）

EXWT标志指示EXWT状态。

[Setting condition]

- 在传输CMD53（多块）读取序列中的最后一个块时，SDIO_MODE中的RWREQ设置为1。

[Clearing condition]

- 当0写入EXWT时。

43.2.22 SDIOINFO1中断屏蔽寄存器(SDIO_INFO1_MASK)

Address(es): SDHI0.SDIO_INFO1_MASK 4006 2070h, SDHI1.SDIO_INFO1_MASK 4006 2470h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EXWTM	EXPUB52M	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQM
重置后的值:	1	1	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	位名称	Description	R/W
b0	IOIRQM	IOIRQ中断屏蔽控制	0：不屏蔽IOIRQ中断1：屏蔽IOIRQ中断。	R/W
b2, b1	—	Reserved	这些位被读取为1。写入值应为1。	R/W
b13 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b14	EXPUB52M	EXPUB52中断请求掩码控制	0：不屏蔽EXPUB52中断请求1：屏蔽EXPUB52中断请求。	R/W

Bit	Symbol	Bit name	Description	R/W
b15	EXWTM	EXWT Interrupt Request Mask Control	0: Do not mask EXWT interrupt requests 1: Mask EXWT interrupt requests.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SDIO_INFO1_MASK register enables or disables interrupt requests from the status flags in the SDIO_INFO1 register. See Table 43.5, Interrupt sources for details on the relationship between the status flags and the requested interrupt source.

43.2.23 DMA Mode Enable Register (SD_DMAEN)

Address(es): SDHI0.SD_DMAEN 4006 21B0h, SDHI1.SD_DMAEN 4006 25B0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMAEN	—
Value after reset:	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0.	R
b1	DMAEN	DMA Transfer Enable*1, *2	0: Disable use of DMA transfer to access SD_BUF0 register 1: Enable use of DMA transfer to access SD_BUF0 register.	R/W
b3, b2	—	Reserved	These bits are read as 0.	R
b4	—	Reserved	This bit is read as 1.	R
b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7, b6	—	Reserved	These bits are read as 0.	R
b9, b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b11, b10	—	Reserved	These bits are read as 0.	R
b12	—	Reserved	This bit is read as 1.	R
b31 to b13	—	Reserved	These bits are read as 0.	R

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY bit is 1.
Note 2. When the SD_INFO2_MASK.BWEM bit is 0 or the SD_INFO2_MASK.BREM bit is 0, set the SD_DMAEN.DMAEN bit to 0. When the SD_DMAEN.DMAEN bit is 1, set the SD_INFO2_MASK.BWEM bit to 1 and the SD_INFO2_MASK.BREM bit to 1.

The SD_DMAEN register enables or disables DMA transfers.

DMAEN bit (DMA Transfer Enable)

When using DMA transfer to access the SD buffer, set the DMAEN bit to 1 before setting the SD_CMD register.

Bit	Symbol	位名称	Description	R/W
b15	EXWTM	EXWT中断请求掩码 Control	0：不屏蔽EXWT中断请求1：屏蔽EXWT中断请求。	R/W
b31 to b16	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SDIO_INFO1_MASK寄存器启用或禁用来自SDIO_INFO1寄存器中状态标志的中断请求。有关状态标志和请求的中断源之间关系的详细信息，请参见表43.5，中断源。

43.2.23 DMA模式使能寄存器(SD_DMAEN)

Address(es): SDHI0.SD_DMAEN 4006 21B0h, SDHI1.SD_DMAEN 4006 25B0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMAEN	—
重置后的值：	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0

Bit	Symbol	位名称		Description	R/W
b0	—	Reserved		该位读为0。	R
b1	DMAEN	DMA传输使能	*1, *2	0：禁止使用DMA传输访问SD_BUF0寄存器1：启用使用DMA传输访问SD_BUF0寄存器。	R/W
b3, b2	—	Reserved		这些位读为0。	R
b4	—	Reserved		该位读为1。	R
b5	—	Reserved		该位读取为0。写入值应为0。	R/W
b7, b6	—	Reserved		这些位读为0。	R
b9, b8	—	Reserved		这些位被读取为0。写入值应为0。	R/W
b11, b10	—	Reserved		这些位读为0。	R
b12	—	Reserved		该位读为1。	R
b31 to b13	—	Reserved		这些位读为0。	R

注1.当SD_INFO2.CBSY位为1时，请勿重写该位。
注2.当SD_INFO2_MASK.BWEM位为0或SD_INFO2_MASK.BREM位为0时，设置SD_DMAEN.DMAEN位为0。当SD_DMAEN.DMAEN位为1时，将SD_INFO2_MASK.BWEM位设置为1，将SD_INFO2_MASK.BREM位设置为1。

SD_DMAEN寄存器启用或禁用DMA传输。

DMAEN位（DMA传输使能）

使用DMA传输访问SD缓冲区时，在设置SD_CMD寄存器之前将DMAEN位设置为1。

43.2.24 Software Reset Register (SOFT_RST)

Address(es): SDHI0.SOFT_RST 4006 21C0h, SDHI1.SOFT_RST 4006 25C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0 and cannot be modified.	R
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b2	—	Reserved	This bit is read as 0 and cannot be modified.	R
b4, b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	—	Reserved	This bit is read as 0 and cannot be modified.	R
b6	BWSWP	SD_BUF0 Swap Write*1	0: Normal write operation 1: Swap the byte endian order before writing to SD_BUF0 register.	R/W
b7	BRSWP	SD_BUF0 Swap Read*1	0: Normal read operation 1: Swap the byte endian order before reading SD_BUF0 register.	R/W
b10 to b8	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b12, b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14, b13	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b31 to b16	—	Reserved	These bits are read as 0. Writing to these bits has no effect.	R

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The EXT_SWAP register selects whether or not the byte endian order is swapped when accessing the SD_BUF0 register. See section 43.3.1 for details on the differences in accessing the SD_BUF0 register based on the EXT_SWAP register value.

43.3 Operation

43.3.1 SD/MMC Interface

When data is read from the SD card/MMC, the process is as follows:

1. The SD/MMC Host Interface receives data from the SD card/MMC through the SDnDAT signal (see Figure 43.2 and Figure 43.3).

Bit	Symbol	位名称	Description	R/W
b8	NOCHKCR	CRC校验掩码	MMC测试命令的CRC校验掩码位。不执行CRC16或CRC状态值检查时置位。0：启用CRC校验1：禁用CRC校验（读取时忽略CRC16值，写入时忽略CRC状态值）。	R/W
b31 to b9	—	Reserved	这些位被读取为0。写入值应为0。	R/W

NOCHKCR位（CRC校验掩码）

NOCHKCR位用于MMC测试命令。当不执行CRC16或CRC状态值检查时，该位置位。

43.2.26 交换控制寄存器(EXT_SWAP)

Address(es): SDHI0.EXT_SWAP 4006 21E0h, SDHI1.EXT_SWAP 4006 25E0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	BRSWP	BWSWP	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	—	Reserved	该位读为0，不能修改。	R
b1	—	Reserved	该位读取为0。写入值应为0。	R/W
b2	—	Reserved	该位读为0，不能修改。	R
b4, b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b5	—	Reserved	该位读为0，不能修改。	R
b6	BWSWP	SD_BUF0 Swap Write*1	0：正常写操作1：在写入SD_BUF0寄存器之前交换字节顺序。	R/W
b7	BRSWP	SD_BUF0 Swap Read*1	0：正常读取操作1：在读取SD_BUF0寄存器之前交换字节顺序。	R/W
b10 to b8	—	Reserved	这些位被读取为0。写入这些位无效。	R
b12, b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b14, b13	—	Reserved	这些位被读取为0。写入这些位无效。	R
b15	—	Reserved	该位读取为0。写入值应为0。	R/W
b31 to b16	—	Reserved	这些位被读取为0。写入这些位无效。	R

Note 1. 当SD_INFO2.CBSY标志为1时，不要重写该位。

EXT_SWAP寄存器选择在访问SD_BUF0寄存器时是否交换字节顺序。
有关根据EXT_SWAP寄存器值访问SD_BUF0寄存器的差异的详细信息，请参见第43.3.1节。

43.3 Operation

43.3.1 SD/MMC Interface

从SD卡MMC读取数据时，流程如下：

1. SDMMC主机接口通过SDnDAT信号从SD卡MMC接收数据（参见图43.2和图43.3）。

2. The received data is stored in SD_BUF of the MMC Host Interface (see Figure 43.4).
3. The data stored in SD_BUF is read from SD_BUF0 (see Figure 43.5).

When data is written to the SD card/MMC, the specified procedure is reversed.

When accessing SD_BUF0, pay attention to the transfer order in SDnDAT and the store order in SD_BUF. If required, you can change the byte endian of the data read from or written to SD_BUF0 using the SDSWAP register. See Figure 43.6.

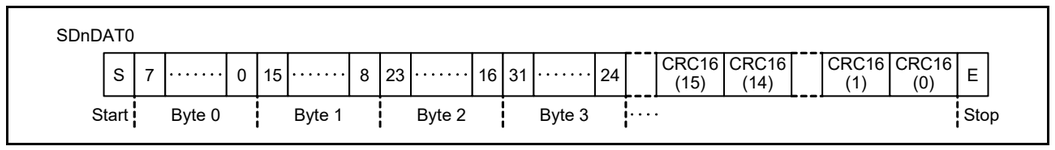

Figure 43.2 SDnDAT in 1-bit width mode

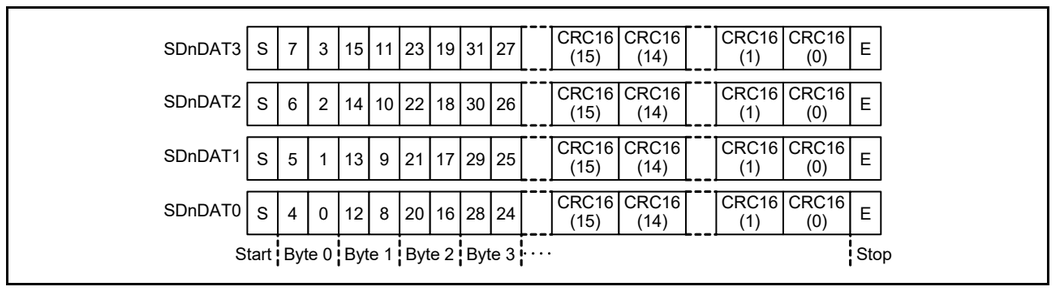

Figure 43.3 SDnDAT in 4-bit width mode

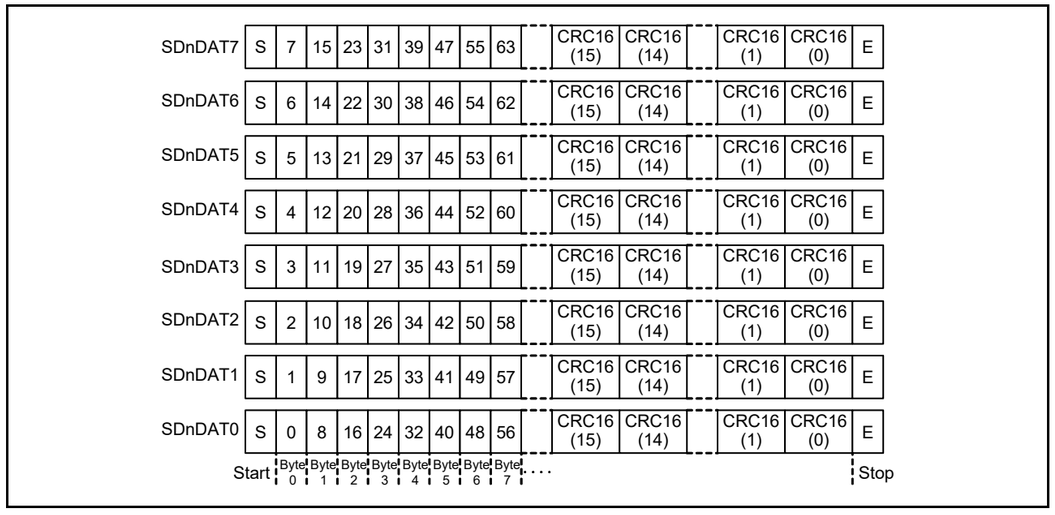

Figure 43.4 SDnDAT in 8-bit width mode

2. 接收到的数据存储在MMC主机接口的SD_BUF中（见图43.4）。
3. SD_BUF中存储的数据从SD_BUF0中读取（参见图43.5）。

当数据写入SD卡MMC时，指定的过程相反。

访问SD_BUF0时，注意SDnDAT中的传输顺序和SD_BUF中的存储顺序。如果需要，您可以使用SDSWAP寄存器更改从SD_BUF0读取或写入数据的字节字节序。请参见图43.6。

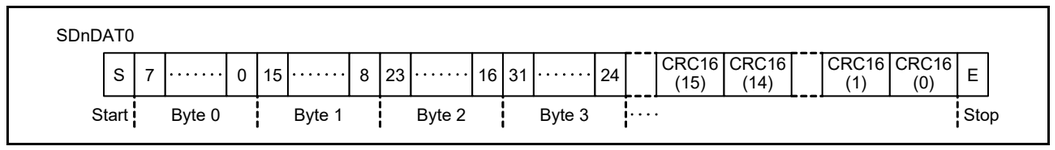

Figure 43.2 SDnDAT在1位宽模式下

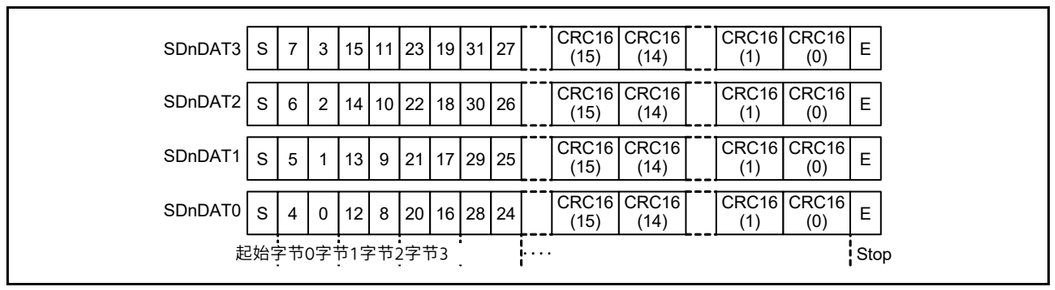

Figure 43.3 SDnDAT在4位宽模式下

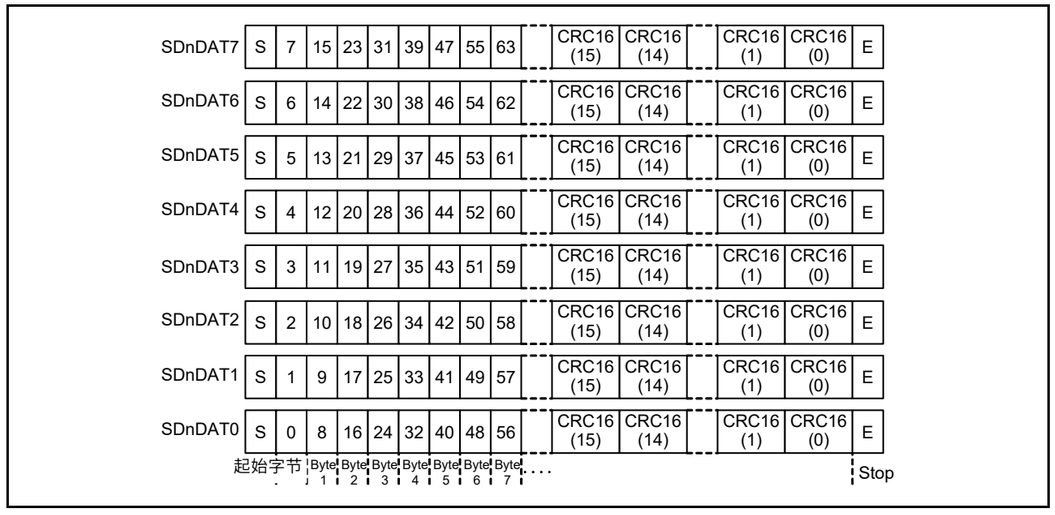

Figure 43.4 SDnDAT在8位宽度模式下

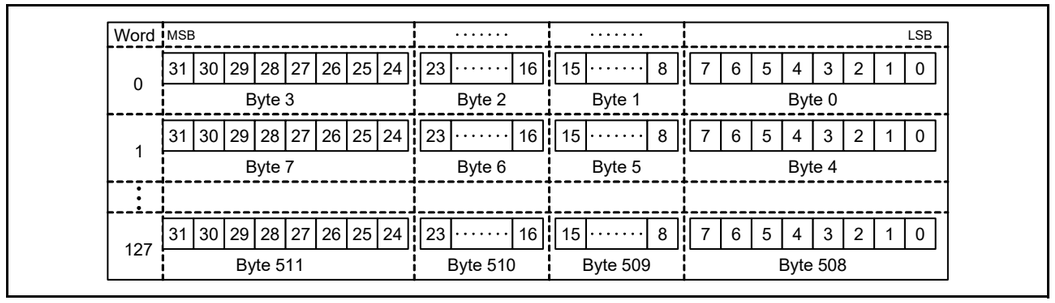

Figure 43.5 SD_BUF store data

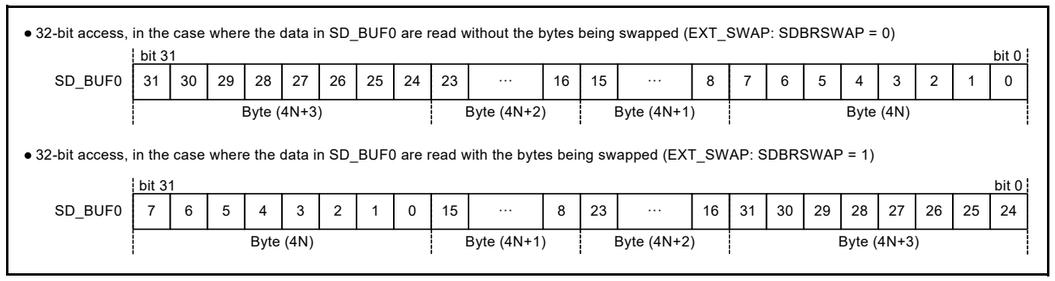

Figure 43.6 Read from SD_BUF0

43.3.2 Card Detect/Write Protect

43.3.2.1 Card detect

The SD/MMC Host Interface has two types of card detect functions.

(1) Card detect with SDnCD (n = 0, 1)

Figure 43.7 shows the timing for card detect using SDnCD. SDnCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is determined by the specification of the SD/MMC host device.

(2) Card insertion

SDnCD is pulled down when a card is inserted. At this point, if SDnCD is pulled down for the Mcycle period (set in SD_OPTION), SDCDIN in SD_INFO1 is set to 1. It is cleared by writing 0.

(3) Card removal

SDnCD is pulled up when a card is removed. At this point, if SDnCD is pulled up for the Mcycle period (set in SD_OPTION), SDCDRM in SD_INFO1 is set to 1. It is cleared by writing 0.

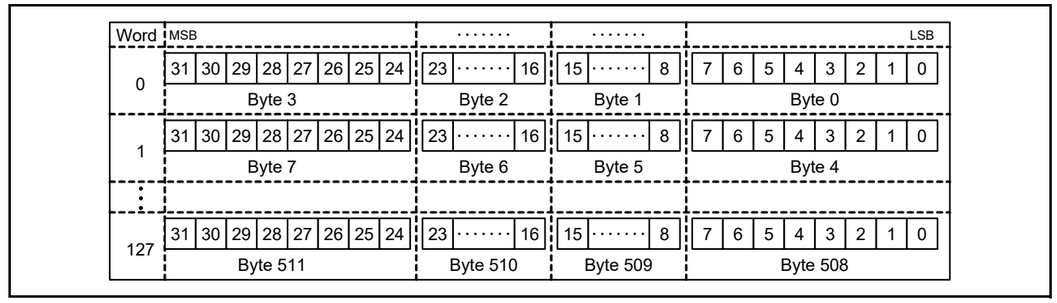

Figure 43.5 SD_BUF存储数据

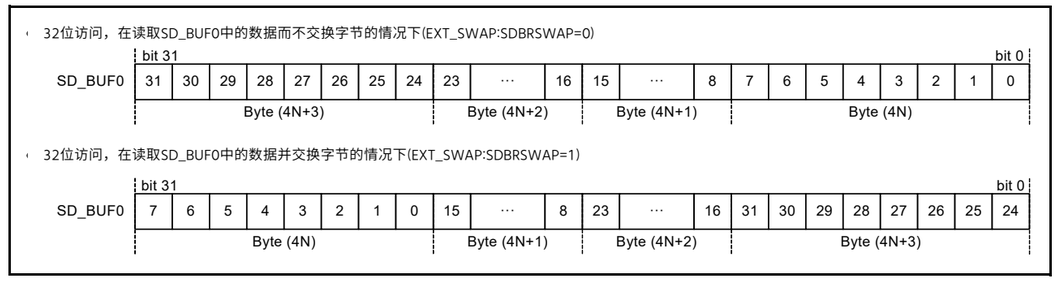

Figure 43.6 从SD_BUF0读取

43.3.2 卡检测写保护

43.3.2.1 卡检测

SDMMC主机接口有两种类型的卡检测功能。

(1) SDnCD卡检测(n=0 1)

图43.7显示了使用SDnCD进行卡检测的时序。SDnCD连接到卡插槽并在主机设备上拉高。上拉电阻的阻值由SD MMC主机设备的规格决定。

(2) 插卡

SDnCD在插入卡时被拉下。此时，如果SDnCD被下拉Mcycle周期（设置在SD_OPTION)，SD_INFO1中的SDCDIN设置为1。写入0清除。

(3) 取卡

取出卡时，SDnCD被拉起。此时，如果SDnCD被拉高了Mcycle周期（设置在SD_OPTION)，SD_INFO1中的SDCDRM设置为1，写入0清零。

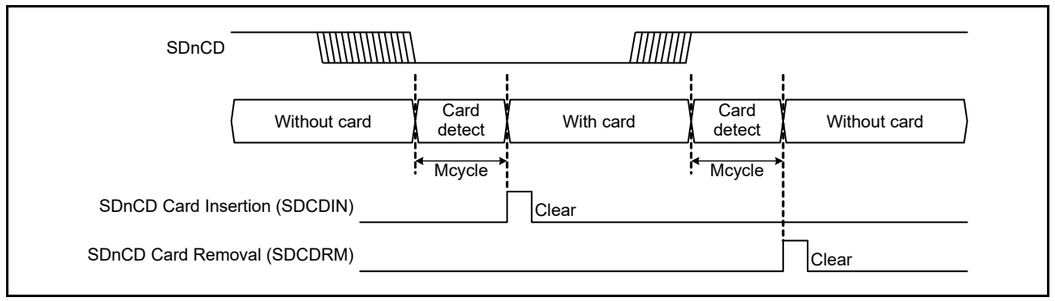

Figure 43.7 Example of card detect with SDnCD

(4) SD card detect with SDnDAT3 (n = 0, 1)

Figure 43.8 shows the timing when the SD card is detected with SDnDAT3. In addition, SDnDAT3 is pulled down by the host device, and the resistance value for pulling down is determined by the specification of the SD host device.

(5) Card insertion

When an SD card is inserted, SDnDAT3 is pulled up and SDD3IN in SD_INFO1 is set to 1. It is cleared by writing 0.

(6) Card removal

When an SD card is removed, SDnDAT3 is pulled down and SDD3RM in SD_INFO1 is set to 1. It is cleared by writing 0.

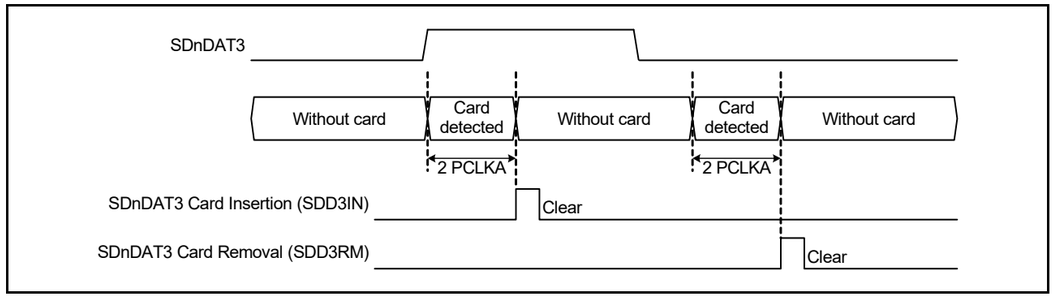

Figure 43.8 SD card detect with SDnDAT3

43.3.2.2 Write protect

The SD/MMC Host Interface has two types of write protect functions.

(1) Write protect with SDnWP (n = 0, 1)

SDnWP is connected to the card socket and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is determined by the specification of the SD host device. When the SDnWP state is reflected to SDWPMON in SD_INFO1, the write protect state is set after the SD card is inserted.

(2) Write protect with command

The internal write protection of the card and the lock/unlock operation of the card are realized by the command.

43.3.3 Interrupt Request and DMA Transfer Request

43.3.3.1 Interrupts

Table 43.5 lists the SDHI interrupt sources. The SDHI requests an interrupt when:

- The status flags in registers SD_INFO1, SD_INFO2, and SDIO_INFO1 set to 1

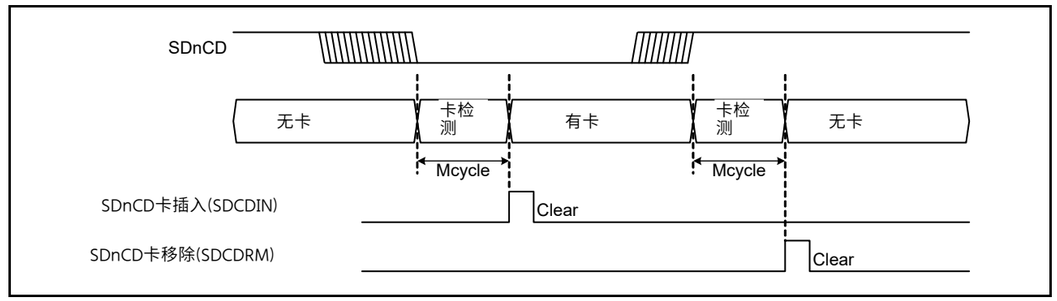

Figure 43.7 SDnCD卡检测示例

(4) 使用SDnDAT3检测SD卡(n=0 1)

图43.8显示了使用SDnDAT3检测到SD卡的时序。此外，SDnDAT3由主机设备下拉，下拉电阻值由SD主机设备的规格决定。

(5) 插卡

插入SD卡时，SDnDAT3上拉，SD_INFO1中的SDD3IN置1，写0清零。

(6) 取卡

拔出SD卡时，SDnDAT3被拉低，SD_INFO1中的SDD3RM置1，写入0清零。

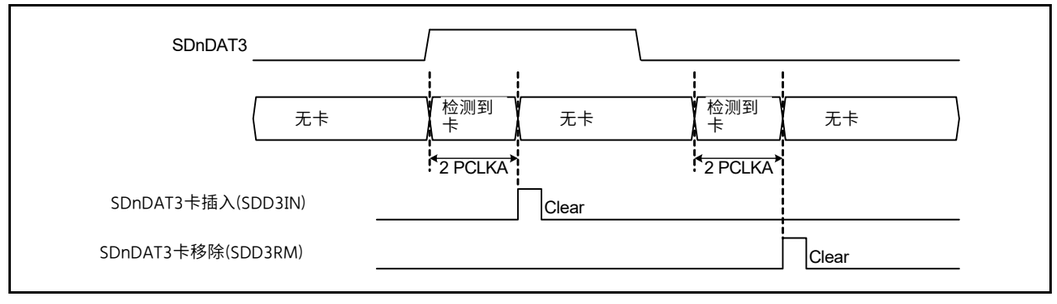

Figure 43.8 使用SDnDAT3检测SD卡

43.3.2.2 写保护

SDMMC主机接口有两种类型的写保护功能。

(1) 使用SDnWP进行写保护(n=0 1)

SDnWP与卡座相连，通过插卡进行上拉或下拉。上拉或下拉的选择和阻值由SD主机设备的规格决定。当SDnWP状态反映到SD_INFO1中的SDWPMON时，插入SD卡后设置写保护状态。

(2) 用命令写保护

卡的内部写保护和卡的开锁操作都是通过命令实现的。

43.3.3 中断请求和DMA传输请求

43.3.3.1 Interrupts

表43.5列出了SDHI中断源。SDHI在以下情况下请求中断：

- 寄存器SD_INFO1、SD_INFO2和SDIO_INFO1中的状态标志设置为1

- The associated bits in the SD_INFO1_MASK, SD_INFO2_MASK, and SDIO_INFO1_MASK registers are 0.

When clearing the status flags in registers SD_INFO1, SD_INFO2, and SDIO_INFO1, write 0 to the status flags to be cleared and write 1 to the status flags that are not being cleared.

Table 43.5 Interrupt sources

Interrupt sources	Status flag register		Interrupt mask register		Interrupt name	
	Register symbol	Bit symbol	Register symbol	Bit symbol	Ch 0	Ch 1
Card Access Interrupt (CACI)	SD_INFO1	ACEND	SD_INFO1_MASK	ACENDM	SDHI_MMC0_ACCS	SDHI_MMC1_ACCS
		RSPEND		RSPENDM		
	SD_INFO2	ILA	SD_INFO2_MASK	ILAM		
		BWE		BWEM		
		BRE		BREM		
		RSPTO		RSPTOM		
		ILR		ILRM		
		ILW		ILWM		
		DTO		DTOM		
		ENDE		ENDEM		
		CRCE		CRCEM		
		CMDE		CMDEM		
SDIO Access Interrupt (SDACI)	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	EXWTM	SDHI_MMC0_SDIO	SDHI_MMC1_SDIO
		EXPUB52		EXPUB52M		
		IOIRQ		IOIRQM		
Card Detect Interrupt (CDETI)	SD_INFO1	SDD3IN	SD_INFO1_MASK	SDD3INM	SDHI_MMC0_CARD	SDHI_MMC1_CARD
		SDD3RM		SDD3RMM		
		SDCDIN		SDCDINM		
		SDCDRM		SDCDRMM		

43.3.3.2 DMA transfer requests (SDHI_MMCn_ODMSDBREQ, n = 0 to 1)

The SD/MMC Host Interface has two types of DMA transfer requests.

(1) SD_BUF write DMA transfer request

- When the BWE bit in SD_INFO2 is set to 1 while the DMAEN bit in SD_DMAEN is set to 1, the SD_BUF write DMA transfer request is asserted.
- The SD_BUF write DMA transfer request is negated when the last data in one block (based on the transfer data size set in SD_SIZE) is transferred. The SD_BUF write DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. However, if a communications error or timeout occurs at the DMA transfer, the SD_BUF write DMA transfer request is not negated.
- The BWE bit in SD_INFO2 is cleared after transfer of the last data in one block following a request for writing to SD_BUF by DMA transfer.
- The number of DMA transfers must be n x one block. (n = integer, one block = the transfer data size set in SD_SIZE)
- When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF write DMA transfer request is negated.
- The DMA transfer request is also negated by clearing the DMAEN bit to 0. However, the DMA transfer request is asserted again when the DMAEN bit is set to 1 before writing to SD_CMD.
- Because the BWE bit in SD_INFO2 is not cleared in response to setting the STP/IOABT bit, or to a communications error or timeout, clear the bit to 0 before issuing the next command. The next request to write to SD_BUF by DMA transfer is not issued while the BWE bit is set.

- SD_INFO1_MASK、SD_INFO2_MASK和SDIO_INFO1_MASK寄存器中的相关位为0。

清除寄存器SD_INFO1、SD_INFO2和SDIO_INFO1中的状态标志时，将要清除的状态标志写入0，将未清除的状态标志写入1。

Table 43.5 中断源

中断源	状态标志寄存器		中断屏蔽寄存器		中断名称	
	注册符号	位符号	注册符号	位符号	Ch 0	Ch 1
卡访问中断(CACI)	SD_INFO1	ACEND	SD_INFO1_MASK	ACENDM	SDHI_MMC0_ACCS	SDHI_MMC1_ACCS
		RSPEND		RSPENDM		
	SD_INFO2	ILA	SD_INFO2_MASK	ILAM		
		BWE		BWEM		
		BRE		BREM		
		RSPTO		RSPTOM		
		ILR		ILRM		
		ILW		ILWM		
		DTO		DTOM		
		ENDE		ENDEM		
		CRCE		CRCEM		
		CMDE		CMDEM		
SDIO Access Interrupt (SDACI)	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	EXWTM	SDHI_MMC0_SDIO	SDHI_MMC1_SDIO
		EXPUB52		EXPUB52M		
		IOIRQ		IOIRQM		
卡检测中断(CDETI)	SD_INFO1	SDD3IN	SD_INFO1_MASK	SDD3INM	SDHI_MMC0_CARD	SDHI_MMC1_CARD
		SDD3RM		SDD3RMM		
		SDCDIN		SDCDINM		
		SDCDRM		SDCDRMM		

43.3.3.2 DMA传输请求（SDHI_MMCn_ODMSDBREQ，n=0到1）

SDMMC主机接口有两种类型的DMA传输请求。

(1) SD_BUF写DMA传输请求

- 当SD_INFO2中的BWE位设置为1而SD_DMAEN中的DMAEN位设置为1时，SD_BUF写DMA传输请求被断言。
- 当一个块中的最后一个数据（基于SD_SIZE中设置的传输数据大小）被传输时，SD_BUF写DMA传输请求被否定。SD_BUF写DMA传输请求也可以通过将SOFT_RST中的SDRST位清0或将SD_STOP中的STP位设置为1来取消。但是，如果DMA传输发生通信错误或超时，则SD_BUF写DMA传输请求不会被取消。否定。
- SD_INFO2中的BWE位在通过DMA传输请求写入SD_BUF后传输一个块中的最后一个数据后被清除。
- DMA传输的数量必须是nx一个块。（n=整数，1块=中设置的传输数据大小SD_SIZE)
- 当SDIO_MODE中的IOABT位设置为1时，SD_BUF写DMA传输请求被否定。
- DMA传输请求也可以通过将DMAEN位清除为0来取消。但是，当DMAEN位在写入SD_CMD之前设置为1时，DMA传输请求会再次有效。
- 因为SD_INFO2中的BWE位不会在设置STPIOABT位或通信错误或超时时被清除，所以在发出下一个命令之前将该位清除为0。当BWE位置位时，不会发出通过DMA传输写入SD_BUF的下一个请求。

(2) SD_BUF read DMA transfer request

- When the BRE bit in SD_INFO2 is set to 1 while the DMAEN bit in the SD_DMAEN register is set to 1, the SD_BUF read DMA transfer request is asserted.
- The SD_BUF read DMA transfer request is negated when the last data in one block (based on the transfer data size set in SD_SIZE) is transferred. The SD_BUF read DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. However, if a communications error or timeout occurs at the DMA transfer, the SD_BUF read DMA transfer request is not negated.
- The BRE bit in SD_INFO2 is cleared after transfer of the last data in one block following a request to write to SD_BUF by DMA transfer.
- The number of DMA transfers must be n x one block. (n = integer, one block = the transfer data size set in SD_SIZE)
- When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF read DMA transfer request is negated.
- The DMA transfer request is also negated by clearing the DMAEN bit to 0. However, the DMA transfer request is asserted again when the DMAEN bit is set to 1 before writing to SD_CMD.
- Because the BRE bit in SD_INFO2 is not cleared in response to setting the STP/IOABT bit or in response to a communications error or timeout, clear the bit to 0 before issuing the next command. The next request to write to SD_BUF by DMA transfer is not issued while the BRE bit is set.

43.3.4 Communication Errors and Timeouts

When a communication error or timeout error occurs, depending on the type of error, the associated status flag in the SD_INFO2 register sets to 1. Also, depending on the source of the error, the associated flag in the SD_ERR_STS1 or SD_ERR_STS2 register sets to 1.

The status flags in registers SD_ERR_STS1 and SD_ERR_STS2 clear to 0 by writing to the SD_CMD register, or by setting the SOFT_RST.SDRST bit to 0.

Table 43.6 Communication errors

Communication error	Interrupt flag register: Register symbol	Interrupt flag register: Bit symbol	Error status register: Register symbol	Error status register: Bit symbol	This occurs when...
End bit error	SD_INFO2	ENDE	SD_ERR_STS1	CRCLENE	The CRC status token length is in error
				RDLENE	The read data length is in error
				RSPLENE1	The response length is in error*1
				RSPLENE0	The response length is in error*2
CRC error		CRCE		CRCTKE	The CRC status token is in error
				RDCRCE	There is a CRC error in the read data
				RSPCRCE1	There is a CRC error in the response*1
				RSPCRCE0	There is a CRC error in the response*2
Command error		CMDE		CMDE1	The command index field value for the transmitted command and received response do not match*1
				CMDE0	The command index field value for the transmitted command and received response do not match*2

Note 1. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

(2) SD_BUF读取DMA传输请求

- 当SD_INFO2中的BRE位设置为1而SD_DMAEN寄存器中的DMAEN位设置为1时，SD_BUF读取DMA传输请求被断言。
- 当传输一个块中的最后一个数据（基于SD_SIZE中设置的传输数据大小）时，会取消SD_BUF读取DMA传输请求。SD_BUF读DMA传输请求也可以通过将SOFT_RST中的SDRST位清0或将SD_STOP中的STP位设置为1来否定。但是，如果DMA传输发生通信错误或超时，则SD_BUF读DMA传输请求不会否定。
- SD_INFO2中的BRE位在一个块中的最后一个数据传输后被清除SD_BUF通过DMA传输。
- DMA传输的数量必须是nx一个块。（n=整数，1块=中设置的传输数据大小SD_SIZE)
- 当SDIO_MODE中的IOABT位设置为1时，SD_BUF读取DMA传输请求被否定。
- DMA传输请求也可以通过将DMAEN位清除为0来取消。但是，当DMAEN位在写入SD_CMD之前设置为1时，DMA传输请求会再次有效。
- 因为SD_INFO2中的BRE位不会在设置STPIOABT位或响应通信错误或超时时被清除，所以在发出下一个命令之前将该位清除为0。当BRE位置位时，不会发出下一个通过DMA传输写入SD_BUF的请求。

43.3.4 通信错误和超时

当发生通信错误或超时错误时，根据错误类型，SD_INFO2寄存器中的相关状态标志设置为1。此外，根据错误源，SD_ERR_STS1中的相关标志或SD_ERR_STS2寄存器设置为1。

通过写入SD_CMD寄存器或将SOFT_RST.SDRST位设置为0，寄存器SD_ERR_STS1和SD_ERR_STS2中的状态标志清零。

Table 43.6 通讯错误

通信故障	中断标志寄存器: 注册符号	中断标志寄存器: 位符号	错误状态寄存器: 注册符号	错误状态寄存器: 位符号	这发生在...
结束位错误	SD_INFO2	ENDE	SD_ERR_STS1	CRCLENE	CRC状态令牌长度错误
				RDLENE	读取数据长度错误
				RSPLENE1	响应长度错误*1
				RSPLENE0	响应长度错误*2
CRC error		CRCE		CRCTKE	CRC状态令牌错误
				RDCRCE	读取数据有CRC错误
				RSPCRCE1	响应中有CRC错误*1
				RSPCRCE0	响应中有CRC错误*2
命令错误		CMDE		CMDE1	发送命令和接收响应的命令索引字段值不匹配*1
				CMDE0	发送命令和接收响应的命令索引字段值不匹配*2

Note 1. 通过SD_CMD中的设置为多块传输启用自动发布时的CMD12，当STP位中的CMD12 SD_STOP设置为1，或当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
Note 2. 通过SD_CMD中的设置为多块传输启用自动发布时的CMD12以外的CMD，当SD_STOP中的STP位设置为1时为CMD12，或者当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。

Table 43.7 Timeouts

Timeout	Interrupt flag register		Error status register		This occurs when...
	Register symbol	Bit symbol	Register symbol	Bit symbol	
Response timeout	SD_INFO2	RSPTO	SD_ERR_STS2	RSPTO1	A response is not received even after a minimum of 640 SDHI clock cycles elapse*1
				RSPTO0	A response is not received even after a minimum of 640 SDHI clock cycles elapse*2
Data timeout (excluding response timeout)		DTO		CRCBSYTO	After the CRC status token is received, the SDHI is busy for at least the period set*3
				CRCTO	After the write data is transmitted, the CRC status token is not received even after at least the period set*3 elapses
				RDTO	After the read command is issued, the read data is not received even after at least the period set*3 elapses
					After the read data is received, the next block read data is not received even after at least the period set*3 elapses
					After the SDHI exits the read wait state, the next block read data is not received even after at least the period set*3 elapses
				BSYTO1	After CMD12 is issued during the command sequence, the SDHI is busy for at least the period set*3
				BSYTO0	After the R1b response is received, the SDHI is busy for at least the period set*3 (a command other than CMD12 is issued during the command sequence)

Note 1. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP bit is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 3. The period is set in the SD_OPTION.TOP[3:0] bits.

43.3.5 Command without Data Transfer (SD/MMC)

Figure 43.9 and Figure 43.10 show example flows.

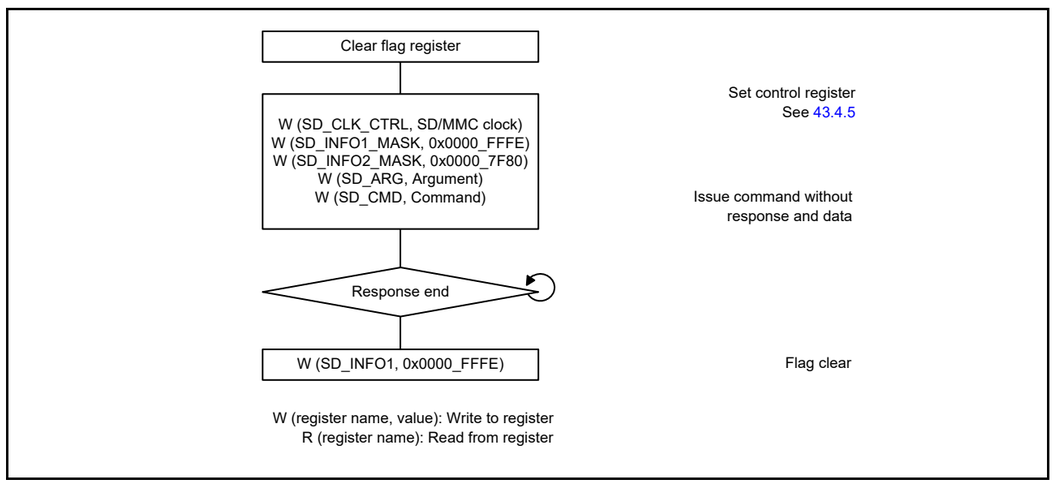

Figure 43.9 Example flow of command without response and data

Table 43.7 Timeouts

Timeout	中断标志寄存器		错误状态寄存器		这发生在...
	注册符号	位符号	注册符号	位符号	
响应超时	SD_INFO2	RSPTO	SD_ERR_STS2	RSPTO1	即使经过至少640个SDHI时钟周期，也没有收到响应*1
				RSPTO0	即使经过至少640个SDHI时钟周期，也没有收到响应*2
数据超时（不包括响应超时）		DTO		CRCBSYTO	收到CRC状态令牌后，SDHI至少在设置的时间段内处于忙碌状态*3
				CRCTO	写入数据发送后，即使经过至少设置的周期*3后也未收到CRC状态令牌
				RDTO	发出读取命令后，即使经过至少设置的时间段*3也未接收到读取数据
					接收到读取数据后，即使经过至少设置的时间段*3也不会接收到下一个块读取数据
					SDHI退出读取等待状态后，即使经过至少设置的时间段*3也不会接收到下一个块读取数据
				BSYTO1	在命令序列期间发出CMD12后，SDHI至少在设置的时间段内处于忙碌状态*3
				BSYTO0	收到R1b响应后，SDHI至少忙了一段时间set*3（在命令序列期间发出CMD12以外的命令）

Note 1. 通过SD_CMD中的设置为多块传输启用自动发布时的CMD12，当STP位中的CMD12 SD_STOP设置为1，或当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
Note 2. 通过SD_CMD中的设置为多块传输启用自动发布时的CMD12以外的CMD、SD_STOP位中的STP位设置为1时的CMD12或SDIO_MODE中的C52PUB或IOABT位设置为1时的CMD52。
Note 3. 周期在SD_OPTION.TOP[3:0]位中设置。

43.3.5 无数据传输的命令(SDMMC)

图43.9和图43.10显示了示例流程。

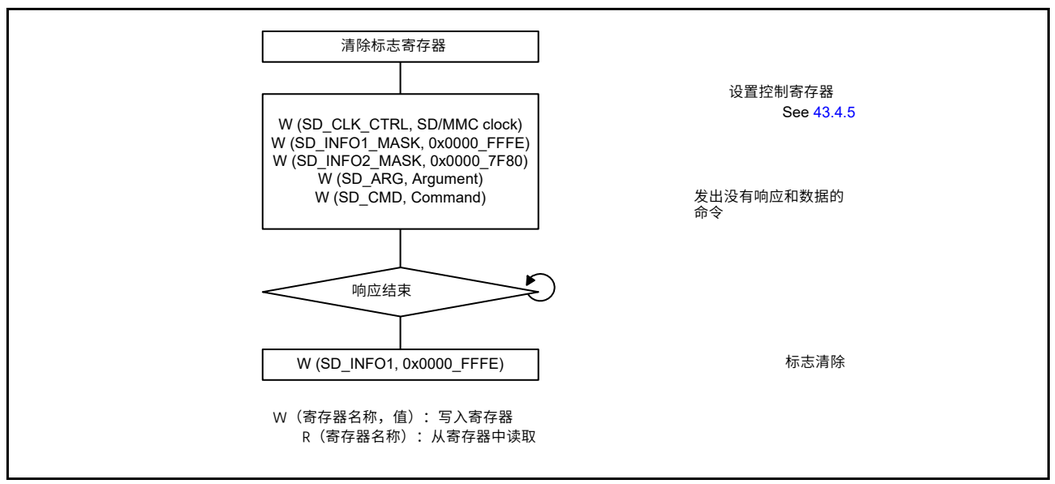

Figure 43.9 没有响应和数据的命令流示例

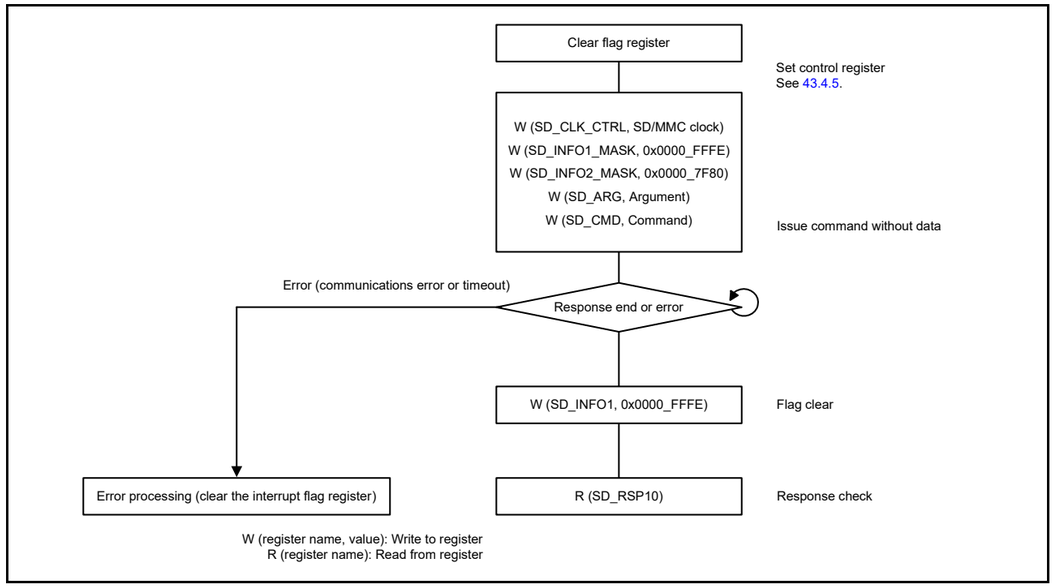

Figure 43.10 Example flow of command without data

43.3.5.1 Operation for command without data transfer

The following legend is used for description of register read/write.

W (register name, value): Write to register

R (register name): Read from register

The operation is described in the following section.

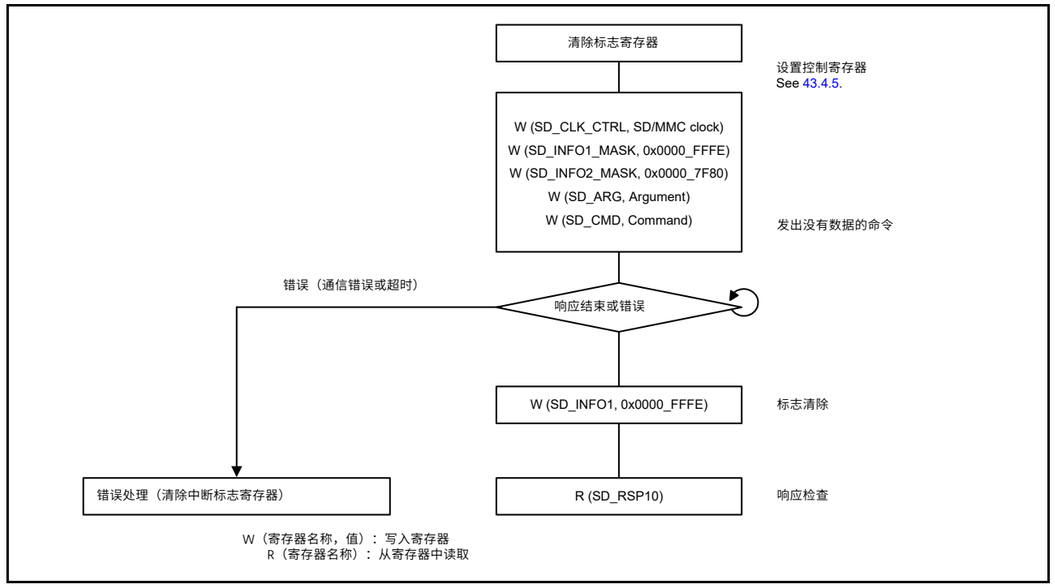

Figure 43.10 没有数据的命令流示例

43.3.5.1 无数据传输的命令操作

以下图例用于描述寄存器读写。

W（寄存器名称，值）：写入寄存器

R（寄存器名称）：从寄存器中读取

该操作在下一节中描述。

(1) Command without response and data

a. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

b. Control register set
Set the SD/MMC clock and interrupt masking. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)

c. Command issue
Set CMD argument in SD_ARG and write to SD_CMD.
Accordingly, CMD is issued, and the operation is started.

d. Flag clear
When transmission of a command is completed, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0.

(2) Command without data

a. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

b. Control register set
Set the SD/MMC clock and interrupt masking. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)

c. Command issue
Set CMD argument in SD_ARG and write to the SD_CMD.
Accordingly, CMD is issued, and the operation is started.

d. Flag clear
When a response is received, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0.

e. Read a response from SD_RSP10. Additionally, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

43.3.6 Single Block Read (SD/MMC)

Figure 43.11 shows an example flow of a single block read operation.

(1) 没有响应和数据的命令

一个。标志寄存器清除
首先，清除标志寄存器中的位。（SD_INFO1和SD_INFO2）

湾。控制寄存器组
设置SDMMC时钟和中断屏蔽。（SD_CLK_CTRL、SD_INFO1_MASK和SD_INFO2_MASK）

C。命令问题
在SD_ARG中设置CMD参数并写入SD_CMD。因此，
发出CMD，并开始操作。

d。标志清除
当命令传输完成时，SD_INFO1中的RSPEND（响应结束）设置为1以产生中断。将RSPEND清除为0。

(2) 没有数据的命令

一个。标志寄存器清除
首先，清除标志寄存器中的位。（SD_INFO1和SD_INFO2）

湾。控制寄存器组
设置SDMMC时钟和中断屏蔽。（SD_CLK_CTRL、SD_INFO1_MASK和SD_INFO2_MASK）

C。命令问题
在SD_ARG中设置CMD参数并写入SD_CMD。
因此，发出CMD，并开始操作。

d。标志清除
当收到响应时，SD_INFO1中的RSPEND（响应结束）置1以产生中断。清除
RSPEND to 0.

e.从SD_RSP10读取响应。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

43.3.6 单块读取(SDMMC)

图43.11显示了单块读取操作的示例流程。

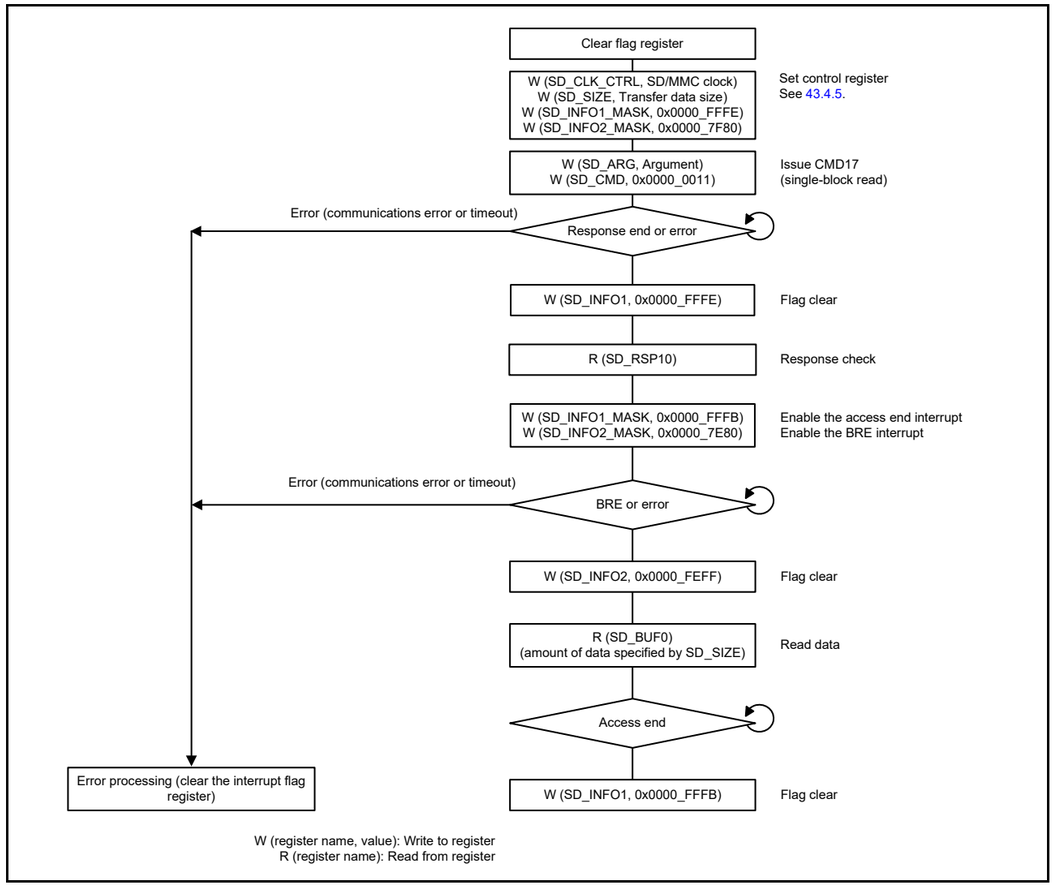

Figure 43.11 Example flow of single block read operation

43.3.6.1 Single block read operation

The operation of the single block read is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).

c. Command issue (CMD17)
Set CMD17 argument in SD_ARG and write 0x0000_0011 to SD_CMD. CMD17 is issued and the single block read operation is started.

d. Response check
On receiving the response, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD_RSP10. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. In addition, this causes CMD12 and CMD52 to not be issued. If the ACEND bit (access end) in SD_INFO1 is set, halting the command sequence also leads to the generation of an interrupt.

e. Data receive from SD card/MMC and data read
Write 0x0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_7E80

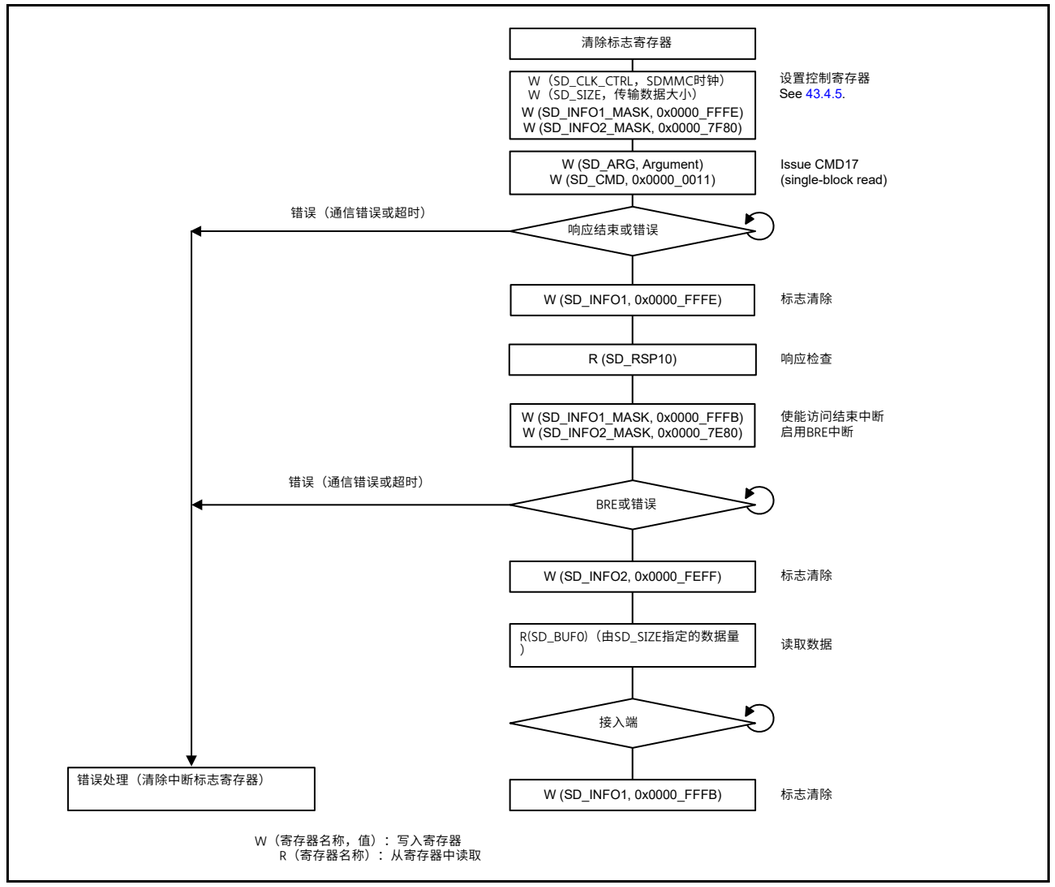

Figure 43.11 单块读操作示例流程

43.3.6.1 单块读操作

单块读取的操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).

C。命令问题(CMD17)
在SD_ARG中设置CMD17参数并将0x0000_0011写入SD_CMD。发出CMD17并开始单块读取操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）置1以产生中断。清除RSPEND为0并从SD_RSP10读取响应。如果响应解码的结果是错误的，可以通过将SD_STP中的STP位或SDIO_MODE中的IOABT位设置为1来暂停命令序列。此外，这会导致CMD12和CMD52不发出。如果SD_INFO1中的ACEND位（访问结束）被设置，停止命令序列也会导致产生中断。

e.从SD卡MMC接收数据并读取数据
将0x0000_FFFB写入SD_INFO1_MASK以使能访问结束中断。另外，写入0x0000_7E80

to SD_INFO2_MASK to enable the BRE interrupt. When the data received from the SD card/MMC is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD_SIZE from SD_BUF0.
A communication error or timeout might be generated if data is being received while reading of SD_BUF0 is in progress.

f. Operation complete
When the data read from SD_BUF0 is completed, ACEND (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear ACEND to 0 to end the single block read operation.
Additionally, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

43.3.7 Single Block Write (SD/MMC)

Figure 43.12 shows an example flow of a single block write operation.

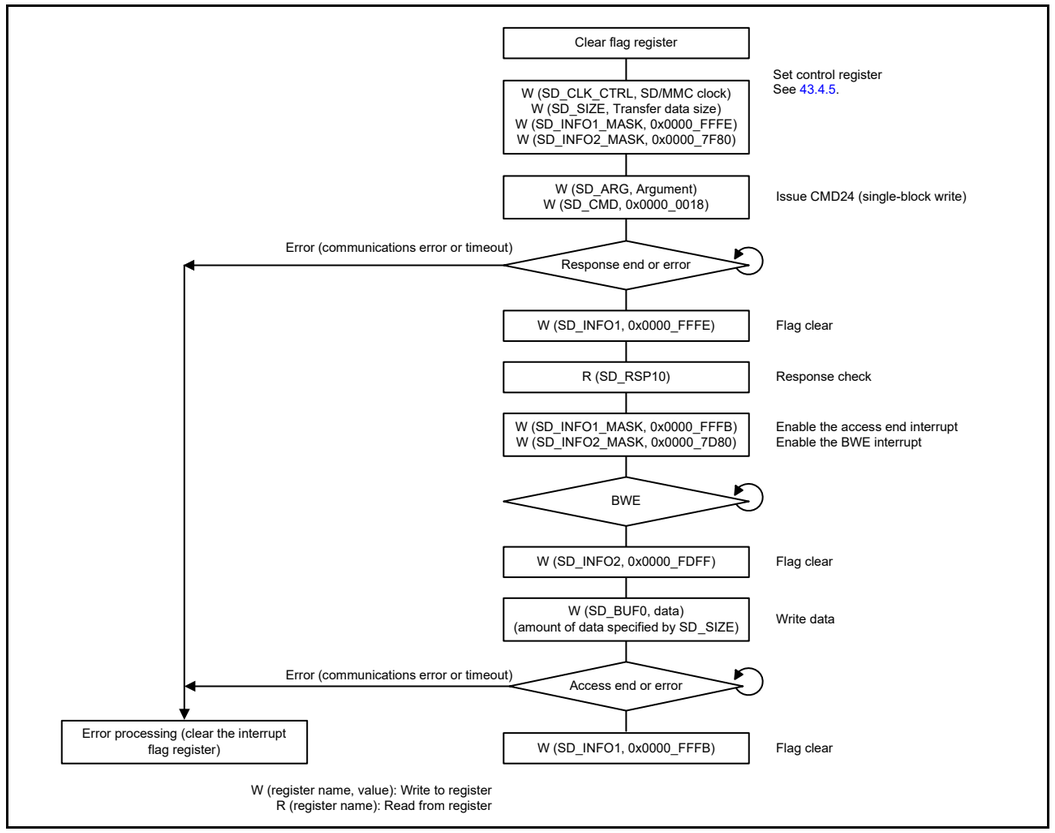

Figure 43.12 Example of single block write operation

到SD_INFO2_MASK以启用BRE中断。当从SD卡MMC接收到数据完成时，SD_INFO2中的BRE位设置为1以产生中断。将BRE位清0并从SD_BUF0中读取SD_SIZE中指定的数据量。如果在读取SD_BUF0时正在接收数据，则可能会产生通信错误或超时。

F。操作完成
当从SD_BUF0读取数据完成后，SD_INFO1中的ACEND（访问结束）置1以产生中断。将ACEND清0结束单块读操作。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

43.3.7 单块写入(SDMMC)

图43.12显示了单个块写入操作的示例流程。

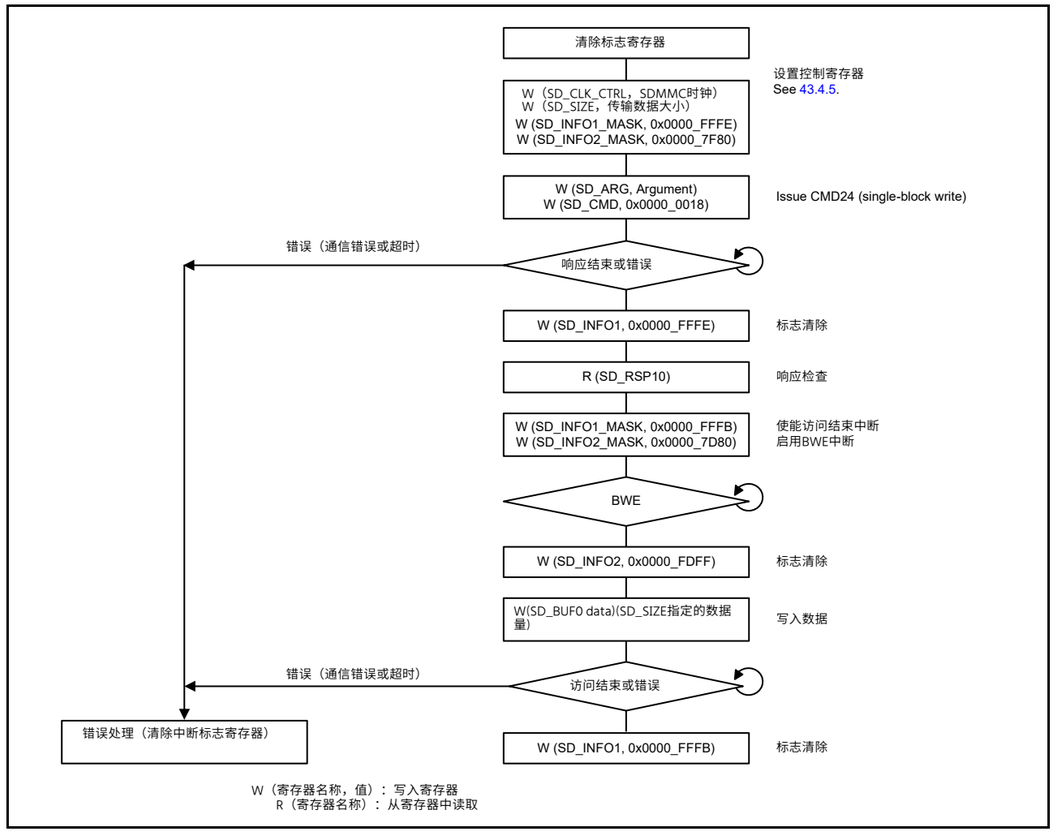

Figure 43.12 单块写操作示例

43.3.7.1 Single block write operation

The operation of the single block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).

c. Command issue (CMD24)
Set CMD24 argument in SD_ARG and write 0x0000_0018 to SD_CMD. CMD24 is issued and the single block write operation is started.

d. Response check
On receiving the response, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD_RSP10. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. In addition, this causes CMD12 and CMD52 to not be issued. If the ACEND bit (access end) in SD_INFO is set, halting the command sequence also leads to the generation of an interrupt.

e. Data write and data transmit to SD card/MMC
Write 0x0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card/MMC.
However, a communications error or timeout might be generated if data is being transmitted after writing to SD_BUF0.

f. Operation complete
When the CRC status and busy state are received from the SD card/MMC, ACEND (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to end the single block write operation.
In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

43.3.8 Multiple Block Read (SD/MMC)

Figure 43.13 shows an example flow of a multiple block read operation.

43.3.7.1 单块写操作

单块写操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).

C。命令问题(CMD24)
在SD_ARG中设置CMD24参数并将0x0000_0018写入SD_CMD。发出CMD24并开始单块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）置1以产生中断。清除RSPEND为0并从SD_RSP10读取响应。如果响应解码的结果是错误的，可以通过将SD_STP中的STP位或SDIO_MODE中的IOABT位设置为1来暂停命令序列。此外，这会导致CMD12和CMD52不发出。如果SD_INFO中的ACEND位（访问结束）被设置，停止命令序列也会导致中断的产生。

e.数据写入和数据传输到SD卡MMC
将0x0000_FFFB写入SD_INFO1_MASK以使能访问结束中断。此外，将0x0000_7D80写入SD_INFO2_MASK以启用BWE中断。当SD_BUF0准备好写入数据时，SD_INFO2中的BWE位设置为1以产生中断。将BWE位清除为0，并将SD_SIZE中指定的数据量写入SD_BUF0。数据写入SD_BUF0完成后，将数据传输到SD卡。然后，从SD卡MMC接收CRC状态和忙状态。

但是，如果在写入后正在传输数据，则可能会产生通信错误或超时
SD_BUF0.

F。操作完成
当从SD卡MMC接收到CRC状态和忙状态时，SD_INFO1中的ACEND（访问端）置1以产生中断。将ACEND位清0以结束单块写操作。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

43.3.8 多块读取(SDMMC)

图43.13显示了多块读取操作的示例流程。

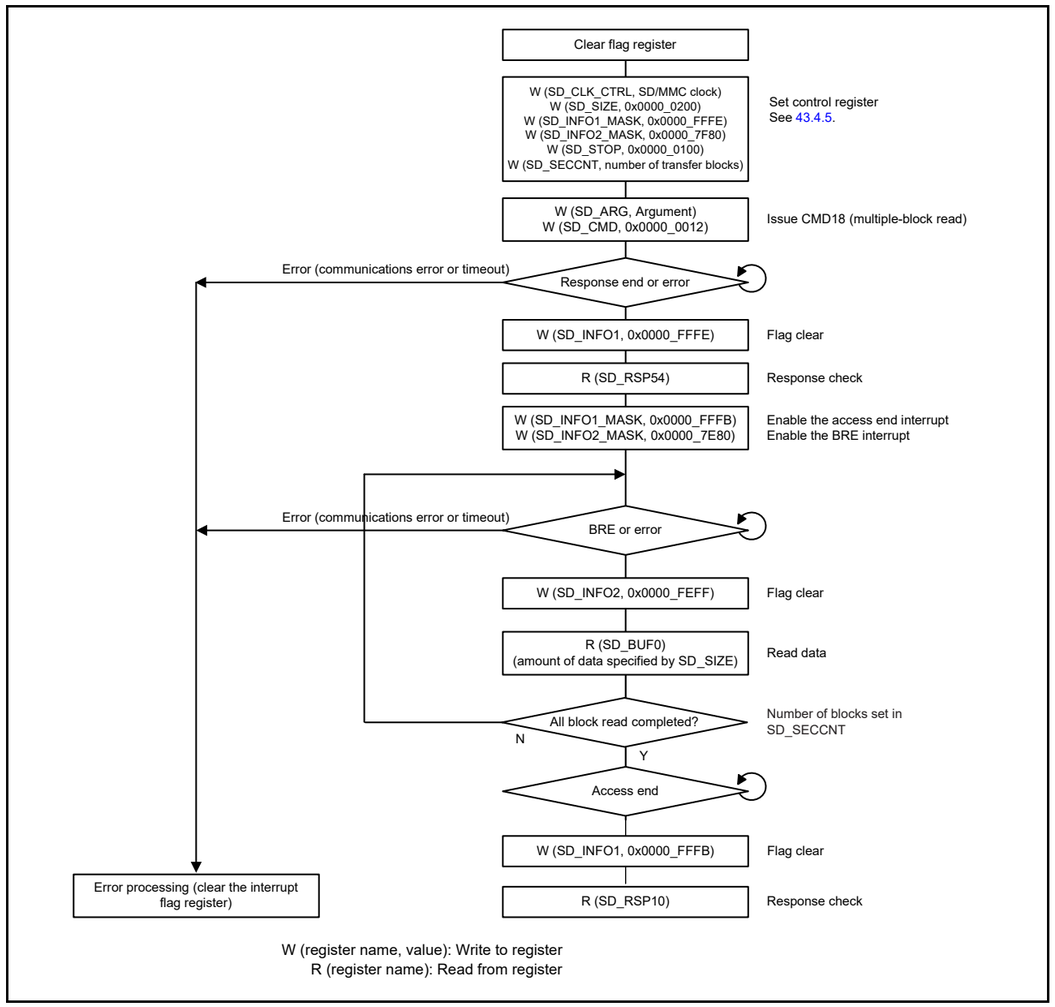

Figure 43.13 Example of multiple block read operation

43.3.8.1 Multiple block read operation

The operation of the multiple block read is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set SEC in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD18)
Set CMD18 argument in SD_ARG and write 0x0000_0012 to SD_CMD. CMD18 is issued and the multiple block read operation is started.

d. Response check
On receiving the response, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear

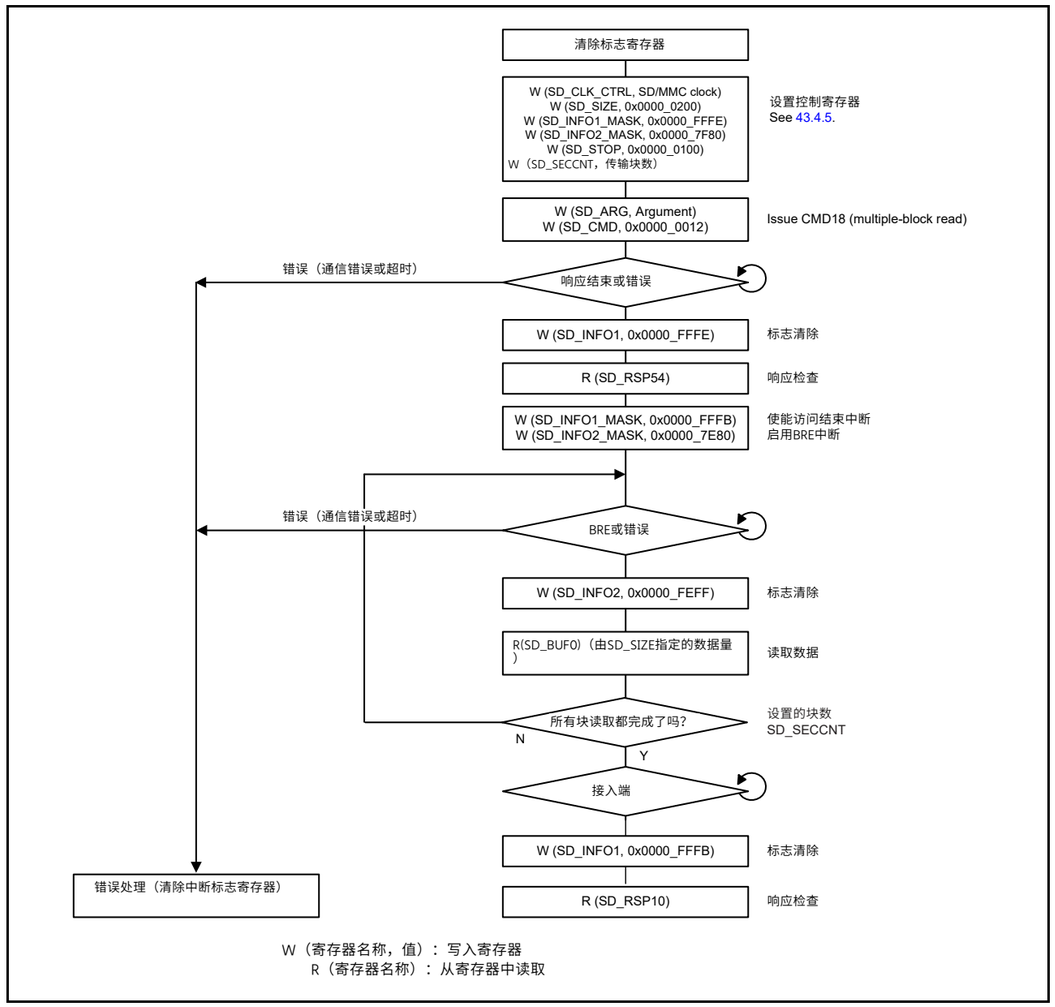

Figure 43.13 多块读取操作示例

43.3.8.1 多块读操作

多块读取的操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).
将SD_STOP中的SEC设置为1，并在SD_SECCNT中设置传输块数。

C。命令问题(CMD18)
在SD_ARG中设置CMD18参数并将0x0000_0012写入SD_CMD。发出CMD18并开始多块读取操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）置1以产生中断。清除

RSPEND to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data receive from SD card/MMC and data read
Write 0x0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data received from the SD card/MMC is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multiblock transfer with the number of blocks that is set to SD_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0x0000_0000.

f. Operation complete
When all-block data read and the CMD12 response received are completed, ACEND (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear ACEND to 0 to read the response. This is the end of multiple block read operation. In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

43.3.9 Multiple Block Write (SD/MMC Using Internal Timer)

Figure 43.14 shows an example flow of a multiple block write using internal timer.

RSPEND为0并从SD_RSP54读取响应。如果响应解码的结果是错误的，可以通过将SD_STP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致发出CMD12并接收响应。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e.从SD卡MMC接收数据并读取数据
将0x0000_FFFB写入SD_INFO1_MASK以使能访问结束中断。此外，将0x0000_7E80写入SD_INFO2_MASK以启用BRE中断。当从SD卡MMC接收到单块数据完成时，SD_INFO2中的BRE位被设置为1以产生中断。将BRE位清0并从SD_BUF0中读取SD_SIZE中指定的数据量。这样做会重复传输SD_SECCNT中设置的块数。但是，如果在读取SD_BUF0时正在接收数据，则可能会产生通信错误或超时。自动发出CMD12以停止多块传输，块数设置为SD_SECCNT并接收响应。此时，CMD12参数自动设置为0x0000_0000。

F。操作完成
当全块数据读取和接收到的CMD12响应完成时，SD_INFO1中的ACEND（访问结束）置1以产生中断。将ACEND清除为0以读取响应。这是多块读取操作的结束。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

43.3.9 多块写入（使用内部定时器的SDMMC）

图43.14显示了使用内部定时器进行多块写入的示例流程。

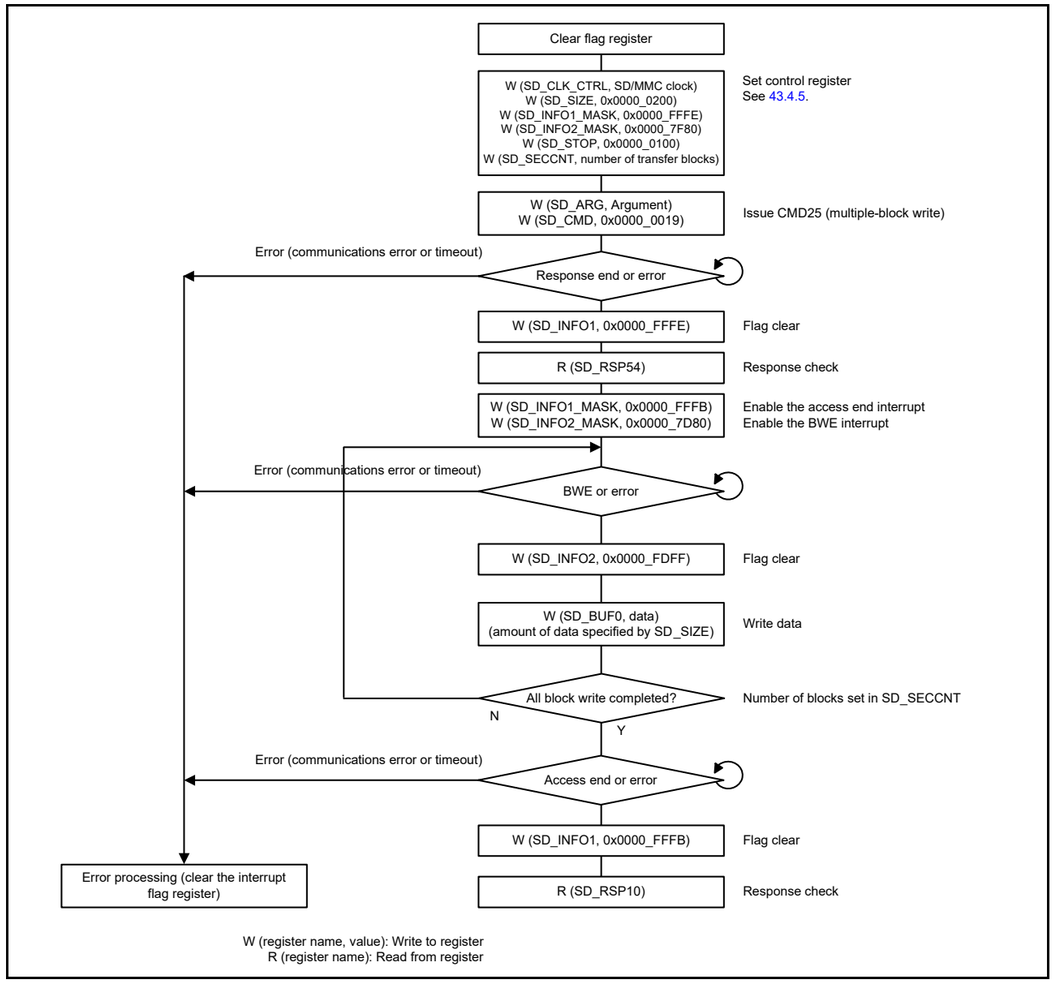

Figure 43.14 Example of multiple block write operation using internal timer

43.3.9.1 Multiple block write operation using internal timer

The operation of the multiple block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD25)
Set CMD25 argument in SD_ARG and write 0x0000_0019 to SD_CMD. CMD25 is issued and the multiple block write operation is started.

d. Response check
On receiving the response, the RSPEND bit (response end) in SD_INFO1 is set to 1 to generate an interrupt.
Clear the RSPEND bit to 0 and read the response from SD_RSP54. If the result of response decoding is an error,

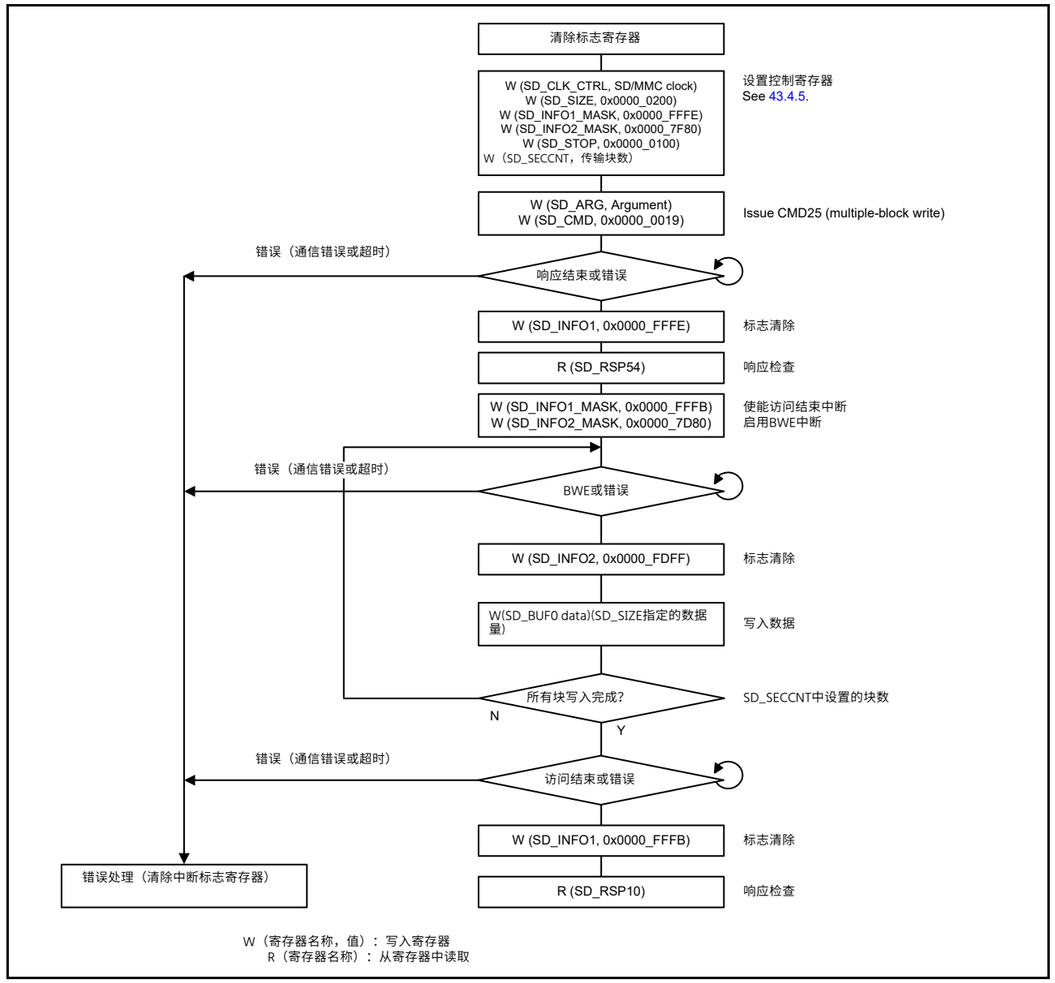

Figure 43.14 使用内部定时器的多块写入操作示例

43.3.9.1 使用内部定时器的多块写操作

多块写入的操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).
将SD_STOP中的SEC位设置为1，并在SD_SECCNT中设置传输块数。

C。命令问题(CMD25)
在SD_ARG中设置CMD25参数并将0x0000_0019写入SD_CMD。发出CMD25并开始多块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND位（响应结束）置1以产生中断。
将RSPEND位清0并从SD_RSP54读取响应。如果响应解码的结果是错误的，

the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data write and data transmit to SD card/MMC
Write 0x0000_FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card/MMC. The CRC status and busy state are received from the SD card/MMC. This repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multiblock transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0x0000_0000.

f. Operation complete
When all-block data transmit and the CRC status receive are completed, the ACEND bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to read the response. This is the end of multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs.

43.3.10 Multiple Block Write (MMC using external timer)

Figure 43.15 shows an example flow of a multiple block write using an external timer.

可以通过将SD_STP中的STP位设置为1来停止命令序列。将STP位设置为1也会导致发出CMD12并接收响应。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e.数据写入和数据传输到SD卡MMC
将0x0000_FFFB写入SD_INFO1_MASK以使能访问结束中断。此外，将0x0000_7D80写入SD_INFO2_MASK以启用BWE中断。当SD_BUF0准备好写入数据时，SD_INFO2寄存器中的BWE位设置为1以产生中断。将BWE位清除为0，并将SD_SIZE中指定的数据量写入SD_BUF0。当数据写入SD_BUF0完成后，数据被传输到SD卡MMC。从SD卡MMC接收CRC状态和忙状态。这将重复传输SD_SECCNT中设置的块数。但是，如果在写入SD_BUF0时正在接收数据，则可能会产生通信错误或超时。自动发出CMD12以停止多块传输，块数设置为SD_SECCNT并接收响应。此时，CMD12参数自动设置为0x0000_0000。

F。操作完成
当全块数据发送和CRC状态接收完成时，ACEND位（访问结束）在
SD_INFO1设置为1以产生中断。将ACEND位清0以读取响应。这是多块写操作的结束。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

43.3.10 多块写入（使用外部定时器的MMC）

图43.15显示了使用外部定时器进行多块写入的示例流程。

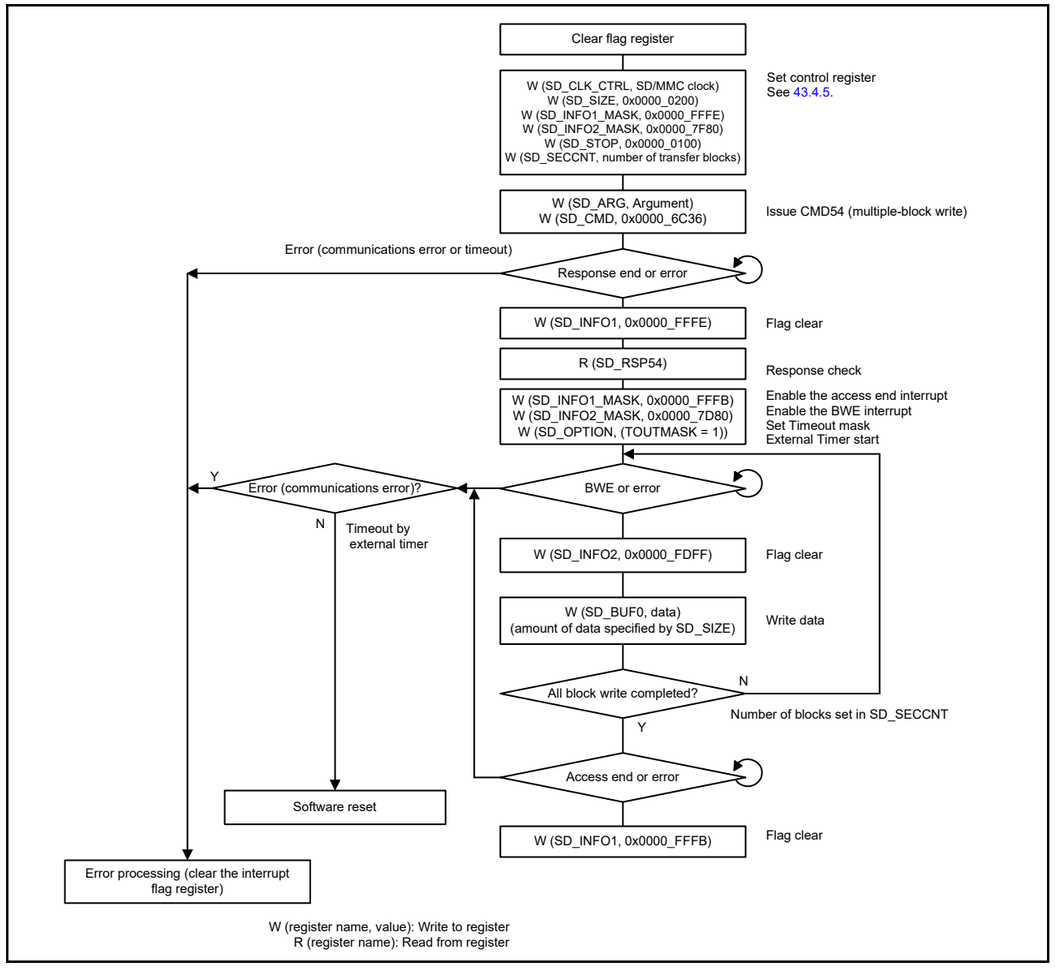

Figure 43.15 Example of multiple block write operation using external timer

43.3.10.1 Multiple block write operation using external timer

The operation of the multiple block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD54)
Set CMD54 Argument in SD_ARG and write 0x0000_6C36 to SD_CMD. CMD54 is issued and the multiple block write operation is started.

d. Response check
On receiving the response, the RSPEND bit (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the RSPEND bit to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes

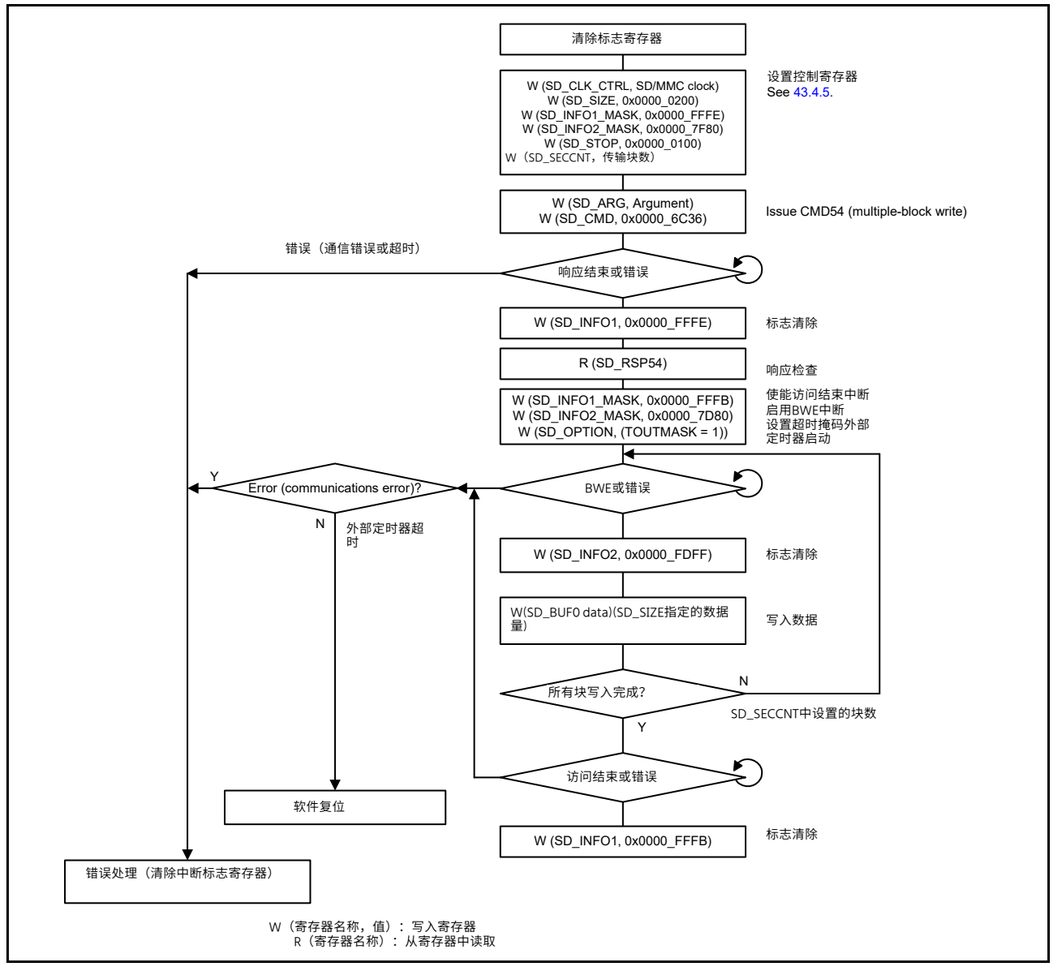

Figure 43.15 使用外部定时器的多块写入操作示例

43.3.10.1 使用外部定时器的多块写操作

多块写入的操作描述如下：

一个。标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置MMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).
将SD_STOP中的SEC位设置为1，并在SD_SECCNT中设置传输块数。

C。命令问题(CMD54)
在SD_ARG中设置CMD54参数并将0x0000_6C36写入SD_CMD。发出CMD54并开始多块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND位（响应结束）置1以产生中断。
将RSPEND位清0并从SD_RSP54读取响应。如果响应解码的结果是错误的，可以通过将SD_STP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致

CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data write and data transmit to MMC
Write 0x0000_FFFB to SD_INFO1_MASK to enable the access end interrupt, write 0x0000_7D80 to SD_INFO2_MASK to enable the BWE interrupt and set 1 to TOUTMASK of SD_OPTION to inactivate timeout. In addition, start external timer. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the MMC. The CRC status and busy state are received from the MMC. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while writing to SD_BUF0 is in progress.

f. Operation complete
When all-block data transmit and the CRC status receive are completed, the ACEND bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to read the response. This is the end of multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs when receiving response. Execute software reset if a timeout by external timer occurs when transmitting data.

43.3.11 IO_RW_DIRECT Command (SD: CMD52)

Figure 43.16 shows an example flow of an IO_DIRECT command (CMD52) operation.

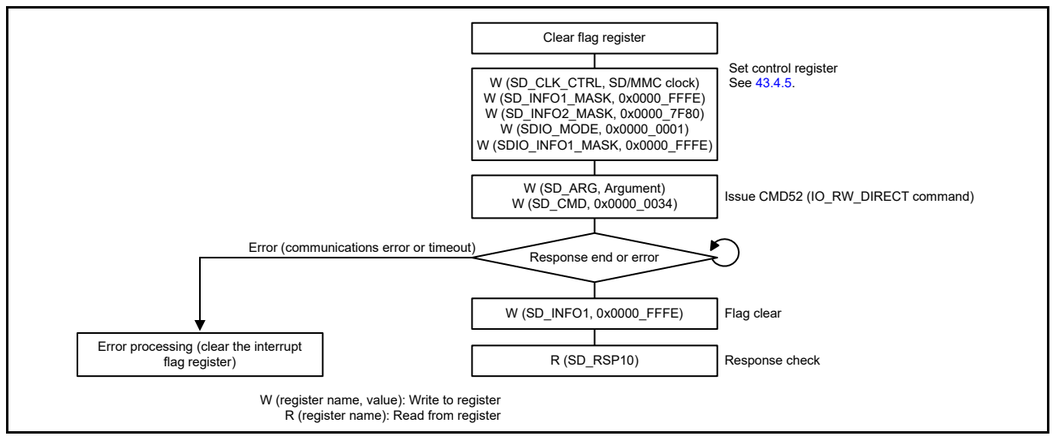

Figure 43.16 Example of IO_RW_DIRECT command (CMD52) operation

43.3.12 IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read)

Figure 43.17 shows an example flow for a CMD53 multiple block read operation.

发出CMD12并收到响应。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e.数据写入和数据传输到MMC
向SD_INFO1_MASK写入0x0000_FFFB使能访问结束中断，向SD_INFO1_MASK写入0x0000_7D80
SD_INFO2_MASK启用BWE中断并将SD_OPTION的TOUTMASK设置为1以禁用超时。另外，启动外部定时器。当SD_BUF0准备好写入数据时，SD_INFO2寄存器中的BWE位设置为1以产生中断。将BWE位清除为0，并将SD_SIZE中指定的数据量写入SD_BUF0。当数据写入SD_BUF0完成后，数据被传输到MMC。从MMC接收CRC状态和忙碌状态。这样做会重复传输SD_SECCNT中设置的块数。但是，如果在写入SD_BUF0时正在接收数据，则可能会产生通信错误或超时。

F。操作完成
当全块数据发送和CRC状态接收完成时，ACEND位（访问结束）在
SD_INFO1设置为1以产生中断。将ACEND位清0以读取响应。这是多块写操作的结束。此外，如果在接收响应时发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。如果在传输数据时发生外部定时器超时，则执行软件复位。

43.4 Usage Notes

43.4.1 SD_BUF Illegal Write Access (SD/MMC)

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified in SD_SIZE must be written.

If the data exceeds the size specified in SD_SIZE is written, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 might not be transmitted and the SD_CLK_CTRLEN bit in SD_INFO2 is held at the value of 0. If this occurs, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SD_CLK_CTRLEN bit to 1.

However, this does not apply to the single byte or three bytes when the SD_SIZE setting is odd, or to the fraction of bytes when the SD_SIZE setting is even (the 2 bytes that are not in a 4-byte unit), because the portion of dummy data writing is regarded as excess data and ignored.

43.4.2 Block Number Constraint for Multiple Block Read (SD)]

When performing a multiple block read of one or two blocks, depending on the timing with which the SD card response register is read, the response value might not be read properly. To prevent this, do one of the following:

1. When receiving one or two blocks of data, use single block reading.
2. Read the response to CMD18 from SD_RSP54.

43.4.2.1 Mechanism of incorrect reading

Figure 43.25 shows the processing flows of the SDHI (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation in Figure 43.25, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response might be read. This problem does not occur for multiple block reads of three or more blocks, because CMD12 is not issued until the block of data is read. The problem also does not occur for multiple block writes, because the CMD25 response is read before the block of data is sent.

	CMD55	0000_0037h	-
	CMD56	0000_0038h	-

43.4 使用说明

43.4.1 SD_BUF非法写访问(SDMMC)

在发出单块写入或多块写入命令后向SD_BUF0写入数据时，必须写入SD_SIZE中指定大小的数据。

如果写入的数据超过SD_SIZE中指定的大小，则SD_INFO2中的ERR4位设置为1。此外，写入SD_BUF0的数据可能不会被传输，并且SD_INFO2中的SD_CLK_CTRLEN位将保持为0。如果这发生时，将SOFT_RST中的SDRST位清除为0，然后将其值恢复为1，将SD_CLK_CTRLEN位清除为1。

但是，这不适用于SD_SIZE设置为奇数时的单个字节或三个字节，或适用于SD_SIZE设置为偶数时的字节部分（不在4字节单元中的2个字节），因为该部分虚拟数据写入的次数被视为多余数据并被忽略。

43.4.2 多块读取（SD）的块号约束]

执行1块或2块的多块读取时，根据读取SD卡响应寄存器的时序，可能无法正确读取响应值。为防止这种情况，请执行以下操作之一：

1. 接收一两块数据时，使用单块读取。
2. 从SD_RSP54读取对CMD18的响应。

43.4.2.1 误读机制

图43.25显示了对两个块执行多块读取时的SDHI（硬件）操作和软件操作的处理流程。如图43.25中的错误操作所示，当接收到CMD18响应时产生中断并且中断读取SD卡响应寄存器（SD_RSP10）的时序延迟时，CMD12响应接收期间的数据或可能会读取CMD12响应。对于三个或更多块的多个块读取不会出现此问题，因为在读取数据块之前不会发出CMD12。多次块写入也不会出现该问题，因为在发送数据块之前读取了CMD25响应。

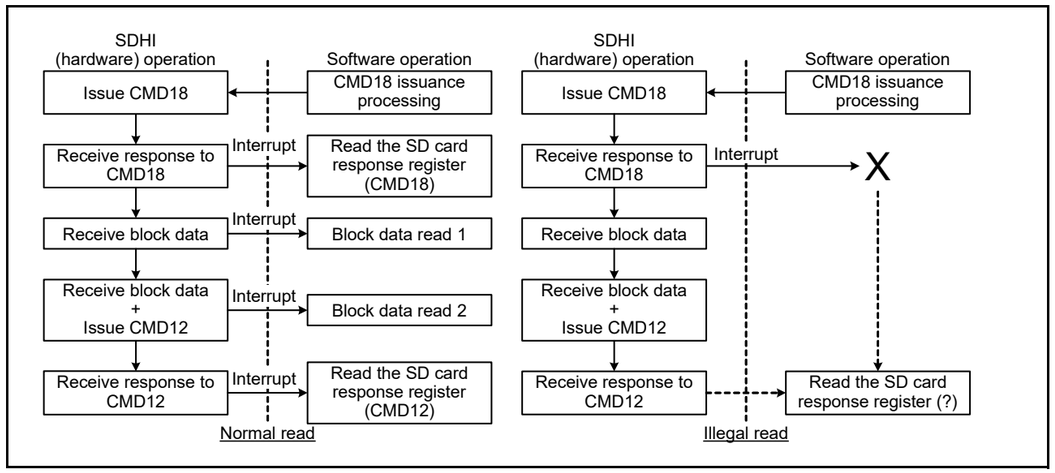

Figure 43.25 Multiple block read operation flow chart (two blocks)

43.4.3 Automatic Control of SD/MMC Clock Output (SD/MMC)

In the SD Card/MMC standard, 74 cycles of SD/MMC clock must be output before initialization of the card. For this reason, use automatic control of SD/MMC clock output after 74 cycles of SD/MMC clock are output. In addition, if automatic control of SD/MMC clock output was in use, SD/MMC clock output is stopped on completion of the sequence for a communications error or timeout. When state transitions within the SD card/MMC are necessary after completion of the sequence, release automatic control of SD/MMC clock output and restart supply of the SD/MMC clock to the SD card/MMC.

43.4.4 Control of the C52PUB Setting for Multiple Block Write (SD)

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write because of CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by using one of the following procedures, as appropriate:

(a) When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the RSPEND interrupt processing in SD_INFO1 because the issuing of CMD52 is completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

(b) When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2,....) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the RSPEND interrupt processing in SD_INFO1 because the issuing of CMD52 is completed, restart writing to SD_BUF by DMA transfer.

43.4.5 Notes on SD_CLK_CTRL Register Settings (SD/MMC)

When the SD_CLK_CTRLEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, you must check that the SD_CLK_CTRLEN bit in SD_INFO2 is 1.

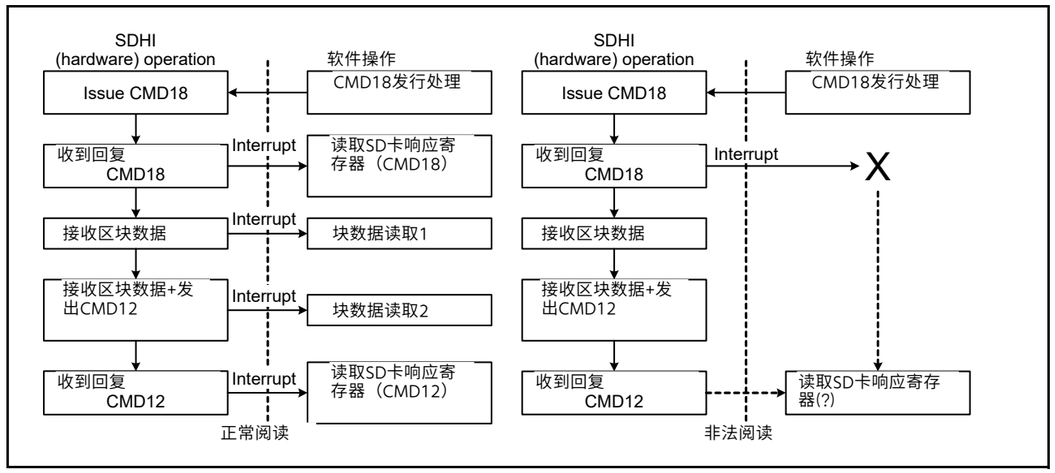

Figure 43.25 多块读取操作流程图（两个块）

43.4.3 SDMMC时钟输出(SDMMC)的自动控制

在SD卡MMC标准中，必须在卡初始化之前输出74个周期的SDMMC时钟。为此，在输出SDMMC时钟的74个周期后使用SDMMC时钟输出的自动控制。此外，如果正在使用SDMMC时钟输出的自动控制，则SDMMC时钟输出会在完成通信错误或超时的序列时停止。当序列完成后需要SD卡MMC内的状态转换时，解除对SDMMC时钟输出的自动控制并重新开始向SD卡MMC提供SDMMC时钟。

43.4.4 控制多块写入(SD)的C52PUB设置

如果SDIO_MODE中的C52PUB位由于CMD53而在多个块写入序列期间设置为1，则在SD_BUF变空之前不会发出CMD52。因此，在暂停写入SD_BUF后，根据需要使用以下过程之一设置C52PUB位：

(a) 不使用DMA传输时

1. 在设置C52PUB位之前，通过在SD_INFO2中进行设置以禁用BWE中断来暂停写入SD_BUF。
2. 将SDIO_MODE中的C52PUB位设置为1（以便在SD_BUF为空时发出CMD52）。
3. 在SD_INFO1中的RSPEND中断处理后，因为CMD52的发出完成，通过在SD_INFO2中进行设置以启用BWE中断，重新开始写入SD_BUF。

(b) 使用DMA传输时

1. 每次DMA传输SD_SIZE n块（其中n=1 2 ....）中设置的值时，暂停写入SD_BUF在C52PUB位被置位之前由DMA传输。
2. 将SDIO_MODE中的C52PUB位设置为1（以便在SD_BUF为空时发出CMD52）。
3. 在SD_INFO1中的RSPEND中断处理后，因为CMD52的发布完成，重新开始通过DMA传输写入SD_BUF。

43.4.5 SD_CLK_CTRL寄存器设置注意事项(SDMMC)

当SD_INFO2中的SD_CLK_CTRLEN位为0时，无法写入SD_CLK_CTRL。在写信之前SD_CLK_CTRL，必须检查SD_INFO2中的SD_CLK_CTRLEN位是否为1。

43.4.6 Specification Limitations

1. The Suspend/Resume operation of the SDIO is not supported.
2. The SPI bus is not supported. (SD/MMC)
3. The shared bus and 8-bit SD bus of the embedded SDIO are not supported.
4. Stream transfer of MMC is not supported.
5. High Priority Interrupt (HPI) of MMC is not supported.
6. Boot Operation/Alternative Boot Operation of MMC is not supported.
7. Open-ended multiple block transfer of MMC is not supported.

43.4.7 STP Bit Setting during Multiple Block Read (SD/MMC)

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence might not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SD_CLK_CTRLEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence does not stop because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, you must leave the SEC bit in SD_STOP as 1.

43.4.8 Register Setting Notes

1. All registers in section 43.2, Register Descriptions are accessed in 32-bit access-only.
2. When setting registers, set them after the I/O Port Register setting.

43.4.6 规格限制

1. 不支持SDIO的SuspendResume操作。
2. 不支持SPI总线。(标清MMC)
3. 不支持嵌入式SDIO的共享总线和8位SD总线。
4. 不支持MMC的流传输。
5. 不支持MMC的高优先级中断(HPI)。
6. 不支持MMC的引导操作替代引导操作。
7. 不支持MMC的开放式多块传输。

43.4.7 多块读取(SDMMC)期间的STP位设置

在通过将SD_STOP中的SEC位设置为1来执行多个块读取并自动执行CMD12期间，即使将SD_STOP中的STP位设置为1以强制停止执行，命令序列也可能不会停止，具体取决于设置STP位。

为避免这种情况，在多块传输期间将SD_STOP中的STP位设置为1时，同时将SD_STOP中的SEC位清除为0。（即使SD_INFO2中的SD_CLK_CTRLEN位为0，也将SEC位从1更改为0。）

当由于SEC位未清0而导致命令序列未停止时，可通过将SOFT_RST中的SDRST位清0来停止命令序列。

通过SDIO_MODE中的IOABT位强制终止CMD53多块传输时，必须将SD_STOP中的SEC位保留为1。

43.4.8 注册设置注意事项

1. 第43.2节，寄存器描述中的所有寄存器都只能以32位访问方式访问。
2. 设置寄存器时，请在设置IO端口寄存器之后设置。

44. Parallel Data Capture Unit (PDC)

44.1 Overview

The MCU provides one Parallel Data Capture Unit (PDC). The PDC communicates with external I/O devices, including image sensors, and transfers parallel data such as an image output from the external I/O device through the DTC or DMAC to the on-chip SRAM and external address spaces (the CS and SDRAM areas). Table 44.1 lists the PDC specifications, Figure 44.1 shows a block diagram, and Table 44.2 lists the I/O pins.

Table 44.1 PDC specifications

Parameter	Specifications
Capture range	Any amount of parallel data within the following ranges in the vertical and horizontal directions: • Vertical direction: 1 to 4095 lines • Horizontal direction: 4 to 4095 bytes
Parallel transfer clock (PIXCLK)	Operating frequency: 1 to 27 MHz*1
Interrupt sources	• Receive data ready • Frame end • Overrun • Underrun • Error in the setting for the number of lines • Error in setting for the number of bytes per line
Startup of DTC or DMAC	Frame end and receive data ready interrupts can start DTC or DMAC
Parallel transfer clock output (PCKO)	• Operating frequency: 1 to 30 MHz*2 • Clock source: Peripheral module clock B (PCLKB) • Frequency division ratio: Selectable from 2, 4, 6, 8, 10, 12, 14, and 16.
Other functions	• PDC reset function • Selectable active polarity for VSYNC and HSYNC signals • Monitoring of VSYNC and HSYNC signals • Endian order selectable
Module-stop function	Module-stop state can be set to reduce power consumption
Internal bus interface	Internal peripheral bus 5

Note 1. Set the frequency of the parallel data transfer clock (PIXCLK) to a value less than that of 0.6 × PCLKB (peripheral module clock).
Note 2. The operating frequency is 30 MHz when peripheral module clock B (PCLKB) is 60 MHz and the frequency division ratio is 2.

44. 并行数据采集单元(PDC)

44.1 Overview

MCU提供一个并行数据采集单元(PDC)。PDC与外部IO设备（包括图像传感器）通信，并通过DTC或DMAC将并行数据（例如从外部IO设备输出的图像）传输到片上SRAM和外部地址空间（CS和SDRAM区域）。表44.1列出了PDC规格，图44.1显示了框图，表44.2列出了IO引脚。

Table 44.1 PDC specifications

Parameter	Specifications
捕获范围	垂直和水平方向上以下范围内的任意数量的并行数据： 垂直方向：1到4095行 水平方向：4到4095字节
并行传输时钟(PIXCLK)	工作频率：1至27MHz*1
中断源	接收数据就绪 帧结束 溢出 欠载 行数设置错误 每行字节数设置错误
DTC或DMAC的启动	帧结束和接收数据就绪中断可以启动DTC或DMAC
并行传输时钟输出(PCKO)	工作频率：1至30MHz*2 时钟源：外围模块时钟B(PCLKB) 分频比：可从2、4、6、8、10、12、14和16中选择。
其他功能	PDC复位功能 可选择VSYNC和HSYNC信号的有效极性 监控VSYNC和HSYNC信号 Endian顺序可选
Module-stop function	可设置模块停止状态以降低功耗
内部总线接口	内部外围总线5

Note 1. 将并行数据传输时钟(PIXCLK)的频率设置为小于0.6×PCLKB（外围模块时钟）的值。
Note 2. 当外围模块时钟B（PCLKB）为60MHz，分频比为2时，工作频率为30MHz。

PCKO	Output	并行传输时钟的输出

44.2 Register Descriptions

44.2.1 PDC Control Register 0 (PCCR0)

Address(es): PDC.PCCR0 4009 4000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	EDS	PCKDIV[2:0]			PCKOE	HERIE	VERIE	UDRIE	OVIE	FEIE	DFIE	PRST	HPS	VPS	PCKE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PCKE	PIXCLK Input Enable	0: Disable PIXCLK input 1: Enable PIXCLK input.	R/W
b1	VPS	VSYNC Signal Polarity Select	0: Set VSYNC signal to active high 1: Set VSYNC signal to active low.	R/W
b2	HPS	HSYNC Signal Polarity Select	0: Set HSYNC signal to active high 1: Set HSYNC signal to active low.	R/W
b3	PRST	PDC Reset	0: Do not apply PDC reset 1: Reset PDC.	R/(W) *1
b4	DFIE	Receive Data Ready Interrupt Enable	0: Disable receive data ready interrupt requests 1: Enable receive data ready interrupt requests.	R/W
b5	FEIE	Frame End Interrupt Enable	0: Disable frame end interrupt requests 1: Enable frame end interrupt requests.	R/W
b6	OVIE	Overrun Interrupt Enable	0: Disable overrun interrupt requests 1: Enable overrun interrupt requests.	R/W
b7	UDRIE	Underrun Interrupt Enable	0: Disable underrun interrupt requests 1: Enable underrun interrupt requests.	R/W
b8	VERIE	Vertical Line Number Setting Error Interrupt Enable	0: Disable vertical line number setting error interrupt requests 1: Enable vertical line number setting error interrupt requests.	R/W
b9	HERIE	Horizontal Byte Number Setting Error Interrupt Enable	0: Disable horizontal byte number setting error interrupt requests 1: Enable horizontal byte number setting error interrupt requests.	R/W
b10	PCKOE	PCKO Output Enable	0: Disable PCKO output (fix to high level) 1: Enable PCKO output.	R/W
b13 to b11	PCKDIV[2:0]	PCKO Frequency Division Ratio Select	b13 b11 0 0 0: PCLKB/2 0 0 1: PCLKB/4 0 1 0: PCLKB/6 0 1 1: PCLKB/8 1 0 0: PCLKB/10 1 0 1: PCLKB/12 1 1 0: PCLKB/14 1 1 1: PCLKB/16.	R/W
b14	EDS	Endian Select	0: Little endian 1: Big endian.	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 1 can be written to this bit.

44.2 注册说明

44.2.1 PDC控制寄存器0(PCCR0)

Address(es): PDC.PCCR0 4009 4000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	EDS	PCKDIV[2:0]			PCKOE	HERIE	VERIE	UDRIE	OVIE	FEIE	DFIE	PRST	HPS	VPS	PCKE
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	PCKE	PIXCLK输入使能	0：禁用PIXCLK输入1： 启用PIXCLK输入。	R/W
b1	VPS	VSYNC信号极性选择	0：将VSYNC信号设置为高电平有效1： 将VSYNC信号设置为低电平有效。	R/W
b2	HPS	HSYNC信号极性选择	0：将HSYNC信号设置为高电平有效1： 将HSYNC信号设置为低电平有效。	R/W
b3	PRST	PDC Reset	0：不应用PDC复位1：复 位PDC。	R/(W) *1
b4	DFIE	接收数据就绪中断使能	0：禁止接收数据就绪中断请求1：使能接收数 据就绪中断请求。	R/W
b5	FEIE	帧结束中断使能	0：禁止帧结束中断请求1：使能帧结 束中断请求。	R/W
b6	OVIE	溢出中断使能	0：禁止溢出中断请求1：使能溢出中 断请求。	R/W
b7	UDRIE	欠载中断使能	0：禁止欠载中断请求1：启用欠载中 断请求。	R/W
b8	VERIE	垂直行号设置错误中断 Enable	0：禁用垂直行号设置错误中断请求1：启用垂直行 号设置错误中断请求。	R/W
b9	HERIE	水平字节数设置错误 中断使能	0：禁用水平字节数设置错误中断请求1：启用 水平字节数设置错误中断请求。	R/W
b10	PCKOE	PCKO输出使能	0：禁用PCKO输出（固定为高电平）1： 启用PCKO输出。	R/W
b13 to b11	PCKDIV[2:0]	PCKO分频比选择	b13 b11 0 0 0: PCLKB/2 0 0 1: PCLKB/4 0 1 0: PCLKB/6 0 1 1: PCLKB/8 1 0 0: PCLKB/10 1 0 1: PCLKB/12 1 1 0: PCLKB/14 1 1 1: PCLKB/16.	R/W
b14	EDS	Endian Select	0：小端1：大 端。	R/W
b31 to b15	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 该位只能写入1。

Only set the PCCR0 register while the PCE bit in the PCCR1 register is 0.

PCKE bit (PIXCLK Input Enable)

The PCKE bit enables or disables input through the PIXCLK pin. Set this bit to 1 before enabling reception. After enabling input through the PIXCLK pin, use the PRST bit to initialize the PDC.

Disable reception operations before setting this bit to 0.

VPS bit (VSYNC Signal Polarity Select)

The VPS bit selects the active polarity of the VSYNC signal.

HPS bit (HSYNC Signal Polarity Select)

The HPS bit selects the active polarity of the HSYNC signal.

PRST bit (PDC Reset)

The PRST bit initializes the internal status of the PDC and the PDC registers targeted by reset. See section 44.3.11, Reset State, for the target registers. Set the PCKE bit to 1 before resetting the PDC.

When 1 is written to the PRST bit, initialization starts in synchronization with the PIXCLK. After initialization completes, the PRST bit clears to 0. After a PDC reset, ensure that the PIXCLK pin has an input signal. Also, after 1 is written to the PRST bit, do not proceed to the next step until verifying that the bit has returned to 0.

For consecutive PDC resets, wait for at least 1 PIXCLK cycle after verifying that the PRST bit has returned to 0.

DFIE bit (Receive Data Ready Interrupt Enable)

The DFIE bit enables or disables the generation of receive data ready interrupt requests.

FEIE bit (Frame End Interrupt Enable)

The FEIE bit enables or disables the generation of frame end interrupt requests.

OVIE bit (Overrun Interrupt Enable)

The OVIE bit enables or disables the generation of overrun interrupt requests.

UDRIE bit (Underrun Interrupt Enable)

The UDRIE bit enables or disables the generation of underrun interrupt requests.

VERIE bit (Vertical Line Number Setting Error Interrupt Enable)

The VERIE bit enables or disables the generation of vertical line number setting error interrupt requests.

HERIE bit (Horizontal Byte Number Setting Error Interrupt Enable)

The HERIE bit enables or disables the generation of horizontal byte number setting error interrupt requests.

PCKOE bit (PCKO Output Enable)

The PCKOE bit enables or disables an output from PCKO. When the PCKOE bit is cleared to 0 during low output of PCKO, it might cause high output on clearing, resulting in corruption of the duty cycle.

PCKDIV[2:0] bits (PCKO Frequency Division Ratio Select)

The PCKDIV[2:0] bits select the frequency division ratio of PCKO. The PCKO output is a clock signal derived by dividing the PCLKB clock signal by a value from 2 to 16, based on the setting in the PCKDIV[2:0] bits. The PCKO operating frequency, the resulting PCLKB division, must fall within the range from 1 to 30 MHz.

EDS bit (Endian Select)

The EDS bit selects the endian order for the captured data.

仅当PCCR1寄存器中的PCE位为0时设置PCCR0寄存器。

PCKE位（PIXCLK输入使能）

PCKE位启用或禁用通过PIXCLK引脚的输入。在启用接收之前将该位设置为1。通过PIXCLK引脚使能输入后，使用PRST位初始化PDC。

在将此位设置为0之前禁用接收操作。

VPS位（VSYNC信号极性选择）

VPS位选择VSYNC信号的有效极性。

HPS位（HSYNC信号极性选择）

HPS位选择HSYNC信号的有效极性。

PRST位（PDC复位）

PRST位初始化PDC和复位目标PDC寄存器的内部状态。请参阅第44.3.11节，重置State，用于目标寄存器。在复位PDC之前将PCKE位设置为1。

当PRST位写入1时，初始化与PIXCLK同步开始。初始化完成后，PRST位清零。在PDC复位后，确保PIXCLK引脚有输入信号。此外，在PRST位写入1后，在验证该位已返回0之前不要进行下一步。

对于连续的PDC复位，请在验证PRST位已返回0后等待至少1个PIXCLK周期。

DFIE位（接收数据就绪中断使能）

DFIE位启用或禁用接收数据就绪中断请求的生成。

FEIE位（帧结束中断允许）

FEIE位启用或禁用帧结束中断请求的生成。

OVIE位（溢出中断使能）

OVIE位启用或禁用溢出中断请求的生成。

UDRIE位（欠载中断使能）

UDRIE位启用或禁用欠载中断请求的生成。

VERIE位（垂直行号设置错误中断使能）

VERIE位启用或禁用垂直行号设置错误中断请求的生成。

HERIE位（水平字节数设置错误中断使能）

HERIE位启用或禁用水平字节数设置错误中断请求的生成。

PCKOE位（PCKO输出使能）

PCKOE位启用或禁用PCKO的输出。当PCKOE位在低输出期间被清除为0 PCKO，它可能会导致清除时的高输出，从而导致占空比损坏。

PCKDIV[2:0]位（PCKO分频比选择）

PCKDIV[2:0]位选择PCKO的分频比。PCKO输出是一个时钟信号，根据PCKDIV[2:0]位的设置，将PCLKB时钟信号除以2到16的值。PCKO工作频率，即产生的PCLKB分频，必须在1到30MHz的范围内。

EDS位（字节序选择）

EDS位选择捕获数据的字节序。

44.2.2 PDC Control Register 1 (PCCR1)

Address(es): PDC.PCCR1 4009 4004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PCE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PCE	PDC Operation Enable	0: Disable reception operations 1: Enable reception operations.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

PCE bit (PDC Operation Enable)

The PCE bit enables or disables reception operations. When the PCE bit is set to 1 during assertion of the VSYNC signal, the PDC starts reception operations from the next valid edge of the VSYNC signal.

Only clear the PCE bit to 0 while reception or continued reception operations are stopped, including for the frame end interrupt. For more on continued reception, see section 44.3.6, Continued Reception Operations at Frame End.

44.2.3 PDC Status Register (PCSR)

Address(es): PDC.PCSR 4009 4008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	PCE	PDC操作使能	0：禁用接收操作1：启用接收操作。	R/W
b31 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

PCE位（PDC操作使能）

PCE位启用或禁用接收操作。在VSYNC信号有效期间PCE位设置为1时，PDC从VSYNC信号的下一个有效边沿开始接收操作。

只有在接收或继续接收操作停止时才将PCE位清零，包括帧结束中断。有关继续接收的更多信息，请参阅第44.3.6节，帧结束时的继续接收操作。

44.2.3 PDC状态寄存器(PCSR)

Address(es): PDC.PCSR 4009 4008h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	位名称	Description	R/W
b0	FBSY	帧忙标志	0：接收操作停止1：接收操作正在进行中。	R
b1	FEMPF	FIFO空标志	0：FIFO不为空1：FIFO为空。	R
b2	FEF	帧结束标志	0：未发生帧结束1：发生帧结束。	R/(W) *1
b3	OVRF	溢出标志	0：未发生FIFO溢出1：发生FIFO溢出。	R/(W) *1
b4	UDRF	Underrun Flag	0：未发生欠载1：发生欠载。	R/(W) *1
b5	VERF	垂直行号设置错误标志	0：未发生垂直行数设置错误1：发生垂直行数设置错误。	R/(W) *1
b6	HERF	水平字节数设置错误标志	0：未发生水平字节数设置错误1：发生水平字节数设置错误。	R/(W) *1

Bit	Symbol	Bit name	Description	R/W
b31 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R

Note 1. Only 0 can be written to these flags, to clear them after they are read as 1.

FBSY flag (Frame Busy Flag)

The FBSY flag indicates the state of PDC operations.

[Setting condition]

- On detection of the valid edge of the VSYNC signal after the enabling of reception operations.

[Clearing conditions]

- On reception of one frame of data in accordance with the settings in the VCR and HCR registers*1
- When an overrun, underrun, vertical line number setting error, or horizontal byte number setting error occurs
- When the PCCR1.PCE bit is 0.

Note 1. This flag is 0 during continued reception operations.

FEMPF flag (FIFO Empty Flag)

The FEMPF flag indicates the state of the FIFO when a vertical line number setting error or a horizontal byte number setting error occurs. It clears to 0 following an overrun and undefined following an underrun.

[Setting conditions]

- On reading of the PCDR register while the FIFO is empty
- On detection of a valid edge of the VSYNC signal
- On PDC reset.

[Clearing condition]

- On storage of the data captured in the FIFO.

FEF flag (Frame End Flag)

The FEF flag indicates the end of a frame.

[Setting condition]

- Reception of one frame of data in accordance with the settings in the VCR and HCR registers.*1

[Clearing conditions]

- On PDC reset
- When 0 is written to the flag after it is read as 1.

Note 1. For continued reception operations, this flag sets to 1 on their completion.

OVRF flag (Overrun Flag)

The OVRF flag indicates the occurrence of an overrun.

[Setting condition]

- When receive data arrives while the FIFO is full.

[Clearing conditions]

- On PDC reset
- When 0 is written to the flag after it is read as 1.

Bit	Symbol	位名称	Description	R/W
b31 to b7	—	Reserved	这些位被读取为0。写入值应为0。	R

Note 1. 这些标志只能写入0，以在读取为1后清除它们。

FBSY标志（帧忙标志）

FBSY标志指示PDC操作的状态。

[Setting condition]

- 在启用接收操作后检测到VSYNC信号的有效边沿。

[Clearing conditions]

- 根据VCR和HCR寄存器中的设置接收一帧数据时*1
- 发生溢出、欠载、垂直行数设置错误或水平字节数设置错误时
- 当PCCR1.PCE位为0时。

注1.在连续接收操作期间该标志为0。

FEMPF标志（FIFO空标志）

FEMPF标志指示发生垂直行数设置错误或水平字节数设置错误时FIFO的状态。它在溢出后清除为0，在下溢后清除为未定义。

[Setting conditions]

- 在FIFO为空时读取PCDR寄存器
- 检测到VSYNC信号的有效边沿
- 在PDC复位时。

[Clearing condition]

- 关于存储在FIFO中捕获的数据。

FEF标志（帧结束标志）

FEF标志指示帧的结束。

[Setting condition]

- 根据VCR和HCR寄存器中的设置接收一帧数据。*1

[Clearing conditions]

- 在PDC复位
- 当标志位读为1后写入0时。

注1.对于连续接收操作，该标志在完成时设置为1。

OVRF标志（溢出标志）

OVRF标志指示发生溢出。

[Setting condition]

- 当FIFO已满时接收数据到达。

[Clearing conditions]

- 在PDC复位
- 当标志位读为1后写入0时。

UDRF flag (Underrun Flag)

The UDRF flag indicates the occurrence of an underrun.

[Setting condition]

- On reading of the PCDR register while the FIFO is empty.

[Clearing conditions]

- On PDC reset
- When 0 is written to the flag after it is read as 1.

VERF flag (Vertical Line Number Setting Error Flag)

The VERF flag indicates an error in the setting for the number of lines.

[Setting condition]

- When the VSYNC signal is negated because fewer lines were captured than the value in the VCR register.

[Clearing conditions]

- On PDC reset
- When 0 is written to the flag after it is read as 1.

HERF flag (Horizontal Byte Number Setting Error Flag)

The HERF flag indicates an error in the number of bytes in a line.

[Setting condition]

- When the HSYNC signal is negated because fewer bytes in a line were captured than the value in the HCR register.

[Clearing conditions]

- On PDC reset
- When 0 is written to the flag after it is read as 1.

44.2.4 PDC Pin Monitor Register (PCMONR)

Address(es): PDC.PCMONR 4009 400Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSYNC	VSYNC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	VSYNC	VSYNC Signal Status Flag	0: VSYNC signal level is low 1: VSYNC signal level is high.	R
b1	HSYNC	HSYNC Signal Status Flag	0: HSYNC signal level is low 1: HSYNC signal level is high.	R
b31 to b2	—	Reserved	These bits are read as 0.	R

VSYNC flag (VSYNC Signal Status Flag)

The VSYNC flag indicates the state of the VSYNC signal.

UDRF flag (Underrun Flag)

UDRF标志指示发生了欠载。

[Setting condition]

- 在FIFO为空时读取PCDR寄存器。

[Clearing conditions]

- 在PDC复位
- 当标志位读为1后写入0时。

VERF标志（垂直行号设置错误标志）

VERF标志表示行数设置错误。

[Setting condition]

- 当VSYNC信号被否定时，因为捕获的行数少于VCR寄存器中的值。

[Clearing conditions]

- 在PDC复位
- 当标志位读为1后写入0时。

HERF标志（水平字节数设置错误标志）

HERF标志表示一行中的字节数有错误。

[Setting condition]

- 当HSYNC信号被否定时，因为一行中捕获的字节数少于HCR寄存器中的值。

[Clearing conditions]

- 在PDC复位
- 当标志位读为1后写入0时。

44.2.4 PDC引脚监控寄存器(PCMONR)

Address(es): PDC.PCMONR 4009 400Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSYNC	VSYNC
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	VSYNC	VSYNC信号状态标志	0：VSYNC信号电平低1：VSYNC信号电平高。	R
b1	HSYNC	HSYNC信号状态标志	0：HSYNC信号电平低1：HSYNC信号电平高。	R
b31 to b2	—	Reserved	这些位读为0。	R

VSYNC标志（VSYNC信号状态标志）

VSYNC标志指示VSYNC信号的状态。

HSYNC flag (HSYNC Signal Status Flag)

The HSYNC flag indicates the state of the HSYNC signal.

44.2.5 PDC Receive Data Register (PCDR)

Address(es): PDC.PCDR 4009 4010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The PDC includes a 32-bit-wide, 22-stage FIFO for the storage of captured data. The FIFO is mapped to the 4-byte PCDR register and four bytes of data are read from the PCDR register at a time. The receive data ready flag sets for every 32 bytes of received data, and this also results in a receive data ready interrupt if the DFIE bit in the PCCR0 register is set to 1. When a receive data ready interrupt is generated, read the PCDR register eight times. Figure 44.2 shows a schematic view of the PCDR register.

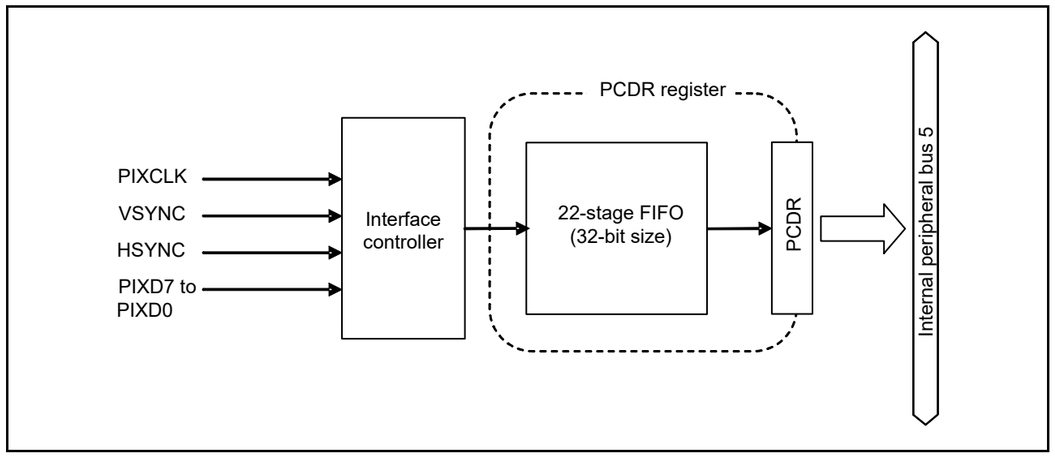

Figure 44.2 Schematic view of PCDR register

For the format of the captured data, either big or little endian can be selected in the EDS bit of the PCCR0 register. Figure 44.3 shows the data arrangements for the endian formats.

HSYNC标志（HSYNC信号状态标志）

HSYNC标志指示HSYNC信号的状态。

44.2.5 PDC接收数据寄存器(PCDR)

Address(es): PDC.PCDR 4009 4010h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PDC包括一个32位宽、22级FIFO，用于存储捕获的数据。FIFO映射到4字节
一次从PCDR寄存器读取PCDR寄存器和四个字节的数据。每接收32字节数据设置接收数据就绪标志，如果PCCR0寄存器中的DFIE位设置为1，这也会导致接收数据就绪中断。当产生接收数据就绪中断时，读取PCDR寄存器八次。图44.2显示了PCDR寄存器的示意图。

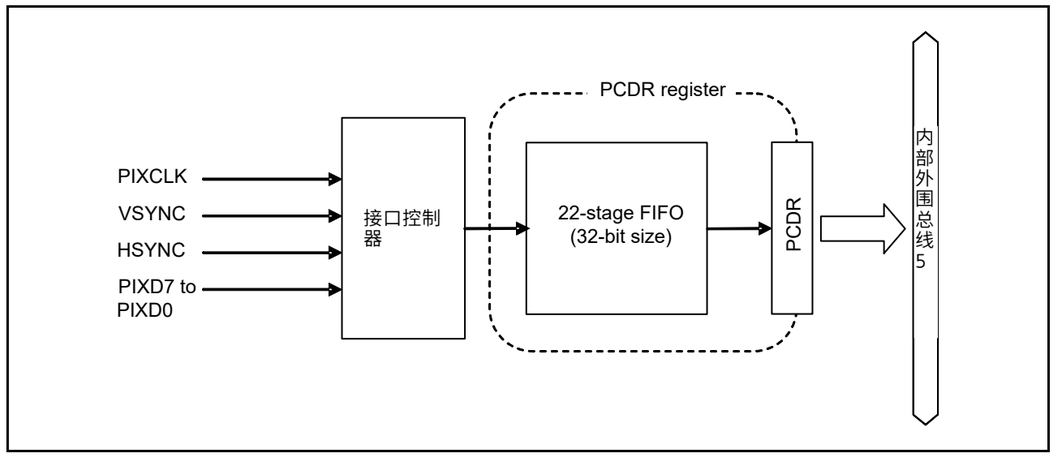

Figure 44.2 PCDR寄存器示意图

对于捕获数据的格式，可以在PCCR0寄存器的EDS位中选择大端或小端。图44.3显示了字节序格式的数据排列。

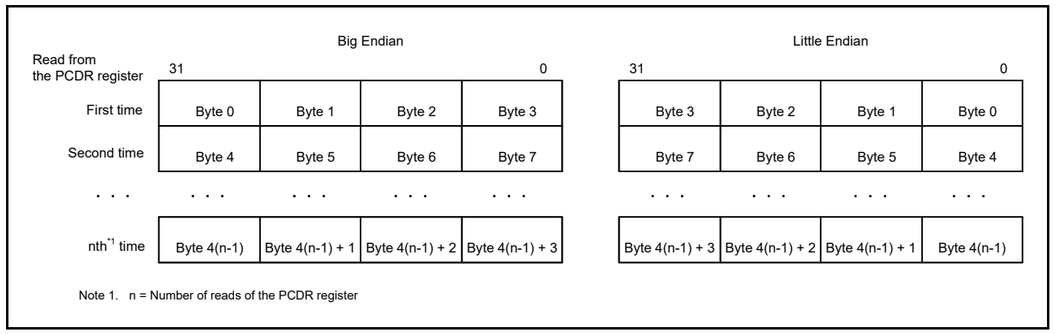

Figure 44.3 Endian formats

44.2.6 Vertical Capture Register (VCR)

Address(es): PDC.VCR 4009 4014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	VSZ[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	VST[11:0]											

Bit	Symbol	Bit name	Description	R/W
b11 to b0	VST[11:0]	Vertical Capture Start Line Position	These bits specify the number of the line where capture is to start.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b27 to b16	VSZ[11:0]	Vertical Capture Size	These bits specify the number of lines to be captured.	R/W
b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

For the relationship between the VCR register setting and the capture range, see section 44.3.3, VCR and HCR Register Settings and the Capture Range. Only set the VCR register while the PCE bit in the PCCR1 register is 0.

VST[11:0] bits (Vertical Capture Start Line Position)

The VST[11:0] bits specify the number of the line where capture is to start. To set the first line, set these bits to 000h; to set the 4095th line, set them to FFEh. The VST[11:0] setting must be within the range from 000h to FFEh and, in combination with the VSZ[11:0] setting, satisfy the following relationship:

Setting range of the VST[11:0] bits: 1 ≤ VST[11:0] + VSZ[11:0] ≤ FFFh.

VSZ[11:0] bits (Vertical Capture Size)

The VSZ[11:0] bits specify the number of lines to be captured. To set one line, set these bits to 001h; to set 4095 lines, set them to FFFh. The VSZ[11:0] setting must be within the range from 001h to FFFh and, in combination with the VST[11:0] setting, satisfy the following relationship:

Setting range of the VSZ[11:0] bits: 1 ≤ VST[11:0] + VSZ[11:0] ≤ FFFh.

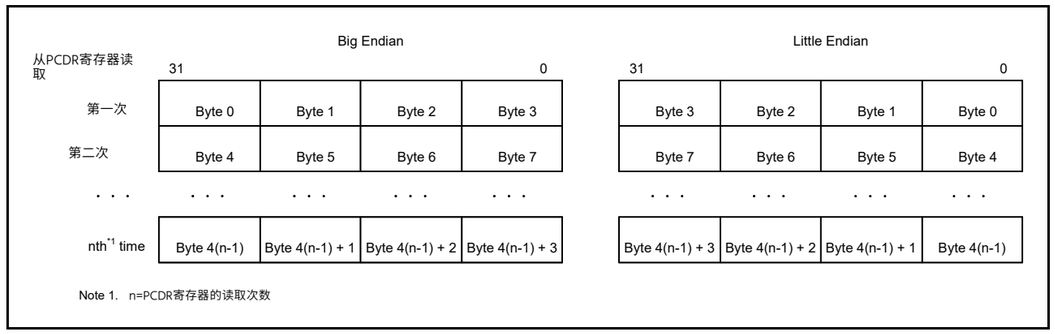

Figure 44.3 Endian formats

44.2.6 垂直捕捉寄存器(VCR)

Address(es): PDC.VCR 4009 4014h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	位名称	Description	R/W
b11 to b0	VST[11:0]	垂直捕捉起始线位置	这些位指定开始捕获的行号。	R/W
b15 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b27 to b16	VSZ[11:0]	垂直捕获大小	这些位指定要捕获的行数。	R/W
b31 to b28	—	Reserved	这些位被读取为0。写入值应为0。	R/W

关于VCR寄存器设置和捕捉范围的关系，请参见第44.3.3节，VCR和HCR寄存器设置和捕获范围。仅当PCCR1寄存器中的PCE位为0时设置VCR寄存器。

VST[11:0]位（垂直捕捉起始行位置）

VST[11:0]位指定捕获开始的行号。要设置第一行，请将这些位设置为000h；要设置第4095行，请将它们设置为FFEh。VST[11:0]设置必须在000h到FFEh的范围内，并与VSZ[11:0]设置结合，满足以下关系：

VST[11:0]位的设置范围：1≤VST[11:0]+VSZ[11:0]≤FFFh。

VSZ[11:0]位（垂直捕获大小）

VSZ[11:0]位指定要捕获的行数。要设置一行，请将这些位设置为001h；要设置4095行，请将它们设置为FFFh。VSZ[11:0]设置必须在001h到FFFh的范围内，并与VST[11:0]设置结合，满足以下关系：

VSZ[11:0]位的设置范围：1≤VST[11:0]+VSZ[11:0]≤FFFh。

44.2.7 Horizontal Capture Register (HCR)

Address(es): PDC.HCR 4009 4018h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	HSZ[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	HST[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b11 to b0	HST[11:0]	Horizontal Capture Start Byte Position	These bits specify the horizontal position in bytes where capture is to start.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b27 to b16	HSZ[11:0]	Horizontal Capture Size	These bits specify the number of bytes to be captured horizontally.	R/W
b31 to b28	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

For the relationship between the HCR register setting and the capture range, see section 44.3.3, VCR and HCR Register Settings and the Capture Range. Only set the HCR register while the PCE bit in the PCCR1 register is 0.

HST[11:0] bits (Horizontal Capture Start Byte Position)

The HST[11:0] bits specify the horizontal position in bytes where capture is to start. To set the first byte, set these bits to 000h; to set the 4092th byte, set them to FFBh. The HST[11:0] setting must be within the range from 000h to FFBh and, in combination with the HSZ[11:0] setting, satisfy the following relationship:

Setting range of the HST[11:0] bits: 1 ≤ HST[11:0] + HSZ[11:0] ≤ FFFh.

HSZ[11:0] bits (Horizontal Capture Size)

The HSZ[11:0] bits specify the number of bytes to be captured per line. To set four bytes, set these bits to 004h; to set 4095 bytes, set them to FFFh. The HSZ[11:0] setting must be within the range from 004h to FFFh and, in combination with the HST[11:0] setting, satisfy the following relationship:

Setting range of the HSZ[11:0] bits: 1 ≤ HST[11:0] + HSZ[11:0] ≤ FFFh.

44.3 Operation

44.3.1 Transfer Formats

The PDC supports the four transfer formats shown in Figure 44.4 to Figure 44.7. The format is determined by the settings in the VPS and HPS bits in the PCCR0 register.

44.2.7 水平捕捉寄存器(HCR)

Address(es): PDC.HCR 4009 4018h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	HSZ[11:0]											
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	HST[11:0]											
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b11 to b0	HST[11:0]	水平捕捉起始字节位置	这些位以字节为单位指定开始捕获的水平位置。	R/W
b15 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b27 to b16	HSZ[11:0]	水平捕捉尺寸	这些位指定要水平捕获的字节数。	R/W
b31 to b28	—	Reserved	这些位被读取为0。写入值应为0。	R/W

关于HCR寄存器设置和捕捉范围的关系，请参见第44.3.3节，VCR和HCR寄存器设置和捕获范围。仅当PCCR1寄存器中的PCE位为0时设置HCR寄存器。

HST[11:0]位（水平捕捉起始字节位置）

HST[11:0]位以字节为单位指定捕获开始的水平位置。要设置第一个字节，请将这些位设置为000h；要设置第4092个字节，请将它们设置为FFBh。HST[11:0]设置必须在000h到FFBh的范围内，并与HSZ[11:0]设置结合，满足以下关系：

HST[11:0]位的设置范围：1≤HST[11:0]+HSZ[11:0]≤FFFh。

HSZ[11:0]位（水平捕获大小）

HSZ[11:0]位指定每行要捕获的字节数。要设置四个字节，请将这些位设置为004h；要设置4095字节，请将它们设置为FFFh。HSZ[11:0]设置必须在004h到FFFh的范围内，并与HST[11:0]设置结合，满足以下关系：

HSZ[11:0]位的设置范围：1≤HST[11:0]+HSZ[11:0]≤FFFh。

44.3 Operation

44.3.1 传输格式

PDC支持图44.4至图44.7所示的四种传输格式。格式由PCCR0寄存器中的VPS和HPS位的设置决定。

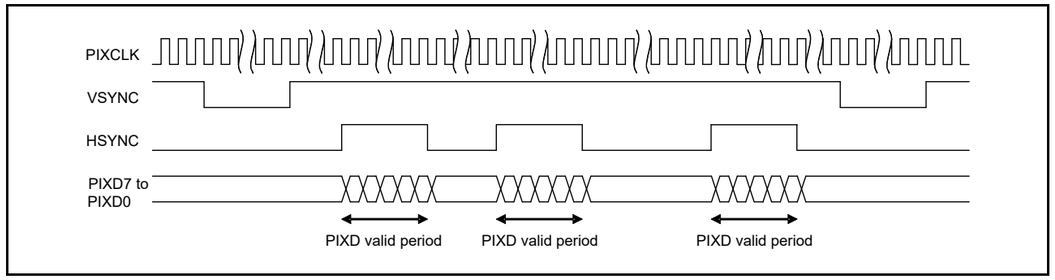

Figure 44.4 PDC transfer format when VPS = 0 and HPS = 0

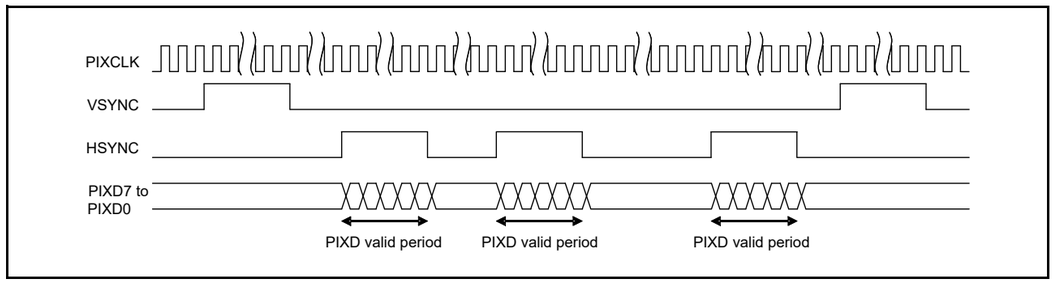

Figure 44.5 PDC transfer format when VPS = 1 and HPS = 0

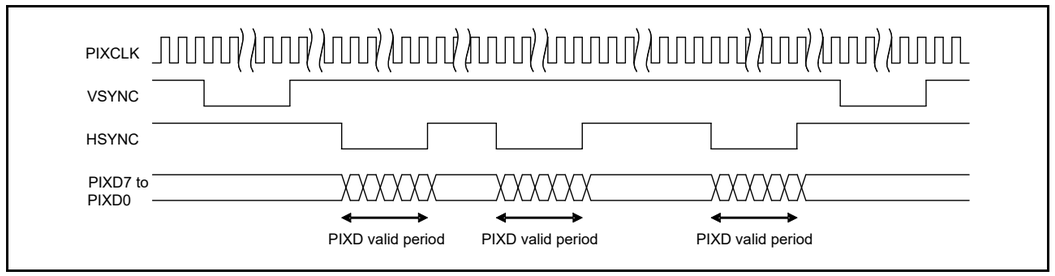

Figure 44.6 PDC transfer format when VPS = 0 and HPS = 1

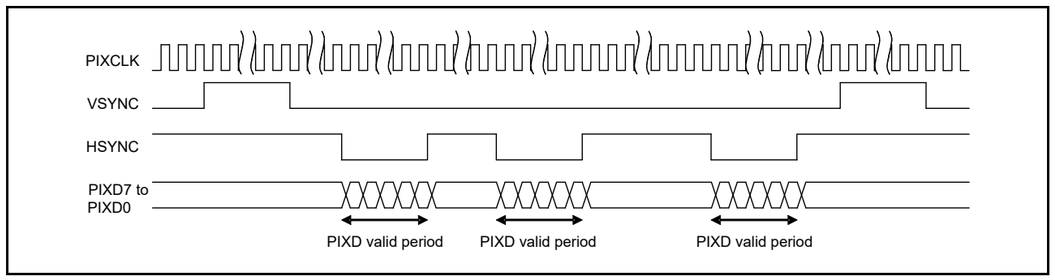

Figure 44.7 PDC transfer format when VPS = 1 and HPS = 1

44.3.2 Transfer Timing

Figure 44.8 and Table 44.3 show the timing of transfers by the PDC.

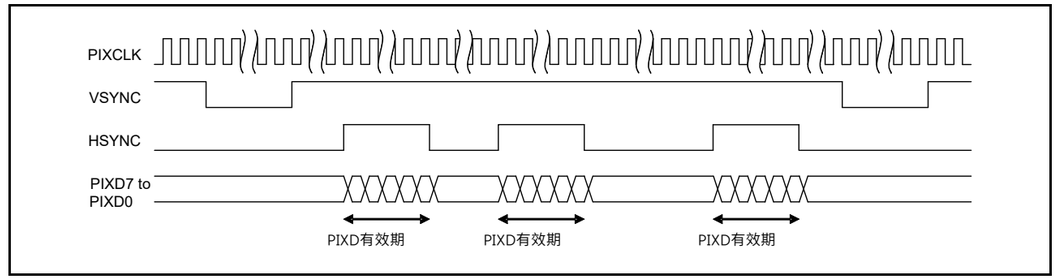

Figure 44.4 VPS=0和HPS=0时的PDC传输格式

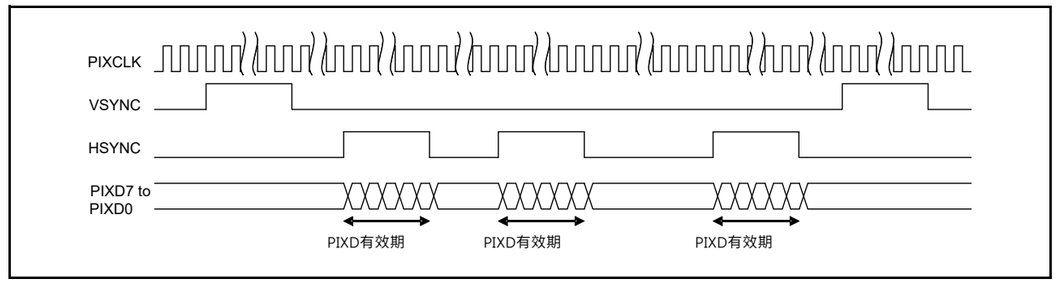

Figure 44.5 VPS=1和HPS=0时的PDC传输格式

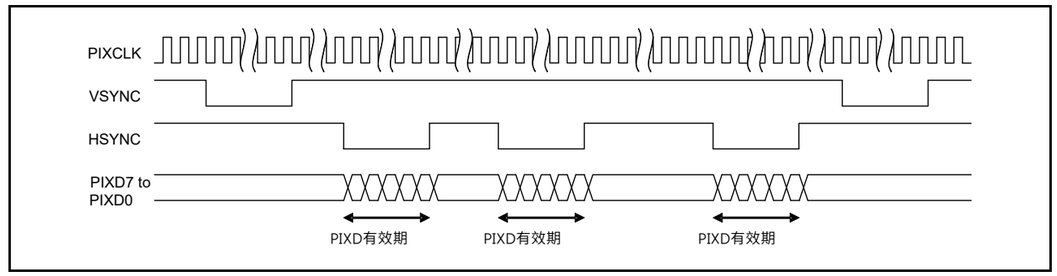

Figure 44.6 VPS=0和HPS=1时的PDC传输格式

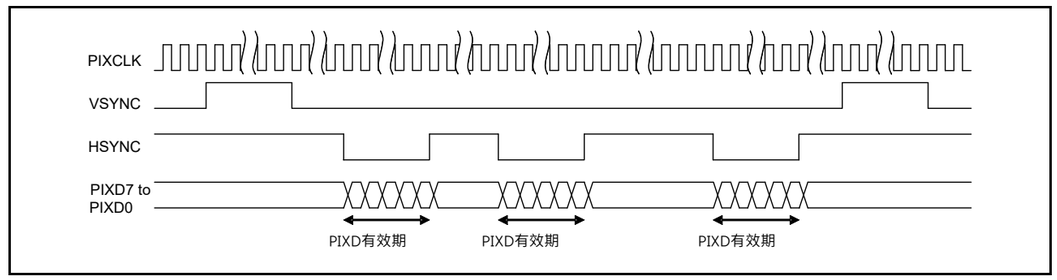

Figure 44.7 VPS=1和HPS=1时的PDC传输格式

44.3.2 传输时间

图44.8和表44.3显示了PDC的传输时间。

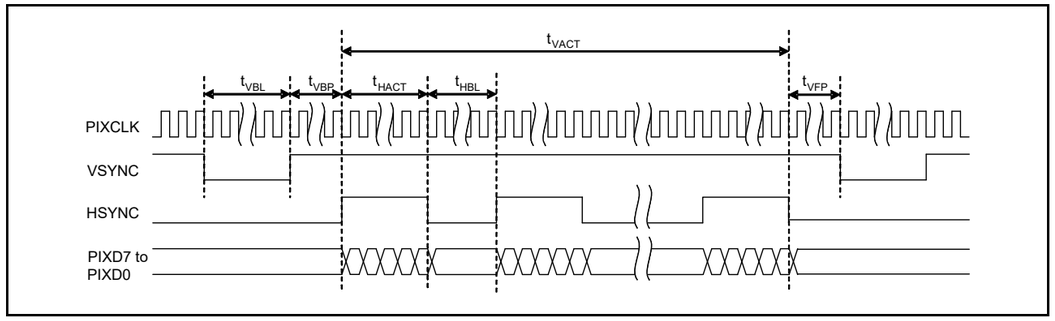

Figure 44.8 PDC transfer timing when VPS = 0 and HPS = 0

Table 44.3 PDC transfer timing when VPS = 0 and HPS = 0

Parameter	Symbol	Min*1	Max	Unit
Vertical blanking period	t_{VBL}	128	-	PIXCLK
Vertical backporch	t_{VBP}	10	-	PIXCLK
Horizontal valid period	t_{HACT}	4	4095	PIXCLK
Horizontal blanking period	t_{HBL}	128	-	PIXCLK
Vertical frontporch	t_{VFP}	10	-	PIXCLK
Vertical valid period	t_{VACT}	1	4095	Line

Note 1. The minimum values are the lowest the PDC is capable of achieving. Operation at these values cannot guarantee the avoidance of overruns, vertical line number setting errors, or horizontal byte number setting errors.

44.3.3 VCR and HCR Register Settings and the Capture Range

Figure 44.9 and Figure 44.10 show the relationship between the settings in the VCR and HCR registers and the capture range.

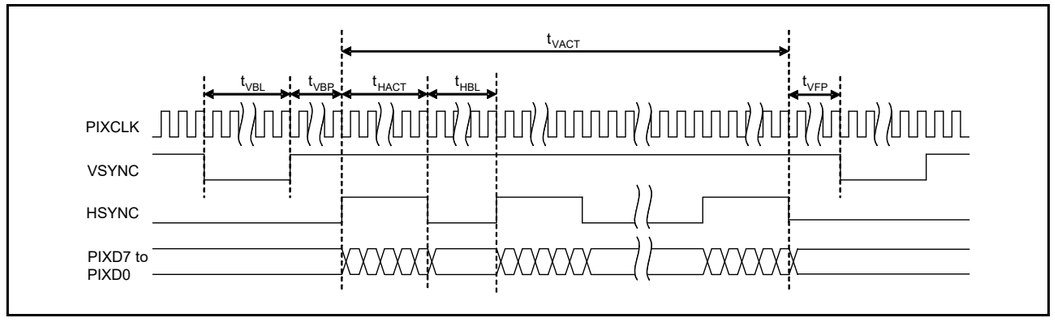

Figure 44.8 VPS=0和HPS=0时的PDC传输时序

Table 44.3 VPS=0和HPS=0时的PDC传输时序

Parameter	Symbol	Min*1	Max	Unit
垂直消隐期	t_{VBL}	128	-	PIXCLK
Vertical backporch	t_{VBP}	10	-	PIXCLK
横向有效期	t_{HACT}	4	4095	PIXCLK
水平消隐期	t_{HBL}	128	-	PIXCLK
Vertical frontporch	t_{VFP}	10	-	PIXCLK
垂直有效期	t_{VACT}	1	4095	Line

Note 1. 最小值是PDC能够达到的最低值。在这些值下操作不能保证避免溢出、垂直行数设置错误或水平字节数设置错误。

44.3.3 VCR和HCR寄存器设置和捕捉范围

图44.9和图44.10显示了VCR和HCR寄存器中的设置与捕获范围之间的关系。

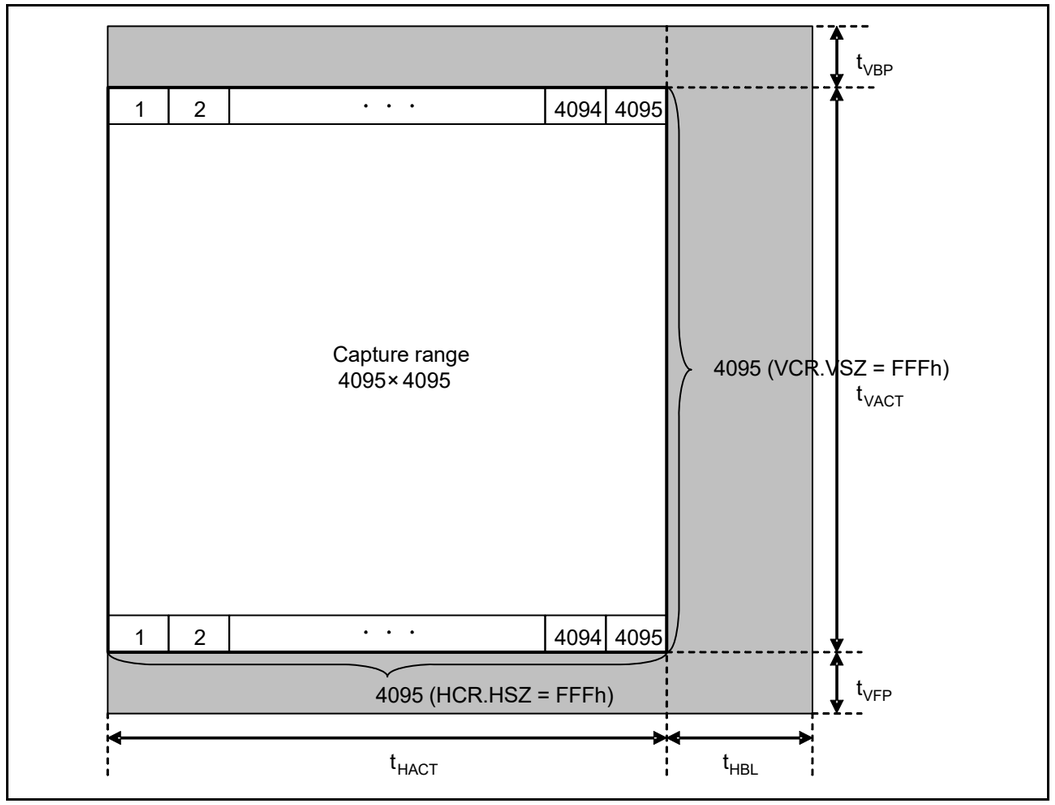

Figure 44.9 Settings in the VCR and HCR registers and the capture range when VCR = 0FFF 0000h and HCR = 0FFF 0000h

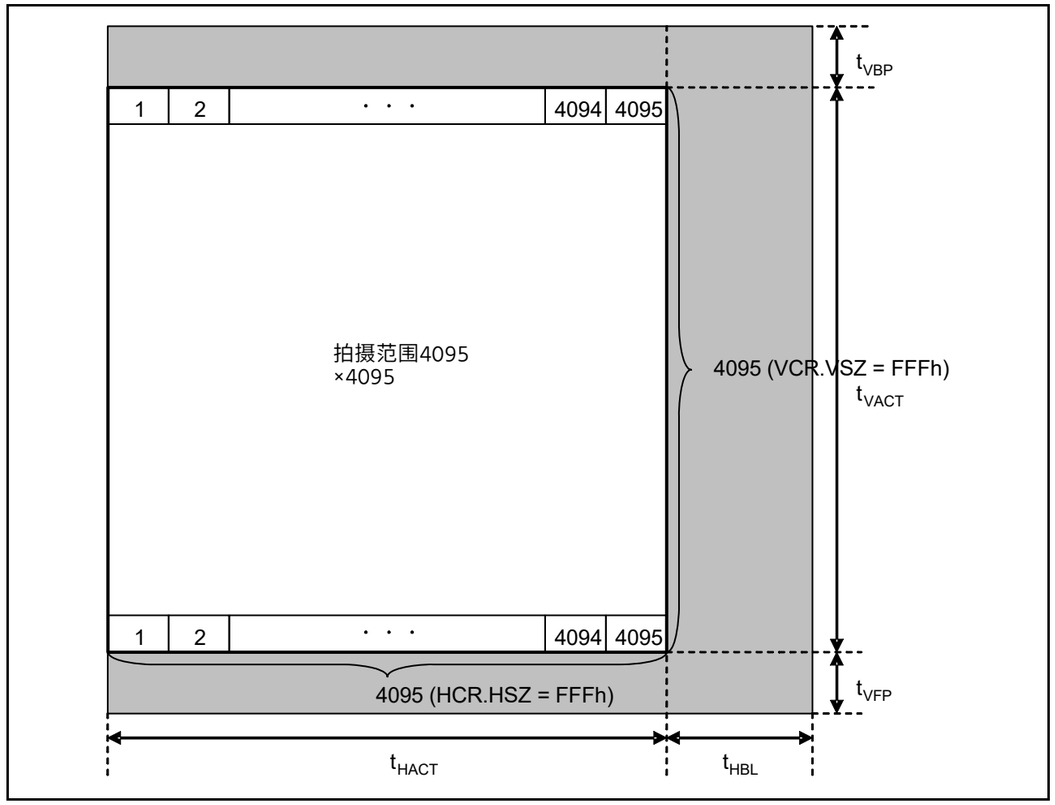

Figure 44.9 VCR和HCR寄存器中的设置以及VCR=0FFF0000h和HCR=0FFF0000h时的捕获范围

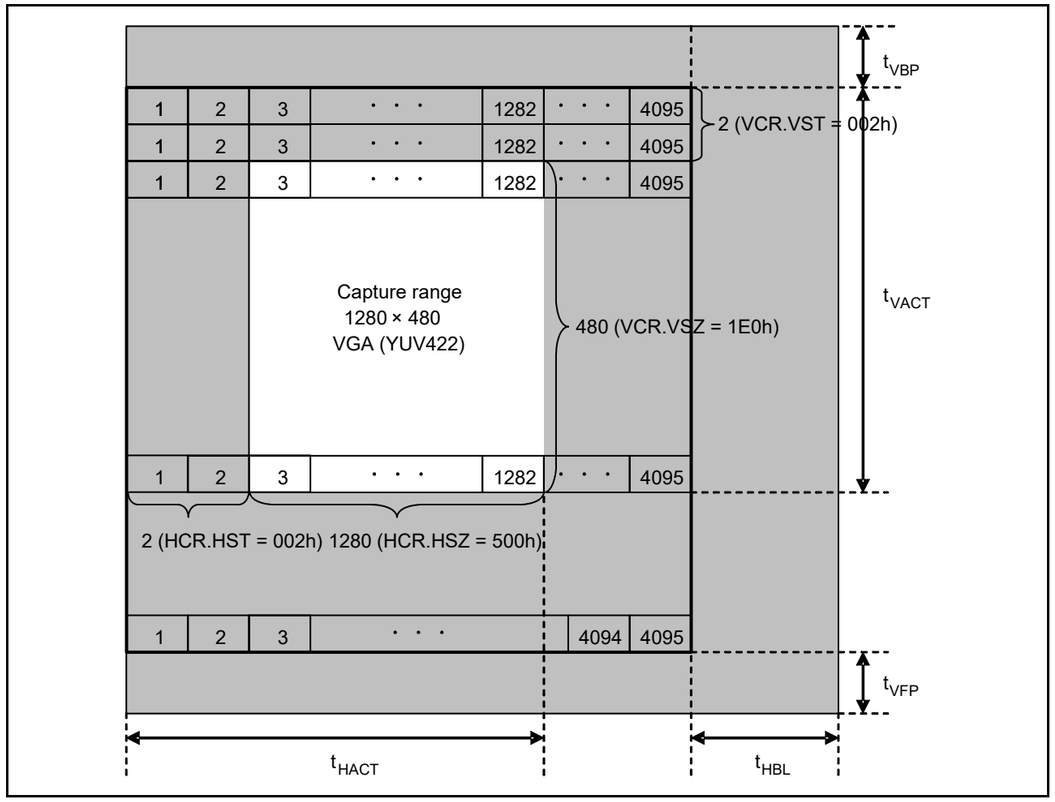

Figure 44.10 Settings in the VCR and HCR registers and the capture range when VCR = 01E0 0002h and HCR = 0500 0002h

44.3.4 Reception Operation

Figure 44.11 shows an example of reception operations when receive data ready interrupts (to start the DTC or DMAC) and frame end interrupts are in use.

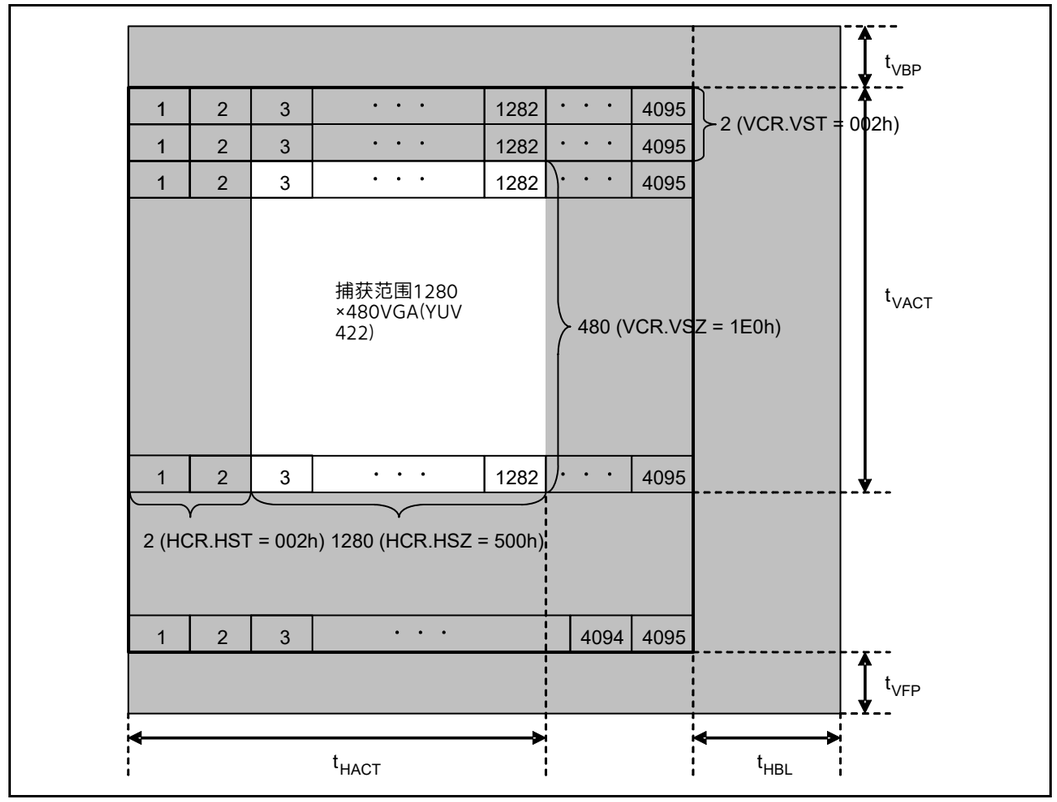

Figure 44.10 VCR和HCR寄存器中的设置以及VCR=01E00002h和HCR=05000002h时的捕获范围

44.3.4 接待操作

图44.11显示了使用接收数据就绪中断（启动DTC或DMAC）和帧结束中断时的接收操作示例。

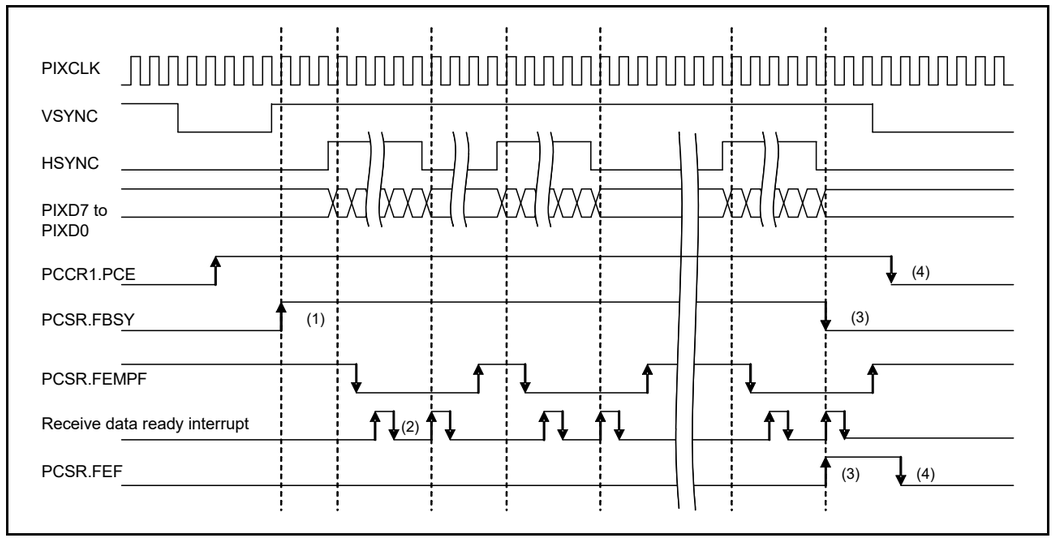

Figure 44.11 Example of reception operations

This section describes the actual operations at the times indicated by (1), (2), (3), and (4) in Figure 44.11.

When a valid edge of the VSYNC signal is detected after the PCE bit in the PCCR1 register is set to 1, the FEMPF flag in the PCSR register sets to 1 and the FIFO is initialized. Concurrently, the FBSY flag in the PCSR register sets to 1 and reception operations start.

When data within the capture range set in the VCR and HCR registers is received, the data is stored in the FIFO. The PDC generates a receive data ready interrupt every time it receives 32 bytes of data, and the interrupt starts transfer of the captured data by the DTC or DMAC to the on-chip SRAM or an external address space. The FIFO is likely to overrun if reading the PCDR register takes more time than reception of the data. Check the OVRF flag in the PCSR register to verify an overrun.

After reception of the last byte of data is complete, the FBSY flag in the PCSR register clears to 0 and the FEF flag in the PCSR register sets to 1 so that a receive data ready interrupt and frame end interrupt are generated.

The FEMPF flag in the PCSR register is polled by the frame end interrupt, after which the program must verify the completion of data transfer by the DTC or DMAC. After the PCE bit in the PCCR1 register is cleared to 0, the FEF flag in the PCSR register also clears to 0, and the reception of one frame of data is complete.

If the FEF flag in the PCSR register sets to 1 before the PCE bit in the PCCR1 register is set to 1, valid edges of the VSYNC signal are not detected and reception operations are not started. Clear the FEF flag in the PCSR register to 0 to start data reception operations.

44.3.5 Operation during Horizontal Blanking Period

If the horizontal blanking period begins but the number of received data bytes has not reached 32 bytes since the previous receive data ready, the count of the received data bytes is retained and carried over to the next valid period. Figure 44.12 shows an example of operation during the horizontal blanking period.

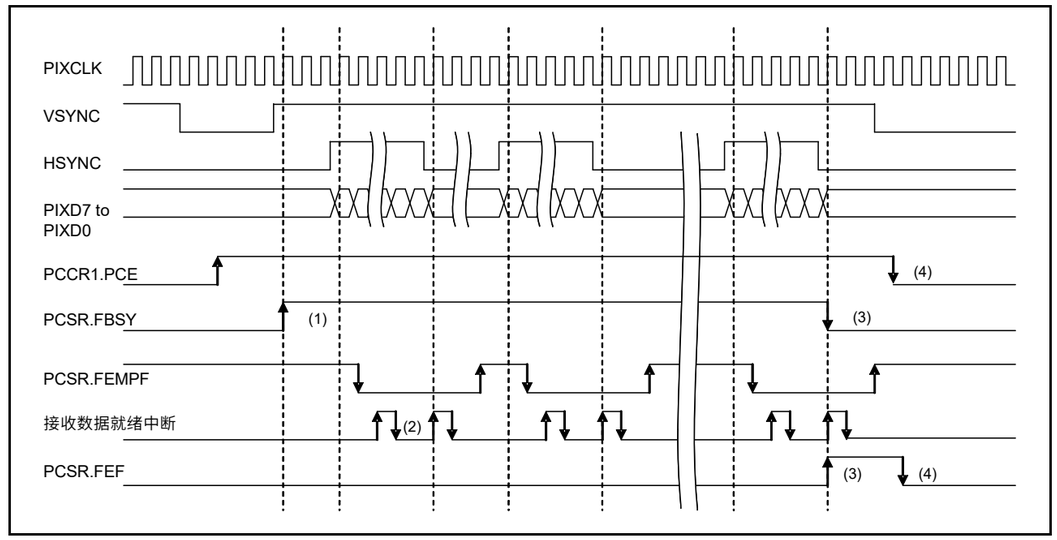

Figure 44.11 接收操作示例

本节介绍图44.11中（1）、（2）、（3）和（4）所示时间的实际操作。

当PCCR1寄存器中的PCE位设置为1后检测到VSYNC信号的有效边沿时，PCSR寄存器中的FEMPF标志设置为1并初始化FIFO。同时，PCSR寄存器中的FBSY标志设置为1，接收操作开始。

当接收到VCR和HCR寄存器中设置的捕获范围内的数据时，数据将存储在FIFO中。这PDC每次接收到32字节数据时产生一个接收数据就绪中断，该中断开始将DTC或DMAC捕获的数据传输到片上SRAM或外部地址空间。如果读取PCDR寄存器的时间比接收数据的时间长，则FIFO可能会溢出。检查PCSR寄存器中的OVRF标志以验证溢出。

接收完最后一个字节的数据后，PCSR寄存器中的FBSY标志清零，FEF标志位在PCSR寄存器中。PCSR寄存器设置为1，以便产生接收数据就绪中断和帧结束中断。

PCSR寄存器中的FEMPF标志由帧结束中断轮询，之后程序必须通过DTC或DMAC验证数据传输是否完成。PCCR1寄存器中的PCE位清0后，PCSR寄存器中的FEF标志位也清0，一帧数据的接收完成。

如果在PCCR1寄存器中的PCE位设置为1之前PCSR寄存器中的FEF标志设置为1，则有效边沿未检测到VSYNC信号且未开始接收操作。将PCSR寄存器中的FEF标志清零，开始数据接收操作。

44.3.5 水平消隐期间的操作

如果水平消隐期开始，但自上次接收数据准备就绪后接收数据字节数未达到32字节，则保留接收数据字节数并结转至下一个有效周期。图44.12显示了水平消隐期间的操作示例。

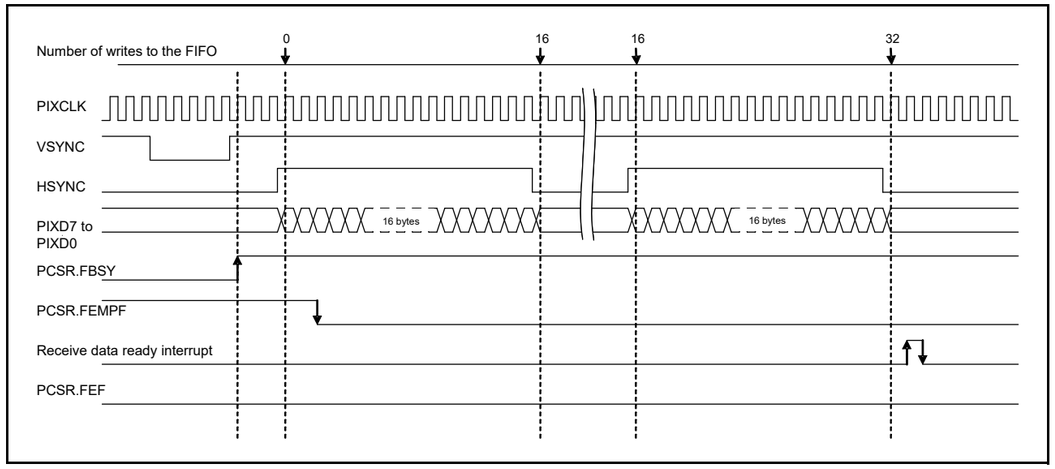

Figure 44.12 Example operation during horizontal blanking period

44.3.6 Continued Reception Operations at Frame End

When the last of the data is received but fewer than 32 bytes of data have been received since the previous receive data ready, the PDC continues to receive data until the number reaches 32, an operation called *continued reception*. When continued reception ends, the PDC generates a receive data ready interrupt and a frame end interrupt. Always input PIXCLK during continued reception. If the data stored in the FIFO is read during this operation, the values are undefined. Figure 44.13 shows an example operation at frame end.

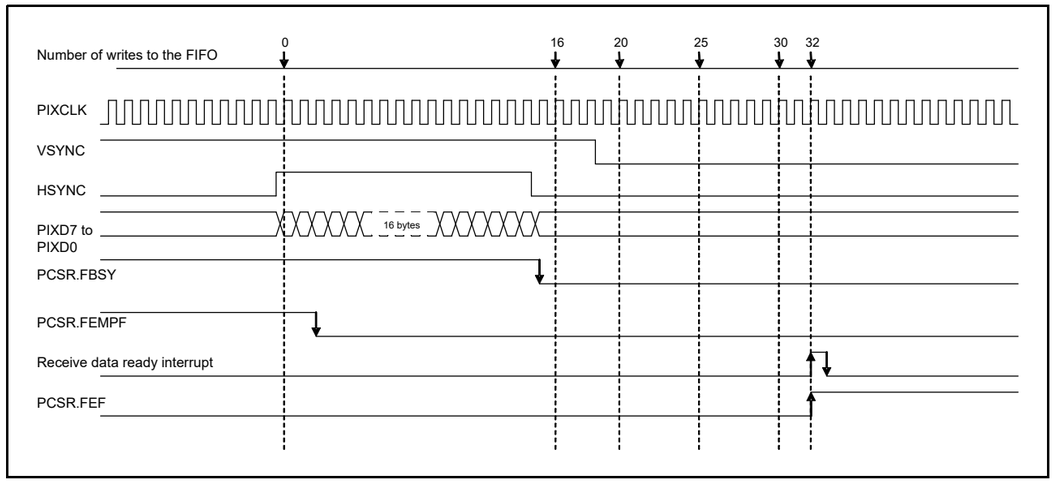

Figure 44.13 Example of continued reception operations at frame end

44.3.7 Error Detection

The PDC provides error detection capabilities, enabling the software to respond to errors during reception operations. Table 44.4 summarizes the conditions for each type of error and the interrupt flags set in response.

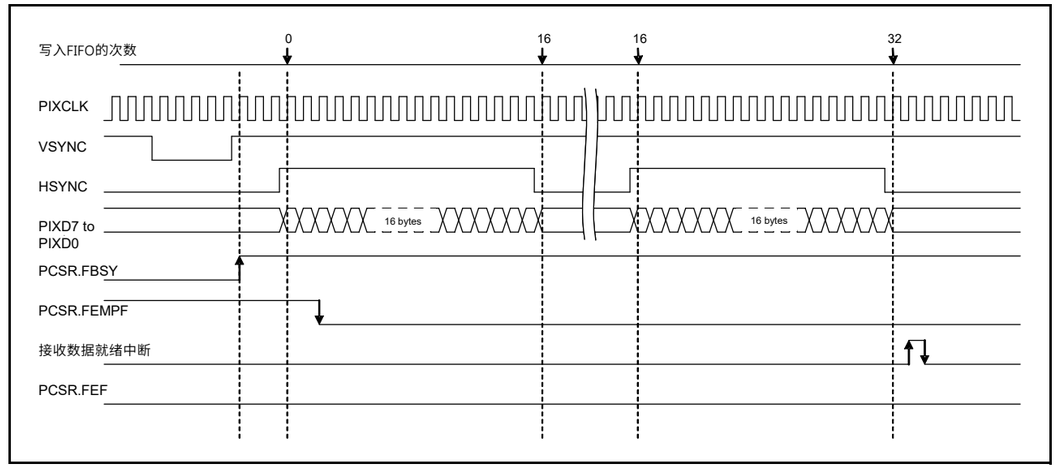

Figure 44.12 水平消隐期间的示例操作

44.3.6 在帧结束时继续接收操作

当接收到最后一个数据，但自上次接收数据就绪后接收到的数据少于32字节时，PDC继续接收数据，直到数量达到32，这种操作称为继续接收。当继续接收结束时，PDC产生一个接收数据就绪中断和一个帧结束中断。在继续接收期间始终输入PIXCLK。如果在此操作期间读取存储在FIFO中的数据，则值未定义。图44.13显示了帧结束时的示例操作。

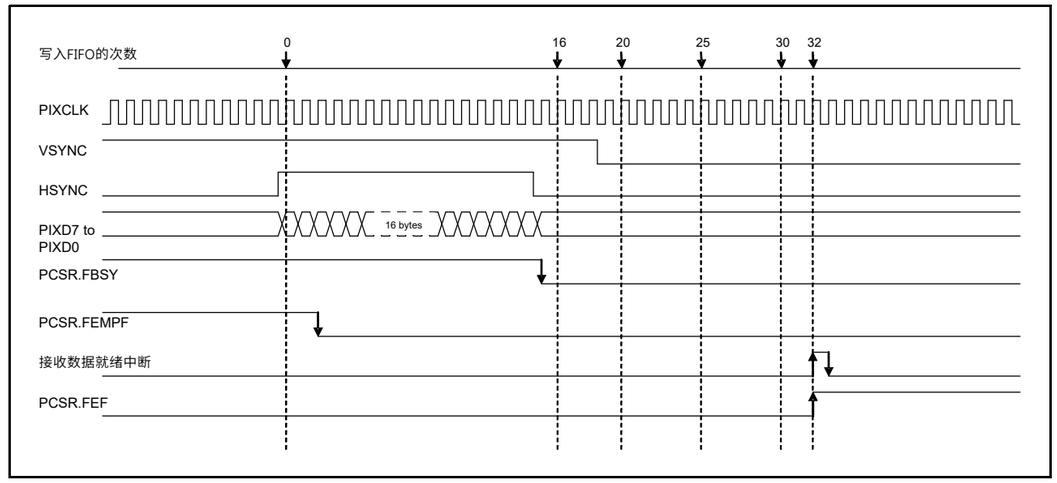

Figure 44.13 帧结束时的连续接收操作示例

44.3.7 错误检测

PDC提供错误检测功能，使软件能够在接收操作期间响应错误。
表44.4总结了每种错误类型的条件和响应设置的中断标志。

Table 44.4 Error detection

Error factor	Conditions for error detection	Interrupt flag	Operation example
Overrun	Receive data arrives while the FIFO is full.*1	PCSR.OVRF	Figure 44.14
Underrun	PCDR register is read while the FIFO is empty.	PCSR.UDRF	Figure 44.15
Vertical line number error	VSYNC signal is negated when the number of captured lines is less than the value set in the VCR register.	PCSR.VERF	Figure 44.16
Horizontal byte number error	HSYNC signal is negated when the number of bytes captured in a line is less than the value set in the HCR register.	PCSR.HERF	Figure 44.17

Note 1. This includes data reception during continued reception operations.

When an error is detected, the PDC sets the associated interrupt flag to 1 to stop reception operations. While the interrupt flag is 1, the PDC does not detect valid edges of the VSYNC signal and does not start reception operations. Clear all error source interrupt flags to 0 to start reception operations.

When an error occurs, data stored in the FIFO is disabled.

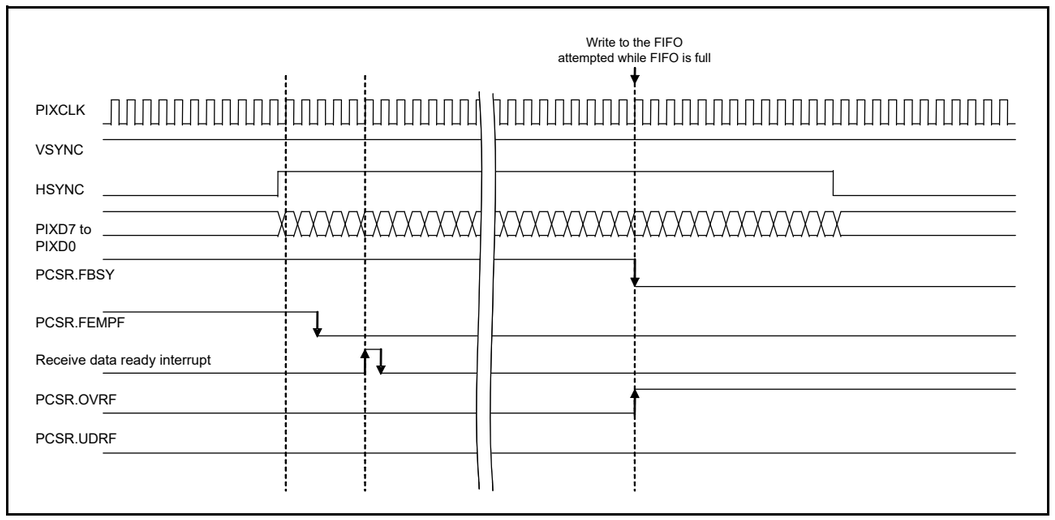

Figure 44.14 Operation when an overrun is detected

Table 44.4 错误检测

误差因素	错误检测的条件	中断标志	操作示例
Overrun	FIFO已满时接收数据到达。*1	PCSR.OVRF	Figure 44.14
Underrun	FIFO为空时读取PCDR寄存器。	PCSR.UDRF	Figure 44.15
垂直行数错误	当捕获的行数小于VCR寄存器中设置的值时，VSYNC信号无效。	PCSR.VERF	Figure 44.16
水平字节数错误	当一行中捕获的字节数小于HCR寄存器中设置的值时，HSYNC信号无效。	PCSR.HERF	Figure 44.17

Note 1. 这包括在连续接收操作期间的数据接收。

当检测到错误时，PDC将相关的中断标志设置为1以停止接收操作。当中断标志为1时，PDC不检测VSYNC信号的有效边沿并且不开始接收操作。将所有错误源中断标志清除为0以开始接收操作。

发生错误时，存储在FIFO中的数据将被禁用。

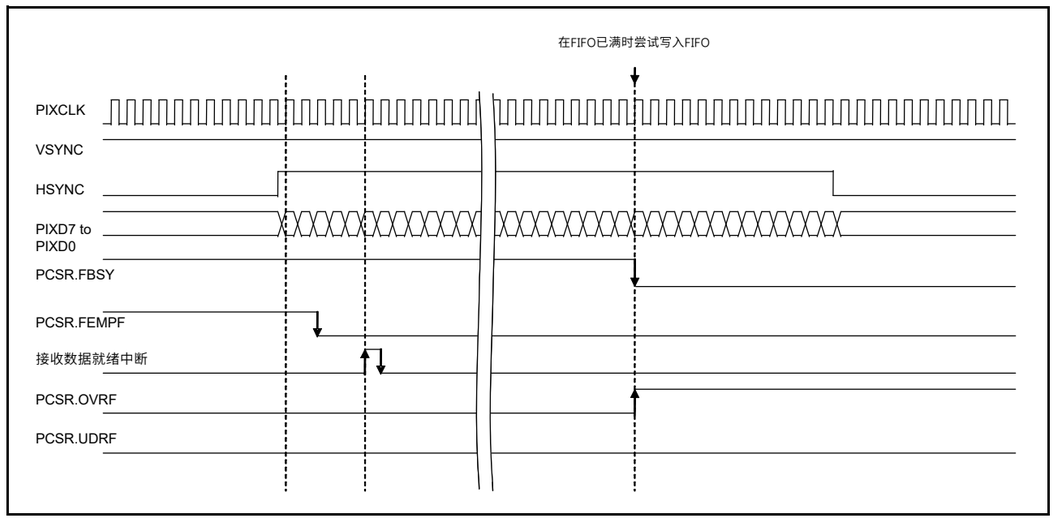

Figure 44.14 检测到溢出时的操作

44.3.8 Initial Settings

Figure 44.18 shows an example flow for initial settings. For a description of how to set up the input and output ports and the Interrupt Controller Unit (ICU), see the descriptions given in the sections on the relevant blocks.

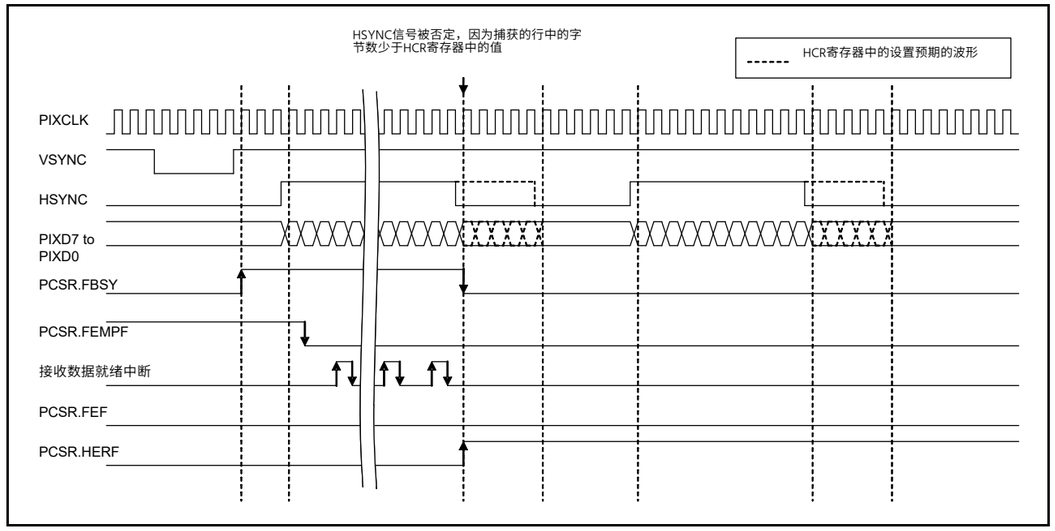

Figure 44.17 检测到水平字节数设置错误时的操作

44.3.8 初始设置

图44.18显示了初始设置的示例流程。有关如何设置输入和输出端口以及中断控制器单元(ICU)的说明，请参阅相关模块部分中的说明。

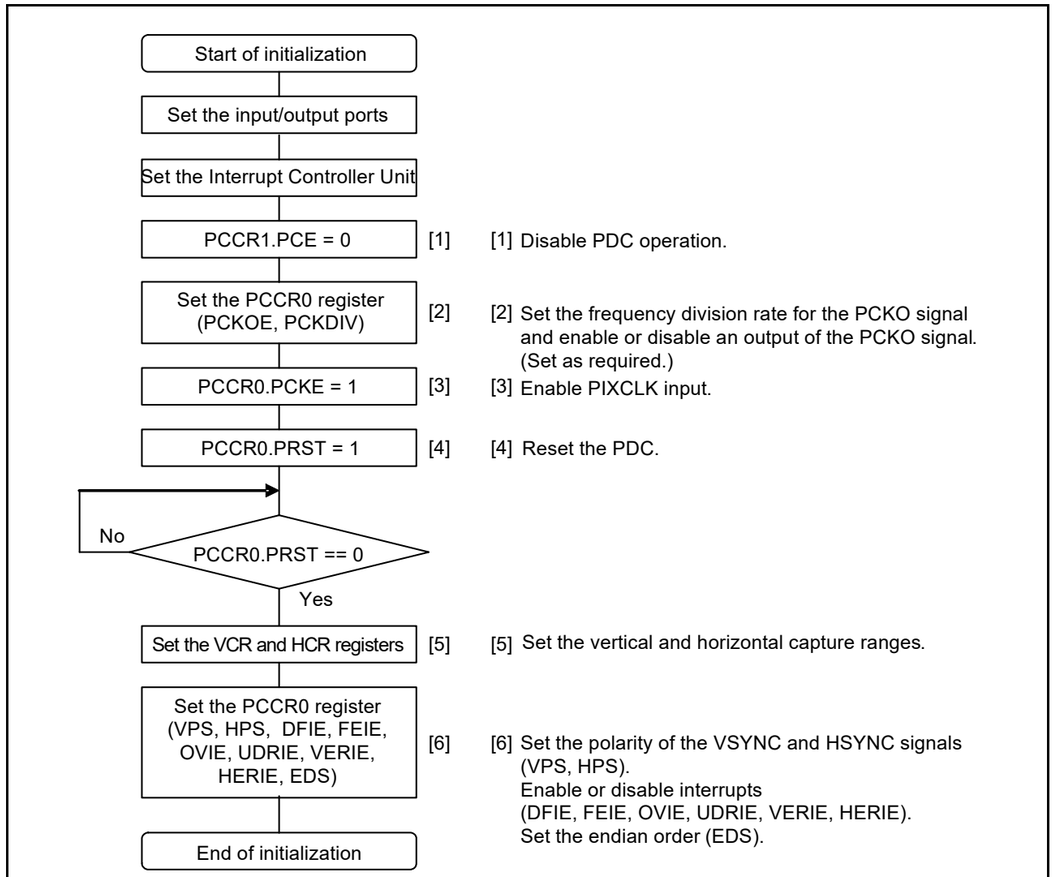

Figure 44.18 Example flow for initial PDC settings

44.3.9 Operation Flows

Figure 44.19 shows an example operation flow when the receive data ready interrupt (to start the DTC or DMAC) and frame end interrupt are in use. For a description of how to set up the DTC or DMAC, see section 17, DMA Controller (DMAC), and section 18, Data Transfer Controller (DTC).

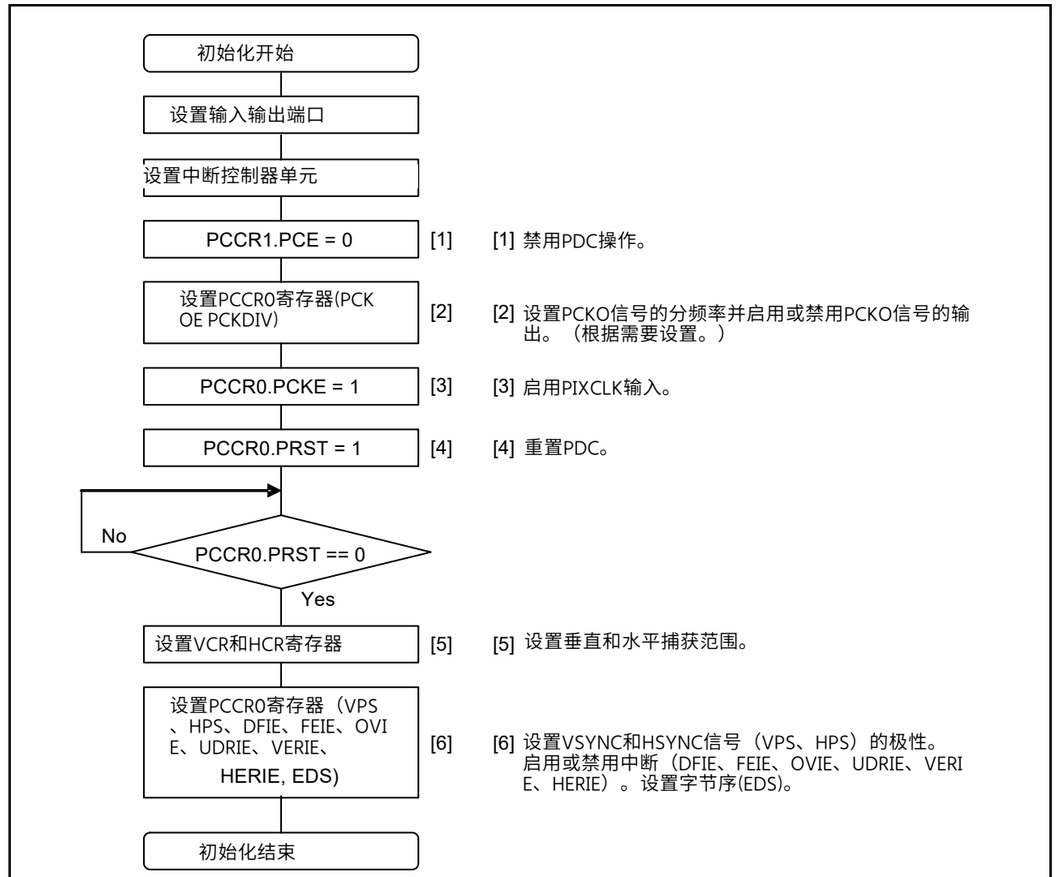

Figure 44.18 初始PDC设置的示例流程

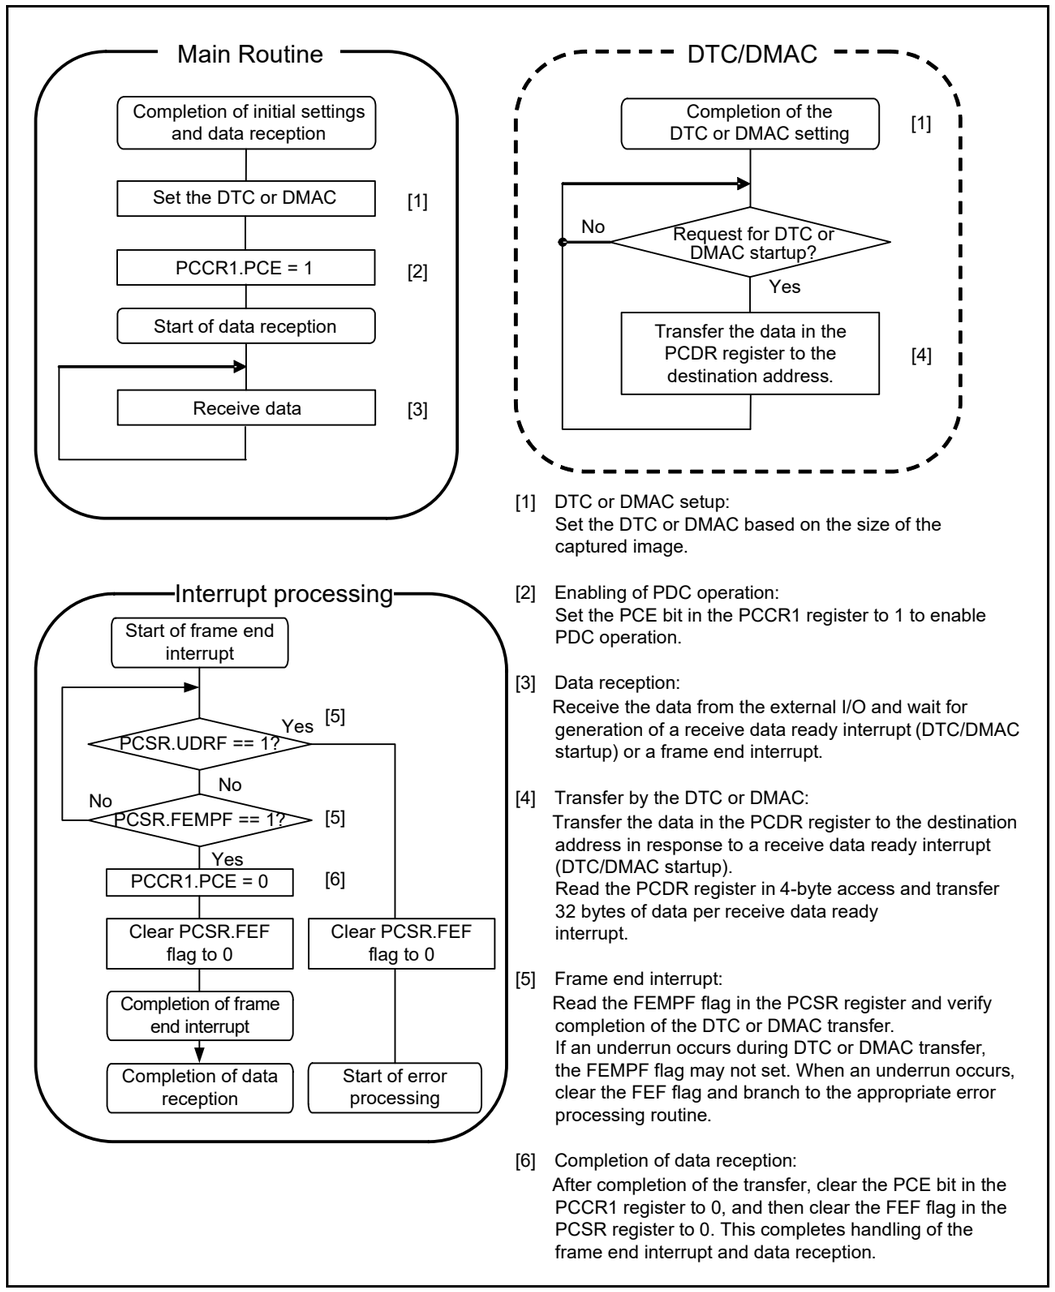
44.3.9 操作流程

图44.19显示了使用接收数据就绪中断（启动DTC或DMAC）和帧结束中断时的示例操作流程。有关如何设置DTC或DMAC的说明，请参阅第17节，DMA控制器(DMAC)和第18节，数据传输控制器(DTC)。



[1] DTC or DMAC setup:
Set the DTC or DMAC based on the size of the captured image.

[2] Enabling of PDC operation:
Set the PCE bit in the PCCR1 register to 1 to enable PDC operation.

[3] Data reception:
Receive the data from the external I/O and wait for generation of a receive data ready interrupt (DTC/DMAC startup) or a frame end interrupt.

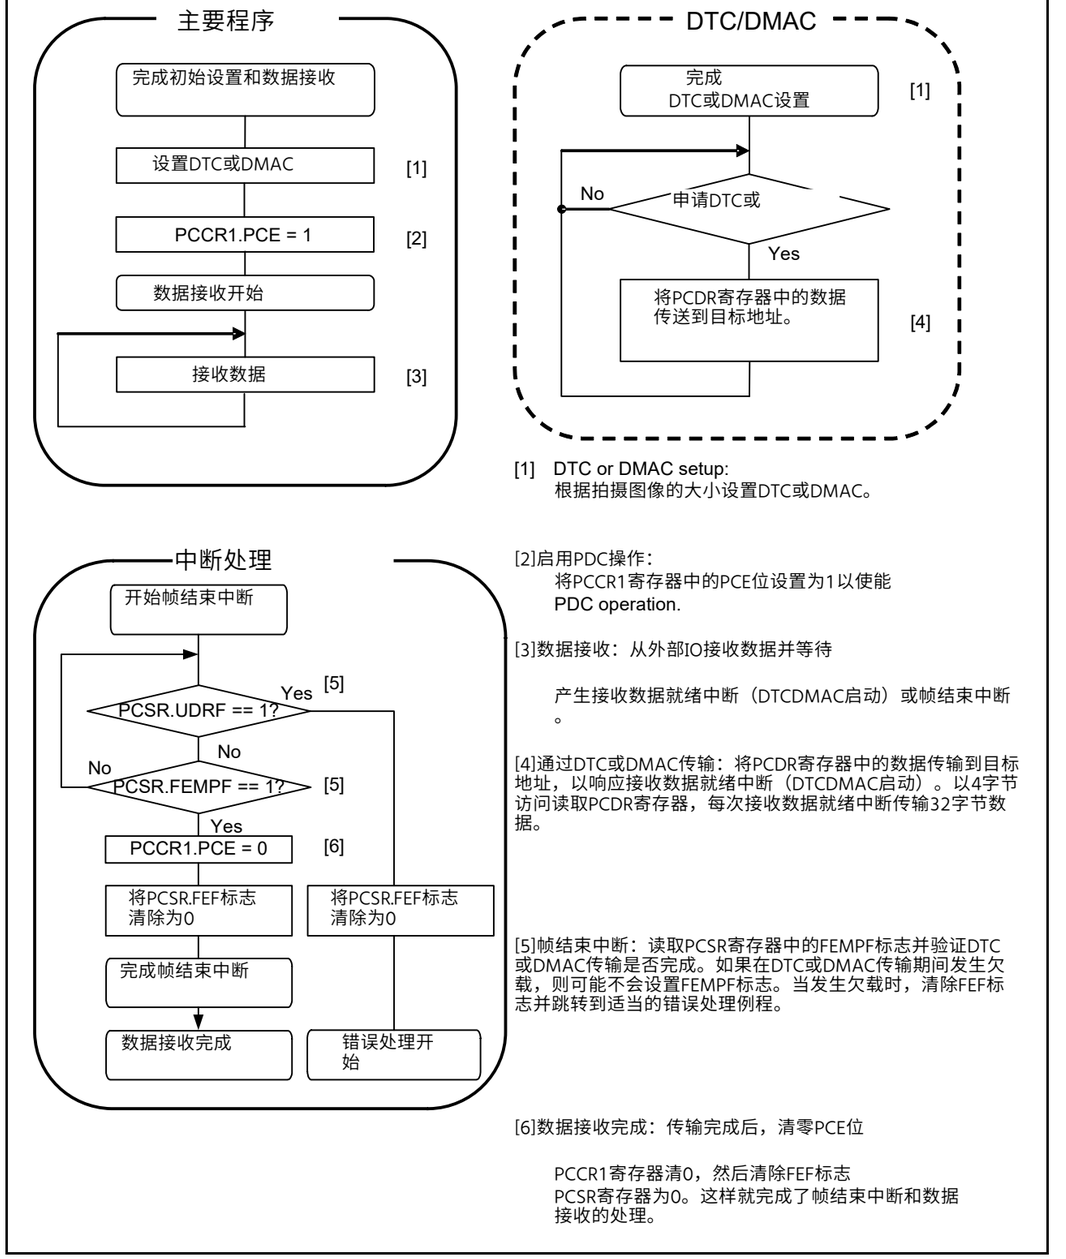
[4] Transfer by the DTC or DMAC:
Transfer the data in the PCDR register to the destination address in response to a receive data ready interrupt (DTC/DMAC startup).
Read the PCDR register in 4-byte access and transfer 32 bytes of data per receive data ready interrupt.

[5] Frame end interrupt:
Read the FEMPF flag in the PCSR register and verify completion of the DTC or DMAC transfer.
If an underrun occurs during DTC or DMAC transfer, the FEMPF flag may not set. When an underrun occurs, clear the FEF flag and branch to the appropriate error processing routine.

[6] Completion of data reception:
After completion of the transfer, clear the PCE bit in the PCCR1 register to 0, and then clear the FEF flag in the PCSR register to 0. This completes handling of the frame end interrupt and data reception.

Figure 44.19 Example operation flow

Figure 44.20 shows an example of the operation flow when responding to an error interrupt.



[1] DTC or DMAC setup:
根据拍摄图像的大小设置DTC或DMAC。

[2]启用PDC操作：
将PCCR1寄存器中的PCE位设置为1以使能PDC operation.

[3]数据接收：从外部IO接收数据并等待

产生接收数据就绪中断（DTCDMAC启动）或帧结束中断。

[4]通过DTC或DMAC传输：将PCDR寄存器中的数据传输到目标地址，以响应接收数据就绪中断（DTCDMAC启动）。以4字节访问读取PCDR寄存器，每次接收数据就绪中断传输32字节数据。

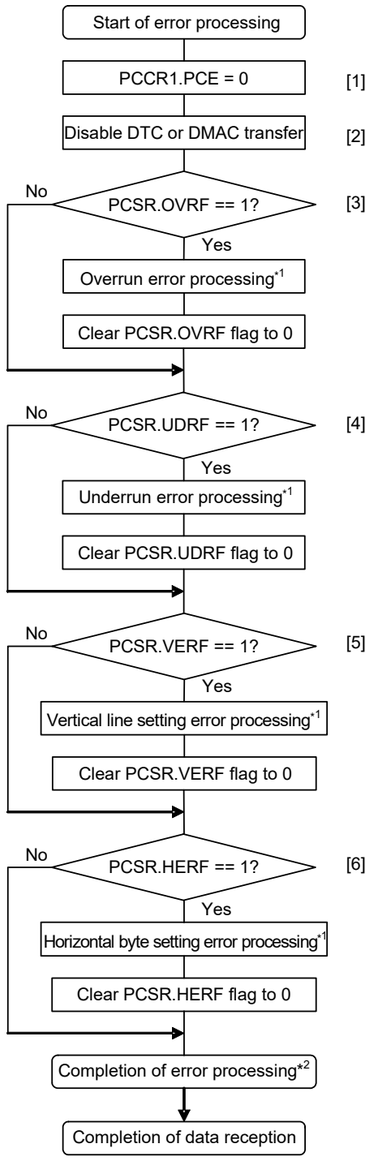
[5]帧结束中断：读取PCSR寄存器中的FEMPF标志并验证DTC或DMAC传输是否完成。如果在DTC或DMAC传输期间发生欠载，则可能不会设置FEMPF标志。当发生欠载时，清除FEF标志并跳转到适当的错误处理例程。

[6]数据接收完成：传输完成后，清零PCE位

PCCR1寄存器清0，然后清除FEF标志
PCSR寄存器为0。这样就完成了帧结束中断和数据接收的处理。

Figure 44.19 示例操作流程

图44.20显示了响应错误中断时的操作流程示例。



[1] Disabling of PDC operation:
Clear the PCE bit in the PCCR1 register to 0 to disable PDC operation.

[2] Disabling of the DTC or DMAC transfer:
Disable the transfer of the DTC or DMAC.

[3] Overrun flag check:
Read the PCSR register to check the state of the OVRF flag. If the flag is set, overrun error handling proceeds, and the flag is then cleared.

[4] Underrun flag check:
Read the PCSR register to check the state of The UDRF flag. If the flag is set, underrun error handling proceeds, and the flag is then cleared.

[5] Check of the vertical line setting error flag:
Read the PCSR register to check the state of the VERF flag. If the flag is set, vertical line setting error handling proceeds, and the flag is then cleared.

[6] Check of the horizontal byte setting error flag:
Read the PCSR register to check the status of the HERF flag. If the flag is set, horizontal byte setting error handling proceeds, and the flag is then cleared.

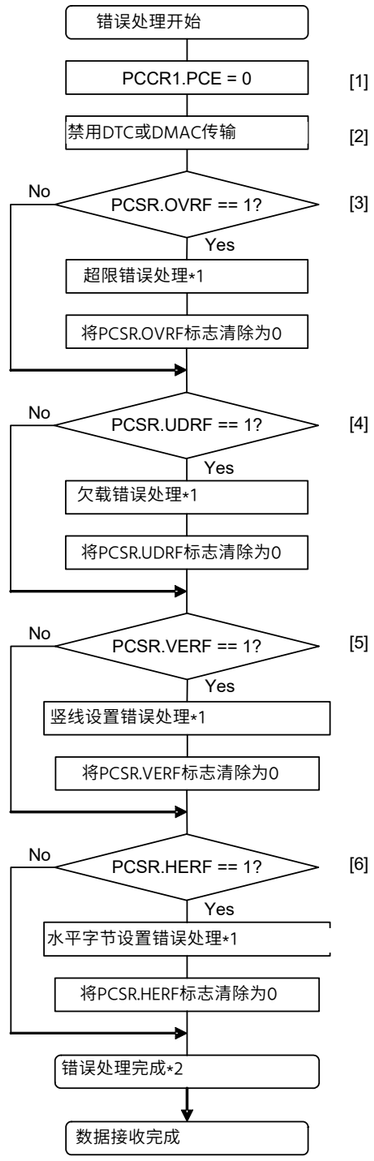
Note 1. Processing for each type of error is defined by the user, so the user needs to prepare error processing for each.
Note 2. If the CPU, DTC, or DMAC reads the PCDR register after an error interrupt occurrs in response to an interrupt source other than an underrun, an underrun may occur.
If an underrun occurs on completion of error processing, run the error processing again and clear the UDRF flag.
Since underruns still require detection after error processing, do not disable the underrun interrupt before the error processing.

Figure 44.20 Example error processing flow

44.3.10 Interrupt Sources

The PDC interrupt sources include:

- Receive data ready
- Frame end
- Overrun



[1]禁用PDC操作：
将PCCR1寄存器中的PCE位清零以禁用PDC操作。

[2]禁用DTC或DMAC传输：禁用DTC或DMAC传输。

[3]溢出标志检查：
读取PCSR寄存器以检查OVRF标志的状态。如果设置了标志，则继续进行溢出错误处理，然后清除标志。

[4] Underrun flag check:
读取PCSR寄存器以检查状态
UDRF标志。如果设置了标志，则继续进行欠载错误处理，然后清除标志。

[5]竖线设置错误标志检查：
读取PCSR寄存器以检查VERF标志的状态。如果设置了标志，则进行垂直线设置错误处理，然后清除标志。

[6]检查水平字节设置错误标志：读取PCSR寄存器以检查HERF标志的状态。如果设置了标志，则进行水平字节设置错误处理，然后清除标志。

注1.每种错误的处理由用户定义，因此用户需要为每种类型准备错误处理。注2.如果CPU、DTC或DMAC在错误中断发生后读取PCDR寄存器以响应欠载以外的中断源，则可能会发生欠载。如果在错误处理完成时发生欠载，请再次运行错误处理并清除UDRF标志。由于在错误处理后仍需要检测欠载，因此在错误处理之前不要禁用欠载中断。

Figure 44.20 错误处理流程示例

44.3.10 中断源

PDC中断源包括：

- 接收数据就绪
- 帧结束
- Overrun

- Underrun
- Vertical line number setting error
- Horizontal byte number setting error.

The PDC can start the DTC or DMAC in response to a receive data ready interrupt request for the transfer of data.

Table 44.5 summarizes the PDC interrupt sources. When an interrupt condition listed in Table 44.5 is satisfied, the associated interrupt is generated. For receive data ready interrupts, the program can clear the interrupt source flag by reading the PCDR register. For the frame end interrupts, clear the FEF flag in the PCSR register. For an overrun, underrun, vertical line number setting error, or a horizontal byte number setting error, the program must check the flags to identify the error source flag, because their interrupt vectors are allocated to the same address by PDC_PCERI. After identifying the source, the program must clear the associated error interrupt source flag (OVRF, UDRF, VERF, or HERF) in the PCSR register.

When the DTC or DMAC module is to handle data transfer, first select the module. After enabling the module for transfers, set up the PDC. For information on setting up the DTC and DMAC, see section 17, DMA Controller (DMAC), and section 18, Data Transfer Controller (DTC).

On completion of output, the request flag clears automatically. An interrupt request signal retained internally can also be cleared by setting the associated interrupt enable bit (the DFIE bit in the PCCR0 register) to 0.

Table 44.5 PDC interrupt sources

Interrupt source	Abbreviation	Interrupt conditions	DTC/DMAC activation
Receive Data Ready	PDC_PCDFI	Receive data ready occurs while the DFIE bit in the PCCR0 register is 1.	Possible
Frame End	PDC_PCFEI	Frame end occurs while the FEIE bit in the PCCR0 register is 1.	Impossible
Errors	PDC_PCERI	• An overrun occurs while the OVIE bit in the PCCR0 register is 1 • An underrun occurs while the UDRIE bit in the PCCR0 register is 1 • A vertical line number setting error occurs while the VERIE bit in the PCCR0 register is 1 • A horizontal byte number setting error occurs while the HERIE bit in the PCCR0 register is 1.	Impossible

44.3.11 Reset State

The PDC has two types of resets: a PDC reset (writing 1 to PCCR0.PRST bit) and other resets.

Other resets include:

- RES pin reset
- Power-on reset
- Voltage monitor reset 0
- Voltage monitor reset 1
- Voltage monitor reset 2
- Deep Software Standby reset
- Independent watchdog timer reset
- Watchdog timer reset
- Software reset
- SRAM parity error reset
- SRAM ECC error reset
- Illegal instruction reset
- Oscillation stop detection reset
- Bus master MPU error reset

- Underrun
- 垂直行数设置错误
- 水平字节数设置错误。

PDC可以启动DTC或DMAC以响应数据传输的接收数据就绪中断请求。

表44.5总结了PDC中断源。当满足表44.5中列出的中断条件时，将产生相关的中断。对于接收数据就绪中断，程序可以通过读取PCDR寄存器来清除中断源标志。对于帧结束中断，清除PCSR寄存器中的FEF标志。对于溢出、欠载、垂直行数设置错误或水平字节数设置错误，程序必须检查标志以识别错误源标志，因为它们的中断向量由PDC_PCERI分配到相同的地址。确定源后，程序必须清除PCSR寄存器中相关的错误中断源标志（OVRF、UDRF、VERF或HERF）。

当DTC或DMAC模块要处理数据传输时，首先选择模块。启用传输模块后，设置PDC。有关设置DTC和DMAC的信息，请参阅第17节，DMA控制器(DMAC)和第18节，数据传输控制器(DTC)。

输出完成后，请求标志自动清除。内部保留的中断请求信号也可以通过将相关的中断使能位（PCCR0寄存器中的DFIE位）设置为0来清除。

Table 44.5 PDC中断源

中断源	Abbreviation	中断条件	DTC/DMAC activation
接收数据就绪	PDC_PCDFI	PCCR0寄存器中的DFIE位为1时发生接收数据准备就绪。	Possible
帧结束	PDC_PCFEI	PCCR0寄存器中的FEIE位为1时发生帧结束。	Impossible
Errors	PDC_PCERI	PCCR0寄存器中的OVIE位为1时发生溢出 PCCR0寄存器中的UDRIE位为1时发生下溢 PCCR0寄存器中的VERIE位为1时发生垂直行数设置错误 水平字节PCCR0寄存器中的HERIE位为1时发生数字设置错误。	Impossible

44.3.11 重置状态

PDC有两种类型的复位：PDC复位（向PCCR0.PRST位写入1）和其他复位。

其他重置包括：

- RES引脚复位
- Power-on reset
- 电压监视器复位0
- 电压监视器复位1
- 电压监视器复位2
- 深度软件待机复位
- 独立看门狗定时器复位
- 看门狗定时器复位
- 软件复位
- SRAM奇偶校验错误复位
- SRAMECC错误复位
- 非法指令复位
- 振荡停止检测复位
- 总线主控MPU错误复位

- Bus slave MPU error reset
- Stack pointer error reset
- Watchdog timer reset in reset sequence.

Table 44.6 shows the register states following the two types of resets.

Table 44.6 Register states on reset

PDC register	PDC reset	Other resets
PCCR0	Retained	Reset
PCCR1	Retained	Reset
PCSR	Reset	Reset
PCMONR	Retained	Reset
PCDR	Retained	Reset
VCR	Retained	Reset
HCR	Retained	Reset

44.4 Usage Notes

44.4.1 Settings for the Module-Stop Function

PDC operation can be disabled or enabled using the MSTPC2 bit in Module Stop Control Register C (MSTPCRC). The PDC is initially stopped (MSTPC2 =1) after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

44.4.2 Constraints on the Low-Power Function

When reducing PDC power consumption by using the low-power function, set the PCE bit in the PCCR1 register to 0 to disable reception operations, and set the PCKE bit in the PCCR0 register to 0 to disable input through the PIXCLK pin. Use the low-power function after these settings are complete.

If the PCKOE bit in the PCCR0 register is set to 1, set it to 0 to stop output of the PCKO signal, in addition to disabling input through the PIXCLK pin in PCKE. Use the low-power function after these settings are complete.

44.4.3 Constraints on Error Interrupts

When an error interrupt occurs, the DTC or DMAC might still be transmitting parallel data, depending on their operation state. Because of this, the error interrupt processing routine must prohibit data transmission by the DTC or DMAC immediately after prohibiting PDC operation (PCCR1.PCE = 0).

44.4.4 Constraints on Using the DTC

When the DTC is used with the receive data ready interrupt, set the DISEL bit in the MRB register to 0 and the SZ bit in the MRA register to 10b.

The maximum number of blocks the DTC can transfer in block transfer mode is 65,536. If 32 bytes are transferred per block transfer, this represents a total of up to 2,097,152 bytes. If more data is to be transferred, set up the DTC again during the horizontal blanking period. For details, see section 18, Data Transfer Controller (DTC).

44.4.5 Constraints on Using the DMAC

When the DMAC is used with the receive data ready interrupt, set the SZ bit in the DMTMD register to 10b, and configure the DESL[8:0] bits in the DELSRn register (n = 0 to 7) appropriately.

The maximum number of blocks the DMAC can transfer in block transfer mode is 65,536. If 32 bytes are transferred per block transfer, this represents a total of up to 2,097,152 bytes. If more data is to be transferred, set up the DMAC again during the horizontal blanking period. For details, see section 14, Interrupt Controller Unit (ICU) and section 17, DMA Controller (DMAC).

- 总线从机MPU错误复位
- 堆栈指针错误复位
- 看门狗定时器按复位顺序复位。

表44.6显示了两种复位后的寄存器状态。

Table 44.6 复位时注册状态

PDC register	PDC reset	其他重置
PCCR0	Retained	Reset
PCCR1	Retained	Reset
PCSR	Reset	Reset
PCMONR	Retained	Reset
PCDR	Retained	Reset
VCR	Retained	Reset
HCR	Retained	Reset

44.4 使用说明

44.4.1 模块停止功能的设置

可以使用模块停止控制寄存器C(MSTPCRC)中的MSTPC2位禁用或启用PDC操作。这
PDC在复位后最初停止(M STPC2=1)。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

44.4.2 对低功耗函数的约束

使用低功耗功能降低PDC功耗时，将PCCR1寄存器中的PCE位设置为0以禁用接收操作，并将PCCR0寄存器中的PCKE位设置为0以禁用通过PIXCLK引脚的输入。完成这些设置后使用低功耗功能。

如果PCCR0寄存器中的PCKOE位设置为1，则将其设置为0以停止输出PCKO信号，同时禁止通过PCKE中的PIXCLK引脚输入。完成这些设置后使用低功耗功能。

44.4.3 错误中断的约束

发生错误中断时，DTC或DMAC可能仍在传输并行数据，具体取决于它们的操作状态。因此，错误中断处理程序必须在禁止PDC操作(PCCR1.PCE=0)后立即禁止DTC或DMAC的数据传输。

44.4.4 使用DTC的限制

当DTC与接收数据就绪中断一起使用时，将MRB寄存器中的DISEL位设置为0，并将MRA寄存器中的SZ位设置为10b。

DTC在块传输模式下可以传输的最大块数为65 536。如果每次块传输传输32个字节，则总共最多2 097 152个字节。如果要传输更多数据，请在水平消隐期间再次设置DTC。有关详细信息，请参阅第18节，数据传输控制器(DTC)。

44.4.5 使用DMAC的限制

当DMAC与接收数据就绪中断一起使用时，将DMTMD寄存器中的SZ位设置为10b，并适当配置DELSRn寄存器中的DESL[8:0]位（n=0至7）。

DMAC在块传输模式下可以传输的最大块数为65 536。如果每次块传输传输32个字节，则总共最多2 097 152个字节。如果要传输更多数据，请在水平消隐期间再次设置DMAC。有关详细信息，请参阅第14节，中断控制器单元(ICU)和第17节，DMA控制器(DMAC)。

45. Boundary Scan

45.1 Overview

The boundary scan function provides a serial I/O interface based on the JTAG (Joint Test Action Group), IEEE Std. 1149.1, and IEEE Standard Test Access Port and Boundary Scan Architecture. Table 45.1 lists the boundary scan specifications, Figure 45.1 shows a block diagram, and Table 45.2 lists the I/O pins.

Table 45.1 Boundary scan specifications

Parameter	Specifications
Execution condition	Boundary scan must be executed when the RES pin is driven low.
Test modes	• BYPASS mode • EXTEST mode • SAMPLE/PRELOAD mode • CLAMP mode • HIGHZ mode • IDCODE mode

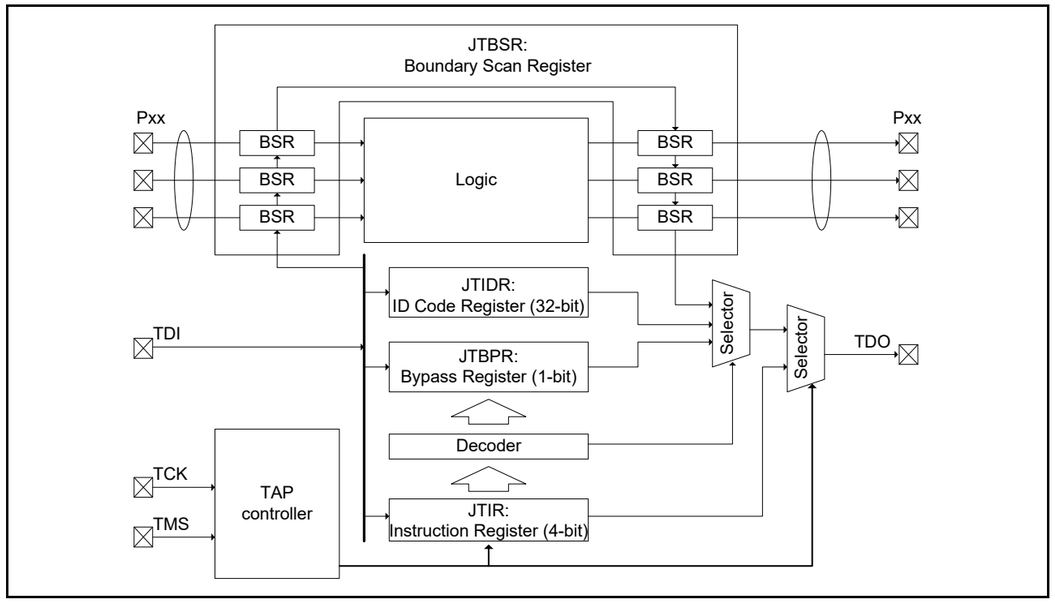


Figure 45.1 Boundary scan function block diagram

Table 45.2 Boundary scan I/O pins

Pin name	I/O	Description
TCK	Input	Test clock input pin Clock signal for boundary scan. The input clock duty cycle is 50% when the boundary scan function is used.
TMS	Input	Test mode select pin
TDI	Input	Test data input pin
TDO	Output	Test data output pin

Note: The MCU does not support the TRST pin for the JTAG interface.

45. 边界扫描

45.1 Overview

边界扫描功能提供基于JTAG（联合测试行动组）、IEEEStd.的串行IO接口。1149.1和IEEE标准测试访问端口和边界扫描架构。表45.1列出了边界扫描规范，图45.1显示了框图，表45.2列出了IO引脚。

Table 45.1 边界扫描规格

Parameter	Specifications
执行条件	当RES引脚驱动为低电平时，必须执行边界扫描。
测试模式	BYPASS模式 EXTEST模式 SAMPLEPRELOAD模式 CLAMP模式 HIGHZ模式 IDCODE模式

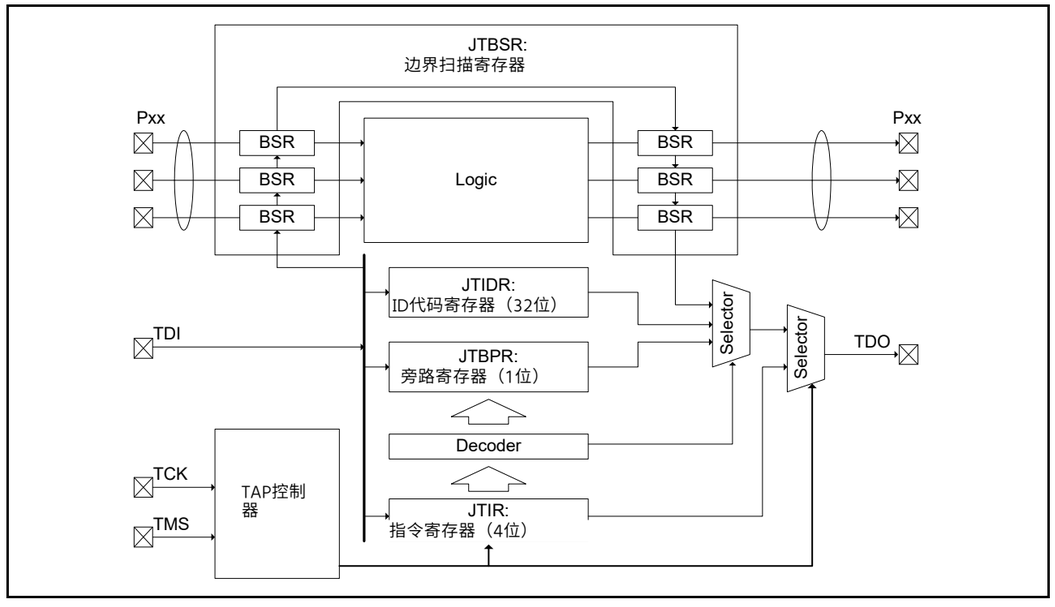

Figure 45.1 边界扫描功能框图

Table 45.2 边界扫描IO引脚

引脚名称	I/O	Description
TCK	Input	测试时钟输入引脚 边界扫描的时钟信号。使用边界扫描功能时，输入时钟占空比为50%。
TMS	Input	测试模式选择引脚
TDI	Input	测试数据输入引脚
TDO	Output	测试数据输出引脚

Note: MCU不支持JTAG接口的TRST引脚。

45.2 Register Descriptions

Table 45.3 lists the boundary scan registers.

Table 45.3 Boundary scan registers

Register name	Symbol	Value after reset
Instruction Register	JTIR	Eh
ID Code Register	JTIDR	0832 9447h
Bypass Register	JTBPR	Undefined
Boundary Scan Register	JTBSR	Undefined

Usage notes for the boundary scan registers:

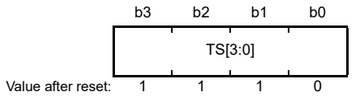
- Instructions can be input to the Instruction Register (JTIR) through the TDI pin by serial transfer.
- The Bypass Register (JTBPR), which is a 1-bit register, is connected between the TDI and TDO pins in BYPASS mode.
- The Boundary Scan Register (JTBSR), which is configured according to the BSDL description, is connected between the TDI and TDO pins when test data is being shifted in.

Table 45.4 shows the availability of serial transfer for the registers.

Table 45.4 Serial transfer for registers

Register name	Serial input	Serial output
Instruction Register (JTIR)	Available	Available
ID Code Register (JTIDR)	Available	Available
Bypass Register (JTBPR)	Available	Available
Boundary Scan Register (JTBSR)	Available	Available

45.2.1 Instruction Register (JTIR)



Bit	Symbol	Bit name	Description	R/W
b3 to b0	TS[3:0]	Test Bit Set	The command configuration for these bits is shown in Table 45.5.	—

Table 45.5 Command configuration

TS3	TS2	TS1	TS0	Instruction
0	0	0	0	EXTEST
0	0	0	1	SAMPLE/PRELOAD
0	0	1	1	IDCODE (Renesas code)
0	1	0	1	CLAMP
0	1	1	0	HIGHZ
1	1	1	1	BYPASS
Other settings				Reserved

JTAG instructions can be transferred to the JTIR register by serial input from the TDI pin. The JTIR register is initialized when a power-on reset occurs, or when the TAP controller is in the Test-Logic-Reset state.

45.2 注册说明

表45.3列出了边界扫描寄存器。

Table 45.3 边界扫描寄存器

注册名称	Symbol	重置后的值
指令寄存器	JTIR	Eh
ID代码寄存器	JTIDR	0832 9447h
绕过寄存器	JTBPR	Undefined
边界扫描寄存器	JTBSR	Undefined

边界扫描寄存器的使用说明：

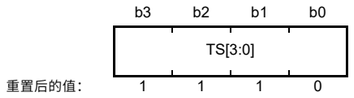
- 指令可以通过串行传输通过TDI引脚输入到指令寄存器(JTIR)。
- 旁路寄存器(JTBPR)是一个1位寄存器，在BYPASS模式下连接在TDI和TDO引脚之间。
- 根据BSDL描述配置的边界扫描寄存器(JTBSR)在移入测试数据时连接在TDI和TDO引脚之间。

表45.4显示了寄存器串行传输的可用性。

Table 45.4 寄存器的串行传输

注册名称	串行输入	串行输出
指令寄存器(JTIR)	Available	Available
ID代码寄存器(JTIDR)	Available	Available
旁路寄存器(JTBPR)	Available	Available
边界扫描寄存器(JTBSR)	Available	Available

45.2.1 指令寄存器(JTIR)



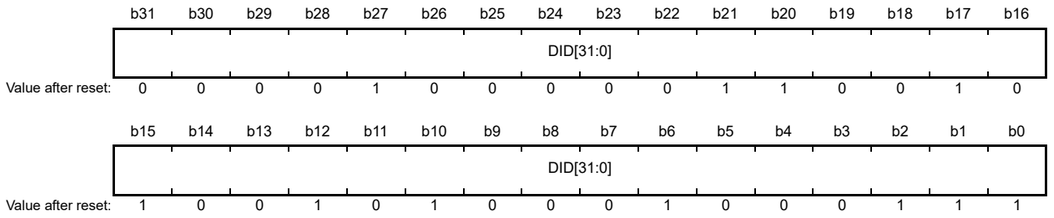
Bit	Symbol	位名称	Description	R/W
b3 to b0	TS[3:0]	测试位组	这些位的命令配置如表45.5所示。	—

Table 45.5 命令配置

TS3	TS2	TS1	TS0	Instruction
0	0	0	0	EXTEST
0	0	0	1	SAMPLE/PRELOAD
0	0	1	1	IDCODE (Renesas code)
0	1	0	1	CLAMP
0	1	1	0	HIGHZ
1	1	1	1	BYPASS
其他设置				Reserved

JTAG指令可以通过TDI引脚的串行输入传输到JTIR寄存器。当发生上电复位或TAP控制器处于Test-Logic-Reset状态时，JTIR寄存器被初始化。

45.2.2 ID Code Register (JTIDR)



Bit	Symbol	Bit name	Description	R/W
b31 to b0	DID[31:0]	Device ID	These bits store the fixed value that indicates the device IDCODE.	—

JTIDR data is output from the TDO pin when the IDCODE instruction is executed. After a reset release, the IDCODE of JTIDR changes into the Arm® debug code. See the *ARM® CoreSight™ SoC-400 Technical Reference Manual* (ARM DDI 0480F).

45.2.3 Bypass Register (JTBPR)

JTBPR is a 1-bit register and is connected between the TDI and TDO pins when the JTIR register is set to BYPASS mode. The JTBPR register cannot be read from or written to by the CPU.

45.2.4 Boundary Scan Register (JTBSR)

JTBSR is a shift register for controlling the external input and output pins of the MCU, and is distributed across the pads. To apply the JTBSR register in boundary-scan testing, issue the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ instructions. The BSDL file describes the associations between the JTBSR bits and the pins of the MCU. The value after reset is undefined.

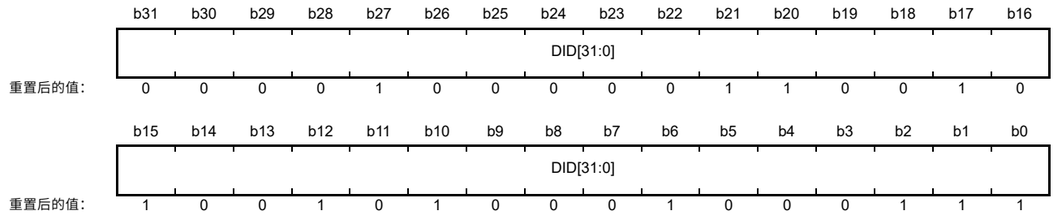
45.3 Operation

During a reset, the JTAG ports, TCK, TMS, TDI, and TDO, are assigned as default pin functions. The TCK, TMS, and TDI pins are pulled up by the pull-up resistors. Boundary scan testing can be executed after the setup time elapses when POR is negated and RES is driven low.

45.3.1 TAP Controller

Figure 45.2 shows the state transition diagram of the TAP controller. All transitions are controlled by the TMS signal.

45.2.2 ID代码寄存器(JTIDR)



Bit	Symbol	位名称	Description	R/W
b31 to b0	DID[31:0]	设备ID	这些位存储指示设备IDCODE的固定值。	—

执行IDCODE指令时，从TDO引脚输出JTIDR数据。复位释放后，IDCODE JTIDR更改为Arm®调试代码。请参阅ARM®CoreSight SoC-400技术参考手册（ARM DDI 0480F).

45.2.3 旁路寄存器(JTBPR)

JTBPR是一个1位寄存器，当JTIR寄存器设置为BYPASS模式时，连接在TDI和TDO引脚之间。CPU无法读取或写入JTBPR寄存器。

45.2.4 边界扫描寄存器(JTBSR)

JTBSR是一个移位寄存器，用于控制MCU的外部输入和输出引脚，分布在各个焊盘上。要在边界扫描测试中应用JTBSR寄存器，请发出EXTEST、SAMPLEPRELOAD、CLAMP和HIGHZ指令。BSDL文件描述了JTBSR位和MCU引脚之间的关联。复位后的值未定义。

45.3 Operation

在复位期间，JTAG端口、TCK、TMS、TDI和TDO被分配为默认引脚功能。TCK、TMS和TDI引脚由上拉电阻上拉。边界扫描测试可以在设置时间过去后执行，当
POR被取反，RES被驱动为低电平。

45.3.1 水龙头控制器

图45.2显示了TAP控制器的状态转换图。所有转换都由TMS信号控制。

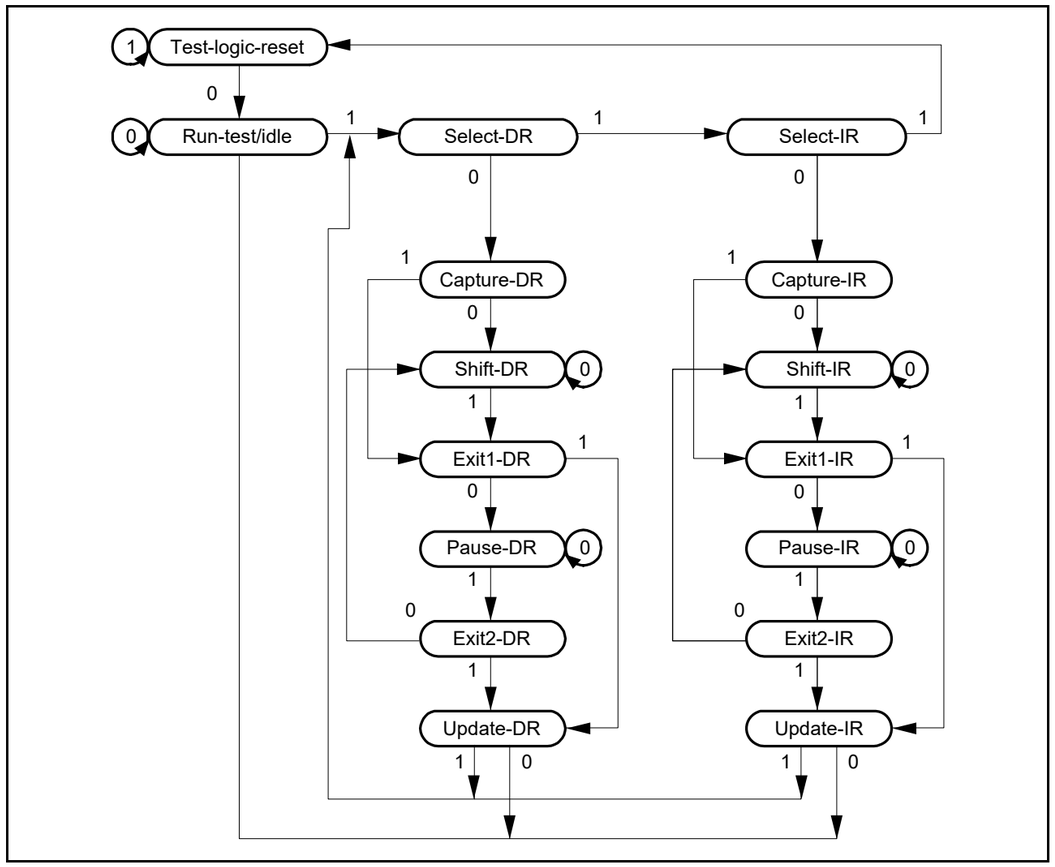


Figure 45.2 State transition diagram of TAP controller

45.3.2 Commands

(1) BYPASS

The BYPASS instruction drives the Bypass Register (JTBPR). This instruction shortens the shift path, facilitating the transfer of serial data to other LSIs on a printed circuit board at higher speeds. While this instruction is being executed, the test circuit has no effect on the system circuits.

The Bypass Register (JTBPR) is connected between the TDI and TDO pins. Bypass operation is initiated from the Shift-DR operation. The TDO is low in the first clock cycle in the Shift-DR state. In the subsequent clock cycles, the TDI signal is output on the TDO pin.

(2) EXTEST

The EXTEST instruction is used to test external circuits when the MCU is installed on the printed circuit board. If this instruction is executed, output pins are used to output test data (specified in the SAMPLE/PRELOAD instruction) from the Boundary Scan Register (JTBSR) to the print circuit board, and input pins are used to input the test result.

(3) SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input data from the internal circuits of the MCU to the Boundary Scan Register (JTBSR), output data from the scan path, and reload the data to the scan path. While this instruction is executed, input signals are directly input to the MCU and output signals are also directly output to the external circuits. The MCU system circuit is not affected by this instruction.

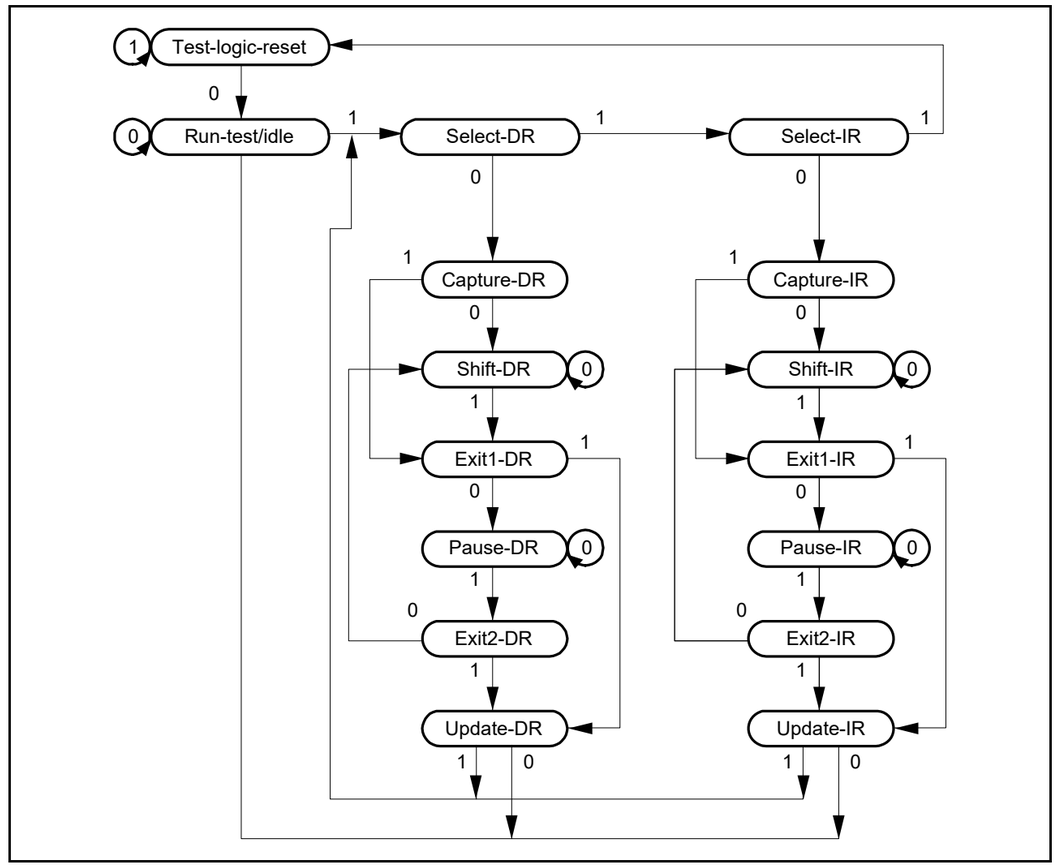

Figure 45.2 TAP控制器的状态转移图

45.3.2 Commands

(1) BYPASS

BYPASS指令驱动旁路寄存器(JTBPR)。该指令缩短了移位路径，便于将串行数据以更高的速度传输到印刷电路板上的其他LSI。在执行该指令时，测试电路对系统电路没有影响。

旁路寄存器(JTBPR)连接在TDI和TDO引脚之间。旁路操作从Shift启动
DR操作。TDO在Shift-DR状态的第一个时钟周期内为低电平。在随后的时钟周期中，TDI信号在TDO引脚上输出。

(2) EXTEST

EXTEST指令用于单片机安装在印刷电路板上时测试外部电路。如果执行该指令，输出引脚用于将测试数据（在SAMPLEPRELOAD指令中指定）从边界扫描寄存器（JTBSR）输出到印刷电路板，输入引脚用于输入测试结果。

(3) SAMPLE/PRELOAD

SAMPLEPRELOAD指令用于将数据从MCU内部电路输入到边界扫描寄存器（JTBSR），从扫描路径输出数据，并将数据重新加载到扫描路径。在执行该指令时，输入信号直接输入到MCU，输出信号也直接输出到外部电路。MCU系统电路不受该指令影响。

In SAMPLE operation, the Boundary Scan Register (JTBSR) latches a snapshot of the data transferred from the input pins to the internal circuit or data transferred from the internal circuit to the output pins. The latched data is read from the scan path. The JTBSR register latches the data snapshot on the rising edge of the TCK pin in the Capture-DR state. The data snapshot is only transferred from the internal circuit to the output pins during a reset.

In PRELOAD operation, the initial value is written from the scan path to the parallel output latch of the Boundary Scan Register (JTBSR) prior to the EXTEST instruction execution. If EXTEST is executed without executing this PRELOAD operation, undefined values are output from the beginning to the end (transfer to the output latch) of the EXTEST sequence. (In the EXTEST instruction, output parallel latches are always output to the output pins.)

(4) IDCODE

When the IDCODE instruction is selected, the ID Code Register (JTIDR) value is output to the TDO pin in the Shift-DR state of the TAP controller. In this case, the JTIDR register value is output LSB-first. During this instruction execution, the test circuit does not affect the system circuit.

(5) CLAMP

When the CLAMP instruction is selected, output pins output the Boundary Scan Register (JTBSR) value that was specified in the SAMPLE/PRELOAD instruction in advance. While the CLAMP instruction is selected, the status of the JTBSR register is maintained regardless of the TAP controller state.

The Bypass Register (JTBPR) is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

(6) HIGHZ

When the HIGHZ instruction is selected, all output pins enter high-impedance state. While the HIGHZ instruction is selected, the status of Boundary Scan Register (JTBSR) is maintained regardless of the state of the TAP controller.

The Bypass Register (JTBPR) is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

45.4 Usage Notes

The boundary scan function is subject to the following constraints:

- The boundary scan must be executed when the RES pin is driven low
- Serial data input/output is in LSB order, as shown in Figure 45.3.

在SAMPLE操作中，边界扫描寄存器(JTBSR)锁存从输入引脚传输到内部电路的数据或从内部电路传输到输出引脚的数据的快照。从扫描路径读取锁存的数据。在Capture-DR状态下，JTBSR寄存器在TCK引脚的上升沿锁存数据快照。数据快照仅在复位期间从内部电路传输到输出引脚。

在PRELOAD操作中，在执行EXTEST指令之前，将初始值从扫描路径写入边界扫描寄存器(JTBSR)的并行输出锁存器。如果在不执行此PRELOAD操作的情况下执行EXTEST，则从EXTEST序列的开头到结尾（传输到输出锁存器）输出未定义的值。（在EXTEST指令中，输出并行锁存器始终输出到输出引脚。）

(4) IDCODE

WhentheIDCODEinstructionisselected theIDCodeRegister(JTIDR)valueisoutputtotheTDOpinintheShift-DRstateoftheTAPcontroller.在这种情况下，JTIDR寄存器值首先输出LSB。在该指令执行期间，测试电路不影响系统电路。

(5) CLAMP

选择CLAMP指令时，输出引脚输出预先在SAMPLEPRELOAD指令中指定的边界扫描寄存器(JTBSR)值。选择CLAMP指令时，无论TAP控制器状态如何，都将保持JTBSR寄存器的状态。

旁路寄存器(JTBPR)连接在TDI和TDO引脚之间，导致与当
选择了BYPASS指令。

(6) HIGHZ

选择Highz指令时，所有输出引脚都输入高阻抗状态。选择HIGHZ指令时，无论TAP控制器的状态如何，边界扫描寄存器(JTBSR)的状态都会保持不变。

旁路寄存器(JTBPR)连接在TDI和TDO引脚之间，导致与当
选择了BYPASS指令。

45.4 使用说明

边界扫描函数受以下约束：

- 当RES引脚驱动为低电平时，必须执行边界扫描
- 串行数据输入输出按LSB顺序排列，如图45.3所示。

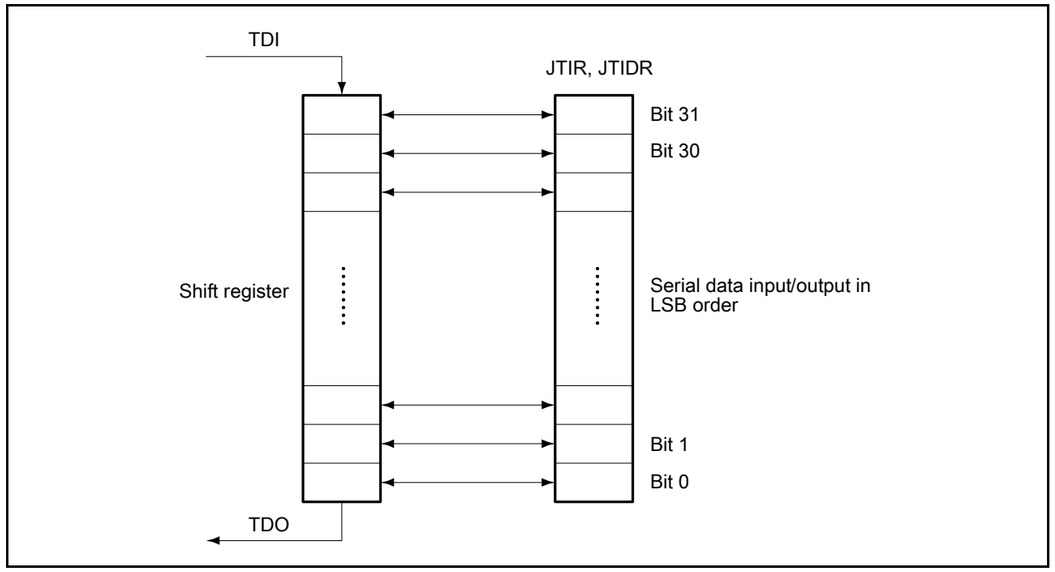

Figure 45.3 Serial data input/output

The following pins cannot be boundary-scanned:

- Power supply pins (VCC, VCL, VCL0, VSS, VBATT, AVCC0, AVSS0, VCC_USB, VSS_USB, AVCC_USBHS, AVSS_USBHS, PVSS_USBHS, VCC_USBHS VSS1_USBHS, and VSS2_USBHS) cannot be boundary-scanned
- Analog reference pins (VREFH0, VREFL0, VREFH, VREFL, USBHS_RREF) cannot be boundary-scanned
- Clock pins (EXTAL, XTAL, XCIN, and XCOUT) cannot be boundary-scanned
- Reset signal (RES) cannot be boundary-scanned
- USB-dedicated pins (USB_DP, USB_DM, USBHS_DP, USBHS_DM) cannot be boundary-scanned
- The boundary-scan pins (TCK, TMS, TDI, and TDO) cannot be boundary-scanned.

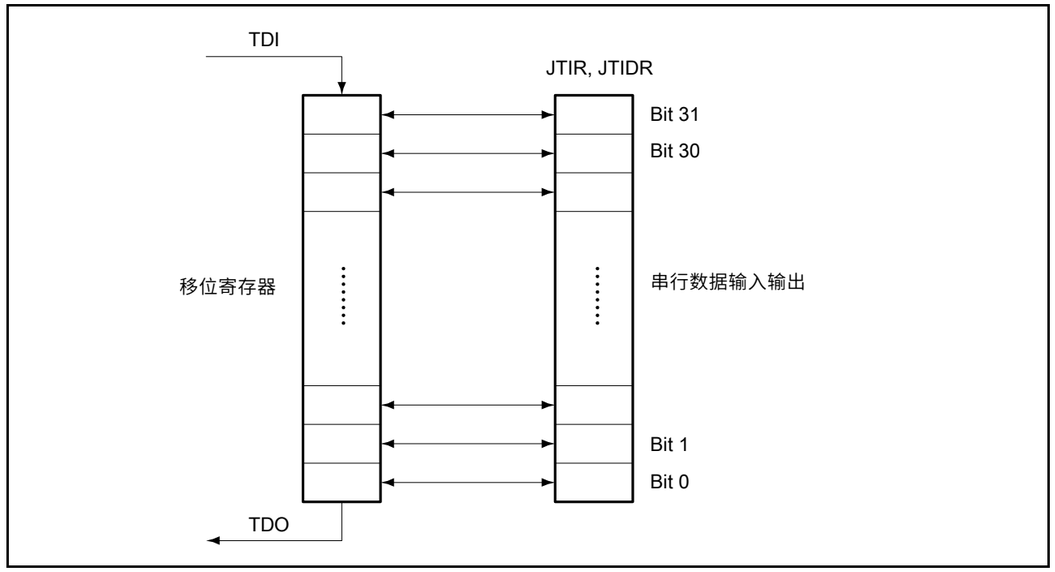

Figure 45.3 串行数据输入输出

以下引脚不能进行边界扫描：

- 电源引脚（VCC、VCL、VCL0、VSS、VBATT、AVCC0、AVSS0、VCC_USB、VSS_USB、AVCC_USBHS、AVSS_USBHS、PVSS_USBHS、VCC_USBHSVSS1_USBHS和VSS2_USBHS）不能进行边界扫描
- 模拟参考引脚（VREFH0、VREFL0、VREFH、VREFL、USBHS_RREF）不能进行边界扫描
- 时钟引脚（EXTAL、XTAL、XCIN和XCOUT）不能进行边界扫描
- 复位信号(RES)不能进行边界扫描
- USB专用引脚（USB_DP、USB_DM、USBHS_DP、USBHS_DM）不能进行边界扫描
- 边界扫描引脚（TCK、TMS、TDI和TDO）不能进行边界扫描。

46. Secure Cryptographic Engine (SCE7)

The MCU incorporates a Secure Cryptographic Engine (SCE7) module to provide security functions. The module consists of an access management circuit, encryption engine, and random number generator.

46.1 Overview

Table 46.1 shows the SCE7 specifications and Figure 46.1 shows the SCE7 block diagram.

Table 46.1 SCE7 specifications (1 of 2)

Parameter	Description
Access control	Access management circuit • In case of irregular access to the SCE7 due to a falsified program or runaway execution of a program, this circuit blocks all subsequent access and stops the output of data from the SCE7.
Encryption engine	Advanced Encryption Standard (AES): Compliant with NIST FIPS PUB 197 algorithm • Key sizes: 128, 192, or 256 bits • Block size: 128 bits • Chaining modes - ECB, CBC, CTR: Compliant with NIST SP 800-38A - GCM: Compliant with NIST SP 800-38D - XTS: Compliant with NIST SP 800-38E - GCTR. • Throughput for 128-bit data - 11 PCLKB cycles for 128-bit key - 15 PCLKB cycles for 256-bit key. AES-GCM • AES-GCM is realized by combining AES-GCTR and GHASH. Triple Data Encryption Standard (3DES): • 168-bit key length • Operates on a fixed 8-byte block of data • Used in legacy Secure Socket Layer (SSL) and Transport Layer Security (TLS) protocols • Throughput for 64-bit data - 16 PCLKB cycles for 56-bit key. Alleged RC4 (ARC4) • 2048-bit key length • Throughput for 128-bit data - 16 PCLKB cycles for 2048-bit key. Key management • Wrapped keys are only valid within the SCE7.
Generation of random numbers	128-bit true random number generator
Signature generation and verification	RSA • Support for 1024-bit and 2048-bit key sizes • Signature generation, signature verification, public-key encryption, private-key decryption. DSA • Support for DSA key sizes: • (1024-bit, 160-bit) • (2048-bit, 224-bit) • (2048-bit, 256-bit). • Signature generation, signature verification. ECC • Support for curve P-192, P-224, P-256, and P-384 • Signature generation, signature verification • Scalar multiplication.
Message digest computation	HASH • SHA1, SHA224, SHA256, and MD5.

46. 安全加密引擎(SCE7)

MCU包含一个安全加密引擎(SCE7)模块以提供安全功能。该模块由访问管理电路、加密引擎和随机数发生器组成。

46.1 Overview

表46.1显示了SCE7规范，图46.1显示了SCE7框图。

Table 46.1 SCE7规范（2个中的1个）

Parameter	Description
访问控制	访问管理电路 如果由于伪造程序或程序执行失控导致对SCE7的非正常访问，该电路将阻止所有后续访问，并停止从SCE7输出数据。
加密引擎	高级加密标准(AES)：符合NISTFIPSPUB197算法 密钥大小：128、192或256位 块大小：128位 链接模式 ECB、CBC、CTR：符合NISTSP800-38AGCM：符合NISTSP800-38DXTS：符合NISTSP800-38EGCTR。 128位数据的吞吐量 128位密钥的11个PCLKB周期256位密钥的15个PCLKB周期。 AES-GCM AES-GCM是通过结合AES-GCTR和GHASH实现的。 三重数据加密标准(3DES)：•1个68位密钥长度•对固定的8字节数据块进行操作•用于传统安全套接字层(SSL)和传输层安全(TLS)协议•64位吞吐量数据 56位密钥的16个PCLKB周期。 所谓的RC4(ARC4) 2048位密钥长度 128位数据的吞吐量 2048位密钥的16个PCLKB周期。 密钥管理 封装的密钥仅在SCE7内有效。
随机数的产生	128位真随机数发生器
签名生成和验证	RSA 支持1024位和2048位密钥大小 签名生成、签名验证、公钥加密、私钥解密。 DSA 支持DSA密钥大小： （1024位、160位） （2048位、224位） （2048位、256位）。签名生成、签名验证。 ECC 支持曲线P-192、P-224、P-256和P-384 签名生成、签名验证 标量乘法。
消息摘要计算	哈希 SHA1、SHA224、SHA256和MD5。

Table 46.1 SCE7 specifications (2 of 2)

Parameter	Description
Unique ID	• A unique ID to the MCU, is accessible from the access management circuit through the dedicated bus • Combining the unique ID with the key generation information prevents the illicit copying of data to another MCU.
Low power consumption	Setting of the module stop state is possible.

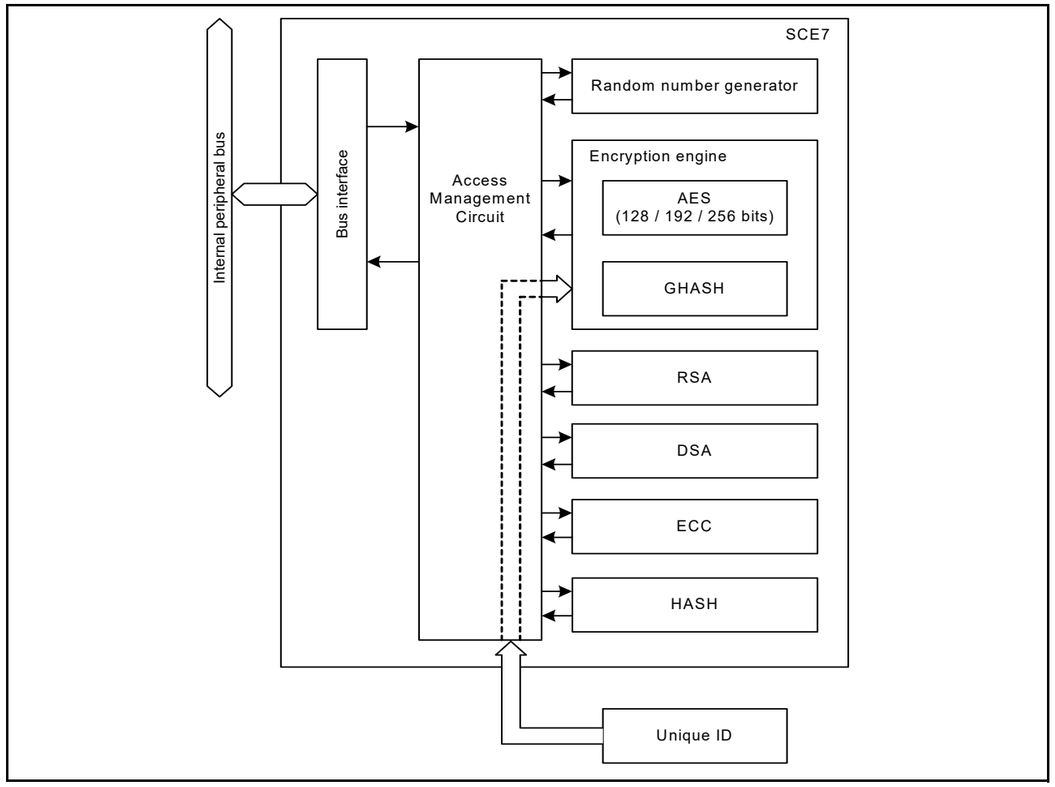

Figure 46.1 SCE7 block diagram

46.2 Operation

46.2.1 Encryption Engine

The encryption engine performs the following operation in hardware, see Figure 46.2:

- Plaintext to ciphertext encryption
- Ciphertext to plaintext decryption.

Table 46.1 SCE7规范（2个中的2个）

Parameter	Description
唯一身份	MCU的唯一ID，可通过专用总线从访问管理电路访问。 将唯一ID与密钥生成信息相结合可防止将数据非法复制到另一个MCU。
低功耗	可以设置模块停止状态。

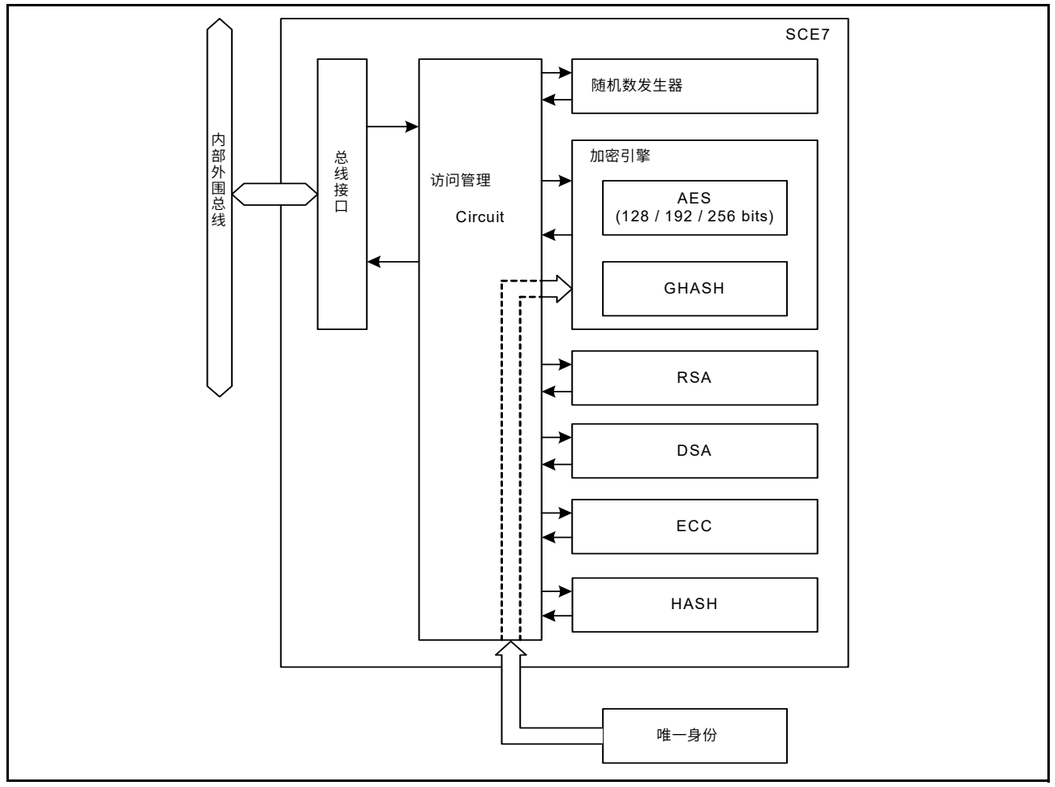

Figure 46.1 SCE7框图

46.2 Operation

46.2.1 加密引擎

加密引擎在硬件中执行以下操作，见图46.2：

- 明文到密文加密
- 密文转明文解密。

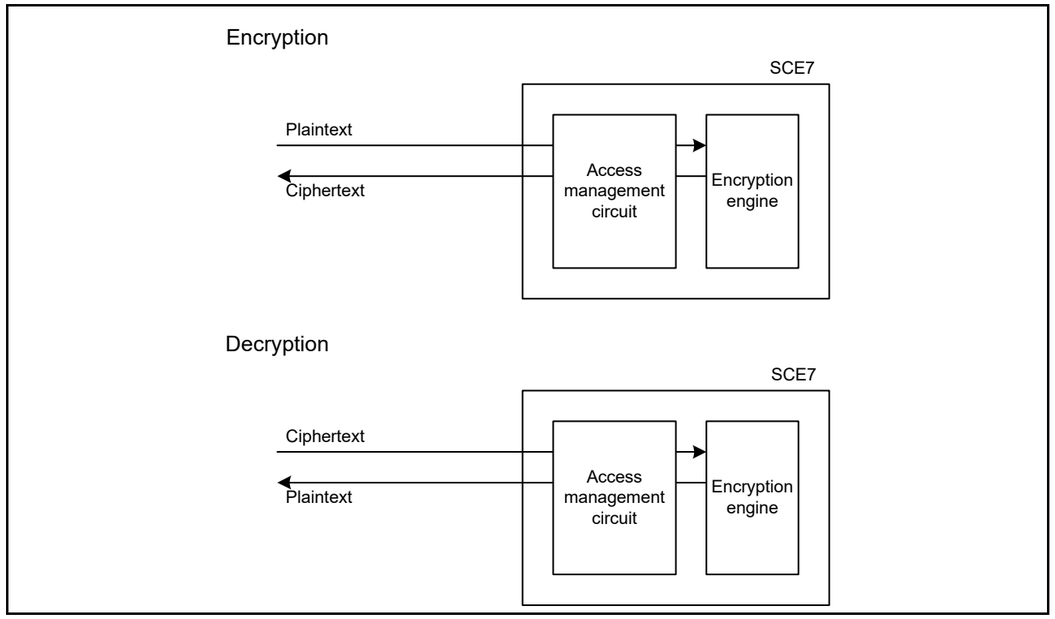

Figure 46.2 Encryption and decryption processes by encryption engine

46.2.2 Encryption and Decryption

To encrypt or decrypt data:

1. Input the data to encrypt or decrypt in the SCE7. The SCE7 converts the plaintext data to ciphertext or ciphertext data to plaintext.
2. Read the converted data.

The encryption engine has an input buffer and an output buffer, enabling encryption/decryption to proceed in parallel with data input/output. Figure 46.3 shows the encryption engine timing.

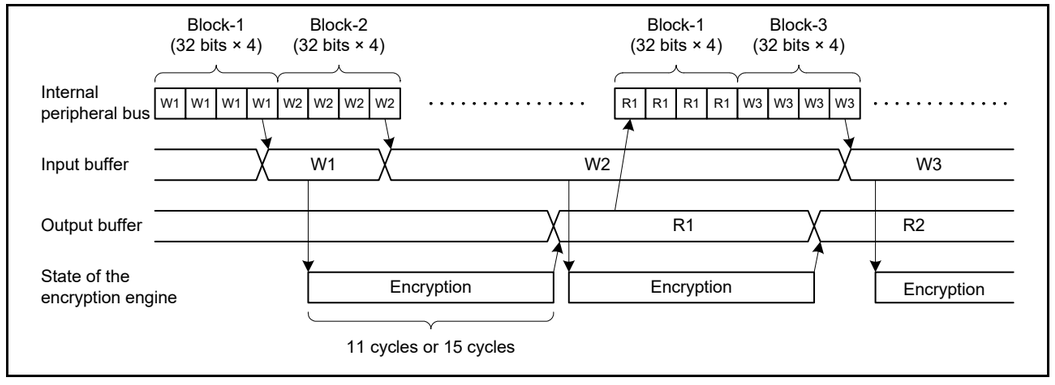

Figure 46.3 Encryption and decryption timing (AES)

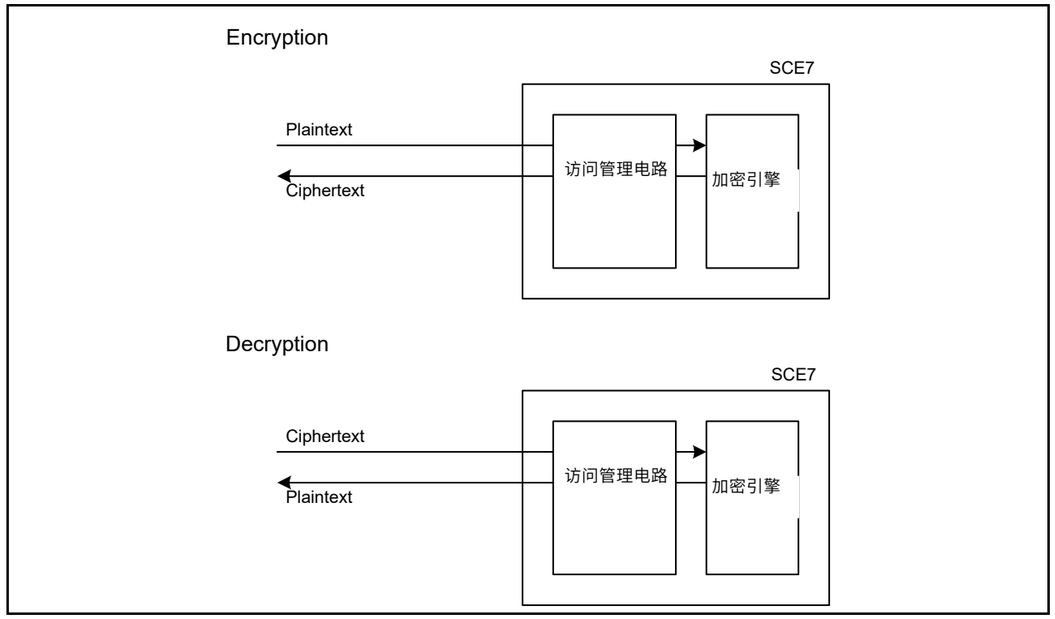

Figure 46.2 加密引擎的加解密过程

46.2.2 加密和解密

要加密或解密数据：

1. 在SCE7中输入要加密或解密的数据。SCE7将明文数据转换为密文或将密文数据转换为明文。
2. 读取转换后的数据。

加密引擎有一个输入缓冲区和一个输出缓冲区，使加密解密与数据输入输出并行进行。图46.3显示了加密引擎的时序。

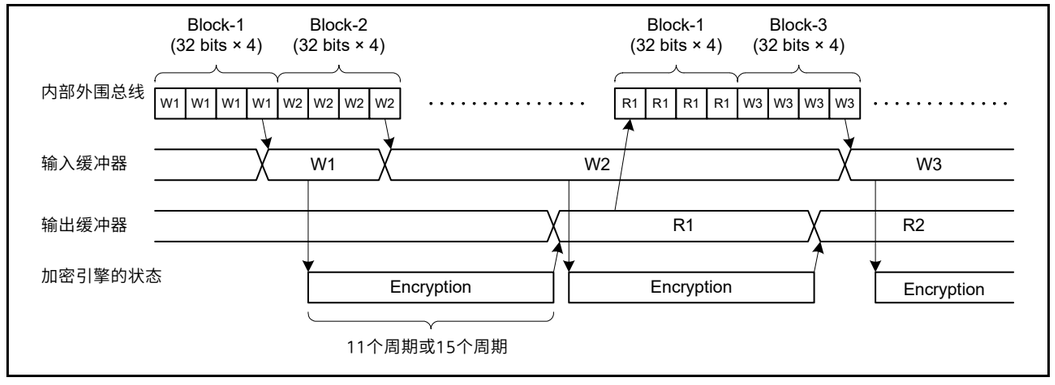

Figure 46.3 加密和解密时序（AES）

46.3 Usage Notes

46.3.1 Software Standby Mode

When Software Standby mode is entered while the encryption engine is in processing, proper processing cannot be resumed after exiting Software Standby mode. Software Standby mode should therefore be entered while the encryption engine is not running.

46.3.2 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable SCE7 operation. The SCE7 module is initially stopped after reset. Releasing the module-stop state enables access to the registers.

46.3 使用说明

46.3.1 软件待机模式

当加密引擎正在处理时进入软件待机模式时，退出软件待机模式后无法恢复正常处理。因此，应在加密引擎未运行时进入软件待机模式。

46.3.2 模块停止功能的设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用SCE7操作。SCE7模块在复位后最初停止。释放模块停止状态可以访问寄存器。

47. 12-Bit A/D Converter (ADC12)

47.1 Overview

The MCU provides two 12-bit successive approximation A/D converter (ADC12) units. In unit 0, up to 13 analog input channels, temperature sensor output, and internal reference voltage are selectable for conversion. In unit 1, up to 11 analog input channels, temperature sensor output, and internal reference voltage are selectable for conversion. The A/D conversion accuracy is selectable from 12-, 10-, and 8-bit conversion, making it possible to optimize the trade-off between speed and resolution in generating a digital value.

ADC12 features include:

- 13 channels (unit 0), 11 channels (unit 1)
- PCLKB = 60 MHz (maximum)
- PCLKC = 60 MHz (maximum)
- Analog channels: AN000 to AN007, AN016 to AN020 (unit 0), AN100 to AN103, AN105 to AN107, AN116 to AN119 (unit 1)
- Resolution: 12-bit, 10-bit, 8-bit
- Dedicated sample-and-hold circuit embedded
- Programmable Gain Amplifier embedded.

The ADC12 supports the following operating modes:

- Single scan mode for converting the analog inputs of arbitrarily selected channels in ascending order of channel number
- Continuous scan mode for sequentially converting analog inputs of arbitrarily selected channels continuously in ascending order of channel number
- Group scan mode for arbitrarily dividing analog inputs of channels into two groups (A and B) and converting the analog input of the selected channel for each group in ascending order of channel number.

In group scan mode, you can start Group A and Group B A/D conversion at different times by individually selecting their scan start conditions. In addition, when a priority control operation for Group A is set, the ADC12 accepts Group A scan starting during Group B A/D conversion, suspending Group B conversion. This allows you to assign higher priority to A/D conversion start for Group A.

In double-trigger mode, the analog input of an arbitrarily selected channel is converted in single scan mode or group scan mode (Group A), and data converted by the first and second A/D conversion start triggers are stored in different registers, providing duplexing of A/D-converted data.

Self-diagnosis is performed once at the beginning of each scan, and one of the three voltage values generated in the ADC12 is A/D-converted.

The temperature sensor output and the internal reference voltage are selectable at the same time as the analog input of the channel. First A/D conversion is performed for the analog input of the channel, next the temperature sensor output, and then the internal reference voltage.

The ADC12 provides a compare function (Window A and Window B). This compare function specifies the upper reference value for Window A and lower reference value for Window B, and outputs an interrupt request when the A/D-converted value of the selected channel meets the comparison conditions.

Table 47.1 lists the ADC12 specifications and Table 47.2 list the functions. Figure 47.1 shows a block diagram of ADC12 unit 0 and Figure 47.2 shows a block diagram of ADC12 unit 1. Table 47.3 lists the I/O pins.

Table 47.1 ADC12 specifications (1 of 3)

Parameter	Specifications
Number of units	Two units, 0 and 1

47. 12-Bit A/D Converter (ADC12)

47.1 Overview

MCU提供两个12位逐次逼近模数转换器(ADC12)单元。在单元0中，可以选择最多13个模拟输入通道、温度传感器输出和内部参考电压进行转换。在单元1中，可以选择多达11个模拟输入通道、温度传感器输出和内部参考电压进行转换。AD转换精度可从12位、10位和8位转换中选择，从而可以在生成数字值时优化速度和分辨率之间的权衡。

ADC12 features include:

- 13 channels (unit 0), 11 channels (unit 1)
- PCLKB = 60 MHz (maximum)
- PCLKC = 60 MHz (maximum)
- 模拟通道：AN000到AN007、AN016到AN020（单元0）、AN100到AN103、AN105到AN107、AN116到AN119 (unit 1)
- Resolution: 12-bit, 10-bit, 8-bit
- 嵌入式专用采样保持电路
- 嵌入式可编程增益放大器。

ADC12支持以下工作模式：

- 单次扫描模式，以通道号升序转换任意选择通道的模拟输入
- 连续扫描模式，用于按通道编号升序连续转换任意选择通道的模拟输入
- 组扫描模式，用于将通道的模拟输入任意分成两组（A和B），并按通道编号的升序转换每组所选通道的模拟输入。

在组扫描模式下，您可以通过单独选择它们的扫描开始条件，在不同的时间开始A组和B组AD转换。此外，当设置A组的优先控制操作时，ADC12在B组AD转换期间接受A组扫描，暂停B组转换。这允许您为A组的AD转换开始分配更高的优先级。

双触发模式下，任意选择通道的模拟输入转换为单扫描模式或组扫描模式（A组），第一次和第二次A/D转换启动触发转换的数据存储在不同的寄存器中，提供双工一个D转换数据。

自诊断在每次扫描开始时执行一次，并在生成的三个电压值之一
ADC12 is A/D-converted.

温度传感器输出和内部参考电压可与通道的模拟输入同时选择。首先对通道的模拟输入进行AD转换，然后是温度传感器输出，然后是内部参考电压。

ADC12提供比较功能（窗口A和窗口B）。该比较函数指定窗口A的上参考值和窗口B的下参考值，并在所选通道的AD转换值满足比较条件时输出中断请求。

表47.1列出了ADC12规格，表47.2列出了功能。图47.1显示了一个框图
ADC12单元0和图47.2显示了ADC12单元1的框图。表47.3列出了IO引脚。

Table 47.1 ADC12规格(1of3)

Parameter	Specifications
单位数量	两个单位，0和1

Table 47.1 ADC12 specifications (2 of 3)

Parameter	Specifications
Input channels	• Unit 0: Up to 13 channels • Unit 1: Up to 11 channels
Extended analog function	Temperature sensor output, internal reference voltage
A/D conversion method	Successive approximation method
Resolution	12 bits, selectable to 12-bit, 10-bit, or 8-bit conversion
Conversion time	0.4 µs/channel, when A/D conversion clock PCLKC (ADCLK) is operating at 60 MHz (See Table 60.40 and Table 60.41 about the condition)
A/D conversion clock	Peripheral module clock PCLKB*1 and A/D conversion clock PCLKC (ADCLK)*1 can be set with the following division ratios: PCLKB to PCLKC (ADCLK) frequency ratios = 1:1, 2:1, 4:1, 8:1, 1:2, 1:4
Data registers	• 24 registers for analog input (13 for unit 0, 11 for unit 1), one for A/D-converted data duplication in double-trigger mode in each unit, and 2 for A/D-converted data duplication in extended operation in double-trigger mode in each unit • One register for temperature sensor output • One register for internal reference voltage • One register for self-diagnosis • Storing of A/D conversion results in A/D data registers • 8-, 10-, and 12-bit accuracy output for A/D conversion results • A/D-converted value addition mode, in which the sum of all A/D conversion results are stored in the in the A/D data registers as the conversion accuracy bit count + 2 bits.*4 • Double-trigger mode (selectable in single scan and group scan modes): The first unit of A/D-converted analog-input data on one selected channel is stored in the data register for the channel, and the second unit is stored in the duplexing register. • Extended operation in double-trigger mode (available for specific triggers): A/D-converted analog-input data on one selected channel is stored in the duplexing register provided for the associated trigger
Operating modes	• Single scan mode: - A/D conversion is performed only once on the analog inputs of arbitrarily selected channels, on the temperature sensor output, and on the internal reference voltage. • Continuous scan mode: - A/D conversion is performed repeatedly on the analog inputs of arbitrarily selected channels, on the temperature sensor output, and on the internal reference voltage. • Group scan mode: - Analog inputs of arbitrarily selected channels, the temperature sensor output, and the internal reference voltage are divided into Group A and Group B, and A/D conversion of the analog input selected on a group basis is performed only once. - The scan start conditions can be independently selected for Group A and Group B, allowing A/D conversion of Group A and Group B to be started independently. • Group scan mode (when Group A is given priority): - If a Group A trigger is input during A/D conversion on Group B, the A/D conversion on Group B stops and A/D conversion is processed on Group A. - Restart (rescan) of Group B conversion after completion of Group A conversion can be set.
Conditions for A/D conversion start	• Software trigger • Synchronous triggers from the Event Link Controller (ELC). • Asynchronous triggering by the external trigger pins, ADTRG0 (unit 0) and ADTRG1 (unit 1)
Functions	• Dedicated sample-and-hold function with optional constant sampling and 3 channels in units 0 and 1 • Variable sampling state count • Self-diagnosis of ADC12 • Selectable A/D-converted value addition mode or average mode • Analog input disconnection detection function (discharge and precharge functions) • Double-trigger mode (duplication of A/D conversion data) • Switching function for 8-, 10-, and 12-bit conversion*2 • Automatic clear function for A/D data registers • Digital comparison of values in the comparison and data registers, and between values in the data registers
Programmable gain amplifier	• Amplification of analog input signals to enable A/D conversion, with 3 channels in units 0 and 1 • Compatible with single-ended input and differential input

Table 47.1 ADC12规格（2个，共3个）

Parameter	Specifications
输入通道	单元0：最多13个通道 单元1：最多11个通道
扩展模拟功能	温度传感器输出，内部参考电压
AD转换方式	逐次逼近法
Resolution	12位，可选择12位、10位或8位转换
转换时间	0.4µs通道，当AD转换时钟PCLKC(ADCLK)以60MHz运行时（有关条件，请参见表60.40和表60.41）
AD转换时钟	外围模块时钟PCLKB*1和AD转换时钟PCLKC(ADCLK)*1可设置为以下分频比：PCLKB与PCLKC(ADCLK)频率比=1:1、2:1、4:1、8:1、1:2 1:4
数据寄存器	24个用于模拟输入的寄存器（13个用于单元0，11个用于单元1），一个用于双触发模式下的AD转换数据复制，以及双触发模式下扩展操作中的AD转换数据复制每个单元中 一个用于温度传感器输出的寄存器 一个用于内部参考电压的寄存器 一个用于自诊断的寄存器 将AD转换结果存储在AD数据寄存器中 用于AD转换的8位、10位和12位精度输出结果 AD转换值加法模式，其中所有AD转换结果的总和作为转换精度位数+2位存储在AD数据寄存器中。*4 双触发模式（在单次扫描中可选和组扫描模式）： 一个选定通道上的AD转换模拟输入数据的第一个单元存储在该通道的数据寄存器中，第二个单元存储在双工寄存器中。 双触发模式下的扩展操作（适用于特定触发）： 一个选定通道上的D转换模拟输入数据存储在为相关触发提供的双工寄存器中
操作模式	单次扫描模式： D转换仅在任意选择通道的模拟输入、温度传感器输出和内部参考电压上执行一次。 连续扫描模式： 对任意选择通道的模拟输入、温度传感器输出和内部参考电压重复执行D转换。 组扫描模式： 任意选择通道的模拟输入、温度传感器输出、内部参考电压分为A组和B组，按组选择的模拟输入只进行一次A/D转换。可以独立选择A组和B组的扫描开始条件，允许A组和B组的AD转换独立启动。 组扫描模式（当A组优先时）： 如果在B组的AD转换期间输入A组触发，则B组的AD转换将停止，并在A组进行AD转换。可以设置A组转换完成后B组转换的重新启动（重新扫描）。
AD转换开始的条件	软件触发器 来自事件链接控制器(ELC)的同步触发器。 通过外部触发引脚ADTRG0（单元0）和ADTRG1（单元1）进行异步触发
Functions	专用采样保持功能，可选恒定采样和3个通道，单元0和1 可变采样状态计数 ADC12自诊断 可选择AD转换值加法模式或平均模式 模拟输入断开检测功能（放电和预充电功能） 双触发模式（AD转换数据的复制） 8位、10位和12位转换的切换功能*2 AD数据寄存器的自动清除功能 比较中的值的数字比较和数据寄存器，以及数据寄存器中的值之间
可编程增益放大器	放大模拟输入信号以实现AD转换，单元0和1具有3个通道 兼容单端输入和差分输入

Table 47.1 ADC12 specifications (3 of 3)

Parameter	Specifications
Interrupt sources and ELC events	• ADC12i_ADI: A/D scan end interrupt • ADC12i_GBADI: A/D scan end interrupt for Group B • ADC12i_CMPAI: Window A compare match • ADC12i_CMPBI: Window B compare match • ADC12i_WCMPM: compare match • ADC12i_WCMPUM: compare mismatch
ELC interface	Scan can be started by a trigger from the ELC
Bus interface	Bus clock synchronized with peripheral clock (PCLKB), maximum frequency = 60 MHz
Reference voltage	• Unit 0: VREFH0 is the high potential reference voltage. VREFL0 is the low potential reference voltage. • Unit 1: VREFH is the high potential reference voltage. VREFL is the low potential reference voltage.
Module-stop function	Module-stop state can be set to reduce power consumption*3

i = 0 for unit 0, and i = 1 for unit 1.

Note 1. Peripheral module clock PCLKB is specified in the SCKDIVCR.PCKB[2:0] bits, and A/D conversion clock ADCLK in the SCKDIVCR.PCKC[2:0] bits in units 0 and 1.
Note 2. Changing the A/D conversion accuracy also changes the A/D conversion time. For details, see section 47.3.6, Analog Input Sampling and Scan Conversion Time.
Note 3. For details, see section 11, Low Power Modes.
Note 4. The number of extended bits for addition varies with the A/D conversion accuracy and the number of addition times. A 2-bit extension is up to 4 times conversion (3 times addition) when the A/D conversion accuracy is 8, 10, or 12 bits. A 4-bit extension is 16 times conversion (15 times addition) when the A/D conversion accuracy is 12 bits.

Table 47.2 ADC12 functions

Parameter			Unit 0 (ADC120)	Unit 1 (ADC121)
Analog input channel			AN000 to AN007, AN016 to AN020 Internal reference voltage Temperature sensor output	AN100 to AN103, AN105 to AN107, AN116 to AN119 Internal reference voltage Temperature sensor output
Conditions for A/D conversion start	Software	Software trigger	Enabled	Enabled
	External trigger	Trigger input pin	ADTRG0	ADTRG1
	Synchronous trigger (trigger from ELC)	ELC trigger	ELC_AD00, ELC_AD01	ELC_AD10, ELC_AD11
Channel-dedicated sample-and-hold function	Target channel		AN000 to AN002	AN100 to AN102
Programmable gain amplifier	Target channel		AN000 to AN002	AN100 to AN102
	Differential input pin		PGAVSS000	PGAVSS100
Interrupt			ADC120_ADI ADC120_GBADI ADC120_CMPAI ADC120_CMPBI	ADC121_ADI ADC121_GBADI ADC121_CMPAI ADC121_CMPBI
Output to ELC			ADC120_ADI ADC120_WCMPM ADC120_WCMPUM	ADC121_ADI ADC121_WCMPM ADC121_WCMPUM
Module-stop function settings*1, *2			MSTPCRD.MSTPD16 bit	MSTPCRD.MSTPD15 bit

Note 1. For details, see section 11, Low Power Modes.
Note 2. Wait for 1 µs or longer to start A/D conversion after release from the module-stop state.

Table 47.1 ADC12规格（3个中的3个）

Parameter	Specifications
中断源和 ELC events	ADC12i_ADI：D扫描结束中断 ADC12i_GBADI：B组的D扫描结束中断 ADC12i_CMPAI：窗口A比较匹配 ADC12i_CMPBI：窗口B比较匹配 ADC12i_WCMPM：比较匹配 ADC12i_WCMPUM：比较不匹配
ELC interface	扫描可以通过来自ELC的触发器启动
总线接口	与外设时钟(PCLKB)同步的总线时钟，最大频率=60MHz
参考电压	• Unit 0: VREFH0是高电位参考电压。VREFL0是低电位参考电压。 单元1： VREFH是高电位参考电压。VREFL是低电位参考电压。
Module-stop function	可设置模块停止状态以降低功耗*3

对于单元0，i=0，对于单元1，i=1。

Note 1. 外围模块时钟PCLKB在SCKDIVCR.PCKB[2:0]位中指定，AD转换时钟ADCLK在SCKDIVCR.PCKC[2:0]位在单元0和1中。
Note 2. 改变AD转换精度也会改变AD转换时间。有关详细信息，请参阅第47.3.6节，模拟输入采样和扫描转换时间。
Note 3. 有关详细信息，请参阅第11节，低功耗模式。
Note 4. 加法的扩展位数随AD转换精度和加法次数而变化。当AD转换精度为8、10或12位时，2位扩展最多可进行4次转换（3次加法）。当AD转换精度为12位时，4位扩展是16次转换（15次加法）。

Table 47.2 ADC12 functions

	ADTRG1	Input	用于启动AD转换的外部触发输入引脚，低电平有效
	PGAVSS100	Input	差分输入引脚

47.2 Register Descriptions

47.2.1 A/D Data Registers y (ADDRy), A/D Data Duplexing Register (ADDBLDR), A/D Data Duplexing Register A (ADDBLDRA), A/D Data Duplexing Register B (ADDBLDRB), A/D Temperature Sensor Data Register (ADTSDR), A/D Internal Reference Voltage Data Register (ADOCDR)

The data registers include:

- ADDRy registers (y = 0 to 7, 16 to 20 in unit 0 and y = 0 to 3, 5 to 7, 16 to 19 in unit 1): 16-bit read-only registers for storing the A/D conversion results
- ADDBLDR register: 16-bit read-only register for storing the A/D conversion results in response to the second trigger in double-trigger mode
- ADDBLDRA and ADDBLDRB registers: 16-bit read-only registers for storing the A/D conversion results in response to the respective triggers during extended operation in double-trigger mode
- ADTSDR register: 16-bit read-only register for storing the A/D conversion result of the temperature sensor output
- ADOCDR register: 16-bit read-only register for storing the A/D result of the internal reference voltage.

The following conditions determine the formats for data in these registers:

- The setting in the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right setting)
- The setting in the A/D Conversion Accuracy Specify bits (ADCER.ADPRC[1:0]) (8-, 10-, or 12-bit setting).

This section describes the data formats for these conditions in different modes.

(1) When A/D-converted value addition/average mode is not selected

The data formats for each condition are as follows:

Settings for flush-right data with 12-bit accuracy

Address(es): ADC120.ADDR0 4005 C020h to ADC120.ADDR7 4005 C02Eh, ADC120.ADDR16 4005 C040h to ADC120.ADDR20 4005 C048h, ADC120.ADDBLDR 4005 C018h, ADC120.ADDBLDRA 4005 C084h, ADC120.ADDBLDRB 4005 C086h, ADC120.ADTSDR 4005 C01Ah, ADC120.ADOCDR 4005 C01Ch, ADC121.ADDR0 4005 C220h to ADC121.ADDR3 4005 C226h, ADC121.ADDR5 4005 C22Ah to ADC121.ADDR7 4005 C22Eh, ADC121.ADDR16 4005 C240h to ADC121.ADDR19 4005 C246h, ADC121.ADDBLDR 4005 C218h, ADC121.ADDBLDRA 4005 C284h, ADC121.ADDBLDRB 4005 C286h, ADC121.ADTSDR 4005 C21Ah, ADC121.ADOCDR 4005 C21Ch

47.2 注册说明

47.2.1 AD数据寄存器y(ADDRy)、AD数据双工寄存器(ADDBLDR)、AD数据双工寄存器A(ADDBLDRA) AD数据双工寄存器B(ADDBLDRB) AD温度传感器数据寄存器(ADTSDR) AD内部参考电压数据寄存器(ADOCDR)

数据寄存器包括：

- ADDRy寄存器（单元0中y=0到7、16到20，单元1中y=0到3、5到7、16到19）：用于存储AD转换结果的16位只读寄存器
- ADDBLDR寄存器：16位只读寄存器，用于存储双触发模式下响应第二次触发的AD转换结果
- ADDBLDRA和ADDBLDRB寄存器：16位只读寄存器，用于存储双触发模式下扩展操作期间响应相应触发的AD转换结果
- ADTSDR寄存器：16位只读寄存器，用于存储温度传感器输出的A/D转换结果
- AOCDR寄存器：16位只读寄存器，用于存储内部参考电压的AD结果。

以下条件决定了这些寄存器中数据的格式：

- AD数据寄存器格式选择位(ADCER.ADRFMT)中的设置（左对齐或右对齐设置）
- AD转换精度指定位(ADCER.ADPRC[1:0])中的设置（8位、10位或12位设置）。

本节介绍不同模式下这些条件的数据格式。

(1) 未选择AD转换值加法平均模式时

每个条件的数据格式如下：

具有12位精度的右冲洗数据设置

Address(es): ADC120.ADDR0 4005 C020h to ADC120.ADDR7 4005 C02Eh, ADC120.ADDR16 4005 C040h to ADC120.ADDR20 4005 C048h, ADC120.ADDBLDR 4005 C018h, ADC120.ADDBLDRA 4005 C084h, ADC120.ADDBLDRB 4005 C086h, ADC120.ADTSDR 4005 C01Ah, ADC120.ADOCDR 4005 C01Ch, ADC121.ADDR0 4005 C220h to ADC121.ADDR3 4005 C226h, ADC121.ADDR5 4005 C22Ah to ADC121.ADDR7 4005 C22Eh, ADC121.ADDR16 4005 C240h to ADC121.ADDR19 4005 C246h, ADC121.ADDBLDR 4005 C218h, ADC121.ADDBLDRA 4005 C284h, ADC121.ADDBLDRB 4005 C286h, ADC121.ADTSDR 4005 C21Ah, ADC121.ADOCDR 4005 C21Ch

b15 to b8	AD[7:0]	Converted Value 7 to 0	8-bit A/D-converted value.	R

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in A/D-converted value addition mode. When A/D-converted value average mode is selected, this register indicates the mean of the A/D-converted values on the specified channel. The value is stored in the A/D data register based on the setting in the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 8-, 10-, or 12-bit accuracy (ADPRC bit setting), 1, 2, 3 or 4 times can be selected for A/D-converted value addition. 16 times can also be selected for addition mode, but only with 12-bit accuracy selected. In addition mode, this register indicates the value that is obtained by adding the A/D-converted values on a specific channel. The conversion results sum is retained in the A/D data register as a 2-bit-extended value of the conversion accuracy specified. The value is stored in the A/D data register based on the setting in the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

When converting 1, 2, 3, or 4 times in addition mode with 8-, 10-, or 12-bit accuracy specified, the conversion result is stored in the A/D data register as a 2-bit-extended value of the specified accuracy.

When converting 16 times in addition mode with 12-bit accuracy specified the conversion result is stored in the A/D data register as a 4-bit-extended value of the specified accuracy.

The data formats for each condition are as follows:

Settings for flush-right data with 12-bit accuracy in A/D-converted value addition mode

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AD[15:0]*1															
	—	—	AD[13:0]*2													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	AD[15:0]*1	Added Value 15 to 0	16 -bit sum of A/D conversion results.	R

Bit	Symbol	Bit name	Description	R/W
b13 to b0	AD[13:0]*2	Added Value 13 to 0	14-bit sum of A/D conversion results.	R
b15, b14	—	Reserved	These bits are read as 0.	R

Note 1. Used when 16 conversion times is specified in A/D-converted value addition mode.
Note 2. Used when 1, 2, 3, or 4 conversion times is specified in A/D-converted value addition mode.

8位精度的左对齐数据设置

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AD[7:0]								—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	—	Reserved	这些位读为0。	R
b15 to b8	AD[7:0]	将值7转换为0	8-bit A/D-converted value.	R

(2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenAD-convertedvalueaveragemodeisselected thisregisterindicatesthemeanoftheAD-convertedvaluesonthespecifiedchannel.该值根据AD数据寄存器格式选择位中的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

(3) 选择AD转换值相加模式时

对于8位、10位或12位精度（ADPRC位设置），可以选择1、2、3或4次进行AD转换值相加。加法模式也可以选择16次，但只能选择12位精度。在加法模式下，该寄存器指示通过将特定通道上的AD转换值相加而获得的值。转换结果和作为指定转换精度的2位扩展值保留在AD数据寄存器中。该值根据AD数据寄存器格式选择位中的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

在指定精度为8位、10位或12位精度的加法模式下转换1、2、3或4次时，转换结果作为指定精度的2位扩展值存储在AD数据寄存器中.

在指定精度的12位加法模式下转换16次时，转换结果作为指定精度的4位扩展值存储在AD数据寄存器中。

每个条件的数据格式如下：

在AD转换值相加模式下以12位精度设置刷新数据

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	AD[15:0]*1															
	—	—	AD[13:0]*2													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	AD[15:0]*1	附加值15到0	AD转换结果的16位和。	R

Bit	Symbol	位名称	Description	R/W

b15 to b6	AD[9:0]	Added Value 9 to 0	10-bit sum of A/D conversion results.	R

47.2.2 A/D Self-Diagnosis Data Register (ADRD)

ADRD is a 16-bit read-only register that holds the A/D conversion results based on the self-diagnosis of the ADC12. In addition to the AD[11:0] bits indicating the A/D-converted value, it includes the self-diagnosis status bit (DIAGST).

The following conditions determine the formats for data in this registers:

- The setting in the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right setting)
- The setting in the A/D Conversion Accuracy Specify bits (ADCER.ADPRC[1:0]) (8-, 10-, or 12-bit setting).

The A/D-converted value addition and average modes cannot be applied to the A/D self-diagnosis function. For details on self-diagnosis, see section 47.2.11, A/D Control Extended Register (ADCER).

This section describes the data formats for each condition.

Settings for flush-right data with 12-bit accuracy

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

47.2.2 AD自诊断数据寄存器(ADRD)

ADRD是一个16位只读寄存器，保存基于ADC12自诊断的AD转换结果。除了指示AD转换值的AD[11:0]位外，它还包括自诊断状态位(DIAGST)。

以下条件决定了该寄存器中数据的格式：

- AD数据寄存器格式选择位(ADCER.ADRFMT)中的设置（左对齐或右对齐设置）
- AD转换精度指定位(ADCER.ADPRC[1:0])中的设置（8位、10位或12位设置）。

AD转换值加法和平均模式不能应用于AD自诊断功能。有关自诊断的详细信息，请参见第47.2.11节，AD控制扩展寄存器(ADCER)。

本节介绍每个条件的数据格式。

具有12位精度的右冲洗数据设置

b15	ADST	AD转换开始	0：停止AD转换过程1：开始AD转换过程。	R/W

i = 0 for unit 0, and i = 1 for unit 1.

Note 1. To start A/D conversion using an external pin (asynchronous trigger):
After a high-level signal is input to the external pin (ADTRG0 in unit 0; ADTRG1 in unit 1), write 1 to both the TRGE and EXTRG bits in ADCSR and drive the external pin signals low. With these settings, the scan conversion process starts on detection of the falling edge of ADTRG0 in unit 0 and ADTRG1 in unit 1. For this configuration, the pulse width of the low-level input must be at least 1.5 PCLKB clock cycles.

DBLANS[4:0] bits (Double Trigger Channel Select)

The DBLANS[4:0] bits select one of the channels for A/D conversion data duplication in double-trigger mode. The A/D conversion results from the specified analog input channel are stored in A/D Data Register y when conversion is started by the first trigger, and in the A/D Data Duplexing Register when started by the second trigger. Table 47.4 shows the channel selection settings for double-triggered operation.

A/D-converted value addition/average mode can be set with double-trigger mode for the channel selected in the DBLANS[4:0] bits by using the ADADS0 and ADADS1 registers. In double-trigger mode, the channels selected in the ADANSA0 and ADANSA1 registers are invalid, and the channel selected in the DBLANS[4:0] bits is A/D-converted instead.

When double-trigger mode is used in group scan mode, double-trigger control is only applied to Group A and not to Group B. This means that multi-channel analog input, temperature sensor output, and internal reference voltage can be selected for Group B even in double-trigger mode.

Only set the DBLANS[4:0] bits while the ADST bit is 0. Do not set them at the same time that you write 1 to the ADST bit.

To enter A/D-converted value addition/average mode when in double-trigger mode, set the channel selected in the DBLANS[4:0] bits in the ADANSA0 and ADANSA1 registers.

Table 47.4 Relationship between DBLANS bit settings and double-trigger enabled channels

Unit 0		Unit 1	
DBLANS[4:0]	Duplication channel	DBLANS[4:0]	Duplication channel

10000	AN016	10000	AN116
10001	AN017	10001	AN117
10010	AN018	10010	AN118
10011	AN019	10011	AN119
10100	AN020	10100	—

Note: A/D-converted data from the self-diagnosis function, temperature sensor output, and internal reference voltage cannot be used in double-trigger mode.
Settings other than those listed in Table 47.4 are prohibited.

GBADIE bit (Group B Scan End Interrupt and ELC Event Enable)

The GBADIE bit enables or disables Group B scan end interrupt (ADC12i_GBADI (i = 0, 1)) in group scan mode.

DBLE bit (Double Trigger Mode Select)

The DBLE bit selects or deselects double-trigger mode. Double-trigger mode can only be operated by the synchronous

对于单元0，i=0，对于单元1，i=1。

Note 1. 使用外部引脚（异步触发）启动AD转换：
向外部引脚（单元0中的ADTRG0；单元1中的ADTRG1）输入高电平信号后，向ADCSR的TRGE和EXTRG位写入1，并将外部引脚信号驱动为低电平。使用这些设置，扫描转换过程在检测到单元0中的ADTRG0和单元1中的ADTRG1的下降沿时开始。对于这种配置，低电平输入的脉冲宽度必须至少为1.5个PCLKB时钟周期。

DBLANS[4:0]位（双触发通道选择）

DBLANS[4:0]位选择通道之一，用于双触发模式下的AD转换数据复制。指定模拟输入通道的AD转换结果在第一次触发开始转换时存储在AD数据寄存器y中，在第二次触发开始时存储在AD数据双工寄存器中。表47.4显示了双触发操作的通道选择设置。

D转换值加法平均模式可以设置为双触发模式用于在
DBLANS[4:0]位通过使用ADADS0和ADADS1寄存器。在双触发模式下，ADANSA0和ADANSA1寄存器中选择的通道无效，DBLANS[4:0]位中选择的通道改为AD转换。

在组扫描模式下使用双触发模式时，双触发控制仅适用于A组，不适用
B组。这意味着即使在双触发模式下，也可以为B组选择多通道模拟输入、温度传感器输出和内部参考电压。

仅在ADST位为0时设置DBLANS[4:0]位。不要在将1写入ADST位的同时设置它们。

要在双触发模式下进入AD转换值加法平均模式，请设置在
ADANSA0和ADANSA1寄存器中的DBLANS[4:0]位。

Table 47.4 DBLANS位设置与双触发启用通道之间的关系

Unit 0		Unit 1	
DBLANS[4:0]	复制通道	DBLANS[4:0]	复制通道

10000	AN016	10000	AN116
10001	AN017	10001	AN117
10010	AN018	10010	AN118
10011	AN019	10011	AN119
10100	AN020	10100	—

Note: 自诊断功能、温度传感器输出和内部参考电压的D转换数据不能用于双触发模式。禁止在表47.4中列出以外的设置。

GBADIE位（B组扫描结束中断和ELC事件使能）

GBADIE位在组扫描模式下启用或禁用组B扫描结束中断(ADC12i_GBADI(i=0 1))。

DBLE位（双触发模式选择）

DBLE位选择或取消选择双触发模式。双触发模式只能由同步操作

trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits.

Double-trigger operation is as follows:

1. The ADC12i_ADI (i = 0, 1) interrupt is not output on completion of the first conversion but on completion of the second conversion.
2. The A/D conversion results from the duplication channel (selected in DBLANS[4:0]) started by the first trigger are stored in A/D Data Register y and those started by the second trigger are stored in the A/D Data Duplexing Register.

When DBLE is set, selecting double-trigger mode, the channels specified in the ADANSA0 and ADANSA1 registers are invalid. Double-trigger mode is deselected by setting DBLE to 0. Setting DBLE to 1 again enables the same double-trigger operation described in 1. and 2. for the first time scanning with the first trigger.

Do not select double-trigger mode in continuous scan mode. Additionally, do not select double-trigger mode for conversion of the temperature sensor output or internal reference voltage except for Group B scan in group scan mode. Software triggering cannot be set in double-trigger mode. Always clear the ADST bit to 0 before setting the DBLE bit. In other words, do not set the DBLE bit at that same time as writing 1 to the ADST bit.

EXTRG bit (Trigger Select)

The EXTRG bit selects the synchronous or asynchronous trigger as the trigger for starting A/D conversion.

TRGE bit (Trigger Start Enable)

The TRGE bit enables or disables A/D conversion by the synchronous and asynchronous triggers. In group scan mode, set this bit to 1.

ADCS[1:0] bits (Scan Mode Select)

The ADCS[1:0] bits select the scan mode.

In single scan mode, A/D conversion is performed for the analog inputs, up to a maximum of 13 channels in unit 0 and 11 channels in unit 1, and selected in the ADANSA0 and ADANSA1 registers in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, the scan conversion stops. When the temperature sensor output or internal reference voltage is selected, A/D conversion of the designated analog input channels is followed by A/D conversion of the temperature sensor output and the internal reference voltage, in that order.

In continuous scan mode, while the ADCSR.ADST bit is 1, A/D conversion is performed for the analog inputs selected in the ADANSA0 and ADANSA1 registers in ascending order of channel number, and when 1 cycle of A/D conversion completes for all the selected channels, A/D conversion is repeated from the first channel. If the ADCSR.ADST bit is set to 0 during continuous scan, A/D conversion stops even if scanning is in progress. When the temperature sensor output or internal reference voltage is selected, A/D conversion of the designated analog input channels is followed by A/D conversion of the temperature sensor output and the internal reference voltage, in that order.

In group scan mode, scanning is started by the synchronous trigger (ELC) selected in the TRSA[5:0] bits in ADSTRGR. A/D conversion is performed on the Group A analog inputs, up to the maximum channels selected in the ADANSA0 and ADANSA1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion stops. On the same trigger, A/D conversion is also performed on the Group B analog inputs, up to the maximum channels selected in the ADANSB0 and ADANSB1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion stops. If the conversion processes in Group A and Group B occur at the same time, those conversions cannot be controlled separately. In this case, set the Group A Priority Control Setting bit (ADGSPCR.PGS) in the A/D Group Scan Priority Control Register (ADGSPCR) to 1 to give priority to Group A conversion. When the temperature sensor output or internal reference voltage is selected, A/D conversion of the designated analog input channels is followed by A/D conversion of the temperature sensor output and the internal reference voltage, in that order.

In group scan mode, select different channels and triggers for Group A and Group B. Clear the ADST bit to 0 before setting the ADCS[1:0] bits. In other words, do not set the ADCS[1:0] bits at the same time as writing 1 to the ADST bit.

在ADSTRGR.TRSA[5:0]位中选择触发(ELC)。

双触发操作如下：

1. ADC12i_ADI(i=0 1)中断不会在第一次转换完成时输出，而是在第二次转换完成时输出。
2. 由第一个触发器启动的复制通道（在DBLANS[4:0]中选择）的AD转换结果存储在AD数据寄存器y中，由第二个触发器启动的那些存储在AD数据双工寄存器中。

设置DBLE时，选择双触发模式，ADANSA0和ADANSA1寄存器中指定的通道无效。通过将DBLE设置为0来取消选择双触发模式。再次将DBLE设置为1将启用与1.和2.中描述的相同的双触发操作，第一次使用第一个触发进行扫描。

不要在连续扫描模式下选择双触发模式。此外，不要选择双触发模式来转换温度传感器输出或内部参考电压，组扫描模式下的B组扫描除外。双触发模式下不能设置软件触发。在设置DBLE位之前，始终将ADST位清零。换言之，不要在将1写入ADST位的同时设置DBLE位。

EXTRG位（触发选择）

EXTRG位选择同步或异步触发作为启动AD转换的触发。

TRGE位（触发启动使能）

TRGE位通过同步和异步触发启用或禁用AD转换。在组扫描模式下，将此位设置为1。

ADCS[1:0]位（扫描模式选择）

ADCS[1:0]位选择扫描模式。

在单次扫描模式下，对模拟输入进行AD转换，单元0中最多13个通道，单元1中最多11个通道，并在ADANSA0和ADANSA1寄存器中按照通道号的升序进行选择。当所有选定通道的1个AD转换周期完成时，扫描转换停止。Whenthetemperaturesensoroutputorinternalreferencevoltageisselected ADconversionofthedesignatedanaloginputchannelsisfollowedbyADconversionofthetemperaturesensoroutputandtheinternalreferencevoltage inthatorder.

在连续扫描模式下，当ADCSR.ADST位为1时，ADANSA0和ADANSA1寄存器中选择的模拟输入按通道编号升序执行AD转换，当所有选择的通道完成1个周期的AD转换时，从第一个通道重复D转换。如果在连续扫描期间ADCSR.ADST位设置为0，即使扫描正在进行，AD转换也会停止。Whenthetemperaturesensoroutputorinternalreferencevoltageisselected ADconversionofthedesignatedanaloginputchannelsisfollowedbyADconversionofthetemperaturesensoroutputandtheinternalreferencevoltage inthatorder.

在组扫描模式下，扫描由在ADSTRGR的TRSA[5:0]位中选择的同步触发(ELC)启动。AD转换在A组模拟输入上执行，直到ADANSA0和ADANSA1寄存器中选择的最大通道，按通道编号的升序排列。当所有选定通道完成1个AD转换周期时，AD转换停止。在同一个触发器上，B组模拟输入也执行AD转换，直到ADANSB0和ADANSB1寄存器中选择的最大通道，按通道编号的升序排列。当所有选定通道完成1个AD转换周期时，AD转换停止。如果A组和B组的转换过程同时发生，则不能单独控制这些转换。在这种情况下，将AD组扫描优先级控制寄存器(ADGSPCR)中的组A优先级控制设置位(ADGSPCR.PGS)设置为1，以优先于A组转换。Whenthetemperaturesensoroutputorinternalreferencevoltageisselected ADconversionofthedesignatedanaloginputchannelsisfollowedbyADconversionofthetemperaturesensoroutputandtheinternalreferencevoltage inthatorder.

在组扫描模式下，为A组和B组选择不同的通道和触发。在设置ADCS[1:0]位之前，将ADST位清零。换言之，不要在将1写入ADST位的同时设置ADCS[1:0]位。

Table 47.5 Selectable targets for A/D conversion depending on scan and double-trigger mode settings

Scan mode setting	Double-trigger mode setting	Targets for A/D conversion				
		Self-diagnosis	Analog input (including Group A)	Analog input (Group B)	Temperature sensor output	Internal reference voltage
Single scan	DBLE = 0	✓	✓	-	✓	✓
	DBLE = 1	-	✓ (1 ch only)	-	-	-
Continuous scan	DBLE = 0	✓	✓	-	✓	✓
	DBLE = 1	-	-	-	-	-
Group scan	DBLE = 0	✓	✓	✓	✓	✓
	DBLE = 1	-	✓ (1 ch only)	✓	✓	✓

✓: Selectable. -: Not selectable.

ADST bit (A/D Conversion Start)

The ADST bit starts or stops the A/D conversion process. Before setting the ADST bit to 1, set the A/D conversion clock, conversion mode, and analog input for the conversion target.

[Setting conditions]

- 1 is written by software
- The synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits is detected when ADCSR.EXTRG is 0 and ADCSR.TRGE is 1
- The synchronous trigger (ELC) selected in the ADSTRGR.TRSB[5:0] bits is detected when ADCSR.TRGE is set to 1 in group scan mode
- The asynchronous trigger is detected when the ADCSR.TRGE and ADCSR.EXTRG bits are set to 1 and the ADSTRGR.TRSA[5:0] bits are set to 000000b
- When Group A priority control operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), the ADGSPCR.GBRP bit is set to 1, and each time A/D conversion of Group B starts.

[Clearing conditions]

- 0 is written by software
- The A/D conversion of all the selected channels, the temperature sensor output or the internal reference voltage completes in single scan mode
- Group A scan completes in group scan mode
- Group B scan completes in group scan mode
- When Group A priority control operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), the ADGSPCR.GBRP bit is set to 1, and each time a scanning of Group B completes.

Note: When Group A priority control operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), do not set the ADST bit to 1.
When Group A priority control operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), do not set the ADST bit to 0. When forcing A/D conversion to terminate, follow the procedure for clearing the ADST bit.

Note: If the single scan continuous function is used (ADGSPCR.GBRP = 1) when the group priority operation mode is enabled (ADCSR.ADCS[1:0] = 01b and ADGSPCR.PGS = 1), the ADST bit is retained to 1.

Table 47.5 AD转换的可选目标取决于扫描和双触发模式设置

扫描模式设置	双触发模式设置	AD转换的目标				
		Self-diagnosis	模拟输入（包括A组）	模拟输入（B组）	温度传感器输出	内部参考电压
单次扫描	DBLE = 0	✓	✓	-	✓	✓
	DBLE = 1	-	✓ (1 ch only)	-	-	-
连续扫描	DBLE = 0	✓	✓	-	✓	✓
	DBLE = 1	-	-	-	-	-
组扫描	DBLE = 0	✓	✓	✓	✓	✓
	DBLE = 1	-	✓ (1 ch only)	✓	✓	✓

：可选择。–：不可选择。

ADST位（AD转换开始）

ADST位启动或停止AD转换过程。在将ADST位设置为1之前，设置转换目标的AD转换时钟、转换模式和模拟输入。

[Setting conditions]

- 1由软件编写
- 当ADCSR.EXTRG为0且ADCSR.TRGE为1时，检测到在ADSTRGR.TRSA[5:0]位中选择的同步触发(ELC)
- 在组扫描模式下，当ADCSR.TRGE设置为1时，检测到在ADSTRGR.TRSB[5:0]位中选择的同步触发(ELC)
- 当ADCSR.TRGE和ADCSR.EXTRG位设置为1并且ADSTRGR.TRSA[5:0]位设置为000000b
- 当A组优先控制操作模式使能时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），ADGSPCR.GBRP位设置为1，并且每次B组的AD转换开始。

[Clearing conditions]

- 0是软件写的
- 所有选定通道、温度传感器输出或内部参考电压的AD转换在单次扫描模式下完成
- A组扫描在组扫描模式下完成
- B组扫描在组扫描模式下完成
- 当启用A组优先控制操作模式（ADCSR.ADCS[1:0]位=01b且ADGSPCR.PGS位=1）时，ADGSPCR.GBRP位设置为1，并且每次完成B组扫描。

Note: 当启用A组优先控制操作模式时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），请勿将ADST位设置为1。当启用A组优先控制操作模式时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），请勿将ADST位设置为0。当强制终止AD转换时，请按照清除ADST位的程序进行。

Note: 如果在启用组优先操作模式（ADCSR.ADCS[1:0]=01b和ADGSPCR.PGS=1）时使用单次扫描连续功能（ADGSPCR.GBRP=1），则ADST位保持为1。

47.2.4 A/D Channel Select Register A0 (ADANSA0)

Address(es): ADC120.ADANSA0 4005 C004h, ADC121.ADANSA0 4005 C204h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	ANSA07 to ANSA00	A/D Conversion Channels Select	0: Do not select associated input channel 1: Select associated input channel.	R/W
b15 to b8	-	Reserved.	These bits are read as 0. The write value should be 0.	R/W

ANSAn bits (n = 00 to 07) (A/D Conversion Channels Select)

The ADANSA0.ANSAn bits select or deselect the analog input channels for A/D conversion for AN000 to AN007 (unit 0) and AN100 to AN103 and AN105 to AN107 (unit 1). The channels and the number of channels can be set arbitrarily. In unit 0, the ANSA00 bit is associated with AN000 and the ANSA07 bit with AN007. In unit 1, the ANSA00 bit is associated with AN100 and the ANSA07 bit with AN107.

In double-trigger mode, the channel selected in the ADANSA0 register is invalid, and the channel selected in the ADCSR.DBLANS[4:0] bits is selected in Group A instead.

In group scan mode, do not select the channels specified in A/D Channel Select Register B0 (ADANSB0) and A/D Channel Select Register B1 (ADANSB1).

Only set the ADANSA0 register while the ADCSR.ADST bit is 0.

47.2.5 A/D Channel Select Register A1 (ADANSA1)

Address(es): ADC120.ADANSA1 4005 C006h, ADC121.ADANSA1 4005 C206h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	ANSA20	ANSA19	ANSA18	ANSA17	ANSA16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b4 to b0	ANSA20 to ANSA16	A/D Conversion Channels Select	0: Do not select associated input channel 1: Select associated input channel	R/W
b15 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

ANSAn bits (n = 16 to 20) (A/D Conversion Channels Select)

The ADANSA1.ANSAn bits select or deselect the analog input channels for A/D conversion for AN016 to AN020 (unit 0) and AN116 to AN119 (unit 1). The channels and the number of channels can be set arbitrarily. In unit 0, the ANSA16 bit is associated with AN016 and the ANSA20 bit with AN020. In unit 1, the ANSA16 bit is associated with AN116 and the ANSA19 bit with AN119.

In double-trigger mode, the ANSA1[15:0] bits are invalid, and the channel selected in the ADCSR.DBLANS[15:0] bits is selected in Group A instead.

In group scan mode, do not select the channels specified in A/D Channel Select Register B0 (ADANSB0) and A/D Channel Select Register B1 (ADANSB1).

Only set the ADANSA1 register while the ADCSR.ADST bit is 0.

47.2.4 AD通道选择寄存器A0(ADANSA0)

Address(es): ADC120.ADANSA0 4005 C004h, ADC121.ADANSA0 4005 C204h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b4 to b0	ANSA20 to ANSA16	AD转换通道 Select	0：不选择关联输入通道1：选择关联输入通道	R/W
b15 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ANSAN位（n=16到20）（AD转换通道选择）

ADANSA1.ANSAN位选择或取消选择用于AN016到AN020（单元0）和AN116到AN119（单元1）的AD转换的模拟输入通道。通道和通道数可以任意设置。在单元0中，ANSA16位与AN016相关联，ANSA20位与AN020相关联。在单元1中，ANSA16位与AN116相关联，ANSA19位与AN119相关联。

双触发模式下，ANSA1[15:0]位无效，ADCSR.DBLANS[15:0]位选择的通道改为A组。

在组扫描模式下，不要选择AD通道选择寄存器B0(ADANSB0)和AD中指定的通道
通道选择寄存器B1(ADANSB1)。

仅在ADCSR.ADST位为0时设置ADANSA1寄存器。

47.2.6 A/D Channel Select Register B0 (ADANSB0)

Address(es): ADC120.ADANSB0 4005 C014h, ADC121.ADANSB0 4005 C214h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ANSB07	ANSB06	ANSB05	ANSB04	ANSB03	ANSB02	ANSB01	ANSB00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	ANSB07 to ANSB00	A/D Conversion Channels Select	0: Do not select associated input channel 1: Select associated input channel.	R/W
b15 to b8	-	Reserved	These bits are read as 0. The write value should be 0.	R/W

ANSBn bits (n = 00 to 07) (A/D Conversion Channels Select)

The ADANSB0.ANSBn bits select the analog input channels for A/D conversion for AN000 to AN007 (unit 0) and AN100 to AN103 and AN105 to AN107 (unit 1) in Group B in group scan mode. The ADANSB0 register is only used for group scan mode, not for any other modes. Exclude the channels specified in Group A (the channels associated with Group A, selected in the ADANSA0 and ADANSA1 registers and the ADCSR.DBLANS[4:0] bits in double-trigger mode), both the selected channels and the number of channels to be set.

In unit 0, the ANSB00 bit is associated with AN000 and the ANSB07 bit with AN007. In unit 1, the ANSB00 bit is associated with AN100 and the ANSB07 bit with AN107.

Only set the ADANSB0 register while the ADCSR.ADST bit is 0.

47.2.7 A/D Channel Select Register B1 (ADANSB1)

Address(es): ADC120.ADANSB1 4005 C016h, ADC121.ADANSB1 4005 C216h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	位名称	Description	R/W
b4 to b0	ANSB20 to ANSB16	AD转换通道 Select	0：不选择关联输入通道1：选择关联输入通道。	R/W
b15 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ANSBn位（n=16至20）（AD转换通道选择）

ADANSB1.ANSBn位选择用于AN016到AN020（单元0）的AD转换的模拟输入通道，以及组扫描模式下B组中的AN116至AN119（单元1）。ADANSB1寄存器仅用于组扫描模式，不用于任何其他模式。排除A组中指定的通道（与A组关联的通道，在ADANSA0和ADANSA1寄存器以及双触发模式下的ADCSR.DBLANS[4:0]位中选择），选择的通道和要被设置。

在单元0中，ANSB16位与AN016相关联，ANSB20位与AN020相关联。在单元1中，ANSB16位与AN116相关联，ANSB19位与AN119相关联。

仅当ADST位为0时设置ADANSB1寄存器位。

47.2.8 A/D-Converted Value Addition/Average Channel Select Register 0 (ADADS0)

Address(es): ADC120.ADADS0 4005 C008h, ADC121.ADADS0 4005 C208h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	ADS07	ADS06	ADS05	ADS04	ADS03	ADS02	ADS01	ADS00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	ADS07 to ADS00	A/D-Converted Value Addition/Average Channel Select	0: Do not select associated input channel 1: Select associated input channel	R/W
b15 to b8	-	Reserved	These bits are read as 0. The write value should be 0.	R/W

ADSn bits (n = 00 to 07) (A/D-Converted Value Addition/Average Channel Select)

When the ADSn bit with the same number as the A/D-converted channel selected in the ANSAn bits (n = 00 to 07) in ADANSA0 or the ADCSR.DBLANS[4:0] bits and the ANSBn bits (n = 00 to 07) in ADANSB0 is set to 1, A/D conversion of the analog input of the selected channels is performed successively 1 to 16 times, as specified in the ADC[2:0] bits in ADADC. When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is stored in the A/D data register. When the ADADC.AVEE bit is 1, the mean value of the results obtained by addition (integration) is stored in the A/D data register. For A/D-converted channels for which addition or average mode is not selected, a normal one-time conversion is executed, and the conversion result is stored in the A/D data register.

In unit 0, the ADS00 bit is associated with AN000 and the ADS07 bit with AN007. In unit 1, the ADS00 bit is associated with AN100 and the ADS07 bit with AN107.

Only set the ADADS0 register bits while the ADCSR.ADST bit is 0.

47.2.9 A/D-Converted Value Addition/Average Channel Select Register 1 (ADADS1)

Address(es): ADC120.ADADS1 4005 C00Ah, ADC121.ADADS1 4005 C20Ah

	—	—	—	—	—	—	—	—	ADS07	ADS06	ADS05	ADS04	ADS03	ADS02	ADS01	ADS00
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	ADS07 to ADS00	A/D-Converted Value Addition/Average Channel Select	0：不选择关联输入通道1：选择关联输入通道	R/W
b15 to b8	-	Reserved	这些位被读取为0。写入值应为0。	R/W

ADSn位（n=00到07）（AD转换值加法平均通道选择）

当ADSn位与在ANSAn位(n=00至07)中选择的AD转换通道相同时ADANSA0或ADCSR.DBLANS[4:0]位和ADANSB0中的ANSBn位（n=00至07）设置为1，选定通道的模拟输入的AD转换按规定连续执行1至16次在ADADC的ADC[2:0]位中。当ADADC.AVEE位为0时，加法（积分）得到的值存储在AD数据寄存器中。当ADADC.AVEE位为1时，加法（积分）得到的结果的平均值存储在AD数据寄存器中。对于未选择加法或平均模式的AD转换通道，将执行一次正常的一次性转换，并将转换结果存储在AD数据寄存器中。

在单元0中，ADS00位与AN000相关联，ADS07位与AN007相关联。在单元1中，ADS00位与AN100相关联，ADS07位与AN107相关联。

仅在ADCSR.ADST位为0时设置ADADS0寄存器位。

47.2.9 D转换值加法平均通道选择寄存器1(ADADS1)

Address(es): ADC120.ADADS1 4005 C00Ah, ADC121.ADADS1 4005 C20Ah

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b4 to b0	ADS20 to ADS16	A/D-Converted Value Addition/Average Channel Select	0：不选择关联输入通道1：选择关联输入通道。	R/W
b15 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ADSn位（n=16至20）（AD转换值加法平均通道选择）

当在ADANSA1或ADCSR.DBLANS[4:0]位和ANSBn位（n=16至20）中选择与AD转换通道相同编号的ADSn位时ADANSB1设置为1，所选通道的模拟输入的AD转换连续执行1到16次，具体由ADADC中的ADC[2:0]位指定。当ADADC.AVEE位为0时，加法（积分）得到的值存储在AD数据寄存器中。当ADADC.AVEE位为1时，加法（积分）得到的结果的平均值存储在AD数据寄存器中。对于未选择加法平均模式的AD转换通道，将执行正常的一次性转换，并将转换结果存储在AD数据寄存器中。

在单元0中，ADS16位与AN016相关联，ADS20位与AN020相关联。在单元1中，ADS16位与AN116相关联，ADS19位与AN119相关联。

Only set the ADADS1 register while the ADCSR.ADST bit is 0.

Figure 47.3 shows a scanning operation sequence in which both the ADADS0.ADS02 and ADS06 bits are set to 1.

In this example, addition mode is selected (ADADS.AVEE = 0), the time conversion is set to 4 (ADADC.ADC[1:0] = 11b), and the AN000 to AN006 channels are selected (ADANSA0.ANSA0[15:0] = 007Fh) in continuous scan mode (ADCSR.ADCS[1:0] = 10b). The conversion process begins with AN000. The AN002 conversion is performed successively 4 times, and the added (integrated) value is returned to A/D data register ADDR2. Next, the AN003 conversion process starts. The AN006 conversion is performed successively 4 times and the added (integrated) value is returned to A/D data register ADDR6. After conversion of AN006, the conversion operation is once again performed in the same sequence from AN000.

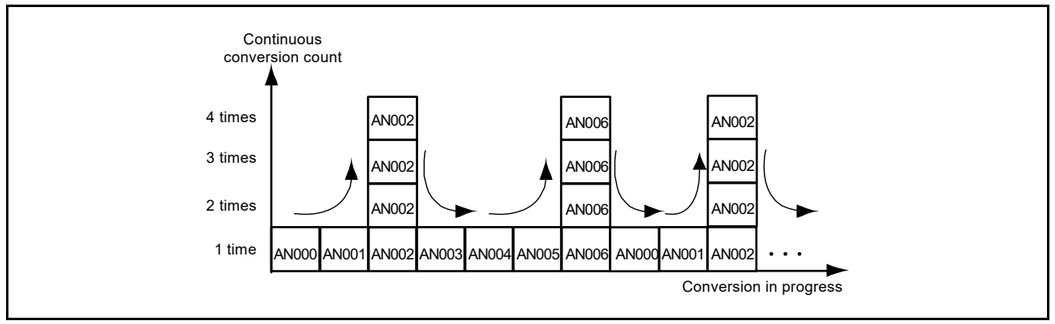

Figure 47.3 Scan conversion sequence with ADADC.ADC[2:0] = 011b, ADADS0.ADS02 = 1, and ADS06 = 1

47.2.10 A/D-Converted Value Addition/Average Count Select Register (ADADC)

Address(es): ADC120.ADADC 4005 C00Ch, ADC121.ADADC 4005 C20Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	AVEE	—	—	—	—	ADC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	ADC[2:0]	Count Select	b2 b0 0 0 0: 1-time conversion (no addition; same as normal conversion) 0 0 1: 2 time conversion (one addition) 0 1 0: 3-time conversion (two additions) 0 1 1: 4 time conversion (three additions) 1 0 1: 16-time conversion (15 additions). Other settings are prohibited.	R/W
b6 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	AVEE	Average Mode Enable	0: Disable average mode*1 1: Enable average mode.*2	R/W

Note 1. When average mode is deselected by setting the ADADC.AVEE bit to 0, set the addition count to 1, 2, 3, 4 or 16-time conversion. 16-time conversion can only be used with 12-bit accuracy selected.

Note 2. When average mode is selected by setting the ADADC.AVEE bit to 1, set the addition count to 1-, 2-, or 4-time conversion. Do not set the addition count to 3- or 16-time conversion (ADC[2:0] = 010b or 101b).

ADC[2:0] bits (Count Select)

The ADC[2:0] bits set the count for all channels for which A/D conversion and addition/average mode are selected, including the channels selected in double-trigger mode in the ADCSR.DBLANS[4:0] bits. The count also applies to A/D conversion of temperature sensor output and internal reference voltage.

When average mode is selected by setting the ADADC.AVEE bit to 1, do not set the count to 3-time conversion

仅在ADCSR.ADST位为0时设置ADADS1寄存器。

图47.3显示了扫描操作序列，其中ADADS0.ADS02和ADS06位都设置为1。

在本例中，选择了加法模式（ADADS.AVEE=0），时间转换设置为4（ADADC.ADC[1:0]=11b），选择了AN000到AN006通道（ADANSA0.ANSA0[15:0]=007Fh)处于连续扫描模式(ADCSR.ADCS[1:0]=10b)。转换过程从AN000开始。AN002转换连续执行4次，相加（积分）的值返回到AD数据寄存器ADDR2。接下来，AN003转换过程开始。AN006转换连续执行4次，相加（积分）的值返回到AD数据寄存器ADDR6。在AN006转换之后，转换操作从AN000以相同的顺序再次执行。

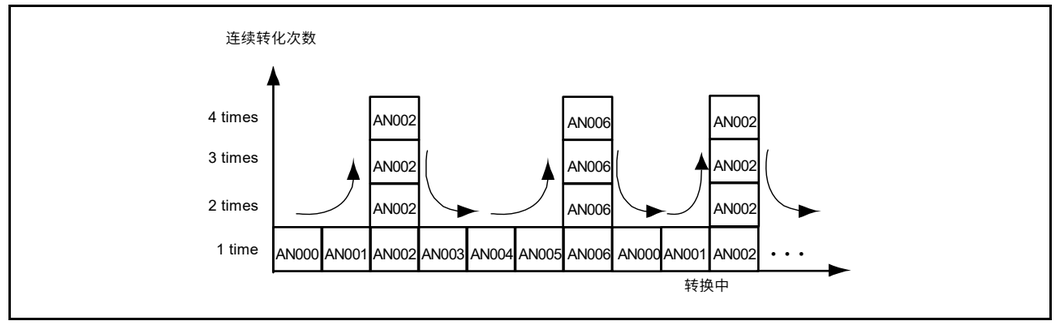

Figure 47.3 使用ADADC.ADC[2:0]=011b、ADADS0.ADS02=1和ADS06=1的扫描转换序列

47.2.10 D转换值加法平均计数选择寄存器(ADADC)

Address(es): ADC120.ADADC 4005 C00Ch, ADC121.ADADC 4005 C20Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	AVEE	—	—	—	—	ADC[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	ADC[2:0]	计数选择	b2 b0 0 0 0：1次转换（不加；同普通转换） 0 0 1：2时间转换（一加） 0 1 0: 3-time conversion (two additions) 0 1 1：4时间转换（三加法） 01：16次转换（15次加法）。禁止其他设置。	R/W
b6 to b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	AVEE	平均模式启用	0：禁用平均模式*11：启用平均模式。*2	R/W

Note 1. 通过将ADADC.AVEE位设置为0取消选择平均模式时，将加法计数设置为1、2、3、4或16次转换。16次转换只能在选择12位精度的情况下使用。

Note 2. 当通过将ADADC.AVEE位设置为1来选择平均模式时，将加法计数设置为1次、2次或4次转换。不要将加法计数设置为3次或16次转换（ADC[2:0]=010b或101b）。

ADC[2:0]位（计数选择）

ADC[2:0]位设置选择AD转换和加法平均模式的所有通道的计数，包括在ADCSR.DBLANS[4:0]位中以双触发模式选择的通道。该计数也适用于温度传感器输出和内部参考电压的AD转换。

通过将ADADC.AVEE位设置为1选择平均模式时，不要将计数设置为3次转换

(ADADC.ADC[2:0] = 010b). Additionally, the combination of 16-time conversion (ADADC.ADC[2:0] = 101b) with a conversion accuracy setting of 8 or 10 bits (ADCER.ADPRC[1:0] = 10b or 01b) is a prohibited setting, as described in section 47.2.2.

Only set the ADC[2:0] bits while the ADCSR.ADST bit is 0. When self-diagnosis is executed (ADCER.DIAGM = 1), do not set the ADC[2:0] bits to any value other than 000b. When the conversion accuracy is 8 or 10 bits (ADCER.ADPRC[1:0] = 10b or 01b), do not set the ADC[2:0] bits to 101b.

AVEE bit (Average Mode Enable)

The AVEE bit selects addition or average mode for all channels for which A/D conversion and addition/average mode are selected, including the channels selected in double-trigger mode in the ADCSR.DBLANS[4:0] bits, temperature sensor output, and internal reference voltage.

When average mode is selected by setting the ADADC.AVEE bit to 1, do not set the addition count to 3-time conversion (ADADC.ADC[2:0] = 010b).

Only set the AVEE bits while the ADCSR.ADST bit is 0.

47.2.11 A/D Control Extended Register (ADCER)

Address(es): ADC120.ADCER 4005 C00Eh, ADC121.ADCER 4005 C20Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ADRFMT	—	—	—	DIAGM	DIAGLD	DIAGVAL[1:0]		—	—	ACE	—	—	ADPRC[1:0]		—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b2, b1	ADPRC[1:0]	A/D Conversion Accuracy Specify	b2 b1 0 0: 12-bit accuracy 0 1: 10-bit accuracy 1 0: 8-bit accuracy 1 1: Setting prohibited.	R/W
b4, b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	ACE	A/D Data Register Automatic Clearing Enable	0: Disable automatic clearing 1: Enable automatic clearing.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9, b8	DIAGVAL[1:0]	Self-Diagnosis Conversion Voltage Select	b9 b8 0 0: Setting prohibited when self-diagnosis is enabled 0 1: 0 V 1 0: Reference power supply voltage*1 x 1/2 1 1: Reference power supply voltage.*1	R/W
b10	DIAGLD	Self-Diagnosis Mode Select	0: Select rotation mode for self-diagnosis voltage 1: Select fixed mode for self-diagnosis voltage.	R/W
b11	DIAGM	Self-Diagnosis Enable	0: Disable ADC12 self-diagnosis 1: Enable ADC12 self-diagnosis.	R/W
b14 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	ADRFMT	A/D Data Register Format Select	0: Select flush-right for the A/D data register format 1: Select flush-left for the A/D data register format.	R/W

Note 1. The reference voltage refers to VREFH0 for unit 0 and to VREFH for unit 1.

ADPRC[1:0] bits (A/D Conversion Accuracy Specify)

The ADPRC[1:0] bits set the A/D conversion accuracy to 8-, 10-, or 12-bit accuracy. Changing the A/D conversion accuracy also changes the bit width of valid data stored in the result register and the A/D conversion time. For details, see section 47.3.6, Analog Input Sampling and Scan Conversion Time.

（ADADC.ADC[2:0]=010b）。此外，16次转换(ADADC.ADC[2:0]=101b)与8位或10位转换精度设置(ADCER.ADPRC[1:0]=10b或01b)的组合是禁止设置，如第47.2.2节所述。

仅在ADCSR.ADST位为0时设置ADC[2:0]位。执行自诊断时(ADCER.DIAGM=1)，请勿将ADC[2:0]位设置为000b以外的任何值.当转换精度为8位或10位时（ADCER.ADPRC[1:0]=10b或01b），请勿将ADC[2:0]位设置为101b。

AVEE位（平均模式启用）

AVEE位为选择了AD转换和加法平均模式的所有通道选择加法或平均模式，包括在ADCSR.DBLANS[4:0]位、温度传感器输出和内部基准中选择的双触发模式的通道电压。

当通过将ADADC.AVEE位设置为1来选择平均模式时，不要将加法计数设置为3次转换(ADADC.ADC[2:0]=010b)。

仅在ADCSR.ADST位为0时设置AVEE位。

47.2.11 AD控制扩展寄存器(ADCER)

Address(es): ADC120.ADCER 4005 C00Eh, ADC121.ADCER 4005 C20Eh

b14 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b15	ADRFMT	AD数据寄存器格式选择	0：AD数据寄存器格式选择flush-right1：AD数据寄存器格式选择flush-left。	R/W

Note 1. 参考电压是指单元0的VREFH0和单元1的VREFH。

ADPRC[1:0]位（AD转换精度指定）

ADPRC[1:0]位将AD转换精度设置为8位、10位或12位精度。更改AD转换精度也会更改存储在结果寄存器中的有效数据的位宽和AD转换时间。有关详细信息，请参见第47.3.6节，模拟输入采样和扫描转换时间。

Only set the ADPRC[1:0] bits while the ADCSR.ADST bit is 0.

ACE bit (A/D Data Register Automatic Clearing Enable)

The ACE bit enables or disables automatic clearing (all 0s) of ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, or ADOCDR after any of these registers is read by the CPU, DTC, or DMAC. Automatic clearing of the A/D data registers enables detection of failures that do not update the A/D data registers.

DIAGVAL[1:0] bits (Self-Diagnosis Conversion Voltage Select)

The DIAGVAL[1:0] bits select the voltage value used in self-diagnosis fixed voltage mode. For details, see the ADCER.DIAGLD bit description.

Do not execute self-diagnosis by setting the ADCER.DIAGLD bit to 1 when the ADCER.DIAGVAL[1:0] bits are set to 00b.

DIAGLD bit (Self-Diagnosis Mode Select)

The DIAGLD bit selects whether the three voltage values are rotated or fixed voltage is used in self-diagnosis. Setting this bit to 0 allows conversion of the voltages in rotation mode where 0 V, the reference power supply × 1/2, and the reference power supply are converted, in that order. After reset, when the self-diagnosis voltage rotation mode is selected, self-diagnosis is executed from 0 V. The fixed voltage specified in the ADCER.DIAGVAL[1:0] bits is converted when self-diagnosis fixed voltage mode is selected. In self-diagnosis voltage rotation mode, the self-diagnosis voltage value does not return to 0 when scan conversion completes. When scan conversion restarts, rotation starts at the voltage value following the previous value. If fixed mode is switched to rotation mode, rotation starts at the fixed voltage value.

Only set the DIAGLD bit while the ADCSR.ADST bit is 0.

DIAGM bit (Self-Diagnosis Enable)

The DIAGM bit enables or disables self-diagnosis. Self-diagnosis is used to detect a failure of the ADC12. In self-diagnosis mode, one of the internally generated voltage values (0, the reference power supply × 1/2, or the reference power supply) is converted. When conversion completes, information on the converted voltage and the conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). ADRD can be read by software to determine whether the conversion result falls within the normal range (normal) or not (abnormal). Self-diagnosis is executed once at the beginning of each scan, and one of the three voltages is converted. When the double-trigger mode is set (ADCSR.DBLE = 1), always deselect self-diagnosis (DIAGM = 0). When self-diagnosis is selected in group scan mode, self-diagnosis is executed separately on Group A and Group B.

Only set the DIAGM bit while the ADCSR.ADST bit is 0.

ADRFMT bit (A/D Data Register Format Select)

The ADRFMT bit specifies flush-right or flush-left for the data to be stored in ADDRy, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, ADOCDR, ADCMPDR0/1, ADWINLLB, ADWINULB, or ADRD.

Only set the ADRFMT bit the ADCSR.ADST bit is 0.

47.2.12 A/D Conversion Start Trigger Select Register (ADSTRGR)

Address(es): ADC120.ADSTRGR 4005 C010h, ADC121.ADSTRGR 4005 C210h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	TRSA[5:0]						—	—	TRSB[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	TRSB[5:0]	A/D Conversion Start Trigger Select for Group B	These bits specify the A/D conversion start trigger for Group B in group scan mode.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

仅在ADCSR.ADST位为0时设置ADPRC[1:0]位。

ACE位（AD数据寄存器自动清除使能）

ACE位启用或禁用ADDRy、ADRD、ADDBLDR、ADDBLDRA、
在CPU、DTC或DMAC读取任何这些寄存器之后的ADDBLDRB、ADTSDR或ADOCDR。自动清除AD数据寄存器可以检测不更新AD数据寄存器的故障。

DIAGVAL[1:0]位（自诊断转换电压选择）

DIAGVAL[1:0]位选择用于自诊断固定电压模式的电压值。有关详细信息，请参阅ADCER.DIAGLD位描述。

当ADCER.DIAGVAL[1:0]位设置为00b时，不要通过将ADCER.DIAGLD位设置为1来执行自诊断。

DIAGLD位（自诊断模式选择）

DIAGLD位选择是旋转三个电压值还是使用固定电压进行自诊断。将此位设置为0允许在旋转模式下转换电压，其中0V、参考电源×12和参考电源按此顺序转换。Afterreset whentheself-diagnosisvoltagerotationmodeisselected self-diagnosisisexecutedfrom0V.ThefixedvoltagespecifiedintheADCER.DIAGVAL[1:0]bitsisconvertedwhenself-diagnosisfixedvoltagemodeisselected.在自诊断电压旋转模式下，扫描转换完成时自诊断电压值不会返回0。扫描转换重新开始时，从前一个值之后的电压值开始旋转。如果将固定模式切换到旋转模式，则从固定电压值开始旋转。

仅在ADCSR.ADST位为0时设置DIAGLD位。

DIAGM位（自诊断使能）

DIAGM位启用或禁用自诊断。自诊断用于检测ADC12的故障。在自诊断模式下，转换内部产生的电压值之一（0，参考电源×12，或参考电源）。转换完成后，转换电压和转换结果的信息存储在AD自诊断数据寄存器(ADRD)中。ADRD可以通过软件读取来判断转换结果是否在正常范围内（正常）或不在（异常）范围内。自诊断在每次扫描开始时执行一次，并转换三个电压之一。当设置了双触发模式(ADCSR.DBLE=1)时，始终取消选择自诊断(DIAGM=0)。在组扫描模式下选择自诊断时，对A组和B组分别执行自诊断。

仅在ADCSR.ADST位为0时设置DIAGM位。

ADRFMT位（AD数据寄存器格式选择）

ADRFMT位指定要存储在ADDRy、ADDBLDR、ADDBLDRA、
ADDBLDRB, ADTSDR, ADOCDR, ADCMPDR0/1, ADWINLLB, ADWINULB, or ADRD.

仅将ADRFMT位设置为ADCSR.ADST位为0。

47.2.12 AD转换开始触发选择寄存器(ADSTRGR)

Address(es): ADC120.ADSTRGR 4005 C010h, ADC121.ADSTRGR 4005 C210h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	TRSA[5:0]						—	—	TRSB[5:0]					
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	TRSB[5:0]	B组的AD转换开始触发选择	这些位指定AD转换开始触发B组处于组扫描模式。	R/W
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Bit	Symbol	Bit name	Description	R/W
b13 to b8	TRSA[5:0]	A/D Conversion Start Trigger Select	These bits specify the A/D conversion start trigger in single scan mode and continuous mode. In group scan mode, the A/D conversion start trigger for Group A is selected.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TRSB[5:0] bits (A/D Conversion Start Trigger Select for Group B)

The TRSB[5:0] bits select the trigger to start scanning of the analog input selected in Group B. The TRSB[5:0] bits must only be set in group scan mode and are not used in any other scan mode. For the scan conversion start trigger for Group B, setting a software trigger or an asynchronous trigger is prohibited. In group scan mode, set the TRSB[5:0] bits to a value other than 000000b and set the ADCSR.TRGE bit to 1.

When Group A is given priority in group scan mode, setting the ADGSPCR.GBRP bit to 1 allows Group B to continuously operate in single scan mode. When setting the ADGSPCR.GBRP bit to 1, set the TRSB[5:0] bits to 3Fh. The issuance period for a conversion trigger must be more than or equal to the actual scan conversion time (tSCAN). If the issuance period is less than tSCAN, A/D conversion by the trigger might have no effect.

When the trigger from a module operated at 120 MHz (GPT) is selected as an A/D conversion start trigger, a delay for synchronization processing occurs. For details, see section 47.3.6, Analog Input Sampling and Scan Conversion Time.

Table 47.6 lists the A/D conversion startup sources selected in the TRSB[5:0] bits.

TRSA[5:0] bits (A/D Conversion Start Trigger Select)

The TRSA[5:0] bits select the trigger to start A/D conversion in single scan mode and continuous scan mode. In group scan mode, the trigger to start scanning of the analog input selected in Group A is selected. When scanning is executed in group scan mode or double-trigger mode, setting a software trigger or an asynchronous trigger is prohibited.

When using a synchronous trigger (ELC) as the A/D conversion start source, set the TRGE bit in ADCSR to 1 and the EXTRG bit in ADCSR to 0.

When using the asynchronous trigger (ADTRGn), set the TRGE bit in ADCSR to 1 and the EXTRG bit in ADCSR to 1.

The software trigger (ADCSR.ADST) is enabled regardless of the settings in the ADCSR.TRGE bit, the ADCSR.EXTRG bit, or the TRSA[5:0] bits. The issuance period for a conversion trigger must be more than or equal to the actual scan conversion time (tSCAN). If the issuance period is less than tSCAN, A/D conversion by the trigger might have no effect.

When the trigger from a module operated at 120 MHz (GPT) is selected as an A/D conversion start trigger, a delay period for synchronization processing occurs. For details, see section 47.3.6, Analog Input Sampling and Scan Conversion Time.

Table 47.7 lists the A/D conversion start sources selected in the TRSA[5:0] bits.

Table 47.6 Selection of A/D conversion start sources in the TRSB[5:0] bits

Source	Remarks	TRSB[5]	TRSB[4]	TRSB[3]	TRSB[2]	TRSB[1]	TRSB[0]

ELC_ADC00 (unit 0), ELC_ADC10 (unit 1)	ELC	0	0	1	0	0	1
ELC_ADC01 (unit 0), ELC_ADC11 (unit 1)	ELC	0	0	1	0	1	0
ELC_ADC00/ELC_ADC01 (unit 0) ELC_ADC10/ELC_ADC11 (unit 1)	ELC	0	0	1	0	1	1

Bit	Symbol	位名称	Description	R/W
b13 to b8	TRSA[5:0]	AD转换开始触发选择	这些位指定单次扫描模式和连续模式下的AD转换启动触发。在组扫描模式下，选择A组的AD转换启动触发。	R/W
b15, b14	—	Reserved	这些位被读取为0。写入值应为0。	R/W

TRSB[5:0]位（B组的AD转换开始触发选择）

TRSB[5:0]位选择触发以开始扫描组B中选择的模拟输入。TRSB[5:0]位只能在组扫描模式下设置，不得用于任何其他扫描模式。对于B组的扫描转换开始触发，禁止设置软件触发或异步触发。在组扫描模式下，将TRSB[5:0]位设置为000000b以外的值，并将ADCSR.TRGE位设置为1。

当A组在组扫描模式下具有优先权时，将ADGSPCR.GBRP位设置为1允许B组在单次扫描模式下连续工作。将ADGSPCR.GBRP位设置为1时，将TRSB[5:0]位设置为3Fh。转换触发的发布周期必须大于或等于实际扫描转换时间(tSCAN)。如果发行周期小于tSCAN，触发的AD转换可能无效。

当从120MHz（GPT）操作的模块中选择触发器作为AD转换启动触发器时，会发生同步处理的延迟。有关详细信息，请参见第47.3.6节，模拟输入采样和扫描转换时间。

表47.6列出了在TRSB[5:0]位中选择的AD转换启动源。

TRSA[5:0]位（AD转换开始触发选择）

TRSA[5:0]位选择触发以在单次扫描模式和连续扫描模式下启动AD转换。在组扫描模式下，选择触发开始扫描在组A中选择的模拟输入。在组扫描模式或双触发模式下执行扫描时，禁止设置软件触发或异步触发。

当使用同步触发(ELC)作为AD转换启动源时，将ADCSR中的TRGE位设置为1，然后ADCSR中的EXTRG位为0。

使用异步触发(ADTRGn)时，将ADCSR中的TRGE位设置为1，并将ADCSR中的EXTRG位设置为1。

无论ADCSR.TRGE位的设置如何，软件触发(ADCSR.ADST)都被启用，ADCSR.EXTRG位或TRSA[5:0]位。转换触发的发布周期必须大于或等于实际扫描转换时间(tSCAN)。如果发行周期小于tSCAN，触发的AD转换可能无效。

当从120MHz（GPT）操作的模块中选择触发器作为AD转换启动触发器时，会发生同步处理的延迟期。有关详细信息，请参见第47.3.6节，模拟输入采样和扫描转换时间。

表47.7列出了在TRSA[5:0]位中选择的AD转换启动源。

Table 47.6 在TRSB[5:0]位中选择AD转换起始源

b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TSSAD bit (Temperature Sensor Output A/D-Converted Value Addition/Average Mode Select)

When the TSSAD bit is set to 1, A/D conversion of the temperature sensor output is selected and performed successively the number of times specified in the ADC[2:0] bits in ADADC. The maximum addition count differs depending on the conversion accuracy (see section 47.2.2, A/D Self-Diagnosis Data Register (ADRD)). When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is returned to the A/D Temperature sensor Data Register (ADTSDR). When the ADADC.AVEE bit is 1, the mean value is returned to ADTSDR.

Only set the TSSAD bit while the ADCSR.ADST bit is 0.

b8	TSSA	温度传感器输出AD转换选择	0：禁止温度传感器输出AD转换1：使能温度传感器输出AD转换。	R/W
b9	OCSA	内部参考电压AD转换选择	0：禁止内部参考电压的AD转换1：使能内部参考电压的AD转换。	R/W
b10	TSSB	温度传感器输出AD B组的转换选择	在组扫描模式下选择B组。0：禁止温度传感器输出AD转换1：使能温度传感器输出AD转换。	R/W
b11	OCSB	B组的内部参考电压AD转换选择	在组扫描模式下选择B组。0：禁止内部参考电压的AD转换1：使能内部参考电压的AD转换。	R/W
b15 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W

TSSAD位（温度传感器输出AD转换值加法平均模式选择）

当TSSAD位设置为1时，选择温度传感器输出的AD转换并连续执行ADADC中ADC[2:0]位指定的次数。最大加法计数因转换精度而异（参见第47.2.2节，AD自诊断数据寄存器(ADRD)）。当ADADC.AVEE位为0时，通过加法（积分）获得的值返回到AD温度传感器数据寄存器(ADTSDR)。当ADADC.AVEE位为1时，平均值返回给ADTSDR。

仅在ADCSR.ADST位为0时设置TSSAD位。

OCSAD bit (Internal Reference Voltage A/D-Converted Value Addition/Average Mode Select)

When the OCSAD bit is set to 1, A/D conversion of the internal reference voltage is selected and performed successively the number of times specified in the ADC[2:0] bits in ADADC. The maximum addition count differs depending on the conversion accuracy (see 47.2.2 A/D Self-Diagnosis Data Register (ADRD)). When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is returned to the A/D Internal Reference Voltage Data Register (ADOCDR). When the ADADC.AVEE bit is 1, the mean value is returned to ADOCDR.

Only set the OCSAD bit while the ADCSR.ADST bit is 0.

TSSA bit (Temperature Sensor Output A/D Conversion Select)

The TSSA bit selects A/D conversion of the temperature sensor output for Group A in single scan mode, continuous scan mode, or group scan mode. When A/D conversion of the temperature sensor output is selected and performed, set the ADCSR.DBLE bit to 0.

Only set the TSSA bit while the ADCSR.ADST bit is 0.

OCSA bit (Internal Reference Voltage A/D Conversion Select)

The OCSA bit selects A/D conversion of the internal reference voltage for Group A in single scan mode, continuous scan mode, or group scan mode. When A/D conversion of the internal reference voltage is selected and performed, set the ADCSR.DBLE bit to 0.

Only set the OCSA bit while the ADCSR.ADST bit is 0. In addition, wait for 400 ns or more after the OCSA bit is set to 1 before starting A/D conversion.

TSSB bit (Temperature Sensor Output A/D Conversion Select for Group B)

The TSSB bit selects A/D conversion of the temperature sensor output for Group B in group scan mode.

Only set the TSSB bit while the ADCSR.ADST bit is 0. Do not set the TSSB bit to 1 while the TSSA bit is 1.

OCSB bit (Internal Reference Voltage A/D Conversion Select for Group B)

The OCSB bit selects A/D conversion of the internal reference voltage for Group B in group scan mode.

Only set the OCSB bit while the ADCSR.ADST bit is 0. Do not set the OCSB bit to 1 while the OCSA bit is 1.

Moreover, start the A/D conversion after waiting for 400 ns or more after the OCSB bit is set to 1.

47.2.14 A/D Sampling State Register n (ADSSTRn) (n = 00 to 07, L, T, O)

Address(es): ADC120.ADSSTR00 4005 C0E0h to ADC120.ADSSTR07 4005 C0E7h, ADC120.ADSSTRL 4005 C0DDh, ADC120.ADSSTRT 4005 C0DEh, ADC120.ADSSTRO 4005 C0DFh, ADC121.ADSSTR00 4005 C2E0h to ADC121.ADSSTR03 4005 C2E3h, ADC121.ADSSTR05 4005 C2E5h to ADC121.ADSSTR07 4005 C2E7h, ADC121.ADSSTRL 4005 C2DDh, ADC121.ADSSTRT 4005 C2DEh, ADC121.ADSSTRO 4005 C2DFh

	b7	b6	b5	b4	b3	b2	b1	b0
	SST[7:0]							
Value after reset:	0	0	0	0	1	0	1	1

Bit	Symbol	Bit name	Description	R/W
b7 to b0	SST[7:0]	Sampling Time Setting	These bits set the sampling time in the range from 5 to 255 states.	R/W

The ADSSTRn register sets the sampling time for analog input. If one state is 1 ADCLK (A/D conversion clock) cycle and the ADCLK clock is 60 MHz, one state is 16.7 ns. The initial value is 11 states. The sampling time can be adjusted if the impedance of the analog input signal source is too high to secure sufficient sampling time, or if the ADCLK clock is slow.

Only set the SST[7:0] bits while the ADCSR.ADST bit is 0.

The lower limit of the sampling time setting depends on the frequency ratio, as follows:

- If the frequency ratio of PCLKB to PCLKC(ADCLK) = 1:1, 2:1, 4:1, or 8:1, the sampling time must be set to a

OCSAD位（内部参考电压AD转换值加法平均模式选择）

当OCSAD位设置为1时，选择内部参考电压的AD转换，并按ADADC的ADC[2:0]位指定的次数连续执行。最大加法计数因转换精度而异（参见47.2.2AD自诊断数据寄存器(ADRD)）。当ADADC.AVEE位为0时，通过加法（积分）获得的值返回到AD内部参考电压数据寄存器（ADocDR）。当ADADC.AVEE位为1时，平均值返回给ADOCDR。

仅在ADCSR.ADST位为0时设置OCSAD位。

TSSA位（温度传感器输出AD转换选择）

TSSA位在单次扫描模式、连续扫描模式或组扫描模式下选择A组温度传感器输出的AD转换。WhenADconversionofthetemperaturesensoroutputisselectedandperformed settheADCSR.DBLEbitto0.

仅在ADCSR.ADST位为0时设置TSSA位。

OCSA位（内部参考电压AD转换选择）

OCSA位选择A组内部参考电压在单次扫描模式、连续扫描模式或组扫描模式下的AD转换。WhenADconversionoftheinternalreferencevoltageisselectedandperformed settheADCSR.DBLEbitto0.

仅在ADCSR.ADST位为0时设置OCSA位。此外，在OCSA位设置为1后等待400ns或更长时间，然后再开始AD转换。

TSSB位（B组温度传感器输出AD转换选择）

TSSB位选择组扫描模式下B组温度传感器输出的AD转换。

仅在ADCSR.ADST位为0时设置TSSB位。不要在TSSA位为1时将TSSB位设置为1。

OCSB位（B组的内部参考电压AD转换选择）

OCSB位选择组扫描模式下B组内部参考电压的AD转换。

仅在ADCSR.ADST位为0时设置OCSB位。不要在OCSA位为1时将OCSB位设置为1。

此外，在将OCSB位设置为1后等待400ns或更长时间后开始AD转换。

47.2.14 AD采样状态寄存器n(ADSSTRn)(n=00to07 L T O)

Address(es): ADC120.ADSSTR00 4005 C0E0h to ADC120.ADSSTR07 4005 C0E7h, ADC120.ADSSTRL 4005 C0DDh, ADC120.ADSSTRT 4005 C0DEh, ADC120.ADSSTRO 4005 C0DFh, ADC121.ADSSTR00 4005 C2E0h to ADC121.ADSSTR03 4005 C2E3h, ADC121.ADSSTR05 4005 C2E5h to ADC121.ADSSTR07 4005 C2E7h, ADC121.ADSSTRL 4005 C2DDh, ADC121.ADSSTRT 4005 C2DEh, ADC121.ADSSTRO 4005 C2DFh

	b7	b6	b5	b4	b3	b2	b1	b0
	SST[7:0]							
重置后的值：	0	0	0	0	1	0	1	1

Bit	Symbol	位名称	Description	R/W
b7 to b0	SST[7:0]	采样时间设置	这些位在5到255个状态范围内设置采样时间。	R/W

ADSSTRn寄存器设置模拟输入的采样时间。如果一种状态是1个ADCLK（AD转换时钟）周期并且ADCLK时钟是60MHz，则一种状态是16.7ns。初始值为11个状态。如果模拟输入信号源的阻抗太高而无法保证足够的采样时间，或者如果ADCLK时钟很慢，则可以调整采样时间。

仅在ADCSR.ADST位为0时设置SST[7:0]位。

采样时间设置的下限取决于频率比，如下：

- 如果PCLKB与PCLKC(ADCLK)的频率比=1:1、2:1、4:1或8:1，则必须将采样时间设置为

value of more than 5 states

- If the frequency ratio of PCLKB to PCLKC(ADCLK) = 1:2 or 1:4, the sampling time must be set to a value of more than 6 states.

Table 47.8 shows the relationship between the A/D Sampling State Register and the associated channels.

For details, see section 47.3.6, Analog Input Sampling and Scan Conversion Time.

Table 47.8 Relationship between A/D sampling state register and associated channels

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	SSTSH[7:0]	Channel-Dedicated Sample-and-Hold Circuit Sampling Time Setting	Sampling time (4 to 255 states).	R/W
b10 to b8	SHANS[2:0]	Channel-Dedicated Sample-and-Hold Circuit Bypass Select	Select whether to use or bypass channel-dedicated sample-and-hold circuits for AN000 to AN002 (unit 0) and AN100 to AN102 (unit 1). 0: Bypass the circuits 1: Use the circuits.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SSTSH[7:0] bits (Channel-Dedicated Sample-and-Hold Circuit Sampling Time Setting)

The SSTSH[7:0] bits set the sampling time for the channel-dedicated sample-and-hold circuits. If one state is 1 ADCLK (A/D conversion clock) cycle and the ADCLK clock is 60 MHz, one state is 16.7 ns. The initial value is 24 states. The sampling time can be adjusted if the impedance of the analog input signal source is too high to secure sufficient sampling time, or if the ADCLK clock is slow.

Only set the SSTSH[7:0] bits while the ADCSR.ADST bit is 0. The sampling time must be set to a value that is 4 states or more and 255 or less.

超过5个州的值

- 如果PCLKB与PCLKC(ADCLK)的频率比=1:2或1:4，则必须将采样时间设置为6个以上状态的值。

表47.8显示了AD采样状态寄存器和相关通道之间的关系。

有关详细信息，请参见第47.3.6节，模拟输入采样和扫描转换时间。

Table 47.8 AD采样状态寄存器与相关通道的关系

Note 1. 选择自诊断功能时，将应用ADSSTR00.SST[7:0]位中设置的采样时间。

47.2.15 AD采样保持电路控制寄存器(ADSHCR)

Address(es): ADC120.ADSHCR 4005 C066h, ADC121.ADSHCR 4005 C266h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	SHANS[2:0]			SSTSH[7:0]							
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	SSTSH[7:0]	Channel-Dedicated Sample-and-Hold 电路采样时间设置	采样时间（4到255个状态）。	R/W
b10 to b8	SHANS[2:0]	Channel-Dedicated Sample-and-Hold 电路旁路选择	选择是使用还是绕过AN000至AN002（单元0）和AN100至AN102（单元1）的通道专用采样保持电路。0：绕过电路1：使用电路。	R/W
b15 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SSTSH[7:0]位（通道专用采样保持电路采样时间设置）

SSTSH[7:0]位设置通道专用采样保持电路的采样时间。如果一种状态是1个ADCLK（AD转换时钟）周期并且ADCLK时钟是60MHz，则一种状态是16.7ns。初始值为24个状态。如果模拟输入信号源的阻抗太高而无法保证足够的采样时间，或者如果ADCLK时钟很慢，则可以调整采样时间。

仅当ADCSR.ADST位为0时设置SSTSH[7:0]位。采样时间必须设置为4个或更多状态且255或更少的值。

SHANS[2:0] bits (Channel-Dedicated Sample-and-Hold Circuit Bypass Select)

The SHANS[2:0] bits select whether to use or bypass the channel-dedicated sample-and-hold circuits for AN000 to AN002 (unit 0) and AN100 to AN102 (unit 1). In unit 0, the SHANS[0] bit is associated with AN000, the SHANS[1] bit with AN001, and the SHANS[2] bit with AN002. In unit 1, the SHANS[0] bit is associated with AN100, the SHANS[1] bit with AN101, and the SHANS[2] bit with AN102.

If any channel from among AN000 to AN002 (unit 0) or AN100 to AD102 (unit 1) is selected for Group B while operation is in group scan mode under Group A priority control, use this setting to bypass the dedicated sample-and-hold circuit of the channel.

Only set the SHANS[2:0] bits while the ADCSR.ADST bit is 0 and the ADSHMSR.SHMD bit is 0.

47.2.16 A/D Sample and Hold Operation Mode Selection Register (ADSHMSR)

Address(es): ADC120.ADSHMSR 4005 C07Ch, ADC121.ADSHMSR 4005 C27Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SHMD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SHMD	Sampling Operation Selection	0: Disable continuous sampling function 1: Enable continuous sampling function.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SHMD bit (Sampling Operation Selection)

Setting SHMD to 1 enables the constant sampling function of the channel-dedicated sample-and-hold selected in the ADSHCR.SHANS[2:0] bits. Only set the SHMD bit while the ADCSR.ADST bit is 0.

When the sampling function is enabled, the sample-and-hold circuit operates sampling while the ADC12 is not operating, and operates holding while the ADC12 is operating.

Note: The ADCSR.ADST bit must become 1 after 400 ns or more elapses after the SHMD bit is set to 1 (when the permissible signal source impedance is 1 kΩ). The sampling period of the sample-and-hold circuit must be 400 ns or more (when the permissible signal source impedance is 1 kΩ).

47.2.17 A/D Disconnection Detection Control Register (ADDISCR)

Address(es): ADC120.ADDISCR 4005 C07Ah, ADC121.ADDISCR 4005 C27Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PCHG	ADNDIS[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	ADNDIS[3:0]	Disconnection Detection Assist Setting	b3 - b0 0000: The disconnection detection assist function is disabled 0001: Setting prohibited Others: The number of states for the discharge or precharge period.	R/W
b4	PCHG	Precharge/discharge select	0: Discharge 1: Precharge.	R/W

SHANS[2:0]位（通道专用采样保持电路旁路选择）

SHANS[2:0]位选择是使用还是绕过AN000的通道专用采样保持电路
AN002（单元0）和AN100到AN102（单元1）。在单元0中，SHANS[0]位与AN000相关联，SHANS[1]位与AN001相关联，SHANS[2]位与AN002相关联。在单元1中，SHANS[0]位与AN100相关联，SHANS[1]位与AN101相关联，SHANS[2]位与AN102相关联。

如果在A组优先控制下的组扫描模式下为组B选择AN000至AN002（单元0）或AN100至AD102（单元1）中的任何通道，则使用此设置绕过专用采样保持通道的电路。

仅在ADCSR.ADST位为0且ADSHMSR.SHMD位为0时设置SHANS[2:0]位。

47.2.16 AD采样和保持操作模式选择寄存器(ADSHMSR)

Address(es): ADC120.ADSHMSR 4005 C07Ch, ADC121.ADSHMSR 4005 C27Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	SHMD
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SHMD	采样操作选择	0：禁用连续采样功能1：启用连续采样功能。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SHMD位（采样操作选择）

将SHMD设置为1启用在
ADSHCR.SHANS[2:0]位。仅在ADCSR.ADST位为0时设置SHMD位。

当采样功能使能时，采样保持电路在ADC12不工作时进行采样，在ADC12工作时进行保持。

Note: ADCSR.ADST位必须在SHMD位设置为1后经过400ns或更长时间后变为1（当允许的信号源阻抗为1kΩ时）。采样保持电路的采样周期必须为400ns或更长（当允许的信号源阻抗为1kΩ时）。

47.2.17 AD断线检测控制寄存器(ADDISCR)

Address(es): ADC120.ADDISCR 4005 C07Ah, ADC121.ADDISCR 4005 C27Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	PCHG	ADNDIS[3:0]			
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	ADNDIS[3:0]	断线检测辅助 Setting	b3b00000：断线检测辅助功能无效0001：设定禁止其他：放电或预充电期间的状态数。	R/W
b4	PCHG	Precharge/discharge select	0: Discharge 1: Precharge.	R/W

Bit	Symbol	Bit name	Description	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ADDISCR register selects either precharge or discharge, and the period of precharge or discharge for the A/D disconnection detection assist function. Only set the ADDISCR register when the ADCSR.ADST bit is 0.

If any of the following functions are used, the disconnection detection assist function must be disabled:

- The temperature sensor
- The internal reference voltage
- A/D self-diagnosis
- The programmable gain amplifier without bypass enabled.

ADNDIS[3:0] bits (Disconnection Detection Assist Setting)

The ADNDIS[3:0] bits specify the period of precharge or discharge. When ADNDIS[3:0] = 0000b, the disconnection detection assist function is disabled. Setting the ADNDIS[3:0] bits to 0001b is prohibited. Except when ADNDIS[3:0] = 0000b or 0001b, the specified value indicates the number of states for the period of precharge or discharge. When the ADNDIS[3:0] bits are set to any values other than 0000b or 0001b, the disconnection detection assistance function is enabled.

PCHG bit (Precharge/discharge select)

Setting the PCHG bit to 1 selects precharge and setting the PCHG bit to 0 selects discharge.

47.2.18 A/D Group Scan Priority Control Register (ADGSPCR)

Address(es): ADC120.ADGSPCR 4005 C080h, ADC121.ADGSPCR 4005 C280h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GBRP	—	—	—	—	—	—	—	—	—	—	—	—	—	GBRSCN	PGS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	PGS	Group A Priority Control Setting*1	0: Operate without Group A priority control 1: Operate with Group A priority control.	R/W
b1	GBRSCN	Group B Restart Setting	(Enabled only when PGS = 1. Reserved when PGS = 0.) 0: Do not restart Group B scanning after it is stopped by Group A priority control 1: Restart Group B scanning after it is stopped by Group A priority control.	R/W
b14 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	GBRP	Group B Single Scan Continuous Start*2	(Enabled only when PGS = 1. Reserved when PGS = 0.) 0: Do not continuously activate single scan for Group B 1: Continuously activate single scan for Group B.	R/W

Note 1. The ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode) before setting PGS to 1. Operation is not guaranteed if these bits are set to any other value.
Note 2. When the GBRP bit is set to 1, single scan is performed continuously for Group B regardless of the setting in the GBRSCN bit.

PGS bit (Group A Priority Control Setting)

Set the PGS bit to 1 to give priority to operation on Group A. The ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode) before setting the PGS bit to 1. Operation is not guaranteed if the bits are set to any other value.

When the PGS bit is set to 0, a clear operation must be performed by software as described in section 47.6.2, Constraints

Bit	Symbol	位名称	Description	R/W
b7 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ADDISCR寄存器选择预充电或放电，以及AD断线检测辅助功能的预充电或放电周期。仅当ADCSR.ADST位为0时设置ADDISCR寄存器。

如果使用以下任何功能，则必须禁用断线检测辅助功能：

- 温度传感器
- 内部参考电压
- A/D self-diagnosis
- 未启用旁路的可编程增益放大器。

ADNDIS[3:0]位（断线检测辅助设置）

ADNDIS[3:0]位指定预充电或放电周期。当ADNDIS[3:0]=0000b时，断线检测辅助功能被禁用。禁止将ADNDIS[3:0]位设置为0001b。除了ADNDIS[3:0]=0000b或0001b时，指定值表示预充电或放电期间的状态数。当ADNDIS[3:0]位设置为0000b或0001b以外的任何值时，将启用断线检测辅助功能。

PCHG位（预充电放电选择）

将PCHG位设置为1选择预充电，将PCHG位设置为0选择放电。

47.2.18 AD组扫描优先控制寄存器(ADGSPCR)

Address(es): ADC120.ADGSPCR 4005 C080h, ADC121.ADGSPCR 4005 C280h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	GBRP	—	—	—	—	—	—	—	—	—	—	—	—	—	GBRSCN	PGS
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	PGS	A组优先控制 Setting*1	0：无A组优先控制运行1：有A组优先控制运行。	R/W
b1	GBRSCN	B组重启设置	（仅在PGS=1时有效。PGS=0时保留。）0：B组扫描被A组优先控制停止后不重新启动1：B组扫描被A组优先控制停止后重新启动。	R/W
b14 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b15	GBRP	B组单次扫描连续 Start*2	（仅在PGS=1时启用。在PGS=0时保留。）0：不连续激活B组单次扫描1：连续激活B组单次扫描。	R/W

注1.ADCSR.ADCS[1:0]位必须在PGS设置为1之前设置为01b（组扫描模式）。如果这些位设置为任何其他值，则无法保证操作。注2.当GBRP位设置为1时，对B组连续执行单次扫描，而与

GBRSCN bit.

PGS位（A组优先控制设置）

将PGS位设置为1以优先对组A进行操作。在将PGS位设置为1之前，必须将ADCSR.ADCS[1:0]位设置为01b（组扫描模式）。如果这些位不保证操作设置为任何其他值。

当PGS位设置为0时，必须由软件执行清除操作，如第47.6.2节，约束中所述

on Stopping A/D Conversion. When the PGS bit is set to 1, use the settings described in section 47.3.4.3, Operation with group A priority control.

GBRSCN bit (Group B Restart Setting)

The GBRSCN bit controls the restarting of scan operation on Group B when operation on Group A is given priority. If a scan operation on Group B is stopped by a Group A trigger input with the GBRSCN bit set to 1, the scan operation is restarted on completion of the Group A conversion. Also, if a Group B trigger is input during A/D conversion on Group A, the scan operation on Group B is restarted on completion of Group A conversion.

When the GBRSCN bit is set to 0, triggers input during A/D conversion are ignored. Only set the GBRSCN bit while the ADCSR.ADST bit is 0.

The setting in the GBRSCN bit is valid when the PGS bit is 1.

GBRP bit (Group B Single Scan Continuous Start)

Set the GBRP bit to perform a single scan operation continuously on Group B. Setting the GBRP bit to 1 starts a single scan on Group B. On completion of the scan, another single scan on Group B starts automatically. If a Group B conversion stops because of an operation on Group A, the Group A operation takes priority, and single scan on Group B restarts automatically on completion of the Group A conversion.

Disable Group B trigger input before setting the GBRP bit to 1. Setting the GBRP bit to 1 invalidates the setting in the GBRSCN bit. Only set the GBRP bit while the ADCSR.ADST is 0.

The setting in the GBRP bit is valid when the PGS bit is 1.

47.2.19 A/D Compare Function Control Register (ADCMPCR)

Address(es): ADC120.ADCMPCR 4005 C090h, ADC121.ADCMPCR 4005 C290h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit name	Description	R/W
b1, b0	CMPAB[1:0]	Window A/B Composite Conditions Setting	b1 b0 0 0: Output ADC12i_WCMPM when Window A OR Window B comparison conditions are met; otherwise, output ADC12i_WCMPUM 0 1: Output ADC12i_WCMPM when Window A EXOR Window B comparison conditions are met; otherwise, output ADC12i_WCMPUM 1 0: Output ADC12i_WCMPM when Window A AND Window B comparison conditions are met; otherwise, output ADC12i_WCMPUM 1 1: Setting prohibited. These bits are valid when both Window A and Window B are enabled (CMPAE = 1 and CMPBE = 1).	R/W
b8 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9	CMPBE	Compare Window B Operation Enable	0: Disable compare Window B operation Disable ADC12i_WCMPM and ADC12i_WCMPUM outputs. 1: Enable compare Window B operation.	R/W
b10	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b11	CMPAE	Compare Window A Operation Enable	0: Disable compare Window A operation Disable ADC12i_WCMPM and ADC12i_WCMPUM outputs. 1: Enable compare Window A operation.	R/W
b12	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

关于停止AD转换。当PGS位设置为1时，使用第47.3.4.3节“A组优先控制操作”中描述的设置。

GBRSCN位（B组重启设置）

当A组操作优先时，GBRSCN位控制B组扫描操作的重新启动。如果通过将GBRSCN位设置为1的A组触发输入停止B组的扫描操作，则在A组转换完成后重新开始扫描操作。此外，如果在A组的AD转换期间输入B组触发，则在A组转换完成时重新开始B组的扫描操作。

当GBRSCN位设置为0时，AD转换期间的触发输入将被忽略。仅设置GBRSCN位，而ADCSR.ADST位为0。

当PGS位为1时GBRSCN位中的设置有效。

GBRP位（B组单次扫描连续启动）

设置GBRP位以在B组上连续执行单次扫描操作。将GBRP位设置为1将启动B组的单次扫描。扫描完成后，自动开始B组上的另一次单次扫描。如果由于对A组的操作而导致B组转换停止，则A组操作优先，并且B组的单次扫描会在A组转换完成后自动重新启动。

在将GBRP位设置为1之前禁用B组触发输入。将GBRP位设置为1会使GBRSCN位。仅在ADCSR.ADST为0时设置GBRP位。

GBRP位中的设置在PGS位为1时有效。

47.2.19 AD比较功能控制寄存器(ADCMPCR)

Address(es): ADC120.ADCMPCR 4005 C090h, ADC121.ADCMPCR 4005 C290h

b12	—	Reserved	该位读取为0。写入值应为0。	R/W

Bit	Symbol	Bit name	Description	R/W
b13	CMPBIE	Compare B Interrupt Enable	0: Disable ADC12i_CMPBI interrupt when comparison conditions (Window B) are met 1: Enable ADC12i_CMPBI interrupt when comparison conditions (Window B) are met.	R/W
b14	WCMPE	Window Function Setting	0: Disable window function Window A and Window B operate as a comparator to compare the single value on the lower side with the A/D conversion result. 1: Enable window function. Window A and Window B operate as a comparator to compare the two values on the upper and lower sides with the A/D conversion result.	R/W
b15	CMPAIE	Compare A Interrupt Enable	0: Disable ADC12i_CMPAI interrupt when comparison conditions (Window A) are met 1: Enable ADC12i_CMPAI interrupt when comparison conditions (Window A) are met.	R/W

Note: i = 0: unit 0, i = 1: unit 1.

CMPAB[1:0] bits (Window A/B Composite Conditions Setting)

The CMPAB[1:0] bits are valid when both Window A and Window B are enabled (CMPAE = 1 and CMPBE = 1) in single scan mode. These bits specify the compare function match/mismatch event output conditions and monitoring conditions of ADWINMON.MONCONB.

Only set the CMPAB[1:0] bits while the ADCSR.ADST bit is 0.

CMPBE bit (Compare Window B Operation Enable)

The CMPBE bit enables or disables the compare Window B operation. Set the CMPBE bit while the ADCSR.ADST bit is 0.

Set this bit to 0 before setting the following registers:

- A/D Channel Select Registers A0, A1, B0, and B1 (ADANSA0, ADANSA1, ADANSB0, and ADANSB1)
- OCSB, TSSB, OCSA, or TSSA bits in the A/D Conversion Extended Input Control Register (ADEXICR)
- CMPCHB[5:0] bits in the Window B Channel Select Register (ADCMPBNSR).

CMPAE bit (Compare Window A Operation Enable)

The CMPAE bit enables or disables the compare Window A operation. Set the CMPAE bit while the ADCSR.ADST bit is 0.

Set this bit to 0 before setting the following registers:

- A/D Channel Select Registers A0, A1, B0, and B1 (ADANSA0, ADANSA1, ADANSB0, and ADANSB1)
- OCSB, TSSB, OCSA, or TSSA bits in the A/D Conversion Extended Input Control Register (ADEXICR)
- Window A Channel Select Registers 0 and 1 (ADCMPANSR0 and ADCMPANSR1)
- Window A Extended Input Select Register (ADCMPANSER)

CMPBIE bit (Compare B Interrupt Enable)

The CMPBIE bit enables or disables the ADC12i_CMPBI (i = 0, 1) interrupt output when the comparison conditions (Window B) are met.

WCMPE bit (Window Function Setting)

The WCMPE bit enables or disables the window function. Set the WCMPE bit while the ADCSR.ADST bit is 0.

CMPAIE bit (Compare A Interrupt Enable)

The CMPAIE bit enables or disables the ADC12i_CMPAI (i = 0, 1) interrupt output when the comparison conditions (Window A) are met.

Bit	Symbol	位名称	Description	R/W
b13	CMPBIE	比较B中断 Enable	0：当比较条件（窗口B）满足时禁止ADC12i_CMPBI中断1：当比较条件（窗口B）满足时，使能ADC12i_CMPBI中断。	R/W
b14	WCMPE	窗口功能设置	0：关闭窗口功能 窗口A和窗口B用作比较器，将下侧的单个值与AD转换结果进行比较。1：启用窗口功能。 窗口A和窗口B用作比较器，将上下两个值与AD转换结果进行比较。	R/W
b15	CMPAIE	比较中断 Enable	0：当比较条件（窗口A）满足时禁止ADC12i_CMPAI中断1：当比较条件（窗口A）满足时，使能ADC12i_CMPAI中断。	R/W

Note: i = 0: unit 0, i = 1: unit 1.

CMPAB[1:0]位（窗口AB复合条件设置）

当窗口A和窗口B在单次扫描模式下启用（CMPAE=1和CMPBE=1）时，CMPAB[1:0]位有效。这些位指定比较函数匹配不匹配事件输出条件和ADWINMON.MONCONB的监视条件。

仅在ADCSR.ADST位为0时设置CMPAB[1:0]位。

CMPBE位（比较窗口B操作使能）

CMPBE位启用或禁用比较窗口B操作。当ADCSR.ADST位为0时设置CMPBE位。

在设置以下寄存器之前将此位设置为0：

- AD通道选择寄存器A0、A1、B0和B1（ADANSA0、ADANSA1、ADANSB0和ADANSB1）
- AD转换扩展输入控制寄存器(ADEXICR)中的OCSB、TSSB、OCSA或TSSA位
- 窗口B通道选择寄存器(ADCMPBNSR)中的CMPCHB[5:0]位。

CMPAE位（比较窗口A操作使能）

CMPAE位启用或禁用比较窗口A操作。当ADCSR.ADST位为0时设置CMPAE位。

在设置以下寄存器之前将此位设置为0：

- AD通道选择寄存器A0、A1、B0和B1（ADANSA0、ADANSA1、ADANSB0和ADANSB1）
- AD转换扩展输入控制寄存器(ADEXICR)中的OCSB、TSSB、OCSA或TSSA位
- 窗口A通道选择寄存器0和1（ADCMPANSR0和ADCMPANSR1）
- 窗口A扩展输入选择寄存器(ADCMPANSER)

CMPBIE位（比较B中断使能）

当满足比较条件（窗口B）时，CMPBIE位启用或禁用ADC12i_CMPBI(i=0 1)中断输出。

WCMPE位（窗口功能设置）

WCMPE位启用或禁用窗口功能。当ADCSR.ADST位为0时设置WCMPE位。

CMPAIE位（比较中断使能）

当满足比较条件（窗口A）时，CMPAIE位启用或禁用ADC12i_CMPAI(i=0 1)中断输出。

47.2.20 A/D Compare Function Window A Channel Select Register 0 (ADCMPANSR0)

CMPLTSA bit (Compare Window A Temperature Sensor Output Comparison Condition Select)

The CMPLTSA bit specifies comparison conditions when the temperature sensor output is the target for the Window A comparison condition. When the temperature sensor output comparison result meets the set condition, the ADCMPSER.CMPSTTSA flag sets to 1 and a compare interrupt (ADC12i_CMPAI (i = 0, 1)) is generated.

CMPLOCA bit (Compare Window A Internal Reference Voltage Comparison Condition Select)

The CMPLOCA bit specifies comparison conditions when the internal reference voltage is the target for the Window A comparison condition. When the internal reference voltage comparison result meets the set condition, the ADCMPSER.CMPSTOCA flag sets to 1 and a compare interrupt (ADC12i_CMPAI) is generated.

47.2.26 A/D Compare Function Window A Lower-Side Level Setting Register (ADCMPDR0), A/D Compare Function Window A Upper-Side Level Setting Register (ADCMPDR1), A/D Compare Function Window B Lower-Side Level Setting Register (ADWINLLB), A/D Compare Function Window B Upper-Side Level Setting Register (ADWINULB)

Address(es): ADC120.ADCMPDR0 4005 C09Ch, ADC120.ADCMPDR1 4005 C09Eh, ADC120.ADWINLLB 4005 C0A8h, ADC120.ADWINULB 4005 C0AAh, ADC121.ADCMPDR0 4005 C29Ch, ADC121.ADCMPDR1 4005 C29Eh, ADC121.ADWINLLB 4005 C2A8h, ADC121.ADWINULB 4005 C2AAh

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	—	Reference value	R/W

The ADCMPDRy (y = 0,1) register specifies the reference data when the compare Window A function is used. ADCMPDR0 sets the lower reference for Window A, and ADCMPDR1 sets the upper reference for Window A.

ADWINULB and ADWINLLB specify the reference data when the compare Window B function is used. ADWINLLB sets the lower reference for Window B, and ADWINULB sets the upper reference for Window B. The ADCMPDRy, ADWINULB, and ADWINLLB are read/write registers.

ADCMPDRy, ADWINULB, and ADWINLLB can be written to even during A/D conversion. The reference data can be dynamically changed by rewriting register values during A/D conversion.

Set these registers so that the upper reference is not less than the lower reference (ADCMPDR1 ≥ ADCMPDR0 and ADWINULBB ≥ ADWINLLB). ADCMPDR1 and ADWINULB are not used when the window function is disabled.

The lower and the upper references are changed when each register is written. For example, when the upper reference value is changed and the lower reference value is being changed, the MCU compares the upper reference (after a rewrite), and the lower reference (before a rewrite) with the A/D conversion result. (See Figure 47.5.) If the comparison during the rewriting of these two references is erroneous, then rewrite these reference values when both ADCSR.ADST

Bit	Symbol	位名称	Description	R/W
b1	CMPLOCA	比较窗口A内部参考电压比较条件选择	比较条件如图47.4所示。 当窗口功能禁用时(ADCMPCR.WCMPE=0)0：ADCMPDR0寄存器值>AD转换值1：ADCMPDR0寄存器值<AD转换值。 启用窗口功能时(ADCMPCR.WCMPE=1)0：D转换值<ADCMPDR0寄存器值，或D转换值>ADCMPDR1寄存器值1：ADCMPDR0寄存器值<AD转换值<ADCMPDR1寄存器值.	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R

CMPLTSA位（比较窗口A温度传感器输出比较条件选择）

当温度传感器输出是窗口A比较条件的目标时，CMPLTSA位指定比较条件。当温度传感器输出比较结果满足设置条件时，ADCMPSER.CMPSTTSA标志设置为1，并产生比较中断(ADC12i_CMPAI(i=0 1))。

CMPLOCA位（比较窗口A内部参考电压比较条件选择）

当内部参考电压是窗口A比较条件的目标时，CMPLOCA位指定比较条件。当内部参考电压比较结果满足设置条件时，ADCMPSER.CMPSTOCA标志设置为1，并产生比较中断(ADC12i_CMPAI)。

47.2.26 AD比较功能窗口A低端电平设置寄存器(ADCMPDR0) AD比较功能窗口A高端电平设置寄存器(ADCMPDR1) AD比较功能窗口B低端电平设置寄存器(ADWINLLB) AD比较功能窗口B上侧电平设置寄存器(ADWINULB)

Address(es): ADC120.ADCMPDR0 4005 C09Ch, ADC120.ADCMPDR1 4005 C09Eh, ADC120.ADWINLLB 4005 C0A8h, ADC120.ADWINULB 4005 C0AAh, ADC121.ADCMPDR0 4005 C29Ch, ADC121.ADCMPDR1 4005 C29Eh, ADC121.ADWINLLB 4005 C2A8h, ADC121.ADWINULB 4005 C2AAh

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	—	—	参考值	R/W

ADCMPDRy(y=0 1)寄存器指定使用比较窗口A功能时的参考数据。ADCMPDDR0设置窗口A的参考下限，ADCMPDR1设置窗口A的参考上限。

ADWINULB和ADWINLLB指定使用比较窗口B功能时的参考数据。ADWINLLB设置窗口B的下参考，ADWINULB设置窗口B的上参考。ADCMPDRy、ADWINULB和ADWINLLB是读写寄存器。

ADCMPDRy、ADWINULB和ADWINLLB即使在AD转换期间也可以写入。参考数据可以通过在AD转换期间重写寄存器值来动态更改。

设置这些寄存器，使参考上限不小于参考下限（ADCMPDR1 ADCMPDR0和ADWINULBB ADWINLLB）。禁用窗口功能时不使用ACMPDDR1和ADWINULB。

写入每个寄存器时会更改下参考和上参考。例如，当上参考值改变和下参考值改变时，MCU将上参考（重写后）和下参考（重写前）与AD转换结果进行比较。（参见图47.5。）如果在重写这两个引用期间的比较是错误的，那么当两个ADCSR.ADST都重写这些引用值时

and the associated compare window operation enable bit (ADCMPCR.CMPAE or ADCMPCR.CMPBE) is 0.

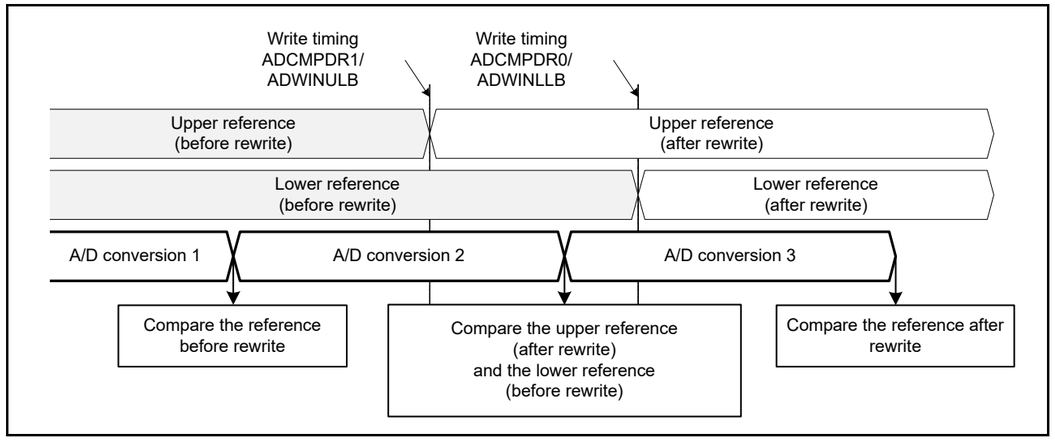

Figure 47.5 Comparison between upper and lower references before and after a rewrite

The ADCMPDRy, ADWINLLB, and ADWINULB registers use different formats depending on the following conditions:

- The value in the A/D Data Register Format Select bit (flush-right or flush-left)
- The value in the A/D Conversion Accuracy Specify bit (12-bit, 10-bit, or 8-bit)
- The value in the A/D-Converted Value Addition/Average Channel Select bits (A/D-converted value addition mode selected or not selected).

The data formats for each condition are as follows:

(1) When A/D-converted value addition mode is not selected

- Flush-right data with 12-bit accuracy: Lower 12 bits ([11:0]) are valid
- Flush-right data with 10-bit accuracy: Lower 10 bits ([9:0]) are valid
- Flush-right data with 8-bit accuracy: Lower 8 bits ([7:0]) are valid
- Flush-left data with 12-bit accuracy: Upper 12 bits ([15:4]) are valid
- Flush-left data with 10-bit accuracy: Upper 10 bits ([15:6]) are valid
- Flush-left data with 8-bit accuracy: Upper 8 bits ([15:8]) are valid.

(2) When A/D-converted value addition mode is selected

- Flush-right data with 12-bit accuracy: Lower 14 bits ([13:0]) are valid
- Flush-right data with 10-bit accuracy: Lower 12 bits ([11:0]) are valid
- Flush-right data with 8-bit accuracy: Lower 10 bits ([9:0]) are valid
- Flush-left data with 12-bit accuracy: Upper 14 bits ([15:2]) are valid
- Flush-left data with 10-bit accuracy: Upper 12 bits ([15:4]) are valid
- Flush-left data with 8-bit accuracy: Upper 10 bits ([15:6]) are valid.

并且相关的比较窗口操作使能位（ADCMPCR.CMPAE或ADCMPCR.CMPBE）为0。

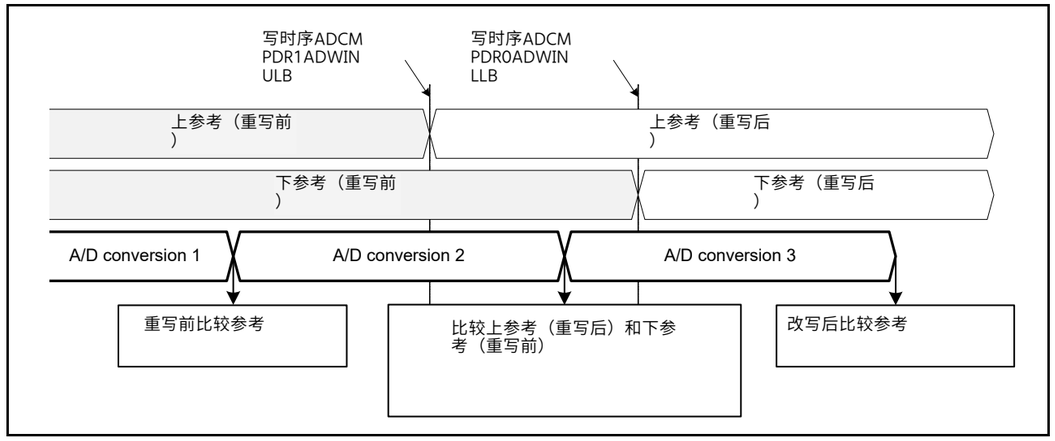

Figure 47.5 重写前后上下引用的比较

ADCMPDRy、ADWINLLB和ADWINULB寄存器根据以下条件使用不同的格式：

- AD数据寄存器格式选择位中的值（右对齐或左对齐）
- AD转换精度指定位（12位、10位或8位）中的值
- AD转换值加法平均通道选择位中的值（选择或未选择AD转换值加法模式）。

每个条件的数据格式如下：

(1) 未选择AD转换值相加模式时

- 12位精度的右冲洗数据：低12位([11:0])有效
- 10位精度的右冲洗数据：低10位([9:0])有效
- 8位精度的右冲洗数据：低8位([7:0])有效
- 12位精度的左刷新数据：高12位([15:4])有效
- 10位精度的左刷新数据：高10位([15:6])有效
- 8位精度的左刷新数据：高8位([15:8])有效。

(2) 选择AD转换值相加模式时

- 12位精度的右冲洗数据：低14位([13:0])有效
- 10位精度的右冲洗数据：低12位([11:0])有效
- 8位精度的右冲洗数据：低10位([9:0])有效
- 12位精度的左刷新数据：高14位([15:2])有效
- 10位精度的左刷新数据：高12位([15:4])有效
- 8位精度的左刷新数据：高10位([15:6])有效。

b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CMPSTCHAn flags (n = 00 to 07) (Compare Window A Flag)

The CMPSTCHAn flags indicate the comparison results for channels to which Window A comparison conditions are applied, selected from AN000 to AN007 (unit 0) and AN100 to AN103, AN105 to AN107 (unit 1). When a comparison condition set in ADCMPLR0.CMPLCHAn is met at the end of A/D conversion, the associated CMPSTCHAn flag sets to 1. When the ADCMPCR.CMPAIE bit is 1, a compare interrupt request (ADC12i_CMPAI (i = 0, 1)) is generated when this flag sets to 1. In unit 0, CMPSTCHA00 is associated with AN000 and CMPSTCHA07 with AN007. In unit 1, CMPSTCHA00 is associated with AN100 and CMPSTCHA07 with AN107.

Writing 1 to the CMPSTCHAn flags is invalid.

[Setting condition]

- The condition set in ADCMPLR0.CMPLCHAn is met when ADCMPCR.CMPAE = 1.

[Clearing condition]

- Writing 0 after reading 1.

b6	—	Reserved	该位读取为0。写入值应为0。	R/W
b7	CMPLB	比较窗口B 比较条件设置	该位设置窗口B的通道比较条件。比较条件如图47.6所示。 禁用窗口功能时(ADCMPCR.WCMPE=0)0：CMPLLB值>AD转换值1：CMPLLB值<AD转换值。 启用窗口功能时(ADCMPCR.WCMPE=1)0：D转换值<CMPLLB值，或CMPULB值<AD转换值1：CMPLLB值<AD转换值<CMPULB值。	R/W

CMPCHB[5:0]位（比较窗口B通道选择）

CMPCHB[5:0]位指定要与比较窗口B条件比较的通道，从AN000到AN007和AN016到AN020（单元0）、AN100到AN103、AN105到AN107和AN116到AN119（单元1），温度传感器和内部参考电压。通过指定在以下位中选择的AD转换通道的十六进制数来启用比较窗口B功能：

Unit 0:

- ADANSA0.ANSA00到ANSA07位
- ADANSA1.ANSA16到ANSA20位
- ADANSB0.ANSB00至ANSB07位
- ADANSB1.ANSB16到ANSB20位。

Unit 1:

- ADANSA0.ANSA00 to ANSA03 bits
- ADANSA0.ANSA05 to ANSA07 bits
- ADANSA1.ANSA16 to ANSA19 bits
- ADANSB0.ANSB00 to ANSB03 bits
- ADANSB0.ANSB05 to ANSB07 bits
- ADANSB1.ANSB16 to ANSB19 bits.

Set the CMPCHB[5:0] bits while the ADCSR.ADST bit is 0.

CMPLB bit (Compare Window B Comparison Condition Setting)

The CMPLB bit specifies the comparison conditions for channels for Window B. When the comparison result of an analog input meets the set condition, the associated ADCMPBSR.CMPSTB flag sets to 1 and a compare interrupt request (ADC12i_CMPBI) (i = 0, 1)) is generated.

Compare conditions when the window function is disabled

CMPLB = 0		CMPLB = 1	
ADWINLLB value ≤ A/D converted value	Not met	ADWINLLB value < A/D converted value	Met
ADWINLLB value > A/D converted value	Met	ADWINLLB value ≥ A/D converted value	Not met

Compare conditions when the window function is enabled

CMPLB = 0

A/D converted value > ADWINULB value	Met
ADWINLLB value ≤ A/D converted value ≤ ADWINULB value	Not met
A/D converted value < ADWINLLB value	Met

CMPLB = 1

A/D converted value ≥ ADWINULB value	Not met
ADWINLLB value <A/D converted value < ADWINULB value	Met
A/D converted value ≤ ADWINLLB value	Not met

Figure 47.6 Explanation of compare conditions for compare function Window B

Unit 1:

MONCOMB bit (Combination Result Monitor)

The read-only MONCOMB bit indicates the combined result of comparison condition results A and B based on the combination condition set in the ADCMPCR.CMPAB[1:0] bits.

[Setting condition]

- The combined result meets the combination condition set in the ADCMPCR.CMPAB[1:0] bits when ADCMPCR.CMPAE = 1 and ADCMPCR.CMPBE = 1.

[Clearing conditions]

- The combined result does not meet the combination condition set in the ADCMPCR.CMPAB[1:0] bits
- ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0.

MONCMPA bit (Comparison Result Monitor A)

The read-only MONCMPA bit is read as 1 when the A/D-converted value of the Window A target channel meets the condition set in ADCMPLR0/ADCMPLR1 and ADCMPLER. Otherwise, it is read as 0.

[Setting condition]

- The A/D-converted value meets the condition set in ADCMPLR0.CMPLCHAn when ADCMPCR.CMPAE = 1.

[Clearing conditions]

- The A/D-converted value does not meet the condition set in ADCMPLR0.CMPLCHAn when ADCMPCR.CMPAE = 1
- ADCMPCR.CMPAE = 0 (automatically cleared when the ADCMPCR.CMPAE value changes from 1 to 0).

MONCMPB bit (Comparison Result Monitor B)

The read-only MONCMPB bit is read as 1 when the A/D-converted value of the Window B target channel meets the condition set in the ADCMPBNSR.CMPLB bit. Otherwise, it is read as 0.

[Setting condition]

- The A/D-converted value meets the condition set in ADCMPBNSR.CMPLB when ADCMPCR.CMPBE = 1.

[Clearing conditions]

- The A/D-converted value does not meet the condition set in ADCMPBNSR.CMPLB when ADCMPCR.CMPBE = 1
- ADCMPCR.CMPBE = 0 (automatically cleared when the ADCMPCR.CMPBE value changes from 1 to 0).

47.2.33 A/D Programmable Gain Amplifier Control Register (ADPGACR)

Address(es): ADC120.ADPGACR 4005 C1A0h, ADC121.ADPGACR 4005 C3A0h

MONCOMB位（组合结果监视器）

只读MONCOMB位指示比较条件结果A和B基于ADCMPCR.CMPAB[1:0]位中设置的组合条件的组合结果。

[Setting condition]

- 当组合结果满足ADCMPCR.CMPAB[1:0]位中设置的组合条件时
  ADCMPCR.CMPAE = 1 and ADCMPCR.CMPBE = 1.

[Clearing conditions]

- 组合结果不满足ADCMPCR.CMPAB[1:0]位中设置的组合条件
- ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0.

MONCMPA位（比较结果监视器A）

当窗口A目标通道的AD转换值满足ADCMPLR0ADCMPLR1和ADCMPLER中设置的条件时，只读MONCMPA位被读取为1。否则，读为0。

[Setting condition]

- 当ADCMPCR.CMPAE=1时，AD转换后的值满足ADCMPLR0.CMPLCHAn中设置的条件。

[Clearing conditions]

- 当ADCMPCR.CMPAE=1时，AD转换后的值不满足ADCMPLR0.CMPLCHAn中设置的条件
- ADCMPCR.CMPAE=0（ADCMPCR.CMPAE值从1变为0时自动清零）。

MONCMPB位（比较结果监视器B）

当窗口B目标通道的AD转换值满足ADCMPBNSR.CMPLB位中设置的条件时，只读MONCMPB位被读取为1。否则，读为0。

[Setting condition]

- 当ADCMPCR.CMPBE=1时，AD转换后的值满足ADCMPBNSR.CMPLB中设置的条件。

[Clearing conditions]

- 当ADCMPCR.CMPBE=
  1
- ADCMPCR.CMPBE=0（ADCMPCR.CMPBE值从1变为0时自动清零）。

PnSEL0 bit (PGA Pn Amplifier Bypass Enable) (n = 000 to 002)

The PnSEL0 bit selects whether to output the signal in a path that bypasses the amplifier in the PGA for each programmable gain amplifier Pn.

PnSEL1 bit (PGA Pn Amplifier Transit Enable) (n = 000 to 002)

The PnSEL1 bit selects whether to output the signal in a path through the amplifier in the PGA for each programmable gain amplifier Pn.

PnENAMP bit (PGA Pn Amplifier Enable) (n = 000 to 002)

The PnENAMP bit selects whether to use the amplifier in the PGA for each programmable gain amplifier Pn.

PnGEN bit (PGA Pn Input Resistance Side Gain Selection Signal Enable) (n = 000 to 002)

The PnGEN bit enables or disables the gain setting for each programmable gain amplifier Pn.

Note: 有关设置这些位的详细信息，请参见第47.3.12节，可编程增益放大器。

PnSEL0位（PGAPn放大器旁路使能）（n=000至002）

PnSEL0位为每个可编程增益放大器Pn选择是否在绕过PGA中放大器的路径输出信号。

PnSEL1位（PGAPn放大器传输使能）（n=000至002）

PnSEL1位为每个可编程增益放大器Pn选择是否在通过PGA中的放大器的路径中输出信号。

PnENAMP位（PGAPn放大器启用）（n=000至002）

PnENAMP位为每个可编程增益放大器Pn选择是否使用PGA中的放大器。

PnGEN位（PGAPn输入电阻侧增益选择信号使能）（n=000至002）

PnGEN位启用或禁用每个可编程增益放大器Pn的增益设置。

b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: For details on setting these bits, see section 47.3.12, Programmable Gain Amplifiers.

PnDG[1:0] bits (Pn Differential Input Gain Setting) (n = 000 to 002)

The PnDG[1:0] bits specify the gain of each PGA amplifier Pn when differential inputs are used. These bits are only valid when the PnDEN bit = 1 and the PnGEN bit = 1.

To use the PGA for differential inputs, set the ADPGADCR0.PnDG[1:0] bits in conjunction with the ADPGAGS0.PnGAIN[3:0] bits.

Example: To set the gain to × 1.5 using P000 for differential input, set:
ADPGAGS0.P000GAIN[3:0] = 0001b
ADPGADCR0.P000DG[1:0] = 00b

PnDEN bit (Pn Differential Input Enable) (n = 000 to 002)

The PnDEN bit enables or disables differential inputs for each PGA amplifier Pn.

47.2.35 AD可编程增益放大器差分输入控制寄存器(ADPGADCR0)

b15 to b12	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 有关设置这些位的详细信息，请参见第47.3.12节，可编程增益放大器。

PnDG[1:0]位（Pn差分输入增益设置）（n=000至002）

当使用差分输入时，PnDG[1:0]位指定每个PGA放大器Pn的增益。这些位仅在PnDEN位=1且PnGEN位=1时有效。

要将PGA用于差分输入，请将ADPGADCR0.PnDG[1:0]位与ADPGAGS0.PnGAIN[3:0] bits.

示例：要使用P000差分输入将增益设置为 1.5，请设置：
ADPGAGS0.P000GAIN[3:0] = 0001b
ADPGADCR0.P000DG[1:0] = 00b

PnDEN位（Pn差分输入使能）（n=000至002）

PnDEN位启用或禁用每个PGA放大器Pn的差分输入。

47.3 Operation

47.3.1 Scanning Operation

In scanning, A/D conversion is performed sequentially on the analog inputs of the specified channels.

Scan conversion is performed in three operating modes: single scan mode, continuous scan mode, and group scan mode. In single scan mode, one or more specified channels are scanned once. In continuous scan mode, one or more specified channels are scanned repeatedly until the ADCSR.ADST bit is cleared to 0 from 1 by software. In group scan mode, the selected channels in Group A and the selected channels in Group B are scanned once after scan starts in response to the respective synchronous trigger (ELC).

In single scan mode and continuous scan mode, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n. In group scan mode, A/D conversion is performed for the ANn channels in Group A selected in the ADANSA0 and ADANSA1 registers first, and then for the ANn channels in Group B selected in the ADANSB0 and ADANSB1 registers, starting from the channel with the smallest number n.

When self-diagnosis is selected, it is executed once at the beginning of each scan, and one of the three voltages generated internally in the ADC12 is converted.

The temperature sensor output and internal reference voltage can be selected at the same time as the analog input of the channels, and A/D conversion is performed on the analog input of channels, temperature sensor output, and internal reference voltage, in that order.

Double-trigger mode can be used with single scan mode or group scan mode. With double-trigger mode enabled (ADCSR.DBLE = 1), A/D conversion data of a channel selected in the ADCSR.DBLANS[4:0] bits is duplicated only if the conversion is started by the synchronous trigger (ELC) selected in the TRSA[5:0] bits in ADSTRGR. Only Group A in group scan mode can use the double-trigger mode.

The extended operation of double-trigger mode means the A/D conversion operation is generated from the synchronous trigger combination. This trigger combination is selected in ADSTRGR.TRSA[5:0] in double-trigger mode. ELC_AD00 and ELC_AD01 are associated with unit 0. ELC_AD10 and ELC_AD11 are associated with unit 1.

In the extended operation of double-trigger mode, in addition to normal double-trigger operation, A/D conversion data from the ELC_AD00 (unit 0) and ELC_AD10 (unit 1) triggers is stored in A/D Data Duplexing Register A (ADDBLDRA), and A/D conversion data from the ELC_AD01 (unit 0) and ELC_AD11 (unit 1) triggers is stored in A/D Data Duplexing Register B (ADDBLDRB). In the extended operation of double-trigger mode, when a combination of triggers occurs at the same time, the data duplexing register settings for the specified triggers do not work, and A/D conversion data is stored in A/D Data Duplexing Register B (ADDBLDRB).

When one synchronous trigger is input during the A/D conversion started by another synchronous trigger, the subsequent trigger is input when the other A/D conversion is canceled.

When any of the AN000 to AN002 (unit 0), and AN100 to AN102 (unit 1) channels are set as a channel-dedicated sample-and-hold circuit in the SHANS[2:0] bits in ADSHCR, the target analog input specified is sampled and held before the first A/D conversion of each scan.

47.3.2 Single Scan Mode

47.3.2.1 Basic operation without channel-dedicated sample-and-hold circuits

In basic operation of single scan mode, A/D conversion is performed once on the analog input of the specified channels.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register (ADDRy).
3. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).

47.3 Operation

47.3.1 扫描操作

扫描时，对指定通道的模拟输入依次进行AD转换。

扫描转换以三种操作模式执行：单次扫描模式、连续扫描模式和组扫描模式。在单次扫描模式下，一个或多个指定通道被扫描一次。在连续扫描模式下，重复扫描一个或多个指定通道，直到ADCSR.ADST位由软件从1清零。在组扫描模式下，A组中的选定通道和B组中的选定通道在扫描开始后扫描一次，以响应各自的同步触发(ELC)。

在单次扫描模式和连续扫描模式下，对选择的ANn通道进行AD转换
ADANSA0和ADANSA1寄存器，从编号n最小的通道开始。在组扫描模式下，首先对ADANSA0和ADANSA1寄存器中选择的A组ANn通道进行A/D转换，然后对ADANSB0和ADANSB1寄存器中选择的B组ANn通道进行A/D转换，从编号最小的通道开始n.

选择自诊断时，在每次扫描开始时执行一次，并转换ADC12内部产生的三个电压之一。

温度传感器输出和内部参考电压可以与通道的模拟输入同时选择，通道的模拟输入、温度传感器输出和内部参考电压依次进行AD转换。

双触发模式可与单扫描模式或组扫描模式一起使用。启用双触发模式(ADCSR.DBLE=1)时，仅当转换由在ADSTRGR中的TRSA[5:0]位。只有组扫描模式下的A组可以使用双触发模式。

双触发模式的扩展操作是指A/D转换操作是由同步触发组合产生的。在双触发模式下，此触发组合在ADSTRGR.TRSA[5:0]中选择。ELC_AD00和ELC_AD01与单元0关联。ELC_AD10和ELC_AD11与单元1关联。

在双触发模式的扩展操作中，除了正常的双触发操作外，来自ELC_AD00（单元0）和ELC_AD10（单元1）触发的AD转换数据存储在AD数据双工寄存器A（ADDBLDRA）中，而AD来自ELC_AD01（单元0）和ELC_AD11（单元1）触发器的转换数据存储在AD数据双工寄存器B(ADDBLDRB)中。在双触发模式的扩展操作中，当同时发生多个触发时，指定触发的数据双工寄存器设置不起作用，AD转换数据存储在AD数据双工寄存器B（ADDBLDRB）中。

在由另一个同步触发启动的AD转换期间输入一个同步触发时，在取消另一个AD转换时输入后续触发。

当任何AN000至AN002（单元0）和AN100至AN102（单元1）通道在ADSHCR的SHANS[2:0]位中设置为通道专用采样保持电路时，目标模拟输入指定在每次扫描的第一个AD转换之前被采样和保持。

47.3.2 单次扫描模式

47.3.2.1 无通道专用采样保持电路的基本操作

在单次扫描模式的基本操作中，对指定通道的模拟输入进行一次AD转换。

操作如下：

1. 当通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，将从ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从具有最小编号n的通道。
2. 每次单个通道的AD转换完成时，AD转换结果都会存储在相关的AD数据寄存器(ADDRy)中。
3. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。

4. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then the ADC12 enters a wait state.

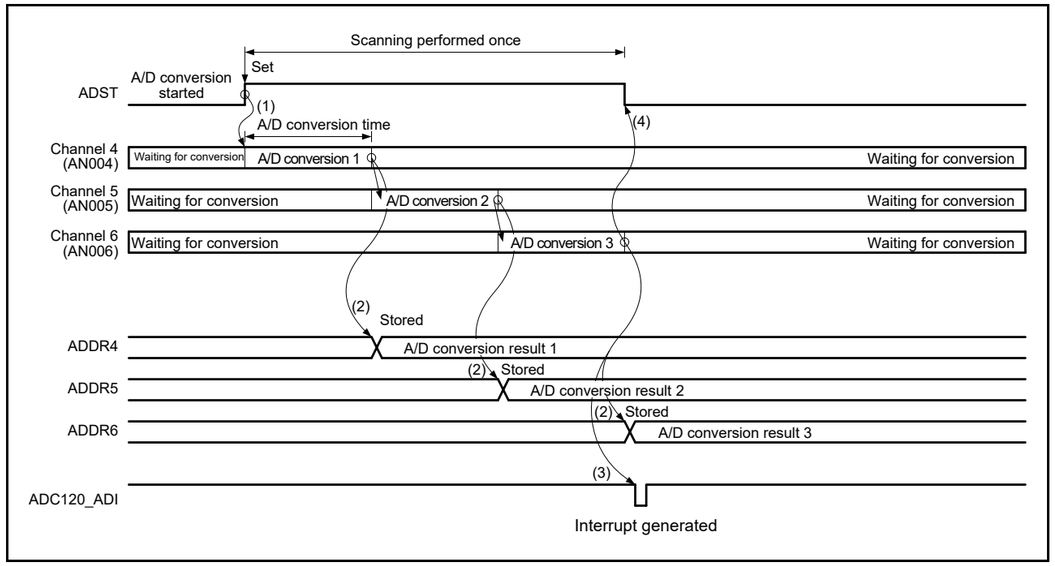

Figure 47.7 Example basic operation in single scan mode when AN004 to AN006 are selected

47.3.2.2 Basic operation with channel-dedicated sample-and-hold circuits and continuous sampling disabled

When the channel-dedicated sample-and-hold circuit is used, sample-and-hold operation is first performed, and then A/D conversion is performed once on the analog input of all the specified channels. The channels whose dedicated sample-and-hold circuit is to be used can be selected in the SHANS[2:0] bits in ADSHCR.

The operation is as follows:

1. Analog input sampling of all channels whose dedicated sample-and-hold circuit is to be used starts when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. After sample-and-hold operation, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then the ADC12 enters a wait state.

4. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后ADC12进入等待状态。

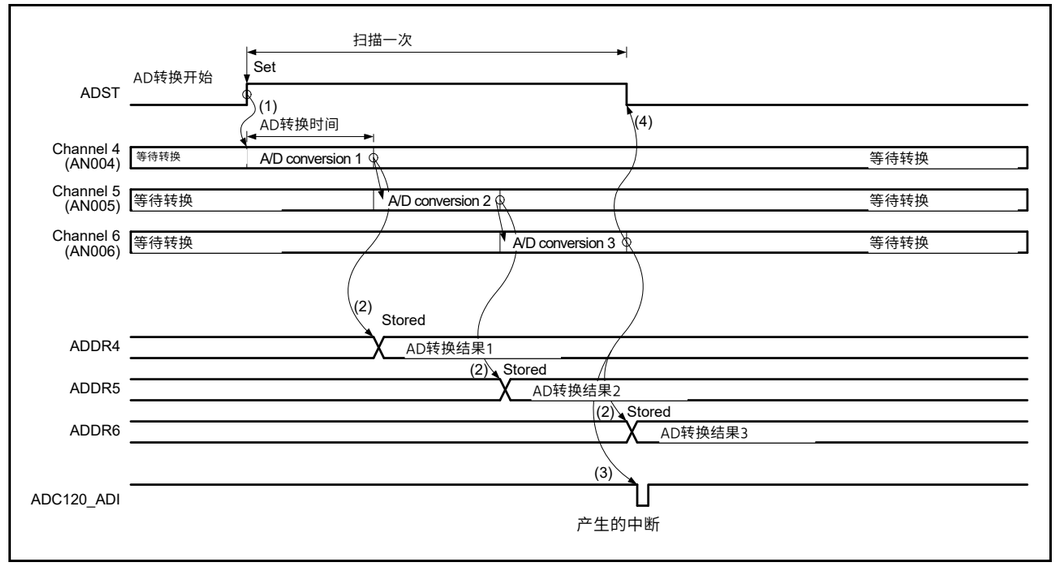

Figure 47.7 选择AN004至AN006时单次扫描模式的基本操作示例

47.3.2.2 通道专用采样保持电路和禁用连续采样的基本操作

当使用通道专用的采样保持电路时，首先进行采样保持操作，然后对所有指定通道的模拟输入进行一次A/D转换。可以在ADSHCR的SHANS[2:0]位中选择要使用专用采样保持电路的通道。

操作如下：

1. 将使用专用采样保持电路的所有通道的模拟输入采样在ADCSR.ADST位通过软件触发、同步触发输入(ELC)或异步触发输入设置为1（AD转换开始）。
2. 采样保持操作后，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从编号n最小的通道开始。
3. 每次单个通道的AD转换完成时，AD转换结果都会存储在相关的AD数据寄存器(ADDRy)中。
4. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
5. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后ADC12进入等待状态。

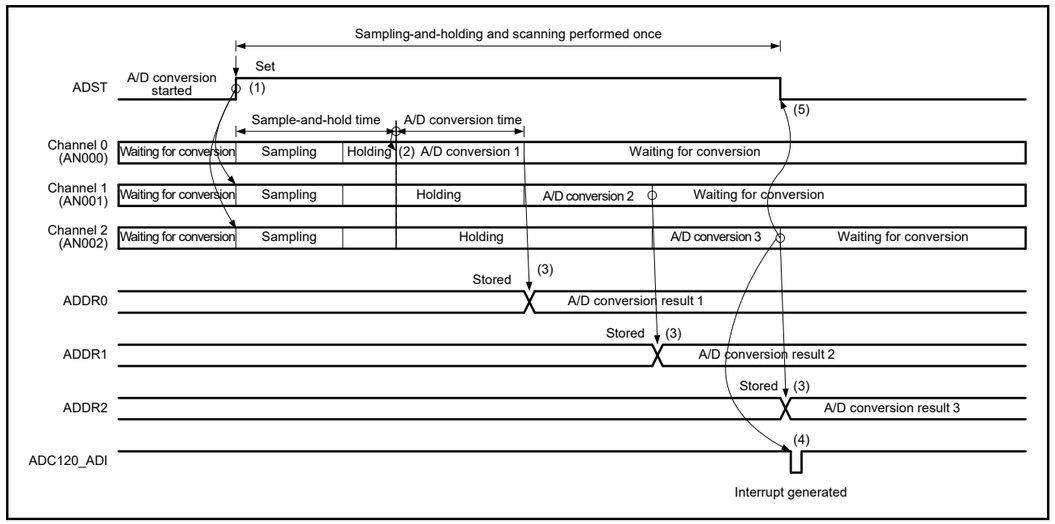

Figure 47.8 Example operation in single scan mode when the channel-dedicated sample-and-hold circuits are used and AN000 to AN002 are selected

47.3.2.3 Basic operation with channel-dedicated sample-and-hold circuits and continuous sampling enabled

When a channel-dedicated sample-and-hold circuit is used while continuous sampling is enabled, sample-and-hold operations are performed first, and this is followed by A/D conversion once of the analog inputs on all selected channels. The ADSHCR.SHANS[2:0] bits specify the channels for which the channel-dedicated sample-and-hold circuits are to be used.

The operation is as follows:

1. When the ADSHMSR.SHMD bit is set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
2. Analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, input of a synchronous trigger signal (ELC), or input of an asynchronous trigger.
3. After the stabilization time of the sample-and-hold circuits elapses, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register (ADDRy), and the sample-and-hold circuit restarts continuous sampling.
5. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
6. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then the ADC12 enters a wait state. If this is followed by single scanning, set the continuous sampling time for the sample-and-hold circuits to at least 400 ns (when the permissible signal source impedance is 1 kΩ).
7. When the ADSHMSR.SHMD bit is set to 0, the sample-and-hold circuits stop.

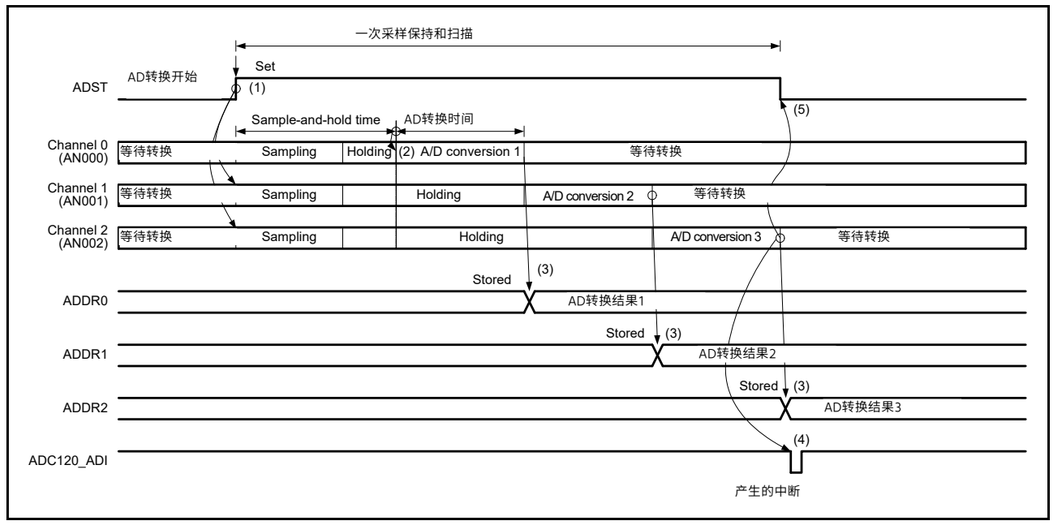

Figure 47.8 使用通道专用采样保持电路并选择AN000至AN002时单扫描模式下的示例操作

47.3.2.3 具有通道专用采样保持电路和连续采样的基本操作

如果在启用连续采样的情况下使用通道专用的采样保持电路，则首先执行采样保持操作，然后对所有选定通道的模拟输入进行一次AD转换。ADSHCR.SHANS[2:0]位指定要使用通道专用采样保持电路的通道。

操作如下：

1. 当ADSHMSR.SHMD位设置为1时，在ADSHCR.SHANS[2:0]位中选择的采样保持电路开始连续采样。
2. 当通过软件触发将ADCSR.ADST位设置为1（AD转换开始）时，将使用通道专用采样保持电路的所有通道开始模拟输入保持，输入同步触发信号(ELC），或异步触发器的输入。
3. 经过采样保持电路的稳定时间后，从编号n最小的通道开始，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换。
4. 每次完成单通道的AD转换，AD转换结果存储在相关的AD数据寄存器（ADDRy）中，采样保持电路重新开始连续采样。
5. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
6. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后ADC12进入等待状态。如果随后进行单次扫描，请将采样保持电路的连续采样时间设置为至少400ns（当允许的信号源阻抗为1kΩ时）。
7. 当ADSHMSR.SHMD位设置为0时，采样保持电路停止。

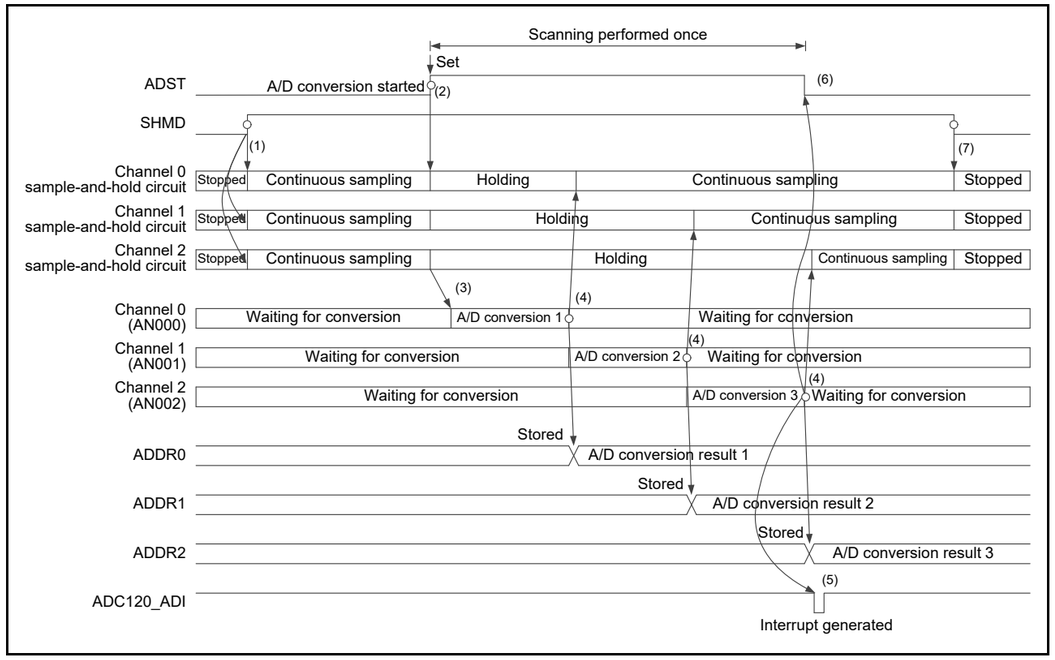

Figure 47.9 Example operation in single scan mode when channel-dedicated sample-and-hold circuits are used, AN000 to AN002 are selected, and continuous sampling is enabled

47.3.2.4 Channel selection and self-diagnosis without channel-dedicated sample-and-hold circuits

When channels and self-diagnosis are selected, A/D conversion is first performed for the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (× 0, × 1/2, or × 1) supplied to the ADC12, and then A/D conversion is performed once on the analog input of the specified channels.

The operation is as follows:

1. A/D conversion for self-diagnosis is first started when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then the ADC12 enters a wait state.

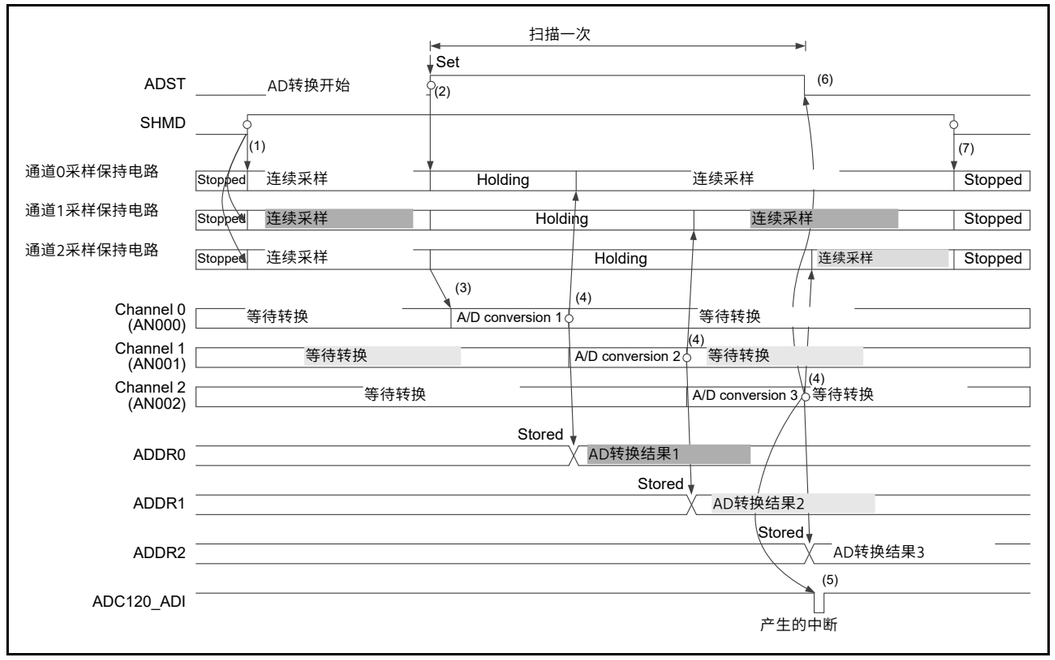

Figure 47.9 使用通道专用采样保持电路、选择AN000至AN002并启用连续采样时的单次扫描模式操作示例

47.3.2.4 通道选择和自诊断，无需通道专用的采样和保持电路

Whenchannelsandself-diagnosisareselected ADconversionisfirstperformedforthereferencevoltageVREFH0(unit0)orVREFH(unit1)(×0 ×12 or×1)suppliedtotheADC12 andthenADconversion在指定通道的模拟输入上执行一次。

操作如下：

1. 通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，首先启动用于自诊断的D转换。
2. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并ADANSA1寄存器，从编号n最小的通道开始。
3. 每次单个通道的AD转换完成时，AD转换结果都会存储在相关的AD数据寄存器(ADDRy)中。
4. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
5. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后ADC12进入等待状态。

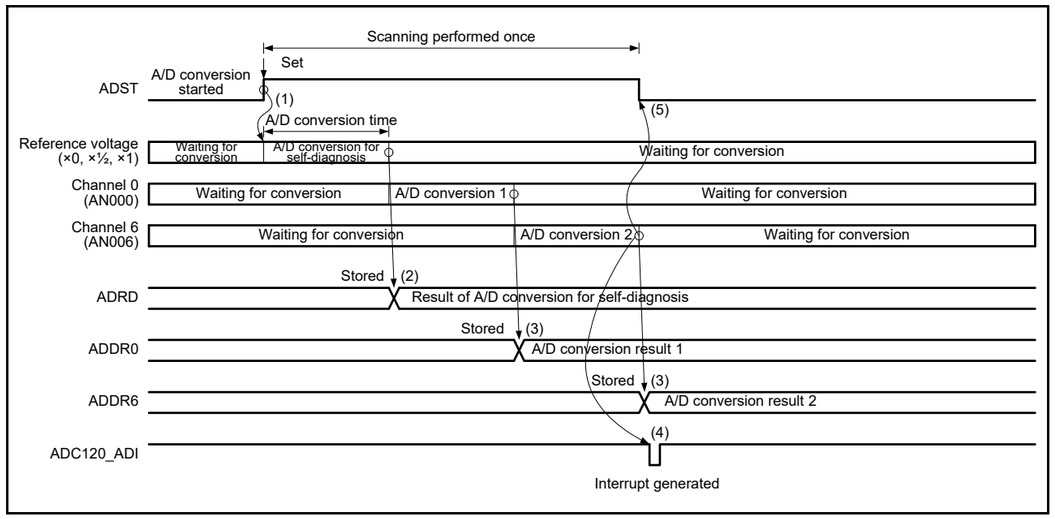

Figure 47.10 Example basic operation in single scan mode when AN000 and AN006 are selected with self-diagnosis

47.3.2.5 Channel selection and self-diagnosis with channel-dedicated sample-and-hold circuits and continuous sampling disabled

When channels and self-diagnosis are selected and a channel-dedicated sample-and-hold circuit is used while continuous sampling is disabled, the sample-and-hold operation is performed first, and then A/D conversion is performed once for the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (×0, ×1/2, or ×1) supplied to the ADC12. After that, A/D conversion is performed only once on the analog input of the selected channels.

The operation is as follows:

1. Analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. After sample-and-hold operation, A/D conversion for self-diagnosis starts.
3. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
5. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
6. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then the ADC12 enters a wait state.

操作如下：

1. 模拟输入采样开始于其专用采样保持电路的所有通道，当ADCSR.ADST位通过软件触发、同步触发输入(ELC)或异步触发输入设置为1（AD转换开始）。
2. 采样保持操作后，用于自诊断的AD转换开始。
3. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并ADANSA1寄存器，从编号n最小的通道开始。
4. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
5. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
6. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后ADC12进入等待状态。

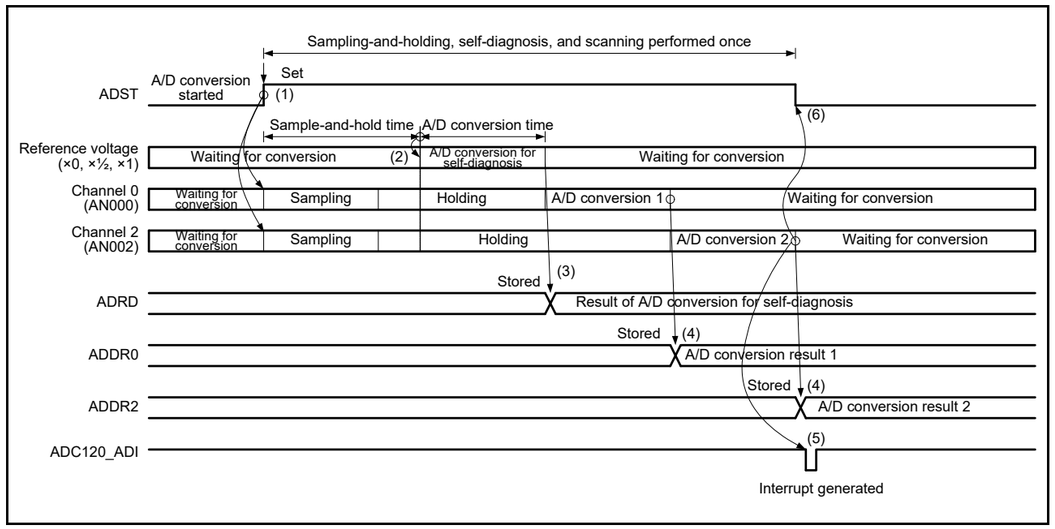

Figure 47.11 Example operation in single scan mode when channel-dedicated sample-and-hold circuits are used, AN000 and AN002 are selected with self-diagnosis, and continuous sampling is disabled

47.3.2.6 Channel selection and self-diagnosis with channel-dedicated sample-and-hold circuits and continuous sampling enabled

When channels and self-diagnosis are selected and a channel-dedicated sample-and-hold circuit is used while continuous sampling is enabled, sample-and-hold operations are performed first, and this is followed by A/D conversion of the reference voltage VREFH0 (unit 0) or VREFH (unit 1) supplied to the ADC12. After that, A/D conversion is performed only once on the analog input of the selected channels.

The operation is as follows:

1. When the ADSHMSR.SHMD bit is set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
2. Analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, input of a synchronous trigger signal (ELC), or input of an asynchronous trigger. Set the ADCSR.ADST bit to 1 after at least 400 ns (when the permissible signal source impedance is 1 kΩ) elapses after the ADSHMSR.SHMD bit is set to 1.
3. After the stabilization time of the sample-and-hold circuits elapses, A/D conversion for self-diagnosis starts.
4. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
5. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy), and the sample-and-hold circuit restarts continuous sampling.
6. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
7. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then the ADC12 enters a wait state. If this is followed by single scanning, set the continuous sampling time for the sample-and-hold circuits to at least 400 ns (when the permissible signal source impedance is 1 kΩ).
8. When the ADSHMSR.SHMD bit is set to 0, the sample-and-hold circuits stop.

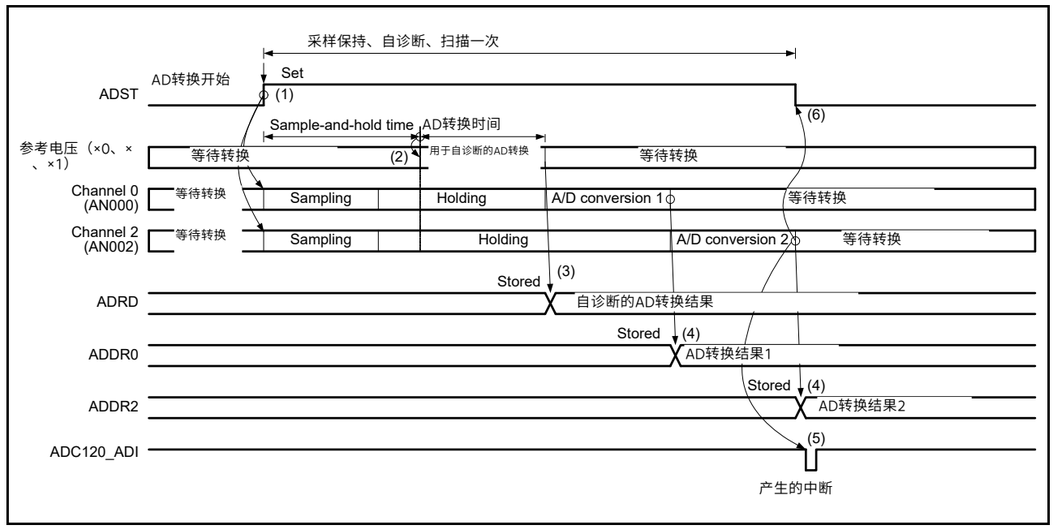

Figure 47.11 使用通道专用采样保持电路、AN000和AN002被选择为具有自诊断功能且连续采样被禁用时的单次扫描模式操作示例

47.3.2.6 通道选择和自诊断，带有通道专用的采样保持电路和连续采样使能

Whenchannelsandself-diagnosisareselectedandachannel-dedicatedsample-and-holdcircuitisusedwhilecontinuoussamplingisenabled sample-and-holdoperationsareperformedfirst andthisisfollowedbyADconversionofthereferencevoltageVREFH0(单元0)或VREFH(单元1)提供给ADC12。之后，仅对所选通道的模拟输入执行一次AD转换。

操作如下：

1. 当ADSHMSR.SHMD位设置为1时，在ADSHCR.SHANS[2:0]位中选择的采样保持电路开始连续采样。
2. 当通过软件触发将ADCSR.ADST位设置为1（AD转换开始）时，将使用通道专用采样保持电路的所有通道开始模拟输入保持，输入同步触发信号(ELC），或异步触发器的输入。在ADSHMSR.SHMD位设置为1后至少经过400ns（当允许的信号源阻抗为1kΩ时）后，将ADCSR.ADST位设置为1。
3. 经过采样保持电路的稳定时间后，开始进行自诊断的A/D转换。
4. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并ADANSA1寄存器，从编号n最小的通道开始。
5. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)，采样保持电路重新开始连续采样。

7. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后ADC12进入等待状态。如果随后进行单次扫描，请将采样保持电路的连续采样时间设置为至少400ns（当允许的信号源阻抗为1kΩ时）。
8. 当ADSHMSR.SHMD位设置为0时，采样保持电路停止。

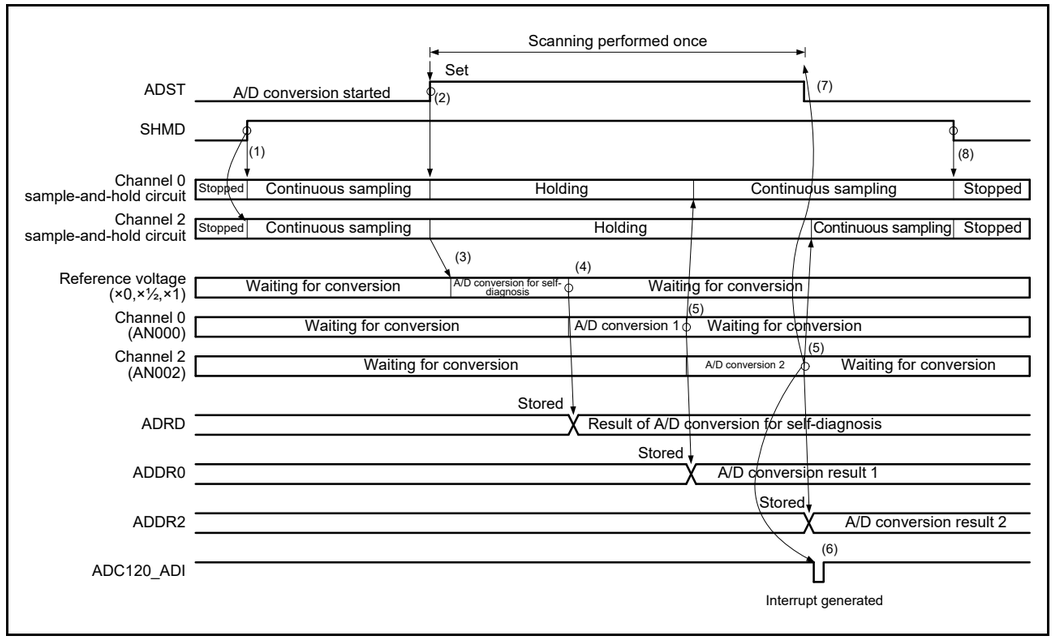

Figure 47.12 Example operation in single scan mode when channel-dedicated sample-and-hold circuits are used, AN000 to AN002 are selected with self-diagnosis, and continuous sampling is enabled

47.3.2.7 A/D conversion of temperature sensor output or internal reference voltage

When the channels and temperature sensor output or internal reference voltage are selected at the same time, A/D conversion is first performed on the analog input of the selected channels, and then A/D conversion is performed once on the temperature sensor output or internal reference voltage. When both temperature sensor output and internal reference voltage are selected, A/D conversion of the temperature sensor output and internal reference voltage is performed, in that order. With the channels deselected, selecting only the temperature sensor output or internal reference voltage is also possible.

The operation is as follows:

1. When a software trigger, synchronous trigger (ELC), or asynchronous trigger sets the ADCSR.ADST bit to 1 (A/D conversion start), A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. On completion of A/D conversion on the channels, the result is stored in the associated A/D Data Register y (ADDRy), and then A/D conversion of the temperature sensor output starts.
3. On completion of A/D conversion of the temperature sensor output, the result is stored in the associated A/D Temperature Sensor Data Register (ADTSDR), and then A/D conversion of the internal reference voltage starts.
4. On completion of A/D conversion of the internal reference voltage, the result is stored in the associated A/D Internal Reference Voltage Data Register (ADOCDR), and an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 on completion of A/D conversion. Then the ADC12 enters a wait state.

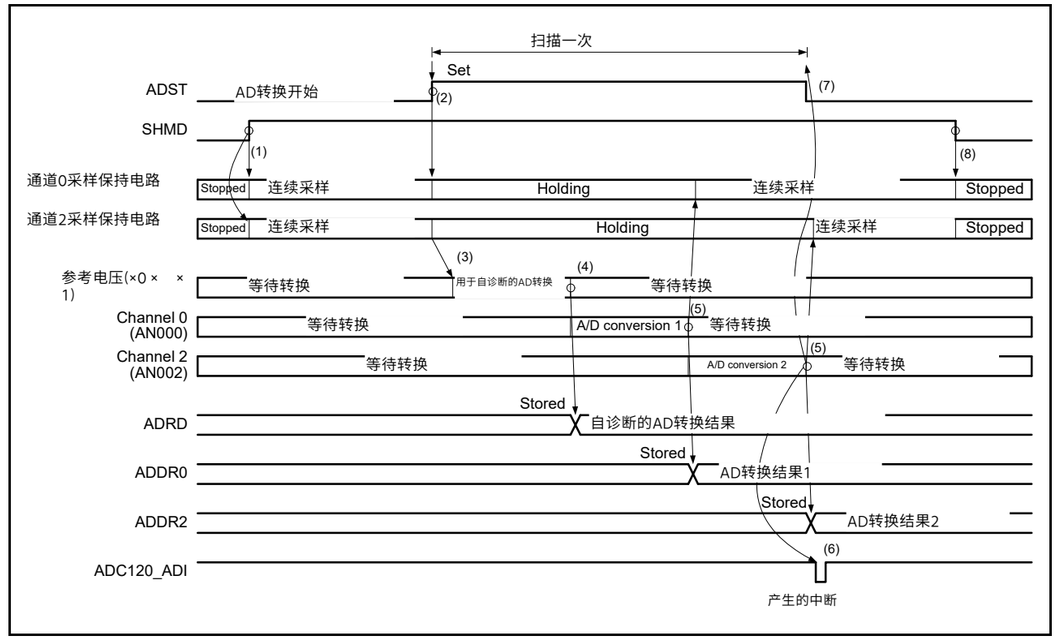

Figure 47.12 使用通道专用采样保持电路、AN000至AN002选择自诊断并启用连续采样时的单次扫描模式操作示例

47.3.2.7 温度传感器输出或内部参考电压的AD转换

当同时选择通道和温度传感器输出或内部参考电压时，首先对所选通道的模拟输入进行AD转换，然后对温度传感器输出或内部参考电压进行一次AD转换。当同时选择温度传感器输出和内部参考电压时，按顺序执行温度传感器输出和内部参考电压的AD转换。取消选择通道后，也可以仅选择温度传感器输出或内部参考电压。

操作如下：

1. 当软件触发、同步触发(ELC)或异步触发将ADCSR.ADST位设置为1（AD转换开始）时，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从具有最小的数n。
2. 在通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中，然后温度传感器输出的AD转换开始。
3. 温度传感器输出的AD转换完成后，结果存储在相关的AD中
温度传感器数据寄存器(ADTSDR)，然后内部参考电压的AD转换开始。
4. 内部参考电压的AD转换完成后，结果存储在相关的AD中
内部参考电压数据寄存器(AOCDR)，并产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
5. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动清零。然后ADC12进入等待状态。

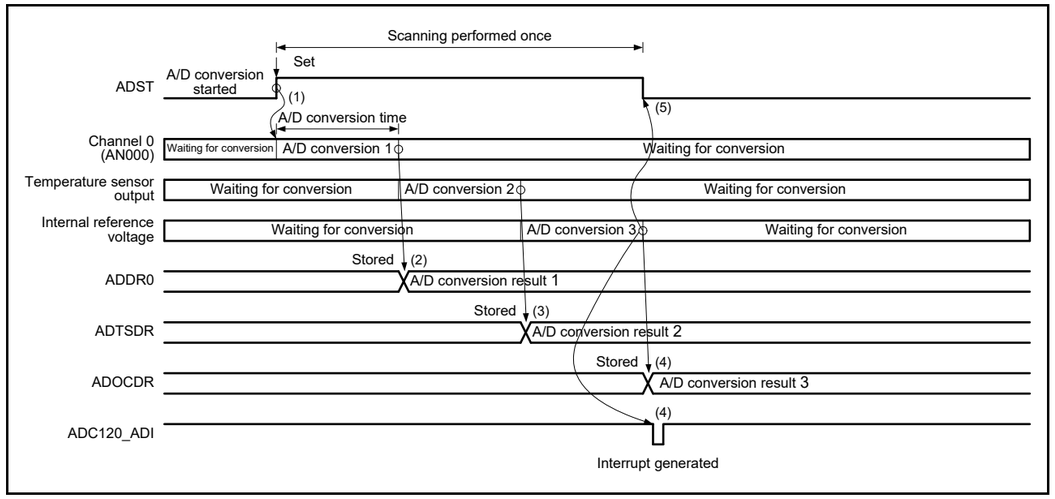

Figure 47.13 Example basic operation in single scan mode when AN000 and temperature sensor output or internal reference voltage are selected

47.3.2.8 A/D conversion in double-trigger mode

When double-trigger mode is selected in single scan mode, two rounds of single scan operation started by a synchronous trigger (ELC) are performed in sequence.

Deselect self-diagnosis, and set the addition/average mode select bits for both temperature sensor output (ADEXICR.TSSA) and internal reference voltage (ADEXICR.OCSA) to 0.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated in the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE to 1. When the ADCSR.DBLE is set to 1, channel selection using the ADANSA0 and ADANSA1 registers is invalid.

In double-trigger mode, select a synchronous trigger (ELC) using the ADSTRGR.TRSA[5:0] bits, and in ADCSR, set the EXTRG bit to 0 and the TRGE bit to 1. Do not use a software trigger.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a synchronous trigger input (ELC), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
3. The ADST bit is automatically cleared to 0 and the ADC12 enters a wait state. An ADC12i_ADI (i = 0, 1) interrupt request is not generated.
4. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by the second trigger input, A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
5. When A/D conversion completes, the result is stored in the A/D Data Duplexing Register (ADDBLDR), which is exclusively used in double-trigger mode.
6. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
7. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion completes. Then the ADC12 enters a wait state.

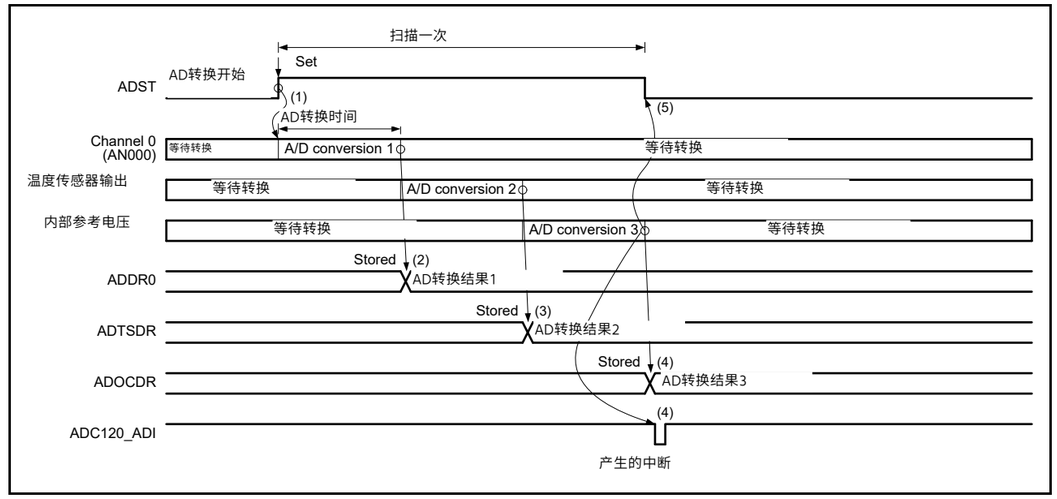

Figure 47.13 选择AN000和温度传感器输出或内部参考电压时单次扫描模式下的基本操作示例

47.3.2.8 双触发模式下的AD转换

在单次扫描模式下选择双触发模式时，由同步触发(ELC)启动的两轮单次扫描操作将依次执行。

取消选择自诊断，并将温度传感器输出(ADEXICR.TSSA)和内部参考电压(ADEXICR.OCSA)的加法平均模式选择位设置为0。

AD转换数据的复制通过在ADCSR.DBLANS[4:0]位并将ADCSR.DBLE设置为1。当ADCSR.DBLE设置为1时，使用ADANSA0和ADANSA1寄存器的通道选择无效。

在双触发模式下，使用ADSTRGR.TRSA[5:0]位选择同步触发(ELC)，在ADCSR中，将EXTRG位设置为0，将TRGE位设置为1。不要使用软件触发。

操作如下：

1. 当同步触发输入(ELC)将ADCSR.ADST位设置为1（AD转换开始）时，AD转换在ADCSR.DBLANS[4:0]位中选择的单个通道上开始。
2. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
3. ADST位自动清零，ADC12进入等待状态。不会产生ADC12i_ADI(i=0 1)中断请求。
4. 当第二个触发输入将ADCSR.ADST位设置为1（AD转换开始）时，AD转换在ADCSR.DBLANS[4:0]位中选择的单个通道上开始。
5. 当AD转换完成时，结果存储在AD数据双工寄存器(ADDBLDR)中，该寄存器专用于双触发模式。
6. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
7. ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动清零。然后ADC12进入等待状态。

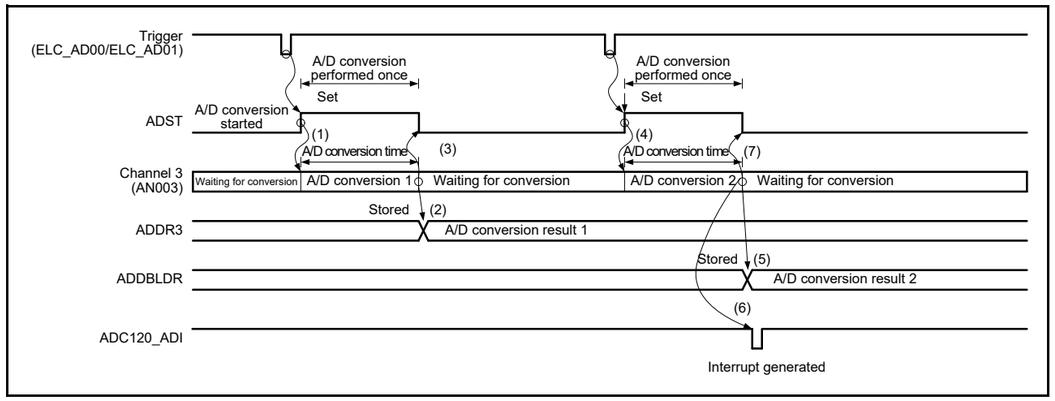

Figure 47.14 Example operation in single scan mode when double-trigger mode is selected and AN003 is duplicated

47.3.2.9 Extended operations when double-trigger mode is selected

When double-trigger mode is selected in single scan mode, and a synchronous trigger (ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1)) is selected as the trigger for the start of A/D conversion, two rounds of single scan operation are performed.

Deselect self-diagnosis, and set the addition/average mode select bits for both temperature sensor output (ADEXICR.TSSA and ADEXICR.TSSB) and internal reference voltage (ADEXICR.OCSA and ADEXICR.OCSB) to 0.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated in the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE bit to 1. When the ADCSR.DBLE bit is set to 1, channel selection using the ADANSA0 and ADANSA1 registers is invalid.

In extended double-trigger mode, select a synchronous trigger (ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1)) by setting the ADSTRGR.TRSA[5:0] bits to 0Bh, and in ADCSR, set the EXTRG bit to 0 and the TRGE bit to 1. Do not use a software trigger.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a synchronous trigger input (ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1)), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. When A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy) and in A/D Data Duplexing Register A (ADDBLDRA) or A/D Data Duplexing Register B (ADDBLDRB) when the trigger of ELC_ADi0 or ELC_ADi1 is input respectively (i=0, 1).
3. The ADCSR.ADST bit is automatically cleared to 0 and the ADC12 enters a wait state. An ADC12i_ADI (i = 0, 1) interrupt request is not generated.
4. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by the second trigger input (ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1)), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
5. When A/D conversion completes, the result is stored in the A/D Data Duplexing Register (ADDBLDR) and in A/D Data Duplexing Register A (ADDBLDRA) or A/D Data Duplexing Register B (ADDBLDRB) when the trigger of ELC_ADi0 or ELC_ADi1 is input respectively (i=0, 1).
6. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
7. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion and is automatically cleared to 0 when A/D conversion completes. Then the ADC12 enters a wait state.

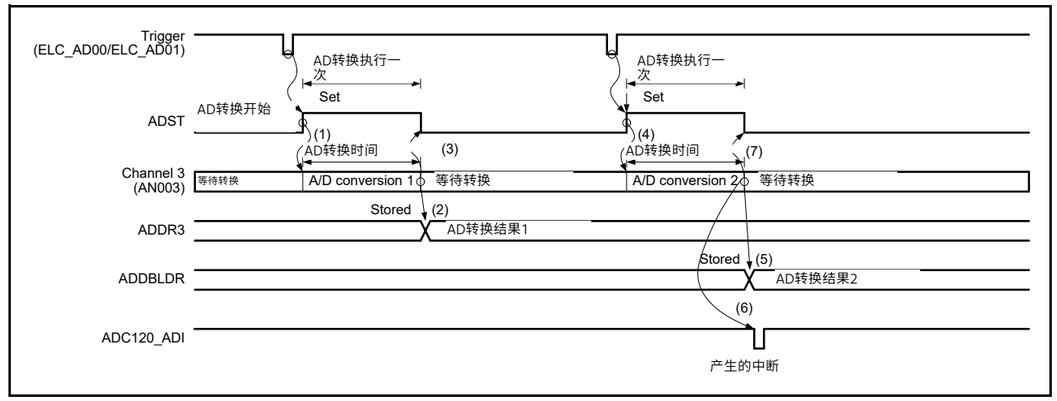

Figure 47.14 选择双触发模式并复制AN003时的单次扫描模式操作示例

47.3.2.9 选择双触发模式时的扩展操作

当在单扫描模式下选择双触发模式时，同步触发（ELC_AD00ELC_AD01（单元0），ELC_AD10ELC_AD11(unit1))被选为AD转换开始的触发器，执行两轮单次扫描操作。

取消选择自诊断，并将温度传感器输出（ADEXICR.TSSA和ADEXICR.TSSB）和内部参考电压（ADEXICR.OCSA和ADEXICR.OCSB）的加法平均模式选择位设置为0。

AD转换数据的复制通过在ADCSR.DBLANS[4:0]位并将ADCSR.DBLE位设置为1。当ADCSR.DBLE位设置为1时，使用ADANSA0和ADANSA1寄存器的通道选择无效。

在扩展双触发模式下，选择同步触发（ELC_AD00ELC_AD01（单元0），ELC_AD10ELC_AD11(unit1))通过将ADSTRGR.TRSA[5:0]位设置为0Bh，并在ADCSR中将EXTRG位设置为0并将TRGE位设置为1。不要使用软件触发。

操作如下：

1. 当同步触发输入（ELC_AD00ELC_AD01（单元0）、ELC_AD10ELC_AD11（单元1））将ADCSR.ADST位设置为1（AD转换开始）时，ADCSR.DBLANS[中选择的单通道上开始AD转换4:0]位。
2. 当单个通道的AD转换完成时，AD转换结果存储在关联的ADData中
   当分别输入ELC_ADi0或ELC_ADi1的触发时(i=0 1)，寄存器y(ADDRy)和AD数据双工寄存器A(ADDBLDRA)或AD数据双工寄存器B(ADDBLDRB)中。
3. ADCSR.ADST位自动清零，ADC12进入等待状态。不会产生ADC12i_ADI(i=0 1)中断请求。
4. 当第二个触发输入（ELC_AD00ELC_AD01（单元0）、ELC_AD10ELC_AD11（单元1））将ADCSR.ADST位设置为1（AD转换开始）时，ADCSR.DBLANS[中选择的单通道开始AD转换4:0]位。
5. 当AD转换完成时，结果存储在AD数据双工寄存器(ADDBLDR)和AD数据双工寄存器A(ADDBLDRA)或AD数据双工寄存器B(ADDBLDRB)中。
   分别输入ELC_ADi0或ELC_ADi1(i=0 1)。
6. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
7. ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动清零。然后ADC12进入等待状态。

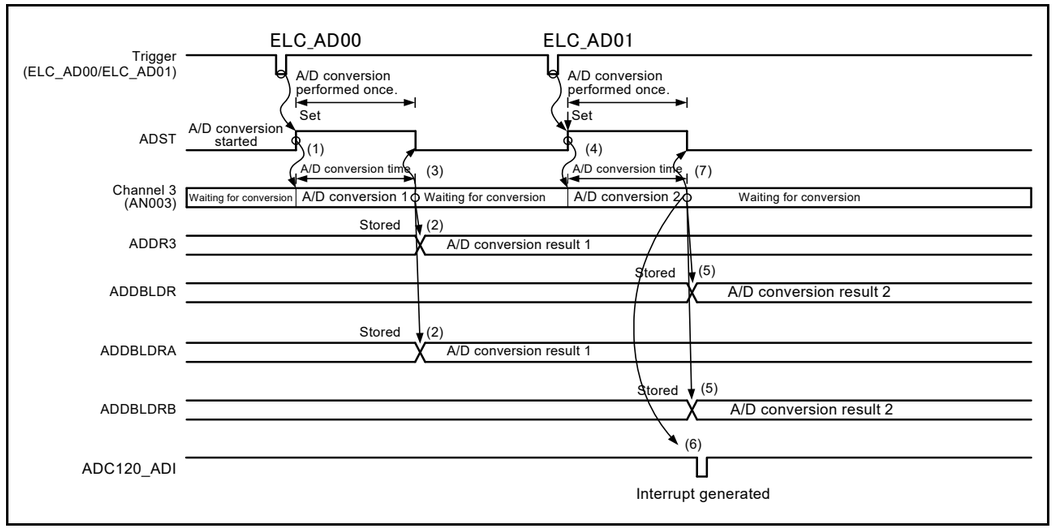

Figure 47.15 Example extended operation in double-trigger mode (1) when duplication is selected for AN003 and ELC_AD00/ELC_AD01 is selected

47.3.3 Continuous Scan Mode

47.3.3.1 Basic operation without channel-dedicated sample-and-hold circuits

In basic operation of continuous scan mode, A/D conversion is performed repeatedly on the analog input of the specified channels.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
3. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0,1) interrupt request is generated (no register setting). The ADC12 sequentially starts A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. The ADCSR.ADST bit is not automatically cleared, and steps 2 and 3 are repeated as long as the bit remains 1 (A/D conversion start). When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
5. When the ADST bit is then set to 1 (A/D conversion start), A/D conversion starts again for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.

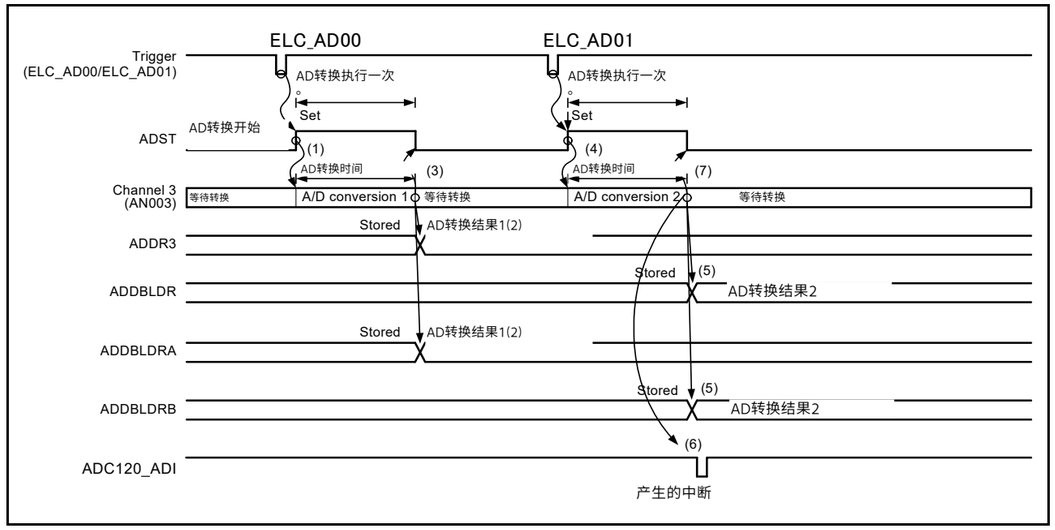

Figure 47.15 当为AN003选择复制并选择ELC_AD00ELC_AD01时，双触发模式下的扩展操作示例(1)

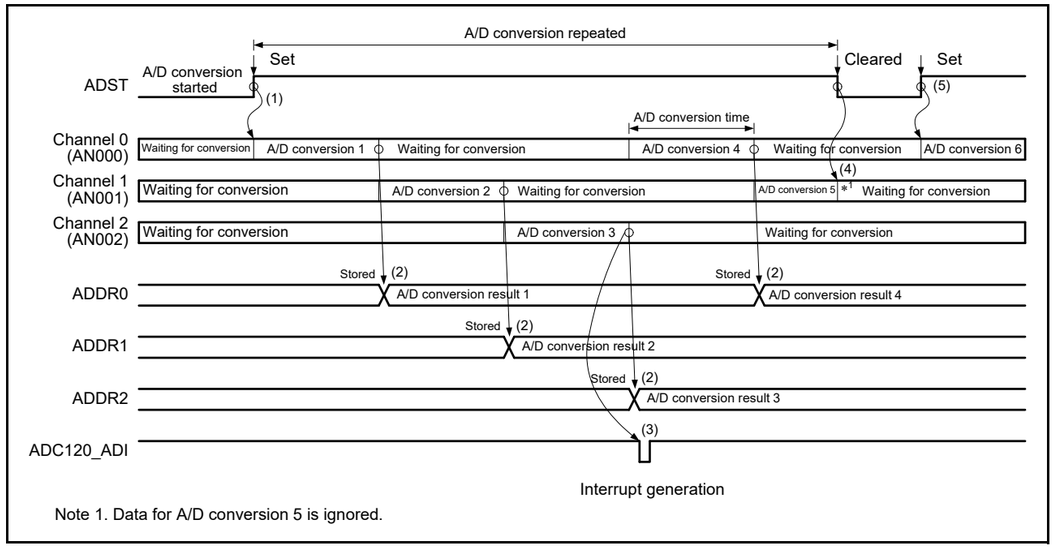
47.3.3 连续扫描模式

47.3.3.1 无通道专用采样保持电路的基本操作

在连续扫描模式的基本操作中，对指定通道的模拟输入重复进行AD转换。

操作如下：

1. 当通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，将从ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从具有最小编号n的通道。
2. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
3. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。ADC12从编号n最小的通道开始依次启动ADANSA0和ADANSA1寄存器中选择的ANn通道的A/D转换。
4. ADCSR.ADST位不会自动清零，只要该位保持为1（AD转换开始），就会重复步骤2和3。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
5. 然后当ADST位设置为1（AD转换开始）时，AD转换再次开始在ADANSA0和ADANSA1寄存器中选择的ANn通道，从具有最小编号n的通道开始。



Note 1. Data for A/D conversion 5 is ignored.

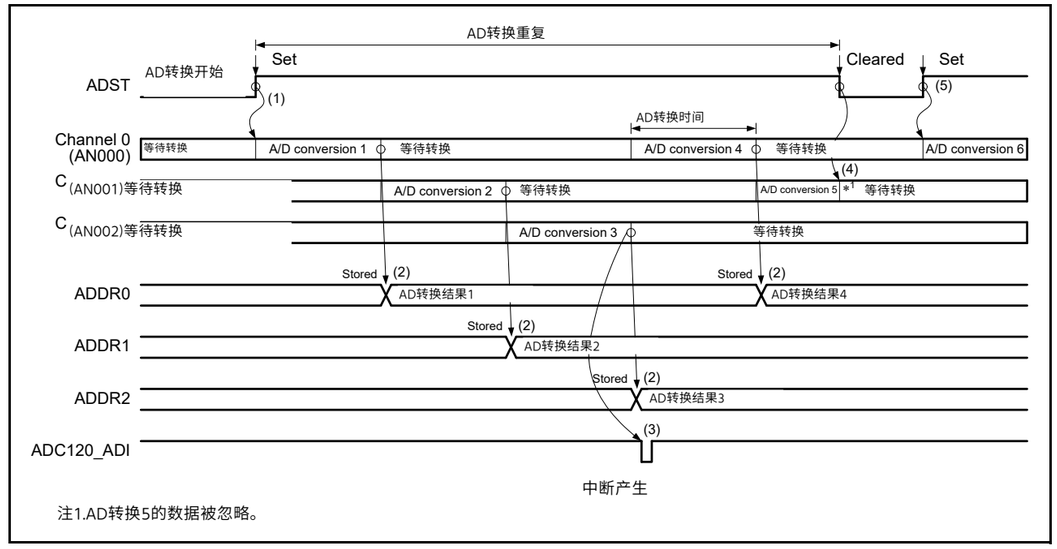
Figure 47.16 Example basic operation in continuous scan mode when AN000 to AN002 are selected

47.3.3.2 Basic operation with channel-dedicated sample-and-hold circuits and continuous sampling disabled

When the channel-dedicated sample-and-hold circuit is used while continuous sampling is disabled, sample-and-hold operation is first performed, and then A/D conversion is repeated on the analog input of all the specified channels. The channels whose dedicated sample-and-hold circuit is to be used can be selected in the SHANS[2:0] bits in ADSHCR.

The operation is as follows:

1. Analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. After sample-and-hold operation, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting). At the same time, analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used.
5. The ADST bit is not automatically cleared, and steps 2 to 4 are repeated as long as the bit remains 1. When the ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. When the ADST bit is then set to 1 (A/D conversion start), analog input sampling starts again for all channels whose dedicated sample-and-hold circuit is to be used.



注1.AD转换5的数据被忽略。

Figure 47.16 选择AN000至AN002时连续扫描模式下的基本操作示例

47.3.3.2 通道专用采样保持电路和禁用连续采样的基本操作

在禁用连续采样的情况下使用通道专用采样保持电路时，首先执行采样保持操作，然后在所有指定通道的模拟输入上重复AD转换。可以在ADSHCR的SHANS[2:0]位中选择要使用专用采样保持电路的通道。

操作如下：

1. 模拟输入采样开始于其专用采样保持电路的所有通道，当ADCSR.ADST位通过软件触发、同步触发输入(ELC)或异步触发输入设置为1（AD转换开始）。
2. 采样保持操作后，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从编号n最小的通道开始。
3. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)。
4. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。同时，对所有要使用专用采样保持电路的通道开始模拟输入采样。
5. ADST位不会自动清零，只要该位保持为1，就会重复步骤2到4。当ADST位设置为0（AD转换停止），AD转换停止，ADC12进入等待状态。
6. 当ADST位随后设置为1（AD转换开始）时，模拟输入采样将重新开始对所有要使用专用采样保持电路的通道进行。

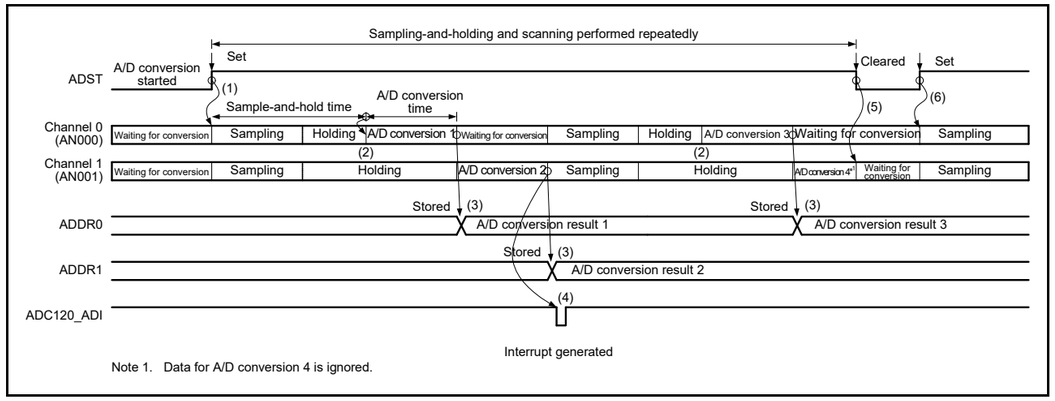


Figure 47.17 Example operation in continuous scan mode when channel-dedicated sample-and-hold circuits are used and AN000 and AN001 are selected

47.3.3.3 Basic operation with channel-dedicated sample-and-hold circuits and continuous sampling enabled

When a channel-dedicated sample-and-hold circuit is used while continuous sampling is enabled, sample-and-hold operations are performed first, after which the analog inputs on all selected channels are A/D-converted as described in this section. The channels for which the channel-dedicated sample-and-hold circuits are to be used can be selected in the ADSHCR.SHANS[2:0] bits.

The operation is as follows:

1. When the ADSHMSR.SHMD bit is set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
2. Analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, input of a synchronous trigger signal (ELC), or input of an asynchronous trigger. Set the ADCSR.ADST bit to 1 after at least 400 ns (when the permissible signal source impedance is 1 kΩ) elapses after the ADSHMSR.SHMD bit is set to 1.
3. After the stabilization time of the sample-and-hold circuits elapses, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy), and the sample-and-hold circuit restarts continuous sampling.
5. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting). Also, analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used.
6. The ADCSR.ADST bit is not automatically cleared, and steps 3 to 5 are repeated as long as the bit remains 1. When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
7. When the ADSHMSR.SHMD bit is set to 0, the sample-and-hold circuits stop.
8. When the ADSHMSR.SHMD bit is then set to 1, the sample-and-hold circuits selected in the ADSHCR.SHANS[2:0] bits start continuous sampling.
9. When the ADCSR.ADST bit is then set to 1 (A/D conversion start), analog input holding starts for all channels for which the channel-dedicated sample-and-hold circuits are to be used.

Note: If continuous scanning is performed when only the channels with the sample-and-hold circuits are selected, time for continuous sampling cannot be secured in the second and subsequent continuous scans. When continuous sampling by the channel-dedicated sample-and-hold circuits is enabled for continuous scanning, select one or more channels among AN003 to AN007 and AN016 to AN020, temperature sensor output, and internal reference voltage for unit 0, and AN103, AN105 to AN107 and AN116 to AN119, temperature sensor output, and internal

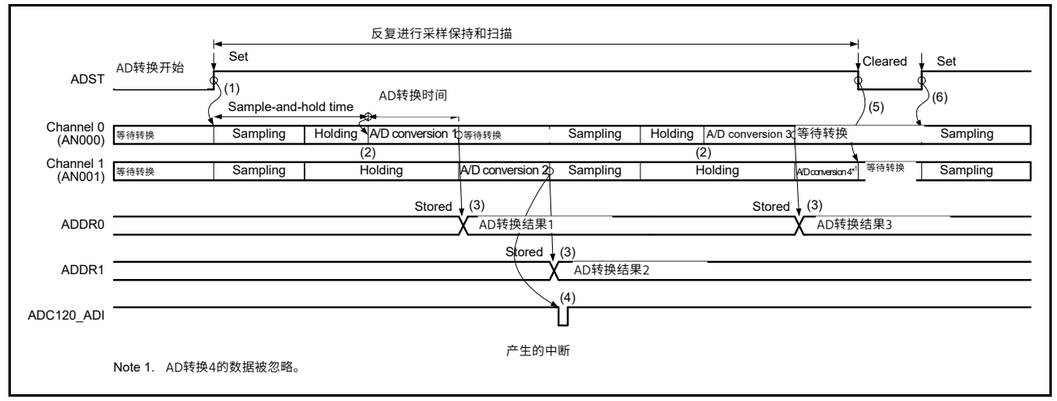

Figure 47.17 使用通道专用采样保持电路并选择AN000和AN001时连续扫描模式下的示例操作

47.3.3.3 具有通道专用采样保持电路和连续采样的基本操作

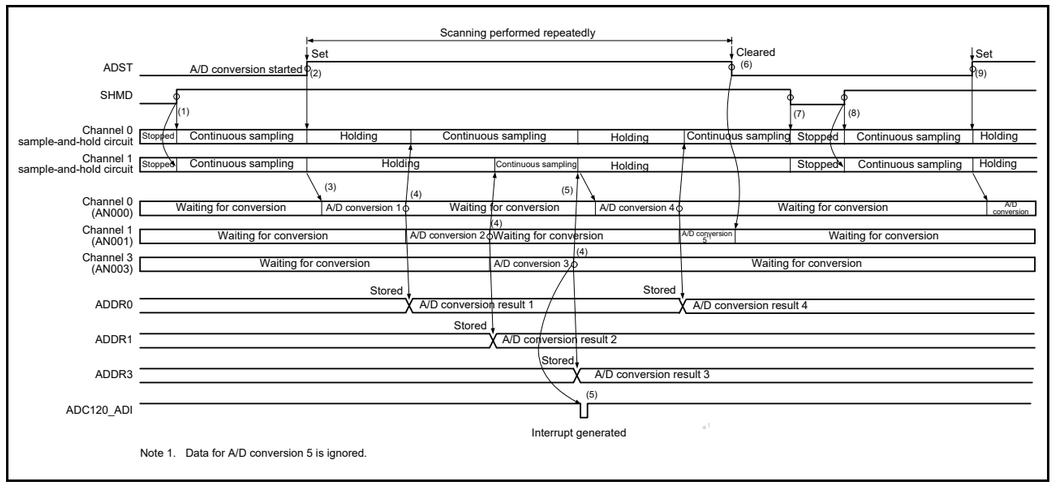
如果在启用连续采样的情况下使用通道专用的采样保持电路，则首先执行采样保持操作，然后将所有选定通道上的模拟输入进行AD转换，如本节所述。可以在ADSHCR.SHANS[2:0]位中选择要使用通道专用采样保持电路的通道。

操作如下：

1. 当ADSHMSR.SHMD位设置为1时，在ADSHCR.SHANS[2:0]位中选择的采样保持电路开始连续采样。
2. 当通过软件触发将ADCSR.ADST位设置为1（AD转换开始）时，将使用通道专用采样保持电路的所有通道开始模拟输入保持，输入同步触发信号(ELC），或异步触发器的输入。在ADSHMSR.SHMD位设置为1后至少经过400ns（当允许的信号源阻抗为1kΩ时）后，将ADCSR.ADST位设置为1。
3. 经过采样保持电路的稳定时间后，从编号n最小的通道开始，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换。
4. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中数据寄存器y(ADDRy)，采样保持电路重新开始连续采样。
5. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。此外，对于要使用通道专用采样保持电路的所有通道，模拟输入保持开始。
6. ADCSR.ADST位不会自动清零，只要该位保持1，就会重复步骤3到5。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止，ADC12进入等待状态。
7. 当ADSHMSR.SHMD位设置为0时，采样保持电路停止。
8. 当ADSHMSR.SHMD位被设置为1时，在ADSHCR.SHANS[2:0]位开始连续采样。
9. 然后，当ADCSR.ADST位设置为1（AD转换开始）时，将开始使用通道专用采样保持电路的所有通道的模拟输入保持。

Note: 如果在仅选择带有采样保持电路的通道时执行连续扫描，则在第二次和随后的连续扫描中无法确保连续采样的时间。当启用通道专用采样保持电路的连续采样以进行连续扫描时，在AN003至AN007和AN016至AN020、温度传感器输出和单元0的内部参考电压以及AN103、AN105中选择一个或多个通道到AN107和AN116到AN119，温度传感器输出和内部

reference voltage for unit 1, and set the continuous sampling time for the sample-and-hold circuits to at least 400 ns (when the permissible signal source impedance is 1 kΩ).



Note 1. Data for A/D conversion 5 is ignored.

Figure 47.18 Example operation in continuous scan mode when channel-dedicated sample-and-hold circuits are used, AN000, AN001, and AN003 are selected, and continuous sampling is enabled

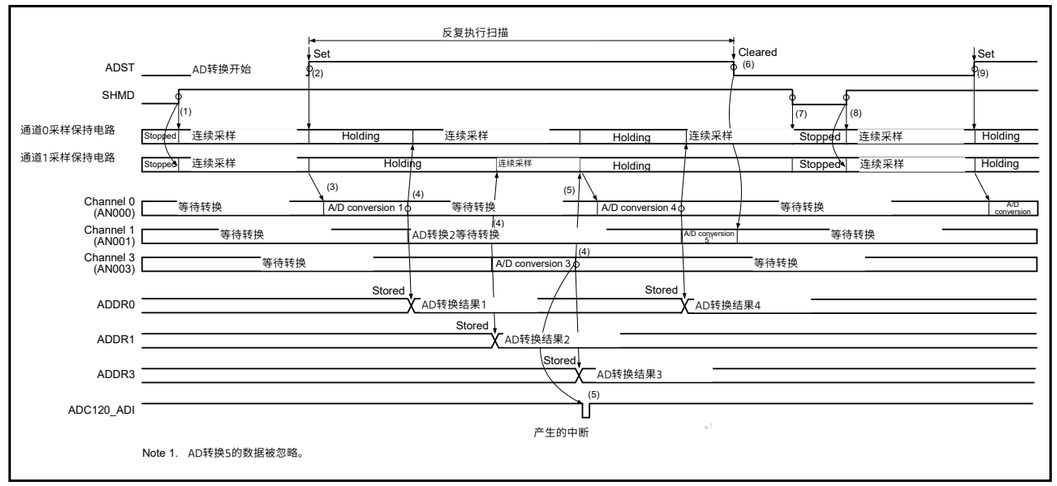
47.3.3.4 Channel selection and self-diagnosis without channel-dedicated sample-and-hold circuits

When channels and self-diagnosis are selected at the same time, A/D conversion is first performed for the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (×0, ×1/2, or ×1) supplied to the ADC12, and then A/D conversion is performed on the analog input of the selected channels, and this sequence is repeated.

The operation is as follows:

1. A/D conversion for self-diagnosis is first started when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting). At the same time, the ADC12 starts A/D conversion for self-diagnosis and then starts A/D conversion on ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
5. The ADST bit is not automatically cleared, and steps 2 to 4 are repeated as long as the bit remains 1. When the ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 when A/D conversion of all the selected channels completes. Then the ADC12 enters a wait state.

单元1的参考电压，并将采样保持电路的连续采样时间设置为至少400ns（当允许的信号源阻抗为1kΩ时）。



Note 1. AD转换5的数据被忽略。

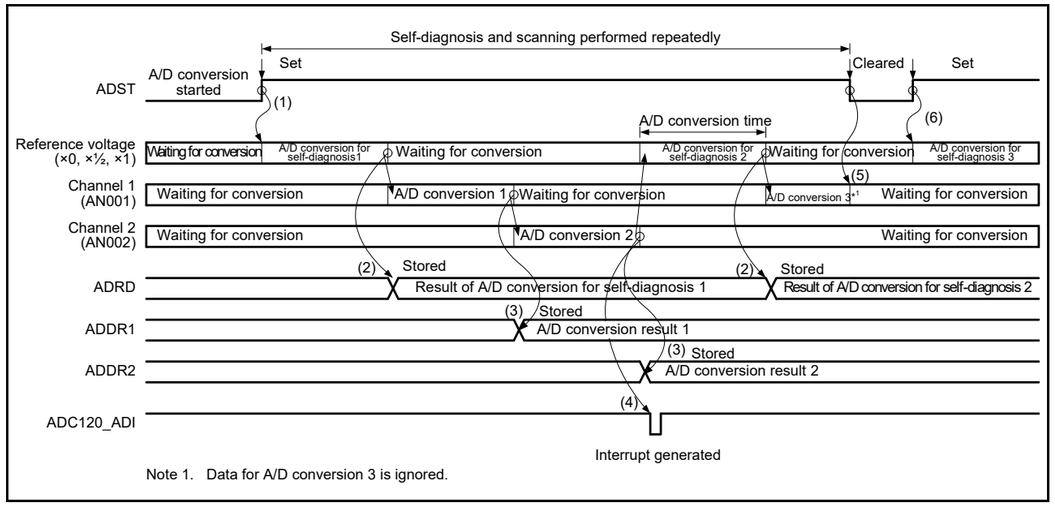
Figure 47.18 使用通道专用采样保持电路、选择AN000、AN001和AN003并启用连续采样时连续扫描模式下的示例操作

47.3.3.4 通道选择和自诊断，无需通道专用的采样和保持电路

当同时选择通道和自诊断时，首先对提供给ADC12的参考电压VREFH0（单元0）或VREFH（单元1）（×0、×12或×1）进行AD转换，然后对所选通道的模拟输入进行AD转换，并重复此序列。

操作如下：

1. 通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，首先启动用于自诊断的D转换。
2. 自诊断用AD转换完成后，AD转换结果存储在AD自诊断中
数据寄存器(ADRD)。然后对ADANSA0中选择的ANn通道执行D转换，并
ADANSA1寄存器，从编号n最小的通道开始。
3. 每次完成单个通道的AD转换，AD转换结果存储在关联的AD中
数据寄存器y(ADDRy)。
4. 当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。同时，ADC12启动AD转换以进行自诊断，然后从编号n最小的通道开始对ADANSA0和ADANSA1寄存器中选择的ANn通道进行AD转换。
5. ADST位不会自动清零，只要该位保持为1，就会重复步骤2到4。当
ADST位设置为0（AD转换停止），AD转换停止，ADC12进入等待状态。
6. ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动清零。然后ADC12进入等待状态。



Note 1. Data for A/D conversion 3 is ignored.

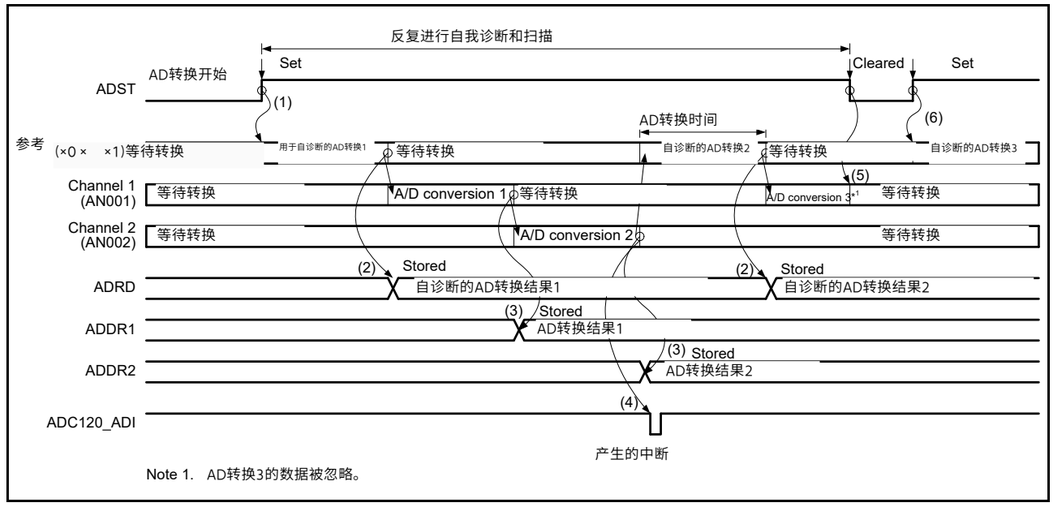
Figure 47.19 Example basic operation in continuous scan mode when AN001 and AN002 are selected with self-diagnosis

47.3.3.5 Channel selection and self-diagnosis with channel-dedicated sample-and-hold circuits and continuous sampling disabled

When channels and self-diagnosis are selected and a channel-dedicated sample-and-hold circuit is used while continuous sampling is disabled, sample-and- hold operation is first performed, and then A/D conversion is performed for the reference voltage VREFH0 (unit 0) or VREFH (unit 1) (×0, ×1/2, or ×1) supplied to the ADC12, and then A/D conversion is performed on the analog input of the selected channels, and this sequence is repeated.

The operation is as follows:

1. Analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, synchronous trigger input (ELC), or asynchronous trigger input.
2. After sample-and-hold operation, A/D conversion for self-diagnosis starts.
3. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
5. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting). At the same time, analog input sampling starts for all channels whose dedicated sample-and-hold circuit is to be used.
6. The ADST bit is not automatically cleared, and steps 2 to 5 are repeated as long as the bit remains 1. When the ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
7. When the ADST bit is then set to 1 (A/D conversion start), analog input sampling starts again for all channels whose dedicated sample-and-hold circuit is to be used.



Note 1. AD转换3的数据被忽略。

9. 当ADSHMSR.SHMD位被设置为1时，在ADSHCR.SHANS[2:0]位开始连续采样。

10.当ADCSR.ADST位被设置为1（AD转换开始）时，所有通道的模拟输入保持开始，所有通道都将使用通道专用的采样保持电路。

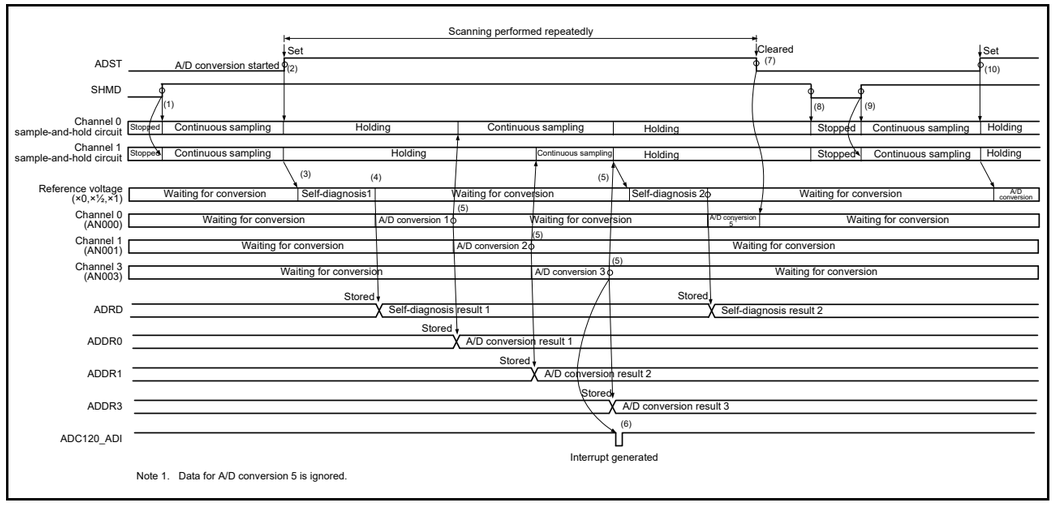

Figure 47.21 Example operation in continuous scan mode when channel-dedicated sample-and-hold circuits are used, AN000, AN001, and AN003 are selected with self-diagnosis, and continuous sampling is enabled

47.3.3.7 A/D conversion of temperature sensor output or internal reference voltage

When the channels and temperature sensor output or internal reference voltage are selected at the same time, A/D conversion is first performed on the analog input of the selected channels, and then A/D conversion of the temperature sensor output or internal reference voltage is repeated. When both temperature sensor output and internal reference voltage are selected, A/D conversion of the temperature sensor output and internal reference voltage is performed, in that order.

With the channels deselected, selecting only the temperature sensor output or internal reference voltage is also possible.

The operation is as follows:

1. When a software trigger, synchronous trigger (ELC), or asynchronous trigger sets the ADCSR.ADST bit to 1 (A/D conversion start), A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. On completion of A/D conversion on the channels, the result is stored in the associated A/D Data Register y (ADDRy), and then A/D conversion of temperature sensor output starts.
3. On completion of A/D conversion of the temperature sensor output, the result is stored in the associated A/D Temperature Sensor Data Register (ADTSDR), and then A/D conversion of internal reference voltage starts.
4. On completion of A/D conversion of the internal reference voltage, the result is stored in the associated A/D Internal Reference Voltage Data Register (ADOCDR), and an ADC12i_ADI interrupt request is generated. In addition, the ADC12 continuously starts A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the lowest number n.
5. The ADCSR.ADST bit is not cleared automatically, and steps 2 to 4 are repeated as long as this bit remains set to 1. When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. When the ADCSR.ADST bit is then set to 1 (A/D conversion start), A/D conversion starts again for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the lowest number n.

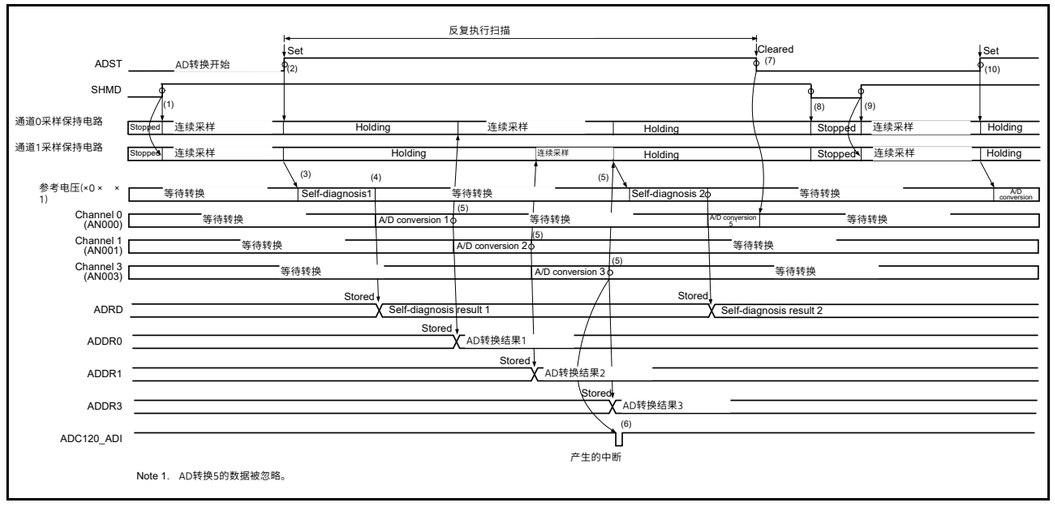

Figure 47.21 使用通道专用采样保持电路、AN000、AN001和AN003选择并进行自诊断并启用连续采样时在连续扫描模式下的示例操作

47.3.3.7 温度传感器输出或内部参考电压的AD转换

当同时选择通道和温度传感器输出或内部参考电压时，首先对所选通道的模拟输入进行AD转换，然后重复温度传感器输出或内部参考电压的AD转换。当同时选择温度传感器输出和内部参考电压时，按顺序执行温度传感器输出和内部参考电压的AD转换。

取消选择通道后，也可以仅选择温度传感器输出或内部参考电压。

操作如下：

1. 当软件触发、同步触发(ELC)或异步触发将ADCSR.ADST位设置为1（AD转换开始）时，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从具有最小的数n。
2. 在通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中，然后温度传感器输出的AD转换开始。
3. 温度传感器输出的AD转换完成后，结果存储在相关的AD温度传感器数据寄存器(ADTSDR)中，然后内部参考电压的AD转换开始。
4. 内部参考电压的AD转换完成后，结果存储在相关的AD中
内部参考电压数据寄存器(AOCDR)，并产生ADC12i_ADI中断请求。此外，ADC12连续启动ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换，从编号最小的通道n开始。
5. ADCSR.ADST位不会自动清零，只要该位保持设置为1，就会重复步骤2到4。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。
6. 当ADCSR.ADST位随后设置为1（AD转换开始）时，AD转换再次开始在ADANSA0和ADANSA1寄存器中选择的ANn通道，从编号最小的通道n开始。

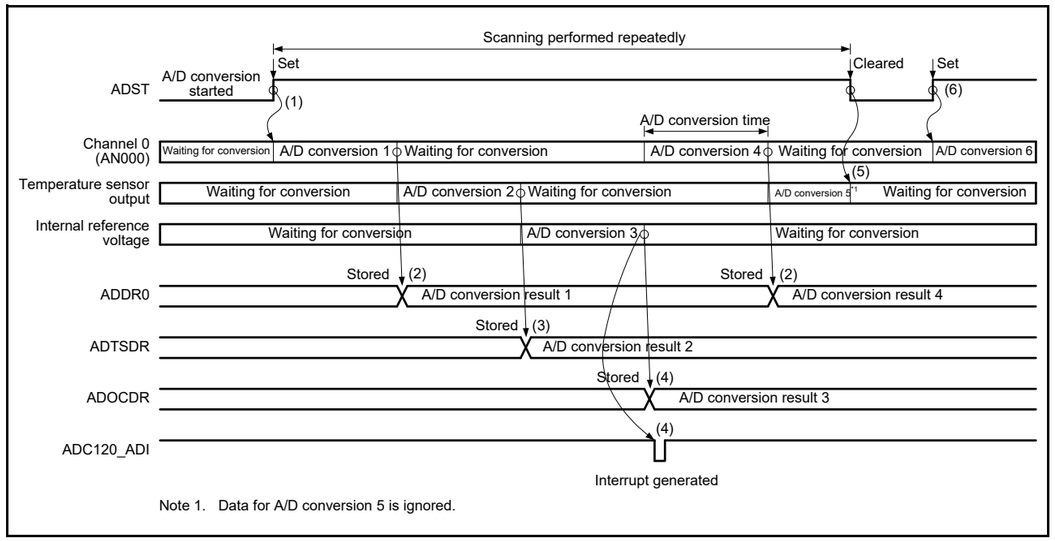

Figure 47.22 Example basic operation in continuous scan mode when AN000 and temperature sensor output or internal reference voltage are selected

47.3.4 Group Scan Mode

47.3.4.1 Basic operation

In group scan mode, A/D conversion is performed once on the analog inputs of all the specified channels in Group A and Group B after scanning is started by a synchronous trigger (ELC). The scan operation of each group is similar to the scan operation in single scan mode.

The synchronous triggers can be selected in the ADSTRGR.TRSA[5:0] bits for Group A and in the ADSTRGR.TRSB[5:0] bits for Group B. Use different triggers for Group A and Group B to prevent simultaneous A/D conversion of the two groups. Do not use a software trigger.

The Group A channels to be A/D-converted are selected using the ADANSA0 and ADANSA1 registers and the ADEXICR.TSSA and OCSA bits, while the Group B channels to be A/D-converted are selected using the ADANSB0 and ADANSB1 registers and the ADEXICR.TSSB and OCSB bits. Group A and Group B cannot use the same channels.

When self-diagnosis is selected in group scan mode, self-diagnosis is separately executed for Group A and Group B.

The following describes operation in group scan mode using a synchronous trigger from the ELC. In this example, the ELC_AD00 and ELC_AD01 (unit 0), and ELC_AD10 and ELC_AD11 (unit 1) triggers from the ELC are used to start conversion of Group A and Group B, respectively. Also, ELC_AD00 and ELC_AD01 (unit 0), and ELC_AD10 and ELC_AD11 (unit 1) are selected for the GPT event in the associated ELC.ELSRn registers.

The operation is as follows:

1. Scanning of Group A is started by ELC_AD00 (unit 0) or ELC_AD10 (unit 1).
2. When Group A scanning completes, an ADC12i_ADI (i = 0, 1) interrupt is generated (no register setting).
3. Scanning of Group B is started by ELC_AD01 (unit 0) or ELC_AD11 (unit 1).
4. When Group B scanning completes, an ADC12i_GBADI interrupt is generated if the ADCSR.GBADIE bit is 1 (ADC12i_GBADI interrupt when scanning completion is enabled).

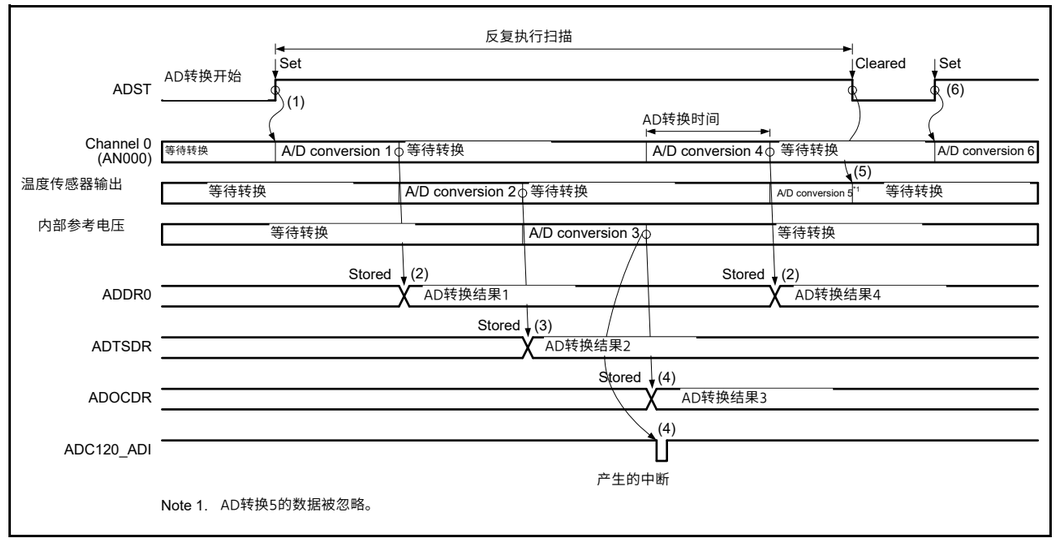

Figure 47.22 选择AN000和温度传感器输出或内部参考电压时连续扫描模式下的基本操作示例

47.3.4 组扫描模式

47.3.4.1 基本操作

在组扫描模式下，由同步触发（ELC）启动扫描后，对A组和B组中所有指定通道的模拟输入进行一次A/D转换。每组的扫描操作类似于单次扫描模式下的扫描操作。

可以在A组的ADSTRGR.TRSA[5:0]位和
B组的ADSTRGR.TRSB[5:0]位。对A组和B组使用不同的触发，以防止两组同时进行AD转换。不要使用软件触发。

使用ADANSA0和ADANSA1寄存器和
ADEXICR.TSSA和OCSA位，而要进行AD转换的B组通道使用ADANSB0和ADANSB1寄存器以及ADEXICR.TSSB和OCSB位进行选择。A组和B组不能使用相同的通道。

在组扫描模式下选择自诊断时，对A组和B组分别执行自诊断。

下面介绍使用来自ELC的同步触发的组扫描模式下的操作。在此示例中，ELC_AD00和ELC_AD01（单元0）以及来自ELC的ELC_AD10和ELC_AD11（单元1）触发器分别用于启动A组和B组的转换。此外，ELC_AD00和ELC_AD01（单元0）以及ELC_AD10和ELC_AD11（单元1）被选择用于相关ELC.ELSRn寄存器中的GPT事件。

操作如下：

1. A组的扫描由ELC_AD00（单元0）或ELC_AD10（单元1）启动。
2. 当A组扫描完成时，会产生ADC12i_ADI(i=0 1)中断（无寄存器设置）。
3. B组的扫描由ELC_AD01（单元0）或ELC_AD11（单元1）启动。
4. 当B组扫描完成时，如果ADCSR.GBADIE位为1（使能扫描完成时ADC12i_GBADI中断），则会产生ADC12i_GBADI中断。

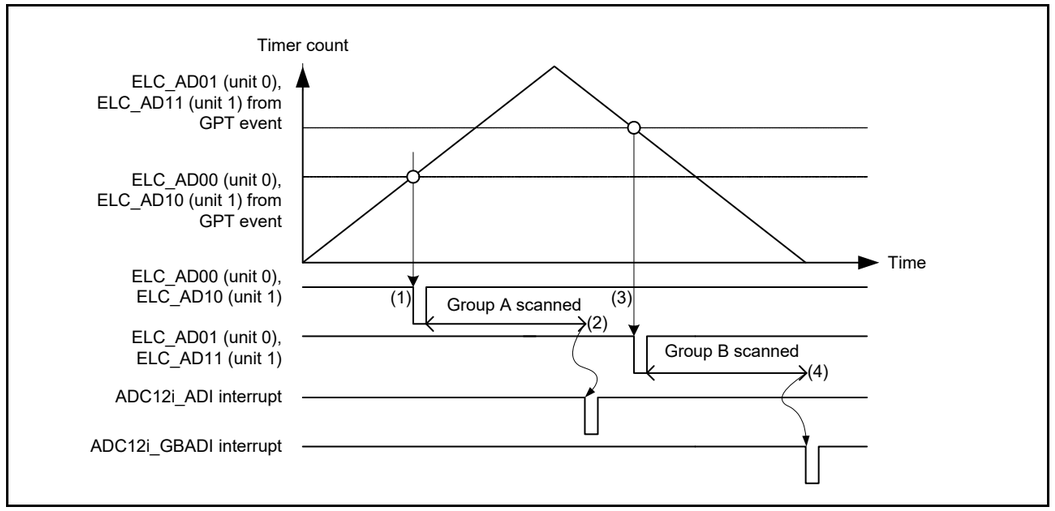

Figure 47.23 Example basic operation in group scan mode when synchronous triggers from the ELC are used

47.3.4.2 A/D conversion in double-trigger mode

When double-trigger mode is selected in group scan mode, two rounds of single scan operation started by a synchronous trigger (ELC) are performed as a sequence for Group A. For Group B, single scan operation started by a synchronous trigger (ELC) is performed once.

In group scan mode, the synchronous triggers can be selected in the TRSA[5:0] bits in ADSTRGR for Group A and in the TRSB[5:0] bits in ADSTRGR for Group B. Use different triggers for Group A and Group B to prevent simultaneous A/D conversion of the two groups. Do not use a software trigger or an asynchronous trigger (ADTRGn).

When ELC_AD00/ELC_AD01 (unit 0), ELC_AD10/ELC_AD11 (unit 1) is selected as the Group A synchronous triggers by setting the ADSTRGR.TRSA[5:0] bits to 0Bh, operation proceeds in extended double-trigger mode.

The channels to be A/D-converted are selected in the DBLANS[4:0] bits in the ADCSR register for Group A and in the ADANSB0 and ADANSB1 registers for Group B. The same channels cannot be selected for both groups.

When double-trigger mode is selected in group scan mode, set the A/D conversion select bits for both the temperature sensor output (ADEXICR.TSSA) and the internal reference voltage (ADEXICR.OCSA) to 0 (deselected). Self-diagnosis cannot be selected when double-trigger mode is selected in group scan mode.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated to the ADCSR.DBLANS[4:0] bits and setting the DBLE bit in ADCSR to 1.

The following describes operation in group scan mode with double-trigger mode using a synchronous trigger from the ELC. In this example, the ELC_AD00 and ELC_AD01 (unit 0), ELC_AD10 and ELC_AD11 (unit 1) triggers from the ELC are used to start conversion of Group A and Group B, respectively. Also, ELC_AD00 and ELC_AD01 (unit 0), ELC_AD10 and ELC_AD11 (unit 1) are selected for the GPT event in the associated ELC.ELSRn registers.

The operation is as follows:

1. Scanning of Group B is started by the ELC_AD00 (unit 0) or ELC_AD10 (unit 1) trigger from the ELC.
2. When Group B scanning completes, an ADC12i_GBADI (i = 0, 1) interrupt is generated if the GBADIE bit in ADCSR is 1 (ADC12i_GBADI interrupt when scanning completion is enabled).
3. The first scan of Group A is started by the first ELC_AD01 (unit 0) or ELC_AD11 (unit 1) trigger.
4. When the first scan of Group A completes, the conversion result is stored in the associated A/D Data Register y (ADDRy); an ADC12i_ADI interrupt request is not generated, regardless of the ADIE bit setting in ADCSR.
5. The second scan of Group A is started by the second ELC_AD01 (unit 0) or ELC_AD11 (unit 1) trigger.

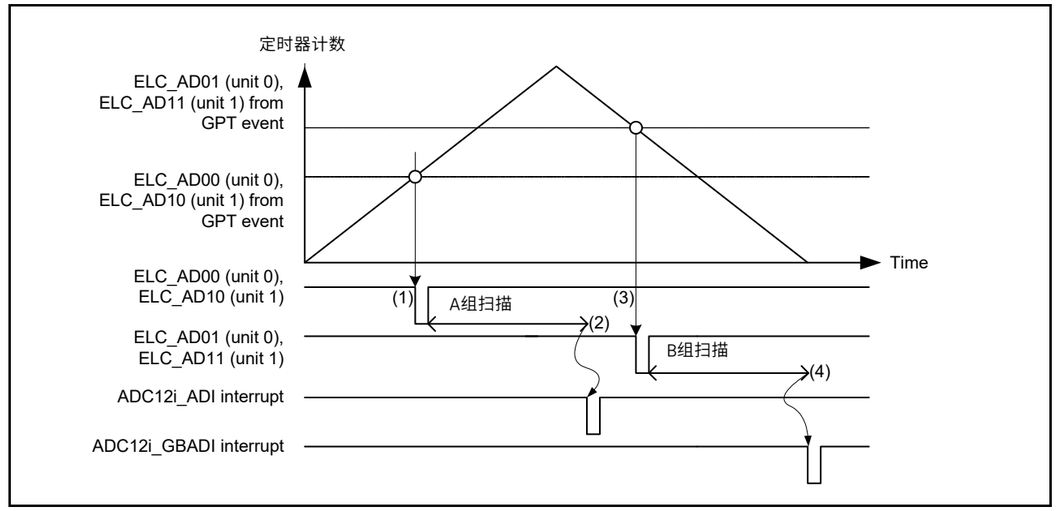

Figure 47.23 使用来自ELC的同步触发时组扫描模式下的基本操作示例

47.3.4.2 双触发模式下的AD转换

在组扫描模式中选择双触发模式时，由同步触发(ELC)启动的两轮单次扫描操作作为A组的顺序执行。对于B组，由同步触发(ELC)启动的单次扫描操作执行一次。

在组扫描模式下，可以在A组的ADSTRGR的TRSA[5:0]位和B组的ADSTRGR的TRSB[5:0]位中选择同步触发。为A组和B组使用不同的触发以防止两组同时进行AD转换。不要使用软件触发或异步触发(ADTRGn)。

当通过将ADSTRGR.TRSA[5:0]位设置为0Bh来选择ELC_AD00ELC_AD01（单元0）、ELC_AD10ELC_AD11（单元1）作为A组同步触发时，操作在扩展双触发模式下进行。

要进行AD转换的通道在A组的ADCSR寄存器的DBLANS[4:0]位和
B组的ADANSB0和ADANSB1寄存器。不能为两个组选择相同的通道。

在组扫描模式下选择双触发模式时，将温度传感器输出(ADEXICR.TSSA)和内部参考电压(ADEXICR.OCSA)的AD转换选择位设置为0（取消选择）。在组扫描模式下选择双触发模式时，不能选择自诊断。

AD转换数据的复制通过将要复制的通道号设置为
ADCSR.DBLANS[4:0]位并将ADCSR中的DBLE位设置为1。

下面介绍使用来自ELC的同步触发的双触发模式的组扫描模式下的操作。在本例中，ELC_AD00和ELC_AD01（单元0）、ELC_AD10和ELC_AD11（单元1）从
ELC分别用于启动A组和B组的转换。此外，ELC_AD00和ELC_AD01（单元0），
在关联的ELC.ELSRn寄存器中为GPT事件选择ELC_AD10和ELC_AD11（单元1）。

操作如下：

1. B组的扫描由来自ELC的ELC_AD00（单元0）或ELC_AD10（单元1）触发器启动。
2. 当B组扫描完成时，如果GBADIE位在
   ADCSR为1（启用扫描完成时ADC12i_GBADI中断）。
3. A组的第一次扫描由第一个ELC_AD01（单元0）或ELC_AD11（单元1）触发器启动。
4. 当A组的第一次扫描完成时，转换结果存储在相关的AD数据寄存器y（ADDRy）中；无论ADCSR中的ADIE位设置如何，都不会产生ADC12i_ADI中断请求。
5. A组的第二次扫描由第二个ELC_AD01（单元0）或ELC_AD11（单元1）触发器启动。

6. When the second scan of Group A completes, the conversion result is stored in ADDBLDR. An ADC12i_ADI interrupt is generated.

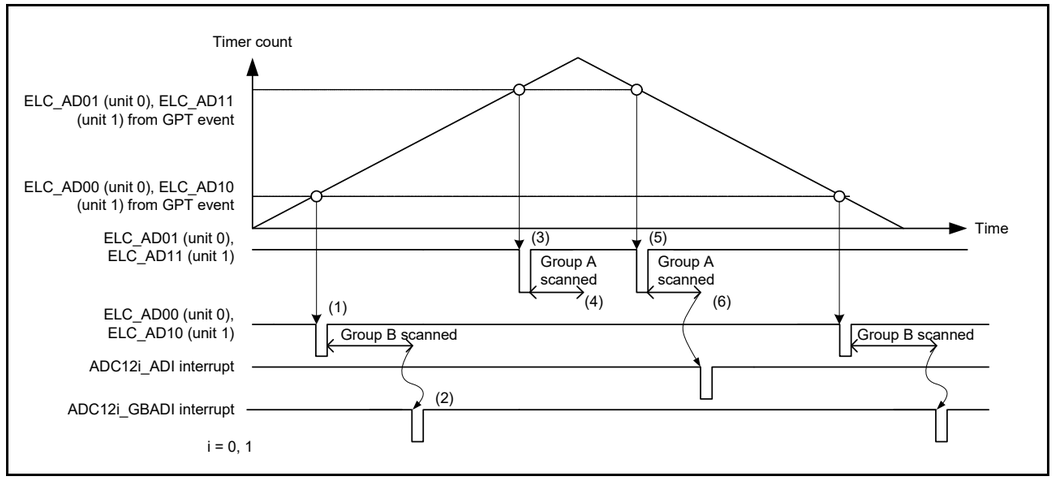

Figure 47.24 Example basic operation in group scan mode with double-trigger mode when synchronous triggers from the ELC are used

47.3.4.3 Operation with group A priority control

Setting the ADGSPCR.PGS bit to 1 in group scan mode makes operation proceed under Group A priority control. When setting the PGS bit in the ADGSPCR register to 1, follow the procedure shown in Figure 47.25. If the procedure is not followed, A/D conversion operation and stored data are not guaranteed.

In basic group scan mode, while A/D conversion is underway for group A or group B, input of the trigger for A/D conversion for the other group is ignored. Under Group A priority control, if a Group A trigger is input during A/D conversion for Group B, A/D conversion for Group B is discontinued and A/D conversion for Group A proceeds. If the setting in the ADGSPCR.GBRSCN bit is 0, the ADC12 enters wait state on completion of the A/D conversion for Group A. If the setting in the ADGSPCR.GBRSCN bit is 1, the ADC12 automatically restarts scanning for Group B from the head of the group after completion of the A/D conversion for Group A. Table 47.9 summarizes operations in response to the input of a trigger during A/D conversion with the settings in the ADGSPCR.GBRSCN bit.

Scan operations in Group A or Group B are the same in single scan mode. Additionally, single scanning continues to proceed if the ADGSPCR.GBRP bit is set to 1 during scanning operations for Group B.

For the trigger settings in group scan mode, select a synchronous trigger for Group A using the ADSTRGR.TRSA[5:0] bits, and select a synchronous trigger for Group B, different from that of Group A, using the ADSTRGR.TRSB[5:0] bits. Set the ADSTRGR.TRSB[5:0] bits to 3Fh when setting the ADGSPCR.GBRP bit to 1.

Additionally, as targets for A/D conversion, select channels for Group A using the ADANSA0 and ADANSA1 registers and the ADEXICR.TSSA and OCSA bits, and for Group B, select channels different from those for Group A using the ADANSB0 and ADANSB1 registers and the ADEXICR.TSSB and OCSB bits.

6. 当A组的第二次扫描完成时，转换结果存储在ADDBLDR中。产生一个ADC12i_ADI中断。

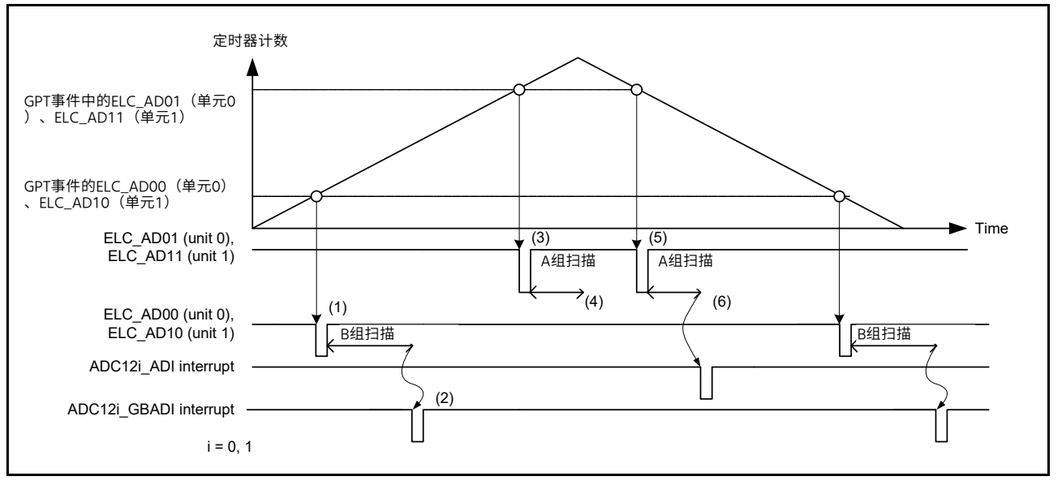

Figure 47.24 当使用来自ELC的同步触发时，具有双触发模式的组扫描模式下的基本操作示例

47.3.4.3 A组优先控制操作

在组扫描模式中将ADGSPCR.PGS位设置为1可使操作在A组优先级控制下进行。将ADGSPCR寄存器中的PGS位设置为1时，请按照图47.25中所示的步骤进行操作。如果不遵循该程序，则无法保证AD转换操作和存储数据。

在基本组扫描模式下，当A组或B组正在进行AD转换时，忽略其他组的AD转换触发输入。在A组优先控制下，如果在B组的AD转换期间输入A组触发，则停止B组的AD转换，继续A组的AD转换。如果ADGSPCR.GBRSCN位设置为0，ADC12在A组AD转换完成时进入等待状态。如果ADGSPCR.GBRSCN位设置为1，ADC12自动从头部重新开始扫描B组组A的AD转换完成后的组。表47.9总结了在ADGSPCR.GBRSCN位中设置的AD转换期间响应触发输入的操作。

A组或B组的扫描操作在单次扫描模式下是相同的。此外，如果在B组的扫描操作期间ADGSPCR.GBRP位设置为1，则单次扫描会继续进行。

对于组扫描模式下的触发设置，使用ADSTRGR.TRSA[5:0]位为A组选择一个同步触发，并使用ADSTRGR.TRSB[为B组选择一个与A组不同的同步触发5:0]位。将ADGSPCR.GBRP位设置为1时，将ADSTRGR.TRSB[5:0]位设置为3Fh。

此外，作为AD转换的目标，使用ADANSA0和ADANSA1寄存器以及ADEXICR.TSSA和OCSA位为A组选择通道，对于B组，使用ADANSB0和ADANSB1寄存器以及ADEXICR选择与A组不同的通道.TSSB和OCSB位。

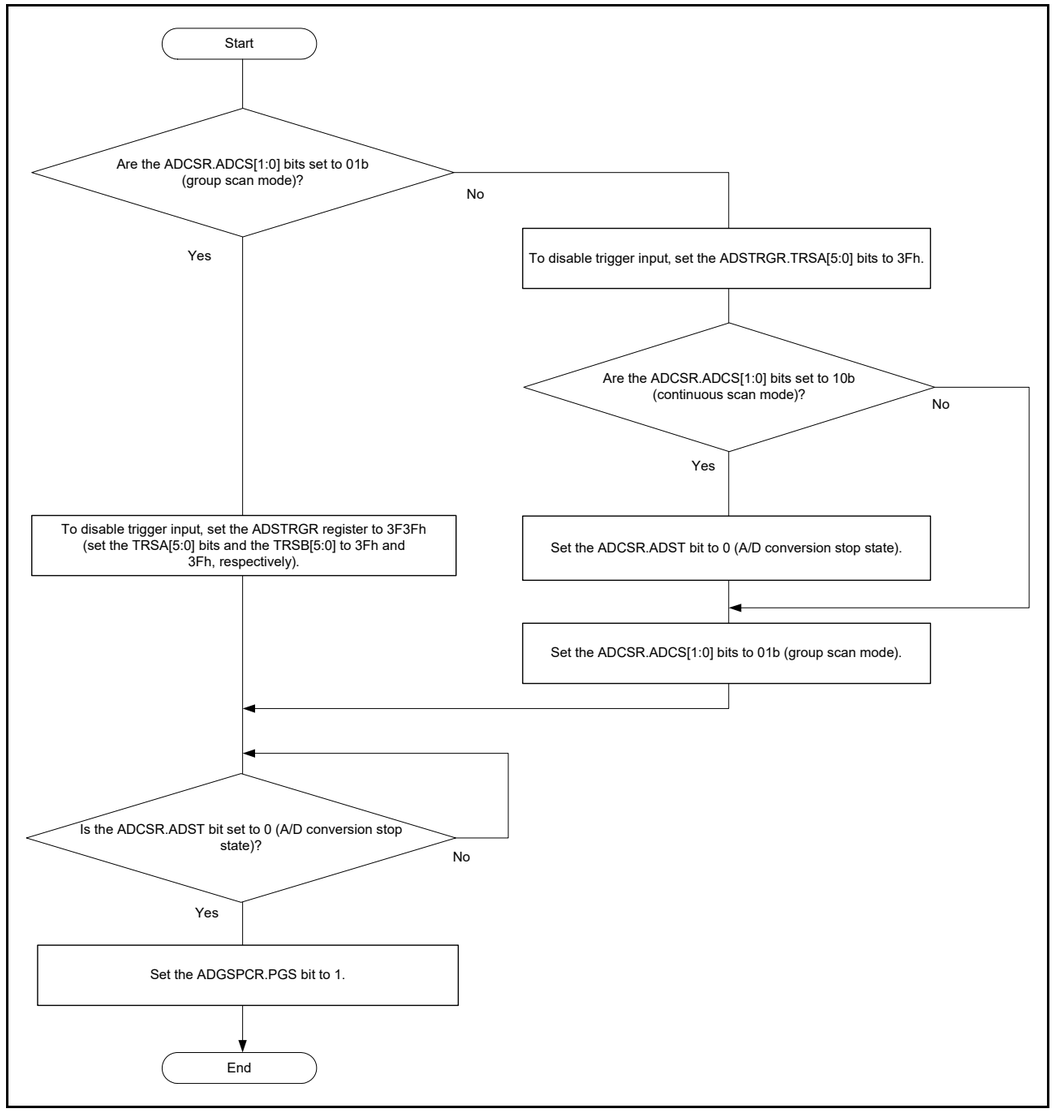

Figure 47.25 Flow for ADGSPCR.PGS bit setting

Table 47.9 Control of A/D conversion operations based on the ADGSPCR.GBRSCN bit settings

A/D conversion operation	Trigger input	ADGSPCR.GBRSCN = 0	ADGSPCR.GBRSCN = 1
When A/D conversion for Group A is in progress	Input of Group A trigger	Trigger input is invalid	Trigger input is invalid
	Input of Group B trigger	Trigger input is invalid	Group B is converted after Group A conversion completes
When A/D conversion for Group B is in progress	Input of Group A trigger	Group B conversion stops and Group A conversion starts	• Group B conversion stops and Group A conversion starts • Group B Conversion starts after Group A conversion completes
	Input of Group B trigger	Trigger input is invalid	Trigger input is invalid

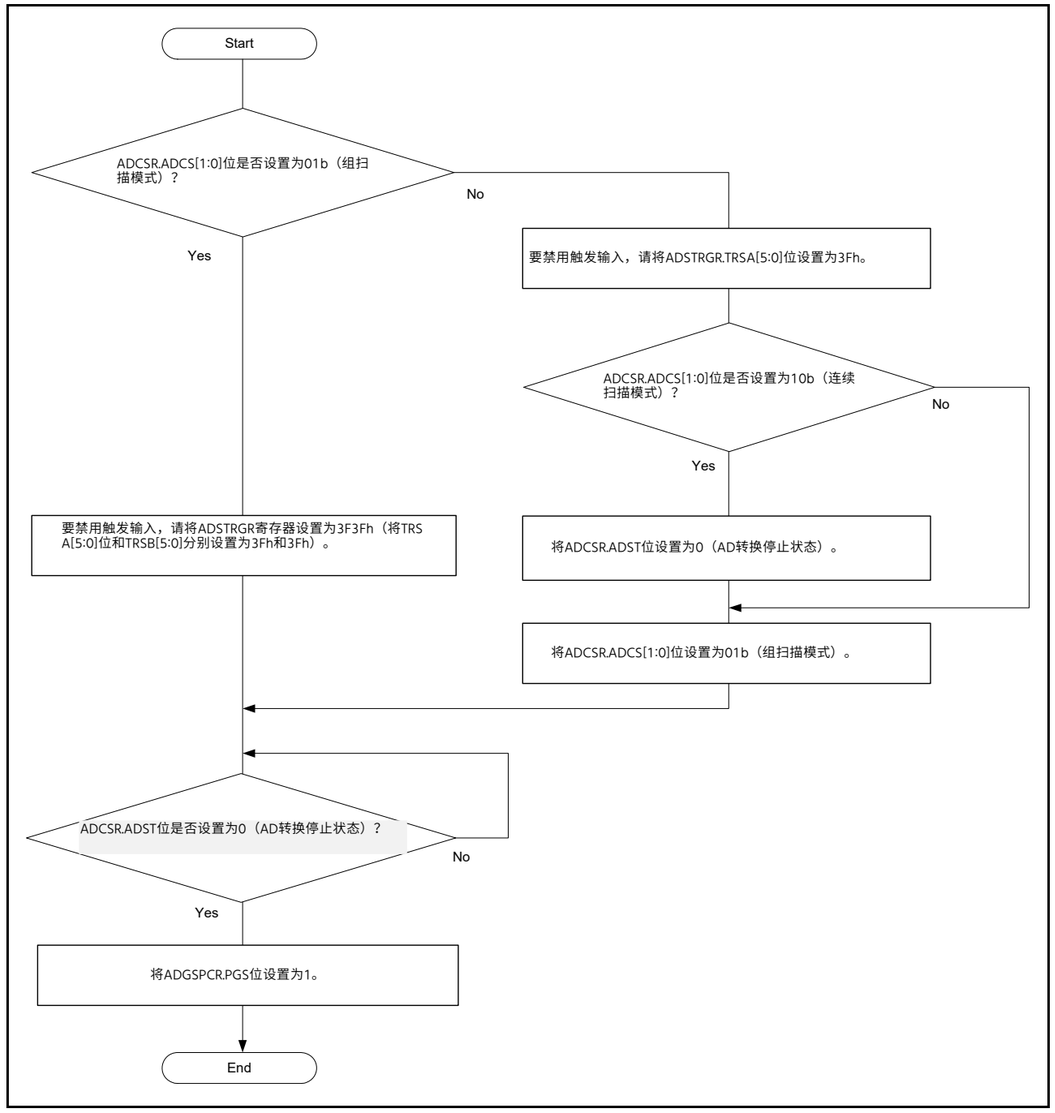

Figure 47.25 ADGSPCR.PGS位设置流程

Table 47.9 根据ADGSPCR.GBRSCN位设置控制AD转换操作

AD转换操作	触发输入	ADGSPCR.GBRSCN = 0	ADGSPCR.GBRSCN = 1
当AD转换为A组进行中	A组触发器输入	触发器输入无效	触发器输入无效
	B组触发输入	触发器输入无效	GroupB在Group之后转换一次转换完成
当AD转换为B组进行中	A组触发器输入	B组转换停止和A组转换开始	B组转换停止，A组转换开始 B组转换在A组转换完成后开始
	B组触发输入	触发器输入无效	触发器输入无效

The following describes the operations in group scan mode under Group A priority control (ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0) when channel 0 is selected for Group A and channels 1 to 3 are selected for Group B.

The operation is as follows:

1. When input of a trigger for Group B sets the ADCSR.ADST bit to 1 (A/D conversion start), conversion for the ANn channels selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
2. On completion of A/D conversion, the result is stored in the associated A/D Data Register y (ADDRy).
3. When a group A trigger is input while A/D conversion for group B is in progress, and A/D conversion for group B is discontinued with the ADCSR.ADST bit remains 1, A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n. If A/D conversion are not complete when conversion of group B is interrupted, A/D conversion result is not stored in the A/D Data Register (ADDRy).
4. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
5. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
6. A/D conversion for the ANn channels in group B selected in the ADANSB0 and ADANSB1 registers restarts in order from the channel with the smallest number n with the ADCSR.ADST bit remains 1.
7. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
8. An ADC12i_GBADI interrupt request is generated if the setting in the ADCSR.GBADIE bit is 1 (ADC12i_GBADI interrupt when Group B scanning completion is enabled).
9. The ADCSR.ADST bit is automatically cleared and ADC12 enters the wait state when A/D conversion completes.

下面介绍在A组优先级控制（ADGSPCR.GBRSCN=1和ADGSPCR.GBRP=0）下，当A组选择通道0，B组选择通道1到3时，组扫描模式下的操作。

操作如下：

1. 当B组的触发输入将ADCSR.ADST位设置为1（AD转换开始）时，ADANSB0和ADANSB1寄存器中选择的ANn通道的转换从编号n最小的通道开始按顺序开始。
2. 完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 如果在B组的AD转换正在进行时输入A组触发，并且B组的AD转换在ADCSR.ADST位保持为1的情况下中断，则在ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换按顺序开始从具有最小编号n的通道。如果B组转换中断时AD转换未完成，AD转换结果不会存储在AD数据寄存器(ADDRy)中。
4. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
5. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
6. 在ADANSB0和ADANSB1寄存器中选择的B组ANn通道的AD转换从具有最小编号n的通道开始按顺序重新启动，ADCSR.ADST位保持为1。
7. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
8. 如果ADCSR.GBADIE位的设置为1（启用B组扫描完成时的ADC12i_GBADI中断），则会产生ADC12i_GBADI中断请求。
9. 当AD转换完成时，ADCSR.ADST位自动清零，ADC12进入等待状态。

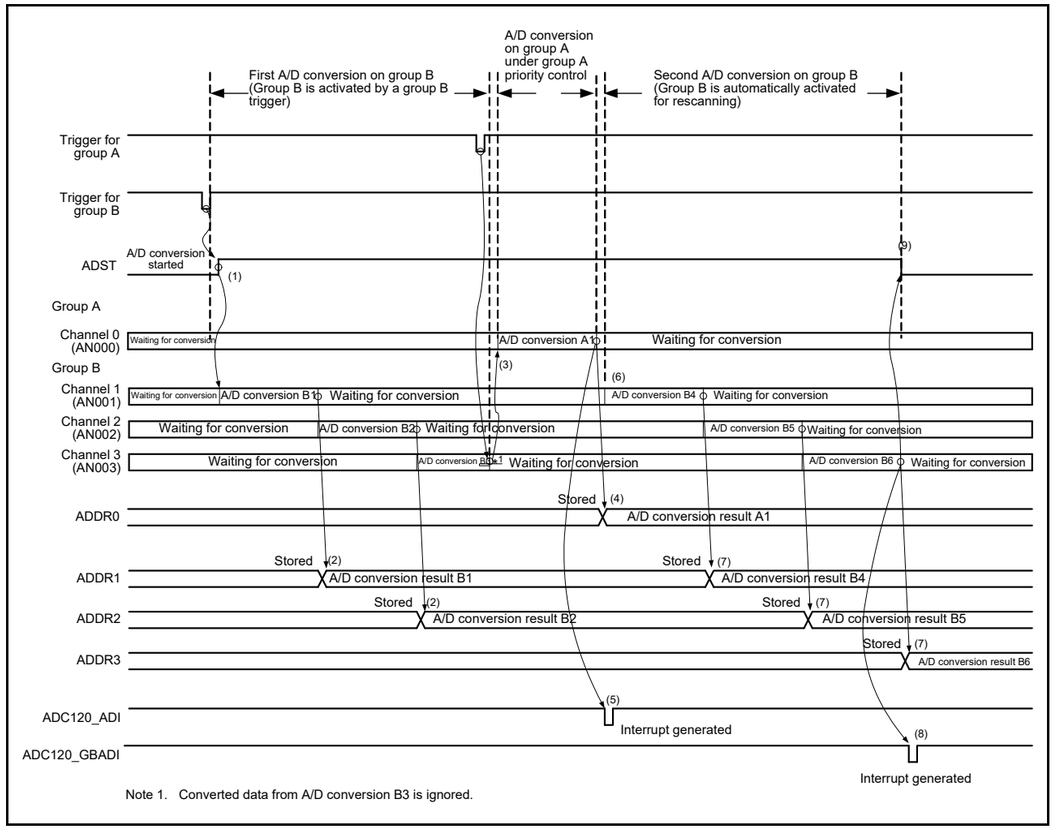

Figure 47.26 Example operation with Group A priority control (1), when ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0

This section provides an example operation when a Group A trigger is input again during rescanning operation on Group B. In this example, channel 0 is selected for Group A and channels 1 to 3 are selected for Group B when operation on Group A is given priority (ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0).

The operation is as follows:

1. When a Group B trigger input sets the ADCSR.ADST bit to 1 (A/D conversion start), conversion for the ANn channels in Group B selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
2. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
3. When a group A trigger is input while A/D conversion for group B is in progress, and A/D conversion for group B is discontinued with the ADCSR.ADST bit remains 1. If A/D conversion are not complete when the conversion of group B is interrupted, A/D conversion result is not stored in the A/D Data Register (ADDRy).
4. A/D conversion for the ANn Group A channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
5. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
6. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
7. If the ADGSPCR.GBRSCN bit is 1 when the A/D conversion of group A completes, the ADCSR.ADST bit remains

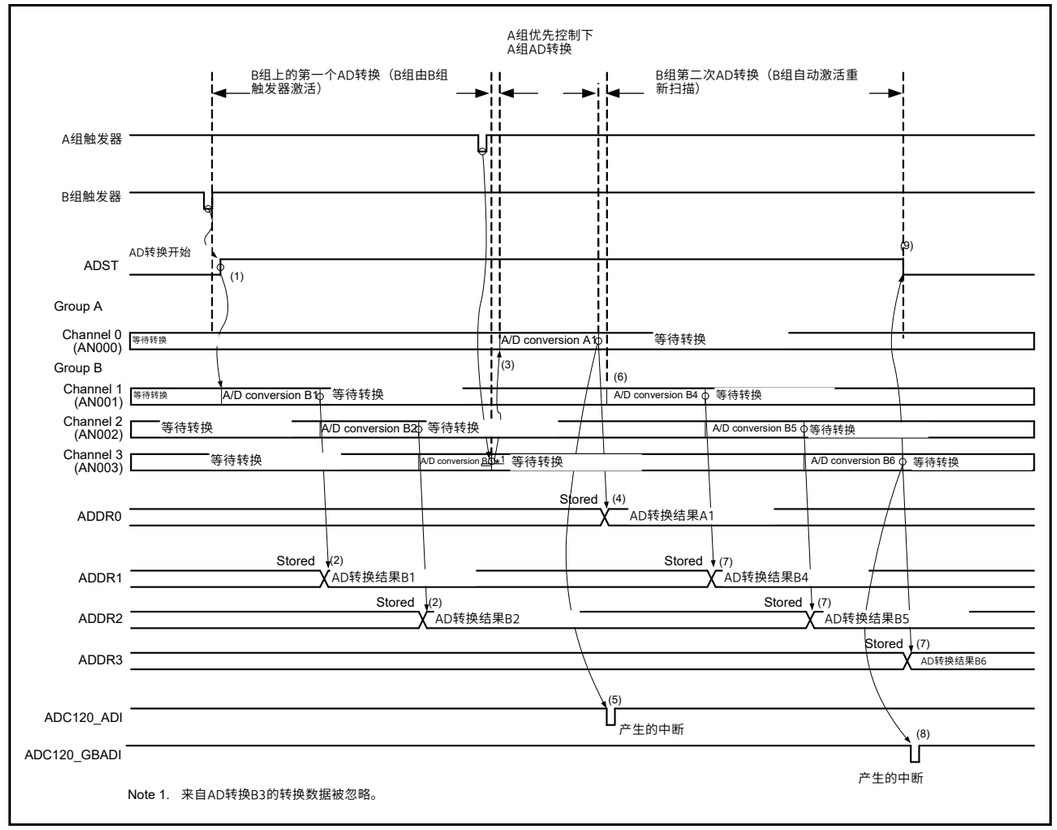

Figure 47.26 使用A组优先级控制(1)的示例操作，当ADGSPCR.GBRSCN=1并且ADGSPCR.GBRP = 0

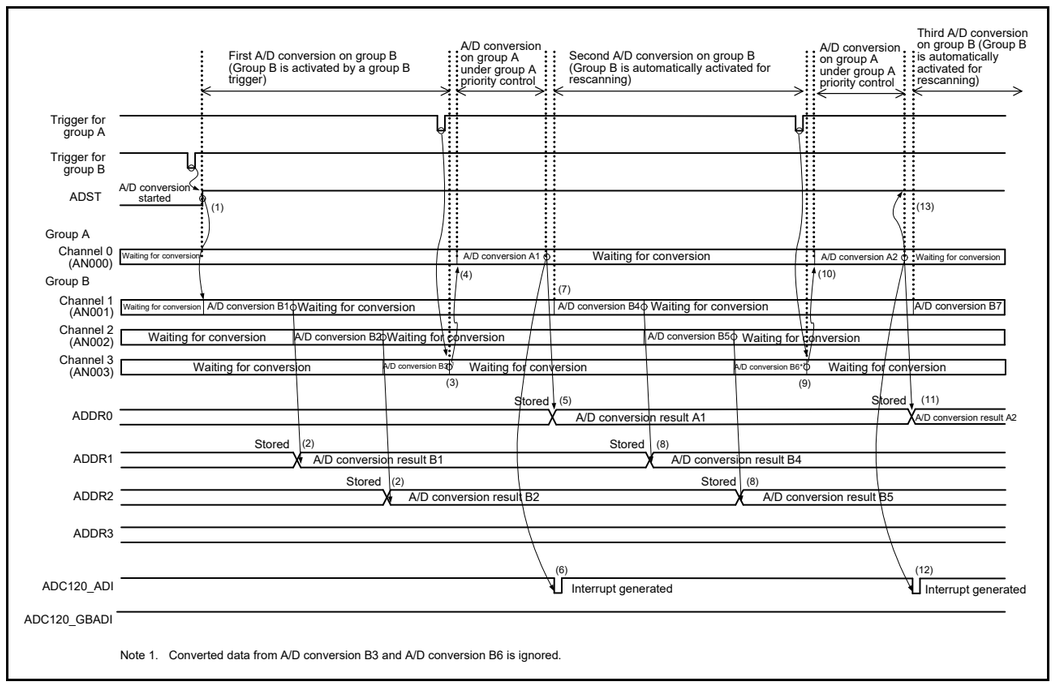
本节提供在对Group进行重新扫描操作期间再次输入GroupA触发器时的示例操作
B.在本例中，A组选择通道0，B组选择通道1到3。
A组具有优先权（ADGSPCR.GBRSCN=1和ADGSPCR.GBRP=0）。

操作如下：

1. 当B组触发输入将ADCSR.ADST位设置为1（AD转换开始）时，ADANSB0和ADANSB1寄存器中选择的B组ANn通道的转换从编号最小的通道开始按顺序开始。
2. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 当B组的AD转换正在进行时输入A组触发，并且B组的AD转换中断且ADCSR.ADST位保持1。如果B组的转换中断时AD转换未完成，则AD转换结果不存储在AD数据寄存器(ADDRy)中。
4. 在ADANSA0和ADANSA1寄存器中选择的ANn组A通道的D转换从编号n最小的通道开始。
5. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
6. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
7. 如果A组AD转换完成时ADGSPCR.GBRSCN位为1，则ADCSR.ADST位保持不变

1 and group B is rescanned. A/D conversion for the ANn group B channels selected in the ADANSB0 and ADANSB1 registers starts again in order from the channel with the smallest number n.

8. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
9. If a group A trigger is input during A/D conversion on group B for rescanning, the ADCSR.ADST bit remains 1 and the ongoing A/D conversion on group B is discontinued.
10. The ADCSR.ADST bit is set to 1 automatically, and A/D conversion for the ANn Group A channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
11. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
12. An ADC12i_ADI interrupt request is generated (no register setting).
13. If the ADGSPCR.GBRSCN bit is 1 when A/D conversion of group A are complete, the ADCSR.ADST bit remains 1 and group B is rescanned. A/D conversion for the ANn group B channels selected in the ADANSB0 and ADANSB1 registers starts again in order from the channel with the smallest number n.
14. If a Group A trigger is input during A/D conversion on Group B for rescanning, steps 9 to 13 are repeated. If a Group A trigger is not input, the ADCSR.ADST bit is cleared automatically on completion of A/D conversion on Group B and ADC12 enters a wait state.



Note 1. Converted data from A/D conversion B3 and A/D conversion B6 is ignored.

Figure 47.27 Example operation with Group A priority control (2), when ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0

This section provides an example of a rescanning operation in which a Group B trigger is input during A/D conversion on Group A. In this example, channels 1 to 3 are selected for Group A and channel 0 is selected for Group B when operation on Group A is given priority (ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0).

The operation is as follows:

1. When input of a trigger for Group A sets the ADCSR.ADST bit to 1 (A/D conversion start), conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest

1组B被重新扫描。ADANSB0和ADANSB1寄存器中选择的ANnB组通道的AD转换从编号n最小的通道重新开始。

8. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
9. 如果在B组的AD转换期间输入A组触发以进行重新扫描，则ADCSR.ADST位保持为1，并且停止B组正在进行的AD转换。

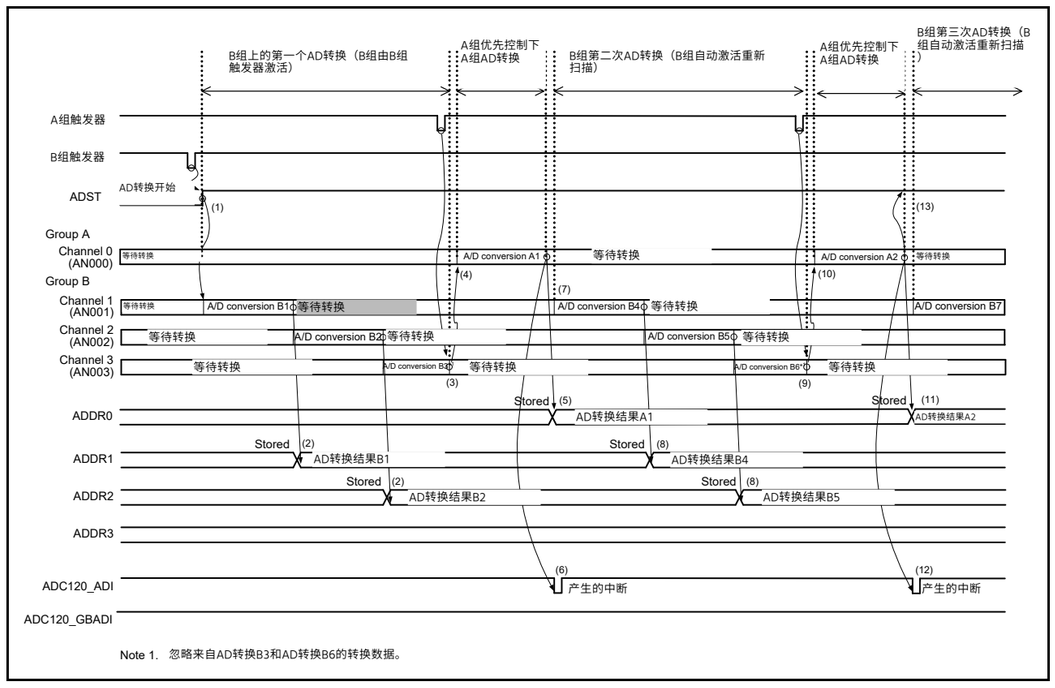
10.ADCSR.ADST位自动设置为1，在ADANSA0和ADANSA1寄存器中选择的ANn组A通道的AD转换从编号n最小的通道开始按顺序开始。

11.在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。

12.产生一个ADC12i_ADI中断请求（无寄存器设置）。

13.如果A组AD转换完成时ADGSPCR.GBRSCN位为1，则ADCSR.ADST位保持1并重新扫描B组。ADANSB0和ADANSB1寄存器中选择的ANnB组通道的AD转换从编号n最小的通道重新开始。

14.如果在B组的AD转换期间输入A组触发以进行重新扫描，则重复步骤9至13。如果一个未输入A组触发，ADCSR.ADST位在AD转换完成后自动清零
B组和ADC12进入等待状态。



Note 1. 忽略来自AD转换B3和AD转换B6的转换数据。

Figure 47.27 使用A组优先级控制(2)的示例操作，当ADGSPCR.GBRSCN=1并且ADGSPCR.GBRP = 0

本节提供了重新扫描操作的示例，其中在A组的AD转换期间输入B组触发。在此示例中，为A组选择通道1至3，在A组操作时为B组选择通道0被赋予优先级（ADGSPCR.GBRSCN=1，ADGSPCR.GBRP=0）。

操作如下：

1. 当A组的触发输入将ADCSR.ADST位设置为1（AD转换开始）时，在ADANSA0和ADANSA1寄存器中选择的ANn通道的转换按顺序从最小的通道开始

number n.

2. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
3. If a Group B trigger is input during A/D conversion on Group A, A/D conversion on Group B can be performed after the A/D conversion on Group A completes. (However, if Group A triggers are input continuously, the scan operation on Group B is canceled by Group A and is not performed.)
4. On completion of the A/D conversion on Group A, an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. On completion of group A conversion, the ADCSR.ADST bit remains 1 and group B is rescanned. Next, A/D conversion for the ANn channels of group B selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
6. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
7. On completion of the rescanning operation on Group B, an ADC12i_GBADI interrupt request is generated if the setting in the ADCSR.GBADIE bit is 1 (ADC12i_GBADI interrupt when scanning completion is enabled).
8. The ADCSR.ADST bit is automatically cleared and ADC12 enters the wait state when A/D conversion completes.

number n.

2. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 如果在A组AD转换期间输入B组触发，则可以在A组AD转换完成后执行B组AD转换。（但是，如果连续输入A组触发，则B组的扫描操作会被A组取消，不会执行。）
4. 完成A组的AD转换后，会产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
5. 完成A组转换后，ADCSR.ADST位保持为1，并重新扫描B组。接下来，ADANSB0和ADANSB1寄存器中选择的B组ANn通道的AD转换从编号n最小的通道开始按顺序开始。
6. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
7. 完成B组的重新扫描操作后，如果ADCSR.GBADIE位中的设置为1（使能扫描完成时的ADC12i_GBADI中断），则会产生ADC12i_GBADI中断请求。
8. 当AD转换完成时，ADCSR.ADST位自动清零，ADC12进入等待状态。

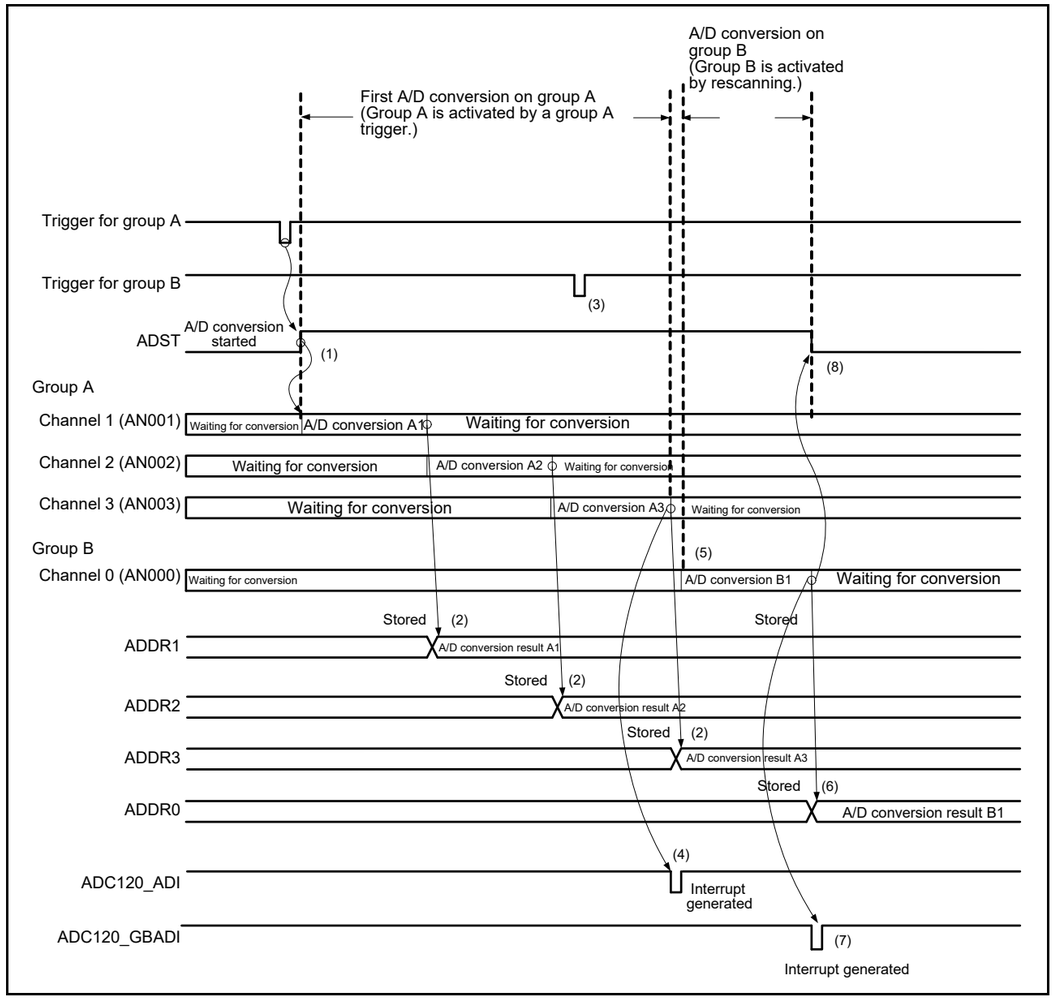


Figure 47.28 Example operation with Group A priority control (3), when ADGSPCR.GBRSCN = 1 and ADGSPCR.GBRP = 0

This section provides an example of operation under Group A priority control in which channel 0 is selected for Group A and channels 1 to 3 are selected for Group B (ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0).

The operation is as follows:

1. When input of a trigger for Group B sets the ADCSR.ADST bit to 1 (A/D conversion start), conversion for the ANn channels selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
2. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
3. If a group A trigger is input while A/D conversion for group B is in progress, and A/D conversion for group B is discontinued with the ADCSR.ADST bit remains 1. Next, A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
4. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).

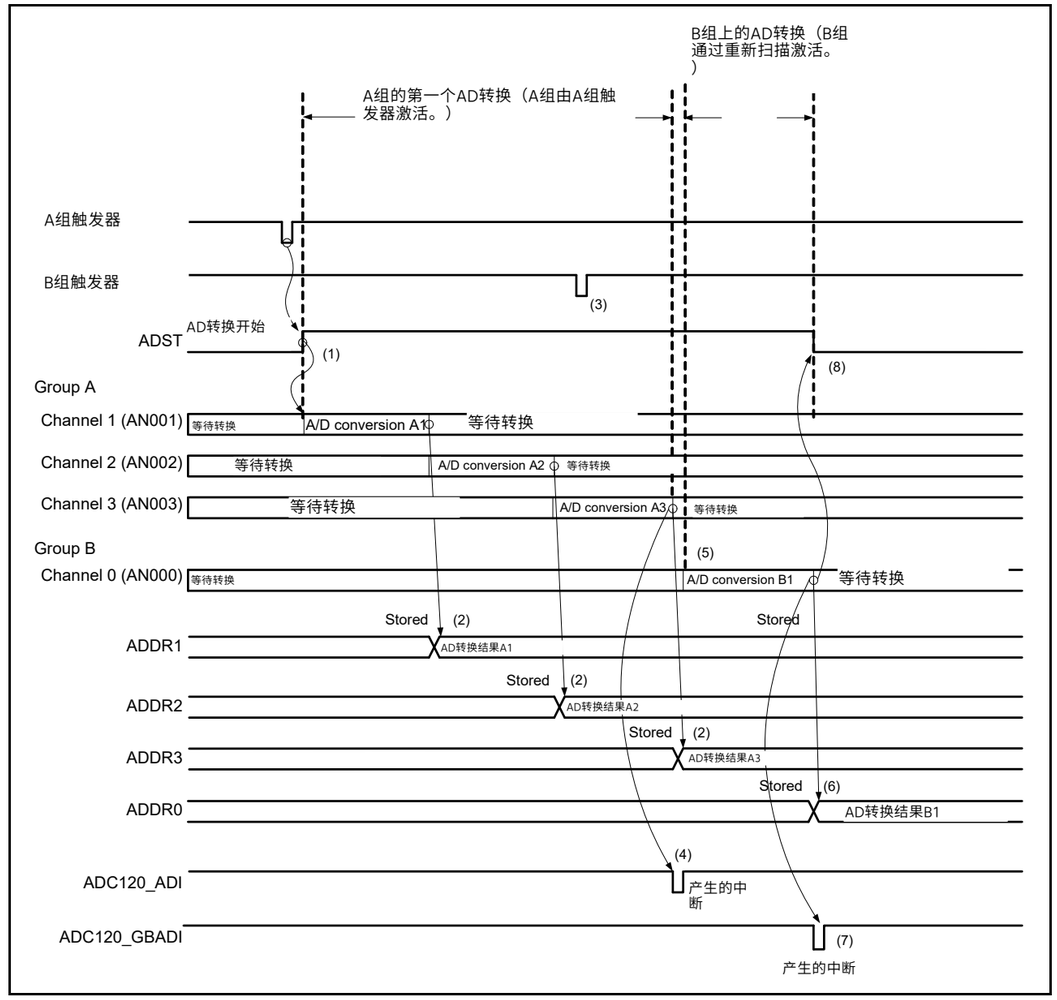

Figure 47.28 使用A组优先级控制(3)的示例操作，当ADGSPCR.GBRSCN=1并且ADGSPCR.GBRP = 0

本节提供了在A组优先级控制下的操作示例，其中为A组选择通道0，为B组选择通道1到3（ADGSPCR.GBRSCN=0，ADGSPCR.GBRP=0）。

操作如下：

1. 当B组的触发输入将ADCSR.ADST位设置为1（AD转换开始）时，ADANSB0和ADANSB1寄存器中选择的ANn通道的转换从编号n最小的通道开始按顺序开始。
2. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 如果在B组的AD转换正在进行时输入A组触发，并且B组的AD转换中断且ADCSR.ADST位保持为1。接下来，在ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换开始从编号n最小的通道开始。
4. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。

5. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
6. The ADCSR.ADST bit is automatically cleared and ADC12 enters the wait state when A/D conversion completes.

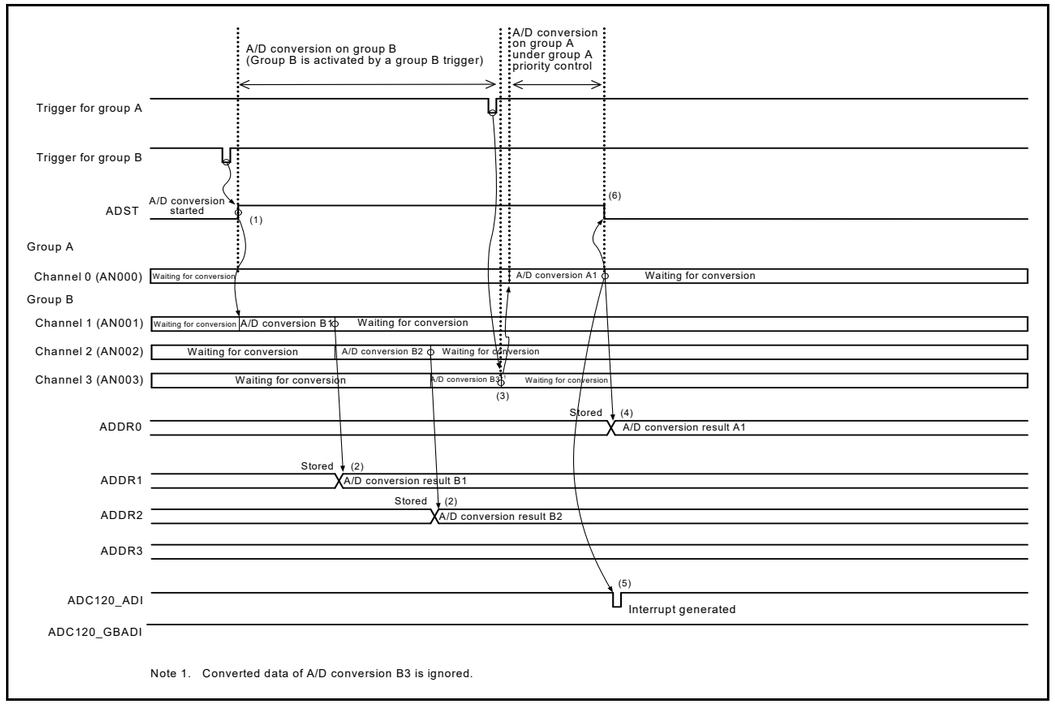

Figure 47.29 Example operation with Group A priority control (4), when ADGSPCR.GBRSCN = 0 and ADGSPCR.GBRP = 0

This section provides an example of operation under Group A priority control in which channel 0 is selected for Group A and channels 1 to 3 are selected for Group B (ADGSPCR.GBRP = 1).

The operation is as follows:

1. The ADCSR.ADST bit is set to 1 (A/D conversion start) when ADGSPCR.GBRP is set to 1, and conversion for the ANn channels selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n.
2. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
3. If a group A trigger is input while A/D conversion for group B is in progress, and A/D conversion for group B is discontinued with the ADCSR.ADST bit remains 1. Next, A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers starts in order from the channel with the smallest number n.
4. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
5. An ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
6. A/D conversion for the ANn channels in group B selected in the ADANSB0 and ADANSB1 registers restarts in order from the channel with the smallest number n and with the ADCSR.ADST bit remains 1.
7. On completion of A/D conversion on a single channel, the result is stored in the associated A/D Data Register y (ADDRy).
8. An ADC12i_GBADI interrupt request is generated if the setting in the ADCSR.GBADIE bit is 1.

5. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
6. 当AD转换完成时，ADCSR.ADST位自动清零，ADC12进入等待状态。

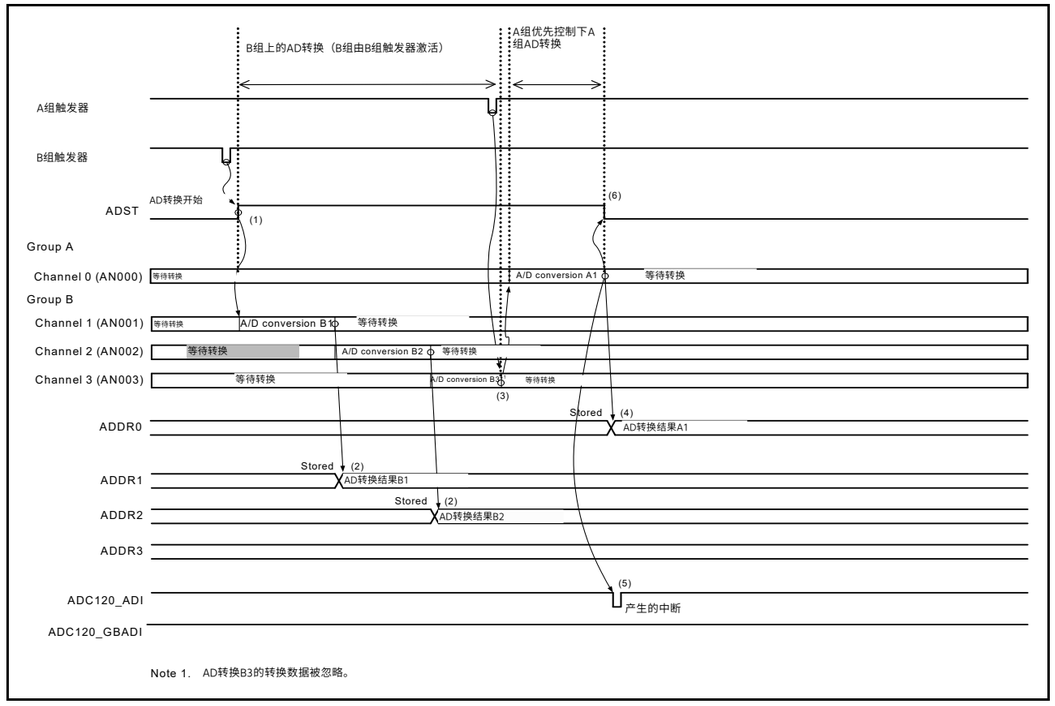

Figure 47.29 使用A组优先级控制(4)的示例操作，当ADGSPCR.GBRSCN=0并且ADGSPCR.GBRP = 0

本节提供A组优先级控制下的操作示例，其中为A组选择通道0，为B组选择通道1至3(ADGSPCR.GBRP=1)。

操作如下：

1. 当ADGSPCR.GBRP设置为1时，ADCSR.ADST位设置为1（AD转换开始），并且ADANSB0和ADANSB1寄存器中选择的ANn通道的转换从编号最小的通道开始按顺序开始。
2. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
3. 如果在B组的AD转换正在进行时输入A组触发，并且B组的AD转换中断且ADCSR.ADST位保持为1。接下来，在ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换开始从编号n最小的通道开始。
4. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
5. 产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。
6. ADANSB0和ADANSB1寄存器中选择的B组ANn通道的AD转换从编号n最小且ADCSR.ADST位保持为1的通道重新开始。
7. 在单个通道上完成AD转换后，结果将存储在相关的AD数据寄存器y(ADDRy)中。
8. 如果ADCSR.GBADIE位中的设置为1，则会产生ADC12i_GBADI中断请求。

9. A/D conversion for the ANn channels selected in the ADANSB0 and ADANSB1 registers starts in order from the channel with the smallest number n. Steps 6 to 9 are repeated as long as the ADGSPCR.GBRP bit remains 1. Clearing of the ADCSR.ADST bit to 0 is prohibited while the ADGSPCR.GBRP bit is set to 1. Follow the procedure for clearing the ADCSR.ADST bit operation by software, shown in Figure 47.40, to force A/D conversion to stop while ADGSPCR.GBRP = 1.

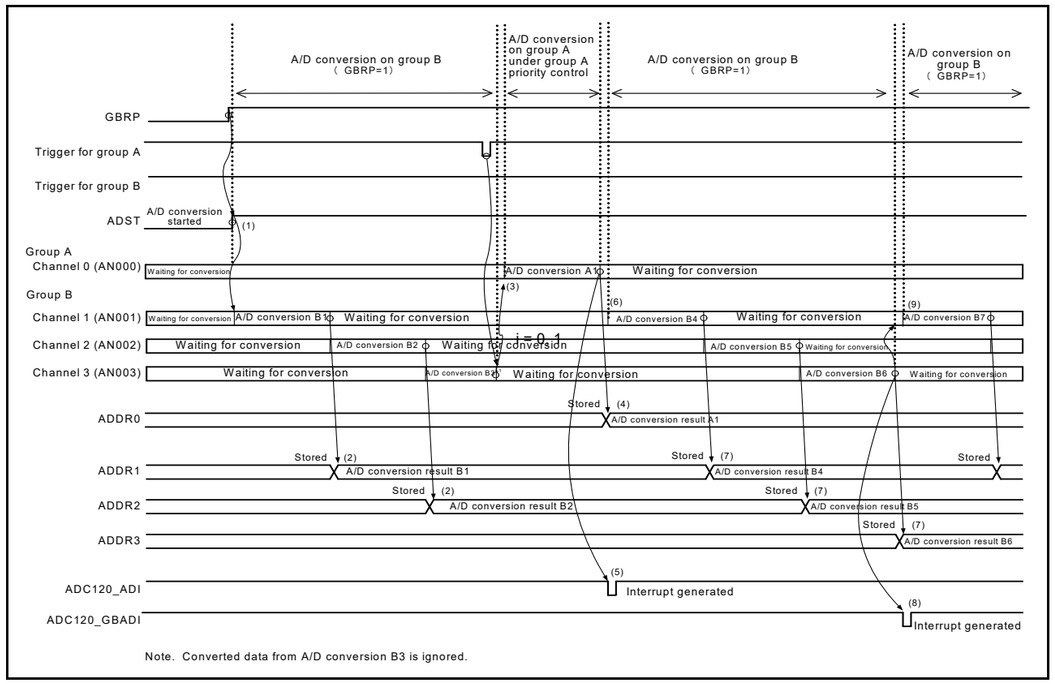

Figure 47.30 Example operation with Group A priority control (5), when ADGSPCR.GBRP = 1

47.3.5 Compare Function for Windows A and B

47.3.5.1 Compare function windows A and B

The compare function compares a reference value with the A/D conversion result. The reference value can be set for Window A and Window B independently. When the compare function is in use, the self-diagnosis function and double-trigger mode cannot be used. The main differences between Window A and Window B are their different interrupt output signals and the constraint on Window B of only one selectable channel.

This section provides an example operation that combines continuous scan mode and the compare function.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by software, a synchronous trigger (ELC) or an asynchronous trigger, A/D conversion starts for the selected channels, temperature sensor, and internal reference voltage.
2. On completion of A/D conversion, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy, ADTSDR, or ADOCDR). When ADCMPCR.CMPAE = 1, if bits in the ADCMPANSRy register or the ADCMPANSER register are set for Window A, the A/D conversion result is compared with the set ADCMPDR0/1 register value. When ADCMPCR.CMPBE = 1, if bits in the ADCMPBNSR register are set for Window B, the A/D conversion result is compared with the ADWINULB/ADWINLLB register setting.
3. As a result of the comparison, when Window A meets the condition set in ADCMPLR0/1 or ADCMPLER, the Compare Window A Flag (ADCMPSR0.CMPSTCHA0n, ADCMPSR1.CMPSTCHA1n, ADCMPSER.CMPSTTSA, or ADCMPSER.CMPSTOCA) sets 1. At this time, if the ADCMPCR.CMPAIE bit is 1,

9. ADANSB0和ADANSB1寄存器中选择的ANn通道的D转换从编号n最小的通道开始按顺序开始。只要ADGSPCR.GBRP位保持为1，就重复步骤6到9。当ADGSPCR.GBRP位设置为1时，禁止将ADCSR.ADST位清除为0。按照清除ADCSR.ADST位操作的程序进行通过软件，如图47.40所示，在ADGSPCR.GBRP=1时强制停止AD转换。

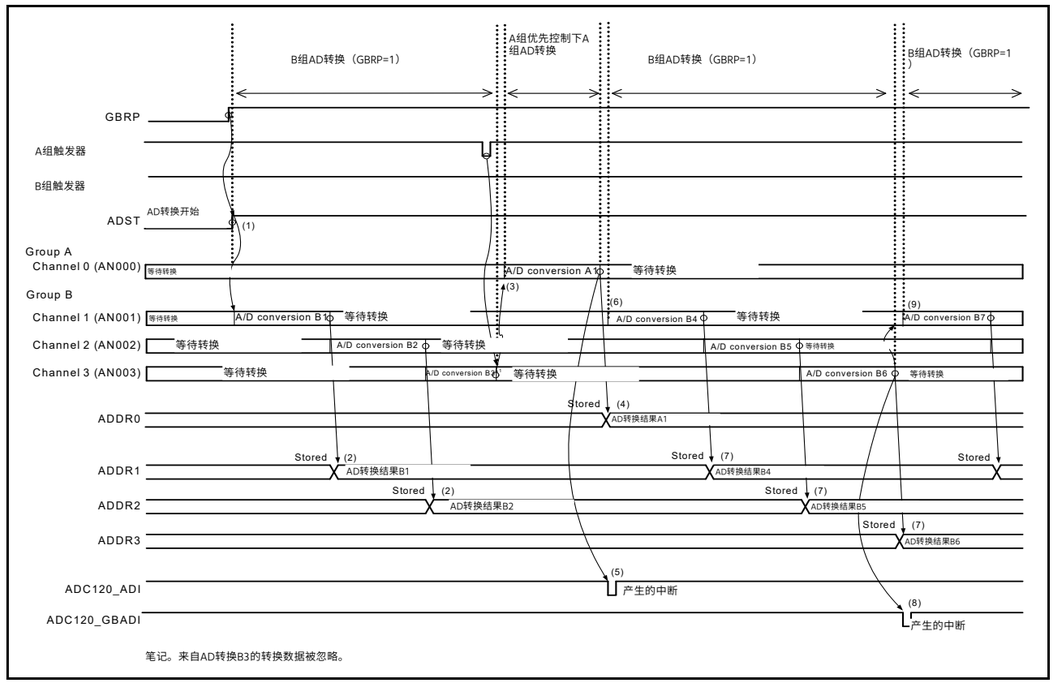

Figure 47.30 当ADGSPCR.GBRP=1时，A组优先级控制(5)的示例操作

47.3.5 比较WindowsA和B的函数

47.3.5.1 比较功能窗口A和B

比较功能将参考值与AD转换结果进行比较。参考值可设置为
窗口A和窗口B独立。使用比较功能时，不能使用自诊断功能和双触发模式。WindowA和WindowB的主要区别在于它们的中断输出信号不同以及WindowB只能选择一个通道的限制。

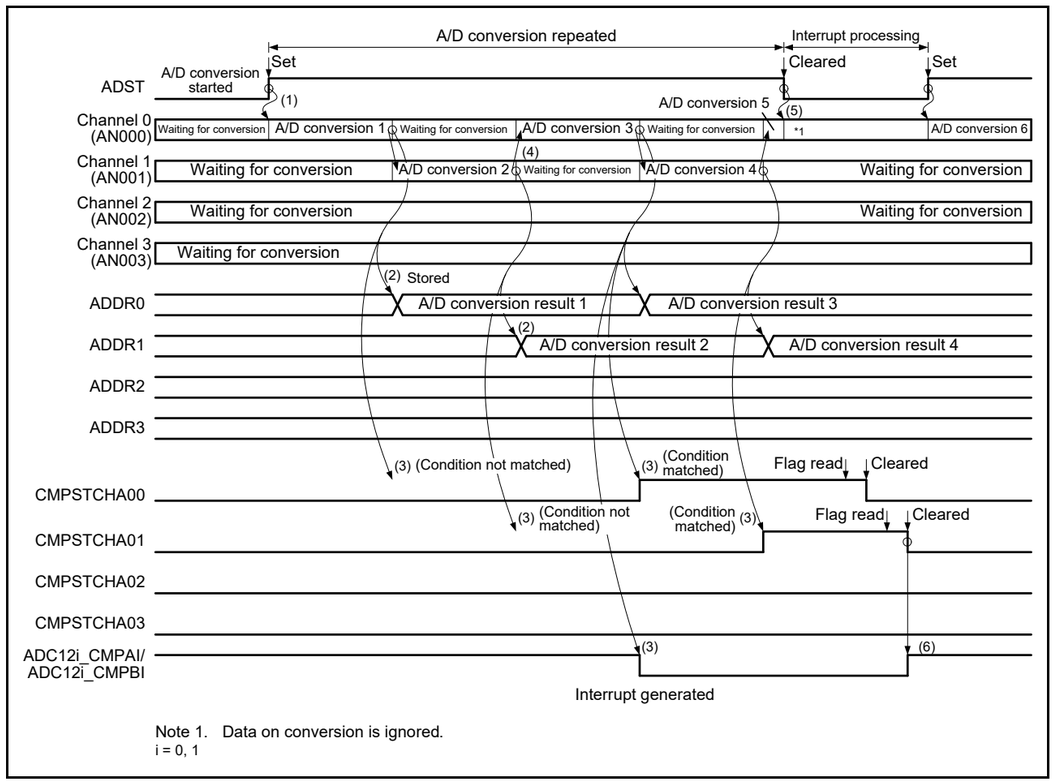
本节提供结合连续扫描模式和比较功能的示例操作。

操作如下：

1. 当ADCSR.ADST位通过软件、同步触发(ELC)或异步触发设置为1（AD转换开始）时，所选通道、温度传感器和内部参考电压的AD转换开始。
2. 完成AD转换后，AD转换结果存储在相关的AD数据寄存器y（ADDRy、ADTSDR或ADOCDR）中。当ADCMPCR.CMPAE=1时，如果ADCMPANSRy寄存器或ADCMPANSER寄存器中的位为窗口A设置，则AD转换结果将与设置的ADCMPDR01寄存器值进行比较。当ADCMPCR.CMPBE=1时，如果ADCMPBNSR寄存器中的位为窗口B设置，则将AD转换结果与ADWINULBADWINLLB寄存器设置进行比较。
3. 作为比较的结果，当窗口A满足ADCMPLR01或ADCMPLER中设置的条件时，比较窗口A标志（ADCMPSR0.CMPSTCHA0n、ADCMPSR1.CMPSTCHA1n、ADCMPSER.CMPSTTSA，或ADCMPSER.CMPSTOCA)设置为1。此时，如果ADCMPCR.CMPAIE位为1，

an ADC12i_CMPAI (i = 0, 1) interrupt request is generated. In the same way, when Window B meets the condition set in ADCMPBNSR.CMPLB, the Compare Window B Flag (ADCMPBSR.CMPSTB) sets to 1. At this time, if the ADCMPCR.CMPBIE bit is 1, an ADC12i_CMPBI interrupt request is generated.

4. On completion of all selected A/D conversions and comparisons, scan restarts.
5. After the ADC12i_CMPAI and ADC12i_CMPBI interrupts are accepted, the ADCSR.ADST bit is set to 0 (A/D conversion stop) and processing is performed for channels for which the compare flag is set to 1.
6. When all compare flags of Window A are cleared, the ADC12i_CMPAI interrupt request is canceled. In the same way, when all compare flags of Window B are cleared, the ADC12i_CMPBI interrupt request is reset. To perform comparison again, restart the A/D conversion.



Note 1. Data on conversion is ignored.
i = 0, 1

Figure 47.31 Example of compare function operation, when AN000 to AN003 are compared

47.3.5.2 Event output of compare function

The event output of compare function specifies the upper reference voltage value for Window A and the lower reference voltage value for Window B, compares the A/D-converted value of the selected channel with the upper and lower reference voltage values, and then outputs the ADC12i_WCMPM and ADC12i_WCMPUM (i = 0, 1) events based on the event conditions (A OR B, A AND B, A XOR B) and comparison results of Window A and Window B.

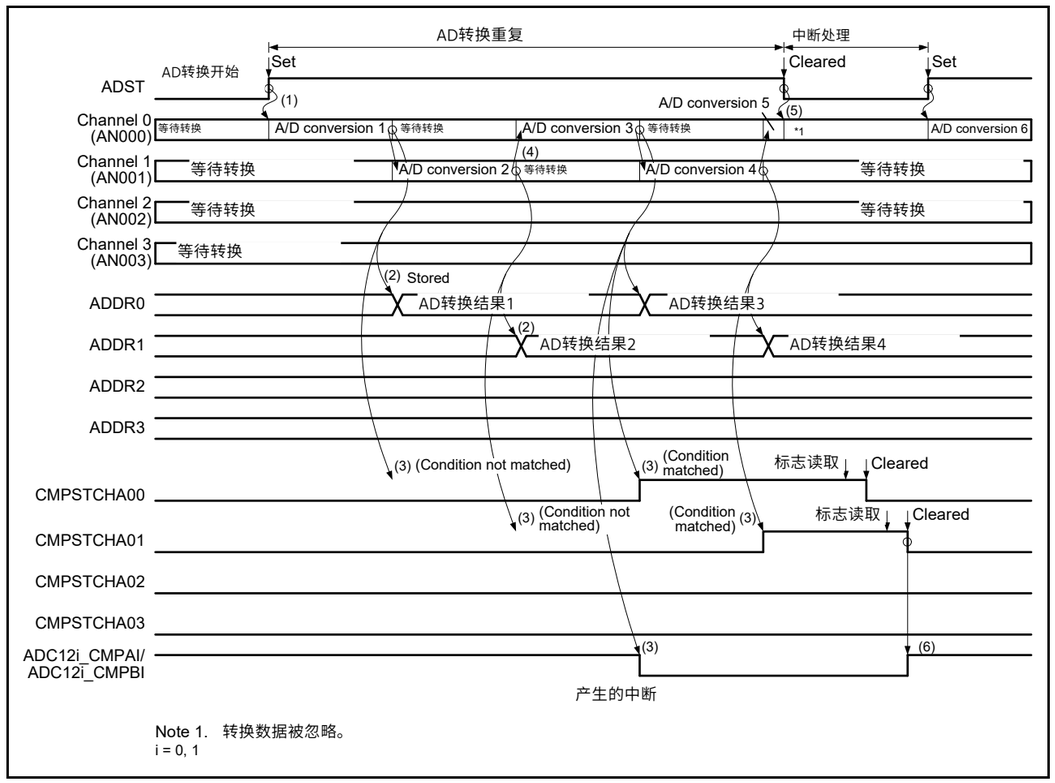
If more than one channel is selected for Window A, and even one channel in Window A meets the comparison condition, the comparison result of Window A becomes met. When using this function, perform A/D conversion in single scan mode. Any channels from AN000 to AN007 and AN016 to AN020 (unit 0), and AN100 to AN103, AN105 to AN107, and AN116 to AN119 (unit 1), internal reference voltage, and temperature sensor output are selectable for Window A.

This section provides the setting procedure and example when using event output of compare function.

To set up event output for the compare function:

产生一个ADC12i_CMPAI(i=0 1)中断请求。同理，当窗口B满足ADCMPBNSR.CMPLB中设置的条件时，比较窗口B标志（ADCMPBSR.CMPSTB）置1。此时如果ADCMPCR.CMPBIE位为1，则产生ADC12i_CMPBI中断请求.

4. 完成所有选定的AD转换和比较后，扫描重新开始。
5. 接受ADC12i_CMPAI和ADC12i_CMPBI中断后，ADCSR.ADST位设置为0（AD转换停止），并对比较标志设置为1的通道执行处理。
6. 当窗口A的所有比较标志被清除时，ADC12i_CMPAI中断请求被取消。同理，当窗口B的所有比较标志都被清除时，ADC12i_CMPBI中断请求被复位。要再次进行比较，请重新开始AD转换。



Note 1. 转换数据被忽略。
i = 0, 1

Figure 47.31 比较功能操作示例，当比较AN000和AN003时

47.3.5.2 比较函数的事件输出

比较函数的事件输出指定窗口A的参考电压上限和窗口B的参考电压下限，将所选通道的AD转换值与上下参考电压值进行比较，然后输出ADC12i_WCMPM和ADC12i_WCMPUM(i=0 1)事件基于事件条件（AORB、AANDB、AXORB）和窗口A和窗口B的比较结果。

如果窗口A选择了多个通道，即使窗口A中的一个通道满足比较条件，窗口A的比较结果也成立。使用此功能时，请在单次扫描模式下进行AD转换。窗口A可选择从AN000到AN007和AN016到AN020（单元0）、AN100到AN103、AN105到AN107和AN116到AN119（单元1）的任何通道、内部参考电压和温度传感器输出。

本节提供使用比较功能的事件输出时的设置步骤和示例。

要为比较功能设置事件输出：

1. Confirm that the value in the ADCSR.ADCS bits is 00b (single scan mode).
2. Select the channel for Window A in ADCMPANSR0/1 and ADCMPANSER. Set window comparison conditions in the ADCMPLR0/1 and ADCMPLER registers. Set the upper and lower reference values in the ADCMPDR0 and 1 registers.
3. Select the channel and comparison conditions for Window B in the ADCMPBNSR register, and set the upper and lower reference values in the ADWINULB and ADWINLLB registers.
4. Set composite conditions for Window A/B, Window A/B operation enable, and interrupt output enable in ADCMPCR.

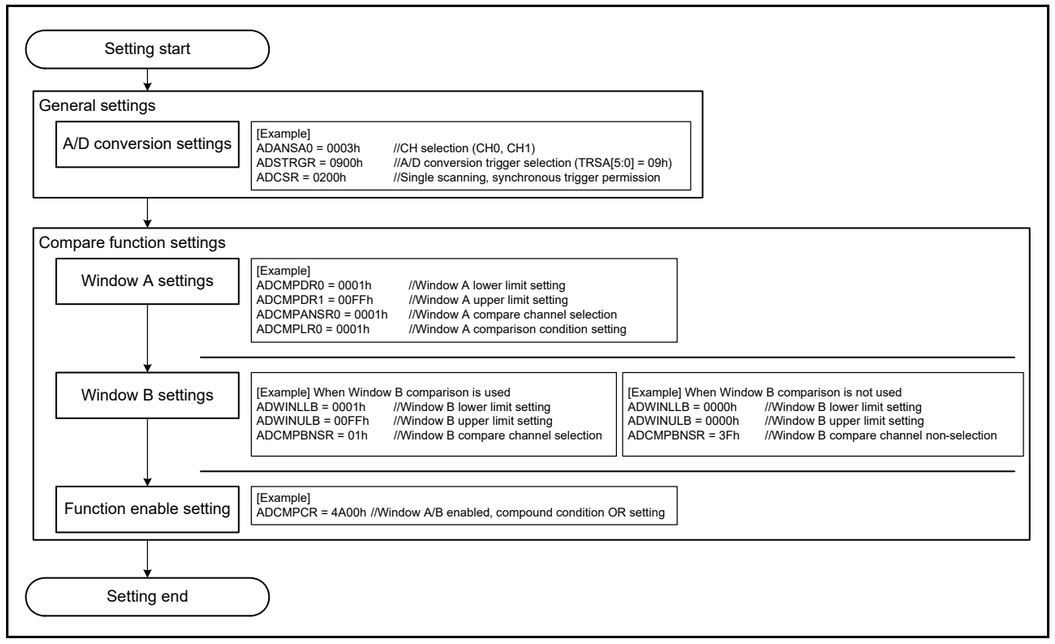


Figure 47.32 Setting example when using the event output of the compare function

Notes on the event output usage when using only the Window A for compare function:

- Enable both Window A and Window B (ADCMPCR.CMPAE = 1, ADCMPCR.CMPBE = 1)
- Set the compound condition of Window A and Window B to “OR condition” (ADCMPCR.CMPAB[1:0] = 00b)
- Set the compared channel of Window B to “Do not select” (ADCMPBNSR.CMPCHB[5:0] = 111111b)
- Set the compare condition of Window B to “0 < results < 0 always means mismatch”. (ADCMPCR.WCMPE = 1, ADWINLLB.CMPLLB[15:0] = ADWINULB.CMPULB[15:0] = 0000h, and ADCMPBNSR.CMPLB = 1)

Figure 47.33 shows the event output operation example of compare function.

A scan end event (ADC12i_ADI) is output with the same timing of one time single scan completion. A match or mismatch event (ADC12i_WCMPM or ADC12i_WCMPUM) is output delayed 1 PCLKB depending on ADCMPCR.CMPAB[1:0] settings.

Note: The match and mismatch events are exclusive, so both events are never output simultaneously.

1. 确认ADCSR.ADCS位中的值为00b（单次扫描模式）。
2. 在ADCMPANSR01和ADCMPANSER中选择窗口A的通道。在ADCMPLR01和ADCMPLER寄存器中设置窗口比较条件。在ADCMPDR0和1寄存器中设置参考值上限和下限。
3. 在ADCMPBNSR寄存器中选择窗口B的通道和比较条件，并在ADWINULB和ADWINLLB寄存器中设置上下参考值。
4. 设置窗口AB、窗口AB操作使能和中断输出使能的复合条件
ADCMPCR.

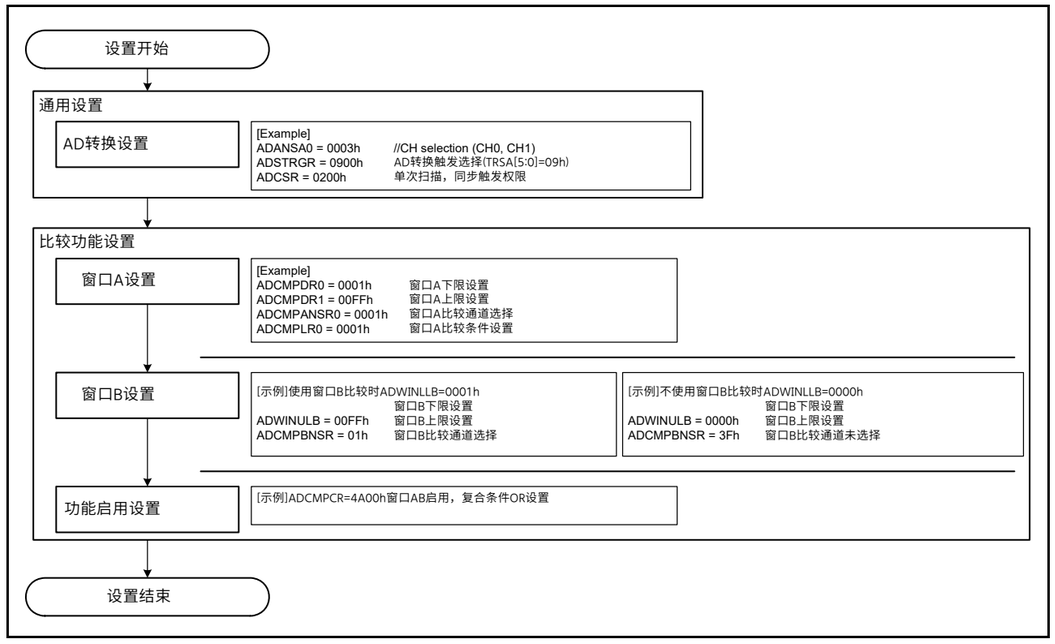

Figure 47.32 使用比较功能的事件输出时的设置示例

仅使用窗口A进行比较功能时的事件输出使用注意事项：

- 启用窗口A和窗口B(ADCMPCR.CMPAE=1 ADCMPCR.CMPBE=1）
- 将窗口A和窗口B的复合条件设置为“或条件”（ADCMPCR.CMPAB[1:0]=00b）
- 将窗口B的比较通道设置为“不选择”（ADCMPBNSR.CMPCHB[5:0]=111111b）
- 将窗口B的比较条件设置为“0<结果<0始终表示不匹配”。（ADCMPCR.WCMPE=1，ADWINLLB.CMPLLB[15:0] = ADWINULB.CMPULB[15:0] = 0000h, and ADCMPBNSR.CMPLB = 1)

图47.33显示了比较功能的事件输出操作示例。

扫描结束事件(ADC12i_ADI)以与一次单次扫描完成相同的时序输出。匹配或不匹配事件（ADC12i_WCMPM或ADC12i_WCMPUM）输出延迟1PCLKB，具体取决于ADCMPCR.CMPAB[1:0]设置。

Note: match和mismatch事件是互斥的，因此这两个事件永远不会同时输出。

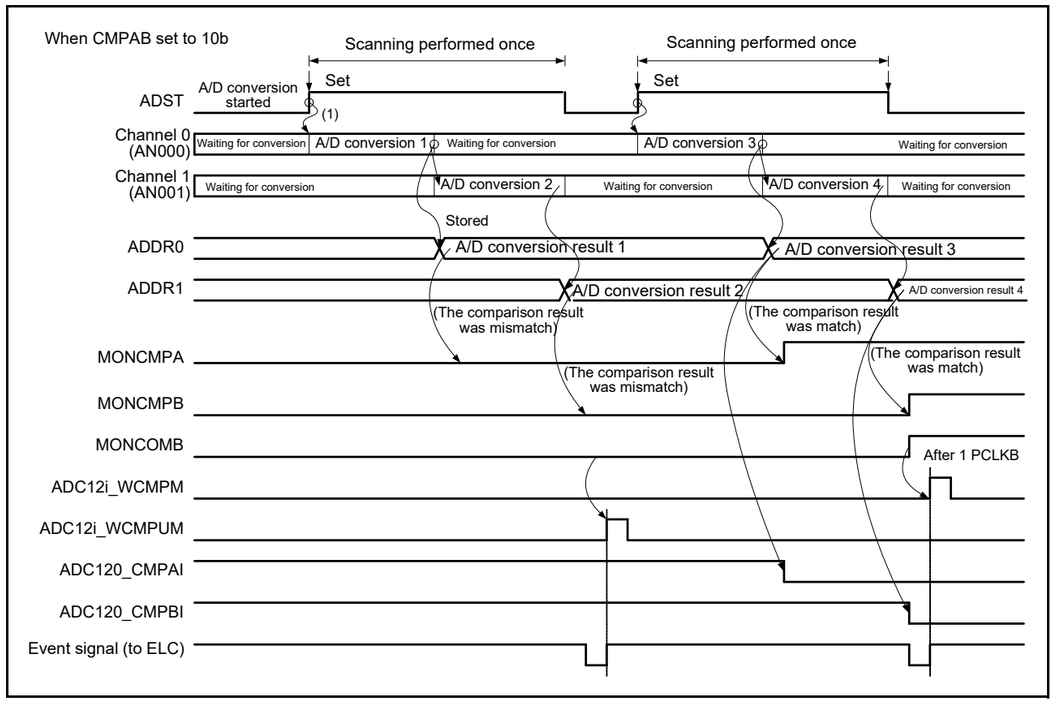

Figure 47.33 Example operation of the compare function event output, when AN000 to AN001 are compared

Note 1. Event output of compare function outputs match/mismatch from the comparison results of Window A and Window B, based on the ADCMPCR.CMPAB[1:0] settings.

Note 2. The comparison result of Window A is the logical addition of the comparison results of the comparison target channels of Window A. The comparison results of Window A and Window B are updated by each A/D conversion, and are kept even when single scan ends. Set ADCMPCR.CMPAE and ADCMPCR.CMPBE to 0 to clear the comparison results to 0.

47.3.5.3 Constraints on the compare function

The following constraints apply for the compare function:

- The compare function cannot be used together with the self-diagnosis function or double-trigger mode. (The compare function is not available for ADRD, ADDBLDR, ADDBLDRA, and ADDBLDRB.)
- Specify single scan mode when using match/mismatch event outputs.
- When the temperature sensor output or internal reference voltage is selected for Window A, Window B operations are disabled.
- When the temperature sensor output or internal reference voltage is selected for Window B, Window A operations are disabled.
- Setting the same channel for Window A and Window B is prohibited.
- Set the reference voltage values so that the high-potential reference voltage value is equal to or larger than the low-potential reference voltage value.

47.3.6 Analog Input Sampling and Scan Conversion Time

Scan conversion can be activated by a software trigger, a synchronous trigger (ELC), or an asynchronous trigger (ADTRGn). After the start-of-scanning-delay (t_D) elapses, processing by the channel-dedicated sample-and-hold circuits, processing for disconnection detection assistance, and processing of conversion for self-diagnosis all proceed,

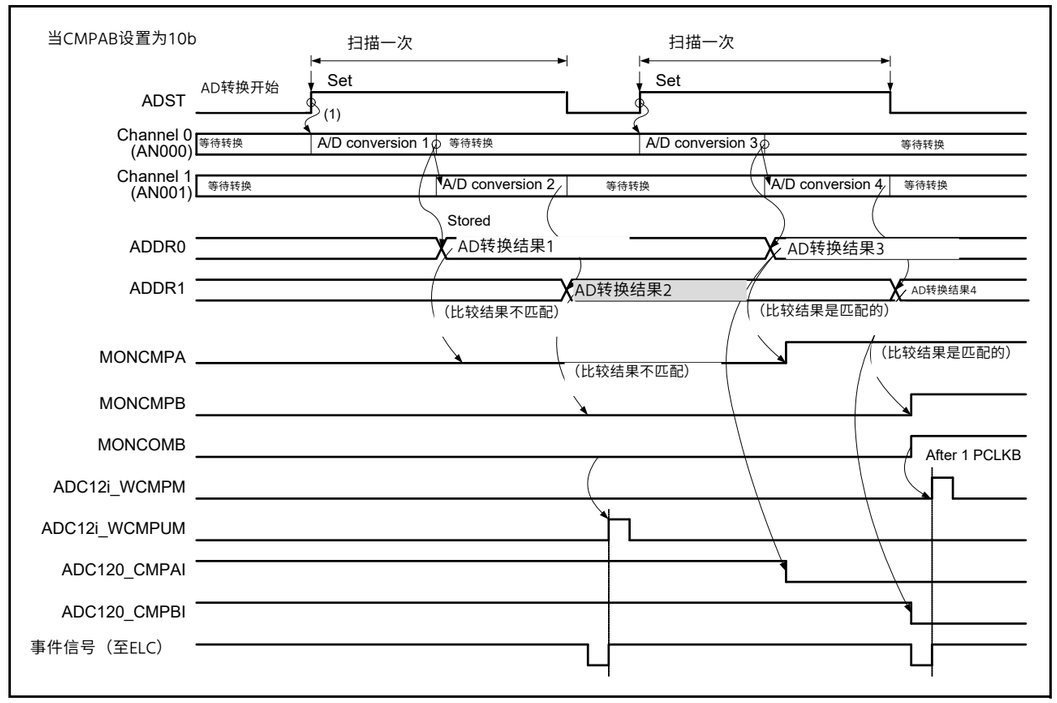

Figure 47.33 比较功能事件输出的示例操作，当AN000与AN001进行比较时

注1.比较函数输出的事件输出matchmismatch来自WindowA和Window的比较结果
B、基于ADCMPCR.CMPAB[1:0]设置。

注2.窗口A的比较结果是窗口A的比较目标通道的比较结果的逻辑相加。窗口A和窗口B的比较结果在每次AD转换时更新，即使单次扫描结束也保持不变.将ADCMPCR.CMPAE和ADCMPCR.CMPBE设置为0，将比较结果清除为0。

47.3.5.3 比较函数的约束

以下约束适用于比较功能：

- 比较功能不能与自诊断功能或双触发模式一起使用。（比较功能不适用于ADRD、ADDBLDR、ADDBLDRA和ADDBLDRB。）
- 使用匹配不匹配事件输出时指定单次扫描模式。
- 当为窗口A选择温度传感器输出或内部参考电压时，窗口B操作被禁用。
- 当为窗口B选择温度传感器输出或内部参考电压时，窗口A操作被禁用。
- 禁止将WindowA和WindowB设置为相同的通道。
- 设置参考电压值，使高电位参考电压值等于或大于低电位参考电压值。

47.3.6 模拟输入采样和扫描转换时间

扫描转换可以通过软件触发、同步触发(ELC)或异步触发(ADTRGn)来激活。在扫描开始延迟(tD)过去之后，通道专用采样保持电路的处理、断线检测辅助处理和自诊断转换处理全部进行，

followed by processing for A/D conversion.

Figure 47.34 shows the scan conversion timing, in which scan conversion is activated by a software trigger or a synchronous trigger (ELC). Figure 47.35 shows the scan conversion timing, in which scan conversion is activated by an asynchronous trigger, ADTRGn. The scan conversion time (t_{SCAN}) includes the start-of-scanning-delay (t_D), channel-dedicated sample-and-hold circuit processing time (t_{SPLSH}),*1 disconnection detection assistance processing time (t_{DIS}),*2 self-diagnosis A/D conversion processing time (t_{DIAG}),*3 A/D conversion processing time (t_{CONV} and t_{DSD}), channel-dedicated sample-and-hold circuit end time (t_{SHED}),*4 and end-of-scanning-delay (t_{ED}).

The A/D conversion processing time (t_{CONV}) consists of the input sampling time (t_{SPL}) and time for conversion by successive approximation (t_{SAM}). The sampling time (t_{SPL}) is used to charge sample-and-hold circuits in the ADC12. If there is not sufficient sampling time because of the high impedance of an analog input signal source, or if the A/D conversion clock (ADCLK) is slow, sampling time can be adjusted using the ADSSTR register.

The time for conversion by successive approximation (t_{SAM}) is 13 ADCLK states with 12-bit accuracy selected, 11 ADCLK states with 10-bit accuracy selected, and 9 ADCLK states with 8-bit accuracy selected.

The scan conversion time (t_{SCAN}) in single scan mode for which the number of selected channels is n can be determined as follows:

$$t_{SCAN} = t_D + t_{SPLSH} + (t_{DIS} \times n) + t_{DIAG} + (t_{CONV} \times n) *5 + t_{ED}$$

The scan conversion time for the first cycle in continuous scan mode is t_{SCAN} for single scan minus t_{ED} plus t_{SHED}. The scan conversion time for the second and subsequent cycles in continuous scan mode is fixed at $t_{SPLSH} + (t_{DIS} \times n) + t_{DIAG} + t_{DSD} + (t_{CONV} \times n) *5 + t_{SHED}$.

Note 1. When no channel-dedicated sample-and-hold circuits are used, $t_{SPLSH} = 0$.
Note 2. When disconnection detection assistance is not selected, $t_{DIS} = 0$.
Note 3. When the self-diagnosis function is not used, $t_{DIAG} = 0$, $t_{DSD} = 0$.
Note 4. When no channel-dedicated sample-and-hold circuits are used, $t_{SHED} = 0$, assuming continuous scan mode is active. In single scan mode and group scan mode, t_{SHED} is included in the end-of-scanning-delay (t_{ED}).
Note 5. When input sampling times (t_{SPL}) of all selected channels are the same, this element equals $t_{CONV} \times n$. If each channel has a different sampling time, this element equals that of t_{SPL} and t_{SAM} set to each selected channel.

然后进行AD转换处理。

图47.34显示了扫描转换时序，其中扫描转换由软件触发或同步触发(ELC)激活。图47.35显示了扫描转换时序，其中扫描转换由异步触发器ADTRGn激活。扫描转换时间(tSCAN)包括扫描开始延迟(tD)、通道专用采样保持电路处理时间(tSPLSH)、*1断线检测辅助处理时间(tDIS)、*2自诊断AD转换处理时间(tDIAG)、*3AD转换处理时间(tCONV和tDSD)、通道专用采样保持电路结束时间(tSHED)、*4和扫描结束–延迟（tED）。

AD转换处理时间(tCONV)由输入采样时间(tSPL)和逐次逼近转换时间(tSAM)组成。采样时间(tSPL)用于为ADC12中的采样保持电路充电。如果由于模拟输入信号源的高阻抗而没有足够的采样时间，或者如果AD转换时钟(ADCLK)很慢，则可以使用ADSSTR寄存器调整采样时间。

逐次逼近转换时间(tSAM)为13个ADCLK状态，选择12位精度，11
选择了10位精度的ADCLK状态，以及选择了8位精度的9个ADCLK状态。

选择通道数为n的单次扫描模式下的扫描转换时间(tSCAN)可以确定如下：

tSCAN=tD+tSPLSH+(tDIS×n)+tDIAG+(tCONV×n)*5+tED

连续扫描模式下第一个周期的扫描转换时间是单次扫描的tSCAN减去tED加上tSHED。连续扫描模式中第二个和后续周期的扫描转换时间固定为tSPLSH+(tDIS×n)+tDIAG+tDSD+(tCONV×n)*5+tSHED。

注1.当不使用通道专用采样保持电路时，tSPLSH=0。
注2.未选择断线检测辅助时，tDIS=0。
注3.不使用自诊断功能时，tDIAG=0，tDSD=0。
注4.当不使用通道专用的采样保持电路时，tSHED=0，假设连续扫描模式处于活动状态。在单扫描模式和组扫描模式中，tSHED包含在扫描结束延迟（tED）中。注5.当所有选定通道的输入采样时间(tSPL)相同时，该元素等于tCONV×n。如果每个

通道具有不同的采样时间，该元素等于为每个选定通道设置的tSPL和tSAM。

Table 47.10 Conversion times during scanning (in numbers of cycles of ADCLK and PCLKB)

Parameter			Symbol		Type/conditions: Synchronous trigger*4	Type/conditions: Asynchronous trigger	Type/conditions: Software trigger	Unit
Scan start processing time*1, *2	A/D conversion on Group A under Group A priority control.	Group B is to be stopped. (Group A is activated after Group B is stopped by of an A/D conversion source from Group A.)	t_D		3 PCLKB + 6 ADCLK 5 PCLKB + 3 ADCLK *5	-	-	Cycles
		Group B is not to be stopped. (Activation by an A/D conversion source from Group A.)			2 PCLKB + 4 ADCLK	-	-	
	A/D conversion when self-diagnosis is enabled	A/D conversion for self-diagnosis is to be started.			2 PCLKB + 6 ADCLK	4 PCLKB + 6 ADCLK	6 ADCLK	
	All other				2 PCLKB + 4 ADCLK	2 PCLKB + 4 ADCLK	4 ADCLK	
Channel-dedicated sample-and-hold processing time*1	Sampling time		t_{SPLSH}	t_{SH}	Without continuous sampling: setting in ADSHCR.SSTSH[7:0] (initial value = 18h × ADCLK) With continuous sampling: 0			
	Wait time between sampling and A/D Conversion			t_W	12

		10位转换精度			11 ADCLK			
		8位转换精度			9 ADCLK			
通道专用的采样保持结束处理时间			t_{SHED}		2 ADCLK			
扫描结束处理时间*1			t_{ED}		1 PCLKB + 3 ADCLK 2 PCLKB + 3 ADCLK*5			

Note 1. 有关时间tD、tSPLSH、tDIAG、tCONV和tED的说明，请参见图47.34和图47.35。
Note 2. 这是从软件写入或触发输入到AD转换开始所需的最长时间。
Note 3. 采样时间设置应满足电气特性。
Note 4. 这不包括从定时器输出到触发输入的路径中消耗的时间。
Note 5. 如果ADCLK比PCLKB快（PCLKB与ADCLK频率比=1:2或1:4），则扫描结束处理时间会发生变化。

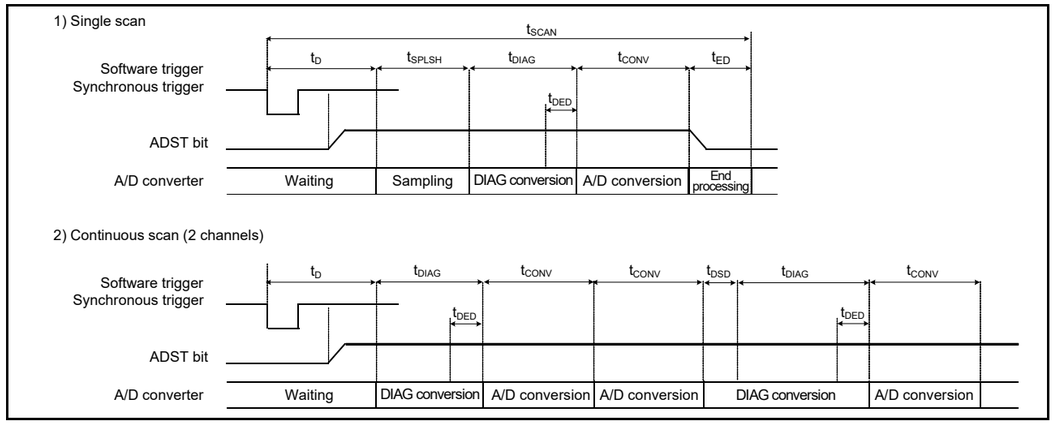

Figure 47.34 Scan conversion timing when activated by software or a synchronous trigger input (ELC)

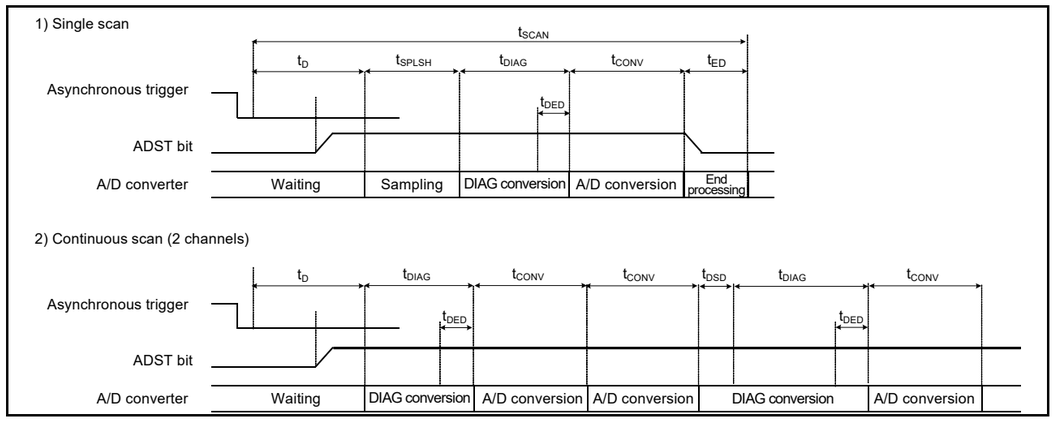

Figure 47.35 Scan conversion timing when activated by an asynchronous trigger input (ADTRG0)

47.3.7 Usage Example of A/D Data Register Automatic Clearing Function

A/D-converted value addition/average mode can be used when A/D conversion of the analog input of the selected channels, temperature sensor output, or internal reference voltage is selected.

Setting the ACE bit in ADCER to 1 automatically clears the data registers (ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, and ADOCDR) to 0000h when the data registers are read by the CPU, DTC, or DMAC. This function enables detection of update failures by the data registers. In the following examples, the function to automatically clear the ADDRy register is enabled and disabled.

If the ACE bit in ADCER is 0 (automatic clearing disabled) and for some reason the A/D conversion result (0222h) is not written to the ADDRy register, the ADDRy value retains the old data (0111h). In addition, if this ADDRy value is read into a general-purpose register using an A/D scan end interrupt, the old data (0111h) can be saved in the general-purpose register. When checking whether there is an update failure, it is necessary to frequently save the old data in SRAM or in a general-purpose register.

If the ACE bit in ADCER is 1 (automatic clearing enabled), when ADDRy = 0111h is read by the CPU, DTC, or DMAC, ADDRy is automatically cleared to 0000h. Next, if the A/D conversion result 0222h cannot be transferred to ADDRy for some reason, the cleared data (0000h) remains as the ADDRy value. If this ADDRy value is read into a general-purpose register using an A/D scan end interrupt at this point, 0000h is saved in the general-purpose register. Occurrence of an ADDRy update failure can be determined by checking that the read data value is 0000h.

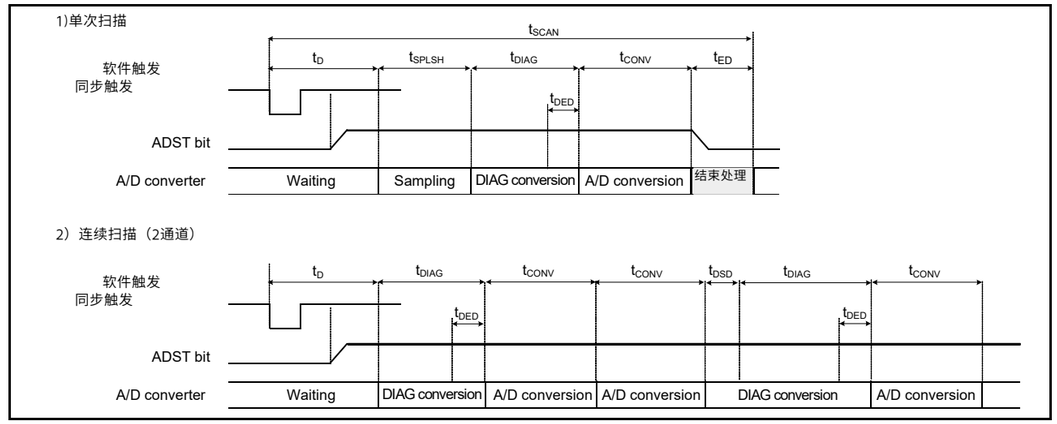

Figure 47.34 由软件或同步触发输入(ELC)激活时的扫描转换时序

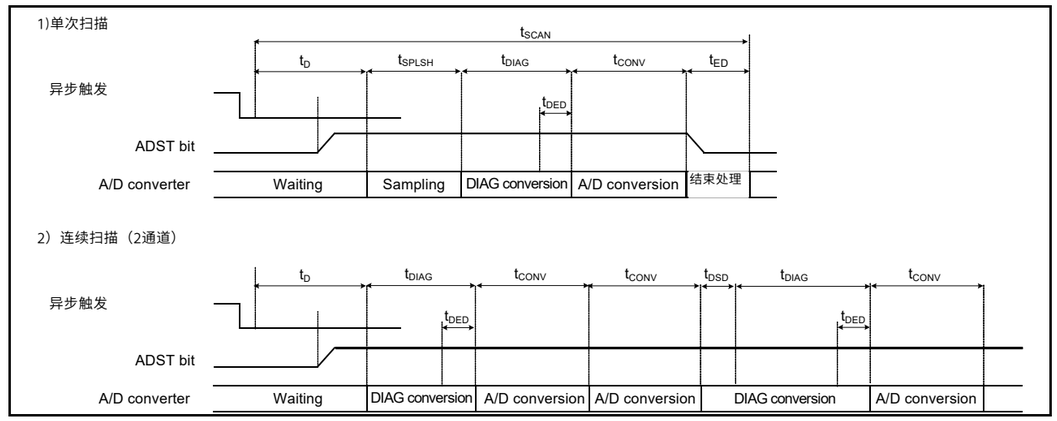

Figure 47.35 由异步触发输入(ADTRG0)激活时的扫描转换时序

47.3.7 AD数据寄存器自动清除功能的使用示例

选择通道的模拟输入、温度传感器输出或内部参考电压的AD转换时，可以使用D转换值加法平均模式。

当CPU、DTC或DMAC读取数据寄存器时，将ADCER中的ACE位设置为1会自动将数据寄存器（ADDRy、ADRD、ADDBLDR、ADDBLDRA、ADDBLDRB、ADTSDR和ADOCDR）清除为0000h。该功能可以通过数据寄存器检测更新失败。在以下示例中，自动清除ADDRy寄存器的功能被启用和禁用。

如果ADCER中的ACE位为0（禁止自动清除）并且由于某种原因AD转换结果（0222h）没有写入ADDRy寄存器，则ADDRy值保留旧数据（0111h）。此外，如果使用AD扫描结束中断将该ADDRy值读入通用寄存器，则可以将旧数据（0111h）保存在通用寄存器中。在检查是否有更新失败时，需要经常将旧数据保存在SRAM或通用寄存器中。

如果ADCER中的ACE位为1（使能自动清零），当CPU、DTC或DMAC读取ADDRy=0111h时，ADDRy会自动清零为0000h。接下来，如果AD转换结果0222h由于某种原因无法传送到ADDRy，则清除的数据(0000h)仍保留为ADDRy值。如果此时使用AD扫描结束中断将该ADDRy值读入通用寄存器，则将0000h保存在通用寄存器中。ADDRy更新失败的发生可以通过检查读取的数据值为0000h来确定。

47.3.8 A/D-Converted Value Addition/Average Mode

In A/D-converted value addition mode, the same channel is A/D-converted 1, 2, 3, 4, or 16*1 consecutive times, and the sum of the converted values is stored in the data register. In A/D-converted value average mode, the same channel is A/D-converted 2 or 4 consecutive times, and the mean of the converted values is stored in the data register. The use of the average of these results can improve the accuracy of A/D conversion, depending on the types of noise components that are present. However, this function cannot always guarantee an improvement in A/D conversion accuracy.

The A/D-converted value addition or average mode can be specified for A/D conversion of the channel select analog input, temperature sensor output, or internal reference voltage.

Note 1. The addition count can be set to 16 only when 12-bit accuracy is selected.

47.3.9 Disconnection Detection Assist Function

This converter incorporates a function that fixes the charge for sampling capacitance to the specified state (VREFH0 or VREFL0 for unit 0, VREFH or VREFL for unit 1) before the start of A/D conversion. This function enables disconnection detection in wiring of analog inputs.

When using the disconnection detection assist function for the channel-dedicated sample-and-hold circuit, set ADSHMSR.SHMD bit to 0 (select disable continuous sampling function).

If any of the following functions are used, the disconnection detection assist function must be disabled:

- The temperature sensor
- The internal reference voltage
- A/D self-diagnosis
- The programmable gain amplifier without bypass enabled.

Figure 47.36 shows the A/D conversion operation when the disconnection detection assist function is used. Figure 47.37 shows an example of disconnection detection when precharge is selected. Figure 47.38 shows an example of disconnection detection when discharge is selected.

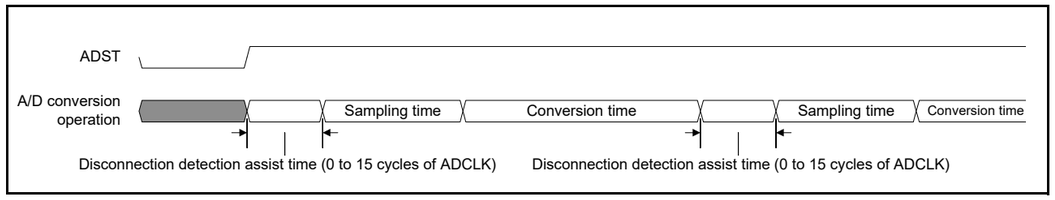

Figure 47.36 A/D conversion operation when the disconnection detection assist function is used

47.3.8 一种D转换的增值平均模式

在AD转换值加法模式下，同一通道连续进行1、2、3、4或16*1次AD转换，并将转换值的总和存储在数据寄存器中。在AD转换值平均模式下，同一通道连续进行2或4次AD转换，转换值的平均值存储在数据寄存器中。根据存在的噪声成分的类型，使用这些结果的平均值可以提高AD转换的精度。但是，该功能不能始终保证AD转换精度的提高。

可以为通道选择模拟输入、温度传感器输出或内部参考电压的AD转换指定AD转换值加法或平均模式。

注1.只有选择12位精度时，才能将加法计数设置为16。

47.3.9 断线检测辅助功能

该转换器包含一个功能，可将采样电容的电荷固定到指定状态（VREFH0或单元0的VREFL0，单元1的VREFH或VREFL）在AD转换开始之前。此功能可在模拟输入接线中进行断线检测。

使用通道专用采样保持电路的断线检测辅助功能时，设置ADSHMSR.SHMD位为0（选择禁用连续采样功能）。

如果使用以下任何功能，则必须禁用断线检测辅助功能：

- 温度传感器
- 内部参考电压
- A/D self-diagnosis
- 未启用旁路的可编程增益放大器。

图47.36显示了使用断线检测辅助功能时的AD转换操作。图47.37显示了选择预充电时的断线检测示例。图47.38显示了选择放电时的断线检测示例。

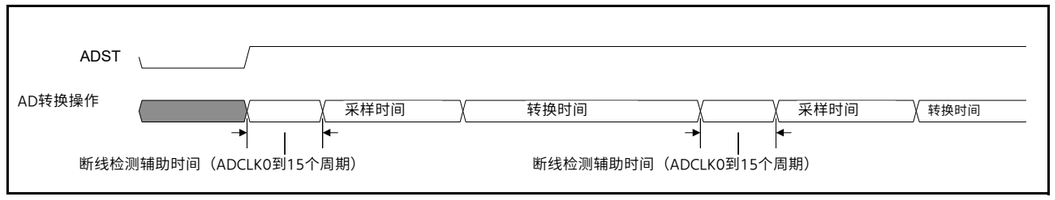

Figure 47.36 使用断线检测辅助功能时的D转换动作

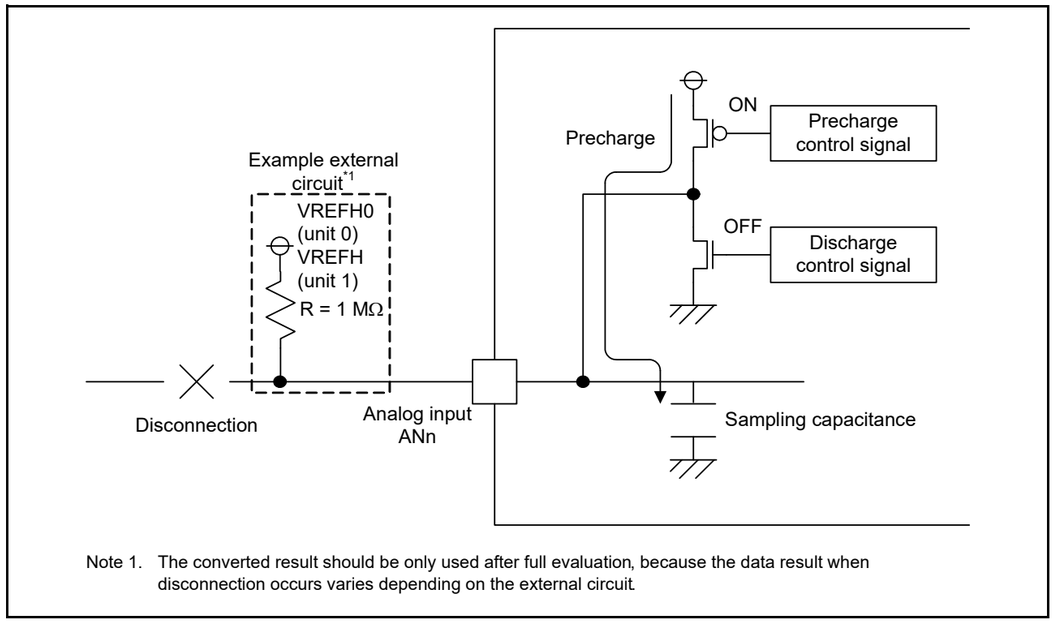
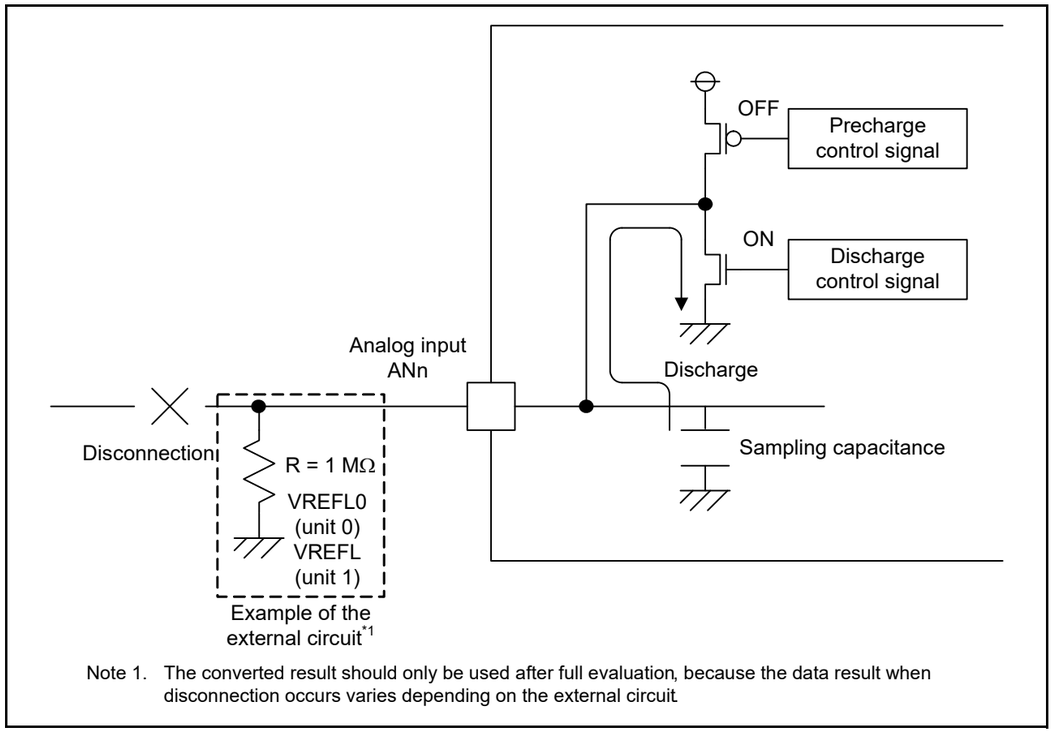


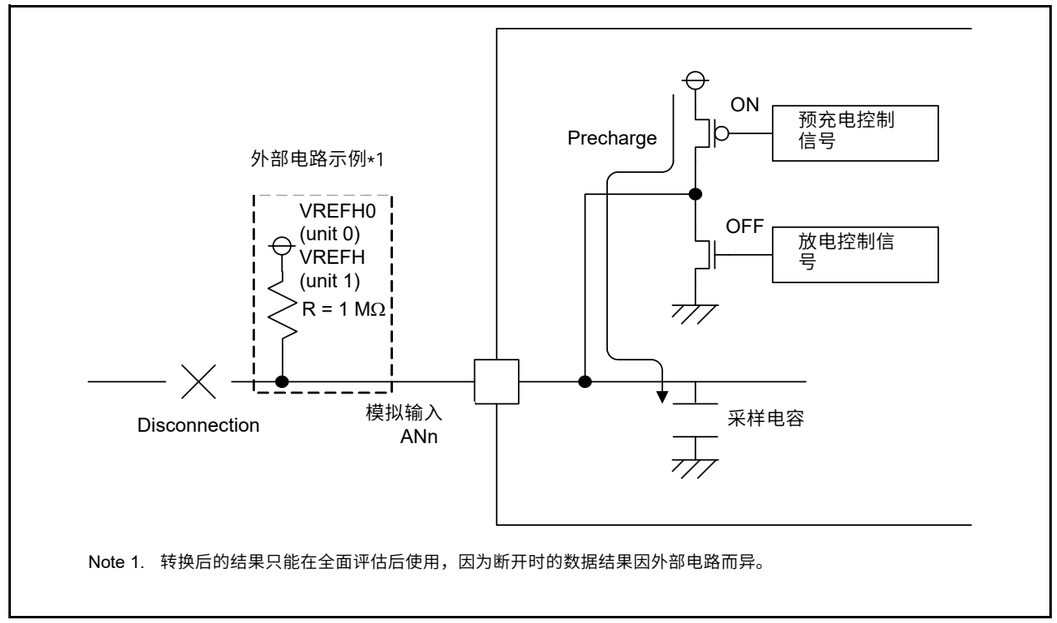
Note 1. The converted result should be only used after full evaluation, because the data result when disconnection occurs varies depending on the external circuit.

Figure 47.37 Example of disconnection detection when precharge is selected



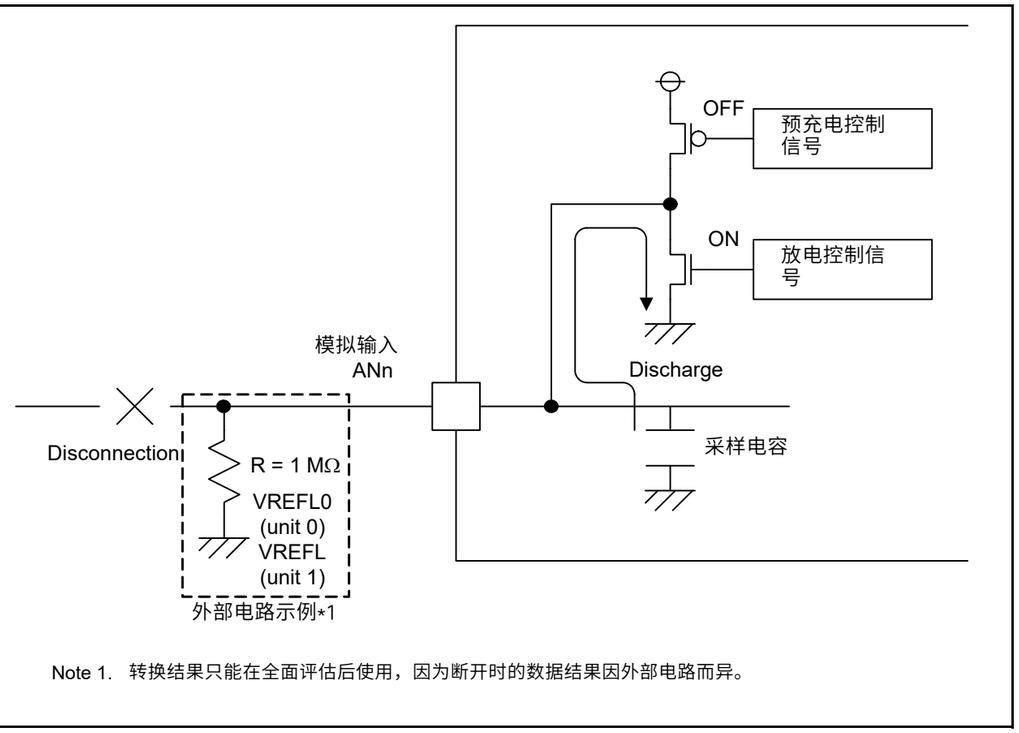
Note 1. The converted result should only be used after full evaluation, because the data result when disconnection occurs varies depending on the external circuit.

Figure 47.38 Example of disconnection detection when discharge is selected



Note 1. 转换后的结果只能在全面评估后使用，因为断开时的数据结果因外部电路而异。

Figure 47.37 选择预充电时的断线检测示例



Note 1. 转换结果只能在全面评估后使用，因为断开时的数据结果因外部电路而异。

Figure 47.38 选择放电时的断线检测示例

47.3.10 Starting A/D Conversion with an Asynchronous Trigger

A/D conversion can be started by the input of an asynchronous trigger. To start the ADC12 by an asynchronous trigger, first set the pin function in the PmnPFS register, next set the A/D Conversion Start Trigger Select bits (ADSTRGR.TRSA[5:0]) to 000000b, and then input a high-level signal to the asynchronous trigger (ADTRGn pin). Finally, set both the ADCSR.TRGE and ADCSR.EXTRG bits to 1. Figure 47.39 shows timing of the asynchronous trigger input.

An asynchronous trigger cannot be selected in the A/D conversion start trigger select bits (ADSTRGR.TRSB[5:0]) for Group B used in group scan mode. For details on setting the pin function, see section 20, I/O Ports.

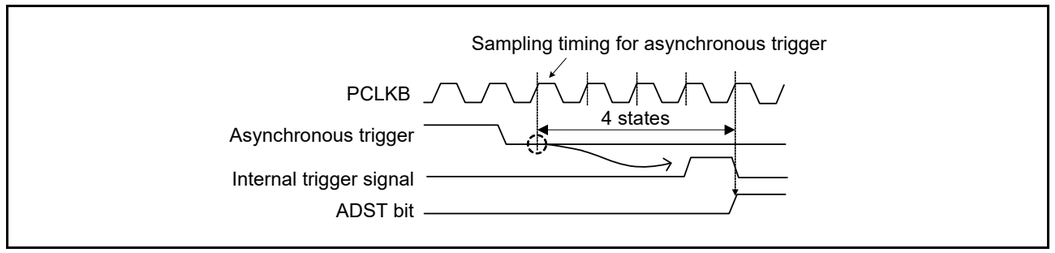


Figure 47.39 Asynchronous trigger input timing

47.3.11 Starting A/D Conversion with a Synchronous Trigger from a Peripheral Module

A/D conversion can be started by a synchronous trigger (ELC). To start the A/D conversion by a synchronous trigger, set the ADCSR.TRGE bit to 1, clear the ADCSR.EXTRG bit to 0, and select the relevant sources in the ADSTRGR.TRSA[5:0] and ADSTRGR.TRSB[5:0] bits.

47.3.12 Programmable Gain Amplifiers

Up to three programmable gain amplifiers (PGAs) can be used in each unit. Select a gain in the ADPGAGS.PnGAIN[3:0] bits (n = 000 to 002) and select an operational amplifier to be used in the ADPGACR.PnSEL bits.

These PGAs accept differential inputs. Pins that accept differential inputs are PGAVSS000 for AN000 to AN002 (unit 0), PGAVSS100 for AN100 to AN102 (unit 1). To use differential inputs, set the differential input gain in the ADPGADCR0.PnDG[2:0] bits, enable the differential input gain setting in the ADPGADCR0.PnGEN bits, and then select the differential input amplifier in the ADPGADCR0.PnDEN bits. The PGA register is selectable as shown in Table 47.11.

Table 47.11 Setting of PGA register and available related functions

Selectable value for each condition	Setting of corresponding Register				related function ✓: available x: unavailable			
	PmnPFS	ADPGACR	ADPGAGS0	ADPGADCR0		ACMPHS*2		
	ASEL*3	PGA P002: bits [11:8] PGA P001: bits [7:4] PGA P000: bit [3:0]	bits [11:8] bits [7:4] bit [3:0]	bits [11:8] bits [7:4] bit [3:0]	Ports*1	IVCMP2	IVCMP3	ADC12
When using Ports	0	Leave these bits with initial values			✓	x	x	x
When using ACMPHS or ADC12(PGA bypass)*4	1	9	0	0	x	✓	x	✓
When using PGA Differential input disabled	1	Eh	0 to Eh	0	x	✓	✓	✓
When using PGA Differential input enabled	1	Eh	1, 5, 9, Bh	8 to Bh	x	x	✓	✓

Note 1. Ports: When using input ports.
Note 2. ACMPHS IVCMP2: When using input through the PGA. ACMPHS IVCMP3: When using input of PGA output.
Note 3. For detail on the configuration of PmnPFS registers, see section 20, I/O Ports.
Note 4. Ports and ACMPHS cannot be used at the same time. Ports and ADC12 cannot be used at the same time.

47.3.10 使用异步触发启动AD转换

可以通过输入异步触发器来启动D转换。要通过异步触发启动ADC12，首先在PmnPFS寄存器中设置引脚功能，然后将AD转换启动触发选择位(ADSTRGR.TRSA[5:0])设置为000000b，然后输入高电平信号到异步触发（ADTRGn引脚）。最后，将ADCSR.TRGE和ADCSR.EXTRG位都设置为1。图47.39显示了异步触发输入的时序。

无法在AD转换开始触发选择位(ADSTRGR.TRSB[5:0])中选择异步触发GroupB用于组扫描模式。有关设置引脚功能的详细信息，请参见第20节，IO端口。

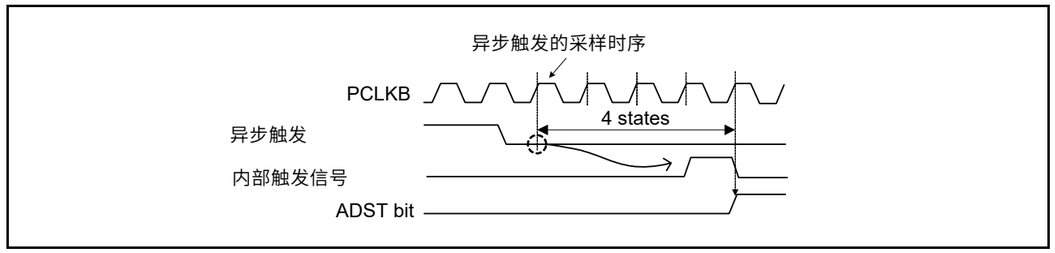

Figure 47.39 异步触发输入时序

47.3.11 使用来自外设模块的同步触发启动AD转换

D转换可以通过同步触发器(ELC)启动。要通过同步触发启动AD转换，请将ADCSR.TRGE位设置为1，将ADCSR.EXTRG位清除为0，并在ADSTRGR.TRSA[5:0]和ADSTRGR.TRSB[5]中选择相关源：0]位。

47.3.12 可编程增益放大器

每个单元最多可使用三个可编程增益放大器(PGA)。选择增益ADPGAGS.PnGAIN[3:0]位（n=000到002）并选择要在ADPGACR.PnSEL位中使用的运算放大器。

这些PGA接受差分输入。接受差分输入的引脚是PGAVSS000，用于AN000到AN002（单元0），PGAVSS100用于AN100至AN102（单元1）。要使用差分输入，设置差分输入增益ADPGADCR0.PnDG[2:0]位，使能ADPGADCR0.PnGEN位中的差分输入增益设置，然后在ADPGADCR0.PnDEN位中选择差分输入放大器。PGA寄存器是可选的，如表47.11所示。

Table 47.11 PGA寄存器的设置和可用的相关功能

每个条件的可选值	对应寄存器的设置				相关功能 ：可用 x：不可用			
	PmnPFS	ADPGACR	ADPGAGS0	ADPGADCR0		ACMPHS*2		
	ASEL*3	PGAP002：位[11:8] PGAP001：位[7:4] PGAP000：位[3:0]	bits [11:8] bits [7:4] bit [3:0]	bits [11:8] bits [7:4] bit [3:0]	Ports*1	IVCMP2	IVCMP3	ADC12
使用端口时	0	将这些位保留为初始值			✓	x	x	x
使用ACMPHS或ADC12（PGA旁路）时*4	1	9	0	0	x	✓	x	✓
使用PGA时 差分输入禁用	1	Eh	0到呃	0	x	✓	✓	✓
使用PGA时 启用差分输入	1	Eh	1, 5, 9, Bh	8 to Bh	x	x	✓	✓

Note 1. 端口：使用输入端口时。
Note 2. ACMPHSIVCMP2：通过PGA使用输入时。ACMPHSIVCMP3：使用PGA输出的输入时。
Note 3. 有关PmnPFS寄存器配置的详细信息，请参见第20节，IO端口。
Note 4. 端口和ACMPHS不能同时使用。端口和ADC12不能同时使用。

Table 47.12 shows the calculation formula for the PGA output voltage.

Table 47.12 PGA output voltage

Mode	PGA output voltage
Single	Gain × Vin
Differential	Gain (Vin - Vs) + 0.5 × AVCC

Vin: AN000 to AN002, AN100 to AN102
Vs: PGAVSS00, PGAVSS001

47.4 Interrupt Sources and DTC/DMAC Transfer Requests

47.4.1 Interrupt Requests

The ADC12 can send scan end interrupt requests, ADC12i_ADI (i = 0, 1) and ADC12i_GBADI, to the CPU. The module also generates the ADC12i_CMPAI and ADC12i_CMPBI interrupts to the CPU in response to matches with a comparison condition.

An ADC12i_ADI interrupt is always generated. An ADC12i_GBADI interrupt can be generated by setting the ADCSR.GBADIE bit to 1. Similarly, ADC12i_CMPAI and ADC12i_CMPBI interrupts can be generated by setting the ADCMPCR.CMPAIE and ADCMPCR.CMPBIE bit to 1.

In addition, the DTC or DMAC can be started when an ADC12i_ADI or ADC12i_GBADI interrupt, or ADC12i_WCMPM or ADC12i_WCMPUM event is generated. Using these interrupts or events to allow the DTC or DMAC to read the converted data enables continuous conversion without burdening the software.

For details on the DTC settings, see section 18, Data Transfer Controller (DTC), and for details on the DMAC settings, see section 17, DMA Controller (DMAC).

Table 47.13 describes the interrupt sources and ELC events available for the ADC12.

PGA输出电压的计算公式如表47.12所示。

Table 47.12 PGA输出电压

Mode	PGA输出电压
Single	增益 Vin
Differential	Gain (Vin - Vs) + 0.5 × AVCC

Vin: AN000 to AN002, AN100 to AN102
Vs: PGAVSS00, PGAVSS001

47.4 中断源和DTCDMAC传输请求

47.4.1 中断请求

ADC12可以向CPU发送扫描结束中断请求ADC12i_ADI(i=0 1)和ADC12i_GBADI。该模块还向CPU生成ADC12i_CMPAI和ADC12i_CMPBI中断，以响应与比较条件的匹配。

始终会产生ADC12i_ADI中断。ADC12i_GBADI中断可以通过设置ADCSR.GBADIE位为1。类似地，ADC12i_CMPAI和ADC12i_CMPBI中断可以通过设置ADCMPCR.CMPAIE和ADCMPCR.CMPBIE位为1。

此外，当ADC12i_ADI或ADC12i_GBADI中断时，可以启动DTC或DMAC，或者生成ADC12i_WCMPM或ADC12i_WCMPUM事件。使用这些中断或事件来允许DTC或读取转换数据的DMAC可以实现连续转换，而不会增加软件负担。

有关DTC设置的详细信息，请参阅第18节，数据传输控制器(DTC)，有关DMAC设置的详细信息，请参阅第17节，DMA控制器(DMAC)。

表47.13描述了ADC12可用的中断源和ELC事件。

47.5 Event Link Function

47.5.1 Event Output to the ELC

The ELC uses the ADC12i_ADI interrupt request signal as an event signal, enabling link operation for the preset module. The ADC12i_GBADI interrupt and ADC12i_CMPAI/ADC12i_CMPBI interrupts cannot be used as event signals. For details, see Table 47.13.

47.5.2 ADC12 Operation through an Event from the ELC

The ADC12 can start A/D conversion by the preset event specified in the ELSRn settings for the ELC as follows:

- Select the ELC_AD00 (unit 0) signal in the ELC.ELSR8 register
- Select the ELC_AD01 (unit 0) signal in the ELC.ELSR9 register
- Select the ELC_AD10 (unit 1) signal in the ELC.ELSR10 register
- Select the ELC_AD11 (unit 1) signal in the ELC.ELSR11 register.

If an ELC_ADi0 or ELC_ADi1 event occurs during A/D conversion, the event is disabled.

Note: i = 0: unit 0, i = 1: unit 1.

47.5 事件链接功能

47.5.1 事件输出到ELC

ELC使用ADC12i_ADI中断请求信号作为事件信号，为预设模块启用链接操作。
ADC12i_GBADI中断和ADC12i_CMPAIADC12i_CMPBI中断不能用作事件信号。详见表47.13。

47.5.2 ADC12通过来自ELC的事件进行操作

ADC12可以通过ELC的ELSRn设置中指定的预设事件启动AD转换，如下所示：

- 选择ELC.ELSR8寄存器中的ELC_AD00（单元0）信号
- 选择ELC.ELSR9寄存器中的ELC_AD01（单元0）信号
- 选择ELC.ELSR10寄存器中的ELC_AD10（单元1）信号
- 选择ELC.ELSR11寄存器中的ELC_AD11（单元1）信号。

如果在AD转换期间发生ELC_ADi0或ELC_ADi1事件，则该事件被禁用。

47.6 Usage Notes

47.6.1 Constraints on Reading the Data Registers

The following registers must be read in halfword units:

- A/D Data Registers
- A/D Data Duplexing Register
- A/D Data Duplexing Register A
- A/D Data Duplexing Register B
- A/D Temperature Sensor Data Register
- A/D Internal Reference Voltage Register
- A/D Self-Diagnosis Data Register.

If a register is read twice in byte units, that is, the upper byte and bytes are read separately, the A/D-converted value read initially might disagree with the A/D-converted value read subsequently. To prevent this, never read the data registers in byte units.

47.6.2 Constraints on Stopping A/D Conversion

To stop A/D conversion when an asynchronous trigger or a synchronous trigger is selected as the condition for starting A/D conversion, follow the procedure shown in Figure 47.40.

47.6 使用说明

47.6.1 读取数据寄存器的限制

以下寄存器必须以半字为单位读取：

- AD数据寄存器
- AD数据双工寄存器
- AD数据双工寄存器A
- AD数据双工寄存器B
- AD温度传感器数据寄存器
- AD内部参考电压寄存器
- AD自诊断数据寄存器。

如果以字节为单位读取寄存器两次，即分别读取高字节和字节，则最初读取的AD转换值可能与随后读取的AD转换值不一致。为防止这种情况，切勿以字节为单位读取数据寄存器。

47.6.2 停止AD转换的约束

选择异步触发或同步触发作为启动条件时停止AD转换
AD转换，按照图47.40所示的步骤进行。

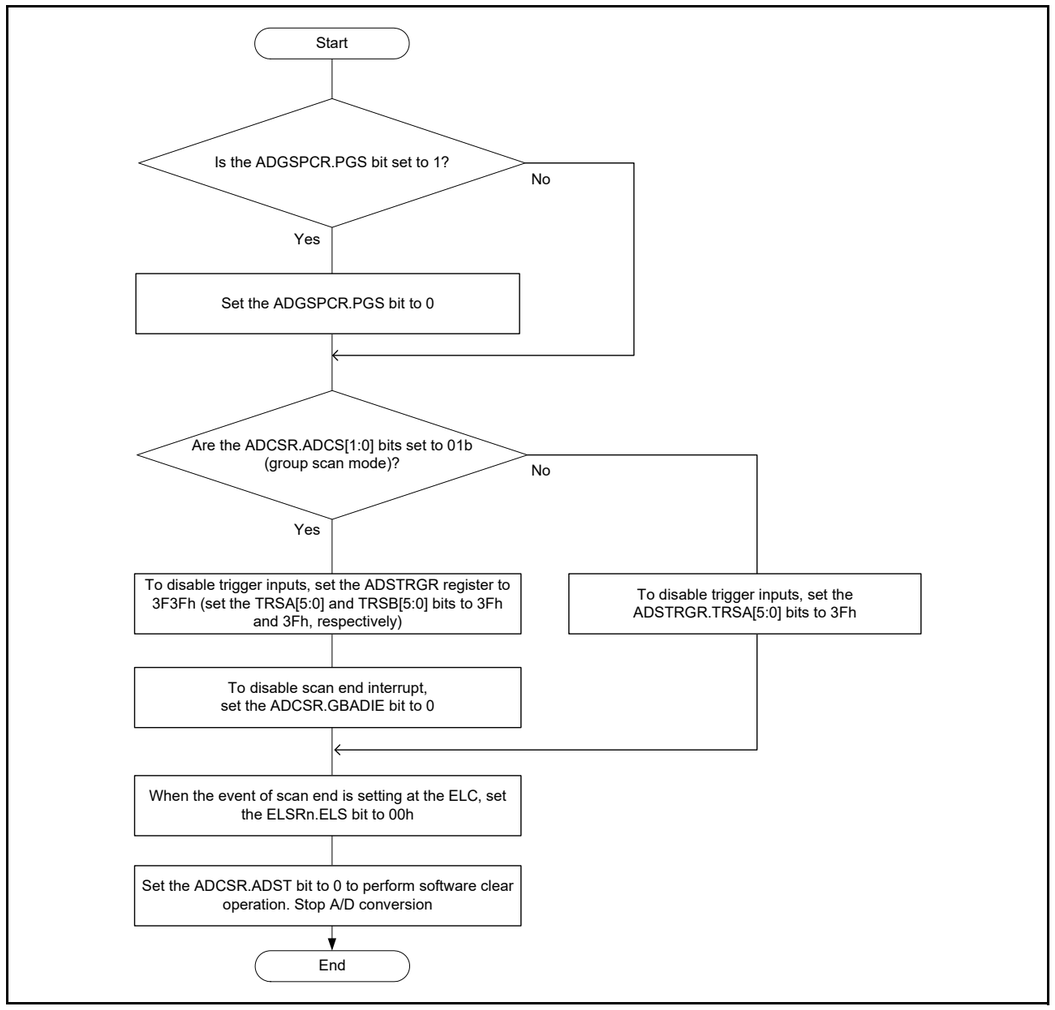

Figure 47.40 Procedures for clearing the ADCSR.ADST bit by software

47.6.3 A/D Conversion Restart and Termination Timing

A maximum of 6 ADCLK cycles is required for the idle analog unit of the ADC12 to restart on setting the ADCSR.ADST bit to 1. A maximum of 2 ADCLK cycles is required for the operating analog unit of the ADC12 to be terminate on setting the ADCSR.ADST bit to 0.

47.6.4 Constraints on Scan End Interrupt Handling

When scanning the same analog input twice using any trigger, the first A/D-converted data is overwritten with the second A/D-converted data if the CPU does not finish reading the A/D-converted data by the time the A/D conversion of the first analog input for the second scan ends after the first scan end interrupt is generated.

47.6.5 Settings for the Module-Stop Function

ADC12 operation can be disabled or enabled using the Module Stop Control Register. The ADC12 is initially stopped after reset. Releasing the module-stop state enables access to the registers. After release from the module-stop state, wait for at least 1 µs before starting A/D conversion. For details, see section 11.4, Module-Stop Function.

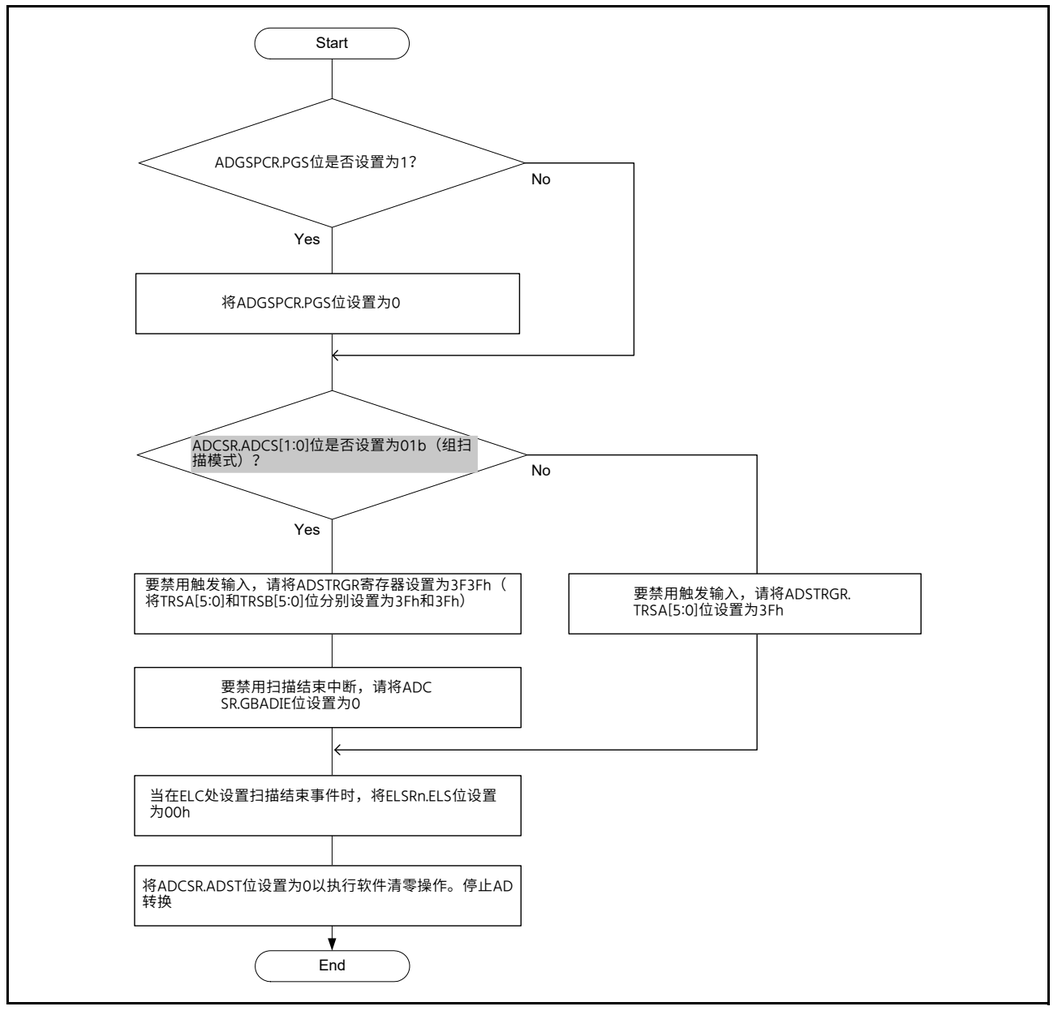

Figure 47.40 通过软件清除ADCSR.ADST位的程序

47.6.3 AD转换重启和终止时序

ADC12的空闲模拟单元最多需要6个ADCLK周期才能在设置时重新启动ADCSR.ADST位为1。ADC12的操作模拟单元最多需要2个ADCLK周期才能在将ADCSR.ADST位设置为0时终止。

47.6.4 扫描结束中断处理的约束

当使用任何触发器扫描相同的模拟输入两次时，如果CPU在第一个AD转换之前没有完成读取AD转换的数据，则第一个AD转换的数据将被第二个AD转换的数据覆盖第二次扫描的模拟输入在第一次扫描结束中断产生后结束。

47.6.5 模块停止功能的设置

可以使用模块停止控制寄存器禁用或启用ADC12操作。ADC12在复位后最初停止。释放模块停止状态可以访问寄存器。从模块停止状态释放后，在开始AD转换之前至少等待1微秒。有关详细信息，请参阅第11.4节，模块停止功能。

47.6.6 Notes on Entering the Low-Power States

Before entering the module-stop state or Software Standby mode, you must stop A/D conversion. Here, set the ADCSR.ADST bit to 0 and secure a period of time until the analog unit of the ADC12 stops.

To secure this time, follow the procedure shown in Figure 47.40 for clearing the ADCSR.ADST bit by software. Next, wait for 2 clock cycles of ADCLK before entering the module-stop state or Software Standby mode.

47.6.7 Error in Absolute Accuracy When Disconnection Detection Assistance Is in Use

Using disconnection detection assistance leads to an error in the absolute accuracy of the ADC12. This error arises because an erroneous voltage is input to the analog input pins because of the resistive voltage division between the pull-up or pull-down resistor (Rp) and the resistance of the signal source (Rs). This error in absolute accuracy is calculated from the following formula.

Maximum error in absolute accuracy (LSB) = $(2^{Resolution} - 1) \times Rs / (Rs + Rp)$, Resolution = 12, 10, 8

Only use disconnection detection assistance after thorough evaluation.

47.6.8 Available Functions and Register Settings of AN000 to AN002, AN007, AN100 to AN102, and AN107

Table 47.14 shows the available functions and register setting of AN000 to AN002, AN007, AN100 to AN102, and AN107. Figure 47.41 shows the setting procedure of registers. To use each function, set the register value shown in Table 47.14.

When the PGA is used with differential input enabled, a negative voltage can be input for AN000 to AN002 and PGAVSS000 for unit 0, and AN100 to AN102 and PGAVSS100 for unit 1 pin after setting the registers.

When the PGA is used with differential input enabled, all PGA amplifiers in each unit must be set to differential input in the ADPGADCR0 register.

When the PGA is used with differential input disabled, the associated PGAVSS pin must be connected to AVSS0. When the PGA is not used, the associated PGAVSS can be used as an input port.

When transitioning to the ADC module-stop state or Software Standby mode from the state of using PGA or sample-and-hold circuit, if 0 is set to the associated bit of ADPGACR or ADSHCR register of each ADC12 before transitioning, power consumption can be reduced.

The initial value of the ASEL bit of P003 and P007 is 1. When these pins are not used as an analog function, to reduce the input leakage current, set the ASEL bit to 0.

Table 47.14 Available functions and register setting

Available functions						Register setting				
						P0nPFS*6		PGA		S/H*3
Ports*1	IRQ*2	S/H*3	PGA-S*4	PGA-D*5	ADC12	ASEL	ISEL	ADPGADCR0*7	ADPGACR*8	ADSHCR*9
✓	-	-	-	-	-	0	0	x	x	x
-	✓	-	-	-	-	0	1	x	x	x
-	-	-	-	-	✓*10	1	x	0	9h	0
-	-	-	-	-	✓*11	1	x	0*11	0 or 9h	0
-	-	✓	-	-	✓	1	x	0	9h	1 (0*13)

-	-	-	-	✓	✓	1	x	1	Eh (0h*12	0

✓: Available
x: Don't care
Note 1. Ports: P000 to P007 can be used as port inputs.
Note 2. IRQ: P000 to P002 and P003 to P005 can be used as IRQ pins.
Note 3. S/H: sample-and-hold circuit.
Note 4. PGA-S: When the PGA setting is Differential input disabled. Corresponding PGAVSS must be set as ASEL to 1,

47.6.6 进入低功耗状态的注意事项

在进入模块停止状态或软件待机模式之前，您必须停止AD转换。在这里，设置ADCSR.ADST位为0并确保一段时间，直到ADC12的模拟单元停止。

为确保该时间，请按照图47.40中所示的过程通过软件清除ADCSR.ADST位。接下来，在进入模块停止状态或软件待机模式之前等待ADCLK的2个时钟周期。

47.6.7 使用断线检测辅助时的绝对精度误差

使用断开检测辅助会导致ADC12的绝对精度出现误差。由于上拉或下拉电阻(Rp)与信号源电阻(Rs)之间的电阻分压，导致错误电压输入到模拟输入引脚，因此会出现此错误。该绝对精度误差由以下公式计算得出。

绝对精度的最大误差(LSB)=(2分辨率−1)×Rs(Rs+Rp)，分辨率=12 10 8

仅在全面评估后使用断线检测辅助。

47.6.8 AN000至AN002、AN007、AN100至AN102和AN107的可用功能和寄存器设置

表47.14显示了AN000至AN002、AN007、AN100至AN102和AN107。图47.41显示了寄存器的设置过程。要使用每个功能，请设置表47.14中所示的寄存器值。

当PGA与差分输入使能时，AN000到AN002可以输入负电压，并且设置寄存器后，单元0为PGAVSS000，单元1引脚为AN100至AN102和PGAVSS100。

当PGA在差分输入使能的情况下使用时，每个单元中的所有PGA放大器都必须在ADPADCR0寄存器中设置为差分输入。

当PGA在差分输入禁用的情况下使用时，相关的PGAVSS引脚必须连接到AVSS0。当不使用PGA时，关联的PGAVSS可以用作输入端口。

当从使用PGA或采样保持电路的状态转换到ADC模块停止状态或软件待机模式时，如果在转换前将每个ADC12的ADPGACR或ADSHCR寄存器的相关位设置为0，则可以降低功耗。

P003和P007的ASEL位初始值为1。当这些引脚不用作模拟功能时，为减小输入漏电流，将ASEL位设置为0。

Table 47.14 可用功能和寄存器设置

可用功能						注册设置				
						P0nPFS*6		PGA		S/H*3
Ports*1	IRQ*2	S/H*3	PGA-S*4	PGA-D*5	ADC12	ASEL	ISEL	ADPGADCR0*7	ADPGACR*8	ADSHCR*9
✓	-	-	-	-	-	0	0	x	x	x
-	✓	-	-	-	-	0	1	x	x	x
-	-	-	-	-	✓*10	1	x	0	9h	0

注2.IRQ：P000至P002和P003至P005可用作IRQ引脚。
注3.SH：采样保持电路。
注4.PGA-S：当PGA设置为差分输入禁用时。对应的PGAVSS必须设置为ASEL为1，

and connect to AVSS0.

Note 5. PGA-D: When the PGA setting is Differential input enabled. Corresponding PGAVSS must set as ASEL to 1.

Note 6. P0nPFS: Port 0 Pin Function Select register (n = 00 to 07) corresponding to analog input pin.

Note 7. It indicates the corresponding Differential Input Enable bit (bit [11] or bit [7] or bit [3]) in the ADPGADCR0 register.

Note 8. It indicates the corresponding Amplifier Control bits (bits [11:8] or bits [7:4], or bits [3:0]) in the ADPGACR register.

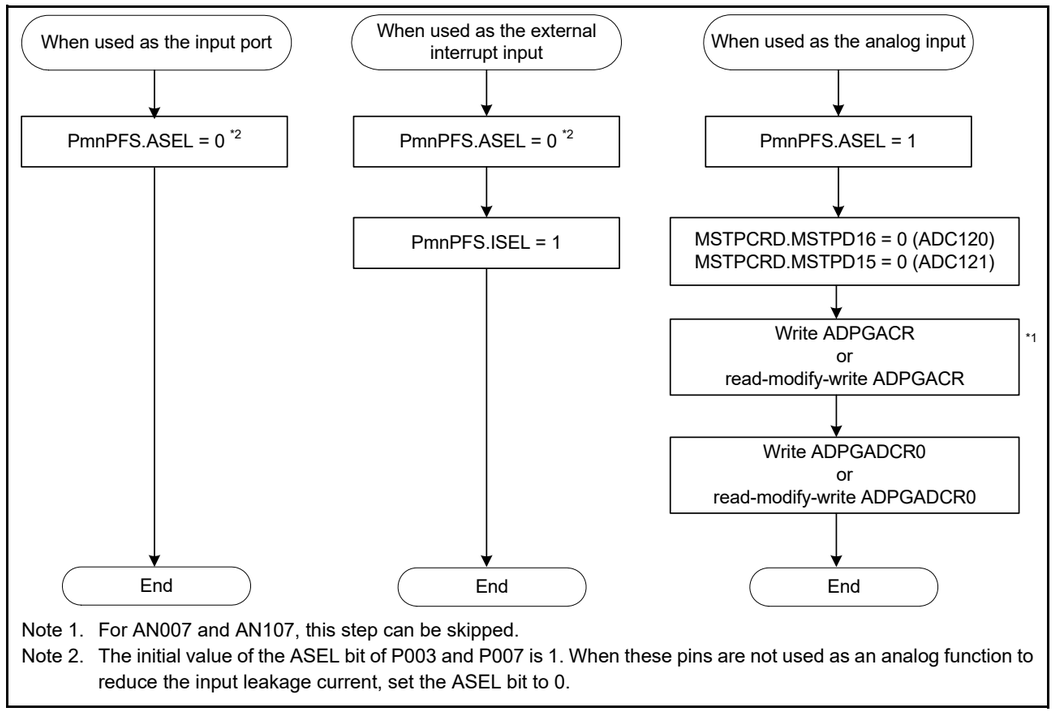
Note 9. It indicates the corresponding Bypass Select bit (bit [10] or bit [9] or bit [8]) in ADSHCR register.

Note 10. When using AN000 to AN002 or AN100 to AN102.

Note 11. When using AN007 or AN107. Set all corresponding bits (ADPGADCR0 bit [11], bit [7], and bit [3] to 0.

Note 12. Power consumption of the PGA can be reduced by setting 0h to the corresponding bit of the ADPGACR register before transitioning to the ADC12 module-stop state or Software Standby mode.

Note 13. Power consumption of the S/H can be reduced by setting 0 to the corresponding bit of the ADSHCR register before transitioning to the ADC12 module-stop state or Software Standby mode.



Note 1. For AN007 and AN107, this step can be skipped.

Note 2. The initial value of the ASEL bit of P003 and P007 is 1. When these pins are not used as an analog function to reduce the input leakage current, set the ASEL bit to 0.

Figure 47.41 Setting procedure of registers

47.6.9 Constraints on Operating Modes and Status Bits

The voltage values in self-diagnosis, the determination of first or second scan in double-trigger mode, and the data buffer pointer and status monitor in the compare function initialize or set it again individually, if required.

- The voltage values in self-diagnosis can be selected in ADCER.DIAGVAL[1:0] after ADCER.DIAGLD is set to 1.
- The double-trigger mode operates as the first scan after ADCSR.DBLE is set to 1 from 0.
- The status monitor bits (MONCMPA, MONCMPB, and MONCOMB) in the compare function are initialized after ADCMPCR.CMPAE and ADCMPCR.CMPBE are cleared to 0.
- The constant sampling function (ADSHMSR.SHMD = 1) is initialized after ADSHMSR.SHMD is cleared to 0. When the constant sampling function is used (setting ADSHMSR.SHMD = 1) again, a wait of 1ADCLK or more waiting is required.

并连接到AVSS0。注5.PGA-D：当PGA设置为差分输入时。对应的PGAVSS必须设置为ASEL为1。

注6.P0nPFS：端口0引脚功能选择寄存器（n=00至07）对应于模拟输入引脚。

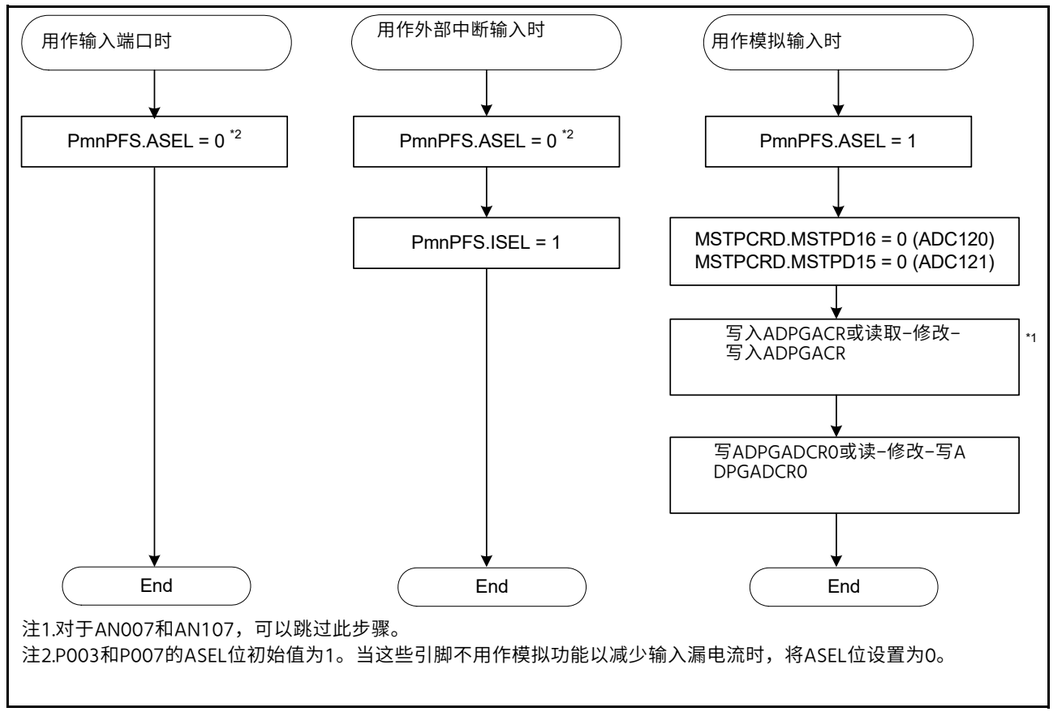
注7.它表示ADPADCR0寄存器中相应的差分输入使能位（位[11]或位[7]或位[3]）。

注8：它表示ADPGACR寄存器中相应的放大器控制位（位[11:8]或位[7:4]或位[3:0]）。注9.它表示ADSHCR寄存器中对应的BypassSelect位（bit[10]或bit[9]或bit[8]）。

注10.使用AN000至AN002或AN100至AN102时。

注11.使用AN007或AN107时。将所有相应位（ADPGADCR0位[11]、位[7]和位[3]）设置为0。

注12.在转换到ADC12模块停止状态或软件待机模式之前，可以通过将ADPGACR寄存器的相应位设置为0h来降低PGA的功耗。注13.在转换到ADC12模块停止状态或软件待机模式之前，可以通过将ADSHCR寄存器的相应位设置为0来降低SH的功耗。



注1.对于AN007和AN107，可以跳过此步骤。

注2.P003和P007的ASEL位初始值为1。当这些引脚不用作模拟功能以减少输入漏电流时，将ASEL位设置为0。

Figure 47.41 寄存器的设置步骤

47.6.9 操作模式和状态位的限制

如果需要，自诊断中的电压值、双触发模式下第一次或第二次扫描的确定以及比较功能中的数据缓冲区指针和状态监视器会单独初始化或重新设置。

- ADCER.DIAGLD设置为1后，可以在ADCER.DIAGVAL[1:0]中选择自诊断中的电压值。
- 双触发模式作为ADCSR.DBLE从0设置为1后的第一次扫描运行。
- 比较函数中的状态监控位（MONCMPA、MONCMPB和MONCOMB）在之后初始化ADCMPCR.CMPAE和ADCMPCR.CMPBE清零。
- 在ADSHMSR.SHMD清零后初始化恒定采样函数(ADSHMSR.SHMD=1)。
  当再次使用恒定采样功能（设置ADSHMSR.SHMD=1）时，需要等待1ADCLK或更多等待。

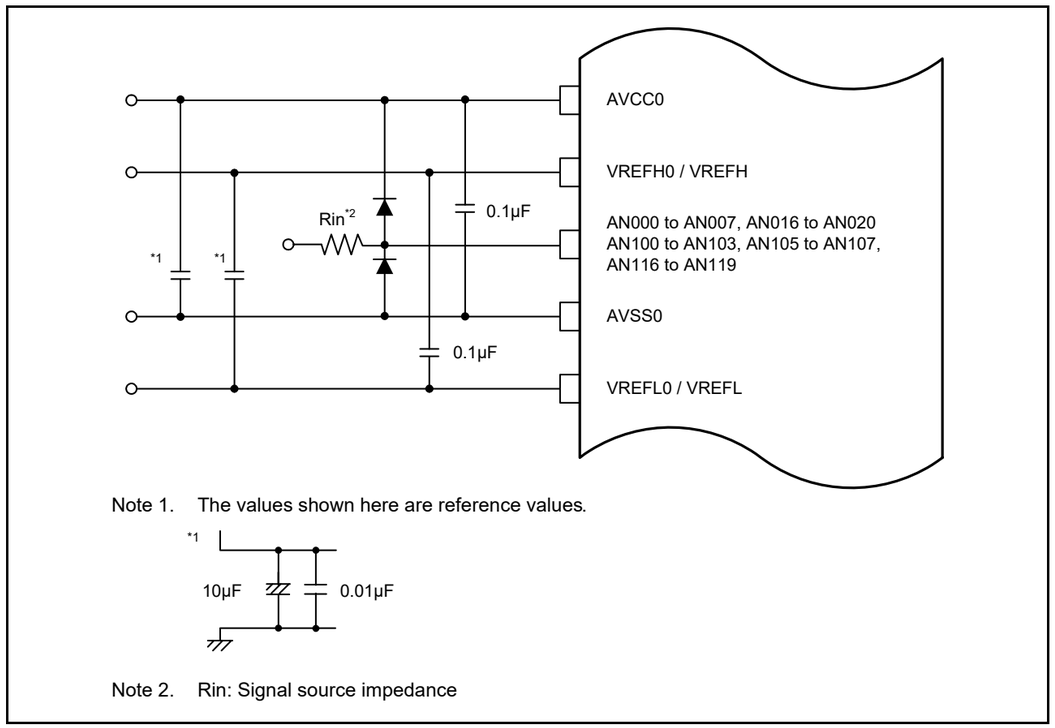
47.6.10 Notes on Board Design

The board should be designed so that digital circuits and analog circuits are separated from each other as far as possible.

In addition, digital circuit signal lines and analog circuit signal lines should not intersect or placed near each other. If these rules are not followed, noise will be produced on analog signals and A/D conversion accuracy will be affected. The analog input pins (AN000 to AN007, AN016 to AN020, AN100 to AN103, AN105 to AN107, AN116 to AN119), reference power supply pin (VREFH0/VREFH), reference ground pin (VREFL0/VREFL), and analog power supply (AVCC0) should be separated from digital circuits using the analog ground (AVSS0). The analog ground (AVSS0) should be connected to a stable digital ground (VSS) on the board (single-point ground plane connection).

47.6.11 Constraints on Noise Prevention

To prevent the analog input pins (AN000 to AN007, AN016 to AN020, AN100 to AN103, AN105 to AN107, and AN116 to AN119) from being destroyed by abnormal voltage such as excessive surges, insert a capacitor between AVCC0 and AVSS0, between VREFH0 and VREFL0, and between VREFH and VREFL, and connect a protection circuit to protect the analog input pins (AN000 to AN007, AN016 to AN020, AN100 to AN103, AN105 to AN107, and AN116 to AN119) as shown Figure 47.42.



Note 1. The values shown here are reference values.

Note 2. Rin: Signal source impedance

Figure 47.42 Example protection circuit for analog inputs

47.6.12 Port Settings When Using the ADC12 Input

When using the high-precision channels, do not use ports 0 as digital output ports. Renesas also recommends not using the digital output that is also used as the A/D analog input, if normal-precision channels is used. If the digital output that is also used as the A/D analog input is used for output signals, perform A/D conversion several times, eliminate the maximum and minimum values, and obtain the average of the other results.

47.6.13 Relationship between ADC12 Units 0 and 1 and the ACMPHS

For the A/D conversion targets in Table 47.15, unit 0 and 1 should not perform A/D conversion at the same time.

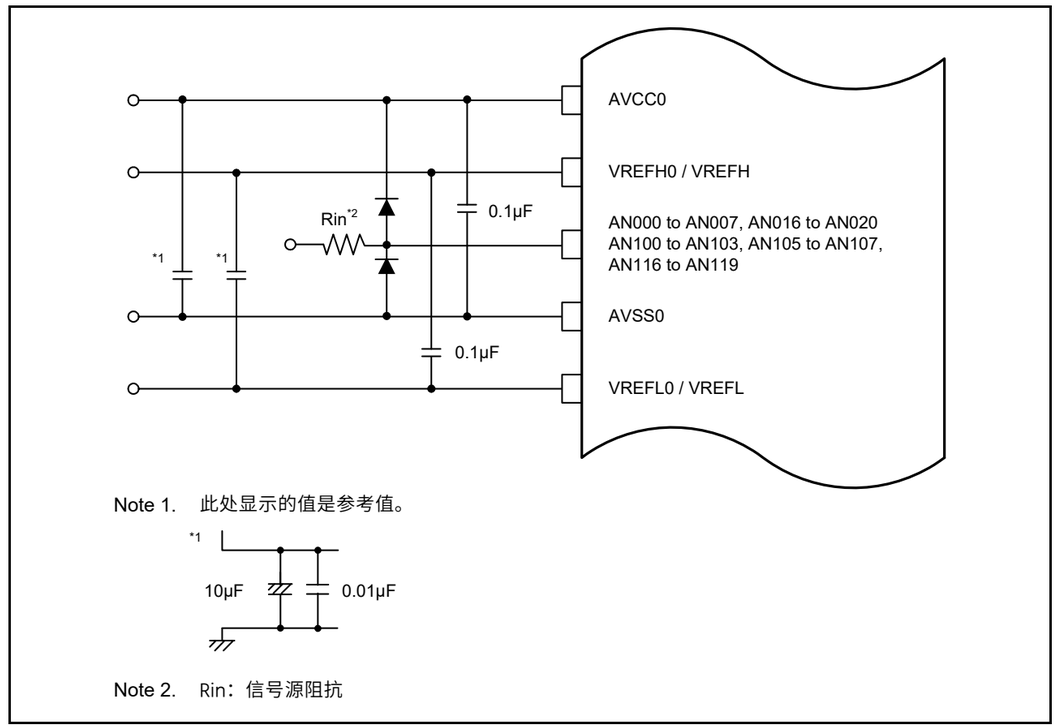
47.6.10 电路板设计注意事项

电路板的设计应使数字电路和模拟电路尽可能分开。

此外，数字电路信号线和模拟电路信号线不应交叉或靠近。如果不遵守这些规则，模拟信号就会产生噪声，影响AD转换精度。模拟输入引脚（AN000至AN007、AN016至AN020、AN100至AN103、AN105至AN107、AN116至AN119）、参考电源引脚（VREFH0VREFH）、参考接地引脚（VREFL0VREFL）和模拟电源（AVCC0）应使用模拟地(AVSS0)与数字电路分开。模拟接地(AVSS0)应连接到板上的稳定数字接地(VSS)（单点接地层连接）。

47.6.11 防止噪音的限制

为防止模拟输入引脚（AN000至AN007、AN016至AN020、AN100至AN103、AN105至AN107和AN116至AN119）被异常电压（如过大浪涌）破坏，请在AVCC0和AVSS0之间、VREFH0和VREFL0和VREFH和VREFL之间，并连接保护电路以保护模拟输入引脚（AN000到AN007、AN016到AN020、AN100到AN103、AN105到AN107和AN116到AN119），如图47.42所示。



Note 1. 此处显示的值是参考值。

Note 2. Rin：信号源阻抗

Figure 47.42 模拟输入保护电路示例

47.6.12 使用ADC12输入时的端口设置

使用高精度通道时，请勿将端口0用作数字输出端口。如果使用标准精度通道，瑞萨还建议不要使用也用作AD模拟输入的数字输出。如果将同时用作AD模拟输入的数字输出用于输出信号，则进行几次AD转换，消除最大值和最小值，取其他结果的平均值。

47.6.13 ADC12单元0和1与ACMPHS之间的关系

对于表47.15中的AD转换目标，单元0和单元1不应同时进行AD转换。

Table 47.15 A/D conversion targets that are mutually exclusive with each other

A/D conversion target	
Unit 0	**Unit 1**
Temperature sensor	
Internal reference voltage	
AN005/DA0	AN105/DA0
AN006/DA1	AN106/DA1

The A/D conversion targets in Table 47.16 should not be selected as ACMPHS input during A/D conversion, because these pins are multiplexed with the ADC12 and ACMPHS.

Table 47.16 A/D conversion targets that are mutually exclusive with ACMPHS

A/D conversion target

48. 12-Bit D/A Converter (DAC12)

48.1 Overview

The MCU provides a 12-Bit D/A Converter (DAC12) with an output amplifier. Table 48.1 lists the DAC12 specifications, Figure 48.1 shows a block diagram, and Table 48.2 lists the I/O pins.

Table 48.1 DAC12 specifications

Parameter	Specifications
Resolution	12 bits
Output channels	2 channels
Interference reduction between analog modules	Methods provided to minimize interference between D/A and A/D conversion: • D/A converted data update timing is controlled by the ADC12 synchronous D/A conversion enable input signal from the ADC12 (unit 1) • Degradation of A/D conversion accuracy caused by interference is reduced by controlling DAC12 inrush current generation timing with the enable signal
Module-stop function	Module-stop state can be set to reduce power consumption
Event link function (input)	DA0 and DA1 conversion can be started when an event signal is input
D/A output amplifier control function	Controls whether the output amplifier (for both amplifier-through and amplifier-bias controls) is used

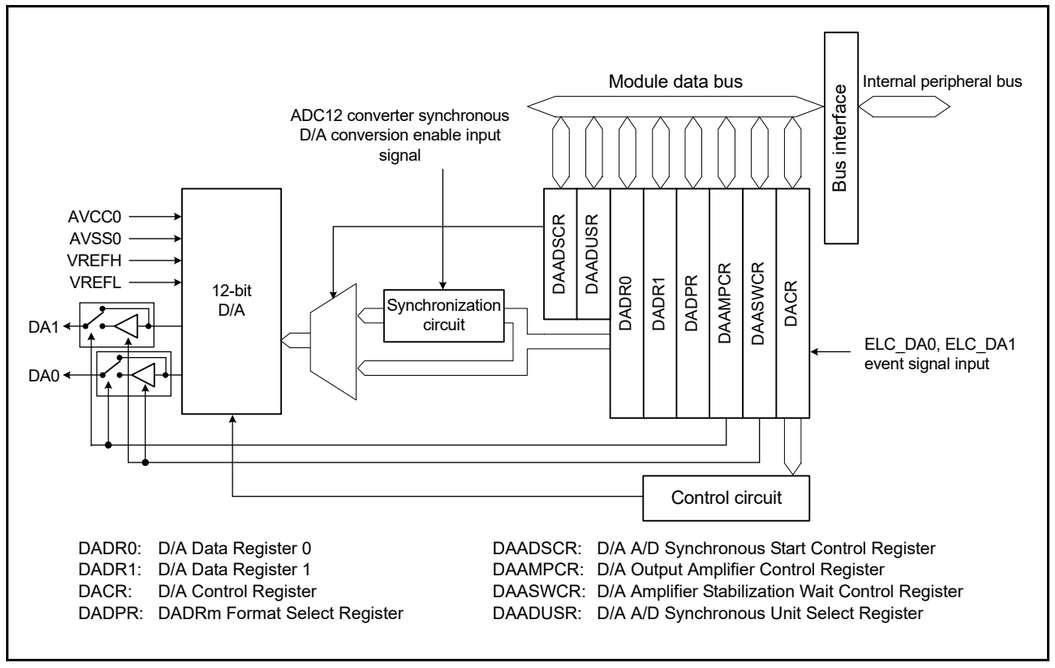

Figure 48.1 DAC12 block diagram

Table 48.2 DAC12 I/O pins (1 of 2)

Pin name	I/O	Function
AVCC0	Input	Analog power supply pin for ADC12, DAC12, and comparator Connect to VCC when these modules are not used.
AVSS0	Input	Analog ground pin for ADC12, DAC12, and comparator Connect to VSS when these modules are not used.

48. 12-Bit D/A Converter (DAC12)

48.1 Overview

MCU提供带输出放大器的12位DA转换器(DAC12)。表48.1列出了DAC12规格，图48.1显示了框图，表48.2列出了IO引脚。

Table 48.1 DAC12 specifications

Table 48.2 DAC12IO引脚（2个中的1个）

引脚名称	I/O	Function
AVCC0	Input	ADC12、DAC12和比较器的模拟电源引脚 不使用这些模块时连接到VCC。
AVSS0	Input	ADC12、DAC12和比较器的模拟接地引脚 不使用这些模块时连接到VSS。

Table 48.2 DAC12 I/O pins (2 of 2)

Pin name	I/O	Function
VREFH	Input	Analog reference top voltage supply pin for the ADC12 (unit 1) and the DAC12
VREFL	Input	Analog reference ground pin for the ADC12 (unit 1) and the DAC12
DA0	Output	Channel 0 analog output pin
DA1	Output	Channel 1 analog output pin

48.2 Register Descriptions

48.2.1 D/A Data Register m (DADRm) (m = 0, 1)

Address(es): DAC12.DADR0 4005 E000h, DAC12.DADR1 4005 E002h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DADRm registers are 16-bit read/write registers that store data for D/A conversion. Whenever an analog output is enabled, the values in DADRm are converted and output to the analog output pins.

12-bit data can be formatted as left- or right-justified in the DADPR.DPSEL bit setting. In right-justified format (DADPR.DPSEL = 0), the lower 12 bits, [11:0], are valid. In left-justified format (DADPR.DPSEL = 1), the upper 12 bits, [15:4], are valid.

For information on using the output amplifier, see section 48.6.5, Initialization Procedure with the Output Amplifier.

48.2.2 D/A Control Register (DACR)

Address(es): DAC12.DACR 4005 E004h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAOE1	DAOE0	DAE	—	—	—	—	—
Value after reset:	0	0	0	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b4 to b0	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b5	DAE	D/A Enable*1	0: Control D/A conversion of channels 0 and 1 individually 1: Control D/A conversion of channels 0 and 1 collectively.	R/W
b6	DAOE0	D/A Output Enable 0	0: Disable analog output of channel 0 (DA0) 1: Enable D/A conversion of channel 0 (DA0).	R/W
b7	DAOE1	D/A Output Enable 1	0: Disable analog output of channel 1 (DA1) 1: Enable D/A conversion of channel 1 (DA1).	R/W

Note 1. This bit controls D/A conversion in combination with the DAOEi bit (i = 0, 1), which controls output of the conversion results. For details, see Table 48.3.

Table 48.2 DAC12IO引脚（2个中的2个）

引脚名称	I/O	Function
VREFH	Input	ADC12（单元1）和DAC12的模拟参考最高电压电源引脚
VREFL	Input	ADC12（单元1）和DAC12的模拟参考接地引脚
DA0	Output	通道0模拟输出引脚
DA1	Output	通道1模拟输出引脚

48.2 注册说明

48.2.1 DA数据寄存器m(DADRm)(m=0 1)

Address(es): DAC12.DADR0 4005 E000h, DAC12.DADR1 4005 E002h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DADRm寄存器是16位读写寄存器，用于存储用于DA转换的数据。每当启用模拟输出时，DADRm中的值都会被转换并输出到模拟输出引脚。

在DADPR.DPSEL位设置中，12位数据可以被格式化为左对齐或右对齐。在右对齐格式(DADPR.DPSEL=0)中，低12位[11:0]有效。在左对齐格式(DADPR.DPSEL=1)中，高12位[15:4]有效。

有关使用输出放大器的信息，请参阅第48.6.5节，使用输出放大器的初始化过程。

48.2.2 DA控制寄存器(DACR)

Address(es): DAC12.DACR 4005 E004h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAOE1	DAOE0	DAE	—	—	—	—	—
重置后的值：	0	0	0	1	1	1	1	1

Bit	Symbol	位名称	Description	R/W
b4 to b0	—	Reserved	这些位被读取为1。写入值应为1。	R/W
b5	DAE	D/A Enable*1	0：分别控制通道0和1的DA转换1：控制通道0和1的DA转换。	R/W
b6	DAOE0	DA输出使能0	0：禁用通道0（DA0）的模拟输出1：启用通道0（DA0）的DA转换。	R/W
b7	DAOE1	DA输出使能1	0：禁用通道1（DA1）的模拟输出1：启用通道1（DA1）的DA转换。	R/W

Note 1. 该位与控制转换结果输出的DAOEi位(i=0 1)一起控制DA转换。详见表48.3。

Table 48.3 D/A conversion controls

b5	b7	b6	
DAE	DAOE1	DAOE0	Description
0	0	0	Disable D/A conversion and analog output pins (DA0, DA1)*1
		1	• Enable D/A conversion of channel 0 and disable D/A conversion of channel 1 • Enable analog output of channel 0 (DA0) and disable analog output of channel 1 (DA1)*1
	1	0	• Disable D/A conversion of channel 0 and enable D/A conversion of channel 1 • Disable analog output of channel 0 (DA0)*1 and enable analog output of channel 1 (DA1)
		1	• Enable D/A conversion of channels 0 and 1 • Enable analog output of channels 0 and 1 (DA0, DA1)
1	x	x	• Enable D/A conversion of channels 0 and 1 • Collective enable analog output of channels 0 and 1 (DA0, DA1)

x: Don't care

Note 1. When analog output is disabled, the analog output signal is placed in the Hi-Z state.

Only set this register while the ADC12 is halted when the DAADSCR.DAADST bit is 1 (interference reduction between D/A and A/D conversion is enabled). Only set DACR while the ADCSR.ADST bit is 0 and after selecting the software trigger, for the ADC12 trigger to securely stop the ADC12. This MCU only supports ADC12 unit 1.

DAE bit (D/A Enable)

The DAE bit controls D/A conversion, amplifier operation, and analog output in combination with the DAOEi bit (i = 0, 1) and the DAMMPCR.DAAMPi bit (i = 0, 1). See Table 48.4.

When interference prevention between D/A and A/D conversions is enabled (DAADSCR.DAADST = 1), set the ADCSR.ADST bit of the ADC12 (unit 1) to 0. Then select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1).

DAOEi bit (D/A Output Enable i)

The DAOEi bit (i = 0, 1) controls D/A conversion, amplifier operation, and analog output in combination with the DAE bit and DAMMPCR.DAAMPi bit (i = 0, 1). See Table 48.4.

When both the DAOEi bit (i = 0, 1) and DAE bit are 0, D/A conversion of channel i (i = 0, 1) is not processed, and no conversion result is output.

When interference prevention between D/A and A/D conversions is enabled (DAADSCR.DAADST = 1), set the DAOEi bit while the ADCSR.ADST bit of the ADC12 (unit 1) is set to 0. Then select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1).

The event link function can be used to set the DAOEi bit to 1. The DAOE0 bit sets to 1 when the event specified in the ELSR12 register of the ELC (ELC_DA0 event) occurs, and output of the D/A conversion results starts. The DAOE1 bit sets to 1 when the event specified in the ELSR13 register of the ELC (ELC_DA1 event) occurs, and output of the D/A conversion results starts.

Table 48.4 D/A conversion and analog output control (1 of 2)

DACR		DAAMPCR			
DAE	DAOEi	DAAMPi	Channel i operation	Amplifier operation of channel i	Analog output of channel i
0	0	0	Stop	Stop	Hi-Z
		1	Stop	Stop	Hi-Z
	1	0	Run	Stop	Amplifier-through
		1	Run	Run	Amplifier output

Table 48.3 DA转换控制

b5	b7	b6	
DAE	DAOE1	DAOE0	Description
0	0	0	禁用DA转换和模拟输出引脚（DA0、DA1）*1
		1	启用通道0的DA转换并禁用通道1的DA转换 启用通道0(DA0)的模拟输出并禁用通道1(DA1)的模拟输出*1
	1	0	禁用通道0的DA转换并启用通道1的DA转换 禁用通道0(DA0)*1的模拟输出并启用通道1(DA1)的模拟输出
		1	启用通道0和1的DA转换 启用通道0和1（DA0、DA1）的模拟输出
1	x	x	启用通道0和1的DA转换 集体启用通道0和1（DA0、DA1）的模拟输出

x: Don't care

Note 1. 禁用模拟输出时，模拟输出信号置于Hi-Z状态。

仅当DAADSCR.DAADST位为1（启用DA和AD转换之间的干扰减少）时ADC12停止时设置此寄存器。只有在ADCSR.ADST位为0且选择软件触发后设置DACR，ADC12触发才能安全停止ADC12。此MCU仅支持ADC12单元1。

DAE位（DA启用）

DAE位与DAOEi位(i=0 1)和DAMMPCR.DAAMPi位(i=0 1)一起控制DA转换、放大器操作和模拟输出。见表48.4。

当启用DA和AD转换之间的干扰防止(DAADSCR.DAADST=1)时，设置ADC12（单元1）的ADCSR.ADST位为0。然后选择ADC12（单元1）触发的软件触发，以安全地停止ADC12（单元1）。

DAOEi位（DA输出使能i）

DAOEi位(i=0 1)与DAE位和DAMMPCR.DAAMPi位(i=0 1)一起控制DA转换、放大器操作和模拟输出。见表48.4。

当DAOEi位(i=0 1)和DAE位均为0时，通道i(i=0 1)的DA转换不进行处理，也不输出转换结果。

当DA和AD转换之间的干扰防止启用时（DAADSCR.DAADST=1），设置DAOEi位同时ADC12（单元1）的ADCSR.ADST位设置为0。然后选择ADC12的软件触发（单元1)触发以安全地停止ADC12（单元1）。

事件链接功能可用于将DAOEi位设置为1。当ELC的ELSR12寄存器中指定的事件（ELC_DA0事件）发生时，DAOE0位设置为1，并开始输出DA转换结果。当ELC的ELSR13寄存器中指定的事件（ELC_DA1事件）发生时，DAOE1位设置为1，并开始输出DA转换结果。

Table 48.4 DA转换和模拟输出控制(1of2)

		1	Run	Run	Amplifier output

i = 0, 1

48.2.3 DADRm Format Select Register (DADPR)

Address(es): DAC12.DADPR 4005 E005h

	b7	b6	b5	b4	b3	b2	b1	b0
	DPSEL	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	DPSEL	DADRm Format Select	0: Right-justified format 1: Left-justified format.	R/W

48.2.4 D/A A/D Synchronous Start Control Register (DAADSCR)

Address(es): DAC12.DAADSCR 4005 E006h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAADST	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	DAADST	D/A A/D Synchronous Conversion	0: Do not synchronize DAC12 operation with ADC12 (unit 1) operation (disable interference prevention between D/A and A/D conversion) 1: Synchronize DAC12 operation with ADC12 (unit 1) operation (enable interference prevention between D/A and A/D conversion).	R/W

To minimize interference between D/A and A/D conversion, the DAADSCR register enables synchronization of the start timing of D/A conversion with the ADC12 synchronous D/A conversion enable input signal.

Only set this register while the ADC12 (unit 1) is halted, that is, while the ADCSR.ADST bit is 0 after selecting the software trigger as the ADC12 (unit 1) trigger.

Select unit 1 as the target ADC12 unit before setting the DAADST bit to 1.

Set bit [1] in the DAADUSR register to 1 to select unit 1. The MCU only supports ADC12 unit 1.

DAADST bit (D/A A/D Synchronous Conversion)

Setting the DAADST bit to 0 allows the DADRm register value to be converted into analog data at any time. Setting the DAADST bit to 1 allows synchronous D/A conversion with the ADC12 synchronous D/A conversion enable input signal from the ADC12 (unit 1). With this bit set, D/A conversion does not start until the ADC12 (unit 1) completes A/D conversion, even if the DADRm register value is changed.

Table 48.4 DA转换和模拟输出控制(2of2)

DACR		DAAMPCR			
DAE	DAOEi	DAAMPi	通道i操作	通道i的放大器操作	通道i的模拟输出
1	0	0	Run	Stop	Amplifier-through
		1	Run	Run	放大器输出
	1	0	Run	Stop	Amplifier-through
		1	Run	Run	放大器输出

i = 0, 1

48.2.3 DADRm格式选择寄存器(DADPR)

Address(es): DAC12.DADPR 4005 E005h

	b7	b6	b5	b4	b3	b2	b1	b0
	DPSEL	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b6 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	DPSEL	DADRm格式选择	0: Right-justified format 1: Left-justified format.	R/W

48.2.4 DAAD同步启动控制寄存器(DAADSCR)

Address(es): DAC12.DAADSCR 4005 E006h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAADST	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b6 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	DAADST	D/A A/D Synchronous Conversion	0：不将DAC12操作与ADC12（单元1）操作同步（禁用DA和AD转换之间的防干扰）1：将DAC12操作与ADC12（单元1）操作同步（启用DA和AD转换之间的防干扰）。	R/W

为了尽量减少DA和AD转换之间的干扰，DAADSCR寄存器使DA转换的开始时序与ADC12同步DA转换使能输入信号同步。

仅在ADC12（单元1）停止时设置该寄存器，即选择软件触发作为ADC12（单元1）触发后ADCSR.ADST位为0。

在将DAADST位设置为1之前，选择单元1作为目标ADC12单元。

将DAADUSR寄存器中的位[1]设置为1以选择单元1。MCU仅支持ADC12单元1。

DAADST位（DAAD同步转换）

将DAADST位设置为0可以随时将DADRm寄存器值转换为模拟数据。将DAADST位设置为1允许使用来自ADC12（单元1）的ADC12同步DA转换使能输入信号进行同步DA转换。设置该位后，即使DADRm寄存器的值发生了变化，ADC12（单元1）完成AD转换后才开始DA转换。

Set this bit while the ADCSR.ADST bit is set to 0. Then select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1). Set bit [1] in the DAADUSR register to 1 before setting the DAADST bit to 1.

The event link function cannot be used when the DAADST bit is set to 1. Stop the event link function by setting the ELSR12 and ELSR13 registers of the ELC. The setting of the DAADST bit is shared by channels 0 and 1 of the DAC12.

48.2.5 D/A Output Amplifier Control Register (DAAMPCR)

Address(es): DAC12.DAAMPCR 4005 E008h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAAMP1	DAAMP0	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	DAAMP0	Amplifier Control 0	0: Do not use channel 0 output amplifier 1: Use channel 0 output amplifier.	R/W
b7	DAAMP1	Amplifier Control 1	0: Do not use channel 1 output amplifier 1: Use channel 1 output amplifier.	R/W

The DAAMPCR register selects D/A output with or without using the amplifier.

DAAMP0 bit (Amplifier Control 0)

When the DAAMP0 bit is 0, analog values are output for D/A output of channel 0 without using the amplifier. When the DAAMP0 bit is 1, analog values are output for D/A output of channel 0 through the amplifier.

When both the DAE and DAOE0 bits are 0, the amplifier is not used regardless of the setting of the DAAMP0 bit. See Table 48.4 for details.

DAAMP1 bit (Amplifier Control 1)

When the DAAMP1 bit is 0, analog values are output for D/A output of channel 1 without using the amplifier. When the DAAMP1 bit is 1, analog values are output for D/A output of channel 1 through the amplifier.

When both the DAE and DAOE1 bits are 0, the amplifier is not used regardless of the setting of the DAAMP1 bit. See Table 48.4 for details.

48.2.6 D/A Amplifier Stabilization Wait Control Register (DAASWCR)

Address(es): DAC12.DAASWCR 4005 E01C

	b7	b6	b5	b4	b3	b2	b1	b0
	DAASW1	DAASW0	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	DAASW0	D/A Amplifier Stabilization Wait 0	0: Amplifier stabilization wait off (output) for channel 0 1: Amplifier stabilization wait on (high-Z) for channel 0.	R/W
b7	DAASW1	D/A Amplifier Stabilization Wait 1	0: Amplifier stabilization wait off (output) for channel 1 1: Amplifier stabilization wait on (high-Z) for channel 1.	R/W

The DAASWCR register controls D/A output with the output amplifier. This register is used in the initialization procedure to wait for stabilization of the D/A output amplifier. Each bit in DAASWCR should be set to 1 when both the

在ADCSR.ADST位设置为0时设置该位。然后为ADC12（单元1）触发器选择软件触发器以安全地停止ADC12（单元1）。在将DAADST位设置为1之前，将DAADUSR寄存器中的位[1]设置为1。

当DAADST位设置为1时，不能使用事件链接功能。通过设置ELC的ELSR12和ELSR13寄存器。DAADST位的设置由DAC12的通道0和1共享。

48.2.5 DA输出放大器控制寄存器(DAAMPCR)

Address(es): DAC12.DAAMPCR 4005 E008h

	b7	b6	b5	b4	b3	b2	b1	b0
	DAAMP1	DAAMP0	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	DAAMP0	放大器控制0	0：不使用通道0输出放大器1：使用通道0输出放大器。	R/W
b7	DAAMP1	放大器控制1	0：不使用通道1输出放大器1：使用通道1输出放大器。	R/W

DAAMPCR寄存器选择使用或不使用放大器的DA输出。

DAAMP0位（放大器控制0）

当DAAMP0位为0时，模拟值输出通道0的DA输出，而不使用放大器。当。。。的时候DAAMP0位为1，模拟值通过放大器输出通道0的DA输出。

当DAE和DAOE0位都为0时，无论DAAMP0位的设置如何，都不会使用放大器。看详细信息见表48.4。

DAAMP1位（放大器控制1）

当DAAMP1位为0时，模拟值输出通道1的DA输出，而不使用放大器。当。。。的时候DAAMP1位为1，模拟值通过放大器输出到通道1的DA输出。

当DAE和DAOE1位都为0时，无论DAAMP1位的设置如何，都不会使用放大器。看详细信息见表48.4。

48.2.6 DA放大器稳定等待控制寄存器(DAASWCR)

Address(es): DAC12.DAASWCR 4005 E01C

	b7	b6	b5	b4	b3	b2	b1	b0
	DAASW1	DAASW0	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b5 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b6	DAASW0	DA放大器稳定等待0	0：通道0的放大器稳定等待关闭（输出）1：通道0的放大器稳定等待打开（高阻态）。	R/W
b7	DAASW1	DA放大器稳定等待1	0：通道1的放大器稳定等待关闭（输出）1：通道1的放大器稳定等待打开（高阻态）。	R/W

DAASWCR寄存器通过输出放大器控制DA输出。该寄存器在初始化过程中用于等待DA输出放大器的稳定。DAASWCR中的每一位都应设置为1，当

DAE bit and the DAOEi (i = 0, 1) bit in the DACR register are 0. See section 48.6.5, Initialization Procedure with the Output Amplifier.

DAASW0 bit (D/A Amplifier Stabilization Wait 0)

Set the DAASW0 bit to 1 in the initialization procedure to wait for stabilization of the output amplifier of D/A channel 0. When DAASW0 is set to 1, D/A conversion operates, but the conversion result D/A is not output from channel 0. When the DAASW0 bit is 0, the stabilization wait time stops, and the D/A conversion result of channel 0 is output through the output amplifier.

DAASW1 bit (D/A Amplifier Stabilization Wait 1)

Set the DAASW1 bit to 1 in the initialization procedure to wait for stabilization of the output amplifier of D/A channel 1. When DAASW1 is set to 1, D/A conversion operates, but the conversion result D/A is not output from channel 1. When the DAASW1 bit is 0, the stabilization wait time stops, and the D/A conversion result of channel 1 is output through the output amplifier.

48.2.7 D/A A/D Synchronous Unit Select Register (DAADUSR)

Address(es): DAC12.DAADUSR 4005 F0C0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	AMADSEL1	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b1	AMADSEL1	A/D Unit 1 Select	0: Do not select unit 1 1: Select unit 1.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The DAADUSR register selects the target ADC12 unit for D/A and A/D synchronous conversions. Set bit [1] to 1 to select unit 1 as the target synchronous unit for the MCU. When setting the DAADSCR.DAADST bit to 1 for synchronous conversions, select the target unit in this register in advance.

Only set the DAADUSR register while the ADCSR.ADST bit of the ADC12 is set to 0 and the DAADSCR.DAADST bit is set to 0.

48.3 Operation

The DAC12 includes D/A conversion circuits for two channels, each of which can operate independently. When the DAOEn bit (n = 0, 1) in DACR is set to 1, DAC12 is enabled and the conversion result is output.

This following is an example of D/A conversion on channel 0. Figure 48.2 shows the timing of this operation.

To process D/A conversion on channel 0:

1. Set the data for D/A conversion in the DADPR.DPSEL bit and the DADR0 register.
2. Set the DACR.DAOE0 bit to 1 to start D/A conversion. The conversion result is output from the analog output pin DA0 after the conversion time tDCONV elapses. The conversion result continues to be output until DADR0 is written to again or the DAOE0 bit is cleared to 0. The output value (reference) is expressed by the following formula:

$$\frac{\text{Setting in DADRm}}{4096} \times \text{VREFH}$$

3. To start conversion again, write to DADR0 again. The conversion result is output after the conversion time tDCONV elapses.
When the DAADSCR.DAADST bit is 1 (interference prevention between D/A and A/D conversion is enabled), a

DACR寄存器中的DAE位和DAOEi(i=0 1)位为0。请参见第48.6.5节，使用
输出放大器。

DAASW0位（DA放大器稳定等待0）

在初始化过程中将DAASW0位设置为1，等待DA通道0的输出放大器稳定。当DAASW0设置为1时，DA转换操作，但转换结果DA不从通道0输出。当DAASW0位为0，稳定等待时间停止，通道0的数模转换结果通过输出放大器输出。

DAASW1位（DA放大器稳定等待1）

在初始化过程中将DAASW1位设置为1，等待DA通道1的输出放大器稳定。当DAASW1设置为1时，DA转换操作，但转换结果DA不从通道1输出。当DAASW1位为0，稳定等待时间停止，通道1的DA转换结果通过输出放大器输出。

48.2.7 DAAD同步单元选择寄存器(DAADUSR)

Address(es): DAC12.DAADUSR 4005 F0C0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	AMADSEL1	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	—	Reserved	该位读取为0。写入值应为0。	R/W
b1	AMADSEL1	AD单元1选择	0：不选择单元11： 选择单元1。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

DAADUSR寄存器为DA和AD同步转换选择目标ADC12单元。将位[1]设置为1以选择单元1作为MCU的目标同步单元。将DAADSCR.DAADST位设置为1以进行同步转换时，请预先在该寄存器中选择目标单位。

仅在ADC12的ADCSR.ADST位设置为0且DAADSCR.DAADST位设置为0时设置DAADUSR寄存器。

48.3 Operation

DAC12包含两个通道的DA转换电路，每个通道都可以独立工作。当。。。的时候
DACR中的DAOEn位(n=0 1)设置为1，使能DAC12并输出转换结果。

以下是通道0上的DA转换示例。图48.2显示了此操作的时序。

在通道0上处理DA转换：

1. 在DADPR.DPSEL位和DADR0寄存器中设置用于DA转换的数据。
2. 将DACR.DAOE0位设置为1以启动DA转换。转换结果从模拟输出引脚输出
转换时间tDCONV过后的DA0。转换结果继续输出，直到再次写入DADR0或DAOE0位清0。输出值（参考值）由以下公式表示：

$$\frac{\text{DADRm4096中的设置}}{} \times \text{VREFH}$$

3. 要再次开始转换，请再次写入DADR0。经过转换时间tDCONV后输出转换结果。当DAADSCR.DAADST位为1（启用DA和AD转换之间的干扰防止）时，a

maximum of one A/D conversion time is required for D/A conversion to start. When ADCLK is faster than the peripheral clock, a longer time period might be required.

4. To disable analog output, set the DAOE0 bit to 0.

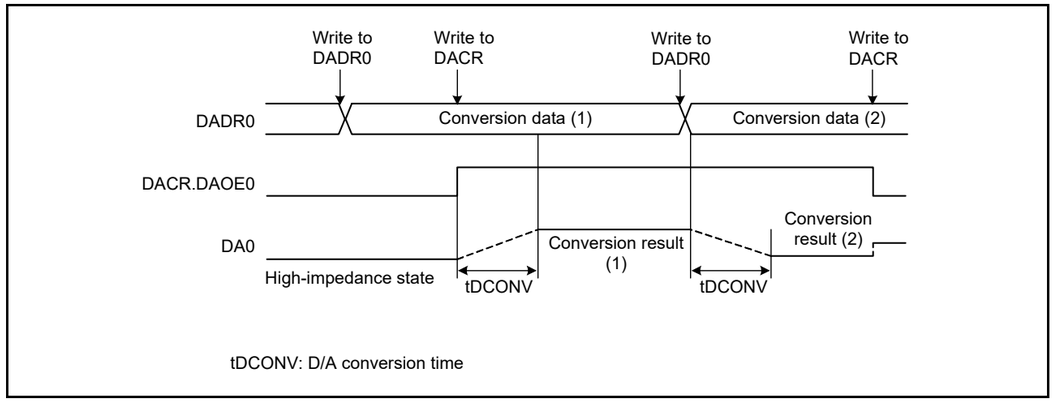

Figure 48.2 Example of DAC12 operation

48.3.1 Reducing Interference between D/A and A/D Conversion

When D/A conversion starts, the DAC12 generates inrush current. Because the same analog power supply is shared by the DAC12 and ADC12 (unit 1), the generated inrush current might interfere with ADC12 (unit 1) operation.

While the DAADSCR.DAADST bit is 1, even if the DADRm register data is changed during ADC12 (unit 1) operation, D/A conversion does not start immediately but starts synchronously with A/D conversion completion. A maximum of one A/D conversion time is required for the DADRm register data update to be reflected as the D/A conversion circuit input. Before reflection, the DADRm register value does not correspond to the analog output value.

When this function is enabled, it is impossible to check by any software means whether the DADRm register value was D/A converted. When the DADRm register data is changed while the ADC12 (unit 1) is halted, D/A conversion starts in 1 PCLKB cycle, even if DAADSCR.DAADST is 1.

The following sequence provides an example of channel 0 D/A conversion, in which the DAC12 operates synchronously with the ADC12 (unit 1).

To process D/A conversion on channel 0 in synchronization with the ADC12 (unit 1):

1. Confirm that the ADC12 (unit 1) is halted and set the DAADUSR.AMADSEL1 bit to 1.
2. Confirm that the ADC12 (unit 1) is halted and set the DAADSCR.DAADST bit to 1.
3. Confirm that the ADC12 (unit 1) is halted and set the DACR.DAOE0 bit to 1.
4. Set the DADR0 register. When ADCLK is faster than the peripheral clock, a period longer than one A/D conversion time might be required.

- If the 12-bit A/D conversion is halted (ADCSR.ADST bit = 0) when the DADR0 register is changed, D/A conversion starts in 1 PCLKB cycle.
- If the 12-bit A/D conversion is in progress (ADCSR.ADST bit = 1) when the DADR0 register is changed, D/A conversion starts on A/D conversion completion. If the DADR0 register is changed twice during A/D conversion, the first update might not be converted.

DA转换开始最多需要一个AD转换时间。当ADCLK比外设时钟快时，可能需要更长的时间周期。

4. 要禁用模拟输出，请将DAOE0位设置为0。

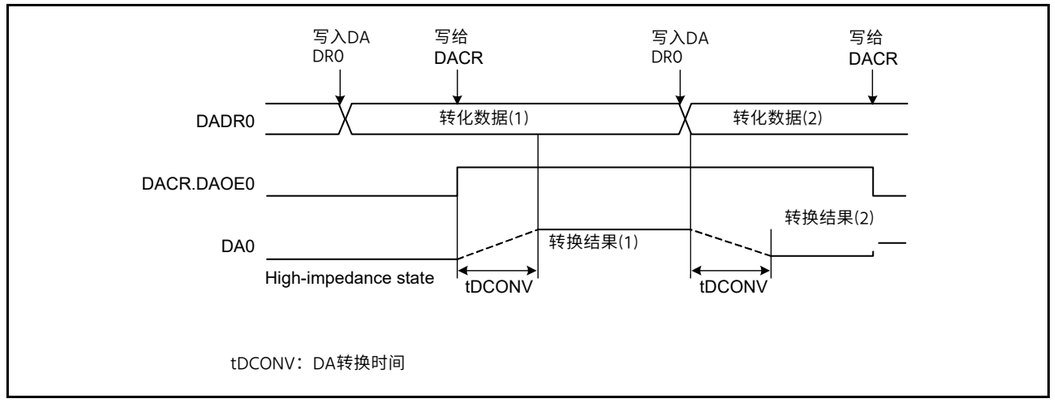

Figure 48.2 DAC12操作示例

48.3.1 减少DA和AD转换之间的干扰

当DA转换开始时，DAC12会产生浪涌电流。由于DAC12和ADC12（单元1）共享相同的模拟电源，所产生的浪涌电流可能会干扰ADC12（单元1）的运行。

当DAADSCR.DAADST位为1时，即使DADRm寄存器数据在ADC12（单元1）操作期间发生变化，DA转换不会立即开始，而是与AD转换完成同步开始。DADRm寄存器数据更新最多需要一个AD转换时间才能反映为DA转换电路输入。反射前，DADRm寄存器值与模拟输出值不对应。

当此功能使能时，任何软件都无法检查DADRm寄存器的值是否经过DA转换。如果在ADC12（单元1）停止时更改DADRm寄存器数据，即使DAADSCR.DAADST为1，DA转换也会在1个PCLKB周期内开始。

以下序列提供了通道0DA转换的示例，其中DAC12与ADC12（单元1）同步运行。

与ADC12（单元1）同步处理通道0上的DA转换：

1. 确认ADC12（单元1）已停止并将DAADUSR.AMADSEL1位设置为1。
2. 确认ADC12（单元1）已停止并将DAADSCR.DAADST位设置为1。
3. 确认ADC12（单元1）已停止并将DACR.DAOE0位设置为1。
4. 设置DADR0寄存器。当ADCLK比外设时钟快时，可能需要比一个AD转换时间更长的周期。

- 如果在DADR0寄存器更改时停止12位AD转换（ADCSR.ADST位=0），则DA转换在1个PCLKB周期内开始。
- 如果DADR0寄存器更改时12位AD转换正在进行（ADCSR.ADST位=1），则DA转换在AD转换完成时开始。如果在AD转换期间DADR0寄存器被更改两次，第一次更新可能不会被转换。

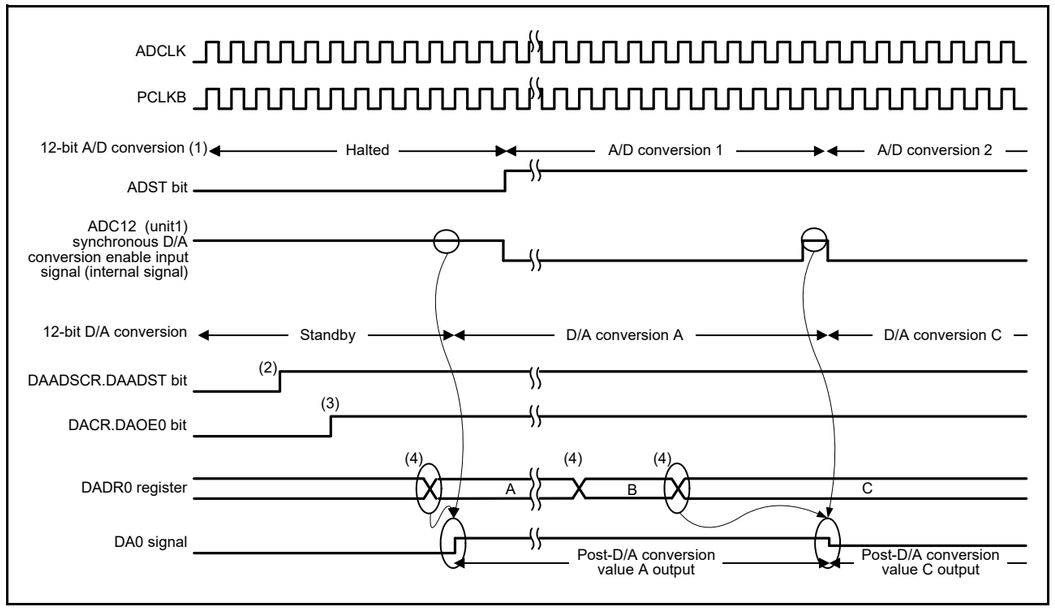

Figure 48.3 Example of conversion when the DAC12 is synchronized with the ADC12

When ADCLK is faster than PCLKB, the DAC12 might not be able to capture an ADC12 (unit 1) synchronous D/A conversion enable input signal for the 1 ADCLK cycle that is output between A/D conversion 1 and A/D conversion 2. Figure 48.4 shows an example of this. In this case, post-D/A conversion value A is continuously output as the DA0 signal.

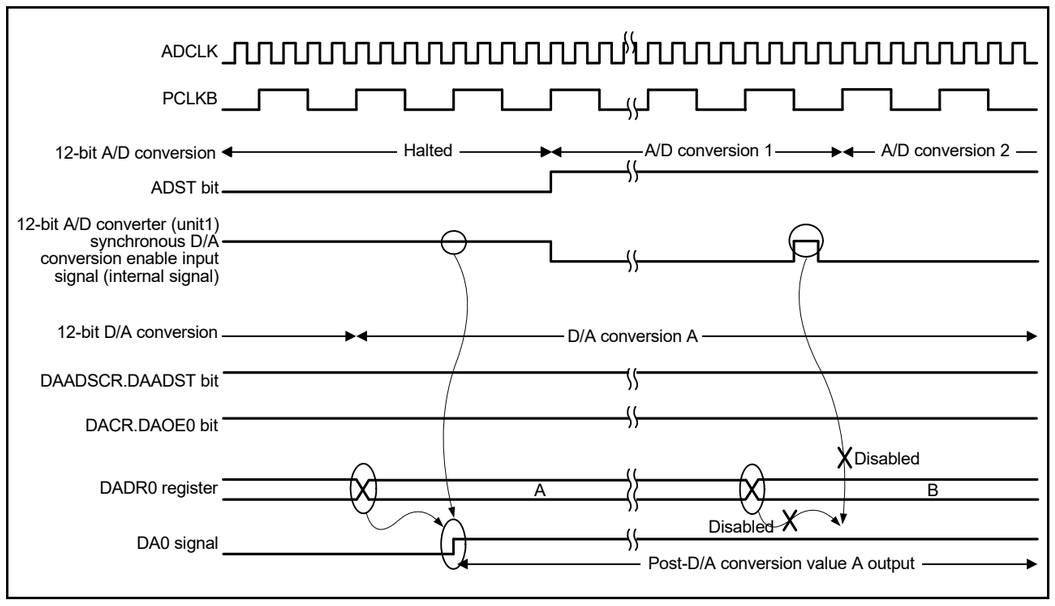

Figure 48.4 Example when the DAC12 cannot capture the synchronous D/A conversion enable input signal from the ADC12 (unit 1)

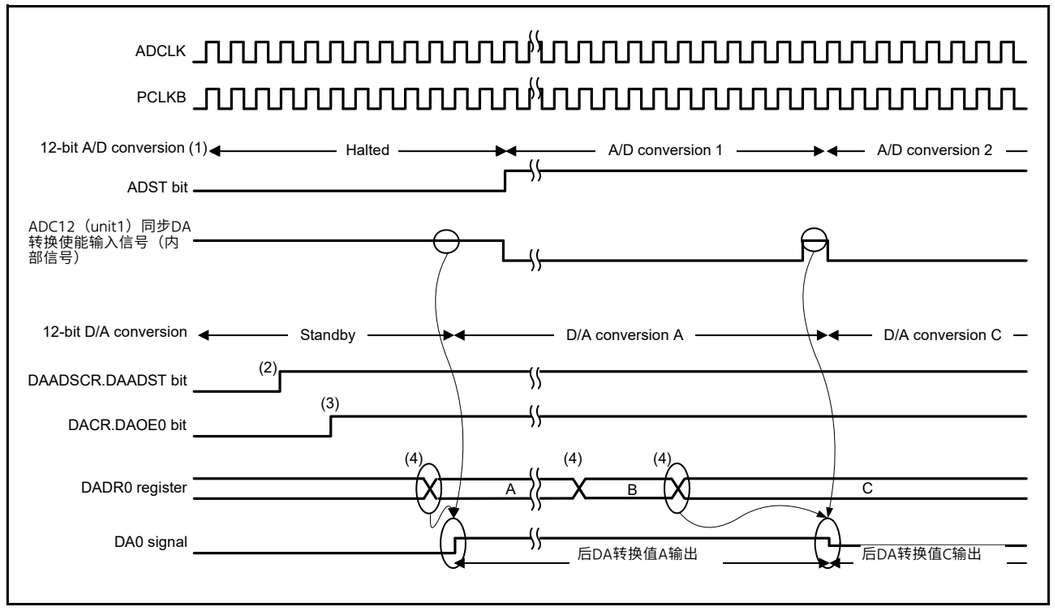

Figure 48.3 DAC12与ADC12同步时的转换示例

当ADCLK比PCLKB快时，DAC12可能无法在AD转换1和AD转换2之间输出的1个ADCLK周期内捕获ADC12（单元1）同步DA转换使能输入信号。图48.4显示了一个示例这个。在这种情况下，后DA转换值A作为DA0信号连续输出。

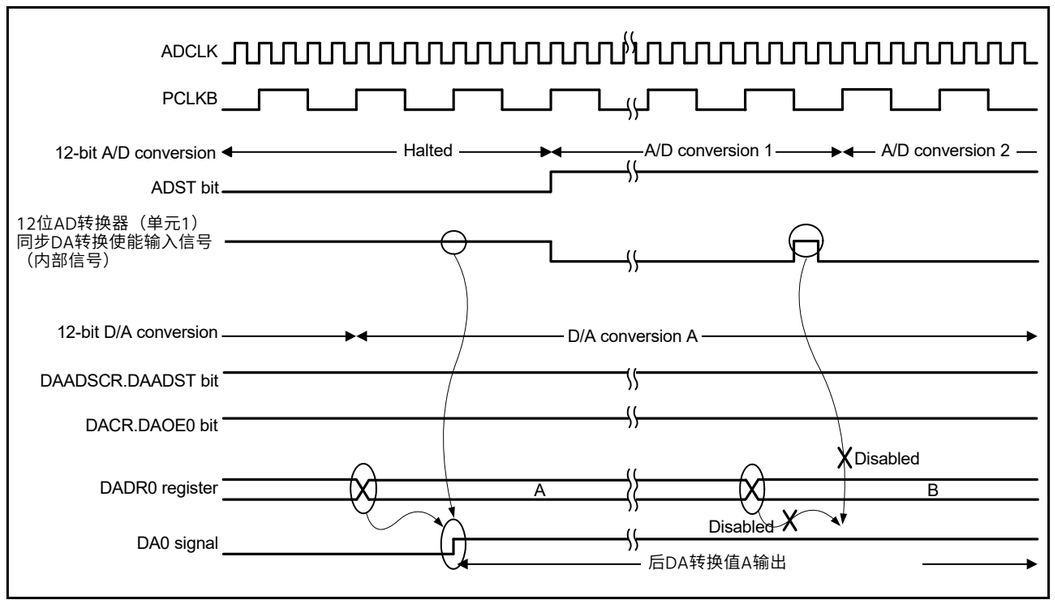

Figure 48.4 DAC12无法捕获来自ADC12（单元1）的同步DA转换使能输入信号时的示例

48.4 Event Link Operation Setting Procedure

This section describes the procedures used in event link operation.

48.4.1 DA0 Event Link Operation Setting Procedure

To set up DA0 event link operation:

1. Set the DADPR.DPSEL bit and set the data for D/A conversion in the DADR0 register.
2. Set the ELC_DA0 event signal to be linked to each peripheral module in the ELSR12 register.
3. Set the ELCR.ELCON bit to 1. This enables event link operation for all modules with the event link function selected.
4. Set the event output source module to activate the event link. After the event is output from the module, the DACR.DAOE0 bit sets to 1, and D/A conversion starts on channel 0.
5. Set the ELSR12.ELS[8:0] bits to 000h to stop event link operation on DAC12 channel 0. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

48.4.2 DA1 Event Link Operation Setting Procedure

To set up DA1 event link operation:

1. Set the DADPR.DPSEL bit and set the data for D/A conversion in the DADR1 register.
2. Set the ELC_DA1 event signal to be linked to each peripheral module in the ELSR13 register.
3. Set the ELCR.ELCON bit to 1. This enables event link operation for all modules with the event link function selected.
4. Set the event output source module to activate the event link. After the event is output from the module, the DACR.DAOE1 bit sets to 1, and D/A conversion starts on channel 1.
5. Set the ELSR13.ELS[8:0] bits to 000h to stop event link operation on DAC12 channel 1. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

48.5 Usage Notes on Event Link Operation

- When the event link function is used, do not use the amplifier output function.
- When the event link function is used, set the DACR.DAE bit to 0.
- When the event specified for the ELC_DA0 event signal is generated while the write cycle is performed on the DACR.DAOE0 bit, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- When the event specified for the ELC_DA1 event signal is generated while the write cycle is performed on the DACR.DAOE1 bit, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- Use of the event link function is prohibited when the DAADSCR.DAADST bit is set to 1 to reduce interference between D/A and A/D conversions.

48.6 Usage Notes

48.6.1 Settings for the Module-Stop Function

DAC12 operation can be disabled or enabled using the Module Stop Control Register. The DAC12 is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

48.6.2 DAC12 Operation in the Module-Stop State

When the MCU enters the module-stop state with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in the module-stop state, disable D/A conversion by setting the DACR.DAOE1, DAOE0, and DAE bits to 0.

48.4 事件链接操作设置步骤

本节介绍事件链接操作中使用的过程。

48.4.1 DA0事件链接操作设置步骤

设置DA0事件链接操作：

1. 设置DADPR.DPSEL位并在DADR0寄存器中设置用于DA转换的数据。
2. 将ELC_DA0事件信号设置为链接到ELSR12寄存器中的每个外围模块。
3. 将ELCR.ELCON位设置为1。这将为所有选择了事件链接功能的模块启用事件链接操作。
4. 设置事件输出源模块以激活事件链接。事件从模块输出后，DACR.DAOE0位设置为1，DA转换从通道0开始。
5. 将ELSR12.ELS[8:0]位设置为000h以停止DAC12通道0上的事件链接操作。当ELCR.ELCON位设置为0时，将停止所有事件链接操作。

48.4.2 DA1事件链接操作设置步骤

设置DA1事件链接操作：

1. 设置DADPR.DPSEL位并在DADR1寄存器中设置用于DA转换的数据。
2. 设置ELC_DA1事件信号链接到ELSR13寄存器中的每个外围模块。
3. 将ELCR.ELCON位设置为1。这将为所有选择了事件链接功能的模块启用事件链接操作。
4. 设置事件输出源模块以激活事件链接。事件从模块输出后，DACR.DAOE1位设置为1，DA转换从通道1开始。
5. 将ELSR13.ELS[8:0]位设置为000h以停止DAC12通道1上的事件链接操作。当ELCR.ELCON位设置为0时，将停止所有事件链接操作。

48.5 事件链接操作使用说明

- 使用事件链接功能时，请勿使用放大器输出功能。
- 使用事件链接功能时，将DACR.DAE位设置为0。
- 当对ELC_DA0事件信号指定的事件在执行写入周期时生成DACR.DAOE0位，写周期停止，产生的事件优先将该位设置为1。
- 当在对ELC_DA1事件信号执行写周期时生成指定的事件时DACR.DAOE1位，写周期停止，产生的事件优先将该位设置为1。
- 当DAADSCR.DAADST位设置为1以减少DA和AD转换之间的干扰时，禁止使用事件链接功能。

48.6 使用说明

48.6.1 模块停止功能的设置

可以使用模块停止控制寄存器禁用或启用DAC12操作。DAC12在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

48.6.2 DAC12在模块停止状态下的操作

当MCU进入模块停止状态并启用DA转换时，DA输出保持不变，模拟电源电流与DA转换时相同。如果在模块停止状态下必须降低模拟电源电流，则通过将DACR.DAOE1、DAOE0和DAE位设置为0来禁用DA转换。

48.6.3 DAC12 Operation in Software Standby Mode

When the MCU enters Software Standby mode with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in Software Standby mode, disable D/A conversion by setting the DACR.DAOE1, DAOE0, and DAE bits to 0.

48.6.4 Constraint on Entering Deep Software Standby Mode

When the MCU enters Deep Software Standby mode with D/A conversion enabled, the outputs of the DAC12 are placed in a high impedance state.

48.6.5 Initialization Procedure with the Output Amplifier

Use the following initialization procedures with the output amplifier. The example shows the case for channel 0.

To initialize the DAC12 with the output amplifier:

1. Write 000h to the DADR0 register.
2. Set the DAASWCR.DAASW0 bit to 1.
3. Set the DAAMPCR.DAAMP0 bit to 1.
4. Set the DACR.DAE bit or the DACR.DAOE0 bit to 1 to start operation of the amplifier.
5. Clear the DAASWCR.DAASW0 bit to 0 after waiting D/A conversion time tCONV.
6. Write the value to be converted in the DADR0 register.

While the amplifier is running, clearing the DACR.DAE and DACR.DAOE0 bits to 0 allows the amplifier to stop operation. To use the amplifier again, repeat procedures 1 to 6.

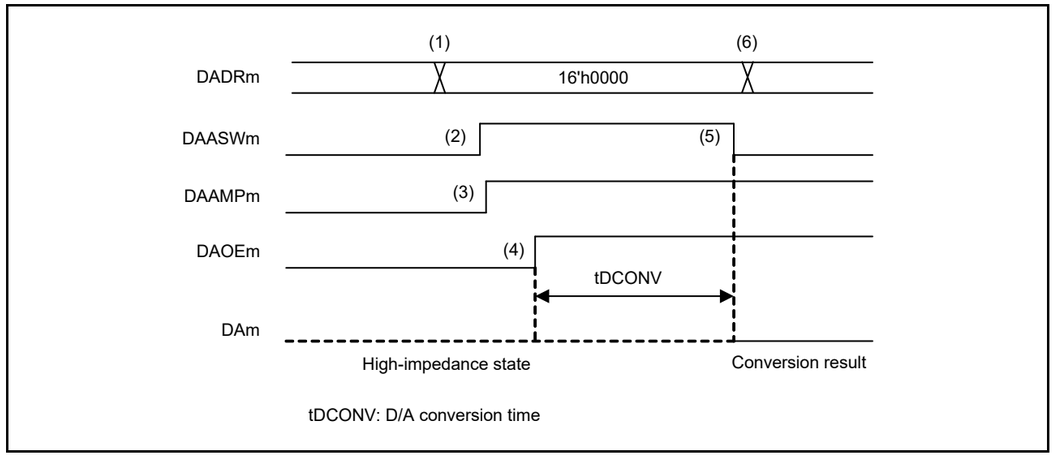

Figure 48.5 Example of the initial flow with the output amplifier in DAC12

48.6.6 Constraints on Usage When Interference Prevention between D/A and A/D Conversion Is Enabled

When the DAADSCR.DAADST bit is 1 (interference prevention between D/A and A/D conversion is enabled), do not place the ADC12 in the module-stop state. This might halt D/A conversion in addition to A/D conversion.

48.6.3 DAC12在软件待机模式下的操作

当MCU进入软件待机模式并启用DA转换时，DA输出保持不变，模拟电源电流与DA转换期间相同。如果在软件待机模式下必须降低模拟电源电流，则通过将DACR.DAOE1、DAOE0和DAE位设置为0来禁用DA转换。

48.6.4 进入深度软件待机模式的限制

当MCU在启用DA转换的情况下进入深度软件待机模式时，DAC12的输出置于高阻抗状态。

48.6.5 输出放大器的初始化程序

对输出放大器使用以下初始化程序。该示例显示了通道0的情况。

使用输出放大器初始化DAC12：

1. 将000h写入DADR0寄存器。
2. 将DAASWCR.DAASW0位设置为1。
3. 将DAAMPCR.DAAMP0位设置为1。
4. 将DACR.DAE位或DACR.DAOE0位设置为1以启动放大器的操作。
5. 等待DA转换时间tCONV后，将DAASWCR.DAASW0位清零。
6. 将要转换的值写入DADR0寄存器。

在放大器运行时，将DACR.DAE和DACR.DAOE0位清零可让放大器停止运行。要再次使用放大器，请重复步骤1至6。

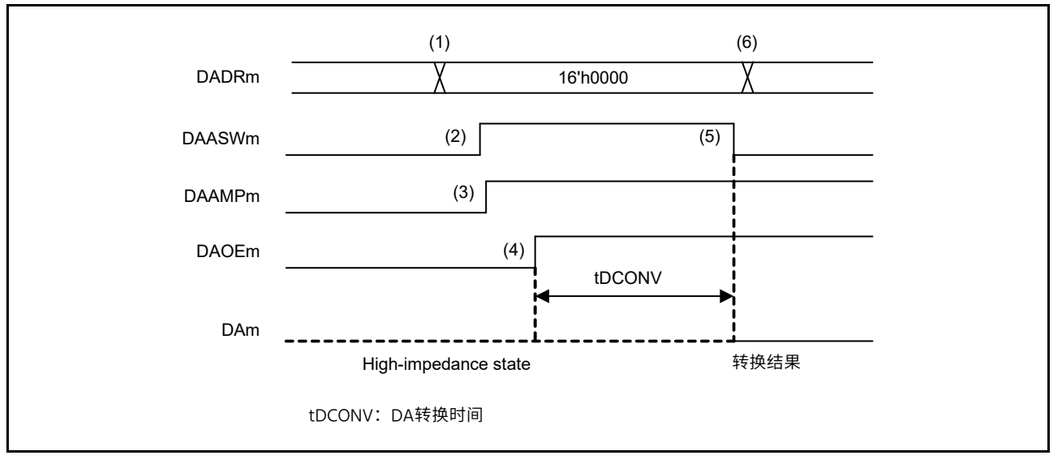

Figure 48.5 DAC12中输出放大器的初始流程示例

48.6.6 DA和AD之间防止干扰时的使用限制转换已启用

当DAADSCR.DAADST位为1（启用DA和AD转换之间的干扰防止）时，不要将ADC12置于模块停止状态。除了AD转换之外，这可能会停止DA转换。

49. Temperature Sensor (TSN)

49.1 Overview

The on-chip temperature sensor can be used to determine and monitor the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC12 for conversion and can also be used by the end application. Table 49.1 lists the temperature sensor specifications and Figure 49.1 shows a block diagram.

Table 49.1 Temperature sensor specifications

Parameter	Specifications
Temperature sensor voltage output	Temperature sensor outputs a voltage to the 12-Bit A/D Converter (ADC12).
Module-stop function	Module-stop state can be set to reduce power consumption
Temperature sensor calibration data	Reference data measured for each MCU at factory shipment is stored

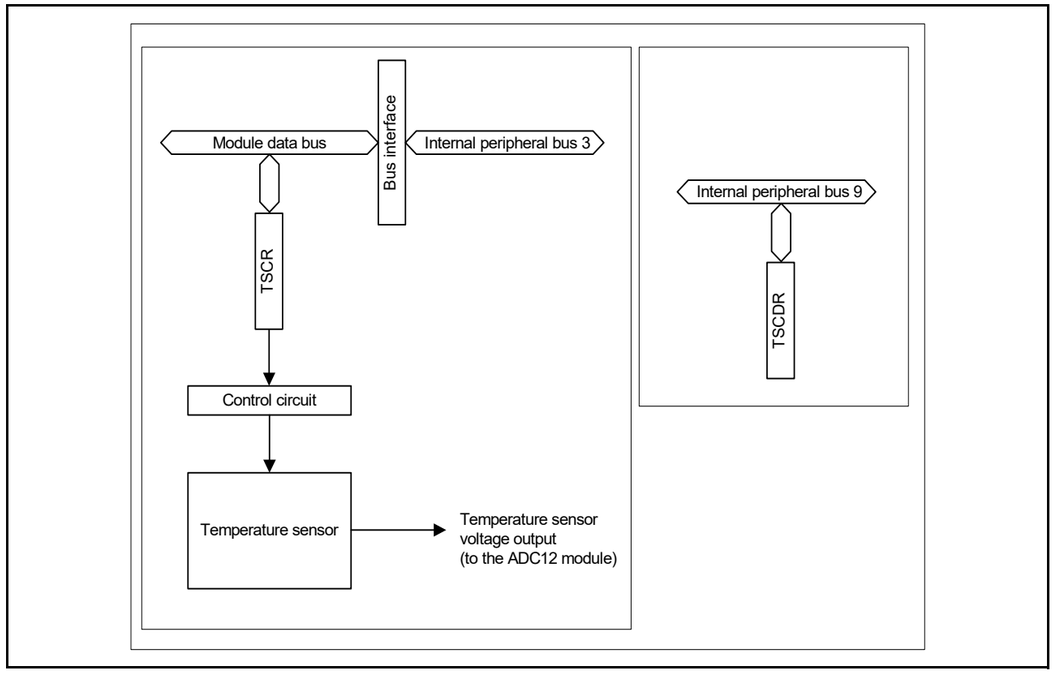

Figure 49.1 Temperature sensor block diagram

49. 温度传感器(TSN)

49.1 Overview

片上温度传感器可用于确定和监控芯片温度，以确保器件可靠运行。传感器输出与管芯温度成正比的电压，管芯温度与输出电压之间的关系相当线性。输出电压提供给ADC12进行转换，也可供最终应用使用。表49.1列出了温度传感器规格，图49.1显示了框图。

Table 49.1 温度传感器规格

Parameter	Specifications
温度传感器电压输出	温度传感器向12位模数转换器(ADC12)输出电压。
Module-stop function	可设置模块停止状态以降低功耗
温度传感器校准数据	存储在出厂时为每个MCU测量的参考数据

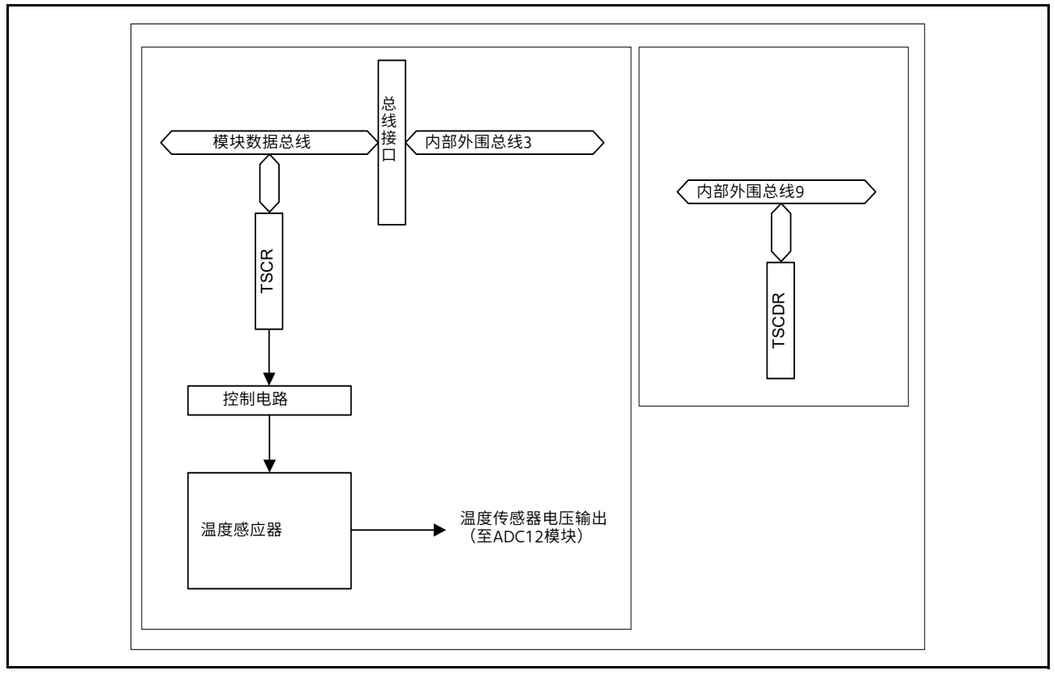

Figure 49.1 温度传感器框图

49.2 Register Descriptions

49.2.1 Temperature Sensor Control Register (TSCR)

Address(es): TSN.TSCR 4005 D000h

	b7	b6	b5	b4	b3	b2	b1	b0
	TSEN	—	—	TSOE	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	TSOE	Temperature Sensor Output Enable	0: Disable output from the temperature sensor to the ADC12 1: Enable output from the temperature sensor to the ADC12.	R/W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	TSEN	Temperature Sensor Enable	0: Stop the temperature sensor 1: Start the temperature sensor.	R/W

The timing constraints shown in Figure 49.3 apply to the settings of the TSCR register.

49.2.2 Temperature Sensor Calibration Data Register(TSCDR)

Address(es): TSD.TSCDR 407F B17Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—												
Value after reset:	0	0	0	0	Unique value for each MCU											

The TSCDR register stores temperature sensor calibration data measured for each MCU at factory shipment. Temperature sensor calibration data is a digital value obtained using the 12-bit A/D converter unit 0 to convert the voltage output by the temperature sensor under the condition Ta = Tj = 127°C and AVCC0 = 3.3 V.

The TSCDR register is a 32-bit read-only register and should be read in 32-bit units.

49.3 Using the Temperature Sensor

The temperature sensor outputs a voltage which varies with the temperature. This voltage is converted to a digital value by the ADC12. You can then obtain the die temperature by converting the value into the temperature.

49.3.1 Preparation for Using the Temperature Sensor

The temperature (T) is proportional to the sensor voltage output (Vs), so temperature is calculated with the following formula:

T = (Vs - V1) / Slope + T1

T: Measured temperature (°C)

Vs: Voltage output by the temperature sensor when temperature is measured (V)

T1: Temperature experimentally measured at one point (°C)

49.2 注册说明

49.2.1 温度传感器控制寄存器(TSCR)

图49.3所示的时序约束适用于TSCR寄存器的设置。

49.2.2 温度传感器校准数据寄存器(TSCDR)

Address(es): TSD.TSCDR 407F B17Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—												
重置后的值：	0	0	0	0	每个MCU的独特价值											

TSCDR寄存器存储在出厂时为每个MCU测量的温度传感器校准数据。
温度传感器校准数据是使用12位AD转换器单元0在Ta=Tj=127°C和AVCC0=3.3V的条件下转换温度传感器输出的电压得到的数字值。

TSCDR寄存器是一个32位只读寄存器，应该以32位为单位读取。

49.3 使用温度传感器

温度传感器输出随温度变化的电压。该电压由ADC12转换为数字值。然后，您可以通过将该值转换为温度来获得芯片温度。

49.3.1 使用温度传感器的准备工作

温度(T)与传感器电压输出(Vs)成正比，因此使用以下公式计算温度：

T = (Vs - V1) / Slope + T1

T:测量温度(°C)

Vs：测量温度时温度传感器输出的电压（V）

T1：在某一点实验测量的温度(°C)

V1: Voltage output by the temperature sensor when T1 is measured (V)

T2: Temperature at the experimental measurement of another point (°C)

V2: Voltage output by the temperature sensor when T2 is measured (V)

Slope: Temperature gradient of the temperature sensor (V / °C), Slope = (V2 - V1) / (T2 - T1)

Determine the values for formula parameter (V1, T1, Slope) measurement. These values vary from sensor to sensor, and Renesas recommends making the following experimental measurement at two different temperatures to determine the values for these parameters:

1. Use the ADC12 to measure the voltage V1 output by the temperature sensor at temperature T1.
2. Use the ADC12 to measure the voltage V2 output by the temperature sensor at a different temperature T2. Obtain the temperature gradient (Slope = (V2 - V1) / (T2 - T1)) from these results.
3. Obtain subsequent temperatures by substituting the slope into the formula for the temperature characteristic (T = (Vs - V1) / Slope + T1).

If you are using the temperature slope given in Table 60.45 of section 60, Electrical Characteristics, use the 12-bit A/D converter unit 0 to measure the voltage V1 output by the temperature sensor at temperature T1, then calculate the temperature characteristic by using the following formula:

T = (Vs - V1) / Slope + T1

T: Measured temperature (°C)

Vs: Voltage output by the temperature sensor when the temperature is measured (V)

T1: Sample temperature measurement at first point (°C)

V1: Voltage output by the temperature sensor when T1 is measured (V)

Slope: Temperature slope given in Table 60.45 ÷ 1000 (V / °C)

In this MCU, the TSCDR register stores the temperature value (CAL127) of the temperature sensor measured under the condition Ta = Tj = 127°C and AVCC0 = 3.3 V. By using this value as the sample measurement result at the first point, preparation before using the temperature sensor can be omitted.

If V1 is calculated from CAL127:

V1 = 3.3 × CAL127 / 4096 [V]

Using this, the measured temperature can be calculated according to the following formula:

T = (Vs - V1) / Slope + 127 [°C]

T: Measured temperature (°C)

Vs: Voltage output by the temperature sensor when the temperature is measured (V)

V1: Voltage output by the temperature sensor when Ta = Tj = 127°C and AVCC0 = 3.3 V (V)

Slope: Temperature slope given in Table 60.45 ÷ 1000 (V / °C)

49.3.2 Procedures for Using the Temperature Sensor

Figure 49.2 shows the procedure for using the temperature sensor. For the procedure to configure the ADC12, see section 47, 12-Bit A/D Converter (ADC12).

V1：测量T1时温度传感器输出的电压（V）

T2：另一点的实验测量温度（°C）

V2：测量T2时温度传感器输出的电压（V）

斜率：温度传感器的温度梯度（V°C），斜率=（V2V1）（T2T1）

确定公式参数（V1、T1、斜率）测量的值。这些值因传感器而异，并且
瑞萨推荐在两种不同温度下进行以下实验测量以确定这些参数的值：

1. 使用ADC12测量温度传感器在温度T1时输出的电压V1。
2. 使用ADC12测量温度传感器在不同温度T2下输出的电压V2。从这些结果中获得温度梯度(Slope=(V2V1)(T2T1))。
3. 通过将斜率代入温度特性公式(T=(VsV1)Slope+T1)来获得后续温度。

如果您使用第60节，电气特性的表60.45中给出的温度斜率，使用12位AD转换器单元0测量温度传感器在温度T1输出的电压V1，然后使用以下公式计算温度特性公式：

T = (Vs - V1) / Slope + T1

T:测量温度(°C)

Vs：测温时温度传感器输出的电压（V）

T1：第一点的样品温度测量(°C)

V1：测量T1时温度传感器输出的电压（V）

斜率：表60.45÷1000(V°C)中给出的温度斜率

在此MCU中，TSCDR寄存器存储在Ta=Tj=127°C和AVCC0=3.3V条件下测量的温度传感器的温度值(CAL127)。
将此值用作第一点的样本测量结果，准备使用前可以省略温度传感器。

如果V1由CAL127计算得出：

V1 = 3.3 × CAL127 / 4096 [V]

使用它，可以根据以下公式计算测量的温度：

T = (Vs - V1) / Slope + 127 [°C]

T:测量温度(°C)

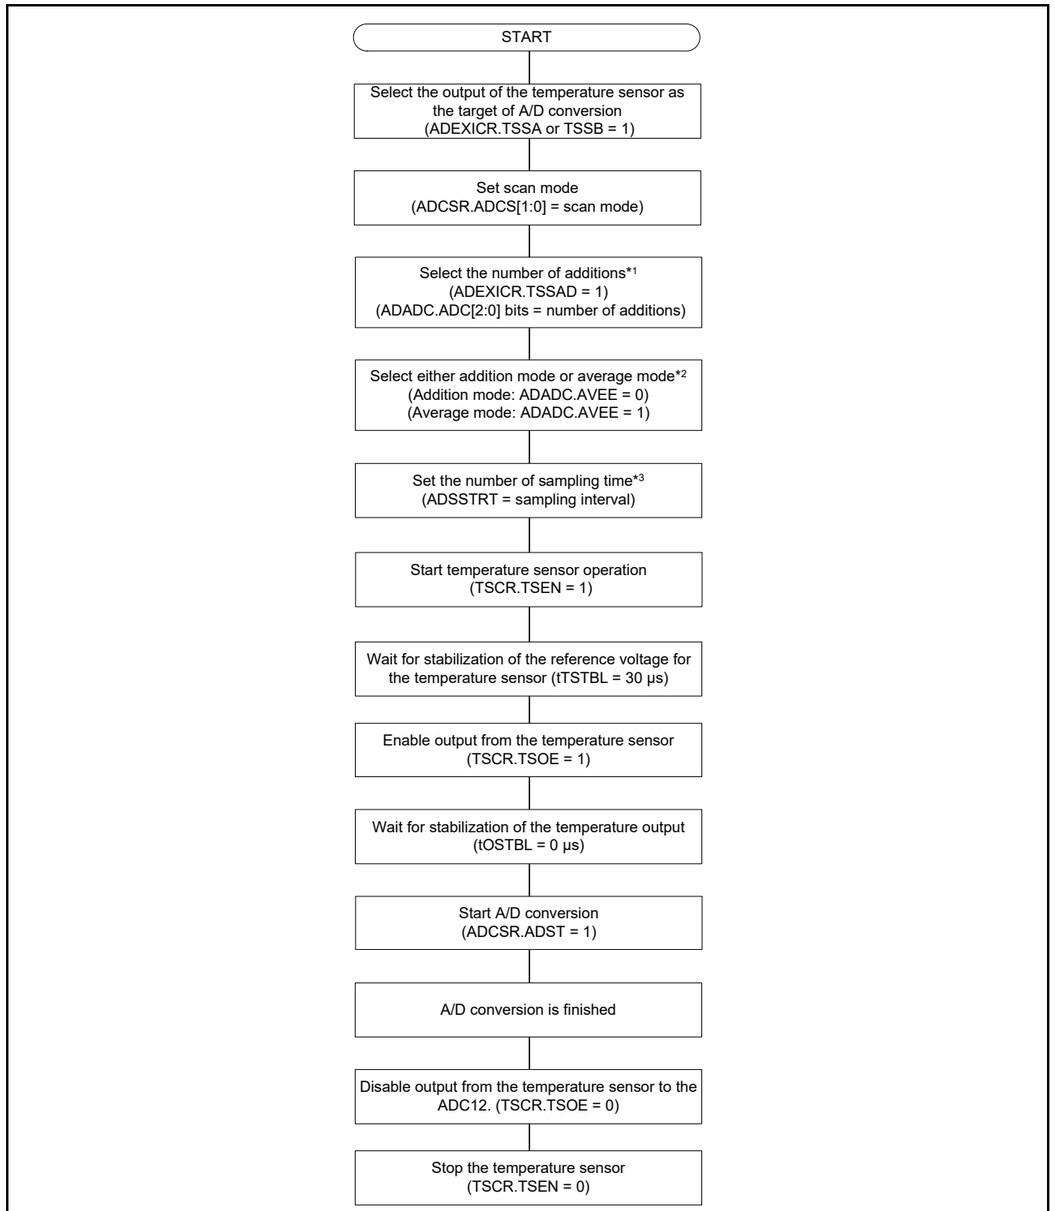
Vs：测温时温度传感器输出的电压（V）

V1：Ta=Tj=127°C且AVCC0=3.3V(V)时温度传感器输出的电压

斜率：表60.45÷1000(V°C)中给出的温度斜率

49.3.2 使用温度传感器的步骤

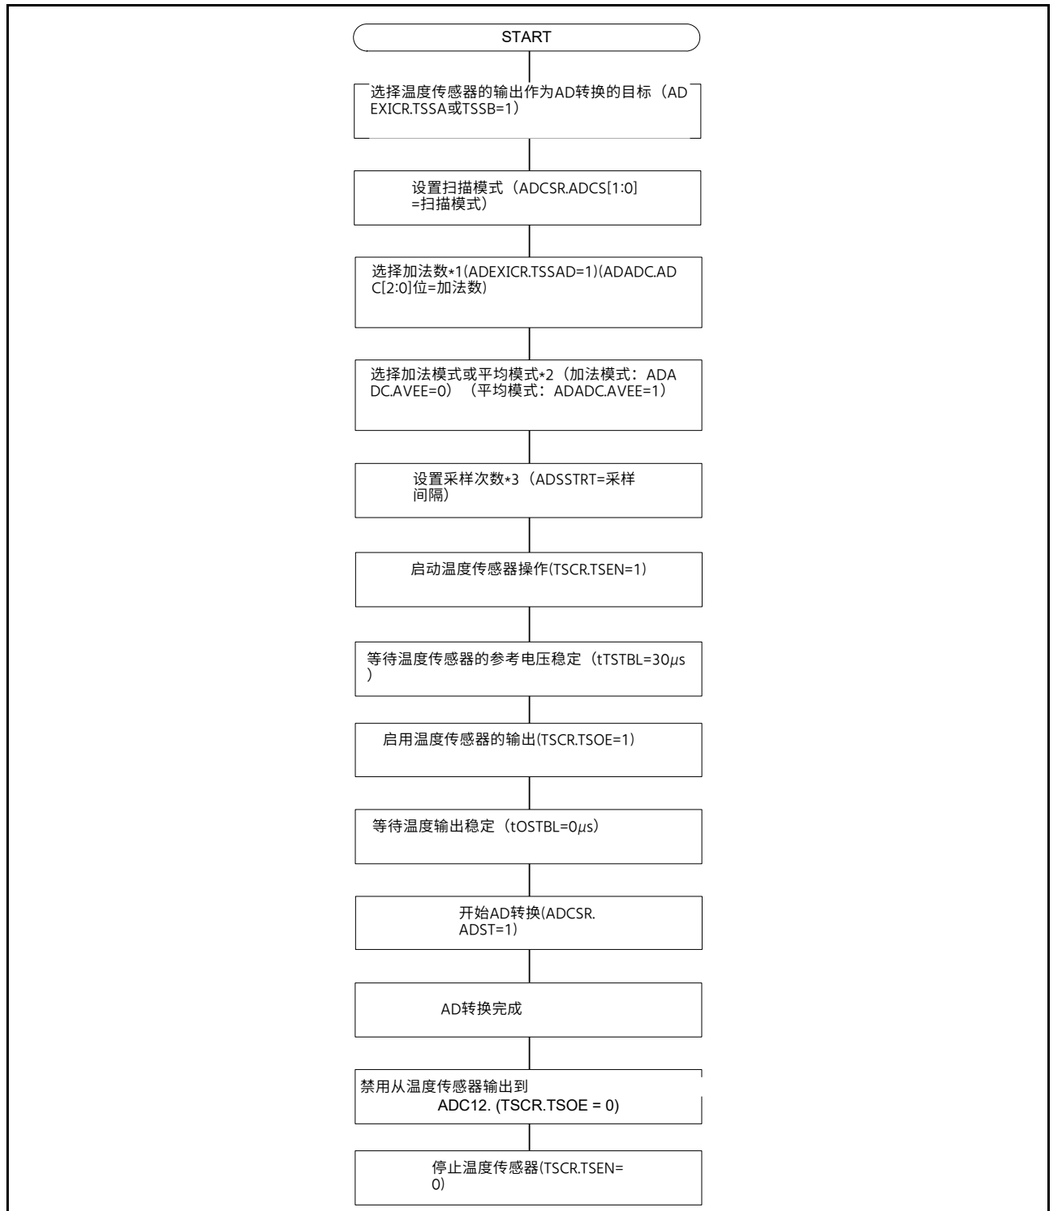
图49.2显示了使用温度传感器的步骤。有关配置ADC12的过程，请参阅第47节，12位AD转换器(ADC12)。



Note 1. The ADADC.ADC[2:0] setting is limited to some values in average mode. For details on available ADADC.ADC[2:0] settings in average mode, see section 47.2.10, A/D-Converted Value Addition/Average Count Select Register (ADADC).
Note 2. This setting is not required if addition/average mode is not set.
Note 3. Set the sampling time to more than the value described in section 60.7, TSN Characteristics.

Figure 49.2 Procedure for using the temperature sensor

Figure 49.3 shows the timing from the start of temperature sensor operation until the completion of A/D conversion when the ADC12 is in single scan mode (the conversion target is the temperature sensor output only). The times shown in the figure are described in Table 49.2.



Note 1. ADADC.ADC[2:0]设置仅限于平均模式下的某些值。有关平均模式下可用ADADC.ADC[2:0]设置的详细信息，请参见第47.2.10节，D转换值加法平均计数选择寄存器(ADADC)。
Note 2. 如果未设置加法平均模式，则不需要此设置。
Note 3. 将采样时间设置为大于第60.7节，TSN特性中描述的值。

Figure 49.2 温度传感器的使用步骤

图49.3显示了当ADC12处于单次扫描模式（转换目标仅为温度传感器输出）时，从温度传感器操作开始到AD转换完成的时序。图中显示的时间在表49.2中描述。

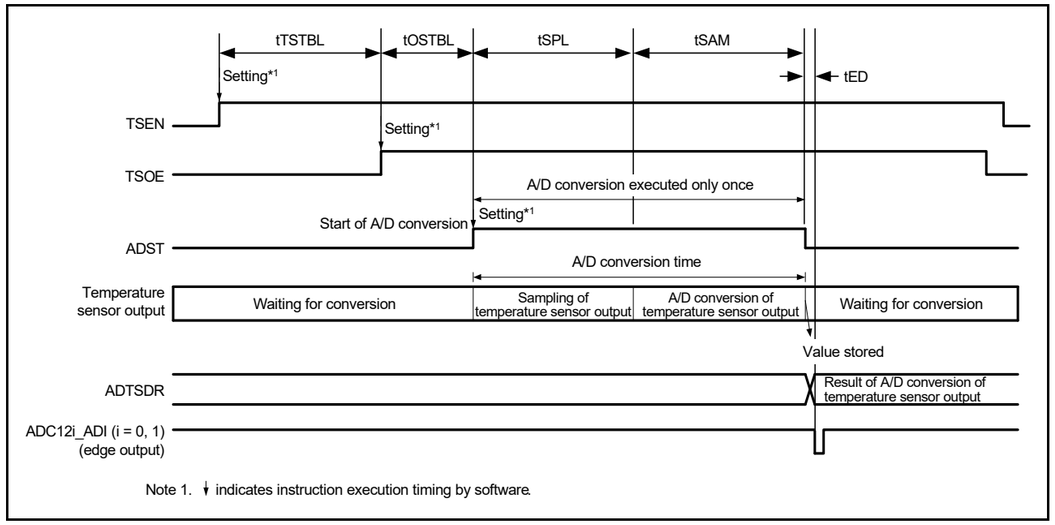


Figure 49.3 Timing from start of temperature sensor operation until completion of A/D conversion

Table 49.2 Time until completion of A/D conversion after start of temperature sensor operation

Parameter	Symbol	Time
Wait time for temperature sensor reference voltage stabilization	tTSTBL	30 µs (min)
Wait time for temperature sensor output stabilization	tOSTBL	0 µs (min)
ADC12 input sampling time	tSPL	ADSSTRT setting × ADCLK cycles
A/D conversion time	tSAM	See Table 47.10, Conversion times during scanning (in numbers of cycles of ADCLK and PCLKB)
Scan conversion end delay	tED	

49.4 Usage Notes

49.4.1 Settings for the Module-Stop Function

Temperature sensor operation can be disabled or enabled using the associated bit in Module Stop Control Register D (MSTPCRD). The temperature sensor is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

49.4.2 Constraints

It is prohibited to use both channels of the ADC12 simultaneously for temperature sensor measurement.

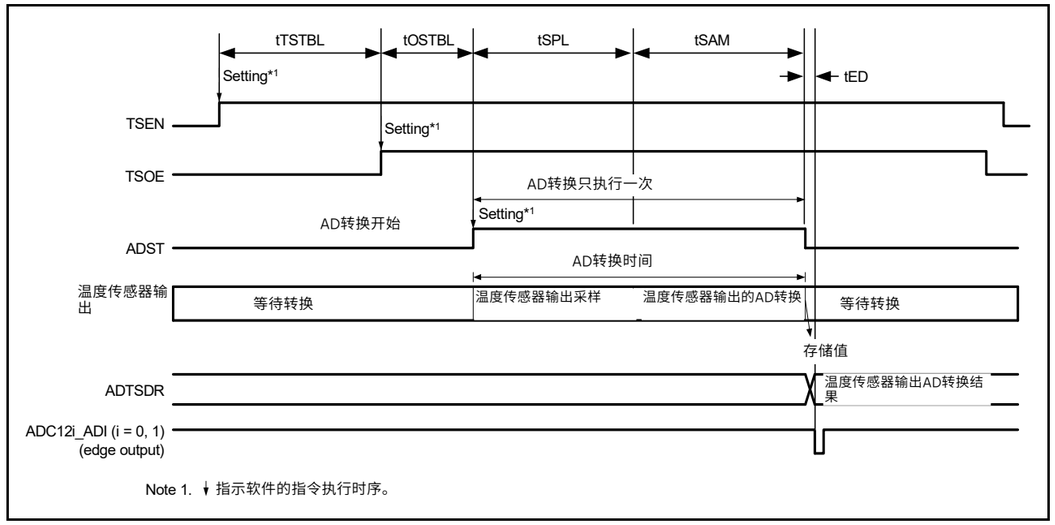

Figure 49.3 从温度传感器操作开始到AD转换完成的时间

Table 49.2 温度传感器动作开始后到AD转换完成的时间

Parameter	Symbol	Time
温度传感器参考电压稳定的等待时间	tTSTBL	30 µs (min)
温度传感器输出稳定的等待时间	tOSTBL	0 µs (min)
ADC12输入采样时间	tSPL	ADSTRT设置×ADCLK周期
AD转换时间	tSAM	请参见表47.10，扫描期间的转换时间（以ADCLK和PCLKB的周期数为单位）
扫描转换结束延迟	tED	

49.4 使用说明

49.4.1 模块停止功能的设置

可以使用模块停止控制寄存器D(MSTPCRD)中的相关位来禁用或启用温度传感器操作。温度传感器在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

49.4.2 Constraints

禁止同时使用ADC12的两个通道进行温度传感器测量。

50. High-Speed Analog Comparator (ACMPHS)

50.1 Overview

The High-Speed Analog Comparator (ACMPHS) can be used to compare a test voltage with a reference voltage and to provide a digital output based on the result of conversion. Both the test voltage and the reference voltage can be provided to the ACMPHS from internal sources (D/A converter output and internal reference voltage) and an external source (with or without an internal PGA). Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion.

Table 50.1 lists the ACMPHS specifications, Figure 50.1 shows a block diagram, and Table 50.2 shows the input source configurations.

Table 50.1 ACMPHS 0 to 5 specifications

Parameter	Specifications
Number of channels	6 channels: ACMPHS 0 to ACMPHS 5
Analog input voltage	• Output from internal PGA • Output from internal D/A converter • Input from internal A/D converter input pin (one selectable).
Reference voltage	• Internal reference voltage (Vref) • Output from internal D/A converter • Input from internal A/D converter input pin (one selectable).
ACMPHS output	• Comparison result • Generation of ELC event output • Monitor output from register.
Interrupt request signal	• Interrupt request generated on valid edge detection from comparison result • Selectable to rising edge, falling edge, or both edges.
Digital filter function	• Selectable to one of three sampling frequencies • Not using the filter function is selectable.

50. 高速模拟比较器(ACMPHS)

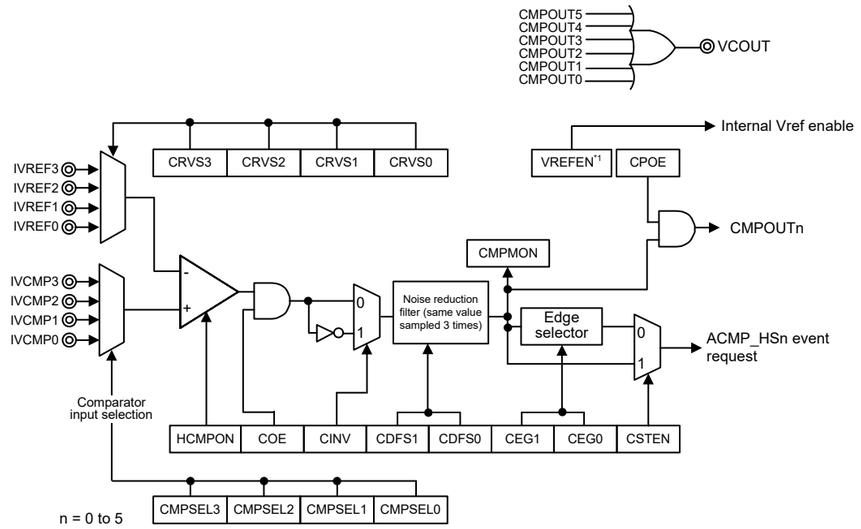
50.1 Overview

高速模拟比较器(ACMPHS)可用于将测试电压与参考电压进行比较，并根据转换结果提供数字输出。测试电压和参考电压都可以从内部源（DA转换器输出和内部参考电压）和外部源（带或不带内部PGA）提供给ACMPHS。这种灵活性在需要在模拟信号之间执行go-no-go比较而不一定需要AD转换的应用中很有用。

表50.1列出了ACMPHS规范，图50.1显示了框图，表50.2显示了输入源配置。

Table 50.1 ACMPHS0到5规格

Parameter	Specifications
通道数	6 channels: ACMPHS 0 to ACMPHS 5
模拟输入电压	来自内部PGA的输出 来自内部DA转换器的输出 来自内部AD转换器输入引脚的输入（一个可选）。
参考电压	内部参考电压(Vref) 来自内部DA转换器的输出 从内部AD转换器输入引脚输入（一个可选）。
ACMPHS output	比较结果 生成ELC事件输出 监控寄存器的输出。
中断请求信号	从比较结果中检测到有效边沿时产生中断请求 可选择上升沿、下降沿或两个边沿。
数字滤波功能	可选择三个采样频率之一。 可选择不使用滤波器功能。



CMPSEL3 to CMPSEL0: Bits in CMPSEL0 register
CRVS3 to CRVS0: Bits in CMPSEL1 register
CPOE, VREFEN: Bits in CPIOC register
CMPMON: Bit in CMPMON register
HCMPON, COE, CINV, CDFS1, CDFS0, CEG1, CEG0, CSTEN: Bits in CMPCTL register

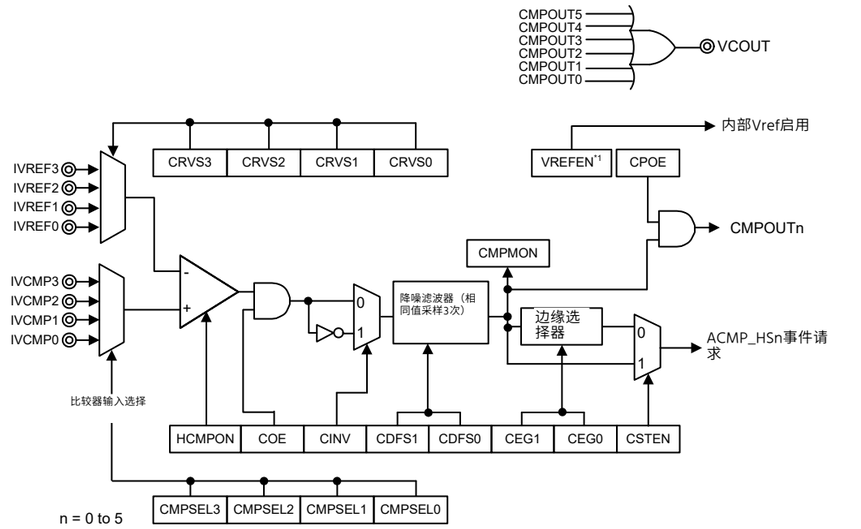
Note: VREFEN exists only in ACMPHS0.

Figure 50.1 ACMPHS block diagram

Table 50.2 Input source configuration of the ACMPHS

	Reference voltage input source				Analog voltage input source				
Comparator	IVREF3	IVREF2	IVREF1	IVREF0	IVCMP3	IVCMP2	IVCMP1	IVCMP0	Output pin
ACMPHS0	DA0*1	Vref*2	AN116	AN016	PGA0 output*6	AN000*3, *6	DA1*4	AN017	VCOUT*5
ACMPHS1	DA0*1	Vref*2	AN116	AN016	PGA1 output*6	AN001*3, *6	DA1*4	AN017	
ACMPHS2	DA0*1	Vref*2	AN116	AN016	PGA2 output*6	AN002*3, *6	DA1*4	AN017	
ACMPHS3	DA0*1	Vref*2	AN116	AN016	PGA3 output*6	AN100*3, *6	DA1*4	AN017	
ACMPHS4	DA0*1	Vref*2	AN116	AN016	PGA4 output*6	AN101*3, *6	DA1*4	AN017	
ACMPHS5	DA0*1	Vref*2	AN116	AN016	PGA5 output*6	AN102*3, *6	DA1*4	AN017	

Note 1. When D/A converter 0 output is not used, the signal can be used as AN005/AN105 analog input.
Note 2. Internal voltage reference.
Note 3. Because input is through PGA, the associated Module Stop bit, MSTPCRD.MSTPD16 (unit 0) or MSTPCRD.MSTPD15 (unit 1) should be set to 0.
Note 4. When D/A converter 1 output is not used, the signal can be used as AN006/AN106 analog input.
Note 5. ACMPHS0 to ACMPHS5 compare outputs are bundled with the VCOUT pin.
Note 6. Setting of the ADC12 is required. For details, see section 47.6.8, Available Functions and Register Settings of AN000 to AN002, AN007, AN100 to AN102, and AN107.



CMPSEL3到CMPSEL0：CMPSEL0寄存器中的位
CRVS3到CRVS0：CMPSEL1寄存器中的位
CPOE、VREFEN：CPIOC寄存器中的位
CMPMON：CMPMON寄存器中的位
HCMPON、COE、CINV、CDFS1、CDFS0、CEG1、CEG0、CSTEN：CMPCTL寄存器中的位

Note: VREFEN仅存在于ACMPHS0中。

Figure 50.1 ACMPHS框图

Table 50.2 ACMPHS的输入源配置

	参考电压输入源				模拟电压输入源				
Comparator	IVREF3	IVREF2	IVREF1	IVREF0	IVCMP3	IVCMP2	IVCMP1	IVCMP0	输出引脚
ACMPHS0	DA0*1	Vref*2	AN116	AN016	PGA0 output*6	AN000*3, *6	DA1*4	AN017	VCOUT*5
ACMPHS1	DA0*1	Vref*2	AN116	AN016	PGA1 output*6	AN001*3, *6	DA1*4	AN017	
ACMPHS2	DA0*1	Vref*2	AN116	AN016	PGA2 output*6	AN002*3, *6	DA1*4	AN017	
ACMPHS3	DA0*1	Vref*2	AN116	AN016	PGA3 output*6	AN100*3, *6	DA1*4	AN017	
ACMPHS4	DA0*1	Vref*2	AN116	AN016	PGA4 output*6	AN101*3, *6	DA1*4	AN017	
ACMPHS5	DA0*1	Vref*2	AN116	AN016	PGA5 output*6	AN102*3, *6	DA1*4	AN017	

Note 1. 当不使用DA转换器0输出时，该信号可用作AN005AN105模拟输入。
Note 2. 内部参考电压。
Note 3. 由于输入是通过PGA进行的，因此相关的模块停止位MSTPCRD.MSTPD16（单元0）或MSTPCRD.MSTPD15（单元1）应设置为0。
Note 4. 当不使用DA转换器1输出时，该信号可用作AN006AN106模拟输入。
Note 5. ACMPHS0到ACMPHS5比较输出与VCOUT引脚捆绑在一起。
Note 6. 需要设置ADC12。有关详细信息，请参阅第47.6.8节，AN000的可用功能和寄存器设置AN002、AN007、AN100至AN102和AN107。

50.2 Register Descriptions

50.2.1 Comparator Control Register (CMPCTL)

Address(es): ACMPHS0.CMPCTL 4008 5000h,ACMPHS1.CMPCTL 4008 5100h, ACMPHS2.CMPCTL 4008 5200h, ACMPHS3.CMPCTL 4008 5300h, ACMPHS4.CMPCTL 4008 5400h, ACMPHS5.CMPCTL 4008 5500h

	b7	b6	b5	b4	b3	b2	b1	b0
	HCMPON	CDFS[1:0]		CEG1	CEG0	CSTEN	COE	CINV
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CINV	Comparator Output Polarity Selection*2, *3	0: Do not invert comparator output 1: Invert comparator output.	R/W
b1	COE	Comparator Output Enable	0: Disable comparator output (output signal is low level) 1: Enable comparator output.	R/W
b2	CSTEN	Interrupt Select*1	0: Output through the edge selector 1: Output directly.	R/W
b4, b3	CEG1/CEG0	Selection of Valid Edge (Edge Selector)	b4 b3 0 0: Do not detect edge 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges.	R/W
b6, b5	CDFS[1:0]	Noise Filter Selection*1, *2, *3, *4	b6 b5 0 0: Do not use noise filter. 0 1: Use noise filter sampling frequency of PCLKB/2[3] 1 0: Use noise filter sampling frequency of PCLKB/2[4] 1 1: Use noise filter sampling frequency of PCLKB/2[5].	R/W
b7	HCMPON	Comparator Operation Control*5	0: Stop operation (comparator outputs a low-level signal) 1: Enable operation (enables input to the comparator pins).	R/W

Note 1. Set the CSTEN bit to 1 and the CDFS[1:0] bits to 00b if the ACMPHS interrupt causes release of Software Standby or Snooze modes. CTSEN is supported only by the ACMPHS0. ACMPHSn.CMPCTL.CTESN (n = 1 to 5) must be set to 0.
Note 2. Disable the ACMPHS output (COE = 0) before changing the CDFS[1:0] and CINV bits.
Note 3. If the CDFS[1:0] and CINV bits are changed, an ACMPHS interrupt request and an ELC event might be generated. Before changing these bits, set the ELSRn register to 0 (the ACMPHS output is not linked). After changing these bits, clear the IR flag in the IELSRn register to 0 to clear the interrupt status.
Note 4. If the CDFS[1:0] bits are changed from 00b (noise filter not used) to a value other than 00b (noise filter used), perform sampling four times and update the filter output, and then use the ACMPHS interrupt request or the ELC event.
Note 5. A stabilization wait time is required to permit ACMPHS operation after enabling it (HCMPON = 1). The operation stabilization wait time for ACMPHS modules 0 to 5 is 300 ns.

The CMPCTL register controls the ACMPHS operation, enables or disables the ACMPHS output, selects the noise filter, selects the valid edge of the interrupt signal, and selects the interrupt. A reset clears this register to 00h.

50.2 注册说明

50.2.1 比较器控制寄存器(CMPCTL)

Address(es): ACMPHS0.CMPCTL 4008 5000h,ACMPHS1.CMPCTL 4008 5100h, ACMPHS2.CMPCTL 4008 5200h, ACMPHS3.CMPCTL 4008 5300h, ACMPHS4.CMPCTL 4008 5400h, ACMPHS5.CMPCTL 4008 5500h

	b7	b6	b5	b4	b3	b2	b1	b0
	HCMPON	CDFS[1:0]		CEG1	CEG0	CSTEN	COE	CINV
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CINV	比较器输出极性Selection*2, *3	0：不反转比较器输出1：反转比较器输出。	R/W
b1	COE	比较器输出使能	0：禁止比较器输出（输出信号为低电平）1：使能比较器输出。	R/W
b2	CSTEN	Interrupt Select*1	0：通过边沿选择器输出1：直接输出。	R/W
b4, b3	CEG1/CEG0	有效边的选择（边Selector)	b4b300：不检测边沿01：检测上升沿10：检测下降沿11：检测两个边沿。	R/W
b6, b5	CDFS[1:0]	噪声滤波器选择*1、*2、*3、*4	b6b500：不使用噪声滤波器。01：使用PCLKB231的噪声滤波器采样频率0：使用PCLKB241的噪声滤波器采样频率1：使用PCLKB25的噪声滤波器采样频率。	R/W
b7	HCMPON	比较器操作控制*5	0：停止操作（比较器输出低电平信号）1：使能操作（使能输入到比较器引脚）。	R/W

Note 1. 如果ACMPHS中断导致软件待机或贪睡模式的释放，请将CSTEN位设置为1，并将CDFS[1:0]位设置为00b。只有ACMPHS0支持CTSEN。ACMPHSn.CMPCTL.CTESN（n=1到5）必须设置为0。
Note 2. 在更改CDFS[1:0]和CINV位之前禁用ACMPHS输出(COE=0)。
Note 3. 如果CDFS[1:0]和CINV位发生变化，可能会产生ACMPHS中断请求和ELC事件。在更改这些位之前，将ELSRn寄存器设置为0（ACMPHS输出未链接）。更改这些位后，将IELSRn寄存器中的IR标志清零以清除中断状态。
Note 4. 如果CDFS[1:0]位从00b（未使用噪声滤波器）更改为00b以外的值（使用噪声滤波器），执行四次采样并更新滤波器输出，然后使用ACMPHS中断请求或ELC事件。
Note 5. 在启用ACMPHS后，需要一个稳定等待时间来允许其运行(HCMPON=1)。ACMPHS模块0到5的操作稳定等待时间为300ns。

CMPCTL寄存器控制ACMPHS操作，使能或禁用ACMPHS输出，选择噪声滤波器，选择中断信号的有效边沿，选择中断。复位将该寄存器清除为00h。

50.2.2 Comparator Input Select Register (CMPSEL0)

Address(es): ACMPHS0.CMPSEL0 4008 5004h, ACMPHS1.CMPSEL0 4008 5104h, ACMPHS2.CMPSEL0 4008 5204h, ACMPHS3.CMPSEL0 4008 5304h, ACMPHS4.CMPSEL0 4008 5404h, ACMPHS5.CMPSEL0 4008 5504h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CMPSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	CMPSEL[3:0]	Comparator Input Selection*1	b3 b0 0 0 0 0: Do not input 0 0 0 1: Select IVCMP0*2 0 0 1 0: Select IVCMP1*2 0 1 0 0: Select IVCMP2*2 1 0 0 0: Select IVCMP3.*2 Other settings are prohibited.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Use the following procedure to change the CMPSEL[3:0] bits. Writing a value other than 0000 0000b while the value of the CMPSEL0 register is not 0000 0000b is invalid. Writing 1 to two or more bits is also invalid. In both cases, the previous value is retained.
To change the CMPSEL[3:0] bits:
1. Set the CMPCTL.COE bit to 0.
2. Set the CMPSEL0 register to 0000 0000b.
3. Set a new value in the CMPSEL[3:0] bits, with 1 set in only one of the bits.
4. Wait for the input switching stabilization wait time (200 ns).
5. Set the CMPCTL.COE bit to 1.
6. Clear the IR flag in the IELSRn register to clear the interrupt status.

Note 2. For details, see Table 50.2.

50.2.3 Comparator Reference Voltage Select Register (CMPSEL1)

Address(es): ACMPHS0.CMPSEL1 4008 5008h, ACMPHS1.CMPSEL1 4008 5108h, ACMPHS2.CMPSEL1 4008 5208h, ACMPHS3.CMPSEL1 4008 5308h, ACMPHS4.CMPSEL1 4008 5408h, ACMPHS5.CMPSEL1 4008 5508h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CRVS[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	CRVS[3:0]	Reference Voltage Selection*1	b3 b0 0 0 0 0: Do not input 0 0 0 1: Select IVREF0*2 0 0 1 0: Select IVREF1*2 0 1 0 0: Select IVREF2*2 1 0 0 0: Select IVREF3*2 Other settings are prohibited.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Use the following procedure to change the CRVS[3:0] bits. Writing a value other than 0000 0000b while the value of the CMPSEL1 register is not 0000 0000b is invalid. Writing 1 to two or more bits is also invalid. In both cases, the previous value is retained.
To change the CRVS[3:0] bits:
1. Set the CMPCTL.COE bit to 0.
2. Set the CMPSEL1 register to 0000 0000b.
3. Set a new value to the CRVS[3:0] bits, with 1 set in only one of the bits.
4. Wait for the input switching stabilization wait time (200 ns)
5. Set the CMPCTL.COE bit to 1.

50.2.2 比较器输入选择寄存器(CMPSEL0)

Address(es): ACMPHS0.CMPSEL0 4008 5004h, ACMPHS1.CMPSEL0 4008 5104h, ACMPHS2.CMPSEL0 4008 5204h, ACMPHS3.CMPSEL0 4008 5304h, ACMPHS4.CMPSEL0 4008 5404h, ACMPHS5.CMPSEL0 4008 5504h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CMPSEL[3:0]			
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	CMPSEL[3:0]	比较器输入选择*1	b3b00000：不输入0001：选择IVCMP0*20010：选择IVCMP1*20100：选择IVCMP2*21000：选择IVCMP3.*2其他设置有禁止。	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 使用以下程序更改CMPSEL[3:0]位。写入00000000b以外的值，而CMPSEL0寄存器不是00000000b无效。将1写入两位或更多位也是无效的。在这两种情况下，都会保留先前的值。要更改CMPSEL[3:0]位：1.将CMPCTL.COE位设置为0。2.将CMPSEL0寄存器设置为00000000b。3.在CMPSEL[3:0]位中设置一个新值，其中一个位设置为1。4.等待输入切换稳定等待时间（200ns）。5.将CMPCTL.COE位设置为1。6.清除IELSRn寄存器中的IR标志以清除中断状态。

Note 2. 详见表50.2。

50.2.3 比较器参考电压选择寄存器(CMPSEL1)

Address(es): ACMPHS0.CMPSEL1 4008 5008h, ACMPHS1.CMPSEL1 4008 5108h, ACMPHS2.CMPSEL1 4008 5208h, ACMPHS3.CMPSEL1 4008 5308h, ACMPHS4.CMPSEL1 4008 5408h, ACMPHS5.CMPSEL1 4008 5508h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CRVS[3:0]			
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	CRVS[3:0]	参考电压选择*1	b3b00000：不输入0001：选择IVREF0*20010：选择IVREF1*20100：选择IVREF2*21000：选择IVREF3*2禁止其他设置.	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 使用以下过程更改CRVS[3:0]位。写入00000000b以外的值，而CMPSEL1寄存器不是00000000b无效。将1写入两位或更多位也是无效的。在这两种情况下，都会保留先前的值。要更改CRVS[3:0]位：1.将CMPCTL.COE位设置为0。2.将CMPSEL1寄存器设置为00000000b。3.为CRVS[3:0]位设置一个新值，其中一个位设置为1。4.等待输入开关稳定等待时间(200ns)5.将CMPCTL.COE位设置为1。

6. Clear the IR flag in the IELSRn register to clear the interrupt status.

Note 2. For details, see Table 50.2.

50.2.4 Comparator Output Monitor Register (CMPMON)

Address(es): ACMPHS0.CMPMON 4008 500Ch, ACMPHS1.CMPMON 4008 510Ch, ACMPHS2.CMPMON 4008 520Ch, ACMPHS3.CMPMON 4008 530Ch, ACMPHS4.CMPMON 4008 540Ch, ACMPHS5.CMPMON 4008 550Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPMON
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CMPMON	Comparator Output Monitor*1	0: Comparator output is low 1: Comparator output is high.	R
b7 to b1	—	Reserved	These bits are read as 0.	R

Note 1. When ACMPHS operation is enabled (HCMPON = COE = 1) but the noise filter is not in use (CDFS[1:0] = 00b), design the software so that the CMPMON bit is read twice and the values are only used after the two consecutive values match.

50.2.5 Comparator Output Control Register (CPIOC)

Address(es): ACMPHS0.CPIOC 4008 5010h, ACMPHS1.CPIOC 4008 5110h, ACMPHS2.CPIOC 4008 5210h, ACMPHS3.CPIOC 4008 5310h, ACMPHS4.CPIOC 4008 5410h, ACMPHS5.CPIOC 4008 5510h

	b7	b6	b5	b4	b3	b2	b1	b0
	VREFEN	—	—	—	—	—	—	CPOE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CPOE	Comparator Output Selection	0: Disable VCOUT pin output of the comparator (output signal is low) 1: Enable VCOUT pin output of the comparator.	R/W
b6 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	VREFEN	Internal Vref Enable*1	0: Disable internal Vref 1: Enable internal Vref.	R/W

Note 1. For ACMPHS modules 0 to 5, VREFEN exists only in ACMPHS0.CPIOC. When using the internal Vref in COMP0 to COMP5, set the VREFEN bit in ACMPHS0.CPIOC to 1. Bit [7] in ACMPHS1.CPIOC to ACMPHS5.CPIOC should be 0 regardless of whether or not the internal Vref is used.

50.3 Operation

The ACMPHS compares a reference voltage to an analog input voltage. Operation is not guaranteed when the values of registers are changed during ACMPHS operation. Table 50.3 shows the procedures for setting the registers associated with ACMPHS.

Table 50.3 Procedure for setting registers associated with ACMPHSn (n = 0 to 5) (1 of 2)

Step	Register	Bit	Setting
1	Associated MSTPCRD register	MSTPD28 to MSTPD23	0: Input clock supply.
2	Associated Port mn Pin Function Select register (PmnPFS)	ASEL	1: Select the function of pins IVREF and IVCMP.
3	ACMPHS0.CPIOC	VREFEN	1: When using the internal Vref.

6.清除IELSRn寄存器中的IR标志以清除中断状态。

Note 2. 详见表50.2。

50.2.4 比较器输出监控寄存器(CMPMON)

Address(es): ACMPHS0.CMPMON 4008 500Ch, ACMPHS1.CMPMON 4008 510Ch, ACMPHS2.CMPMON 4008 520Ch, ACMPHS3.CMPMON 4008 530Ch, ACMPHS4.CMPMON 4008 540Ch, ACMPHS5.CMPMON 4008 550Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CMPMON
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CMPMON	比较器输出监视器*1	0：比较器输出低1：比较器输出高。	R
b7 to b1	—	Reserved	这些位读为0。	R

Note 1. 当启用ACMPHS操作(HCMPON=COE=1)但未使用噪声滤波器(CDFS[1:0]=00b)时，设计软件以便CMPMON位被读取两次并且值仅在两个连续的值匹配。

50.2.5 比较器输出控制寄存器(CPIOC)

Address(es): ACMPHS0.CPIOC 4008 5010h, ACMPHS1.CPIOC 4008 5110h, ACMPHS2.CPIOC 4008 5210h, ACMPHS3.CPIOC 4008 5310h, ACMPHS4.CPIOC 4008 5410h, ACMPHS5.CPIOC 4008 5510h

	VREFEN	—	—	—	—	—	—	CPOE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CPOE	比较器输出选择	0：禁止比较器的VCOUT引脚输出（输出信号为低电平）1：使能比较器的VCOUT引脚输出。	R/W
b6 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	VREFEN	Internal Vref Enable*1	0：禁用内部Vref1：启用内部Vref。	R/W

Note 1. 对于ACMPHS模块0到5，VREFEN仅存在于ACMPHS0.CPIOC中。当使用COMP0到COMP5的内部Vref时，将ACMPHS0.CPIOC中的VREFEN位设置为1。无论是否使用内部Vref，ACMPHS1.CPIOC到ACMPHS5.CPIOC中的位[7]都应为0。

50.3 Operation

ACMPHS将参考电压与模拟输入电压进行比较。如果在ACMPHS操作期间更改寄存器的值，则无法保证操作。表50.3显示了设置与ACMPHS相关的寄存器的过程。

Table 50.3 设置与ACMPHSn相关的寄存器的过程（n=0到5）（1of2）

Step	Register	Bit	Setting
1	相关的MSTPCRD寄存器	MSTPD28 to MSTPD23	0：输入时钟电源。
2	关联端口mn引脚功能选择寄存器(PmnPFS)	ASEL	1：选择引脚IVREF和IVCMP的功能。
3	ACMPHS0.CPIOC	VREFEN	1：使用内部Vref时。

Table 50.3 Procedure for setting registers associated with ACMPHSn (n = 0 to 5) (2 of 2)

Step	Register	Bit	Setting
4	Associated D/A convertor		When using the D/A convertor, select in the register.
5	CMPSEL0, CMPSEL1	CMPSEL0 to CMPSEL3, CRVS0 to CRVS3	Select the ACMPHSn input, with 1 set in only one of the bits.
6	CMPCTL	CDFS[1:0], CEG1, CEG0, and CINV	Set up ACMPHSn control.
		HCMPON	1: Enable ACMPHSn operation.
7	Waiting for the ACMPHS stabilization time (minimum 300 ns).		
8	CMPCTL	COE	1: Enable ACMPHSn output.
9	CPIOC	CPOE	Set the VCOUT output
	Associated Port mn Pin Function Select register (PmnPFS)	PSEL, PMR	Select the VCOUT port function.
10	IELSRn	IR, IELS[8:0]	When using an interrupt, select the interrupt status flag and the ICU event link.*1
11	ELSRn	ELS[8:0]	When using an ELC, select the event link.*2
12	Operation started		
13	CMPCTL	COE	0: When changing IVREF or IVCMP, to disable ACMPHSn output.
14	CMPSEL1	CRVS0 to CRVS3	Change the CMPSEL1 bits as follows: 1. Set bits CMPSEL1 to 0000 0000b. 2. Set a new value to the CMPSEL1 bits, with 1 set in only one of the bits.
	CMPSEL0	CMPSEL0 to CMPSEL3	Change the CMPSEL0 bits as follows: 1. Set bits CMPSEL0 to 0000 0000b. 2. Set a new value to the CMPSEL0 bits, with 1 set in only one of the bits.
15	Waiting for the ACMPHS switching stabilization time (minimum 200 ns).		
16	CMPCTL	COE	1: Enable ACMPHSn output.
17	Operation restarted		

Note 1. After ACMPHSn is set, an unnecessary interrupt might occur until operation becomes stable, so initialize the interrupt flag.
Note 2. After ACMPHSn is set, an unnecessary interrupt might occur until operation becomes stable, so initialize the event link select.

Figure 50.2 shows an example of ACMPHS operation. The VCOUT output becomes 1 when the analog input voltage is higher than the ACMPHS reference input voltage, and the VCOUT output becomes 0 when the analog input voltage is lower than the reference voltage. When the ACMPHS output changes, an interrupt request and an ELC event are output.

Table 50.3 设置与ACMPHSn相关的寄存器的过程（n=0到5）（2之2）

Step	Register	Bit	Setting
4	Associated D/A convertor		使用DA转换器时，在寄存器中选择。
5	CMPSEL0, CMPSEL1	CMPSEL0 to CMPSEL3, CRVS0 to CRVS3	选择ACMPHSn输入，仅其中一位设置为1。
6	CMPCTL	CDFS[1:0], CEG1, CEG0, and CINV	设置ACMPHSn控制。
		HCMPON	1：使能ACMPHSn操作。
7	等待ACMPHS稳定时间（最少300ns）。		
8	CMPCTL	COE	1：使能ACMPHSn输出。
9	CPIOC	CPOE	设置VCOUT输出
	关联端口mn引脚功能 选择寄存器(PmnPFS)	PSEL, PMR	选择VCOUT端口功能。
10	IELSRn	IR, IELS[8:0]	使用中断时，选择中断状态标志和ICU事件链接。*1
11	ELSRn	ELS[8:0]	使用ELC时，请选择事件链接。*2
12	操作开始		
13	CMPCTL	COE	0：改变IVREF或IVCMP时，禁用ACMPHSn输出。
14	CMPSEL1	CRVS0 to CRVS3	如下更改CMPSEL1位：1.将CMPSEL1位设置为00000000b。2.为CMPSEL1位设置一个新值，其中一个位设置为1。
	CMPSEL0	CMPSEL0 to CMPSEL3	如下更改CMPSEL0位：1.将CMPSEL0位设置为00000000b。2.为CMPSEL0位设置一个新值，其中一个位设置为1。
15	等待ACMPHS开关稳定时间（最少200ns）。		
16	CMPCTL	COE	1：使能ACMPHSn输出。
17	操作重新开始		

Note 1. 设置ACMPHSn后，可能会发生不必要的中断，直到运行稳定为止，因此请初始化中断标志。
Note 2. 设置ACMPHSn后，在操作稳定之前可能会发生不必要的中断，因此初始化事件链接选择。

图50.2显示了ACMPHS操作的示例。当模拟输入电压高于ACMPHS参考输入电压时，VCOUT输出变为1，当模拟输入电压低于参考电压时，VCOUT输出变为0。当ACMPHS输出改变时，会输出一个中断请求和一个ELC事件。

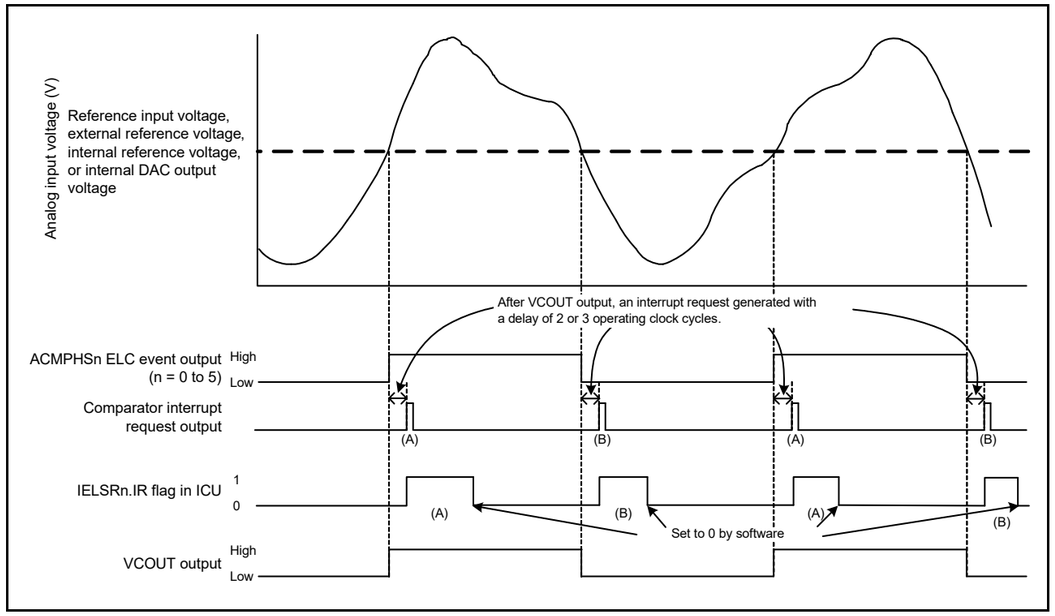

Figure 50.2 ACMPHS operation example

Figure 50.2 applies when CPOE = 1 (pin output enabled), CDFS[1:0] = 00b (filter not used), and CEG1 = CEG0 = 1 (both-edge detection selected). When CINV = 0, CEG0 = 1, and CEG1 = 0 (rising-edge detection selected for non-inversion output signal from the ACMPHS), the IELSR.IR flag changes as shown by (A) only. When CINV = 0, CEG0 = 0, and CEG1 = 1 (falling-edge detection selected for non-inversion output signal from the ACMPHS), the IR flag changes as shown by (B) only. When CPOE = 1, VCOUT directly outputs the ELC event output.

50.4 Noise Filter

The ACMPHS contains a noise filter. The sampling clock can be selected in the CMPCTL.CDFS[1:0] bits. The ACMPHS signal is sampled every sampling clock, and if the same value is sampled three times, the noise filter output at the next sampling clock cycle is used as the ACMPHS output.

Figure 50.3 shows the configuration of the noise filter and edge detector, and Figure 50.4 shows an example of noise filter and interrupt operation.

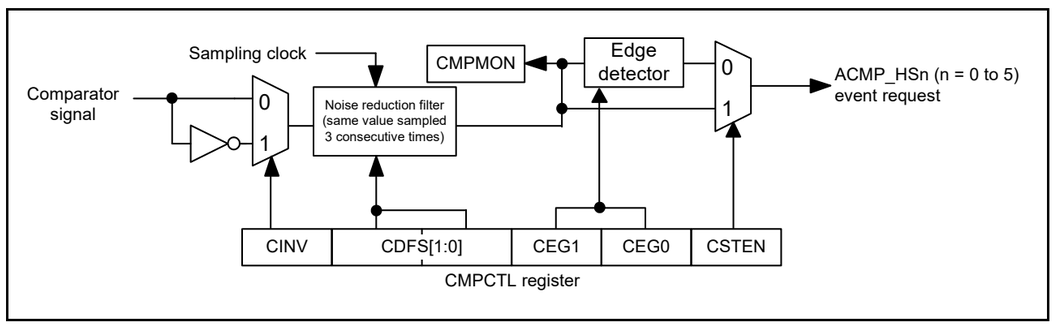

Figure 50.3 Noise filter and edge detection configuration

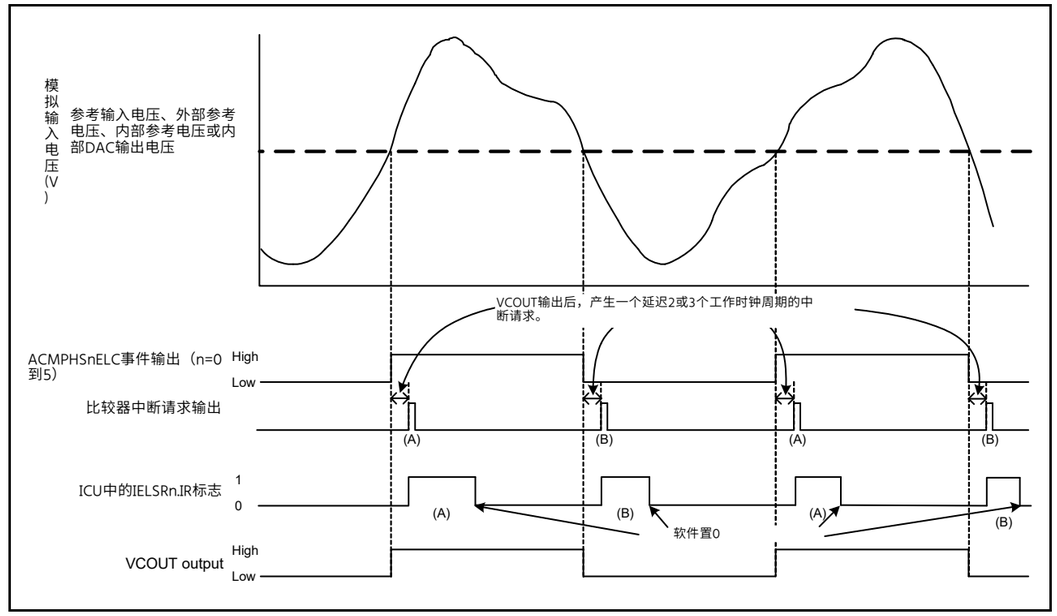

Figure 50.2 ACMPHS操作示例

图50.2适用于CPOE=1（使能引脚输出）、CDFS[1:0]=00b（未使用滤波器）和CEG1=CEG0=1（选择双沿检测）时。当CINV=0、CEG0=1和CEG1=0（为来自ACMPHS的同相输出信号选择上升沿检测）时，IELSR.IR标志仅如(A)所示变化。当CINV=0、CEG0=0和CEG1=1（为来自ACMPHS的非反相输出信号选择下降沿检测）时，IR标志仅如(B)所示变化。当CPOE=1时，VCOUT直接输出ELC事件输出。

50.4 噪声过滤器

ACMPHS包含一个噪声滤波器。可以在CMPCTL.CDFS[1:0]位中选择采样时钟。这
每个采样时钟对ACMPHS信号进行采样，如果采样3次相同的值，则将下一个采样时钟周期的噪声滤波器输出作为ACMPHS输出。

图50.3显示了噪声滤波器和边缘检测器的配置，图50.4显示了噪声滤波器和中断操作的示例。

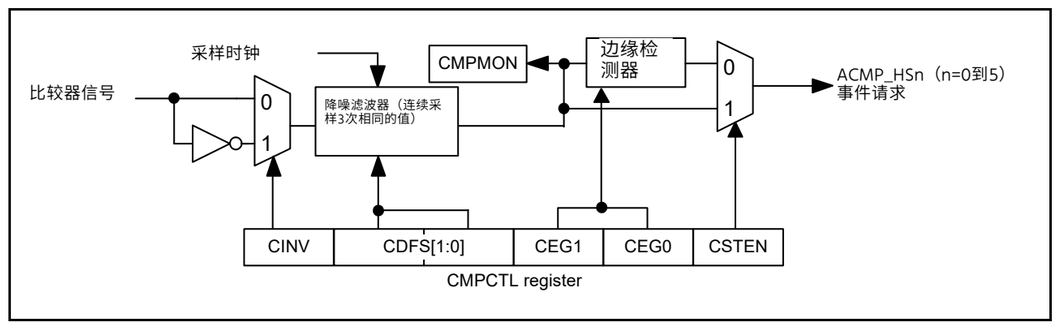

Figure 50.3 噪声过滤器和边缘检测配置

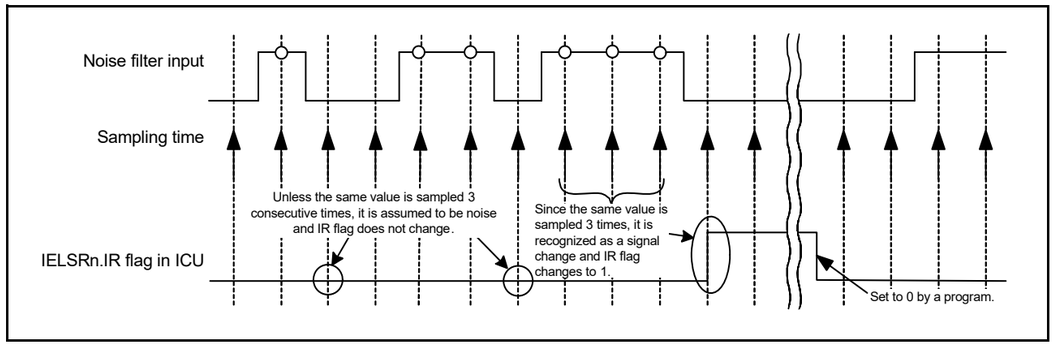

Figure 50.4 Noise filter and interrupt operation example

The operation example in Figure 50.4 applies when the CMPCTL.CDFS[1:0] bits are 01b, 10b, or 11b (noise filter used).

50.5 ACMPHS Interrupts

The ACMPHS generates six interrupt requests from sources ACMPHS0 to ACMPHS5. To use an ACMPHS interrupt, select it in the IELSR register in the Interrupt Controller Unit (ICU). Select the interrupt request in the CMPCTL.CSTEN bit, either through the edge selector, or not.

When using the ACMPHS interrupt through the edge selector, set at least one of the CMPCTL.CEG0 and CMPCTL.CEG1 bits to 1 (to a value other than 00b for no edge selection). In most cases, set the CMPCTL.CSTEN bit to 0 (output through the edge selector). Setting this bit to 1 is only permitted to release Software Standby or Snooze mode.

To use the ACMPHS interrupt in Software Standby or Snooze mode, set the CMPCTL.CSTEN bit to 1 (direct output), set the CMPCTL.CDFS[1:0] bits to 00b (digital noise filter not used), and set CMPCTL.CINV as follows:

- When detecting compare result 0 to 1, set CMPCTL.CINV to 0 (comparator output not inverted)
- When detecting compare result 1 to 0, set CMPCTL.CINV to 1 (comparator output inverted).

An ACMPHS0 interrupt request can be used to release Software Standby or Snooze modes. (ACMPHS1 to ACMPHS5 cannot be used.)

For details on the register settings related to ACMPHS interrupt requests, see section 50.2.1, Comparator Control Register (CMPCTL).

50.6 ACMPHS Output to the Event Link Controller (ELC)

The ELC uses the ACMPHS interrupt request signal as an ELC event signal, enabling link operation for the preset module. To use the ACMPHS ELC event, select them in the ELSRn register in the ELC. When using the ELC event request, set the CMPCTL.CSTEN bit to 0 (output through the edge selector). Also set at least one of the CMPCTL.CEG0 and CMPCTL.CEG1 bits to 1 (to a value other than 00b for no edge selection).

50.7 ACMPHS Pin Output

The comparison result from the ACMPHS can be output to external pins. Use the CMPCTL.CINV and CPIOC.CPOE bits to set the output polarity (non-inverted or inverted output) and enable or disable output. To output the ACMPHS comparison result to the VCOUT output pin, set the associated Port mn Pin Function Select register (PmnPFS) in the I/O register.

50.8 Usage Notes

50.8.1 Settings for the Module-Stop Function

ACMPHS operation can be disabled or enabled using the Module Stop Control Register. The ACMPHS is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

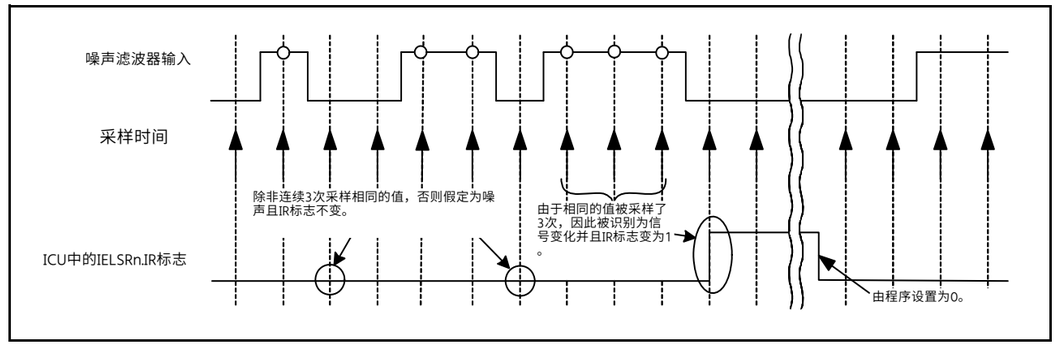

Figure 50.4 噪声滤波器和中断操作示例

图50.4中的操作示例适用于CMPCTL.CDFS[1:0]位为01b、10b或11b（使用噪声滤波器）时。

50.5 ACMPHS Interrupts

ACMPHS从源ACMPHS0到ACMPHS5产生六个中断请求。要使用ACMPHS中断，请在中断控制器单元(ICU)的IELSR寄存器中选择它。通过边沿选择器选择CMPCTL.CSTEN位中的中断请求，或者不选择。

通过边沿选择器使用ACMPHS中断时，至少设置CMPCTL.CEG0和CMPCTL.CEG1位为1（为00b以外的值，无边沿选择）。在大多数情况下，将CMPCTL.CSTEN位设置为0（通过边沿选择器输出）。将该位设置为1仅允许释放软件待机或贪睡模式。

要在软件待机或贪睡模式下使用ACMPHS中断，请将CMPCTL.CSTEN位设置为1（直接输出），将CMPCTL.CDFS[1:0]位设置为00b（未使用数字噪声滤波器），然后设置CMPCTL。CINV如下：

- 检测比较结果0到1时，设置CMPCTL.CINV为0（比较器输出不反相）
- 当检测到比较结果1到0时，将CMPCTL.CINV设置为1（比较器输出反转）。

ACMPHS0中断请求可用于释放软件待机或贪睡模式。（不能使用ACMPHS1到ACMPHS5。）

有关与ACMPHS中断请求相关的寄存器设置的详细信息，请参见第50.2.1节，比较器控制Register (CMPCTL).

50.6 ACMPHS输出到事件链接控制器(ELC)

ELC使用ACMPHS中断请求信号作为ELC事件信号，为预设模块启用链接操作。要使用ACMPHSELC事件，请在ELC的ELSRn寄存器中选择它们。使用ELC事件请求时，将CMPCTL.CSTEN位设置为0（通过边沿选择器输出）。还要将CMPCTL.CEG0和CMPCTL.CEG1位中的至少一个设置为1（设置为00b以外的值以不进行边沿选择）。

50.7 ACMPHS引脚输出

ACMPHS的比较结果可以输出到外部引脚。使用CMPCTL.CINV和CPIOC.CPOE位设置输出极性（非反相或反相输出）并启用或禁用输出。要将ACMPHS比较结果输出到VCOUT输出引脚，请在IO寄存器中设置相关的端口mn引脚功能选择寄存器(PmnPFS)。

50.8 使用说明

50.8.1 模块停止功能的设置

可以使用模块停止控制寄存器禁用或启用ACMPHS操作。ACMPHS在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

50.8.2 Relationship with the ADC12

Constraints apply on the simultaneous use of ACMPHS analog input and ADC12 analog input. For details, see section 47, Relationship between ADC12 Units 0 and 1 and the ACMPHS.

50.8.2 与ADC12的关系

同时使用ACMPHS模拟输入和ADC12模拟输入有一些限制。有关详细信息，请参阅第47节，ADC12单元0和1与ACMPHS之间的关系。

51. Capacitive Touch Sensing Unit (CTSU)

51.1 Overview

The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software that enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical insulator so that a finger does not come into direct contact with the electrode.

As Figure 51.1 shows, electrostatic capacitance (parasitic capacitance) exists between the electrode and the surrounding insulators. Because the human body is an electrical conductor, when a finger is placed close to the electrode, the value of electrostatic capacitance increases.

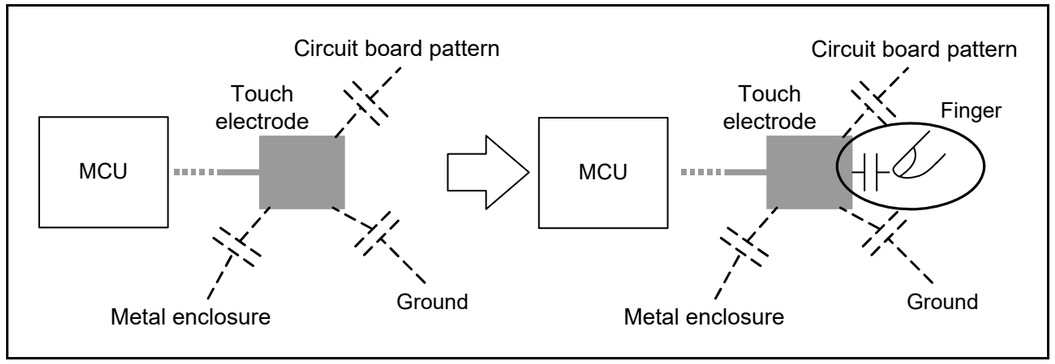

Figure 51.1 Increased electrostatic capacitance because of the presence of a finger

Electrostatic capacitance is detected by the self-capacitance and mutual capacitance methods. In the self-capacitance method, the CTSU detects electrostatic capacitance generated between a finger and a single electrode. In the mutual capacitance method, two electrodes are used as a transmit electrode and a receive electrode, and the CTSU detects the change in the electrostatic capacitance generated between the two when a finger is placed close to them.

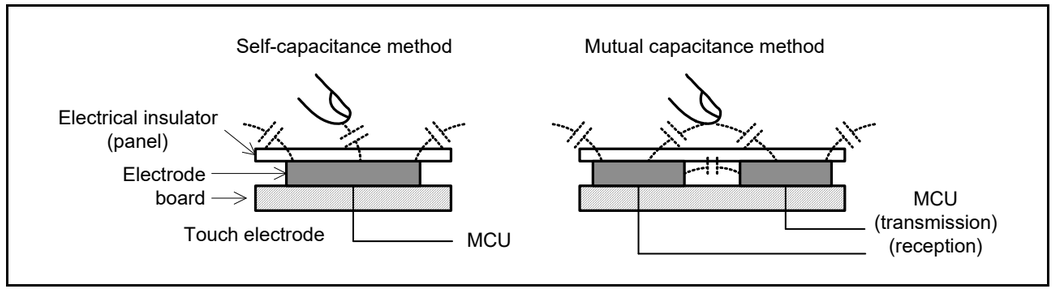

Figure 51.2 Self-capacitance and mutual capacitance methods

Electrostatic capacitance is measured by counting a clock signal whose frequency changes according to the amount of charged or discharged current, for a specified period. For details on the measurement principles of the CTSU, see section 51.3.1, Principles of Measurement Operation. Table 51.1 lists the CTSU specifications and Figure 51.3 shows a block diagram.

Table 51.1 CTSU specifications (1 of 2)

Parameter	Specifications
Operating clock	PCLKB, PCLKB/2, or PCLKB/4

51. 电容式触控感应单元(CTSU)

51.1 Overview

电容式触摸传感单元(CTSU)测量触摸传感器的静电电容。静电电容的变化由软件确定，该软件使CTSU能够检测手指是否与触摸传感器接触。触摸传感器的电极表面通常被电绝缘体包围，因此手指不会直接接触电极。

如图51.1所示，静电电容（寄生电容）存在于电极和周围绝缘体之间。因为人体是电导体，当手指靠近电极时，静电电容值会增加。

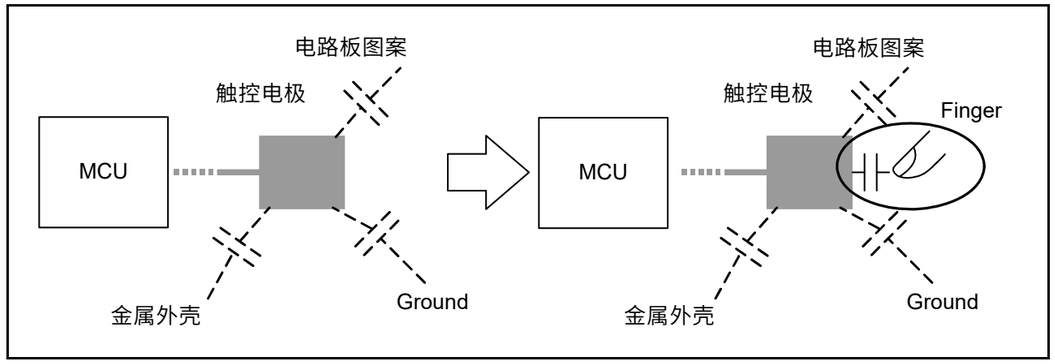

Figure 51.1 由于手指的存在而增加了静电电容

静电电容的检测方法有自电容法和互电容法。在自电容法中，CTSU检测手指和单个电极之间产生的静电电容。在互电容法中，两个电极用作发送电极和接收电极，当手指靠近它们时，CTSU会检测两者之间产生的静电电容的变化。

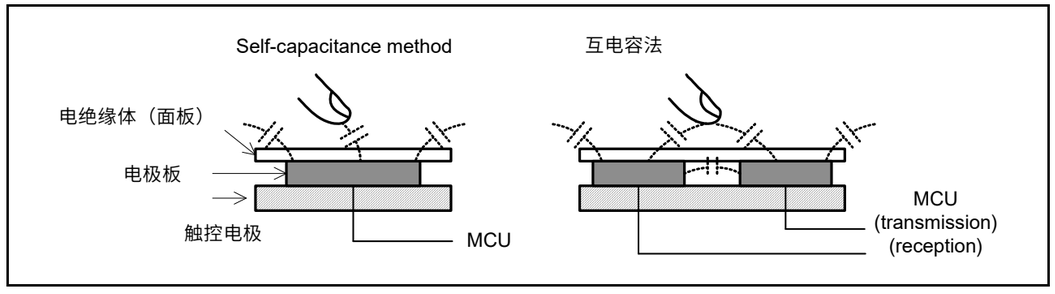

Figure 51.2 自电容和互电容方法

静电电容是通过对时钟信号进行计数来测量的，该时钟信号的频率根据充电或放电电流的大小而变化，在指定的时间段内。有关CTSU测量原理的详细信息，请参见第51.3.1节“测量操作原理”。表51.1列出了CTSU规格，图51.3显示了框图。

Table 51.1 CTSU规格(1of2)

Parameter	Specifications
工作时钟	PCLKB, PCLKB/2, or PCLKB/4

Table 51.1 CTSU specifications (2 of 2)

Parameter		Specifications
Pins	Electrostatic capacitance measurement	18 channels (TS00 to TS17)
	TSCAP	Low Pass Filter (LPF) connection pin
Measurement modes	Self-capacitance single scan mode	Electrostatic capacitance is measured on one channel using the self-capacitance method
	Self-capacitance multiscan mode	Electrostatic capacitance is measured successively on multiple channels using the self-capacitance method
	Mutual capacitance full scan mode	Electrostatic capacitance is measured successively on multiple channels using the mutual capacitance method
Noise prevention		Synchronous noise prevention, high-pass noise prevention
Measurement start conditions		• Software trigger • External trigger (ELC_CTSU from the Event Link Controller (ELC))

As Figure 51.3 shows, the CTSU consists of a status control block, trigger control block, clock control block, channel control block, port control block, sensor drive pulse generator, measurement block, interrupt block, and I/O registers.

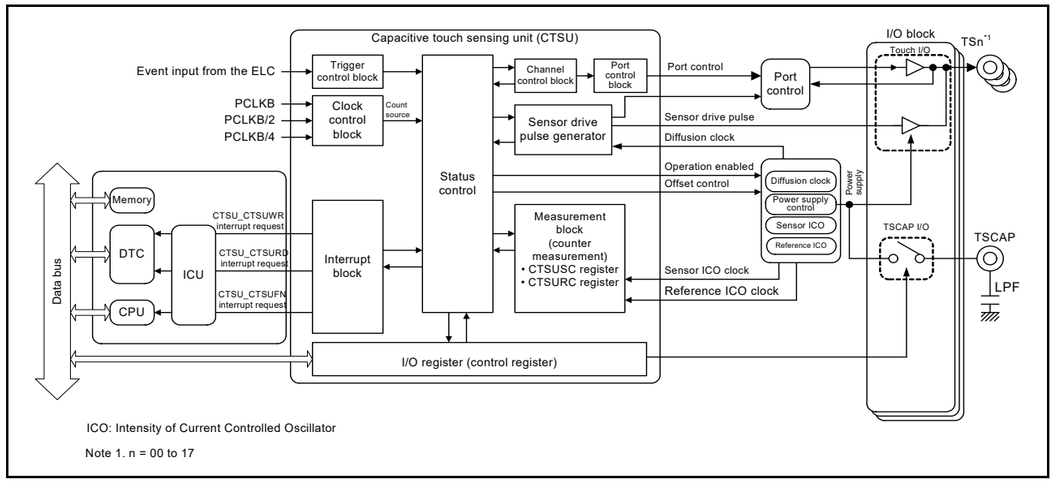

Figure 51.3 CTSU block diagram

Table 51.2 CTSU I/O pins

Pin name	I/O	Function
TS00 to TS17	Input	Electrostatic capacitive measurement pins (touch pins)
TSCAP	-	LPF connection pin

Table 51.1 CTSU规格（2个中的2个）

Parameter		Specifications
Pins	静电电容测量	18通道（TS00至TS17）
	TSCAP	低通滤波器(LPF)连接引脚
测量模式	自电容单次扫描模式	使用自电容法在一个通道上测量静电电容
	Self-capacitance multiscan mode	使用自电容法在多个通道上连续测量静电电容
	互电容全扫描模式	使用互电容法在多个通道上连续测量静电电容
噪音预防		同步防噪、防高通防噪
测量开始条件		软件触发 外部触发（来自事件链接控制器(ELC)的ELC_CTSU）

如图51.3所示，CTSU由状态控制块、触发控制块、时钟控制块、通道控制块、端口控制块、传感器驱动脉冲发生器、测量块、中断块和IO寄存器组成。

51.2 Register Descriptions

51.2.1 CTSU Control Register 0 (CTSUCR0)

Address(es): CTSU.CTSUCR0 4008 1000h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUTXVSEL	—	—	CTSUINIT	—	CTSUSNZ	CTSUCAP	CTSUSTRT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CTSUSTRT	CTSU Measurement Operation Start	0: Stop measurement operation*1 1: Start measurement operation.	R/W
b1	CTSUCAP	CTSU Measurement Operation Start Trigger Select	0: Software trigger 1: External trigger.	R/W
b2	CTSUSNZ	CTSU Wait State Power-Saving Enable	0: Disable power-saving function during wait state 1: Enable power-saving function during wait state.	R/W
b3	—	Reserved	This bit read as 0. The write value should be 0.	R/W
b4	CTSUINIT	CTSU Control Block Initialization	Writing 1 to this bit initializes the CTSU control block and CTSUSC, CTSURC, CTSUMCH0, CTSUMCH1, and CTSUST registers. This bit is read as 0.	W
b6, b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	CTSUTXVSEL	CTSU Transmission Power Supply Select	0: VCC selected 1: Internal logic power supply selected.	R/W

Note 1. When the CTSU is not used, set the value of this bit to 0.

Only set the CTSUCAP and CTSUSNZ bits when the CTSUSTRT bit is 0. These bits can be set at the same time that measurement operation starts.

CTSUSTRT bit (CTSU Measurement Operation Start)

The CTSUSTRT bit specifies whether CTSU operation starts or stops. When the CTSUCAP bit is 0, measurement starts when the software writes 1 to the CTSUSTRT bit (software trigger) and stops when the hardware clears the CTSUSTRT bit to 0. When the CTSUCAP bit is 1, the CTSU waits for an external trigger by writing 1 to the CTSUSTRT bit, and measurement starts on the rising edge of the external trigger. When measurement is stopped, the CTSU waits for the next external trigger and operation continues.

Table 51.3 lists the CTSU states.

Table 51.3 CTSU states

CTSUSTRT bit	CTSUCAP bit	CTSU state
0	0	Stopped
0	1	Stopped
1	0	Measurement in progress
1	1	Measurement in progress and waiting for an external trigger*1

Note 1. The state can be read from the CTSUST.CTSUSTC[2:0] flags as follows:
During measurement: CTSUST.CTSUSTC[2:0] flags ≠ 000b
While waiting for an external trigger: CTSUST.CTSUSTC[2:0] flags = 000b

If the software sets the CTSUSTRT bit to 1 when the bit is already 1, the write is ignored and operation continues. To force operation to stop through the software when the CTSUSTRT bit is 1, set the CTSUSTRT bit to 0 and the CTSUINIT bit to 1 at the same time.

51.2 注册说明

51.2.1 CTSU控制寄存器0(CTSUCR0)

Address(es): CTSU.CTSUCR0 4008 1000h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUTXVSEL	—	—	CTSUINIT	—	CTSUSNZ	CTSUCAP	CTSUSTRT
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CTSUSTRT	CTSU测量操作 Start	0：停止测量操作*11：开始测量操作。	R/W
b1	CTSUCAP	CTSU测量操作 开始触发选择	0：软件触发1： 外部触发。	R/W
b2	CTSUSNZ	CTSU等待状态省电 Enable	0：等待状态下禁用省电功能1：等待状态下启用省电功能。	R/W
b3	—	Reserved	该位读为0。写入值应为0。	R/W
b4	CTSUINIT	CTSU控制块 Initialization	向该位写入1初始化CTSU控制块并CTSUSC, CTSURC, CTSUMCH0, CTSUMCH1, and CTSUST注册。该位读为0。	W
b6, b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b7	CTSUTXVSEL	CTSU传输功率 供应选择	0：选择VCC1：选择内部逻辑电源。	R/W

Note 1. 不使用CTSU时，将该位的值设为0。

仅当CTSUSTRT位为0时设置CTSUCAP和CTSUSNZ位。这些位可以在测量操作开始的同时设置。

CTSUSTRT位（CTSU测量操作开始）

CTSUSTRT位指定CTSU操作是开始还是停止。当CTSUCAP位为0时，软件将1写入CTSUSTRT位（软件触发）时开始测量，并在硬件将CTSUSTRT位清为0时停止测量。当CTSUCAP位为1时，CTSU通过写入等待外部触发1到CTSUSTRT位，并在外部触发的上升沿开始测量。当测量停止时，CTSU等待下一个外部触发并继续操作。

表51.3列出了CTSU状态。

Table 51.3 CTSU states

CTSUSTRT bit	CTSUCAP bit	CTSU state
0	0	Stopped
0	1	Stopped
1	0	测量中
1	1	正在进行测量并等待外部触发*1

Note 1. 可以从CTSUST.CTSUSTC[2:0]标志读取状态，如下所示：
测量期间：CTSUST.CTSUSTC[2:0]flags≠000b
等待外部触发时：CTSUST.CTSUSTC[2:0]flags=000b

如果在CTSUSTRT位已经为1时软件将该位设置为1，则忽略写入并继续操作。要在CTSUSTRT位为1时通过软件强制停止操作，请将CTSUSTRT位设置为0，同时将CTSUINIT位设置为1。

CTSUCAP bit (CTSU Measurement Operation Start Trigger Select)

The CTSUCAP bit specifies the measurement start condition. For details, see CTSUSTRT bit (CTSU Measurement Operation Start).

CTSUSNZ bit (CTSU Wait State Power-Saving Enable)

The CTSUSNZ bit enables or disables power-saving operation during a wait state. It can also suspend the CTSU power supply, which decreases power consumption during the wait state. In the suspended state, the CTSU power supply is turned off while the external TSCAP is still charged.

Table 51.4 shows the CTSU power supply state control.

Table 51.4 CTSU power supply state control

CTSUCR1.CTSUPON bit	CTSUSNZ bit	CTSUCAP bit	CTSUSTRT bit	CTSU power supply state
0	0	0	0	Stopped
1	0	—	—	Operating
1	1	0	0	Suspended

Note: Other settings are prohibited.

To start measurement from the suspended state, set the CTSUSNZ bit to 0, and then set the CTSUSTRT bit to 1. To suspend the module after measurement stops, set the CTSUSNZ bit to 1.

CTSUINIT bit (CTSU Control Block Initialization)

Write 1 to the CTSUINIT bit to initialize the internal control registers. To force the current operation to stop, set the CTSUSTRT bit to 0 and the CTSUINIT bit to 1 at the same time. This stops the operation and initializes the internal control registers.

Do not write 1 to the CTSUINIT bit when the CTSUSTRT bit is 1.

CTSUTXVSEL bit (CTSU Transmission Power Supply Select)

This bit is used to switch the power supply for the transmit buffer in mutual capacitance full scan mode. Set this bit to 0 for any other mode or when the VCC voltage is lower than 2.7 V. This bit switches the power supply for touch I/O which is set for transmission by the CTSUCHTRCn registers. Table 51.5 lists the power supply for TSm pin. When the VCC voltage fluctuates greatly due to the switching of the output buffer, switching to the internal logic power supply can reduce the effect on the voltage fluctuation.

Table 51.5 Power supplied to the TSm pins

Setting of CTSUCHTRCn Register	CTSUTXVSEL bit	Power supply of TSm pins
0 (Reception)	*	VCC
1 (Transmission)	0 (VCC)	
	1 (Internal logic power supply)	Internal logic power supply

CTSUCAP位（CTSU测量操作开始触发选择）

CTSUCAP位指定测量开始条件。有关详细信息，请参阅CTSUSTRT位（CTSU测量
Operation Start).

CTSUSNZ位（CTSU等待状态省电使能）

CTSUSNZ位在等待状态期间启用或禁用省电操作。它还可以暂停CTSU电源，从而降低等待状态下的功耗。在挂起状态下，CTSU电源关闭，而外部TSCAP仍在充电。

表51.4显示了CTSU电源状态控制。

Table 51.4 CTSU电源状态控制

CTSUCR1.CTSUPON bit	CTSUSNZ bit	CTSUCAP bit	CTSUSTRT bit	CTSU供电状态
0	0	0	0	Stopped
1	0	—	—	Operating
1	1	0	0	Suspended

Note: 禁止其他设置。

要从暂停状态开始测量，请将CTSUSNZ位设置为0，然后将CTSUSTRT位设置为1。要在测量停止后暂停模块，请将CTSUSNZ位设置为1。

CTSUINIT位（CTSU控制块初始化）

向CTSUINIT位写入1以初始化内部控制寄存器。要强制停止当前操作，同时将CTSUSTRT位设置为0并将CTSUINIT位设置为1。这将停止操作并初始化内部控制寄存器。

当CTSUSTRT位为1时，不要将1写入CTSUINIT位。

CTSUTXVSEL位（CTSU发射电源选择）

该位用于切换互电容全扫描模式下发送缓冲器的电源。对于任何其他模式或当VCC电压低于2.7V时，将该位设置为0。该位切换由CTSUCHTRn寄存器设置为发送的触摸IO的电源。表51.5列出了TSm引脚的电源。当VCC电压由于输出缓冲器的切换而波动很大时，切换到内部逻辑电源可以减少对电压波动的影响。

Table 51.5 为TSm引脚供电

CTSUCHTRn寄存器的设置	CTSUTXVSEL bit	TSm管脚电源
0 (Reception)	*	VCC
1 (Transmission)	0 (VCC)	
	1（内部逻辑电源）	内部逻辑电源

51.2.2 CTSU Control Register 1 (CTSUCR1)

Address(es): CTSU.CTSUCR1 4008 1001h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUMD[1:0]		CTSUCLK[1:0]		CTSUATUNE1	—	CTSUCSW	CTSUPON
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	CTSUPON	CTSU Power Supply Enable	0: Power off the CTSU 1: Power on the CTSU.	R/W
b1	CTSUCSW	CTSU LPF Capacitance Charging Control	This bit controls charging of the LPF capacitance connected to the TSCAP pin. 0: Turn off capacitance switch 1: Turn on capacitance switch.	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	CTSUATUNE1	CTSU Power Supply Capacity Adjustment	0: Normal output 1: High-current output.	R/W
b5, b4	CTSUCLK[1:0]	CTSU Operating Clock Select	b5 b4 0 0: PCLKB 0 1: PCLKB/2 (PCLKB divided by 2) 1 0: PCLKB/4 (PCLKB divided by 4) 1 1: Setting prohibited.	R/W
b7, b6	CTSUMD[1:0]	CTSU Measurement Mode Select	b7 b6 0 0: Self-capacitance single scan mode 0 1: Self-capacitance multiscan mode 1 0: Setting prohibited 1 1: Mutual capacitance full scan mode.	R/W

Only set the CTSUCR1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUPON bit (CTSU Power Supply Enable)

The CTSUPON bit controls the power supply to the CTSU. Set the CTSUPON and CTSUCSW bits to the same value.

CTSUCSW bit (CTSU LPF Capacitance Charging Control)

The CTSUCSW bit controls charging of the LPF capacitor connected to the TSCAP pin by turning the capacitance switch on or off. After the capacitance switch is turned on, wait until the capacitance connected to the TSCAP pin is charged for the specified time before starting measurement by setting CTSUCR0.CTSUSTRT to 1. Before starting measurement, use an I/O port to output low to the TSCAP pin, and discharge the existing LPF capacitance. Set the CTSUPON and CTSUCSW bits to the same value.

CTSUATUNE1 bit (CTSU Power Supply Capacity Adjustment)

The CTSUATUNE1 bit sets the capacity of the CTSU power supply. Normally, set this bit to 0.

CTSUCLK[1:0] bits (CTSU Operating Clock Select)

The CTSUCLK[1:0] bits select the operating clock.

CTSUMD[1:0] bits (CTSU Measurement Mode Select)

The CTSUMD[1:0] bits set the measurement mode. For details, see section 51.3.2, Measurement Modes.

51.2.2 CTSU控制寄存器1(CTSUCR1)

Address(es): CTSU.CTSUCR1 4008 1001h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUMD[1:0]		CTSUCLK[1:0]		CTSUATUNE1	—	CTSUCSW	CTSUPON
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CTSUPON	CTSU电源使能	0：CTSU断电1：CTSU上电。	R/W
b1	CTSUCSW	CTSULPF电容充电Control	该位控制连接到TSCAP引脚的LPF电容的充电。0：关闭电容开关1：打开电容开关。	R/W
b2	—	Reserved	该位读取为0。写入值应为0。	R/W
b3	CTSUATUNE1	CTSU电源容量Adjustment	0：正常输出1：大电流输出。	R/W
b5, b4	CTSUCLK[1:0]	CTSU工作时钟选择	b5 b4 0 0: PCLKB 0 1：PCLKB2（PCLKB除以2） 1 0：PCLKB4（PCLKB除以4） 1 1：禁止设置。	R/W
b7, b6	CTSUMD[1:0]	CTSU测量模式选择	b7 b6 0 0：自电容单扫描模式 0 1: Self-capacitance multiscan mode 1 0：禁止设定 1 1：互电容全扫描模式。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCR1寄存器。

CTSUPON位（CTSU电源使能）

CTSUPON位控制CTSU的电源。将CTSUPON和CTSUCSW位设置为相同的值。

CTSUCSW位（CTSULPF电容充电控制）

CTSUCSW位通过打开或关闭电容开关来控制连接到TSCAP引脚的LPF电容的充电。电容开关打开后，通过将CTSUCR0.CTSUSTRT设置为1，等到连接到TSCAP引脚的电容充电指定时间后再开始测量。开始测量之前，使用IO端口向TSCAP引脚输出低电平，并对现有的LPF电容进行放电。将CTSUPON和CTSUCSW位设置为相同的值。

CTSUATUNE1位（CTSU电源容量调整）

CTSUATUNE1位设置CTSU电源的容量。通常，将此位设置为0。

CTSUCLK[1:0]位（CTSU工作时钟选择）

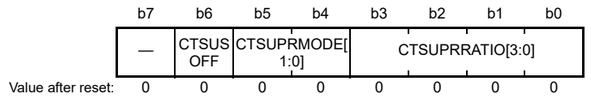
CTSUCLK[1:0]位选择工作时钟。

CTSUMD[1:0]位（CTSU测量模式选择）

CTSUMD[1:0]位设置测量模式。有关详细信息，请参阅第51.3.2节，测量模式。

51.2.3 CTSU Synchronous Noise Reduction Setting Register (CTSUSDPRS)

Address(es): CTSU.CTSUSDPRS 4008 1002h



Bit	Symbol	Bit name	Description	R/W
b3 to b0	CTSUPRRATIO[3:0]	CTSU Measurement Time and Pulse Count Adjustment	These bits set the measurement time and the measurement pulse count setting. Recommended setting: 3 (0011b).	R/W
b5, b4	CTSUPRMODE[1:0]	CTSU Base Period and Pulse Count Setting	These bits set the base pulse count. b5 b4 0 0: 510 pulses 0 1: 126 pulses 1 0: 62 pulses (recommended setting) 1 1: Setting prohibited.	R/W
b6	CTSUSOFF	CTSU High-Pass Noise Reduction Function Off Setting	This bit turns spectrum diffusion on or off to reduce high-pass noise. 0: Turn on 1: Turn off.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Only set the CTSUSDPRS register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUPRRATIO[3:0] bits (CTSU Measurement Time and Pulse Count Adjustment)

The CTSUPRRATIO[3:0] bits are used to determine the measurement time and the measurement pulse count. These values are calculated using the following formulas, where the base pulse count is determined by the CTSUPRMODE[1:0] setting:

Measurement pulse count = base pulse count × (CTSUPRRATIO[3:0] bits + 1)
Measurement time = (base pulse count × (CTSUPRRATIO[3:0] bits + 1) + base pulse count - 2) × 0.25 × base clock cycle

Note: For details on the base clock cycle, see section 51.2.17, CTSU Sensor Offset Register 1 (CTSUSO1).

CTSUPRMODE[1:0] bits (CTSU Base Period and Pulse Count Setting)

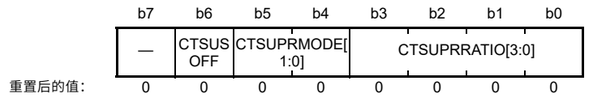
The CTSUPRMODE[1:0] bits select the number of base pulses that occur during measurement.

CTSUSOFF bit (CTSU High-Pass Noise Reduction Function Off Setting)

The CTSUSOFF bit turns on or off the function for reducing high-pass noise. Set this bit to 1 to turn the function off.

51.2.3 CTSU同步降噪设置寄存器(CTSUSDPRS)

Address(es): CTSU.CTSUSDPRS 4008 1002h



Bit	Symbol	位名称	Description	R/W
b3 to b0	CTSUPRRATIO[3:0]	CTSU测量时间和脉冲计数调整	这些位设置测量时间和测量脉冲计数设置。推荐设置：3(0011b)。	R/W
b5, b4	CTSUPRMODE[1:0]	CTSU基本周期和脉冲计数Setting	这些位设置基本脉冲计数。b5b4 0 0: 510 pulses 0 1: 126 pulses 1 0: 62 pulses (recommended setting) 1 1：禁止设置。	R/W
b6	CTSUSOFF	CTSU高通降噪功能关闭设置	该位打开或关闭频谱扩散以减少高通噪声。0：开启 1：关闭。	R/W
b7	—	Reserved	该位读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSDPRS寄存器。

CTSURRATIO[3:0]位（CTSU测量时间和脉冲计数调整）

CTSUPRRATIO[3:0]位用于确定测量时间和测量脉冲计数。这些值使用以下公式计算，其中基本脉冲计数由CTSUPRMODE[1:0]设置确定：

测量脉冲数=基本脉冲数×(CTSUPRRATIO[3:0]位+1)
测量时间=(基本脉冲计数×(CTSUPRRATIO[3:0]位+1)+基本脉冲计数2)×0.25×基本时钟周期

Note: 有关基本时钟周期的详细信息，请参见第51.2.17节，CTSU传感器偏移寄存器1(CTSUSO1)。

CTSUPRMODE[1:0]位（CTSU基本周期和脉冲计数设置）

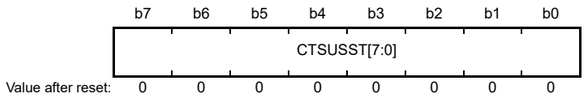
CTSUPRMODE[1:0]位选择测量期间出现的基本脉冲数。

CTSUSOFF位（CTSU高通降噪功能关闭设置）

CTSUSOFF位打开或关闭降低高通噪声的功能。将此位设置为1可关闭该功能。

51.2.4 CTSU Sensor Stabilization Wait Control Register (CTSUSST)

Address(es): CTSU.CTSUSST 4008 1003h



Bit	Symbol	Bit name	Description	R/W
b7 to b0	CTSUSST[7:0]	CTSU Sensor Stabilization Wait Control	Fix the value of these bits to 00010000b.	R/W

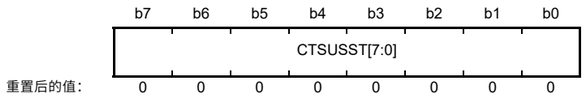
Only set the CTSUSST register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUSST[7:0] bits (CTSU Sensor Stabilization Wait Control)

The CTSUSST[7:0] bits set the stabilization wait time for the TSCAP pin voltage. Always fix these bits to 00010000b. If these bits are not set, the TSCAP voltage will be unstable at the start of measurement, and the CTSU will be unable to obtain correct touch measurement results.

51.2.4 CTSU传感器稳定等待控制寄存器(CTSUSST)

Address(es): CTSU.CTSUSST 4008 1003h



Bit	Symbol	位名称	Description	R/W
b7 to b0	CTSUSST[7:0]	CTSU传感器稳定等待Control	将这些位的值固定为00010000b。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSST寄存器。

CTSUSST[7:0]位（CTSU传感器稳定等待控制）

CTSUSST[7:0]位设置TSCAP引脚电压的稳定等待时间。始终将这些位固定为00010000b。如果未设置这些位，TSCAP电压将在测量开始时不稳定，CTSU将无法获得正确的触摸测量结果。

51.2.5 CTSU Measurement Channel Register 0 (CTSUMCH0)

Address(es): CTSU.CTSUMCH0 4008 1004h

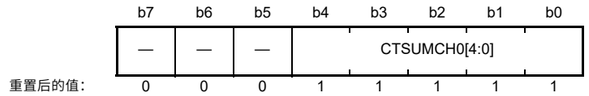
Bit	Symbol	Bit name	Description	R/W
b4 to b0	CTSUMCH0[4:0]	CTSU Measurement Channel 0	In self-capacitance single scan mode, these bits set the channel to be measured. b4 b0 0 0 0 0 0: TS00 0 0 0 0 1: TS01 0 0 0 1 0: TS02 0 0 0 1 1: TS03 0 0 1 0 0: TS04 0 0 1 0 1: TS05 0 0 1 1 0: TS06 0 0 1 1 1: TS07 0 1 0 0 0: TS08 0 1 0 0 1: TS09 0 1 0 1 0: TS10 0 1 0 1 1: TS11 0 1 1 0 0: TS12 0 1 1 0 1: TS13 0 1 1 1 0: TS14 0 1 1 1 1: TS15 1 0 0 0 0: TS16 1 0 0 0 1: TS17. Other than when specified, starting measurement operation by setting CTSUCR0.CTSUSTRT to 1 is prohibited after these bits are set. In other measurement modes, these bits indicate the channel that is currently being measured. b4 b0 0 0 0 0 0: TS00 0 0 0 0 1: TS01 0 0 0 1 0: TS02 0 0 0 1 1: TS03 0 0 1 0 0: TS04 0 0 1 0 1: TS05 0 0 1 1 0: TS06 0 0 1 1 1: TS07 0 1 0 0 0: TS08 0 1 0 0 1: TS09 0 1 0 1 0: TS10 0 1 0 1 1: TS11 0 1 1 0 0: TS12 0 1 1 0 1: TS13 0 1 1 1 0: TS14 0 1 1 1 1: TS15 1 0 0 0 0: TS16 1 0 0 0 1: TS17 1 1 1 1 1: Measurement is being stopped.	R/W*1
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits is only enabled in self-capacitance single scan mode (CTSUCR1.CTSUMD[1:0] bits = 00b).

Only set the CTSUMCH0 register when the CTSUCR0.CTSUSTRT bit is 0.

51.2.5 CTSU测量通道寄存器0(CTSUCH0)

Address(es): CTSU.CTSUMCH0 4008 1004h



Bit	Symbol	位名称	Description	R/W
b4 to b0	CTSUMCH0[4:0]	CTSU测量通道0	在自电容单次扫描模式下，这些位设置要测量的通道。b4b000000：TS0000001：TS0100010：TS0200011：TS0300100：TS0400101：TS0500110：TS0600111：TS0701000：TS0801001：TS0901010：TS1001011：TS1101100：TS1201101：TS1301110：TS1401111：TS1510000：TS1610001：TS17。除非指定，否则在设置这些位后禁止通过将CTSUCR0.CTSUSTRT设置为1来启动测量操作。 在其他测量模式下，这些位指示当前正在测量的通道。b4b000000：TS0000001：TS0100010：TS0200011：TS0300100：TS0400101：TS0500110：TS0600111：TS0701000：TS0801001：TS0901010：TS1001011：TS1101100：TS1201101：TS1301110：TS1401111：TS1510000：TS1610001：TS1711111：正在停止测量。	R/W*1
b7 to b5	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只有在自电容单次扫描模式下才能写入这些位（CTSUCR1.CTSUMD[1:0]位=00b）。

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUMCH0寄存器。

CTSUMCH0[4:0] bits (CTSU Measurement Channel 0)

In self-capacitance single scan mode, the CTSUMCH0[4:0] bits set the channel to be measured. In this mode, only specify enabled channels (00000b to 10001b). In other modes, these indicate the receive channel that is being measured, and writing to these bits has no effect.

51.2.6 CTSU Measurement Channel Register 1 (CTSUMCH1)

Address(es): CTSU.CTSUMCH1 4008 1005h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CTSUMCH1[4:0]				
Value after reset:	0	0	0	1	1	1	1	1

Bit	Symbol	Bit name	Description	R/W
b4 to b0	CTSUMCH1[4:0]	CTSU Measurement Channel 1	b4 b0 0 0 0 0 0: TS00 0 0 0 0 1: TS01 0 0 0 1 0: TS02 0 0 0 1 1: TS03 0 0 1 0 0: TS04 0 0 1 0 1: TS05 0 0 1 1 0: TS06 0 0 1 1 1: TS07 0 1 0 0 0: TS08 0 1 0 0 1: TS09 0 1 0 1 0: TS10 0 1 0 1 1: TS11 0 1 1 0 0: TS12 0 1 1 0 1: TS13 0 1 1 1 0: TS14 0 1 1 1 1: TS15 1 0 0 0 0: TS16 1 0 0 0 1: TS17 1 1 1 1 1: Measurement is being stopped.	R
b7 to b5	—	Reserved	These bits are read as 0.	R

CTSUMCH1[4:0] bits (CTSU Measurement Channel 1)

In full scan mode, the CTSUMCH1[4:0] bits indicate the transmit channel that is being measured. They are always 11111b when measurement is stopped, or in self-capacitance single scan and multi-scan modes.

51.2.7 CTSU Channel Enable Control Register 0 (CTSUCHAC0)

Address(es): CTSU.CTSUCHAC0 4008 1006h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUCHAC0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CTSUCHAC0[7:0]	CTSU Channel Enable Control 0	These bits select whether the associated TS pin is measured. 0: Do not measure 1: Measure. These bits specify the TS00 to TS07 pins.	R/W

Only set the CTSUCHAC0 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCH0[4:0]位（CTSU测量通道0）

在自电容单次扫描模式下，CTSUMCH0[4:0]位设置要测量的通道。在此模式下，仅指定启用的通道（00000b到10001b）。在其他模式下，这些表示正在测量的接收通道，写入这些位无效。

51.2.6 CTSU测量通道寄存器1(CTSUCH1)

Address(es): CTSU.CTSUMCH1 4008 1005h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CTSUMCH1[4:0]				
重置后的值：	0	0	0	1	1	1	1	1

Bit	Symbol	位名称	Description	R/W
b4 to b0	CTSUMCH1[4:0]	CTSU测量通道1	b4b000000：TS0000001：TS0100010：TS0200011：TS0300100：TS0400101：TS0500110：TS0600111：TS0701000：TS0801001：TS0901010：TS1001011：TS1101100：TS1201101：TS1301110：TS1401111：TS1510000：TS1610001：TS1711111：正在停止测量。	R
b7 to b5	—	Reserved	这些位读为0。	R

CTSUCH1[4:0]位（CTSU测量通道1）

在全扫描模式下，CTSUMCH1[4:0]位指示正在测量的发送通道。当测量停止时，它们始终为11111b，或者在自电容单扫描和多扫描模式下。

51.2.7 CTSU通道使能控制寄存器0(CTSUCHAC0)

Address(es): CTSU.CTSUCHAC0 4008 1006h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUCHAC0[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	CTSUCHAC0[7:0]	CTSU通道使能控制0	这些位选择是否测量相关的TS引脚。0：不测量1：测量。这些位指定TS00到TS07引脚。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHAC0寄存器。

CTSUCHAC0[7:0] bits (CTSU Channel Enable Control 0)

The CTSUCHAC0[7:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured. CTSUCHAC0[0] is associated with TS00 and CTSUCHAC0[7] with TS07.

51.2.8 CTSU Channel Enable Control Register 1 (CTSUCHAC1)

Address(es): CTSU.CTSUCHAC1 4008 1007h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUCHAC1[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CTSUCHAC1[7:0]	CTSU Channel Enable Control 1	These bits select whether the associated TS pin is measured. 0: Do not measure 1: Measure. These bits specify the TS08 to TS15 pins.	R/W

Only set the CTSUCHAC1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHAC1[7:0] bits (CTSU Channel Enable Control 1)

The CTSUCHAC1[7:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured. CTSUCHAC1[0] is associated with TS08 and CTSUCHAC1[7] with TS15.

51.2.9 CTSU Channel Enable Control Register 2 (CTSUCHAC2)

Address(es): CTSU.CTSUCHAC2 4008 1008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CTSUCHAC2 [1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1 to b0	CTSUCHAC2 [1:0]	CTSU Channel Enable Control 2	These bits select whether the associated TS pin is measured. 0: Do not measure 1: Measure. These bits specify the TS16 to TS17 pins.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Only set the CTSUCHAC2 register when the CTSUCR0.CTSUSTRT bit = 0.

CTSUCHAC2 [1:0] bits (CTSU Channel Enable Control 2)

The CTSUCHAC2 [1:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured. CTSUCHAC2[0] is associated with TS16 and CTSUCHAC2[1] with TS17.

CTSUCHAC0[7:0]位（CTSU通道使能控制0）

CTSUCHAC0[7:0]位选择要测量其静电电容的接收和发送引脚。
CTSUCHAC0[0]与TS00相关联，CTSUCHAC0[7]与TS07相关联。

51.2.8 CTSU通道使能控制寄存器1(CTSUCHAC1)

Address(es): CTSU.CTSUCHAC1 4008 1007h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUCHAC1[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	CTSUCHAC1[7:0]	CTSU通道使能控制1	这些位选择是否测量相关的TS引脚。0：不测量1：测量。这些位指定TS08到TS15引脚。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHAC1寄存器。

CTSUCHAC1[7:0]位（CTSU通道使能控制1）

CTSUCHAC1[7:0]位选择要测量其静电电容的接收和发送引脚。
CTSUCHAC1[0]与TS08相关联，CTSUCHAC1[7]与TS15相关联。

51.2.9 CTSU通道使能控制寄存器2(CTSUCHAC2)

Address(es): CTSU.CTSUCHAC2 4008 1008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CTSUCHAC2 [1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1 to b0	CTSUCHAC2 [1:0]	CTSU通道启用控制2	这些位选择是否测量相关的TS引脚。0：不测量1：测量。这些位指定TS16到TS17引脚。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

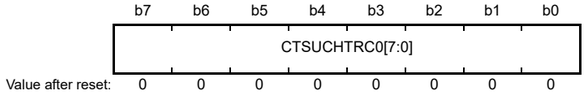
仅当CTSUCR0.CTSUSTRT位=0时设置CTSUCHAC2寄存器。

CTSUCHAC2[1:0]位（CTSU通道使能控制2）

CTSUCHAC2[1:0]位选择要测量其静电电容的接收和发送引脚。
CTSUCHAC2[0]与TS16相关联，CTSUCHAC2[1]与TS17相关联。

51.2.10 CTSU Channel Transmit/Receive Control Register 0 (CTSUCHTRC0)

Address(es): CTSU.CTSUCHTRC0 4008 100Bh



Bit	Symbol	Bit name	Description	R/W
b7 to b0	CTSUCHTRC0[7:0]	CTSU Channel Transmit/Receive Control 0	0: Reception 1: Transmission. These bits specify the TS00 to TS07 pins.	R/W

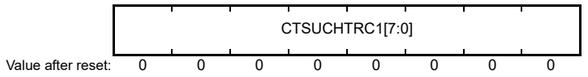
Only set the CTSUCHTRC0 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHTRC0[7:0] bits (CTSU Channel Transmit/Receive Control 0)

In full scan mode, the CTSUCHTRC0[7:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multi-scan modes. CTSUCHTRC0[0] is associated with TS00 and CTSUCHTRC0[7] with TS07.

51.2.11 CTSU Channel Transmit/Receive Control Register 1 (CTSUCHTRC1)

Address(es): CTSU.CTSUCHTRC1 4008 100Ch



Bit	Symbol	Bit name	Description	R/W
b7 to b0	CTSUCHTRC1[7:0]	CTSU Channel Transmit/Receive Control 1	0: Reception 1: Transmission. These bits specify the TS08 to TS15 pins.	R/W

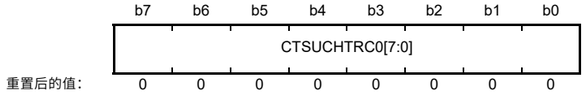
Only set the CTSUCHTRC1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHTRC1[7:0] bits (CTSU Channel Transmit/Receive Control 1)

In full scan mode, the CTSUCHTRC1[7:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multiscan modes. CTSUCHTRC1[0] is associated with TS08 and CTSUCHTRC1[7] with TS15.

51.2.10 CTSU通道发送接收控制寄存器0(CTSUCHTRC0)

Address(es): CTSU.CTSUCHTRC0 4008 100Bh



Bit	Symbol	位名称	Description	R/W
b7 to b0	CTSUCHTRC0[7:0]	CTSU Channel Transmit/Receive Control 0	0：接收1：发送。这些位指定TS00到TS07引脚。	R/W

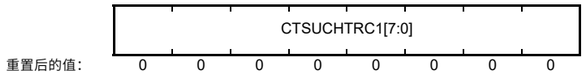
仅在CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC0寄存器。

CTSUCHTRC0[7:0]位（CTSU通道发送接收控制0）

在全扫描模式下，CTSUCHTRC0[7:0]位将接收或发送分配给相关的TS引脚。在自电容单次扫描和多次扫描模式下，该设置被忽略。CTSUCHTRC0[0]与TS00相关联，CTSUCHTRC0[7]与TS07相关联。

51.2.11 CTSU通道发送接收控制寄存器1(CTSUCHTRC1)

Address(es): CTSU.CTSUCHTRC1 4008 100Ch



Bit	Symbol	位名称	Description	R/W
b7 to b0	CTSUCHTRC1[7:0]	CTSU Channel Transmit/Receive Control 1	0：接收1：发送。这些位指定TS08到TS15引脚。	R/W

仅在CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC1寄存器。

CTSUCHTRC1[7:0]位（CTSU通道发送接收控制1）

在全扫描模式下，CTSUCHTRC1[7:0]位将接收或发送分配给相关的TS引脚。在自电容单扫描和多扫描模式下，该设置被忽略。CTSUCHTRC1[0]与TS08相关联，CTSUCHTRC1[7]与TS15相关联。

51.2.12 CTSU Channel Transmit/Receive Control Register 2 (CTSUCHTRC2)

Address(es): CTSU.CTSUCHTRC2 4008 100Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CTSUCHTRC2 [1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1 to b0	CTSUCHTRC2 [1:0]	CTSU Channel Transmit/Receive Control 2	0: Reception 1: Transmission. These bits specify the TS16 to TS17 pins.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Only set the CTSUCHTRC2 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHTRC2 [1:0] bits (CTSU Channel Transmit/Receive Control 2)

In full scan mode, the CTSUCHTRC2 [1:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multiscan modes. CTSUCHTRC2[0] is associated with TS16 and CTSUCHTRC2 [1] with TS17.

51.2.13 CTSU High-Pass Noise Reduction Control Register (CTSUDCLKC)

Address(es): CTSU.CTSUDCLKC 4008 1010h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CTSUSSCNT[1:0]		—	—	CTSUSSMOD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	CTSUSSMOD[1:0]	CTSU Diffusion Clock Mode Select	Set these bits to 00b.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5, b4	CTSUSSCNT[1:0]	CTSU Diffusion Clock Mode Control	Set these bits to 11b.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Only set the CTSUDCLKC register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUSSMOD[1:0] bits (CTSU Diffusion Clock Mode Select)

The CTSUSSMOD[1:0] bits set the mode of the spectrum diffusion clock for high-pass noise reduction. When using the high-pass function, always fix these bits to 00b. If these bits are not set, the CTSU will be unable to effectively reduce high-pass noise.

CTSUSSCNT[1:0] bits (CTSU Diffusion Clock Mode Control)

The CTSUSSCNT[1:0] bits adjust the amount of spectrum diffusion applied to reduce high-pass noise. When using the high-pass noise reduction function, always fix these bits to 11b. If these bits are not set, touch measurement might be performed incorrectly.

51.2.12 CTSU通道发送接收控制寄存器2(CTSUCHTRC2)

Address(es): CTSU.CTSUCHTRC2 4008 100Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	CTSUCHTRC2 [1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1 to b0	CTSUCHTRC2 [1:0]	CTSU Channel Transmit/Receive Control 2	0：接收1：发送。这些位指定TS16到TS17引脚。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC2寄存器。

CTSUCHTRC2[1:0]位（CTSU通道发送接收控制2）

在全扫描模式下，CTSUHTRC2[1:0]位将接收或发送分配给相关的TS引脚。在自电容单扫描和多扫描模式下，该设置被忽略。CTSUCHTRC2[0]与TS16相关联，CTSUCHTRC2[1]与TS17相关联。

51.2.13 CTSU高通降噪控制寄存器(CTSUDCLKC)

Address(es): CTSU.CTSUDCLKC 4008 1010h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CTSUSSCNT[1:0]		—	—	CTSUSSMOD[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	CTSUSSMOD[1:0]	CTSU扩散时钟模式选择	将这些位设置为00b。	R/W
b3, b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b5, b4	CTSUSSCNT[1:0]	CTSU扩散时钟模式控制	将这些位设置为11b。	R/W
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUDCLKC寄存器。

CTSUSSMOD[1:0]位（CTSU扩散时钟模式选择）

CTSUSSMOD[1:0]位设置频谱扩散时钟的模式以降低高通噪声。使用高通功能时，请始终将这些位固定为00b。如果未设置这些位，CTSU将无法有效降低高通噪声。

CTSUSSCNT[1:0]位（CTSU扩散时钟模式控制）

CTSUSSCNT[1:0]位调整应用的频谱扩散量以减少高通噪声。使用高通降噪功能时，请始终将这些位固定为11b。如果未设置这些位，则可能会错误地执行触摸测量。

51.2.14 CTSU Status Register (CTSUST)

Address(es): CTSU.CTSUST 4008 1011h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUPS	CTSUROVF	CTSUSOVF	CTSUDTSR	—	CTSUSTC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	CTSUSTC[2:0]	CTSU Measurement Status Counter	These counters indicate the current measurement status. b2 b0 0 0 0: Status 0 0 0 1: Status 1 0 1 0: Status 2 0 1 1: Status 3 1 0 0: Status 4 1 0 1: Status 5.	R
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	CTSUDTSR	CTSU Data Transfer Status Flag	This flag indicates whether the measurement result stored in the sensor counter and the reference counter was read. 0: Read 1: Not read.	R
b5	CTSUSOVF	CTSU Sensor Counter Overflow Flag	This flag indicates an overflow on the sensor counter. 0: No overflow occurred 1: Overflow occurred.	R/W
b6	CTSUROVF	CTSU Reference Counter Overflow Flag	This flag indicates an overflow on the reference counter. 0: No overflow occurred 1: Overflow occurred.	R/W
b7	CTSUPS	CTSU Mutual Capacitance Status Flag	This flag indicates the measurement status in mutual capacitance full scan mode. 0: First measurement 1: Second measurement.	R

When using the CTSUCR0.CTSUINIT bit to clear an overflow flag, make sure that the CTSUCR0.CTSUSTRT bit is 0.

CTSUSTC[2:0] flags (CTSU Measurement Status Counter)

The CTSUSTC[2:0] flags are a counter indicating the current measurement status. For details on each status, see section 51.3.2.2, Status counter.

CTSUDTSR flag (CTSU Data Transfer Status Flag)

The CTSUDTSR flag indicates whether the measurement result stored in the sensor counter and the reference counter was read. The flag sets to 1 when measurement completes and 0 when the reference counter is read by software or the DTC. The flag can also be cleared using the CTSUCR0.CTSUINIT bit.

CTSUSOVF flag (CTSU Sensor Counter Overflow Flag)

The CTSUSOVF flag sets to 1 when the sensor counter, CTSUSC, overflows. On overflow, the counter value reads as FFFFh. Measurement processing continues for the specified period.

No interrupt occurs on an overflow. To determine the channel on which the overflow occurred, read the measurement result of each channel after measurement completes, signaled by a measurement end interrupt.

This flag is cleared when 0 is written after 1 is read by software. It can also be cleared using the CTSUCR0.CTSUINIT bit.

51.2.14 CTSU状态寄存器(CTSUST)

Address(es): CTSU.CTSUST 4008 1011h

	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUPS	CTSUROVF	CTSUSOVF	CTSUDTSR	—	CTSUSTC[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	CTSUSTC[2:0]	CTSU测量状态计数器	这些计数器指示当前的测量状态。b2 b0 0 0 0: Status 0 0 0 1: Status 1 0 1 0: Status 2 0 1 1: Status 3 1 0 0: Status 4 1 0 1: Status 5.	R
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	CTSUDTSR	CTSU数据传输状态标志	该标志指示存储在传感器计数器和参考计数器中的测量结果是否被读取。0：读取1：未读取。	R
b5	CTSUSOVF	CTSU传感器计数器溢出标志	该标志表示传感器计数器溢出。0：未发生溢出1：发生溢出。	R/W
b6	CTSUROVF	CTSU参考计数器溢出Flag	该标志表示参考计数器溢出。0：未发生溢出1：发生溢出。	R/W
b7	CTSUPS	CTSU互电容状态Flag	该标志指示互电容全扫描模式下的测量状态。0：第一次测量1：第二次测量。	R

使用CTSUCR0.CTSUINIT位清除溢出标志时，请确保CTSUCR0.CTSUSTRT位为0。

CTSUSTC[2:0]标志（CTSU测量状态计数器）

CTSUSTC[2:0]标志是指示当前测量状态的计数器。有关每个状态的详细信息，请参阅第51.3.2.2节，状态计数器。

CTSUDTSR标志（CTSU数据传输状态标志）

CTSUDTSR标志指示存储在传感器计数器和参考计数器中的测量结果是否被读取。当测量完成时，该标志设置为1，当软件或DTC读取参考计数器时，该标志设置为0。也可以使用CTSUCR0.CTSUINIT位清除该标志。

CTSUSOVF标志（CTSU传感器计数器溢出标志）

当传感器计数器CTSUSC溢出时，CTSUSOVF标志设置为1。溢出时，计数器值读取为FFFFh。测量处理持续指定的时间。

溢出时不发生中断。要确定发生溢出的通道，请在测量完成后读取每个通道的测量结果，由测量结束中断发出信号。

当软件读取1后写入0时清除该标志。它也可以使用CTSUCR0.CTSUINIT位清零。

CTSUROVF flag (CTSU Reference Counter Overflow Flag)

The CTSUROVF flag sets to 1 when the reference counter, CTSURC, overflows. On overflow, the counter value reads as FFFFh. Measurement processing continues for the specified period.

No interrupt occurs on an overflow. To determine the channel on which the overflow occurred, read the measurement result of each channel after measurement completes, signaled by a measurement end interrupt.

This flag is cleared when 0 is written after 1 is read by software. It can also be cleared using the CTSUCR0.CTSUINIT bit.

CTSUPS flag (CTSU Mutual Capacitance Status Flag)

In mutual capacitance full scan mode, when CTSUCR1.CTSUMD[1:0] = 11b, the CTSUPS flag indicates whether the measurement is the first or second of two measurements for each channel. When measurement is stopped or in other measurement modes, this flag is always 0.

51.2.15 CTSU High-Pass Noise Reduction Spectrum Diffusion Control Register (CTSUSSC)

Address(es): CTSU.CTSUSSC 4008 1012h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CTSUSSDIV[3:0]				—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b11 to b8	CTSUSSDIV[3:0]	CTSU Spectrum Diffusion Frequency Division Setting	These bits specify the spectrum diffusion frequency division setting based on the base clock frequency division setting.	R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CTSUSSDIV[3:0] bits (CTSU Spectrum Diffusion Frequency Division Setting)

The CTSUSSDIV[3:0] bits specify the spectrum diffusion frequency derived from the base clock frequency division setting. To calculate the correct setting for CTSUSSDIV[3:0], see the relationship between base clock frequencies and the settings in Table 51.6.

Table 51.6 Relationship between base clock frequencies and CTSUSSDIV[3:0] bit settings (1 of 2)

Base clock frequency fb (MHz)	CTSUSSDIV[3:0] bit setting
4.00 ≤ fb	0000b
2.00 ≤ fb < 4.00	0001b
1.33 ≤ fb < 2.00	0010b
1.00 ≤ fb < 1.33	0011b
0.80 ≤ fb < 1.00	0100b
0.67 ≤ fb < 0.80	0101b
0.57 ≤ fb < 0.67	0110b
0.50 ≤ fb < 0.57	0111b
0.44 ≤ fb < 0.50	1000b
0.40 ≤ fb < 0.44	1001b
0.36 ≤ fb < 0.40	1010b
0.33 ≤ fb < 0.36	1011b
0.31 ≤ fb < 0.33	1100b

CTSUROVF标志（CTSU参考计数器溢出标志）

当参考计数器CTSURC溢出时，CTSUROVF标志设置为1。溢出时，计数器值读取为FFFFh。测量处理持续指定的时间。

溢出时不发生中断。要确定发生溢出的通道，请在测量完成后读取每个通道的测量结果，由测量结束中断发出信号。

当软件读取1后写入0时清除该标志。它也可以使用CTSUCR0.CTSUINIT位清零。

CTSUPS标志（CTSU互电容状态标志）

在互电容全扫描模式下，当CTSUCR1.CTSUMD[1:0]=11b时，CTSUPS标志指示测量是每个通道的两次测量中的第一个还是第二个。当测量停止或处于其他测量模式时，该标志始终为0。

51.2.15 CTSU高通降噪频谱扩散控制寄存器(CTSUSSC)

Address(es): CTSU.CTSUSSC 4008 1012h

51.2.16 CTSU Sensor Offset Register 0 (CTSUSO0)

Address(es): CTSU.CTSUSO0 4008 1014h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUSNUM[5:0]						CTSUSO[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b9 to b0	CTSUSO[9:0]	CTSU Sensor Offset Adjustment	These bits adjust the electronic capacitance when the electrode is not being touched. b9 b0 0 0 0 0 0 0 0 0 0 0: Current offset is 0 0 0 0 0 0 0 0 0 0 1: Current offset is 1 0 0 0 0 0 0 0 0 1 0: Current offset is 2 : : 1 1 1 1 1 1 1 1 1 0: Current offset is 1022 1 1 1 1 1 1 1 1 1 1: Current offset is maximum.	R/W
b15 to b10	CTSUSNUM[5:0]	CTSU Measurement Count Setting	These bits set the number of measurements.	R/W

CTSUSO[9:0] bits (CTSU Sensor Offset Adjustment)

The CTSUSO[9:0] bits offset the sensor ICO input current generated from electrostatic capacitance during touch measurement when the electrode is not being touched. This prevents the CTSU sensor counter from overflowing. Set the TS pin that is to be measured next after a CTSU_CTSUWR interrupt occurs.

CTSUSNUM[5:0] bits (CTSU Measurement Count Setting)

The CTSUSNUM[5:0] bits specify how many times the measurement pulse count specified in the CTSUSDPRS.CTSUPRRATIO[3:0] and CTSUSDPRS.CTSUPRMODE[1:0] bits is repeated during the measurement time. The measurement pulse count is repeated (CTSUSNUM[5:0] bits + 1) times. Set the TS pin that is to be measured next after a CTSU_CTSUWR interrupt is generated.

Table 51.6 基本时钟频率和CTSUSSDIV[3:0]位设置之间的关系(2of2)

基本时钟频率fb(MHz)	CTSUSSDIV[3:0]位设置
0.29 ≤ fb < 0.31	1101b
0.27 ≤ fb < 0.29	1110b
fb < 0.27	1111b

51.2.16 CTSU传感器偏移寄存器0(CTSUSO0)

Address(es): CTSU.CTSUSO0 4008 1014h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUSNUM[5:0]						CTSUSO[9:0]									
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b9 to b0	CTSUSO[9:0]	CTSU传感器偏移调整	这些位在电极未被触摸 时调整电子电容。b9 b000000000000：当前偏移量为000000000001 ：当前偏移量为10000000010：当前偏移量为 2::1111111110：当前偏移为1022111111111 1：当前偏移最大。	R/W
b15 to b10	CTSUSNUM[5:0]	CTSU测量计数	这些位设置测量次数。	R/W

CTSUSO[9:0]位（CTSU传感器偏移调整）

CTSUSO[9:0]位在电极未被触摸 时在触摸测量期间抵消由静电电容产生的传感器ICO输入电流。这可以防止CTSU传感器计数器溢出。在发生CTSU_CTSUWR中断后设置接下来要测量的TS引脚。

CTSUSNUM[5:0]位（CTSU测量计数设置）

CTSUSNUM[5:0]位指定测量脉冲计数的次数
CTSUSDPRS.CTSUPRRATIO[3:0]和CTSUSDPRS.CTSUPRMODE[1:0]位在测量期间重复。测量脉冲计数重复(CTSUSNUM[5:0]位+1)次。在产生CTSU_CTSUWR中断后设置接下来要测量的TS引脚。

b15	—	Reserved	该位读取为0。写入值应为0。	R/W

Note 1. 在互电容全扫描模式（CTSUCR1.CTSUMD[1:0]位=11b）。

After a CTSU_CTSUWR interrupt occurs, write first to the CTSUSSC register, next to the CTSUSO0 register, and then to the CTSUSO1 register. The write to the CTSUSO1 register causes a transition to Status 3. (See Table 51.7 and Table 51.8.) Set all of the bits in a single operation when writing to the CTSUSO1 register.

CTSURICOA[7:0] bits (CTSU Reference ICO Current Adjustment)

The CTSURICOA[7:0] bits adjust the oscillation frequency using the input current of the reference ICO.

CTSUSDPA[4:0] bits (CTSU Base Clock Setting)

The CTSUSDPA[4:0] bits select the base clock used as the source for the sensor drive pulse by dividing the operating clock. For details on the setting procedure, see section 51.3.2.1, Initial settings flow.

CTSUICOG[1:0] bits (CTSU ICO Gain Adjustment)

The CTSUICOG[1:0] bits adjust the output frequency gain of the sensor ICO and the reference ICO. Normally, set these bits to 00b for the maximum gain. If changes in the capacitance between when the electrode is touched and when it is not touched greatly exceed the dynamic range of the sensor ICO, adjust the gain appropriately with this setting.

51.2.18 CTSU Sensor Counter (CTSUSC)

Address(es): CTSU.CTSUSC 4008 1018h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUSC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	CTSUSC[15:0]	CTSU Sensor Counter	These bits indicate the measurement result of the sensor ICO. They read FFFFh when an overflow occurs.	R

After a CTSU_CTSURD interrupt occurs, read first from the CTSUSC counter and then from the CTSURC counter.

CTSUSC[15:0] bits (CTSU Sensor Counter)

The CTSUSC[15:0] bits are configured as an increment counter for the sensor ICO clock. Read these bits after a CTSU_CTSURD interrupt occurs. After the CTSURC counter is read, these bits are cleared immediately before the CTSU measurement status counter value changes to Status 4 (the CTSUST.CTSUSTC[2:0] flags changes to 100b) in the next measurement. They can also be cleared using the CTSUCR0.CTSUINIT bit.

51.2.19 CTSU Reference Counter (CTSURC)

Address(es): CTSU.CTSURC 4008 101Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSURC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	CTSURC[15:0]	CTSU Reference Counter	These bits indicate the measurement result of the reference ICO. They read FFFFh when an overflow occurs.	R

After a CTSU_CTSURD interrupt occurs, read first from the CTSUSC counter and then from the CTSURC counter. Status 3 continues until the CTSURC counter is read, even if the stabilization time specified for Status 3 elapses.

发生CTSU_CTSUWR中断后，先写入CTSUSSC寄存器，然后写入CTSUSO0寄存器，然后写入CTSUSO1寄存器。写入CTSUSO1寄存器会导致转换到状态3。（参见表51.7和表51.8。）在写入CTSUSO1寄存器时，在一次操作中设置所有位。

CTSURICOA[7:0]位（CTSU参考ICO电流调整）

CTSURICOA[7:0]位使用参考ICO的输入电流调整振荡频率。

CTSUSDPA[4:0]位（CTSU基本时钟设置）

CTSUSDPA[4:0]位通过对工作时钟进行分频来选择用作传感器驱动脉冲源的基本时钟。有关设置过程的详细信息，请参阅第51.3.2.1节，初始设置流程。

CTSUICOG[1:0]位（CTSUICO增益调整）

CTSUICOG[1:0]位调整传感器ICO和参考ICO的输出频率增益。通常，将这些位设置为00b以获得最大增益。如果触摸电极和未触摸电极之间的电容变化大大超过传感器ICO的动态范围，请使用此设置适当调整增益。

51.2.18 CTSU传感器计数器(CTSUSC)

Address(es): CTSU.CTSUSC 4008 1018h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUSC[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	CTSUSC[15:0]	CTSU传感器计数器	这些位表示传感器ICO的测量结果。它们在发生溢出时读取FFFFh。	R

发生CTSU_CTSURD中断后，先从CTSUSC计数器读取，然后再从CTSURC计数器读取。

CTSUSC[15:0]位（CTSU传感器计数器）

CTSUSC[15:0]位配置为传感器ICO时钟的增量计数器。后读取这些位
CTSU_CTSURD中断发生。读取CTSURC计数器后，这些位在
CTSU测量状态计数器值在下一次测量中更改为状态4（CTSUST.CTSUSTC[2:0]标志更改为100b）。它们也可以使用CTSUCR0.CTSUINIT位清零。

51.2.19 CTSU参考计数器(CTSURC)

Address(es): CTSU.CTSURC 4008 101Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSURC[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	CTSURC[15:0]	CTSU参考计数器	这些位表示参考ICO的测量结果。它们在发生溢出时读取FFFFh。	R

发生CTSU_CTSURD中断后，先从CTSUSC计数器读取，然后再从CTSURC计数器读取。
状态3一直持续到读取CTSURC计数器为止，即使为状态3指定的稳定时间已过。

CTSURC[15:0] bits (CTSU Reference Counter)

The CTSURC[15:0] bits are configured as an increment counter for the reference ICO clock. The reference ICO optimizes touch measurement performed by the sensor ICO. There is some deviation depending on the internal sensor ICO and the reference ICO in the CTSU, but both ICOs have almost the same characteristics, including the dynamic range and the current-to-frequency characteristics. The range of current amount that can be set in the reference ICO current adjustment bits is about the same as the dynamic range of both ICOs, and the current amount input to the sensor ICO must be within this dynamic range. To ensure this, use the reference ICO to check the differences between the ICOs and measure the current-to-oscillation frequency characteristics. Because the reference ICO oscillation frequency can be obtained from the reference ICO counter, the ICO oscillation frequency (counter value/measurement time) for the input current amount can be measured by setting the value in the reference ICO current adjustment bits and measuring the reference ICO counter. The reference ICO counter value measured using the maximum value in the reference ICO current adjustment bits is the maximum value of the ICO dynamic range. The current to the sensor ICO must be offset in the offset adjustment bits so that the sensor ICO counter value does not exceed this value.

Read the CTSURC[15:0] bits after a CTSU_CTSURD interrupt occurs. After these bits are read, they are cleared immediately before the CTSU measurement status counter value changes to Status 4 (the CTSUST.CTSUSTC[2:0] flags changes to 100b) in the next measurement. They can also be cleared using the CTSUCR0.CTSUINIT bit.

51.2.20 CTSU Error Status Register (CTSUERRS)

Address(es): CTSU.CTSUERRS 4008 101Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUICOMP	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b14 to b0	—	Reserved	These bits are read as 0.	R
b15	CTSUICOMP	TSCAP Voltage Error Monitor	This bit monitors the error status of the TSCAP voltage. 0: Normal TSCAP voltage 1: Abnormal TSCAP voltage.*1	R

Note 1. When CTSUCR1.CTSUPON bit is 0, this bit is set to 1.

CTSUICOMP bit (TSCAP Voltage Error Monitor)

If the offset current amount set in the CTSUSO1 register exceeds the sensor ICO input current during touch measurement, the TSCAP voltage becomes abnormal and touch measurement cannot be performed correctly. The CTSUICOMP bit monitors the TSCAP voltage and it sets to 1 if the voltage becomes abnormal.

If the TSCAP voltage becomes abnormal, the sensor ICO counter value becomes undefined, but touch measurement completes normally, so it is difficult to detect an abnormality by reading the sensor ICO counter value. If the CTSU reference ICO current adjustment bits (CTSURICOA[7:0]) in the CTSUSO1 register are set to any value other than 0, always check this bit when touch measurement completes.

This bit is cleared by writing 0 to the CTSUCR1.CTSUPON bit and turning off the power supply.

51.3 Operation

51.3.1 Principles of Measurement Operation

Figure 51.4 shows the measurement circuit.

CTSURC[15:0]位（CTSU参考计数器）

CTSURC[15:0]位配置为参考ICO时钟的增量计数器。参考ICO优化了传感器ICO执行的触摸测量。CTSU中的内部传感器ICO和参考ICO存在一些偏差，但两种ICO具有几乎相同的特性，包括动态范围和电流频率特性。参考ICO电流调整位可设置的电流量范围与两个ICO的动态范围大致相同，输入到传感器ICO的电流量必须在此动态范围内。为确保这一点，请使用参考ICO检查ICO之间的差异并测量电流-振荡频率特性。因为可以从参考ICO计数器获得参考ICO振荡频率，所以可以通过设置参考ICO电流调整位中的值并测量参考ICO计数器来测量输入电流量的ICO振荡频率（计数器值测量时间）.使用参考ICO电流调整位中的最大值测量的参考ICO计数器值是ICO动态范围的最大值。传感器ICO的电流必须在偏移调整位中进行偏移，以使传感器ICO计数器值不超过此值。

在CTSU_CTSURD中断发生后读取CTSURC[15:0]位。读取这些位后，在CTSU测量状态计数器值在下一次测量中立即变为状态4（CTSUST.CTSUSTC[2:0]标志变为100b）之前将它们清零。它们也可以使用CTSUCR0.CTSUINIT位清零。

51.2.20 CTSU错误状态寄存器(CTSUERRS)

Address(es): CTSU.CTSUERRS 4008 101Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTSUICOMP	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	位名称	Description	R/W
b14 to b0	—	Reserved	这些位读为0。	R
b15	CTSUICOMP	TSCAP电压错误监视器	该位监控TSCAP电压的错误状态。0：正常TSCAP电压1：异常TSCAP电压。*1	R

Note 1. 当CTSUCR1.CTSUPON位为0时，该位设置为1。

CTSUICOMP位（TSCAP电压错误监视器）

如果CTSUSO1寄存器中设置的偏移电流量在触摸测量期间超过传感器ICO输入电流，则TSCAP电压会异常，无法正确执行触摸测量。CTSUICOMP位监控TSCAP电压，如果电压异常，它设置为1。

如果TSCAP电压异常，则传感器ICO计数器值变得不确定，但触摸测量正常完成，因此很难通过读取传感器ICO计数器值来检测异常。如果CTSUSO1寄存器中的CTSU参考ICO电流调整位(CTSURICOA[7:0])设置为0以外的任何值，则在触摸测量完成时始终检查该位。

通过向CTSUCR1.CTSUPON位写入0并关闭电源来清除该位。

51.3 Operation

51.3.1 测量操作原理

图51.4显示了测量电路。

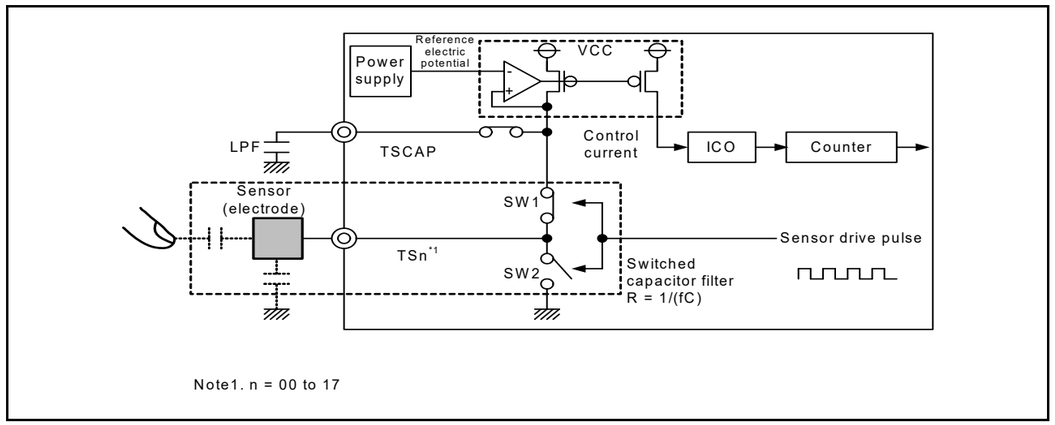

Figure 51.4 Measurement circuit

Figure 51.5 to Figure 51.7 explain the electrostatic capacitance measurement operation principles of the CTSU current frequency conversion method.

The electrostatic capacitance of the electrode is charged by turning SW1 on and SW2 off (Figure 51.5).

The charged capacitance is discharged by turning SW1 off and SW2 on (Figure 51.6).

Current flows to the switched capacitor filter by switching between charging and discharging. At this point, if a finger is in close proximity, the capacitance and the flowing current change. A clock is generated by supplying the control current, which is proportional to the amount of current flowing through the switched capacitor filter, from the circuit that generates the TSCAP power supply to the ICO. The counter measures the clock frequency that changes depending on whether a finger is in close proximity. The software uses the value read from the counter to determine contact with a finger (Figure 51.7).

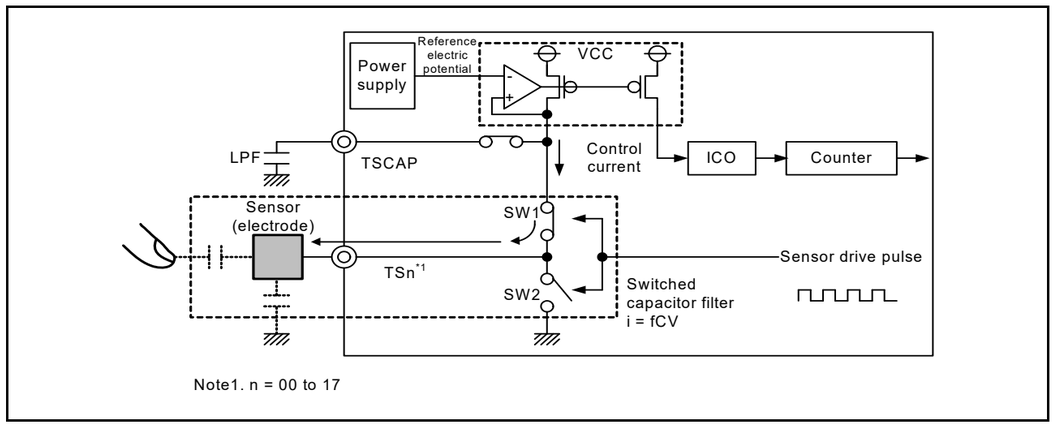

Figure 51.5 Charging operation

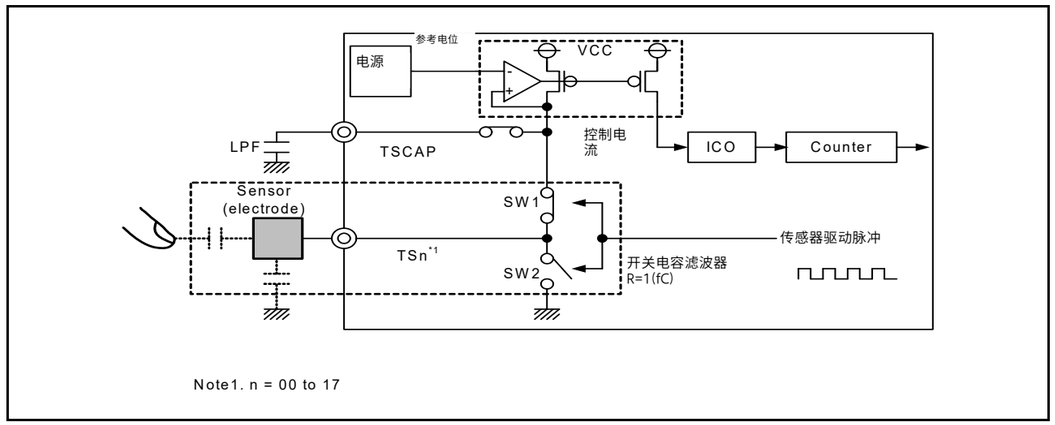

Figure 51.4 测量电路

图51.5至图51.7说明了CTSU电流变频方式的静电电容测量操作原理。

通过打开SW1和关闭SW2对电极的静电电容进行充电（图51.5）。

通过关闭SW1和打开SW2对充电的电容进行放电（图51.6）。

通过在充电和放电之间切换，电流流向开关电容滤波器。此时，如果手指靠近，则电容和流动电流会发生变化。通过从产生TSCAP电源的电路向ICO提供与流过开关电容滤波器的电流量成比例的控制电流来产生时钟。计数器测量时钟频率，该频率根据手指是否靠近而变化。软件使用从计数器读取的值来确定与手指的接触（图51.7）。

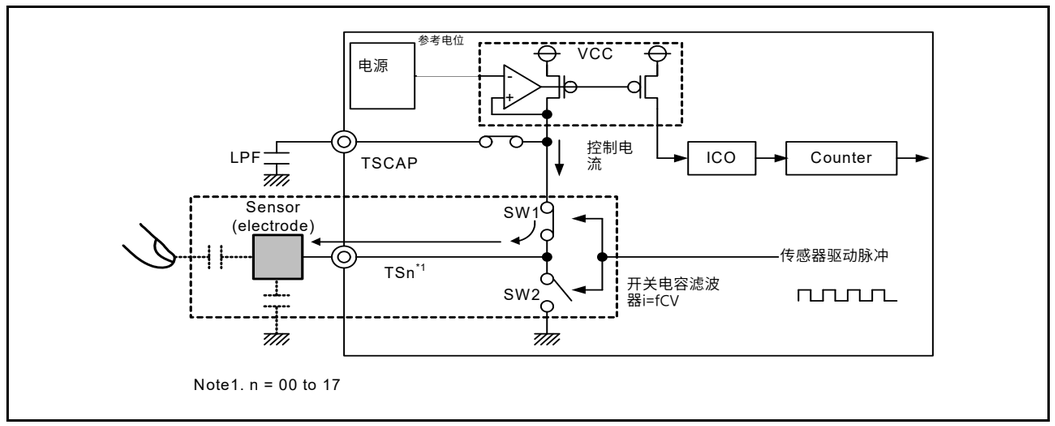

Figure 51.5 充电操作

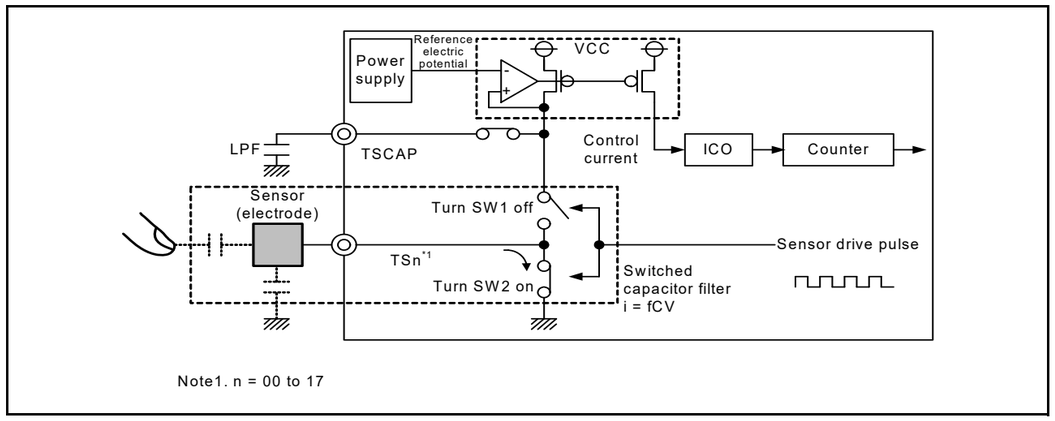

Figure 51.6 Discharging operation

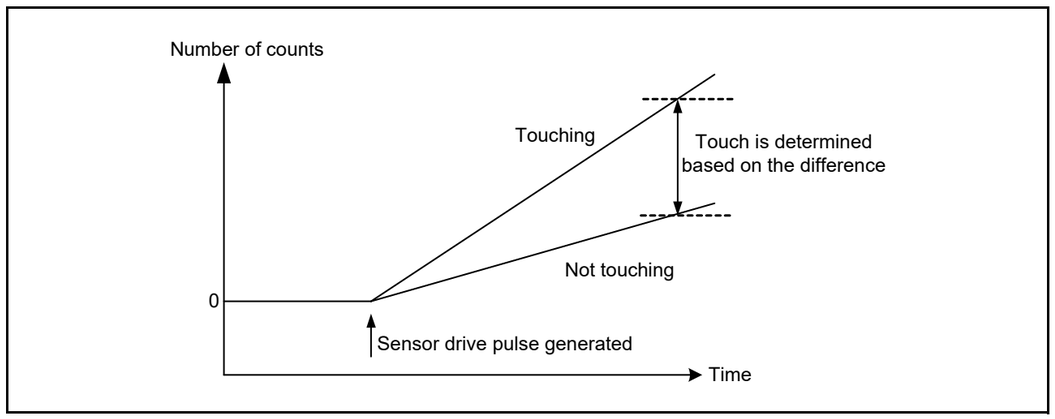

Figure 51.7 Change in measured value when finger is touching and not touching

51.3.2 Measurement Modes

The CTSU supports self-capacitance and mutual capacitance methods. Figure 51.8 illustrates these methods.

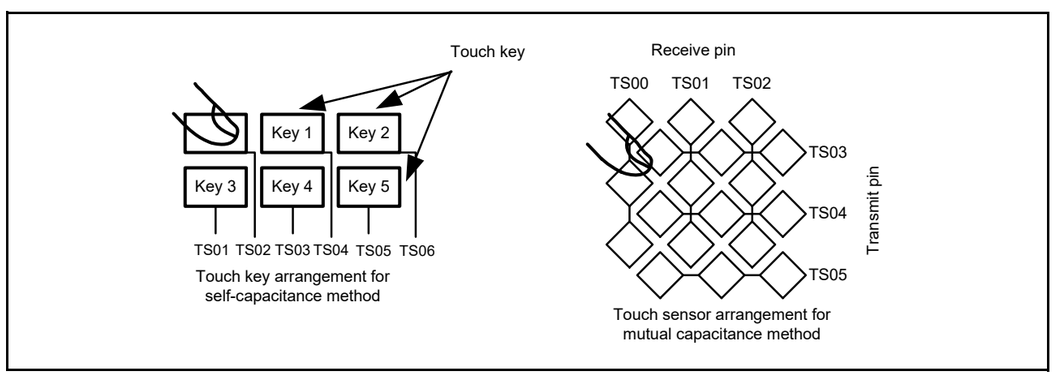

Figure 51.8 Overview of self-capacitance method and mutual capacitance method

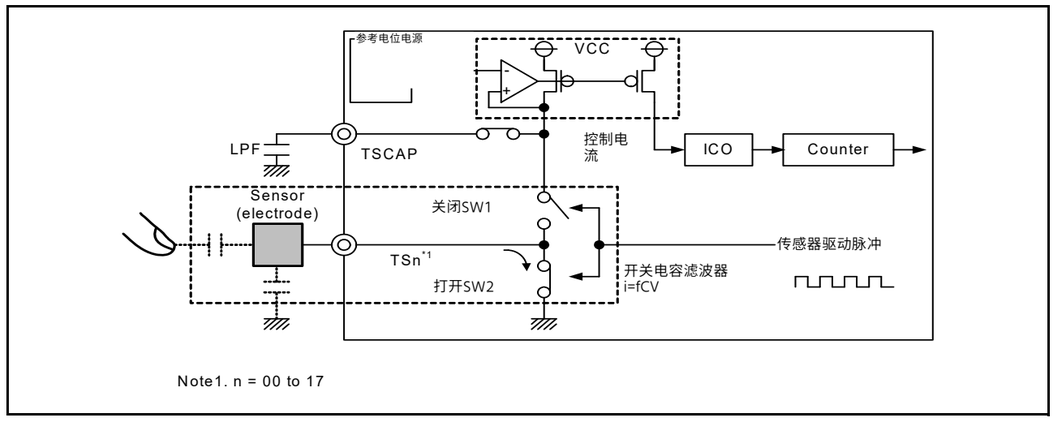

Figure 51.6 卸料作业

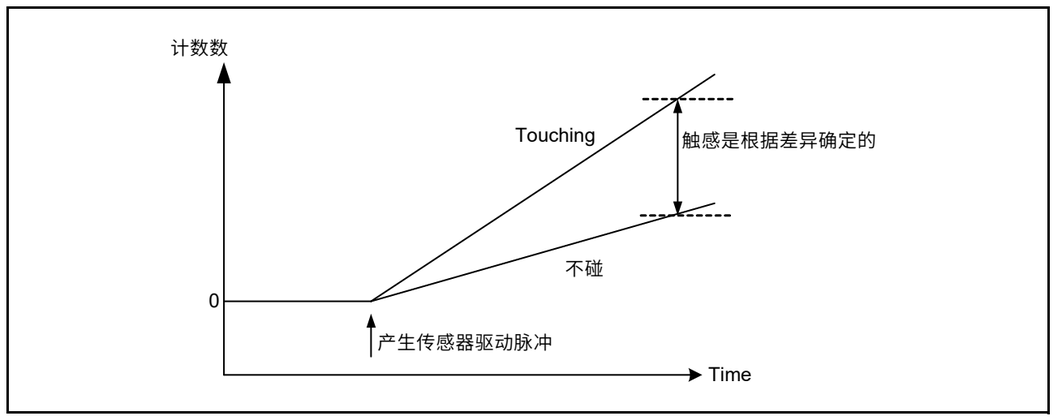

Figure 51.7 手指接触和不接触时测量值的变化

51.3.2 测量模式

CTSU支持自电容和互电容方法。图51.8说明了这些方法。

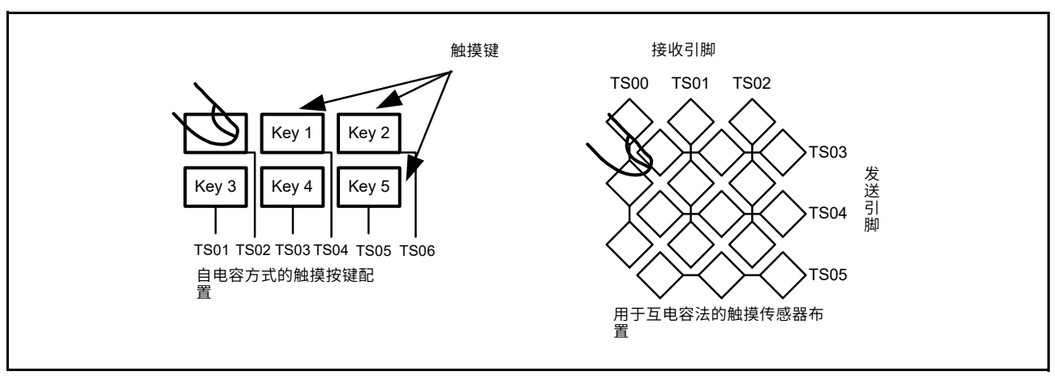

Figure 51.8 自电容法和互电容法概述

In the self-capacitance method, a single touch pin is allocated to a single touch key to measure individual electrostatic capacitance when a finger is in close proximity. In this method, capacitance can be measured in both single scan and multiscan modes. In the mutual capacitance method, the capacitance between two opposing electrodes (transmit and receive pins) is measured.

51.3.2.1 Initial settings flow

Figure 51.9 shows the flow for the CTSU initial settings.

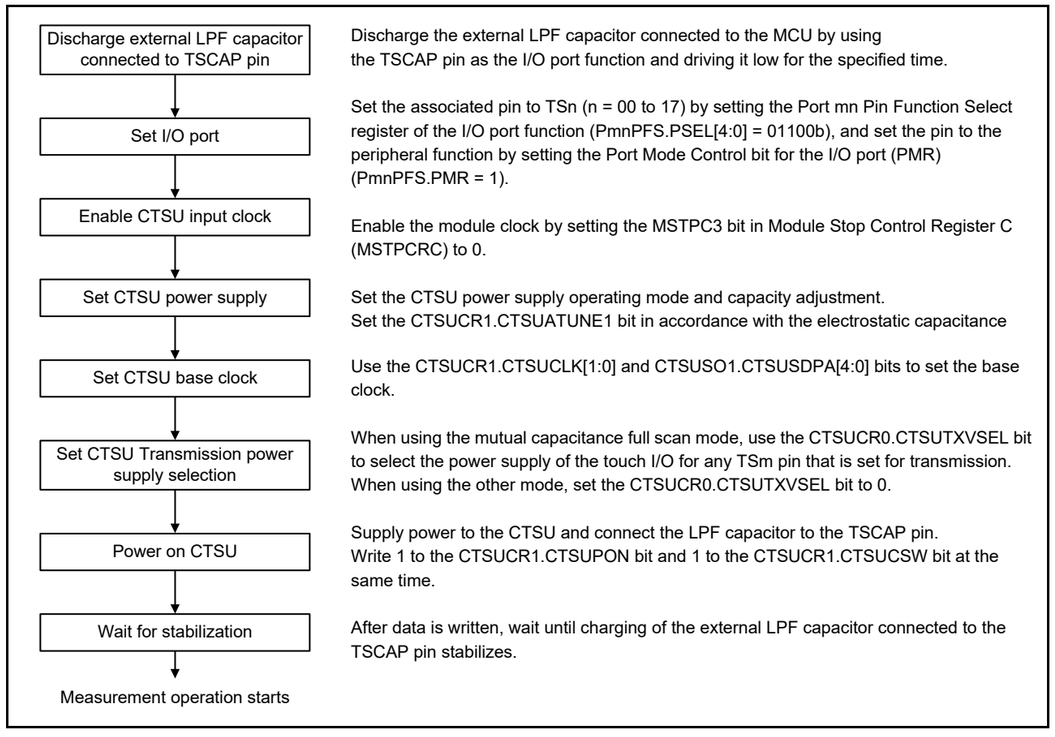

Figure 51.9 CTSU initial settings flow

Figure 51.10 shows the flow for stopping CTSU operation and invoking the standby state.

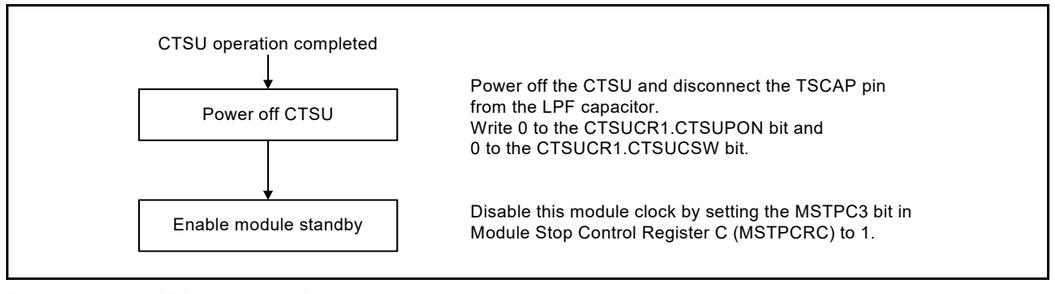

Figure 51.10 CTSU stopping flow

When restarting operation after it stops, follow the initial settings flow shown in Figure 51.9.

在自电容法中，将单个触摸引脚分配给单个触摸键，以在手指靠近时测量单个静电电容。在这种方法中，可以在单扫描和多扫描模式下测量电容。在互电容法中，测量两个相对电极（发送和接收引脚）之间的电容。

51.3.2.1 初始设置流程

图51.9显示了CTSU初始设置的流程。

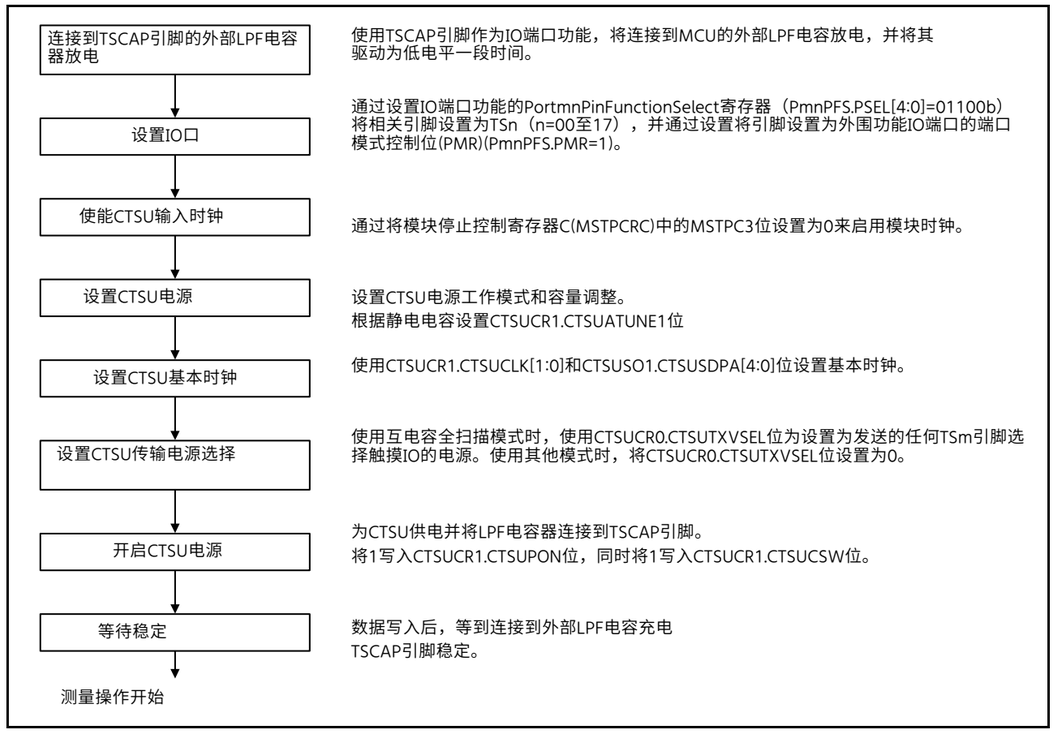

Figure 51.9 CTSU初始设置流程

图51.10显示了停止CTSU操作并调用待机状态的流程。

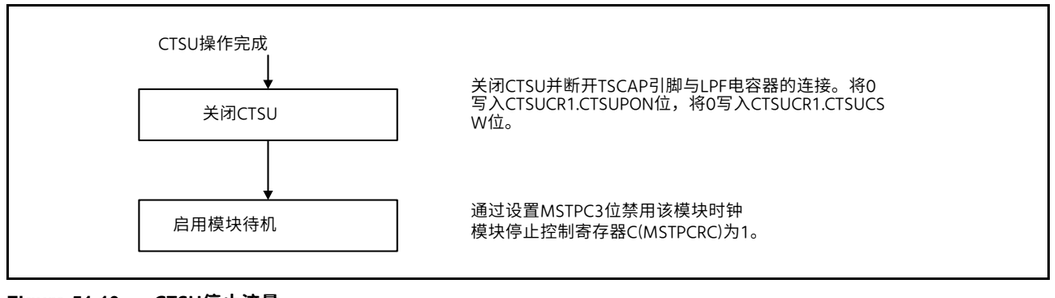

Figure 51.10 CTSU停止流量

停止后重新开始运行时，请按照图51.9所示的初始设置流程进行操作。

51.3.2.2 Status counter

The measurement status counter of the CTSU Status Register (CTSUST) indicates the current measurement status. The measurement status is shared by all three modes. Figure 51.11 shows the status operation transitions.

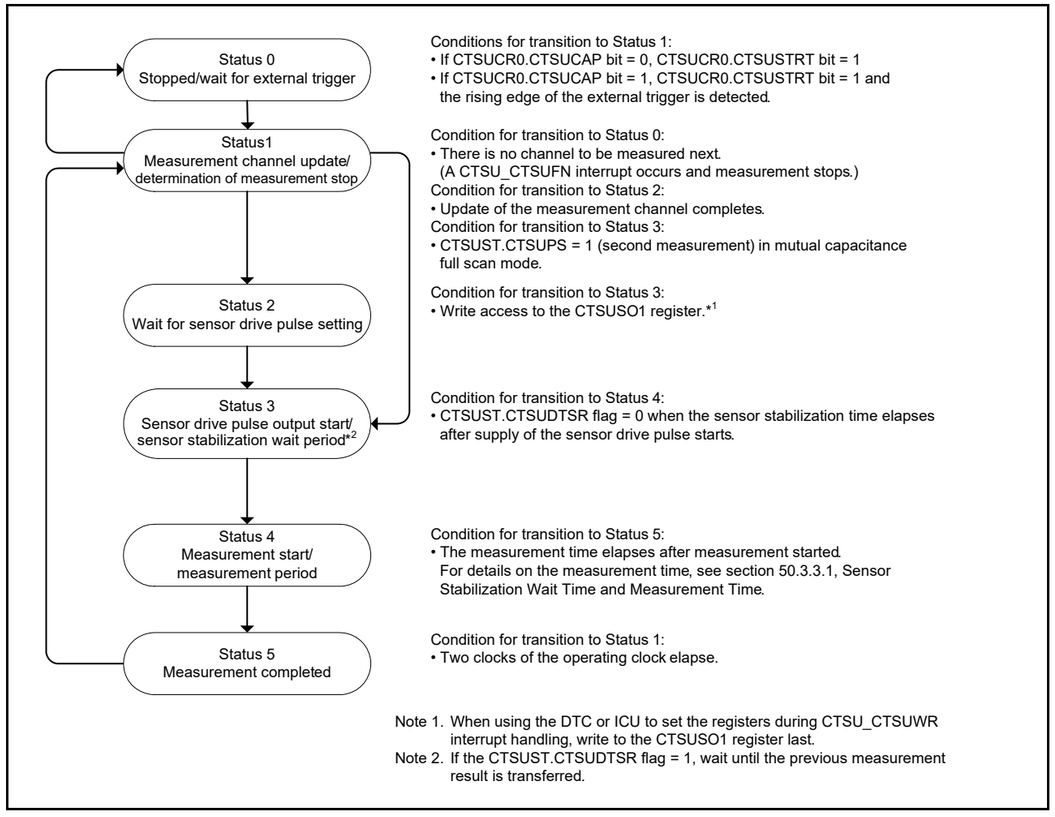

Figure 51.11 Status operation transitions

The status counter transitions to Status 0 when all of the specified measurement channels are measured.

The CTSUCR0.CTSUSTRT bit is cleared to 0 by hardware when a software trigger is used. When an external trigger is used, the value of 1 is retained, and the CTSU waits for the next trigger.

When operation is forced to stop during measurement or the trigger wait state, by a simultaneous 0 write to the CTSUCR0.CTSUSTRT bit and a 1 write to the CTSUCR0.CTSUINIT bit, the status transitions to Status 0 and measurement stops.

If the channel to be measured is not set in the CTSUCHAC0 to CTSUCHAC2 or CTSUCHTRC0 to CTSUCHTRC2 registers, a CTSU_CTSUFN interrupt occurs immediately after a transition to Status 1, and then the status transitions to Status 0.

In the following situations, there is no channel to be measured:

- No measurement target channel is specified in the CTSUCHAC0 to CTSUCHAC2 registers.
- In self-capacitance single scan mode, the channel specified in the CTSUMCH0 register is not a measurement target in the CTSUCHAC0 to CTSUCHAC2 registers.
- In full scan modes, there is no transmit channel or receive channel to be measured based on the combined settings of the CTSUCHAC0 to CTSUCHAC2 and CTSUCHTRC0 to CTSUCHTRC2 registers.

51.3.2.2 状态计数器

CTSU状态寄存器(CTSUST)的测量状态计数器指示当前测量状态。测量状态由所有三种模式共享。图51.11显示了状态操作转换。

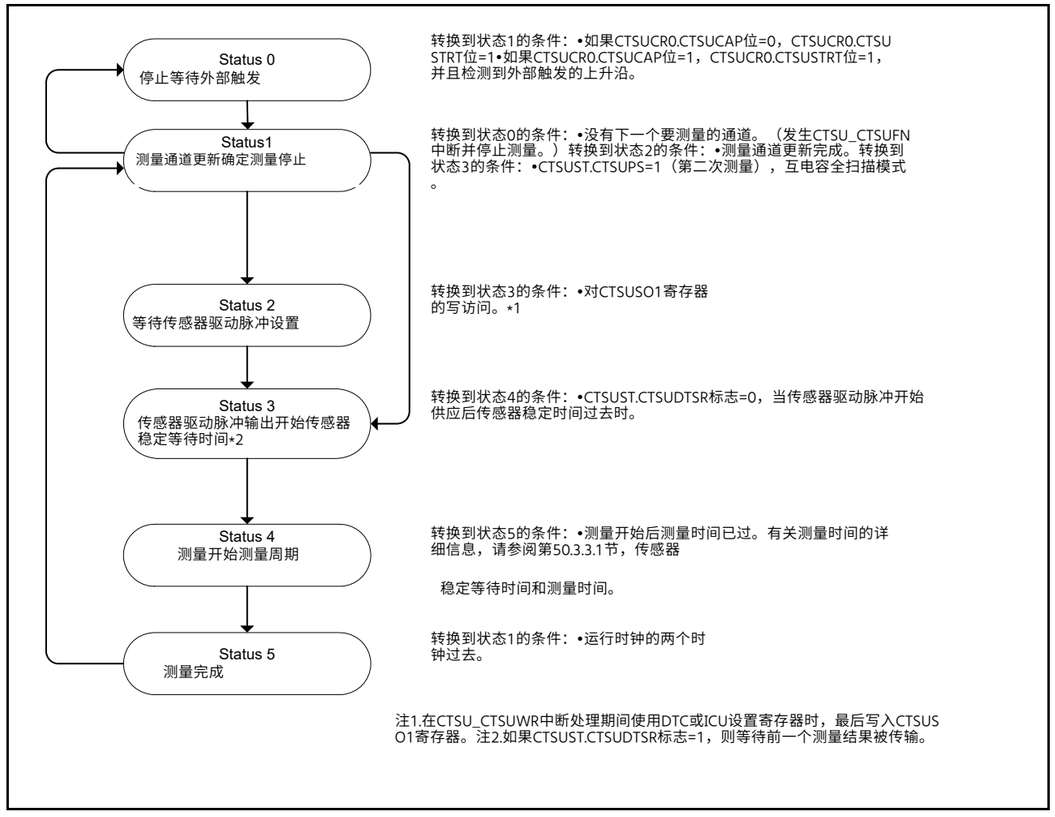

Figure 51.11 状态操作转换

当测量所有指定的测量通道时，状态计数器转换为状态0。

使用软件触发时，CTSUCR0.CTSUSTRT位由硬件清零。使用外部触发时，保留值1，CTSU等待下一次触发。

在测量或触发等待状态期间强制停止操作时，通过同时向CTSUCR0.CTSUSTRT位写入0和向CTSUCR0.CTSUINIT位写入1，状态转换为状态0并停止测量。

如果要测量的通道未在CTSUCHAC0到CTSUCHAC2或CTSUCHTC0到CTSUCHRC2寄存器中设置，则在转换到状态1后立即发生CTSU_CTSUFN中断，然后状态转换到状态0。

在以下情况下，没有要测量的通道：

- CTSUCHAC0至CTSUCHAC2寄存器中未指定测量目标通道。
- 在自电容单次扫描模式下，CTSUCHAC0寄存器中指定的通道不是CTSUCHAC0至CTSUCHAC2寄存器中的测量目标。
- 在全扫描模式下，根据CTSUCHAC0至CTSUCHAC2和CTSUCHTC0至CTSUCHRC2寄存器的组合设置，没有要测量的发送通道或接收通道。

51.3.2.3 Self-capacitance single scan mode operation

In self-capacitance single scan mode, electrostatic capacitance on one channel is measured. Figure 51.12 shows the software flow and an operation example, and Figure 51.13 shows the timing.

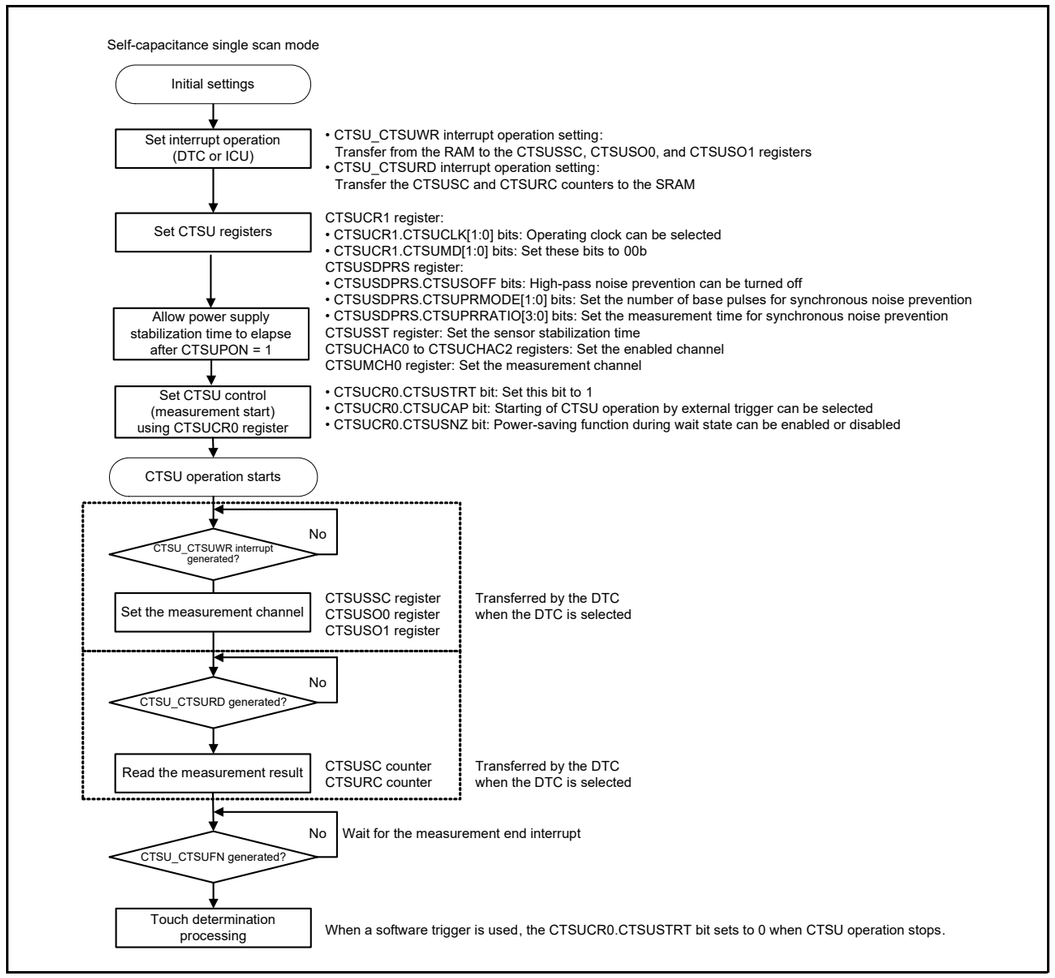

Figure 51.12 Software flow and example operation for self-capacitance single scan mode

51.3.2.3 自电容单次扫描模式操作

在自电容单次扫描模式下，测量一个通道上的静电电容。图51.12显示了软件流程和操作示例，图51.13显示了时序。

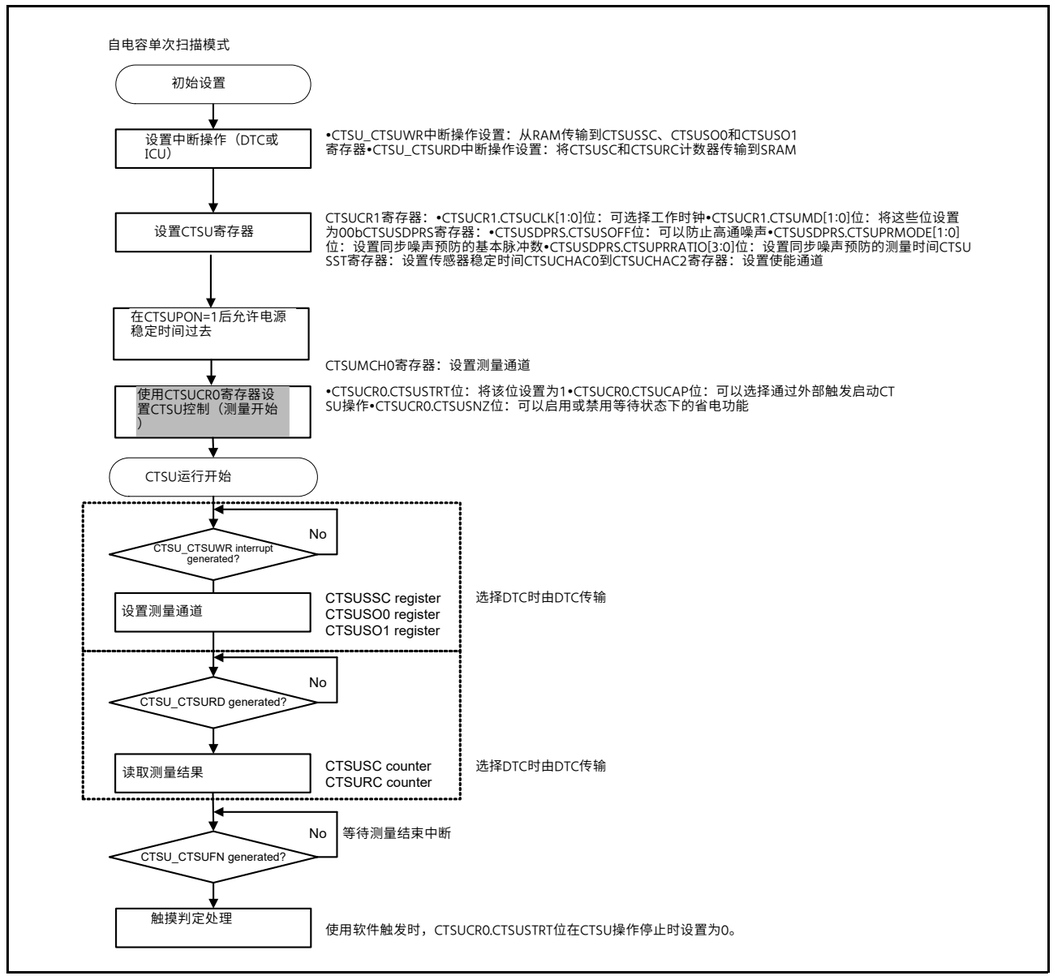

Figure 51.12 自电容单次扫描模式的软件流程和示例操作

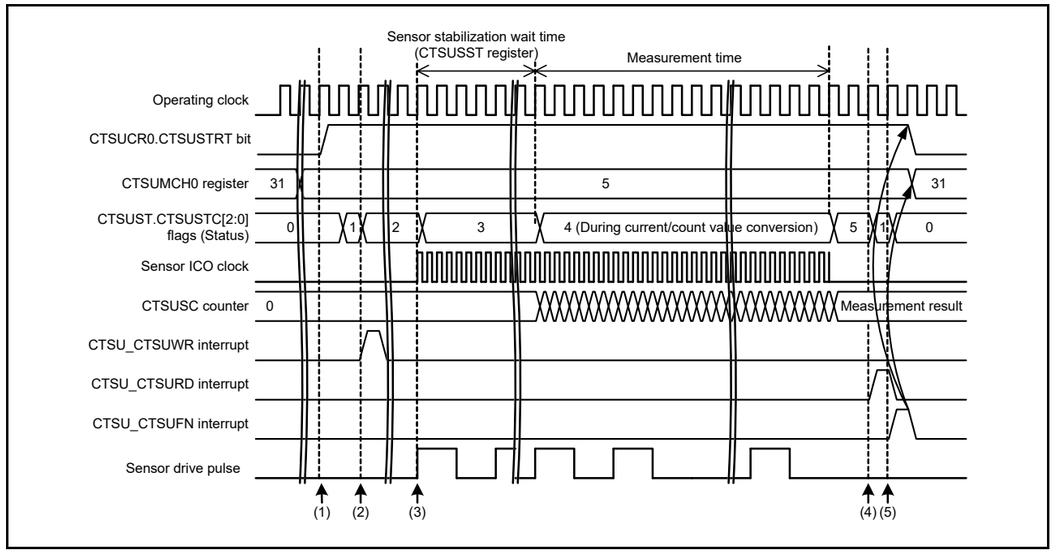

Figure 51.13 Timing of self-capacitance single scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 51.13.

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and reference ICO clock operate.
4. After the sensor stabilization wait time and the measurement time elapse, and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. A measurement end interrupt (CTSU_CTSUFN) is output and measurement stops (transition to Status 0).

Table 51.7 lists the touch pin states in self-capacitance single scan mode.

Table 51.7 Touch pin states in self-capacitance single scan mode

	Touch pin	
Status	**Measured channel**	**Non-measured channel**
0	Low	Low
1	Low	Low
2	Low	Low
3	Pulse	Low
4	Pulse	Low
5	Low	Low

51.3.2.4 Self-capacitance multi-scan mode operation

In self-capacitance multi-scan mode, electrostatic capacitance on all channels that are specified as measurement targets in the CTSUCHAC0 to CTSUCHAC2 registers is measured sequentially in ascending order. Figure 51.14 shows the software flow and an operation example, and Figure 51.15 shows the timing.

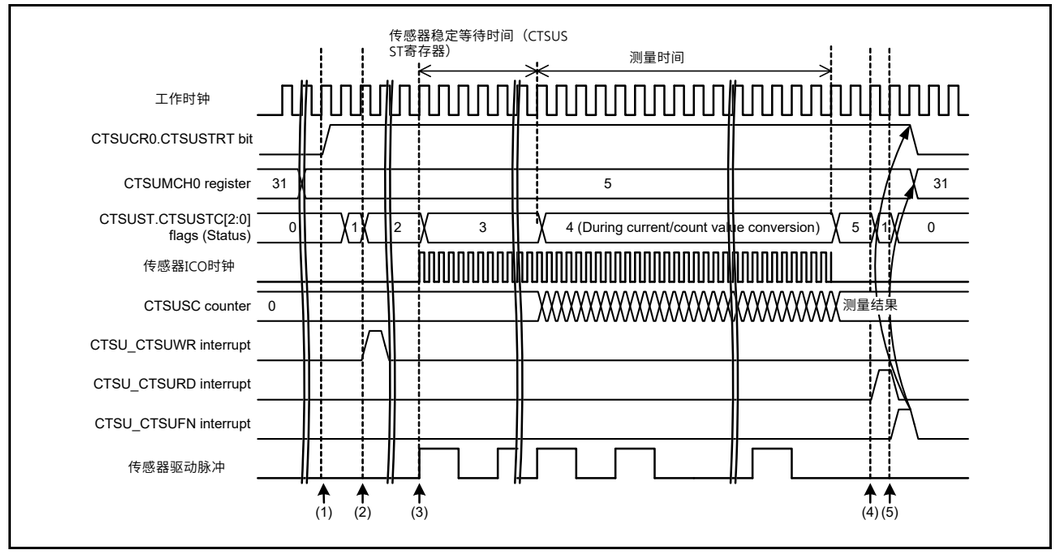

Figure 51.13 测量开始条件为软件触发时的自电容单次扫描模式时序

下面介绍图51.13所示的操作。

1. 进行初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。
2. 根据预设条件确定待测通道后，输出通道设置请求（CTSU_CTSUWR）。
3. 写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。
4. 在传感器稳定等待时间和测量时间过去，测量停止后，输出测量结果读取请求（CTSU_CTSURD）。
5. 输出测量结束中断(CTSU_CTSUFN)并停止测量（转换到状态0）。

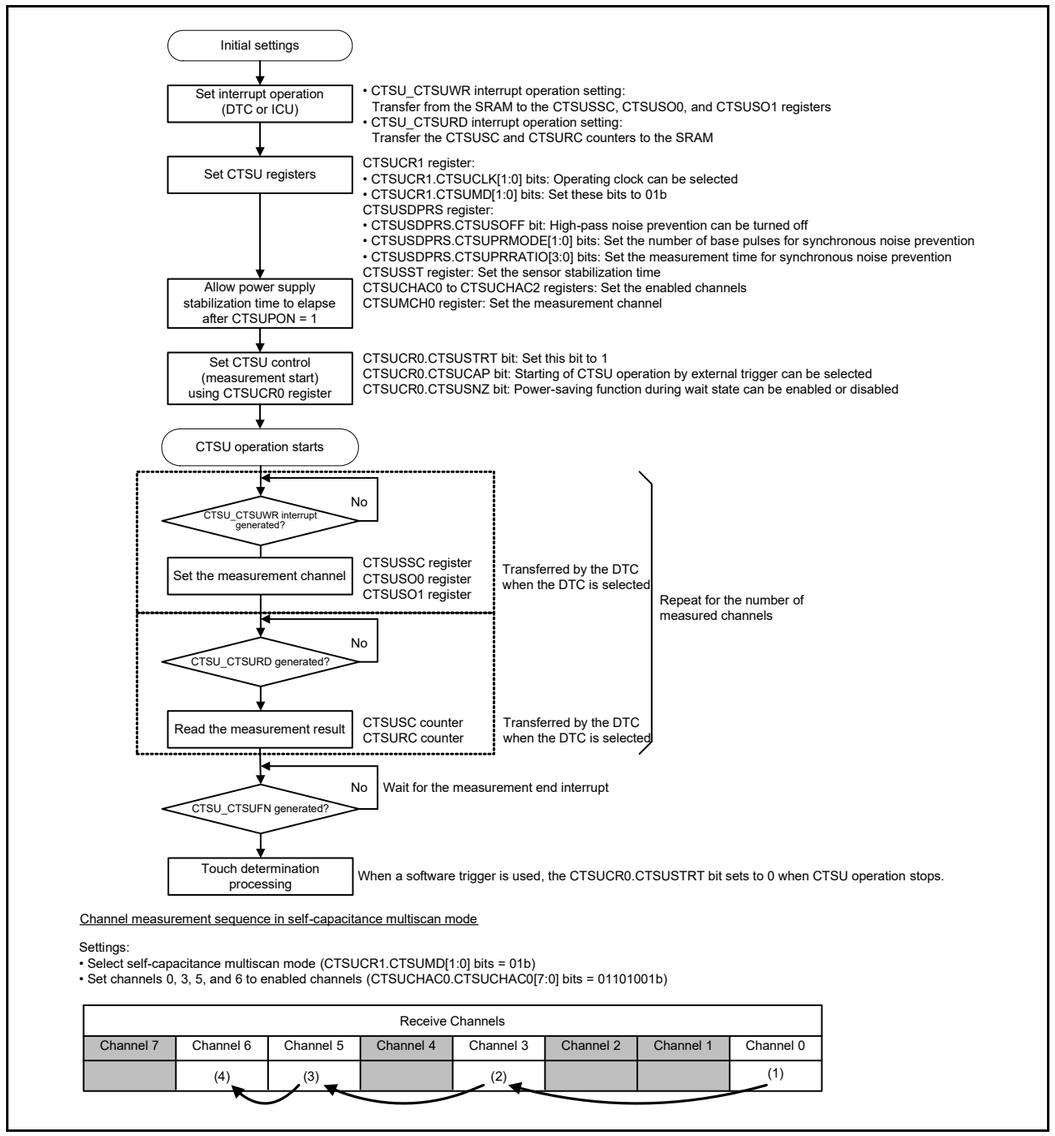
表51.7列出了自电容单次扫描模式下的触摸引脚状态。

Table 51.7 自电容单次扫描模式下的触摸引脚状态

	触摸针	
Status	**测量通道**	**Non-measured channel**
0	Low	Low
1	Low	Low
2	Low	Low
3	Pulse	Low
4	Pulse	Low
5	Low	Low

51.3.2.4 自电容多扫描模式操作

在自电容多重扫描模式下，CTSUCHAC0至CTSUCHAC2寄存器中指定为测量目标的所有通道上的静电电容按升序顺序测量。图51.14显示了软件流程和操作示例，图51.15显示了时序。



Channel measurement sequence in self-capacitance multiscan mode

Settings:
• Select self-capacitance multiscan mode (CTSUCR1.CTSUMD[1:0] bits = 01b)
• Set channels 0, 3, 5, and 6 to enabled channels (CTSUCHAC0.CTSUCHAC0[7:0] bits = 01101001b)

Receive Channels

Figure 51.14 自电容多扫描模式的软件流程和示例操作

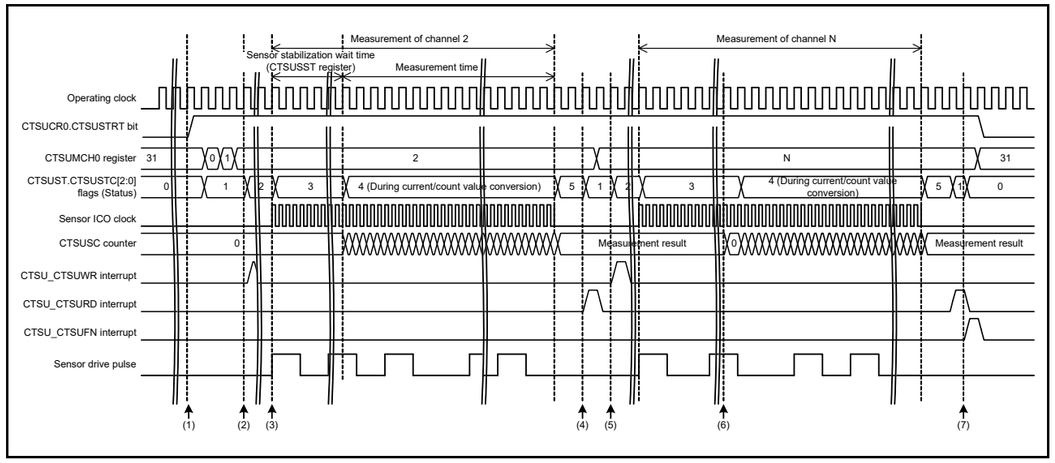

Figure 51.15 Timing of self-capacitance multi-scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 51.15:

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and the reference ICO clock operate.
4. After the sensor stabilization wait time and the measurement time elapse, and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. After the channel to be measured next is determined, a measurement channel setting request (CTSU_CTSUWR) is output.
6. After the stabilization wait time elapses and when the previous measurement is read, the result is cleared and measurement starts.
7. On completion of all measurement channels, a measurement end interrupt (CTSU_CTSUFN) is output and measurement is stopped (transition to Status 0).

Table 51.8 lists the touch pin states in self-capacitance multi-scan mode.

Table 51.8 Touch pin states in self-capacitance multi-scan mode

	Touch pin	
Status	**Measured channel**	**Non-measured channel**

5	Low	Low

51.3.2.5 Mutual capacitance full scan mode operation

In mutual capacitance full scan mode, measurement is performed during the high-level period of the sensor drive pulse on the receive channel by applying the edge to the target transmit channel to be measured. A single measurement target is measured twice, on the rising and falling edges. The difference between the data of these two measurements determines whether or not the electrode was touched, which results in a higher touch sensitivity.

Electrostatic capacitance is measured sequentially on channels set to transmission or reception in the CTSUCHTRC0 to CTSUCHTRC2 registers, and specified as measurement targets in the CTSUCHAC0 to CTSUCHAC2 registers. The capacitance is measured by combining these signals. Figure 51.16 shows the software flow and an operation example, and Figure 51.17 shows the timing.

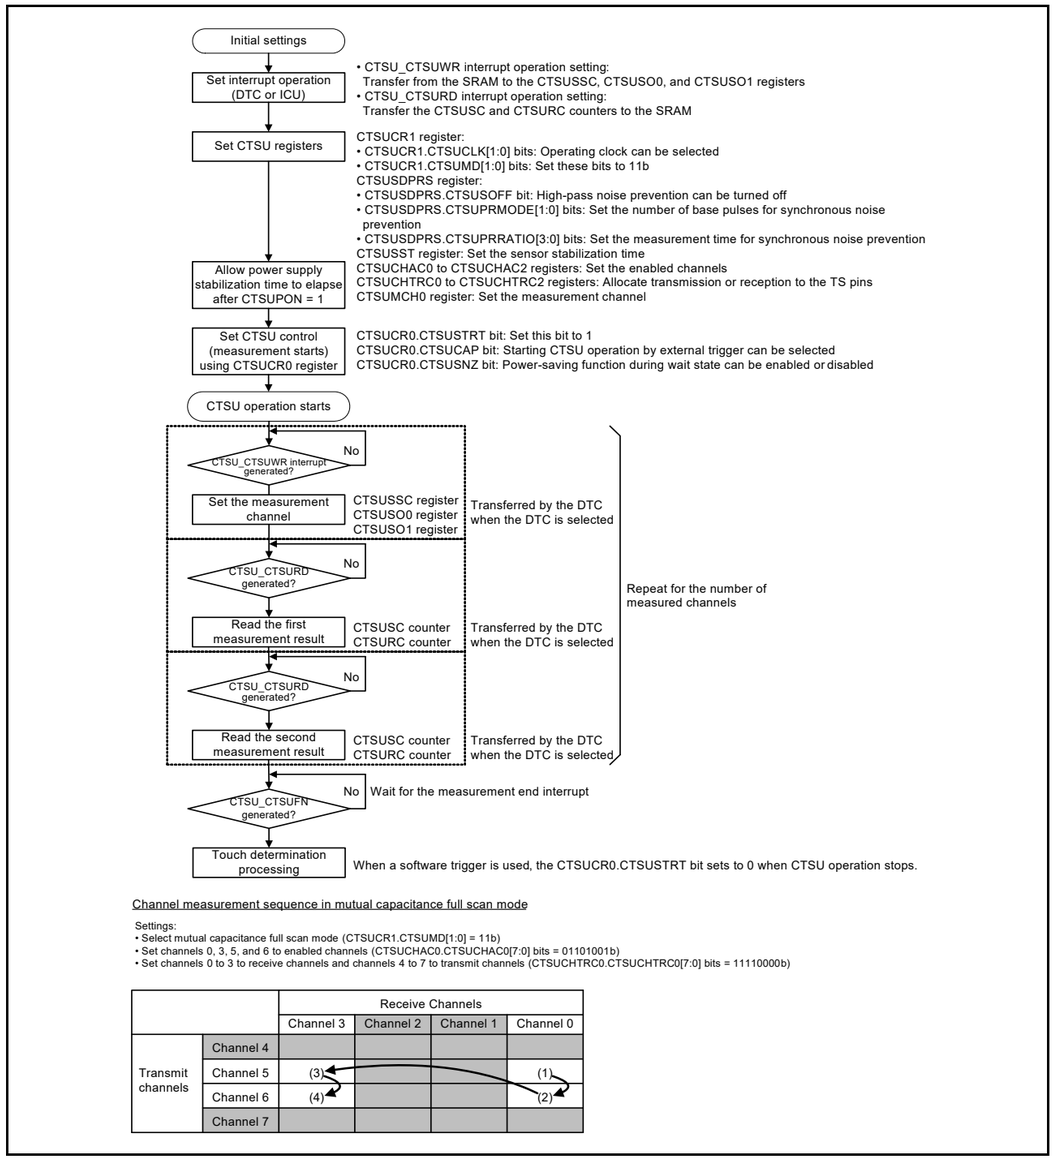

Figure 51.16 Software flow and example operation for mutual capacitance full scan mode

51.3.2.5 互电容全扫描模式操作

在互电容全扫描模式下，在接收通道上的传感器驱动脉冲的高电平期间通过将边沿施加到要测量的目标发送通道来执行测量。在上升沿和下降沿对单个测量目标进行两次测量。这两次测量的数据之间的差异决定了电极是否被触摸，从而导致更高的触摸灵敏度。

在CTSUCHTRC0中设置为发送或接收的通道上依次测量静电电容
CTSUCHAC2寄存器，并在CTSUCHAC0至CTSUCHAC2寄存器中指定为测量目标。通过组合这些信号来测量电容。图51.16显示了软件流程和操作示例，图51.17显示了时序。

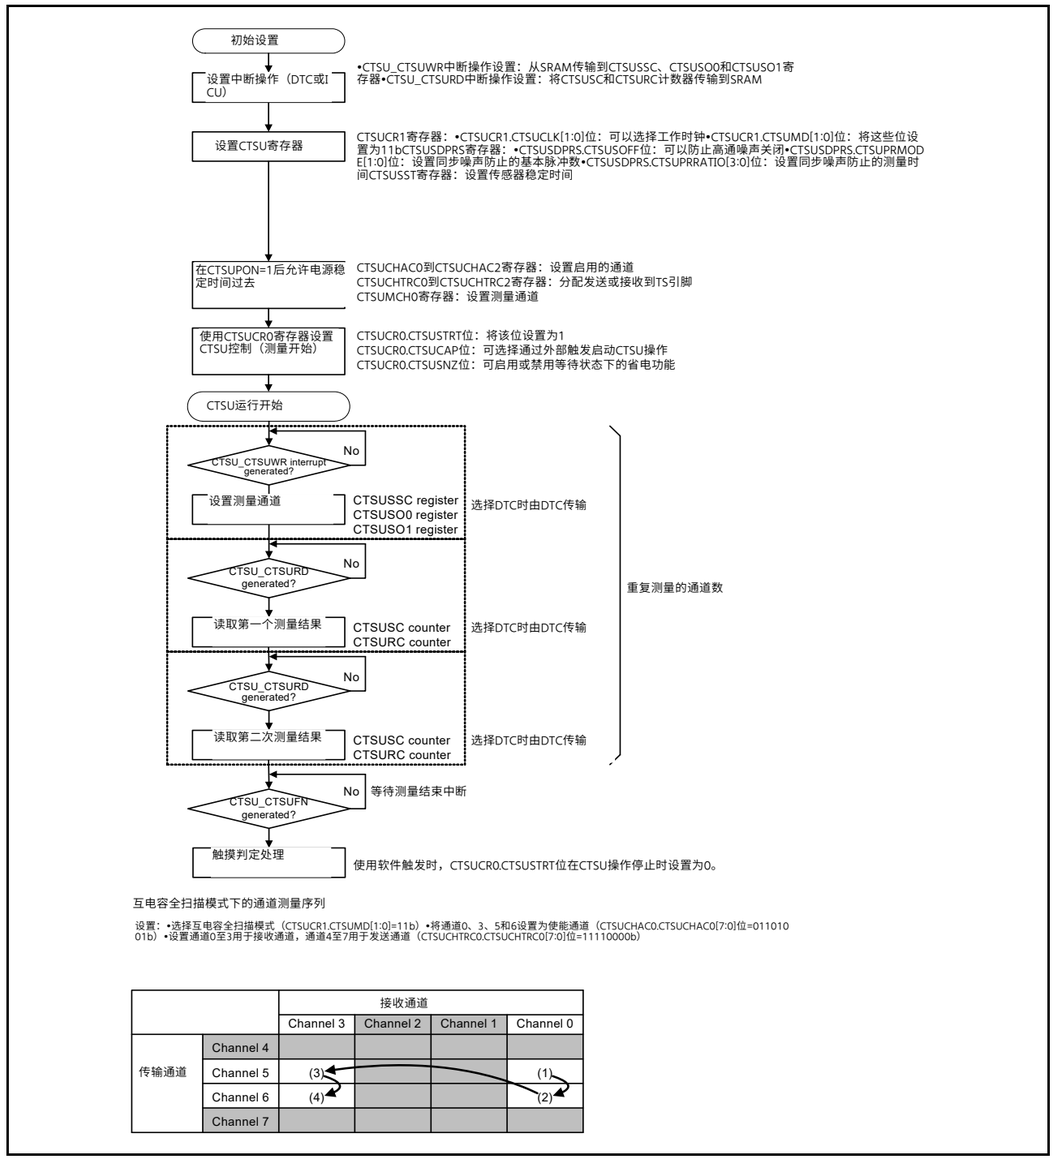

Figure 51.16 互电容全扫描模式的软件流程和示例操作

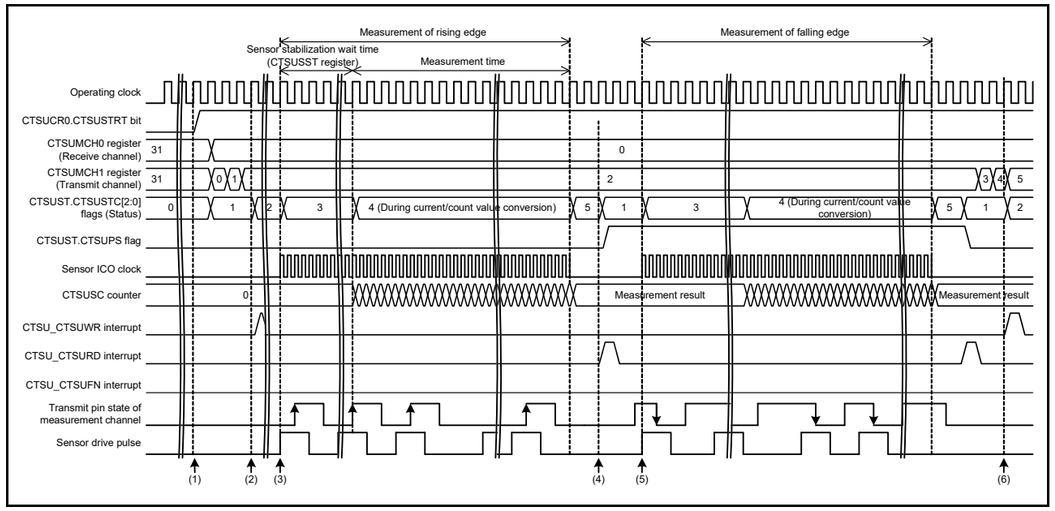

Figure 51.17 Timing of mutual capacitance full scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 51.17.

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and the reference ICO clock operate. At the same time, a pulse detected on the rising edge is output to the transmit pin on the measurement channel during the high-level period of the sensor drive pulse.
4. After the sensor stabilization wait time and the measurement time elapsed and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. The same channel is measured by outputting a pulse detected on the falling edge during the high-level period of the sensor drive pulse.
6. After the same channel is measured twice, the channel to be measured next is determined and measured in the same way.
7. On completion of all measurement channels, a measurement end interrupt (CTSU_CTSUFN) is output and measurement stops (transition to Status 0).

The CTSU mutual capacitance status flag (CTSUST.CTSUPS bit) changes when Status 5 transitions to Status 1.

Table 51.9 lists the touch pin states in mutual capacitance full scan mode.

Table 51.9 Touch pin states in mutual capacitance full scan mode (1 of 2)

Status	Touch pins for receive channels		Touch pins for transmit channels		Remarks
	Measured channel	Non-measured channel	Measured channel	Non-measured channel	
0	Low	Low	Low	Low	-
1	Low	Low	Low/high	Low	-
2	Low	Low	Low	Low	-

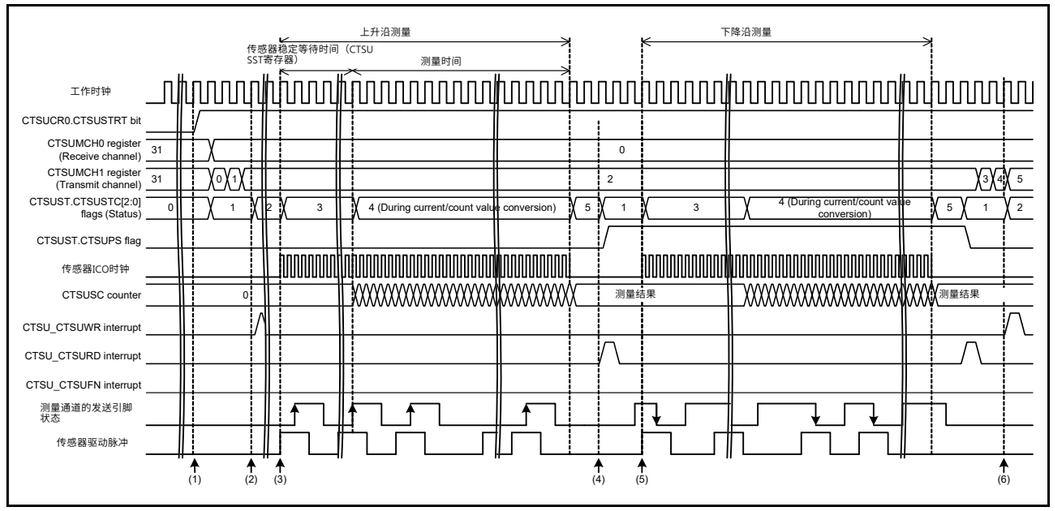

Figure 51.17 测量开始条件为软件触发时互电容全扫描模式的时序

下面介绍图51.17所示的操作。

1. 进行初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。
2. 根据预设条件确定待测通道后，输出通道设置请求（CTSU_CTSUWR）。
3. 写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。同时，在传感器驱动脉冲的高电平期间，将在上升沿检测到的脉冲输出到测量通道的发送引脚。
4. 在传感器稳定等待时间和测量时间过去并停止测量后，输出测量结果读取请求(CTSU_CTSURD)。
5. 通过在传感器驱动脉冲的高电平期间输出在下降沿检测到的脉冲来测量同一通道。
6. 同一通道测量两次后，确定下一个要测量的通道，以同样的方式进行测量。
7. 所有测量通道完成后，将输出测量结束中断(CTSU_CTSUFN)并停止测量（转换到状态0）。

当状态5转换为状态1时，CTSU互电容状态标志（CTSUST.CTSUPS位）发生变化。

表51.9列出了互电容全扫描模式下的触摸引脚状态。

Table 51.9 互电容全扫描模式下的触摸引脚状态（1of2）

Status	接收通道的触摸引脚		用于传输通道的触摸引脚		Remarks
	测量通道	Non-measured channel	测量通道	Non-measured channel	
0	Low	Low	Low	Low	-
1	Low	Low	Low/high	Low	-
2	Low	Low	Low	Low	-

Table 51.9 Touch pin states in mutual capacitance full scan mode (2 of 2)

Status	Touch pins for receive channels		Touch pins for transmit channels		Remarks
	Measured channel	Non-measured channel	Measured channel	Non-measured channel	
3	Pulse	Low	Pulse	Low	The phase pulse is the same as that of the receive channel on the first measurement and opposite on the second measurement.
4	Pulse	Low	Pulse	Low	-
5	Low	Low	Low	Low	-

51.3.3 Parameters Common to Multiple Modes

51.3.3.1 Sensor stabilization wait time and measurement time

Figure 51.18 shows the timing of the sensor stabilization wait and measurement.

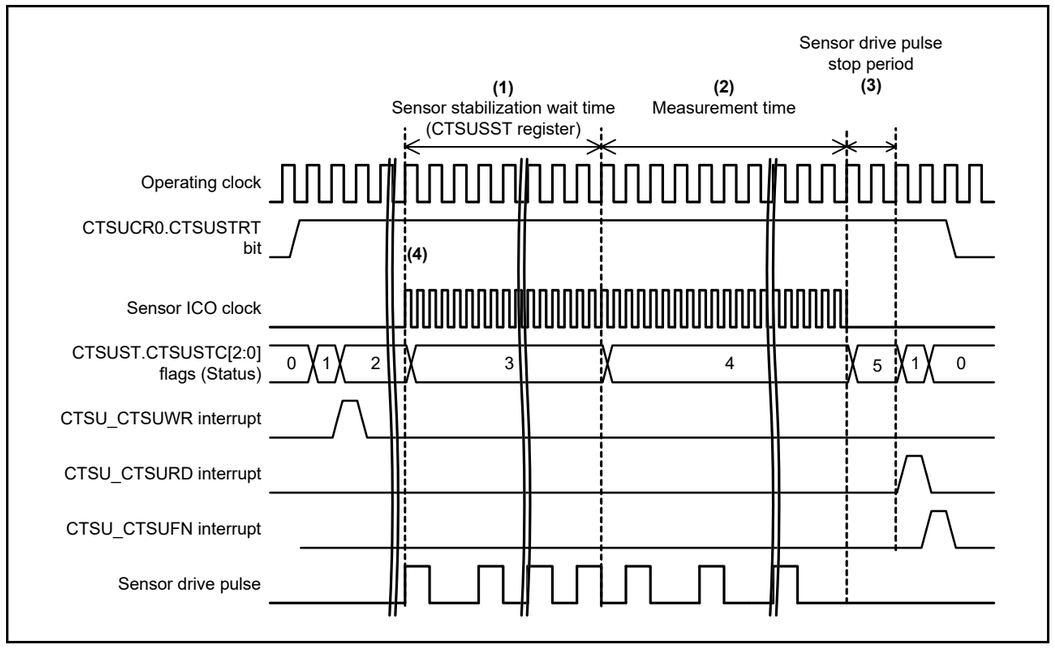

Figure 51.18 Sensor stabilization wait and measurement timing

The following describes the operation shown in Figure 51.18:

1. In response to the CTSU_CTSUWR interrupt request, output of the sensor drive pulse is started by a write access to the CTSUSO1 register. The CTSU waits for the stabilization time set in the CTSUSST register.
2. When the sensor stabilization time elapses and the CTSUST.CTSUDTSR flag clears to 0, measurement starts on transition to Status 4. The measurement time is determined by the base clock cycle setting and the CTSUSDPRS.CTSUPRMODE[1:0], CTSUPRRATIO[3:0], and CTSUSO0.CTSUSNUM[5:0] bits. When the measurement time elapses, measurement of the channel stops.
3. After the measurement time elapses, the status transitions to Status 1 after two operating clock cycles, and a CTSU_CTSURD interrupt occurs. Read the data from the CTSUSC and CTSURC counters. At this time, the sensor drive pulse is output at the low level. When measurement of all specified channels is completed, the CTSUCR0.CTSUSTRT bit clears to 0.
4. The sensor ICO clock oscillates while the CTSUST.CTSUSTC[2:0] flags = 011b (Status 3) or 100b (Status 4).

Table 51.9 互电容全扫描模式下的触摸引脚状态（2个中的2个）

Status	接收通道的触摸引脚		用于传输通道的触摸引脚		Remarks
	测量通道	Non-measured channel	测量通道	Non-measured channel	
3	Pulse	Low	Pulse	Low	相位脉冲在第一次测量时与接收通道的相位脉冲相同，而在第二次测量时则相反。
4	Pulse	Low	Pulse	Low	-
5	Low	Low	Low	Low	-

51.3.3 多种模式共有的参数

51.3.3.1 传感器稳定等待时间和测量时间

图51.18显示了传感器稳定等待和测量的时序。

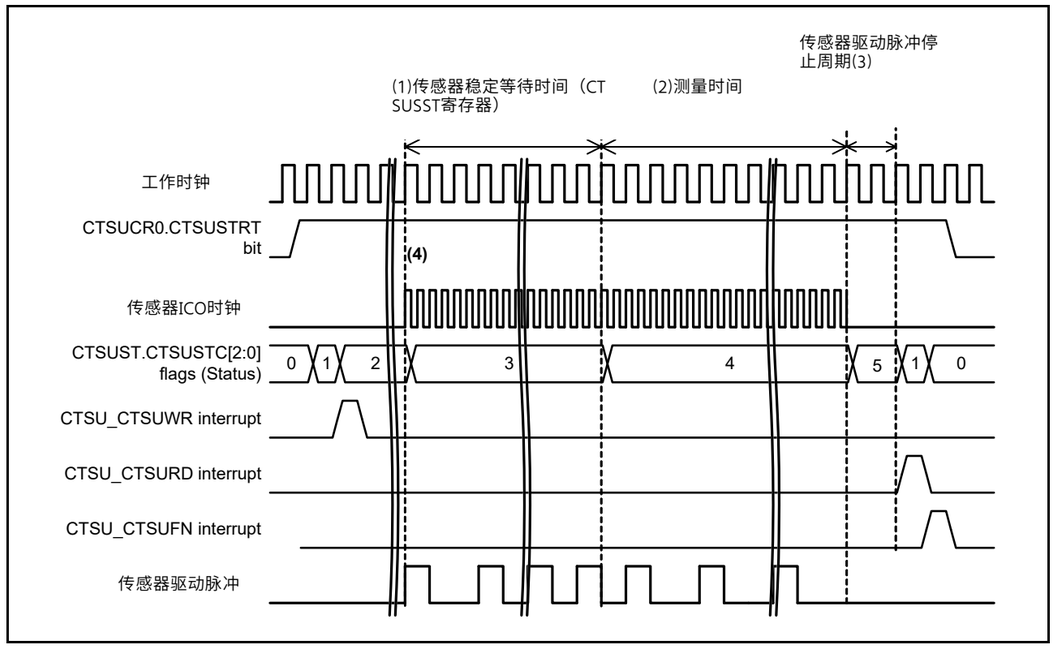

Figure 51.18 传感器稳定等待和测量定时

下面介绍图51.18所示的操作：

1. 响应CTSU_CTSUWR中断请求，通过对CTSUSO1寄存器的写访问开始输出传感器驱动脉冲。CTSU等待CTSUSST寄存器中设置的稳定时间。
2. 当传感器稳定时间过去且CTSUST.CTSUDTSR标志清除为0时，测量开始转换到状态4。测量时间由基本时钟周期设置和CTSUSDPRS.CTSUPRMODE[1:0]、CTSUPRATIO[3:0]和CTSUSO0.CTSUSNUM[5:0]位。当测量时间过去时，通道的测量将停止。
3. 测量时间过去后，状态在两个工作时钟周期后转换为状态1，并且CTSU_CTSURD中断发生。从CTSUSC和CTSURC计数器读取数据。此时，传感器驱动脉冲输出为低电平。完成所有指定通道的测量后，CTSUCR0.CTSUSTRT位清零。
4. 传感器ICO时钟在CTSUST.CTSUSTC[2:0]标志=011b（状态3）或100b（状态4）时振荡。

51.3.3.2 Interrupts

The CTSU supports the following interrupts:

- Write request interrupt for setting registers for each channel (CTSU_CTSUWR)
- Measurement data transfer request interrupt (CTSU_CTSURD)
- Measurement end interrupt (CTSU_CTSUFN).

(1) Write request interrupt for setting registers for each channel (CTSU_CTSUWR)

Store the settings for each measurement channel in the SRAM, and set up the DTC or ICU transfer associated with the CTSU_CTSUWR interrupt in advance. The CTSU_CTSUWR interrupt is output when Status 1 transitions to Status 2. Write the settings for the selected channel from the SRAM to the CTSUSSC, CTSUSO0, and CTSUSO1 registers (Figure 51.19). Because write access to the CTSUSO1 register controls the transition to the next status, you must set this register last.

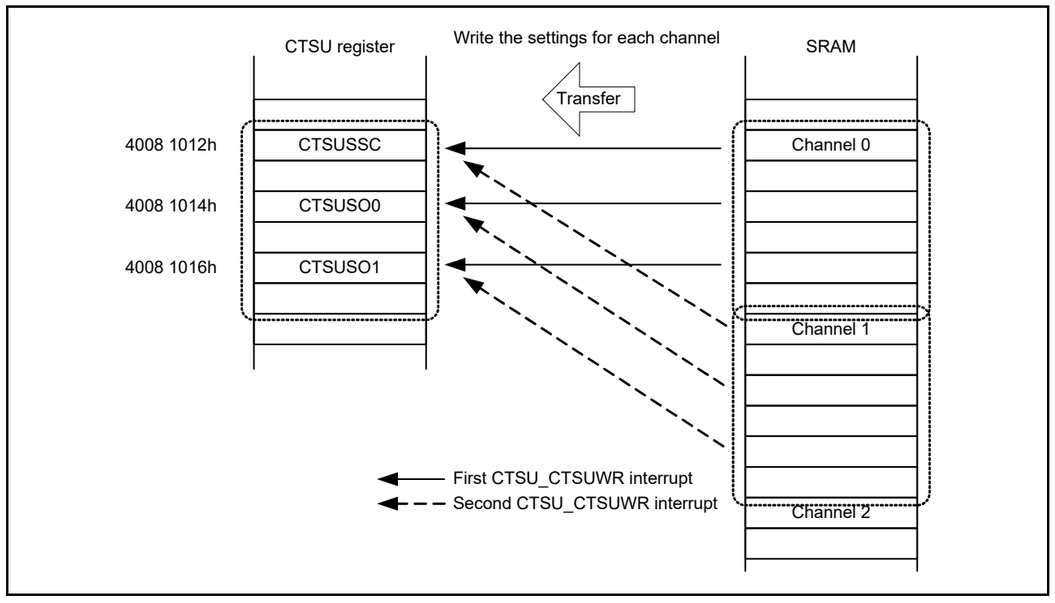

Figure 51.19 Example of DTC transfer operation using the CTSU_CTSUWR interrupt

The registers to be set (CTSUSSC, CTSUSO0, and CTSUSO1) are allocated at sequential addresses. On CTSU_CTSUWR interrupt generation, set up the operation as follows:

- Transfer destination address: CTSUSSC register address
- Handling at the transfer destination address: Transfer 2-byte data three times with a single interrupt. The address of the start byte is fixed
- Transfer source address: CTSUSSC register data storage address for the lowest number channel in the settings stored in the SRAM
- Handling at the transfer source address: Transfer 2-byte data three times with a single interrupt. The address of the first byte is continued from the previous interrupt handling
- Number of transfers per interrupt: Specify the number of measurements.

(2) Measurement data transfer request interrupt (CTSU_CTSURD)

Set up the DTC or ICU transfer associated with the CTSU_CTSURD interrupt in advance. The CTSU_CTSURD interrupt is output when Status 5 transitions to Status 1. Read the measurement result from the CTSUSC and CTSURC counters (Figure 51.20).

51.3.3.2 Interrupts

CTSU支持以下中断：

- 为每个通道设置寄存器的写请求中断(CTSU_CTSUWR)
- 测量数据传输请求中断(CTSU_CTSURD)
- 测量结束中断(CTSU_CTSUFN)。

(1) 为每个通道设置寄存器的写请求中断(CTSU_CTSUWR)

将每个测量通道的设置存储在SRAM中，并提前设置与CTSU_CTSUWR中断相关的DTC或ICU传输。当状态1转换到状态2时输出CTSU_CTSUWR中断。
将所选通道的设置从SRAM写入CTSUSSC、CTSUSO0和CTSUSO1寄存器（图51.19）。因为对CTSUSO1寄存器的写访问控制到下一个状态的转换，所以您必须最后设置该寄存器。

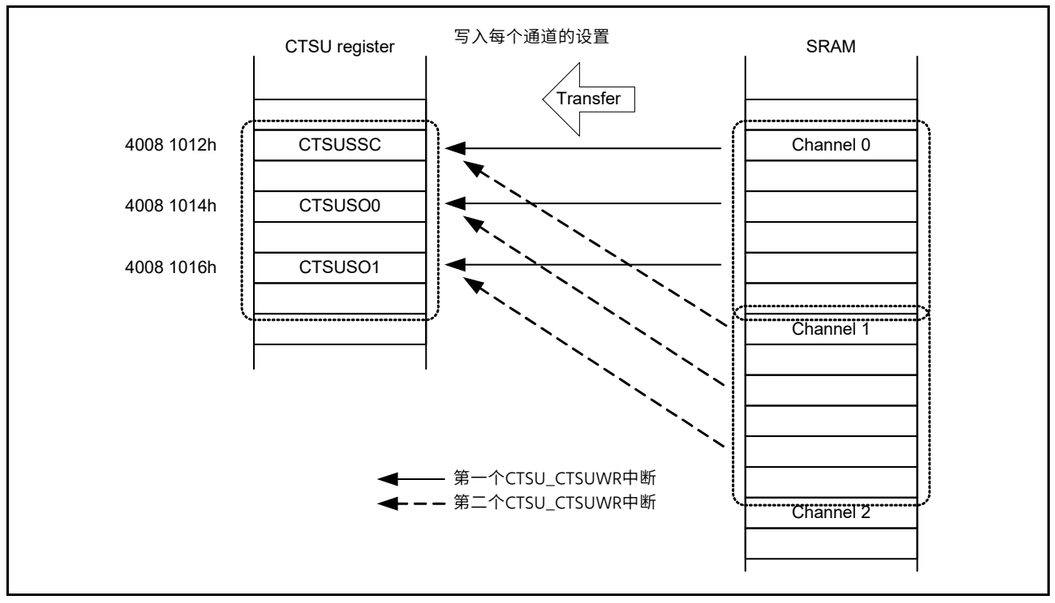

Figure 51.19 使用CTSU_CTSUWR中断的DTC传输操作示例

要设置的寄存器（CTSUSSC、CTSUSO0和CTSUSO1）分配在顺序地址。上
CTSU_CTSUWR中断产生，设置操作如下：

- 传输目标地址：CTSUSSC寄存器地址
- 传送目标地址处的处理：一次中断传送3次2字节数据。起始字节的地址是固定的
- 传输源地址：CTSUSSC寄存器数据存储地址，用于SRAM中存储的设置中编号最小的通道
- 传输源地址处的处理：一次中断传输3次2字节数据。第一个字节的地址从之前的中断处理继续
- 每次中断的传输次数：指定测量次数。

(2) 测量数据传输请求中断(CTSU_CTSURD)

提前设置与CTSU_CTSURD中断相关的DTC或ICU传输。当状态5转换为状态1时输出CTSU_CTSURD中断。从CTSUSC和CTSURC计数器读取测量结果（图51.20）。

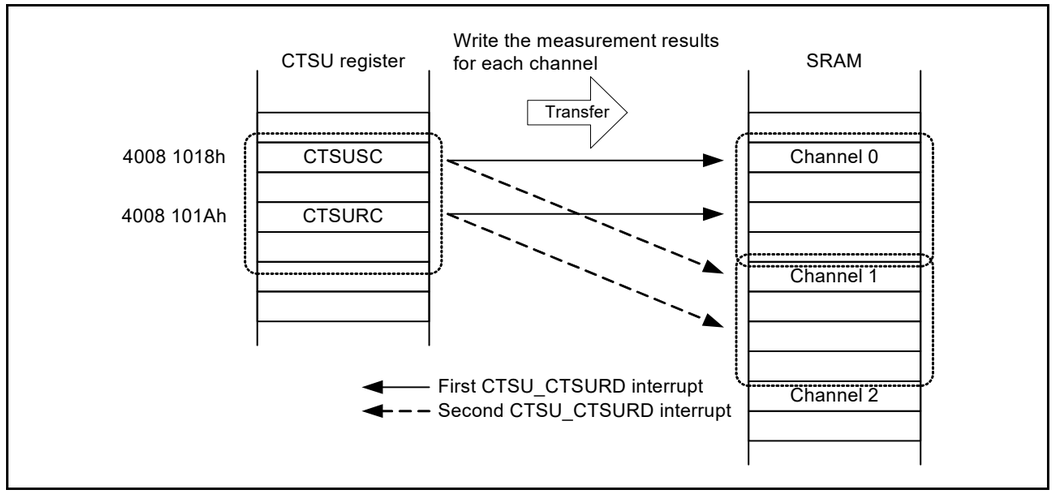

Figure 51.20 Example of DTC transfer operation using the CTSU_CTSURD interrupt

The measurement result registers (CTSUSC and CTSURC counters) used as transfer sources are allocated at sequential addresses. On CTSU_CTSURD interrupt generation, set up the operation as follows:

- Transfer source address: CTSUSC counter address
- Handling at the transfer source address: Transfer 2-byte data twice with a single interrupt. The start address is fixed
- Transfer destination address: CTSUSC counter data storage address for the lowest number channel in the settings stored in the SRAM
- Handling at the transfer destination address: Transfer 2-byte data twice with a single interrupt. The start address is continued from the previous interrupt handling
- Number of transfers per interrupt: Specify the number of measurements.

(3) Measurement end interrupt (CTSU_CTSUFN)

When all channels are measured, an interrupt occurs when Status 1 transitions to Status 0. In the software, check the overflow flags (CTSUST.CTSUSOVF and CTSUROVF) and read the measurement results to determine whether or not the electrode was touched. Interrupt requests are accepted or disabled in the interrupt control block.

51.4 Usage Notes

51.4.1 Measurement Result Data (CTSUSC and CTSURC Counters)

Read access during measurement is prohibited. If the measurement result data is accessed, an incorrect value might be read because of asynchronous operation.

51.4.2 Constraint on Software Trigger

When 10b (PCLKB/4) is selected in the CTSUCR1.CTSUCLK[1:0] bits, to restart measurement by writing 1 to the CTSUR0.CTSUSTRT bit after measurement is complete, wait for at least 3 cycles to elapse after an interrupt occurs, and then write to the CTSUCR0.CTSUSTRT bit.

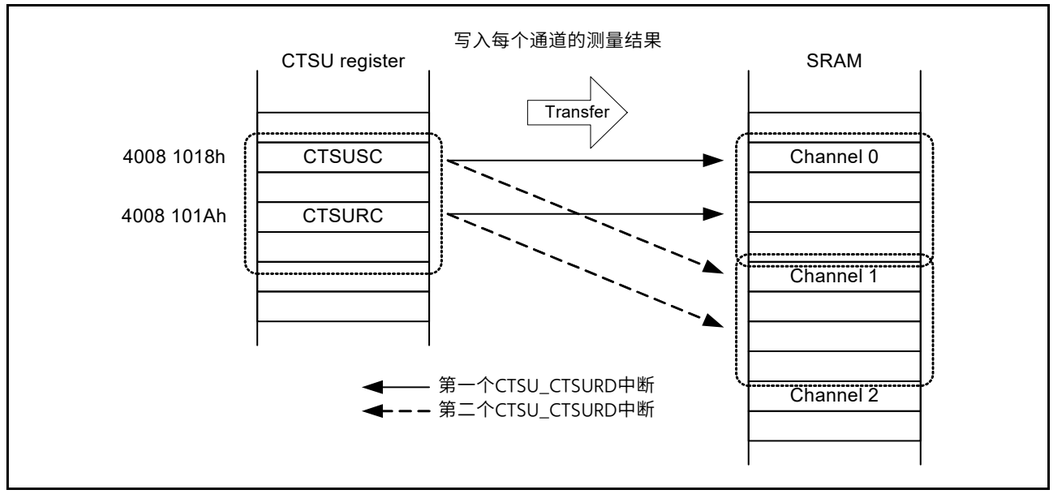

Figure 51.20 使用CTSU_CTSURD中断的DTC传输操作示例

用作传输源的测量结果寄存器（CTSUSC和CTSURC计数器）按顺序分配。在CTSU_CTSURD中断生成时，按如下方式设置操作：

- 传输源地址：CTSUSC计数器地址
- 传输源地址处的处理：用一个中断传输2字节数据两次。起始地址是固定的
- 传送目标地址：SRAM中存储的设置中最小编号通道的CTSUSC计数器数据存储地址
- 传送目标地址处的处理：用一个中断传送2字节数据两次。起始地址从上一个中断处理继续
- 每次中断的传输次数：指定测量次数。

(3) 测量结束中断(CTSU_CTSUFN)

测量所有通道时，状态1转换为状态0时发生中断。在软件中，检查溢出标志（CTSUST.CTSUSOVF和CTSUROVF）并读取测量结果以确定电极是否被触摸。在中断控制块中接受或禁用中断请求。

51.4 使用说明

51.4.1 测量结果数据（CTSUSC和CTSURC计数器）

禁止在测量期间进行读取访问。如果访问测量结果数据，可能会因为异步操作而读取到不正确的值。

51.4.2 软件触发约束

当在CTSUCR1.CTSUCLK[1:0]位中选择10b(PCLKB4)时，通过将1写入
测量完成后CTSUR0.CTSUSTRT位，在发生中断后至少等待3个周期，然后写入CTSUCR0.CTSUSTRT位。

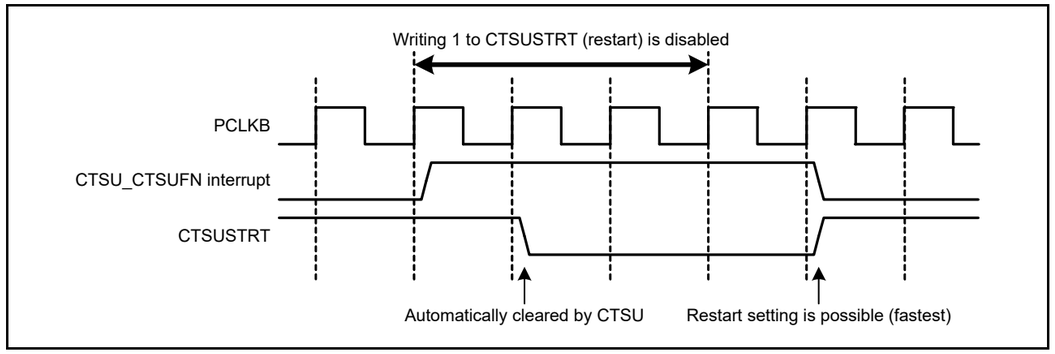

Figure 51.21 Notes on restarting measurement

51.4.3 Constraints on External Triggers

- If an external trigger is input during the measurement time, measurement does not start. The next external event is enabled after 1 cycle of the operating clock when a CTSU_CTSUFN interrupt occurs.
- To stop external trigger mode, write 0 to the CTSUCR0.CTSUSTRT bit and 0 to the CTSUCR0.CTSUINIT bit at the same time (forced stop).

51.4.4 Constraints on Forced Stops

To force the current operation to stop, write 0 to the CTSUCR0.CTSUSTRT bit and 1 to the CTSUCR0.CTSUINIT bit at the same time. After this setting, the operation is stopped and the internal control registers are initialized.

When the CTSUCR0.CTSUINIT bit is used for initialization, the following registers are initialized in addition to the initialization of the internal measurement state.

- CTSUMCH0 register
- CTSUMCH1 register
- CTSUST register
- CTSUSC counter
- CTSURC counter.

If operation is forced to stop, an interrupt request might be generated depending on the internal state. After a forced stop, also perform the processing for stopping and disabling the DTC or ICU. If a DTC transfer is stopped in an installed system for some reason, also perform the processing for forcing stop to and initializing the CTSU.

51.4.5 TSCAP Pin

The TSCAP pin requires an external decoupling capacitor to stabilize CTSU internal voltage. The traces between the TSCAP pin and the capacitor, and the capacitor and ground should be as short and wide as physically possible.

The capacitor connected to the TSCAP pin should be fully discharged using I/O port control to output a low level, before turning on the switch (CTSUCR1.CTSUCSW bit = 1) to establish a connection.

51.4.6 Constraints on Measurement Operation (CTSUCR0.CTSUSTRT Bit = 1)

During measurement (CTSUCR0.CTSUSTRT bit = 1), do not use the settings for stopping the peripheral clock or changing the port settings related to the touch pins (TSn and TSCAP pins) and Transmission power supply selection (CTSUCR0.CTSUTXVSEL) in the higher layers of the system.

If control settings non-compliant with these constraints are made, operation is forced to stop (CTSUCR0.CTSUSTRT bit = 0 and CTSUCR0.CTSUINIT bit = 1), write 0 to the CTSUCR1.CTSUPON bit and 0 to the CTSUCR1.CTSUCSW bit at the same time, and set the CTSUCR0.CTSUSNZ bit to 0. Next, restart from the initial settings flow shown in Figure 51.9.

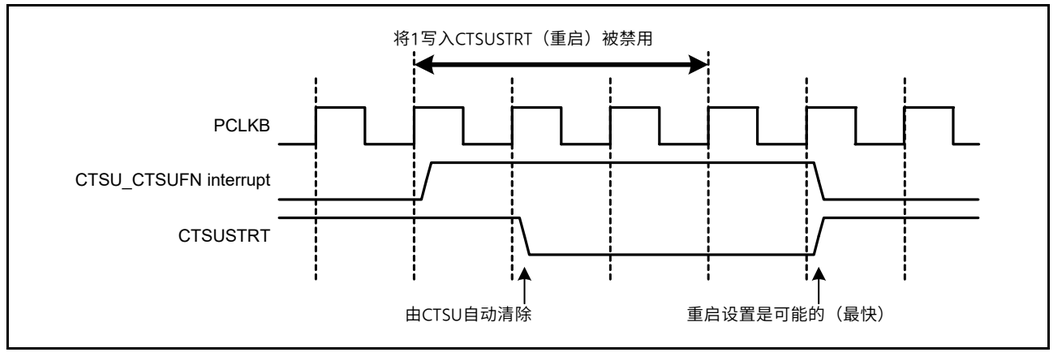

Figure 51.21 重新开始测量的注意事项

51.4.3 外部触发器的约束

- 如果在测量期间输入外部触发，测量不会开始。当CTSU_CTSUFN中断发生时，下一个外部事件在工作时钟的1个周期后启用。
- 要停止外部触发模式，同时向CTSUCR0.CTSUSTRT位写入0和向CTSUCR0.CTSUINIT位写入0（强制停止）。

51.4.4 强制停止的约束

要强制停止当前操作，请同时向CTSUCR0.CTSUSTRT位写入0，向CTSUCR0.CTSUINIT位写入1。设置完成后，操作停止，内部控制寄存器初始化。

当CTSUCR0.CTSUINIT位用于初始化时，除了内部测量状态的初始化之外，还初始化以下寄存器。

- CTSUMCH0 register
- CTSUMCH1 register
- CTSUST register
- CTSUSC counter
- CTSURC counter.

如果操作被强制停止，根据内部状态可能会产生中断请求。强制停止后，还要执行停止和禁用DTC或ICU的处理。如果由于某种原因在已安装的系统中停止了DTC传输，则还要执行强制停止和初始化CTSU的处理。

51.4.5 TSCAP Pin

TSCAP引脚需要一个外部去耦电容来稳定CTSU内部电压。之间的痕迹
TSCAP引脚和电容器，以及电容器和地线应尽可能短且宽。

在打开开关（CTSUCR1.CTSUCSW位=1）建立连接之前，应使用IO端口控制将连接到TSCAP引脚的电容器完全放电以输出低电平。

51.4.6 测量操作的限制（CTSUCR0.CTSUSTRT位=1）

在测量期间（CTSUCR0.CTSUSTRT位=1），请勿使用与触摸引脚（TSn和TSCAP引脚）和发送电源选择（CTSUCR0.CTSUTXVSEL）相关的端口设置停止外围时钟或更改高位系统的层次。

如果进行了不符合这些约束的控制设置，则强制停止操作（CTSUCR0.CTSUSTRT位=0且CTSUCR0.CTSUINIT位=1），将0写入CTSUCR1.CTSUPON位并将0写入CTSUCR1.CTSUCSW位同时，将CTSUCR0.CTSUSNZ位设置为0。接下来，从图51.9所示的初始设置流程重新启动。

52. Data Operation Circuit (DOC)

52.1 Overview

The Data Operation Circuit (DOC) is used to compare, add, and subtract 16-bit data. When a selected condition applies, 16-bit data is compared and an interrupt can be generated. Table 52.1 lists the DOC specifications and Figure 52.1 shows a block diagram.

Table 52.1 DOC specifications

Parameter	Specifications
Data operation function	16-bit data comparison, addition, and subtraction
Module-stop function	Module-stop state can be set to reduce power consumption
Interrupts and event link function (DOC_DOPCI)	An interrupt occurs on the following conditions: • Compared values either match or mismatch • Data addition result is greater than FFFFh • Data subtraction result is less than 0000h

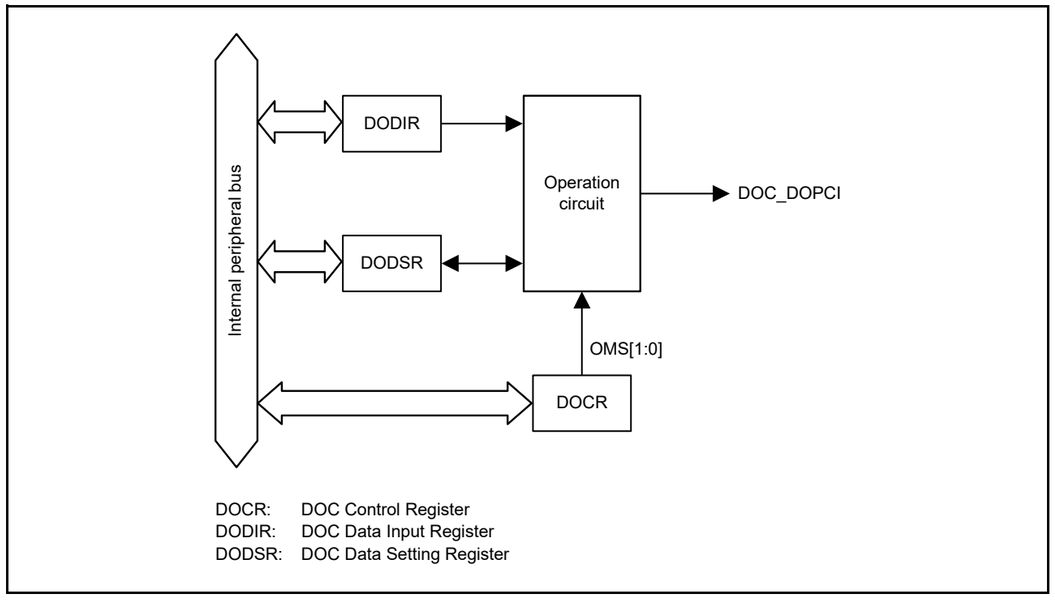

Figure 52.1 DOC block diagram

52. 数据运算电路(DOC)

52.1 Overview

数据运算电路(DOC)用于比较、加和减16位数据。当适用选定条件时，比较16位数据并可以生成中断。表52.1列出了DOC规范，图52.1显示了框图。

Table 52.1 文档规范

Parameter	Specifications
数据运算功能	16位数据比较、加法和减法
Module-stop function	可设置模块停止状态以降低功耗
中断和事件链接功能（DOC_DOPCI）	在以下条件下发生中断： 比较值匹配或不匹配 数据加法结果大于FFFFh 数据减法结果小于0000h

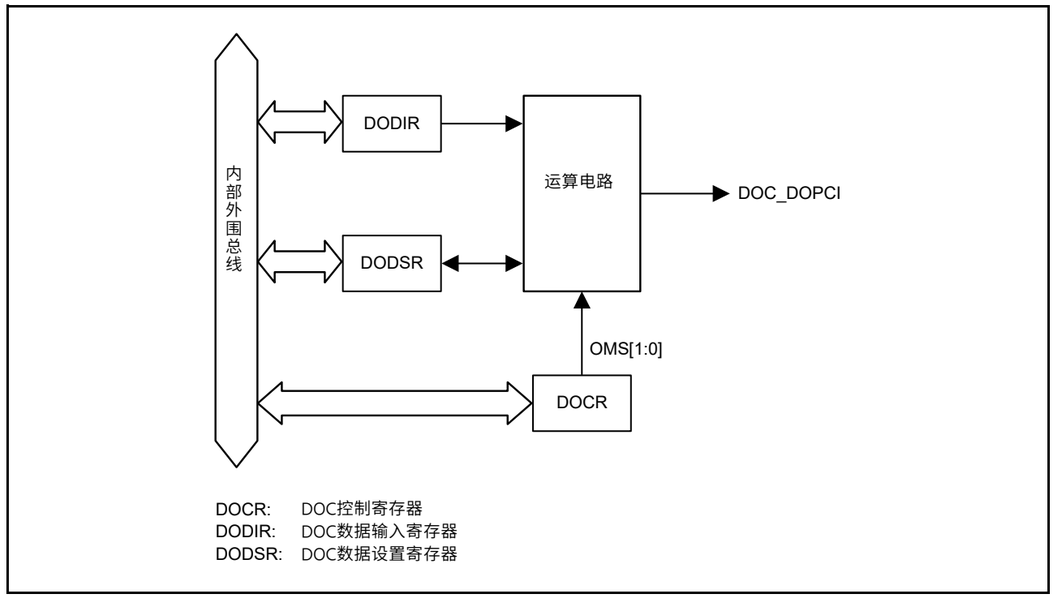

Figure 52.1 文档框图

52.2 Register Descriptions

52.2.1 DOC Control Register (DOCR)

Address(es): DOC.DOCR 4005 4100h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	DOPCFCL	DOPCF	—	—	DCSEL	OMS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	OMS[1:0]	Operating Mode Select	b1 b0 0 0: Data comparison mode 0 1: Data addition mode 1 0: Data subtraction mode 1 1: Setting prohibited.	R/W
b2	DCSEL*1	Detection Condition Select	0: Set DOPCF when data mismatch detected 1: Set DOPCF when data match detected.	R/W
b4, b3	—	Reserved	There bits are read as 0. The write value should be 0.	R/W
b5	DOPCF	Data Operation Circuit Flag	Indicates the result of an operation.	R
b6	DOPCFCL	DOPCF Clear	0: Retain DOPCF flag state 1: Clear DOPCF flag.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Only valid when data comparison mode is selected.

OMS[1:0] bits (Operating Mode Select)

The OMS[1:0] bits select the operating mode of the DOC.

DCSEL bit (Detection Condition Select)

The DCSEL bit selects the detection condition in data comparison mode. This bit is only valid when data comparison mode is selected.

DOPCF flag (Data Operation Circuit Flag)

The DOPCF flag indicates the result of an operation.

[Setting conditions]

- The condition selected in the DCSEL bit is met
- A data addition result is greater than FFFFh
- A data subtraction result is less than 0000h.

[Clearing condition]

- Writing 1 to the DOPCFCL bit.

DOPCFCL bit (DOPCF Clear)

Setting the DOPCFCL bit to 1 clears the DOPCF flag. This bit is read as 0.

52.2 注册说明

52.2.1 DOC控制寄存器(DOCR)

Address(es): DOC.DOCR 4005 4100h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	DOPCFCL	DOPCF	—	—	DCSEL	OMS[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	OMS[1:0]	操作模式选择	b1b000：数据比较模式01： 数据加法模式10：数据减法 模式11：禁止设置。	R/W
b2	DCSEL*1	检测条件选择	0：检测到数据不匹配时置位DOPCF1：检测 到数据匹配时置位DOPCF。	R/W
b4, b3	—	Reserved	有位被读取为0。写入值应为0。	R/W
b5	DOPCF	数据运算电路标志	表示操作的结果。	R
b6	DOPCFCL	DOPCF Clear	0：保持DOPCF标志状态1 ：清除DOPCF标志。	R/W
b7	—	Reserved	该位读取为0。写入值应为0。	R/W

Note 1. 仅在选择数据比较模式时有效。

OMS[1:0]位（操作模式选择）

OMS[1:0]位选择DOC的工作模式。

DCSEL位（检测条件选择）

DCSEL位选择数据比较模式下的检测条件。该位仅在选择数据比较模式时有效。

DOPCF标志（数据操作电路标志）

DOPCF标志指示操作的结果。

[Setting conditions]

- 满足在DCSEL位中选择的条件
- 数据相加结果大于FFFFh
- 数据减法结果小于0000h。

[Clearing condition]

- 将1写入DOPCFCL位。

DOPCFCL位（DOPCF清除）

将DOPCFCL位设置为1会清除DOPCF标志。该位读为0。

52.2.2 DOC Data Input Register (DODIR)

Address(es): DOC.DODIR 4005 4102h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DODIR is a 16-bit read/write register that stores 16-bit data used in the operations.

52.2.3 DOC Data Setting Register (DODSR)

Address(es): DOC.DODSR 4005 4104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DODSR is a 16-bit read/write register that stores 16-bit data used as a reference in data comparison mode. This register also stores the results of operations in data addition and subtraction modes.

52.3 Operation

52.3.1 Data Comparison Mode

Figure 52.2 shows an example of the steps involved in data comparison mode operation by the DOC. The following is an example operation when DCSEL is set to 0 (data mismatch is detected as a result of data comparison):

1. Write 00b to the DOCR.OMS[1:0] bits to select data comparison mode.
2. Set 16-bit reference data in DODSR.
3. Write 16-bit data for comparison to DODIR.
4. Continue writing 16-bit data until all data for comparison is written to DODIR.
5. If a value written to DODIR does not match that in DODSR,*1 the DOCR.DOPCF flag sets to 1.

Note 1. When DOCR.DCSEL = 0

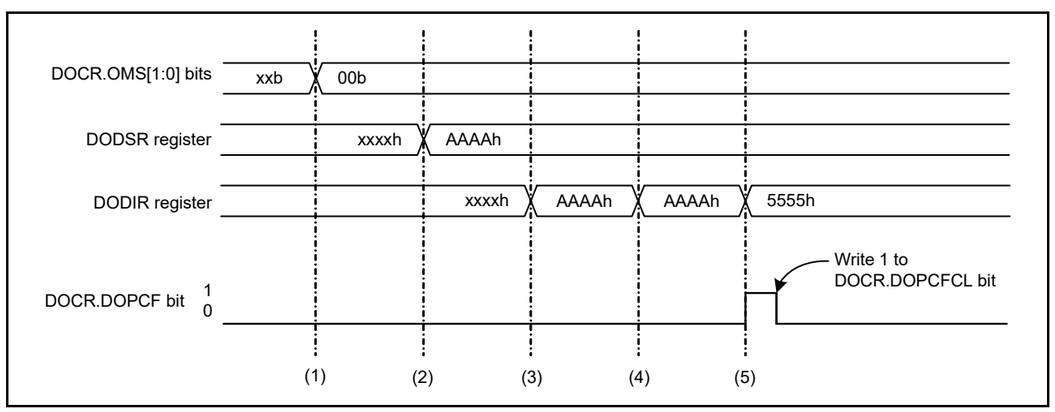

Figure 52.2 Example of operation in data comparison mode

52.2.2 DOC数据输入寄存器(DODIR)

Address(es): DOC.DODIR 4005 4102h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DODIR是一个16位读写寄存器，用于存储操作中使用的16位数据。

52.2.3 DOC数据设置寄存器(DODSR)

Address(es): DOC.DODSR 4005 4104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DODSR是一个16位读写寄存器，用于存储16位数据，在数据比较模式下用作参考。该寄存器还存储数据加法和减法模式下的运算结果。

52.3 Operation

52.3.1 数据比较模式

图52.2显示了DOC在数据比较模式操作中涉及的步骤示例。以下是DCSEL设置为0时的示例操作（通过数据比较检测到数据不匹配）：

1. 将00b写入DOCR.OMS[1:0]位以选择数据比较模式。
2. 在DODSR中设置16位参考数据。
3. 写入16位数据以与DODIR进行比较。
4. 继续写入16位数据，直到所有用于比较的数据都写入DODIR。
5. 如果写入DODIR的值与DODSR中的值不匹配，*1DOCR.DOPCF标志设置为1。

注1.当DOCR.DCSEL=0时

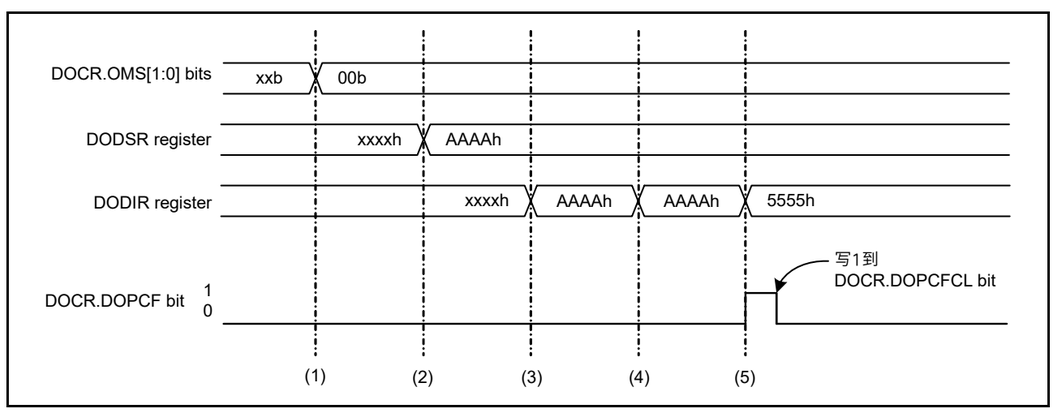

Figure 52.2 数据比较模式的操作示例

52.3.2 Data Addition Mode

Figure 52.3 shows an example of the steps involved in data addition mode operation by the DOC:

1. Write 01b to the DOCR.OMS[1:0] bits to select data addition mode.
2. Set 16-bit data in the DODSR register as the initial value.
3. Write 16-bit data to be added to DODIR. The result of the operation is stored in DODSR.
4. Continue writing 16-bit data until all data for addition is written to DODIR.
5. If the result of an operation is greater than FFFFh, the DOCR.DOPCF flag sets to 1.

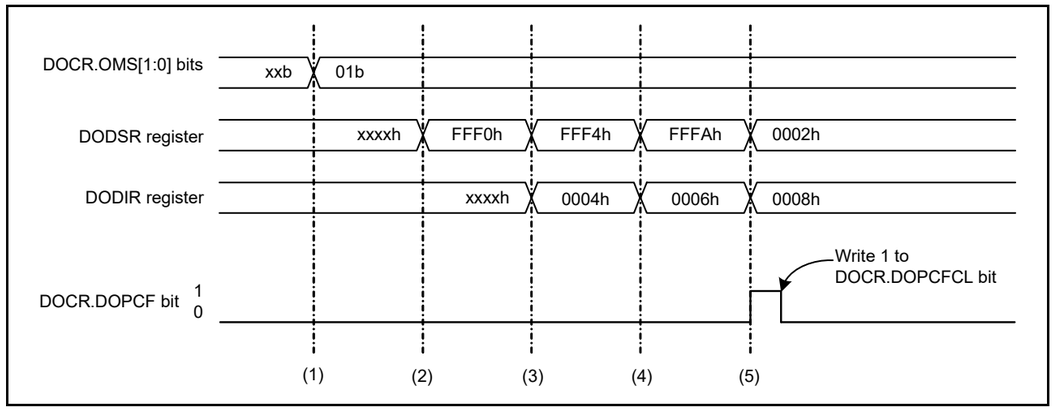

Figure 52.3 Example of operation in data addition mode

52.3.3 Data Subtraction Mode

Figure 52.4 shows an example of the steps involved in data subtraction mode operation by the DOC:

1. Write 10b to the DOCR.OMS[1:0] bits to select data subtraction mode.
2. Set 16-bit data in the DODSR register as the initial value.
3. Write 16-bit data to be subtracted to DODIR. The result of the operation is stored in DODSR.
4. Continue writing 16-bit data until all data for subtraction is written to DODIR.
5. If the result of an operation is less than 0000h, the DOCR.DOPCF flag sets to 1.

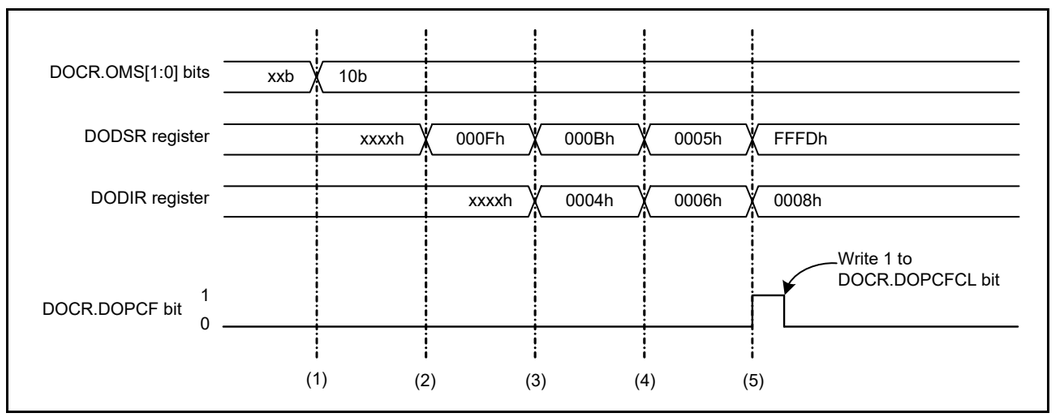

Figure 52.4 Example of operation in data subtraction mode

52.3.2 数据加法模式

图52.3显示了DOC在数据添加模式操作中涉及的步骤示例：

1. 将01b写入DOCR.OMS[1:0]位以选择数据添加模式。
2. 将DODSR寄存器中的16位数据设置为初始值。
3. 写入要添加到DODIR的16位数据。操作结果存储在DODSR中。
4. 继续写入16位数据，直到所有要添加的数据都写入DODIR。
5. 如果运算结果大于FFFFh，则DOCR.DOPCF标志设置为1。

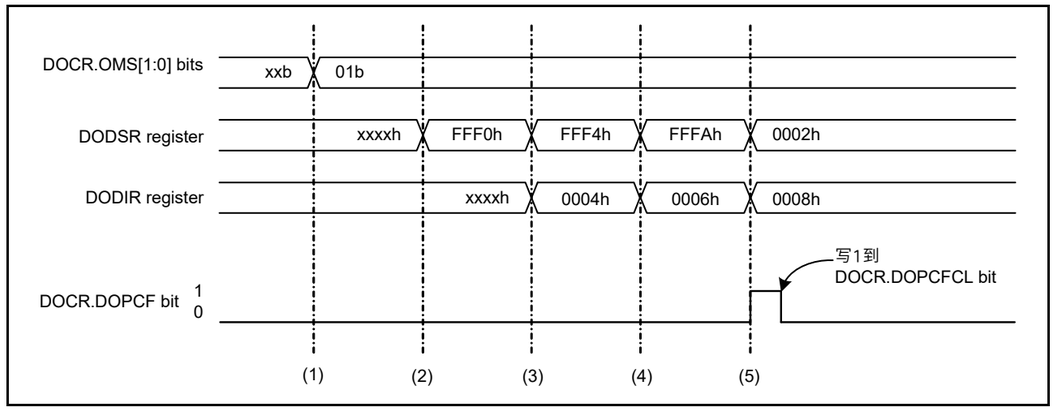

Figure 52.3 数据添加模式中的操作示例

52.3.3 数据减法模式

图52.4显示了DOC在数据减法模式操作中涉及的步骤示例：

1. 将10b写入DOCR.OMS[1:0]位以选择数据减法模式。
2. 将DODSR寄存器中的16位数据设置为初始值。
3. 将要减去的16位数据写入DODIR。操作结果存储在DODSR中。
4. 继续写入16位数据，直到所有减法数据都写入DODIR。
5. 如果运算结果小于0000h，则DOCR.DOPCF标志设置为1。

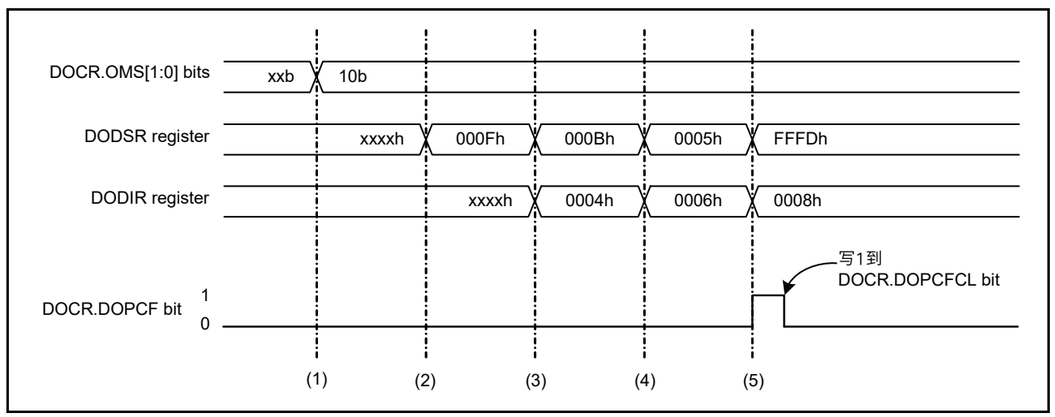

Figure 52.4 数据减法模式下的操作示例

52.4 Interrupt Request and Output to the Event Link Controller (ELC)

The DOC outputs an event signal for the ELC under the following conditions:

- The compared values either match or mismatch
- The data addition result is greater than FFFFh
- The data subtraction result is less than 0000h.

This signal can be used to initiate operations by other modules selected in advance and also can be used as an interrupt request. When an event signal is generated, the Data Operation Circuit Flag (DOCR.DOPCF) sets to 1.

52.5 Usage Notes

52.5.1 Settings for the Module-Stop Function

DOC operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The DOC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 11, Low Power Modes.

52.4 中断请求和输出到事件链接控制器(ELC)

DOC在以下条件下为ELC输出事件信号：

- 比较的值匹配或不匹配
- 数据相加结果大于FFFFh
- 数据减法结果小于0000h。

该信号可用于启动其他预先选择的模块的操作，也可用作中断请求。生成事件信号时，数据操作电路标志(DOCR.DOPCF)设置为1。

52.5 使用说明

52.5.1 模块停止功能的设置

可以使用模块停止控制寄存器C(MSTPCRC)禁用或启用DOC操作。DOC在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第11节，低功耗模式。

53. SRAM

53.1 Overview

The MCU provides on-chip high-speed SRAM modules with either parity-bit checking or ECC (Error Correction Code). The area of the first 32 KB of SRAM0 is subject to ECC. Parity check is performed on other areas. Table 53.1 lists the SRAM specifications.

Table 53.1 SRAM specifications

Parameter	Specifications without ECC	Specifications with ECC	SRAMHS specifications
SRAM capacity	SRAM0: 224 KB SRAM1: 256 KB	SRAM0 (ECC area): 32 KB	SRAMHS: 128 KB
SRAM addresses*2	SRAM0: 2000 8000h to 2003 FFFFh SRAM1: 2004 0000h to 2007 FFFFh	SRAM0 (ECC area): 2000 0000h to 2000 7FFFh	SRAMHS: 1FFE 0000h to 1FFF FFFFh
Access*1	Wait states are inserted into the read cycle by default. If the ICLK frequency is faster than 60 (up to 120) MHz, a wait state is required. If the ICLK frequency is 60 MHz or less, a wait state is not required. For details, see section 53.4, Usage Notes.	Wait states are inserted into the read cycle by default. If the ICLK frequency is faster than 60 (up to 120) MHz, wait state is required. If the ICLK frequency is 60 MHz or less, a wait state is not required. For details, see section 53.4, Usage Notes.	Access to the SRAMHS is always no wait state.
Data retention	Not available in Deep Software Standby mode		
Module-stop function	Module-stop state can be set to reduce power consumption		
Parity	Even-parity (data: 8 bits, parity: 1 bit)	No parity	Even-parity (data: 8 bits, parity: 1 bit)
Error checking	Even-parity error check	Detection up to 2-bit errors	Even-parity error check

Note 1. For details, see section 53.3.7, Access Cycles.

Note 2. The Cortex®-M4 processor supports Arm®v7 unaligned accesses. In this product, SRAMHS and SRAM0 are adjacent to each other and there is an access boundary between them. Therefore, when SRAMHS and SRAM0 are used as a continuous area of memory space, access that straddles the boundary must not be produced as this might lead to access of data other than what is intended. For details, see the *ARM® Cortex®-M4 Processor Technical Reference Manual*.

53.2 Register Descriptions

53.2.1 SRAM Parity Error Operation After Detection Register (PARIOAD)

Address(es): SRAM.PARIOAD 4000 2000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OAD	Operation after Detection	1: Reset 0: Non-maskable interrupt.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The PARIOAD register controls the operation on detection of a parity error. The SRAM Protection Register (SRAMPRCR) protects this register against writing. Set the SRAMPRCR bit in the SRAMPRCR register to the enabled setting before writing to this register. Do not write to the PARIOAD register while access to the SRAM is in progress.

OAD bit (Operation after Detection)

The OAD bit specifies generation of either a reset or non-maskable interrupt when a parity error is detected. The OAD

53. SRAM

53.1 Overview

MCU提供带有奇偶校验位检查或ECC（纠错码）的片上高速SRAM模块。
SRAM0的前32KB区域受ECC约束。在其他区域执行奇偶校验。表53.1列出了
SRAM specifications.

Table 53.1 SRAM specifications

Parameter	不带ECC的规格	带ECC的规格	SRAMHS specifications
SRAM capacity	SRAM0: 224 KB SRAM1: 256 KB	SRAM0 (ECC area): 32 KB	SRAMHS: 128 KB
SRAM addresses*2	SRAM0: 2000 8000h to 2003 FFFFh SRAM1: 2004 0000h to 2007 FFFFh	SRAM0 (ECC area): 2000 0000h to 2000 7FFFh	SRAMHS: 1FFE 0000h to 1FFF FFFFh
Access*1	默认情况下，等待状态被插入到读取周期中。如果ICLK频率高于60（最高120）MHz，则需要等待状态。如果ICLK频率为60MHz或更低，则不需要等待状态。有关详细信息，请参阅第53.4节，使用说明。	默认情况下，等待状态被插入到读取周期中。如果ICLK频率高于60（最高120）MHz，则需要等待状态。如果ICLK频率为60MHz或更低，则不需要等待状态。有关详细信息，请参阅第53.4节，使用说明。	访问SRAMHS始终是无等待状态。
数据保留	在深度软件待机模式下不可用		
Module-stop function	可设置模块停止状态以降低功耗		
Parity	Even-parity (data: 8 bits, parity: 1 bit)	无平价	Even-parity (data: 8 bits, parity: 1 bit)
错误检查	偶校验错误检查	检测多达2位错误	偶校验错误检查

Note 1. 有关详细信息，请参阅第53.3.7节，访问周期。

Note 2. Cortex®-M4处理器支持Arm®v7非对齐访问。在本产品中，SRAMHS和SRAM0是相邻的，它们之间存在访问边界。因此，当SRAMHS和SRAM0用作存储空间的连续区域时，不得产生跨越边界的访问，因为这可能会导致访问预期之外的数据。有关详细信息，请参阅ARM®Cortex®-M4处理器技术参考手册。

53.2 注册说明

53.2.1 检测寄存器后的SRAM奇偶校验错误操作(PARIOAD)

Address(es): SRAM.PARIOAD 4000 2000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OAD
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	OAD	检测后的操作	1：复位0：不可屏蔽中断 。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

PARIOAD寄存器控制检测奇偶校验错误时的操作。SRAM保护寄存器(SRAMPRCR)保护该寄存器不被写入。在写入该寄存器之前，将SRAMPRCR寄存器中的SRAMPRCR位设置为启用设置。在访问SRAM的过程中不要写入PARIOAD寄存器。

OAD位（检测后操作）

OAD位指定在检测到奇偶校验错误时产生复位或不可屏蔽中断。OAD

bit in the PARIOAD register is shared by SRAM0 (without ECC), SRAM1, SRAMHS, and the Standby SRAM.

53.2.2 SRAM Protection Register (SRAMPRCR)

Address(es): SRAM.SRAMPRCR 4000 2004h

	b7	b6	b5	b4	b3	b2	b1	b0
	KW[6:0]							SRAMPRCR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	SRAMPRCR	Register Write Control	0: Disable writes to protected registers 1: Enable writes to protected registers.	R/W
b7 to b1	KW[6:0]	Write Key Code	These bits enable or disable writing of the SRAMPRCR bit.	R/W

SRAMPRCR bit (Register Write Control)

The SRAMPRCR bit controls the write mode of the SRAMWTSC and PARIOAD registers. When the bit is set to 1, writing to the SRAMWTSC and PARIOAD registers is enabled. When you write to this bit, write 78h to the KW[6:0] bits simultaneously.

KW[6:0] bits (Write Key Code)

The KW[6:0] bits enable or disable writes to the SRAMPRCR bit. When you write to the SRAMPRCR bit, write 78h to the KW[6:0] bits simultaneously. When a value other than 78h is written to KW[6:0], the SRAMPRCR bit is not updated. The KW[6:0] bits are always read as 0.

53.2.3 SRAM Wait State Control Register (SRAMWTSC)

Address(es): SRAM.SRAMWTSC 4000 2008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	SRAM1WTEN	SRAM0WTEN	SRAM0ERDWTEN	—
Value after reset:	0	0	0	0	1	1	1	0

Bit	Symbol	Bit name	Description	R/W
b0	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b1	SRAM0ERDWTEN	SRAM0 (ECC area) Read Wait Enable	1: Add wait state in read access cycle to SRAM0 (ECC area) 0: Do not add wait state in read access cycle to SRAM0 (ECC area).	R/W
b2	SRAM0WTEN	SRAM0 Wait Enable	1: Add wait state in read access cycle to SRAM0 0: Do not add wait state in read access cycle to SRAM0.	R/W
b3	SRAM1WTEN	SRAM1 Wait Enable	1: Add wait state in read access cycle to SRAM1 0: Do not add wait state in read access cycle to SRAM1.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The SRAMWTSC register controls the wait states in the SRAM modules. The SRAM Protection Register (SRAMPRCR) protects this register against writing. Set the SRAMPRCR bit in the SRAMPRCR register to the enabled setting before writing to this register. Do not write to the SRAMWTSC register while access to the SRAM is in progress.

SRAM0ERDWTEN bit (SRAM0 (ECC area) Read Wait Enable)

The SRAM0ERDWTEN bit enables the wait cycle for reads from the ECC area in SRAM0. When this bit is set to 1, one

PARIOAD寄存器中的位由SRAM0（无ECC）、SRAM1、SRAMHS和备用SRAM共享。

53.2.2 SRAM保护寄存器(SRAMPRCR)

Address(es): SRAM.SRAMPRCR 4000 2004h

	b7	b6	b5	b4	b3	b2	b1	b0
	KW[6:0]							SRAMPRCR
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	SRAMPRCR	寄存器写控制	0：禁止写入受保护寄存器1：允许写入受保护寄存器。	R/W
b7 to b1	KW[6:0]	编写关键代码	这些位启用或禁用SRAMPRCR位的写入。	R/W

SRAMPRCR位（寄存器写控制）

SRAMPRCR位控制SRAMWTSC和PARIOAD寄存器的写模式。当该位设置为1时，允许写入SRAMWTSC和PARIOAD寄存器。写入该位时，同时将78h写入KW[6:0]位。

KW[6:0]位（写入密钥代码）

KW[6:0]位启用或禁用对SRAMPRCR位的写入。写入SRAMPRCR位时，同时将78h写入KW[6:0]位。当78h以外的值写入KW[6:0]时，SRAMPRCR位不会更新。KW[6:0]位总是读为0。

53.2.3 SRAM等待状态控制寄存器(SRAMWTSC)

Address(es): SRAM.SRAMWTSC 4000 2008h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	SRAM1WTEN	SRAM0WTEN	SRAM0ERDWTEN	—
重置后的值：	0	0	0	0	1	1	1	0

Bit	Symbol	位名称	Description	R/W
b0	—	Reserved	该位读取为0。写入值应为0。	R/W
b1	SRAM0ERDWTEN	SRAM0 (ECC area) Read 等待启用	1：将读访问周期中的等待状态添加到SRAM0（ECC区域）0：不将读访问周期中的等待状态添加到SRAM0（ECC区域）。	R/W
b2	SRAM0WTEN	SRAM0等待使能	1：将读访问周期中的等待状态添加到SRAM00：不将读访问周期中的等待状态添加到SRAM0。	R/W
b3	SRAM1WTEN	SRAM1等待使能	1：将读访问周期中的等待状态添加到SRAM10：不将读访问周期中的等待状态添加到SRAM1。	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

SRAMWTSC寄存器控制SRAM模块中的等待状态。SRAM保护寄存器(SRAMPRCR)保护该寄存器不被写入。在写入该寄存器之前，将SRAMPRCR寄存器中的SRAMPRCR位设置为启用设置。访问SRAM时不要写入SRAMWTSC寄存器。

SRAM0ERDWTEN位（SRAM0（ECC区域）读取等待使能）

SRAM0ERDWTEN位使能从SRAM0中的ECC区域读取的等待周期。当该位设置为1时，一个

wait cycle is inserted into the read cycle of the ECC area in SRAM0. When the read access frequency is more than 60 MHz, this one-wait cycle setting is required.

SRAM0WTEN bit (SRAM0 Wait Enable)

The SRAM0WTEN bit enables the wait cycle for reads from SRAM0. When this bit is set to 1, one wait cycle is inserted into the read cycle of SRAM0. When the read access frequency is more than 60 MHz, this one-wait cycle setting is required.

SRAM1WTEN bit (SRAM1 Wait Enable)

The SRAM1WTEN bit enables the wait cycle for reads from SRAM1. When this bit is set to 1, one wait cycle is inserted into the read cycle of SRAM1. When the read access frequency is more than 60 MHz, this one-wait cycle setting is required.

53.2.4 ECC Operating Mode Control Register (ECCMODE)

Address(es): SRAM.ECCMODE 4000 20C0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	ECCMOD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	ECCMOD[1:0]	ECC Operating Mode Select	b1 b0 0 0: Disable ECC function 0 1: Setting prohibited 1 0: Enable ECC function without error checking 1 1: Enable ECC function with error checking.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ECCMODE register specifies the ECC operating mode. The ECC Protection Register (ECCPRCR) protects this register against writing. Set the ECCPRCR bit in the ECCPRCR register to the enabled setting before writing to this register. Do not write to the ECCMODE register while access to the SRAM is in progress.

ECCMOD[1:0] bit (ECC Operating Mode Select)

The ECCMOD[1:0] bit sets the access mode for the ECC area in SRAM0.

53.2.5 ECC 2-Bit Error Status Register (ECC2STS)

Address(es): SRAM.ECC2STS 4000 20C1h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ECC2ERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ECC2ERR	ECC 2-Bit Error Status	0: No 2-bit ECC error occurred 1: 2-bit ECC error occurred.	R(/W)*1
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the bit.

等待周期被插入到SRAM0中ECC区域的读取周期中。当读访问频率超过60MHz时，需要设置此一等待周期。

SRAM0WTEN位（SRAM0等待使能）

SRAM0WTEN位使能从SRAM0读取的等待周期。当该位设置为1时，插入一个等待周期

进入SRAM0的读周期。当读访问频率超过60MHz时，需要设置此一等待周期。

SRAM1WTEN位（SRAM1等待使能）

SRAM1WTEN位使能从SRAM1读取的等待周期。当该位设置为1时，会在SRAM1的读取周期中插入一个等待周期。当读访问频率超过60MHz时，需要设置此一等待周期。

53.2.4 ECC操作模式控制寄存器(ECCMODE)

Address(es): SRAM.ECCMODE 4000 20C0h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	ECCMOD[1:0]	
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	ECCMOD[1:0]	ECC操作模式选择	b1b000：禁用ECC功能01：设置禁止10：启用ECC功能不进行错误检查11：启用ECC功能并进行错误检查。	R/W
b7 to b2	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ECCMODE寄存器指定ECC工作模式。ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该寄存器之前，将ECPCRR寄存器中的ECPCRR位设置为使能设置。访问SRAM时不要写入ECCMODE寄存器。

ECCMOD[1:0]位（ECC操作模式选择）

ECCMOD[1:0]位设置SRAM0中ECC区域的访问模式。

53.2.5 ECC2位错误状态寄存器(ECC2STS)

Address(es): SRAM.ECC2STS 4000 20C1h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ECC2ERR
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	ECC2ERR	ECC2位错误状态	0：未发生2位ECC错误1：发生2位ECC错误。	R(/W)*1
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只能写入0以清除该位。

ECC2ERR bit (ECC 2-Bit Error Status)

The ECC2ERR bit indicates whether a 2-bit ECC error occurred in the ECC area of the SRAM. When ECC operations are enabled and error correction is selected, this bit sets to 1 if a 2-bit error is detected. The SRAM error signal is also asserted. Writing 0 to the ECC2ERR bit negates the SRAM error signal triggered by the 2-bit ECC error.

The SRAM error can be specified as a non-maskable interrupt or reset in the ECCOAD register. Do not access the ECC area in the SRAM while writing 0 to this register.

53.2.6 ECC 1-Bit Error Information Update Enable Register (ECC1STSEN)

Address(es): SRAM.ECC1STSEN 4000 20C2h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	E1STSEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	E1STSEN	ECC 1-Bit Error Information Update Enable	0: Disable updating of 1-bit ECC error information 1: Enable updating of 1-bit ECC error information.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ECC1STSEN register enables or disables updating of the ECC 1-Bit Error Status Register (ECC1STS) in response to a 1-bit ECC error in the SRAM (ECC area). The ECC Protection Register (ECCPRCR) protects this register against writing. Set the ECCPRCR bit in the ECCPRCR register to the enabled setting before writing to this bit.

E1STSEN bit (ECC 1-Bit Error Information Update Enable)

The E1STSEN bit enables or disables updating of the SRAM (ECC area) 1-Bit Error Status Register (ECC1STS) in response to a 1-bit error in the ECC area of SRAM. The register also functions as an interrupt and reset mask.

53.2.7 ECC 1-Bit Error Status Register (ECC1STS)

Address(es): SRAM.ECC1STS 4000 20C3h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ECC1ERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ECC1ERR	ECC 1-Bit Error Status	0: No 1-bit ECC error occurred 1: 1-bit ECC error occurred.	R(/W)*1
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to clear the bit.

ECC1ERR bit (ECC 1-Bit Error Status)

The ECC1ERR bit indicates whether a 1-bit ECC error occurred in the ECC area of the SRAM. When ECC operations are enabled and error correction is selected, and updating of the 1-bit error information is enabled, this bit sets to 1 if a 1-bit error is detected. The SRAM error signal is also asserted. Writing 0 to the ECC1ERR bit negates the SRAM error signal triggered by the 1-bit ECC error.

The SRAM error can be specified as a non-maskable interrupt or reset in the ECCOAD register. Do not access the ECC area in the SRAM while writing 0 to this register.

ECC2ERR位（ECC2位错误状态）

ECC2ERR位指示SRAM的ECC区域是否发生2位ECC错误。当启用ECC操作并选择纠错时，如果检测到2位错误，则该位设置为1。SRAM错误信号也被置位。将0写入ECC2ERR位会否定由2位ECC错误触发的SRAM错误信号。

SRAM错误可以在ECCOAD寄存器中指定为不可屏蔽中断或复位。向该寄存器写入0时不要访问SRAM中的ECC区域。

53.2.6 ECC1位错误信息更新使能寄存器(ECC1STSEN)

Address(es): SRAM.ECC1STSEN 4000 20C2h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	E1STSEN
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	E1STSEN	ECC1位错误信息更新Enable	0：禁止更新1-bitECC错误信息1：允许更新1-bit ECC错误信息。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ECC1STSEN寄存器启用或禁用ECC1位错误状态寄存器(ECC1STS)的更新，以响应SRAM（ECC区域）中的1位ECC错误。ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该位之前，将ECPCRR寄存器中的ECPCRR位设置为使能设置。

E1STSEN位（ECC1位错误信息更新使能）

E1STSEN位启用或禁用SRAM（ECC区域）1位错误状态寄存器(ECC1STS)的更新，以响应SRAM的ECC区域中的1位错误。该寄存器还用作中断和复位掩码。

53.2.7 ECC1位错误状态寄存器(ECC1STS)

Address(es): SRAM.ECC1STS 4000 20C3h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	ECC1ERR
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	ECC1ERR	ECC1位错误状态	0：未发生1位ECC错误1：发生1位ECC错误。	R(/W)*1
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 只能写入0以清除该位。

ECC1ERR位（ECC1位错误状态）

ECC1ERR位指示SRAM的ECC区域是否发生1位ECC错误。当启用ECC操作并选择纠错并启用1位错误信息更新时，如果检测到1位错误，则该位设置为1。SRAM错误信号也被置位。将0写入ECC1ERR位会否定由1位ECC错误触发的SRAM错误信号。

SRAM错误可以在ECCOAD寄存器中指定为不可屏蔽中断或复位。向该寄存器写入0时不要访问SRAM中的ECC区域。

53.2.8 ECC Protection Register (ECCPRCR)

Address(es): SRAM.ECCPRCR 4000 20C4h

	b7	b6	b5	b4	b3	b2	b1	b0
	KW[6:0]							ECCPRCR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	ECCPRCR	Registers Write Control	0: Disable writes to protected registers 1: Enable writes to protected registers.	R/W
b7 to b1	KW[6:0]	Write Key Code	These bits enable or disable writes to the ECCPRCR bit.	R/W

ECCPRCR bit (Registers Write Control)

The ECCPRCR bit controls the write mode of the ECCMODE, ECC1STSEN, and ECCOAD registers. When the bit is set to 1, writing to the ECCMODE, ECC1STSEN, and ECCOAD registers is enabled. When you write to this bit, write 78h to the KW[6:0] simultaneously.

KW[6:0] bits (Write Key Code)

The KW[6:0] bits enable or disable writes to the ECCPRCR bit. When you write to the ECCPRCR bit, write 78h to the KW[6:0] bits simultaneously. When a value other than 78h is written to KW[6:0], the ECCPRCR bit is not updated. The KW[6:0] bits are always read as 0.

53.2.9 ECC Test Control Register (ECCETST)

Address(es): SRAM.ECCETST 4000 20D4h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TSTBYP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TSTBYP	ECC Bypass Select	0: ECC bypass disabled 1: ECC bypass enabled.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ECC Protection Register (ECCPRCR2) protects this register against writing. Change the ECCPRCR2 bit in the ECCPRCR2 register to the enabled setting before writing to this bit. Do not write to the ECCETST register while access to SRAM is in progress.

TSTBYP bit (ECC Bypass Select)

The TSTBYP bit enables direct access to the ECC code by bypassing ECC function. The ECC bypass function is used with the ECCMOD[1:0] bits in the ECCMODE register to 00b. Access the same address with 32-bit access size as the data that is checked by ECC. The lower 7 bits of 32-bit write data can be written as an ECC code when the ECC bypass is enabled. The higher 25 bits in the write data are then ignored. The lower 7 bits of the 32-bit read data can be used as ECC code. The higher 25 bits in the read data are unknown.

Note: For details of ECC test, see section 53.3.4, ECC Decoder Testing.

53.2.8 ECC保护寄存器(ECPCRR)

Address(es): SRAM.ECCPRCR 4000 20C4h

	b7	b6	b5	b4	b3	b2	b1	b0
	KW[6:0]							ECCPRCR
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	ECCPRCR	寄存器写控制	0：禁止写入受保护寄存器1：允许写入受保护寄存器。	R/W
b7 to b1	KW[6:0]	编写关键代码	这些位启用或禁用写入ECCPRCR bit.	R/W

ECPCRR位（寄存器写控制）

ECPCRR位控制ECCMODE、ECC1STSEN和ECCOAD寄存器的写模式。当该位设置为1时，允许写入ECCMODE、ECC1STSEN和ECCOAD寄存器。写入该位时，同时将78h写入KW[6:0]。

KW[6:0]位（写入密钥代码）

KW[6:0]位启用或禁用对ECPCRR位的写入。写入ECPCRR位时，同时将78h写入KW[6:0]位。当向KW[6:0]写入78h以外的值时，不会更新ECPCRR位。这
KW[6:0]位总是读为0。

53.2.9 ECC测试控制寄存器(ECCETST)

Address(es): SRAM.ECCETST 4000 20D4h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TSTBYP
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	TSTBYP	ECC旁路选择	0：禁用ECC旁路1：启用ECC旁路。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ECC保护寄存器(ECCPRCR2)保护该寄存器不被写入。改变ECPCRR2位
在写入该位之前，将ECPCRR2寄存器设置为使能设置。访问SRAM时不要写入ECCETST寄存器。

TSTBYP位（ECC旁路选择）

TSTBYP位允许通过绕过ECC功能直接访问ECC代码。ECC旁路功能与ECCMODE寄存器中的ECCMOD[1:0]位为00b一起使用。以32位访问大小访问与ECC检查的数据相同的地址。当ECC旁路使能时，32位写数据的低7位可以写为ECC代码。然后忽略写入数据中的高25位。32位读取数据的低7位可用作ECC码。读取数据中的高25位是未知的。

Note: 有关ECC测试的详细信息，请参阅第53.3.4节，ECC解码器测试。

53.2.10 SRAM ECC Error Operation After Detection Register (ECCOAD)

Address(es): SRAM.ECCOAD 4000 20D8h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	OAD	Operation after Detection	1: Reset 0: Non-maskable interrupt.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The ECCOAD register controls the operation on detection of a ECC error. The ECC Protection Register (ECCPRCR) protects this register against writing. Set the ECCPRCR bit in the ECCPRCR register to the enabled setting before writing to this register. Do not write to the ECCOAD register while access to the SRAM is in progress.

OAD bit (Operation after Detection)

The OAD bit specifies generation of either a reset or a non-maskable interrupt when a ECC error is detected. The OAD bit in the ECCOAD register is used for the SRAM (ECC area).

53.3 Operation

53.3.1 Low-Power Functions

Power consumption can be reduced by setting Module Stop Control Register A (MSTPCRA) to stop supply of the clock signal to the SRAM. The control bits are as follows for each module:

- Setting both the MSTPA0 and MSTPA6 bits in the MSTPCRA to 1 stops supply of the clock signal to SRAM0*1
- Setting the MSTPA1 bit in the MSTPCRA to 1 stops supply of the clock signal to SRAM1
- Setting the MSTPA5 bit in MSTPCRA to 1 stops supply of the clock signal to the SRAMHS
- Setting the MSTPA7 bit in the MSTPCRA to 1 stops supply of the clock signal to the Standby SRAM.

Stopping the clock signal supply places the SRAM in the module-stop state. The SRAM operates after a reset.

The SRAM is not accessible in the module-stop state. Do not transition to the module-stop state while access to the SRAM is in progress. Access to the SRAM in the module-stop state is prohibited. If access is attempted, correct operation is not guaranteed.

For details on the MSTPCRA register, see section 11, Low Power Modes.

Note 1. The settings in the MSTPA0 and MSTPA6 bits in the MSTPCRA register must be the same.

53.3.2 ECC Function

Enabling and disabling of ECC error correction can be selected through ECCMODE register setting. In the initial state, ECC error correction is disabled. The ECC check type is SEC-DED (Single-Error Correction and Double-Error Detection Code).

When ECC function is enabled, 7-bit check bits are appended to 32-bit data for writing. For reading, 39-bit (data: 32 bits, check bits: 7 bits) data is read out from the SRAM (ECC area).

When ECC function is enabled and error checking is enable, error correction is done if a 1-bit error occurs and the ECC1ERR bit in the ECC1STS register is set to 1 if the E1STSEN bit in the ECC1STSEN register is 1; if a 2-bit error occurs, error detection is done and the ECC2ERR bit in the ECC2STS register is set to 1, though error correction is not performed.

When ECC function is enabled and the error checking is disable, error correction is done if a 1-bit error occurs but

53.2.10 SRAMECC检测后错误操作寄存器(ECCOAD)

Address(es): SRAM.ECCOAD 4000 20D8h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	OAD
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	OAD	检测后的操作	1：复位0：不可屏蔽中断 。	R/W
b7 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

ECCOAD寄存器控制检测到ECC错误时的操作。ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该寄存器之前，将ECPCRR寄存器中的ECPCRR位设置为使能设置。访问SRAM时不要写入ECCOAD寄存器。

OAD位（检测后操作）

OAD位指定在检测到ECC错误时生成复位或不可屏蔽中断。ECCOAD寄存器中的OAD位用于SRAM（ECC区域）。

53.3 Operation

53.3.1 Low-Power Functions

通过设置模块停止控制寄存器A(MSTPCRA)停止向SRAM提供时钟信号，可以降低功耗。每个模块的控制位如下：

- 将MSTPCRA中的MSTPA0和MSTPA6位都设置为1会停止向SRAM0提供时钟信号*1
- 将MSPCRA中的MSTPA1位设置为1会停止向SRAM1提供时钟信号
- 将MSPCRA中的MSTPA5位设置为1会停止向SRAMHS提供时钟信号
- 将MSPCRA中的MSTPA7位设置为1会停止向待机SRAM提供时钟信号。

停止时钟信号供应会将SRAM置于模块停止状态。SRAM在复位后运行。

SRAM在模块停止状态下不可访问。不要转换到模块停止状态，同时访问
SRAM正在进行中。禁止在模块停止状态下访问SRAM。如果尝试访问，则无法保证正确操作。

有关MSTPCRA寄存器的详细信息，请参见第11节，低功耗模式。

注1.MSTPCRA寄存器中的MSTPA0和MSTPA6位的设置必须相同。

53.3.2 ECC Function

可以通过ECCMODE寄存器设置来选择ECC纠错的启用和禁用。在初始状态下，
ECC纠错已禁用。ECC校验类型是SEC-DED（单纠错和双错误
Detection Code).

当ECC功能使能时，7位校验位被附加到32位数据中进行写入。读取时，从SRAM（ECC区域）中读取39位（数据：32位，校验位：7位）数据。

当启用ECC功能并启用错误检查时，如果发生1位错误并且
如果ECC1STSEN寄存器中的E1STSEN位为1，则ECC1STS寄存器中的ECC1ERR位设置为1；如果发生2位错误，则进行错误检测并将ECC2STS寄存器中的ECC2ERR位设置为1，但不执行错误纠正。

当启用ECC功能且禁用错误检查时，如果发生1位错误，则进行错误纠正，但

ECC1ERR bit in the ECC1STS register is not updated although E1STSEN bit in the ECC1STSEN register is 1; if a 2-bit error occurs, this error is detected but the ECC2ERR bit in the ECC2STS register is not updated, and error correction is not performed.

When ECC function is disable, neither error correction nor error detection is done although 1-bit or 2-bit error occur. So ECC1ERR bit and ECC2ERR bit are not updated.

There is no way to confirm the location where the error was found. Therefore, when after the occurrence of an error, update all the data.

When updating all the data after the occurrence of an error, the only support of 32-bit data writing.

Because the SRAM data is undefined after power on and release from deep software standby mode, accessing the SRAM when ECC function is enabled and error checking is selected causes an ECC error to occur. Therefore, before using ECC function, initial writing with 32-bit data size to the area to be used in the SRAM should be done.

When a read access is executed in a row after a write access, read access is executed with priority. Therefore, during initialization, please do not perform the read access in a row after the write access.

53.3.3 ECC Error Generation

When ECC function is enabled and error checking is applied to the SRAM (ECC area), an ECC error occurs when either the ECC2ERR bit in the ECC2STS register or the ECC1ERR bit in the ECC1STS register becomes 1 to indicate that ECC checking revealed a 2-bit error or a 1-bit error, respectively.

An ECC error is output with a pulse width of ICLK. When the ECC 1-bit error is to be masked, set the ECC1STSEN.E1STSEN bit to 0 to disable updating of the ECC1ERR bit. An ECC error will not be generated while ECC function is disabled or when ECC function is enabled but error checking is not selected.

ECC error can choose non maskable interrupt or reset by ECCOAD register. When set 1 in the OAD bit of the ECCOAD register, ECC error is output to the reset function. When set 0 in the OAD bit of the ECCOAD register, ECC Error interrupt is output to the ICU as non-maskable interrupt.

53.3.4 ECC Decoder Testing

Figure 53.1 shows the ECC decoder testing.

尽管ECC1STSEN寄存器中的E1STSEN位为1，但ECC1STS寄存器中的ECC1ERR位不更新；如果发生2位错误，则会检测到该错误，但不会更新ECC2STS寄存器中的ECC2ERR位，也不会执行错误纠正。

当ECC功能被禁用时，即使发生1位或2位错误，也不会进行纠错或错误检测。所以ECC1ERR位和ECC2ERR位不更新。

无法确认发现错误的位置。因此，当发生错误后，更新所有数据。

发生错误后更新所有数据时，仅支持32位数据写入。

由于SRAM数据在上电并从深度软件待机模式释放后未定义，因此在启用ECC功能并选择错误检查时访问SRAM会导致发生ECC错误。因此，在使用ECC功能之前，应先将32位数据大小写入SRAM中要使用的区域。

在写访问之后连续执行读访问时，优先执行读访问。因此，在初始化过程中，请不要在写访问之后连续进行读访问。

53.3.3 ECC错误生成

当启用ECC功能并对SRAM（ECC区域）应用错误检查时，当ECC2STS寄存器中的ECC2ERR位或ECC1STS寄存器中的ECC1ERR位变为1时发生ECC错误，表示ECC检查显示2-位错误或1位错误，分别。

以ICLK脉冲宽度输出ECC错误。当要屏蔽ECC1位错误时，设置ECC1STSEN.E1STSEN位为0以禁用ECC1ERR位的更新。不会产生ECC错误，同时ECC功能被禁用或ECC功能启用但未选择错误检查时。

ECC错误可以选择不可屏蔽中断或通过ECCOAD寄存器复位。当ECCOAD寄存器的OAD位设置为1时，ECC错误输出到复位功能。当ECCOAD寄存器的OAD位设置为0时，ECC错误中断作为不可屏蔽中断输出到ICU。

53.3.4 ECC解码器测试

图53.1显示了ECC解码器测试。

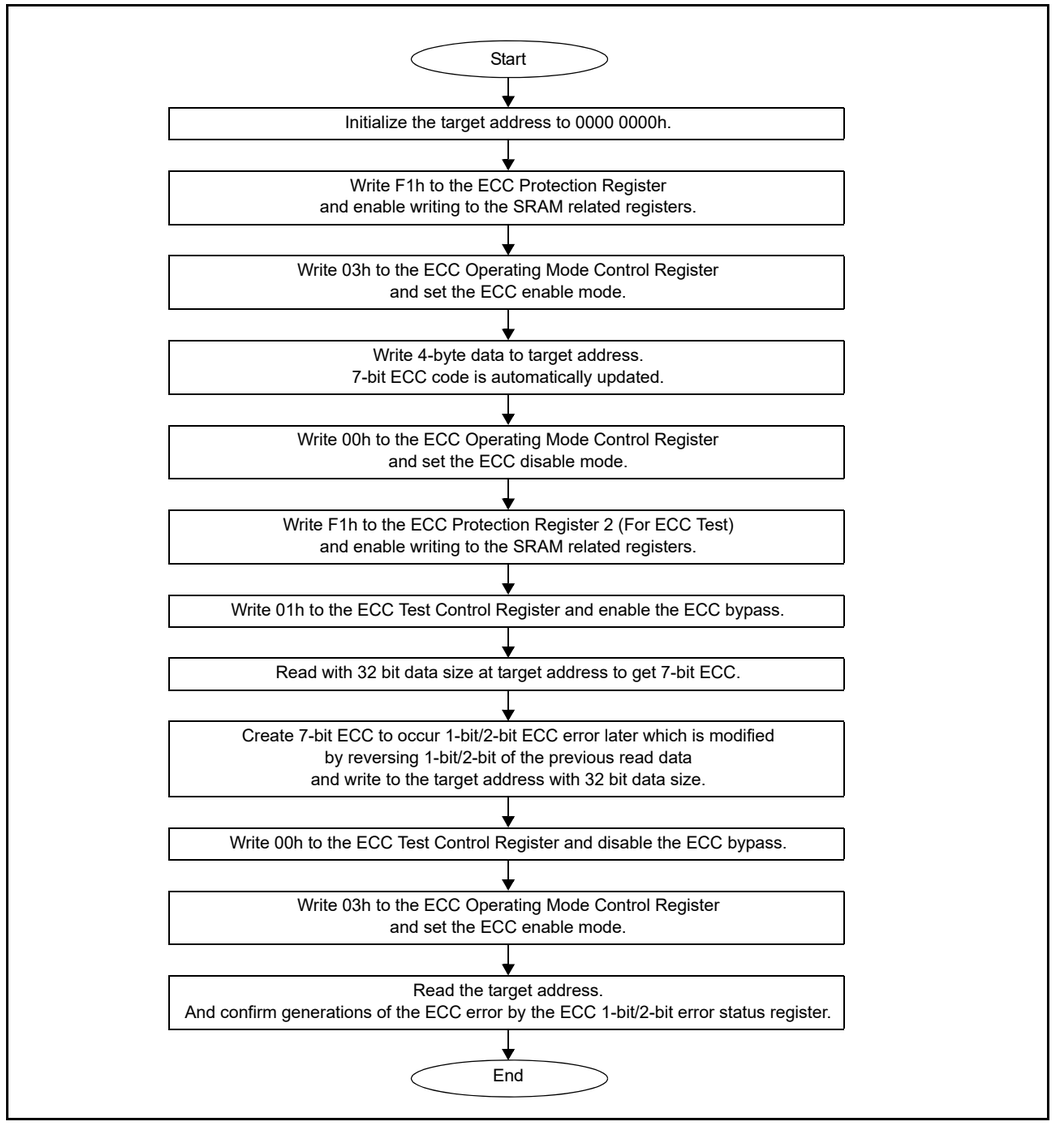

Figure 53.1 ECC Decoder Testing

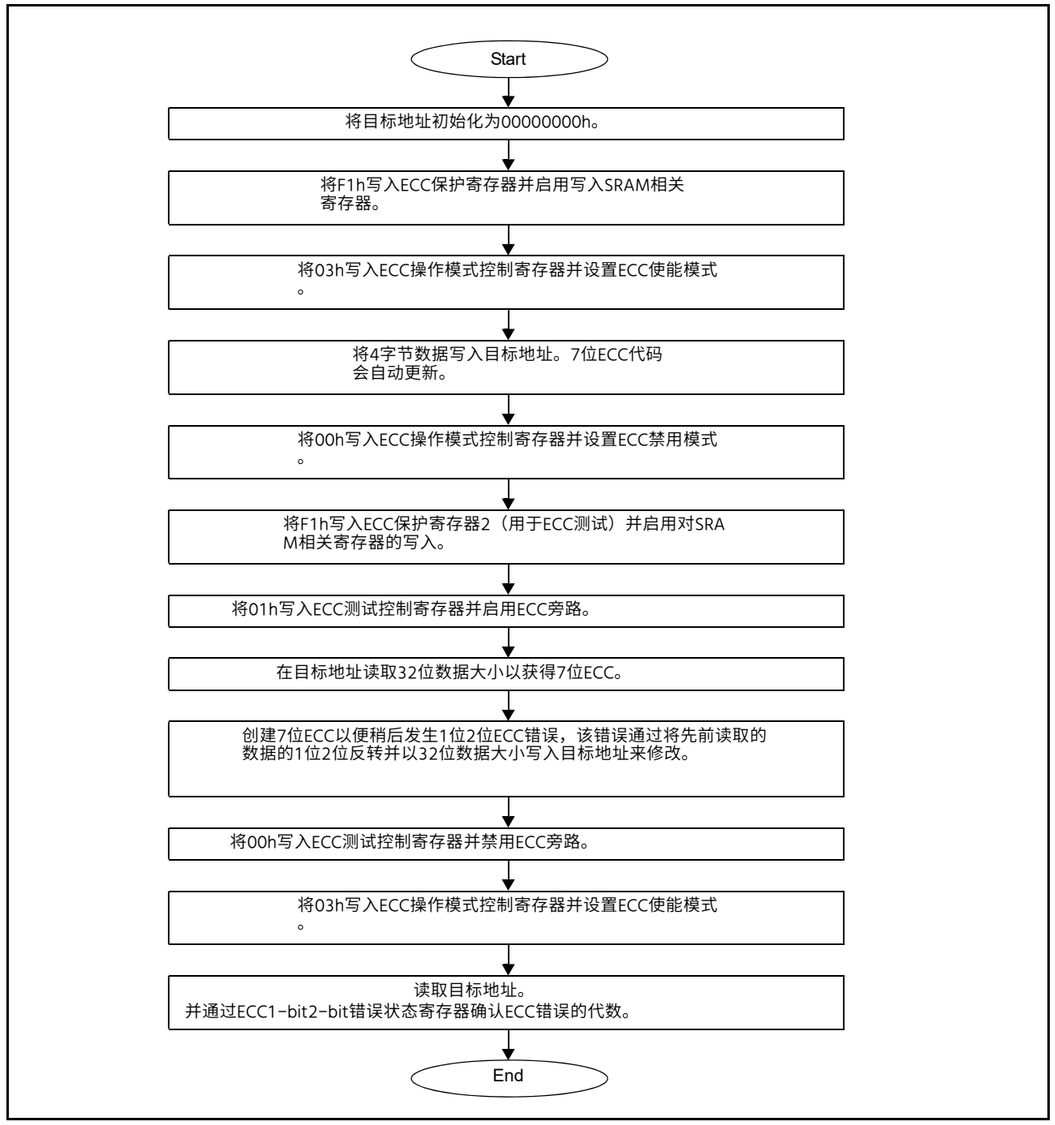

Figure 53.1 ECC解码器测试

53.3.5 Parity Calculation Function

The IEC60730 standard requires the checking of SRAM data. A parity bit is therefore added to every 8-bit data unit in the SRAM modules that have 32-bit data width. With this SRAM parity error detection function, the parity bit is appended when data is written, and the parity is checked when the data is read. When a parity error occurs, a parity-error notification is generated. This function can also be used to trigger a reset. The specification for SRAM0 without ECC, SRAM1, SRAMHS, and Standby SRAM is even parity.

Parity error notification can be specified as either a non-maskable interrupt or reset in the PARIOAD register. When the OAD bit in the PARIOAD register is set to 1, a parity error is output to the reset function. When the OAD bit in the PARIOAD register is set to 0, a parity error is output to the ICU as a non-maskable interrupt.

Parity errors often occur because of noise. To confirm whether the cause is noise or corruption, follow the parity check flows shown in Figure 53.2 and Figure 53.3.

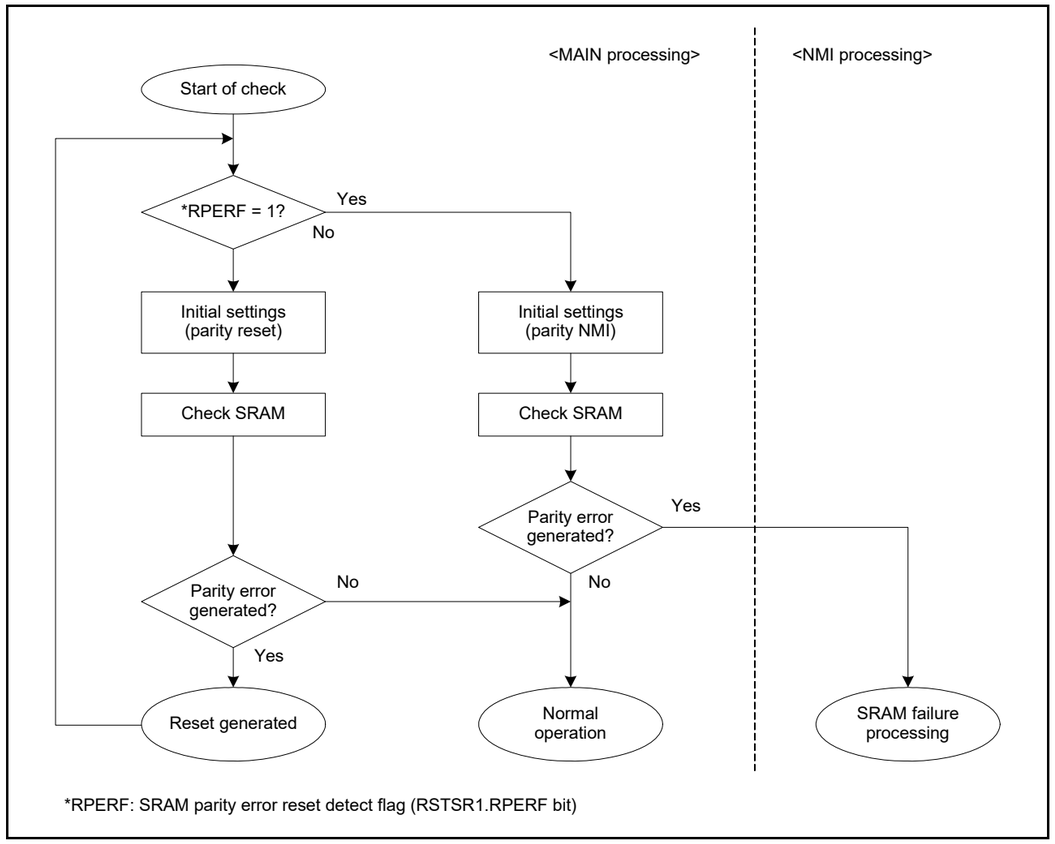

Figure 53.2 Flow of SRAM parity check when SRAM parity reset is enabled

53.3.5 奇偶校验计算功能

IEC60730标准要求检查SRAM数据。因此，具有32位数据宽度的SRAM模块中的每个8位数据单元都会添加一个奇偶校验位。使用该SRAM奇偶校验错误检测功能，写入数据时附加奇偶校验位，读取数据时检查奇偶校验位。当发生奇偶校验错误时，会生成奇偶校验错误通知。此功能也可用于触发复位。无ECC的SRAM0、SRAM1、SRAMHS和备用SRAM的规格是偶校验。

奇偶校验错误通知可以在PARIOAD寄存器中指定为不可屏蔽中断或复位。当。。。的时候PARIOAD寄存器中的OAD位设置为1，奇偶校验错误输出到复位功能。当OAD位在PARIOAD寄存器设置为0，奇偶校验错误作为不可屏蔽中断输出到ICU。

奇偶校验错误经常因噪声而发生。要确认原因是噪声还是损坏，请按照图53.2和图53.3所示的奇偶校验流程进行操作。

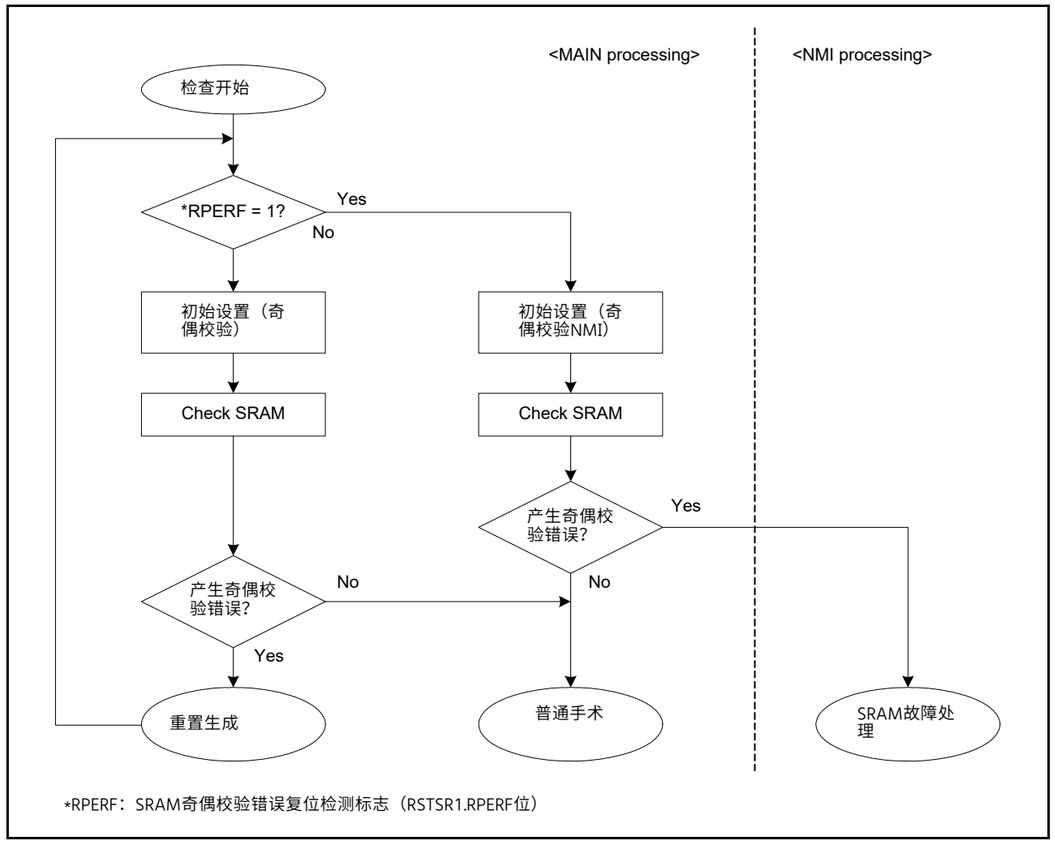

Figure 53.2 启用SRAM奇偶校验复位时的SRAM奇偶校验流程

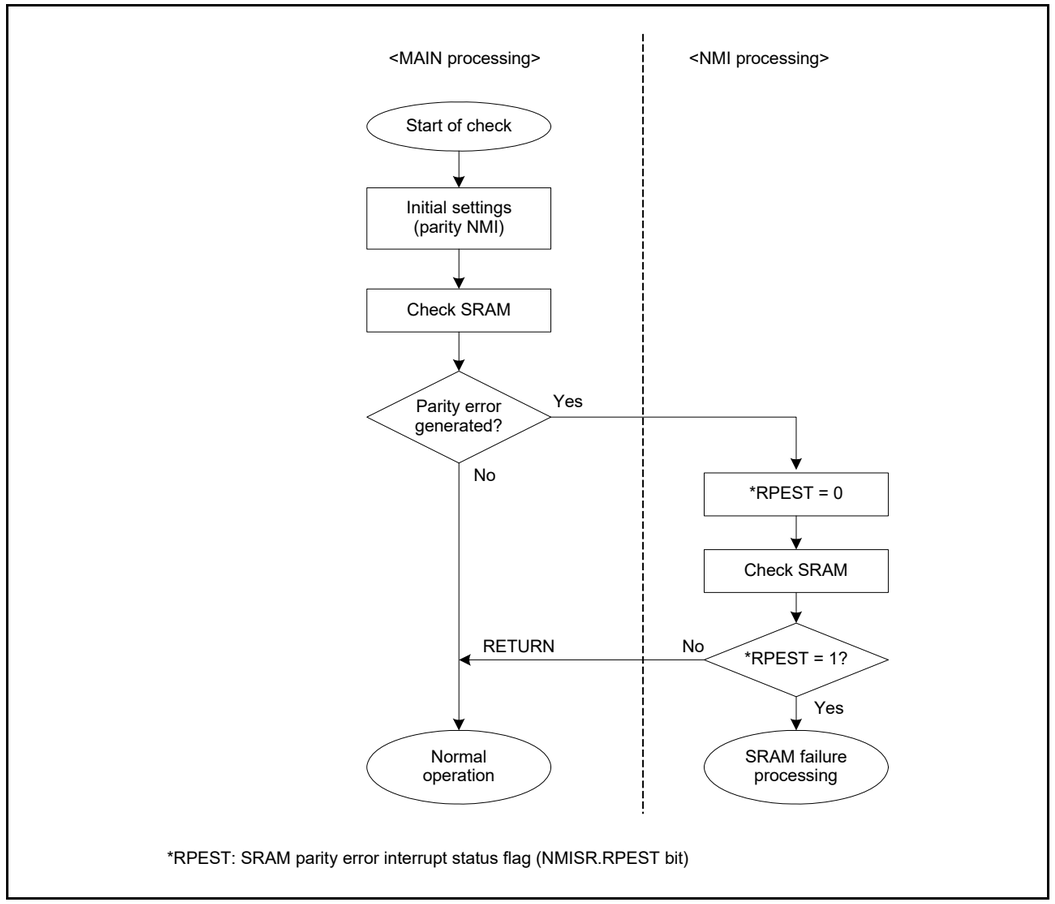

Figure 53.3 Flow of SRAM parity check when SRAM parity interrupt is enabled

53.3.6 SRAM Error Sources

The SRAM error sources are ECC errors and parity errors. ECC errors can be specified as non-maskable interrupts or resets in the OAD bit in the ECCOAD register, and parity errors can be specified as non-maskable interrupts or resets in the PARIOAD register.

Table 53.2 SRAM error sources

Interrupt source	DTC activation	DMAC activation
ECC error (SRAM0 area with ECC)	Not possible	Not possible
Parity error (SRAM0 area without ECC, SRAM1, SRAMHS	Not possible	Not possible

53.3.7 Access Cycles

Table 53.3 SRAMHS (parity area 1FFE 0000h to 1FFF FFFFh)

Read (cycles)		Write (cycles)	
Word access	Halfword/byte access	Word access	Halfword/byte access
2		2	

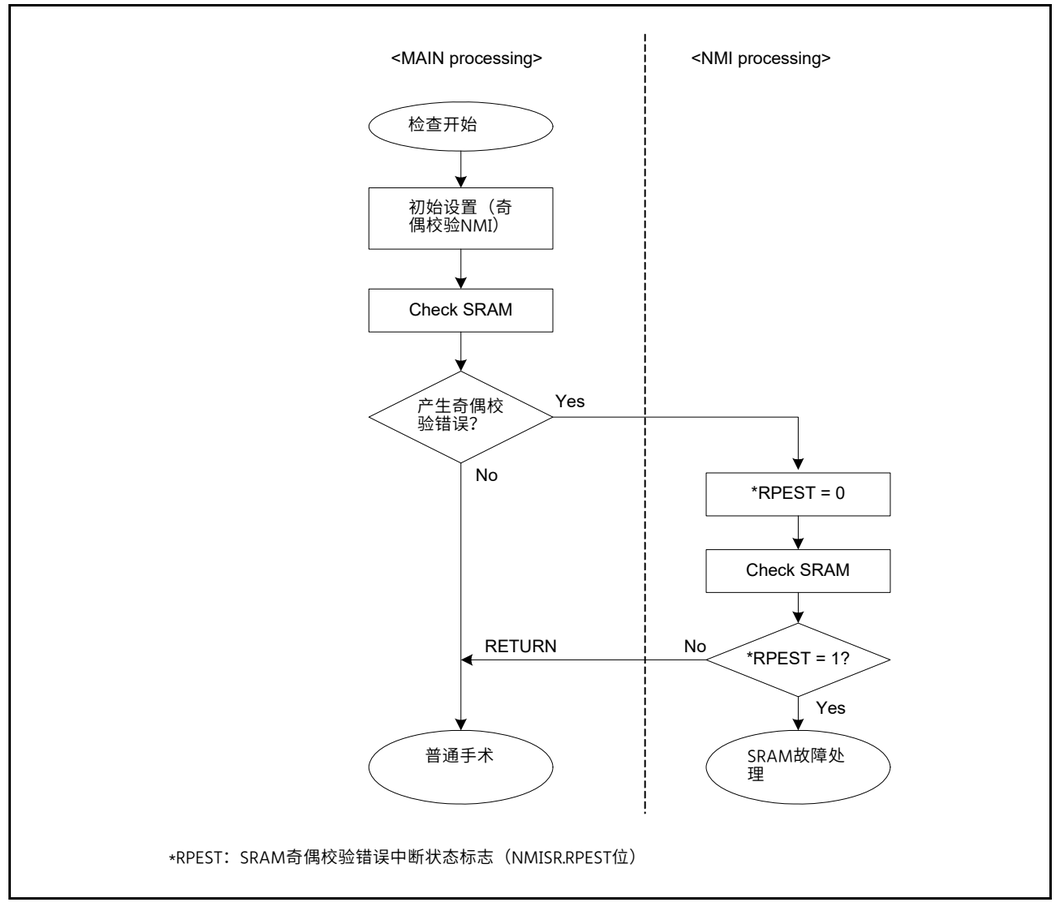

Figure 53.3 启用SRAM奇偶校验中断时的SRAM奇偶校验流程

53.3.6 SRAM错误源

SRAM错误源是ECC错误和奇偶校验错误。ECC错误可在ECCOAD寄存器的OAD位中指定为不可屏蔽中断或复位，奇偶校验错误可在PARIOAD寄存器中指定为不可屏蔽中断或复位。

Table 53.2 SRAM错误源

中断源	DTC activation	DMAC activation
ECC错误（带ECC的SRAM0区域）	不可能	不可能
奇偶校验错误（SRAM0区域无ECC、SRAM1、SRAMHS	不可能	不可能

53.3.7 访问周期

	Word access	Halfword or byte access	Word access	Halfword or byte access
SRAM1WTEN = 0	2		2	
SRAM1WTEN = 1	3		2	

53.4 Usage Notes

53.4.1 Wait State Insertion

Set the number of SRAM wait cycles in the SRAMWTSC register based on the following:

- SRAM0, SRAM1
  1 wait: 60 MHz < ICLK ≤ 120 MHz
  No wait: ICLK ≤ 60 MHz

53.4.2 Instruction Fetch from the SRAM Area

When using SRAM0, SRAM1, or the SRAMHS to operate a program, initialize the SRAM area so the CPU can correctly prefetch data. If the CPU prefetches data from an SRAM area that is not initialized, an ECC error or a parity error might occur. Initialize the additional 12-byte area from the end address of the program with the 4-byte boundary. Renesas recommends using the NOP instruction for data initialization.

53.4.3 Store Buffer of SRAM

For fast access between SRAM and CPU, a store buffer is used. When a load instruction is executed from the same address after a store instruction to SRAM, the load instruction might read out data from the buffer instead of data from the SRAM. To read data on the SRAM correctly, use either of the following procedures:

- After writing to the SRAM (address = A), use the NOP instruction, then read the SRAM (address = A)
- After writing to the SRAM (address = A), read data from area other than SRAM (address = A), then read the SRAM (address = A).

Table 53.4 SRAM0（ECC区域20000000h至20007FFFh）

位设置		Read (cycles)		Write (cycles)	
		字访问	半字或字节访问	字访问	半字或字节访问
ECC Off ECCMOD[1] = 0	SRAM0ERDWTEN = 0	2		2	
	SRAM0ERDWTEN = 1	3		2	
ECC On ECCMOD[1] = 1	SRAM0ERDWTEN = 0	2		2	4
	SRAM0ERDWTEN = 1	3		2	4

Table 53.5 SRAM0（奇偶校验区20008000h到2003FFFFh）

位设置	Read (cycles)		Write (cycles)	
	字访问	半字或字节访问	字访问	半字或字节访问
SRAM1WTEN = 0	2		2	
SRAM1WTEN = 1	3		2	

53.4 使用说明

53.4.1 等待状态插入

根据以下内容在SRAMWTSC寄存器中设置SRAM等待周期数：

- SRAM0, SRAM1
  1 wait: 60 MHz < ICLK ≤ 120 MHz
  No wait: ICLK ≤ 60 MHz

53.4.2 从SRAM区域取指令

当使用SRAM0、SRAM1或SRAMHS操作程序时，初始化SRAM区域，以便CPU可以正确预取数据。如果CPU从未初始化的SRAM区域预取数据，则可能会发生ECC错误或奇偶校验错误。用4字节边界从程序的结束地址初始化额外的12字节区域。瑞萨推荐使用NOP指令进行数据初始化。

53.4.3 SRAM的存储缓冲区

对于SRAM和CPU之间的快速访问，使用了存储缓冲区。当在对SRAM执行存储指令之后从同一地址执行加载指令时，加载指令可能会从缓冲区中读取数据，而不是从SRAM中读取数据。要正确读取SRAM上的数据，请使用以下任一过程：

- 写入SRAM（地址=A）后，使用NOP指令，然后读取SRAM（地址=A）
- 写入SRAM（地址=A）后，从SRAM以外的区域（地址=A）读取数据，然后读取SRAM（地址=A）。

54. Standby SRAM

54.1 Overview

An on-chip SRAM is provided to retain data in Deep Software Standby mode. Table 54.1 lists the Standby SRAM specifications.

Table 54.1 Standby SRAM specifications

Parameter	Specifications
SRAM capacity	8 KB
SRAM address	200F E000h to 200F FFFFh
Access	The number of access depends on the frequency between ICLK and PCLKB. See section 54.2.4, Access Cycle for details.
Data retention	Data can be retained in Deep Software Standby mode
Parity	Even parity (data: 8 bits, parity: 1 bit)
Module-stop function	Module-stop state can be set to reduce power consumption

54.2 Operation

54.2.1 Data Retention

The power supply to the Standby SRAM in Deep Software Standby mode is enabled by the DPSBYCR.DEEPCUT[1:0] bits. If the DPSBYCR.DEEPCUT[1:0] bits are set to 00b, data in the Standby SRAM is retained in Deep Software Standby mode. See section 11, Low Power Modes, for details on the DPSBYCR.DEEPCUT[1:0] bits.

54.2.2 Low-Power Function

Power consumption can be reduced by setting Module Stop Control Register A (MSTPCRA) to stop supply of the clock signal to the SRAM. Setting the MSTPA7 bit in MSTPCRA to 1 stops supply of the clock signal to the Standby SRAM. The Standby SRAM is then placed in the module-stop state by stopping supply of the clock signals. The Standby SRAM operates after a reset. The Standby SRAM is not accessible if it is in the module-stop state. Do not transition to the module-stop state while access to the Standby SRAM is in progress. For details on the MSTPCRA register, see section 11, Low Power Modes.

54.2.3 Parity Calculation Function

The parity calculation function for Standby SRAM is the same as for SRAM1 or SRAM0 without error correction code (ECC). The function of the OAD bit in the PARIOAD register and the flow of the SRAM parity check are shared by the Standby SRAM modules. For details, see section 53.3.5, Parity Calculation Function and section 53.3.6, SRAM Error Sources.

54.2.4 Access Cycle

Table 54.2 Standby SRAM access cycle

	Read (cycles)		Write (cycles)	
Frequency	Word access	Halfword/byte access	Word access	Halfword/byte access
Same Frequency ICLK = PCLKB	3 ICLK		2 ICLK	
Different Frequency ICLK > PCLKB	1 ICLK + 2 to 3 PCLKB		1 ICLK + 1 to 2 PCLKB	

54. Standby SRAM

54.1 Overview

提供片上SRAM以在深度软件待机模式下保留数据。表54.1列出了备用SRAM规格。

Table 54.1 备用SRAM规格

Parameter	Specifications
SRAM capacity	8 KB
SRAM address	200F E000h to 200F FFFFh
Access	访问次数取决于ICLK和PCLKB之间的频率。 有关详细信息，请参阅第54.2.4节，访问周期。
数据保留	数据可以在深度软件待机模式下保留
Parity	偶校验（数据：8位，奇偶校验：1位）
Module-stop function	可设置模块停止状态以降低功耗

54.2 Operation

54.2.1 数据保留

深度软件待机模式下的待机SRAM电源由DPSBYCR.DEEPCUT[1:0]位启用。如果DPSBYCR.DEEPCUT[1:0]位设置为00b，则待机SRAM中的数据将保留在深度软件待机模式中。有关DPSBYCR.DEEPCUT[1:0]位的详细信息，请参见第11节，低功耗模式。

54.2.2 Low-Power Function

通过设置模块停止控制寄存器A(MSTPCRA)停止向SRAM提供时钟信号，可以降低功耗。将MSPTCRA中的MSTPA7位设置为1会停止向待机SRAM提供时钟信号。然后通过停止提供时钟信号将待机SRAM置于模块停止状态。待机SRAM在复位后运行。如果处于模块停止状态，则无法访问备用SRAM。在访问备用SRAM的过程中不要转换到模块停止状态。有关MSTPCRA寄存器的详细信息，请参见第11节，低功耗模式。

54.2.3 奇偶校验计算功能

StandbySRAM的奇偶校验计算功能与无纠错码(ECC)的SRAM1或SRAM0相同。PARIOAD寄存器中OAD位的功能和SRAM奇偶校验流程由备用SRAM模块共享。有关详细信息，请参阅第53.3.5节，奇偶校验计算函数和第53.3.6节，SRAM错误

Sources.

54.2.4 访问周期

Table 54.2 待机SRAM访问周期

	Read (cycles)		Write (cycles)	
Frequency	字访问	Halfword/byte access	字访问	Halfword/byte access
同频 ICLK = PCLKB	3 ICLK		2 ICLK	
不同频率 ICLK > PCLKB	1 ICLK + 2 to 3 PCLKB		1 ICLK + 1 to 2 PCLKB	

54.3 Usage Notes

54.3.1 Instruction Fetch from the Standby SRAM area

When using Standby SRAM to operate a program, initialize the Standby SRAM area so that the CPU can correctly prefetch data. A parity error might occur if the CPU prefetches from an area that is not initialized. Initialize the additional 12-byte area from the end address of the program with the 4-byte boundary. Renesas recommends using the NOP instruction for data initialization.

54.3 使用说明

54.3.1 从备用SRAM区域取指令

使用StandbySRAM操作程序时，初始化StandbySRAM区域，以便CPU可以正确预取数据。如果CPU从未初始化的区域预取，则可能发生奇偶校验错误。用4字节边界从程序的结束地址初始化额外的12字节区域。瑞萨推荐使用NOP指令进行数据初始化。

55. Flash Memory

55.1 Overview

The MCU provides up to 2-MB code flash memory and 64-KB data flash memory. The Flash Control Unit (FCU) controls programming and erasure of the flash memory. The Flash Application Command Interface (FACI) controls the FCU in accordance with the specified FACI commands.

Table 55.1 lists the specifications of the code flash memory and data flash memory, and Figure 55.1 shows a block diagram of the related modules. Figure 55.2 shows the configuration of the code flash memory, and Figure 55.3 shows the configuration of the data flash memory.

Table 55.1 Specifications of the code flash memory and data flash memory

Parameter	Code flash memory specifications	Data flash memory specifications
Memory capacity	• Up to 2 MB	64 KB
Read cycle	• 80 MHz < ICLK frequency ≤ 120 MHz: Cache hit: 1 cycle Cache miss: 3 cycles • 40 MHz < ICLK frequency ≤ 80 MHz: Cache hit: 1 cycle Cache miss: 2 cycles • ICLK frequency ≤ 40 MHz: Cache hit: 1 cycle Cache miss: 1 cycle	A read operation takes seven cycles of FCLK in words or bytes (FCLK frequency is up to 60 MHz)
Value after erasure	FFh	Undefined
Programming/erasing methods	• Programming and erasing of code and data flash memory handled by FACI commands specified in the FACI command issuing area (407E 0000h) • Programming by dedicated flash-memory programmer transfer through a serial interface (serial programming) • Programming of flash memory by user program (self-programming)	
Security function	Protection against illicit tampering with or reading of data in flash memory	
Protection	Protection against erroneous overwriting of flash memory	
Background operations (BGOs)	• Code flash memory can be read during code flash memory programming*1 • Code flash memory can be read during data flash memory programming • Data flash memory can be read during code flash memory programming	
Units of programming and erasure	• 128-byte units for programming in user area • Block units for erasure in user area	• 4/8/16-byte units for programming in data area • 64/128/256-byte units for erasure in data area
Other functions	Interrupts can be accepted during self-programming	
	An expansion area of flash memory (option bytes) can be set in the initial MCU settings	
On-board programming (four types)	Programming in serial programming mode (SCI boot mode): • Asynchronous serial interface (SCI9) used • Transfer rate adjusted automatically Programming in serial programming mode (USB boot mode): • USBFS used • Dedicated hardware not required, so direct connection to PC is possible Programming in On-chip debug mode: • JTAG or SWD interface used • Dedicated hardware not required Programming by a routine for code and data flash memory programming within the user program: • Allows code and data flash memory programming without resetting the system	

Note 1. Constraints apply to the combinations of ranges in which writing can proceed. See Table 55.11.

55. 闪存

55.1 Overview

MCU提供高达2-MB的代码闪存和64-KB的数据闪存。闪存控制单元(FCU)控制闪存的编程和擦除。Flash应用命令接口(FACI)根据指定的FACI命令控制FCU。

表55.1列出了代码闪存和数据闪存的规格，图55.1给出了相关模块的框图。图55.2显示了代码闪存的配置，图55.3显示了数据闪存的配置。

Table 55.1 代码闪存和数据闪存的规格

Parameter	代码闪存规格	数据闪存规格
内存容量	高达2MB	64 KB
读周期	80MHz<ICLK频率≤120MHz：高速缓存命中：1个周期 缓存未命中：3个周期 40MHz<ICLK频率≤80MHz：缓存命中：1个周期 缓存未命中：2个周期 ICLK频率≤40MHz：缓存命中：1个周期 缓存未命中：1个周期	读取操作需要7个字或字节的FCLK周期（FCLK频率高达60MHz）
擦除后的值	FFh	Undefined
Programming/erasing methods	由FACI命令发出区域(407E0000h)中指定的FACI命令处理的代码和数据闪存的编程和擦除 通过串行接口传输的专用闪存编程器进行编程（串行编程） 通过用户程序对闪存进行编程（自编程）	
安全功能	防止非法篡改或读取闪存中的数据	
Protection	防止错误覆盖闪存	
后台操作(BGO)	代码闪存可以在代码闪存编程期间读取*1 代码闪存可以在数据闪存编程期间读取 数据闪存可以在代码闪存编程期间读取	
编程和擦除单元	128字节单元，用于用户区中的编程 块单元，用于用户区中的擦除	48个16字节单元，用于数据区中的编程 64128256字节单元，用于数据区中的擦除
其他功能	自编程期间可以接受中断	
	可在初始MCU设置中设置闪存的扩展区域（选项字节）	
On-board programming (four types)	在串行编程模式下编程（SCI引导模式）： 使用异步串行接口(SCI9) 自动调整传输速率在串行编程模式下编程（USB引导模式）： 使用USBFS 不需要专用硬件，因此可以直接连接到PC可以在片上调试模式下进行编程： 使用JTAG或SWD接口 不需要专用硬件通过用户程序中的代码和数据闪存编程例程进行编程： 允许在不重置系统的情况下进行代码和数据闪存编程	

Note 1. 约束适用于可以进行写入的范围组合。见表55.11。

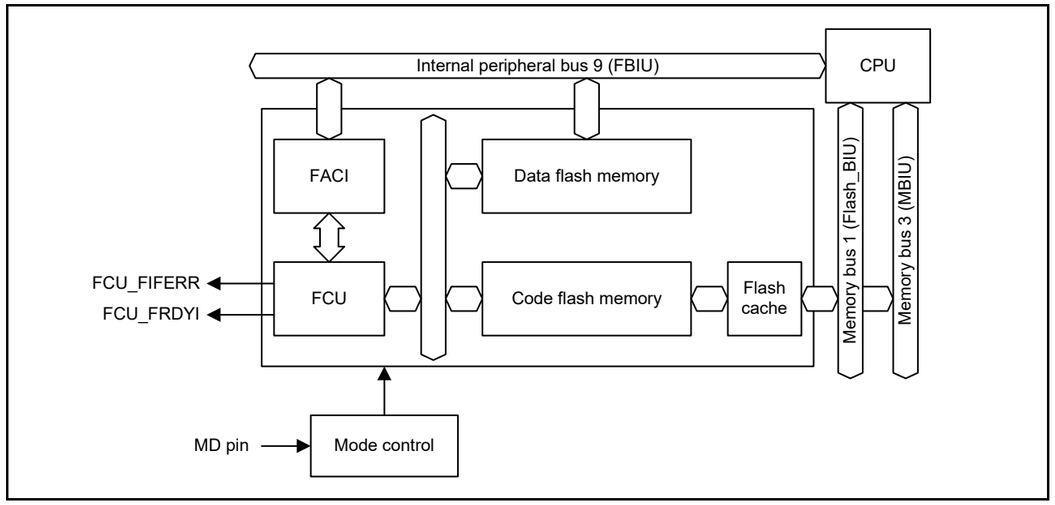

Figure 55.1 Block diagram of flash memory-related modules

55.2 Structure of Memory

Figure 55.2 shows the mapping of the code flash memory, and Table 55.2 shows the read and programming/erasure addresses by product. The user space of the code flash memory is divided into 8- and 32-KB blocks, which serve as the units of erasure. The user area is available for storing the user program.

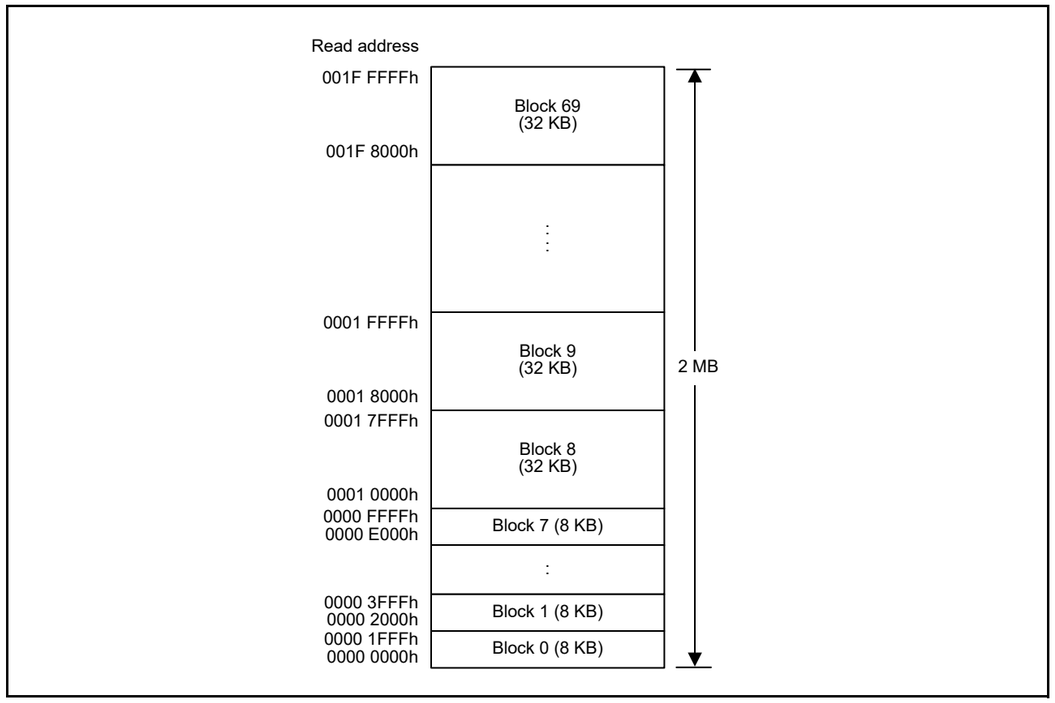

Figure 55.2 Mapping of the code flash memory

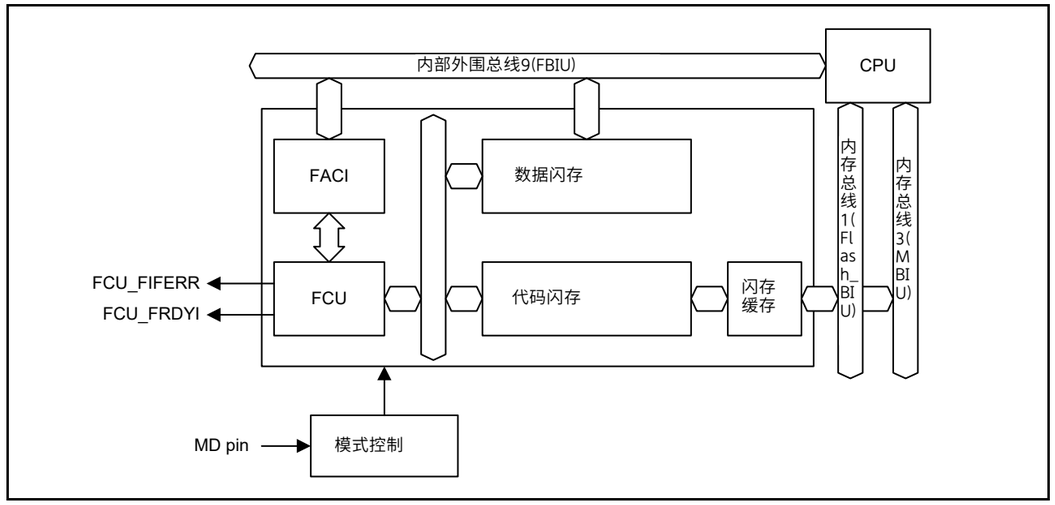

Figure 55.1 闪存相关模块框图

55.2 内存结构

图55.2显示了代码闪存的映射，表55.2显示了按产品划分的读取和编程擦除地址。代码闪存的用户空间分为8KB和32KB块，作为擦除单位。用户区可用于存储用户程序。

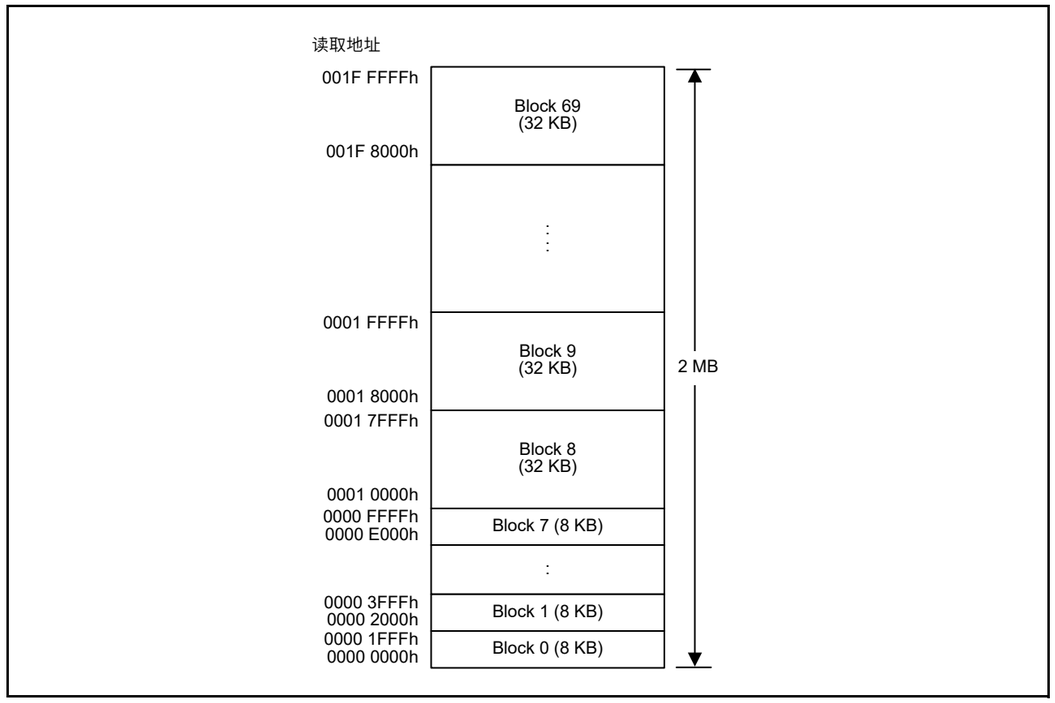

Figure 55.2 代码闪存的映射

Table 55.2 Read and P/E addresses by product for the code flash memory

Product	Read address	P/E address	Number of blocks
2-MB product	0000 0000h to 001F FFFFh	0000 0000h to 001F FFFFh	0 to 69
1-MB product	0000 0000h to 000F FFFFh	0000 0000h to 000F FFFFh	0 to 37

The data area of the data flash memory is divided into 64-byte blocks, with each being a unit for erasure. Figure 55.3 shows the mapping of the data flash memory.

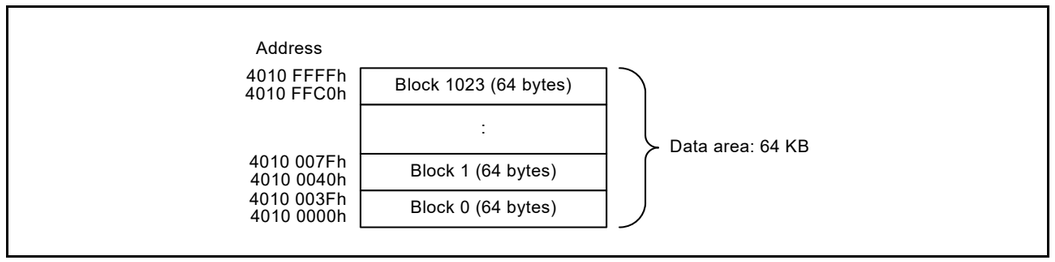

Figure 55.3 Mapping of the data flash memory

55.3 Register Descriptions

55.3.1 Flash Cache Enable Register (FCACHEE)

Address(es): FCACHE.FCACHEE 4001 C100h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FCACHEEN	FCACHE Enable	0: Disable FCACHE 1: Enable FCACHE.	R/W
b15 to b1	—	Reserved	These bits are read as 0.	R

The FCACHEE.FCACHEEN bit enables or disables the flash cache function of FCACHE1, FCACHE2, and FLPF. This bit does not affect FCACHEIV.FCACHEIV. When FCACHE is enabled, the HPROT[3] determines whether it is cacheable or non-cacheable. See section 15.8 for details on HPROT[3].

Table 55.2 代码闪存按产品读取和PE地址

Product	读取地址	P/E address	块数
2-MB product	0000 0000h to 001F FFFFh	0000 0000h to 001F FFFFh	0 to 69
1-MB product	0000 0000h to 000F FFFFh	0000 0000h to 000F FFFFh	0 to 37

数据闪存的数据区被划分为64个字节的块，每个块为一个擦除单元。图55.3显示了数据闪存的映射。

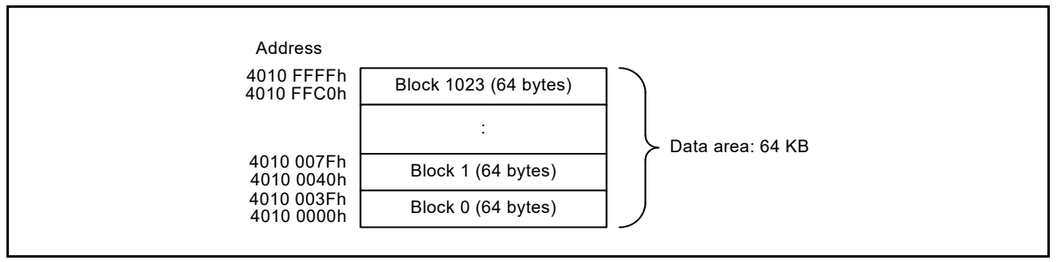

Figure 55.3 数据闪存的映射

55.3 注册说明

55.3.1 闪存缓存启用寄存器(FCACHEE)

Address(es): FCACHE.FCACHEE 4001 C100h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEEN
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	FCACHEEN	FCACHE Enable	0：禁用FCACHE1： 启用FCACHE。	R/W
b15 to b1	—	Reserved	这些位读为0。	R

FCACHEE.FCACHEEN位启用或禁用FCACHE1、FCACHE2和FLPF的闪存缓存功能。该位不影响FCACHEIV.FCACHEIV。当启用FCACHE时，HPROT[3]确定它是可缓存的还是不可缓存的。有关HPROT[3]的详细信息，请参见第15.8节。

55.3.2 Flash Cache Invalidate Register (FCACHEIV)

Address(es): FCACHE.FCACHEIV 4001 C104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEIV
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	FCACHEIV	FCACHE Invalidate	• Reads: 0: Do not invalidate 1: Invalidate. • Writes: When write value is 1, FCACHE is invalidated. When write value is 0, this setting is ignored.	R/W
b15 to b1	—	Reserved	These bits are read as 0.	R

When 1 is written to the FCACHEIV.FCACHEIV bit, the flash cache data in FCACHE1, FCACHE2, and FLPF is invalidated.

55.3.3 Flash Wait Cycle Register (FLWT)

Address(es): FCACHE.FLWT 4001 C11Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	FLWT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	FLWT[2:0]*1	Flash Wait Cycle	b2 b0 0 0 0: 0 waits (ICLK ≤ 40 MHz) 0 0 1: 1 wait (40 MHz < ICLK ≤ 80 MHz) 0 1 0: 2 waits (80 MHz < ICLK ≤ 120 MHz). Other settings are reserved.	R/W
b15 to b3	—	Reserved	These bits are read as 0.	R

Note 1. Settings other than 000b are prohibited in the SubOSC-speed mode.

The Flash Wait Cycle Register (FLWT) sets the access wait count for the flash memory. For faster clock frequencies, set FLWT.FLWT before changing the clock frequency. For slower clock frequencies, set FLWT.FLWT after changing the clock frequency.

55.3.2 闪存缓存无效寄存器(FCACHEIV)

Address(es): FCACHE.FCACHEIV 4001 C104h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEIV
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	FCACHEIV	FCACHE Invalidate	读取：0：不无效1：无效。 写入：当写入值为1时，FCACHE无效。当写入值为0时，忽略此设置。	R/W
b15 to b1	—	Reserved	这些位读为0。	R

当FCACHEIV.FCACHEIV位写入1时，FCACHE1、FCACHE2和FLPF中的闪存缓存数据无效。

55.3.3 闪存等待周期寄存器(FLWT)

Address(es): FCACHE.FLWT 4001 C11Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	FLWT[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	FLWT[2:0]*1	闪存等待周期	b2b0000：0次等待（ICLK≤40MHz）001：1次等待（40MHz<ICLK≤80MHz）010：2次等待（80MHz<ICLK≤120MHz）。保留其他设置。	R/W
b15 to b3	—	Reserved	这些位读为0。	R

Note 1. 在SubOSC速度模式中禁止设置000b以外的设置。

闪存等待周期寄存器(FLWT)设置闪存的访问等待计数。对于更快的时钟频率，设置
更改时钟频率之前的FLWT.FLWT。对于较慢的时钟频率，请在更改时钟频率后设置FLWT.FLWT。

55.3.4 Factory MCU Information Flash Root Table (FMIFRT)

Address(es): 407F B19Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	Value depends on the product															

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	Value depends on the product															

Bit	Description	R/W
b31 to b0	Base address of unique ID	R

The FMIFRT is a read-only register that stores a base address of the Unique ID register, Part Numbering register and MCU Version register. The FMIFRT should be read in 32-bit units. The base address of the RA6M3 MCU is 0x01007000.

55.3.5 Unique ID Register n (UIDRn) (n = 0 to 3)

Address(es): UIDR0 FMIFRT+14h, UIDR1 FMIFRT+18h, UIDR2 FMIFRT+1Ch, UIDR3 FMIFRT+20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	Unique value for each MCU															

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	Unique value for each MCU															

Bit	Description	R/W
b31 to b0	Unique ID	R

The UIDRn is a read-only register that stores a 16-byte ID code (unique ID) for identifying the individual MCU. The UIDRn register should be read in 32-bit units.

55.3.4 工厂MCU信息闪存根表(FMIFRT)

Address(es): 407F B19Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	价值取决于产品															

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	价值取决于产品															

Bit	Description	R/W
b31 to b0	唯一标识的基地址	R

FMIFRT是一个只读寄存器，用于存储唯一ID寄存器的基地址、零件编号寄存器和MCU版本寄存器。FMIFRT应以32位为单位读取。RA6M3MCU的基地址为0x01007000。

55.3.5 唯一ID寄存器n(UIDRn)(n=0到3)

Address(es): UIDR0 FMIFRT+14h, UIDR1 FMIFRT+18h, UIDR2 FMIFRT+1Ch, UIDR3 FMIFRT+20h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
重置后的值：	每个MCU的独特价值															

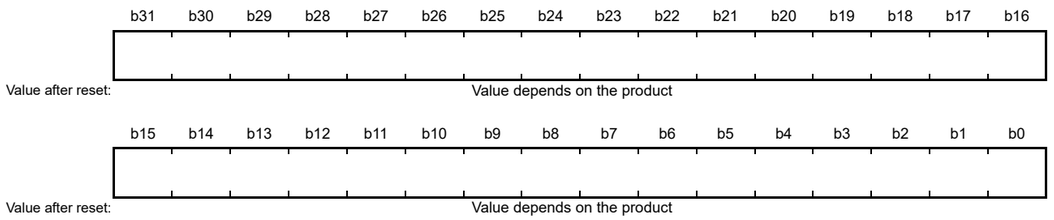
	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
重置后的值：	每个MCU的独特价值															

Bit	Description	R/W
b31 to b0	唯一身份	R

UIDRn是一个只读寄存器，它存储一个16字节的ID代码（唯一ID），用于识别单个MCU。这UIDRn寄存器应以32位为单位读取。

55.3.6 Part Numbering Register n (PNRn) (n = 0 to 3)

Address(es): PNR0 FMIFRT+24h, PNR1 FMIFRT+28h, PNR2 FMIFRT+2Ch, PNR3 FMIFRT+30h

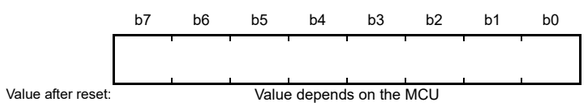


Bit	Description	R/W
b31 to b0	Product part number	R

The PNRn is a read-only register that stores a 16-byte part numbering. The PNRn register should be read in 32-bit units. Each byte corresponds to the ASCII code representation of the product part number as described in Table 1.14, Product list. The first character ("R", 0x52 in ASCII code) of the part number is stored in the byte with the smallest address (FMIFRT + 24h).

55.3.7 MCU Version Register (MCUVER)

Address(es): FMIFRT+44h



Bit	Description	R/W
b7 to b0	MCU version	R

The MCUVER is a read-only register that stores the MCU version. The MCUVER register should be read in 8-bit units. The higher the value, the newer the MCU version.

55.4 Flash Cache

55.4.1 Overview

The flash cache (FCACHE) speeds up read access from the bus master to the flash memory. The FCACHE includes:

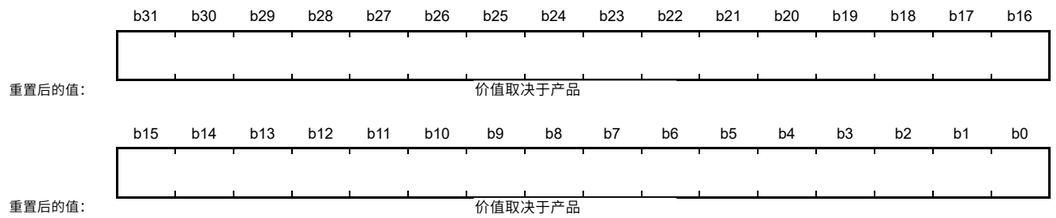
- FCACHE1, for CPU instruction fetches
- FCACHE2, for CPU operand access and DMA
- FLPF, for the prefetch access in CPU instruction fetches.

Table 55.3 Flash cache overview (1 of 2)

Parameter	Flash cache 1 (FCACHE1)	Flash cache 2 (FCACHE2)	Prefetch Buffer (FLPF)
Cache target region	0000 0000h - 001F FFFFh	0000 0000h - 001F FFFFh	0000 0000h - 001F FFFFh

55.3.6 零件编号寄存器n(PNRn)（n=0到3）

Address(es): PNR0 FMIFRT+24h, PNR1 FMIFRT+28h, PNR2 FMIFRT+2Ch, PNR3 FMIFRT+30h

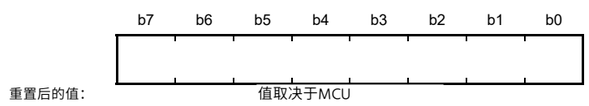


Bit	Description	R/W
b31 to b0	产品部件号	R

PNRn是一个只读寄存器，存储一个16字节的零件编号。PNRn寄存器应以32位为单位读取。每个字节对应于产品部件号的ASCII代码表示，如表1.14，产品列表中所述。零件编号的第一个字符（“R”，ASCII代码中的0x52）存储在地址最小的字节中（FMIFRT+24h）。

55.3.7 MCU版本寄存器(MCUVER)

Address(es): FMIFRT+44h



Bit	Description	R/W
b7 to b0	MCU version	R

MCUVER是一个只读寄存器，用于存储MCU版本。MCUVER寄存器应以8位为单位读取。
值越高，MCU版本越新。

55.4 闪存缓存

55.4.1 Overview

闪存高速缓存(FCACHE)加快了从总线主机到闪存的读取访问。FCACHE包括：

- FCACHE1，用于CPU指令取指
- FCACHE2，用于CPU操作数访问和DMA
- FLPF，用于CPU取指中的预取访问。

Table 55.3 闪存缓存概述(1of2)

Parameter	闪存缓存1(FCACHE1)	闪存缓存2(FCACHE2)	Prefetch Buffer (FLPF)
缓存目标区域	0000 0000h - 001F FFFFh	0000 0000h - 001F FFFFh	0000 0000h - 001F FFFFh

Table 55.3 Flash cache overview (2 of 2)

Parameter	Flash cache 1 (FCACHE1)	Flash cache 2 (FCACHE2)	Prefetch Buffer (FLPF)
Target bus master	CPU instruction fetch	CPU Operand Access and Access from other than CPU	FLPF
Capacity	256 bytes	16 bytes	32 bytes
Associativity	• 8-way set associative • 128 bits/entry (128-bit aligned data) • 2 entries/way	• Fully associative • 128 bits/entry (128-bit aligned data) • 1 entry for FCACHE2	• Fully associative • 128 bits/entry (128-bit aligned data) • 2 entries
Access cycles	• Cache hit: 0 waits • Cache miss: Number of waits set in Flash Wait Cycle Register	• Cache hit: 0 waits • Cache miss: Number of waits set in Flash Wait Cycle Register	• Cache hit: 0 waits • Cache miss: Number of waits set in Flash Wait Cycle Register

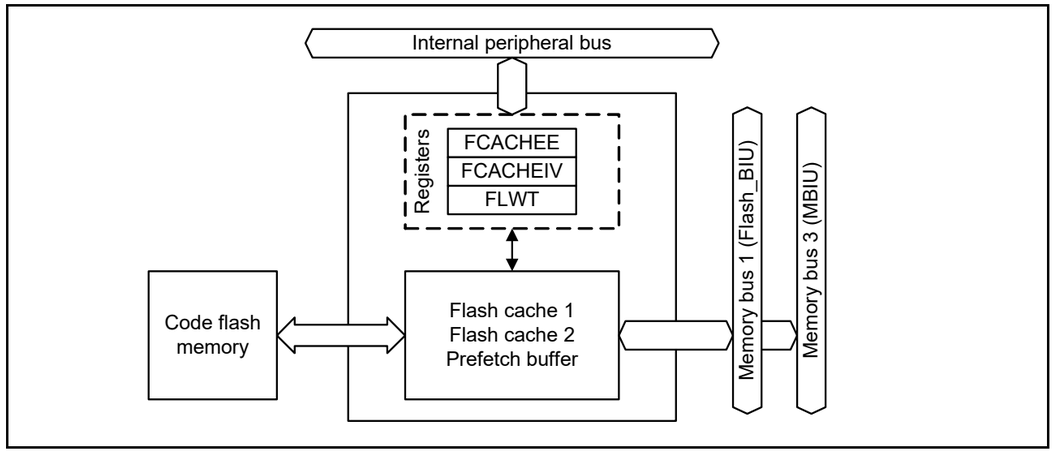


Figure 55.4 FCACHE block diagram

55.5 Operation

Use the FCACHEE register to set up and enable flash operation.

To set up the flash cache and prepare to rewrite the flash memory:

1. Disable the flash cache by resetting FCACHEE.FCACHEEN.*1
2. Invalidate the flash cache by setting FCACHEIV.FCACHEIV.
3. Check that FCACHEIV.FCACHEIV is 0.
4. Enable the flash cache by setting FCACHEE.FCACHEEN.

Note 1. It is not necessary to disable the flash cache on the first setup after reset.

55.5.1 Notice to use Flash Cache

When using Flash cache by access from the CPU, Arm® MPU should also be set to cacheable.

See the ARMv7-M Architecture Reference Manual and the Cortex-M4 Devices Generic User Guide.

55.6 Operating Modes Associated with the Flash Memory

Figure 55.5 shows a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, see section 3, Operating Modes.

Table 55.3 闪存缓存概述(2of2)

Parameter	闪存缓存1(FCACHE1)	闪存缓存2(FCACHE2)	Prefetch Buffer (FLPF)
目标总线主机	CPU指令获取	CPU操作数访问和非CPU访问	FLPF
Capacity	256 bytes	16 bytes	32 bytes
Associativity	8路组关联 128位条目（128位对齐数据） 2项方式	完全关联 128位条目（128位对齐数据） FCACHE2的1个条目	完全关联 128位条目（128位对齐数据） 2个条目
访问周期	缓存命中：0次等待 缓存未命中Flash等待周期寄存器中设置的等待数	缓存命中：0次等待 缓存未命中Flash等待周期寄存器中设置的等待数	缓存命中：0次等待 缓存未命中：Flash等待周期寄存器中设置的等待数

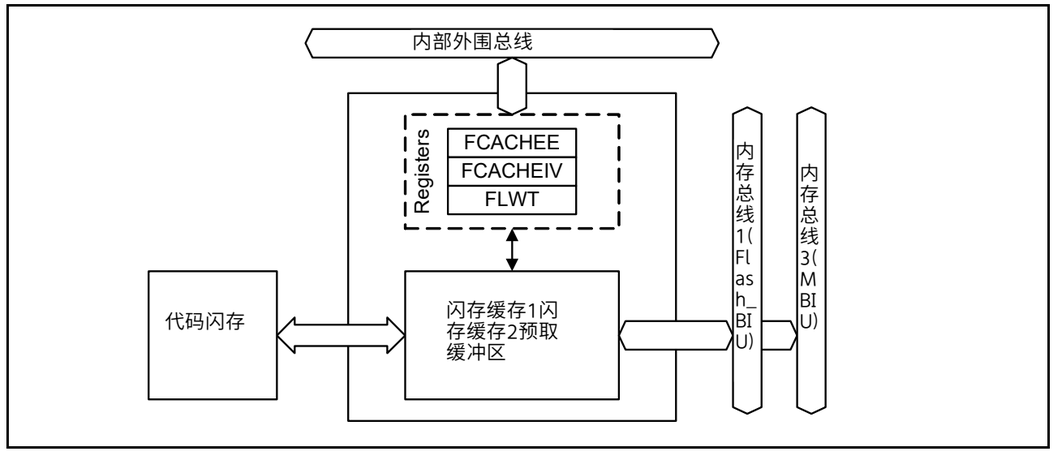

Figure 55.4 FCACHE框图

55.5 Operation

使用FCACHEE寄存器设置和启用闪存操作。

设置闪存缓存并准备重写闪存：

1. 通过重置FCACHEE.FCACHEEN禁用闪存缓存。*1
2. 通过设置FCACHEIV.FCACHEIV使闪存缓存无效。
3. 检查FCACHEIV.FCACHEIV是否为0。
4. 通过设置FCACHEE.FCACHEEN启用闪存缓存。

注1.复位后第一次设置时无需禁用闪存缓存。

55.5.1 使用FlashCache的注意事项

当通过CPU访问使用Flash缓存时，Arm®MPU也应设置为可缓存。

请参阅ARMv7-M架构参考手册和Cortex-M4设备通用用户指南。

55.6 与闪存相关的操作模式

图55.5显示了与闪存相关的模式转换图。有关设置模式的步骤，请参阅第3节，操作模式。

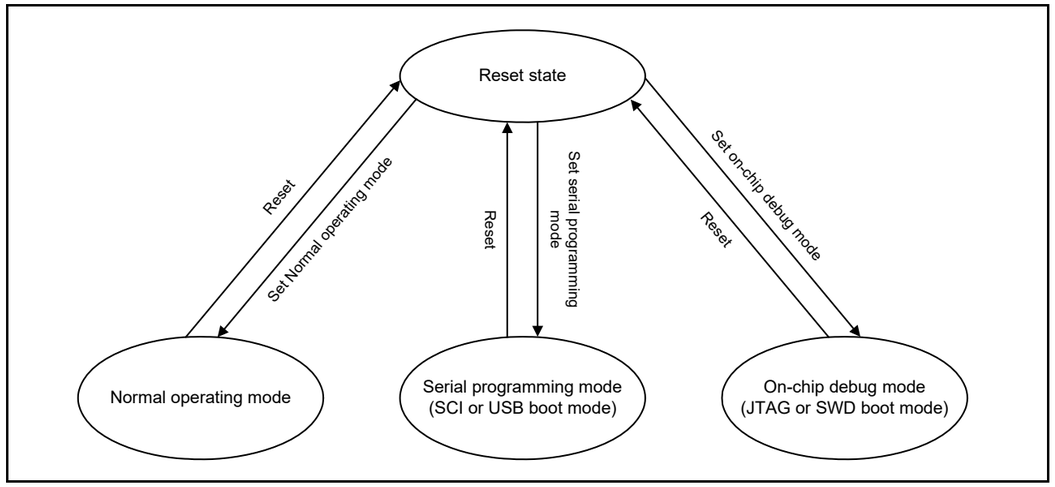

Figure 55.5 Mode transitions associated with flash memory

The flash memory area where programming and erasure are permitted and where the boot program executes after a reset differ with the mode. Table 55.4 shows the differences between the modes.

Table 55.4 Difference between modes

Parameter	Normal operating mode	Serial programming mode (SCI or USB boot mode)	On-chip debug mode (JTAG or SWD boot mode)
Programmable and erasable areas	• Code flash memory • Data flash memory	• Code flash memory • Data flash memory	• Code flash memory • Data flash memory
Erasure in block units	Possible	Possible	Possible
Boot program at a reset	User area program	Embedded program for serial programming	Depends on debug command

55.6.1 ID Code Protection

This function prohibits programming and on-chip debugging. The device validates or invalidates the ID code and determines the ID code based on an ID code stored in the flash memory. When ID code protection is enabled, the ID code sent from the host is compared with the ID code in the flash memory to determine whether they match. Programming and on-chip debugging are enabled only when the two match. The ID code in flash memory consists of four 32-bit words.

ID code bits 127 and 126 determine whether ID code protection is enabled and the method of authentication to use with the host. Table 55.5 shows how the ID code determines the method of authentication.

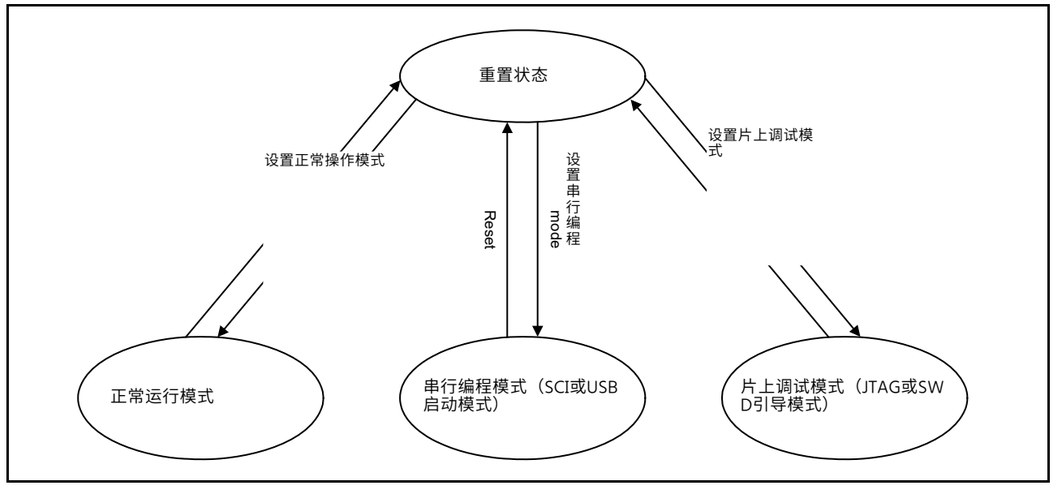

Figure 55.5 与闪存相关的模式转换

允许编程和擦除以及复位后执行引导程序的闪存区域因模式而异。表55.4显示了这些模式之间的差异。

Table 55.4 模式之间的差异

Parameter	正常运行模式	串行编程模式（SCI或USB启动模式）	片上调试模式（JTAG或SWD引导模式）
可编程和可擦除区域	代码闪存 数据闪存	代码闪存 数据闪存	代码闪存 数据闪存
以块为单位擦除	Possible	Possible	Possible
复位时的引导程序	用户区程序	用于串行编程的嵌入式程序	取决于调试命令

55.6.1 ID码保护

该功能禁止编程和片上调试。设备使ID代码有效或无效，并根据存储在闪存中的ID代码确定ID代码。启用ID码保护后，主机发送的ID码与闪存中的ID码进行比较，以确定它们是否匹配。编程和片上调试仅在两者匹配时才启用。闪存中的ID代码由四个32位字组成。

ID代码位127和126确定是否启用ID代码保护以及与主机一起使用的身份验证方法。表55.5显示了ID代码如何确定身份验证方法。

Table 55.5 Specifications for ID code protection

Operating mode on boot up	ID code	State of protection	Operations on connection with the programmer or on-chip debugger
Serial programming mode (SCI/USB boot mode) On-chip debug mode (JTAG/SWD boot mode)	FFh, …, FFh (All bytes = FFh)	Protection disabled	ID code validation is not performed, the ID code always matches, and connection to the programmer or the on-chip debugger is permitted.
	Bit 127 = 1, Bit 126 = 1, and at least one of the 16 bytes is not FFh	Protection enabled	Matching ID code: Authentication ends and connection to the programmer or on-chip debugger is permitted. Non-matching ID code: Additional transition to the ID code protection waiting state. When the ID code sent from the programmer or the on-chip debugger is “ALeRASE” in ASCII code (414C_6552_4153_45FF_FFFF_FFFF_FFFF_FFFFh), the content of the user flash (code and data) area and the configuration area are erased. However, forced erasure is not executed when the AWS.FSPR*1 bit is 0.
	Bit 127 = 1 and bit 126 = 0	Protection enabled	Matching ID code: Authentication ends and connection to the programmer or the on-chip debugger is permitted. Non-matching ID code: Additional transition to the ID code protection waiting state.
	Bit 127 = 0	Protection enabled	ID code validation is not performed, the ID code is always non-matching, and connection to the programmer or the on-chip debugger is prohibited.

Note 1. For details on the AWS.FSPR bit, see section 7.2.3, Access Window Setting Register (AWS).

55.7 Overview of Functions

By using a dedicated flash-memory programmer to program the on-chip flash memory through a serial interface (serial programming) or JTAG/SWD interface (on-chip debug mode), the device can be programmed before or after it is mounted on the target system.

Additionally, security functions to prohibit overwriting of the user program written to the on-chip flash memory are incorporated to prevent tampering by third parties.

Programming by the user program (self-programming) is available for applications that might require updating after system manufacturing or shipment. Protection features for safely overwriting the flash memory area are also provided. Additionally, interrupt processing during self-programming is supported so programming can proceed while processing external communications and other functions. Table 55.6 lists the programming methods and the corresponding operating modes.

Table 55.6 Programming methods (1 of 2)

Programming method	Functional overview	Operating mode
Serial programming	A dedicated flash-memory programmer through the SCI or USBFS interface enables on-board programming of the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash-memory programmer through the SCI or USBFS interface and a dedicated programming adapter board allow off-board programming of the flash memory, for example, programming of the device before it is mounted on the target system.	

Table 55.5 ID码保护规范

启动时的操作模式	身份证号码	保护状态	与编程器或片上调试器连接的操作
串行编程模式（SCIUSB启动模式）	FFh, …, FFh (All bytes = FFh)	保护已禁用	不执行ID代码验证，ID代码始终匹配，并且允许连接到编程器或片上调试器。
片上调试模式（JTAGSWD引导模式）	Bit127=1，Bit126=1，16个字节中至少有一个不是FFh	启用保护	匹配ID代码：验证结束并允许连接到编程器或片上调试器。ID码不匹配：额外转换到ID码保护等待状态。 当编程器或片上调试器发送的ID码是ASCII码（414C_6552_4153_45FF_FFFF_FFFF_FFFF_FFFFh）中的“ALeRASE”时，用户闪存（代码和数据）区和配置区的内容被擦除。然而，强制擦除不执行时 AWS.FSPR*1位为0。
	位127=1和位126=0	启用保护	匹配ID代码：验证结束，允许连接到编程器或片上调试器。ID码不匹配：额外转换到ID码保护等待状态。
	Bit 127 = 0	启用保护	不执行ID码验证，ID码始终不匹配，禁止连接编程器或片上调试器。

Note 1. 有关AWS.FSPR位的详细信息，请参阅第7.2.3节，访问窗口设置寄存器(AWS)。

55.7 功能概述

通过使用专用闪存编程器通过串行接口（串行编程）或JTAGSWD接口（片上调试模式）对片上闪存进行编程，可以在器件安装到目标之前或之后对其进行编程系统。

此外，还集成了禁止覆盖写入片上闪存的用户程序的安全功能，以防止第三方篡改。

用户程序编程（自编程）可用于在系统制造或发货后可能需要更新的应用程序。还提供了用于安全覆盖闪存区域的保护功能。此外，支持自编程期间的中断处理，因此可以在处理外部通信和其他功能的同时继续编程。表55.6列出了编程方法和相应的操作模式。

Table 55.6 编程方法(1of2)

编程方法	功能概览	操作模式
串行编程	通过SCI或USBFS接口的专用闪存编程器可在器件安装到目标系统后对闪存进行板载编程。	串行编程模式
	通过SCI或USBFS接口的专用闪存编程器和专用编程适配器板允许对闪存进行板外编程，例如，在设备安装到目标系统之前对其进行编程。	

Table 55.6 Programming methods (2 of 2)

Programming method	Functional overview	Operating mode
Self-programming	A user program written to memory in advance of serial programming execution can also program the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data from the code flash memory while the data flash memory is programmed. As a result, a program resident in the code flash memory can program the data flash memory. Background operation can also be used for reading from and writing to the code flash memory by itself, but only when the address ranges of the code flash memory that are the targets for programming and reading satisfy particular conditions (see Table 55.11). When those conditions are met, a program resident in one half of the code flash memory can be executed to program the other half of the code flash memory. For background operations that are not possible, instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being programmed by self-programming. In such cases, a program for programming from the internal SRAM or external memory must be transferred in advance and executed.	Normal operating mode
JTAG or SWD programming	A dedicated flash-memory programmer or an on-chip debugger through JTAG or SWD enables on-board programming of the flash memory after the device is mounted on the target system.	On-chip debug mode
	A dedicated flash-memory programmer or an on-chip debugger through JTAG or SWD and a dedicated programming adapter board allow off-board programming of the flash memory, for example, programming of the device before it is mounted on the target system.	

Table 55.7 lists the functions of the on-chip flash memory. The functions in serial programming are realized by serial programmer commands, while the functions in self-programming are realized by reading of the on-chip flash memory by a FACI command or the user program.

Table 55.7 Basic functions

Function	Functional overview	Availability	
		Serial programming	Self-programming
Blank check	Checks a specified block to ensure that writing to it has not already proceeded. Results of reading from data flash memory to which nothing is written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	Not supported	Supported (data flash programming only)
Block erasure	Erases the memory contents in the specified block.	Supported	Supported
Programming	Writes to the specified address.	Supported	Supported
Read	Reads data programmed in the flash memory.	Supported	Not supported (read by user program is possible)
ID code check	Compares the ID code sent by the host with the code stored in the ROM, and if the two match, the FCU enters the wait state for programming and erasure commands from the host.	Supported	Not supported (ID authentication is not performed)
Security configuration	Configures the security function for serial programming.	Supported with conditions (only switching from enabled to disabled configuration is possible)	Supported with conditions (Only switching from enabled to disabled is possible)
Protection configuration	Configures the access window for flash area protection in the code flash memory.	Supported	Supported

The on-chip flash memory supports the ID code security function. Authentication of ID codes is a security function for use with serial programming and with JTAG or SWD programming. Table 55.8 lists the security functions supported by the on-chip flash memory, and Table 55.9 lists available operations and security settings.

Table 55.6 编程方法（2之2）

编程方法	功能概览	操作模式
Self-programming	在串行编程执行之前写入存储器的用户程序也可以对闪存进行编程。后台操作能力使得在对数据闪存进行编程时，可以从代码闪存中获取指令或以其他方式读取数据。结果，驻留在代码闪存中的程序可以对数据闪存进行编程。后台操作也可以单独用于对代码闪存进行读写，但仅当作为编程和读取目标的代码闪存的地址范围满足特定条件时（参见表55.11）。当满足这些条件时，可以执行驻留在一半代码闪存中的程序来对另一半代码闪存进行编程。对于无法进行的后台操作，在通过自编程对代码闪存进行编程时，无法获取代码闪存中的指令并且无法访问数据。在这种情况下，必须预先传输并执行从内部SRAM或外部存储器进行编程的程序。	正常运行模式
JTAG或SWD编程	专用闪存编程器或通过JTAG或SWD的片上调试器可在器件安装到目标系统后对闪存进行板载编程。	片上调试模式
	专用闪存编程器或通过JTAG或SWD的片上调试器和专用编程适配器板允许对闪存进行板外编程，例如，在将器件安装到目标系统之前对其进行编程。	

表55.7列出了片上闪存的功能。串行编程中的功能是通过串行编程器命令实现的，而自编程中的功能是通过FACI命令或用户程序读取片上闪存来实现的。

Table 55.7 基本功能

Function	功能概览	Availability	
		串行编程	Self-programming
空白支票	检查指定的块以确保尚未对其进行写入。无法保证从擦除后没有写入任何内容的数据闪存中读取的结果，因此使用空白检查来确认擦除后没有继续写入内存。	不支持	支持（仅数据闪存编程）
块擦除	擦除指定块中的内存内容。	Supported	Supported
Programming	写入指定地址。	Supported	Supported
Read	读取闪存中编程的数据。	Supported	不支持（可由用户程序读取）
识别码检查	将主机发送的ID代码与存储在ROM中的代码进行比较，如果两者匹配，则FCU进入等待状态，等待来自主机的编程和擦除命令。	Supported	不支持（不进行身份验证）
安全配置	配置串行编程的安全功能。	有条件支持（只能从启用配置切换到禁用配置）	有条件支持（只能从启用切换到禁用）
保护配置	配置代码闪存中闪存区域保护的访问窗口。	Supported	Supported

片上闪存支持ID码安全功能。ID代码验证是一种安全功能，可用于串行编程和JTAG或SWD编程。表55.8列出了片上闪存支持的安全功能，表55.9列出了可用的操作和安全设置。

Table 55.8 Security functions

Function	Description
ID authentication	Result of ID authentication can be used to control the connection of a serial programmer for serial programming.

55.7.1 配置区位图

图55.6显示了配置区域位图。引导程序必须使用这些位作为十六进制数据。

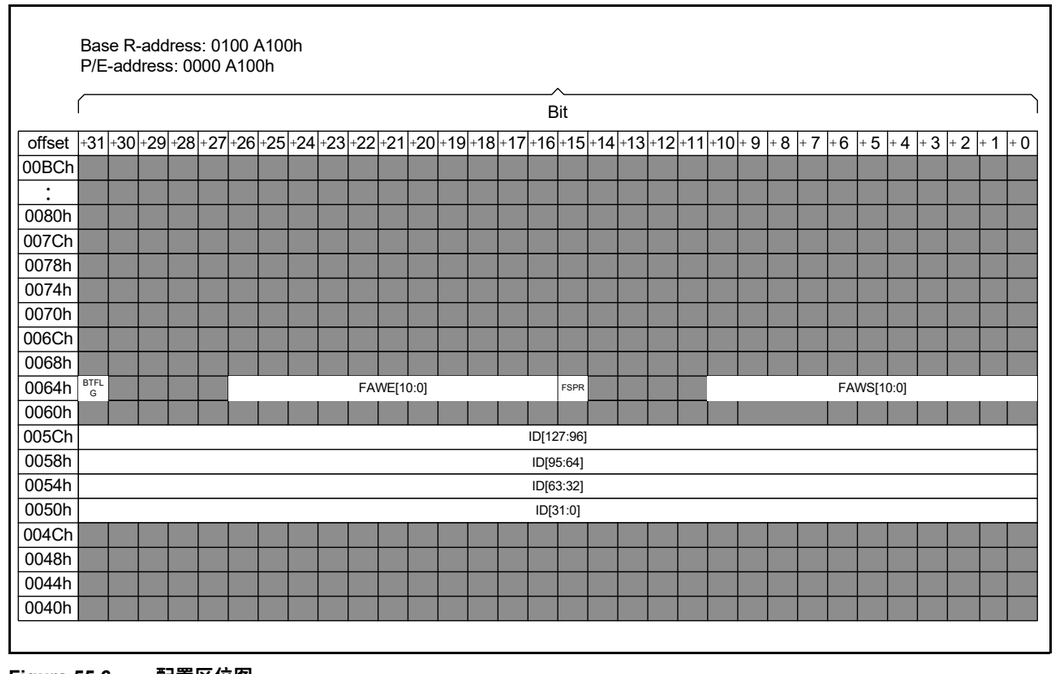

Figure 55.6 配置区位图

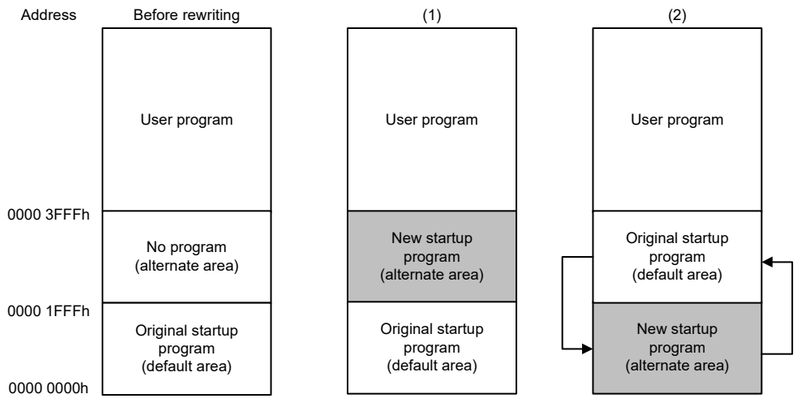
55.7.2 Startup Area Select

The startup area select function allows the boot program to be safely updated. The size of the startup area is 8 KB, and the startup area is located in the user area. FACI controls the address of the startup area based on the startup area select flag (AWS.BTFLG) that is located in the configuration area. The startup area can be locked by the AWS.FSPR*1 bit.

Note 1. For the AWS.FSPR bit, see section 7.2.3, Access Window Setting Register (AWS).



(1) Program a new startup program in the alternate area. If the alternate area fails to be rewritten, the new startup program can be rewritten again after starting up using the default area, because the original startup program is in the default area.
(2) After the alternate area is successfully rewritten, the default and alternate areas are switched using the self-programming library. After that, the program in the alternate area starts after a reset.

Figure 55.7 Overview of startup program protection

55.7.3 Protection by Access Window

Issuing the program or block erase command to a flash memory area outside of the access window results in the command-locked state. The access window is only valid in the user area of the code flash memory. The access window provides protection in self-programming mode, serial programming mode, and on-chip debug mode.

The access window is specified in both the AWS.FAWS[10:0] and AWS.FAWE[10:0]*1 bits. The following describes how to set the FAWS and FAWE bits in different conditions:

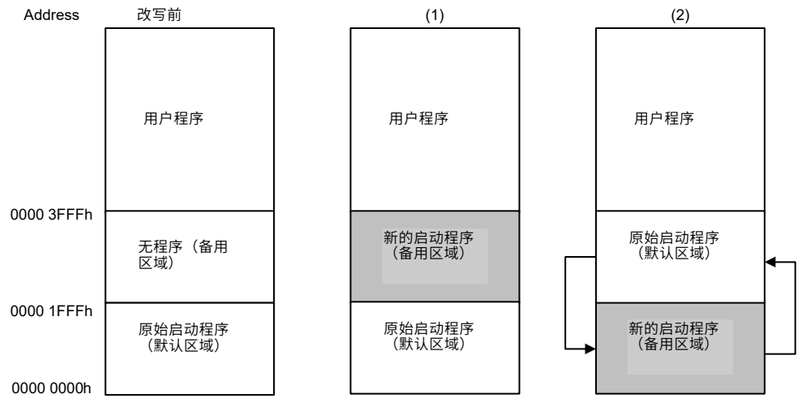
- FAWE = FAWS: The P/E command can execute anywhere in the user area of the code flash memory
- FAWE > FAWS: The P/E command can only execute in the window from the block pointed to by the FAWS bits to one block lower than the one pointed to by the FAWE bits
- FSWE < FAWS: The P/E command cannot execute anywhere in the user area of the code flash memory.

Note 1. For information on the AWS.FAWS and AWS.FAWE bits, see section 7.2.4, OCD/Serial Programmer ID Setting Register (OSIS).

55.7.2 启动区域选择

启动区域选择功能允许安全更新引导程序。启动区大小为8KB，启动区位于用户区。FACI根据位于配置区域中的启动区域选择标志(AWS.BTFLG)控制启动区域的地址。启动区域可以通过AWS.FSPR*1位锁定。

注1.关于AWS.FSPR位，请参见第7.2.3节，访问窗口设置寄存器(AWS)。



⑴在备用区编写一个新的启动程序。如果替换区改写失败，新的启动程序可以在使用默认区启动后重新改写，因为原来的启动程序在默认区。⑵备用区改写成功后，使用自编程库切换默认区和备用区。之后，备用区域中的程序在重置后启动。

Figure 55.7 启动程序保护概述

55.7.3 通过访问窗口保护

向访问窗口之外的闪存区域发出程序或块擦除命令会导致命令锁定状态。访问窗口仅在代码闪存的用户区有效。访问窗口在自编程模式、串行编程模式和片上调试模式下提供保护。

访问窗口在AWS.FAWS[10:0]和AWS.FAWE[10:0]*1位中指定。下面介绍如何在不同条件下设置FAWS和FAWE位：

- FAWE=FAWS：PE命令可以在代码闪存用户区的任何地方执行
- FAWE>FAWS：PE命令只能在窗口中从FAWS位指向的块到比FAWE位指向的块低一个块执行
- FSWE<FAWS：PE命令不能在代码闪存的用户区的任何地方执行。

注1.有关AWS.FAWS和AWS.FAWE位的信息，请参阅第7.2.4节，OCD串行程序员ID设置
Register (OSIS).

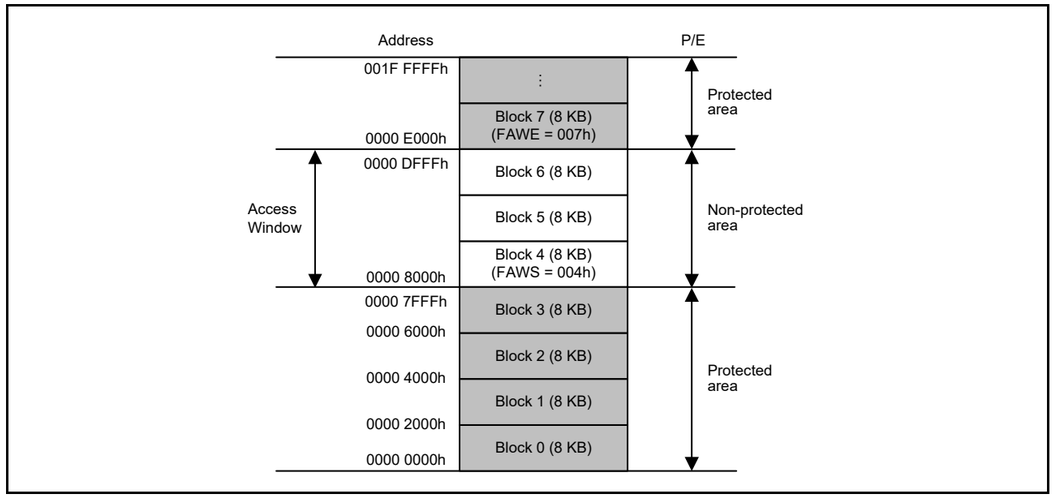


Figure 55.8 Start block address (FAWS) and end block address (FAWE) of access window when the access window only includes the 8-KB block size

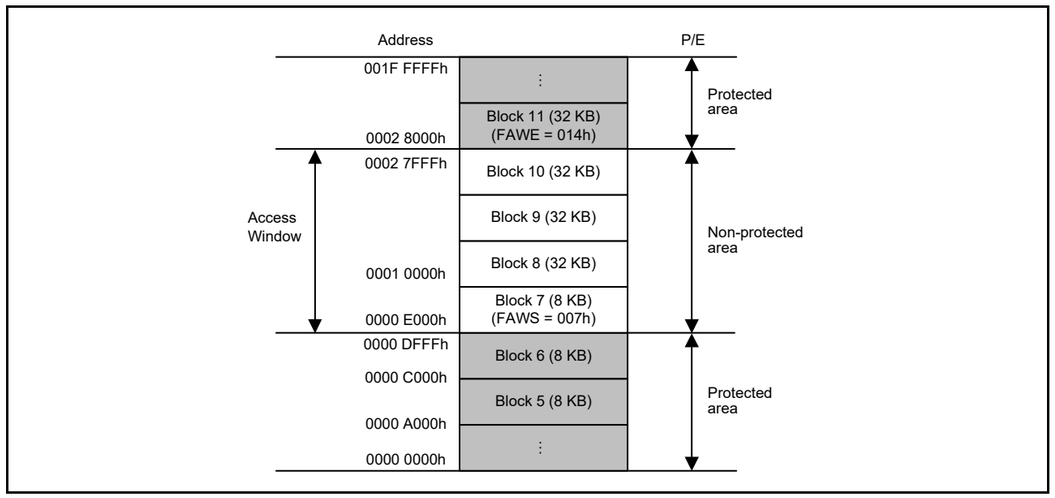

Figure 55.9 Start block address (FAWS) and end block address (FAWE) of access window when the access window includes 8-KB and 32-KB block sizes

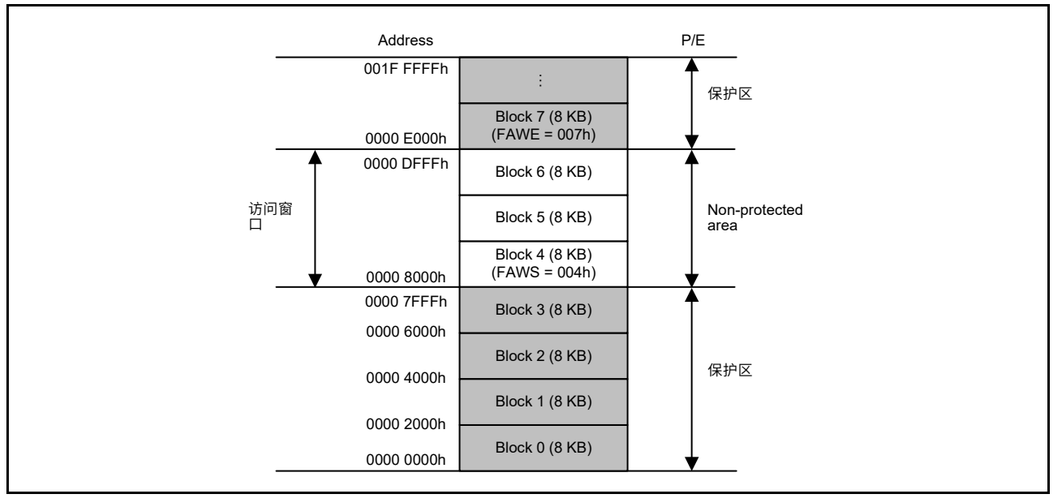

Figure 55.8 当访问窗口仅包含8-KB块大小时访问窗口的起始块地址(FAWS)和结束块地址(FAWE)

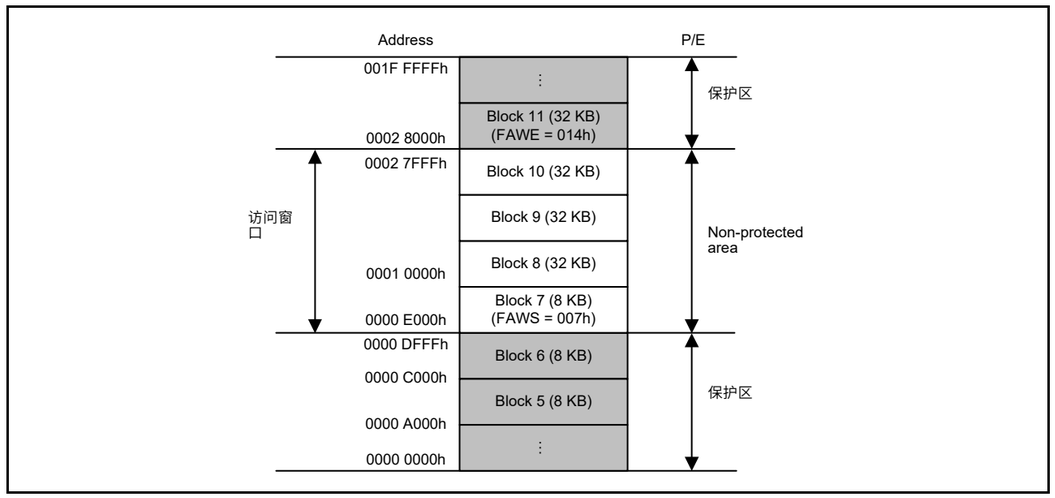

Figure 55.9 当访问窗口包括8-KB和32-KB块大小时访问窗口的起始块地址(FAWS)和结束块地址(FAWE)

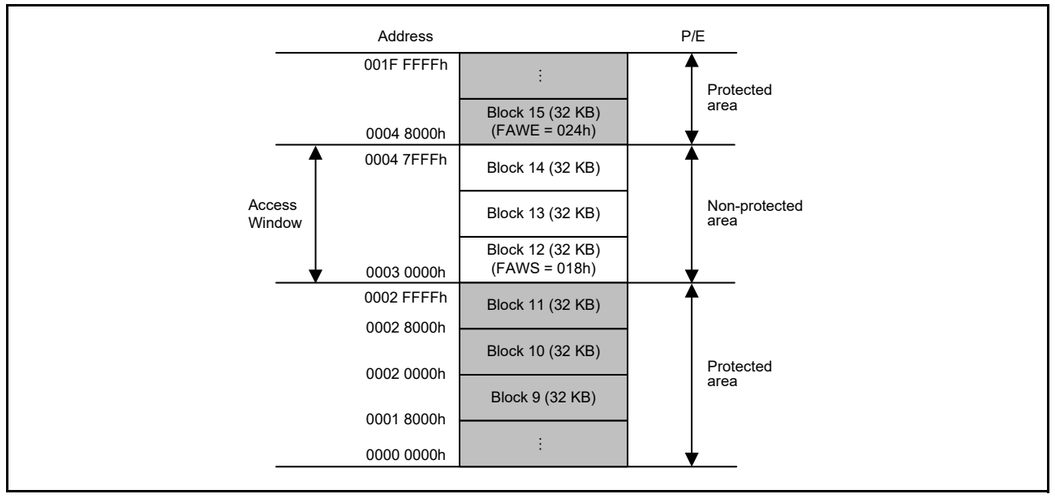

Figure 55.10 Start block address (FAWS) and end block address (FAWE) of access window when the access window only includes the 32-KB block size

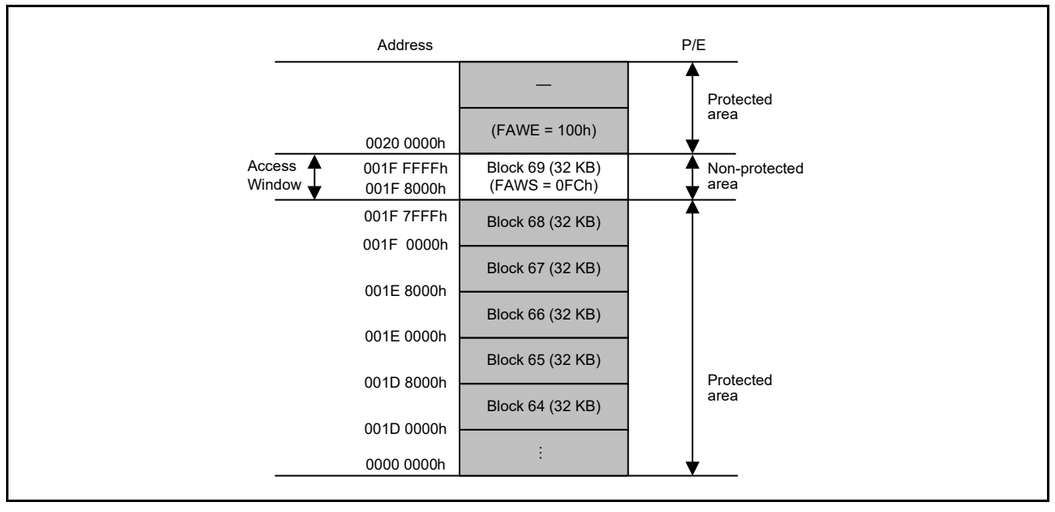

Figure 55.11 Start block address (FAWS) and end block address (FAWE) of access window when the access window only includes the final block

55.8 Programming Commands

The FACI controls the FCU in accordance with the specified FACI commands.

55.9 Suspend Operation

Reading from the code or data flash memory is not possible during programming or erasure when the address ranges do not satisfy the conditions for background operation. When a P/E suspend command is issued to suspend the programming or erasure of the code or data flash memory, reading from the memory is enabled. One suspend command mode is available for programming and two suspend command modes are available for erasure (suspension priority mode and erasure priority mode). The P/E resume command is available for resuming suspended programming or erasure.

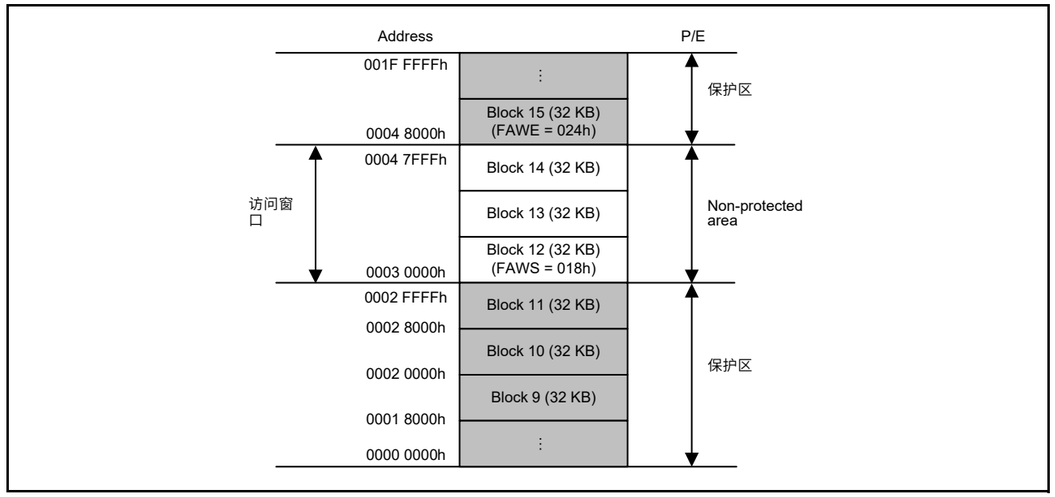

Figure 55.10 当访问窗口仅包含32−KB块大小时访问窗口的起始块地址(FAWS)和结束块地址(FAWE)

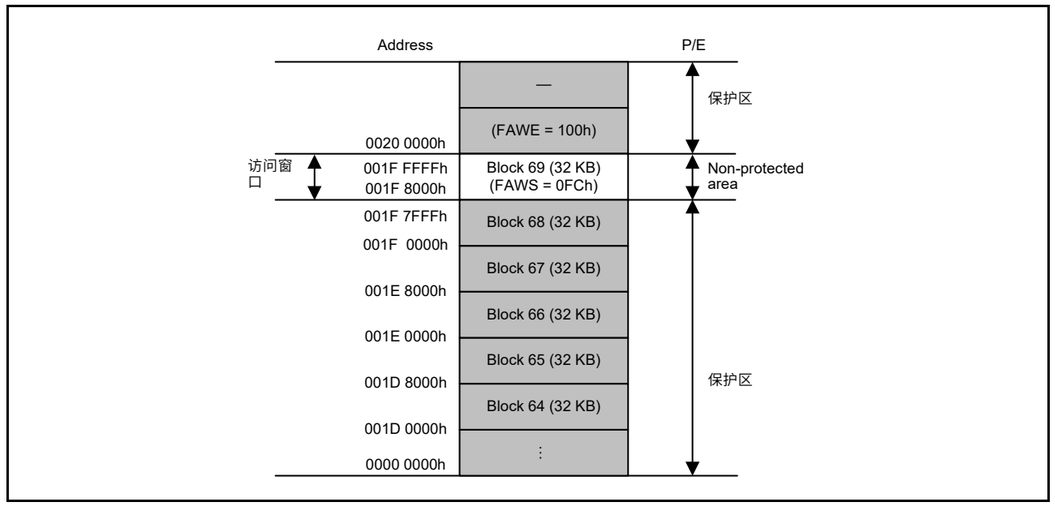

Figure 55.11 访问窗口只包含最终块时访问窗口的起始块地址（FAWS）和结束块地址（FAWE）

55.8 编程命令

FACI根据指定的FACI命令控制FCU。

55.9 暂停操作

当地址范围不满足后台操作条件时，在编程或擦除期间无法读取代码或数据闪存。当发出PE暂停命令以暂停代码或数据闪存的编程或擦除时，将启用从存储器读取。一种挂起命令模式可用于编程，两种挂起命令模式可用于擦除（挂起优先模式和擦除优先模式）。PEresume命令可用于恢复暂停的编程或擦除。

55.10 Protection

Provided types of protection include:

- Software protection
- Error protection
- Boot program protection.

55.11 Serial Programming Mode

The serial programming modes include:

- Boot mode with SCI9
- USB boot mode with the USBFS.

Table 55.10 lists the I/O pins for the flash memory-related modules.

Table 55.10 I/O pins for flash memory-related modules

Pin name	I/O	Applicable modes	Function
MD	Input	SCI boot mode USB boot mode (Serial programming mode)	Selection of operating mode
P110/RXD9	Input	SCI boot mode	For host communication, to receive data through SCI
P109/TXD9	Output		For host communication, to transmit data through SCI
USB_DP, USB_DM	I/O	USB boot mode	USB data I/O
USB_VBUS	Input		Detection of connection and disconnection of USB cables

55.11.1 SCI Boot Mode

In boot mode, the host sends control commands and data for programming, and the code and data flash memory area are programmed or erased accordingly. An on-chip SCI handles transfer between the host and the MCU in asynchronous mode. Tools for transmission of control commands and the data for programming must be prepared in the host.

When the MCU is activated in boot mode, the embedded program for serial programming is executed. This program automatically adjusts the bit rate of the SCI and controls programming and erasure by receiving control commands from the host. The USB cable must not be connected on reset release.

Figure 55.12 shows the system configuration for operations in boot mode.

55.10 Protection

提供的保护类型包括：

- 软件保护
- 错误保护
- 引导程序保护。

55.11 串行编程模式

串行编程模式包括：

- 带有SCI9的引导模式
- USB引导模式与USBFS。

表55.10列出了闪存相关模块的IO引脚。

Table 55.10 闪存相关模块的IO引脚

引脚名称	I/O	适用模式	Function
MD	Input	SCI启动模式USB启动模式（串行编程模式）	操作模式的选择
P110/RXD9	Input	SCI开机模式	用于主机通信，通过SCI接收数据
P109/TXD9	Output		用于主机通信，通过SCI传输数据
USB_DP, USB_DM	I/O	USB启动模式	USB数据输入输出
USB_VBUS	Input		检测USB电缆的连接和断开

55.11.1 SCI启动模式

在引导模式下，主机发送控制命令和数据进行编程，代码和数据闪存区域被相应地编程或擦除。片上SCI以异步模式处理主机和MCU之间的传输。主机中必须准备好用于传输控制命令和编程数据的工具。

当MCU在引导模式下激活时，将执行用于串行编程的嵌入式程序。该程序通过接收来自主机的控制命令自动调整SCI的比特率并控制编程和擦除。复位释放时不得连接USB电缆。

图55.12显示了引导模式下操作的系统配置。

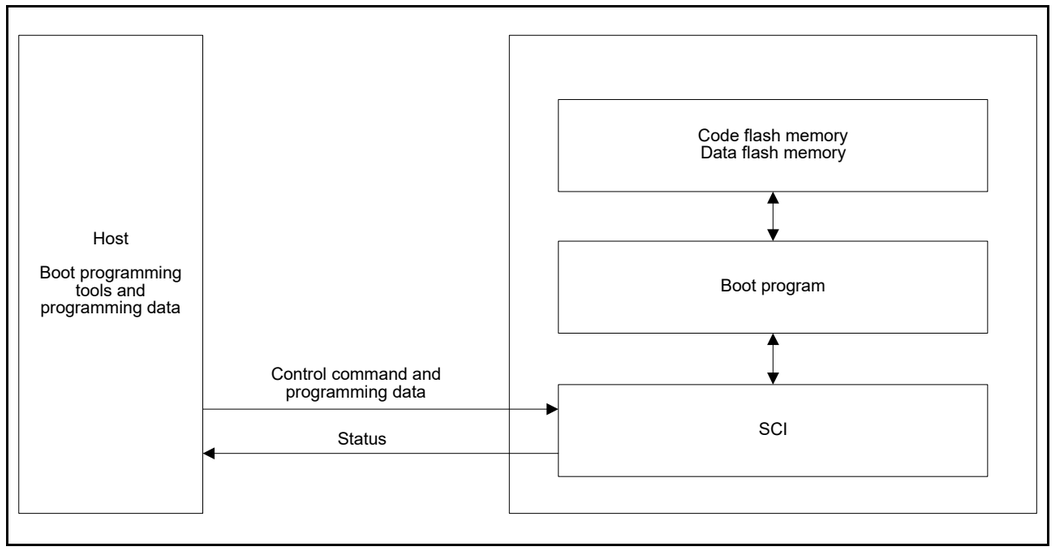

Figure 55.12 System configuration in SCI boot mode

55.11.2 USB Boot Mode

In USB boot mode, the code and data flash memory are programmed or erased by control commands and data for programming transmitted from an externally connected host through the USB interface.

Using USB boot mode requires preparation on the host side of the tools for transmitting control commands and data for programming, and of the data. Figure 55.13 shows the configuration of a system for use in USB boot mode. The USB cable must be connected on reset release.

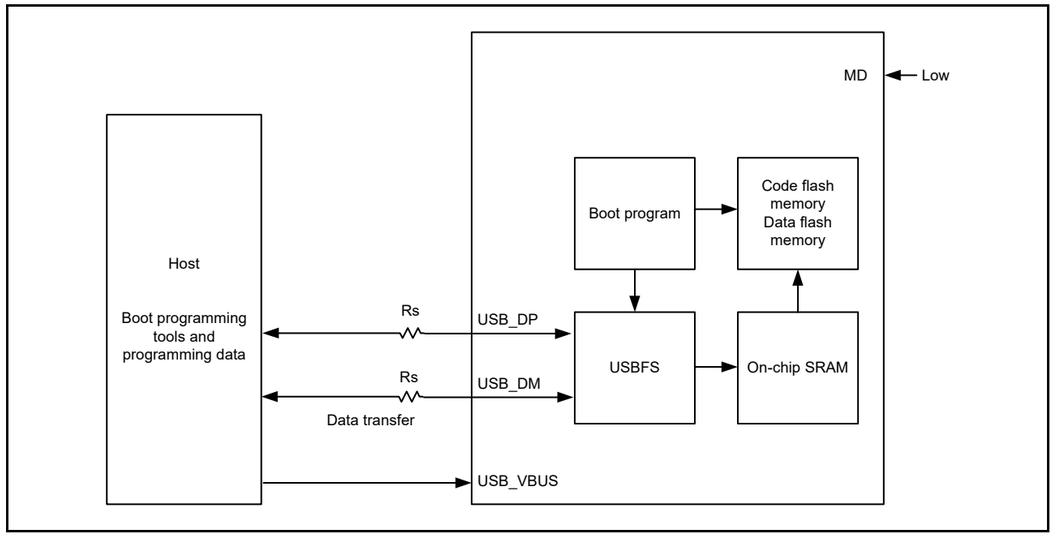

Figure 55.13 System configuration in USB boot mode

55.12 Using a Serial Programmer for Programming

A dedicated flash memory programmer can be used to program the flash memory in serial programming mode.

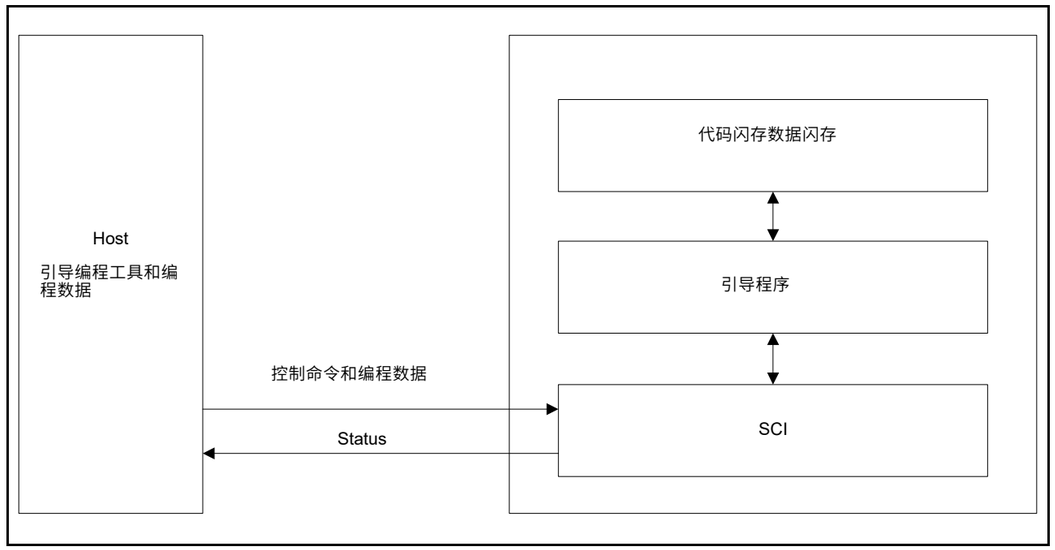

Figure 55.12 SCI引导模式下的系统配置

55.11.2 USB启动模式

在USB引导模式下，代码和数据闪存通过USB接口从外部连接的主机传输的控制命令和用于编程的数据进行编程或擦除。

使用USB引导模式需要在主机端准备用于传输控制命令和数据以进行编程的工具以及数据。图55.13显示了用于USB引导模式的系统配置。USB电缆必须在复位释放时连接。

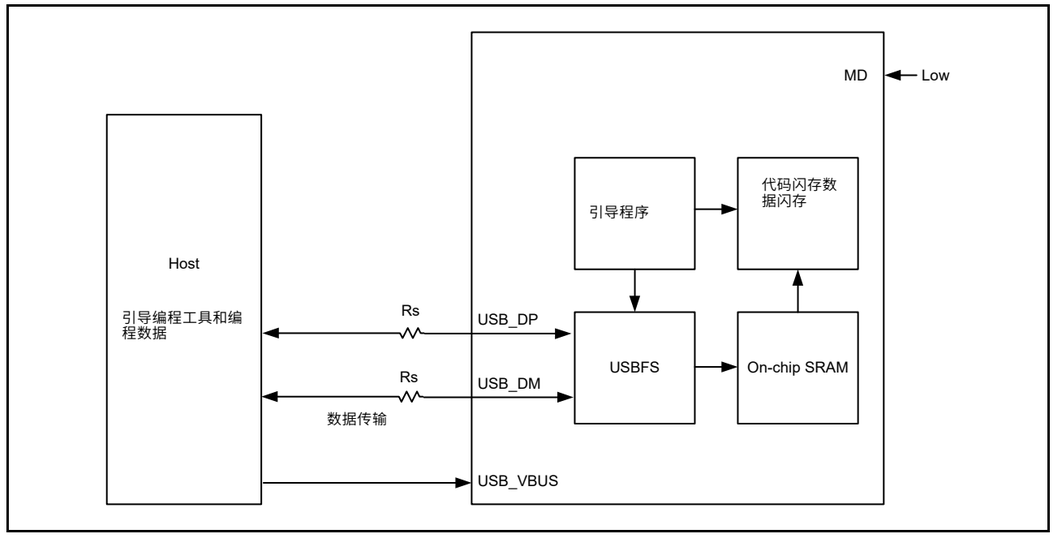

Figure 55.13 USB引导模式下的系统配置

55.12 使用串行编程器进行编程

可以使用专用的闪存编程器在串行编程模式下对闪存进行编程。

55.12.1 Serial Programming

The MCU is mounted on the system board for serial programming. A connector to the board allows programming by the flash memory programmer to proceed.

55.12.2 Programming Environments

Figure 55.14 shows the environments that Renesas recommends for programming the flash memory of the MCU with data.

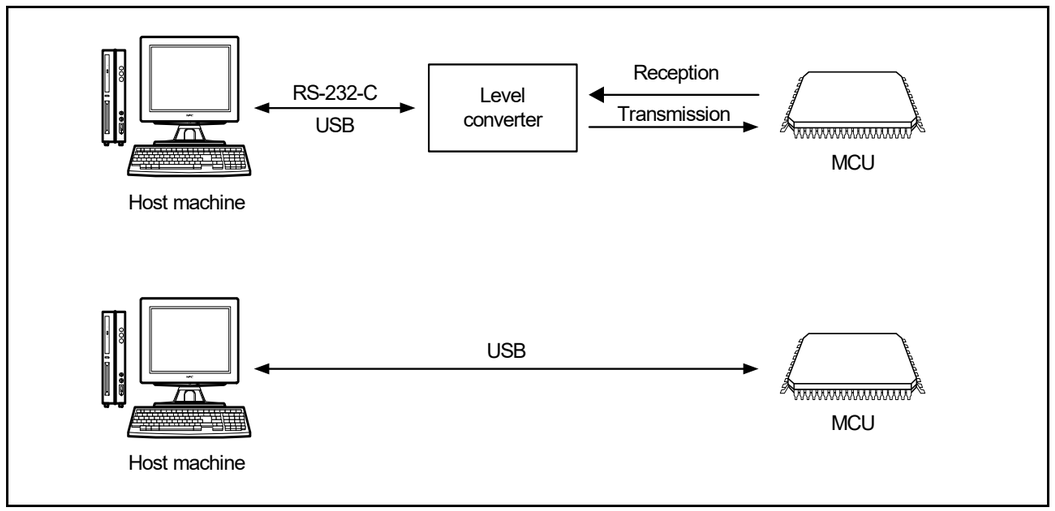

Figure 55.14 Environments for writing programs to the flash memory

55.13 Programming through Self-Programming

55.13.1 Overview

The MCU supports programming of the flash memory by the user program itself. The programming commands can be used with user programs for writing to both the code and data flash memory. This enables upgrading of user programs and overwriting of constant data fields.

For data flash memory programming, the background operation facility makes it possible to program the memory from a programming program in the code flash memory. This programming program can also be copied in advance to and executed from the internal SRAM or external memory.

For code flash memory programming, background operation is available for use when the address ranges of the code flash memory area to be programmed and the code flash memory area to be read satisfy particular conditions (see Table 55.11). For self-programming, a programming program in one half of the code flash memory can be used to program the other half of the code flash memory. This programming program can also be copied in advance to and executed from the internal SRAM or external memory. This is useful when the address ranges do not satisfy the conditions for background operation.

55.12.1 串行编程

MCU安装在系统板上，用于串行编程。板上的连接器允许闪存编程器进行编程。

55.12.2 编程环境

图55.14显示了瑞萨推荐的使用数据对MCU闪存进行编程的环境。

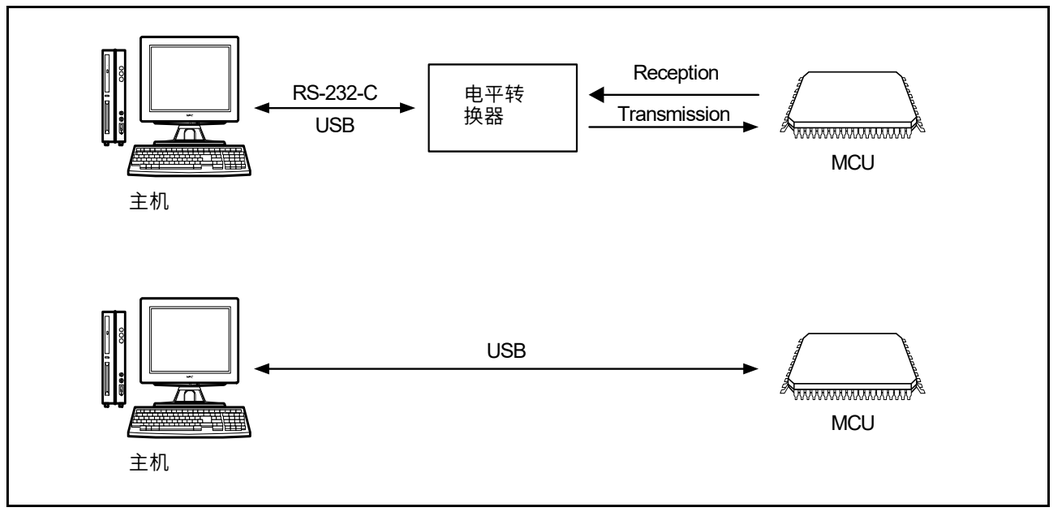

Figure 55.14 将程序写入闪存的环境

55.13 通过自编程进行编程

55.13.1 Overview

MCU支持用户程序本身对闪存进行编程。编程命令可与用户程序一起用于写入代码和数据闪存。这使得用户程序的升级和常量数据字段的覆盖成为可能。

对于数据闪存编程，后台操作工具可以通过代码闪存中的编程程序对存储器进行编程。该编程程序也可以预先复制到内部SRAM或外部存储器中执行。

对于代码闪存编程，当要编程的代码闪存区域和要读取的代码闪存区域的地址范围满足特定条件时，可以使用后台操作（参见表55.11）。对于自编程，可以使用一半代码闪存中的编程程序对另一半代码闪存进行编程。该编程程序也可以预先复制到内部SRAM或外部存储器中执行。当地址范围不满足后台操作的条件时，这很有用。

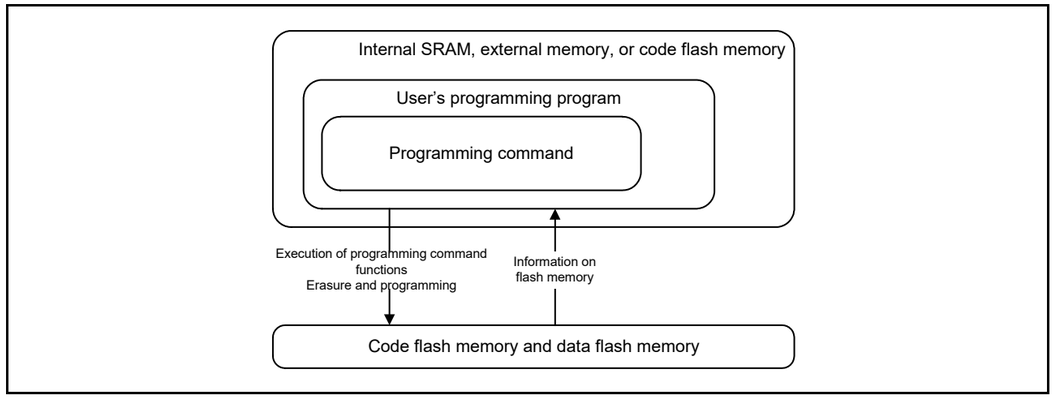

Figure 55.15 Schematic view of self-programming

55.13.2 Background Operation

Background operation can be used when a combination of the flash memory for writing and reading is any of those listed in Table 55.11.

Table 55.11 Conditions under which background operation is available

Product	Range for writing	Range for reading
All products	Data flash memory	Code flash memory
	Code flash memory	Data flash memory
2-MB products	First half (1 MB) of the user area of the code flash memory (addresses 0000 0000h to 000F FFFFh)	Second half (1 MB) of the user area of the code flash memory (addresses 0010 0000h to 001F FFFFh)
	Second half (1 MB) of the user area of the code flash memory (addresses 0010 0000h to 001F FFFFh)	First half (1 MB) of the user area of the code flash memory (addresses 0000 0000h to 000F FFFFh)
1-MB products	First half (0.5 MB) of the user area of the code flash memory (addresses 0000 0000h to 0007 FFFFh)	Second half (0.5 MB) of the user area of the code flash memory (addresses 0008 0000h to 000F FFFFh)
	Second half (0.5 MB) of the user area of the code flash memory (addresses 0008 0000h to 000F FFFFh)	First half (0.5 MB) of the user area of the code flash memory (addresses 0000 0000h to 0007 FFFFh)

55.14 Reading the Flash Memory

55.14.1 Reading the Code Flash Memory

No special settings are required to read the code flash memory in Normal mode. Data can be read through access to addresses in the code flash memory. Values read from code flash memory that was erased but not yet reprogrammed, such as code flash memory in the non-programmed state, are all read as 1s.

55.14.2 Reading the Data Flash Memory

No special settings are required to read the data flash memory in Normal mode. Data can be read through access to addresses in the data flash memory. Values read from data flash memory that was erased but not yet reprogrammed again, such as data flash memory in the non-programmed state, are undefined. Use blank checking to confirm that an area is in the non-programmed state.

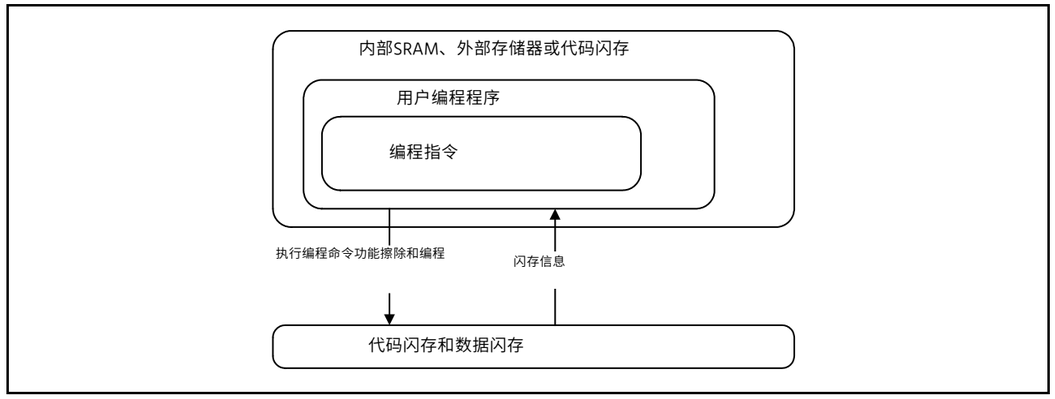

Figure 55.15 自编程示意图

55.13.2 后台操作

当用于写入和读取的闪存组合是表55.11中列出的任何一种时，可以使用后台操作。

Table 55.11 后台操作可用的条件

Product	书写范围	读取范围
所有产品	数据闪存	代码闪存
	代码闪存	数据闪存
2-MB products	代码闪存用户区的前半部分(1MB)（地址00000000h到000FFFFFh）	代码闪存用户区的后半部分(1MB)（地址00100000h到001FFFFFh）
	代码闪存用户区的后半部分(1MB)（地址00100000h到001FFFFFh）	代码闪存用户区的前半部分(1MB)（地址00000000h到000FFFFFh）
1-MB products	代码闪存用户区的前半部分(0.5MB)（地址00000000h到0007FFFFh）	代码闪存用户区的后半部分(0.5MB)（地址00080000h到000FFFFFh）
	代码闪存用户区的后半部分(0.5MB)（地址00080000h到000FFFFFh）	代码闪存用户区的前半部分(0.5MB)（地址00000000h到0007FFFFh）

55.14 读取闪存

55.14.1 读取代码闪存

在正常模式下读取代码闪存不需要特殊设置。可以通过访问代码闪存中的地址来读取数据。从已擦除但尚未重新编程的代码闪存中读取的值，例如处于未编程状态的代码闪存，都被读取为1。

55.14.2 读取数据闪存

在正常模式下读取数据闪存不需要特殊设置。可以通过访问数据闪存中的地址来读取数据。从已擦除但尚未再次重新编程的数据闪存中读取的值（例如处于未编程状态的数据闪存）是未定义的。使用空白检查来确认某个区域处于非编程状态。

55.15 Usage Notes

55.15.1 Reading Areas Where Programming or Erasure Was Interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid reading undefined data, which can be a source of faulty operation, do not fetch instructions or read data from areas where programming or erasure was interrupted.

55.15.2 Constraint on Additional Writes

Other than the configuration area, no other area can be written to twice. After a write to a flash memory area is complete, erase the area before attempting to overwrite data in that area. The configuration area can be overwritten.

55.15.3 Resets during Programming and Erasure

After a reset triggered by a signal assertion on the RES pin during programming and erasure, wait for tRESW until the operating voltage is within the range stipulated in the electrical characteristics before releasing the device from the reset state. For details on tRESW, see section 60.3.3, Reset Timing.

55.15.4 Allocation of Vectors for Interrupts and Other Exceptions during Programming and Erasure

Generation of an interrupt or other exception during programming or erasure might lead to fetching of the vector from the code flash memory. If the vector allocation does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.

55.15.5 Constraints during Programming and Erasure

During programming and erasure, do not:

- Permit the operating voltage from the power supply to go beyond the allowed range
- Change the frequency of the peripheral clock.

55.15.6 Abnormal Termination of Programming and Erasure

When programming or erasure ends abnormally because of the generation of a reset by the RES pin, the programming or erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming or erasure ends abnormally, the blank check function cannot determine whether the area was erased successfully. Erase the area again to ensure that the corresponding area is completely erased before use.

55.15 使用说明

55.15.1 编程或擦除被中断的阅读区域

当闪存区域的编程或擦除被中断时，存储在该区域中的数据变得不确定。为避免读取可能导致错误操作的未定义数据，请勿从编程或擦除中断的区域获取指令或读取数据。

55.15.2 额外写入的限制

除配置区域外，其他区域不能写入两次。对闪存区域的写入完成后，请先擦除该区域，然后再尝试覆盖该区域中的数据。配置区域可以被覆盖。

55.15.3 编程和擦除期间的复位

在编程和擦除过程中由RES引脚上的信号断言触发复位后，等待tRESW直到工作电压在电气特性规定的范围内，然后再将器件从复位状态释放。有关tRESW的详细信息，请参见第60.3.3节，复位时序。

55.15.4 在编程和擦除期间为中断和其他异常分配向量

在编程或擦除期间产生中断或其他异常可能会导致从代码闪存中获取向量。如果向量分配不满足使用后台操作的条件，则将取向量的地址设置为不在代码闪存中的地址。

55.15.5 编程和擦除期间的约束

在编程和擦除期间，不要：

- 允许来自电源的工作电压超出允许范围
- 改变外设时钟的频率。

55.15.6 烧写异常终止和擦除

当由于RES引脚产生复位而导致编程或擦除异常结束时，无法验证或检查具有未定义数据的闪存的编程或擦除状态。对于编程或擦除异常结束的区域，空白检查功能无法确定该区域是否擦除成功。再次擦除该区域，以确保在使用前将相应区域完全擦除。

56. 2D Drawing Engine (DRW)

56.1 Overview

The 2D Drawing Engine (DRW) provides flexible functions that can support almost any object geometry, rather than being bound to only a few specific geometries such as lines, triangles, or circles. The edges of every object can be independently blurred or anti-aliased.

Rasterization is executed on the bounding box of the object from left to right and top to bottom, and performed one pixel per clock. The 2D Drawing Engine can also raster from bottom to top in certain cases, to optimize the performance. In addition, optimization methods are provided to avoid rasterization of many empty pixels of the bounding box.

The distances to the edges of the object are calculated by a set of edge equations for every pixel of the bounding box. These edge equations can be combined to describe the entire object. If a pixel is inside the object, it is selected for rendering, and if it is outside it is discarded. If it is on the edge, an alpha value can be chosen proportional to the distance of the pixel to the nearest edge for anti-aliasing. Every pixel that is selected for rendering can be textured. The resulting aRGB quadruple can be modified by a general raster operation approach independently for each of the four channels. The aRGB quadruples can then be blended with one of the multiple blend modes of the module.

The 2D Drawing Engine provides two inputs (texture read and framebuffer read) and one output (framebuffer write). The internal color format is always aRGB (8888). The color formats from the inputs are converted to the internal format on read and converted back on write.

Figure 56.1 shows examples of objects that can be drawn in hardware with the 2D Drawing Engine, Figure 56.2 shows a simplified rendering pipeline setup, and Figure 56.3 shows a block diagram of the module.

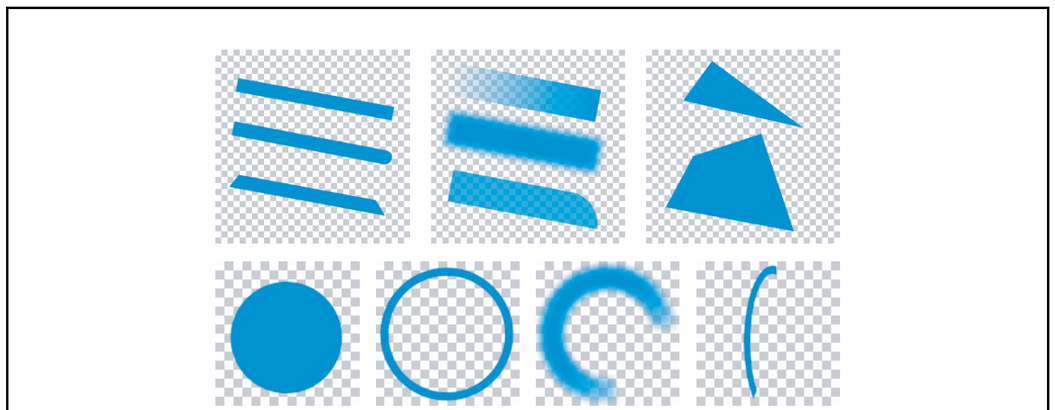

Figure 56.1 Examples of drawing objects

The 2D Drawing Engine also supports a display list mode, which makes it possible to decouple the CPU and graphics controller efficiently and perform rendering in parallel with other CPU activities.

56. 2D绘图引擎(DRW)

56.1 Overview

2D绘图引擎(DRW)提供了灵活的功能，可以支持几乎任何对象几何图形，而不是仅绑定到几个特定的 几何图形，例如线条、三角形或圆形。每个对象的边缘都可以独立模糊或消除锯齿。

光栅化是在物体的边界框上从左到右、从上到下执行的，每个时钟执行一个像素。在某些情况下，2D绘图引擎还可以从下到上进行光栅化，以优化性能。此外，还提供了优化方法来避免边界框的许多空像素的光栅化。

到对象边缘的距离由边界框的每个像素的一组边缘方程计算。
这些边缘方程可以组合起来描述整个物体。如果像素在对象内部，则选择它进行渲染，如果在对象外部，则将其丢弃。如果它在边缘，则可以选择与像素到最近边缘的距离成比例的alpha值以进行抗锯齿。每个被选择用于渲染的像素都可以被纹理化。可以通过通用光栅操作方法对四个通道中的每一个独立地修改得到的aRGB四元组。然后可以将aRGB四元组与模块的多种混合模式之一混合。

2D绘图引擎提供两个输入（纹理读取和帧缓冲区读取）和一个输出（帧缓冲区写入）。内部颜色格式始终为aRGB(8888)。来自输入的颜色格式在读取时转换为内部格式，并在写入时转换回内部格式。

图56.1显示了可以使用2D绘图引擎在硬件中绘制的对象示例，图56.2显示了简化的渲染管道设置，图56.3显示了模块的框图。

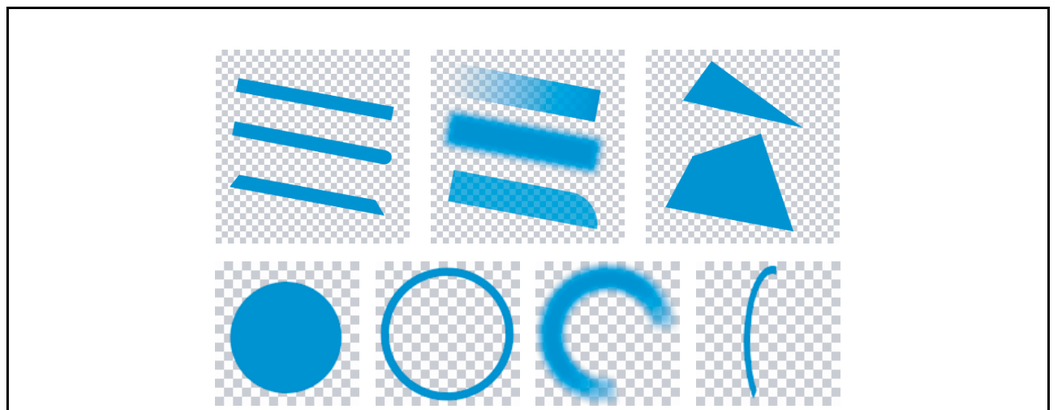

Figure 56.1 绘图对象示例

2D绘图引擎还支持显示列表模式，可以有效地解耦CPU和图形控制器，并与其他CPU活动并行执行渲染。

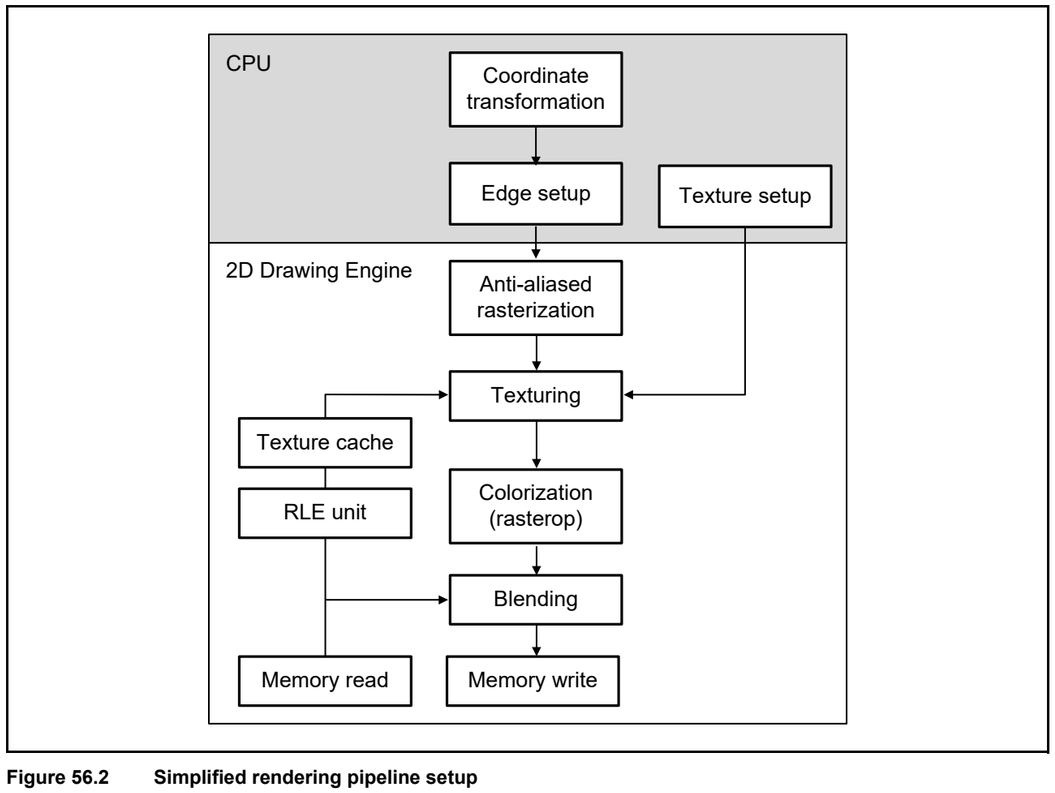

Figure 56.2 Simplified rendering pipeline setup

Note: When using the DRW, set the clock to ICLK = PCLKA.

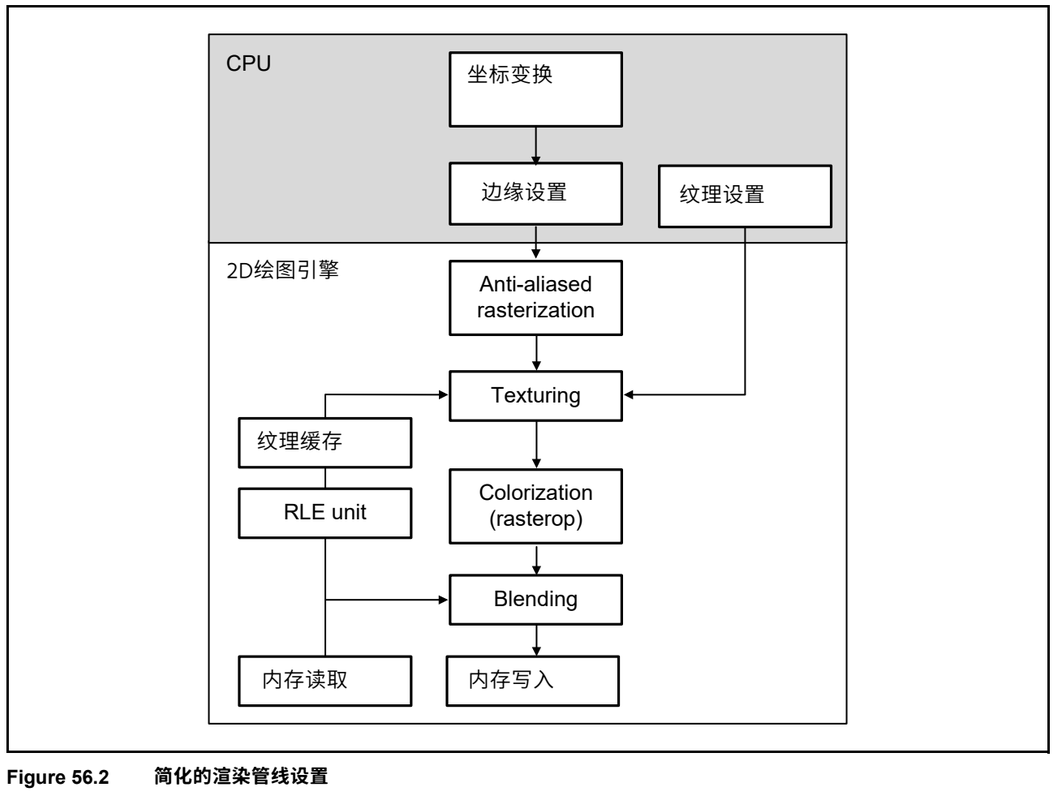

Figure 56.2 简化的渲染管线设置

Note: 使用DRW时，将时钟设置为ICLK=PCLKA。

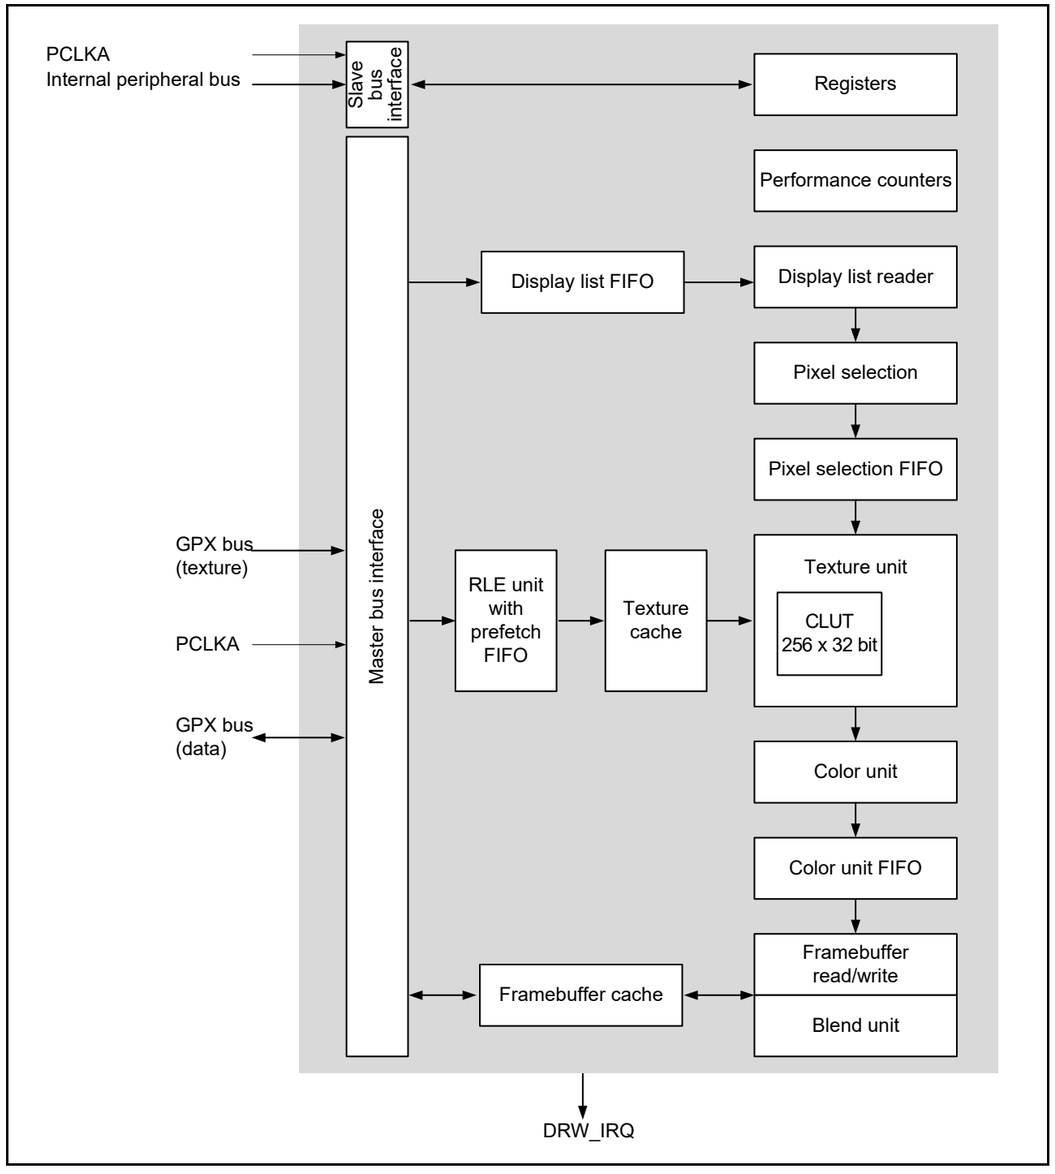

Figure 56.3 Block diagram of the 2D Drawing Engine

The 2D Drawing Engine accesses the GPX bus as bus master through separate caches for:

- Reading and writing pixel data from and to the framebuffer
- Reading textures
- Reading display lists.

The control registers are accessed through the internal peripheral bus interface.

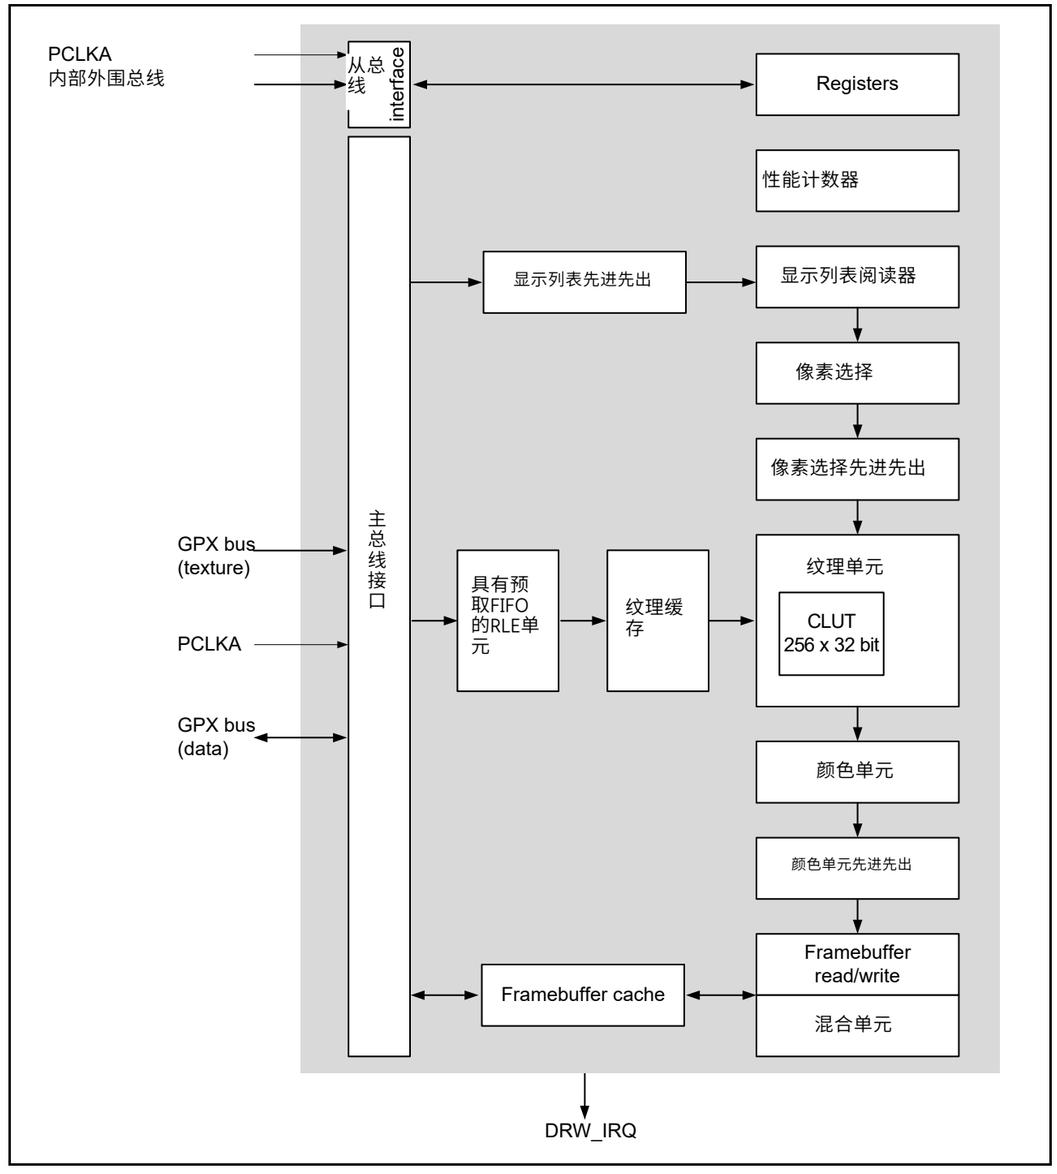

Figure 56.3 二维绘图引擎的框图

2D绘图引擎通过单独的高速缓存作为总线主控器访问GPX总线：

- 从帧缓冲区读取像素数据和向帧缓冲区写入像素数据
- 阅读纹理
- 阅读显示列表。

控制寄存器通过内部外围总线接口访问。

Bit	Symbol	Bit name	Description	R/W
b0	PATTERN ENABLE	Pattern Color Enable for Pixel Source	Pixel source is a pattern color (blend of COLOR1 and COLOR2 depending on PATTERN and pattern index). 0: Disable pattern 1: Enable pattern. When patterns are used to fill a primitive an index into the pattern bit mask is generated for each pixel with the U limiter. Depending on the pattern bits the color is selected from COLOR1 and COLOR2 registers. Fractional indices can be interpolated between those two values by using TEXTUREFILTERX = 1. The pattern can be wrapped by using TEXTURECLAMPX = 0, and the mask must be set in the TEXMASK register using the mask for u.	W
b1	TEXTURE ENABLE	Texture Enable for Pixel Source	Pixel source is read from texture and used as an alpha to blend between COLOR1 and COLOR2. 0: Disable texture 1: Enable texture.	W
b2	PATTERN SOURCEL5	Limiter 5 Enable for Pattern Index	Limiter 5 is used as pattern index instead of the default U limiter. Limiter 5 can be combined with limiter 6 to form a quadratic limiter that can be used to make quadratic pattern functions to draw radial patterns.	W
b3	USEACB	Alpha Blend Mode	0: Use WRITEALPHA[1:0] mode 1: Use full alpha channel blending mode.	W

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	CFLUSHTX	CENABLETX	CFLUSHFX	CENABLEFX
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	CENABLEFX	帧缓冲缓存启用	0：禁用帧缓冲缓存1：启用帧缓冲缓存。	W
b1	CFLUSHFX	刷新帧缓冲缓存	0：不刷新帧缓冲缓存1：刷新帧缓冲缓存。	W
b2	CENABLETX	纹理缓存启用	0：禁用纹理缓存1：启用纹理缓存。	W
b3	CFLUSHTX	刷新纹理缓存	0：不刷新纹理缓存1：刷新纹理缓存。	W
b31 to b4	—	Reserved	写入值应为0。	W

56.2.5 状态控制寄存器(STATUS)

Address(es): DRW.STATUS 400E 4000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	BUSERRMDL	BUSERRMTX	BUSERRMFB	—	BUSIRQ	DLISTIRQ	ENUMIRQ	DLISTACTIVE	缓存脏	忙写	BUSYENUM
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	BUSY ENUM	枚举单元状态	0：枚举单元空闲1：枚举单元忙，无法启动新原语。	R

Bit	Symbol	Bit name	Description	R/W
b1	BUSY WRITE	Framebuffer Writeback Status	0: Framebuffer writeback finished 1: Framebuffer writeback busy, framebuffer type cannot be changed.	R
b2	CACHE DIRTY	Framebuffer Cache Status	0: Framebuffer cache is not dirty 1: Framebuffer cache is dirty, and frame should not be flipped.	R
b3	DLIST ACTIVE	Display List Reader Status	0: Display list reader is idle 1: Display list reader is busy, and no direct write access to registers allowed.	R
b4	ENUM IRQ	Enumeration Interrupt Triggered	0: Enumeration not finished or interrupt disabled 1: Enumeration finished interrupt triggered.	R
b5	DLIST IRQ	Display List Interrupt Triggered	0: Display list not finished or interrupt disabled 1: Display list finished interrupt triggered.	R
b6	BUS IRQ	Bus Error Interrupt Triggered	0: No bus error occurred or interrupt disabled 1: Bus error interrupt triggered.	R
b7	—	Reserved	This bit is read as 0.	R
b8	BUSERR MFB	Framebuffer Bus Error Interrupt Triggered	0: No framebuffer bus error occurred or interrupt disabled 1: Framebuffer bus error interrupt triggered.	R
b9	BUSERR MTXMRL	Texture Bus Error Interrupt Triggered*1	0: No texture bus error occurred or interrupt disabled 1: Texture bus error interrupt triggered.	R
b10	BUSERR MDL	Display List Bus Error Interrupt Triggered	0: No display list bus error occurred or interrupt disabled 1: Display list bus error interrupt triggered.	R
b31 to b11	—	Reserved	These bits are read as 0.	R

Note 1. Because the RLE unit is also reading data through the texture bus, an error during RLE data access is also reflected in this bit.

56.2.6 Hardware Version and Feature Set ID Register (HWREVISION)

Address(es): DRW.HWREVISION 400E 4004h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	1	1	1	1	1	0	1	1	1	1	1	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	REV[11:0]											
Value after reset:	0	0	0	0	0	0	0	1	0	0	0	0	0	1	1	1

Bit	Symbol	Bit name	Description	R/W
b11 to b0	REV[11:0]	Revision Number	Revision number.	R
b16 to b12	—	Reserved	These bits are read as 0.	R
b17	DLR	Display List Reader Available	Display list reader is available.	R
b18	FBCACHE	Framebuffer Cache Available	Framebuffer cache is available.	R
b19	TX CACHE	Texture Cache Available	Texture cache is available.	R
b20	PERF COUNT	Two Performance Counter Available	Two performance counter is available.	R
b21	TEXCLUT	Texture CLUT Available	Texture CLUT is available.	R
b22	—	Reserved	This bit is read as 0.	R
b23	RLEUNIT	RLE Unit Available	RLE unit is available.	R

Bit	Symbol	位名称	Description	R/W
b1	忙写	Framebuffer Writeback Status	0：Framebufferwriteback完成1：Framebufferwriteback忙，framebuffer类型不能更改。	R
b2	缓存脏	帧缓冲缓存状态	0：Framebuffer缓存不脏1：Framebuffer缓存脏，帧不应该被翻转。	R
b3	DLIST ACTIVE	显示列表阅读器状态	0：显示列表阅读器空闲1：显示列表阅读器忙，不允许直接写访问寄存器。	R
b4	ENUM IRQ	枚举中断触发	0：枚举未完成或中断禁用1：枚举完成中断触发。	R
b5	DLIST IRQ	显示列表中断触发	0：显示列表未完成或中断禁用1：显示列表完成中断触发。	R
b6	BUS IRQ	触发总线错误中断	0：未发生总线错误或中断禁用1：触发了总线错误中断。	R
b7	—	Reserved	该位读为0。	R
b8	BUSERR MFB	帧缓冲总线错误中断 Triggered	0：未发生帧缓冲区总线错误或中断禁用1：已触发帧缓冲区总线错误中断。	R
b9	BUSERR MTXMRL	纹理总线错误中断 Triggered*1	0：未发生纹理总线错误或中断禁用1：已触发纹理总线错误中断。	R
b10	BUSERR MDL	显示列表总线错误中断 Triggered	0：未发生显示列表总线错误或中断禁用1：已触发显示列表总线错误中断。	R
b31 to b11	—	Reserved	这些位读为0。	R

Note 1. 因为RLE单元也是通过纹理总线读取数据，所以RLE数据访问过程中的错误也反映在该位上。

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LBAND[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LBAND[31:0]	Limiter m Band Width Parameter	Specifies limiter m band width parameter.	W

56.2.14 Texture Base Address Register (TEXORIGIN)

Address(es): DRW.TEXORIGIN 400E 40BCh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TEXORIGIN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TEXORIGIN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	TEXORIGIN[31:0]	Texture Base Address	Specifies texture base address.	W

56.2.12 限制器NY轴增量寄存器(LnYADD)

Address(es): DRW.L1YADD 400E 4040h, DRW.L2YADD 400E 4044h, DRW.L3YADD 400E 4048h, DRW.L4YADD 400E 404Ch, DRW.L5YADD 400E 4050h, DRW.L6YADD 400E 4054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LYADD[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LYADD[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b31 to b0	LYADD[31:0]	Y-Axis Increment	指定y轴增量。	W

56.2.13 限制器M带宽参数寄存器(LmBAND)

Address(es): DRW.L1BAND 400E 4058h, DRW.L2BAND 400E 405Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LBAND[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LBAND[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b31 to b0	LBAND[31:0]	限制器m带宽参数	指定限制器m带宽参数。	W

56.2.14 纹理基地址寄存器(TEXORIGIN)

Address(es): DRW.TEXORIGIN 400E 40BCh

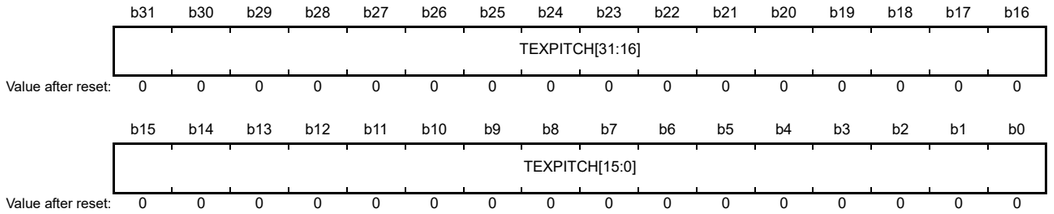
	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TEXORIGIN[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TEXORIGIN[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b31 to b0	TEXORIGIN[31:0]	纹理基地址	指定纹理基地址。	W

56.2.15 Texels Per Texture Line Register (TEXPITCH)

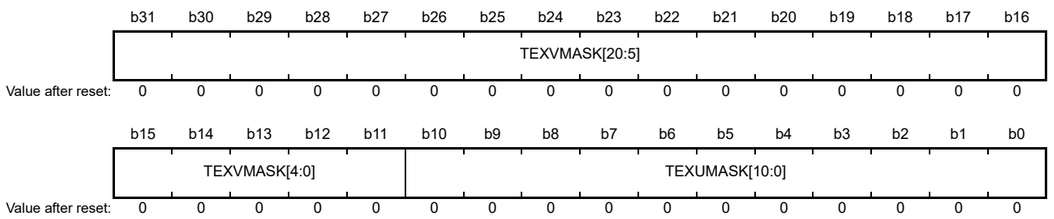
Address(es): DRW.TEXPITCH 400E 40B4h



Bit	Symbol	Bit name	Description	R/W
b31 to b0	TEXPITCH[31:0]	Texels Per Texture Line	Specifies texels per texture line. Valid range: 0 to 2048.	W

56.2.16 Texture Size or Texture Address Mask Register (TEXMASK)

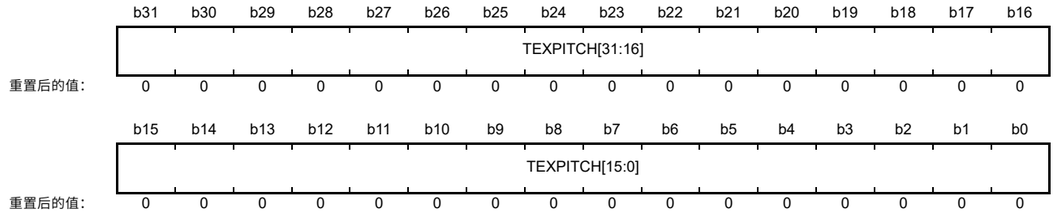
Address(es): DRW.TEXMASK 400E 40B8h



Bit	Symbol	Bit name	Description	R/W
b10 to b0	TEXUMASK[10:0]	U Mask in Texture Mode	Specifies the U mask. Set to texture_width -1. • In texture wrapping mode (CONTROL2.TEXTURECLAMPX = 0): Texture_width must be a power of 2 • In texture clamping mode (CONTROL2.TEXTURECLAMPX = 1): All widths up to 2048 are allowed.	W
b31 to b11	TEXVMASK[20:0]	V Mask in Texture Mode	Specifies the V mask. Set to DRWTEXPITCH (texture_height - 1). • In texture wrapping mode (CONTROL2.TEXTURECLAMPY = 0): Texture_height must be a power of 2 • In texture clamping mode (CONTROL2.TEXTURECLAMPY = 1): All heights up to 1024 are allowed.	W

56.2.15 每个纹理线寄存器的纹素(TEXPITCH)

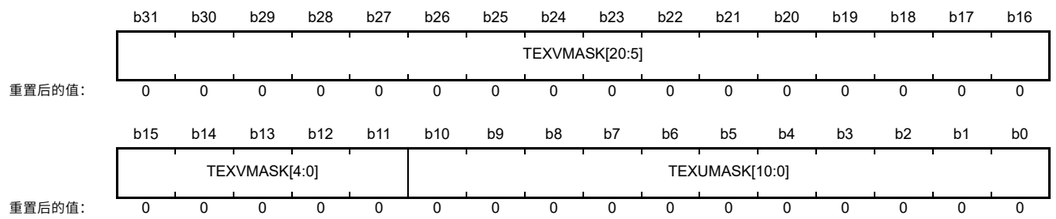
Address(es): DRW.TEXPITCH 400E 40B4h



Bit	Symbol	位名称	Description	R/W
b31 to b0	TEXPITCH[31:0]	每条纹理线的纹素	指定每条纹理线的纹素。有效范围：0到2048。	W

56.2.16 纹理大小或纹理地址掩码寄存器(TEXMASK)

Address(es): DRW.TEXMASK 400E 40B8h



Bit	Symbol	位名称	Description	R/W
b10 to b0	TEXUMASK[10:0]	纹理模式下的U蒙版	指定U掩码。设置为texture_width-1。 在纹理环绕模式下 (CONTROL2.TEXTURECLAMPX=0)：Texture_width必须是2的幂 在纹理钳制模式下 (CONTROL2.TEXTURECLAMPX=1)：允许最大为2048的所有宽度。	W
b31 to b11	TEXVMASK[20:0]	纹理模式下的V蒙版	指定V遮罩。设置为DRWTEXPITCH(texture_height1)。 在纹理环绕模式下 (CONTROL2.TEXTURECLAMPY=0)：Texture_height必须是2的幂 在纹理钳制模式下 (CONTROL2.TEXTURECLAMPY=1)：允许所有高度达到1024。	W

56.2.17 U Limiter Start Value Register (LUSTART)

Address(es): DRW.LUSTART 400E 4090h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LUSTART[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LUSTART[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	LUSTART[31:0]	U Limiter Start Value	Specifies U limiter start value.	W

56.2.18 U Limiter X-Axis Increment Register (LUXADD)

Address(es): DRW.LUXADD 400E 4094h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LUXADD[31:16]

	—	—	—	—	—	—	—	—	CLADDR[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	CLADDR[7:0]	纹理CLUT起始地址	指定纹理CLUT起始地址。	W

Bit	Symbol	Bit name	Description	R/W
b31 to b8	—	Reserved	The write value should be 0.	W

56.2.26 CLUT Data Register (TEXCLDATA)

Address(es): DRW.TEXCLDATA 400E 40E0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CLDATA[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CLDATA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	CLDATA[31:0]	Texture CLUT Data	Specifies texture CLUT data.	W

56.2.27 CLUT Offset Register (TEXCLOFFSET)

Address(es): DRW.TEXCLOFFSET 400E 40E4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CLOFFSET[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CLOFFSET[7:0]	Texture CLUT Offset	Specifies texture CLUT offset. CLOFFSET[7:0] is OR gated with the original index.	W
b31 to b8	—	Reserved	The write value should be 0.	W

Bit	Symbol	位名称	Description	R/W
b31 to b8	—	Reserved	写入值应为0。	W

56.2.26 CLUT数据寄存器(TEXCLDATA)

Address(es): DRW.TEXCLDATA 400E 40E0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CLDATA[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CLDATA[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b31 to b0	CLDATA[31:0]	纹理CLUT数据	指定纹理CLUT数据。	W

56.2.27 CLUT偏移寄存器(TEXCLOFFSET)

Address(es): DRW.TEXCLOFFSET 400E 40E4h

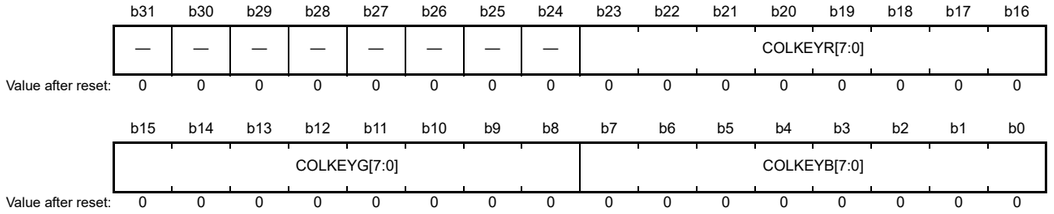
	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	CLOFFSET[7:0]							
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	CLOFFSET[7:0]	纹理CLUT偏移	指定纹理CLUT偏移。CLOFFSET[7:0]是使用原始索引进行或门控。	W
b31 to b8	—	Reserved	写入值应为0。	W

56.2.28 Color Key Register (COLKEY)

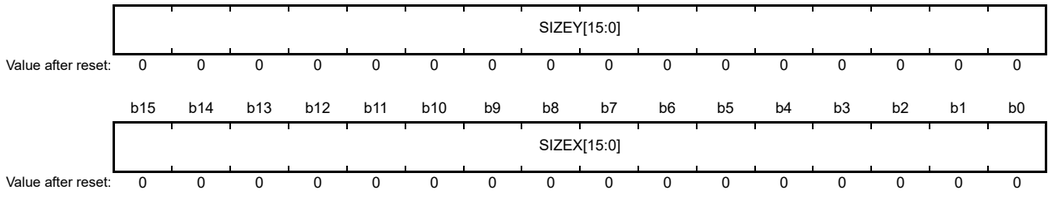
Address(es): DRW.COLKEY 400E 40E8h



Bit	Symbol	Bit name	Description	R/W
b7 to b0	COLKEYB[7:0]	Blue Channel of Color Key	Specifies blue channel of color key.	W
b15 to b8	COLKEYG[7:0]	Green Channel of Color Key	Specifies green channel of color key.	W
b23 to b16	COLKEYR[7:0]	Red Channel of Color Key	Specifies red channel of color key.	W
b31 to b24	—	Reserved	The write value should be 0.	W

56.2.29 Bounding Box Dimension Register (SIZE)

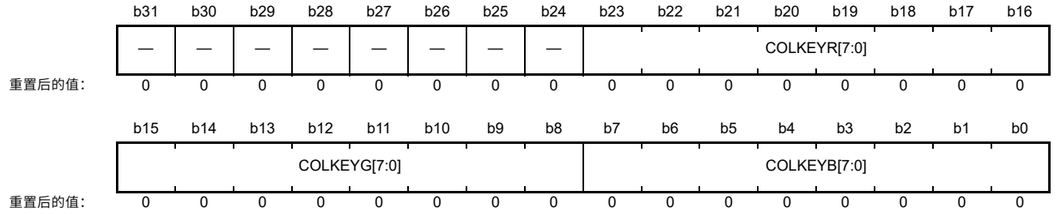
Address(es): DRW.SIZE 400E 4078h



Bit	Symbol	Bit name	Description	R/W
b15 to b0	SIZEX[15:0]	Bounding Box Width	Specifies width of bounding box in pixels. Valid range: 0 to 1024.	W
b31 to b16	SIZEY[15:0]	Bounding Box Height	Specifies height of bounding box in pixels. Valid range: 0 to 1024.	W

56.2.28 颜色键寄存器(COLKEY)

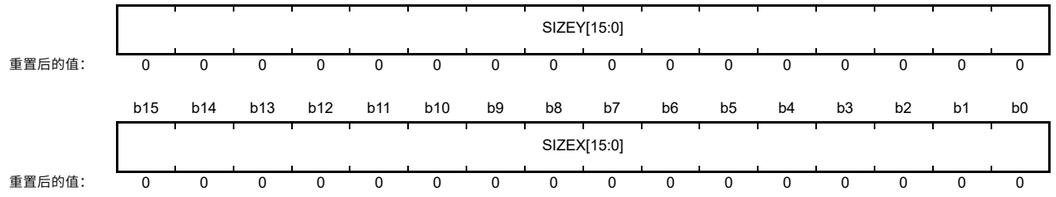
Address(es): DRW.COLKEY 400E 40E8h



Bit	Symbol	位名称	Description	R/W
b7 to b0	COLKEYB[7:0]	颜色键的蓝色通道	指定颜色键的蓝色通道。	W
b15 to b8	COLKEYG[7:0]	颜色键的绿色通道	指定颜色键的绿色通道。	W
b23 to b16	COLKEYR[7:0]	颜色键的红色通道	指定颜色键的红色通道。	W
b31 to b24	—	Reserved	写入值应为0。	W

56.2.29 边界框尺寸寄存器（SIZE）

Address(es): DRW.SIZE 400E 4078h



Bit	Symbol	位名称	Description	R/W
b15 to b0	SIZEX[15:0]	边界框宽度	以像素为单位指定边界框的宽度。有效范围：0到1024。	W
b31 to b16	SIZEY[15:0]	边界框高度	以像素为单位指定边界框的高度。有效范围：0到1024。	W

56.2.30 Framebuffer Pitch And Spanstore Delay Register (PITCH)

Address(es): DRW.PITCH 400E 407Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SSD[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PITCH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	PITCH[15:0]	Pitch of the Framebuffer	A negative width can be used to render bottom-up instead of top-down.	W
b31 to b16	SSD[15:0]	Spanstore Delay	Specifies number of scan lines to delay spanstore operations.	W

56.2.31 Framebuffer Base Address Register (ORIGIN)

Address(es): DRW.ORIGIN 400E 4080h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	ORIGIN[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ORIGIN[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	ORIGIN[31:0]	Address of the First Pixel in Framebuffer	Writing to ORIGIN triggers the start of rendering.	W

56.2.30 帧缓冲间距和跨度存储延迟寄存器(PITCH)

Address(es): DRW.PITCH 400E 407Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SSD[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PITCH[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	PITCH[15:0]	帧缓冲区的间距	负宽度可用于自下而上而不是自上而下渲染。	W
b31 to b16	SSD[15:0]	Spanstore Delay	指定延迟spanstore操作的扫描行数。	W

56.2.31 帧缓冲基地址寄存器(ORIGIN)

Address(es): DRW.ORIGIN 400E 4080h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	ORIGIN[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ORIGIN[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b31 to b0	ORIGIN[31:0]	第一个像素的地址 Framebuffer	写入ORIGIN会触发渲染的开始。	W

56.2.32 Display List Start Address Register (DLISTSTART)

Address(es): DRW.DLISTSTART 400E 40C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DLISTSTART[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DLISTSTART[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b31 to b0	DLISTSTART[31:0]	Display List Start Address	Setting a new display list base address triggers execution of the new display list. Execution stops only when a new list is set or the current list terminates.	W

56.2.33 Performance Counters Control Register (PERFTRIGGER)

Address(es): DRW.PERFTRIGGER 400E 40D4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PERFTRIGGER2[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PERFTRIGGER1[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	PERFTRIGGER1[15:0]	Trigger of Performance Counter 1	Selects the internal event that increments the PERFCOUNT1 register. 0: Disable performance counter 1: Select 2D Drawing Engine active cycles 2: Select framebuffer read access 3: Select framebuffer write access 4: Select texture read access 5: Select invisible pixels (enumerated but selected with alpha 0%) 6: Select invisible pixels while internal FIFO is empty (lost cycles) 7: Select display list reader active cycles 8: Select framebuffer read hits 9: Select framebuffer read misses 10: Select framebuffer write hits 11: Select framebuffer write misses 12: Select texture read hits 13: Select texture read misses 31: Select every clock cycle (for use as timer).	W
b31 to b16	PERFTRIGGER2[15:0]	Trigger of Performance Counter 2	Same as for PERFTRIGGER1, but for performance counter 2.	W

56.2.32 显示列表起始地址寄存器(DLISTSTART)

Address(es): DRW.DLISTSTART 400E 40C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DLISTSTART[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DLISTSTART[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b31 to b0	DLISTSTART[31:0]	显示列表起始地址	设置新的显示列表基地址会触发新显示列表的执行。仅当设置了新列表或当前列表终止时才停止执行。	W

56.2.33 性能计数器控制寄存器(PERFTRIGGER)

Address(es): DRW.PERFTRIGGER 400E 40D4h

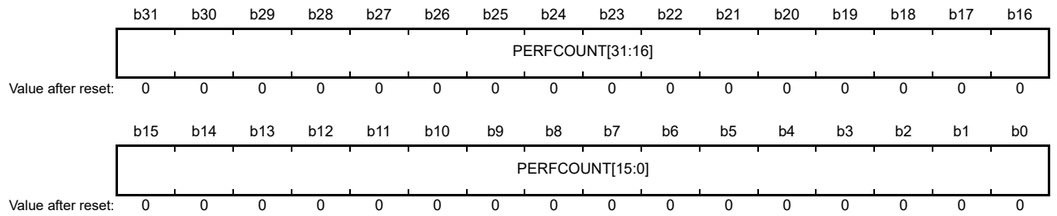
	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PERFTRIGGER2[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PERFTRIGGER1[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	PERFTRIGGER1[15:0]	绩效触发器 Counter 1	选择增加PERFCOUNT1寄存器的内部事件。 0：禁用性能计数器1：选择2D绘图引擎活动周期2：选择帧缓冲区读取访问3：选择帧缓冲区写入访问4：选择纹理读取访问5：选择不可见像素（枚举但选择alpha0%）6：选择不可见像素内部FIFO为空（丢失周期）7：选择显示列表读取器活动周期8：选择帧缓冲区读取命中9：选择帧缓冲区读取未命中10：选择帧缓冲区写入命中11：选择帧缓冲区写入未命中12：选择纹理读取命中13：选择纹理读取未命中31：选择每个时钟周期（用作计时器）。	W
b31 to b16	PERFTRIGGER2[15:0]	绩效触发器 Counter 2	与PERFTRIGGER1相同，但针对性能计数器2。	W

56.2.34 Performance Counter k (PERFCOUNTk) (k = 1, 2)

Address(es): DRW.PERFCOUNT1 400E 40CCh, DRW.PERFCOUNT2 400E 40D0h



Bit	Symbol	Bit name	Description	R/W
b31 to b0	PERFCOUNT[31:0]	Performance Counter k Value	Specifies counter k value. The counter is reset by writing PERFCOUNTk = 0000_0000h.	R/W

56.3 Drawing Features

56.3.1 Drawing Features Summary

56.3.1.1 Color formats

Supported color formats are:

Framebuffer formats

- 8-bit: a (8)
- 16-bit: RGB (565), aRGB (4444)
- 32-bit: aRGB (8888).

Texture formats

- 1-bit: CLUT (1)/I (1)
- 2-bit: CLUT (2)/I (2)
- 4-bit: CLUT (4)/I (4)
- 8-bit: a (8), CLUT (8)/I (8), aCLUT (44)
- 16-bit: aRGB (4444), aRGB (1555), RGB (565)
- 24-bit: RGB (888) (run length encoded (RLE) unit)
- 32-bit: aRGB (8888).

CLUT formats use a 256-entry color lookup table.

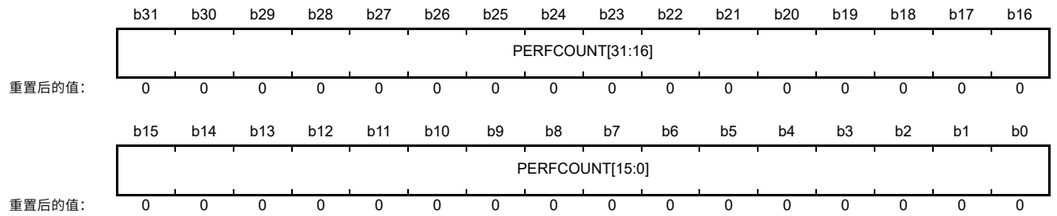
56.3.1.2 BitBLT features

The 2D Drawing Engine supports the BitBLT features using its vector drawing function to draw a rectangle and texture it based on the selected BitBLT function. This approach results in the following BitBLT features:

- Fill
- Copy
- Stretch BitBLT
- Rotate and scale
- Alpha blending

56.2.34 性能计数器k(PERFCOUNTk)(k=1 2)

Address(es): DRW.PERFCOUNT1 400E 40CCh, DRW.PERFCOUNT2 400E 40D0h



Bit	Symbol	位名称	Description	R/W
b31 to b0	PERFCOUNT[31:0]	性能计数器k值	指定计数器k值。通过写入PERFCOUNTk=0000_0000h来复位计数器。	R/W

56.3 绘图功能

56.3.1 绘图功能摘要

56.3.1.1 颜色格式

支持的颜色格式有：

Framebuffer formats

- 8-bit: a (8)
- 16-bit: RGB (565), aRGB (4444)
- 32-bit: aRGB (8888).

纹理格式

- 1-bit: CLUT (1)/I (1)
- 2-bit: CLUT (2)/I (2)
- 4-bit: CLUT (4)/I (4)
- 8-bit: a (8), CLUT (8)/I (8), aCLUT (44)
- 16-bit: aRGB (4444), aRGB (1555), RGB (565)
- 24位：RGB(888)（运行长度编码(RLE)单元）
- 32-bit: aRGB (8888).

CLUT格式使用256项颜色查找表。

56.3.1.2 BitBLT features

2D绘图引擎支持BitBLT功能，使用其矢量绘图功能绘制一个矩形并根据所选的BitBLT函数对其进行纹理化。这种方法产生了以下BitBLT功能：

- Fill
- Copy
- Stretch BitBLT
- 旋转和缩放
- 阿尔法混合

- Bilinear filtering
- Color conversion
- Subpixel exact placement.

56.3.1.3 Vector drawing features

The vector 2D Drawing Engine uses a half-plane rendering approach, which simplifies implementation of edge anti-aliasing and blurring features without much overhead. When combining some of its functional units, the module can draw not only linear primitives such as lines or polygons, but also quadratic equation-based primitives such as circles and ellipsoids. The following primitives are supported:

- Lines
- Polygons
- Circles and ellipses
- Quadratic curves (software driver support)
- 2D texture mapping
- Bilinear filtering of the textures.

56.3.2 Vector Drawing

For a detailed explanation of the algorithms, see section 56.6, Rendering Pipeline. Supported vector drawing includes:

Lines

- Arbitrary width
- Round endpoints
- Truncated endpoints
- Alpha gradients
- Soft edges (blurring)
- Render attribute: color, pattern, or texture.

Polygons

- Triangles and quadrangles (complex polygons are tessellated by software)
- Alpha gradients
- Soft edges (blurring)
- Per edge controls for anti-aliasing
- Render attribute: color, pattern, or texture.

Circles and ellipses

- All conic sections
- Filled or with arbitrary width
- Arcs of 0° to 360°
- Soft edges
- Alpha gradients
- Render attribute: color, pattern, or texture.

Quadratic Bézier

- Approximated by circle arcs
- Arbitrary width

- Bilinear filtering
- 颜色转换
- 亚像素精确位置。

56.3.1.3 矢量绘图功能

矢量2D绘图引擎使用半平面渲染方法，可简化边缘抗锯齿和模糊功能的实现，而无需太多开销。当组合它的一些功能单元时，该模块不仅可以绘制直线或多边形等线性图元，还可以绘制圆和椭圆体等基于二次方程的图元。支持以下原语：

- Lines
- Polygons
- 圆和椭圆
- 二次曲线（软件驱动支持）
- 2D纹理映射
- 纹理的双线性过滤。

56.3.2 矢量绘图

有关算法的详细说明，请参阅第56.6节，渲染管道。支持的矢量图包括：

Lines

- 任意宽度
- Round endpoints
- Truncated endpoints
- 阿尔法渐变
- 软边缘（模糊）
- 渲染属性：颜色、图案或纹理。

Polygons

- 三角形和四边形（复杂的多边形由软件镶嵌）
- 阿尔法渐变
- 软边缘（模糊）
- 用于抗锯齿的每个边缘控制
- 渲染属性：颜色、图案或纹理。

圆和椭圆

- 所有圆锥截面
- 填充或任意宽度
- 0°到360°的弧度
- 软边
- 阿尔法渐变
- 渲染属性：颜色、图案或纹理。

Quadratic Bézier

- 近似圆弧
- 任意宽度

- Round or truncated endpoints
- Outlines, blurring
- Alpha gradients
- Render attribute: color.

Texture mapping

- 2D array of pixels that can be mapped implicitly or explicitly on all primitives provided by the 2D Drawing Engine
- Translation, rotation, and scaling/shearing
- Bilinear filtering of the textures
- 3D-like texturing accomplished with line-by-line mapping, if constant in one axis.

56.3.3 BitBLT

A dedicated BitBLT unit is not required in the 2D Drawing Engine. The rendering pipeline described for vector drawing is used as the BitBLT unit and already provides a 1 pixel/cycle throughput. For details, see section 56.6, Rendering Pipeline.

56.3.3.1 Fill

Any rectangle in the framebuffer can be filled with any value. Possible color formats are any 8-, 16-, or 32-bpp format. The driver optimizes the fill to gain the full benefit of 32-bit parallel rasterization. If the selected color format is less than 32 bpp, the driver corrects the alignment and fills 32 bits per clock, resulting in 2 to 4 times faster fill performance for 8- and 16-bpp formats.

56.3.3.2 Copy

Any rectangle in the framebuffer can be filled with any rectangular data from the texture input. When the texture input points to the framebuffer, copying from framebuffer to framebuffer is possible. To avoid copy problems because of overlapping source and destination areas, the copy start point can be selected from top left to bottom right. Possible color formats are any 8-, 16-, or 32-bpp format.

The driver optimizes the copy to gain the full benefit of 32-bit parallel rasterization. If the selected color format is less than 32 bpp, the driver corrects the alignment and copies 32 bits per clock, resulting in 2 to 4 times faster copy performance for 8- and 16-bpp formats.

56.3.3.3 Stretch BitBLT

This is similar to the normal copy operation. Because the copy is done as a type of texture mapping, the full texture mapping feature set can be used. Any scaling ratios in the x and y directions is selectable, and filtering can be enabled independently for each axis.

56.3.3.4 Rotate and scale

This is similar to the normal copy operation. Because the copy is done as a type of texture mapping, the full texture mapping feature set can be used. Any scaling ratios in the x and y direction and any rotation angle is selectable. The x and y directions can be rotated and scaled independently, and filtering for the scalers can be enabled independently for each axis.

56.3.3.5 Alpha blending

Alpha blending is a fundamental block in the rendering pipeline, so the full alpha blend feature set is available for any BitBLT operation. It is possible to copy an area and blend it over the destination by using any constant global alpha value (register value) or by using an alpha mask. The alpha mask is part of the texture data and can be either a per-pixel value together with a pixel color (aRGB formats) or an alpha-only format using a register color.

In addition to the color channels, the alpha channel can be blended. The formula for the alpha channel can be set independently from the formula for the color channels.

- 圆形或截断端点
- 轮廓，模糊
- 阿尔法渐变
- 渲染属性：颜色。

纹理映射

- 可以在2D绘图引擎提供的所有图元上隐式或显式映射的2D像素数组
- 平移、旋转和缩放剪切
- 纹理的双线性过滤
- 如果在一个轴上保持不变，则通过逐行映射完成类似3D的纹理。

56.3.3 BitBLT

2D绘图引擎中不需要专用的BitBLT单元。矢量绘图所描述的渲染管道用作BitBLT单元，并且已经提供了1个像素周期的吞吐量。有关详细信息，请参阅第56.6节，渲染管道。

56.3.3.1 Fill

帧缓冲区中的任何矩形都可以填充任何值。可能的颜色格式是任何8、16或32-bpp格式。驱动程序优化填充以获得32位并行光栅化的全部优势。如果所选颜色格式小于32bpp，驱动程序会纠正对齐并填充每个时钟32位，从而使8和16-bpp格式的填充性能提高2到4倍。

56.3.3.2 Copy

帧缓冲区中的任何矩形都可以填充来自纹理输入的任何矩形数据。当纹理输入指向帧缓冲区时，可以从帧缓冲区复制到帧缓冲区。为避免由于源区域和目标区域重叠而导致的复制问题，可以从左上角到右下角选择复制起点。可能的颜色格式是任何8、16或32-bpp格式。

驱动程序优化副本以获得32位并行光栅化的全部优势。如果所选颜色格式小于32bpp，驱动程序会纠正对齐并以每时钟32位的速度复制，从而使8和16-bpp格式的复制性能提高2到4倍。

56.3.3.3 Stretch BitBLT

这类似于正常的复制操作。因为复制是作为一种纹理映射完成的，所以可以使用完整的纹理映射特征集。x和y方向上的任何缩放比例都是可选的，并且可以为每个轴独立启用过滤。

56.3.3.4 旋转和缩放

这类似于正常的复制操作。因为复制是作为一种纹理映射完成的，所以可以使用完整的纹理映射特征集。x和y方向上的任何缩放比例以及任何旋转角度都是可选的。x和y方向可以独立旋转和缩放，并且可以为每个轴独立启用缩放器的过滤。

56.3.3.5 阿尔法混合

Alpha混合是渲染管道中的一个基本块，因此完整的Alpha混合功能集可用于任何BitBLT操作。通过使用任何恒定的全局alpha值（寄存器值）或使用alpha掩码，可以复制一个区域并将其混合到目标上。alpha掩码是纹理数据的一部分，可以是每像素值和像素颜色（aRGB格式），也可以是使用寄存器颜色的仅alpha格式。

除了颜色通道，还可以混合Alpha通道。Alpha通道的公式可以独立于颜色通道的公式进行设置。

56.3.3.6 Bilinear filtering

The texture unit can be used to scale, rotate, or shear images. The texturing result can be filtered in the x and y directions independently. When selecting both filters, the result is a bilinear filtered texture. Using the unit twice with two independent textures would generate trilinear filtered bitmaps, improving the visual impression for high dynamic scale ratios.

56.3.3.7 Color conversion

Color conversion is required when using different texture formats than the framebuffer format. For saving texture memory, several formats are supported with less bpp than the framebuffer usually has. The 2D Drawing Engine always operates internally with 32-bpp aRGB (8888). All input data is converted into 32 bpp, and finally is converted back into the framebuffer format.

56.4 Input and Output Data Formats

56.4.1 Source and Destination Data

There are two possible inputs, the framebuffer and the texture or pattern input. The output is always the framebuffer.

Every drawing operation is internally rendered in 32 bpp aRGB (8888). If the input color does not provide an alpha channel, the blue channel is taken as the alpha channel. This alpha can be substituted with any alpha (for example, by an external constant) during the colorization step in the 2D Drawing Engine.

56.4.2 Framebuffer Color Formats

Table 56.1 shows the supported framebuffer color formats.

Table 56.1 Framebuffer color formats

Framebuffer memory occupation	Format	Remarks
8 bpp	a (8)	This color format uses 1 byte per pixel. The alpha channel is internally replicated on the red, blue, and green channels and can be substituted with any color during the color step in the 2D Drawing Engine.
16 bpp	RGB (565)	This color format uses 2 bytes per pixel with 5 bits for red and blue and 6 bits for green. The blue color is taken as the alpha channel during color conversion. The alpha can be substituted with any alpha during the colorization step in the 2D Drawing Engine.
	aRGB (4444)	This color format uses 2 bytes per pixel with 4 bits for each color and alpha channel.
32 bpp	aRGB (8888)	This color format uses 4 bytes per pixel with 8 bits for each color and alpha channel.

The framebuffer color format is selected in the Surface Control Register bits, CONTROL2.READFORMAT[2:0].

56.4.3 Texture Color Formats

Table 56.2 shows the supported texture color formats.

Table 56.2 Texture color formats (1 of 2)

Texture memory occupation	Format	Remarks
1 bpp	CLUT (1)/I (1)	In this mode, a 1-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value.
2 bpp	CLUT (2)/I (2)	In this mode, a 2-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value.
4 bpp	CLUT (4)/I (4)	In this mode, a 4-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value.

56.3.3.6 Bilinear filtering

纹理单元可用于缩放、旋转或剪切图像。纹理结果可以在x和y方向上独立过滤。选择两个过滤器时，结果是双线性过滤纹理。使用具有两个独立纹理的单元两次将生成三线性过滤位图，从而改善高动态比例的视觉印象。

56.3.3.7 颜色转换

当使用与帧缓冲区格式不同的纹理格式时，需要进行颜色转换。为了节省纹理内存，支持多种格式，其bpp比通常的帧缓冲区少。2D绘图引擎始终在内部以32-bppaRGB(8888)运行。所有输入数据都转换为32bpp，最后转换回帧缓冲区格式。

56.4 输入和输出数据格式

56.4.1 源数据和目标数据

有两种可能的输入，帧缓冲区和纹理或图案输入。输出始终是帧缓冲区。

每个绘图操作在内部以32bppaRGB(8888)呈现。如果输入颜色不提供Alpha通道，则将蓝色通道作为Alpha通道。在2D绘图引擎中的着色步骤期间，此alpha可以替换为任何alpha（例如，由外部常量）。

56.4.2 帧缓冲区颜色格式

表56.1显示了支持的帧缓冲区颜色格式。

Table 56.1 帧缓冲区颜色格式

帧缓冲内存占用	Format	Remarks
8 bpp	a (8)	这种颜色格式每个像素使用1个字节。Alpha通道在内部复制到红色、蓝色和绿色通道上，并且可以在2D绘图引擎中的颜色步骤中替换为任何颜色。
16 bpp	RGB (565)	这种颜色格式每个像素使用2个字节，其中5位用于红色和蓝色，6位用于绿色。在颜色转换过程中，蓝色作为Alpha通道。在2D绘图引擎的着色步骤中，可以用任何alpha替换alpha。
	aRGB (4444)	这种颜色格式每个像素使用2个字节，每个颜色和Alpha通道使用4位。
32 bpp	aRGB (8888)	这种颜色格式每个像素使用4个字节，每个颜色和Alpha通道使用8位。

帧缓冲区颜色格式在表面控制寄存器位CONTROL2.READFORMAT[2:0]中选择。

56.4.3 纹理颜色格式

表56.2显示了支持的纹理颜色格式。

Table 56.2 纹理颜色格式(1of2)

纹理内存占用	Format	Remarks
1 bpp	CLUT (1)/I (1)	在此模式下，使用1位索引来寻址颜色查找表中的256种预定义颜色之一。如果不使用CLUT，则将索引作为亮度值。
2 bpp	CLUT (2)/I (2)	在此模式下，使用2位索引来寻址颜色查找表中的256种预定义颜色之一。如果不使用CLUT，则将索引作为亮度值。
4 bpp	CLUT (4)/I (4)	在此模式下，使用4位索引来寻址颜色查找表中的256种预定义颜色之一。如果不使用CLUT，则将索引作为亮度值。

Table 56.2 Texture color formats (2 of 2)

Texture memory occupation	Format	Remarks
8 bpp	CLUT (8)/I (8)	In this mode, an 8-bit index is used to address one of 256 predefined colors in the color lookup table. If the CLUT is not used, the index is taken as a luminance value.
	a (8)	This color format uses 1 byte per pixel. The alpha channel is internally replicated on the red, blue, and green channels and can be substituted with any color during the colorization step in the 2D Drawing Engine.
	aCLUT (44)	This color format uses 1 byte per pixel. 4 bits are used as an alpha value and 4 bits are used as an index to a color palette. This approach saves space if 16 colors are sufficient to describe the image, because the next bigger alpha format would be 2-byte aRGB (4444).
16 bpp	RGB(565)	This color format uses 2 bytes per pixel with 5 bits for red and blue and 6 bits for green. The blue color is taken as the alpha channel during color conversion. The alpha can be substituted with any alpha during the colorization step in the 2D Drawing Engine.
	aRGB (4444)	This color format uses 2 bytes per pixel with 4 bits for each color and alpha channel.
	aRGB (1555)	This color format uses 2 bytes per pixel. Every color channel has 5 bits and the topmost single bit is taken as an alpha value. This can be used to hold an image with a transparency mask.
24 bpp	RGB (888)	This color format uses 3 bytes per pixel with 8 bits for each color channel. This format is only available as run length encoded data (RLE compression).
32 bpp	aRGB (8888)	This color format uses 4 bytes per pixel with 8 bits for each color and alpha channel.

The texture color format is selected in the Surface Control Register bits, CONTROL2.WRITEFORMAT[3:0].

56.5 Texture Data Processing

Figure 56.4 shows the processing of texture data.

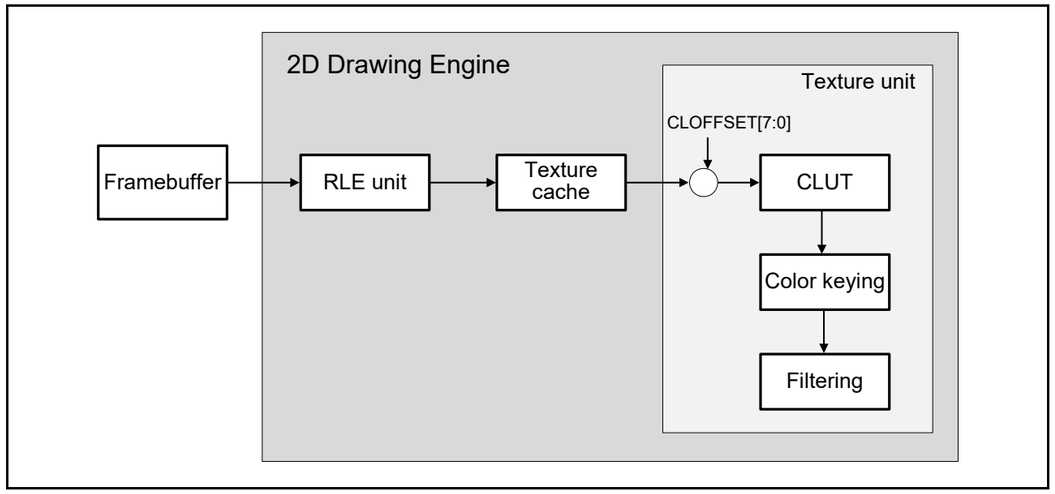


Figure 56.4 Texture data processing

56.5.1 Texture Color Format

Table 56.3 shows the supported texture data formats.

Table 56.2 纹理颜色格式(2of2)

纹理内存占用	Format	Remarks
8 bpp	CLUT (8)/I (8)	在此模式下，使用8位索引来寻址颜色查找表中的256种预定义颜色之一。如果不使用CLUT，则将索引作为亮度值。
	a (8)	这种颜色格式每个像素使用1个字节。Alpha通道在内部复制到红色、蓝色和绿色通道上，并且可以在2D绘图引擎中的着色步骤中替换为任何颜色。
	aCLUT (44)	这种颜色格式每个像素使用1个字节。4位用作alpha值，4位用作调色板的索引。如果16种颜色足以描述图像，这种方法可以节省空间，因为下一个更大的alpha格式将是2字节aRGB(4444)。
16 bpp	RGB(565)	这种颜色格式每个像素使用2个字节，其中5位用于红色和蓝色，6位用于绿色。在颜色转换过程中，蓝色作为Alpha通道。在2D绘图引擎的着色步骤中，可以用任何alpha替换alpha。
	aRGB (4444)	这种颜色格式每个像素使用2个字节，每个颜色和Alpha通道使用4位。
	aRGB (1555)	这种颜色格式每个像素使用2个字节。每个颜色通道有5位，最高的一位作为alpha值。这可用于保存带有透明蒙版的图像。
24 bpp	RGB (888)	这种颜色格式每个像素使用3个字节，每个颜色通道使用8位。此格式仅可用作行程编码数据（RLE压缩）。
32 bpp	aRGB (8888)	这种颜色格式每个像素使用4个字节，每个颜色和Alpha通道使用8位。

纹理颜色格式在表面控制寄存器位CONTROL2.WRITEFORMAT[3:0]中选择。

56.5 纹理数据处理

图56.4显示了纹理数据的处理。

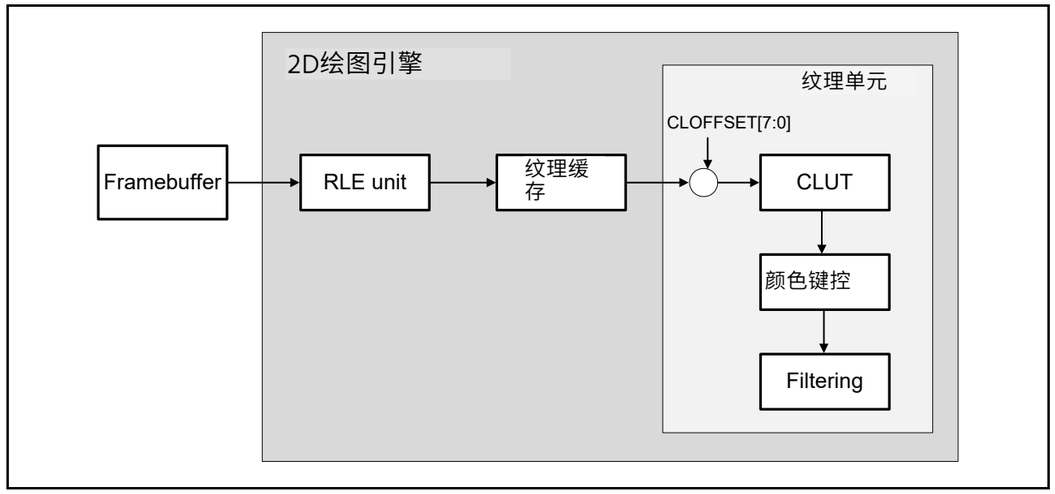

Figure 56.4 纹理数据处理

56.5.1 纹理颜色格式

表56.3显示了支持的纹理数据格式。

Table 56.3 Texture color formats

Texel bit width	Texel format
32 bits	aRGB (8888)
24 bits	RGB (888)
16 bits	aRGB (4444), aRGB (1555), RGB (565)
8 bits	CLUT (8)I (8), a (8), aCLUT (44)
4 bits	CLUT (4)/I (4)
2 bits	CLUT (2)/I (2)
1 bit	CLUT (1)/I (1)

56.5.2 Run Length Encoded (RLE) Unit

The RLE unit decompresses Targa-like compressed textures and hands the decompressed texel data over to the texture unit. The key features are:

- Support for Targa format
- Avoids the additional Targa limitation to scan lines
- Support for clipping of compressed images, in which the 2D Drawing Engine is allowed to copy only a portion of a larger original texture
- Control of the RLE unit in drawing list operation
- Bypassing of the RLE unit logic if uncompressed textures are fetched from the framebuffer.

Texture cache

The RLE unit feeds the texture cache. The texture cache can be disabled by setting CACHECTL.CENABLETX = 0.

Caution: A texture cache flush operation (CACHECTL.CFLUSHTX = 1) is necessary at the beginning and end of every new RLE texture.

The texture cache and the RLE unit can be bypassed by setting CONTROL2.RLEENABLE = 0.

56.5.2.1 RLE Texel formats

Table 56.4 lists the data formats supported by the RLE unit.

Table 56.4 Texel formats supported by the RLE unit (1 of 2)

Memory texel format	RLE parameters	RLE coded unit format (CONTROL2.RLEPIXELWIDTH[1:0])	Delivered format
32-bit aRGB (8888)	Included in Targa and RLE formats	32 bits (11b)	32 bits
24-bit RGB (888)		24 bits (10b)	32 bits *1
16-bit aRGB (4444), aRGB (1555), RGB (565)		16 bits (01b)	16 bits
8-bit CLUT (8)I (8), a (8), aCLUT (44)		8 bits (00b)	8 bits
4-bit CLUT (4)/I (4)	Optional for RLE *2	8 = 2 x 4 bits	4 + 4 bits

Table 56.3 纹理颜色格式

纹素位宽	Texel format
32 bits	aRGB (8888)
24 bits	RGB (888)
16 bits	aRGB (4444), aRGB (1555), RGB (565)
8 bits	CLUT (8)I (8), a (8), aCLUT (44)
4 bits	CLUT (4)/I (4)
2 bits	CLUT (2)/I (2)
1 bit	CLUT (1)/I (1)

56.5.2 运行长度编码(RLE)单元

RLE单元解压缩类似Targa的压缩纹理，并将解压缩的纹素数据交给纹理单元。主要特点是：

- 支持Targa格式
- 避免了对扫描线的额外Targa限制
- 支持剪切压缩图像，其中2D绘图引擎只允许复制较大原始纹理的一部分
- 图纸列表操作中RLE单元的控制
- 如果从帧缓冲区获取未压缩的纹理，则绕过RLE单元逻辑。

纹理缓存

RLE单元提供纹理缓存。可以通过设置CACHECTL.CENABLETX=0来禁用纹理缓存。

Caution: 在每个新RLE纹理的开始和结束时都需要进行纹理缓存刷新操作(CACHECTL.CFLUSHTX=1)。

可以通过设置CONTROL2.RLEENABLE=0绕过纹理缓存和RLE单元。

56.5.2.1 RLE Texel formats

表56.4列出了RLE单元支持的数据格式。

Table 56.4 RLE单元支持的纹素格式(1of2)

内存纹素格式	RLE parameters	RLE编码单元格式(CONTROL2.RLEPIXELWIDTH[1:0])	交付格式
32-bit aRGB (8888)	包含在Targa和RLE格式中	32 bits (11b)	32 bits
24-bit RGB (888)		24 bits (10b)	32 bits *1
16-bit aRGB (4444), aRGB (1555), RGB (565)		16 bits (01b)	16 bits
8-bit CLUT (8)I (8), a (8), aCLUT (44)		8 bits (00b)	8 bits
4-bit CLUT (4)/I (4)	RLE可选*2	8 = 2 x 4 bits	4 + 4 bits

Table 56.4 Texel formats supported by the RLE unit (2 of 2)

Memory texel format	RLE parameters	RLE coded unit format (CONTROL2.RLEPIXELWIDTH[1:0])	Delivered format
2-bit CLUT (2)/I (2)	No RLE		
1-bit CLUT (1)/I (1)			

Note 1. 24-bit RGB (888) encoded texels are delivered as aRGB (8888) with Alpha set to 1.
Note 2. Encoding of textures with 4 bits per texel is not defined by the Targa specification but can be done by:
- Combining two 4-bit texels to one byte
- Padding with 4 zero bits at the end of the file, if the number of texels is odd
- Encoding as with 8-bit texels.

Texel addressing for RLE textures

The address of a texel is the byte address of the first byte of the texel. The origin of the texture is given by the register TEXORIGIN.

Note: The RLE code must begin at a word boundary of the memory.

Caution: When the FIFO is filled, there is no provision to inhibit read access beyond the end of the RLE code. To avoid memory access violations, the RLE code must be padded by 32 memory words, where every bit of each word is set to 1.

56.5.2.2 Targa RLE format

Run-length encoded (RLE) images include two types of data elements:

- Run-length packets
- Raw packets.

The first field (1 byte) of each packet is called the repetition count field. The second field is called the pixel value field (1, 2, 3. or 4 bytes). For run-length packets, the pixel value field contains a single pixel value. For raw packets, the field is a variable number of pixel values.

The highest order bit of the repetition count indicates whether the packet is a raw packet or a run-length packet, as follows:

- If bit [7] of the repetition count is set to 1, the packet is a run-length packet
- If bit [7] of the repetition count is set to zero, the packet is a raw packet.

The lower 7 bits of the repetition count specify how many pixel values are represented by the packet. For a run-length packet, this count indicates how many successive pixels have the pixel value specified in the pixel value field. For raw packets, this count specifies how many pixel values are actually contained in the next field. This 7-bit value is actually encoded as 1 less than the number of pixels in the packet (a value of 0 implies 1 pixel while a value of 7Fh implies 128 pixels).

Run-length packet

Run-length packets are composed of two parts. The first is a repetition count and the second is the pixel value to repeat.

Table 56.5 Run-length packet

Field name	Packet type (must be 1 for run-length)	Pixel count (number of pixels encoded in this packet - 1)	Pixel data (the shared pixel value to be used)
Field size	1 bit	7 bits	Pixel depth (field 5.5)

Raw packet

The raw packet always includes two fields. The first field is the repetition count and the second field is the pixel data field.

Table 56.4 RLE单元支持的纹素格式(2of2)

内存纹素格式	RLE parameters	RLE编码单元格式(CONTROL2.RLEPIXELWIDTH[1:0])	交付格式
2-bit CLUT (2)/I (2)	No RLE		
1-bit CLUT (1)/I (1)			

Note 1. 24位RGB(888)编码的纹素以aRGB(8888)形式提供，Alpha设置为1。
Note 2. Targa规范没有定义每个纹素4位的纹理编码，但可以通过以下方式完成：将两个4位纹素组合为一个字节如果纹素数为奇数，则在文件末尾填充4个零位编码与8位纹素一样。

RLE纹理的Texel寻址

纹素的地址是纹素的第一个字节的字节地址。纹理的来源由寄存器给出TEXORIGIN.

Note: RLE代码必须从存储器的字边界开始。

Caution: 当FIFO被填满时，没有规定禁止在RLE代码结束后进行读取访问。为避免内存访问违规，RLE代码必须填充32个内存字，其中每个字的每一位都设置为1。

56.5.2.2 Targa RLE format

游程编码(RLE)图像包括两种类型的数据元素：

- Run-length packets
- 原始数据包。

每个数据包的第一个字段（1个字节）称为重复计数字段。第二个字段称为像素值字段（1、2、3.或4个字节）。对于游程包，像素值字段包含单个像素值。对于原始数据包，该字段是可变数量的像素值。

重复计数的最高位指示该数据包是原始数据包还是游程数据包，如下所示：

- 如果重复计数的第[7]位设置为1，则数据包是游程数据包
- 如果重复计数的位[7]设置为零，则数据包是原始数据包。

重复计数的低7位指定数据包表示多少像素值。对于游程长度数据包，此计数指示有多少连续像素具有像素值字段中指定的像素值。对于原始数据包，此计数指定下一个字段中实际包含多少像素值。这个7位值实际上被编码为比数据包中的像素数少1（值0表示1个像素，而值7Fh表示128个像素）。

Run-length packet

游程包由两部分组成。第一个是重复计数，第二个是要重复的像素值。

Table 56.5 Run-length packet

字段名称	数据包类型（行程长度必须为1）	像素数（此数据包中编码的像素数1）	像素数据（要使用的共享像素值）
字段大小	1 bit	7 bits	像素深度（5.5场）

原始数据包

原始数据包始终包含两个字段。第一个字段是重复计数，第二个字段是像素数据字段。

Table 56.6 Raw packet

Field name	Packet type (must be 0 for raw packet)	Pixel count (number of pixels encoded by this packet - 1)	Pixel data
Field size	1 bit	7 bits	Pixel depth x pixel count - 1

56.5.3 Color Lookup Table (CLUT)

The color lookup table receives an index that addresses one out of the 256 predefined colors.

The predefined color format can be selected as:

- CONTROL2.CLUTFORMAT = 0: aRGB (8888)
- CONTROL2.CLUTFORMAT = 1: RGB (565).

The CLUT is filled by the use of two registers:

- TEXCLDATA
  The aRGB (8888) color definition is written to this register, while the CLUT address is taken from TEXCLADDR.
- TEXCLADDR.
  This is set to the first address of the CLUT to write to and is automatically incremented after each write to TEXCLDATA.

An offset for indexed formats (CLUT (1), CLUT (2), CLUT (4), and CLUT (8)) can be set up in the TEXCLOFFSET register to allow selecting an offset part of the CLUT. The CLUT index is calculated by CLUT (x) or TEXCLOFFSET.CLOFFSET[7:0].

56.5.3.1 CLUT/I pixel data formats

The following tables explain in which order the pixels are stored within the byte. The left-most pixel is stored at the lowest bit of the memory byte.

CLUT (1)/I (1) format

The CLUT (1)/I (1) format expresses 1 pixel by using a total of 1 bit.

Memory byte	7 (MSB)	6	5	4	3	2	1	0 (LSB)
Pixel	P7	P6	P5	P4	P3	P2	P1	P0

The left-most pixel is stored at lowest bit of the memory byte.

CLUT (2)/I (2) format

The CLUT (2)/I (2) format expresses 1 pixel by using a total of 2 bits.

Memory byte	7 (MSB)	6	5	4	3	2	1	0 (LSB)
Pixel	P3		P2		P1		P0	

The left-most pixel is stored at lowest 2 bits of the memory byte.

CLUT (4)/I (4) format

The CLUT (4)/I (4) format expresses 1 pixel by using a total of 4 bits.

Memory byte	7 (MSB)	6	5	4	3	2	1	0 (LSB)

Table 56.6 原始数据包

字段名称	数据包类型（原始数据包必须为0）	像素数（此数据包编码的像素数1）	像素数据
字段大小	1 bit	7 bits	像素深度x像素数1

56.5.3 颜色查找表(CLUT)

颜色查找表接收一个索引，该索引对256种预定义颜色中的一种进行寻址。

预定义的颜色格式可以选择为：

- CONTROL2.CLUTFORMAT = 0: aRGB (8888)
- CONTROL2.CLUTFORMAT = 1: RGB (565).

CLUT使用两个寄存器填充：

- TEXCLDATA
  aRGB(8888)颜色定义写入该寄存器，而CLUT地址取自TEXCLADDR。
- TEXCLADDR。这设置为要写入的CLUT的第一个地址，并在每次写入后自动递增

  TEXCLDATA.

可以在TEXCLOFFSET寄存器中设置索引格式（CLUT(1)、CLUT(2)、CLUT(4)和CLUT(8)）的偏移量，以允许选择CLUT的偏移量部分。CLUT指数由CLUT(x)或TEXCLOFFSET.CLOFFSET[7:0]计算得出。

56.5.3.1 CLUTI像素数据格式

下表解释了像素在字节中的存储顺序。最左边的像素存储在内存字节的最低位。

CLUT (1)/I (1) format

CLUT(1)I(1)格式通过使用总共1位来表示1个像素。

内存字节	7 (MSB)	6	5	4	3	2	1	0 (LSB)
Pixel	P7	P6	P5	P4	P3	P2	P1	P0

最左边的像素存储在内存字节的最低位。

CLUT (2)/I (2) format

CLUT(2)I(2)格式通过使用总共2位来表示1个像素。

内存字节	7 (MSB)	6	5	4	3	2	1	0 (LSB)
Pixel	P3		P2		P1		P0	

最左边的像素存储在内存字节的最低2位。

CLUT (4)/I (4) format

CLUT(4)I(4)格式通过使用总共4位来表示1个像素。

内存字节	7 (MSB)	6	5	4	3	2	1	0 (LSB)

Pixel	P1	P0

The left-most pixel is stored at lowest 4 bits of the memory byte.

56.5.4 Color Keying

The 2D Drawing Engine provides a color keying unit in front of the texture unit. It operates as follows:

1. If enabled, the incoming color is compared with a transparent color, defined by COLKEY.
2. If the value matches, the alpha and color values are set to 0 to mark the color as transparent and handle it as if alpha was pre-multiplied.
3. If the value does not match, then alpha is set to 1.
4. Additional operations such as alpha_in × alpha_const are still possible.

With this approach, an object such as a round icon can be cut out from a rectangular texture and still can be faded by a constant alpha over the background.

56.6 Rendering Pipeline

56.6.1 Coordinate Transformation

Coordinate transformation such as rotation, translation, projection, and scaling must be done on the application side. This is not part of the 2D Drawing Engine hardware or driver. Because all coordinates fed into the 2D Drawing Engine are in fixed point format, these calculations can be made in fixed point format and do not require a floating point unit.

56.6.2 Rasterization

During rasterization, the vector data of the object must be converted to pixel data. To convert the data, the program sets up the edge interpolation hardware, called a limiter, for each edge of the object that calculates a decision value. The limiter determines which side of the edge the pixel is positioned on. The 2D Drawing Engine includes six internal hardware limiters. In principle, the limiter registers contain the distance between the pixel being processed and the edge.

In the linear setup, a limiter describes a half plane. The intersection of all half planes is the object. If three half planes intersect, a triangle is created as shown in Figure 56.5.

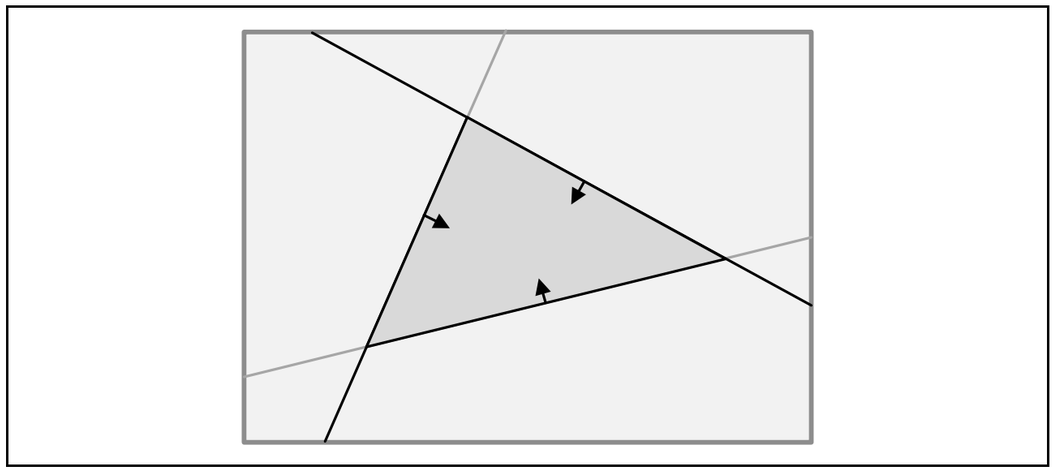

Figure 56.5 Intersection of half planes

The limiter output is clamped to an interval of [0:1]. In limiters 1 and 2 it is possible to apply a band filter before the clamping operation. In this case, the limiter is not describing a half plane but a small band. With this approach, a single limiter can describe a thick line of infinite length.

The output of the different limiters can be combined by the combiner units with a maximum or minimum operation.

Pixel	P1	P0

最左边的像素存储在内存字节的最低4位。

56.5.4 颜色键控

2D绘图引擎在纹理单元之前提供了一个颜色键控单元。它的运作方式如下：

1. 如果启用，则将传入颜色与由COLKEY定义的透明颜色进行比较。
2. 如果该值匹配，则将alpha和颜色值设置为0以将颜色标记为透明并像alpha被预乘一样处理它。
3. 如果值不匹配，则alpha设置为1。
4. 诸如alpha_in×alpha_const之类的附加操作仍然是可能的。

使用这种方法，可以从矩形纹理中剪切出诸如圆形图标之类的对象，并且仍然可以通过背景上的恒定alpha淡化。

56.6 渲染管线

56.6.1 坐标变换

旋转、平移、投影、缩放等坐标变换必须在应用端完成。这不是2D绘图引擎硬件或驱动程序的一部分。因为输入2D绘图引擎的所有坐标都是定点格式，所以这些计算可以定点格式进行，不需要浮点单位。

56.6.2 Rasterization

在光栅化过程中，必须将对象的矢量数据转换为像素数据。为了转换数据，程序为计算决策值的对象的每个边缘设置边缘插值硬件，称为限制器。限制器确定像素位于边缘的哪一侧。2D绘图引擎包括六个内部硬件限制器。原则上，限制寄存器包含正在处理的像素与边缘之间的距离。

在线性设置中，限制器描述了一个半平面。所有半平面的交点就是对象。如果三个半平面相交，则会创建一个三角形，如图56.5所示。

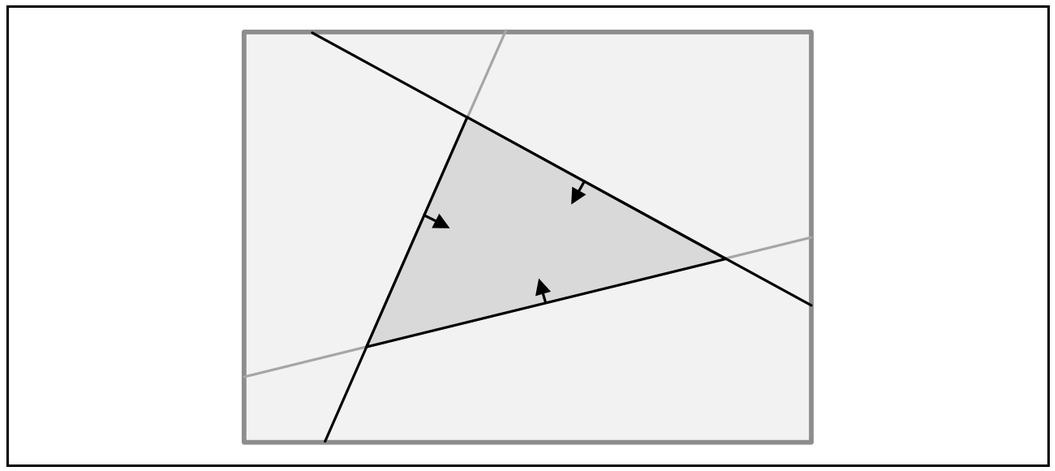

Figure 56.5 半平面的交点

限幅器输出被钳位在[0:1]的间隔内。在限幅器1和2中，可以在钳位操作之前应用带滤波器。在这种情况下，限制器不是描述一个半平面而是一个小带。使用这种方法，单个限制器可以描述无限长的粗线。

不同限制器的输出可以由组合器单元以最大或最小操作进行组合。

Maximum operation describes the union of both half planes, and minimum operation describes the intersection of both half planes. The final output is then used as an alpha value. Edge anti-aliasing can be done with no additional effort with this hardware.

To calculate the decision value for each possible pixel with a limiter, the bounding box of the object must be calculated. Then, the decision value for the top left corner of the bounding box must be calculated for each edge. Finally, the increments for a step in the x direction and a step in the y direction must be calculated. This is done by the CPU in the driver.

With this information, the 2D Drawing Engine scans the whole bounding box and calculates the decision value for every pixel incrementally. For a block diagram of the entire rasterization unit, see section 56.1, Overview.

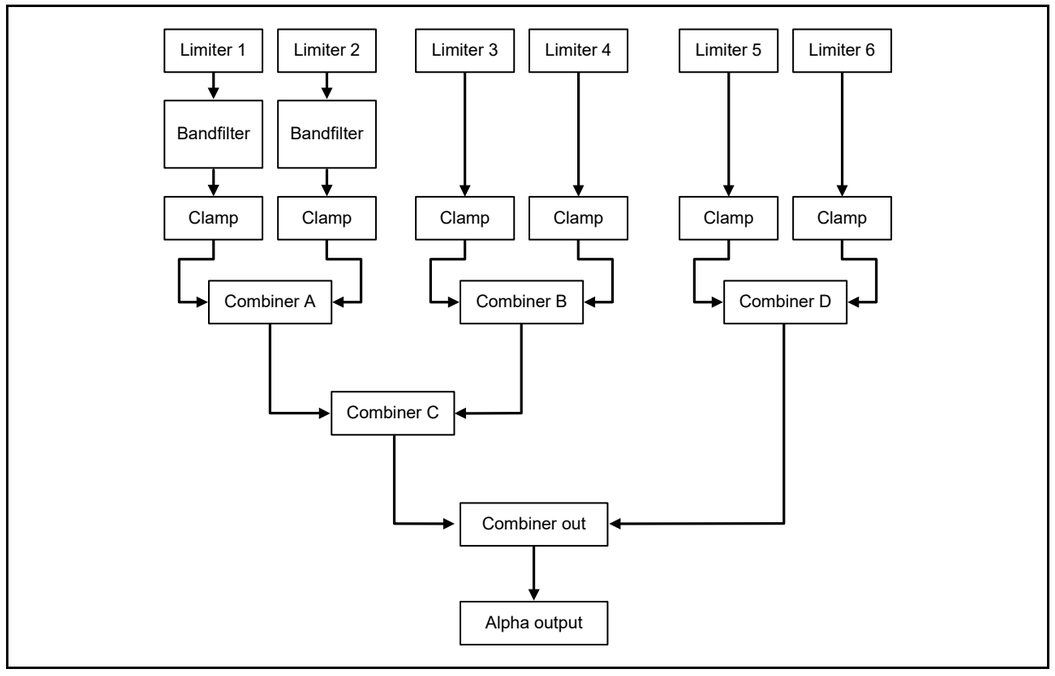

Figure 56.6 Block diagram of rasterization unit

The limiters calculate distances and the combiner units combine them to an alpha value. The combiner units define the conditions for whether or not a pixel is in the bounding box. The alpha value must be greater than 0.

Note: It is possible to have all limiters switched off.

56.6.2.1 Edge setup linear case

(1) Mathematical background

To setup a linear edge, consider the line equation in the classical form:

This can be written as:

$$y = \tilde{a}x + \tilde{b}$$

This can be rewritten as:

$$0 = f(x, y) = \tilde{a}x - y + \tilde{b} = ax + by + c$$

with $a = \tilde{a}$, $b = -1$, $c = \tilde{b}$

This is a more general form. Consider a vector form of this equation:

最大运算描述两个半平面的并集，最小运算描述两个半平面的交集。然后将最终输出用作alpha值。使用此硬件无需额外努力即可完成边缘抗锯齿。

要使用限制器计算每个可能像素的决策值，必须计算对象的边界框。
然后，必须为每条边计算边界框左上角的决策值。最后，必须计算x方向步长和y方向步长的增量。这是由驱动程序中的CPU完成的。

使用此信息，2D绘图引擎扫描整个边界框并逐步计算每个像素的决策值。有关整个光栅化单元的框图，请参阅第56.1节，概述。

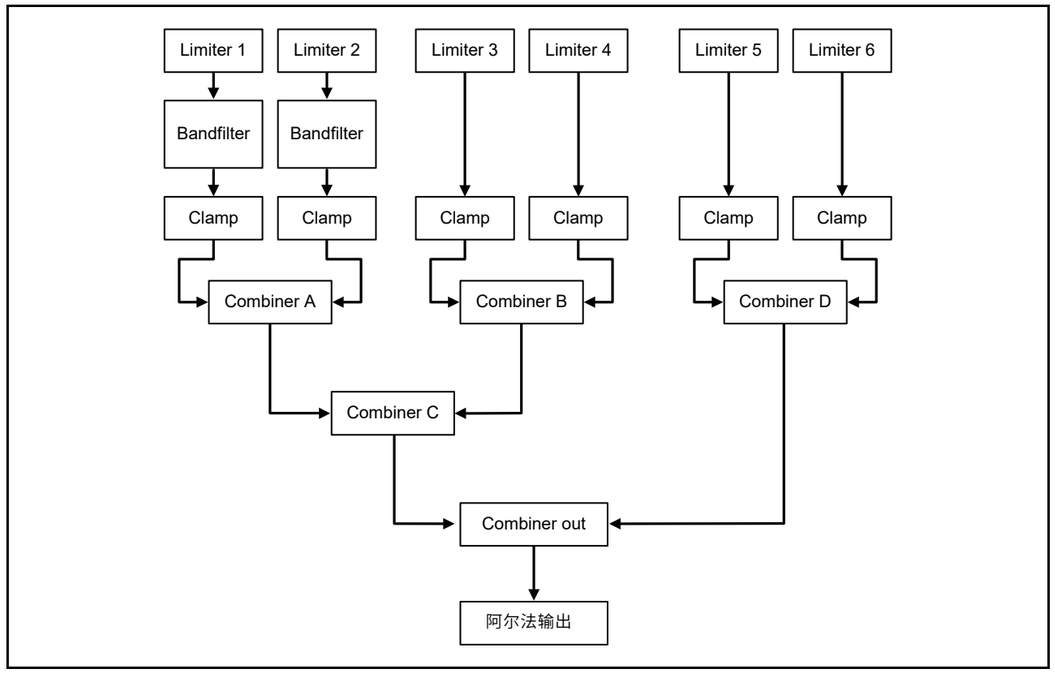

Figure 56.6 光栅化单元框图

限制器计算距离，组合器单元将它们组合成一个alpha值。组合器单元定义像素是否在边界框中的条件。alpha值必须大于0。

Note: 可以关闭所有限制器。

56.6.2.1 边缘设置线性案例

(1) 数学背景

要设置线性边缘，请考虑经典形式的线方程：

这可以写成：

$$y = \tilde{a}x + \tilde{b}$$

这可以重写为：

$$0 = f(x, y) = \tilde{a}x - y + \tilde{b} = ax + by + c$$

with $a = \tilde{a}$, $b = -1$, $c = \tilde{b}$

这是一种更一般的形式。考虑这个方程的向量形式：

$\vec{p} = \begin{pmatrix} x \\ y \end{pmatrix}, \vec{n} = \begin{pmatrix} a \\ b \end{pmatrix} \Rightarrow f(x, y) = ax + by + c = \vec{p} \cdot \vec{n} + c$

If a point $\vec{p}_0$ is on the line:

$0 = f(x, y) = \vec{p}_0 \cdot \vec{n} + c \Rightarrow c = -\vec{p}_0 \cdot \vec{n}$

Rewriting the constant, the equation becomes:

$c = -\vec{p}_0 \cdot \vec{n} \Rightarrow f(x, y) = (\vec{p} - \vec{p}_0) \cdot \vec{n}$

The vector $\vec{n}$ is called the normal vector and is perpendicular to the line. The setup can be seen in Figure 56.7.

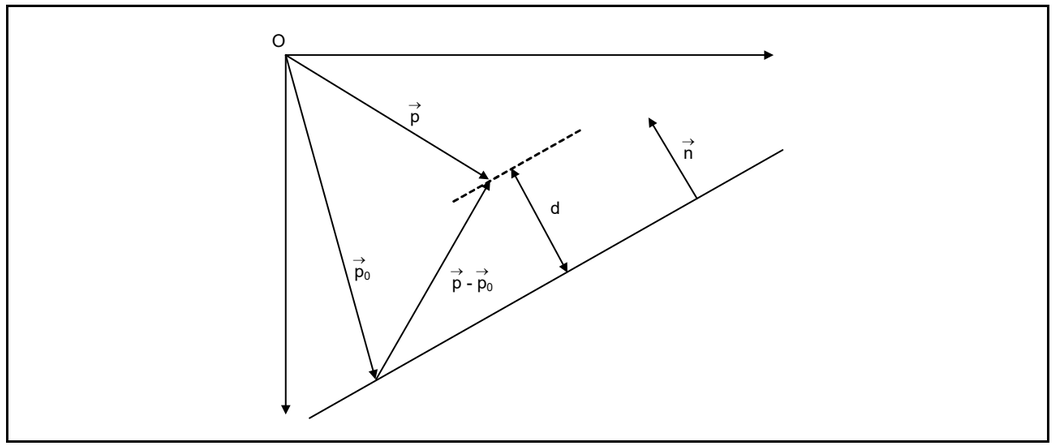

Figure 56.7 Distance of a point to a line

The projection of $\vec{p} - \vec{p}_0$ to $\vec{n}$ is the distance d of the point P to the line. In this case, f (x, y) describes the distance to the line of the pixel with coordinates (x, y).

To calculate the distance of every pixel of the bounding box incrementally, first the distance to the line at origin must be calculated:

$f(0, 0) = -\vec{p}_0 \cdot \vec{n} = c$

Next the increments for a step in the x direction and a step in the y direction must be calculated:

$f(\vec{p} + \vec{e}_x) = (\vec{p} + \vec{e}_x - \vec{p}_0) \cdot \vec{n} = f(\vec{p}) + \vec{e}_x \cdot \vec{n} = f(\vec{p}) + a$

$f(\vec{p} + \vec{e}_y) = (\vec{p} + \vec{e}_y - \vec{p}_0) \cdot \vec{n} = f(\vec{p}) + \vec{e}_y \cdot \vec{n} = f(\vec{p}) + b$

with $\vec{e}_x = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \vec{e}_y = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$

Consequently, the new distance can be calculated from the old distance with the increments a and b. A step in the x direction changes the distance by a, and a step in the y direction changes the distance by b. The distance of the origin to the line is c.

With this information, the entire bounding box can be scanned. If the bounding box top left corner is not at the origin, an offset must be added.

(2) Limiter operation

The 2D Drawing Engine contains six limiters. Each limiter contains three registers:

- LnSTART
- LnXADD
- LnYADD.

See Figure 56.8 for details. It is possible to drive the limiters in a threshold mode, in which all values above 0.5 are set to 1, and all values below or equal to 0.5 are set to 0. This feature is used when anti-aliasing is not wanted.

$\vec{p} = \begin{pmatrix} x \\ y \end{pmatrix}, \vec{n} = \begin{pmatrix} a \\ b \end{pmatrix} \Rightarrow f(x, y) = ax + by + c = \vec{p} \cdot \vec{n} + c$

如果一个点 $\vec{p}_0$ 上线：

$0 = f(x, y) = \vec{p}_0 \cdot \vec{n} + c \Rightarrow c = -\vec{p}_0 \cdot \vec{n}$

改写常数，方程变为：

$c = -\vec{p}_0 \cdot \vec{n} \Rightarrow f(x, y) = (\vec{p} - \vec{p}_0) \cdot \vec{n}$

向量 $\vec{n}$ 称为法向量，垂直于直线。设置如图56.7所示。

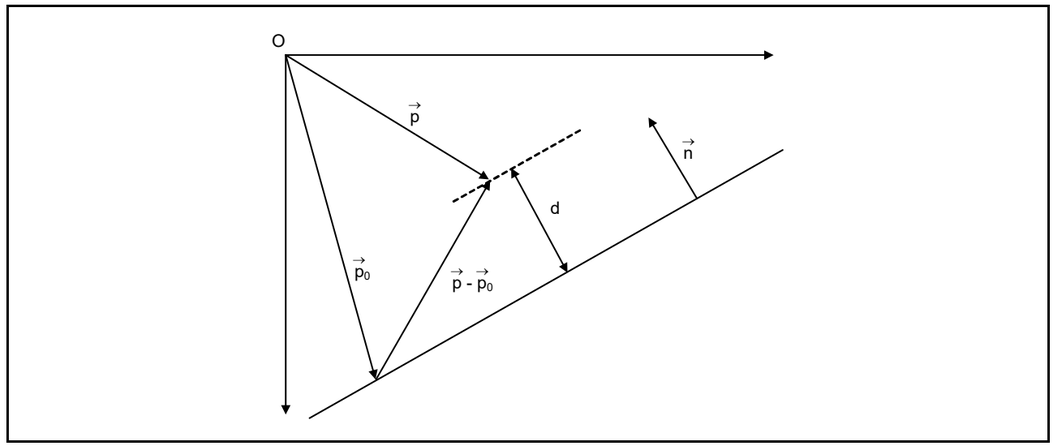

Figure 56.7 点到线的距离

to是点P到直线的距离d。在这种情况下，f(x y)用坐标(x y)描述像素到直线的距离。

要增量计算边界框每个像素的距离，首先必须计算到原点线的距离：

$f(0, 0) = -\vec{p}_0 \cdot \vec{n} = c$

接下来，必须计算x方向的步长和y方向的步长：

$f(\vec{p} + \vec{e}_x) = (\vec{p} + \vec{e}_x - \vec{p}_0) \cdot \vec{n} = f(\vec{p}) + \vec{e}_x \cdot \vec{n} = f(\vec{p}) + a$

$f(\vec{p} + \vec{e}_y) = (\vec{p} + \vec{e}_y - \vec{p}_0) \cdot \vec{n} = f(\vec{p}) + \vec{e}_y \cdot \vec{n} = f(\vec{p}) + b$

with $\vec{e}_x = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \vec{e}_y = \begin{pmatrix} 0 \\ 1 \end{pmatrix}$

因此，新的距离可以从旧距离以增量a和b计算。在x方向上的一步将距离更改a，在y方向上的一步将距离更改为b。原点到直线的距离为c。

有了这些信息，就可以扫描整个边界框。如果边界框左上角不在原点，则必须添加偏移量。

(2) 限制器操作

2D绘图引擎包含六个限制器。每个限制器包含三个寄存器：

- LnSTART
- LnXADD
- LnYADD.

详见图56.8。可以在阈值模式下驱动限制器，其中所有高于0.5的值都设置为1，所有低于或等于0.5的值都设置为0。当不需要抗锯齿时使用此功能。

Note: In Figure 56.8, the following abbreviations are used:
start = LnSTART
xadd = LnXADD
yadd = LnYADD

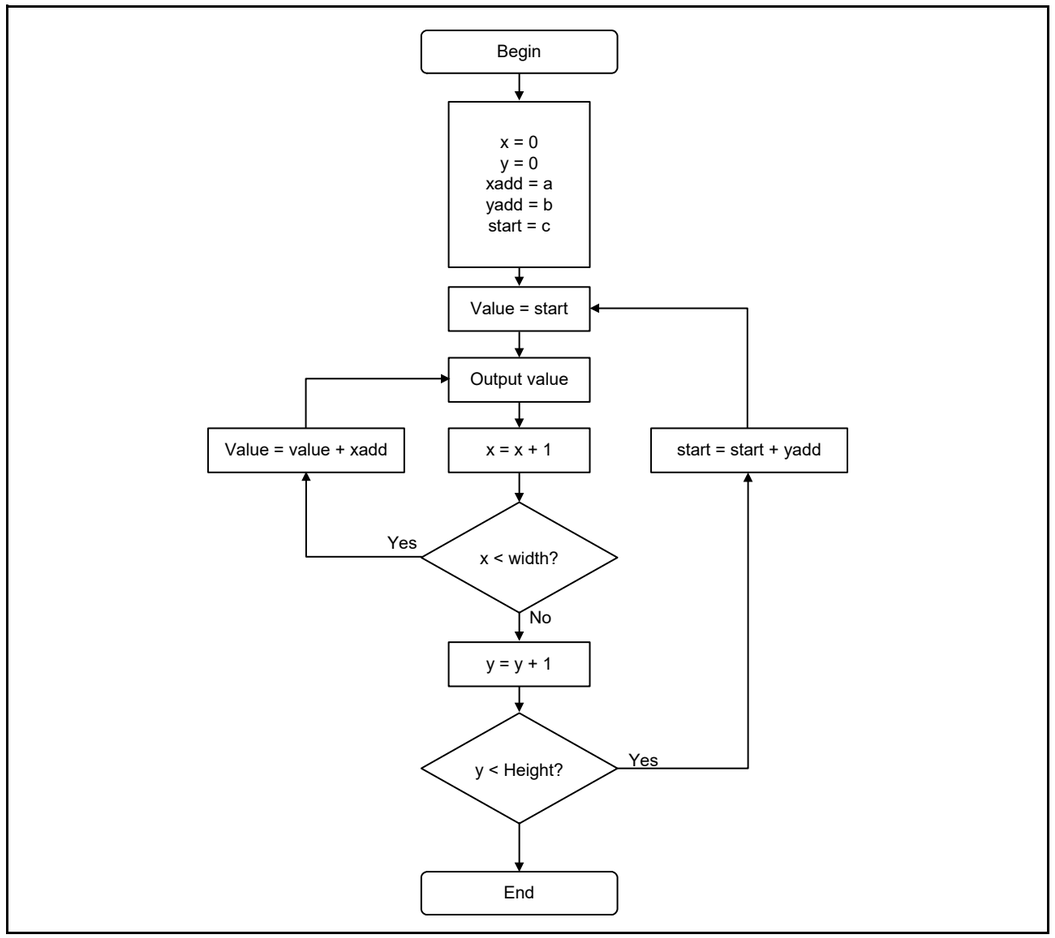

Figure 56.8 Operation flow of the linear limiter

(3) Example

If a straight line is given by the points P0 and P1, then the values are calculated as follows:

$$\Delta\vec{p} = \vec{p}_1 - \vec{p}_0 = \begin{pmatrix} x_1 - x_0 \\ y_1 - y_0 \end{pmatrix} = \begin{pmatrix} \Delta x \\ \Delta y \end{pmatrix}$$

The normal vector (perpendicular but not unit size) is then:

$$\vec{n} = \begin{pmatrix} -\Delta y \\ \Delta x \end{pmatrix}$$

The not normalized distance between edge and origin is then:

$$\vec{p}_0 \cdot \vec{n} = -x_0\Delta y + y_0\Delta x$$

The limiter parameters would be:

$$start = -x_0\Delta y + y_0\Delta x$$

Note: 在图56.8中，使用了以下缩写：start=LnSTARTxadd =LnXADDyadd=LnYADD

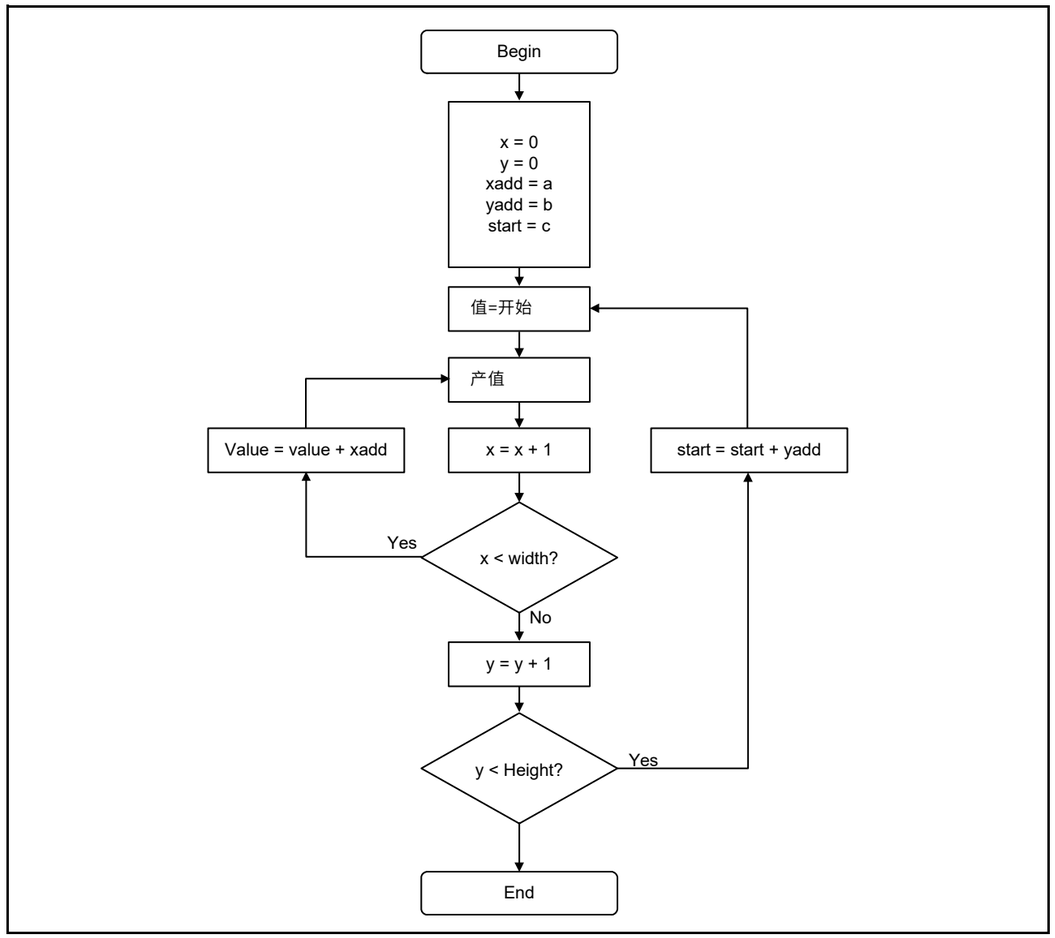

Figure 56.8 线性限幅器的操作流程

(3) Example

如果由点P0和P1给出一条直线，则值计算如下：

$$\Delta\vec{p} = \vec{p}_1 - \vec{p}_0 = \begin{pmatrix} x_1 - x_0 \\ y - y \end{pmatrix} = \begin{pmatrix} \Delta x \\ \Delta y \end{pmatrix}$$

法线向量（垂直但不是单位大小）为：

$$\vec{n} = \begin{pmatrix} -\Delta y \\ \Delta x \end{pmatrix}$$

那么边缘和原点之间的非标准化距离是：

$$\vec{p}_0 \cdot \vec{n} = -x_0\Delta y + y_0\Delta x$$

限制器参数为：

$$start = -x_0\Delta y + y_0\Delta x$$

$xadd = -\Delta y$

$yadd = \Delta x$

In the normalized case, the normal vector is:

$\vec{n} = \begin{pmatrix} -\Delta y \\ \Delta x \end{pmatrix} / (\sqrt{\Delta x^2 + \Delta y^2})$

The distance between edge and origin is:

$\vec{p}_0 \cdot \vec{n} = (-x_0 \cdot \Delta y + y_0 \cdot \Delta x) / (\sqrt{\Delta x^2 + \Delta y^2})$

The limiter parameters would be:

$start = (-x_0 \Delta y + y_0 \Delta x) / (\sqrt{\Delta x^2 + \Delta y^2})$

$xadd = -\Delta y / (\sqrt{\Delta x^2 + \Delta y^2})$

$yadd = \Delta x / (\sqrt{\Delta x^2 + \Delta y^2})$

Normalization is only required if anti-aliasing is used. The driver contains an optimized inverse square root function to speed up the normalization process.

56.6.2.2 Edge setup quadratic case

(1) Mathematical background

It is also possible to set up the limiters to incrementally calculate the following equation:

$f(x, y) = ax^2 + by^2 + cx + dy + f$

At the origin, the value is:

$f(0, 0) = f$

The step in the x direction is:

$f(x + 1, y)$

$= a(x + 1)^2 + by^2 + c(x + 1) + dy + f$

$= ax^2 + 2ax + a + by^2 + cx + c + dy + f$

$= f(x, y) + 2ax + c + a$

$dx(x) = f(x + 1, y) - f(x) = 2ax + c + a$

The step in the y direction is:

$f(x, y + 1)$

$= ax^2 + b(y + 1)^2 + cx + d(y + 1) + f$

$= ax^2 + by^2 + 2by + b + cx + d(y + 1) + f$

$= f(x, y) + 2bx + b$

$dy(y) = f(x + 1, y) - f(x) = 2by + d + b$

In the quadratic case, the increments dx and dy depend on x and y and are not constant. They can be calculated incrementally:

$d^2x = dx(x + 1) - dx(x) = 2a(x + 1) + c + 1 - (2ax + c + 1) = 2a$

$d^2y = dy(y + 1) - dy(y) = 2b(y + 1) + d + 1 - (2by + d + 1) = 2b$

At the origin, the increments are:

$dx(0) = c + 1$ and $dy(0) = d + 1$

By incrementing the value by dx and dy for every step in the x and y direction and incrementing dx, dy by d^2x, and d^2y for every step in the x and y direction, the quadratic equation can be easily calculated for the whole bounding box.

$xadd = -\Delta y$

$yadd = \Delta x$

在归一化的情况下，法向量是：

$\vec{n} = \begin{pmatrix} -\Delta y \\ \Delta x \end{pmatrix} / (\sqrt{\Delta x^2 + \Delta y^2})$

边缘到原点的距离为：

$\vec{p}_0 \cdot \vec{n} = (-x_0 \cdot \Delta y + y_0 \cdot \Delta x) / (\sqrt{\Delta x^2 + \Delta y^2})$

限制器参数为：

$start = (-x_0 \Delta y + y_0 \Delta x) / (\sqrt{\Delta x^2 + \Delta y^2})$

$xadd = -\Delta y / (\sqrt{\Delta x^2 + \Delta y^2})$

$yadd = \Delta x / (\sqrt{\Delta x^2 + \Delta y^2})$

仅当使用抗锯齿时才需要规范化。该驱动程序包含一个优化的平方根反函数，以加快标准化过程。

56.6.2.2 边缘设置二次案例

(1) 数学背景

也可以设置限制器以增量计算以下等式：

$f(x, y) = ax^2 + by^2 + cx + dy + f$

在原点，值为：

$f(0, 0) = f$

x方向的步长为：

$f(x + 1, y)$

$= a(x + 1)^2 + by^2 + c(x + 1) + dy + f$

$= ax^2 + 2ax + a + by^2 + cx + c + dy + f$

$= f(x, y) + 2ax + c + a$

$dx(x) = f(x + 1, y) - f(x) = 2ax + c + a$

y方向的步长为：

$f(x, y + 1)$

$= ax^2 + b(y + 1)^2 + cx + d(y + 1) + f$

$= ax^2 + by^2 + 2by + b + cx + d(y + 1) + f$

$= f(x, y) + 2bx + b$

$dy(y) = f(x + 1, y) - f(x) = 2by + d + b$

在二次情况下，增量dx和dy取决于x和y并且不是常数。它们可以增量计算：

$d^2x = dx(x + 1) - dx(x) = 2a(x + 1) + c + 1 - (2ax + c + 1) = 2a$

$d^2y = dy(y + 1) - dy(y) = 2b(y + 1) + d + 1 - (2by + d + 1) = 2b$

在原点，增量为：

$dx(0) = c + 1$ and $dy(0) = d + 1$

通过在x和y方向上每一步增加dx和dy的值，并在x和y方向上每一步增加dx、dy和d2x和d2y，可以很容易地计算出二次方程整个边界框。

(2) Limiter operation

In the quadratic case, two linear limiters are combined to operate as one quadratic limiter, called limiter 1 and limiter 2. The registers are:

- L1START, L1XADD, L1YADD
- L2START, L2XADD, L2YADD.

See Figure 56.9 for details. The gray box is an addition that performs a different operation, as in the linear setup. It is possible to drive the limiters in a threshold mode, in which all values above 0.5 are set to 1, and all values below or equal to 0.5 are set to 0. This feature is used when anti-aliasing is not wanted.

Note: In Figure 56.9, the following abbreviations are used:

- start1 = L1START, start2 = L2START
- xadd1 = L1XADD, xadd2 = L2XADD
- yadd1 = L1YADD, yadd2 = L2YADD.

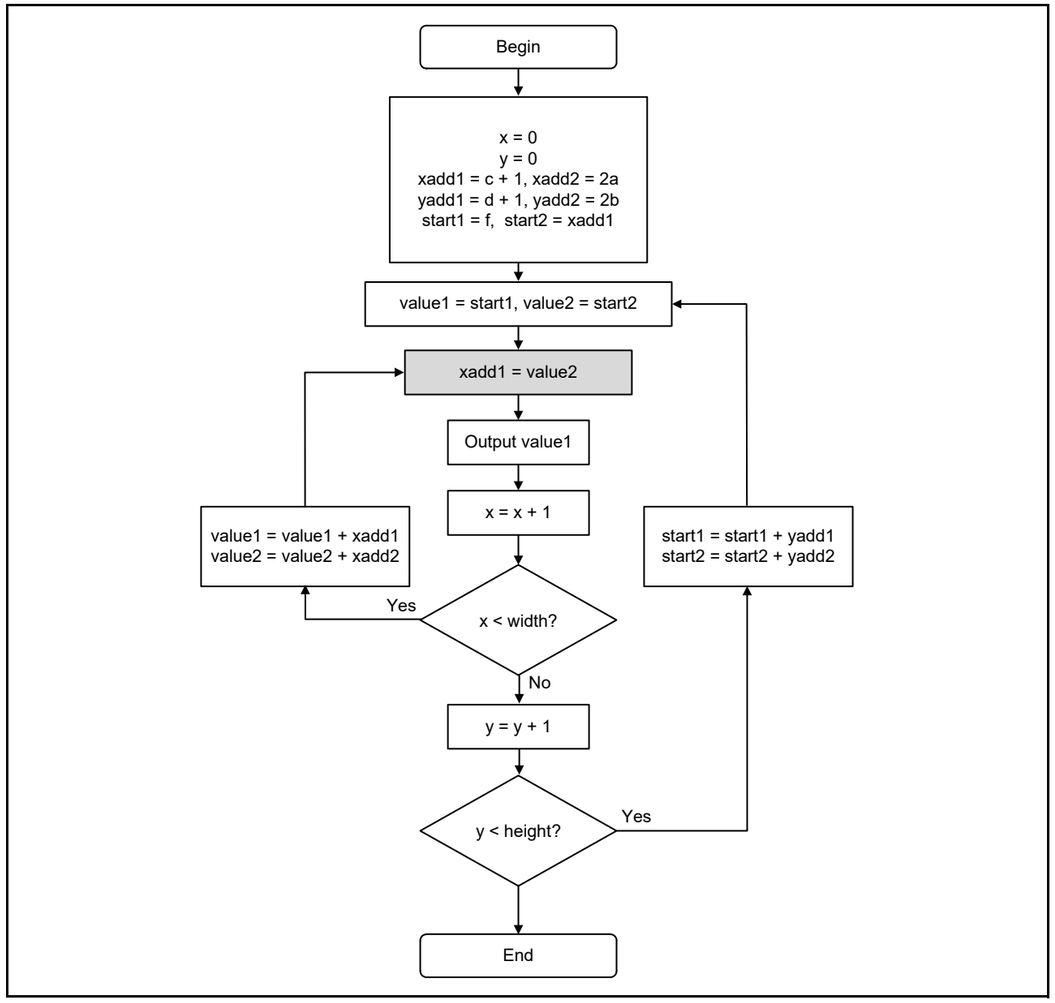

Figure 56.9 Operation flow of the quadratic limiter

(2) 限制器操作

在二次情况下，两个线性限制器组合起来作为一个二次限制器运行，称为限制器1和限制器2。
寄存器是：

- L1START, L1XADD, L1YADD
- L2START, L2XADD, L2YADD.

有关详细信息，请参见图56.9。灰色框是执行不同操作的附加项，如在线性设置中。可以在阈值模式下驱动限制器，其中所有高于0.5的值都设置为1，所有低于或等于0.5的值都设置为0。当不需要抗锯齿时使用此功能。

Note: 在图56.9中，使用了以下缩写：

- start1 = L1START, start2 = L2START
- xadd1 = L1XADD, xadd2 = L2XADD
- yadd1 = L1YADD, yadd2 = L2YADD.

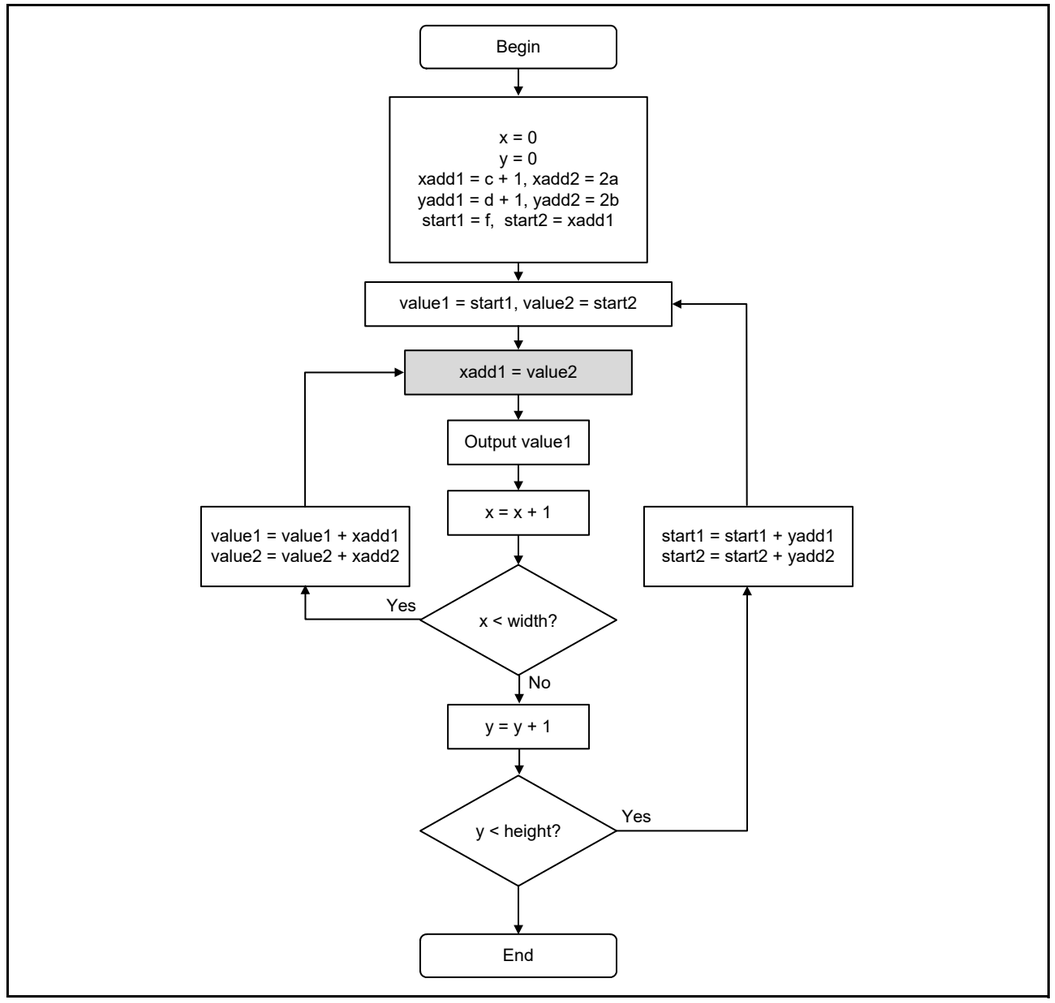

Figure 56.9 二次限幅器的操作流程

(3) Example

Consider the equation for a circle with the center at $\vec{c} = \begin{pmatrix} s \\ t \end{pmatrix}$ and radius r:

$$0 = f(x, y) = (x - s)^2 + (y - t)^2 - r^2$$

This equation can be rewritten as:

$$f(x, y) = x^2 - 2xs + s^2 + y^2 - 2yt + t^2 - r^2$$

This can be sorted to fit to the original equation:

$$f(x, y) = x^2 + y^2 - 2sx - 2ty + (s^2 + t^2 - r^2)$$

With the following assignments, the circle equation can be calculated incrementally:

$$a = 1$$

$$b = 1$$

$$c = -2s$$

$$d = -2t$$

$$f = s^2 + t^2 - r^2$$

For the limiters with the results calculated in (1) Mathematical background, this would result in:

$$start1 = f = s^2 + t^2 - r^2$$

$$xadd1 = c + 1 = -2s + 1$$

$$yadd1 = d + 1 = -2t + 1$$

$$start2 = xadd1$$

$$xadd2 = 2a = 2$$

$$yadd2 = 2b = 2$$

56.6.2.3 Band filter

The output of limiter 1 and 2 can be modified to use a band filter. The band filter has a single filter parameter w.

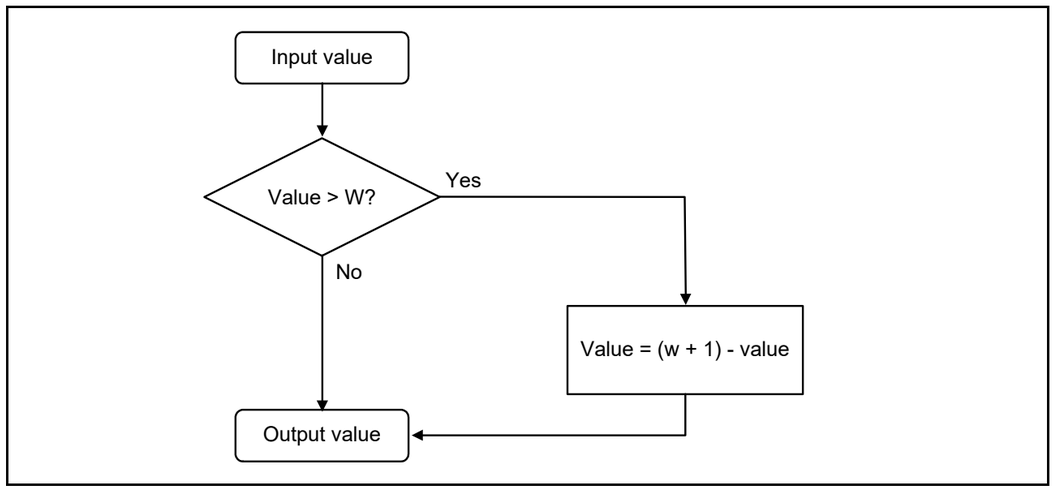

Figure 56.10 Band filter

(3) Example

考虑圆心为的圆的方程 $\vec{c} = \begin{pmatrix} s \\ t \end{pmatrix}$ 和半径r：

$$0 = f(x, y) = (x - s)^2 + (y - t)^2 - r^2$$

这个方程可以改写为：

$$f(x, y) = x^2 - 2xs + s^2 + y^2 - 2yt + t^2 - r^2$$

这可以排序以适合原始方程：

$$f(x, y) = x^2 + y^2 - 2sx - 2ty + (s^2 + t^2 - r^2)$$

通过以下分配，可以增量计算圆方程：

$$a = 1$$

$$b = 1$$

$$c = -2s$$

$$d = -2t$$

$$f = s^2 + t^2 - r^2$$

对于在(1)数学背景中计算结果的限制器，这将导致：

$$start1 = f = s^2 + t^2 - r^2$$

$$xadd1 = c + 1 = -2s + 1$$

$$yadd1 = d + 1 = -2t + 1$$

$$start2 = xadd1$$

$$xadd2 = 2a = 2$$

$$yadd2 = 2b = 2$$

56.6.2.3 带式滤波器

限幅器1和2的输出可以修改为使用带状滤波器。带状滤波器只有一个滤波器参数w。

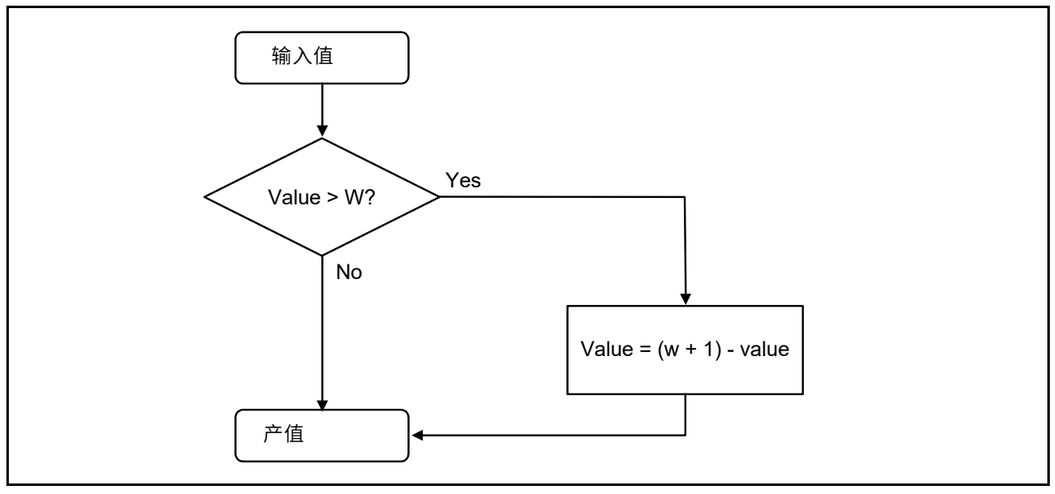

Figure 56.10 带式滤波器

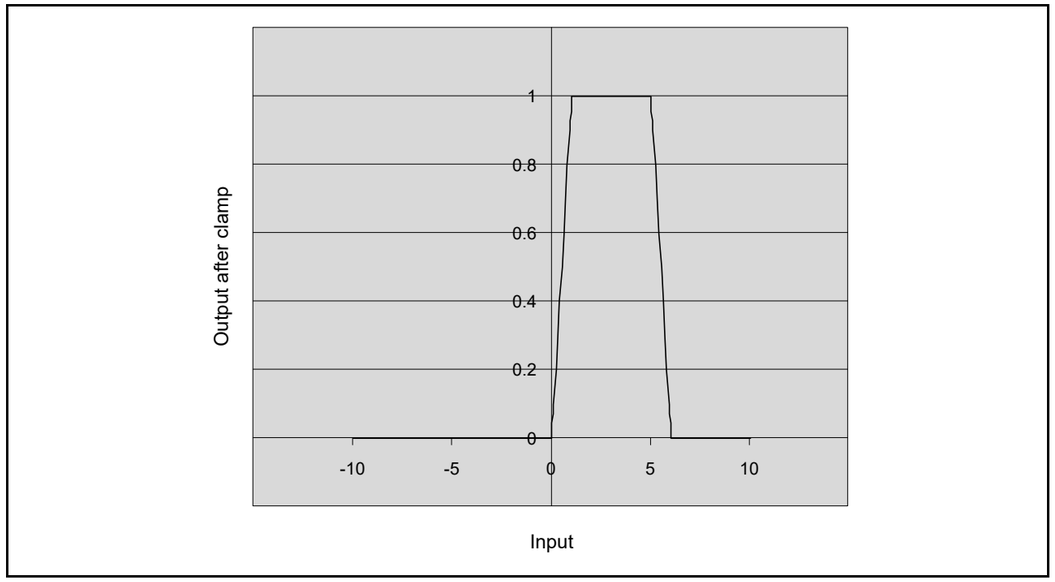

Figure 56.11 Band filter output after clamp with w = 7

56.6.2.4 Clamping unit

The clamping unit cuts the limiter output to the interval [0:1].

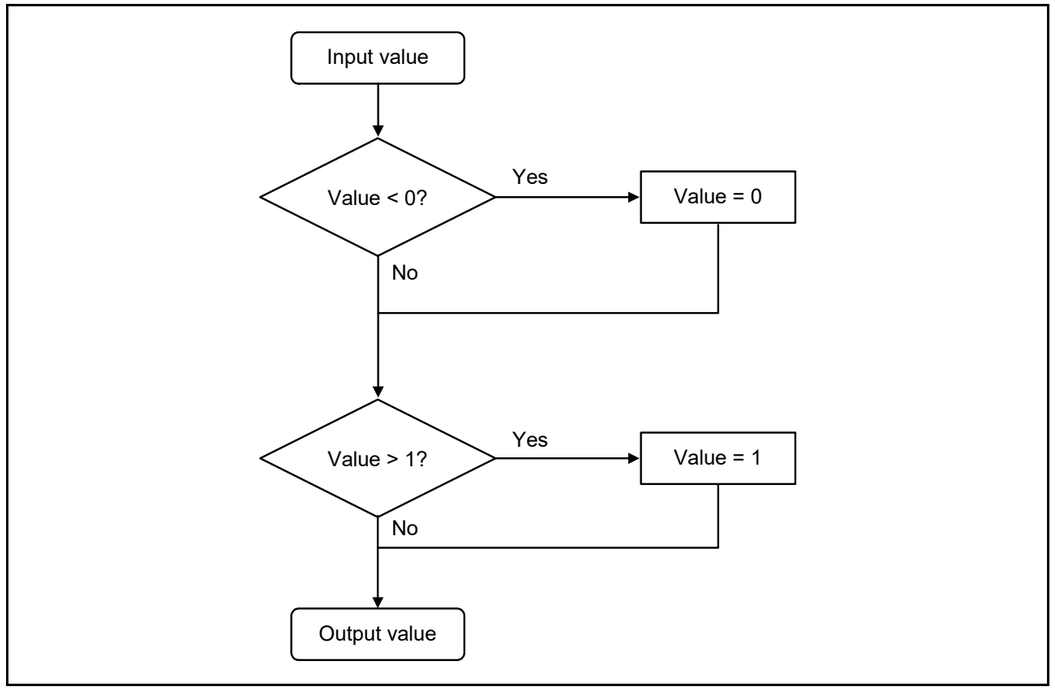

Figure 56.12 Clamping unit

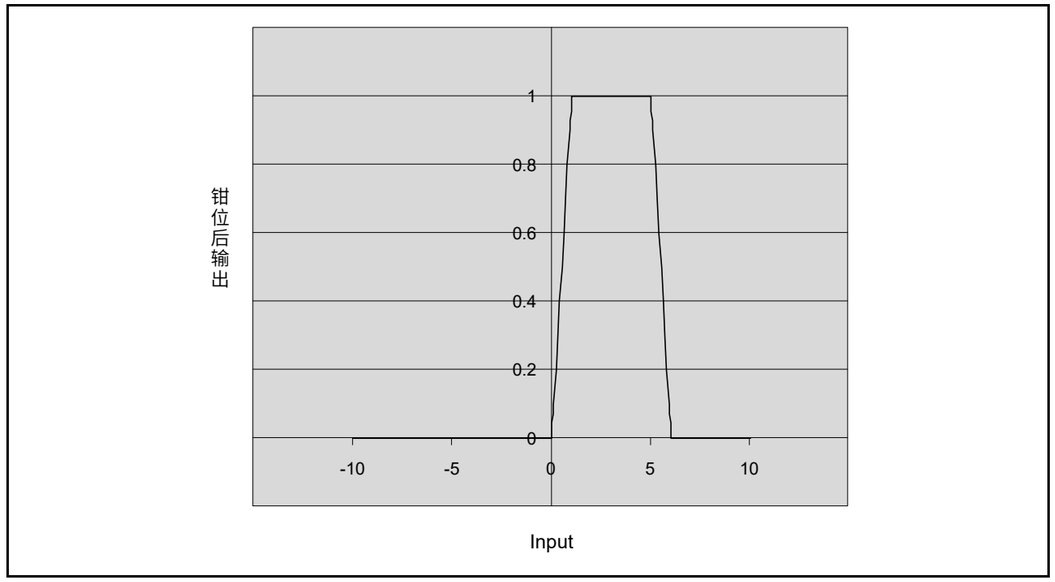

Figure 56.11 w=7钳位后的带状滤波器输出

56.6.2.4 夹紧单元

钳位单元将限制器输出切割到区间[0:1]。

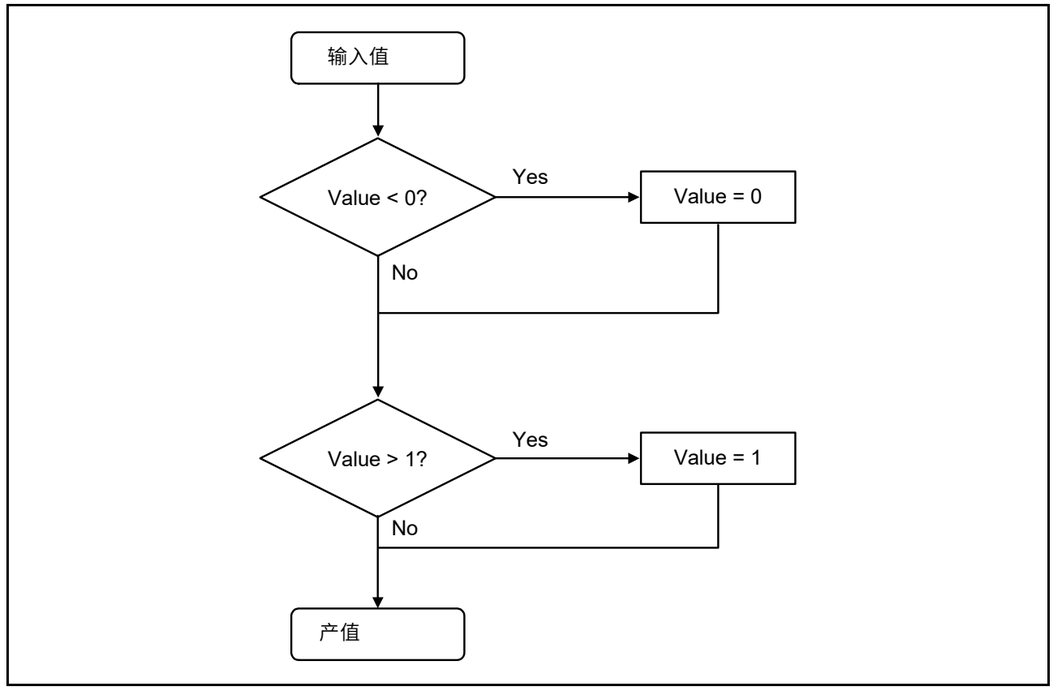

Figure 56.12 夹紧单元

The clamping unit can be put into threshold mode, in which all values greater than 0.5 are set to 1, and all values below or equal to 0.5 are set to 0. This feature is used when anti-aliasing is not wanted, such as for shared edges.

56.6.2.5 Combiner unit

The combiner unit can be operated in minimum mode and in maximum mode. In minimum mode the smaller value is output, and in maximum mode the larger value is output. The minimum mode represents the intersection, and the maximum mode represents the union of the two regions.

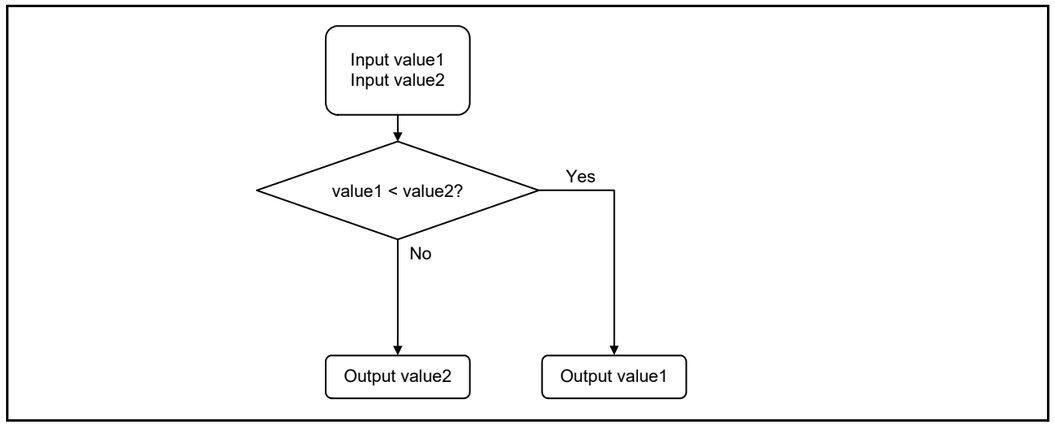

Figure 56.13 Combiner operated in minimum mode with intersection

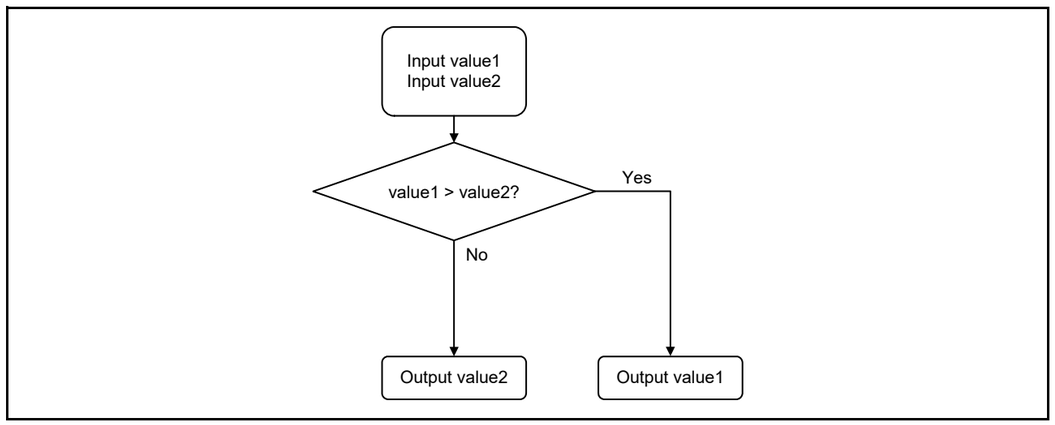

Figure 56.14 Combiner operated in maximum mode with union

56.6.2.6 Rasterization optimization

During rasterization, it is necessary to step through the whole bounding box one pixel at a time. This requirement can lead to an unnecessary number of steps for pixels that are not drawn. The 2D Drawing Engine provides optimization methods designed to reduce the number of steps required during rasterization. One optimization relies on the fact that any convex primitive can have only one span per line (a span is a contiguous horizontal line). This form of optimization detects a span start and saves the information for the next line. Another optimization is to detect a span end and stop rasterization for the current line.

(1) Spanstore

Consider the case in Figure 56.15.

钳位单元可以设置为阈值模式，所有大于0.5的值都设置为1，所有小于或等于0.5的值都设置为0。此功能用于不需要抗锯齿的情况，例如共享边。

56.6.2.5 Combiner unit

组合器单元可以在最小模式和最大模式下运行。在最小模式下输出较小的值，在最大模式下输出较大的值。最小众数代表相交，最大众数代表两个区域的并集。

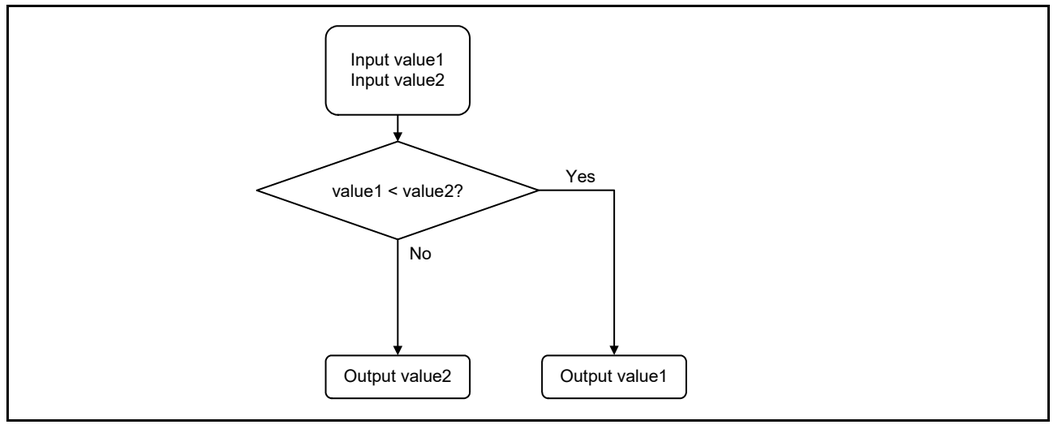

Figure 56.13 合路器以最小模式运行，有交叉口

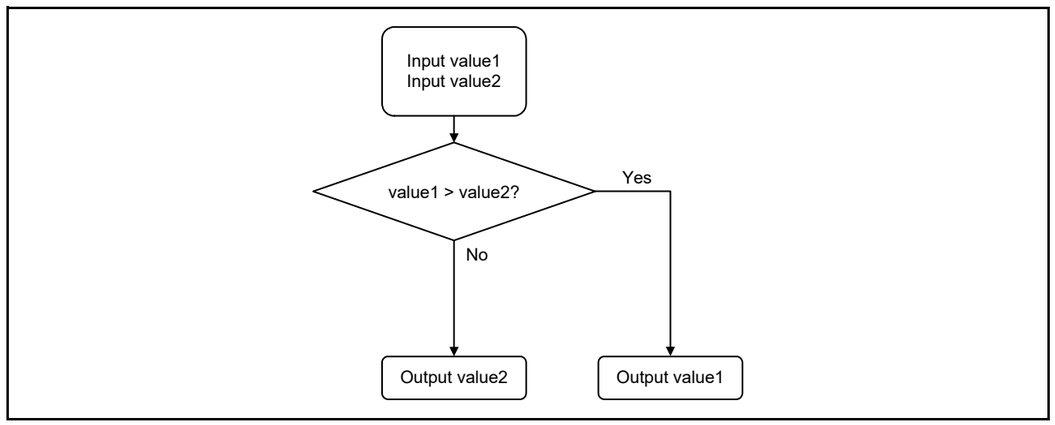

Figure 56.14 组合器在最大模式下运行，带联合

56.6.2.6 Rasterization optimization

在光栅化过程中，需要一次一个像素地遍历整个边界框。对于未绘制的像素，此要求可能会导致不必要的步数。2D绘图引擎提供了旨在减少光栅化过程中所需步骤数量的优化方法。一种优化依赖于这样一个事实，即任何凸图元每条线只能有一个跨度（跨度是一条连续的水平线）。这种优化形式检测跨度开始并保存下一行的信息。另一个优化是检测跨度结束并停止当前行的光栅化。

(1) Spanstore

考虑图56.15中的情况。

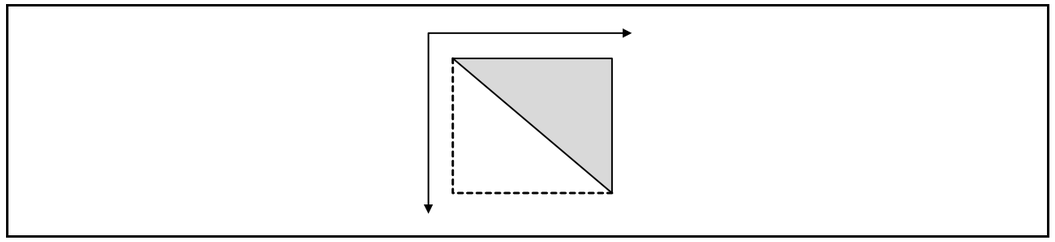

Figure 56.15 Triangle where the first edge is monotone growing

If the gray triangle must be rendered, half of the pixels processed by the rendering engine in the dotted bounding box would not be drawn. This situation can be optimized with the spanstore operation. When spanstore is activated and a span start is detected, the x position of the span start is detected.

In the next line the rendering starts with the stored x position. This only works if the edge is monotonically increasing ($y_1 > y_2 \Rightarrow x_1 \geq x_2$).

Consider the case in Figure 56.16.

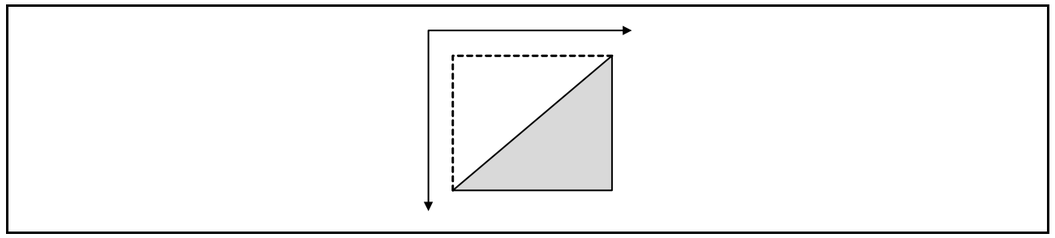

Figure 56.16 Triangle where the first edge is monotone falling

In this case, the normal spanstore operation cannot be performed. For this, the y direction of the rendering is reversed, and spanstore can operate again.

Consider the last case in Figure 56.17.

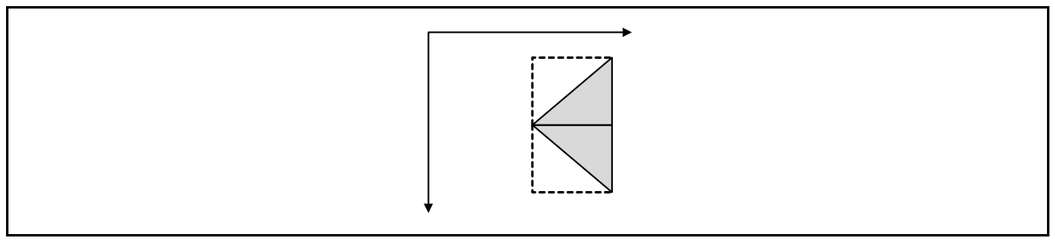

Figure 56.17 Triangle where the first edge is first monotone falling and then monotone growing

In this case, the triangle must be split and rendered as two parts for the spanstore optimization to work.

It is also possible to delay spanstore activation for a number of lines. This approach is used for rasterizing circles, as shown in Figure 56.18.

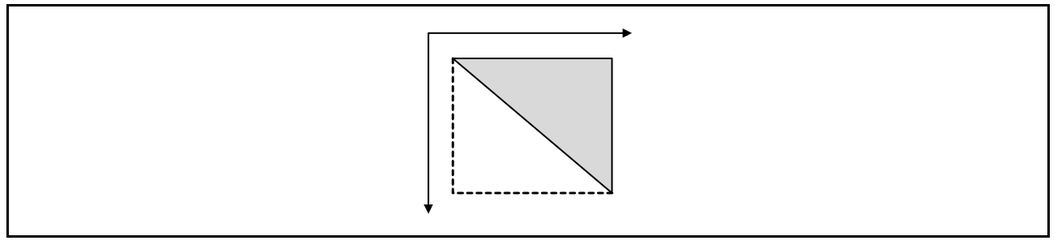

Figure 56.15 第一条边单调增长的三角形

如果必须渲染灰色三角形，虚线框内的渲染引擎处理过的像素有一半不会被绘制出来。这种情况可以通过spanstore操作进行优化。当spanstore被激活并检测到spanstart时，将检测到spanstart的x位置。

在下一行中，渲染从存储的x位置开始。这仅适用于边缘单调递增(y1>y2=>x1　x2)。

考虑图56.16中的情况。

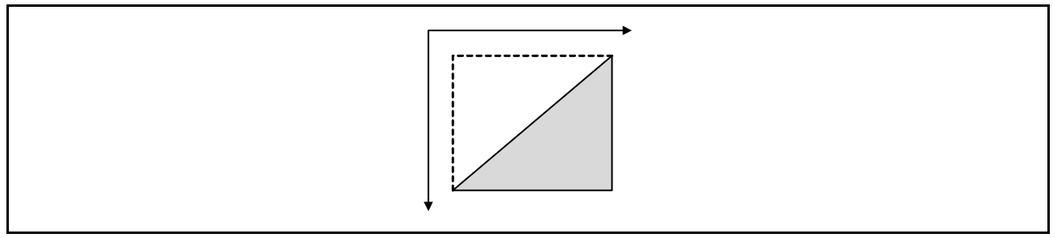

Figure 56.16 第一个边单调下降的三角形

在这种情况下，无法执行正常的spanstore操作。为此，将渲染的y方向反转，spanstore可以再次操作。

考虑图56.17中的最后一种情况。

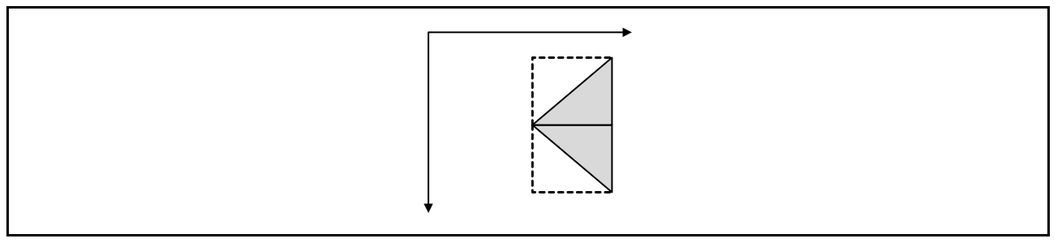

Figure 56.17 第一个边先单调下降然后单调增长的三角形

在这种情况下，必须将三角形分割并渲染为两部分，才能使spanstore优化起作用。

也可以延迟多行的spanstore激活。这种方法用于光栅化圆，如图56.18所示。

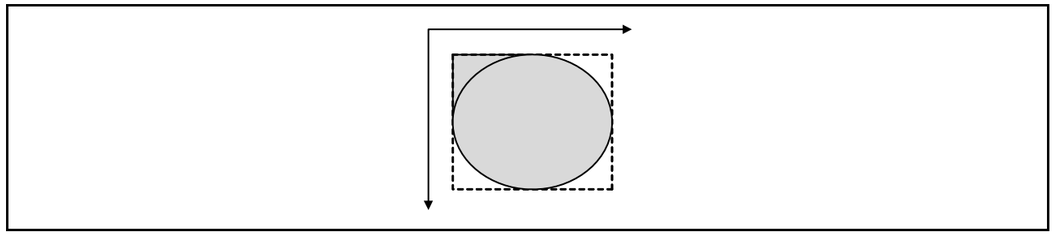

Figure 56.18 Full circle where the first edge is monotone falling for the first half and monotone growing for the second half

In this case, spanstore cannot be activated in the top left corner but can be activated in the bottom left corner. The empty corners in the top right and the bottom right cannot be rasterized because of the spanabort optimization.

(2) Spanabort

The second optimization assumes that the object that must be drawn is convex, which means there is only one span per scan line to be drawn. A non-convex object includes an object such as a triangle that is not filled and only consists of a thick border.

For a convex object, the rasterization can be stopped when the end of the first span is detected. No other constraints apply to this optimization for convex objects.

(3) Optimization efficiency

The efficiency of the optimizations can be seen for a typical case in Figure 56.19. In this case, the triangle is always rendered as single piece and is not separated into multiple triangles for higher optimizations. For this, the spanstore delay is used.

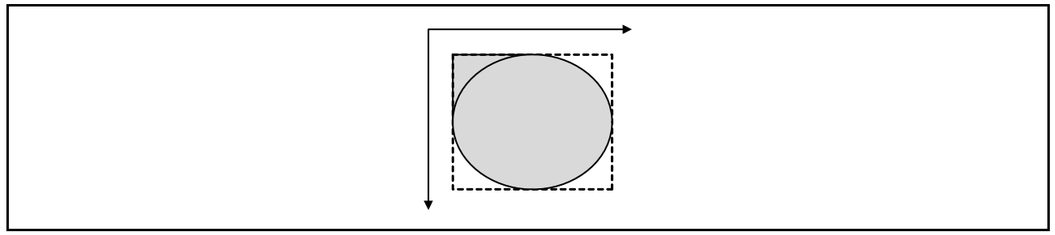

Figure 56.18 第一个边缘是前半部分单调下降和后半部分单调增长的完整圆

在这种情况下，spanstore不能在左上角激活，但可以在左下角激活。由于spanabort优化，右上角和右下角的空角无法栅格化。

(2) Spanabort

第二个优化假设必须绘制的对象是凸的，这意味着每条扫描线只有一个跨度要绘制。非凸对象包括诸如未填充且仅由粗边框组成的三角形的对象。

对于凸对象，当检测到第一个跨度结束时，可以停止光栅化。没有其他约束适用于凸对象的这种优化。

(3) 优化效率

对于图56.19中的典型案例，可以看到优化的效率。在这种情况下，三角形始终呈现为单件，并且不会分成多个三角形以进行更高的优化。为此，使用了spanstore延迟。

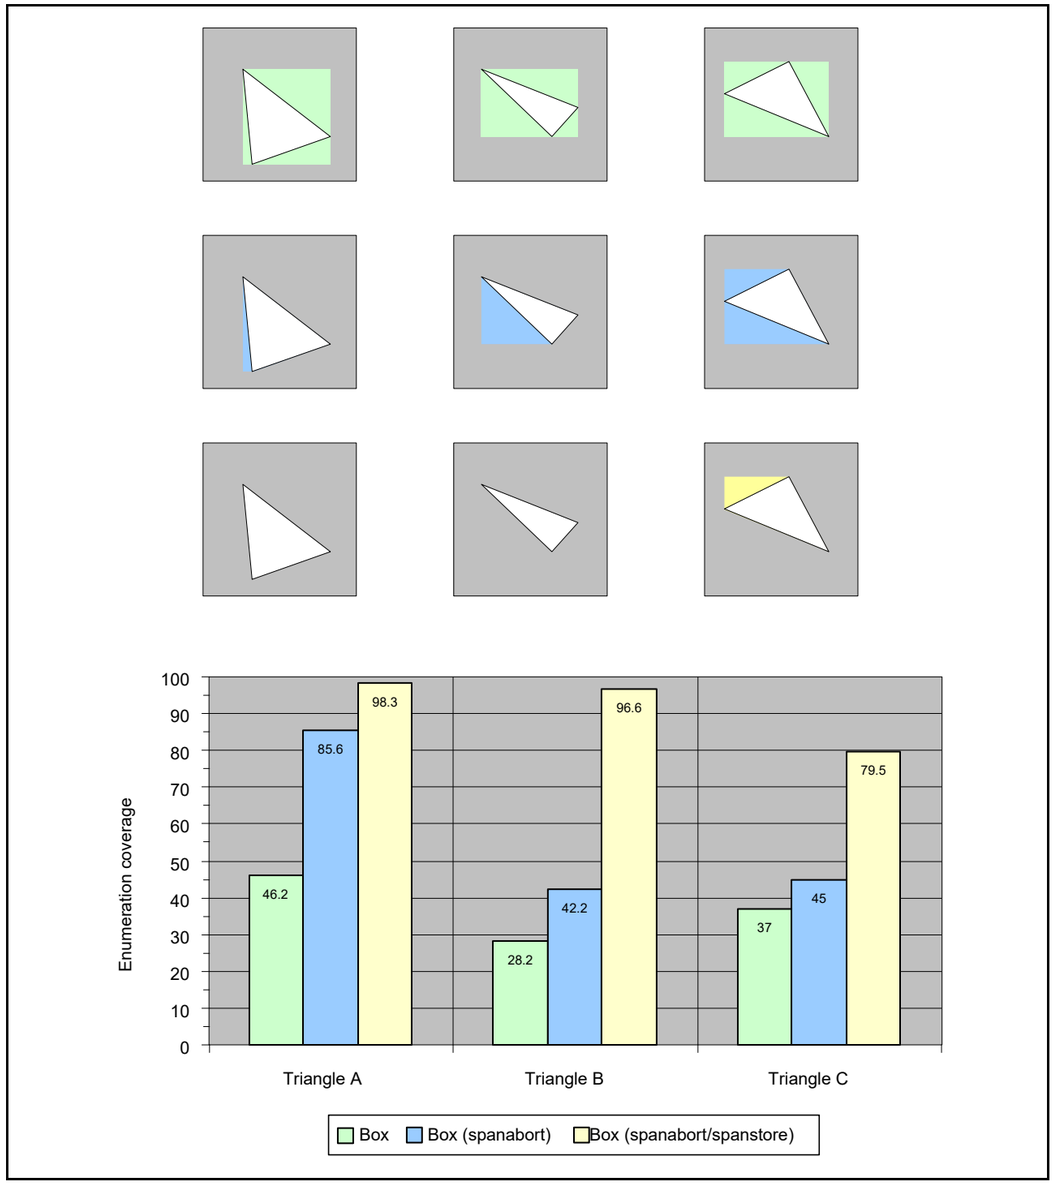

Figure 56.19 Efficiency of spanstore and spanabort optimizations with enumeration coverage equal to {pixels of primitive/pixels of bounding box}

56.6.3 Texturing

The texture unit can cover any primitive with a picture. The picture can be stretched, sheared, rotated, and translated in one step. To avoid aliasing, the result can be filtered bilinear in the u and v directions.

56.6.3.1 Mathematical background

The arbitrary mapping problem is completely determined by a mapping from 3 points in the object space (x, y) to 3 points in the texture space (u, v).

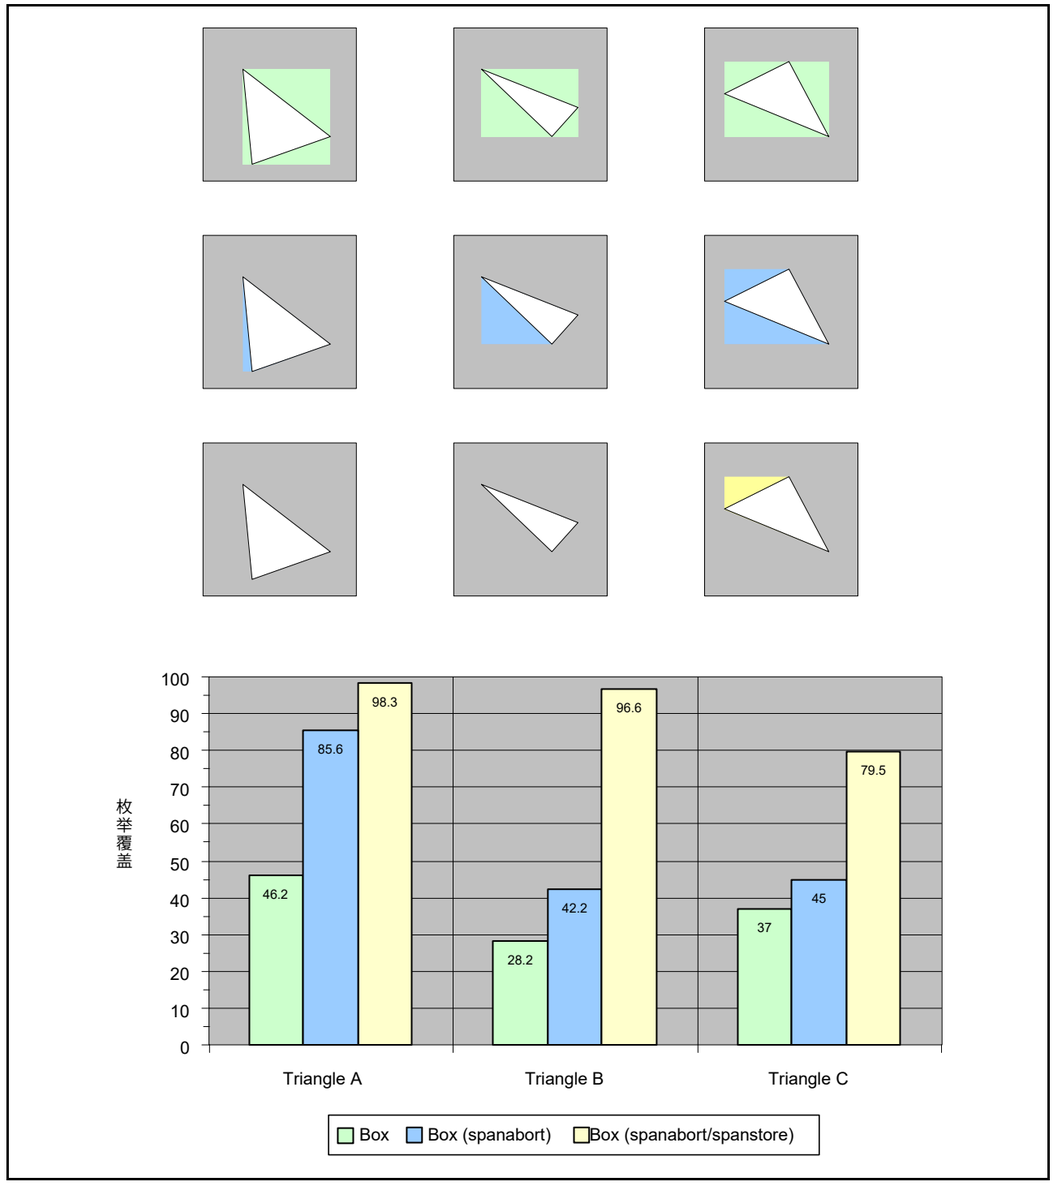

Figure 56.19 枚举覆盖率等于{boundingbox的原始像素的像素 的spanstore和spanabort优化的效率

56.6.3 Texturing

纹理单元可以覆盖任何带有图片的图元。图片可以在一个步骤中进行拉伸、剪切、旋转和平移。为了避免混叠，可以在u和v方向对结果进行双线性过滤。

56.6.3.1 数学背景

任意映射问题完全由对象空间中的3个点(x y)到纹理空间中的3个点(u v)的映射决定。

Consider the following mapping:

$$\vec{p}_0 = \begin{pmatrix} x_0 \\ y_0 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_0) = \begin{pmatrix} u_0 \\ v_0 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\vec{p}_1 = \begin{pmatrix} x_1 \\ y_1 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_1) = \begin{pmatrix} u_1 \\ v_1 \end{pmatrix} = \begin{pmatrix} w \\ 0 \end{pmatrix}$$

$$\vec{p}_2 = \begin{pmatrix} x_2 \\ y_2 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_2) = \begin{pmatrix} u_2 \\ v_2 \end{pmatrix} = \begin{pmatrix} 0 \\ h \end{pmatrix}$$

where w is the width of the texture and h is the height of the texture.

Examine Figure 56.20 in the object space. To simplify calculations the difference vectors are taken as calculations:

$$\vec{d}_1 = \vec{p}_1 - \vec{p}_0$$

$$\vec{d}_2 = \vec{p}_2 - \vec{p}_0$$

This is equivalent to transforming from coordinate system O to coordinate system O’.

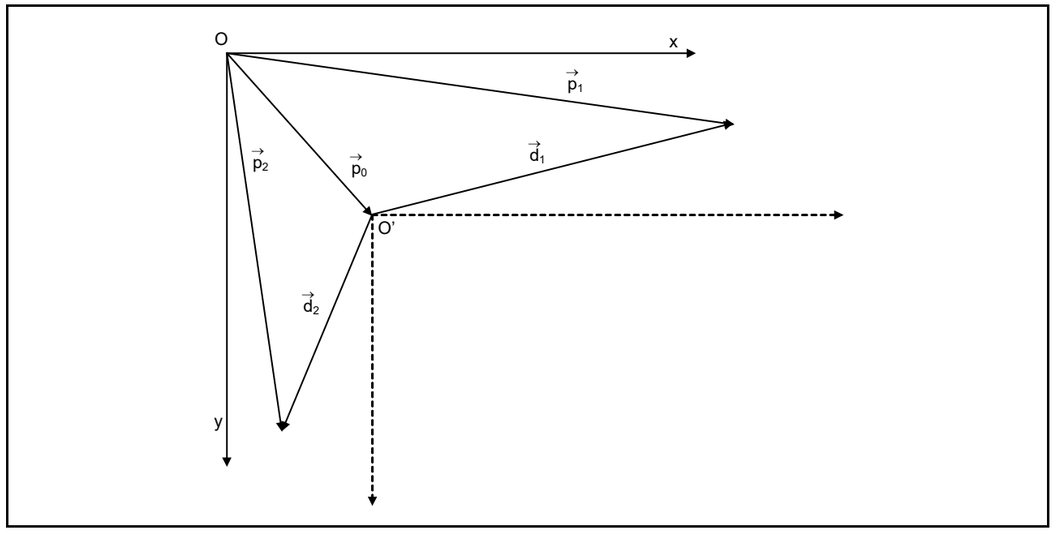

Figure 56.20 Texture mapping, object space, and transformation from coordinate system O to O’ to simplify calculations

考虑以下映射：

$$\vec{p}_0 = \begin{pmatrix} x_0 \\ y_0 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_0) = \begin{pmatrix} u_0 \\ v_0 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\vec{p}_1 = \begin{pmatrix} x_1 \\ y_1 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_1) = \begin{pmatrix} u_1 \\ v_1 \end{pmatrix} = \begin{pmatrix} w \\ 0 \end{pmatrix}$$

$$\vec{p}_2 = \begin{pmatrix} x_2 \\ y_2 \end{pmatrix} \Rightarrow (\tilde{\vec{p}}_2) = \begin{pmatrix} u_2 \\ v_2 \end{pmatrix} = \begin{pmatrix} 0 \\ h \end{pmatrix}$$

其中w是纹理的宽度，h是纹理的高度。

检查对象空间中的图56.20。为了简化计算，将差分向量作为计算：

$$\vec{d}_1 = \vec{p}_1 - \vec{p}_0$$

$$\vec{d}_2 = \vec{p}_2 - \vec{p}_0$$

这相当于从坐标系O变换到坐标系O'。

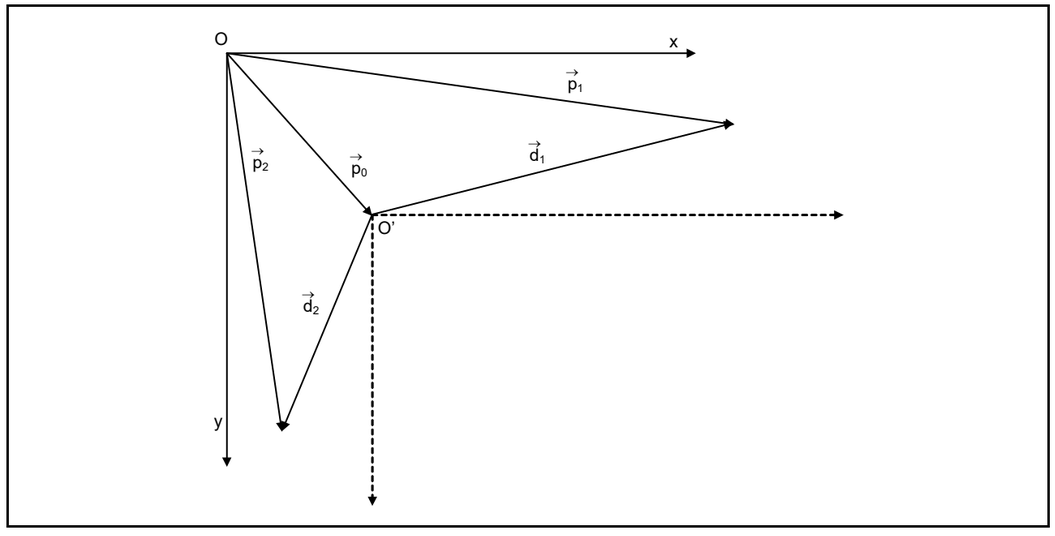

Figure 56.20 纹理映射、对象空间和从坐标系O到O'的转换以简化计算

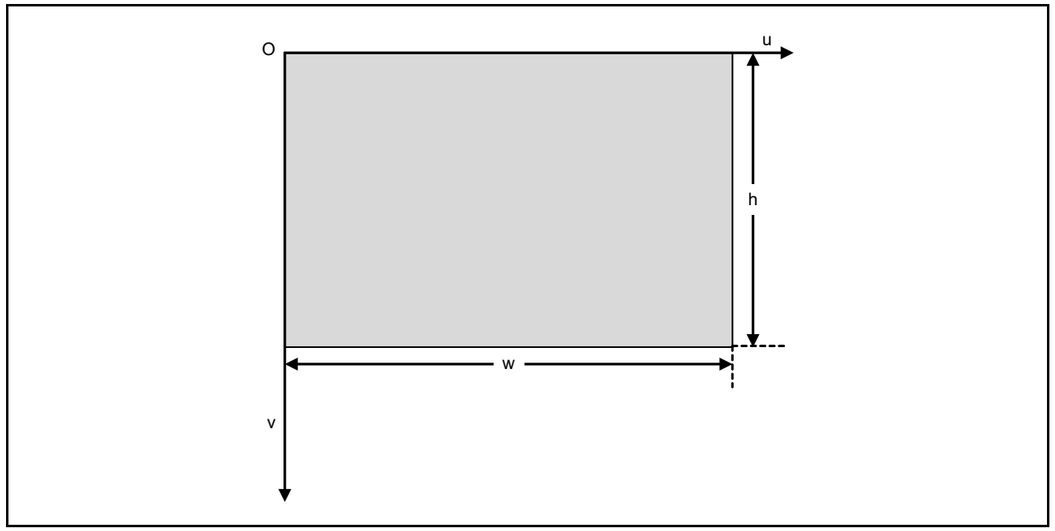

Figure 56.21 Texture mapping, texture space, and texture with width w and height h

In O', the mapping is:

$$\vec{p'}_0 = \begin{pmatrix}0\\0\end{pmatrix} \Rightarrow (\tilde{\vec{p}}_0) = \begin{pmatrix}u_0\\v_0\end{pmatrix} = \begin{pmatrix}0\\0\end{pmatrix}$$

$$\vec{d}_1 = \begin{pmatrix}dx_1\\dy_1\end{pmatrix} \Rightarrow (\tilde{\vec{p}}_1) = \begin{pmatrix}u_1\\v_1\end{pmatrix} = \begin{pmatrix}w\\0\end{pmatrix}$$

$$\vec{d}_2 = \begin{pmatrix}dx_2\\dy_2\end{pmatrix} \Rightarrow (\tilde{\vec{p}}_2) = \begin{pmatrix}u_2\\v_2\end{pmatrix} = \begin{pmatrix}w\\h\end{pmatrix}$$

This is a linear mapping that can be described by a 2 x 2 matrix.

$$(\tilde{\vec{p}}) = M \cdot \vec{p'} = \begin{bmatrix}m_{11} & m_{12}\\m_{21} & m_{22}\end{bmatrix} \cdot \vec{p'}$$

$$\Rightarrow \begin{pmatrix}w\\0\end{pmatrix} = M \cdot \vec{d}_1 \wedge \begin{pmatrix}0\\h\end{pmatrix} = M \cdot \vec{d}_2$$

If the equations are expanded and sorted, the result is two equation systems each with two unknowns. These can be described more easily with a new matrix.

Let $A = \begin{bmatrix}dx_1 & dy_1\\dx_2 & dy_2\end{bmatrix}$ then the equation system can be rewritten as:

$$\begin{pmatrix}w\\0\end{pmatrix} = A \cdot \begin{pmatrix}m_{11}\\m_{12}\end{pmatrix} \wedge \begin{pmatrix}0\\h\end{pmatrix} = A \cdot \begin{pmatrix}m_{21}\\m_{22}\end{pmatrix}$$

This can be easily solved with determinants.

Let $c = \frac{1}{detA} = \frac{1}{dx_1 \cdot dy_2 - dx_2 \cdot dy_1}$

The resulting constants are:

$$m_{11} = c \cdot w \cdot dy_2 = \frac{du}{dx}$$

$$m_{12} = -c \cdot w \cdot dx_2 = \frac{du}{dy}$$

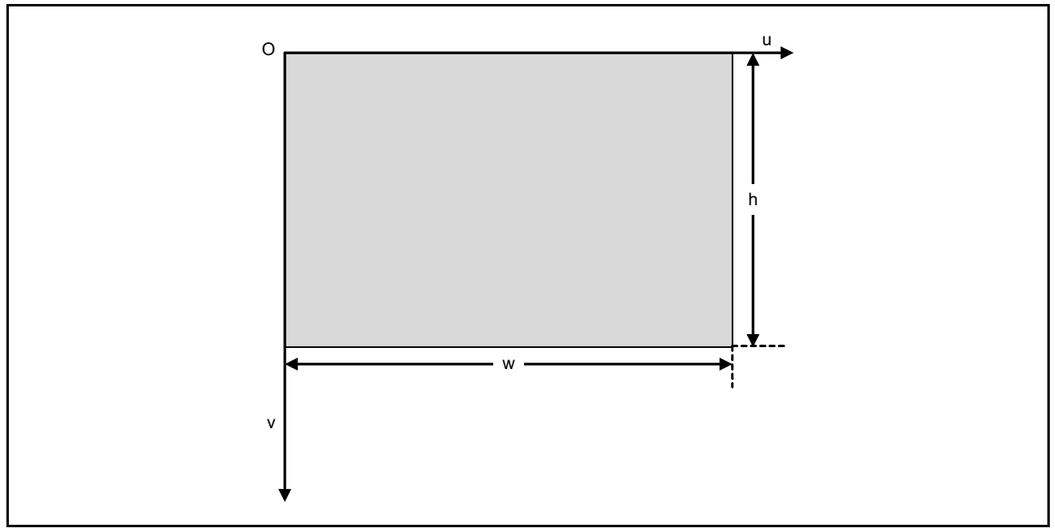

Figure 56.21 纹理映射、纹理空间和宽度为w和高度为h的纹理

在O'中，映射为：

$$\vec{p'}_0 = \begin{pmatrix}0\\0\end{pmatrix} \Rightarrow (\tilde{\vec{p}}_0) = \begin{pmatrix}u_0\\v_0\end{pmatrix} = \begin{pmatrix}0\\0\end{pmatrix}$$

$$\vec{d}_1 = \begin{pmatrix}dx_1\\dy_1\end{pmatrix} \Rightarrow (\tilde{\vec{p}}_1) = \begin{pmatrix}u_1\\v_1\end{pmatrix} = \begin{pmatrix}w\\0\end{pmatrix}$$

$$\vec{d}_2 = \begin{pmatrix}dx_2\\dy_2\end{pmatrix} \Rightarrow (\tilde{\vec{p}}_2) = \begin{pmatrix}u_2\\v_2\end{pmatrix} = \begin{pmatrix}w\\h\end{pmatrix}$$

这是一个可以用2x2矩阵描述的线性映射。

$$(\tilde{\vec{p}}) = M \cdot \vec{p'} = \begin{bmatrix}m_{11} & m_{12}\\m_{21} & m_{22}\end{bmatrix} \cdot \vec{p'}$$

$$\Rightarrow \begin{pmatrix}w\\0\end{pmatrix} = M \cdot \vec{d}_1 \wedge \begin{pmatrix}0\\h\end{pmatrix} = M \cdot \vec{d}_2$$

如果方程被扩展和排序，结果是两个方程组，每个方程组有两个未知数。这些可以用新的矩阵更容易地描述。

Let $A = \begin{bmatrix}dx_1 & dy_1\\dx_2 & dy_2\end{bmatrix}$ 那么方程组可以改写为：

$$\begin{pmatrix}w\\0\end{pmatrix} = A \cdot \begin{pmatrix}m_{11}\\m_{12}\end{pmatrix} \wedge \begin{pmatrix}0\\h\end{pmatrix} = A \cdot \begin{pmatrix}m_{21}\\m_{22}\end{pmatrix}$$

这可以通过行列式轻松解决。

Let $c = \frac{1}{detA} = \frac{1}{dx \cdot dy_2 - dx_2 \cdot dy_1}$

结果常数为：

$$m_{11} = c \cdot w \cdot dy_2 = \frac{du}{dx}$$

$$m_{12} = -c \cdot w \cdot dx_2 = \frac{杜迪}{\text{-----}}$$

$$m_{21} = c \cdot h \cdot dx_1 = \frac{dv}{dx}$$

$$m_{22} = -c \cdot h \cdot dx_2 = \frac{dv}{dy}$$

To calculate the start values for u and v at the top of the bounding box, the transformation from O' to O must be reversed. Let us and vs be the start values, then:

$$\begin{pmatrix} u_s \\ v_s \end{pmatrix} = M \cdot (-\vec{p}_0) = c \cdot \begin{pmatrix} -w \cdot (x_0 \cdot dy_2 - y_0 \cdot dx_2) \\ h \cdot (x_0 \cdot dy_1 - y_0 \cdot dx_1) \end{pmatrix}$$

Examples

U and v are in the texture space. Enter the following into any case:

- Copy case:
  dx1 = 1, dx2 = 0, dy1 = 0, dy1 = 1
- Scaling case x scaling copy case:
  dx1 = f, dx2 = 0, dy1 = 0, dy1 = 1
  with f being the scaling factor in the x direction similar for the y direction
- Rotation case:
  dx1 = cosa, dx2 = -sina, dy1 = sina, dy1 = cosa
  with the angle between d1 and the x axis in the clockwise direction.

56.6.3.2 Limiter operation

The texture limiters operate exactly the same as the spatial limiters shown in Figure 56.8, Operation flow of the linear limiter.

The register layout for the u limiter is the same:

- LUSTART = us
- LUXADD = du/dx
- LUYADD = du/dy.

The register layout for the v limiter is slightly different. TEXPITCH is multiplied to save one hardware multiplier.

- LVSTARTI = floor (vs) • TEXPITCH
  Contains the integer part of the start value.
- LVSTARTF = (vs-floor (vs)) • TEXPITCH
  Contains the fractional part of the start value.
- LVXADDI = floor (dv/dx) • TEXPITCH
  Contains the integer part of dv/dz.
- LVYADD = floor (dv/dy) • TEXPITCH
  Contains the integer part of dv/dy.
- LVYXADDF = (dv/dy - floor (dv/dy)) • TEXPITCH ((dv/dx - floor (dv/dx)) • TEXPITCH)
  Contains the fractional part of dv/dy and dv/dx combined in one register.
- TEXMASK
  Contains a mask for u and v separately to wraparound values of u and v. This is useful for staying inside the limits of the texture or repeat a texture. Wrap around textures have to have a size multiple of 2.
- TEXPITCH
  Contains the width of the texture in pixels in framebuffer memory. This information is required to calculate the new address if stepping to a new line.
- TEXORIGIN.
  Contains the base address of the texture.

$$m_{21} = c \cdot h \cdot dx_1 = \frac{dv}{dx}$$

$$m_{22} = -c \cdot h \cdot dx_2 = \frac{dv}{dy}$$

要计算边界框顶部的u和v的起始值，必须反转从O'到O的转换。
让我们和vs成为起始值，然后：

$$\begin{pmatrix} u_s \\ v_s \end{pmatrix} = M \cdot (-\vec{p}_0) = c \cdot \begin{pmatrix} -w \cdot (x_0 \cdot dy_2 - y_0 \cdot dx_2) \\ h \cdot (x_0 \cdot dy_1 - y_0 \cdot dx_1) \end{pmatrix}$$

Examples

U和v在纹理空间中。在任何情况下输入以下内容：

- Copy case:
  dx1 = 1, dx2 = 0, dy1 = 0, dy1 = 1
- 缩放案例x缩放复制案例：dx1=f dx2=0 dy1=0 dy1=1其中f是x方向的比例因子，类似于y方向
- 旋转情况：dx1=cosa，dx2=−sina，dy1=sina，dy1=cosa，d1与x轴之间的角度为顺时针方向。

56.6.3.2 限制器操作

纹理限制器的操作与图56.8，线性限制器的操作流程中所示的空间限制器完全相同。

u限制器的寄存器布局是相同的：

- LUSTART = us
- LUXADD = du/dx
- LUYADD = du/dy.

v限制器的寄存器布局略有不同。TEXPITCH相乘以节省一个硬件乘数。

- LVSTARTI = floor (vs) • TEXPITCH
  包含起始值的整数部分。
- LVSTARTF = (vs-floor (vs)) • TEXPITCH
  包含起始值的小数部分。
- LVXADDI = floor (dv/dx) • TEXPITCH
  包含dvdz的整数部分。
- LVYADD = floor (dv/dy) • TEXPITCH
  包含dvdy的整数部分。
- LVYXADDF = (dv/dy - floor (dv/dy)) • TEXPITCH ((dv/dx - floor (dv/dx)) • TEXPITCH)
  包含组合在一个寄存器中的dvdy和dvdx的小数部分。
- TEXMASK
  分别包含u和v的掩码以环绕u和v的值。这对于保持在纹理的限制内或重复纹理很有用。环绕纹理的大小必须是2的倍数。
- TEXPITCH
  包含帧缓冲区内存中纹理的宽度（以像素为单位）。如果步进到新行，则需要此信息来计算新地址。
- TEXORIGIN.
  包含纹理的基地址。

56.6.4 Colorization

After a pixel is found to be part of the geometry, its color is calculated. The 2D Drawing Engine supports a very general color calculation scheme, allowing support for several color modes. This color scheme uses an interpolation between two color registers, COLOR1 and COLOR2. See Figure 56.22 for details. COLOR1 and COLOR2 are marked as A, B in the figure for clarity.

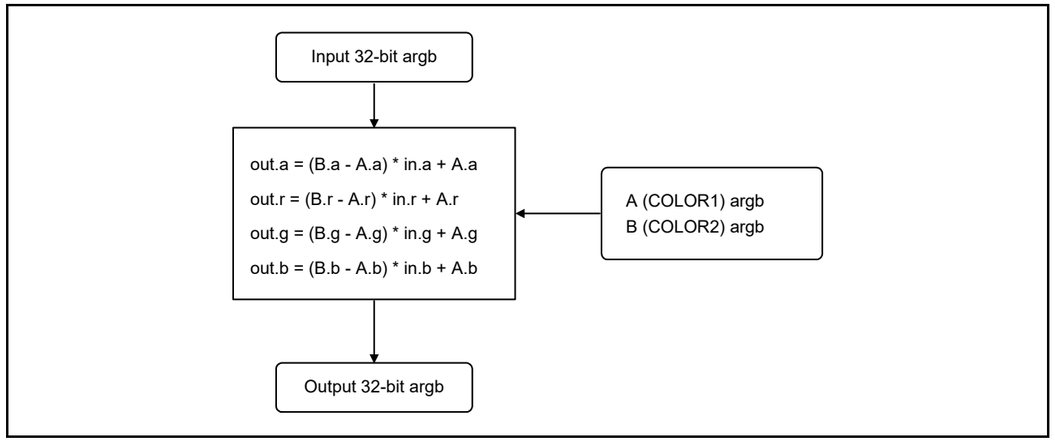

Figure 56.22 Colorization step and interpolation between the two color registers, A (COLOR1) and B (COLOR2)

This general approach can be used to support several different color modes that can be individually applied to any color or alpha channel of the input.

Table 56.7 Colorization operations

Operation	Settings for A and B *1
Copy	A = 0, B = 0xff
Replace with a constant value v	A = v, B = v
Multiply by a constant value v	A = 0, B = v
Colorize an alpha texture with the RGB value v	A.a = 0, A.r = B.r, A.g = B.g, A.b = B.b, B.a = 0xff,B.r = v.r, B.g = v.g, B.b = v.b
Invert a channel	A = 0xff, B = 0
Invert multiply with v	A = v, B = 0
Interpolate between color v and color u	A = v, B = u

Note 1. A = COLOR1, B = COLOR2

56.6.5 Blending

56.6.5.1 Color channel blending

The last step before the pixel is written to the framebuffer is to blend the pixel with the data that is already written to the framebuffer. If blending is activated, the framebuffer, referred to as DST, must be read. SRC is the output from the colorization unit.

The following color blend modes are supported:

- SRC_ZERO
- SRC_ONE
- SRC_ALPHA

56.6.4 Colorization

在发现一个像素是几何图形的一部分后，将计算其颜色。2D绘图引擎支持非常通用的颜色计算方案，允许支持多种颜色模式。此配色方案使用两个颜色寄存器COLOR1和COLOR2之间的插值。详见图56.22。为清楚起见，图中将COLOR1和COLOR2标记为A、B。

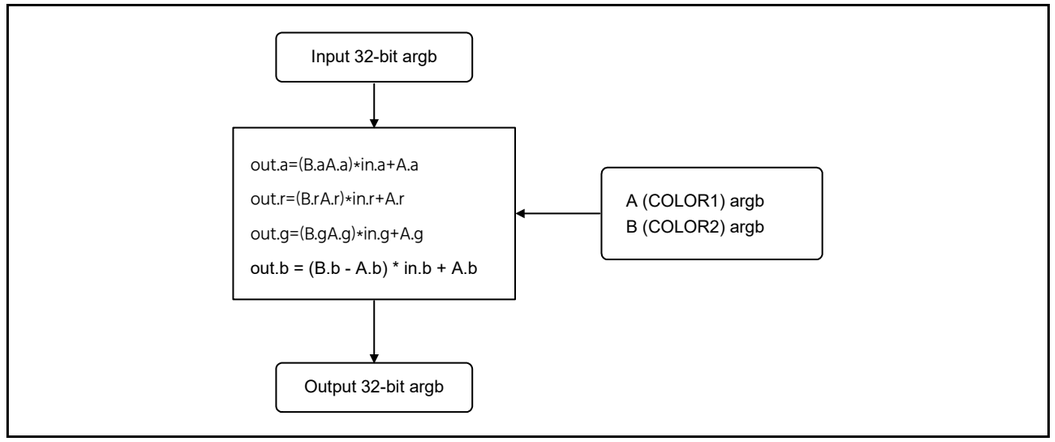

Figure 56.22 两个颜色寄存器A(COLOR1)和B(COLOR2)之间的着色步骤和插值

这种通用方法可用于支持几种不同的颜色模式，这些模式可以单独应用于输入的任何颜色或Alpha通道。

Table 56.7 着色操作

Operation	A和B的设置*1
Copy	A = 0, B = 0xff
替换为常数值v	A = v, B = v
乘以一个常数值v	A = 0, B = v
使用RGB值v为alpha纹理着色	A.a=0 A.r=B.r A.g=B.g A.b=B.b B.a=0xff B.r=v.r B.g=v.g B.b=v.b
反转通道	A = 0xff, B = 0
用v反转乘法	A = v, B = 0
在颜色v和颜色u之间进行插值	A = v, B = u

Note 1. A = COLOR1, B = COLOR2

56.6.5 Blending

56.6.5.1 颜色通道混合

将像素写入帧缓冲区之前的最后一步是将像素与已写入帧缓冲区的数据混合。如果激活了混合，则必须读取称为DST的帧缓冲区。SRC是着色单元的输出。

支持以下颜色混合模式：

- SRC_ZERO
- SRC_ONE
- SRC_ALPHA

- SRC_ONE_MINUS_ALPHA
- DST_ZERO
- DST_ONE
- DST_ALPHA
- DST_ONE_MINUS_ALPHA.

The selection of the color channel blend modes is performed with the following flags:

- BSF: blend source factor is alpha
- BSI: blend source factor invert
- BDF: blend destination factor is alpha
- BDI: blend destination factor invert.

The formula for the blending is:

$dst = src \cdot f_S + dst \cdot f_D$

where:

BSF = 0, BSI = 0 $\Rightarrow f_S = 1$

BSF = 1, BSI = 0 $\Rightarrow f_S = \alpha$

BSF = 0, BSI = 1 $\Rightarrow f_S = 0$

BSF = 1, BSI = 1 $\Rightarrow f_S = 1 - \alpha$

BDF = 0, BDI = 0 $\Rightarrow f_D = 1$

BDF = 1, BDI = 0 $\Rightarrow f_D = \alpha$

BDF = 0, BDI = 1 $\Rightarrow f_D = 0$

BDF = 1, BDI = 1 $\Rightarrow f_D = 1 - \alpha$.

Table 56.8 lists all possible color channel blend modes.

Table 56.8 Color channel blend modes

Mode	BSF	BSI	BDF	BDI	Blend equation
SRC_ONE DST_ONE	0	0	0	0	SRC + DST
SRC_ONE	0	0	0	1	SRC
SRC_ONE DST_ALPHA	0	0	1	0	SRC + DST × ALPHA
SRC_ONE DST_ONE_MINUS_ALPHA	0	0	1	1	SRC + DST × (1 - ALPHA)
SRC_ZERO DST_ONE	0	1	0	0	DST
SRC_ZERO DST_ZERO	0	1	0	1	0
SRC_ZERO DST_ALPHA	0	1	1	0	DST × ALPHA
SRC_ZERO DST_ONE_MINUS_ALPHA	0	1	1	1	DST × (1 - ALPHA)
SRC_ALPHA DST_ONE	1	0	0	0	SRC × ALPHA + DST
SRC_ALPHA	1	0	0	1	SRC × ALPHA
SRC_ALPHA DST_ALPHA	1	0	1	0	SRC × ALPHA + DST × ALPHA
SRC_ALPHA DST_ONE_MINUS_ALPHA	1	0	1	1	SRC × ALPHA + DST × (1 - ALPHA)
SRC_ONE_MINUS_ALPHA DST_ONE	1	1	0	0	SRC × (1 - ALPHA) + DST
SRC_ONE_MINUS_ALPHA	1	1	0	1	SRC × (1 - ALPHA)
SRC_ONE_MINUS_ALPHA DST_ALPHA	1	1	1	0	SRC × (1 - ALPHA) + DST × ALPHA
SRC_ONE_MINUS_ALPHA DST_ONE_MINUS_ALPHA	1	1	1	1	SRC × (1 - ALPHA) + DST × (1 - ALPHA)

- SRC_ONE_MINUS_ALPHA
- DST_ZERO
- DST_ONE
- DST_ALPHA
- DST_ONE_MINUS_ALPHA.

使用以下标志执行颜色通道混合模式的选择：

- BSF：混合源因子为alpha
- BSI：混合源因子反转
- BDF：混合目标因子为alpha
- BDI：混合目标因子反转。

混合公式为：

$dst = src \cdot f_S + dst \cdot f_D$

where:

BSF = 0, BSI = 0 $\Rightarrow f_S = 1$

BSF = 1, BSI = 0 $\Rightarrow f_S = \alpha$

BSF = 0, BSI = 1 $\Rightarrow f_S = 0$

BSF = 1, BSI = 1 $\Rightarrow f_S = 1 - \alpha$

BDF = 0, BDI = 0 $\Rightarrow f_D = 1$

BDF = 1, BDI = 0 $\Rightarrow f_D = \alpha$

BDF = 0, BDI = 1 $\Rightarrow f_D = 0$

BDF = 1, BDI = 1 $\Rightarrow f_D = 1 - \alpha$.

表56.8列出了所有可能的颜色通道混合模式。

Table 56.8 颜色通道混合模式

Mode	BSF	BSI	BDF	BDI	混合方程
SRC_ONE DST_ONE	0	0	0	0	SRC + DST
SRC_ONE	0	0	0	1	SRC
SRC_ONE DST_ALPHA	0	0	1	0	SRC + DST × ALPHA
SRC_ONE DST_ONE_MINUS_ALPHA	0	0	1	1	SRC + DST × (1 - ALPHA)
SRC_ZERO DST_ONE	0	1	0	0	DST
SRC_ZERO DST_ZERO	0	1	0	1	0
SRC_ZERO DST_ALPHA	0	1	1	0	DST × ALPHA
SRC_ZERO DST_ONE_MINUS_ALPHA	0	1	1	1	DST × (1 - ALPHA)
SRC_ALPHA DST_ONE	1	0	0	0	SRC × ALPHA + DST
SRC_ALPHA	1	0	0	1	SRC × ALPHA
SRC_ALPHA DST_ALPHA	1	0	1	0	SRC × ALPHA + DST × ALPHA
SRC_ALPHA DST_ONE_MINUS_ALPHA	1	0	1	1	SRC × ALPHA + DST × (1 - ALPHA)
SRC_ONE_MINUS_ALPHA DST_ONE	1	1	0	0	SRC × (1 - ALPHA) + DST
SRC_ONE_MINUS_ALPHA	1	1	0	1	SRC × (1 - ALPHA)
SRC_ONE_MINUS_ALPHA DST_ALPHA	1	1	1	0	SRC × (1 - ALPHA) + DST × ALPHA
SRC_ONE_MINUS_ALPHA DST_ONE_MINUS_ALPHA	1	1	1	1	SRC × (1 - ALPHA) + DST × (1 - ALPHA)

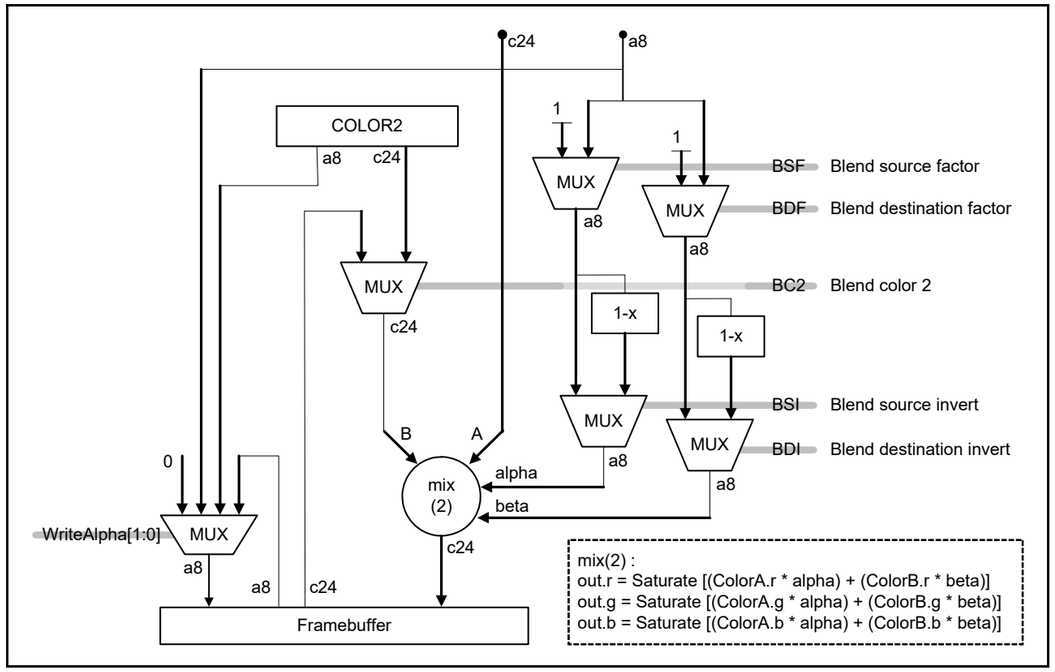

Figure 56.23 Color channel blend unit when CONTROL2.USEACB = 0

56.6.5.2 Alpha channel blending

The alpha channel can be blended in addition to the color channels. Alpha channel blending is enabled by setting CONTROL2.USEACB = 1. Alpha channel blending uses the same formulas and same blend modes as for the color channels. The alpha channel formulas can be set independently from the color channels.

The following alpha channel blend modes are supported:

- SRC_A_ZERO
- SRC_A_ONE
- SRC_A_SRC_A
- SRC_A_ONE_MINUS_SRC_A
- DST_A_ZERO
- DST_A_ONE
- DST_A_SRC_A
- DST_A_ONE_MINUS_SRC_A.

The alpha channel blend modes selected with the following flags:

- BSFA: blend source factor is SRC_A
- BSIA: blend source factor invert
- BDFA: blend destination factor is SRC_A
- BDIA: blend destination factor invert.

The formula for the blending is:

$dst\_alpha = src\_a \cdot f_{S\_a} + dst\_a \cdot f_{D\_a}$

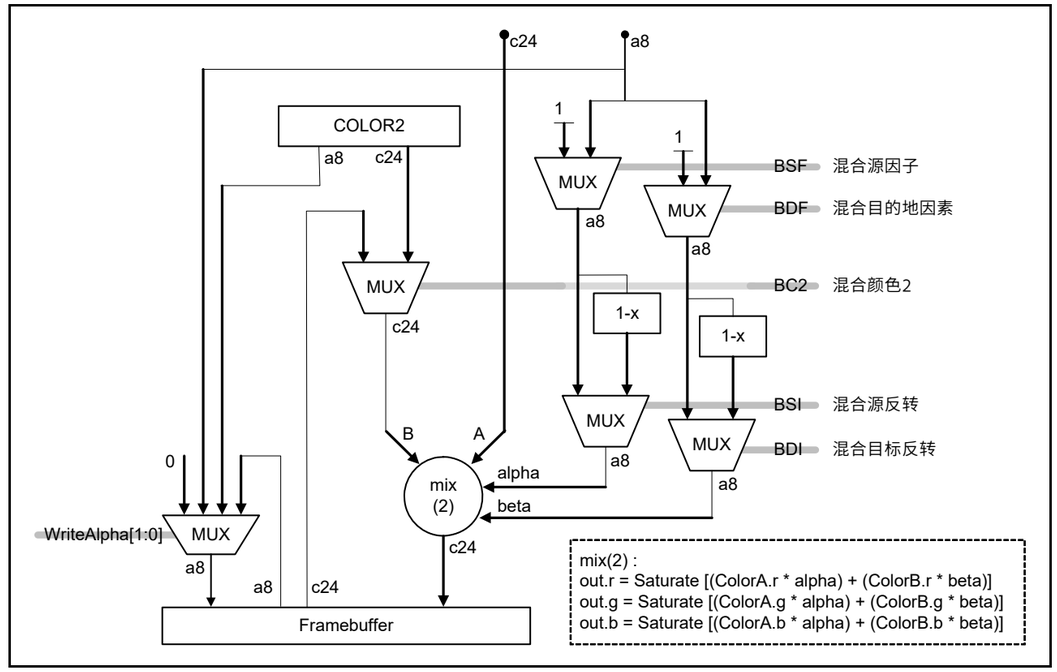

Figure 56.23 CONTROL2.USEACB=0时的颜色通道混合单元

56.6.5.2 Alpha通道混合

除了颜色通道之外，还可以混合Alpha通道。通过设置启用Alpha通道混合CONTROL2.USEACB=1。Alpha通道混合使用与颜色通道相同的公式和混合模式。Alpha通道公式可以独立于颜色通道进行设置。

支持以下Alpha通道混合模式：

- SRC_A_ZERO
- SRC_A_ONE
- SRC_A_SRC_A
- SRC_A_ONE_MINUS_SRC_A
- DST_A_ZERO
- DST_A_ONE
- DST_A_SRC_A
- DST_A_ONE_MINUS_SRC_A.

使用以下标志选择的Alpha通道混合模式：

- BSFA：混合源因子为SRC_A
- BSIA：混合源因子反转
- BDFA：混合目标因子为SRC_A
- BDIA：混合目标因子反转。

混合公式为：

$dst\_alpha = src\_a \cdot f_{S\_a} + dst\_a \cdot f_{D\_a}$

where:

BSFA = 0, BSIA = 0 ⇒ f_{S_a} = 1

BSFA = 1, BSIA = 0 ⇒ f_{S_a} = src_a

BSFA = 0, BSIA = 1 ⇒ f_{S_a} = 0

BSFA = 1, BSIA = 1 ⇒ f_{S_a} = 1 - src_a

BDFA = 0, BDIA = 0 ⇒ f_{D_a} = 1

BDFA = 1, BDIA = 0 ⇒ f_{D_a} = src_a

BDFA = 0, BDIA = 1 ⇒ f_{D_a} = 0

BDFA = 1, BDIA = 1 ⇒ f_{D_a} = 1 - src_a.

Table 56.9 lists all possible alpha channel blend modes.

Table 56.9 Alpha channel blend modes

Mode	BSF	BSI	BDF	BDI	Blend equation
SRC_A_ONE DST_A_ONE	0	0	0	0	SRC_A + DST_A
SRC_A_ONE	0	0	0	1	SRC_A
SRC_A_ONE DST_A_SRC_A	0	0	1	0	SRC_A + DST_A × SRC_A
SRC_A_ONE DST_A_ONE_MINUS_SRC_A	0	0	1	1	SRC_A + DST_A × (1 - SRC_A)
SRC_A_ZERO DST_A_ONE	0	1	0	0	DST_A

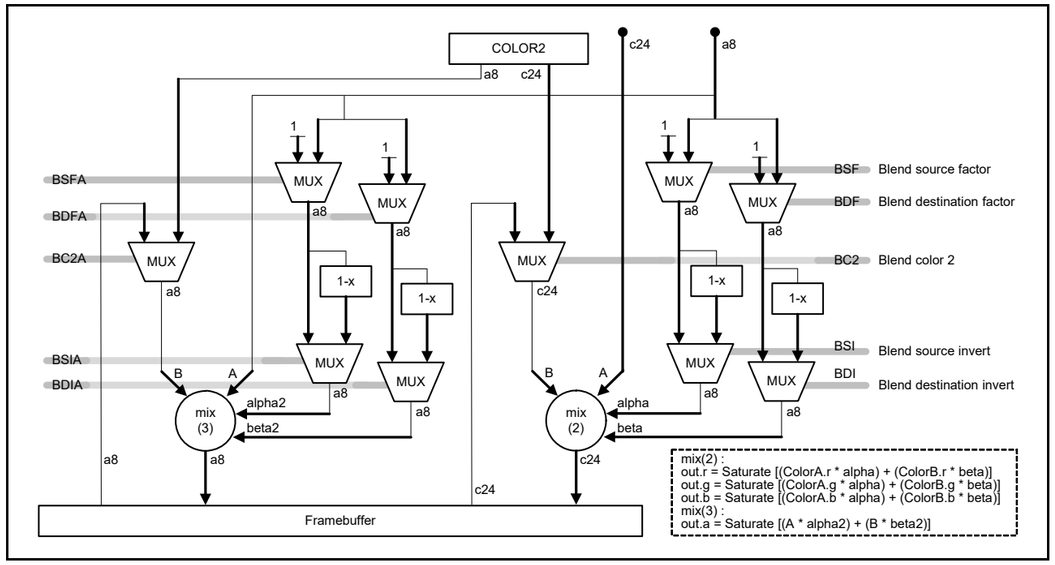

Figure 56.24 Alpha- and color-channel blend unit when CONTROL2.USEACB = 1

56.7 Rendering Modes

The rendering process can be performed in two different modes, register mode and display list mode.

56.7.1 Register Mode

In register mode, when operation is based on register settings, the host CPU configures and initiates each render process separately. To start a new render process, the host CPU must wait until the previous one is completed. In this mode, the host CPU is heavily engaged throughout the entire drawing procedure and is consequently to a large extent unavailable for other tasks.

The host CPU must set up all registers for performing a certain drawing operation before it can start the rendering process. A new register setup can only be started when the previous render process has completed. Before starting a new register setup, make sure that:

- STATUS.DLISTACTIVE = 0: Display list reader is idle
- STATUS.BUSENUM = 0: Pixel selection unit is idle.

Lastly, write the framebuffer start address to the ORIGIN register. This write triggers the 2D Drawing Engine to start rendering.

56.7.2 Display List Mode

In display list mode, the host CPU creates a display list in memory prior to starting the 2D Drawing Engine. Such a display contains a bundle of render operations. When started, the 2D Drawing Engine executes the display list autonomously in parallel with the host CPU, which is not involved with drawing operations most of the time. Use of a display list allows a fully asynchronous operation of the host CPU and the 2D Drawing Engine and offers the best possible system performance.

In this mode, the display list reader reads a memory block containing instructions on how to set the 2D Drawing Engine control registers and executes these control register writes accordingly.

Display list start

To start execution of a display list, which already resides in memory, the start address of the display list is written to the display list start address register DLISTSTART. Because rewriting DLISTSTART also stops any ongoing display list

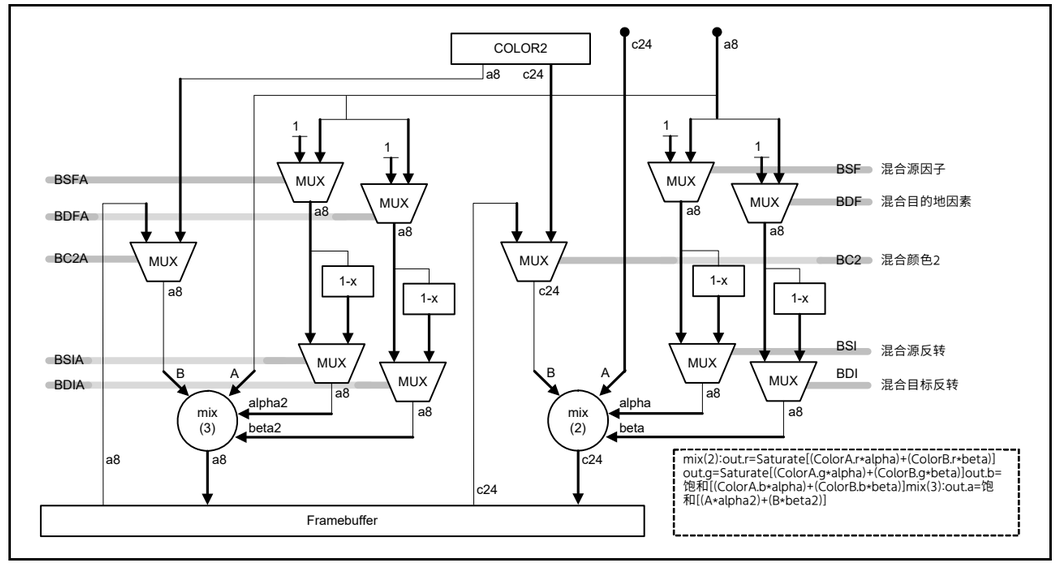

Figure 56.24 CONTROL2.USEACB=1时的Alpha和颜色通道混合单元

56.7 渲染模式

渲染过程可以在两种不同的模式下执行，注册模式和显示列表模式。

56.7.1 注册模式

在寄存器模式下，当操作基于寄存器设置时，主机CPU分别配置和启动每个渲染过程。要开始一个新的渲染进程，主机CPU必须等到前一个渲染完成。在这种模式下，主机CPU在整个绘图过程中都处于繁忙状态，因此在很大程度上无法用于其他任务。

主机CPU必须设置所有寄存器以执行特定的绘图操作，然后才能开始渲染过程。只有在前一个渲染过程完成后才能开始新的寄存器设置。在开始新的寄存器设置之前，请确保：

- STATUS.DLISTACTIVE=0：显示列表阅读器空闲
- STATUS.BUSENUM=0：像素选择单元空闲。

最后，将帧缓冲区起始地址写入ORIGIN寄存器。此写入触发2D绘图引擎开始渲染。

56.7.2 显示列表模式

在显示列表模式下，主机CPU在启动2D绘图引擎之前在内存中创建一个显示列表。这样的显示包含一组渲染操作。启动时，2D绘图引擎与主机CPU并行自主地执行显示列表，大部分时间不参与绘图操作。使用显示列表允许主机CPU和2D绘图引擎的完全异步操作，并提供最佳的系统性能。

在此模式下，显示列表读取器读取包含有关如何设置2D绘图引擎控制寄存器的指令的内存块，并相应地执行这些控制寄存器写入。

显示列表开始

为了开始执行已经驻留在存储器中的显示列表，将显示列表的起始地址写入显示列表起始地址寄存器DLISTSTART。因为重写DLISTSTART也会停止任何正在进行的显示列表

execution, make sure that the previous display list process is completed by either of the following two methods:

- Check that STATUS.DLISTACTIVE = 0, which indicates idle status of the display list reader
- Wait for the display list interrupt DRWDLISTIRQ, which indicates completion of the previous display list process.

Caution: Direct writing to 2D Drawing Engine registers while the display list mode is active (STATUS.DLISTACTIVE = 1) might lead to a 2D Drawing Engine hang-up. To prevent this, always check that the display list reader is idle ((STATUS.DLISTACTIVE = 0) before writing to any 2D Drawing Engine register.

Display list format

Display lists are stored using direct register-to-value mappings, which means that the display list contains a one byte index that addresses a certain register and the value to be written to the register. The register index is derived from the address offset of the register address and can be calculated by dividing the address offset by 4. For the index of each register, see section 56.2, Register Descriptions.

As the 2D Drawing Engine registers are always 32 bits wide, each data unit (called a data word) to be written to a register is of the same size. An address word that contains the indices of the register to be written is stored in a packed notation with up to four indices stored in one 32-bit address word.

A display list command always starts with an address word, followed by up to four data words, one for each register. The indices are read and interpreted from LSB to MSB, so the register of the low byte index is written first.

Example

In the following example:

- DWORD 201A 1930h // start of list address word
- DWORD 0000 0013h // data word 1 (for register 30h)
- DWORD FFFF FFAAh // data word 2 (for register 19h)
- DWORD 4033 6480h // data word 3 (for register 1Ah)
- DWORD 0001 0000h // data word 4 (for register 20h)
- DWORD... // next address word.

This stream of dwords updates the DRW registers as follows:

- Write 0000_0013h to register 30h = 48, which is IRQCTL
- Write FFFF_FFAAh to register 19h = 25, which is COLOR1
- Write 4033_6480h to register 1Ah = 26, which is COLOR2
- Write 0001_0000h to register 20h = 32, which is ORIGIN.

Address word indices

Besides referencing a register, the indices of an address word can also have other meanings, depending on their value.

Table 56.10 Address indices function (1 of 2)

Index	Function	
00h to 7Fh	Register indices Two register indices trigger additional actions:	
	- 20h = 32:	A write to ORIGIN to set a new frame buffer address is delayed until the ongoing frame buffer write-back is complete, when STATUS.BUSYWRITE = 0.
	- 32h = 50:	A write to DLISTSTART sets a new display list start address stops the current display list and starts the new one.
80h	Gap index, which is used to fill unused bytes of an address word. For example, if fewer than four indices are required, the remaining bytes are filled with 80h. In this case, the number of the subsequent data words must be reduced accordingly.	

执行，请确保之前的显示列表过程通过以下两种方法之一完成：

- 检查STATUS.DLISTACTIVE=0，表示显示列表阅读器的空闲状态
- 等待显示列表中断DRWDLISTIRQ，表示上一个显示列表过程完成。

Caution: 在显示列表模式处于活动状态(STATUS.DLISTACTIVE=1)时直接写入2D绘图引擎寄存器可能会导致2D绘图引擎挂起。为了防止这种情况，在写入任何2D绘图引擎寄存器之前，请始终检查显示列表读取器是否处于空闲状态((STATUS.DLISTACTIVE=0)。

显示列表格式

显示列表使用直接寄存器到值的映射来存储，这意味着显示列表包含一个字节索引，该索引对某个寄存器和要写入该寄存器的值进行寻址。寄存器索引由寄存器地址的地址偏移量得出，可以通过将地址偏移量除以4来计算。对于每个寄存器的索引，请参见第56.2节，寄存器说明。

由于2D绘图引擎寄存器始终为32位宽，因此要写入寄存器的每个数据单元（称为数据字）具有相同的大小。包含要写入的寄存器索引的地址字以压缩符号存储，一个32位地址字中最多存储四个索引。

显示列表命令总是以地址字开头，后跟最多四个数据字，每个寄存器一个。索引从LSB读取并解释为MSB，因此首先写入低字节索引的寄存器。

Example

在以下示例中：

- DWORD201A1930h列表地址字的开始
- DWORD00000013h数据字1（用于寄存器30h）
- DWORDFFFFFFAAh数据字2（用于寄存器19h）
- DWORD40336480h数据字3（用于寄存器1Ah）
- DWORD00010000h数据字4（用于寄存器20h）
- DWORD…下一个地址字。

此双字流更新DRW寄存器如下：

- 将0000_0013h写入寄存器30h=48，即IRQCTL
- 将FFFF_FFAAh写入寄存器19h=25，即COLOR1
- 将4033_6480h写入寄存器1Ah=26，即COLOR2
- 将0001_0000h写入寄存器20h=32，即ORIGIN。

地址字索引

除了引用寄存器之外，地址字的索引还可以具有其他含义，具体取决于它们的值。

Table 56.10 地址索引函数(1of2)

Index	Function	
00h to 7Fh	注册索引 两个寄存器索引触发其他操作：	
	- 20h = 32:	当STATUS.BUSYWRITE=0时，延迟写入ORIGIN以设置新的帧缓冲区地址，直到正在进行的帧缓冲区回写完成。
	- 32h = 50:	对DLISTSTART的写入会设置一个新的显示列表起始地址，从而停止当前的显示列表并启动新的显示列表。
80h	间隙索引，用于填充地址字的未使用字节。例如，如果需要的索引少于四个，则剩余字节用80h填充。在这种情况下，必须相应减少后续数据字的数量。	

Table 56.10 Address indices function (2 of 2)

Index	Function	
FFh	If the first index of an address word contains the special index FFh, the subsequent (second) index is interpreted as follows:	
	- Bit [0] set:	Display list end.
	- Bit [1] set:	Issue a full pipeline flush and wait (necessary before flip).
	- Bit [2] set:	Wait for writeback complete (necessary before framebuffer format change).
	- Bits [3:7]	Set all to 0s.
	Bit [1] and [2] settings are mutually exclusive. All indices after the special index FFh are ignored, and the next address word is read, if no display list end (bit [0] = 1) was set.	
	The remaining two indices must be set to 00h.	

Caution: Gap indices 80h must not be placed between other indices, for example as “index1 - 80h - index3 - index4”. Always fill all indices after 80h with the gap index.

Caution: If any of the special indices 80h and FFh are used, no register index can follow after them in the same address word.

Table 56.11 2D Drawing Engine registers overview (1 of 2)

Register function	Symbol	Index
Control registers:		
Geometry control 0	CONTROL	0

Limiter 6 y-axis increment	L6YADD	21
Limiter 1 band width parameter	L1BAND	22

Table 56.10 地址索引函数(2of2)

Index	Function	
FFh	如果地址字的第一个索引包含特殊索引FFh，则后续（第二个）索引解释如下：	
	- Bit [0] set:	显示列表结束。
	- Bit [1] set:	发出完整的管道刷新并等待（翻转前必需）。
	- Bit [2] set:	等待写回完成（在帧缓冲区格式更改之前是必需的）。
	- Bits [3:7]	全部设置为0。
	位[1]和[2]设置是互斥的。如果没有设置显示列表结束（位[0]=1），则忽略特殊索引FFh之后的所有索引，并读取下一个地址字。	
	其余两个索引必须设置为00h。	

Caution: 间隙索引80h不得放在其他索引之间，例如“index180hindex3index4”。在80小时后始终使用间隙索引填充所有索引。

Caution: 如果使用了特殊索引80h和FFh中的任何一个，则在同一地址字中不能跟在它们之后。

Performance counter 1	PERFCOUNT1	51
Performance counter 2	PERFCOUNT2	52

Note 1. These registers are read-only and cannot be accessed in display list mode, and they therefore have no index.

56.7.3 Stopping the Render Process

Stopping an ongoing render process requires a specific procedure, which is described in section 56.10, Stopping the 2D Drawing Engine Render Process.

56.8 Interrupts

The 2D Drawing Engine generates three interrupts:

- DRWBUSIRQ
- DRWENUMIRQ
- DRWDLISTIRQ.

56.8.1 Interrupt sources

DRWBUSIRQ

This is the 2D Drawing Engine bus error interrupt. It occurs when the 2D Drawing Engine attempts to access an undefined address range through the following:

- Framebuffer Base Address Register ORIGIN
- Texture Base Address Register TEXORIGIN

Table 56.11 2D绘图引擎寄存器概述(2of2)

注册功能	Symbol	Index
限制器2带宽参数	L2BAND	23

颜色查找表起始地址	TEXCLADDR	55
将数据写入DRWTEXCLADDR；每次数据写入后，DRWTEXCLADDR加1。	TEXCLDATA	56
索引纹理格式i8、i4、i2和i1的索引偏移量	TEXCLOFFSET	57
比较内部纹理颜色表示的R、G、B分量的值。	COLKEY	58
Miscellaneous registers:		
边界框尺寸	SIZE	30
帧缓冲间距和跨度存储延迟	PITCH	31
帧缓冲区中第一个像素的地址	ORIGIN	32
显示列表起始地址	DLISTSTART	50
性能计数器控制	PERFTRIGGER	53
性能计数器1	PERFCOUNT1	51
性能计数器2	PERFCOUNT2	52

Note 1. 这些寄存器是只读的，不能在显示列表模式下访问，因此它们没有索引。

56.7.3 停止渲染过程

停止正在进行的渲染过程需要一个特定的过程，这在第56.10节中描述，停止2D绘图引擎渲染过程。

56.8 Interrupts

2D绘图引擎产生三个中断：

- DRWBUSIRQ
- DRWENUMIRQ
- DRWDLISTIRQ.

56.8.1 中断源

DRWBUSIRQ

这是2D绘图引擎总线错误中断。当2D绘图引擎尝试通过以下方式访问未定义的地址范围时会发生这种情况：

- 帧缓冲基地址寄存器ORIGIN
- 纹理基地址寄存器TEXORIGIN

- Display List Start Address Register (DLISTSTART).

The bus error interrupt DRWBUSIRQ is then generated. The bus error interrupt only serves for debugging purposes. The interrupt source can be determined by the BUSERRMFB, BUSERRMTXMRL, and BUSERRMDL bits of the STATUS register.

Note: After a DRWBUSIRQ occurrence, you must apply a system reset.

DRWENUMIRQ

This is the current render process finished interrupt.

DRWDLISTIRQ

This is the display list interrupt. It is asserted on completion of a display list process. DRWDLISTIRQ is activated if one of the following is true:

- The entire display list is complete
- The display list processing stops because a new display list start is triggered by a write to the Display List Start Address Register (DLISTSTART).

56.8.2 Interrupt Control

The three 2D Drawing Engine interrupts are combined into a single shared interrupt, DRW_IRQ, to the CPU. Each interrupt can be masked (disabled), or unmasked (enabled) by setting its associated enable bit in the Interrupt Control Register (IRQCTL).

The occurrence of an enabled interrupt (one with its mask bit set to 1 in IRQCTL) is monitored in the Status Control Register (STATUS) with its associated interrupt status bit is set to 1. The shared 2D Drawing Engine interrupt DRW_IRQ is then generated.

To clear the interrupt, the host CPU must write 1 to the interrupt clear bit in IRQCTL. The interrupt clear bit returns to 0 automatically.

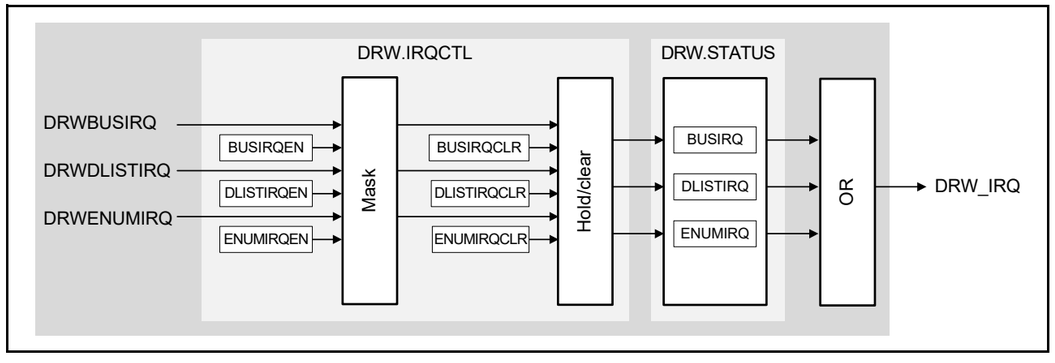

Figure 56.25 Interrupt Controller Unit (ICU)

56.9 Performance Counters

The 2D Drawing Engine features two independent 32-bit performance counter registers (PERFCOUNTk (k = 1, 2)) to count the number of occurrences of a certain event. The events to be counted can be set up independently for each performance counter register with the Performance Counter Control Registers, PERFTRIGGER.PERFTRIGGER2 for PERFCOUNT2 and PERFTRIGGER.PERFTRIGGER1 for PERFCOUNT1.

Table 56.12 lists the performance counter trigger events that can be selected.

- 显示列表起始地址寄存器(DLISTSTART)。

然后产生总线错误中断DRWBUSIRQ。总线错误中断仅用于调试目的。中断源可以由STATUS寄存器的BUSERRMFB、BUSERRMTXMRL和BUSERRMDL位确定。

Note: 发生DRWBUSIRQ后，您必须应用系统复位。

DRWENUMIRQ

这是当前渲染过程完成的中断。

DRWDLISTIRQ

这是显示列表中断。它在显示列表过程完成时被断言。如果以下条件之一为真，则激活DRWDLISTIRQ：

- 整个显示列表完整
- 显示列表处理停止，因为新的显示列表开始是由对显示列表开始的写入触发的地址寄存器(DLISTSTART)。

56.8.2 中断控制

三个2D绘图引擎中断组合成一个共享中断DRW_IRQ，发送给CPU。通过设置中断控制寄存器(IRQCTL)中的相关启用位，可以屏蔽（禁用）或取消屏蔽（启用）每个中断。

在状态控制中监视启用的中断（在IRQCTL中其屏蔽位设置为1）的发生寄存器(STATUS)及其相关的中断状态位设置为1。共享的2D绘图引擎中断然后生成DRW_IRQ。

要清除中断，主机CPU必须将1写入IRQCTL中的中断清除位。中断清除位自动返回0。

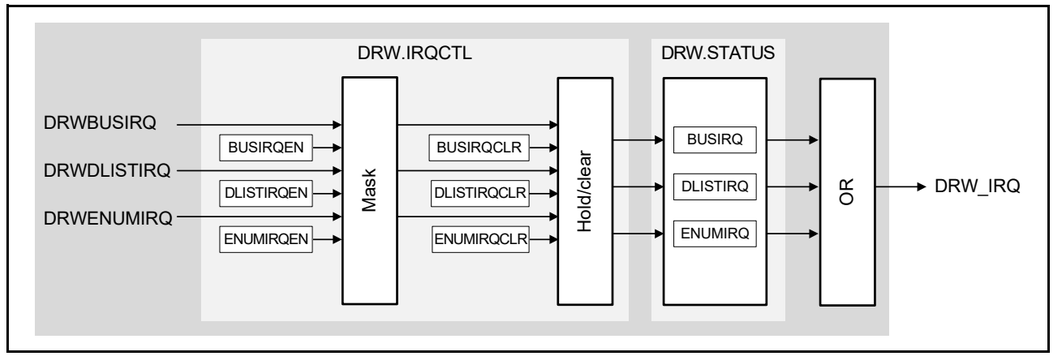

Figure 56.25 中断控制器单元(ICU)

56.9 性能计数器

2D绘图引擎具有两个独立的32位性能计数器寄存器(PERFCOUNTk(k=1 2))，用于计算某个事件的发生次数。可以使用性能计数器控制寄存器为每个性能计数器寄存器单独设置要计数的事件，PERFTRIGGER.PERFTRIGGER2用于PERFCOUNT2，PERFTRIGGER.PERFTRIGGER1用于PERFCOUNT1。

表56.12列出了可以选择的性能计数器触发事件 。

Table 56.12 Performance counter trigger events

PERFTRIGGER.PERFTRIGGERk	Event
0	Disable performance counter
1	2D Drawing Engine active cycles
2	Framebuffer read access
3	Framebuffer write access
4	Texture read access
5	Invisible pixels (enumerated but selected with alpha 0%)
6	Invisible pixels while internal FIFO is empty (lost cycles)
7	Display list reader active cycles
8	Framebuffer read hits
9	Framebuffer read misses
10	Framebuffer write hits
11	Framebuffer write misses
12	Texture read hits
13	Texture read misses
31	Every clock cycle (for use as timer)

56.10 Stopping the 2D Drawing Engine Render Process

If a render process has started either in register or display list mode, the 2D Drawing Engine processes the data autonomously until the render process is finished. Depending on the rendering, this process might take several milliseconds.

If the 2D Drawing Engine is to be disabled because, for example, the MCU enters a low power mode, proceed as follows to stop the ongoing rendering:

1. Set the following registers as follows:

   SIZE = 0001 0001h

   Set bounding box dimensions to 1 pixel x 1 line.

   CONTROL2 = 0000 0000h

   Color format a (8), no texture, CLUT.

   ORIGIN = UnmappedAddress

   The UnmappedAddress is an address that is not available for 2D Drawing Engine access.

   The recommended UnmappedAddress is given here under the key word “UnmappedAddress”.

   Alternatively do the same in display list mode:

   ```
   DWORD 8020 011Eh          // start of “address word” list
   DWORD 0001 0001h          // SIZE = 0001 0001h
   DWORD 0000 0000h          // CONTROL2 = 0000 0000h
   DWORD UnmappedAddress     // ORIGIN = UnmappedAddress
   ```

2. Wait for the Bus Error corresponding to the unmapped address violation, which indicates access to an unmapped address and the stop of the render process.
   UnmappedAddress = FFFF FFF0h

3. Disable the 2D Drawing Engine, if wanted.

Table 56.12 性能计数器触发事件

PERFTRIGGER.PERFTRIGGERk	Event
0	禁用性能计数器
1	2D绘图引擎活动周期
2	帧缓冲区读取访问
3	帧缓冲区写访问
4	纹理读取访问
5	不可见像素（枚举但使用alpha0%选择）
6	内部FIFO为空时不可见像素（丢失周期）
7	显示列表阅读器活动周期
8	帧缓冲读取命中
9	帧缓冲区读取未命中
10	帧缓冲区写入命中
11	帧缓冲区写入未命中
12	纹理读取命中
13	纹理读取未命中
31	每个时钟周期（用作定时器）

56.10 停止2D绘图引擎渲染进程

如果渲染进程已在注册或显示列表模式下启动，则2D绘图引擎会自主处理数据，直到渲染进程完成。
根据渲染，此过程可能需要几毫秒。

如果要禁用2D绘图引擎，例如，MCU进入低功耗模式，请按照以下步骤停止正在进行的渲染：

1. 如下设置以下寄存器：

   SIZE = 0001 0001h
   将边界框尺寸设置为1像素x1行。
   CONTROL2 = 0000 0000h
   颜色格式a(8)，无纹理，CLUT。
   ORIGIN = UnmappedAddress
   UnmappedAddress是不可用于2D绘图引擎访问的地址。
   推荐的UnmappedAddress在关键字“UnmappedAddress”下给出。
   或者在显示列表模式下执行相同操作：
   DWORD8020011Eh“地址字”列表的开始DWORD0001000
   1hSIZE=00010001h

   ```
   DWORD 0000 0000h          // CONTROL2 = 0000 0000h
   DWORD UnmappedAddress     // ORIGIN = UnmappedAddress
   ```

2. 等待未映射地址违规对应的总线错误，表示访问未映射地址并停止渲染进程。未映射地址=FFFFFFF0h

3. 如果需要，禁用2D绘图引擎。

57. JPEG Codec (JPEG)

57.1 Overview

The JPEG Codec conforms to the JPEG baseline compression and decompression standard to provide high-speed compression of image data and high-speed decoding of JPEG data. Table 57.1 lists the JPEG Codec specifications and Figure 57.1 shows a block diagram.

Table 57.1 JPEG Codec specifications

Parameter	Specifications
Compliant standard	Complies with JPEG Baseline standard within the range described in this document. The JPEG Codec does not support the following features: • Scanning with two elements • Non-interleave scanning with multiple elements
Operational precision	Conforms to JPEG Part 2, ISO-IEC10918-2
Image input/output system	Block interleave method
Pixel format	• Compression: YCbCr422 (H = 2:1:1, V = 1:1:1) • Decompression: YCbCr444 (H = 1:1:1, V = 1:1:1), YCbCr422 (H = 2:1:1, V = 1:1:1), YCbCr411 (H = 4:1:1, V = 1:1:1), YCbCr420 (H = 2:1:1, V = 2:1:1) • Output pixel format to the buffer: ARGB8888, RGB565
Quantization table	• Four tables provided
Huffman table	• Four tables provided (two tables for AC coefficients and two tables for DC coefficients)
Markers supported	SOI (start of image), SOF0 (start of frame type 0), SOS (start of scan), DQT (define quantization tables), DHT (define Huffman tables), DRI (define restart interval), RSTm (restart marks), and EOI (end of image)
Processing unit	8-byte address boundary units can be set
Image sizes that can be processed	Sizes divisible by the minimum coded unit (MCU): 8 lines by 8 pixels in YCbCr444, 8 lines by 16 pixels in YCbCr422, 8 lines by 32 pixels in YCbCr411, 16 lines by 16 pixels in YCbCr420

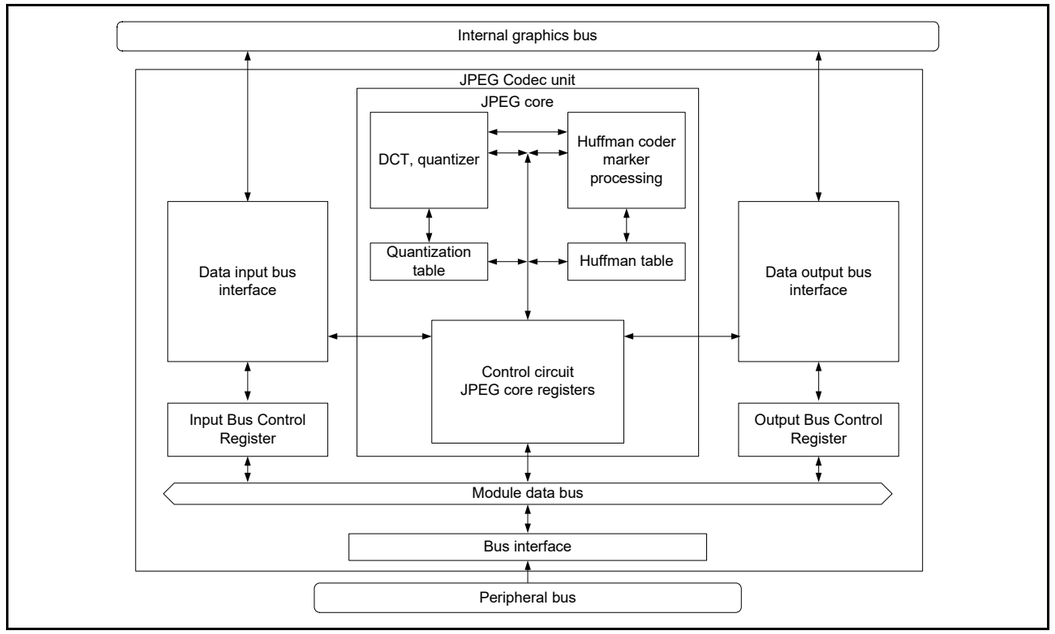

Figure 57.1 JPEG Codec block diagram

Note: When using the JPEG, set the clock to ICLK = PCLKA.

57. JPEG编解码器(JPEG)

57.1 Overview

JPEGCodec符合JPEG基线压缩和解压缩标准，可提供图像数据的高速压缩和JPEG数据的高速解码。表57.1列出了JPEG编解码器规范，图57.1显示了框图。

Table 57.1 JPEG编解码器规格

Parameter	Specifications
符合标准	在本文档描述的范围内符合JPEGBaseline标准。 JPEG编解码器不支持以下功能： 使用两个元素进行扫描 使用多个元素进行非交错扫描
操作精度	符合JPEG第2部分，ISO-IEC10918-2
图像输入输出系统	块交错法
像素格式	压缩：YCbCr422(H=2:1:1 V=1:1:1) 减压：YCbCr444(H=1:1:1 V=1:1:1) YCbCr422(H=2:1):1 V=1:1:1) YCbCr411(H=4:1:1 V=1:1:1) YCbCr420(H=2:1:1 V=2:1:1) 输出像素格式到缓冲区：ARGB8888、RGB565
量化表	提供四张桌子
Huffman table	提供四个表格（两个表格用于交流系数，两个表格用于直流系数）
支持的标记	SOI（图像开始）、SOF0（帧类型0开始）、SOS（扫描开始）、DQT（定义量化表）、DHT（定义霍夫曼表）、DRI（定义重启间隔）、RSTm（重启标记）、和EOI（图片结束）
处理单元	8字节地址边界单元可设置
可处理的图像尺寸	可被最小编码单元(MCU)整除的尺寸：YCbCr444中8行x8像素，YCbCr422中8行x16像素，YCbCr411中8行x32像素，YCbCr420中16行x16像素

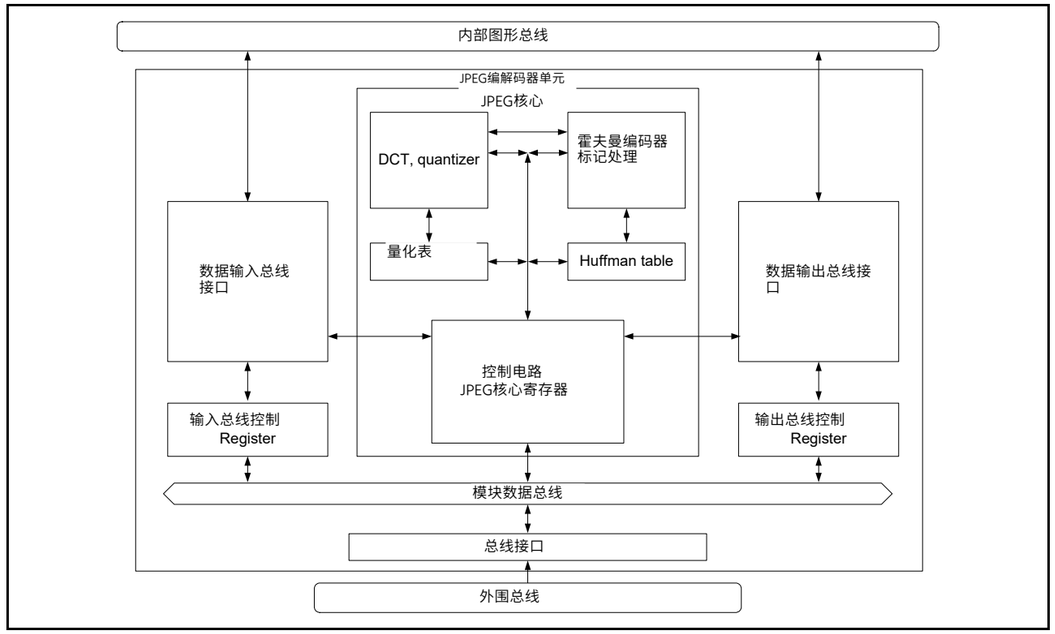

Figure 57.1 JPEG编解码器框图

Note: 使用JPEG时，将时钟设置为ICLK=PCLKA。

57.2 Register Descriptions

57.2.1 JPEG Code Mode Register (JCMOD)

Address(es): JPEG.JCMOD 400E 6000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	DSP	REDU[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	REDU[2:0]	Pixel Format	• With compression b2 b0 0 0 1: YCbCr422. Other settings are prohibited. • With decompression b2 b0 0 0 0: YCbCr444 0 0 1: YCbCr422 1 1 0: YCbCr411 0 1 0: YCbCr420. Other settings result in an error. The JPEG Codec cannot process them normally.	R/W*2
b3	DSP	Compression/Decompression Set*1	0: Select compression process 1: Select decompression process.	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. When changing between processing for compression and decompression, you must reset the JPEG Codec in advance by setting the BRST bit in JPEG Code Command Register (JCCMD).
Note 2. In decompression mode, these bits are read-only.

57.2.2 JPEG Code Command Register (JCCMD)

Address(es): JPEG.JCCMD 400E 6001h

	b7	b6	b5	b4	b3	b2	b1	b0
	BRST	—	—	—	—	JEND	JRST	JSRT
Value after reset:	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit name	Description	R/W
b0	JSRT	JPEG Core Process Start Command	Set this bit to 1 to start JPEG core processing. Do not write this bit to 1 again while the JPEG Codec is in operation.	W
b1	JRST	JPEG Core Process Stop Clear Command	Set this bit to 1 to clear the process-stopped state caused by requests to read the image size and pixel format (enabled in the INT3 bit in JINTE0).	W*1
b2	JEND	Interrupt Request Clear Command	Set this bit to 1 to clear an interrupt request. This bit is only valid for the interrupt sources associated with the INS6, INS5, and INS3 bits in JINTS0.	W

57.2 注册说明

57.2.1 JPEG代码模式寄存器(JCMOD)

Address(es): JPEG.JCMOD 400E 6000h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	DSP	REDU[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	REDU[2:0]	像素格式	带压缩b2b0001：YCbCr422。禁止其他设置。 减压b2b000：YCbCr444001：YCbCr422110：YCbCr411010：YCbCr420。其他设置会导致错误。JPEG编解码器无法正常处理它们。	R/W*2
b3	DSP	Compression/Decompression Set*1	0：选择压缩过程1：选择解压缩过程。	R/W
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 在压缩处理和解压缩处理之间切换时，必须通过设置JPEG代码命令寄存器(JCCMD)中的BRST位来提前复位JPEG编解码器。
Note 2. 在解压缩模式下，这些位是只读的。

57.2.2 JPEG代码命令寄存器(JCCMD)

Address(es): JPEG.JCCMD 400E 6001h

	b7	b6	b5	b4	b3	b2	b1	b0
	BRST	—	—	—	—	JEND	JRST	JSRT
重置后的值：	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	位名称	Description	R/W
b0	JSRT	JPEG核心进程启动命令	将此位设置为1以启动JPEG核心处理。在JPEG编解码器运行时，不要再次将此位写入1。	W
b1	JRST	JPEG核心进程停止清除Command	将此位设置为1以清除因请求读取图像大小和像素格式（在JINTE0的INT3位中启用）导致的进程停止状态。	W*1
b2	JEND	中断请求清除命令	将此位设置为1以清除中断请求。该位仅对与JINTS0中的INS6、INS5和INS3位相关的中断源有效。	W

Bit	Symbol	Bit name	Description	R/W
b6 to b3	—	Reserved	The write value should be 0.	W
b7	BRST	Bus Reset	Set this bit to 1 to reset the JCDTCU, JCDTCM, JCDTCD, JCDERR and JCRST registers. Do not set this bit to 1 while the JPEG Codec is in operation (from setting the JPEG core process start command to writing the last output code and image data). For the bus reset processing, see section 57.5, Bus Reset Processing.	W

Note: Clearing the bits in this register to 0 after setting a command is not required. Multiple commands must not be set simultaneously.
Note 1. In compression mode, this bit is invalid.

57.2.3 JPEG Code Quantization Table Number Register (JCQTN)

Address(es): JPEG.JCQTN 400E 6003h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	QT3[1:0]		QT2[1:0]		QT1[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b1, b0	QT1[1:0]	Quantization Table Number for the First Color Component	b1 b0 0 0: Quantization table 0 (JCQTBL0) 0 1: Quantization table 1 (JCQTBL1) 1 0: Quantization table 2 (JCQTBL2) 1 1: Quantization table 3 (JCQTBL3).	R/W*1
b3, b2	QT2[1:0]	Quantization Table Number for the Second Color Component	b3 b2 0 0: Quantization table 0 (JCQTBL0) 0 1: Quantization table 1 (JCQTBL1) 1 0: Quantization table 2 (JCQTBL2) 1 1: Quantization table 3 (JCQTBL3).	R/W*1
b5, b4	QT3[1:0]	Quantization Table Number for the Third Color Component	b5 b4 0 0: Quantization table 0 (JCQTBL0) 0 1: Quantization table 1 (JCQTBL1) 1 0: Quantization table 2 (JCQTBL2) 1 1: Quantization table 3 (JCQTBL3).	R/W*1
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. In decompression mode, these bits are read-only.

Bit	Symbol	位名称	Description	R/W
b6 to b3	—	Reserved	写入值应为0。	W
b7	BRST	总线复位	将此位设置为1可复位JCDTCU、JCDTCM、JCDTCD、JCDERR和JCRST寄存器。 在JPEG编解码器运行时（从设置JPEG核心进程启动命令到写入最后的输出代码和图像数据），请勿将此位设置为1。 关于总线复位处理，请参阅第57.5节，总线复位 Processing.	W

Note: 不需要在设置命令后将该寄存器中的位清除为0。不能同时设置多个命令。

Note 1. 在压缩模式下，该位无效。

57.2.3 JPEG码量化表编号寄存器（JCQTN）

Address(es): JPEG.JCQTN 400E 6003h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	QT3[1:0]		QT2[1:0]		QT1[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b1, b0	QT1[1:0]	第一个颜色分量的量化表编号	b1b000：量化表0（JCQTBL0）01：量化表1（JCQTBL1）10：量化表2（JCQTBL2）11：量化表3（JCQTBL3）。	R/W*1
b3, b2	QT2[1:0]	第二颜色分量的量化表编号	b3b200：量化表0（JCQTBL0）01：量化表1（JCQTBL1）10：量化表2（JCQTBL2）11：量化表3（JCQTBL3）。	R/W*1
b5, b4	QT3[1:0]	第三颜色分量的量化表编号	b5b400：量化表0（JCQTBL0）01：量化表1（JCQTBL1）10：量化表2（JCQTBL2）11：量化表3（JCQTBL3）。	R/W*1
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 在解压缩模式下，这些位是只读的。

57.2.4 JPEG Code Huffman Table Number Register (JCHTN)

Address(es): JPEG.JCHTN 400E 6004h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	HTA3	HTD3	HTA2	HTD2	HTA1	HTD1
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	HTD1	Huffman Table Number (DC) for the First Color Component	b1 b0 0 0: DC/AC Huffman table 0 (JCHTBD0 and JCHTBA0) 1 1: DC/AC Huffman table 1 (JCHTBD1 and JCHTBA1). Other settings are prohibited.	R/W*1
b1	HTA1	Huffman Table Number (AC) for the First Color Component		R/W*1
b2	HTD2	Huffman Table Number (DC) for the Second Color Component	b3 b2 0 0: DC/AC Huffman table 0 (JCHTBD0 and JCHTBA0) 1 1: DC/AC Huffman table 1 (JCHTBD1 and JCHTBA1). Other settings are prohibited.	R/W*1
b3	HTA2	Huffman Table Number (AC) for the Second Color Component		R/W*1
b4	HTD3	Huffman Table Number (DC) for the Third Color Component	b5 b4 0 0: DC/AC Huffman table 0 (JCHTBD0 and JCHTBA0) 1 1: DC/AC Huffman table 1 (JCHTBD1 and JCHTBA1). Other settings are prohibited.	R/W*1
b5	HTA3	Huffman Table Number (AC) for the Third Color Component		R/W*1
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. In decompression mode, these bits are read-only.

57.2.5 JPEG Code DRI Upper Register (JCDRIU)

Address(es): JPEG.JCDRIU 400E 6005h

	b7	b6	b5	b4	b3	b2	b1	b0
	DRIU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	DRIU[7:0]	Upper Bytes of MCUs Preceding RST Marker	Valid settings: 00h to FFh (0 to 255).*1	R/W*2

Note 1. When both JCDRIU = 00h and JCDRID = 00h, neither the DRI nor the RST marker is placed.
Note 2. In decompression mode, these bits are invalid.

57.2.4 JPEG代码霍夫曼表编号寄存器(JCHTN)

Address(es): JPEG.JCHTN 400E 6004h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	HTA3	HTD3	HTA2	HTD2	HTA1	HTD1
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	HTD1	第一个颜色分量的霍夫曼表编号(DC)	b1b000：直流交流霍夫曼表0（JCHTBD0和JCHTBA0） 1：直流交流霍夫曼表1（JCHTBD1和JCHTBA1）。禁止其他设置。	R/W*1
b1	HTA1	第一个颜色分量的霍夫曼表编号(AC)		R/W*1
b2	HTD2	第二个颜色分量的霍夫曼表编号(DC)	b3b200：直流交流霍夫曼表0（JCHTBD0和JCHTBA0） 1：直流交流霍夫曼表1（JCHTBD1和JCHTBA1）。禁止其他设置。	R/W*1
b3	HTA2	第二个颜色分量的霍夫曼表编号(AC)		R/W*1
b4	HTD3	第三个颜色分量的霍夫曼表编号(DC)	b5b400：直流交流霍夫曼表0（JCHTBD0和JCHTBA0） 1：直流交流霍夫曼表1（JCHTBD1和JCHTBA1）。禁止其他设置。	R/W*1
b5	HTA3	第三个颜色分量的霍夫曼表编号(AC)		R/W*1
b7, b6	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 在解压缩模式下，这些位是只读的。

57.2.5 JPEG代码DRI上位寄存器(JCDRIU)

Address(es): JPEG.JCDRIU 400E 6005h

	b7	b6	b5	b4	b3	b2	b1	b0
	DRIU[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	DRIU[7:0]	前面MCU的高字节 RST Marker	有效设置：00h到FFh（0到255）。*1	R/W*2

Note 1. 当JCDRIU=00h和JCDRID=00h时，既不放置DRI也不放置RST标记。
Note 2. 在解压模式下，这些位无效。

57.2.6 JPEG Code DRI Lower Register (JCDRID)

Address(es): JPEG.JCDRID 400E 6006h

	b7	b6	b5	b4	b3	b2	b1	b0
	DRIU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	DRIU[7:0]	Lower Bytes of MCUs Preceding RST Marker	Valid settings: 00h to FFh (0 to 255).*1	R/W*2

Note 1. When both JCDRIU = 00h and JCDRID = 00h, neither the DRI nor the RST marker is placed.
Note 2. In decompression mode, these bits are invalid.

57.2.7 JPEG Code Vertical Size Upper Register (JCVSZU)

Address(es): JPEG.JCVSZU 400E 6007h

	b7	b6	b5	b4	b3	b2	b1	b0
	VSZU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	VSZU[7:0]	Upper Bytes of Vertical Image Size	Valid settings: 00h to FFh (0 to 255).*2	R/W*1

Note 1. In decompression mode, these bits are read-only.
Note 2. In the decompression process, a downloaded value from the JPEG coded data is set.

57.2.8 JPEG Code Vertical Size Lower Register (JCVSZD)

Address(es): JPEG.JCVSZD 400E 6008h

	b7	b6	b5	b4	b3	b2	b1	b0
	VSZD[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	VSZD[7:0]	Lower Bytes of Vertical Image Size	Valid settings: 00h to FFh (0 to 255).*2	R/W*1

Note 1. In decompression mode, these bits are read-only.
Note 2. In the decompression process, a downloaded value from the JPEG coded data is set.

57.2.6 JPEG代码DRI低位寄存器(JCDRID)

Address(es): JPEG.JCDRID 400E 6006h

	b7	b6	b5	b4	b3	b2	b1	b0
	DRIU[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	DRIU[7:0]	RST标记之前的MCU的低字节	有效设置：00h到FFh（0到255）。*1	R/W*2

Note 1. 当JCDRIU=00h和JCDRID=00h时，既不放置DRI也不放置RST标记。
Note 2. 在解压模式下，这些位无效。

57.2.7 JPEG代码垂直大小上寄存器(JCVSZU)

Address(es): JPEG.JCVSZU 400E 6007h

	b7	b6	b5	b4	b3	b2	b1	b0
	VSZU[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	VSZU[7:0]	垂直图像大小的高字节	有效设置：00h到FFh（0到255）。*2	R/W*1

Note 1. 在解压缩模式下，这些位是只读的。
Note 2. 在解压缩过程中，设置来自JPEG编码数据的下载值。

57.2.8 JPEG代码垂直大小低位寄存器(JCVSZD)

Address(es): JPEG.JCVSZD 400E 6008h

	b7	b6	b5	b4	b3	b2	b1	b0
	VSZD[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	VSZD[7:0]	垂直图像大小的低字节	有效设置：00h到FFh（0到255）。*2	R/W*1

Note 1. 在解压缩模式下，这些位是只读的。
Note 2. 在解压缩过程中，设置来自JPEG编码数据的下载值。

57.2.9 JPEG Code Horizontal Size Upper Register (JCHSZU)

Address(es): JPEG.JCHSZU 400E 6009h

	b7	b6	b5	b4	b3	b2	b1	b0
	HSZU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	HSZU[7:0]	Upper Bytes of Horizontal Image Size	Valid settings: 00h to FFh (0 to 255).*2	R/W*1

Note 1. In decompression mode, these bits are read-only.
Note 2. In the decompression process, a downloaded value from the JPEG coded data is set.

57.2.10 JPEG Coded Horizontal Size Lower Register (JCHSZD)

Address(es): JPEG.JCHSZD 400E 600Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	HSZD[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	HSZD[7:0]	Lower Bytes of Horizontal Image Size	Valid settings: 00h to FFh (0 to 255).*2	R/W*1

Note 1. In decompression mode, these bits are read-only.
Note 2. In the decompression process, a downloaded value from the JPEG coded data is set.

57.2.11 JPEG Code Data Count Upper Register (JCDTCU)

Address(es): JPEG.JCDTCU 400E 600Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	DCU[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	DCU[7:0]	Upper Bytes of Counted Amount of Data to Be Compressed	Valid settings: 00h to FFh (0 to 255).	R*2

Note 1. The values in this register are reset before compression starts.
Note 2. In decompression mode, these bits are invalid.

57.2.9 JPEG代码水平尺寸上限寄存器(JCHSZU)

Address(es): JPEG.JCHSZU 400E 6009h

	b7	b6	b5	b4	b3	b2	b1	b0
	HSZU[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	HSZU[7:0]	水平图像大小的高字节	有效设置：00h到FFh（0到255）。*2	R/W*1

Note 1. 在解压缩模式下，这些位是只读的。
Note 2. 在解压缩过程中，设置来自JPEG编码数据的下载值。

57.2.10 JPEG编码水平尺寸低位寄存器(JCHSZD)

Address(es): JPEG.JCHSZD 400E 600Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	HSZD[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	HSZD[7:0]	水平图像大小的低字节	有效设置：00h到FFh（0到255）。*2	R/W*1

Note 1. 在解压缩模式下，这些位是只读的。
Note 2. 在解压缩过程中，设置来自JPEG编码数据的下载值。

57.2.11 JPEG代码数据计数高位寄存器(JCDTCU)

Address(es): JPEG.JCDTCU 400E 600Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	DCU[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	DCU[7:0]	待计数数据量的高字节 Compressed	有效设置：00h到FFh（0到255）。	R*2

Note 1. 该寄存器中的值在压缩开始前被复位。
Note 2. 在解压模式下，这些位无效。

57.2.12 JPEG Code Data Count Middle Register (JCDTCM)

Address(es): JPEG.JCDTCM 400E 600Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	DCM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	DCM[7:0]	Middle Bytes of Counted Amount of Data to Be Compressed	Valid settings: 00h to FFh (0 to 255).	R*2

Note 1. The values in this register are reset before compression starts.
Note 2. In decompression mode, these bits are invalid.

57.2.13 JPEG Code Data Count Lower Register (JCDTCD)

Address(es): JPEG.JCDTCD 400E 600Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	DCD[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	DCD[7:0]	Lower Bytes of Counted Amount of Data to Be Compressed	Valid settings: 00h to FFh (0 to 255).	R*2

Note 1. The values in this register are reset before compression starts.
Note 2. In decompression mode, these bits are invalid.

57.2.14 JPEG Interrupt Enable Register 0 (JINTE0)

Address(es): JPEG.JINTE0 400E 600Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	INT7	INT6	INT5	—	INT3	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3	INT3	Interrupt Request Signal INS3 Enable Control	Enables interrupt generation when determined that image size and pixel format of compressed data can be read by analyzing the data.	R/W*2
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5	INT5	Interrupt Request Last MCU Data Number Error Enable Control	Enables interrupt generation when final number of MCU data units in Huffman-coding segment is not correct in decompression. When this bit is not set to enable, no error code is returned.	R/W*2
b6	INT6	Interrupt Request Total Number Error Enable Control	Enables interrupt generation when total number of data units in Huffman-coding segment is not correct in decompression. When this bit is not set to enable, no error code is returned.	R/W*2

57.2.12 JPEG代码数据计数中间寄存器(JCDTCM)

Address(es): JPEG.JCDTCM 400E 600Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	DCM[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	DCM[7:0]	待统计数据量的中间字节 Compressed	有效设置：00h到FFh（0到255）。	R*2

Note 1. 该寄存器中的值在压缩开始前被复位。
Note 2. 在解压模式下，这些位无效。

57.2.13 JPEG代码数据计数低位寄存器(JCDTCD)

Address(es): JPEG.JCDTCD 400E 600Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	DCD[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b7 to b0	DCD[7:0]	计数数据量的低字节 Compressed	有效设置：00h到FFh（0到255）。	R*2

Note 1. 该寄存器中的值在压缩开始前被复位。
Note 2. 在解压模式下，这些位无效。

57.2.14 JPEG中断使能寄存器0(JINTE0)

Address(es): JPEG.JINTE0 400E 600Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	INT7	INT6	INT5	—	INT3	—	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b3	INT3	中断请求信号INS3 启用控制	当确定可以通过分析数据读取压缩数据的图像大小和像素格式时，启用中断生成。	R/W*2
b4	—	Reserved	该位读取为0。写入值应为0。	R/W
b5	INT5	中断请求最后MCU数据编号 错误使能 Control	当Huffman编码段中的最终MCU数据单元数在解压缩中不正确时，启用中断生成。当该位未设置为使能时，不返回错误代码。	R/W*2
b6	INT6	中断请求总数 错误启用控制	当数据单元总数在 Huffman编码段在解压时不正确。 当该位未设置为使能时，不返回错误代码。	R/W*2

Bit	Symbol	Bit name	Description	R/W
b7	INT7	Interrupt Request Restart Interval Data Number Error Enable Control	Enables interrupt generation when number of data units in restart interval of Huffman-coding segment is not correct in decompression. When this bit is not set to enable, no error code is returned.	R/W*2

Note 1. When any of the bits from INT7 to INT5 sets to 1, the INS5 bit in the JINTS0 register indicates 1 as the error status on occurrence of the compression data error, and the ERR[3:0] bits in the JCDERR register indicate the specific error code.
Note 2. In compression mode, these bits are invalid.

57.2.15 JPEG Interrupt Status Register 0 (JINTS0)

Address(es): JPEG.JINTS0 400E 600Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	INS6	INS5	—	INS3	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3	INS3	Request for Reading the Image Size and Pixel Format	This bit sets to 1 when image size and pixel format can be read. When an interrupt occurs, the JPEG Codec stops processing and the state is indicated in the JCRST register. To resume module processing, set the JPEG Core Process Stop Clear Command Bit (JRST) in JCCMD.	R/W*2, *3
b4	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5	INS5	JPEG Decompression Error Occurrence	This bit sets to 1 when a compressed data error occurs.	R/W*2, *3
b6	INS6	JPEG Decompression Process End	This bit sets to 1 when the JPEG Codec completes compression process normally.	R/W*2
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. The interrupt sources in this register should be cleared by clearing the associated interrupt status bits to 0 and setting the relevant bit in JCCMD appropriately.
Note 2. Clear this bit by writing 0 to it. Do not write 1 to this bit.
Note 3. In compression mode, these bits are invalid.

57.2.16 JPEG Code Decode Error Register (JCDERR)

Address(es): JPEG.JCDERR 400E 6010h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	ERR[3:0]			
Value after reset:	0	0	0	0	1	0	1	0

Bit	Symbol	Bit name	Description	R/W
b3 to b0	ERR[3:0]	Error Code	See Table 57.3 and Table 57.4. for error codes.	R/W*2
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The values in this register are reset before the JPEG Codec starts decompression.
Note 2. In compression mode, these bits are invalid.

Bit	Symbol	位名称	Description	R/W
b7	INT7	中断请求重启 间隔数据编号错误 启用控制	当Huffman编码段的重新启动间隔中的数据单元数在解压缩时不正确时，启用中断生成。当该位未设置为使能时，不返回错误代码。	R/W*2

Note 1. 当INT7到INT5中的任何一位设置为1时，JINTS0寄存器中的INS5位指示1作为发生压缩数据错误时的错误状态，JCDERR寄存器中的ERR[3:0]位指示具体错误代码。
Note 2. 在压缩模式下，这些位无效。

57.2.15 JPEG中断状态寄存器0(JINTS0)

Address(es): JPEG.JINTS0 400E 600Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	INS6	INS5	—	INS3	—	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b3	INS3	请求阅读 图像尺寸和像素 Format	当可以读取图像大小和像素格式时，该位设置为1。 发生中断时，JPEG编解码器停止处理并在JCRST寄存器中指示状态。要恢复模块处理，请在JCCMD中设置JPEG核心进程停止清除命令位(JRST)。	R/W*2, *3
b4	—	Reserved	该位读取为0。写入值应为0。	R/W
b5	INS5	JPEG解压 错误发生	当发生压缩数据错误时，该位设置为1。	R/W*2, *3
b6	INS6	JPEG解压 流程结束	当JPEGCodec正常完成压缩过程时，该位设置为1。	R/W*2
b7	—	Reserved	该位读取为0。写入值应为0。	R/W

Note 1. 该寄存器中的中断源应通过将相关中断状态位清除为0并适当设置JCCMD中的相关位来清除。

Note 2. 通过向该位写入0来清除该位。不要向该位写入1。
Note 3. 在压缩模式下，这些位无效。

57.2.16 JPEG代码解码错误寄存器(JCDERR)

Address(es): JPEG.JCDERR 400E 6010h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	ERR[3:0]			
重置后的值：	0	0	0	0	1	0	1	0

Bit	Symbol	位名称	Description	R/W
b3 to b0	ERR[3:0]	错误代码	见表57.3和表57.4。对于错误代码。	R/W*2
b7 to b4	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 该寄存器中的值在JPEG编解码器开始解压缩之前复位。
Note 2. 在压缩模式下，这些位无效。

57.2.17 JPEG Code Reset Register (JCRST)

Address(es): JPEG.JCRST 400E 6011h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RST	Operating State	0: All other states 1: Suspended state caused by JINTE0 interrupt sources.	R*2
b7 to b1	—	Reserved	These bits are read as 0.	R

Note 1. To resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.
Note 2. In compression mode, this bit is invalid.

57.2.18 JPEG Interface Compression Control Register (JIFECNT)

Address(es): JPEG.JIFECNT 400E 6040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	JOUTSWAP[2:0]		—	DINRINI	DINRCMD	DINLC	—	DINSWAP[2:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	DINSWAP[2:0]	Byte/Halfword/Word Swap	Swaps input image data in compression. b2 b0 0 0 0: (1) (2) (3) (4) (5) (6) (7) (8) 0 0 1: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 0 1 0: (3) (4) (1) (2) (7) (8) (5) (6) [Halfword swap] 0 1 1: (4) (3) (2) (1) (8) (7) (6) (5) [Halfword - byte swap] 1 0 0: (5) (6) (7) (8) (1) (2) (3) (4) [Word swap] 1 0 1: (6) (5) (8) (7) (2) (1) (4) (3) [Word - byte swap] 1 1 0: (7) (8) (5) (6) (3) (4) (1) (2) [Word - halfword swap] 1 1 1: (8) (7) (6) (5) (4) (3) (2) (1) [Word - halfword - byte swap].	R/W*1
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	DINLC	Count Mode Setting for Stopping Input Image Data Lines	0: Turn off count mode for stopping input of image data lines 1: Turn on count mode for stopping input of image data lines.	R/W*1
b5	DINRCMD	Input Image Data Lines Resume Command	Set this bit to 1 to resume reading of input image data. This bit is only valid when the count mode for stopping input of image data lines is on. This bit is always read as 0.	W*1
b6	DINRINI	Address Initialization when Resuming Input of Image Data Lines	This bit is only valid when the count mode for stopping input of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: Do not initialize transfer address when input of image data lines restarts 1: Initialize transfer address when input of image data lines restarts.	R/W*1
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

57.2.17 JPEG代码重置寄存器(JCRST)

Address(es): JPEG.JCRST 400E 6011h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RST
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	RST	工作状态	0：所有其他状态1：由JINTE0中断源引起的挂起状态。	R*2
b7 to b1	—	Reserved	这些位读为0。	R

Note 1. 要恢复处理，请在JCCMD中设置JPEG核心进程停止清除命令位(JRST)。
Note 2. 在压缩模式下，该位无效。

57.2.18 JPEG接口压缩控制寄存器(JIFECNT)

Address(es): JPEG.JIFECNT 400E 6040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	JOUTSWAP[2:0]		—	DINRINI	DINRCMD	DINLC	—	DINSWAP[2:0]			
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	DINSWAP[2:0]	Byte/Halfword/Word Swap	交换压缩中的输入图像数据。b2b0000:(1)(2)(3)(4)(5)(6)(7)(8)001:(2)(1)(4)(3)(6)(5)(8)(7)[字节交换]010:(3)(4)(1)(2)(7)(8)(5)(6)[半字交换]011:(4)(3)(2)(1)(8)(7)(6)(5)[半字字节交换]100:(5)(6)(7)(8)(1)(2)(3)(4)[字交换]101:(6)(5)(8)(7)(2)(1)(4)(3)[字字节交换]110:(7)(8)(5)(6)(3)(4)(1)(2)[字半字交换]111:(8)(7)(6)(5)(4)(3)(2)(1)[字半字字节交换]。	R/W*1
b3	—	Reserved	该位读取为0。写入值应为0。	R/W
b4	DINLC	计数模式设置 停止输入图像 数据线	0：关闭计数模式，停止输入图像数据线1：打开计数模式， 停止输入图像数据线。	R/W*1
b5	DINRCMD	输入图像数据线 恢复命令	将此位设置为1以恢复读取输入图像数据。 该位仅在停止输入图像数据线的计数模式打开时有效。该位始终读为0。	W*1
b6	DINRINI	恢复输入图像数据行时的地址初始化	该位仅在停止输入图像数据线的计数模式打开时有效。在将1写入数据线恢复命令位之前设置该位。0：重新输入图像数据线时不初始化传输地址1：重新输入图像数据线时初始化传输地址。	R/W*1
b7	—	Reserved	该位读取为0。写入值应为0。	R/W

Bit	Symbol	Bit name	Description	R/W
b10 to b8	JOUTSWAP[2:0]	Byte/Halfword/Word Swap	Swaps output coded data in compression. b10 b8 0 0 0: (1) (2) (3) (4) (5) (6) (7) (8) 0 0 1: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 0 1 0: (3) (4) (1) (2) (7) (8) (5) (6) [Halfword swap] 0 1 1: (4) (3) (2) (1) (8) (7) (6) (5) [Halfword - byte swap] 1 0 0: (5) (6) (7) (8) (1) (2) (3) (4) [Word swap] 1 0 1: (6) (5) (8) (7) (2) (1) (4) (3) [Word - byte swap] 1 1 0: (7) (8) (5) (6) (3) (4) (1) (2) [Word - halfword swap] 1 1 1: (8) (7) (6) (5) (4) (3) (2) (1) [Word - halfword - byte swap].	R/W*1
b31 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. In decompression mode, these bits are invalid.

57.2.19 JPEG Interface Compression Source Address Register (JIFESA)

Address(es): JPEG.JIFESA 400E 6044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	ESA[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ESA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	ESA[2:0]	Input Image Data Source Address	The lower three bits should be set to 0. These bits are read as 0.	R/W
b31 to b3	ESA[31:3]		Input image data source address in 8-byte units.	R/W*2

Note 1. This register must be set in 8-byte units.
Note 2. In decompression mode, these bits are invalid.

57.2.20 JPEG Interface Compression Line Offset Register (JIFESOFST)

Address(es): JPEG.JIFESOFST 400E 6048h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	ESMW[14:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	ESMW[2:0]	Input Image Data Lines Offset	The lower three bits should be set to 0. These bits are read as 0.	R/W*2
b14 to b3	ESMW[14:3]		Input image data lines offset in 8-byte units.	R/W*2
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. This register must be set in 8-byte units.

Bit	Symbol	位名称	Description	R/W
b10 to b8	JOUTSWAP[2:0]	Byte/Halfword/Word Swap	交换压缩中的输出编码数据。b10b8000:(1)(2)(3)(4)(5)(6)(7)(8)001:(2)(1)(4)(3)(6)(5)(8)(7)[字节交换]010:(3)(4)(1)(2)(7)(8)(5)(6)[半字交换]011:(4)(3)(2)(1)(8)(7)(6)(5)[半字字节交换]100:(5)(6)(7)(8)(1)(2)(3)(4)[字交换]101:(6)(5)(8)(7)(2)(1)(4)(3)[字字节交换]110:(7)(8)(5)(6)(3)(4)(1)(2)[字半字交换]111:(8)(7)(6)(5)(4)(3)(2)(1)[字半字字节交换]。	R/W*1
b31 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 在解压模式下，这些位无效。

57.2.19 JPEG接口压缩源地址寄存器(JIFESA)

Address(es): JPEG.JIFESA 400E 6044h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	ESA[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	ESA[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	ESA[2:0]	输入图像数据源 Address	低三位应设置为0。这些位被读取为0。	R/W
b31 to b3	ESA[31:3]		以8字节为单位输入图像数据源地址。	R/W*2

Note 1. 该寄存器必须以8字节为单位进行设置。
Note 2. 在解压模式下，这些位无效。

57.2.20 JPEG接口压缩线偏移寄存器(JIFESOFST)

Address(es): JPEG.JIFESOFST 400E 6048h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	ESMW[14:0]														
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	ESMW[2:0]	输入图像数据线偏移	低三位应设置为0。这些位被读取为0。	R/W*2
b14 to b3	ESMW[14:3]		输入图像数据行以8字节为单位偏移。	R/W*2
b31 to b15	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 该寄存器必须以8字节为单位进行设置。

Note 2. In decompression mode, these bits are invalid.

57.2.21 JPEG Interface Compression Destination Address Register (JIFEDA)

Address(es): JPEG.JIFEDA 400E 604Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	EDA[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EDA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	EDA[2:0]	Output Coded Data Destination Address	The lower three bits should be set to 0. These bits are read as 0.	R/W*2
b31 to b3	EDA[31:3]		Output coded data destination address in 8-byte units.	R/W*2

Note 1. This register must be set in 8-byte units.
Note 2. In decompression mode, these bits are invalid.

57.2.22 JPEG Interface Compression Source Line Count Register (JIFESLC)

Address(es): JPEG.JIFESLC 400E 6050h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LINES[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	LINES[2:0]	Number of Input Image Data Lines to Be Read	The lower three bits should be set to 0. These bits are read as 0.	R/W*2
b15 to b3	LINES[15:3]		Number of input image data lines to be read, in 8-line units.	R/W*2
b18 to b16	—	Reserved	These bits are read as undefined. The write value should be 0.	R/W
b31 to b19	—	Reserved	These bits are read as undefined. The write value should be 1	R

Note 1. This register must be set in 8-byte units.
Note 2. In decompression mode, these bits are invalid.

Note 2. 在解压模式下，这些位无效。

57.2.21 JPEG接口压缩目标地址寄存器(JIFEDA)

Address(es): JPEG.JIFEDA 400E 604Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	EDA[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	EDA[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	EDA[2:0]	输出编码数据目的地 Address	低三位应设置为0。这些位被读取为0。	R/W*2
b31 to b3	EDA[31:3]		以8字节为单位输出编码数据目标地址。	R/W*2

Note 1. 该寄存器必须以8字节为单位进行设置。
Note 2. 在解压模式下，这些位无效。

57.2.22 JPEG接口压缩源行计数寄存器(JIFESLC)

Address(es): JPEG.JIFESLC 400E 6050h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	DDA[2:0]	Output Image Data Destination Address	The lower three bits should be set to 0. These bits are read as 0.	R/W*2
b31 to b3	DDA[31:3]		Output image data destination address in 8-byte units.	R/W*2

Note 1. This register must be set in 8-byte units.
Note 2. In compression mode, these bits are invalid.

57.2.25 JPEG接口解压缩行偏移寄存器(JIDFDOFST)

Address(es): JPEG.JIFDDOFST 400E 6060h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	DDMW[14:0]														
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	DDMW[2:0]	输出图像数据线偏移	低三位应设置为0。这些位被读取为0。	R/W*2
b14 to b3	DDMW[14:3]		输出图像数据行以8字节为单位偏移。	R/W*2
b31 to b15	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 该寄存器必须以8字节为单位进行设置。
Note 2. 在压缩模式下，这些位无效。

57.2.26 JPEG接口解压目标地址寄存器(JIFDDA)

Address(es): JPEG.JIFDDA 400E 6064h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	DDA[31:16]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DDA[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b2 to b0	DDA[2:0]	输出图像数据目的地Address	低三位应设置为0。这些位被读取为0。	R/W*2
b31 to b3	DDA[31:3]		以8字节为单位输出图像数据目标地址。	R/W*2

Note 1. 该寄存器必须以8字节为单位进行设置。
Note 2. 在压缩模式下，这些位无效。

57.2.27 JPEG Interface Decompression Source Data Count Register (JIFDSDC)

Address(es): JPEG.JIFDSDC 400E 6068h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	JDATAS[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	JDATAS[2:0]	Amount of Input Coded Data to Be Read	The lower three bits should be set to 0. These bits are read as 0.	R/W*2
b15 to b3	JDATAS[15:3]		Amount of input coded data to be read, in 8-byte units.	R/W*2
b18 to b16	—	Reserved	These bits are read as undefined. The write value should be 0.	R/W
b31 to b19	—	Reserved	These bits are read as undefined. The write value should be 1.	R

Note 1. This register must be set in 8-byte units.
Note 2. In compression mode, these bits are invalid.

57.2.28 JPEG Interface Decompression Destination Line Count Register (JIFDDLC)

Address(es): JPEG.JIFDDLC 400E 606Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	LINES[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0

Bit	Symbol	Bit name	Description	R/W
b2 to b0	LINES[2:0]	Number of Output Image Data Lines to Be Written	The lower three bits should be set to 0. These bits are read as 0.	R/W*2
b15 to b3	LINES[15:3]		Specifies number of lines of output image data to be written. Set the value so that the output image data line count matches the MCU unit. For YCbCr444, YCbCr422, and YCbCr411 output, the setting value × 1 is equal to the output image data line count. For YCbCr420 output, the setting value × 2 is equal to the output image data line count.	R/W*2
b18 to b16	—	Reserved	These bits are read as undefined. The write value should be 0.	R/W
b31 to b19	—	Reserved	These bits are read as undefined. The write value should be 1.	R

Note 1. Set this register so that the output image data line count matches the MCU unit.
Note 2. In compression mode, these bits are invalid.

57.2.27 JPEG接口解压缩源数据计数寄存器(JIFDSDC)

Address(es): JPEG.JIFDSDC 400E 6068h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b2	DBTEN	中断请求位DBTF 启用控制	当JINTS1中的DBTF位设置为1时，启用或禁用数据传输处理中断请求(JPEG_JDTI)。0：禁用中断请求1：启用中断请求。	R/W*1
b4, b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b5	DINLEN	中断请求位DINLF 启用控制	当JINTS1中的DINLF位设置为1时，启用或禁用数据传输处理中断请求(JPEG_JDTI)。0：禁用中断请求1：启用中断请求。	R/W*2

Bit	Symbol	Bit name	Description	R/W
b6	CBTEN	Interrupt Request Bit CBTF Enable Control	Enables or disables a data transfer processing interrupt request (JPEG_JDTI) when the CBTF bit in JINTS1 sets to 1. 0: Disable interrupt request 1: Enable interrupt request.	R/W*2
b31 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. In compression mode, these bits are invalid.
Note 2. In decompression mode, these bits are invalid.

57.2.31 JPEG Interrupt Status Register 1 (JINTS1)

Address(es): JPEG.JINTS1 400E 6090h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	CBTF	DINLF	—	—	DBTF	JINF	DOUTLF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	DOUTLF	Request for Decompressed Data Output Line Finish	In decompression, this bit sets to 1 when the number of lines of output image data indicated in JIFDDLC is written. This bit is only valid when the DOUTLC bit in JIFDCNT is set to 1.	R/W*1,*2,*3
b1	JINF	Request for JPEG Input Finish	This bit sets to 1 when the amount of input coded data indicated in JIFDSDC is read in decompression. This bit is only valid when the JINC bit in JIFDCNT is set to 1.	R/W*1,*2,*3
b2	DBTF	Request for Decompressed Data Bottom Finish	This bit sets to 1 when the last output image data is written in decompression.	R/W*1,*2,*3
b4, b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b5	DINLF	Request for Data Input Line Finish	This bit sets to 1 when the number of input image data lines indicated in JIFESLC is read in compression. This bit is only valid when the DINLC bit in JIFECNT is set to 1.	R/W*1,*2,*4
b6	CBTF	Request for Compressed Data Bottom Finish	This bit sets to 1 when the last output coded data is written in compression.	R/W*1,*2,*4
b31 to b7	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Clear the interrupt sources of this register by writing 0s to this register.
Note 2. When the bit is read as 1, write 0 to clear it. When the bit is read as 0, write 1 to set it.
Note 3. In compression mode, these bits are invalid.
Note 4. In decompression mode, these bits are invalid.

57.3 Operation

57.3.1 Compression

This section describes the compression process flows.

(1) Processing overview

The compression process overview is as follows:

1. The JPEG core is activated. A marker is output, after which, image data can be input. Approximately 30,000 cycles are required (for generating the SOI to SOS markers).

Bit	Symbol	位名称	Description	R/W
b6	CBTEN	中断请求位CBTF 启用控制	当JINTS1中的CBTF位设置为1时，启用或禁用数据传输处理中断请求(JPEG_JDTI)。0：禁用中断请求1：启用中断请求。	R/W*2
b31 to b7	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 在压缩模式下，这些位无效。
Note 2. 在解压模式下，这些位无效。

57.2.31 JPEG中断状态寄存器1(JINTS1)

Address(es): JPEG.JINTS1 400E 6090h

	—	—	—	—	—	—	—	—	—	CBTF	DINLF	—	—	DBTF	JINF	DOUTLF
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	DOUTLF	解压请求 数据输出线完成	在解压缩中，当写入JIFDDLC中指示的输出图像数据的行数时，该位设置为1。该位仅在JIFDCNT中的DOUTLC位设置为1时有效。	R/W*1,*2,*3
b1	JINF	请求JPEG输入 Finish	当在解压缩中读取JIFDSDC中指示的输入编码数据量时，该位设置为1。该位仅在JIFDCNT中的JINC位设置为1时有效。	R/W*1,*2,*3
b2	DBTF	解压请求 数据底部完成	当最后一个输出图像数据以解压缩方式写入时，该位设置为1。	R/W*1,*2,*3
b4, b3	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b5	DINLF	数据输入线请求 Finish	当在压缩中读取JIFESLC中指示的输入图像数据行数时，该位设置为1。该位仅在JIFECNT中的DINLC位设置为1时有效。	R/W*1,*2,*4
b6	CBTF	压缩请求 数据底部完成	当最后一个输出编码数据以压缩方式写入时，该位设置为1。	R/W*1,*2,*4
b31 to b7	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note 1. 通过向该寄存器写入0来清除该寄存器的中断源。
Note 2. 当该位读取为1时，写入0将其清除。当该位被读取为0时，写入1来设置它。
Note 3. 在压缩模式下，这些位无效。
Note 4. 在解压模式下，这些位无效。

57.3 Operation

57.3.1 Compression

本节介绍压缩处理流程。

(1) 处理概述

压缩过程概述如下：

1. JPEG核心被激活。输出标记后，可以输入图像数据。大约需要30 000个周期（用于生成SOI到SOS标记）。

2. Image data is transferred in MCUs from the external buffer to the JPEG Codec.
   - If the count mode for stopping the input of image data lines is on, reading stops each time the number of lines set in JIFESLC is read. To resume reading, set the DINRCMD bit in JIFECNT to 1.
   - When the DINRINI bit in JIFECNT is 0, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   - When the DINRINI bit is 1, the address set in JIFESA is used on resumption.
   - Reading is also stopped when one frame of image data is completely transferred.
   - If the count mode for stopping the input of image data lines is off, reading continues until one frame of image data is completely transferred.
3. Image data is input to the JPEG core. The input data is processed in MCUs at any time in the JPEG core.
4. Coded data is transferred from the JPEG Codec to the external buffer.
5. Compression is complete after one frame of data is processed completely.

(2) Compression flow

(a) Initial settings

To set the initial settings for compression:

After completing the JPEG core settings and input/output buffer settings and transferring image data to the external buffer, activate the JPEG Codec by setting the JSRT bit in JCCMD to 1. After the JPEG Codec is activated, the JPEG markers (SOI to SOS) are generated and output. Generating the markers takes approximately 30,000 cycles.

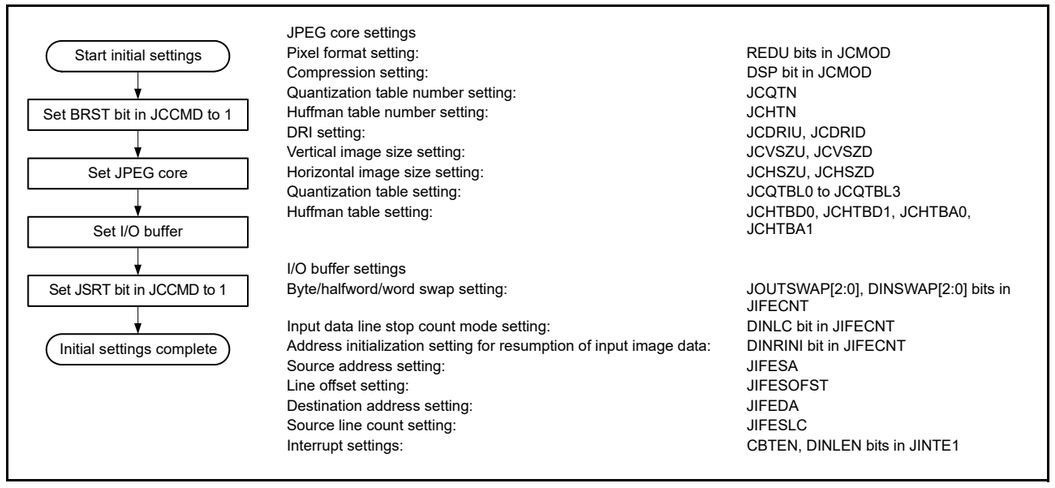

Figure 57.2 Flow of compression initial settings

(b) Compression process

The compression process flow is as follows:

1. When JPEG compression process is completed, the INS6 bit in JINTS0 sets to 1. However, the JPEG Codec continues processing, because the coded data remains to be transferred. The CBTF bit in JINTS1 sets to 1 when the last coded data is transferred. The interrupt source is cleared by a 0 write to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by a 0 write to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
2. When the JPEG Codec has completed compression and all coded data is transferred, the CBTF flag in JINTS1 sets to 1. When the CBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by a 0 write to the CBTF flag.

2. 图像数据在MCU中从外部缓冲区传输到JPEG编解码器。
   - 如果停止输入图像数据线的计数模式打开，则每次读取JIFESLC中设置的线数时停止读取。要恢复读取，请将JIFECNT中的DINRCMD位设置为1。
   - 当JIFECNT的DINRINI位为0时，恢复读取的地址从上一轮传输的地址继续。
   - 当DINRINI位为1时，在恢复时使用JIFESA中设置的地址。
   - 当一帧图像数据完全传输时，读取也会停止。
   - 如果停止输入图像数据线的计数模式关闭，则继续读取直到一帧图像数据传输完毕。
3. 图像数据被输入到JPEG核心。输入数据在JPEG内核中随时在MCU中处理。
4. 编码数据从JPEG编解码器传输到外部缓冲区。
5. 完成一帧数据处理后，即完成压缩。

(2) 压缩流量

(a) 初始设置

要设置压缩的初始设置：

完成JPEG核心设置和输入输出缓冲区设置并将图像数据传输到外部缓冲区后，通过将JCCMD中的JSRT位设置为1来激活JPEG编解码器。激活JPEG编解码器后，JPEG标记（SOI到SOS）为生成并输出。生成标记大约需要30 000个循环。

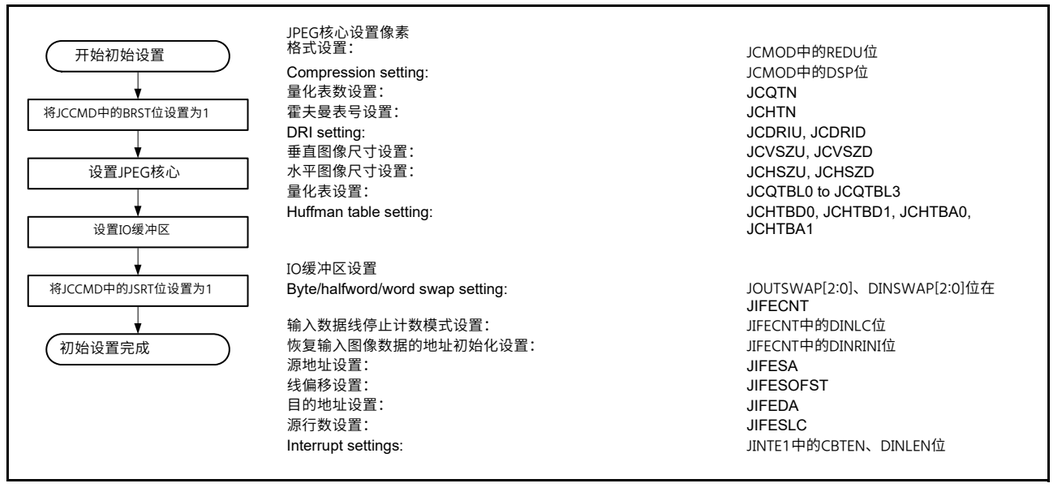

Figure 57.2 压缩初始设定流程

(b) 压缩过程

压缩处理流程如下：

1. 当JPEG压缩过程完成时，JINTS0中的INS6位设置为1。但是，JPEG编解码器继续处理，因为编码数据仍有待传输。当传输最后一个编码数据时，JINTS1中的CBTF位设置为1。向INS6位写入0可清除中断源。但是，此中断源发出的中断请求不能通过向INS6位写入0来清除。设置中断请求清除命令（通过将JCCMD中的JEND位设置为1）来清除中断请求。
2. 当JPEGCodec完成压缩并传输所有编码数据时，JINTS1中的CBTF标志设置为1。当此处JINTE1中的CBTEN位为1时，产生中断。将0写入CBTF标志清除中断源。

3. If the count mode for stopping image data lines is on, when the specified number of image data lines set in JIFESLC is read, the DINLF flag in JINTS1 sets to 1, and reading stops. When the DINLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by a 0 write to the DINLEN bit. Setting the DINRCMD bit in JIFECNT to 1 resumes reading.
   - When the DINRINI bit in JIFECNT is 0, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   - When the DINRINI bit is 1, the address set in JIFESA is used on resumption.

(c) Data correction

After the output coded data is divided by 8, if the remainder is 1 to 6 bytes, transfer of bytes 1 to 6 of the remainder might not complete successfully. If the transfer is unsuccessful, bytes 1 to 6 of the remainder are written to the address specified in the JPEG interface compression destination address register (JIFEDA), overwriting the existing data.*1

For this reason, it is necessary to check whether the output coded data was transferred successfully and, if not, to perform data correction.

Note 1. The JPEG Codec handles the output of coded data in 16-bit units. For this reason, if the coded data has an odd code length, the final code output is D9FFh. (FFh is appended.) When the remainder is 1, 3, or 5 bytes, the remainder data (1, 3, or 5 bytes) + FFh is written to the address specified in JIFEDA, overwriting the existing data.

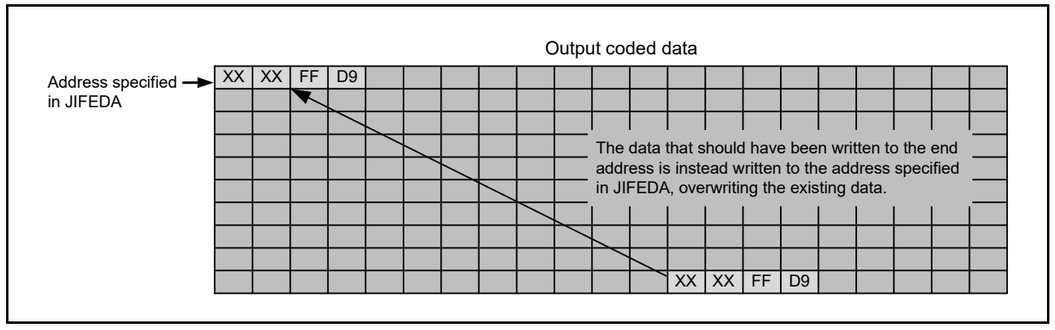

Figure 57.3 Conceptual diagram of abnormal transfer of output coded data

3. 如果停止图像数据线的计数模式打开，当读取JIFESLC中设置的指定数量的图像数据线时，JINTS1中的DINLF标志设置为1，并且读取停止。这里当JINTE1的DINLEN位为1时，产生中断。向DINLEN位写入0可清除中断源。将JIFECNT中的DINRCMD位设置为1可恢复读取。
   - 当JIFECNT的DINRINI位为0时，恢复读取的地址从上一轮传输的地址继续。
   - 当DINRINI位为1时，在恢复时使用JIFESA中设置的地址。

(c) 数据修正

输出编码数据除以8后，如果余数为1到6个字节，则余数的1到6字节的传输可能无法成功完成。如果传输不成功，则将剩余的字节1到6写入JPEG接口压缩目标地址寄存器(JIFEDA)中指定的地址，覆盖现有数据。*1

为此，有必要检查输出的编码数据是否传输成功，如果没有，则进行数据校正。

注1JPEG编解码器以16位为单位处理编码数据的输出。因此，如果编码数据的码长为奇数，则最终码输出为D9FFh。（附加FFh。）当余数为1、3或5字节时，将余数数据（1、3或5字节）+FFh写入JIFEDA中指定的地址，覆盖现有数据。

(3) JPEG coded data format

Figure 57.6 shows the data output stream in compression. The amount of coded data from SOI to EOI is indicated in JCDTCU, JCDTCM, and JCDTCD. When both JCDRIU and JCDRID are set to 0000_0000h, the following markers are not output:

- DRI marker
- RST marker (in compressed image data).

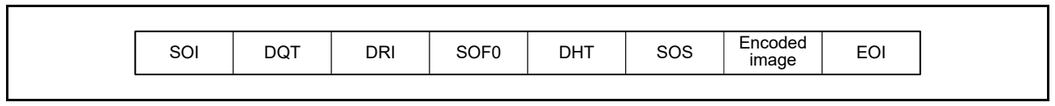

Figure 57.6 JPEG coded data format

- DQT: Not output for unused table
- DHT: Output in the order DC0, AC0, DC1, and AC1. Not output for unused tables
- SOF0: Component identifiers are C1 = first color component, C2 = second color component, and C3 = third color component
- SOS: Scan component selectors are CS1 = first color component, CS2 = second color component, and CS3 = third color component.

Header volume (reference)

- SOI: 2 bytes (FFD8)
- DQT: 134 bytes when two quantization tables are used, 199 bytes when three quantization tables are used (±65 bytes/table increase or decrease)
- DRI: 6 bytes
- SOF0: 19 bytes (4:2:2)
- DHT: 420 bytes (two tables are used)
- SOS: 14 bytes (4:2:2)
- EOI: 2 bytes (FFD9).

(4) Table setting

(a) Quantization table specification

The order of addresses shown in 8 × 8 blocks corresponds to that of the register addresses. Do not access this table while the JPEG Codec is processing.

Table 57.2 Quantization table

00	01	02	03	04	05	06	07
08	09	0A	0B	0C	0D	0E	0F

JCQTBL0 (400E 6102h) = 02h

(3) JPEG编码数据格式

图57.6显示了压缩后的数据输出流。从SOI到EOI的编码数据量在JCDTCU、JCDTCM和JCDTCD。当JCDRIU和JCDRID都设置为0000_0000h时，不输出以下标记：

- DRI标记
- RST标记（在压缩图像数据中）。

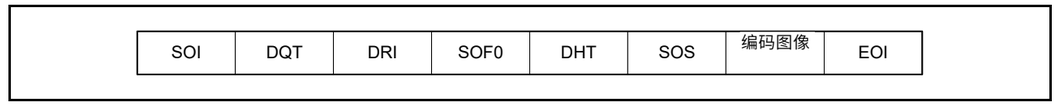

Figure 57.6 JPEG编码数据格式

- DQT：未使用的表不输出
- DHT：按DC0、AC0、DC1和AC1的顺序输出。未使用的表不输出
- SOF0：分量标识符为C1=第一个颜色分量，C2=第二个颜色分量，C3=第三个颜色分量
- SOS：扫描分量选择器是CS1=第一个颜色分量、CS2=第二个颜色分量和CS3=第三个颜色分量。

标头卷（参考）

- SOI: 2 bytes (FFD8)
- DQT：使用两个量化表时134字节，使用三个量化表时199字节（±65字节表增加或减少）
- DRI: 6 bytes
- SOF0: 19 bytes (4:2:2)
- DHT：420字节（使用两个表）
- SOS: 14 bytes (4:2:2)
- EOI: 2 bytes (FFD9).

(4) 桌面设置

(a) 量化表规范

8×8块中显示的地址顺序对应于寄存器地址的顺序。当JPEG编解码器正在处理时，请勿访问此表。

(b) Huffman table specification

This section provides examples of the Huffman table specification given in the ITU-T T81 Annex K.3.3 recommended by JPEG. In compression, the following settings must be specified for all the codes so that Huffman codes can be generated for all the group numbers.

- DC Huffman table: The number of codes for each code length is 12, and the group numbers in the order of frequency of occurrence are 12.
- AC Huffman table: The number of codes for each code length is 162, and the zero run length/group numbers in the order of frequency of occurrence are 162.

Do not access the following tables while the JPEG Codec is processing. In particular, read access is prohibited.

- Table K.3/T81

  JCHTBD0 (400E 6200h) = 00h
  JCHTBD0 (400E 6201h) = 01h
  JCHTBD0 (400E 6202h) = 05h
  JCHTBD0 (400E 6203h) = 01h
  :

(b) 霍夫曼表规范

本节提供了JPEG推荐的ITU-TT81附件K.3.3中给出的霍夫曼表规范的示例。在压缩中，必须为所有代码指定以下设置，以便可以为所有组号生成霍夫曼代码。

- DCHuffman表：每个码长的码数为12，按出现频率排序的组号为12。
- ACHuffman表：每个码长的码数为162，零游程组数按出现频率排序为162。

当JPEG编解码器正在处理时，请勿访问下表。特别是，禁止读取访问。

- Table K.3/T81

JCHTBA1 (400E 6323h) = 02h
:
JCHTBA1 (400E 63D1h) = FAh

(5) Input pixel format

Image data in the YCbCr422 format can be input to the JPEG Codec. Allocation of data in the YCbCr422 format can be changed by the DINSWAP[2:0] bits in JIFECNT as shown in the following diagrams.

- When the DINSWAP[2:0] bits = 000b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits	Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits

- When the DINSWAP[2:0] bits = 001b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits	Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits

- When the DINSWAP[2:0] bits = 010b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits	Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits

- When the DINSWAP[2:0] bits = 100b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits	Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits

- When the DINSWAP[2:0] bits = 101b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits	Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits

- When the DINSWAP[2:0] bits = 110b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits	Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits

- When the DINSWAP[2:0] bits = 111b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cr1 8 bits	Y3 8 bits	Cb1 8 bits	Y2 8 bits	Cr0 8 bits	Y1 8 bits	Cb0 8 bits	Y0 8 bits

(6) Output coded data

For compression, coded data is output. The JPEG Codec handles the output of coded data in 16-bit units. For this reason, if the coded data has an odd code length such as fractional, the final code for output is D9FFh.

The JOUTSWAP[2:0] bits in JIFECNT can be used to alter the arrangement of coded data in output.

57.3.2 Decompression

This section describes the decompression process flows.

JCHTBA0 (400E 6221h) = 02h
JCHTBA0 (400E 6222h) = 01h
JCHTBA0 (400E 6223h) = 03h
:
JCHTBA0 (400E 62D1h) = FAh

- Table K.6/T81

JCHTBA1 (400E 6320h) = 00h
JCHTBA1 (400E 6321h) = 02h
JCHTBA1 (400E 6322h) = 01h
JCHTBA1 (400E 6323h) = 02h
:
JCHTBA1 (400E 63D1h) = FAh

(5) 输入像素格式

YCbCr422格式的图像数据可以输入到JPEG编解码器。如下图所示，可以通过JIFECNT中的DINSWAP[2:0]位更改YCbCr422格式的数据分配。

- 当DINSWAP[2:0]位=000b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0

- 当DINSWAP[2:0]位=001b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits	Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits

- 当DINSWAP[2:0]位=010b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits	Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits

- 当DINSWAP[2:0]位=100b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits	Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits

- 当DINSWAP[2:0]位=101b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits	Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits

- 当DINSWAP[2:0]位=110b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits	Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits

- 当DINSWAP[2:0]位=111b

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cr1 8 bits	Y3 8 bits	Cb1 8 bits	Y2 8 bits	Cr0 8 bits	Y1 8 bits	Cb0 8 bits	Y0 8 bits

(6) 输出编码数据

为了压缩，输出编码数据。JPEG编解码器以16位为单位处理编码数据的输出。因此，如果编码数据的码长为小数等奇数，则输出的最终码为D9FFh。

JIFECNT中的JOUTSWAP[2:0]位可用于改变输出中编码数据的排列。

57.3.2 Decompression

本节介绍解压流程。

(1) Processing overview

The decompression process overview is as follows:

1. The JPEG core is activated.
2. Coded data is transferred from the external buffer to the JPEG Codec.
   - If the count mode for stopping the input of coded data is on, reading stops each time the amount of coded data set in JIFDSLC is read. To resume reading, set the JINRCMD bit in JIFDCNT to 1.
   - When the JINRINI bit in JIFDCNT is 0, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   - When the JINRINI bit is 1, the address set in JIFDSA is used on resumption.
   - Reading stops when the end of the coded data is detected.
   - If the count mode for stopping the input of coded data is off, reading continues until the end of code is detected. With this JPEG Codec, more coded data can be read than the coded data size because coded data reading continues until the end of code is detected.
3. Coded data is input to the JPEG core. The input data is processed in MCUs at any time in the JPEG core.
4. Image data is transferred in MCUs from the JPEG Codec to the external buffer.
   - If the count mode for stopping the output of image data lines is on, writing stops each time the number of image data lines set in JIFDDLC is written. To resume writing, set the DOUTRCMD bit in JIFDCNT to 1.
   - When the DOUTRINI bit in JIFDCNT is 0, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   - When the DOUTRINI bit is 1, the address set in JIFDDA is used on resumption.
   - Writing stops when one frame of image data is completely transferred.
   - If the count mode for stopping the output of image data lines is off, writing continues until one frame of image data is completely transferred.
5. Decompression is complete after one frame of data is processed completely.

(a) Initial settings

To set the initial settings for decompression:

1. When the INT3 bit in JINTE0 is 0:
   After completing the JPEG core settings and input/output buffer settings and transferring coded data to the external buffer, activate the JPEG Codec by setting the JSRT bit in JCCMD to 1.
2. When the INT3 bit in JINTE0 is 1:
   a. After completing the JPEG core settings and input buffer settings and transferring coded data to the external buffer, activate the JPEG Codec by setting the JSRT bit in JCCMD to 1.
   b. When the image size and pixel format become readable after the coded data is decompressed, the INS3 bit in JINTS0 is set. At this time, decompression stops temporarily.
   c. After the image size and pixel format are read, set the output buffer.
   d. After interrupt handling, set the JRST bit in JCCMD to 1 to resume decompression.

(1) 处理概述

解压过程概览如下：

1. JPEG核心被激活。
2. 编码数据从外部缓冲区传输到JPEG编解码器。
   - 如果停止输入编码数据的计数模式打开，则每次读取JIFDSLC中设置的编码数据量时，读取停止。要恢复读取，请将JIFDCNT中的JINRCMD位设置为1。
   - 当JIFDCNT的JINRINI位为0时，恢复读取的地址从上一轮传输的地址开始继续。
   - 当JINRINI位为1时，在JIFDSA中设置的地址在恢复时使用。
   - 检测到编码数据结束时停止读取。
   - 如果停止输入编码数据的计数模式关闭，则继续读取直到检测到编码结束。
     使用此JPEG编解码器，可以读取比编码数据大小更多的编码数据，因为编码数据读取会持续到检测到代码结尾。
3. 编码数据输入到JPEG核心。输入数据在JPEG内核中随时在MCU中处理。
4. 图像数据在MCU中从JPEG编解码器传输到外部缓冲区。
   - 如果停止输出图像数据线的计数模式打开，则每次写入JIFDDLC中设置的图像数据线数时，写入停止。要恢复写入，请将JIFDCNT中的DOUTRCMD位设置为1。
   - 当JIFDCNT的DOUTRINI位为0时，恢复写入的地址从上一轮传输的地址开始继续。
   - 当DOUTRINI位为1时，在恢复时使用JIFDDA中设置的地址。
   - 当一帧图像数据传输完毕时，写入停止。
   - 如果停止输出图像数据线的计数模式为关闭，则继续写入直到一帧图像数据传输完毕。
5. 完成一帧数据处理后，解压完成。

(a) 初始设置

要设置减压的初始设置：

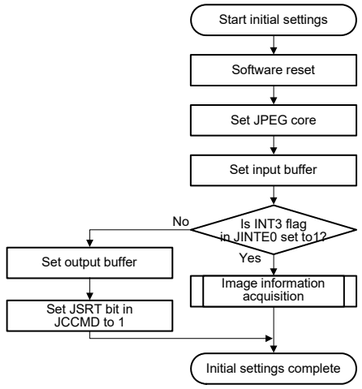
1. 当JINTE0的INT3位为0时：
   完成JPEG核心设置和输入输出缓冲区设置并将编码数据传输到外部缓冲区后，通过将JCCMD中的JSRT位设置为1来激活JPEG编解码器。
2. 当JINTE0的INT3位为1时：

   一个。完成JPEG核心设置和输入缓冲区设置并将编码数据传输到外部缓冲区后，通过将JCCMD中的JSRT位设置为1来激活JPEG编解码器。

   湾。当编码数据解压缩后图像大小和像素格式变得可读时，设置JINTS0中的INS3位。此时，减压暂时停止。

   C。读取图像大小和像素格式后，设置输出缓冲区。

   d。中断处理后，将JCCMD中的JRST位设置为1以恢复解压。



Software reset
Reset the JPEG Codec in advance by setting the BRST bit in the JCCMD register.

JPEG core settings

Compression setting:	DSP bit in JCMOD
JPEG size clear:	JCVSZU, JCVSZD, JCHSZU, and JCHSZD are set to 0
Decompression setting:	DSP bit in JCMOD
Interrupt setting:	INT7 to INT5 and INT3 flags in JINTE0

Input buffer settings

Byte/halfword/word swap setting:	JINSWAP bit in JIFDCNT
Input coded data stop count setting:	JINC bit in JIFDCNT
Address initialization setting for resumption of input coded data:	JINRINI bit in JIFDCNT
Source address setting:	JIFDSA
Source count setting:	JIFDSDC
Interrupt setting:	JINF bit in JINTS1 is set to 0 JINEN bit in JINTE1

Output buffer settings

Byte/halfword/word swap setting:	DOUTSWAP bit in JIFDCNT
Vertical/horizontal subsampling setting:	VINTER and HINTER bits in JIFDCNT
Output image pixel format setting:	OPF bits in JIFDCNT
Output data line stop count setting:	DOUTLC bit in JIFDCNT

(b) Decompression process

The decompression process flow is as follows:

1. When JPEG decompression process is completed, the INS6 bit in JINTS0 sets to 1. However, the JPEG Codec continues processing, because the image data remains to be transferred. The DBTF bit in JINTS1 sets to 1 when the last image data is transferred. The interrupt source is cleared by a 0 write to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by a 0 write to the INS6 bit. Set an interrupt request clear

Figure 57.8 图像信息获取流程

(b) 解压过程

解压过程流程如下：

1. 当JPEG解压缩过程完成时，JINTS0中的INS6位设置为1。但是，JPEGCodec继续处理，因为图像数据还有待传输。当传输最后一个图像数据时，JINTS1中的DBTF位设置为1。向INS6位写入0可清除中断源。但是，此中断源发出的中断请求不能通过向INS6位写入0来清除。设置中断请求清除

command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.

2. When the JPEG Codec has completed decompression and all image data is transferred, the DBTF flag in JINTS1 sets to 1. When the DBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by a 0 write to the DBTF flag.
3. If the count mode for stopping input coded data is on, when the specified amount of coded data set in JIFDSDC is read, the JINF flag in JINTS1 sets to 1, and reading stops. When the JINEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by a 0 write to the JINF bit. Setting the JINRCMD bit in JIFDCNT to 1 resumes reading.
   - When the JINRINI bit in JIFDCNT is 0, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   - When the JINRINI bit is 1, the address set in JIFDSA is used on resumption.
4. If the count mode for stopping the output image data is on, when the specified number of image data lines set in JIFDDLC is written, the DOUTLF flag in JINT1 sets to 1 and writing stops. When the DOUTLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by a 0 write to the DOUTLF bit. Setting the DOUTRCMD bit in JIFDCNT to 1 resumes writing.
   - When the DOUTRINI bit in JIFDCNT is 0, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   - When the DOUTRINI bit is 1, the address set in JIFDDA is used on resumption.

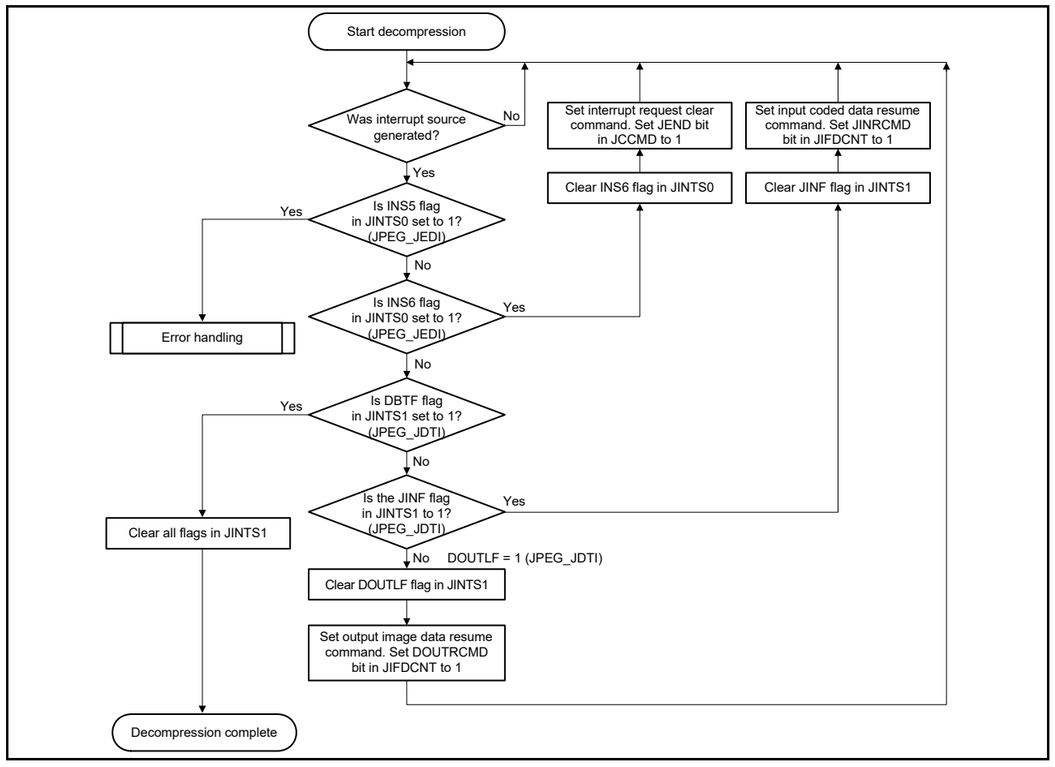

Figure 57.9 Decompression process flow

(c) Error handling

If the INS5 bit in JINTS0 is 1, it indicates that there is an error in the input JPEG coded data and that the decompression process by the JPEG Codec has ended. Read the ERR[3:0] bits in JCDERR to determine the cause of the error. Interrupt

命令（通过将JCCMD中的JEND位设置为1）来清除中断请求。

2. 当JPEGCodec完成解压并传输所有图像数据时，JINTS1中的DBTF标志置1。当JINTE1中的DBTEN位为1时，产生中断。中断源通过向DBTF标志写入0来清除。
3. 如果停止输入编码数据的计数模式打开，则当读取JIFDSDC中设置的指定数量的编码数据时，JINTS1中的JINF标志设置为1，并且读取停止。这里当JINTE1中的JINEN位为1时，产生中断。向JINF位写入0可清除中断源。将JIFDCNT中的JINRCMD位设置为1可恢复读取。
   - 当JIFDCNT的JINRINI位为0时，恢复读取的地址从上一轮传输的地址开始继续。
   - 当JINRINI位为1时，在JIFDSA中设置的地址在恢复时使用。
4. 如果停止输出图像数据的计数模式打开，当指定的图像数据行数设置在写入JIFDDLC，JINT1中的DOUTLF标志设置为1，写入停止。这里当JINTE1的DOUTLEN位为1时，产生中断。向DOUTLF位写入0可清除中断源。将JIFDCNT中的DOUTRCMD位设置为1可恢复写入。
   - 当JIFDCNT的DOUTRINI位为0时，恢复写入的地址从上一轮传输的地址开始继续。
   - 当DOUTRINI位为1时，在恢复时使用JIFDDA中设置的地址。

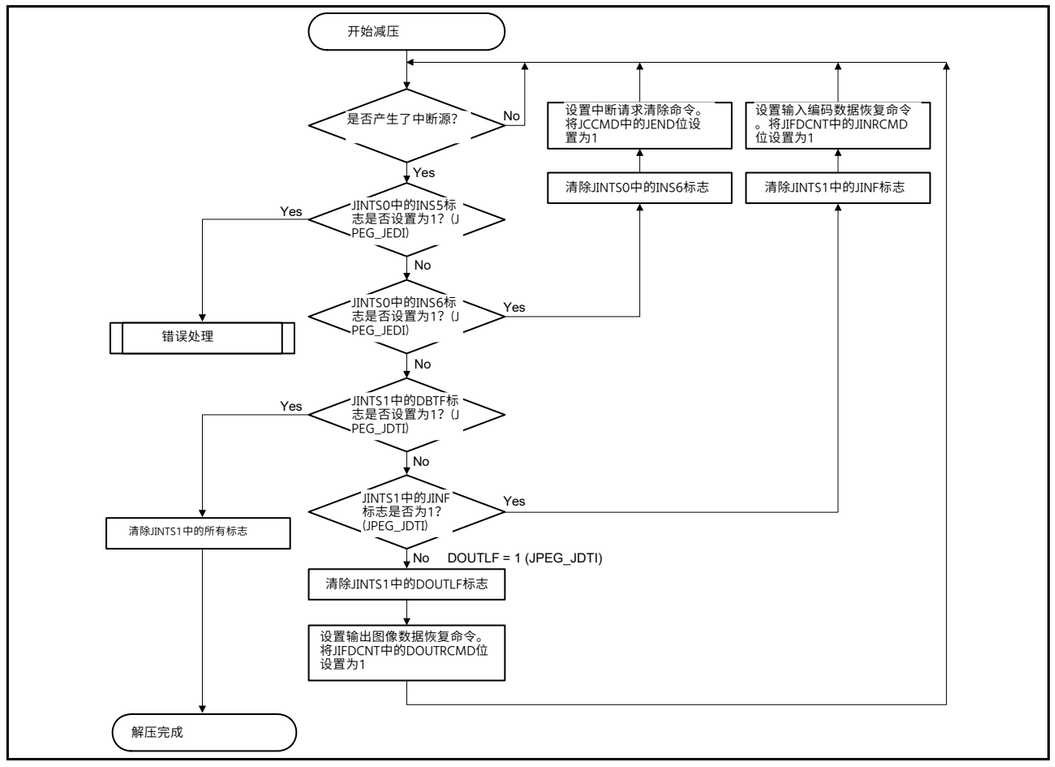

Figure 57.9 减压工艺流程

(c) 错误处理

如果JINTS0中的INS5位为1，则表示输入的JPEG编码数据有错误，JPEGCodec的解压过程已经结束。读取JCDERR中的ERR[3:0]位以确定错误原因。打断

signals asserted because of the interrupt source indicated in the INS5 bit cannot be negated by clearing the interrupt status with a 0 write. To clear the interrupt request, you must set the interrupt request clear command (by setting the JEND bit in JCCMD to 1). To perform decompression or compression processing after error handling finishes, start the processing from the initial settings.

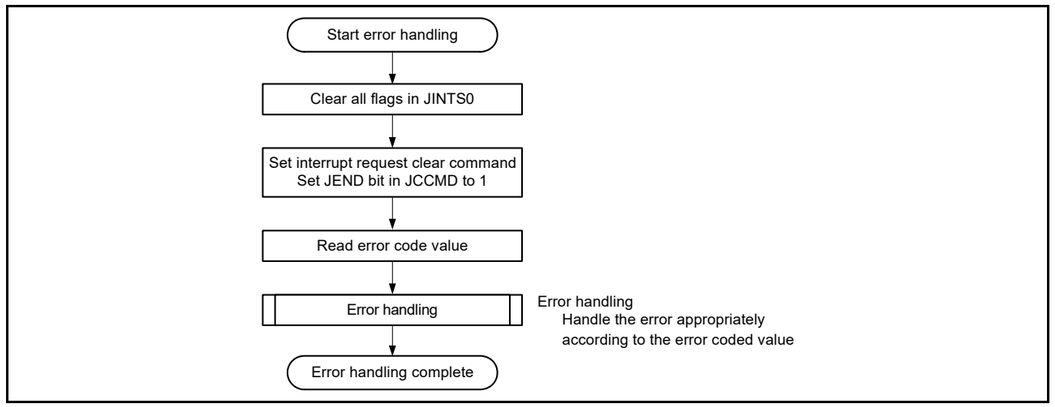

Figure 57.10 Error handling flow

(2) Input JPEG coded data

The markers to be processed in decompression are SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI. Except for the error markers shown in Table 57.3, other markers are ignored even if they are read.

The JINSWAP[2:0] bits in JIFDCNT can be used to alter the arrangement for the input of coded data.

(3) JPEG decompression errors

(a) Error markers

If a marker error is found during analysis of compressed data for decompression, the code to identify the error type (shown in Table 57.3) is set to the ERR[3:0] bits in JCDERR. When an error is detected, the JPEG Codec generates an interrupt signal and terminates decoding. The stored code value is set to 1010b (default value) at the start of processing of the next frame or after a bus reset.

Table 57.3 Decompression error codes (1 of 2)

Code	Description
0000b	Normal
0001b	SOI not detected: SOI not detected until EOI detected
0010b	SOF1 to SOFF detected
0011b	Unprovided pixel format detected
0100b	SOF accuracy error: Value other than 8 detected
0101b	DQT accuracy error: Value other than 0 detected
0110b	Component error 1: Number of SOF0 header components detected is value other than 1, 3, or 4
0111b	Component error 2: Number of components differs between SOF0 header and SOS
1000b	SOF0, DQT, and DHT not detected when SOS detected
1001b	SOS not detected: SOS not detected until EOI detected
1010b	EOI not detected (default)
1011b	Restart interval data number error detected
1100b	Image size error detected
1101b	Last MCU data number error detected

由于INS5位中指示的中断源而断言的信号不能通过用0写入清除中断状态来否定。要清除中断请求，必须设置中断请求清除命令（通过将JCCMD中的JEND位设置为1）。要在错误处理完成后执行解压缩或压缩处理，请从初始设置开始处理。

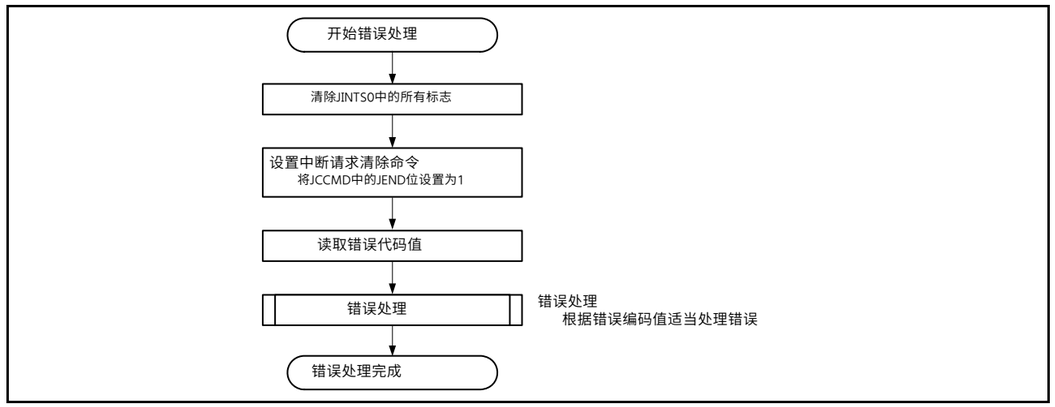

Figure 57.10 错误处理流程

(2) 输入JPEG编码数据

解压需要处理的标记有SOI、SOF0、SOS、DQT、DHT、DRI、RSTm、EOI。除了表57.3中所示的错误标记外，其他标记即使被读取也会被忽略。

JIFDCNT中的JINSWAP[2:0]位可用于更改编码数据输入的排列。

(3) JPEG解压缩错误

(a) 错误标记

如果在解压压缩数据分析过程中发现标记错误，则将识别错误类型的代码（如表57.3所示）设置为JCDERR中的ERR[3:0]位。当检测到错误时，JPEG编解码器生成中断信号并终止解码。存储的代码值在下一帧处理开始时或总线复位后设置为1010b（默认值）。

Table 57.3 解压错误代码(1of2)

Code	Description
0000b	Normal
0001b	未检测到SOI：在检测到EOI之前未检测到SOI
0010b	检测到SOF1到SOFF
0011b	检测到未提供的像素格式
0100b	SOF精度错误：检测到8以外的值
0101b	DQT精度错误：检测到非0值
0110b	组件错误1：检测到的SOF0标头组件的数量是1、3或4以外的值
0111b	组件错误2：SOF0标头和SOS之间的组件数量不同
1000b	检测到SOS时未检测到SOF0、DQT和DHT
1001b	未检测到SOS：在检测到EOI之前未检测到SOS
1010b	未检测到意向书（默认）
1011b	检测到重启间隔数据数错误
1100b	检测到图像尺寸错误
1101b	检测到最后一个MCU数据编号错误

Table 57.3 Decompression error codes (2 of 2)

Code	Description
1110b	Block data number error detected

(b) Huffman coded segment error

During the compression data analysis in decompression operation, if there is an increase or decrease in the decoded data count because of an error resulting from bit reversal or missing data in the Huffman-coded segment, determine the error type, and set the error code in the ERR[3:0] bits in JCDERR. Table Table 57.4 lists the segment error codes. The error code is set, an interrupt signal is issued, and the process ends only if the INT7 to INT5 bit in JINTE0 associated with the detected error is set to 1. The set code value returns to the default value (1010h) at the start of processing of the next frame or after a bus reset. However, in this error detection if an error in the Huffman-coded segment does not result in an alteration in the decoded data count, the error is undetected.

Figure 57.11 shows an example of the number of data units in a Huffman coded segment with pixel format setting YCbCr422, DRI = 2, X = 80 pixels, and Y = 8 pixels.

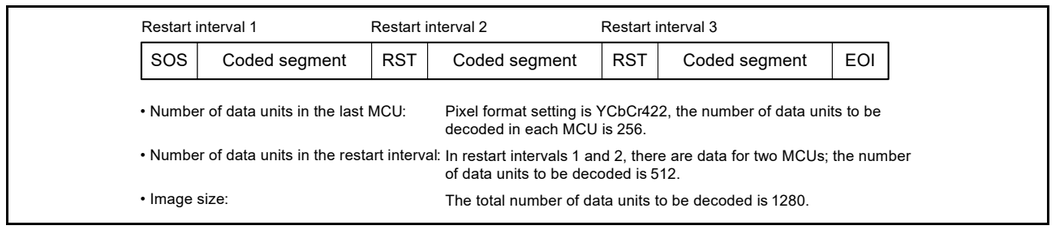

Figure 57.11 Huffman coded segment

Table 57.4 Segment error codes

Code	Description
0000h	Normal
1011h	Restart interval data number error: The number of data units in each interval is compared with the number of data units specified by the DRI marker. If an interval has more or less data than is specified by the DRI marker, the decompression error code (1011) is set. The last interval which is shorter than the restart interval is not compared. If the DRI marker segment is not placed or the specified number is 00, an error is not detected even if the RSTm marker is placed. Also, an m indicating the order of RSTm marker modulo 8 (m = 0 to 7) is exempt from the error detection analysis. When the INT7 bit in JINTE0 sets to 0, this error is not detected.
1100h	Image size error: The number of data units in an image that is calculated from the number of lines specified by the frame parameter and the number of samples per line is compared with the total number of data units from SOS to EOI (in pixel units). If the numbers of data units do not match, the decompression error code (1100) is set. When the INT6 bit in JINTE0 sets to 0, this error is not detected. The number of data units in an image is shown in MCUs. As a result, the number of lines and the number of samples per line for calculation must be shown in MCUs.
1101h	Last MCU data number error: Whether the number of data units in MCUs on EOI detection is shown in MCU units is checked and fractions are detected. If error (1100) occurs simultaneously with another error, error (1100) has priority. When the INT5 bit in JINTE0 sets to 0, this error is not detected.
1110h	Block data number error: Whether a block is an 8 × 8 array is checked and fractions are detected. When the INT7 to INT5 bits in JINTE0 are all set to 0, this error is not detected.

57.3.3 Output Pixel Format in Decompression

The JPEG Codec is capable of decompressing JPEG encoded data created in the YCbCr444, YCbCr422, YCbCr411, and YCbCr420 formats. The pixel format of the output image is ARGB8888 or RGB565. Figure 57.12 shows the flow of converting decompressed data to the given output pixel format.

Table 57.3 解压错误代码(2of2)

Code	Description
1110b	检测到块数据编号错误

(b) 霍夫曼编码段错误

在解压操作中进行压缩数据分析时，如果由于Huffman编码段位反转或丢失数据导致解码数据计数增加或减少，则判断错误类型，并将错误代码设置为JCDERR中的ERR[3:0]位。表57.4列出了段错误代码。设置错误代码，发出中断信号，只有当与检测到的错误相关的JINTE0中的INT7到INT5位设置为1时，该过程才结束。设置的代码值在开始时返回默认值（1010h）处理下一帧或总线复位后。然而，在该错误检测中，如果霍夫曼编码段中的错误不导致解码数据计数的改变，则错误未被检测到。

图57.11显示了具有像素格式设置的霍夫曼编码段中数据单元数量的示例
YCbCr422，DRI=2，X=80像素，Y=8像素。

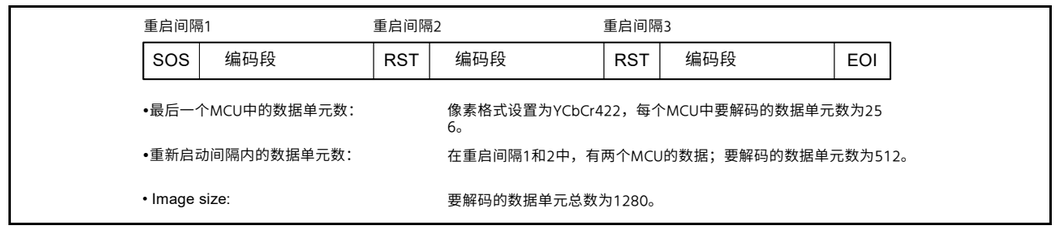

Figure 57.11 霍夫曼编码段

Table 57.4 段错误代码

Code	Description
0000h	Normal
1011h	重启间隔数据数错误： 将每个区间中的数据单元数与DRI标记指定的数据单元数进行比较。如果间隔的数据多于或少于DRI标记指定的数据，则设置解压缩错误代码(1011)。不比较比重新启动间隔短的最后一个间隔。如果没有放置DRI标记段或指定编号为00，即使 放置RSTm标记。此外，指示RSTm标记模8（m=0到7）的阶数的m不属于错误检测分析。当JINTE0中的INT7位设置为0时，不会检测到此错误。
1100h	图片尺寸错误： 将根据帧参数指定的行数和每行的样本数计算出的图像中的数据单元数与从SOS到EOI的数据单元总数（以像素为单位）进行比较。如果数据单元的数量不匹配，则设置解压缩错误代码（1100）。当JINTE0中的INT6位设置为0时，不会检测到该错误。图像中的数据单元数量显示在MCU中。因此，必须在MCU中显示用于计算的行数和每行的采样数。
1101h	最后MCU数据编号错误： 检查EOI检测时MCU中数据单元的数量是否以MCU为单位显示，并检测分数。如果错误(1100)与另一个错误同时发生，则错误(1100)具有优先权。当JINTE0中的INT5位设置为0时，不会检测到此错误。
1110h	块数据编号错误： 检查块是否为8×8数组并检测分数。当JINTE0中的INT7到INT5位都设置为0时，不会检测到该错误。

57.3.3 解压输出像素格式

JPEG编解码器能够解压缩在YCbCr444、YCbCr422、YCbCr411和
YCbCr420格式。输出图像的像素格式为ARGB8888或RGB565。图57.12显示了将解压缩数据转换为给定输出像素格式的流程。

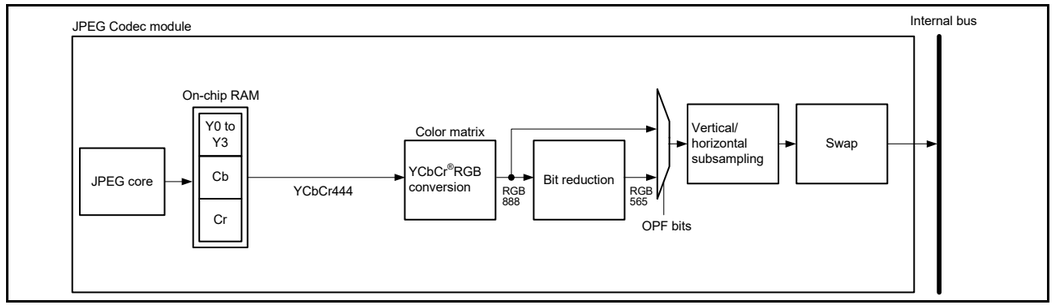

Figure 57.12 Output pixel format conversion in decompression block diagram

(1) On-chip SRAM

Data decoded by the JPEG core is stored in MCUs on SRAM in the JPEG Codec.

(2) YCbCr → RGB conversion

Data in the YCbCr444 format is converted to the RGB888 format. The following formulas are used:

R = 1.000Y + 1.402Cr
G = 1.000Y - 0.344Cb - 0.714Cr
B = 1.000Y + 1.772Cb

(3) Bit reduction

RGB888 data is reduced to RGB565 data. The lower three bits of red and blue, and lower two bits of green are removed.

(4) Output pixel format selection

The pixel format to be output is selected in the OPF[1:0] bits in JIFDCNT. When the DOUTSWAP[2:0] bits in JIFDCNT = 000b, allocation of data in the pixel format is as follows:

- ARGB8888 (32 bits/pixel)

b31 b24	b23 b16	b15 b8	b7 b0
*1	Red 8 bits	Green 8 bits	Blue 8 bits

Note 1. This value is determined by the ALPHA[7:0] bits in JIFDADT.

- RGB565 (16 bits/pixel)

b15 b11	b10 b5	b4 b0
Red 5 bits	Green 6 bits	Blue 5 bits

(5) Vertical and horizontal subsampling

The output data can be horizontally and vertically subsampled based on the VINTER[1:0] and HINTER[1:0] settings in JIFDCNT. Figure 57.13 to Figure 57.15 show the line subsampling modes. In the figures, for the ARGB8888 and RGB565 output formats, one cell represents one pixel. Because sub-sampling is carried out in minimum coded units (MCUs), the numbers of the horizontal and vertical block units vary based on the decompressed pixel format.

Table 57.5 and Table 57.6 show the values of n and m in the figures.

Horizontal

Table 57.5 Number of horizontal blocks (1 of 2)

Compression format	Output format	n
YCbCr444	ARGB8888, RGB565	1
YCbCr422	ARGB8888, RGB565	2

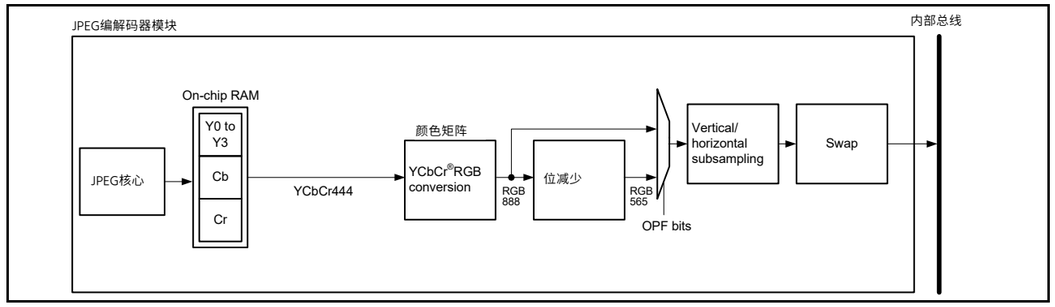

Figure 57.12 解压框图中的输出像素格式转换

(1) On-chip SRAM

JPEG内核解码的数据存储在JPEG编解码器中SRAM上的MCU中。

(2) YCbCr → RGB conversion

YCbCr444格式的数据转换为RGB888格式。使用以下公式：

R = 1.000Y + 1.402Cr
G = 1.000Y - 0.344Cb - 0.714Cr
B = 1.000Y + 1.772Cb

(3) 位减少

RGB888数据减少为RGB565数据。红色和蓝色的低三位以及绿色的低两位被移除。

(4) 输出像素格式选择

要输出的像素格式在JIFDCNT的OPF[1:0]位中选择。当JIFDCNT中的DOUTSWAP[2:0]位=000b时，像素格式的数据分配如下：

- ARGB8888 (32 bits/pixel)

b31 b24	b23 b16	b15 b8	b7 b0
*1	红色8位	绿色8位	蓝色8位

注1.该值由JIFDADT中的ALPHA[7:0]位确定。

- RGB565 (16 bits/pixel)

b15 b11	b10 b5	b4 b0
红色5位	绿色6位	蓝色5位

(5) 垂直和水平二次采样

输出数据可以根据VINTER[1:0]和HINTER[1:0]设置进行水平和垂直二次采样JIFDCNT。图57.13到图57.15显示了线二次采样模式。在图中，对于ARGB8888和RGB565输出格式，一个单元格代表一个像素。由于子采样是在最小编码单元(MCU)中执行的，因此水平和垂直块单元的数量会根据解压缩的像素格式而有所不同。

表57.5和表57.6显示了图中n和m的值。

Horizontal

Table 57.5 水平块数（2个中的1个）

压缩格式	输出格式	n

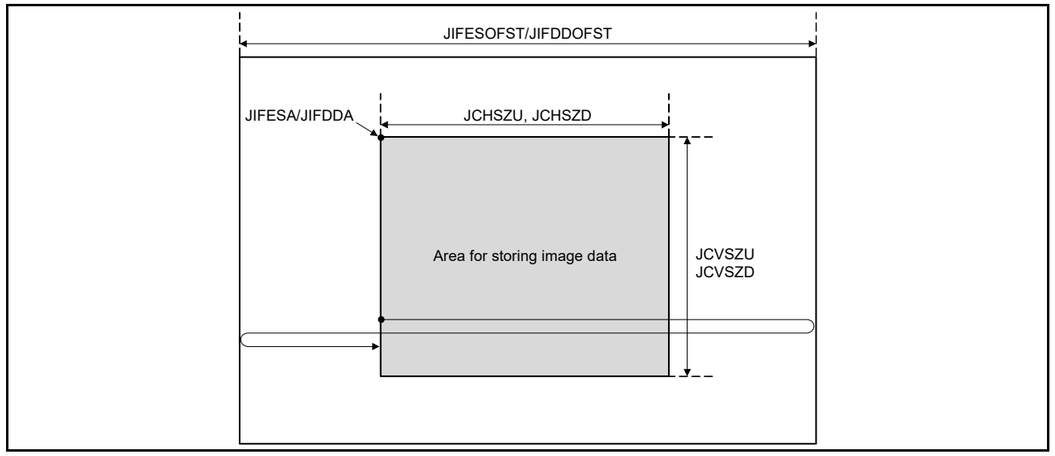

Figure 57.16 Conceptual diagram of image data storing

57.4 Interrupts

Two types of interrupt requests, compression/decompression process interrupt requests (JPEG_JEDI) and data transfer interrupt requests (JPEG_JDTI), are available in the JPEG Codec. The two types of interrupt requests are each related to multiple sources. The interrupt request cancellation methods differ depending on the source of the interrupt request.

57.4.1 Compression/Decompression Process Interrupt Request (JPEG_JEDI)

The flags in JINTS0 indicate compression and decompression-related sources. The interrupt requests asserted by these interrupt sources cannot be negated by clearing the associated interrupt status bits to 0. Issue an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request. When a flag in JINTS0 sets to 1, a compression/decompression process interrupt request is sent to the Interrupt Controller Unit (ICU).

(1) Compression

- JPEG compression process end

  When the INS6 bit in JINTS0 is 1, the JPEG compression process completed successfully. After all of the coded data is transferred, the JPEG Codec completes compression.

(2) Decompression

- JPEG decompression process end

  When the INS6 bit in JINTS0 is 1, the JPEG decompression process completed successfully. After all of the image data is transferred, the JPEG Codec completes decompression.
- JPEG decompression error occurrence

  When the INS5 bit in JINTS0 is 1, the input JPEG coded data has an error and the JPEG Codec has stopped the decompression process. Read the error code (ERR[3:0] bits in JCDERR) and identify the error source. This interrupt occurs when any of the INT7 to INT5 bits in JINTE0 is 1.
- Request for reading the image size and pixel format

  When the INS3 bit in JINTS0 is 1, JPEG coded data is input, and information regarding the image size and pixel format can be read. Because the JPEG decompression process is suspended, resume the JPEG decompression process by setting the process stop clear command after accessing the required registers. This interrupt occurs when

- Offset
  - Compression: JIFESOFST
  - Decompression: JIFDDOFST

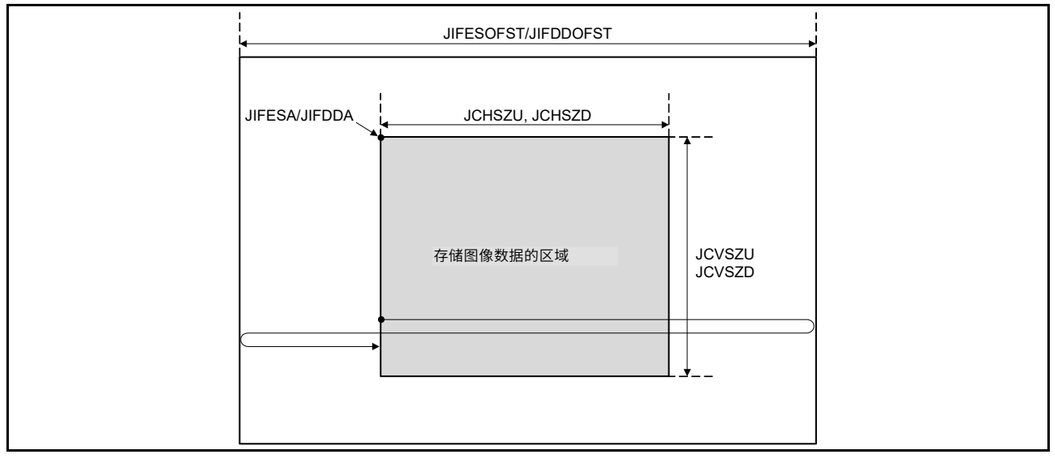

Figure 57.16 图像数据存储概念图

57.4 Interrupts

JPEG编解码器中提供了两种类型的中断请求，压缩解压缩过程中断请求(JPEG_JEDI)和数据传输中断请求(JPEG_JDTI)。这两种类型的中断请求都与多个源相关。中断请求取消方法因中断请求的来源而异。

57.4.1 压缩解压缩过程中断请求(JPEG_JEDI)

JINTS0中的标志指示与压缩和解压缩相关的源。这些中断源发出的中断请求不能通过将相关中断状态位清除为0来取消。发出中断请求清除命令（通过将JCCMD中的JEND位设置为1）来清除中断请求。当JINTS0中的标志设置为1时，向中断控制器单元(ICU)发送压缩解压缩过程中断请求。

(1) Compression

- JPEG压缩处理结束

  当JINTS0中的INS6位为1时，JPEG压缩过程成功完成。传输完所有编码数据后，JPEG编解码器完成压缩。

(2) Decompression

- JPEG解压过程结束

  当JINTS0中的INS6位为1时，JPEG解压过程成功完成。传输完所有图像数据后，JPEGCodec完成解压缩。

- JPEG解压错误发生

  当JINTS0中的INS5位为1时，输入的JPEG编码数据有错误，JPEGCodec已停止解压过程。读取错误代码（JCDERR中的ERR[3:0]位）并识别错误源。当JINTE0中的任何INT7到INT5位为1时，将发生此中断。

- 请求读取图像大小和像素格式

  当JINTS0的INS3位为1时，输入JPEG编码数据，可以读取图像大小和像素格式的信息。由于JPEG解压过程暂停，请在访问所需寄存器后通过设置processstopclear命令恢复JPEG解压过程。此中断发生时

the INT3 bit in JINTE0 is 1.

57.4.2 Data Transfer Interrupt Request (JPEG_JDTI)

The flags in JINTS1 are the interrupt sources for transferring the image data and coded data. The interrupt requests asserted by these interrupt sources can be negated by clearing the associated interrupt status bits to 0.

(1) Compression

- Interrupt request generated after the specified number of input image data lines is read

  When the DINLF bit in JINTS1 is 1, the number of image data lines specified in JIFESLC is transferred. Transfer the rest of the image data to the external buffer and resume transferring the data from the external buffer. A data transfer interrupt request is sent when the DINLEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are complete

  When the CBTF bit in JINTS1 is 1, the JPEG Codec has completed compression and transferred all of the coded data. The data transfer interrupt request is sent when the CBTEN bit in JINTE1 is set to 1.

(2) Decompression

- Interrupt request generated after the specified number of output image data lines is written to

  When the DOUTLF bit in the JINTS1 is 1, the number of image data lines specified in JIFDDLC is transferred. Secure a space for the next coded data in the external buffer and resume the transfer process. A data transfer interrupt request is sent when the DOUTLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of input coded data is read

  The JINF bit in JINTS1 sets to 1 when the amount of coded data specified in JIFDSDC is transferred. Secure the next coded data in the external buffer and resume the transfer process. A data transfer interrupt is also sent at this time if the JINEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed

  The DBTF bit in JINTS1 sets to 1 when the JPEG Codec has completed decompression and transferred all of the coded data. A data transfer interrupt request is also sent at this time if the DBTEN bit in JINTE1 is set to 1.

57.5 Bus Reset Processing

Issuing the bus reset command (setting the BRST bit in JCCMD to 1) causes a bus reset. Do not issue the bus reset command while the JPEG Codec is operating. The following registers are initialized by a bus reset:

- JPEG Code Data Count Upper Register (JCDTCU)
- JPEG Code Data Count Middle Register (JCDTCM)
- JPEG Code Data Count Lower Register (JCDTCD)
- JPEG Interrupt Status Register 0 (JINTS0)
- JPEG Code Decode Error Register (JCDERR)
- JPEG Code Reset Register (JCRST).

57.6 Usage Notes

57.6.1 Notes on the Decompression Process

Renesas recommends that a timeout detection mechanism be implemented through software or through the operating system to prevent locking of the module in case invalid JPEG code data is detected. This timeout detection mechanism is recommended especially when setting JIFDCNT.JINC bit to 1 because the decompression process might not be complete depending on the timing of the JPEG code data input. If a timeout error occurs while decoding the image, reset the JPEG Codec by setting the BRST bit in the JCCMD register first, then follow the flow for decompression initial settings as shown in Figure 57.7.

JINTE0中的INT3位为1。

57.4.2 数据传输中断请求(JPEG_JDTI)

JINTS1中的标志位是传输图像数据和编码数据的中断源。这些中断源发出的中断请求可以通过将相关的中断状态位清除为0来取消。

(1) Compression

- 读取指定数量的输入图像数据线后产生的中断请求

  JINTS1中的DINLF位为1时，传送JIFESLC中指定的图像数据行数。将剩余的图像数据传输到外部缓冲区并从外部缓冲区继续传输数据。当JINTE1的DINLEN位为1时，发送数据传输中断请求。

- 所有进程完成后产生的中断请求

  当JINTS1中的CBTF位为1时，JPEGCodec已完成压缩并传输所有编码数据。当JINTE1中的CBTEN位设置为1时，发送数据传输中断请求。

(2) Decompression

- 写入指定数量的输出图像数据线后产生的中断请求

  当JINTS1中的DOUTLF位为1时，传输JIFDDLC中指定的图像数据行数。
  为外部缓冲区中的下一个编码数据保留一个空间并恢复传输过程。当JINTE1的DOUTLEN位为1时，发送数据传输中断请求。

- 读取指定数量的输入编码数据后产生的中断请求

  当传输JIFDSDC中指定的编码数据量时，JINTS1中的JINF位设置为1。保护外部缓冲区中的下一个编码数据并恢复传输过程。如果JINTE1中的JINEN位为1，此时也会发送数据传输中断。

- 所有进程完成后产生的中断请求

  当JPEGCodec完成解压缩并传输所有编码数据时，JINTS1中的DBTF位设置为1。如果JINTE1中的DBTEN位设置为1，此时也会发送数据传输中断请求。

57.5 总线复位处理

发出总线复位命令（将JCCMD中的BRST位设置为1）会导致总线复位。不要在JPEG编解码器运行时发出总线复位命令。以下寄存器由总线复位初始化：

- JPEG代码数据计数高位寄存器(JCDTCU)
- JPEG代码数据计数中间寄存器(JCDTCM)
- JPEG代码数据计数低位寄存器(JCDTCD)
- JPEG中断状态寄存器0(JINTS0)
- JPEG代码解码错误寄存器(JCDERR)
- JPEG代码复位寄存器(JCRST)。

57.6 使用说明

57.6.1 解压过程注意事项

瑞萨建议通过软件或操作系统实现超时检测机　　制，以防止在检测到无效JPEG代码数据时锁定模块。建议使用这种超时检测机　　制，尤其是在将JIFDCNT.JINC位设置为1时，因为根据JPEG代码数据输入的时序，解压缩过程可能无法完成。如果在解码图像时发生超时错误，首先通过设置JCCMD寄存器中的BRST位来复位JPEGCodec，然后按照图57.7所示的流程进行解压初始设置。

58. Graphics LCD Controller (GLCDC)

The multifunctional Graphics LCD Controller (GLCDC) supports multiple data formats and panels. Key GLCDC features include:

- GPX bus master function for accessing graphics data
- Superimposition of three planes (single color background plane, graphics 1 plane, and graphics 2 plane)
- Supports many types of 32- and 16-bit/pixel graphics data and 8-, 4-, and 1-bit LUT data formats
- Digital interface signal output supporting the video image size of WVGA.

Figure 58.1 shows a block diagram of the GLCDC.

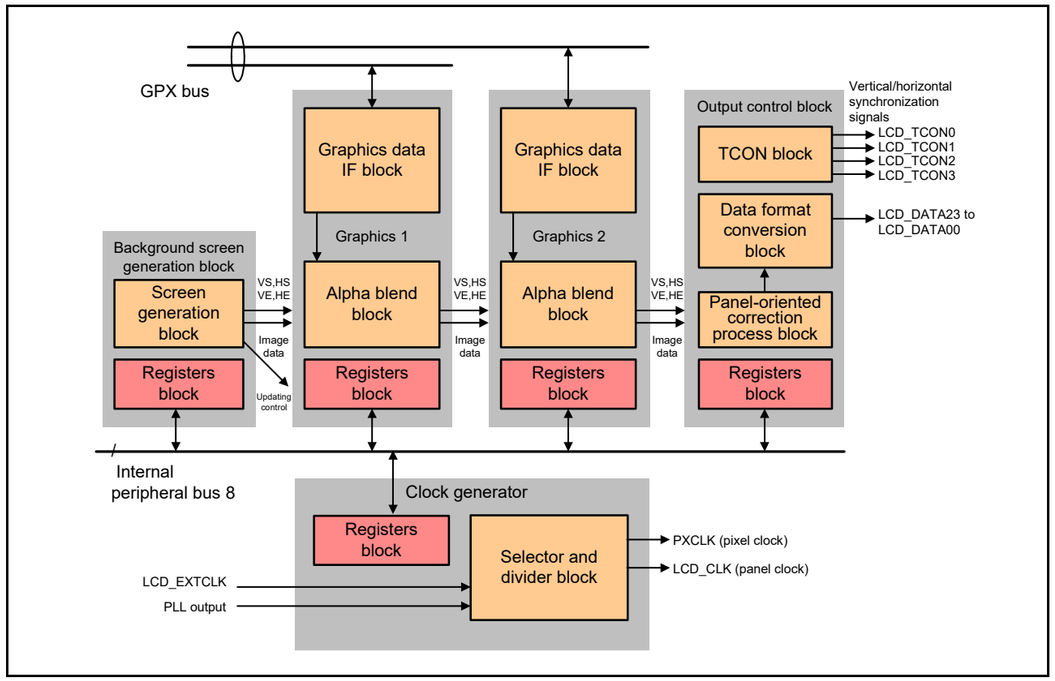

Figure 58.1 GLCDC block diagram

Note: When using the GLCDC, set the clock to ICLK = PCLKA.

Table 58.1 GLCDC I/O pins (1 of 2)

Pin name	I/O	Function
LCD_EXTCLK	Input	Panel clock source input pin
LCD_CLK	Output	Panel clock output pin
LCD_DATA23 to LCD_DATA00	Output	LCD signal output pins RGB888 signal R/G/B: 8 bits each (unsigned) RGB666 signal R/G/B: 6 bits each (unsigned) RGB565 signal R/B: 5 bits each (unsigned) G: 6 bits (unsigned) Serial RGB signal R/G/B/-: 8 bits (unsigned)

LCD_TCON2	Output	LCD_TCON2 output signal pin
LCD_TCON1	Output	LCD_TCON1 output signal pin

58. 图形LCD控制器(GLCDC)

多功能图形LCD控制器(GLCDC)支持多种数据格式和面板。关键GLCDC功能包括：

- 用于访问图形数据的GPX总线主控功能
- 三平面叠加（单色背景平面、图形1平面、图形2平面）
- 支持多种类型的32位和16位像素图形数据以及8位、4位和1位LUT数据格式
- 支持WVGA视频图像尺寸的数字接口信号输出。

图58.1显示了GLCDC的框图。

58.1 Functional Overview

Table 58.2 provides a functional overview of GLCDC.

Table 58.2 Functional overview of GLCDC (1 of 2)

Parameter		Function
Graphics	Graphics planes	• Single color background (lowest layer) and two graphics planes • Graphics planes can be alpha-blended with the lower-layer plane
	Pixel format	• RGB-888 progressive format (-: 8 bits, R: 8 bits, G: 8 bits, B: 8 bits; 32 bits in total) • ARGB8888 progressive format (A: 8 bits, R: 8 bits, G: 8 bits, B: 8 bits; 32 bits in total) • RGB565 progressive format (A: None, R: 5 bits, G: 6 bits, B: 5 bits; 16 bits in total) • ARGB1555 progressive format (CLUT: 1 bit, R: 5 bits, G: 5 bits, B: 5 bits; 16 bits in total) • ARGB4444 progressive format (A: 4 bits, R: 4 bits, G: 4 bits, B: 4 bits; 16 bits in total) • CLUT8 progressive format (color palette address: 8 bits) • CLUT4 progressive format (color palette address: 4 bits) • CLUT1 progressive format (color palette address: 1 bit) • CLUT memory: 512 words × 32 bits per graphics plane (ARGB8888)
	Frame buffer control	The following parameters can be set for the frame buffer: • Base address: Start address of the frame buffer, aligned with a 64-byte boundary (burst transfer size) • Macro line offset: Offset address from the start address to the next macro line, aligned with a 64-byte boundary (burst transfer size) • Frame offset: Offset address from the start address to the next frame, aligned with a 64-byte boundary (burst transfer size) • Number of data transfers: Number of data transfers of a macro line • Number of macro lines: Number of macro lines in a single frame
	Alpha blending	• Alpha blending in rectangular area (blending ratio: 256 gradation levels) • Alpha blending in pixel units (blending ratio: 256 gradation levels) • RGB-index chroma key (replaced with the specified color when the object color agrees with the preset value)
Internal video image format		• Total number of vertical lines: Up to 1024 lines • Number of valid vertical lines: 16 to 1020 lines (resolution: 1 line) • Vertical front porch: 2 lines (minimum) • Vertical back porch: 1 line (minimum) • Vertical synchronization (VS) pulse width: 1 line (fixed) • Total number of horizontal pixels: Up to 1024 pixels • Number of valid horizontal pixels: 16 to 1016 pixels (resolution: 2 pixels) • Horizontal front porch: 3 pixels (minimum) • Horizontal back porch: 1 pixel (minimum) • Horizontal synchronization (HS) pulse width: 4 pixels
Data format conversion	Output video image size	• From 16 lines × 16 pixels to 1020 lines × 1016 pixels
	Data format	• RGB888 (parallel 24 bits) • RGB666 (parallel 18 bits) • RGB565 (parallel 16 bits) • RGB888 (serial 8 bits); clock cycle is four times the pixel clock • Bit endian order change and B/R signal swap
	Dither processing	• Reduces 10-bit signals (output after panel-oriented correction) to 8-, 6-, or 5-bit signals (output data format) • Supports the following modes: - Truncate mode - Round-off mode - 2×2 pattern dither mode

Table 58.1 GLCDCIO引脚（2个中的2个）

58.1 功能概述

表58.2提供了GLCDC的功能概览。

Table 58.2 GLCDC的功能概述(1of2)

Parameter		Function
Graphics	图形平面	单色背景（最低层）和两个图形平面 图形平面可以与下层平面进行alpha混合
	像素格式	RGB-888逐行格式（-：8位，R：8位，G：8位，B：8位；总共32位） ARGB8888逐行格式（A：8位，R：8位，G：8位，B：8位；共32位）RGB565逐行格式（A：无，R：5位，G：6位，B：5位；共16位）ARGB1555逐行格式（CLUT：1位）R：5位，G：5位，B：5位；共16位） ARGB4444逐行格式（A：4位，R：4位，G：4位，B：4位；共16位)CLUT8逐行格式（调色板地址：8位）CLUT4逐行格式（调色板地址：4位）CLUT1逐行格式（调色板地址：1位）CLUT内存：每个图形平面512字×32位ARGB8888）
	帧缓冲控制	可为帧缓冲区设置以下参数： 基地址：帧缓冲区的起始地址，与64字节边界对齐（突发传输大小） 宏行偏移：从起始地址到下一个宏行的偏移地址，与64字节边界对齐（突发传输大小） 帧偏移：从起始地址到下一帧的偏移地址，与64字节边界对齐（突发传输大小） 数据传输次数：数据传输次数宏行数宏行数：单帧中的宏行数
	阿尔法混合	矩形区域的Alpha混合（混合比：256级） 以像素为单位的Alpha混合（混合比：256级） RGB索引色度键（当对象颜色与预设值一致时替换为指定颜色）
内部视频图像格式		垂直总行数：最多1024行 有效垂直行数：16到1020行（分辨率：1行） 垂直前廊：2行（最少） 垂直后廊：1行（最少） 垂直同步(VS)脉冲宽度：1行（固定） 水平像素总数：最多1024个像素 有效水平像素数：16到1016个像素（分辨率：2个像素） 水平前沿：3个像素（最小） 水平后沿：1像素（最小值） 水平同步(HS)脉冲宽度：4像素
数据格式转换	输出视频图像尺寸	从16行×16像素到1020行×1016像素
	数据格式	RGB888（并行24位） RGB666（并行18位） RGB565（并行16位） RGB888（串行8位）；时钟周期是像素时钟的四倍 位端顺序更改和BR信号交换
	抖动处理	将10位信号（面向面板校正后输出）减少为8位、6位或5位信号（输出数据格式）支持以下模式：截断模式舍入模式2×2模式抖动模式

Table 58.2 Functional overview of GLCDC (2 of 2)

Parameter		Function
Timing control signal	Signal generation	5 timing signals (STVA, STVB, STHA, STHB, and DE) can be generated from HS / VS: • Vertical synchronization signal (variable) • Horizontal synchronization signal (variable) • Data enable signal
	Signal select	• Signals generated by the signal generation circuit can be output from LCD_TCONn pins (n = 0 to 3)
Output control panel-oriented correction processing	Brightness and contrast	• 10-bit internal processing; the sequence of this processing and gamma correction can be swapped. • Brightness: DC value adjustment range: from -512[LSB] to +512[LSB] • Contrast: gain value adjustment range: from 0 to 2 times (from 0/128 to 255/128)
	Gamma correction	• Sixteen areas; input/output: 10 bits • Gain value adjustment range in the area: From 0 to 2 times (from 0/1024 to 2047/1024)
Interrupts		• Number of specified lines interrupt (GLCDC_VPOS) • Graphics 1 buffer underflow interrupt (GLCDC_L1UNDF) • Graphics 2 buffer underflow interrupt (GLCDC_L2UNDF)

58.1.1 GLCDC Configuration

Figure 58.2 shows the configuration of the GLCDC.

The GLCDC includes the following blocks:

- Background screen generation block: Generates the background screen (including the blanking interval), selects the background color, and generates the synchronization signals for controlling the screens.
- Graphics data interface blocks (2 blocks): Convert the graphics data/CLUT data read through the GPX bus into ARGB (8888) data for internal processing, and transfer the clocks (PCLKA → PXCLK).
- Alpha blending blocks (2 blocks): Superimpose graphics data on the lower-layer screen and perform alpha blending based on the register settings and the alpha blending values for the current screen graphics data.
- TCON block: Generates the vertical and horizontal synchronization and enable signals suited for the specifications of the connected panel, from the internal vertical and horizontal synchronization signals.
- Data format conversion block: Processes data into the specific internal RGB888 format into the data of the specific format suited for the specifications of the panel with dither correction for output image data length.
- Panel-oriented correction processing block: Corrects brightness and contrast, and performs gamma correction suited for the characteristics of the connected panel, allowing either brightness and contrast correction or gamma correction to be performed first.
- Clock generator block: Generates the pixel and the panel clocks on a specific frequency from either LCD_EXTCLK or PLL output.

Table 58.2 GLCDC的功能概述(2of2)

Parameter		Function
定时控制信号	信号产生	可以从HSVS生成5个定时信号（STVA、STVB、STHA、STHB和DE）： 垂直同步信号（可变） 水平同步信号（可变） 数据使能信号
	信号选择	信号发生电路产生的信号可以从LCD_TCONn引脚（n=0到3）输出
面向输出控制面板的校正处理	亮度和对比度	10位内部处理；该处理和伽马校正的顺序可以互换。 亮度：DC值调整范围：从-512[LSB]到+512[LSB] 对比度：增益值调整范围：从0到2倍（从0128到255128）
	伽玛校正	十六个领域；输入输出：10位区域内增益值调整范围：从0到2倍（从01024到20471024）
Interrupts		指定行数中断(GLCDC_VPOS) 图形1缓冲区下溢中断(GLCDC_L1UNDF) 图形2缓冲区下溢中断(GLCDC_L2UNDF)

58.1.1 GLCDC Configuration

图58.2显示了GLCDC的配置。

GLCDC包括以下模块：

- 背景画面生成模块：生成背景画面（包括消隐间隔），选择背景颜色，生成控制画面的同步信号。
- 图形数据接口块（2块）：将通过GPX总线读取的图形数据CLUT数据转换成ARGB(8888)数据用于内部处理，并传输时钟(PCLKA→PXCLK)。
- Alphablendingblocks（2个block）：将图形数据叠加到下层屏幕上，根据寄存器设置和当前屏幕图形数据的alphablending值进行alphablending。
- TCON模块：根据内部垂直和水平同步信号，生成适合所连接面板规格的垂直和水平同步和使能信号。
- 数据格式转换块：将内部特定RGB888格式的数据处理成适合面板规格的特定格式的数据，输出图像数据长度的抖动校正。
- 面向面板的校正处理块：校正亮度和对比度，并执行适合所连接面板特性的伽马校正，允许首先进行亮度和对比度校正或伽马校正。
- 时钟发生器模块：从LCD_EXTCLK或PLL输出以特定频率生成像素和面板时钟。

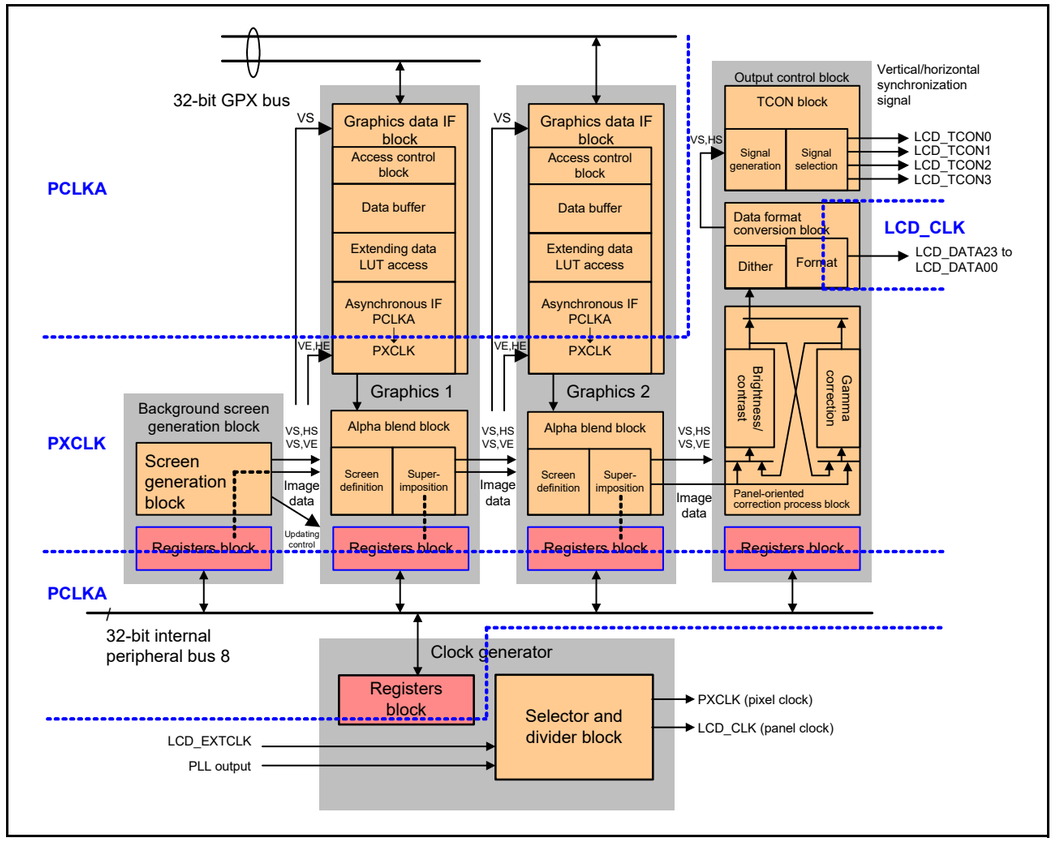

Figure 58.2 GLCDC configuration

58.1.2 Screen Format

Figure 58.3 shows the screen format overview of the GLCDC.

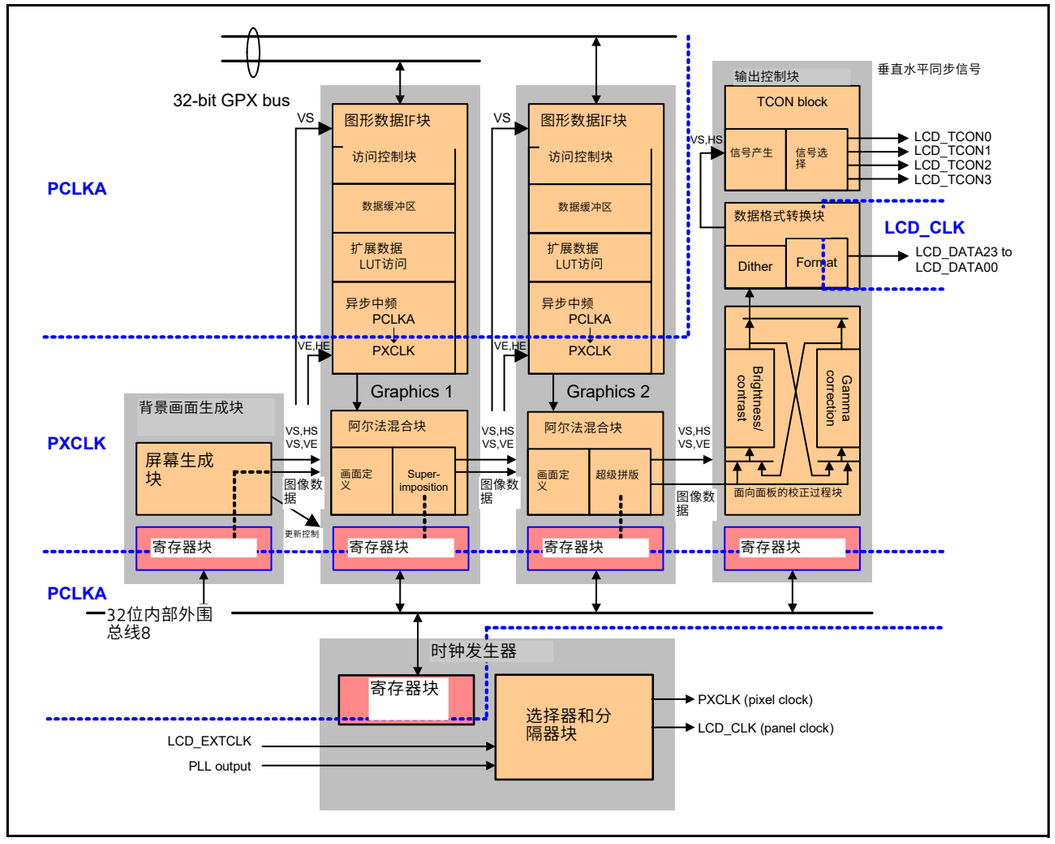

Figure 58.2 GLCDC configuration

58.1.2 屏幕格式

图58.3显示了GLCDC的屏幕格式概览。

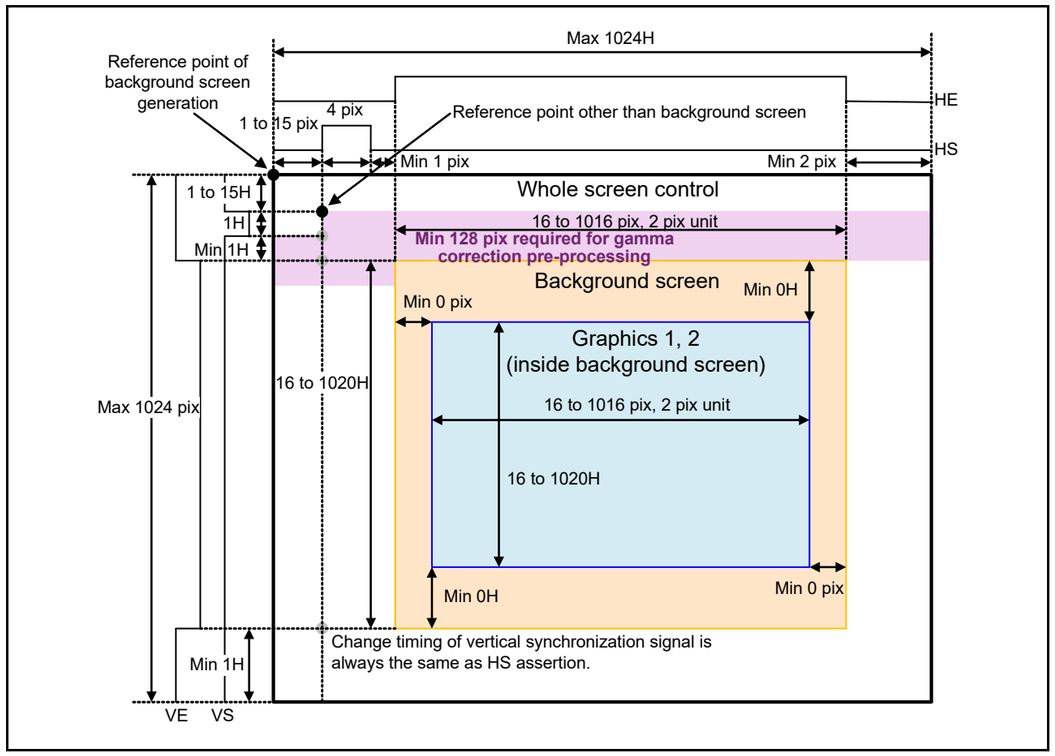

Figure 58.3 Internal screen format

The background screen generation block generates the essential timing signals for operations in the module as a whole. The graphics data interface blocks, alpha blending blocks, gamma correction block, output control block, and TCON block operate based on the synchronization and enable signals, which are sequentially transferred from the background screen generation block.

58.1.3 Graphics and Color Palette (CLUT) Data Formats

The GLCDC handles three display screens, one of which is a background screen. For the background screen, frame data is RGB888 graphics data stored in the registers, and for the other two screens, frame data is stored in the memory connected to the GPX bus as 32- or 16-bit/pixel graphics data or 8-, 4-, or 1-bit/pixel color palette (CLUT) data. The frame data of the relevant screen is read by the graphics data interface block, read into the GLCDC, and extended (converted) into ARGB8888 data for superimposition and blending. Figure 58.4 shows the frame data formats.

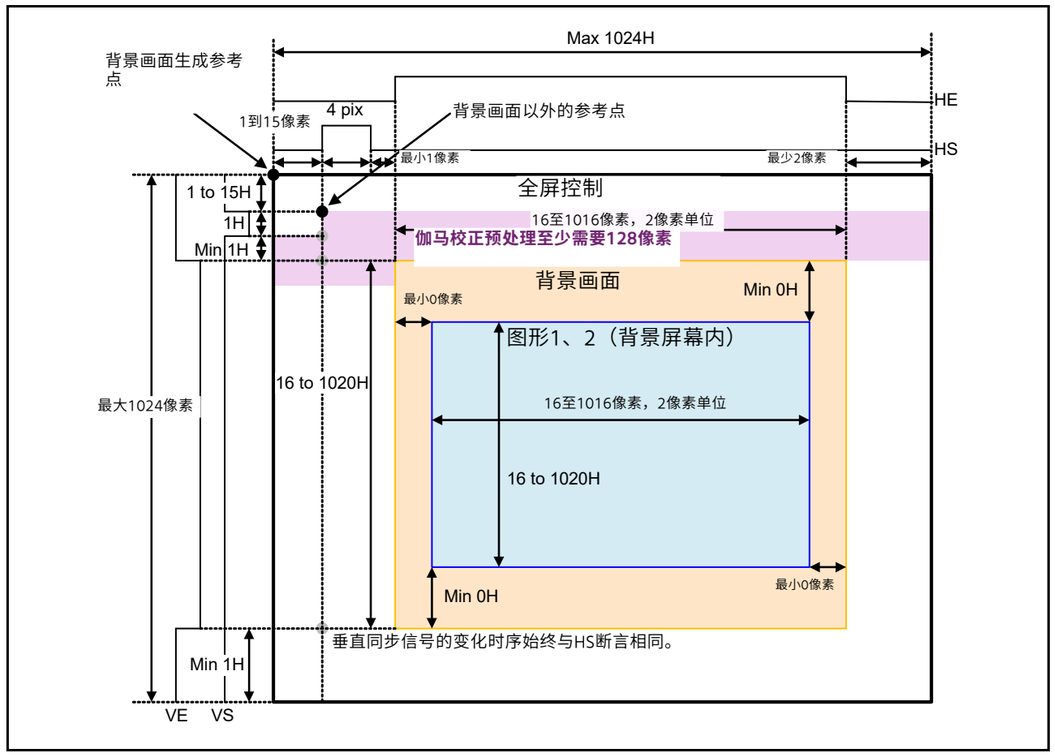

Figure 58.3 内部屏幕格式

背景屏幕生成块为整个模块中的操作生成必要的时序信号。图形数据接口块、阿尔法混合块、伽马校正块、输出控制块和TCON块基于从背景屏幕生成块顺序传输的同步和使能信号进行操作。

58.1.3 图形和调色板(CLUT)数据格式

GLCDC处理三个显示屏幕，其中一个是背景屏幕。对于背景屏幕，帧数据是存储在寄存器中的RGB888图形数据，而对于其他两个屏幕，帧数据作为32位或16位像素图形数据或8-、4-、或1位像素调色板(CLUT)数据。相关画面的帧数据 由图形数据接口块读取，读入GLCDC，扩展（转换）为ARGB8888数据进行叠加混合。图58.4显示了帧数据格式。

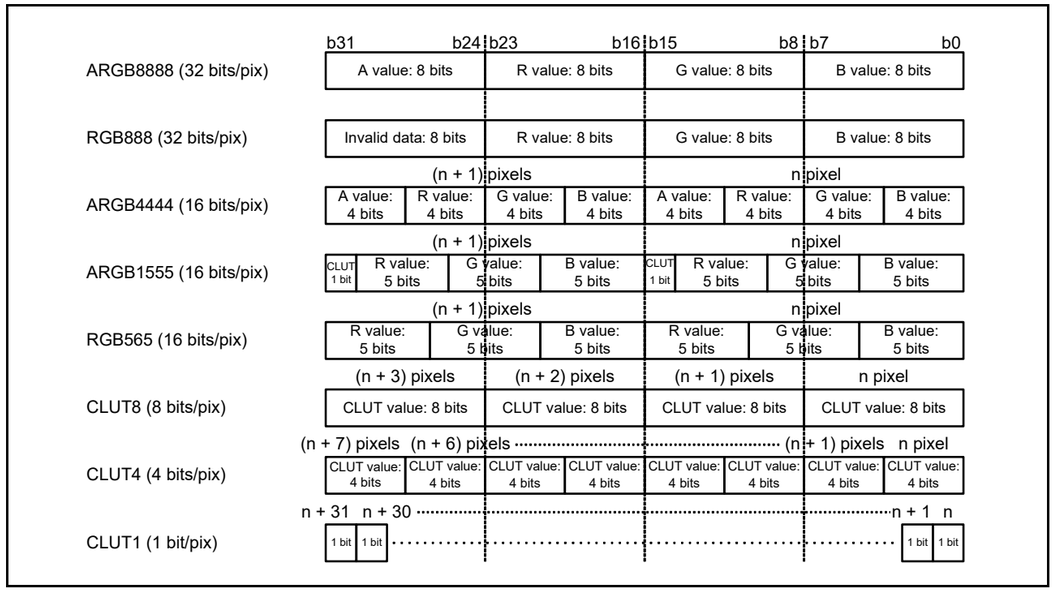

Figure 58.4 Frame data format

The A value (alpha blending value) represents the blending ratio of pixel data for displaying the lower-layer and current graphics screens after superimposition. The blending process is performed in accordance with the equations given in section 58.1.7, Graphics Data Interface. The CLUT value represents the color palette memory address (plane 0 or 1 is selected in the registers), and the data in the color palette is ARGB8888 (32 bits/pixel) graphics data. Addresses 01h/00h are accessed with CLUT1, 0Fh to 00h with CLUT4, and FFh to 00h with CLUT8. Addresses 80h/00h are accessed with ARGB1555 data.

58.1.4 Output Control for Data Format

The GLCDC can output data in accordance with the following formats and register settings:

- Data formats
  - Parallel: RGB888, RGB666, and RGB565
  - Serial: RGB888
  - Lower bits are processed in one of the following modes when 10-bit signals are reduced to 8-, 6-, and 5- bit signals:
    - — Truncate mode
    - — Round-off mode
    - — 2×2 pattern dither processing + truncate mode.
- Pixel arrangement
  - RGB
  - BGR.
- Scan direction select for serial RGB888
  - Forward scan
  - Reverse scan.
- Data output delay of serial RGB888

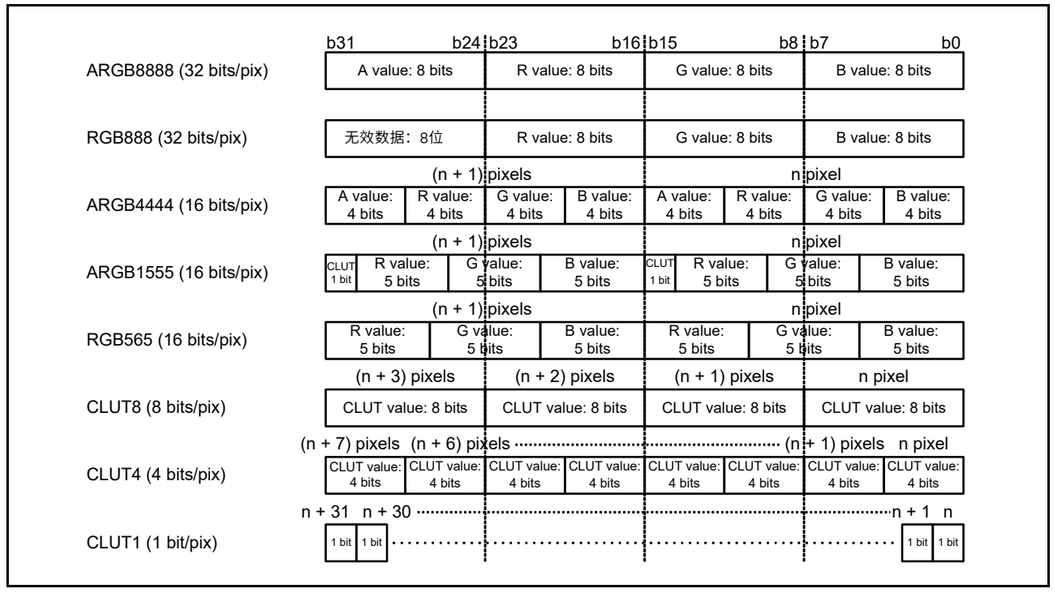

Figure 58.4 帧数据格式

A值(alphablendingvalue)表示叠加后显示下层和当前图形画面的像素数据的混合比例。根据第58.1.7节"图形数据接口"中给出的公式执行混合过程。CLUT值代表调色板内存地址（寄存器中选择平面0或1），调色板中的数据为ARGB8888（32位像素）图形数据。使用CLUT1访问地址01h00h，使用CLUT4访问地址0Fh到00h，使用CLUT8访问FFh到00h。使用ARGB1555数据访问地址80h00h。

58.1.4 数据格式的输出控制

GLCDC可以按照以下格式和寄存器设置输出数据：

- 数据格式
  - Parallel: RGB888, RGB666, and RGB565
  - Serial: RGB888
  - 当10位信号缩减为8位、6位和5位信号时，低位将按以下模式之一进行处理：
    - — Truncate mode
    - — Round-off mode
    - —2×2模式抖动处理+截断模式。
- 像素排列
  - RGB
  - BGR.
- 串行RGB888的扫描方向选择
  - 前向扫描
  - 反向扫描。
- 串口RGB888的数据输出延迟

- 0 to 3 clock cycles.

- Pin assignment.
  - Little endian
  - Big endian.

For details on dither processing, see section 58.2.48, Output Control Block Panel Dither Correction Register (OUT_PDTHA).

Bit assignment of LCD signals for parallel RGB888 format

Table 58.3 shows RGB signal inputs assigned to the LCD signal outputs for the parallel RGB888 output format.

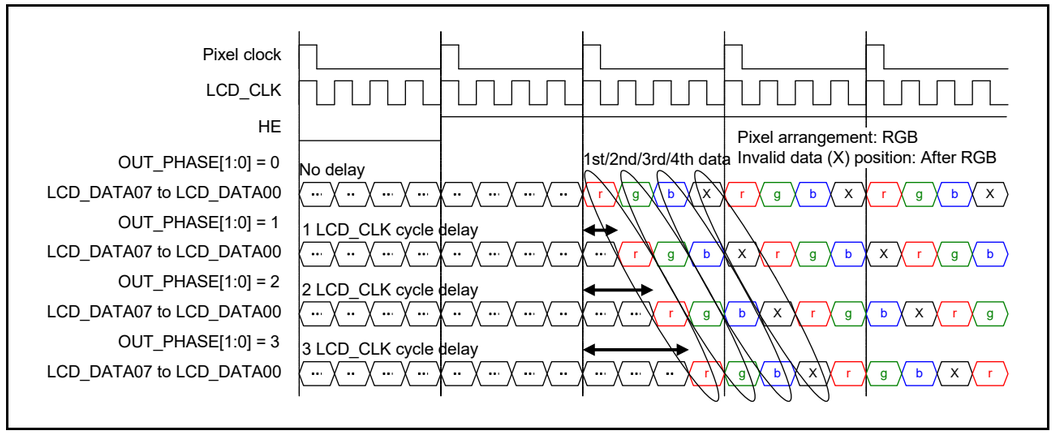

Figure 58.5 Serial RGB888 (4x speed) output timing

58.1.5 Output Control for Panel-Oriented Correction Process

The following panel-oriented correction processes are provided:

- Brightness correction
- Contrast correction
- RGB gamma correction.

Brightness correction always precedes contrast correction, but RGB gamma correction can either precede or follow brightness and contrast correction, based on the register settings. In panel-oriented correction, 10-bit RGB data obtained by extending 8-bit RGB data output from graphics 2 is used, and 10-bit RGB data is also output to the output control (data format conversion) block. Figure 58.6 shows the configuration of the panel-oriented correction circuit.

Table 58.7 用于串行RGB888格式、BGR排列的RGB信号输入的位分配

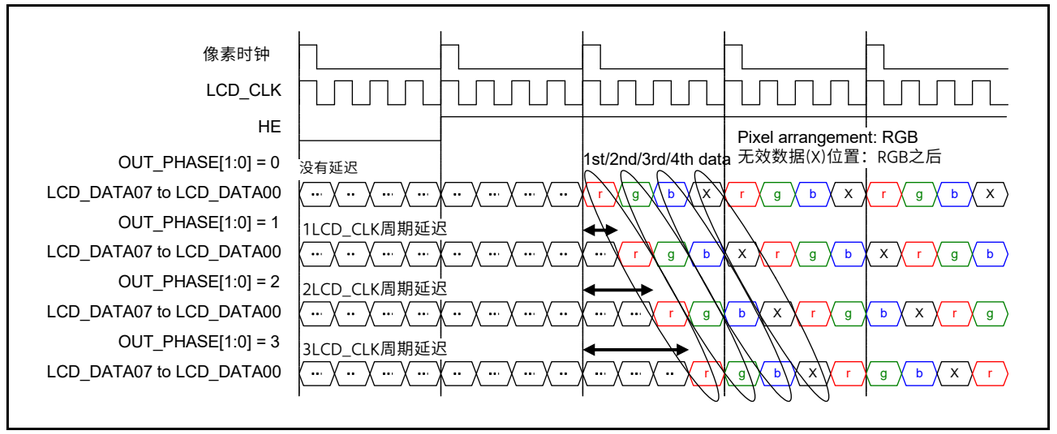

Figure 58.5 串行RGB888（4倍速）输出时序

58.1.5 面向面板的校正过程的输出控制

提供以下面向面板的校正过程：

- 亮度校正
- 对比度校正
- RGB伽马校正。

亮度校正始终先于对比度校正，但RGB伽马校正可以根据寄存器设置在亮度和对比度校正之前或之后进行。在面向面板的校正中，使用通过扩展从图形2输出的8位RGB数据获得的10位RGB数据，并且10位RGB数据也被输出到输出控制（数据格式转换）块。图58.6显示了面向面板的校正电路的配置。

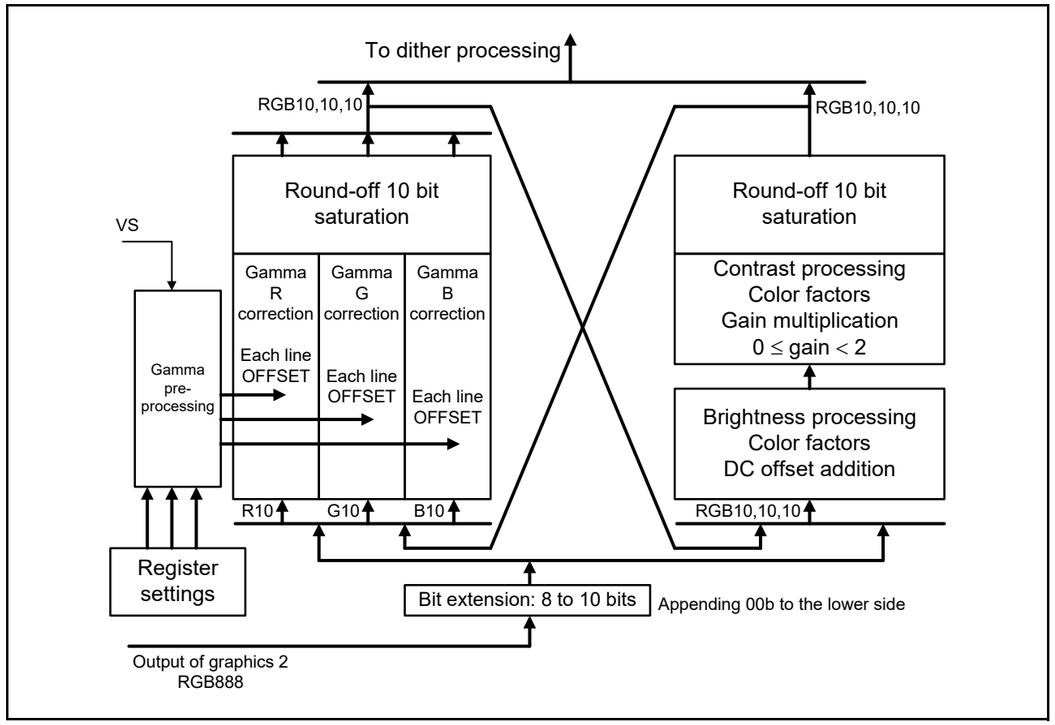

Figure 58.6 Configuration of panel-oriented correction circuit

58.1.6 Output Control for TCON

Any of the four signals generated from the internal vertical and horizontal synchronization signals (STVA, STVB, STHA, and STHB) that have passed through the data format conversion block can be selected for output on four pins, LCD_TCON0, LCD_TCON1, LCD_TCON2, and LCD_TCON3. The generated signals are completely independent of the image data. They are not affected by the output image format or any internal data process, and no register settings for signal generation affect the output image format or any internal data process. The data enable signal DE, which is to be generated by the TCON block, is the logical AND of the two signals STVB and STHB, which were previously generated by the TCON block. Consequently, three signals in total can actually be generated if DE is to be output.

58.1.7 Graphics Data Interface

Two circuit systems are provided for reading graphics data (graphics 1 and 2), each of which incorporates an access control block, data buffer, CLUT memory, data extension block, and asynchronous interface block.

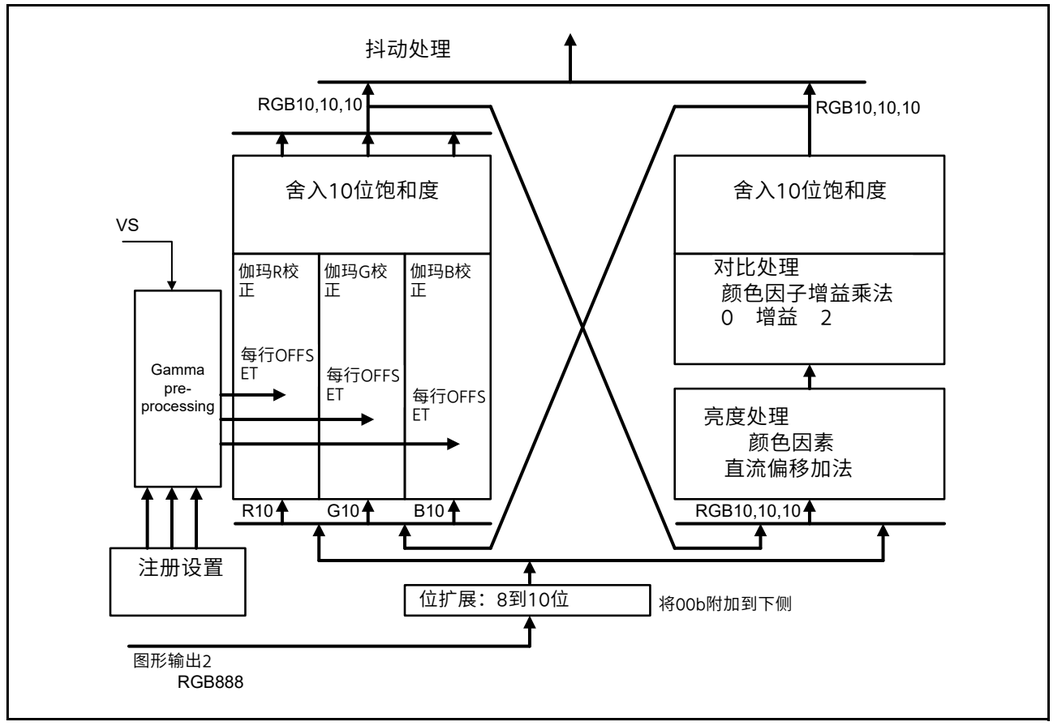

Figure 58.6 面向面板的校正电路的构成

58.1.6 TCON的输出控制

从内部垂直和水平同步信号（STVA、STVB、
通过数据格式转换模块的STHA和STHB)可以选择在四个引脚上输出，
LCD_TCON0、LCD_TCON1、LCD_TCON2和LCD_TCON3。生成的信号完全独立于图像数据。它们不受输出图像格式或任何内部数据处理的影响，并且没有用于信号生成的寄存器设置影响输出图像格式或任何内部数据处理。将由TCON块产生的数据使能信号DE是先前由TCON块产生的两个信号STVB和STHB的逻辑与。因此，如果要输出DE，实际上总共可以产生三个信号。

58.1.7 图形数据接口

提供了两个用于读取图形数据（图形1和2）的电路系统，每个系统都包含访问控制块、数据缓冲器、CLUT存储器、数据扩展块和异步接口块。

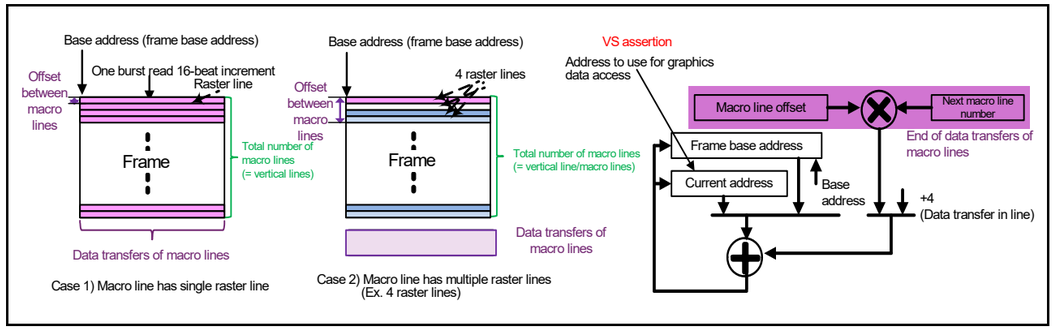

Figure 58.7 Calculation of graphics data access address

Graphics (or CLUT) data is accessed and output to the pixel operation block as ARGB8888 data (32 bits/pixel).

The GPX bus is accessed in word (32-bit) units in 16-beat increment burst reads, in accordance with the preset parameters in the two-dimensional addressing mode, in which the macro line structure is accounted for as shown in Figure 58.7, and data is stored in the data buffer. Even if invalid data is at the macro line end, all the data is stored in the data buffer, and the invalid data is skipped when data is read internally. Regardless of the format of the graphics data, data is extended to ARGB8888 data before being output to the alpha blending blocks.

58.1.8 Blending

The following processes are performed for the graphics areas specified in the registers. The lower-layer graphics plane is output without any processing to the display area outside the graphics area.

- Display plane selection
- RGB-index chroma-key
- Alpha blending.

Figure 58.8 shows the relationship between the graphics display selection and rectangular alpha blending area.

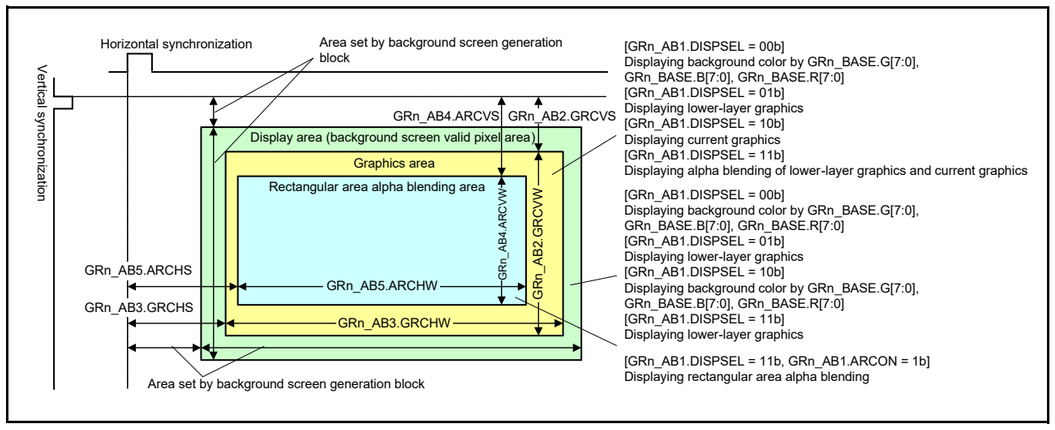

Figure 58.8 Graphics display selection

(1) Display plane selection

Based on the register settings, the following data is output to the graphics area:

- Background color:
  - RGB data specified in the registers.

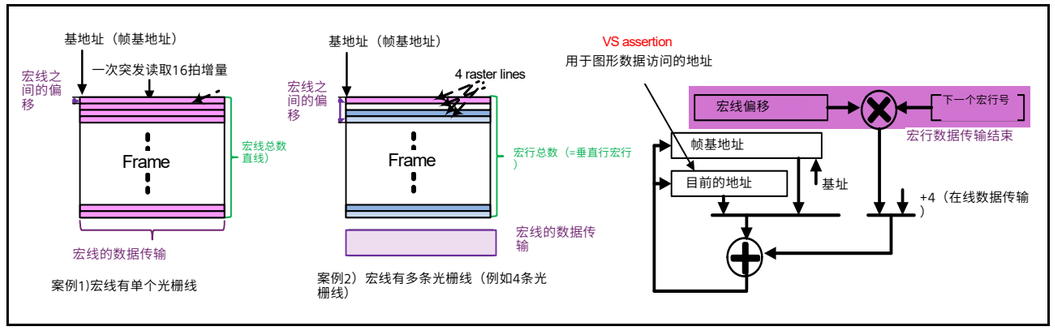

Figure 58.7 计算图形数据访问地址

图形（或CLUT）数据被访问并作为ARGB8888数据（32位像素）输出到像素操作块。

GPX总线以16-beat增量突发读取为单位，按照二维寻址方式中的预设参数，以字（32位）为单位进行访问，其中宏线结构如图58.7所示，数据存储在数据缓冲区中。即使无效数据在宏行结束，所有数据都存储在数据缓冲区中，内部读取数据时会跳过无效数据。无论图形数据的格式如何，在输出到alpha混合块之前，数据都被扩展为ARGB8888数据。

58.1.8 Blending

对寄存器中指定的图形区域执行以下处理。下层图形平面不经过任何处理就输出到图形区域外的显示区域。

- 显示平面选择
- RGB-index chroma-key
- 阿尔法混合。

图58.8显示了图形显示选择和矩形alpha混合区域之间的关系。

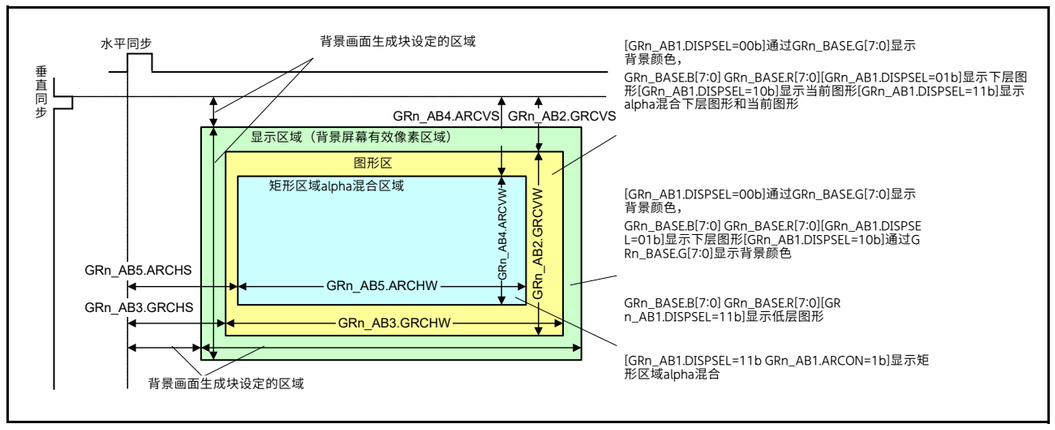

Figure 58.8 图形显示选择

(1) 显示平面选择

根据寄存器设置，将以下数据输出到图形区域：

- Background color:
  - 寄存器中指定的RGB数据。

- Lower-layer graphics:
  - RGB data input from the previous module
  - Output from the background screen generation block for graphics 1
  - Output from graphics 1 for graphics 2.
- Current graphics:
  - RGB data obtained by the graphics data interface block extending the graphics data read by the graphics 1 or 2 module through the GPX bus or CLUT data to ARGB8888 format data.
- Blending:
  - RGB data obtained by blending the lower-layer graphics data and current graphics data obtained by the graphics data interface block extension to ARGB8888 format data, based on the alpha blending values or the register settings.

It is possible to modify the register values related to these functions while display operation is in progress, and to allow reflection of the updates to the internal operations when the VS (vertical synchronization signal) is asserted, if reflection of the register settings to the internal operations on vertical synchronization is enabled.

(2) RGB-index chroma-key

If the RGB value of the ARGB8888 data input from the graphics data interface block agrees with the value set in the GRn_AB8 register, the ARGB8888 data is entirely replaced with the value preset in the GRn_AB9 register. All the ARGB8888 data input from the graphics data interface block is subject to this process. If your application excludes CLUT memory output from this process, you must disable the corresponding process in GRn_AB7.CKON.

(3) Alpha blending

If blending is selected in the selected display plane, lower-layer graphics and current graphics are alpha-blended based on the register settings using either of the following two functions.

(a) Alpha-blending in a rectangular area

The following process is performed for the rectangular area (in the graphics area) preset in the registers:

1. Lower-layer graphics and current graphics planes are blended in accordance with the A value set in the registers.
2. After the number of frames set in the registers passes, the A value is updated to the A value + Δ (register setting).
3. The lower-layer graphics and current graphics planes are blended in accordance with this updated A value.
4. The process of updating the A value after the number of frames set in the registers passes is repeated (A value: min/max value saturation).

(b) Alpha-blending in pixel units

The lower-layer graphics and current graphics planes are blended in accordance with the A value of the ARGB8888 data input from the graphics data interface block.

Figure 58.9 shows the update of the alpha blending value in the rectangular alpha blending area.

- Lower-layer graphics:
  - 从上一个模块输入的RGB数据
  - 图形1的背景屏幕生成块的输出
  - 图形2的图形1输出。
- Current graphics:
  - 图形数据接口块将图形1或2模块通过GPX总线读取的图形数据或CLUT数据扩展为ARGB8888格式数据得到的RGB数据。
- Blending:
  - 根据alpha混合值或寄存器设置，将下层图形数据和图形数据接口块扩展得到的当前图形数据混合为ARGB8888格式数据得到的RGB数据。

可以在显示操作进行时修改与这些功能相关的寄存器值，并允许在VS（垂直同步信号）置位时将更新反映到内部操作，如果将寄存器设置反映到内部启用垂直同步操作。

(2) RGB-index chroma-key

如果从图形数据接口块输入的ARGB8888数据的RGB值与GRn_AB8寄存器，ARGB8888数据全部替换为GRn_AB9寄存器中预设的值。所有从图形数据接口块输入的ARGB8888数据都要经过这个过程。如果您的应用程序不包括此进程的CLUT内存输出，必须在GRn_AB7.CKON中禁用相应进程。

(3) 阿尔法混合

如果在选定的显示平面中选择了混合，则下层图形和当前图形使用以下两个功能之一根据寄存器设置进行alpha混合。

(a) 矩形区域中的Alpha混合

对寄存器中预设的矩形区域（图形区域内）进行如下处理：

1. 下层图形和当前图形平面按照寄存器中设置的A值进行混合。
2. 在寄存器中设置的帧数通过后，A值更新为A值+Δ（寄存器设置）。
3. 下层图形和当前图形平面按照这个更新的A值进行混合。
4. 在寄存器中设置的帧数通过后更新A值的过程被重复（A值：最小最大值饱和）。

(b) 以像素为单位的Alpha混合

下层图形和当前图形平面按照从图形数据接口块输入的ARGB8888数据的A值进行混合。

图58.9显示了矩形alpha混合区域中alpha混合值的更新。

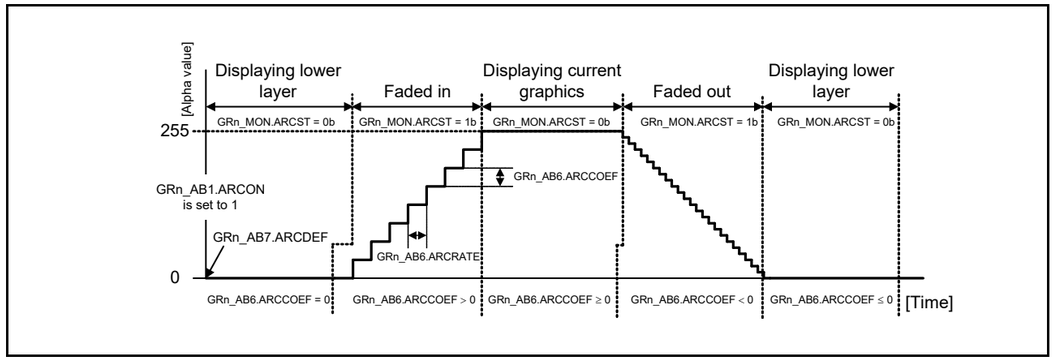

Figure 58.9 Updating of alpha blending value

Alpha blending is based on the following formulas:

When A value = 255
Rout/Gout/Bout = current graphics data
When A value ≠ 255
Rout = (Rin1 × A + Rin0 × (256 - A))/256
Gout = (Gin1 × A + Gin0 × (256 - A))/256
Bout = (Bin1 × A + Bin0 × (256 - A))/256

where,

A: alpha blending value
Rin1/Gin1/Bin1: current graphics data
Rin0/Gin0/Bin0: lower-layer graphics data

58.2 Register Descriptions

x: Undefined

Bit	Symbol	位名称	Description	R/W
b7 to b0	B[7:0]	图形m平面的调色板n平面的B值	图形m平面的调色板n平面的B值。无符号8位整数。	R/W

Bit	Symbol	Bit name	Description	R/W
b15 to b8	G[7:0]	G Value of Color Palette n Plane for Graphics m Plane	G value of color palette n plane for graphics m plane. Unsigned 8-bit integer.	R/W
b23 to b16	R[7:0]	R Value of Color Palette n Plane for Graphics m Plane	R value of color palette n plane for graphics m plane. Unsigned 8-bit integer.	R/W
b31 to b24	A[7:0]	Alpha Blending Value of Color Palette n Plane for Graphics m Plane	Alpha blending value of color palette n plane for graphics m plane. Unsigned 8-bit integer.	R/W

B[7:0] bits (B Value of Color Palette n Plane for Graphics m Plane)

The B[7:0] bits set the B value when this color palette is used.

G[7:0] bits (G Value of Color Palette n Plane for Graphics m Plane)

The G[7:0] bits set the G value when this color palette is used.

R[7:0] bits (R Value of Color Palette n Plane for Graphics m Plane)

The R[7:0] bits set the R value when this color palette is used.

A[7:0] bits (Alpha Blending Value of Color Palette n Plane for Graphics m Plane)

The A[7:0] bits set the alpha blending value when this color palette is used.

All the planes can always be accessed through the register access bus (internal peripheral bus 8), regardless of the plane specified to be used by the graphics data access block. The updates are reflected to the internal operations directly, not in synchronization with the vertical synchronization signal. To keep reflection of the CLUT memory contents to the internal operations in synchronization with the vertical synchronization signal, first write data through the register access bus to the plane that is not being used for internal operations, and then modify the GRn_CLUTINT.SEL bit for controlling the plane that is to be used.

58.2.2 Background Plane Setting Operation Control Register (BG_EN)

Address(es): GLCDC.BG_EN 400E 1000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

EN bit (Background Plane Operation Enable)

The EN bit enables or disables the operation of the background plane generation module. When the operation is stopped (this bit is cleared to 0) after the operation is enabled (set to 1), the operation is stopped at the end of screen generation, unlike when a software reset occurs.

When setting this bit to 1, set the BG_EN.VEN bit to 1 simultaneously to enable register value reflection to internal operations. When clearing this bit to 0, also clear the BG_EN.VEN bit to 0 simultaneously. Before clearing this bit to 0, confirm that the BG_MON.VEN bit is cleared to 0, to make sure that the signal for controlling reflection of the register values to internal operations is negated. Operation is not guaranteed if this bit and the BG_EN.VEN bit are set to 1, or if the settings in other registers are modified before the BG_MON.EN bit is cleared to 0.

VEN bit (Control of GLCDC Internal Register Value Reflection to Internal Operations)

The VEN bit enables or disables reflection of the GLCDC internal register to the GLCDC internal operation on assertion of the vertical synchronization signal (input). When this bit is set to 1, the signal of GLCDC internal register values reflection control is set to 1 at the immediate start of the screen, and are automatically cleared to 0 at the end of the vertical valid pixel of the same screen. Set this bit to 1 only when 0. Operation is not guaranteed if this bit is set to 1 when 1. Also, while this bit is 1, do not modify any register whose value is reflected to the internal operations at the start of the screen in the GLCDC or on assertion of the vertical synchronization signal (input). Otherwise, operation is not guaranteed.

SWRST bit (Software Reset Control)

The SWRST bit controls a software reset of the entire GLCDC, not only the background plane generation module. When this bit is cleared to 0, the GLCDC enters the reset state from any operation state. This bit must be set to 1 before the registers are set or operation enabled. Although the registers (except the CLUT memory and the some of the operation control registers) can be set while this bit is set to 1 (immediately after), before accessing the CLUT memory, enabling operation, or reflecting the register values to the internal operation by the vertical synchronization signal, confirm that PXCLK/LCD_CLK and PCLKA are supplied and that the BG_MON.SWRST bit, which monitors the entire module software reset state, is set to 1. Operation is not guaranteed if the software accesses CLUT memory, enables operation, or reflects the register vales to the internal operation on the vertical synchronization signal while PXCLK/LCD_CLK and PCLKA are not supplied or the BG_MON.SWRST bit is not set to 1. The peripheral bus clock (PCLKA) must be supplied to the GLCDC when this bit is used to apply or cancel a software reset. If PCLKA is not supplied, writing to this bit is impossible.

The bits in this register control the GLCDC states. The internal states can be read from the associated bits in the status monitor registers and BG_EN.VEN (this register). Because the GLCDC, which operates on multiple clock signals, requires a certain period for state transition, you must confirm that the internal state has stabilized (state transition is complete) when settings are modified. Operation is not guaranteed if settings are modified again before the internal state stabilizes (state transition is complete). However, clearing a software reset to 0 immediately makes the whole GLCDC reset, setting it to 1 releases the reset state. These operations do not require the clock supply of PXCLK.

EN位（后台平面操作使能）

EN位启用或禁用后台平面生成模块的操作。当操作使能（设置为1）后停止操作（该位清零）时，操作在屏幕生成结束时停止，这与发生软件复位时不同。

将此位设置为1时，同时将BG_EN.VEN位设置为1，以使寄存器值反映到内部操作。将该位清0时，同时将BG_EN.VEN位清0。在将该位清零之前，请确认BG_MON.VEN位清零，以确保控制寄存器值反映到内部操作的信号被取反。如果该位和BG_EN.VEN位设置为1，或者如果在BG_MON.EN位清零之前修改了其他寄存器中的设置，则无法保证操作。

VEN位（控制GLCDC内部寄存器值反映到内部操作）

VEN位启用或禁用GLCDC内部寄存器在垂直同步信号（输入）断言时反射到GLCDC内部操作。当该位设置为1时，GLCDC内部寄存器值反射控制的信号在屏幕的立即开始时设置为1，并在同一屏幕的垂直有效像素结束时自动清零。仅在0时将此位设置为1。如果此位在1时设置为1，则不保证操作。此外，当此位为1时，请勿修改其值反映到屏幕开始时的内部操作的任何寄存器在GLCDC或垂直同步信号（输入）的断言。否则，无法保证操作。

SWRST位（软件复位控制）

SWRST位控制整个GLCDC的软件复位，而不仅仅是后台平面生成模块。当该位清0时，GLCDC从任何操作状态进入复位状态。在设置寄存器或启用操作之前，该位必须设置为1。虽然寄存器（除了CLUT存储器和一些操作控制寄存器）可以在该位设置为1时（紧接之后）设置，但在访问CLUT存储器、启用操作或将寄存器值反映到内部操作之前通过垂直同步信号，确认提供了PXCLKLCD_CLK和PCLKA，并且监控整个模块软件复位状态的BG_MON.SWRST位设置为1。如果软件访问CLUT存储器，使能操作，则无法保证操作，或在未提供PXCLKLCD_CLK和PCLKA或BG_MON.SWRST位未设置为1时将寄存器值反映到垂直同步信号上的内部操作。当此位时，必须向GLCDC提供外围总线时钟(PCLKA)用于应用或取消软件复位。如果未提供PCLKA，则无法写入该位。

该寄存器中的位控制GLCDC状态。可以从状态监视器寄存器和BG_EN.VEN（此寄存器）中的相关位读取内部状态。由于GLCDC对多个时钟信号进行操作，因此需要一定的状态转换周期，因此在修改设置时必须确认内部状态已稳定（状态转换完成）　　。如果在内部状态稳定（状态转换完成）　　之前再次修改设置，则无法保证操作。但是，将软件复位清除为0会立即使整个GLCDC复位，将其设置为1会释放复位状态。这些操作不需要PXCLK的时钟供应。

58.2.3 Background Plane Setting Free-Running Period Register (BG_PERI)

Address(es): GLCDC.BG_PERI 400E 1004h

b31 to b20	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Rewriting these bits is prohibited during operation. Set the required settings before enabling operation. Operation is not guaranteed if the bit is rewritten during operation.

HP[3:0] bits (Background Plane Horizontal Synchronization Signal Assertion Position)

The HP[3:0] bits set the horizontal synchronization signal assertion position of the background plane. The signal is held asserted for a 4-pixel clock width.

VP[3:0] bits (Background Plane Vertical Synchronization Assertion Position)

The VP[3:0] bits set the vertical synchronization signal assertion position of the background plane. The signal is held asserted for a 1H width, and the assertion timing within a single horizontal line is specified in BG_SYNC.HP[3:0].

58.2.4 后台平面设置同步位置寄存器（BG_SYNC）

Note: Rewriting these bits is prohibited during operation. Set the required settings before enabling operation. Operation is not guaranteed if the bit is rewritten during operation.

VW[10:0] bits (Background Plane Vertical Valid Pixel Width)

The VW[10:0] bits set the vertical valid pixel width of the background plane. This field contains 11 bits and can be set to any number from 000h to 7FFh. However, the valid range is 010h to 3FCh. Operation is not guaranteed if a value outside the valid range is set.

VP[10:0] bits (Background Plane Vertical Valid Pixel Start Position)

The VP[10:0] bits set the vertical valid pixel start position of the background plane. This field contains 11 bits and can be set to any number from 000h to 7FFh. However, the valid range is 003h to 3EFh. Operation is not guaranteed if a value outside the valid range is set.

Specify the vertical valid pixel area between the assertion position of the vertical synchronization signal + 2 and the (background plane end - 1)th line. Operation is not guaranteed if the area is specified outside this range.

	—	—	—	—	—	HW[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b10 to b0	HW[10:0]	Background Plane Horizontal Valid Pixel Width	Width based on pixel clocks (PXCLK). 010h: 16 cycles : 3F8h: 1016 cycles. Other settings are prohibited.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b26 to b16	HP[10:0]	Background Plane Horizontal Valid Pixel Start Position	Position based on pixel clocks (PXCLK). 006h: 6th cycle (pixel) : 3EEh: 1006th cycle (pixel). Other settings are prohibited.	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Rewriting these bits is prohibited during operation. Set the required settings before enabling operation. Operation is not guaranteed if the bit is rewritten during operation.

HW[10:0] bits (Background Plane Horizontal Valid Pixel Width)

The HW[10:0] bits set the horizontal valid pixel width of the background plane. This field contains 11 bits and can be set to any number from 000h to 7FFh. However, the valid range is 010h to 3F8h. Operation is not guaranteed if a value outside the valid range is set. When serial RGB is selected as the output format for the output control block, add two to the horizontal valid pixel width and set the resulting value to these bits.

HP[10:0] bits (Background Plane Horizontal Valid Pixel Start Position)

The HP[10:0] bits set the horizontal valid pixel start position of the background plane. This field contains 11 bits and can be set to any number from 000h to 7FFh. However, the valid range is 006h to 3EEh. Operation is not guaranteed if a value outside the valid range is set.

Specify the horizontal valid pixel area between the assertion position of the horizontal synchronization signal + 5 and pixel number (line end - 2). Operation is not guaranteed if the area is specified outside this range.

The background plane generation module outputs the values that are specified in the Background Color Register (BG_BGC) for the area defined by the Full Image Vertical Size Register (BG_VSIZE) and Full Image Horizontal Size Register (BG_HSIZE), and it outputs 00h as the RGB values for the blanking interval area.

b31 to b17	—	Reserved	These bits are read as 0.	R

EN bit (Background Plane Operation Monitor)

The EN bit indicates whether the background plane generation module is operating or not. To stop the operation of the background plane generation module by clearing BG_EN.EN to 0, read this bit to confirm that the operation of the background plane is complete. Clearing BG_EN.EN to 0 does not stop the operation until completion of the background plane, unlike when BG_EN.SWRST is cleared to 0.

VEN bit (Entire Module Internal Operation Reflection Control Signal Monitor)

The VEN bit indicates the value of the signal for controlling reflection of the GLCDC internal register values to the internal operations. This signal is asserted at the start of a screen immediately after setting BG_EN.VEN to 1 and negated at the VE negate timing output from the background screen generation block.

SWRST bit (Entire Module SW Reset State Monitor)

The SWRST bit indicates the software reset state of the entire module when PXCLK is supplied. This bit value indicates the result of the peripheral module clock A (PCLKA) resampling the result of the pixel clock (PXCLK) sampling the BG_EN.SWRST bit. Even if PXCLK is not supplied, clearing the BG_EN.SWRST to 0 clears this bit to 0.

b31 to b17	—	Reserved	这些位读为0。	R

EN位（后台平面操作监视器）

EN位指示后台平面生成模块是否正在运行。要通过将BG_EN.EN清为0来停止后台平面生成模块的操作，请读取该位以确认后台平面的操作已完成。与BG_EN.SWRST清零不同，将BG_EN.EN清零不会停止操作，直到后台平面完成。

VEN位（整个模块内部操作反射控制信号监视器）

VEN位指示用于控制GLCDC内部寄存器值反映到内部操作的信号值。该信号在将BG_EN.VEN设置为1后立即在屏幕开始时置位，并在后台屏幕生成模块的VE否定时序输出时被否定。

SWRST位（整个模块SW复位状态监视器）

SWRST位指示提供PXCLK时整个模块的软件复位状态。该位值表示外围模块时钟A(PCLKA)对像素时钟(PXCLK)对BG_EN.SWRST位进行采样的结果进行重采样的结果。即使未提供PXCLK，将BG_EN.SWRST清除为0也会将该位清除为0。

58.2.9 图形1寄存器更新控制寄存器(GR1_VEN)图形2寄存器更新控制寄存器(GR2_VEN)

Address(es): GLCDC.GR1_VEN 400E 1100h, GLCDC.GR2_VEN 400E 1200h

Bit	Symbol	位名称	Description	R/W
b0	PVEN	图形控制n将值反射注册到内部像素操作	0：禁止在垂直同步信号(VS)断言时将寄存器值反映到内部操作1：启用在垂直同步信号(VS)断言时将寄存器值反映到内部操作。该位由内部源清零。	R/W
b31 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

PVEN位（控制图形n寄存器值反映到内部像素操作）

PVEN位启用或禁用寄存器值在垂直同步信号（输入）断言时反映到像素操作电路的内部操作。当该位设置为1时，寄存器值在垂直同步信号（输入）置位时立即反映到内部操作，并自动清零。仅当为0时将该位设置为1。如果出现以下情况，则不保证操作此位在1时设置为1。此外，如果信号

output is asserted from the background plane generation module that controls reflection of the register values to the internal operations of all the modules, the register values are always reflected to the internal operations on assertion of the vertical synchronization signal (input), regardless of the value of this bit. While this bit is 1, do not modify any register whose value is reflected to the internal operations on assertion of the vertical synchronization signal (input) in this block. Otherwise, operation is not guaranteed.

This bit must not be 1 at the same time as the BG_EN.VEN bit (control of background plane register value reflection to internal operations) in the Operation Control Register (BG_EN), one of the background plane setting registers. Otherwise, operation is not guaranteed.

58.2.10 Graphics 1 Frame Buffer Read Control Register (GR1_FLMRD) Graphics 2 Frame Buffer Read Control Register (GR2_FLMRD)

Address(es): GLCDC.GR1_FLMRD 400E 1104h, GLCDC.GR2_FLMRD 400E 1204h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	RENB	Graphics Data Read Enable	0: Disable reading 1: Enable reading. Graphics data is the frame buffer data.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

RENB bit (Graphics Data Read Enable)

The RENB bit enables or disables reading of the graphics data (frame buffer data in memory connected through the GPX bus). If the current graphics data is required, data read must be enabled (GRn_FLMRD.RENB = 1) before the background panel operation is enabled, register value internal operation reflection control is enabled, or the register value internal operation reflection control of graphics 1 and 2 is enabled.

If the current graphics data is not required, data read must be disabled (GRn_FLMRD.RENB = 0) before the background panel operation is enabled, register value internal operation reflection control is enabled, or the register value internal operation reflection control of graphics 1 and 2 is enabled.

输出从后台平面生成模块断言，该模块控制寄存器值对所有模块的内部操作的反映，无论值如何，寄存器值总是在垂直同步信号（输入）断言时反映到内部操作这一点。当该位为1时，不要修改任何寄存器，其值反映到该模块中垂直同步信号（输入）置位时的内部操作。否则，无法保证操作。

该位不能与后台平面设置寄存器之一的操作控制寄存器(BG_EN)中的BG_EN.VEN位（控制后台平面寄存器值反映到内部操作）同时为1。否则，无法保证操作。

58.2.10 图形1帧缓冲区读取控制寄存器(GR1_FLMRD)图形2帧缓冲区读取控制寄存器(GR2_FLMRD)

b31 to b0	BASE[31:0]	访问的基地址 图形数据	帧缓冲区中要存储图形数据的起始地址。在64字节突发传输期间将GRn_FLM2.BASE[5:0]修复为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
GRn_VEN.PVEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

BASE[31:0] bits (Base Address for Accessing Graphics Data)

The BASE[31:0] bits specify the base address (start address in the first frame buffer) for graphics data access. Because the GLCDC only supports the 16-beat increment burst transfer mode, in which data is aligned with a 64-byte boundary, the lower 6 bits (GRn_FLM2.BASE[5:0]) must be fixed to 0.

58.2.13 Graphics 1 Frame Buffer Control Register 3 (GR1_FLM3)
Graphics 2 Frame Buffer Control Register 3 (GR2_FLM3)

Address(es): GLCDC.GR1_FLM3 400E 1110h, GLCDC.GR2_FLM3 400E 1210h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LNOFF[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b31 to b16	LNOFF[15:0]	Macro Line Offset Address for Accessing Graphics Data	Macro line offset address for accessing graphics data (frame buffer data). Signed, 16-bit integer.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

LNOFF[15:0] bits (Macro Line Offset Address for Accessing Graphics Data)

The LNOFF[15:0] bits specify the macro line offset address for accessing graphics data (offset to be added to the current address at the macro line end for calculating the start address of the next macro line). Because the GLCDC only supports the 16-beat increment burst transfer mode, in which data is aligned with a 64-byte boundary, the lower 6 bits (GRn_FLM3.LNOFF[5:0]) must be fixed to 0.

BASE[31:0]位（访问图形数据的基地址）

BASE[31:0]位指定图形数据访问的基地址（第一个帧缓冲区中的起始地址）。由于GLCDC仅支持16拍增量突发传输模式，其中数据与64字节边界对齐，因此低6位(GRn_FLM2.BASE[5:0])必须固定为0。

58.2.13 图形1帧缓冲区控制寄存器3(GR1_FLM3)图形2帧缓冲区控制寄存器3(GR2_FLM3)

Address(es): GLCDC.GR1_FLM3 400E 1110h, GLCDC.GR2_FLM3 400E 1210h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	LNOFF[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b31 to b16	LNOFF[15:0]	宏行偏移地址 访问图形数据	访问图形数据（帧缓冲数据）的宏行偏移地址。有符号的16位整数。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时GRn_VEN.PVEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

LNOFF[15:0]位（用于访问图形数据的宏行偏移地址）

LNOFF[15:0]位指定访问图形数据的宏行偏移地址（在宏行结束时添加到当前地址的偏移，用于计算下一个宏行的起始地址）。由于GLCDC仅支持16拍增量突发传输模式，其中数据与64字节边界对齐，因此低6位(GRn_FLM3.LNOFF[5:0])必须固定为0。

58.2.14 Graphics 1 Frame Buffer Control Register 5 (GR1_FLM5)
Graphics 2 Frame Buffer Control Register 5 (GR2_FLM5)

Address(es): GLCDC.GR1_FLM5 400E 1118h, GLCDC.GR2_FLM5 400E 1218h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	DATANUM[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b15 to b0	DATANUM[15:0]	Number of Data Transfer Times Per Line for Accessing Graphics Data	Number of data transfers per macro line for accessing graphics data (frame buffer data), where one transfer is defined as 16-beat burst access (64-byte boundary). 0000h: Once : FFFFh: 65536 times.	R/W
b26 to b16	LNNUM[10:0]	Number of Lines Per Frame for Accessing Graphics Data	Number of macro lines per frame for accessing graphics data (frame buffer data). 000h: 1 macro line : 3FBh: 1020 macro lines. Other settings are prohibited.	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

DATANUM[15:0] bits (Number of Data Transfer Times Per Line for Accessing Graphics Data)

The DATANUM[15:0] bits specify the number of data transfers per macro line for accessing graphics data, where one transfer is defined as a 16-beat burst access through the GPX bus. For all the data transfers, at least 2 bytes of valid pixel data are required (16 pixels in LUT1 format and 16 pixels or more in the other formats). If the number of bytes per macro line cannot be divided by 64 (4 bytes × 16-beat), DATANUM is obtained by rounding up to the whole number.

LNNUM[10:0] bits (Number of Lines Per Frame for Accessing Graphics Data)

The LNNUM[10:0] bits specify the number of lines per frame for accessing graphics data. When graphics data for the number of lines set to these bits is read, it signals the end of the frame and the base address is loaded.

The following are two use cases for macro lines. In these use cases, the frame size is 480 pixels × 272 lines and the pixel format is RGB565 (16 bpp).

Case 1) One macro line is configured to be equivalent to the frame raster width. The number of macro lines is equivalent to the number of vertical lines.

DATANUM: 000Eh (15 times = 16 × 480 / 512)
LNNUM: 10Fh (272 macro lines = 272 / 1)

Case 2) One macro line is configured to be repeated during the display frame. The number of macro lines is not equivalent to the number of vertical lines. In the example, one macro line has 16 times the raster width.

DATANUM: 00EFh (240 times = 16 × 480 / 512 × 16)
LNNUM: 010h (17 macro lines = 272 / 16)

58.2.14 图形1帧缓冲区控制寄存器5(GR1_FLM5)图形2帧缓冲区控制寄存器5(GR2_FLM5)

Address(es): GLCDC.GR1_FLM5 400E 1118h, GLCDC.GR2_FLM5 400E 1218h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	DATANUM[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b15 to b0	DATANUM[15:0]	每行的数据传输次数 访问图形数据	用于访问图形数据（帧缓冲区数据）的每条宏线的数据传输次数，其中一次传输定义为16拍突发访问（64字节边界）。0000h：一次 : FFFFh: 65536 times.	R/W
b26 to b16	LNNUM[10:0]	每帧访问的行数 图形数据	用于访问图形数据（帧缓冲区数据）的每帧宏行数。000h：1条宏线 :3FBh:1020宏线。禁止其他设置。	R/W
b31 to b27	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
GRn_VEN.PVEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

DATANUM[15:0]位（访问图形数据的每行数据传输次数）

DATANUM[15:0]位指定用于访问图形数据的每条宏线的数据传输次数，其中一次传输定义为通过GPX总线的16拍突发访问。对于所有数据传输，至少需要2个字节的有效像素数据（LUT1格式为16个像素，其他格式为16个或更多像素）。如果每个宏行的字节数不能除以64（4字节×16-beat），则通过四舍五入获得DATANUM。

LNNUM[10:0]位（访问图形数据的每帧行数）

LNNUM[10:0]位指定用于访问图形数据的每帧的行数。当读取设置为这些位的行数的图形数据时，它表示帧结束并加载基地址。

以下是宏行的两个用例。在这些用例中，帧大小为480像素×272行，像素格式为RGB565(16bpp)。

案例1)一条宏线被配置为与帧光栅宽度相等。宏行数等于垂直行数。

DATANUM: 000Eh (15 times = 16 × 480 / 512)
LNNUM：10Fh（272宏行=2721）

情况2)一个宏行被配置为在显示帧期间重复。宏行数不等于垂直行数。在该示例中，一条宏线具有光栅宽度的16倍。

DATANUM: 00EFh (240 times = 16 × 480 / 512 × 16)
LNNUM：010h（17行宏=27216）

58.2.15 Graphics 1 Frame Buffer Control Register 6 (GR1_FLM6) Graphics 2 Frame Buffer Control Register 6 (GR2_FLM6)

Bit	Symbol	Bit name	Description	R/W
b27 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b30 to b28	FORMAT[2:0]	Data Format for Accessing Graphics Data	Data format for accessing graphics data (frame buffer data). b30 b28 0 0 0: RGB565 (16 bits/pixel) 0 0 1: RGB888 (32 bits/pixel, 8 bits on the MSB side are invalid) 0 1 0: ARGB1555 (16 bits/pixel, 1 bit of A is LUT data) 0 1 1: ARGB4444 (16 bits/pixel) 1 0 0: ARGB8888 (32 bits/pixel) 1 0 1: CLUT8 (8 bits/pixel) 1 1 0: CLUT4 (4 bits/pixel) 1 1 1: CLUT1 (1 bit/pixel).	R/W
b31	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

FORMAT[2:0] bits (Data Format for Accessing Graphics Data)

The FORMAT[2:0] bits specify the data format for accessing graphics data. CLUT1, CLUT4, CLUT8 contain the addresses 01h or 00h, 0Fh to 00h, and FFh to 00h, respectively, for accessing the color palette. ARGB1555 contains the address for accessing the color palette (80h or 00h) in the MSB and RGB data in the other bits. ARGB8888 and ARGB4444 contain the upper 8-bit or 4-bit alpha blending values and RGB data. RGB888 and RGB565 contain RGB data only.

GRn_VEN.PVEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

FORMAT[2:0]位（访问图形数据的数据格式）

FORMAT[2:0]位指定访问图形数据的数据格式。CLUT1、CLUT4、CLUT8分别包含地址01h或00h、0Fh到00h和FFh到00h，用于访问调色板。ARGB1555在MSB中包含用于访问调色板（80h或00h）的地址，在其他位中包含RGB数据。ARGB8888和ARGB4444包含高8位或4位alpha混合值和RGB数据。RGB888和RGB565仅包含RGB数据。

b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	ARCON	Rectangular Area Alpha Blending Control	0: Turn blending off 1: Turn blending on.	R/W
b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

DISPSEL[1:0] bits (Graphics Display Plane Control)

The DISPSEL[1:0] bits control the graphics display plane. When the plane is selected as the lower-layer graphics, the image input from the previous stage is displayed (the background plane for GR1, and output from GR1 for GR2); as the background color, the background color specified in the GLCDC registers is displayed; and as the current graphics, the ARGB8888 data obtained by expanding the graphics data read by the GLCDC from the GPX bus is displayed. When the current graphics display is selected (these bits are set to 10b), RGB888 data is displayed, regardless of the alpha blending value in the pixel. Table 58.8 and Figure 58.10 show the relationship between the register setting and display area.

GRCDISPON bit (Graphics Image Area Border Display Control)

The GRCDISPON bit turns on or off the border display for the graphics image area. When the display is turned on (this bit is set to 1), the graphics image area is bordered with the preset color. The border is 1 pixel wide on the outermost periphery of the area with the display data set as FFh for each RGB color.

ARCDISPON bit (Image Area Border Display Control for Rectangular Area Alpha Blending)

The ARCDISPON bit turns on or off the border display for the image area where rectangular area alpha blending is performed. When the display is turned on (this bit is set to 1), the image area for the rectangular alpha blending is bordered with the preset color. The border is 1 pixel wide on the outermost periphery of the area and the display data set

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
GRn_VEN.PVEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

DISPSEL[1:0]位（图形显示平面控制）

DISPSEL[1:0]位控制图形显示平面。选择平面作为下层图形时，显示上一阶段输入的图像（GR1为背景平面，GR2为GR1输出）；作为背景颜色，显示在GLCDC寄存器中指定的背景颜色；将GLCDC从GPX总线读取的图形数据展开后得到的ARGB8888数据作为当前图形显示。选择当前图形显示时（这些位设置为10b），无论像素中的alpha混合值如何，都会显示RGB888数据。表58.8和图58.10显示了寄存器设置和显示区域之间的关系。

GRCDISPON位（图形图像区域边框显示控制）

GRCDISPON位打开或关闭图形图像区域的边框显示。开启显示时（该位设置为1），图形图像区域以预设颜色为边框。该区域最外围的边界为1个像素宽，显示数据设置为每种RGB颜色的FFh。

ARCDISPON位（矩形区域Alpha混合的图像区域边框显示控制）

ARCDISPON位打开或关闭执行矩形区域Alpha混合的图像区域的边框显示。当显示器打开时（该位设置为1），矩形alpha混合的图像区域以预设颜色为边框。区域最外围1像素宽的边框和显示数据集

as FFh for each RGB color.

ARCON bit (Rectangular Area Alpha Blending Control)

The ARCON bit turns on or off alpha blending in a rectangular area. When alpha blending is turned on (this bit is set to 1), pixels are processed in accordance with the alpha blending control specified in the relevant registers for the specified rectangular area, not in accordance with the alpha value input from the graphics data interface for each pixel. In the areas outside the rectangular area in the graphics area, pixels are processed in accordance with the alpha value input from the graphics data interface for each pixel.

Table 58.8 Display selections

GRn_AB1. DISPSEL[1:0] (display plane)	GRn_AB1. ARCON (rectangular)	GRn_AB7. CKON (chroma key)	Within rectangular alpha blending area	Outside rectangular alpha blending area within graphics area	Outside graphics area within display area	Outside display area
00b	0	0	-	Background color	Background color	Lower layer R = G = B = 00h
01b	0	0	-	Lower layer	Lower layer	Lower layer R = G = B = 00h
10b	0	0	-	Current	Background color	Lower layer R = G = B = 00h
11b	0	0	-	Current + alpha blending in pixel units	Lower layer	Lower layer R = G = B = 00h
11b	0	1	-	Current + RGB-index chroma key + alpha blending in pixel units	Lower layer	Lower layer R = G = B = 00h
11b	1	0	Current + rectangular alpha blending	Current + alpha blending in pixel units	Lower layer	Lower layer R = G = B = 00h
11b	1	1	Current + rectangular alpha blending	Current + RGB-index chroma key + alpha blending in pixel units	Lower layer	Lower layer R = G = B = 00h

Note: Operation is not guaranteed when any other value is set.

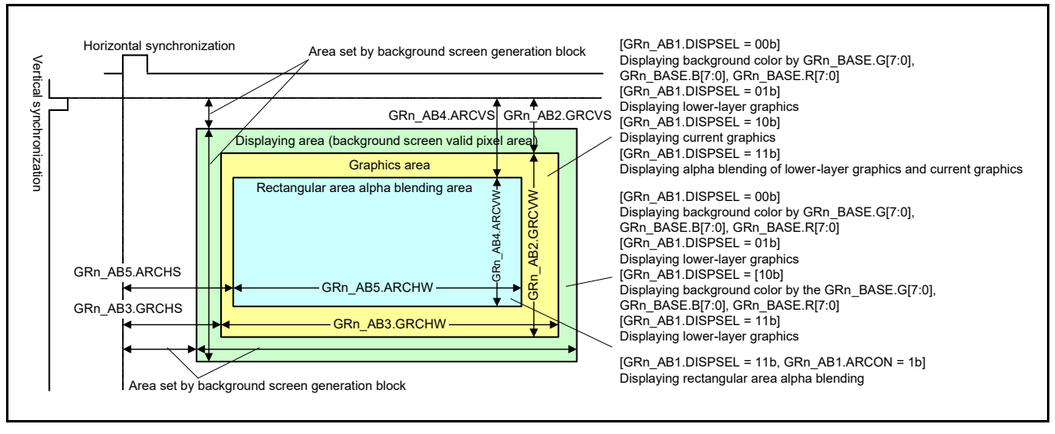

Figure 58.10 Selection of graphics display plane

作为每种RGB颜色的FFh。

ARCON位（矩形区域Alpha混合控制）

ARCON位打开或关闭矩形区域中的alpha混合。开启alphablending时（该位设置为1），像素按照指定矩形区域的相关寄存器中指定的alphablending控制进行处理，而不是按照从图形数据接口输入的alpha值进行处理。每个像素。在图形区域的矩形区域以外的区域，按照每个像素从图形数据接口输入的阿尔法值对像素进行处理。

Table 58.8 显示选择

GRn_AB1. DISPSEL[1:0] (display plane)	GRn_AB1. ARCON (rectangular)	GRn_AB7. CKON (chroma key)	在矩形Alpha混合区域内	图形区域内的外部矩形Alpha混合区域	显示区域内的外部图形区域	外展区

Bit	Symbol	Bit name	Description	R/W
b7 to b0	ARCRATE[7:0]	Frame Rate for Alpha Blending in Rectangular Area	00h: 1 frame : FFh: 256 frames.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b24 to b16	ARCCOEF[8:0]	Alpha Coefficient for Alpha Blending in Rectangular Area	Valid settings: -255 to 255. Bit [8]: Sign 0: Add 1: Subtract. Bits [7:0]: Variation, as an absolute value.	R/W
b31 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

ARCRATE[7:0] bits (Frame Rate for Alpha Blending in Rectangular Area)

The ARCRATE[7:0] bits specify the frame rate for alpha blending in a rectangular area.

ARCCOEF[8:0] bits (Alpha Coefficient for Alpha Blending in Rectangular Area)

The ARCCOEF[8:0] bits specify the alpha coefficient for alpha blending in a rectangular area.

In alpha blending in a rectangular area, current graphics are faded in or out with the GRn_AB7.ARCDEF[7:0], GRn_AB6.ARCCOEF[8:0], and GRn_AB6.ARCRATE[7:0] settings. If the alpha value is set in the GR_ARC_DEF[7:0] bits, the GR_ARC_DEF[7:0] bits and the alpha blending in a rectangular area are turned on. Each time the vertical synchronization signal (VS) rises the number of times set in the GR_ARC_RATE[7:0] bits, the value in GR_ARC_COEF[8:0] is added to or subtracted from the alpha value. Figure 58.11 shows change in the alpha value.

Bit	Symbol	位名称	Description	R/W
b7 to b0	ARCRATE[7:0]	Alpha的帧速率 混合矩形 Area	00h: 1 frame : FFh: 256 frames.	R/W
b15 to b8	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b24 to b16	ARCCOEF[8:0]	Alpha的Alpha系数 混合矩形 Area	有效设置：-255到255。 Bit[8]：符号0：加1：减。位[7:0]：变化，作为绝对值。	R/W
b31 to b25	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
GRn_VEN.PVEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

ARCRATE[7:0]位（矩形区域中Alpha混合的帧速率）

ARCRATE[7:0]位指定矩形区域中alpha混合的帧速率。

ARCCOEF[8:0]位（矩形区域中Alpha混合的Alpha系数）

ARCCOEF[8:0]位指定矩形区域中alpha混合的alpha系数。

在矩形区域的alpha混合中，当前图形使用GRn_AB7.ARCDEF[7:0]淡入或淡出，GRn_AB6.ARCCOEF[8:0]和GRn_AB6.ARCRATE[7:0]设置。如果在GR_ARC_DEF[7:0]位中设置了alpha值，则GR_ARC_DEF[7:0]位和矩形区域中的alpha混合将打开。每次垂直同步信号(VS)上升GR_ARC_RATE[7:0]位中设置的次数时，都会将GR_ARC_COEF[8:0]中的值添加到alpha值或从alpha值中减去。图58.11显示了alpha值的变化。

Bit	Symbol	Bit name	Description	R/W
b0	CKON	RGB-Index Chroma-Key Processing Control	0: Disable chroma-key processing 1: Enable chroma-key processing.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b23 to b16	ARCDEF[7:0]	Initial Alpha Value for Alpha Blending in Rectangular Area	Initial alpha value for alpha blending in rectangular area.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

CKON bit (RGB-Index Chroma-Key Processing Control)

The CKON bit turns RGB-index chroma-key processing on or off. This function is enabled only if this bit is 1 when the graphics display plane is the blended display (GRn_AB1.DISPSEL[1:0] = 11b). And it is reflected to the graphics area except alpha blending in a rectangular area. For details, see Table 58.8.

ARCDEF[7:0] bits (Initial Alpha Value for Alpha Blending in Rectangular Area)

The ARCDEF[7:0] bits specify the initial alpha value for alpha blending in a rectangular area. For changes in the alpha value during fade-in or fade-out of the current graphics using this bit, see Figure 58.11.

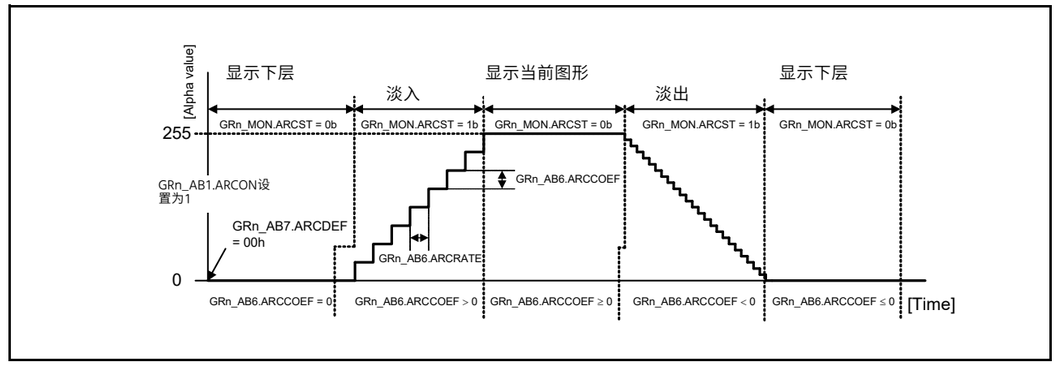

Figure 58.11 alpha值的变化

b31 to b24	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时 GRn_VEN.PVEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

CKON位（RGB索引色度键处理控制）

CKON位打开或关闭RGB索引色度键处理。仅当图形显示平面为混合显示(GRn_AB1.DISPSEL[1:0]=11b)时该位为1，才启用此功能。并且它反映到图形区域，除了矩形区域中的alpha混合。详见表58.8。

ARCDEF[7:0]位（矩形区域中Alpha混合的初始Alpha值）

ARCDEF[7:0]位指定矩形区域中alpha混合的初始alpha值。对于使用该位在当前图形的淡入或淡出过程中alpha值的变化，请参见图58.11。

58.2.23 Graphics 1 Alpha Blending Control Register 8 (GR1_AB8) Graphics 2 Alpha Blending Control Register 8 (GR2_AB8)

	CKKB[7:0]								CKKR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CKKR[7:0]	R Signal for RGB-Index Chroma-Key Processing	R signal for RGB-index chroma-key processing. Unsigned 8-bit value.	R/W
b15 to b8	CKKB[7:0]	B Signal for RGB-Index Chroma-Key Processing	B signal for RGB-index chroma-key processing. Unsigned 8-bit value.	R/W
b23 to b16	CKKG[7:0]	G Signal for RGB-Index Chroma-Key Processing	G signal for RGB-index chroma-key processing. Unsigned 8-bit value.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

If RGB-index chroma-key processing is enabled when the RGB values of the current bit graphics agree with the values of the associated chroma-key bits, the image data of the current graphics (ARGB8888, including the alpha blending values) is replaced by the values in the GRn_AB9 register. In alpha blending in pixel units at later stages, the latest alpha values are used.

CKKR[7:0] bits (R Signal for RGB-Index Chroma-Key Processing)

The CKKR[7:0] bits specify the value to be compared with the R value of the current graphics in the RGB-index chroma-key processing.

CKKB[7:0] bits (B Signal for RGB-Index Chroma-Key Processing)

The CKKB[7:0] bits specify the value to be compared with the B value of the current graphics in the RGB-index chroma-key processing.

CKKG[7:0] bits (G Signal for RGB-Index Chroma-Key Processing)

The CKKG[7:0] bits specify the value to be compared with the G value of the current graphics in the RGB-index chroma-key processing.

b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GRn_VEN.PVEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

LINE[10:0] bits (Number of Detection Lines)

The LINE[10:0] bits specify the number of lines to be detected. When the number of lines specified in this bit are detected, the event is recognized outside the module on the HS assertion. To retain the status of the recognized event and assert the GLCDC interrupt request signal, set the prescribed value to the State Detection Control Register (SYSCNT_DTCTEN) and Interrupt Request Enable Control Register (SYSCNT_INTEN), which are system control registers. Although this function is provided to both graphics 1 and 2, it is only enabled in graphics 2 in this GLCDC.

SEL bit (CLUT Table Control)

The SEL bit controls the CLUT plane to be used for internal operations. Access to the color palette (CLUT) through the register access bus is always valid for both planes 0 and 1, regardless of the setting in this bit, and the written value is immediately reflected to the internal operations (not in synchronization with the vertical synchronization signal).

To keep reflection of the CLUT memory contents to the internal operations in synchronization with the vertical synchronization signal, first write data through the register access bus to the plane that is not being used for the internal operations, and then modify the bits intended for controlling the plane that is to be used for the internal operations.

58.2.26 图形1CLUT表中断控制寄存器(GR1_CLUTINT)图形2CLUT表中断控制寄存器(GR2_CLUTINT)

b31 to b17	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时GRn_VEN.PVEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

LINE[10:0]位（检测线数）

LINE[10:0]位指定要检测的行数。当检测到该位中指定的行数时，在模块外部通过HS断言识别事件。要保留已识别事件的状态并断言GLCDC中断请求信号，请将规定值设置为系统控制寄存器状态检测控制寄存器(SYSCNT_DTCTEN)和中断请求使能控制寄存器(SYSCNT_INTEN)。虽然此功能同时提供给图形1和2，但它仅在此GLCDC中的图形2中启用。

SEL位（CLUT表控制）

SEL位控制要用于内部操作的CLUT平面。通过寄存器访问总线访问调色板（CLUT）对于平面0和平面1始终有效，无论该位的设置如何，写入的值立即反映到内部操作（与垂直同步不同步）信号）。

为了保持CLUT存储器内容与垂直同步信号同步地反映到内部操作，首先通过寄存器访问总线将数据写入未用于内部操作的平面，然后修改用于控制用于内部操作的平面。

58.2.27 Graphics 1 Status Monitor Register (GR1_MON) Graphics 2 Status Monitor Register (GR2_MON)

Bit	Symbol	Bit name	Description	R/W
b0	ARCST	Status Monitor for Alpha Blending in Rectangular Area	0: Fade-in/fade-out not in progress 1: Fade-in/fade-out in progress.	R
b15 to b1	—	Reserved	These bits are read as 0.	R
b16	UNDFLST	Underflow Status Monitor	0: No underflow occurred in internal operations 1: Underflow occurred in internal operations.	R
b31 to b17	—	Reserved	These bits are read as 0.	R

ARCST bit (Status Monitor for Alpha Blending in Rectangular Area)

The ARCST bit indicates whether or not alpha blending (fade-in/fade-out) in a rectangular area is in progress. When alpha blending in a rectangular area is turned on (GRn_AB1.ARCON is set to 1) and the register value is to be reflected to the internal operations on assertion of the vertical synchronization signal (VS), this bit sets to 1 immediately on assertion of the vertical synchronization signal. When alpha blending in a rectangular area is turned off (GRn_AB1.ARCON cleared to 0) or when the alpha blending (fade-in/fade-out) in a rectangular area is complete (alpha blended value reaches the minimum or maximum value), this bit clears to 0. If the alpha coefficient for the alpha blending in a rectangular area (GRn_AB6.ARCCOEF[8:0]) is set to 000h and the initial alpha value for alpha blending in a rectangular area (GRn_AB7.ARCDEF[7:0]) is set to any value other than FFh or 00h, the alpha blending value does not reach the minimum or maximum value, and this bit remains 1 (no timeout processing is performed).

UNDFLST bit (Underflow Status Monitor)

The UNDFLST bit indicates whether or not an underflow has occurred in the internal operations. The underflow interrupt request flag sets when an underflow occurs, and retains its value until it is cleared by software. However, this bit monitors the internal status, and so the flag automatically clears to 0 when the graphics data bus interface initializes on assertion of the vertical synchronization signal. Even when the current graphics data is not required (GRn_AB1.DISPSEL[1:0] = 0xb), this bit sets to 1 during the period from the graphics image valid area start to the next frame vertical synchronization signal (VS) assertion timing set in the registers.

58.2.27 图形1状态监视器寄存器(GR1_MON)图形2状态监视器寄存器(GR2_MON)

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARCST
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	ARCST	Alpha状态监视器 在矩形区域中混合	0：淡入淡出未进行1：淡入淡出进行中。	R
b15 to b1	—	Reserved	这些位读为0。	R
b16	UNDFLST	下溢状态监视器	0：内部操作未发生下溢1：内部操作发生下溢。	R
b31 to b17	—	Reserved	这些位读为0。	R

ARCST位（矩形区域中Alpha混合的状态监视器）

ARCST位指示矩形区域中的alpha混合（淡入淡出）是否正在进行。当矩形区域中的alpha混合打开（GRn_AB1.ARCON设置为1）并且寄存器值要在垂直同步信号(VS)断言时反映到内部操作时，该位在断言时立即设置为1的垂直同步信号。当矩形区域的alpha混合关闭（GRn_AB1.ARCON清为0）或矩形区域的alpha混合（淡入淡出）完成（alpha混合值达到最小值或最大值）时，此位清除为0。如果矩形区域中alpha混合的alpha系数(GRn_AB6.ARCCOEF[8:0])设置为000h，并且矩形区域中alpha混合的初始alpha值(GRn_AB7.ARCDEF[7:0])设置为FFh或00h以外的任何值，alpha混合值未达到最小值或最大值，该位保持1（不执行超时处理）。

UNDFLST位（下溢状态监视器）

UNDFLST位指示内部操作中是否发生下溢。下溢中断请求标志在发生下溢时置位，并保持其值直到被软件清除。然而，该位监视内部状态，因此当图形数据总线接口在垂直同步信号的断言上初始化时，该标志自动清除为0。即使不需要当前图形数据(GRn_AB1.DISPSEL[1:0]=0xb)，在从图形图像有效区域开始到下一帧垂直同步信号(VS)断言时序设置期间，该位设置为1在寄存器中。

58.2.28 Gamma G Register Update Control Register (GAMG_LATCH) Gamma B Register Update Control Register (GAMB_LATCH) Gamma R Register Update Control Register (GAMR_LATCH)

Bit	Symbol	Bit name	Description	R/W
b0	VEN	Control of Gamma Correction x Module Register Value Reflection to Internal Operations	0: Disable reflection of register values to internal operations on assertion of vertical synchronization signal (VS) 1: Enable reflection of register values to internal operations on assertion of the vertical synchronization signal (VS).	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

VEN bit (Control of Gamma Correction x Module Register Value Reflection to Internal Operations)

The VEN bit enables or disables reflection of the register values to the internal operations in the gamma correction circuit on assertion of the vertical synchronization signal (input). When this bit is set to 1, the register values are immediately reflected to the internal operations on assertion of the vertical synchronization signal (input), and then this bit automatically clears to 0. Also, if the signal is asserted that controls reflection of the register values to the internal operations of all the modules output from the background plane generation module, the register values are reflected to the internal operations on assertion of the vertical synchronization signal (input), regardless of the value of this bit. While this bit is 1, do not modify any register whose value is reflected to the internal operations on assertion of the vertical synchronization signal (input) in the GLCDC. Otherwise, operation is not guaranteed.

This bit must not be 1 at the same time as the BG_EN.VEN bit (control of background plane register value reflection to internal operations) in the Operation Control Register (BG_EN), one of the background plane setting registers. Otherwise, operation is not guaranteed.

Although there are three VEN bits, one for each G, R, and B color, only the GAMG_LATCH.VEN bit controls the gamma correction with the reflection of the GAM_SW.GAMON bit. To enable gamma correction, set the GAMG_LATCH.VEN bit once after setting the GAM_SW.GAMON bit.

The VEN bit is set to 1 by writing 1, and automatically clears to 0 immediately on assertion of the vertical synchronization signal.

58.2.28 GammaG寄存器更新控制寄存器(GAMG_LATCH)GammaB寄存器更新控制寄存器(GAMB_LATCH)GammaR寄存器更新控制寄存器(GAMR_LATCH)

Address(es): GLCDC.GAMG_LATCH 400E 1300h, GLCDC.GAMB_LATCH 400E 1340h, GLCDC.GAMR_LATCH 400E 1380h

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	VEN	伽玛校正控制x 模块寄存器值反映到内部操作	0：禁止将寄存器值反映到内部 垂直同步信号(VS)断言操作1：启用寄存器值反映到垂直同步信号(VS)断言的内部操作。	R/W
b31 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

VEN位（Gamma校正x模块寄存器值反映到内部操作的控制）

VEN位启用或禁用寄存器值在垂直同步信号（输入）置位时反映到伽马校正电路的内部操作。当该位设置为1时，寄存器值立即反映到垂直同步信号（输入）置位时的内部操作，然后该位自动清除为0。此外，如果控制反射的信号被置位寄存器值反映到后台平面生成模块输出的所有模块的内部操作，无论该位的值如何，寄存器值都反映到垂直同步信号（输入）置位时的内部操作。当该位为1时，不要修改其值反映到GLCDC中垂直同步信号（输入）断言的内部操作的任何寄存器。否则，无法保证操作。

该位不能与后台平面设置寄存器之一的操作控制寄存器(BG_EN)中的BG_EN.VEN位（控制后台平面寄存器值反映到内部操作）同时为1。否则，无法保证操作。

虽然有三个VEN位，每个G、R和B颜色一个，但只有GAMG_LATCH.VEN位通过GAM_SW.GAMON位的反射来控制伽马校正。要启用伽马校正，请在设置GAM_SW.GAMON位后设置一次GAMG_LATCH.VEN位。

VEN位通过写入1设置为1，并在垂直同步信号有效时立即自动清除为0。

Bit	Symbol	位名称	Description	R/W
b10 to b0	GAIN01[10:0]	区域1的增益值	无符号11位定点值。000h:0.000(01024) : 400h: 1.000 (1024/1024) : 7FFh: 1.999 (2047/1024).	R/W
b15 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b26 to b16	GAIN00[10:0]	0区增益值	无符号11位定点值。000h:0.000(01024) : 400h: 1.000 (1024/1024) : 7FFh: 1.999 (2047/1024).	R/W

Bit	Symbol	Bit name	Description	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GAMx_LATCH.VEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

Gamma correction for each color is carried out as follows:

- Din (input signal): 10 bits. To correct the output of graphics 2, 00b is appended as the lower 2 bits for extension
- Dout (output signal): 10 bits
- TH (threshold): 10 bits (register setting); up to 15 can be set
- GAIN (gain): 0/1024 to 2047/1024 for each area (register setting), can be set for up to 16 areas
- OFFSET (offset value): 21 bits (result of internal calculation; calculation of up to 15 points)

The following is automatically calculated from the assertion of the vertical synchronization signal (VS) to the start of valid pixel data internally:

- Dout = ((Din - TH(n)) × GAIN(n) + OFFSET(n))
- OFFSET(n) = OFFSET(n - 1) + (TH(n) - TH(n - 1)) × GAIN(n - 1), where OFFSET(0) = 0

Note: Because the gain is a positive number (≥ 0), the correction line shows a monotonic increase.

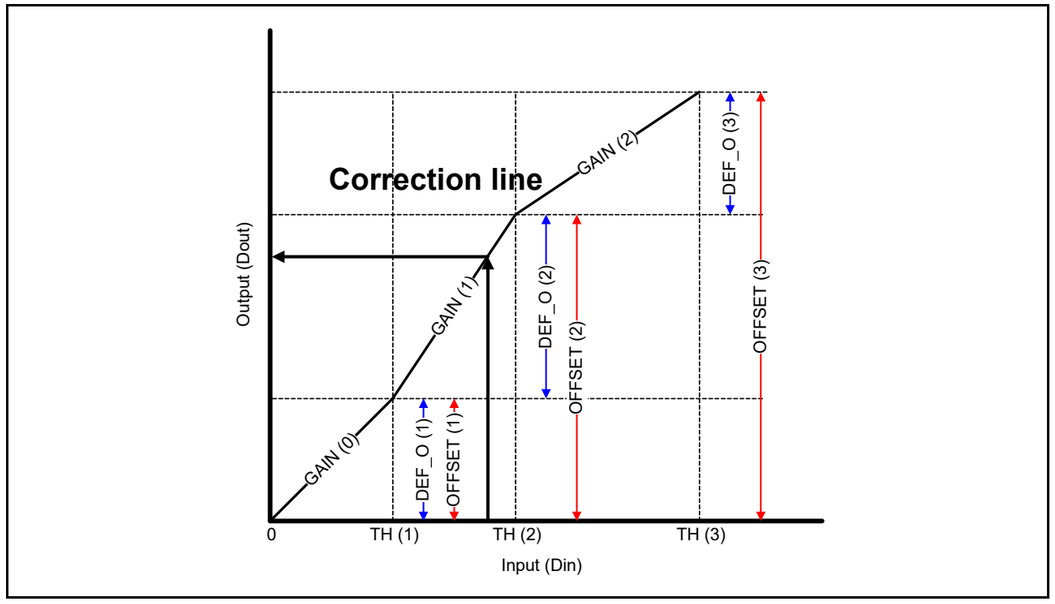

Figure 58.12 Calculation of gamma correction value

GAIN01[10:0] bits (Gain Value of Area 1)

The GAIN01[10:0] bits specify the gain value of area 1 to be used for gamma correction in terms of an unsigned 11-bit fixed point (0/1024 to 2047/1024). The location of the decimal point is between bits [10] and [11].

GAIN00[10:0] bits (Gain Value of Area 0)

The GAIN00[10:0] bits specify the gain value of area 0 to be used for gamma correction in terms of an unsigned 11-bit fixed point (0/1024 to 2047/1024). The location of the decimal point is between bits [10] and [11].

Bit	Symbol	位名称	Description	R/W
b31 to b27	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
GAMx_LATCH.VEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

每种颜色的Gamma校正如下进行：

- Din（输入信号）：10位。为了更正图形2的输出，00b被附加为低2位用于扩展
- Dout (output signal): 10 bits
- TH（阈值）：10位（寄存器设置）；最多可设置15个
- GAIN（增益）：01024到20471024每个区域（寄存器设置），最多可设置16个区域
- OFFSET（偏移值）：21位（内部计算结果；最多计算15个点）

以下是从垂直同步信号(VS)的断言到内部有效像素数据开始的自动计算：

- Dout = ((Din - TH(n)) × GAIN(n) + OFFSET(n))
- OFFSET(n) = OFFSET(n - 1) + (TH(n) - TH(n - 1)) × GAIN(n - 1), where OFFSET(0) = 0

Note: 因为增益是正数（ 0），所以校正线显示出单调增加。

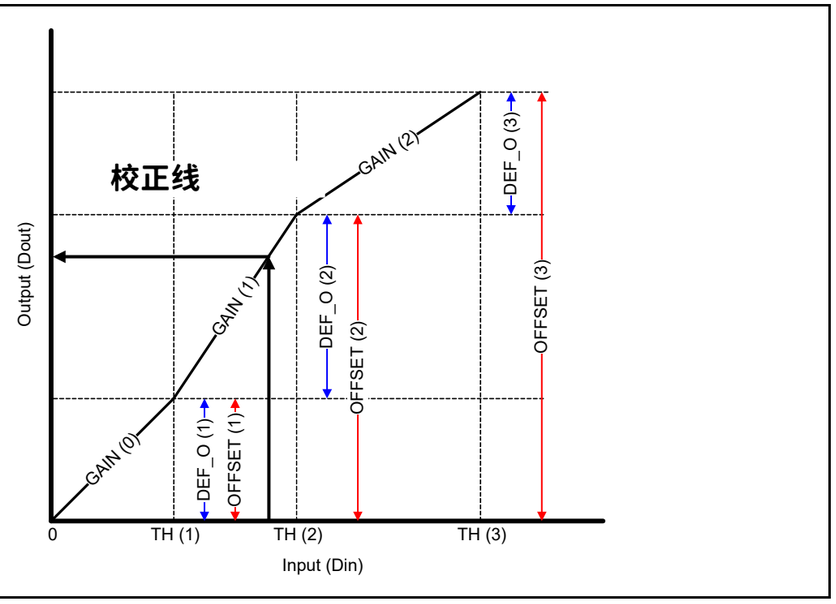

Figure 58.12 伽马校正值的计算

GAIN01[10:0]位（区域1的增益值）

GAIN01[10:0]位指定区域1的增益值，用于以无符号11位定点（01024到20471024）的形式进行伽马校正。小数点的位置在位[10]和[11]之间。

GAIN00[10:0]位（区域0的增益值）

GAIN00[10:0]位指定区域0的增益值，用于以无符号11位定点（01024到20471024）的形式进行伽马校正。小数点的位置在位[10]和[11]之间。

Bit	Symbol	Bit name	Description	R/W
b9 to b0	TH03[9:0]	Start Threshold of Area 3	Start threshold of area 3. Unsigned 10-bit integer.	R/W
b19 to b10	TH02[9:0]	Start Threshold of Area 2	Start threshold of area 2. Unsigned 10-bit integer.	R/W
b29 to b20	TH01[9:0]	Start Threshold of Area 1	Start threshold of area 1. Unsigned 10-bit integer.	R/W
b31 to b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GAMx_LATCH.VEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

Set the start threshold TH(n) of area n (n = 0 to 15) to satisfy the following conditions. Otherwise, operation is not guaranteed.

TH (n) < TH (n + 1)
n = 0 to 15 and TH (0) = 000h, TH (16) = 3FFh
TH (n) = TH (n + 1) is valid only if TH (n) = 3FFh.

For details on calculation of the gamma correction value, see section 58.2.30, Gamma G Correction Block Table Setting Register 1 (GAMG_LUT1) Gamma B Correction Block Table Setting Register 1 (GAMB_LUT1) Gamma R Correction Block Table Setting Register 1 (GAMR_LUT1), and Figure 58.12.

TH03[9:0] bits (Start Threshold of Area 3)

The TH03[9:0] bits specify the start threshold of area 3 to be used for gamma correction in terms of an unsigned 10-bit integer.

TH02[9:0] bits (Start Threshold of Area 2)

The TH02[9:0] bits specify the start threshold of area 2 to be used for gamma correction in terms of an unsigned 10-bit integer.

TH01[9:0] bits (Start Threshold of Area 1)

The TH01[9:0] bits specify the start threshold of area 1 to be used for gamma correction in terms of an unsigned 10-bit integer.

Bit	Symbol	位名称	Description	R/W
b9 to b0	TH03[9:0]	区域3的起始阈值	区域3的起始阈值。无符号10位整数。	R/W
b19 to b10	TH02[9:0]	区域2的起始阈值	区域2的起始阈值。无符号10位整数。	R/W
b29 to b20	TH01[9:0]	区域1的起始阈值	区域1的起始阈值。无符号10位整数。	R/W
b31 to b30	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
GAMx_LATCH.VEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

设置区域n(n=0到15)的起始阈值TH(n)以满足以下条件。否则，无法保证操作。

TH(n)<TH(n+1)n=0到15并且TH(0)=000h TH(16)
=3FFhTH(n)=TH(n+1)只有当TH(n)=时才有效3FF
h。

有关伽马校正值计算的详细信息，请参阅第58.2.30节，伽马G校正块表设置寄存器1(GAMG_LUT1)伽玛B校正块表设置寄存器1(GAMB_LUT1)伽玛R校正
块表设置寄存器1(GAMR_LUT1)和图58.12。

TH03[9:0]位（区域3的起始阈值）

TH03[9:0]位指定区域3的起始阈值，用于以无符号10位整数形式进行伽马校正。

TH02[9:0]位（区域2的起始阈值）

TH02[9:0]位以无符号10位整数的形式指定要用于伽马校正的区域2的起始阈值。

TH01[9:0]位（区域1的起始阈值）

TH01[9:0]位以无符号10位整数的形式指定用于伽马校正的区域1的起始阈值。

58.2.39 Gamma G Correction Block Area Setting Register 2 (GAMG_AREA2) Gamma B Correction Block Area Setting Register 2 (GAMB_AREA2) Gamma R Correction Block Area Setting Register 2 (GAMR_AREA2)

Address(es): GLCDC.GAMG_AREA2 400E 132Ch, GLCDC.GAMB_AREA2 400E 136Ch, GLCDC.GAMR_AREA2 400E 13ACh

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit name	Description	R/W
b9 to b0	TH06[9:0]	Start Threshold of Area 6	Start threshold of area 6. Unsigned 10-bit integer.	R/W
b19 to b10	TH05[9:6], TH08[5:0]	Start Threshold of Area 5	Start threshold of area 5. Unsigned 10-bit integer.	R/W
b29 to b20	TH04[9:0]	Start Threshold of Area 4	Start threshold of area 4. Unsigned 10-bit integer.	R/W
b31 to b30	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when GAMx_LATCH.VEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

TH06[9:0] bits (Start Threshold of Area 6)

The TH06[9:0] bits specify the start threshold of area 6 to be used for gamma correction in terms of an unsigned 10-bit integer.

TH05[9:0] bits (Start Threshold of Area 5)

The TH05[9:0] bits specify the start threshold of area 5 to be used for gamma correction in terms of an unsigned 10-bit integer.

TH04[9:0] bits (Start Threshold of Area 4)

The TH04[9:0] bits specify the start threshold of area 4 to be used for gamma correction in terms of an unsigned 10-bit integer.

Bit	Symbol	Bit name	Description	R/W
b0	VEN	Control of Output Control Module Register Value Reflection to Internal Operations	0: Disable reflection of register values to internal operations on assertion of vertical synchronization signal (VS) 1: Enable reflection of register values to internal operations on assertion of vertical synchronization signal (VS).	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

VEN bit (Control of Output Control Module Register Value Reflection to Internal Operations)

The VEN bit enables or disables reflection of the register values to the internal operations in the output control circuit on assertion of the vertical synchronization signal (input). When this bit is set to 1, the register values are immediately reflected to the internal operations on assertion of the vertical synchronization signal (input), and then this bit automatically clears to 0. Also, if the signal is asserted that controls reflection of the register values to the internal operations of all the modules output from the ground plane generation module, the register values are reflected to the internal operations on assertion of the vertical synchronization signal (input), regardless of the value of this bit. While this bit is 1, do not modify any register whose value is reflected to the internal operations on assertion of the vertical synchronization signal (input) in the GLCDC. Otherwise, operation is not guaranteed.

This bit must not be 1 at the same time as the BG_EN.VEN bit (control of background plane register value reflection to internal operations) in the Operation Control Register (BG_EN), one of the background plane setting registers. Otherwise, operation is not guaranteed.

58.2.43 输出控制块寄存器更新控制寄存器(OUT_VLATCH)

Address(es): GLCDC.OUT_VLATCH 400E 13C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	位名称	Description	R/W
b0	VEN	输出控制模块的控制 注册值反射到 内部运营	0：禁止将寄存器值反映到内部 垂直同步信号(VS)1的断言操作：启用寄存器值到内部的反射 垂直同步信号（VS）的断言操作。	R/W
b31 to b1	—	Reserved	这些位被读取为0。写入值应为0。	R/W

VEN位（输出控制模块寄存器值反映到内部操作的控制）

VEN位启用或禁用寄存器值在垂直同步信号（输入）置位时反映到输出控制电路中的内部操作。当该位设置为1时，寄存器值立即反映到垂直同步信号（输入）断言的内部操作，然后该位自动清除为0。此外，如果该信号被断言，控制反射寄存器值反映到地平面生成模块输出的所有模块的内部操作，无论该位的值如何，寄存器值都反映到垂直同步信号（输入）有效时的内部操作。当该位为1时，不要修改其值反映到GLCDC中垂直同步信号（输入）断言的内部操作的任何寄存器。否则，无法保证操作。

该位不能与后台平面设置寄存器之一的操作控制寄存器(BG_EN)中的BG_EN.VEN位（控制后台平面寄存器值反映到内部操作）同时为1。否则，无法保证操作。

Bit	Symbol	Bit name	Description	R/W
b1, b0	PHASE[1:0]	Data Output Delay Control in Serial RGB Format	Data delay in LCD_CLK cycles. b1 b0 0 0: 0 cycle 0 1: 1 cycle 1 0: 2 cycles 1 1: 3 cycles.	R/W
b3, b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	DIRSEL	Scan Direction Select of Serial RGB Format	0: Forward scan 1: Reverse scan.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9, b8	FRQSEL[1:0]	Clock Frequency Division Control	b9 b8 0 0: No frequency division, parallel RGB 0 1: Setting prohibited 1 0: Quarter frequency (serial RGB) 1 1: Setting prohibited.	R/W
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13, b12	FORMAT[1:0]	Output Format Select	b13 b12 0 0: RGB888; select RGB888 as dither output format 0 1: RGB666; select RGB666 as dither output format 1 0: RGB565; select RGB565 as dither output format 1 1: Serial RGB; select RGB888 as dither output format. Select dither output format in OUT_PDTHA.FORM[1:0].	R/W
b23 to b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b24	SWAPON	Pixel Order Control	0: RGB order 1: BGR order.	R/W
b27 to b25	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b28	ENDIANON	Bit Endian Control	0: Descending order (little endian) 1: Ascending order (big endian).	R/W
b31 to b29	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Rewriting these bits is prohibited during operation. Set the settings before operation is enabled. Operation is not guaranteed if the bit is rewritten during operation.

For details on assignment of pixel data to the output pins (LCD_DATA23 to LCD_DATA00) by setting these bits (except for OUT_SET.FRQSEL[1:0]), see Figure 58.3 to Figure 58.6.

PHASE[1:0] bits (Data Output Delay Control in Serial RGB Format)

The PHASE[1:0] bits control data output delay in serial RGB format. When the delay is 0 cycles (these bits are 00b), pixel data (R, B, or invalid data, depending on the setting in this register) is output one pixel clock (PXCLK) cycle after the horizontal data enable signal (HE). When any value other than 00b is set to OUT_SET.PHASE[1:0], pixel data output is delayed for a preset number of LCD_CLK cycles.

58.2.44 输出控制块输出接口寄存器(OUT_SET)

b31 to b29	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 操作期间禁止改写这些位。在启用操作之前进行设置。如果在操作期间重写该位，则无法保证操作。

有关通过设置这些位（OUT_SET.FRQSEL[1:0]除外）将像素数据分配到输出引脚（LCD_DATA23至LCD_DATA00）的详细信息，请参见图58.3至图58.6。

PHASE[1:0]位（串行RGB格式的数据输出延迟控制）

PHASE[1:0]位控制串行RGB格式的数据输出延迟。当延迟为0个周期（这些位为00b）时，像素数据（R、B或无效数据，取决于此寄存器中的设置）在水平数据使能信号(HE)后一个像素时钟(PXCLK)周期输出.当00b以外的任何值设置为OUT_SET.PHASE[1:0]时，像素数据输出会延迟预设数量的LCD_CLK周期。

DIRSEL bit (Scan Direction Select of Serial RGB Format)

The DIRSEL bit controls the data arrangement of the serial RGB format. When this bit is set to 1, the serial RGB data is arranged in reverse direction, and when it is 0, the serial RGB is arranged in forward direction.

FRQSEL[1:0] bits (Clock Frequency Division Control)

The FRQSEL[1:0] bits control clock frequency division of LCD_CLK (panel output clock) and PXCLK (pixel clock for internal operations). Set these bits to 10b only for the serial RGB format (OUT_SET.FORMAT[1:0] = 11b), so that PXCLK has a quarter frequency of the LCD_CLK frequency and synchronizes with LCD_CLK. Set these bits to 00b for the parallel RGB format (OUT_SET.FORMAT[1:0] = 10b, 01b, or 00b), so that PXCLK has the same frequency as the LCD_CLK frequency and synchronizes with LCD_CLK. Otherwise, operation is not guaranteed.

FORMAT[1:0] bits (Output Format Select)

The FORMAT[1:0] bits select the output format of RGB data. Set these bits in accordance with the output format select bits in the Panel Dither Correction Register (OUT_PDTHA.FORM[1:0]). For serial RGB format (these bits are 11b), set OUT_PDTHA.FORM[1:0] to 00b. Otherwise, operation is not guaranteed.

SWAPON bit (Pixel Order Control)

The SWAPON bit controls the pixel order of RGB data output. When this bit is set to 1, internally processed data is assigned to the output pins in BGR order, and when this bit is 0, data is assigned in the RGB order. Data is assigned to the output pins (LCD_DATA23 to LCD_DATA00) with the MSB first for the RGB parallel format, and serially for the RGB serial format.

ENDIANON bit (Bit Endian Control)

The ENDIANON bit controls the bit order of RGB data output. When this bit is set to 1, internally processed data is assigned to the output pins in ascending order (big endian), and when this bit is 0, data is assigned in descending order (little endian).

58.2.45 Output Control Block Brightness Correction Register 1 (OUT_BRIGHT1)

Address(es): GLCDC.OUT_BRIGHT1 400E 13C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	BRTG[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b9 to b0	BRTG[9:0]	Brightness Adjustment of G Signal	Brightness (DC) adjustment of G signal. Unsigned 10-bit integer; +512 with offset.	R/W
b31 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when OUT_VLATCH.VEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

BRTG[9:0] bits (Brightness Adjustment of G Signal)

The BRTG[9:0] bits specify the brightness (DC) adjustment of the G signal.

Brightness correction of the G signal is performed as follows:

- Gout: Output of brightness correction (input of contrast correction); unsigned; 10 bits

DIRSEL位（串行RGB格式的扫描方向选择）

DIRSEL位控制串行RGB格式的数据排列。该位为1时，串行RGB数据反向排列，为0时，串行RGB数据正向排列。

FRQSEL[1:0]位（时钟分频控制）

FRQSEL[1:0]位控制LCD_CLK（面板输出时钟）和PXCLK（用于内部操作的像素时钟）的时钟分频。仅针对串行RGB格式(OUT_SET.FORMAT[1:0]=11b)将这些位设置为10b，以便PXCLK具有LCD_CLK频率的四分之一频率并与LCD_CLK同步。对于并行RGB格式（OUT_SET.FORMAT[1:0]=10b、01b或00b）将这些位设置为00b，以便PXCLK与LCD_CLK频率具有相同的频率并与LCD_CLK同步。否则，无法保证操作。

FORMAT[1:0]位（输出格式选择）

FORMAT[1:0]位选择RGB数据的输出格式。根据面板抖动校正寄存器(OUT_PDTHA.FORM[1:0])中的输出格式选择位设置这些位。对于串行RGB格式（这些位为11b），将OUT_PDTHA.FORM[1:0]设置为00b。否则，无法保证操作。

SWAPON位（像素顺序控制）

SWAPON位控制RGB数据输出的像素顺序。当此位设置为1时，内部处理的数据按BGR顺序分配给输出引脚，当此位为0时，数据按RGB顺序分配。对于RGB并行格式，数据分配到输出引脚（LCD_DATA23到LCD_DATA00），MSB在前，对于RGB串行格式，数据以串行方式分配。

ENDIANON位（位字节序控制）

ENDIANON位控制RGB数据输出的位顺序。当该位设置为1时，内部处理的数据按升序（大端）分配给输出引脚，当该位为0时，数据按降序（小端）分配。

58.2.45 输出控制块亮度校正寄存器1(OUT_BRIGHT1)

Address(es): GLCDC.OUT_BRIGHT1 400E 13C8h

b9 to b0	BRTG[9:0]	G信号亮度调节	G信号的亮度（DC）调整。无符号10位整数；+512带偏移量。	R/W
b31 to b10	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
OUT_VLATCH.VEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

BRTG[9:0]位（G信号亮度调节）

BRTG[9:0]位指定G信号的亮度(DC)调整。

G信号的亮度校正如下进行：

- Gout：亮度校正的输出（对比度校正的输入）；未签名；10位

- Gin: Input of brightness correction; unsigned; 10 bits
- BRTG: Setting in this bit
- Gout = Gin + BRTG - 512.

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b9 to b0	BRTR[9:0]	Brightness Adjustment of R Signal	Brightness (DC) adjustment of R signal. Unsigned 10-bit integer; +512 with offset.	R/W
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b25 to b16	BRTB[9:0]	Brightness Adjustment of B Signal	Brightness (DC) adjustment of B signal. Unsigned 10-bit integer; +512 with offset.	R/W
b31 to b26	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when OUT_VLATCH.VEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

BRTR[9:0] bits (Brightness Adjustment of R Signal)

The BRTR[9:0] bits specify the brightness (DC) adjustment of the R signal.

Brightness correction of the R signal is performed as follows:

- Rout: Output of brightness correction (input of contrast correction); unsigned; 10 bits
- Rin: Input of brightness correction; unsigned; 10 bits
- BRTR: Setting in this bit
- Rout = Rin + BRTR - 512.

BRTB[9:0] bits (Brightness Adjustment of B Signal)

The BRTB[9:0] bits specify the brightness (DC) adjustment of the B signal.

Brightness correction of the B signal is performed as follows:

- Bout: Output of brightness correction (input of contrast correction); unsigned; 10 bits
- Bin: Input of brightness correction; unsigned; 10 bits
- BRTB: Setting in this bit
- Bout = Bin + BRTB - 512.

- Gin：亮度校正的输入；未签名；10位
- BRTG：在该位设置
- 痛风=杜松子酒+BRTG512。

Bit	Symbol	Bit name	Description	R/W
b7 to b0	CONTR[7:0]	Contrast Adjustment of R Signal	Unsigned 8-bit fixed point value adjusting GAIN on R signal. 00h: 0/128 = 0.000 : 80h: 128/128 = 1.000 : FFh: 255/128 = 1.992.	R/W
b15 to b8	CONTB[7:0]	Contrast Adjustment of B Signal	Unsigned 8-bit fixed point value adjusting GAIN on B signal. 00h: 0/128 = 0.000 : 80h: 128/128 = 1.000 : FFh: 255/128 = 1.992.	R/W
b23 to b16	CONTG[7:0]	Contrast Adjustment of G Signal	Unsigned 8-bit fixed point value adjusting GAIN on G signal. 00h: 0/128 = 0.000 : 80h: 128/128 = 1.000 : FFh: 255/128 = 1.992.	R/W
b31 to b24	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when OUT_VLATCH.VEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

CONTR[7:0] bits (Contrast Adjustment of R Signal)

The CONTR[7:0] bits specify the contrast (GAIN) adjustment of R signal. The location of the decimal point is between bit [7] and [6].

CONTB[7:0] bits (Contrast Adjustment of B Signal)

The CONTB[7:0] bits specify the contrast (GAIN) adjustment of B signal. The location of the decimal point is between bit [7] and [6].

CONTG[7:0] bits (Contrast Adjustment of G Signal)

The CONTG[7:0] bits specify the contrast (GAIN) adjustment of G signal. The location of the decimal point is between bit [7] and [6].

Contrast correction of each pixel is performed as follows (x = R, G, B):

- Dxout: Output of contrast correction; unsigned; 10 bits
- Dxin: Input of contrast correction (output of brightness correction); unsigned; 10 bits
- CONTx: Setting in this bit

58.2.47 输出控制块对比度校正寄存器(OUT_CONTRAST)

b31 to b24	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
OUT_VLATCH.VEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

CONTR[7:0]位（R信号的对比度调整）

CONTR[7:0]位指定R信号的对比度(GAIN)调整。小数点的位置在位[7]和[6]之间。

CONTB[7:0]位（B信号对比度调整）

CONTB[7:0]位指定B信号的对比度(GAIN)调整。小数点的位置在位[7]和[6]之间。

CONTG[7:0]位（G信号对比度调整）

CONTG[7:0]位指定G信号的对比度(GAIN)调整。小数点的位置在位[7]和[6]之间。

每个像素的对比度校正执行如下（x=R，G，B）：

- Dxout：对比度校正的输出；未签名；10位
- Dxin：对比度校正的输入（亮度校正的输出）；未签名；10位
- CONTx：在该位中设置

- Dxout = Dxin × CONTx.

b13, b12	PA[1:0]	Pattern Value (A) of 2×2 Pattern Dither	Pattern value (A) of 2×2 pattern dither. Unsigned 2-bit integer.	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b17, b16	FORM[1:0]	Output Format Select	b17 b16 0 0: RGB888; select RGB888 or serial RGB as output interface format 0 1: RGB666; select RGB666 as output interface format 1 0: RGB565; select RGB565 as output interface format 1 1: Setting prohibited. Select output interface format in OUT_SET.FORMAT[1:0].	R/W
b19, b18	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b21, b20	SEL[1:0]	Operation Mode	b21 b20 0 0: Truncate 0 1: Round-off 1 0: 2×2 pattern dither 1 1: Setting prohibited.	R/W
b31 to b22	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when OUT_VLATCH.VEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

PA[1:0], PB[1:0], PC[1:0], PD[1:0] bits (Pattern Value (A, B, C, D) of 2×2 Pattern Dither)

The PA[1:0], PB[1:0], PC[1:0], and PD[1:0] bits specify the pattern value A, B, C, and D of 2×2 pattern dither. Figure 58.13 shows the configuration of the dither correction block.

FORM[1:0] bits (Output Format Select)

The FORM[1:0] bits specify the output format of the dither process. These bits must be set in accordance with the OUT_SET.FORMAT[1:0] bits of the Output Interface Register. For serial RGB (OUT_SET.FORMAT[1:0] = 11b), set these bits to 00b. Otherwise, operation is not guaranteed.

- Dxout = Dxin × CONTx.

b31 to b22	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
OUT_VLATCH.VEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

PA[1:0] PB[1:0] PC[1:0] PD[1:0]bits(2×2PatternDither的PatternValue(A B C D))

PA[1:0]、PB[1:0]、PC[1:0]和PD[1:0]位指定2×2模式抖动的模式值A、B、C和D。图58.13显示了抖动校正模块的配置。

FORM[1:0]位（输出格式选择）

FORM[1:0]位指定抖动过程的输出格式。这些位必须按照
输出接口寄存器的OUT_SET.FORMAT[1:0]位。对于串行RGB(OUT_SET.FORMAT[1:0]=11b)，将这些位设置为00b。否则，无法保证操作。

SEL[1:0] bits (Operation Mode)

The SEL[1:0] bits specify the dither operation mode. The dither process is performed for the bits equal to or shorter than the pixel data length selected in the output format select bits (OUT_PDTHA.FORM[1:0]). OUT_PDTHA.PA[1:0], PB[1:0], PC[1:0], and PD[1:0] are used for 2×2 pattern dither.

Figure 58.13 shows the configuration of the dither correction block.

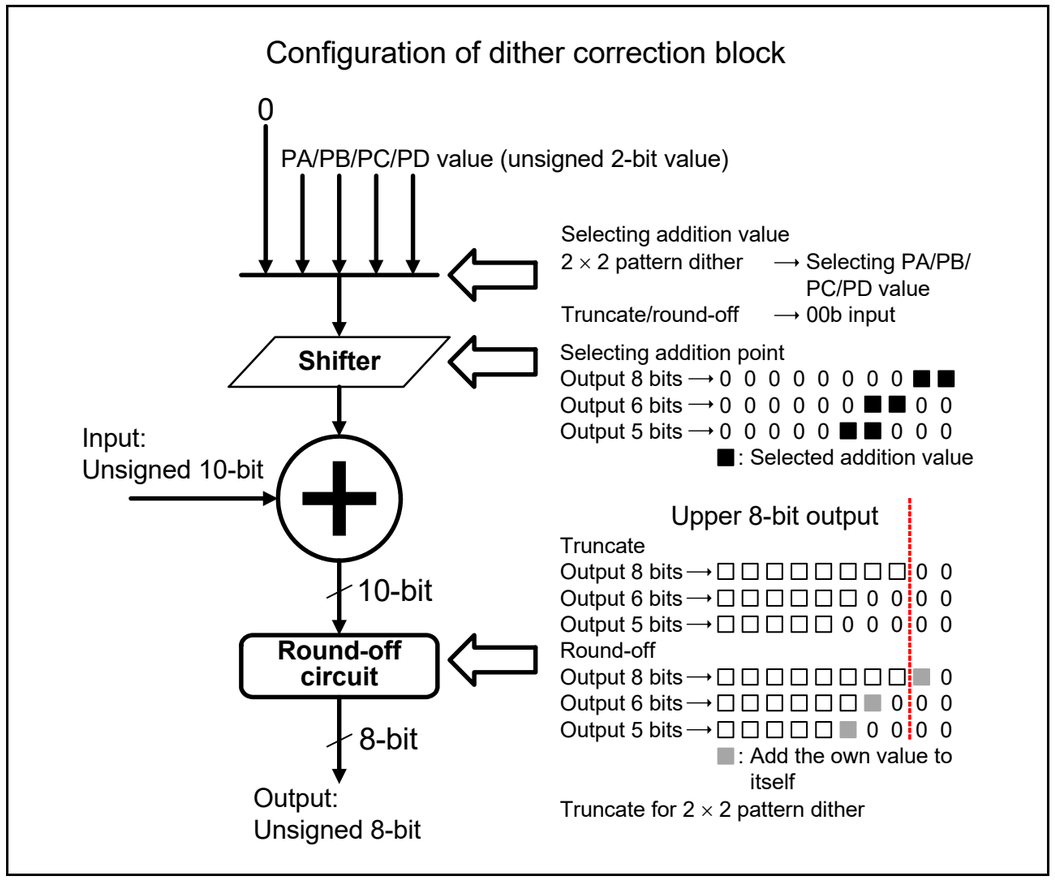

Figure 58.13 Configuration of dither correction block

Figure 58.14 shows the addition value selection method for 2×2 pattern dither.

SEL[1:0]位（操作模式）

SEL[1:0]位指定抖动操作模式。对等于或短于在输出格式选择位(OUT_PDTHA.FORM[1:0])中选择的像素数据长度的位执行抖动处理。OUT_PDTHA.PA[1:0]、PB[1:0]、PC[1:0]和PD[1:0]用于2×2模式抖动。

图58.13显示了抖动校正模块的配置。

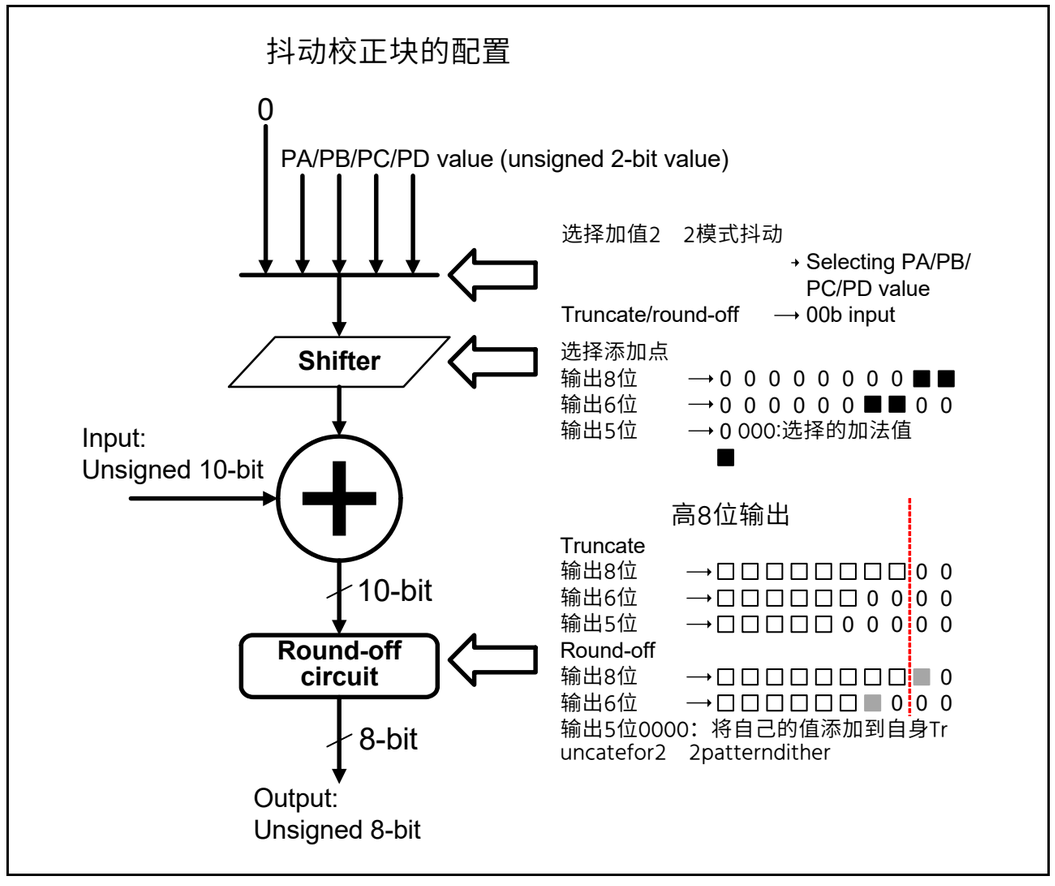

Figure 58.13 抖动校正块的配置

图58.14显示了2×2模式抖动的加值选择方法。

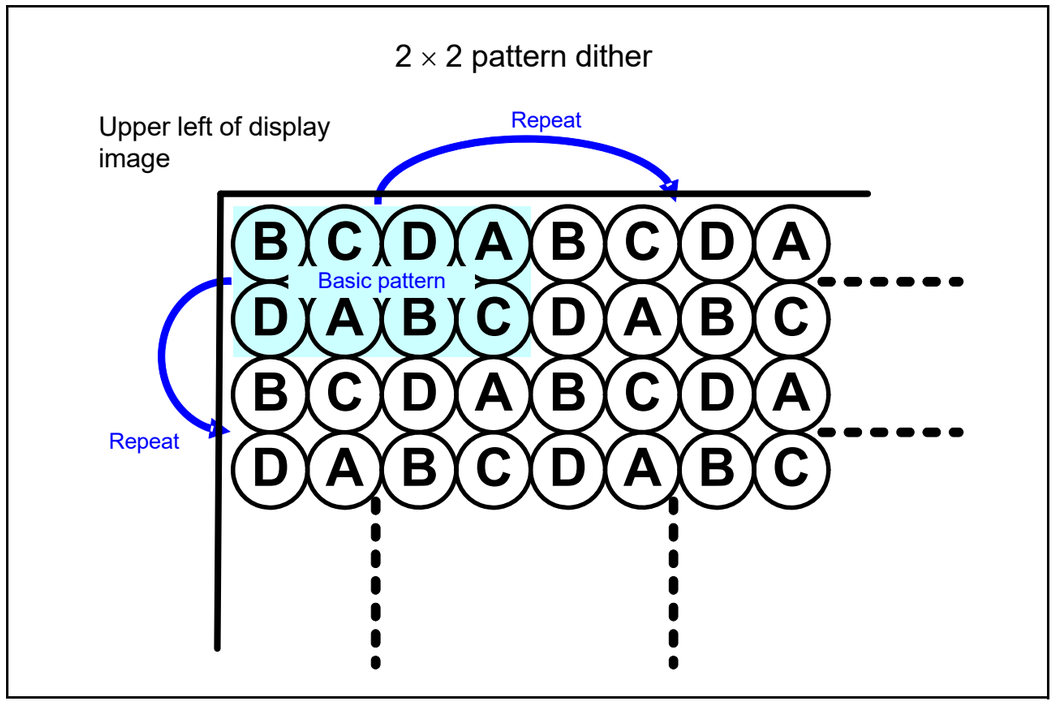

Figure 58.14 Addition value selection method for 2×2 pattern dither

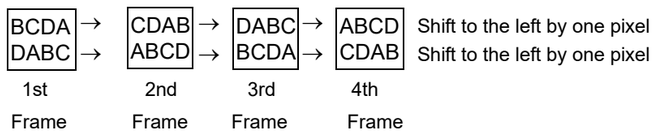
A basic pattern is repeated as follows. Four frames constitute 1 cycle.



- A: Value obtained after OUT_PDTHA.PA[1:0] bit value is shifted in accordance with the output format
- B: Value obtained after OUT_PDTHA.PB[1:0] bit value is shifted in accordance with the output format
- C: Value obtained after OUT_PDTHA.PC[1:0] bit value is shifted in accordance with the output format
- D: Value obtained after OUT_PDTHA.PD[1:0] bit value is shifted in accordance with the output format

Renesas recommends setting the bits as follows: PA[1:0] = 11b, PB[1:0] = 00b, PC[1:0] = 10b, PD[1:0] = 01b

When 2×2 pattern dither (OUT_PDTHA.SEL[1:0] = 10b) is to be set, the valid pixel area of the background plane must be an integer multiple of the basic pattern. If serial RGB is selected as the output format for the output control block, add two to the horizontal valid pixel width and set the resulting value to the background plane horizontal valid pixel width bits (BG_HSIZE.HW[10:0]).

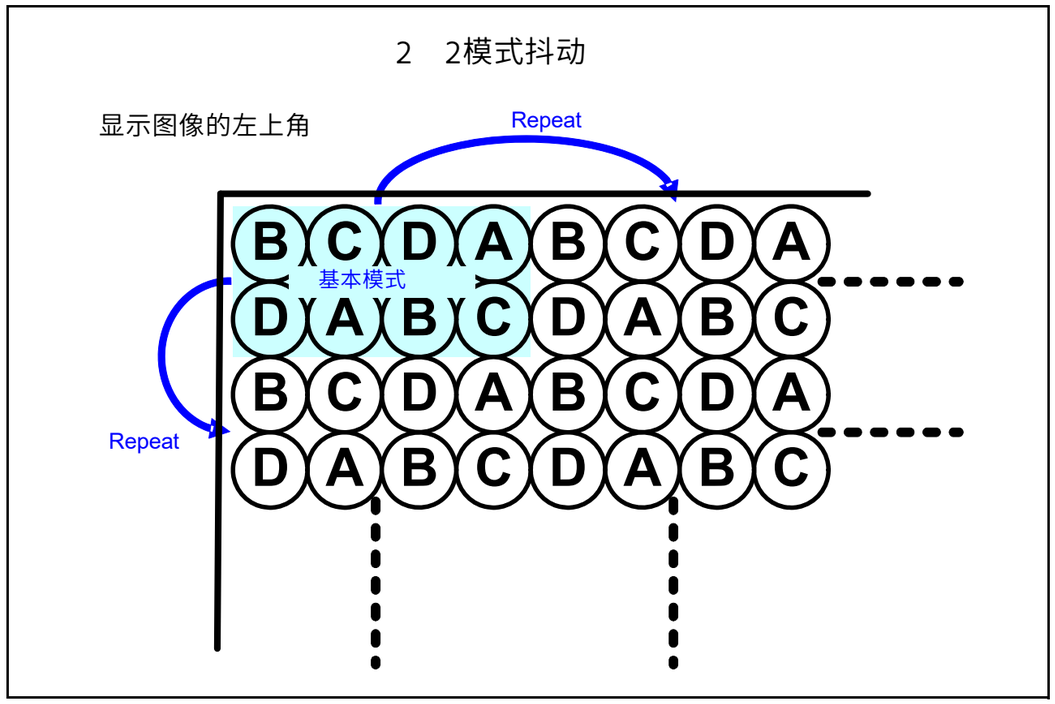


Figure 58.14 2×2图案抖动的加值选择方法

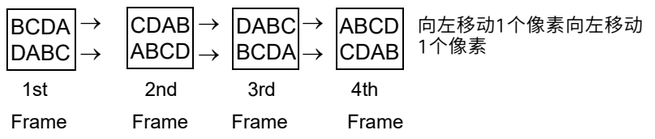
如下重复基本模式。四帧构成1个周期。



- A：OUT_PDTHA.PA[1:0]位值按照输出格式移位后得到的值
- B：OUT_PDTHA.PB[1:0]位值按照输出格式移位后得到的值
- C：OUT_PDTHA.PC[1:0]位值按照输出格式移位后得到的值
- D：OUT_PDTHA.PD[1:0]位值按照输出格式移位后得到的值

瑞萨推荐如下设置这些位：PA[1:0]=11b PB[1:0]=00b PC[1:0]=10b PD[1:0]=01b

当设置2×2图案抖动（OUT_PDTHA.SEL[1:0]=10b）时，背景平面的有效像素区域必须是基本图案的整数倍。如果选择串行RGB作为输出控制块的输出格式，则将水平有效像素宽度加2，并将结果值设置为背景平面水平有效像素宽度位(BG_HSIZE.HW[10:0])。

Note: This setting is reflected to the internal operations on assertion of the vertical synchronization signal (input) when OUT_VLATCH.VEN = 1 or when the register value reflection control signal to internal operations for all the modules is asserted.

TCON3EDGE bit (LCD_TCON3 Output Phase Control)

The TCON3EDGE bit controls the output phase of LCD_TCON3. When this bit is set to 1, LCD_TCON3 is output in synchronization with the falling edge of LCD_CLK, and when it is cleared to 0, LCD_TCON3 is output in synchronization with the rising edge.

TCON2EDGE bit (LCD_TCON2 Output Phase Control)

The TCON2EDGE bit controls the output phase of LCD_TCON2. When this bit is set to 1, LCD_TCON2 is output in synchronization with the falling edge of LCD_CLK, and when it is cleared to 0, LCD_TCON2 is output in synchronization with the rising edge.

TCON1EDGE bit (LCD_TCON1 Output Phase Control)

The TCON1EDGE bit controls the output phase of LCD_TCON1. When this bit is set to 1, LCD_TCON1 is output in synchronization with the falling edge of LCD_CLK, and when it is cleared to 0, LCD_TCON1 is output in synchronization with the rising edge.

TCON0EDGE bit (LCD_TCON0 Output Phase Control)

The TCON0EDGE bit controls the output phase of LCD_TCON0. When this bit is set to 1, LCD_ TCON0 is output in synchronization with the falling edge of LCD_CLK, and when it is cleared to 0, LCD_TCON0 is output in

Note: 此设置反映到垂直同步信号（输入）断言的内部操作时
OUT_VLATCH.VEN=1或当所有模块的内部操作的寄存器值反射控制信号被断言时。

TCON3EDGE位（LCD_TCON3输出相位控制）

TCON3EDGE位控制LCD_TCON3的输出相位。该位置1时，LCD_TCON3与LCD_CLK的下降沿同步输出，清0时，LCD_TCON3与上升沿同步输出。

TCON2EDGE位（LCD_TCON2输出相位控制）

TCON2EDGE位控制LCD_TCON2的输出相位。该位设置为1时，LCD_TCON2与LCD_CLK的下降沿同步输出，清为0时，LCD_TCON2与上升沿同步输出。

TCON1EDGE位（LCD_TCON1输出相位控制）

TCON1EDGE位控制LCD_TCON1的输出相位。当该位设置为1时，LCD_TCON1与LCD_CLK的下降沿同步输出，当清零时，LCD_TCON1与上升沿同步输出。

TCON0EDGE位（LCD_TCON0输出相位控制）

TCON0EDGE位控制LCD_TCON0的输出相位。该位置1时，LCD_TCON0与LCD_CLK下降沿同步输出，清0时，LCD_TCON0输出

synchronization with the rising edge.

LCDEDGE bit (LCD_DATA Output Phase Control)

The LCDEDGE bit controls the output phase of the LCD_DATA pins (LCD_DATA23 to LCD_DATA00). When this bit is set to 1, the LCD_DATA pins are output in synchronization with the falling edge of LCD_CLK, and when it is cleared to 0, the LCD_DATA pins are output in synchronization with the rising edge.

FRONTGAM bit (Correction Control)

The FRONTGAM bit controls the correction sequence. When this bit is set to 1, gamma correction is followed by brightness and contrast correction, and when it is cleared to 0, gamma correction follows brightness and contrast correction. In both cases, each RGB data output from the graphics 2 module is extended from 8 bits to 10 bits (with 00b appended to the lower side), and is input to the preceding stage of the correction circuit. The output is rounded to 10 bits and is input to the dither correction circuit. Although the sequence of RGB gamma correction and brightness/contrast correction can be reversed using this bit, brightness correction always precedes contrast correction.

58.2.50 TCON Reference Timing Setting Register (TCON_TIM)

Address(es): GLCDC.TCON_TIM 400E 1404h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	HALF[10:0]

	—	—	—	—	—	OFFSET[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b10 to b0	OFFSET[10:0]	Horizontal Synchronization Signal Generation Reference Timing	Offset from the assertion of the internal horizontal synchronization signal in pixels. 000h: 1 pixel : 3FFh: 1024 pixels. Other settings are prohibited.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b26 to b16	HALF[10:0]	Vertical Synchronization Signal Generation Change Timing	Delay from the assertion of the internal horizontal synchronization signal in pixels. 000h: 1 pixel (no delay) : 3FFh: 1024 pixels. Other settings are prohibited.	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Rewriting these bits is prohibited during operation. Set the required settings before enabling operation. Operation is not guaranteed if the bit is rewritten during operation.

OFFSET[10:0] bits (Horizontal Synchronization Signal Generation Reference Timing)

The OFFSET[10:0] bits specify the reference timing to be used when the horizontal synchronization signal is generated in the TCON. Set the offset from the assertion of the internal horizontal synchronization signal (HS) in terms of pixels. Figure 58.15 shows the horizontal synchronization signal generation reference timing in the TCON.

与上升沿同步。

LCDEDGE位（LCD_DATA输出相位控制）

LCDEDGE位控制LCD_DATA引脚（LCD_DATA23至LCD_DATA00）的输出相位。当该位设置为1时，LCD_DATA引脚与LCD_CLK的下降沿同步输出，当它清为0时，LCD_DATA引脚与上升沿同步输出。

FRONTGAM位（校正控制）

FRONTGAM位控制校正序列。当该位设置为1时，伽马校正跟随亮度和对比度校正，当它清零时，伽马校正跟随亮度和对比度校正。在这两种情况下，图形2模块输出的每个RGB数据都从8位扩展到10位（下侧附加00b），并输入到校正电路的前级。输出四舍五入到10位并输入到抖动校正电路。尽管使用该位可以颠倒RGB伽马校正和亮度对比度校正的顺序，但亮度校正总是先于对比度校正。

58.2.50 TCON参考时序设置寄存器(TCON_TIM)

Address(es): GLCDC.TCON_TIM 400E 1404h

Bit	Symbol	位名称	Description	R/W
b10 to b0	OFFSET[10:0]	水平同步信号 生成参考时序	与内部水平同步信号断言的偏移量（以像素为单位）。000h：1像素 :3FFh:1024像素。禁止其他设置。	R/W
b15 to b11	—	Reserved	这些位被读取为0。写入值应为0。	R/W
b26 to b16	HALF[10:0]	垂直同步信号 代换时间	内部水平同步信号的断言延迟（以像素为单位）。000h：1像素（无延迟） :3FFh:1024像素。禁止其他设置。	R/W
b31 to b27	—	Reserved	这些位被读取为0。写入值应为0。	R/W

Note: 操作期间禁止改写这些位。在启用操作之前设置所需的设置。如果在操作期间重写该位，则无法保证操作。

OFFSET[10:0]位（水平同步信号生成参考时序）

OFFSET[10:0]位指定在TCON中生成水平同步信号时要使用的参考时序。以像素为单位设置内部水平同步信号(HS)断言的偏移量。图58.15显示了TCON中的水平同步信号生成参考时序。

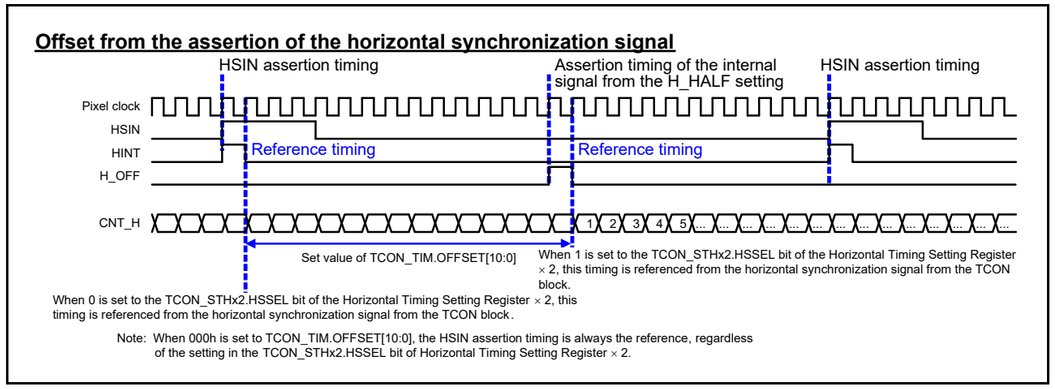

Figure 58.15 Reference timing in the TCON for horizontal synchronization signal generation

HALF[10:0] bits (Vertical Synchronization Signal Generation Change Timing)

The HALF[10:0] bits specify the vertical synchronization signal change timing when the signal is generated in the TCON. Set the change timing as a delay from the assertion of the internal horizontal synchronization signal (HS) in terms of pixels. Figure 58.16 shows the vertical synchronization signal change timing in the TCON.

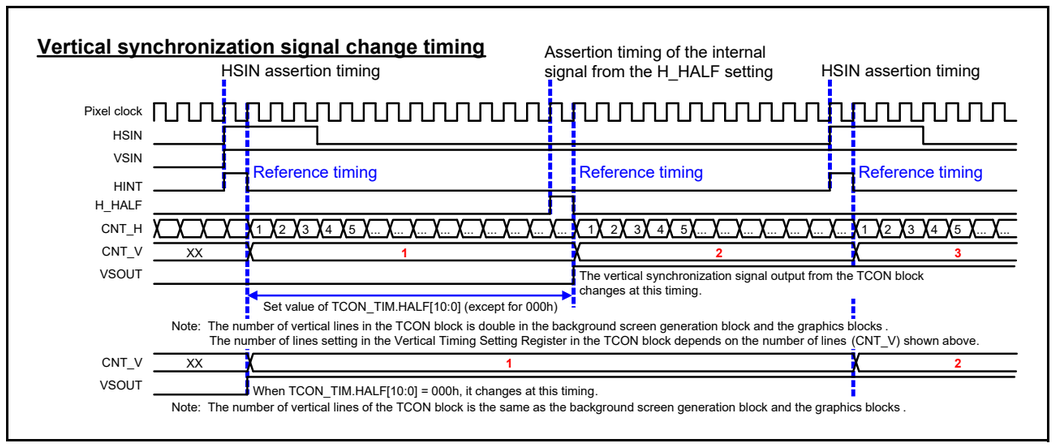

Figure 58.16 Timing in the TCON for vertical synchronization signal change

It is possible to change the vertical synchronization signal at any time within a horizontal line by setting this bit to the appropriate value.

Also, Figure 58.17 shows the relationship between the TCON block and the output format block in the output control block. These blocks are based on shared control signals (same timing) and image data, and the internal delay is the same. The delay difference specified in the register settings is the source of the timing differences on the external pins.

- TCON block: 3 cycles delay of the pixel clock (PXCLK)
- Data Format Block:
  - Parallel RGB: 3 cycles delay of the pixel clock (PXCLK)
  - Serial RGB: 3 cycles delay of the pixel clock (PXCLK)
    - The delay of the pixel head data including invalid data
    - No delay of the serial RGB data.

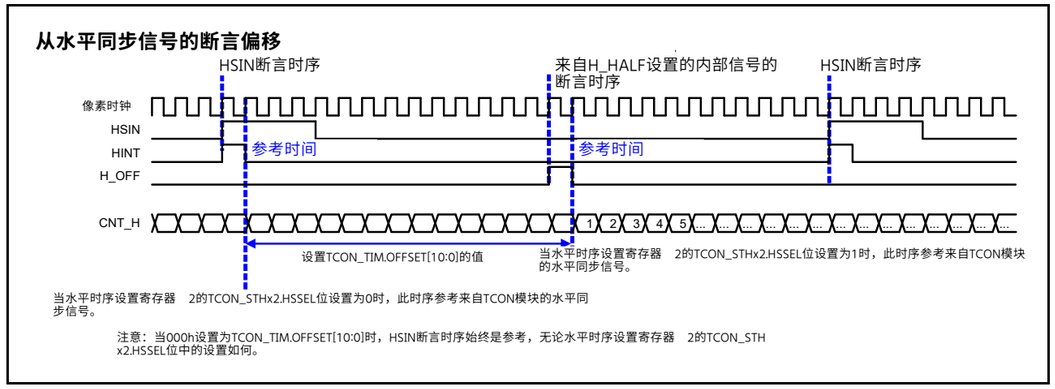

Figure 58.15 TCON中用于水平同步信号生成的参考时序

HALF[10:0]位（垂直同步信号发生变化时序）

HALF[10:0]位指定当信号在
TCON。以像素为单位，将更改时序设置为内部水平同步信号(HS)断言的延迟。图58.16显示了TCON中的垂直同步信号变化时序。

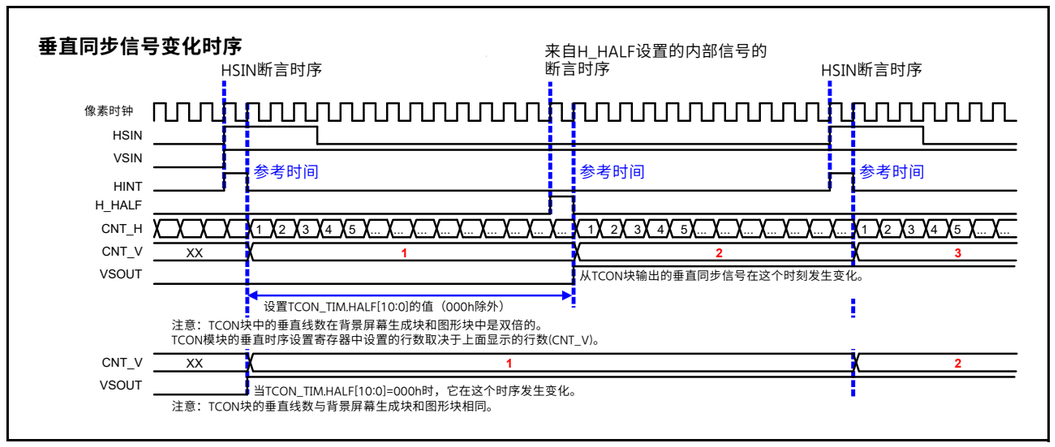

Figure 58.16 TCON中用于垂直同步信号变化的时序

通过将此位设置为适当的值，可以随时在水平行内更改垂直同步信号。

此外，图58.17显示了TCON块和输出控制块中的输出格式块之间的关系。这些块基于共享的控制信号（相同的时序）和图像数据，内部延迟相同。寄存器设置中指定的延迟差异是外部引脚上的时序差异的来源。

- TCON块：像素时钟(PXCLK)的3个周期延迟
- 数据格式块：
  - 并行RGB：像素时钟(PXCLK)的3个周期延迟
  - 串行RGB：像素时钟(PXCLK)的3个周期延迟

    包含无效数据的像素头数据延迟

    串行RGB数据无延迟。

Bit	Symbol	Bit name	Description	R/W
b10 to b0	VW[10:0]	Vertical Synchronization Signal STVx1 Second Change Timing	Signal assertion width in lines. 000h: 0 line (no vertical synchronization signal assertion) : 7FFh: 2047 lines.	R/W
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b26 to b16	VS[10:0]	Vertical Synchronization Signal STVx1 First Change Timing	Signal delay in lines. 000h: 0 line (no delay) : 7FFh: 2047 lines.	R/W
b31 to b27	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Rewriting these bits is prohibited during operation. Set the required settings before enabling operation. Operation is not guaranteed if the bit is rewritten during operation.

The vertical timing setting registers (TCON_STVA1/TCON_STVB1 and TCON_STVA2/TCON_STVB2) have the same configuration, and x is either A or B in the descriptions.

VW[10:0] bits (Vertical Synchronization Signal STVx1 Second Change Timing)

The VW[10:0] bits specify the second change (negation) timing of the vertical synchronization signal STVx1, which is generated in the TCON. Set the second change timing as a delay from the first change point in terms of lines. The change position in a horizontal line is defined in TCON_TIM.HALF[10:0] in the Reference Timing Setting Register (TCON_TIM), as is the first change timing.

水平时序设置寄存器（TCON_STHA1TCON_STHB1和TCON_STHA2TCON_STHB2）具有相同的配置，在说明中x为A或B。

HW[10:0] bits (Horizontal Synchronization Signal STHx1 Second Change Timing)

The HW[10:0] bits specify the second change (negation) timing of the horizontal synchronization signal STHx1, which is generated in the TCON. Set the second change timing as a distance from the first change point in terms of pixels.

HS[10:0] bits (Horizontal Synchronization Signal STHx1 First Change Timing)

The HS[10:0] bits specify the first change (assertion) timing of the horizontal synchronization signal STHx1, which is generated in the TCON. Set the change timing as a distance from the input horizontal synchronization signal (HSIN) or the reference timing based on the offset specified in the TCON_TIM.OFFSET[10:0] bit (horizontal synchronization signal generation reference timing) in terms of pixels.

Figure 58.20 shows the horizontal synchronization signal generation timing if the input horizontal synchronization signal (HSIN) is based on the negated edge reference of the HINT signal. Figure 58.21 shows the horizontal synchronization signal generation timing after offset. By setting the TCON_TIM.OFFSET[10:0] bit (horizontal synchronization generation reference timing) and these horizontal synchronization bits appropriately, it is possible to generate a signal that is asserted before HSIN and negated after HSIN, where HSIN is the horizontal synchronization signal input to the TCON.

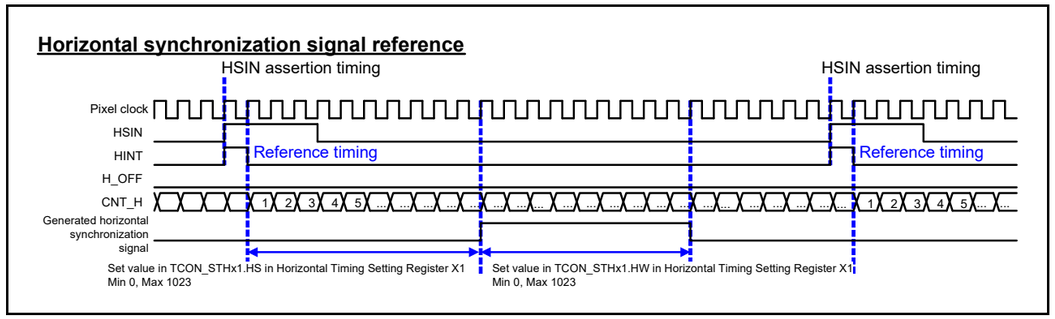

Figure 58.20 Signal generation based on input horizontal synchronization signal (HSIN)

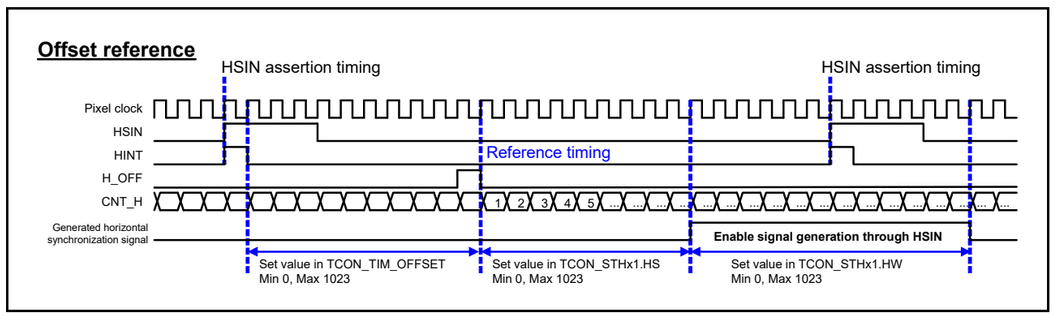

Figure 58.21 Horizontal synchronization signal generation based on offset

When generating the signal across HSIN on the offset reference, the horizontal synchronization signal of the last line of the frame spans the first line of the next frame. Even if the BG_EN.EN bit is cleared to 0 and the GLCDC operation is stopped, the horizontal synchronization signal across HSIN is not cleared at the frame end and retains the predetermined value until the second change timing set in the registers. If BG_EN.SWRST is cleared to 0, the signal returns to the initial state immediately.

HW[10:0]位（水平同步信号STHx1秒变化时序）

HW[10:0]位指定在TCON中生成的水平同步信号STHx1的第二次变化（否定）时序。以像素为单位将第二个变化时间设置为与第一个变化点的距离。

HS[10:0]位（水平同步信号STHx1首次变化时序）

HS[10:0]位指定在TCON中生成的水平同步信号STHx1的第一个变化（断言）时序。根据TCON_TIM.OFFSET[10:0]位（水平同步信号生成参考定时）以像素为单位指定的偏移量，将更改定时设置为距输入水平同步信号(HSIN)或参考定时的距离。

图58.20显示了如果输入水平同步信号(HSIN)基于HINT信号的取反边沿参考，则水平同步信号生成时序。图58.21显示了偏移后的水平同步信号生成时序。通过适当地设置TCON_TIM.OFFSET[10:0]位（水平同步生成参考时序）和这些水平同步位，可以生成一个在HSIN之前断言并在HSIN之后取反的信号，其中HSIN是水平同步信号输入到TCON。

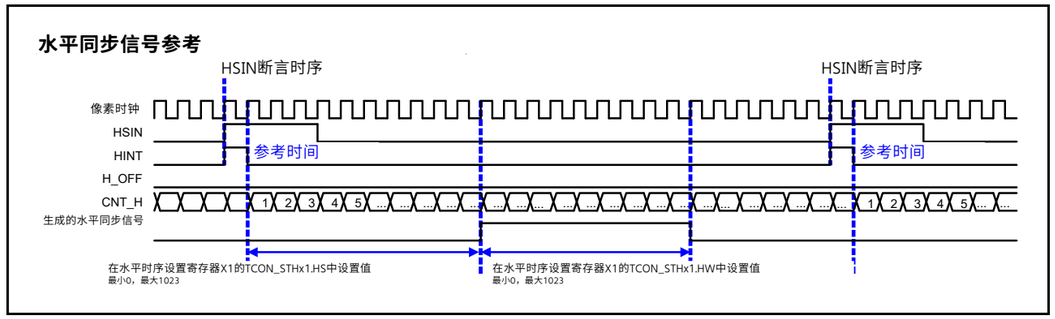

Figure 58.20 基于输入水平同步信号(HSIN)的信号生成

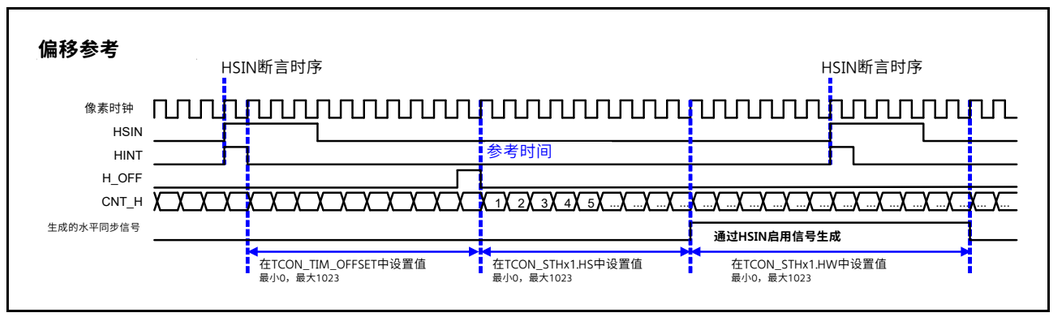

Figure 58.21 基于偏移的水平同步信号生成

当在偏移参考上生成跨HSIN的信号时，帧最后一行的水平同步信号跨越下一帧的第一行。即使BG_EN.EN位清0并停止GLCDC操作，HSIN两端的水平同步信号在帧结束时也不会被清除，并保持预定值直到寄存器中设置的第二次更改时序。如果BG_EN.SWRST清零，信号立即返回初始状态。

注1.将BG_EN.EN位设置为1后，将VPOSDTC位设置为1。

注2.当将LnUNDFDTC(n=1 2)位设置为1并且将BG_SYNC.VP[3:0]位设置为大于5h的值时，会发生意外的GLCDC_LnUNDF(n=1 2)中断在GLCDC启动后生成。因此，将SYSCNT_STCLR.LnUNDFCLR(n=1 2)位设置为1，然后将SYSCNT_STMON.LnUNDF(n=1 2)位设置为0以清除意外的GLCDC_LnUNDF(n=1 2)中断。

VPOSDTC bit (Specified Line Detection Control)

The VPOSDTC bit enables or disables detection of the specified line. When this bit is set to 1, the associated bit in the SYSCNT_STMON register sets to 1 on event notification from graphics 2. When it is cleared to 0, the associated bit in the SYSCNT_STMON register does not set to 1 even on event notification from graphics 2.

L1UNDFDTC bit (Graphics 1 Underflow Detection Control)

The L1UNDFDTC bit enables or disables detection of the graphics 1 underflow. When this bit is set to 1, the associated bit in the SYSCNT_STMON register sets to 1 when an underflow occurs in graphics 1. When it is cleared to 0, the associated bit in the SYSCNT_STMON register does not set to 1 even when an underflow occurs in graphics 1. The underflow state in graphics 1 is automatically cleared on assertion of the vertical synchronization signal (VS) regardless of the value of this bit, and normal operation is recovered.

L2UNDFDTC bit (Graphics 2 Underflow Detection Control)

The L2UNDFDTC bit enables or disables detection of the graphics 2 underflow. When this bit is set to 1, the associated bit in the SYSCNT_STMON register sets to 1 when an underflow occurs in graphics 2. When it is cleared to 0, the associated bit in the SYSCNT_STMON register does not set to 1 even when an underflow occurs in graphics 2. The underflow state in graphics 2 is automatically cleared on assertion of the vertical synchronization signal (VS) regardless of the value of this bit, and normal operation is recovered.

b2	L2UNDFINTEN	Interrupt Request Signal GLCDC_L2UNDF Enable Control	0: Disable GLCDC_L2UNDF output 1: Enable GLCDC_L2UNDF output.	R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

VPOSINTEN bit (Interrupt Request Signal GLCDC_VPOS Enable Control)

The VPOSINTEN bit enables or disables the interrupt request signal GLCDC_VPOS. When this bit is set to 1, the interrupt request signal GLCDC_VPOS is asserted when the associated status monitor flag SYSCNT_STMON[0] sets. When it is cleared to 0, the interrupt request signal GLCDC_VPOS is not asserted even when the associated status monitor flag SYSCNT_STMON[0] sets. If this bit is cleared during GLCDC_VPOS assertion, the associated status monitor flag SYSCNT_STMON[0] does not change, but the interrupt request signal GLCDC_VPOS is negated.

L1UNDFINTEN bit (Interrupt Request Signal GLCDC_L1UNDF Enable Control)

The L1UNDFINTEN bit enables or disables the interrupt request signal GLCDC_L1UNDF. When this bit is set to 1, the interrupt request signal GLCDC_L1UNDF is asserted when the associated status monitor flag SYSCNT_STMON[1] sets. When it is cleared to 0, the interrupt request signal GLCDC_L1UNDF is not asserted even when the associated status monitor flag SYSCNT_STMON[1] sets. If this bit is cleared during GLCDC_L1UNDF assertion, the associated

VPOSDTC位（指定线路检测控制）

VPOSDTC位启用或禁用对指定线路的检测。当该位设置为1时，SYSCNT_STMON寄存器中的相关位在来自图形2的事件通知时设置为1。当它清零时，即使在来自图形的事件通知时，SYSCNT_STMON寄存器中的相关位也不会设置为12.

L1UNDFDTC位（图形1下溢检测控制）

L1UNDFDTC位启用或禁用图形1下溢检测。当该位设置为1时，当图形1中发生下溢时，SYSCNT_STMON寄存器中的相关位设置为1。当它清零时，即使发生下溢，SYSCNT_STMON寄存器中的相关位也不会设置为1在图形1中。图形1中的下溢状态在垂直同步信号(VS)置位时自动清除，无论该位的值如何，恢复正常操作。

L2UNDFDTC位（图形2下溢检测控制）

L2UNDFDTC位启用或禁用图形2下溢检测。当该位设置为1时，当图形2中发生下溢时，SYSCNT_STMON寄存器中的相关位设置为1。当它清零时，即使发生下溢，SYSCNT_STMON寄存器中的相关位也不会设置为1在图2中。图2中的下溢状态在垂直同步信号(VS)置位时自动清除，无论该位的值如何，恢复正常操作。

b0	VPOSCLR	Graphics 2 Specified Line Detection Flag Clear	0: No operation 1: Clear the graphics 2 specified line detection flag.	R/W*1
b1	L1UNDFCLR	Graphics 1 Underflow Detection Flag Clear	0: No operation 1: Clear the graphics 1 underflow detection flag.	R/W*1
b2	L2UNDFCLR	Graphics 2 Underflow Detection Flag Clear	0: No operation 1: Clears the graphics 2 underflow detection flag.	R/W*1
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. These bits are read as 0.

VPOSCLR bit (Graphics 2 Specified Line Detection Flag Clear)

Writing 1 to the VPOSCLR bit clears the graphics 2 specified line detection flag. Clearance of the flag by this bit is only valid for the associated flag, and does not directly affect the other states and interrupt request signals. However, an interrupt request signal might be negated by clearing the detection flag.

L1UNDFCLR bit (Graphics 1 Underflow Detection Flag Clear)

Writing 1 to the L1UNDFCLR bit clears the graphics 1 underflow detection flag. Clearance of the flag by this bit is only valid for the associated flag, and does not directly affect the other states and interrupt request signals. However, an interrupt request signal might be negated by clearing the detection flag.

L2UNDFCLR bit (Graphics 2 Underflow Detection Flag Clear)

Writing 1 to the L2UNDFCLR bit clears the graphics 2 underflow detection flag. Clearance of the flag by this bit is only valid for the associated flag, and does not directly affect the other states and interrupt request signals. However, an interrupt request signal might be negated by clearing the detection flag.

状态监控标志SYSCNT_STMON[1]不改变，但中断请求信号GLCDC_L1UNDF被否定。

L2UNDFINTEN位（中断请求信号GLCDC_L2UNDF使能控制）

L2UNDFINTEN位启用或禁用中断请求信号GLCDC_L2UNDF。当该位设置为1时，中断请求信号GLCDC_L2UNDF在相关状态监控标志SYSCNT_STMON[2]设置时被断言。当它被清除为0时，即使相关状态监视标志SYSCNT_STMON[2]设置，中断请求信号GLCDC_L2UNDF也不会被断言。如果在GLCDC_L2UNDF断言期间清除该位，则相关的状态监控标志SYSCNT_STMON[2]不会改变，但中断请求信号GLCDC_L2UNDF被否定。

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit name	Description	R/W
b0	VPOS	Graphics 2 Specified Line Detection Flag	0: Specified line notification not detected in graphics 2 1: Specified line notification detected in graphics 2.	R
b1	L1UNDF	Graphics 1 Underflow Detection Flag	0: No underflow detected in graphics 1 1: Underflow detected in graphics 1.	R
b2	L2UNDF	Graphics 2 Underflow Detection Flag	0: No underflow detected in graphics 2 1: Underflow detected in graphics 2.	R
b31 to b3	—	Reserved	These bits are read as 0.	R

VPOS flag (Graphics 2 Specified Line Detection Flag)

The VPOS flag indicates that the specified line notification was detected in graphics 2. When this flag is 1, it indicates that the specified line notification was detected in graphics 2 at some time in the past. It does not necessarily mean that graphics 2 is currently processing the specified line. When this flag is 0, it indicates that no specified line notification was detected after the module operation was enabled. When the interrupt request signal is enabled and is cleared while this flag is 1, the associated interrupt request signal GLCDC_VPOS is negated, but this does not affect the state of graphics 2.

L1UNDF flag (Graphics 1 Underflow Detection Flag)

The L1UNDF flag indicates that an underflow was detected in graphics 1. When this flag is 1, it indicates that an underflow was detected in graphics 1 at some time in the past. It does not necessarily mean that graphics 1 is currently in the underflow state. When this flag is 0, it indicates that no underflow was detected after the module operation was enabled. When the interrupt request signal is enabled and is cleared while this flag is 1, the associated interrupt request signal GLCDC_L1UNDF is negated, but this does not affect the state of graphics 1.

Even if the current graphics data is not required (GR1_AB1.DISPSEL[1:0] = 0xb), if the SYSCNT_DTCTEN.L1UNDFDTC flag (graphics 1 underflow detection control) is 1 and detection is enabled, this flag sets to 1 at the start of the graphics image valid area. To avoid unnecessary detection flag settings or interrupt request signal assertions, when the display does not require the current graphics data, clear the SYSCNT_DTCTEN.L1UNDFDTC flag and the SYSCNT_INTEN.L1UNDFINTEN bit (interrupt request signal GLCDC_L1UNDF enable control) to 0.

L2UNDF flag (Graphics 2 Underflow Detection Flag)

The L2UNDF flag indicates that an underflow was detected in graphics 2. When this flag is 1, it indicates that an underflow was detected in graphics 2 at some time in the past. It does not necessarily mean that graphics 2 is currently in the underflow state. When this flag is 0, it indicates that no underflow was detected after the module operation was enabled. When the interrupt request signal is enabled and is cleared while this flag is 1, the associated interrupt request signal GLCDC_L2UNDF is negated, but this does not affect the state of graphics 2.

Even if the current graphics data is not required (GR2_AB1.DISPSEL[1:0] = 0xb), if the SYSCNT_DTCTEN.L2UNDFDTC flag (graphics 2 underflow detection control) is 1 and detection is enabled, this flag sets to 1 at the start of the graphics image valid area. To avoid the unnecessary detection flag settings or interrupt request signal assertions, when the display does not require the current graphics data, clear the SYSCNT_DTCTEN.L2UNDFDTC flag and the SYSCNT_INTEN.L2UNDFINTEN bit (interrupt request signal

VPOS标志（图形2指定行检测标志）

VPOS标志表示在图形2中检测到指定线路通知。当该标志为1时，表示在过去某个时间在图形2中检测到指定线路通知。这并不一定意味着图形2当前正在处理指定的行。当该标志为0时，表示启用模块操作后未检测到指定线路通知。当该标志为1时中断请求信号被使能并被清除时，相关的中断请求信号GLCDC_VPOS被否定，但这并不影响图形2的状态。

L1UNDF标志（图形1下溢检测标志）

L1UNDF标志表示在图形1中检测到下溢。当该标志为1时，它表示在过去某个时间在图形1中检测到下溢。这并不一定意味着图形1当前处于下溢状态。该标志为0时，表示模块操作使能后未检测到下溢。当该标志为1时中断请求信号被使能并被清除时，相关的中断请求信号GLCDC_L1UNDF被否定，但这并不影响图形1的状态。

即使不需要当前图形数据（GR1_AB1.DISPSEL[1:0]=0xb），如果SYSCNT_DTCTEN.L1UNDFDTC标志（图形1下溢检测控制）为1并启用检测，该标志在图形图像有效区域开始时设置为1。为避免不必要的检测标志设置或中断请求信号断言，当显示不需要当前图形数据时，清除SYSCNT_DTCTEN.L1UNDFDTC标志和SYSCNT_INTEN.L1UNDFINTEN位（中断请求信号

GLCDC_L1UNDF启用控制）为0。

L2UNDF标志（图形2下溢检测标志）

L2UNDF标志表示在图形2中检测到下溢。当该标志为1时，表示在过去某个时间在图形2中检测到下溢。这并不一定意味着图形2当前处于下溢状态。该标志为0时，表示模块操作使能后未检测到下溢。当该标志为1时中断请求信号被使能并被清除时，相关的中断请求信号GLCDC_L2UNDF被否定，但这并不影响图形2的状态。

即使不需要当前图形数据（GR2_AB1.DISPSEL[1:0]=0xb），如果SYSCNT_DTCTEN.L2UNDFDTC标志（图形2下溢检测控制）为1并启用检测，该标志在图形图像有效区域开始时设置为1。为避免不必要的检测标志设置或中断请求信号断言，当显示不需要当前图形数据时，清除SYSCNT_DTCTEN.L2UNDFDTC标志和SYSCNT_INTEN.L2UNDFINTEN位（中断请求信号

GLCDC_L2UNDF enable control) to 0.

The configuration of the pixel and panel clock generator circuits are shown in Figure 9.1, Clock generation circuit block diagram.

DCDR[5:0] bits (Clock Division Ratio Setting Control)

The DCDR[5:0] bits control the setting of the panel clock division ratio. The division ratio bit can only be set to the values listed in Table 58.9. Operation is not guaranteed for values not listed.

Table 58.9 Input clock division (1 of 2)

100000b	1/32	LCD_EXTCLK/32	PLL output/32

Note 1. The panel clock is output as the LCD_CLK output clock. This setting may be prohibited because LCD_EXTCLK and LCD_CLK have limited frequencies. See section 60, Electrical Characteristics.

To set the panel clock:

1. After setting the input source of the panel clock in the CLKSEL bit, set the division ratio in the DCDR[5:0] bits and the pixel clock selection.
2. Set the CLKEN bit to 1.

CLKEN bit (Panel Clock Output Enable Control)

The CLKEN bit enables or disables the panel clock output. When enabling the panel clock output and operating the panel clock block, set this bit to 1. When changing the PIXSEL, CLKSEL, or DCDR bit, you must set this bit to 0 once and stop the panel clock output. Operation is not guaranteed if any setting is changed while the panel clock is being output.

CLKSEL bit (Panel Clock Supply Source Control)

The CLKSEL bit controls the selection of the panel clock supply source from either the external clock pin (LCD_EXTCLK) or PLL output. When the external clock is selected, set this bit to 0. When PLL output is selected, set this bit to 1.

PIXSEL bit (Pixel Clock Select Control)

The PIXSEL bit controls the selection of the pixel clock output. When selecting parallel RGB, set this bit to 0 to output the same frequency as the panel clock (no frequency division). When selecting serial RGB, set this bit to 1 to output the quarter frequency of the panel clock as the pixel clock.

This bit must be synchronized with the OUT_SET.FRQSEL[1:0] setting. You must set the same value as in FRQSEL[1]. Otherwise, operation is not guaranteed.

VER[15:0] bits (Version Information)

The VER[15:0] bits provide GLCDC version information.

58.3 Operation

58.3.1 Overall Control

The GLCDC consists of six modules as shown in Figure 58.22, each of which functions independently. The four modules handling image data are interconnected by the vertical and horizontal synchronization signals VS, HS, VE, and HE, and image data (RGB888), as shown in Figure 58.23. The processing of image data is carried out with the pixel clock (PXCLK). LCD_CLK synchronizes with PXCLK (also in phase with each other), and has the same or quadruple frequency (for serial RGB888 output). The registers controlling operation and setting parameters are connected with the internal peripheral bus 8 and operate on PCLKA. The circuits, including the data buffer and the CLUT memory, operate on PCLKA to read graphics data from the GPX bus, access the color palette (CLUT) memory, and expand graphics data into the ARGB8888 format.

Table 58.9 输入时钟分频（2之2）

DCDR[5:0]	时钟分频比	CLKSEL = 0, LCD_EXTCLK(≤ 60 MHz)	CLKSEL=1，PLL输出（120至240MHz）
001001b	1/9	LCD_EXTCLK/9	PLL output/9
001100b	1/12	LCD_EXTCLK/12	PLL output/12
010000b	1/16	LCD_EXTCLK/16	PLL output/16
011000b	1/24	LCD_EXTCLK/24	PLL output/24
100000b	1/32	LCD_EXTCLK/32	PLL output/32

Note 1. 面板时钟作为LCD_CLK输出时钟输出。此设置可能会被禁止，因为LCD_EXTCLK和LCD_CLK的频率有限。请参见第60节，电气特性。

设置面板时钟：

1. 在CLKSEL位设置面板时钟的输入源后，在DCDR[5:0]位设置分频比和像素时钟选择。
2. 将CLKEN位设置为1。

CLKEN位（面板时钟输出使能控制）

CLKEN位启用或禁用面板时钟输出。当使能面板时钟输出并操作面板时钟模块时，将该位设置为1。当更改PIXSEL、CLKSEL或DCDR位时，必须将该位设置为0一次并停止面板时钟输出。如果在面板时钟输出期间更改任何设置，则无法保证操作。

CLKSEL位（面板时钟电源控制）

CLKSEL位控制来自外部时钟引脚(LCD_EXTCLK)或PLL输出的面板时钟供应源的选择。Whentheexternalclockisselected setthisbitto0.WhenPLLoutputisselected setthisbitto1.

PIXSEL位（像素时钟选择控制）

PIXSEL位控制像素时钟输出的选择。选择并行RGB时，将此位设置为0以输出与面板时钟相同的频率（不分频）。选择串行RGB时，将此位设置为1，以输出面板时钟的四分之一频率作为像素时钟。

该位必须与OUT_SET.FRQSEL[1:0]设置同步。您必须设置与FRQSEL[1]中相同的值。
否则，无法保证操作。

VER[15:0]位（版本信息）

VER[15:0]位提供GLCDC版本信息。

58.3 Operation

58.3.1 整体控制

GLCDC由如图58.22所示的六个模块组成，每个模块独立运行。处理图像数据的四个模块通过垂直和水平同步信号VS、HS、VE、HE和图像数据（RGB888）相互连接，如图58.23所示。图像数据的处理是通过像素时钟(PXCLK)进行的。LCD_CLK与PXCLK同步（彼此同相），并具有相同或四倍的频率（用于串行RGB888输出）。控制操作和设置参数的寄存器与内部外围总线8相连，在PCLKA上操作。这些电路，包括数据缓冲器和CLUT内存，在PCLKA上运行以从GPX总线读取图形数据，访问调色板(CLUT)内存，并将图形数据扩展为ARGB8888格式。

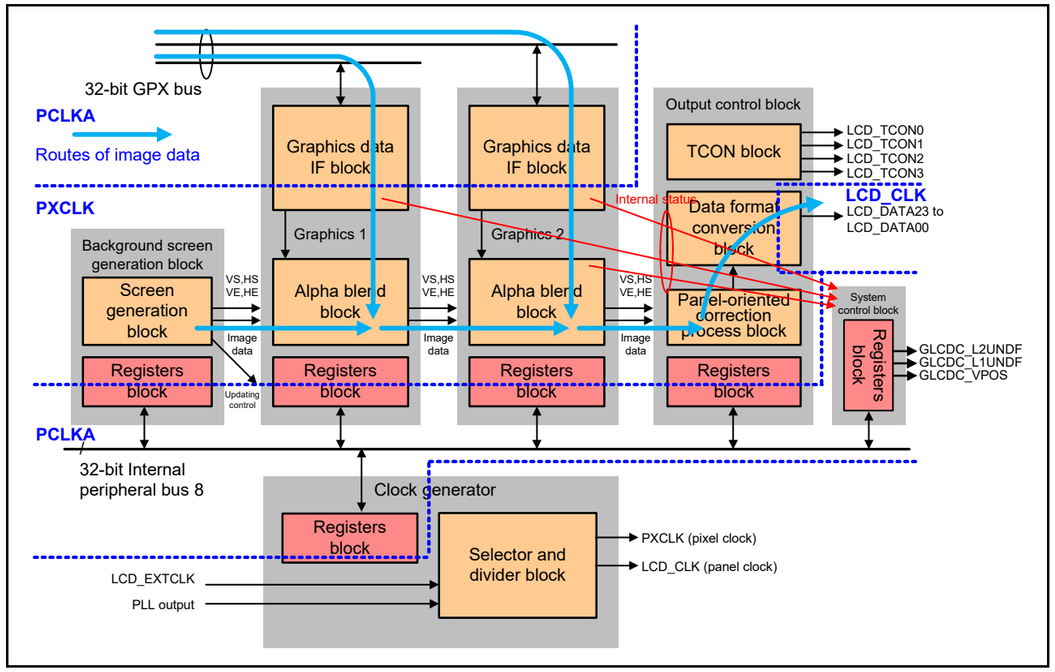

Figure 58.22 GLCDC configuration

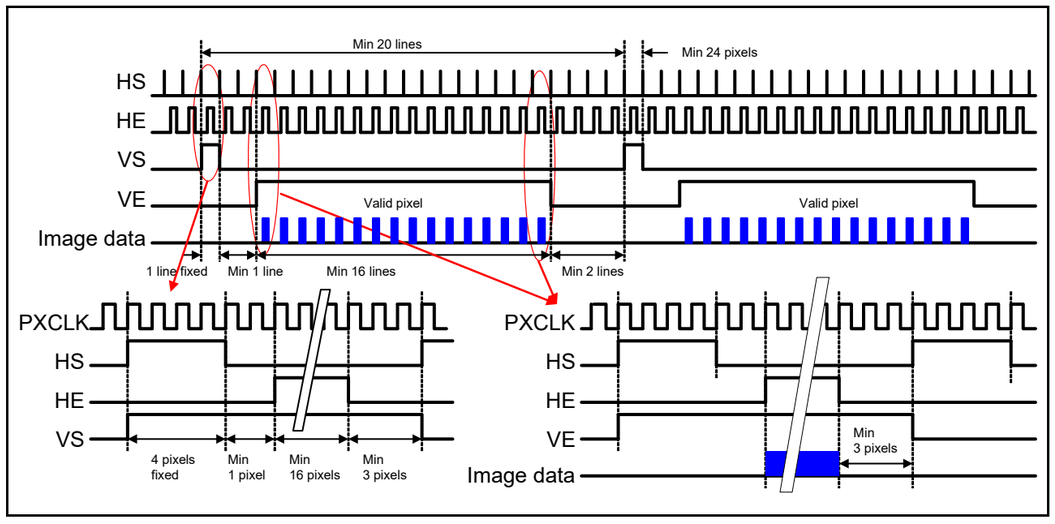

Figure 58.23 Image data carrier signals in the GLCDC

The graphics 1, graphics 2, and output control modules have no individual operation enable bits. By clearing the software reset state in the background screen generation module, these modules wait for vertical and horizontal synchronization signals VS, HS,VE, and HE, and image data (RGB888) to be input, detect assertion of the vertical synchronization signal VS, and start operation for each frame based on the values preset in the registers. For the system control module, clearing the software reset state in the background screen generation module allows it to monitor the status of graphics 1 and 2 in accordance with the register settings and assert interrupt request signals. These status flags are intended for observing the internal status and exert no influence on the internal operation. The operation between startup and stop of the GLCDC is

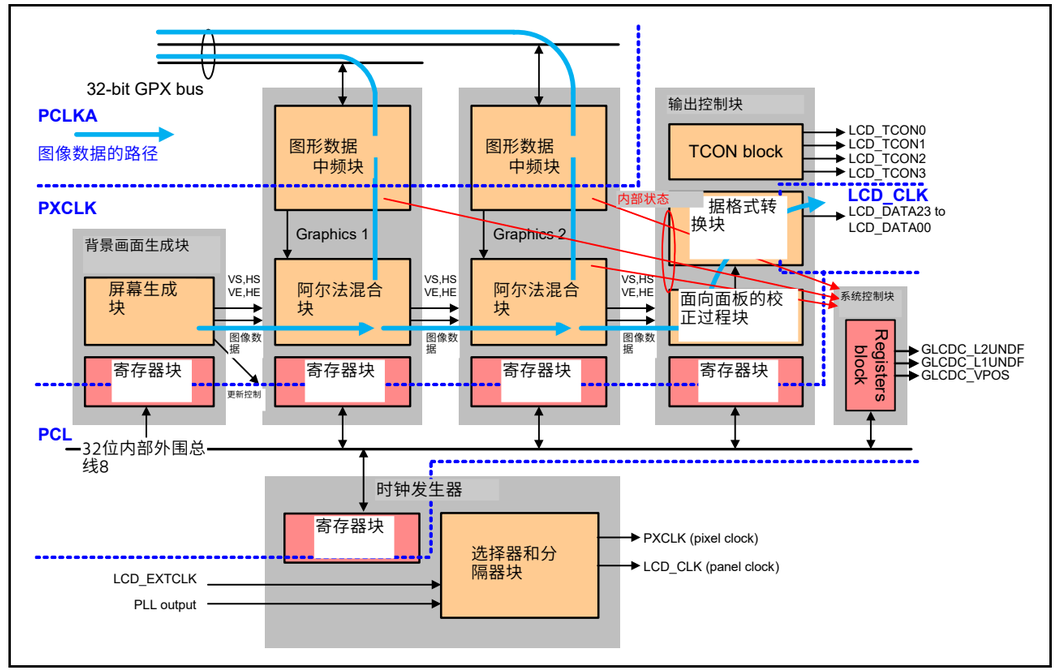

Figure 58.22 GLCDC configuration

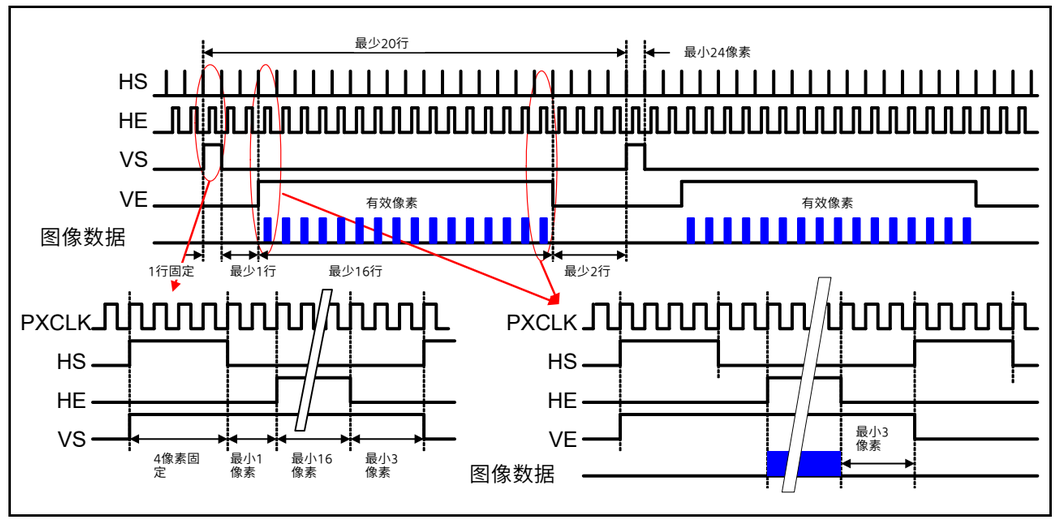

Figure 58.23 GLCDC中的图像数据载体信号

图形1、图形2和输出控制模块没有单独的操作使能位。通过清除后台屏幕生成模块中的软件复位状态，这些模块等待垂直和水平同步信号VS、HS、VE和HE以及图像数据（RGB888）的输入，检测垂直同步信号VS的断言，并根据寄存器中预设的值开始每一帧的操作。对于系统控制模块，清除后台画面生成模块中的软件复位状态，可以根据寄存器设置监控图形1和2的状态，并断言中断请求信号。这些状态标志用于观察内部状态，不影响内部操作。GLCDC启动和停止之间的操作是

outlined in this section.

(1) Startup

To start GLCDC operation:

1. Confirm that PCLKA is supplied to the GLCDC and that the reset is negated. When setting LCD_CLK to the same frequency as PXCLK or LCD_CLK to the quadruple speed clock, the setting must be consistent with the value in the register specified in the subsequent stage. The quadruple speed clock is required only when the output format is serial RGB888. Operation is not guaranteed if the quadruple speed clock is supplied to LCD_CLK in other output formats than serial RGB888.
2. Set 1 to the BG_EN.SWRST bit to release the entire GLCDC from a software reset.
3. Set parameters necessary for operation in each register. Although registers of any module can be set first, while the BG_EN.VEN bit (control of GLCDC internal register value reflection to internal operations), BG_EN.EN bit (background plane operation enable) of the background screen generation module, and the VEN bit in the register update control register of each module remain cleared to 0, confirm that PCLKA and PXCLK/LCD_CLK are supplied and the BG_MON.SWRST bit (entire module software reset state monitor) is set to 1.
4. When displaying the graphics data read by graphics 1 and 2 through the GPX bus, set 1 to the GRn_FLMRD.RENB bit (graphics data read enable).
5. Write the color palette data of graphics 1 and 2 (0 and 1 planes) to the CLUT memory through the register access bus (internal peripheral bus 8) as required. This is necessary for the LUT1, LUT4, LUT8, and ARGB1555 data formats. ARGB1555 uses addresses 80h and 00h on the two planes, LUT1 uses 01h and 00h, LUT4 uses the addresses from 0Fh to 00h, and LUT8 uses the addresses from FFh to 00h.
6. Set 1 to the BG_EN.VEN bit (control of background plane register value reflection to internal operations) and the BG_EN.EN bit (background plane operation enable) of the background screen generation module at the same time. This setting allows output of the vertical and horizontal synchronization signals VS, HS, VE, and HE, and the image data (RGB888) from the background screen generation module. When the pixel data is valid (both VE and HE are 1), output from the background screen generation module uses the value in the BG_BGC register. The data value is 00 0000h for pixels that are not valid.
7. Each module detects the assertion of the vertical synchronization signal (VS) output from its previous stage (background screen generation module for graphics 1, graphics 1 for graphics 2, and graphics 2 for the output control module) and starts operation in accordance with its register settings. All the modules control the operation in frame units. When the assertion of the vertical synchronization signal (VS) is detected, the current frame is taken as the frame head and the status is initialized. If necessary (when the VEN bits in the register update control registers are 1), the register values read through the register access bus are reflected to the internal operation.

(2) Changing parameters during operation

With the GLCDC, it is possible to update parameters of each module and reflect the updates to the internal operations during operation, without preventing graphics data to be read by the background screen generation module, graphics 1, or graphics 2. By setting 1 to the VEN bits of the modules, including the background screen generation module, almost all parameters are reflected to the internal operations at the start of the following frame (at the start of the control screen for the background screen generation module, and immediately after the VS assertion of the previous stage for the other modules). However, if the CLUT plane being used for internal operations (determined in the GRn_CLUTINT.SEL[1:0] bits) is modified, the updates are reflected to the internal operations immediately without waiting for the following VS assertion. To circumvent this immediate reflection of the CLUT plane modification to the internal operations, first write all the image data (ARGB8888) necessary for the CLUT plane that is not being used for internal operations, next modify the GRn_CLUTINT.SEL[1:0] bits, and finally set 1 to the VEN bit of the background screen generation module or the target module.

To modify parameters during operation:

1. Confirm that the VEN bit of each module is 0. Operation is not guaranteed if the target registers are modified when the VEN bit of the module to which the register values are to be reflected to the internal operations, or the VEN bit of the background screen generation module is 1.
2. Modify the value of the target registers.
3. If only a particular module is to be the target, set 1 to the VEN bit of the target module. If multiple modules or the

本节概述。

(1) Startup

启动GLCDC操作：

1. 确认PCLKA被提供给GLCDC并且复位被否定。将LCD_CLK设置为与PXCLK相同的频率或将LCD_CLK设置为四倍速时钟时，设置必须与后续阶段指定的寄存器中的值一致。仅当输出格式为串行RGB888时才需要四倍速时钟。如果以串行RGB888以外的其他输出格式向LCD_CLK提供四倍速时钟，则无法保证操作。
2. 将BG_EN.SWRST位设置为1以从软件复位中释放整个GLCDC。
3. 在每个寄存器中设置操作所需的参数。虽然可以先设置任意模块的寄存器，但是后台画面生成模块的BG_EN.VEN位（控制GLCDC内部寄存器值反映到内部操作）、BG_EN.EN位（后台平面操作使能）、VEN位在每个模块的寄存器更新控制寄存器中保持清零，确认PCLKA和PXCLKLCD_CLK已供电且BG_MON.SWRST位（整个模块软件复位状态监视器）设置为1。
4. 当显示图形1和2通过GPX总线读取的图形数据时，将GRn_FLMRD.RENB位设置为1（图形数据读取使能）。
5. 根据需要通过寄存器访问总线（内部外围总线8）将图形1和2（0和1平面）的调色板数据写入CLUT内存。这对于LUT1、LUT4、LUT8和ARGB1555数据格式是必需的。ARGB1555在两个平面上使用地址80h和00h，LUT1使用01h和00h，LUT4使用0Fh到00h的地址，LUT8使用FFh到00h的地址。
6. 同时将背景画面生成模块的BG_EN.VEN位（控制背景平面寄存器值反映到内部操作）和BG_EN.EN位（背景平面操作使能）置1。此设置允许输出垂直和水平同步信号VS、HS、VE和HE，以及来自背景屏幕生成模块的图像数据(RGB888)。当像素数据有效时（VE和HE均为1），背景画面生成模块的输出使用BG_BGC寄存器中的值。无效像素的数据值为000000h。
7. 每个模块检测从其前一级输出的垂直同步信号（VS）的断言（图形1的背景屏幕生成模块，图形2的图形1和输出控制模块的图形2）并根据其寄存器开始操作设置。所有模块都以帧为单位控制操作。当检测到垂直同步信号（VS）有效时，将当前帧作为帧头并初始化状态。如有必要（当寄存器更新控制寄存器中的VEN位为1时），通过寄存器访问总线读取的寄存器值反映到内部操作。

(2) 在运行期间更改参数

使用GLCDC，可以在运行期间更新每个模块的参数并将更新反映到内部操作，而不会阻止背景屏幕生成模块、图形1或图形2读取图形数据。通过将1设置为模块的VEN位，包括背景画面生成模块，几乎所有参数都反映到下一帧开始时的内部操作（背景画面生成模块的控制画面开始时，VS断言后立即）其他模块的前一阶段）。但是，如果用于内部操作的CLUT平面（在GRn_CLUTINT.SEL[1:0]位中确定）被修改，则更新会立即反映到内部操作，而无需等待以下VS断言。为了避免CLUT平面修改对内部操作的直接反映，首先写入未用于内部操作的CLUT平面所需的所有图像数据(ARGB8888)，然后修改GRn_CLUTINT.SEL[1:0]位，最后将后台画面生成模块或目标模块的VEN位设置为1。

在运行过程中修改参数：

1. 确认每个模块的VEN位为0。如果要反映寄存器值的模块的VEN位被修改为内部操作，或者后台屏幕的VEN位被修改，则不保证操作生成模块为1。
2. 修改目标寄存器的值。
3. 如果仅将特定模块作为目标，则将目标模块的VEN位设置为1。如果多个模块或

background screen generation module are to be the targets, set 1 to the VEN bit of the background screen generation module. In this case, all the modules are included as targets, not only the background screen generation module.

4. Confirm that the VEN bit to which 1 was set is 0. If the bit is cleared to 0, the target register contents are reflected to the internal operations. If the bit remains 1, however, the target register contents might not yet be reflected to the internal operations. The VEN bit of each module is cleared to 0 immediately after the target register values are internally reflected. However, the VEN bit of the background screen generation module is not cleared to 0 until the module output VE is negated (with all the modules, sufficient delay is secured in reference to the VS assertion of the background screen generation module so that the register values are reflected to the internal operations for the same frame). Figure 58.24 shows the operation of the signals output by the background screen generation module and the monitor bits.

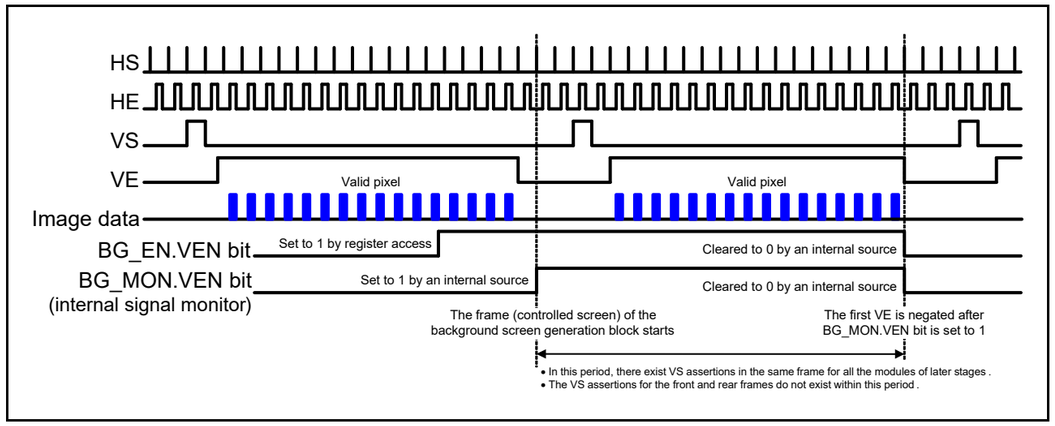

Figure 58.24 Control signals for register value reflection to internal operations

(3) Stopping and restarting in normal operation

To stop the GLCDC:

1. Confirm that the VEN bit of each module is cleared to 0.
2. Clear the BG_EN.EN bit (background plane operation enable) of the background screen generation module to 0.
3. Confirm that the BG_MON.EN bit (background plane operation monitor) of the background screen generation module has changed to 0. This bit is cleared to 0 only after operation has stopped. It is cleared at the frame end of the background screen generation module, not when the operations of all the modules are complete (not at the frame end of the output control module). If it is necessary to wait for all the modules to complete operations, a certain period (for example, a period equivalent to one line) is required.
4. Usually, a software reset can be safely applied (clearing of the BG_EN.SWRST bit) after confirming that the BG_MON.EN bit of the background screen generation module has changed to 0. (Even if the output signal returns to the initial value, no problems occur because the GLCDC has already entered the vertical blanking interval.)
5. When restarting the GLCDC by setting the relevant registers without applying a software reset, wait until sufficient time elapses after the BG_MON.EN bit becomes 0 (when the output control module output is the frame end) before starting the GLCDC. The GLCDC itself is not affected by this because the GLCDC starts operating after recognizing the assertion of the VS of the previous stage as the frame head. However, operation of some connected devices might be affected if a blanking interval or a period equivalent to one line is too short. For details, check the specifications of the connected device. When a software reset is applied, the register values are also initialized and almost all of the registers must be set again. Only the color palette data (CLUT memory content) is retained (only for a software reset after normal end).

Figure 58.25 shows the changes in signal lines and bits for the stop and restart in normal operation. Even if the background screen generation module is stopped by a clearing of the BG_EN.EN bit to 0, the GLCDC stops because of an abnormal operation sequence, not normal operation, if the GPX bus access is not complete at the frame end because of an underflow in graphics 1 or 2, inappropriate setting of graphics data access, or other undesirable conditions.

背景画面生成模块作为对象，将背景画面生成模块的VEN位设为1。在这种情况下，所有模块都作为目标包括在内，而不仅仅是背景屏幕生成模块。

4. 确认设置为1的VEN位为0。如果该位被清除为0，则目标寄存器内容反映到内部操作中。但是，如果该位保持为1，则目标寄存器内容可能尚未反映到内部操作中。每个模块的VEN位在目标寄存器值在内部反映后立即清零。但是，背景屏幕生成模块的VEN位不会被清除为0，直到模块输出VE被取反（对于所有模块，参考背景屏幕生成模块的VS断言确保足够的延迟，以便寄存器值反映到同一帧的内部操作）。图58.24显示了背景屏幕生成模块和监视器位输出的信号的操作。

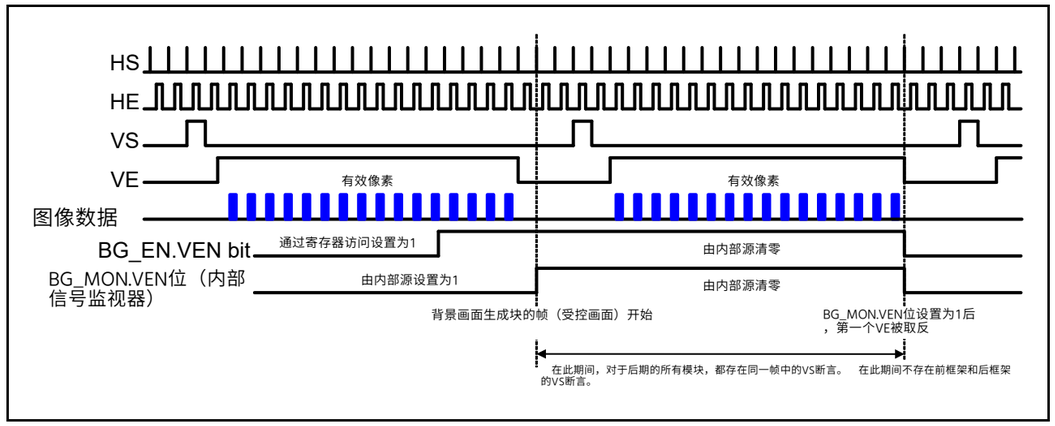

Figure 58.24 寄存器值反映到内部操作的控制信号

(3) 正常运行中的停止和重新启动

要停止GLCDC：

1. 确认各模块的VEN位清零。
2. 将后台画面生成模块的BG_EN.EN位（后台平面操作使能）清0。
3. 确认后台画面生成模块的BG_MON.EN位（后台平面操作监视器）已变为0。只有在操作停止后，该位才清为0。在后台画面生成模块的帧尾清零，而不是在所有模块操作完成时（不是在输出控制模块的帧尾）。如果需要等待所有模块完成操作，则需要一定的周期（例如，相当于一行的周期）。
4. 通常，在确认背景画面生成模块的BG_MON.EN位已变为0后，可以安全地应用软件复位（清除BG_EN.SWRST位）。（即使输出信号恢复到初始值，也不会出现问题是因为GLCDC已经进入垂直消隐区间。）
5. 在不应用软件复位的情况下通过设置相关寄存器重新启动GLCDC时，请等到BG_MON.EN位变为0（当输出控制模块输出为帧结束时）经过足够的时间后，再启动GLCDC。GLCDC本身不受此影响，因为GLCDC在将前一级的VS的断言识别为帧头后开始运行。但是，如果消隐间隔或相当于一条线的周期太短，可能会影响某些连接设备的操作。有关详细信息，请检查所连接设备的规格。当应用软件复位时，寄存器值也被初始化并且几乎所有的寄存器都必须重新设置。仅保留调色板数据（CLUT内存内容）（仅用于正常结束后的软件复位）。

图58.25显示了正常操作中停止和重启的信号线和位的变化。即使背景屏幕生成模块通过将BG_EN.EN位清除为0来停止，如果GPX总线访问在帧结束时由于图形1或2中的下溢、图形数据访问设置不当或其他不良情况。

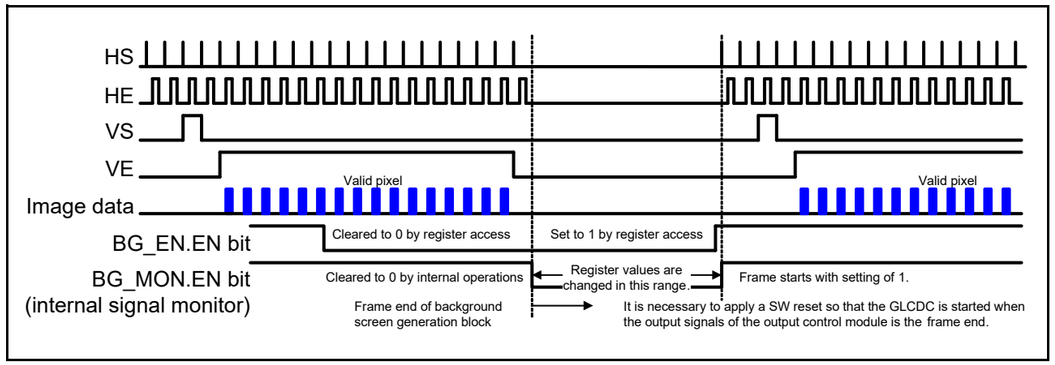

Figure 58.25 Stop and restart in normal operation

(4) Stopping and restarting in abnormal operation

Stop in abnormal operation occurs in the following cases:

- When during operation (BG_EN.EN or BG_MON.EN is set to 1), a software reset (BG_EN.SWRST bit is cleared to 0) or a reset is applied
- When unnecessary (unintended) access to the GPX bus occurs and a data cycle is not completed, even though the BG_EN.EN bit is cleared to 0 and so the BG_MON.EN bit is also cleared to 0.

In both cases, the GLCDC is internally initialized and the register access bus can be accessed normally (except for a hardware reset). However, the GPX bus might write unintended graphics data to the GLCDC. Therefore, it is advisable to apply a software reset (clear the BG_EN.SWRST bit to 0) and confirm that there is no unintended access to the GPX bus, even after confirming that both the BG_EN.EN and BG_MON.EN bits are cleared to 0. Next release the GLCDC from the software reset (set the BG_EN.SWRST bit to 1), set the relevant registers, and set the BG_EN.En and BG_EN.VEN bits in the background screen generation module to 1 to restart the GLCDC. For the procedure for checking the GPX bus state, see the *Arm® AHB Specification*. Use this procedure even after a reset when the GPX bus, a target device, or a target controller is not initialized. If these are initialized on a reset assertion for the GLCDC, a normal startup procedure can be used without checking the GPX bus state.

58.3.2 Screen Definition

The essential signals for GLCDC operations are generated by the background screen generation module, and the graphics 1 and 2 modules and output control module operate based on the sequentially transferred vertical and horizontal synchronization signals (VS and HS) and vertical and horizontal pixel enable signals (VE and HE). The reference point (frame start point) of the background screen cannot be determined by the output signals. The point shown in the figures is virtual and provided only for register settings. The reference points (frame start points) of the graphics 1 and 2 modules and output control module are the assertion of the vertical synchronization signal (VS), which is input (output) from the previous stage. Each module defines the valid pixel display area and special processing area for pixel data (rectangular areas for graphics 1 and 2) according to the position and width based on this reference point. Figure 58.26 shows the definition of the background screen, and Figure 58.27 shows the definition of the graphics 1 and 2 screen. The output control module performs correction for the entire valid pixel area (when both VE and HE are 1) output from the previous stage (graphics 2). (No registers are provided in the output control module for setting the correction area.) TCON in the output control module generates the control signals to be output based on the internal vertical and horizontal synchronization signals (VS and HS), and the change timing of the output signals can be freely modified within the valid setting range specifiable in the registers.

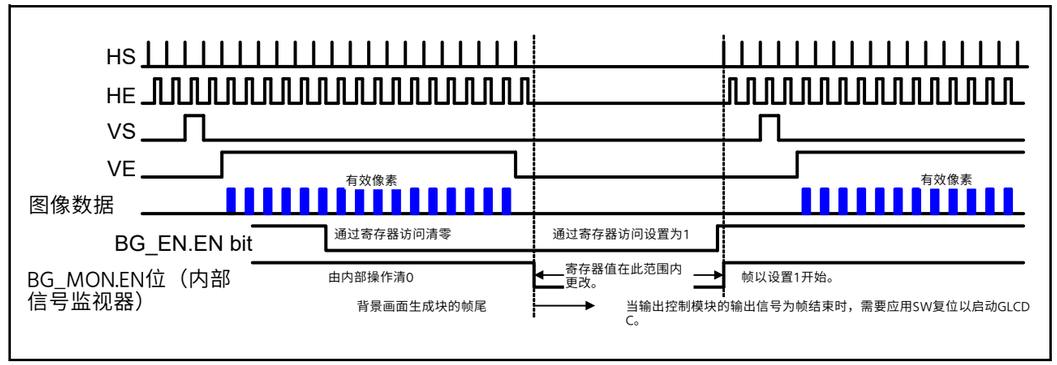

Figure 58.25 在正常运行中停止和重新启动

(4) 异常运行中的停止和重新启动

在以下情况下会出现异常停止：

- 操作期间（BG_EN.EN或BG_MON.EN设置为1）时，软件复位（BG_EN.SWRST位清零）或应用复位
- 当发生对GPX总线的不必要（意外）访问且数据周期未完成时，即使BG_EN.EN位清零，因此BG_MON.EN位也清零。

在这两种情况下，GLCDC都在内部进行了初始化，并且可以正常访问寄存器访问总线（硬件复位除外）。但是，GPX总线可能会将意外的图形数据写入GLCDC。因此，建议应用软件复位（将BG_EN.SWRST位清0）并确认没有意外访问GPX总线，即使在确认BG_EN.EN和BG_MON.EN位都被清零之后0.接下来从软件复位中释放GLCDC（将BG_EN.SWRST位设置为1），设置相关寄存器，并将后台屏幕生成模块中的BG_EN.En和BG_EN.VEN位设置为1，重新启动GLCDC。有关检查GPX总线状态的过程，请参阅Arm®AHB规范。即使在GPX总线、目标设备或目标控制器未初始化时重置后，也可以使用此过程。如果这些在GLCDC的复位断言上被初始化，则可以使用正常启动过程而不检查GPX总线状态。

58.3.2 屏幕定义

GLCDC操作的基本信号由背景屏幕生成模块产生，图形1和2模块和输出控制模块根据顺序传输的垂直和水平同步信号（VS和HS）和垂直和水平像素使能信号（VE和他）。背景画面的参考点（帧开始点）不能由输出信号确定。图中显示的点是虚拟的，仅用于寄存器设置。图形1和2模块和输出控制模块的参考点（帧起点）是垂直同步信号（VS）的断言，它是从前一级输入（输出）的。每个模块根据这个参考点的位置和宽度，定义了像素数据的有效像素显示区域和特殊处理区域（图形1和2的矩形区域）。图58.26显示了背景屏幕的定义，图58.27显示了图形1和2屏幕的定义。输出控制模块对前一阶段输出的整个有效像素区域（当VE和HE均为1时）进行校正（图2）。（输出控制模块中没有提供设置校正区域的寄存器。）输出控制模块中的TCON根据内部垂直和水平同步信号（VS和HS）产生控制信号输出，以及输出信号可以在寄存器指定的有效设置范围内自由修改。

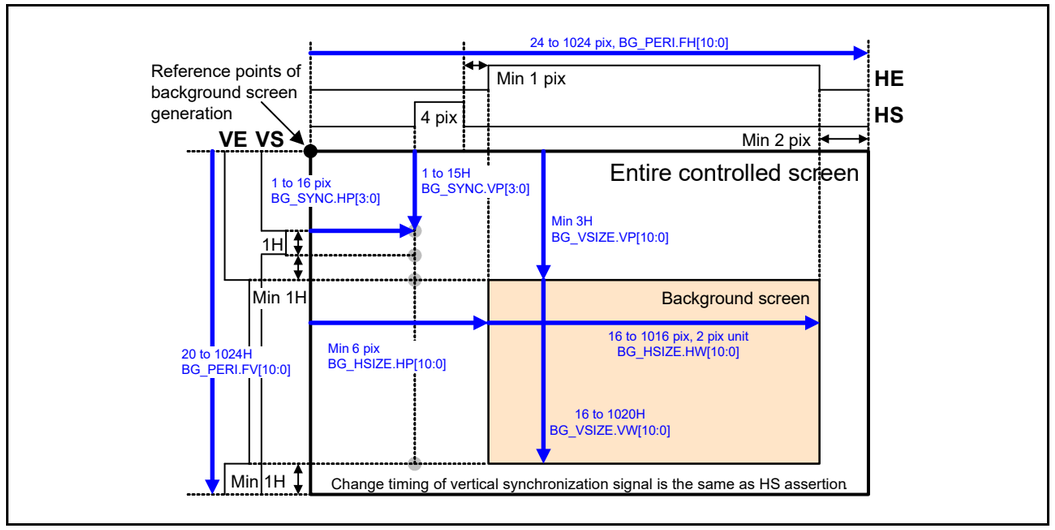

Figure 58.26 Internal definition of background screen

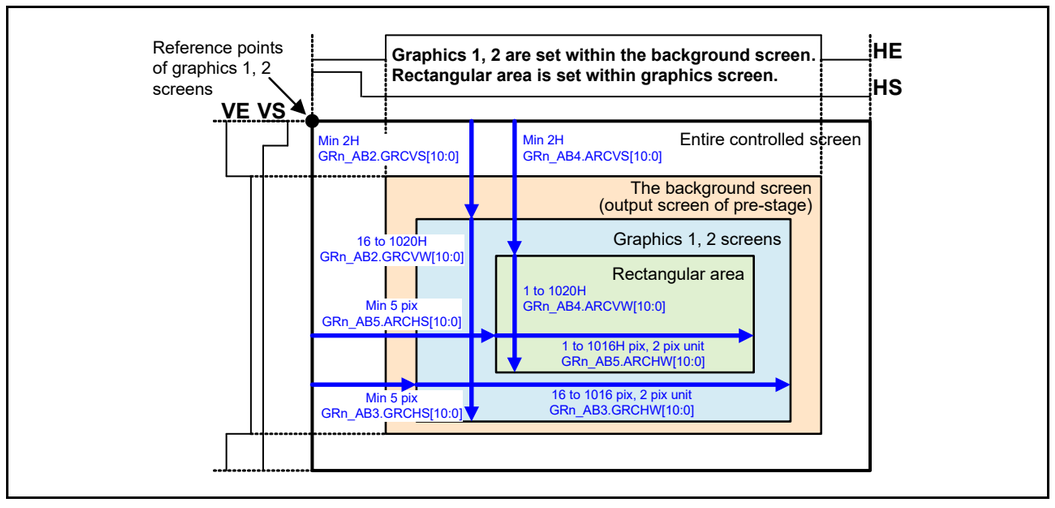

Figure 58.27 Internal definition of graphics 1 and 2 screens

58.3.3 Underflow and Interrupts

The GLCDC can detect the three types of status conditions described in this section. To detect each status condition, set the associated bit in the Status Detection Control Register (SYSCNT_DTCTEN) to 1.

58.3.3.1 Graphics 2 underflow detection

This function detects underflows in the graphics data interface block for graphics 2. The SYSCNT_STMON.L2UNDF flag sets to 1 if the graphics data cannot be read from the graphics data interface block (if valid data is not stored in the 4-stage ring buffer). The underflow is cleared as an internal state of graphics 2 on the VS (vertical synchronization) signal assertion of the previous stage. However, to clear the relevant bit in the Status Monitor Register of the system control block, the software must set the associated bit in the Status Clear Register to 1.

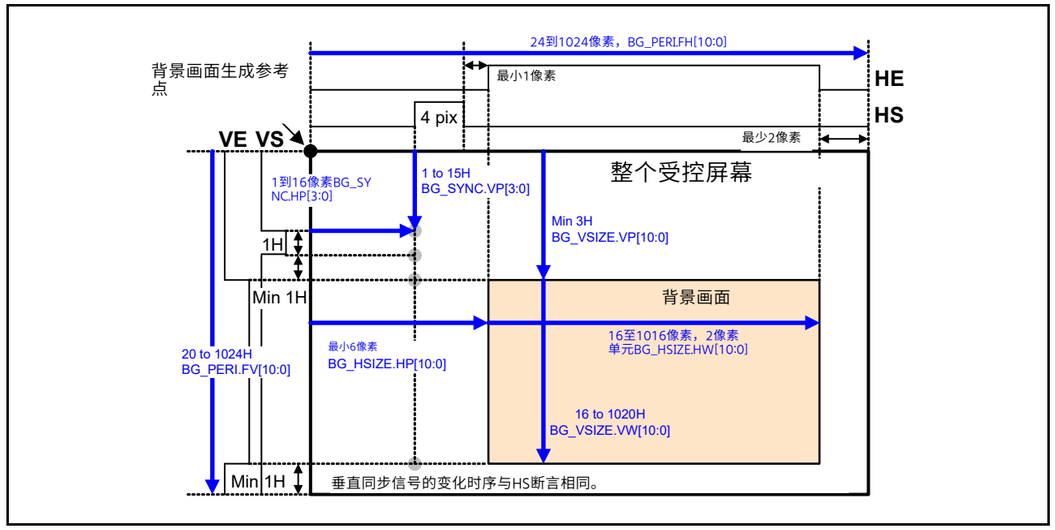

Figure 58.26 背景画面的内部定义

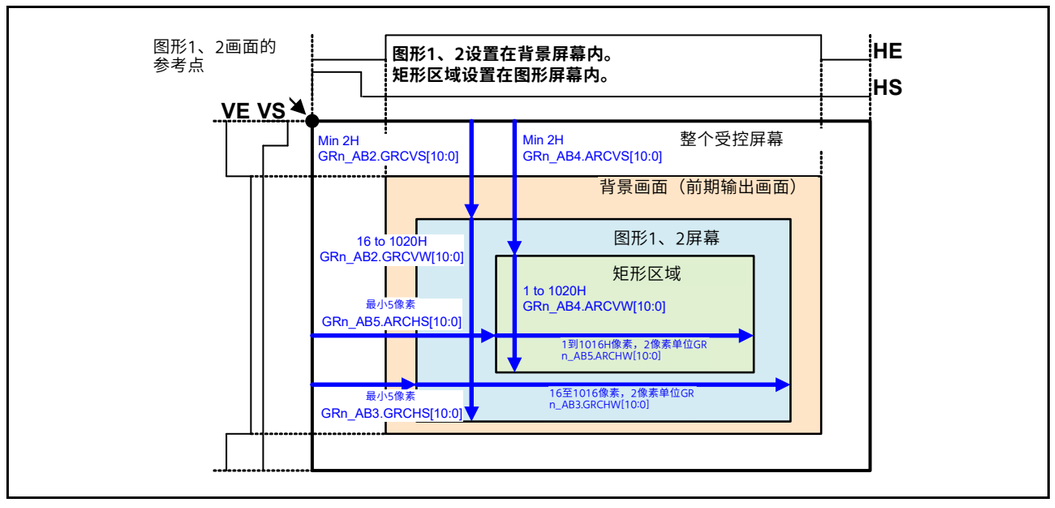

Figure 58.27 图形1和2屏幕的内部定义

58.3.3 下溢和中断

GLCDC可以检测本节中描述的三种状态条件。要检测每个状态条件，请将状态检测控制寄存器(SYSCNT_DTCTEN)中的相关位设置为1。

58.3.3.1 图形2下溢检测

此函数检测图形2的图形数据接口块中的下溢。如果无法从图形数据接口块中读取图形数据（如果有效数据未存储在4级环形缓冲区中），则SYSCNT_STMON.L2UNDF标志设置为1。在前一阶段的VS（垂直同步）信号断言上，下溢作为图形2的内部状态被清除。但是，要清除系统控制块的状态监视器寄存器中的相关位，软件必须将状态清除寄存器中的相关位设置为1。

58.3.3.2 Graphics 1 underflow detection

This function detects underflows in the graphics data interface block for graphics 1. The SYSCNT_STMON.L1UNDF flag is set to 1 if the graphics data cannot be read from the graphics data interface block (if valid data is not stored in the 4-stage ring buffer). The underflow is cleared as an internal state of graphics 1 on the VS (vertical synchronization) signal assertion of the previous stage. However, to clear the relevant bit in the Status Monitor Register of the system control block, the software must set the associated bit in the Status Clear Register to 1.

58.3.3.3 Graphics 2 line detection

This function detects that the number of lines specified in the GR2_CLUTINT.LINE[10:0] bit was processed. The detection is performed on the HS (horizontal synchronization) signal assertion of the previous stage, not when valid pixels start to be processed. Each time the number of detected lines reach the value specified for graphics 2, the SYSCNT_STMON.VPOS flag sets to 1. As with underflow detection, to clear the relevant bit in the Status Monitor Register of the system control block, the software must set the associated bit in the Status Clear Register to 1.

58.3.3.4 Interrupts

The GLCDC provides three interrupt request output signals (GLCDC_L2UNDF, GLCDC_L1UNDF, and GLCDC_VPOS) that correspond to detection of the three status conditions. The GLCDC_L2UNDF, GLCDC_L1UNDF, and GLCDC_VPOS signals are associated with graphics 2 underflow detection, graphics 1 underflow detection, and graphics 2 line detection, respectively. Each of the interrupt request signals is asserted by setting the associated bit in the Interrupt Request Enable Register (SYSCNT_INTEN) to 1. Detecting the status and enabling the associated interrupt request can be controlled separately. Even if detection is enabled, the interrupt request signal is not asserted unless the interrupt request output signal is enabled. In addition, if the Status Monitor Register (SYSCNT_STMON) clears while the interrupt request output signal is asserted (the associated bit in the Status Clear Register (SYSCNT_STCLR) is set to 1), or if the associated bit in the Interrupt Request Enable Register (SYSCNT_INTEN) is cleared to 0, the interrupt request signal is negated. The interrupt request signal generation circuit is configured as shown in Figure 58.28. This circuit is glitch-free except for reset-induced glitches.

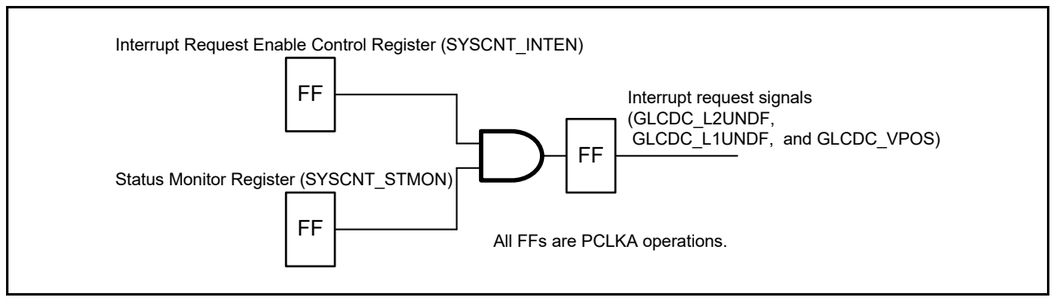

Figure 58.28 Interrupt request signal generation circuit

58.3.3.2 图形1下溢检测

此函数检测图形1的图形数据接口块中的下溢。如果无法从图形数据接口块中读取图形数据（如果有效数据未存储在4级环形缓冲区中，则SYSCNT_STMON.L1UNDF标志设置为1）。在前一阶段的VS（垂直同步）信号断言上，下溢作为图形1的内部状态被清除。但是，要清除系统控制块的状态监视器寄存器中的相关位，软件必须将状态清除寄存器中的相关位设置为1。

58.3.3.3 图形2线检测

此函数检测到在GR2_CLUTINT.LINE[10:0]位中指定的行数已被处理。检测是在前一阶段的HS（水平同步）信号断言上执行的，而不是在开始处理有效像素时执行的。每次检测到的线数达到为图形2指定的值时，SYSCNT_STMON.VPOS标志设置为1。与下溢检测一样，清除状态监视器中的相关位

系统控制块的寄存器，软件必须将状态清除寄存器中的相关位设置为1。

58.3.3.4 Interrupts

GLCDC提供三个中断请求输出信号（GLCDC_L2UNDF、GLCDC_L1UNDF和GLCDC_VPOS)对应于三种状态条件的检测。GLCDC_L2UNDF、GLCDC_L1UNDF和GLCDC_VPOS信号分别与图形2下溢检测、图形1下溢检测和图形2线检测相关联。每个中断请求信号通过将中断请求使能寄存器(SYSCNT_INTEN)中的相关位设置为1来置位。检测状态和启用相关中断请求可以单独控制。即使使能检测，除非使能中断请求输出信号，否则不会断言中断请求信号。此外，如果状态监视器寄存器(SYSCNT_STMON)在中断请求输出信号有效时清除（状态清除寄存器(SYSCNT_STCLR)中的相关位设置为1），或者如果中断请求使能寄存器中的相关位(SYSCNT_INTEN)清零，中断请求信号无效。中断请求信号发生电路的结构如图58.28所示。除了复位引起的毛刺外，该电路没有毛刺。

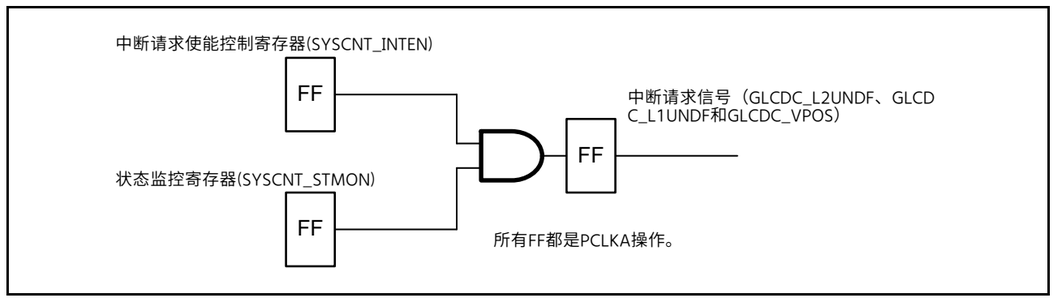

Figure 58.28 中断请求信号发生电路

59. Internal Voltage Regulator

59.1 Overview

The MCU includes a linear regulator (LDO) that supplies voltage to the internal circuits and memory except for I/O, analog, USB, and battery backup power domain.

59.2 Operation

Table 59.1 lists the setting descriptions for the LDO mode pins, and Figure 59.1 shows the LDO mode settings. In LDO mode, the internal voltage is generated from VCC.

Table 59.1 Setting descriptions for the LDO mode pins

Parameter	Description
All VCC pins	• Connect each pin to the system power supply. • Connect each pin to VSS through a 0.1-µF multilayer ceramic capacitor. Place the capacitor close to the pin.
VCL and VCL0 pins	Connect each pin to VSS through a 0.1-µF multilayer ceramic capacitor. Place the capacitor close to the pin.

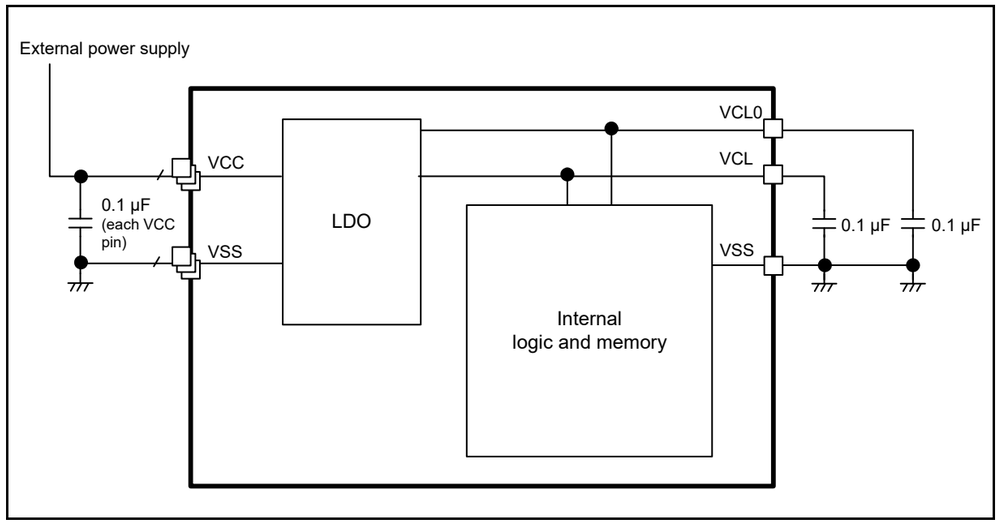

Figure 59.1 LDO mode settings

59. 内部稳压器

59.1 Overview

MCU包含一个线性稳压器(LDO)，可为除IO、模拟、USB和电池备用电源域之外的内部电路和存储器提供电压。

59.2 Operation

表59.1列出了LDO模式引脚的设置说明，图59.1显示了LDO模式设置。在LDO模式下，内部电压由VCC产生。

Table 59.1 LDO模式引脚的设置说明

Parameter	Description
所有VCC引脚	将每个引脚连接到系统电源。 通过一个0.1µF多层陶瓷电容器将每个引脚连接到VSS。将电容器靠近引脚放置。
VCL和VCL0引脚	通过一个0.1µF多层陶瓷电容器将每个引脚连接到VSS。将电容器靠近引脚放置。

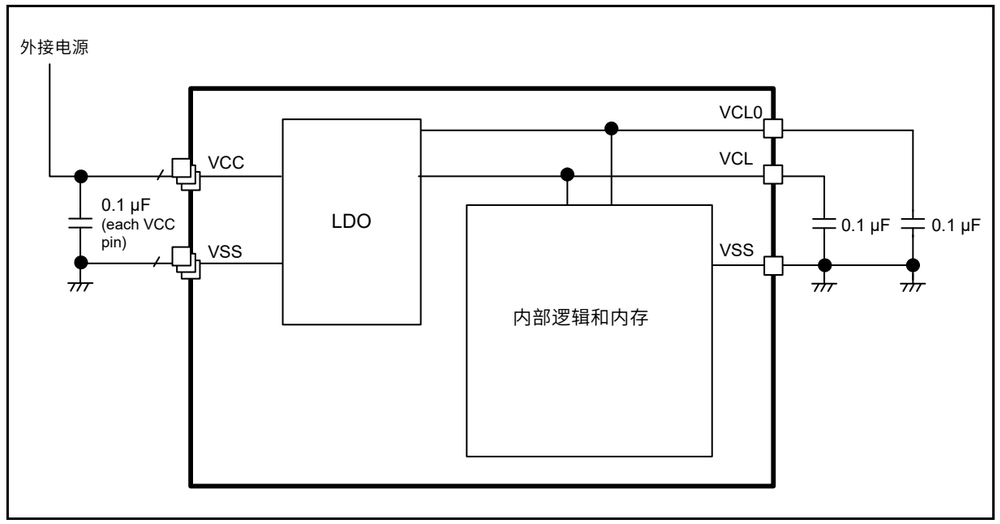

Figure 59.1 LDO模式设置

60. Electrical Characteristics

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

VCC = AVCC0 = VCC_USB = VBATT = 2.7 to 3.6 V, 2.7 ≤ VREFH0/VREFH ≤ AVCC0, VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V, VSS = AVSS0 = VREFL0/VREFL = VSS_USB = VSS1_USBHS = VSS2_USBHS = PVSS_USBHS = AVSS_USBHS = 0 V, Ta = Topr.

Figure 60.1 shows the timing conditions.

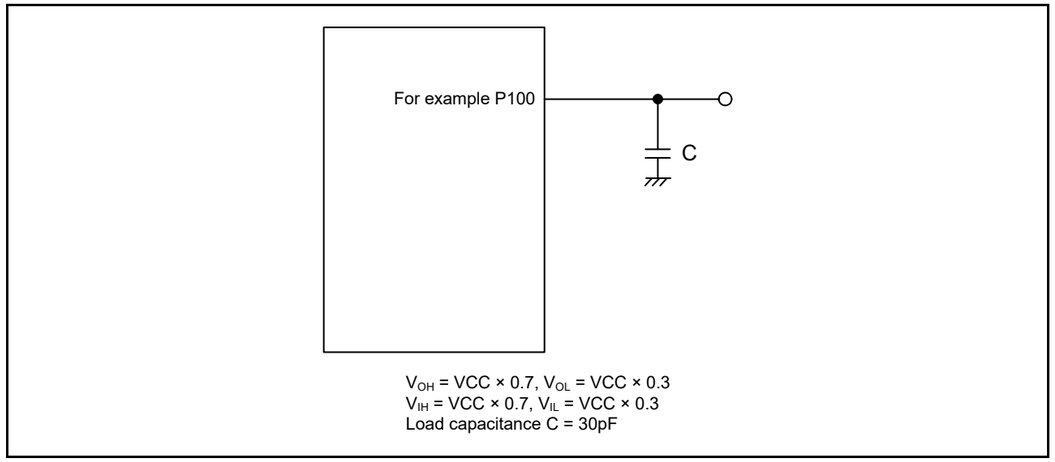

Figure 60.1 Input or output timing measurement conditions

The measurement conditions of timing specification in each peripherals are recommended for the best peripheral operation, however make sure to adjust driving abilities of each pins to meet your conditions.

60.1 Absolute Maximum Ratings

Table 60.1 Absolute maximum ratings

Parameter	Symbol	Value	Unit
Power supply voltage	VCC, VCC_USB *2	-0.3 to +4.0	V
VBATT power supply voltage	VBATT	-0.3 to +4.0	V
Input voltage (except for 5V-tolerant ports*1)	V_{in}	-0.3 to VCC + 0.3	V
Input voltage (5V-tolerant ports*1)	V_{in}	-0.3 to + VCC + 4.0 (max 5.8)	V
Reference power supply voltage	VREFH/VREFH0	-0.3 to AVCC0 + 0.3	V
Analog power supply voltage	AVCC0 *2	-0.3 to +4.0	V
USBHS power supply voltage	VCC_USBHS	-0.3 to +4.0	V
USBHS analog power supply voltage	AVCC_USBHS	-0.3 to +4.0	V
Analog input voltage (except for P000 to P007)	V_{AN}	-0.3 to AVCC0 + 0.3	V
Analog input voltage (P000 to P007) when PGA differential input is disabled	V_{AN}	-0.3 to AVCC0 + 0.3	V
Analog input voltage (P000 to P002, P004 to P006) when PGA differential input is enabled	V_{AN}	-1.3 to AVCC0 + 0.3	V
Analog input voltage (P003, P007) when PGA differential input is enabled	V_{AN}	-0.8 to AVCC0 + 0.3	V
Operating temperature*3,*4,*5	T_{opr}	-40 to +85 -40 to +105	°C
Storage temperature	T_{stg}	-55 to +125	°C

60. 电气特性

除非另有规定，MCU的电气特性在以下条件下定义：

VCC = AVCC0 = VCC_USB = VBATT = 2.7 to 3.6 V, 2.7 ≤ VREFH0/VREFH ≤ AVCC0, VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V, VSS = AVSS0 = VREFL0/VREFL = VSS_USB = VSS1_USBHS = VSS2_USBHS = PVSS_USBHS = AVSS_USBHS = 0 V, Ta = Topr.

图60.1显示了时序条件。

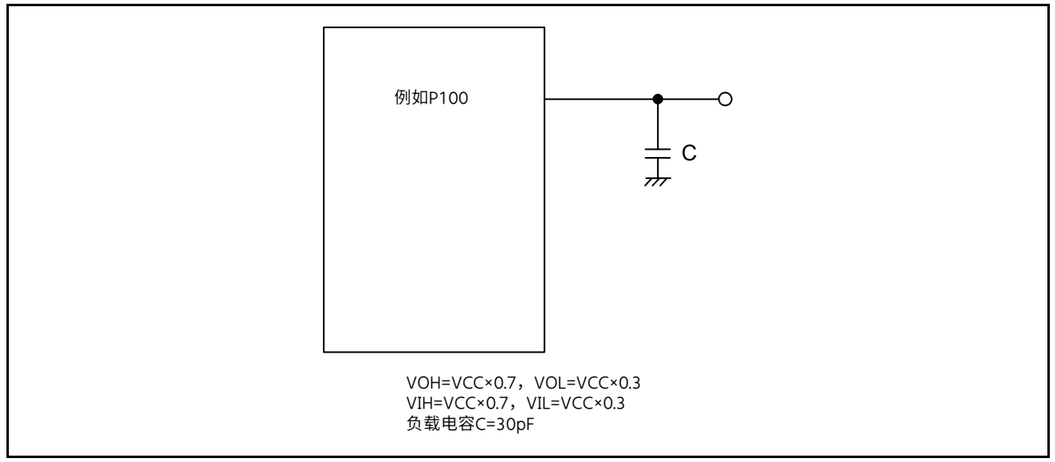

Figure 60.1 输入或输出定时测量条件

每个外设的时序规范的测量条件是推荐的，以获得最佳的外设操作，但请确保调整每个引脚的驱动能力以满足您的条件。

60.1 绝对最大额定值

Table 60.1 绝对最大额定值

Parameter	Symbol	Value	Unit
电源电压	VCC, VCC_USB *2	-0.3 to +4.0	V
VBATT电源电压	VBATT	-0.3 to +4.0	V
输入电压（5V耐受端口除外*1）	V_{in}	-0.3 to VCC + 0.3	V
输入电压（5V容限端口*1）	V_{in}	-0.3 to + VCC + 4.0 (max 5.8)	V
参考电源电压	VREFH/VREFH0	-0.3 to AVCC0 + 0.3	V
模拟电源电压	AVCC0 *2	-0.3 to +4.0	V
USBHS电源电压	VCC_USBHS	-0.3 to +4.0	V
USBHS模拟电源电压	AVCC_USBHS	-0.3 to +4.0	V
模拟输入电压（P000至P007除外）	V_{AN}	-0.3 to AVCC0 + 0.3	V
PGA差分输入禁用时的模拟输入电压（P000至P007）	V_{AN}	-0.3 to AVCC0 + 0.3	V
启用PGA差分输入时的模拟输入电压（P000至P002、P004至P006）	V_{AN}	-1.3 to AVCC0 + 0.3	V
PGA差分输入启用时的模拟输入电压(P003 P007)	V_{AN}	-0.8 to AVCC0 + 0.3	V
Operating temperature*3,*4,*5	T_{opr}	-40 to +85 -40 to +105	°C
贮存温度	T_{stg}	-55 to +125	°C

Caution: Permanent damage to the MCU might result if absolute maximum ratings are exceeded.

Note 1. Ports P205, P206, P400, P401, P407 to P415, P511, P512, P708 to P713, and PB01 are 5V-tolerant.
Note 2. Connect AVCC0 and VCC_USB to VCC.
Note 3. See section 60.2.1, T_j/T_a Definition.
Note 4. Contact a Renesas Electronics sales office for information on derating operation when T_a = +85°C to +105°C. Derating is the systematic reduction of load for improved reliability.
Note 5. The upper limit of operating temperature is 85°C or 105°C, depending on the product. For details, see section 1.3, Part Numbering.

Table 60.2 Recommended operating conditions

Parameter	Symbol	Value	Min	Typ	Max	Unit
Power supply voltages	VCC	When USB/SDRAM is not used	2.7	-	3.6	V
		When USB/SDRAM is used	3.0	-	3.6	V
	VSS		-	0	-	V
USB power supply voltages	VCC_USB, VCC_USBHS		-	VCC	-	V
	VSS_USB, AVSS_USBHS, PVSS_USBHS, VSS1_USBHS, VSS2_USBHS		-	0	-	V
VBATT power supply voltage	VBATT		1.8	-	3.6	V
Analog power supply voltages	AVCC0*1		-	VCC	-	V
	AVSS0		-	0	-	V

Note 1. Connect AVCC0 to VCC. When neither the A/D converter nor the D/A converter nor the comparator is in use, do not leave the AVCC0, VREFH/VREFH0, AVSS0, and VREFL/VREFL0 pins open. Connect the AVCC0 and VREFH/VREFH0 pins to VCC, and the AVSS0 and VREFL/VREFL0 pins to VSS, respectively.

60.2 DC Characteristics

60.2.1 T_j/T_a Definition

Table 60.3 DC characteristics
Conditions: Products with operating temperature (T_a) -40 to +105°C

Parameter	Symbol	Typ	Max	Unit	Test conditions
Permissible junction temperature	T_j	-	125	°C	High-speed mode Low-speed mode Subosc-speed mode
			105*1		

Note: Make sure that $T_j = T_a + \theta ja \times$ total power consumption (W), where total power consumption = $(VCC - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + I_{CC}max \times VCC$.
Note 1. The upper limit of operating temperature is 85°C or 105°C, depending on the product. For details, see section 1.3, Part Numbering. If the part number shows the operation temperature to 85°C, then Tj max is 105°C, otherwise, 125°C.

Caution: 如果超过绝对最大额定值，可能会对MCU造成永久性损坏。

Note 1. 端口P205、P206、P400、P401、P407至P415、P511、P512、P708至P713和PB01可承受5V。
Note 2. 将AVCC0和VCC_USB连接到VCC。
Note 3. 请参阅第60.2.1节，TjTa定义。
Note 4. 有关在Ta=+85°C至+105°C时降额运行的信息，请联系瑞萨电子销售办事处。降额是系统地减少负载以提高可靠性。
Note 5. 工作温度上限为85°C或105°C，具体取决于产品。有关详细信息，请参阅第1.3节，部分Numbering.

Table 60.2 推荐工作条件

Parameter	Symbol	Value	Min	Typ	Max	Unit
电源电压	VCC	不使用USBSDRAM时	2.7	-	3.6	V
		使用USBSDRAM时	3.0	-	3.6	V
	VSS		-	0	-	V
USB电源电压	VCC_USB, VCC_USBHS		-	VCC	-	V
	VSS_USB, AVSS_USBHS, PVSS_USBHS, VSS1_USBHS, VSS2_USBHS		-	0	-	V
VBATT电源电压	VBATT		1.8	-	3.6	V
模拟电源电压	AVCC0*1		-	VCC	-	V
	AVSS0		-	0	-	V

Note 1. 将AVCC0连接到VCC。当AD转换器、DA转换器和比较器均未使用时，请勿将AVCC0、VREFHVREFH0、AVSS0和VREFLVREFL0引脚悬空。将AVCC0和VREFHVREFH0引脚分别连接到VCC，将AVSS0和VREFLVREFL0引脚分别连接到VSS。

60.2 DC Characteristics

60.2.1 T_j/T_a Definition

Table 60.3 DC characteristics
条件：工作温度(Ta)−40至+105°C的产品

Parameter	Symbol	Typ	Max	Unit	测试条件
允许结温	T_j	-	125	°C	High-speed mode Low-speed mode Subosc-speed mode
			105*1		

Note: 确保Tj=Ta+θja×总功耗(W)，其中总功耗=(VCCVOH)×ΣIOH+VOL×ΣIOL+ICCmax×VCC。
Note 1. 工作温度上限为85°C或105°C，具体取决于产品。有关详细信息，请参阅第1.3节，部分编号。如果部件号显示工作温度为85°C，则Tjmax为105°C，否则为125°C。

60.2.2 I/O V_{IH}, V_{IL}

Table 60.4 I/O V_{IH}, V_{IL}

Parameter				Symbol	Min	Typ	Max	Unit

					V_{IL}	-	-	V_{BATT} × 0.2
					ΔV_T	V_{BATT} × 0.05	-	-
				选择VCC电源时	V_{IH}	VCC × 0.8	-	更高的电压VCC+0.3V或VBATT+0.3V
					V_{IL}	-	-	VCC × 0.2
					ΔV_T	VCC × 0.05	-	-
			不使用备用电池时 Function		V_{IH}	VCC × 0.8	-	VCC + 0.3
					V_{IL}	-	-	VCC × 0.2
					ΔV_T	VCC × 0.05	-	-
		其他输入引脚*4			V_{IH}	VCC × 0.8	-	-
					V_{IL}	-	-	VCC × 0.2
					ΔV_T	VCC × 0.05	-	-
	Ports	5V-tolerant ports*5, *7			V_{IH}	VCC × 0.8	-	VCC + 3.6 (max 5.8)
					V_{IL}	-	-	VCC × 0.2
		其他输入引脚*6			V_{IH}	VCC × 0.8	-	-
					V_{IL}	-	-	VCC × 0.2

Note 1. SCL0_B (P204), SCL1_B, SDA1_B (total 3 pins).
Note 2. SCL0_A, SDA0_A, SCL0_B (P408), SDA0_B, SCL1_A, SDA1_A, SCL2, SDA2 (total 8 pins).
Note 3. RES和与P205、P206、P400、P401、P407至P415、P511、P512、P708至P713、PB01相关的外围功能引脚（共23个引脚）。

Note 4. All input pins except for the peripheral function pins already described in the table.
Note 5. P205, P206, P400, P401, P407 to P415, P511, P512, P708 to P713, PB01 (total 22 pins).
Note 6. All input pins except for the ports already described in the table.
Note 7. When VCC is less than 2.7 V, the input voltage of 5 V-tolerant ports should be less than 3.6 V, otherwise breakdown might occur because the 5 V-tolerant ports are electrically controlled to not violate the breakdown voltage.

60.2.3 I/O I_{OH}, I_{OL}

Table 60.5 I/O I_{OH}, I_{OL}

Parameter			Symbol	Min	Typ	Max	Unit
Permissible output current (average value per pin)	Ports P008 to P010, P201	-	I_{OH}	-	--	-2.0	mA
			I_{OL}	-	-	2.0	mA
	Ports P014, P015	-	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
	Ports P205, P206, P407 to P415, P602, P708 to P713, PB01 (total 19 pins)	Low drive*1	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
		Middle drive*2	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		High drive*3	I_{OH}	-	-	-20	mA
			I_{OL}	-	-	20	mA
	Other output pins*4	Low drive*1	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
		Middle drive*2	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		High drive*3	I_{OH}	-	-	-16	mA
			I_{OL}	-	-	16	mA
Permissible output current (max value per pin)	Ports P008 to P010, P201	-	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
	Ports P014, P015	-	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
	Ports P205, P206, P407 to P415, P602, P708 to P713, PB01 (total 19 pins)	Low drive*1	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		Middle drive*2	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
		High drive*3	I_{OH}	-	-	-40	mA
			I_{OL}	-	-	40	mA
	Other output pins*4	Low drive*1	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		Middle drive*2	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
		High drive*3	I_{OH}	-	-	-32	mA
			I_{OL}	-	-	32	mA
Permissible output current (max value total pins)	Maximum of all output pins		ΣI_{OH} (max)	-	-	-80	mA
			ΣI_{OL} (max)	-	-	80	mA

Caution: To protect the reliability of the MCU, the output current values should not exceed the values in this table. The average output current indicates the average value of current measured during 100 µs.

Note 1. This is the value when low driving ability is selected in the port drive capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 2. This is the value when middle driving ability is selected in the port drive capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 3. This is the value when high driving ability is selected in the port drive capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.

Note 4. 除表中已描述的外围功能引脚外的所有输入引脚。
Note 5. P205, P206, P400, P401, P407 to P415, P511, P512, P708 to P713, PB01 (total 22 pins).
Note 6. 除表中已描述的端口外的所有输入引脚。
Note 7. 当VCC小于2.7V时，耐5V端口的输入电压应小于3.6V，否则可能发生击穿，因为5V耐压端口被电控不超过击穿电压。

60.2.3 我爱我哦

Table 60.5 我爱我哦

Parameter			Symbol	Min	Typ	Max	Unit
允许输出电流（每个引脚的平均值）	端口P008至P010、P201	-	I_{OH}	-	--	-2.0	mA
			I_{OL}	-	-	2.0	mA
	Ports P014, P015	-	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
	端口P205、P206、P407至P415、P602、P708至P713、PB01（共19针）	低驱*1	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
		中驱*2	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		高驱*3	I_{OH}	-	-	-20	mA
			I_{OL}	-	-	20	mA
	其他输出引脚*4	低驱*1	I_{OH}	-	-	-2.0	mA
			I_{OL}	-	-	2.0	mA
		中驱*2	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		高驱*3	I_{OH}	-	-	-16	mA
			I_{OL}	-	-	16	mA
允许输出电流（每个引脚的最大值）	端口P008至P010、P201	-	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
	Ports P014, P015	-	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
	端口P205、P206、P407至P415、P602, P708 to P713, PB01 (total 19 pins)	低驱*1	I_{OH}	-	-	-4.0	mA
			I_{OL}	-	-	4.0	mA
		中驱*2	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
		高驱*3	I_{OH}	-	-	-40	mA
			I_{OL}	-	-	40	mA

			I_{OL}	-	-	4.0	mA
		中驱*2	I_{OH}	-	-	-8.0	mA
			I_{OL}	-	-	8.0	mA
		高驱*3	I_{OH}	-	-	-32	mA
			I_{OL}	-	-	32	mA
允许输出电流（最大总引脚数）	所有输出引脚的最大值		ΣI_{OH} (max)	-	-	-80	mA
			ΣI_{OL} (max)	-	-	80	mA

Caution: 为保护单片机的可靠性，输出电流值不应超过此表中的值。平均输出电流是指在100µs内测得的电流平均值。

Note 1. 这是在PmnPFS寄存器的端口驱动能力位中选择低驱动能力时的值。在深度软件待机模式下会保留所选的驾驶能力。
Note 2. 这是在PmnPFS寄存器的端口驱动能力位中选择中等驱动能力时的值。在深度软件待机模式下会保留所选的驾驶能力。
Note 3. 这是在PmnPFS寄存器的端口驱动能力位中选择高驱动能力时的值。在深度软件待机模式下会保留所选的驾驶能力。

Note 4. Except for P000 to P007, P200, which are input ports.

60.2.4 I/O V_{OH}, V_{OL}, and Other Characteristics

Table 60.6 I/O V_{OH}, V_{OL}, and other characteristics

Parameter			Symbol	Min	Typ	Max	Unit	Test conditions
Output voltage	IIC		V_{OL}	-	-	0.4	V	I_{OL} = 3.0 mA
			V_{OL}	-	-	0.6		I_{OL} = 6.0 mA
	IIC*1		V_{OL}	-	-	0.4		I_{OL} = 15.0 mA (ICFER.FMPE = 1)
			V_{OL}	-	0.4	-		I_{OL} = 20.0 mA (ICFER.FMPE = 1)
	ETHERC		V_{OH}	VCC - 0.5	-	-		I_{OH} = -1.0 mA
			V_{OL}	-	-	0.4		I_{OL} = 1.0 mA
	Ports P205, P206, P407 to P415, P602, P708 to P713, PB01 (total 19 pins)*2		V_{OH}	VCC - 1.0	-	-		I_{OH} = -20 mA VCC = 3.3 V
			V_{OL}	-	-	1.0		I_{OL} = 20 mA VCC = 3.3 V
	Other output pins		V_{OH}	VCC - 0.5	-	-		I_{OH} = -1.0 mA
			V_{OL}	-	-	0.5		I_{OL} = 1.0 mA
Input leakage current	RES		$\|I_{in}\|$	-	-	5.0	μA	V_{in} = 0 V V_{in} = 5.5 V
	Ports P000 to P002, P004 to P006, P200			-	-	1.0		V_{in} = 0 V V_{in} = VCC
	Ports P003, P007	Before initialization*3		-	-	45.0		V_{in} = 0 V V_{in} = VCC
		After initialization*4		-	-	1.0		V_{in} = 0 V V_{in} = VCC
Three-state leakage current (off state)	5V-tolerant ports		$\|I_{TSI}\|$	-	-	5.0	μA	V_{in} = 0 V V_{in} = 5.5 V
	Other ports (except for ports P000 to P007, P200)			-	-	1.0		V_{in} = 0 V V_{in} = VCC
Input pull-up MOS current	Ports P0 to PB (except for ports P000 to P007)		I_p	-300	-	-10	μA	VCC = 2.7 to 3.6 V V_{in} = 0 V
Input capacitance	USB_DP, USB_DM, and ports P003, P007, P014, P015, P400, P401, P511, P512		C_{in}	-	-	16	pF	Vbias = 0V Vamp = 20mV f = 1 MHz T_a = 25°C
	Other input pins			-	-	8		

Note 1. SCL0_A, SDA0_A (total 2 pins).
Note 2. This is the value when high driving ability is selected in the port drive capability bit in the PmnPFS register.
The selected driving ability is retained in Deep Software Standby mode.
Note 3. P0nPFS.ASEL (n = 3 or 7) = 1.
Note 4. P0nPFS.ASEL (n = 3 or 7) = 0.

Note 4. 除了P000至P007、P200为输入端口。

60.2.4 IOVOH VOL和其他特性

Table 60.6 IOVOH、VOL和其他特性

Parameter			Symbol	Min	Typ	Max	Unit	测试条件

	ADC12单元1处于待机模式				-	0.07	0.8	µA	-

Table 60.7 Operating and standby current (2 of 2)

Parameter			Symbol	Min	Typ	Max	Unit	Test conditions
USB operating current	Low speed	USB	$I_{CCUSBLS}$	-	3.5	6.5	mA	VCC_USB
		USBHS		-	10.5	13.5	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 0)
		USBHS		-	2.8	3.6	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 1)
	Full speed	USB	$I_{CCUSBFS}$	-	4.0	10.0	mA	VCC_USB
		USBHS		-	14	22	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 0)
		USBHS		-	6.5	13.0	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 1)
	High speed	USBHS	$I_{CCUSBHS}$	-	50	65	mA	VCC_USBHS = AVCC_USBHS
	Standby mode (direct power down)	USBHS	$I_{CCUSBSBY}$	-	0.5	4.5	µA	VCC_USBHS = AVCC_USBHS

Note 1. Supply current values are with all output pins unloaded and all input pull-up MOS transistors in the off state.
Note 2. Measured with clocks supplied to the peripheral functions. This does not include the BGO operation.
Note 3. ICC depends on f (ICLK) as follows. (ICLK:PCLKA:PCLKB:PCLKC:PCLKD:BCK:EBCLK = 2:2:1:1:2:1:1)
ICC Max. = 0.84 × f + 37 (max. operation in High-speed mode)
ICC Typ. = 0.09 × f + 3.7 (normal operation in High-speed mode)
ICC Typ. = 0.6 × f + 1.8 (Low-speed mode 1)
ICC Max. = 0.08 × f + 37 (Sleep mode).
Note 4. This does not include the BGO operation.
Note 5. Supply of the clock signal to peripherals is stopped in this state. This does not include the BGO operation.
Note 6. FCLK, BCLK, PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (3.75 MHz).
Note 7. When using ETHERC, GLCDC, DRW, and JPEG, PCLKA frequency is such that PCLKA = ICLK.
Note 8. When the MCU is in Software Standby mode or the MSTPCRD.MSTPD16 (ADC120 Module Stop bit) and MSTPCRD.MSTPD15 (ADC121 Module Stop bit) are in the module-stop state. See section 47.6.8, Available Functions and Register Settings of AN000 to AN002, AN007, AN100 to AN102, and AN107.

Table 60.7 工作和待机电流(2of2)

Parameter			Symbol	Min	Typ	Max	Unit	测试条件
USB工作电流	低速	USB	$I_{CCUSBLS}$	-	3.5	6.5	mA	VCC_USB
		USBHS		-	10.5	13.5	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 0)
		USBHS		-	2.8	3.6	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 1)
	全速	USB	$I_{CCUSBFS}$	-	4.0	10.0	mA	VCC_USB
		USBHS		-	14	22	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 0)
		USBHS		-	6.5	13.0	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 1)
	高速	USBHS	$I_{CCUSBHS}$	-	50	65	mA	VCC_USBHS = AVCC_USBHS
	待机模式（直接断电）	USBHS	$I_{CCUSBSBY}$	-	0.5	4.5	µA	VCC_USBHS = AVCC_USBHS

Note 1. 电源电流值是在所有输出引脚空载且所有输入上拉MOS晶体管处于关闭状态的情况下。
Note 2. 使用提供给外围功能的时钟进行测量。这不包括BGO操作。
Note 3. ICC取决于f(ICLK)，如下所示。（ICLK:PCLKA:PCLKB:PCLKC:PCLKD:BCK:EBCLK=2:2:1:1:2:1:1）
ICC最大值=0.84×f+37（高速模式下的最大操作）
ICC典型值。=0.09×f+3.7（高速模式下的正常操作）
ICC Typ. = 0.6 × f + 1.8 (Low-speed mode 1)
ICC Max. = 0.08 × f + 37 (Sleep mode).
Note 4. 这不包括BGO操作。
Note 5. 在该状态下停止向外围设备提供时钟信号。这不包括BGO操作。
Note 6. FCLK、BCLK、PCLKA、PCLKB、PCLKC和PCLKD设置为64分频(3.75MHz)。
Note 7. 当使用ETHERC、GLCDC、DRW和JPEG时，PCLKA频率使得PCLKA=ICLK。
Note 8. 当MCU处于软件待机模式或MSTPCRD.MSTPD16（ADC120模块停止位）和MSTPCRD.MSTPD15（ADC121模块停止位）处于模块停止状态。请参阅第47.6.8节，可用功能和AN000至AN002、AN007、AN100至AN102和AN107的寄存器设置。

60.2.6 VCC Rise and Fall Gradient and Ripple Frequency

Table 60.8 Rise and fall gradient characteristics

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
VCC rising gradient	Voltage monitor 0 reset disabled at startup	SrVCC	0.0084	-	20	ms/V	-
	Voltage monitor 0 reset enabled at startup		0.0084	-	-		-
	SCI/USB boot mode*1		0.0084	-	20		-
VCC falling gradient*2		SfVCC	0.0084	-	-	ms/V	-

Note 1. At boot mode, the reset from voltage monitor 0 is disabled regardless of the value of OFS1.LVDAS bit.
Note 2. This applies when VBATT is used.

Table 60.9 Rise and fall gradient and ripple frequency characteristics
The ripple voltage must meet the allowable ripple frequency $f_{r(VCC)}$ within the range between the VCC upper limit (3.6 V) and lower limit (2.7 V). When the VCC change exceeds VCC ±10%, the allowable voltage change rising and falling gradient dt/dVCC must be met.

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Allowable ripple frequency	$f_{r (VCC)}$	-	-	10	kHz	Figure 60.6 $V_{r (VCC)}$ ≤ VCC × 0.2
		-	-	1	MHz	Figure 60.6 $V_{r (VCC)}$ ≤ VCC × 0.08
		-	-	10	MHz	Figure 60.6 $V_{r (VCC)}$ ≤ VCC × 0.06
Allowable voltage change rising and falling gradient	dt/dVCC	1.0	-	-	ms/V	When VCC change exceeds VCC ±10%

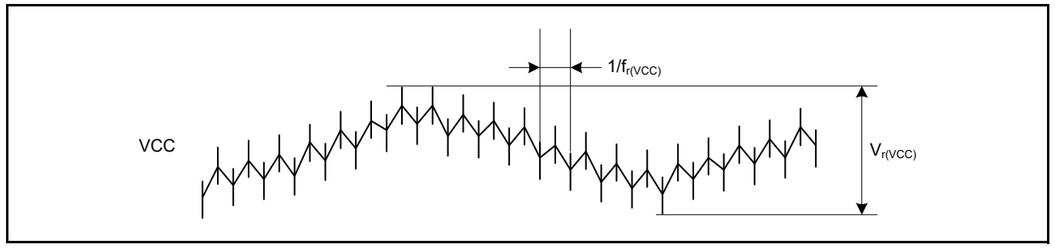

Figure 60.6 Ripple waveform

60.3 AC Characteristics

60.3.1 Frequency

Table 60.10 Operation frequency value in high-speed mode

Parameter			Symbol	Min	Typ	Max	Unit
Operation frequency	System clock (ICLK*2)		f	-	-	120	MHz
	Peripheral module clock (PCLKA)*2			-	-	120	
	Peripheral module clock (PCLKB)*2			-	-	60	
	Peripheral module clock (PCLKC)*2			-*3	-	60	
	Peripheral module clock (PCLKD)*2			-	-	120	
	Flash interface clock (FCLK)*2			-*1	-	60	
	External bus clock (BCLK)*2			-	-	120	
	EBCLK pin output			-	-	60	
	SDCLK pin output	VCC ≥ 3.0 V		-	-	120	

60.2.6 VCC上升和下降梯度和纹波频率

Table 60.8 上升和下降梯度特性

Parameter		Symbol	Min	Typ	Max	Unit	测试条件
VCC上升梯度	启动时禁用电压监视器0复位	SrVCC	0.0084	-	20	ms/V	-
	启动时启用电压监视器0复位		0.0084	-	-		-
	SCI/USB boot mode*1		0.0084	-	20		-
VCC falling gradient*2		SfVCC	0.0084	-	-	ms/V	-

Note 1. 在引导模式下，无论OFS1.LVDAS位的值如何，电压监视器0的复位均被禁用。
Note 2. 这适用于使用VBATT时。

Table 60.9 升降梯度和纹波频率特性
纹波电压必须在VCC上限(3.6V)和下限(2.7V)之间的范围内满足允许的纹波频率fr(VCC)。当VCC变化超过VCC±10%时，必须满足允许的电压变化上升和下降梯度dtdVCC。

Parameter	Symbol	Min	Typ	Max	Unit	测试条件
允许纹波频率	$f_{r (VCC)}$	-	-	10	kHz	Figure 60.6 $V_{r (VCC)}$ ≤ VCC × 0.2
		-	-	1	MHz	Figure 60.6 $V_{r (VCC)}$ ≤ VCC × 0.08
		-	-	10	MHz	Figure 60.6 $V_{r (VCC)}$ ≤ VCC × 0.06
允许电压变化上升下降梯度	dt/dVCC	1.0	-	-	ms/V	当VCC变化超过VCC±10%

60.3 交流特性

60.3.1 Frequency

Table 60.10 高速模式下的运行频率值

Parameter			Symbol	Min	Typ	Max	Unit
运行频率	系统时钟(ICLK*2)		f	-	-	120	MHz
	外设模块时钟(PCLKA)*2			-	-	120	
	外设模块时钟(PCLKB)*2			-	-	60	
	外设模块时钟(PCLKC)*2			-*3	-	60	
	外设模块时钟(PCLKD)*2			-	-	120	
	闪存接口时钟(FCLK)*2			-*1	-	60	
	外部总线时钟(BCLK)*2			-	-	120	
	EBCLK引脚输出			-	-	60	
	SDCLK 引脚输出	VCC ≥ 3.0 V		-	-	120	

Note 1. FCLK must run at a frequency of at least 4 MHz when programming or erasing the flash memory.
Note 2. See section 9, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, and BCLK frequencies.
Note 3. When the ADC12 is used, the PCLKC frequency must be at least 1 MHz.

Table 60.11 Operation frequency value in low-speed mode

Parameter		Symbol	Min	Typ	Max	Unit
Operation frequency	System clock (ICLK)*2	f	-	-	1	MHz
	Peripheral module clock (PCLKA)*2		-	-	1	
	Peripheral module clock (PCLKB)*2		-	-	1	
	Peripheral module clock (PCLKC)*2,*3		-*3	-	1	
	Peripheral module clock (PCLKD)*2		-	-	1	
	Flash interface clock (FCLK)*1, *2		-	-	1	
	External bus clock (BCLK)		-	-	1	
	EBCLK pin output		-	-	1	

Note 1. Programming or erasing the flash memory is disabled in low-speed mode.
Note 2. See section 9, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, and BCLK frequencies.
Note 3. When the ADC12 is used, the PCLKC frequency must be set to at least 1 MHz.

Table 60.12 Operation frequency value in Subosc-speed mode

Parameter		Symbol	Min	Typ	Max	Unit
Operation frequency	System clock (ICLK)*2	f	27.8	-	37.7	kHz
	Peripheral module clock (PCLKA)*2		-	-	37.7	
	Peripheral module clock (PCLKB)*2		-	-	37.7	
	Peripheral module clock (PCLKC)*2,*3		-	-	37.7	
	Peripheral module clock (PCLKD)*2		-	-	37.7	
	Flash interface clock (FCLK)*1, *2		27.8	-	37.7	
	External bus clock (BCLK)*2		-	-	37.7	
	EBCLK pin output		-	-	37.7	

Note 1. Programming or erasing the flash memory is disable in Subosc-speed mode.
Note 2. See section 9, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, and BCLK frequencies.
Note 3. The ADC12 cannot be used.

60.3.2 Clock Timing

Table 60.13 Clock timing except for sub-clock oscillator (1 of 2)

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
EBCLK pin output cycle time	t_{Bcyc}	16.6	-	-	ns	Figure 60.7
EBCLK pin output high pulse width	t_{CH}	3.3	-	-	ns	
EBCLK pin output low pulse width	t_{CL}	3.3	-	-	ns	
EBCLK pin output rise time	t_{Cr}	-	-	5.0	ns	
EBCLK pin output fall time	t_{Cf}	-	-	5.0	ns	
SDCLK pin output cycle time	t_{SDcyc}	8.33	-	-	ns	
SDCLK pin output high pulse width	t_{CH}	1.0	-	-	ns	
SDCLK pin output low pulse width	t_{CL}	1.0	-	-	ns	
SDCLK pin output rise time	t_{Cr}	-	-	3.0	ns	
SDCLK pin output fall time	t_{Cf}	-	-	3.0	ns	

Note 1. 在对闪存进行编程或擦除时，FCLK必须以至少4MHz的频率运行。
Note 2. 有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD、FCLK和BCLK frequencies.
Note 3. 使用ADC12时，PCLKC频率必须至少为1MHz。

Table 60.11 低速模式下的运行频率值

Parameter		Symbol	Min	Typ	Max	Unit
运行频率	系统时钟(ICLK)*2	f	-	-	1	MHz
	外设模块时钟(PCLKA)*2		-	-	1	
	外设模块时钟(PCLKB)*2		-	-	1	
	外设模块时钟(PCLKC)*2 *3		-*3	-	1	
	外设模块时钟(PCLKD)*2		-	-	1	
	Flash接口时钟(FCLK)*1 *2		-	-	1	
	外部总线时钟(BCLK)		-	-	1	
	EBCLK引脚输出		-	-	1	

Note 1. 在低速模式下禁止对闪存进行编程或擦除。
Note 2. 有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD、FCLK和BCLK frequencies.
Note 3. 使用ADC12时，PCLKC频率必须设置为至少1MHz。

Table 60.12 Subosc-speed模式下的运行频率值

Parameter		Symbol	Min	Typ	Max	Unit
运行频率	系统时钟(ICLK)*2	f	27.8	-	37.7	kHz
	外设模块时钟(PCLKA)*2		-	-	37.7	
	外设模块时钟(PCLKB)*2		-	-	37.7	
	外设模块时钟(PCLKC)*2 *3		-	-	37.7	
	外设模块时钟(PCLKD)*2		-	-	37.7	
	Flash接口时钟(FCLK)*1 *2		27.8	-	37.7	
	外部总线时钟(BCLK)*2		-	-	37.7	
	EBCLK引脚输出		-	-	37.7	

Note 1. 在Subosc速度模式下，禁止对闪存进行编程或擦除。
Note 2. 有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD、FCLK和BCLK frequencies.
Note 3. ADC12不能使用。

60.3.2 时钟时序

Table 60.13 除副时钟振荡器外的时钟时序（2个中的1个）

Parameter	Symbol	Min	Typ	Max	Unit	测试条件
EBCLK引脚输出周期时间	t_{Bcyc}	16.6	-	-	ns	Figure 60.7
EBCLK引脚输出高脉冲宽度	t_{CH}	3.3	-	-	ns	
EBCLK引脚输出低脉冲宽度	t_{CL}	3.3	-	-	ns	
EBCLK引脚输出上升时间	t_{Cr}	-	-	5.0	ns	
EBCLK引脚输出下降时间	t_{Cf}	-	-	5.0	ns	
SDCLK 引脚输出周期时间	t_{SDcyc}	8.33	-	-	ns	
SDCLK 引脚输出高脉冲宽度	t_{CH}	1.0	-	-	ns	
SDCLK 引脚输出低脉冲宽度	t_{CL}	1.0	-	-	ns	
SDCLK 引脚输出上升时间	t_{Cr}	-	-	3.0	ns	
SDCLK 引脚输出下降时间	t_{Cf}	-	-	3.0	ns	

Table 60.13 Clock timing except for sub-clock oscillator (2 of 2)

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
EXTAL external clock input cycle time		t_{EXcyc}	41.66	-	-	ns	Figure 60.8
EXTAL external clock input high pulse width		t_{EXH}	15.83	-	-	ns	
EXTAL external clock input low pulse width		t_{EXL}	15.83	-	-	ns	
EXTAL external clock rise time		t_{EXr}	-	-	5.0	ns	
EXTAL external clock fall time		t_{EXf}	-	-	5.0	ns	
Main clock oscillator frequency		f_{MAIN}	8	-	24	MHz	-
Main clock oscillation stabilization wait time (crystal) *1		$t_{MAINOSCWT}$	-	-	-*1	ms	Figure 60.9
LOCO clock oscillation frequency		f_{LOCO}	27.8528	32.768	37.6832	kHz	-
LOCO clock oscillation stabilization wait time		t_{LOCOWT}	-	-	60.4	µs	Figure 60.10
ILOCO clock oscillation frequency		f_{ILOCO}	12.75	15	17.25	kHz	-
MOCO clock oscillation frequency		F_{MOCO}	6.8	8	9.2	MHz	-
MOCO clock oscillation stabilization wait time		t_{MOCOWT}	-	-	15.0	µs	-
HOCO clock oscillator oscillation frequency	Without FLL	f_{HOCO16}	15.78	16	16.22	MHz	-20 ≤ Ta ≤ 105°C
		f_{HOCO18}	17.75	18	18.25		
		f_{HOCO20}	19.72	20	20.28		
		f_{HOCO16}	15.71	16	16.29		-40 ≤ Ta ≤ -20°C
		f_{HOCO18}	17.68	18	18.32		
		f_{HOCO20}	19.64	20	20.36		
	With FLL	f_{HOCO16}	15.955	16	16.045		-40 ≤ Ta ≤ 105°C Sub-clock frequency accuracy is ±50 ppm.
		f_{HOCO18}	17.949	18	18.051		
		f_{HOCO20}	19.944	20	20.056		
HOCO clock oscillation stabilization wait time*2		t_{HOCOWT}	-	-	64.7	µs	-
FLL stabilization wait time		t_{FLLWT}	-	-	1.8	ms	-
PLL clock frequency		f_{PLL}	120	-	240	MHz	-
PLL clock oscillation stabilization wait time		t_{PLLWT}	-	-	174.9	µs	Figure 60.11

Note 1. When setting up the main clock oscillator, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time. Set the MOSCWTCR register to a value equal to or greater than the recommended value.
After changing the setting in the MOSCCR.MOSTP bit to start main clock operation, read the OSCSF.MOSCSF flag to confirm that it is 1, and then start using the main clock oscillator.

Note 2. This is the time from release from reset state until the HOCO oscillation frequency (fHOCO) reaches the range for guaranteed operation.

Table 60.14 Clock timing for the sub-clock oscillator

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Sub-clock frequency	f_{SUB}	-	32.768	-	kHz	-
Sub-clock oscillation stabilization wait time	$t_{SUBOSCWT}$	-	-	*1	s	Figure 60.12

Note 1. When setting up the sub-clock oscillator, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time.
After changing the setting in the SOSCCR.SOSTP bit to start sub-clock operation, only start using the sub-clock oscillator after the sub-clock oscillation stabilization time elapses with an adequate margin. Two times the value shown is recommended.

Table 60.13 除副时钟振荡器外的时钟时序(2of2)

Parameter		Symbol	Min	Typ	Max	Unit	测试条件
EXTAL外部时钟输入周期时间		t_{EXcyc}	41.66	-	-	ns	Figure 60.8
EXTAL外部时钟输入高脉冲宽度		t_{EXH}	15.83	-	-	ns	
EXTAL外部时钟输入低脉冲宽度		t_{EXL}	15.83	-	-	ns	
EXTAL外部时钟上升时间		t_{EXr}	-	-	5.0	ns	
EXTAL外部时钟下降时间		t_{EXf}	-	-	5.0	ns	
主时钟振荡器频率		f_{MAIN}	8	-	24	MHz	-
主时钟振荡稳定等待时间（晶振）*1		$t_{MAINOSCWT}$	-	-	-*1	ms	Figure 60.9
LOCO时钟振荡频率		f_{LOCO}	27.8528	32.768	37.6832	kHz	-
LOCO时钟振荡稳定等待时间		t_{LOCOWT}	-	-	60.4	µs	Figure 60.10
ILOCO时钟振荡频率		f_{ILOCO}	12.75	15	17.25	kHz	-
MOCO时钟振荡频率		F_{MOCO}	6.8	8	9.2	MHz	-
MOCO时钟振荡稳定等待时间		t_{MOCOWT}	-	-	15.0	µs	-
HOCO时钟振荡器振荡频率	Without FLL	f_{HOCO16}	15.78	16	16.22	MHz	-20 ≤ Ta ≤ 105°C
		f_{HOCO18}	17.75	18	18.25		
		f_{HOCO20}	19.72	20	20.28		
		f_{HOCO16}	15.71	16	16.29		-40 ≤ Ta ≤ -20°C
		f_{HOCO18}	17.68	18	18.32		
		f_{HOCO20}	19.64	20	20.36		
	With FLL	f_{HOCO16}	15.955	16	16.045		−40≤Ta≤105°C副时钟频率精度为±50ppm。
		f_{HOCO18}	17.949	18	18.051		
		f_{HOCO20}	19.944	20	20.056		
HOCO时钟振荡稳定等待时间*2		t_{HOCOWT}	-	-	64.7	µs	-
FLL稳定等待时间		t_{FLLWT}	-	-	1.8	ms	-
锁相环时钟频率		f_{PLL}	120	-	240	MHz	-
PLL时钟振荡稳定等待时间		t_{PLLWT}	-	-	174.9	µs	Figure 60.11

Note 1. 设置主时钟振荡器时，请向振荡器制造商索取振荡评估，并将结果作为推荐的振荡稳定时间。将MOSCWTCR寄存器设置为等于或大于推荐值的值。更改MOSCCR.MOSTP位的设置以启动主时钟操作后，读取OSCSF.MOSCSF标志以确认其为1，然后开始使用主时钟振荡器。

Note 2. 这是从复位状态释放到HOCO振荡频率(fHOCO)达到保证工作范围的时间。

Table 60.14 副时钟振荡器的时钟时序

Parameter	Symbol	Min	Typ	Max	Unit	测试条件
Sub-clock frequency	f_{SUB}	-	32.768	-	kHz	-
副时钟振荡稳定等待时间	$t_{SUBOSCWT}$	-	-	*1	s	Figure 60.12

Note 1. 设置副时钟振荡器时，请向振荡器制造商索取振荡评估，并将结果作为推荐的振荡稳定时间。更改SOSCCR.SOSTP位的设置以启动副时钟操作后，只有在副时钟振荡稳定时间过去并留有足够余量后才开始使用副时钟振荡器。建议使用显示值的两倍。

取消深度软件待机模式后的等待时间			t_{DSBYWT}	34	-	35	t_{cyc}	
从软件待机模式恢复到	系统时钟源为HOCO(20MHz)时的高速模式		t_{SNZ}	-	35*9, *10	71 *9, *10	µs	Figure 60.17
贪睡模式	系统时钟源为MOCO(8MHz)时的高速模式		t_{SNZ}	-	11*9	14*9	µs	

Note 1. The recovery time is determined by the system clock source. When multiple oscillators are active, the recovery time can be determined with the following equation:
Total recovery time = recovery time for an oscillator as the system clock source + the longest oscillation stabilization time of any oscillators requiring longer stabilization times than the system clock source + 2 LOCO cycles (when LOCO is operating) + 3 SOSC cycles (when Subosc is oscillating and MSTPC0 = 0 (CAC module stop)).

Note 2. When the frequency of the crystal is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 05h). For other settings (MOSCWTCR is set to Xh), the recovery time can be determined with the following equation:
t_{SBYMC} (MOSCWTCR = Xh) = t_{SBYMC} (MOSCWTCR = 05h) + ($t_{MAINOSCWT}$ (MOSCWTCR = Xh) - $t_{MAINOSCWT}$ (MOSCWTCR = 05h))

Note 3. When the frequency of PLL is 240 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 05h). For other settings (MOSCWTCR is set to Xh), the recovery time can be determined with the following equation:
t_{SBYMC} (MOSCWTCR = Xh) = t_{SBYMC} (MOSCWTCR = 05h) + ($t_{MAINOSCWT}$ (MOSCWTCR = Xh) - $t_{MAINOSCWT}$ (MOSCWTCR = 05h))

Note 4. When the frequency of the external clock is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 01h). For other settings (MOSCWTCR is set to Xh), the recovery time can be determined with the following equation:
t_{SBYMC} (MOSCWTCR = Xh) = t_{SBYMC} (MOSCWTCR = 01h) + ($t_{MAINOSCWT}$ (MOSCWTCR = Xh) - $t_{MAINOSCWT}$ (MOSCWTCR = 01h))

Note 5. When the frequency of PLL is 240 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 01h). For other settings (MOSCWTCR is set to Xh), the recovery time can be determined with the following equation:
t_{SBYMC} (MOSCWTCR = Xh) = t_{SBYMC} (MOSCWTCR = 01h) + ($t_{MAINOSCWT}$ (MOSCWTCR = Xh) - $t_{MAINOSCWT}$ (MOSCWTCR = 01h))

Note 6. The HOCO frequency is 20 MHz.

Note 7. The MOCO frequency is 8 MHz.

Note 8. In Subosc-speed mode, the sub-clock oscillator or LOCO continues oscillating in Software Standby mode.

Note 9. When the SNZCR.RXDREQEN bit is set to 0, the following time is added as the power supply recovery time:
STCONR.STCON[1:0] = 00b:16 µs (typical), 34 µs (maximum)
STCONR.STCON[1:0] = 11b:16 µs (typical), 104 µs (maximum).

Note 10. When the SNZCR.RXDREQEN bit is set to 0, 16 µs (typical) or 18 µs (maximum) is added as the HOCO wait time.

Note 1. 恢复时间由系统时钟源决定。当多个振荡器处于活动状态时，恢复时间可以通过以下公式确定：总恢复时间=振荡器作为系统时钟源的恢复时间+任何需要比系统时钟源更长稳定时间的振荡器的最长振荡稳定时间+2个LOCO周期（当LOCO运行时）+3个SOSC周期（当Subosc正在振荡且MSTPC0=0（CAC模块停止）时）。

Note 2. 当晶振频率为24MHz时（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为05h）。对于其他设置（MOSCWTCR设置为Xh），可以使用以下公式确定恢复时间：tSBYMC(MOSCWTCR=Xh)=tSBYMC(MOSCWTCR=05h)+(tMAINOSCWT(MOSCWTCR=Xh)tMAINOSCWT(MOSCWTCR=05h))

Note 3. 当PLL的频率为240MHz时（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为05h）。对于其他设置（MOSCWTCR设置为Xh），可以使用以下公式确定恢复时间：tSBYMC(MOSCWTCR=Xh)=tSBYMC(MOSCWTCR=05h)+(tMAINOSCWT(MOSCWTCR=Xh)tMAINOSCWT(MOSCWTCR=05h))

Note 4. 当外部时钟频率为24MHz时（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为01h）。对于其他设置（MOSCWTCR设置为Xh），可以使用以下公式确定恢复时间：tSBYMC(MOSCWTCR=Xh)=tSBYMC(MOSCWTCR=01h)+(tMAINOSCWT(MOSCWTCR=Xh)tMAINOSCWT(MOSCWTCR=01h))

Note 5. 当PLL的频率为240MHz时（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为01h）。对于其他设置（MOSCWTCR设置为Xh），可以使用以下公式确定恢复时间：tSBYMC(MOSCWTCR=Xh)=tSBYMC(MOSCWTCR=01h)+(tMAINOSCWT(MOSCWTCR=Xh)tMAINOSCWT(MOSCWTCR=01h))

Note 6. HOCO频率为20MHz。

Note 7. MOCO频率为8MHz。

Note 8. 在Subosc速度模式下，副时钟振荡器或LOCO在软件待机模式下继续振荡。

Note 9. 当SNZCR.RXDREQEN位设置为0时，添加以下时间作为电源恢复时间：
STCONR.STCON[1:0] = 00b:16 µs (typical), 34 µs (maximum)
STCONR.STCON[1:0] = 11b:16 µs (typical), 104 µs (maximum).

注10.当SNZCR.RXDREQEN位设置为0时，添加16µs（典型值）或18µs（最大值）作为HOCO等待时间。

60.3.6 Bus Timing

Table 60.18 Bus timing (1 of 2)
Condition 1: When using the CS area controller (CSC).
BCLK = 8 to 120 MHz, EBCLK = 8 to 60 MHz
VCC = AVCC0 = VCC_USB = VBATT = 2.7 to 3.6 V, VREFH/VREFH0 = 2.7 V to AVCC0,
VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 30 pF
EBCLK: High drive output is selected in the port drive capability bit in the PmnPFS register.
Others: Middle drive output is selected in the port drive capability bit in the PmnPFS register.

Condition 2: When using the SDRAM area controller (SDRAMC).
BCLK = SDCLK = 8 to 120 MHz
VCC = AVCC0 = VCC_USB = VBATT = 3.0 to 3.6 V, VREFH/VREFH0 = 3.0 V to AVCC0,
VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 15 pF
High drive output is selected in the port drive capability bit in the PmnPFS register.

Condition 3: When using the SDRAM area controller (SDRAMC) and CS area controller (CSC) simultaneously.
BCLK = SDCLK = 8 to 60 MHz
VCC = AVCC0 = VCC_USB = VBATT = 3.0 to 3.6 V, VREFH/VREFH0 = 3.0 V to AVCC0,
VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
Output load conditions: VOH = VCC × 0.5, VOL = VCC × 0.5, C = 15 pF
High drive output is selected in the port drive capability bit in the PmnPFS register.

Parameter	Symbol	Min	Max	Unit	Test conditions
Address delay	t_{AD}	-	12.5	ns	Figure 60.20 to Figure 60.25
Byte control delay	t_{BCD}	-	12.5	ns	
CS delay	t_{CSD}	-	12.5	ns	
ALE delay time	t_{ALED}	-	12.5	ns	
RD delay	t_{RSD}	-	12.5	ns	
Read data setup time	t_{RDS}	12.5	-	ns	
Read data hold time	t_{RDH}	0	-	ns	
WR/WRn delay	t_{WRD}	-	12.5	ns	
Write data delay	t_{WDD}	-	12.5	ns	
Write data hold time	t_{WDH}	0	-	ns	
WAIT setup time	t_{WTS}	12.5	-	ns	Figure 60.26
WAIT hold time	t_{WTH}	0	-	ns	

Note 1. tPcyc表示PCLKB周期。
Note 2. tNMICK表示NMI数字滤波器采样时钟的周期。
Note 3. tIRQCK表示IRQi数字滤波器采样时钟的周期。

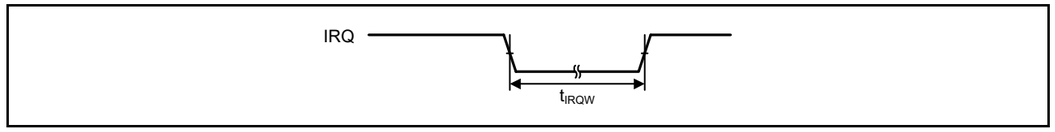

Figure 60.19 IRQ中断输入时序

60.3.6 巴士时间

Table 60.18 巴士计时（1of2）
条件1：使用CS区域控制器(CSC)时。
BCLK = 8 to 120 MHz, EBCLK = 8 to 60 MHz
VCC = AVCC0 = VCC_USB = VBATT = 2.7 to 3.6 V, VREFH/VREFH0 = 2.7 V to AVCC0,
VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
输出负载条件：VOH=VCC×0.5，VOL=VCC×0.5，C=30pF
EBCLK：在PmnPFS寄存器的端口驱动能力位中选择高驱动输出。其他：中间驱动输出在PmnPFS寄存器的端口驱动能力位中选择。

条件2：使用SDRAM区域控制器(SDRAMC)时。
BCLK = SDCLK = 8 to 120 MHz
VCC = AVCC0 = VCC_USB = VBATT = 3.0 to 3.6 V, VREFH/VREFH0 = 3.0 V to AVCC0,
VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
输出负载条件：VOH=VCC×0.5，VOL=VCC×0.5，C=15pF
在PmnPFS寄存器的端口驱动能力位中选择高驱动输出。

条件3：同时使用SDRAM区域控制器(SDRAMC)和CS区域控制器(CSC)时。
BCLK = SDCLK = 8 to 60 MHz
VCC = AVCC0 = VCC_USB = VBATT = 3.0 to 3.6 V, VREFH/VREFH0 = 3.0 V to AVCC0,
VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
输出负载条件：VOH=VCC×0.5，VOL=VCC×0.5，C=15pF
在PmnPFS寄存器的端口驱动能力位中选择高驱动输出。

		High drive buffer		-	6		
	OPS output skew GTOUUP, GTOULO, GTOVUP, GTOVLO, GTOWUP, GTOWLO		t_{GTOSK}	-	5	ns	Figure 60.38
GPT(PWM Delay Generation Circuit)	GTIOCxY_Z output skew (x = 0 to 3, Y = A or B, Z = A)		t_{HRSK}*2	-	2.0	ns	Figure 60.39
AGT	AGTIO, AGTEE input cycle		t_{ACYC}*3	100	-	ns	Figure 60.40
	AGTIO, AGTEE input high width, low width		t_{ACKWH}, t_{ACKWL}	40	-	ns	
	AGTIO, AGTO, AGTOA, AGTOB output cycle		t_{ACYC2}	62.5	-	ns	
ADC12	ADC12 trigger input pulse width		t_{TRGW}	1.5	-	t_{Pcyc}	Figure 60.41
KINT	KRn (n = 00 to 07) pulse width		t_{KR}	250	-	ns	Figure 60.42

Note: t_{Pcyc}: PCLKB cycle, t_{PDcyc}: PCLKD cycle.
Note 1. This skew applies when the same driver I/O is used. If the I/O of the middle and high drivers is mixed, operation is not guaranteed.
Note 2. The load is 30 pF.
Note 3. Constraints on input cycle:
When not switching the source clock: $t_{Pcyc} \times 2 < t_{ACYC}$ should be satisfied.
When switching the source clock: $t_{Pcyc} \times 6 < t_{ACYC}$ should be satisfied.

Parameter	Min	Typ	Max	Unit	Test conditions
A/D internal reference voltage	1.13	1.18	1.23	V	-
Sampling time	4.15	-	-	µs	-

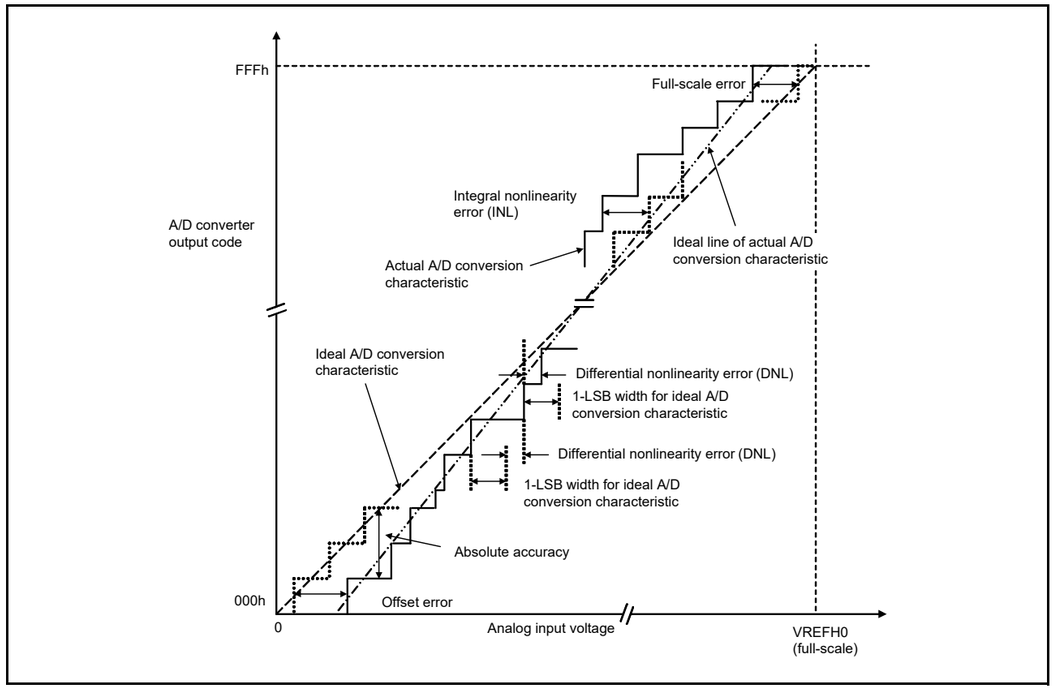

Figure 60.95 Illustration of ADC12 characteristic terms

Absolute accuracy

Absolute accuracy is the difference between output code based on the theoretical A/D conversion characteristics, and the actual A/D conversion result. When measuring absolute accuracy, the voltage at the midpoint of the width of the analog input voltage (1-LSB width), which can meet the expectation of outputting an equal code based on the theoretical A/D conversion characteristics, is used as an analog input voltage. For example, if 12-bit resolution is used and the reference voltage VREFH0 = 3.072 V, then 1-LSB width becomes 0.75 mV, and 0 mV, 0.75 mV, and 1.5 mV are used as the analog input voltages. If the analog input voltage is 6 mV, an absolute accuracy of ±5 LSB means that the actual A/D conversion result is in the range of 003h to 00Dh, though an output code of 008h can be expected from the theoretical A/D conversion characteristics.

Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal line when the measured offset and full-scale errors are zeroed, and the actual output code.

Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between the 1-LSB width based on the ideal A/D conversion characteristics and the width of the actual output code.

Note: 在unit0和unit1中同时使用通道专用采样保持电路时，建议将ADSHMSR.SHMD位设置为1。

Table 60.43 AD内部参考电压特性

Parameter	Min	Typ	Max	Unit	测试条件
AD内部参考电压	1.13	1.18	1.23	V	-
采样时间	4.15	-	-	µs	-

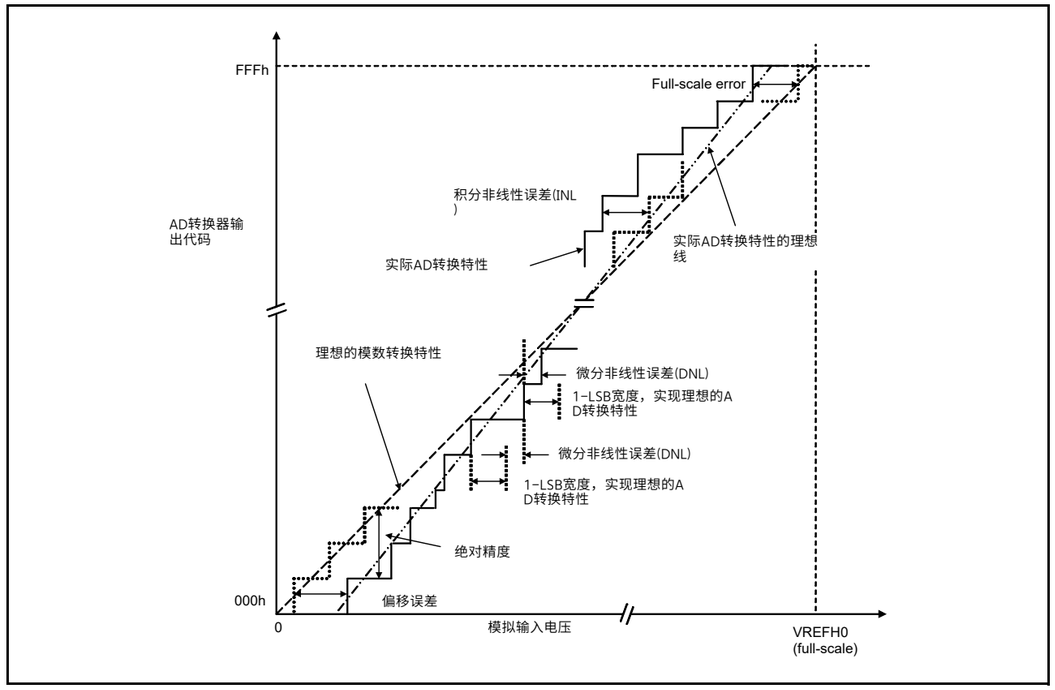

Figure 60.95 ADC12特征项说明

绝对精度

绝对精度是基于理论AD转换特性的输出代码与实际AD转换结果之间的差异。测量绝对精度时，将模拟输入电压宽度（1-LSB宽度）的中点电压作为模拟输入电压，该电压可以满足基于理论模数转换特性输出等码的预期.例如，如果使用12位分辨率并且参考电压VREFH0=3.072V，则1-LSB宽度变为0.75mV，并且使用0mV、0.75mV和1.5mV作为模拟输入电压。如果模拟输入电压为6mV，±5LSB的绝对精度意味着实际的AD转换结果在003h到00Dh的范围内，尽管从理论上的AD转换特性可以预期输出码为008h。

积分非线性误差(INL)

积分非线性误差是测量的偏移和满量程误差为零时的理想线与实际输出代码之间的最大偏差。

微分非线性误差(DNL)

微分非线性误差是基于理想AD转换特性的1-LSB宽度与实际输出码的宽度之差。

Offset error

Offset error is the difference between the transition point of the ideal first output code and the actual first output code.

Full-scale error

Full-scale error is the difference between the transition point of the ideal last output code and the actual last output code.

	32-KB	t_{E32K}	-	283	864	-	157	480	ms	
Erasure time $N_{PEC} > 100$ times	8-KB	t_{E8K}	-	94	260	-	52	144	ms	
	32-KB	t_{E32K}	-	341	1040	-	189	576	ms	
Reprogramming/erasure cycle*Note:		N_{PEC}	10000*1	-	-	10000*1	-	-	Times	
Suspend delay during programming		t_{SPD}	-	-	264	-	-	120	µs	
First suspend delay during erasure in suspend priority mode		t_{SESD1}	-	-	216	-	-	120	µs	
Second suspend delay during erasure in suspend priority mode		t_{SESD2}	-	-	1.7	-	-	1.7	ms	
Suspend delay during erasure in erasure priority mode		t_{SEED}	-	-	1.7	-	-	1.7	ms	
Forced stop command		t_{FD}	-	-	32	-	-	20	µs	
Data hold time*2		t_{DRP}	10*2, *3	-	-	10*2, *3	-	-	Years	
			30*2, *3	-	-	30*2, *3	-	-		Ta = +85°C

Note: The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 10,000), erasing can be performed n times for each block. For example, when 128-byte programming is performed 64 times for different addresses in 8-KB blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address several times as one erasure is not enabled. (Overwriting is prohibited.)
Note 1. This is the minimum number of times to guarantee all the characteristics after reprogramming. The guaranteed range is from 1 to the minimum value.
Note 2. This indicates the minimum value of the characteristic when reprogramming is performed within the specified range.
Note 3. This result is obtained from reliability testing.

Table 1.1 Port states in each processing state (6 of 6)

Port name	Reset	Software Standby mode		Deep Software Standby mode	After Deep Software Standby mode is canceled (return to startup mode)	
		OPE = 0	OPE = 1		IOKEEP = 0	IOKEEP = 1*1
P908/CS7	Hi-Z	[CS7 output] Hi-Z [All other] Keep-O	[CS7 output] H [All other] Keep-O	Keep	Hi-Z	Keep
PA00, PA01	Hi-Z	Keep-O		Keep	Hi-Z	Keep
PA08 to PA10	Hi-Z	Keep-O		Keep	Hi-Z	Keep
PB00	Hi-Z	Keep-O		Keep	Hi-Z	Keep
PB01/USBHS_VBUS	Hi-Z	Keep-O*2		Keep-O*3	Hi-Z	Keep
USB_DP	Hi-Z	Keep-O*4		Hi-Z*3	Hi-Z	
USB_DM	Hi-Z	Keep-O*4		Hi-Z*3	Hi-Z	
USBHS_DP	Hi-Z	Keep-O*4		Hi-Z*5	Hi-Z	
USBHS_DM	Hi-Z	Keep-O*4		Hi-Z*5	Hi-Z	

H: High-level
L: Low-level
Hi-Z: High-impedance
Keep-O: Output pins retain their previous values. Input pins go to high-impedance.
Keep: Pin states are retained during periods in Software Standby mode.

Note 1. Retains the I/O port state until the DPSBYCR.IOKEEP bit is cleared to 0.
Note 2. Input is enabled if the pin is specified as the Software Standby canceling source while it is used as an external interrupt pin.
Note 3. Input is enabled if the pin is specified as the Deep Software Standby canceling source.
Note 4. Input is enabled while the pin is used as an input pin.
Note 5. For host operation, set the USBHS.SYSCFG.DRPD bit to 1 to enable the USBHS_DP and USBHS_DM pull-down resistors.
For device operation, set the USBHS.SYSCFG.DPRPU bit to 1 to enable the DP pull-up resistor.

Table 1.1 每个处理状态中的端口状态（6个中的6个）

端口名称	Reset	软件待机模式		深度软件待机模式	取消深度软件待机模式后（返回启动模式）	
		OPE = 0	OPE = 1		IOKEEP = 0	IOKEEP = 1*1
P908/CS7	Hi-Z	[CS7 output] Hi-Z [All other] Keep-O	[CS7 output] H [All other] Keep-O	Keep	Hi-Z	Keep
PA00, PA01	Hi-Z	Keep-O		Keep	Hi-Z	Keep
PA08 to PA10	Hi-Z	Keep-O		Keep	Hi-Z	Keep
PB00	Hi-Z	Keep-O		Keep	Hi-Z	Keep
PB01/USBHS_VBUS	Hi-Z	Keep-O*2		Keep-O*3	Hi-Z	Keep
USB_DP	Hi-Z	Keep-O*4		Hi-Z*3	Hi-Z	
USB_DM	Hi-Z	Keep-O*4		Hi-Z*3	Hi-Z	
USBHS_DP	Hi-Z	Keep-O*4		Hi-Z*5	Hi-Z	
USBHS_DM	Hi-Z	Keep-O*4		Hi-Z*5	Hi-Z	

H: High-level
L: Low-level
Hi-Z: High-impedance
Keep-O：输出引脚保留其先前的值。输入引脚变为高阻抗。
保持：在软件待机模式期间保持引脚状态。

Note 1. 保持IO端口状态，直到DPSBYCR.IOKEEP位被清除为0。
Note 2. 如果引脚被指定为软件待机取消源，同时它被用作外部中断引脚，则输入被启用。
Note 3. 如果将引脚指定为深度软件待机取消源，则启用输入。
Note 4. 当引脚用作输入引脚时，输入被启用。
Note 5. 对于主机操作，将USBHS.SYSCFG.DRPD位设置为1以启用USBHS_DP和USBHS_DM下拉电阻。
对于设备操作，将USBHS.SYSCFG.DPRPU位设置为1以启用DP上拉电阻。

Appendix 3. I/O Registers

This appendix describes I/O register addresses, access cycles, and reset values by function.

3.1 Peripheral Base Addresses

This section provides the base addresses for peripherals described in this manual.

Table 3.1 shows the name, description, and the base address of each peripheral.

Table 3.1 Peripheral base address (1 of 3)

Name	Description	Base address
MMPU	Bus Master MPU	0x40000000
SMPU	Bus Slave MPU	0x40000C00
SPMON	CPU Stack Pointer Monitor	0x40000D00
MMF	Memory Mirror Function	0x40001000
SRAM	SRAM Control	0x40002000
BUS	Bus Control	0x40003000
DMAC0	Direct Memory Access Controller 0	0x40005000
DMAC1	Direct Memory Access Controller 1	0x40005040
DMAC2	Direct Memory Access Controller 2	0x40005080
DMAC3	Direct Memory Access Controller 3	0x400050C0
DMAC4	Direct Memory Access Controller 4	0x40005100
DMAC5	Direct Memory Access Controller 5	0x40005140
DMAC6	Direct Memory Access Controller 6	0x40005180
DMAC7	Direct Memory Access Controller 7	0x400051C0
DMA	DMAC Module Activation	0x40005200
DTC	Data Transfer Controller	0x40005400
ICU	Interrupt Controller	0x40006000
DBG	Debug Function	0x4001B000
FCACHE	Flash Cache	0x4001C000
SYSTEM	System Control	0x4001E000
PORT0	Port 0 Control Registers	0x40040000
PORT1	Port 1 Control Registers	0x40040020
PORT2	Port 2 Control Registers	0x40040040
PORT3	Port 3 Control Registers	0x40040060
PORT4	Port 4 Control Registers	0x40040080

PORT6	Port 6 Control Registers	0x400400C0
PORT7	Port 7 Control Registers	0x400400E0
PORT8	Port 8 Control Registers	0x40040100
PORT9	Port 9 Control Registers	0x40040120
PORTA	Port A Control Registers	0x40040140
PORTB	Port B Control Registers	0x40040160
PFS	Pmn Pin Function Control Register	0x40040800
PMISC	Miscellaneous Port Control Register	0x40040D00
ELC	Event Link Controller	0x40041000
POEG	Port Output Enable Module for GPT	0x40042000
RTC	Realtime Clock	0x40044000
WDT	Watchdog Timer	0x40044200

附录3.IO寄存器

本附录按功能描述了IO寄存器地址、访问周期和复位值。

3.1 外设基地址

本节提供本手册中描述的外设的基地址。

表3.1显示了每个外设的名称、描述和基地址。

Table 3.1 外设基地址(1of3)

Name	Description	基址
MMPU	总线主控MPU	0x40000000
SMPU	总线从MPU	0x40000C00
SPMON	CPU堆栈指针监视器	0x40000D00
MMF	内存镜像功能	0x40001000
SRAM	SRAM Control	0x40002000
BUS	总线控制	0x40003000

3.2 Access Cycles

This section provides access cycle information for the I/O registers described in this manual.

The following information applies to Table 3.2 and Table 3.3:

- Registers are grouped by associated module
- The number of access cycles indicates the number of cycles based on the specified reference clock
- In the internal I/O area, reserved addresses that are not allocated to registers must not be accessed, otherwise operations cannot be guaranteed
- The number of I/O access cycles depends on bus cycles of the internal peripheral bus, divided clock synchronization cycles, and wait cycles of each module. Divided clock synchronization cycles differ depending on the frequency ratio between ICLK and PCLK.
- When the frequency of ICLK is equal to that of PCLK, the number of divided clock synchronization cycles is always constant.
- When the frequency of ICLK is greater than that of PCLK, at least 1 PCLK cycle is added to the number of divided clock synchronization cycles.

3.2 访问周期

本节提供本手册中描述的IO寄存器的访问周期信息。

以下信息适用于表3.2和表3.3：

- 寄存器按相关模块分组
- 访问周期数表示基于指定参考时钟的周期数
- 在内部IO区，不能访问未分配给寄存器的保留地址，否则无法保证操作
- IO访问周期数取决于内部外设总线的总线周期、分频时钟同步周期和每个模块的等待周期。分频时钟同步周期取决于ICLK和PCLK之间的频率比。
- 当ICLK的频率等于PCLK的频率时，分频时钟同步周期的数量始终是恒定的。
- 当ICLK的频率大于PCLK的频率时，分频时钟同步周期数至少增加1个PCLK周期。

Note: This applies to the number of cycles when access from the CPU does not conflict with the instruction fetching to the external memory or bus access from other bus masters such as DTC or DMAC.

Table 3.2 Access cycles (1 of 2)

Peripherals	Address		Number of access cycles				Cycle Unit	Related function
			ICLK = PCLK		ICLK > PCLK*1			
	From	To	Read	Write	Read	Write

PDC	4009 4000h	4009 4FFFh	3		2 to 3		PCLKB	Parallel Data Capture Unit
GLCDC, DRW	400E 0000h	400E 4FFFh	3		-		PCLKA	Graphics LCD Controller 2D Drawing Engine
JPEG	400E 6000h	400E 603Fh	13	5	-		PCLKA	JPEG Codec
JPEG	400E 6040h	400E 6FFFh	5	4	-		PCLKA	JPEG Codec
QSPI	6400 0000h	6400 000Fh	3	13 to *6	2 to 3	12 to *6	PCLKA	Quad Serial Peripheral Interface
QSPI	6400 0010h	6400 0013h	24 to *6	5 to *6	23 to *6	4 to *6	PCLKA	Quad Serial Peripheral Interface
QSPI	6400 0014h	6400 0037h	3	13 to *6	2 to 3	12 to *6	PCLKA	Quad Serial Peripheral Interface
QSPI	6400 0804h	6400 0807h	2	2	1 to 2	1 to 2	PCLKA	Quad Serial Peripheral Interface

Note 1. If the number of PCLK cycles is non-integer (for example 1.5), the minimum value is without the decimal point, and the maximum value is rounded up to the decimal point. For example, 1.5 to 2. 5 is 1 to 3.
Note 2. BWAIT is the number of waits (not cycles) described in the USBHS.BUSWAIT register.
Note 3. The wait cycle refers to the EPTPC chapter (30.6.2 Wait Cycles for Register Access).
Note 4. When accessing a 16-bit register (FTDRHL, FRDRHL, FCR, FDR, LSR, and CDR), access is 2 cycles more than the value shown in Table 3.2. When accessing an 8-bit register (including FTDRH, FTDRL, FRDRH, and FRDRL), the access cycles are as shown in Table 3.2.
Note 5. When accessing the 32-bit register (SPDR), access is 2 cycles more than the value in Table 3.2. When accessing an 8-bit or 16-bit register (SPDR_HA), the access cycles are as shown in Table 3.2.
Note 6. The access cycles depend on the QSPI bus cycles.

3.3 Register Descriptions

This section provides information associated with registers described in this manual.

Table 3.3 shows a list of registers including address offsets, address sizes, access rights, and reset values.

Table 3.3 Register description (1 of 44)

Peripheral	Dim	Dim incr.	Dim index	Register name	Description	Address offset	Size	Access	Reset value	Reset mask
MMPU	3	0x400	A,B,C	MMPUCTL%s	Bus Master MPU Control Register	0x000	16	read/ write	0x0000	0xFFFF
MMPU	-	-	-	MMPUPTA	Group A Protection of Register	0x102	16	read/ write	0x0000	0xFFFF
MMPU	32	0x010	0-31	MMPUACA%s	Group A Region %s Access Control Register	0x200	32	read/ write	0x00000000	0xFFFFFFFF

Table 3.2 访问周期(2of2)

Peripherals	Address		访问周期数				Cycle Unit	相关功能
			ICLK = PCLK		ICLK > PCLK*1			
	From	To	Read	Write	Read	Write		
GPT_ODC	4007 B000h	4007 BFFFh	2		1 to 2		PCLKA	PWM延迟生成 Circuit
KINT, CTSU	4008 0000h	4008 1FFFh	2		1 to 2		PCLKB	按键中断功能，电容式触控感应 Unit
AGTn	4008 4000h	4008 4FFFh	5	3	4 to 5	2 to 3	PCLKB	异步通用目的定时器

USBFS	4009 0000h	4009 03FFh	4		3 to 4		PCLKB	USB2.0全速模块
USBFS	4009 0400h	4009 04FFh	2		1 to 2		PCLKB	USB2.0全速模块
PDC	4009 4000h	4009 4FFFh	3		2 to 3		PCLKB	并行数据采集单元
GLCDC, DRW	400E 0000h	400E 4FFFh	3		-		PCLKA	图形LCD控制器2D绘图引擎
JPEG	400E 6000h	400E 603Fh	13	5	-		PCLKA	JPEG编解码器
JPEG	400E 6040h	400E 6FFFh	5	4	-		PCLKA	JPEG编解码器
QSPI	6400 0000h	6400 000Fh	3	13 to *6	2 to 3	12 to *6	PCLKA	四路串行外设 Interface
QSPI	6400 0010h	6400 0013h	24 to *6	5 to *6	23 to *6	4 to *6	PCLKA	四路串行外设 Interface
QSPI	6400 0014h	6400 0037h	3	13 to *6	2 to 3	12 to *6	PCLKA	四路串行外设 Interface
QSPI	6400 0804h	6400 0807h	2	2	1 to 2	1 to 2	PCLKA	四路串行外设 Interface

注1.如果PCLK周期数为非整数（例如1.5），则最小值不带小数点，最大值四舍五入到小数点。例如，1.5到2。5是1到3。注2.BWAIT是USBHS.BUSWAIT寄存器中描述的等待数（不是周期数）。

注3.等待周期参考EPTPC章节（30.6.2寄存器访问的等待周期）。
注4.访问16位寄存器（FTDRHL、FRDRHL、FCR、FDR、LSR和CDR）时，访问比表3.2中显示的值多2个周期。访问8位寄存器（包括FTDRH、FTDRL、FRRDH和FRDRL）时，访问周期如表3.2所示。

注5.访问32位寄存器(SPDR)时，访问比表3.2中的值多2个周期。访问8位或16位寄存器（SPDR_HA）时，访问周期如表3.2所示。注6.访问周期取决于QSPI总线周期。

3.3 注册说明

本节提供与本手册中描述的寄存器相关的信息。

表3.3显示了寄存器列表，包括地址偏移、地址大小、访问权限和复位值。

QSPI	-	-	-	SFMCNT1	外部QSPI地址 Register 1	0x804	32	read/ write	0x00000000	0xFFFFFFFF

外设名称=外设名称
Dim=寄存器数组中的元素数
Diminc=地址映射中寄存器阵列的两个同时寄存器之间的地址增量

Dim index = Sub string that replaces the %s placeholder within the register name
Register name = Name of register
Description = Register description
Address offset = Address of the register relative to the base address defined by the peripheral of the register
Size = Bit width of the register
Access = Register access rights:
Read-only: Read access is permitted. Write operations have undefined results.
Write-only: Write access is permitted. Read operations have undefined results.
Read/write: Both read and write accesses are permitted. Writes affect the state of the register and reads return a value related to the register.
Reset value = Default reset value of a register
Reset mask = Identifies which register bits have a defined reset value

暗淡索引=替换寄存器名称中的%s占位符的子字符串
寄存器名称=寄存器名称描述=寄
存器描述
地址偏移量=相对于寄存器外设定义的基地址的寄存器地址
大小=寄存器的位宽
访问=注册访问权限：
只读：允许读访问。写操作有未定义的结果。只写：允许写访问。读取操作具
有未定义的结果。
读写：允许读写访问。写入会影响寄存器的状态，读取会返回与寄存器相关的值。复位值=寄存器的默认复位值

复位掩码=标识哪些寄存器位具有定义的复位值

Revision History — RA6M3 Group User's Manual

Rev.	Date	Chapter	Summary
1.00	Oct 8, 2019	—	First Edition issued
1.10	Dec 25, 2020	—	Second Edition issued
		section 1, Overview	Updated Figure 1.2, Part numbering scheme
		section 4, Address Space	Updated Figure 4.1 and Figure 4.2
		section 7, Option-Setting Memory	Updated description for HOCOEN bit
		section 9, Clock Generation Circuit	Updated description for CKSEL[2:0] bits
			Updated description for HCSTP bit, HOCOSF flag
			Updated section 9.7, Internal Clock
			Updated Figure 9.14 and Figure 9.15
		section 11, Low Power Modes	Updated Note 18. in Table 11.2, Operating conditions of each low power mode
			Updated description for OPE bit
			Updated description in Invalid register write accesses by the DTC or DMAC
		section 20, I/O Ports	Updated Table 20.2, I/O port functions and Table 20.9, Register settings for I/O pin functions (PORT2)
		section 23, General PWM Timer (GPT)	Updated section 23.2.20, General PWM Timer Compare Capture Register n (GTCCRn) (n = A to F)
			Updated Figure 23.81
			Updated section 23.3.11.6, Event Link Controller (ELC) output
		section 25, Asynchronous General-Purpose Timer (AGT)	Updated Figure 25.2
			Updated section 25.4.11, When Switching Source Clock
		section 26, Realtime Clock (RTC)	Updated section 26.6.8, When Switching Source Clock
		section 32, USB 2.0 Full-Speed Module (USBFS)	Updated description for TRNENSEL bits in section 32.2.12, SOF Output Configuration Register (SOFCFG) and section 32.2.16, NRDY Interrupt Status Register (NRDYSTS)
		section 36, I²C Bus Interface (IIC)	Updated description for NACKE bit in section 36.2.6, I²C Bus Function Enable Register (ICFER)
			Updated description for AL flag in section 36.2.10, I²C Bus Status Register 2 (ICSR2)
			Updated Figure 36.23
			Updated section 36.7.3, Device-ID Address Detection
			Updated Figure 36.28, Figure 36.39, and Figure 36.49
			Updated section 36.12.2, Extra SCL Clock Cycle Output Function
			Updated Table 36.11, Register states when issuing each condition
		section 39, Quad Serial Peripheral Interface (QSPI)	Updated the bit name for SFMMD3 in section 39.2.1, Transfer Mode Control Register (SFMSMD)
			Updated Figure 39.4, Figure 39.5, Figure 39.6 and Figure 39.7
			Updated section 39.4.2, SPI Mode
			Removed Section 39.5.9 Serial Data Receiving Latency
			Updated the Note in section 39.10.3, Generating the SPI Bus Cycle during Direct Communication
		section 46, Secure Cryptographic Engine (SCE7)	Updated Table 46.1, SCE7 specifications
			Updated Figure 46.1
		section 47, 12-Bit A/D Converter (ADC12)	Updated description in section 47.1, Overview
		section 50, High-Speed Analog Comparator (ACMPHS)	Updated section 50.5, ACMPHS Interrupts
		section 55, Flash Memory	Added section 55.3.4, Factory MCU Information Flash Root Table (FMIFRT)
			Added section 55.3.5, Unique ID Register n (UIDRn) (n = 0 to 3)
			Added section 55.3.6, Part Numbering Register n (PNRn) (n = 0 to 3)
			Added section 55.3.7, MCU Version Register (MCUVER)
		section 57, JPEG Codec (JPEG)	Updated Figure 57.7

修订记录 — RA6M3组用户手册

Rev.	Date	Chapter	Summary
1.00	Oct 8, 2019	—	第一版发行
1.10	Dec 25, 2020	—	第二版发行
		第1节，概述	更新了图1.2，零件编号方案
		第4节，地址空间	更新了图4.1和图4.2
		第7节，选项设置记忆	更新了HOCOEN位的描述
		第9节，时钟生成电路	更新了CKSEL[2:0]位的描述
			更新了HCSTP位、HOCOSF标志的描述
			更新了第9.7节，内部时钟
		更新了图9.14和图9.15第11节，低功耗模式	更新了表11.2中的注18，每种低功耗模式的工作条件
			更新了OPE位的描述
			更新了DTC或DMAC的无效寄存器写访问中的描述
		第20节，IO端口	更新了表20.2，IO端口功能和表20.9，I的寄存器设置O引脚功能(PORT2)
		第23节，通用PWM定时器(GPT)	更新了第23.2.20节，通用PWM定时器比较捕捉寄存器n(GTCCRn)（n=A到F）
			更新了图23.81
			更新了第23.3.11.6节，事件链接控制器(ELC)输出
		第25节，异步通用定时器(AGT)	更新了图25.2
			更新了第25.4.11节，切换源时钟时
		第26节，实时时钟(RTC)	更新了第26.6.8节，切换源时钟时
		第32节，USB2.0全速模块(USBFS)	更新了第32.2.12节，SOF输出配置寄存器(SOFCFG)和第32.2.16节，NRDY中断状态寄存器(NRDYSTS)中TRNENSEL位的描述
		第36节，I2C总线接口(IIC)	更新了第36.2.6节中对NACKE位的描述，I2C总线功能启用寄存器(ICFER)
			更新了第36.2.10节中AL标志的描述，I2C总线状态寄存器2(ICSR2)更新了图36.23
			更新了第36.7.3节，设备ID地址检测更新了图36.28、图36.39和图36.49
			更新了第36.12.2节，额外SCL时钟周期输出功能更新了表36.11，发出每个条件时的寄存器状态
		第39节，四路串行外设接口(QSPI)	在第39.2.1节，传输模式控制中更新了SFMMD3的位名称Register (SFMSMD)
			更新了图39.4、图39.5、图39.6和图39.7
			更新了第39.4.2节，SPI模式
			删除了第39.5.9节串行数据接收延迟
			更新了第39.10.3节中的注释，在期间生成SPI总线周期直接沟通
		第46节，安全加密引擎(SCE7)	更新了表46.1，SCE7规范
			更新了图46.1
		第47节，12位模数转换器(ADC12)	更新了第47.1节概述中的描述
		第50节，高速模拟比较器(ACMPHS)	更新了第50.5节，ACMPHS中断
		第55节，闪存	添加了第55.3.4节，工厂MCU信息闪存根表(FMIFRT)
			添加了第55.3.5节，唯一ID寄存器n(UIDRn)（n=0到3）
			添加了第55.3.6节，部件编号寄存器n(PNRn)（n=0到3）
			添加了第55.3.7节，MCU版本寄存器(MCUVER)
		第57节，JPEG编解码器(JPEG)	更新了图57.7

Rev.	Date	Chapter	Summary
1.10	Dec 25, 2020	section 60, Electrical Characteristics	Updated Note 4. and Note 5. in Table 60.16, Timing of recovery from low power modes
			Updated Figure 60.81
		section 2, Package Dimensions	Updated Figure 2.4, 144-pin LQFP
		section 3, I/O Registers	Changed the address offset of the D/A Amplifier Stabilization Wait Control Register from 0x101C to 0x001C in Table 3.3, Register description

Rev.	Date	Chapter	Summary
1.10	Dec 25, 2020	第60节，电气特性	更新了表60.16中的注4和注5，从低功耗模式恢复的时序更新了图60.81
		第2节，包装尺寸	更新了图2.4，144引脚LQFP
		第3节，IO寄存器	更改了DA放大器稳定的地址偏移 表3.3中从0x101C到0x001C的等待控制寄存器，寄存器说明
