3. Check that the TDRE flag in ICSR2 is 1, and then write the value for transmission (the first byte indicates the slave address and value of the R/W# bit) to ICDRT. When the transmit data is written to ICDRT, the TDRE flag automatically is set to 0, the data is transferred from ICDRT to ICDRS, and the TDRE flag again is set to 1. When the byte containing the slave address and R/W# bit is transmitted, the value of the ICCR2.TRS bit automatically updates to select transmit or receive mode based on the value of the transmitted R/W# bit. If the value of the R/W# bit is 1, the TRS bit is set to 0 on the rising edge of the ninth cycle of the SCL clock, placing the IIC in master receive mode. At this time, the TDRE flag is set to 0 and the ICSR2.RDRF flag automatically is set to 1.
   Because the ICSR2.NACKF flag being 1 at this time indicates that no slave device recognized the address or there was an error in communications, write 1 to the ICCR2.SP bit to issue a stop condition.
   For master reception from a device with a 10-bit address, start by using master transmission to issue the 10-bit address, and then issue a restart condition. After that, transmitting 11110b, the two higher-order bits of the slave address, and the R bit places the IIC in master receive mode.
4. Dummy read ICDRR after confirming that the RDRF flag in ICSR2 is 1. This makes the IIC start output of the SCL clock and start data reception.

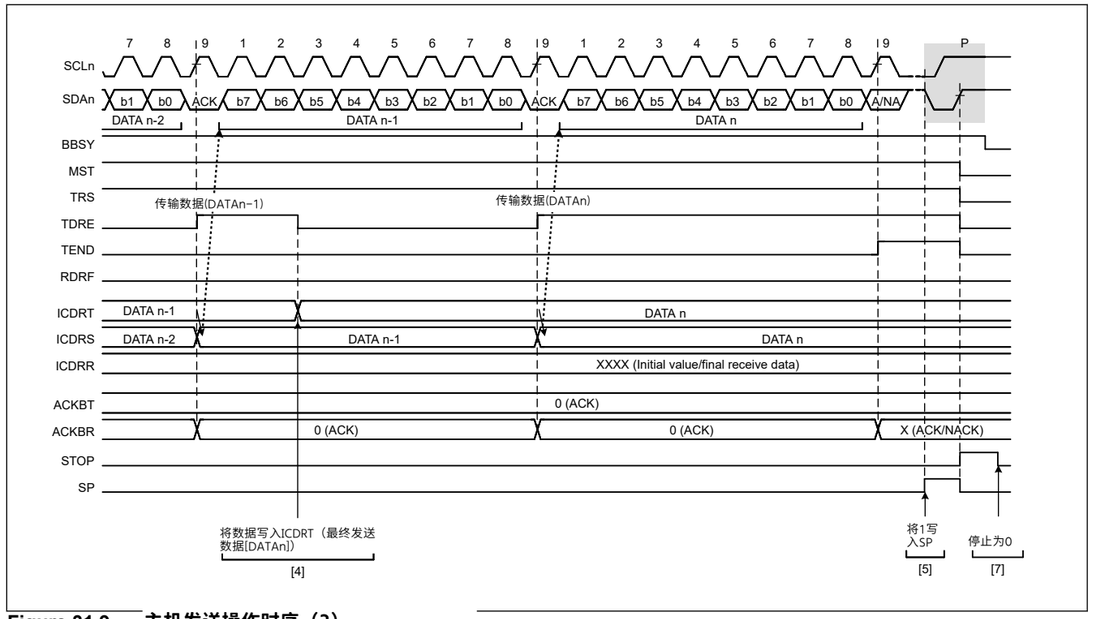

Figure 31.9 主机发送操作时序（3）

31.3.4 主接收操作

在主设备接收操作中，作为主设备的IIC输出SCL时钟，从从设备接收数据，并返回确认。因为IIC必须首先向相关的从设备发送一个从地址，所以这部分程序在主发送模式下执行，但后续步骤在主接收模式下执行。

图31.10和图31.11显示了主机接收的示例（7位地址格式），图31.12至图31.14显示了主机接收的操作时序。

设置和执行主接收：

1.处理初始设置。有关详细信息，请参阅第31.3.2节。初始设置。

2.读取ICCR2中的BBSY标志，检查总线是否空闲，然后将ICCR2中的ST位设置为1（启动条件要求）。收到请求后，IIC发出一个开始条件。当IIC检测到启动条件时，ICSR2中的BBSY和START标志位自动置1，ST位自动置0。此时，如果检测到启动条件，则SDA输出的电平和电平在ST位为1时SDAn线匹配时，IIC识别出由ST位请求的启动条件的发布已成功完成，并且MST和

ICCR2中的TRS位自动设置为1，将IIC置于主机发送模式。ICSR2中的TDRE标志也自动设置为1，以响应TRS位设置为1。

3、检查ICSR2中的TDRE标志为1，然后写入值进行发送（第一个字节表示从机RW#位的地址和值）到ICDRT。当发送数据写入ICDRT时，TDRE标志自动设置为0，数据从ICDRT传输到ICDRS，TDRE标志再次设置为1。当发送包含从机地址和RW#位的字节时，ICCR2.TRS位的值自动更新以根据发送的RW#位的值选择发送或接收模式。如果RW#位的值为1，则在SCL时钟的第9个周期的上升沿将TRS位设置为0，将IIC置于主机接收模式。此时TDRE标志置0，ICSR2.RDRF标志自动置1。因为此时ICSR2.NACKF标志为1表示没有从设备识别该地址或通信出现错误，向ICCR2.SP位写入1以发出停止条件。对于来自具有10位地址的设备的主机接收，首先使用主机发送来发出10位地址，然后发出重启条件。之后，发送11110b、从机地址的两个高阶位和R位将IIC置于主机接收模式。

4.确认ICSR2中的RDRF标志为1后伪读ICDRR。这使得IIC开始输出SCL时钟并开始数据接收。

5. After 1 byte of data is received, the RDRF flag in ICSR2 is set to 1 on the rising edge of the 8th or 9th cycle of the SCL clock, as selected in the RDRFS bit in ICMR3. Reading ICDRR at this time produces the received data, and the RDRF flag is automatically set to 0 at the same time. Additionally, the value of the acknowledgment field received during the ninth cycle of the SCL clock is returned as the value set in the ICMR3.ACKBT bit. If the next byte to be received is the second-to-last byte, set the ICMR3.WAIT bit to 1 for wait insertion before reading ICDRR, containing the second-to-last byte. In addition to enabling NACK output, even when interrupts or other operations result in delays in setting the ICMR3.ACKBT bit to 1 (NACK) in step (6), this fixes the SCLn line to the low level on the rising edge of the ninth clock cycle in reception of the last byte, which enables the issuing of a stop condition.
6. When the ICMR3.RDRFS bit is 0, and the slave device must be notified that it is to end transfer for data reception after transfer of the next and final byte, set the ICMR3.ACKBT bit to 1 (NACK).
7. After reading the second-to-last byte from the ICDRR register, if the value of the ICSR2.RDRF flag is 1, write 1 to the SP bit in ICCR2 (stop condition requested), and then read the last byte from ICDRR. When ICDRR is read, the IIC is released from the wait state and issues the stop condition after low-level output in the ninth clock cycle is complete or the SCLn line is released from the low-hold state.
8. On detecting the stop condition, the IIC automatically sets the MST and TRS bits in ICCR2 to 00b and enters slave receive mode. Additionally, detection of the stop condition sets the ICSR2.STOP flag to 1.
9. Check that the ICSR2.STOP flag is 1, then set the ICSR2.NACKF and STOP flags to 0 for the next transfer operation.

5.接收到1个字节的数据后，在SCL时钟的第8或第9个周期的上升沿将ICSR2中的RDRF标志设置为1，这由ICMR3中的RDRFS位选择。此时读取ICDRR产生接收数据，同时RDRF标志位自动置0。此外，在SCL时钟的第9个周期内接收到的确认字段的值作为ICMR3.ACKBT位中设置的值返回。如果要接收的下一个字节是倒数第二个字节，则在读取包含倒数第二个字节的ICDRR之前将ICMR3.WAIT位设置为1以等待插入。除了使能NACK输出外，即使在中断或其他操作导致在步骤(6)中将ICMR3.ACKBT位设置为1(NACK)时出现延迟，这也会在第9次的上升沿将SCLn线固定为低电平接收最后一个字节的时钟周期，它可以发出停止条件。

6.当ICMR3.RDRFS位为0时，必须通知从设备在传输下一个和最后一个字节后结束传输以进行数据接收，将ICMR3.ACKBT位设置为1(NACK)。

7.从ICDRR寄存器中读取倒数第二个字节后，如果ICSR2.RDRF标志的值为1，则将1写入ICCR2中的SP位（请求停止条件），然后从ICDRR中读取最后一个字节.当读取ICDRR时，IIC从等待状态中释放，并在第9个时钟周期的低电平输出完成或SCLn线从低保持状态释放后发出停止条件。

8.在检测到停止条件时，IIC自动将ICCR2中的MST和TRS位设置为00b并进入从机接收模式。此外，检测到停止条件会将ICSR2.STOP标志设置为1。

9.检查ICSR2.STOP标志是否为1，然后将ICSR2.NACKF和STOP标志设置为0以进行下一次传输操作。

31.3.5 Slave Transmit Operation

In slave transmit operation, the master device outputs the SCL clock, the IIC transmits data as a slave device, and the master device returns acknowledgments.

Figure 31.15 shows an example of slave transmission, and Figure 31.16 and Figure 31.17 show the operation timing in slave transmission.

To set up and perform slave transmission:

1. Initialize the IIC using the procedure in section 31.3.2. Initial Settings.
   After initialization, the IIC stays in the standby state until it receives a slave address that matches.
2. After receiving a matching slave address, the IIC sets one of the associated ICSR1.HOA, GCA, and AASy flags (y = 0 to 2) to 1 on the rising edge of the ninth cycle of the SCL clock and outputs the value set in the ICMR3.ACKBT bit to the acknowledge bit on the ninth cycle of the SCL clock. If the value of the R/W# bit is 1, the IIC automatically places itself in slave transmit mode by setting both the ICCR2.TRS bit and the ICSR2.TDRE flag to 1.
3. Check that the ICSR2.TDRE flag is 1, then write the transmit data to the ICDRT register. If the IIC receives no acknowledge from the master device (receives an NACK signal) while the ICFER.NACKE bit is 1, the IIC suspends transfer of the next data.
4. Wait until the ICSR2.TEND flag is set to 1 while the ICSR2.TDRE flag is 1, after the ICSR2.NACKF flag is set to 1 or the last byte for transmission is written to the ICDRT register. When the ICSR2.NACKF flag or the TEND flag is 1, the IIC drives the SCLn line low on the ninth falling edge of the SCL clock.
5. When the ICSR2.NACKF or ICSR2.TEND flag is 1, dummy read ICDRR to complete the processing. This releases the SCLn line.
6. On detecting the stop condition, the IIC automatically sets the ICSR1.HOA, GCA, and AASy flags (y = 0 to 2), the ICSR2.TDRE and TEND flags, and the ICCR2.TRS bit to 0, and enters slave receive mode.
7. Check that the ICSR2.STOP flag is 1, then set the ICSR2.NACKF and STOP flags to 0 for the next transfer operation.

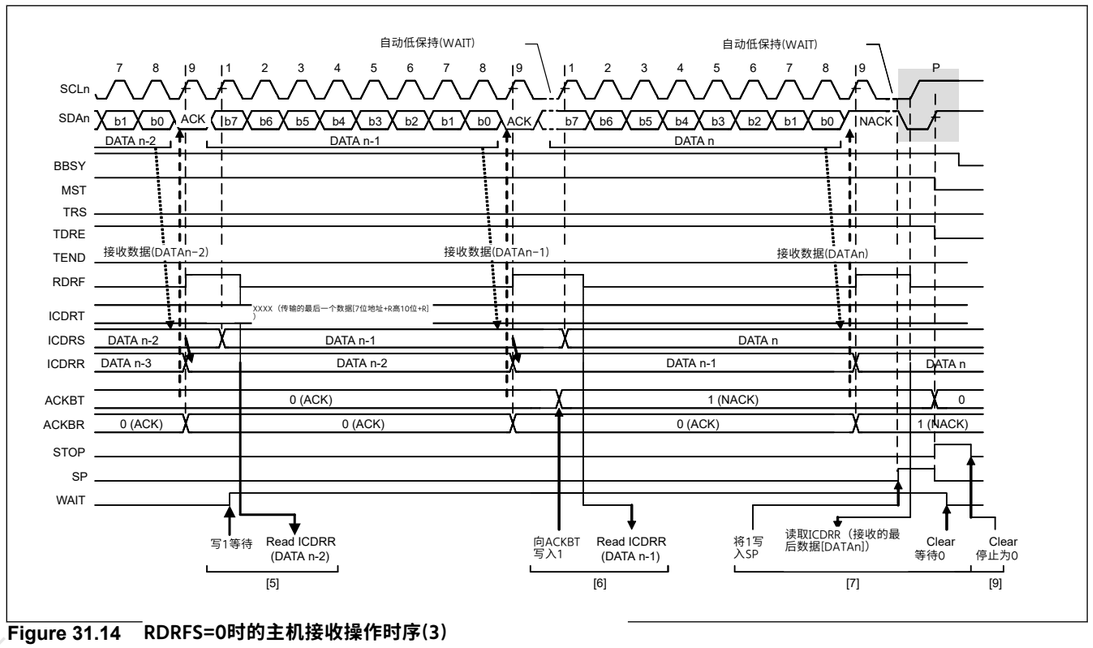

Figure 31.14 RDRFS=0时的主机接收操作时序(3)

31.3.5 从机发送操作

在从发送操作中，主设备输出SCL时钟，IIC作为从设备发送数据，主设备返回确认。

图31.15显示了从机传输的示例，图31.16和图31.17显示了从机传输的操作时序。

设置和执行从属传输：

1.使用第31.3.2节中的过程初始化IIC。初始设置。
初始化后，IIC一直处于待机状态，直到收到匹配的从机地址。

2.接收到匹配的从地址后，IIC在SCL时钟的第9个周期的上升沿将相关的ICSR1.HOA、GCA和AASy标志之一（y=0到2）设置为1，并输出该值在SCL时钟的第9个周期将ICMR3.ACKBT位设置为确认位。如果RW#位的值为1，则IIC通过将ICCR2.TRS位和ICSR2.TDRE标志都设置为1自动将自身置于从发送模式。

3.检查ICSR2.TDRE标志是否为1，然后将发送数据写入ICDRT寄存器。如果IIC没有收到
当ICFER.NACKE位为1时，来自主设备的确认（接收NACK信号），IIC暂停下一个数据的传输。

4.等到ICSR2.TEND标志设置为1，而ICSR2.TDRE标志为1，在ICSR2.NACKF标志设置为1或将要发送的最后一个字节写入ICDRT寄存器之后。当ICSR2.NACKF标志或TEND标志为1时，IIC在SCL时钟的第九个下降沿将SCLn线驱动为低电平。

5.当ICSR2.NACKF或ICSR2.TEND标志为1时，假读ICDRR完成处理。这将释放SCLn线。

6.在检测到停止条件时，IIC自动将ICSR1.HOA、GCA和AASy标志（y=0到2）、ICSR2.TDRE和TEND标志以及ICCR2.TRS位设置为0，并进入从机接收模式。

7.检查ICSR2.STOP标志是否为1，然后将ICSR2.NACKF和STOP标志设置为0以进行下一次传输操作。

31.3.6 Slave Receive Operation

In slave receive operation, the master device outputs the SCL clock and transmit data, and the IIC returns acknowledgments as a slave device.

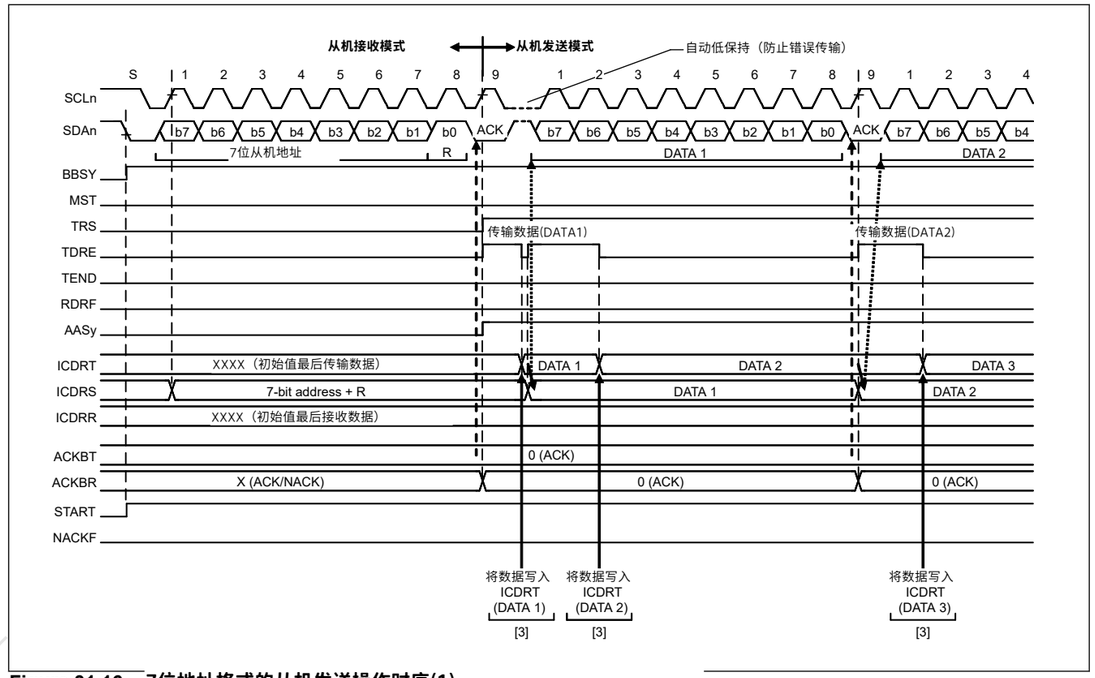

Figure 31.16 7位地址格式的从机发送操作时序(1)

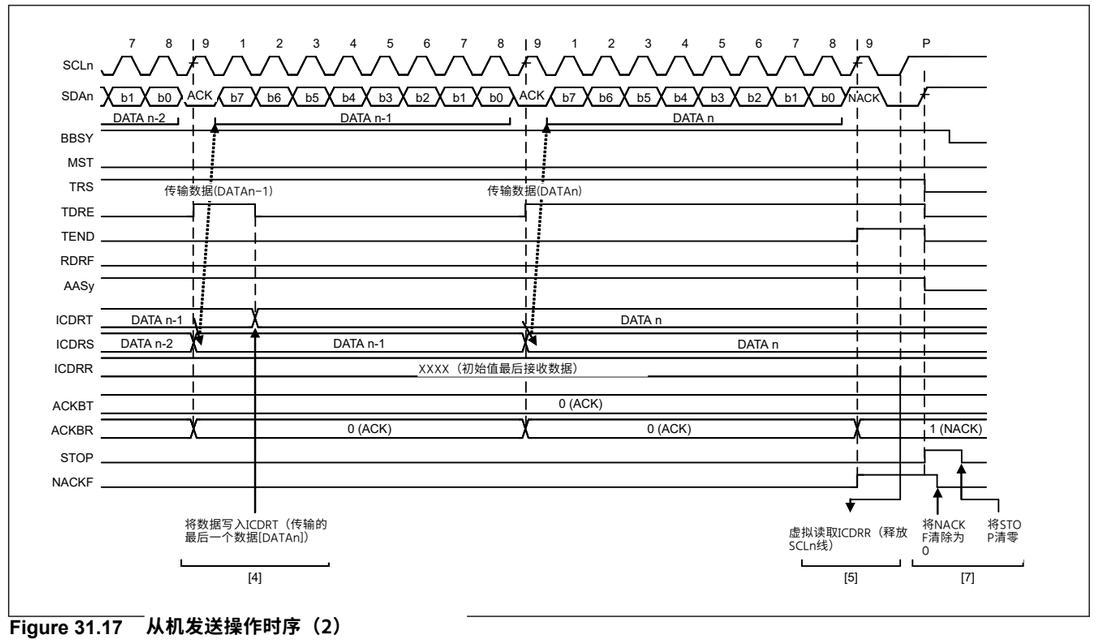

Figure 31.17 从机发送操作时序（2）

31.3.6 从机接收操作

在从机接收操作中，主设备输出SCL时钟并发送数据，IIC作为从设备返回确认。

Figure 31.18 shows an example of slave reception, and Figure 31.19 and Figure 31.20 show the operation timing in slave reception.

To set up and perform slave reception:

1. Initialize the IIC using the procedure in section 31.3.2. Initial Settings.
   After initialization, the IIC stays in the standby state until it receives a slave address that matches.
2. After receiving a matching slave address, the IIC sets one of the associated ICSR1.HOA, GCA, and AASy flags (y = 0 to 2) to 1 on the rising edge of the ninth cycle of the SCL clock and outputs the value set in the ICMR3.ACKBT bit to the acknowledge bit on the ninth cycle of the SCL clock. If the value of the R/W# bit is 0, the IIC continues to place itself in slave receive mode and sets the RDRF flag in ICSR2 to 1.
3. Check that the ICSR2.STOP flag is 0 and the ICSR2.RDRF flag is 1, then dummy read ICDRR. The dummy value consists of the slave address and R/W# bit when the 7-bit address format is selected, or the lower 8 bits when the 10-bit address format is selected.
4. When ICDRR is read, the IIC automatically sets the ICSR2.RDRF flag to 0. If reading of ICDRR is delayed and a next byte is received while the RDRF flag is still set to 1, the IIC holds the SCLn line low until 1 SCL cycle before the point where RDRF must be set. In this case, reading ICDRR releases the SCLn line from being held low.
   When the ICSR2.STOP flag is 1 and the ICSR2.RDRF flag is also 1, read ICDRR until all the data is completely received.
5. On detecting the stop condition, the IIC automatically clears the ICSR1.HOA, GCA, and AASy flags (y = 0 to 2) to 0.
6. Check that the ICSR2.STOP flag is 1, then set the ICSR2.STOP flag to 0 for the next transfer operation.

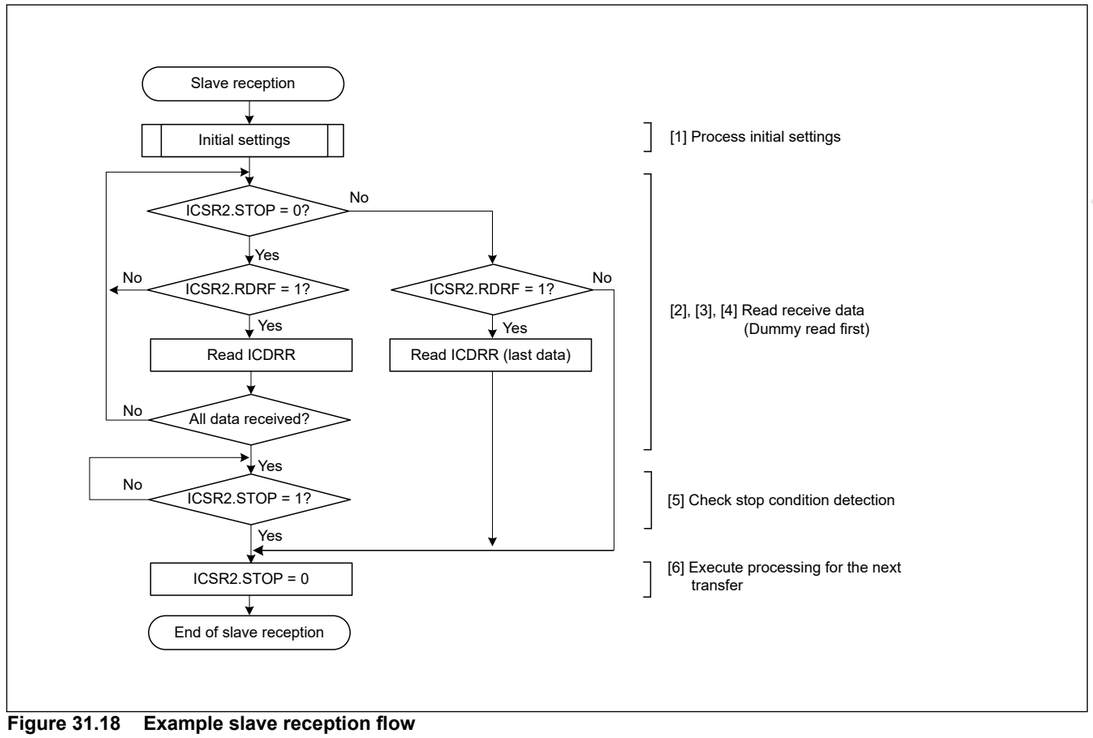

Figure 31.18 Example slave reception flow

图31.18显示了从机接收的示例，图31.19和图31.20显示了从机接收的操作时序。

设置和执行从属接收：

1.使用第31.3.2节中的过程初始化IIC。初始设置。
初始化后，IIC一直处于待机状态，直到收到匹配的从机地址。

2.接收到匹配的从地址后，IIC在SCL时钟的第9个周期的上升沿将相关的ICSR1.HOA、GCA和AASy标志之一（y=0到2）设置为1，并输出该值在SCL时钟的第9个周期将ICMR3.ACKBT位设置为确认位。如果RW#位的值为0，则IIC继续将自身置于从机接收模式并将ICSR2中的RDRF标志设置为1。

3.检查ICSR2.STOP标志为0且ICSR2.RDRF标志为1，然后虚拟读取ICDRR。虚拟值
选择7位地址格式时由从机地址和RW#位组成，选择10位地址格式时由低8位组成。

4.读取ICDRR时，IIC自动将ICSR2.RDRF标志设置为0。如果ICDRR的读取延迟并且在RDRF标志仍设置为1时接收到下一个字节，则IIC将SCLn线保持为低电平直到1SCL在必须设置RDRF的点之前循环。在这种情况下，读取ICDRR会释放SCLn线的低电平。当ICSR2.STOP标志为1且ICSR2.RDRF标志也为1时，读取ICDRR直到完全接收到所有数据。

5.在检测到停止条件时，IIC自动将ICSR1.HOA、GCA和AASy标志（y=0到2）清除为0。

6.检查ICSR2.STOP标志是否为1，然后将ICSR2.STOP标志设置为0以进行下一次传输操作。

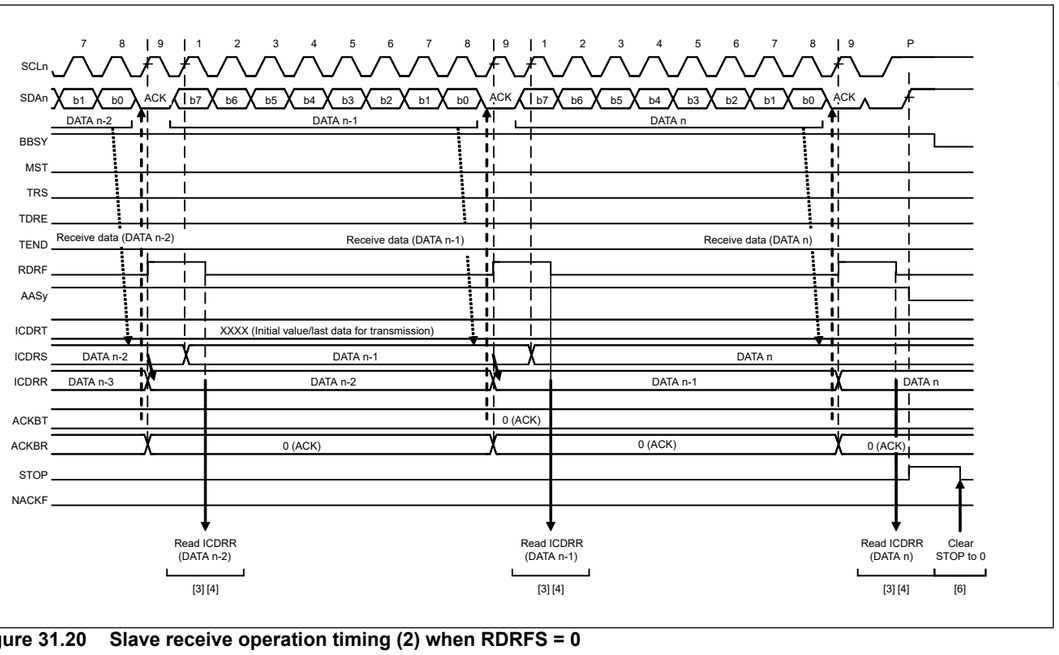

Figure 31.20 Slave receive operation timing (2) when RDRFS = 0

31.4 SCL Synchronization Circuit

For generation of the SCL clock, the IIC starts counting the value for the high-level period specified in ICBRH when it detects a rising edge on the SCLn line, and it drives the SCLn line low when it completes counting. When the IIC detects the falling edge of the SCLn line, it starts counting the value for the low-level period specified in ICBRL, and then it stops

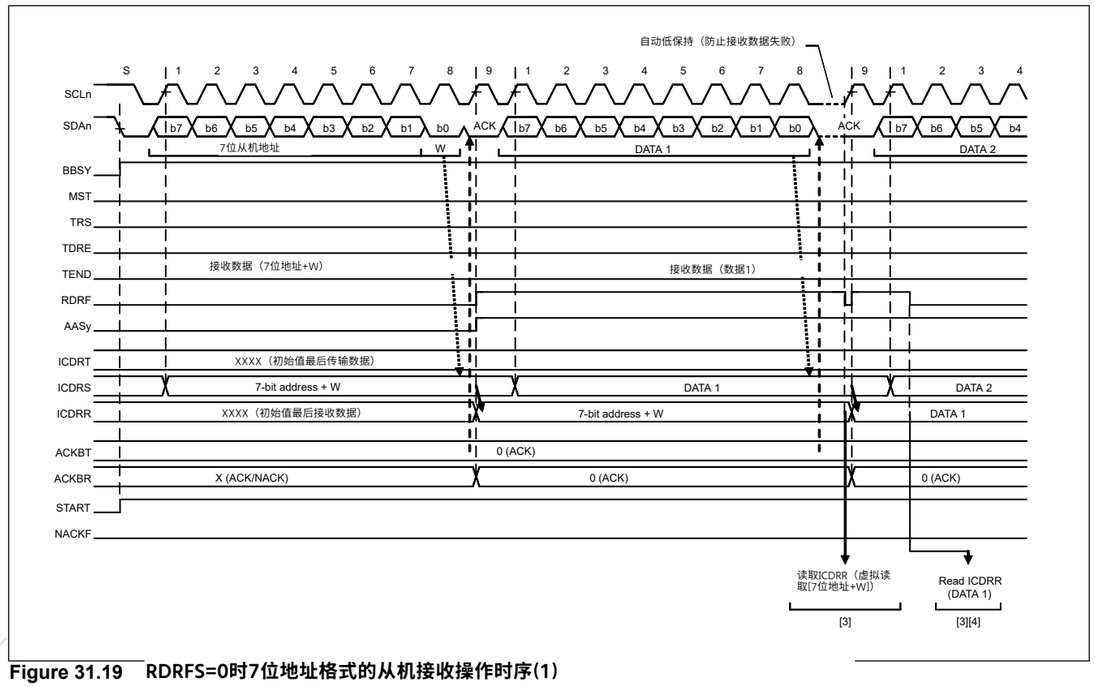

Figure 31.19 RDRFS=0时7位地址格式的从机接收操作时序(1)

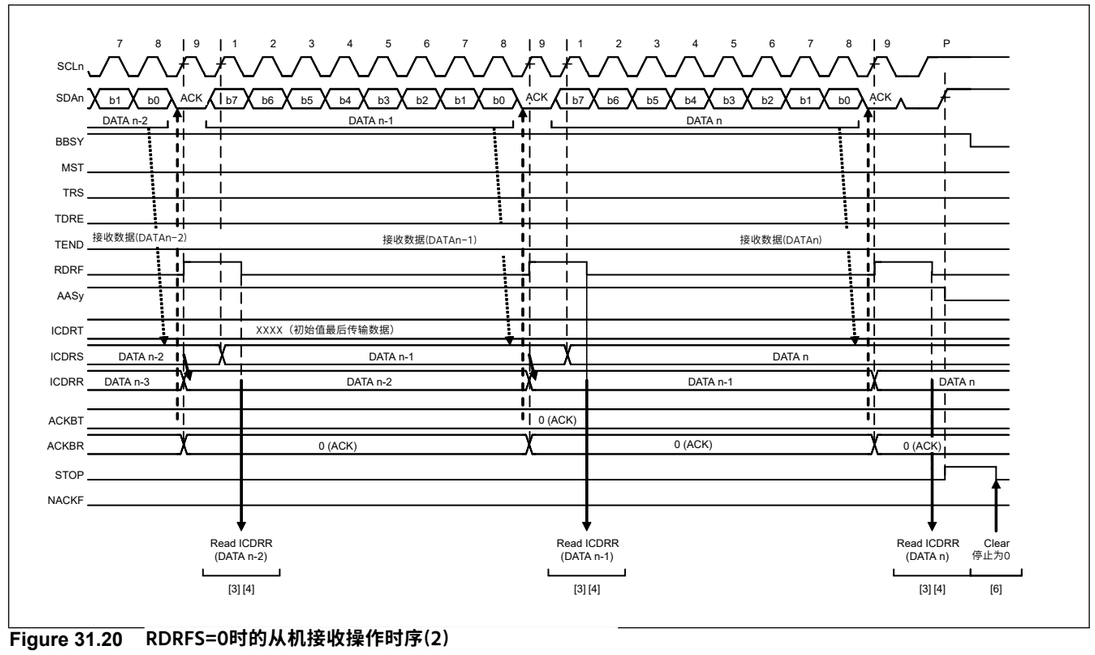

Figure 31.20 RDRFS=0时的从机接收操作时序(2)

31.4 SCL同步电路

为了生成SCL时钟，IIC在检测到SCLn线上的上升沿时开始对ICBRH中指定的高电平周期的值进行计数，并在完成计数时将SCLn线驱动为低电平。当IIC检测到SCLn线的下降沿时，它开始计数ICBRL中指定的低电平周期的值，然后停止

driving the SCLn line, releasing the line, when it completes counting. The IIC repeats this process to generate the SCL clock.

If multiple master devices are connected to the I2C bus, a collision of SCL signals might arise because of contention with another master device. In such cases, the master devices must synchronize their SCL signals. Because this synchronization of SCL signals must be bit-by-bit, the IIC is equipped with an SCL synchronization circuit to obtain bit-by-bit synchronization of the SCL clock signals by monitoring the SCLn line while in master mode.

When the IIC detects a rising edge on the SCLn line and starts counting the high-level period specified in ICBRH.BRH[4:0], and the level on the SCLn line falls because an SCL signal is being generated by another master device, the IIC performs the following:

1. Stops counting when it detects the falling edge.
2. Drives the level on the SCLn line low.
3. Starts counting the low-level period specified in ICBRL.BRL[4:0].

When the IIC finishes counting the low-level period, it stops driving the SCLn line low to release the line. If the low-level period of the SCL clock signal from the other master device is longer than the low-level period set in the IIC, the low-level period of the SCL signal is extended. When the low-level period for the other master device ends, the SCL signal rises because the SCLn line is released.

When the IIC finishes outputting the low-level period of the SCL clock, the SCLn line is released and the SCL clock rises. That is, when SCL signals from more than one master are contending, the high-level period of the SCL signal is synchronized with that of the clock with the narrower period, and the low-level period of the SCL signal is synchronized with that of the clock with the broader period. However, such synchronization of the SCL signal is only enabled when the SCLE bit in ICFER is set to 1.

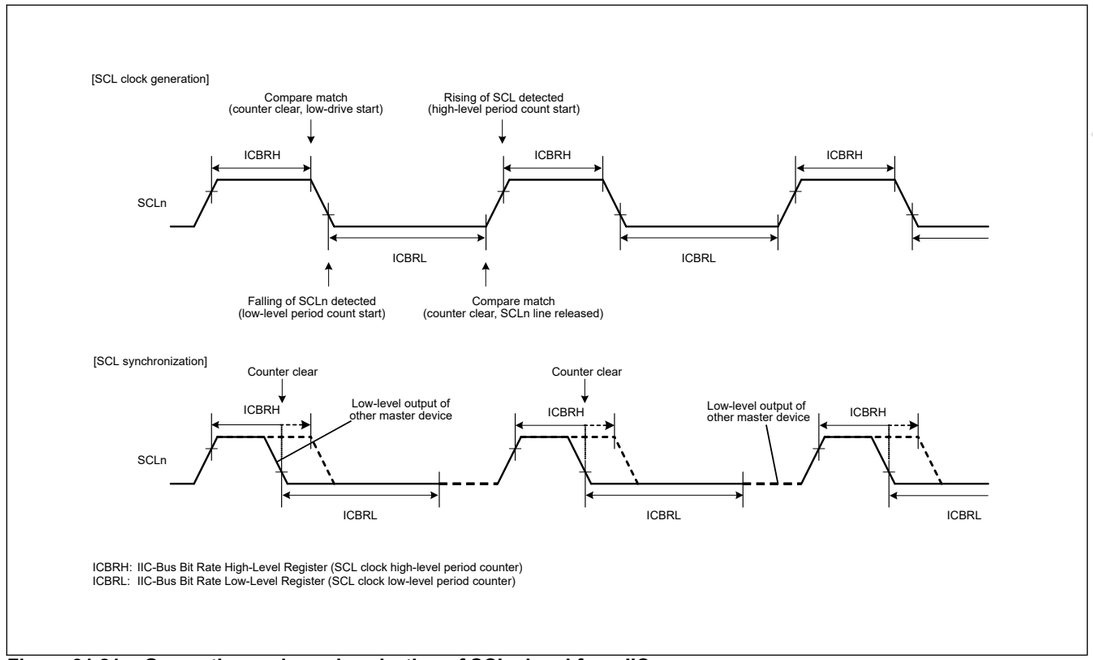

Figure 31.21 Generation and synchronization of SCL signal from IIC

31.5 SDA Output Delay Function

The IIC module incorporates a function for delaying output on the SDA line. The delay can be applied to all output on the SDA line, including issuing of the start, restart, and stop conditions, data, and the ACK and NACK signals.

完成计数后，驱动SCLn线，释放线。IIC重复此过程以生成SCL时钟。

如果多个主设备连接到I2C总线，由于与另一个主设备争用，可能会出现SCL信号冲突。在这种情况下，主设备必须同步它们的SCL信号。因为SCL信号的这种同步必须是逐位的，所以IIC配备了一个SCL同步电路，通过在主机模式下监视SCLn线来获得SCL时钟信号的逐位同步。

当IIC检测到SCLn线上的上升沿并开始计数指定的高电平周期时
ICBRH.BRH[4:0]，并且SCLn线上的电平下降，因为另一个主设备正在生成SCL信号，IIC执行以下操作：

1.检测到下降沿停止计数。

2.将SCLn线上的电平拉低。

3.开始计算ICBRL.BRL[4:0]中指定的低电平周期。

当IIC完成对低电平周期的计数时，它停止将SCLn线驱动为低电平以释放该线。如果来自其他主设备的SCL时钟信号的低电平周期长于IIC中设置的低电平周期，则延长SCL信号的低电平周期。当另一个主设备的低电平周期结束时，SCL信号上升，因为SCLn线被释放。

当IIC输出完SCL时钟的低电平周期后，SCLn线被释放，SCL时钟上升。
即当来自多个主控的SCL信号竞争时，SCL信号的高电平周期与周期较窄的时钟同步，SCL信号的低电平周期与主控的低电平周期同步。具有更广泛周期的时钟。但是，只有当ICFER中的SCLE位设置为1时，才会启用SCL信号的这种同步。

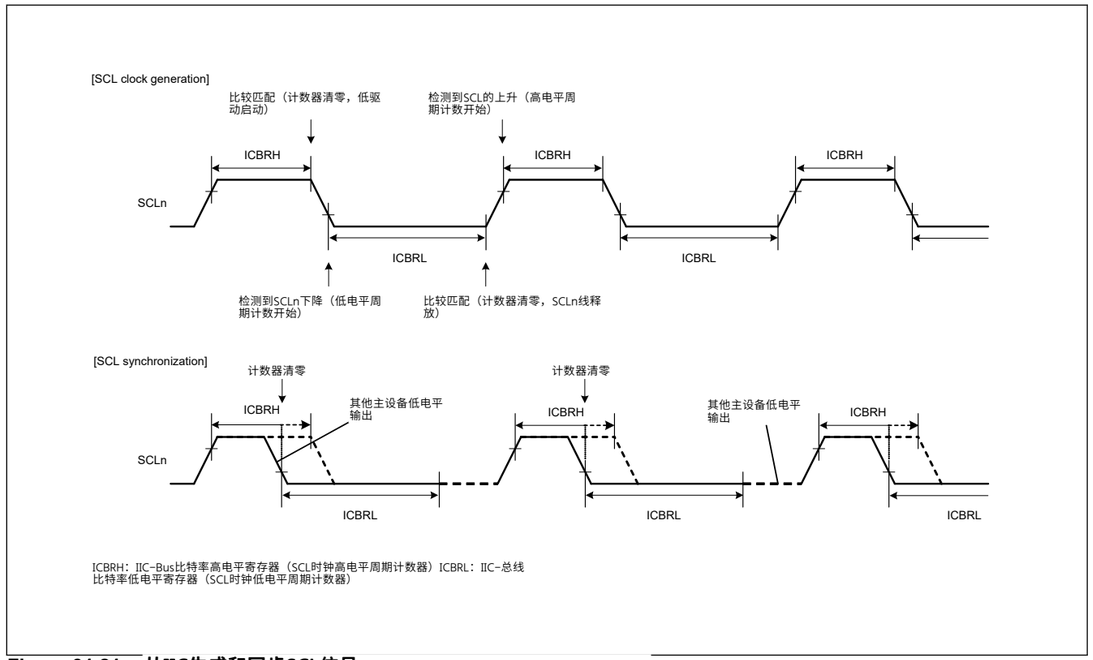

Figure 31.21 从IIC生成和同步SCL信号

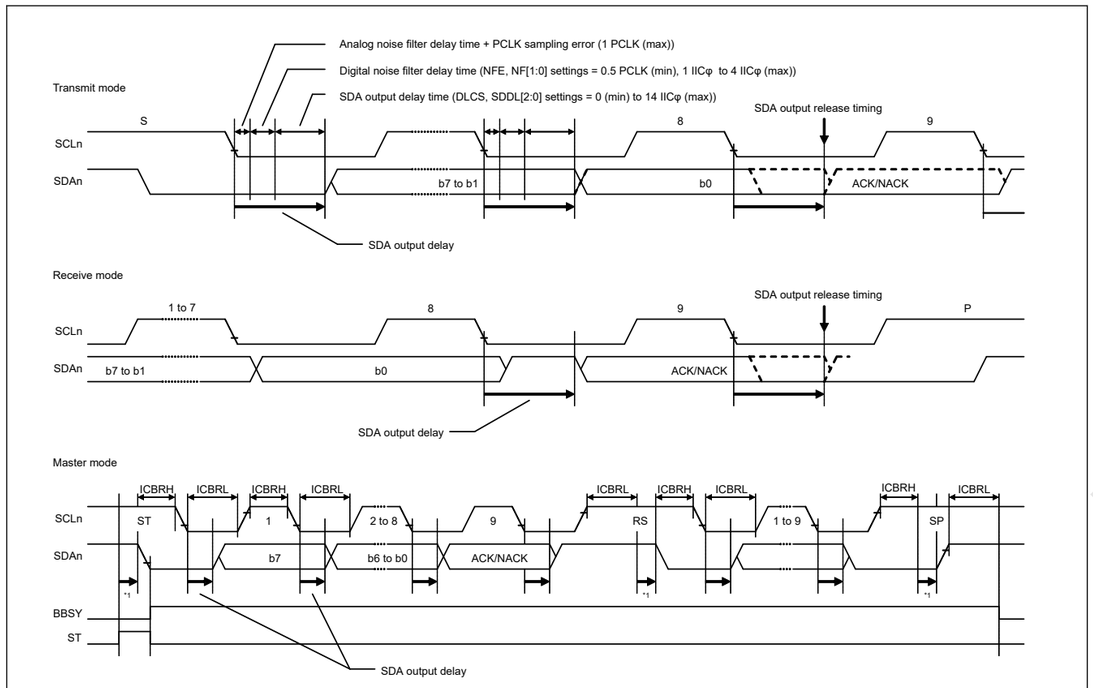
31.5 SDA输出延迟功能

IIC模块包含延迟SDA线上输出的功能。延迟可以应用于所有输出SDA线，包括发出启动、重新启动和停止条件、数据以及ACK和NACK信号。

With this function, SDA output is delayed from the detection of a falling edge of the SCL signal to ensure that the SDA signal is output within the interval during which the SCL clock is low. This approach helps prevent erroneous operation of communications devices, with the aim of satisfying the 300-ns minimum data-hold time requirement of the SMBus specification. The output delay function is enabled by setting the SDDL[2:0] bits in ICMR2 to a value other than 000b, and disabled by setting the same bits to 000b.

When the SDA output delay function is enabled, for example, the DLCS bit in ICMR2 selects the clock source for the SDA output delay counter, either as the internal base clock (IICφ) for the IIC module or as the internal base clock divided by 2 (IICφ/2). The counter counts the number of cycles set in the SDDL[2:0] bits in ICMR2. When the delay cycles count is reached, the IIC module places the required output (start, restart, or stop condition, data, or an ACK or NACK signal) on the SDA line.



Note: PCLK = PCLKB
Note 1. The output delay function is set by the DLCS and SDDL[2:0] bits when a start (ST), restart (RS), or stop (SP) condition is issued.

Figure 31.22 SDA output delay function

31.6 Digital Noise Filter Circuits

The internal circuitry sees the states of the SCLn and SDAn pins through analog and digital noise-filter circuits. Figure 31.23 shows a block diagram of the digital noise-filter circuit.

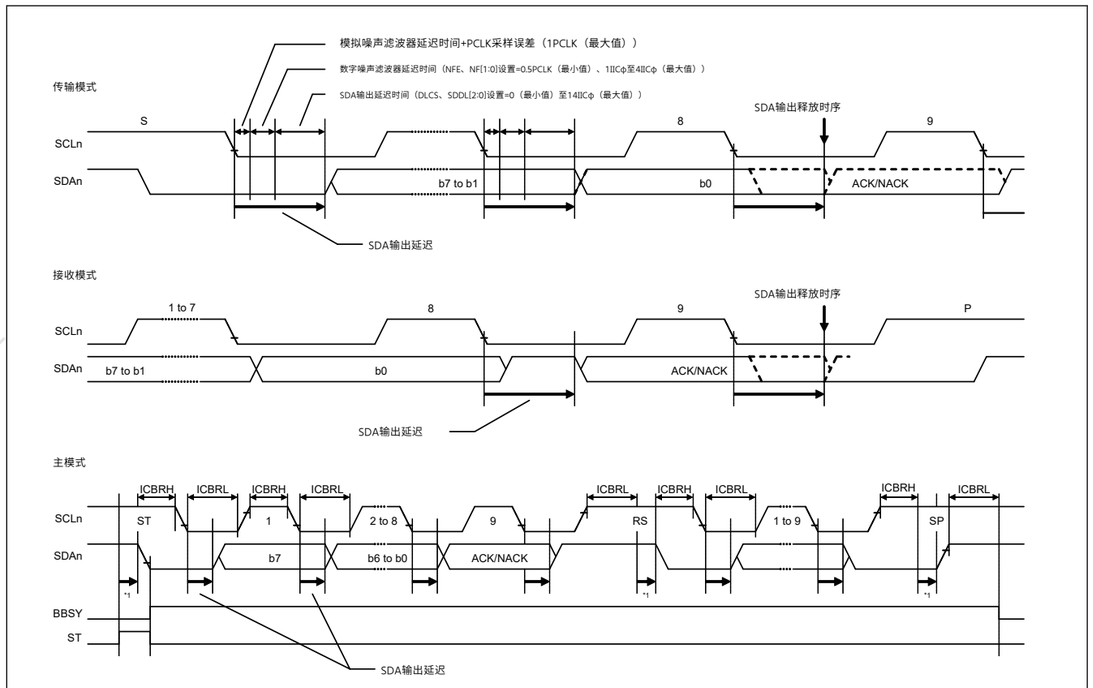
The on-chip digital noise-filter circuit of the IIC consists of four flip-flop circuit stages connected in series and a match-detection circuit. The number of valid stages in the digital noise filter is selected in the NF[1:0] bits in ICMR3. The selected number of valid stages determines the noise-filtering capability as a period from 1 to 4 IICφ cycles.

The input signal to the SCLn pin (or SDAn pin) is sampled on falling edges of the IICφ signal. When the input signal level matches the output level of the number of valid flip-flop circuit stages as selected in the NF[1:0] bits in ICMR3, the signal level is seen in the the subsequent stage. If the signal levels do not match, the previous value is saved.

If the ratio between the frequency of the internal operating clock (PCLKB) and the transfer rate is small, for example, if data transfer is 400 kbps with PCLKB = 4 MHz, the characteristics of the digital noise filter might lead to the elimination of

使用此功能，SDA输出从检测到SCL信号的下降沿开始延迟，以确保在SCL时钟为低电平的时间间隔内输出SDA信号。这种方法有助于防止通信设备的错误操作，旨在满足SMBus规范的300ns最小数据保持时间要求。通过将ICMR2中的SDDL[2:0]位设置为000b以外的值来启用输出延迟功能，通过将相同位设置为000b来禁用输出延迟功能。

例如，当SDA输出延迟功能使能时，ICMR2中的DLCS位选择SDA输出延迟计数器的时钟源，或者作为IIC模块的内部基准时钟(IICφ)，或者作为内部基准时钟除以2(IICφ2)。计数器计算ICMR2中SDDL[2:0]位中设置的周期数。当达到延迟周期计数时，IIC模块将所需的输出（启动、重启或停止条件、数据或ACK或NACK信号）放在SDA线上。



Note: PCLK = PCLKB
注1.当发出启动(ST)、重启(RS)或停止(SP)条件时，输出延迟功能由DLCS和SDDL[2:0]位设置。

Figure 31.22 SDA输出延迟功能

31.6 数字噪声滤波器电路

内部电路通过模拟和数字噪声滤波器电路查看SCLn和SDAn引脚的状态。图31.23显示了数字噪声滤波器电路的框图。

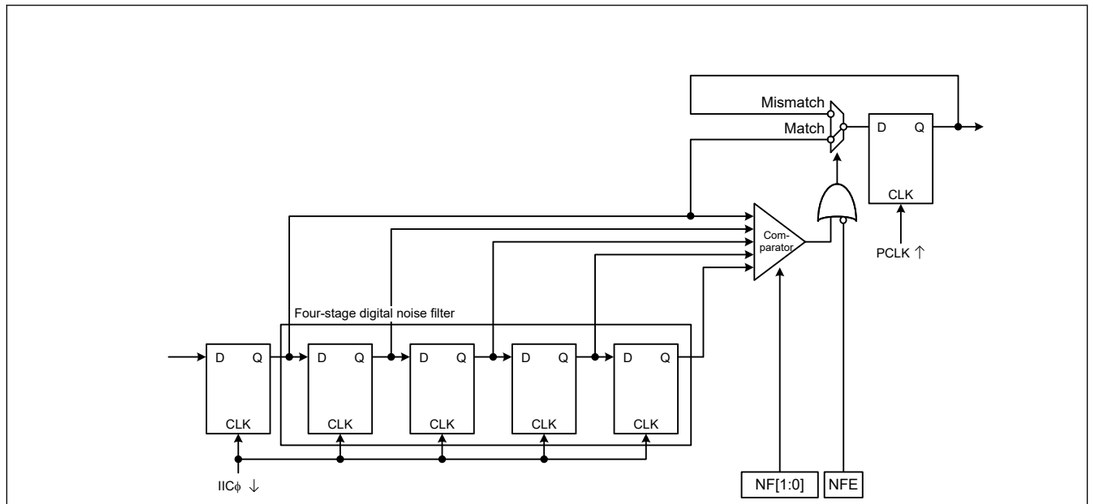
IIC的片上数字噪声滤波器电路由四个串联的触发器电路级和一个匹配检测电路组成。数字噪声滤波器的有效级数在ICMR3的NF[1:0]位中选择。选定的有效级数决定了噪声过滤能力，周期为1到4个IICφ周期。

SCLn引脚（或SDAn引脚）的输入信号在IICφ信号的下降沿采样。当输入信号电平与在ICMR3的NF[1:0]位中选择的有效触发器电路级数的输出电平相匹配时，将在后续级中看到信号电平。如果信号电平不匹配，则保存先前的值。

如果内部工作时钟(PCLKB)的频率与传输速率之间的比率很小，例如，如果数据传输为400kbps，PCLKB=4MHz，则数字噪声滤波器的特性可能会导致消除

RA生态工作室

required signals as noise. In such cases, it is possible to disable the digital noise-filter circuit by setting the ICFER.NFE bit to 0, and use only the analog noise filter circuit.



Note: PCLK = PCLKB

Figure 31.23 Digital noise filter circuit block diagram

31.7 Address Match Detection

The IIC can set three unique slave addresses in addition to the general call address and host address. The slave addresses can be 7-bit or 10-bit slave addresses.

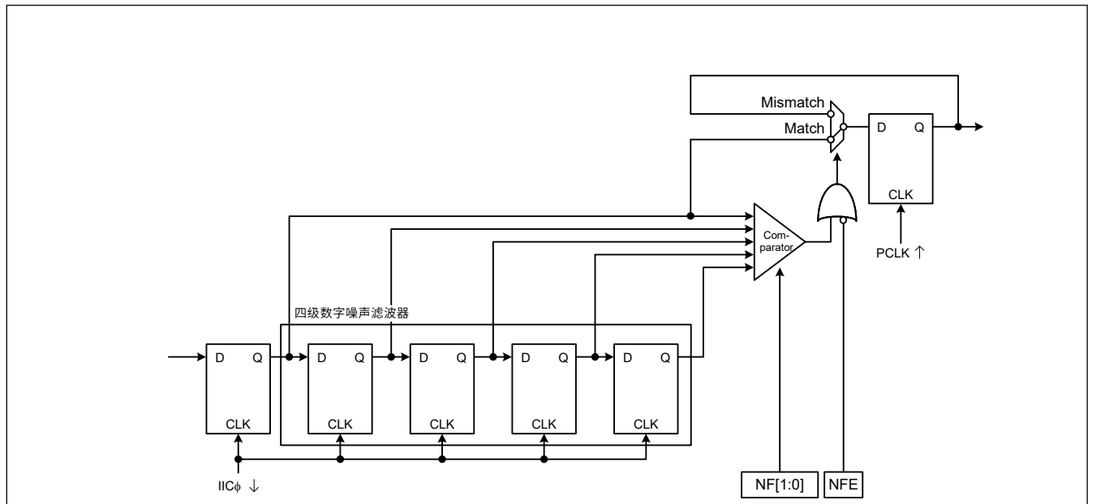
31.7.1 Slave-Address Match Detection

The IIC can set three unique slave addresses and has a slave address detection function for each unique slave address. When the SARyE bit (y = 0 to 2) in ICSER is set to 1, the slave addresses set in SARUy and SARLy (y = 0 to 2) can be detected.

When the IIC detects a match of the set slave address, the associated AASy flag (y = 0 to 2) in ICSR1 is set to 1 on the rising edge of the ninth SCL clock cycle, and the RDRF flag in ICSR2 or the TDRE flag in ICSR2 is set to 1 by the subsequent R/W# bit. This causes a receive data full interrupt (IICn_RXI) or transmit data empty interrupt (IICn_TXI) to be generated. The AASy flag identifies which slave address is specified.

Figure 31.24 to Figure 31.26 show the AASy flag set timing in three cases.

所需的信号作为噪声。在这种情况下，可以通过将ICFER.NFE位设置为0来禁用数字噪声滤波器电路，并仅使用模拟噪声滤波器电路。



Note: PCLK = PCLKB

Figure 31.23 数字噪声滤波器电路框图

31.7 地址匹配检测

IIC除了广播地址和主机地址外，还可以设置三个唯一的从机地址。从地址可以是7位或10位从地址。

31.7.1 从地址匹配检测

IIC可以设置三个唯一的从机地址，并对每个唯一的从机地址具有从机地址检测功能。当ICSER中的SARyE位（y=0到2）设置为1时，可以检测到设置在SARUy和SARLy（y=0到2）中的从机地址。

当IIC检测到与设置的从地址匹配时，ICSR1中相关的AASy标志（y=0到2）在第9个SCL时钟周期的上升沿设置为1，并且ICSR2中的RDRF标志或TDRE标志ICSR2中的1由随后的RW#位设置为1。这会导致产生接收数据满中断（IICn_RXI）或发送数据空中断（IICn_TXI）。AASy标志标识指定了哪个从地址。

图31.24至图31.26显示了三种情况下的AASy标志设置时序。

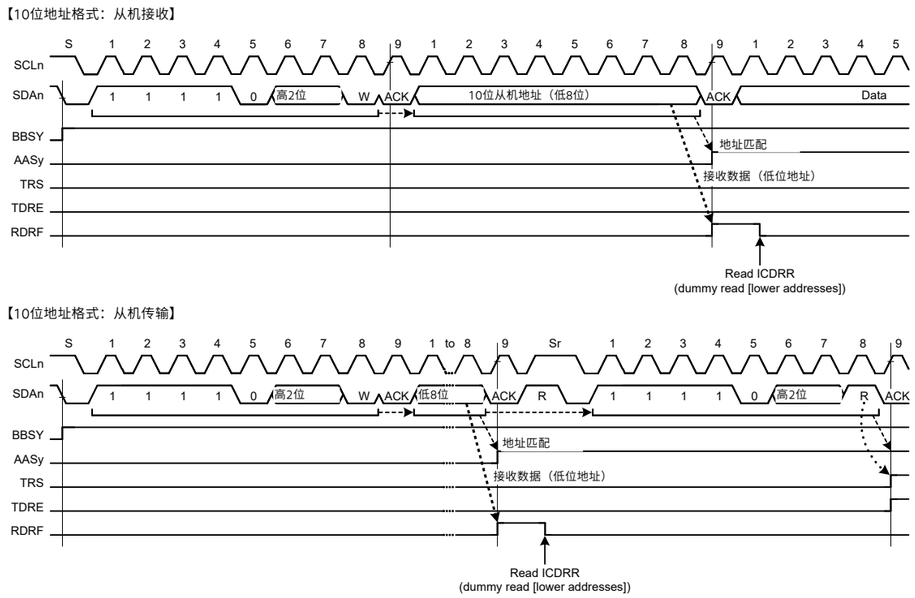

Figure 31.25 10位地址格式的AASy标志设置时序

RA生态工作室

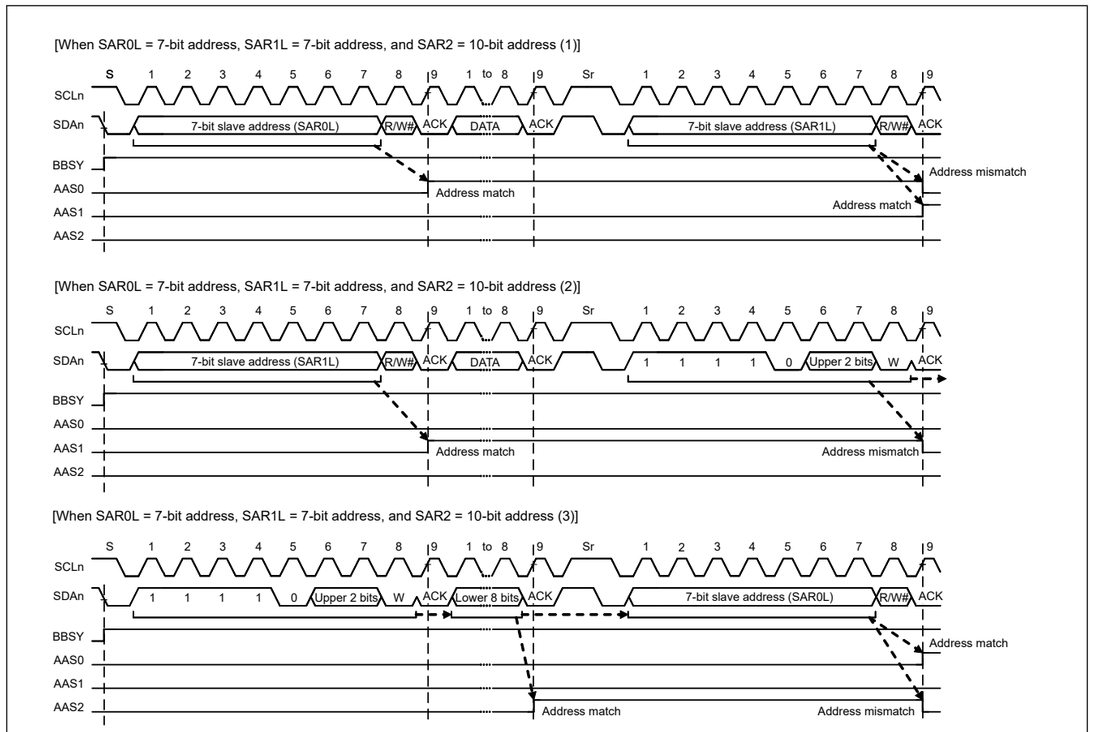

Figure 31.26 AASy flag set and clear timing with mixed 7-bit and 10-bit address formats

31.7.2 Detection of General Call Address

The IIC provides detection of the general call address (0000 000b + 0 [W]). This is enabled by setting the GCAE bit in ICSER to 1.

If the address received after a start or restart condition is issued is 0000 000b + 1[R] (start byte), the IIC recognizes this as the address of a slave device with an all-zero address, but not as the general call address.

When the IIC detects the general call address, both the GCA flag in ICSR1 and the RDRF flag in ICSR2 set to 1 on the rising edge of the ninth cycle of the SCL clock. This leads to the generation of a receive data full interrupt (IICn_RXI). The value of the GCA flag can be checked to confirm that the general call address was transmitted.

Operation after detection of the general call address is the same as normal slave receive operation.

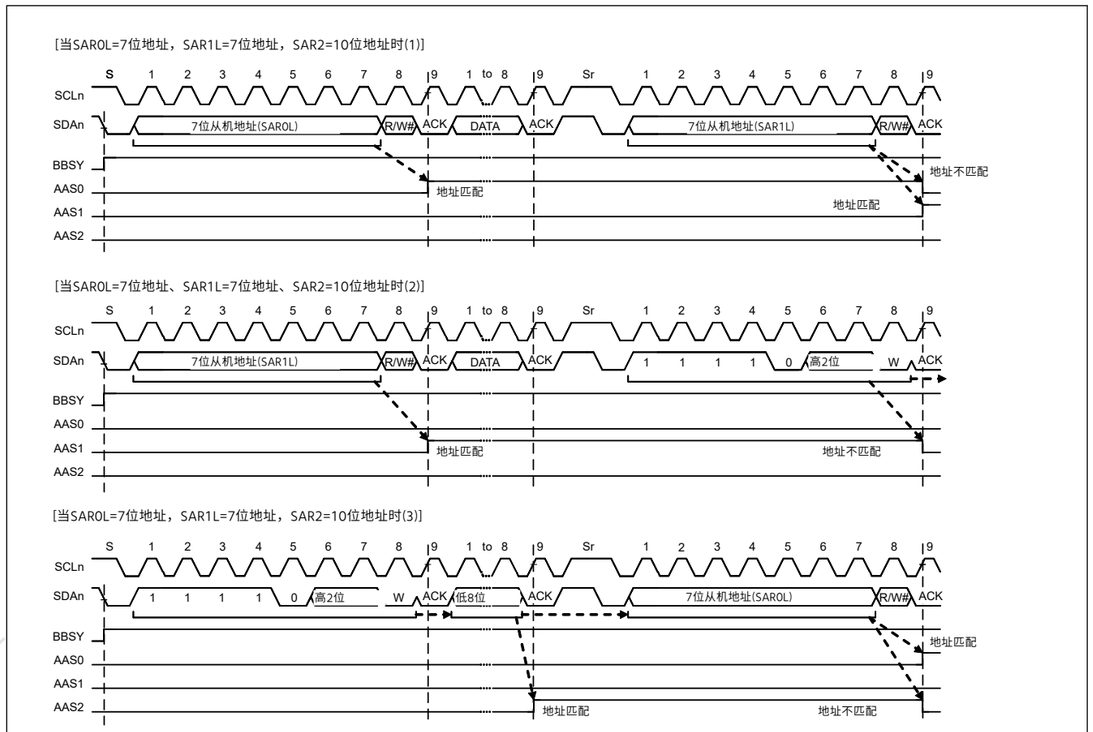

Figure 31.26 混合7位和10位地址格式的AASy标志设置和清除时序

31.7.2 广播呼叫地址检测

IIC提供对广播呼叫地址(0000000b+0[W])的检测。这是通过设置GCAE位启用
ICSER to 1.

如果在发出启动或重新启动条件后接收到的地址是0000000b+1[R]（起始字节），则IIC将其识别为具有全零地址的从设备的地址，但不是广播地址.

当IIC检测到广播呼叫地址时，ICSR1中的GCA标志和ICSR2中的RDRF标志都在SCL时钟的第9个周期的上升沿设置为1。这会导致接收数据完全中断(IICn_RXI)的产生。可以检查GCA标志的值以确认广播呼叫地址已被传输。

检测到广播呼叫地址后的操作与正常的从机接收操作相同。

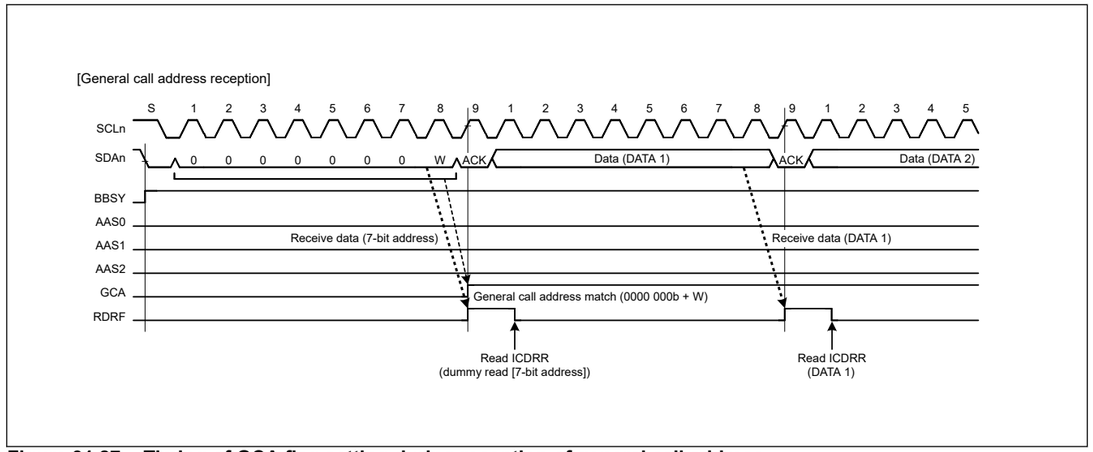

Figure 31.27 Timing of GCA flag setting during reception of general call address

31.7.3 Device-ID Address Detection

The IIC module provides detection of device-ID address compliant with the I^2C bus specification (revision 03). When the IIC receives 1111 100b as the first byte after a start or restart condition is issued with the DIDE bit in ICSER set to 1, it recognizes the address as a device ID, sets the DID flag in ICSR1 to 1 on the rising edge of the ninth SCL clock cycle when the subsequent R/W# bit is 0, then compares the second and subsequent bytes with its own slave address. If the address matches the value in the slave address register, the IIC sets the associated AASy flag (y = 0 to 2) in ICSR1 to 1.

When the first byte received after the issue of a start or restart condition matches the device ID address (1111 100b) again and the subsequent R/W# bit is 1, the IIC does not compare the second and subsequent bytes and sets the ICSR2.TDRE flag to 1.

In the device ID address detection function, the IIC sets the DID flag to 0 if a match with the IIC slave address is not obtained or a match with the device ID address is not obtained after a match with the IIC slave address and a restart condition is not detected. If the first byte after detection of a start or restart condition matches the device ID address (1111 100b), and the R/W# bit is 0, the IIC sets the DID flag to 1 and compares the second and subsequent bytes with the slave address of the IIC. If the R/W# bit is 1, the DID flag holds the previous value and the IIC does not compare the second and subsequent bytes. Therefore, the reception of a device ID address can be checked by reading the DID flag after confirming that TDRE = 1.

Additionally, prepare the device ID fields (3 bytes: 12 bits indicating the manufacturer + 9 bits identifying the part + 3 bits indicating the revision) that must be sent to the host after reception of a continuous device-ID field as normal transmit data. For details on the information that must be included in device ID fields, contact NXP Semiconductors.

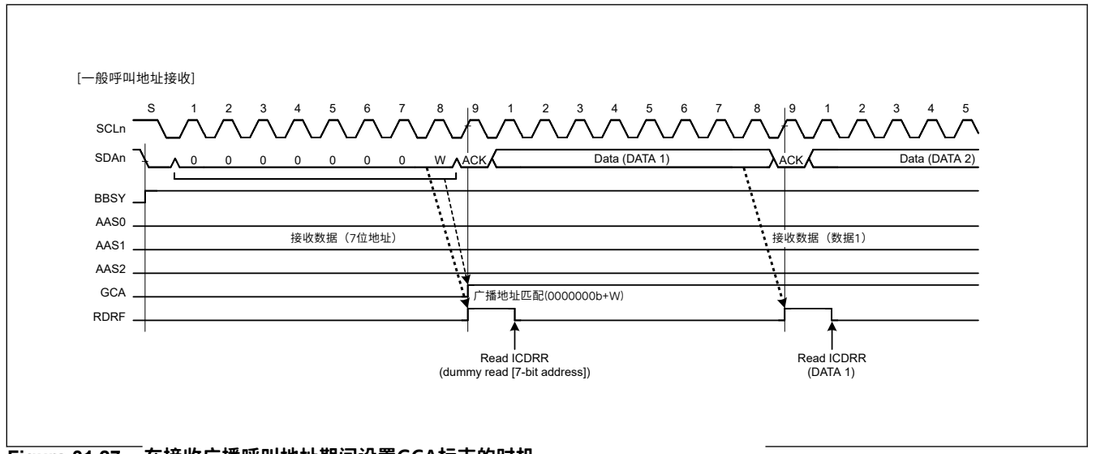

Figure 31.27 在接收广播呼叫地址期间设置GCA标志的时机

31.7.3 设备ID地址检测

IIC模块提供符合I2C总线规范（修订版03）的设备ID地址检测。当。。。的时候

IIC在ICSER中的DIDE位设置为1的情况下，在发出启动或重启条件后接收1111100b作为第一个字节，它将地址识别为设备ID，在第9个上升沿将ICSR1中的DID标志设置为1当后续的RW#位为0时，SCL时钟周期，然后将第二个和后续字节与其自己的从地址进行比较。如果地址与从地址寄存器中的值匹配，则IIC将ICSR1中相关的AASy标志（y=0到2）设置为1。

当发出启动或重启条件后接收到的第一个字节再次与设备ID地址(1111100b)匹配且后续RW#位为1时，IIC不比较第二个和后续字节并设置ICSR2.TDRE标志为1。

在设备ID地址检测功能中，如果没有获得与IIC从机地址匹配或在与IIC从机地址匹配和重启条件后未获得与设备ID地址匹配，则IIC将DID标志设置为0未检测到。如果检测到启动或重启条件后的第一个字节与设备ID地址(1111100b)匹配，并且RW#位为0，则IIC将DID标志设置为1，并将第二个和后续字节与从机地址进行比较IIC。如果RW#位为1，则DID标志保持前一个值，并且IIC不比较第二个和后续字节。因此，在确认TDRE=1后，可以通过读取DID标志来检查设备ID地址的接收。

此外，准备设备ID字段（3个字节：12位表示制造商+9位表示部件+3位表示版本）在接收到连续的设备ID字段作为正常发送数据后必须发送到主机。有关必须包含在设备ID字段中的信息的详细信息，请联系NXPSemiconductors。

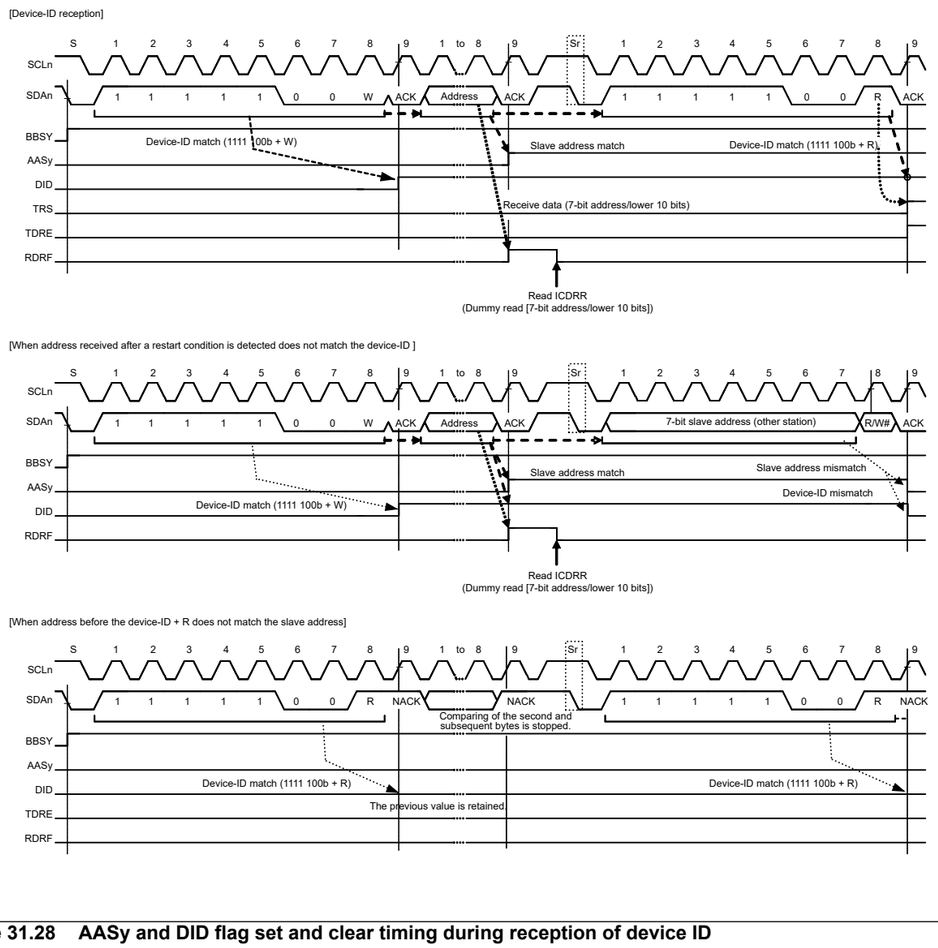

Figure 31.28 AASy and DID flag set and clear timing during reception of device ID

31.7.4 Host Address Detection

The IIC provides host address detection when operating in SMBus. When the HOAE bit in ICSER is set to 1 while the SMBS bit in ICMR3 is 1, the IIC can detect the host address (0001 000b) in slave receive mode (MST and TRS bits = 00b in ICCR2).

When the IIC detects the host address, the HOA flag in ICSR1 is set to 1 on the rising edge of the 9th SCL clock cycle, and at the same time, the RDRF flag in ICSR2 is set to 1 when the R/W# bit is 0 (Wr bit). This causes a receive data full interrupt (IICn_RXI) to be generated. The HOA flag indicates that the host address was sent from another device.

If the bit following the host address (0001 000b) is an Rd bit (R/W# bit = 1), the IIC can also detect the host address. After the host address is detected, the IIC operates in the same manner as in normal slave operation.

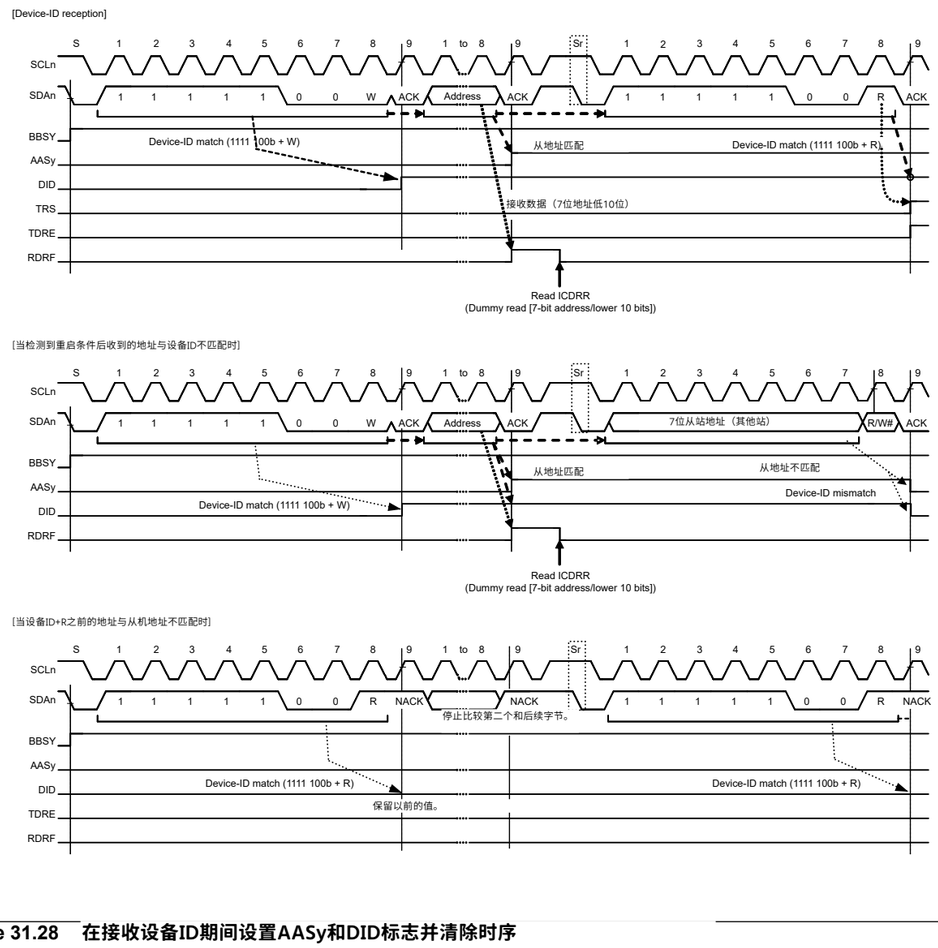

Figure 31.28 在接收设备ID期间设置AASy和DID标志并清除时序

31.7.4 主机地址检测

IIC在SMBus中运行时提供主机地址检测。当ICSER中的HOAE位设置为1而ICMR3中的SMBS位为1，IIC可以在从机接收模式下检测主机地址（0001000b）（ICCR2中的MST和TRS位=00b）。

当IIC检测到主机地址时，ICSR1中的HOA标志在第9个SCL时钟周期的上升沿置1，同时ICSR2中的RDRF标志在RW#位为0时置1（写位）。这会导致产生接收数据完全中断（IICn_RXI）。HOA标志表明主机地址是从另一个设备发送的。

如果主机地址（0001000b）后面的位是Rd位（RW#位=1），则IIC也可以检测主机地址。检测到主机地址后，IIC以与正常从机操作相同的方式运行。

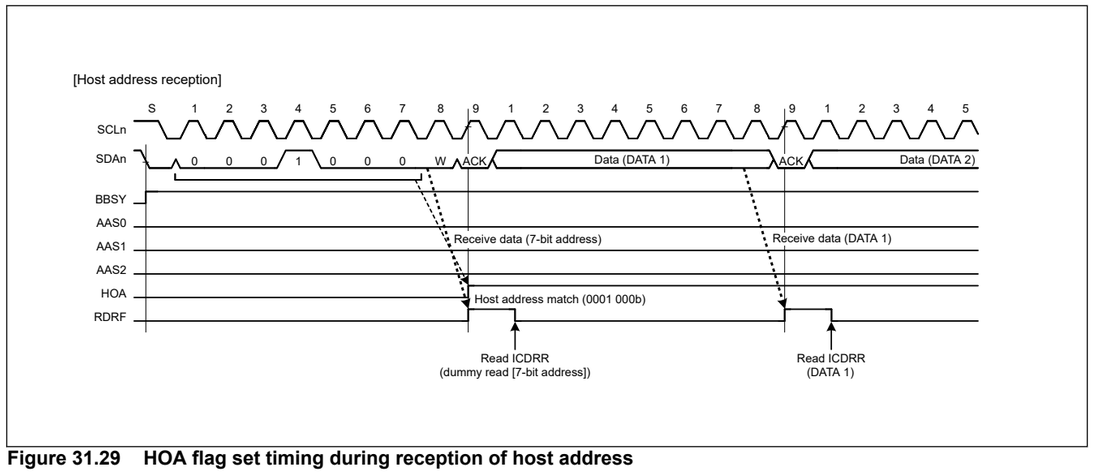

Figure 31.29 HOA flag set timing during reception of host address

31.8 Wakeup Function

The IIC provides a wakeup function that causes the MCU to transition from Software Standby mode or Snooze mode to normal operation. The wakeup function enables the reception of data when the system clock (PCLKB) is stopped, and generates a wakeup interrupt signal on a match of the slave address of the received data. This wakeup interrupt signal triggers the return to normal operation. After the wakeup interrupt occurs, switch the IIC to PCLKB synchronous operation so that communication can continue.

The wakeup function has four operation modes:

- Normal wakeup mode 1
- Normal wakeup mode 2
- Command recovery mode
- EEP response mode

Table 31.9 describes the behavior in these modes.

Table 31.9 Wakeup operation modes

Operation mode	ACK response timing	ACK response before wakeup to PCLKB synchronous operation	SCL state during wakeup to PCLKB synchronous operation
Normal wakeup mode 1	Before wakeup to PCLKB synchronous operation*1	ACK	Fixed low
Normal wakeup mode 2	After wakeup to PCLKB synchronous operation*2	Before wakeup: no response (NACK level retained) After wakeup: ACK response	Fixed low
Command recovery mode	Before wakeup to PCLKB synchronous operation*1	ACK	Open
EEP response mode	Before recovery to PCLKB synchronous operation*1	NACK	Open

Note 1. Switching timing from PCLKB asynchronous operation to PCLKB synchronous operation is the falling edge of the 9th clock of the SCL.
Note 2. Switching timing from PCLKB asynchronous operation to PCLKB synchronous operation is the falling edge of the 8th clock of the SCL.

The following can be selected as wakeup interrupt sources:

- Host address detection (valid when ICSER.HOAE = 1)
- General call address detection (valid when ICSER.GCAE = 1)
- Slave address 0*1 detection (valid when ICSER.SAR0E = 1)

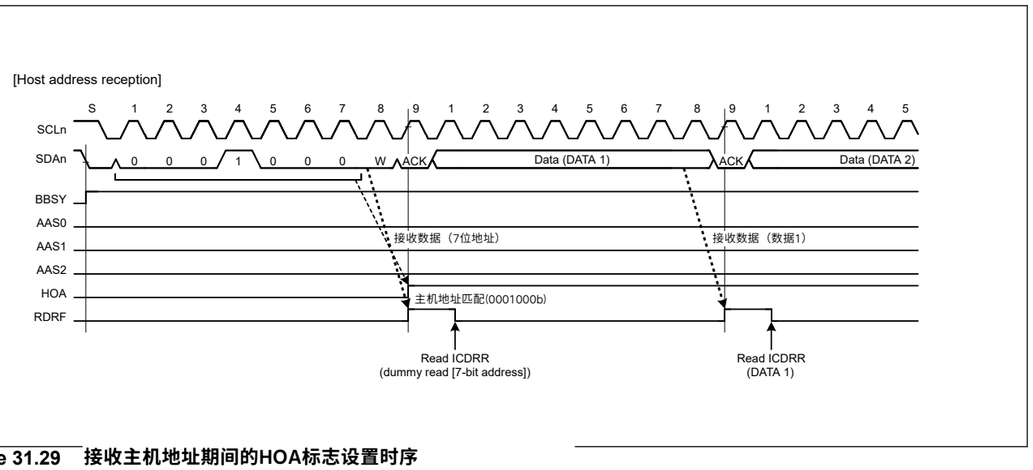

Figure 31.29 接收主机地址期间的HOA标志设置时序

31.8 唤醒功能

IIC提供唤醒功能，使MCU从软件待机模式或贪睡模式转换到正常操作。唤醒功能在系统时钟（PCLKB）停止时启用数据接收，并在接收到的数据的从地址匹配时产生唤醒中断信号。该唤醒中断信号触发恢复正常操作。唤醒中断发生后，将IIC切换为PCLKB同步操作，以便继续通信。

唤醒功能有四种操作模式：

- ●正常唤醒模式1
- ●正常唤醒模式2
- ●命令恢复模式
- ●EEP响应方式

表31.9描述了这些模式下的行为。

Table 31.9 唤醒操作模式

操作模式	ACK响应时间	唤醒前的ACK响应到PCLKB同步操作	唤醒到PCLKB同步操作期间的SCL状态
正常唤醒模式1	唤醒到PCLKB同步操作之前*1	ACK	固定低
正常唤醒模式2	唤醒到PCLKB同步操作后*2	唤醒前：无响应（保留NACK电平） 唤醒后：ACK响应	固定低
命令恢复模式	唤醒到PCLKB同步操作之前*1	ACK	Open
EEP响应模式	恢复到PCLKB同步操作之前*1	NACK	Open

注1.从PCLKB异步操作切换到PCLKB同步操作的时序是第9个时钟的下降沿SCL.
注2.从PCLKB异步操作切换到PCLKB同步操作的时序是第8个时钟的下降沿SCL.

可以选择以下作为唤醒中断源：

- ●主机地址检测（当ICSER.HOAE=1时有效）
- ●广播地址检测（ICSER.GCAE=1时有效）
- ●从机地址0*1检测（在ICSER.SAR0E=1时有效）

- Slave address 1*1 detection (valid when ICSER.SAR1E = 1)
- Slave address 2*1 detection (valid when ICSER.SAR2E = 1)

Note 1. Only 7-bit address can be set. Set the FS bit in SARUy (y = 0 to 2) to 0.

Precautions on the use of the wakeup function

- Do not change the content of the IIC registers except the WUSEN bit in ICWUR2 while the WUASYF flag in ICWUR2 is 1 (during PCLKB asynchronous operation).
- Set ICWUR.WUE and ICWUR.WUIE to 1, and ICCR2.MST and ICCR2.TRS to 0 (slave reception mode) before switching to PCLKB asynchronous mode.
- The device ID and the 10-bit slave address cannot be selected for the wakeup interrupt source. Set the DIDE bit in ICSER and FS bit in SARUy (y = 0 to 2) to 0.
- Set bits TIE, TEIE, RIE, NAKIE, SPIE, STIE, ALIE, and TMOIE in the ICIER register to 0 (interrupt disabled) before switching to the asynchronous operation.
- When the wakeup function is enabled, do not use the timeout function (ICWUR.WUE = 1)
- Even when a wakeup interrupt is generated during PCLKB asynchronous operation (when ICWUR2.WUASYF = 1), if the slave addresses match in PCLKB synchronous mode (ICWUR2.WUASYF = 0), the wakeup interrupt does not occur and the WUF flag is not set.
- If the timing of writing 0 to the ICWUR2.WUSEN bit and the timing of detecting a start condition conflict, the IIC might start the next reception in PCLKB synchronous operation mode. In this case, ICWUR2.WUASYF flag becomes 1 (switch to PCLKB asynchronous mode) when data communication is complete, a stop condition is detected, and detection of a wakeup event starts.
- After writing 0 to the WUSEN bit in ICWUR2, do not change registers relate to the IIC operation mode setting (ICMR3, ICSER, and SARLy) until the mode is switched to PCLKB asynchronous operation from PCLKB synchronous operation (while the ICWUR2.WUASYF flag is 1). If the register value changes during this period by an interrupt handling or another factor, the IIC might malfunction before switching to the asynchronous operation.

31.8.1 Normal Wakeup Mode 1

This section describes the behavior, the timing, and an example operation of normal wakeup mode 1.

In normal wakeup mode 1, a wakeup interrupt triggered by the match of the slave address initiates the transition to normal operation as follows:

Before wakeup:	ACK is sent in response to the data received with its own slave address of the IIC.
During wakeup:	ACK response is made on the 9th clock cycle of SCL, after which SCL is held low*1.
After wakeup:	Normal operation continues.

Note 1. Between the 9th clock cycle and 1st clock cycle during wakeup, WAIT = 1 is invalid.

If the slave address does not match, the SCL line is not held low after the 9th clock cycle of SCL, and the slave operation continues. Figure 31.30 shows an operation example, and Figure 31.32 shows the detailed timing.

If the transition from Software Standby mode or Snooze mode is triggered by an interrupt other than a wakeup interrupt, for example the IRQn, the WUF flag is not set to 1. Figure 31.31 shows an operation example.

●从机地址1*1检测（当ICSER.SAR1E=1时有效）

●从机地址2*1检测（当ICSER.SAR2E=1时有效）

注1.只能设置7位地址。将SARUy（y=0到2）中的FS位设置为0。

唤醒功能使用注意事项

●当ICWUR2的WUASYF标志为1时（PCLKB异步操作期间），不要改变ICWUR2中除WUSEN位以外的IIC寄存器的内容。

●在切换到PCLKB异步模式之前，将ICWUR.WUE和ICWUR.WUIE设置为1，并将ICCR2.MST和ICCR2.TRS设置为0（从接收模式）。

●唤醒中断源不能选择设备ID和10位从机地址。将ICSER中的DIDE位和SARUy（y=0到2）中的FS位设置为0。

●在切换到异步操作之前，将ICIER寄存器中的TIE、TEIE、RIE、NAKIE、SPIE、STIE、ALIE和TMOIE位设置为0（禁止中断）。

●启用唤醒功能时，不要使用超时功能（ICWUR.WUE=1）

●即使在PCLKB异步操作期间（ICWUR2.WUASYF=1）产生唤醒中断，如果在PCLKB同步模式下从机地址匹配（ICWUR2.WUASYF=0），唤醒中断不会发生并且WUF标志不放。

●如果向ICWUR2.WUSEN位写入0的时序与检测启动条件的时序冲突，则IIC可能会在PCLKB同步操作模式下开始下一次接收。在这种情况下，当数据通信完成时，ICWUR2.WUASYF标志变为1（切换到PCLKB异步模式），检测到停止条件，并开始检测唤醒事件。

●在ICWUR2的WUSEN位写入0后，不要更改与IIC操作模式设置相关的寄存器（ICMR3、ICSER和SARLy），直到模式从PCLKB同步操作切换到PCLKB异步操作（同时ICWUR2.WUASYF标志是1）。如果在此期间寄存器值因中断处理或其他因素而发生变化，则IIC可能会在切换到异步操作之前发生故障。

31.8.1 正常唤醒模式1

本节介绍正常唤醒模式1的行为、时序和示例操作。

在正常唤醒模式1中，由匹配从机地址触发的唤醒中断启动到正常操作的转换，如下所示：

Before wakeup:	ACK是响应接收到的带有IIC从机地址的数据而发送的。
During wakeup:	在SCL的第9个时钟周期做出ACK响应，之后SCL保持低电平*1。
After wakeup:	正常操作继续。

注1.在唤醒期间的第9个时钟周期和第1个时钟周期之间，WAIT=1无效。

如果从机地址不匹配，则SCL线在SCL的第9个时钟周期后不保持低电平，从机操作继续。图31.30显示了一个操作示例，图31.32显示了详细的时序。

如果从软件待机模式或贪睡模式的转换是由唤醒中断以外的中断触发的，例如IRQn，则WUF标志不设置为1。图31.31显示了一个操作示例。

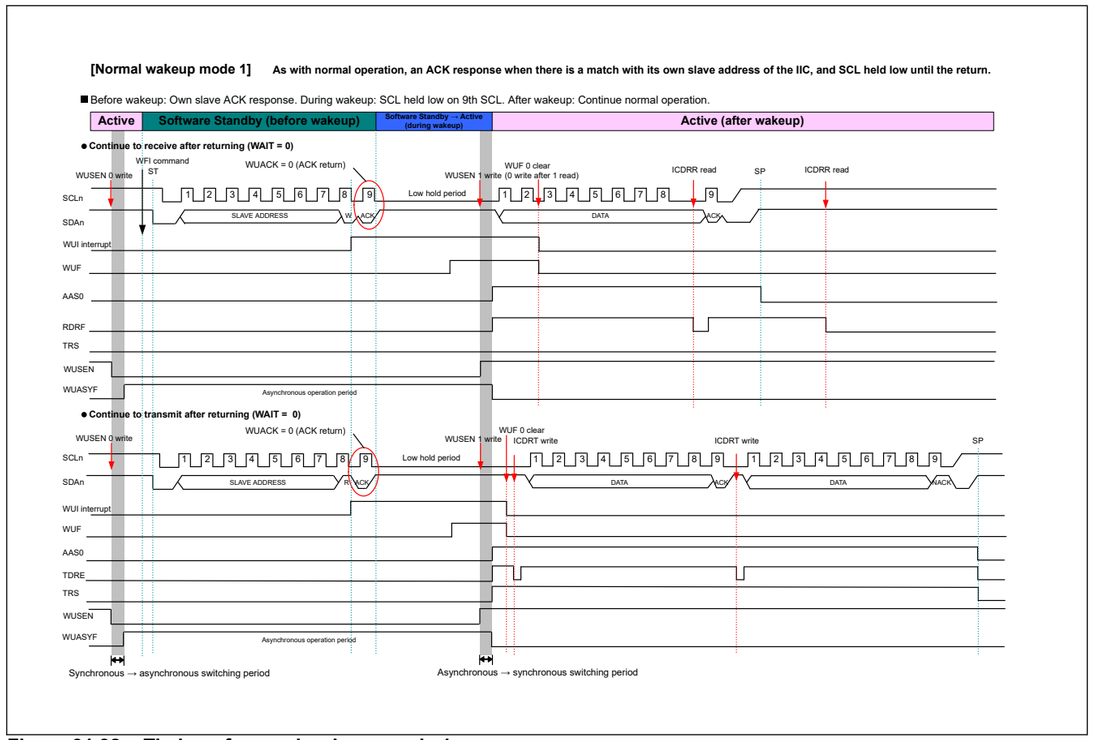

Figure 31.32 Timing of normal wakeup mode 1

31.8.2 Normal Wakeup Mode 2

This section describes the behavior, the timing, and an example operation of normal wakeup mode 2.

In normal wakeup mode 2, a wakeup interrupt triggered by a match of the slave address initiates the transition to normal operation as follows:

Before wakeup:	No response to data received with its own slave address until the end of the 8th SCL cycle.
During wakeup:	SCL line held low during the 8th and 9th clock cycles.
After wakeup:	ACK returns on the 9th clock cycle of SCL, and normal operation continues.

If the slave address does not match, the SCL line is not held low after the 8 th SCL clock cycle, and the slave operation continues. Figure 31.33 shows an example operation, and Figure 31.34 shows the detailed timing.

If the transition from Software Standby mode or Snooze mode is triggered by an interrupt other than a wakeup interrupt, such as the IRQn, for example, the WUF flag is not set to 1. Figure 31.31 shows an operation example.

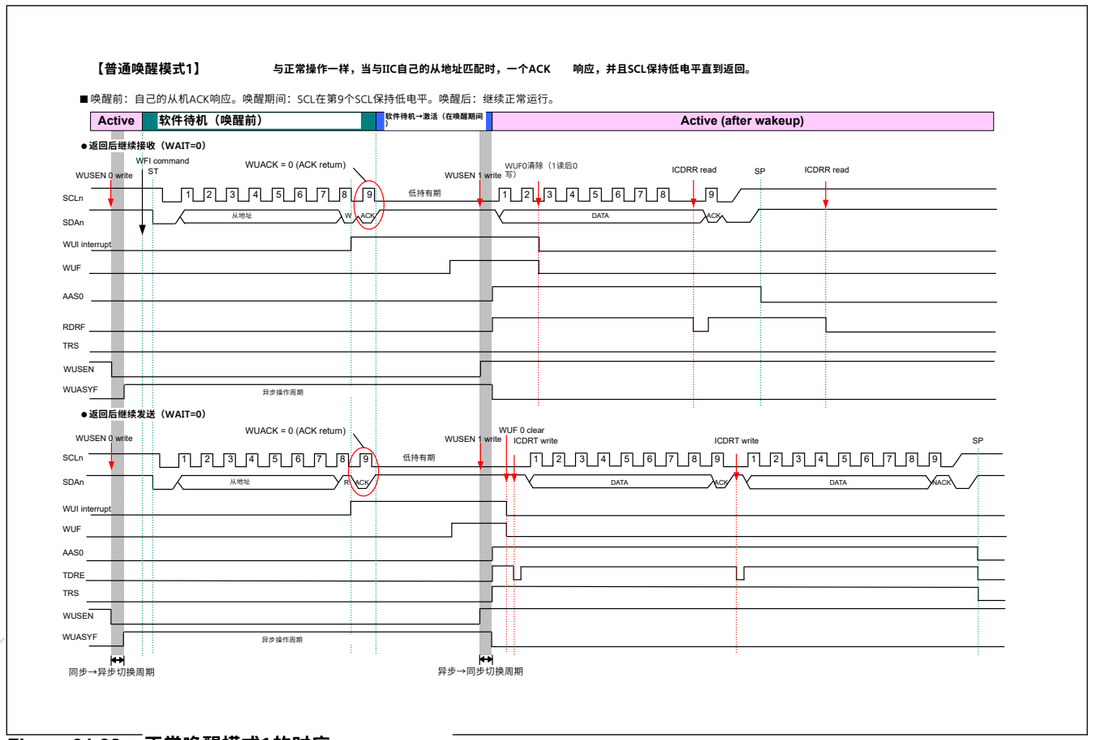

Figure 31.32 正常唤醒模式1的时序

31.8.2 正常唤醒模式2

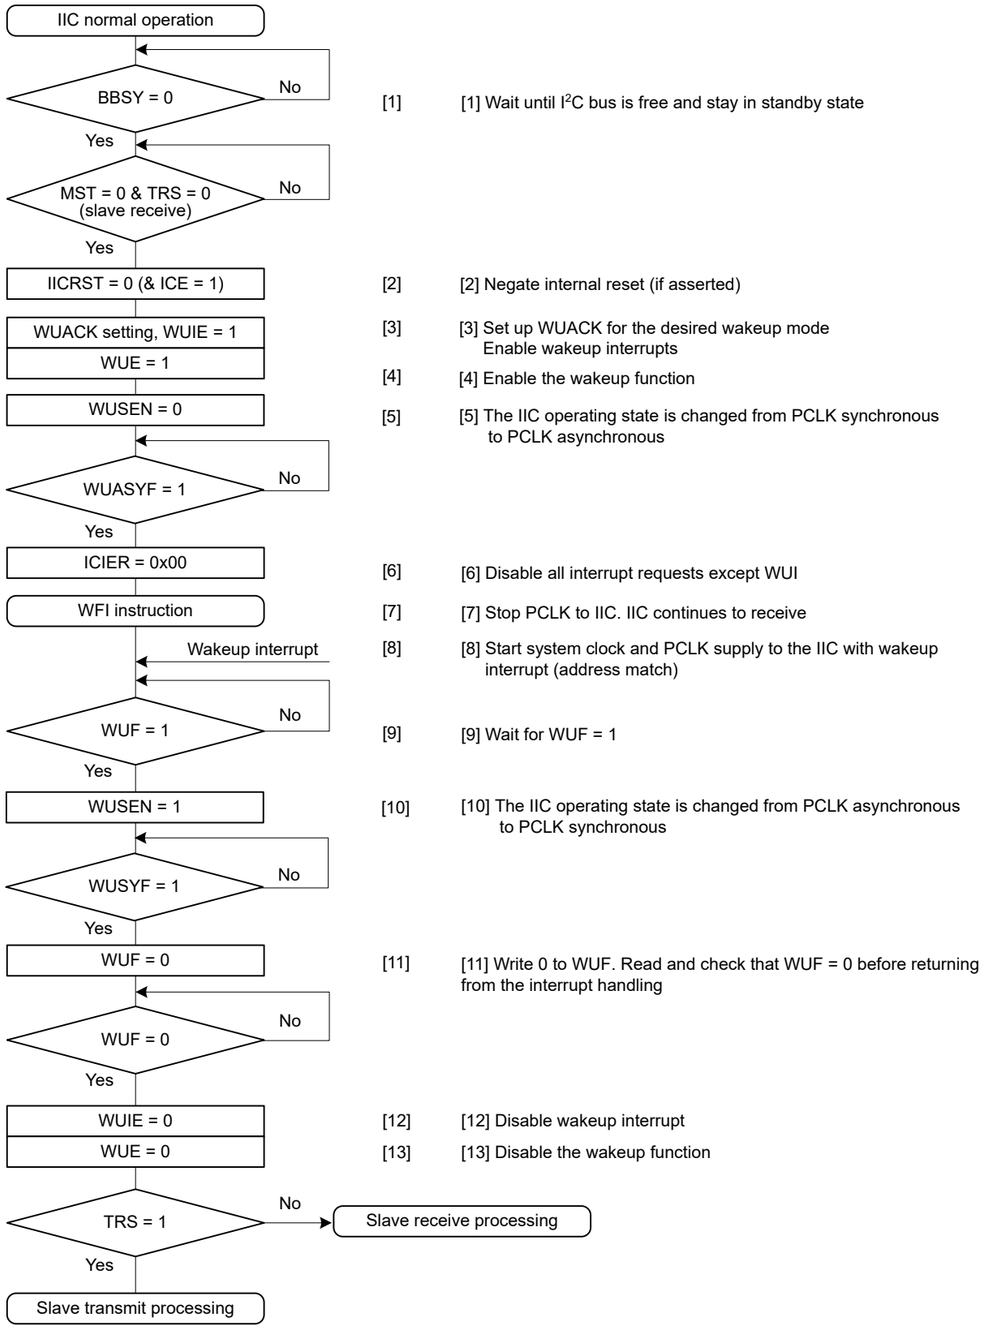
本节介绍正常唤醒模式2的行为、时序和示例操作。

在正常唤醒模式2中，由匹配从机地址触发的唤醒中断会启动到正常操作的转换，如下所示：

Before wakeup:	直到第8个SCL周期结束，才对接收到的带有自己的从地址的数据作出响应。
During wakeup:	SCL线在第8和第9个时钟周期内保持低电平。
After wakeup:	ACK在SCL的第9个时钟周期返回，并继续正常操作。

如果从机地址不匹配，则SCL线在第8个SCL时钟周期后不会保持低电平，从机操作继续。图31.33显示了一个示例操作，图31.34显示了详细的时序。

如果从软件待机模式或贪睡模式的转换是由唤醒中断以外的中断触发的，例如IRQn，则WUF标志不设置为1。图31.31显示了一个操作示例。



Note: PCLK = PCLKB

Note: See Precautions on the use of the wakeup function.

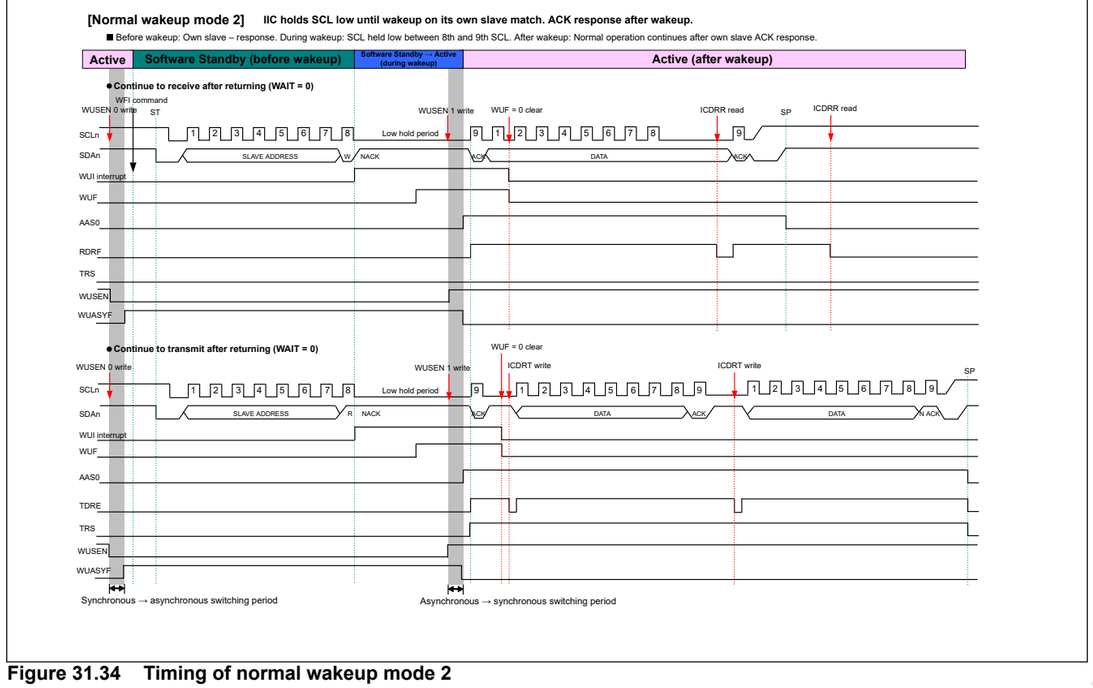

Figure 31.34 Timing of normal wakeup mode 2

31.8.3 Command Recovery Mode and EEP Response Mode (Special Wakeup Modes)

This section describes the behavior, the timing, and example operations of the command recovery and EEP response modes.

In the command recovery and EEP response modes, the SCL line is not held low during the wakeup period (after the rise of the 9th clock cycle of SCL). Therefore, other IIC devices can use the I^2C bus during this period.

A wakeup interrupt triggered by a match of the slave address initiates the transition to normal operation as follows:

Before wakeup:	In response to the data received with its own slave address, the IIC returns ACK (command recovery mode) or NACK (EEP response mode).
During wakeup:	The SCL line is not held low.
After wakeup:	Normal operation continues after IIC initialization.

If the slave address does not match, the slave operation continues.

Note: Because the SCL line is not held low during wakeup, transmission or reception of the data that follows the slave address is not possible.

Note: The command recovery and EEP response modes are internal reset states (ICE = IICRST = 1). Therefore, the match of the slave address does not set the flags, HOA, GCA, ASS0, ASS1, and ASS2 in the ICSR1 register.

Figure 31.35 shows an example operation in recovery and EEP response modes. Figure 31.37 shows the detailed timing.

If the transition from Software Standby mode or Snooze mode is triggered by an interrupt other than a wakeup interrupt, such as IRQn for example, the WUF flag is not set to 1. Follow the processing shown in Figure 31.36.

Note: 请参阅唤醒功能使用注意事项。

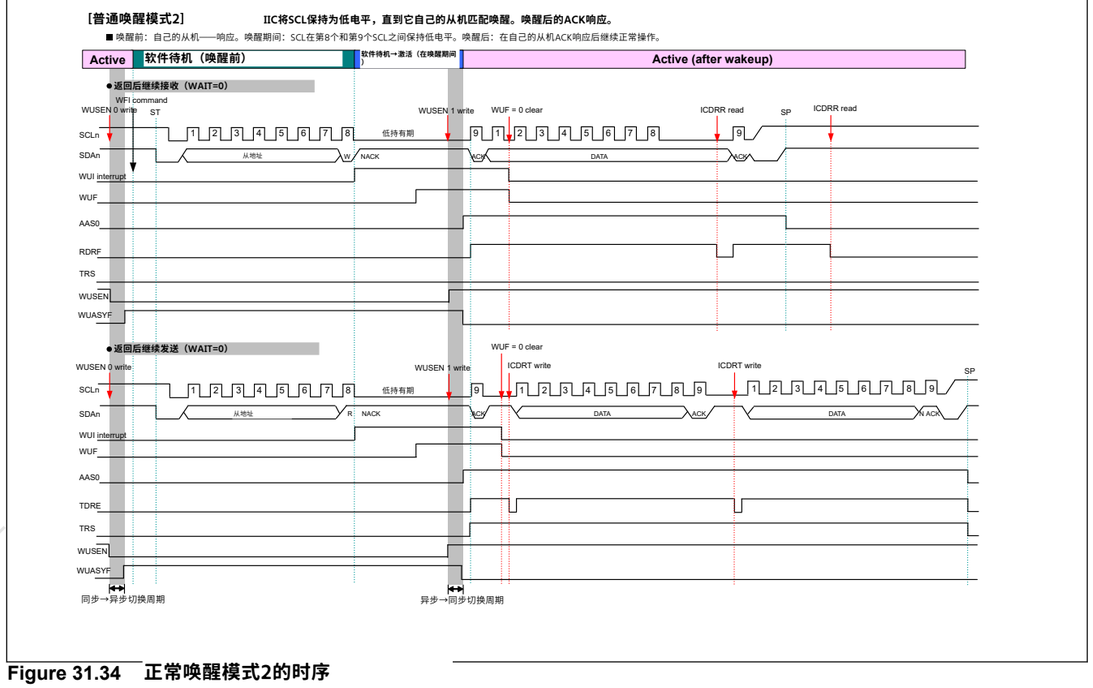

Figure 31.34 正常唤醒模式2的时序

31.8.3 命令恢复模式和EEP响应模式（特殊唤醒模式）

本节介绍命令恢复和EEP响应模式的行为、时序和示例操作。

在命令恢复和EEP响应模式下，SCL线在唤醒期间（在SCL的第9个时钟周期上升之后）不保持低电平。因此，其他IIC设备在此期间可以使用I2C总线。

由匹配从地址触发的唤醒中断会启动到正常操作的转换，如下所示：

Before wakeup:	IIC响应使用自己的从机地址接收到的数据，返回ACK（命令恢复模式）或NACK（EEP响应模式）。
During wakeup:	SCL线没有保持低电平。
After wakeup:	IIC初始化后继续正常操作。

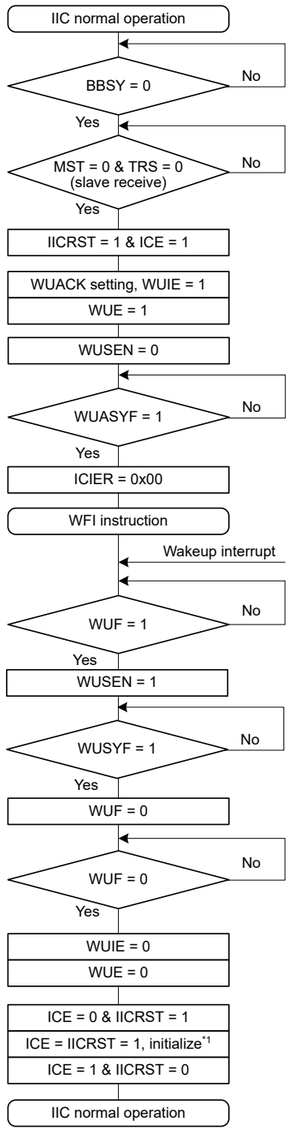
如果从机地址不匹配，从机操作继续。

Note: 因为SCL线在唤醒期间没有保持低电平，所以无法发送或接收跟随从地址的数据。

Note: 命令恢复和EEP响应模式是内部复位状态(ICE=IICRST=1)。因此，从地址的匹配不会设置ICSR1寄存器中的标志位HOA、GCA、ASS0、ASS1和ASS2。

图31.35显示了恢复和EEP响应模式下的示例操作。图31.37显示了详细的时序。

如果从软件待机模式或贪睡模式的转换是由唤醒中断以外的中断触发的，例如IRQn，则WUF标志不设置为1。按照图31.36中所示的处理。



[1] [1] Wait until I^2C bus is open and stay in standby state.

[2] [2] Internal reset is asserted.

[3] [3] Set up WUACK for the desired wakeup mode. Enable wakeup interrupt.

[4] [4] Enable wakeup function.

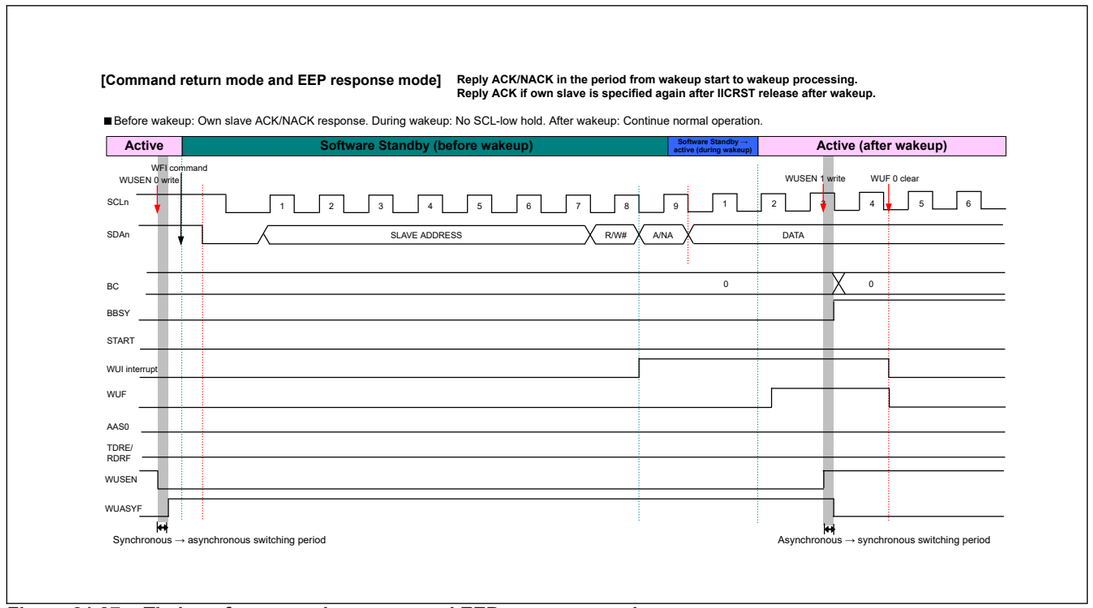

Figure 31.37 Timing of command recovery and EEP response modes

31.9 Automatic Low-Hold Function for SCL

31.9.1 Function to Prevent Wrong Transmission of Transmit Data

If the I²C Bus Shift Register (ICDRS) is empty and data has not been written to the I²C Bus Transmit Data Register (ICDRT) with the IIC in transmission mode (TRS bit = 1 in ICCR2), the SCLn line is automatically held low over the subsequent intervals. This low-hold period is extended until the transmit data is written, which prevents the unintended transmission of erroneous data.

Master transmit mode:

- Low-level interval after a start or restart condition is issued
- Low-level interval between the 9th clock cycle of one transfer and the 1st clock cycle of the next.

Slave transmit mode:

- Low-level interval between the 9th clock cycle of one transfer and the 1st clock cycle of the next.

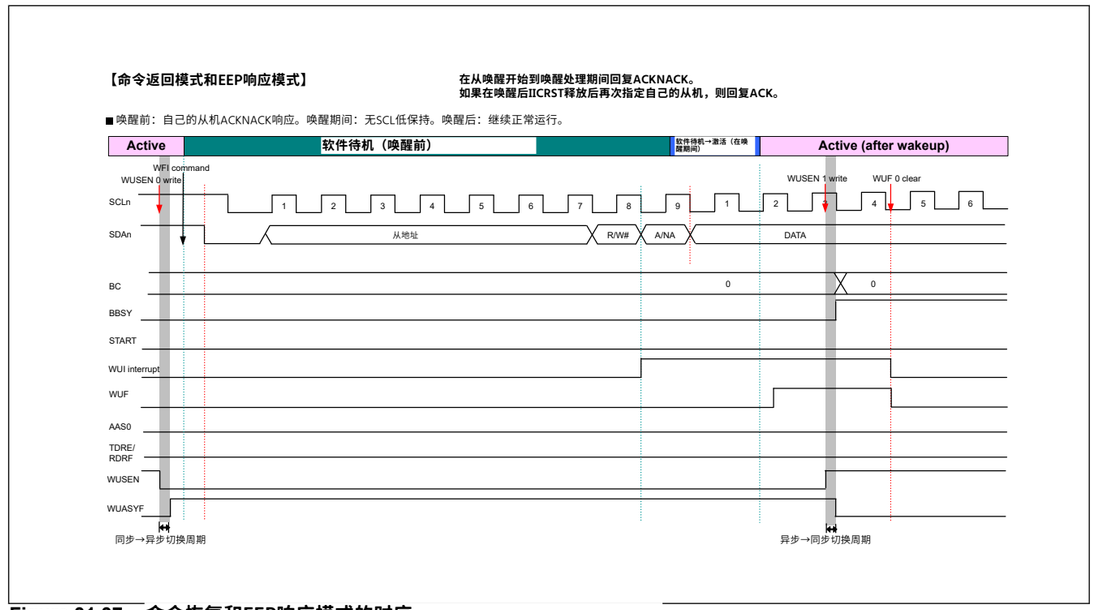

Figure 31.37 命令恢复和EEP响应模式的时序

31.9 SCL的自动低保持功能

31.9.1 防止传输数据错误传输的功能

如果I2C总线移位寄存器(ICDRS)为空且数据尚未写入I2C总线发送数据寄存器(ICDRT)且IIC处于传输模式（TRS位=ICCR2中的1），则SCLn线为在随后的时间间隔内自动保持低电平。这个低保持期一直延长到发送数据被写入，这样可以防止错误数据的意外传输。

主传输模式：

●发出启动或重启条件后的低电平间隔

●一次传输的第9个时钟周期和下一次传输的第1个时钟周期之间的低电平间隔。

从机发送模式：

●一次传输的第9个时钟周期和下一次传输的第1个时钟周期之间的低电平间隔。

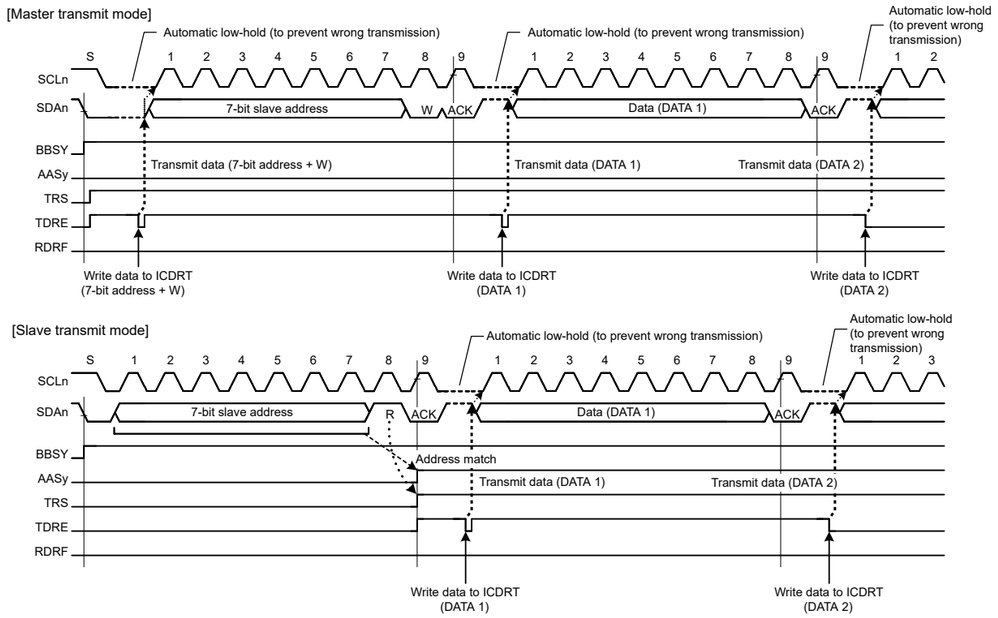

Figure 31.38 Automatic low-hold operation in transmit mode

31.9.2 NACK Reception Transfer Suspension Function

This function suspends transfer operation when NACK is received in transmit mode (TRS bit = 1 in ICCR2). This function is enabled when the NACKE bit in ICFER is set to 1. If the next transmit data is already written (TDRE flag = 0 in ICSR2) when NACK is received, the next data transmission on the falling edge of the 9th SCL clock cycle is automatically suspended. This prevents the SDAn line output level from being held low when the MSB of the next transmit data is 0.

If the transfer operation is suspended by this function (NACKF flag = 1 in ICSR2), transmit and receive operations are discontinued. To restore transmit or receive operation, after issuing the restart condition, you need to set the NACKF flag to 0 and try again, or set the NACKF flag to 0 after issuing the stop condition and then start again from issuing the start condition..

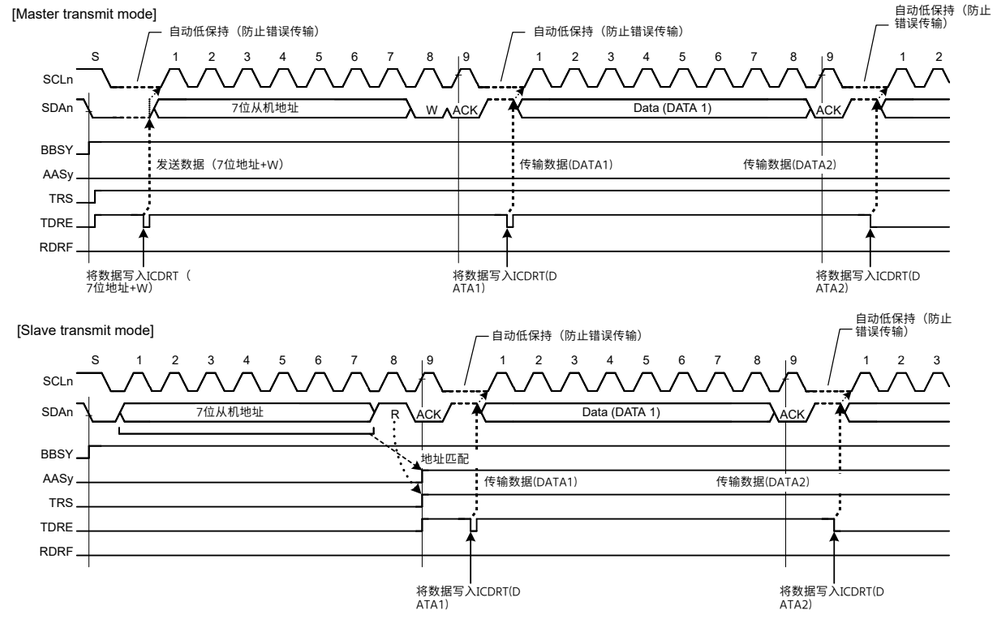

Figure 31.38 发送模式下的自动低保持操作

31.9.2 NACK接收传输暂停功能

当在发送模式下接收到NACK（ICCR2中的TRS位=1）时，该函数暂停传输操作。当ICFER中的NACKE位设置为1时，此功能使能。如果在收到NACK时已经写入下一个发送数据（ICSR2中的TDRE标志=0），则在第9个SCL时钟周期的下降沿进行下一个数据发送被自动挂起。这可以防止SDAn线路输出电平在下一个发送数据的MSB为0时保持低电平。

如果传输操作被该函数挂起（ICSR2中的NACKF标志=1），发送和接收操作将中断。要恢复发送或接收操作，在发出重启条件后，您需要将NACKF标志设置为0并重试，或者在发出停止条件后将NACKF标志设置为0，然后从发出启动条件重新开始。

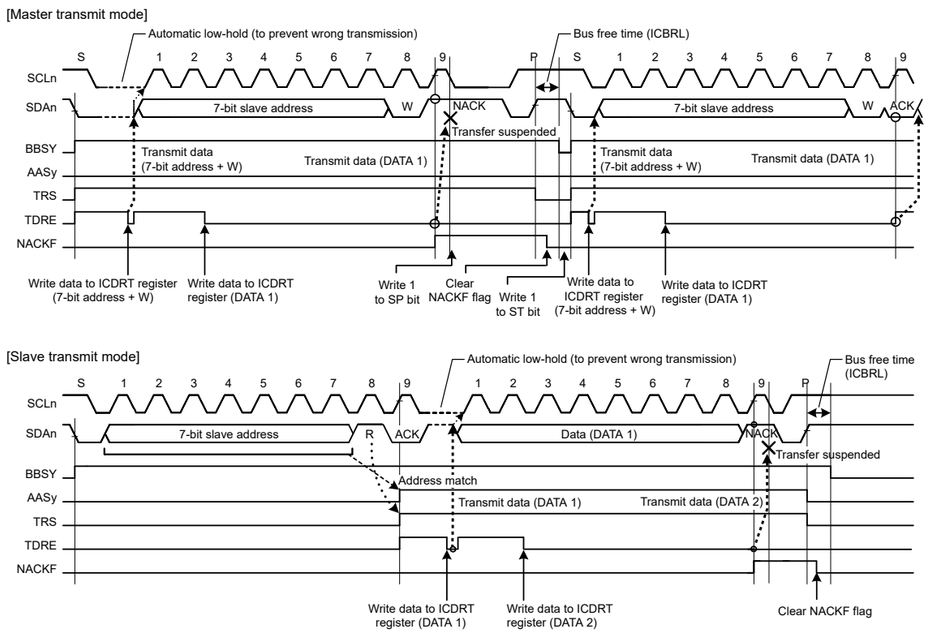

Figure 31.39 Suspension of data transfer when NACK is received, when NACKE = 1

31.9.3 Function to Prevent Failure to Receive Data

If response processing is delayed when receive data (ICDRR) read is delayed for a period of one transfer frame or more with receive data full (RDRF flag = 1 in ICSR2) in receive mode (TRS = 0 in ICCR2), the IIC holds the SCLn line low automatically immediately before the next data is received to prevent a failure to receive data.

This function is enabled even if the read processing of the final receive data is delayed and, in the meantime, the IIC slave address is designated after a stop condition is issued. This function does not interfere with other communication because the IIC does not hold the SCLn line low when a mismatch with its own slave address occurs after a stop condition is issued.

Periods in which the SCLn line is held low can be selected with a combination of the WAIT and RDRFS bits in ICMR3.

(1) 1-byte receive operation and automatic low-hold function using the WAIT bit

When the WAIT bit in ICMR3 is set to 1, the IIC performs a 1-byte receive operation using the WAIT bit function. Additionally, when the ICMR3.RDRFS bit is 0, the IIC automatically sends the ACKBT bit value in ICMR3 for the acknowledge bit in the period from the falling edge of the 8th SCL clock cycle to the falling edge of the 9th SCL clock cycle, and automatically holds the SCLn line low on the falling edge of the 9th SCL clock cycle using the WAIT bit function. This low-hold is released by reading data from ICDRR, which enables byte-wise receive operation.

The WAIT bit function is enabled for receive frames after a match with the IIC slave address, including the general call address and host address, is obtained in master or slave receive mode.

(2) 1-byte receive operation (ACK/NACK transmission control) and automatic low-hold function using the RDRFS bit

When the RDRFS bit in ICMR3 is set to 1, the IIC performs a 1-byte receive operation using the RDRFS bit function. When the RDRFS bit is set to 1, the RDRF flag in ICSR2 is set to 1 (receive data full) on the rising edge of the eighth SCL clock cycle, and the SCLn line is automatically held low on the falling edge of the eighth SCL clock cycle. This low-hold is released by writing a value to the ACKBT bit in ICMR3, but cannot be released by reading data from ICDRR, which enables receive operation through the ACK or NACK transmission control based on the data received in byte units.

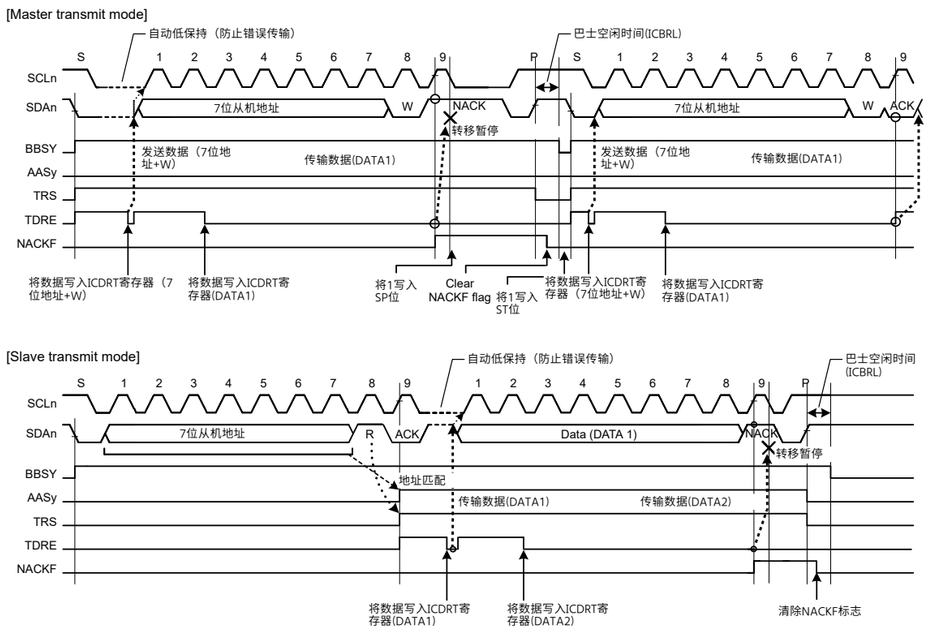

Figure 31.39 接收到NACK时暂停数据传输，当NACKE=1

31.9.3 防止数据接收失败的功能

如果在接收模式（ICCR2中的TRS=0）下接收数据（ICDRR）读取延迟一个传输帧或更长时间且接收数据已满（ICSR2中的RDRF标志=1）时响应处理延迟，则IIC保持在接收到下一个数据之前，SCLn线自动变为低电平，以防止接收数据失败。

即使最终接收数据的读取处理延迟，该功能也有效，同时，在发出停止条件后指定IIC从机地址。此功能不会干扰其他通信，因为在发出停止条件后发生与其自己的从地址不匹配时，IIC不会将SCLn线保持为低电平。

SCLn线保持低电平的周期可以通过ICMR3中的WAIT和RDRFS位的组合来选择。

(1) 使用WAIT位的1字节接收操作和自动低保持功能

当ICMR3中的WAIT位设置为1时，IIC使用WAIT位功能执行1字节接收操作。此外，当ICMR3.RDRFS位为0时，IIC会在第8个SCL时钟周期的下降沿到第9个SCL时钟周期的下降沿期间自动发送ICMR3中的ACKBT位值作为确认位，并且使用WAIT位功能在第9个SCL时钟周期的下降沿自动将SCLn线保持为低电平。该低保持通过从ICDRR读取数据来释放，从而启用逐字节接收操作。

在主机或从机接收模式下获得与IIC从机地址（包括广播地址和主机地址）匹配后的接收帧启用WAIT位功能。

(2) 1字节接收操作（ACKNACK传输控制）和使用RDRFS位的自动低保持功能

当ICMR3中的RDRFS位设置为1时，IIC使用RDRFS位功能执行1字节接收操作。当RDRFS位为1时，ICSR2中的RDRF标志位在第8个SCL时钟周期的上升沿置1（接收数据满），并且SCLn线在第8个SCL的下降沿自动保持为低时钟周期。该低保持通过向ICMR3中的ACKBT位写入值来释放，但不能通过从ICDRR读取数据来释放，ICDRR可以根据以字节为单位接收的数据通过ACK或NACK传输控制进行接收操作。

The RDRFS bit function is enabled for receive frames after a match with the IIC slave address, including the general call address and host address, is obtained in master or slave receive mode.

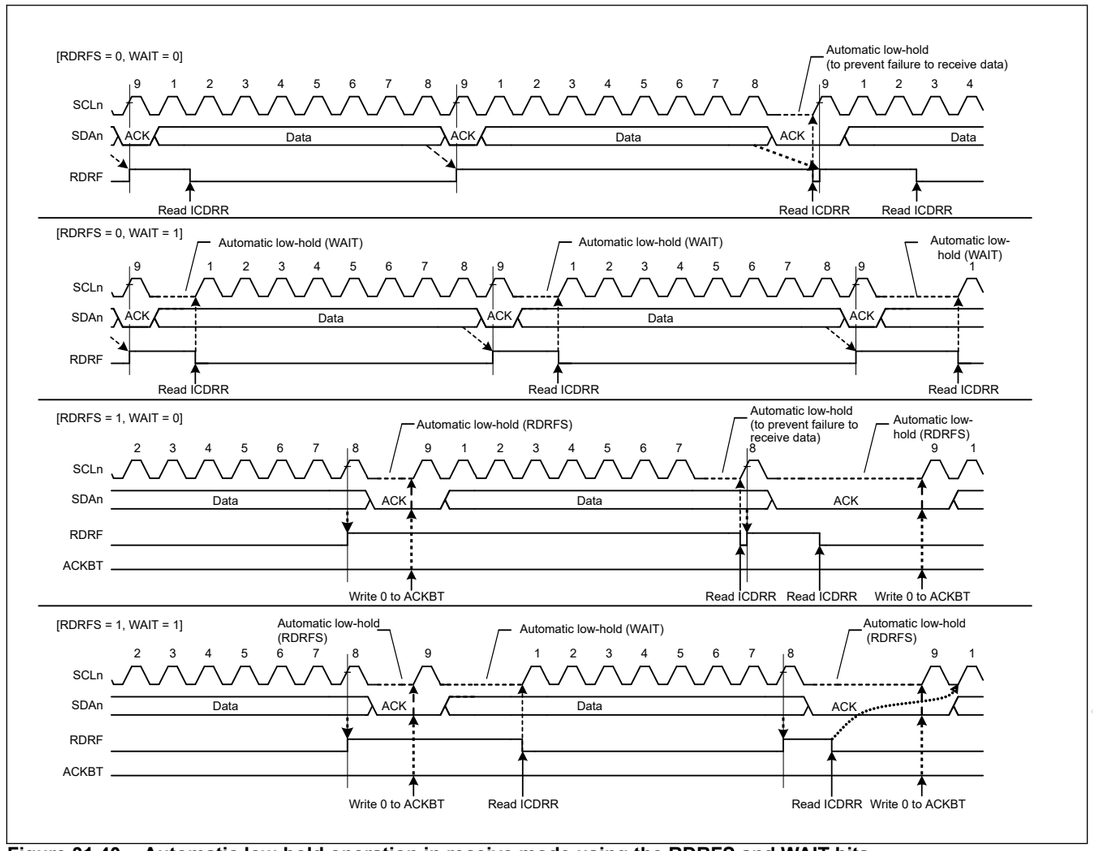

Figure 31.40 Automatic low-hold operation in receive mode using the RDRFS and WAIT bits

31.10 Arbitration-Lost Detection Functions

In addition to the normal arbitration-lost detection function defined by the I^2C bus standard, the IIC provides functions to prevent double-issue of a start condition, detect arbitration-lost during transmission of NACK, and detect arbitration-lost in slave transmit mode.

31.10.1 Master Arbitration-Lost Detection (MALE Bit)

The IIC drives the SDAn line low to issue a start condition. However, if the SDAn line was already driven low by another master device issuing a start condition, the IIC regards its own start condition as an error and considers this a loss in arbitration. Priority is given to transfer by the other master device. Similarly, if a request to issue a start condition is made by setting the ST bit in ICCR2 to 1 while the bus is busy (BBSY flag = 1 in ICCR2), the IIC regards this as a double-issuing-of-start-condition error and considers itself to have lost in arbitration. This prevents a failure of transfer resulting from a start condition being issued while transfer is in progress.

When a start condition is issued successfully, if the transmit data including the address bits (internal SDA output level) and the level on the SDAn line do not match (high output as the internal SDA output, meaning the SDAn pin is in the high-impedance state) and a low level is detected on the SDAn line, the IIC loses in arbitration.

After a loss in arbitration of mastership, the IIC immediately enters slave receive mode. If a slave address, including the general call address, matches its own address at this time, the IIC continues in slave operation.

在主机或从机接收模式下获得与IIC从机地址（包括广播地址和主机地址）匹配后的接收帧启用RDRFS位功能。

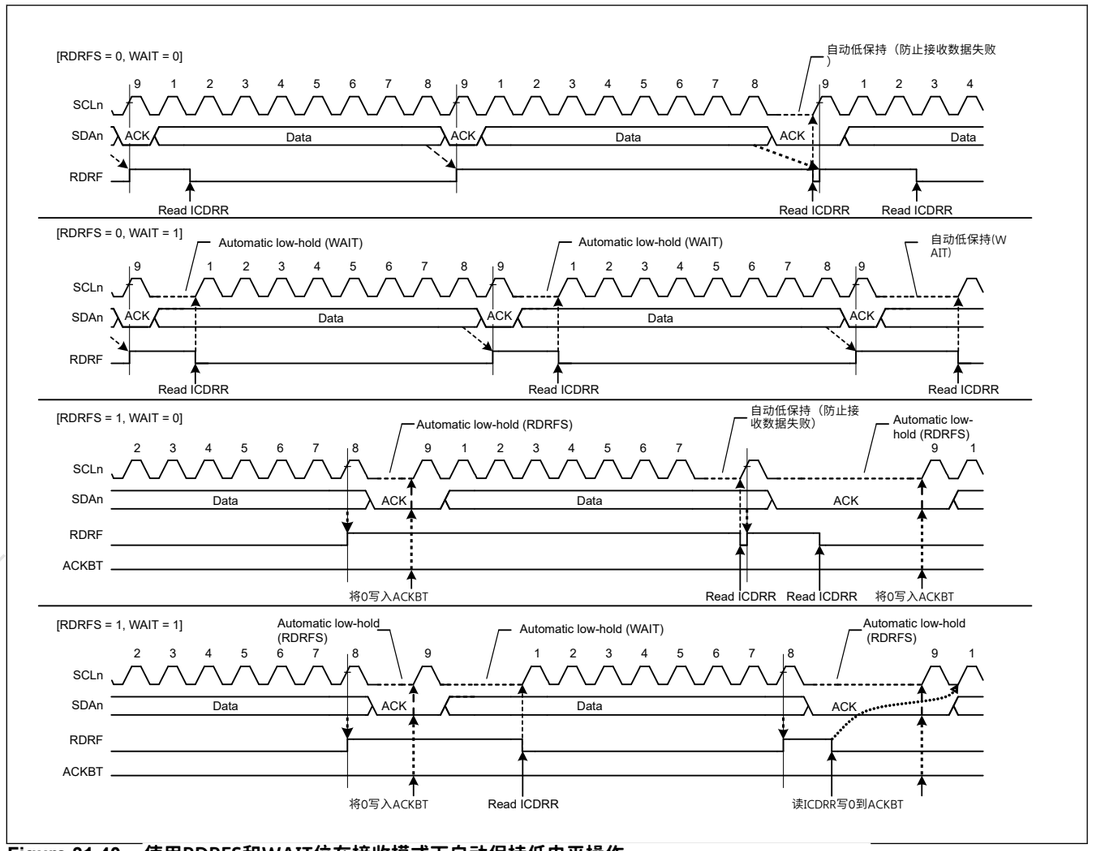

Figure 31.40 使用RDRFS和WAIT位在接收模式下自动保持低电平操作

31.10 仲裁丢失检测功能

除了I2C总线标准定义的正常仲裁丢失检测功能外，IIC还提供防止重复发出启动条件、在NACK传输期间检测仲裁丢失以及在从机发送中检测仲裁丢失的功能模式。

31.10.1 主仲裁丢失检测（MALE位）

IIC将SDAn线驱动为低电平以发出启动条件。但是，如果SDAn线已经被另一个发出启动条件的主设备驱动为低电平，则IIC将其自己的启动条件视为错误，并认为这是仲裁失败。其他主设备优先传输。类似地，如果在总线繁忙时通过将ICCR2中的ST位设置为1来请求发出启动条件（ICCR2中的BBSY标志=1），则IIC将此视为双重发出启动条件错误，并且认为自己在仲裁中败诉。这可以防止由于在传输过程中发出启动条件而导致传输失败。

当启动条件成功发出时，如果发送数据包括地址位（内部SDA输出电平）与SDAn线上的电平不匹配（高输出作为内部SDA输出，意味着SDAn引脚处于高阻抗状态)并且在SDAn线上检测到低电平，则IIC在仲裁中失败。

在主控权仲裁失败后，IIC立即进入从机接收模式。如果此时从机地址（包括广播地址）与自己的地址匹配，则IIC继续从机操作。

A loss in arbitration of mastership is detected when the following conditions are met while the MALE bit in ICFER is 1 (master arbitration-lost detection enabled).

[Master arbitration-lost conditions]

- Mismatching of the internal level for output on SDA and the level on the SDAn line after a start condition was issued by setting the ST bit in ICCR2 to 1 while the BBSY flag in ICCR2 is set to 0 (erroneous issuing of a start condition)
- Setting of the ST bit in ICCR2 to 1 (start condition double-issue error) while the BBSY flag is 1
- When the transmit data excluding acknowledge (internal SDA output level) does not match the level on the SDAn line in master transmit mode (MST and TRS bits = 11b in ICCR2).

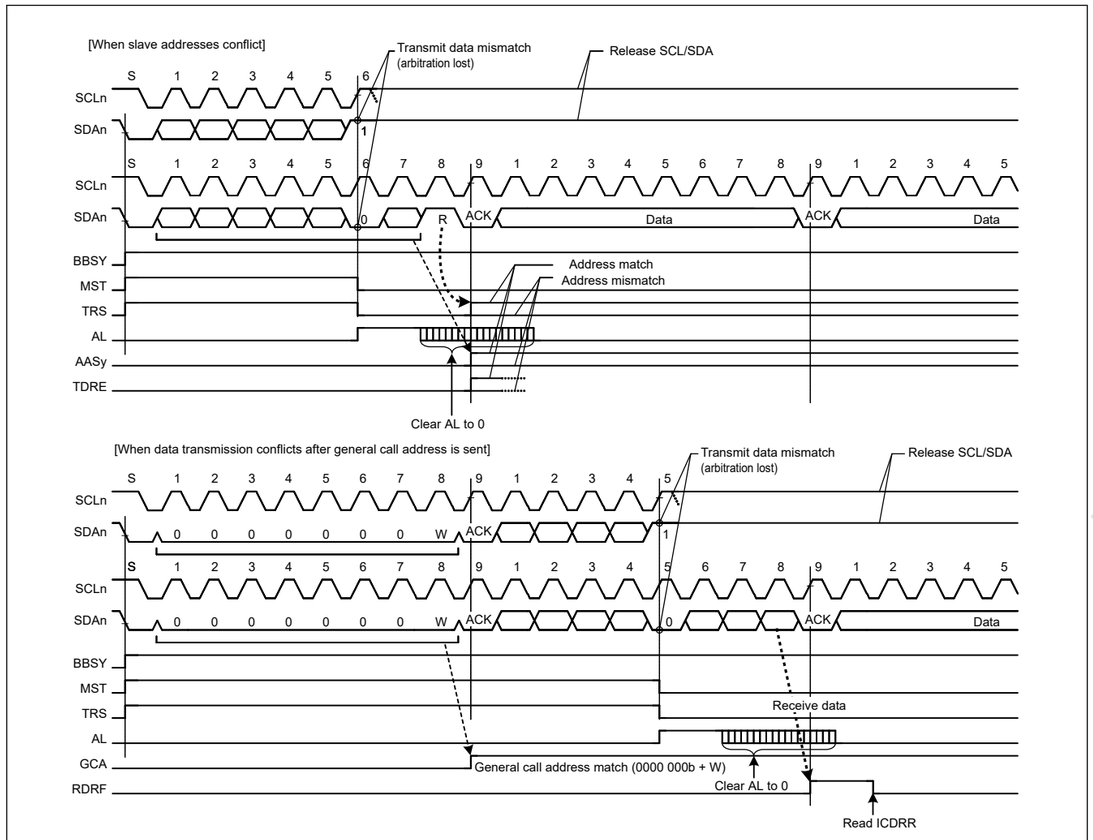

Figure 31.41 Examples of master arbitration-lost detection when MALE = 1

当ICFER中的MALE位为1（启用主仲裁丢失检测）时满足以下条件时，检测到主控仲裁丢失。

[Master arbitration-lost conditions]

●通过将ICCR2中的ST位设置为1，同时将ICCR2中的BBSY标志设置为0，发出启动条件后，SDA输出的内部电平与SDAn线上的电平不匹配（错误发出启动条件）

●在BBSY标志为1时将ICCR2中的ST位设置为1（启动条件双发错误）

●当发送数据不包括确认（内部SDA输出电平）与主发送模式下SDAn线上的电平不匹配时（ICCR2中的MST和TRS位=11b）。

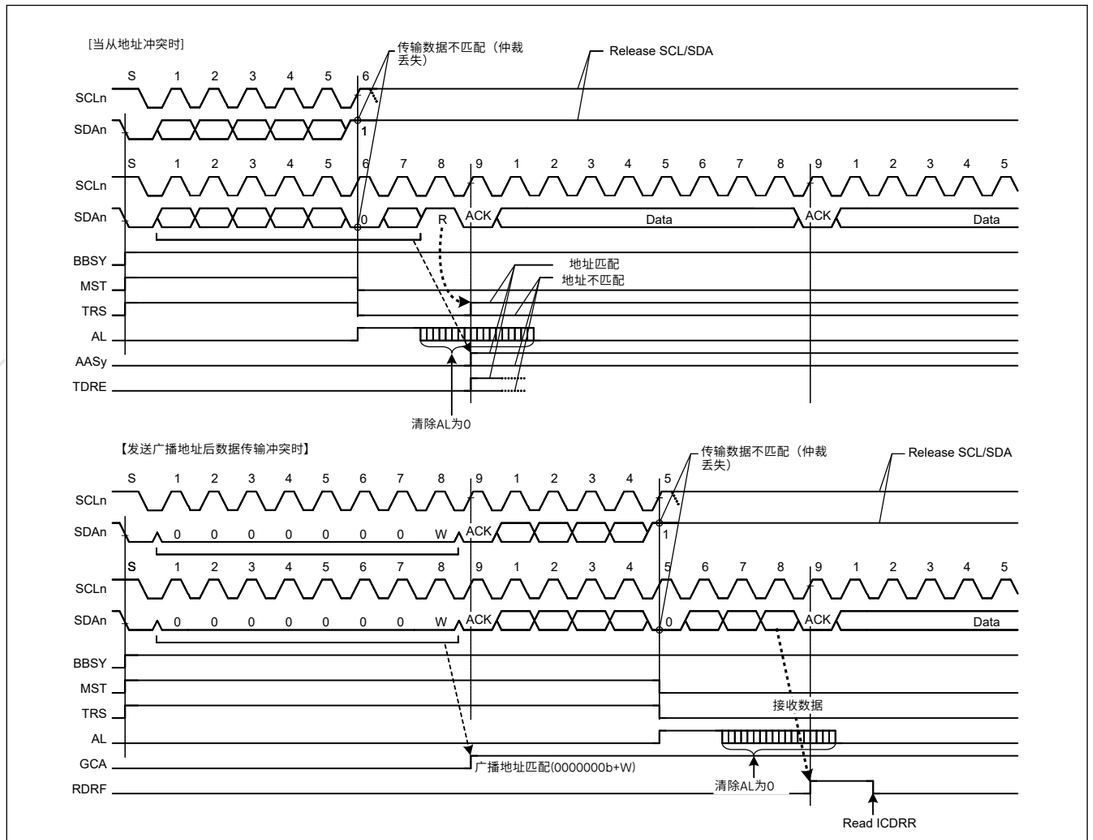

Figure 31.41 MALE=1时的主仲裁丢失检测示例

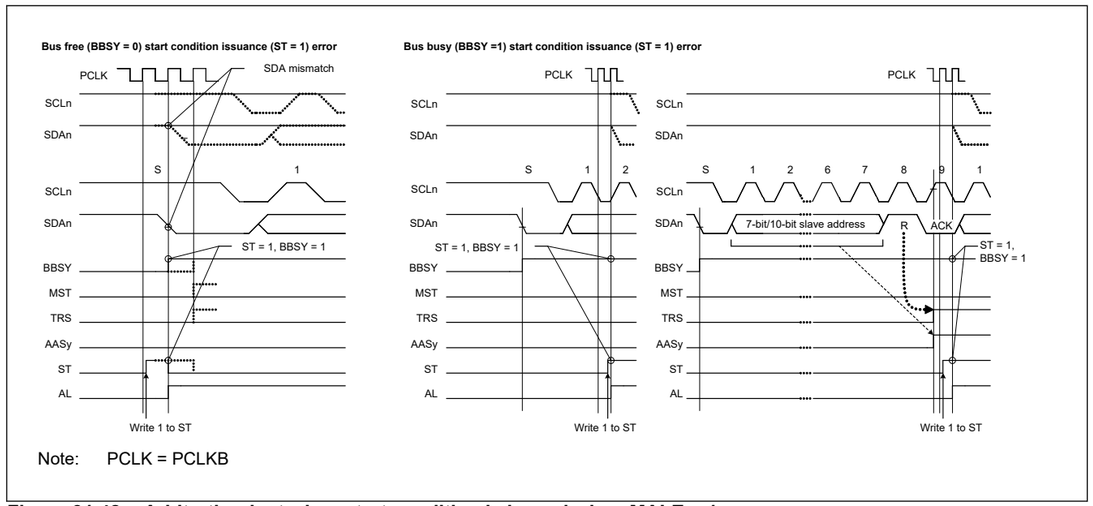

Figure 31.42 Arbitration-lost when start condition is issued when MALE = 1

31.10.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit)

This function causes arbitration to be lost if the internal SDA output level does not match the level on the SDAn line (high output as the internal SDA output, meaning the SDAn pin is in the high-impedance state) and the low level is detected on the SDAn line during transmission of NACK in receive mode. Arbitration is lost because of a conflict between NACK and ACK transmissions when two or more master devices receive data from the same slave device simultaneously in a multi-master system. Such a conflict occurs when multiple master devices send or receive the same information through a single slave device. Figure 31.43 shows an example of arbitration-lost detection during transmission of NACK.

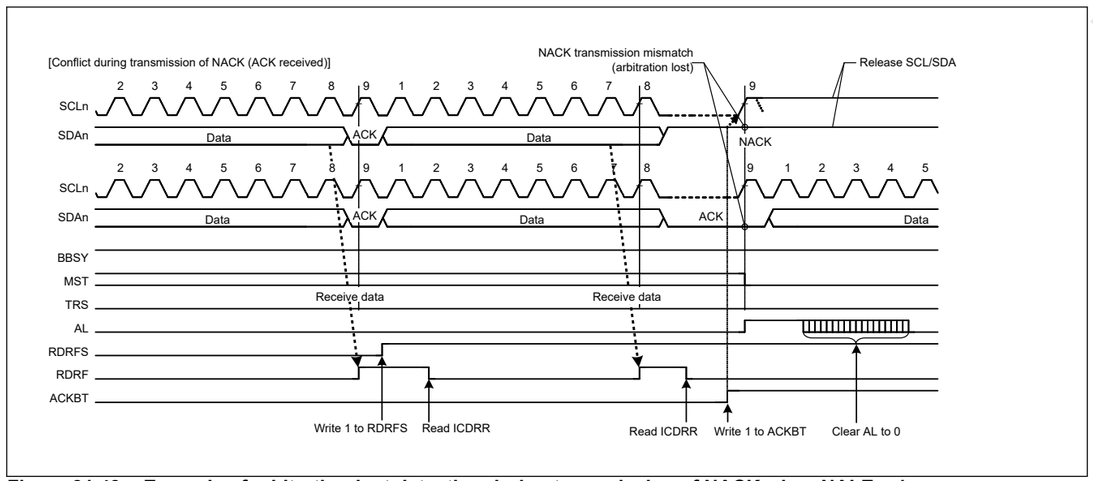

Figure 31.43 Example of arbitration-lost detection during transmission of NACK when NALE = 1

The following explains arbitration-lost detection using an example in which two master devices (master A and master B) and a single slave device are connected through the bus. In this example, master A receives 2 bytes of data from the slave device, and master B receives 4 bytes of data from the slave device.

If master A and master B access the slave device simultaneously, because the slave address is identical, arbitration is not lost in either master A or master B during access to the slave device. Therefore, both master A and master B recognize that they have obtained the bus mastership and operate as such. Master A sends NACK when it has received 2 final bytes of data from the slave device. Meanwhile, master B sends ACK because it has not received the required 4 bytes of data. At this time, the NACK transmission from master A and the ACK transmission from master B conflict. In general, if a conflict like

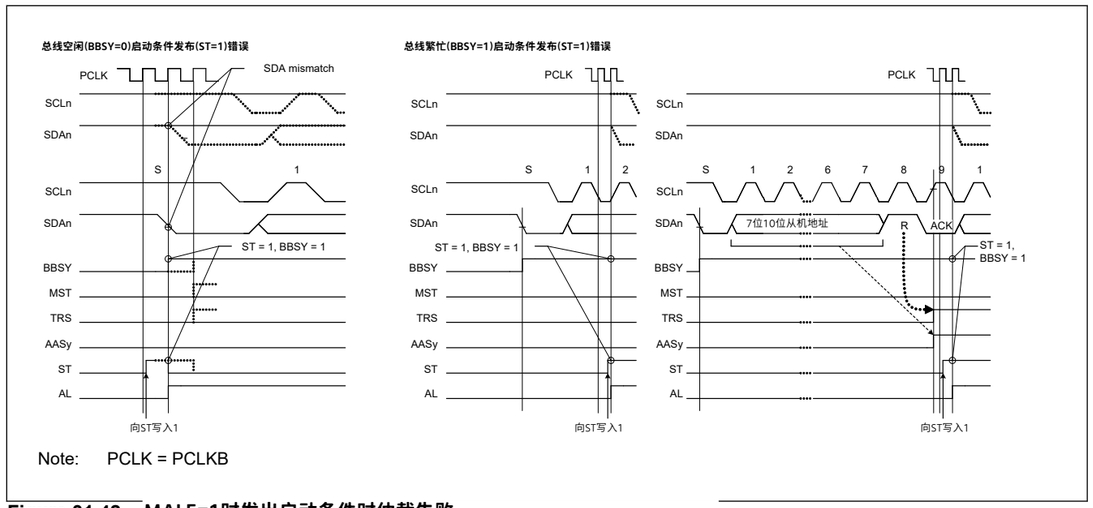

Figure 31.42 MALE=1时发出启动条件时仲裁失败

31.10.2 在NACK传输期间检测仲裁丢失的功能（NALE位）

如果内部SDA输出电平与SDAn线上的电平不匹配（高输出作为内部SDA输出，意味着SDAn引脚处于高阻抗状态）并且在上检测到低电平，此功能会导致仲裁丢失在接收模式下发送NACK期间的SDAn线。当多主控系统中两个或多个主控设备同时从同一从属设备接收数据时，由于NACK和ACK传输之间的冲突，仲裁会丢失。当多个主设备通过单个从设备发送或接收相同的信息时，就会发生这种冲突。图31.43显示了在NACK传输期间检测仲裁丢失的示例。

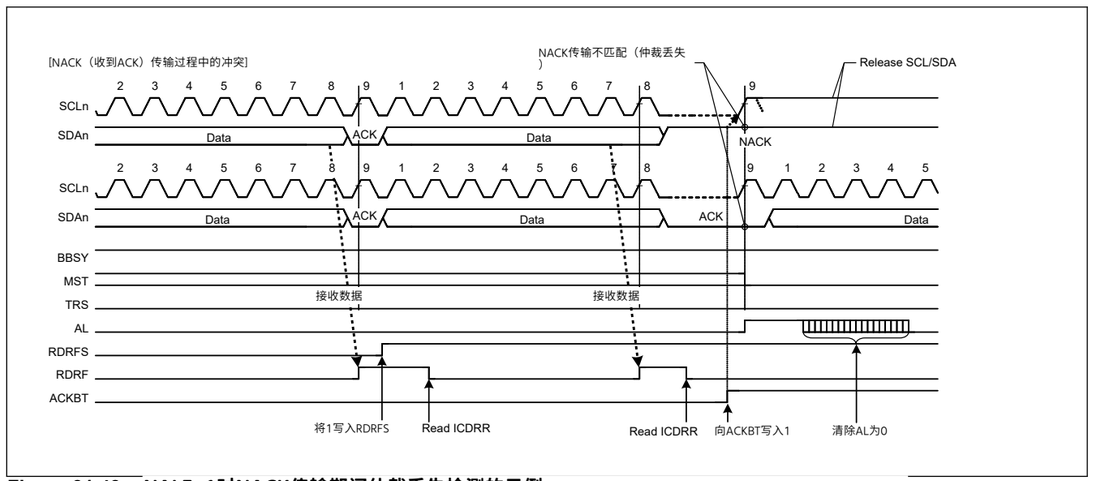

Figure 31.43 NALE=1时NACK传输期间仲裁丢失检测的示例

下面以两个主设备（主设备A和主设备B）和一个从设备通过总线连接的示例来说明仲裁丢失检测。在本例中，主设备A从从设备接收2个字节的数据，主设备B从从设备接收4个字节的数据。

如果主设备A和主设备B同时访问从设备，因为从设备地址相同，在访问从设备期间，主设备A或主设备B都不会丢失仲裁。因此，主机A和主机B都承认他们已经获得了总线控制权并照此运行。主设备A在从从设备接收到2个最终字节的数据时发送NACK。同时，masterB发送ACK，因为它没有收到所需的4字节数据。此时，来自masterA的NACK传输和来自masterB的ACK传输冲突。一般来说，如果像这样的冲突

this occurs, master A cannot detect the ACK transmitted by master B and issues a stop condition. The stop condition issue conflicts with the SCL clock output of master B, which disrupts communication.

When the IIC receives ACK during transmission of NACK, it detects a defeat in conflict with other master devices and causes arbitration to be lost. If arbitration is lost during transmission of NACK, the IIC immediately cancels the slave match condition and enters slave receive mode. This prevents a stop condition from being issued, preventing a communication failure on the bus.

Similarly, in the ARP command processing of SMBus, the function to detect loss of arbitration during transmission of NACK is also available for eliminating the extra clock cycle processing, such as 0xFF transmission processing, which is required if the UDID (Unique Device Identifier) of the assigned address does not match in the Get UDID general processing after the Assign Address command.

The IIC detects arbitration-lost during transmission of NACK when the following condition is met with the NALE bit in ICFER set to 1 (arbitration-lost detection during NACK transmission enabled).

[Condition for arbitration-lost during NACK transmission]

- When the internal SDA output level does not match the SDAn line (ACK is received) during transmission of NACK (ACKBT bit = 1 in ICMR3).

31.10.3 Slave Arbitration-Lost Detection (SALE Bit)

This function causes arbitration to be lost if the transmit data (internal SDA output level) and the level on the SDAn line do not match (high output as the internal SDA output, meaning the SDAn pin is in the high-impedance state), and the low level is detected on the SDAn line in slave transmit mode. This arbitration-lost detection function is mainly used when transmitting a UDID (Unique Device Identifier) over an SMBus.

When the IIC loses slave arbitration, the IIC is immediately released from the slave-matched state and enters slave receive mode. This function can detect conflicts of data during transmission of UDIDs over an SMBus and eliminates subsequent redundant processing for the transmission of 0xFF.

The IIC detects slave arbitration-lost when the following condition is met with the SALE bit in ICFER set to 1 (slave arbitration-lost detection enabled).

[Condition for slave arbitration-lost]

- When transmit data excluding acknowledge (internal SDA output level) does not match the SDAn line in slave transmit mode (MST and TRS bits = 01b in ICCR2).

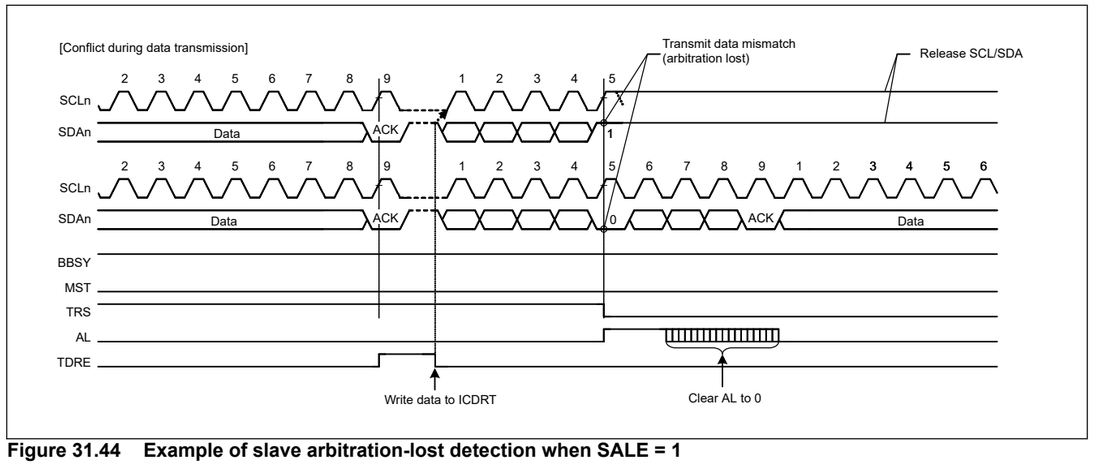

Figure 31.44 Example of slave arbitration-lost detection when SALE = 1

发生这种情况时，主机A无法检测到主机B发送的ACK并发出停止条件。停止条件问题与主B的SCL时钟输出冲突，从而中断通信。

当IIC在NACK传输过程中收到ACK时，它会检测到与其他主设备冲突的失败并导致仲裁丢失。如果在NACK传输过程中仲裁丢失，IIC立即取消从机匹配条件并进入从机接收模式。这可以防止发出停止条件，从而防止总线上的通信故障。

同样，在SMBus的ARP命令处理中，检测传输过程中仲裁丢失的功能
NACK也可用于消除额外的时钟周期处理，例如0xFF传输处理，如果分配地址的UDID（唯一设备标识符）在分配地址命令后的获取UDID常规处理中不匹配，则需要此处理。

IIC在NACK传输期间检测到仲裁丢失，当满足以下条件时
ICFER设置为1（启用NACK传输期间的仲裁丢失检测）。

[在NACK传输期间仲裁丢失的条件]

●在发送NACK（ICMR3中的ACKBT位=1）期间，当内部SDA输出电平与SDAn线不匹配时（接收到ACK）。

31.10.3 从设备仲裁丢失检测（SALE位）

如果发送数据（内部SDA输出电平）与SDAn线上的电平不匹配（高输出作为内部SDA输出，意味着SDAn引脚处于高阻状态），此功能会导致仲裁丢失，并且在从机发送模式下，SDAn线上检测到低电平。这种仲裁丢失检测功能主要用于通过SMBus传输UDID（唯一设备标识符）时。

当IIC失去从机仲裁时，IIC立即从从机匹配状态中释放并进入从机接收模式。该功能可以检测通过SMBus传输UDID期间的数据冲突，并消除后续对0xFF传输的冗余处理。

当ICFER中的SALE位设置为1（启用从设备仲裁丢失检测）满足以下条件时，IIC检测从设备仲裁丢失。

[从机仲裁失败的条件]

●当发送数据不包括确认（内部SDA输出电平）与从发送模式下的SDAn线不匹配时（MST和TRS位=ICCR2中的01b）。

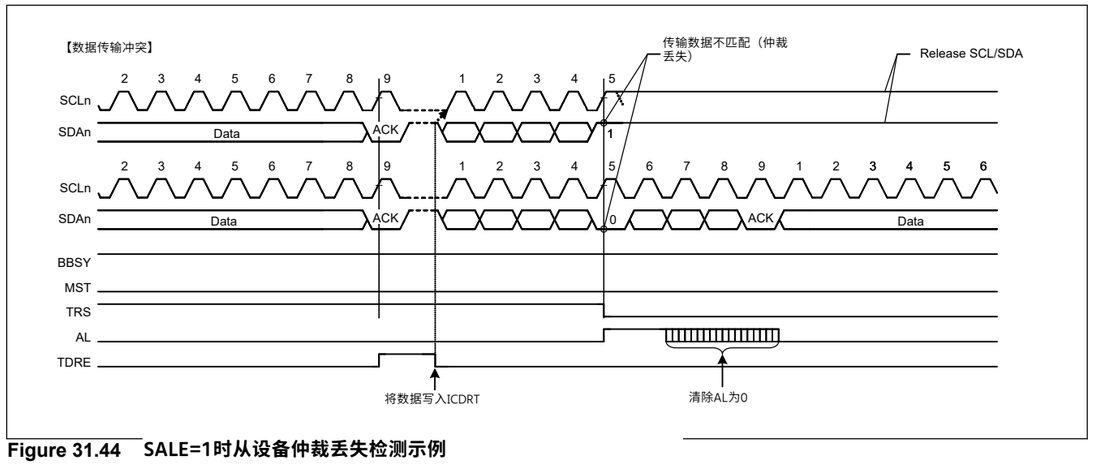

Figure 31.44 SALE=1时从设备仲裁丢失检测示例

31.11 Start, Restart, and Stop Condition Issuing Function

31.11.1 Issuing a Start Condition

The IIC issues a start condition when the ST bit in ICCR2 is set to 1. When the ST bit is set to 1, a start condition request is made, and the IIC issues a start condition when the BBSY flag in ICCR2 is 0 (bus free state). When a start condition is issued normally, the IIC automatically shifts to the master transmit mode.

To issue a start condition:

1. Drive the SDAn line low (high level to low level).
2. Ensure that the time set in ICBRH and the start condition hold time elapse.
3. Drive the SCLn line low (high level to low level).
4. Detect low level on the SCLn line and ensure the low-level period of the SCLn line set in ICBRL elapses.

31.11.2 Issuing a Restart Condition

The IIC issues a restart condition when the RS bit in ICCR2 is set to 1. When the RS bit is set to 1, a restart condition request is made, and the IIC issues a restart condition when the BBSY flag in ICCR2 is 1 (bus busy state) and the MST bit in ICCR2 is 1 (master mode).

To issue a restart condition:

1. Release the SDAn line.
2. Ensure the low-level period of the SCLn line set in ICBRL elapses.
3. Release the SCLn line (low level to high level).
4. Detect a high level on the SCLn line and ensure the time set in ICBRL and the restart condition setup time elapse.
5. Drive the SDAn line low (high level to low level).
6. Ensure the time set in ICBRH and the restart condition hold time elapse.
7. Drive the SCLn line low (high level to low level).
8. Detect a low level on the SCLn line and ensure the low-level period of the SCLn line set in ICBRL elapses.

Note: When issuing restart condition requests, write the slave address to ICDRT after confirming that ICCR2.RS = 0. Data written while ICCR2.RS = 1 is not forwarded because of the retransmission condition before the occurrence.

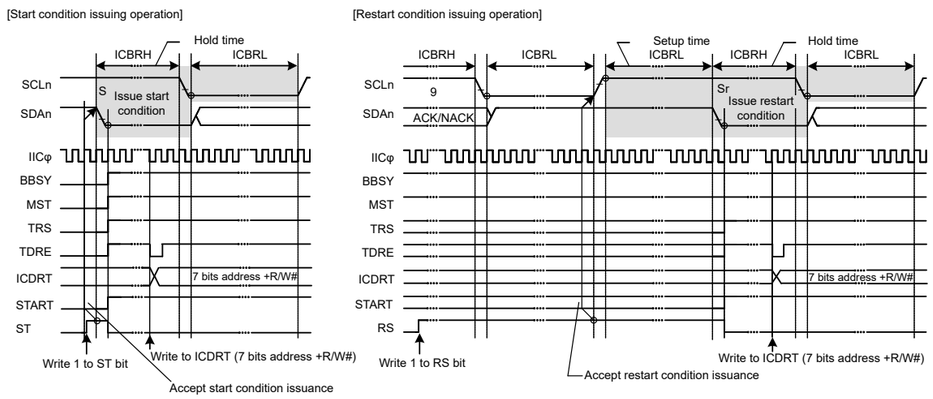

Figure 31.45 Start and restart condition issue timing using the ST and RS bits

31.11 启动、重启和停止条件发布功能

31.11.1 发出开始条件

当ICCR2中的ST位设置为1时，IIC发出启动条件。 当ST位设置为1时，发出启动条件请求，当ICCR2中的BBSY标志为0时，IIC发出启动条件（总线自由状态）。当启动条件正常发出时，IIC自动切换到主机发送模式。

发出开始条件：

1.将SDAn线拉低（高电平转低电平）。

2.确保ICBRH中设置的时间和启动条件保持时间已过。

3.将SCLn线拉低（高电平转低电平）。

4.检测SCLn线的低电平，确保ICBRL中设置的SCLn线的低电平周期过去。

31.11.2 发出重启条件

当ICCR2中的RS位设置为1时，IIC发出重启条件。当RS位设置为1时，发出重启条件请求，当ICCR2中的BBSY标志为1时，IIC发出重启条件（总线忙状态）并且ICCR2中的MST位为1（主模式）。

发出重启条件：

1.释放SDAn线。

2.确保ICBRL中设置的SCLn线的低电平周期已过。

3.释放SCLn线（低电平到高电平）。

4.检测SCLn线上的高电平并确保ICBRL中设置的时间和重启条件设置时间已过。

5.将SDAn线拉低（高电平转低电平）。

6.确保ICBRH中设置的时间和重启条件保持时间已过。

7.将SCLn线拉低（从高电平到低电平）。

8.检测SCLn线上的低电平，确保ICBRL中设置的SCLn线的低电平周期过去。

Note: 发出重启条件请求时，确认ICCR2.RS=0后，将从机地址写入ICDRT。在ICCR2.RS=1时写入的数据由于发生前的重传条件而不会转发。

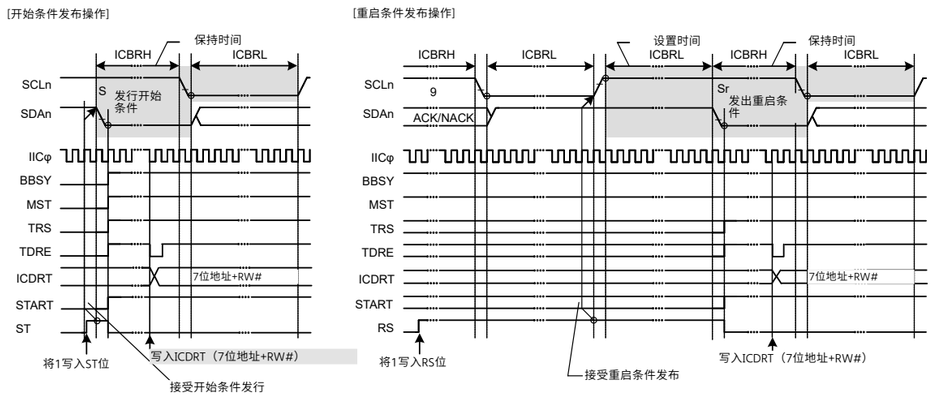

Figure 31.45 使用ST和RS位的启动和重启条件发出时序

Figure 31.46 shows the operation timing when a restart condition is issued after the master transmission.

[To issue a restart condition after the master transmission:]

1. Initialize the IIC using the procedure in section 31.3.2. Initial Settings.
2. Read the BBSY flag in ICCR2 to check that the bus is open, then set the ST bit in ICCR2 to 1 (start condition issuance request). On receiving the request, the IIC issues a start condition. At the same time, the BBSY and the START flags in ICSR2 are automatically set to 1 and the ST bit is automatically set to 0. If the start condition is detected and the internal levels for the SDA output state and the levels on the SDAn line match while the ST bit is 1, the IIC recognizes that a start condition is successfully issued as requested by the ST bit has been successfully completed. The MST and TRS bits in ICCR2 are automatically set to 1, placing the IIC in master transmit mode. The TDRE flag in ICSR2 is also automatically set to 1 when the TRS bit is set to 1.
3. Check that the TDRE flag in ICSR2 is 1, and then write the value for transmission (the slave address and the R/W# bit) to ICDRT. After the data for transmission is written to ICDRT, the TDRE flag is automatically set to 0, data is transferred from ICDRT to ICDRS, and the TDRE flag is again set to 1. After the byte containing the slave address and R/W# bit has been transmitted, the value of the TRS bit is automatically updated to select master transmit or master receive mode according to the value of the transmitted R/W# bit. If the value of the R/W# bit is 0, the IIC continues in master transmit mode. If the ICSR2.NACKF flag is 1 at this time, indicating that no slave device recognized the address or that there was an error in communications, write 1 to ICCR2.SP bit to issue a stop condition. To transmit data with an address in the 10-bit format, start by writing 1111 0b, the 2 upper bits of the slave address, and W to ICDRT as the first address transmission. Then, as the second address transmission, write the 8 lower bits of the slave address to ICDRT.
4. After confirming that the TDRE flag in ICSR2 is 1, write data for transmission to the ICDRT register. The IIC automatically holds the SCLn line low until data for transmission is ready, a restart condition is issued or a stop condition is issued.
5. After all bytes of data for transmission are written to the ICDRT register, wait until the value of the TEND flag in ICSR2 returns to 1. Then after checking that the START flag in ICSR2 is 1, set the START flag in ICSR2 to 0.
6. Set the RS bit in ICCR2 to 1 (restart condition issue request). On receiving the request, the IIC issues a restart condition.
7. After checking that the START flag in ICSR2 is 1, write the value for transmission (the slave address and the R/W# bit) to ICDRT.

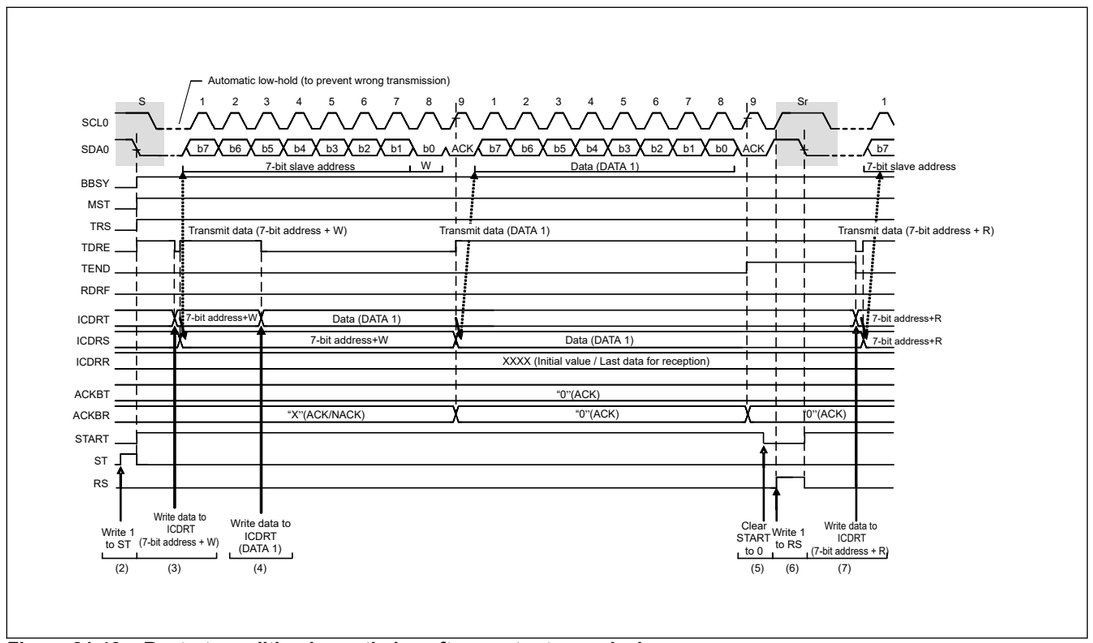

Figure 31.46 Restart condition issue timing after master transmission.

图31.46显示了在主机发送后发出重新启动条件时的操作时序。

[在主传输后发出重启条件：]

1.使用第31.3.2节中的过程初始化IIC。初始设置。

2.读取ICCR2中的BBSY标志以检查总线是否打开，然后将ICCR2中的ST位设置为1（开始条件发出请求）。收到请求后，IIC发出一个开始条件。同时，ICSR2中的BBSY和START标志位自动设置为1，ST位自动设置为0。如果检测到启动条件，则内部电平为SDA输出状态和SDAn线上的电平当ST位为1时匹配，IIC识别成功发出启动条件，因为ST位请求已成功完成。ICCR2中的MST和TRS位自动设置为1，将IIC置于主机发送模式。当TRS位设置为1时，ICSR2中的TDRE标志也自动设置为1。

3.检查ICSR2中的TDRE标志是否为1，然后将要发送的值（从机地址和RW#位）写入ICDRT。待传输数据写入ICDRT后，TDRE标志自动置0，数据从ICDRT传输到ICDRS，TDRE标志再次置1。发送时，TRS位的值会根据发送的RW#位的值自动更新以选择主机发送或主机接收模式。如果RW#位的值为0，则IIC继续处于主机发送模式。如果此时ICSR2.NACKF标志位为1，表示没有从设备识别该地址或通信出现错误，向ICCR2.SP位写入1发出停止条件。要使用10位格式的地址传输数据，首先将11110b、从机地址的高2位和W写入ICDRT作为第一个地址传输。然后，作为第二次地址传输，将从地址的低8位写入ICDRT。

4.确认ICSR2中的TDRE标志为1后，将要发送的数据写入ICDRT寄存器。IIC自动将SCLn线保持为低电平，直到传输数据准备好、发出重启条件或发出停止条件。

5.待发送的所有字节数据写入ICDRT寄存器后，等待ICSR2中的TEND标志的值返回1。然后检查ICSR2中的START标志为1后，将ICSR2中的START标志设置为0.

6.将ICCR2中的RS位设置为1（重新启动条件发出请求）。收到请求后，IIC发出重启条件。

7.检查ICSR2中的START标志为1后，将要发送的值（从机地址和RW#位）写入ICDRT。

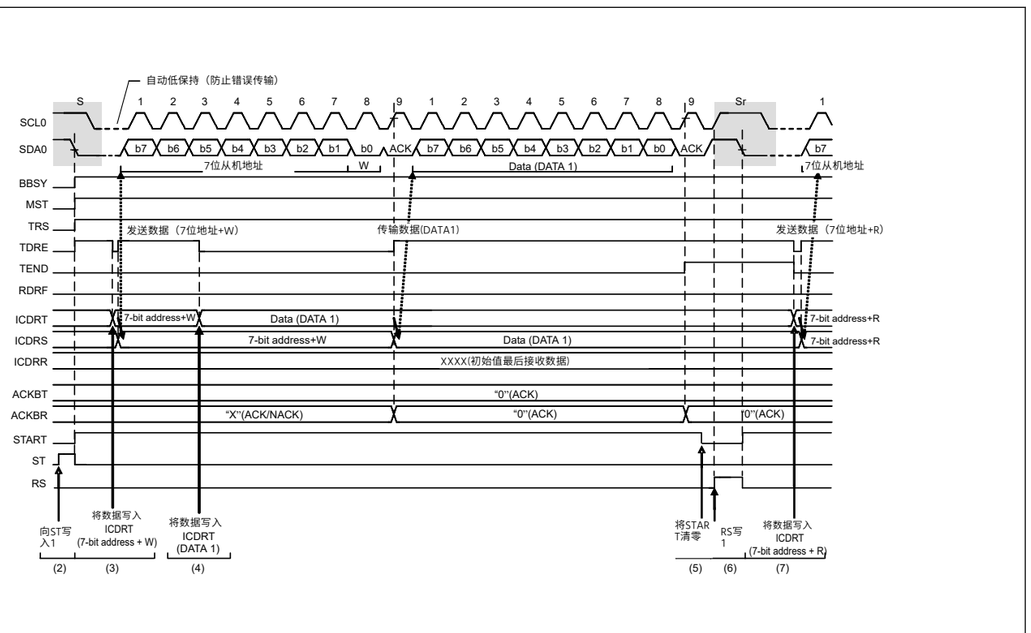

Figure 31.46 主传输后重启条件发出时序。

31.11.3 Issuing a Stop Condition

The IIC issues a stop condition when the SP bit in ICCR2 is set to 1. When the SP bit is set to 1, a stop condition request is made, and the IIC issues a stop condition when the BBSY flag in ICCR2 is 1 (bus busy state) and the MST bit in ICCR2 is 1 (master mode).

To issue a stop condition:

1. Drive the SDAn line low (high level to low level).
2. Ensure the low-level period of the SCLn line set in ICBRL elapses.
3. Release the SCLn line (low level to high level).
4. Detect a high level on the SCLn line and ensure the time set in ICBRH and the stop condition setup time elapse.
5. Release the SDAn line (low level to high level).
6. Ensure the time set in ICBRL and the bus free time elapse.
7. Clear the BBSY flag to 0 to release the bus mastership.

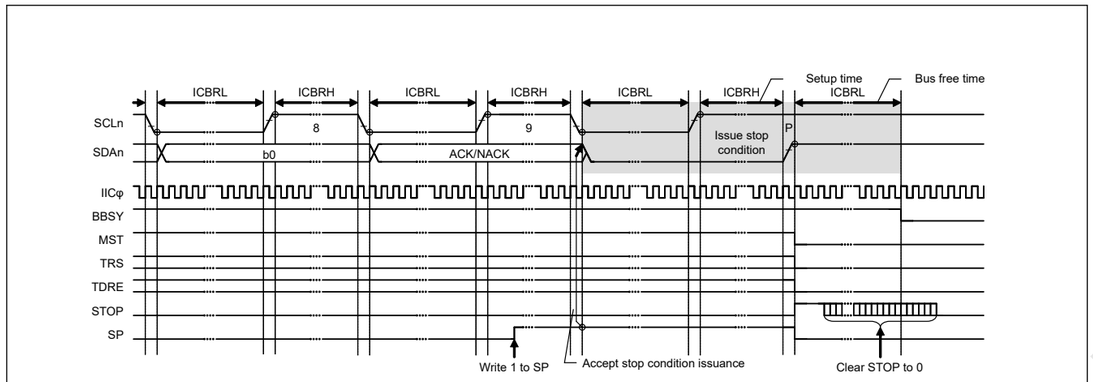

Figure 31.47 Stop condition issue timing using the SP bit

31.12 Bus Hanging

If the clock signals from the master and slave devices are out of synchronization because of noise or other factors, the I^2C bus might hang with a fixed level on the SCLn line or SDAn line.

To manage bus hanging, the IIC has a timeout function to detect hanging by monitoring the SCLn line, and a function for outputting an extra SCL clock cycle to release the bus from:

- A timeout function to detect hanging by monitoring the SCLn line
- The IIC reset function
- An internal reset function.

By checking the SCLO, SDAO, SCLI, and SDAI bits in ICCR1, it is possible to see whether the IIC or its communicating partner is placing the low level on the SCLn or SDAn line.

31.12.1 Timeout Function

The timeout function can detect when the SCLn line is stuck longer than the predetermined time. The IIC can detect an abnormal bus state by monitoring that the SCLn line is stuck low or high for a predetermined time.

The timeout function monitors the SCLn line state and counts the low- or high-level period using the internal counter. The timeout function resets the internal counter each time the SCLn line changes (rises or falls), but continues to count unless the SCLn line changes. If the internal counter overflows because no SCLn line changes, the IIC can detect the timeout and report the bus hung state.

31.11.3 发出停止条件

当ICCR2中的SP位设置为1时，IIC发出停止条件。当SP位设置为1时，发出停止条件请求，当ICCR2中的BBSY标志为1时，IIC发出停止条件（总线忙状态）并且ICCR2中的MST位为1（主模式）。

发出停止条件：

1.将SDAn线拉低（高电平转低电平）。

2.确保ICBRL中设置的SCLn线的低电平周期已过。

3.释放SCLn线（低电平到高电平）。

4.检测SCLn线上的高电平并确保ICBRH中设置的时间和停止条件设置时间已过。

5.释放SDAn线（低电平到高电平）。

6.确保ICBRL中设置的时间和巴士空闲时间已过。

7.将BBSY标志清为0以释放总线控制权。

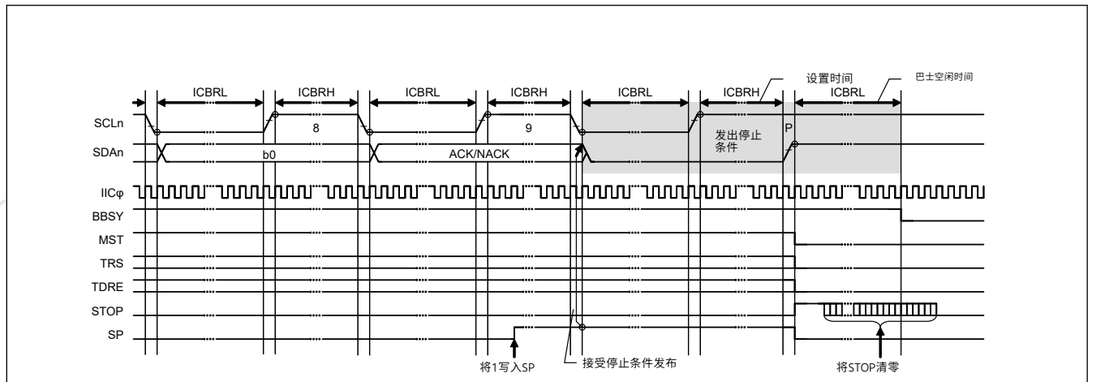

Figure 31.47 使用SP位的停止条件发出时序

31.12 巴士挂

如果来自主从设备的时钟信号由于噪声或其他因素不同步，则I2C总线可能会在SCLn线或SDAn线上以固定电平挂起。

为了管理总线挂起，IIC具有通过监视SCLn线检测挂起的超时功能，以及输出额外SCL时钟周期以释放总线的功能：

●通过监控SCLn线路来检测挂起的超时功能

●IIC复位功能

●内部复位功能。

通过检查ICCR1中的SCLO、SDAO、SCLI和SDAI位，可以查看IIC或其通信伙伴是否将SCLn或SDAn线置于低电平。

31.12.1 超时功能

超时功能可以检测SCLn线路何时卡住超过预定时间。IIC可以通过监视SCLn线在预定时间内保持低电平或高电平来检测异常总线状态。

超时功能监控SCLn线路状态并使用内部计数器计算低电平或高电平周期。每次SCLn线改变（上升或下降）时，超时功能都会复位内部计数器，但除非SCLn线改变，否则会继续计数。如果内部计数器因为SCLn线没有变化而溢出，IIC可以检测到超时并报告总线挂起状态。

RA生态工作室

This timeout function is enabled when the ICFER.TMOE bit is 1. It detects a hung state when the SCLn line is stuck low or high during the following conditions:

- The bus is busy (ICCR2.BBSY flag is 1) in master mode (ICCR2.MST bit is 1)
- The IIC slave address is detected (ICSR1 register is not 0x00) and the bus is busy (ICCR2.BBSY flag is 1) in slave mode (ICCR2.MST bit is 0)
- The bus is open (ICCR2.BBSY flag is 0) while a start condition is requested (ICCR2.ST bit is 1).

The internal counter of the timeout function uses the internal reference clock (IICφ) set in the CKS[2:0] bits in ICMR1 as a count source. It functions as a 16-bit counter when long mode is selected (TMOS bit = 0 in ICMR2) or a 14-bit counter when short mode is selected (TMOS bit = 1).

The SCLn line level (low, high, or both levels) during which this counter is activated can be selected in the TMOH and TMOL bits in ICMR2. If both TMOL and TMOH bits are set to 0, the internal counter is disabled.

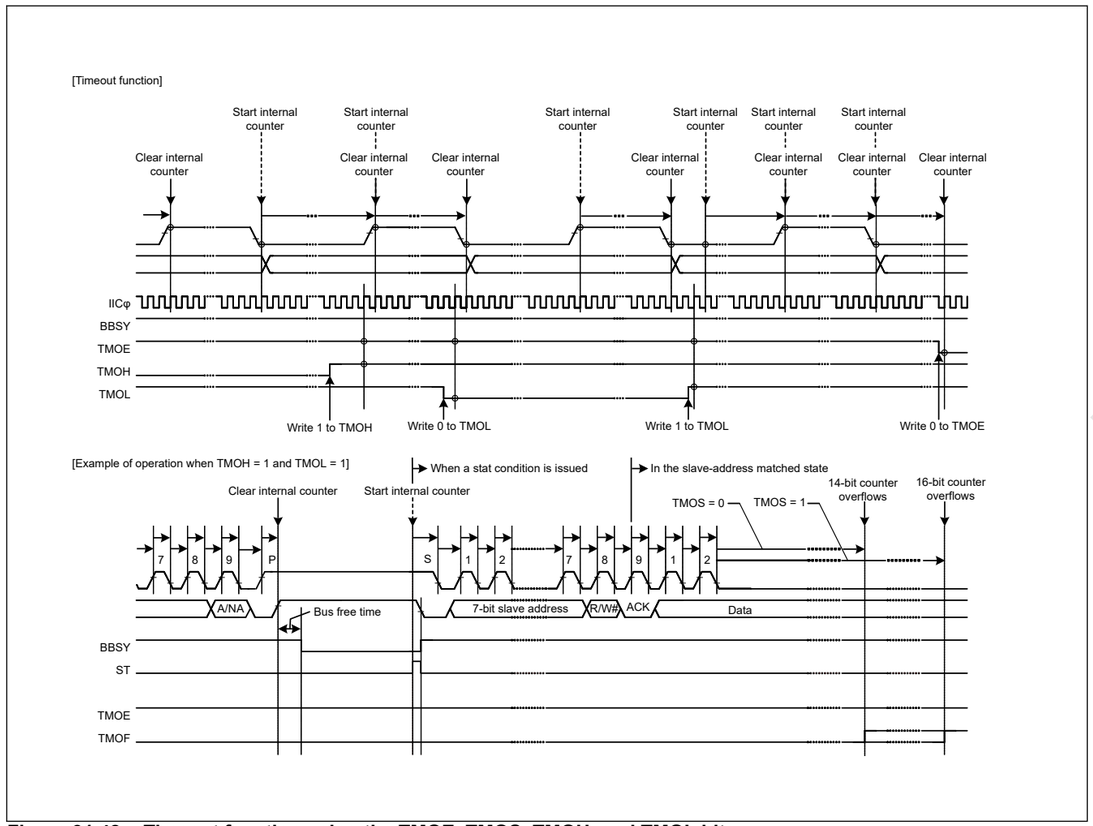

Figure 31.48 Timeout function using the TMOE, TMOS, TMOH, and TMOL bits

31.12.2 Extra SCL Clock Cycle Output Function

In master mode, this function outputs extra SCL clock cycles to release the SDAn line of the slave device from being held low because the master is out of synchronization with the slave device. This function is mainly used in master mode to release the SDAn line of the slave device from being fixed low by including extra cycles of SCL output from the IIC. It uses single cycles of the SCL clock for a bus error where the IIC cannot issue a stop condition because the slave device is holding the SDAn line at the low level. Do not use this function in normal situations. Using it when communications are proceeding correctly leads to malfunctions.

When the CLO bit in ICCR1 is set to 1 in master mode, a single cycle of the SCL clock at the frequency specified in the CKS[2:0] bits in ICMR1, and in the ICBRH and ICBRL registers, is output as an extra clock cycle. After output of this

此超时功能在ICFER.TMOE位为1时启用。在以下情况下，当SCLn线卡在低电平或高电平时，它会检测到挂起状态：

●总线繁忙（ICCR2.BBSY标志为1）在主机模式（ICCR2.MST位为1）

●检测到IIC从机地址（ICSR1寄存器不是0x00）并且在从机模式下总线忙（ICCR2.BBSY标志为1）（ICCR2.MST位为0）

●请求启动条件时（ICCR2.ST位为1），总线打开（ICCR2.BBSY标志为0）。

超时功能的内部计数器使用ICMR1的CKS[2:0]位中设置的内部参考时钟(IICφ)作为计数源。Itfunctionsasa16-bitcounterwhenlongmodeisselected(TMOSbit=0inICMR2)ora14-bitcounterwhenshortmodeisselected(TMOSbit=1).

可以在TMOH和
ICMR2中的TMOL位。如果TMOL和TMOH位都设置为0，则内部计数器被禁用。

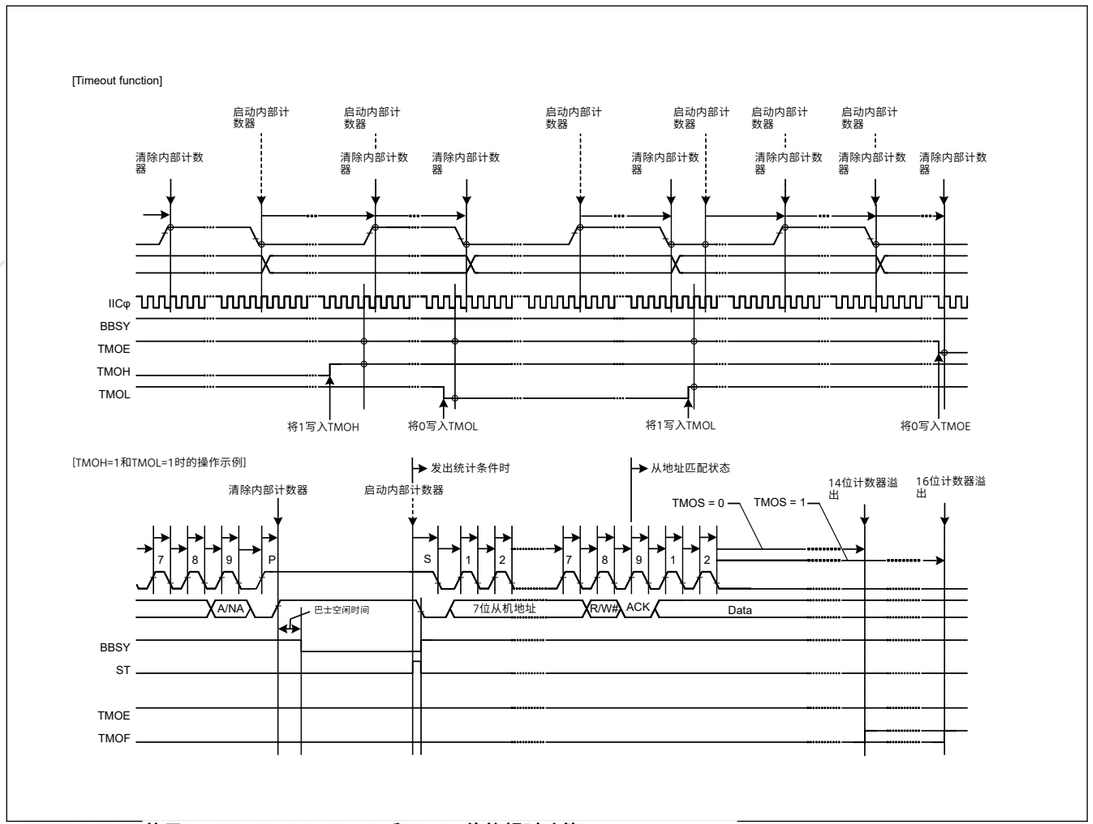

Figure 31.48 使用TMOE、TMOS、TMOH和TMOL位的超时功能

31.12.2 额外的SCL时钟周期输出功能

在主模式下，该函数输出额外的SCL时钟周期，以释放从设备的SDAn线保持低电平，因为主设备与从设备不同步。该功能主要用于主机模式，通过包含IIC的额外SCL输出周期来释放从机设备的SDAn线固定为低电平。它使用SCL时钟的单个周期来处理IIC无法发出停止条件的总线错误，因为从设备将SDAn线保持在低电平。在正常情况下不要使用此功能。在通信正常进行时使用它会导致故障。

当ICCR1中的CLO位在主机模式下设置为1时，以ICMR1中的CKS[2:0]位以及ICBRH和ICBRL寄存器中指定的频率的SCL时钟的单个周期作为额外输出输出时钟周期。这个输出后

single cycle of the SCL clock, the CLO bit is automatically set to 0. At this time, if ICCR2.BBSY = 1, the SCL pin goes low, and when ICCR2.BBSY = 0, the SCL pin goes high. After confirming that the CLO bit is 0 by software, write 1 to the CLO bit to output the additional clock continuously.

When the IIC module is in master mode and the slave device is holding the SDAn line low because synchronization with the slave device is lost because of effects like noise, the output of a stop condition is not possible. This function can be used to output extra cycles of SCL one by one to make the slave device release the SDAn line from being held low, and so recover the bus from an unusable state. Release of the SDAn line by the slave device can be monitored by reading the SDAI bit in ICCR1. After confirming the release of the SDAn line by the slave device, complete communications by reissuing the stop condition.

[Output conditions for using the CLO bit in ICCR1]

- When the bus is open (BBSY flag in ICCR2 = 0) or in master mode (MST bit = 1 and BBSY flag = 1 in ICCR2)
- When the communication device does not hold the SCLn line low.

Figure 31.49 shows the operation timing of the extra SCL clock cycle output function (CLO bit).

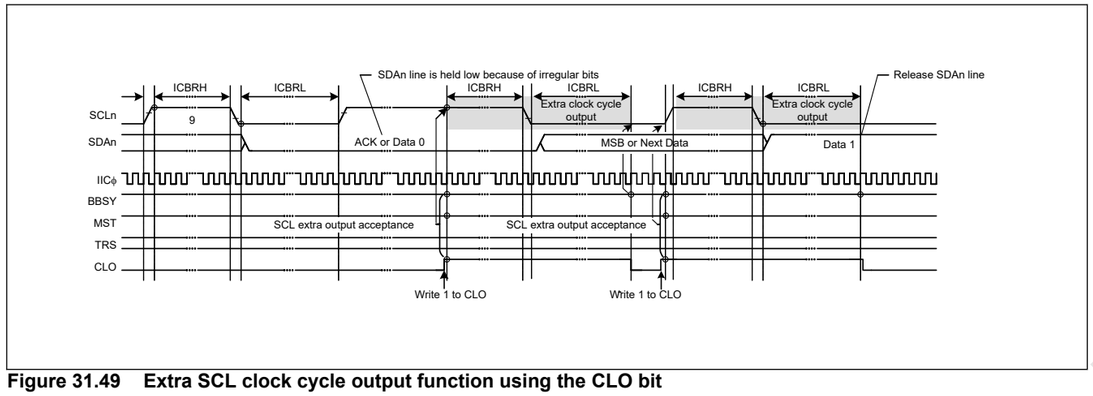

Figure 31.49 Extra SCL clock cycle output function using the CLO bit

31.12.3 IIC Reset and Internal Reset

The IIC module incorporates a function for resetting itself. It uses two types of resets:

- An IIC reset, which initializes all registers, including the BBSY flag in ICCR2.
- An internal reset, which releases the IIC from the slave-address matched state and initializes the internal counter while saving other settings.

After issuing a reset, always set the IICRST bit in ICCR1 to 0. Both types of resets are valid for release from bus-hung states, because both restore the output state of the SCLn and SDAn pins to the high-impedance state.

Issuing a reset during slave operation might lead to a loss of synchronization between the master device clock and the slave device clock, so avoid this when possible. In addition, monitoring of the bus state, such as for the presence of a start condition, is not possible during an IIC reset (ICE and IICRST bits = 01b in ICCR1).

For a detailed description of the IIC and internal resets, see section 31.15. State of Registers When Issuing Each Condition.

31.13 SMBus Operation

The IIC supports data communication conforming to the SMBus Specification (version 2.0). To perform SMBus communication, set the SMBS bit in ICMR3 to 1. To use the transfer rate within a range of 10 to 100 kbps of the SMBus standard, set the CKS[2:0] bits in ICMR1, the ICBRH, and ICBRL registers. In addition, specify the values in the DLCS bit in ICMR2 and the SDDL[2:0] bits in ICMR2 to meet the data hold time specification of 300 ns or more. When the IIC is used only as a slave device, the transfer rate setting is not required, but ICBRL must be set to a value longer than the data setup time (250 ns).

For the SMBus device default address (1100 001b), use one of the slave address registers L0 to L2 (SARL0, SARL1, and SARL2), and set the associated FS bit (7- or 10-bit address format select) in SARUy (y = 0 to 2) to 0 (7-bit address format).

在SCL时钟的一个周期内，CLO位自动设置为0。此时，如果ICCR2.BBSY=1，SCL引脚变为低电平，当ICCR2.BBSY=0时，SCL引脚变为高电平。通过软件确认CLO位为0后，向CLO位写入1以连续输出附加时钟。

当IIC模块处于主模式且从设备保持SDAn线为低电平时，由于噪声等影响与从设备失去同步，因此无法输出停止条件。该功能可用于逐个输出额外的SCL周期，使从设备释放SDAn线的低电平状态，从而将总线从不可用状态恢复。从设备释放SDAn线可以通过读取ICCR1中的SDAI位来监控。从设备确认SDAn线的释放后，通过重新发出停止条件完成通信。

[使用ICCR1中CLO位的输出条件]

●当总线打开（ICCR2中的BBSY标志=0）或主机模式（ICCR2中的MST位=1和BBSY标志=1）时

●当通信设备不保持SCLn线为低电平时。

图31.49显示了额外SCL时钟周期输出功能（CLO位）的操作时序。

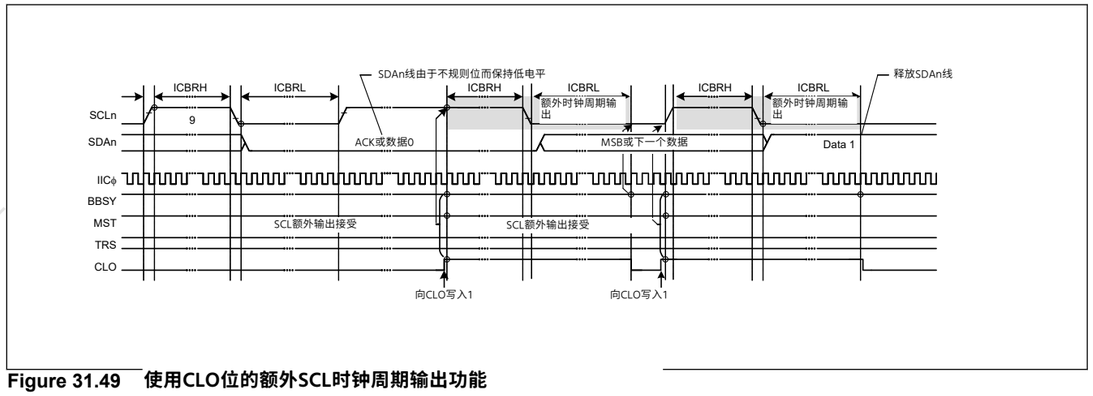

Figure 31.49 使用CLO位的额外SCL时钟周期输出功能

31.12.3 IIC复位和内部复位

IIC模块包含一个自我复位功能。它使用两种类型的重置：

●IIC复位，初始化所有寄存器，包括ICCR2中的BBSY标志。

●内部复位，将IIC从从地址匹配状态释放并初始化内部计数器，同时保存其他设置。

发出复位后，始终将ICCR1中的IICRST位设置为0。两种类型的复位都对从总线挂起状态释放有效，因为两者都将SCLn和SDAn引脚的输出状态恢复为高阻状态。

在从机操作期间发出复位可能会导致主设备时钟和从设备时钟之间失去同步，因此请尽可能避免这种情况。此外，在IIC复位（ICE和IICRST位=ICCR1中的01b）期间无法监控总线状态，例如是否存在启动条件。

有关IIC和内部复位的详细说明，请参见第31.15节。发出每个条件时的寄存器状态。

31.13 SMBus Operation

IIC支持符合SMBus规范（2.0版）的数据通信。要执行SMBus通信，请将ICMR3中的SMBS位设置为1。要使用SMBus标准的10至100kbps范围内的传输速率，请设置ICMR1、ICBRH和ICBRL寄存器中的CKS[2:0]位.此外，请指定ICMR2中的DLCS位和ICMR2中的SDDL[2:0]位中的值，以满足300ns或更长的数据保持时间规范。当IIC仅用作从设备时，不需要设置传输速率，但必须将ICBRL设置为比数据建立时间（250ns）更长的值。

对于SMBus器件默认地址(1100001b)，使用从地址寄存器L0到L2之一（SARL0、SARL1和SARL2），并将SARUy(y=0to2)中相关的FS位（7位或10位地址格式选择）设置为0（7位地址格式）。

RA生态工作室

When transmitting the UDID (Unique Device Identifier), set the SALE bit in ICFER to 1 to enable the slave arbitration-lost detection function.

31.13.1 SMBus Timeout Measurement

(1) Measuring slave device timeout

The following period (timeout interval: $T_{LOW: SEXT}$) must be measured for slave devices in SMBus communication:

- From start condition to stop condition.

To measure timeout for slave devices, measure the period from start condition detection to stop condition detection with the GPT using the IIC start condition detection interrupt (STIn) and stop condition detection interrupt (SPIn). The measured timeout period must be within the total clock low-level period [slave device] $T_{LOW: SEXT}$: 25 ms (maximum) of the SMBus standard.

If the time measured with the GPT exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (minimum) of the SMBus standard, the slave device must release the bus by writing 1 to the IICRST bit in ICCR1 to issue an internal reset of the IIC. When an internal reset is issued, the IIC stops driving the bus for the SCLn and SDAn pins, making them output high-impedance, which releases the bus.

(2) Measuring master device timeout

The following periods (timeout interval: $T_{LOW: MEXT}$) must be measured for master devices in SMBus communication:

- From start condition to acknowledge bit
- Between acknowledge bits
- From acknowledge bit to stop condition.

To measure timeout for master devices, measure these periods with the GPT using the IIC start condition detection interrupt (STIn), stop condition detection interrupt (SPIn), transmit end interrupt (IICn_TEI), or receive data full interrupt (IICn_RXI). The measured timeout period must be within the total clock low-level extended period (master device) $T_{LOW: MEXT}$: 10 ms (maximum) of the SMBus standard, and the total of all $T_{LOW: MEXT}$ values from start condition to stop condition must be within $T_{LOW: SEXT}$: 25 ms (maximum).

For the ACK receive timing (rising edge of the 9th SCL clock cycle), monitor the TEND flag in ICSR2 in master transmit mode (master transmitter) and the RDRF flag in ICSR2 in master receive mode (master receiver). Perform byte-wise transmit operations in master transmit mode, and hold the RDRFS bit in ICMR3 at 0 until the byte immediately before reception of the final byte in master receive mode. While the RDRFS bit is 0, the RDRF flag is set to 1 on the rising edge of the 9th SCL clock cycle.

If the period measured with the GPT exceeds the total clock low-level extended period (master device) $T_{LOW: MEXT}$: 10 ms (maximum) of the SMBus standard or the total of measured periods exceeds the clock low-level detection timeout $T_{TIMEOUT}$: 25 ms (minimum) of the SMBus standard, the master device must stop the transaction by issuing a stop condition. In master transmit mode, immediately stop the transmit operation (stop writing data to ICDRT).

发送UDID（UniqueDeviceIdentifier）时，将ICFER中的SALE位设置为1，以使能从机仲裁丢失检测功能。

31.13.1 SMBus超时测量

(1) 测量从设备超时

对于SMBus通信中的从设备，必须测量以下周期（超时间隔：TLOW:SEXT）：

●从开始条件到停止条件。

要测量从设备的超时，请使用GPT使用IIC启动条件检测中断(STIn)和停止条件检测中断(SPIn)测量从启动条件检测到停止条件检测的周期。测得的超时周期必须在总时钟低电平周期[从设备]TLOW:SEXT:SMBus标准的25ms（最大值）内。

如果用GPT测量的时间超过时钟低电平检测超时TTIMEOUT:25ms（最小值）
SMBus标准，从设备必须通过向ICCR1中的IICRST位写入1来释放总线，以发出IIC的内部复位。当发出内部复位时，IIC停止驱动SCLn和SDAn引脚的总线，使它们输出高阻抗，从而释放总线。

(2) 测量主设备超时

对于SMBus通信中的主设备，必须测量以下周期（超时间隔：TLOW:MEXT）：

●从开始条件到确认位
●确认位之间
●从确认位到停止条件。

要测量主设备的超时，请使用GPT使用IIC开始条件检测中断(STIn)、停止条件检测中断(SPIn)、发送结束中断(IICn_TEI)或接收数据完整中断(IICn_RXI)来测量这些周期。测量的超时周期必须在总时钟低电平扩展周期（主设备）TLOW内：

MEXT：SMBus标准的10毫秒（最大值），从开始条件到停止条件的所有TLOW：MEXT值的总和必须在TLOW：SEXT：25毫秒（最大值）内。

对于ACK接收时序（第9个SCL时钟周期的上升沿），在主机发送模式（主机发送器）下监控ICSR2中的TEND标志，在主机接收模式（主机接收器）下监控ICSR2中的RDRF标志。在主机发送模式下执行逐字节发送操作，并将ICMR3中的RDRFS位保持为0，直到在主机接收模式下接收到最后一个字节之前的字节。当RDRFS位为0时，RDRF标志在第9个SCL时钟周期的上升沿设置为1。

如果用GPT测量的周期超过总时钟低电平延长周期（主设备）TLOW:MEXT:SMBus标准的10ms（最大值）或总测量周期超过时钟低电平检测超时TTIMEOUT：SMBus标准的25ms（最小值），主设备必须通过发出停止条件来停止事务。在主机发送模式下，立即停止发送操作（停止向ICDRT写入数据）。

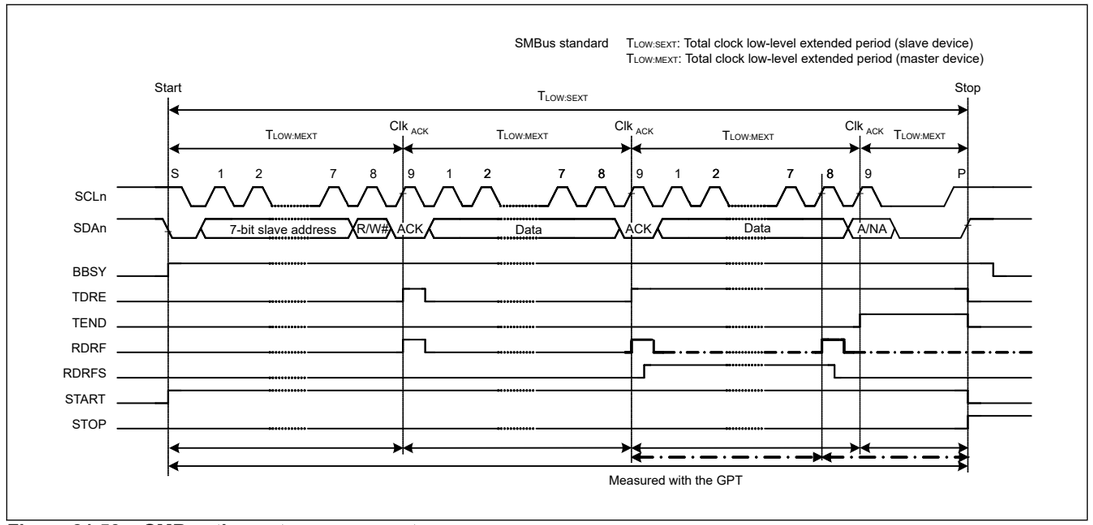

Figure 31.50 SMBus timeout measurement

31.13.2 Packet Error Code (PEC)

The MCU provides a CRC calculator that enables transmission of a Packet Error Code (PEC) or allows checking of the received data in SMBus data communication for the IIC. For the CRC-generating polynomials of the CRC calculator, see section 40, Cyclic Redundancy Check (CRC).

In master transmit mode, the PEC data can be generated by writing all transmit data to the CRC Data Input Register (CRCDIR) in the CRC calculator.

In master receive mode, the PEC data can be checked by writing all receive data to CRCDIR in the CRC calculator and comparing the obtained value in the CRC Data Output Register (CRCDOR) with the received PEC data.

To send ACK or NACK based on the match or mismatch result when the final byte is received as a result of the PEC code check, set the RDRFS bit in ICMR3 to 1 before the rising edge of the 8th SCL clock cycle during reception of the final byte, and hold the SCLn line low on the falling edge of the 8th clock cycle.

31.13.3 SMBus Host Notification Protocol (Notify ARP Master Command)

In communicating over an SMBus, a slave device can temporarily act as a master device to notify the SMBus host (or ARP master) of its own slave address, or to request its own slave address from the SMBus host.

For a product using the MCU to operate as an SMBus host or ARP master, the host address (0001 000b) sent from the slave device must be detected as a slave address, and so the IIC provides a function for detecting the host address. To detect the host address as a slave address, set the SMBS bit in ICMR3 and the HOAE bit in ICSER to 1. Operation after the host address is detected is the same as normal slave operation.

31.14 Interrupt Sources

The IIC issues five types of interrupt requests:

- Transfer error or event generation (arbitration-lost, NACK detection, timeout detection, start condition detection, and stop condition detection)
- Receive data full
- Transmit data empty
- Transmit end
- Address match during wakeup function

Table 31.10 lists details about the interrupt requests. The receive data full and transmit data empty interrupts can activate data transfer by the DTC or DMAC.

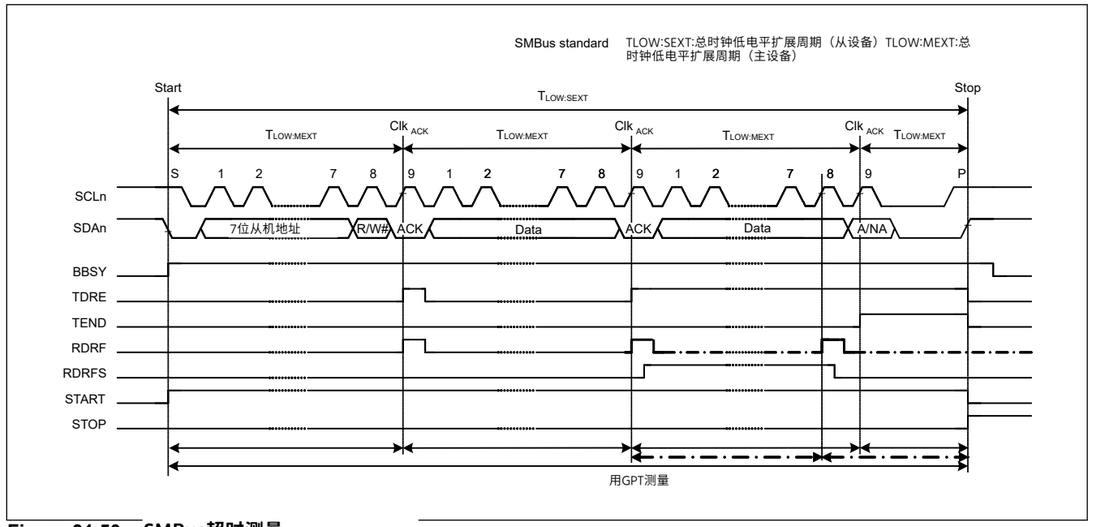

Figure 31.50 SMBus超时测量

31.13.2 数据包错误代码(PEC)

MCU提供了一个CRC计算器，可以传输数据包错误代码(PEC)或检查IIC的SMBus数据通信中接收到的数据。有关CRC计算器的CRC生成多项式，请参阅第40节，循环冗余校验(CRC)。

在主机发送模式下，可以通过将所有发送数据写入CRC计算器中的CRC数据输入寄存器(CRCDIR)来生成PEC数据。

在主机接收模式下，可以通过将所有接收数据写入CRC计算器中的CRCDIR并将获得的CRC数据输出寄存器(CRCDOR)中的值与接收到的PEC数据进行比较来检查PEC数据。

当作为PEC代码检查的结果接收到最后一个字节时，要根据匹配或不匹配结果发送ACK或NACK，请在接收最后一个字节期间的第8个SCL时钟周期的上升沿之前将ICMR3中的RDRFS位设置为1字节，并在第8个时钟周期的下降沿保持SCLn线为低电平。

31.13.3 SMBus主机通知协议（通知ARP主机命令）

在通过SMBus进行通信时，从设备可以临时充当主设备来通知SMBus主机（或ARP主机）它自己的从地址，或者从SMBus主机请求它自己的从地址。

对于使用MCU作为SMBus主机或ARP主机的产品，从机发送的主机地址（0001000b）必须被检测为从机地址，因此IIC提供了主机地址检测功能。要将主机地址检测为从机地址，请将ICMR3中的SMBS位和ICSER中的HOAE位设置为1。检测到主机地址后的操作与正常从机操作相同。

31.14 中断源

IIC发出五种类型的中断请求：

- 传输错误或事件发生（仲裁丢失、NACK检测、超时检测、开始条件检测和停止条件检测）
- 接收数据已满
- 传输数据为空
- 发送端
- 唤醒功能期间的地址匹配

表31.10列出了有关中断请求的详细信息。接收数据满和发送数据空中断可以通过DTC或DMAC激活数据传输。

Table 31.10 Interrupt sources

Symbol	Interrupt source	Interrupt flag	DTC or DMAC activation	Interrupt condition
IICn_EEI*5	Transfer error or event occurrence	AL	Not possible	AL = 1, ALIE = 1
		NACKF		NACKF = 1, NAKIE = 1
		TMOF		TMOF = 1, TMOIE = 1
		START		START = 1, STIE = 1
		STOP		STOP = 1, SPIE = 1
IICn_RXI*2 *5	Receive data full	RDRF	Possible	RDRF = 1, RIE = 1
IICn_TXI*1 *5	Transmit data empty	RDRF	Possible	TDRE = 1, TIE = 1
IICn_TEI*3 *5	Transmit end	TEND	Not possible	TEND = 1, TEIE = 1
IIC0_WUI*4	Slave address match during wakeup function	WUF	Not possible	Slave address match Slave receive complete RWAK operation ASY0 = 1 WUIE = 1

Note: There is a delay between the execution of a write instruction for a peripheral module by the CPU and the actual writing to the module. When an interrupt flag is cleared or masked, read the relevant flag again to check whether clearing or masking is complete, then return from interrupt handling. Not doing so creates the possibility of repeated processing of the same interrupt.

Note 1. Because IICn_TXI is edge-detected, it does not require clearing. Additionally, the TDRE flag in ICSR2 (condition for IICn_TXI) is automatically set to 0 when transmit data is written to the ICDRT register or a stop condition is detected (STOP flag = 1 in ICSR2).

Note 2. Because IICn_RXI is edge-detected, it does not require clearing. Additionally, the RDRF flag in ICSR2 (condition for IICn_RXI) is automatically set to 0 when data is read from ICDRR.

Note 3. When using the IICn_TEI interrupt, clear the TEND flag in ICSR2 in the IICn_TEI interrupt handling. The TEND flag in ICSR2 automatically is set to 0 when transmit data is written to the ICDRT register or a stop condition is detected (STOP flag = 1 in ICSR2).

Note 4. Only channel 0 has a wakeup function, so IIC0_WUI is for channel 0 only.

Note 5. Channel number (n = 0 to 2).

Clear or mask each flag during interrupt handling.

31.14.1 Buffer Operation for IICn_TXI and IICn_RXI Interrupts

If the conditions for generating an IICn_TXI or IICn_RXI interrupt are satisfied while the associated IR flag is 1, the interrupt request is not output for the ICU but is saved internally. One request per source can be saved internally.

An interrupt request that is saved in the ICU is output when the ICU.IELSRn.IR flag becomes 0. Internally saved interrupt requests are automatically cleared under normal conditions. They can also be cleared by writing 0 to the interrupt enable bit within the associated peripheral module.

31.15 State of Registers When Issuing Each Condition

The IIC has two dedicated resets, IIC reset and Internal reset. Table 31.11 lists the registers states when issuing each condition.

Table 31.11 Register states when issuing each condition (1 of 2)

Registers		Reset	IIC reset (ICE = 0, IICRST = 1)	Internal reset (ICE = 1, IICRST = 1)	Start or restart condition detection	Stop condition detection
ICCR1	ICE, IICRST	In reset	Saved	Saved	Saved	Saved
	SCLO, SDAO		In reset	In reset		
	Others			Saved		
ICCR2	BBSY	In reset	In reset	Saved	Set	In reset
	ST, RS			In reset	In reset	Saved
	SP					In reset
	TRS				Set or saved	
	MST					

Table 31.10 中断源

Symbol	中断源	中断标志	DTC或DMAC激活	中断条件
IICn_EEI*5	传输错误或事件发生	AL	不可能	AL = 1, ALIE = 1
		NACKF		NACKF = 1, NAKIE = 1
		TMOF		TMOF = 1, TMOIE = 1
		START		START = 1, STIE = 1
		STOP		STOP = 1, SPIE = 1
IICn_RXI*2 *5	接收数据已满	RDRF	Possible	RDRF = 1, RIE = 1
IICn_TXI*1 *5	传输数据为空	RDRF	Possible	TDRE = 1, TIE = 1
IICn_TEI*3 *5	发射端	TEND	不可能	TEND = 1, TEIE = 1
IIC0_WUI*4	唤醒功能期间的从机地址匹配	WUF	不可能	从地址匹配 从机接收完成 RWAK operation ASY0 = 1 WUIE = 1

Note: CPU执行外围模块的写指令与实际写入模块之间存在延迟。当一个中断标志被清除或屏蔽时，再次读取相关标志，检查清除或屏蔽是否完成，然后从中断处理返回。不这样做会产生重复处理同一中断的可能性。

注1.因为IICn_TXI是边沿检测，所以不需要清零。此外，当发送数据写入ICDRT寄存器或检测到停止条件（ICSR2中的STOP标志=1）时，ICSR2中的TDRE标志（IICn_TXI的条件）自动设置为0。

注2.因为IICn_RXI是边沿检测，所以不需要清零。此外，从ICDRR读取数据时，ICSR2中的RDRF标志（IICn_RXI的条件）自动设置为0。

注3.使用IICn_TEI中断时，在IICn_TEI中断处理中清除ICSR2中的TEND标志。当发送数据写入ICDRT寄存器或检测到停止条件（ICSR2中的STOP标志=1）时，ICSR2中的TEND标志自动设置为0。

注4.只有通道0有唤醒功能，所以IIC0_WUI仅适用于通道0。

注5.通道编号（n=0至2）。

在中断处理期间清除或屏蔽每个标志。

31.14.1 IICn_TXI和IICn_RXI中断的缓冲区操作

如果在相关的IR标志为1时满足产生IICn_TXI或IICn_RXI中断的条件，则中断请求不会输出给ICU，而是在内部保存。每个源的一个请求可以在内部保存。

当ICU.IELSRn.IR标志变为0时，输出ICU中保存的中断请求。在正常情况下，内部保存的中断请求会自动清除。它们也可以通过向相关外围模块中的中断使能位写入0来清除。

31.15 发布每个条件时的寄存器状态

IIC有两个专用复位，IIC复位和内部复位。表31.11列出了发出每个条件时的寄存器状态。

Table 31.11 发出每个条件时注册状态（2个中的1个）

Registers		Reset	IIC reset (ICE = 0, IICRST = 1)	内部复位（ICE=1，IICRST=1）	启动或重启条件检测	停止条件检测
ICCR1	ICE, IICRST	复位中	Saved	Saved	Saved	Saved
	SCLO, SDAO		复位中	复位中		
	Others			Saved		
ICCR2	BBSY	复位中	复位中	Saved	Set	复位中
	ST, RS			复位中	复位中	Saved
	SP					复位中
	TRS				设置或保存

31.16 Event Link Output

The IIC0 module handles the event output for the Event Link Controller (ELC) for the following sources:

(1) Transfer error event

When a transfer error event occurs, the associated event signal can be output to another module by the ELC.

(2) Receive data full

When a receive data register becomes full, the associated event signal can be output to another module by the ELC.

(3) Transmit data empty

When a transmit data register becomes empty, the associated event signal can be output to another module by the ELC.

(4) Transmit end

On completion of the transfer, the associated event signal can be output to another module by the ELC.

31.16.1 Interrupt Handling and Event Linking

Each of the IIC interrupt types (see Table 31.10) has an enable bit to control enabling and disabling of the associated interrupt signal. An interrupt request signal is output to the CPU when an interrupt source condition is satisfied while the associated enable bit is set.

Table 31.11 发布每个条件时注册状态（2个中的2个）

31.16 事件链接输出

IIC0模块为以下源处理事件链接控制器(ELC)的事件输出：

(1) 传输错误事件

当发生传输错误事件时，ELC可以将相关事件信号输出到另一个模块。

(2) 接收数据已满

当接收数据寄存器变满时，ELC可以将相关的事件信号输出到另一个模块。

(3) 传输数据为空

当发送数据寄存器变为空时，ELC可以将相关的事件信号输出到另一个模块。

(4) 发射端

传输完成后，ELC可以将相关的事件信号输出到另一个模块。

31.16.1 中断处理和事件链接

每种IIC中断类型（见表31.10）都有一个启用位来控制相关中断信号的启用和禁用。当相关的使能位设置时，中断源条件成立时，将向CPU输出中断请求信号。

The associated event link output signals are sent to other modules as event signals by the ELC when the interrupt source conditions are satisfied, regardless of the interrupt enable bit settings. For details on interrupt sources, see Table 31.10.

31.17 Usage Notes

31.17.1 Settings for the Module-Stop Function

The Module Stop Control Register B (MSTPCRB) can enable or disable IIC operation. The IIC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

31.17.2 Notes on Starting Transfer

If the IR flag associated with the IIC interrupt is 1 when transfer is started (ICCR1.ICE bit = 1), follow the procedure in this section to clear the interrupts before enabling operations. Starting transfer with the IR flag set to 1 while the ICCR1.ICE bit is 1 leads to an interrupt request being internally saved after transfer starts, and this can lead to unexpected behavior of the IR flag.

To clear interrupts before starting transfer operation:

1. Confirm that the ICCR1.ICE bit is 0.
2. Set the relevant interrupt enable bits, such as ICIER.TIE to 0.
3. Read the relevant interrupt enable bits, such as ICIER.TIE, and confirm that the value is 0.
4. Set the IR flag to 0.

当满足中断源条件时，ELC将关联的事件链接输出信号作为事件信号发送到其他模块，而不管中断使能位设置如何。有关中断源的详细信息，请参见表31.10。

31.17 使用说明

31.17.1 模块停止功能的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用IIC操作。IIC在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

31.17.2 开始转移注意事项

如果在传输开始时与IIC中断相关的IR标志为1（ICCR1.ICE位=1），请按照本节中的步骤在使能操作之前清除中断。在ICCR1.ICE位为1时将IR标志设置为1开始传输会导致在传输开始后内部保存中断请求，这可能导致IR标志的意外行为。

在开始传输操作之前清除中断：

1.确认ICCR1.ICE位为0。

2.设置相关的中断使能位，如ICIER.TIE为0。

3、读取相关的中断使能位，如ICIER.TIE，确认值为0。

4.将IR标志设置为0。

RA生态工作室

32. CAN-FD

32.1 Overview

The Controller Area Network-Flexible Data (CAN-FD) module supports the following functions:

- Multiple channel operation
- Gateway function
- CAN with Flexible Data rate.*1

Note 1. This feature is not available in the classical CAN function.

The CAN-FD module has a flexible message buffer and FIFO structure that meet the requirements of various applications. It also provides test modes to achieve high testability of the module that can be useful for power-on testing.

This specification describes a 2 channel implementation of the CAN-FD module.

The CAN-FD mode is only available in certain products that support it.

32.1.1 CAN-FD Module

Table 32.1 CAN-FD module specifications (1 of 2)

Parameter	Specifications
Communication	CAN functionality conforms to CAN-FD ISO 11898-1 (2015)
Gateway function	CAN 2.0 ↔ CAN 2.0 CAN 2.0 ↔ CAN-FD gateway (only 8-byte payload)*1 CAN-FD ↔ CAN-FD*1
Data transfer rate	Up to 1 Mbps for arbitration phase and up to 8 Mbps for data phase, individually for each CAN channel
Operation frequency Peripheral clock/APB clock	50 MHz (PCLKB) RAM clock: 100 MHz (PCLKA)
Data Link Layer (DLL) clock	Max ≤ 40 MHz
Input/Output pins	TX/RX
CAN channels	2 channels
Selectable ID type	11-bit Standard ID
	11-bit Standard ID + 18-bit Extended ID
Selectable frame type	Data frame (RTR = 0) (CAN and CAN-FD frames)
	Remote frame (RTR = 1) (only CAN frames)
Variable data byte count for data frames	DLC range: 0 to F
Message buffer	Up to 16 × 2 reception message buffers, shared among all the CAN channels
	16 transmit message buffers per channel
	4 transmission queues per channel Automatic message transfer into transmission queues supported
FIFO number	8 reception FIFO buffers Up to 3 × 2 FIFOs individually configurable as: ● Reception FIFO ● Transmission FIFO ● CAN-to-CAN Gateway FIFO
Automatic delay interval timer for transmission	The delay timer can be applied to: ● Transmission FIFO ● CAN-to-CAN Gateway FIFO

32. CAN-FD

32.1 Overview

控制器局域网灵活数据(CAN-FD)模块支持以下功能：

●多通道操作

●网关功能

●具有灵活数据速率的CAN。*1

注1.此功能在经典CAN功能中不可用。

CAN-FD模块具有灵活的报文缓冲区和FIFO结构，可满足各种应用的要求。它还提供了测试模式来实现模块的高可测试性，这对于上电测试很有用。

本规范描述了CAN-FD模块的2通道实现。

CAN-FD模式仅在支持它的某些产品中可用。

32.1.1 CAN-FD Module

Table 32.1 CAN-FD模块规格(1of2)

Parameter	Specifications
Communication	CAN功能符合CAN-FDISO11898-1(2015)
网关功能	CAN 2.0 ↔ CAN 2.0 CAN2.0↔CAN-FD网关（仅8字节有效负载）*1 CAN-FD ↔ CAN-FD*1
数据传输率	仲裁阶段高达1Mbps，数据阶段高达8Mbps，每个CAN通道单独
运行频率 外设时钟APB时钟	50 MHz (PCLKB) RAM clock: 100 MHz (PCLKA)
数据链路层(DLL)时钟	Max ≤ 40 MHz
Input/Output pins	TX/RX
CAN通道	2 channels
可选择的ID类型	11位标准ID
	11位标准ID+18位扩展ID
可选择的框架类型	数据帧(RTR=0)（CAN和CAN-FD帧）
	远程帧(RTR=1)（仅限CAN帧）
数据帧的可变数据字节数	DLC range: 0 to F
消息缓冲区	多达16×2个接收消息缓冲区，在所有CAN通道之间共享
	每个通道16个传输消息缓冲区
	每个通道4个传输队列支持自动将消息传输到传输队列
FIFO number	8个接收FIFO缓冲区最多3×2个FIFO，可单独配置为：● ● Transmission FIFO ● CAN-to-CAN Gateway FIFO
传输的自动延迟间隔定时器	延时定时器可应用于：● ● CAN-to-CAN Gateway FIFO

Table 32.1 CAN-FD module specifications (2 of 2)

Parameter	Specifications
Enhanced reception filtering	Support of 11 bits and 29 bits CAN identifier
	Programmable 29 bits CAN identifier acceptance filter mask for each entry
	Programmable gateway routing capability for each channel (up to 8 routing destinations)
	RTR and IDE masking
	Data Length Code (DLC) filter
	Message buffer payload overload protection
	Payload filter
	Updating Acceptance Filter List (AFL) entry during communication
General software support	Automatic label information added to receive message (for upper software layer support)
Timer	TX and RX Timestamp function
Power down function	Module start stop function for each CAN node (Channel and Global Sleep modes)
RAM	RAM ECC protected (2 bits error detection, 1-bit error correction)
Bus traffic measurement	CAN bus traffic measurement of each channel is possible
TrustZone Filter	One security attribution can be set, and the attribution of the two channels are the same

Note 1. This feature is not available in the classical CAN function.

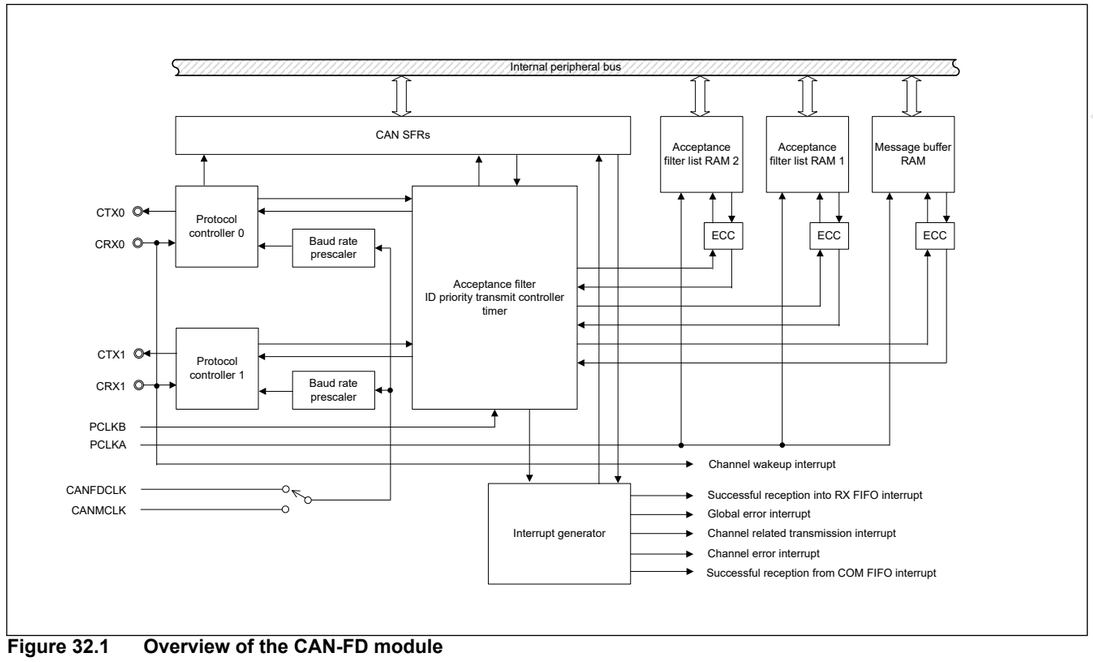

Figure 32.1 Overview of the CAN-FD module

- TX/RX:
  Input/Output, CRXn/CTXn, pins of the CAN module
- Protocol controller:
  Handles CAN protocol processing such as bus arbitration, bit timing at transmission and reception, stuffing, error handling

Table 32.1 CAN-FD模块规格（2之2）

Parameter	Specifications
增强的接收过滤	支持11位和29位CAN标识符
	每个条目的可编程29位CAN标识符接受过滤器掩码
	每个通道的可编程网关路由功能（最多8个路由目的地）
	RTR和IDE掩码
	数据长度代码(DLC)过滤器
	消息缓冲区负载过载保护
	有效负载过滤器
	在通信期间更新接受过滤器列表(AFL)条目
通用软件支持	接收消息自动添加标签信息（用于上层软件层支持）
Timer	TX和RX时间戳功能
断电功能	每个CAN节点的模块启动停止功能（通道和全局睡眠模式）
RAM	RAMECC保护（2位错误检测，1位错误纠正）
公交车流量测量	可以对每个通道进行CAN总线流量测量
TrustZone Filter	可设置一个安全属性，两个通道的属性相同

注1.此功能在经典CAN功能中不可用。

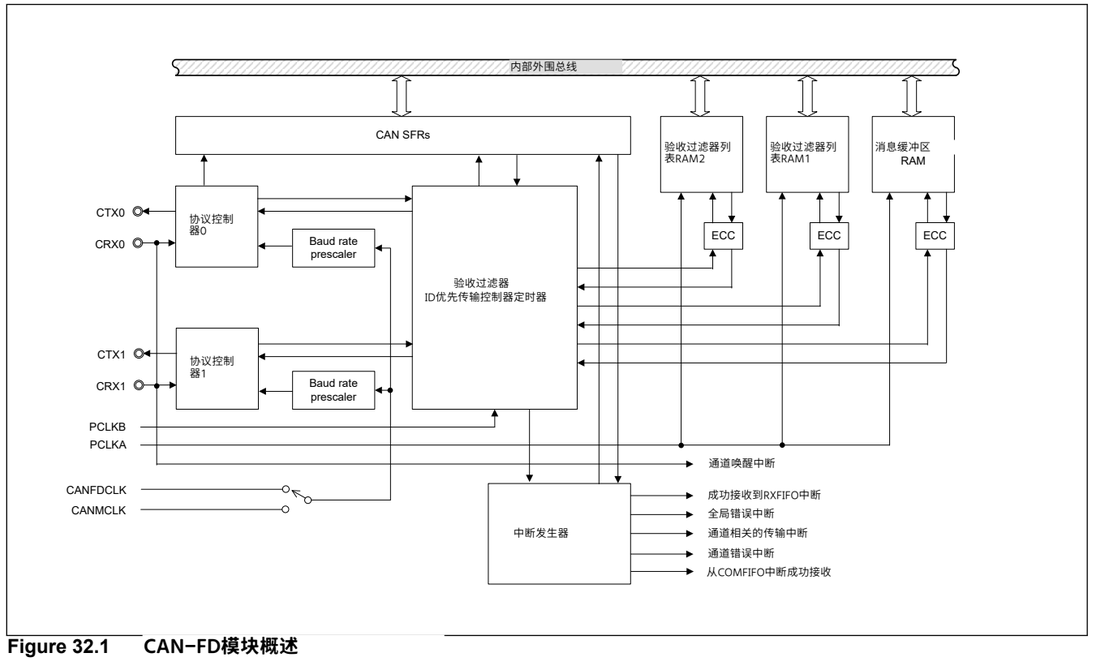

Figure 32.1 CAN-FD模块概述

- TX/RX:
  输入输出，CRXnCTXn，CAN模块的引脚
- Protocol controller:
  处理CAN协议处理，例如总线仲裁、发送和接收时的位时序、填充、错误处理

- Acceptance filter list RAM:
  This RAM is used to store the message acceptance filtering entries for all channels. Each acceptance filter entry has an individual ID, data length code, data field, message pointer for upper layer application usage and message direction pointer. The AFLRAM is divided in two parts to accelerate the Acceptance Filter List (AFL) access process.
- Message buffer RAM:
  This RAM is used to store messages after reception or for transmission using a normal message buffer or a FIFO. Each message entry has an individual ID, data length code, data field, message pointer for upper layer application usage and a time stamp.
- Acceptance filter:
  Performs filtering of received messages. The entries in the Acceptance filter list RAM are used for the filtering process.
- Two timers:
  - Reception Timestamp function
  - Transmission separation time for FIFO buffers
- Interrupt generator:
  Generates several types of global and channel interrupts
- CAN Special Function Registers (SFRs):
  Registers associated with CAN. See section 32.2.87. Message Buffer Component Structure.

32.2 Register Descriptions

32.2.1 Register Table

The reset value shown for the RAM area, consisting of CFDGAFLIDn, CFDGAFLMn, CFDGAFLP0n, CFDGAFLP1n, CFDRMBCPn, CFDRFMBCPn, CFDCFMBCPn, CFDTMBCPn, CFDTHLACC0n, CFDTHLACC1n and CFDRPGACCn is valid after initialization of a hardware reset. See section 32.4.2. CAN Module Configuration after Hardware Reset for details of the initialization process.

If a write access with a size of 8 or 16 bits is performed for the RAM area, then the CAN-FD module does a read-modify write-access to the RAM location, because the RAM requires a 32-bit access through the ECC module.

For single bit error, the correct data is written back. For multiple bit errors, unknown data is written back.

Do not access the space where the register is not assigned.

The read data from the space where the register is not assigned is unknown.

32.2.2 Legend

For all repetitive registers and bits, a lowercase index is used to indicate which slice is being referenced. If an index is being used, it is defined and described in the Register table it is being used in.

There is one global index used across all the registers and bits that need it.

Table 32.2 CANFD Registers (1 of 4)

Register name	Symbol	Reset value	Offset Address	Access size
Channel n Nominal Bitrate Configuration Register n	CFDCnNCFG	0x00000000	0x0000 + n × 0x0010	8, 16, 32
Channel n Control Registers	CFDCnCTR	0x00000005	0x0004 + n × 0x0010	8, 16, 32
Channel n Status Registers	CFDCnSTS	0x00000005	0x0008 + n × 0x0010	8, 16, 32
Channel n Error Flag Registers	CFDCnERFL	0x00000000	0x000C + n × 0x0010	8, 16, 32
Global Configuration Register	CFDGCFG	0x00000000	0x0084	8, 16, 32
Global Control Register	CFDGCTR	0x00000005	0x0088	8, 16, 32
Global Status Register	CFDGSTS	0x0000000D	0x008C	8, 16, 32
Global Error Flag Register	CFDGERFL	0x00000000	0x0090	8, 16, 32
Global Timestamp Counter Register	CFDGTSC	0x00000000	0x0094	16, 32

●验收过滤器列表RAM：
此RAM用于存储所有通道的消息接受过滤条目。每个接受过滤器条目都有一个单独的ID、数据长度代码、数据字段、供上层应用程序使用的消息指针和消息方向指针。AFLRAM分为两部分以加速接受过滤器列表(AFL)访问过程。

●消息缓冲区RAM：
此RAM用于在接收后存储消息或使用普通消息缓冲区或FIFO进行传输。每个消息条目都有一个单独的ID、数据长度代码、数据字段、供上层应用程序使用的消息指针和时间戳。

- Acceptance filter:
  对收到的消息执行过滤。接受过滤器列表RAM中的条目用于过滤过程。
- Two timers:
  -接收时间戳功能
  FIFO缓冲区的传输分离时间
- Interrupt generator:
  生成多种类型的全局和通道中断

●CAN特殊功能寄存器(SFR)：
与CAN相关的寄存器。请参阅第32.2.87节。消息缓冲区组件结构。

32.2 注册说明

32.2.1 寄存器表

RAM区域的复位值，包括CFDGAFLIDn、CFDGAFLMn、CFDGAFLP0n、CFDGAFLP1n、CFDRMBCPn、CFDRFMBCPn、CFDCMBCPn、CFDTMBCPn、CFDTHLACC0n、CFDTHLACC1n和CFDRPGACCn，在硬件复位初始化后有效。请参见第32.4.2节。有关初始化过程的详细信息，请参阅硬件复位后的CAN模块配置。

如果对RAM区域执行8位或16位大小的写访问，则CAN-FD模块会对RAM位置执行读修改写访问，因为RAM需要通过ECC进行32位访问模块。

对于单位错误，正确的数据被写回。对于多位错误，将写回未知数据。

不要访问未分配寄存器的空间。

从未分配寄存器的空间读取的数据是未知的。

32.2.2 Legend

对于所有重复的寄存器和位，小写索引用于指示正　　在引用哪个切片。如果正在使用索引，则在使用它的寄存器表中对其进行定义和描述。

所有需要它的寄存器和位都使用一个全局索引。

Table 32.2 CANFD寄存器(1of4)

注册名称	Symbol	重置值	偏移地址	访问大小

TX消息缓冲区数据字段p 寄存器n通道i	CFDTMDFpn_i	0x00000000*1	请参阅第32.2.87.17节。CFDTMDFpn_i：TX消息缓冲区数据字段p寄存器n 通道i(p=0到15 n=0到7 32到39 i=0 1)	8, 16, 32

Note: 下标（n、f、i、p）的范围请参考各寄存器的说明。
注1.RAM区域在硬件复位后初始化，见32.4.2节。硬件复位后的CAN模块配置。
注2：这些寄存器在经典CAN功能中不可用。

RA生态工作室

32.2.3 CFDCnNCFG : Channel n Nominal Bitrate Configuration Register (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x0000 + 0x10 × n

Bit position:	31 … 25	24 … 17	16 … 10	9 … 0
Bit field:	NTSEG2[6:0]	NTSEG1[7:0]	NSJW[6:0]	NBRP[9:0]
Value after reset:	0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0	0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
9:0	NBRP[9:0]	Channel Nominal Baud Rate Prescaler Nominal baud rate prescaler division ratio	R/W
16:10	NSJW[6:0]	Resynchronization Jump Width 0x00: 1 Tq 0x01: 2 Tq ⋮ 0x7E: 127 Tq 0x7F: 128 Tq	R/W
24:17	NTSEG1[7:0]	Timing Segment 1 0x00: Reserved 0x01: 2 Tq 0x02: 3 Tq 0x03: 4 Tq ⋮ 0xFE: 255 Tq 0xFF: 256 Tq	R/W
31:25	NTSEG2[6:0]	Timing Segment 2 0x00: Reserved 0x01: 2 Tq ⋮ 0x7E: 127 Tq 0x7F: 128 Tq	R/W

Note: Tq means time quantum.

This register configures the transmission/reception nominal baud rate parameters of the channels.

NBRP[9:0] bits (Channel Nominal Baud Rate Prescaler)

The NBRP[9:0] bits are used to define the peripheral bus clock periods contained in a time quantum.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the CAN-FD channel is in CH_RESET or CH_HALT mode.

NSJW[6:0] bits (Resynchronization Jump Width)

The NSJW[6:0] bits set the synchronization jump width. A value from 1 to 128 time quanta can be set.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the CAN-FD channel is in CH_RESET or CH_HALT mode.

NTSEG1[7:0] bits (Timing Segment 1)

The NTSEG1[7:0] bits set the segment TSEG1 to compensate for edges on the CAN bus with a positive phase error. These bits contain the propagation segment.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the CAN-FD channel is in CH_RESET or CH_HALT mode.

Additionally, configure a Tq value only between 2 and 256, inclusive. See section 32.4.1.2. CAN Bit Timing for more details.

32.2.3 CFDCnNCFG:通道n标称比特率配置寄存器(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x0000 + 0x10 × n

Note: Tq表示时间量。

该寄存器配置通道的发送接收标称波特率参数。

NBRP[9:0]位（通道标称波特率预分频器）

NBRP[9:0]位用于定义包含在时间片中的外围总线时钟周期。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

NSJW[6:0]位（重新同步跳转宽度）

NSJW[6:0]位设置同步跳转宽度。可以设置1到128个时间量子的值。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

NTSEG1[7:0]位（时序段1）

NTSEG1[7:0]位设置段TSEG1以补偿CAN总线上具有正相位误差的边沿。这些位包含传播段。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

此外，仅在2和256之间配置Tq值（包括2和256）。请参阅第32.4.1.2节。CAN位时序了解更多详情。

RA生态工作室

NTSEG2[6:0] bits (Timing Segment 2)

The NTSEG2[6:0] bits set the segment TSEG2 to compensate for edges on the CAN bus with a negative phase error.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the CAN-FD channel is in CH_RESET or CH_HALT mode.

Additionally, configure a Tq value only between 2 and 128, inclusive.

32.2.4 CFDCnCTR : Channel n Control Registers (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x0004 + 0x10 × n

NTSEG2[6:0]位（时序段2）

NTSEG2[6:0]位设置段TSEG2以补偿CAN总线上的边沿与负相位误差。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

此外，仅将Tq值配置在2到128之间（包括2到128）。

32.2.4 CFDCnCTR:通道n控制寄存器(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x0004 + 0x10 × n

31	ROM*1	Restricted Operation Mode 0: Restricted operation mode disabled 1: Restricted operation mode enabled	R/W

Note 1. These bits are not available in the classical CAN function.

Each Channel Control register controls the modes of the related channel. It is used to enable generation of interrupts if errors are detected on the CAN bus connected to this channel. It is also used to configure the channel in test mode.

CHMDC[1:0] bits (Channel Mode Control)

The CHMDC[1:0] bits can be used to configure modes of the CAN channel.

CAN mode transitions are described in more details in section 32.3.3. Channel Modes.

Setting CHMDC[1:0] bits to 11b has no effect. When the CAN-FD module is in GL_HALT mode, these bits can only be set to 10b or 01b. These bits cannot be set in CH_SLEEP mode.

These bits can change automatically when transitioning to Halt mode by the CFDCnCTR.BOM settings.

If CPU write access to CFDCnCTR.CHMDC occurs at the same time when the CAN channel enters Halt mode (at the start of bus-off when CFDCnCTR.BOM = 01b, or at the end of bus-off when CFDCnCTR.BOM = 10b), then the CPU write access has the highest priority.

Bit	Symbol	Function	R/W

31	ROM*1	受限操作模式 0：禁用限制操作模式1：启用限制操作模式	R/W

注1.这些位在经典CAN功能中不可用。

每个通道控制寄存器控制相关通道的模式。如果在连接到此通道的CAN总线上检测到错误，它用于启用中断生成。它还用于在测试模式下配置通道。

CHMDC[1:0]位（通道模式控制）

CHMDC[1:0]位可用于配置CAN通道的模式。

CAN模式转换在第32.3.3节中有更详细的描述。频道模式。

将CHMDC[1:0]位设置为11b无效。当CAN-FD模块处于GL_HALT模式时，这些位只能设置为10b或01b。这些位不能在CH_SLEEP模式下设置。

当通过CFDCnCTR.BOM设置转换到暂停模式时，这些位可以自动更改。

如果CPU对CFDCnCTR.CHMDC的写访问发生在CAN通道进入Halt模式的同时（当CFDCnCTR.BOM=01b时在总线关闭开始时，或者当CFDCnCTR.BOM=10b时在总线关闭结束时），则CPU写访问的优先级最高。

RA生态工作室

The CAN channel changes the value of CFDCnCTR.CHMDC within the Channel Control Registers for the specified cases only if the CFDCnCTR.CHMDC value is 00b (Operation mode).

CSLPR bit (Channel Sleep Request)

When the CSLPR bit is 1, a Sleep mode request is generated for the corresponding CAN channel

When this bit is 0, a request to exit Sleep mode is generated for the related CAN-FD channel.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

RTBO bit (Return from Bus-Off)

When the protocol controller of the CAN channel enters bus-off state, you can force a recovery from bus-off state by setting the RTBO bit in the Channel Control Register to 1.

The error state changes from bus-off state to integrating with a maximum delay of 1 CAN bit time.

When the RTBO bit is set to 1, the REC and TEC registers are initialized and the Bus-Off Status bit (Channel Bus-off Status, CFDCnSTS.BOSTS) is set to 0.

Registers other than the REC and TEC registers are not initialized by this command. Even if CFDCnCTR.BORIE is set, a bus-off recovery interrupt is not generated by this recovery from the bus-off state.

The RTBO bit cannot be set in CH_SLEEP mode. Setting this bit in any state other than bus-off state has no effect and the bit is cleared immediately. The read value is always 0.

Return from the Bus-Off command should be used only when CFDCnCTR.BOM is set to 00b.

Only write to this bit when the related CAN-FD channel is in CH_OPERATION mode. This bit is automatically cleared when set by software.

BEIE bit (Bus Error Interrupt Enable)

When the BEIE and the CFDCnERFL.BEF bits are both 1, an error interrupt request is generated.

This bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

EWIE bit (Error Warning Interrupt Enable)

When the EWIE and the CFDCnERFL.EWF bits are both 1, an error interrupt request is generated.

The EWIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

EPIE bit (Error Passive Interrupt Enable)

An error interrupt request is generated when the EPIE bit and the CFDCnERFL.EPF are both 1.

The EPIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

BOEIE bit (Bus-Off Entry Interrupt Enable)

When the BOEIE and the CFDCnERFL.BOEF bits are both 1, an error interrupt request is generated.

The BOEIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

BORIE bit (Bus-Off Recovery Interrupt Enable)

When the BORIE and the CFDCnERFL.BORF bits are both 1, an error interrupt request is generated.

The BORIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

OLIE bit (Overload Interrupt Enable)

When the OLIE and the CFDCnERFL.OVLF bits are both 1, an error interrupt request is generated.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

仅当CFDCnCTR.CHMDC值为00b（操作模式）时，CAN通道才会在指定情况下更改通道控制寄存器中CFDCnCTR.CHMDC的值。

CSLPR位（通道休眠请求）

当CSLPR位为1时，为相应的CAN通道生成休眠模式请求

当该位为0时，会为相关的CAN-FD通道生成退出休眠模式的请求。

仅当相关CAN-FD通道处于CH_RESET或CH_SLEEP模式时才写入该位。

RTBO位（从总线关闭返回）

当CAN通道的协议控制器进入总线关闭状态时，您可以通过将通道控制寄存器中的RTBO位设置为1来强制从总线关闭状态恢复。

错误状态从总线关闭状态变为积分，最大延迟为1个CAN位时间。

当RTBO位设置为1时，REC和TEC寄存器被初始化并且总线关闭状态位（通道总线关闭状态，CFDCnSTS.BOSTS)设置为0。

该命令不初始化REC和TEC寄存器以外的寄存器。即使设置了CFDCnCTR.BORIE，从总线关闭状态恢复也不会产生总线关闭恢复中断。

在CH_SLEEP模式下不能设置RTBO位。将该位设置为总线关闭状态以外的任何状态均无效，并且该位立即被清除。读取值始终为0。

只有当CFDCnCTR.BOM设置为00b时，才应使用从总线关闭命令返回。

仅当相关CAN-FD通道处于CH_OPERATION模式时才写入该位。该位由软件置位时自动清零。

BEIE位（总线错误中断使能）

当BEIE和CFDCnERFL.BEF位均为1时，产生错误中断请求。

在CH_SLEEP模式下不能设置该位。仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。

EWIE位（错误警告中断使能）

当EWIE和CFDCnERFL.EWF位都为1时，会产生错误中断请求。

在CH_SLEEP模式下不能设置EWIE位。仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。

EPIE位（错误被动中断使能）

当EPIE位和CFDCnERFL.EPF都为1时产生错误中断请求。

在CH_SLEEP模式下不能设置EPIE位。仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。

BOEIE位（总线关闭进入中断允许）

当BOEIE和CFDCnERFL.BOEF位均为1时，会产生错误中断请求。

在CH_SLEEP模式下不能设置BOEIE位。仅当相关CAN-FD通道在时才写入该位
CH_RESET mode.

BORIE位（总线关闭恢复中断使能）

当BORIE和CFDCnERFL.BORF位均为1时，会产生错误中断请求。

在CH_SLEEP模式下不能设置BORIE位。仅当相关CAN-FD通道在时才写入该位
CH_RESET mode.

OLIE位（过载中断使能）

当OLIE和CFDCnERFL.OVLF位都为1时，产生错误中断请求。

在CH_SLEEP模式下不要写入该位。仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。

BLIE bit (Bus Lock Interrupt Enable)

When the BLIE and the CFDCnERFL.BLF bits are both 1, an error interrupt request is generated.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

ALIE bit (Arbitration Lost Interrupt Enable)

When the ALIE and the CFDCnERFL.ALF bits are both 1, an error interrupt request is generated.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

TAIE bit (Transmission Abort Interrupt Enable)

When the TAIE bit is 1 and a transmission is successfully aborted from a TX MB belonging to the corresponding CAN channel, an interrupt request is generated.

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

EOCOIE bit (Error Occurrence Counter Overflow Interrupt Enable)

When the EOCOIE bit is 1 and the CFDCnFDSTS.EOCO bit belonging to the corresponding CAN channel is 1, an error interrupt request is generated.

The EOCOIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

SOCOIE bit (Successful Occurrence Counter Overflow Interrupt Enable)

When the SOCOIE bit is 1 and the CFDCnFDSTS.SOCO bit belonging to the corresponding CAN channel is 1, an error interrupt request is generated.

The SOCOIE bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

TDCVFIE bit (Transceiver Delay Compensation Violation Interrupt Enable)

When the TDCVFIE bit is 1 and the CFDCnFDSTS.TDCVF bit belonging to the corresponding CAN channel is 1, an error interrupt request is generated.

The TDCVFIE bit cannot be set in CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET mode. Do not set this bit when in Classical-only mode.

Note: This bit is not available in the classical CAN function.

BOM[1:0] bits (Channel Bus-Off Mode)

The BOM[1:0]bits control the timing of the recovery from Bus-Off mode of the CAN-FD Channel.

Do not write to these bits in CH_SLEEP mode. Only write to these bits when the related CAN-FD channel is in CH_RESET mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET mode.

ERRD bit (Channel Error Display)

The ERRD bit controls the display mode of the error flag bits [14:8] in the Channel Error Flag Register (CFDCnERFL).

If the ERRD bit is 0 and more than one error occur at the same time, the error flag bits are set for all the errors that occurred at the same time. No further errors are flagged until CFDCnERFL[14:8] is cleared.

Do not write to the ERRD bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

CTME bit (Channel Test Mode Enable)

The CTME bit enables the channel test modes.

BLIE位（总线锁定中断使能）

当BLIE和CFDCnERFL.BLF位都为1时，会产生错误中断请求。

在CH_SLEEP模式下不要写入该位。仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。

ALIE位（仲裁丢失中断使能）

当ALIE和CFDCnERFL.ALF位都为1时，会产生错误中断请求。

在CH_SLEEP模式下不要写入该位。仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。

TAIE位（发送中止中断使能）

当TAIE位为1并且从属于相应CAN通道的TXMB成功中止传输时，将产生中断请求。

在CH_SLEEP模式下不要写入该位。仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。

EOCOIE位（错误发生计数器溢出中断使能）

当EOCOIE位为1且属于相应CAN通道的CFDCnFDSTS.EOCO位为1时，产生错误中断请求。

在CH_SLEEP模式下不能设置EOCOIE位。仅当相关CAN-FD通道在时才写入该位
CH_RESET mode.

SOCOIE位（成功发生计数器溢出中断使能）

当SOCOIE位为1且属于相应CAN通道的CFDCnFDSTS.SOCO位为1时，产生错误中断请求。

在CH_SLEEP模式下不能设置SOCOIE位。仅当相关CAN-FD通道在时才写入该位
CH_RESET mode.

TDCVFIE位（收发器延迟补偿违反中断允许）

当TDCVFIE位为1且属于相应CAN通道的CFDCnFDSTS.TDCVF位为1时，产生错误中断请求。

在CH_SLEEP模式下不能设置TDCVFIE位。

仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。在仅经典模式下不要设置该位。

Note: 该位在经典CAN功能中不可用。

BOM[1:0] bits (Channel Bus-Off Mode)

BOM[1:0]位控制CAN-FD通道从总线关闭模式恢复的时序。

请勿在CH_SLEEP模式下写入这些位。仅当相关CAN-FD通道处于CH_RESET模式时才写入这些位。

仅当相关CAN-FD通道处于CH_RESET模式时才写入这些位。

ERRD位（通道错误显示）

ERRD位控制通道错误标志寄存器(CFDCnERFL)中错误标志位[14:8]的显示模式。

如果ERRD位为0并且同时发生多个错误，则为同时发生的所有错误设置错误标志位。在清除CFDCnERFL[14:8]之前不会标记更多错误。

请勿在CH_SLEEP模式下写入ERRD位。仅当相关CAN-FD通道在时才写入该位
CH_RESET或CH_HALT模式。

CTME位（通道测试模式启用）

CTME位启用通道测试模式。

Do not write to this bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_HALT mode.

CTMS[1:0] bits (Channel Test Mode Select)

The CTMS[1:0] bits are used to select the required test mode.

Do not write to these bits in CH_SLEEP or CH_RESET mode. Only write to these bits when the related CAN-FD channel is in CH_HALT mode.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

CRCT bit (CRC Error Test)

The CRCT bit checks the internal CRC generator logic of the protocol controller.

The internal generated CRC value is always observed in the following registers:

- CFDCnERFL.CRCREG (Classical CAN frames)
- CFDCnFDCRC.CRCREG (CAN-FD frames).*1

Note 1. This feature is not available in the classical CAN function.

Some restriction exist when using this bit:

- It is not possible to use this feature with CAN nodes connected to the MCU externally, only with nodes connected to the internal CAN bus communication can be used
- One CAN node can send a reference message and the receiver node can invert one bit of the incoming bit stream.

Note: The transmitter and receiver modes share the same CRC generator, therefore it is not necessary to consider the modes separately when testing.

The CRC Error test mode is enabled if the CRCT (new control signal that inverts the first bit of the bit stream) and CTME bits are both 1.

Do not write to the CRCT bit in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_HALT mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

ROM bit (Restricted Operation Mode)

When the ROM and CTME bits are both 1, the restricted operation mode is enabled. This mode should only be used in basic test mode (CFDCnCTR.CTMS[1:0] = 00b).

The ROM bit cannot be set in CH_SLEEP mode. Only write to this bit when the related CAN-FD channel is in CH_HALT mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. Do not set this bit when in Classical-only mode.

Note: This bit is not available in the classical CAN function.

32.2.5 CFDCnSTS : Channel n Status Registers (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x0008 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ESIF	COMSTS	RECSTS	TRMSTS	BOSTS	EPSTS	CSLPSTS	CHLTSTS	CRSTSTS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1

在CH_SLEEP模式下不要写入该位。仅当相关CAN-FD通道处于CH_HALT模式时才写入该位。

CTMS[1:0]位（通道测试模式选择）

CTMS[1:0]位用于选择所需的测试模式。

不要在CH_SLEEP或CH_RESET模式下写入这些位。仅当相关CAN-FD通道处于CH_HALT模式时才写入这些位。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

CRCT位（CRC错误测试）

CRCT位检查协议控制器的内部CRC生成器逻辑。

内部生成的CRC值始终在以下寄存器中观察：

- CFDCnERFL.CRCREG (Classical CAN frames)
- CFDCnFDCRC.CRCREG (CAN-FD frames).*1

注1.此功能在经典CAN功能中不可用。

使用该位时存在一些限制：

●外接单片机的CAN节点无法使用此功能，只能使用内接CAN总线通讯的节点

●一个CAN节点可以发送参考消息，接收节点可以反转输入比特流的一位。

Note: 发送器和接收器模式共享相同的CRC生成器，因此在测试时无需单独考虑这些模式。

如果CRCT（反转比特流第一位的新控制信号）和CTME位均为1，则启用CRC错误测试模式。

请勿在CH_SLEEP模式下写入CRCT位。仅当相关CAN-FD通道在时才写入该位
CH_HALT mode.

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

ROM位（受限操作模式）

当ROM和CTME位都为1时，限制操作模式被使能。该模式只能用于基本测试模式（CFDCnCTR.CTMS[1:0]=00b）。

在CH_SLEEP模式下不能设置ROM位。仅当相关CAN-FD通道处于CH_HALT模式时才写入该位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。不要设置该位时
Classical-only mode.

Note: 该位在经典CAN功能中不可用。

32.2.5 CFDCnSTS:通道n状态寄存器(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x0008 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	TEC[7:0]								REC[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ESIF	COMSTS	RECSTS	TRMSTS	BOSTS	EPSTS	CSLPSTS	CHLTSTS	CRSTSTS
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1

Bit	Symbol	Function	R/W
0	CRSTSTS	Channel Reset Status 0: Channel not in Reset mode 1: Channel in Reset mode	R
1	CHLTSTS	Channel Halt Status 0: Channel not in Halt mode 1: Channel in Halt mode	R
2	CSLPSTS	Channel Sleep Status 0: Channel not in Sleep mode 1: Channel in Sleep mode	R
3	EPSTS	Channel Error Passive Status 0: Channel not in error passive state 1: Channel in error passive state	R
4	BOSTS	Channel Bus-Off Status 0: Channel not in bus-off state 1: Channel in bus-off state	R
5	TRMSTS	Channel Transmit Status 0: Channel is not transmitting 1: Channel is transmitting	R
6	RECSTS	Channel Receive Status 0: Channel is not receiving 1: Channel is receiving	R
7	COMSTS	Channel Communication Status 0: Channel is not ready for communication 1: Channel is ready for communication	R
8	ESIF*1	Error State Indication Flag 0: No CAN-FD message has been received when the ESI flag was set 1: At least one CAN-FD message was received when the ESI flag was set	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
23:16	REC[7:0]	Reception Error Count These bits increment or decrement the counter value according to error status of the CAN channel during reception.	R
31:24	TEC[7:0]	Transmission Error Count These bits increment or decrement the counter value according to error status of the CAN channel during transmission.	R

Note 1. This bit is not available in the classical CAN function.

Each Channel Status Register shows the mode, error and transmission or reception status of the related channel together with its reception and transmission error count values.

CRSTSTS bit (Channel Reset Status)

The CRSTSTS bit indicates whether the related CAN channel is in Reset mode.

This bit is set automatically when the related CAN channel enters Channel Reset mode. When the mode is changed from Reset mode to Sleep mode, the CRSTSTS bit remains 1.

This bit is cleared automatically when the related CAN channel exits the Channel Reset mode, except when changing to Sleep mode.

CHLTSTS bit (Channel Halt Status)

The CHLTSTS bit indicates whether the related CAN channel is in Halt mode.

This bit is set automatically when the related CAN module enters Halt mode, and is cleared automatically when the related CAN module exits Halt mode.

CSLPSTS bit (Channel Sleep Status)

The CSLPSTS bit indicates whether the related CAN channel is in Sleep mode.

Bit	Symbol	Function	R/W
0	CRSTSTS	通道复位状态 0：通道不处于复位模式1：通道处于复位模式	R
1	CHLTSTS	通道暂停状态 0：通道未处于暂停模式1：通道处于暂停模式	R
2	CSLPSTS	通道休眠状态 0：通道不处于休眠模式1：通道处于休眠模式	R
3	EPSTS	通道错误被动状态 0：通道未处于错误被动状态1：通道处于错误被动状态	R
4	BOSTS	通道总线关闭状态 0：通道未处于总线关闭状态1：通道处于总线关闭状态	R
5	TRMSTS	通道传输状态 0：通道未发送1：通道正在发送	R
6	RECSTS	频道接收状态 0：通道未接收1：通道正在接收	R
7	COMSTS	通道通讯状态 0：通道未准备好通讯1：通道准备好通讯	R
8	ESIF*1	错误状态指示标志 0：设置ESI标志时未接收到CAN-FD消息1：设置ESI标志时至少接收到一条CAN-FD消息	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W
23:16	REC[7:0]	接收错误计数 这些位根据接收期间CAN通道的错误状态递增或递减计数器值。	R
31:24	TEC[7:0]	传输错误计数 这些位在传输过程中根据CAN通道的错误状态递增或递减计数器值。	R

注1.该位在经典CAN功能中不可用。

每个通道状态寄存器显示相关通道的模式、错误和发送或接收状态及其接收和发送错误计数值。

CRSTSTS位（通道复位状态）

CRSTSTS位指示相关CAN通道是否处于复位模式。

当相关CAN通道进入通道复位模式时，该位自动置位。当模式从将模式复位为休眠模式，CRSTSTS位保持为1。

当相关CAN通道退出通道复位模式时，该位自动清零，除非更改为睡眠模式。

CHLTSTS位（通道暂停状态）

CHLTSTS位指示相关CAN通道是否处于暂停模式。

该位在相关CAN模块进入Halt模式时自动置位，当相关CAN模块进入Halt模式时自动清零CAN模块退出暂停模式。

CSLPSTS位（通道休眠状态）

CSLPSTS位指示相关CAN通道是否处于休眠模式。

RA生态工作室

This bit is set automatically when the related CAN-FD channel enters Sleep mode, and is cleared automatically when the related CAN-FD channel exits Sleep mode.

EPSTS bit (Channel Error Passive Status)

The EPSTS bit indicates whether the related CAN-FD channel has entered the error passive state.

This bit is set automatically when the value of the CAN Transmission or Reception Counter Register exceeds the value of 0x7F.

This bit is cleared automatically when the related CAN-FD channel exits the error passive state or enters Reset mode.

BOSTS bit (Channel Bus-Off Status)

The BOSTS bit indicates whether the related CAN-FD channel has entered the error bus-off state.

This bit is set automatically when the value of the related CAN Transmission Error Count Register exceeds 0xFF and the related CAN-FD channel is in the bus-off state (CAN Transmission Error Count Register > 0xFF).

This bit is cleared automatically when the related CAN-FD channel exits bus-off state.

TRMSTS bit (Channel Transmit Status)

The TRMSTS bit indicates whether the related CAN-FD channel is transmitting a message.

This bit is set automatically when the related CAN-FD channel is operating as a transmitter node or is in the bus-off state.

This bit is cleared automatically when the related CAN-FD channel is in the bus-idle state or starts operating as a receiver node.

RECSTS bit (Channel Receive Status)

The RECSTS bit indicates whether the related CAN-FD channel is receiving a message.

This bit is set automatically when the related CAN-FD channel is operating as a receiver node.

This bit is cleared automatically when the related CAN-FD channel is in the bus-idle state or starts operating as a transmitter node.

COMSTS bit (Channel Communication Status)

The COMSTS bit indicates whether the related CAN-FD channel is ready for communication.

This bit is set automatically when the related CAN-FD channel is ready to perform communication following the detection of 11 consecutive recessive bits after exiting the Reset or Halt mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET or CD_HALT mode.

Note: This bit is 1 during bus-off state.

ESIF bit (Error State Indication Flag)

The ESIF bit is set when the ESI bit is sampled recessively for a reception CAN message without any error. When in Loopback or Mirror mode, the self-transmitted messages are considered reception messages.

If a set from the CAN-FD channel occurs simultaneously with a clear by a write access, then the bit is set.

This bit is cleared by writing 0 to it. This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

Note: This bit is not available in the classical CAN function.

REC[7:0] bits (Reception Error Count)

The REC[7:0] bits increment or decrement the counter value according to error status of the CAN-FD channel during reception, and display the value of the REC error counter.

The value in bus-off state is indeterminate.

该位在相关CAN-FD通道进入休眠模式时自动置位，并在相关CAN-FD通道退出休眠模式时自动清零。

EPSTS位（通道错误被动状态）

EPSTS位指示相关的CAN-FD通道是否已进入错误被动状态。

当CAN发送或接收计数器寄存器的值超过0x7F的值时，该位自动置位。

当相关CAN-FD通道退出错误被动状态或进入复位模式时，该位自动清零。

BOSTS bit (Channel Bus-Off Status)

BOSTS位指示相关CAN-FD通道是否已进入错误总线关闭状态。

当相关CAN传输错误计数寄存器的值超过0xFF且相关CAN-FD通道处于总线关闭状态（CAN传输错误计数寄存器>0xFF）时，该位自动设置。

当相关CAN-FD通道退出总线关闭状态时，该位自动清零。

TRMSTS位（通道发送状态）

TRMSTS位指示相关的CAN-FD通道是否正在发送消息。

当相关CAN-FD通道作为发送器节点运行或处于总线关闭状态时，该位自动设置。

当相关CAN-FD通道处于总线空闲状态或开始作为接收器节点运行时，该位自动清零。

RECSTS位（通道接收状态）

RECSTS位指示相关的CAN-FD通道是否正在接收消息。

当相关CAN-FD通道作为接收器节点运行时，该位自动设置。

当相关CAN-FD通道处于总线空闲状态或开始作为发送器节点运行时，该位自动清零。

COMSTS位（通道通信状态）

COMSTS位指示相关的CAN-FD通道是否已准备好进行通信。

当相关CAN-FD通道在退出复位或暂停模式后检测到11个连续隐性位后准备好执行通信时，该位自动置位。

当相关CAN-FD通道处于CH_RESET或CD_HALT模式时，该位自动清零。

Note: 该位在总线关闭状态下为1。

ESIF位（错误状态指示标志）

当ESI位被隐性采样以接收CAN报文且没有任何错误时，设置ESIF位。当在Loopback或Mirror模式下，自发的消息被认为是接收消息。

如果来自CAN-FD通道的设置与写访问清除同时发生，则设置该位。

该位通过写入0清零。当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

Note: 该位在经典CAN功能中不可用。

REC[7:0]位（接收错误计数）

REC[7:0]位根据接收时CAN-FD通道的错误状态递增或递减计数器值，并显示REC错误计数器的值。

总线关闭状态的值是不确定的。

These bits are cleared automatically when the CAN-FD module enters GL_RESET or the CAN-FD channel is in CH_RESET mode.

TEC[7:0] bits (Transmission Error Count)

The TEC[7:0] bits increment or decrement the counter value according to error status of the CAN-FD channel during transmission, and display the value of the TEC error counter.

Only write to these bits when in test mode and CAN-FD channel is in CH_HALT mode.

These bits are cleared automatically when CAN-FD module is in GL_RESET or CAN-FD channel is in CH_RESET mode.

32.2.6 CFDCnERFL : Channel n Error Flag Registers (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x000C + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	CRCREG[14:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	ADERR	B0ERR	B1ERR	CERR	AERR	FERR	SERR	ALF	BLF	OVLF	BORF	BOEF	EPF	EWF	BEF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BEF	Bus Error Flag 0: Channel bus error not detected 1: Channel bus error detected	R/W
1	EWF	Error Warning Flag 0: Channel error warning not detected 1: Channel error warning detected	R/W
2	EPF	Error Passive Flag 0: Channel error passive not detected 1: Channel error passive detected	R/W
3	BOEF	Bus-Off Entry Flag 0: Channel bus-off entry not detected 1: Channel bus-off entry detected	R/W
4	BORF	Bus-Off Recovery Flag 0: Channel bus-off recovery not detected 1: Channel bus-off recovery detected	R/W
5	OVLF	Overload Flag 0: Channel overload not detected 1: Channel overload detected	R/W
6	BLF	Bus Lock Flag 0: Channel bus lock not detected 1: Channel bus lock detected	R/W
7	ALF	Arbitration Lost Flag 0: Channel arbitration lost not detected 1: Channel arbitration lost detected	R/W
8	SERR	Stuff Error 0: Channel stuff error not detected 1: Channel stuff error detected	R/W
9	FERR	Form Error 0: Channel form error not detected 1: Channel form error detected	R/W

当CAN-FD模块进入GL_RESET或CAN-FD通道处于CH_RESET mode.

TEC[7:0]位（传输错误计数）

TEC[7:0]位在传输过程中根据CAN-FD通道的错误状态递增或递减计数器值，并显示TEC错误计数器的值。

仅当处于测试模式且CAN-FD通道处于CH_HALT模式时写入这些位。

当CAN-FD模块处于GL_RESET或CAN-FD通道处于CH_RESET模式时，这些位会自动清除。

32.2.6 CFDCnERFL:通道n错误标志寄存器(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x000C + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	CRCREG[14:0]														
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	ADERR	B0ERR	B1ERR	CERR	AERR	FERR	SERR	ALF	BLF	OVLF	BORF	BOEF	EPF	EWF	BEF
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BEF	总线错误标志 0：未检测到通道总线错误1：检测到通道总线错误	R/W
1	EWF	错误警告标志 0：未检测到通道错误警告1：检测到通道错误警告	R/W
2	EPF	错误被动标志 0：未检测到被动通道错误1：检测到被动通道错误	R/W
3	BOEF	总线关闭进入标志 0：未检测到通道总线关闭条目1：检测到通道总线关闭条目	R/W
4	BORF	总线关闭恢复标志 0：未检测到通道总线关闭恢复1：检测到通道总线关闭恢复	R/W
5	OVLF	过载标志 0：未检测到通道过载1：检测到通道过载	R/W
6	BLF	总线锁标志 0：未检测到通道总线锁定1：检测到通道总线锁定	R/W
7	ALF	仲裁丢失标志 0：未检测到通道仲裁丢失1：检测到通道仲裁丢失	R/W

14	ADERR	Acknowledge Delimiter Error 0: Channel acknowledge delimiter error not detected 1: Channel acknowledge delimiter error detected	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W
30:16	CRCREG[14:0]	CRC Register value These bits show the CRC value calculated for the CAN2.0 CAN frame.	R
31	—	This bit is read as 0. The write value should be 0.	R/W

Each Channel Error Flag register shows the status of various error conditions detectable regardless of the setting of the related CAN Channel Error Interrupt Enable Register. It also shows the status of the various bus errors detectable by the CAN channel. Refer to the CAN specification (ISO 11898-1) to check when each error condition occurs.

For this register, only a single bit can be cleared by software. Do not use the bit clear instruction to clear the bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

Example in assembler language to clear the CFDCnERFL.BEF bit:

mov.b #0x0FE, CFDCnERFL ;

BEF bit (Bus Error Flag)

The BEF bit indicates a detection of a CAN channel bus error state, flagged by bits [14:8] in this register.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when a bus error is detected, and is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

EWF bit (Error Warning Flag)

The EWF bit indicates whether an error warning condition has been detected for the CAN channel.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when either TEC or REC exceeds 0x5F.

The setting of this bit only occurs when the TEC or REC initially exceeds 0x5F. Therefore, if the TEC or REC remains > 0x5F and the EWF bit is cleared by software, it is not set again until both the TEC and REC go below 0x60 and either TEC or REC crosses over again from a value 0x5F to a value > 0x5F.

If a set condition occurs simultaneously with a clear condition, then the bit is set. It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

EPF bit (Error Passive Flag)

The EPF bit indicates a detection of a CAN channel error passive state.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

Bit	Symbol	Function	R/W
10	AERR	确认错误 0：未检测到通道确认错误1：检测到通道确认错误	R/W
11	CERR	CRC Error 0：未检测到通道CRC错误1：检测到通道CRC错误	R/W
12	B1ERR	位1错误 0：未检测到通道位1错误1：检测到通道位1错误	R/W
13	B0ERR	位0错误 0：未检测到通道位0错误1：检测到通道位0错误	R/W
14	ADERR	确认分隔符错误 0：未检测到通道确认分隔符错误1：检测到通道确认分隔符错误	R/W
15	—	该位读取为0。写入值应为0。	R/W
30:16	CRCREG[14:0]	CRC寄存器值 这些位显示为CAN2.0CAN帧计算的CRC值。	R
31	—	该位读取为0。写入值应为0。	R/W

每个通道错误标志寄存器显示各种可检测到的错误条件的状态，无论相关CAN通道错误中断启用寄存器的设置如何。它还显示CAN通道可检测到的各种总线错误的状态。请参阅CAN规范(ISO11898-1)以检查每个错误情况何时发生。

对于该寄存器，软件只能清零一个位。不要使用位清除指令来清除位。使用MOV指令确保只清除指定位。其他位保持1。

用汇编语言清除CFDCnERFL.BEF位的示例：

mov.b #0x0FE, CFDCnERFL ;

BEF位（总线错误标志）

BEF位指示检测到CAN通道总线错误状态，由该寄存器中的位[14:8]标记。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

该位在检测到总线错误时自动置位，并在相关CAN-FD通道处于CH_RESET模式时自动清零。

如果来自CAN通道的设置与写访问清除同时发生，则该位被设置。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

EWF位（错误警告标志）

EWF位指示是否检测到CAN通道的错误警告条件。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

当TEC或REC超过0x5F时，该位自动置位。

该位的设置仅在TEC或REC最初超过0x5F时发生。因此，如果TEC或REC保持>0x5F并且EWF位由软件清零，则不会再次设置，直到TEC和REC都低于0x60并且TEC或REC再次从值0x5F跨越到值>0x5F.

如果设置条件与清除条件同时出现，则设置该位。相关时自动清除CAN-FD通道处于CH_RESET模式。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

EPF位（错误被动标志）

EPF位指示检测到CAN通道错误被动状态。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

This bit is set automatically when the CAN error state becomes error passive state.

The setting of this bit only occurs when the TEC or REC initially exceeds 0x7F. Therefore, if the TEC or REC remains > 0x7F and the bit is cleared by software, it is not set again until both the TEC and REC go below 0x80 and either TEC or REC crosses over again from a value ≤ 0x7F to a value > 0x7F.

If a set condition occurs simultaneously with a clear condition, then the bit is set. It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

BOEF bit (Bus-Off Entry Flag)

The BOEF bit indicates a detection of a CAN channel bus-off entry state.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when the CAN error state enters the bus-off state.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If a set condition occurs simultaneously with a clear condition, then the bit is set.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

BORF bit (Bus-Off Recovery Flag)

The BORF bit indicates a detection of a CAN channel bus-off recovery state.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically if CAN channel recovers from bus-off state in the following conditions:

- When CFDCnCTR.BOM is 00b and normal recovery (11 consecutive recessive bits x 128 times detected) occurs
- When CFDCnCTR.BOM is 10b and normal recovery (11 consecutive recessive bits x 128 times detected) occurs
- When CFDCnCTR.BOM is 11b and normal recovery (11 consecutive recessive bits x 128 times detected) occurs.

The bit is not set if CAN channel recovers from bus-off state in the following conditions:

- When CAN Reset mode is requested
- When CFDCnCTR.RTBO is set to 1 (the CAN channel returns to error active)
- When CFDCnCTR.BOM is 01b
- When CFDCnCTR.BOM is 11b and a halt request is asserted before the CAN channel reaches the end of the bus-off state.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If a set condition occurs simultaneously with a clear condition, the flag is set.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

OVLF bit (Overload Flag)

The OVLF flag indicates a detection of a CAN channel overload state.

The OVLF bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when an overload condition is detected. If a set condition occurs simultaneously with a clear condition, then the bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

BLF bit (Bus Lock Flag)

The BLF bit indicates a detection of a CAN channel bus lock condition.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

This bit is set automatically when 32 consecutive dominant bits are detected on the CAN bus while the CAN channel is in Operation mode.

当CAN错误状态变为错误被动状态时，该位自动设置。

该位的设置仅在TEC或REC最初超过0x7F时发生。因此，如果TEC或REC保持>0x7F并且该位由软件清除，则不会再次设置，直到TEC和REC都低于0x80并且TEC或REC再次从值≤0x7F跨越到值>0x7F.

如果设置条件与清除条件同时出现，则设置该位。相关时自动清除
CAN-FD通道处于CH_RESET模式。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

BOEF位（总线关闭进入标志）

BOEF位指示检测到CAN通道总线关闭进入状态。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

当CAN错误状态进入总线关闭状态时，该位自动置位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果设置条件与清除条件同时出现，则设置该位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

BORF位（总线关闭恢复标志）

BORF位指示检测到CAN通道总线关闭恢复状态。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

如果CAN通道在以下情况下从总线关闭状态恢复，则该位自动设置：

●当CFDCnCTR.BOM为00b并且发生正常恢复（11个连续隐性位x检测128次）时

●当CFDCnCTR.BOM为10b且发生正常恢复（11个连续隐性位x128次检测）时

●当CFDCnCTR.BOM为11b并且发生正常恢复（11个连续隐性位x检测到128次）时。

如果CAN通道在以下情况下从总线关闭状态恢复，则不会设置该位：

●请求CAN复位模式时

●当CFDCnCTR.RTBO设置为1时（CAN通道返回错误激活）

●当CFDCnCTR.BOM为01b时

●当CFDCnCTR.BOM为11b并且在CAN通道到达总线关闭状态结束之前发出停止请求时。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果设置条件与清除条件同时出现，则设置标志。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

OVLF bit (Overload Flag)

OVLF标志指示检测到CAN通道过载状态。

OVLF位通过向其写入0来清除，并且只能由CAN-FD模块逻辑设置。写1无效。

当检测到过载情况时，该位自动置位。如果设置条件与清除条件同时出现，则设置该位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时写入该位。

BLF位（总线锁定标志）

BLF位指示检测到CAN通道总线锁定条件。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

当CAN通道在CAN总线上检测到32个连续显性位时，该位自动设置
操作模式。

If a set condition occurs simultaneously with a clear condition, then the bit is set. It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

ALF bit (Arbitration Lost Flag)

The ALF bit indicates a detection of a CAN channel bus arbitration lost condition.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

The bit is set automatically when an arbitration lost condition is detected on the CAN bus while the CAN channel is in Operation mode.

If a set condition occurs simultaneously with a clear condition, then the bit is set. It is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

SERR bit (Stuff Error)

The SERR bit indicates a detection of a CAN stuff error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a stuff error is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at CFDCnERFL[14:8] is already set. Otherwise, this bit is set if CFDCnERFL[14:8] is 0000000b.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

FERR bit (Form Error)

The FERR bit indicates a detection of a CAN form error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a form error is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at CFDCnERFL[14:8] is already set. Otherwise, this bit is set if CFDCnERFL[14:8] is 0000000b.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

AERR bit (Acknowledge Error)

The AERR bit indicates a detection of a CAN acknowledge error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.

如果设置条件与清除条件同时出现，则设置该位。相关时自动清除CAN-FD通道处于CH_RESET模式。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

当相关CAN-FD通道处于CH_RESET模式时，它会自动清除。

ALF位（仲裁丢失标志）

ALF位指示检测到CAN通道总线仲裁丢失情况。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

当CAN通道在CAN总线上检测到仲裁丢失条件时，该位自动设置操作模式。

如果设置条件与清除条件同时出现，则设置该位。相关时自动清除CAN-FD通道处于CH_RESET模式。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

SERR bit (Stuff Error)

SERR位指示检测到CAN填充错误。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

要清除该位，请使用以下序列：

1.清除对应的标志位。

2.读取标志位是否被清除。

3.如果是，继续，否则返回步骤1。

当检测到填充错误时，该位自动设置。如果CFDCnCTR.ERRD位为1，并且该位的置位和清除条件同时发生，则该位被置位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果CFDCnCTR.ERRD位为0并且该位的置位和清零条件同时发生，则如果CFDCnERFL[14:8]的位已经置位，则清零。否则，如果CFDCnERFL[14:8]为0000000b，则设置该位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

FERR bit (Form Error)

FERR位指示检测到CAN格式错误。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

要清除该位，请使用以下序列：

1.清除对应的标志位。

2.读取标志位是否被清除。

3.如果是，继续，否则返回步骤1。

当检测到表格错误时，该位自动置位。如果CFDCnCTR.ERRD位为1，并且该位的置位和清除条件同时发生，则该位被置位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果CFDCnCTR.ERRD位为0并且该位的置位和清零条件同时发生，则如果CFDCnERFL[14:8]的位已经置位，则清零。否则，如果CFDCnERFL[14:8]为0000000b，则设置该位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

AERR bit (Acknowledge Error)

AERR位指示检测到CAN确认错误。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

要清除该位，请使用以下序列：

1.清除对应的标志位。

2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when an acknowledge error is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at CFDCnERFL[14:8] is already set. Otherwise, this bit is set if CFDCnERFL[14:8] is 0000000b.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION.

CERR bit (CRC Error)

The CERR bit indicates a detection of a CAN CRC error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a CRC error is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at CFDCnERFL[14:8] is already set. Otherwise, this bit is set if CFDCnERFL[14:8] is 0000000b.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

B1ERR bit (Bit 1 Error)

The B1ERR bit indicates a detection of a recessive bit error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a recessive bit error (expected recessive bit, sampled as dominant bit) is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at CFDCnERFL[14:8] is already set. Otherwise, this bit is set if CFDCnERFL[14:8] is 0000000b.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

B0ERR bit (Bit 0 Error)

The B0ERR bit indicates a detection of a dominant bit error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a dominant bit error (expected dominant bit, sampled as recessive bit) is detected. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

2.读取标志位是否被清除。

3.如果是，继续，否则返回步骤1。

当检测到确认错误时，该位自动置位。如果CFDCnCTR.ERRD位为1，并且该位的置位和清除条件同时发生，则该位被置位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果CFDCnCTR.ERRD位为0并且该位的置位和清零条件同时发生，则如果CFDCnERFL[14:8]的位已经置位，则清零。否则，如果CFDCnERFL[14:8]为0000000b，则设置该位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION时才写入该位。

CERR bit (CRC Error)

CERR位指示检测到CANCRC错误。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

要清除该位，请使用以下序列：

1.清除对应的标志位。

2.读取标志位是否被清除。

3.如果是，继续，否则返回步骤1。

当检测到CRC错误时，该位自动置位。如果CFDCnCTR.ERRD位为1，并且该位的置位和清除条件同时发生，则该位被置位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果CFDCnCTR.ERRD位为0并且该位的置位和清零条件同时发生，则如果CFDCnERFL[14:8]的位已经置位，则清零。否则，如果CFDCnERFL[14:8]为0000000b，则设置该位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

B1ERR bit (Bit 1 Error)

B1ERR位指示检测到隐性位错误。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

要清除该位，请使用以下序列：

1.清除对应的标志位。

2.读取标志位是否被清除。

3.如果是，继续，否则返回步骤1。

当检测到隐性位错误（预期的隐性位，采样为显性位）时，该位自动置位。如果CFDCnCTR.ERRD位为1，如果该位的设置和清除条件同时发生，则该位被设置。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果CFDCnCTR.ERRD位为0并且该位的置位和清零条件同时发生，则如果CFDCnERFL[14:8]的位已经置位，则清零。否则，如果CFDCnERFL[14:8]为0000000b，则设置该位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

B0ERR bit (Bit 0 Error)

B0ERR位指示检测到显性位错误。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

要清除该位，请使用以下序列：

1.清除对应的标志位。

2.读取标志位是否被清除。

3.如果是，继续，否则返回步骤1。

当检测到显性位错误（预期显性位，采样为隐性位）时，该位自动置位。如果CFDCnCTR.ERRD位为1，如果该位的设置和清除条件同时发生，则该位被设置。

RA生态工作室

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at CFDCnERFL[14:8] is already set. Otherwise, this bit is set if CFDCnERFL[14:8] is 0000000b.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

ADERR bit (Acknowledge Delimiter Error)

The ADERR bit indicates a detection of an acknowledge delimiter bit error.

This bit is cleared by writing 0 to it, and can only be set by CAN-FD module logic. Writing 1 has no effect.

To clear this bit, use the following sequence:

1. Clear the corresponding flag bit.
2. Read if the flag bit is cleared.
3. If yes, continue, else go back to step 1.

This bit is set automatically when a form error is detected during the acknowledge delimiter state of frame transmission. If CFDCnCTR.ERRD bit is 1 and if the set and clear conditions occur at the same time for this bit, then this bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode. If CFDCnCTR.ERRD bit is 0 and the set and clear conditions occur at the same time for this bit, then it is cleared if a bit at CFDCnERFL[14:8] is already set. Otherwise, this bit is set if CFDCnERFL[14:8] is 0000000b.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

CRCREG[14:0] bits (CRC Register value)

The CRCREG[14:0] bits read the calculated CRC value when CFDCnCTR.CTME bit is 1 for the channel.

If CFDCnCTR.CTME bit is 0, then these bits are always read as 0.

These bits show the CAN2.0 CRC value calculated by the CAN-FD channel logic when the CTME bit is enabled.

The CFDCnERFL.CRCREG value is updated in the first bit of the CRC field of the CAN frame (reception and transmission).

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

32.2.7 CFDCnDCFG : Channel n Data Bitrate Configuration Register (n = 0, 1)

This register is not available in the classical CAN function.

Base address: CANFD = 0x400B_0000

Offset address: 0x1400 + 0x20 × n

Bit position:	31				27				24				19				16				12				8	7						0
Bit field:	—	—	—	—	DSJW[3:0]				—	—	—	—	DTSEG2[3:0]				—	—	—	—	DTSEG1[4:0]					DBRP[7:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DBRP[7:0]	Channel Data Baud Rate Prescaler Data Baud Rate Prescaler division ratio	R/W
12:8	DTSEG1[4:0]	Timing Segment 1 0x00: Reserved 0x01: 2 Tq 0x02: 3 Tq 0x03: 4 Tq ⋮ 0x1E: 31 Tq 0x1F: 32 Tq	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果CFDCnCTR.ERRD位为0并且该位的置位和清零条件同时发生，则如果CFDCnERFL[14:8]的位已经置位，则清零。否则，如果CFDCnERFL[14:8]为0000000b，则设置该位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

ADERR bit (Acknowledge Delimiter Error)

ADERR位指示检测到确认分隔符位错误。

该位通过写入0清零，并且只能由CAN-FD模块逻辑设置。写1无效。

要清除该位，请使用以下序列：

1.清除对应的标志位。

2.读取标志位是否被清除。

3.如果是，继续，否则返回步骤1。

当在帧传输的确认分隔符状态期间检测到格式错误时，该位自动设置。如果CFDCnCTR.ERRD位为1，如果该位的设置和清除条件同时发生，则该位被设置。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。如果CFDCnCTR.ERRD位为0并且该位的置位和清零条件同时发生，则如果CFDCnERFL[14:8]的位已经置位，则清零。否则，如果CFDCnERFL[14:8]为0000000b，则设置该位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

CRCREG[14:0]位（CRC寄存器值）

当通道的CFDCnCTR.CTME位为1时，CRCREG[14:0]位读取计算的CRC值。

如果CFDCnCTR.CTME位为0，则这些位始终读为0。

这些位显示CTME位使能时CAN-FD通道逻辑计算的CAN2.0CRC值。

CFDCnERFL.CRCREG值在CAN帧（接收和发送）的CRC字段的第一位更新。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

32.2.7 CFDCnDCFG:通道n数据比特率配置寄存器(n=0 1)

该寄存器在经典CAN功能中不可用。

Base address: CANFD = 0x400B_0000

Offset address: 0x1400 + 0x20 × n

Bit position:	31				27				24				19				16				12				8	7						0
Bit field:	—	—	—	—	DSJW[3:0]				—	—	—	—	DTSEG2[3:0]				—	—	—	—	DTSEG1[4:0]					DBRP[7:0]						
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W

15:13	—	这些位被读取为0。写入值应为0。	R/W

Bit	Symbol	Function	R/W
19:16	DTSEG2[3:0]	Timing Segment 2 0x0: Reserved 0x1: 2 Tq ⋮ 0xE: 15 Tq 0xF: 16 Tq	R/W
23:20	—	These bits are read as 0. The write value should be 0.	R/W
27:24	DSJW[3:0]	Resynchronization Jump Width 0x0: 1 Tq 0x1: 2 Tq ⋮ 0xF: 16 Tq	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note: Tq means time quantum.

The Channel n Data Bitrate Configuration Register (n = 0, 1) configures the transmission/reception data baud rate parameters of the channels.

The channel of Classical-only mode does not perform configuration of this register.

DBRP[7:0] bits (Channel Data Baud Rate Prescaler)

The DBRP[7:0] bits define the peripheral bus clock periods contained in a time quantum.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

DTSEG1[4:0] bits (Timing Segment 1)

The DTSEG1[4:0] bits set the segment TSEG1 to compensate for edges on the CAN bus with a positive phase error. A value from 2 to 32 time quanta can be set.

The DTSEG1[4:0] bits are also used to set the propagation segment.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode. Do not write any other value to these bits. See section 32.4.1.2. CAN Bit Timing for more details.

DTSEG2[3:0] bits (Timing Segment 2)

The DTSEG2[3:0] bits set the segment TSEG2 to compensate for edges on the CAN bus with a negative phase error. A value from 2 to 16 time quanta can be set.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode. Do not write any other value to these bits.

DSJW[3:0] bits (Resynchronization Jump Width)

The DSJW[3:0] bits set the synchronization jump width. A value from 1 to 16 time quanta can be set.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

32.2.8 CFDCnFDCFG : Channel n CAN-FD Configuration Register (n = 0, 1)

This register is not available in the classical CAN function.

Bit	Symbol	Function	R/W
19:16	DTSEG2[3:0]	计时段2 0x0: Reserved 0x1: 2 Tq ⋮ 0xE: 15 Tq 0xF: 16 Tq	R/W
23:20	—	这些位被读取为0。写入值应为0。	R/W
27:24	DSJW[3:0]	再同步跳转宽度 0x0: 1 Tq 0x1: 2 Tq ⋮ 0xF: 16 Tq	R/W
31:28	—	这些位被读取为0。写入值应为0。	R/W

Note: Tq表示时间量。

通道n数据比特率配置寄存器(n=0 1)配置通道的发送接收数据波特率参数。

Classical-only模式的通道不执行该寄存器的配置。

DBRP[7:0]位（通道数据波特率预分频器）

DBRP[7:0]位定义包含在时间片中的外围总线时钟周期。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

DTSEG1[4:0]位（时序段1）

DTSEG1[4:0]位设置段TSEG1以补偿CAN总线上的正相位误差边沿。可以设置2到32个时间量的值。

DTSEG1[4:0]位也用于设置传播段。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。不要将任何其他值写入这些位。请参阅第32.4.1.2节。CAN位时序了解更多详情。

DTSEG2[3:0]位（时序段2）

DTSEG2[3:0]位设置段TSEG2以补偿CAN总线上具有负相位误差的边沿。可以设置2到16个时间量子的值。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。不要将任何其他值写入这些位。

DSJW[3:0]位（再同步跳转宽度）

DSJW[3:0]位设置同步跳转宽度。可以设置1到16个时间量的值。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

32.2.8 CFDCnFDCFG:通道nCAN-FD配置寄存器(n=0 1)

该寄存器在经典CAN功能中不可用。

Base address: CANFD = 0x400B_0000

Offset address: 0x1404 + 0x20 × n

31	CFDTE	CAN-FD Frame Distinction Enable 0: CAN-FD frame distinction disabled 1: CAN-FD frame distinction enabled	R/W

Note 1. These bits are not available in the classical CAN function.

The Channel n CAN-FD Configuration Register (n = 0, 1) configures which communication direction (transmitter/receiver) errors are counted.

EOCCFG[2:0] bits (Error Occurrence Counter Configuration)

The EOCCFG[2:0] bits select which type of CAN frame configuration and direction, including protocol errors are counted.

Do not write to these bits in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

TDCOC bit (Transceiver Delay Compensation Offset Configuration)*1

The TDCOC bit selects which offset is used when defining the position of the secondary sample point (SSP) for the CAN-FD channel. If the bit is set to 0, the position of the SSP is the measured transceiver delay plus the fixed offset. If the bit is 1, the position of the SSP is defined only by the offset.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode. Do not set this bit when in Classical-only mode.

TDCE bit (Transceiver Delay Compensation Enable)*1

The TDCE bit enables the transceiver delay compensation for the CAN-FD channel.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode. Do not set this bit when in Classical-only mode.

ESIC bit (Error State Indication Configuration)*1

Bus controllers that are used as CAN-to-CAN gateway support that in every forwarded CAN-FD message. The ESI flag does not change to reflect the status of the gateway, bridge, or router but instead the flag is sent as it was in the original message.

The ESIC bit controls the transmission of either the ESI flag information or the message of ESI flag information (CFDCFFDCSTSn.CFESI or CFDTMFDCTRn.TMESI).

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode. Do not set this bit when in Classical-only mode.

TDCO[7:0] bits (Transceiver Delay Compensation Offset)*1

The TDCO[7:0] bits set the secondary sample point offset. How this value is used, depends on the CFDCnFDCFG.TDCOC setting.

If CFDCnFDCFG.TDCOC = 0, the transceiver delay compensation result is equal to the Trv_Delay (measured delay) + the value in CFDCnFDCFG.TDCO, rounded down to the nearest integer number of time quanta. Otherwise, the result is equal to the value in CFDCnFDCFG.TDCO. See section 32.4.1.5. Transmitter Delay Compensation for details on how CFDCnFDCFG.TDCO is used.

The actual offset value is interpreted as TDCO + 1. For example, if 4 is set in TDCO, the offset is 5 clock cycles. Clock cycle is 1 cycle of CAN channel DLL clock.

Do not write to the TDCO[7:0] bits in CH_OPERATION or CH_SLEEP mode.

Bit	Symbol	Function	R/W
30	CLOE*1	经典CAN-Only启用 0：仅经典模式禁用1：仅经典模式启用	R/W
31	CFDTE	CAN-FD帧区分启用 0：禁用CAN-FD帧识别1：启用CAN-FD帧识别	R/W

注1.这些位在经典CAN功能中不可用。

通道nCAN-FD配置寄存器(n=0 1)配置计算哪个通信方向（发送器接收器）错误。

EOCCFG[2:0]位（错误发生计数器配置）

EOCCFG[2:0]位选择计算哪种类型的CAN帧配置和方向，包括协议错误。

不要在CH_OPERATION或CH_SLEEP模式下写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

TDCOC位（收发器延迟补偿偏移配置）*1

TDCOC位选择在为CAN定义辅助采样点(SSP)的位置时使用哪个偏移量
FD频道。如果该位设置为0，则SSP的位置是测量的收发器延迟加上固定偏移。如果该位为1，则SSP的位置仅由偏移量定义。

请勿在CH_OPERATION或CH_SLEEP模式下写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。不要设置该位时
Classical-only mode.

TDCE位（收发器延迟补偿启用）*1

TDCE位使能CAN-FD通道的收发器延迟补偿。

请勿在CH_OPERATION或CH_SLEEP模式下写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。不要设置该位时
Classical-only mode.

ESIC位（错误状态指示配置）*1

用作CAN-to-CAN网关的总线控制器在每个转发的CAN-FD消息中都支持这一点。ESI标志不会更改以反映网关、网桥或路由器的状态，而是按照原始消息中的状态发送标志。

ESIC位控制ESI标志信息或ESI标志信息消息（CFDCFFDCSTSn.CFESI或CFDTMFDCTRn.TMESI）的传输。

请勿在CH_OPERATION或CH_SLEEP模式下写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。不要设置该位时
Classical-only mode.

TDCO[7:0]位（收发器延迟补偿偏移）*1

TDCO[7:0]位设置辅助采样点偏移。该值的使用方式取决于CFDCnFDCFG.TDCOC设置。

如果CFDCnFDCFG.TDCOC=0，则收发器延迟补偿结果等于Trv_Delay（测量延迟）+CFDCnFDCFG.TDCO中的值，向下舍入到最接近的时间量子整数。否则，结果等于CFDCnFDCFG.TDCO中的值。请参阅第32.4.1.5节。有关如何使用CFDCnFDCFG.TDCO的详细信息，请参阅发送器延迟补偿。

实际偏移值被解释为TDCO+1。例如，如果TDCO设置为4，则偏移为5个时钟周期。时钟周期为CAN通道DLL时钟的1个周期。

请勿在CH_OPERATION或CH_SLEEP模式下写入TDCO[7:0]位。

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode. Do not set to this bit when in Classical-only mode.

GWEN bit (CAN2.0, CAN-FD Multi-Gateway Enable)*1

When the GWEN bit is enabled, a multi-gateway is enabled. Message received on one node can be routed to another node using the COM FIFO when they are configured as gateway FIFO (CFDCFCCn.CFM = 10b). Furthermore, when TX Queue is set as gateway mode, the message received on one node can be stored in TX Queue and can be sent to another node.

The FDF and BRS bits of the routed message can be changed by the configuration value of the CFDCnFDCFG.GWFDF and CFDCnFDCFG.GWBRS bits. By this, the transmitted value of these bits can be replaced.

Example :

CFDCnFDCFG.GWEN = 1 on channel y

CFDCnFDCFG.GWFDF = 1

If a Classical CAN frame is received on channel x and routed to a gateway FIFO or TX Queue of channel y. Then this CAN frame is sent on channel y as a CAN-FD frame because of the CFDCnFDCFG.GWFDF bit.

Table 32.3 shows how the message information is changed depending on the received and configured data.

Table 32.3 Modified message information by received and configured data

Routed CAN frame	Routed received DLC	CAN BRS bit	Configured CFDCnFDCFG.GWFDF bit	Gateway message DLC	Gateway message BRS bit	Gateway message frame type
CAN2.0	≤ 8	N/A	1	≤ 8	Based on configuration of CFDCnFDCFG.GWBRS	FD
CAN2.0	> 8	N/A	1	= 8	Based on configuration of CFDCnFDCFG.GWBRS	FD
FD	≤ 8	None	1	≤ 8	Based on configuration of CFDCnFDCFG.GWBRS	FD
FD	> 8	None	1	> 8	Based on configuration of CFDCnFDCFG.GWBRS	FD
CAN2.0	≤ 8	N/A	0	≤ 8	N/A	CAN2.0
CAN2.0	> 8	N/A	0	> 8	N/A	CAN2.0
FD	≤ 8	None	0	≤ 8	N/A	CAN2.0
FD	> 8	None	0	= 8	N/A	CAN2.0

Note: This gateway is limited to an 8-byte data payload for different frame type. If routing and target frame type is the same, the data length code (DLC) value remains the same. If the source frame is a CAN-FD with more than 8 data bytes, then on classical destination node, the data payload is reduced to 8 bytes. Only the first 8 bytes of data perform gateway transmission.

Note: Transmission buffers other than the gateway FIFO are not affected by this feature.

Do not route remote frames through the gateway when CFDCnFDCFG.GWEN is set. When a destination node is CFDCnFDCFG.FDOE = 1, set CFDCnFDCFG.GWEN and CFDCnFDCFG.GWFDF to 1. When a destination node is CFDCnFDCFG.CLOE = 1, set CFDCnFDCFG.GWEN=1 and CFDCnFDCFG.GWFDF = 0.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET mode.

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。在仅经典模式下不要设置此位。

GWEN位（CAN2.0、CAN-FD多 网关使能）*1

启用GWEN位时，启用多网关。当一个节点上接收到的消息被配置为网关FIFO(CFDCFCCn.CFM=10b)时，可以使用COMFIFO将它们路由到另一个节点。此外，当TXQueue设置为网关模式时，一个节点上接收到的消息可以存储在TXQueue中，并可以发送到另一个节点。

路由消息的FDF和BRS位可以通过CFDCnFDCFG.GWFDF和CFDCnFDCFG.GWBRS位的配置值进行更改。这样，可以替换这些位的传输值。

Example :

CFDCnFDCFG.GWEN=1在通道y

CFDCnFDCFG.GWFDF = 1

如果在通道x上接收到经典CAN帧并路由到通道y的网关FIFO或TX队列。然后，由于CFDCnFDCFG.GWFDF位，此CAN帧在通道y上作为CAN-FD帧发送。

表32.3显示了如何根据接收和配置的数据更改消息信息。

Table 32.3 通过接收和配置的数据修改消息信息

路由CAN帧	路由接收DLC	CANBRS位	Configured CFDCnFDCFG.GWFDF bit	网关消息DLC	网关消息BRS位	网关消息帧类型
CAN2.0	≤ 8	N/A	1	≤ 8	基于CFDCnFDCFG.G的配置 WBRS	FD
CAN2.0	> 8	N/A	1	= 8	基于CFDCnFDCFG.G的配置 WBRS	FD
FD	≤ 8	None	1	≤ 8	基于CFDCnFDCFG.G的配置 WBRS	FD
FD	> 8	None	1	> 8	基于CFDCnFDCFG.G的配置 WBRS	FD
CAN2.0	≤ 8	N/A	0	≤ 8	N/A	CAN2.0
CAN2.0	> 8	N/A	0	> 8	N/A	CAN2.0
FD	≤ 8	None	0	≤ 8	N/A	CAN2.0
FD	> 8	None	0	= 8	N/A	CAN2.0

Note: 此网关仅限于不同帧类型的8字节数据有效负载。如果路由和目标帧类型相同，则数据长度代码(DLC)值保持不变。如果源帧是具有超过8个数据字节的CAN-FD，那么在经典目标节点上，数据有效负载减少到8个字节。只有前8个字节的数据执行网关传输。

Note: 网关FIFO以外的传输缓冲区不受此功能的影响。

当设置了CFDCnFDCFG.GWEN时，不要通过网关路由远程帧。当目标节点是CFDCnFDCFG.FDOE=1，设置CFDCnFDCFG.GWEN和CFDCnFDCFG.GWFDF为1。当目的节点为CFDCnFDCFG.CLOE=1，设置CFDCnFDCFG.GWEN=1和CFDCnFDCFG.GWFDF=0。

请勿在CH_OPERATION或CH_SLEEP模式下写入该位。

仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。

RA生态工作室

GWFDF bit (Gateway FDF Configuration Bit)*1

When the GWEN bit is set to 1, the FDF bit of the transmitting gateway frame is replaced by the value of the GWFDF bit.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to these bits when the CAN-FD module is in CH_RESET mode. Do not set this bit when in Classical-only mode.

GWBRS bit (Gateway BRS Configuration Bit)*1

When the GWEN bit is set to 1, the BRS bit of the transmitting gateway frame is replaced by the value of CFDCnFDCFG.GWBRS.

In classical CAN frames, the GWBRS bit is invalid.

Do not write to this bit in CH_OPERATION or CH_SLEEP mode.

Only write to this bit when the related CAN-FD channel is in CH_RESET mode. Do not set this bit when in Classical-only mode.

FDOE bit (FD-Only Enable)*1

The FDOE bit enables the reception and transmission of CAN-FD-only frames. If enabled, communication in Classical CAN frame format is disabled. Transmission of Classical CAN frames is not possible because the FDF bit of the message buffer is a don't care (CFDCFFDCSTSn.CFFDF/CFDTMFDCTRn.TMFDF).

If messages with Classical CAN frame format are received, the protocol controller treats them as invalid frames and response with error frames. When a Classical CAN frame is configured for transmitting, the FDF bit is sent as recessive, therefore an FD frame is sent. If the data length code (DLC) is configured of greater than 8 bytes, the remaining data bytes are padded with 0xCC.

The FDOE bit cannot be written in CH_OPERATION, CH_HALT or CH_SLEEP mode.

Do not set CFDCnFDCFG.FDOE and CFDCnFDCFG.CLOE simultaneously.

REFE bit (RX Edge Filter Enable)

The REFE bit enables the RX edge filter during the IDLE detection (bus integration). When the bit is enabled, two consecutive dominant time quanta are required to detect a synchronization edge.

The REFE bit cannot be written in CH_OPERATION, CH_HALT and CH_SLEEP mode. Do not set this bit when in Classical-only mode and when CFDCnFDCFG.CFDTE = 0 (disabled CAN-FD frame distinction).

CLOE bit (Classical CAN-Only Enable)*1

The CLOE bit enables the Classical CAN-only mode. If this bit is 1, the protocol controller can only send classical frames and response with a form or CRC error on FD frames.

Do not set CFDCnFDCFG.CLOE and CFDCnFDCFG.FDOE simultaneously.

CFDCnFDCFG.CLOE	CFDCnFDCFG.FDOE	Channel mode
0	0	CAN-FD mode
0	1	FD-only mode
1	0	Classical CAN-only mode
1	1	Reserved

The CANFD mode is available only for CANFD supported product.

Do not write to this bit in CH_OPERATION, CH_HALT or CH_SLEEP mode.

Only write to these bits when the CAN-FD channel is in CH_RESET mode.

CFDTE bit (CAN-FD Frame Distinction Enable)

The CFDTE bit enables the CAN-FD frame distinction function. The CFDTE bit is required for Classical CAN-only mode (CFDCnFDCFG.CLOE = 1).

If this bit is 0, the protocol controller can only send Classical frames and response with a Form or CRC error on FD frames.

GWFDF位（网关FDF配置位）*1

当GWEN位设置为1时，发送网关帧的FDF位被GWFDF位的值替换。

请勿在CH_OPERATION或CH_SLEEP模式下写入该位。

仅当CAN-FD模块处于CH_RESET模式时才写入这些位。在仅经典模式下不要设置该位。

GWBRS位（网关BRS配置位）*1

当GWEN位设置为1时，发送网关帧的BRS位被替换为CFDCnFDCFG.GWBRS.

在经典CAN帧中，GWBRS位无效。

请勿在CH_OPERATION或CH_SLEEP模式下写入该位。

仅当相关CAN-FD通道处于CH_RESET模式时才写入该位。在仅经典模式下不要设置该位。

FDOE bit (FD-Only Enable)*1

FDOE位启用CAN-FD-only帧的接收和发送。如果启用，以经典方式进行通信CAN帧格式被禁用。传统CAN帧的传输是不可能的，因为消息缓冲区的FDF位是无关紧要的(CFDCFFDCSTSn.CFFDFCFDTMFDCTRn.TMFDF)。

如果接收到具有经典CAN帧格式的消息，协议控制器会将其视为无效帧并以错误帧响应。当经典CAN帧配置为发送时，FDF位作为隐性发送，因此发送FD帧。如果数据长度代码(DLC)配置为大于8个字节，则剩余的数据字节用0xCC填充。

FDOE位不能在CH_OPERATION、CH_HALT或CH_SLEEP模式下写入。

不要同时设置CFDCnFDCFG.FDOE和CFDCnFDCFG.CLOE。

REFE位（RX边沿过滤器使能）

在空闲检测（总线集成）期间，REFE位使能RX边沿滤波器。当该位使能时，需要两个连续的显性时间量来检测同步边沿。

在CH_OPERATION、CH_HALT和CH_SLEEP模式下不能写入REFE位。不要设置该位时仅经典模式和当CFDCnFDCFG.CFDTE=0（禁用CAN-FD帧区分）时。

CLOE bit (Classical CAN-Only Enable)*1

CLOE位启用经典CAN-only模式。如果该位为1，则协议控制器只能发送经典帧并在FD帧上带有格式或CRC错误的响应。

不要同时设置CFDCnFDCFG.CLOE和CFDCnFDCFG.FDOE。

CFDCnFDCFG.CLOE	CFDCnFDCFG.FDOE	频道模式
0	0	CAN-FD mode
0	1	FD-only mode
1	0	经典CAN-only模式
1	1	Reserved

CANFD模式仅适用于支持CANFD的产品。

请勿在CH_OPERATION、CH_HALT或CH_SLEEP模式下写入该位。

仅当CAN-FD通道处于CH_RESET模式时才写入这些位。

CFDTE位（CAN-FD帧区分使能）

CFDTE位使能CAN-FD帧识别功能。经典CAN-only模式(CFDCnFDCFG.CLOE=1)需要CFDTE位。

如果该位为0，协议控制器只能发送Classical帧和响应FD帧上的Form或CRC错误。

If this bit is 1, the protocol controller behaves according to the ISO 11898-1 (DIS 2015) specification. If the FDF bit is detected recessive, then the protocol controller enters the protocol exception state, and attempts to integrate back to the CAN communication.

Do not write this bit in CH_OPERATION, CH_HALT or CH_SLEEP mode.

Only write to these bits when the related CAN-FD channel is in CH_RESET mode.

Note 1. These bits are not available in the classical CAN function.

32.2.9 CFDCnFDCTR : Channel n CAN-FD Control Register (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1408 + 0x20 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOCCLR	EOCCLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EOCCLR	Error Occurrence Counter Clear 0: No error occurrence counter clear 1: Clear error occurrence counter	R/W
1	SOCCLR	Successful Occurrence Counter Clear 0: No successful occurrence counter clear 1: Clear successful occurrence counter	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

The Channel n CAN-FD Control Register (n = 0, 1) controls the error and successful occurrence counters.

EOCCLR bit (Error Occurrence Counter Clear)

The EOCCLR bit is used to clear the error occurrence counter.

Do not write to this bit in CH_SLEEP or CH_RESET mode. The read value is always 0.

This bit is cleared automatically by the RS-CAN-FD logic and when the related CAN-FD channel is in CH_RESET mode.

SOCCLR bit (Successful Occurrence Counter Clear)

The SOCCLR bit is used to clear the successful occurrence counter.

Do not write to this bit in CH_SLEEP or CH_RESET mode. The read value is always 0.

This bit is cleared automatically by the RS-CAN-FD logic and when the related CAN-FD channel is in CH_RESET mode.

如果该位为1，则协议控制器的行为符合ISO11898-1(DIS2015)规范。如果检测到FDF位为隐性，则协议控制器进入协议异常状态，并尝试集成回CAN通信。

请勿在CH_OPERATION、CH_HALT或CH_SLEEP模式下写入该位。

仅当相关CAN-FD通道处于CH_RESET模式时才写入这些位。

注1.这些位在经典CAN功能中不可用。

32.2.9 CFDCnFDCTR:通道nCAN-FD控制寄存器(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1408 + 0x20 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOCCLR	EOCCLR
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EOCCLR	错误发生计数器清除 0：不清除错误发生计数器1：清除错误发生计数器	R/W
1	SOCCLR	成功发生计数器清除 0：无成功发生计数器清零1：清零成功发生计数器	R/W
31:2	—	这些位被读取为0。写入值应为0。	R/W

通道nCAN-FD控制寄存器(n=0 1)控制错误和成功发生计数器。

EOCCLR位（错误发生计数器清除）

EOCCLR位用于清除错误发生计数器。

请勿在CH_SLEEP或CH_RESET模式下写入该位。读取值始终为0。

当相关CAN-FD通道处于CH_RESET模式时，该位由RS-CAN-FD逻辑自动清零。

SOCCLR位（成功发生计数器清零）

SOCCLR位用于清除成功发生计数器。

请勿在CH_SLEEP或CH_RESET模式下写入该位。读取值始终为0。

当相关CAN-FD通道处于CH_RESET模式时，该位由RS-CAN-FD逻辑自动清零。

32.2.10 CFDCnFDSTS : Channel n CAN-FD Status Register (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x140C + 0x20 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SOC[7:0]								EOC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TDCVF	—	—	—	—	—	SOCO	EOCO	TDCR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	TDCR[7:0]*1	Transceiver Delay Compensation Result	R
8	EOCO	Error Occurrence Counter Overflow 0: Error occurrence counter has not overflowed 1: Error occurrence counter has overflowed	R/W
9	SOCO	Successful Occurrence Counter Overflow 0: Successful occurrence counter has not overflowed 1: Successful occurrence counter has overflowed	R/W
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	TDCVF*1	Transceiver Delay Compensation Violation Flag 0: Transceiver delay compensation violation has not occurred 1: Transceiver delay compensation violation has occurred	R/W
23:16	EOC[7:0]	Error Occurrence Counter These bits show the error occurrence counter value.	R
31:24	SOC[7:0]	Successful occurrence counter register These bits show the successful occurrence counter value.	R

Note 1. These bits are not available in the classical CAN function.

The Channel n CAN-FD Status Register (n = 0, 1) indicates the transceiver compensation delay result and its related FIFO message lost status.

TDCR[7:0] bits (Transceiver Delay Compensation Result)

The TDCR[7:0] bits are set when the transceiver delay has been measured.

The measured delay is a multiple of the CAN channel DLL clock. The result depends on the CFDCnFDCFG.TDCOC configuration and the offset value in CFDCnFDCFG.TDCO. See section 32.4.1.5. Transmitter Delay Compensation for details on how this value is derived.

The TDCR[7:0] bits are updated at the falling edge between FDF and the RES bit when CFDCnFDCFG.TDCOC = 0 and the transceiver delay compensation is enabled (CFDCnFDCFG.TDCE = 1).

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Note: These bits are not available in the classical CAN function.

EOCO bit (Error Occurrence Counter Overflow)

The EOCO bit indicates whether the related CAN channel error occurrence counter has overflowed. This bit is cleared by writing 0 to it. Writing 1 has no effect.

This bit is set automatically when CFDCnFDSTS.EOC is 0xFF and a CAN bus error is detected based on the configuration defined in CFDCnFDCFG.EOCCFG.

If the set from the CAN channel occurs simultaneously with the clear by the write access, then the bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

32.2.10 CFDCnFDSTS:通道nCAN-FD状态寄存器(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x140C + 0x20 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SOC[7:0]								EOC[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TDCVF	—	—	—	—	—	SOCO	EOCO	TDCR[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	TDCR[7:0]*1	收发器延迟补偿结果	R
8	EOCO	错误发生计数器溢出 0：错误发生计数器未溢出1：错误发生计数器已溢出	R/W
9	SOCO	成功发生计数器溢出 0：成功发生计数器未溢出1：成功发生计数器已溢出	R/W
14:10	—	这些位被读取为0。写入值应为0。	R/W
15	TDCVF*1	收发器延迟补偿违规标志 0：未发生收发器延迟补偿违规1：已发生收发器延迟补偿违规	R/W
23:16	EOC[7:0]	错误发生计数器 这些位显示错误发生计数器的值。	R
31:24	SOC[7:0]	成功发生计数器寄存器 这些位显示成功发生计数器的值。	R

注1.这些位在经典CAN功能中不可用。

通道nCAN-FD状态寄存器(n=0 1)指示收发器补偿延迟结果及其相关的FIFO消息丢失状态。

TDCR[7:0]位（收发器延迟补偿结果）

TDCR[7:0]位在测量到收发器延迟后置位。

测得的延迟是CAN通道DLL时钟的倍数。结果取决于CFDCnFDCFG.TDCOC配置和CFDCnFDCFG.TDCO中的偏移值。请参阅第32.4.1.5节。TransmitterDelayCompensation了解有关如何得出此值的详细信息。

当CFDCnFDCFG.TDCOC=0并且使能收发器延迟补偿(CFDCnFDCFG.TDCE=1)时，TDCR[7:0]位在FDF和RES位之间的下降沿更新。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

Note: 这些位在经典CAN功能中不可用。

EOCO位（错误发生计数器溢出）

EOCO位指示相关的CAN通道错误发生计数器是否溢出。该位通过写入0清零。写1无效。

当CFDCnFDSTS.EOC为0xFF且根据CFDCnFDCFG.EOCCFG中定义的配置检测到CAN总线错误时，该位自动设置。

如果来自CAN通道的设置与写访问清除同时发生，则该位被设置。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

SOCO bit (Successful Occurrence Counter Overflow)

The SOCO bit indicates whether the related CAN channel successful occurrence counter has overflowed. This bit is cleared by writing 0 to it. Writing 1 has no effect.

This bit is set automatically when CFDCnFDSTS.SOC is 0xFF and a successful message reception or successful message transmission occurs.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Write to this bit only when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

TDCVF bit (Transceiver Delay Compensation Violation Flag)

The CAN-FD module captures internally the transmitted data bit-by-bit. This data is then compared against the received CAN bus level which is delayed by the transceiver loop delay.

The transceiver delay has some variations depending on the physical parameters such as temperature. The result bit CFDCnFDSTS.TDCR is updated by each message. However, temporary maximum delay violation could be missed. Therefore, the TDCVF bit captures this violation.

This bit is cleared by writing 0 to it. Writing 1 has no effect.

This bit is set automatically when the transceiver delay compensation is greater than the maximum delay compensation (6 data bit times - 2 clk_dlc) and the internal bit is overrun.

If the set from the CAN channel occurs simultaneously with the clear by the write access, then the bit is set.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

Note: This bit is not available in the classical CAN function.

EOC[7:0] bits (Error Occurrence Counter)

The EOC[7:0] bits are used together with the SOC[7:0] bits to support an option for host-controlled fall-back to payload bit rate identical to arbitration bit rate when messages utilizing the reduced payload bit length have significant higher error rates compared to other messages.

This higher error rate can be detected depending on the configuration of the CFDCnFDCFG.EOCCFG bits.

The EOC[7:0] bits are set only by CAN-FD module logic. These bits are cleared by writing 1 to CFDCnFDCTR.EOCCLR. Writing any other value has no effect.

These bits are updated when an error occurs, according to the configuration of the CFDCnFDCFG.EOCCFG bits. When the counter reaches the value of 0xFF, the update stops.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

SOC[7:0] bits (Successful occurrence counter register)

The SOC[7:0] bits are used together with the EOC[7:0] bits to support an option for host-controlled fall-back to payload bit rate identical to arbitration bit rate when messages utilizing the reduced payload bit length have significant higher error rates compared to other messages.

The SOC[7:0] bits are set only by CAN-FD module logic. Writing any other value has no effect.

These bits are updated when the occurrence of any error-free messages on the bus is detected through reception or transmission. When the counter reaches the value of 0xFF, the update stops.

Note: In Loopback mode, the counter is incremented twice.

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

SOCO位（成功发生计数器溢出）

SOCO位指示相关CAN通道成功发生计数器是否溢出。该位通过写入0清零。写1无效。

当CFDCnFDSTS.SOC为0xFF且成功接收消息或成功发送消息时，该位自动置位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

TDCVF位（收发器延迟补偿违规标志）

CAN-FD模块在内部逐位捕获传输的数据。然后将该数据与接收到的数据进行比较
由收发器环路延迟延迟的CAN总线电平。

收发器延迟有一些变化，具体取决于温度等物理参数。结果位CFDCnFDSTS.TDCR由每个消息更新。但是，
可能会错过临时最大延迟违规。
因此，TDCVF位捕获此违规。

该位通过写入0清零。写1无效。

当收发器延迟补偿大于最大延迟补偿（6个数据位乘以2个clk_dlc）并且内部位溢出时，该位自动置位。

如果来自CAN通道的设置与写访问清除同时发生，则该位被设置。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

Note: 该位在经典CAN功能中不可用。

EOC[7:0]位（错误发生计数器）

EOC[7:0]位与SOC[7:0]位一起使用，以支持当使用减少的有效负载位长度的消息具有重要与其他消息相比，错误率更高。

根据CFDCnFDCFG.EOCCFG位的配置，可以检测到这种较高的错误率。

EOC[7:0]位仅由CAN-FD模块逻辑设置。这些位通过向CFDCnFDCTR.EOCCLR写入1来清除。
写入任何其他值均无效。

根据CFDCnFDCFG.EOCCFG位的配置，这些位在发生错误时更新。当计数器达到0xFF的值时，更新停止。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

SOC[7:0]位（成功发生计数器寄存器）

SOC[7:0]位与EOC[7:0]位一起使用，以支持主机控制的回退到与仲裁比特率相同的有效负载比特率选项，当使用减少的有效负载位长度的消息具有显着性时与其他消息相比，错误率更高。

SOC[7:0]位仅由CAN-FD模块逻辑设置。写入任何其他值均无效。

当通过接收或传输检测到总线上出现任何无错误消息时，这些位将被更新。当计数器达到0xFF的值时，
更新停止。

Note: 在环回模式下，计数器增加两次。

These bits are cleared by writing 1 to CFDCnFDCTR.SOCCLR.

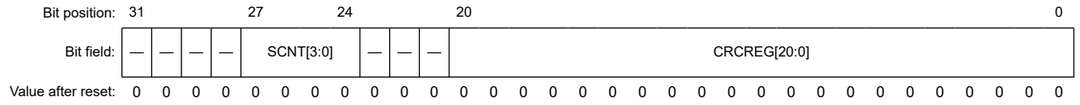
These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

32.2.11 CFDCnFDCRC : Channel n CAN-FD CRC Register (n = 0, 1)

This register is not available in the classical CAN function.

Base address: CANFD = 0x400B_0000

Offset address: 0x1410 + 0x20 × n



Bit	Symbol	Function	R/W
20:0	CRCREG[20:0]	CRC Register value These bits show the CRC value calculated for the CAN-FD frame.	R
23:21	—	These bits are read as 0. The write value should be 0.	R/W
27:24	SCNT[3:0]	Stuff bit count These bits shows the stuff bit count (mod 8) for the CAN-FD frame.	R
31:28	—	These bits are read as 0. The write value should be 0.	R/W

The Channel n CAN-FD CRC Register (n = 0, 1) holds the CRC value calculated for the CAN-FD frame.

CRCREG[20:0] bits (CRC Register value)

The CRCREG[20:0] bits contain the CRC value calculated by the CAN-FD channel logic when the CFDCnCTR.CTME bit is enabled.

The CFDCnFDCRC.CRCREG value is updated in the first bit of the CRC field of the CAN-FD frame (reception and transmission).

When the CFDCnCTR.CTME bit is 0, the CRCREG[20:0] bits are always read as 0.

When bit 17th of the CRC field is used, CRCREG[20:17] are always read as 0.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

SCNT[3:0] bits (Stuff bit count)

The SCNT[3:0] bits contain the stuff count value of the CAN-FD frame. These bits indicate the number of inserted stuff bits (modulo 8, Graycoded) for a CAN-FD frame when the CFDCnCTR.CTME bit is enabled in CFDCnFDCRC.SCNT[3:1]. SCNT[0] is the parity bit.

When the CFDCnCTR.CTME bit is 0, the SCNT[3:0] bits are always read as 0.

The SCNT value is updated in the first bit of CRC field of the CAN-FD frame (reception and transmission).

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

这些位通过向CFDCnFDCTR.SOCCLR写入1来清除。

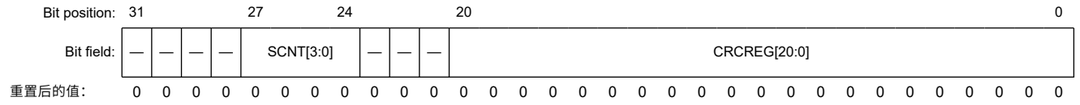
当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

32.2.11 CFDCnFDCRC:通道nCAN-FDCRC寄存器(n=0 1)

该寄存器在经典CAN功能中不可用。

Base address: CANFD = 0x400B_0000

Offset address: 0x1410 + 0x20 × n



Bit	Symbol	Function	R/W
20:0	CRCREG[20:0]	CRC寄存器值 这些位显示为CAN-FD帧计算的CRC值。	R
23:21	—	这些位被读取为0。写入值应为0。	R/W
27:24	SCNT[3:0]	东西位数 这些位显示CAN-FD帧的填充位计数(mod8)。	R
31:28	—	这些位被读取为0。写入值应为0。	R/W

通道nCAN-FDCRC寄存器(n=0 1)保存为CAN-FD帧计算的CRC值。

CRCREG[20:0]位（CRC寄存器值）

CRCREG[20:0]位包含使能CFDCnCTR.CTME位时由CAN-FD通道逻辑计算的CRC值。

CFDCnFDCRC.CRCREG值在CAN-FD帧（接收和发送）的CRC字段的第一位更新。

当CFDCnCTR.CTME位为0时，CRCREG[20:0]位总是读为0。

当使用CRC字段的第17位时，CRCREG[20:17]总是读为0。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

SCNT[3:0]位（填充位计数）

SCNT[3:0]位包含CAN-FD帧的填充计数值。当在CFDCnFDCRC.SCNT[3:1]中启用CFDCnCTR.CTME位时，这些位指示CAN-FD帧的插入填充位（模8，格雷编码）的数量。SCNT[0]是奇偶校验位。

当CFDCnCTR.CTME位为0时，SCNT[3:0]位总是读为0。

SCNT值在CAN-FD帧（接收和发送）的CRC字段的第一位更新。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

32.2.12 CFDGCFG : Global Configuration Register

Base address: CANFD = 0x400B_0000

Offset address: 0x0084

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

12	TSSS	Timestamp Source Select 0: Source clock for timestamp counter is peripheral clock 1: Source clock for timestamp counter is bit time clock	R/W
15:13	TSBTCS[2:0]	Timestamp Bit Time Channel Select 0 0 0: Select clock from channel 0 0 0 1: Select clock from channel 1 Others: Setting prohibited	R/W
31:16	ITRCP[15:0]	Interval Timer Reference Clock Prescaler FIFO interval timer prescaler value	R/W

Note 1. This bit are not available in the classical CAN function.

The Global Configuration Register is used to select the transmission priority to be used for all the TX message buffers and the clock source for the CAN protocol engine of all CAN channels. The CFDGCFG register is also used to select the source for the timestamp clock and to configure the frequency for the timestamp clock and interval timer reference clock.

32.2.12 CFDGCFG:全局配置寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x0084

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	ITRCP[15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

31:16	ITRCP[15:0]	间隔定时器参考时钟预分频器 FIFO间隔定时器预分频器值	R/W

注1.该位在经典CAN功能中不可用。

全局配置寄存器用于选择用于所有TX报文缓冲区的传输优先级和所有CAN通道的CAN协议引擎的时钟源。CFDGCFG寄存器还用于选择时间戳时钟源以及配置时间戳时钟和间隔定时器参考时钟的频率。

TPRI bit (Transmission Priority)

The TPRI bit selects the transmission priority for all CAN channels.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

Message buffer number priority should not be used together with TX queue transmission.

DCE bit (DLC Check Enable)

The DCE bit enables data length code (DLC) check for all CAN channels.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

DRE bit (DLC Replacement Enable)

When the DRE bit is 1 and the DCE is 1, the CAN-FD stores the configured value (CFDGAFLP0n.GAFLDLC) of the DLC in the destination RX message buffer or FIFO buffer if the DLC check passes. Otherwise, the DLC value in the destination RX message buffer or FIFO buffer is unchanged.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

MME bit (Mirror Mode Enable)

The MME bit enables the Mirror mode for all CAN channels.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

DCS bit (Data Link Controller Clock Select)

The DCS bit selects the clock source for CAN communication. Internal clean clock has a smaller clock jitter than the peripheral clock B (PCLKB).

Do not write to this bit in GL_SLEEP or GL_OPERATION mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

CMPOC bit (CAN-FD Message Payload Overflow Configuration)

The CMPOC bit controls the message payload acceptance mechanism when the received payload is higher than the message buffer payload size CFDRMNB.RMPLS, CFDRFCCn.RFPLS, and CFDCFCCn.CFPLS. The received message payload is always compared with the available message payload size in the message buffer.

Do not write to this bit in GL_SLEEP or GL_OPERATION mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

When this bit is set and payload overflow occurs, the DLC value is stored in the RX message buffer or FIFO buffer unchanged.

Note: This bit is not available in the classical CAN function.

TSP[3:0] bits (Timestamp Prescaler)

The value configured in the TSP[3:0] bits defines the period of the clock source used for the timestamp counter.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

TSSS bit (Timestamp Source Select)

The TSSS bit allows the selection of the clock source for the timestamp counter.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode. Additionally, do not set this bit to 1 when CAN-FD communication is used.*1

Note: The bit time clock varies depending on the nominal and data rate bit configuration.

Note 1. This feature is not available in the classical CAN function.

TSBTCS[2:0] bits (Timestamp Bit Time Channel Select)

The TSBTCS[2:0] bits allow the selection of the bit time clock of a particular channel for the timestamp counter.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

TPRI bit (Transmission Priority)

TPRI位选择所有CAN通道的传输优先级。

不要在GL_SLEEP模式下写入该位。仅当CAN-FD模块处于GL_RESET模式时写入该位。

消息缓冲区编号优先级不应与TX队列传输一起使用。

DCE位（DLC检查启用）

DCE位启用所有CAN通道的数据长度代码(DLC)检查。

不要在GL_SLEEP模式下写入该位。仅当CAN-FD模块处于GL_RESET模式时写入该位。

DRE位（DLC替换启用）

当DRE位为1且DCE为1时，如果DLC检查通过，CAN-FD将DLC的配置值(CFDGAFLP0n.GAFLDLC)存储在目标RX消息缓冲区或FIFO缓冲区中。否则，目标RX消息缓冲区或FIFO缓冲区中的DLC值不变。

不要在GL_SLEEP模式下写入该位。仅当CAN-FD模块处于GL_RESET模式时写入该位。

MME位（镜像模式启用）

MME位使能所有CAN通道的镜像模式。

不要在GL_SLEEP模式下写入该位。仅当CAN-FD模块处于GL_RESET模式时写入该位。

DCS位（数据链路控制器时钟选择）

DCS位选择CAN通信的时钟源。内部干净时钟的时钟抖动小于外设时钟B(PCLKB)。

不要在GL_SLEEP或GL_OPERATION模式下写入该位。仅当CAN-FD模块处于工作状态时写入该位
GL_RESET mode.

CMPOC位（CAN-FD消息有效负载溢出配置）

当接收到的有效载荷高于消息缓冲区有效载荷大小CFDRMNB.RMPLS、CFDRFCCn.RFPLS和CFDCFCCn.CFPLS时，CMPOC位控制消息有效载荷接受机制。接收到的消息负载总是与消息缓冲区中可用的消息负载大小进行比较。

不要在GL_SLEEP或GL_OPERATION模式下写入该位。仅当CAN-FD模块处于工作状态时写入该位
GL_RESET mode.

当该位被置位并发生有效载荷溢出时，DLC值不变地存储在RX报文缓冲区或FIFO缓冲区中。

Note: 该位在经典CAN功能中不可用。

TSP[3:0] bits (Timestamp Prescaler)

TSP[3:0]位中配置的值定义了用于时间戳计数器的时钟源的周期。

不要在GL_SLEEP模式下写入该位。仅当CAN-FD模块处于GL_RESET模式时写入该位。

TSSS位（时间戳源选择）

TSSS位允许选择时间戳计数器的时钟源。

不要在GL_SLEEP模式下写入该位。仅当CAN-FD模块处于GL_RESET模式时写入该位。
此外，使用CAN-FD通信时，请勿将此位设置为1。*1

Note: 位时钟取决于标称和数据速率位配置。

注1.此功能在经典CAN功能中不可用。

TSBTCS[2:0]位（时间戳位时间通道选择）

TSBTCS[2:0]位允许为时间戳计数器选择特定通道的位时钟。

不要在GL_SLEEP模式下写入该位。仅当CAN-FD模块处于GL_RESET模式时写入该位。

ITRCP[15:0] bits (Interval Timer Reference Clock Prescaler)

The ITRCP[15:0] bits allow the definition of a reference clock for the FIFO interval timer source clock.

When these bits are 0x0000, the timer is disabled.

Do not write to this bit in GL_SLEEP mode. Only write to this bit when CAN-FD module is in GL_RESET mode.

32.2.13 CFDGCTR : Global Control Register

Base address: CANFD = 0x400B_0000

31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is not available in the classical CAN function.

ITRCP[15:0]位（间隔定时器参考时钟预分频器）

ITRCP[15:0]位允许为FIFO间隔定时器源时钟定义参考时钟。

当这些位为0x0000时，定时器被禁用。

不要在GL_SLEEP模式下写入该位。仅当CAN-FD模块处于GL_RESET模式时写入该位。

32.2.13 CFDGCTR:全局控制寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x0088

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31:17	—	这些位被读取为0。写入值应为0。	R/W

注1.该位在经典CAN功能中不可用。

RA生态工作室

The Global Control Register controls the global mode of the CAN-FD module and the timestamp function. The register also enables and disables the global error interrupts.

GMDC bits (Global Mode Control)

The GMDC bits can be used to configure the modes for the CAN-FD module. Additionally, if CFDGCTR.GSLPR bit is 1 when the CAN-FD module is in Reset mode, the CAN-FD module enters Global Sleep mode. Additionally, if CFDGCTR.GSLPR is 1 when the CAN-FD module is in Reset Mode, then the CAN-FD module enters Global Sleep Mode.

Setting the GMDC bits to 11b has no effect. Mode transition is described in detail in section 32.3.2. Global Modes.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

GSLPR bit (Global Sleep Request)

The GSLPR bit globally selects the sleep request for CAN-FD module including all CAN channels. Channel sleep request is set automatically for all channels.

Only write to this bit when the CAN-FD module is in GL_RESET or GL_SLEEP mode.

DEIE bit (DLC Check Interrupt Enable)

When the DEIE bit is 1, an interrupt is generated if a DLC error is detected in the received frames.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

MEIE bit (Message Lost Error Interrupt Enable)

When the MEIE bit is 1, an interrupt is generated if a message lost condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

THLEIE bit (TX History List Entry Lost Interrupt Enable)

When the THLEIE bit is 1, an interrupt is generated if a TX history list entry lost condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CMPOFIE bit (CAN-FD Message Payload Overflow Flag Interrupt Enable)

When the CMPOFIE bit is 1, an interrupt is generated when a CAN-FD message payload overflow condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

Note: This bit is not available in the classical CAN function

QMEIE bit (TXQ Message Lost Error Interrupt Enable)

When the QMEIE bit is 1, an interrupt is generated when a TXQ message lost condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

MOWEIE bit (GW FIFO Message Overwrite Error Interrupt Enable)

When the MOWEIE bit is 1, an interrupt is generated in GW mode and a GW FIFO message over write condition occurs.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

TSRST bit (Timestamp Reset)

When the TSRST bit is 1, the Global Timestamp Register is reset to 0x0000.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode.

Read value is always 0.

This bit is cleared automatically by the RS-CAN-FD logic.

全局控制寄存器控制CAN-FD模块的全局模式和时间戳功能。该寄存器还启用和禁用全局错误中断。

GMDC位（全局模式控制）

GMDC位可用于配置CAN-FD模块的模式。此外，如果当CAN-FD模块处于复位模式时CFDGCTR.GSLPR位为1，则CAN-FD模块进入全局休眠模式。此外，如果当CAN-FD模块处于复位模式时CFDGCTR.GSLPR为1，则CAN-FD模块进入全局休眠模式。

将GMDC位设置为11b无效。模式转换在第32.3.2节中有详细描述。全局模式。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

GSLPR位（全局休眠请求）

GSLPR位全局选择CAN-FD模块的睡眠请求，包括所有CAN通道。为所有通道自动设置通道睡眠请求。

仅当CAN-FD模块处于GL_RESET或GL_SLEEP模式时写入该位。

DEIE位（DLC检查中断使能）

当DEIE位为1时，如果在接收的帧中检测到DLC错误，则产生中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

MEIE位（消息丢失错误中断使能）

当MEIE位为1时，如果发生信息丢失情况，将产生中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

THLEIE位（TX历史列表条目丢失中断使能）

当THLEIE位为1时，如果发生TX历史列表条目丢失情况，将产生中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

CMPOFIE位（CAN-FD消息有效负载溢出标志中断使能）

当CMPOFIE位为1时，当CAN-FD报文有效负载溢出条件发生时产生中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

Note: 该位在经典CAN功能中不可用

QMEIE位（TXQ消息丢失错误中断使能）

当QMEIE位为1时，当发生TXQ报文丢失情况时会产生中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

MOWEIE位（GWFIFO消息覆盖错误中断使能）

当MOWEIE位为1时，在GW模式下会产生一个中断，并且会出现一个GWFIFO消息覆盖写入条件。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

TSRST bit (Timestamp Reset)

当TSRST位为1时，全局时间戳寄存器复位为0x0000。

当CAN-FD模块处于GL_SLEEP或GL_RESET模式时，请勿写入该位。

读取值始终为0。

该位由RS-CAN-FD逻辑自动清零。

32.2.14 CFDGSTS : Global Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x008C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	GRAM INIT	GSLP STS	GHLT STS	GRST STS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1

Bit	Symbol	Function	R/W
0	GRSTSTS	Global Reset Status 0: Not in Reset mode 1: In Reset mode	R
1	GHLTSTS	Global Halt Status 0: Not in Halt mode 1: In Halt mode	R
2	GSLPSTS	Global Sleep Status 0: Not in Sleep mode 1: In Sleep mode	R
3	GRAMINIT	Global RAM Initialization 0: RAM initialization is complete 1: RAM initialization is ongoing	R
31:4	—	These bits are read as 0. The write value should be 0.	R/W

The Global Status Register indicates the global status of the CAN-FD module.

GRSTSTS bit (Global Reset Status)

The GRSTSTS bit indicates the status of Global CAN-FD module Reset mode.

This bit is set automatically when the CAN-FD module enters GL_RESET mode. When the mode changes from GL_RESET mode to GL_SLEEP mode, this bit remains set.

This bit is cleared automatically when the CAN-FD module exits the GL_RESET mode.

GHLTSTS bit (Global Halt Status)

The GHLTSTS bit indicates the status of Global CAN-FD module Halt mode.

This bit is set automatically when the CAN-FD module enters GL_HALT mode.

This bit is cleared automatically when the CAN-FD module exits the GL_HALT mode.

GSLPSTS bit (Global Sleep Status)

The GSLPSTS bit indicates the status of Global CAN-FD module Sleep mode.

This bit is set automatically when the CAN-FD module enters GL_SLEEP mode.

This bit is cleared automatically when the CAN-FD module exits the GL_SLEEP mode.

GRAMINIT bit (Global RAM Initialization)

The GRAMINIT bit indicates the status of Global CAN-FD module RAM initialization.

This bit is set automatically when the CAN-FD module enters GL_SLEEP mode after a hardware reset.

This bit is cleared automatically when the CAN-FD module completed RAM initialization.

This bit is cleared when the test_mode input port is set to 1.

32.2.14 CFDGSTS:全局状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x008C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1

Bit	Symbol	Function	R/W
0	GRSTSTS	全局重置状态 0：不处于复位模式1 ：处于复位模式	R
1	GHLTSTS	全局停止状态 0：不处于暂停模式 1：处于暂停模式	R
2	GSLPSTS	全局睡眠状态 0：不处于休眠模式1 ：处于休眠模式	R
3	GRAMINIT	全局RAM初始化 0：RAM初始化完成1：RAM初始化正在进行	R
31:4	—	这些位被读取为0。写入值应为0。	R/W

全局状态寄存器指示CAN-FD模块的全局状态。

GRSTSTS位（全局复位状态）

GRSTSTS位指示全局CAN-FD模块复位模式的状态。

当CAN-FD模块进入GL_RESET模式时，该位自动设置。当模式从GL_RESET模式到GL_SLEEP模式，该位保持设置。

当CAN-FD模块退出GL_RESET模式时，该位自动清零。

GHLTSTS位（全局停止状态）

GHLTSTS位指示全局CAN-FD模块暂停模式的状态。

当CAN-FD模块进入GL_HALT模式时，该位自动置位。

当CAN-FD模块退出GL_HALT模式时，该位自动清零。

GSLPSTS位（全局休眠状态）

GSLPSTS位指示全局CAN-FD模块休眠模式的状态。

当CAN-FD模块进入GL_SLEEP模式时，该位自动置位。

当CAN-FD模块退出GL_SLEEP模式时，该位自动清零。

GRAMMINIT位（全局RAM初始化）

GRAMMINIT位指示全局CAN-FD模块RAM初始化的状态。

当CAN-FD模块在硬件复位后进入GL_SLEEP模式时，该位会自动设置。

当CAN-FD模块完成RAM初始化时，该位自动清零。

当test_mode输入端口设置为1时，该位清零。

32.2.15 CFDGERFL : Global Error Flag Register

Base address: CANFD = 0x400B_0000

Offset address: 0x0090

2	THLES	TX History List Entry Lost Error Status 0: TX history list entry lost error not detected 1: TX history list entry lost error detected	R
3	CMPOF*1	CAN-FD Message Payload Overflow Flag 0: CAN-FD message payload overflow not detected 1: CAN-FD message payload overflow detected	R/W
4	QOWES	TXQ Message Overwrite Error Status 0: TXQ message overwrite error not detected 1: TXQ message overwrite error detected	R
5	—	This bit is read as 0. The write value should be 0.	R
6	QMES	TXQ Message Lost Error Status 0: TXQ message lost error not detected 1: TXQ message lost error detected	R
15:7	—	These bits are read as 0. The write value should be 0.	R/W
16	EEF0	ECC Error Flag for Channel 0 0: ECC error not detected during TX-SCAN 1: ECC error detected during TX-SCAN	R/W
17	EEF1	ECC Error Flag for Channel 1 0: ECC error not detected during TX-SCAN 1: ECC error detected during TX-SCAN	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is not available in the classical CAN function.

The Global Error Flag register indicates the detection of global errors.

DEF bit (DLC Error Flag)

The DEF bit indicates the error status of the DLC.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when a DLC error is detected in a received frame.

If the set from the CAN channel occurs simultaneously with the clear by the write access, then the bit is set

The bit is cleared by writing 0 to it.

32.2.15 CFDGERFL:全局错误标志寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x0090

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

17	EEF1	通道1的ECC错误标志 0：在TX-SCAN期间未检测到ECC错误1：在 TX-SCAN期间检测到ECC错误	R/W
31:18	—	这些位被读取为0。写入值应为0。	R/W

注1.该位在经典CAN功能中不可用。

全局错误标志寄存器指示全局错误的检测。

DEF位（DLC错误标志）

DEF位指示DLC的错误状态。

当CAN-FD模块处于GL_SLEEP或GL_RESET模式时，请勿写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

当在接收帧中检测到DLC错误时，该位自动设置。

如果来自CAN通道的设置与写访问清除同时发生，则该位被设置

该位通过向其写入0来清除。

This bit is cleared automatically in GL_RESET mode.

MES bit (Message Lost Error Status)

The MES bit indicates status of the message lost error.

This bit is set automatically when a FIFO message lost error is detected.

This bit is cleared automatically when:

- All FIFO message lost flags are cleared
- The CAN-FD module is in GL_RESET mode.

THLES bit (TX History List Entry Lost Error Status)

The THLES bit indicates status of the TX history list entry lost error.

This bit is set automatically when a TX history list entry lost error is detected.

This bit is cleared automatically when:

- All TX history list entry lost flags are cleared
- The CAN-FD module is in GL_RESET mode.

CMPOF bit (CAN-FD Message Payload Overflow Flag)

The CMPOF bit is set automatically when a CAN-FD message payload overflow is detected on at least one channel.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode.

This bit is cleared by writing 0 to it. Writing 1 to this bit has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is cleared automatically in GL_RESET mode.

Note: This bit is not available in the classical CAN function

QOWES bit (TXQ Message Overwrite Error Status)

The QOWES bit is set automatically when a TXQ message overwrite error is detected.

This bit is cleared automatically when all TXQ message overwrite flags are cleared.

This bit is cleared automatically in GL_RESET mode.

QMES bit (TXQ Message Lost Error Status)

The QMES bit is set automatically when a TXQ message lost error is detected.

This bit is cleared automatically when all TXQ message lost flags are cleared.

This bit is cleared automatically in GL_RESET mode.

EEF0 bit (ECC Error Flag for Channel 0)

The EEF0 bit specifies whether an ECC error has occurred on Channel 0.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode. Writing 1 to this bit has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

The bit is cleared by writing 0 to it. This bit is cleared automatically in GL_RESET mode.

EEF1 bit (ECC Error Flag for Channel 1)

The EEF1 bit specifies whether an ECC error has occurred on Channel 1.

Do not write to this bit when the CAN-FD module is in GL_SLEEP or GL_RESET mode. Writing 1 to this bit has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

The bit is cleared by writing 0 to it. This bit is cleared automatically in GL_RESET mode.

该位在GL_RESET模式下自动清除。

MES位（消息丢失错误状态）

MES位指示消息丢失错误的状态。

当检测到FIFO消息丢失错误时，该位自动置位。

该位在以下情况下自动清零：

●清除所有FIFO消息丢失标志

●CAN-FD模块处于GL_RESET模式。

THLES位（TX历史列表条目丢失错误状态）

THLES位指示TX历史列表条目丢失错误的状态。

当检测到TX历史列表条目丢失错误时，该位自动设置。

该位在以下情况下自动清零：

●清除所有TX历史列表条目丢失标志

●CAN-FD模块处于GL_RESET模式。

CMPOF位（CAN-FD消息有效负载溢出标志）

当在至少一个通道上检测到CAN-FD消息有效负载溢出时，CMPOF位自动置位。

当CAN-FD模块处于GL_SLEEP或GL_RESET模式时，请勿写入该位。

该位通过写入0清零。向该位写入1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

该位在GL_RESET模式下自动清除。

Note: 该位在经典CAN功能中不可用

QOWES位（TXQ报文覆盖错误状态）

当检测到TXQ报文覆盖错误时，QOWES位自动置位。

当所有TXQ报文覆盖标志被清除时，该位自动清除。

该位在GL_RESET模式下自动清除。

QMES位（TXQ消息丢失错误状态）

当检测到TXQ消息丢失错误时，QMES位自动置位。

当所有TXQ消息丢失标志被清除时，该位自动清除。

该位在GL_RESET模式下自动清除。

EEF0位（通道0的ECC错误标志）

EEF0位指定通道0上是否发生ECC错误。

当CAN-FD模块处于GL_SLEEP或GL_RESET模式时，请勿写入该位。向该位写入1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

该位通过向其写入0来清除。该位在GL_RESET模式下自动清除。

EEF1位（通道1的ECC错误标志）

EEF1位指定通道1上是否发生ECC错误。

当CAN-FD模块处于GL_SLEEP或GL_RESET模式时，请勿写入该位。向该位写入1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

该位通过向其写入0来清除。该位在GL_RESET模式下自动清除。

RA生态工作室

Bit	Symbol	Function	R/W
14	CFOTIF1	COM FIFO One Frame Transmission Interrupt Flag Channel 1 0: Channel n COM FIFO One Frame Transmission Interrupt flag not set 1: Channel n COM FIFO One Frame Transmission Interrupt flag set	R
31:15	—	These bits are read as 0. The write value should be 0.	R/W

The Global TX Interrupt Status register indicates the detection of transmit specific interrupts.

TSIF0 bit (TX Successful Interrupt Flag Channel 0)

The TSIF0 bit is set to 1 when the TX Successful Interrupt flag of the related channel is set (when the interrupt is enabled).
This bit is cleared automatically:

- When the related TX MB Result Status bits are cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

TAI0 bit (TX Abort Interrupt Flag Channel 0)

The TAIF0 bit is set to 1 when the TX Abort Interrupt flag of the related channel is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX MB Result Status bits are cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

TQIF0 bit (TX Queue Interrupt Flag Channel 0)

The TQIF0 bit is set to 1 when the TX Queue Interrupt flag of the related channel is set (when the interrupt is enabled).
This bit is cleared automatically:

- When the related TX Queue Interrupt flag is cleared (when the interrupt is enable disabled)
- When in GL_RESET or CH_RESET mode.

CFTIF0 bit (COM FIFO TX/GW Mode Interrupt Flag Channel 0)

The CFTIF0 bit is set to 1 when the related COM TX/GW FIFO Mode Interrupt flag (CFDCFSTSn.CFTXIF) is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related COM TX/GW FIFO Mode Interrupt flag (CFDCFSTSn.CFTXIF) is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

THIF0 bit (TX History List Interrupt Channel 0)

The THIF0 bit is set to 1 when the related TX History List Interrupt flag (CFDTHLSTSn.THLIF) is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX History List Interrupt flag (CFDTHLSTSn.THLIF) is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

CFDGTINTSTS0.TQOFIFn bit (TX Queue One Frame Transmission Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.TQOFIFn bit is set to 1 when the TX Queue One Frame Transmission Interrupt flag of the related channel is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX Queue One Frame Transmission Interrupt flag is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

Bit	Symbol	Function	R/W
14	CFOTIF1	COMFIFO一帧传输中断标志通道1 0：未设置通道nCOMFIFO一帧传输中断标志1：设置通道nCOMFIFO一帧传输中断标志	R
31:15	—	这些位被读取为0。写入值应为0。	R/W

全局TX中断状态寄存器指示发送特定中断的检测。

TSIF0位（TX成功中断标志通道0）

当相关通道的TX成功中断标志置位时（中断使能时），TSIF0位设置为1。
该位自动清零：

●当相关的TXMBResultStatus位被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

TAI0位（TX中止中断标志通道0）

当相关通道的TXAbortInterrupt标志置位时（中断使能时），TAIF0位被置1。

该位自动清零：

●当相关的TXMBResultStatus位被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

TQIF0位（TX队列中断标志通道0）

当相关通道的TX队列中断标志置位（中断使能时）时，TQIF0位被置1。
该位自动清零：

●相关TXQueueInterrupt标志清零时（中断使能禁止时）

●在GL_RESET或CH_RESET模式下。

CFTIF0位（COMFIFOTXGW模式中断标志通道0）

当相关的COMTXGWFIFO模式中断标志(CFDCFSTSn.CFTXIF)置位时（中断使能时），CFTIF0位设置为1。

该位自动清零：

●当相关的COMTXGWFIFO模式中断标志(CFDCFSTSn.CFTXIF)被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

THIF0位（TX历史列表中断通道0）

当相关的TX历史列表中断标志(CFDTHLSTSn.THLIF)置位时（中断使能时），THIF0位设置为1。

该位自动清零：

●当相关的TX历史列表中断标志(CFDTHLSTSn.THLIF)被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

CFDGTINTSTS0.TQOFIFn位（TX队列一帧传输中断标志通道n(n=0 1)）

当相关通道的TX队列一帧传输中断标志置位时（中断使能时），CFDGTINTSTS0.TQOFIFn位设置为1。

该位自动清零：

●当相关的TXQueue一帧传输中断标志被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

CFDGTINTSTS0.CFOTIFn bit (COM FIFO One Frame Transmission Interrupt Flag Channel n (n = 0, 1))

The CFDGTINTSTS0.CFOTIFn bit is set to 1 when the related COM FIFO One Frame Transmission Interrupt flag (CFDCFSTSn.CFOFTXIF) is set (when the Interrupt is enabled).

This bit is cleared automatically:

- When the related COM FIFO One Frame Transmission Interrupt flag (CFDCFSTSn.CFOFTXIF) is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

TSIF1 bit (TX Successful Interrupt Flag Channel 1)

The TSIF1 bit is set to 1 when the TX Successful Interrupt flag of the related channel is set (when the interrupt is enabled).
This bit is cleared automatically:

- When the related TX MB Result Status bits are cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

TAIF1 bit (TX Abort Interrupt Flag Channel 1)

The TAIF1 bit is set to 1 when the TX Abort Interrupt flag of the related channel is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX MB Result Status bits are cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

TQIF1 bit (TX Queue Interrupt Flag Channel 1)

The TQIF1 bit is set to 1 when the TX Queue Interrupt flag of the related channel is set (when the interrupt is enabled).
This bit is cleared automatically:

- When the related TX Queue Interrupt flag is cleared (when the interrupt is enable disabled)
- When in GL_RESET or CH_RESET mode.

CFTIF1 bit (COM FIFO TX/GW Mode Interrupt Flag Channel 1)

The CFTIF1 bit is set to 1 when the related COM TX/GW FIFO Mode Interrupt flag (CFDCFSTSn.CFTXIF) is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related COM TX/GW FIFO Mode Interrupt flag (CFDCFSTSn.CFTXIF) is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

THIF1 bit (TX History List Interrupt Channel 1)

The THIF1 bit is set to 1 when the related TX History List Interrupt flag (CFDTHLSTSn.THLIF) is set (when the interrupt is enabled).

This bit is cleared automatically:

- When the related TX History List Interrupt flag (CFDTHLSTSn.THLIF) is cleared (when the interrupt enable is disabled)
- When in GL_RESET or CH_RESET mode.

CFDGTINTSTS0.CFOTIFn位（COMFIFO一帧传输中断标志通道n(n=0 1)）

当相关的COMFIFO一帧传输中断标志(CFDCFSTSn.CFOFTXIF)设置时（中断使能时），CFDGTINTSTS0.CFOTIFn位设置为1。

该位自动清零：

●当相关的COMFIFO一帧传输中断标志（CFDCFSTSn.CFOFTXIF）被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

TSIF1位（TX成功中断标志通道1）

当相关通道的TX成功中断标志置位时（中断使能时），TSIF1位设置为1。
该位自动清零：

●当相关的TXMBResultStatus位被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

TAIF1位（TX中止中断标志通道1）

当相关通道的TXAbortInterrupt标志置位时（允许中断时），TAIF1位设置为1。

该位自动清零：

●当相关的TXMBResultStatus位被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

TQIF1位（TX队列中断标志通道1）

当相关通道的TX队列中断标志置位（中断使能时）时，TQIF1位设置为1。
该位自动清零：

●相关TXQueueInterrupt标志清零时（中断使能禁止时）

●在GL_RESET或CH_RESET模式下。

CFTIF1位（COMFIFOTXGW模式中断标志通道1）

当相关的COMTXGWFIFO模式中断标志(CFDCFSTSn.CFTXIF)置位时（中断使能时），CFTIF1位设置为1。

该位自动清零：

●当相关的COMTXGWFIFO模式中断标志(CFDCFSTSn.CFTXIF)被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

THIF1位（TX历史列表中断通道1）

当相关的TX历史列表中断标志(CFDTHLSTSn.THLIF)置位时（当允许中断时），THIF1位设置为1。

该位自动清零：

●当相关的TX历史列表中断标志(CFDTHLSTSn.THLIF)被清除时（当中断使能被禁用时）

●在GL_RESET或CH_RESET模式下。

32.2.17 CFDGTSC : Global Timestamp Counter Register

Base address: CANFD = 0x400B_0000

Offset address: 0x0094

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TS[15:0]	Timestamp value	R
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The Global Timestamp Counter register stores the timestamp based on the selected configuration.

TS[15:0] bits (Timestamp value)

The Timestamp value is stored in the Global Timestamp Counter register based on the configuration of TSSS, TSBTCS and TSP. The accuracy of the timestamp counter cannot be guaranteed when transitioning to halt state.

The Timestamp value is stored in this register based on the configuration of TSSS, TSBTCS and TSP.

Do not write to bits TS[15:0] when the CAN-FD module is in GL_RESET or GL_SLEEP mode.

The TS[15:0] bits are cleared automatically in GL_RESET mode.

32.2.18 CFDGAFLECTR : Global Acceptance Filter List Entry Control Register

Base address: CANFD = 0x400B_0000

Offset address: 0x0098

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	AFLDAE	—	—	—	—	AFLPN[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	AFLPN[3:0]	Acceptance Filter List Page Number Select an Acceptance Filter List page	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	AFLDAE	Acceptance Filter List Data Access Enable 0: Acceptance Filter List data access disabled 1: Acceptance Filter List data access enabled	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

The Global Acceptance Filter List Entry Control Register is used to select the Global Acceptance Filter List page for reading or writing entries into the Global Acceptance Filter List.

AFLPN[3:0] bits (Acceptance Filter List Page Number)

The AFLPN[3:0] bits select the page number to access the desired RAM area of the Acceptance Filter List. One Acceptance Filter List page consists of 16 Acceptance Filter List entries.

Read/write accesses to the Acceptance Filter List can only be performed through a fixed window.

32.2.17 CFDGTSC:全球时间戳计数器寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x0094

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TS[15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TS[15:0]	时间戳值	R
31:16	—	这些位被读取为0。写入值应为0。	R/W

全局时间戳计数器寄存器存储基于所选配置的时间戳。

TS[15:0] bits (Timestamp value)

Timestamp值根据TSSS、TSBTCS和
茶多酚。转换到停止状态时，无法保证时间戳计数器的准确性。

Timestamp值根据TSSS、TSBTCS和TSP的配置存储在该寄存器中。

当CAN-FD模块处于GL_RESET或GL_SLEEP模式时，请勿写入位TS[15:0]。

TS[15:0]位在GL_RESET模式下自动清零。

32.2.18 CFDGAFLECTR:全局接受过滤器列表条目控制寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x0098

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	AFLDAE	—	—	—	—	AFLPN[3:0]			
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	AFLPN[3:0]	接受过滤器列表页码选择接受过滤器 列表页面	R/W
7:4	—	这些位被读取为0。写入值应为0。	R/W
8	AFLDAE	接受过滤器列表数据访问启用 0：禁用接受过滤器列表数据访问1：启用接受 过滤器列表数据访问	R/W
31:9	—	这些位被读取为0。写入值应为0。	R/W

全局接受过滤器列表条目控制寄存器用于选择全局接受过滤器列表页面，以将条目读取或写入全局接受过滤器列表。

AFLPN[3:0]位（接受过滤器列表页码）

AFLPN[3:0]位选择页码以访问验收过滤器列表的所需RAM区域。一次验收过滤器列表页面由16个接受过滤器列表条目组成。

只能通过固定窗口执行对接受过滤器列表的读写访问。

Do not write to these bits when the CAN-FD module is in GL_SLEEP mode. Enter only the values between 0x00 and 0x07, inclusive.

AFLDAE bit (Acceptance Filter List Data Access Enable)

The AFLDAE bit prevents write access to the Acceptance Filter List when cleared after configuration of the Acceptance Filter List.

Data can be read from the Acceptance Filter List independent of the status of this bit.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode. Set this bit to enable write access for the Acceptance Filter List.

32.2.19 CFDGAFLCFG0 : Global Acceptance Filter List Configuration Register 0

Base address: CANFD = 0x400B_0000

Offset address: 0x009C

Bit position:	31							24								16								8								0
Bit field:	—	—	—	—	—	—	—	RNC0[8:0]								—	—	—	—	—	—	—	RNC1[8:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	RNC1[8:0]	Rule Number for Channel 1 Number of rules dedicated to channel 1	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
24:16	RNC0[8:0]	Rule Number for Channel 0 Number of rules dedicated to channel 0	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

The Global Acceptance Filter List Configuration Register 0 is used to define the number of rules for entries in the Acceptance Filter List, applicable for channels 0 to 1.

The total number of available entries in the Acceptance Filter List is 64 × (n + 1), 128 for 2 CAN channels. However, the filters can be allocated flexibly to the different channels depending on requirements as long as both of the following conditions are satisfied:

- The maximum number of acceptance filter per channel is 384
- The total number of rules defined for all channels is not exceeding the number of available entries in the Acceptance Filter List.

RNC0[8:0] bits (Rule Number for Channel n (n = 0, 1))

The RNC0[8:0] bits define the number of rules in the Acceptance Filter List for channel n.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

当CAN-FD模块处于GL_SLEEP模式时，不要写入这些位。仅输入0x00和0x07之间的值（包括0x00和0x07）。

AFLDAE位（接受过滤器列表数据访问使能）

AFLDAE位在配置接受后清除时可防止对接受过滤器列表的写访问
过滤器列表。

可以从接受过滤器列表中读取数据，而与该位的状态无关。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。设置该位以启用写访问
接受过滤器列表。

32.2.19 CFDGAFLCFG0：全局接受过滤器列表配置寄存器0

Base address: CANFD = 0x400B_0000

Offset address: 0x009C

Bit position:	31							24								16								8								0
Bit field:	—	—	—	—	—	—	—	RNC0[8:0]								—	—	—	—	—	—	—	RNC1[8:0]									
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	RNC1[8:0]	通道1的规则编号 专用于通道1的规则数	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W
24:16	RNC0[8:0]	通道0的规则编号 专用于通道0的规则数	R/W
31:25	—	这些位被读取为0。写入值应为0。	R/W

全局接受过滤器列表配置寄存器0用于定义条目中的规则数量
接受过滤器列表，适用于通道0到1。

接受过滤器列表中可用条目的总数为64×(n+1)，2个CAN通道为128。但是，只要同时满足以下两个条件，就可以根据需要将滤波器灵活分配给不同的通道：

●每通道最大接收滤波器数为384

●为所有通道定义的规则总数不超过接受过滤器列表中可用条目的数量。

RNC0[8:0]位（通道n(n=0 1)的规则编号）

RNC0[8:0]位定义通道n的接受过滤器列表中的规则数量。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

32.2.20 CFDGAFLIDn : Global Acceptance Filter List ID Registers (n = 1 to 16)

Base address: CANFD = 0x400B_0000

Offset address: 0x1800 + 0x10 × (n - 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	GAFLIDE	GAFLRTR	GAFLLB	GAFLID[28:16]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GAFLID[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
28:0	GAFLID[28:0]	Global Acceptance Filter List Entry ID Field ID part of the Global Acceptance Filter List entry	R/W
29	GAFLLB	Global Acceptance Filter List Entry Loopback Configuration 0: Global Acceptance Filter List entry ID for acceptance filtering with attribute RX 1: Global Acceptance Filter List entry ID for acceptance filtering with attribute TX	R/W
30	GAFLRTR	Global Acceptance Filter List Entry RTR Field 0: Data frame 1: Remote frame	R/W
31	GAFLIDE	Global Acceptance Filter List Entry IDE Field 0: Standard identifier of rule entry ID is valid for acceptance filtering 1: Extended identifier of rule entry ID is valid for acceptance filtering	R/W

The Global Acceptance Filter List ID Registers (n = 1 to 16) are used to configure the ID field for the rules of entries in the Global Acceptance Filter List.

GAFLID[28:0] bits (Global Acceptance Filter List Entry ID Field)

The GAFLID[28:0] bits represent the CAN identifier (ID) field of each entry in the Global Acceptance Filter List.

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLLB bit (Global Acceptance Filter List Entry Loopback Configuration)

The GAFLLB bit selects whether entry in the Global Acceptance Filter List gets the attribute RX or TX.

This attribute determines the validity of the entry in Mirror mode, Loopback test mode, and during standard (non-loopback) reception. See section 32.5.5. Loopback Modes for detailed description of the validity of the Global Acceptance Filter List entry depending on transmitter/receiver case, the type of loopback mode, and RX/TX attribute.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLRTR bit (Global Acceptance Filter List Entry RTR Field)

The GAFLRTR bit allows the configuration of the specified frame format (data frame or remote frame) for each entry of the Global Acceptance Filter List. For each rule entry in a CAN channel, the acceptance filter process compares this bit against the RTR bit of the received CAN message.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLIDE bit (Global Acceptance Filter List Entry IDE Field)

The GAFLIDE bit allows the configuration of the ID format (standard ID or extended ID) for each entry in the Global Acceptance Filter List. For each rule entry in a CAN channel, the acceptance filter process compares this bit against the IDE bit of the received CAN message.

32.2.20 CFDGAFLIDn：全局接受过滤器列表ID寄存器（n=1到16）

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	GAFLIDE	GAFLRTR	GAFLLB	GAFLID[28:16]												
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GAFLID[15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
28:0	GAFLID[28:0]	全局接受过滤器列表条目ID字段 全局接受过滤器列表条目的ID部分	R/W
29	GAFLLB	全局接受过滤器列表条目环回配置 0：全局接受过滤器列表条目ID，用于带有属性RX的接受过滤1：全局接受过滤器列表条目ID，用于带有属性TX的接受过滤	R/W
30	GAFLRTR	全局接受过滤器列表条目RTR字段 0：数据帧1：远程帧	R/W
31	GAFLIDE	全局验收过滤器列表条目IDE字段 0：规则条目ID的标准标识符对接受过滤有效1：规则条目ID的扩展标识符对接受过滤有效	R/W

全局接受过滤器列表ID寄存器（n=1到16）用于配置ID字段以用于全局接受过滤器列表。

GAFLID[28:0]位（全局接受过滤器列表条目ID字段）

GAFLID[28:0]位代表全局接受过滤器列表中每个条目的CAN标识符(ID)字段。

当CFDGAFLECTR.AFLDAE位为0时，不要写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

GAFLLB位（全局接受过滤器列表条目环回配置）

GAFLLB位选择全局接受过滤器列表中的条目是否获得属性RX或TX。

此属性确定条目在镜像模式、环回测试模式和标准（非环回）接收期间的有效性。请参阅第32.5.5节。Loopback Modes用于详细描述GlobalAcceptanceFilterList条目的有效性，具体取决于发送器接收器情况、环回模式的类型和RXTX属性。

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

GAFLRTR位（全局接受过滤器列表条目RTR字段）

GAFLRTR位允许为全局接受过滤器列表的每个条目配置指定的帧格式（数据帧或远程帧）。对于CAN通道中的每个规则条目，接受过滤器进程将该位与接收到的CAN消息的RTR位进行比较。

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

GAFLIDE位（全局接受过滤器列表条目IDE字段）

GAFLIDE位允许为全局中的每个条目配置ID格式（标准ID或扩展ID）接受过滤器列表。对于CAN通道中的每个规则条目，接受过滤器进程将该位与接收到的CAN消息的IDE位进行比较。

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

32.2.21 CFDGAFLMn : Global Acceptance Filter List Mask Registers (n = 1 to 16)

Base address: CANFD = 0x400B_0000

Offset address: 0x1804 + 0x10 × (n - 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	GAFLIDEM	GAFLRTRM	GAFLIFL1	GAFLIDM[28:16]												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GAFLIDM[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
28:0	GAFLIDM[28:0]	Global Acceptance Filter List ID Mask Field Global Acceptance Filter List Mask field bits for ID field	R/W
29	GAFLIFL1	Global Acceptance Filter List Information Label 1 Global Acceptance Filter List information label bit 1	R/W
30	GAFLRTRM	Global Acceptance Filter List Entry RTR Mask 0: RTR bit is not used for ID matching 1: RTR bit is used for ID matching	R/W
31	GAFLIDEM	Global Acceptance Filter List IDE Mask 0: IDE bit is not used for ID matching 1: IDE bit is used for ID matching	R/W

The Global Acceptance Filter List Mask Registers are used to configure the Mask field of each rule for entries in the Global Acceptance Filter List.

GAFLIDM[28:0] bits (Global Acceptance Filter List ID Mask Field)

GAFLIDM[28:0] bits are the filter mask bits for the related bits in the CAN Identifier field of each Global Acceptance Filter List entry.

0	Corresponding STD-ID/EXT-ID bit is not used for ID matching
1	Corresponding STD-ID/EXT-ID bit is used for ID matching

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLIFL1 bit (Global Acceptance Filter List Information Label 1)

The GAFLIFL1 bit allows the configuration of a 2-bit information label to be attached to a received message accepted by the associated entry in the Global Acceptance Filter List. This bit is a MSB bit of an information label.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

This bit is stored in the Information Label Field [1] (CFDRMFDSTSn.RMIFL [1], CFDRFFDSTSn.RFIFL [1], CFDCFFDCSTSn.CFIFL [1]) of the storage location of an incoming message.

Note: This bit is stored in CFDTHLACC1n.TIFL [1] when CFDTHLCCn.THLDGE = 1 is set up using Gateway function.

GAFLRTRM bit (Global Acceptance Filter List Entry RTR Mask)

The GAFLRTRM bit allows the configuration of the RTR mask bit for each entry in the Global Acceptance Filter List.

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

32.2.21 CFDGAFLMn：全局验收过滤器列表屏蔽寄存器（n=1到16）

Base address: CANFD = 0x400B_0000

Offset address: 0x1804 + 0x10 × (n - 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	GAFLIDEM	GAFLRTRM	GAFLIFL1	GAFLIDM[28:16]												
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GAFLIDM[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
28:0	GAFLIDM[28:0]	全局接受过滤器列表ID掩码字段 ID字段的全局接受过滤器列表掩码字段位	R/W
29	GAFLIFL1	全局接受过滤器列表信息标签1 全局接受过滤器列表信息标签位1	R/W
30	GAFLRTRM	全局接受过滤器列表条目RTR掩码 0：RTR位不用于ID匹配1：RTR位用于ID匹配	R/W
31	GAFLIDEM	全局接受过滤器列表IDE掩码 0：IDE位不用于ID匹配1：IDE位用于ID匹配	R/W

全局接受过滤器列表掩码寄存器用于为全局中的条目配置每个规则的掩码字段
接受过滤器列表。

GAFLIDM[28:0]位（全局接受过滤器列表ID掩码字段）

GAFLIDM[28:0]位是每个全局接受过滤器的CAN标识符字段中相关位的过滤器掩码位
列表条目。

0	对应的STD-IDEXT-ID位不用于ID匹配
1	对应的STD-IDEXT-ID位用于ID匹配

当CFDGAFLECTR.AFLDAE位为0时，不要写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

GAFLIFL1位（全局接受过滤器列表信息标签1）

GAFLIFL1位允许将2位信息标签的配置附加到由全局接受过滤器列表中的相关条目接受的接收消息。该位是信息标签的MSB位。

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

该位存储在信息标签字段[1]（CFDRMFDSTSn.RMIFL[1]、CFDRFFDSTSn.RFIFL[1]、CFDCFFDCSTSn.CFIFL[1])传入消息的存储位置。

Note: 当使用网关功能设置CFDTHLCCn.THLDGE=1时，该位存储在CFDTHLACC1n.TIFL[1]中。

GAFLRTRM位（全局接受过滤器列表条目RTR掩码）

GAFLRTRM位允许为全局接受过滤器列表中的每个条目配置RTR掩码位。

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLIDEM bit (Global Acceptance Filter List IDE Mask)

The GAFLIDEM bit allows the configuration of the IDE mask bit for each entry in the Global Acceptance Filter List.

When the IDE mask bit is 0, the ID comparison depends on the received IDE bit.

If the received IDE bit is 0, the STD-ID comparison takes place.

If the received IDE bit is 1, the EXT-ID comparison takes place.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to this bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

32.2.22 CFDGAFLP0n : Global Acceptance Filter List Pointer 0 Registers (n = 1 to 16)

Base address: CANFD = 0x400B_0000

Offset address: 0x1808 + 0x10 × (n - 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	GAFLPTR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GAFL RMV	—	—	GAFLRMDP[4:0]					GAFLI FL0	GAFL SRD2	GAFL SRD1	GAFL SRD0	GAFLDLC[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	GAFLDLC[3:0]	Global Acceptance Filter List DLC Field Minimum number of data bytes in a data frame required for acceptance	R/W
4	GAFLSRD0	Global Acceptance Filter List Select Routing Destination 0 0: Routing target is CFIFO0 1: Routing target is TX Queue 0 instead of CFIFO0	R/W
5	GAFLSRD1	Global Acceptance Filter List Select Routing Destination 1 0: Routing target is CFIFO1 1: Routing target is TX Queue 1 instead of CFIFO1	R/W
6	GAFLSRD2	Global Acceptance Filter List Select Routing Destination 2 0: Routing target is CFIFO2 1: Routing target is TX Queue 2 instead of CFIFO2	R/W
7	GAFLIFL0	Global Acceptance Filter List Information Label 0	R/W
12:8	GAFLRMDP[4:0]	Global Acceptance Filter List RX Message Buffer Direction Pointer RX message buffer number for storage of received messages	R/W
14:13	—	These bits are read as 0. The write value should be 0.	R/W
15	GAFLRMV	Global Acceptance Filter List RX Message Buffer Valid 0: Single message buffer direction pointer is invalid 1: Single message buffer direction pointer is valid	R/W
31:16	GAFLPTR[15:0]	Global Acceptance Filter List Pointer	R/W

The Global Acceptance Filter List Pointer 0 Registers (n = 1 to 16) are used to configure the data length code (DLC), software pointer, single message buffer select, and message buffer direction pointer for each rule entry in the Global Acceptance Filter List.

GAFLDLC[3:0] bits (Global Acceptance Filter List DLC Field)

The GAFLDLC[3:0] bits allow the configuration of a minimum data length code (DLC) value for a message to be accepted by the associated entry in the Global Acceptance Filter List (automatic DLC filter function).

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

GAFLIDEM位（全局接受过滤器列表IDE掩码）

GAFLIDEM位允许为全局接受过滤器列表中的每个条目配置IDE掩码位。

当IDE掩码位为0时，ID比较取决于接收到的IDE位。

如果接收到的IDE位为0，则进行STD-ID比较。

如果接收到的IDE位为1，则进行EXT-ID比较。

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

32.2.22 CFDGAFLP0n：全局验收过滤器列表指针0寄存器（n=1到16）

Base address: CANFD = 0x400B_0000

Offset address: 0x1808 + 0x10 × (n - 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	GAFLPTR[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GAFL RMV	—	—	GAFLRMDP[4:0]					GAFLI FL0	GAFL SRD2	GAFL SRD1	GAFL SRD0	GAFLDLC[3:0]			
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	GAFLDLC[3:0]	全局接受过滤器列表DLC字段 接受所需的数据帧中的最小数据字节数	R/W
4	GAFLSRD0	全局接受过滤器列表选择路由目的地0 0：路由目标是CFIFO01：路由目标是TXQueue0而不是CFIFO0	R/W
5	GAFLSRD1	全局接受过滤器列表选择路由目的地1 0：路由目标是CFIFO11：路由目标是TXQueue1而不是CFIFO1	R/W
6	GAFLSRD2	全局接受过滤器列表选择路由目的地2 0：路由目标是CFIFO21：路由目标是TXQueue2而不是CFIFO2	R/W
7	GAFLIFL0	全局接受过滤器列表信息标签0	R/W
12:8	GAFLRMDP[4:0]	全局接受过滤器列表RX消息缓冲区方向指针 RX消息缓冲区号，用于存储接收到的消息	R/W
14:13	—	这些位被读取为0。写入值应为0。	R/W
15	GAFLRMV	全局接受过滤器列表RX消息缓冲区有效 0：单报文缓冲区方向指针无效1：单报文缓冲区方向指针有效	R/W
31:16	GAFLPTR[15:0]	全局接受过滤器列表指针	R/W

全局接受过滤器列表指针0寄存器（n=1到16）用于为全局接受过滤器列表中的每个规则条目配置数据长度代码(DLC)、软件指针、单个消息缓冲区选择和消息缓冲区方向指针.

GAFLDLC[3:0]位（全局接受过滤器列表DLC字段）

GAFLDLC[3:0]位允许配置消息的最小数据长度代码(DLC)值，以便被全局接受过滤器列表中的相关条目接受（自动DLC过滤器功能）。

DLC filter process is only passed if the DLC value of the message accepted by an entry in the Global Acceptance Filter List is equal to or higher than the DLC value configured for this associated Global Acceptance Filter List entry. Automatic DLC filter function is disabled for the corresponding rule entry when this field is set to 0.

Table 32.4 shows DLC value that can be configured.

Table 32.4 Configuration of DLC value

Format	DLC[3]	DLC[2]	DLC[1]	DLC[0]	Description
CAN and CAN-FD	0	0	0	0	DLC of received message = 0 or more (DLC filter check is disabled)
CAN and CAN-FD	0	0	0	1	DLC of received message = 1 or more
CAN and CAN-FD	0	0	1	0	DLC of received message = 2 or more
CAN and CAN-FD	0	0	1	1	DLC of received message = 3 or more
CAN and CAN-FD	0	1	0	0	DLC of received message = 4 or more
CAN and CAN-FD	0	1	0	1	DLC of received message = 5 or more
CAN and CAN-FD	0	1	1	0	DLC of received message = 6 or more
CAN and CAN-FD	0	1	1	1	DLC of received message = 7 or more
CAN	1	x	x	x	DLC of received message = 8 or more
CAN-FD	1	0	0	0	DLC of received message = 8 or more*1
CAN-FD	1	0	0	1	DLC of received message = 12 or more*1
CAN-FD	1	0	1	0	DLC of received message = 16 or more*1
CAN-FD	1	0	1	1	DLC of received message = 20 or more*1
CAN-FD	1	1	0	0	DLC of received message = 24 or more*1
CAN-FD	1	1	0	1	DLC of received message = 32 or more*1
CAN-FD	1	1	1	0	DLC of received message = 48 or more*1
CAN-FD	1	1	1	1	DLC of received message = 64*1

Note 1. This setting is not available in the classical CAN function.

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLSRD0 bit (Global Acceptance Filter List Select Routing Destination 0)

The GAFLSRD0 bit changes a copy destination to CFIFO0 or TXQ0 by routing.

If this bit is set as 1, the preset value of CFDGAFLP1n.GAFLFDP selects TX Queue.

If this bit is set to 0, the preset value of CFDGAFLP1n.GAFLFDP selects CFIFO0.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to the bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLSRD1 bit (Global Acceptance Filter List Select Routing Destination 1)

The GAFLSRD1 bit changes a copy destination to CFIFO1 or TXQ1 by routing.

If this bit is set to 1, the preset value of CFDGAFLP1n.GAFLFDP selects TXQ1.

If this bit is set to 0, the preset value of CFDGAFLP1n.GAFLFDP selects CFIFO1.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

仅当全局接受过滤器列表中的条目所接受的消息的DLC值等于或高于为此关联的全局接受过滤器列表条目配置的DLC值时，才通过DLC过滤器过程。该字段设置为0时，对应规则条目禁用DLC自动过滤功能。

表32.4显示了可配置的DLC值。

Table 32.4 DLC值的配置

Format	DLC[3]	DLC[2]	DLC[1]	DLC[0]	Description
CAN和CAN FD	0	0	0	0	收到消息的DLC=0或更多（DLC过滤器检查已禁用）
CAN和CAN FD	0	0	0	1	收到消息的DLC=1或更多
CAN和CAN FD	0	0	1	0	收到消息的DLC=2或更多
CAN和CAN FD	0	0	1	1	收到消息的DLC=3或更多
CAN和CAN FD	0	1	0	0	收到消息的DLC=4或更多
CAN和CAN FD	0	1	0	1	收到消息的DLC=5或更多
CAN和CAN FD	0	1	1	0	收到消息的DLC=6或更多
CAN和CAN FD	0	1	1	1	收到消息的DLC=7或更多
CAN	1	x	x	x	收到消息的DLC=8或更多
CAN-FD	1	0	0	0	收到消息的DLC=8个或更多*1
CAN-FD	1	0	0	1	收到消息的DLC=12或更多*1
CAN-FD	1	0	1	0	收到消息的DLC=16或更多*1
CAN-FD	1	0	1	1	收到消息的DLC=20或更多*1
CAN-FD	1	1	0	0	收到消息的DLC=24或更多*1
CAN-FD	1	1	0	1	收到消息的DLC=32或更多*1
CAN-FD	1	1	1	0	收到消息的DLC=48或更多*1
CAN-FD	1	1	1	1	收到消息的DLC=64*1

注1.此设置在经典CAN功能中不可用。

当CFDGAFLECTR.AFLDAE位为0时，不要写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

GAFLSRD0位（全局接受过滤器列表选择路由目的地0）

GAFLSRD0位通过路由将复制目标更改为CFIFO0或TXQ0。

如果该位设置为1，则CFDGAFLP1n.GAFLFDP的预设值选择TXQueue。

如果该位设置为0，则CFDGAFLP1n.GAFLFDP的预设值选择CFIFO0。

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

GAFLSRD1位（全局接受过滤器列表选择路由目的地1）

GAFLSRD1位通过路由将复制目标更改为CFIFO1或TXQ1。

如果该位设置为1，则CFDGAFLP1n.GAFLFDP的预设值选择TXQ1。

如果该位设置为0，则CFDGAFLP1n.GAFLFDP的预设值选择CFIFO1。

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

Only write to the bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLSRD2 bit (Global Acceptance Filter List Select Routing Destination 2)

The GAFLSRD2 bit changes a copy destination to CFIFO2 or TXQ2 by routing.

If this bit is set to 1, the preset value of CFDGAFLP1n.GAFLFDP selects TXQ2.

If this bit is set to 0, the preset value of CFDGAFLP1n.GAFLFDP selects CFIFO2.

Do not write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to the bit when the CAN-FD module is in CH_RESET or CH_HALT mode.

GAFLIFL0 bit (Global Acceptance Filter List Information Label 0)

The GAFLIFL0 bit allows the configuration of a 2-bit information label that can be attached to a received message accepted by the related Global Acceptance Filter List entry. This bit is a LSB bit of an information label.

You cannot write to this bit when CFDGAFLECTR.AFLDAE bit is 0.

Only write to the bit when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

This bit is stored in Information Label Field[0] (CFDRMFDSTSn.RMIFL[0], CFDRFFDSTSn.RFIFL[0],CFDCFFDCSTSn.CFIFL[0]) of the storage location of an incoming message.

This bit is stored in CFDTHLACC1n.TIFL[0] when CFDTHLCCn.THLDGE = 1 is set up using the gateway function.

GAFLRMDP[4:0] bits (Global Acceptance Filter List RX Message Buffer Direction Pointer)

The GAFLRMDP[4:0] bits allow the configuration of a single reception message buffer as the destination target for a received message that passes the acceptance check of the related Global Acceptance Filter List entry. The value entered is the single destination message buffer number.

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

CFDRMNB.NRXMB[7:0] is the value entered in the RX Message Buffer Number Register to configure the number of RX message buffers. The value to be entered in CFDGAFLP0n.GAFLRMDP[6:0] bits should only be between 0x00 and CFDMNB.NMB[7:0] to 1 less.

If CFDRMNB.NRXMB[7:0] = 0x00, the GAFLRMV bit should be configured as 0.

GAFLRMV bit (Global Acceptance Filter List RX Message Buffer Valid)

The GAFLRMV bit allows the enabling or disabling of a single reception message buffer as the target for a received message that passes the acceptance check of the related Global Acceptance Filter List entry.

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

GAFLPTR[15:0] bits (Global Acceptance Filter List Pointer)

The GAFLPTR[15:0] bits allow the configuration of a 16-bit pointer to be attached to a received message accepted by the related Global Acceptance Filter List entry. The pointer is added during message storage in the Message Buffer area and can be used by the application as a support function. The pointer information can be used for example, to support PDU Identifier allocation for the received message in AUTOSAR systems.

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0.

Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

GAFLSRD2位（全局接受过滤器列表选择路由目的地2）

GAFLSRD2位通过路由将复制目标更改为CFIFO2或TXQ2。

如果该位设置为1，则CFDGAFLP1n.GAFLFDP的预设值选择TXQ2。

如果该位设置为0，则CFDGAFLP1n.GAFLFDP的预设值选择CFIFO2。

当CFDGAFLECTR.AFLDAE位为0时，请勿写入该位。

仅当CAN-FD模块处于CH_RESET或CH_HALT模式时写入该位。

GAFLIFL0位（全局接受过滤器列表信息标签0）

GAFLIFL0位允许配置2位信息标签，该标签可以附加到相关全局接受过滤器列表条目接受的接收消息。该位是信息标签的LSB位。

当CFDGAFLECTR.AFLDAE位为0时，您不能写入该位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入该位。

该位存储在信息标签字段[0](CFDRMFDSTSn.RMIFL[0] CFDRFFDSTSn.RFIFL[0] CFDCFFDCSTSn.CFIFL[0])传入消息的存储位置。

当使用网关功能设置CFDTHLCCn.THLDGE=1时，该位存储在CFDTHLACC1n.TIFL[0]中。

GAFLRMDP[4:0]位（全局接受过滤器列表RX消息缓冲区方向指针）

GAFLRMDP[4:0]位允许将单个接收消息缓冲区配置为接收消息的目标目标，该消息通过相关全局接受过滤器列表条目的接受检查。输入的值是单个目标消息缓冲区号。

当CFDGAFLECTR.AFLDAE位为0时，不要写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

CFDRMNB.NRXMB[7:0]是在RX消息缓冲区编号寄存器中输入的值，用于配置RX消息缓冲区的数量。要在CFDGAFLP0n.GAFLRMDP[6:0]位中输入的值只能在0x00和CFDMNB.NMB[7:0]之间减去1。

如果CFDRMNB.NRXMB[7:0]=0x00，则GAFLRMV位应配置为0。

GAFLRMV位（全局接受过滤器列表RX消息缓冲区有效）

GAFLRMV位允许启用或禁用单个接收消息缓冲区作为通过相关全局接受过滤器列表条目的接受检查的接收消息的目标。

当CFDGAFLECTR.AFLDAE位为0时，不要写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

GAFLPTR[15:0]位（全局接受过滤器列表指针）

GAFLPTR[15:0]位允许配置一个16位指针，以附加到相关全局接受过滤器列表条目所接受的接收消息。该指针是在消息缓冲区中的消息存储期间添加的，并且可以由应用程序用作支持功能。例如，指针信息可用于支持AUTOSAR系统中接收到的消息的PDU标识符分配。

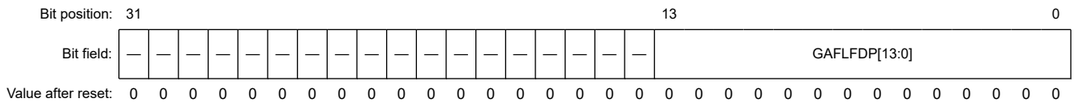
当CFDGAFLECTR.AFLDAE位为0时，不要写入这些位。

仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

32.2.23 CFDGAFLP1n : Global Acceptance Filter List Pointer 1 Registers (n = 1 to 16)

Base address: CANFD = 0x400B_0000

Offset address: 0x180C + 0x10 × (n - 1)



Bit	Symbol	Function	R/W
13:0	GAFLFDP[13:0]	Global Acceptance Filter List FIFO Direction Pointer FIFO direction pointer bits for received message storage	R/W
31:14	—	These bits are read as 0. The write value should be 0.	R/W

The Global Acceptance Filter List Pointer 1 registers are used to configure the FIFO direction pointer fields in each Rule Entry of the Global Acceptance Filter List.

GAFLFDP[13:0] bits (Global Acceptance Filter List FIFO Direction Pointer)

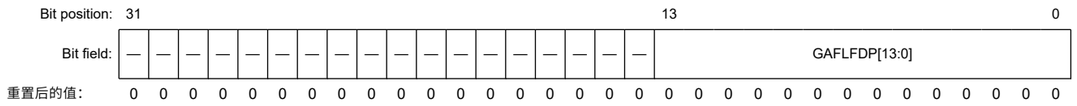
The GAFLFDP[13:0] bits allow the configuration of FIFO buffers as the target for a received message that passes the acceptance check of the related Global Acceptance Filter List entry. Each bit of the CFDGAFLP1n.GAFLFDP[13:0] is configured as dedicated FIFO.

Bit	Value (binary)	Function
0	0	Disable RX FIFO 0 as target for reception
	1	Enable RX FIFO 0 as target for reception
1	0	Disable RX FIFO 1 as target for reception
	1	Enable RX FIFO 1 as target for reception
2	0	Disable RX FIFO 2 as target for reception
	1	Enable RX FIFO 2 as target for reception
3	0	Disable RX FIFO 3 as target for reception
	1	Enable RX FIFO 3 as target for reception
4	0	Disable RX FIFO 4 as target for reception
	1	Enable RX FIFO 4 as target for reception
5	0	Disable RX FIFO 5 as target for reception
	1	Enable RX FIFO 5 as target for reception
6	0	Disable RX FIFO 6 as target for reception
	1	Enable RX FIFO 6 as target for reception
7	0	Disable RX FIFO 7 as target for reception
	1	Enable RX FIFO 7 as target for reception
8	0	Disable Common FIFO 0 and Channel 0 TX Queue 0 as target for reception
	1	GAFLSRD0 = 0: Enable Common FIFO 0 as target for reception GAFLSRD0 = 1: Enable Channel 0 TX Queue 0 as target for reception
9	0	Disable Common FIFO 1 and Channel 0 TX Queue 1 as target for reception
	1	GAFLSRD1 = 0: Enable Common FIFO 1 as target for reception GAFLSRD1 = 1: Enable Channel 0 TX Queue 1 as target for reception
10	0	Disable Common FIFO 2 and Channel 0 TX Queue 2 as target for reception
	1	GAFLSRD2 = 0: Enable Common FIFO 2 as target for reception GAFLSRD2 = 1: Enable Channel 0 TX Queue 2 as target for reception

32.2.23 CFDGAFLP1n：全局验收过滤器列表指针1寄存器（n=1到16）

Base address: CANFD = 0x400B_0000

Offset address: 0x180C + 0x10 × (n - 1)



Bit	Symbol	Function	R/W
13:0	GAFLFDP[13:0]	全局验收过滤器列表FIFO方向指针 用于接收消息存储的FIFO方向指针位	R/W
31:14	—	这些位被读取为0。写入值应为0。	R/W

全局接受过滤器列表指针1寄存器用于配置每个规则中的FIFO方向指针字段
全局接受过滤器列表的条目。

GAFLFDP[13:0]位（全局接受过滤器列表FIFO方向指针）

GAFLFDP[13:0]位允许将FIFO缓冲区配置为接收消息的目标，该消息通过相关全局接受过滤器列表条目的接受检查。CFDGAFLP1n.GAFLFDP[13:0]的每一位都配置为专用FIFO。

Bit	Value (binary)	Function
0	0	禁用RXFIFO0作为接收目标
	1	启用RXFIFO0作为接收目标
1	0	禁用RXFIFO1作为接收目标
	1	启用RXFIFO1作为接收目标
2	0	禁用RXFIFO2作为接收目标
	1	启用RXFIFO2作为接收目标
3	0	禁用RXFIFO3作为接收目标
	1	启用RXFIFO3作为接收目标
4	0	禁用RXFIFO4作为接收目标
	1	启用RXFIFO4作为接收目标
5	0	禁用RXFIFO5作为接收目标
	1	启用RXFIFO5作为接收目标
6	0	禁用RXFIFO6作为接收目标
	1	启用RXFIFO6作为接收目标
7	0	禁用RXFIFO7作为接收目标
	1	启用RXFIFO7作为接收目标
8	0	禁用CommonFIFO0和Channel0TXQueue0作为接收目标
	1	GAFLSRD0=0：启用CommonFIFO0作为接收目标 GAFLSRD0=1：启用通道0TX队列0作为接收目标
9	0	禁用CommonFIFO1和Channel0TXQueue1作为接收目标
	1	GAFLSRD1=0：启用CommonFIFO1作为接收目标 GAFLSRD1=1：启用通道0TX队列1作为接收目标
10	0	禁用CommonFIFO2和Channel0TXQueue2作为接收目标
	1	GAFLSRD2=0：启用CommonFIFO2作为接收目标 GAFLSRD2=1：启用通道0TX队列2作为接收目标

RA生态工作室

Bit	Value (binary)	Function
11	0	Disable Common FIFO 3 and Channel 1 TX Queue 0 as target for reception
	1	GAFLSRD0 = 0: Enable Common FIFO 3 as target for reception GAFLSRD0 = 1: Enable Channel 1 TX Queue 0 as target for reception
12	0	Disable Common FIFO 4 and Channel 1 TX Queue 1 as target for reception
	1	GAFLSRD1 = 0: Enable Common FIFO 4 as target for reception GAFLSRD1 = 1: Enable Channel 1 TX Queue 1 as target for reception
13	0	Disable Common FIFO 5 and Channel 1 TX Queue 2 as target for reception
	1	GAFLSRD2 = 0: Enable Common FIFO 5 as target for reception GAFLSRD2 = 1: Enable Channel 1 TX Queue 2 as target for reception

Do not write to these bits when CFDGAFLECTR.AFLDAE bit is 0. Only write to these bits when the related CAN-FD channel is in CH_RESET or CH_HALT mode.

For storage in TX queue, TX queue buffers of a target that is in GW mode is possible.

For storage in TX Queue, when these TX Queue buffers of a target are in GW mode, it can do.

Only one of the following configurations is valid:

- Up to 8 destination FIFO buffers
- 7 destination FIFO buffers plus one RX message buffer
- 8 destination TX queue buffers
- 7 destination TX queue buffers plus one RX message buffer
- A maximum of 8 destinations in all at FIFO buffer and TX queue buffer.

32.2.24 CFDRMNB : RX Message Buffer Number Register

Base address: CANFD = 0x400B_0000

Offset address: 0x00AC

Bit position:	31																				10	8	7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RMPLS[2:0]		NRXMB[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	NRXMB[7:0]	Number of RX Message Buffers	R/W
10:8	RMPLS[2:0]*1	Reception Message Buffer Payload Data Size 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes	R/W
31:11	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. These bits are not available in the classical CAN function.

The RX Message Buffer Number register is used to configure the total number of RX message buffers allocated to all channels.

NRXMB[7:0] bits (Number of RX Message Buffers)

The NRXMB[7:0] bits are used to configure the number of RX message buffers.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

Bit	Value (binary)	Function
11	0	禁用CommonFIFO3和Channel1TXQueue0作为接收目标
	1	GAFLSRD0=0：启用CommonFIFO3作为接收目标 GAFLSRD0=1：启用通道1TX队列0作为接收目标
12	0	禁用CommonFIFO4和Channel1TXQueue1作为接收目标
	1	GAFLSRD1=0：启用CommonFIFO4作为接收目标 GAFLSRD1=1：启用通道1TX队列1作为接收目标
13	0	禁用CommonFIFO5和Channel1TXQueue2作为接收目标
	1	GAFLSRD2=0：启用CommonFIFO5作为接收目标 GAFLSRD2=1：启用通道1TX队列2作为接收目标

当CFDGAFLECTR.AFLDAE位为0时不要写入这些位。仅当相关CAN-FD通道处于CH_RESET或CH_HALT模式时才写入这些位。

对于TX队列中的存储，可以使用处于GW模式的目标的TX队列缓冲区。

对于TXQueue中的存储，当一个目标的这些TXQueue缓冲区处于GW模式时，它可以做到。

只有以下配置之一有效：

- ●多达8个目标FIFO缓冲区
- ●7个目标FIFO缓冲区和1个RX消息缓冲区
- ●8个目标TX队列缓冲区
- ●7个目标TX队列缓冲区和1个RX消息缓冲区
- ●FIFO缓冲区和TX队列缓冲区总共最多8个目的地。

32.2.24 CFDRMNB:RX消息缓冲区编号寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x00AC

Bit position:	31																				10	8	7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RMPLS[2:0]		NRXMB[7:0]							
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	NRXMB[7:0]	RX消息缓冲区的数量	R/W
10:8	RMPLS[2:0]*1	接收消息缓冲区有效负载数据大小 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes	R/W
31:11	—	这些位被读取为0。写入值应为0。	R/W

注1.这些位在经典CAN功能中不可用。

RX消息缓冲区编号寄存器用于配置分配给所有通道的RX消息缓冲区的总数。

NRXMB[7:0]位（RX消息缓冲区的数量）

NRXMB[7:0]位用于配置RX消息缓冲区的数量。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

Enter only values between 0 and 32 inclusive, with 0x00 indicating that no RX message buffer is allocated.

RMPLS[2:0] bits (Reception Message Buffer Payload Data Size)

The RMPLS[2:0] bits are used to configure the message buffer payload data size.

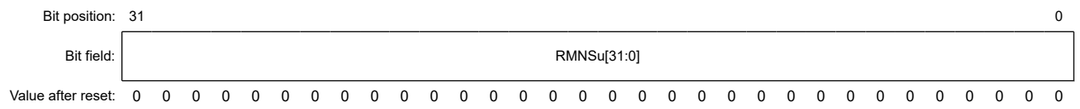
Only write to these bits when the CAN-FD module is in GL_RESET mode.

Note: These bits are not available in the classical CAN function.

32.2.25 CFDRMNDn : RX Message Buffer New Data Register n (n = 0)

Base address: CANFD = 0x400B_0000

Offset address: 0x00B0



Bit	Symbol	Function	R/W
31:0	RMNSu[31:0]	RX Message Buffer New Data Status 0: New data not stored in corresponding RX message buffer 1: New data stored in corresponding RX message buffer	R/W

The RX Message Buffer New Data Status Register (n = 0) specifies the new data storage status of the RX message buffers.

RMNSu[31:0] bits (RX Message Buffer New Data Status)

The RMNSu[31:0] bits indicate the status of new data for the corresponding RX message buffer. RMNS bit [0] corresponds to RX message buffer [0] and so on.

The bit position of CFDRMND corresponds to the buffer number of RXMB.

Do not write to these bits when the CAN-FD module is in GL_RESET or GL_SLEEP mode. Writing 1 has no effect.

These bits cannot be cleared when message storage in the corresponding RX message buffer is in progress.
Do not use the bit clear instruction to clear these bits. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

These bits are set automatically when storage of new messages are in the corresponding RX message buffer. These bits are cleared by writing 0. These bits are cleared automatically when the CAN-FD module is in GL_RESET mode.

When CFDRMNB.RMPLS = 000b (maximum 8 bytes payload), the duration of message storage is 6 PCLKB cycles.

When CFDRMNB.RMPLS > 000b, the duration of message storage is 6 PCLKB cycles + 1 for each 4 bytes (maximum of 20 PCLKB cycles for 64 bytes).

Note: This feature is not available in the classical CAN function.

仅输入介于0和32之间的值，其中0x00表示未分配RX消息缓冲区。

RMPLS[2:0]位（接收消息缓冲区有效负载数据大小）

RMPLS[2:0]位用于配置消息缓冲区有效负载数据大小。

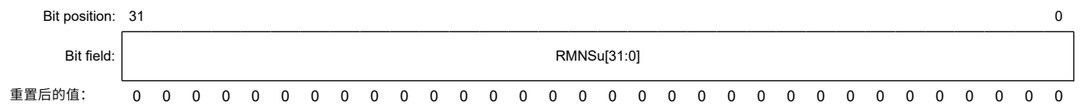
仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

Note: 这些位在经典CAN功能中不可用。

32.2.25 CFDRMNDn：RX消息缓冲区新数据寄存器n(n=0)

Base address: CANFD = 0x400B_0000

Offset address: 0x00B0



Bit	Symbol	Function	R/W
31:0	RMNSu[31:0]	RX消息缓冲区新数据状态 0：新数据未存储在相应的RX报文缓冲区中1：新数据存储在相应的RX报文缓冲区中	R/W

RX报文缓冲区新数据状态寄存器(n=0)指定RX报文缓冲区的新数据存储状态。

RMNSu[31:0]位（RX报文缓冲区新数据状态）

RMNSu[31:0]位指示相应RX消息缓冲区的新数据状态。RMNS位[0]对应于RX消息缓冲区[0]等等。

CFDRMND的位位置对应于RXMB的缓冲区号。

当CAN-FD模块处于GL_RESET或GL_SLEEP模式时，请勿写入这些位。写1无效。

当相应RX消息缓冲区中的消息存储正在进行时，这些位不能被清除。
不要使用位清除指令来清除这些位。使用MOV指令确保只清除指定位。其他位保持1。

当新消息存储在相应的RX消息缓冲区中时，这些位会自动设置。这些位通过写入0清除。当CAN-FD模块处于GL_RESET模式时，这些位会自动清除。

当CFDRMNB.RMPLS=000b（最大8字节有效载荷）时，消息存储的持续时间为6个PCLKB周期。

当CFDRMNB.RMPLS>000b时，消息存储的持续时间为6个PCLKB周期+每4个字节1个（64个字节最多20个PCLKB周期）。

Note: 此功能在经典CAN功能中不可用。

32.2.26 CFDRFCCn : RX FIFO Configuration/Control Registers n (n = 0 to 7)

Base address: CANFD = 0x400B_0000

Offset address: 0x00C0 + 0x04 × n

16	RFFIE	RXFIFO完全中断使能 0：禁用FIFO中断生成1：启用FIFO中 断生成	R/W

Bit	Symbol	Function	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. These bits are not available in the classical CAN function.

The RX FIFO Configuration/Control Registers (n = 0 to 7) are used to configure and control the eight RX FIFOs.

RFE bit (RX FIFO Enable)

The RFE bit enables the FIFO. When this bit is set to 0, the RX FIFO is cleared to empty.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

This bit can only be set if the configured FIFO depth is greater than 0x000 (CFDRFCCn.RFDC > 0x000).

Set the RFE bit with a separate write access to the CFDRFCCn register, after all the other bits in the CFDRFCCn register are set.

This bit is cleared automatically when the CAN-FD module is in GL_RESET mode.

RFIE bit (RX FIFO Interrupt Enable)

The RFIE bit enables generation of the FIFO interrupt.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

RFPLS[2:0] bits (Rx FIFO Payload Data Size Configuration)

The RFPLS[2:0] bits define the message data payload allocation in the RAM.

This is the maximum number of bytes which can be received by this FIFO.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

Note: These bits are not available in the classical CAN function.

RFDC[2:0] bits (RX FIFO Depth Configuration)

The RFDC[2:0] bits select the depth of the FIFO in terms of the number of messages. If the FIFO depth is configured to 0 messages, the FIFO cannot be used.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

RFIM bit (RX FIFO Interrupt Mode)

The RFIM bit selects the interrupt generation condition for the FIFO.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

RFIGCV[2:0] bits (RX FIFO Interrupt Generation Counter Value)

The RFIGCV[2:0] bits select the counter value of the FIFO for generation of FIFO interrupts. These values represent fractions of the FIFO depth for which an interrupt is generated.

Do not write to these bits when the CAN-FD module is in GL_SLEEP mode.

The setting of the RFIGCV[2:0] bits should be synchronized with the RFDC[2:0] bits.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

RFFIE bit (RX FIFO Full Interrupt Enable)

The RFFIE bit enables generation of the RXFIFO full interrupt. Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

The following content shows examples of interruptions:

- Interruption output in number of arbitrary stages (CFDRFCCn.RFIGCV)
- Interruption output in FIFO full state.

Note: Management of the receiving data of FIFO can be performed by these notices of interruption.

Bit	Symbol	Function	R/W
31:17	—	这些位被读取为0。写入值应为0。	R/W

注1.这些位在经典CAN功能中不可用。

RXFIFO配置控制寄存器（n=0到7）用于配置和控制8个RXFIFO。

RFE bit (RX FIFO Enable)

RFE位使能FIFO。当该位设置为0时，RXFIFO被清空。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式时写入该位。

仅当配置的FIFO深度大于0x000(CFDRFCCn.RFDC>0x000)时才能设置该位。

在设置CFDRFCCn寄存器中的所有其他位之后，通过对CFDRFCCn寄存器的单独写访问来设置RFE位。

当CAN-FD模块处于GL_RESET模式时，该位会自动清零。

RFIE位（RXFIFO中断允许）

RFIE位使能FIFO中断的产生。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

RFPLS[2:0]位（RxFIFO有效负载数据大小配置）

RFPLS[2:0]位定义RAM中的消息数据有效负载分配。

这是该FIFO可以接收的最大字节数。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

Note: 这些位在经典CAN功能中不可用。

RFDC[2:0]位（RXFIFO深度配置）

RFDC[2:0]位根据消息数量选择FIFO的深度。如果FIFO深度配置为0消息，则无法使用FIFO。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

RFIM位（RXFIFO中断模式）

RFIM位选择FIFO的中断产生条件。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

仅当CAN-FD模块处于GL_RESET模式时写入该位。

RFIGCV[2:0]位（RXFIFO中断生成计数器值）

RFIGCV[2:0]位选择FIFO的计数器值以生成FIFO中断。这些值代表产生中断的FIFO深度的分数。

当CAN-FD模块处于GL_SLEEP模式时，不要写入这些位。

RFIGCV[2:0]位的设置应与RFDC[2:0]位同步。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

RFFIE位（RXFIFO完全中断使能）

RFFIE位使能RXFIFO满中断的产生。当CAN-FD模块处于工作状态时，请勿写入该位
GL_SLEEP mode.

以下内容显示了中断的示例：

●任意级数的中断输出(CFDRFCCn.RFIGCV)

●FIFO满状态下的中断输出。

Note: 可以通过这些中断通知来管理FIFO的接收数据。

32.2.27 CFDRFSTSn : RX FIFO Status Registers n (n = 0 to 7)

Base address: CANFD = 0x400B_0000

Offset address: 0x00E0 + 0x04 × n

7:4	—	These bits are read as 0. The write value should be 0.	R/W
15:8	RFMC[7:0]	RX FIFO Message Count Number of messages stored in FIFO	R
16	RFFIF	RX FIFO Full Interrupt Flag 0: FIFO full interrupt condition not satisfied 1: FIFO full interrupt condition satisfied	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

The RX FIFO Status Registers (n = 0 to 7) show the status of messages stored in the corresponding FIFO buffers.

RFEMP bit (RX FIFO Empty)

The RFEMP bit is set automatically when:

- The RFMC bit is 0
- RX FIFO is disabled by setting the CFDRFCCn.RFE bit to is 0
- The CAN-FD module is in GL_RESET mode.

The RFEMP bit is cleared automatically when the first message is stored in the RX FIFO buffer.

RFFLL bit (RX FIFO Full)

The RFFLL bit is set automatically when the number of CAN messages stored in the FIFO buffer matches the configured FIFO depth.

The RFFLL is cleared automatically when:

- The number of CAN messages stored in the FIFO buffer is less than the configured FIFO depth
- RX FIFO is disabled by setting the CFDRFCCn.RFE bit to 0
- The CAN-FD module is in GL_RESET mode.

32.2.27 CDFRFTSn:RXFIFO状态寄存器n(n=0到7)

Base address: CANFD = 0x400B_0000

Offset address: 0x00E0 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFFIF
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RFMC[7:0]								—	—	—	—	RFIF	RFML T	RFFLL	RFEM P
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	RFEMP	RX FIFO Empty 0：FIFO非空1：FIF O空	R
1	RFFLL	RX FIFO Full 0：FIFO未满1 ：FIFO已满	R
2	RFMLT	RXFIFO消息丢失 0：FIFO中没有消息丢失1：FIFO消息丢失	R/W
3	RFIF	RXFIFO中断标志 0：不满足FIFO中断条件1：满足FIFO中断条件	R/W
7:4	—	这些位被读取为0。写入值应为0。	R/W
15:8	RFMC[7:0]	RXFIFO消息计数 存储在FIFO中的消息数	R
16	RFFIF	RXFIFO满中断标志 0：不满足FIFO满中断条件1：满足FIFO满中断条件	R/W
31:17	—	这些位被读取为0。写入值应为0。	R/W

RXFIFO状态寄存器（n=0到7）显示存储在相应FIFO缓冲区中的消息的状态。

RFEMP bit (RX FIFO Empty)

RFEMP位在以下情况下自动设置：

- RFMC位为0
- 通过将CFDRFCCn.RFE位设置为0来禁用RXFIFO
- CAN-FD模块处于GL_RESET模式。

当第一条消息存储在RXFIFO缓冲区中时，RFEMP位会自动清零。

RFFLL bit (RX FIFO Full)

当存储在FIFO缓冲区中的CAN报文数量与配置的匹配时，RFFLL位会自动设置FIFO depth.

RFFLL在以下情况下自动清除：

- FIFO缓冲区中存储的CAN报文数小于配置的FIFO深度
- 通过将CFDRFCCn.RFE位设置为0来禁用RXFIFO
- CAN-FD模块处于GL_RESET模式。

RA生态工作室

RFMLT bit (RX FIFO Message Lost)

Only write to the RFMLT bit when CAN-FD module is in GL_HALT or GL_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically whenever a message is lost due to attempted storage when the FIFO buffer is already full. If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode.

RFIF bit (RX FIFO Interrupt Flag)

The RFIF bit is set automatically when the configured interrupt condition is satisfied. This bit is not automatically cleared when the RX FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then this bit is set.

The bit is cleared by writing 0 to it. The bit is also cleared when CAN-FD module is in GL_RESET mode.

RFMC[7:0] bits (RX FIFO Message Count)

The RFMC[7:0] bits indicate the number of CAN messages stored in the RX FIFO buffer that can be read by the CPU.

These bits are cleared automatically when the FIFO is disabled and when the CAN-FD module is in GL_RESET mode.

RFFIF bit (RX FIFO Full Interrupt Flag)

The RFFIF bit is not cleared automatically when the RX FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the FIFO full interrupt condition is satisfied. If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The bit is cleared by writing 0 to it.

The bit is also cleared when the CAN-FD module is in GL_RESET mode.

32.2.28 CFDRFPCTRn : RX FIFO Pointer Control Registers n (n = 0 to 7)

Base address: CANFD = 0x400B_0000

Offset address: 0x0100 + 0x04 × n

Bit position:	31	…	7	…	0
Bit field:	—	…	—	RFPC[7:0]	
Value after reset:	0	…	0	0	0

Bit	Symbol	Function	R/W
7:0	RFPC[7:0]	RX FIFO Pointer Control Increments read pointer of the corresponding RX FIFO buffers	W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The RX FIFO Pointer Control Registers (n = 0 to 7) can be used to increment the read pointer of the corresponding RX FIFO buffers.

RFMLT位（RXFIFO消息丢失）

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式时写入RFMLT位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

当FIFO缓冲区已满时，每当由于尝试存储而导致消息丢失时，该位会自动设置。如果来自CAN通道的设置与写访问清除同时发生，则该位被设置。

该位被清除：

●写入0

●CAN-FD模块处于GL_RESET模式时。

RFIF位（RXFIFO中断标志　　）

当配置的中断条件满足时，RFIF位自动置位。当RXFIFO缓冲器被禁用时，该位不会自动清除。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式时写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

如果来自CAN通道的设置与写访问清除同时发生，则设置该位。

该位通过向其写入0来清除。当CAN-FD模块处于GL_RESET模式时，该位也会被清除。

RFMC[7:0]位（RXFIFO消息计数）

RFMC[7:0]位指示存储在RXFIFO缓冲区中可供CPU读取的CAN报文数量。

当FIFO被禁用并且CAN-FD模块处于GL_RESET模式时，这些位会自动清除。

RFFIF位（RXFIFO满中断标志）

当RXFIFO缓冲区被禁用时，RFFIF位不会自动清除。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式时写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

当满足FIFO满中断条件时，该位自动置位。如果来自CAN通道的设置与写访问清除同时发生，则该位被设置。

该位通过向其写入0来清除。

当CAN-FD模块处于GL_RESET模式时，该位也会被清除。

32.2.28 CFDRFPCTRn：RXFIFO指针控制寄存器n（n=0到7）

Base address: CANFD = 0x400B_0000

Offset address: 0x0100 + 0x04 × n

Bit position:	31	…	7	…	0
Bit field:	—	…	—	RFPC[7:0]	
重置后的值：	0	…	0	0	0

Bit	Symbol	Function	R/W
7:0	RFPC[7:0]	RXFIFO指针控制 增加相应RXFIFO缓冲区的读指针	W
31:8	—	这些位被读取为0。写入值应为0。	R/W

RXFIFO指针控制寄存器（n=0到7）可用于递增相应RX的读指针
FIFO buffers.

RFPC bits (RX FIFO Pointer Control)

When the value 0xFF is written to the RFPC bits, the pointer of the corresponding RX FIFO buffer is moved to the next FIFO entry. Only write 0xFF to these registers when the corresponding RX FIFO buffer is enabled and not empty.

The read value from these bits is always 0x00.

Only write to these bits when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

Do not write to the RX FIFO Pointer Control registers when DMA is enabled.

32.2.29 CFDCFCCn : Common FIFO Configuration/Control Registers n (n = 0 to 5)

Base address: CANFD = 0x400B_0000

Offset address: 0x0120 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CFITT[7:0]								CFDC[2:0]			CFTML[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

11	CFITR	Common FIFO Interval Timer Resolution 0: Reference clock period × 1 1: Reference clock period × 10	R/W

RFPC位（RXFIFO指针控制）

当值0xFF写入RFPC位时，相应的RXFIFO缓冲区的指针移动到下一个
先进先出入口。仅当相应的RXFIFO缓冲区启用且不为空时，才将0xFF写入这些寄存器。

从这些位读取的值始终为0x00。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式时才写入这些位。

启用DMA时不要写入RXFIFO指针控制寄存器。

32.2.29 CFDCFCCn：通用FIFO配置控制寄存器n（n=0到5）

Base address: CANFD = 0x400B_0000

Offset address: 0x0120 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31:24	CFITT[7:0]	Common FIFO Interval Transmission Time Delay the start of transmission from the FIFO if configured in TX or GW mode, delay is a multiple of basic Interval Timer Clock Source unit	R/W

Note 1. These bits are not available in the classical CAN function.

CFE bit (Common FIFO Enable)

The CFE bit enables the FIFO when set. FIFO is disabled when this bit is cleared.

This bit can also be used, by clearing it, to abort transmission from Common FIFO when configured in TX mode or GW mode, or to stop reception into the Common FIFO in RX mode.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFOs configured as TX or GW FIFO.

This bit can only be set if the configured FIFO depth is greater than 0 (CFDC bit > 0).

Set the CFE bit with a separate write access to the CFDCFCCn register, after all the other bits in this register are set.

This bit is cleared automatically when the CAN-FD module is in GL_RESET mode.

This bit is also cleared automatically when the related channel is in CH_RESET mode if the FIFO is configured in TX or GW mode.

Bit	Symbol	Function	R/W
12	CFIM	通用FIFO中断模式 0：RXFIFO模式：CommonFIFO计数器从较低值到达CFIGCV值时产生RX中断 TXFIFO模式：CommonFIFO成功发送最后一条报文时产生TX中断GWFIFO模式： 对于RX中断标志 ：当FIFO计数器递增并达到CFIGCV中配置的值时产生中断 对于TX中断标志 ： FIFO成功发送最后一条报文时产生中断 1：RXFIFO模式：在每个接收到的消息存储结束时产生RX中断TXFIFO模式：在每个成功发送的消息产生中断 GW FIFO mode: 对于RX中断标志 ：消息存储在FIFO中时产生的中断 对于TX中断标志 ： 当消息从FIFO成功传输时产生中断	R/W

31:24	CFITT[7:0]	公共FIFO间隔传输时间 如果配置为TX或GW模式，则延迟从FIFO开始传输，延迟是基本间隔定时器时钟源单元的倍数	R/W

注1.这些位在经典CAN功能中不可用。

CFE bit (Common FIFO Enable)

CFE位在设置时启用FIFO。当该位清零时，FIFO被禁用。

当配置为TX模式或GW模式时，通过清零该位也可用于中止来自CommonFIFO的传输，或在RX模式下停止接收到CommonFIFO。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式且相关CAN-FD通道未处于配置为TX或GWFIFO的FIFO的CH_RESET模式时写入该位。

仅当配置的FIFO深度大于0（CFDC位>0）时，才能设置该位。

在设置该寄存器中的所有其他位之后，通过对CFDCFCCn寄存器的单独写访问来设置CFE位。

当CAN-FD模块处于GL_RESET模式时，该位会自动清零。

如果FIFO配置为TX或
GW mode.

CFRXIE bit (Common FIFO RX Interrupt Enable)

The CFRXIE bit enables generation of FIFO interrupts when the interrupt flag is set after reception of a frame in the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CFTXIE bit (Common FIFO TX Interrupt Enable)

The CFTXIE bit enables generation of common FIFO interrupts when the interrupt flag is set after transmission of a frame from the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CFPLS[2:0] bits (Common FIFO Payload Data Size Configuration)

The CFPLS[2:0] bits define the message data payload allocation in the RAM. This is the maximum number of bytes which can be received or transmitted by the FIFO buffer.

For details, see section 32.6. FIFO Buffers and Normal Message Buffer Configuration.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

Note: These bits are not available in the classical CAN function.

CFM[1:0] bits (Common FIFO Mode)

The CFM[1:0] bits select the mode of the FIFO. When a hardware reset is applied, all the Common FIFO buffers are configured in RX FIFO mode. Do not configure these bits to 11b.

Do not write to these bits in GL_OPERATION or GL_SLEEP mode.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

CFITSS bit (Common FIFO Interval Timer Source Select)

The CFITSS bit selects the basic clock source for the Interval Transmission Timer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode. In addition, do not write to this bit when the CFE bit is set to 1.

Do not write 1 to this bit when CAN-FD communication is used.*1

Note: The bit time clock can vary depending on the nominal and data rate bit configuration.

Note 1. This feature is not available in the classical CAN function.

CFITR bit (Common FIFO Interval Timer Resolution)

The CFITR bit selects the resolution of the reference clock for the Interval Transmission Timer (peripheral clock is the source for the reference clock).

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode. Also, do not write to this bit when the CFE bit is set to 1.

CFIM bit (Common FIFO Interrupt Mode)

The CFIM bit selects the interrupt generation condition for the FIFO buffer.

Do not write to this bit in GL_SLEEP mode.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

CFIGCV[2:0] bits (Common FIFO Interrupt Generation Counter Value)

The CFIGCV[2:0] bits select the message counter value for the generation of FIFO interrupts. These values represent fractions of the FIFO depth at which the interrupt is to be generated.

Do not write to these bits when the CAN-FD module is in GL_SLEEP mode.

The setting of these bits should be synchronized with the CFDC[2:0] bits.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

CFRXIE位（通用FIFORX中断使能）

当在相应的FIFO缓冲区中接收到帧后设置中断标志时，CFRXIE位允许生成FIFO中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

CFTXIE位（通用FIFOTX中断使能）

当从相应的FIFO缓冲区传输帧后设置中断标志时，CFTXIE位使能通用FIFO中断的生成。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

CFPLS[2:0]位（通用FIFO有效负载数据大小配置）

CFPLS[2:0]位定义RAM中的消息数据有效负载分配。这是FIFO缓冲区可以接收或发送的最大字节数。

有关详细信息，请参阅第32.6节。FIFO缓冲区和正常消息缓冲区配置。

仅当CAN-FD模块处于GL_RESET模式时写入该位。

Note: 这些位在经典CAN功能中不可用。

CFM[1:0] bits (Common FIFO Mode)

CFM[1:0]位选择FIFO的模式。应用硬件复位时，所有通用FIFO缓冲区都配置为RXFIFO模式。不要将这些位配置为11b。

不要在GL_OPERATION或GL_SLEEP模式下写入这些位。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

CFITSS位（通用FIFO间隔定时器源选择）

CFITSS位选择间隔传输定时器的基本时钟源。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。此外，当CFE位设置为1时，请勿写入该位。

使用CAN-FD通信时，请勿向该位写入1。*1

Note: 位时钟可以根据标称和数据速率位配置而变化。

注1.此功能在经典CAN功能中不可用。

CFITR位（通用FIFO间隔定时器分辨率）

CFITR位为间隔传输定时器选择参考时钟的分辨率（外围时钟是参考时钟的来源）。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。此外，当CFE位设置为1时，请勿写入该位。

CFIM位（通用FIFO中断模式）

CFIM位选择FIFO缓冲器的中断产生条件。

不要在GL_SLEEP模式下写入该位。

仅当CAN-FD模块处于GL_RESET模式时写入该位。

CFIGCV[2:0]位（通用FIFO中断生成计数器值）

CFIGCV[2:0]位选择用于生成FIFO中断的消息计数器值。这些值表示要生成中断的FIFO深度的分数。

当CAN-FD模块处于GL_SLEEP模式时，不要写入这些位。

这些位的设置应与CFDC[2:0]位同步。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

CFTML[4:0] bits (Common FIFO TX Message Buffer Link)

The CFTML[4:0] bits select the normal transmit message buffer position where the TX or GW FIFO is linked to, for transmission scanning.

Do not write to these bits in GL_OPERATION or GL_SLEEP mode.

Only write to this bit when the CAN-FD module is in GL_RESET mode.

CFDC[2:0] bits (Common FIFO Depth Configuration)

The CFDC[2:0] bits select the depth of the common FIFO in terms of the number of messages. If the FIFO depth is configured to 0 message, the FIFO cannot be used.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

CFITT[7:0] bits (Common FIFO Interval Transmission Time)

The CFITT[7:0] bits select the delay in the start of transmission for all messages transmitted from this FIFO buffer when configured in TX or GW mode. The delay is a multiple of the basic interval timer clock source period (reference clock × 1, reference clock × 10, or bit time clock of the related CAN channel).

Do not write to these bits when the CAN-FD module is in GL_SLEEP mode.

Do not write to these bits when the CFE bit is set to 1.

When CFDGCFG.ITRCP[15:0] = 0x0000, set the CFITT[7:0] bits to 0x0000.

32.2.30 CFDCFCCEn : Common FIFO Configuration/Control Enhancement Registers n (n = 0 to 5)

Base address: CANFD = 0x400B_0000

Offset address: 0x0180 + 0x04 × n

2	CFOFTXIE	Common FIFO One Frame Transmission Interrupt Enable 0: One Frame TX interrupt generation disabled 1: One Frame TX interrupt generation enabled	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	CFMOWM	Common FIFO Message Overwrite Mode 0: Message discarded mode 1: Message overwrite mode	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	CFBME	Common FIFO Buffering Mode Enable 0: Transmission from Common FIFO 1: Transmission halt from Common FIFO	R/W

CFTML[4:0]位（通用FIFOTX报文缓冲区链接）

CFTML[4:0]位选择TX或GWFIFO链接到的正常发送消息缓冲区位置，用于发送扫描。

不要在GL_OPERATION或GL_SLEEP模式下写入这些位。

仅当CAN-FD模块处于GL_RESET模式时写入该位。

CFDC[2:0]位（通用FIFO深度配置）

CFDC[2:0]位根据消息数量选择公共FIFO的深度。如果FIFO深度配置为0报文，则无法使用FIFO。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

CFITT[7:0]位（通用FIFO间隔传输时间）

当配置为TX或GW模式时，CFTT[7:0]位选择从此FIFO缓冲区发送的所有消息的开始发送延迟。延迟是基本间隔定时器时钟源周期（参考时钟×1，参考时钟×10，或相关CAN通道的位时钟）的倍数。

当CAN-FD模块处于GL_SLEEP模式时，不要写入这些位。

当CFE位设置为1时，请勿写入这些位。

当CFDGCFG.ITRCP[15:0]=0x0000时，将CFITT[7:0]位设置为0x0000。

32.2.30 CFDCFCCEn：通用FIFO配置控制增强寄存器n（n=0到5）

Base address: CANFD = 0x400B_0000

Offset address: 0x0180 + 0x04 × n

31:17	—	These bits are read as 0. The write value should be 0.	R/W

The Common FIFO Configuration/Control Enhancement Registers (n = 0 to 5) are used to configure the Common FIFOs.

no_of_channels = 2

no_of_CFIFOs_per_channel = Number of Common FIFOs per channel = 3

Where the total number of CFIFOs = no_of_CFIFOs_per_channel × no_of_channels = 3 × 2 = 6 as shown in Figure 32.28.

n = Common FIFO index = [0 .. no_of_CFIFOs - 1]

CFFIE bit (Common FIFO Full Interrupt Enable)

The CFFIE bit enables generation of the FIFO full interrupt when the interrupt flag is set after reception of a frame in the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

The following content shows examples of interruptions:

1. Interruption output in number of arbitrary stages (CFDCFCCn.CFIGCV)
2. Interruption output in FIFO full state.

Management of the receiving data of FIFO can be performed by these notices of interruption.

CFOFRXIE bit (Common FIFO One Frame Reception Interrupt Enable)

The CFOFRXIE bit enables generation of the one frame reception interrupt when the interrupt flag is set after reception of a frame in the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CFOFTXIE bit (Common FIFO One Frame Transmission Interrupt Enable)

The CFOFTXIE bit enables generation of the one frame transmission interrupt when the interrupt flag is set after transmission of a frame in the corresponding FIFO buffer.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

CFMOWM bit (Common FIFO Message Overwrite Mode)

When the CFMOWM bit is 0, a receiving message is discarded and FIFO is full. When the CFMOWM bit is 1, a receiving message is overwritten and FIFO is full.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode.

Only write 1 to this bit when the common FIFO is in GW mode.

Do not write 1 to this bit when the CFE bit is 1.

CFBME bit (Common FIFO Buffering Mode Enable)

When the CFBME bit is 0, messages are transmitted from FIFO. When the CFBME bit is 1, messages are not transmitted from FIFO.

Do not write to this bit when the CAN-FD module is in GL_SLEEP mode. Additionally, do not write 1 to this bit when the CFE bit is 1.

Bit	Symbol	Function	R/W
31:17	—	这些位被读取为0。写入值应为0。	R/W

通用FIFO配置控制增强寄存器（n=0到5）用于配置通用FIFO。

no_of_channels = 2

no_of_CFIFOs_per_channel=每个通道的公共FIFO数量=3

其中CFIFO的总数=no_of_CFIFOs_per_channel×no_of_channels=3×2=6，如图32.28所示。

n=通用FIFO索引=[0..no_of_CFIFOs1]

CFFIE位（通用FIFO满中断使能）

当在相应的FIFO缓冲区中接收到帧后设置中断标志时，CFFIE位使能生成FIFO满中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

以下内容显示了中断的示例：

1.任意级数的中断输出（CFDCFCCn.CFIGCV）

2.FIFO满状态下的中断输出。

可以通过这些中断通知来管理FIFO的接收数据。

CFOFRXIE位（通用FIFO一帧接收中断使能）

CFOFRXIE位允许在相应FIFO缓冲区中接收到一帧后设置中断标志时生成一帧接收中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

CFOFTXIE位（通用FIFO一帧传输中断使能）

CFOFTXIE位允许在相应FIFO缓冲区中传输一帧后设置中断标志时生成一帧传输中断。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

CFMOWM位（通用FIFO消息覆盖模式）

当CFMOWM位为0时，接收报文被丢弃且FIFO已满。当CFMOWM位为1时，接收报文被覆盖且FIFO已满。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。

仅当通用FIFO处于GW模式时向该位写入1。

当CFE位为1时，请勿向该位写入1。

CFBME位（通用FIFO缓冲模式使能）

当CFBME位为0时，消息从FIFO发送。当CFBME位为1时，不从FIFO发送消息。

当CAN-FD模块处于GL_SLEEP模式时，请勿写入该位。此外，当CFE位为1。

32.2.31 CFDCFSTSn : Common FIFO Status Registers n (n = 0 to 5)

CFEMP bit (Common FIFO Empty)

The CFEMP bit is set automatically when:

- The CPU has read all messages from the FIFO configured in RX mode
- All messages have been transmitted from the FIFO configured in TX or GW mode
- The FIFO is disabled by setting the CFE bit to 0
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET when FIFO configured in TX or GW mode.

32.2.31 CFDCFSTSn：通用FIFO状态寄存器n（n=0到5）

31:25	—	这些位被读取为0。写入值应为0。	R/W

CFEMP bit (Common FIFO Empty)

CFEMP位在以下情况下自动设置：

- ●CPU已从配置为RX模式的FIFO中读取所有消息
- ●所有消息均已从配置为TX或GW模式的FIFO发送
- ●通过将CFE位设置为0来禁用FIFO
- ●CAN-FD模块处于GL_RESET模式
- ●当FIFO配置为TX或GW模式时，相关CAN-FD通道处于CH_RESET状态。

The CFEMP bit is cleared automatically when:

- The first reception message is stored in the FIFO buffer when configured in RX mode
- The first message to be transmitted is stored in the FIFO buffer when configured in TX or GW mode.

CFFLL bit (Common FIFO Full)

The CFFLL bit is set automatically when the number of CAN messages stored in the FIFO matches the configured FIFO depth.

The CFFLL bit is cleared automatically when:

- The number of CAN messages stored in the FIFO is less than the configured FIFO depth
- The FIFO is disabled by setting the CFE bit to 0
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode when FIFO buffer is configured in TX or GW mode.

CFMLT bit (Common FIFO Message Lost)

The CFMLT bit is set automatically whenever a message is lost due to attempted storage of a new message when FIFO is already full in RX or GW mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then this bit is set.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

The CFMLT bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFRXIF bit (Common RX FIFO Interrupt Flag)

The CFRXIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the configured interrupt condition is satisfied for Common FIFO buffers when configured in GW mode or RX mode.

The CFRXIF bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in GW mode.

CFTXIF bit (Common TX FIFO Interrupt Flag)

The CFTXIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO buffer configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the configured interrupt condition is satisfied for Common FIFO buffers configured in GW or TX mode.

CFEMP位在以下情况下自动清零：

●当配置为RX模式时，第一个接收报文存储在FIFO缓冲区中

●当配置为TX或GW模式时，要发送的第一个消息存储在FIFO缓冲区中。

CFFLL bit (Common FIFO Full)

当存储在FIFO中的CAN报文数量与配置的FIFO深度匹配时，CFFLL位会自动设置。

CFFLL位在以下情况下自动清零：

●FIFO中存储的CAN报文数量小于配置的FIFO深度

●通过将CFE位设置为0来禁用FIFO

●CAN-FD模块处于GL_RESET模式

●当FIFO缓冲区配置为TX或GW模式时，相关CAN-FD通道处于CH_RESET模式。

CFMLT位（通用FIFO消息丢失）

当RX或GW模式下FIFO已满时，每当由于尝试存储新消息而导致消息丢失时，CFMLT位会自动设置。

如果来自CAN通道的设置与写访问清除同时发生，则设置该位。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式且相关CAN-FD通道未处于CH_RESET模式（对于配置为TX或GWFIFO的FIFO）时写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

CFMLT位清零：

●写入0

●CAN-FD模块处于GL_RESET模式时

●如果FIFO缓冲区配置为TX或GW模式，则相关CAN-FD通道处于CH_RESET模式时。

CFRXIF位（通用RXFIFO中断标志 ）

如果禁用通用FIFO缓冲区，则CFRXIF位不会自动清除。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式且相关CAN-FD通道未处于CH_RESET模式（对于配置为TX或GWFIFO的FIFO）时写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

当配置为GW模式或RX模式时，当配置的通用FIFO缓冲区满足配置的中断条件时，该位自动设置。

CFRXIF位清零：

●写入0

●CAN-FD模块处于GL_RESET模式时

●如果FIFO缓冲区配置为GW模式，则相关CAN-FD通道处于CH_RESET模式时。

CFTXIF位（通用TXFIFO中断标志 ）

如果禁用通用FIFO缓冲区，CFTXIF位不会自动清除。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式且相关的CAN-FD通道未处于CH_RESET模式时才写入该位，以用于配置为TX或GWFIFO的FIFO缓冲区。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

当配置中配置的通用FIFO缓冲区满足配置的中断条件时，该位自动设置
GW或TX模式。

The CFTXIF bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFMC[7:0] bits (Common FIFO Message Count)

The CFMC[7:0] bits indicate the following:

- Number of CAN messages stored by the CPU in the FIFO buffer configured in TX mode pending for transmission
- Number of CAN messages stored in the FIFO buffer configured in RX mode by RS-CAN-FD to be read by the CPU
- Number of CAN messages stored by the RS-CAN-FD in the GW FIFO pending for transmission.

The CFMC[7:0] bits are cleared automatically when:

- The FIFO is disabled
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFFIF bit (Common FIFO Full Interrupt Flag)

The CFFIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the FIFO Full Interrupt condition is satisfied for Common FIFO buffers when configured in GW or RX mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The CFFIF bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFOFRXIF bit (Common FIFO One Frame Reception Interrupt Flag)

The CFOFRXIF bit is not cleared automatically if the Common FIFO buffer is disabled.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for the FIFO buffer configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the One Frame Reception Interrupt condition is satisfied for the Common FIFO buffers when configured in GW or RX mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The CFOFRXIF bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

CFOFTXIF bit (Common FIFO One Frame Transmission Interrupt Flag)

The CFOFTXIF bit is not cleared automatically if the Common FIFO buffer is disabled.

CFTXIF位清零：

●写入0

●CAN-FD模块处于GL_RESET模式时

●如果FIFO缓冲区配置为TX或GW模式，则相关CAN-FD通道处于CH_RESET模式时。

CFMC[7:0]位（通用FIFO消息计数）

CFMC[7:0]位指示以下内容：

●CPU存储在TX模式下配置的FIFO缓冲区中等待传输的CAN报文数

●RS-CAN-FD在RX模式下配置的FIFO缓冲区中存储的可供CPU读取的CAN报文数

●RS-CAN-FD存储在GWFIFO中等待传输的CAN消息数。

CFMC[7:0]位在以下情况下自动清零：

●FIFO被禁用

●CAN-FD模块处于GL_RESET模式

●如果FIFO缓冲区配置为TX或GW模式，则相关CAN-FD通道处于CH_RESET模式。

CFFIF位（通用FIFO满中断标志）

如果禁用通用FIFO缓冲区，则CFFIF位不会自动清除。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式且相关CAN-FD通道未处于CH_RESET模式（对于配置为TX或GWFIFO的FIFO）时写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

当配置为GW或RX模式时，当满足通用FIFO缓冲区的FIFO满中断条件时，该位自动设置。

如果来自CAN通道的设置与写访问清除同时发生，则该位被设置。

CFFIF位清零：

●写入0

●CAN-FD模块处于GL_RESET模式时

●如果FIFO缓冲区配置为TX或GW模式，则相关CAN-FD通道处于CH_RESET模式时。

CFOFRXIF位（通用FIFO一帧接收中断标志）

如果禁用通用FIFO缓冲区，CFOFRXIF位不会自动清除。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式且相关CAN-FD通道未处于配置为TX或GWFIFO的FIFO缓冲区的CH_RESET模式时写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

当配置为GW或RX模式时，当满足通用FIFO缓冲区的一帧接收中断条件时，该位自动设置。

如果来自CAN通道的设置与写访问清除同时发生，则该位被设置。

CFOFRXIF位清零：

●写入0

●CAN-FD模块处于GL_RESET模式时

●如果FIFO缓冲区配置为TX或GW模式，则相关CAN-FD通道处于CH_RESET模式时。

CFOFTXIF位（通用FIFO一帧传输中断标志）

如果禁用通用FIFO缓冲区，则CFOFTXIF位不会自动清除。

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFOs configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is set automatically when the One Frame Transmission Interrupt condition is satisfied for Common FIFO buffers configured in GW mode or TX mode.

If a set from the CAN channel occurs simultaneously with a clear by a write access, then the bit is set.

The bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO is configured in TX or GW mode.

CFMOW bit (Common FIFO Message Overwrite)

The CFMOW bit is set automatically whenever a message is an overwrite storage of a new message when CFDCFCCEn.CFMOWM = 1 and FIFO is already full in GW mode.

If the set from the CAN channel occurs simultaneously with the clear by a write access, the bit is set.

Only write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode and the related CAN-FD channel is not in CH_RESET mode for FIFO buffer configured as TX or GW FIFO. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

The CFMOW bit is cleared:

- By writing 0 to it
- When the CAN-FD module is in GL_RESET mode
- When the related CAN-FD channel is in CH_RESET mode if the FIFO buffer is configured in TX or GW mode.

32.2.32 CFDCFPCTRn : Common FIFO Pointer Control Registers n (n = 0 to 5)

Base address: CANFD = 0x400B_0000

Offset address: 0x0240 + 0x04 × n

Bit position:	31																								7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFPC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CFPC[7:0]	Common FIFO Pointer Control Increments read or write pointer of the corresponding Common FIFO buffers depending on the mode configuration.	W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The Common FIFO Pointer Control Registers (n = 0 to 5) can be used to increment the read or write pointer of the corresponding Common FIFO buffer.

CFPC[7:0] bits (Common FIFO Pointer Control)

When the value 0xFF is written into the CFPC[7:0] bits, the read pointer of the corresponding Common FIFO buffer (when configured in RX mode), or the write pointer of the corresponding Common FIFO buffer (when configured in TX mode) moves to the next FIFO entry.

The read value from these bits is always 0x00.

Only write to these bits when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

Only write 0xFF to this register when:

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式且相关CAN-FD通道未处于配置为TX或GWFIFO的FIFO的CH_RESET模式时写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

当配置为GW模式或TX模式的通用FIFO缓冲区满足单帧传输中断条件时，该位自动设置。

如果来自CAN通道的设置与写访问清除同时发生，则该位被设置。

该位被清除：

●写入0

●CAN-FD模块处于GL_RESET模式时

●当FIFO配置为TX或GW模式时，相关CAN-FD通道为CH_RESET模式。

CFMOW位（通用FIFO消息覆盖）

每当一条消息是新消息的覆盖存储时，CFMOW位就会自动设置
CFDCFCCEn.CFMOWM=1，在GW模式下FIFO已满。

如果来自CAN通道的设置与通过写访问清除同时发生，则设置该位。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式且相关的CAN-FD通道未处于CH_RESET模式时才写入该位，以用于配置为TX或GWFIFO的FIFO缓冲区。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

CFMOW位清零：

●写入0

●CAN-FD模块处于GL_RESET模式时

●如果FIFO缓冲区配置为TX或GW模式，则相关CAN-FD通道处于CH_RESET模式时。

32.2.32 CFDCFPCTRn：通用FIFO指针控制寄存器n（n=0到5）

Base address: CANFD = 0x400B_0000

Offset address: 0x0240 + 0x04 × n

Bit position:	31																								7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFPC[7:0]							
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CFPC[7:0]	通用FIFO指针控制 根据模式配置增加相应通用FIFO缓冲区的读取或写入指针。	W
31:8	—	这些位被读取为0。写入值应为0。	R/W

通用FIFO指针控制寄存器（n=0到5）可用于递增相应通用FIFO缓冲区的读或写指针。

CFPC[7:0]位（通用FIFO指针控制）

当值0xFF写入CFPC[7:0]位时，对应CommonFIFO缓冲区的读指针（配置为RX模式时），或对应的CommonFIFO缓冲区的写指针（配置为TX模式时）移动到下一个FIFO条目。

从这些位读取的值始终为0x00。

仅当CAN-FD模块处于GL_HALT或GL_OPERATION模式时才写入这些位。

仅在以下情况下向该寄存器写入0xFF：

- The Common FIFO buffer is enabled and is not empty if configured in RX mode
- The Common FIFO buffer is enabled and is not full if configured in TX mode
- The Common FIFO buffer is enabled and is not configured in GW mode.

Do not write to the Common FIFO Pointer Control registers when DMA is enabled.

32.2.33 CFDFESTS : FIFO Empty Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02A0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXEMP[5:0]						RFXEMP[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	RFXEMP[7:0]	RX FIFO Empty Status 0: Corresponding FIFO not empty 1: Corresponding FIFO empty	R
13:8	CFXEMP[5:0]	Common FIFO Empty Status 0: Corresponding FIFO not empty 1: Corresponding FIFO empty	R
31:14	—	These bits are read as 0. The write value should be 0.	R

The FIFO Empty Status register shows status of the empty bits of the FIFO buffers.

RFXEMP[7:0] bits (RX FIFO Empty Status)

Bit 7 (RFXEMP[7]) is associated with FIFO index 7 and bit 0 (RFXEMP[0]) is associated with FIFO index 0.

The RFXEMP[7:0] bits are set when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the RX FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the RX FIFO Status Registers.

CFXEMP[5:0] bits (Common FIFO Empty Status)

Bit 13 (CFXEMP[5]) is associated with common FIFO index 5 and bit 8 (CFXEMP[0]) is associated with common FIFO index 0.

The CFXEMP[5:0] bits are set when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

32.2.34 CFDFFSTS : FIFO Full Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02A4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXFLL[5:0]						RFXFLL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

●如果配置为RX模式，则CommonFIFO缓冲区已启用且不为空

●如果配置为TX模式，则CommonFIFO缓冲区已启用且未满

●CommonFIFO缓冲区使能，GW模式下未配置。

启用DMA时不要写入通用FIFO指针控制寄存器。

32.2.33 CFDFESTS:FIFO空状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x02A0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXEMP[5:0]						RFXEMP[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	RFXEMP[7:0]	RXFIFO空状态 0：对应的FIFO不为空1：对应的FIFO为空	R
13:8	CFXEMP[5:0]	常见FIFO空状态 0：对应的FIFO不为空1：对应的FIFO为空	R
31:14	—	这些位被读取为0。写入值应为0。	R

FIFOEmptyStatus寄存器显示FIFO缓冲区的空位状态。

RFXEMP[7:0]位（RXFIFO空状态）

位7(RFXEMP[7])与FIFO索引7相关联，位0(RFXEMP[0])与FIFO索引0相关联。

当CAN-FD模块处于GL_RESET模式时，RFXEMP[7:0]位被设置。

当在RXFIFO状态寄存器中设置相应位时，每个位都会自动设置。

当RXFIFO状态寄存器中的相应位清零时，每个位都会自动清零。

CFXEMP[5:0]位（通用FIFO空状态）

位13(CFXEMP[5])与通用FIFO索引5相关联，位8(CFXEMP[0])与通用FIFO索引0相关联。

CFXEMP[5:0]位在CAN-FD模块处于GL_RESET模式时置位。

当在通用FIFO状态寄存器中设置相应位时，每个位都会自动设置。

当公共FIFO状态寄存器中的相应位清零时，每个位都会自动清零。

32.2.34 CFDFFSTS:FIFO满状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x02A4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXFLL[5:0]						RFXFLL[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RFXFLL[7:0]	RX FIFO Full Status 0: Corresponding FIFO not full 1: Corresponding FIFO full	R
13:8	CFXFLL[5:0]	Common FIFO Full Status 0: Corresponding FIFO not full 1: Corresponding FIFO full	R
31:14	—	These bits are read as 0. The write value should be 0.	R

The FIFO Full Status Register shows status of the full bits of the FIFO buffers.

RFXFLL[7:0] bits (RX FIFO Full Status)

The RFXFLL[7:0] bits are cleared when CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the RX FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the RX FIFO Status Registers.

CFXFLL[5:0] bits (Common FIFO Full Status)

The CFXFLL[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

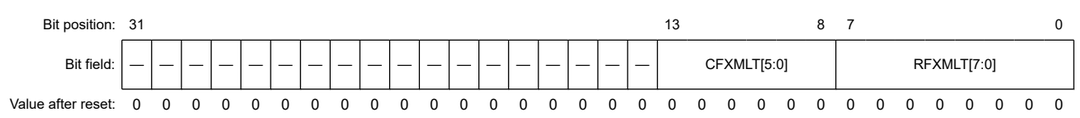
Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

32.2.35 CFDFMSTS : FIFO Message Lost Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02A8



Bit	Symbol	Function	R/W
7:0	RFXMLT[7:0]	RX FIFO Message Lost Status 0: Corresponding FIFO Message Lost flag not set 1: Corresponding FIFO Message Lost flag set	R
13:8	CFXMLT[5:0]	Common FIFO Message Lost Status 0: Corresponding FIFO Message Lost flag not set 1: Corresponding FIFO Message Lost flag set	R
31:14	—	These bits are read as 0. The write value should be 0.	R

The FIFO Message Lost Status Register shows status of the Msg Lost bits of the FIFO buffers.

RFXMLT[7:0] bits (RX FIFO Message Lost Status)

The RFXMLT[7:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the RX FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the RX FIFO Status Registers.

CFXMLT[5:0] bits (Common FIFO Message Lost Status)

The CFXMLT[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

Bit	Symbol	Function	R/W
7:0	RFXFLL[7:0]	RXFIFO满状态 0：对应FIFO未满1：对应FIFO已满	R
13:8	CFXFLL[5:0]	通用FIFO满状态 0：对应FIFO未满1：对应FIFO已满	R
31:14	—	这些位被读取为0。写入值应为0。	R

FIFO满状态寄存器显示FIFO缓冲器的满位状态。

RFXFLL[7:0]位（RXFIFO满状态）

当CAN-FD模块处于GL_RESET模式时，RFXFLL[7:0]位被清除。

当在RXFIFO状态寄存器中设置相应位时，每个位都会自动设置。

当RXFIFO状态寄存器中的相应位清零时，每个位都会自动清零。

CFXFLL[5:0]位（通用FIFO满状态）

当CAN-FD模块处于GL_RESET模式时，CFXFLL[5:0]位被清除。

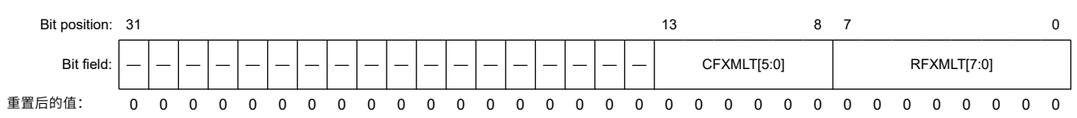
当在通用FIFO状态寄存器中设置相应位时，每个位都会自动设置。

当公共FIFO状态寄存器中的相应位清零时，每个位都会自动清零。

32.2.35 CFDFMSTS:FIFO消息丢失状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x02A8



Bit	Symbol	Function	R/W
7:0	RFXMLT[7:0]	RXFIFO消息丢失状态 0：未设置对应的FIFO报文丢失标志1：设置了对应的FIFO报文丢失标志	R
13:8	CFXMLT[5:0]	常见FIFO消息丢失状态 0：未设置对应的FIFO报文丢失标志1：设置了对应的FIFO报文丢失标志	R
31:14	—	这些位被读取为0。写入值应为0。	R

FIFO消息丢失状态寄存器显示FIFO缓冲区的MsgLost位的状态。

RFXMLT[7:0]位（RXFIFO消息丢失状态）

当CAN-FD模块处于GL_RESET模式时，RFXMLT[7:0]位被清除。

当在RXFIFO状态寄存器中设置相应位时，每个位都会自动设置。

当RXFIFO状态寄存器中的相应位清零时，每个位都会自动清零。

CFXMLT[5:0]位（通用FIFO消息丢失状态）

当CAN-FD模块处于GL_RESET模式时，CFXMLT[5:0]位被清除。

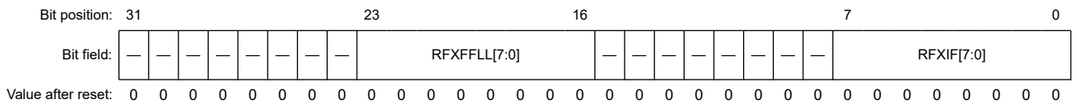
当在通用FIFO状态寄存器中设置相应位时，每个位都会自动设置。

当公共FIFO状态寄存器中的相应位清零时，每个位都会自动清零。

32.2.36 CFDRFISTS : RX FIFO Interrupt Flag Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02AC



Bit	Symbol	Function	R/W
7:0	RFXIF[7:0]	RX FIFO[x] Interrupt Flag Status 0: Corresponding RX FIFO Interrupt flag not set 1: Corresponding RX FIFO Interrupt flag set	R
15:8	—	These bits are read as 0. The write value should be 0.	R/W
23:16	RFXFFLL[7:0]	RX FIFO[x] Interrupt Full Flag Status 0: Corresponding RX FIFO Interrupt Full flag not set 1: Corresponding RX FIFO Interrupt Full flag set	R
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The FIFO Interrupt Flag Status Register shows status of the interrupt flag bits of the RX FIFO buffers.

RFXIF[7:0] bits (RX FIFO[x] Interrupt Flag Status)

Each bit is set automatically when the corresponding interrupt flag bit is set in the RX FIFO Status Registers.

The RFXIF[7:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding interrupt flag bit is cleared in the RX FIFO Status Registers.

RFXFFLL[7:0] bits (RX FIFO[x] Interrupt Full Flag Status)

Each bit is set automatically when the corresponding interrupt full flag bit is set in the RX FIFO Status Registers.

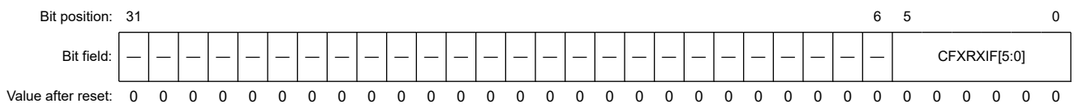
The RFXFFLL[7:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding interrupt full flag bit is cleared in the RX FIFO Status Registers.

32.2.37 CFDCFRISTS : Common FIFO RX Interrupt Flag Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02B0



Bit	Symbol	Function	R/W
5:0	CFXRXIF[5:0]	Common FIFO RX Interrupt Flag Status 0: Corresponding Common FIFO RX Interrupt flag is not set 1: Corresponding Common FIFO RX Interrupt flag is set	R
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The Common FIFO RX Interrupt Flag Status Register shows status of the interrupt flag bits of the Common FIFO buffers.

CFXRXIF[5:0] bits (Common FIFO RX Interrupt Flag Status)

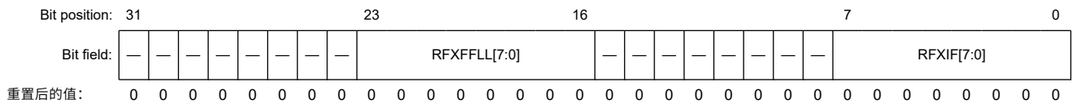
Each bit is set automatically when the corresponding RX interrupt flag bit is set in the Common FIFO Status Registers.

The CFXRXIF[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

32.2.36 CFDRFISTS:RXFIFO中断标志 状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x02AC



Bit	Symbol	Function	R/W
7:0	RFXIF[7:0]	RXFIFO[x]中断标志 状态 0：未设置相应的RXFIFO中断标志 1：设置了相应的RXFIFO中断标志	R
15:8	—	这些位被读取为0。写入值应为0。	R/W
23:16	RFXFFLL[7:0]	RXFIFO[x]中断满标志状态 0：未设置对应的RXFIFO中断满标志1：设置了相应的RXFIFO中断满标志	R
31:24	—	这些位被读取为0。写入值应为0。	R/W

FIFO中断标志 状态寄存器显示RXFIFO缓冲区的中断标志位的状态。

RFXIF[7:0]位（RXFIFO[x]中断标志 状态）

当在RXFIFO状态寄存器中设置相应的中断标志位时，每个位都会自动设置。

当CAN-FD模块处于GL_RESET模式时，RFXIF[7:0]位被清除。

当RXFIFO状态寄存器中相应的中断标志位被清零时，每个位都会自动清零。

RFXFFLL[7:0]位（RXFIFO[x]中断满标志状态）

当在RXFIFO状态寄存器中设置相应的中断满标志位时，每个位都会自动设置。

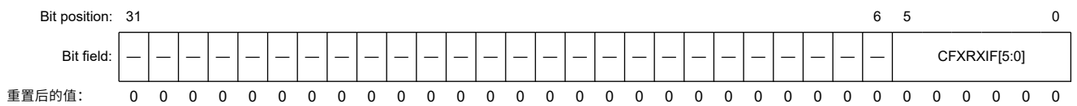
当CAN-FD模块处于GL_RESET模式时，RFXFFLL[7:0]位被清除。

当RXFIFO状态寄存器中相应的中断满标志位被清零时，每个位都会自动清零。

32.2.37 CFDCFRISTS：通用FIFORX中断标志 状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x02B0



Bit	Symbol	Function	R/W
5:0	CFXRXIF[5:0]	通用FIFORX中断标志 状态 0：未设置对应的CommonFIFORX中断标志 1：设置了对应的CommonFIFORX中断标志	R
31:6	—	这些位被读取为0。写入值应为0。	R/W

公共FIFORX中断标志 状态寄存器显示公共FIFO缓冲区的中断标志位的状态。

CFXRXIF[5:0]位（通用FIFORX中断标志 状态）

当在通用FIFO状态寄存器中设置相应的RX中断标志 位时，每个位都会自动设置。

当CAN-FD模块处于GL_RESET模式时，CFXRXIF[5:0]位被清除。

Each bit is cleared automatically when the corresponding RX interrupt flag bit is cleared in the Common FIFO Status Registers.

32.2.38 CFDCFTISTS : Common FIFO TX Interrupt Flag Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02B4

Bit position:	31																								6	5		0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXTXIF[5:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CFXTXIF[5:0]	Common FIFO [x] TX Interrupt Flag Status 0: Corresponding Common FIFO TX Interrupt flag is not set 1: Corresponding Common FIFO TX Interrupt flag is set	R
31:6	—	These bits are read as 0. The write value should be 0.	R/W

The Common FIFO TX Interrupt Flag Status Register shows status of the interrupt flag bits of the Common FIFO buffers.

CFXTXIF[5:0] bits (Common FIFO [x] TX Interrupt Flag Status)

Each bit is set automatically when the corresponding TX interrupt flag bit is set in the Common FIFO Status Registers.

The CFXTXIF[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding TX interrupt flag bit is cleared in the Common FIFO Status Registers.

32.2.39 CFDFFFSTS : FIFO FDC Full Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02C4

Bit position:	31																			13					8	7			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXFFLL[5:0]						RFXFFLL[7:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RFXFFLL[7:0]	RX FIFO FDC Level Full Status 0: Corresponding FIFO full interrupt not set 1: Corresponding FIFO full interrupt is set	R
13:8	CFXFFLL[5:0]	COMMON FIFO FDC Level Full Status 0: Corresponding FIFO full interrupt not set 1: Corresponding FIFO full interrupt is set	R
31:14	—	These bits are read as 0. The write value should be 0.	R

The FIFO FDC Full Status Register shows status of the full interrupt flag bits of the FIFO buffers.

RFXFFLL[7:0] bits (RX FIFO FDC Level Full Status)

Each bit is set automatically when the corresponding bit is set in the RX FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the RX FIFO Status Registers.

The RFXFFLL[7:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

CFXFFLL[5:0] bits (COMMON FIFO FDC Level Full Status)

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

当CommonFIFOStatus中相应的RX中断标志 位被清除时，每个位都会自动清除 Registers.

32.2.38 CFDCFTISTS：通用FIFOTX中断标志 状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x02B4

Bit position:	31																								6	5		0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXTXIF[5:0]		
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CFXTXIF[5:0]	通用FIFO[x]TX中断标志 状态 0：未设置相应的CommonFIFOTX中断标志 1：设置了相应的CommonFIFOTX中断标志	R
31:6	—	这些位被读取为0。写入值应为0。	R/W

公共FIFOTX中断标志 状态寄存器显示公共FIFO缓冲区的中断标志位的状态。

CFXTXIF[5:0]位（通用FIFO[x]TX中断标志 状态）

当在通用FIFO状态寄存器中设置相应的TX中断标志 位时，每个位都会自动设置。

当CAN-FD模块处于GL_RESET模式时，CFXTXIF[5:0]位被清除。

当CommonFIFOStatus中相应的TX中断标志 位清零时，每个位都会自动清零 Registers.

32.2.39 CFDFFFSTS:FIFOFDC满状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x02C4

Bit position:	31																			13					8	7			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXFFLL[5:0]						RFXFFLL[7:0]			
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	RFXFFLL[7:0]	RXFIFOFDC电平满状态 0：未设置相应的FIFO满中断1：设置了相应的FIFO满中断	R
13:8	CFXFFLL[5:0]	COMMONFIFOFDC级别满状态 0：未设置相应的FIFO满中断1：设置了相应的FIFO满中断	R
31:14	—	这些位被读取为0。写入值应为0。	R

FIFOFDC满状态寄存器显示FIFO缓冲器的满中断标志位的状态。

RFXFFLL[7:0]位（RXFIFOFDC电平满状态）

当在RXFIFO状态寄存器中设置相应位时，每个位都会自动设置。

当RXFIFO状态寄存器中的相应位清零时，每个位都会自动清零。

当CAN-FD模块处于GL_RESET模式时，RFXFFLL[7:0]位被清除。

CFXFFLL[5:0]位（COMMONFIFOFDC电平满状态）

当在通用FIFO状态寄存器中设置相应位时，每个位都会自动设置。

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

The CFXFFLL[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

32.2.40 CFDCFMOWSTS : Common FIFO Message Over Write Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02C0

Bit position:	31																									5	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXMOW[5:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CFXMOW[5:0]	Common FIFO Massage Overwrite Status 0: Corresponding FIFO Overwrite flag is not set 1: Corresponding FIFO Overwrite flag is set	R
31:6	—	These bits are read as 0. The write value should be 0.	R

CFXMOW[5:0] bits (Common FIFO Massage Overwrite Status)

The CFXMOW[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode. This register is only valid in GW mode.

Each bit is set automatically when the corresponding bit is set in the Common FIFO Status Registers.

Each bit is cleared automatically when the corresponding bit is cleared in the Common FIFO Status Registers.

32.2.41 CFDCFOFRISTS : Common FIFO One Frame RX Interrupt Flag Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x02B8

Bit position:	31																									5	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXOFRXIF[5:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CFXOFRXIF[5:0]	Common FIFO One Frame RX Interrupt Flag Status 0: Corresponding Common FIFO One Frame RX Interrupt flag is not set 1: Corresponding Common FIFO One Frame RX Interrupt flag is set	R
31:6	—	These bits are read as 0. The write value should be 0.	R

The Common FIFO One Frame RX Interrupt Flag Status register shows status of the interrupt flag bits of the Common FIFO buffers.

CFXOFRXIF[5:0] bits (Common FIFO One Frame RX Interrupt Flag Status)

Each bit is set automatically when the corresponding One Frame RX Interrupt flag bit is set in the Common FIFO Status Registers.

The CFXOFRXIF[5:0] bits are cleared when the CAN-FD module is in GL_RESET mode.

Each bit is cleared automatically when the corresponding One Frame RX Interrupt flag bit is cleared in the Common FIFO Status Registers.

当公共FIFO状态寄存器中的相应位清零时，每个位都会自动清零。

当CAN-FD模块处于GL_RESET模式时，CFXFFLL[5:0]位被清除。

32.2.40 CFDCFMOWSTS:通用FIFO消息覆盖写入状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x02C0

Bit position:	31																									5	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFXMOW[5:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CFXMOW[5:0]	通用FIFO按摩覆盖状态 0：不设置对应的FIFO覆盖标志1：设置对应的FIFO覆盖标志	R
31:6	—	这些位被读取为0。写入值应为0。	R

CFXMOW[5:0]位（通用FIFO消息覆盖状态）

当CAN-FD模块处于GL_RESET模式时，CFXMOW[5:0]位被清除。该寄存器仅在GW模式下有效。

当在通用FIFO状态寄存器中设置相应位时，每个位都会自动设置。

当公共FIFO状态寄存器中的相应位清零时，每个位都会自动清零。

32.2.41 CFDCFOFRISTS:通用FIFO一帧RX中断标志 状态寄存器

9	CFDMAE1	DMA Transfer Enable for Common FIFO 0 of Channel 1 0: DMA transfer request disabled 1: DMA transfer request enabled	R/W
31:10	—	These bits are read as 0. The write value should be 0.	R/W

The DMA Transfer Control Register controls the start and stop of DMA transfer operation.

RFDMAEn (n = 0 to 7) bit (DMA Transfer Enable for RXFIFOn)

The RFDMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

CFDMAEn (n = 0, 1) bit (DMA Transfer Enable for Common FIFO 0 of Channel 0, 1)

The CFDMAEn bit enables or disables DMA transfer request for common FIFO 0 of channel 0 or 1. Only Common FIFO 0 can be linked to a DMA channel with this bit. Common FIFO 1 cannot be linked to a DMA channel.

To link Common FIFO 2, see bit CFDCDTTCT.CFDMAEn in section 32.2.45. CFDCDTTCT : DMA TX Transfer Control Register.

The CFDMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

Do not enable a DMA transfer for a Common FIFO that is configured as TX or GW FIFO.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

32.2.44 CFDCDTSTS : DMA Transfer Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x1334

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8	CFDMAE0	通道0的公共FIFO0的DMA传输使能 0：禁用DMA传输请求1：启用DMA传输请求	R/W
9	CFDMAE1	通道1的公共FIFO0的DMA传输使能 0：禁用DMA传输请求1：启用DMA传输请求	R/W
31:10	—	这些位被读取为0。写入值应为0。	R/W

DMA传输控制寄存器控制DMA传输操作的开始和停止。

RFDMAEn（n=0到7）位（RXFIFOn的DMA传输使能）

RFDMAEn位不能在GL_SLEEP或GL_RESET模式下设置。

当CAN-FD模块处于GL_RESET模式时，该位清零。

CFDMAEn(n=0 1)位（通道0 1的公共FIFO0的DMA传输使能）

CFDMAEn位启用或禁用通道0或1的公共FIFO0的DMA传输请求。只有公共FIFO0可以通过该位链接到DMA通道。通用FIFO1不能链接到DMA通道。

要链接CommonFIFO2，请参见第32.2.45节中的位CFDCDTTCT.CFDMAEn。CFDCDTTCT:DMATX传输控制Register.

CFDMAEn位不能在GL_SLEEP或GL_RESET模式下设置。

不要为配置为TX或GWFIFO的CommonFIFO启用DMA传输。

当CAN-FD模块处于GL_RESET模式时，该位清零。

32.2.44 CFDCDTSTS:DMA传输状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x1334

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RFDMASTS0	DMA Transfer Status for RX FIFO 0 0: DMA transfer stopped 1: DMA transfer on going	R
1	RFDMASTS1	DMA Transfer Status for RX FIFO 1 0: DMA transfer stopped 1: DMA transfer on going	R
2	RFDMASTS2	DMA Transfer Status for RX FIFO 2 0: DMA transfer stopped 1: DMA transfer on going	R
3	RFDMASTS3	DMA Transfer Status for RX FIFO 3 0: DMA transfer stopped 1: DMA transfer on going	R
4	RFDMASTS4	DMA Transfer Status for RX FIFO 4 0: DMA transfer stopped 1: DMA transfer on going	R
5	RFDMASTS5	DMA Transfer Status for RX FIFO 5 0: DMA transfer stopped 1: DMA transfer on going	R
6	RFDMASTS6	DMA Transfer Status for RX FIFO 6 0: DMA transfer stopped 1: DMA transfer on going	R
7	RFDMASTS7	DMA Transfer Status for RX FIFO 7 0: DMA transfer stopped 1: DMA transfer on going	R
8	CFDMASTS0	DMA Transfer Status only for Common FIFO 0 of Channel 0 0: DMA transfer stopped 1: DMA transfer on going	R
9	CFDMASTS1	DMA Transfer Status only for Common FIFO 0 of Channel 1 0: DMA transfer stopped 1: DMA transfer on going	R
31:10	—	These bits are read as 0.	R

The DMA Transfer Status Register shows the status of the DMA transfer.

RFDMASTSn (n = 0 to 7) bit (DMA Transfer Status for RX FIFO n)

Each bit is set automatically when the corresponding DMA enable bit is set and the corresponding DMA FIFO is not empty.

Each bit is cleared automatically when the DMA transfer stops either because the DMA is disabled or the DMA FIFO is empty.

When CFDCDTCT.RFDMAEn (see CFDCDTCT.RFDMAEn bit in section 32.2.43. CFDCDTCT : DMA Transfer Control Register) is set to 0 while DMA transfer for the corresponding FIFO is on going, the RFDMASTSn bit becomes 0 when the DMA transfer is complete.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

CFDMASTSn bit (DMA Transfer Status only for Common FIFO 0 of Channel 0, 1)

Each bit is set automatically when the corresponding DMA enable bit is set and the corresponding DMA FIFO is not empty.

Each bit is cleared automatically when the DMA transfer stops either because the DMA is disabled or the DMA FIFO is empty.

When CFDCDTCT.CFDMAEn (see CFDCDTCT.CFDMAEn bit in section 32.2.43. CFDCDTCT : DMA Transfer Control Register) is set to 0 while DMA transfer for the corresponding FIFO is on going, the CFDMASTSn bit becomes 0 when the DMA transfer is complete.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

Bit	Symbol	Function	R/W
0	RFDMASTS0	RXFIFO0的DMA传输状态 0：DMA传输停止1：DMA传输正在进行	R
1	RFDMASTS1	RXFIFO1的DMA传输状态 0：DMA传输停止1：DMA传输正在进行	R
2	RFDMASTS2	RXFIFO2的DMA传输状态 0：DMA传输停止1：DMA传输正在进行	R
3	RFDMASTS3	RXFIFO3的DMA传输状态 0：DMA传输停止1：DMA传输正在进行	R

8	CFDMASTS0	DMA传输状态仅适用于通道0的CommonFIFO0 0：DMA传输停止1：DMA传输正在进行	R
9	CFDMASTS1	DMA传输状态仅适用于通道1的CommonFIFO0 0：DMA传输停止1：DMA传输正在进行	R
31:10	—	这些位读为0。	R

DMA传输状态寄存器显示DMA传输的状态。

RFDMASTSn(n=0to7)位（RXFIFOn的DMA传输状态）

当设置相应的DMA使能位且相应的DMAFIFO不为空时，每个位都会自动设置。

当DMA传输停止时，每个位都会自动清除，因为DMA被禁用或DMAFIFO为空。

当CFDCDTCT.RFDMAEn（参见第32.2.43节中的CFDCDTCT.RFDMAEn位。CFDCDTCT：DMA传输控制寄存器）设置为0，同时相应FIFO的DMA传输正在进行时，RFDMASTSn位变为0。
DMA传输完成。

当CAN-FD模块处于GL_RESET模式时，该位清零。

CFDMASTSn位（DMA传输状态仅适用于通道0、1的CommonFIFO0）

当设置相应的DMA使能位且相应的DMAFIFO不为空时，每个位都会自动设置。

当DMA传输停止时，每个位都会自动清除，因为DMA被禁用或DMAFIFO为空。

当CFDCDTCT.CFDMAEn（参见第32.2.43节中的CFDCDTCT.CFDMAEn位。CFDCDTCT：DMA传输控制寄存器）设置为0，同时相应FIFO的DMA传输正在进行时，CFDMASTSn位变为0。
DMA传输完成。

当CAN-FD模块处于GL_RESET模式时，该位清零。

32.2.45 CFDCDTTCT : DMA TX Transfer Control Register

Base address: CANFD = 0x400B_0000

Offset address: 0x1340

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	TQ3DMAE1	TQ3DMAE0	—	—	—	—	—	—	TQ0DMAE1	TQ0DMAE0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TQ0DMAE0	DMA TX Transfer Enable for TXQ 0 of Channel 0 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled	R/W
1	TQ0DMAE1	DMA TX Transfer Enable for TXQ 0 of Channel 1 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	TQ3DMAE0	DMA TX Transfer Enable for TXQ 3 of Channel 0 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled	R/W
9	TQ3DMAE1	DMA TX Transfer Enable for TXQ 3 of Channel 1 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
16	CFDMAE0	DMA TX Transfer Enable for Common FIFO 2 of Channel 0 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled	R/W
17	CFDMAE1	DMA TX Transfer Enable for Common FIFO 2 of Channel 1 0: DMA TX transfer request disabled 1: DMA TX transfer request enabled	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

The DMA TX Transfer Control Register controls the start and stop of DMA transfer operation.

TQ0DMAEn (n = 0, 1) bit (DMA TX Transfer Enable for TXQ 0 of Channel n)

The TQ0DMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

TQ3DMAEn (n = 0, 1) bit (DMA TX Transfer Enable for TXQ 3 of Channel n)

The TQ3DMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

CFDMAEn (n = 0, 1) bit (DMA TX Transfer Enable for Common FIFO 2 of Channel n)

The CFDMAEn bit cannot be set in GL_SLEEP or GL_RESET mode.

Only common FIFO 2 can be linked to a DMA channel with this bit. Common FIFO 1 cannot be linked to a DMA channel.

To link Common FIFO 0, see CFDCDTCT.CFDMAEn bit in section 32.2.43. CFDCDTCT : DMA Transfer Control Register.

Do not enable a DMA transfer for a Common FIFO that is configured as RX or GW FIFO.

32.2.45 CFDCDTTCT:DMATX传输控制寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x1340

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

17	CFDMAE1	通道1的通用FIFO2的DMATX传输使能 0：禁用DMATX传输请求1：启用DMATX传输请求	R/W
31:18	—	这些位被读取为0。写入值应为0。	R/W

DMATX传输控制寄存器控制DMA传输操作的开始和停止。

TQ0DMAEn(n=0 1)位（通道n的TXQ0的DMATX传输使能）

TQ0DMAEn位不能在GL_SLEEP或GL_RESET模式下设置。

当CAN-FD模块处于GL_RESET模式时，该位清零。

TQ3DMAEn(n=0 1)位（通道n的TXQ3的DMATX传输使能）

TQ3DMAEn位不能在GL_SLEEP或GL_RESET模式下设置。

当CAN-FD模块处于GL_RESET模式时，该位清零。

CFDMAEn(n=0 1)位（通道n的公共FIFO2的DMATX传输使能）

CFDMAEn位不能在GL_SLEEP或GL_RESET模式下设置。

只有通用FIFO2可以通过该位链接到DMA通道。通用FIFO1不能链接到DMA通道。

要链接CommonFIFO0，请参见第32.2.43节中的CFDCDTCT.CFDMAEn位。CFDCDTCT:DMA传输控制Register.

不要为配置为RX或GWFIFO的CommonFIFO启用DMA传输。

RA生态工作室

The CFDMAEn bit is cleared when the CAN-FD module is in GL_RESET mode.

32.2.46 CFDCDTTSTS : DMA TX Transfer Status Register

Base address: CANFD = 0x400B_0000

Offset address: 0x1344

17	CFDMASTS1	DMA TX Transfer Status only for Common FIFO 2 of Channel 1 0: DMA transfer stopped 1: DMA transfer enabled	R
31:18	—	These bits are read as 0. The write value should be 0.	R/W

The DMA TX Transfer Status Register shows the status of the DMA transfer.

TQ0DMASTSn (n = 0, 1) bit (DMA TX Transfer Status for TXQ 0 of Channel n)

The TQ0DMASTSn bit is set when the CFDCDTTCT.TQ0DMAEn bit in the corresponding CFDCDTTCT register is set (see section 32.2.45. CFDCDTTCT : DMA TX Transfer Control Register).

This bit is cleared when:

- The CFDCDTTCT.TQ0DMAEn bit in the corresponding CFDCDTTCT register is cleared
- The CAN-FD module is in GL_RESET mode.

TQ3DMASTSn (n = 0, 1) bit (DMA TX Transfer Status for TXQ 3 of Channel n)

The TQ3DMASTSn bit is set when the CFDCDTTCT.TQ3DMAEn bit in the corresponding CFDCDTTCT register is set (see section 32.2.45. CFDCDTTCT : DMA TX Transfer Control Register).

This bit is cleared when:

- The CFDCDTTCT.TQ3DMAEn bit in the corresponding CFDCDTTCT register is cleared

当CAN-FD模块处于GL_RESET模式时，CFDMAEn位被清除。

32.2.46 CFDDTTSTS:DMATX传输状态寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x1344

●CAN-FD模块处于GL_RESET模式

●相关的CAN-FD通道处于CH_RESET模式。

CFOFRIF[30:28]位（通用FIFO一帧RX中断标志 通道n(n=0 1)）

CFOFRIF[30:28]位会在相关通道的通用FIFO一帧RX中断标志 位在中断使能时自动置位。

CFOFRIF[30:28]位在以下情况下自动清零：

●相关的CommonFIFORX结果状态位被清除或中断使能被禁用

●CAN-FD模块处于GL_RESET模式

●相关的CAN-FD通道处于CH_RESET模式。

32.2.48 CFDTMCn：TX消息缓冲区控制寄存器n（n=0到7、32到39、64到71、96到103）

Base address: CANFD = 0x400B_0000

Offset address: 0x02D0 + 0x01 × i

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	TMOM	TMTAR	TMTR
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TMTR	TX消息缓冲区传输请求 0：未请求TX报文缓冲区传输1：已请求TX报文缓冲区传输	R/W
1	TMTAR	TX消息缓冲区传输中止请求 0：未请求TX报文缓冲区传输请求中止1：已请求TX报文缓冲区传输请求中止	R/W
2	TMOM	TX消息缓冲区一次性模式 0：TX报文缓冲区未配置为one-shot模式1：TX报文缓冲区配置为one-shot模式	R/W
7:3	—	这些位被读取为0。写入值应为0。	R/W

TX报文缓冲区控制寄存器配置TX报文缓冲区功能。

TMTR bit (TX Message Buffer Transmission Request)

When the TMTR bit is set, the CAN-FD module logic tries to transmit the message stored in the corresponding message buffer.

Only write to this bit when the related CAN-FD module is in CH_HALT or CH_OPERATION mode.

Do not set this bit if the corresponding TX message buffer is linked to a COM FIFO in TX or GW mode or is a part of TX Queue.

This bit cannot be directly cleared by a CPU write access.

This bit can only be set when the Transmission Result flag bits (CFDTMSTSn.TMTRF) in the CFDTMSTSn register corresponding to the message buffer are cleared to 00b.

The TMTR bit is automatically cleared by the:

- CAN-FD module logic at the end of a successful transmission
- CAN-FD module logic at the end of a transmission abort, requested by the corresponding CFDTMCn.TMTAR bit
- CAN-FD module logic when there is a detection of a CAN bus error or arbitration loss if CFDTMCn.TMOM bit is set for the message buffer
- CAN-FD module logic when the CAN-FD module is in GL_RESET mode or the related channel is in CH_RESET mode.

TMTAR bit (TX Message Buffer Transmission Abort Request)

When the TMTAR bit is set, the CAN-FD module logic tries to abort the transmission of the frame stored in the corresponding message buffer.

In most cases, transmission cannot be aborted if the internal scan for transmission is complete and the message buffer has already been selected for transmission. In this case, frame may be transmitted successfully from the message buffer. The message buffer selection is released by entering CH_HALT mode.

However, message buffer selected for transmission can be aborted by an abort request when the CAN node detects a new message on the bus (RX pin) before it starts transmission from the selected message buffer.

Only write to the TMTAR bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode. This bit can only be set when the related transmit request TMTR bit is set.

The TMTAR bit cannot be cleared by a CPU write access. Clearing of this bit by CAN-FD has priority over setting by a CPU write access.

The TMTAR bit is automatically cleared by:

- The CAN-FD module logic at the end of a successful transmission
- The CAN-FD module logic at the end of a transmission abort
- The CAN-FD module logic when there is detection of a CAN bus error or arbitration loss
- The CAN-FD module logic when the CAN-FD module is in GL_RESET mode or the related channel enters CH_RESET mode.

TMOM bit (TX Message Buffer One-shot Mode)

When the TMOM bit is set, the CAN-FD module logic tries to transmit the message only once.

If the transmission is successful, the CFDTMSTSn.TMTRF bits are set to 10b or 11b. Otherwise, the transmission is automatically aborted and CFDTMSTSn.TMTRF bits are set to 01b due to a bus error or a bus arbitration lost.

The TMOM bit remains set if the transmission has completed successfully or aborted due to an error or a loss of arbitration.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Set this bit at the same time as the TMTR bit. Clear this bit with a write access.

If a message has already been requested for transmission, do not write to this bit until the message has been successfully transmitted or transmission has been aborted.

The TMOM bit is automatically cleared by the CAN-FD module logic when the CAN-FD module is in GL_RESET mode or the related channel is in CH_RESET mode.

TMTR位（TX报文缓冲区传输请求）

当设置TMTR位时，CAN-FD模块逻辑尝试发送存储在相应消息缓冲区中的消息。

仅当相关CAN-FD模块处于CH_HALT或CH_OPERATION模式时写入该位。

如果相应的TX消息缓冲区在TX或GW模式下链接到COMFIFO或者是TX的一部分，则不要设置该位
Queue.

该位不能通过CPU写访问直接清除。

只有当报文缓冲区对应的CFDTMSTSn寄存器中的传输结果标志位(CFDTMSTSn.TMTRF)被清零时，才能设置该位。

TMTR位通过以下方式自动清零：

●成功传输结束时的CAN-FD模块逻辑

●发送中止结束时的CAN-FD模块逻辑，由相应的CFDTMCn.TMTAR位请求

●如果CFDTMCn.TMOM位为消息缓冲区设置，则检测到CAN总线错误或仲裁丢失时的CAN-FD模块逻辑

●CAN-FD模块处于GL_RESET模式或相关通道处于CH_RESET模式时的CAN-FD模块逻辑。

TMTAR位（TX报文缓冲区传输中止请求）

当设置TMTAR位时，CAN-FD模块逻辑尝试中止存储在相应消息缓冲区中的帧的传输。

在大多数情况下，如果内部扫描传输完成并且消息缓冲区已被选择用于传输，则无法中止传输。在这种情况下，可以从消息缓冲区成功传输帧。通过进入CH_HALT模式释放消息缓冲区选择。

但是，当CAN节点在从选定的消息缓冲区开始传输之前检测到总线（RX引脚）上的新消息时，可以通过中止请求中止选择用于传输的消息缓冲区。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入TMTAR位。只有当相关的发送请求TMTR位被置位时，该位才能被置位。

CPU写访问不能清除TMTAR位。CAN-FD清零该位优先于设置
CPU写访问。

TMTAR位通过以下方式自动清零：

●成功传输结束时的CAN-FD模块逻辑

●传输中止结束时的CAN-FD模块逻辑

●检测到CAN总线错误或仲裁丢失时的CAN-FD模块逻辑

●CAN-FD模块处于GL_RESET模式或相关通道进入CH_RESET模式时的CAN-FD模块逻辑。

TMOM位（TX消息缓冲区一次性模式）

当TMOM位置位时，CAN-FD模块逻辑尝试仅发送一次消息。

如果传输成功，CFDTMSTSn.TMTRF位设置为10b或11b。否则，由于总线错误或总线仲裁丢失，传输将自动中止并且CFDTMSTSn.TMTRF位设置为01b。

如果传输成功完成或由于错误或仲裁丢失而中止，则TMOM位保持设置。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。

该位与TMTR位同时置位。通过写访问清除该位。

如果已请求发送消息，则在消息成功发送或发送中止之前不要写入该位。

当CAN-FD模块处于GL_RESET模式或相关通道处于CH_RESET模式时，TMOM位由CAN-FD模块逻辑自动清零。

32.2.49 CFDTMSTSn : TX Message Buffer Status Registers n (n = 0 to 7, 32 to 39, 64 to 71, 96 to 103)

Base address: CANFD = 0x400B_0000

Offset address: 0x07D0 + 0x01 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TMTSTS	TX Message Buffer Transmission Status 0: No on-going transmission 1: On-going transmission	R
2:1	TMTRF[1:0]	TX Message Buffer Transmission Result Flag 0 0: No result 0 1: Transmission aborted from the TX message buffer 1 0: Transmission successful from the TX message buffer and transmission abort was not requested 1 1: Transmission successful from the TX message buffer and transmission abort was requested	R/W
3	TMTRM	TX Message Buffer Transmission Request Mirrored 0: TX message buffer transmission not requested 1: TX message buffer transmission requested	R
4	TMTARM	TX Message Buffer Transmission Abort Request Mirrored 0: TX message buffer transmission request abort not requested 1: TX message buffer transmission request abort requested	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

The TX Message Buffer Status Registers show status of the transmission and transmission abort for the corresponding message buffers.

TMTSTS bit (TX Message Buffer Transmission Status)

The TMTSTS bit is set automatically at the start of the transmission from the corresponding TX message buffer.

This bit is cleared automatically when:

- Transmission stops
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

TMTRF[1:0] bits (TX Message Buffer Transmission Result Flag)

The TMTRF[1:0] bits show the result for the corresponding TX message buffer. The status is as follows:

- 00: Transmission in progress or has not been requested
- 01: Transmission has been aborted from the corresponding TX message buffer
- 10: Transmission was successful from the corresponding TX message buffer and the CFDTMCn.TMTAR bit was not set for this TX message buffer
- 11: Transmission was successful from the corresponding TX message buffer, but the CFDTMCn.TMTAR bit was set for this TX message buffer.

Only write to these bits when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

The TMTRF[1:0] bits are cleared automatically when the CAN-FD module is in GL_RESET mode or the related channel is in CH_RESET mode.

32.2.49 CFDTMSTSn：TX消息缓冲区状态寄存器n（n=0到7、32到39、64到71、96到103）

Base address: CANFD = 0x400B_0000

Offset address: 0x07D0 + 0x01 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TMTSTS	TX消息缓冲区传输状态 0：没有进行中的传输1：进行中的传输	R
2:1	TMTRF[1:0]	TX消息缓冲区传输结果标志 00：无结果01：从TX报文缓冲区中止传输10：从TX报文缓冲区传输成功并且未请求传输中止 11：从TX报文缓冲区传输成功并请求传输中止	R/W
3	TMTRM	TX消息缓冲区传输请求已镜像 0：未请求TX消息缓冲区传输1：请求TX消息缓冲区传输	R
4	TMTARM	TX消息缓冲区传输中止请求已镜像 0：未请求TX报文缓冲区传输请求中止1：已请求TX报文缓冲区传输请求中止	R
7:5	—	这些位被读取为0。写入值应为0。	R/W

TX报文缓冲区状态寄存器显示相应报文缓冲区的传输和传输中止状态。

TMTSTS位（TX报文缓冲区传输状态）

TMTSTS位在相应TX报文缓冲区的传输开始时自动设置。

该位在以下情况下自动清零：

●传输停止

●CAN-FD模块处于GL_RESET模式

●相关的CAN-FD通道处于CH_RESET模式。

TMTRF[1:0]位（TX报文缓冲区传输结果标志）

TMTRF[1:0]位显示相应TX报文缓冲区的结果。状态如下：

●00：传输中或未请求

●01：已从相应的TX消息缓冲区中止传输

●10：从相应的TX报文缓冲区发送成功，并且没有为该TX报文缓冲区设置CFDTMCn.TMTAR位

●11：从相应的TX报文缓冲区发送成功，但为该TX报文缓冲区设置了CFDTMCn.TMTAR位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入这些位。

当CAN-FD模块处于GL_RESET模式或相关通道处于CH_RESET模式时，TMTRF[1:0]位会自动清零。

TMTRM bit (TX Message Buffer Transmission Request Mirrored)

The TMTRM bit is set when the CFDTMCn.TMTR bit in the corresponding CFDTMCn register is set.

This bit is cleared when the CFDTMCn.TMTR bit in the corresponding CFDTMCn register is cleared.

TMTARM bit (TX Message Buffer Transmission Abort Request Mirrored)

The TMTARM bit is set when the CFDTMCn.TMTAR bit in the corresponding CFDTMCn register is set.

This bit is cleared when the CFDTMCn.TMTAR bit in the corresponding CFDTMCn register is cleared.

32.2.50 CFDTMTRSTSf : TX Message Buffer Transmission Request Status Register f (f = 0 to 3)

Base address: CANFD = 0x400B_0000

Offset address: 0x0CD0 + 0x04 × f

Bit position:	31																						8	7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFDTMTRSTSg[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CFDTMTRSTSg[7:0]	TX Message Buffer Transmission Request Status 0: Transmission not requested for corresponding TX message buffer 1: Transmission requested for corresponding TX message buffer	R
31:8	—	These bits are read as 0. The write value should be 0.	R

CFDTMTRSTSg[7:0] bits (TX Message Buffer Transmission Request Status)

The CFDTMTRSTSg[7:0] bits show status of the CFDTMCn.TMTR bits of the TX Message Buffer Control Registers.

Each bit is set automatically when the corresponding bit is set in the TX Message Buffer Control Registers (CFDTMCn), and only when the message buffer does not belong to a TX Queue.

Each bit is cleared automatically when:

- The corresponding bit is cleared in the TX Message Buffer Control Registers
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

32.2.51 CFDTMTARSTSf : TX Message Buffer Transmission Abort Request Status Register f (f = 0 to 3)

Base address: CANFD = 0x400B_0000

Offset address: 0x0D70 + 0x04 × f

Bit position:	31																						8	7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFDTMTARSTSg[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CFDTMTARSTSg[7:0]	TX Message Buffer Transmission Abort Request Status 0: Transmission abort not requested for corresponding TX message buffer 1: Transmission abort requested for corresponding TX message buffer	R
31:8	—	These bits are read as 0. The write value should be 0.	R

TMTRM位（镜像的TX消息缓冲区传输请求）

当相应CFDTMCn寄存器中的CFDTMCn.TMTR位置位时，TMTRM位置位。

当相应CFDTMCn寄存器中的CFDTMCn.TMTR位清零时，该位清零。

TMTARM位（已镜像TX消息缓冲区传输中止请求）

当相应的CFDTMCn寄存器中的CFDTMCn.TMTAR位被置位时，TMTARM位被置位。

当相应CFDTMCn寄存器中的CFDTMCn.TMTAR位清零时，该位清零。

32.2.50 CFDTMTRSTSf：TX报文缓冲区传输请求状态寄存器f（f=0到3）

Base address: CANFD = 0x400B_0000

Offset address: 0x0CD0 + 0x04 × f

Bit position:	31																						8	7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFDTMTRSTSg[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CFDTMTRSTSg[7:0]	TX消息缓冲区传输请求状态 0：对应的TX报文缓冲区未请求传输1：对应的TX报文缓冲区请求传输	R
31:8	—	这些位被读取为0。写入值应为0。	R

CFDTMTRSTSg[7:0]位（TX消息缓冲区传输请求状态）

CFDTMTRSTSg[7:0]位显示TX报文缓冲区控制寄存器的CFDTMCn.TMTR位的状态。

当TX报文缓冲区控制寄存器(CFDTMCn)中的相应位置位时，每个位都会自动设置，并且仅当报文缓冲区不属于TX队列时。

在以下情况下，每个位都会自动清除：

- TX报文缓冲区控制寄存器中的相应位清零
- CAN-FD模块处于GL_RESET模式
- 相关的CAN-FD通道处于CH_RESET模式。

32.2.51 CFDTMTARSTSf:TX消息缓冲区传输中止请求状态寄存器f（f=0到3）

Base address: CANFD = 0x400B_0000

Offset address: 0x0D70 + 0x04 × f

Bit position:	31																						8	7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CFDTMTARSTSg[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CFDTMTARSTSg[7:0]	TX消息缓冲区传输中止请求状态 0：对应的TX报文缓冲区未请求发送中止1：对应的TX报文缓冲区请求发送中止	R
31:8	—	这些位被读取为0。写入值应为0。	R

CFDTMTARSTSg[7:0] bits (TX Message Buffer Transmission Abort Request Status)

The CFDTMTARSTSg[7:0] bits show status of the CFDTMCn.TMTAR bits of the TX Message Buffer Control Registers.

Alignment of the CFDTMTARSTSg[7:0] bits is shown in Table 32.5.

Table 32.5 Alignment of CFDTMTARSTSg[7:0] mirror bits

Bit position	g = TX message buffer number
n*64-fmin*32	n*64+0
n*64+1-fmin*32	n*64+1
⋮	⋮
n*64+31-fmin*32	n*64+31
n*64+32-fmax*32	n*64+32
n*64+33-fmax*32	n*64+33
⋮	⋮
n*64+62-fmax*32	n*64+62
n*64+63-fmax*32	n*64+63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1, fmin = 2, fmax = 3

Each bit is set automatically when the corresponding bit is set in the TX Message Buffer Control Registers, and when the message buffer belongs to a TX Queue.

Each bit is cleared automatically when:

- The corresponding bit is cleared in the TX Message Buffer Control Registers
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

32.2.52 CFDTMTCSTSf : TX Message Buffer Transmission Completion Status Register f (f = 0 to 3)

Base address: CANFD = 0x400B_0000

Offset address: 0x0E10 + 0x04 × f

Bit position:	31 … 8	7 … 0
Bit field:	—	CFDTMTCSTSf[7:0]
Value after reset:	0	0

Bit	Symbol	Function	R/W
7:0	CFDTMTCSTSf[7:0]	TX Message Buffer Transmission Completion Status 0: Transmission not complete for corresponding TX message buffer 1: Transmission completed for corresponding TX message buffer	R
31:8	—	These bits are read as 0. The write value should be 0.	R

CFDTMTCSTSf[7:0] bits (TX Message Buffer Transmission Completion Status)

The CFDTMTCSTSf[7:0] bits show status of successful completion of the TX Message Buffer Status Registers.

Each bit is set automatically when the corresponding bit is set in the TX Message Buffer Status Registers.

Each bit is cleared automatically when:

- The corresponding bit is cleared in the TX Message Buffer Status Registers
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

CFDTMTARSTSg[7:0]位（TX报文缓冲区传输中止请求状态）

CFDTMTARSTSg[7:0]位显示TX报文缓冲区控制寄存器的CFDTMCn.TMTAR位的状态。

CFDTMTARSTSg[7:0]位的对齐方式如表32.5所示。

Table 32.5 CFDTMTARSTSg[7:0]镜像位的对齐

位位置	g=TX消息缓冲区编号
n*64-fmin*32	n*64+0
n*64+1-fmin*32	n*64+1
⋮	⋮
n*64+31-fmin*32	n*64+31
n*64+32-fmax*32	n*64+32
n*64+33-fmax*32	n*64+33
⋮	⋮
n*64+62-fmax*32	n*64+62
n*64+63-fmax*32	n*64+63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1, fmin = 2, fmax = 3

当TX报文缓冲区控制寄存器中的相应位被设置时，并且报文缓冲区属于TX队列时，每个位都会自动设置。

在以下情况下，每个位都会自动清除：

- TX报文缓冲区控制寄存器中的相应位清零
- CAN-FD模块处于GL_RESET模式
- 相关的CAN-FD通道处于CH_RESET模式。

32.2.52 CFDTMTCSTSf：TX报文缓冲区传输完成状态寄存器f（f=0到3）

Base address: CANFD = 0x400B_0000

Offset address: 0x0E10 + 0x04 × f

Bit position:	31 … 8	7 … 0
Bit field:	—	CFDTMTCSTSf[7:0]
重置后的值:	0	0

Bit	Symbol	Function	R/W
7:0	CFDTMTCSTSf[7:0]	TX消息缓冲区传输完成状态 0：对应的TX报文缓冲区的传输未完成1：对应的TX报文缓冲区的传输完成	R
31:8	—	这些位被读取为0。写入值应为0。	R

CFDTMTCSTSf[7:0]位（TX消息缓冲区传输完成状态）

CFDTMTCSTSf[7:0]位显示成功完成TX报文缓冲区状态寄存器的状态。

当在TX报文缓冲区状态寄存器中设置相应位时，每个位都会自动设置。

在以下情况下，每个位都会自动清除：

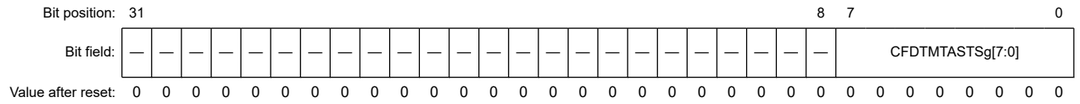
- TX报文缓冲区状态寄存器中的相应位清零
- CAN-FD模块处于GL_RESET模式
- 相关的CAN-FD通道处于CH_RESET模式。

If a CAN channel enters CH_RESET mode, then the bits related to that channel are cleared.

32.2.53 CFDTMTASTSf : TX Message Buffer Transmission Abort Status Register f (f = 0 to 3)

Base address: CANFD = 0x400B_0000

Offset address: 0x0EB0 + 0x04 × f



Bit	Symbol	Function	R/W
7:0	CFDTMTASTSg[7:0]	TX Message Buffer Transmission Abort Status 0: Transmission not aborted for corresponding TX message buffer 1: Transmission aborted for corresponding TX message buffer	R
31:8	—	These bits are read as 0. The write value should be 0.	R

CFDTMTASTSg[7:0] bits (TX Message Buffer Transmission Abort Status)

The CFDTMTASTSg[7:0] bits show status of the successful transmission abort of the corresponding TX message buffer.

Alignment of the CFDTMTASTSg[7:0] bits is shown in Table 32.6.

Table 32.6 Alignment of CFDTMTASTSg[7:0] mirror bits

Bit position	g = TX message buffer number
n*64-fmin*32	n*64+0
n*64+1-fmin*32	n*64+1
⋮	⋮
n*64+31-fmin*32	n*64+31
n*64+32-fmax*32	n*64+32
n*64+33-fmax*32	n*64+33
⋮	⋮
n*64+62-fmax*32	n*64+62
n*64+63-fmax*32	n*64+63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1, fmin = 2, fmax = 3

Each bit is set automatically when the CFDTMSTSn.TMTRF bits are set to 01b in the corresponding TX Message Buffer Status Register.

Each bit is cleared automatically when:

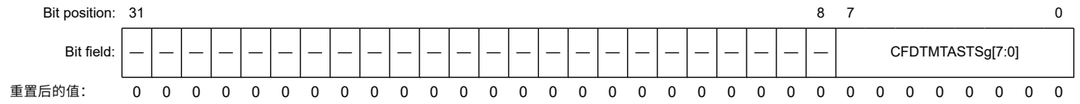
- The CFDTMSTSn.TMTRF bits are cleared in the corresponding TX Message Buffer Status Register
- The CAN-FD module is in GL_RESET mode
- The related CAN-FD channel is in CH_RESET mode.

如果CAN通道进入CH_RESET模式，则与该通道相关的位被清除。

32.2.53 CFDTMTASTSf：TX报文缓冲区传输中止状态寄存器f（f=0到3）

Base address: CANFD = 0x400B_0000

Offset address: 0x0EB0 + 0x04 × f



Bit	Symbol	Function	R/W
7:0	CFDTMTASTSg[7:0]	TX报文缓冲区传输中止状态 0：相应的TX报文缓冲区的传输未中止1：相应的TX报文缓冲区的传输中止	R
31:8	—	这些位被读取为0。写入值应为0。	R

CFDTMTASTSg[7:0]位（TX报文缓冲区传输中止状态）

CFDTMTASTSg[7:0]位显示相应TX消息缓冲区的成功发送中止状态。

CFDTMTASTSg[7:0]位的对齐如表32.6所示。

Table 32.6 CFDTMTASTSg[7:0]镜像位的对齐

位位置	g=TX消息缓冲区编号
n*64-fmin*32	n*64+0
n*64+1-fmin*32	n*64+1
⋮	⋮
n*64+31-fmin*32	n*64+31
n*64+32-fmax*32	n*64+32
n*64+33-fmax*32	n*64+33
⋮	⋮
n*64+62-fmax*32	n*64+62
n*64+63-fmax*32	n*64+63

Note: When n = 0, fmin = 0, fmax = 1
When n = 1, fmin = 2, fmax = 3

当相应的TX报文缓冲区中的CFDTMSTSn.TMTRF位设置为01b时，每个位都会自动设置状态寄存器。

在以下情况下，每个位都会自动清除：

- CFDTMSTSn.TMTRF位在相应的TX报文缓冲区状态寄存器中清零
- CAN-FD模块处于GL_RESET模式
- 相关的CAN-FD通道处于CH_RESET模式。

32.2.54 CFDTMIECf : TX Message Buffer Interrupt Enable Configuration Register f (f = 0 to 3)

Base address: CANFD = 0x400B_0000

Offset address: 0x0F50 + 0x04 × f

Bit position:	31	…	8	7	…	0
Bit field:	—	…	—	TMIEf[7:0]		
Value after reset:	0	…	0	0	…	0

Bit	Symbol	Function	R/W
7:0	TMIEf[7:0]	TX Message Buffer Interrupt Enable 0: TX message buffer interrupt disabled for corresponding TX message buffer 1: TX message buffer interrupt enabled for corresponding TX message buffer	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R

TMIEf[7:0] bits (TX Message Buffer Interrupt Enable)

If the TMIEf[7:0] bits are set, an interrupt is generated at the end of a successful transmission from the corresponding message buffer.

See section 32.7. Interrupts and DMA for TX Message Buffer Interrupt specification.

Do not write to the TMIEf[7:0] bits when:

- The CAN-FD module is in GL_SLEEP mode
- The related CAN-FD channel is in CH_SLEEP mode
- The corresponding TX message buffer is part of a TX Queue
- The corresponding TX message buffer is linked to a Common FIFO with the CFDCFCCn.CFTML bits.

32.2.55 CFDTXQCC0n : TX Queue Configuration/Control Registers 0n (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1000 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQOFTXIE	TXQOFRXIE	TXQFIE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	TXQDC[12:8]					TXQIM	—	TXQTXIE	—	—	—	TXQGWE	TXQE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TXQE	TX Queue Enable 0: TX Queue disabled 1: TX Queue enabled	R/W
1	TXQGWE	TX Queue Gateway Mode Enable 0: TX Queue GW mode disabled 1: TX Queue GW mode enabled	R/W
4:2	—	These bits are read as 0. The write value should be 0.	R/W
5	TXQTXIE	TX Queue TX Interrupt Enable 0: TX Queue TX interrupt disabled 1: TX Queue TX interrupt enabled	R/W

32.2.54 CFDTMIECf：TX报文缓冲区中断使能配置寄存器f（f=0到3）

Base address: CANFD = 0x400B_0000

Offset address: 0x0F50 + 0x04 × f

Bit position:	31	…	8	7	…	0
Bit field:	—	…	—	TMIEf[7:0]		
重置后的值：	0	…	0	0	…	0

Bit	Symbol	Function	R/W
7:0	TMIEf[7:0]	TX报文缓冲区中断使能 0：禁用相应TX报文缓冲区的TX报文缓冲区中断1：启用相应TX报文缓冲区的TX报文缓冲区中断	R/W
31:8	—	这些位被读取为0。写入值应为0。	R

TMIEf[7:0]位（TX报文缓冲区中断使能）

如果TMIEf[7:0]位被设置，则在从相应的消息缓冲区成功传输结束时会产生中断。

请参见第32.7节。TX消息缓冲区中断规范的中断和DMA。

在以下情况下不要写入TMIEf[7:0]位：

- ●CAN-FD模块处于GL_SLEEP模式
- ●相关CAN-FD通道处于CH_SLEEP模式
- ●对应的TX消息缓冲区是TXQueue的一部分
- ●相应的TX报文缓冲区通过CFDCFCCn.CFTML位链接到CommonFIFO。

32.2.55 CFDTXQCC0n：TX队列配置控制寄存器0n(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1000 + 0x04 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQOFTXIE	TXQOFRXIE	TXQFIE
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TXQE	TX队列启用 0：禁用TX队列1：启用TX队列	R/W
1	TXQGWE	TX队列网关模式启用 0：禁用TXQueueGW模式1：启用TXQueueGW模式	R/W
4:2	—	这些位被读取为0。写入值应为0。	R/W
5	TXQTXIE	TX队列TX中断使能 0：禁止发送队列发送中断1：允许发送队列发送中断	R/W

Bit	Symbol	Function	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	TXQIM	TX Queue Interrupt Mode 0: When the last message is successfully transmitted 1: At every successful transmission	R/W
12:8	TXQDC[12:8]	TX Queue Depth Configuration 0x00: 0 messages 0x01: Reserved 0x02: 3 messages 0x03: 4 messages ⋮ 0x0F: 16 messages Others: Setting prohibited	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
16	TXQFIE	TXQ Full Interrupt Enable 0: TX Queue full interrupt generation disabled 1: TX Queue full interrupt generation enabled	R/W
17	TXQOFRXIE	TXQ One Frame Reception Interrupt Enable 0: One Frame RX interrupt generation disabled 1: One Frame RX interrupt generation enabled	R/W
18	TXQOFTXIE	TXQ One Frame Transmission Interrupt Enable 0: One Frame TX interrupt generation disabled 1: One Frame TX interrupt generation enabled	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

The TX Queue Configuration/Control Registers 0n (n = 0, 1) are used to configure the TX Queue transmission.

TXQ0 is composed of TXMB0 to TXMB31 (at the maximum) when TXQE is enabled.

TXQE bit (TX Queue Enable)

The TXQE bit cannot be set if the configured TX Queue depth is 0x00 (CFDTXQCC0n.TXQDC == 0x00).

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

The TXQE bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQGWE bit (TX Queue Gateway Mode Enable)

When the TXQGWE bit is set, the TX Queue is in TX Queue GW mode.

When this bit is set, CPU must not access the TX Queue.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQTXIE bit (TX Queue TX Interrupt Enable)

When the TXQTXIE bit is set, an interrupt is generated based on the setting of the TXQIM bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQIM bit (TX Queue Interrupt Mode)

The TXQIM bit selects the interrupt generation condition for the TX Queue.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

Bit	Symbol	Function	R/W
6	—	该位读取为0。写入值应为0。	R/W
7	TXQIM	TX队列中断模式 0：最后一条信息发送成功时1：每次发送成功时	R/W
12:8	TXQDC[12:8]	TX队列深度配置 0x00：0条消息0x0 1：保留0x02：3条 消息0x03：4条消 息 ⋮ 0x0F: 16 messages 其他：禁止设置	R/W
15:13	—	这些位被读取为0。写入值应为0。	R/W
16	TXQFIE	TXQ全中断使能 0：禁用TX队列满中断生成1：启用TX队列满中 断生成	R/W
17	TXQOFRXIE	TXQ一帧接收中断使能 0：禁止产生一帧RX中断1：允许产生一帧RX中 断	R/W
18	TXQOFTXIE	TXQ一帧传输中断使能 0：禁用一帧TX中断生成1：启用一帧TX中断生 成	R/W
31:19	—	这些位被读取为0。写入值应为0。	R/W

TX队列配置控制寄存器0n(n=0 1)用于配置TX队列传输。

当TXQE使能时，TXQ0由TXMB0到TXMB31（最大）组成。

TXQE位（TX队列使能）

如果配置的TX队列深度为0x00(CFDTXQCC0n.TXQDC==0x00)，则无法设置TXQE位。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_RESET或CH_SLEEP模式时，请勿写入该位。

当相关CAN-FD通道处于CH_RESET模式时，TXQE位会自动清零。

TXQGWE位（TX队列网关模式启用）

当TXQGWE位置位时，TXQueue处于TXQueueGW模式。

当该位置位时，CPU不得访问TX队列。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQTXIE位（TX队列TX中断允许）

当TXQTXIE位置位时，会根据TXQIM位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

TXQIM位（TX队列中断模式）

TXQIM位选择TX队列的中断产生条件。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQDC[12:8] bits (TX Queue Depth Configuration)

The TXQDC[12:8] bits select the depth of the transmission queue. The message buffer selection starts from MB[0] up to MB[7] depending on the configured depth.

When using TXQ1 and TXQ0 simultaneously, the total depth of TXQ1 and TXQ0 should be 8 or less.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQFIE bit (TXQ Full Interrupt Enable)

When the TXQFIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS0n.TXQFIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit in Gateway mode (CFDTXQCC0n.TXQGWE = 1).

TXQOFRXIE bit (TXQ One Frame Reception Interrupt Enable)

When the TXQOFRXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS0n.TXQOFRXIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit in GW mode (CFDTXQCC0n.TXQGWE = 1).

TXQOFTXIE bit (TXQ One Frame Transmission Interrupt Enable)

When the TXQOFTXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS0n.TXQOFTXIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

32.2.56 CFDTXQCC1n : TX Queue Configuration/Control Registers 1n (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1060 + 0x04 × n

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQDC[12:8]位（TX队列深度配置）

TXQDC[12:8]位选择传输队列的深度。消息缓冲区选择从MB[0]开始直到MB[7]取决于配置的深度。

当同时使用TXQ1和TXQ0时，TXQ1和TXQ0的总深度应小于等于8。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQFIE位（TXQ完全中断允许）

当TXQFIE位置位时，会根据CFDTXQSTS0n.TXQFIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

仅在网关模式下向该位写入1(CFDTXQCC0n.TXQGWE=1)。

TXQOFRXIE位（TXQ一帧接收中断允许）

当TXQOFRXIE位置位时，会根据CFDTXQSTS0n.TXQOFRXIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

仅在GW模式下（CFDTXQCC0n.TXQGWE=1）向该位写入1。

TXQOFTXIE位（TXQ一帧传输中断允许）

当TXQOFTXIE位置位时，会根据CFDTXQSTS0n.TXQOFTXIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

31:19	—	These bits are read as 0. The write value should be 0.	R/W

The TX Queue Configuration/Control Registers 1n (n = 0, 1) are used to configure the TX Queue transmission.

TXQ1 is composed of TXMB31 to TXMB0 (at the maximum) when TXQE is enabled.

TXQE bit (TX Queue Enable)

The TXQE bit cannot be set if the configured TX Queue depth is 0x00 (CFDTXQCC1n.TXQDC == 0x00).

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQGWE bit (TX Queue Gateway Mode Enable)

When the TXQGWE bit is set, the TX Queue is in TX Queue Gateway mode.

When this bit is set, CPU must not access the TX Queue.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQTXIE bit (TX Queue TX Interrupt Enable)

When the TXQTXIE bit is set, an interrupt is generated based on the setting of the TXQIM bit.

Bit	Symbol	Function	R/W
1	TXQGWE	TX队列网关模式启用 0：禁用TXQueueGW模式1：启用TXQueueGW模式	R/W

17	TXQOFRXIE	TXQ一帧接收中断使能 0：禁止产生一帧RX中断1：允许产生一帧RX中断	R/W
18	TXQOFTXIE	TXQ一帧传输中断使能 0：禁用一帧TX中断生成1：启用一帧TX中断生成	R/W
31:19	—	这些位被读取为0。写入值应为0。	R/W

TX队列配置控制寄存器1n(n=0 1)用于配置TX队列传输。

当TXQE使能时，TXQ1由TXMB31到TXMB0（最大）组成。

TXQE位（TX队列使能）

如果配置的TX队列深度为0x00(CFDTXQCC1n.TXQDC==0x00)，则无法设置TXQE位。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_RESET或CH_SLEEP模式时，请写入该位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

TXQGWE位（TX队列网关模式启用）

当TXQGWE位置位时，TX队列处于TX队列网关模式。

当该位置位时，CPU不得访问TX队列。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQTXIE位（TX队列TX中断允许）

当TXQTXIE位置位时，会根据TXQIM位的设置产生中断。

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQIM bit (TX Queue Interrupt Mode)

The TXQIM bit selects the interrupt generation condition for the TX Queue.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_SLEEP
- CH_OPERATION.

TXQDC[12:8] bits (TX Queue Depth Configuration)

The TXQDC[12:8] bits select the depth of the transmission queue. The message buffer selection starts from MB[7] down to MB[0] depending on the configured depth.

When using TXQ1 and TXQ0 simultaneously, the total depth of TXQ1 and TXQ0 should be 8 or less.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQFIE bit (TXQ Full Interrupt Enable)

When the TXQFIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS1n.TXQFIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit when in Gateway mode (CFDTXQCC1n.TXQGWE = 1)..

TXQOFRXIE bit (TXQ One Frame Reception Interrupt Enable)

When the TXQOFRXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS1n.TXQOFRXIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit when in Gateway mode (CFDTXQCC1n.TXQGWE = 1).

TXQOFTXIE bit (TXQ One Frame Transmission Interrupt Enable)

When the TXQOFTXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS1n.TXQOFTXIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

TXQIM位（TX队列中断模式）

TXQIM位选择TX队列的中断产生条件。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_SLEEP
- CH_OPERATION.

TXQDC[12:8]位（TX队列深度配置）

TXQDC[12:8]位选择传输队列的深度。消息缓冲区选择从MB[7]开始到MB[0]取决于配置的深度。

当同时使用TXQ1和TXQ0时，TXQ1和TXQ0的总深度应小于等于8。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQFIE位（TXQ完全中断允许）

当TXQFIE位置位时，根据CFDTXQSTS1n.TXQFIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

仅在网关模式下（CFDTXQCC1n.TXQGWE=1）时向该位写入1..

TXQOFRXIE位（TXQ一帧接收中断允许）

当TXQOFRXIE位置位时，会根据CFDTXQSTS1n.TXQOFRXIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

仅在网关模式(CFDTXQCC1n.TXQGWE=1)时向该位写入1。

TXQOFTXIE位（TXQ一帧传输中断允许）

当TXQOFTXIE位置位时，会根据CFDTXQSTS1n.TXQOFTXIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

TX队列配置控制寄存器2n(n=0 1)用于配置TX队列传输。

当TXQE使能时，TXQ2由TXMB32到TXMB63（最大）组成。

TXQE位（TX队列使能）

如果配置的TX队列深度为0x00(CFDTXQCC2n.TXQDC==0x00)，则无法设置TXQE位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

RA生态工作室

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

TXQGWE bit (TX Queue Gateway Mode Enable)

When the TXQGWE bit is set, the TX Queue is in TX Queue Gateway mode. When this bit is set, CPU must not access the TX Queue.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQTXIE bit (TX Queue TX Interrupt Enable)

When the TXQTXIE bit is set, an interrupt is generated based on the setting of the TXQIM bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQIM bit (TX Queue Interrupt Mode)

The TXQIM bit selects the interrupt generation condition for the TX Queue.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQDC[12:8] bits (TX Queue Depth Configuration)

The TXQDC[12:8] bits select the depth of the transmission queue. The message buffer selection starts from MB[32] up to MB[39] depending on the configured depth.

When using TXQ3 and TXQ2 simultaneously, the total depth of TXQ3 and TXQ2 should be 8 or less.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_HALT
- CH_OPERATION
- CH_SLEEP.

TXQFIE bit (TXQ Full Interrupt Enable)

When the TXQFIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS2n.TXQFIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit when in GW mode (CFDTXQCC2n.TXQGWE = 1).

TXQOFRXIE bit (TXQ One Frame Reception Interrupt Enable)

When the TXQOFRXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS2n.TXQOFRXIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

Only write 1 to this bit when in GW mode (CFDTXQCC2n.TXQGWE = 1).

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_RESET或CH_SLEEP模式时，请勿写入该位。

TXQGWE位（TX队列网关模式启用）

当TXQGWE位置位时，TX队列处于TX队列网关模式。当该位置位时，CPU不得访问TX Queue.

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQTXIE位（TX队列TX中断允许）

当TXQTXIE位置位时，会根据TXQIM位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

TXQIM位（TX队列中断模式）

TXQIM位选择TX队列的中断产生条件。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION.

TXQDC[12:8]位（TX队列深度配置）

TXQDC[12:8]位选择传输队列的深度。消息缓冲区选择从MB[32]开始直到MB[39]取决于配置的深度。

当同时使用TXQ3和TXQ2时，TXQ3和TXQ2的总深度应小于等于8。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_HALT
- CH_OPERATION
- CH_SLEEP.

TXQFIE位（TXQ完全中断允许）

当TXQFIE位置位时，会根据CFDTXQSTS2n.TXQFIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

仅在GW模式(CFDTXQCC2n.TXQGWE=1)时向该位写入1。

TXQOFRXIE位（TXQ一帧接收中断允许）

当TXQOFRXIE位置位时，会根据CFDTXQSTS2n.TXQOFRXIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

仅在GW模式(CFDTXQCC2n.TXQGWE=1)时向该位写入1。

TXQOFTXIE bit (TXQ One Frame Transmission Interrupt Enable)

When the TXQOFTXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS2n.TXQOFTXIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQueueConfiguration控制寄存器3n(n=0 1)用于配置TXQueue传输。

当TXQE使能时，TXQ3由TXMB63到TXMB32（最大）组成。

TXQE位（TX队列使能）

如果配置的TX队列深度为0x00(CFDTXQCC3n.TXQDC==0x00)，则无法设置TXQE位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_RESET或CH_SLEEP模式时，请勿写入该位。

RA生态工作室

TXQTXIE bit (TX Queue TX Interrupt Enable)

When the TXQTXIE bit is set, an interrupt is generated based on the setting of the TXQIM bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

TXQIM bit (TX Queue Interrupt Mode)

The TXQIM bit selects the interrupt generation condition for the TX Queue.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION mode.

TXQDC[12:8] bits (TX Queue Depth Configuration)

The TXQDC[12:8] bits select the depth of the transmission queue. The message buffer selection starts from MB[39] down to MB[32] depending on the configured depth.

When using TXQ3 and TXQ2 simultaneously, the total depth of TXQ3 and TXQ2 should be 8 or less.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in any of the following modes:

- CH_SLEEP
- CH_HALT
- CH_OPERATION mode.

TXQOFTXIE bit (TXQ One Frame Transmission Interrupt Enable)

When the TXQOFTXIE bit is set, an interrupt is generated based on the setting of the CFDTXQSTS3n.TXQOFTXIF bit.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the related CAN-FD channel is in CH_SLEEP mode.

32.2.59 CFDTXQSTS0n : TX Queue Status Registers 0n (n = 0, 1)

TXQTXIE位（TX队列TX中断允许）

当TXQTXIE位置位时，会根据TXQIM位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

TXQIM位（TX队列中断模式）

TXQIM位选择TX队列的中断产生条件。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION mode.

TXQDC[12:8]位（TX队列深度配置）

TXQDC[12:8]位选择传输队列的深度。根据配置的深度，消息缓冲区选择从MB[39]开始到MB[32]。

当同时使用TXQ3和TXQ2时，TXQ3和TXQ2的总深度应小于等于8。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于以下任一模式时，请勿写入该位：

- CH_SLEEP
- CH_HALT
- CH_OPERATION mode.

TXQOFTXIE位（TXQ一帧传输中断允许）

当TXQOFTXIE位置位时，会根据CFDTXQSTS3n.TXQOFTXIF位的设置产生中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入该位。

31:20	—	These bits are read as 0. The write value should be 0.	R/W

The TX Queue Status Registers 0n (n = 0, 1) show the status of the TX Queue of corresponding CAN channel.

TXQEMP bit (TX Queue Empty)

The TXQEMP bit is set automatically when the TX Queue is disabled or no messages are stored in the TX Queue.

This bit is set automatically when:

- The last message is transmitted from the TX Queue
- The related CAN-FD channel is in CH_RESET mode.

The bit is cleared automatically when the first message to be transmitted is stored in the TX Queue.

TXQFLL bit (TX Queue Full)

The TXQFLL bit is set automatically when the number of CAN messages stored in the TX Queue matches the configured TX Queue depth.

This bit is cleared automatically when:

- The number of CAN messages stored in the TX Queue is less than the configured TX Queue depth
- The related CAN-FD channel is in CH_RESET mode.

TXQTXIF bit (TX Queue TX Interrupt Flag)

The TXQTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

This bit is set automatically when the configured interrupt condition is satisfied for the TX Queue.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMC[13:8] bits (TX Queue Message Count)

The TXQMC[13:8] bits show the number of CAN messages in the TX Queue.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Bit	Symbol	Function	R/W
2	TXQTXIF	TX队列TX中断标志 0：一帧TX后不满足TX队列中断条件1：一帧TX后满足TX队列中断条件	R/W

31:20	—	这些位被读取为0。写入值应为0。	R/W

TX队列状态寄存器0n(n=0 1)显示相应CAN通道的TX队列状态。

TXQEMP位（TX队列空）

当TX队列被禁用或没有消息存储在TX队列中时，TXQEMP位自动置位。

该位在以下情况下自动设置：

●最后一条消息是从TXQueue发送的

●相关的CAN-FD通道处于CH_RESET模式。

当要发送的第一个消息存储在TX队列中时，该位会自动清除。

TXQFLL位（TX队列已满）

当存储在TX队列中的CAN报文数量与配置的匹配时，自动设置TXQFLL位
TX队列深度。

该位在以下情况下自动清零：

●TXQueue中存储的CAN报文数量小于配置的TXQueue深度

●相关的CAN-FD通道处于CH_RESET模式。

TXQTXIF位（TX队列TX中断标志 ）

如果TX队列被禁止，TXQTXIF位不会自动清零。

停止TX队列时，应在禁用TXQE并检查TX队列的空状态后清除该位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

当为TX队列配置的中断条件满足时，该位自动置位。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQMC[13:8]位（TX队列消息计数）

TXQMC[13:8]位显示TX队列中的CAN报文数。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

TXQFIF bit (TXQ Full Interrupt Flag)

The TXQFIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Only in GW mode (CFDTXQCC0n.TXQGWE = 1) that this bit is set automatically when the TX Queue enters a buffer full status.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFRXIF bit (TXQ One Frame Reception Interrupt Flag)

The TXQOFRXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When receiving data is stored in the TX Queue in Gateway mode, this bit is set automatically.

This function can only be used in GW mode of the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFTXIF bit (TXQ One Frame Transmission Interrupt Flag)

The TXQOFTXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When transmission is successful in the TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMLT bit (TXQ Message Lost)

The TXQMLT bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When a message lost occurs in GW mode of the TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQFIF位（TXQ满中断标志）

如果TX队列被禁止，TXQFIF位不会自动清零。

停止TX队列时，应在禁用TXQE并检查TX的空状态后清除该位
Queue.

只有在GW模式下（CFDTXQCC0n.TXQGWE=1），当TX队列进入缓冲区满状态时，该位才会自动置位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQOFRXIF位（TXQ一帧接收中断标志）

如果TX队列被禁止，TXQOFRXIF位不会自动清零。

停止TX队列时，应在禁用TXQE并检查TX队列的空状态后清除该位。
当接收数据在网关模式下存储在TX队列中时，该位自动设置。

该功能只能在TXQueue的GW模式下使用。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQOFTXIF位（TXQ一帧发送中断标志）

如果TX队列被禁止，TXQOFTXIF位不会自动清零。

停止TX队列时，应在禁用TXQE并检查TX队列的空状态后清除该位。
当TXQueue中的传输成功时，该位自动置位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQMLT位（TXQ消息丢失）

如果TX队列被禁止，TXQMLT位不会自动清零。

停止TX队列时，应在禁用TXQE并检查TX队列的空状态后清除该位。
当TXQueue的GW模式下发生消息丢失时，该位自动置位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQMC[13:8]位（TX队列消息计数）

TXQMC[13:8]位显示TX队列中的CAN报文数。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

TXQFIF位（TXQ满中断标志）

如果TX队列被禁止，TXQFIF位不会自动清零。

停止TX队列时，应在禁用TXQE并检查TX队列的空状态后清除该位。

只有在网关模式（CFDTXQCC1n.TXQGWE=1）下，当TXQueue进入缓冲区满状态时，该位才会自动设置。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQOFRXIF位（TXQ一帧接收中断标志）

如果TX队列被禁止，TXQOFRXIF位不会自动清零。

停止TX队列时，应在禁用TXQE并检查TX队列的空状态后清除该位。
当接收数据在网关模式下存储在TX队列中时，该位自动设置。

该功能只能在TXQueue的GW模式下使用。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQOFTXIF位（TXQ一帧发送中断标志）

如果TX队列被禁止，TXQOFTXIF位不会自动清零。

停止TX队列时，应在禁用TXQE并检查TX队列的空状态后清除该位。
当TXQueue中的传输成功时，该位自动置位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMLT bit (TXQ Message Lost)

The TXQMLT bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue. When a message lost occurs in GW mode of the TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

The TX Queue Status Registers 2n (n = 0, 1) show the status of the TX Queue of corresponding CAN Channel.

TXQEMP bit (TX Queue Empty)

The TXQEMP bit is set automatically when the TX Queue is disabled or no messages are stored in the TX Queue.

This bit is cleared automatically when the first message to be transmitted is stored in the TX Queue.

This bit is set automatically when:

- The last message is transmitted from the TX Queue
- The related CAN-FD channel is in CH_RESET mode.

TXQFLL bit (TX Queue Full)

The TXQFLL bit is set automatically when the number of CAN messages stored in the TX Queue matches the configured TX Queue depth

This bit is cleared automatically when:

- The number of CAN messages stored in the TX Queue is less than the configured TX Queue depth
- The related CAN-FD channel is in CH_RESET mode.

TXQTXIF bit (TX Queue TX Interrupt Flag)

The TXQTXIF bit is not cleared automatically if the TX Queue is disabled.

This bit is set automatically when the configured interrupt condition is satisfied for the TX Queue.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMC[13:8] bits (TX Queue Message Count)

The TXQMC[13:8] bits show the number of CAN messages in the TX Queue.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

TXQFIF bit (TXQ Full Interrupt Flag)

The TXQFIF bit is not cleared automatically if the TX Queue is disabled.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Only in Gateway mode (CFDTXQCC2n.TXQGWE = 1) that this bit is set automatically when the TX Queue enters a buffer full status.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

Bit	Symbol	Function	R/W
19	TXQMLT	TXQ消息丢失 0：TXQ中没有消息丢失1： TXQ消息丢失	R/W
31:20	—	这些位被读取为0。写入值应为0。	R/W

TX队列状态寄存器2n(n=0 1)显示相应CAN通道的TX队列状态。

TXQEMP位（TX队列空）

当TX队列被禁用或没有消息存储在TX队列中时，TXQEMP位自动置位。

当要发送的第一个消息存储在TX队列中时，该位会自动清零。

该位在以下情况下自动设置：

●最后一条消息是从TXQueue发送的

●相关的CAN-FD通道处于CH_RESET模式。

TXQFLL位（TX队列已满）

当存储在TX队列中的CAN报文数量与配置的匹配时，自动设置TXQFLL位
TX队列深度

该位在以下情况下自动清零：

●TXQueue中存储的CAN报文数量小于配置的TXQueue深度

●相关的CAN-FD通道处于CH_RESET模式。

TXQTXIF位（TX队列TX中断标志 ）

如果TX队列被禁止，TXQTXIF位不会自动清零。

当为TX队列配置的中断条件满足时，该位自动置位。

停止TX队列时，应在禁用TXQE并检查TX的空状态后清除该位
Queue.

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQMC[13:8]位（TX队列消息计数）

TXQMC[13:8]位显示TX队列中的CAN报文数。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

TXQFIF位（TXQ满中断标志）

如果TX队列被禁止，TXQFIF位不会自动清零。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

停止TX队列时，应在禁用TXQE并检查TX的空状态后清除该位
Queue.

只有在网关模式（CFDTXQCC2n.TXQGWE=1）下，当TX队列进入缓冲区满状态时，该位才会自动设置。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

该位被清除：

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFRXIF bit (TXQ One Frame Reception Interrupt Flag)

The TXQOFRXIF bit is not cleared automatically if the TX Queue is disabled.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.
When receiving data is stored in the TX Queue in Gateway mode, this bit is set automatically.

This function can only be used in Gateway mode of the TX queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared.
Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQOFTXIF bit (TXQ One Frame Transmission Interrupt Flag)

The TXQOFTXIF bit is not cleared automatically if the TX Queue is disabled.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.
When transmission is successful in the TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared.
Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMLT bit (TXQ Message Lost)

The TXQMLT bit is not cleared automatically if the TX Queue is disabled.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.
When a message lost occurs in Gateway mode of the TX Queue, this bit is set automatically.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared.
Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

31:19	—	These bits are read as 0. The write value should be 0.	R/W

The TX Queue Status Registers 3n (n = 0, 1) show the status of the TX Queue of corresponding CAN Channel.

TXQEMP bit (TX Queue Empty)

The TXQEMP bit is cleared automatically when the first message to be transmitted is stored in the TX Queue.

This bit is set automatically when:

- The TX Queue is disabled or no messages are stored in the TX Queue
- The last message is transmitted from the TX Queue
- The related CAN-FD channel is in CH_RESET mode.

TXQFLL bit (TX Queue Full)

The TXQFLL bit is set automatically when the number of CAN messages stored in the TX Queue matches the configured TX Queue depth.

This bit is cleared automatically when:

- The number of CAN messages stored in the TX Queue is less than the configured TX Queue depth
- The related CAN-FD channel is in CH_RESET mode.

TXQTXIF bit (TX Queue TX Interrupt Flag)

The TXQTXIF bit is not cleared automatically if the TX Queue is disabled.

This bit is set automatically when the configured interrupt condition is satisfied for the TX Queue.

When stopping TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of TX Queue.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

TXQMC[13:8] bits (TX Queue Message Count)

The TXQMC[13:8] bits show the number of CAN messages in the TX Queue.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

Bit	Symbol	Function	R/W

31:19	—	这些位被读取为0。写入值应为0。	R/W

TX队列状态寄存器3n(n=0 1)显示相应CAN通道的TX队列状态。

TXQEMP位（TX队列空）

当要发送的第一个消息存储在TX队列中时，TXQEMP位会自动清零。

该位在以下情况下自动设置：

●TXQueue被禁用或TXQueue中没有消息存储

●最后一条消息是从TXQueue发送的

●相关的CAN-FD通道处于CH_RESET模式。

TXQFLL位（TX队列已满）

当存储在TX队列中的CAN报文数量与配置的匹配时，自动设置TXQFLL位
TX队列深度。

该位在以下情况下自动清零：

●TXQueue中存储的CAN报文数量小于配置的TXQueue深度

●相关的CAN-FD通道处于CH_RESET模式。

TXQTXIF位（TX队列TX中断标志 ）

如果TX队列被禁止，TXQTXIF位不会自动清零。

当为TX队列配置的中断条件满足时，该位自动置位。

停止TXQueue时，应在禁用TXQE并检查TXQueue的空状态后清除该位。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

TXQMC[13:8]位（TX队列消息计数）

TXQMC[13:8]位显示TX队列中的CAN报文数。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

TXQOFTXIF bit (TXQ One Frame Transmission Interrupt Flag)

The TXQOFTXIF bit is not cleared automatically if the TX Queue is disabled. When transmission is successful in the TX Queue, this bit is set automatically.

You cannot write to this bit when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode. When stopping the TX Queue, this bit should be cleared, after disabling TXQE and checking an empty state of the TX Queue.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1. Writing 1 has no effect.

The bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

32.2.63 CFDTXQPCTR0n : TX Queue Pointer Control Registers 0n (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1040 + 0x04 × n

Bit position:	31																								7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	TXQPC[7:0]	TX Queue Pointer Control Increments the write pointer to the TX Queue buffer in the corresponding channel	W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The TX Queue Pointer Control Registers 0n (n = 0, 1) are used to confirm storage of a full message in the corresponding TX Queue buffers.

TXQPC[7:0] bits (TX Queue Pointer Control)

When the value 0xFF is written to the TXQPC[7:0] bits, the write pointer of the corresponding TX Queue buffer is updated and a transmit request is initiated for this message.

The read value from these bits is always 0x00. Do not write to the FIFO control registers when DMA is enabled.

You cannot write to these bits when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Only write 0xFF to this register when:

- The corresponding TX Queue is enabled and not full
- The Common FIFO is enabled and is not configured in GW mode.

32.2.64 CFDTXQPCTR1n : TX Queue Pointer Control Registers 1n (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x10A0 + 0x04 × n

Bit position:	31																								7							0

Bit	Symbol	Function	R/W
7:0	TXQPC[7:0]	TX Queue Pointer Control Increments the write pointer to the TX Queue buffer in the corresponding channel	W

TXQOFTXIF位（TXQ一帧发送中断标志）

如果TX队列被禁止，TXQOFTXIF位不会自动清零。当TX传输成功时
队列，这个位是自动设置的。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入该位。当停止
TXQueue，在禁用TXQE并检查TXQueue的空状态后，应清除该位。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。写1无效。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

32.2.63 CFDTXQPCTR0n：TX队列指针控制寄存器0n(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1040 + 0x04 × n

Bit position:	31																								7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQPC[7:0]							
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	TXQPC[7:0]	TX队列指针控制 将写入指针递增到相应通道中的TX队列缓冲区	W
31:8	—	这些位被读取为0。写入值应为0。	R/W

TX队列指针控制寄存器0n(n=0 1)用于确认在相应的TX中存储完整消息
队列缓冲区。

TXQPC[7:0]位（TX队列指针控制）

当值0xFF写入TXQPC[7:0]位时，相应的TX队列缓冲区的写指针被更新，并为此消息启动发送请求。

从这些位读取的值始终为0x00。启用DMA时不要写入FIFO控制寄存器。

当相关CAN-FD通道处于CH_SLEEP或CH_RESET模式时，您无法写入这些位。

仅在以下情况下向该寄存器写入0xFF：

●对应的TXQueue已启用且未满

●CommonFIFO已使能，GW模式下未配置。

32.2.64 CFDTXQPCTR1n：TX队列指针控制寄存器1n(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x10A0 + 0x04 × n

Bit position:	31																								7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQPC[7:0]							
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	TXQPC[7:0]	TX队列指针控制 将写入指针递增到相应通道中的TX队列缓冲区	W

Bit	Symbol	Function	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The TX Queue Pointer Control Registers 1n (n = 0, 1) are used to confirm storage of a full message in the corresponding TX Queue buffers.

TXQPC[7:0] bits (TX Queue Pointer Control)

When the value 0xFF is written to the TXQPC[7:0] bits, the write pointer of the corresponding TX Queue buffer is updated and a transmit request is initiated for this message.

The read value from these bits is always 0x00.

Only write 0xFF to this register when:

- The corresponding TX Queue is enabled and not full
- The Common FIFO is enabled and is not configured in GW mode.

32.2.65 CFDTXQPCTR2n : TX Queue Pointer Control Registers 2n (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1100 + 0x04 × n

Bit position:	31 … 7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TXQPC[7:0]
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	TXQPC[7:0]	TX Queue Pointer Control Increments the write pointer to the TX Queue buffer in the corresponding channel	W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

The TX Queue Pointer Control Registers 2n (n = 0, 1) are used to confirm storage of a full message in the corresponding TX Queue buffers.

TXQPC[7:0] bits (TX Queue Pointer Control)

When the value 0xFF is written to the TXQPC[7:0] bits, the write pointer of the corresponding TX Queue buffer is updated and a transmit request is initiated for this message.

The read value from these bits is always 0x00.

You cannot write to these bits when the related CAN-FD channel is in CH_SLEEP or CH_RESET mode.

Only write 0xFF to this register when:

- The corresponding TX Queue is enabled and not full
- The Common FIFO is enabled and is not configured in GW mode.

32.2.66 CFDTXQPCTR3n : TX Queue Pointer Control Registers 3n (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1160 + 0x04 × n

Bit position:	31 … 7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TXQPC[7:0]
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:8	—	这些位被读取为0。写入值应为0。	R/W

TX队列指针控制寄存器1n(n=0 1)用于确认在相应的TX中存储完整消息
队列缓冲区。

TXQPC[7:0]位（TX队列指针控制）

当值0xFF写入TXQPC[7:0]位时，相应的TX队列缓冲区的写指针被更新，并为此消息启动发送请求。

从这些位读取的值始终为0x00。

仅在以下情况下向该寄存器写入0xFF：

●对应的TXQueue已启用且未满

●CommonFIFO已使能，GW模式下未配置。

32.2.65 CFDTXQPCTR2n：TX队列指针控制寄存器2n(n=0 1)

Base address: CANFD = 0x400B_0000

The TX Queue One Frame RX Interrupt Status Register shows the status of the One Frame RX Interrupt flag of the TXQ buffers.

TXQxOFRISF[2:0] (x = 0, 1) bits (TXQ One Frame RX Interrupt Status Flag)

Each bit is set automatically when the corresponding bit is set in the TX Queue One Frame RX Interrupt Status Register.

Each bit is cleared automatically when the corresponding bit is cleared in the TX Queue One Frame RX Interrupt Status Register.

This bit is cleared when the CAN-FD module is in GL_RESET mode.

Bit position	Corresponding TX Queue
0	Channel 0 TX Queue0
1	Channel 0 TX Queue1
2	Channel 0 TX Queue2
3	Reserved
4	Channel 1 TX Queue0
5	Channel 1 TX Queue1
6	Channel 1 TX Queue2
7	Reserved

32.2.73 CFDTXQFSTS : TX Queue Full Status Register

31:12	—	These bits are read as 0. The write value should be 0.	R/W

The TX History List Configuration/Control Register n (n = 0, 1) configures the TX History List functions.

THLE bit (TX History List Enable)

The THLE bit enables the TX History List buffer when it is set.

You cannot write to this bit when the related CAN-FD channel is in CH_RESET or CH_SLEEP mode.

This bit is cleared automatically when the related CAN-FD channel is in CH_RESET mode.

THLIE bit (TX History List Interrupt Enable)

The THLIE bit enables the generation of the TX History List interrupt when it is set.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

THLIM bit (TX History List Interrupt Mode)

The THLIM bit selects the interrupt generation condition for the FIFO.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

THLDTE bit (TX History List Dedicated TX Enable)

The THLDTE bit selects the condition for storing an entry in the TX History List after successful transmission.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

THLDGE bit (TX History List Dedicated Gateway Enable)

The THLDGE bit selects the condition for storing an entry in the TX History List after successful transmission.

You cannot write to this bit when the CAN-FD module is in GL_SLEEP mode.

Do not write to this bit when the CAN-FD module is in GL_HALT or GL_OPERATION mode.

32.2.75 CFDTHLSTSn : TX History List Status Register n (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1220 + 0x04 × n (n = 0, 1)

11	THLDGE	TX历史列表专用网关启用 0：非专用网关FIFO+网关TX队列1：专用网关FIFO+网关TX队列	R/W
31:12	—	这些位被读取为0。写入值应为0。	R/W

TX历史列表配置控制寄存器n(n=0 1)配置TX历史列表功能。

THLE位（TX历史列表启用）

THLE位在设置时启用TX历史列表缓冲区。

当相关CAN-FD通道处于CH_RESET或CH_SLEEP模式时，您无法写入该位。

当相关CAN-FD通道处于CH_RESET模式时，该位自动清零。

THLIE位（TX历史列表中断允许）

THLIE位在设置时允许生成TX历史列表中断。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

THLIM位（TX历史列表中断模式）

THLIM位选择FIFO的中断产生条件。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当CAN-FD模块处于GL_HALT或GL_OPERATION模式时，请勿写入该位。

THLDTE位（TX历史列表专用TX使能）

THLDTE位选择在成功发送后将条目存储在TX历史列表中的条件。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当CAN-FD模块处于GL_HALT或GL_OPERATION模式时，请勿写入该位。

THLDGE位（TX历史列表专用网关启用）

THLDGE位选择在成功传输后将条目存储在TX历史列表中的条件。

当CAN-FD模块处于GL_SLEEP模式时，您无法写入该位。

当CAN-FD模块处于GL_HALT或GL_OPERATION模式时，请勿写入该位。

32.2.75 CFDTHLSTSn:TX历史列表状态寄存器n(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1220 + 0x04 × n (n = 0, 1)

13:8	THLMC[5:0]	TX History List Message Count Number of messages stored in TX History List	R
31:14	—	These bits are read as 0. The write value should be 0.	R/W

The TX History List Status register shows the status of data stored in the TX History List buffer.

THLEMP bit (TX History List Empty)

The THLEMP bit is set automatically when the CPU has read all the entries from the TX History List buffer.

This bit is cleared automatically when the first entry is stored to the TX History List.

This bit is set automatically when:

- TX History List is disabled
- The related CAN-FD channel is in CH_RESET mode.

THLFLL bit (TX History List Full)

The THLFLL bit is set automatically when the number of entries in the TX History List buffer matches the TX History List depth.

Each TX History List can store up to 32 entries (each channel has a dedicated TX History List).

This bit is cleared automatically when:

- The number of entries in the TX History List buffer is less than the TX History List depth
- The TX History List is disabled
- The related CAN-FD channel is in CH_RESET mode.

THLELT bit (TX History List Entry Lost)

The THLELT bit is set when a new entry cannot be stored because the related TX History List buffer is already full.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode. Writing 1 has no effect.

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

THLIF bit (TX History List Interrupt Flag)

The THLIF bit is set when the configured interrupt condition is satisfied.

Only write to this bit when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode. Writing 1 has no effect.

Bit	Symbol	Function	R/W
0	THLEMP	TX历史列表空 0：TX历史列表不为空1：TX 历史列表为空	R
1	THLFLL	TX历史列表完整 0：TX历史列表未满1：T X历史列表已满	R
2	THLELT	TX历史列表条目丢失 0：TX历史列表中没有条目丢失1 ：TX历史列表条目丢失	R/W
3	THLIF	TX历史列表中断标志 0：不满足TX历史列表中断条件1：满足TX历史列 表中断条件	R/W
7:4	—	这些位被读取为0。写入值应为0。	R/W
13:8	THLMC[5:0]	TX历史列表消息计数 TX历史列表中存储的信息数量	R
31:14	—	这些位被读取为0。写入值应为0。	R/W

TX历史列表状态寄存器显示TX历史列表缓冲区中存储的数据的状态。

THLEMP位（TX历史列表空）

当CPU从TXHistoryList缓冲区读取所有条目时，THLEMP位自动置位。

当第一个条目存储到TX历史列表时，该位自动清零。

该位在以下情况下自动设置：

●TX历史列表被禁用

●相关的CAN-FD通道处于CH_RESET模式。

THLFLL位（TX历史列表已满）

当TX历史列表缓冲区中的条目数与TX历史列表深度匹配时，自动设置THLFLL位。

每个TX历史列表最多可以存储32个条目（每个通道都有一个专用的TX历史列表）。

该位在以下情况下自动清零：

●TX历史列表缓冲区中的条目数小于TX历史列表深度

●TX历史列表被禁用

●相关的CAN-FD通道处于CH_RESET模式。

THLELT位（TX历史列表条目丢失）

当由于相关的TX历史列表缓冲区已满而无法存储新条目时，将设置THLELT位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。写1无效。

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

THLIF位（TX历史列表中断标志）

当配置的中断条件满足时，THLIF位置位。

仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入该位。写1无效。

Do not use the bit clear instruction to clear this bit. Use the MOV instruction to ensure that only the specified bit is cleared. Other bits remain 1.

This bit is cleared:

- By writing 0 to it
- When the related CAN-FD channel is in CH_RESET mode.

The bit is cleared by writing 0 to it.

This bit is automatically cleared in CH_RESET mode.

THLMC[5:0] bits (TX History List Message Count)

The THLMC[5:0] bits show the number of transmitted messages stored in the TX History List.

These bits are cleared automatically when the related CAN-FD channel is in CH_RESET mode.

32.2.76 CFDTHLACC0n : TX History List Access Registers 0 (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x8000 + 0x08 × n (n = 0, 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	TMTS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TGW	—	—	—	—	—	BN[6:0]							BT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	BT[2:0]	Buffer Type 0 0 1: Flat TX message buffer 0 1 0: TX FIFO message buffer number and gateway FIFO message number 1 0 0: TX Queue message buffer number	R
9:3	BN[6:0]	Buffer Number Number of the message buffer	R
14:10	—	These bits are read as 0. The write value should be 0.	R
15	TGW	Transmit Gateway Buffer Indication 0: No transmission from gateway 1: Transmission from gateway	R
31:16	TMTS[15:0]	Transmit Timestamp Transmit timestamp value for software drivers	R

The TX History List Access Registers 0 (n = 0, 1) provide access to the entry in the TX History List based on the read timestamp value.

BT[2:0] bits (Buffer Type)

The BT[2:0] bits indicate whether data has been stored following a transmission from a FIFO buffer, a TX Queue or a TX message buffer.

BN[6:0] bits (Buffer Number)

The BN[6:0] bits show the message buffer from which transmission was successfully completed. If a message from a Common FIFO is transmitted, then these bits show the message buffer that is linked to the Common FIFO for transmission.

TGW bit (Transmit Gateway Buffer Indication)

The TGW bit is automatically set to 1 when transmission is completed in GW mode.

不要使用位清除指令清除该位。使用MOV指令确保只清除指定位。
其他位保持1。

该位被清除：

●写入0

●当相关CAN-FD通道处于CH_RESET模式时。

该位通过向其写入0来清除。

该位在CH_RESET模式下自动清零。

THLMC[5:0]位（TX历史列表消息计数）

THLMC[5:0]位显示存储在TX历史列表中的已发送消息的数量。

当相关CAN-FD通道处于CH_RESET模式时，这些位会自动清零。

32.2.76 CFDTHLACC0n：TX历史列表访问寄存器0(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x8000 + 0x08 × n (n = 0, 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	TMTS[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	BT[2:0]	缓冲器类型 001：平坦的TX消息缓冲区010：TXFIFO消息缓冲区号和网关FIFO消息号100 ：TXQueue消息缓冲区号	R
9:3	BN[6:0]	缓冲区号 消息缓冲区的编号	R
14:10	—	这些位被读取为0。写入值应为0。	R
15	TGW	发送网关缓冲区指示 0：网关不发送1：网关发送	R
31:16	TMTS[15:0]	传输时间戳 传输软件驱动程序的时间戳值	R

TX历史列表访问寄存器0(n=0 1)根据读取的时间戳值提供对TX历史列表中条目的访问。

BT[2:0] bits (Buffer Type)

BT[2:0]位指示数据是否已在从FIFO缓冲区、TX队列或TX消息缓冲区传输后存储。

BN[6:0] bits (Buffer Number)

BN[6:0]位显示成功完成传输的消息缓冲区。如果一个消息来自
传输通用FIFO，然后这些位显示链接到通用FIFO以进行传输的消息缓冲区。

TGW位（发送网关缓冲区指示）

在GW模式下传输完成时，TGW位自动设置为1。

TMTS[15:0] bits (Transmit Timestamp)

The TMTS[15:0] bits indicate the timestamp for use by software drivers.

32.2.77 CFDTHLACC1n : TX History List Access Registers 1 (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x8004 + 0x08 × n (n = 0, 1)

Bit position:	31														17	16	15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TIFL[1:0]			TID[15:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	TID[15:0]	Transmit ID These bits indicate that message buffer reference ID, TX FIFO reference ID, or AFL pointer field is stored for software drivers.	R
17:16	TIFL[1:0]	Transmit Information Label These bits indicate that message buffer information label, TX FIFO information label, or AFL information label is stored for software drivers.	R
31:18	—	These bits are read as 0. The write value should be 0.	R/W

The TX History List Access Registers 1 provide access to entry in the TX History List based on the read pointer value.

TID[15:0] bits (Transmit ID)

The TID[15:0] bits indicate whether the message buffer reference ID (CFDTMFDCTRn.TMPTR) or the TX FIFO reference ID (CFDCFFDCSTSn.CFPTR) is for use by software drivers.

When transmission in GW mode, these bits indicate the AFL pointer field (CFDGAFLP0n.GAFLPTR) instead of the message buffer reference ID (CFDTMFDCTRn.TMPTR).

TIFL[1:0] bits (Transmit Information Label)

The TIFL[1:0] bits indicate whether the message buffer information label (CFDTMFDCTRn.TMIFL) or the TX FIFO information label (CFDCFFDCSTSn.CFIFL) is for use by software drivers.

When transmission in GW mode, these bits indicate the AFL pointer field (CFDGAFLMn.GAFLIFL1 and CFDGAFLP0n.GAFLIFL0) instead of the MB information label (CFDTMFDCTRn.TMIFL).

32.2.78 CFDTHLPCTRn : TX History List Pointer Control Registers n (n = 0, 1)

Bit	Symbol	Function	R/W
15:0	TID[15:0]	传输ID 这些位指示为软件驱动程序存储消息缓冲区参考ID、TXFIFO参考ID或AFL指针字段。	R
17:16	TIFL[1:0]	传输信息标签 这些位指示为软件驱动程序存储消息缓冲区信息标签、TXFIFO信息标签或AFL信息标签。	R
31:18	—	这些位被读取为0。写入值应为0。	R/W

TX历史列表访问寄存器1根据读取的指针值提供对TX历史列表中条目的访问。

TID[15:0] bits (Transmit ID)

TID[15:0]位指示消息缓冲区参考ID(CFDTMFDCTRn.TMPTR)还是TXFIFO参考ID(CFDCFFDCSTSn.CFPTR)供软件驱动程序使用。

在GW模式下传输时，这些位指示AFL指针字段(CFDGAFLP0n.GAFLPTR)，而不是消息缓冲区引用ID(CFDTMFDCTRn.TMPTR)。

TIFL[1:0]位（发送信息标签）

TIFL[1:0]位指示消息缓冲区信息标签(CFDTMFDCTRn.TMIFL)或TXFIFO信息标签(CFDCFFDCSTSn.CFIFL)是否供软件驱动程序使用。

在GW模式下传输时，这些位指示AFL指针字段（CFDGAFLMn.GAFLIFL1和CFDGAFLP0n.GAFLIFL0)代替MB信息标签(CFDTMFDCTRn.TMIFL)。

32.2.78 CFDTHLPCTRn:TX历史列表指针控制寄存器n(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1240 + 0x04 × n (n = 0, 1)

Bit position:	31																								7						0

重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	THLPC[7:0]	TX历史列表指针控制 将写入指针递增到相应通道中的TX历史列表	W
31:8	—	这些位被读取为0。写入值应为0。	R/W

TX历史列表指针控制寄存器n(n=0 1)用于递增TX历史列表的读指针。

THLPC[7:0] bits (TX History List Pointer Control)

When 0xFF is written to the THLPC[7:0] bits, the read pointer of the TX History List is moved to the next TX History List entry address.

The read value from these bits is always 0x00. Only write to these bits when the related CAN-FD channel is in CH_HALT or CH_OPERATION mode.

Only write 0xFF to these registers when the corresponding TX History List is enabled and not empty.

32.2.79 CFDGRSTC : Global SW reset Register

Base address: CANFD = 0x400B_0000

Offset address: 0x1380

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	SRST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRST	SW Reset 0: Normal state 1: SW reset state	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code These bits control the validity of rewriting of a SRST bit.	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

SRST bit (SW Reset)

When the SRST bit is set, the CAN-FD module is in the same state as hardware reset. When a reset is required, write 1 then write 0 to this bit.

This bit is cleared when the CAN-FD module is in GL_SLEEP mode.

When this bit is cleared, the RAM initialization sequence does not operate. The configuration of RAM is performed by software.

The RAM is not initialized when software reset is performed during the initialization of RAM. Software must perform the initialization of RAM.

KEY[7:0] bits (Key Code)

When 0xC4 is written in the KEY[15:8] bits, a write to the SRST bit is valid.

The read value from these bits is always 0x00.

CFDGRSTC.SRST bit and the CFDGRSTC.KEY bit should be written simultaneously.

THLPC[7:0]位（TX历史列表指针控制）

当0xFF写入THLPC[7:0]位时，TX历史列表的读指针将移动到下一个TX历史列表条目地址。

从这些位读取的值始终为0x00。仅当相关CAN-FD通道处于CH_HALT或CH_OPERATION模式时才写入这些位。

仅当相应的TX历史列表启用且不为空时，才向这些寄存器写入0xFF。

32.2.79 CFDGRSTC:全局软件复位寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x1380

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit field:	KEY[7:0]								—	—	—	—	—	—	—	SRST
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRST	SW Reset 0：正常状态1： 软件复位状态	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W
15:8	KEY[7:0]	关键代码 这些位控制SRST位重写的有效性。	W
31:16	—	这些位被读取为0。写入值应为0。	R/W

SRST bit (SW Reset)

当SRST位置位时，CAN-FD模块处于与硬件复位相同的状态。当需要复位时，先写1然后写0到该位。

当CAN-FD模块处于GL_SLEEP模式时，该位清零。

当该位清零时，RAM初始化序列不工作。RAM的配置由软件执行。

在RAM初始化过程中执行软件复位时，RAM不会被初始化。软件必须执行RAM的初始化。

KEY[7:0] bits (Key Code)

当KEY[15:8]位写入0xC4时，写入SRST位有效。

从这些位读取的值始终为0x00。

CFDGRSTC.SRST位和CFDGRSTC.KEY位应同时写入。

32.2.80 CFDGTSTCFG : Global Test Configuration Register

Base address: CANFD = 0x400B_0000

Offset address: 0x1308

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

25:16	RTMPS[9:0]	RAM Test Mode Page Select Select a RAM test mode page	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

The Global Test Configuration Register is used to configure the CAN channels joining the internal CAN bus communication test mode and the RAM test mode page.

ICBCE[1:0] bits (Channel n Internal CAN Bus Communication Test Mode Enable)

When the ICBCE[1:0] bits are set and CAN-FD module is configured in the internal CAN bus communication test mode, then CAN channel n joins the internal CAN bus communication test mode operation.

Do not write to these bits when the CAN-FD module is in GL_RESET or GL_SLEEP mode.

Only write to these bits when the CAN-FD module is in GL_HALT mode.

These bits are cleared automatically when the CAN-FD module is in GL_RESET mode.

RTMPS[9:0] bits (RAM Test Mode Page Select)

The RTMPS[9:0] bits select the RAM page mode for CPU read/write access when the CAN-FD module is configured in RAM test mode.

See section 32.9.2.1. RAM Test Mode for the RAM test mode specification.

Do not write to these bits when the CAN-FD module is in GL_RESET or GL_SLEEP mode.

Only enter values from 0 to 7 (0x007) for the AFL RAM and 8 to 39 (0x027) for the message buffer RAM.

Only write to these bits when the CAN-FD module is in GL_HALT mode.

These bits are cleared automatically when the related CAN-FD channel is in GL_RESET mode.

32.2.80 CFDGTSTCFG:全局测试配置寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x1308

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15:2	—	这些位被读取为0。写入值应为0。	R/W
25:16	RTMPS[9:0]	RAM测试模式页面Select选择 RAM测试模式页面	R/W
31:26	—	这些位被读取为0。写入值应为0。	R/W

全局测试配置寄存器用于配置加入内部CAN总线通信测试模式和RAM测试模式页面的CAN通道。

ICBCE[1:0]位（通道n内部CAN总线通信测试模式启用）

当ICBCE[1:0]位置位且CAN-FD模块配置为内部CAN总线通信测试模式时，CAN通道n加入内部CAN总线通信测试模式操作。

当CAN-FD模块处于GL_RESET或GL_SLEEP模式时，请勿写入这些位。

仅当CAN-FD模块处于GL_HALT模式时才写入这些位。

当CAN-FD模块处于GL_RESET模式时，这些位会自动清除。

RTMPS[9:0]位（RAM测试模式页面选择）

当CAN-FD模块配置为
RAM测试模式。

请参阅第32.9.2.1节。RAM测试模式用于RAM测试模式规范。

当CAN-FD模块处于GL_RESET或GL_SLEEP模式时，请勿写入这些位。

只为AFLRAM输入0到7(0x007)的值，为消息缓冲区RAM输入8到39(0x027)的值。

仅当CAN-FD模块处于GL_HALT模式时才写入这些位。

当相关CAN-FD通道处于GL_RESET模式时，这些位会自动清除。

32.2.81 CFDGTSTCTR : Global Test Control Register

Base address: CANFD = 0x400B_0000

Offset address: 0x130C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

2	RTME	RAM Test Mode Enable 0: RAM test mode disabled 1: RAM test mode enabled	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

The Global Test Control register is used to control the global test modes of the CAN-FD module.

ICBCTME bit (Internal CAN Bus Communication Test Mode Enable)

When the ICBCTME bit is set, internal CAN bus communication is enabled for the CAN channels that are configured for internal CAN bus communication participation. See section 32.9.2.2. Internal CAN Bus Communication Test Mode for the specification of internal CAN bus communication test mode.

Only write to this bit when the CAN-FD module is in GL_HALT mode.

Clear this bit when the CAN-FD module is in GL_HALT mode.

This bit is cleared automatically when the CAN-FD module is in GL_RESET mode.

RTME bit (RAM Test Mode Enable)

When the RTME bit is set, the CAN-FD module is configured in RAM test mode. See section 32.9.2.1. RAM Test Mode for RAM test mode specification.

Only write to this bit when the CAN-FD module is in GL_HALT mode.

Clear this bit when the CAN-FD module is in GL_HALT mode.

This bit is cleared automatically when the CAN-FD module is in GL_RESET mode.

32.2.81 CFDGTTSTCTR:全局测试控制寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x130C

1	—	该位读取为0。写入值应为0。	R/W
2	RTME	RAM测试模式启用 0：禁用RAM测试模式1：启用RAM测试模式	R/W
31:3	—	这些位被读取为0。写入值应为0。	R/W

全局测试控制寄存器用于控制CAN-FD模块的全局测试模式。

ICBCTME位（内部CAN总线通信测试模式启用）

当ICBCTME位被设置时，内部CAN总线通信被配置用于内部CAN总线通信参与的CAN通道启用。请参阅第32.9.2.2节。内部CAN总线通信测试模式用于指定内部CAN总线通信测试模式。

仅当CAN-FD模块处于GL_HALT模式时写入该位。

当CAN-FD模块处于GL_HALT模式时清零该位。

当CAN-FD模块处于GL_RESET模式时，该位会自动清零。

RTME位（RAM测试模式启用）

当RTME位置位时，CAN-FD模块配置为RAM测试模式。请参阅第32.9.2.1节。RAM测试模式RAM测试模式规范。

仅当CAN-FD模块处于GL_HALT模式时写入该位。

当CAN-FD模块处于GL_HALT模式时清零该位。

当CAN-FD模块处于GL_RESET模式时，该位会自动清零。

32.2.82 CFDGFDCFG : Global FD Configuration Register

Base address: CANFD = 0x400B_0000

Offset address: 0x1314

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31:10	—	These bits are read as 0. The write value should be 0.	R/W

RPED bit (RES Bit Protocol Exception Disable)

The RPED bit configures the protocol exception event handling according to ISO 11898-1.

When this bit is enabled, the protocol exception event detection is disabled, and the protocol controller transmits an error frame when the protocol exception event is detected (RES bit is sampled recessive).

Only write to this bit when the CAN-FD module is in GL_RESET mode.

TSCCFG[1:0] bits (Timestamp Capture Configuration)

The TSCCFG[1:0] bits configure the different capture points of the timestamp for transmission and reception.

When CFDGFDCFG.TSCCFG[1:0] = 10b, the timestamp capture is performed for CAN-FD frames at RES bit and for Classical frames at the start of frame.

Only write to these bits when the CAN-FD module is in GL_RESET mode.

32.2.83 CFDGLOCKK : Global Lock Key Register

Base address: CANFD = 0x400B_0000

Offset address: 0x131C

Bit position:	31	15	0
Bit field:	—	LOCK[15:0]	
Value after reset:	0	0	0

Bit	Symbol	Function	R/W
15:0	LOCK[15:0]	Lock Key Key bits for unlocking the protection of test modes	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The Global Lock Key register is a write-only register that is used to unlock the protection for special test bits.

32.2.82 CFDGFDCFG:全局FD配置寄存器

Base address: CANFD = 0x400B_0000

Offset address: 0x1314

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

31:10	—	这些位被读取为0。写入值应为0。	R/W

RPED位（RES位协议异常禁用）

RPED位根据ISO11898-1配置协议异常事件处理。

当该位使能时，协议异常事件检测被禁用，并且协议控制器在检测到协议异常事件时发送一个错误帧（RES位被采样为隐性）。

仅当CAN-FD模块处于GL_RESET模式时写入该位。

TSCCFG[1:0]位（时间戳捕获配置）

TSCCFG[1:0]位配置发送和接收时间戳的不同捕获点。

当CFDGFDCFG.TSCCFG[1:0]=10b时，对CAN-FD帧的RES位和帧开始处的经典帧。

仅当CAN-FD模块处于GL_RESET模式时才写入这些位。

32.2.83 CFDGLOCKK:全局锁定密钥寄存器

15:0	LOCK[15:0]	钥匙 用于解锁测试模式保护的密钥位	W
31:16	—	这些位被读取为0。写入值应为0。	R/W

全局锁定密钥寄存器是一个只写寄存器，用于解锁对特殊测试位的保护。

See section 32.9.2. Global Test Modes for Lock key specification.

LOCK[15:0] bits (Lock Key)

The unlock key sequence must be written in the LOCK[15:0] bits to configure the CAN-FD module in FIFO OTB disable and RAM test modes.

The read value from these bits is always 0x0000.

You cannot write to these bits when the CAN-FD module is in GL_SLEEP or GL_RESET mode.

Do not write to these bits when the CAN-FD module is in GL_OPERATION mode.

32.2.84 CFDRPGACCn : RAM Test Page Access Registers n (n = 0 to 63)

Bit	Symbol	Function	R/W
0	BLCE	Bus Load Counter Enable 0: Bus load counter disable 1: Bus load counter enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	BLCLD	BUS Load Counter Load When CFDCnBLCT.BLCLD is set, it is reset after a Bus load counter value is loaded.	W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

BLCE bit (Bus Load Counter Enable)

The BLCE bit indicates the enabling signal of a bus load counter. Write to this bit after setting up the CFDCnNCFG register.

请参阅第32.9.2节。锁键规范的全局测试模式。

LOCK[15:0] bits (Lock Key)

解锁密钥序列必须写入LOCK[15:0]位，以将CAN-FD模块配置为FIFOOTB禁用和RAM测试模式。

从这些位读取的值始终为0x0000。

当CAN-FD模块处于GL_SLEEP或GL_RESET模式时，您无法写入这些位。

当CAN-FD模块处于GL_OPERATION模式时，请勿写入这些位。

32.2.84 CFDRPGACCn：RAM测试页访问寄存器n（n=0到63）

Base address: CANFD = 0x400B_0000

Offset address: 0x8400 + 0x04 × n (n = 0 to 63)

Bit position:	31																													0
Bit field:	RDTA[31:0]																													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	RDTA[31:0]	RAM数据测试访问 RAM数据字节	R/W

RDTA[31:0]位（RAM数据测试访问）

当CAN-FD模块配置为RAM测试模式时，可以从RDTA[31:0]位读取或写入数据。

仅当CAN-FD模块处于GL_HALT模式并启用RAM测试模式时才写入该位。

在RAM测试模式期间，软件数据应被读取写入RAM测试页访问寄存器。

32.2.85 CFDCnBLCT:通道n总线负载控制寄存器(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1418 + 0x20 × n (n = 0, 1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BLCLD	—	—	—	—	—	—	—	BLCE
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BLCE	总线负载计数器使能 0：总线负载计数器禁用1： 总线负载计数器启用	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W
8	BLCLD	总线负载计数器负载 当CFDCnBLCT.BLCLD置位时，它会在加载总线加载计数器值后复位。	W
31:9	—	这些位被读取为0。写入值应为0。	R/W

BLCE位（总线负载计数器使能）

BLCE位指示总线负载计数器的使能信号。在设置CFDCnNCFG寄存器后写入该位。

When this bit is 0, the bus load counter stops but the counter is not clear.

The bit is cleared when the related CAN-FD channel is in CH_RESET mode.

You cannot write to this bit in CH_SLEEP mode.

BLCLD bit (BUS Load Counter Load)

When the BLCLD bit is set, the bus load counter value is loaded into CFDCnBLSTS.BLC and the bus load counter is reset.

The read value is always 0.

32.2.86 CFDCnBLSTS : Channel n Bus Load Status Register (n = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x141C + 0x20 × n (n = 0, 1)

Bit position:	31																										3		0
Bit field:	BLC[31:3]																										—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
31:3	BLC[31:3]	Bus Load Counter These bits indicate the bus load counter value.	R

BLC[31:3] bits (Bus Load Counter)

When the CFDCnBLCT.BLCLD bit is set, the bus load counter value is loaded to BLC bit and the bus load counter is reset.

Bits [2:0] are fixed to 000b.

The bus load counter increases by CANFDCLK period while the CAN bus is in an idle state.

These bits are set only by the CAN-FD module. Writing any value has no effect.

32.2.87 Message Buffer Component Structure

32.2.87.1 Start Addresses

The start address for each of the Message Buffer component is calculated using the number of related Message Buffer components and the number of channels.

no_of_channels	2
no_of_RMBCPs_per_channel	16
no_of_RFMBCPs	8
no_of_CFMBCPs_per_channel	3
no_of_TMBCPs_per_channel	16

The start addresses for each register in the Message Buffer component are depicted in Table 32.7.

Table 32.7 Message Buffer Component Register Start Addresses (1 of 2)

b = Message buffer component index	MBCP	Register	p	Regular Start Address n = [0…no_of_channels-1]
[0…no_of_RMBCPs_per_channel-1]	RMBCPb[i]	RMID	x	0x2000 + b*0x0080 + n*0x800
		RMPTR	x	0x2004 + b*0x0080 + n*0x800
		RMFDSTS	x	0x2008 + b*0x0080 + n*0x800
		RMDFp	[0…15]	0x200C + p*0x0004 + b*0x0080 + n*0x800

当该位为0时，总线加载计数器停止但计数器不清零。

当相关CAN-FD通道处于CH_RESET模式时，该位清零。

在CH_SLEEP模式下不能写入该位。

BLCLD位（总线加载计数器加载）

当设置BLCLD位时，总线加载计数器值被加载到CFDCnBLSTS.BLC并且总线加载计数器被复位。

读取值始终为0。

32.2.86 CFDCnBLSTS:通道n总线负载状态寄存器(n=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x141C + 0x20 × n (n = 0, 1)

Bit position:	31																										3		0
Bit field:	BLC[31:3]																										—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	—	这些位被读取为0。写入值应为0。	R/W
31:3	BLC[31:3]	总线负载计数器 这些位指示总线负载计数器值。	R

BLC[31:3]位（总线负载计数器）

当CFDCnBLCT.BLCLD位置位时，总线加载计数器值被加载到BLC位并且总线加载计数器被复位。

位[2:0]固定为000b。

当CAN总线处于空闲状态时，总线负载计数器增加CANFDCLK周期。

这些位仅由CAN-FD模块设置。写入任何值都没有效果。

32.2.87 消息缓冲区组件结构

32.2.87.1 起始地址

每个消息缓冲区组件的起始地址是使用相关消息缓冲区组件的数量和通道数来计算的。

no_of_channels	2
no_of_RMBCPs_per_channel	16
no_of_RFMBCPs	8
no_of_CFMBCPs_per_channel	3
no_of_TMBCPs_per_channel	16

消息缓冲区组件中每个寄存器的起始地址如表32.7所示。

Table 32.7 消息缓冲区组件寄存器起始地址(1of2)

b=消息缓冲区组件索引	MBCP	Register	p	常规起始地址n=[0…no_of_channels-1]
[0…no_of_RMBCPs_per_channel-1]	RMBCPb[i]	RMID	x	0x2000 + b*0x0080 + n*0x800
		RMPTR	x	0x2004 + b*0x0080 + n*0x800
		RMFDSTS	x	0x2008 + b*0x0080 + n*0x800
		RMDFp	[0…15]	0x200C + p*0x0004 + b*0x0080 + n*0x800

Table 32.7 Message Buffer Component Register Start Addresses (2 of 2)

b = Message buffer component index	MBCP	Register	p	Regular Start Address n = [0…no_of_channels-1]
[0…no_of_RFMBCPs-1]	RFMBCPb[i]	RFIDE	x	0x6000 + b*0x0080
		RFPTRE	x	0x6004 + b*0x0080
		RFFDSTSE	x	0x6008 + b*0x0080
		RFDFpE	[0…15]	0x600C + p*0x0004 + b*0x0080
[0…no_of_CFMBCPs_per_channel-1]	CFMBCPb[i]	CFIDE	x	0x6400 + b*0x0080 + n*0x180
		CFPTRE	x	0x6404 + b*0x0080 + n*0x180
		CFFDCSTSE	x	0x6408 + b*0x0080 + n*0x180
		CFDFpE	[0…15]	0x640C + p*0x0004 + b*0x0080 + n*0x180
[0…no_of_TMBCPs_per_channel-1]	TMBCPb[i]	TMID	x	0x10000 + b*0x0080 + n*0x2000
		TMPTR	x	0x10004 + b*0x0080 + n*0x2000
		TMFDCTR	x	0x10008 + b*0x0080 + n*0x2000
		TMDFp	[0…15]	0x1000C + p*0x0004 + b*0x0080 + n*0x2000

Note: '-' means Not Applicable

The message buffer configuration consists of four types of Message Buffer components:

- RX Message Buffer Component (CFDRMBCPb[i])
- RX FIFO Access Message Buffer Component (CFDRFMBCPb[i])
- Common FIFO Access Message Buffer Component (CFDCFMBCPb[i])
- TX Message Buffer Component (CFDTMBCPb[i]).

Where b = the Message Buffer component index that has a range that varies based on the type of Message Buffer component and i = channel index that has a range from 0 to n.

For a summary of this configuration, see Figure 32.28. For a detailed description of the number of and the different types of message buffers, see section 32.6. FIFO Buffers and Normal Message Buffer Configuration.

As described in section 32.2. Register Descriptions, each Message Buffer component consists of the following registers:

- Identifier (ID)
- Pointer (PTR)
- Data Field (DFp).

Rc is the Message Buffer Component register where c = Message Buffer Component register index that has a range that varies based on the type of Message Buffer component.

A description of the registers, their associated bits and their accessibility are shown below the summary and detailed figures of each component.

In each of the figures, a cell that contains '-' means reserved and has the same behavio as reserved bits for registers in section 32.2.87. Message Buffer Component Structure.

Table 32.7 消息缓冲区组件寄存器起始地址(2of2)

b=消息缓冲区组件索引	MBCP	Register	p	常规起始地址n=[0…no_of_channels-1]
[0…no_of_RFMBCPs-1]	RFMBCPb[i]	RFIDE	x	0x6000 + b*0x0080
		RFPTRE	x	0x6004 + b*0x0080
		RFFDSTSE	x	0x6008 + b*0x0080
		RFDFpE	[0…15]	0x600C + p*0x0004 + b*0x0080
[0…no_of_CFMBCPs_per_channel-1]	CFMBCPb[i]	CFIDE	x	0x6400 + b*0x0080 + n*0x180
		CFPTRE	x	0x6404 + b*0x0080 + n*0x180
		CFFDCSTSE	x	0x6408 + b*0x0080 + n*0x180
		CFDFpE	[0…15]	0x640C + p*0x0004 + b*0x0080 + n*0x180
[0…no_of_TMBCPs_per_channel-1]	TMBCPb[i]	TMID	x	0x10000 + b*0x0080 + n*0x2000
		TMPTR	x	0x10004 + b*0x0080 + n*0x2000
		TMFDCTR	x	0x10008 + b*0x0080 + n*0x2000
		TMDFp	[0…15]	0x1000C + p*0x0004 + b*0x0080 + n*0x2000

Note: '–'表示不适用

消息缓冲区配置由四种类型的消息缓冲区组件组成：

●RX消息缓冲区组件(CFDRMBCPb[i])

●RXFIFO访问消息缓冲区组件(CFDRFMBCPb[i])

●通用FIFO访问消息缓冲区组件(CFDCCFMBCPb[i])

●TX消息缓冲区组件(CFDTMBCPb[i])。

其中b=消息缓冲区组件索引，其范围根据消息缓冲区组件的类型而变化，i=通道索引，范围从0到n。

有关此配置的摘要，请参见图32.28。有关消息缓冲区的数量和不同类型的详细说明，请参阅第32.6节。FIFO缓冲区和正常消息缓冲区配置。

如第32.2节所述。寄存器说明，每个MessageBuffer组件由以下寄存器组成：

- Identifier (ID)
- Pointer (PTR)

●数据字段(DFp)。

Rc是消息缓冲区组件寄存器，其中c=消息缓冲区组件寄存器索引，其范围根据消息缓冲区组件的类型而变化。

每个组件的摘要和详细图下方显示了寄存器、相关位及其可访问性的描述。

在每个图中，包含"–"的单元格表示保留，并且与第32.2.87节中的寄存器保留位具有相同的行为。消息缓冲区组件结构。

32.2.87.2 CFDRMIDn_i : RX Message Buffer ID Register n Channel i (n = 0 to 15, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x2000 + 0x080 × n + 0x800 × i

Bit position:	31	30	28	0
Bit field:	RMIDE	RMRTR	—	RMID[28:0]
Value after reset:	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
28:0	RMID[28:0]	RX Message Buffer ID Field STD-ID/EXT-ID fields	R
29	—	This bit is read as 0. The write value should be 0.	R
30	RMRTR	RX Message Buffer RTR Bit 0: Data frame 1: Remote frame	R
31	RMIDE	RX Message Buffer IDE Bit 0: STD-ID is stored 1: EXT-ID is stored	R

The RX Message Buffer ID Registers n (n = 0 to 15) store the ID field, IDE bit, and RTR bit of the received message.

RMID[28:0] bits (RX Message Buffer ID Field)

The RMID[28:0] are the bits of the STD-ID/EXT-ID fields of the message stored in the RX message buffer.

See section 32.2.87.1. Start Addresses for details on how to interpret the structure of this buffer component.

RMRTR bit (RX Message Buffer RTR Bit)

The RMRTR bit shows whether a data frame or a remote frame was stored in the RX message buffer.

Note: There are no remote frames in CAN-FD format. When a CAN-FD frame is received, the register reflects the state of the received value (the RRS bit in FD frame format).

RMIDE bit (RX Message Buffer IDE Bit)

The RMIDE bit shows whether message with Standard Identifier or Extended Identifier was stored in the RX message buffer.

32.2.87.3 CFDRMPTRn_i : RX Message Buffer Pointer Register n Channel i (n = 0 to 15, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x2004 + 0x080 × n + 0x800 × i

Bit position:	31	28	15	0
Bit field:	RMDLC[3:0]	—	RMTS[15:0]	
Value after reset:	0 0 0 0	0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	

Bit	Symbol	Function	R/W
15:0	RMTS[15:0]	RX Message Buffer Timestamp Field Timestamp value stored for the message in the RX message buffer	R
27:16	—	These bits are read as 0. The write value should be 0.	R
31:28	RMDLC[3:0]	RX Message Buffer DLC Field Number of data bytes received in a CAN frame.	R

32.2.87.2 CFDRMIDn_i:RX消息缓冲区ID寄存器n通道i(n=0到15 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x2000 + 0x080 × n + 0x800 × i

Bit position:	31	30	28	0
Bit field:	RMIDE	RMRTR	—	RMID[28:0]
重置后的值:	0	0	0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
28:0	RMID[28:0]	RX消息缓冲区ID字段 STD-ID/EXT-ID fields	R
29	—	该位读取为0。写入值应为0。	R
30	RMRTR	RX报文缓冲区RTR位 0：数据帧1：远程帧	R
31	RMIDE	RX消息缓冲区IDE位 0：存储STD-ID1：存储EXT-ID	R

RX报文缓冲区ID寄存器n（n=0到15）存储接收到的报文的ID字段、IDE位和RTR位。

RMID[28:0]位（RX消息缓冲区ID字段）

RMID[28:0]是存储在RX消息缓冲区中的消息的STD-IDEXT-ID字段的位。

请参阅第32.2.87.1节。起始地址以获取有关如何解释此缓冲区组件结构的详细信息。

RMRTR位（RX报文缓冲区RTR位）

RMRTR位显示数据帧或远程帧是否存储在RX报文缓冲区中。

Note: CAN-FD格式中没有远程帧。当接收到CAN-FD帧时，寄存器反映接收值的状态（FD帧格式中的RRS位）。

RMIDE位（RX报文缓冲区IDE位）

RMIDE位显示带有标准标识符或扩展标识符的消息是否存储在RX消息缓冲区中。

32.2.87.3 CFDRMPTRn_i:RX消息缓冲区指针寄存器n通道i(n=0到15 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x2004 + 0x080 × n + 0x800 × i

Bit position:	31	28	15	0
Bit field:	RMDLC[3:0]	—	RMTS[15:0]	
重置后的值:	0 0 0 0	0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	

Bit	Symbol	Function	R/W
15:0	RMTS[15:0]	RX消息缓冲区时间戳字段 为RX消息缓冲区中的消息存储的时间戳值	R
27:16	—	这些位被读取为0。写入值应为0。	R
31:28	RMDLC[3:0]	RX消息缓冲区DLC字段 CAN帧中接收的数据字节数。	R

The RX Message Buffer Pointer Registers n (n = 0 to 15) store the DLC and Timestamp fields for the received message.

RMTS[15:0] bits (RX Message Buffer Timestamp Field)

The RMTS[15:0] bits store the timestamp value taken at the capture point as configured by CFDGFDCFG.TSCCFG of the received message.

RMDLC[3:0] bits (RX Message Buffer DLC Field)

The RMDLC[3:0] bits store the number of data bytes that were received in the RX message buffer.

See Table 5 in ISO 11898-1 (2015) Specification for details in defining the number of data bytes that were received.

Note: The maximum capacity of the buffer belongs to CFDRMNB.RMPLS and this is not available in the classical CAN function.

32.2.87.4 CFDRMFDSTSn_i : RX Message Buffer CAN-FD Status Register n Channel i (n = 0 to 15, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x2008 + 0x080 × n + 0x800 × i

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	RMPTR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	RMIFL[1:0]		—	—	—	—	—	RMFDF	RMBRS	RMESI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RMESI*1	Error State Indicator bit 0: CAN-FD frame received from error active node 1: CAN-FD frame received from error passive node	R
1	RMBRS*1	Bit Rate Switch bit 0: CAN-FD frame received with no bit rate switch 1: CAN-FD frame received with bit rate switch	R
2	RMFDF*1	CAN FD Format bit 0: Non CAN-FD frame received 1: CAN-FD frame received	R
7:3	—	These bits are read as 0. The write value should be 0.	R
9:8	RMIFL[1:0]	RX Message Buffer Information Label Field	R
15:10	—	These bits are read as 0. The write value should be 0.	R
31:16	RMPTR[15:0]	RX Message Buffer Pointer Field	R

Note 1. This bit is not available in the classical CAN function.

The RX Message Buffer CAN-FD Status Registers n (n = 0 to 2) show the status of the FDF, BRS and ESI bits, and pointer of the received CAN-FD frame.

RMESI bit (Error State Indicator bit)

The RMESI bit has the same value as the ESI bit of the received CAN-FD frame.

When the received FDF bit is 0, this means a CAN2.0 frame is received and 0 is stored to this bit.

Note: This bit is not available in the classical CAN function.

RMBRS bit (Bit Rate Switch bit)

The RMBRS bit has the same value as the BRS bit of the received CAN-FD frame.

RX消息缓冲区指针寄存器n（n=0到15）存储接收消息的DLC和时间戳字段。

RMTS[15:0]位（RX消息缓冲区时间戳字段）

RMTS[15:0]位存储在捕获点获取的时间戳值，由接收到的消息的CFDGFDCFG.TSCCFG配置。

RMDLC[3:0]位（RX消息缓冲区DLC字段）

RMDLC[3:0]位存储在RX报文缓冲区中接收到的数据字节数。

有关定义接收的数据字节数的详细信息，请参见ISO11898-1(2015)规范中的表5。

Note: 缓冲区的最大容量属于CFDRMNB.RMPLS，这在经典CAN功能中不可用。

32.2.87.4 CFDRMFDSTSn_i:RX消息缓冲区CAN-FD状态寄存器n通道i(n=0到15 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x2008 + 0x080 × n + 0x800 × i

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	RMPTR[15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	RMIFL[1:0]		—	—	—	—	—	RMFDF	RMBRS	RMESI
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RMESI*1	错误状态指示位 0：从错误主动节点接收到CAN-FD帧1：从错误被动节点接收到CAN-FD帧	R
1	RMBRS*1	比特率切换位 0：接收到的CAN-FD帧，没有比特率切换1：接收到的CAN-FD帧，有比特率切换	R
2	RMFDF*1	CANFD格式位 0：接收到非CAN-FD帧1：接收到CAN-FD帧	R
7:3	—	这些位被读取为0。写入值应为0。	R
9:8	RMIFL[1:0]	RX消息缓冲区信息标签字段	R
15:10	—	这些位被读取为0。写入值应为0。	R
31:16	RMPTR[15:0]	RX消息缓冲区指针字段	R

注1.该位在经典CAN功能中不可用。

RX消息缓冲区CAN-FD状态寄存器n（n=0到2）显示FDF、BRS和ESI位的状态，以及接收到的CAN-FD帧的指针。

RMESI位（错误状态指示位）

RMESI位与接收到的CAN-FD帧的ESI位具有相同的值。

当接收到的FDF位为0时，表示接收到CAN2.0帧，并将0存储到该位。

Note: 该位在经典CAN功能中不可用。

RMBRS位（比特率切换位）

RMBRS位与接收到的CAN-FD帧的BRS位具有相同的值。

When the received FDF bit is 0, this means a CAN2.0 frame is received and 0 is stored to this bit.

Note: This bit is not available in the classical CAN function.

RMFDF bit (CAN FD Format bit)

The RMFDF bit has the same value as the FDF bit of the received CAN-FD frame.

Note: This bit is not available in the classical CAN function.

RMIFL[1:0] bits (RX Message Buffer Information Label Field)

The RMIFL[1:0] bits store the information label value from the related Global Acceptance Filter List entry.

RMPTR[15:0] bits (RX Message Buffer Pointer Field)

The RMPTR[15:0] bits store the pointer value from the related Global Acceptance Filter List entry.

32.2.87.5 CFDRMDFpn_i : RX Message Buffer Data Field p Register n Channel i (p = 0 to 15, n = 0 to 15, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x200C + 0x004 × p + 0x080 × n + 0x800 × i

Bit position:	31 to 24	23 to 16	15 to 8	7 to 0
Bit field:	RMDB((p * 4) + 3)[7:0]	RMDB((p * 4) + 2)[7:0]	RMDB((p *4) + 1)[7:0]	RMDB((p * 4))[7:0]
Value after reset:	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	RMDB((p * 4))[7:0]	RX Message Buffer Data Byte (p * 4)	R
15:8	RMDB((p *4) + 1)[7:0]	RX Message Buffer Data Byte ((p * 4) + 1)	R
23:16	RMDB((p * 4) + 2)[7:0]	RX Message Buffer Data Byte ((p * 4) + 2)	R
31:24	RMDB*1((p * 4) + 3)[7:0]	RX Message Buffer Data Byte ((p * 4) + 3)	R

Note 1. These bits are not available in the classical CAN function.

The RX Message Buffer Data Field p Registers n (p = 0 to 15, n = 0 to 15) store the data bytes (p * 4) to data bytes ((p * 4) + 3) of the received message.

RMDB((p * 4))[7:0] bits (RX Message Buffer Data Byte (p * 4))

The RMDB(p * 4) [7:0] bits store data bytes (p*4) of the message in the RX message buffer.

Unused data bytes are filled with 0x00.

RMDB((p *4) + 1)[7:0] bits (RX Message Buffer Data Byte ((p * 4) + 1))

The RMDB((p * 4) + 1)[7:0] bits store data bytes ((p * 4) + 1) of the message in the RX message buffer.

Unused Data Bytes will be filled with 0x00.

RMDB((p * 4) + 2)[7:0] bits (RX Message Buffer Data Byte ((p * 4) + 2))

The RMDB((p * q) +2)[7:0] bits store data bytes ((p * 4 + 2) of the message in the RX message buffer.

Unused data bytes are filled with 0x00.

RMDB((p * 4) + 3)[7:0] bits (RX Message Buffer Data Byte ((p * 4) + 3))

The RMDB((p * 4) +3)[7:0] bits store data bytes ((p * 4) + 3) of the message in the RX message buffer.

Unused data bytes are filled with 0x00.

当接收到的FDF位为0时，表示接收到CAN2.0帧，并将0存储到该位。

Note: 该位在经典CAN功能中不可用。

RMFDF位（CANFD格式位）

RMFDF位与接收到的CAN-FD帧的FDF位具有相同的值。

Note: 该位在经典CAN功能中不可用。

RMIFL[1:0]位（RX消息缓冲区信息标签字段）

RMIFL[1:0]位存储来自相关全局接受过滤器列表条目的信息标签值。

RMPTR[15:0]位（RX消息缓冲区指针字段）

RMPTR[15:0]位存储来自相关全局接受过滤器列表条目的指针值。

32.2.87.5 CFDRMDFpn_i:RX消息缓冲区数据字段p寄存器n通道i(p=0到15 n=0到15 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x200C + 0x004 × p + 0x080 × n + 0x800 × i

Bit position:	31 to 24	23 to 16	15 to 8	7 to 0
Bit field:	RMDB((p * 4) + 3)[7:0]	RMDB((p * 4) + 2)[7:0]	RMDB((p *4) + 1)[7:0]	RMDB((p * 4))[7:0]
重置后的值:	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	RMDB((p * 4))[7:0]	RX消息缓冲区数据字节(p*4)	R
15:8	RMDB((p *4) + 1)[7:0]	RX消息缓冲区数据字节((p*4)+1)	R
23:16	RMDB((p * 4) + 2)[7:0]	RX消息缓冲区数据字节((p*4)+2)	R
31:24	RMDB*1((p * 4) + 3)[7:0]	RX消息缓冲区数据字节((p*4)+3)	R

注1.这些位在经典CAN功能中不可用。

RX报文缓冲区数据字段p寄存器n（p=0到15，n=0到15）存储接收到的报文的数据字节（p*4）到数据字节（（p*4）+3）。

RMDB((p*4))[7:0]bits(RX报文缓冲区数据字节(p*4))

RMDB(p*4)[7:0]位将消息的数据字节(p*4)存储在RX消息缓冲区中。

未使用的数据字节用0x00填充。

RMDB((p*4)+1)[7:0]bits(RX报文缓冲区数据字节((p*4)+1))

RMDB((p*4)+1)[7:0]位将消息的数据字节((p*4)+1)存储在RX消息缓冲区中。

未使用的数据字节将用0x00填充。

RMDB((p*4)+2)[7:0]bits(RX报文缓冲区数据字节((p*4)+2))

RMDB((p*q)+2)[7:0]位将消息的数据字节((p*4+2)存储在RX消息缓冲区中。

未使用的数据字节用0x00填充。

RMDB((p*4)+3)[7:0]bits(RX报文缓冲区数据字节((p*4)+3))

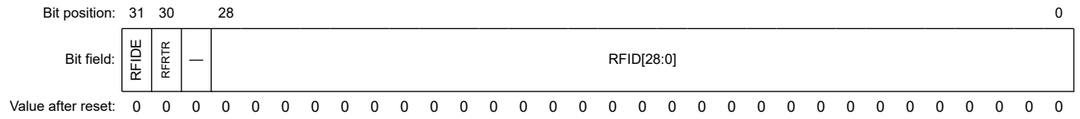
RMDB((p*4)+3)[7:0]位将消息的数据字节((p*4)+3)存储在RX消息缓冲区中。

未使用的数据字节用0x00填充。

32.2.87.6 CFDRFIDn : RX FIFO Access ID Register n (n = 0 to 7)

Base address: CANFD = 0x400B_0000

Offset address: 0x6000 + 0x080 × n



Bit	Symbol	Function	R/W
28:0	RFID[28:0]	RX FIFO Buffer ID Field STD-ID/EXT-ID fields	R
29	—	This bit is read as 0.	R
30	RFRTR	RX FIFO Buffer RTR bit 0: Data frame 1: Remote frame	R
31	RFIDE	RX FIFO Buffer IDE bit 0: STD-ID has been received 1: EXT-ID has been received	R

The RX FIFO Access ID Registers n (n = 0 to 7) store the ID field, IDE bit and RTR bit of the message.

RFID[28:0] bits (RX FIFO Buffer ID Field)

The RFID[28:0] bits are the bits of the STD-ID/EXT-ID fields of the message in the FIFO buffer.

For alignment of these bits in standard and extended frame format, see Identifier Bits Alignment.

RFRTR bit (RX FIFO Buffer RTR bit)

The RFRTR bit shows whether a data frame or a remote frame was stored in the FIFO buffer.

Note: There are no remote frames in CAN-FD format. When a CAN-FD frame was received, the register reflects the state of the received value (RRS bit in FD frame format).

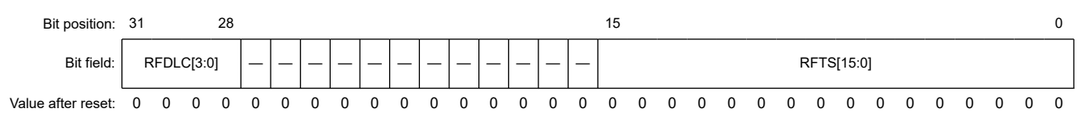
RFIDE bit (RX FIFO Buffer IDE bit)

The RFIDE bit shows whether message with the Standard Identifier or Extended Identifier was received in the FIFO buffer.

32.2.87.7 CFDRFPTRn : RX FIFO Access Pointer Register n (n = 0 to 7)

Base address: CANFD = 0x400B_0000

Offset address: 0x6004 + 0x080 × n



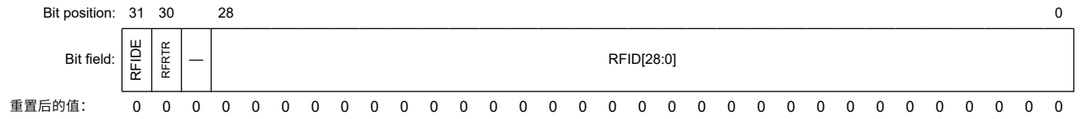
Bit	Symbol	Function	R/W
15:0	RFTS[15:0]	RX FIFO Timestamp Value Timestamp value of the received CAN frame	R
27:16	—	These bits are read as 0. The write value should be 0.	R
31:28	RFDLC[3:0]	RX FIFO Buffer DLC Field Number of data bytes received in a CAN frame	R

The FIFO Access Pointer Registers n (n = 0 to 7) store the DLC and Timestamp fields for the received message.

32.2.87.6 CFDRFIDn：RXFIFO访问ID寄存器n（n=0到7）

Base address: CANFD = 0x400B_0000

Offset address: 0x6000 + 0x080 × n



Bit	Symbol	Function	R/W
28:0	RFID[28:0]	RXFIFO缓冲区ID字段 STD-ID/EXT-ID fields	R
29	—	该位读为0。	R
30	RFRTR	RXFIFO缓冲区RTR位 0：数据帧1：远程帧	R
31	RFIDE	RXFIFO缓冲器IDE位 0：接收到STD-ID1：接收到EXT-ID	R

RXFIFO访问ID寄存器n（n=0到7）存储消息的ID字段、IDE位和RTR位。

RFID[28:0]位（RXFIFO缓冲区ID字段）

RFID[28:0]位是FIFO缓冲区中消息的STD-IDEXT-ID字段的位。

有关标准和扩展帧格式中这些位的对齐方式，请参阅标识符位对齐。

RFRTR位（RXFIFO缓冲器RTR位）

RFRTR位显示数据帧或远程帧是否存储在FIFO缓冲区中。

Note: CAN-FD格式中没有远程帧。当接收到CAN-FD帧时，寄存器反映接收值的状态（FD帧格式中的RRS位）。

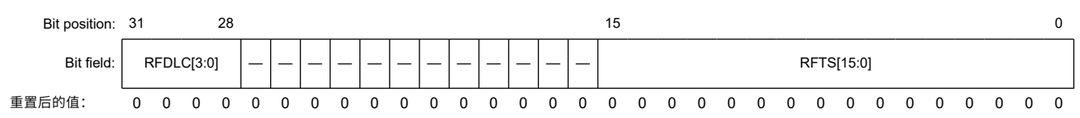
RFIDE位（RXFIFO缓冲器IDE位）

RFIDE位显示在FIFO缓冲区中是否接收到带有标准标识符或扩展标识符的消息。

32.2.87.7 CFDRFPTRn：RXFIFO访问指针寄存器n（n=0到7）

Base address: CANFD = 0x400B_0000

Offset address: 0x6004 + 0x080 × n



Bit	Symbol	Function	R/W
15:0	RFTS[15:0]	RXFIFO时间戳值 接收到的CAN帧的时间戳值	R
27:16	—	这些位被读取为0。写入值应为0。	R
31:28	RFDLC[3:0]	RXFIFO缓冲区DLC字段 CAN帧中接收的数据字节数	R

FIFO访问指针寄存器n（n=0到7）存储接收消息的DLC和时间戳字段。

RFTS[15:0] bits (RX FIFO Timestamp Value)

The RFTS[15:0] bits store the timestamp value taken at the capture point as configured by the CFDGFDCFG.TSCCFG bit of the received message.

RFDLC[3:0] bits (RX FIFO Buffer DLC Field)

The RFDLC[3:0] bits store the number of data bytes that were received in the RX FIFO buffer.

See Table 5 in ISO 11898-1 (2015) Specification for details in defining the number of data bytes that were received.

32.2.87.8 CFDRFFDSTSn : RX FIFO Access CAN-FD Status Register n (n = 0 to 7)

Base address: CANFD = 0x400B_0000

Offset address: 0x6008 + 0x080 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CFDRFPTR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	RFIFL[1:0]		—	—	—	—	—	RFFDF	RFBRS	RFESI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RFESI*1	Error State Indicator bit 0: CAN-FD frame received from error active node 1: CAN-FD frame received from error passive node	R
1	RFBRS*1	Bit Rate Switch bit 0: CAN-FD frame received with no bit rate switch 1: CAN-FD frame received with bit rate switch	R
2	RFFDF*1	CAN FD Format bit 0: Non CAN-FD frame received 1: CAN-FD frame received	R
7:3	—	These bits are read as 0. The write value should be 0.	R
9:8	RFIFL[1:0]	RX FIFO Buffer Information Label Field	R
15:10	—	These bits are read as 0. The write value should be 0.	R
31:16	CFDRFPTR[15:0]	RX FIFO Buffer Pointer Field	R

Note 1. This bit is not available in the classical CAN function.

The RX FIFO Access CAN-FD Status Registers n (n = 0 to 7) show the status of the FDF, BRS, and ESI bits, including the pointer of the received CAN-FD frame.

RFESI bit (Error State Indicator bit)

The RFESI bit has the same value as the ESI bit of the received CAN-FD frame.

When the received FDF bit is 0, this means a CAN2.0 frame is received and 0 is stored to this bit.

Note: This bit is not available in the classical CAN function.

RFBRS bit (Bit Rate Switch bit)

The RFBRS bit has the same value as the BRS bit of the received CAN-FD frame.

When the received FDF bit is 0, this means a CAN2.0 frame is received and 0 is stored to this bit.

Note: This bit is not available in the classical CAN function.

RFTS[15:0]位（RXFIFO时间戳值）

RFTS[15:0]位存储在捕获点获取的时间戳值，由接收到的消息的CFDGFDCFG.TSCCFG位配置。

RFDLC[3:0]位（RXFIFO缓冲区DLC字段）

RFDLC[3:0]位存储在RXFIFO缓冲区中接收到的数据字节数。

有关定义接收的数据字节数的详细信息，请参见ISO11898-1(2015)规范中的表5。

32.2.87.8 CFDRFFDSTSn：RXFIFO访问CAN-FD状态寄存器n（n=0到7）

Base address: CANFD = 0x400B_0000

Offset address: 0x6008 + 0x080 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CFDRFPTR[15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	RFIFL[1:0]		—	—	—	—	—	RFFDF	RFBRS	RFESI
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RFESI*1	错误状态指示位 0：从错误主动节点接收到CAN-FD帧1：从错误被动节点接收到CAN-FD帧	R
1	RFBRS*1	比特率切换位 0：接收到的CAN-FD帧，没有比特率切换1：接收到的CAN-FD帧，有比特率切换	R
2	RFFDF*1	CANFD格式位 0：接收到非CAN-FD帧1：接收到CAN-FD帧	R
7:3	—	这些位被读取为0。写入值应为0。	R
9:8	RFIFL[1:0]	RXFIFO缓冲区信息标签字段	R
15:10	—	这些位被读取为0。写入值应为0。	R
31:16	CFDRFPTR[15:0]	RXFIFO缓冲区指针字段	R

注1.该位在经典CAN功能中不可用。

RXFIFO访问CAN-FD状态寄存器n（n=0到7）显示FDF、BRS和ESI位的状态，包括接收到的CAN-FD帧的指针。

RFESI位（错误状态指示位）

RFESI位与接收到的CAN-FD帧的ESI位具有相同的值。

当接收到的FDF位为0时，表示接收到CAN2.0帧，并将0存储到该位。

Note: 该位在经典CAN功能中不可用。

RFBRS位（比特率切换位）

RFBRS位与接收到的CAN-FD帧的BRS位具有相同的值。

当接收到的FDF位为0时，表示接收到CAN2.0帧，并将0存储到该位。

Note: 该位在经典CAN功能中不可用。

RA生态工作室

RFFDF bit (CAN FD Format bit)

The RFFDF bit has the same value as the FDF bit of the received CAN-FD frame.

Note: This bit is not available in the classical CAN function.

RFIFL[1:0] bits (RX FIFO Buffer Information Label Field)

The RFIFL[1:0] bits store the information label value from the related Global Acceptance Filter List entry.

CFDRFPTR[15:0] bits (RX FIFO Buffer Pointer Field)

The CFDRFPTR[15:0] bits store the pointer value from the related Global Acceptance Filter List entry.

32.2.87.9 CFDRFDFpn : RX FIFO Access Data Field p Register n (p = 0 to 15, n = 0 to 7)

Base address: CANFD = 0x400B_0000

Offset address: 0x600C + 0x004 × p + 0x080 × n

Bit position:	31 24	23 16	15 8	7 0
Bit field:	RFDB((p * 4) + 3)[7:0]	RFDB((p * 4) + 2)[7:0]	RFDB((p * 4) + 1)[7:0]	RFDB((p * 4)[7:0]
Value after reset:	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	RFDB((p * 4)[7:0]	RX FIFO Buffer Data Byte (p * 4)	R
15:8	RFDB((p * 4) + 1)[7:0]	RX FIFO Buffer Data Byte ((p * 4) + 1)	R
23:16	RFDB((p * 4) + 2)[7:0]	RX FIFO Buffer Data Byte ((p * 4) + 2)	R
31:24	RFDB((p * 4) + 3)[7:0]	RX FIFO Buffer Data Byte ((p * 4) + 3)	R

The RX FIFO Access Data Field p Registers n (p = 0 to 15, n = 0 to 7) store data bytes ((p * 4) to data byte ((p * 4) + 3) of the received message.

RFDB((p * 4)[7:0] bits (RX FIFO Buffer Data Byte (p * 4))

The RFDB(p * 4)[7:0] bits store data bytes (p * 4) of the message present in the FIFO buffer.

Unused data bytes are filled with 0x00 according to the configured data payload size CFDRFCCn.RFPLS.

RFDB((p * 4) + 1)[7:0] bits (RX FIFO Buffer Data Byte ((p * 4) + 1))

The RFDB((p * 4) + 1))[7:0] bits store data bytes ((p * 4) + 1)) of the message present in the FIFO buffer.

Unused data bytes are filled with 0x00.

RFDB((p * 4) + 2)[7:0] bits (RX FIFO Buffer Data Byte ((p * 4) + 2))

The RFDB((p * 4) + 2)[7:0] bits store data bytes ((p * 4) + 2) of the message present in the FIFO buffer.

Unused data bytes are filled with 0x00.

RFDB((p * 4) + 3)[7:0] bits (RX FIFO Buffer Data Byte ((p * 4) + 3))

The RFDB((p * 4) + 3)[7:0] bits store data bytes ((p * 4) + 3) of the message present in the FIFO buffer.

Unused data bytes are filled with 0x00.

RFFDF位（CANFD格式位）

RFFDF位与接收到的CAN-FD帧的FDF位具有相同的值。

Note: 该位在经典CAN功能中不可用。

RFIFL[1:0]位（RXFIFO缓冲区信息标签字段）

RFIFL[1:0]位存储来自相关全局接受过滤器列表条目的信息标签值。

CFDRFPTR[15:0]位（RXFIFO缓冲区指针字段）

CFDRFPTR[15:0]位存储来自相关全局接受过滤器列表条目的指针值。

32.2.87.9 CFDRFDFpn：RXFIFO访问数据字段p寄存器n（p=0到15，n=0到7）

Base address: CANFD = 0x400B_0000

Offset address: 0x600C + 0x004 × p + 0x080 × n

Bit position:	31 24	23 16	15 8	7 0
Bit field:	RFDB((p * 4) + 3)[7:0]	RFDB((p * 4) + 2)[7:0]	RFDB((p * 4) + 1)[7:0]	RFDB((p * 4)[7:0]
重置后的值：	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	RFDB((p * 4)[7:0]	RXFIFO缓冲区数据字节(p*4)	R
15:8	RFDB((p * 4) + 1)[7:0]	RXFIFO缓冲区数据字节((p*4)+1)	R
23:16	RFDB((p * 4) + 2)[7:0]	RXFIFO缓冲区数据字节((p*4)+2)	R
31:24	RFDB((p * 4) + 3)[7:0]	RXFIFO缓冲区数据字节((p*4)+3)	R

RXFIFO访问数据字段p寄存器n(p=0到15，n=0到7)存储接收到的报文的数据字节((p*4)到数据字节((p*4)+3)。

RFDB((p*4)[7:0]bits(RXFIFO缓冲区数据字节(p*4))

RFDB(p*4)[7:0]位存储FIFO缓冲区中存在的消息的数据字节(p*4)。

根据配置的数据有效负载大小CFDRFCCn.RFPLS，未使用的数据字节用0x00填充。

RFDB((p*4)+1)[7:0]bits(RXFIFO缓冲区数据字节((p*4)+1))

RFDB((p*4)+1))[7:0]位存储FIFO缓冲区中存在的消息的数据字节((p*4)+1))。

未使用的数据字节用0x00填充。

RFDB((p*4)+2)[7:0]bits(RXFIFO缓冲区数据字节((p*4)+2))

RFDB((p*4)+2)[7:0]位存储FIFO缓冲区中存在的消息的数据字节((p*4)+2)。

未使用的数据字节用0x00填充。

RFDB((p*4)+3)[7:0]bits(RXFIFO缓冲区数据字节((p*4)+3))

RFDB((p*4)+3)[7:0]位存储FIFO缓冲区中存在的消息的数据字节((p*4)+3)。

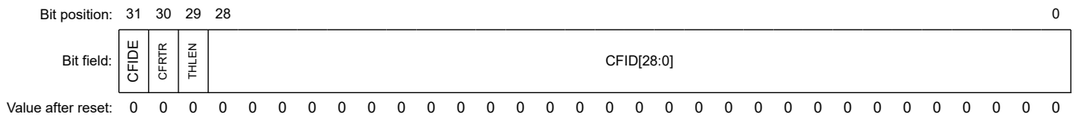
未使用的数据字节用0x00填充。

RA生态工作室

32.2.87.10 CFDCFIDn_i : Common FIFO Access ID Register n Channel i (n = 0 to 2, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x6400 + 0x080 × n + 0x180 × i



Bit	Symbol	Function	R/W
28:0	CFID[28:0]	Common FIFO Buffer ID Field STD-ID/EXT-ID fields	R/W
29	THLEN	THL Entry Enable TX FIFO mode: 0: Entry is not to be stored in THL after successful TX 1: Entry is to be stored in THL after successful TX RX FIFO mode: Reserved, this bit is read as 0.	R/W
30	CFRTR	Common FIFO Buffer RTR bit 0: Data frame 1: Remote frame	R/W
31	CFIDE	Common FIFO Buffer IDE bit 0: STD-ID is to be transmitted or has been received 1: EXT-ID is to be transmitted or has been received	R/W

The Common FIFO Access ID Registers n (n = 0 to 5) store the ID field, IDE bit and RTR bit of the message.

In TX mode, you can read data from the FIFO, only for the current entry based on the write pointer value, and not for the other entries.

CFID[28:0] bits (Common FIFO Buffer ID Field)

The CFID[28:0] bits are the bits of the STD-ID/EXT-ID fields of the message in the FIFO buffer.

In TX mode, you can write and read from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

THLEN bit (THL Entry Enable)

The THLEN bit controls the storage of an entry corresponding to the transmitted message in the TX History list at the end of a successful transmission.

In TX mode, you can write and read from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

CFRTR bit (Common FIFO Buffer RTR bit)

The CFRTR bit selects whether a data frame or a remote frame is to be transmitted from or was received in the FIFO buffer.

Note: There are no remote frames in CAN FD format. When a CAN-FD frame is received (RX mode), the register reflects the state of the received value (RRS bit in FD frame format). When CAN-FD transmission (TX or GW mode CFDCFID.CFFDF = 1), the bit is always transmitted dominant (data frame).

In TX mode, you can write and read from FIFO buffers.

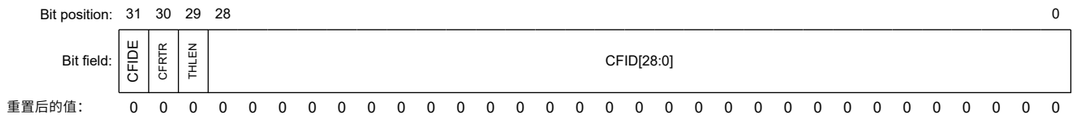
In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

32.2.87.10 CFDCFIDn_i:通用FIFO访问ID寄存器n通道i(n=0到2 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x6400 + 0x080 × n + 0x180 × i



Bit	Symbol	Function	R/W
28:0	CFID[28:0]	通用FIFO缓冲区ID字段 STD-ID/EXT-ID fields	R/W
29	THLEN	THL条目启用 TX FIFO mode: 0：TX成功后不存入THL1：TX成功后存入THL RX FIFO mode: 保留，该位读为0。	R/W
30	CFRTR	通用FIFO缓冲器RTR位 0：数据帧1：远程帧	R/W
31	CFIDE	通用FIFO缓冲器IDE位 0：STD-ID待发送或已接收1：EXT-ID待发送或已接收	R/W

通用FIFO访问ID寄存器n（n=0到5）存储消息的ID字段、IDE位和RTR位。

在TX模式下，您可以从FIFO中读取数据，仅针对基于写指针值的当前条目，而不能针对其他条目。

CFID[28:0]位（通用FIFO缓冲区ID字段）

CFID[28:0]位是FIFO缓冲区中消息的STD-IDEXT-ID字段的位。

在TX模式下，您可以写入和读取FIFO缓冲区。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

THLEN位（THL入口使能）

THLEN位控制在成功发送结束时将对应于发送消息的条目存储在TX历史列表中。

在TX模式下，您可以写入和读取FIFO缓冲区。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

CFRTR位（通用FIFO缓冲区RTR位）

CFRTR位选择是从FIFO缓冲区发送还是接收数据帧或远程帧。

Note: CANFD格式中没有远程帧。当接收到CAN-FD帧时（RX模式），寄存器反映接收值的状态（FD帧格式中的RRS位）。当CAN-FD传输（TX或GW模式CFDCFID.CFFDF=1）时，该位始终为显性传输（数据帧）。

在TX模式下，您可以写入和读取FIFO缓冲区。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

CFIDE bit (Common FIFO Buffer IDE bit)

The CFIDE bit selects whether a message with EXT-ID or STD-ID is to be transmitted from or was received in the FIFO buffer.

In TX mode, you can write and read from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

32.2.87.11 CFDCFPTRn_i : Common FIFO Access Pointer Register n Channel i (n = 0 to 2, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x6404 + 0x080 × n + 0x180 × i

Bit position:	31															15															0
Bit field:	CFDLC[3:0]				—	—	—	—	—	—	—	—	—	—	—	CFTS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	CFTS[15:0]	Common FIFO Timestamp Value Timestamp value of the received CAN frame (FIFO in RX mode).	R/W
27:16	—	These bits are read as 0. The write value should be 0.	R/W
31:28	CFDLC[3:0]	Common FIFO Buffer DLC Field Number of data bytes received in a CAN frame, or to be transmitted in a CAN frame.	R/W

The Common FIFO Access Pointer Registers n (n = 0 to 2) store the DLC and Timestamp fields.

In TX mode, you can read data from the FIFO buffer, only for the current entry based on the write pointer value, and not for the other entries.

CFTS[15:0] bits (Common FIFO Timestamp Value)

The CFTS[15:0] bits store the timestamp value taken at the capture point as configured by the CFDGFDCFG.TSCCFG bit of the received message (if FIFO is configured in RX mode).

In TX mode, you can read and write from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

CFDLC[3:0] bits (Common FIFO Buffer DLC Field)

The CFDLC[3:0] bits store the number of data bytes that were received in the FIFO buffer or are to be transmitted.

See Table 5 in ISO 11898-1 (2015) Specification for details in defining the number of data bytes.

In TX mode, you can read and write from the FIFO buffers. Do not read data for the other entries in the FIFO when configured in TX mode.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

CFIDE位（通用FIFO缓冲器IDE位）

CFIDE位选择带有EXT-ID或STD-ID的消息是从FIFO缓冲区发送还是在FIFO缓冲区中接收。

在TX模式下，您可以写入和读取FIFO缓冲区。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

32.2.87.11 CFDCFPTRn_i:公共FIFO访问指针寄存器n通道i(n=0到2 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x6404 + 0x080 × n + 0x180 × i

Bit position:	31															15															0
Bit field:	CFDLC[3:0]				—	—	—	—	—	—	—	—	—	—	—	CFTS[15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	CFTS[15:0]	通用FIFO时间戳值 接收到的CAN帧的时间戳值（RX模式下的FIFO）。	R/W
27:16	—	这些位被读取为0。写入值应为0。	R/W
31:28	CFDLC[3:0]	通用FIFO缓冲区DLC字段 在一个CAN帧中接收的数据字节数，或在一个CAN帧中传输的数据字节数。	R/W

公共FIFO访问指针寄存器n（n=0到2）存储DLC和时间戳字段。

在TX模式下，您可以从FIFO缓冲区读取数据，仅根据写指针值读取当前条目，而不能读取其他条目。

CFTS[15:0]位（通用FIFO时间戳值）

CFTS[15:0]位存储由接收消息的CFDGFDCFG.TSCCFG位配置的捕获点的时间戳值（如果FIFO配置为RX模式）。

在TX模式下，您可以从FIFO缓冲区读取和写入。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

CFDLC[3:0]位（通用FIFO缓冲区DLC字段）

CFDLC[3:0]位存储已在FIFO缓冲区中接收或将要发送的数据字节数。

有关定义数据字节数的详细信息，请参见ISO11898-1(2015)规范中的表5。

在TX模式下，您可以从FIFO缓冲区读取和写入。在TX模式下配置时，不要读取FIFO中其他条目的数据。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

32.2.87.12 CFDCFFDCSTSn_i : Common FIFO Access CAN-FD Control/Status Register n Channel i (n = 0 to 2, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x6408 + 0x080 × n + 0x180 × i

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CFPTR[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CFIFL[1:0]		—	—	—	—	—	CFFDF	CFBRS	CFESI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CFESI*1	Error State Indicator bit 0: CAN-FD frame received or to transmit by error active node 1: CAN-FD frame received or to transmit by error passive node	R/W
1	CFBRS*1	Bit Rate Switch bit 0: CAN-FD frame received or to transmit with no bit rate switch 1: CAN-FD frame received or to transmit with bit rate switch	R/W
2	CFFDF*1	CAN FD Format bit 0: Non CAN-FD frame received or to transmit 1: CAN-FD frame received or to transmit	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
9:8	CFIFL[1:0]	COMMON FIFO Buffer Information Label Field	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W
31:16	CFPTR[15:0]	Common FIFO Buffer Pointer Field	R/W

Note 1. This bit is not available in the classical CAN function.

The Common FIFO Access CAN-FD Control/Status Registers n (n = 0 to 2) show the status of the FDF, BRS and ESI bits, including the pointer of the received CAN-FD frame or the CAN-FD frame to transmit.

In TX mode, you can read data from the FIFO, only for the current entry based on the write pointer value, and not for the other entries.

CFESI bit (Error State Indicator bit)

In TX mode, you can read and write from FIFO buffers. In this mode, when the CAN-FD module is not in error passive, the CFESI bit equals the write value. Otherwise, it is a don't care and the bit is transmitted as 1 on the CAN bus, indicating this is an error passive node.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

In RX or GW mode, the CFESI bit is updated with the ESI bit value of the CAN-FD frame when it has been received, indicating the error state of the transmitting node. In RX or GW mode, 0 is stored to this bit when the received FDF bit is 0, this means a CAN 2.0 frame is received.

Note: This bit is not available in the classical CAN function.

CFBRS bit (Bit Rate Switch bit)

In TX mode, you can read and write from FIFO buffers. In this mode, the CAN-FD module either transmits a 0 to indicate no bit rate switch in the frame to be transmitted or a 1 to indicate a bit rate switch in the frame to be transmitted.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

32.2.87.12 CFDCFFDCSTSn_i:通用FIFO访问CAN-FD控制状态寄存器n通道i(n=0到2 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x6408 + 0x080 × n + 0x180 × i

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CFPTR[15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CFIFL[1:0]		—	—	—	—	—	CFFDF	CFBRS	CFESI
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CFESI*1	错误状态指示位 0：CAN-FD帧接收或发送错误主动节点1：CAN-FD帧接收或发送错误被动节点	R/W
1	CFBRS*1	比特率切换位 0：接收或发送CAN-FD帧，不带比特率切换1：接收或发送CAN-FD帧，带比特率切换	R/W
2	CFFDF*1	CANFD格式位 0：接收或发送非CAN-FD帧1：接收或发送CAN-FD帧	R/W
7:3	—	这些位被读取为0。写入值应为0。	R/W
9:8	CFIFL[1:0]	COMMONFIFO缓冲区信息标签字段	R/W
15:10	—	这些位被读取为0。写入值应为0。	R/W
31:16	CFPTR[15:0]	通用FIFO缓冲区指针字段	R/W

注1.该位在经典CAN功能中不可用。

通用FIFO访问CAN-FD控制状态寄存器n（n=0到2）显示FDF、BRS和ESI位的状态，包括接收到的CAN-FD帧或要发送的CAN-FD帧的指针。

在TX模式下，您可以从FIFO中读取数据，仅针对基于写指针值的当前条目，而不能针对其他条目。

CFESI位（错误状态指示位）

在TX模式下，您可以从FIFO缓冲区读取和写入。在这种模式下，当CAN-FD模块没有处于错误被动状态时，CFESI位等于写入值。否则，它是无关紧要的，该位在CAN总线上传输为1，表示这是一个错误被动节点。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

在RX或GW模式下，当CAN-FD帧接收到时，CFESI位会更新为ESI位值，指示发送节点的错误状态。在RX或GW模式下，当接收到的FDF位为0时，将0存储到该位，这意味着接收到CAN2.0帧。

Note: 该位在经典CAN功能中不可用。

CFBRS位（比特率切换位）

在TX模式下，您可以从FIFO缓冲区读取和写入。在这种模式下，CAN-FD模块要么发送0表示要发送的帧中没有比特率切换，要么发送1表示要发送的帧中的比特率切换。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

In RX or GW mode, the CFBRS bit is updated with the BRS bit value of the CAN-FD frame when it has been received, indicating whether there is a bit rate switch (1) or (0) on the CAN-FD frame.

In RX or GW mode, 0 is stored to the CFBRS bit when the received FDF bit is 0, this means a CAN 2.0 frame is received.

Note: This bit is not available in the classical CAN function.

CFFDF bit (CAN FD Format bit)

In TX mode, you can read and write from FIFO buffers. In this mode, the CAN-FD module either transmits a 0 to indicate a CAN 2.0 frame is to be transmitted or a 1 to indicate a CAN-FD frame is to be transmitted.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

In RX or GW mode, the CFFDF bit is updated with the FDF bit value of the CAN frame when it has been received, indicating whether it is a CAN 2.0 frame (0) or a CAN-FD frame (1).

Note: This bit is not available in the classical CAN function.

CFIFL[1:0] bits (COMMON FIFO Buffer Information Label Field)

If the Common FIFO is configured in TX mode, the value programmed in CFDCFFDCSTSn.CFIFL[1:0] is stored together with additional message information, to the TX History List after successful transmission of the message.

The information label value from the related Global Acceptance Filter List entry is stored in these bits (if FIFO is configured in either RX or GW mode).

In TX mode, you can read and write from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

CFPTR[15:0] bits (Common FIFO Buffer Pointer Field)

If the Common FIFO is configured in TX mode, the value programmed in CFDCFFDCSTSn.CFPTR[15:0] is stored together with additional message information, to the TX History List after successful transmission of the message.

The pointer value from the related Global Acceptance Filter List entry is stored in these bits (if FIFO is configured in either RX or GW mode).

In TX mode, you can read and write from FIFO buffers.

In RX mode, you can only read data from FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

32.2.87.13 CFDCFDFpn_i : Common FIFO Access Data Field p Register n Channel i (p = 0 to 15, n = 0 to 2, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x640C + 0x004 × p + 0x080 × n + 0x180 × i

Bit position:	31							24	23							16	15							8	7							0
Bit field:	CFDB((p * 4) + 3)[7:0]								CFDB((p * 4) + 2)[7:0]								CFDB((p * 4) + 1)[7:0]								CFDB((p * 4)[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CFDB((p * 4)[7:0]	Common FIFO Buffer Data Bytes ((p * 4)	R/W
15:8	CFDB((p * 4) + 1)[7:0]	Common FIFO Buffer Data Bytes ((p * 4) + 1)	R/W
23:16	CFDB((p * 4) + 2)[7:0]	Common FIFO Buffer Data Bytes ((p * 4) + 2)	R/W

在RX或GW模式下，CFBRS位在接收到CAN-FD帧后用BRS位值更新，指示CAN-FD帧上是否有比特率切换（1）或（0）。

在RX或GW模式下，当接收到的FDF位为0时，将0存储到CFBRS位，这意味着接收到CAN2.0帧。

Note: 该位在经典CAN功能中不可用。

CFFDF位（CANFD格式位）

在TX模式下，您可以从FIFO缓冲区读取和写入。在这种模式下，CAN-FD模块要么发送一个0来表示一个将发送CAN2.0帧或1表示要发送CAN-FD帧。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

在RX或GW模式下，CFFDF位在接收到CAN帧时更新为CAN帧的FDF位值，指示它是CAN2.0帧（0）还是CAN-FD帧（1）。

Note: 该位在经典CAN功能中不可用。

CFIFL[1:0]位（通用FIFO缓冲区信息标签字段）

如果CommonFIFO配置为TX模式，则在成功发送消息后，CFDCFFDCSTSn.CFIFL[1:0]中编程的值与附加消息信息一起存储到TX历史列表中。

来自相关GlobalAcceptanceFilterList条目的信息标签值存储在这些位中（如果FIFO配置为RX或GW模式）。

在TX模式下，您可以从FIFO缓冲区读取和写入。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

CFPTR[15:0]位（通用FIFO缓冲区指针字段）

如果CommonFIFO配置为TX模式，则在成功传输消息后，CFDCFFDCSTSn.CFPTR[15:0]中编程的值与附加消息信息一起存储到TX历史列表中。

来自相关全局接受过滤器列表条目的指针值存储在这些位中（如果FIFO被配置为RX or GW mode).

在TX模式下，您可以从FIFO缓冲区读取和写入。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

32.2.87.13 CFDCFDFpn_i:公共FIFO访问数据字段p寄存器n通道i(p=0到15 n=0到2 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x640C + 0x004 × p + 0x080 × n + 0x180 × i

Bit position:	31							24	23							16	15							8	7							0
Bit field:	CFDB((p * 4) + 3)[7:0]								CFDB((p * 4) + 2)[7:0]								CFDB((p * 4) + 1)[7:0]								CFDB((p * 4)[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CFDB((p * 4)[7:0]	公共FIFO缓冲区数据字节((p*4)	R/W
15:8	CFDB((p * 4) + 1)[7:0]	公共FIFO缓冲区数据字节((p*4)+1)	R/W
23:16	CFDB((p * 4) + 2)[7:0]	公共FIFO缓冲区数据字节((p*4)+2)	R/W

Bit	Symbol	Function	R/W
31:24	CFDB((p * 4) + 3) [7:0]	Common FIFO Buffer Data Bytes ((p * 4) + 3)	R/W

i = Channel number

The FIFO Access Data Field p Registers n (p = 0 to 15, n = 0 to 2) store data bytes (p * 4) to data bytes ((p * q) + 3) of the message.

In TX mode, you can read data from the FIFO, only for the current entry based on the write pointer value, and not for the other entries.

CFDB((p * 4)[7:0] bits (Common FIFO Buffer Data Bytes ((p * 4))

The CFDB((p * 4)[7:0] bits store data bytes ((p * 4) of the message present in the FIFO buffer.

In TX mode, you can read and write from the FIFO buffers.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

In RX or GW mode, unused data bytes are filled with 0x00, according to their configured data payload size CFDCFCCn.CFPLS.*1

CFDB((p * 4) + 1)[7:0] bits (Common FIFO Buffer Data Bytes ((p * 4) + 1))

The CFDB((p * 4) + 1)[7:0] bits store data bytes ((p * 4) + 1) of the message present in the FIFO buffer.

In TX mode, you can read and write from the FIFO buffers.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

In RX or GW mode, unused data bytes are filled with 0x00, according to their configured data payload size CFDCFCCn.CFPLS.*1

CFDB((p * 4) + 2)[7:0] bits (Common FIFO Buffer Data Bytes ((p * 4) + 2))

The CFDB((p * 4) + 2)[7:0] bits store data bytes ((p * 4) + 2) of the message present in the FIFO buffer.

In TX mode, you can read and write from the FIFO buffers.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

In RX or GW mode, unused data bytes are filled with 0x00, according to their configured data payload size CFDCFCCn.CFPLS.*1

CFDB((p * 4) + 3)[7:0] bits (Common FIFO Buffer Data Bytes ((p * 4) + 3))

The CFDB((p * 4) + 3)[7:0] bits store data bytes ((p * 4) + 3) of the message present in the FIFO buffer.

In TX mode, you can read and write from the FIFO buffers.

In RX mode, you can only read data from the FIFO buffers.

In GW mode, you cannot write data to the FIFO buffers.

In RX or GW mode, unused data bytes are filled with 0x00, according to their configured data payload size CFDCFCCn.CFPLS.*1

Note 1. In RX or GW mode, unused data bytes are filled with 0x00 according to the configured data payload size CFDCFCCn.CFPLS, which is a CAN-FD feature not found in classical CAN.

Bit	Symbol	Function	R/W
31:24	CFDB((p * 4) + 3) [7:0]	公共FIFO缓冲区数据字节((p*4)+3)	R/W

i=通道号

FIFO访问数据字段p寄存器n(p=0到15，n=0到2)将数据字节(p*4)存储到消息的数据字节((p*q)+3)。

在TX模式下，您可以从FIFO中读取数据，仅针对基于写指针值的当前条目，而不能针对其他条目。

CFDB((p*4)[7:0]bits(通用FIFO缓冲区数据字节((p*4))

CFDB((p*4)[7:0]位存储FIFO缓冲区中存在的消息的数据字节((p*4)。

在TX模式下，您可以从FIFO缓冲区读取和写入。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

在RX或GW模式下，未使用的数据字节根据其配置的数据有效负载大小填充为0x00 CFDCFCCn.CFPLS.*1

CFDB((p*4)+1)[7:0]位（通用FIFO缓冲区数据字节((p*4)+1)）

CFDB((p*4)+1)[7:0]位存储FIFO缓冲区中存在的消息的数据字节((p*4)+1)。

在TX模式下，您可以从FIFO缓冲区读取和写入。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

在RX或GW模式下，未使用的数据字节根据其配置的数据有效负载大小填充为0x00 CFDCFCCn.CFPLS.*1

CFDB((p*4)+2)[7:0]位（通用FIFO缓冲区数据字节((p*4)+2)）

CFDB((p*4)+2)[7:0]位存储FIFO缓冲区中存在的消息的数据字节((p*4)+2)。

在TX模式下，您可以从FIFO缓冲区读取和写入。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

在RX或GW模式下，未使用的数据字节根据其配置的数据有效负载大小填充为0x00 CFDCFCCn.CFPLS.*1

CFDB((p*4)+3)[7:0]位（通用FIFO缓冲区数据字节((p*4)+3)）

CFDB((p*4)+3)[7:0]位存储FIFO缓冲区中存在的消息的数据字节((p*4)+3)。

在TX模式下，您可以从FIFO缓冲区读取和写入。

在RX模式下，您只能从FIFO缓冲区读取数据。

在GW模式下，您不能将数据写入FIFO缓冲区。

在RX或GW模式下，未使用的数据字节根据其配置的数据有效负载大小填充为0x00 CFDCFCCn.CFPLS.*1

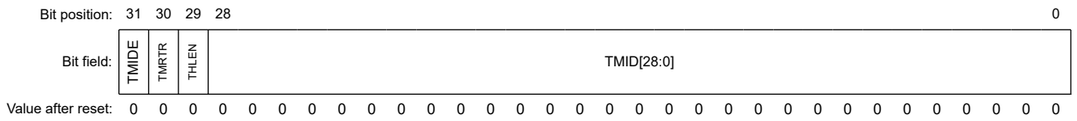
注1.在RX或GW模式下，未使用的数据字节根据配置的数据负载大小用0x00填充 CFDCFCCn.CFPLS，这是经典CAN中没有的CAN-FD功能。

RA生态工作室

32.2.87.14 CFDTMIDn_i : TX Message Buffer ID Register n Channel i (n = 0 to 7, 32 to 39, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1_0000 + 0x080 × n + 0x2000 × i



Bit	Symbol	Function	R/W
28:0	TMID[28:0]	TX Message Buffer ID Field STD-ID/EXT-ID fields	R/W
29	THLEN	Tx History List Entry 0: Entry not stored in THL after successful TX 1: Entry stored in THL after successful TX	R/W
30	TMRTR	TX Message Buffer RTR bit 0: Data frame 1: Remote frame	R/W
31	TMIDE	TX Message Buffer IDE bit 0: STD-ID is transmitted 1: EXT-ID is transmitted	R/W

Each TX Message Buffer ID Registers n (n = 0 to 7, 32 to 39) are used to store the ID, IDE, RTR fields and history configuration of the message to be transmitted from the associated buffer.

TMID[28:0] bits (TX Message Buffer ID Field)

The TMID[28:0] bits are bits of the STD-ID/EXT-ID fields of the message stored in this TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

THLEN bit (Tx History List Entry)

The THLEN bit controls the storage of an entry corresponding to the transmitted message in the TX History list at the end of a successful transmission.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMRTR bit (TX Message Buffer RTR bit)

The TMRTR bit selects whether a data frame or remote frame is to be transmitted from this TX message buffer.

Note: There are no remote frames in CAN-FD format. For a CAN-FD transmission (CFDTMFDCTRn.CFFDF = 1), this bit is always transmitted dominant (data frame).

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMIDE bit (TX Message Buffer IDE bit)

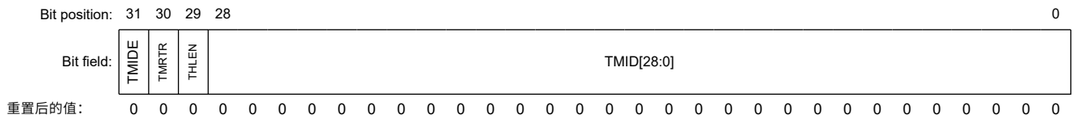
The TMIDE bit selects whether a message with EXT-ID or STD-ID is to be transmitted from this TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

32.2.87.14 CFDTMIDn_i:TX消息缓冲区ID寄存器n通道i(n=0到7 32到39 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1_0000 + 0x080 × n + 0x2000 × i



Bit	Symbol	Function	R/W
28:0	TMID[28:0]	TX消息缓冲区ID字段 STD-ID/EXT-ID fields	R/W
29	THLEN	Tx历史列表条目 0：成功TX后条目不存储在THL中1：成功TX后条目存储在THL	R/W
30	TMRTR	TX报文缓冲区RTR位 0：数据帧1：远程帧	R/W
31	TMIDE	TX消息缓冲区IDE位 0：发送STD-ID1：发送EXT-ID	R/W

每个TX报文缓冲区ID寄存器n（n=0到7、32到39）用于存储要从相关缓冲区发送的报文的ID、IDE、RTR字段和历史配置。

TMID[28:0]位（TX消息缓冲区ID字段）

TMID[28:0]位是存储在此TX消息缓冲区中的消息的STD-IDEXT-ID字段的位。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

THLEN位（Tx历史列表条目）

THLEN位控制在成功发送结束时将对应于发送消息的条目存储在TX历史列表中。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

TMRTR位（TX报文缓冲区RTR位）

TMRTR位选择是从该TX报文缓冲区发送数据帧还是远程帧。

Note: CAN-FD格式中没有远程帧。对于CAN-FD传输（CFDTMFDCTRn.CFFDF=1），该位始终为显性传输（数据帧）。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

TMIDE位（TX消息缓冲区IDE位）

TMIDE位选择是从该TX报文缓冲区发送带有EXT-ID还是STD-ID的报文。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

32.2.87.15 CFDTMPTRn_i : TX Message Buffer Pointer Register n Channel i (n = 0 to 7, 32 to 39, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1_0004 + 0x080 × n + 0x2000 × i

Bit position:	31																													0
Bit field:	TMDLC[3:0]	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
27:0	—	The read values are undefined. The write value should be 0.	R/W
31:28	TMDLC[3:0]	TX Message Buffer DLC Field Number of data bytes to be transmitted in a CAN frame.	R/W

Each TX Message Buffer Pointer Register n (n = 0 to 7, 32 to 39) is used to store the DLC fields of the message to transmit from the associated buffer.

TMDLC[3:0] bits (TX Message Buffer DLC Field)

The TMDLC[3:0] bits select the number of data bytes to be transmitted from this TX message buffer when the corresponding TMRTR bit is configured as 0.

See Table 5 in ISO 11898-1 (2015) Specification for details in defining the number of data bytes to be transmitted.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

32.2.87.16 CFDTMFDCTRn_i : TX Message Buffer CAN-FD Control Register n Channel i (n = 0 to 7, 32 to 39, i = 0, 1)

Base address: CANFD = 0x400B_0000

Bit	Symbol	Function	R/W
31:16	TMPTR[15:0]	TX Message Buffer Pointer Field	R/W

Note 1. This bit is not available in the classical CAN function.

The TX Message Buffer CAN-FD Control Registers n (n = 0 to 7, 32 to 39) show the status of the FDF, BRS and ESI bits, including the pointer fields of the CAN-FD frame to be transmitted.

TMESI bit (Error State Indicator bit)

If the channel is not in error passive, then the TMESI bit equals the write value, otherwise it is a don't care and the bit is transmitted as 1 on the CAN bus, indicating this is an error passive node.

Do not write to the TMESI bit when the related CAN-FD channel is in CH_SLEEP mode.

Note: This bit is not available in the classical CAN function.

TMBRS bit (Bit Rate Switch bit)

Do not write to the TMBRS bit when the related CAN-FD channel is in CH_SLEEP mode.

Note: This bit is not available in the classical CAN function.

TMFDF bit (CAN FD Format bit)

Do not write to the TMFDF bit when the related CAN-FD channel is in CH_SLEEP mode.

Note: This bit is not available in the classical CAN function.

TMIFL[1:0] bits (TX Message Buffer Information Label Field)

The TMIFL[1:0] bits store the information label value to be copied, together with additional message information, in the TX History List after successful transmission of the message.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMPTR[15:0] bits (TX Message Buffer Pointer Field)

The TMPTR[15:0] bits store the pointer value to be copied, together with additional message information in the TX History List after successful transmission of the message.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

32.2.87.17 CFDTMDFpn_i : TX Message Buffer Data Field p Register n Channel i (p = 0 to 15, n = 0 to 7, 32 to 39, i = 0, 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1_0000C + 0x004 × p + 0x080 × n + 0x2000 × i

Bit position:	31 … 24	23 … 16	15 … 8	7 … 0
Bit field:	TMDB((p * 4) + 3)[7:0]	TMDB((p * 4) + 2)[7:0]	TMDB((p * 4) + 1)[7:0]	TMDB((p * 4)[7:0]
Value after reset:	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	TMDB((p * 4)[7:0]	TX Message Buffer Data Byte ((p * 4)	R/W

23:16	TMDB((p * 4) + 2)[7:0]	TX Message Buffer Data Byte ((p * 4) + 2)	R/W
31:24	TMDB((p * 4) + 3)[7:0]	TX Message Buffer Data Byte ((p * 4) + 3)	R/W

i = Channel number

Bit	Symbol	Function	R/W
31:16	TMPTR[15:0]	TX消息缓冲区指针字段	R/W

注1.该位在经典CAN功能中不可用。

TX报文缓冲区CAN-FD控制寄存器n（n=0到7、32到39）显示FDF、BRS和ESI位的状态，包括要发送的CAN-FD帧的指针字段。

TMESI位（错误状态指示位）

如果通道不是被动错误，则TMESI位等于写入值，否则为无关位，该位在CAN总线上传输为1，表示这是一个错误被动节点。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入TMESI位。

Note: 该位在经典CAN功能中不可用。

TMBRS位（比特率切换位）

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入TMBRS位。

Note: 该位在经典CAN功能中不可用。

TMFDF位（CANFD格式位）

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入TMFDF位。

Note: 该位在经典CAN功能中不可用。

TMIFL[1:0]位（TX消息缓冲区信息标签字段）

TMIFL[1:0]位将要复制的信息标签值与附加消息信息一起存储在TX中成功传输消息后的历史列表。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

TMPTR[15:0]位（TX消息缓冲区指针字段）

TMPTR[15:0]位存储要复制的指针值，以及TX历史记录中的附加消息信息成功传输消息后的列表。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

32.2.87.17 CFDTMDFpn_i:TX消息缓冲区数据字段p寄存器n通道i(p=0到15 n=0到7 32到39 i=0 1)

Base address: CANFD = 0x400B_0000

Offset address: 0x1_0000C + 0x004 × p + 0x080 × n + 0x2000 × i

Bit position:	31 … 24	23 … 16	15 … 8	7 … 0

23:16	TMDB((p * 4) + 2)[7:0]	TX消息缓冲区数据字节((p*4)+2)	R/W
31:24	TMDB((p * 4) + 3)[7:0]	TX消息缓冲区数据字节((p*4)+3)	R/W

i=通道号

Each TX Message Buffer Data Field p Register n (p = 0 to 15, n = 0 to 7, 32 to 39) is used to store data bytes ((p * q) + (q - 4)) to data bytes ((p * q) + (q - 1)) of the message to transmit from the associated buffer.

TMDB((p * 4)[7:0] bits (TX Message Buffer Data Byte ((p * 4))

Data bytes ((p * 4)[7:0] of the message stored in the TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMDB((p * 4) + 1)[7:0] bits (TX Message Buffer Data Byte ((p * 4) + 1))

Data bytes ((p * 4) + 1)[7:0] of the message stored in the TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMDB((p * 4) + 2)[7:0] bits (TX Message Buffer Data Byte ((p * 4) + 2))

Data bytes ((p * 4) + 2)[7:0] of the message stored in the TX message buffer.

Do not write to these bits when the related CAN-FD channel is in CH_SLEEP mode.

TMDB((p * 4) + 3)[7:0] bits (TX Message Buffer Data Byte ((p * 4) + 3))

Data bytes ((p * 4) + 3)[7:0] of the message stored in the TX message buffer.

Do not write to these bits when the related CAN-FD hannel is in CH_SLEEP mode.

32.3 Modes of Operation

32.3.1 Overview

The modes of the CAN-FD module can be classified into 2 groups:

- Global modes
- Channel modes

32.3.2 Global Modes

These modes are applicable for the complete CAN-FD module and therefore are called Global modes. The global modes of the CAN-FD module are:

- Global Sleep
- Global Reset
- Global Halt
- Global Operation.

Figure 32.2 shows the possible transitions between the Global modes.

每个TX报文缓冲区数据字段p寄存器n(p=0到15 n=0到7 32到39)用于存储数据字节((p*q)+(q4))到数据字节((p*q)+(q1))从相关缓冲区传输的消息。

TMDB((p*4)[7:0]bits(TX报文缓冲区数据字节((p*4))

存储在TX消息缓冲区中的消息的数据字节((p*4)[7:0]。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

TMDB((p*4)+1)[7:0]bits(TX报文缓冲区数据字节((p*4)+1))

存储在TX消息缓冲区中的消息的数据字节((p*4)+1)[7:0]。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

TMDB((p*4)+2)[7:0]bits(TX报文缓冲区数据字节((p*4)+2))

存储在TX消息缓冲区中的消息的数据字节((p*4)+2)[7:0]。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

TMDB((p*4)+3)[7:0]bits(TX报文缓冲区数据字节((p*4)+3))

存储在TX消息缓冲区中的消息的数据字节((p*4)+3)[7:0]。

当相关CAN-FD通道处于CH_SLEEP模式时，请勿写入这些位。

32.3 运作模式

32.3.1 Overview

CAN-FD模块的模式可分为2组：

●全局模式

●频道模式

32.3.2 全局模式

这些模式适用于完整的CAN-FD模块，因此称为全局模式。CAN-FD模块的全局模式有：

●全局睡眠

●全局重置

●全球暂停

●全球运营。

图32.2显示了全局模式之间可能的转换。

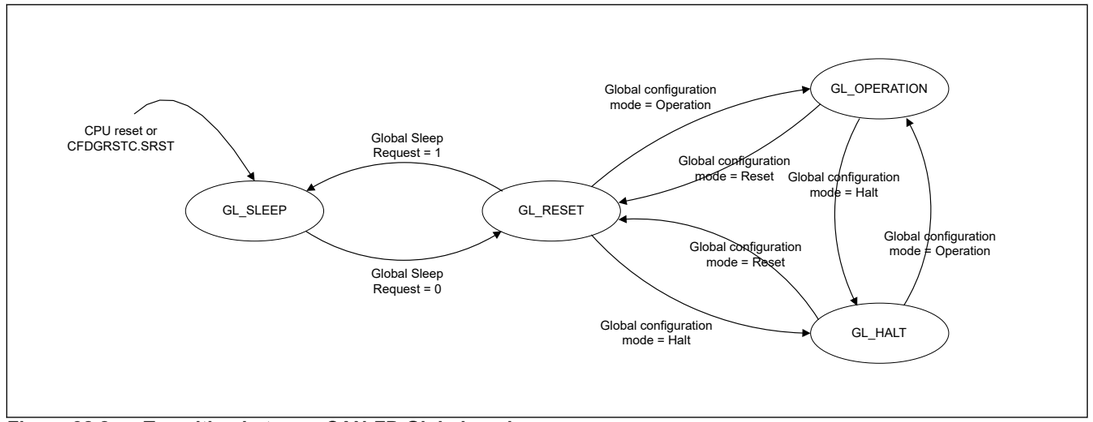

Figure 32.2 Transition between CAN-FD Global modes

Change in the Global mode can affect the Channel mode. Table 32.8 shows the effect of a Global mode transition on a Channel mode.

Table 32.8 Possible CAN-FD Channel modes and Global modes

Current Global mode	Target Global mode			
	Sleep	**Reset**	**Halt**	**Operation**
Sleep		Ch-Sleep: Keep Ch-Reset: N/A Ch-Halt: N/A Ch-Oper: N/A		
Reset	Ch-Sleep: Keep Ch-Reset: → Ch-Sleep Ch-Halt: N/A Ch-Oper: N/A		Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: N/A Ch-Oper: N/A	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: N/A Ch-Oper: N/A
Halt		Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: → Ch-Reset Ch-Oper: N/A		Ch-Sleep:Keep Ch-Reset: Keep Ch-Halt: Keep Ch-Oper: N/A
Operation		Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: → Ch-Reset Ch-Oper: → Ch-Reset	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: Keep Ch-Oper: → Ch-Halt	

32.3.2.1 Global Sleep Mode

After the release of a hardware reset or after setting and clearing a CFDGRSTC.SRST bit, the CAN-FD module automatically enters Global Sleep mode.

The CAN-FD module also enters the Global Sleep mode when the Global Sleep Request bit is set while it is in Global Reset mode. This control bit cannot be set in Global Halt mode or Global Operation mode.

Setting the Global Sleep Request bit sets all Channel Sleep Request bits and forces all channels into the Channel Sleep mode.

Sleep mode is used for power saving purpose. When CAN-FD module is in Global Sleep mode, only the clock for CPU write access to the Global Sleep Mode Request bit is active. All other clocks are stopped and all other functions of the CAN-FD module are suspended.

Read access from all registers is still possible and all register values are preserved.

After setting the Global Sleep Request bit, it is necessary to confirm that the Global Sleep status has been updated, indicating successful transition to Global Sleep mode before the Global Sleep Request bit can be cleared again.

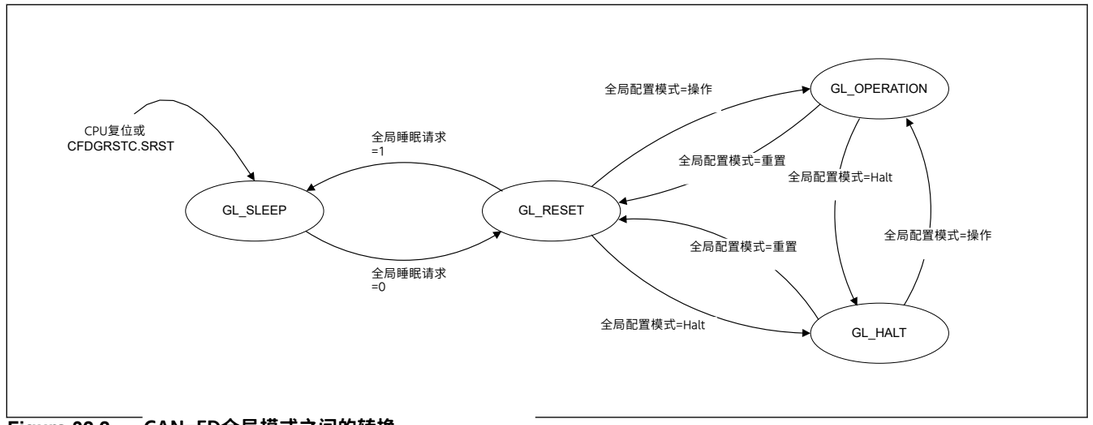

Figure 32.2 CAN-FD全局模式之间的转换

全局模式的变化会影响通道模式。表32.8显示了全局模式转换对频道模式。

Table 32.8 可能的CAN-FD通道模式和全局模式

当前全局模式	目标全局模式			
	Sleep	**Reset**	**Halt**	**Operation**
Sleep		Ch-Sleep: Keep Ch-Reset: N/A Ch-Halt: N/A Ch-Oper: N/A		
Reset	Ch-Sleep: Keep Ch-Reset: → Ch-Sleep Ch-Halt: N/A Ch-Oper: N/A		Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: N/A Ch-Oper: N/A	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: N/A Ch-Oper: N/A
Halt		Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: → Ch-Reset Ch-Oper: N/A		Ch-Sleep:Keep Ch-Reset: Keep Ch-Halt: Keep Ch-Oper: N/A
Operation		Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: → Ch-Reset Ch-Oper: → Ch-Reset	Ch-Sleep: Keep Ch-Reset: Keep Ch-Halt: Keep Ch-Oper: → Ch-Halt	

32.3.2.1 全局睡眠模式

在释放硬件复位或设置和清除CFDGRSTC.SRST位后，CAN-FD模块自动进入全局休眠模式。

当CAN-FD模块处于全局复位模式时，如果全局睡眠请求位被置位，CAN-FD模块也会进入全局睡眠模式。该控制位不能在GlobalHalt模式或GlobalOperation模式下设置。

设置全局休眠请求位会设置所有通道休眠请求位并强制所有通道进入通道休眠模式。

睡眠模式用于省电目的。当CAN-FD模块处于全局休眠模式时，只有CPU对全局休眠模式请求位进行写访问的时钟有效。所有其他时钟停止，CAN-FD模块的所有其他功能暂停。

仍然可以从所有寄存器进行读取访问，并且所有寄存器值都被保留。

设置全局睡眠请求位后，需要确认全局睡眠状态已更新，表明成功转换到全局睡眠模式，然后才能再次清除全局睡眠请求位。

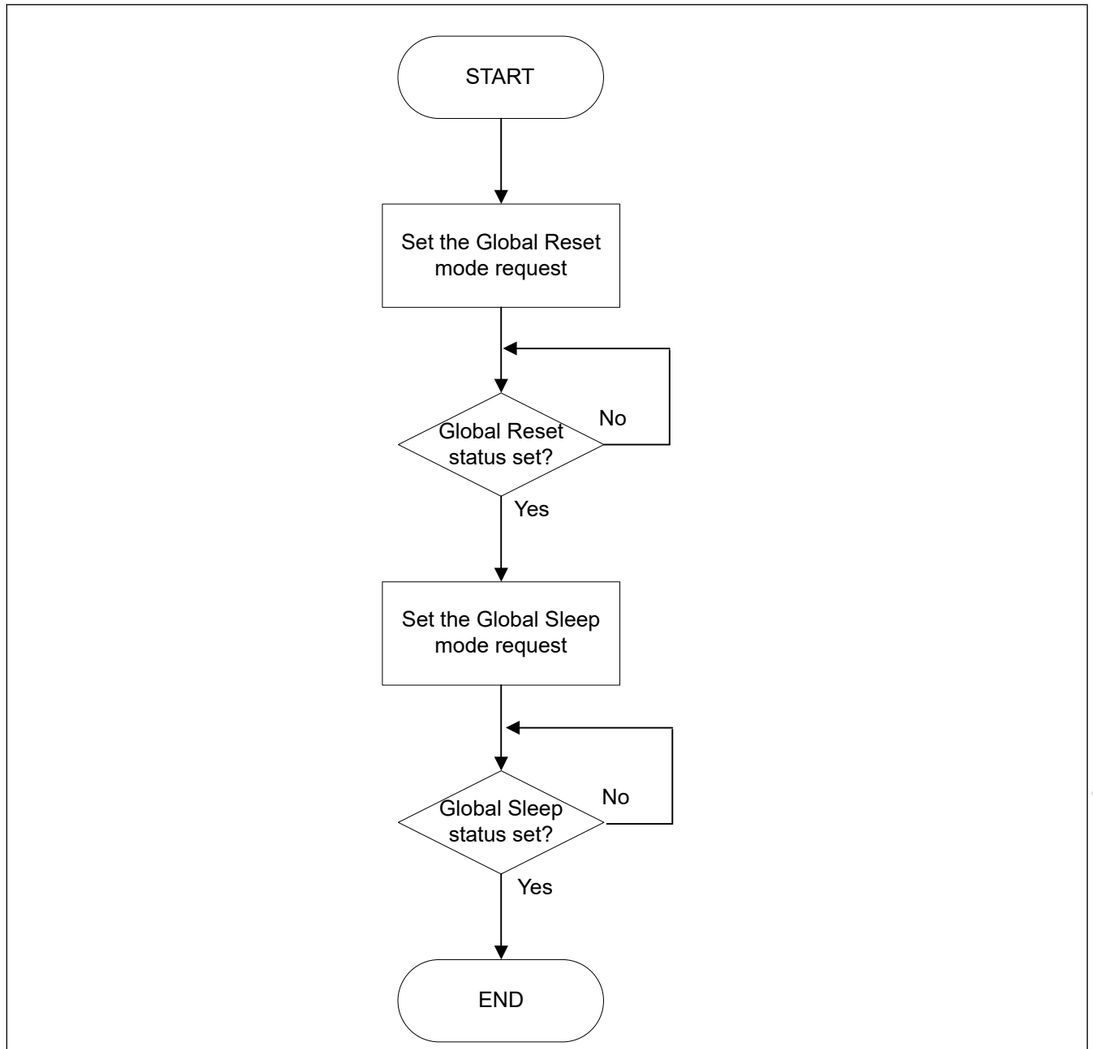

Figure 32.3 Procedure for entering Global Sleep mode

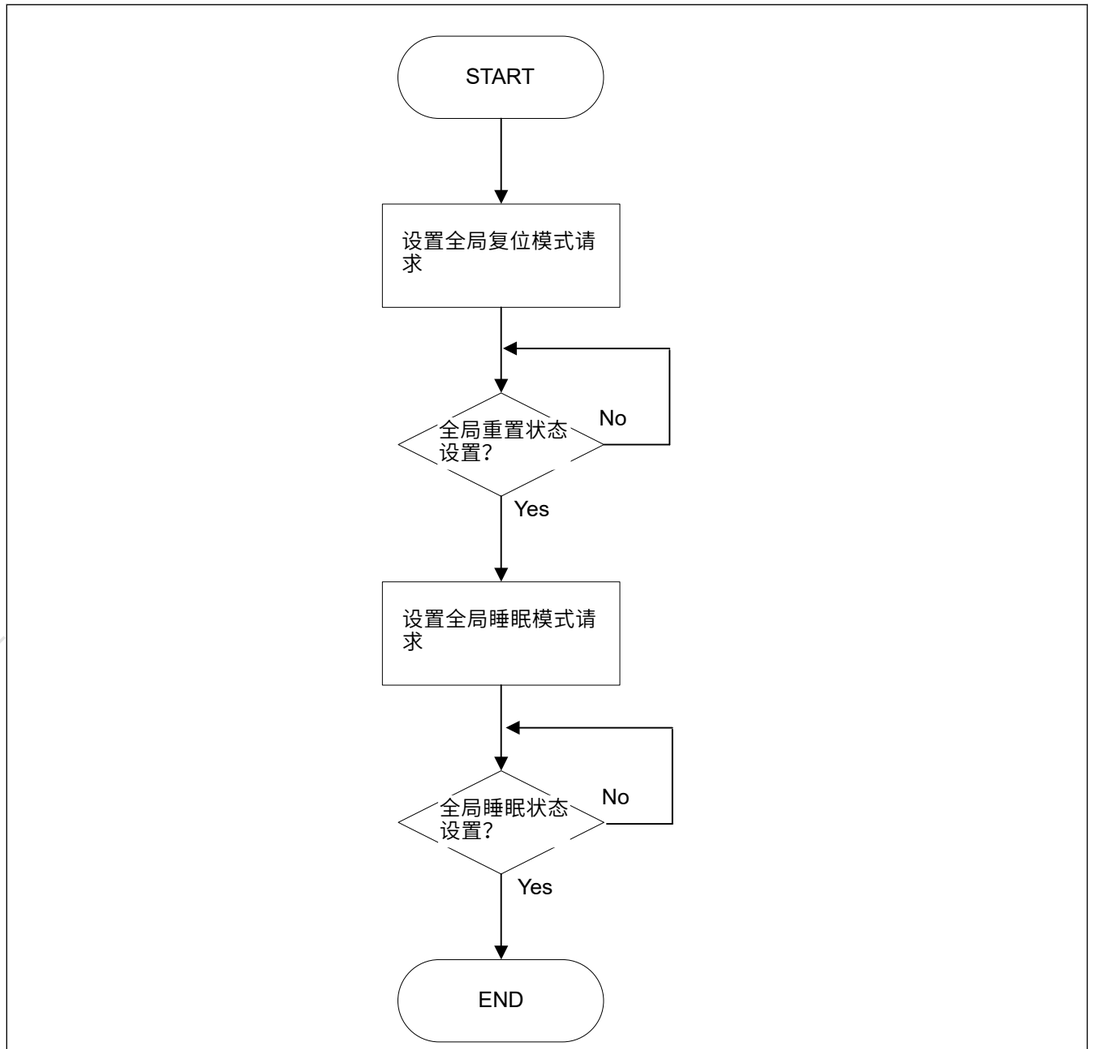

Figure 32.3 进入全局睡眠模式的步骤

RA生态工作室

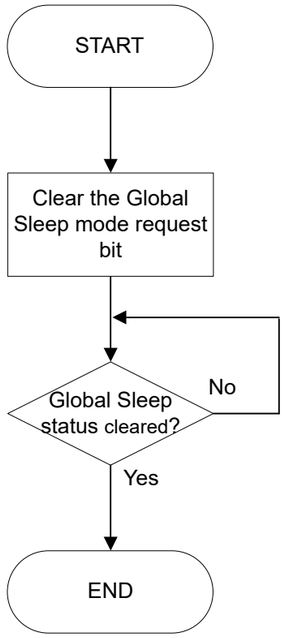

Figure 32.4 Procedure for exiting Global Sleep mode

32.3.2.2 Global Reset Mode

The CAN-FD module enters this mode in the following ways:

- Global Mode Control bit CFDGCTR.GMDC in the Global Control Register is configured for Global Reset mode while the CAN-FD module is in Global Halt or Global Operation mode
- Global Sleep Mode Request bit is cleared while CAN-FD module is in Global Sleep mode.

In Global Reset mode, all CAN-FD module functions are suspended and all status and flag registers are initialized.

Additionally all FIFOs and all channel TX Queues are disabled and transmission control bits are cleared.

Configuration registers (except the test mode registers) are not initialized in this mode to their MCU reset values and the CAN-FD module can be configured.

See section 32.3.4. Global Mode and Channel Mode Transition Interactions for a detailed description of the behavior of all registers when transition to Global Reset mode is performed.

Setting the Global mode to Reset by setting the Global Mode Control bits CFDGCTR.GMDC in the Global Control Register to 01b sets all Channel Mode Control bits CFDCnCTR.CHMDC in the Channel Control Registers to 01b and forces all channels into the Channel Reset mode.

For channels that are already in Channel Reset mode or Channel Sleep mode, this automatic transition is not performed (CFDCnCTR.CHMDC of related channel already set to 01b).

After setting Global Mode Control bit CFDGCTR.GMDC to Reset mode, it is necessary to confirm that the Reset Mode Status bit CFDGSTS.GRSTSTS in the Global Status Register has been updated, indicating successful transition to Global Reset mode before CFDGCTR.GMDC can be changed again.

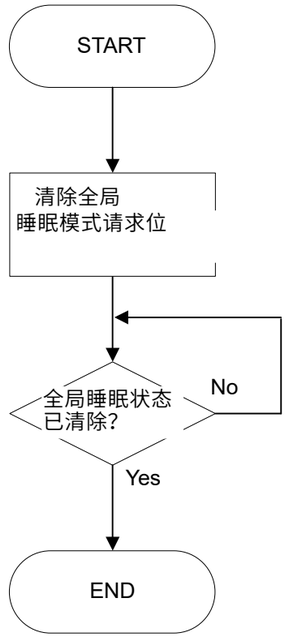

Figure 32.4 退出全局休眠模式的步骤

32.3.2.2 全局重置模式

CAN-FD模块通过以下方式进入该模式：

●全局控制寄存器中的全局模式控制位CFDGCTR.GMDC配置为全局复位模式，而CAN-FD模块处于全局暂停或全局操作模式

●CAN-FD模块处于全局休眠模式时，全局休眠模式请求位被清零。

在全局复位模式下，所有CAN-FD模块功能都被暂停，所有状态和标志寄存器都被初始化。

此外，所有FIFO和所有通道TX队列都被禁用，传输控制位被清除。

配置寄存器（测试模式寄存器除外）在此模式下未初始化为其MCU复位值，并且CAN-FD模块可配置。

请参见第32.3.4节。GlobalModeandChannelModeTransitionInteractions详细描述了当转换到全局复位模式时所有寄存器的行为。

通过设置全局控制中的全局模式控制位CFDGCTR.GMDC将全局模式设置为复位寄存器为01b将通道控制寄存器中的所有通道模式控制位CFDCnCTR.CHMDC设置为01b，并强制所有通道进入通道复位模式。

对于已经处于通道复位模式或通道休眠模式的通道，不执行此自动转换（相关通道的CFDCnCTR.CHMDC已设置为01b）。

将全局模式控制位CFDGCTR.GMDC设置为复位模式后，需要确认复位模式GlobalStatusRegister中的状态位CFDGSTS.GRSTSTS已更新，表示成功转换到Global可以再次更改CFDGCTR.GMDC之前的复位模式。

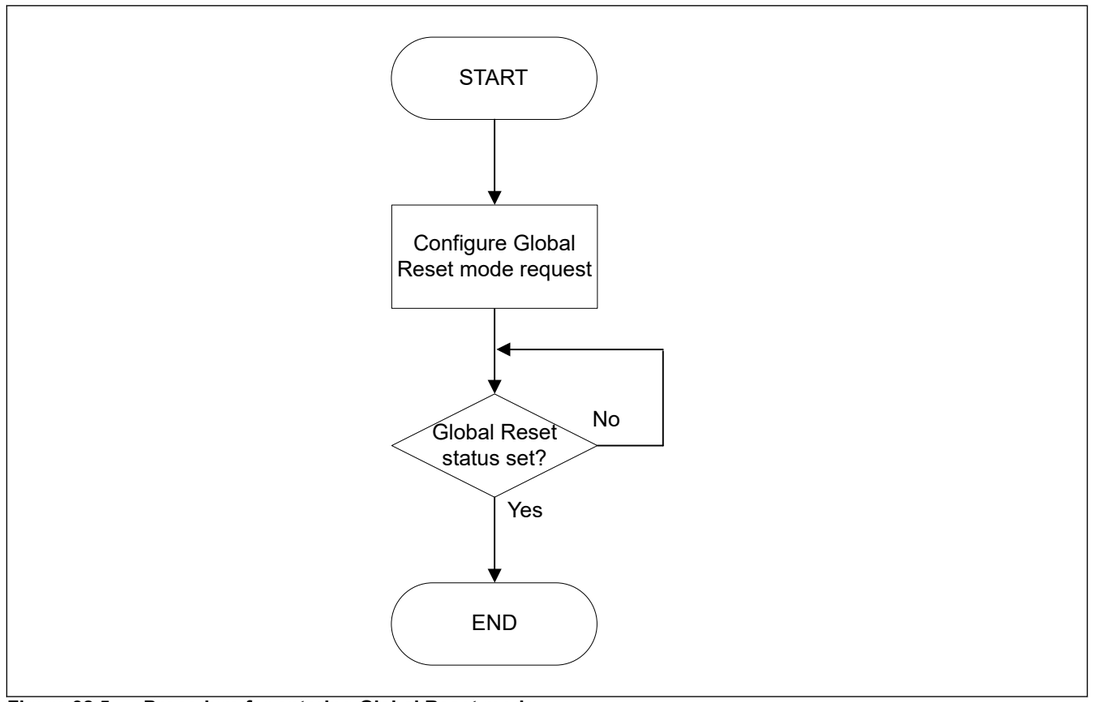

Figure 32.5 Procedure for entering Global Reset mode

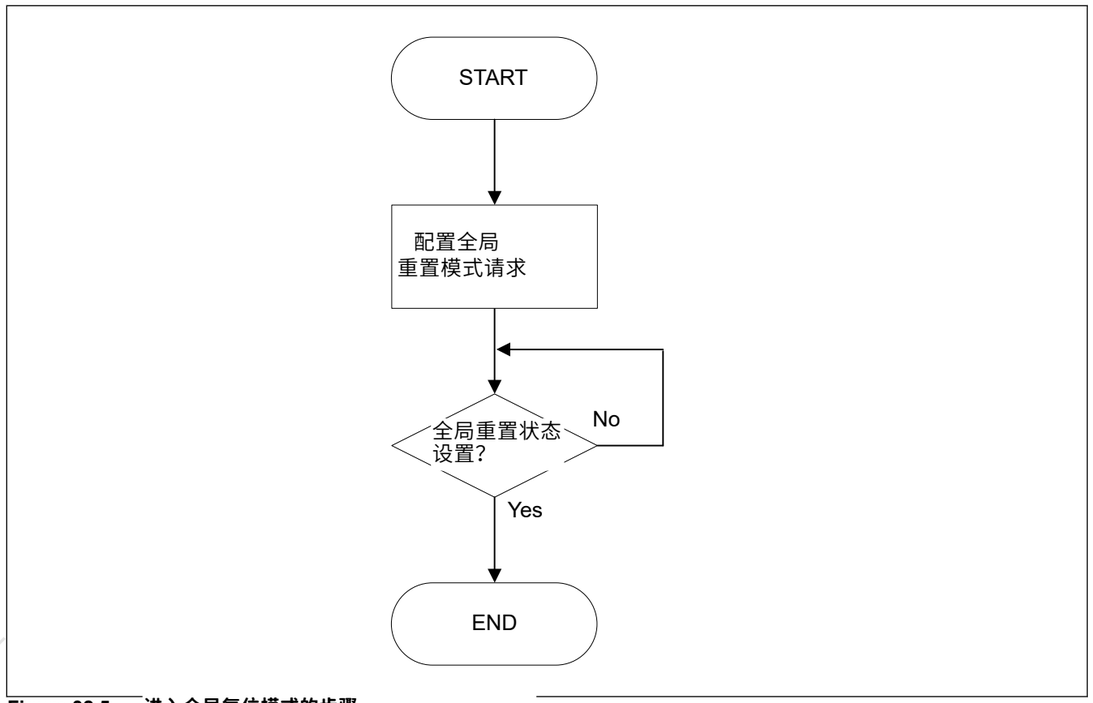

Figure 32.5 进入全局复位模式的步骤

RA生态工作室

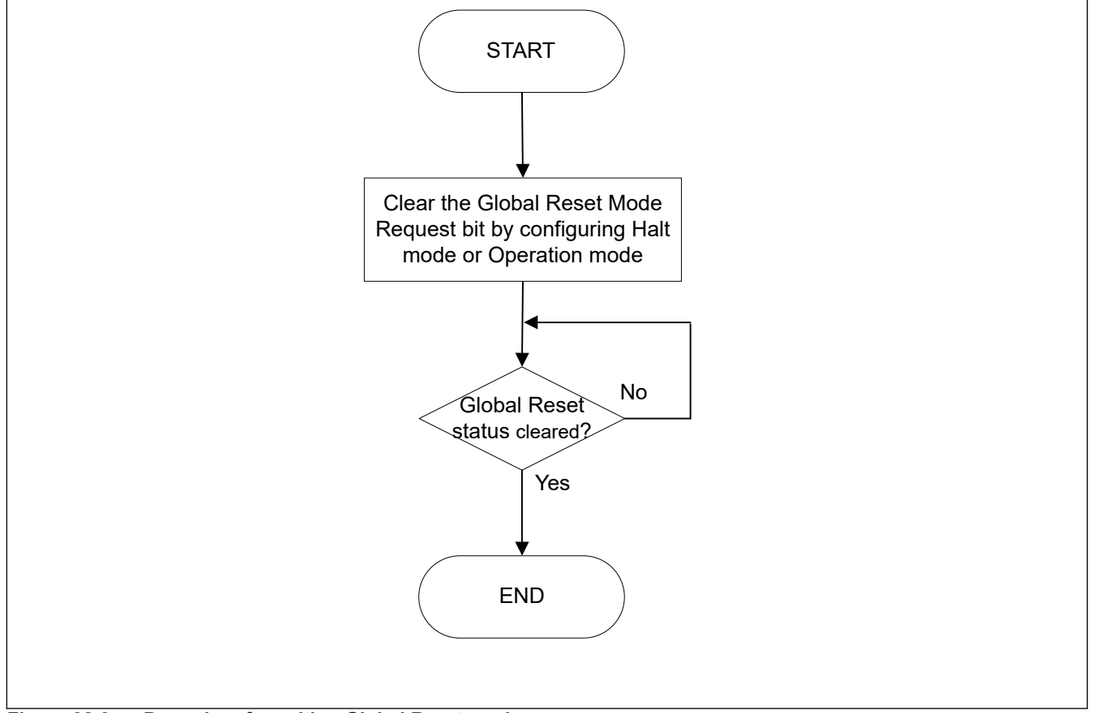

Figure 32.6 Procedure for exiting Global Reset mode

32.3.2.3 Global Halt Mode

The CAN-FD module enters this mode in the following ways:

- Global Mode Control bit CFDGCTR.GMDC in the Global Control Register is configured for Global Halt mode while the CAN-FD module is in Global Reset mode:
  - the channels is in either Channel Reset or Channel Sleep mode and remains in this mode
- Global Mode Control bit CFDGCTR.GMDC in the Global Control Register is configured for Global Halt mode while the CAN-FD module is in Global Operation mode:
  - all channels in Channel Reset, Channel Halt, or Channel Sleep mode remain in this mode
  - all channels in Channel Operation mode transit to Channel Halt mode
  - Global Halt Mode Status bit is set when all channels have left Channel Operation mode.

If a transmission or reception is ongoing for a channel, the transition to Channel Halt mode is delayed until completion of the communication.

Similarly, if a channel is in bus-off, the full bus-off recovery sequence may be delayed depending on the channel configuration.

In Global Halt mode, all communications are suspended and CAN-FD logic does not cause any change to the Status and Flag registers (only when a channel is in the bus-off that its REC and TEC values are cleared). Additionally, the test mode configuration and control registers are not initialized in this mode.

The Global Halt mode should be used to configure global module test modes.

See section 32.3.4. Global Mode and Channel Mode Transition Interactions for a detailed description of the behavior of all registers when transition to Global Halt mode is performed.

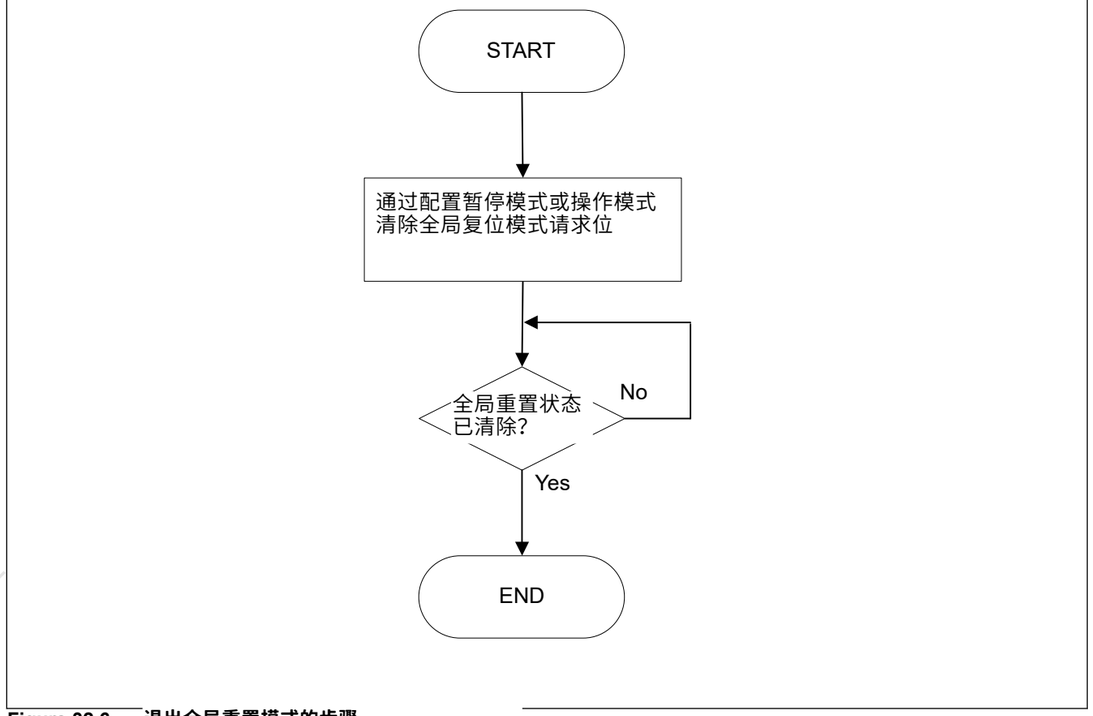

Figure 32.6 退出全局重置模式的步骤

32.3.2.3 全局停止模式

CAN-FD模块通过以下方式进入该模式：

●当CAN-FD模块处于全局复位模式时，全局控制寄存器中的全局模式控制位CFDGCTR.GMDC配置为全局暂停模式：

通道处于通道复位或通道休眠模式并保持在此模式

●当CAN-FD模块处于全局操作模式时，全局控制寄存器中的全局模式控制位CFDGCTR.GMDC配置为全局暂停模式：

处于通道复位、通道暂停或通道休眠模式的所有通道都保持在此模式

通道操作模式中的所有通道转换到通道暂停模式

当所有通道都离开通道操作模式时，设置全局暂停模式状态位。

如果通道正在进行传输或接收，则延迟到通道暂停模式的转换，直到通信完成。

类似地，如果通道处于总线关闭状态，则完全总线关闭恢复序列可能会延迟，具体取决于通道配置。

在GlobalHalt模式下，所有通信都暂停，CAN-FD逻辑不会导致Status和标志寄存器（仅当通道处于总线关闭状态时，其REC和TEC值才被清除）。此外，测试模式配置和控制寄存器在此模式下未初始化。

GlobalHalt模式应该用于配置全局模块测试模式。

请参见第32.3.4节。GlobalModeandChannelModeTransitionInteractions详细描述了在转换到全局暂停模式时所有寄存器的行为。

Setting the Global mode to Halt by setting the Global Mode Control bit CFDGCTR.GMDC in the Global Control Register to 10b sets all Channel Mode Control bits CFDCnCTR.CHMDC in the Channel Control Registers to 10b for the channels that are in Channel Operation mode and forces these channels into the Channel Halt mode.

For channels that are already in Channel Reset, Channel Halt, or Channel Sleep mode, this automatic transition is not performed.

Therefore, the Global Halt mode request can be used to shut down all CAN-FD channel communications without loss of messages and disruption on the related CAN bus (no interruption of reception/transmission processes on the channels).

After setting the Global Mode Control bit CFDGCTR.GMDC to Halt mode, it is necessary to confirm that the Halt Mode Status bit CFDGSTS.GHLTSTS in the Global Status Register has been updated to indicate a successful transition to Global Halt mode. Do not specify any other SFR setting until confirming CFDGSTS.GHLTSTS is set.

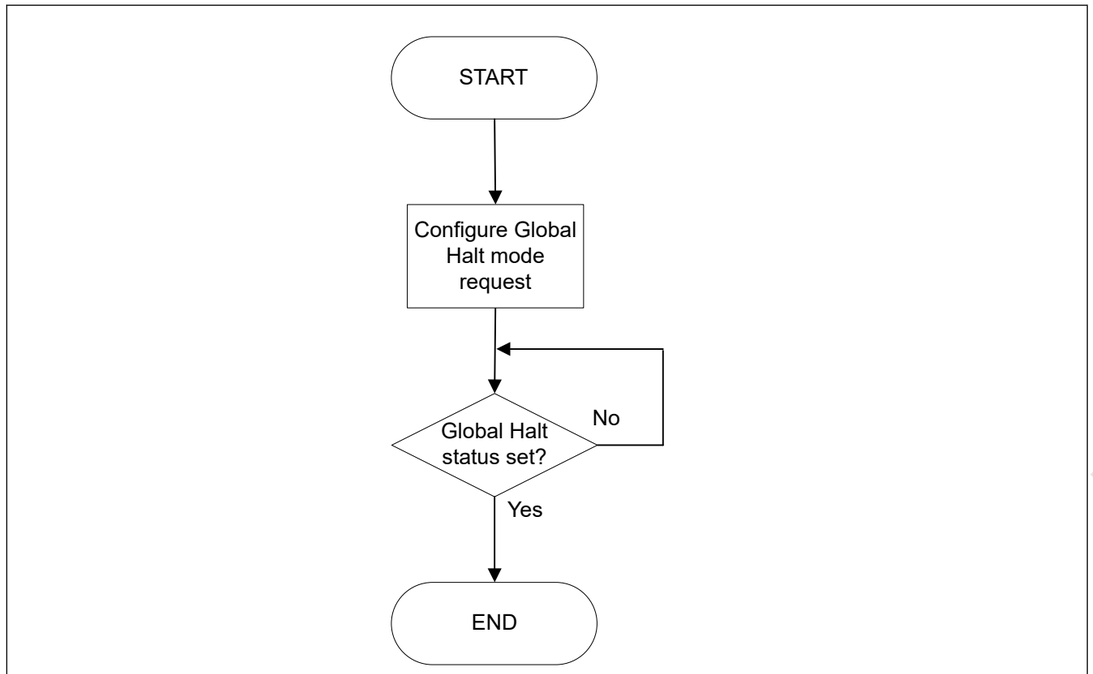

Figure 32.7 Procedure for entering Global Halt mode

通过将全局控制寄存器中的全局模式控制位CFDGCTR.GMDC设置为10b将全局模式设置为暂停，对于处于通道操作模式的通道，将通道控制寄存器中的所有通道模式控制位CFDCnCTR.CHMDC设置为10b并强制这些通道进入通道暂停模式。

对于已经处于通道复位、通道暂停或通道休眠模式的通道，不会执行此自动转换。

因此，全局暂停模式请求可用于关闭所有CAN-FD通道通信，而不会丢失消息和中断相关CAN总线（不会中断通道上的接收传输过程）。

将GlobalModeControl位CFDGCTR.GMDC设置为Halt模式后，需要确认HaltMode全局状态寄存器中的状态位CFDGSTS.GHLTTSTS已更新以指示成功转换到全局暂停模式。在确认设置CFDGSTS.GHLTTSTS之前，不要指定任何其他SFR设置。

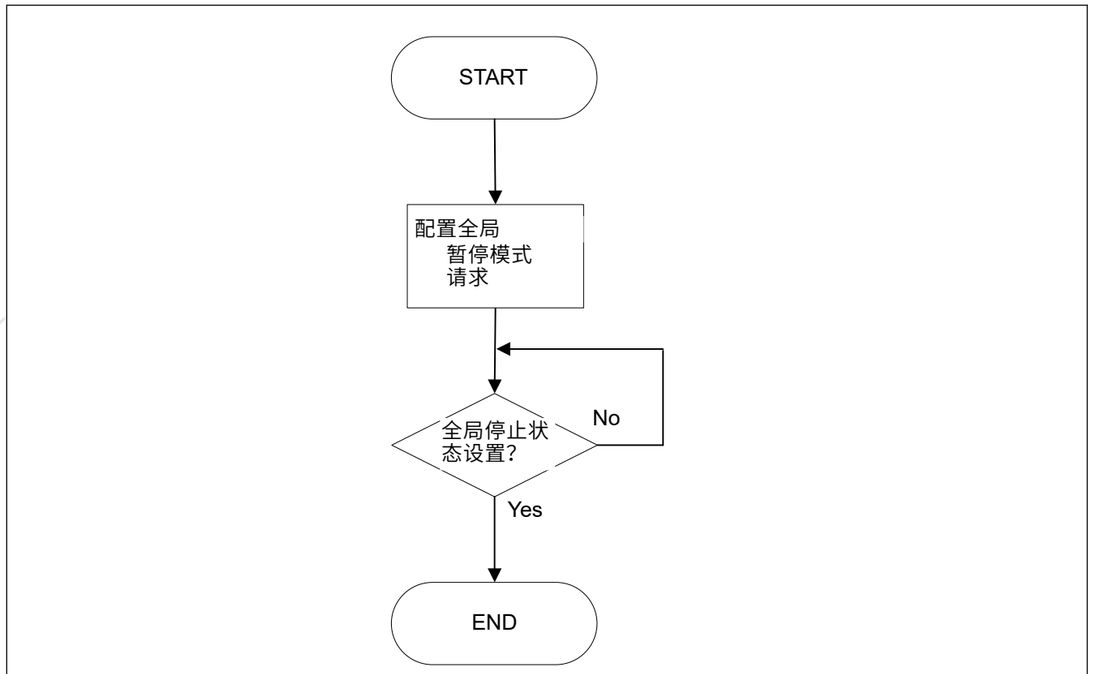

Figure 32.7 进入GlobalHalt模式的步骤

RA生态工作室

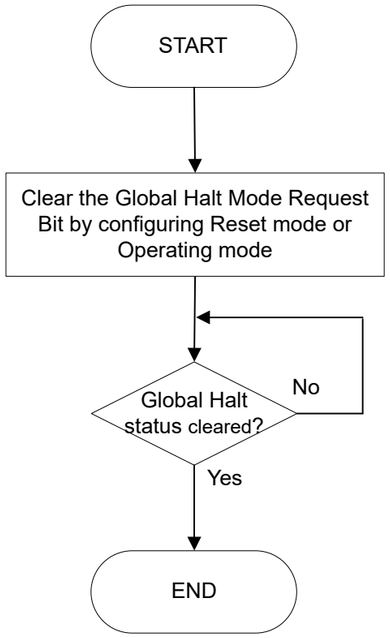

Figure 32.8 Procedure for exiting Global Halt mode

32.3.2.4 Global Operation Mode

The CAN-FD module enters this mode when the Global Mode Configuration bits are set to Global Operation mode.

The CAN-FD channels can only be set to Channel Operation mode and start CAN communication when CAN-FD is in Global Operation mode.

After setting the Global Mode Control bit CFDGCTR.GMDC to Global Operation mode, it is necessary to confirm that the Global Reset Mode Status bit CFDGSTS.GRSTSTS and the Global Halt Mode Status bit CFDGSTS.GHLTSTS in the Global Status Register have been cleared to indicate a successful transition to Global Operation mode before CFDGCTR.GMDC can be modified again.

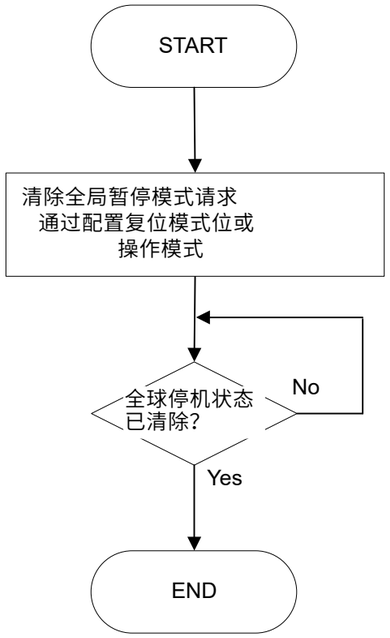

Figure 32.8 退出全局暂停模式的步骤

32.3.2.4 全球运营模式

当全局模式配置位设置为全局操作模式时，CAN-FD模块进入此模式。

CAN-FD通道只能设置为ChannelOperation模式并在CAN-FD处于工作状态时启动CAN通信
全局操作模式。

将全局模式控制位CFDGCTR.GMDC设置为全局操作模式后，需要确认
全局复位模式状态位CFDGSTS.GRSTSTS和全局暂停模式状态位CFDGSTS.GHLTSTS在
全局状态寄存器已被清除以指示成功转换到全局操作模式之前
CFDGCTR.GMDC可以再次修改。

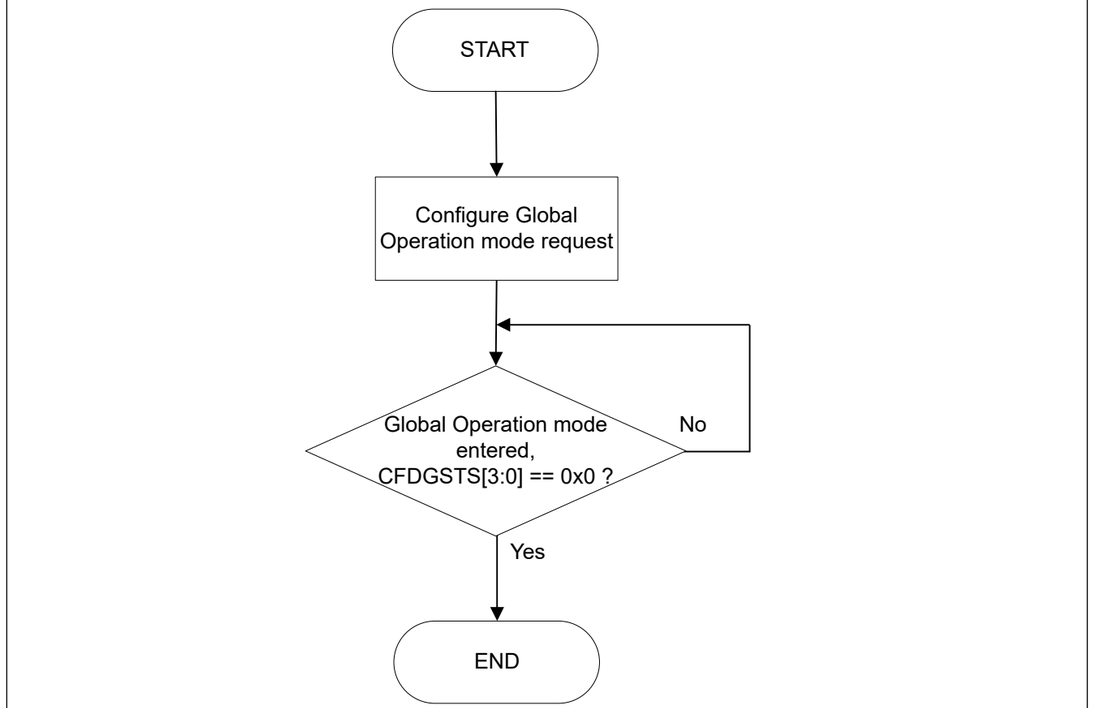

Figure 32.9 Procedure for entering Global Operation mode

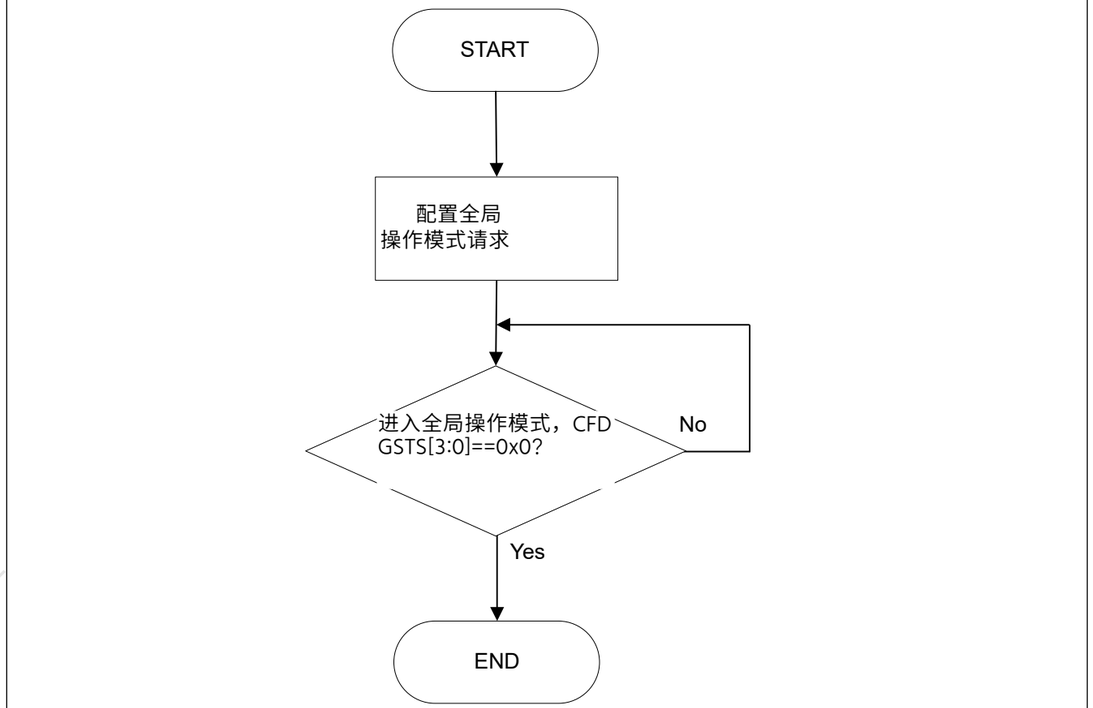

Figure 32.9 进入全局操作模式的步骤

RA生态工作室

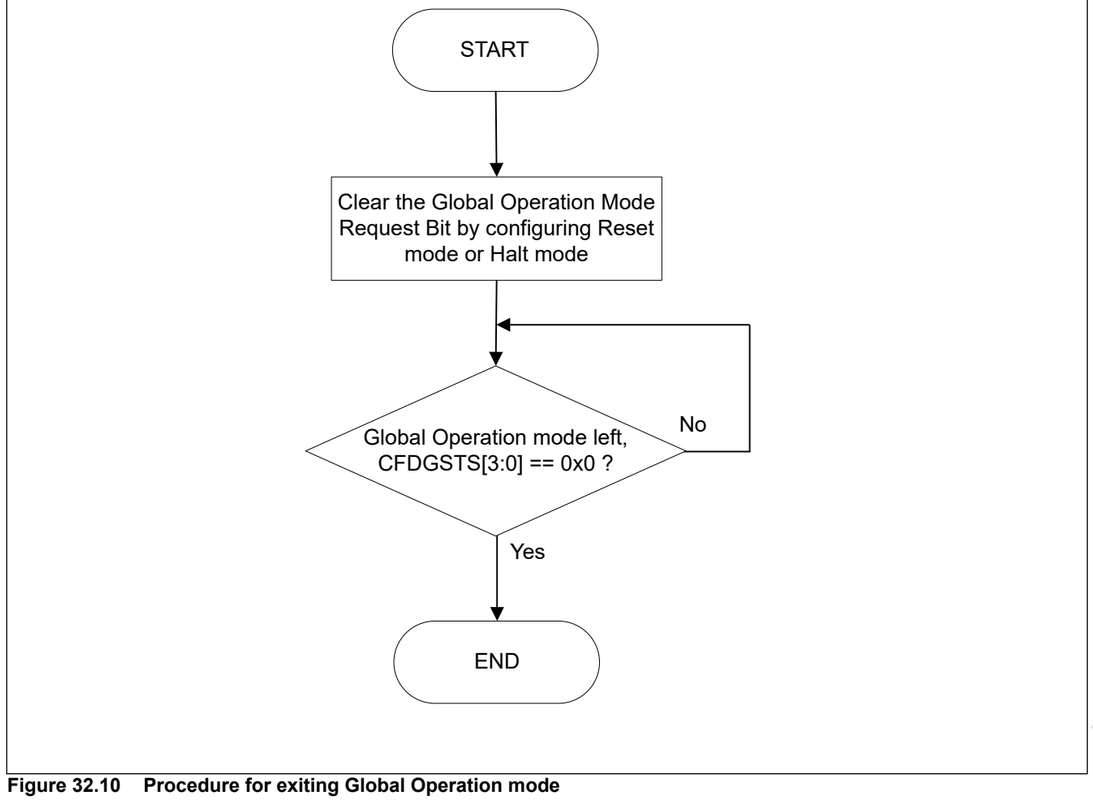

Figure 32.10 Procedure for exiting Global Operation mode

32.3.3 Channel Modes

Each CAN channel can be in one of the following four channel modes:

- Reset
- Halt
- Operation
- Sleep.

Figure 32.11 shows the possible transitions between the channel modes.

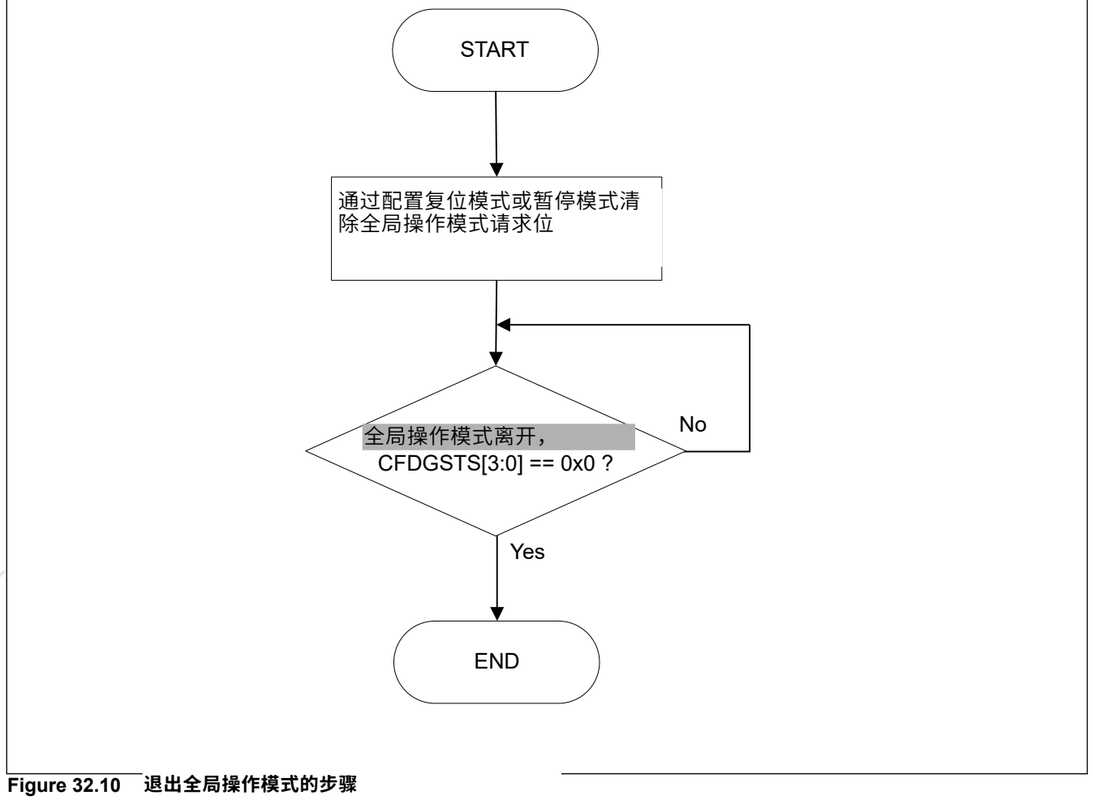

Figure 32.10 退出全局操作模式的步骤

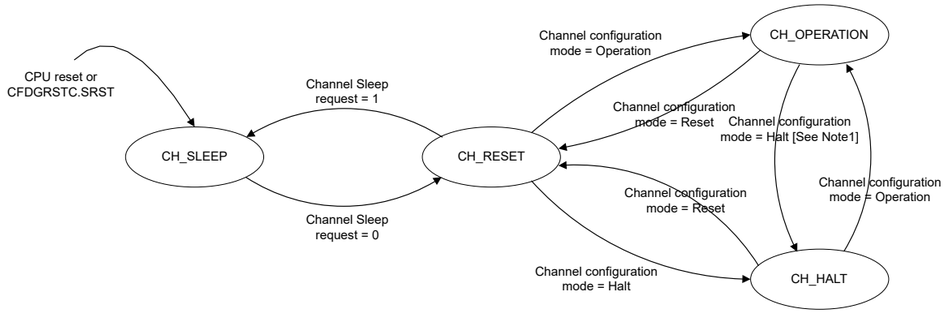
32.3.3 频道模式

每个CAN通道可以处于以下四种通道模式之一：

- Reset
- Halt
- Operation
- Sleep.

图32.11显示了通道模式之间可能的转换。



Note 1. The transition timing depends on BOM setting in the Channel Configuration Register:
- when BOM = 01b, the state transition timing is immediate after entering bus-off state
- when BOM = 10b, the state transition timing is at the end of bus-off state
- when BOM = 11b, the state transition timing is matching with the setting of CHMDC to Halt mode.

Figure 32.11 Transition between CAN channel modes

32.3.3.1 CAN Channel Sleep Mode

After the release of a hardware reset or after setting and clearing the CFDGRSTC.SRST bit, each CAN channel of the CAN-FD module automatically enters Channel Sleep mode.

Each CAN channel also enters Channel Sleep mode when the related Channel Sleep Mode Request bit is set while the CAN channel is in Channel Reset mode. Do not set this control bit in Channel Halt mode or Channel Operation mode.

Entering the CAN Channel Sleep mode instantly stops the clock supplied to the CAN channel unit and therefore reduces power consumption.

After setting the Channel Sleep Mode Request bit, it is necessary to confirm that the Channel Sleep mode status has been updated to indicate a successful transition to Channel Sleep mode before the Channel Sleep Mode Request bit can be cleared again.

During Channel Sleep mode, do not write to channel related registers. Read operation is still possible.

32.3.3.2 CAN Channel Reset Mode

A CAN-FD CAN channel enters this mode in the following ways:

- Channel Mode Control bit CFDCnCTR.CHMDC in the Channel Control Registers is configured for Channel Reset mode while the related CAN channel is in Channel Halt mode or Channel Operation mode
- Channel Sleep Mode Request bit is cleared while the related CAN channel is in Channel Sleep mode
- Global Mode Control bit CFDGCTR.GMDC is set to Global Reset mode and CAN channel is not in Channel Sleep mode or Channel Reset mode.

In Channel Reset mode, all CAN channel status and flag registers are initialized.

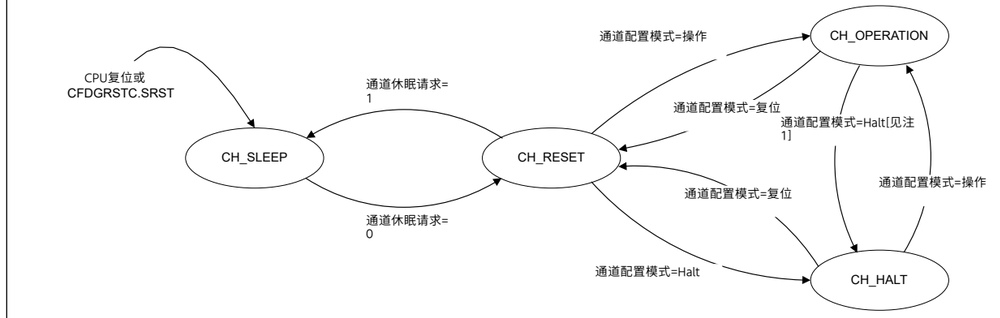
Additionally all channel related transmission control bits are cleared and the channel related TX Queue is disabled.

Configuration registers (except the Channel Test Mode registers) are not initialized in this mode and the CAN channel can be configured for communication.

See section 32.3.4. Global Mode and Channel Mode Transition Interactions for a detailed description of the behavior of all registers when transition to Channel Reset mode is performed.

After setting the Channel Mode Control bit CFDCnCTR.CHMDC to Channel Reset mode, it is necessary to confirm that the Reset Mode Status bit CFDCnSTS.CRSTSTS in the related Channel Status Registers has been updated to indicate a successful transition to Channel Reset mode before the related CFDCnCTR.CHMDC bit can be modified again.

See Table 32.9 for the behavior of transitioning to Channel Reset mode while CAN communication is ongoing.



注1.转换时序取决于通道配置寄存器中的BOM设置：●
当BOM=01b时，状态转换时序在进入总线关闭状态后立即进行
- 当BOM=10b时，状态转换时序在总线关闭状态结束时
- 当BOM=11b时，状态转换时序与CHMDC设置为Halt模式相匹配。

Figure 32.11 CAN通道模式之间的转换

32.3.3.1 CAN通道休眠模式

在释放硬件复位或设置和清除CFDGRSTC.SRST位后，CAN的每个CAN通道FD模块自动进入通道休眠模式。

当CAN通道处于通道复位模式时，当相关通道休眠模式请求位置位时，每个CAN通道也会进入通道休眠模式。不要在ChannelHalt模式或ChannelOperation模式下设置该控制位。

进入CAN通道休眠模式会立即停止提供给CAN通道单元的时钟，从而降低功耗。

设置通道休眠模式请求位后，必须确认通道休眠模式状态已更新以指示成功转换到通道休眠模式，然后才能再次清除通道休眠模式请求位。

在通道休眠模式期间，不要写入通道相关寄存器。仍然可以进行读取操作。

32.3.3.2 CAN通道复位模式

CAN-FDCAN通道通过以下方式进入此模式：

●通道控制寄存器中的通道模式控制位CFDCnCTR.CHMDC配置为通道复位模式，而相关的CAN通道处于通道暂停模式或通道操作模式

●通道休眠模式请求位在相关CAN通道处于通道休眠模式时清零

●全局模式控制位CFDGCTR.GMDC设置为全局复位模式，CAN通道不处于通道休眠模式或通道复位模式。

在通道复位模式下，所有CAN通道状态和标志寄存器都被初始化。

此外，所有通道相关的传输控制位都被清除，通道相关的TX队列被禁用。

配置寄存器（通道测试模式寄存器除外）在此模式下未初始化，CAN通道可配置为进行通信。

请参见第32.3.4节。GlobalModeandChannelModeTransitionInteractions详细描述了当转换到通道复位模式时所有寄存器的行为。

将通道模式控制位CFDCnCTR.CHMDC设置为通道复位模式后，需要确认相关通道状态寄存器中的复位模式状态位CFDCnSTS.CRSTSTS已更新，以指示在相关CFDCnCTR.CHMDC位可以再次修改之前成功转换到通道复位模式。

有关在CAN通信进行时转换到通道复位模式的行为，请参见表32.9。

32.3.3.3 CAN Channel Halt Mode

An CAN-FD CAN channel enters this mode in the following ways:

- Channel Mode Control bit CFDCnCTR.CHMDC in the Channel Control Registers is configured for Channel Halt mode while the related CAN channel is in Channel Reset mode or Channel Operation mode
- Global Mode Control bit CFDGCTR.GMDC is set to Global Halt mode and CAN channel is in Channel Operation mode.

In Channel Halt mode, all channel CAN communication is suspended but all status and flag registers remain unchanged during Channel Halt mode entry (except for the bus-off case where REC and TEC values are cleared for this channel).

In addition, the Channel Test Mode Configuration and Control registers are not initialized in this mode.

The Channel Halt mode should be used to configure channel test modes.

See section 32.3.4. Global Mode and Channel Mode Transition Interactions for a detailed description of the behavior of all registers when transition to Channel Halt mode is performed.

After setting the Channel Mode Control bit CFDCnCTR.CHMDC to Channel Halt mode, it is necessary to confirm that the Halt Mode Status bit CFDCnSTS.CHLTSTS in the related Channel Status Register has been updated to indicate a successful transition to Channel Halt mode before the related CFDCnCTR.CHMDC can be modified again.

See Table 32.9 for the transition behavior to Channel Halt mode while CAN communication is ongoing.

Table 32.9 Transition behavior in CAN Reset mode and Halt mode

Mode	State		
	Receiver	Transmitter	Bus-Off
CAN Channel Reset mode (CFDCnCTR.CHMDC = 01b)	The CAN channel enters Channel Reset mode without waiting for the completion of the ongoing reception.*1	The CAN channel enters Channel Reset mode without waiting for the completion of the ongoing transmission.*1	The CAN channel enters Channel Reset mode without waiting for the completion of the bus-off recovery.
CAN Channel Halt mode (CFDCnCTR.CHMDC = 10b)	CAN channel enters Channel Halt mode at the end of the ongoing reception or error.*2	CAN channel enters Channel Halt mode after completion of the ongoing transmission.	When CFDCnCTR.BOM is set to 00b, a Channel Halt mode request is accepted only after the completion of the full bus-off recovery sequence. When CFDCnCTR.BOM is set to 10b, the CAN channel transits automatically to Channel Halt mode after waiting for the completion of the bus-off recovery. When CFDCnCTR.BOM is set to 01b, the CAN channel transits automatically to Channel Halt mode without waiting for the completion of the bus-off recovery. When CFDCnCTR.BOM is set to 11b, the CAN channel enters Channel Halt mode as soon as Channel Halt mode is requested (without waiting for the completion of the bus-off recovery).

Note 1. If the entry to Channel Reset mode is required only at the end of an ongoing communication, then Channel Halt mode can be requested first to prevent interruption of CAN communication by direct transition to Channel Reset mode. After the CAN channel enters Channel Halt mode, the Channel Reset mode can be requested.

Note 2. If CAN communication is locked at dominant level after an error flag, software can detect this situation by monitoring the channel related BusLock flag and resolve lock condition by setting the CAN channel to Channel Reset mode.

32.3.3.4 CAN Channel Operation Mode

The Channel Operation mode is activated by setting the CFDCnCTR.CHMDC bits to 00b. If 11 consecutive recessive bits are detected after entering the CAN Operation mode, the CFDCnSTS.COMSTS bit is set and the CAN channel:

32.3.3.3 CAN通道暂停模式

CAN-FDCAN通道通过以下方式进入此模式：

●通道控制寄存器中的通道模式控制位CFDCnCTR.CHMDC配置为通道暂停模式，而相关的CAN通道处于通道复位模式或通道操作模式

●全局模式控制位CFDGCTR.GMDC设置为全局暂停模式，CAN通道处于通道操作模式。

在ChannelHalt模式下，所有通道CAN通信都暂停，但在ChannelHalt模式进入期间所有状态和标志寄存器保持不变（总线关闭情况除外，该通道的REC和TEC值被清除）。

此外，通道测试模式配置和控制寄存器在此模式下未初始化。

通道暂停模式应该用于配置通道测试模式。

请参见第32.3.4节。GlobalModeandChannelModeTransitionInteractions详细描述了当转换到ChannelHalt模式时所有寄存器的行为。

将通道模式控制位CFDCnCTR.CHMDC设置为通道暂停模式后，需要确认
相关通道状态寄存器中的暂停模式状态位CFDCnSTS.CHLTSTS已更新，以指示在可以再次修改相关CFDCnCTR.CHMDC之前成功转换到通道暂停模式。

有关CAN通信正在进行时到通道暂停模式的转换行为，请参见表32.9。

Table 32.9 CAN复位模式和暂停模式下的转换行为

Mode	State		
	Receiver	Transmitter	Bus-Off
CAN通道复位模式(CFDCnCTR.CHMDC=01b)	CAN通道进入 通道复位模式无需等待正在进行的接收完成。*1	CAN通道进入 通道复位模式无需等待正在进行的传输完成。*1	CAN通道进入 通道复位模式无需等待总线关闭恢复完成。
CAN通道暂停模式(CFDCnCTR.CHMDC=10b)	CAN通道在正在进行的接收或错误结束时进入通道暂停模式。*2	CAN通道进入Channel 正在进行的传输完成后暂停模式。	当CFDCnCTR.BOM设置为00b时，仅在完成完整的总线关闭恢复序列后才接受通道暂停模式请求。当CFDCnCTR.BOM设置为10b时，CAN通道在等待总线关闭恢复完成后自动转换到通道暂停模式。当CFDCnCTR.BOM设置为01b时，CAN通道自动转换到通道暂停模式，无需等待总线关闭恢复完成。当CFDCnCTR.BOM设置为11b时，只要请求ChannelHalt模式，CAN通道就会进入ChannelHalt模式（无需等待总线关闭恢复完成）。

注1.如果仅在正在进行的通信结束时需要进入通道复位模式，则通道暂停模式可以是
首先请求通过直接转换到通道复位模式来防止CAN通信中断。CAN通道进入ChannelHalt模式后，可以请求ChannelReset模式。

注2.如果CAN通信在出现错误标志后被锁定在显性电平，软件可以通过监控通道相关的BusLock标志来检测这种情况，并通过将CAN通道设置为通道复位模式来解决锁定条件。

32.3.3.4 CAN通道操作模式

通道操作模式通过将CFDCnCTR.CHMDC位设置为00b来激活。如果在进入CAN操作模式后检测到11个连续的隐性位，则CFDCnSTS.COMSTS位置位并且CAN通道：

- Enables the functions of the channel communication by allowing the channel to become an active node on the CAN network
- Releases the internal fault confinement logic including receive and transmit error counters

At this point, the CAN channel can start transmission and reception of CAN messages.

Within the CAN Channel Operation mode, the channel may be in four different sub-modes, depending on which type of communication functions are performed (see Figure 32.12):

- Channel idle: The CAN channel is neither receiving nor transmitting
- Channel receives: The channel is receiving a CAN message sent by another CAN node
- Channel transmits: The channel is transmitting a CAN message

  Note: The channel may receive its own message simultaneously when Self-test mode is enabled.
- Channel is in bus-off state: The CAN channel is cut-off from CAN bus communication.

After setting the Channel Mode Control bit CFDCnCTR.CHMDC to Channel Operation mode, it is necessary to confirm that the Channel Reset Mode Status bit CFDCnSTS.CRSTSTS and the Channel Halt Mode Status bit CFDCnSTS.CHLTSTS in the Channel Status Register have been updated to indicate a successful transition to Channel Operation mode before the related CFDCnCTR.CHMDC bit can be changed again.

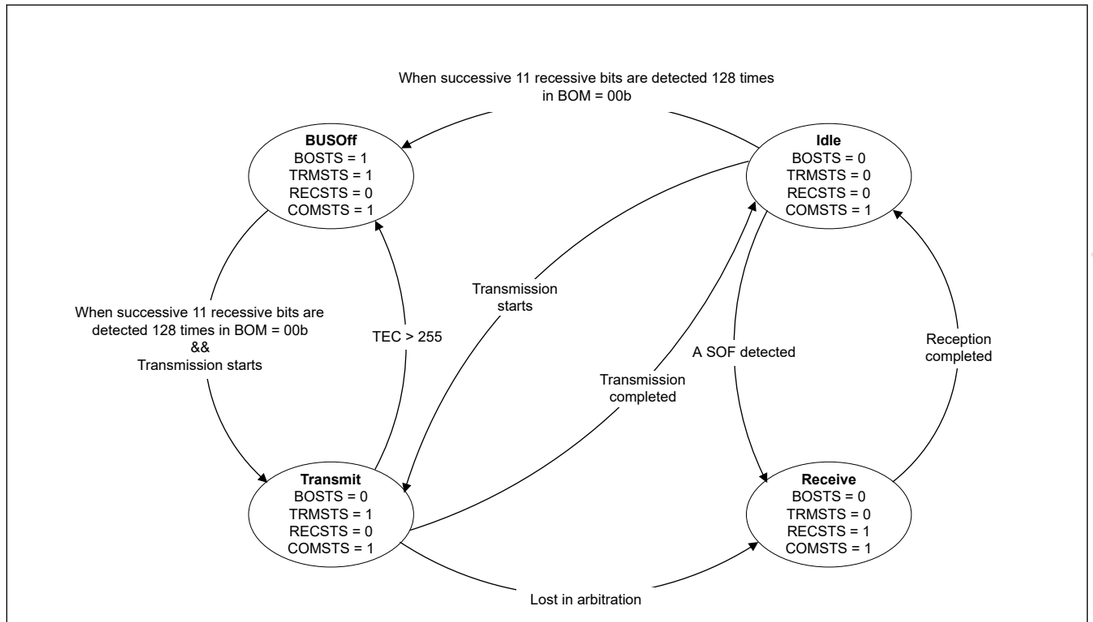


Figure 32.12 Sub-modes of CAN Channel Operation mode (only when BOM = 00b)

32.3.3.5 CAN Channel Bus-Off State

The CAN channel bus-off state is entered according to the fault confinement rules of the CAN specification. The following modes can be configured for returning to the CAN Channel Operation mode from the bus-off state:

- CFDCnCTR.BOM = 00b:
  Bus-Off recovery is compliant to ISO 11898-1, namely the CAN channel re-enters CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. TEC and REC counters are initialized to 0. The Bus-Off Recovery Flag CFDCnERFL.BORF is set in this case.
- CFDCnCTR.BOM = 01b:

●通过让通道成为CAN网络上的活动节点来启用通道通信的功能

●释放内部故障限制逻辑，包括接收和发送错误计数器

此时，CAN通道就可以开始发送和接收CAN报文了。

在CAN通道操作模式下，通道可能处于四种不同的子模式，具体取决于执行的通信功能类型（参见图32.12）：

●Channelidle：CAN通道既不接收也不发送

●通道接收：通道正在接收另一个CAN节点发送的CAN报文

●通道传输：通道正在传输CAN报文

Note: 启用自检模式后，通道可能会同时收到自己的消息。

●通道处于总线关闭状态：CAN通道与CAN总线通讯中断。

将通道模式控制位CFDCnCTR.CHMDC设置为通道操作模式后，需要确认通道状态寄存器中的通道复位模式状态位CFDCnSTS.CRSTSTS和通道暂停模式状态位CFDCnSTS.CHLTSTS已更新以指示成功过渡到频道

可以再次更改相关CFDCnCTR.CHMDC位之前的操作模式。

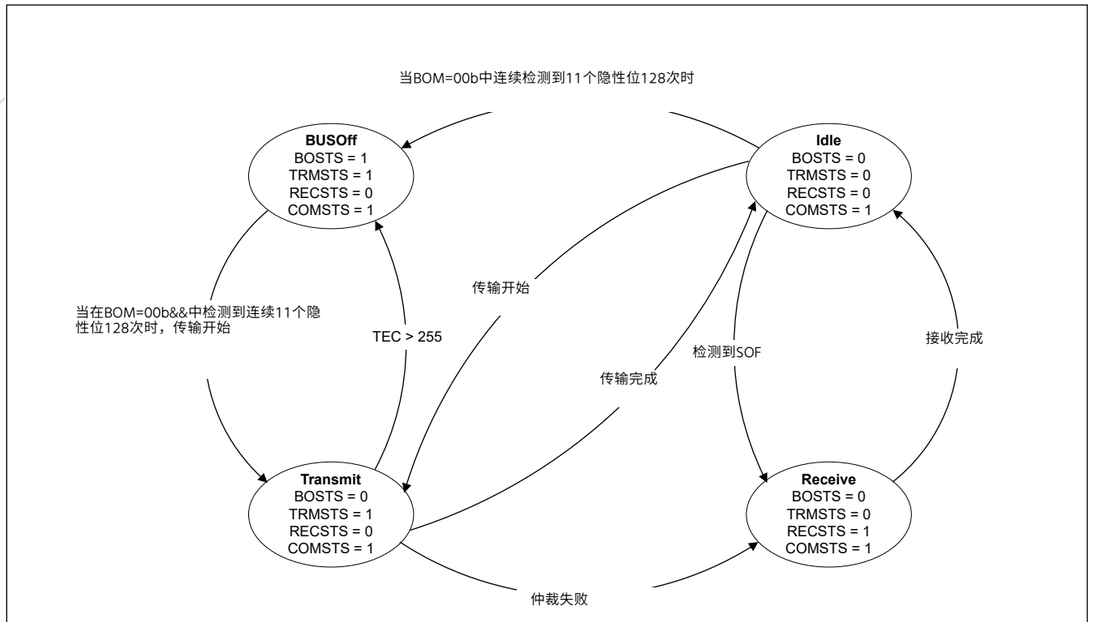

Figure 32.12 CAN通道操作模式的子模式（仅当BOM=00b时）

32.3.3.5 CAN通道总线关闭状态

根据CAN规范的故障限制规则进入CAN通道总线关闭状态。可以配置以下模式以从总线关闭状态返回到CAN通道操作模式：

- CFDCnCTR.BOM = 00b:
  Bus-Off恢复符合ISO11898-1标准，即CAN通道在连续检测到11个隐性位128次后重新进入CAN通信（错误激活状态）。TEC和REC计数器初始化为0。在这种情况下设置总线关闭恢复标志CFDCnERFL.BORF。
- CFDCnCTR.BOM = 01b:

RA生态工作室

The CAN channel changes the value of the CFDCnCTR.CHMDC bits within the CAN Channel Control Register to 10b and switches immediately to Channel Halt mode automatically after entering bus-off state. TEC and REC counters are initialized to 0 and the Bus-Off Recovery Flag CFDCnERFL.BORF is not set in this case.

- CFDCnCTR.BOM = 10b:
  The CAN channel changes the value of the CFDCnCTR.CHMDC bits within the CAN Channel Control Register to 10b as soon as it reaches bus-off state and enters Channel Halt mode automatically after the CAN channel has completed the bus-off recovery sequence (after 11 consecutive recessive bits are detected 128 times). TEC and REC counters are initialized to 0 and the Bus-Off Recovery Flag CFDCnERFL.BORF is set in this case.
- CFDCnCTR.BOM = 11b:
  Bus-off recovery is initiated but CAN channel can immediately enter Channel Halt mode when still in bus-off state if a request is made to enter Channel Halt mode.
  TEC and REC counters are initialized to 0 and the Bus-Off Recovery Flag CFDCnERFL.BORF is not set.
  Without setting CFDCnCTR.CHMDC [1:0] = 10b and when 11 recessive bits is detected 128 times continuously, transition conditions become the same as CFDCnCTR.BOM = 00b.

Note: If the recovery from bus-off occurs normally in this mode (after waiting for 128 sequences of 11 consecutive recessive bits), and no halt request has been generated during this period, then the Bus-Off Recovery flag CFDCnERFL.BORF is set.

When software writes to the CFDCnCTR.CHMDC bit at the same time as the CAN channel enters Halt mode (at the start of bus-off when CFDCnCTR.BOM = 01b, or at the end of bus-off when CFDCnCTR.BOM = 10b), the software request has the highest priority.

Note: In the above case, the automatic setting of the CFDCnCTR.CHMDC bit to Channel Halt mode request is performed when the CFDCnCTR.CHMDC bit value is previously 00b (Channel Operation mode).

Additionally, it is possible to force the CAN channel to recover from the bus-off state by setting CFDCnCTR.RTBO to 1. The error state changes from bus-off state to integrating state with a maximum delay of 1 CAN bit time, and the CAN communication becomes possible again after 11 consecutive recessive bits are detected. The Bus-Off Recovery Flag is not set in this case, and the TEC and REC counters are initialized to 0.

Before setting CFDCnCTR.RTBO to 1, all pending transmissions from the TX message buffers, TX Queues and/or Common FIFO in TX or GW mode should be disabled.

The disable of the pending transmission message buffer, TX Queue or FIFO must be confirmed by the corresponding acknowledge flags.

For the TX message buffer, the acknowledge flags are the Transmission Result Flags (CFDTMSTSn.TMTRF). For the TX Queue, it is the TX Queue Empty flag (CFDTXQSTSn.TXQEMP). For the FIFO, it is the FIFO Empty flag (CFDCFSTSn.CFEMP).

The CFDCnCTR.RTBO bit should be used for bus-off recovery only when CFDCnCTR.BOM is set to 00b.

Setting this bit in any state other than bus-off has no effect and the bit is cleared immediately.

Table 32.10 shows the settings for the Bus-Off Entry flag CFDCnERFL.BOEF and the Bus-Off Recovery flag CFDCnERFL.BORF for the different configurations of CFDCnCTR.BOM.

Table 32.10 Behavior of Bus-off Entry and Recovery flags

BOM	BOEF bit set	BORF bit set
00b	Always (on entry to bus-off)	Always (on exit from bus-off)
00b CFDCnCTR.RTBO set to 1	Always (on entry to bus-off)	Only if normal bus-off recovery occurs before software sets CFDCnCTR.RTBO to 1'
01b	Always (on entry to bus-off)	Never
10b	Always (on entry to bus-off)	Always (on exit from bus-off)
11b	Always (on entry to bus-off)	Only if normal bus-off recovery occurs before software issues a Halt request

For an efficient software procedure, it is not necessary to wait for the bus-off recovery sequence to end.

CAN通道将CAN通道控制寄存器中的CFDCnCTR.CHMDC位的值更改为10b，并在进入总线关闭状态后立即自动切换到通道暂停模式。在这种情况下，TEC和REC计数器初始化为0，并且总线关闭恢复标志CFDCnERFL.BORF未设置。

- CFDCnCTR.BOM = 10b:
  CAN通道一旦达到总线关闭状态，就会将CAN通道控制寄存器中的CFDCnCTR.CHMDC位的值更改为10b，并在CAN通道完成总线关闭恢复序列后自动进入通道暂停模式（11连续的隐性位被检测到128次）。在这种情况下，TEC和REC计数器被初始化为0，并且总线关闭恢复标志CFDCnERFL.BORF被设置。
- CFDCnCTR.BOM = 11b:
  总线关闭恢复已启动，但如果请求进入通道暂停模式，CAN通道仍处于总线关闭状态时可立即进入通道暂停模式。TEC和REC计数器初始化为0，并且总线关闭恢复标志CFDCnERFL.BORF未设置。

  在不设置CFDCnCTR.CHMDC[1:0]=10b且连续128次检测到11个隐性位时，转换条件与CFDCnCTR.BOM=00b相同。

Note: 如果在此模式下从总线关闭中恢复正常（在等待128个序列的11个连续隐性位之后），并且在此期间没有产生暂停请求，则设置总线关闭恢复标志CFDCnERFL.BORF。

当软件在CAN通道进入暂停模式的同时写入CFDCnCTR.CHMDC位（当CFDCnCTR.BOM=01b时在总线关闭开始时，或者当CFDCnCTR.BOM=10b时在总线关闭结束时），软件请求具有最高优先级。

Note: 在上述情况下，当CFDCnCTR.CHMDC位的值先前为00b（通道操作模式）时，会执行将CFDCnCTR.CHMDC位自动设置为通道暂停模式请求。

此外，可以通过将CFDCnCTR.RTBO设置为1来强制CAN通道从总线关闭状态恢复。错误状态从总线关闭状态变为积分状态，最大延迟为1个CAN位时间，并且在检测到11个连续的隐性位后，CAN通信再次成为可能。在这种情况下，不设置总线关闭恢复标志，并且TEC和REC计数器初始化为0。

在将CFDCnCTR.RTBO设置为1之前，来自TX消息缓冲区、TX队列和或TX或GW模式下的通用FIFO应禁用。

未决传输消息缓冲区、TX队列或FIFO的禁用必须由相应的确认标志确认。

对于TX消息缓冲区，确认标志是传输结果标志(CFDTMSTSn.TMTRF)。对于TX Queue，它是TXQueueEmpty标志（CFDTXQSTSn.TXQEMP）。对于FIFO，它是FIFO空标志(CFDCFSTSn.CFEMP)。

只有当CFDCnCTR.BOM设置为00b时，才应使用CFDCnCTR.RTBO位进行总线关闭恢复。

将该位设置为除总线关闭以外的任何状态均无效，并且该位立即被清除。

表32.10显示了Bus-OffEntry标志CFDCnERFL.BOEF和Bus-OffRecovery标志的设置CFDCnERFL.BORF用于CFDCnCTR.BOM的不同配置。

Table 32.10 总线关闭进入和恢复标志的行为

BOM	BOEF位组	BORF位组
00b	总是（在进入巴士下车时）	总是（在巴士下车的出口处）
00bCFDCnCTR.RTBO设置为1	总是（在进入巴士下车时）	只有在软件设置之前发生正常的总线关闭恢复CFDCnCTR.RTBO to 1'
01b	总是（在进入巴士下车时）	Never
10b	总是（在进入巴士下车时）	总是（在巴士下车的出口处）
11b	总是（在进入巴士下车时）	只有在软件发出暂停请求之前发生正常的总线关闭恢复

对于有效的软件程序，不必等待总线关闭恢复序列结束。

It is possible to perform a transmission re-initialization during bus-off recovery. To do this, follow the recommended software flow in Figure 32.13.

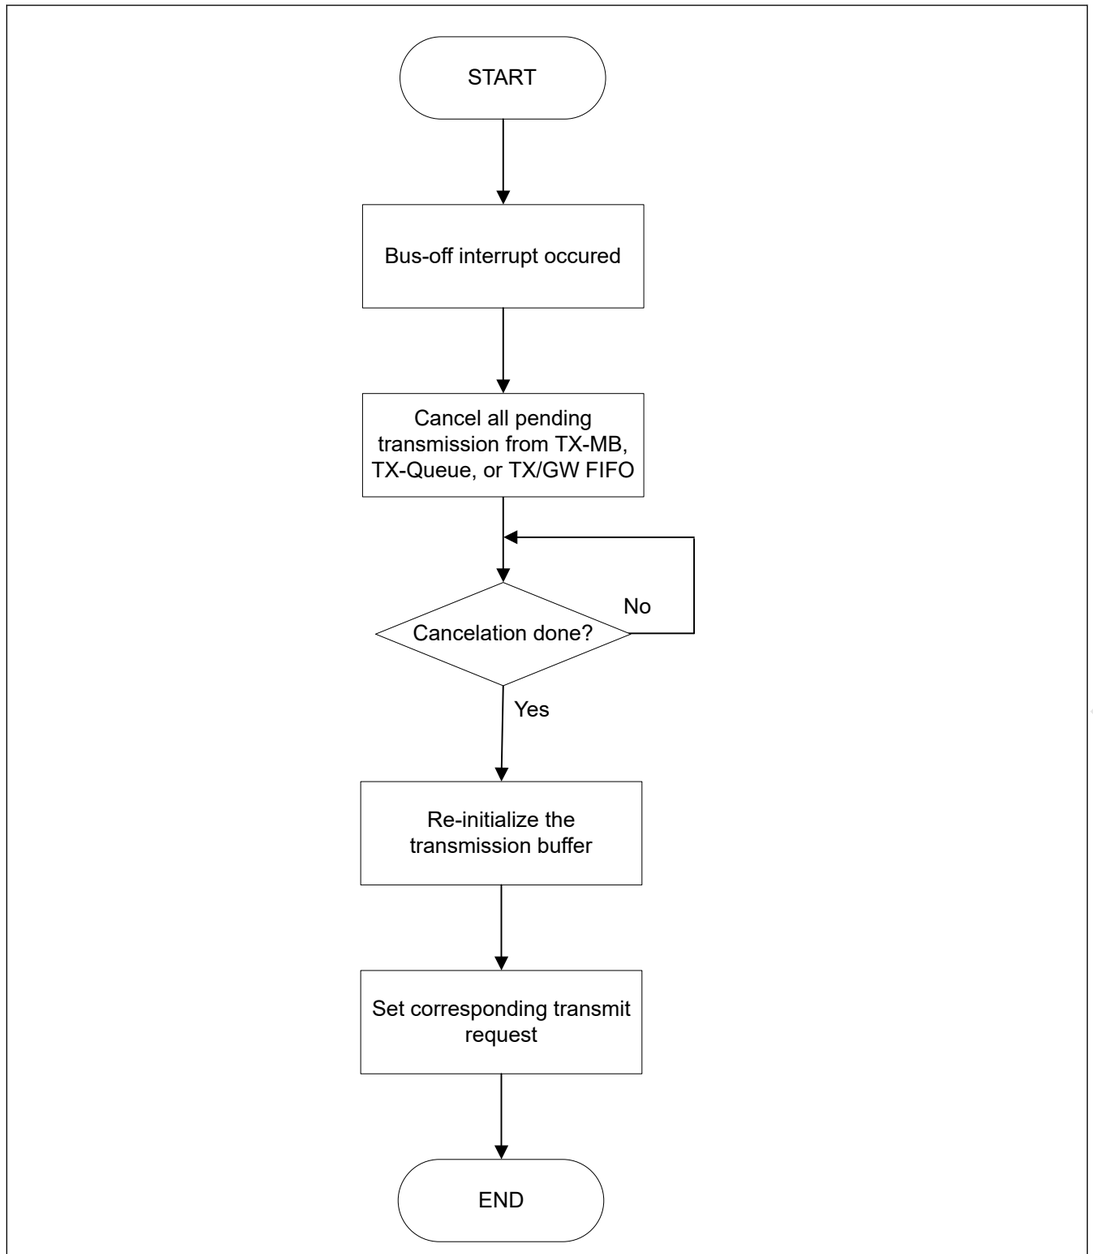

Figure 32.13 Transmission re-initialization during bus-off

32.3.4 Global Mode and Channel Mode Transition Interactions

The interaction between Global mode setting and Channel mode setting is as follows:

可以在总线关闭恢复期间执行传输重新初始化。为此，请遵循图32.13中推荐的软件流程。

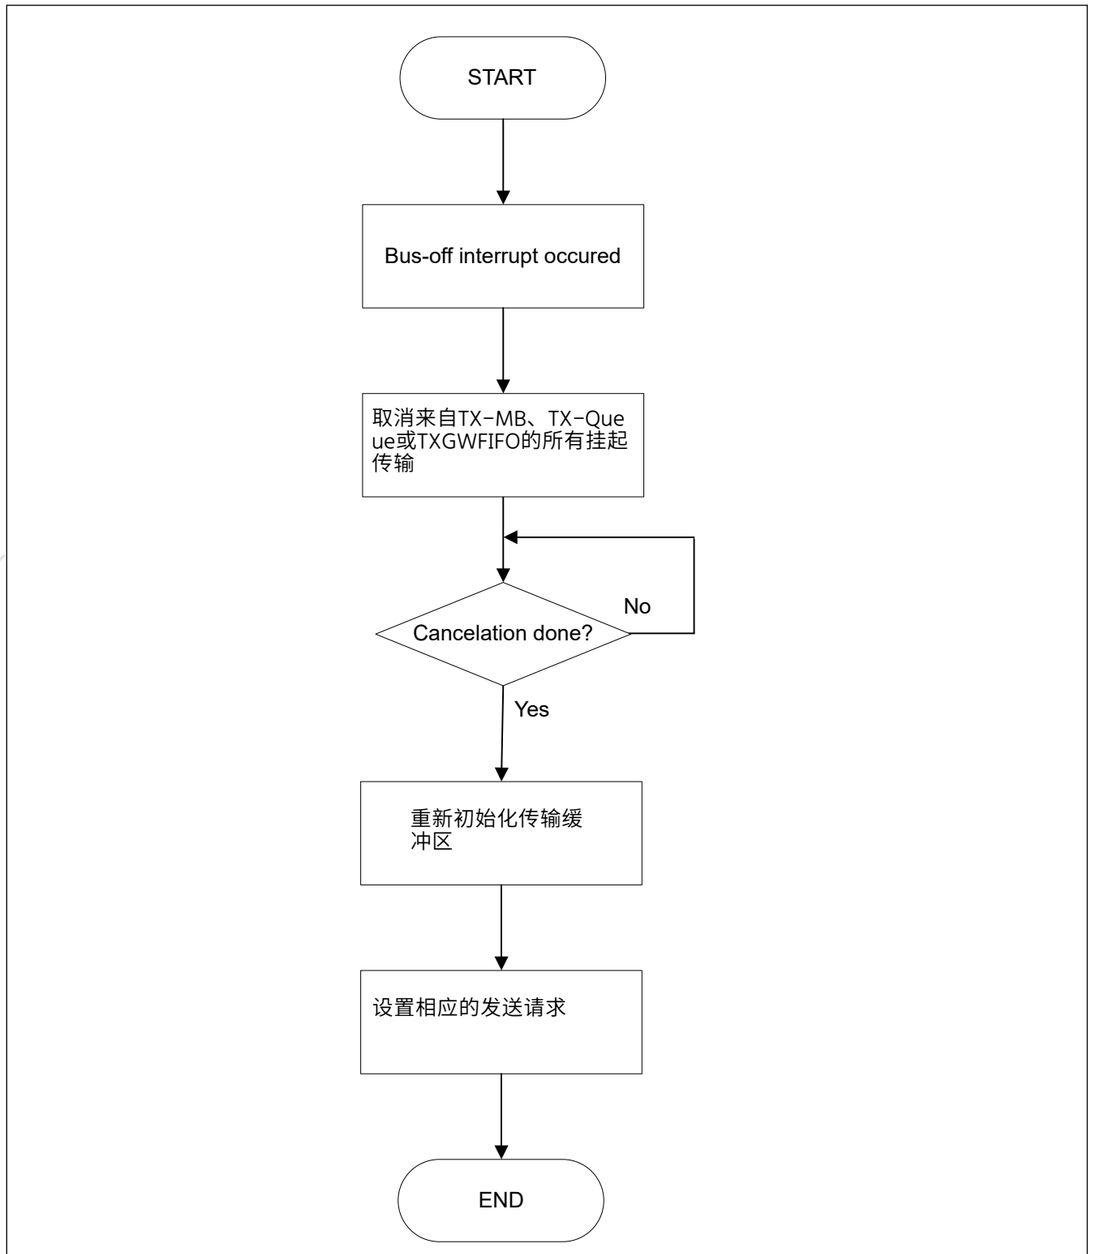

Figure 32.13 总线关闭期间的传输重新初始化

32.3.4 全局模式和通道模式转换交互

Global模式设置和Channel模式设置的交互如下：

- Changing the Channel Mode Control bit CFDCnCTR.CHMDC in the Channel Control Registers does not affect the Global Mode Control bit CFDGCTR.GMDC.
- Changing the Global Mode Control bit CFDGCTR.GMDC affects the channel mode control as described in Table 32.11.

Table 32.11 Interaction between Global and Channel mode transition

Global mode change	Channel mode	Channel mode transition action
Sleep → Reset	Sleep	Channel remains in Sleep mode
Sleep → Halt	— (Global mode change not possible)	
Sleep → Operation	— (Global mode change not possible)	
Reset → Sleep	Sleep	Channels remains in Sleep mode
	Reset	Channel Sleep request bit is set automatically, channel enters Sleep Mode
Reset → Halt	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
Reset → Operation	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
Halt → Sleep	— (Global mode change not possible)	
Halt → Reset	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
	Halt	Channel mode control is set to Reset mode, channel enters Reset mode
Halt → Operation	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
	Halt	Channel remains in Halt mode
Operation → Sleep	— (Global mode change not possible)	
Operation → Reset	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
	Halt	Channel mode control is set to Reset mode, channel enters Reset mode
	Operation	Channel mode control is set to Reset mode, channel enters Reset mode
Operation → Halt	Sleep	Channel remains in Sleep mode
	Reset	Channel remains in Reset mode
	Halt	Channel remains in Halt mode
	Operation	Channel mode control is set to Halt mode, channel enters Halt mode after communication finished

32.3.4.1 Timing of Global Mode Change

The transition time for the Global mode changes are shown in the following table.

Table 32.12 Maximum transition time for the global mode (1 of 2)

From	To	Maximum transition time
GL_SLEEP	GL_RESET	3 peripheral clock cycles*2
GL_RESET	GL_SLEEP	3 peripheral clock cycles
GL_RESET	GL_HALT	10 peripheral clock cycles
GL_RESET	GL_OPERATION	10 peripheral clock cycles

●更改通道控制寄存器中的通道模式控制位CFDCnCTR.CHMDC不会影响全局模式控制位CFDGCTR.GMDC。

●更改全局模式控制位CFDGCTR.GMDC会影响通道模式控制，如表32.11所述。

Table 32.11 全局和通道模式转换之间的交互

全局模式改变	频道模式	通道模式转换动作
睡眠→重置	Sleep	通道保持休眠模式
睡眠→暂停	—（无法更改全局模式）	
睡眠→操作	—（无法更改全局模式）	
重置→睡眠	Sleep	通道保持休眠模式
	Reset	通道休眠请求位自动置位，通道进入休眠状态 Mode
重置→停止	Sleep	通道保持休眠模式
	Reset	通道保持在复位模式
重置→操作	Sleep	通道保持休眠模式
	Reset	通道保持在复位模式
暂停→睡眠	—（无法更改全局模式）	
暂停→重置	Sleep	通道保持休眠模式
	Reset	通道保持在复位模式
	Halt	通道模式控制设置为复位模式，通道进入复位模式
暂停→运行	Sleep	通道保持休眠模式
	Reset	通道保持在复位模式
	Halt	通道保持暂停模式
运行→睡眠	—（无法更改全局模式）	
操作→复位	Sleep	通道保持休眠模式
	Reset	通道保持在复位模式
	Halt	通道模式控制设置为复位模式，通道进入复位模式
	Operation	通道模式控制设置为复位模式，通道进入复位模式
运行→停止	Sleep	通道保持休眠模式
	Reset	通道保持在复位模式
	Halt	通道保持暂停模式
	Operation	通道模式控制设置为Halt模式，通讯结束后通道进入Halt模式

32.3.4.1 全局模式变化的时机

全局模式更改的转换时间如下表所示。

Table 32.12 全局模式的最大转换时间（1of2）

From	To	最长过渡时间
GL_SLEEP	GL_RESET	3个外设时钟周期*2
GL_RESET	GL_SLEEP	3个外设时钟周期
GL_RESET	GL_HALT	10个外设时钟周期
GL_RESET	GL_OPERATION	10个外设时钟周期

Table 32.12 Maximum transition time for the global mode (2 of 2)

From	To	Maximum transition time
GL_HALT	GL_RESET	2 CAN bit times
GL_HALT	GL_OPERATION	3 peripheral clock cycles
GL_OPERATION	GL_RESET	2 CAN bit times
GL_OPERATION	GL_HALT	3 CAN frames*1 *3

Note 1. The given transition time is the time without any errors on the bus. In case of an error condition, the transition time can lengthen to an uncalculated result. The transition time can also come to a stuck condition for locked RX lines or continued error conditions.
Note 2. Exit GL_SLEEP mode only when CFDGSTS.GRAMINIT is cleared.
Note 3. TQ, CAN frame and CAN bits are related to the individual channels. For the maximum transition time, the channel with the lowest baud rate must be used.

32.3.4.2 Timing of Channel Mode Change

The transition time for the Channel mode changes are shown in the following table.

Table 32.13 Maximum transition time for the channel mode

From	To	max. transition time
CH_SLEEP	CH_RESET	3 peripheral clock cycles
CH_RESET	CH_SLEEP	3 peripheral clock cycles
CH_RESET	CH_HALT	3 CAN bit times
CH_RESET	CH_OPERATION	4 CAN bit times
CH_HALT	CH_RESET	2 CAN bit times
CH_HALT	CH_OPERATION	4 CAN bit times*3
CH_OPERATION	CH_RESET	2 CAN bit times
CH_OPERATION	CH_HALT	2 CAN frames*1 *2

Note 1. The time specified for this transition does not include the case where channel enters bus-off state. For bus-off, the timing depends on the configuration of the CFDCnCTR.BOM[1:0] bits.
Note 2. The given transition time is the time without any errors on the bus. In case of an error condition, the transition time can lengthen to an uncalculated result. The transition time can also come to a stuck condition for locked RX lines or continued error conditions.
Note 3. In general, if the baudrate prescaler value CFDCnNCFG.NBRP is changed in CH_HALT mode, the transition time can deviate. The internal prescaler is a free running down counter that creates the TQ clock, and new BRP value is captured when the counter reaches the value 0.

32.4 Initialization

Before joining CAN communications, configure the following settings:

- Clock setting
- Bit timing setting (nominal and data rate)
- Baud Rate setting (nominal and data rate)
- CAN-FD setting
- Acceptance Filter setting (configuration of Global Acceptance Filter List)
- Reception, Transmission and GW-FIFO setting
- CAN Operation mode setting

32.4.1 Initialization of CAN Clock, Bit Timing and Baud Rate

32.4.1.1 Bit Timing Conditions

The following lines describe the composition of each segment and the restriction that apply to the segment setting.

1. Each segment setting
   SS = Fixed to 1 TQ

Table 32.12 全局模式的最大转换时间（2之2）

From	To	最长过渡时间
GL_HALT	GL_RESET	2个CAN位时间
GL_HALT	GL_OPERATION	3个外设时钟周期
GL_OPERATION	GL_RESET	2个CAN位时间
GL_OPERATION	GL_HALT	3个CAN帧*1*3

注1.给定的转换时间是总线上没有任何错误的时间。如果出现错误情况，转换时间可能会延长到无法计算的结果。对于锁定的RX线或持续的错误情况，转换时间也可能达到卡住状态。
注2.仅当CFDGSTS.GRAMINIT被清除时才退出GL_SLEEP模式。
注3.TQ、CAN帧和CAN位与各个通道相关。对于最大转换时间，必须使用具有最低波特率的通道。

32.3.4.2 频道模式改变的时机

通道模式更改的转换时间如下表所示。

Table 32.13 通道模式的最大转换时间

From	To	最大限度。过渡时间
CH_SLEEP	CH_RESET	3个外设时钟周期
CH_RESET	CH_SLEEP	3个外设时钟周期
CH_RESET	CH_HALT	3CAN位时间
CH_RESET	CH_OPERATION	4个CAN位时间
CH_HALT	CH_RESET	2个CAN位时间
CH_HALT	CH_OPERATION	4CAN位时间*3
CH_OPERATION	CH_RESET	2个CAN位时间
CH_OPERATION	CH_HALT	2个CAN帧*1*2

注1.为该转换指定的时间不包括通道进入总线关闭状态的情况。对于总线关闭，时序取决于CFDCnCTR.BOM[1:0]位的配置。

注2.给定的转换时间是总线上没有任何错误的时间。如果出现错误情况，转换时间可能会延长到无法计算的结果。对于锁定的RX线或持续的错误情况，转换时间也可能达到卡住状态。
注3.一般情况下，如果波特率预分频器值CFDCnNCFG.NBRP在CH_HALT模式下发生变化，则转换时间可能会发生偏差。内部预分频器是一个自由运行的递减计数器，它创建TQ时钟，当计数器达到值0时，捕获新的BRP值。

32.4 Initialization

在加入CAN通信之前，请配置以下设置：

●时钟设置
●位定时设置（标称和数据速率）
●波特率设置（标称和数据速率）
- CAN-FD setting
●验收过滤器设置（全局验收过滤器列表的配置）
●接收、发送和GW-FIFO设置
●CAN操作模式设置

32.4.1 CAN时钟、位时序和波特率的初始化

32.4.1.1 位时序条件

以下几行描述了每个段的组成以及适用于段设置的限制。

1.每段设置SS=Fixedto
1TQ

TSEG1 = See to (CFDCnNCFG) and (CFDCnDCFG)*1
TSEG2 = See to (CFDCnNCFG) and (CFDCnDCFG)*1
SJW = See to (CFDCnNCFG) and (CFDCnDCFG)*1
SS + TSEG1 + TSEG2 = 5 to 49 TQs for Data Bit Rate and 8 to 385 for Nominal Bit Rate

2. Restriction on TSEG1, TSEG2 and SJW
TSEG1(N) > TSEG2(N) ≥ SJW(N)
TSEG1(D) ≥ TSEG2(D) ≥ SJW(D)*1
When only classical frames are used, configure the bit fields TSEG1 and TSEG2 of CFDCnDCFG to valid values.

Note 1. This feature is not available in the classical CAN function.

Table 32.14 shows an example of how to set the bit timing to achieve the required Sample Point settings.

Table 32.14 Bit timing examples

1 bit	Set value (TQ)				Sample point*1(%)
	SS	TSEG1	TSEG2	SJW	
5TQ	1	2	2	1	60.00
8TQ	1	4	3	1	62.50
	1	5	2	1	75.00
10TQ	1	6	3	1	70.00
	1	7	2	1	80.00
12TQ	1	8	3	1	75.00
	1	9	2	1	83.33
15TQ	1	10	4	1	73.33
	1	11	3	1	80.00
16TQ	1	10	5	1	68.75
	1	11	4	1	75.00
20TQ	1	12	7	1	65.00
	1	13	6	1	70.00
24TQ	1	15	8	1	66.66
	1	16	7	1	70.83
50TQ	1	39	10	4	80.00

Note 1. Sample point (in case of 75%)

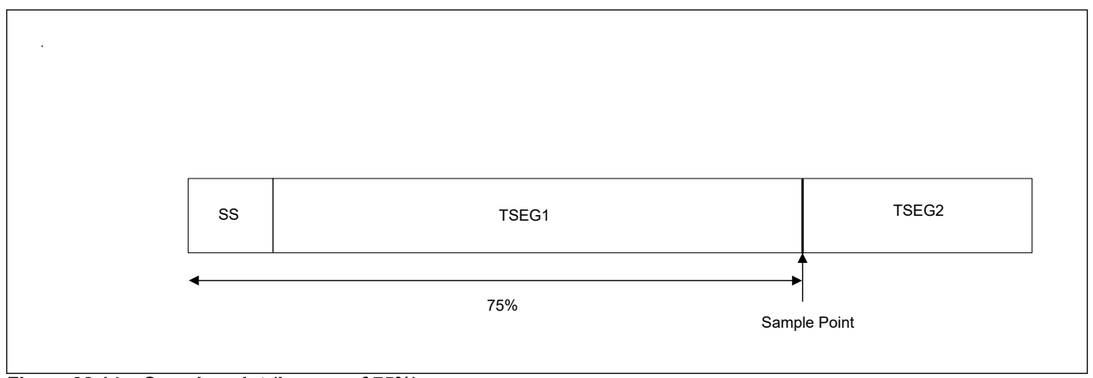

Figure 32.14 Sample point (in case of 75%)

TSEG1=参见(CFDCnNCFG)和(CFDCnDCFG)*1
TSEG2=参见(CFDCnNCFG)和(CFDCnDCFG)*1
SJW=参见(CFDCnNCFG)和(CFDCnDCFG)*1
SS+TSEG1+TSEG2=5到49个TQ用于数据比特率，8到385个用于标称比特率

2.对TSEG1、TSEG2和SJW的限制TSEG1(
N)>TSEG2(N)≥SJW(N)
TSEG1(D) ≥ TSEG2(D) ≥ SJW(D)*1
当仅使用经典帧时，将CFDCnDCFG的位域TSEG1和TSEG2配置为有效值。

注1.此功能在经典CAN功能中不可用。

表32.14显示了如何设置位时序以实现所需采样点设置的示例。

Table 32.14 位时序示例

1 bit	设定值(TQ)				采样点*1(%)
	SS	TSEG1	TSEG2	SJW	
5TQ	1	2	2	1	60.00
8TQ	1	4	3	1	62.50
	1	5	2	1	75.00
10TQ	1	6	3	1	70.00
	1	7	2	1	80.00
12TQ	1	8	3	1	75.00
	1	9	2	1	83.33
15TQ	1	10	4	1	73.33
	1	11	3	1	80.00
16TQ	1	10	5	1	68.75
	1	11	4	1	75.00
20TQ	1	12	7	1	65.00
	1	13	6	1	70.00
24TQ	1	15	8	1	66.66
	1	16	7	1	70.83
50TQ	1	39	10	4	80.00

注1.采样点（在75%的情况下）

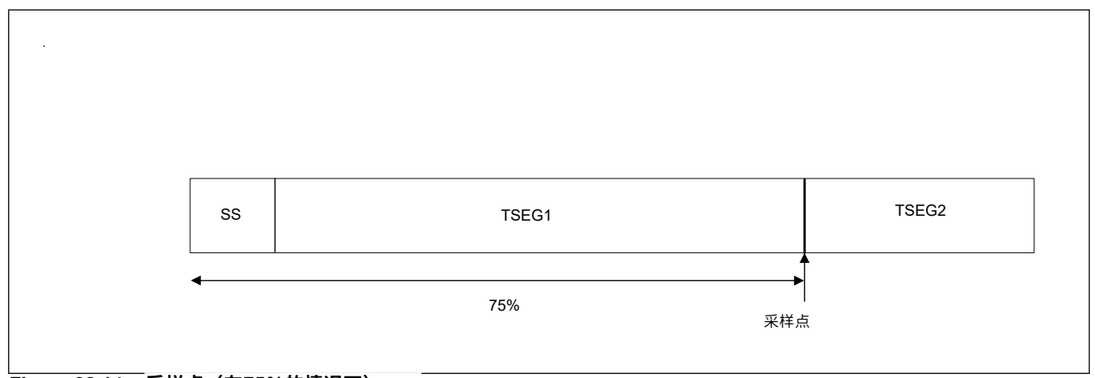

Figure 32.14 采样点（在75%的情况下）

32.4.1.2 CAN Bit Timing

In the CAN protocol, each bit in a communication frame is composed of three segments that can be configured individually for each channel using the related CFDCnNCFG and CFDCnDCFG*1 registers.

Note 1. This register is not available in the classical CAN function.

Figure 32.15 shows the segment composition of a bit and the sample point in it.

Of these segments, the Time Segment 1 (TSEG1) and Time Segment 2 (TSEG2) are used to specify the position of the sample point, so that the timing at which each bit on the CAN bus is sampled can be altered by changing the values of these segments.

The minimum resolution for this timing is referred to as Time Quantum (TQ), which is determined by the clock frequency supplied to the CAN channel and the divide-by-N value of the baud rate prescaler (nominal and data rate).

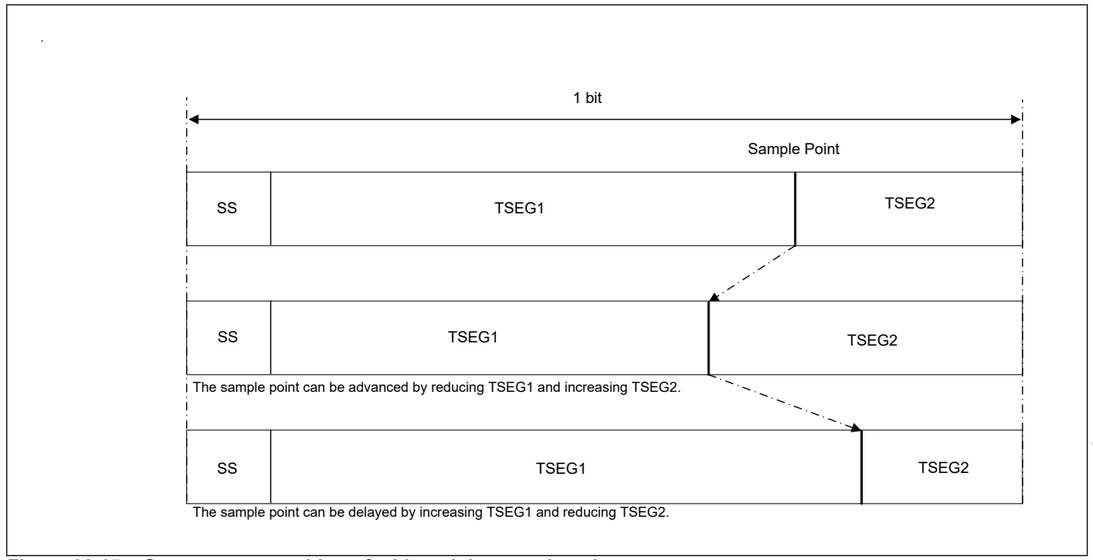

Figure 32.15 Segment composition of a bit and the sample point

1. SS: Synchronization Segment
   This segment is used to synchronize bits by monitoring a recessive-to-dominant edge during the interframe space. This comprises of intermission, suspend transmission, bus idle, during bus idle, and all nodes that can start transmission.
2. TSEG1: Time Segment 1
   This segment absorbs physical delays on the CAN network. A physical delay on the network is two times the total sum of a bus delay, input comparator delay, and output driver delay. It can be lengthened by SJW.
3. TSEG2: Time Segment 2
   This segment is used to correct a phase error by performing resynchronization. It can be shortened by SJW. While sending or receiving a message, communication frames between some nodes may get out of sync due to a drift in the oscillator frequency or a delay in the transmission path. This is referred to as a phase error.
4. SJW: Resynchronization Jump Width
   This is the maximum width by which bits that have become out of sync due to a phase error may be corrected.

Figure 32.15 shows only one symbolic sample point.

32.4.1.3 Baud Rate

Either the CAN channel system clock (clean clock) or the external oscillator clock can be selected globally for all CAN channels as CAN communication clock.

The transfer speed is determined by the DLL clock, the divide-by-N value of the baud rate prescaler, and the number of TQs in one bit.

32.4.1.2 CAN位时序

在CAN协议中，通信帧中的每个位由三个段组成，可以使用相关的CFDCnNCFG和CFDCnDCFG*1寄存器为每个通道单独配置。

注1.该寄存器在经典CAN功能中不可用。

图32.15显示了一个位的分段组成和其中的采样点。

在这些段中，时间段1(TSEG1)和时间段2(TSEG2)用于指定采样点的位置，因此可以通过更改值来更改CAN总线上每个位的采样时序这些细分市场。

此时序的最小分辨率称为时间量子(TQ)，它由提供给CAN通道的时钟频率和波特率预分频器的N分频值（标称和数据速率）决定。

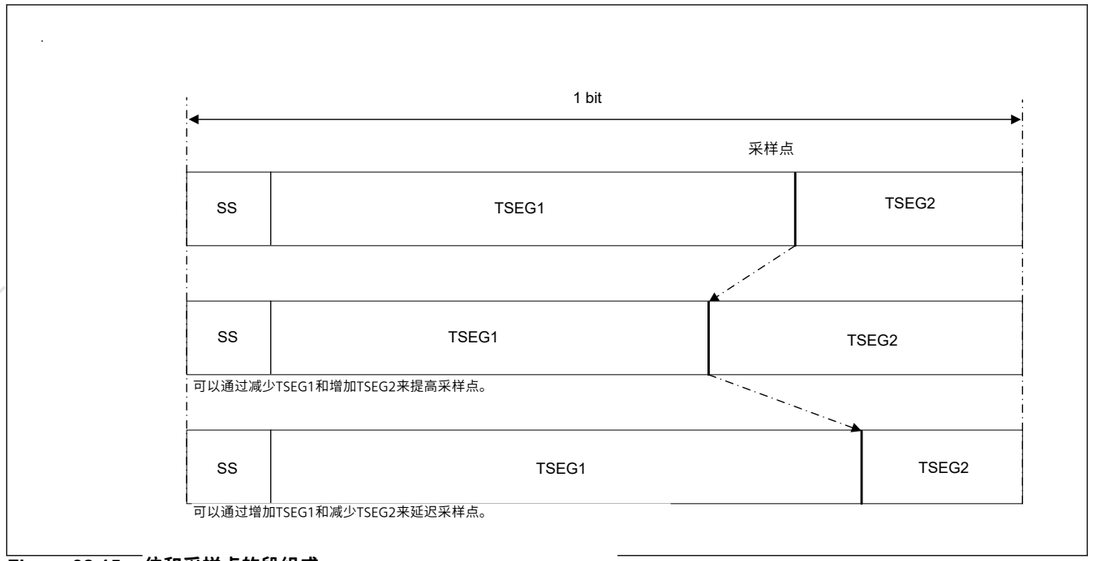

Figure 32.15 位和采样点的段组成

1.SS：同步段
该段用于通过监视帧间空间期间的隐性到显性边缘来同步位。这包括中断、暂停传输、总线空闲、总线空闲期间以及所有可以开始传输的节点。

2.TSEG1：时间段1
该段吸收CAN网络上的物理延迟。网络上的物理延迟是总线延迟、输入比较器延迟和输出驱动器延迟总和的两倍。它可以通过SJW加长。

3.TSEG2：时间段2
该段用于通过执行重新同步来纠正相位误差。它可以被SJW缩短。在发送或接收消息时，某些节点之间的通信帧可能会由于振荡器频率的漂移或传输路径的延迟而失去同步。这被称为相位误差。

4.SJW：再同步跳转宽度
这是由于相位误差而变得不同步的位可以被纠正的最大宽度。

图32.15只显示了一个符号采样点。

32.4.1.3 Baud Rate

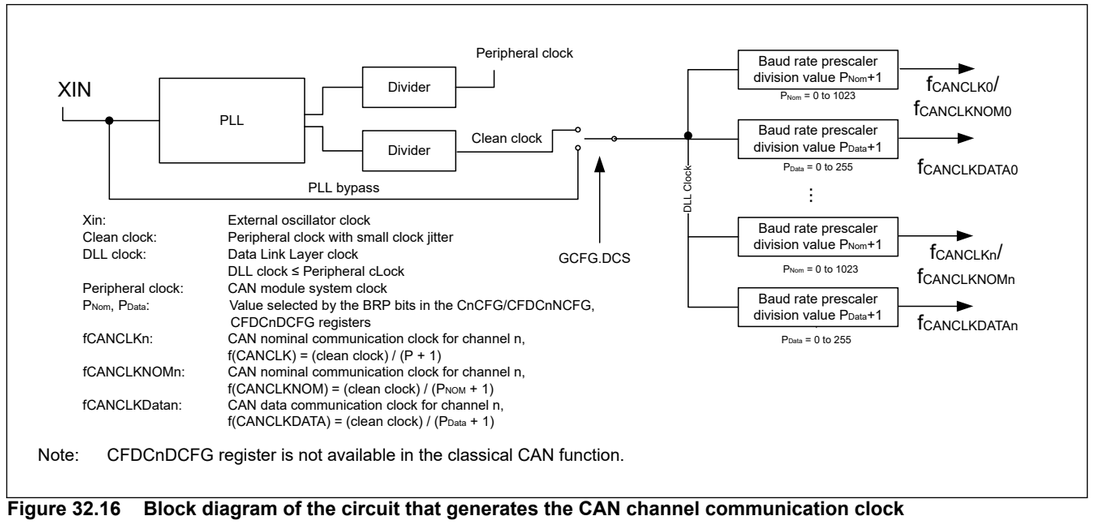
CAN通道系统时钟（干净时钟）或外部振荡器时钟可以全局选择所有CAN通道作为CAN通信时钟。

传输速度由DLL时钟、波特率预分频器的N分频值和一位TQ的数量决定。

RA生态工作室

$$baudrate = \frac{DLL_Clock}{(number_of_time_quanta_per_bit) \times (BRP + 1)}$$

Figure 32.16 shows a block diagram of the circuit that generates the CAN channel system clock and Table 32.15 shows a baud rate examples.



Note: CFDCnDCFG register is not available in the classical CAN function.

Figure 32.16 Block diagram of the circuit that generates the CAN channel communication clock

Table 32.15 Nominal baud rate calculation formula and example CAN communication configurations

Baud rate calculation formula	(DLL clock) (baud rate prescaler divide-by-N value*1) × (number of TQs in one bit)								
	80 MHz	40 MHz	32 MHz	30 MHz	24 MHz	20 MHz	16 MHz	10 MHz	8 MHz*2

Note: ()中显示的是波特率预分频器除以N的值。
注1.波特率预分频器除以N值=P+1(P=01023)P：由通道配置中的BRP位选择的值
Registers.

Note 2. Minimum frequency to achieve maximum nominal baud rate of 1 Mbps.

Table 32.16 Baud rate calculation example for nominal and data bit rate CAN communication configurations

Baud rate calculation formula	(DLL clock) (baud rate prescaler divide-by-N value*1) × (number of TQs in one bit)		
	80 MHz	40 MHz	20 MHz
Nominal 1 Mbps Data 8 Mbps	80TQ (1)	40TQ (1)	20TQ (1)
	10TQ (1)	5TQ (1)	Not possible
Nominal 1 Mbps Data 5 Mbps	80TQ (1)	40TQ (1)	20TQ (1)
	16TQ (1)	8TQ (1)	Not possible
Nominal 500 Kbps Data 2 Mbps	160TQ (1)	80TQ (1)	40TQ (1)
	40TQ (1)	20TQ (1)	10TQ (1)

Note: Shown in ( ) are the baud rate prescaler divide-by-N values and this table is not available in the classical CAN function.
Note 1. Baud rate prescaler divide-by-N value = P + 1 (P = 0 - 1023) P: value selected by the BRP bits in the Channel Configuration Registers.

For optimum clock tolerance in networks using the FD frame format, the length of the time quantum should be the same in nominal bit time and in data bit time. This means CFDCnNCFG.NBRP = CFDCnDCFG.DBRP.

Additionally, if transceiver delay compensation is used, do not program the CFDCnDCFG.DBRP bit to be greater than 1, as 1 means divide by 2.

32.4.1.4 Setting of CAN Clock, Bit Timing and Baud Rate

Figure 32.17 shows the procedure for setting the CAN clock and the baud rate for each channel.

These settings should be performed during Channel Reset mode (Configuration mode) for the CAN channels.

Before going to channel communication state, the baud rate must be configured, otherwise the mode does not switch correctly.

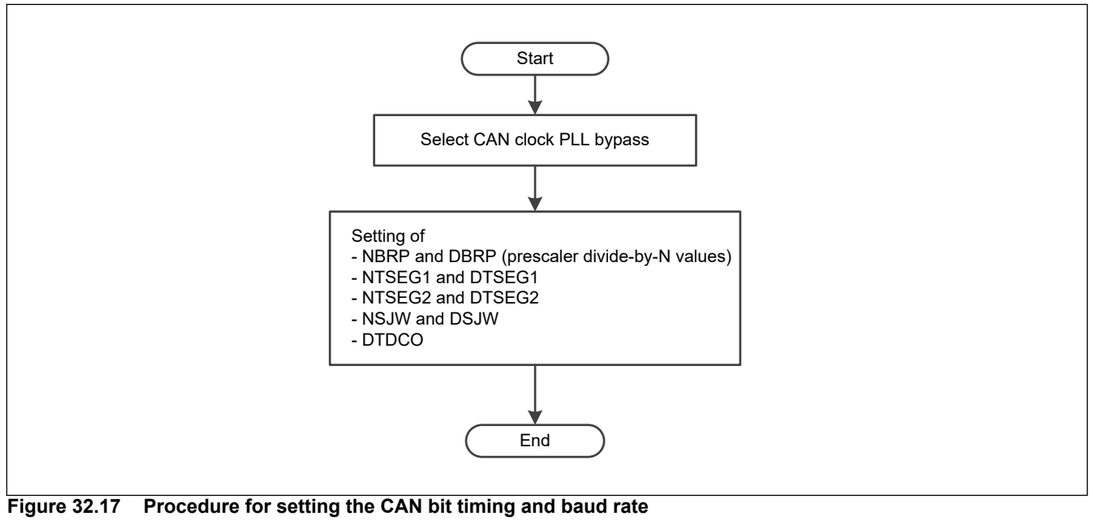

Figure 32.17 Procedure for setting the CAN bit timing and baud rate

32.4.1.5 Transmitter Delay Compensation

This chapter is not valid for classical CAN.

注2.实现1Mbps的最大标称波特率的最小频率。

Table 32.16 标称和数据比特率CAN通信配置的波特率计算示例

波特率计算公式	（DLL时钟）（波特率预分频器除以N值*1）×（一位TQ的数量）		
	80 MHz	40 MHz	20 MHz
Nominal 1 Mbps Data 8 Mbps	80TQ (1)	40TQ (1)	20TQ (1)
	10TQ (1)	5TQ (1)	不可能
Nominal 1 Mbps Data 5 Mbps	80TQ (1)	40TQ (1)	20TQ (1)
	16TQ (1)	8TQ (1)	不可能
Nominal 500 Kbps Data 2 Mbps	160TQ (1)	80TQ (1)	40TQ (1)
	40TQ (1)	20TQ (1)	10TQ (1)

Note: ()中显示的是波特率预分频器除以N的值，该表在经典CAN函数中不可用。
注1.波特率预分频器除以N值=P+1(P=01023)P：由通道配置中的BRP位选择的值
Registers.

为了在使用FD帧格式的网络中获得最佳时钟容限，时间片的长度在标称位时间和数据位时间中应该相同。这意味着CFDCnNCFG.NBRP=CFDCnDCFG.DBRP。

此外，如果使用收发器延迟补偿，请勿将CFDCnDCFG.DBRP位编程为大于1，因为1表示除以2。

32.4.1.4 CAN时钟、位时序和波特率的设置

图32.17显示了为每个通道设置CAN时钟和波特率的过程。

这些设置应在CAN通道的通道复位模式（配置模式）期间执行。

在进入通道通信状态之前，必须配置波特率，否则无法正确切换模式。

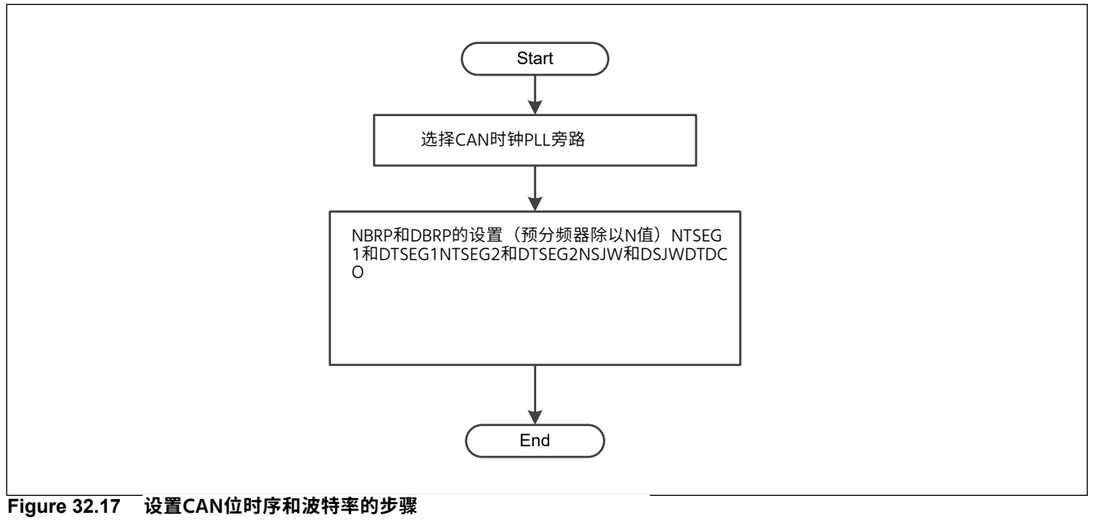

Figure 32.17 设置CAN位时序和波特率的步骤

32.4.1.5 发射机延迟补偿

本章不适用于经典CAN。

When a high baud rate is used such as 5 to 8 Mbps for the data phase, the transmitter delay can become greater than TSEG1. In this case, the transmitter always detects a bit-error in the data phase of the CAN-FD frame. The TDC compensates for the inability of the transmitter to receive its own transmitted bit at the sample point of that bit.

There is another symbolic sample point known as the Secondary Sample Point (SSP) that is used only during the data phase of CAN-FD frames. This is derived from the Transceiver Delay Compensation Result bit (CFDCnFDSTS.TDCR) as shown in Figure 32.18.

The resolution of the configuration, measured and offset values is based on the CAN channel DLL clock.

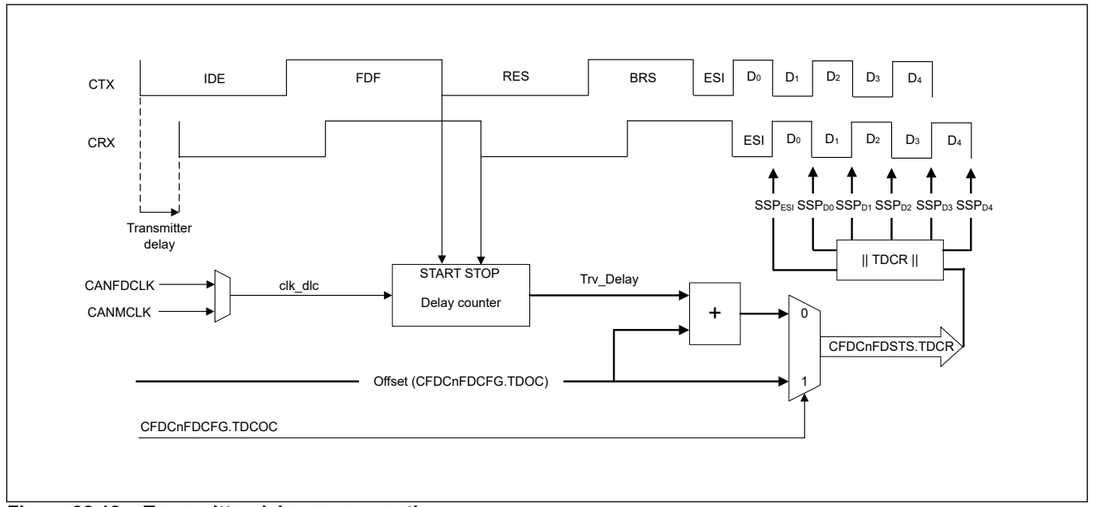

Figure 32.18 Transmitter delay compensation

The measured Trv_Delay is based on the number of clk_dlc clock cycles.The delay is counted up by one for each started clock until the dominant value is seen on CAN_RX. Figure 32.19 shows the measured result. Trv_Delay counted to maximum 127 with a clk_dlc clock.

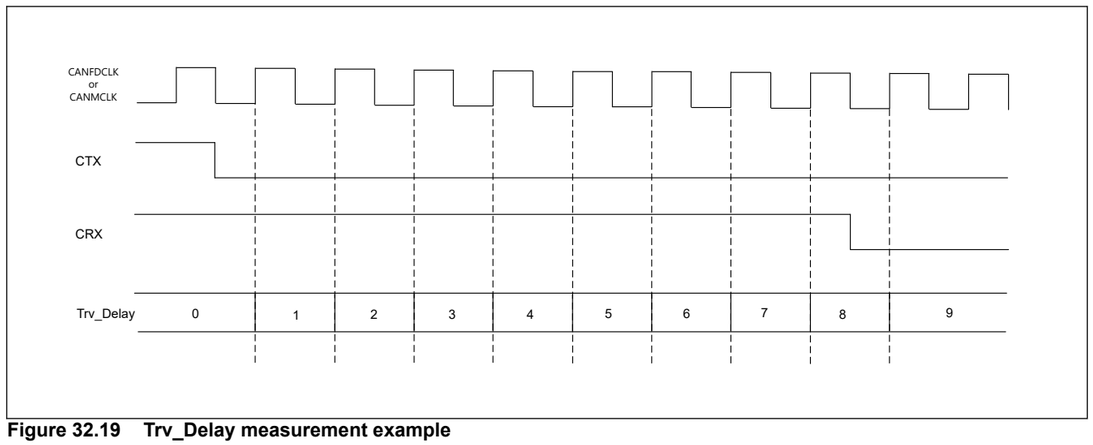

Figure 32.19 Trv_Delay measurement example

The SSP is calculated by taking the result from CFDCnFDSTS.TDCR and rounding the value down to the nearest integer number of data time quanta.

Figure 32.20 shows the positioning of the secondary sample point. When CFDCnFDCFG.TDCOC is equal to 0, the SSP is equal to the Trv_Delay (measured delay) + CFDCnFDCFG.TDCO, rounded down to the nearest integer number of time quanta. Usually, the TDCO value should have the size of (SyncSegmentdata + TSEG1data) to position the SSP to a theoretical location of the sample point.

当数据阶段使用高波特率（例如5到8Mbps）时，发送器延迟可能会大于TSEG1。在这种情况下，发送器总是在CAN-FD帧的数据阶段检测到位错误。TDC补偿发送器无法在该位的采样点接收其自己的发送位。

还有另一个符号采样点，称为辅助采样点(SSP)，仅在CAN-FD帧的数据阶段使用。这源自收发器延迟补偿结果位(CFDCnFDSTS.TDCR)，如图32.18所示。

配置、测量值和偏移值的分辨率基于CAN通道DLL时钟。

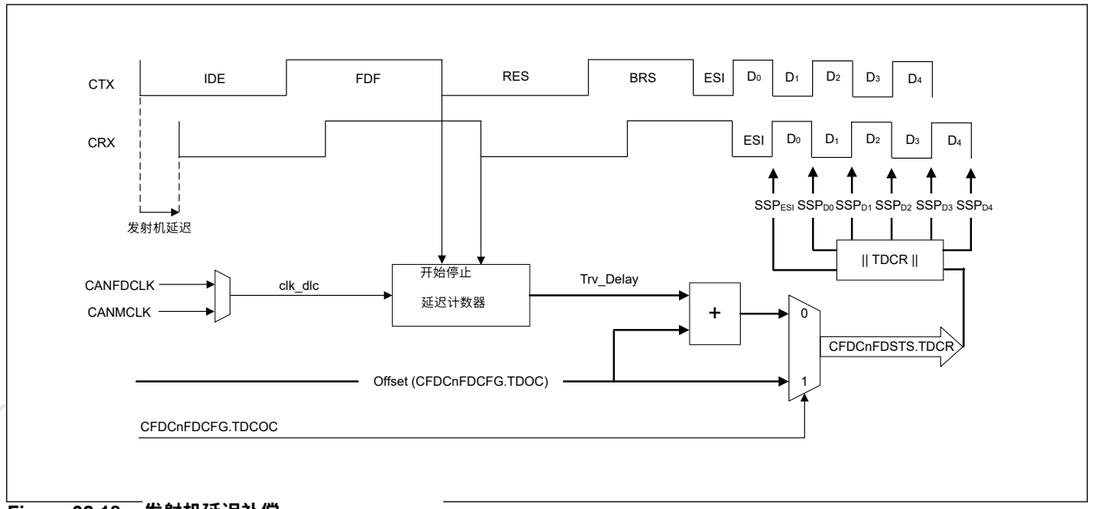

Figure 32.18 发射机延迟补偿

测得的Trv_Delay基于clk_dlc时钟周期数。对于每个启动的时钟，延迟将加一，直到在CAN_RX上看到显性值。图32.19显示了测量结果。使用clk_dlc时钟时，Trv_Delay最大计数为127。

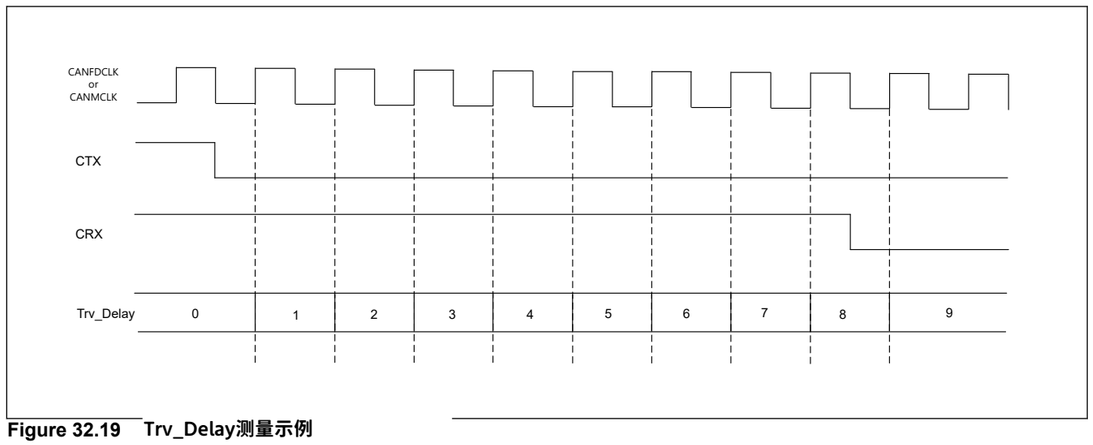

Figure 32.19 Trv_Delay测量示例

SSP的计算方法是从CFDCnFDSTS.TDCR获取结果并将该值向下舍入到最接近的数据时间量整数。

图32.20显示了辅助采样点的定位。当CFDCnFDCFG.TDCOC等于0时，SSP等于Trv_Delay（测量延迟）+CFDCnFDCFG.TDCO，向下舍入到最接近的整数时间量。通常，TDCO值的大小应为(SyncSegmentdata+TSEG1data)以将SSP定位到采样点的理论位置。

If the CFDCnFDCFG.TDCOC is equal to 1, the SSP is defined by CFDCnFDCFG.TDCO. If CFDCnDCFG.DBRP is greater than 0, the value is also rounded down to the nearest integer number of time quanta.

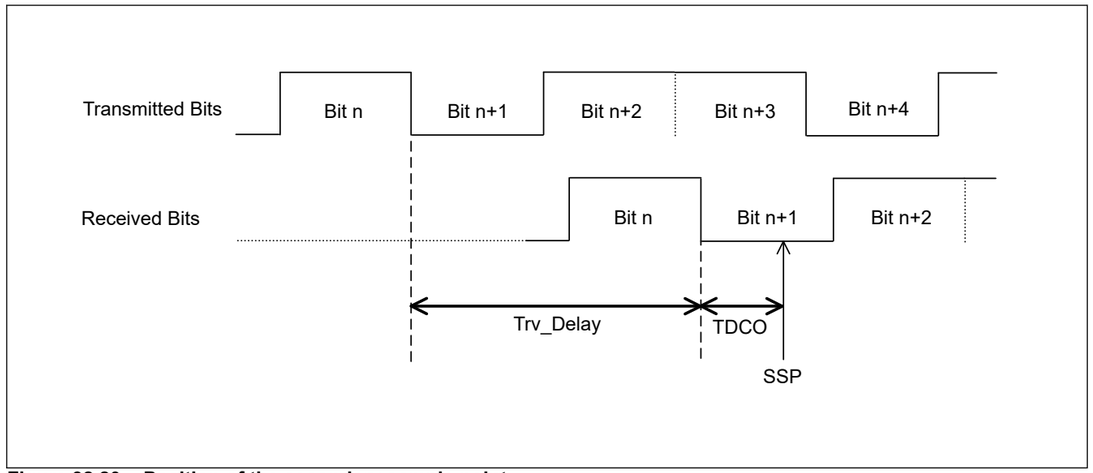

Figure 32.20 Position of the secondary sample point

The maximum delay (Trv_Delay + TDCO) which can be compensated by the CAN-FD module is (6 data bits - 2clk_dlc).

The ISO 11898-1 allows you to set different values for BRP_data and BRP_nom.

If different values are used for CFDCnNCFG.NBRP and CFDCnDCFG.DBRP, then two CAN nodes may be out of synchronization at the point when the bit rate changes from nominal bit rate to data bit rate after sample point of the BRS bit. This condition is shown in Figure 32.21.

The length of the time quantum should be the same in the nominal bit time and in the data bit time. This means CFDCnNCFG.NBRP = CFDCnDCFG.DBRP.

Different bit rates can be achieved by selecting different configuration values for the Time Segments. The nominal bit rate can be configured from 8 to 385 TQs and the data bit rate from 5 to 49 TQs.

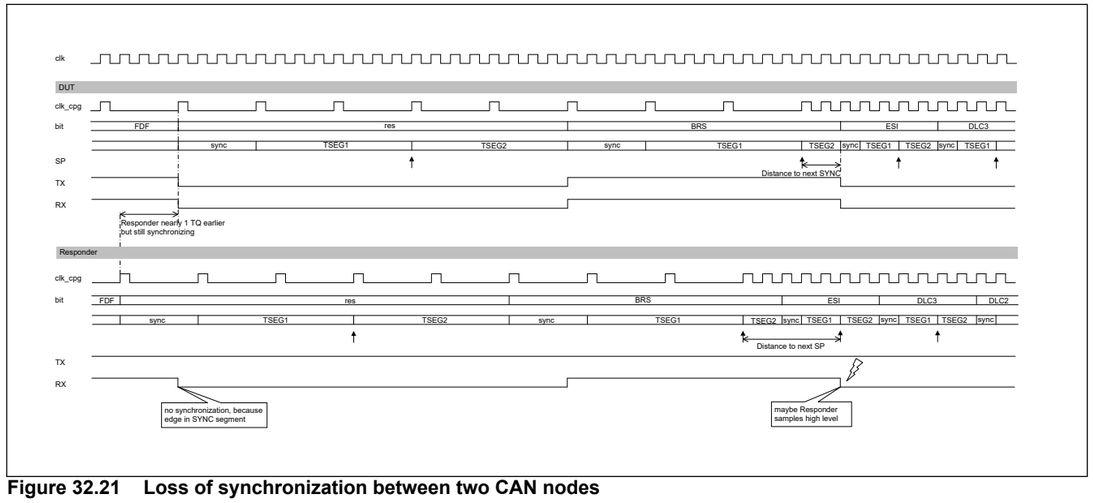

Figure 32.21 Loss of synchronization between two CAN nodes

The transmitter delay compensation measurement result is updated at the falling edge from FDF bit to RES bit when configured accordingly (CFDCnFDCFG.TDCE = 1, CFDCnFDCFG.TDCOC = 0).

Figure 32.22 shows the read flow to get the measured transmitter delay compensation result.

如果CFDCnFDCFG.TDCOC等于1，则SSP由CFDCnFDCFG.TDCO定义。如果CFDCnDCFG.DBRP大于0，则该值也向下舍入到最接近的整数时间量。

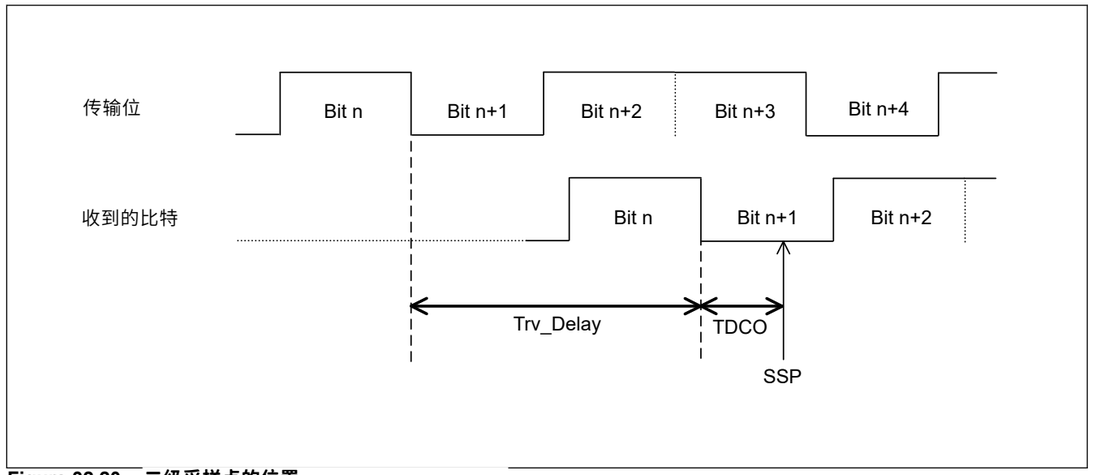

Figure 32.20 二级采样点的位置

CAN-FD模块可以补偿的最大延迟（Trv_Delay+TDCO）为（6个数据位2clk_dlc）。

ISO11898-1允许您为BRP_data和BRP_nom设置不同的值。

如果CFDCnNCFG.NBRP和CFDCnDCFG.DBRP使用不同的值，则在BRS位采样点之后，当比特率从标称比特率变为数据比特率时，两个CAN节点可能不同步。这种情况如图32.21所示。

时间段的长度在标称位时间和数据位时间中应该相同。这表示CFDCnNCFG.NBRP = CFDCnDCFG.DBRP.

通过为时间段选择不同的配置值可以实现不同的比特率。标称比特率可配置为8至385TQ，数据比特率可配置为5至49TQ。

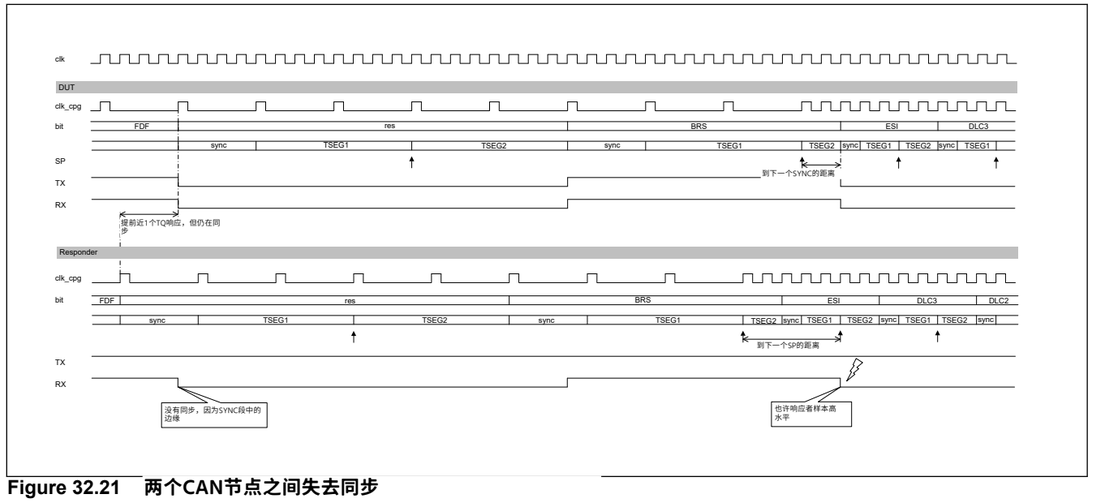

Figure 32.21 两个CAN节点之间失去同步

当相应配置时（CFDCnFDCFG.TDCE=1，CFDCnFDCFG.TDCOC=0），发送器延迟补偿测量结果在从FDF位到RES位的下降沿更新。

图32.22显示了读取流程以获得测量的发送器延迟补偿结果。

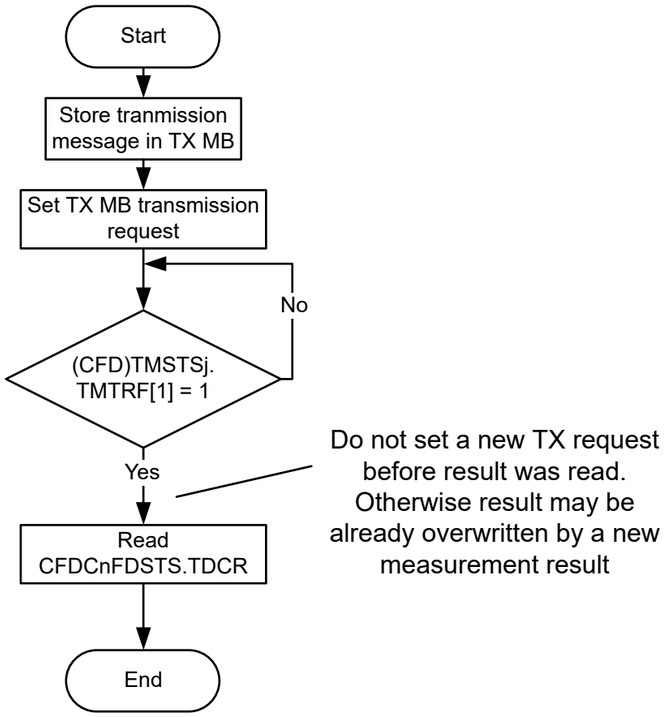

Figure 32.22 TDC result read flow

32.4.2 CAN Module Configuration after Hardware Reset

After a hardware reset (power on reset) or after setting and clearing a CFDGRSTC.SRST bit, the CAN-FD module enters Global Sleep mode automatically.

To enable configuration of the CAN-FD module, you must exit Sleep mode by clearing the Global Sleep Request bit CFDGCTR.GSLPR to 0.

After a hardware reset, the module starts RAM initialization, the CFDGSTS.GRAMINIT bit in the Global Status Register is set automatically to indicate that the CAN-FD logic is initializing the RAM.

After RAM initialization is complete, this bit is cleared automatically.

RAM initialization is necessary to avoid setting of false ECC error flag after HW reset the random data presented in the RAM.

Do not access registers of CAN-FD in either read or write until RAM initialization is complete and the CFDGSTS.GRAMINIT bit is cleared.

Before going to communication mode, the Global Acceptance Filter List and message FIFO buffers must be configured. In addition, each required CAN channel must be configured such as CAN bit timing. For this configuration, all required CAN channels must be released from Channel Sleep mode and must be configured for communication in Channel Reset mode (Configuration mode).

Figure 32.23 shows the configuration procedure. For details about each step, seesection 32.5. Acceptance Filtering Function using Global Acceptance Filter List (AFL), section 32.6. FIFO Buffers and Normal Message Buffer Configuration, section 32.7. Interrupts and DMA and section 32.4.1.3. Baud Rate.

The CAN-FD module does not perform the RAM initialization sequence after executing a software reset by setting CFDGRSTC.SRST.

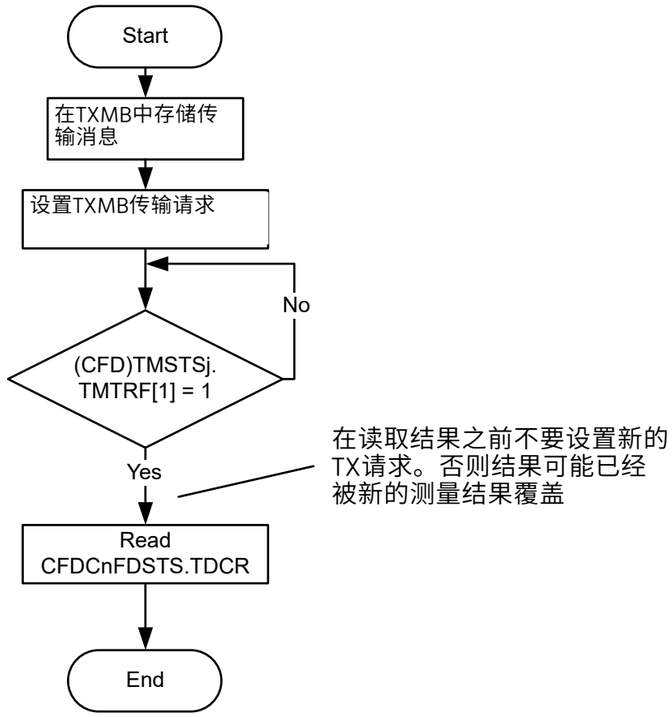

Figure 32.22 TDC结果读取流程

32.4.2 硬件复位后的CAN模块配置

硬件复位（上电复位）或设置和清除CFDGRSTC.SRST位后，CAN-FD模块进入全局睡眠模式自动。

要启用CAN-FD模块的配置，您必须通过清除全局休眠请求位来退出休眠模式CFDGCTR.GSLPR to 0.

硬件复位后，模块开始RAM初始化，全局状态寄存器中的CFDGSTS.GRAMINIT位自动置位，表示CAN-FD逻辑正在初始化RAM。

RAM初始化完成后，该位自动清零。

RAM初始化是必要的，以避免在硬件重置随机数据后设置错误的ECC错误标志RAM.

在RAM初始化完成之前，不要以读或写方式访问CAN-FD的寄存器并且CFDGSTS.GRAMINIT位清零。

在进入通信模式之前，必须配置全局接受过滤器列表和消息FIFO缓冲区。此外，必须配置每个所需的CAN通道，例如CAN位时序。对于此配置，所有必需的CAN通道必须从通道休眠模式中释放，并且必须配置为在通道复位模式（配置模式）下进行通信。

图32.23显示了配置过程。有关每个步骤的详细信息，请参见第32.5节。使用全局接受过滤器列表(AFL)的接受过滤功能，第32.6节。FIFO缓冲区和正常消息缓冲区配置，第32.7节。中断和DMA以及第32.4.1.3节。波特率。

CAN-FD模块在通过设置执行软件复位后不执行RAM初始化序列CFDGRSTC.SRST.

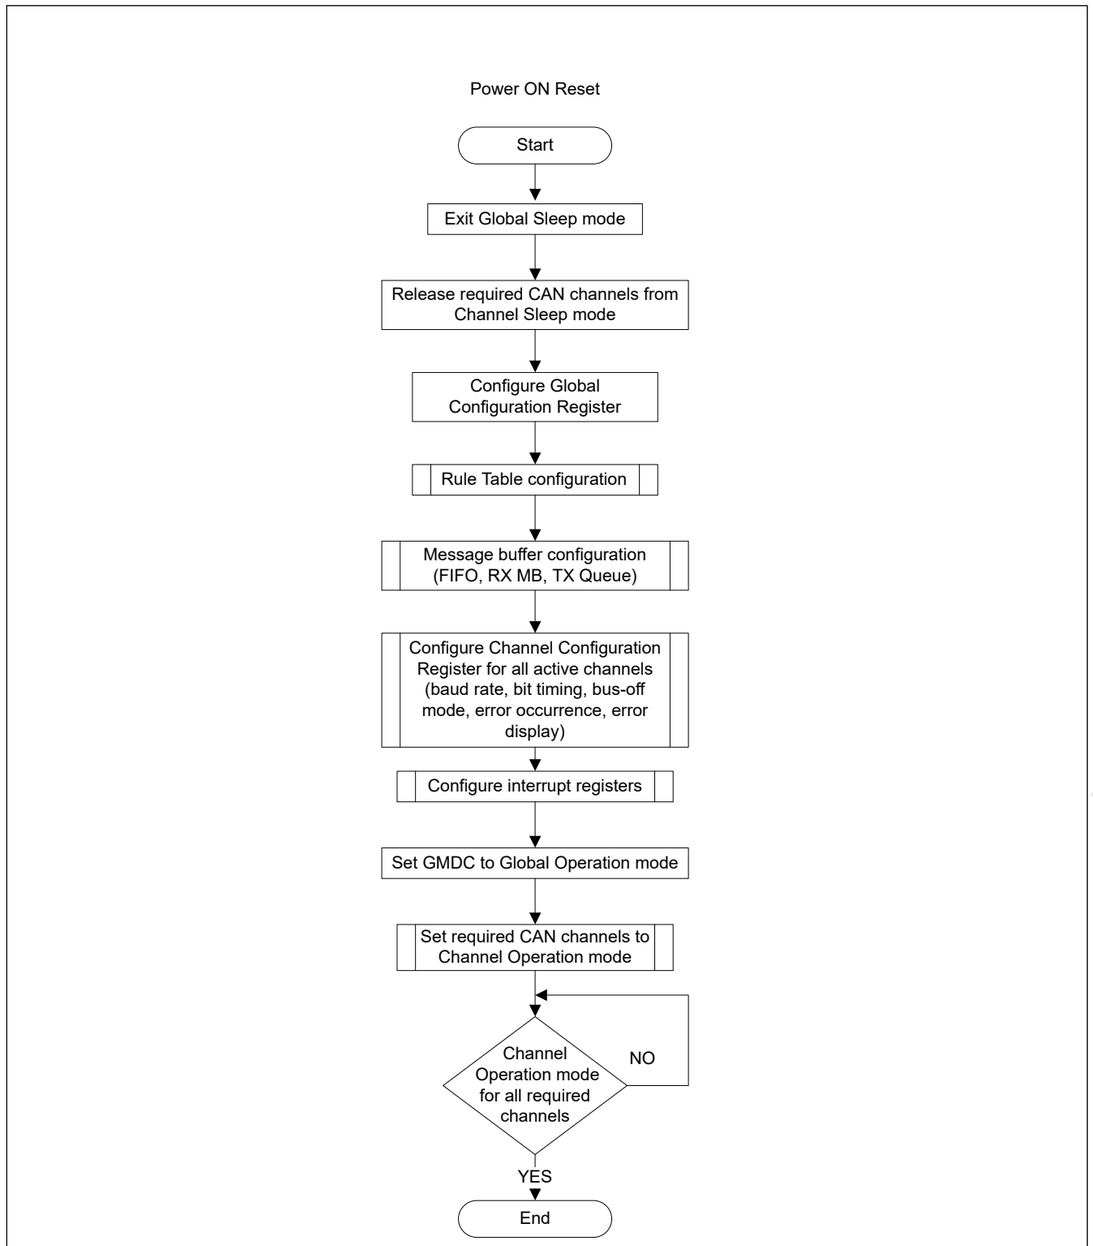

Figure 32.23 Configuration procedure after a hardware reset

32.5 Acceptance Filtering Function using Global Acceptance Filter List (AFL)

32.5.1 Overview

The CAN-FD module can handle message acceptance filtering for all channels with a global Acceptance Filter List (called AFL). Each element of the AFL defines a filter rule for messages received on a specific channel.

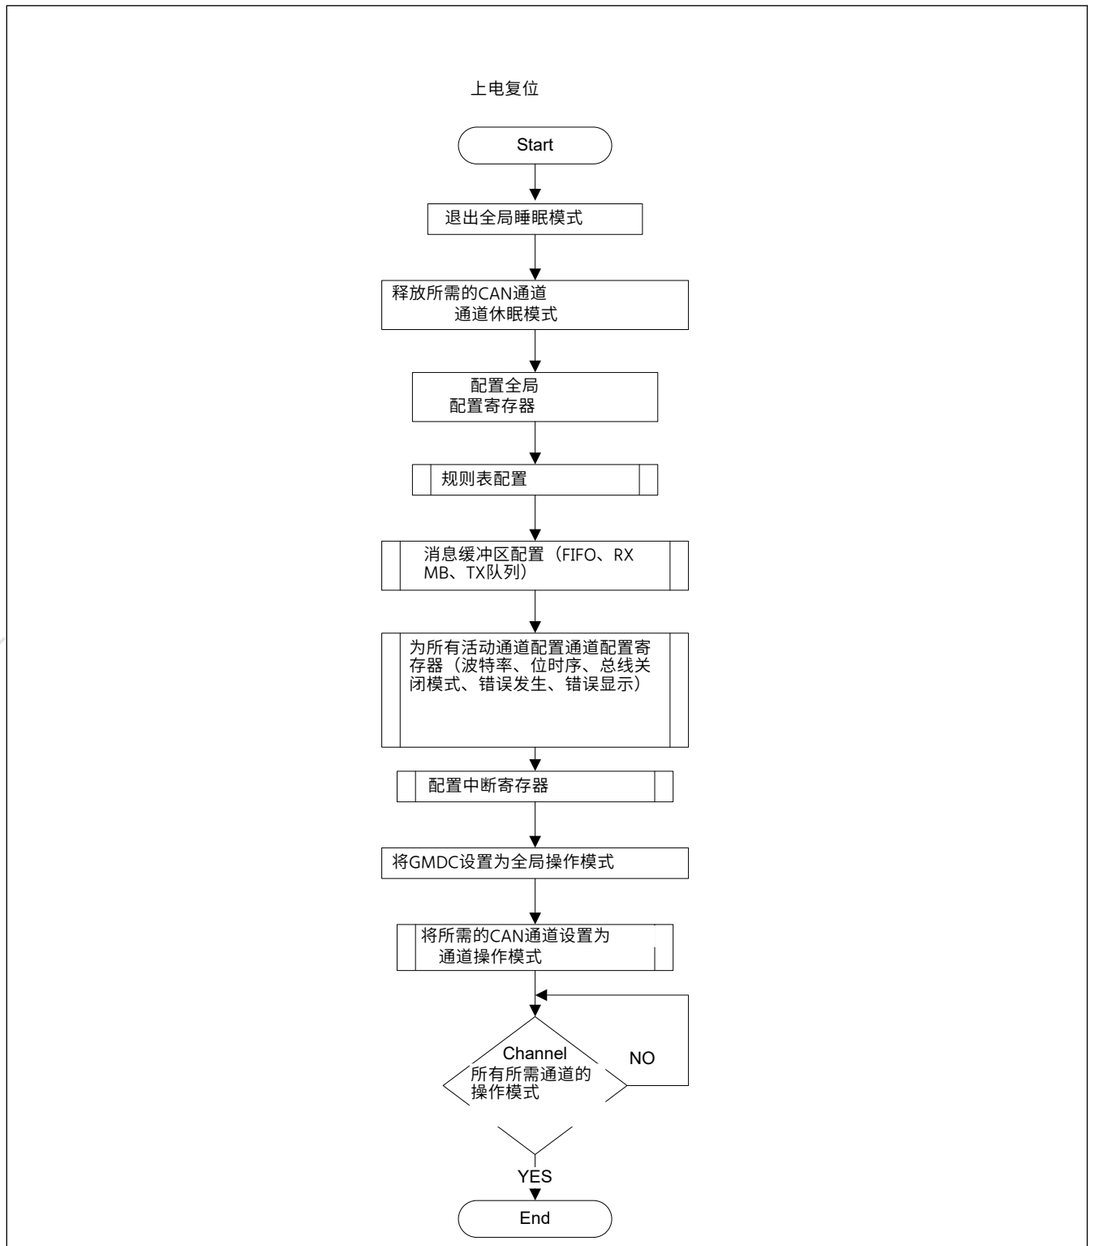

Figure 32.23 硬件复位后的配置过程

32.5 使用全局接受过滤器列表(AFL)的接受过滤功能

32.5.1 Overview

CAN-FD模块可以使用全局接受过滤器列表（称为AFL)。AFL的每个元素都为在特定通道上接收到的消息定义了一个过滤规则。

The following actions are performed based on the AFL entries:

- Acceptance filtering based on received CAN Identifier and masking
- DLC filtering based on received DLC value
- Message data payload according to the CFDGCFG.CMPOC bit*1
- Storage of accepted messages in the message buffer objects defined in the related AFL entry
- Attaching a 16-bit pointer to the stored messages defined in the related AFL entry, for example to support AUTOSAR applications
- Attaching a 2-bit information label to the stored messages defined in the related AFL entry

Note 1. This feature is not available in the classical CAN function.

The 2-channel CAN-FD module allows a maximum of 128 AFL entries across all channels with a maximum of 64 AFL entries per channel.

During acceptance filtering process, each AFL entry in a channel is checked against the received message by the acceptance filter unit. The check starts from the lowest AFL entry number for this channel.

AFL search stops when a match of the received identifier with a configured identifier/mask combination occurs or when the received identifier has been compared against all AFL entries defined for the related channel. If no match occurs, then the received message is rejected. No notification is given to the application in this case.

Additionally, an automatic DLC filtering is performed for each accepted message if DLC check is globally enabled. If the DLC value of the received message is equal to or higher than the configured DLC value in the matching AFL entry, the DLC check is passed.

If DLC replacement (CFDGCFG.DRE bit) is enabled, DLC value configured in the matching AFL entry is greater than 0x0 and DLC check passes, then the configured value of DLC in the matching AFL entry is stored in the destination RXMB or FIFO Buffer.

If the received value of DLC is greater than the configured DLC value in the matching AFL entry, then the additional data bytes received on the CAN Bus are not stored in the destination RXMB or FIFO Buffer. These additional data bytes are stored as 0x00 in the destination RXMB or FIFO Buffer.

If DLC replacement is enabled and DLC value of matching AFL entry is 0x0, then the received value of DLC is stored in the destination RX MB or FIFO Buffer.

If DLC replacement (the CFDGCFG.DRE bit) is disabled and DLC check passes, then the received value of DLC on the CAN bus is stored in the destination RXMB or FIFO buffer.

If the received value of DLC is greater than the configured DLC value in the matching AFL entry, then the additional data bytes received from the CAN bus are also stored in the destination RXMB or FIFO buffer.

If DLC value of the received message is less than the configured DLC value in the matching AFL entry, then DLC check fails. In this case, the received message is rejected and is not stored in any RXMB or FIFO buffer.

Additionally, DLC check failure is flagged by the DLC Error Flag in the Global Error Flag Register. If configured, an error interrupt is also generated. The DLC replacement configuration has no impact if the DLC check fails.

If a message has passed both acceptance filtering and DLC filtering, it is stored in a single reception message buffer and/or in FIFO buffers configured for reception or gateway function.

This message storage target information is also defined in the same AFL entry. Do not set a target at the AFL entry which is not configured.

Each accepted received message can be stored into a maximum of 8 different target destinations (single reception message buffer and/or FIFO buffers).

The programming of more than eight target destinations is not allowed. If more destinations are programmed, then the internal timing might lead to a race condition that prevents the storage of received messages in the message RAM.. Correct configuration of the numbers of target destination is the responsibility of the application.

Additional protection mechanism is made for the case when a received message contains more data payload Bytes than possible to store in the target destination (CFDRMNB.RMPLS, CFDRFCCn.RFPLS or CFDCFCCn.CFPLS).

If CFDGCFG.CMPOC = 0, the message is completely rejected and is stored in the target destination. When CFDGCFG.CMPOC = 0 and RX or Common FIFO full including the received message contains more data payload bytes

根据AFL条目执行以下操作：

●基于接收到的CAN标识符和掩码的接受过滤

●根据接收到的DLC值进行DLC过滤

●根据CFDGCFG.CMPOC位的消息数据有效负载*1

●将接受的消息存储在相关AFL条目中定义的消息缓冲区对象中

●将16位指针附加到相关AFL条目中定义的存储消息，例如以支持AUTOSAR应用程序

●将2位信息标签附加到相关AFL条目中定义的存储消息

注1.此功能在经典CAN功能中不可用。

2通道CAN-FD模块允许跨所有通道最多128个AFL条目，每个通道最多64个AFL条目。

在接受过滤过程中，接受过滤单元根据接收到的消息检查通道中的每个AFL条目。检查从该通道的最低AFL条目号开始。

当接收到的标识符与配置的标识符掩码组合发生匹配时，或者当接收到的标识符已与为相关通道定义的所有AFL条目进行比较时，AFL搜索停止。如果不匹配，则拒绝接收到的消息。在这种情况下，不会向应用程序发出通知。

此外，如果全局启用DLC检查，则会对每个接受的消息执行自动DLC过滤。如果接收到的消息的DLC值等于或高于匹配的AFL条目中配置的DLC值，则DLC检查通过。

如果启用DLC替换（CFDGCFG.DRE位），匹配AFL条目中配置的DLC值大于0x0并且DLC检查通过，则匹配AFL条目中的DLC配置值存储在目标RXMB或FIFO缓冲区中。

如果接收到的DLC值大于匹配AFL条目中配置的DLC值，则CAN总线上接收到的附加数据字节不会存储在目标RXMB或FIFO缓冲区中。这些额外的数据字节作为0x00存储在目标RXMB或FIFO缓冲区中。

如果启用DLC替换并且匹配AFL条目的DLC值为0x0，则接收到的DLC值存储在目标RXMB或FIFO缓冲区中。

如果DLC替换（CFDGCFG.DRE位）被禁用并且DLC检查通过，则接收到的DLC值在CAN总线存储在目标RXMB或FIFO缓冲区中。

如果接收到的DLC值大于匹配AFL条目中配置的DLC值，则从CAN总线接收的附加数据字节也将存储在目标RXMB或FIFO缓冲区中。

如果接收到的消息的DLC值小于匹配的AFL条目中配置的DLC值，则DLC检查失败。在这种情况下，接收到的报文被拒绝并且不存储在任何RXMB或FIFO缓冲区中。

此外，DLC检查失败由全局错误标志寄存器中的DLC错误标志标记。如果已配置，还会生成错误中断。如果DLC检查失败，则DLC替换配置没有影响。

如果消息已通过接受过滤和DLC过滤，则将其存储在单个接收消息缓冲区和/或为接收或网关功能配置的FIFO缓冲区中。

该消息存储目标信息也在同一个AFL条目中定义。不要在未配置的AFL条目上设置目标。

每个接受的接收消息最多可以存储到8个不同的目标目的地（单个接收消息缓冲区和/或FIFO缓冲区）。

不允许对超过8个目标目的地进行编程。如果对更多目的地进行了编程，则内部计时可能会导致竞争条件，从而阻止将接收到的消息存储在消息RAM中。正确配置目标目的地的数量是应用程序的责任。

当接收到的消息包含的数据有效负载字节多于可能存储在目标目的地（CFDRFCCn.RMPLS、CFDRFCCn.RFPLS或CFDCFCCn.CFPLS）中时，会采用额外的保护机制。

如果CFDGCFG.CMPOC=0，则消息被完全拒绝并存储在目标目的地中。什么时候CFDGCFG.CMPOC=0并且RX或CommonFIFOfull包括接收到的消息包含更多的数据有效负载字节

than possible to store in the target destination (CFDRMNB.RMPLS, CFDRFCCn.RFPLS or CFDCFCCn.CFPLS), the corresponding CFDFMSTS.RFxMLT or CFDFMSTS.CFxMLT bit is not set to 1, respectively.

When CFDGCFG.CMPOC = 1, the received data bytes greater than CFDRMNB.RMPLS is rejected. When CFDGCFG.CMPOC = 1 and RX or Common FIFO full including the received message contains more data payload bytes than possible to store in the target destination (CFDRMNB.RMPLS, CFDRFCCn.RFPLS or CFDCFCCn.CFPLS), the corresponding CFDFMSTS.RFxMLT or CFDFMSTS.CFxMLT bit is set to 1, respectively.

Depending on the CFDGCFG.DRE bit, the original received DLC or the DLC value configured at the AFL entry is stored.

Regardless of the CFDGCFG.CMPOC bit setting, CFDGERFL.CMPOF is set to 1 if a payload overflow condition is detected.

The DLC filtering is performed before the payload overflow function. So for one reception frame, only one flag can be set at the same time with CFDGERFL.DEF or CFDGERFL.CMPOF*1.

Note 1. This bit is not available in the classical CAN function.

32.5.2 Allocation of AFL Entries to each CAN Channel

The number of AFL entries per channel can be configured using the dedicated field in the related Global Acceptance Filter Configuration Registers (see Figure 32.24).

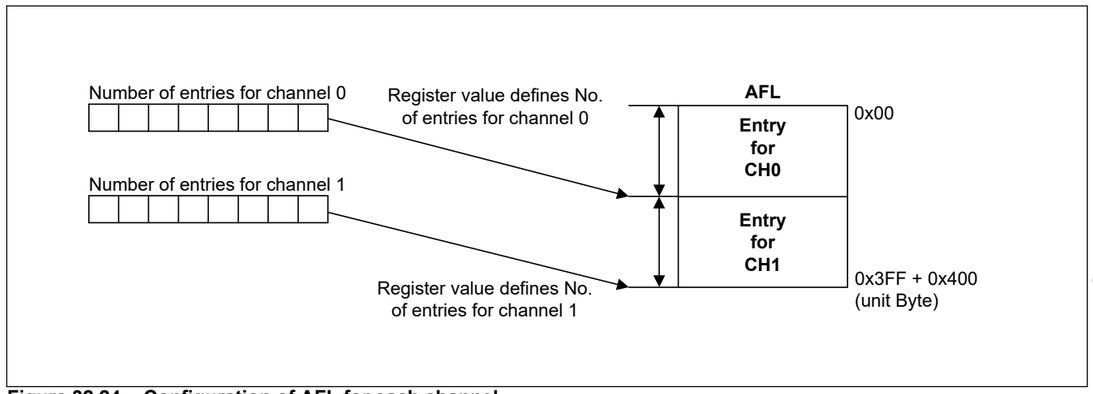

Figure 32.24 Configuration of AFL for each channel

The minimum number of entries for one channel is 0 (no entries defined for the channel) and the maximum number of entries for one channel is 64. The total number of entries for all channels should not exceed the maximum limit of (n + 1) × 64.

All entries are unique for a channel and overlapping or sharing of entries is not supported. Correct configuration of the AFL is the responsibility of the application.

The CAN-FD module does not flag errors related to the configuration of the AFL.

32.5.3 AFL Entry Description

Each AFL entry consists of 16 bytes. The fields in all entries are identical.

Each entry contains the following information for acceptance filtering and DLC filtering:

- Identifier (11 bits for Standard Frame format, 29 bits for Extended Frame format):
  Acceptance filter unit checks the identifier field of the received message against the identifier field of each AFL entry (full 29 bits masking of identifier bits is possible, see information that follows).
- IDE bit:
  Acceptance filter unit checks the IDE bit of the received message against this bit and selects the relevant part of the identifier field for acceptance filtering (masking of IDE bit is possible, see the information that follows).
- RTR bit:

比可能存储在目标目的地（CFRDRMNB.RMPLS、CFDRFCCn.RFPLS或CFDCFCCn.CFPLS）中，相应的CFDFMSTS.RFxMLT或CFDFMSTS.CFxMLT位分别不设置为1。

当CFDGCFG.CMPOC=1时，大于CFDRMNB.RMPLS的接收数据字节被拒绝。什么时候CFDGCFG.CMPOC=1并且RX或CommonFIFOfull（包括接收到的消息）包含的数据有效负载字节数超过了可能存储在目标目的地（CFDRMBG.RMPLS、CFDRFCCn.RFPLS或CFDCFCCn.CFPLS）、相应的CFDFMSTS.RFxMLT或CFDFMSTS中的数据。CFxMLT位分别设置为1。

根据CFDGCFG.DRE位，存储原始接收的DLC或在AFL条目中配置的DLC值。

无论CFDGCFG.CMPOC位设置如何，如果检测到有效负载溢出条件，CFDGERFL.CMPOF将设置为1。

DLC过滤在有效载荷溢出功能之前执行。因此对于一个接收帧，只能使用CFDGERFL.DEF或CFDGERFL.CMPOF*1同时设置一个标志。

注1.该位在经典CAN功能中不可用。

32.5.2 将AFL条目分配到每个CAN通道

可以使用相关全局接受过滤器中的专用字段配置每个通道的AFL条目数
配置寄存器（见图32.24）。

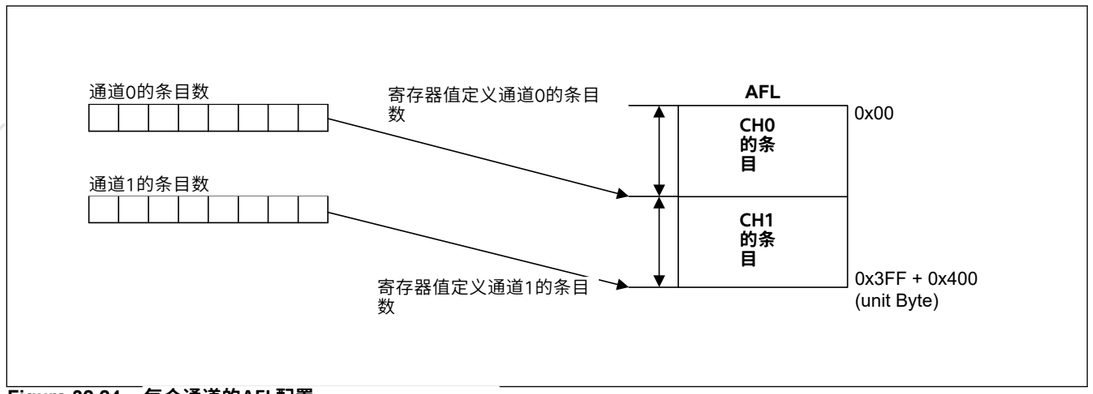

Figure 32.24 每个通道的AFL配置

一个通道的最小条目数为0（没有为通道定义条目），一个通道的最大条目数为64。所有通道的条目总数不应超过(n+1)的最大限制×64。

频道的所有条目都是唯一的，不支持条目的重叠或共享。正确配置AFL是应用程序的责任。

CAN-FD模块不会标记与AFL配置相关的错误。

32.5.3 AFL条目说明

每个AFL条目由16个字节组成。所有条目中的字段都是相同的。

每个条目都包含以下接受过滤和DLC过滤的信息：

- 标识符（标准帧格式为11位，扩展帧格式为29位）：
  接受过滤器单元根据每个AFL条目的标识符字段检查接收到的消息的标识符字段（标识符位的全29位掩码是可能的，请参阅以下信息）。
- IDE bit:
  接受过滤单元对照该位检查接收到的消息的IDE位，并选择标识符字段的相关部分进行接受过滤（可以屏蔽IDE位，参见以下信息）。
- RTR bit:

RA生态工作室

Acceptance filter unit only accepts data frames (RTR = 0) or remote frames (RTR = 1) according to the setting of this bit (masking of RTR bit is possible, see the information that follows).

- Loopback Configuration bit:
  This bit can enable or disable the AFL entry depending on the Loopback Configuration or Mirror mode condition.

- Mask for Identifier bits (29 bits):
  Each bit in the identifier mask can mask the corresponding identifier bit in the AFL entry during acceptance filtering, see Figure 32.25.

- Mask for IDE bit:
  If this Mask bit masks the IDE bit of the AFL entry in both Standard Identifier and Extended Identifier format, messages can be accepted by this AFL entry. The identifier of the received message is compared against the Standard Identifier part of the AFL entry for Standard Identifier format messages and against the Extended Identifier part of the AFL entry for Extended Identifier format messages.

- Mask for RTR bit:
  If this Mask bit masks the RTR bit of the AFL entry in both frame formats, data frame and remote frame formats are accepted by this AFL entry.

- Pointer information (16 bits):
  This 16-bit pointer is attached to a received message accepted by the related AFL entry. The pointer is added during message storage in the message buffer area and can be used by application as support function. The pointer information can be used for example to support PDU identifier allocation for the received message in AUTOSAR systems.

- Information label (2 bits):
  This 2-bit label is attached to a received message accepted by the related AFL entry. The label is added during message storage in the message buffer area and can be used by application as support function.

- DLC value for automatic DLC filtering:
  If the DLC value of the received message is equal or higher than the configured DLC value, the DLC check is passed.

If the DLC value in this AFL entry is configured to 0, DLC filtering is effectively disabled for this entry (all accepted messages pass DLC filtering).

Each AFL entry contains the following information for the handling of received messages:

- Message buffer number of one single reception message buffer as target for received message storage
- Single reception message buffer enable bit to configure the single reception message buffer number to be valid or invalid, as target for received message storage
- FIFO direction pointer - each bit of the FIFO direction pointer configures a dedicated FIFO as possible target for a received message

Note: A message received on channel A can be routed to Common FIFO buffer of another channel. If this Common FIFO buffer is configured in Gateway mode, then the message stored in this Common FIFO Buffer is transmitted on that channel because Common FIFO buffer is associated with channel.

There is no hardware protection against such storage of message. Therefore, the FIFO direction pointer must be configured carefully.

接受过滤器单元仅根据该位的设置接受数据帧（RTR=0）或远程帧（RTR=1）（RTR位的屏蔽是可能的，参见下面的信息）。

- Loopback Configuration bit:
  该位可以根据环回配置或镜像模式条件启用或禁用AFL条目。

●标识符位掩码（29位）：
标识符掩码中的每个位都可以在接受过滤期间屏蔽AFL条目中的相应标识符位，请参见图32.25。

●IDE位掩码：
如果此掩码位以标准标识符和扩展标识符格式屏蔽AFL条目的IDE位，则此AFL条目可以接受消息。接收消息的标识符与标准标识符格式消息的AFL条目的标准标识符部分和扩展标识符部分进行比较

扩展标识符格式消息的AFL条目。

●RTR位掩码：
如果此掩码位在两种帧格式中屏蔽AFL条目的RTR位，则此AFL条目接受数据帧和远程帧格式。

●指针信息（16位）：
这个16位指针附加到相关AFL条目接受的接收消息。该指针是在消息存储过程中在消息缓冲区中添加的，可供应用程序用作支持函数。例如，指针信息可用于支持AUTOSAR系统中接收到的消息的PDU标识符分配。

●信息标签（2位）：
这个2位标签附加到相关AFL条目接受的接收消息。该标签是在消息存储过程中在消息缓冲区中添加的，可供应用程序用作支持功能。

●自动DLC过滤的DLC值：
如果接收到的消息的DLC值等于或大于配置的DLC值，则DLC检查通过。

如果此AFL条目中的DLC值配置为0，则有效禁用此条目的DLC过滤（所有接受的消息都通过DLC过滤）。

每个AFL条目都包含以下用于处理接收到的消息的信息：

●作为接收消息存储目标的单个接收消息缓冲区的消息缓冲区号

●单次接收报文缓冲区使能位，用于配置单次接收报文缓冲区号有效或无效，作为接收报文存储的目标

●FIFO方向指针FIFO方向指针的每一位配置一个专用的FIFO作为接收消息的可能目标

Note: 在通道A上接收到的消息可以路由到另一个通道的CommonFIFO缓冲区。如果此CommonFIFO缓冲区配置为网关模式，则存储在此CommonFIFO缓冲区中的消息将在该通道上传输，因为CommonFIFO缓冲区与通道相关联。

没有针对此类消息存储的硬件保护。因此，必须仔细配置FIFO方向指针。

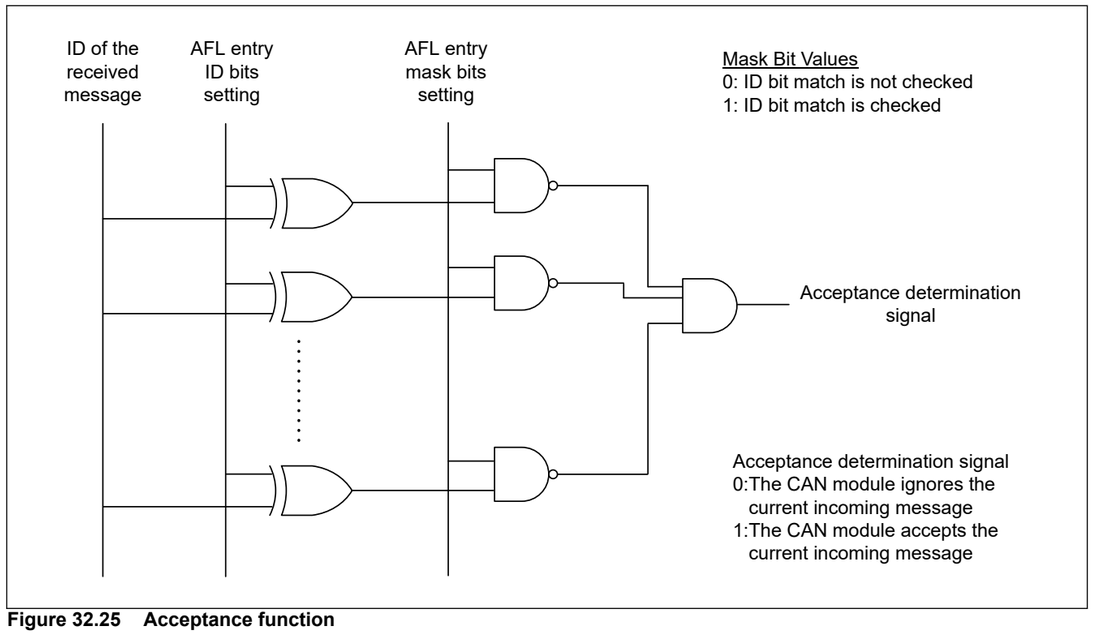

Figure 32.25 Acceptance function

32.5.4 Entering Entries in the AFL

Application software can enter one full entry into the AFL using the following registers:

- Global AFL ID Entry Register: Part 1 of the AFL entry
- Global AFL Mask Entry Register: Part 2 of the AFL entry
- Global AFL Pointer 0 Entry Register: Part 3 of the AFL entry
- Global AFL Pointer 1 Entry Register: Part 4 of the AFL entry.

16 sets of these registers form a group of AFL entries. Each group can be accessed through a page mechanism. For the CAN-FD module, 2-channel version, 8 of these pages exist to allow access to the whole AFL range. The AFL should only be configured in CH_RESET or CH_HALT mode. Pages are linked to the AFL entries in the following way:

Page 0	Entry 0 — 15
Page 1	Entry 16 — 31
Page 2	Entry 32 — 47
Page 3	Entry 48 — 63
Page 4	Entry 64 — 79
Page 5	Entry 80 — 95
Page 6	Entry 96 — 111
Page 7	Entry 112 — 127

The selection of the AFL access page is done using the Global Acceptance Filter List Entry Control Register (CFDGAFLECTR) (Figure 32.26). This register has the following fields:

- 7 bits to select the AFL page number
- 1 bit to enable or disable the AFL data access to prevent unwanted write access to the AFL.

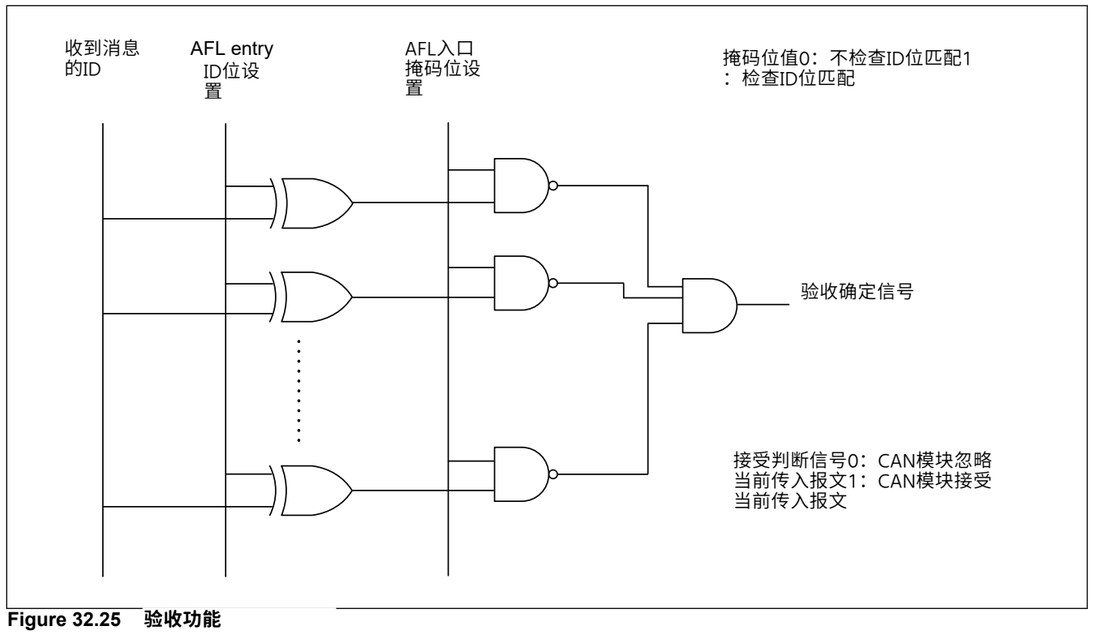

Figure 32.25 验收功能

32.5.4 在AFL中输入条目

应用软件可以使用以下寄存器将一个完整条目输入AFL：

●全球AFLID条目寄存器：AFL条目的第1部分

●全局AFL掩码条目寄存器：AFL条目的第2部分

●全局AFL指针0条目寄存器：AFL条目的第3部分

●全局AFL指针1条目寄存器：AFL条目的第4部分。

16组这些寄存器形成一组AFL条目。每个组都可以通过页面机制访问。对于CAN-FD模块，2通道版本，其中8个页面允许访问整个AFL范围。AFL只能在CH_RESET或CH_HALT模式下配置。页面通过以下方式链接到AFL条目：

Page 0	Entry 0 — 15
Page 1	Entry 16 — 31
Page 2	Entry 32 — 47
Page 3	Entry 48 — 63
Page 4	Entry 64 — 79
Page 5	Entry 80 — 95
Page 6	Entry 96 — 111
Page 7	Entry 112 — 127

AFL访问页面的选择是使用全局接受过滤器列表条目控制寄存器(CFDGAFLECTR)完成的（图32.26）。该寄存器具有以下字段：

●7位选择AFL页码

●1位启用或禁用AFL数据访问，以防止对AFL的不必要的写访问。

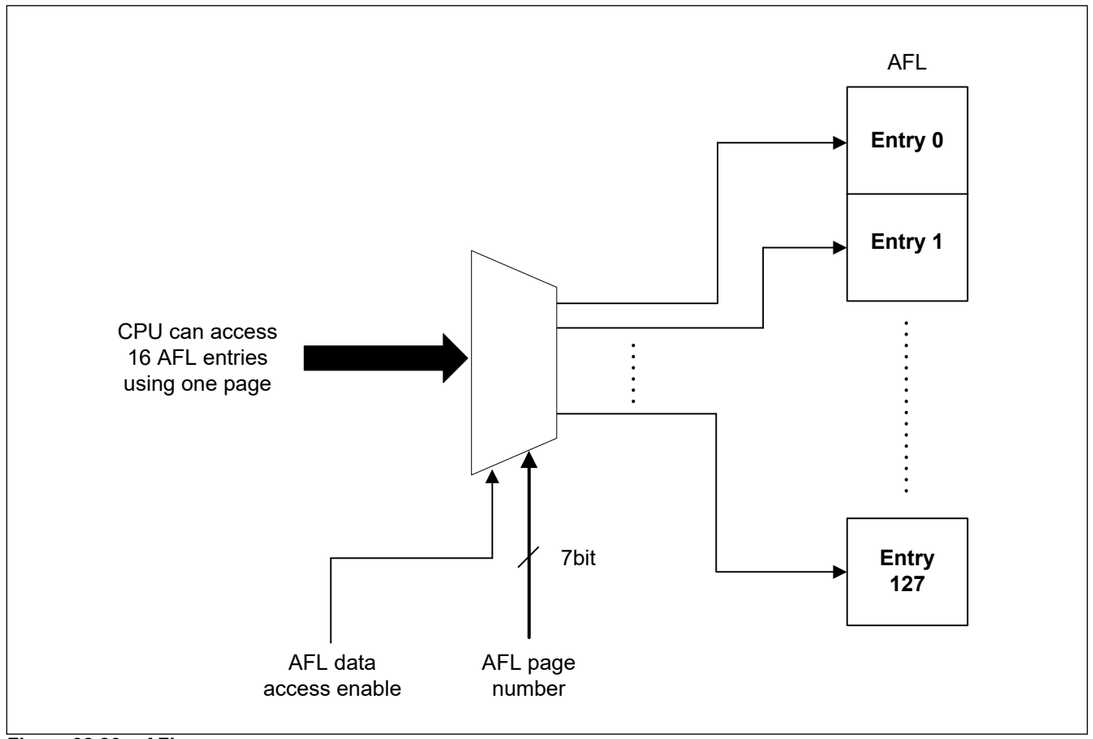

Figure 32.26 AFL page access

Application software should not write numbers higher than 0x5F for the AFL page number.

Follow the configuration shown in Figure 32.27 to program the AFL.

After entering all entries in Configuration mode, locking of the AFL access should be performed to protect unwanted write access to the AFL.

Write protection is active during all Global modes (GL_RESET, GL_HALT, and GL_OPERATION) if the lock bit is set.

Read access to AFL is still possible during all Global modes even when AFL data access is disabled (consistency check of AFL contents is possible during run time).

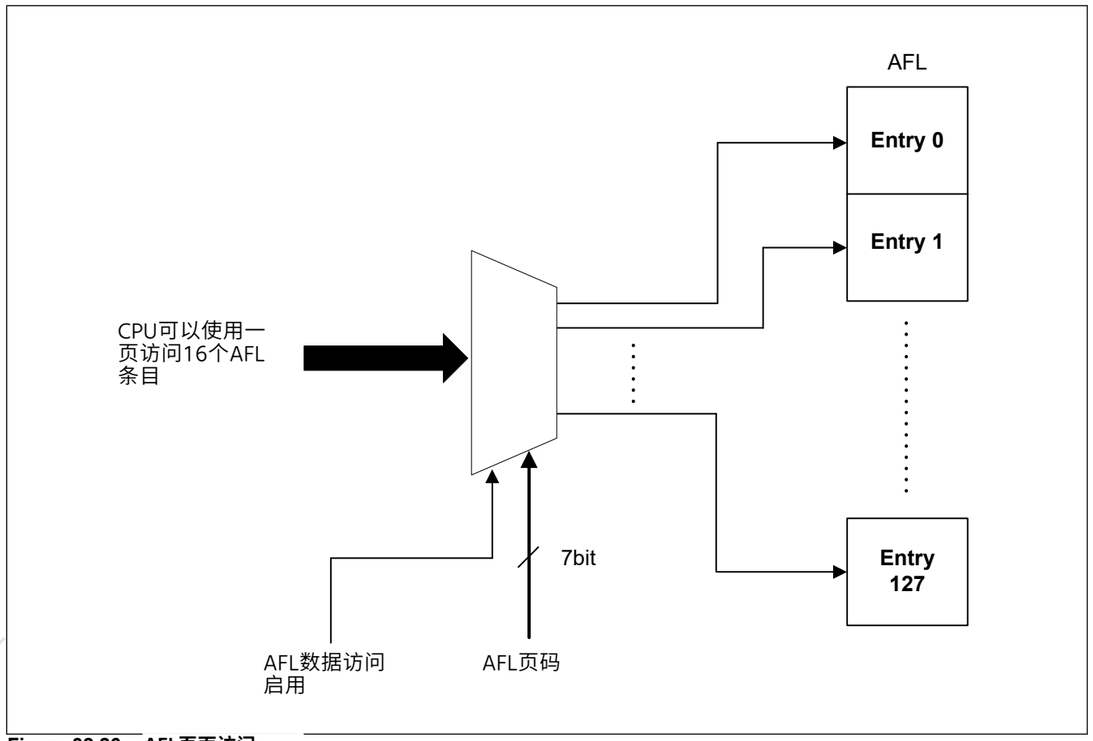

Figure 32.26 AFL页面访问

应用软件不应为AFL页号写入高于0x5F的数字。

按照图32.27所示的配置对AFL进行编程。

在配置模式下输入所有条目后，应执行AFL访问锁定以保护对AFL的不需要的写访问。

如果设置了锁定位，则写保护在所有全局模式（GL_RESET、GL_HALT和GL_OPERATION）期间都处于活动状态。

即使禁用AFL数据访问（一致性检查
AFL内容在运行时是可能的）。

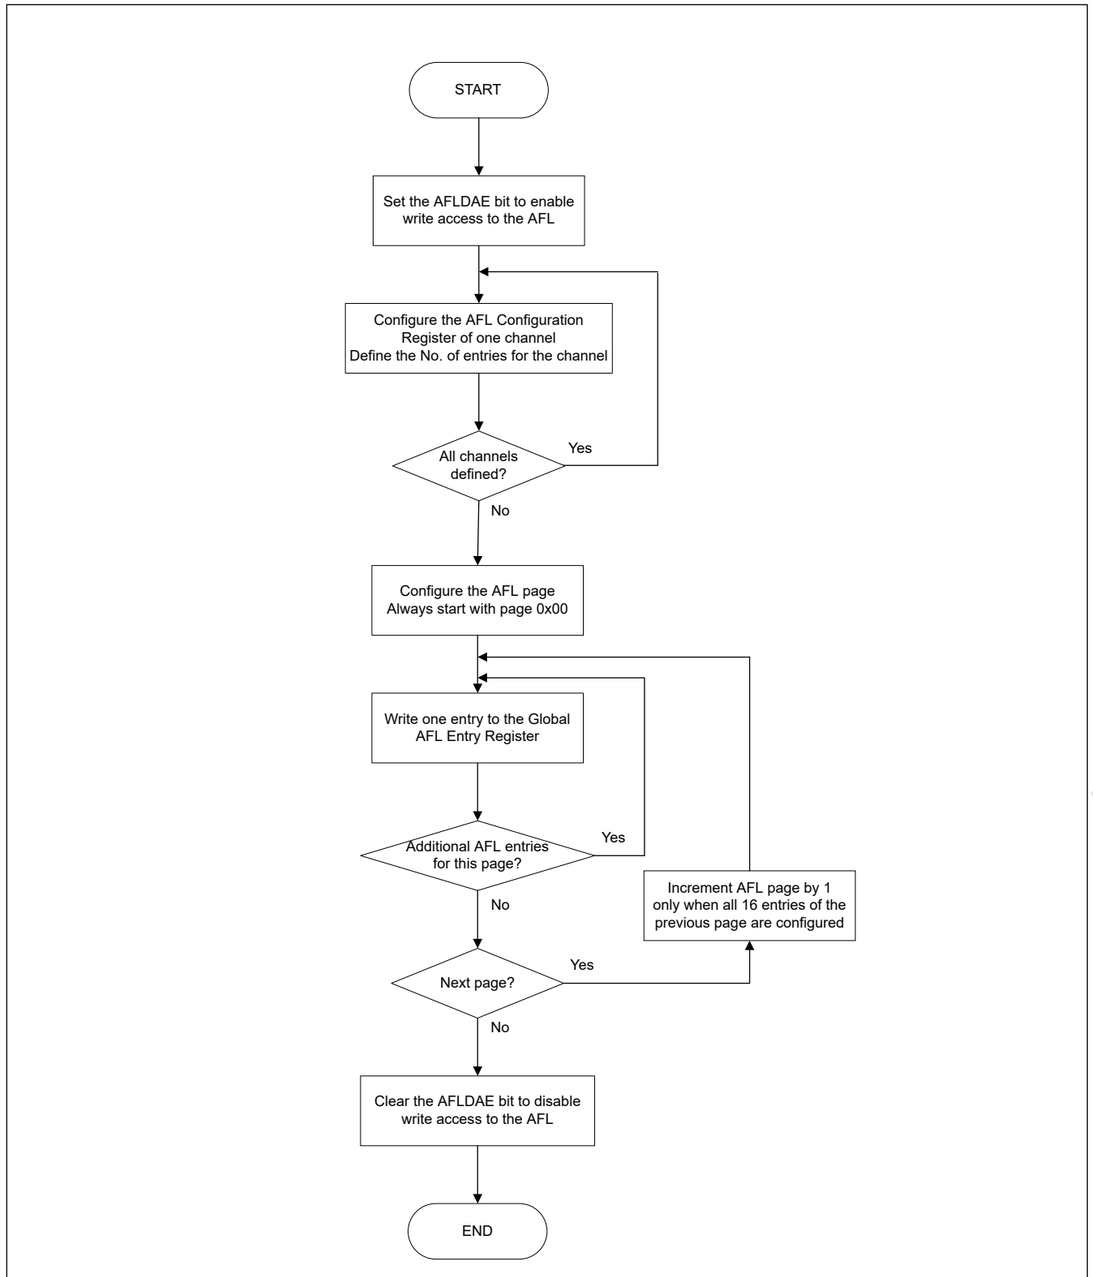

Figure 32.27 AFL configuration flow

32.5.5 Loopback Modes

If the Loopback Configuration bit is set, the AFL entry is only valid in Loopback test mode (Self-test mode 0 or Self-test mode 1) or in mirror mode when receiving messages that were transmitted by the respective CAN channel itself.

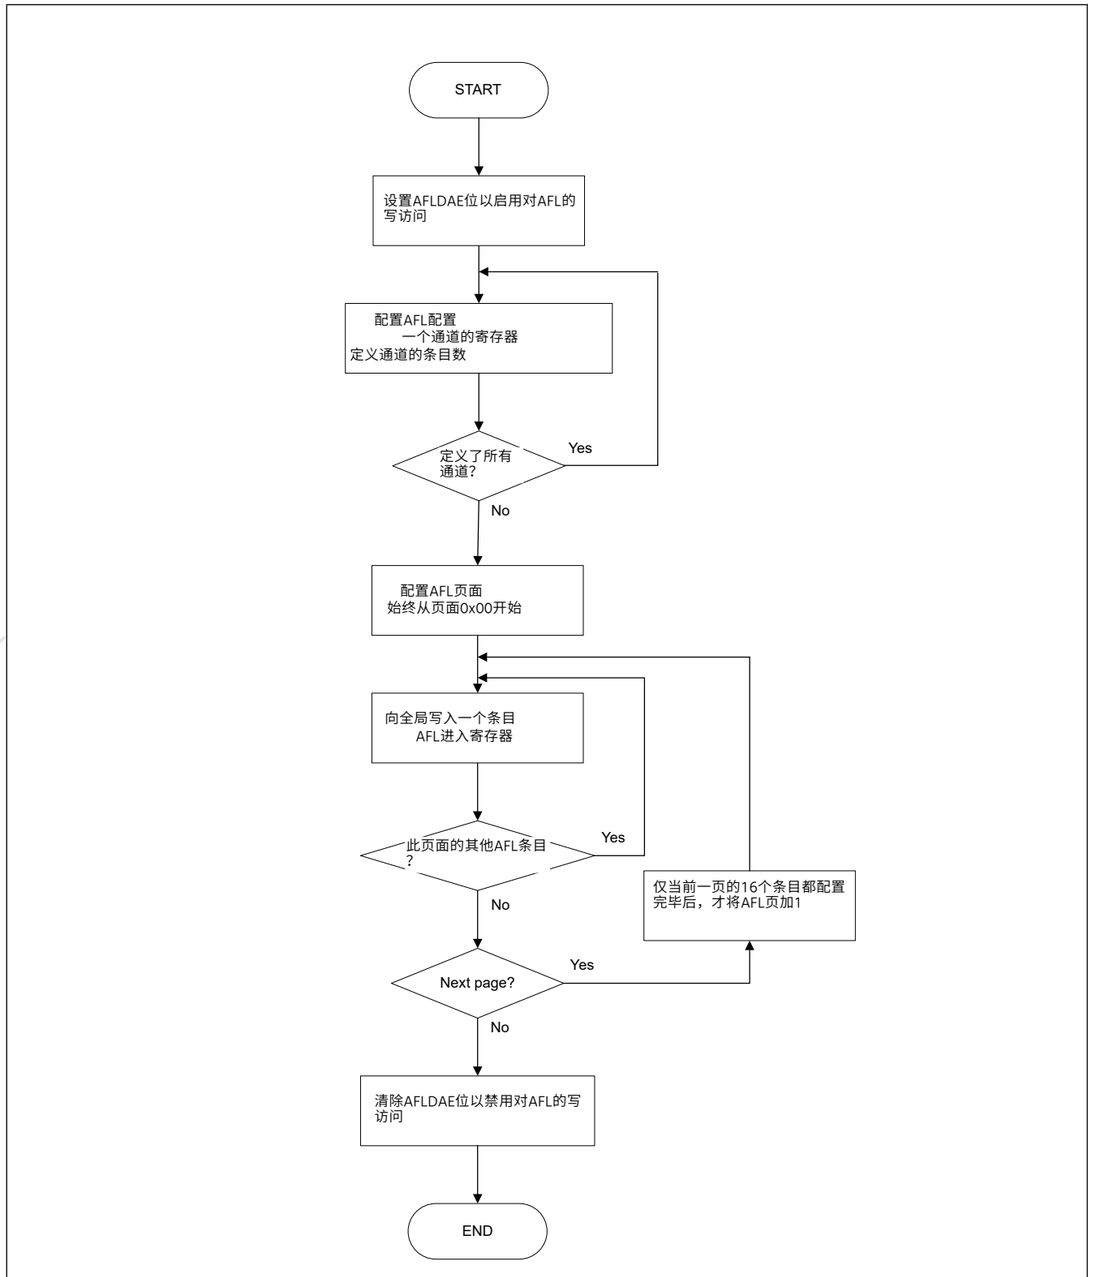

Figure 32.27 AFL配置流程

32.5.5 Loopback Modes

如果设置了环回配置位，则AFL条目仅在环回测试模式（自测模式0或自测模式1）或在接收由相应CAN通道本身发送的消息时的镜像模式下有效。

RA生态工作室

The AFL entry is not valid for received messages in loopback mode transmitted by other CAN nodes on the bus. The expression valid or invalid for the related entry means that this AFL entry is or is not compared against the received message ID respectively.

If the Loopback Configuration bit is 0, the AFL entry is only valid for:

- Received messages transmitted by other CAN nodes on the bus in normal (non-loopback mode) and mirror modes
- Received messages transmitted by other CAN nodes or the CAN channel itself in Loopback test mode.

The mirror mode can be enabled with the CFDGCFG.MME bit in the Global Configuration Register. If CFDGCFG.MME bit is set, then a successfully transmitted message can be stored back in an RX message buffer or FIFO buffer if a matching entry is configured in the AFL for that channel.

The Loopback Configuration bit in the matching AFL entry must be set to store this frame.

If Mirror mode and Loopback test mode are configured at the same time, the Loopback test mode behavior applies.

Table 32.17 shows the behavior of the acceptance filter unit depending on the setting of the related input signals.

Table 32.17 Behavior of acceptance filter based on the loopback configuration setting in AFL entry

Mirror Mode Enable (MME Configuration bit)	Loopback in test mode (Self-test mode 0 or Self-test mode 1)	Channel mode	Loopback Configuration bit in AFL entry	AFL entry
0	0	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Invalid
			1	Invalid
	1	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Valid
			1	Valid
1	0	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Invalid
			1	Valid
	1	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Valid
			1	Valid

Note: The expression valid or invalid for the related entry means that this AFL entry is or is not compared against the received message ID, respectively.

32.5.6 IDE Masking

When the GAFLIDEM bit is 0 in an AFL entry, the IDE bit configured in the AFL entry is not used for ID matching. In this case, the use of ID[10:0] or ID[28:0] matching is based on the received IDE bit.

Consider the following example:

- The ID and Mask fields of an AFL entry x is configured as follows:
  - CFDGAFLID [x] = 0xC0553A20 → IDE = 1, RTR = 1, LLB = 0, ID[10:0] = 0x220 / ID[28:0] = 0x00553A20
  - CFDGAFLMn = 0x0000FFFF → IDEM = 0. RTRM = 0, IDM[10:0] = 0x7FF / IDM[28:0] = 0x0000FFFF
- The comparison result for the four different received IDs with AFL entry x is described as follows:
  - If a frame with IDE = 0 and ID = 0x220 is received, this is considered as a match
  - If a frame with IDE = 0 and ID = 0x320 is received, this is not a match

AFL条目对于总线上其他CAN节点发送的环回模式下接收到的消息无效。相关条目的表达式有效或无效表示该AFL条目分别与接收到的消息ID进行比较或不进行比较。

如果环回配置位为0，则AFL条目仅对以下情况有效：

●接收到总线上其他CAN节点在正常（非环回模式）和镜像模式下发送的报文

●Loopback测试模式下接收到其他CAN节点或CAN通道本身发送的报文。

可以使用全局配置寄存器中的CFDGCFG.MME位启用镜像模式。如果设置了CFDGCFG.MME位，则如果在AFL中为该通道配置了匹配条目，则成功传输的消息可以存储回RX消息缓冲区或FIFO缓冲区。

必须设置匹配AFL条目中的环回配置位以存储该帧。

如果同时配置了镜像模式和环回测试模式，则应用环回测试模式行为。

表32.17显示了接收滤波器单元的行为，具体取决于相关输入信号的设置。

Table 32.17 基于AFL条目中环回配置设置的验收过滤器的行为

镜像模式启用（MME配置位）	测试模式环回（自检模式0或自检模式1）	频道模式	AFL条目中的环回配置位	AFL entry
0	0	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Invalid
			1	Invalid
	1	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Valid
			1	Valid
1	0	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Invalid
			1	Valid
	1	Receiver	0	Valid
			1	Invalid
		Transmitter	0	Valid
			1	Valid

Note: 相关条目的表达式有效或无效表示此AFL条目是否与接收到的消息进行比较身份证，分别。

32.5.6 IDE屏蔽

当AFL条目中的GAFLIDEM位为0时，AFL条目中配置的IDE位不用于ID匹配。在这种情况下，ID[10:0]或ID[28:0]匹配的使用基于接收到的IDE位。

考虑以下示例：

●AFL表项x的ID和Mask字段配置如下：

- CFDGAFLID [x] = 0xC0553A20 → IDE = 1, RTR = 1, LLB = 0, ID[10:0] = 0x220 / ID[28:0] = 0x00553A20
- CFDGAFLMn = 0x0000FFFF → IDEM = 0. RTRM = 0, IDM[10:0] = 0x7FF / IDM[28:0] = 0x0000FFFF

●四种不同的接收ID与AFL条目x的比较结果描述如下：

如果接收到IDE=0且ID=0x220的帧，则视为匹配

如果接收到IDE=0且ID=0x320的帧，则不匹配

- If a frame with IDE = 1 and ID = 0x1FFF3A20 is received, this is considered as a match
- If a frame with IDE = 1 and ID = 0x08803220 is received, this is not a match.

32.6 FIFO Buffers and Normal Message Buffer Configuration

This section describes the process for configuring the number of RX message buffers, the FIFO buffers, and the flat TX message buffers in the CAN-FD module. The message buffers are mapped as shown in Figure 32.28.

The RX message buffers can be accessed with the RX Message Buffer Registers.

The RX FIFO buffers and the common FIFO buffers configured in RX mode, TX mode, or GW mode can only be accessed with the FIFO Access Registers.

If the common FIFO is configured in TX mode, you can only write data into the FIFO buffer using the FIFO Access registers.

If the common FIFO is configured in GW mode or RX mode, you can only read data from the FIFO Access Registers.

The TX message buffers can be accessed with the TX Message Buffer Registers.

If unused message buffer locations are read, the message buffer locations are read as unknown values.

如果接收到IDE=1且ID=0x1FFF3A20的帧，则视为匹配

如果接收到IDE=1且ID=0x08803220的帧，则不匹配。

32.6 FIFO缓冲区和正常消息缓冲区配置

本节介绍在CAN-FD模块中配置RX报文缓冲区、FIFO缓冲区和平面TX报文缓冲区数量的过程。消息缓冲区的映射如图32.28所示。

RX报文缓冲区可以通过RX报文缓冲区寄存器访问。

RXFIFO缓冲区和配置为RX模式、TX模式或GW模式的通用FIFO缓冲区只能通过FIFO访问寄存器进行访问。

如果普通FIFO配置为TX模式，则只能使用FIFO访问寄存器将数据写入FIFO缓冲区。

如果普通FIFO配置为GW模式或RX模式，则只能从FIFO访问寄存器中读取数据。

TX报文缓冲区可以通过TX报文缓冲区寄存器访问。

如果读取未使用的消息缓冲区位置，则将消息缓冲区位置作为未知值读取。

RA生态工作室

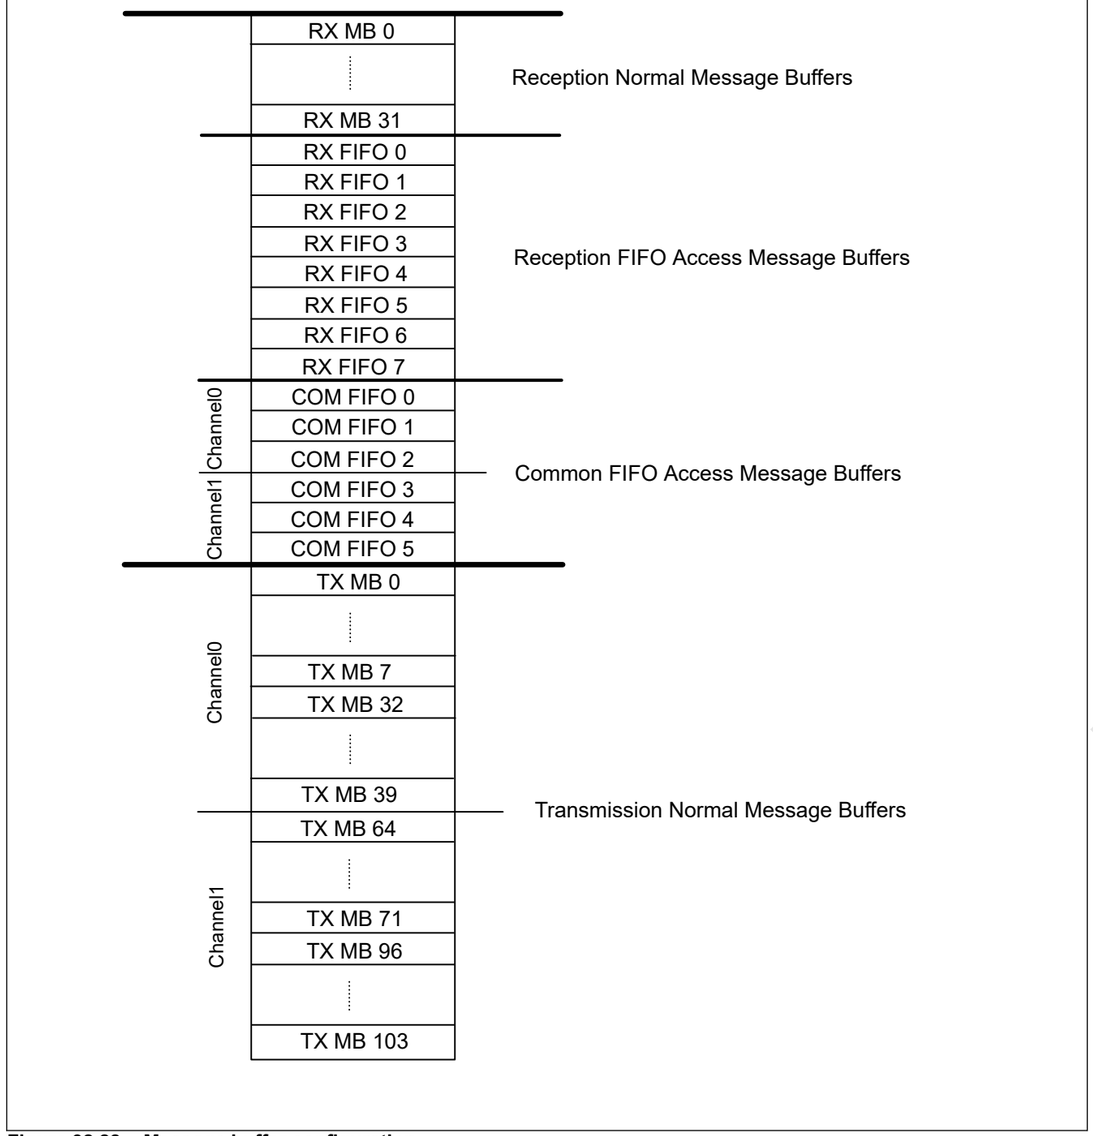

Figure 32.28 Message buffer configuration

32.6.1 Normal RX Message Buffers

In CAN-FD module, the frames received by various channels can be stored in normal RX message buffers based on the configuration of the AFL entries.

Additionally, the number of normal RX message buffers required in the system can be chosen up to a fixed maximum limit.

32.6.1.1 Normal RX Message Buffer Configuration

In CAN-FD module, the number of normal RX message buffers can be configured by writing to the RX Message Buffer Number Register.

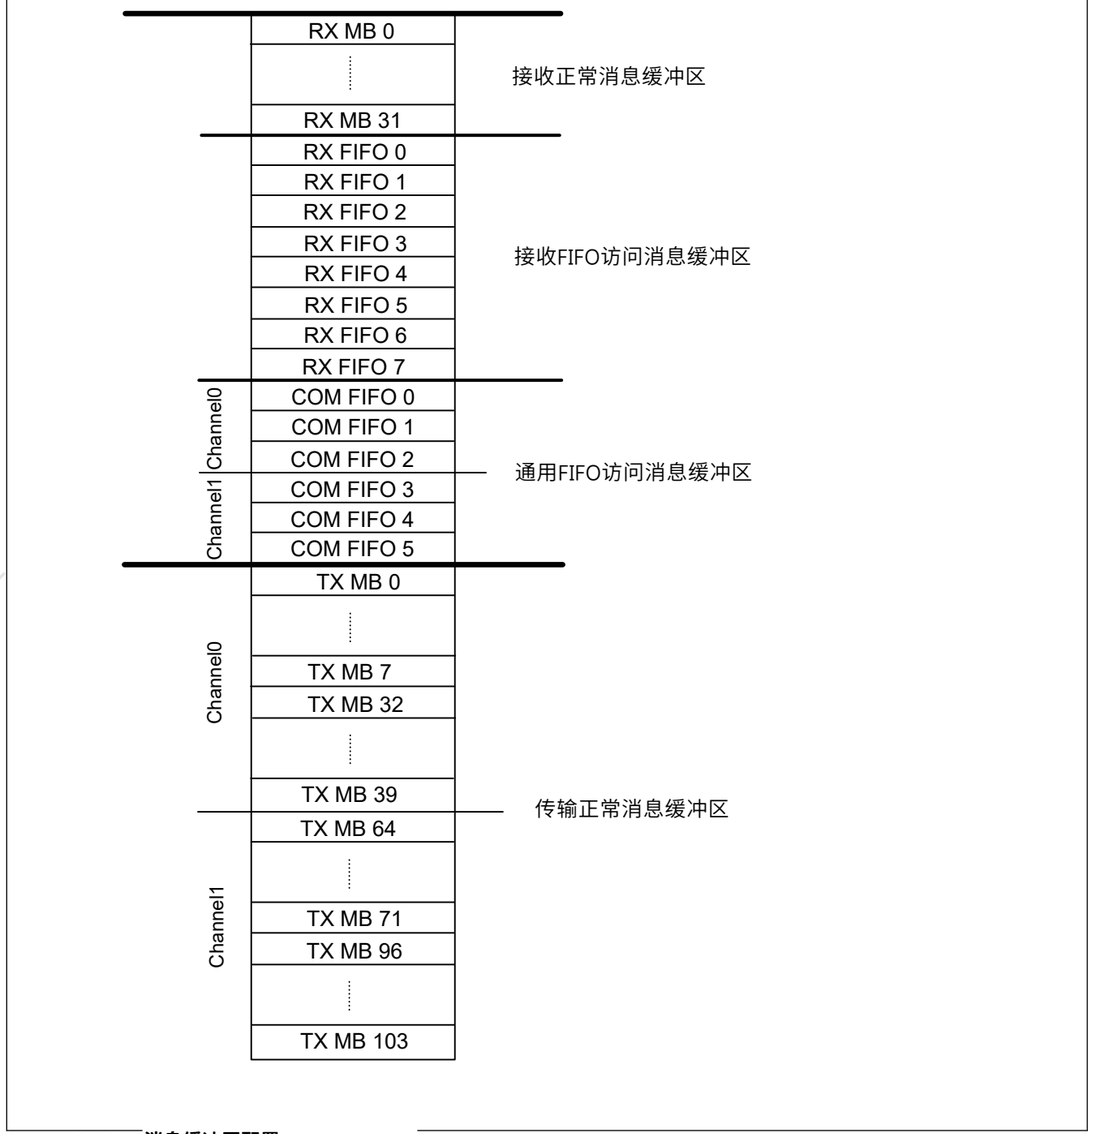

Figure 32.28 消息缓冲区配置

32.6.1 正常RX消息缓冲区

在CAN-FD模块中，各个通道接收到的帧可以根据AFL条目的配置存储在正常的RX消息缓冲区中。

此外，系统所需的正常RX消息缓冲区的数量可以选择为固定的最大限制。

32.6.1.1 正常RX报文缓冲区配置

在CAN-FD模块中，可以通过写入RX消息缓冲区来配置正常RX消息缓冲区的数量
号码寄存器。

RA生态工作室

The limiting values for the configuration of number of message buffers are:

- Minimum value = 0x00 (no normal RX MB)
- Maximum value = (16 × No. of CAN channels) = 16 × 2 = 32
  = 0x20 (32 flat RX MBs for 2 channels)

Do not use values outside these limits.

The AFL entries for routing the received messages to normal RX message buffers must be configured to match the requirements of the system.

The AFL entries must also be configured properly, and an AFL entry for normal RX message buffers should not exceed the number of message buffers configured in the RX Message Buffer Number Register.

Note: There is no internal check procedure provided in CAN-FD module against wrong configuration of the AFL.

The data field size of the RX message buffer can be configured with the CFDRMNB.RMPLS bit. The default size is 8 bytes and the maximum data payload size is 64 bytes.

When the receiving frame exceeds the data field size, then the acceptance depends on the configuration of CFDGCFG.CMPOC (message rejecting or data payload cut).

Note: RMPLS and CMPOC bit is not available in the classical CAN function, so, these feature is not valid for classical CAN.

32.6.2 FIFO Buffers

The CAN-FD module provides a fixed number of FIFO buffers to support storage of frames for reception, transmission and gateway functions for various CAN channels.

The number of reception-only FIFO buffers is fixed to 8. However, 3 common FIFO buffers per channel can be configured to store messages for transmission, reception, or gateway function.

These FIFO buffers can be enabled or disabled, and the following parameters can be configured to match the system requirements:

- Size
- Interrupt structure
- Message lost mechanism
- Message overwrite mechanism of the FIFO buffers
- Location of the TX FIFO or GW FIFO.

When the receiving frame exceeds the data field size, the acceptance depends on the configuration of the CFDGCFG.CMPOC bit (message rejecting or data payload cut).

32.6.2.1 FIFO Buffers Configuration

In CAN-FD module, the FIFO buffers can be configured to match the system requirements.

The total number of FIFO buffers = 8 RX FIFO buffers + 6 common FIFO buffers = 14 FIFO buffers for 2 channels and message overwrite mechanism.

消息缓冲区数量配置的限制值为：

●最小值=0x00（非正常RXMB）

●最大值=（16×CAN通道数）=16×2=32=0x20（2个通道
的32个扁平RXMB）

不要使用超出这些限制的值。

用于将接收到的消息路由到正常RX消息缓冲区的AFL条目必须配置为匹配系统的要求。

AFL条目也必须正确配置，正常RX消息缓冲区的AFL条目不应超过RX消息缓冲区编号寄存器中配置的消息缓冲区数。

Note: CAN-FD模块中没有针对AFL的错误配置提供内部检查程序。

RX消息缓冲区的数据字段大小可以通过CFDRMNB.RMPLS位进行配置。默认大小为8字节，最大数据负载大小为64字节。

当接收帧超过数据字段大小时，则接受取决于配置
CFDGCFG.CMPOC（消息拒绝或数据有效负载切断）。

Note: RMPLS和CMPOC位在经典CAN功能中不可用，因此，这些功能对经典CAN功能无效
CAN.

32.6.2 FIFO Buffers

CAN-FD模块提供固定数量的FIFO缓冲区，以支持存储用于各种CAN通道的接收、传输和网关功能的帧。

仅接收FIFO缓冲区的数量固定为8。但是，每个通道可以配置3个通用FIFO缓冲区来存储用于传输、接收或网关功能的消息。

可以启用或禁用这些FIFO缓冲区，并且可以配置以下参数以匹配系统要求：

- Size

●中断结构

●消息丢失机制

●FIFO缓冲区的消息覆盖机制

●TXFIFO或GWFIFO的位置 。

当接收帧超过数据字段大小时，接受取决于配置的
CFDGCFG.CMPOC位（消息拒绝或数据有效负载切断）。

32.6.2.1 FIFO缓冲器配置

在CAN-FD模块中，可以配置FIFO缓冲区以匹配系统要求。

FIFO缓冲区的总数=8个RXFIFO缓冲区+6个通用FIFO缓冲区=2个通道和消息覆盖机制的14个FIFO缓冲区。

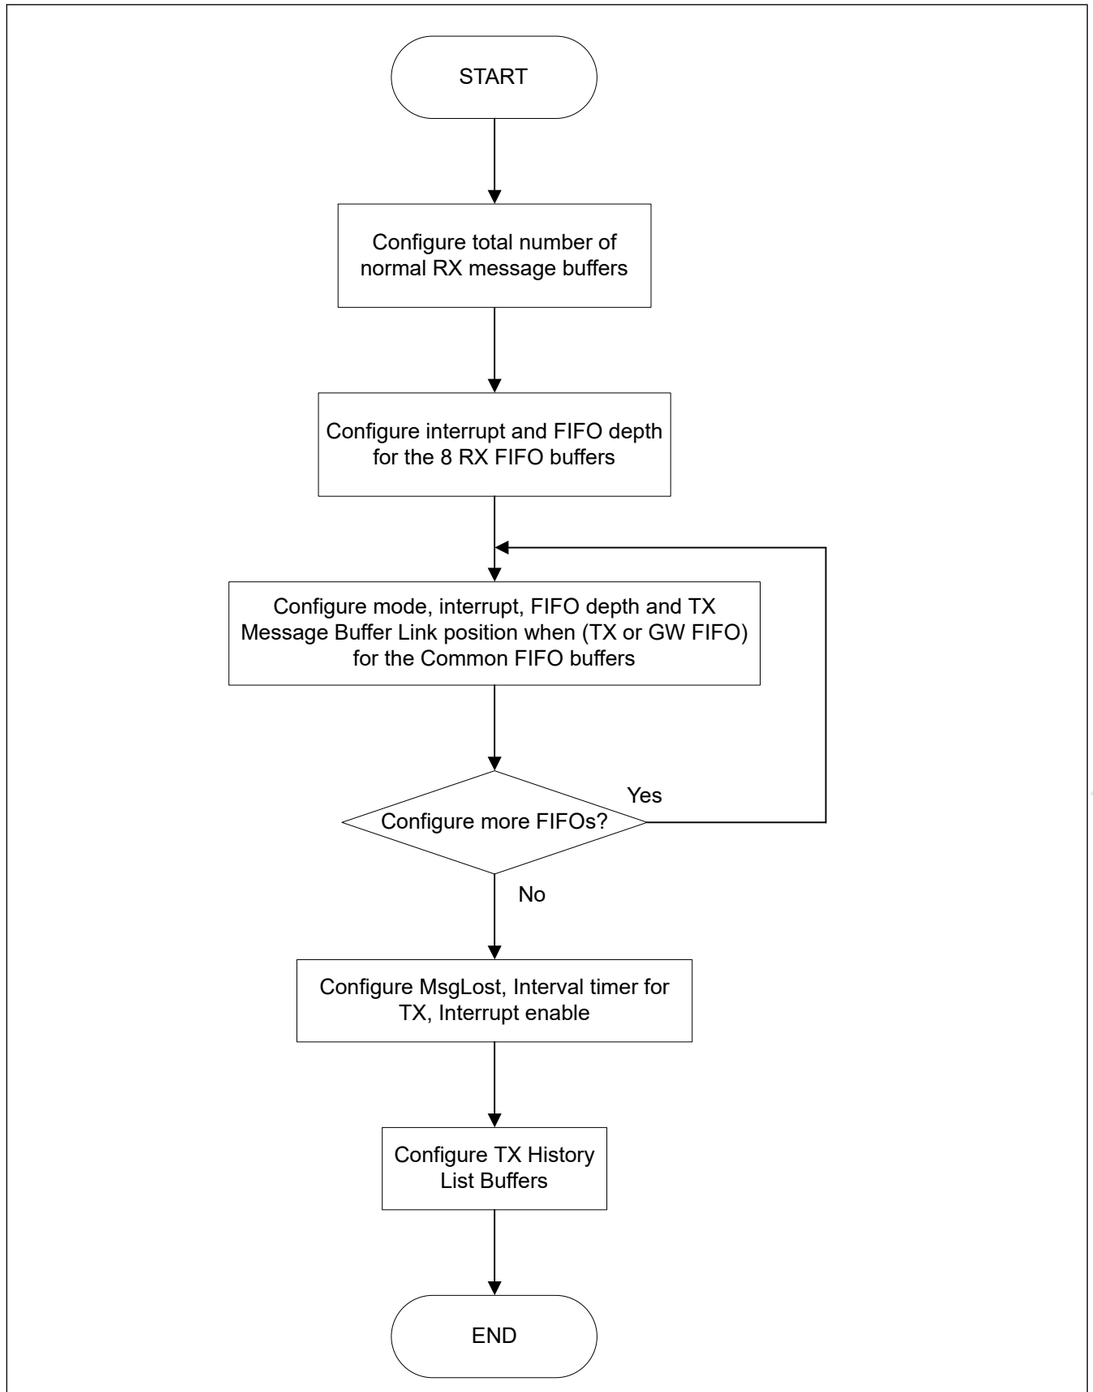

Figure 32.29 FIFO buffer configuration flow in CAN-FD module

As shown in Figure 32.29, the various FIFO buffers can be configured by writing to the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/Control Registers.

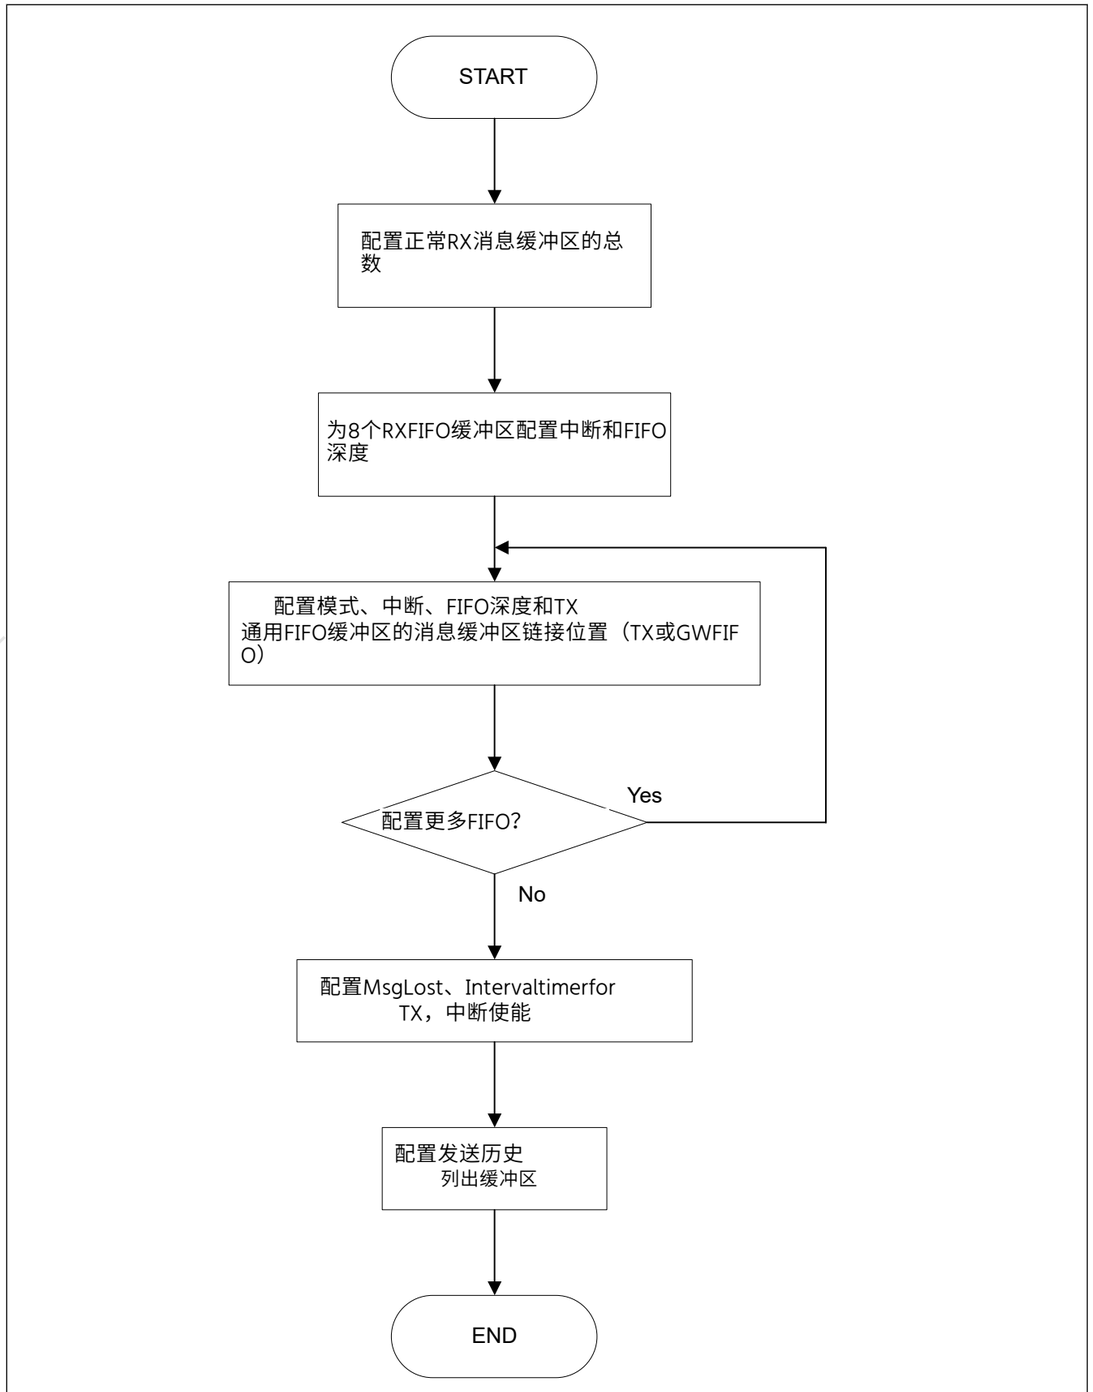

Figure 32.29 CAN-FD模块中的FIFO缓冲区配置流程

如图32.29所示，可以通过写入RXFIFO配置控制来配置各种FIFO缓冲区寄存器和通用FIFO配置控制寄存器。

For the 8 RX FIFO buffers, the following parameters can be configured:

- Interrupts
- FIFO depth
- FIFO payload data size.

For the common FIFO buffers, the following parameters can be configured:

- Mode
- Interrupts FIFO depth
- FIFO payload data size
- FIFO TX link position.

(1) FIFO mode configuration of Common FIFO buffers

The mode of the common FIFO buffers can be configured by writing to the CFDCFCCn.CFM[1:0] bits in the Common FIFO Configuration/Control Registers. The possible modes of configuration for Common FIFO buffers are:

- 00b RX mode (default mode after hardware reset)
- 100b TX mode
- 10b GW mode
- 11b Reserved (Do not write this value to the register bits)

Messages can only be read from the RX FIFO buffers and the Common FIFO buffers configured in RX mode. Messages are stored by the CAN module in these FIFO buffers based on the AFL entries.

Messages can be read and written into the Common FIFO buffers configured in TX mode. These messages are transmitted on the appropriate CAN channel.

Messages can only be read from the Common FIFO buffers configured in GW mode. However, the CPU read access has no impact on the read or write pointers. The pointers can only be incremented when a new message is stored in the FIFO buffer and decremented when a message is transmitted on the corresponding CAN channel by the CAN-FD module.

After a hardware reset, all the Common FIFO buffers are configured in RX mode by default. Only enable the FIFO buffers after configuring the Common FIFO buffers in the required modes.

In GW mode, when a transmit/receive FIFO buffer is trying to receive a new message while the transmit/receive FIFO buffer is already full of data, the oldest data of the buffer is overwritten with the message received or the message is discarded. The behavior is determined by setting the CFDCFCCEn.CFMOWM bit.

- When CFDCFCCEn.CFMOWM = 0:
  When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the received message is discarded, and CFDCFSTSn.CFMLT bit is set to 1.

- When CFDCFCCEn.CFMOWM = 1:
  When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the oldest data in the buffer is overwritten with the received message.
  The read pointer of the transmit/receive FIFO buffer simultaneously moves to the next oldest message.
  The CFDCFSTSn.CFMOW bit is then set to 1, which notifies that the oldest message has been overwritten with the received message.
  In addition, when a CAN bus error or arbitration-lost for the transmitting message occurs in the transmit/receive FIFO buffer full, the transmitting message is lost and retransmision for the message is not performed. The read point is then moves to the next message automatically.
  Do not write to this bit when the CFDCFCCn.CFE bit is 1.

(2) FIFO TX message buffer link configuration

When the common FIFO is configured as TX or GW FIFO, the FIFO buffer must be linked to a normal TX message buffer to participate in the transmission scan.

The link to a normal TX message buffer must be unique, for example the same TX message buffer cannot be shared between 2 or more common FIFO buffers.

对于8个RXFIFO缓冲区，可以配置以下参数：

- Interrupts
- FIFO depth

●FIFO有效负载数据大小。

对于常见的FIFO缓冲区，可以配置以下参数：

- Mode

●中断FIFO深度

●FIFO有效负载数据大小

●FIFOTX链路位置。

(1) CommonFIFO缓冲区的FIFO模式配置

通用FIFO缓冲区的模式可以通过写入Common中的CFDCFCCn.CFM[1:0]位来配置FIFO配置控制寄存器。通用FIFO缓冲区的可能配置模式有：

●00bRX模式（硬件复位后的默认模式）

- 100b TX mode
- 10b GW mode

●11b保留（不要将此值写入寄存器位）

只能从RXFIFO缓冲区和配置为RX模式的CommonFIFO缓冲区读取消息。CAN模块根据AFL条目将消息存储在这些FIFO缓冲区中。

可以在TX模式下配置的通用FIFO缓冲区中读取和写入消息。这些消息在适当的CAN通道上传输。

只能从配置为GW模式的CommonFIFO缓冲区读取消息。但是，CPU读取访问对读取或写入指针没有影响。只有当新消息存储在FIFO缓冲区中时，指针才能递增，而当CAN-FD模块在相应的CAN通道上传输消息时，指针才能递减。

硬件复位后，所有CommonFIFO缓冲区默认配置为RX模式。仅在所需模式下配置CommonFIFO缓冲区后才启用FIFO缓冲区。

在GW模式下，当发送接收FIFO缓冲区尝试接收新消息而发送接收FIFO缓冲区已满数据时，缓冲区中最旧的数据将被接收到的消息覆盖或丢弃该消息。该行为是通过设置CFDCFCCEn.CFMOWM位来确定的。

- When CFDCFCCEn.CFMOWM = 0:
  当发送接收FIFO缓冲区已满数据而由于接收到新报文而需要写入数据时，将丢弃接收到的报文，并将CFDCFSTSn.CFMLT位设置为1。

- When CFDCFCCEn.CFMOWM = 1:
  当发送接收FIFO缓冲区已满数据时，由于接收到新报文而需要写入数据时，缓冲区中最旧的数据将被接收到的报文覆盖。发送接收FIFO缓冲区的读指针同时移动到下一个最旧的消息。

  然后将CFDCFSTSn.CFMOW位设置为1，通知最旧的消息已被接收的消息覆盖。此外，当发送接收FIFO缓冲区满时发生CAN总线错误或发送报文仲裁丢失时，发送报文丢失且不进行报文重传。然后读取点自动移动到下一条消息。当CFDCFCCn.CFE位为1时不要写入该位。

(2) FIFOTX消息缓冲区链接配置

当普通FIFO配置为TX或GWFIFO时，FIFO缓冲区必须链接到正常的TX消息缓冲区才能参与传输扫描。

到普通TX消息缓冲区的链接必须是唯一的，例如，不能在2个或更多公共FIFO缓冲区之间共享相同的TX消息缓冲区。

Do not write data into a TX message buffer that is linked to a Common FIFO buffer. Also, the TX message buffer linked to a Common FIFO buffer should not be a part of the TX Queue.

The TX message buffer link of each Common FIFO buffer can be configured by writing to the CFDCFCCn.CFTML[4:0] bits in the Common FIFO Configuration/Control Registers. Available options for TX message buffer link configuration are:

- 0x00: TX Message Buffer 32
- 0x01: TX Message Buffer 33
- ⋮
- 0x07: TX Message Buffer 39

(3) FIFO depth configuration

The depth of each FIFO buffer can be configured by writing to the CFDRFCCn.RFDC[2:0] bits and CFDCFCCn.CFDC[2:0] bits in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/ Control Registers. The 8 available options for depth configuration are:

- 0x000: 0 Messages (FIFO buffer cannot be enabled)
- 0x001: 4 Messages
- 0x010: 8 Messages
- 0x011: 16 Messages
- 0x100: 32 Messages
- 0x101: 48 Messages
- 0x110: 64 Messages
- 0x111: 128 Messages

The RAM allocation for RX message buffers along with FIFO buffers is limited to (n + 1) × 256 messages. Configuration of the RX message buffers, along with FIFO buffers, that exceeds this maximum limit should not be done.

CAN-FD module logic does not check the validity of the configuration.

Note: If the FIFO depth of a common FIFO is 4 messages or more (CFDCFCCn.CFDC[2:0] > 000b), then the Common FIFO TX message buffer link is valid when the FIFO is disabled or enabled.

If FIFO depth is 0 messages, then the Common FIFO TX message buffer link is not valid when the FIFO is disabled or enabled.

(4) FIFO payload size configuration

The data size of each FIFO buffer can be configured by writing to the CFDRFCCn.RFPLS[2:0] bits and CFDCFCCn.CFPLS[2:0] bits in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/ Control Registers. The eight available options for depth configuration are:

- 000b: 8 bytes
- 001b: 12 bytes
- 010b: 16 bytes
- 011b: 20 bytes
- 100b: 24 bytes
- 101b: 32 bytes
- 110b: 48 bytes
- 111b: 64 bytes

The RAM allocation for RX message buffers along with FIFO buffers is limited to (n + 1) × 256 messages with 64 data bytes. Configuration of the RX message buffers, along with FIFO buffers, that exceeds this maximum limit should not be done.

CAN-FD module logic does not check the validity of the configuration.

不要将数据写入链接到通用FIFO缓冲区的TX消息缓冲区。此外，链接到通用FIFO缓冲区的TX消息缓冲区不应成为TX队列的一部分。

每个通用FIFO缓冲区的TX报文缓冲区链接可以通过写入通用FIFO配置控制寄存器中的CFDCFCCn.CFTML[4:0]位来配　　置。TX消息缓冲区链路配置的可用选项包括：

- 0x00：TX报文缓冲区32
- 0x01：TX报文缓冲区33
- ⋮
- 0x07：TX报文缓冲区39

(3) FIFO深度配置

每个FIFO缓冲区的深度可以通过写入CFDRFCCn.RFDC[2:0]位和RXFIFO配置控制寄存器和通用FIFO配置中的CFDCFCCn.CFDC[2:0]位控制寄存器。深度配置的8个可用选项是：

- 0x000：0条消息（无法启用FIFO缓冲区）
- 0x001: 4 Messages
- 0x010: 8 Messages
- 0x011: 16 Messages
- 0x100: 32 Messages
- 0x101: 48 Messages
- 0x110: 64 Messages
- 0x111: 128 Messages

RX消息缓冲区和FIFO缓冲区的RAM分配限制为(n+1)×256条消息。不应配置超过此最大限制的RX消息缓冲区以及FIFO缓冲区。

CAN-FD模块逻辑不检查配置的有效性。

Note: 如果公共FIFO的FIFO深度为4条或更多消息（CFDCFCCn.CFDC[2:0]>000b），则公共FIFOTX报文缓冲区链接在FIFO禁用或启用时有效。

如果FIFO深度为0消息，则通用FIFOTX消息缓冲区链接在FIFO禁用或启用时无效。

(4) FIFO有效载荷大小配置

每个FIFO缓冲区的数据大小可以通过写入CFDRFCCn.RFPLS[2:0]位和RXFIFO配置控制寄存器和通用FIFO配置中的CFDCFCCn.CFPLS[2:0]位控制寄存器。深度配置的八个可用选项是：

- 000b: 8 bytes
- 001b: 12 bytes
- 010b: 16 bytes
- 011b: 20 bytes
- 100b: 24 bytes
- 101b: 32 bytes
- 110b: 48 bytes
- 111b: 64 bytes

RX报文缓冲区和FIFO缓冲区的RAM分配限制为(n+1)×256条64数据字节的报文。不应配置超过此最大限制的RX消息缓冲区以及FIFO缓冲区。

CAN-FD模块逻辑不检查配置的有效性。

Note: This feature is not available in the classical CAN function.

(5) FIFO interrupt configuration

The Interrupt generation conditions for the FIFO buffers can be configured by writing to the CFDRFCCn.RFIM and CFDCFCCn.CFIM bit in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/Control Registers. The two available options are:

- 0:
  - RX FIFO mode: Interrupt generated when the Common FIFO counter reaches CFDRFCCn.RFIGCV/ CFDCFCCn.CFIGCV value
  - TX FIFO mode: Interrupt generated when the Common FIFO transmits the last message successfully
  - GW FIFO mode
  - Frame RX: Interrupt generated when message counter increments and reaches the interrupt threshold value
  - Frame TX: Interrupt generated when the last message is transmitted successfully from FIFO.
- 1:
  - RX FIFO mode: Interrupt generated at the end of storage of every received message
  - TX FIFO mode: Interrupt generated for every successfully transmitted message
  - GW FIFO mode
  - Frame RX: Interrupt generated when message is stored in the FIFO
  - Frame TX: Interrupt generated when message is successfully transmitted from the FIFO.

If the Interrupt Mode bit is 0 for a RX FIFO, then interrupt is generated based on the configuration of the CFDRFCCn.RFIGCV[2:0] bits.

Similarly, if the Interrupt Mode bit is 0 for a Common FIFO configured in RX mode, then interrupt is generated based on the configuration of CFDCFCCn.CFIGCV[2:0] bits.

The eight available options for configuring the FIFO counter value for generation of an interrupt are:

- 000b: Interrupt generated when FIFO is 1/8th Full
- 001b: Interrupt generated when FIFO is 1/4th Full
- 010b: Interrupt generated when FIFO is 3/8th Full
- 011b: Interrupt generated when FIFO is 1/2 Full
- 100b: Interrupt generated when FIFO is 5/8th Full
- 101b: Interrupt generated when FIFO is 3/4th Full
- 110b: Interrupt generated when FIFO is 7/8th Full
- 111b: Interrupt generated when FIFO is Full.

In this case, an interrupt is generated when the message count matches the configured value.

However, there are some limitations on the configuration of the CFDRFCCn.RFIGCV[2:0] and CFDCFCCn.CFIGCV[2:0] bits depending on the FDC[2:0] bits (FIFO Depth Configuration), see Table 32.18.

Table 32.18 FIFO interrupt generation counter and FIFO depth configuration (1 of 2)

RFDC[2:0] (CFDC[2:0])	RFIGCV[2:0] (CFIGCV[2:0])							
	111b	110b	101b	100b	011b	010b	001b	000b
000b	Don't care (FIFO cannot be enabled)							
001b	Allowed	Not allowed	Allowed	Not allowed	Allowed	Not allowed	Allowed	Not allowed
010b	Allowed							
011b	Allowed							
100b	Allowed							

Note: 此功能在经典CAN功能中不可用。

(5) FIFO中断配置

FIFO缓冲区的中断生成条件可以通过写入CFDRFCCn.RFIM和RXFIFO配置控制寄存器和通用FIFO配置控制中的CFDCFCCn.CFIM位寄存器。两个可用选项是：

- 0:
  RXFIFO模式：CommonFIFO计数器达到CFDRFCCn.RFIGCVCFDCFCCn.CFIGCV值时产生中断

  TXFIFO模式：CommonFIFO成功发送最后一条报文时产生中断
  - GW FIFO mode

  FrameRX：当消息计数器递增并达到中断阈值时产生中断

  FrameTX：当最后一条消息从FIFO成功发送时产生中断。
- 1:
  RXFIFO模式：在每个接收到的消息存储结束时产生中断

  TXFIFO模式：为每个成功传输的消息生成中断
  - GW FIFO mode

  FrameRX：消息存储在FIFO中时产生的中断

  FrameTX：消息从FIFO成功传输时产生的中断。

如果RXFIFO的中断模式位为0，则根据配置生成中断CFDRFCCn.RFIGCV[2:0] bits.

同样，如果配置为RX模式的CommonFIFO的中断模式位为0，则根据CFDCFCCn.CFIGCV[2:0]位的配置生成中断。

配置FIFO计数器值以生成中断的八个可用选项是：

- ●000b：FIFO为18thFull时产生的中断
- ●001b：FIFO为14thFull时产生中断
- ●010b：FIFO为38thFull时产生中断
- ●011b：FIFO为12Full时产生中断
- ●100b：FIFO为58thFull时产生的中断
- ●101b：FIFO为34thFull时产生中断
- ●110b：FIFO为78thFull时产生中断
- ●111b：FIFO满时产生中断。

在这种情况下，当消息计数与配置值匹配时会产生中断。

但是，CFDRFCCn.RFIGCV[2:0]和CFDCFCCn.CFIGCV[2:0]位的配置有一些限制，具体取决于FDC[2:0]位（FIFO深度配置），请参见表32.18。

Table 32.18 FIFO中断生成计数器和FIFO深度配置（1of2）

RFDC[2:0] (CFDC[2:0])	RFIGCV[2:0] (CFIGCV[2:0])							
	111b	110b	101b	100b	011b	010b	001b	000b
000b	无关（无法启用FIFO）							
001b	Allowed	不允许	Allowed	不允许	Allowed	不允许	Allowed	不允许
010b	Allowed							
011b	Allowed							
100b	Allowed							

Table 32.18 FIFO interrupt generation counter and FIFO depth configuration (2 of 2)

RFDC[2:0] (CFDC[2:0])	RFIGCV[2:0] (CFIGCV[2:0])							
	111b	110b	101b	100b	011b	010b	001b	000b
101b	Allowed							
110b	Allowed							
111b	Allowed							

Common FIFO buffer can set an interrupt output at the completion time of transmitting one frame, or the completion of reception. In addition, Common FIFO and RX FIFO can set an interrupt output, when stored to the setup number (CFDC/RFDC) of FIFO stages.

32.6.2.2 FIFO Buffers Control

The FIFO interrupt must be enabled by setting any one of the following bits in the RX FIFO Configuration/Control Registers:

- CFDRFCCn.RFIE
- CFDRFCCn.RFFIE.

In addition, the FIFO interrupt must be enabled by setting any one of the following bits in the Common FIFO Configuration/Control Registers:

- CFDCFCCn.CFRXIE
- CFDCFCCn.CFTXIE
- CFDCFCCEn.CFFIE
- CFDCFCCEn.CFOFRXIE
- CFDCFCCEn.CFOFTXIE.

After configuration is complete, each FIFO can be enabled by setting the CFDRFCCn.RFE and CFDCFCCn.CFE bits in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/Control Registers to allow transmission and reception of messages.

When CFDCFCCEn.CFBME = 1, it becomes FIFO buffering mode, send data is stored in the Common FIFO, and transmission is stopped. Transmission starts when CFDCFCCEn.CFBME = 0.

Do not write 1 from 0 for this bit when the CFDCFCCn.CFE bit is 1.

32.7 Interrupts and DMA

32.7.1 Interrupts

The CAN-FD module generates several interrupts. The interrupt output, which is connected to the Interrupt Controller Unit (ICU), can be controlled by the corresponding interrupt enable bit.

The status flag is set independent from this enable bit.

The channel transmission interrupt has an additional status flag register. The status bits are set when the corresponding interrupt enables are set.

The status flag register supports the identification of the interrupt source for the channel transmission, as this interrupt is driven by several trigger sources.

The interrupts in the CAN-FD module can be classified into two groups, global interrupts and channel interrupts:

- Global interrupts:
  The CAN-FD module can generate 2 global interrupts:
  - Global interrupt for successful reception into the 8 RX FIFO buffers
  - Global error interrupt.
- Channel interrupts:
  Each channel of the CAN-FD module can generate 3 channel interrupts:

Table 32.18 FIFO中断生成计数器和FIFO深度配置（2之2）

RFDC[2:0] (CFDC[2:0])	RFIGCV[2:0] (CFIGCV[2:0])							
	111b	110b	101b	100b	011b	010b	001b	000b
101b	Allowed							
110b	Allowed							
111b	Allowed							

普通FIFO缓冲器可以在发送一帧完成时设置中断输出，或者接收完成时输出中断。此外，CommonFIFO和RXFIFO可以设置中断输出，当存储到FIFO阶段的设置号(CFDCRFDC)时。

32.6.2.2 FIFO缓冲器控制

必须通过设置RXFIFO配置控制中的以下任一位来启用FIFO中断
Registers:

- CFDRFCCn.RFIE
- CFDRFCCn.RFFIE.

此外，必须通过设置CommonFIFO中的以下任一位来启用FIFO中断
Configuration/Control Registers:

- CFDCFCCn.CFRXIE
- CFDCFCCn.CFTXIE
- CFDCFCCEn.CFFIE
- CFDCFCCEn.CFOFRXIE
- CFDCFCCEn.CFOFTXIE.

配置完成后，可以通过设置CFDRFCCn.RFE和CFDCFCCn.CFE位来使能每个FIFO
RXFIFO配置控制寄存器和通用FIFO配置控制寄存器，以允许发送和接收消息。

当CFDCFCCEn.CFBME=1时，变为FIFO缓冲模式，发送数据存放在CommonFIFO中，停止发送。当CFDCFCCEn.CFBME=0时开始传输。

当CFDCFCCn.CFE位为1时，请勿对该位从0写入1。

32.7 中断和DMA

32.7.1 Interrupts

CAN-FD模块产生几个中断。连接到中断控制器单元（ICU）的中断输出可由相应的中断使能位控制。

状态标志的设置独立于该使能位。

通道传输中断有一个额外的状态标志寄存器。当相应的中断使能被设置时，状态位被设置。

状态标志寄存器支持识别通道传输的中断源，因为该中断由多个触发源驱动。

CAN-FD模块中的中断可以分为两类，全局中断和通道中断：

- Global interrupts:
  CAN-FD模块可以产生2个全局中断：
  成功接收到8个RXFIFO缓冲区的全局中断
  全局错误中断。
- Channel interrupts:
  CAN-FD模块的每个通道可以产生3个通道中断：

1. Channel transmission
   - Transmission completion from channel
   - Transmission abort from channel
   - Transmission from TX Queue for a channel
   - Channel THL interrupt
   - Successful transmission from a Common FIFO in TX or GW mode for a channel.
2. Channel error interrupt
3. Successful reception in a Common FIFO in RX or GW mode for a channel or successful routing in a TXQ.

The interrupts are cleared when the corresponding flag bits are cleared or the Interrupt enable bits are cleared.

Table 32.19 gives an overview of interrupt sources for the different interrupt outputs. The interrupt outputs are active-high.

Table 32.19 Interrupt source overview (1 of 2)

Parameter	Interrupt	Interrupt source	Interrupt clearing
Global interrupts	Successful reception into at least one RX FIFO	Interrupt flag of corresponding RX FIFO for which interrupt is enabled	Clear the interrupt flag of corresponding RX FIFO buffer for which interrupt is enabled
	FIFO full into at least one RX FIFO	FIFO Full Interrupt flag of corresponding RX FIFO for which interrupt is enabled	Clear the FIFO Full Interrupt flags of corresponding RX FIFO buffer for which interrupt is enabled
	Global error	Interrupt source is any of the following: • DLC Error flag • Message Lost Status bit • Message Overwrite Status bit • TXQ Message Lost Status bit • TXQ Message Overwrite Status bit • TX History Entry Lost Status bit • CAN-FD Message Payload Overflow flag*1	Clear all of the following: • DLC Error flag • Message Lost flags in all of the FIFO Status Registers • Message Overwrite flags in all of the Common FIFO Status Registers • Message Lost flags in all of the TXQ Status Registers • Message Overwrite flags in all of the TXQ Status Registers • TX History List Entry Lost flag • CAN-FD Message Payload Overflow flag.*1

1.渠道传输
   从通道传输完成
   从通道中止传输
   从通道的TX队列传输
   通道THL中断
   在TX或GW模式下从通用FIFO成功传输通道。
2.通道错误中断
3.通道在RX或GW模式下的通用FIFO中成功接收或TXQ中的成功路由。

当相应的标志位被清除或中断使能位被清除时，中断被清除。

表32.19概述了不同中断输出的中断源。中断输出为高电平有效。

Table 32.19 中断源概述(1of2)

Parameter	Interrupt	中断源	中断清除
全局中断	成功接收到至少一个RXFIFO	对应的RXFIFO的中断标志，中断使能	清除对应的中断标志 启用中断的RXFIFO缓冲区
	FIFO已满至至少一个RXFIFO	允许中断的相应RXFIFO的FIFOFull中断标志	清除启用中断的相应RXFIFO缓冲区的FIFOFullInterrupt标志
	全局错误	中断源为以下任意一种：● DLC错误标志 • 消息丢失状态位 • 消息覆盖状态位 • TXQ消息丢失状态位 • TXQ报文覆盖状态位 • TX历史条目丢失状态位 • CAN-FD消息有效负载溢出标志*1	清除以下所有内容：● DLC错误标志 • 在所有的消息丢失标志FIFO状态寄存器 • 所有通用FIFO状态寄存器中的消息覆盖标志 • 在所有的消息丢失标志TXQ状态寄存器 • 所有TXQ状态寄存器中的消息覆盖标志 • TX历史列表条目丢失标志 • CAN-FD消息负载溢出标志。*1

Table 32.19 Interrupt source overview (2 of 2)

Parameter	Interrupt	Interrupt source	Interrupt clearing
Channel transmission interrupts	Channel n successful transmission	Any channel related TX MB Successful flag when interrupt is enabled. Separate interrupts are provided for Common FIFO buffers and TX Queue. Note: These interrupts are only set for TX message buffers that do not belong to an enabled TX Queue and are not pointing to a Common FIFO.	Clear all channel related TX MB Result Status bits for which the interrupt is enabled
	Channel n abort	Any channel related TX MB Abort flag when interrupt is enabled Separate interrupts are provided for Common FIFO buffers and TX Queue Note: These interrupts are only set for TX message buffers that do not belong to an enabled TX Queue and are not pointing to a Common FIFO.	Clear all channel related TX MB Result Status bits for which the interrupt is enabled globally
	Channel n transmission from TX Queue	Related Channel TX Queue Interrupt flag	Clear related Channel TX Queue Interrupt flag
	Channel n THL Interrupt	Channel n THL Interrupt Status flag	Clear the relevant THL Interrupt Status flag
	Channel n COM FIFO TX Interrupt	Interrupt flag for Common FIFOs in TX or GW mode belonging to the related channel	Clear the interrupt flags of Common FIFOs in RX or GW mode belonging to the related channel
	Channel n COM FIFO One Frame TX Interrupt	One Frame Transmission Interrupt flag for Common FIFOs belonging to the related channel	Clear the One Frame Transmission Interrupt flags of Common FIFOs belonging to the related channel
	Channel n TXQ One Frame TX Interrupt	One Frame Transmission Interrupt flag for TXQs belonging to the related channel	Clear the One Frame Transmission Interrupt flags of TXQs belonging to the related channel
Channel COM RX FIFO Interrupt	Channel n COM FIFO RX Interrupt	Interrupt Flag for Common FIFOs in RX or GW mode belonging to the related channel	Clear the interrupt flags of Common FIFOs in RX or GW mode belonging to the related channel
	Channel n COM FIFO One Frame RX Interrupt	One Frame Reception Interrupt flag for Common FIFOs belonging to the related channel	Clear the One Frame Reception Interrupt flags of Common FIFOs belonging to the related channel
	Channel n COM FIFO Full Interrupt	FIFO Full Interrupt flag for Common FIFOs in RX or GW mode belonging to the related channel	Clear the FIFO Full Interrupt flags of Common FIFOs in RX or GW mode belonging to the related channel
	Channel n TXQ One Frame Routing Interrupt	One Frame Routing Interrupt flag for TXQs in GW mode belonging to the related channel	Clear the One Frame Routing Interrupt flags of TXQs in GW mode belonging to the related channel
	Channel n TXQ Full Interrupt	TXQ Full Interrupt flag for TXQs in GW mode belonging to the related channel	Clear the FIFO Full Interrupt flags of TXQs in GW mode belonging to the related channel
Channel Error Interrupt	Channel n Error	Any channel related error flag in the Channel Error Flag Register for which interrupt is enabled in the Channel Error Interrupt Enable Register	Clear all channel related error flags in the Channel Error Flag Register for which interrupt is enabled in the Channel Error Interrupt Enable Register

Note 1. This feature is not available in the classical CAN function.

Table 32.19 中断源概述(2of2)

Parameter	Interrupt	中断源	中断清除
通道传输中断	通道n传输成功	允许中断时任何与通道相关的TXMB成功标志。为公共提供单独的中断 FIFO缓冲区和TX队列。 Note: 这些中断仅针对不属于启用的TX队列且不指向CommonFIFO的TX消息缓冲区设置。	清除所有通道相关的TXMB结果 启用中断的状态位
	频道n中止	允许中断时任何与通道相关的TXMB中止标志为公共提供单独的中断 FIFO缓冲区和TX队列 Note: 这些中断仅针对不属于启用的TX队列且不指向CommonFIFO的TX消息缓冲区设置。	清除所有通道相关的TXMB结果 全局启用中断的状态位
	来自TXQueue的通道n传输	相关通道TX队列中断标志	清除相关ChannelTXQueue中断标志
	Channel n THL Interrupt	通道nTHL中断状态标志	清除相关的THL中断状态标志
	通道nCOMFIFO TX Interrupt	属于相关通道的TX或GW模式下CommonFIFO的中断标志	清除Common的中断标志 属于相关通道的RX或GW模式的FIFO
	通道nCOMFIFO一帧发送Interrupt	一帧传输中断标志 属于相关通道的通用FIFO	清除一帧传输 属于相关通道的CommonFIFO的中断标志
	通道nTXQ一帧TX中断	属于相关通道的TXQ的一帧传输中断标志	清除一帧传输 属于相关通道的TXQ的中断标志
通道COMRX FIFO Interrupt	通道nCOMFIFO RX Interrupt	属于相关通道的RX或GW模式下CommonFIFO的中断标志	清除Common的中断标志 属于相关通道的RX或GW模式的FIFO
	通道nCOMFIFO一帧接收Interrupt	通用的一帧接收中断标志 属于相关通道的FIFO	清除属于相关通道的CommonFIFO的一帧接收中断标志
	通道nCOMFIFO完全中断	属于相关通道的处于RX或GW模式的CommonFIFO的FIFOFull中断标志	清除属于相关通道的RX或GW模式下CommonFIFO的FIFOFullInterrupt标志
	通道nTXQ一帧路由Interrupt	属于相关通道的GW模式下TXQ的一帧路由中断标志	清除属于相关通道的GW模式TXQ的一帧路由中断标志
	通道nTXQ已满Interrupt	属于相关通道的GW模式下TXQ的TXQ完全中断标志	清除属于相关通道的GW模式下TXQ的FIFOFullInterrupt标志
通道错误Interrupt	通道n错误	通道错误标志寄存器中的任何通道相关错误标志，其中断被启用 通道错误中断使能寄存器	清除通道错误标志寄存器中所有通道相关的错误标志，在通道错误中断允许寄存器中允许中断

注1.此功能在经典CAN功能中不可用。

32.7.2 DMA Transfer

The CAN-FD module has message buffers that can be associated with a DMA channel:

- Reception DMA
  - 8 RX FIFO message buffers
  - 8 Common FIFO message buffers
- Transmission DMA
  - 16 TXQ message buffers (TXQ0, TXQ3)
  - 8 Common FIFO message buffers.

Figure 32.32 shows the potential DMA channels.

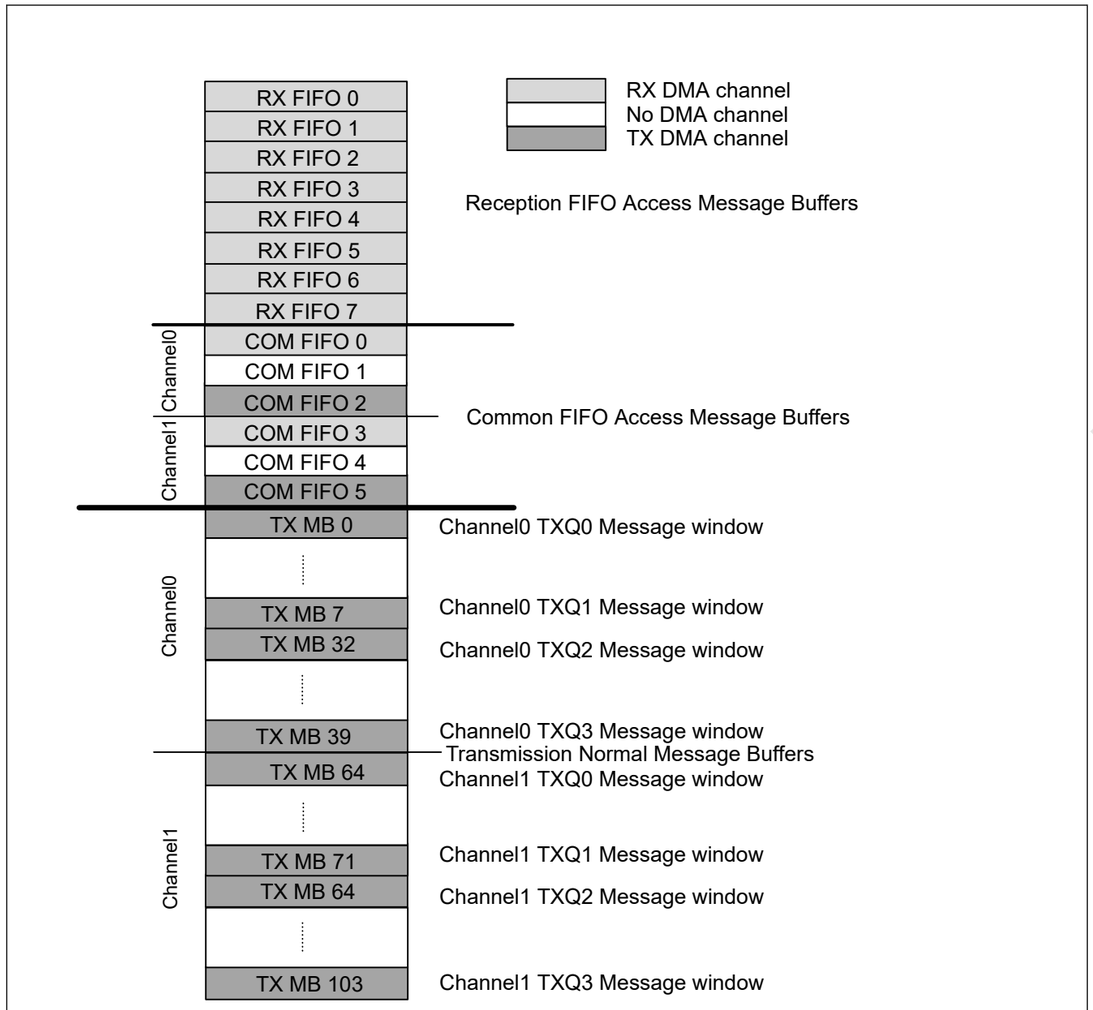

Figure 32.32 Message buffer connectable to a DMA channel

32.7.2 DMA Transfer

CAN-FD模块具有可与DMA通道关联的消息缓冲区：

- Reception DMA
  8个RXFIFO消息缓冲区
  8个通用FIFO消息缓冲区
- Transmission DMA
  16个TXQ消息缓冲区（TXQ0、TXQ3）
  8个通用FIFO消息缓冲区。

图32.32显示了潜在的DMA通道。

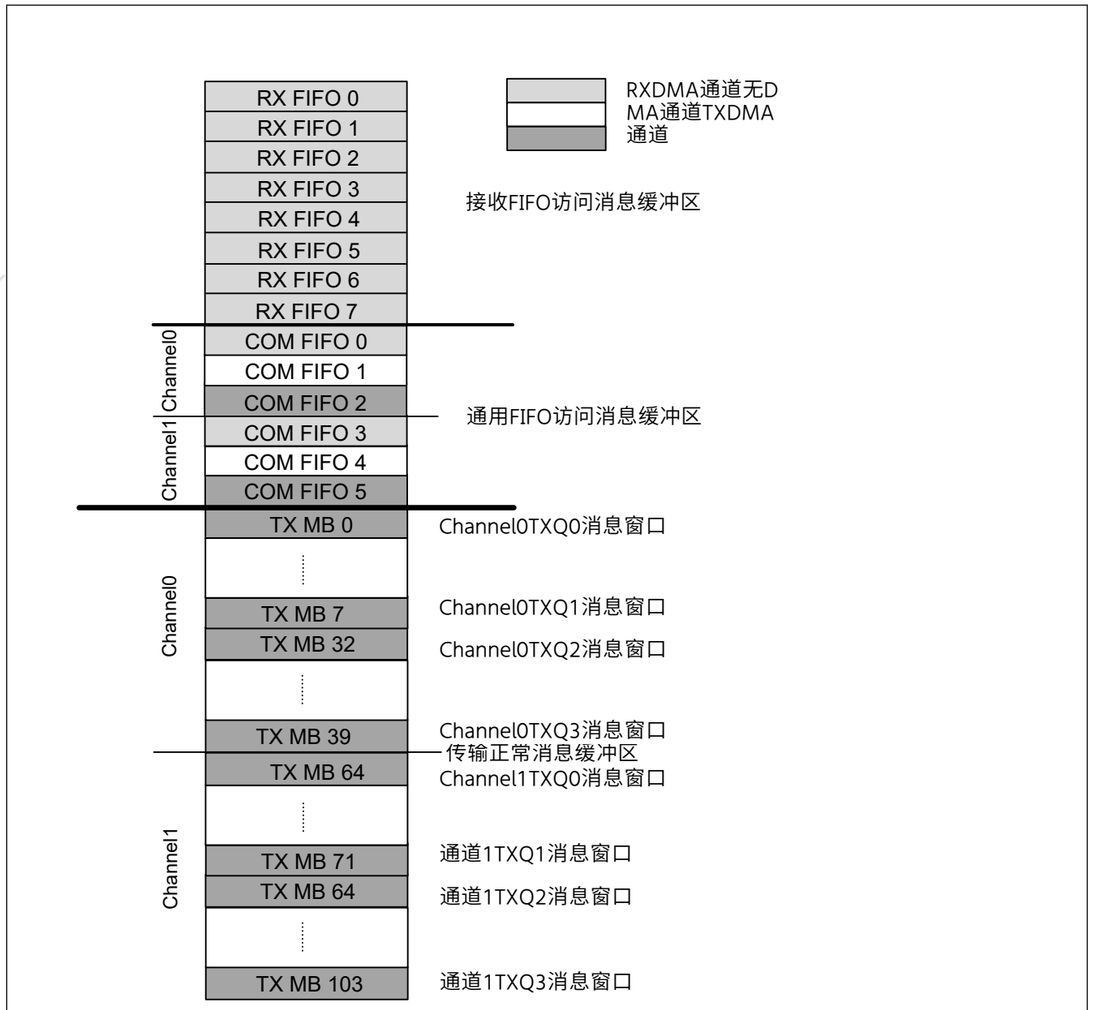

Figure 32.32 可连接到DMA通道的消息缓冲区

A DMA channel transfer request is generated for each FIFO entry to the DMAC when the related CFDCDTCT.RFDMAE or CFDCDTCT.CFDMAE is set to 1 and the belonging FIFO is not empty.

Reception FIFO Interrupt should be disabled for this particular FIFO (CFDRFCCn.RFIE or CFDCFCCn.CFRXIE)

Use the regular start address for the DMA access window address and add 0x8000 to the regular start address for the debugger access window. See Figure 32.33.

Table 32.20 DMA channel access window address

b = Message buffer component index	MBCP	Register	P	Regular start address n = [0, 1]
[0…7]	FRMBCPb[i]	RFIDE	x	0x6000 + b*0x0080
		RFPTRE	x	0x6004 + b*0x0080
		RFFDSTSE	x	0x6008 + b*0x0080
		RFDFpE	[0…15]	0x600C + b*0x0004 + b*0x0080
[0…2]	CFMBCPb[i]	CFIDE	x	0x6400 + b*0x0080 + n*0x180
		CFPTRE	x	0x6404 + b*0x0080 + n*0x180
		CFFDCSTSE	x	0x6408 + b*0x0080 + n*0x180
		CFDFpE	[0…15]	0x640C + b*0x0004 + b*0x0080 + n*0x180

DMA FIFO pointer decrement is done automatically by reading the last configured data payload byte (CFDRFCCn.RFPLS or CFDCFCCn.CFPLS).

Note: The DMA must read the exact length of the configured data payload size (CFDRFCCn.RFPLS or CFDCFCCn.CFPLS).

Note: This feature is not available for classical CAN function because CFDRFCCn.RFPLS and CFDCFCCn.CFPLS are not in classical CAN.

Do not write to the FIFO and TXQ control registers when DMA is enabled. The DMA enable of the particular DMA FIFO (CFDCDTCT.RFDMAE or CFDCDTCT.CFDMAE) can be set at any time. Figure 32.33 shows a configuration flow for an initial setup.

When CFDCDTTCT.TQ0DMAE or CFDCDTTCT.TQ3DMAE or CFDCDTTCT.CFDMAE is set, the messages of the corresponding TXQ or Common FIFO can be handled by a DMA controller.

The following procedure shows when the TXQ or the Common FIFO can be handled by a DMA controller.

1. CPU checks the TXQ or the Common FIFO is not full.
2. When transmit data can be used, the CPU sets this data to Common FIFO or TXQ.
   When using Common FIFO, transmit data is write in CFDCFID, CFDCFPTR, CFDCFFDCSTS and CFDTMBCPb[i] register.
   When using TXQ, transmit data is write in CFDTMID, CFDTMPTR, CFDTMFDCTR and CFDTMDFp register.
3. For Common FIFO, the common FIFO pointer is incremented automatically when DMA controller writes the last data payload byte configured by CFDCFCCn.CFPLS.
   For TXQ, if the data of 64 data payload is written, a TXQ pointer increases automatically. When payload data is less than 64 bytes, dummy data must be written in and 64 data payload size must be done.

Note: Only 32-bit write-access can be possible on the DMA message handling.

当相关的CFDCDTCT.RFDMAE或
CFDCDTCT.CFDMAE设置为1并且所属的FIFO不为空。

应禁用此特定FIFO（CFDRFCCn.RFIE或CFDCFCCn.CFRXIE）的接收FIFO中断

使用常规起始地址作为DMA访问窗口地址，并将0x8000添加到调试器访问窗口的常规起始地址。请参见图32.33。

Table 32.20 DMA通道访问窗口地址

b=消息缓冲区组件索引	MBCP	Register	P	常规起始地址n=[0 1]
[0…7]	FRMBCPb[i]	RFIDE	x	0x6000 + b*0x0080
		RFPTRE	x	0x6004 + b*0x0080
		RFFDSTSE	x	0x6008 + b*0x0080
		RFDFpE	[0…15]	0x600C + b*0x0004 + b*0x0080
[0…2]	CFMBCPb[i]	CFIDE	x	0x6400 + b*0x0080 + n*0x180
		CFPTRE	x	0x6404 + b*0x0080 + n*0x180
		CFFDCSTSE	x	0x6408 + b*0x0080 + n*0x180
		CFDFpE	[0…15]	0x640C + b*0x0004 + b*0x0080 + n*0x180

DMAFIFO指针递减是通过读取最后配置的数据有效负载字节（CFDRFCCn.RFPLS或CFDCFCCn.CFPLS）自动完成的。

Note: DMA必须读取配置的数据有效负载大小（CFDRFCCn.RFPLS或CFDCFCCn.CFPLS).

Note: 此功能不适用于经典CAN功能，因为CFDRFCCn.RFPLS和CFDCFCCn.CFPLS不在经典CAN中。

启用DMA时不要写入FIFO和TXQ控制寄存器。可以随时设置特定DMAFIFO（CFDCDTCT.RFDMAE或CFDCDTCT.CFDMAE）的DMA使能。图32.33显示了初始设置的配置流程。

当CFDCDTTCT.TQ0DMAE或CFDCDTTCT.TQ3DMAE或CFDCDTTCT.CFDMAE置位时，相应的TXQ或CommonFIFO的消息可以由DMA控制器处理。

以下过程显示了DMA控制器何时可以处理TXQ或通用FIFO。

1.CPU检查TXQ或CommonFIFO未满。

2.当可以使用发送数据时，CPU将此数据设置为CommonFIFO或TXQ。
使用CommonFIFO时，发送数据写入CFDCFID、CFDCFPTR、CFDCFDCSTS和CFDTMBCPb[i]寄存器。使用TXQ时，发送数据写入CFDTMID、CFDTMPTR、CFDTMFDCTR和CFDTMDFp寄存器。

3.对于CommonFIFO，当DMA控制器写入由CFDCFCCn.CFPLS配置的最后一个数据负载字节时，commonFIFO指针会自动递增。对于TXQ，如果写入64位数据载荷的数据，则TXQ指针自动增加。当有效载荷数据小于64字节时，必须写入虚拟数据，并且必须完成64数据有效载荷大小。

Note: DMA消息处理只能进行32位写访问。

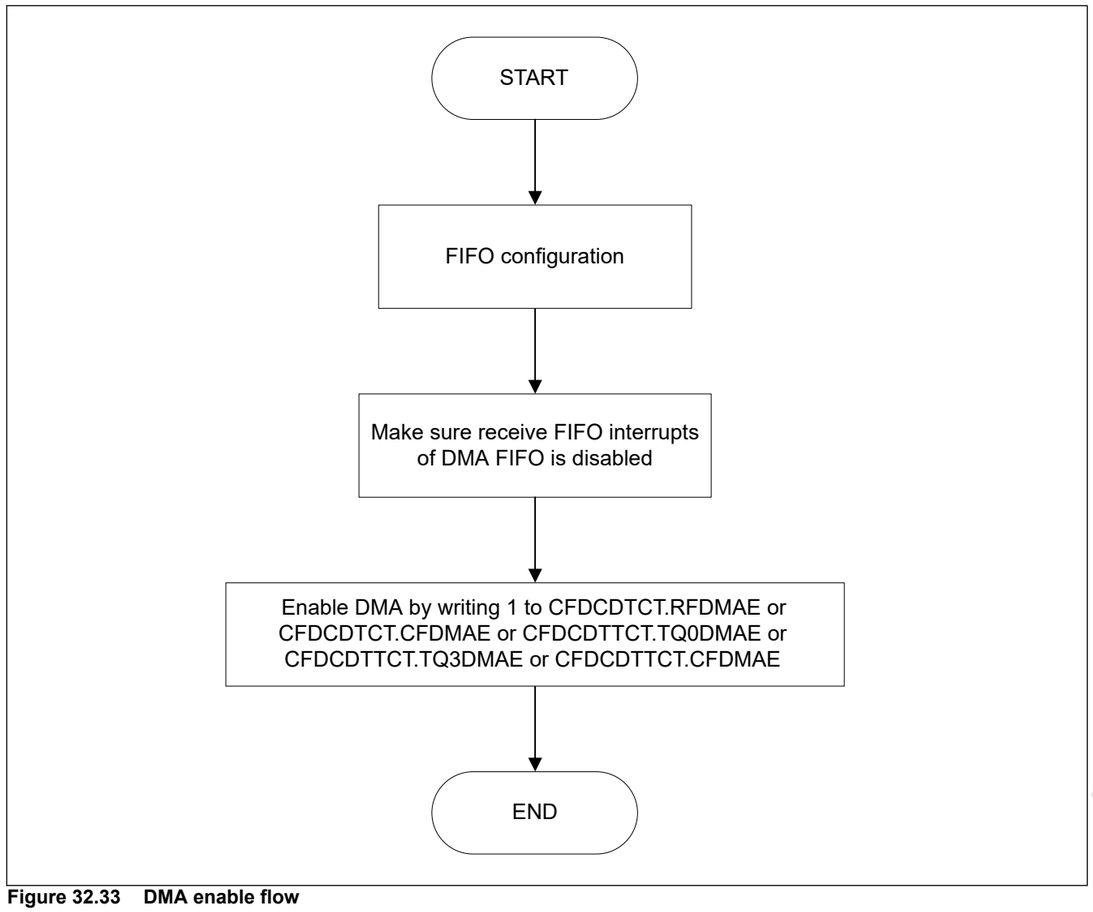

Figure 32.33 DMA enable flow

To disable a DMA transfer request, you must disable the particular DMA enable bit (CFDCDTCT.RFDMAE or CFDCDTCT.CFDMAE). If the disable is made during an ongoing transfer, then the transfer must be completed first before further action can be taken. The transfer status can be identified by the CFDCDTSTS.RFDMASTS or CFDCDTSTS.CFDMASTS bit. See Figure 32.34 for the DMA disable flow. When the DMA is disabled, consideration should be made for the remaining or new incoming messages to this particular reception FIFO.

When the FIFO is not disabled, reception to the FIFO continues.

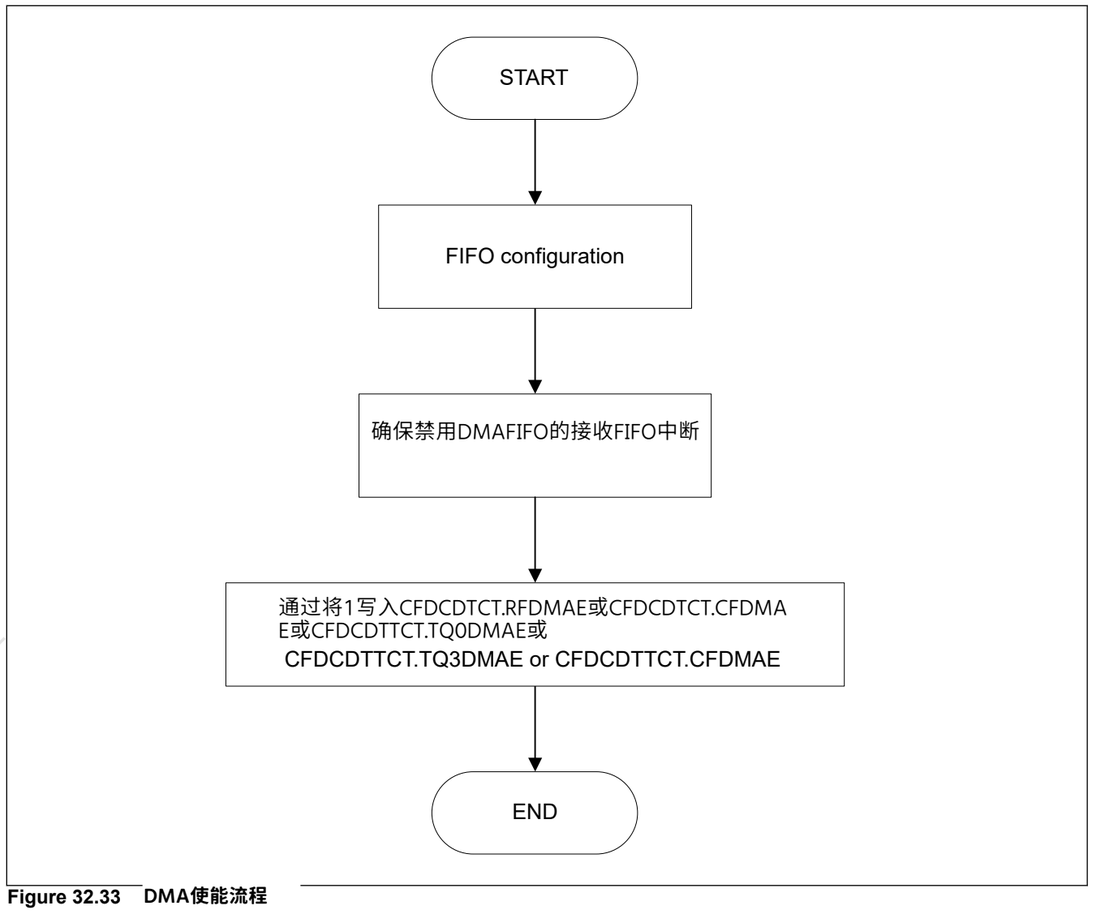

Figure 32.33 DMA使能流程

要禁用DMA传输请求，您必须禁用特定的DMA启用位（CFDCDTCT.RFDMAE或CFDCDTCT.CFDMAE)。如果在正在进行的传输过程中进行了禁用，则必须先完成传输，然后才能采取进一步的操作。传输状态可以通过CFDCDTSTS.RFDMASTS或CFDCDTSTS.CFDMASTS位来识别。有关DMA禁用流程，请参见图32.34。禁用DMA时，应考虑到此特定接收FIFO的剩余或新传入消息。

当FIFO未被禁用时，继续接收FIFO。

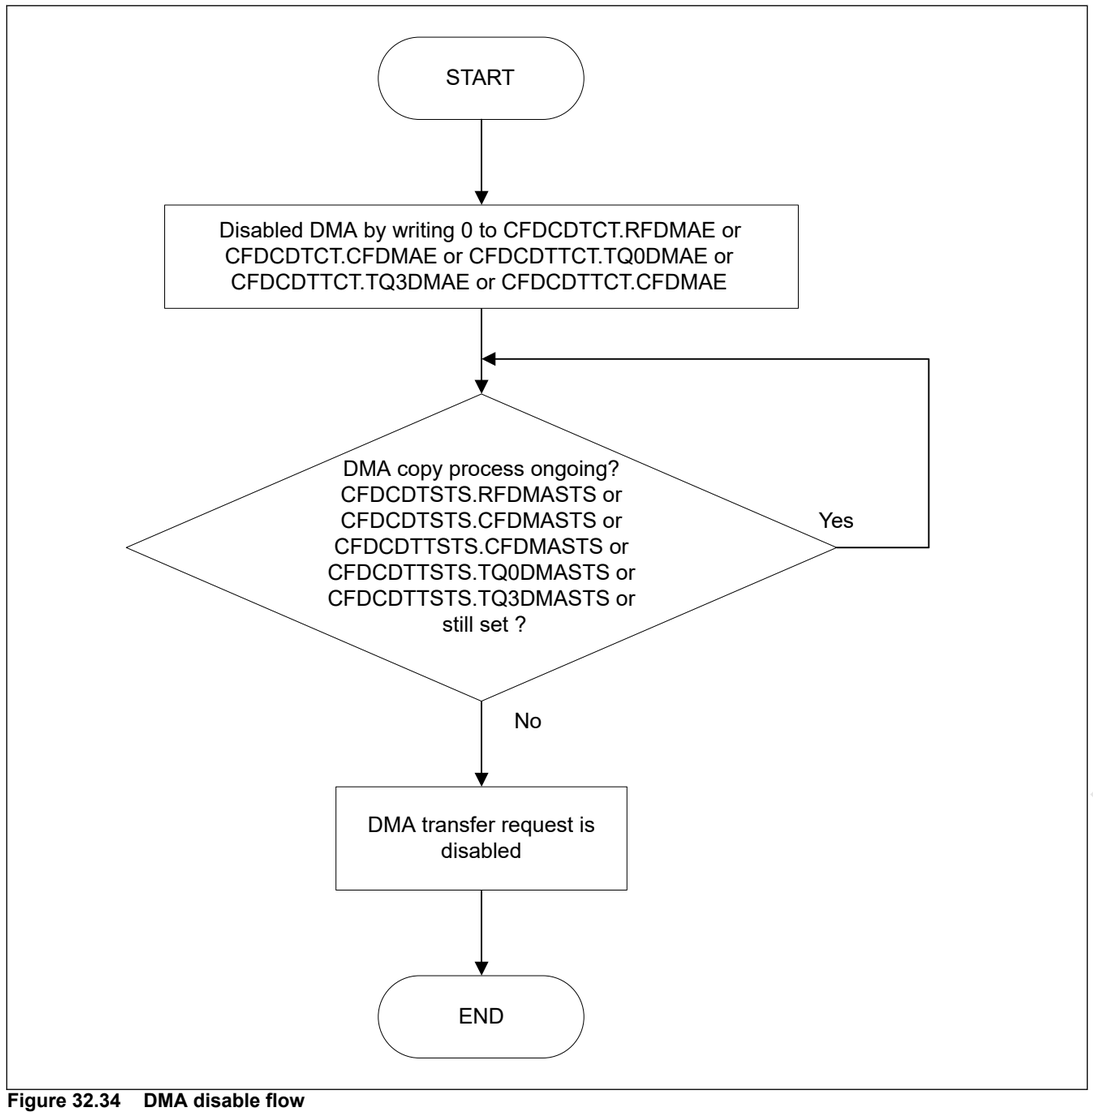

Figure 32.34 DMA disable flow

32.8 Reception and Transmission

32.8.1 Reception

In the CAN-FD module, CAN messages received on any of the channels are stored in RX message buffers, RX FIFO buffers, or Common FIFO buffers configured in RX mode or GW mode depending on the Acceptance Filter List entries.

- Up to 32 RX message buffers can be configured
- 8 RX FIFO buffers available
- Up to 6 Common FIFO buffers can be configured in RX mode or GW mode
- Up to 4 TX Queue can be configured in GW mode.

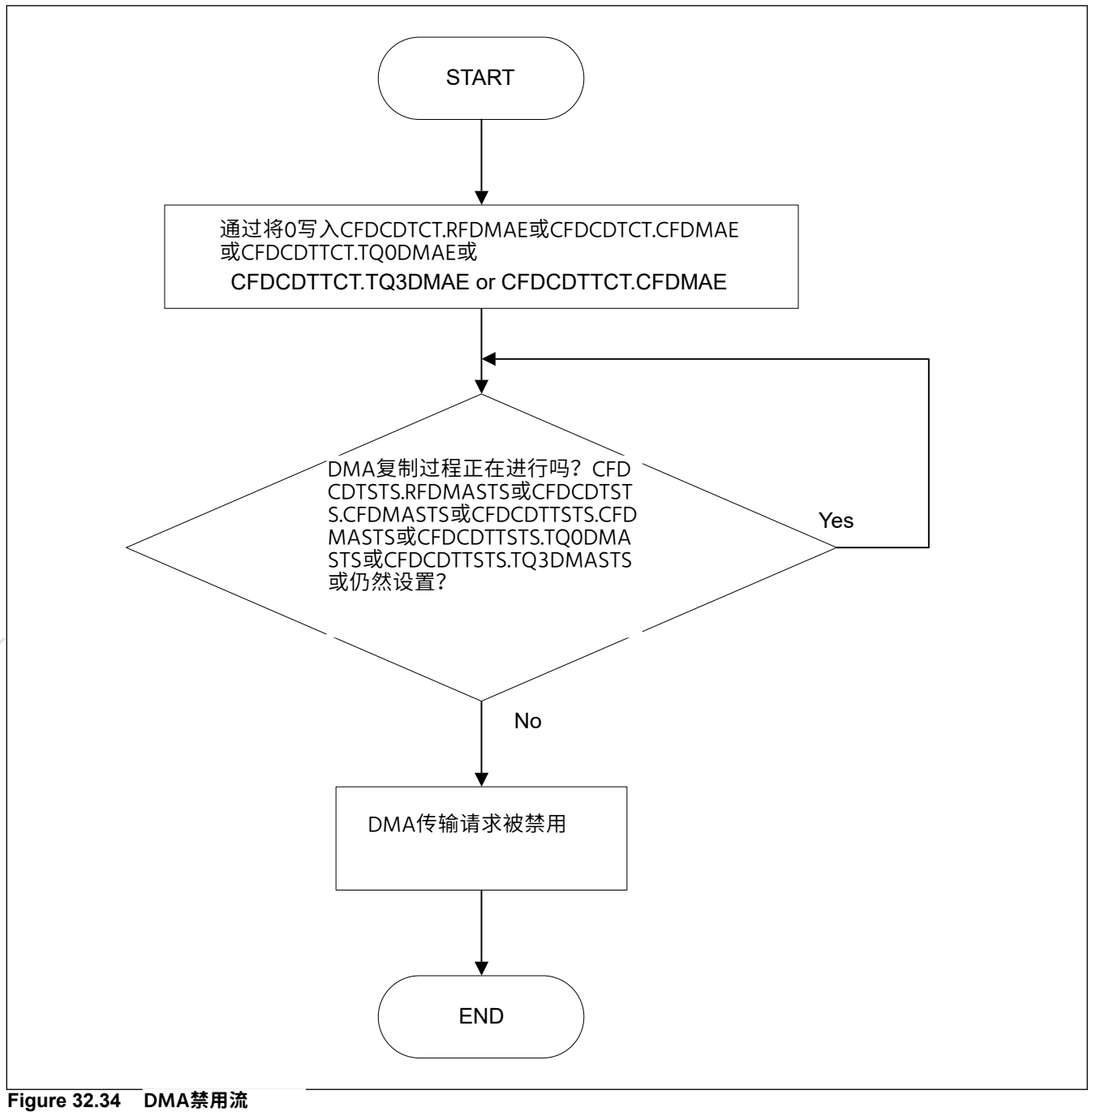

Figure 32.34 DMA禁用流

32.8 接收和传输

32.8.1 Reception

在CAN-FD模块中，在任何通道上接收到的CAN消息都存储在RX消息缓冲区、RXFIFO缓冲区或配置为RX模式或GW模式的CommonFIFO缓冲区中，具体取决于AcceptanceFilterList条目。

- ●最多可配置32个RX报文缓冲区
- ●8个RXFIFO缓冲器可用
- ●RX模式或GW模式下最多可配置6个CommonFIFO缓冲区
- ●GW模式下最多可以配置4个TXQueue。

32.8.1.1 Message Storage in RX Message Buffers

When a message is successfully received and stored in a RX message buffer, the corresponding New Data flag is set in the RX Message Buffer New Data Register.

The CAN message can be read from the corresponding RX message buffer.

If a new message is stored into a RX message buffer before the previous message in this message buffer can be read, then the original message is overwritten. There is no mechanism for preventing a new message from overwriting the current message in the RX message buffer. If such a loss of messages is not acceptable, then RX FIFO should be used for storing related messages.

Note: Interrupts are not provided for the RX message buffers in the CAN-FD module and therefore, the RX Message Buffer New Data Registers should be accessed periodically to check if a new message has been stored in the RX message buffers.

Note: Unused data bytes are filled with 0x00 depending on the DLC value.

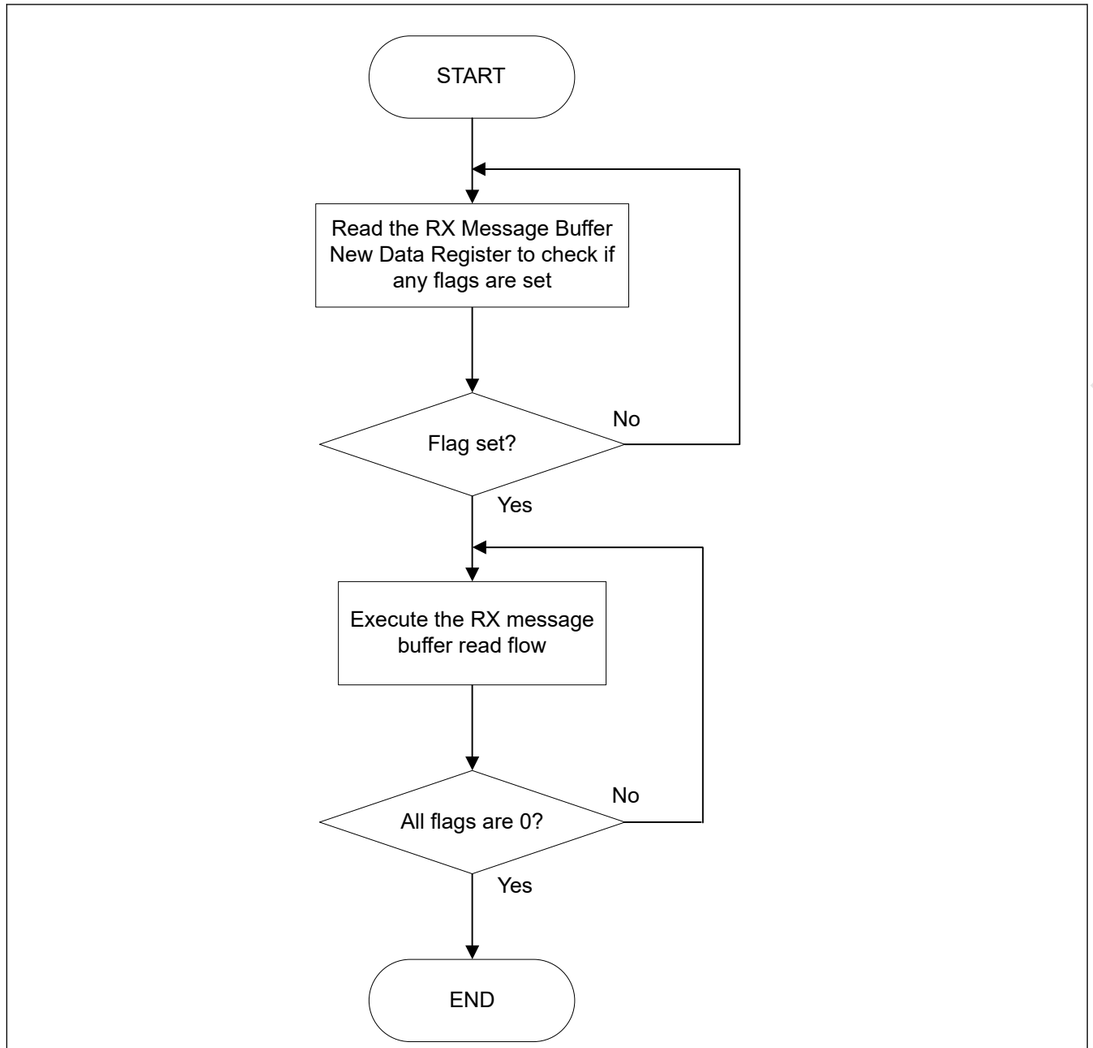

Figure 32.35 Access flow of RX message buffer

32.8.1.1 RX消息缓冲区中的消息存储

当消息被成功接收并存储在RX消息缓冲区中时，相应的NewData标志在RX消息缓冲区新数据寄存器。

CAN报文可以从相应的RX报文缓冲区中读取。

如果在可以读取此消息缓冲区中的前一个消息之前将新消息存储到RX消息缓冲区中，则原始消息将被覆盖。没有机制可以防止新消息覆盖RX消息缓冲区中的当前消息。如果这样的消息丢失是不可接受的，则应使用RXFIFO来存储相关消息。

Note: CAN-FD模块中的RX消息缓冲区没有提供中断，因此，RX消息应定期访问缓冲区新数据寄存器以检查新消息是否已存储在RX消息缓冲区中。

Note: 未使用的数据字节根据DLC值填充为0x00。

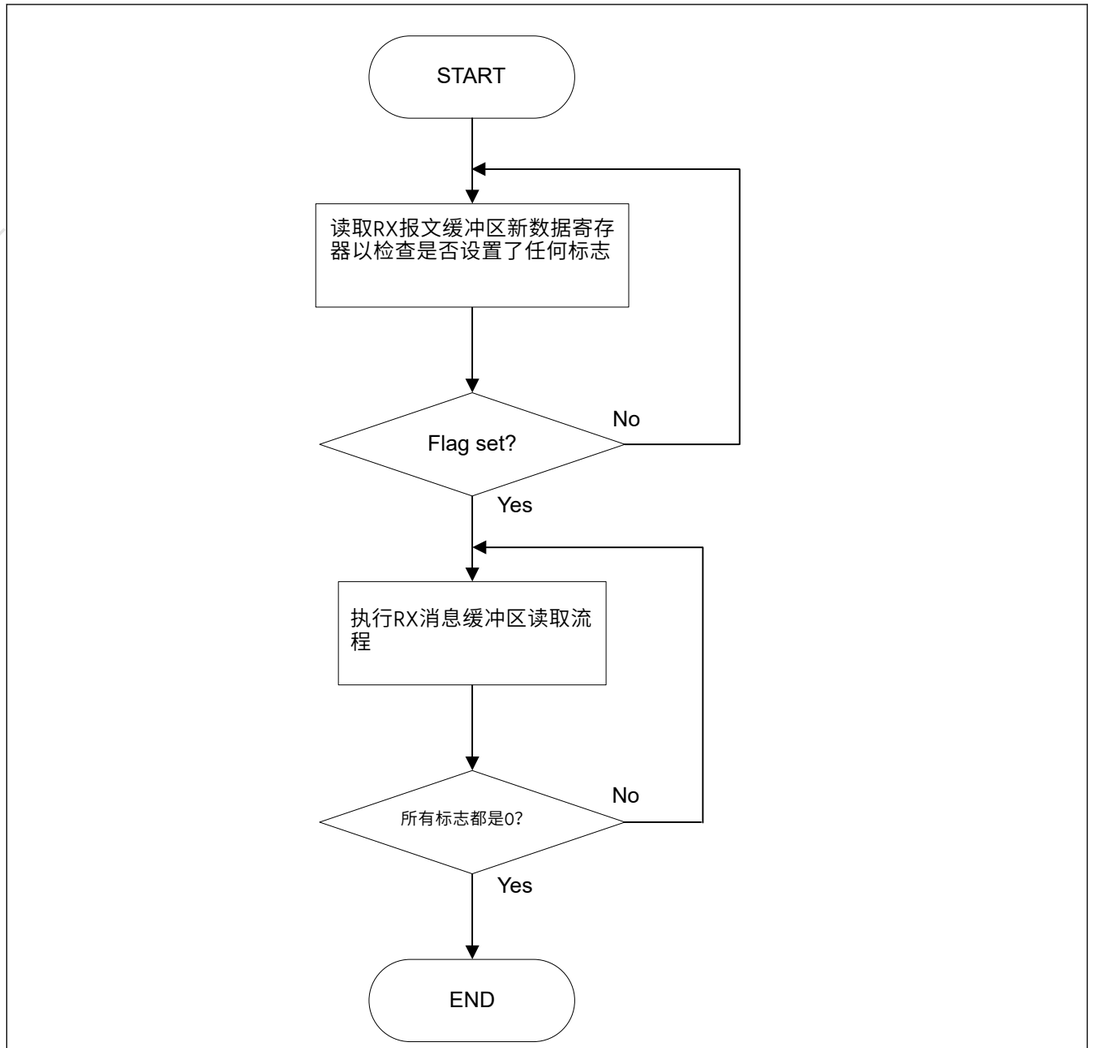

Figure 32.35 RX消息缓冲区的访问流程

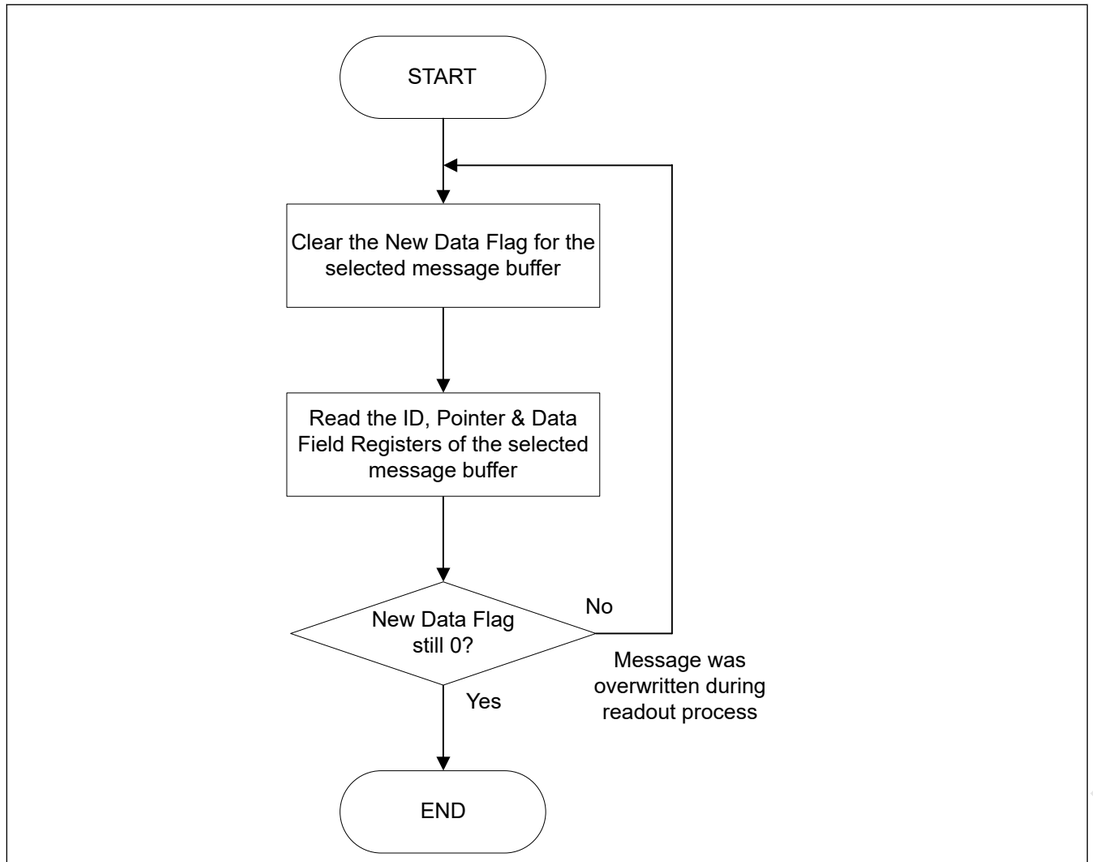

Figure 32.36 Read flow of RX message buffer

32.8.1.2 Message Storage in FIFO Buffers

The AFL entries for routing the received messages to RX FIFO buffers or Common FIFO buffers configured in RX or GW mode should be configured based on system requirements.

The CFDGAFLP1n.GAFLFDP[31:0] field in the matching AFL entry selects the FIFO buffers to which the related reception message is stored.

When the received message is stored in one or more RX FIFO buffers or Common FIFO buffers configured in RX mode or GW mode, the message counter value is incremented in the corresponding RX FIFO Status Registers or Common FIFO Status Registers.

Depending on the configuration of the FIFO buffers, an interrupt might also be generated.

The message can be read from the corresponding FIFO Access registers.

Note: Because many messages can be stored in the FIFO buffers, reading more than one message may be required to read the latest message stored in a FIFO buffer.

If the message count value matches the FIFO depth, the FIFO Full flag is set.

When the value 0xFF is written to the corresponding FIFO Pointer Control Register, the message count is decremented by 1.

Only write 0xFF to the FIFO Pointer Control register after reading the complete message from the FIFO Access registers of the corresponding FIFO.

When all the messages stored in the FIFO are read, the FIFO Empty flag is set.

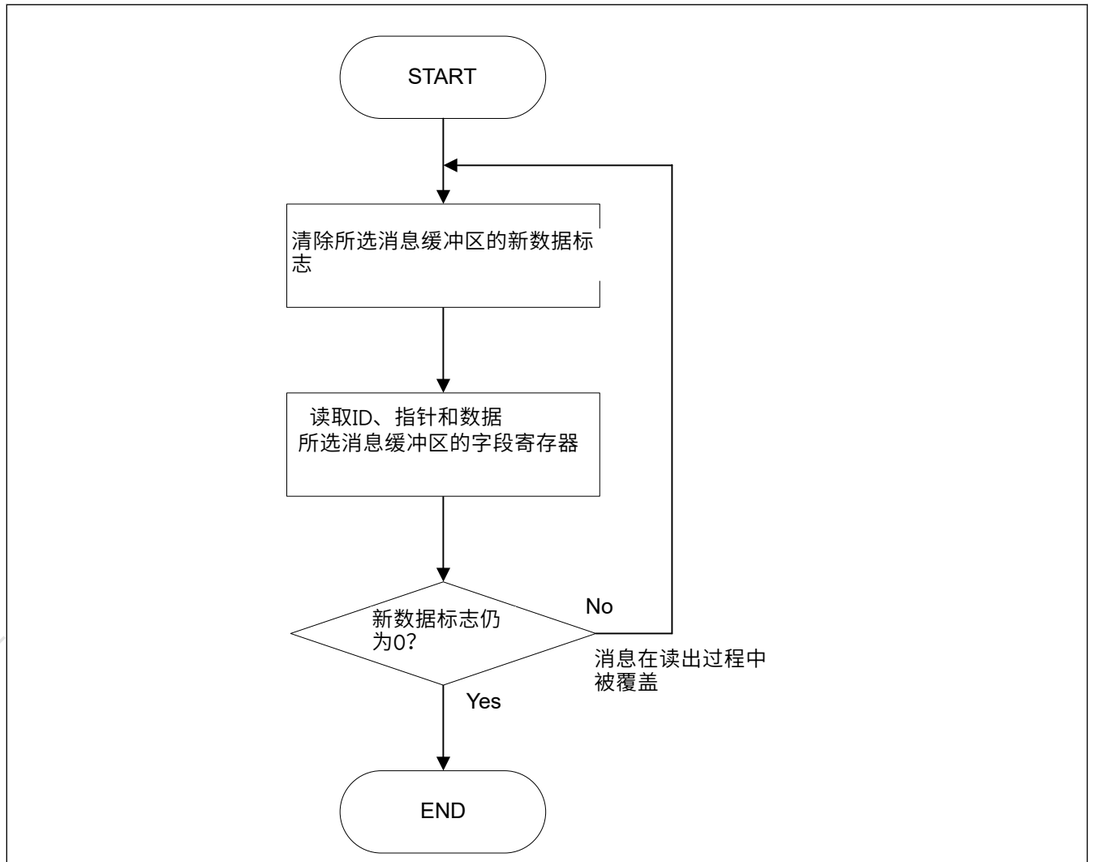

Figure 32.36 读取RX消息缓冲区的流程

32.8.1.2 FIFO缓冲区中的消息存储

用于将接收到的消息路由到RXFIFO缓冲区或配置为RX或GW模式的CommonFIFO缓冲区的AFL条目应根据系统要求进行配置。

匹配AFL条目中的CFDGAFLP1n.GAFLFDP[31:0]字段选择存储相关接收消息的FIFO缓冲区。

当接收到的报文存储在一个或多个RXFIFO缓冲区或配置为RX模式的CommonFIFO缓冲区时，或GW模式，消息计数器值在相应的RXFIFO状态寄存器或CommonFIFO中递增状态寄存器。

根据FIFO缓冲区的配置，也可能会产生中断。

该消息可以从相应的FIFO访问寄存器中读取。

Note: 因为许多消息可以存储在FIFO缓冲区中，所以可能需要读取多个消息才能读取存储在FIFO缓冲区中的最新消息。

如果消息计数值与FIFO深度匹配，则设置FIFO满标志。

当值0xFF写入相应的FIFO指针控制寄存器时，消息计数减1。

仅在从相应FIFO的FIFO访问寄存器中读取完整报文后，将0xFF写入FIFO指针控制寄存器。

当读取存储在FIFO中的所有消息时，设置FIFOEmpty标志。

If a new message is stored into the FIFO when the FIFO message count matches the FIFO depth (FIFO full condition), the FIFO Message Lost flag is set and the new message is lost (no overwrite of already stored messages takes place).

An appropriate value can be configured as warning level to generate an interrupt before the FIFO full condition occurs to avoid loss of a message due to an overrun condition.

In GW mode, when a transmit/receive FIFO buffer is receiving a new message while the transmit/receive FIFO buffer is already full of data, the oldest data of the buffer is overwritten with the message received or the message is discarded. The behavior is determined by setting CFDCFCCEn.CFMOWM bit.

- When CFDCFCCEn.CFMOWM = 0:
  When writing data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the received message is discarded and the CFDCFSTSn.CFMLT bit is set to 1.

- When CFDCFCCEn.CFMOWM = 1:
  When writing data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the oldest data in the buffer is overwritten with the received message.
  The read pointer of the transmit/receive FIFO buffer simultaneously moves to the next oldest message.
  The CFDCFSTSn.CFMOW bit is set to 1, which notifies that the oldest message has been overwritten with the received message.
  In addition, when a CAN bus error or arbitration-lost for the transmitting message occurs in the transmit/receive FIFO buffer full, the transmitting message is lost and retransmission for the message is not performed. The read point moves to the next message automatically.

Do not modify this bit when the CFDCFCCn.CFE bit is 1.

Common FIFO can set the interrupt when CAN frame reception is completed.

Common FIFO can set the interrupt when FIFO is in full status in RX mode or GW mode.

Note: The message lost can be set only in RX or GW mode by CAN, and the flag is not set when the CPU is overloading the FIFO buffers.

Note: When CFDGAFLP0n.GAFLSRD i (i = 0 to 2) is set and the CFDTXQCCin.TXQGWE (i = 0 to 2, n = 0 to 7) is also set, a receiving frame is stored in the target TXQ as send data by routing.

The RX FIFO buffers and the Common FIFO buffers configured in RX or GW mode can be disabled at any time by clearing the CFDRFCCn.RFE or CFDCFCCn.CFE bit in the RX FIFO Configuration/Control Registers and the Common FIFO Configuration/Control Registers.

When the CFDRFCCn.RFE or CFDCFCCn.CFE bit is cleared, the message read and write pointers of the FIFO are cleared and are no longer active. Therefore, all messages in the FIFO buffers are lost and no further messages can be stored into the FIFO.

When the RX FIFO buffers or Common FIFO buffers configured in RX mode is assigned as a DMA channel, software should not access the FIFO Access Register of this FIFO buffer or write 0xFF to the FIFO Pointer Control Register (CFDCFPCTRn.CFPC or CFDRFPCTRn.RFPC). This can lead to unintended FIFO message decrement. The DMA channel controls the FIFO decrement automatically.

Note: If the interrupt flag is set for a FIFO buffer and then the FIFO is disabled, the interrupt flag is not cleared automatically. The interrupt flag should be cleared before disabling the FIFO.

如果在FIFO消息计数与FIFO深度匹配（FIFO满状态）时将新消息存储到FIFO，则
FIFO消息丢失标志被设置，新消息丢失（不会覆盖已存储的消息）。

可以将适当的值配置为警告级别，以在FIFO满情况发生之前生成中断，以避免由于溢出情况而丢失消息。

在GW模式下，当发送接收FIFO缓冲区正在接收新消息而发送接收FIFO缓冲区已满数据时，缓冲区中最旧的数据将被接收到的消息覆盖或丢弃该消息。该行为由设置CFDCFCCEn.CFMOWM位决定。

- When CFDCFCCEn.CFMOWM = 0:
  当发送接收FIFO缓冲区已满数据而由于接收到新报文而需要写入数据时，将丢弃接收到的报文并将CFDCFSTSn.CFMLT位设置为1。

- When CFDCFCCEn.CFMOWM = 1:
  当发送接收FIFO缓冲区已满数据时，由于接收到新报文而需要写入数据时，缓冲区中最旧的数据将被接收到的报文覆盖。发送接收FIFO缓冲区的读指针同时移动到下一个最旧的消息。

  CFDCFSTSn.CFMOW位设置为1，表示最旧的消息已被接收的消息覆盖。此外，当发送接收FIFO缓冲区已满时发生CAN总线错误或发送报文仲裁丢失时，发送报文将丢失，并且不执行报文重传。阅读点自动移动到下一条消息。

当CFDCFCCn.CFE位为1时不要修改该位。

普通FIFO可以在CAN帧接收完成时设置中断。

CommonFIFO可以在RX模式或GW模式下FIFO处于满状态时设置中断。

Note: 消息丢失只能由CAN在RX或GW模式下设置，并且当CPU使FIFO缓冲区过载时不设置该标志。

Note: 当CFDGAFLP0n.GAFLSRDi(i=0to2)被设置并且CFDTXQCCin.TXQGWE(i=0to2 n=0to7)也被设置时，接收帧被存储在目标TXQ作为路由发送数据.

通过清除RXFIFO配置控制寄存器和通用FIFO配置控制寄存器中的CFDRFCCn.RFE或CFDCFCCn.CFE位，可以随时禁用在RX或GW模式下配置的RXFIFO缓冲区和通用FIFO缓冲区。

当CFDRFCCn.RFE或CFDCFCCn.CFE位被清零时，FIFO的报文读写指针被清零，不再处于活动状态。因此，FIFO缓冲区中的所有消息都将丢失，并且无法将更多消息存储到FIFO中。

当在RX模式下配置的RXFIFO缓冲区或通用FIFO缓冲区被分配为DMA通道时，软件不应访问该FIFO缓冲区的FIFO访问寄存器或将0xFF写入FIFO指针控制寄存器（CFDCFPCTRn.CFPC或CFDRFPCTRn.RFPC）.这可能导致意外的FIFO消息递减。DMA通道自动控制FIFO递减。

Note: 如果为FIFO缓冲区设置了中断标志，然后禁用了FIFO，则不会自动清除中断标志。在禁用FIFO之前应清除中断标志。

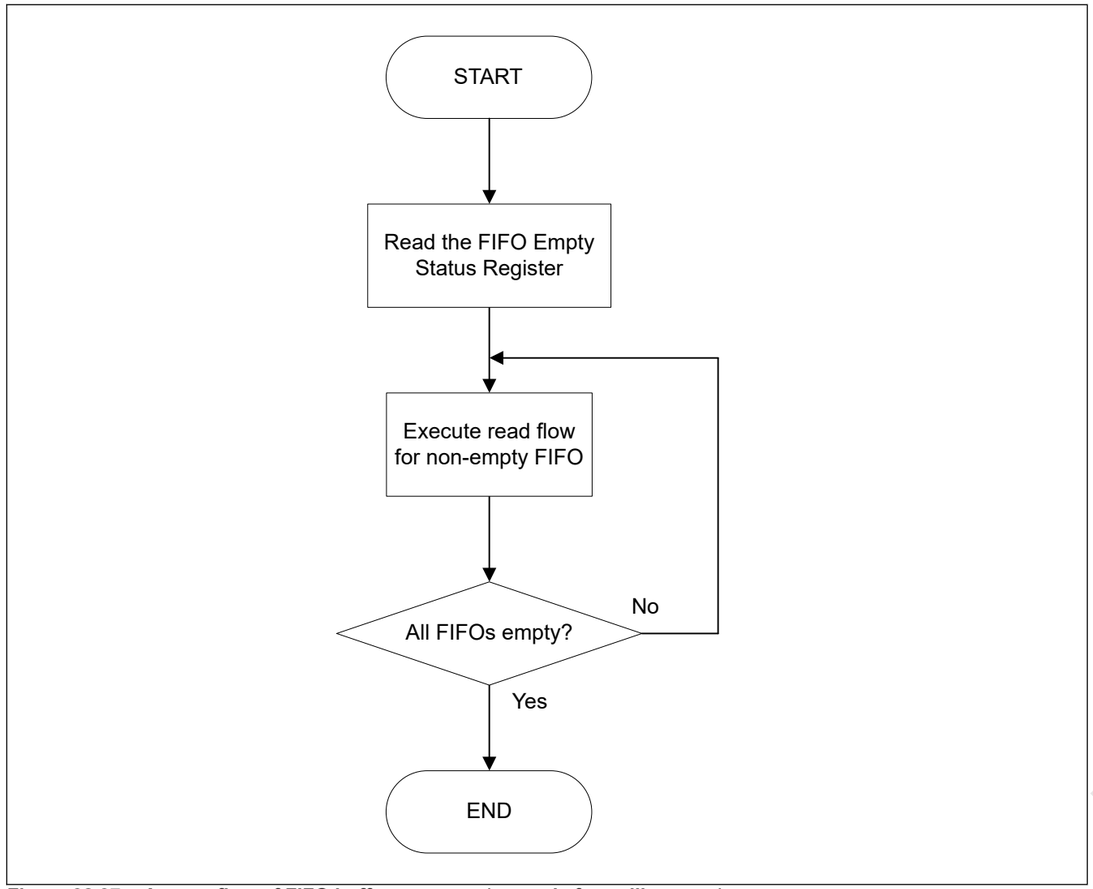

Figure 32.37 Access flow of FIFO buffer message (example for polling case)

RA生态工作室

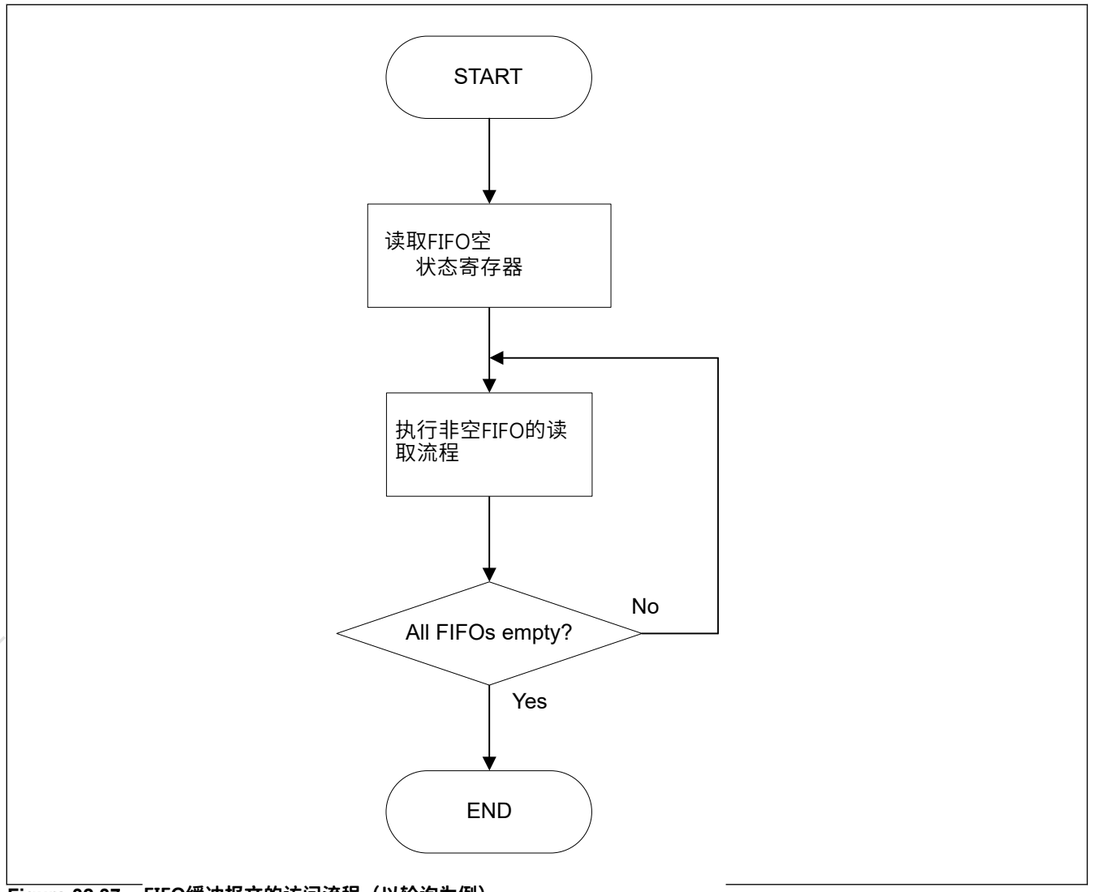

Figure 32.37 FIFO缓冲报文的访问流程（以轮询为例）

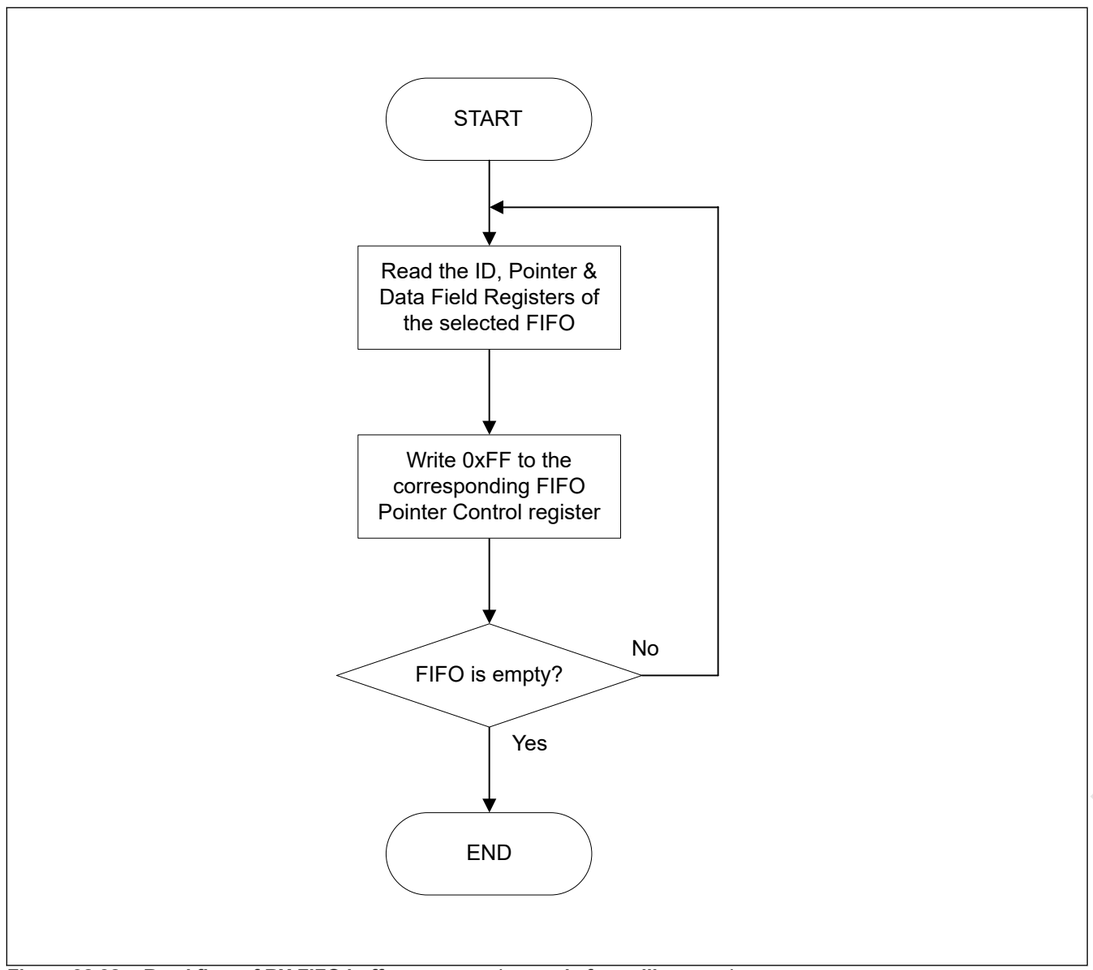

Figure 32.38 Read flow of RX FIFO buffer message (example for polling case)

Note: When the next frame is received before clearing the completion interrupt flag of reception, the completion interrupt of reception is not set again.

Even when an interruption flag is cleared after the completion processing of reception, the already received interrupt flag is not set.

It is necessary to perform the completion processing of reception even before the next completion of frame reception, and to clear an interruption flag.

When processing does not meet the condition, after checking that receiving data is empty, interrupt flag is cleared and it checks that receiving data is empty again.

32.8.1.3 Timestamp

The timestamp counter is a free-running counter that can be used to check reception time of an incoming message or transmission time of successful transmitted messages. The Timestamp counter value is captured based on the CFDGFDCFG.TSCCFG[1:0] configuration (at the sample point of start of frame, point in time when the frame is valid, or for CAN-FD frames also at the sample point of the RES bit). For reception, it is stored together with the message ID and data into the target RX message buffer or RX/GW FIFO.

For transmit message, the timestamp counter value is stored as part of the TX History List entry.

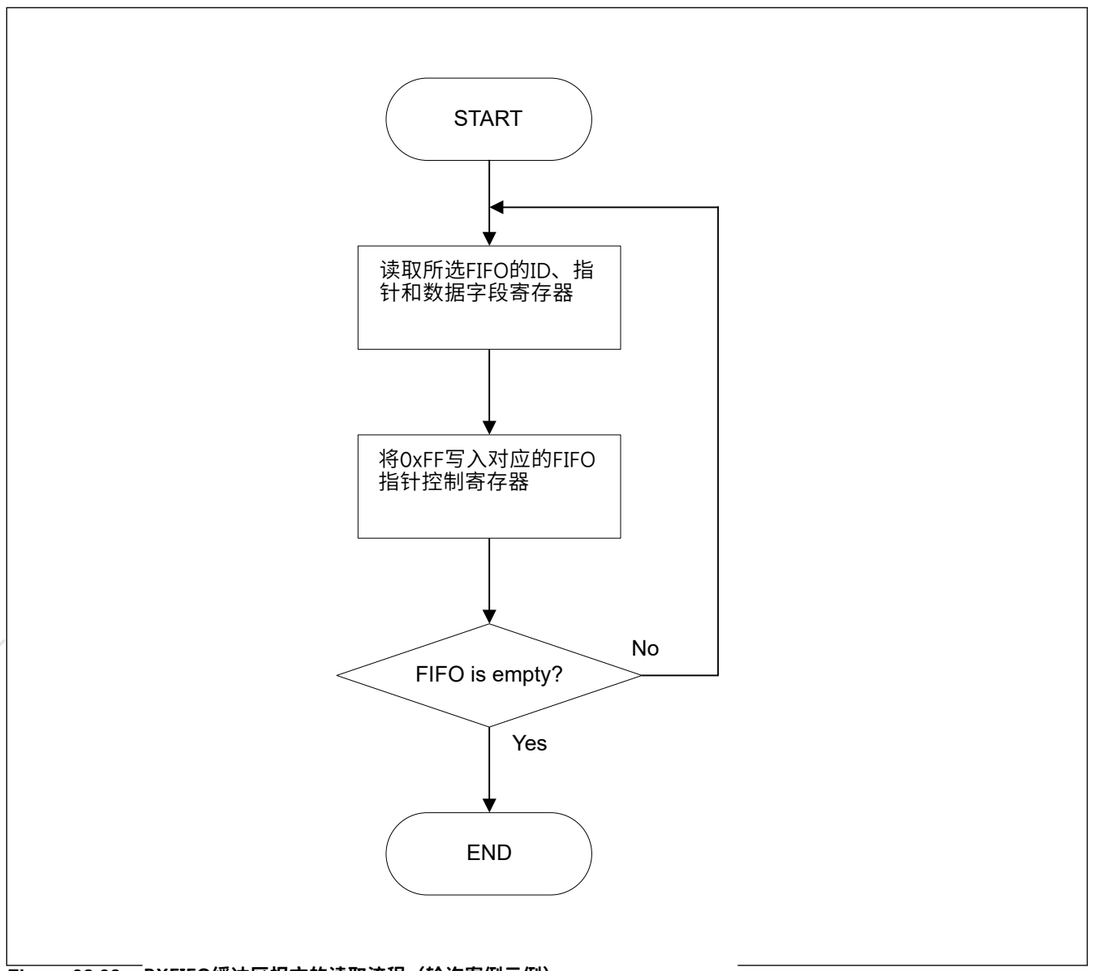

Figure 32.38 RXFIFO缓冲区报文的读取流程（轮询案例示例）

Note: 在清除接收完成中断标志之前接收到下一帧时，不再设置接收完成中断。

即使在接收完成处理后清除中断标志，已接收中断标志也不会置位。

甚至在下一次帧接收完成之前也需要执行接收完成处理，并清除中断标志。

当处理不满足条件时，检查接收数据为空后，清除中断标志，再次检查接收数据是否为空。

32.8.1.3 Timestamp

时间戳计数器是一个自由运行的计数器，可用于检查传入消息的接收时间或成功传输消息的传输时间。Timestamp计数器值基于CFDGFDCFG.TSCCFG[1:0]配置（在帧开始的采样点、帧有效的时间点或CAN-FD帧的采样点）捕获。RES位）。对于接收，它与消息ID和数据一起存储到目标RX消息缓冲区或RXGWFIFO中。

对于发送消息，时间戳计数器值存储为TX历史列表条目的一部分。

RA生态工作室

The counter can be clocked with the peripheral clock or with the CAN channel bit timing clock. The counter source clock can be configured with the CFDGCFG.TSSS bit of the Global Configuration Register. If this bit is 0, the peripheral clock is used. If the bit is 1, the selected CAN channel bit time clock is used.

The channel selection is performed with the CFDGCFG.TSBTCS bit of the Global Configuration Register.

Care must be taken when using selected CAN channel bit time clock as the clock source. When entering Channel Halt mode or Channel Reset node, for this channel, the timestamp counter is stopped. For other CAN channels, the timestamp counter value is not updated.

If peripheral clock is selected as the timestamp counter clock source, Channel modes do not affect the timestamp counter function.

The source clock for the timestamp counter can be divided by a factor defined by the CFDGCFG.TSP bits (timestamp prescaler) in the Global Configuration Register.

The timestamp counter can be reset to 0x0000 with the CFDGCTR.TSRST bit (timestamp reset).

32.8.2 Transmission

There are several possible transmission configurations for each channel:

- Normal transmission
- FIFO transmission
- Gateway transmission
- TX Queue transmission
  A fixed number of transmission message buffers (16 TX message buffers) are dedicated for each channel. These message buffers are only used for transmission and cannot be configured for reception.
  Additionally transmission from TX Queue or Common FIFO in TX or GW mode can be configured in the following way (see Figure 32.39):
  – TX Queue: Up to eight transmission message buffers for one channel can be grouped to form a TX Queue with a common access window.
    Upper transmission message buffers are used to form the TXQ1 or TXQ3.
    Lower transmission message buffers are used to form the TXQ0 or TXQ2.
    Transmission Control and Status registers of these transmission message buffers should not be used.
    One channel has four TX Queues.
    Each TXQ has an access window.
    - TXQ0 is transmission Message Buffer 0 of each channel.
    - TXQ1 is transmission Message Buffer 7 of each channel.
    - TXQ2 is transmission Message Buffer 32 of each channel.
    - TXQ3 is transmission Message Buffer 39 of each channel.

    When using TXQ1 and TXQ0 simultaneously, the sum of the depths of TXQ1 and TXQ0 should not exceed 8.
    When using TXQ3 and TXQ2 simultaneously, the sum of the depths of TXQ3 and TXQ2 should not exceed 8.
- Common FIFO (TX/GW mode): each Common FIFO in TX or GW mode is linked to a dedicated channel.
  Each channel has a fixed number of three Common FIFOs assigned to it. Within the channel, a Common FIFO configured in TX or GW mode, can be freely linked (assigned) between 32 and 39 transmission message buffers (only one FIFO to one transmission message buffer).
  The Common FIFO buffer then replaces the transmission message buffer linked to it.
  Transmission Control and Status registers of these transmission message buffers should not be used.

See Figure 32.28 for information about Common FIFO buffer assignment to related channels.

Note: Common FIFO buffers should not be linked to TX message buffers that are already part of a TX Queue.

计数器可以使用外设时钟或CAN通道位定时时钟进行计时。计数器源时钟可以通过全局配置寄存器的CFDGCFG.TSSS位进行配置。如果该位为0，则使用外设时钟。如果该位为1，则使用选定的CAN通道位时钟。

通道选择通过全局配置寄存器的CFDGCFG.TSBTCS位执行。

使用选定的CAN通道位时钟作为时钟源时必须小心。当进入ChannelHalt模式或ChannelReset节点时，对于该通道，时间戳计数器停止。对于其他CAN通道，时间戳计数器值不会更新。

如果选择外设时钟作为时间戳计数器时钟源，通道模式不影响时间戳计数器功能。

时间戳计数器的源时钟可以除以全局配置寄存器中的CFDGCFG.TSP位（时间戳预分频器）定义的因子。

时间戳计数器可通过CFDGCTR.TSRST位（时间戳复位）复位为0x0000。

32.8.2 Transmission

每个通道有几种可能的传输配置：

●正常传输

- FIFO transmission

●网关传输

●TX队列传输
  固定数量的传输消息缓冲区（16个TX消息缓冲区）专用于每个通道。这些消息缓冲区仅用于传输，不能配置为接收。此外，在TX或GW模式下从TXQueue或CommonFIFO传输可以通过以下方式配置（参见图32.39）：
  TX队列：可以将一个通道的多达8个传输消息缓冲区分组，以形成具有公共访问窗口的TX队列。上部传输消息缓冲区用于形成TXQ1或TXQ3。较低的传输消息缓冲区用于形成TXQ0或TXQ2。

  不应使用这些传输消息缓冲区的传输控制和状态寄存器。
  一个通道有四个TX队列。每个
  TXQ都有一个访问窗口。
  - TXQ0是每个通道的传输消息缓冲区0。
  - TXQ1是每个通道的传输报文缓冲器7。
  - TXQ2是每个通道的传输消息缓冲器32。
  - TXQ3是每个通道的传输消息缓冲器39。

  当同时使用TXQ1和TXQ0时，TXQ1和TXQ0的深度之和不应超过8。当同时使用TXQ3和TXQ2时，TXQ3和TXQ2的深度之和不应超过8。

●CommonFIFO（TXGW模式）：TX或GW模式下的每个CommonFIFO都链接到一个专用通道。
  每个通道都分配有固定数量的三个通用FIFO。在通道内，配置为TX或GW模式的CommonFIFO可以在32和39个传输消息缓冲区之间自由链接（分配）（只有一个FIFO到一个传输消息缓冲区）。通用FIFO缓冲区然后替换链接到它的传输消息缓冲区。

  不应使用这些传输消息缓冲区的传输控制和状态寄存器。

有关分配给相关通道的通用FIFO缓冲区的信息，请参见图32.28。

Note: 公共FIFO缓冲区不应链接到已经是TX队列一部分的TX消息缓冲区。

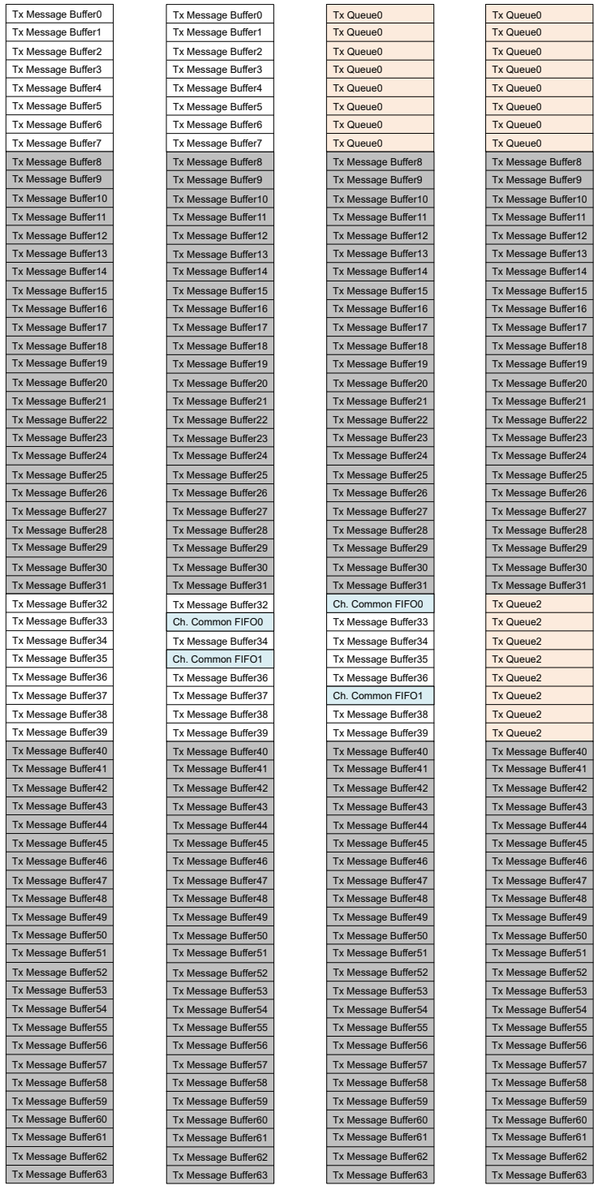

Figure 32.39 Configuration of channel transmission message buffer

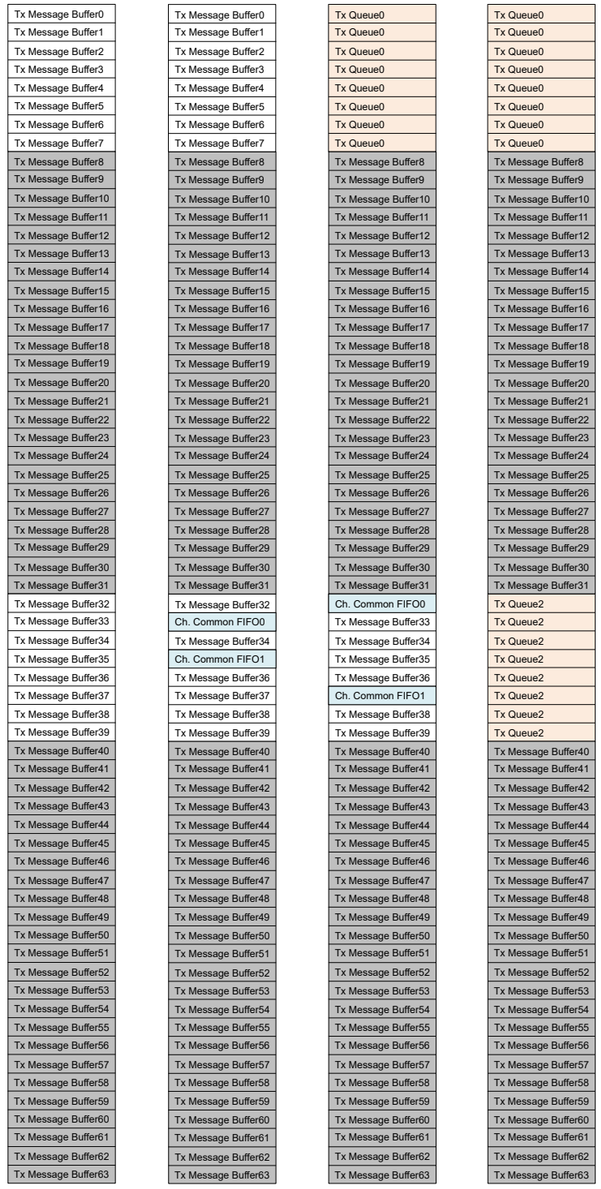

Figure 32.39 通道传输消息缓冲区的配置

32.8.2.1 Transmission Priority

If two or more transmission message buffers of a channel are configured for transmission, then the transmission priority in the CAN-FD module can be selected from the following two modes:

- CAN ID priority
- Message buffer number priority.

The transmission priority mode is common for all message buffers and all CAN channels. It can be configured with the CFDGCFG.TPRI bit in the Global Configuration Register.

For message buffer number priority transmission, the smallest message buffer number with transmission request has the highest priority for transmission. This also includes the TX message buffers linked to the Common FIFO buffers configured in TX mode or GW mode.

However, message buffer number priority should not be used if TX Queue is enabled.

For CAN ID priority transmission, ID priority complies with the CAN bus arbitration rule (as specified in ISO 11898-1 specification). All TX message buffers can enter the ID priority comparison for message buffers configured for transmission. This also includes the TX message buffers linked to the Common FIFO buffers configured in TX mode or GW mode and includes the TX Queue message buffers.

If the ID of two or more message buffers is the same, then the smaller message buffer number has higher priority for transmission.

Note: For Common FIFO buffers configured in TX mode or GW mode, only the message currently being pointed to by the FIFO read pointer can be included in the transmission arbitration.

If the message is being transmitted from the FIFO, then the next pending message within the same FIFO is considered in the transmission arbitration.

In contrast to this, all transmission message buffers of a TX Queue participate in internal transmission arbitration.

Figure 32.40 shows the transmission configuration flow.

32.8.2.1 传输优先级

如果配置了一个通道的两个或多个传输报文缓冲区进行传输，则CAN-FD模块中的传输优先级可以从以下两种模式中选择：

- CANID优先级
- 消息缓冲区编号优先级。

传输优先模式对于所有消息缓冲区和所有CAN通道都是通用的。它可以配置为全局配置寄存器中的CFDGCFG.TPRI位。

对于消息缓冲区号优先传输，具有传输请求的最小消息缓冲区号具有最高传输优先级。这还包括链接到在TX模式或GW模式下配置的CommonFIFO缓冲区的TX消息缓冲区。

但是，如果启用了TXQueue，则不应使用消息缓冲区编号优先级。

对于CANID优先级传输，ID优先级符合CAN总线仲裁规则（在ISO11898-1规范中指定）。所有TX报文缓冲区都可以进入配置为传输的报文缓冲区的ID优先级比较。这还包括链接到在TX模式或GW模式下配置的Common FIFO缓冲区的TX消息缓冲区，并包括TXQueue消息缓冲区。

如果两个或多个消息缓冲区的ID相同，则较小的消息缓冲区号具有较高的传输优先级。

Note: 对于配置为TX模式或GW模式的CommonFIFO缓冲区，只有当前由FIFO读指针可以包含在传输仲裁中。

如果消息是从FIFO传输的，则在传输仲裁中考虑同一FIFO中的下一个待处理消息。

与此相反，TXQueue的所有传输消息缓冲区都参与内部传输仲裁。

图32.40显示了传输配置流程。

RA生态工作室

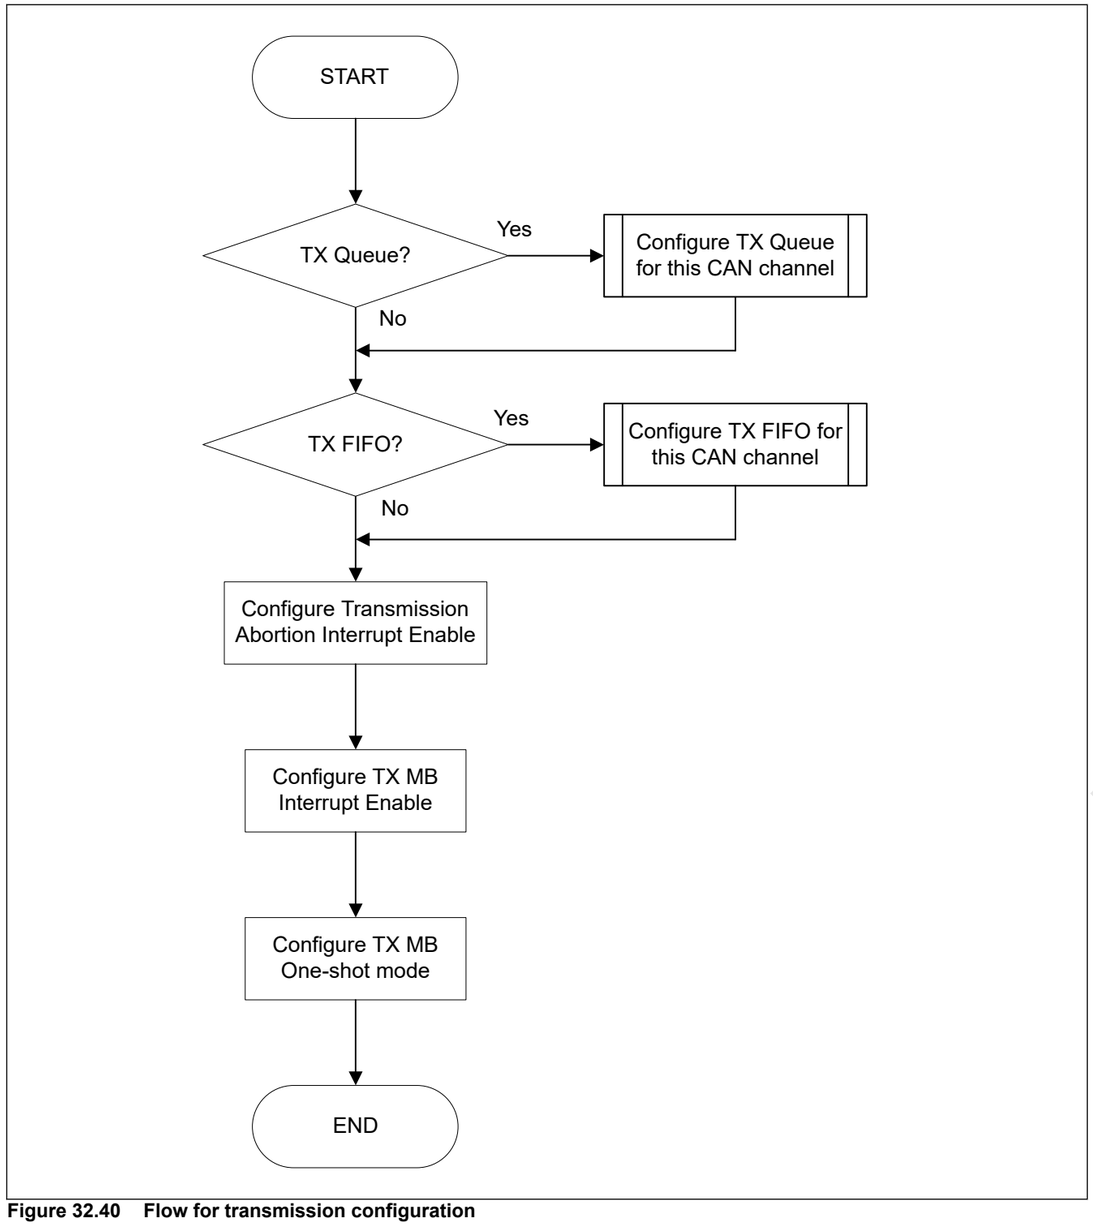

Figure 32.40 Flow for transmission configuration

32.8.2.2 Normal Transmission

Each transmission message buffer has two modes of message transmission:

1. Regular transmission mode
   If the message buffer is placed in regular transmission mode, the data frame or remote frame set in that message buffer can be transmitted.
   Completion of regular transmission can be checked through the related TX Message Buffer Transmission Result flag bits (CFDTMSTSn.TMTRF) in the TX Message Buffer Status Registers. These bits are set to 10b or 11b when the regular transmission is successful.

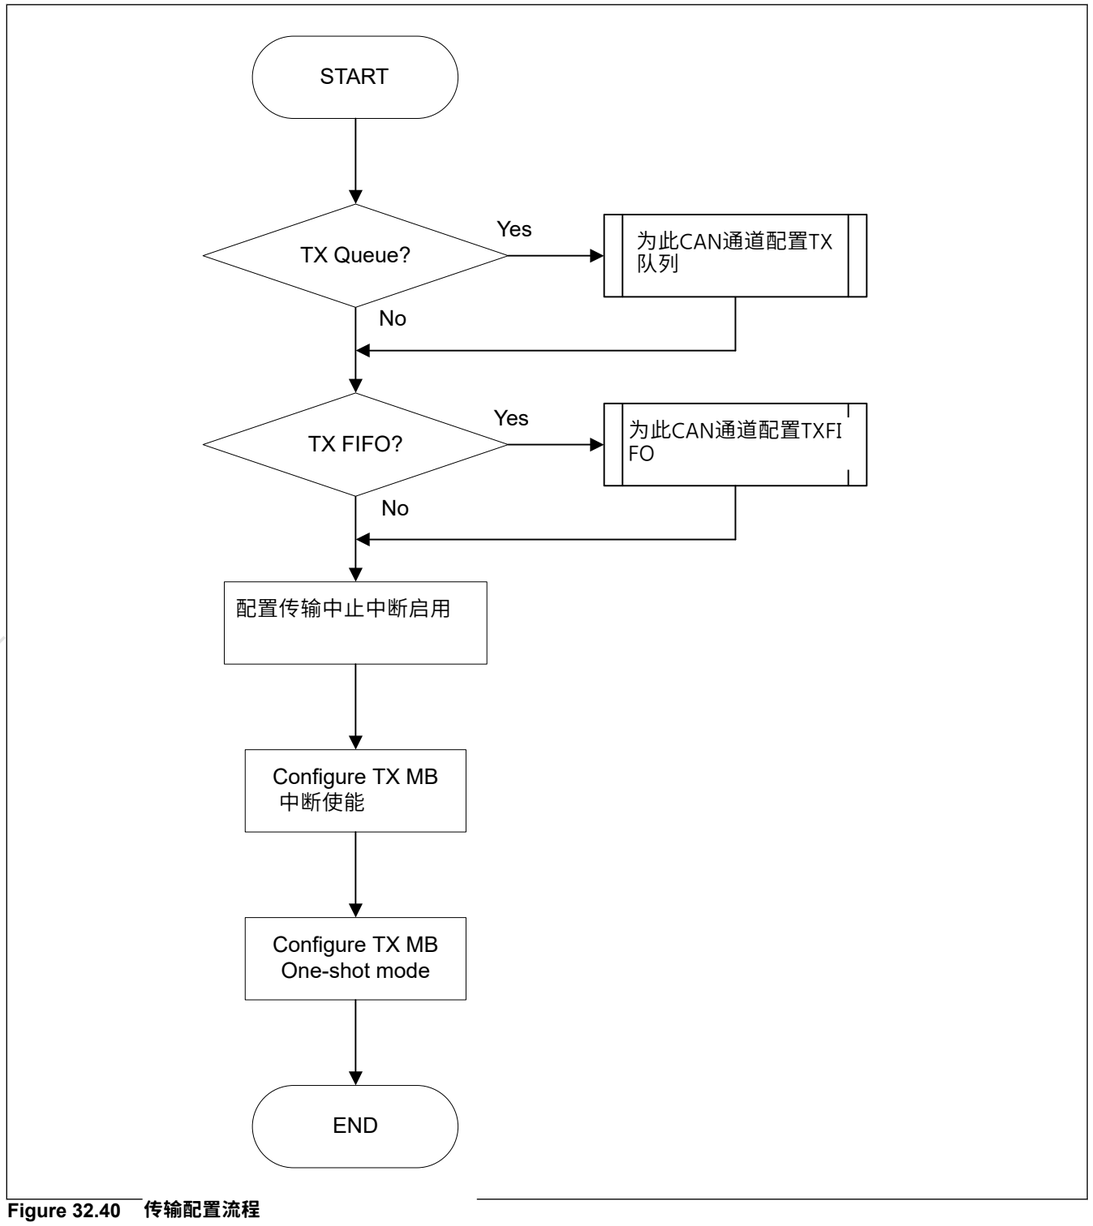

Figure 32.40 传输配置流程

32.8.2.2 正常传输

每个传输消息缓冲区有两种消息传输模式：

1.常规传输方式
   如果将消息缓冲区置于常规传输模式，则可以传输该消息缓冲区中设置的数据帧或远程帧。可以通过TX报文缓冲区状态寄存器中的相关TX报文缓冲区传输结果标志位(CFDTMSTSn.TMTRF)来检查是否完成了定期传输。当常规传输成功时，这些位设置为10b或11b。

When arbitration is lost or an error occurs, message transmission is further attempted if no transmission abort request is set for this transmission message buffer.
New internal transmission arbitration for this channel is performed for all message buffers with transmission request.

2. One-shot transmission mode

When the CFDTMCn.TMOM bit of the TX Message Buffer Control Registers is set for a transmission message buffer, the message buffer is placed in One-shot transmission mode and attempts to transmit a message only once.

Completion of One shot transmission can be checked through the related TX Message Buffer Transmission Result Flag bits (CFDTMSTSn.TMTRF) in the TX Message Buffer Status Registers. The CFDTMSTSn.TMTRF bits are set to 10b or 11b when One-shot transmission is successful.

The CFDTMSTSn.TMTRF bits are set to 01b when arbitration is lost or an error occurs during transmission of the related message buffer.

Additional message transmission is not attempted in this case.

The regular transmission request procedure after a configuration is shown in Figure 32.41.

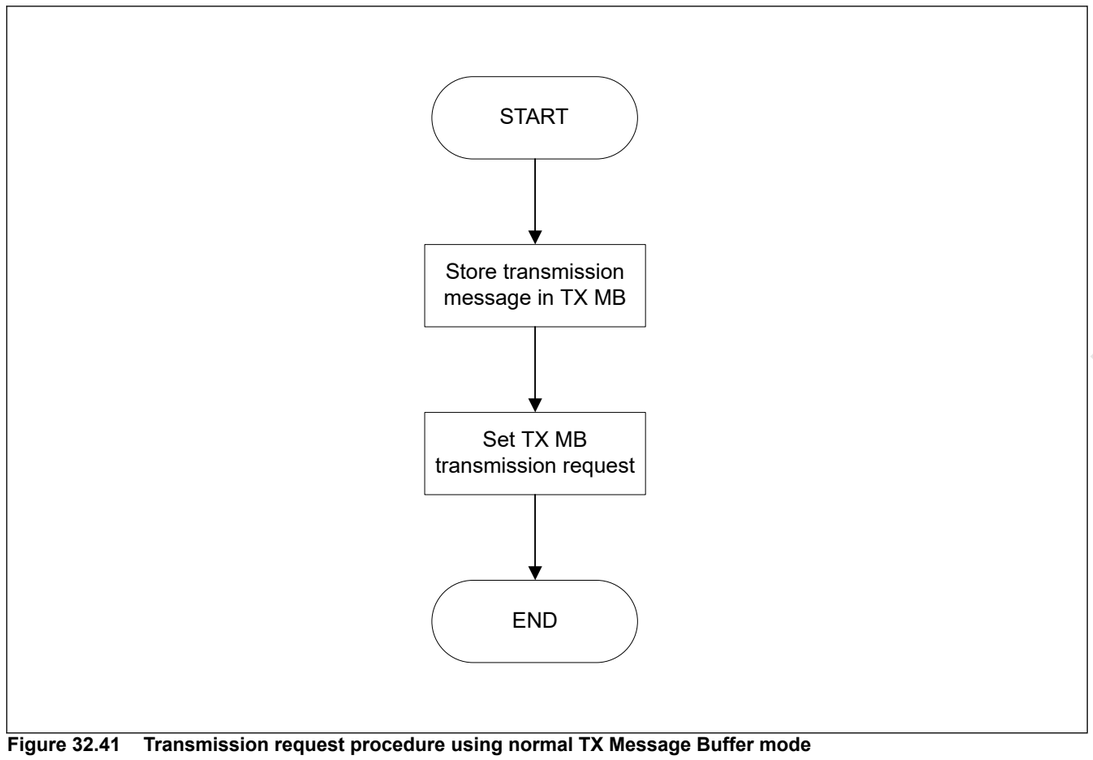

Figure 32.41 Transmission request procedure using normal TX Message Buffer mode

(1) Setting for TX Message Buffer Control Register

Table 32.21 shows configuration of a normal CAN transmission mode.

Table 32.21 Configuration of CAN transmission mode (1 of 2)

Transmission request CFDTMCn.TMTR	Transmission abort request CFDTMCn.TMTAR	One-shot enable CFDTMCn.TMOM	Communication activity
0	0	0	Message buffer disabled
0	0	1	Message buffer disabled

当仲裁丢失或发生错误时，如果没有为此发送消息缓冲区设置发送中止请求，则进一步尝试发送消息。该通道的新内部传输仲裁针对所有具有传输请求的消息缓冲区执行。

2.一键传输模式

当TX报文缓冲区控制寄存器的CFDTMCn.TMOM位为发送报文缓冲区设置时，报文缓冲区被置于一次性发送模式，并且只尝试发送一次报文。

可以通过TX报文缓冲区状态寄存器中的相关TX报文缓冲区传输结果标志位(CFDTMSTSn.TMTRF)来检查一次性传输是否完成。当One-shot传输成功时，CFDTMSTSn.TMTRF位设置为10b或11b。

当仲裁丢失或在相关消息缓冲区的传输过程中发生错误时，CFDTMSTSn.TMTRF位设置为01b。

在这种情况下，不会尝试额外的消息传输。

配置后的常规传输请求流程如图32.41所示。

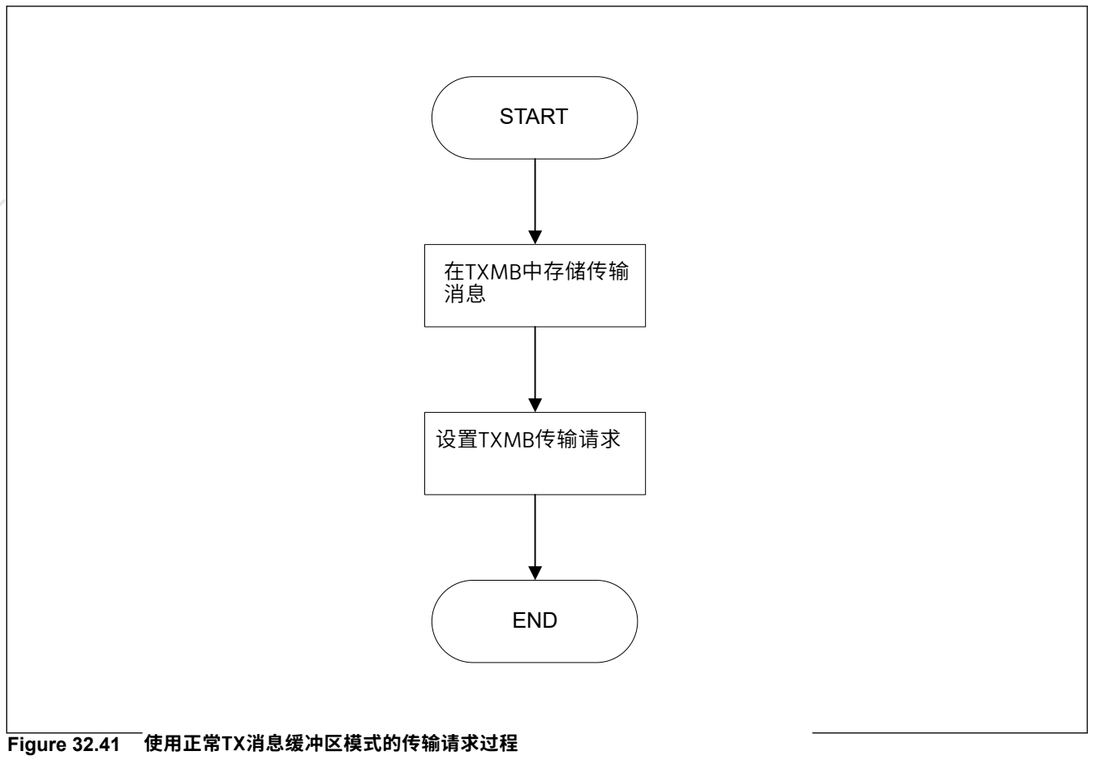

Figure 32.41 使用正常TX消息缓冲区模式的传输请求过程

(1) TX报文缓冲区控制寄存器的设置

表32.21显示了普通CAN传输模式的配置。

Table 32.21 CAN传输模式的配置（1of2）

传输请求 CFDTMCn.TMTR	传输中止请求 CFDTMCn.TMTAR	One-shot enable CFDTMCn.TMOM	通信活动
0	0	0	消息缓冲区已禁用
0	0	1	消息缓冲区已禁用

RA生态工作室

Table 32.21 Configuration of CAN transmission mode (2 of 2)

Transmission request CFDTMCn.TMTR	Transmission abort request CFDTMCn.TMTAR	One-shot enable CFDTMCn.TMOM	Communication activity
1	0	0	Configured as a transmission message buffer for a data frame or a remote frame
1	0	1	Configured as a one-shot transmission message buffer for a data frame or a remote frame
1	1	0	Transmission abort requested
1	1	1	One-shot transmission abort requested

The configuration bits can be configured in the TX Message Buffer Control Registers.

Figure 32.42 shows timings for successful transmission for two message buffers of one channel.

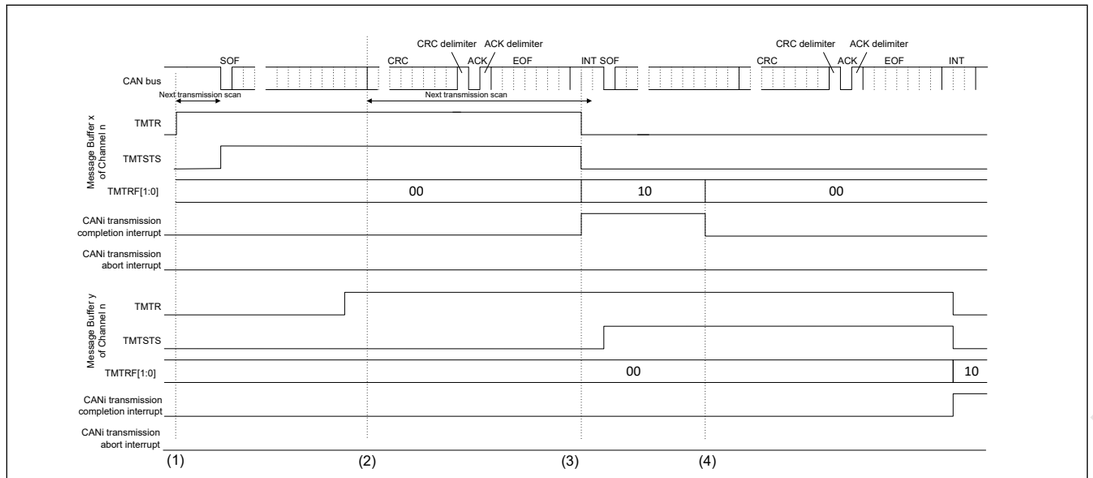

Figure 32.42 Timing of request and flag bits for successful transmission

1. If the CFDTMCn.TMTR bit in the TX Message Buffer Control Registers is set in the bus idle state, the message buffer scanning procedure determines the highest priority message buffer for transmission.
   When the transmission message buffer is determined, the CFDTMSTSn.TMTSTS bit in the related TX Message Buffer Status Registers is set (transmitting/transmitter), and CAN channel starts the transmission *1.
2. At the first bit of CRC, the transmission scanning procedure starts for the next possible transmission when pending transmission requests exist.
   The scan time can be delayed due to other transmission scan on other channels, but it finishes before intermission 3 to be able to continue transmission without any gaps.
3. If the message has been successfully transmitted, the CFDTMSTSn.TMTRF[1:0] bits in the corresponding TX Message Buffer Status Registers are set to 10b and CFDTMSTSn.TMTSTS and the CFDTMCn.TMTR bits are cleared.
   When the TMIE bit in the TX Message Buffer Interrupt Enable Configuration Registers is set (interrupt enabled), the CAN successful transmission interrupt request is generated.
   To clear the related interrupt line, clear the CFDTMSTSn.TMTRF flag bits.
4. Before starting the next transmission, clear the CFDTMSTSn.TMTRF bits. Load the next message in the transmission message buffer and set the CFDTMCn.TMTR bit again.
   CFDTMCn.TMTR bit cannot be set again before CFDTMSTSn.TMTRF[1:0] bits are cleared.

Note 1. If arbitration is lost after the CAN channel starts the transmission, the CFDTMSTSn.TMTSTS bit is cleared.
The transmission scanning procedure is performed again to search for the highest priority transmission message buffer from the beginning of the first CRC bit.

Table 32.21 CAN传输模式的配置（2of2）

传输请求 CFDTMCn.TMTR	传输中止请求 CFDTMCn.TMTAR	One-shot enable CFDTMCn.TMOM	通信活动
1	0	0	配置为数据帧或远程帧的传输消息缓冲区
1	0	1	配置为数据帧或远程帧的一次性传输消息缓冲区
1	1	0	请求传输中止
1	1	1	请求单发传输中止

配置位可以在TX报文缓冲区控制寄存器中进行配置。

图32.42显示了一个通道的两个消息缓冲区成功传输的时序。

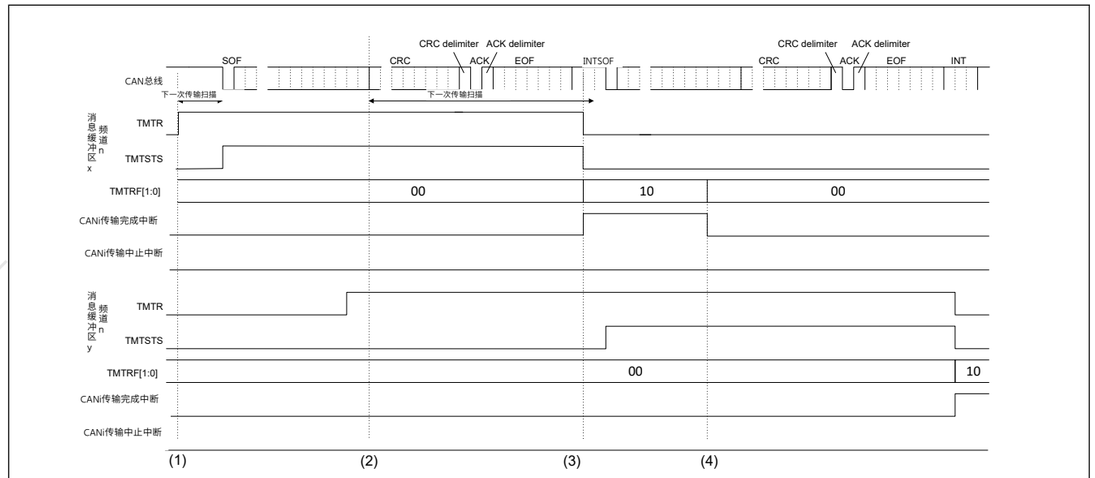

Figure 32.42 成功传输的请求和标志位的时序

1.如果TX报文缓冲区控制寄存器中的CFDTMCn.TMTR位在总线空闲状态下设置，则报文缓冲区扫描程序确定发送的最高优先级报文缓冲区。当确定发送消息缓冲区时，相关的TX消息缓冲区中的CFDTMSTSn.TMTSTS位

设置状态寄存器（发送发送器），CAN通道开始发送*1。

2.在CRC的第一位，当存在未决的传输请求时，传输扫描程序开始为下一个可能的传输。由于其他通道上的其他传输扫描，扫描时间可能会延迟，但它会在间歇3之前完成，以便能够继续传输而没有任何间隙。

3.如果报文已成功发送，则相应的TX报文缓冲区状态寄存器中的CFDTMSTSn.TMTRF[1:0]位设置为10b，CFDTMSTSn.TMTSTS和CFDTMCn.TMTR位清零。

当TX报文缓冲区中断允许配置寄存器中的TMIE位置位（允许中断）时，
CAN成功传输中断请求产生。
要清除相关中断线，请清除CFDTMSTSn.TMTRF标志位。

4.在开始下一次传输之前，清除CFDTMSTSn.TMTRF位。在发送消息缓冲区中加载下一条消息并再次设置CFDTMCn.TMTR位。在CFDTMSTSn.TMTRF[1:0]位清零之前，CFDTMCn.TMTR位不能再次置位。

注1.如果在CAN通道开始传输后仲裁丢失，CFDTMSTSn.TMTSTS位被清零。

再次执行传输扫描程序，以从第一个CRC位的开头搜索最高优先级的传输消息缓冲区。

If an error occurs either during transmission or following the loss of arbitration, then during the error frame, the transmission scanning procedure is performed again to search for the highest priority transmission message buffer.

Note: The setting point of CFDTMSTSn.TMTSTS is not always fixed at the start of the SOF. It may be delayed up to the start of the standard ID due to the synchronization logic implemented for the PLL bypass.

Figure 32.43 shows timings for transmission abort for two message buffers of one channel.

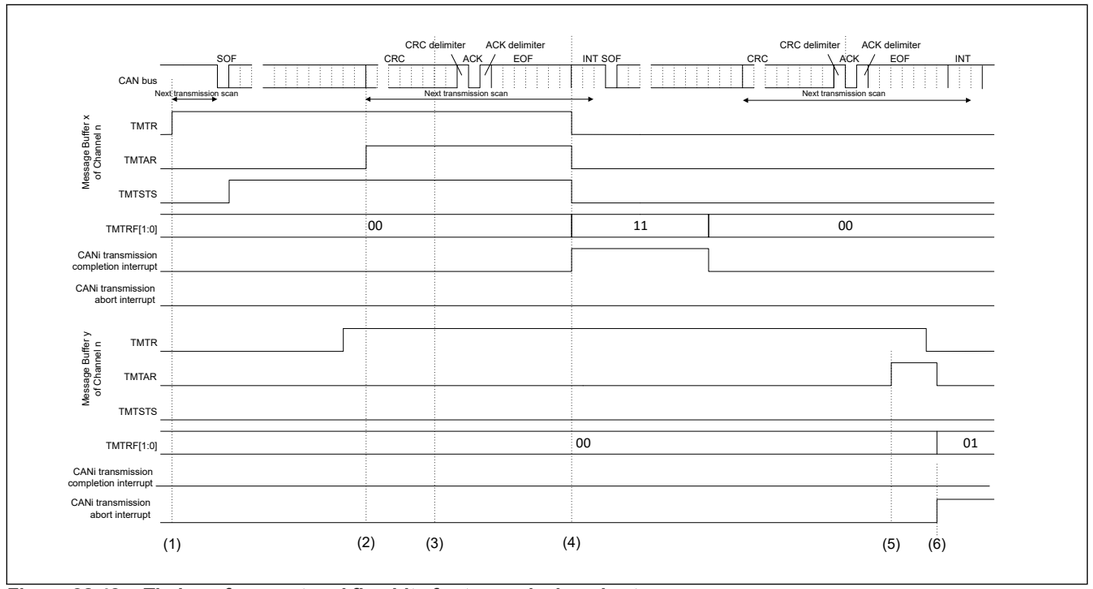

Figure 32.43 Timing of request and flag bits for transmission abort

1. If the CFDTMCn.TMTR bit in the TX Message Buffer Control Registers is set in the bus idle state, the message buffer scanning procedure determines the highest priority message buffer for transmission.
   When the transmission message buffer is determined, the CFDTMSTSn.TMTSTS bit in the TX Message Buffer Status Registers is set (transmitting/transmitter), and CAN channel starts the transmission*1.
2. If the CFDTMCn.TMTAR bit is set when the related message buffer is already selected for transmission or currently transmitting, the message is not aborted, if no error occurs or arbitration is lost.
3. At the first CRC bit, the transmission scanning procedure starts for the next transmission. In this example, timing chart message buffer y is not selected as the next transmission message buffer.
   The scan time can be delayed due to other transmission scan on other channels, but it finishes before intermission 3 to be able to continue transmission without any gaps.
4. If the message has been successfully transmitted, the CFDTMSTSn.TMTRF[1:0] bits in the corresponding TX Message Buffer Status Registers are set to 11b and the CFDTMSTSn.TMTSTS and CFDTMCn.TMTR bits are cleared.
   When the TMIE bit in the TX Message Buffer Interrupt Enable Configuration Registers is set (interrupt enabled), the CAN successful transmission interrupt request is generated.
   To clear the related interrupt line, clear the CFDTMSTSn.TMTRF[1:0] bits.
5. Another CAN node is transmitting on the CAN bus (CFDTMSTSn.TMTSTS is not set). If the CFDTMCn.TMTAR bit is set when the related channel is under transmission scan, the transmission request cannot be cleared.
6. After internal processing time, the transmission is aborted and the CFDTMSTSn.TMTRF[1:0] bits are set to 01b.
   If the message buffer is not transmitting or selected as the next transmission message buffer or under transmit scan, then the abort is immediately accepted and the corresponding CFDTMSTSn.TMTRF[1:0] bits in the TX Message Buffer Status Registers are set to 01b.
   In addition, CFDTMCn.TMTR, and CFDTMCn.TMTAR bits are cleared automatically.
   When the transmission abort interrupt enable TAIE bit of the related Channel Control Register is set then an interrupt is generated for successful transmission abort.
   To clear the related interrupt line the CFDTMSTSn.TMTRF[1:0] bits have to be cleared.

如果在传输过程中或仲裁失败后发生错误，则在错误帧期间，再次执行传输扫描程序以搜索最高优先级的传输消息缓冲区。

Note: CFDTMSTSn.TMTSTS的设定点并不总是固定在SOF的开始处。由于为PLL旁路实现的同步逻辑，它可能会延迟到标准ID的开始。

图32.43显示了一个通道的两个消息缓冲区的传输中止时序。

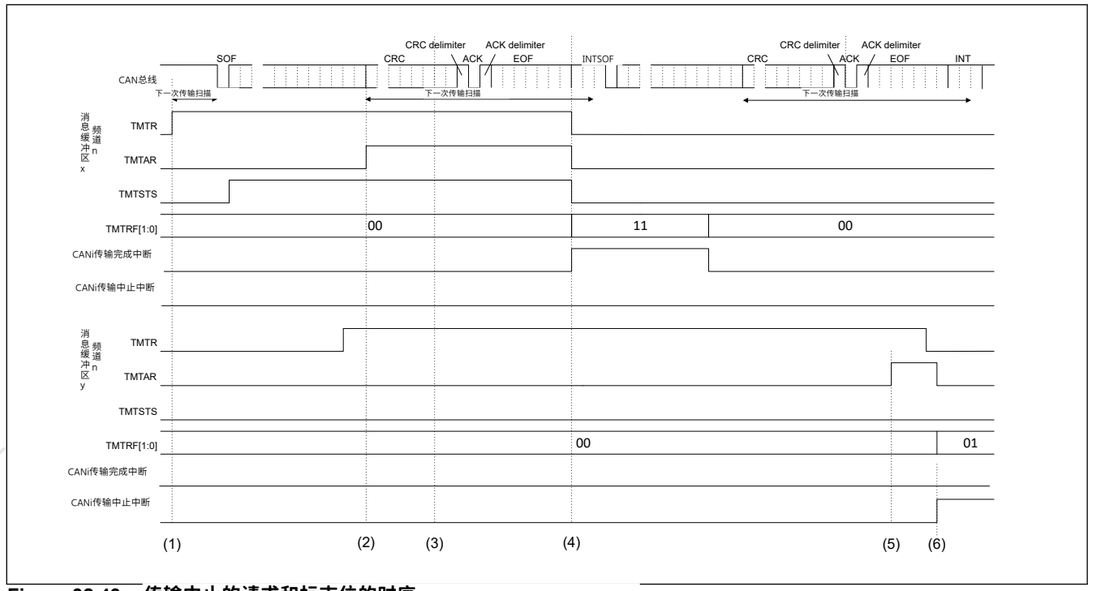

Figure 32.43 传输中止的请求和标志位的时序

1.如果TX报文缓冲区控制寄存器中的CFDTMCn.TMTR位在总线空闲状态下设置，则报文缓冲区扫描程序确定发送的最高优先级报文缓冲区。当确定发送报文缓冲区时，TX报文缓冲区状态中的CFDTMSTSn.TMTSTS位

设置寄存器（发送发送器），CAN通道开始发送*1。

2.如果CFDTMCn.TMTAR位在相关报文缓冲区已被选择发送或正在发送时被置位，如果没有错误发生或仲裁丢失，则不会中止报文。

3.在第一个CRC位，传输扫描程序开始下一次传输。在这个例子中，时序图消息缓冲区y没有被选为下一个传输消息缓冲区。由于其他通道上的其他传输扫描，扫描时间可能会延迟，但它会在间歇3之前完成，以便能够继续传输而没有任何间隙。

4.如果报文已成功发送，则相应的TX报文缓冲区状态寄存器中的CFDTMSTSn.TMTRF[1:0]位设置为11b，并且CFDTMSTSn.TMTSTS和CFDTMCn.TMTR位清零。
当TX报文缓冲区中断允许配置寄存器中的TMIE位置位（允许中断）时，
CAN成功传输中断请求产生。
要清除相关中断线，请清除CFDTMSTSn.TMTRF[1:0]位。

5.另一个CAN节点正在CAN总线上传输（CFDTMSTSn.TMTSTS未设置）。如果在相关通道正在发送扫描时设置CFDTMCn.TMTAR位，则不能清除发送请求。

6.内部处理时间过后，发送中止，CFDTMSTSn.TMTRF[1:0]位设置为01b。
如果报文缓冲区未发送或被选为下一个发送报文缓冲区或正在发送扫描，则立即接受中止并将TX报文缓冲区状态寄存器中的相应CFDTMSTSn.TMTRF[1:0]位设置为01b。

此外，CFDTMCn.TMTR和CFDTMCn.TMTAR位会自动清零。
当相关通道控制寄存器的发送中止中断使能位TAIE置位时，将产生中断以成功发送中止。要清除相关的中断线，必须清除CFDTMSTSn.TMTRF[1:0]位。

Note 1. If arbitration is lost after the CAN channel starts the transmission, the CFDTMSTSn.TMTSTS bit is cleared.

The transmission scanning procedure is performed again to search for the highest priority transmission message buffer from the beginning of the first CRC bit.

If an error occurs, either during transmission, or following the loss of arbitration, then during the error frame, the transmission scanning procedure is performed again to search for the highest priority transmission message buffer.

32.8.2.3 TX FIFO or GW FIFO Transmission

Three common FIFO buffers are assigned to each channel. The three FIFO buffers can be linked to any normal TX message buffer position for this channel with the CFDCFCCn.CFTML bits in the Common FIFO Configuration/Control Register if configured in TX or GW mode.

When the transmission scan starts and the FIFO buffer corresponding to this TX message buffer is enabled, the relevant message in the FIFO buffer participates in the transmission scan.

Configuration of a TX message buffer linked to a FIFO buffer configured in TX or GW mode should not be done.

(1) TX FIFO Operation

CAN messages can be written into the TX FIFO by writing to the corresponding FIFO Access registers.

When the value 0xFF is written into the corresponding FIFO Pointer Control Register, the message count of the related FIFO is incremented by 1.

Only write to the FIFO Pointer Control register after writing the complete message to the corresponding FIFO Access registers. If the message count matches the FIFO depth, the FIFO Full flag is set.

The oldest message in the TX FIFO is included in the scan for transmission by the corresponding CAN-FD module channel logic.

When a message is successfully transmitted from the TX FIFO, the message count value is decremented by 1. When all the messages from the FIFO are transmitted, the FIFO Empty flag is set.

The interrupt generation conditions for the TX FIFO buffers can be configured by configuring the CFDCFCCn.CFIM bit in the corresponding Common FIFO Configuration/Control Registers.

If CFDCFCCn.CFIM bit is 0, then interrupt is generated when the last message is successfully transmitted from the TX FIFO buffer.

If CFDCFCCn.CFIM bit is 1, then interrupt is generated for every successfully transmitted message from the TX FIFO buffer.

The Common FIFO can set interrupt when CAN frame transmission is complete.

The Common FIFO buffers configured in TX Mode can be disabled by clearing the CFDCFCCn.CFE bit in the Common FIFO Configuration/Control Registers. If this bit is cleared to 0, the FIFO Empty flag is set as follows:

- Immediately if the message from the TX FIFO is neither scheduled for the next transmission nor in transmission
- Following the transmission completion, the detection of an error on the CAN bus, loss of arbitration or transition to Channel or Global Halt mode if the transmission from the TX FIFO is already scheduled for transmission or already in transmission.

Note: The Common FIFO buffer is considered as disabled after clearing the CFDCFCCn.CFE bit only when the Empty flag is set for the corresponding Common FIFO buffer.

Other possible messages pending from the TX FIFO are lost and their transmission must be requested again. Before CFDCFCCn.CFE is set again, ensure that CFDCFSTSn.CFEMP bit is set and that there are no pending abort from the TX FIFO.

When the CFDCFCCn.CFE bit is cleared, the message read and write pointers of the FIFO are cleared and are no longer active. Therefore, all messages in the FIFO buffers are lost and no further message can be stored into the FIFO.

The FIFO transmission request procedure after configuration is shown in Figure 32.44.

注1.如果在CAN通道开始传输后仲裁丢失，CFDTMSTSn.TMTSTS位被清零。

再次执行传输扫描程序，以从第一个CRC位的开头搜索最高优先级的传输消息缓冲区。

如果在传输过程中或在仲裁失败之后发生错误，则在错误帧期间，再次执行传输扫描程序以搜索最高优先级的传输消息缓冲区。

32.8.2.3 TXFIFO或GWFIFO传输

为每个通道分配了三个通用FIFO缓冲区。如果配置为TX或GW模式，则三个FIFO缓冲区可以通过通用FIFO配置控制寄存器中的CFDCFCCn.CFTML位链接到该通道的任何正常TX消息缓冲区位置。

当发送扫描开始并且与该TX报文缓冲区对应的FIFO缓冲区使能时，FIFO缓冲区中的相关报文参与发送扫描。

不应配置链接到在TX或GW模式下配置的FIFO缓冲区的TX消息缓冲区。

(1) TX FIFO Operation

通过写入相应的FIFO访问寄存器，可以将CAN消息写入TXFIFO。

当值0xFF被写入对应的FIFO指针控制寄存器时，相关的报文计数
FIFO加1。

仅在将完整消息写入相应的FIFO访问寄存器后才写入FIFO指针控制寄存器。如果消息计数与FIFO深度匹配，则设置FIFO满标志。

TXFIFO中最旧的消息包含在相应CAN-FD模块通道逻辑的传输扫描中。

当一条消息从TXFIFO成功发送时，消息计数值减1。当FIFO中的所有消息都发送完毕时，FIFO空标志置位。

TXFIFO缓冲区的中断生成条件可以通过配置相应通用FIFO配置控制寄存器中的CFDCFCCn.CFIM位来配置。

如果CFDCFCCn.CFIM位为0，则当最后一条消息从TX成功发送时产生中断
FIFO buffer.

如果CFDCFCCn.CFIM位为1，则每次从TXFIFO缓冲区成功发送的消息都会产生中断。

当CAN帧传输完成时，CommonFIFO可以设置中断。

在TX模式下配置的通用FIFO缓冲区可以通过清除通用的CFDCFCCn.CFE位来禁用
FIFO配置控制寄存器。如果该位清0，FIFO空标志设置如下：

●如果来自TXFIFO的消息既没有安排下一次传输也没有在传输中，则立即执行

●传输完成后，检测到CAN总线错误、仲裁丢失或转换到
如果来自TXFIFO的传输已被安排传输或已在传输中，则为通道或全局暂停模式。

Note: 仅当为相应的CommonFIFO缓冲区设置Empty标志时，在清除CFDCFCCn.CFE位后，CommonFIFO缓冲区才被视为禁用。

来自TXFIFO的其他可能未决消息丢失，必须再次请求它们的传输。前
CFDCFCCn.CFE再次设置，确保CFDCFSTSn.CFEMP位已设置并且TX没有挂起的中止
FIFO.

当CFDCFCCn.CFE位清零时，FIFO的报文读写指针被清零，不再处于活动状态。因此，FIFO缓冲区中的所有消息都将丢失，并且无法将更多消息存储到FIFO中。

配置后的FIFO发送请求流程如图32.44所示。

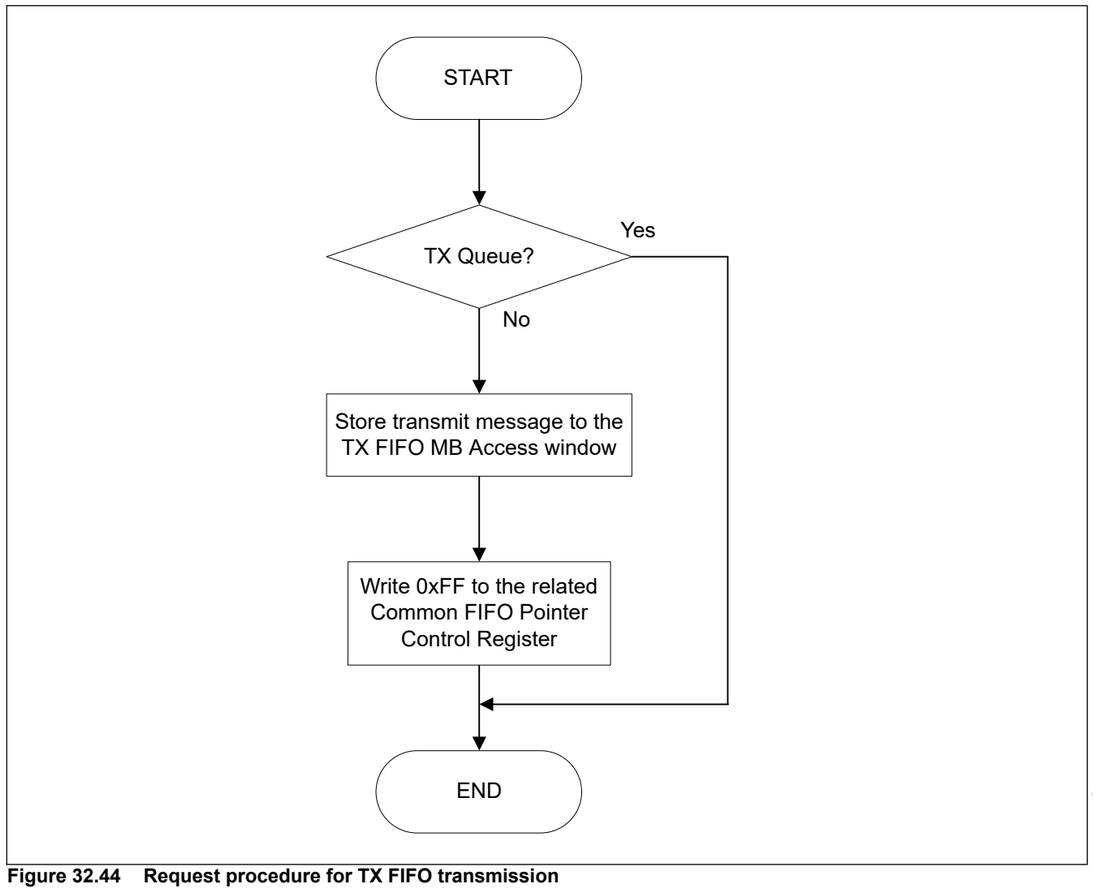

Figure 32.44 Request procedure for TX FIFO transmission

(2) GW FIFO Operation

The AFL entries for routing the received messages to GW FIFO buffers should be configured based on the system requirements. The matching AFL entry selects the GW FIFO buffer for storage of a received message on any of the CAN channels.

When a message is successfully received and stored in a GW FIFO buffer, the FIFO message count in the corresponding FIFO Status Register is incremented by 1. If the message count matches the FIFO depth, the FIFO Full flag is set.

The oldest message in the GW FIFO is included in the scan for transmission by the corresponding CAN-FD module channel logic.

When a message is successfully transmitted from the GW FIFO, the message count value is decremented by 1. When all messages from the GW FIFO are transmitted, the FIFO Empty flag is set.

If a new message is stored into the FIFO when the FIFO message count matches the FIFO depth (FIFO Full condition), the FIFO Message Lost flag is set and the new message is lost (no overwrite of already stored messages takes place).

In GW mode, when a transmit/receive FIFO buffer is receiving a new message while the transmit/receive FIFO buffer is already full of data, the oldest data of the buffer is overwritten with the message received or the message is discarded. The behavior is determined by setting the CFDCFCCEn.CFMOWM bit.

- When CFDCFCCEn.CFMOWM = 0:
  When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the received message is discarded and the CFDCFSTSn.CFMLT bit is set to 1.

- When CFDCFCCEn.CFMOWM = 1:

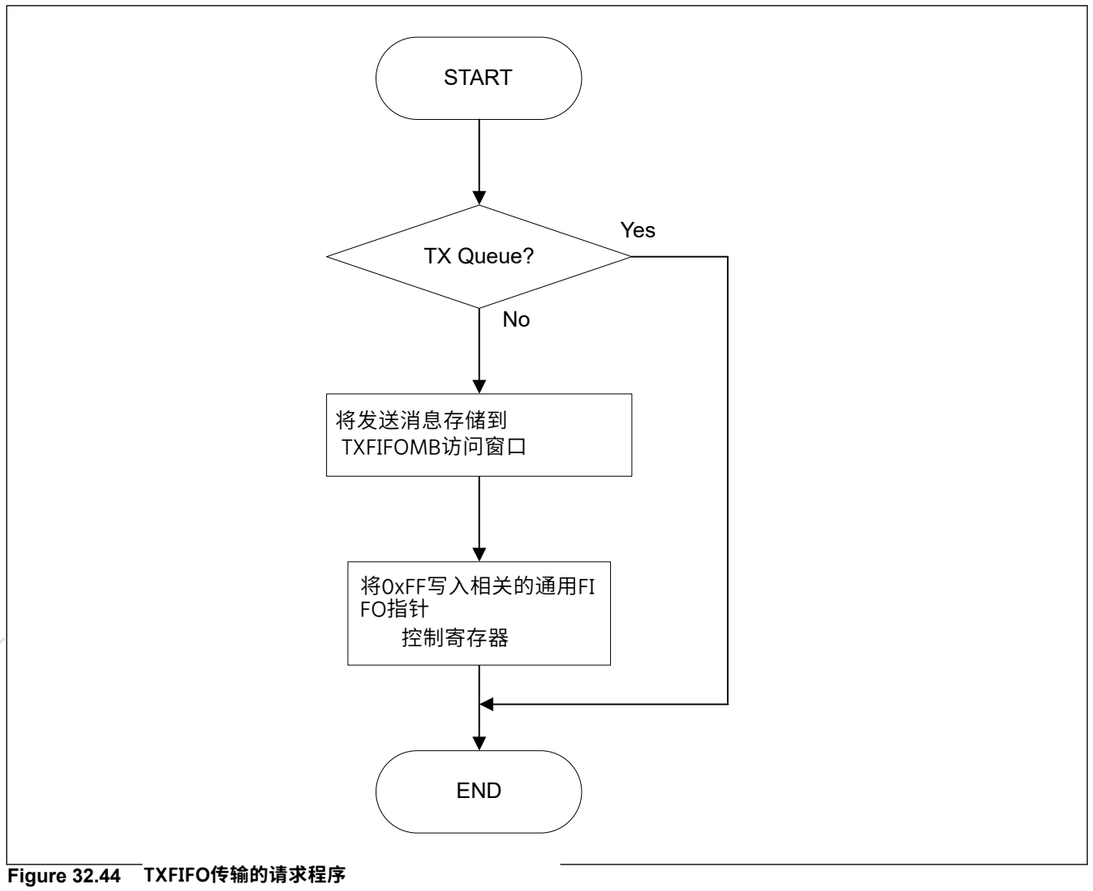

Figure 32.44 TXFIFO传输的请求程序

(2) GW FIFO Operation

应根据系统要求配置用于将接收到的消息路由到GWFIFO缓冲区的AFL条目。匹配的AFL条目选择GWFIFO缓冲区，用于在任何CAN通道上存储接收到的消息。

当消息被成功接收并存储在GWFIFO缓冲区中时，相应的FIFO消息计数
FIFO状态寄存器加1。如果报文计数与FIFO深度匹配，则设置FIFO满标志。

GWFIFO中最旧的消息包含在扫描中以供相应的CAN-FD模块通道逻辑进行传输。

当一条消息从GWFIFO成功传输时，消息计数值减1。当所有来自GWFIFO的消息都传输完毕时，设置FIFOEmpty标志。

如果在FIFO消息计数与FIFO深度匹配（FIFO满条件）时将新消息存储到FIFO，则
FIFO消息丢失标志被设置，新消息丢失（不会覆盖已存储的消息）。

在GW模式下，当发送接收FIFO缓冲区正在接收新消息而发送接收FIFO缓冲区已满数据时，缓冲区中最旧的数据将被接收到的消息覆盖或丢弃该消息。该行为是通过设置CFDCFCCEn.CFMOWM位来确定的。

- When CFDCFCCEn.CFMOWM = 0:
  当发送接收FIFO缓冲区已满数据而由于接收到新报文而需要写入数据时，将丢弃接收到的报文并将CFDCFSTSn.CFMLT位设置为1。

- When CFDCFCCEn.CFMOWM = 1:

RA生态工作室

When writing of data is required due to reception of a new message while a transmit/receive FIFO buffer is full of data, the oldest data in the buffer is overwritten with the received message.
The read pointer of the transmit/receive FIFO buffer simultaneously moves to the next oldest message. The CFDCFSTSn.CFMOW bit is then set to 1, which notifies that the oldest message has been overwritten with the received message.
In addition, when a CAN bus error or arbitration-lost for the transmitting message occurs in transmit/receive FIFO buffer full, the transmitting message is lost and retransmission of the message is not performed. The read pointer moves to the next message automatically.

The interrupt generation conditions for the GW FIFO buffers can be configured by setting the CFDCFCCn.CFIM bit in the corresponding Common FIFO Configuration/Control Registers.

If CFDCFCCn.CFIM bit is 0, the RX Interrupt flag is set when the FIFO counter increments and reaches value configured by CFDCFCCn.CFIGCV and the TX Interrupt flag is set when FIFO transmits the last message successfully.

If CFDCFCCn.CFIM bit is 1, the RX Interrupt flag is set at the end of storage of every received message and the TX Interrupt flag is set if a message is successfully transmitted from the FIFO.

The Common FIFO can set interrupt when:

- CAN frame transmitted is complete
- CAN frame reception is complete
- FIFO is in full status in RX mode or GW mode.

When CFDCFCCEn.CFBME = 1, the mode is FIFO buffering, send data is stored in Common FIFO, and transmission is stopped. Transmission is started if it is set as CFDCFCCEn.CFBME = 0.

The Common FIFO buffers configured in GW mode can be disabled by clearing the CFDCFCCn.CFE bit in the Common FIFO Configuration/Control Register. If this bit is cleared, the GW FIFO becomes empty as follows:

- Immediately if the message from the GW FIFO is neither scheduled for the next transmission nor in transmission
- Following the transmission completion, the detection of an error on the CAN bus, loss of arbitration or transition to Channel or Global Halt mode if the transmission from the GW FIFO is already scheduled for transmission or already in transmission.

Other possible messages pending from the GW FIFO are lost.

Before CFDCFCCn.CFE is set again, ensure that the CFDCFSTSn.CFEMP bit is set and that there are no pending abort from the GW FIFO.

When the CFDCFCCn.CFE bit is cleared and the CFDCFSTSn.CFEMP bit is set, the read and write pointers of the message in GW FIFO are cleared and are no longer active. Therefore, all messages in the GW FIFO buffers are lost and no further message can be stored into the GW FIFO.

In applications intended to be used as CAN-to-CAN gateways, it is recommended that if the Error State Indication (ESI) information of the routing messages is not replaced by the sending node error state indication. For this, each channel has the Control Function register CFDCnFDCFG.ESIC to replace their own ESI information by the routing ESI information.

Note: If the sending node is error-passive, the ESI bit is sent anyway as error-passive (ESI = 1).

Note: This feature is not available in classical CAN function because CFDCnFDCFG is not in classical CAN.

(3) Interval Timer for FIFO Transmission

For each Common FIFO in TX or GW mode, it is possible to specify a delay between two consecutive messages that are configured for transmission from the same FIFO buffer. This delay is called interval time. This interval time starts after the first message has been successfully transmitted from the FIFO buffer after the CFDCFCCn.CFE bit is set.

When the Common FIFO in TX or GW mode is enabled, the first message is transmitted without considering this interval time.

The interval timer stops counting when:

- FIFO is disabled by clearing the CFDCFCCn.CFE bit.
- CAN channel is in CH_RESET mode.

当发送接收FIFO缓冲区已满数据时，由于接收到新报文而需要写入数据时，缓冲区中最旧的数据将被接收到的报文覆盖。发送接收FIFO缓冲区的读指针同时移动到下一个最旧的消息。这

CFDCFSTSn.CFMOW位然后设置为1，通知最旧的消息已被接收的消息覆盖。此外，当发送接收FIFO缓冲区已满时发生CAN总线错误或发送报文仲裁丢失时，发送报文丢失且不进行报文重传。读取指针自动移动到下一条消息。

GWFIFO缓冲区的中断生成条件可以通过设置相应的通用FIFO配置控制寄存器中的CFDCFCCn.CFIM位来配置。

如果CFDCFCCn.CFIM位为0，则当FIFO计数器递增并达到CFDCFCCn.CFIGCV配置的值时设置RX中断标志 ，并且当FIFO成功发送最后一条消息时设置TX中断标志 。

如果CFDCFCCn.CFIM位为1，则RX中断标志 在每个接收到的消息的存储结束时设置，并且TX
如果消息从FIFO成功发送，则设置中断标志。

CommonFIFO可以在以下情况下设置中断：

●CAN帧传输完成

●CAN帧接收完成

●在RX模式或GW模式下，FIFO处于满状态。

当CFDCFCCEn.CFBME=1时，模式为FIFO缓冲，发送数据存储在CommonFIFO中，停止发送。如果设置为CFDCFCCEn.CFBME=0，则开始传输。

配置为GW模式的CommonFIFO缓冲区可以通过清除Common中的CFDCFCCn.CFE位来禁用。
FIFO配置控制寄存器。如果该位清零，则GWFIFO变为空，如下所示：

●如果来自GWFIFO的消息既没有安排下一次传输也没有在传输中，则立即执行

●传输完成后，检测到CAN总线错误、仲裁丢失或转换到
如果来自GWFIFO的传输已被安排传输或已在传输中，则通道或全局暂停模式。

GWFIFO中未决的其他可能消息将丢失。

在再次设置CFDCFCCn.CFE之前，确保设置了CFDCFSTSn.CFEMP位并且没有来自GWFIFO的挂起的中止。

当CFDCFCCn.CFE位清零并设置CFDCFSTSn.CFEMP位时，GWFIFO中报文的读写指针被清零，不再处于活动状态。因此，GWFIFO缓冲区中的所有消息都将丢失，并且无法将更多消息存储到GWFIFO中。

在打算用作CAN到CAN网关的应用中，如果路由消息的错误状态指示(ESI)信息不被发送节点错误状态指示替换，则建议。为此，每个通道都有控制功能寄存器CFDCnFDCFG.ESIC来用路由ESI信息替换自己的ESI信息。

Note: 如果发送节点是错误被动的，ESI位无论如何都会作为错误被动（ESI=1）发送。

Note: 此功能在经典CAN功能中不可用，因为CFDCnFDCFG不在经典CAN中。

(3) FIFO传输间隔定时器

对于TX或GW模式下的每个CommonFIFO，可以指定配置为从同一FIFO缓冲区传输的两个连续消息之间的延迟。这种延迟称为间隔时间。在CFDCFCCn.CFE位置位后，从FIFO缓冲区成功发送第一条消息后，此间隔时间开始。

当TX或GW模式下的CommonFIFO被使能时，第一个报文在不考虑这个间隔时间的情况下被发送。

间隔计时器在以下情况下停止计数：

●通过清除CFDCFCCn.CFE位禁用FIFO。

●CAN通道处于CH_RESET模式。

The interval time is specified by the CFDCFCCn.CFITT value from 0 to 255 timer units in the Common FIFO Configuration/Control Register.

The timer unit can be defined based on two different source clocks for the interval timer. To disable the interval timer for FIFO transmission, select a value of 0.

The timer source can be selected with the configuration bit CFITSS in the Common FIFO Configuration/Control Register.

If CAN channel bit time clock is configured as the clock source, and the CAN channel enters CH_HALT, CH_RESET, or CH_SLEEP mode, the interval timer is stopped for that channel.

If peripheral clock is selected as the interval timer clock source, the interval timer is stopped only when the CAN channel is in CH_RESET or CH_SLEEP mode.

The reference clock can be used to configure the interval time in fixed time units. It is based on the peripheral clock. The reference clock prescaler value CFDGCFG.ITRCP in the Global Configuration Register defines the relation between the peripheral clock frequency/period and the reference clock period.

See Table 32.22 for CFDGCFG.ITRCP configuration values to achieve different reference clock periods based on the peripheral clock frequency and period.

Table 32.22 Configuration example for the reference clock of the FIFO interval timer

Reference clock/Peripheral clock	1 µs	100 µs	500 µs
16 MHz/62.5 ns	16	1600	8000
20 MHz/50 ns	20	2000	10000
32 MHz/31.25 ns	32	3200	16000
50 MHz/20 ns	50	5000	25000

The reference clock resolution can be specified by the interval timer reference clock resolution value CFDCFCCn.CFITR in the Common FIFO Configuration/Control Register.

The interval time is based on the reference clock period multiplied by the configured value (x1 or x10). The reference clock based interval timer can be used to satisfy the requirements of the ISO 15765-2 Separation Time. The whole range for the separation time from 100 µs to 127 µs can be covered.

The specified interval time starts after successful transmission event (after EOF7 state of the CAN protocol).

When the interval time has elapsed, the next transmission request is raised by the related TX/GW FIFO. Therefore, the interval time defines the minimum time between two messages transmitted from one FIFO.

The next message is sent at earliest after this interval time. Figure 32.45 shows an example timing of the internal processing.

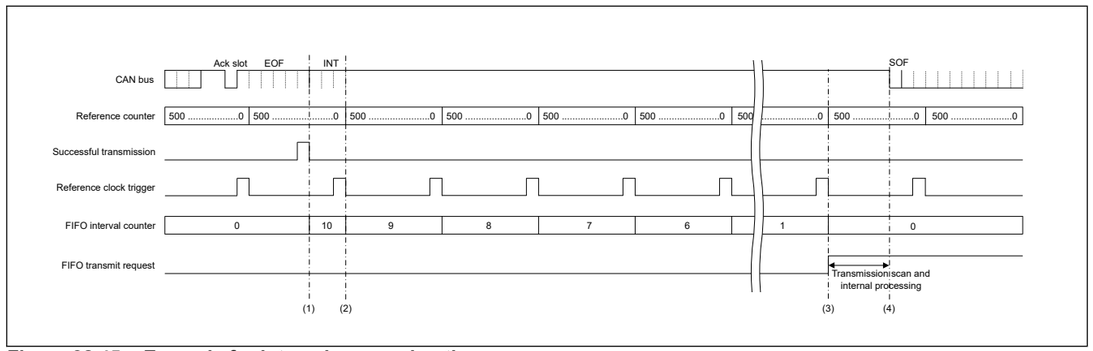

Figure 32.45 Example for interval processing time

The configuration for the timing in Figure 32.45 is as follows:

- Peripheral clock frequency = 50 MHz
- Interval timer reference clock (CFDGCFG.ITRCP) = 500 times
- Reference clock from the settings in Figure 32.45 = 10 µs

间隔时间由CommonFIFO中0到255个定时器单位的CFDCFCCn.CFITT值指定
Configuration/Control Register.

可以根据间隔定时器的两个不同源时钟来定义定时器单元。禁用间隔计时器
FIFO传输，选择值0。

定时器源可以通过通用FIFO配置控制寄存器中的配置位CFITSS来选择。

如果CAN通道位时间时钟配置为时钟源，并且CAN通道进入CH_HALT、CH_RESET或
CH_SLEEP模式，该通道的间隔定时器停止。

如果选择外设时钟作为间隔定时器时钟源，则间隔定时器只有在CAN通道处于CH_RESET或CH_SLEEP模式时才会停止。

参考时钟可用于以固定时间单位配置间隔时间。它基于外设时钟。全局配置寄存器中的参考时钟预分频器值CFDGCFG.ITRCP定义了外设时钟频率周期和参考时钟周期之间的关系。

有关CFDGCFG.ITRCP配置值，请参见表32.22，以根据外设时钟频率和周期实现不同的参考时钟周期。

Table 32.22 FIFO间隔定时器的参考时钟配置示例

参考时钟外设时钟	1 µs	100 µs	500 µs
16 MHz/62.5 ns	16	1600	8000
20 MHz/50 ns	20	2000	10000
32 MHz/31.25 ns	32	3200	16000
50 MHz/20 ns	50	5000	25000

参考时钟分辨率可以通过公共FIFO配置控制寄存器中的间隔定时器参考时钟分辨率值CFDCFCCn.CFITR来指定。

间隔时间基于参考时钟周期乘以配置值（x1或x10）。基于参考时钟的间隔定时器可用于满足ISO15765-2分离时间的要求。可以覆盖从100µs到127µs的整个分离时间范围。

指定的间隔时间在成功传输事件后（在CAN协议的EOF7状态后）开始。

当间隔时间过去时，下一个传输请求由相关的TXGWFIFO提出。因此，间隔时间定义了从一个FIFO传输的两条消息之间的最短时间。

下一条消息最早在此间隔时间之后发送。图32.45显示了内部处理的示例时序。

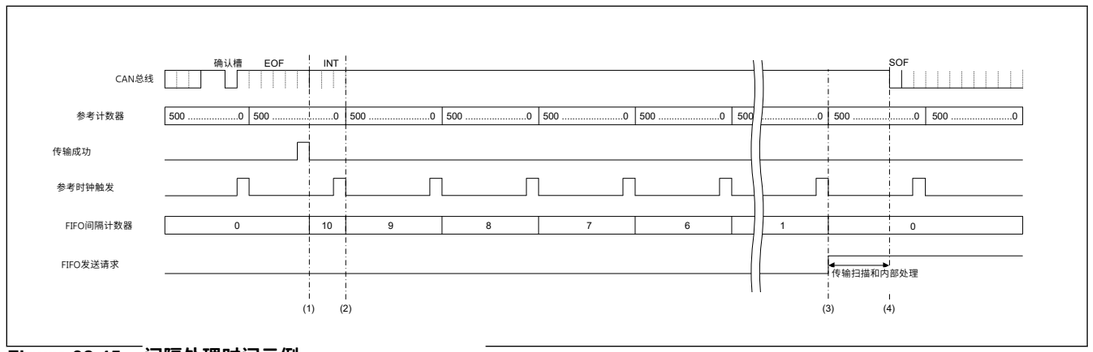

Figure 32.45 间隔处理时间示例

图32.45中的时序配置如下：

- 外设时钟频率=50MHz
- 间隔定时器参考时钟(CFDGCFG.ITRCP)=500次
- 图32.45中设置的参考时钟=10µs

- Common FIFO interval timer source selection (CFDCFCCn.CFITSS) = 0
- Common FIFO interval timer resolution (CFDCFCCn.CFITR) = 0
- Common FIFO interval transmission time (CFDCFCCn.CFITT) = 10 times
- Theoretical message separation interval = 100 µs

1. Internal FIFO interval timer is restarted with the occurrence of successful transmission result. This restart is not synchronized to the reference clock trigger. Therefore, the first interval is counting less or equal to 1 reference clock interval.
2. With the next reference clock trigger the FIFO interval timer is decremented.
3. When the FIFO interval timer reached the value 0, the FIFO transmit request is set.
4. When the FIFO is selected for transmission, the transmission starts. Due to internal processing, this usually takes less than 3 CAN bit time, between the internal FIFO transmit request set in step 3. and the actual transmission.

In the worst case when multiple events such as a reception scan, an internal message routing, a transmit scan on all channels occur, it can take up to 1152 peripheral clock cycles.

As shown in Figure 32.45, it is not guaranteed that the minimum interval is always equal to the configured value. If a minimum time must never be breached, configure CFDCFCCn.CFITT to the required minimum value plus 1.

If additional TX message buffers or TX/GW FIFOs are configured for transmission of the same channel, the real delay between two messages transmitted from a TX FIFO can be much longer than specified by the interval time. This is due to higher priority message transmission from these TX message buffers or TX/GW FIFOs.

Figure 32.46 shows a block diagram of the FIFO interval time generation circuit.

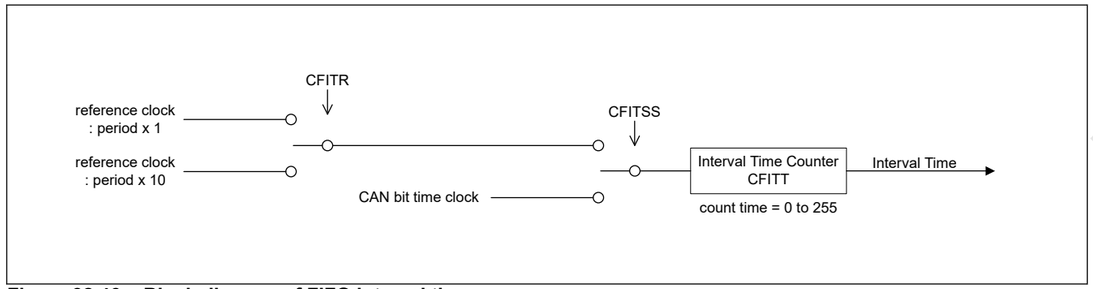

Figure 32.46 Block diagram of FIFO interval timer

32.8.2.4 TX Queue

Each enabled TX Queue for a specific channel consists of three to 16 TX message buffers, which are accessed through one access window. One channel has four TX Queues:

- The first TX Queue can be configured with a depth of three up to eight buffers and uses TX Message Buffer No. 0 as access window (referred to as TXQ0)
- The second TX Queue can be configured with a depth of three up to eight buffers and uses TX Message Buffer No. 7 as access window (referred to as TXQ1)
- The third TX Queue can be configured with a depth of three up to eight buffers and uses TX Message Buffer No. 32 as access window (referred to as TXQ2)
- The fourth TX Queue can be configured with a depth of three up to eight buffers and uses TX Message Buffer No. 39 as access window (referred to as TXQ3).

All the TXQ0, TXQ1, TXQ2 and TXQ3 messages enter the priority comparison for transmission, which should be only ID Priority (CFDGCFG.TPRI = 0).

The registers for TXQ0 are:

- CFDTXQCC0[n]
- CFDTXQSTS0[n]

●通用FIFO间隔定时器源选择(CFDCFCCn.CFITSS)=0
●通用FIFO间隔定时器分辨率(CFDCFCCn.CFITR)=0
●普通FIFO间隔传输时间（CFDCFCCn.CFITT）=10次
●理论消息分离间隔=100µs

1.内部FIFO间隔定时器随着成功传输结果的出现而重新启动。这次重启不同步到参考时钟触发。因此，第一个间隔计数小于或等于1个参考时钟间隔。

2.随着下一个参考时钟触发，FIFO间隔定时器递减。

3.当FIFO间隔定时器达到值0时，设置FIFO发送请求。

4.WhentheFIFOisselectedfortransmission thetransmissionstarts.由于内部处理，在步骤3中设置的内部FIFO发送请求和实际发送之间，这通常需要不到3个CAN位时间。

在最坏的情况下，当接收扫描、内部消息路由、所有通道上的发送扫描等多个事件发生时，可能需要多达1152个外设时钟周期。

如图32.45所示，不能保证最小间隔总是等于配置的值。如果决不能超过最短时间，请将CFDCFCCn.CFITT配置为所需的最小值加1。

如果额外的TX消息缓冲区或TXGWFIFO配置为传输同一通道，则从TXFIFO传输的两个消息之间的实际延迟可能比间隔时间指定的长得多。这是由于来自这些TX消息缓冲区或TXGWFIFO的更高优先级的消息传输。

图32.46显示了FIFO间隔时间生成电路的框图。

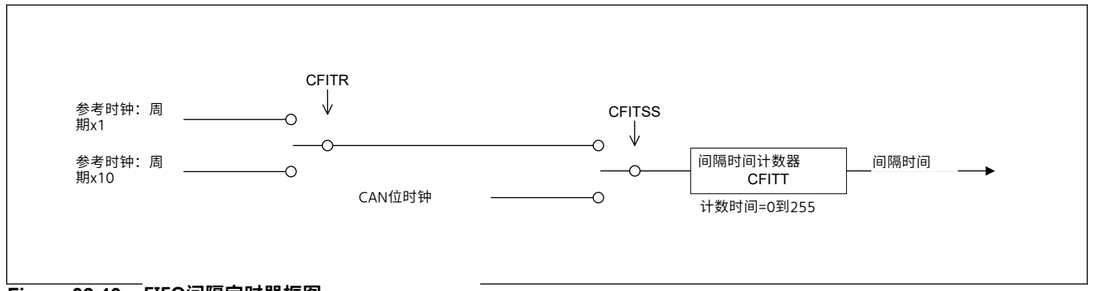

Figure 32.46 FIFO间隔定时器框图

32.8.2.4 TX Queue

特定通道的每个启用的TX队列由3到16个TX消息缓冲区组成，这些缓冲区通过一个访问窗口访问。一个通道有四个TX队列：

●第一个TXQueue可以配置深度为3到8个缓冲区，并使用0号TX消息缓冲区作为访问窗口（简称TXQ0）

●第二个TXQueue可配置深度为3到8个缓冲区，并使用7号TX消息缓冲区作为访问窗口（简称TXQ1）

●第三个TXQueue可配置深度为3到8个缓冲区，并使用32号TXMessageBuffer作为访问窗口（简称TXQ2）

●第四个TXQueue可配置深度为3到8个缓冲区，并使用39号TX消息缓冲区作为访问窗口（简称TXQ3）。

所有的TXQ0、TXQ1、TXQ2、TXQ3报文都进入优先级比较进行传输，应该只有ID Priority (CFDGCFG.TPRI = 0).

TXQ0的寄存器是：

- CFDTXQCC0[n]
- CFDTXQSTS0[n]

- CFDTXQPCTR0[n].

The registers for TXQ1 are:

- CFDTXQCC1[n]
- CFDTXQSTS1[n]
- CFDTXQPCTR1[n].

The registers for TXQ2 are:

- CFDTXQCC2 [n]
- CFDTXQSTS2[n]
- CFDTXQPCTR2[n].

The registers for TXQ3 are:

- CFDTXQCC3[n]
- CFDTXQSTS3[n]
- CFDTXQPCTR3[n].

See related access registers TX Message Buffer ID Registers (TMID[m]), TX Message Buffer Pointer Registers (TMPTR[m]), TX Message Buffer Data Field 0 Registers, and TX Message Buffer Data Field 1 Registers (TMDF[0:1][m]) when access window TXQ0, TXQ1, TXQ2, or TXQ3 is used.

The depth of each TXQ0 buffer can be configured by writing to the CFDTXQCC0n.TXQDC[12:8] bits of the TX Queue Configuration/Control Register. TXQ0 can be set from TXMB0 to TXMB7 as a queue buffer at the maximum.

The 15 available options for the depth configuration of TXQ0 buffer are:

- 0x00: TX Queue disabled
- 0x01: Reserved
- 0x02: 3 messages
- ⋮
- 0x0D: 14 messages
- 0x0E: 15 messages
- 0x0F: 16 messages

The depth of each TXQ1 buffer can be configured by writing to the CFDTXQCC1n.TXQDC[12:8] bits of the TX Queue Configuration/Control Register. TXQ1 can be set from TXMB7 to TXMB0 as a queue buffer at the maximum.

The 15 available options for the depth configuration of TXQ1 buffer are:

- 0x00: TX Queue disabled
- 0x01: Reserved
- 0x02: 3 messages
- ⋮
- 0x0D: 14 messages
- 0x0E: 15 messages
- 0x0F: 16 messages

The depth of each TXQ2 buffer can be configured by writing to the CFDTXQCC2n.TXQDC[12:8] bits of the TX Queue Configuration/Control Register. TXQ2 can be set from TXMB32 to TXMB39 as a queue buffer at the maximum.

The 15 available options for the depth configuration of TXQ2 buffer are:

- 0x00: TX Queue disabled
- 0x01: Reserved

- CFDTXQPCTR0[n].

TXQ1的寄存器是：

- CFDTXQCC1[n]
- CFDTXQSTS1[n]
- CFDTXQPCTR1[n].

TXQ2的寄存器是：

- CFDTXQCC2 [n]
- CFDTXQSTS2[n]
- CFDTXQPCTR2[n].

TXQ3的寄存器是：

- CFDTXQCC3[n]
- CFDTXQSTS3[n]
- CFDTXQPCTR3[n].

请参阅相关访问寄存器TX报文缓冲区ID寄存器(TMID[m])、TX报文缓冲区指针寄存器(TMPTR[m])、TX报文缓冲区数据字段0寄存器和TX报文缓冲区数据字段1寄存器(TMDF[0:1][m])当使用访问窗口TXQ0、TXQ1、TXQ2或TXQ3时。

每个TXQ0缓冲区的深度可以通过写入TX队列的CFDTXQCC0n.TXQDC[12:8]位来配　　置配置控制寄存器。TXQ0最大可以设置为TXMB0到TXMB7作为队列缓冲区。

TXQ0缓冲区深度配置的15个可用选项是：

- 0x00：TX队列禁用
- 0x01: Reserved
- 0x02: 3 messages
- ⋮
- 0x0D: 14 messages
- 0x0E: 15 messages
- 0x0F: 16 messages

每个TXQ1缓冲区的深度可以通过写入TX队列的CFDTXQCC1n.TXQDC[12:8]位来配　　置配置控制寄存器。TXQ1最大可以设置为TXMB7到TXMB0作为队列缓冲区。

TXQ1缓冲器深度配置的15个可用选项是：

- 0x00：TX队列禁用
- 0x01: Reserved
- 0x02: 3 messages
- ⋮
- 0x0D: 14 messages
- 0x0E: 15 messages
- 0x0F: 16 messages

每个TXQ2缓冲区的深度可以通过写入TX队列的CFDTXQCC2n.TXQDC[12:8]位来配　　置配置控制寄存器。TXQ2最大可以设置为TXMB32到TXMB39作为队列缓冲区。

TXQ2缓冲器深度配置的15个可用选项是：

- 0x00：TX队列禁用
- 0x01: Reserved

- 0x02: 3 messages
- ⋮
- 0x0D: 14 messages
- 0x0E: 15 messages
- 0x0F: 16 messages

The depth of each TXQ3 buffer can be configured by writing to the CFDTXQCC3n.TXQDC[12:8] bits of the TX Queue Configuration/Control Register. TXQ3 can be set from TXMB39 to TXMB32 as a queue buffer at the maximum.

The 15 available options for the depth configuration of TXQ3 buffer are:

- 00000b: TX Queue disabled
- 00001b: Reserved
- 00010b: 3 messages
- ⋮
- 0x0D: 14 messages
- 0x0E: 15 messages
- 0x0F: 16 messages

When using TXQ1 and TXQ0 simultaneously, the depth of TXQ is 8 or less in total.

When using TXQ3 and TXQ2 simultaneously, the depth of TXQ is 8 or less in total.

Do not access all the TX message buffers forming the TX Queue directly (except TX Message Buffer No. 39, TX Message Buffer No. 32, TX Message Buffer No. 7 and TX Message Buffer No. 0, which act as TX Queue access window).

When CFDGAFLP0n.GAFLSRD i (i = 0 to 2) is set and the CFDTXQCCin.TXQGWE (i = 0 to 2, n = 0 to 7) is also set, a receiving frame is stored in the target TXQ as send data by routing.

When CFDTXQCCn.TXQOWE bit is 1, the TX Queue is in TX Queue Overwrite mode. If the message of the same ID is stored in TX Queue when a frame is received and it is stored in TX Queue, an old message is overwritten by a new message. Therefore, an old message is not transmitted. When the old message of the same ID is transmitting and a CAN bus error and an arbitration-lost occur, the message of old ID is not resent.

When using the function in GW mode and TX Queue Overwrite mode, the depth of TXQ (CFDTXQCC0n.TXQDC) should be configured to a value that is the various number of ID used in the TX Queue plus 3. If it accesses by routing in GW mode when a TXQ buffer is full, CFDTXQSTS.TXQMLT is set and send data is thrown away. The function is valid for the standard ID frame and is invalid for the extended ID frame.

Operation of the TXQ same ID over-writing function in GW mode is shown in the following figure.

- 0x02: 3 messages
- ⋮
- 0x0D: 14 messages
- 0x0E: 15 messages
- 0x0F: 16 messages

每个TXQ3缓冲区的深度可以通过写入TX队列的CFDTXQCC3n.TXQDC[12:8]位来配　　置
配置控制寄存器。TXQ3最大可以设置为TXMB39到TXMB32作为队列缓冲区。

TXQ3缓冲器深度配置的15个可用选项是：

●00000b：TX队列禁用

- 00001b: Reserved
- 00010b: 3 messages
- ⋮
- 0x0D: 14 messages
- 0x0E: 15 messages
- 0x0F: 16 messages

当同时使用TXQ1和TXQ0时，TXQ的深度总共为8或更少。

当同时使用TXQ3和TXQ2时，TXQ的深度总共为8或更少。

不要直接访问形成TXQueue的所有TX消息缓冲区（TX消息缓冲区No.39，TX消息除外）
BufferNo.32、TXMessageBufferNo.7和TXMessageBufferNo.0，作为TXQueue访问窗口）。

当CFDGAFLP0n.GAFLSRDi(i=0to2)被设置并且CFDTXQCCin.TXQGWE(i=0to2 n=0to7)也被设置时，接收帧被存储
在目标TXQ作为路由发送数据.

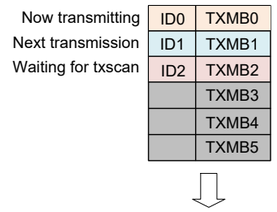
当CFDTXQCCn.TXQOWE位为1时，TXQueue处于TXQueueOverwrite模式。如果在接收到一帧时将相同ID的消息存储在TXQueue中，并将其存储在TXQueue中，则旧消息将被新消息覆盖。因此，不发送旧消息。当发送相同ID的旧报文时，出现CAN总线错误和仲裁丢失时，旧ID报文不再发送。

在GW模式和TXQueueOverwrite模式下使用该功能时，TXQ的深度（CFDTXQCC0n.TXQDC）应配置为TXQueue中使用的各种ID数加3的值。如果通过GW中的路由访问当TXQ缓冲区已满时，设置CFDTXQSTS.TXQMLT并丢弃发送数据。该功能对标准ID帧有效，对扩展ID帧无效。

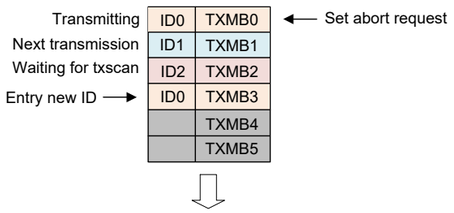
GW模式下TXQ同ID覆盖功能的操作如下图所示。

TXQ0 depth = 6 buffers, ID is 3, TXQ0 GW mode

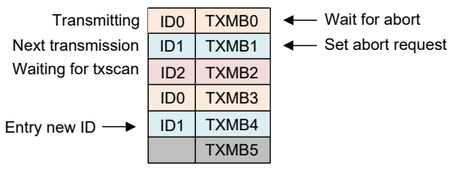
1. Three frames are stored.



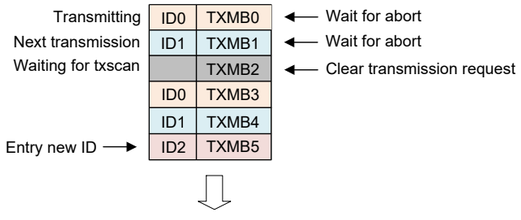
2. ID0 is stored in TXMB3 and abort is set as TXMB0.



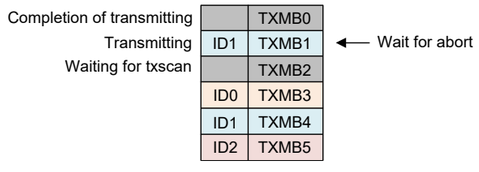
3. ID1 is stored in TXMB4 and abort is set as TXMB1.



4. ID2 is stored in TXMB5 and the transmit request of TXMB2 is cleared.



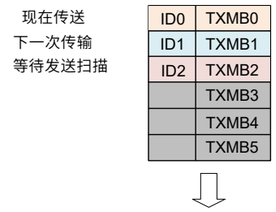
5. Transmission of TXMB0 is complete and transmission of ID1 of TXMB1 is started.



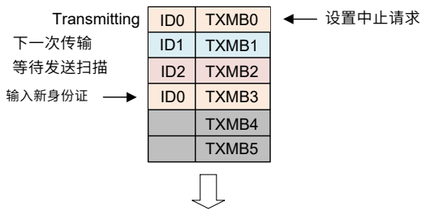
When a system writes in TXQ, it writes in send data, after checking the state of TXQ.

TXQ0深度=6个缓冲区，ID为3，TXQ0GW模式

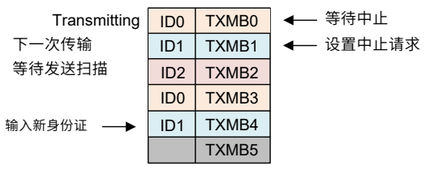
1.存储三帧。



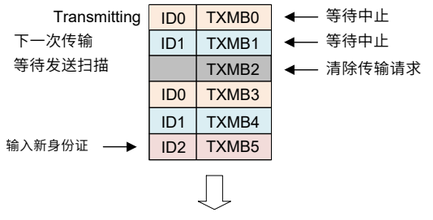
2.ID0存储在TXMB3中，abort设置为TXMB0。



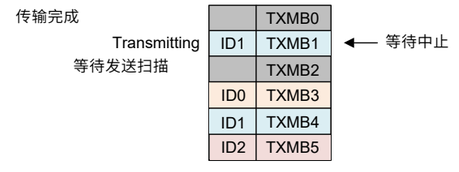
3.ID1存储在TXMB4中，abort设置为TXMB1。



4.ID2存储在TXMB5中，TXMB2的发送请求被清除。



5.TXMB0发送完成，开始发送TXMB1的ID1。



当系统写入TXQ时，它会在检查TXQ的状态后写入发送数据。

Do not access or configure the related TX Message Buffer Control Registers.

The messages stored to the TX Queue access window are internally stored to a free buffer of the TX Queue.

When the buffer is full, no further access should be done to the queue, until it is no longer full. If access is a software write when the buffer of TXQ is full, send data is overwritten.

The TX Queue can be disabled by clearing the TXQE bit in the TX Queue Configuration/Control Register. If this bit is cleared, the TX Queue Empty flag is set as follows:

- Immediately if the message from the TX Queue is neither scheduled for the next transmission nor in transmission
- Following the transmission completion, the detection of an error on the CAN bus, loss of arbitration or transition to Channel or Global Halt mode if the transmission from the TX Queue is already scheduled for transmission or already in transmission.

Note: The TX Queue is disabled only when the Empty flag is set after clearing the TXQE bit for the corresponding TX Queue.

Other possible messages pending from the TX Queue are lost and their transmission must be requested again.

Before TXQE is set again, ensure that the CFDTXQSTSn.TXQEMP bit is set and that there is no pending abort from the TX Queue.

When the TXQE bit is cleared, all messages in the TX Queue buffers are lost and no further message should be stored in the TX Queue.

When a message has been stored to the TX Queue, write 0xFF in the TX Queue Pointer Control Register. This sets the transmit request automatically and changes the internal message buffer pointer to the next free message buffer location of the TX Queue.

Note: If two messages with the same ID are stored in the TX Queue, the order of transmission of these messages can be different from the order in which they were stored in the TX Queue.

To avoid this condition, it is important to confirm that the previous message with the same ID was successfully transmitted before a new message with the same ID is stored in the TX Queue.

If TX Queue Overwrite mode is used, the frame of the same ID is rewritten on a new frame.

For the TX Queue, a dedicated interrupt can be enabled by setting the TXQIE bit of the TX Queue Configuration/Control Register.

The interrupt mode can be configured with the CFDTXQCCn.TXQIM bit of the same register either to generate an interrupt for every transmitted message or for the last transmitted message.

The TX Queue transmission request procedure after configuration is shown in Figure 32.48.

不要访问或配置相关的TX报文缓冲区控制寄存器。

存储到TXQueue访问窗口的消息在内部存储到TXQueue的空闲缓冲区中。

当缓冲区已满时，不应进一步访问队列，直到它不再满为止。如果在TXQ的缓冲区已满时访问是软件写入，则发送数据将被覆盖。

可以通过清除TX队列配置控制寄存器中的TXQE位来禁用TX队列。如果该位清零，则TXQueueEmpty标志设置如下：

- 如果来自TXQueue的消息既没有安排下一次传输也没有在传输中，则立即执行
- 传输完成后，检测到CAN总线错误、仲裁丢失或转换到
  如果来自TX队列的传输已被安排传输或已在传输中，则通道或全局暂停模式。

Note: 只有在清除相应TX的TXQE位后设置Empty标志时，才会禁用TX队列
Queue.

其他可能从TXQueue挂起的消息丢失，必须再次请求它们的传输。

在再次设置TXQE之前，确保CFDTXQSTSn.TXQEMP位已设置并且没有挂起的中止来自
TX Queue.

当TXQE位被清零时，TX队列缓冲区中的所有消息都将丢失，并且不应将更多消息存储在
TX Queue.

当消息已存储到TX队列时，在TX队列指针控制寄存器中写入0xFF。这会自动设置发送请求并将内部消息缓冲区指针更改为TX队列的下一个空闲消息缓冲区位置。

Note: 如果两个具有相同ID的消息存储在TXQueue中，则这些消息的传输顺序可能与它们存储在TXQueue中的顺序不同。

为避免这种情况，重要的是在将具有相同ID的新消息存储到TXQueue之前确认先前具有相同ID的消息已成功传输。

如果使用TXQueueOverwrite模式，相同ID的帧将被重写到新帧上。

对于TX队列，可以通过设置TX队列配置控制的TXQIE位来启用专用中断
Register.

可以使用同一寄存器的CFDTXQCCn.TXQIM位配置中断模式，以便为每个发送的消息或最后发送的消息产生中断。

配置后的TXQueue发送请求流程如图32.48所示。

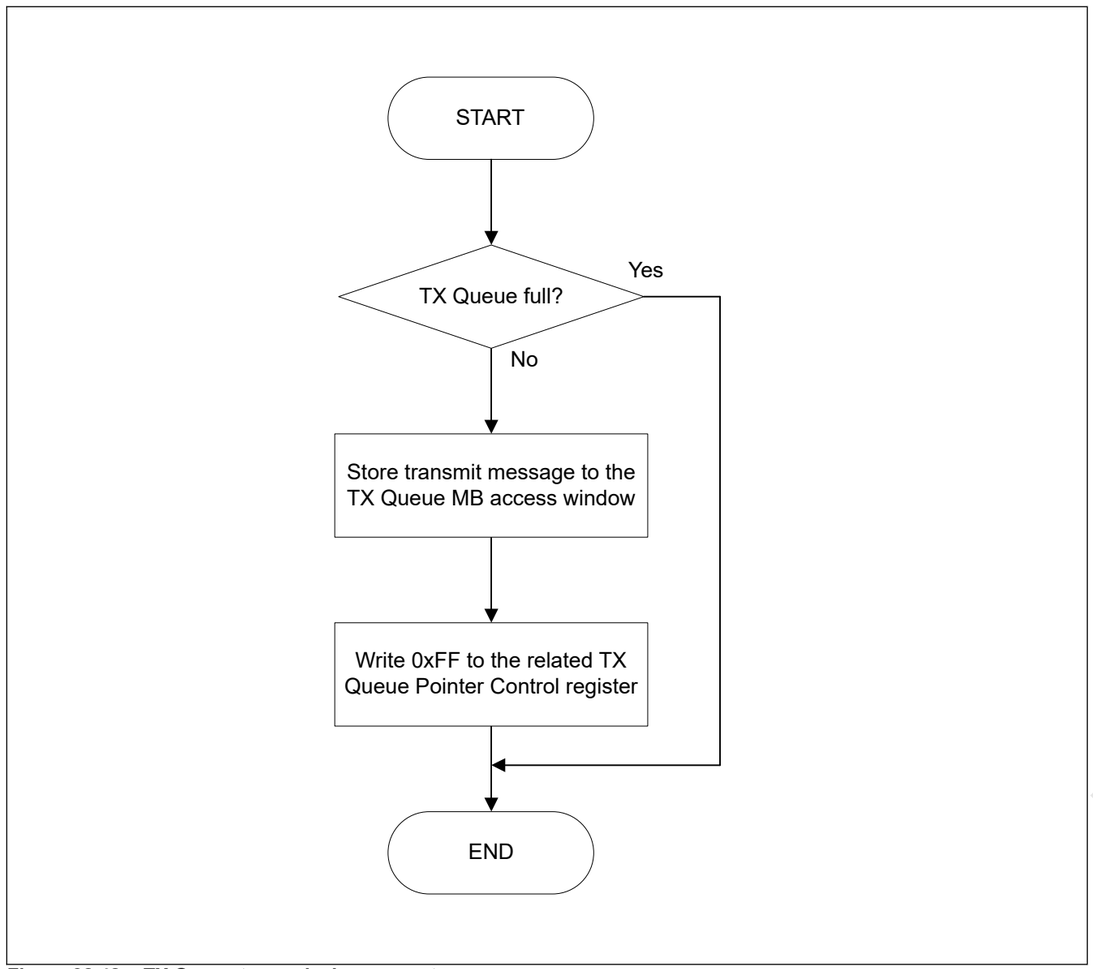


Figure 32.48 TX Queue transmission request

TXQ name	Access window	Range width	Direction	Hardware routing access point	CPU access point	DMA access point	Note
TXQ0	TXMB0	0, 3-16	TXMB0 → TXMB7	Yes	Yes	Yes	When using both TXQ0 and TXQ1, the total number of stages is 8 or less
TXQ1	TXMB7	0, 3-16	TXMB7 → TXMB0	Yes	No	No	
TXQ2	TXMB32	0, 3-16	TXMB32 → TXMB39	Yes	No	No	When using both TXQ2 and TXQ3, the total number of stages is 8 or less
TXQ3	TXMB39	0, 3-16	TXMB39 → TXMB32	No	Yes	Yes	

TXQ0 can use hardware routing access, CPU access, and DMA access. However, these access methods should not be used simultaneously. Only choose one access method.

32.8.2.5 TX History List

The TX History List function records the information of the successfully transmitted message in the TX History List Buffers for each CAN channel. Two TX History List buffers are provided for each CAN channel and each THL buffer can store up to 16 TX History List entries for a CAN channel.

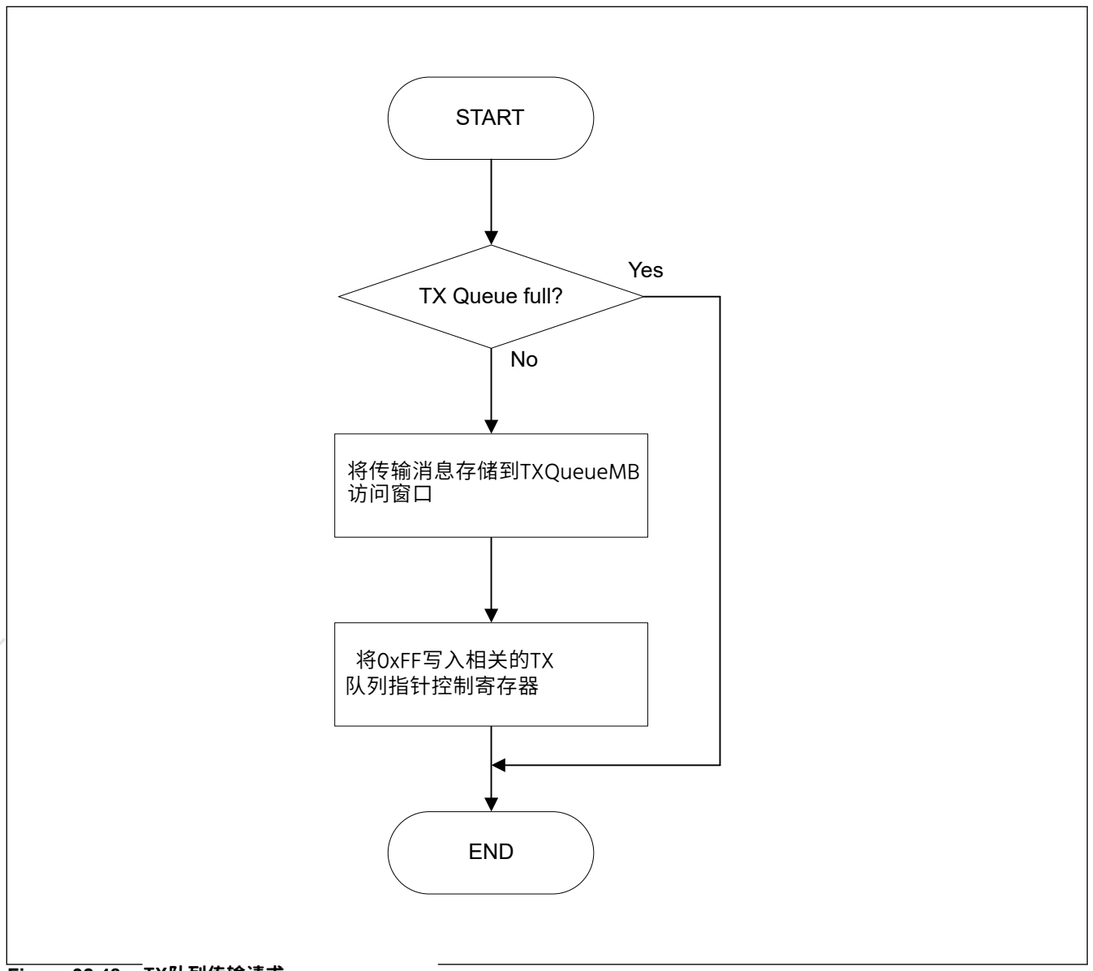

Figure 32.48 TX队列传输请求

TXQ name	访问窗口	范围宽度	Direction	硬件路由接入点	CPU访问点	DMA访问点	Note
TXQ0	TXMB0	0, 3-16	TXMB0 → TXMB7	Yes	Yes	Yes	当同时使用TXQ0和TXQ1，总级数为8或更少
TXQ1	TXMB7	0, 3-16	TXMB7 → TXMB0	Yes	No	No	
TXQ2	TXMB32	0, 3-16	TXMB32 → TXMB39	Yes	No	No	当同时使用TXQ2和TXQ3，总级数为8或更少
TXQ3	TXMB39	0, 3-16	TXMB39 → TXMB32	No	Yes	Yes	

TXQ0可以使用硬件路由访问、CPU访问和DMA访问。但是，这些访问方法不应同时使用。只选择一种访问方法。

32.8.2.5 交易历史列表

TXHistoryList功能将成功传输的报文信息记录在每个CAN通道的TXHistoryListBuffers中。为每个CAN通道提供两个TX历史列表缓冲区，每个THL缓冲区可以为一个CAN通道存储多达16个TX历史列表条目。

The CFDTHLCCn.THLDTE bit of the TX History List Configuration/Control Register can be used to configure if only message information from TX FIFOs or TX Queue is stored, or if all transmit message information from TX Queue, TX FIFO, or normal TX message buffers is stored in the TX History List for a CAN channel.

When a CFDTHLCCn.THLDGE bit is set, the information on all the frames transmitted in Gateway mode is stored in TX History List. Each transmit message can be individually configured for acceptance to the TX History List with the CFDCFID.THLEN bit in the Message Buffer Pointer Register.

The message information is stored to the TX History List Buffer of a CAN channel after the message is successfully transmitted on that CAN channel.

Storing to the list is not synchronized with the status of CFDTMSTSn.TMTRF[1:0] bits in the TX Message Buffer Status Register.

Due to internal processing, the storage to the list can happen with a delay after the successful transmission indication.

Storing the TX History List data can be recognized by the condition that the THLIF is set to 1 when the THLIE bit is configured to 1 or when the TX History List counter CFDTHLSTSn.THLMC[5:0] is increased.

The delay time is dependent on the number of channels due to internal processing.

- Maximum delay time from setting the CFDTMSTSn.TMTRF to store the TX History List data is 224 peripheral bus clock cycles.

The History list records the following information of a transmitted message:

- Buffer type:
  - 001: TX Message Buffer
  - 010: TX FIFO
  - 100: TX Queue
- Buffer number:
  TX message buffer, TX Queue message buffer or TX message buffer link for the Common FIFO buffer from which transmission occurred. The number depends on the buffer type. See Table 32.23.
- Transmission ID:
  Transmission pointer stored in the transmission message
- Transmit timestamp:
  Message timestamp captured at capture point as configured by CFDGFDCFG.TSCCFG.
- Transmission information label:
  Transmission information label stored in the transmission message.
- Transmit gateway buffer indication:
  When data is transmitted from gateway, CFDTHLACC0n.TGW bit is set to 1.

TX历史列表配置控制寄存器的CFDTHLCCn.THLDTE位可用于配置是否仅存储来自TXFIFO或TX队列的报文信息，或者是否存储了来自TXQueue、TXFIFO或正常TX报文缓冲区的所有发送报文信息存储在CAN通道的TX历史列表中。

当CFDTHLCCn.THLDGE位置位时，在网关模式下传输的所有帧的信息都存储在TX中
历史列表。每个发送消息都可以单独配置为接受到TX历史列表，其中
消息缓冲区指针寄存器中的CFDCFID.THLEN位。

在CAN通道上成功传输消息后，消息信息将存储到CAN通道的TX历史列表缓冲区。

存储到列表与TX消息缓冲区状态中CFDTMSTSn.TMTRF[1:0]位的状态不同步
Register.

由于内部处理，在成功传输指示后存储到列表可能会有延迟。

当THLIE位配置为1或TX历史列表计数器CFDTHLSTSn.THLMC[5:0]增加时，THLIF设置为1的条件可以识别存储TX历史列表数据。

由于内部处理，延迟时间取决于通道数。

●从设置CFDTMSTSn.TMTRF到存储TXHistoryList数据的最大延迟时间为224个外设总线时钟周期。

历史列表记录传输消息的以下信息：

- Buffer type:
  001：TX消息缓冲区
  - 010: TX FIFO
  - 100: TX Queue
- Buffer number:
  用于发生传输的通用FIFO缓冲区的TX消息缓冲区、TX队列消息缓冲区或TX消息缓冲区链接。数量取决于缓冲区类型。见表32.23。
- Transmission ID:
  传输消息中存储的传输指针
- Transmit timestamp:
  在CFDGFDCFG.TSCCFG配置的捕获点捕获的消息时间戳。

●传输信息标签：
传输信息标签存储在传输消息中。

●发送网关缓冲区指示：
从网关发送数据时，CFDTHLACC0n.TGW位设置为1。

Table 32.23 TX History List Buffer number entry

BT[2:0] Buffer Type		
001b	**101b**	**100b**
TX Message Buffer	**TX FIFO**	**TX Queue**
TXMB0	Number shown corresponds to the common FIFO. TX Message Buffer Link CFTML of the related Common FIFO configuration	Number shown corresponds to the message buffer belonging to the TX Queue for which the frame was transmitted

TXMB7		
TXMB32		
TXMB33		
TXMB34		
TXMB35		
TXMB36		
TXMB37		
TXMB38		
TXMB39		

The Transmission ID entry is used to identify which message of a TX FIFO or TX Queue has been successfully transmitted because the TX FIFO or TX Queue number alone is not sufficient.

Therefore, a unique number can be attached to each transmission message stored in a TX FIFO or TX Queue. This unique identification number should be written to the CFDCFFDCSTSn.CFPTR[15:0] part of the Common FIFO Access Pointer Register for a TX FIFO or to the CFDTMFDCTRn.TMPTR[15:0] part of the TX Message Buffer Pointer Register of the TX Queue access window message buffer.

When the message is successfully transmitted, this identification number is stored together with the other message related information to the TX History List and can be read using the Transmission ID (TID) of the TX History List Access Register.

Also, for normal TX message buffers, the CFDTMFDCTRn.TMPTR[15:0] part of the TX Message Buffer Pointer Register is stored in the Transmission History List and the information label is the same.

Figure 32.48 shows a transmission preparation flow when TX History List is used.

Read access to the TX History List Access Register is done for every single entry.

After reading one entry, 0xFF must be written to the corresponding TX History List Pointer Control Register to be able to access the next entry until TX History List is empty.

Figure 32.49 shows an example flow for processing the TX History List information.

The TX History Lists have dedicated interrupts, which can be configured with the CFDTHLCCn.THLIM bit of the corresponding TX History List Configuration/Control Registers and enabled with the CFDTHLCCn.THLIE bit of the same registers, either to generate an interrupt when the History List reached a filling level of 75% or for every new TX History List entry.

An entry lost indication is flagged by the CFDTHLSTSn.THLELT bit in the TX History List Status Register. The status of this bit is also shown by the THLES bit in the Global Error Flag Register.

Table 32.23 TX历史列表缓冲区编号条目

BT[2:0]缓冲器类型		
001b	**101b**	**100b**
TX消息缓冲区	**TX FIFO**	**TX Queue**
TXMB0	显示的数字对应于常见的FIFO。TXMessageBufferLinkCFTML的相关 通用FIFO配置	显示的数字对应于属于发送帧的TX队列的消息缓冲区
TXMB1		
TXMB2

TXMB4		
TXMB5		
TXMB6		
TXMB7		
TXMB32		
TXMB33		
TXMB34		
TXMB35		
TXMB36		
TXMB37		
TXMB38		
TXMB39		

传输ID条目用于识别TXFIFO或TXQueue的哪个消息已成功传输，因为仅TXFIFO或TXQueue编号是不够的。

因此，可以将唯一编号附加到存储在TXFIFO或TX队列中的每个传输消息。此唯一标识号应写入TXFIFO的通用FIFO访问指针寄存器的CFDCFFDCSTSn.CFPTR[15:0]部分，或写入TXFIFO的TX消息缓冲区指针寄存器的CFDTMFDCTRn.TMPTR[15:0]部分德克萨斯州

队列访问窗口消息缓冲区。

当报文成功发送时，该标识号与其他报文相关信息一起存储到TX历史列表中，并可使用TX历史列表访问寄存器的发送ID(TID)读取。

此外，对于普通的TX报文缓冲区，TX报文缓冲区指针寄存器的CFDTMFDCTRn.TMPTR[15:0]部分存储在传输历史列表中，并且信息标签相同。

图32.48显示了使用TXHistoryList时的传输准备流程。

对TX历史列表访问寄存器的读取访问针对每个条目进行。

读取一个条目后，必须将0xFF写入相应的TX历史列表指针控制寄存器，才能访问下一个条目，直到TX历史列表为空。

图32.49显示了处理TX历史列表信息的示例流程。

TX历史列表具有专用中断，可以使用相应的TX历史列表配置控制寄存器的CFDTHLCCn.THLIM位进行配置，并使用相同寄存器的CFDTHLCCn.THLIE位启用，以便在达到历史列表时生成中断75%的填充水平或每个新的TX历史列表条目。

条目丢失指示由TX历史列表状态寄存器中的CFDTHLSTSn.THLELT位标记。该位的状态也由全局错误标志寄存器中的THLES位显示。

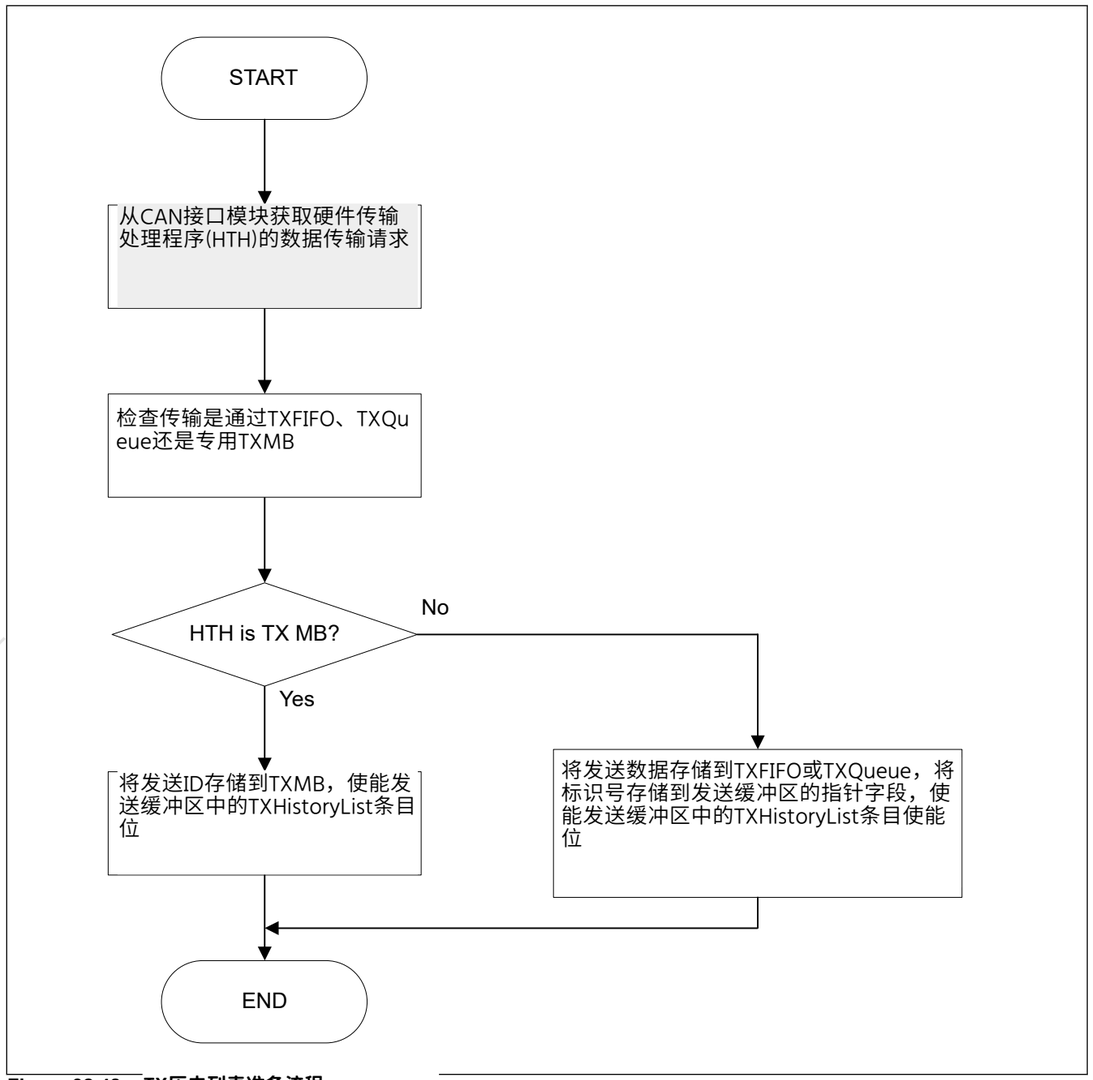

Figure 32.48 TX历史列表准备流程

RA生态工作室

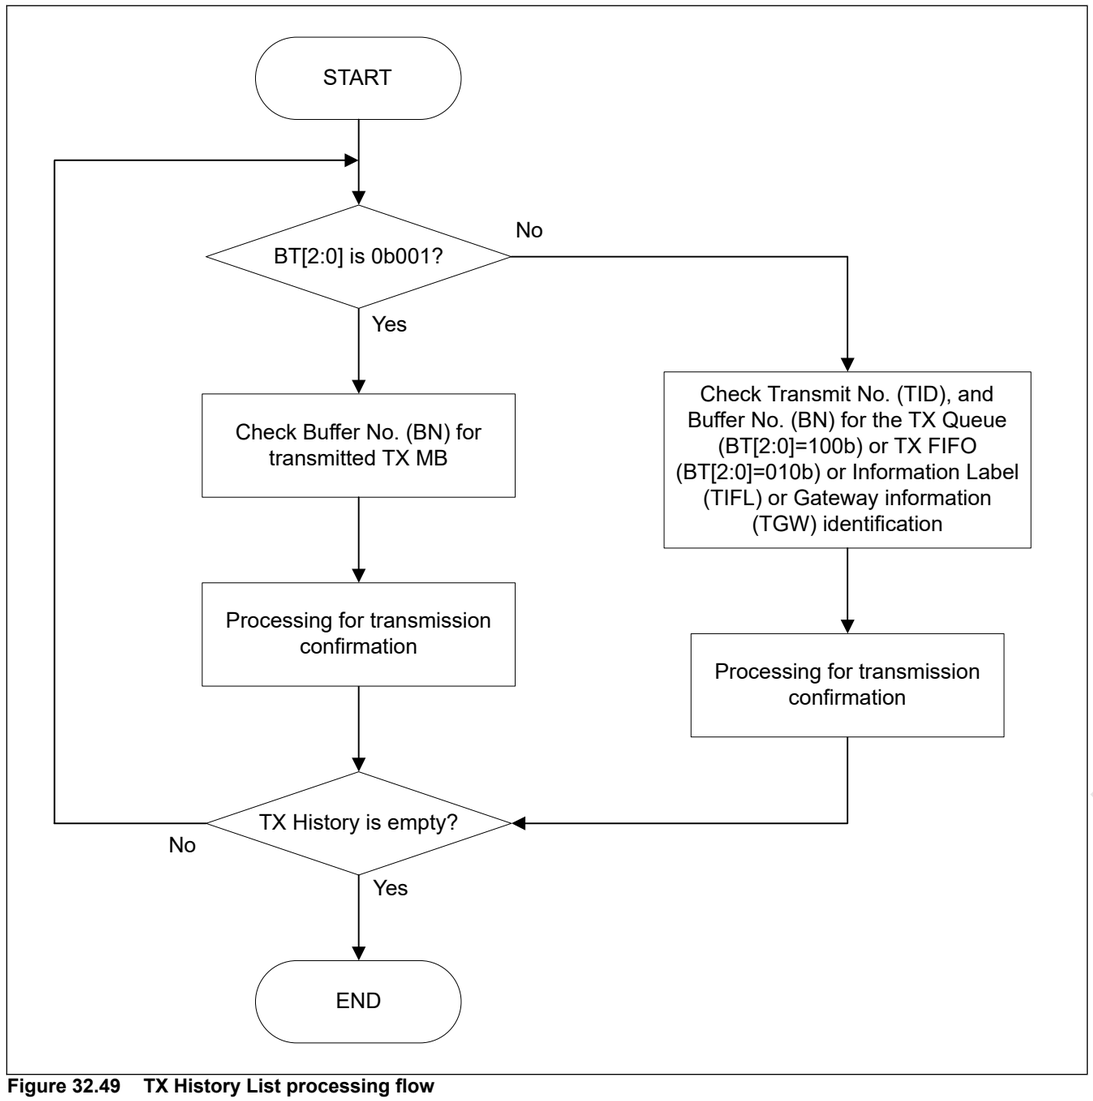

Figure 32.49 TX History List processing flow

32.8.2.6 TX Data Padding

This chapter is not valid for classical CAN.

If the data length code (DLC) of the transmitting message has a higher number of data bytes than the buffer size, the data bytes beyond the restricted range are replaced by bytes with the value of 0xCC.

This can happen for Common FIFOs configured as (TX or GW mode) when the transmit message DLC is higher than the CFDCFCCn.CFPLS.

This can also happen in FD only mode, if a Classical frame is configured with a DLC bigger than 8.

32.9 Test Mode

The CAN-FD module can be configured into test modes to allow testing of certain features. These features are provided only for special purposes and care must be taken when configuring the CAN-FD module in test modes.

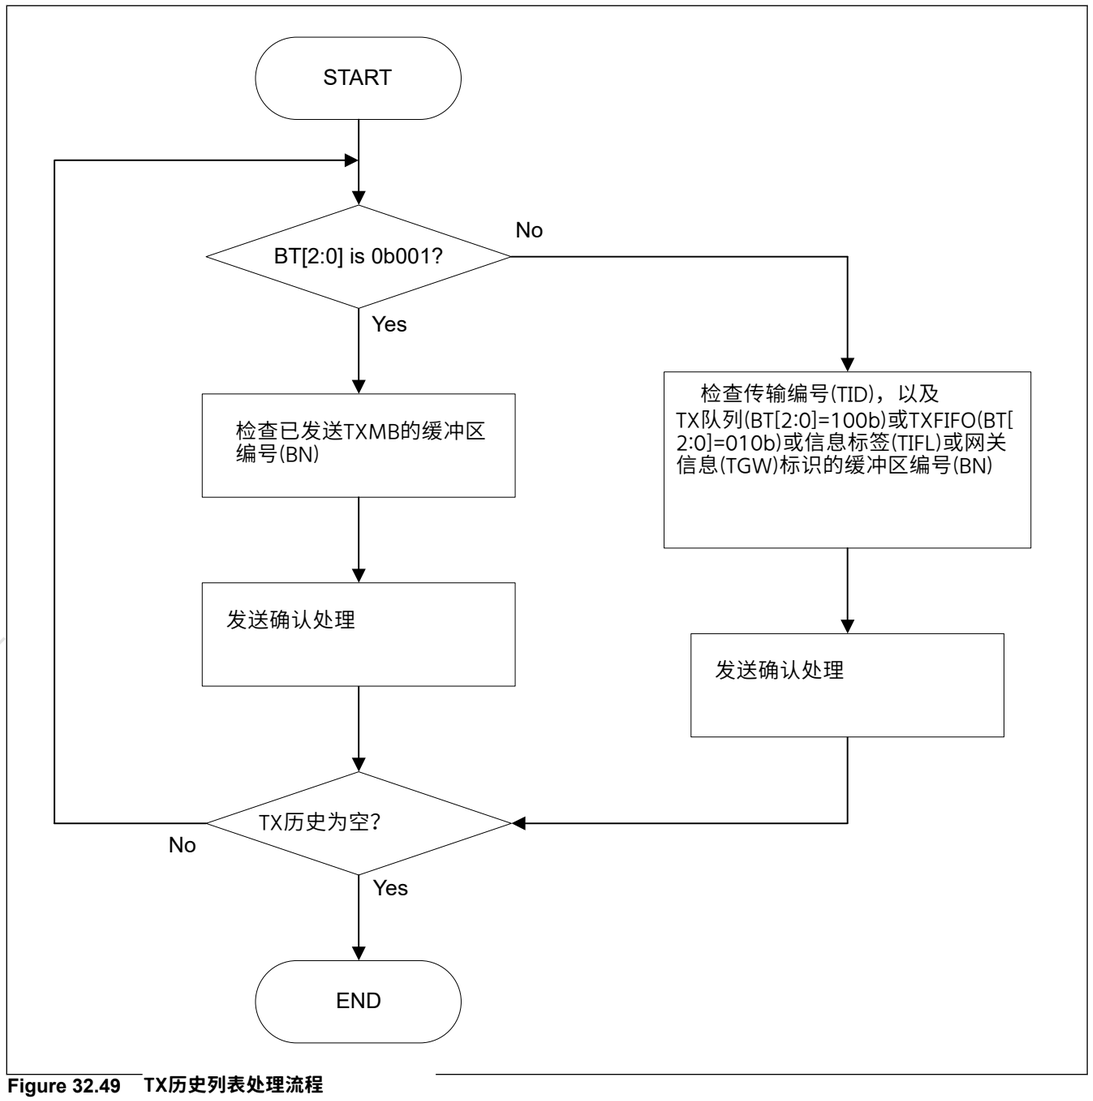

Figure 32.49 TX历史列表处理流程

32.8.2.6 TX数据填充

本章不适用于经典CAN。

如果发送报文的数据长度码(DLC)的数据字节数大于缓冲区大小，则超出限制范围的数据字节将替换为值为0xCC的字节。

当发送消息DLC高于
CFDCFCCn.CFPLS.

如果经典帧配置了大于8的DLC，这也可能发生在仅FD模式下。

32.9 测试模式

CAN-FD模块可以配置为测试模式以允许测试某些功能。这些功能仅用于特殊目的，在测试模式下配置CAN-FD模块时必须小心。

Note: All test modes are mutually exclusive unless it is explicitly stated that some functions can be enabled across other test modes.

Do not enable any combination of the various test modes specified in this section.

The test modes can be broadly split into 2 groups:

- Channel specific test modes
- Global test modes.

32.9.1 Channel Specific Test Modes

Each CAN channel can be configured into the following test modes:

- Basic test mode
- Listen-only mode
- Self-test mode 0 (External loop back mode)
- Self-test mode 1 (Internal loop back mode)
- Restricted operation mode.

32.9.1.1 Basic Test Mode

The basic test mode should be used when there is requirement for a particular test setting to be enabled other than when in Listen-only and Self-test modes.

32.9.1.2 Listen-only Mode

The ISO 11898-1 recommends an optional bus-monitoring mode. In this mode, the CAN channel is able to receive valid data frames and valid remote frames. However, it sends only recessive bits on the CAN bus and is not allowed to transmit. If the CAN engine is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is routed internally so that the CAN engine monitors this as dominant. The external TX pin remains in recessive state.

This mode can be used for baud rate detection. In this mode, an error interrupt is generated if a bus error occurs and the interrupt is enabled.

In this mode, it is not permitted to request transmission from any normal TX message buffer or TX/GW FIFO of this channel.

Note: If a message is stored in GW FIFO or routing TXQ, ensure that the transmitting channel is not in Listen-only mode so that transmission is not requested for this channel from the GW FIFO or routing TXQ.

Note: 所有测试模式都是互斥的，除非明确声明某些功能可以跨其他测试模式启用。

不要启用本节中指定的各种测试模式的任何组合。

测试模式可以大致分为两组：

●通道特定的测试模式

●全局测试模式。

32.9.1 通道特定测试模式

每个CAN通道都可以配置为以下测试模式：

●基本测试模式

- Listen-only mode

●自检模式0（外部环回模式）

●自检模式1（内部环回模式）

●受限操作模式。

32.9.1.1 基本测试模式

当需要启用特定测试设置时，应使用基本测试模式，而不是在只听和自测模式。

32.9.1.2 Listen-only Mode

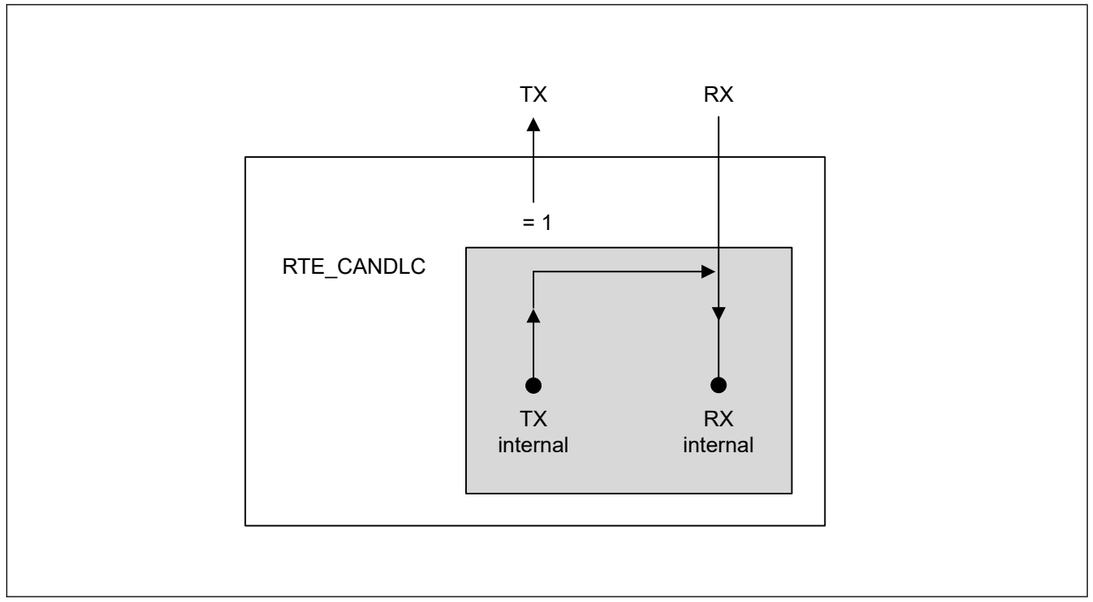
ISO11898-1推荐一种可选的总线监控模式。在此模式下，CAN通道能够接收有效的数据帧和有效的远程帧。但是，它只在CAN总线上发送隐性位，不允许发送。

如果CAN引擎需要发送显性位（ACK位、过载标志、活动错误标志），则该位在内部路由，以便CAN引擎将其监控为显性。外部TX引脚保持隐性状态。

该模式可用于波特率检测。在此模式下，如果发生总线错误并启用中断，则会产生错误中断。

在此模式下，不允许从该通道的任何正常TX消息缓冲区或TXGWFIFO请求传输。

Note: 如果消息存储在GWFIFO或路由TXQ中，请确保发送通道不处于Listen-only模式，以便不会从GWFIFO或路由TXQ请求此通道的传输。

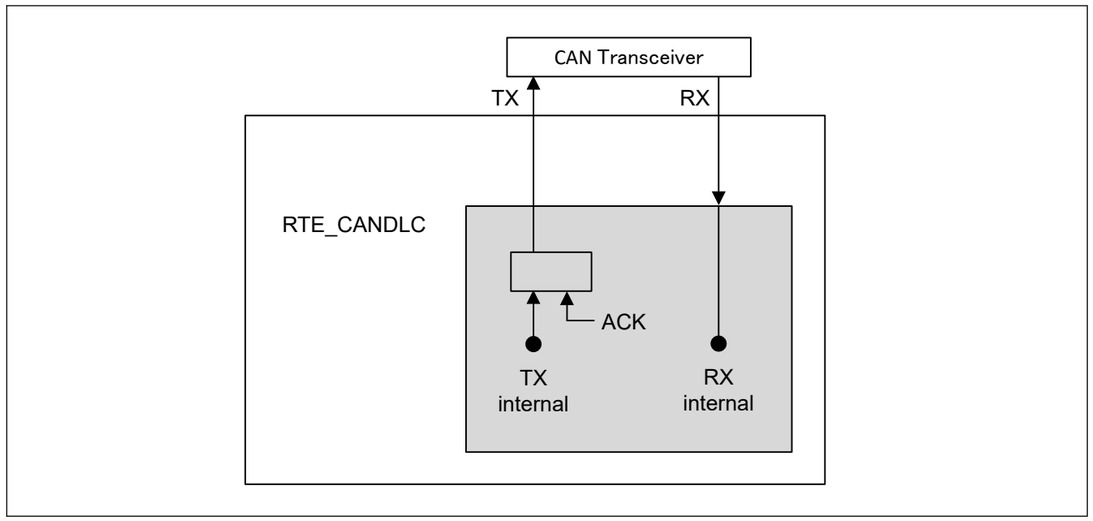


32.9.1.3 Self-test Mode 0 (External loopback mode)

In Self-test mode 0, the CAN engine treats its own transmitted messages as received messages through the CAN transceiver and stores them into its receive message buffers.

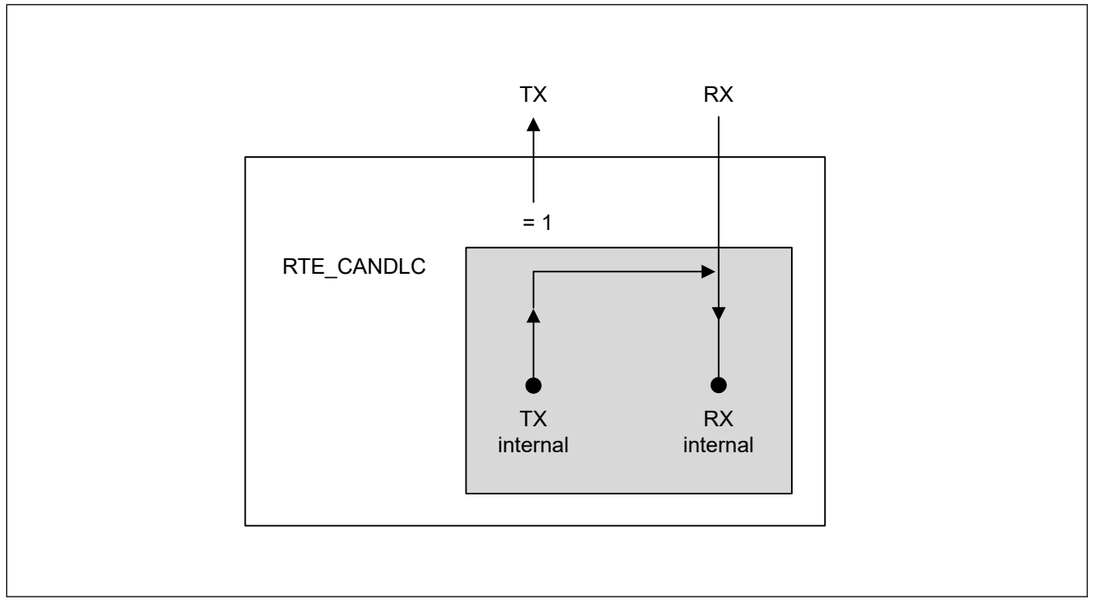
To be independent from external stimulation, the engine generates its own Acknowledge bit.

This test can be used for CAN transceiver tests and the RX/TX pins should be connected to the transceiver.



32.9.1.4 Self-test Mode 1 (Internal loopback mode)

In Self-test mode 1, the CAN engine treats its own transmitted messages as received messages and stores them into the receive buffer. This mode is provided for self-test functions. To be independent from external stimulation, the CAN engine generates its own Acknowledge bit. In this mode the CAN engine performs an internal feedback from TX internal to RX internal. The actual value of the external RX input is disregarded by the CAN engine.

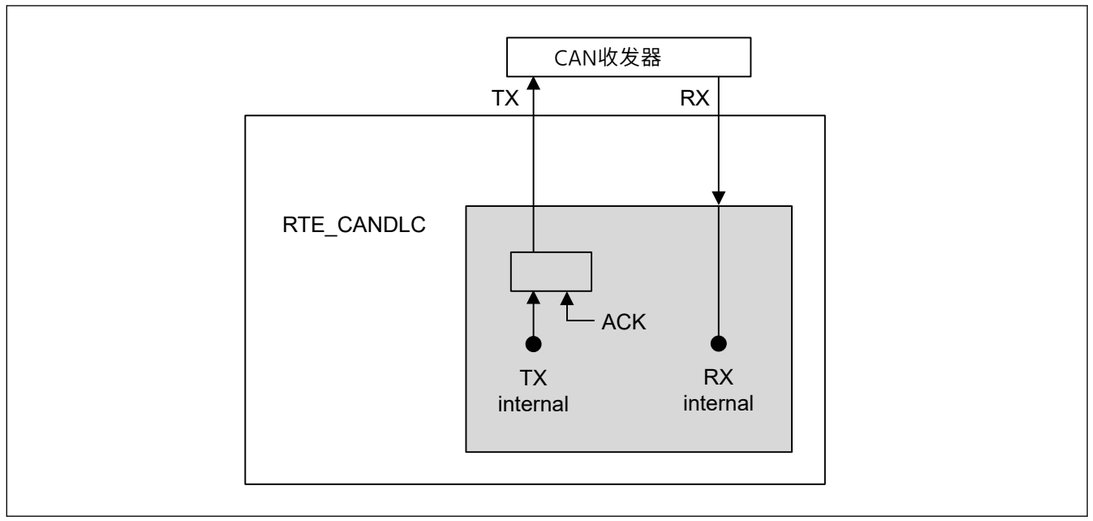


32.9.1.3 Self-test Mode 0 (External loopback mode)

在自检模式0中，CAN引擎将自己发送的消息视为通过CAN收发器接收到的消息，并将它们存储到其接收消息缓冲区中。

为了独立于外部刺激，引擎会生成自己的确认位。

此测试可用于CAN收发器测试，并且RXTX引脚应连接到收发器。

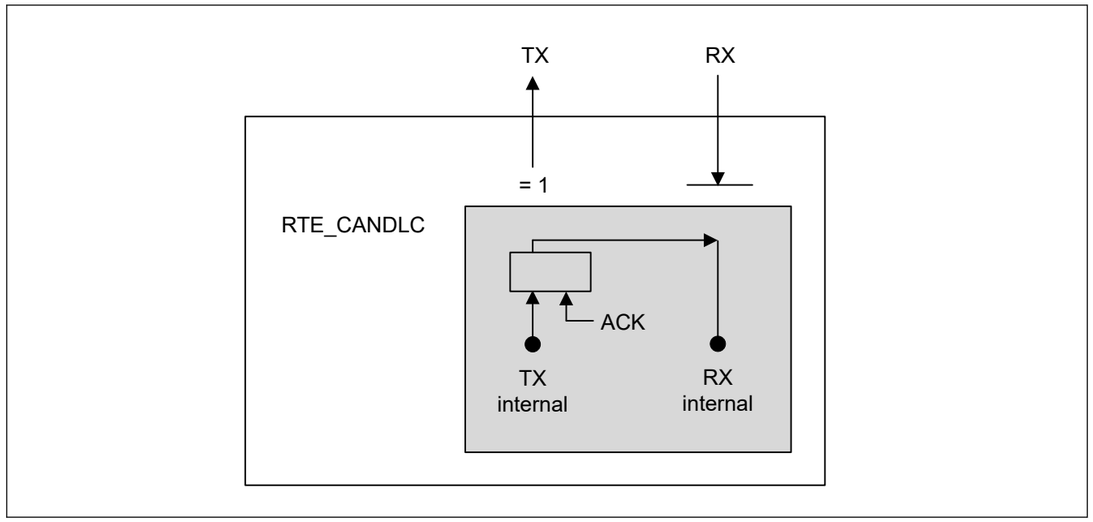


32.9.1.4 Self-test Mode 1 (Internal loopback mode)

在自检模式1中，CAN引擎将自己发送的消息视为接收的消息，并将它们存储到接收缓冲区中。此模式用于自检功能。为了独立于外部刺激，CAN引擎生成自己的确认位。在这种模式下，CAN引擎执行从TX内部到RX内部的内部反馈。CAN引擎忽略外部RX输入的实际值。

The external TX pin outputs only recessive bits. The RX/TX pins do not need to be connected to the CAN bus or any external device.

Note: The channel pins are also disconnected from the internal CAN bus communication line.



32.9.1.5 Restricted Operation Mode

This chapter is not valid for classical CAN.

In Restricted operation mode, the CAN node is able to receive valid data and remote frames generating the Acknowledge bit.

Active error or overload frames cannot be transmitted, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication after an error or overload condition occurs.

Additionally, the Receive and Transmit Error Counter (REC and TEC) are frozen independently from the occurrence of errors. The mode is specified in ISO 11898-1 and the setting of transmit request is permitted.

32.9.2 Global Test Modes

The CAN-FD module can be configured into the following test modes:

- RAM test mode
- Internal CAN bus communication mode
- CRC error test

The test modes in the following table are protected by a special software procedure to enable the mode. This software procedure enables write access to the test mode by a specific unlock key as shown in the table.

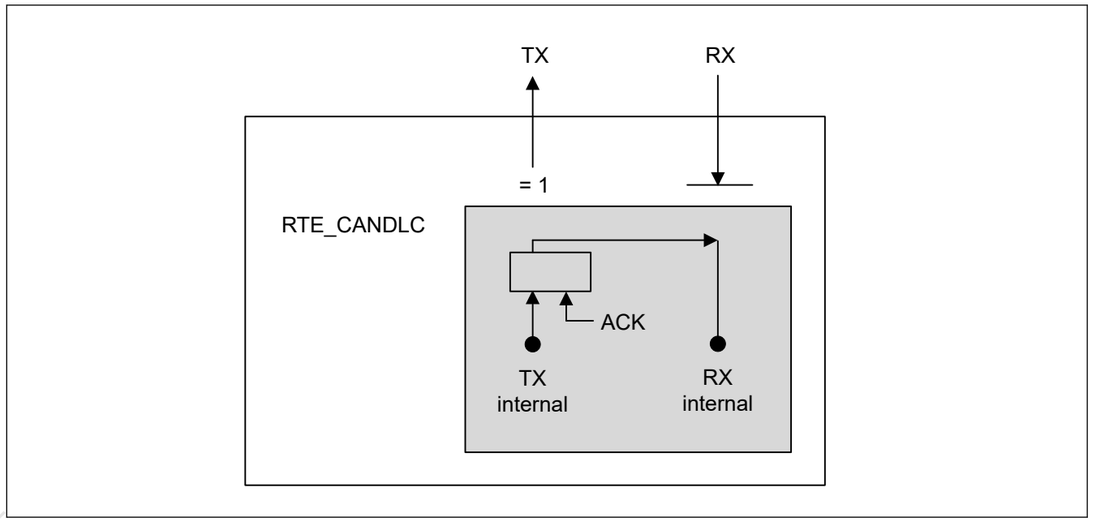
Test mode	Unlock key 1	Unlock key 2
RAM test mode	0x7575	0x8A8A

If the software sequence of the two consecutive unlock key write accesses (half-word or word access) is interrupted by any other write access to the register or if incorrect data is written to the Global Unlock Key Register, the corresponding test mode cannot be set and the sequence must be restarted.

After the two unlock key write accesses, the next write access should be to set the corresponding test mode enable bit. If this is not followed, the unlock mechanism reset and the test mode enable bit cannot be set and the unlock sequence must be restarted.

外部TX引脚仅输出隐性位。RXTX引脚不需要连接到CAN总线或任何外部设备。

Note: 通道引脚也与内部CAN总线通信线路断开。



32.9.1.5 受限操作模式

本章不适用于经典CAN。

在受限操作模式下，CAN节点能够接收有效数据和生成确认位的远程帧。

无法传输主动错误或过载帧，而是在发生错误或过载情况后等待总线空闲条件的出现以重新同步到CAN通信。

此外，接收和发送错误计数器（REC和TEC）独立于错误发生而被冻结。模式在ISO11898-1中指定，允许设置发送请求。

32.9.2 全局测试模式

CAN-FD模块可配置为以下测试模式：

- RAM测试模式
- 内部CAN总线通讯方式
- CRC错误测试

下表中的测试模式受特殊软件程序保护以启用该模式。该软件程序允许通过特定的解锁密钥对测试模式进行写访问，如表中所示。

测试模式	解锁钥匙1	解锁钥匙2
RAM测试模式	0x7575	0x8A8A

如果两次连续的解锁密钥写访问（半字或字访问）的软件序列被对寄存器的任何其他写访问中断，或者如果向全局解锁密钥寄存器写入不正确的数据，则无法设置相应的测试模式并且必须重新启动序列。

在两次解锁密钥写访问之后，下一次写访问应该是设置相应的测试模式使能位。如果不遵循，解锁机制复位和测试模式使能位不能设置，解锁序列必须重新启动。

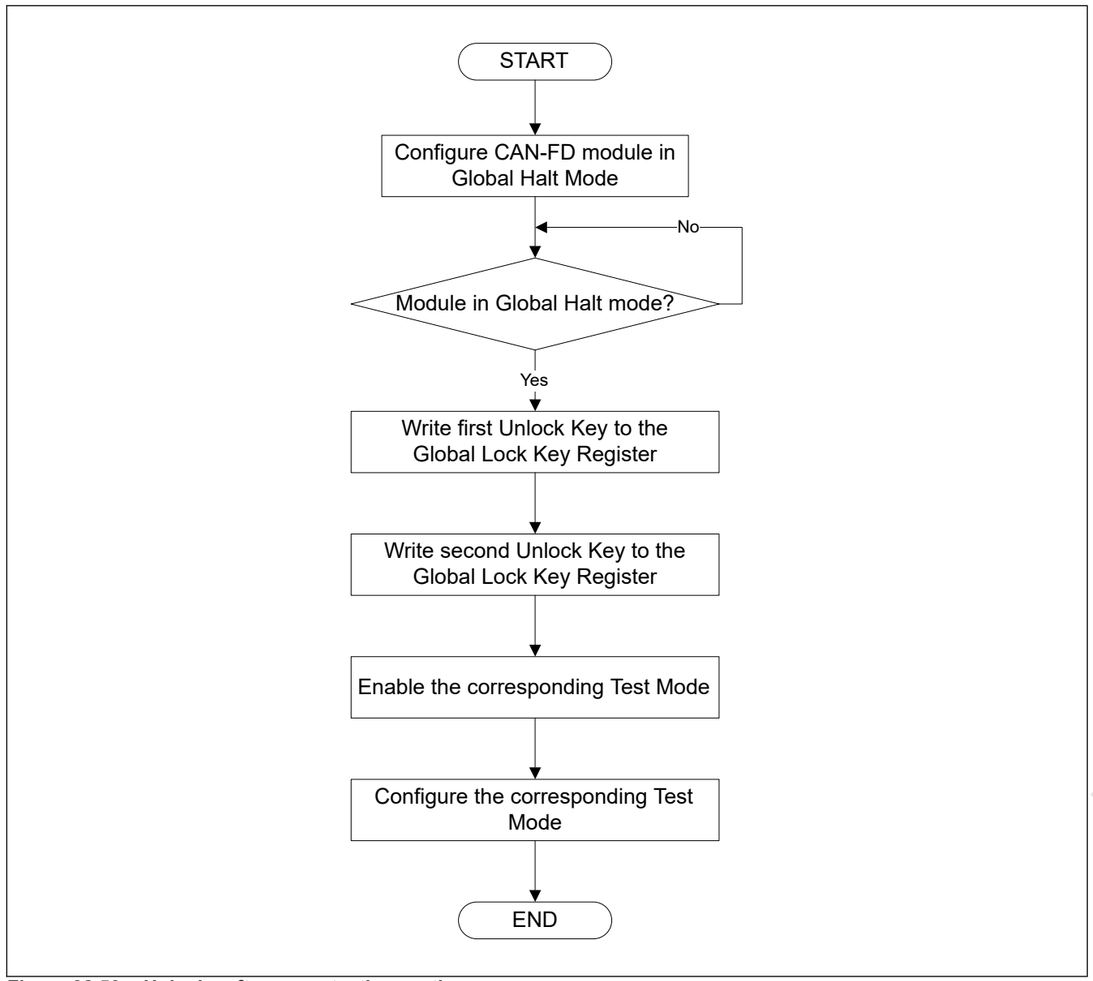


Figure 32.50 Unlock software protection routine

32.9.2.1 RAM Test Mode

The CAN-FD module can be configured in RAM test mode by setting the CFDGTSTCTR.RTME bit in the Global Test Control Register when the corresponding lock key is previously written. This is a special test mode, in which, the complete RAM area can be accessed.

Note: The actual RAM size is bigger than the RAM area initialized after a hardware reset. Therefore, ECC error flag (of the ECC macro) may be set if CPU reads data from this uninitialized RAM area while CAN-FD module is in RAM test mode.

In this mode, the RAM area is split into number of pages (pn) of 256 bytes, each which can be accessed with the CFDRPGACCn register.

The page should be selected for read/write access by writing to the CFDGTSTCFG.RTMPS[9:0] bits in the Global Test Control Register. Data can then be read from or written in to the RAM Test Page Access Registers.

Figure 32.51 shows the structure of the pages in the RAM when performing a RAM test mode.

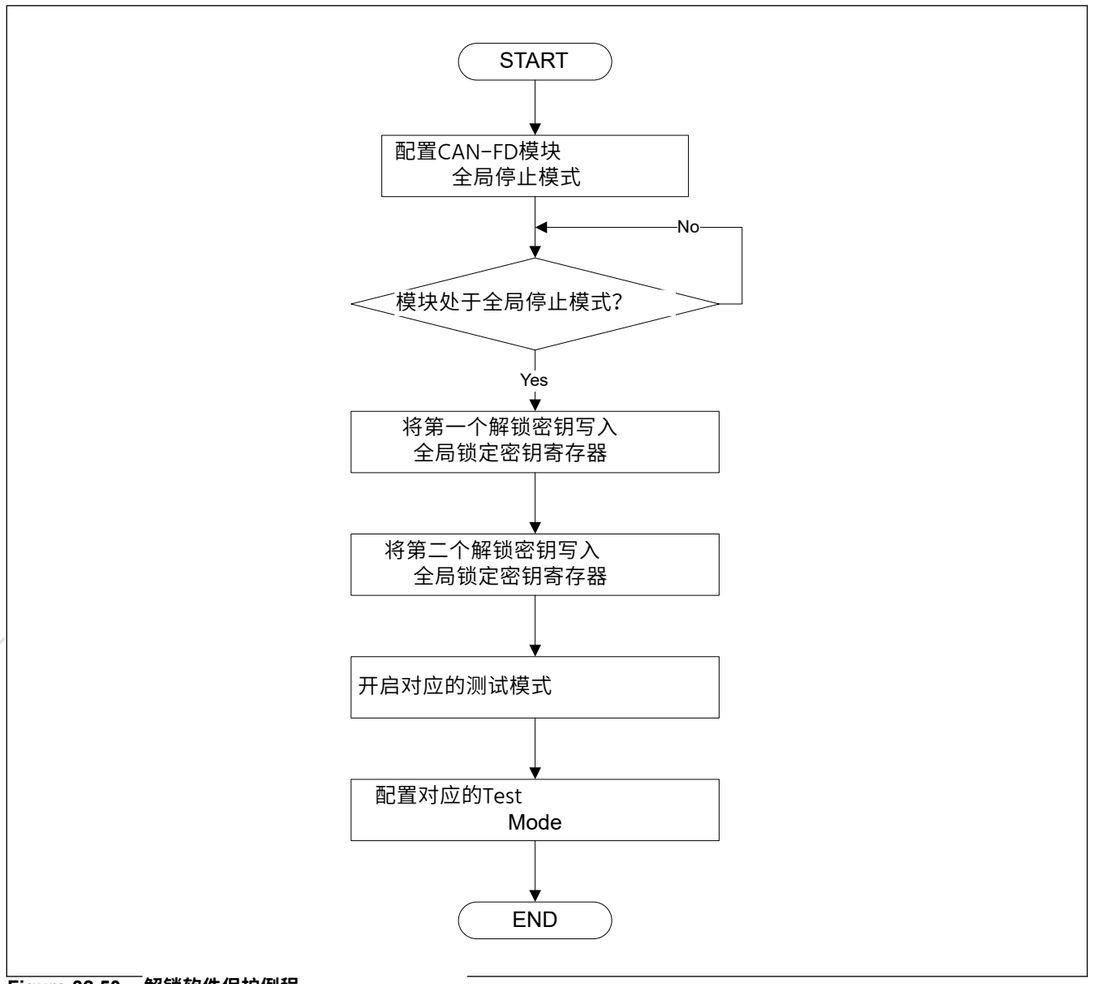

Figure 32.50 解锁软件保护例程

32.9.2.1 RAM测试模式

CAN-FD模块可通过设置GlobalTest中的CFDGTSTCTR.RTME位配置为RAM测试模式控制寄存器，当相应的锁定键先前被写入时。这是一种特殊的测试模式，其中，完整的可以访问RAM区域。

Note: 实际RAM大小大于硬件复位后初始化的RAM区域。因此，ECC错误标志（的如果在CAN-FD模块处于RAM测试模式时CPU从该未初始化的RAM区域读取数据，则可以设置ECC宏。

在这种模式下，RAM区域被分成256字节的页数(pn)，每个页都可以通过CFDRPGACCn register.

应通过写入全局测试中的CFDGTSTCFG.RTMPS[9:0]位来选择该页面进行读写访问控制寄存器。然后可以从RAM测试页访问寄存器读取或写入数据。

图32.51显示了执行RAM测试模式时RAM中的页面结构。

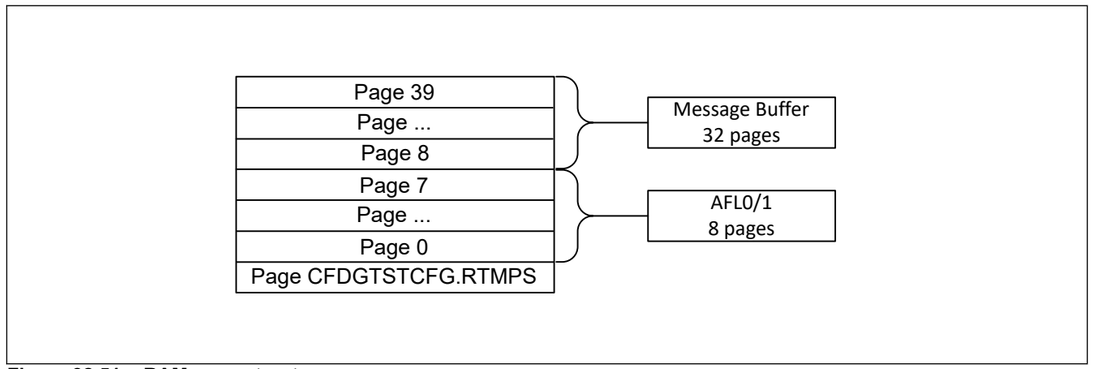

Figure 32.51 RAM page structure

The total available RAM size for a 2-CAN channel version is 2048 bytes for the AFL RAM and 8192 bytes for the Message Buffer RAM.

AFL RAM0/1 can treat RAM test mode as one RAM.

The pn and CFDGTSTCFG.RTMPS[9:0] values for the AFL and MB RAMs are calculated in the following way:

pn = ceil (total RAM size in bytes / number of bytes per page)

- AFL RAM:
  pn = ceil (2048 / 256) = 8 pages
  CFDGTSTCFG.RTMPS[9:0] = 0 to 7 (0x00F) inclusive
- MB RAM:
  pn = ceil (8192 / 256) = 32 pages
  CFDGTSTCFG.RTMPS[9:0] = 8 to 39 (0x27) inclusive

Figure 32.52 shows the software flow for RAM test mode.

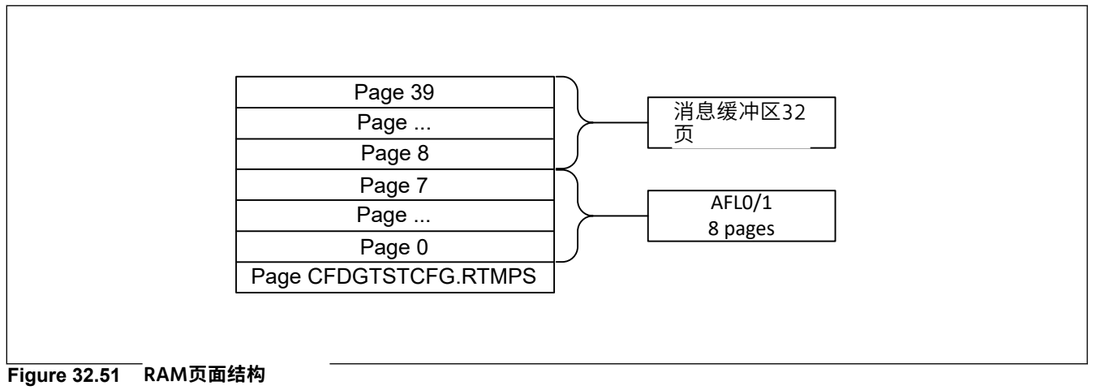

Figure 32.51 RAM页面结构

2-CAN通道版本的总可用RAM大小为AFLRAM为2048字节，消息为8192字节缓冲RAM。

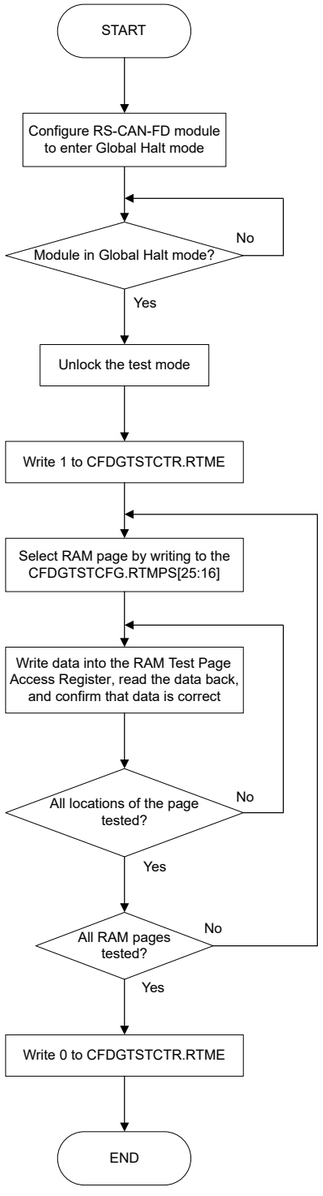
AFLRAM01可以将RAM测试模式视为一个RAM。

AFL和MBRAM的pn和CFDGTSTCFG.RTMPS[9:0]值按以下方式计算：

pn=ceil（以字节为单位的总RAM大小每页的字节数）

- AFL RAM:
  pn=ceil(2048256)=8页CFDGTSTCFG.RTMPS[9:0]=0到7(0x00F)（含）
- MB RAM:
  pn=ceil(8192256)=32页CFDGTSTCFG.RTMPS[9:0]=8到39(0x27)（含）

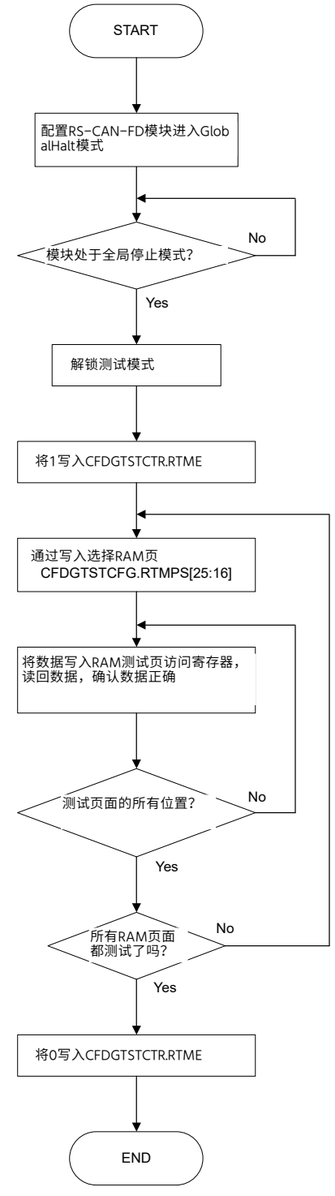
图32.52显示了RAM测试模式的软件流程。



Note 1. Change into the following status before changing to RAMTEST.
- Cancel of a request for transmission.
- Disable of all the FIFO and TXQ.
- Clear of the receiving flag for a receiving buffer.

Figure 32.52 Software flow for RAM test mode

To exit this test mode, the CFDGTSTCTR.RTME bit must be cleared. The CFDGTSTCTR.RTME bit is cleared by writing 0 to it.



注1.更改为RAMTEST之前，请更改为以下状态。
- 取消传输请求。
- 禁用所有FIFO和TXQ。
- 清除接收缓冲区的接收标志。

Figure 32.52 RAM测试模式的软件流程

要退出此测试模式，CFDGTSTCTR.RTME位必须清零。CFDGTSTCTR.RTME位通过向其写入0来清除。

RA生态工作室

The CFDGTSTCTR.RTME bit is cleared automatically when the CAN-FD module enters Global Reset mode from the test mode.

32.9.2.2 Internal CAN Bus Communication Test Mode

The CAN-FD module can be configured in internal CAN bus communication test mode by setting the CFDGTSTCTR.ICBCTME bit in the Global Test Control Register. This is a special test mode, in which the CAN channels can be connected together internally to generate a CAN cluster within the CAN-FD module.

Only use the following sequence to enter internal CAN bus communication test mode:

1. Configure all channels in Halt mode and check that all channels have entered Halt mode (Global Halt mode).
2. Write data into the Global Test Configuration Register to select the channels participating in the internal CAN bus communication test.
3. Set the CFDGTSTCTR.ICBCTME bit of the Global Test Control Register.
4. Check that CFDGTSTCTR.ICBCTME bit is set in the Global Test Control Register.

In this mode, the TXD outputs of the channels participating (configured) in internal CAN bus communication mode are connected together using AND gate. The output of the AND gate is connected to the RXD inputs of all participating channels to create a CAN cluster within the CAN-FD module. The channels are isolated from the external CAN bus while the CAN-FD module is in this test mode.

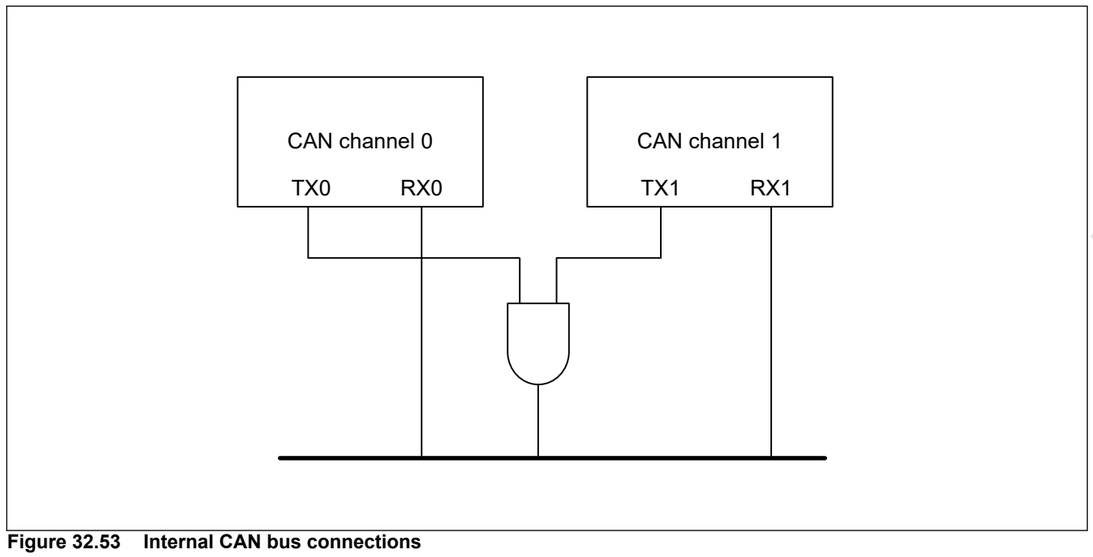


Figure 32.53 Internal CAN bus connections

The AFL, Flat RX message buffers, FIFO buffers, Flat TX message buffers and various registers can now be configured as normal to start communication between channels.

The channels not participating in internal CAN bus should only be configured in Halt mode.

(1) CRC Error Test

After the CAN-FD module has been configured in internal CAN bus communication test mode, use the following sequence to perform CRC Error testing. In this sequence, channel x is the reference transmitter CAN-FD module and channel y is the receiver CAN-FD module where (x,y = [0…n] and x ≠ y):

1. Configure channel x node to transmit 1 reference message.
2. Set the CFDCyCTR.CRCT bit to 1 to invert the first bit of the incoming bit stream from channel x.
3. Set the CFDTMCx.TMTR.
4. Read either the CFDCyERFL.CRCREG or the CFDCyCRC.CRCREG (depending on the received frame type: Classical or FD). The value should be different from the received CRC value of the reference message from channel x.

当CAN-FD模块从测试模式进入全局复位模式时，CFDGTSTCTR.RTME位会自动清零。

32.9.2.2 内部CAN总线通讯测试模式

CAN-FD模块可以通过设置内部CAN总线通信测试模式配置
全局测试控制寄存器中的CFDGTSTCTR.ICBCTME位。这是一种特殊的测试模式，其中CAN通道可以在内部连接在一起，以在CAN-FD模块内生成一个CAN集群。

只能使用以下顺序进入内部CAN总线通讯测试模式：

1.将所有通道配置为Halt模式，并检查所有通道是否已进入Halt模式（GlobalHalt模式）。

2.向全局测试配置寄存器写入数据，选择参与内部CAN总线通信测试的通道。

3.设置全局测试控制寄存器的CFDGTSTCTR.ICBCTME位。

4.检查CFDGTSTCTR.ICBCTME位是否在全局测试控制寄存器中设置。

在此模式下，参与（配置）内部CAN总线通信模式的通道的TXD输出使用与门连接在一起。与门的输出连接到所有参与通道的RXD输入，以在CAN-FD模块内创建一个CAN集群。当CAN-FD模块处于此测试模式时，通道与外部CAN总线隔离。

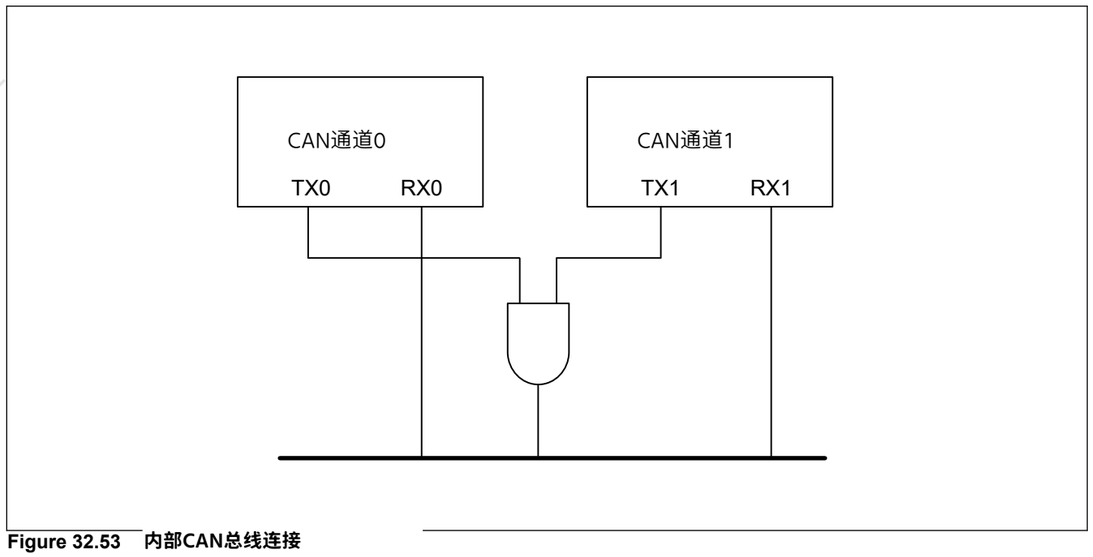

Figure 32.53 内部CAN总线连接

AFL、FlatRX消息缓冲区、FIFO缓冲区、FlatTX消息缓冲区和各种寄存器现在可以正常配置以开始通道之间的通信。

不参与内部CAN总线的通道只能配置为暂停模式。

(1) CRC错误测试

将CAN-FD模块配置为内部CAN总线通信测试模式后，按照以下顺序执行CRC错误测试。在此序列中，通道x是参考发送器CAN-FD模块，通道y是接收器CAN-FD模块，其中(x y=[0…n]且x≠y)：

1.配置通道x节点发送1条参考消息。

2.将CFDCyCTR.CRCT位设置为1，以反转来自通道x的输入比特流的第一位。

3.设置CFDTMCx.TMTR。

4.读取CFDCyERFL.CRCREG或CFDCyCRC.CRCREG（取决于接收到的帧类型：Classic或FD）。该值应不同于从通道x接收到的参考消息的CRC值。

5. Check that CFDCyERFL.CERR is 1

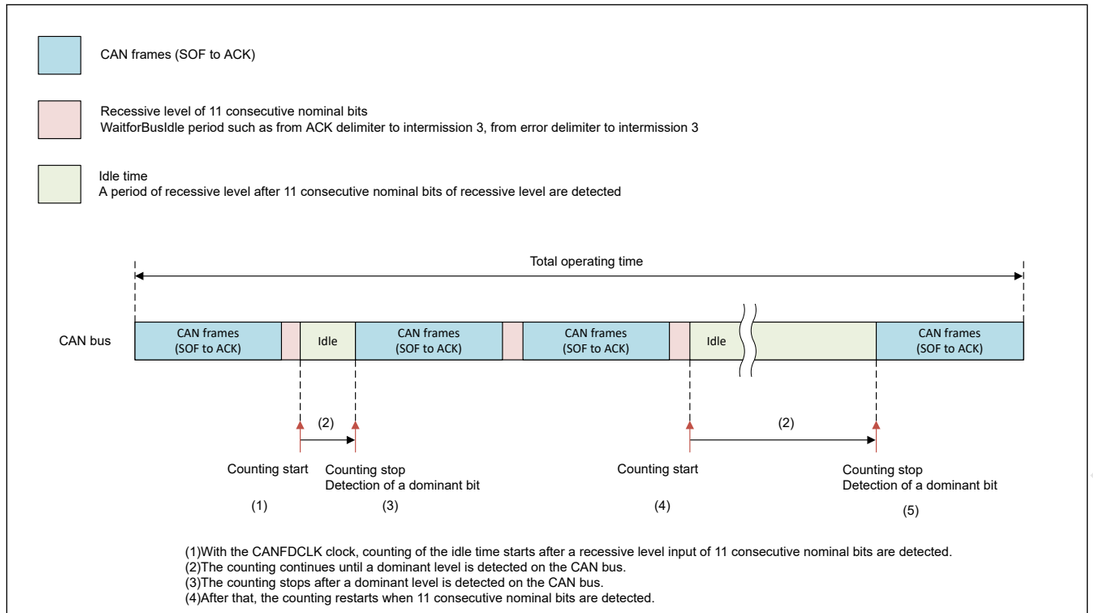
The CRC generator logic is shared between RX and TX so there is no need to create a separate TX CRC error test.

32.10 Bus Traffic Measurement

The idle time of the CAN bus can be measured using the CANFDCLK or CANMCLK. Bus traffic can be calculated based on the measurement results.

32.10.1 How to Count the CAN Bus Idle Time

The following figure shows the concept for measuring idle time of the CAN bus.



(1)With the CANFDCLK clock, counting of the idle time starts after a recessive level input of 11 consecutive nominal bits are detected.
(2)The counting continues until a dominant level is detected on the CAN bus.
(3)The counting stops after a dominant level is detected on the CAN bus.
(4)After that, the counting restarts when 11 consecutive nominal bits are detected.

32.10.2 Operations and Measurement Procedure

The following procedure shows the steps for measuring idle time of the CAN bus.

1. The channel to be measured exters operation mode.
2. Write 1 to CFDCnBLCT.BLCE bit to set the measuring counter to operating mode.
3. Write 1 to CFDCnBLCT.BLCLD bit to clear the counter register.
4. Detect a recessive level input of 11 consecutive nominal bits.
5. Start counting the bus idle time.
6. Detect a dominant level.
7. The counting stops.
8. Detect a recessive level input of 11 consecutive nominal bits.
9. The counting starts.
10. Write 1 to CFDCnBLCT.BLCLD bit to clear the counter register and simultaneously load the counter value to CFDCnBLSTS.
11. Read the value of CFDCnBLSTS.

5.检查CFDCyERFL.CERR是否为1

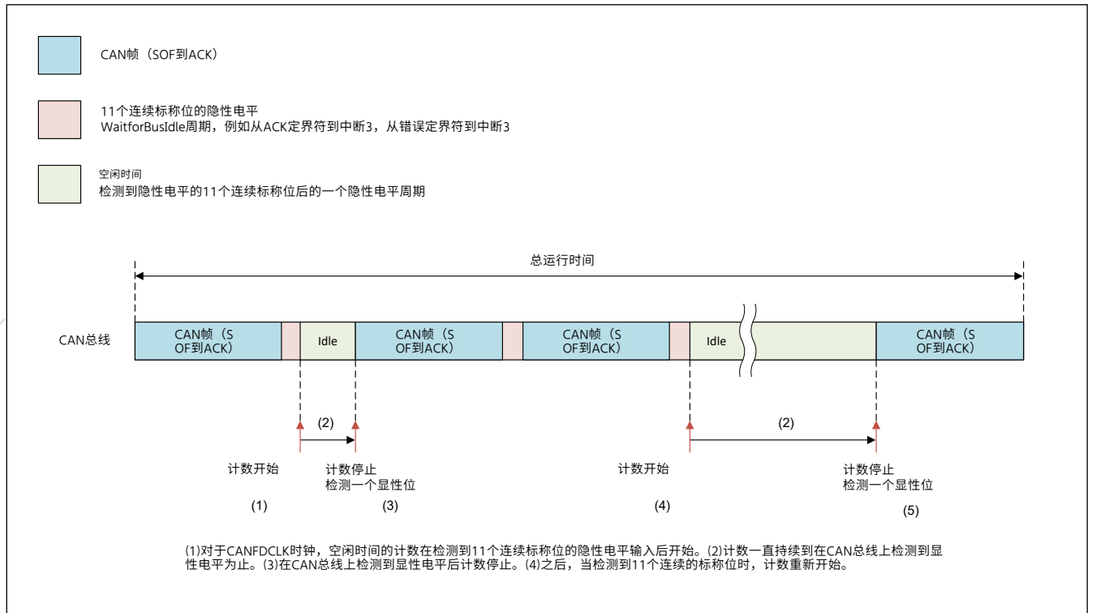
CRC生成器逻辑在RX和TX之间共享，因此无需创建单独的TXCRC错误测试。

32.10 公交车流量测量

CAN总线的空闲时间可以使用CANFDCLK或CANMCLK来测量。可以根据测量结果计算总线流量。

32.10.1 如何计算CAN总线空闲时间

下图显示了测量CAN总线空闲时间的概念。



(1)对于CANFDCLK时钟，空闲时间的计数在检测到11个连续标称位的隐性电平输入后开始。(2)计数一直持续到在CAN总线上检测到显性电平为止。(3)在CAN总线上检测到显性电平后计数停止。(4)之后，当检测到11个连续的标称位时，计数重新开始。

32.10.2 操作和测量程序

以下过程显示了测量CAN总线空闲时间的步骤。

1.被测通道采用工作模式。
2.将1写入CFDCnBLCT.BLCE位以将测量计数器设置为工作模式。
3.将1写入CFDCnBLCT.BLCLD位以清除计数器寄存器。
4.检测11个连续标称位的隐性电平输入。
5.开始计算总线空闲时间。
6.检测显性电平。
7.计数停止。
8.检测11个连续标称位的隐性电平输入。
9.计数开始。
10.将1写入CFDCnBLCT.BLCLD位以清除计数器寄存器，同时将计数器值加载到CFDCnBLSTS。

11.读取CFDCnBLSTS的值。

To stop the measurement counter, write 0 to CFDCnBLCT.BLCE bit.

To initialize the counter, write 1 to CFDCnBLCT.BLCLD bit.

This measurement is enabled when the channel to be measured is in operation mode.

When the relevant channels are in reset mode, the counter does not operate.

Also, accurate measurements are not available in test mode.

Write 1 to CFDCnBLCT.BLCLD bit to clear the counter register and simultaneously load the value of the counter to CFDCnBLSTS.

The lower three bits of CFDCnBLSTS are fixed to 0.

Based on the values of the counter, software can calculate the CAN bus traffic according to the following formulas.

$$\frac{(\text{total operating time} - \text{total idle time})}{\text{Total operating time}} = \frac{\text{bus operating time}}{\text{total operating time}} = \text{Bus usage ratio}$$

- Total idle time: a value read from CFDCnBLSTS × a clock cycle of CANFDCLK
- Total operating time: a setting interval of CFDCnBLCT.BLCLD bit

Example: Below is a calculation example under the following conditions.

- Conditions: nominal bit rate = 1 Mbps
- CANFDCLK clock = 40 MHz (= 25 ns)
- A setting interval of CFDCnBLCT.BLCLD bit = cycle of 1 ms
- A read value of CFDCnBLSTS register = 0x4E20

$$\frac{(\text{total operating time} - \text{total idle time})}{\text{Total operating time}} = \frac{(1000000\text{ns} - 20000 * 25\text{ns})}{1000000\text{ns}} = 50\,\%$$

要停止测量计数器，请将0写入CFDCnBLCT.BLCE位。

要初始化计数器，请将1写入CFDCnBLCT.BLCLD位。

当要测量的通道处于操作模式时，启用此测量。

当相关通道处于复位模式时，计数器不工作。

此外，在测试模式下无法进行精确测量。

将1写入CFDCnBLCT.BLCLD位以清除计数器寄存器并同时将计数器的值加载到CFDCnBLSTS.

CFDCnBLSTS的低三位固定为0。

根据计数器的值，软件可以根据以下公式计算CAN总线流量。

（总运行时间-总空闲时间）总运行时间 =巴总运行时间=公交使用率

●总空闲时间：从CFDCnBLSTS读取的一个值×CANFDCLK的一个时钟周期

●总运行时间：CFDCnBLCT.BLCLD位的设置间隔

示例：以下是以下条件下的计算示例。

●条件：标称比特率=1Mbps

- CANFDCLK clock = 40 MHz (= 25 ns)

●CFDCnBLCT.BLCLD位的设置间隔=1ms周期

●CFDCnBLSTS寄存器的读取值=0x4E20

（总运行时间-总空闲时间）总运行时间 $= \frac{(1000000\text{ns} - 20000 * 25\text{ns})}{1000000\text{ns}} = 50\,\%$

RA生态工作室

33. CANFD ECC (CNECC)

33.1 Overview

AFLRAM0, AFLRAM1 and MBRAM have ECC function of 2-bit ECC error detection and 1-bit ECC error detection and correction*1. The ECC module adds 7 bits ECC data to 32 bits RAM data.

Note 1. The ECC module cannot detect 3 or more bits error. In this case, the ECC module detects 1-bit or 2-bit error, does not detect errors, or corrects the erroneous bit to erroneous data by setting. When all RAM data are fixed to 0 or 1, it is detected as 2-bit ECC error.

33.2 Register Descriptions

33.2.1 EC710CTL : ECC Control Register

Base address: ECCAFLn = 0x4012_F000 + 0x0100 × n (n = 0, 1)
ECCMB = 0x4012_F200

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECDEDF0	ECSEDF0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

33. CANFD ECC (CNECC)

33.1 Overview

AFLRAM0、AFLRAM1和MBRAM具有2位ECC错误检测和1位ECC错误检测和纠正的ECC功能*1。ECC模块将7位ECC数据添加到32位RAM数据中。

注1.ECC模块无法检测3位或更多位错误。在这种情况下，ECC模块检测1位或2位错误，不检测错误，或通过设置将错误位纠正为错误数据。当所有RAM数据固定为0或1时，将被检测为2位ECC错误。

33.2 注册说明

33.2.1 EC710CTL:ECC控制寄存器

Base address: ECCAFLn = 0x4012_F000 + 0x0100 × n (n = 0, 1)

31:18	—	These bits are read as 0. The write value should be 0.	R/W

ECEMF bit (ECC Error Message Flag)

The ECEMF bit shows that there is error in present read data bus. This bit is updated by every RAM output data.

When RAM output data is undefined and the ECERVF bit is set to 1, the value of this bit is undefined.

[Setting condition]

There is bit error in present RAM output data under the condition that error judgement is enabled.

[Clearing condition]

- Under the condition that there is no 1-bit error in input data to decode circuit
- When ECC error judgement is disabled (ECERVF = 0).

ECER1F bit (ECC Error Detection and Correction Flag)

The ECER1F bit shows that the bit errors are detected in the one part of RAM read data [38:0] at RAM read access when the error judgment is enabled.

When the 1-bit error interrupt output is enabled, error interrupt is generated by setting this flag.

This bit is read-only, so writing 1 or 0 has no effect.

At clearing, write 1 to the ECER1C bit.

When 1-bit error is detected again under the condition that this bit is set, the interrupt is not generated.

[Setting condition]

When the error judgment is enabled and there is 1-bit error to RAM output data (when not setting ECER1C = 1).

[Clearing condition]

- Writing ECER1C = 1
- When ECC error judgement is disabled (ECERVF = 0).

ECER2F bit (2-bit ECC Error Detection Flag)

The ECER2F bit shows that the bit errors are detected in the two parts of RAM read data [38:0] at RAM read access when the error judgment is enabled.

When the 2-bit error interrupt output is enabled, error interrupt is generated by setting this flag.

This bit is read-only, so writing 1 or 0 has no effect.

At clearing, write 1 to the ECER2C bit.

When 2-bit error is detected again under the condition that this bit is set, the interrupt is not generated.

[Setting condition]

Bit	Symbol	Function	R/W
10	ECER2C	2位ECC错误检测标志清除 0：无效1：清除2位ECC错误检测标志	R/W
11	ECOVFF	ECC溢出检测标志 0：无效1：ECC溢出检测标志	R
13:12	—	这些位被读取为0。写入值应为0。	R/W
15:14	EMCA[1:0]	ECC模式选择位的访问控制 这些位启用或禁用对ECERVF位的写访问。	R/W
16	ECSEDF0	ECC单位错误地址检测标志 0：复位或清除ECER1F后EC710EAD0中没有位错误位1：EC710EAD0中捕获的地址显示发生并捕获了1位错误	R
17	ECDEDF0	ECC双位错误地址检测标志 0：复位或清除ECER2F位后EC710EAD0中没有位错误1：EC710EAD0中捕获的地址显示发生并捕获了2位错误	R
31:18	—	这些位被读取为0。写入值应为0。	R/W

ECEMF位（ECC错误消息标志）

ECEMF位显示当前读数据总线有错误。该位由每个RAM输出数据更新。

当RAM输出数据未定义且ECERVF位设置为1时，该位的值未定义。

[Setting condition]

在启用错误判断的情况下，当前RAM输出数据存在位错误。

[Clearing condition]

●解码电路的输入数据无1位错误的情况下

●ECC错误判断无效时（ECERVF=0）。

ECER1F位（ECC错误检测和纠正标志）

ECER1F位表示当启用错误判断时，在RAM读取访问时，在RAM读取数据[38:0]的一部分中检测到位错误。

当1位错误中断输出使能时，通过设置该标志产生错误中断。

该位是只读的，因此写入1或0无效。

清零时，将1写入ECER1C位。

在该位置位的情况下再次检测到1位错误时，不会产生中断。

[Setting condition]

启用错误判断且RAM输出数据有1位错误时（未设置ECER1C=1时）。

[Clearing condition]

- Writing ECER1C = 1

●ECC错误判断无效时（ECERVF=0）。

ECER2F位（2位ECC错误检测标志）

ECER2F位表示当错误判断使能时，在RAM读取访问的两部分RAM读取数据[38:0]中检测到位错误。

当2位错误中断输出使能时，通过设置该标志产生错误中断。

该位是只读的，因此写入1或0无效。

清除时，将1写入ECER2C位。

在该位置位的情况下再次检测到2位错误时，不会产生中断。

[Setting condition]

When the error judgment is enabled and there is 2-bit error to RAM output data (when not setting ECER2C = 1).

[Clearing condition]

- Writing ECER2C = 1
- When ECC error judgement is disabled (ECERVF = 0).

EC1EDIC bit (ECC 1-bit Error Detection Interrupt Control)

The EC1EDIC controls the interrupt output at detecting 1-bit error. By setting 1 to this bit, the 1-bit error interrupt is outputted when 1-bit error detected.

EC2EDIC bit (ECC 2-bit Error Detection Interrupt Control)

The EC2EDIC controls the interrupt output at detecting 2-bit error. By setting 1 to this bit, the 2-bit error interrupt is outputted when 2-bit error detected.

EC1ECP bit (ECC 1-bit Error Correction Permission)

The EC1ECP sets enable or disable to correct the 1-bit error when ECC error detection and correction is valid. By setting 1 to this bit, the non-corrected data is outputted if 1-bit error is detected.

ECERVF bit (ECC Error Judgment Enable Flag)

Setting the ECERVF bit to 1 enables the judgment of error. The correction of output data and the interrupt output depend on setting of the EC1ECP bit, EC2EDIC bit, and EC1EDIC bit.

The write access to this bit is valid when the write value of the EMCA[1:0] is 01b. So only the 16 bits or 32 bits operation command is valid in the case of the write access to this bit.

ECER1C bit (Accumulating ECC Error Detection and Correction Flag Clear)

The ECER1C bit clears the status flag of the ECER1F bit.

The read value is always 0. By writing 0, the internal condition is not changed. When the competition between writing 1 to this bit and setting the ECER1F bit, the former has priority.

The ECER1F bit is cleared by writing 1 to this bit while the ECER1F bit is set. Additionally, the Overflow Detection flag (ECOVFF), ECC Dual Bit Error flag (ECDEDF0) and ECC Single Bit Error flag (ECSEDF0) are also cleared.

ECER2C bit (2-bit ECC Error Detection Flag Clear)

The ECER2C bit clears the status flag of the ECER2F bit.

The read value is always 0. By writing 0, the internal condition is not changed. When the competition between writing 1 to this bit and setting the ECER2F bit, the former has priority.

The ECER2F bit is cleared by writing 1 to this bit while the ECER2F bit is set. Additionally, the Overflow Detection flag (ECOVFF), ECC Dual Bit Error flag (ECDEDF0), and ECC Single Bit Error flag (ECSEDF0) are also cleared.

ECOVFF bit (ECC Overflow Detection Flag)

The ECOVFF bit is set and the overflow interruption is outputted by detecting the new error address under the condition that error address is already captured in the EC710EAD0 register. The overflow interrupt is outputted again when this bit is set and new error is detected.

This bit is read-only, so writing 1 or 0 has no effect.

To clear this bit, write 1 to the ECER2C bit and the ECER1C bit.

[Setting condition]

When new error address is captured under the condition that error address is already captured in the EC710EAD0 register (when not setting ECER2C = 1 or ECER1C = 1).

[Clearing condition]

- Writing ECER2C = 1 or ECER1C = 1
- When ECC error judgement is disabled (ECERVF = 0).

启用错误判断且RAM输出数据有2位错误时（未设置ECER2C=1时）。

[Clearing condition]

- Writing ECER2C = 1
- ●ECC错误判断无效时（ECERVF=0）。

EC1EDIC位（ECC1位错误检测中断控制）

EC1EDIC在检测到1位错误时控制中断输出。通过将该位设置为1，当检测到1位错误时输出1位错误中断。

EC2EDIC位（ECC2位错误检测中断控制）

EC2EDIC在检测到2位错误时控制中断输出。通过将此位设置为1，当检测到2位错误时输出2位错误中断。

EC1ECP位（ECC1位纠错权限）

当ECC错误检测和纠正有效时，EC1ECP设置启用或禁用以纠正1位错误。通过将此位设置为1，如果检测到1位错误，则输出未校正的数据。

ECERVF位（ECC错误判断使能标志）

将ECERVF位设置为1可以进行错误判断。输出数据的校正和中断输出取决于EC1ECP位、EC2EDIC位和EC1EDIC位的设置。

当EMCA[1:0]的写值为01b时，对该位的写访问有效。因此在对该位进行写访问的情况下，只有16位或32位操作命令有效。

ECER1C位（累积ECC错误检测和纠正标志清除）

ECER1C位清除ECER1F位的状态标志。

读取值始终为0。通过写入0，内部条件不会改变。当向该位写1与设置ECER1F位竞争时，前者具有优先权。

当ECER1F位置位时，通过向该位写入1来清除ECER1F位。此外，溢出检测标志(ECOVFF)、ECC双比特错误标志(ECDEDF0)和ECC单比特错误标志(ECSEDF0)也被清除。

ECER2C位（2位ECC错误检测标志清除）

ECER2C位清除ECER2F位的状态标志。

读取值始终为0。通过写入0，内部条件不会改变。当向该位写1与设置ECER2F位竞争时，前者具有优先权。

当ECER2F位置位时，通过向该位写入1来清除ECER2F位。此外，溢出检测标志(ECOVFF)、ECC双比特错误标志(ECDEDF0)和ECC单比特错误标志(ECSEDF0)也被清除。

ECOVFF位（ECC溢出检测标志）

在EC710EAD0寄存器中已经捕捉到错误地址的情况下，通过检测新的错误地址，设置ECOVFF位并输出溢出中断。当该位置位并检测到新错误时，溢出中断再次输出。

该位是只读的，因此写入1或0无效。

要清除该位，向ECER2C位和ECER1C位写入1。

[Setting condition]

在EC710EAD0寄存器中已捕获错误地址的情况下捕获新的错误地址时（未设置ECER2C=1或ECER1C=1时）。

[Clearing condition]

- ●写入ECER2C=1或ECER1C=1
- ●ECC错误判断无效时（ECERVF=0）。

EMCA[1:0] bit (Access Control to ECC Mode Select bit)

The EMCA[1:0] bits are the write trigger reserved bits to the ECERVF bit. The read value is always 0. When the value of these bits is 01b, it is possible to have write access to the ECERVF bit. If these bits are not 01b, write access to the ECERVF bit is ignored and the value is not written.

ECSEDF0 bit (ECC Single bit Error Address Detection Flag)

The ECSEDF0 bit shows that the error is captured in the error address register when error detection is valid. This bit is set by 1-bit error detection.

When 1-bit error is detected after the 2-bit error address is already captured in the EC710EAD0 register, this bit is not updated but the EC710EAD0 register is updated.

This bit is read-only, so writing 1 or 0 has no effect. To clear these bits, write 1 to the ECER1C bit.

[Setting condition]

When there is 1-bit error to RAM output data and error address is captured in EC710EAD0 under the condition that the error judgment is permitted (when not setting ECER1C = 1).

[Clearing condition]

- Writing ECER1C = 1
- When ECC error judgement is disabled (ECERVF = 0).

ECDEDF0 bit (ECC Dual Bit Error Address Detection Flag)

The ECDEDF0 bit shows that the error is captured in the error address register when error detection is valid. This bit is set by 2-bit error detection.

When 2-bit error is detected after the 1-bit error address is already captured in the EC710EAD0 register, this bit is not updated and the EC710EAD0 register is updated.

This bit is read-only, so writing 1 or 0 has no effect. To clear these bits, write 1 to the ECER2C bit.

[Setting condition]

When there is 2-bit error to RAM output data and error address is captured in EC710EAD0 under the condition that the error judgment is permitted (when not setting ECER2C = 1).

[Clearing condition]

- Writing ECER2C = 1
- When ECC error judgement is disabled (ECERVF = 0).

33.2.2 EC710TMC : ECC Test Mode Control Register

Base address: ECCAFLn = 0x4012_F000 + 0x0100 × n (n = 0, 1)
ECCMB = 0x4012_F200

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ETMA[1:0]		—	—	—	—	—	—	ECTMCE	—	—	—	—	—	ECDCS	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	ECDCS	ECC Decode Input Select 0: Input lower 32 bits of RAM output data to data area of decode circuit 1: Input ECEDB31-0 in EC710TED register to data area of decode circuit	R/W
6:2	—	These bits are read as 0. The write value should be 0.	R/W

EMCA[1:0]位（ECC模式选择位的访问控制）

EMCA[1:0]位是ECERVF位的写触发保留位。读取值始终为0。当这些位的值为01b时，可以对ECERVF位进行写访问。如果这些位不是01b，则忽略对ECERVF位的写访问并且不写入该值。

ECSEDF0位（ECC单个位错误地址检测标志）

ECSEDF0位表示当错误检测有效时，错误被捕获到错误地址寄存器中。该位由1位错误检测设置。

当在EC710EAD0寄存器中已捕获2位错误地址后检测到1位错误时，该位不会更新，但EC710EAD0寄存器会更新。

该位是只读的，因此写入1或0无效。要清除这些位，请将1写入ECER1C位。

[Setting condition]

在允许错误判断的条件下（未设置ECER1C=1时），当RAM输出数据出现1位错误并在EC710EAD0中捕获错误地址时。

[Clearing condition]

- Writing ECER1C = 1
- ●ECC错误判断无效时（ECERVF=0）。

ECDEDF0位（ECC双位错误地址检测标志）

ECDEDF0位表示当错误检测有效时，错误被捕获在错误地址寄存器中。该位由2位错误检测设置。

当在EC710EAD0寄存器中已捕获1位错误地址后检测到2位错误时，该位不更新，EC710EAD0寄存器更新。

该位是只读的，因此写入1或0无效。要清除这些位，请将1写入ECER2C位。

[Setting condition]

在允许错误判断的条件下（未设置ECER2C=1时），当RAM输出数据有2位错误并且错误地址被捕获到EC710EAD0中时。

[Clearing condition]

- Writing ECER2C = 1
- ●ECC错误判断无效时（ECERVF=0）。

33.2.2 EC710TMC：ECC测试模式控制寄存器

Base address: ECCAFLn = 0x4012_F000 + 0x0100 × n (n = 0, 1)
ECCMB = 0x4012_F200

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ETMA[1:0]		—	—	—	—	—	—	ECTMCE	—	—	—	—	—	ECDCS	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	该位读取为0。写入值应为0。	R/W
1	ECDCS	ECC解码输入选择 0：将RAM输出数据的低32位输入到解码电路的数据区1：将EC710TED寄存器中的ECEDB31-0输入到解码电路的数据区	R/W
6:2	—	这些位被读取为0。写入值应为0。	R/W

Bit	Symbol	Function	R/W
7	ECTMCE	ECC Test Mode Control Enable 0: The access to test mode register and bit is disabled 1: The access to test mode register and bit is enabled	R/W
13:8	—	These bits are read as 0. The write value should be 0.	R/W
15:14	ETMA[1:0]	ECC Test Mode Bit Access Control These bits enable or disable write access to ECTMCE bit.	R/W

ECDCS bit (ECC Decode Input Select)

The ECDCS bit selects either the lower 32 bits data value from RAM or value from the internal test register (EDEDB[31:0] in EC710TED) as input signal to decoder.

The write access to this bit is valid under the condition of ECTMCE = 1 (it is possible to set them at the same time.)

This bit is cleared by setting ECTMCE = 0.

ECTMCE bit (ECC Test Mode Control Enable)

The ECTMCE bit selects the access enable or disable to test register and test control bit.

The write access to this bit is valid under the condition that the value of the ETMA[1:0] bits is 10b.

ETMA[1:0] bits (ECC Test Mode Bit Access Control)

The ETMA[1:0] bits are the write trigger reserved bits to the ECTMCE bit. The read value is always 0. When the value of these bits is 10b, it is possible to have write access to the ECTMCE bit. If these bits are not 10b, the write access to the ECTMCE bit is ignored and the value is not written.

33.2.3 EC710TED : ECC Test Substitute Data Register

Base address: ECCAFLn = 0x4012_F000 + 0x0100 × n (n = 0, 1)
ECCMB = 0x4012_F200

Offset address: 0x0C

Bit position:	31																												0
Bit field:	ECEDB[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	ECEDB[31:0]	ECC Test Substitute Data Substitute data in ECC test mode.	R/W

This register is for the 32 bits data for ECC decode. It is possible to read and write using 32 bits operation command when ECTMCE = 1. When ECTMCE = 0, all bits are always 0.

ECEDB[31:0] bits (ECC Test Substitute Data)

When ECDCS in EC710TMC register is 1, the value of this register is bits [31:0] of the input data to the decode circuit.

Bit	Symbol	Function	R/W
7	ECTMCE	ECC测试模式控制启用 0：禁止访问测试模式寄存器和位1：允许访问测试模式寄存器和位	R/W
13:8	—	这些位被读取为0。写入值应为0。	R/W
15:14	ETMA[1:0]	ECC测试模式位访问控制 这些位启用或禁用对ECTMCE位的写访问。	R/W

ECDCS位（ECC解码输入选择）

ECDCS位选择来自RAM的低32位数据值或来自内部测试寄存器（EC710TED中的EDEDB[31:0]）的值作为解码器的输入信号。

对该位的写访问在ECTMCE=1的条件下有效（可以同时置位）。

该位通过设置ECTMCE=0清零。

ECTMCE位（ECC测试模式控制使能）

ECTMCE位选择对测试寄存器和测试控制位的访问启用或禁用。

在ETMA[1:0]位的值为10b的情况下，对该位的写访问是有效的。

ETMA[1:0]位（ECC测试模式位访问控制）

ETMA[1:0]位是ECTMCE位的写触发保留位。读取值始终为0。当这些位的值为10b时，可以对ECTMCE位进行写访问。如果这些位不是10b，则忽略对ECTMCE位的写访问并且不写入该值。

33.2.3 EC710TED:ECC测试替代数据寄存器

Base address: ECCAFLn = 0x4012_F000 + 0x0100 × n (n = 0, 1)
ECCMB = 0x4012_F200

Offset address: 0x0C

Bit position:	31																												0
Bit field:	ECEDB[31:0]																												
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	ECEDB[31:0]	ECC测试替代数据 在ECC测试模式下替换数据。	R/W

该寄存器用于ECC解码的32位数据。可以使用32位操作命令读取和写入时ECTMCE=1。当ECTMCE=0时，所有位始终为0。

ECEDB[31:0]位（ECC测试替代数据）

当EC710TMC寄存器中的ECDCS为1时，该寄存器的值为解码电路输入数据的位[31:0]。

33.2.4 EC710EAD0 : ECC Error Address Register

Base address: ECCAFLn = 0x4012_F000 + 0x0100 × n (n = 0, 1)
ECCMB = 0x4012_F200

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	ECEAD[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
10:0	ECEAD[10:0]	ECC Error Address	R
31:11	—	These bits are read as 0. The write value should be 0.	R

This is a read-only register to hold the ECC error address.

ECEAD[10:0] bits (ECC Error Address)

When ECC error is detected for permitting ECC error judgment, RAM address is captured by the detected signal as a trigger and is hold as the error occurring address. The error address is not captured when the error occurred again to the one held by the same factor.

If 2-bit error occurred under the condition that 1-bit error address is already captured, the 2-bit error address is over-written and the ECDEDF0 bit is set to 1.

If 1-bit error occurred under the condition that 2-bit error address is already captured, the 1-bit error address is not overwritten and the ECSEDF0 bit is not set to 1.

33.3 Operation

33.3.1 ECC Function Setting

Figure 33.1 shows a procedure for ECC function setting.

33.2.4 EC710EAD0：ECC错误地址寄存器

Base address: ECCAFLn = 0x4012_F000 + 0x0100 × n (n = 0, 1)
ECCMB = 0x4012_F200

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	ECEAD[10:0]										
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
10:0	ECEAD[10:0]	ECC错误地址	R
31:11	—	这些位被读取为0。写入值应为0。	R

这是一个只读寄存器，用于保存ECC错误地址。

ECEAD[10:0]位（ECC错误地址）

当检测到ECC错误以允许ECC错误判断时，RAM地址被检测信号捕获作为触发，并作为错误发生地址保持。当错误再次发生到相同因素持有的地址时，错误地址不会被捕获。

如果在已捕获1位错误地址的情况下发生2位错误，则覆盖2位错误地址并将ECDEDF0位设置为1。

如果在已捕获2位错误地址的情况下发生1位错误，则不会覆盖1位错误地址且ECSEDF0位不会设置为1。

33.3 Operation

33.3.1 ECC功能设置

图33.1显示了ECC功能设置的过程。

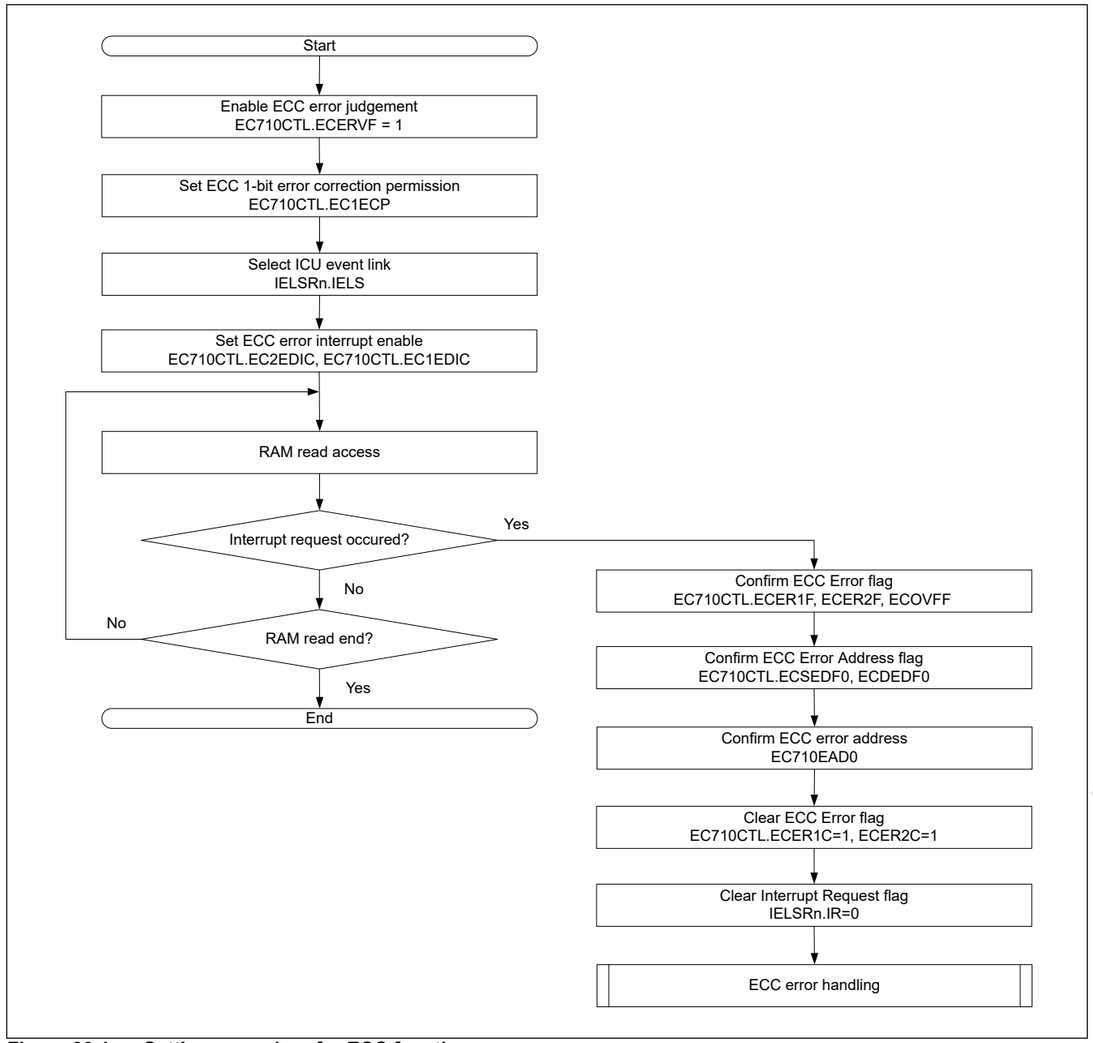

Figure 33.1 Setting procedure for ECC function

33.3.2 ECC Decoder Testing

ECC interrupts can be intentionally generated by ECC test mode. Figure 33.2 shows a procedure for ECC decoder testing.

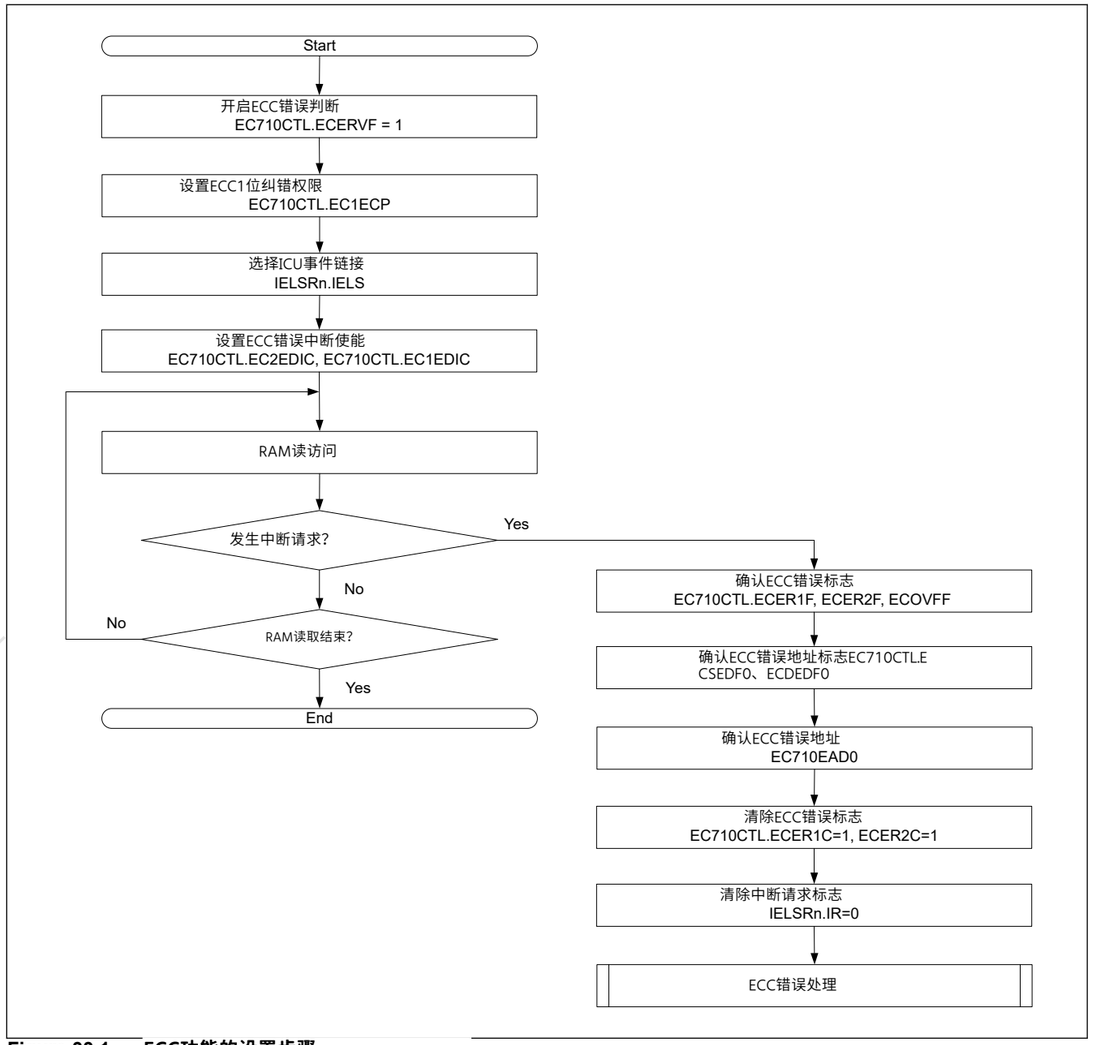

Figure 33.1 ECC功能的设置步骤

33.3.2 ECC解码器测试

ECC测试模式可以有意生成ECC中断。图33.2显示了ECC解码器测试的过程。

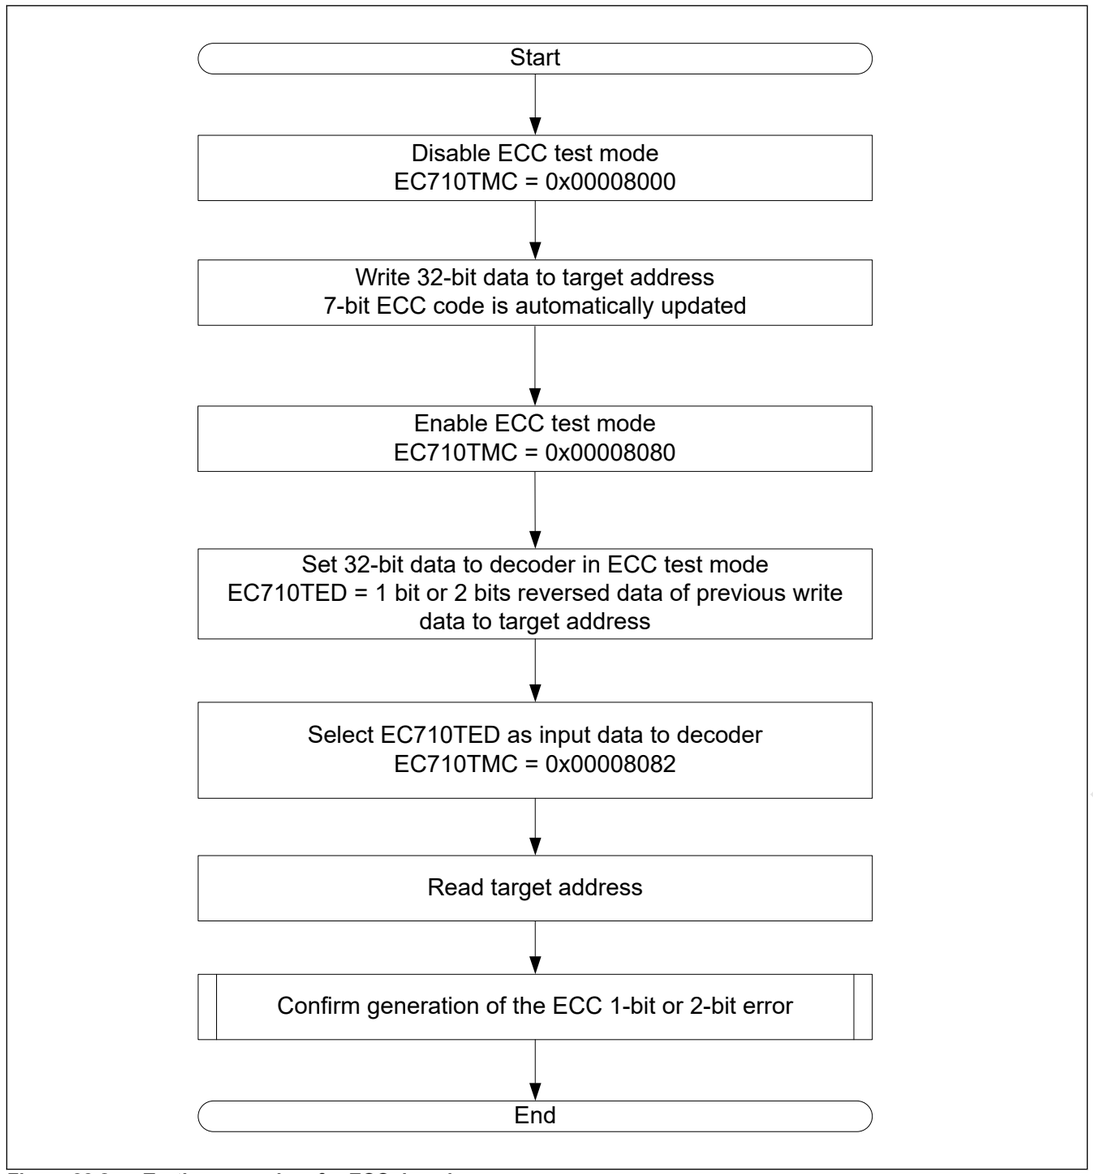

Figure 33.2 Testing procedure for ECC decoder

33.4 Interrupts

The ECC module issues three interrupt requests:

- CAN_AFLRAM0_ERI
- CAN_AFLRAM1_ERI
- CAN_MRAM_ERI.

Interrupt sources of each interrupt request include:

- 1-bit ECC error
- 2-bit ECC error

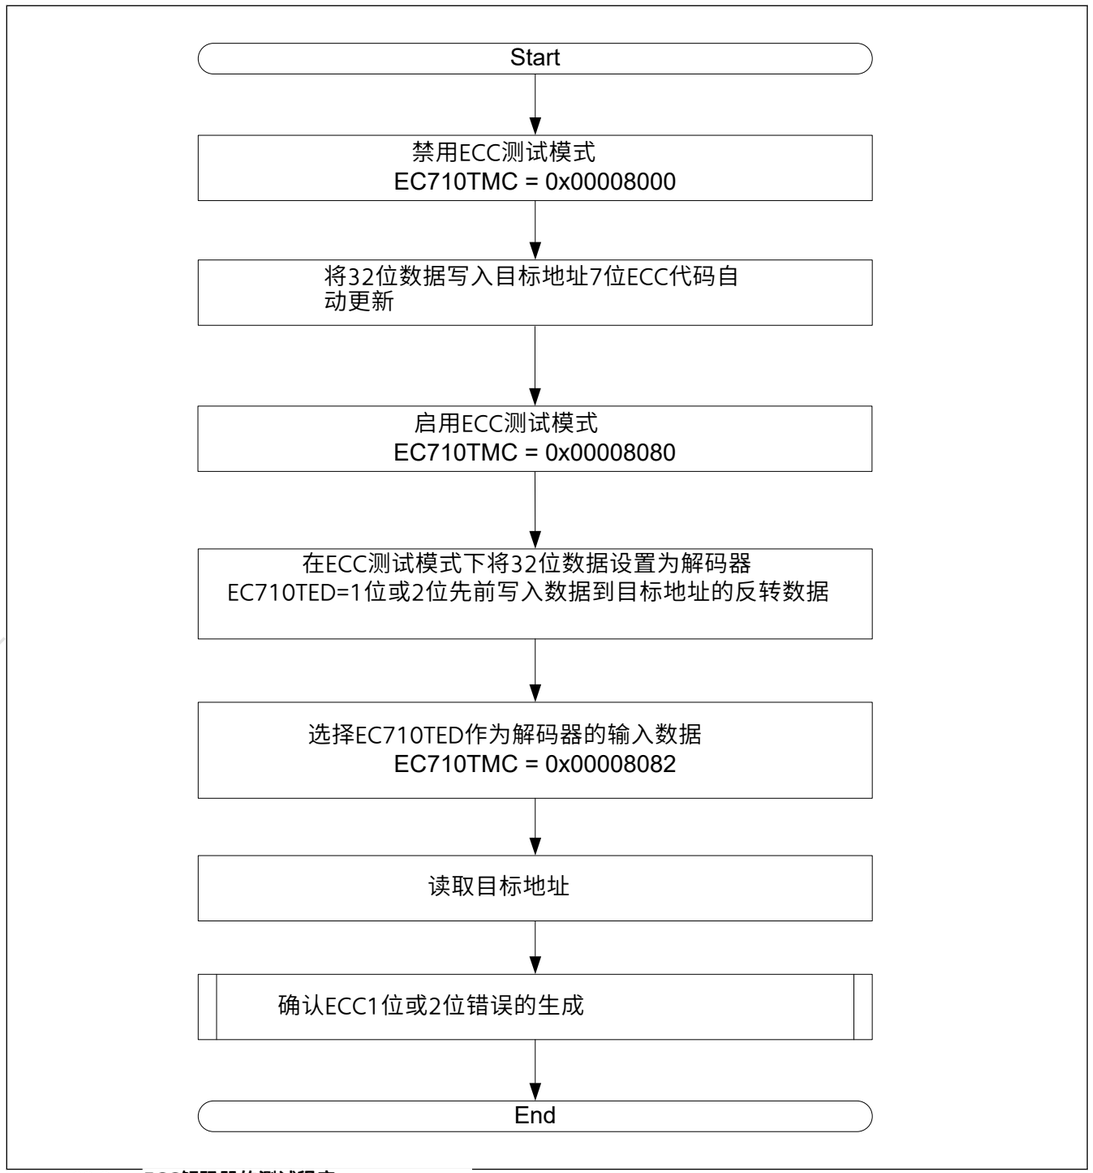

Figure 33.2 ECC解码器的测试程序

33.4 Interrupts

ECC模块发出三个中断请求：

- CAN_AFLRAM0_ERI
- CAN_AFLRAM1_ERI
- CAN_MRAM_ERI.

每个中断请求的中断源包括：

- 1-bit ECC error
- 2-bit ECC error

RA生态工作室

- ECC error overflow.

●ECC错误溢出。

34. Serial Peripheral Interface (SPI)

34.1 Overview

The Serial Peripheral Interface (SPI) provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices. Table 34.1 lists the SPI specifications, Figure 34.1 shows a block diagram, and Table 34.2 lists the I/O pins.

Table 34.1 SPI specifications (1 of 2)

Parameter	Specifications
Number of channels	Two channels
SPI transfer functions	• Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allows serial communications through SPI operation (4-wire method) or clock synchronous operation (3-wire method) • Transmit-only operation available • Receive-only operation is available (Slave mode only) • Communication mode selectable to full-duplex or transmit-only • RSPCK polarity switching • RSPCK phase switching
Data format	• MSB-first or LSB-first selectable • Transfer bit length selectable to 8, 9, 10, 11, 12, 13, 14, 15, 16, 20, 24, or 32 bits • 128-bit transmit and receive buffers • Up to four frames transferable in one round of transmission or reception (each frame consisting of up to 32 bits) • Byte swap operating function • Transmit/receive data can be inverted.
Bit rate	• In master mode, the on-chip baud rate generator generates RSPCK by frequency-dividing PCLKA (the division ratio ranges from divided by 2 to divided by 4096) • In slave mode, the minimum PCLKA clock divided by 4 can be input as RSPCK (PCLKA divided by 4 is the maximum RSPCK frequency) Width at high level: 2 PCLKA cycles; width at low level: 2 PCLKA cycles
Buffer configuration	• Double buffer configuration for the transmit and receive buffers • 128 bits for the transmit and receive buffers
Error detection	• Mode fault error detection • Underrun error detection • Overrun error detection*1 • Parity error detection
SSL control function	• Four SSL pins (SSLni: SSLn0 to SSLn3) (n = A, B) for each channel • In single-master mode, SSLn0 to SSLn3 pins are output • In multi-master mode, SSLn0 pin for input, and SSLn1 to SSLn3 pins either for output or unused • In slave mode, SSLn0 pin for input and SSLn1 to SSLn3 pins unused • Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable delay from RSPCK stop to SSL output negation (SSL negation delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Controllable wait for next-access SSL output assertion (next-access delay) Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units) • Function for changing SSL polarity • Delay between frames in burst transfer is settable
Control in master transfer	• Transfers of up to eight commands each can be executed sequentially in looped execution • For each command, the following can be set: SSL signal value, bit rate, RSPCK polarity and phase, transfer data length, MSB- or LSB-first, burst, RSPCK delay, SSL negation delay, and next-access delay • Transfers can be initiated by writing to the transmit buffer • MOSI signal value specifiable in SSL negation • RSPCK auto-stop function

34. 串行外设接口(SPI)

34.1 Overview

串行外围接口(SPI)提供与多个处理器和外围设备的高速全双工同步串行通信。表34.1列出了SPI规格，图34.1显示了框图，表34.2列出了IO引脚。

Table 34.1 SPI规格（2个中的1个）

Parameter	Specifications
通道数	两个通道
SPI传输函数	• 使用MOSI（主输出从输入）、MISO（主输入从输出）、SSL（从选择）和RSPCK（SPI时钟）信号允许通过SPI操作（4线方法）或时钟同步操作（3-线法） • 仅传输操作可用 • 仅接收操作可用（仅从模式） • 通信模式可选择全双工或仅传输 • RSPCK极性切换 • RSPCK相位切换
数据格式	• 可选择MSB优先或LSB优先 • 传输位长度可选择为8、9、10、11、12、13、14、15、16、20、24或32位 • 128位发送和接收缓冲器 • 在一轮发送或接收中最多可传输四帧（每帧最多包含32位） • 字节交换操作功能 • 发送接收数据可以反转。
比特率	• 在主机模式下，片内波特率发生器通过分频产生RSPCK PCLKA（分频比范围从2分频到4096分频） • 从机模式下，可以输入最小PCLKA时钟4分频作为RSPCK（PCLKA4分频为最大RSPCK频率）高电平宽度：2个PCLKA周期；低电平宽度：2个PCLKA周期
缓冲区配置	• 发送和接收缓冲区的双缓冲区配置 • 128位用于发送和接收缓冲区
错误检测	• 模式故障错误检测 • 欠载错误检测 • 溢出错误检测*1 • 奇偶校验错误检测
SSL控制功能	• 每个通道有四个SSL引脚（SSLni：SSLn0到SSLn3）（n=A、B） • 在单主模式下，输出SSLn0到SSLn3引脚 • 在多主模式下，SSLn0引脚用于输入，SSLn1至SSLn3引脚用于输出或未使用 • 在从机模式下，SSLn0引脚用于输入，SSLn1到SSLn3引脚未使用 • 从SSL输出断言到RSPCK操作的可控延迟（RSPCK延迟） 范围：1到8个RSPCK循环（以RSPCK循环为单位设置） • 从RSPCK停止到SSL输出否定的可控延迟（SSL否定延迟） 范围：1到8个RSPCK循环（以RSPCK循环为单位设置） • 下一次访问SSL输出断言的可控等待（下一次访问延迟） 范围：1到8个RSPCK循环（以RSPCK循环为单位设置） • 更改SSL极性的功能 • 突发传输中帧之间的延迟是可设置的
主传输中的控制	• 最多可传输8个命令，每个命令可以在循环执行中顺序执行 • 对于每个命令，可以设置以下内容： SSL信号值、比特率、RSPCK极性和相位、传输数据长度、MSBorLSB在前、突发、RSPCK延迟、SSL否定延迟和下一次访问延迟 • 可以通过写入发送缓冲区来启动传输 • 在SSL否定中可指定的MOSI信号值 • RSPCK auto-stop function

RA生态工作室

Table 34.1 SPI specifications (2 of 2)

Parameter	Specifications
Interrupt sources	Interrupt sources: ● Receive buffer full interrupt ● Transmit buffer empty interrupt ● SPI error interrupt (mode fault error, overrun error, parity error) ● SPI idle interrupt (SPI idle) ● Transmission-complete interrupt
Event link function	The following events can be output to the Event Link Controller (ELC): ● Receive buffer full signal ● Transmit buffer empty signal ● Mode fault, underrun, overrun, or parity error signal ● SPI idle signal ● Communication end signal
Other functions	● Switching between CMOS output and open-drain output ● SPI initialization function ● Loopback mode
Module-stop function	Module-stop state can be set to reduce power consumption.
TrustZone Filter	Security attribution can be set

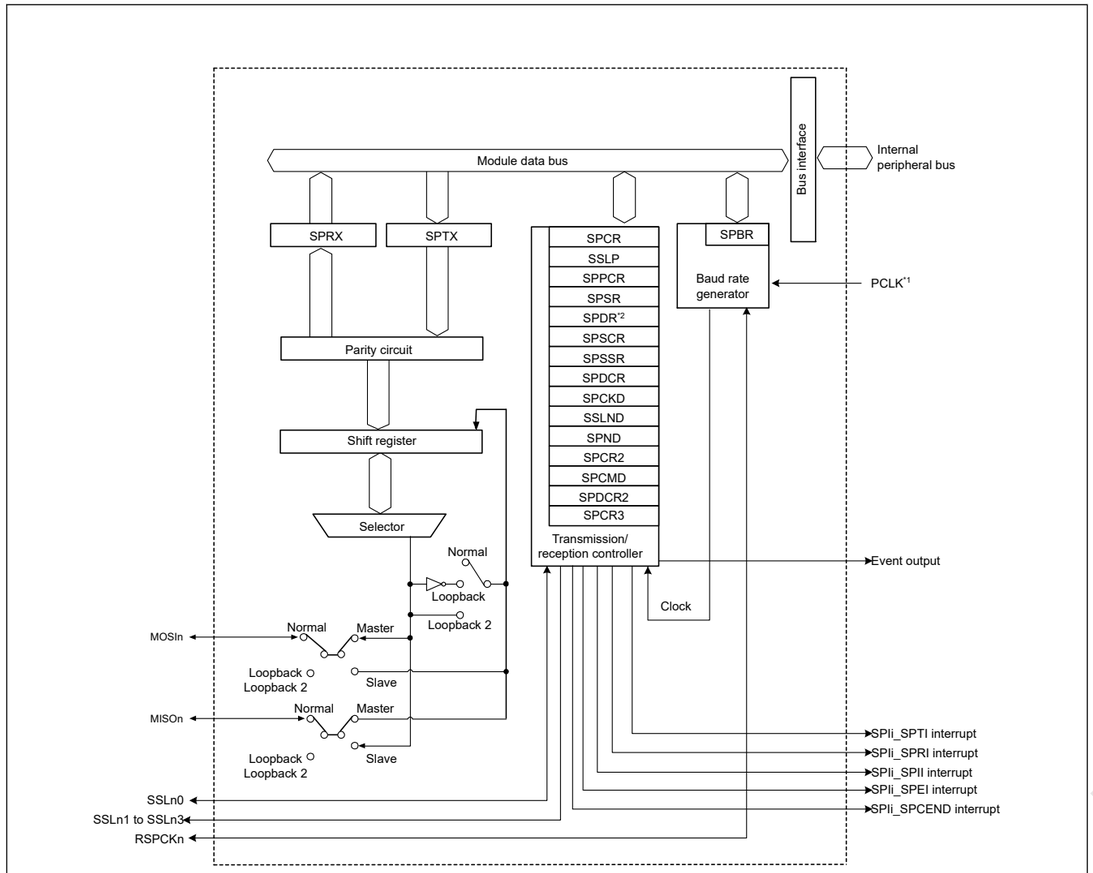
Note 1. In master reception and when the RSPCK auto-stop function is enabled, an overrun error does not occur because the transfer clock is stopped on overrun error detection.

Table 34.1 SPI规范（2个中的2个）

Parameter	Specifications
中断源	Interrupt sources: ● 接收缓冲区满中断 ● 发送缓冲区空中断 ● SPI错误中断（模式错误错误、溢出错误、奇偶校验错误） ● SPI空闲中断（SPI空闲） ● Transmission-complete interrupt
事件链接功能	以下事件可以输出到事件链接控制器(ELC)：● 接收缓冲区满信号 ● 发送缓冲器空信号 ● 模式故障、欠载、溢出或奇偶校验错误信号 ● SPI空闲信号 ● 通讯结束信号
其他功能	● 在CMOS输出和开漏输出之间切换 ● SPI初始化函数 ● Loopback mode
Module-stop function	可设置模块停止状态以降低功耗。
TrustZone Filter	可设置安全属性

注1.在主机接收和启用RSPCK自动停止功能时，不会发生溢出错误，因为在检测到溢出错误时会停止传输时钟。

RA生态工作室



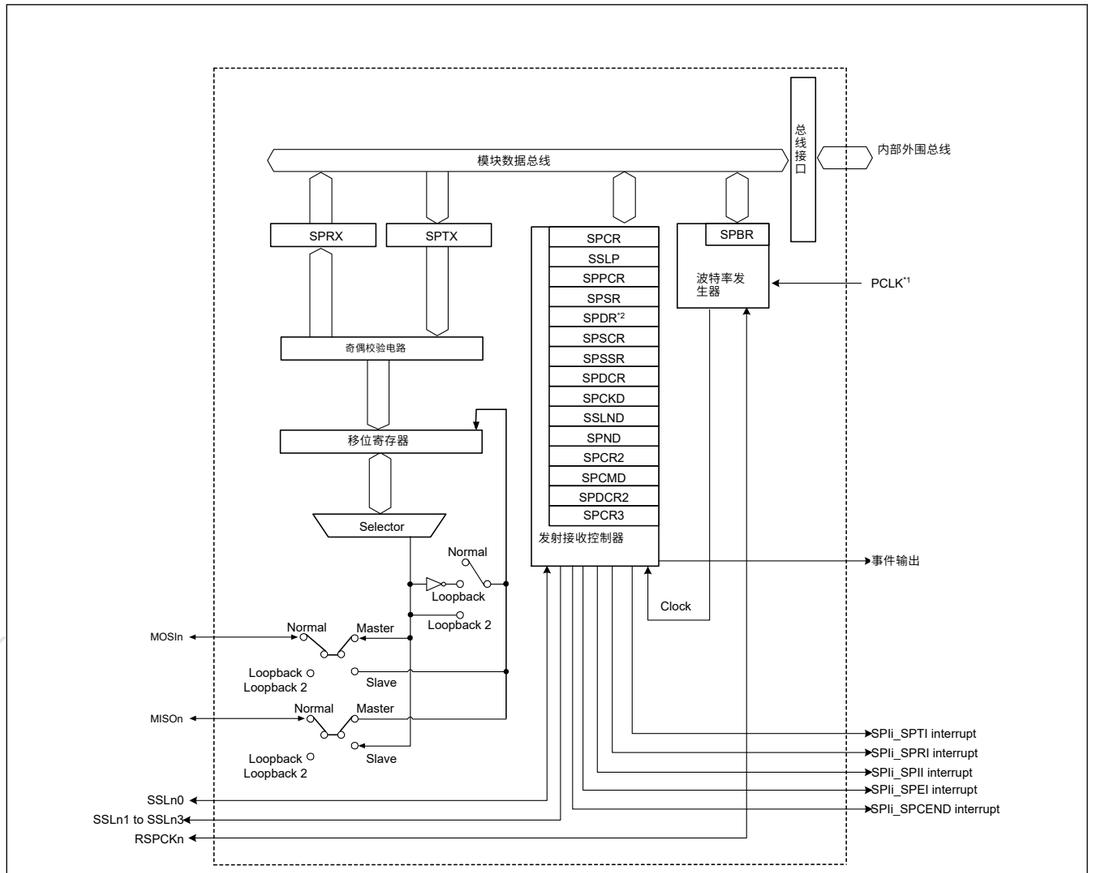
Note 1. PCLK = PCLKA
Note 2. SPDR = SPDR/SPDR_HA/SPDR_BY
Note 3. m = 0 to 7

Figure 34.1 SPI block diagram

The SPI automatically switches the I/O direction of the SSLn0 pin. SSLn0 is set as an output when the SPI is a single master, and as an input when the SPI is a multi-master or a slave. The RSPCKn, MOSIn, and MISOn pins are automatically set as inputs or outputs based on the master or slave setting and the level input on the SSLn0 pin. For details, see section 34.3.2. Controlling the SPI Pins.

Table 34.2 SPI I/O pins (1 of 2)

Channel	Pin name	I/O	Description
SPI0	RSPCKA	I/O	Clock input/output pin
	SSLA0	I/O	Slave selection input/output
	SSLA1 to SSLA3	Output	Slave selection output
	MOSIA	I/O	Master transmit data input/output
	MISOA	I/O	Slave transmit data input/output
SPI1	RSPCKB	I/O	Clock input/output pin
	MOSIB	I/O	Master transmit data input/output



Note 1. PCLK = PCLKA
Note 2. SPDR = SPDR/SPDR_HA/SPDR_BY
注3.m=0到7

Figure 34.1 SPI框图

SPI自动切换SSLn0引脚的IO方向。当SPI为单主机时SSLn0设置为输出，当SPI为多主机或从机时设置为输入。RSPCKn、MOSIn和MISOn引脚会根据主机或从机设置以及SSLn0引脚上的电平输入自动设置为输入或输出。有关详细信息，请参阅第34.3.2节。控制SPI引脚。

Table 34.2 SPIIO引脚（2个中的1个）

Channel	引脚名称	I/O	Description
SPI0	RSPCKA	I/O	时钟输入输出引脚
	SSLA0	I/O	从机选择输入输出
	SSLA1 to SSLA3	Output	从机选择输出
	MOSIA	I/O	主机发送数据输入输出
	MISOA	I/O	从机发送数据输入输出
SPI1	RSPCKB	I/O	时钟输入输出引脚
	MOSIB	I/O	主机发送数据输入输出

Table 34.2 SPI I/O pins (2 of 2)

Channel	Pin name	I/O	Description
	MISOB	I/O	Slave transmit data input/output
	SSLB0	I/O	Slave selection input/output
	SSLB1 to SSLB3	Output	Slave selection output

Note: Pin names are indicated as "...A" or "...An" for SPI0, and "...B" or "...Bn" for SPI1 (n = 0, 1, 2, or 3).

34.2 Register Descriptions

34.2.1 SPCR : SPI Control Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SPRIE	SPE	SPTIE	SPEIE	MSTR	MODFEN	TXMD	SPMS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SPMS	SPI Mode Select 0: Select SPI operation (4-wire method) 1: Select clock synchronous operation (3-wire method)	R/W
1	TXMD	Communications Operating Mode Select 0: Select full-duplex synchronous serial communications 1: Select serial communications with transmit-only	R/W
2	MODFEN	Mode Fault Error Detection Enable 0: Disable detection of mode fault errors 1: Enable detection of mode fault errors	R/W
3	MSTR	SPI Master/Slave Mode Select 0: Select slave mode 1: Select master mode	R/W
4	SPEIE	SPI Error Interrupt Enable 0: Disable SPI error interrupt requests 1: Enable SPI error interrupt requests	R/W
5	SPTIE	Transmit Buffer Empty Interrupt Enable 0: Disable transmit buffer empty interrupt requests 1: Enable transmit buffer empty interrupt requests	R/W
6	SPE	SPI Function Enable 0: Disable SPI function 1: Enable SPI function	R/W
7	SPRIE	SPI Receive Buffer Full Interrupt Enable 0: Disable SPI receive buffer full interrupt requests 1: Enable SPI receive buffer full interrupt requests	R/W

SPMS bit (SPI Mode Select)

The SPMS bit selects SPI operation (4-wire method) or clock synchronous operation (3-wire method).

The SSLn0 to SSLn3 pins are not used in clock synchronous operation. The RSPCKn, MOSIn, and MISOn pins handle communications. For clock synchronous operation in master mode (MSTR = 1), the SPCMDm.CPHA bit can be set to either 0 or 1. For clock synchronous operation in slave mode (MSTR = 0), always set the CPHA bit to 1. Do not perform operations if the CPHA bit is set to 0 for clock synchronous operation in slave mode (MSTR = 0).

Table 34.2 SPIIO引脚（2个中的2个）

Channel	引脚名称	I/O	Description
	MISOB	I/O	从机发送数据输入输出
	SSLB0	I/O	从机选择输入输出
	SSLB1 to SSLB3	Output	从机选择输出

Note: SPIO的引脚名称表示为"...A"或"...An"，SPI1的引脚名称表示为"...B"或"...Bn"（n=0、1、2或3）。

34.2 注册说明

34.2.1 SPCR:SPI控制寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SPRIE	SPE	SPTIE	SPEIE	MSTR	MODFEN	TXMD	SPMS
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SPMS	SPI模式选择 0：选择SPI操作（4线方式）1：选择时钟同步操作（3线方式）	R/W
1	TXMD	通讯操作模式选择 0：选择全双工同步串行通信1：选择只发送串行通信	R/W
2	MODFEN	模式故障错误检测启用 0：禁用模式故障错误检测1：启用模式故障错误检测	R/W
3	MSTR	SPI主从模式选择 0：选择从模式1：选择主模式	R/W
4	SPEIE	SPI错误中断使能 0：禁用SPI错误中断请求1：启用SPI错误中断请求	R/W
5	SPTIE	发送缓冲区空中断使能 0：禁止发送缓冲区空中断请求1：允许发送缓冲区空中断请求	R/W
6	SPE	SPI功能使能 0：禁用SPI功能1：启用SPI功能	R/W
7	SPRIE	SPI接收缓冲器满中断使能 0：禁止SPI接收缓冲区满中断请求1：使能SPI接收缓冲区满中断请求	R/W

SPMS位（SPI模式选择）

SPMS位选择SPI操作（4线方法）或时钟同步操作（3线方法）。

SSLn0到SSLn3引脚不用于时钟同步操作。RSPCKn、MOSIn和MIOn引脚处理通信。对于主机模式下的时钟同步操作(MSTR=1)，SPCMDm.CPHA位可以设置为0或1。对于从机模式下的时钟同步操作(MSTR=0)，始终将CPHA位设置为1。不要如果CPHA位设置为0以在从机模式下进行时钟同步操作（MSTR=0），则执行操作。

TXMD bit (Communications Operating Mode Select)

The TXMD bit selects full-duplex synchronous serial communications or transmit-only operations. When this bit is set to 1, the SPI only performs transmit operations and not receive operations (see section 34.3.6. Data Transfer Modes), and receive buffer full interrupt requests cannot be used.

TXMD setting is invalid in receive only slave mode.

MODFEN bit (Mode Fault Error Detection Enable)

The MODFEN bit enables or disables the detection of mode fault errors (see section 34.3.9. Error Detection). In addition, the SPI determines the I/O direction of the SSLni pins based on combination of the MODFEN and MSTR bits (see section 34.3.2. Controlling the SPI Pins).

MSTR bit (SPI Master/Slave Mode Select)

The MSTR bit selects master or slave mode for the SPI. Based on the MSTR bit settings, the SPI determines the direction of the RSPCKn, MOSIn, MISOn, and SSLni pins.

SPEIE bit (SPI Error Interrupt Enable)

The SPEIE bit enables or disables the generation of SPI error interrupt requests when one of the following occurs:

- The SPI detects a mode fault error or underrun error and sets the SPSR.MODF flag to 1
- The SPI detects an overrun error and sets the SPSR.OVRF flag to 1
- The SPI detects a parity error and sets the SPSR.PERF flag to 1

For details, see section 34.3.9. Error Detection.

SPTIE bit (Transmit Buffer Empty Interrupt Enable)

The SPTIE bit enables or disables the generation of transmit buffer empty interrupt requests when the SPI detects that the transmit buffer is empty. To generate a transmit buffer empty interrupt request when transmission starts, set the SPE and SPTIE bits to 1 at the same time or set the SPE bit to 1 after setting the SPTIE bit to 1.

When the SPTIE bit is 1, transmit buffer interrupts are generated even when the SPI function is disabled (when the SPE bit is changed to 0).

SPE bit (SPI Function Enable)

The SPE bit enables or disables the SPI function. The SPE bit cannot be set to 1 when the SPSR.MODF flag is 1. For details, see section 34.3.9. Error Detection.

Setting the SPE bit to 0 disables the SPI function and initializes a part of the module function. For details, see section 34.3.10. Initializing the SPI. In addition, a transmit buffer empty interrupt request is generated when the SPE bit is changed from 0 to 1 or from 1 to 0.

SPRIE bit (SPI Receive Buffer Full Interrupt Enable)

The SPRIE bit enables or disables the generation of an SPI receive buffer full interrupt request when the SPI detects a receive buffer full write after completion of a serial transfer.

34.2.2 SSLP : SPI Slave Select Polarity Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	SSL3P	SSL2P	SSL1P	SSL0P
Value after reset:	0	0	0	0	0	0	0	0

TXMD位（通信操作模式选择）

TXMD位选择全双工同步串行通信或仅发送操作。当该位设置为1时，SPI只执行发送操作而不执行接收操作（参见第34.3.6节。数据传输模式），并且无法使用接收缓冲区满中断请求。

TXMD设置在只接收从机模式下无效。

MODFEN位（模式故障错误检测使能）

MODFEN位启用或禁用模式故障错误检测（请参见第34.3.9节。错误检测）。此外，SPI根据MODFEN和MSTR位的组合确定SSLni引脚的IO方向（参见第34.3.2节。控制SPI引脚）。

MSTR位（SPI主从模式选择）

MSTR位选择SPI的主模式或从模式。根据MSTR位设置，SPI确定RSPCKn、MOSIn、MISOn和SSLni引脚的方向。

SPEIE位（SPI错误中断使能）

当发生以下情况之一时，SPEIE位启用或禁用SPI错误中断请求的生成：

- SPI检测到模式故障错误或欠载错误并将SPSR.MODF标志设置为1
- SPI检测到溢出错误并将SPSR.OVRF标志设置为1
- SPI检测到奇偶校验错误并将SPSR.PERF标志设置为1

有关详细信息，请参阅第34.3.9节。错误检测。

SPTIE位（发送缓冲区空中断允许）

当SPI检测到发送缓冲区为空时，SPTIE位使能或禁止生成发送缓冲区空中断请求。要在发送开始时产生发送缓冲区空中断请求，请将SPE和SPTIE位同时设置为1，或在将SPTIE位设置为1后将SPE位设置为1。

当SPTIE位为1时，即使禁用SPI功能（当SPE位变为0时）也会产生发送缓冲区中断。

SPE位（SPI功能使能）

SPE位启用或禁用SPI功能。当SPSR.MODF标志为1时，SPE位不能设置为1。详情请参见34.3.9节。错误检测。

将SPE位设置为0将禁用SPI功能并初始化部分模块功能。有关详细信息，请参阅第34.3.10节。初始化SPI。此外，当SPE位从0变为1或从1变为0时，会产生发送缓冲区空中断请求。

SPRIE位（SPI接收缓冲器满中断使能）

当SPI在串行传输完成后检测到接收缓冲区已满写入时，SPRIE位启用或禁用SPI接收缓冲区已满中断请求的生成。

34.2.2 SSLP：SPI从机选择极性寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	SSL3P	SSL2P	SSL1P	SSL0P
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SSL0P	SSLn0 Signal Polarity Setting 0: Set SSLn0 signal to active-low 1: Set SSLn0 signal to active-high	R/W
1	SSL1P	SSLn1 Signal Polarity Setting 0: Set SSLn1 signal to active-low 1: Set SSLn1 signal to active-high	R/W
2	SSL2P	SSLn2 Signal Polarity Setting 0: Set SSLn2 signal to active-low 1: Set SSLn2 signal to active-high	R/W
3	SSL3P	SSLn3 Signal Polarity Setting 0: Set SSLn3 signal to active-low 1: Set SSLn3 signal to active-high	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

34.2.3 SPPCR : SPI Pin Control Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MOIFE	MOIFV	—	—	SPLP2	SPLP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SPLP	SPI Loopback 0: Normal mode 1: Loopback mode (receive data = inverted transmit data)	R/W
1	SPLP2	SPI Loopback 2 0: Normal mode 1: Loopback mode (receive data = transmit data)	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	MOIFV	MOSI Idle Fixed Value 0: Set level output on MOSIn pin during MOSI idling to low 1: Set level output on MOSIn pin during MOSI idling to high	R/W
5	MOIFE	MOSI Idle Value Fixing Enable 0: Set MOSI output value to equal final data from previous transfer 1: Set MOSI output value to equal value set in the MOIFV bit	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

SPLP bit (SPI Loopback)

The SPLP bit selects the mode of the SPI pins. When this bit is set to 1, the SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, and between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0. The SPI then inverts the value of the input path for the shift register and connects it to the output path (loopback mode). For more information, see section 34.3.13. Loopback Mode.

SPLP2 bit (SPI Loopback 2)

The SPLP2 bit selects the mode of the SPI pins. When this bit is set to 1, the SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, and between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0. The SPI then connects the value of the input path for the shift register to the output path (loopback mode) without inverting the value. For more information, see section 34.3.13. Loopback Mode.

Bit	Symbol	Function	R/W
0	SSL0P	SSLn0信号极性设置 0：将SSLn0信号设置为低电平有效 1：将SSLn0信号设置为高电平有效	R/W
1	SSL1P	SSLn1信号极性设置 0：将SSLn1信号设置为低电平有效 1：将SSLn1信号设置为高电平有效	R/W
2	SSL2P	SSLn2信号极性设置 0：将SSLn2信号设置为低电平有效 1：将SSLn2信号设置为高电平有效	R/W
3	SSL3P	SSLn3信号极性设置 0：设置SSLn3信号为低电平有效1 ：设置SSLn3信号为高电平有效	R/W
7:4	—	这些位被读取为0。写入值应为0。	R/W

34.2.3 SPPCR:SPI引脚控制寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MOIFE	MOIFV	—	—	SPLP2	SPLP
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SPLP	SPI Loopback 0：正常模式1：环回模式（接收数据=反转发送数据）	R/W
1	SPLP2	SPI Loopback 2 0：正常模式1：环回模式（接收数据=发送数据）	R/W
3:2	—	这些位被读取为0。写入值应为0。	R/W
4	MOIFV	MOSI空闲固定值 0：在MOSI空闲期间将MOSIn引脚的电平输出设置为低1：在MOSI空闲期间将MOSIn引脚的电平输出设置为高	R/W
5	MOIFE	MOSI空闲值固定启用 0：设置MOSI输出值等于上次传输的最终数据1：设置MOSI输出值等于MOIFV位中设置的值	R/W
7:6	—	这些位被读取为0。写入值应为0。	R/W

SPLP bit (SPI Loopback)

SPLP位选择SPI引脚的模式。当该位设置为1时，如果SPCR.MSTR位为1，则SPI关闭MIOn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则关闭MOSIn引脚和移位寄存器之间的路径。SPI然后反转移位寄存器的输入路径的值并将其连接到输出路径（环回模式）。有关详细信息，请参阅第34.3.13节。环回模式。

SPLP2 bit (SPI Loopback 2)

SPLP2位选择SPI引脚的模式。当该位设置为1时，如果SPCR.MSTR位为1，则SPI关闭MIOn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则关闭MOSIn引脚和移位寄存器之间的路径。然后SPI将移位寄存器的输入路径的值连接到输出路径（环回模式），而不反转该值。有关详细信息，请参阅第34.3.13节。环回模式。

MOIFV bit (MOSI Idle Fixed Value)

The MOIFV bit determines the MOSIn pin output value during the SSL negation period (including the SSL retention period during a burst transfer) when the MOIFE bit is 1 in master mode.

MOIFE bit (MOSI Idle Value Fixing Enable)

The MOIFE bit fixes the MOSIn output value when the SPI is in master mode and in an SSL negation period (including the SSL retention period during a burst transfer).When the MOIFE bit is 0, the SPI outputs the last data from the previous serial transfer during the SSL negation period to the MOSIn pin. When the MOIFE bit is 1, the SPI outputs the fixed value set in the MOIFV bit to the MOSIn pin.

34.2.4 SPSR : SPI Status Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x03

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SPRF	CENDF	SPTEF	UDRF	PERF	MODF	IDLNF	OVRF
Value after reset:	0	0	1	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OVRF	Overrun Error Flag 0: No overrun error occurred 1: Overrun error occurred	R/W*1
1	IDLNF	SPI Idle Flag 0: SPI is in the idle state 1: SPI is in the transfer state	R
2	MODF	Mode Fault Error Flag 0: No mode fault or underrun error occurred 1: Mode fault error or underrun error occurred	R/W*1
3	PERF	Parity Error Flag 0: No parity error occurred 1: Parity error occurred	R/W*1
4	UDRF	Underrun Error Flag The UDRF bit is valid when MODF flag is 1. 0: Mode fault error occurred (MODF = 1) 1: Underrun error occurred (MODF = 1)	R/W*1 *2
5	SPTEF	SPI Transmit Buffer Empty Flag 0: Data is in the transmit buffer 1: No data is in the transmit buffer	R/W*3
6	CENDF	Communication End Flag 0: Not communicating or communicating 1: Communication completed	R/W*1
7	SPRF	SPI Receive Buffer Full Flag 0: No valid data is in SPDR/SPDR_HA 1: Valid data is in SPDR/SPDR_HA	R/W*3

Note 1. Only 0 can be written to clear the flag after reading 1.
Note 2. Clear the UDRF flag at the same time as the MODF flag.
Note 3. The write value should be 1.

OVRF flag (Overrun Error Flag)

The OVRF flag indicates the occurrence of an overrun error. In master mode (SPCR.MSTR bit = 1) and when the RSPCK clock auto-stop function is enabled (SPCR1.SCKASE bit = 1), overrun errors do not occur. This flag does not set to 1. For details, see section 34.3.9.1. Overrun errors.

[Setting condition]

When the next serial transfer ends and the receive buffer is full, and satisfy one of following.

MOIFV位（MOSI空闲固定值）

MOIFV位决定主模式下MOIFE位为1时SSL否定期间（包括突发传输期间的SSL保持期间）的MOSIn引脚输出值。

MOIFE位（MOSI空闲值固定启用）

MOIFE位固定SPI处于主机模式和SSL否定周期（包括突发传输期间的SSL保持周期）时的MOSIn输出值。当MOIFE位为0时，SPI输出上一个串行的最后一个数据在SSL否定期间传输到MOSIn引脚。当MOIFE位为1时，SPI将MOIFV位中设置的固定值输出到MOSIn引脚。

34.2.4 SPSR：SPI状态寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x03

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SPRF	CENDF	SPTEF	UDRF	PERF	MODF	IDLNF	OVRF
重置后的值：	0	0	1	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OVRF	溢出错误标志 0：未发生溢出错误1：发生溢出错误	R/W*1
1	IDLNF	SPI空闲标志 0：SPI处于空闲状态1：SPI处于传输状态	R
2	MODF	模式故障错误标志 0：未发生模式故障或欠载错误1：发生模式故障错误或欠载错误	R/W*1
3	PERF	奇偶校验错误标志 0：未发生奇偶校验错误1 ：发生奇偶校验错误	R/W*1
4	UDRF	欠载错误标志 当MODF标志为1时，UDRF位有效。 0：发生模式故障错误（MODF=1）1：发生欠载错误（MODF=1）	R/W*1 *2
5	SPTEF	SPI发送缓冲区空标志 0：发送缓冲区中有数据1：发送缓冲区中没有数据	R/W*3
6	CENDF	通讯结束标志 0：不通讯或通讯1：通讯完成	R/W*1
7	SPRF	SPI接收缓冲区满标志 0：SPDRSPDR_HA中没有有效数据1：SPDRSPDR_HA中有有效数据	R/W*3

注1.读1后只能写0清除标志。
注2.在清除MODF标志的同时清除UDRF标志。
注3.写入值应为1。

OVRF标志（溢出错误标志）

OVRF标志指示发生溢出错误。在主机模式（SPCR.MSTR位=1）和启用RSPCK时钟自动停止功能（SPCR1.SCKASE位=1）时，不会发生溢出错误。此标志不设置为1。有关详细信息，请参阅第34.3.9.1节。溢出错误。

[Setting condition]

当下一次串行传输结束且接收缓冲区已满时，满足以下条件之一。

RA生态工作室

- The SPCR.TXMD bit = 0. (transmit-receive master mode or transmit-receive slave mode or receive only slave mode)
- The SPCR.MSTR bit = 0, and the SPCR3.ETXMD bit = 1. (receive only slave mode)

[Clearing condition]

- When 0 is written to the OVRF flag after the OVRF flag is confirmed to be 1 by a read of SPSR.

IDLNF flag (SPI Idle Flag)

The IDLNF flag indicates the transfer status of the SPI.

[Setting conditions]

Master mode

- When none of the conditions in the master mode [Clearing condition] is met.

Slave mode

- When the SPE bit in SPCR is 1, enabling the SPI function.

[Clearing conditions]

Master mode

When condition 1 or all other conditions are satisfied.

Condition 1: The SPE bit in SPCR is 0, indicating that the SPI is initialized.

Condition 2: The transmit buffer (SPTX) is empty, indicating that data for the next transfer is not set.

Condition 3: The SPI internal sequencer is in the idle state, indicating that operation up to next-access delay is complete.

Condition 4: The SPCP[2:0] bits in SPSSR are 000 (at the beginning of sequence control)

Slave mode

- When condition 1 is satisfied.

MODF flag (Mode Fault Error Flag)

The MODF flag indicates the occurrence of a mode fault error or an underrun error. The UDRF flag indicates which error occurred.

[Setting conditions]

Multi-master mode

- When the input level of the SSLni pin changes to the active level while the SPCR.MSTR bit is 1 (master mode) and the SPCR.MODFEN bit is 1 (mode fault error detection is enabled), triggering a mode fault error.

Slave mode

- When condition 1 or 2 is satisfied.

Condition 1: The SSLni pin is negated before the RSPCK cycle required for data transfer ends while the SPCR.MSTR bit is 0 (slave mode) and the SPCR.MODFEN bit is 1 (mode fault error detection is enabled), triggering a mode fault error.

Condition 2: The serial transfer begins with the SPCR.MSTR bit is set to 0 (slave mode), the SPCR.SPE bit is set to 1, and the transmission data not prepared, triggering an underrun error.

The active level of the SSLni signal is determined by the SSLP.SSLiP bit (SSLi signal polarity setting).

[Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

PERF flag (Parity Error Flag)

The PERF flag indicates the occurrence of a parity error.

[Setting condition]

When a serial transfer ends while the SPCR2.SPPE bit is 1, triggering a parity error, and satisfy one of following.

●SPCR.TXMD位=0。（发送-接收主模式或发送-接收从模式或仅接收从模式）

●SPCR.MSTR位=0，SPCR3.ETXMD位=1。（仅接收从机模式）

[Clearing condition]

●在通过读取SPSR确认OVRF标志为1后，向OVRF标志写入0时。

IDLNF标志（SPI空闲标志）

IDLNF标志指示SPI的传输状态。

[Setting conditions]

主模式

●当主模式[清除条件]中的条件均不满足时。

从机模式

●当SPCR的SPE位为1时，使能SPI功能。

[Clearing conditions]

主模式

当满足条件1或所有其他条件时。

条件1：SPCR中的SPE位为0，表示SPI已初始化。

条件2：发送缓冲区（SPTX）为空，表示未设置下一次传输的数据。

条件3：SPI内部定序器处于空闲状态，表示到next-accessdelay的操作已完成。

条件4：SPSSR中的SPCP[2:0]位为000（在序列控制开始时）

从机模式

●满足条件1时。

MODF标志（模式故障错误标志）

MODF标志指示发生模式故障错误或欠载错误。UDRF标志指示发生了哪个错误。

[Setting conditions]

Multi-master mode

●当SPCR.MSTR位为1（主模式）且SPCR.MODFEN位为1（使能模式故障错误检测）时，SSLni管脚的输入电平变为有效电平时，触发模式故障错误。

从机模式

●满足条件1或2时。

条件1：当SPCR.MSTR位为0（从模式）且SPCR.MODFEN位为1（启用模式故障错误检测）时，SSLni引脚在数据传输所需的RSPCK周期结束前被取反，触发模式故障错误。

条件2：串行传输开始时SPCR.MSTR位设置为0（从模式），SPCR.SPE位设置为1，传输数据未准备好，触发欠载错误。

SSLni信号的有效电平由SSLP.SSLiP位（SSLi信号极性设置）确定。

[Clearing condition]

●当此标志为1时读取SPSR，然后将0写入此标志。

PERF标志（奇偶校验错误标志）

PERF标志指示奇偶校验错误的发生。

[Setting condition]

当SPCR2.SPPE位为1时串行传输结束，触发奇偶校验错误，并满足以下之一。

- The SPCR.TXMD bit = 0. (transmit-receive master mode or transmit-receive slave mode or receive only slave mode)
- The SPCR.MSTR bit = 0, and the SPCR3.ETXMD bit = 1. (receive only slave mode)

[Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

UDRF flag (Underrun Error Flag)

The UDRF flag indicates the occurrence of an underrun error.

[Setting condition]

- When the serial transfer begins with the SPCR.MSTR bit is set to 0 (slave mode), the SPCR3.ETXMD bit =0 (transmit-receive slave mode or transmit slave mode) the SPCR.SPE bit is set to 1, and the transmission data not prepared, triggering an underrun error.

[Clearing condition]

- When SPSR is read while this flag is 1, and then 0 is written to this flag.

SPTEF flag (SPI Transmit Buffer Empty Flag)

The SPTEF flag indicates the status of the transmit buffer for the SPI Data Register (SPDR/SPDR_HA).

[Setting conditions]

- When condition 1. or 2. is satisfied.
  1. The SPCR.SPE bit is 0, indicating that the SPI is initialized.
  2. Transmit data (the frame size specified by the SPDCR.SPFC[1:0]) is transferred from the transmit buffer to the shift register.

[Clearing condition]

- When data is written to SPDR/SPDR_HA/SPDR_BY equals the number of frames set in the SPFC[1:0] bits in the SPI Data Control Register (SPDCR).

Data can only be written to SPDR/SPDR_HA/SPDR_BY when the SPTEF flag is 1. If data is written to the transmit buffer of SPDR/SPDR_HA when the SPTEF flag is 0, data in the transmit buffer is not updated.

CENDF flag (Communication End Flag)

This flag indicates communication end status of RSPI. It turns 1 at communication end, and turns 0 at starting next communication.

[Setting condition]

Mastar mode

The following 3 conditions are met.

- The transmit buffer(SPTX) is empty. (There is no next transmission data.)
- The SPSSR.SPCP[2:0] are 000b. (It means the head of the sequential control.)
- The state of RSPI internal sequencer transferred to the idle state. (It means the next access delay has been completed.)

Transmit-receive / transmit only slave mode in SPI serial communication (4-wire: the SPCR.SPMS bit is 0)

The following 3 conditions are met.

- The transmit buffer(SPTX) is empty. (There is no next transmission data.)
- The transmission shift register is empty. (It means RSPI does not do serial transfer.)
- SSL0 was negated.

Transmit-receive / transmit only slave mode in clock synchronous (3-wire: the SPCR.SPMS bit is 1)

The following 3 conditions are met.

- The transmit buffer(SPTX) is empty. (There is no next transmission data.)

●SPCR.TXMD位=0。（发送-接收主模式或发送-接收从模式或仅接收从模式）

●SPCR.MSTR位=0，SPCR3.ETXMD位=1。（仅接收从机模式）

[Clearing condition]

●当此标志为1时读取SPSR，然后将0写入此标志。

UDRF标志（欠载错误标志）

UDRF标志指示发生了欠载错误。

[Setting condition]

●当串行传输开始时SPCR.MSTR位设置为0（从机模式），SPCR3.ETXMD位=0（发送接收从机模式或发送从机模式）SPCR.SPE位设置为1，发送数据未准备好，触发欠载错误。

[Clearing condition]

●当此标志为1时读取SPSR，然后将0写入此标志。

SPTEF标志（SPI发送缓冲区空标志）

SPTEF标志指示SPI数据寄存器(SPDRSPDR_HA)的发送缓冲区的状态。

[Setting conditions]

●满足条件1.或2.时。

1.SPCR.SPE位为0，表示SPI初始化。

2.发送数据（由SPDCR.SPFC[1:0]指定的帧大小）从发送缓冲器传送到移位寄存器。

[Clearing condition]

●当数据写入SPDRSPDR_HASPDR_BY等于SPI数据控制寄存器(SPDCR)的SPFC[1:0]位中设置的帧数。

数据只能在SPTEF标志为1时写入SPDRSPDR_HASPDR_BY。如果在SPTEF标志为0时将数据写入SPDRSPDR_HA的发送缓冲区，则发送缓冲区中的数据不会更新。

CENDF标志（通信结束标志）

该标志指示RSPI的通信结束状态。通讯结束时变为1，开始下一次通讯时变为0。

[Setting condition]

Mastar mode

满足以下3个条件。

●发送缓冲区(SPTX)为空。（没有下一个传输数据。）

●SPSSR.SPCP[2:0]为000b。（表示顺序控制的头部。）

●RSPI内部定序器的状态转为空闲状态。（表示下一次访问延迟已经完成。）

SPI串行通信中的发送-接收仅发送从机模式（4线：SPCR.SPMS位为0）

满足以下3个条件。

●发送缓冲区(SPTX)为空。（没有下一个传输数据。）

●传输移位寄存器为空。（这意味着RSPI不进行串行传输。）

●SSL0被否定。

时钟同步中的发送-接收仅发送从模式（3线：SPCR.SPMS位为1）

满足以下3个条件。

●发送缓冲区(SPTX)为空。（没有下一个传输数据。）

- The transmission shift register is empty. (It means RSPI does not do serial transfer.)
- The last even edge of RSPCK of the last data was detected. (When the SPCMD.CPHA bit is “1”.)

Receive only slave mode in SPI serial communication (4-wire: the SPCR.SPMS bit is 0)

The following condition is met.

- SSL0 was negated after the last data was written in the received buffer.

Receive only slave mode in clock synchronous (3-wire: the SPCR.SPMS bit is 1)

The following condition is met.

- The last even edge of RSPCK of the last data was detected. (When the SPCMD.CPHA bit is 1.)

[Clearing condition]

Master mode

Satisfy one of following.

- The next transmit data was written to the transmit buffer (SPTX).
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1

Transmit-receive / transmit only slave mode

Satisfy one of following.

- The next transmit data was written to the transmit buffer(SPTX).
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Receive only slave mode in SPI serial communication (4-wire: the SPCR.SPMS bit is 0)

Satisfy one of following.

- SSL0 assertion of next data was detected.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Receive only slave mode in clock synchronous (3-wire: the SPCR.SPMS bit is 1)

Satisfy one of following.

- The first edge of RSPCK of the next data was detected.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

SPRF flag (SPI Receive Buffer Full Flag)

The SPRF flag indicates the status of the receive buffer for the SPI Data Register (SPDR/SPDR_HA).

[Setting condition]

- Received data with the frame size specified by the SPDCR.SPFC[1:0] bits have been transferred to the SPDR from the shift register while the SPRF flag is 0. And satisfy one of following. However, the SPRF flag does not change from 0 to 1 while the OVRF flag = 1.
  - The SPCR.TXMD bit is 0 (transmit-receive master mode, transmit-receive slave mode, or receive only slave mode)
  - The SPCR.MSTR bit is 0 and the SPCR3.ETXMD bit is 1 (receive only slave mode)

[Clearing condition]

- When received data is read from the SPDR/SPDR_HA.

●传输移位寄存器为空。（这意味着RSPI不进行串行传输。）

●检测到最后一个数据的RSPCK的最后一个偶边沿。（当SPCMD.CPHA位为“1”时。）

SPI串行通信中仅接收从机模式（4线：SPCR.SPMS位为0）

满足以下条件。

●最后一个数据写入接收缓冲区后，SSL0被否定。

在时钟同步下仅接收从模式（3线：SPCR.SPMS位为1）

满足以下条件。

●检测到最后一个数据的RSPCK的最后一个偶边沿。（当SPCMD.CPHA位为1时。）

[Clearing condition]

主模式

满足以下之一。

●下一个发送数据被写入发送缓冲区(SPTX)。

●当CENDF标志为1时，读取SPSR后CENDF标志被写入0

发送-接收仅发送从模式

满足以下之一。

●下一个发送数据被写入发送缓冲区(SPTX)。

●当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

SPI串行通信中仅接收从机模式（4线：SPCR.SPMS位为0）

满足以下之一。

●检测到下一个数据的SSL0断言。

●当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

在时钟同步下仅接收从模式（3线：SPCR.SPMS位为1）

满足以下之一。

●检测到下一个数据的RSPCK的第一个边沿。

●当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

SPRF标志（SPI接收缓冲区满标志）

SPRF标志指示SPI数据寄存器(SPDRSPDR_HA)的接收缓冲区的状态。

[Setting condition]

●在SPRF标志为0时，接收到的具有SPDCR.SPFC[1:0]位指定的帧大小的数据已从移位寄存器传送到SPDR。并且满足以下之一。但是，当OVRF标志=1时，SPRF标志不会从0变为1。

SPCR.TXMD位为0（发送-接收主机模式、发送-接收从机模式或仅接收从机模式）

SPCR.MSTR位为0，SPCR3.ETXMD位为1（仅接收从模式）

[Clearing condition]

●从SPDRSPDR_HA读取接收数据时。

34.2.5 SPDR/SPDR_HA/SPDR_BY : SPI Data Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

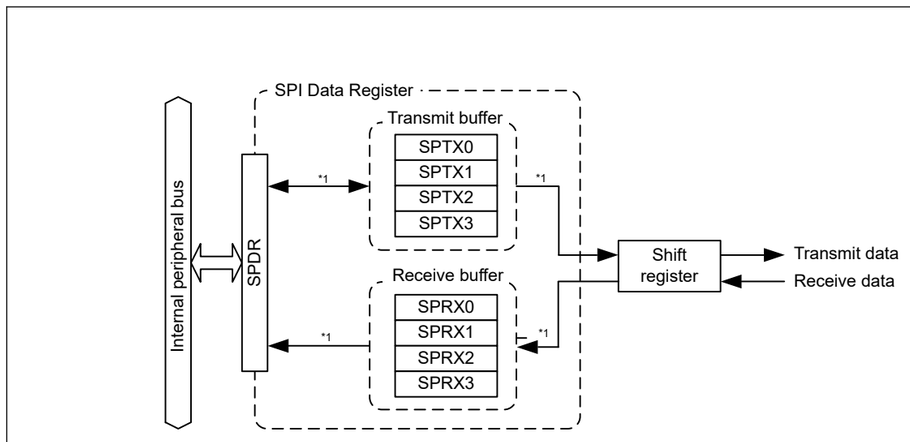
Offset address: 0x04

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	SPI Data	R/W

SPDR/SPDR_HA/SPDR_BY is the interface with the buffers that hold data for transmission and reception by the SPI. When accessing this register in words (the SPDCR.SPLW bit is 1), access SPDR. When accessing it in halfwords (the SPLW bit is 0), access SPDR_HA. When accessing it in byte (the SPDCR.SPBYT bit is 1), access SPDR_BY.

The transmit buffer (SPTX) and receive buffer (SPRX) are independent but are both mapped to SPDR/SPDR_HA. Figure 34.2 shows the configuration of the SPDR/SPDR_HA register.



Note: SPDR = SPDR/SPDR_HA/SPDR_BY
Note 1. The destination buffer and stage for access is automatically switched by the hardware.

Figure 34.2 Configuration of SPDR/SPDR_HA/SPDR_BY

The transmit and receive buffers each have one stages. The four stages of the buffer are all mapped to the single address of SPDR/SPDR_HA/SPDR_BY.

Data written to SPDR/SPDR_HA/SPDR_BY is written to a transmit-buffer stage (SPTXn) (n = 0 to 3), and then transmitted from the buffer. The receive buffer holds received data on completion of reception. The receive buffer is not updated if an overrun is generated.

Additionally, if the data length is not 32 bits, bits not referred to in SPTXn (n = 0 to 3) are stored in the associated bits in SPRXn (n = 0 to 3). For example, if the data length is 9 bits, the received data is stored in the SPRXn[8:0] bits, and the SPTXn[31:9] bits are stored in the SPRXn[31:9] bits.

(1) Bus interface

SPDR/SPDR_HA/SPDR_BY is an interface with 32-bit wide transmit and receive buffers, each of which has one stages, for a total of 32 bytes. The 32 bytes are mapped to the 4-byte address space for SPDR/SPDR_HA/SPDR_BY. Additionally, the unit of access for SPDR/SPDR_HA/SPDR_BY is selected by the SPI Word Access/Halfword Access Specification bit in the

34.2.5 SPDRSPDR_HASPDR_BY:SPI数据寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

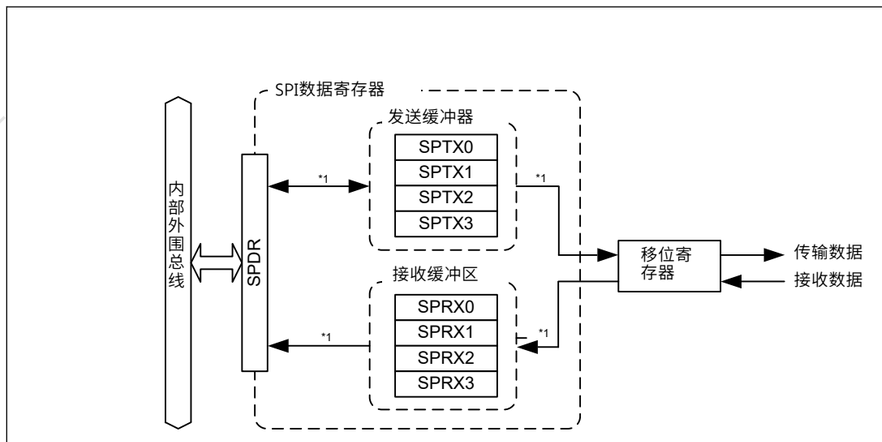
Offset address: 0x04

Bit position:	31																												0
Bit field:																													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	SPI数据	R/W

SPDRSPDR_HASPDR_BY是与缓冲区的接口，缓冲区保存数据以供SPI发送和接收。以字访问该寄存器时（SPDCR.SPLW位为1），访问SPDR。当以半字访问它时（
SPLW位为0），访问SPDR_HA。当按字节访问时（SPDCR.SPBYT位为1），访问SPDR_BY。

发送缓冲区(SPTX)和接收缓冲区(SPRX)是独立的，但都映射到SPDRSPDR_HA。图34.2显示了SPDRSPDR_HA寄存器的配置。



Note: SPDR = SPDR/SPDR_HA/SPDR_BY
注1.访问的目标缓冲区和阶段由硬件自动切换。

Figure 34.2 SPDRSPDR_HASPDR_BY的配置

发送和接收缓冲器各有一级。缓冲区的四个阶段都映射到单个地址
SPDR/SPDR_HA/SPDR_BY.

写入SPDRSPDR_HASPDR_BY的数据被写入发送缓冲区级(SPTXn)(n=0到3)，然后从缓冲区发送。接收缓冲器在接收完成时保存接收到的数据。如果产生溢出，接收缓冲区不会更新。

此外，如果数据长度不是32位，SPTXn(n=0到3)中未提及的位将存储在
SPRXn（n=0到3）。例如，如果数据长度为9位，则接收到的数据存储在SPRXn[8:0]位中，而
SPTXn[31:9]位存储在SPRXn[31:9]位中。

(1) 总线接口

SPDRSPDR_HASPDR_BY是一个具有32位宽的发送和接收缓冲区的接口，每个缓冲区都有一个阶段，总共32个字节。32个字节映射到SPDRSPDR_HASPDR_BY的4字节地址空间。此外，SPDRSPDR_HASPDR_BY的访问单元由SPI字访问半字访问规范位选择

RA生态工作室

SPI Data Control Register (SPDCR.SPLW). SPDR can also be accessed with the access size specified by the SPI Byte Access bit in the SPI Data Control Register (SPDCR.SPBYT).

Flush the transmission data at the LSB end of the register, and store the received data at the LSB end.

The following sections describe the operations involved in writing to and reading from SPDR/SPDR_HA/SPDR_BY.

Writing

Data written to SPDR/SPDR_HA/SPDR_BY is written to a transmit buffer (SPTXn). This is not affected by the value of the SPDCR.SPRDTD bit, unlike when reading from SPDR/SPDR_HA/SPDR_BY. The transmit buffer includes a transmit buffer write pointer that is automatically updated to reference the next stage each time data is written to SPDR/SPDR_HA/SPDR_BY.

Figure 34.3 shows the configuration of the bus interface with the transmit buffer when writing to SPDR/SPDR_HA/SPDR_BY.

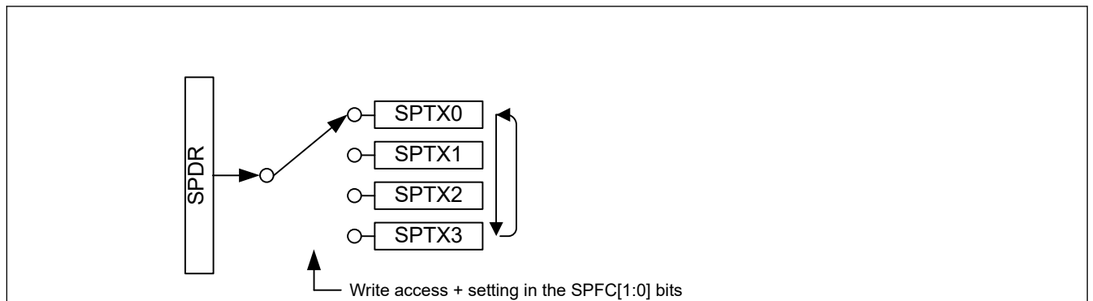


Figure 34.3 Configuration of SPDR/SPDR_HA/SPDR_BY for write access

The sequence for switching the transmit buffer write pointer differs with the setting of the number of frames specification bits in the SPI Data Control Register (SPDCR.SPFC[1:0]). The relationship of the SPFC[1:0] setting and the sequence of pointer switching from SPTX0 to SPTX3 is as follows:

- When SPFC[1:0] = 00b: SPTX0 → SPTX0 → SPTX0 → …
- When SPFC[1:0] = 01b: SPTX0 → SPTX1 → SPTX0 → SPTX1 → …
- When SPFC[1:0] = 10b: SPTX0 → SPTX1 → SPTX2 → SPTX0 → SPTX1 → …
- When SPFC[1:0] = 11b: SPTX0 → SPTX1 → SPTX2 → SPTX3 → SPTX0 → SPTX1 → …

When 1 is written to the SPI Function Enable bit in the SPI Control Register (SPCR.SPE) while the bit is 0, SPTX0 is the destination for the next write.

When writing to the transmit buffer (SPTXn) after generating the transmit buffer empty interrupt (when SPSR.SPTEF is 1), write the number of frames set in SPFC[1:0] in the SPI Data Control Register (SPDCR). Even when the specified number of frames is written to the transmit buffer (SPTXn), the value of the buffer is not updated after completion of the writing and before generation of the next transmit buffer empty interrupt (when SPTEF is 0).

Reading

SPDR/SPDR_HA/SPDR_BY can be accessed to read the value of a receive buffer (SPRXn) or a transmit buffer (SPTXn). The setting in the SPI Receive/Transmit Data Select bit in the SPI Data Control Register (SPDCR.SPRDTD) selects whether reading is of the receive or transmit buffer. The sequence of reading the SPDR/SPDR_HA/SPDR_BY register is controlled by the independent receive buffer and transmit buffer read pointers.

Figure 34.4 shows the configuration of the bus interface with the receive and transmit buffers for reading from SPDR/SPDR_HA/SPDR_BY.

SPI数据控制寄存器(SPDCR.SPLW)。SPDR也可以通过SPI字节指定的访问大小进行访问
SPI数据控制寄存器(SPDCR.SPBYT)中的访问位。

在寄存器的LSB端刷新发送数据，在LSB端存储接收到的数据。

以下部分描述了写入和读取SPDRSPDR_HASPDR_BY所涉及的操作。

Writing

写入SPDRSPDR_HASPDR_BY的数据被写入发送缓冲区(SPTXn)。这不受价值的影响
SPDCR.SPRDTD位，与从SPDRSPDR_HASPDR_BY读取时不同。发送缓冲区包括一个发送缓冲区写指针，每次将数据写入SPDRSPDR_HASPDR_BY时，该指针会自动更新以引用下一阶段。

图34.3显示了写入SPDRSPDR_HA时带有发送缓冲区的总线接口的配置
SPDR_BY.

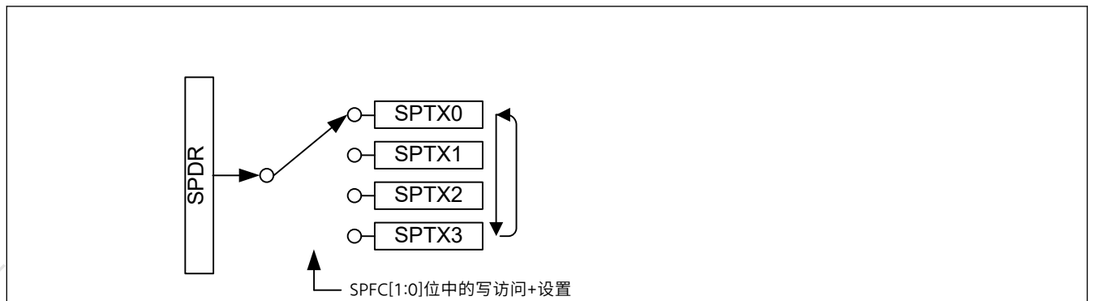

Figure 34.3 为写访问配置SPDRSPDR_HASPDR_BY

发送缓冲区写指针的切换顺序因SPI数据控制寄存器(SPDCR.SPFC[1:0])中帧数规范位的设置而异。SPFC[1:0]设置与指针从SPTX0切换到SPTX3的顺序关系如下：

- When SPFC[1:0] = 00b: SPTX0 → SPTX0 → SPTX0 → …
- When SPFC[1:0] = 01b: SPTX0 → SPTX1 → SPTX0 → SPTX1 → …
- When SPFC[1:0] = 10b: SPTX0 → SPTX1 → SPTX2 → SPTX0 → SPTX1 → …
- When SPFC[1:0] = 11b: SPTX0 → SPTX1 → SPTX2 → SPTX3 → SPTX0 → SPTX1 → …

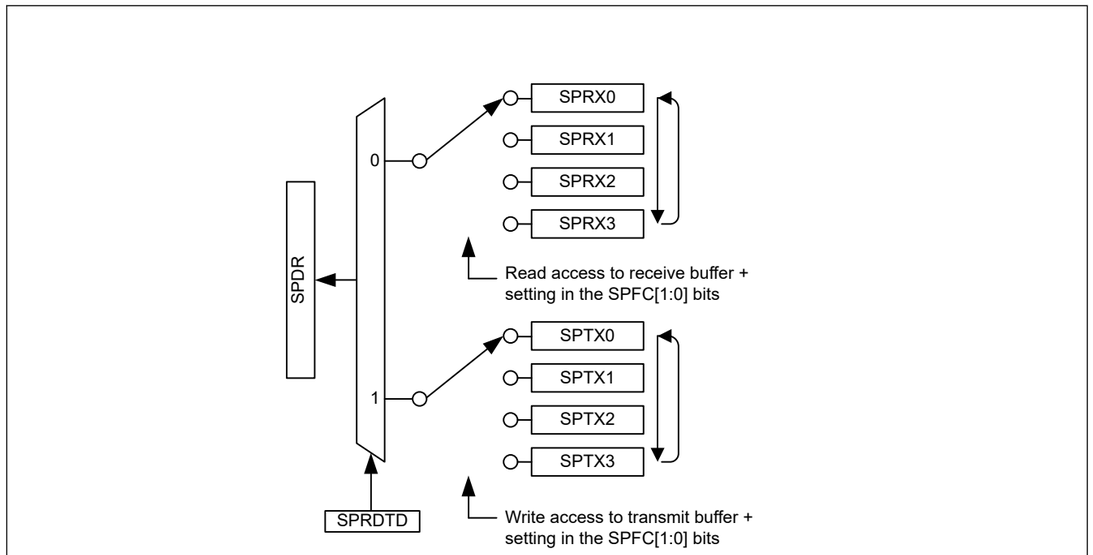
当1写入SPI控制寄存器(SPCR.SPE)中的SPI功能使能位且该位为0时，SPTX0是下一次写入的目标。

在产生发送缓冲区空中断后写入发送缓冲区(SPTXn)时（当SPSR.SPTEF为1时），将SPFC[1:0]中设置的帧数写入SPI数据控制寄存器(SPDCR)。即使指定的帧数被写入发送缓冲区(SPTXn)，缓冲区的值在写入完成后和下一个发送缓冲区空中断发生之前（SPTEF为0时）也不会更新。

Reading

SPDRSPDR_HA可以访问SPDR_BY以读取接收缓冲区(SPRXn)或发送缓冲区(SPTXn)的值。
SPI数据控制寄存器(SPDCR.SPRDTD)的SPI接收发送数据选择位中的设置选择读取接收缓冲区还是发送缓冲区。
读取SPDRSPDR_HASPDR_BY寄存器的顺序由独立的接收缓冲区和发送缓冲区读取指针控制。

图34.4显示了带有用于从SPDR读取的接收和发送缓冲区的总线接口配置
SPDR_HA/SPDR_BY.



Note: SPDR = SPDR/SPDR_HA/SPDR_BY

Figure 34.4 Configuration of SPDR/SPDR_HA/SPDR_BY for read access

Reading the receive buffer switches the receive buffer read pointer to the next buffer automatically. The switching sequence for the receive buffer read pointer is the same as that for the transmit buffer write pointer. However, when 1 is written to the SPI Function Enable bit in the SPI Control Register (SPCR.SPE) while the value of the bit is 1, SPRX0 is referenced by the buffer read pointer for the next read.

The transmit buffer read pointer is updated when writing to SPDR/SPDR_HA/SPDR_BY, but not updated when reading from the transmit buffer. When reading from the transmit buffer, the value most recently written to SPDR/SPDR_HA/SPDR_BY is read.

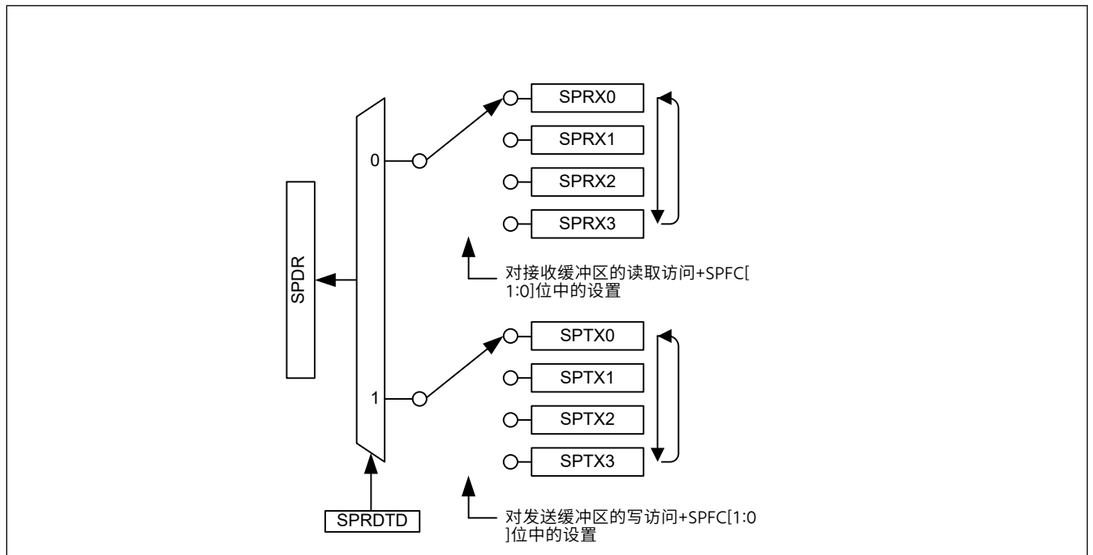
After a transmit buffer empty interrupt is generated, reading from the transmit buffer returns all 0s after the completion of writing the number of frames of data specified in the SPDCR.SPFC[1:0] bits, until the next buffer empty interrupt is generated (when SPTEF is 0).

34.2.6 SPSCR : SPI Sequence Control Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SPSLN[2:0]		
Value after reset:	0	0	0	0	0	0	0	0



Note: SPDR = SPDR/SPDR_HA/SPDR_BY

Figure 34.4 为读取访问配置SPDRSPDR_HASPDR_BY

读取接收缓冲区会自动将接收缓冲区读取指针切换到下一个缓冲区。接收缓冲区读指针的切换顺序与发送缓冲区写指针的切换顺序相同。但是，当1写入SPI控制寄存器(SPCR.SPE)中的SPI功能使能位且该位的值为1时，缓冲区读取指针将引用SPRX0以进行下一次读取。

发送缓冲区读指针在写入SPDRSPDR_HASPDR_BY时更新，但在从发送缓冲区读取时不更新。从发送缓冲区读取时，会读取最近写入SPDRSPDR_HASPDR_BY的值。

产生发送缓冲区空中断后，在完成写入SPDCR.SPFC[1:0]位中指定的数据帧数后，从发送缓冲区读取返回全0，直到产生下一个缓冲区空中断（当SPTEF为0时）。

34.2.6 SPSCR:SPI序列控制寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SPSLN[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SPSLN[2:0]	SPI Sequence Length Specification The sequence length that is set in these bits determines the order in which the SPCMD0 to SPCMD07 registers are referenced. The setting defines the relationship between the sequence length and the SPCMD0 to SPCMD7 registers referenced by the SPI. In slave mode, the SPI references SPCMD0. 0 0 0: Sequence Length is 1 (Referenced SPCMDn, n = 0→0→…) 0 0 1: Sequence Length is 2 (Referenced SPCMDn, n = 0→1→0→…) 0 1 0: Sequence Length is 3 (Referenced SPCMDn, n = 0→1→2→0→…) 0 1 1: Sequence Length is 4 (Referenced SPCMDn, n = 0→1→2→3→0→…) 1 0 0: Sequence Length is 5 (Referenced SPCMDn, n = 0→1→2→3→4→0→…) 1 0 1: Sequence Length is 6 (Referenced SPCMDn, n = 0→1→2→3→4→5→0→…) 1 1 0: Sequence Length is 7 (Referenced SPCMDn, n = 0→1→2→3→4→5→6→0→…) 1 1 1: Sequence Length is 8 (Referenced SPCMDn, n = 0→1→2→3→4→5→6→7→0→…)	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

SPSCR specifies the sequence length when the SPI operates in master mode. Before changing the SPSLN[2:0] bits while both the SPCR.MSTR and SPCR.SPE bits are 1, check that the SPSR.IDLNF flag is 0.

SPSLN[2:0] bits (SPI Sequence Length Specification)

The SPSLN[2:0] bits specify the sequence length when the SPI in master mode performs sequential operations. The SPI in master mode changes the SPCMD0 to SPCMD7 registers to be referenced, and the order in which they are referenced is based on this sequence length setting. In slave mode, SPCMD0 is referenced.

34.2.7 SPSSR : SPI Sequence Status Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x09

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SPECM[2:0]			—	SPCP[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SPCP[2:0]	SPI Command Pointer 0 0 0: SPCMD0 0 0 1: SPCMD1 0 1 0: SPCMD2 0 1 1: SPCMD3 1 0 0: SPCMD4 1 0 1: SPCMD5 1 1 0: SPCMD6 1 1 1: SPCMD7	R
3	—	This bit is read as 0.	R
6:4	SPECM[2:0]	SPI Error Command 0 0 0: SPCMD0 0 0 1: SPCMD1 0 1 0: SPCMD2 0 1 1: SPCMD3 1 0 0: SPCMD4 1 0 1: SPCMD5 1 1 0: SPCMD6 1 1 1: SPCMD7	R
7	—	This bit is read as 0.	R

SPSSR indicates the sequence control status when the SPI operates in master mode. Any writes to SPSSR are ignored.

Bit	Symbol	Function	R/W
2:0	SPSLN[2:0]	SPI序列长度规范 在这些位中设置的序列长度决定了SPCMD0到 引用了SPMD07寄存器。该设置定义了序列长度与SPI引用的SPCMD0到SPCMD7寄存器之间的关系。在从机模式下，SPI参考SPCMD0。 000：序列长度为1（参考SPCMDn，n=0→0→…）001：序列长度为2（参考SPCMDn，n=0→1→0→…）010：序列长度为3（参考SPCMDn，n=0→1→2→0→…）011：序列长度为4（参考SPCMDn，n=0→1→2→3→0→…）100：序列长度为5（参考SPCMDn，n=0→1→2→3→4→0→…）101：序列长度为6（参考SPCMDn，n=0→1→2→3→4→5→0→…）110：序列长度为7（参考SPCMDn，n=0→1→2→3→4→5→6→0→…）111：序列长度为8（参考SPCMDn，n=0→1→2→3→4→5→6→7→0→…）	R/W
7:3	—	这些位被读取为0。写入值应为0。	R/W

SPSCR指定SPI在主模式下工作时的序列长度。在SPCR.MSTR和SPCR.SPE位均为1时更改SPSLN[2:0]位之前，请检查SPSR.IDLNF标志是否为0。

SPSLN[2:0]位（SPI序列长度规范）

SPSLN[2:0]位指定SPI在主模式下执行顺序操作时的序列长度。主机模式下的SPI将SPCMD0到SPCMD7寄存器更改为被引用，它们被引用的顺序基于此序列长度设置。在从模式下，以SPMD0为参考。

34.2.7 SPSSR：SPI序列状态寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x09

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SPECM[2:0]			—	SPCP[2:0]		
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W

3	—	该位读为0。	R
6:4	SPECM[2:0]	SPI错误命令 0 0 0: SPCMD0 0 0 1: SPCMD1 0 1 0: SPCMD2 0 1 1: SPCMD3 1 0 0: SPCMD4 1 0 1: SPCMD5 1 1 0: SPCMD6 1 1 1: SPCMD7	R
7	—	该位读为0。	R

SPSSR指示SPI在主模式下工作时的序列控制状态。对SPSSR的任何写入都将被忽略。

SPCP[2:0] bits (SPI Command Pointer)

The SPCP[2:0] bits indicate the SPCMDm register that is referenced to by the pointer during sequence control by the SPI. For the SPI sequence control, see section 34.3.11.1. Master mode operation.

SPECM[2:0] bits (SPI Error Command)

The SPECM[2:0] bits indicate the SPCMDm register that is specified in the SPCP[2:0] bits when an error is detected during sequence control by the SPI. The SPI updates the SPECM[2:0] bits only when an error is detected. If both the SPSR.OVRF and SPSR.MODF flags are 0 and there is no error, the values of the SPECM[2:0] bits have no meaning.

For the SPI error detection function, see section 34.3.9. Error Detection. For the SPI sequence control, see section 34.3.11.1. Master mode operation.

34.2.8 SPBR : SPI Bit Rate Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	n/a	Bit rate	R/W

SPBR sets the bit rate in master mode.

When the SPI is in slave mode, the bit rate depends on the bit rate of the input clock, regardless of the settings in SPBR and the SPCMDm.BRDV[1:0] bits (bit rate division setting). Use bit rates that satisfy the electrical characteristics of the device.

The bit rate is determined by combinations of the SPBR and SPCMDm.BRDV[1:0] settings in the SPI Command Register. The equation for calculating the bit rate is given as follows:

$$\text{Bit rate} = \frac{f(\text{PCLK})}{2 \times (n+1) \times 2^N}$$

(PCLK = PCLKA)

In the equation, n denotes an SPBR setting (0, 1, 2, …, 255), and N denotes a BRDV[1:0] setting (0, 1, 2, 3).

Table 34.3 lists examples of the relationship between the SPBR settings, the BRDV[1:0] settings, and bit rates.

Table 34.3 Relationship between SPBR settings, BRDV[1:0] settings, and bit rates

SPBR(n)	BRDV[1:0] bits (N)	Division ratio	Bit rate
			PCLKA = 32 MHz
0	0	2	16.0 Mbps
1	0	4	8.00 Mbps
2	0	6	5.33 Mbps
3	0	8	4.00 Mbps
4	0	10	3.20 Mbps
5	0	12	2.67 Mbps
5	1	24	1.33 Mbps
5	2	48	667 kbps
5	3	96	333 kbps
255	3	4096	7.81 kbps

SPCP[2:0]位（SPI命令指针）

SPCP[2:0]位指示在SPI序列控制期间指针所引用的SPCMDm寄存器。
有关SPI序列控制，请参见第34.3.11.1节。主模式操作。

SPECM[2:0]位（SPI错误命令）

SPECM[2:0]位指示在SPI序列控制期间检测到错误时在SPCP[2:0]位中指定的SPCMDm寄存器。SPI仅在检测到错误时更新SPECM[2:0]位。如果SPSR.OVRF和SPSR.MODF标志均为0且没有错误，则SPECM[2:0]位的值没有意义。

关于SPI错误检测功能，请参见第34.3.9节。错误检测。有关SPI序列控制，请参见第34.3.11.1节。
主模式操作。

34.2.8 SPBR:SPI比特率寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
重置后的值:	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	n/a	比特率	R/W

SPBR在主模式下设置比特率。

当SPI处于从机模式时，比特率取决于输入时钟的比特率，与SPBR和SPMDm.BRDV[1:0]位（比特率分频设置）的设置无关。使用满足设备电气特性的比特率。

比特率由SPI命令寄存器中的SPBR和SPMDm.BRDV[1:0]设置的组合确定。
计算比特率的公式如下：

$$\text{比特率} = \frac{f(\text{PCLK})}{2 \times (n+1) \times 2^N}$$

H I

在等式中，n表示SPBR设置(0 1 2 … 255)，N表示BRDV[1:0]设置(0 1 2 3)。

表34.3列出了SPBR设置、BRDV[1:0]设置和比特率之间的关系示例。

Table 34.3 SPBR设置、BRDV[1:0]设置和比特率之间的关系

SPBR(n)	BRDV[1:0] bits (N)	分工比	比特率
			PCLKA = 32 MHz
0	0	2	16.0 Mbps
1	0	4	8.00 Mbps
2	0	6	5.33 Mbps
3	0	8	4.00 Mbps
4	0	10	3.20 Mbps
5	0	12	2.67 Mbps
5	1	24	1.33 Mbps
5	2	48	667 kbps
5	3	96	333 kbps
255	3	4096	7.81 kbps

34.2.9 SPDCR : SPI Data Control Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SPBYT	SPLW	SPRDTD	—	—	SPFC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SPFC[1:0]	Number of Frames Specification 0 0: 1 frame 0 1: 2 frames 1 0: 3 frames 1 1: 4 frames	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	SPRDTD	SPI Receive/Transmit Data Select 0: Read SPDR/SPDR_HA values from receive buffer 1: Read SPDR/SPDR_HA values from transmit buffer, but only if the transmit buffer is empty	R/W
5	SPLW	SPI Word Access/Halfword Access Specification 0: Set SPDR_HA to valid for halfword access 1: Set SPDR to valid for word access	R/W
6	SPBYT	SPI Byte Access Specification 0: SPDR/SPDR_HA is accessed in halfword or word (SPLW is valid) 1: SPDR_BY is accessed in byte (SPLW is invalid)	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

The SPI Data Control Register (SPDCR) is used to read the number of frames that can be stored in the SPDR register,read the SPDR register, and to set the access width for the SPDR register to word access, halfword access, or byte access. Up to four frames can be transmitted or received in one round of transmission or reception. The amount of data in each transfer is controlled by the combination of the SPCMDm.SPB[3:0] bits, the SPSCR.SPSLN[2:0] bits, and the SPFC[1:0] bits.

When changing the SPFC[1:0] bits while the SPCR.SPE bit is 1, check that the SPSR.IDLNF flag is 0.

SPFC[1:0] bits (Number of Frames Specification)

The SPFC[1:0] bits specify the number of frames that can be stored in SPDR/SPDR_HA per transfer activation. Up to four frames can be transmitted or received in one round of transmission or reception.

When the number of transmission data frames specified in the SPFC[1:0] bits is written to the SPDR/SPDR_HA register, SPI clears the SPSR.SPTEF flag to 0 and begins transmitting. After that, when the number of transmission data frames specified in the SPFC[1:0] bits is transmitted to the shift register, the SPI generates the transmit buffer empty interrupt (SPSR.SPTEF sets to 1).

When the number of data frames specified in the SPFC[1:0] bits is received, the SPI generates the receive buffer full interrupt (SPSR.SPRF sets to 1).

Table 34.4 Settable combinations of the SPSLN[2:0] and SPFC[1:0] bits (1 of 2)

Setting	SPSLN[2:0]	SPFC[1:0]	Number of frames in a single sequence	Number of frames at which transmission or receive buffer is filled
1-1	000b	00b	1	1
1-2	000b	01b	2	2
1-3	000b	10b	3	3
1-4	000b	11b	4	4
2-1	001b	01b	2	2

34.2.9 SPDCR:SPI数据控制寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SPBYT	SPLW	SPRDTD	—	—	SPFC[1:0]	
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SPFC[1:0]	帧数规格 00：1帧01： 2帧10：3帧1 1：4帧	R/W
3:2	—	这些位被读取为0。写入值应为0。	R/W
4	SPRDTD	SPI接收发送数据选择 0：从接收缓冲区读取SPDRSPDR_HA值1：从发送缓冲区读取SPDRSPDR_HA值，但前提是发送缓冲区为空	R/W
5	SPLW	SPI字访问半字访问规范 0：将SPDR_HA设置为对半字访问有效1：将SPDR设置为对字访问有效	R/W
6	SPBYT	SPI字节访问规范 0：SPDRSPDR_HA以半字或字访问（SPLW有效）1：SPDR_BY以字节访问（SPLW无效）	R/W
7	—	该位读取为0。写入值应为0。	R/W

SPI数据控制寄存器(SPDCR)用于读取SPDR寄存器中可存储的帧数，读取SPDR寄存器，并将SPDR寄存器的访问宽度设置为字访问、半字访问或字节访问.在一轮发送或接收中最多可以发送或接收四帧。每次传输中的数据量由SPCMDm.SPB[3:0]位、SPSCR.SPSLN[2:0]位和SPFC[1:0]位的组合控制。

在SPCR.SPE位为1时更改SPFC[1:0]位时，检查SPSR.IDLNF标志是否为0。

SPFC[1:0]位（帧数规范）

SPFC[1:0]位指定每次传输激活时可以存储在SPDRSPDR_HA中的帧数。在一轮发送或接收中最多可以发送或接收四帧。

当SPFC[1:0]位中指定的传输数据帧数写入SPDRSPDR_HA寄存器时，SPI将SPSR.SPTEF标志清除为0并开始发送。之后，当SPFC[1:0]位中指定的发送数据帧数被发送到移位寄存器时，SPI产生发送缓冲区空中断（SPSR.SPTEF设置为1）。

当接收到SPFC[1:0]位中指定的数据帧数时，SPI产生接收缓冲区满中断（SPSR.SPRF设置为1）。

Table 34.4 SPSLN[2:0]和SPFC[1:0]位的可设置组合（2个中的1个）

Setting	SPSLN[2:0]	SPFC[1:0]	单个序列中的帧数	填充传输或接收缓冲区的帧数
1-1	000b	00b	1	1
1-2	000b	01b	2	2
1-3	000b	10b	3	3
1-4	000b	11b	4	4
2-1	001b	01b	2	2

Table 34.4 Settable combinations of the SPSLN[2:0] and SPFC[1:0] bits (2 of 2)

Setting	SPSLN[2:0]	SPFC[1:0]	Number of frames in a single sequence	Number of frames at which transmission or receive buffer is filled
2-2	001b	11b	4	4
3	010b	10b	3	3
4	011b	11b	4	4
5	100b	00b	5	1
6	101b	00b	6	1
7	110b	00b	7	1
8	111b	00b	8	1

SPRDTD bit (SPI Receive/Transmit Data Select)

The SPRDTD bit selects whether the SPDR/SPDR_HA reads values from the receive buffer or from the transmit buffer. If reading is from the transmit buffer, the last value written to SPDR/SPDR_HA register is read. Read the transmit buffer after an SPI transmit buffer empty interrupt is generated until data of frames specified by SPFC[1:0] has been written (while the SPSR.SPTEF flag is 1).

For details, see section 34.2.5. SPDR/SPDR_HA/SPDR_BY : SPI Data Register.

SPLW bit (SPI Word Access/Halfword Access Specification)

The SPLW bit specifies the access width for SPDR. Access to SPDR_HA in halfwords is valid when the SPLW bit is 0 and access to SPDR in words is valid when the SPLW bit is 1. Also, when this bit is 0, set the SPI data length setting bits, SPCMDm.SPB[3:0], from 8 to 16 bits. Do not perform any operations when a data length of 20, 24, or 32 bits is specified.

SPBYT bit (SPI Byte Access Specification)

The SPBYT bit is used to set the data width of access to the SPI Data Register (SPDR). When SPBYT = 0, use word or half word access to SPDR/SPDR_HA. When SPBYT = 1 (in that case, SPLW is invalid), use byte access to SPDR_BY.

When SPBYT = 1, set the SPI data length bits (SPB[3:0]) in the SPI Command Register m (SPCMDm) to 8 bits. If SPB[3:0] are set to 9 to 16, 20, 24, or 32 bit, subsequent operation is not guaranteed.

34.2.10 SPCKD : SPI Clock Delay Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SCKDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SCKDL[2:0]	RSPCK Delay Setting 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

SPCKD specifies the RSPCK delay, the period from the beginning of SSLni signal assertion to RSPCK oscillation, when the SPCMDm.SCKDEN bit is 1.

Table 34.4 SPSLN[2:0]和SPFC[1:0]位的可设置组合（2个中的2个）

Setting	SPSLN[2:0]	SPFC[1:0]	单个序列中的帧数	填充传输或接收缓冲区的帧数
2-2	001b	11b	4	4
3	010b	10b	3	3
4	011b	11b	4	4
5	100b	00b	5	1
6	101b	00b	6	1
7	110b	00b	7	1
8	111b	00b	8	1

SPRDTD位（SPI接收发送数据选择）

SPRDTD位选择SPDRSPDR_HA是从接收缓冲区还是从发送缓冲区读取值。如果从发送缓冲区读取，则读取写入SPDRSPDR_HA寄存器的最后一个值。在产生SPI发送缓冲区空中断后读取发送缓冲区，直到SPFC[1:0]指定的帧数据被写入（此时SPSR.SPTEF标志为1）。

有关详细信息，请参阅第34.2.5节。SPDRSPDR_HASPDR_BY：SPI数据寄存器。

SPLW位（SPI字访问半字访问规范）

SPLW位指定SPDR的访问宽度。当SPLW位为0时，以半字访问SPDR_HA有效，当SPLW位为1时，以字访问SPDR有效。此外，当该位为0时，设置SPI数据长度设置位SPMDm.SPB[3：0]，从8到16位。当指定数据长度为20、24或32位时，请勿执行任何操作。

SPBYT位（SPI字节访问规范）

SPBYT位用于设置访问SPI数据寄存器(SPDR)的数据宽度。当SPBYT=0时，使用字或半字访问SPDRSPDR_HA。当SPBYT=1时（在这种情况下，SPLW无效），使用对SPDR_BY的字节访问。

当SPBYT=1时，将SPI命令寄存器m(SPCMDm)中的SPI数据长度位(SPB[3:0])设置为8位。如果SPB[3:0]设置为9至16、20、24或32位，不保证后续操作。

34.2.10 SPCKD:SPI时钟延迟寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SCKDL[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SCKDL[2:0]	RSPCK延迟设置 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK	R/W
7:3	—	这些位被读取为0。写入值应为0。	R/W

SPCKD指定RSPCK延迟，即从SSLni信号断言开始到RSPCK振荡的周期，当SPCMDm.SCKDEN位为1时。

SCKDL[2:0] bits (RSPCK Delay Setting)

The SCKDL[2:0] bits specify an RSPCK delay value when the SPCMDm.SCKDEN bit is 1. When using the SPI in slave mode, set the SCKDL[2:0] bits to 000b.

34.2.11 SSLND : SPI Slave Select Negation Delay Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SLNDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SLNDL[2:0]	SSL Negation Delay Setting 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

SSLND specifies the SSL negation delay, the period from the transmission of a final RSPCK edge to the negation of the SSLni signal during a serial transfer by the SPI in master mode. If the contents of SSLND are changed while both the SPCR.MSTR and SPCR.SPE bits are 1, do not perform subsequent operations.

SLNDL[2:0] bits (SSL Negation Delay Setting)

The SLNDL[2:0] bits specify an SSL negation delay value when the SLNDEN bit in SPCMDn is 1 and the SPI is in master mode. When using the SPI in slave mode, set the SLNDL[2:0] bits to 000b.

34.2.12 SPND : SPI Next-Access Delay Register

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SPNDL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SPNDL[2:0]	SPI Next-Access Delay Setting 0 0 0: 1 RSPCK + 2 PCLKA 0 0 1: 2 RSPCK + 2 PCLKA 0 1 0: 3 RSPCK + 2 PCLKA 0 1 1: 4 RSPCK + 2 PCLKA 1 0 0: 5 RSPCK + 2 PCLKA 1 0 1: 6 RSPCK + 2 PCLKA 1 1 0: 7 RSPCK + 2 PCLKA 1 1 1: 8 RSPCK + 2 PCLKA	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

SPND specifies the next-access delay, the non-active period of the SSLni signal after termination of a serial transfer, when the SPCMDm.SPNDEN bit is 1.

SCKDL[2:0]位（RSPCK延迟设置）

当SPCMDm.SCKDEN位为1时，SCKDL[2:0]位指定RSPCK延迟值。在从机模式下使用SPI时，将SCKDL[2:0]位设置为000b。

34.2.11 SSLND:SPI从机选择否定延迟寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SLNDL[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SLNDL[2:0]	SSL否定延迟设置 0 0 0: 1 RSPCK 0 0 1: 2 RSPCK 0 1 0: 3 RSPCK 0 1 1: 4 RSPCK 1 0 0: 5 RSPCK 1 0 1: 6 RSPCK 1 1 0: 7 RSPCK 1 1 1: 8 RSPCK	R/W
7:3	—	这些位被读取为0。写入值应为0。	R/W

SSLND指定SSL否定延迟，从传输最终RSPCK边缘到否定SPI在主模式下进行串行传输期间的SSLni信号。如果SSLND的内容发生更改，而SPCR.MSTR和SPCR.SPE位为1，不执行后续操作。

SLNDL[2:0]位（SSL否定延迟设置）

当SPCMDn中的SLNDEN位为1且SPI处于主模式时，SLNDL[2:0]位指定SSL否定延迟值。在从机模式下使用SPI时，将SLNDL[2:0]位设置为000b。

34.2.12 SPND:SPI下一次访问延迟寄存器

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SPNDL[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SPNDL[2:0]	SPI下一次访问延迟设置 0 0 0: 1 RSPCK + 2 PCLKA 0 0 1: 2 RSPCK + 2 PCLKA 0 1 0: 3 RSPCK + 2 PCLKA 0 1 1: 4 RSPCK + 2 PCLKA 1 0 0: 5 RSPCK + 2 PCLKA 1 0 1: 6 RSPCK + 2 PCLKA 1 1 0: 7 RSPCK + 2 PCLKA 1 1 1: 8 RSPCK + 2 PCLKA	R/W
7:3	—	这些位被读取为0。写入值应为0。	R/W

当SPMDm.SPNDEN位为1时，SPND指定下一次访问延迟，即串行传输终止后SSLni信号的非活动期。

SPNDL[2:0] bits (SPI Next-Access Delay Setting)

The SPNDL[2:0] bits specify a next-access delay when the SPCMDm.SPNDEN bit is 1. When using the SPI in slave mode, set the SPNDL[2:0] bits to 000b.

34.2.13 SPCR2 : SPI Control Register 2

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SCKASE	PTE	SPIIE	SPOE	SPPE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SPPE	Parity Enable 0: Do not add parity bit to transmit data and do not check parity bit of receive data 1: When SPCR.TXMD = 0: Add parity bit to transmit data and check parity bit of receive data When SPCR.TXMD = 1: Add parity bit to transmit data but do not check parity bit of receive data	R/W
1	SPOE	Parity Mode 0: Select even parity for transmission and reception 1: Select odd parity for transmission and reception	R/W
2	SPIIE	SPI Idle Interrupt Enable 0: Disable idle interrupt requests 1: Enable idle interrupt requests	R/W
3	PTE	Parity Self-Testing 0: Disable self-diagnosis function of the parity circuit 1: Enable self-diagnosis function of the parity circuit	R/W
4	SCKASE	RSPCK Auto-Stop Function Enable 0: Disable RSPCK auto-stop function 1: Enable RSPCK auto-stop function	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

SPPE bit (Parity Enable)

The SPPE bit enables or disables the parity function.

When the SPCR.TXMD bit is 0 and this bit is 1, the parity bit is added to transmit data and parity checking is performed for receive data.

When the SPCR.TXMD bit is 1 and this bit is 1, the parity bit is added to transmit data but parity checking is not performed for receive data.

SPOE bit (Parity Mode)

The SPOE bit specifies odd or even parity.

When even parity is set, parity bit addition is performed so that the total number of bits whose value is 1 in the transmit or receive character plus the parity bit is even. Similarly, when odd parity is set, parity bit addition is performed so that the total number of bits whose value is 1 in the transmit or receive character plus the parity bit is odd.

The SPOE bit is only valid when the SPPE bit is 1.

SPIIE bit (SPI Idle Interrupt Enable)

The SPIIE bit enables or disables the generation of SPI idle interrupt requests when an idle state is detected in the SPI and the SPSR.IDLNF flag clears is set to 0.

PTE bit (Parity Self-Testing)

The PTE bit enables self-diagnosis of the parity circuit to check whether the parity function is operating correctly.

SPNDL[2:0]位（SPI下一次访问延迟设置）

当SPMDm.SPNDEN位为1时，SPNDL[2:0]位指定下一次访问延迟。在从机模式下使用SPI时，将SPNDL[2:0]位设置为000b。

34.2.13 SPCR2：SPI控制寄存器2

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SCKASE	PTE	SPIIE	SPOE	SPPE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SPPE	奇偶校验使能 0：发送数据不添加奇偶校验位，接收数据不校验校验位1：当SPCR.TXMD=0：发送数据添加校验位，接收数据校验校验位当SPCR.TXMD=1：添加校验位位发送数据但不检查接收数据的奇偶校验位	R/W
1	SPOE	奇偶校验模式 0：发送和接收选择偶校验1：发送和接收选择奇校验	R/W
2	SPIIE	SPI空闲中断使能 0：禁用空闲中断请求1：启用空闲中断请求	R/W
3	PTE	Parity Self-Testing 0：禁用奇偶电路自诊断功能1：启用奇偶电路自诊断功能	R/W
4	SCKASE	RSPCK自动停止功能启用 0：禁用RSPCK自动停止功能1：启用RSPCK自动停止功能	R/W
7:5	—	这些位被读取为0。写入值应为0。	R/W

SPPE bit (Parity Enable)

SPPE位启用或禁用奇偶校验功能。

当SPCR.TXMD位为0且该位为1时，发送数据添加奇偶校验位，接收数据执行奇偶校验。

当SPCR.TXMD位为1且该位为1时，发送数据添加奇偶校验位，但接收数据不执行奇偶校验。

SPOE bit (Parity Mode)

SPOE位指定奇校验或偶校验。

当设置了偶校验时，执行奇偶校验位相加，以使发送或接收字符中值为1的总位数加上奇偶校验位为偶数。类似地，当设置奇校验时，执行校验位相加，使得发送或接收字符中值为1的位加上奇偶校验位的总数为奇数。

SPOE位仅在SPPE位为1时有效。

SPIIE位（SPI空闲中断允许）

当在SPI中检测到空闲状态并且SPSR.IDLNF标志清除设置为0时，SPIIE位启用或禁用SPI空闲中断请求的生成。

PTE bit (Parity Self-Testing)

PTE位启用奇偶校验电路的自诊断，以检查奇偶校验功能是否正常运行。

SCKASE bit (RSPCK Auto-Stop Function Enable)

The SCKASE bit enables or disables the RSPCK auto-stop function. When this function is enabled, the RSPCK clock is stopped before an overrun error occurs, when data is received in master mode. For details, see section 34.3.9.1. Overrun errors.

34.2.14 SPCMDm : SPI Command Register m (m = 0 to 7)

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x10 + 0x02 × m

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SCKDEN	SLNDEN	SPNDEN	LSBF	SPB[3:0]				SSLKP	SSLA[2:0]			BRDV[1:0]		CPOL	CPHA
Value after reset:	0	0	0	0	0	1	1	1	0	0	0	0	1	1	0	1

Bit	Symbol	Function	R/W
0	CPHA	RSPCK Phase Setting 0: Select data sampling on leading edge, data change on trailing edge 1: Select data change on leading edge, data sampling on trailing edge	R/W
1	CPOL	RSPCK Polarity Setting 0: Set RSPCK low during idle 1: Set RSPCK high during idle	R/W
3:2	BRDV[1:0]	Bit Rate Division Setting 0 0: Base bit rate 0 1: Base bit rate divided by 2 1 0: Base bit rate divided by 4 1 1: Base bit rate divided by 8	R/W
6:4	SSLA[2:0]	SSL Signal Assertion Setting 0 0 0: SSL0 0 0 1: SSL1 0 1 0: SSL2 0 1 1: SSL3 Others: Setting prohibited	R/W
7	SSLKP	SSL Signal Level Keeping 0: Negate all SSL signals on completion of transfer 1: Keep SSL signal level from the end of transfer until the beginning of the next access	R/W
11:8	SPB[3:0]	SPI Data Length Setting 0x0: 20 bits 0x1: 24 bits 0x2: 32 bits 0x3: 32 bits 0x8: 9 bits 0x9: 10 bits 0xA: 11 bits 0xB: 12 bits 0xC: 13 bits 0xD: 14 bits 0xE: 15 bits 0xF: 16 bits Others: 8 bits	R/W
12	LSBF	SPI LSB First 0: MSB-first 1: LSB-first	R/W
13	SPNDEN	SPI Next-Access Delay Enable 0: Select next-access delay of 1 RSPCK + 2 PCLKA 1: Select next-access delay equal to the setting in the SPI Next-Access Delay Register (SPND)	R/W

SCKASE位（RSPCK自动停止功能使能）

SCKASE位启用或禁用RSPCK自动停止功能。启用此功能后，在主机模式下接收数据时，RSPCK时钟会在发生溢出错误之前停止。有关详细信息，请参阅第34.3.9.1节。溢出错误。

34.2.14 SPCMDm：SPI命令寄存器m（m=0到7）

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x10 + 0x02 × m

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

12	LSBF	SPILSB优先 0: MSB-first 1: LSB-first	R/W
13	SPNDEN	SPI下一次访问延迟使能 0：选择下一次访问延迟1RSPCK+2PCLKA1：选择下一次访问延迟等于SPI下一次访问延迟寄存器(SPND)中的设置	R/W

Bit	Symbol	Function	R/W
14	SLNDEN	SSL Negation Delay Setting Enable 0: Select SSL negation delay of 1 RSPCK 1: Select SSL negation delay equal to the setting in the SPI Slave Select Negation Delay Register (SSLND)	R/W
15	SCKDEN	RSPCK Delay Setting Enable 0: Select RSPCK delay of 1 RSPCK 1: Select RSPCK delay equal to the setting in the SPI Clock Delay Register (SPCKD)	R/W

The SPCMDm registers specify the transfer format for the SPI in master mode. Each channel has eight SPCMDm (m = 0 to 7). Some of the bits in the SPCMD0 registers are used to set the transfer mode for the SPI in slave mode. The SPI in master mode sequentially references the SPCMDm registers based on the settings in the SPSCR.SPSLN[2:0] bits and executes the serial transfer that is set in the referenced SPCMDm registers.

Set the SPCMDm registers while the transmit buffer is empty (SPSR.SPTEF is 1 and data for the next transfer is not set) and before the setting of the data to be transmitted when that SPCMDm registers is referenced.

The SPCMDm registers referenced by the SPI in master mode can be checked by means of the SPSSR.SPCP[2:0] bits.

CPHA bit (RSPCK Phase Setting)

The CPHA bit selects the RSPCK phase of the SPI in master or slave mode. Data communications between SPI modules require the same RSPCK phase setting between the modules.

CPOL bit (RSPCK Polarity Setting)

The CPOL bit selects the RSPCK polarity of the SPI in master or slave mode. Data communications between SPI modules require the same RSPCK polarity setting between the modules.

BRDV[1:0] bits (Bit Rate Division Setting)

The BRDV[1:0] bits determine the bit rate in combination with the settings in the SPBR register. (see section 34.2.8. SPBR : SPI Bit Rate Register). The SPBR settings determine the base bit rate. The BRDV[1:0] setting selects the bit rate obtained by dividing the base bit rate by 1, 2, 4, or 8. Different BRDV[1:0] bit settings can be specified in the SPCMD0 register. This enables execution of serial transfers at different bit rates for each command.

SSLA[2:0] bits (SSL Signal Assertion Setting)

The SSLA[2:0] bits control the SSLni signal assertion when the SPI performs serial transfers in master mode. When an SSLni signal is asserted, its polarity is determined by the value set in the associated SSLP. When the SSLA[2:0] bits are set to 000b in multi-master mode, serial transfers are performed with all the SSL signals in the negated state (as the SSLn0 pin acts as input).

When using the SPI in slave mode, set the SSLA[2:0] bits to 000b.

SSLKP bit (SSL Signal Level Keeping)

When the SPI in master mode performs a serial transfer, the SSLKP bit specifies whether the SSLni signal level for the current command is to be kept or negated between the SSL negation associated with the current command and the SSL assertion associated with the next command. Setting the SSLKP bit to 1 enables a burst transfer. For details, see section 34.3.11.1. Master mode operation. When using the SPI in slave mode, set the SSLKP bit to 0.

SPB[3:0] bits (SPI Data Length Setting)

The SPB[3:0] bits specify the transfer data length for the SPI in master or slave mode.

LSBF bit (SPI LSB First)

The LSBF bit specifies the data format of the SPI in master or slave mode to MSB-first or LSB-first.

SPNDEN bit (SPI Next-Access Delay Enable)

The SPNDEN bit specifies the next-access delay, the period from the time the SPI in master mode terminates a serial transfer and sets the SSLni signal inactive until the SPI enables the SSLni signal assertion for the next access. If the SPNDEN bit is 0, the SPI sets the next-access delay to 1 RSPCK + 2 PCLKA. If the SPNDEN bit is 1, the SPI inserts a next-access delay according to the SPND setting.

Bit	Symbol	Function	R/W
14	SLNDEN	SSL否定延迟设置启用 0：选择SSL否定延迟1RSPCK1：选择SSL否定延迟等于SPI从选择否定延迟寄存器(SSLND)中的设置	R/W
15	SCKDEN	RSPCK延迟设置启用 0：选择RSPCK延迟为1RSPCK1：选择RSPCK延迟等于SPI时钟延迟寄存器(SPCKD)中的设置	R/W

SPCMDm寄存器指定主模式下SPI的传输格式。每个通道有8个SPCMDm（m=0到7）。SPCMD0寄存器中的一些位用于设置SPI在从机模式下的传输模式。主机模式下的SPI根据SPSCR.SPSLN[2:0]位中的设置顺序引用SPCMDm寄存器，并执行在引用的SPCMDm寄存器中设置的串行传输。

在发送缓冲区为空时（SPSR.SPTEF为1且未设置下一次传输的数据）和设置要发送的数据之前，当引用该SPCMDm寄存器时设置SPCMDm寄存器。

SPI在主模式下引用的SPCMDm寄存器可以通过SPSSR.SPCP[2:0]位进行检查。

CPHA位（RSPCK相位设置）

CPHA位在主模式或从模式下选择SPI的RSPCK相位。SPI模块之间的数据通信需要模块之间相同的RSPCK相位设置。

CPOL位（RSPCK极性设置）

CPOL位在主模式或从模式下选择SPI的RSPCK极性。SPI模块之间的数据通信要求模块之间的RSPCK极性设置相同。

BRDV[1:0]位（比特率划分设置）

BRDV[1:0]位结合SPBR寄存器中的设置确定比特率。（参见第34.2.8节。SPBR：SPI比特率寄存器）。SPBR设置决定了基本比特率。BRDV[1:0]设置选择通过将基本比特率除以1、2、4或8获得的比特率。可以在SPCMD0寄存器中指定不同的BRDV[1:0]位设置。这使得每个命令能够以不同的比特率执行串行传输。

SSLA[2:0]位（SSL信号断言设置）

当SPI在主模式下执行串行传输时，SSLA[2:0]位控制SSLni信号断言。当一个SSLni信号被置位，其极性由相关SSLP中设置的值确定。当SSLA[2:0]位在多主机模式下设置为000b时，串行传输在所有SSL信号处于否定状态时执行（因为SSLn0引脚用作输入）。

在从机模式下使用SPI时，将SSLA[2:0]位设置为000b。

SSLKP位（SSL信号电平保持）

当主模式的SPI执行串行传输时，SSLKP位指定当前命令的SSLni信号电平是在与当前命令关联的SSL否定和与下一个命令关联的SSL断言之间保持还是否定。将SSLKP位设置为1可启用突发传输。有关详细信息，请参阅第34.3.11.1节。主模式操作。在从机模式下使用SPI时，将SSLKP位设置为0。

SPB[3:0]位（SPI数据长度设置）

SPB[3:0]位指定SPI在主模式或从模式下的传输数据长度。

LSBF bit (SPI LSB First)

LSBF位指定SPI在主模式或从模式下的数据格式为MSB优先或LSB优先。

SPNDEN位（SPI下一次访问延迟使能）

SPNDEN位指定下一次访问延迟，即从主模式下的SPI终止串行传输并将SSLni信号设置为无效到SPI为下一次访问启用SSLni信号断言的时间段。如果SPNDEN位为0，则SPI将下一次访问延迟设置为1RSPCK+2PCLKA。如果SPNDEN位为1，则SPI根据SPND设置插入下一次访问延迟。

When using the SPI in slave mode, set the SPNDEN bit to 0.

SLNDEN bit (SSL Negation Delay Setting Enable)

The SLNDEN bit specifies the SSL negation delay, the period from the time the SPI in master mode stops RSPCK oscillation until the SPI sets the SSLni signal to inactive. If the SLNDEN bit is 0, the SPI sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, the SPI negates the SSL signal at the SSL negation delay according to the SSLND setting.

When using the SPI in slave mode, set the SLNDEN bit to 0.

SCKDEN bit (RSPCK Delay Setting Enable)

The SCKDEN bit specifies the SPI clock delay, the period from the point when the SPI in master mode asserts the SSLni signal until the RSPCK starts oscillation. If the SCKDEN bit is 0, the SPI sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, the SPI starts the oscillation of RSPCK at an RSPCK delay according to the SPCKD setting.

When using the SPI in slave mode, set the SCKDEN bit to 0.

34.2.15 SPDCR2 : SPI Data Control Register 2

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x20

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SINV	BYSW
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BYSW	Byte Swap Operating Mode Select 0: Byte Swap OFF 1: Byte Swap ON	R/W
1	SINV	Serial Data Invert Bit 0: Not invert serial data 1: Invert serial data	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

SPI Data Control Register 2 (SPDCR2) is the setting register, that is to swap a transmit/receive data in byte units and to invert serial data. If these bits are modified while the SPI in slave mode is enabled (SPCR.SPE = 1), subsequent operation is not guaranteed.

BYSW bit (Byte Swap Operating Mode Select)

It is a setting bit, that is to swap a transmit/receive data in byte units. When byte access is valid (SPDCR.SPBYT = 1), byte swap is invalid. When byte swap is valid, parity function must be invalid (SPCR2.SPPE bit = 0). Setting change of BYSW bit must be SPCR.SPE bit = 0.

A data after byte swap is different by a data length (setting of SPCMD.SPB[3:0]).

When byte swap, A data length (setting of SPB[3:0]) must be set to 32 bit or 16bit. Other case of data length (that is 8 to 15, 20, 24 bit length), byte swap is not guaranteed. Before swap and after swap are shown below (length data (32 bit/16 bit)).

- Length data 32 bits (SPB[3:0] = 0010b or 0011b)

  Before swap: [31:24] [23:16] [15:8] [7:0]

  After swap: [7:0] [15:8] [23:16] [31:24]
- Length data 16 bit (SPB[3:0] = 1111b)

  Before swap: [31:24] [23:16]

  After swap: [23:16] [31:24]

When byte access mode (SPDCR.SPBT = 1), byte swap setting is invalid.

在从机模式下使用SPI时，将SPNDEN位设置为0。

SLNDEN位（SSL否定延迟设置启用）

SLNDEN位指定SSL否定延迟，即从主模式下的SPI停止RSPCK振荡到SPI将SSLni信号设置为无效的时间段。如果SLNDEN位为0，则SPI将SSL否定延迟设置为1RSPCK。如果SLNDEN位为1，则SPI根据SSLND设置在SSL否定延迟时否定SSL信号。

在从机模式下使用SPI时，将SLNDEN位设置为0。

SCKDEN位（RSPCK延迟设置使能）

SCKDEN位指定SPI时钟延迟，即从主模式下的SPI断言SSLni信号到RSPCK开始振荡的周期。如果SCKDEN位为0，则SPI将RSPCK延迟设置为1RSPCK。如果SCKDEN位为1，则SPI根据SPCKD设置以RSPCK延迟启动RSPCK的振荡。

在从机模式下使用SPI时，将SCKDEN位设置为0。

34.2.15 SPDCR2:SPI数据控制寄存器2

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x20

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SINV	BYSW
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BYSW	字节交换操作模式选择 0：字节交换关闭1 ：字节交换开启	R/W
1	SINV	串行数据反转位 0：不反转串行数据1： 反转串行数据	R/W
7:2	—	这些位被读取为0。写入值应为0。	R/W

SPI数据控制寄存器2(SPDCR2)是设置寄存器，即以字节为单位交换发送接收数据和反转串行数据。如果在使能从模式下的SPI(SPCR.SPE=1)时修改这些位，则无法保证后续操作。

BYSW位（字节交换操作模式选择）

它是一个设置位，即以字节为单位交换一个发送接收数据。当字节访问有效时（SPDCR.SPBYT=1），字节交换无效。当字节交换有效时，奇偶校验功能必须无效（SPCR2.SPPE位=0）。BYSW位的设置更改必须是SPCR.SPE位=0。

字节交换后的数据因数据长度不同（SPCMD.SPB[3:0]的设置）。

字节交换时，A数据长度（SPB[3:0]的设置）必须设置为32位或16位。其他数据长度情况（即8到15、20、24位长度），不保证字节交换。交换前和交换后如下所示（长度数据（32位16位））。

●长度数据32位(SPB[3:0]=0010b或0011b)

Before swap: [31:24] [23:16] [15:8] [7:0]

After swap: [7:0] [15:8] [23:16] [31:24]

●长度数据16位(SPB[3:0]=1111b)

Before swap: [31:24] [23:16]

After swap: [23:16] [31:24]

当字节访问模式（SPDCR.SPBT=1）时，字节交换设置无效。

When byte swap is valid, set parity function to invalid (SPCR2.SPPE = 0). When the parity function set to valid, the behavior is not guaranteed.

SINV bit (Serial Data Invert Bit)

This bit is used to invert transmit data and receive data.

When the SINV bit is set to 1, transmit buffer (SPTX) data is inverted to invert transmit data and receive data, and then the inverted data is stored in the receive buffer (SPRX). The parity bit is the value corresponding to the inverted transmission/ reception data.

34.2.16 SPCR3 : SPI Control Register 3

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x21

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CENDIE	—	—	BFDS	ETXMD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ETXMD	Extended Communication Mode Select 0: Full-duplex synchronous or transmit-only serial communications. [the SPCR.TXMD bit is enabled] 1: Receive-only serial communications in slave mode (SPCR.MSTR bit = 0). [the SPCR.TXMD bit is disabled] Setting is prohibited in master mode (SPCR.MSTR bit = 1).	R/W
1	BFDS	Between Burst Transfer Frames Delay Select 0: Delay (RSPCK delay, SSL negation delay and next-access delay) between frames is inserted in burst transfer. 1: Delay between frames is not inserted in burst transfer.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	CENDIE	RSPI Communication End Interrupt Enable 0: Communication end interrupt request is disabled. 1: Communication end interrupt request is enabled.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

SPI control register 3 (SPCR3) is control register for operation mode. If you change the value of ETXMD and BFDS when the SPCR.SPE bit is 1, the SPI operation does not guarantee.

ETXMD bit (Extended Communication Mode Select)

This bit is valid on slave mode only (the SPCR.MSTR bit is 0). This bit select receive only operation. When the ETXMD bit is 1 on slave mode, the communication is only received not transmit (see section 34.3.6. Data Transfer Modes). When the ETXMD is 1, transmit data empty interrupt can not be used.

The communication state by each mode (master mode, slave mode) is shown as below. It is controlled by the ETXMD bit, the SPCR.MSTR bit and the TXMD bit.

Table 34.5 RSPI communication state (master/slave mode)

SPCR.MSTR bit	SPCR3.ETXMD bit	SPCR.TXMD bit	Communication state
1	0	0	Transmit-receive master mode
1	0	1	Transmit master mode
0	0	0	Transmit-receive slave mode (default)
0	0	1	Transmit slave mode
0	1	—	Receive slave mode

当字节交换有效时，将奇偶校验功能设置为无效（SPCR2.SPPE=0）。当奇偶校验函数设置为有效时，行为不被保证。

SINV位（串行数据反转位）

该位用于反转发送数据和接收数据。

当SINV位设置为1时，发送缓冲器(SPTX)数据反转以反转发送数据和接收数据，然后将反转的数据存储在接收缓冲器(SPRX)中。奇偶校验位是对应于反转的发送接收数据的值。

34.2.16 SPCR3：SPI控制寄存器3

Base address: SPIn = 0x4011_A000 + 0x0100 × n (n = 0, 1)

Offset address: 0x21

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CENDIE	—	—	BFDS	ETXMD
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ETXMD	扩展通信模式选择 0：全双工同步或仅传输串行通信。[启用SPCR.TXMD位] 1：从机模式下仅接收串行通信（SPCR.MSTR位=0）。[SPCR.TXMD位禁用]主机模式下禁止设置（SPCR.MSTR位=1）。	R/W
1	BFDS	突发传输帧之间延迟选择 0：在突发传输中插入帧之间的延迟（RSPCK延迟、SSL否定延迟和下一次访问延迟）。 1：突发传输中不插入帧间延迟。	R/W
3:2	—	这些位被读取为0。写入值应为0。	R/W
4	CENDIE	RSPI通信结束中断使能 0：禁止通讯结束中断请求。1：使能通信结束中断请求。	R/W
7:5	—	这些位被读取为0。写入值应为0。	R/W

SPI控制寄存器3(SPCR3)是操作模式的控制寄存器。如果在SPCR.SPE位为1时更改ETXMD和BFDS的值，则SPI操作不保证。

ETXMD位（扩展通信模式选择）

该位仅在从模式下有效（SPCR.MSTR位为0）。该位选择只接收操作。当ETXMD位在从机模式下为1时，通信只接收不发送（参见第34.3.6节。数据传输模式）。当ETXMD为1时，不能使用发送数据空中断。

各模式（主模式、从模式）的通信状态如下所示。它由ETXMD位、SPCR.MSTR位和TXMD位控制。

Table 34.5 RSPI通信状态（主从模式）

SPCR.MSTR bit	SPCR3.ETXMD bit	SPCR.TXMD bit	通讯状态
1	0	0	收发主模式
1	0	1	传输主模式
0	0	0	发送接收从模式（默认）
0	0	1	传输从模式
0	1	—	接收从机模式

RA生态工作室

BFDS bit (Between Burst Transfer Frames Delay Select)

This bit controls whether insert the delay time between the burst transfer frames.

This bit is valid when the SPCMD.SSLKP bit is 1 in master mode (the SPCR.MSTR bit is 1).

This bit should be set to 0 in slave mode. The usage of SSL delay control between transfer frames is shown as below. See (4)Burst transfers in detail.

Table 34.6 Usage of SSL delay control between transfer frames (Master mode)

Transmit		SPCMD.SSLKP bit	SPCR3.BFDS bit	SSL delay control register*1 (RSPCK clock delay, SSL negation delay, next access delay)
Non-burst transmit		0	0	Any given value. You can control each delay value according to setting for RSPCK clock delay, SSL negation delay and next access delay.
Burst transmit with delay between frames	From the 1st frame to the last previous frame	1	0	
	The last frame	0	0	
Burst transmit with no delay between frames	From the 1st frame to the last previous frame	1	1	Any given value. But delay is inserted only below. ● RSPCK clock delay of the 1st frame ● SSL negation delay and next access delay of the last frame
	The last frame	0	1	

Note 1. Whether the setting value of following bits are valid or not depends on the setting value of the SPCMD.SPNDEN bit (see section 34.2.14. SPCMDm : SPI Command Register m (m = 0 to 7)).
The SPCKD.SCKDL[2:0] bits: RSPCK delay
The SSLND.SLNDL[2:0] bits: SSL negate delay
The SPND.SPNDL[2:0] bits: Next access delay

CENDIE bit (RSPI Communication End Interrupt Enable)

This bit controls generation of a communication end interrupt request.

34.3 Operation

In this section, the serial transfer period refers to the period from the beginning of driving valid data to the fetching of the final valid data.

34.3.1 Overview of SPI Operation

The SPI is capable of synchronous serial transfers in the following modes:

- Slave mode (SPI operation)
- Single master mode (SPI operation)
- Multi-master mode (SPI operation)
- Slave mode (clock synchronous operation)
- Master mode (clock synchronous operation)

The SPI mode can be selected by using the MSTR, MODFEN, and SPMS bits in SPCR. Table 34.7 lists the relationship between SPI modes and SPCR settings, and a description of each mode.

Table 34.7 Relationship between SPCR settings and SPI modes (1 of 2)

Mode	Slave (SPI operation)	Single-master (SPI operation)	Multi-master (SPI operation)	Slave (clock synchronous operation)	Master (clock synchronous operation)
MSTR bit setting	0	1	1	0	1
MODFEN bit setting	0 or 1	0	1	0	0
SPMS bit setting	0	0	0	1	1

BFDS位（突发传输帧之间延迟选择）

该位控制是否在突发传输帧之间插入延迟时间。

当SPCMD.SSLKP位在主机模式下为1（SPCR.MSTR位为1）时，该位有效。

在从机模式下，该位应设置为0。传输帧之间的SSL延迟控制的使用如下所示。详见(4)突发传输。

Table 34.6 传输帧之间使用SSL延迟控制（主模式）

Transmit		SPCMD.SSLKP bit	SPCR3.BFDS bit	SSL延迟控制寄存器*1 （RSPCK时钟延迟、SSL否定延迟、下一次访问延迟）
Non-burst transmit		0	0	任何给定的值。您可以根据对RSPCK时钟延迟、SSL否定延迟和下一次访问延迟的设置来控制每个延迟值。
帧之间有延迟的突发传输	从第一帧到最后一帧	1	0	
	最后一帧	0	0	
帧间无延迟的突发传输	从第一帧到最后一帧	1	1	任何给定的值。但是延迟只在下面插入。● 第一帧的RSPCK时钟延迟 ● 最后一帧的SSL否定延迟和下一次访问延迟
	最后一帧	0	1	

注1.以下位的设置值是否有效取决于SPCMD.SPNDEN位的设置值（参见第34.2.14节。SPCMDm：SPI命令寄存器m（m=0至7））。SPCKD.SCDL[2:0]位：RSPCK延迟

SSLND.SLNDL[2:0]位：SSL否定延迟SPND.SPNDL[2:0]位：下一次访问延迟

CENDIE位（RSPI通信结束中断使能）

该位控制通信结束中断请求的产生。

34.3 Operation

在本节中，串行传输周期是指从开始驱动有效数据到获取最终有效数据的周期。

34.3.1 SPI操作概述

SPI能够在以下模式下进行同步串行传输：

●从机模式（SPI操作）

●单主模式（SPI操作）

- Multi-master mode (SPI operation)

●从机模式（时钟同步操作）

●主模式（时钟同步操作）

可以使用SPCR中的MSTR、MODFEN和SPMS位选择SPI模式。表34.7列出了SPI模式和SPCR设置之间的关系，以及每种模式的说明。

Table 34.7 SPCR设置和SPI模式之间的关系(1of2)

Mode	Slave (SPI operation)	Single-master (SPI operation)	Multi-master (SPI operation)	从机（时钟同步操作）	主控（时钟同步操作）
MSTR位设置	0	1	1	0	1
MODFEN位设置	0 or 1	0	1	0	0
SPMS位设置	0	0	0	1	1

Table 34.7 Relationship between SPCR settings and SPI modes (2 of 2)

Mode	Slave (SPI operation)	Single-master (SPI operation)	Multi-master (SPI operation)	Slave (clock synchronous operation)	Master (clock synchronous operation)
RSPCKn pins	Input	Output	Output/Hi-Z	Input	Output
MOSIn pin	Input	Output	Output/Hi-Z	Input	Output
MISOn pin	Output/Hi-Z	Input	Input	Output	Input
SSLn0 pins	Input	Output	Input	Hi-Z*1	Hi-Z*1
SSLn1 to SSLn3 pins	Hi-Z*1	Output	Output/Hi-Z	Hi-Z*1	Hi-Z*1
SSL polarity change function	Supported	Supported	Supported	—	—
Max transfer rate	PCLKA/4	PCLKA/2	PCLKA/2	PCLKA/4	PCLKA/2
Clock source	RSPCK input	On-chip baud rate generator	On-chip baud rate generator	RSPCK input	On-chip baud rate generator
Clock polarity	Two				
Clock phase	Two	Two	Two	One (CPHA = 1)	Two
First transfer bit	MSB/LSB				
Transfer data length	8 to 16, 20, 24, 32 bits				
Burst transfer	Possible (CPHA = 1)	Possible (CPHA = 0, 1)	Possible (CPHA = 0, 1)	—	—
RSPCK delay control	Not supported	Supported	Supported	Not supported	Supported
SSL negation delay control	Not supported	Supported	Supported	Not supported	Supported
Next-access delay control	Not supported	Supported	Supported	Not supported	Supported
Transfer trigger	SSL input active or RSPCK oscillation	Write to transmit buffer on generation of transmit buffer empty interrupt request (SPTEF = 1)	Write to transmit buffer on generation of transmit buffer empty interrupt request (SPTEF = 1)	RSPCK oscillation	Write to transmit buffer on generation of transmit buffer empty interrupt request (SPTEF = 1)
Sequence control	Not supported	Supported	Supported	Not supported	Supported
Transmit buffer empty detection	Supported*5				
Receive buffer full detection	Supported*2				
Overrun error detection	Supported*2	Supported*2*4	Supported*2*4	Supported*2	Supported*2
Parity error detection	Supported*3*2				
Mode fault error detection	Supported (MODFEN = 1)	Not supported	Supported	Not supported	Not supported
Underrun error detection	Supported*5	Not supported	Not supported	Supported*5	Not supported

Note 1. This function is not supported in this mode.
Note 2. When the SPCR.TXMD bit is 1, detection of receiver buffer full, overrun error, and parity error are not performed.
Note 3. When the SPCR2.SPPE bit is 0, parity error detection is not performed.
Note 4. When the SPCR2.SCKASE bit is 1, overrun error detection does not proceed.
Note 5. When SPI is receive only slave mode, none of transmit buffer empty and underrun error is detected.

34.3.2 Controlling the SPI Pins

Based on the settings of the MSTR, MODFEN, and SPMS bits in SPCR and the PmnPFS.NCODR bit for I/O Ports, the SPI can switch pin states. Table 34.8 lists the relationship between pin states and bit settings. Setting the PmnPFS.NCODR bit for an I/O port to 0 selects the CMOS output. Setting it to 1 selects the open-drain output. The I/O port settings must follow this relationship.

Table 34.7 SPCR设置和SPI模式之间的关系(2of2)

Mode	Slave (SPI operation)	Single-master (SPI operation)	Multi-master (SPI operation)	从机（时钟同步操作）	主控（时钟同步操作）
RSPCKn pins	Input	Output	Output/Hi-Z	Input	Output
MOSIn pin	Input	Output	Output/Hi-Z	Input	Output
MISOn pin	Output/Hi-Z	Input	Input	Output	Input
SSLn0 pins	Input	Output	Input	Hi-Z*1	Hi-Z*1
SSLn1到SSLn3引脚	Hi-Z*1	Output	Output/Hi-Z	Hi-Z*1	Hi-Z*1
SSL极性改变功能	Supported	Supported	Supported	—	—
最大传输率	PCLKA/4	PCLKA/2	PCLKA/2	PCLKA/4	PCLKA/2
时钟源	RSPCK input	片上波特率发生器	片上波特率发生器	RSPCK input	片上波特率发生器
时钟极性	Two				
时钟相位	Two	Two	Two	One (CPHA = 1)	Two
第一个传输位	MSB/LSB				
传输数据长度	8至16、20、24、32位				
突发传输	Possible (CPHA = 1)	Possible (CPHA = 0, 1)	Possible (CPHA = 0, 1)	—	—
RSPCK延迟控制	不支持	Supported	Supported	不支持	Supported
SSL否定延迟控制	不支持	Supported	Supported	不支持	Supported
下一次访问延迟控制	不支持	Supported	Supported	不支持	Supported
转移触发	SSL输入有效或RSPCK振荡	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)	RSPCK oscillation	在产生发送缓冲区空中断请求时写入发送缓冲区(SPTEF=1)
顺序控制	不支持	Supported	Supported	不支持	Supported
发送缓冲区空检测	Supported*5				
接收缓冲区满检测	Supported*2				
溢出错误检测	Supported*2	Supported*2*4	Supported*2*4	Supported*2	Supported*2
奇偶校验错误检测	Supported*3*2				
模式故障错误检测	Supported (MODFEN = 1)	不支持	Supported	不支持	不支持
欠载错误检测	Supported*5	不支持	不支持	Supported*5	不支持

注1.此模式不支持此功能。
注2.当SPCR.TXMD位为1时，不执行接收缓冲区满、溢出错误和奇偶校验错误的检测。
注3.当SPCR2.SPPE位为0时，不执行奇偶校验错误检测。
注4.当SPCR2.SCKASE位为1时，不进行溢出错误检测。
注5.当SPI为仅接收从机模式时，不会检测到发送缓冲区为空和欠载错误。

34.3.2 控制SPI引脚

根据SPCR中的MSTR、MODFEN和SPMS位以及IO端口的PmnPFS.NCODR位的设置，SPI可以切换引脚状态。表34.8列出了引脚状态和位设置之间的关系。将IO端口的PmnPFS.NCODR位设置为0可选择CMOS输出。将其设置为1选择开漏输出。IO端口设置必须遵循这种关系。

RA生态工作室

Table 34.8 Relationship between pin states and bit settings

Mode	Pin	Pin state*2	
		PmnPFS.NCODR bit for I/O ports = 0	PmnPFS.NCODR bit for I/O ports = 1
Single-master mode (SPI operation) (MSTR = 1, MODFEN = 0, SPMS = 0)	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3	CMOS output	Open-drain output
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Multi-master mode (SPI operation) (MSTR = 1, MODFEN = 1, SPMS = 0)	RSPCKn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	SSLn0	Input	Input
	SSLn1 to SSLn3*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MOSIn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MISOn	Input	Input
Slave mode (SPI operation) (MSTR = 0, SPMS = 0)	RSPCKn	Input	Input
	SSLn0	Input	Input
	SSLn1 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn*4	CMOS output/Hi-Z	Open-drain output/Hi-Z
Master mode (clock synchronous operation) (MSTR = 1, MODFEN = 0, SPMS = 1)	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Slave mode (clock synchronous operation) (MSTR = 0, SPMS = 1)	RSPCKn	Input	Input
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn	CMOS output	Open-drain output

Note 1. This function is not supported in this mode.
Note 2. SPI settings are not reflected in multiplexed pins for which the SPI function is not selected.
Note 3. When SSLn0 is at the active level, the pin state is Hi-Z. Whether or not the input signal is at the active level determines the setting of the SSLP.SSL0P bit.
Note 4. When SSLn0 is at the non-active level or the SPCR.SPE bit is 0, the pin state is Hi-Z. Whether or not the input signal is at the active level determines the setting of the SSLP.SSL0P bit.
Note 5. These pins are available for use as I/O port pins.

The SPI in single-master mode (SPI operation) or multi-master mode (SPI operation) determines the MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) based on the MOIFE and MOIFV bit settings in SPPCR, as listed in Table 34.9.

Table 34.9 MOSI signal value determination during SSL negation

MOIFE bit	MOIFV bit	MOSIn signal value during SSL negation
0	0, 1	Final data from previous transfer
1	0	Low
1	1	High

Table 34.8 引脚状态和位设置之间的关系

Mode	Pin	引脚状态*2	
		IO端口的PmnPFS.NCODR位=0	IO端口的PmnPFS.NCODR位=1
Single-master mode (SPI operation) (MSTR = 1, MODFEN = 0, SPMS = 0)	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3	CMOS output	Open-drain output
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
Multi-master mode (SPI operation) (MSTR = 1, MODFEN = 1, SPMS = 0)	RSPCKn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	SSLn0	Input	Input
	SSLn1 to SSLn3*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MOSIn*3	CMOS output/Hi-Z	Open-drain output/Hi-Z
	MISOn	Input	Input
从机模式（SPI操作）（MSTR=0，SPMS=0）	RSPCKn	Input	Input
	SSLn0	Input	Input
	SSLn1 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn*4	CMOS output/Hi-Z	Open-drain output/Hi-Z
主模式（时钟同步操作）（MSTR=1，MODFEN=0，SPMS=1）	RSPCKn	CMOS output	Open-drain output
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	CMOS output	Open-drain output
	MISOn	Input	Input
从机模式（时钟同步操作）（MSTR=0，SPMS=1）	RSPCKn	Input	Input
	SSLn0 to SSLn3*5	Hi-Z*1	Hi-Z*1
	MOSIn	Input	Input
	MISOn	CMOS output	Open-drain output

注1.此模式不支持此功能。
注2.SPI设置不反映在未选择SPI功能的复用引脚中。
注3.当SSLn0处于有效电平时，引脚状态为Hi-Z。输入信号是否处于活动电平决定SSLP.SSL0P位的设置。

注4.当SSLn0处于无效电平或SPCR.SPE位为0时，引脚状态为Hi-Z。输入信号是否处于活动电平决定SSLP.SSL0P位的设置。

注5.这些引脚可用作IO端口引脚。

单主机模式（SPI操作）或多主机模式（SPI操作）下的SPI根据中的MOIFE和MOIFV位设置确定SSL否定期间（包括突发传输期间的SSL保留期间）的MOSI信号值SPPCR，如表34.9中所列。

Table 34.9 SSL否定期间的MOSI信号值确定

MOIFE bit	MOIFV bit	SSL否定期间的MOSIn信号值
0	0, 1	上次传输的最终数据
1	0	Low
1	1	High

34.3.3 SPI System Configuration Examples

34.3.3.1 Single-master/single-slave with the MCU as a master

Figure 34.5 shows a single-master/single-slave SPI system configuration example where the MCU is used as a master. In the single-master/single-slave configuration, the SSLni outputs of the MCU (master) are not used. The SSL input of the SPI slave is fixed to the low level, and the SPI slave is maintained in the selected state.*1

Note 1. In the transfer format configured when the SPCMDm.CPHA bit is 0, the SSL signal for some slave devices cannot be fixed to an active level. In this case, always connect the SSLni output of the MCU to the SSL input of the slave device.

The MCU (master) drives the RSPCKn and MOSIn signals. The SPI slave drives the MISO signal.

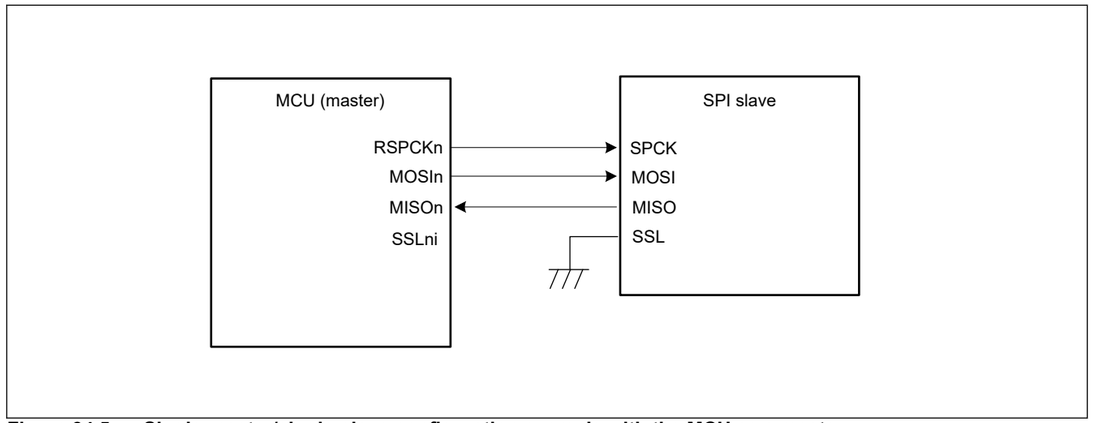

Figure 34.5 Single-master/single-slave configuration example with the MCU as a master

34.3.3.2 Single-master/single-slave with the MCU as a slave

Figure 34.6 shows a single-master/single-slave SPI system configuration example where the MCU is used as a slave. When the MCU operates as a slave, the SSLn0 pin is used as SSL input. The SPI master drives the RSPCK and MOSI signals. The MCU (slave) drives the MISOn signal.*1

Note 1. When SSLn0 is at a non-active level, the pin state is Hi-Z.

In the single-slave configuration when the SPCMDm.CPHA bit is set to 1, the SSLn0 input of the MCU (slave) is fixed to the low level and the MCU (slave) is maintained in the selected state. This enables serial transfer execution (Figure 34.7). However, the communication end interrupt does not output when SSL0 input is fixed as Figure 34.7.

34.3.3 SPI系统配置示例

34.3.3.1 单主单从单片机为主

图34.5显示了单主单从SPI系统配置示例，其中MCU用作主机。在单主单从配置中，不使用MCU（主）的SSLni输出。SPI从机的SSL输入固定为低电平，SPI从机保持在选中状态。*1

注1.在SPCMDm.CPHA位为0时配置的传输格式中，某些从设备的SSL信号不能固定为有效电平。在这种情况下，请始终将MCU的SSLni输出连接到从设备的SSL输入。

MCU（主控）驱动RSPCKn和MOSIn信号。SPI从机驱动MISO信号。

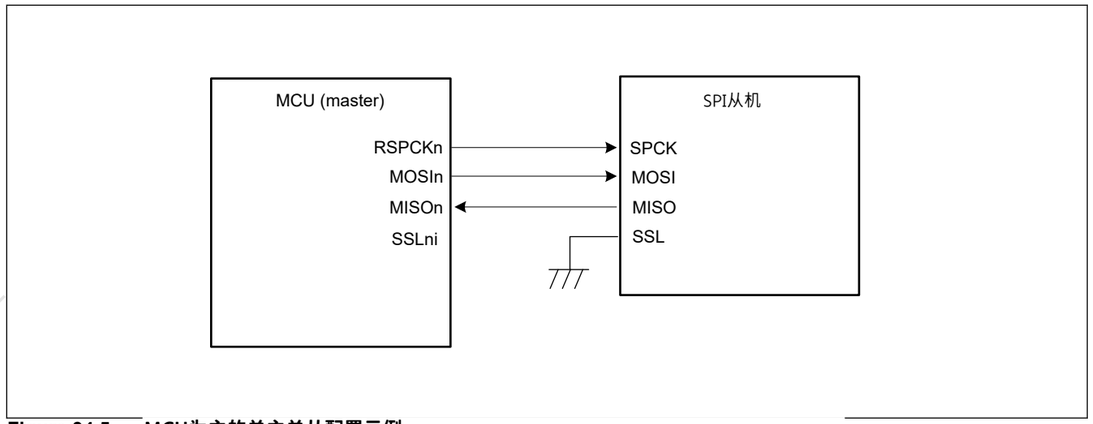

Figure 34.5 MCU为主的单主单从配置示例

34.3.3.2 单主单从单片机作为从机

图34.6显示了单主单从SPI系统配置示例，其中MCU用作从机。当MCU作为从机运行时，SSLn0引脚用作SSL输入。SPI主机驱动RSPCK和MOSI信号。MCU（从机）驱动MIOn信号。*1

注1.当SSLn0处于非活动电平时，引脚状态为Hi-Z。

在单从机配置中，当SPCMDm.CPHA位设置为1时，MCU（从机）的SSLn0输入固定为低电平，MCU（从机）保持在选择状态。这将启用串行传输执行（图34.7）。但是，如图34.7那样固定SSL0输入时，不输出通信结束中断。

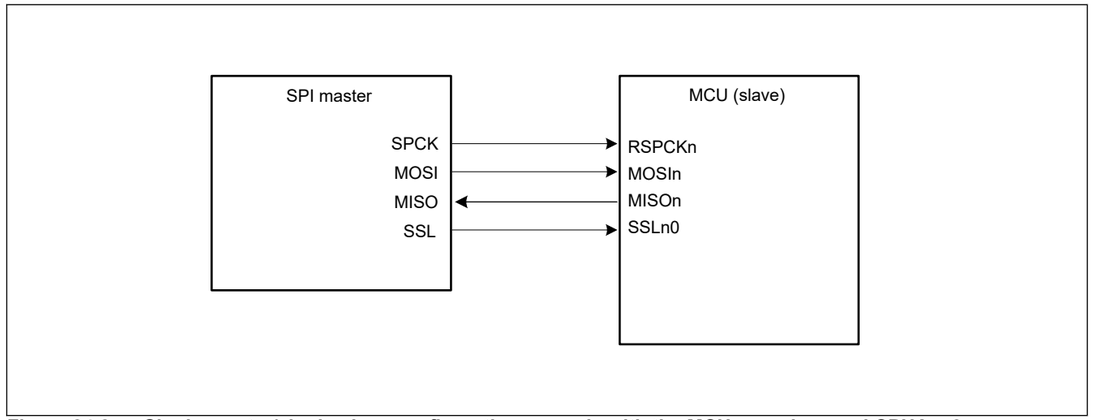

Figure 34.6 Single-master/single-slave configuration example with the MCU as a slave and CPHA = 0

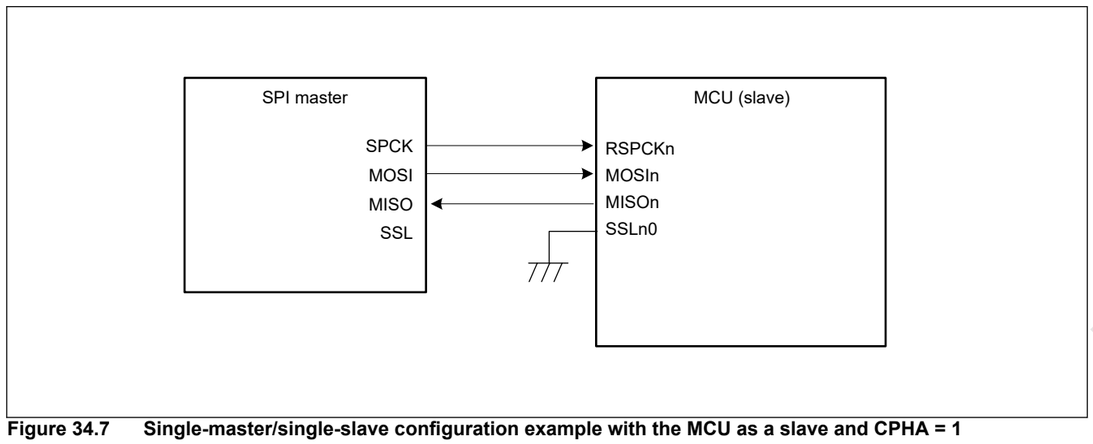

Figure 34.7 Single-master/single-slave configuration example with the MCU as a slave and CPHA = 1

34.3.3.3 Single-master/multi-slave with the MCU as a master

Figure 34.8 shows a single-master/multi-slave SPI system configuration example where the MCU is used as a master. In this example, the SPI system includes the MCU (master) and four slaves (SPI slave 0 to SPI slave 3).

The RSPCKn and MOSIn outputs of the MCU (master) are connected to the RSPCK and MOSI inputs of SPI slaves 0 to 3. The MISO outputs of SPI slaves 0 to 3 are all connected to the MISOn input of the MCU (master). The SSLn0 to SSLn3 outputs of the MCU (master) are connected to the SSL inputs of SPI slaves 0 to 3, respectively.

The MCU (master) drives the RSPCKn, MOSIn, and SSLn0 to SSLn3 signals. Of the SPI slaves 0 to 3, the slave that receives low-level input into the SSL input drives the MISO signal.

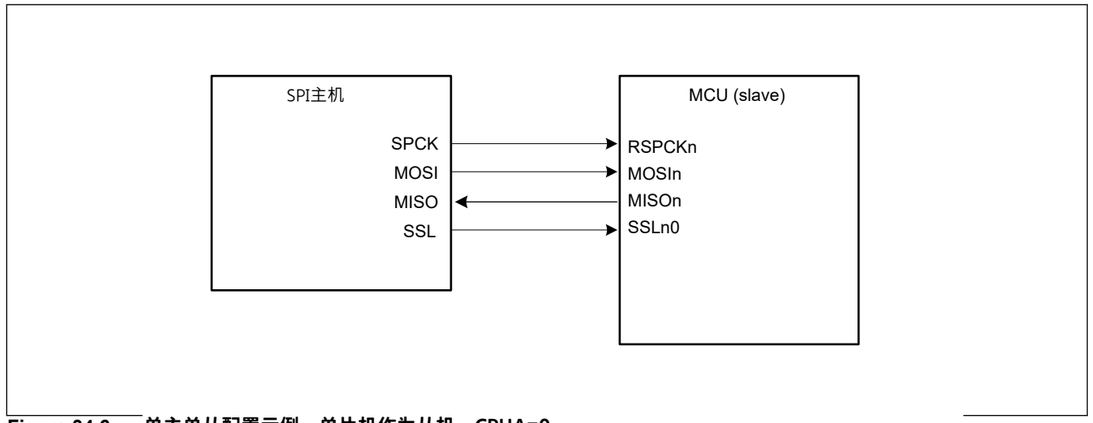

Figure 34.6 单主单从配置示例，单片机作为从机，CPHA=0

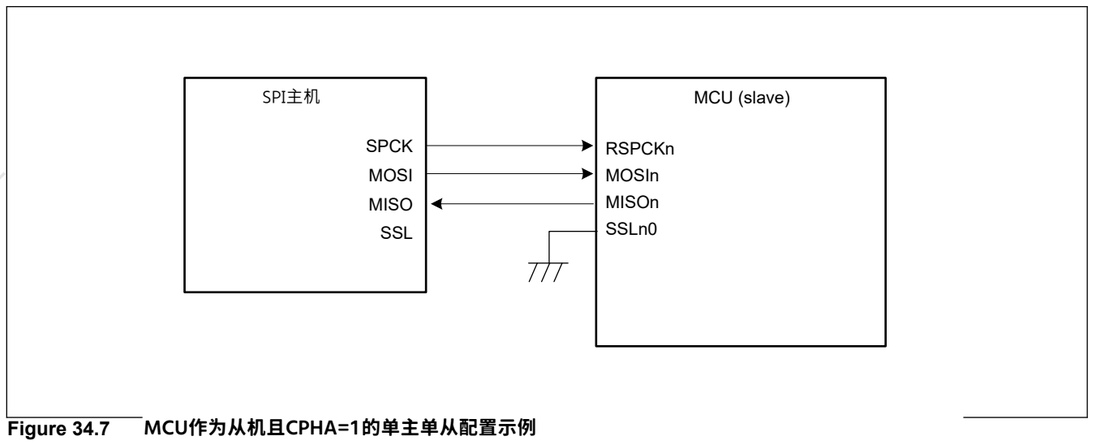

Figure 34.7 MCU作为从机且CPHA=1的单主单从配置示例

34.3.3.3 单主多从，单片机为主

图34.8显示了单主多从SPI系统配置示例，其中MCU用作主控。在本例中，SPI系统包括MCU（主机）和四个从机（SPI从机0到SPI从机3）。

MCU（主机）的RSPCKn和MOSIn输出连接到SPI从机0到3的RSPCK和MOSI输入。
SPI从机0到3的MISO输出都连接到MCU（主机）的MISOn输入。MCU（主机）的SSLn0到SSLn3输出分别连接到SPI从机0到3的SSL输入。

MCU（主控）驱动RSPCKn、MOSIn和SSLn0到SSLn3信号。在SPI从机0到3中，接收到SSL输入的低电平输入的从机驱动MISO信号。

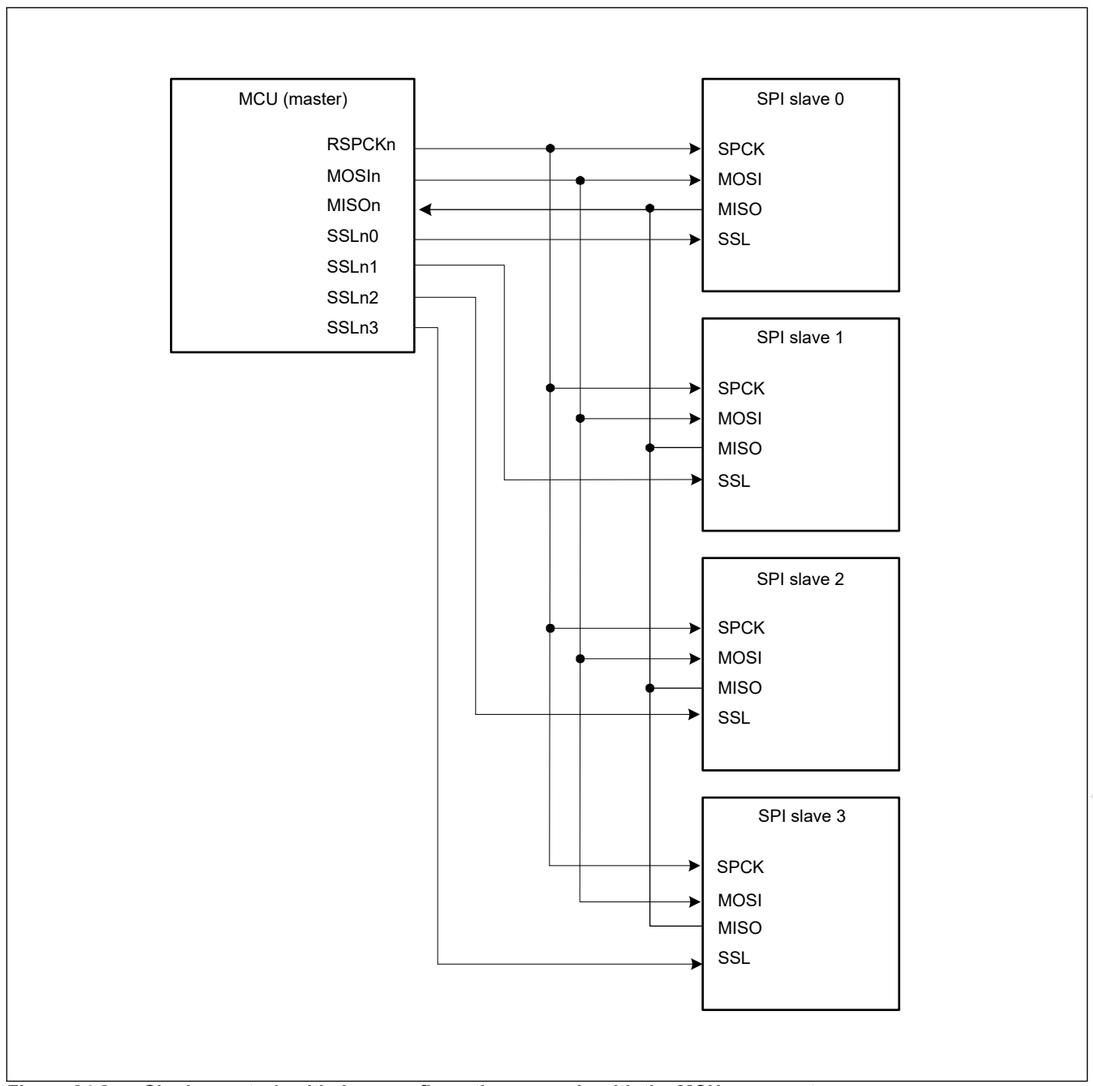

Figure 34.8 Single-master/multi-slave configuration example with the MCU as a master

34.3.3.4 Single-master/mult-slave with the MCU as a slave

Figure 34.9 shows a single-master/multi-slave SPI system configuration example where the MCU is used as a slave. In this example, the SPI system includes an SPI master and two MCUs (slaves X and Y).

The SPCK and MOSI outputs of the SPI master are connected to the RSPCKn and MOSIn inputs of the MCUs (slaves X and Y). The MISOn outputs of the MCUs (slaves X and Y) are all connected to the MISO input of the SPI master. The SSLX and SSLY outputs of the SPI master are connected to the SSLn0 inputs of the MCUs (slaves X and Y, respectively).

The SPI master drives the SPCK, MOSI, SSLX, and SSLY signals. Of the MCUs (slaves X and Y), the slave that receives low-level input into the SSLn0 input drives the MISOn signal.

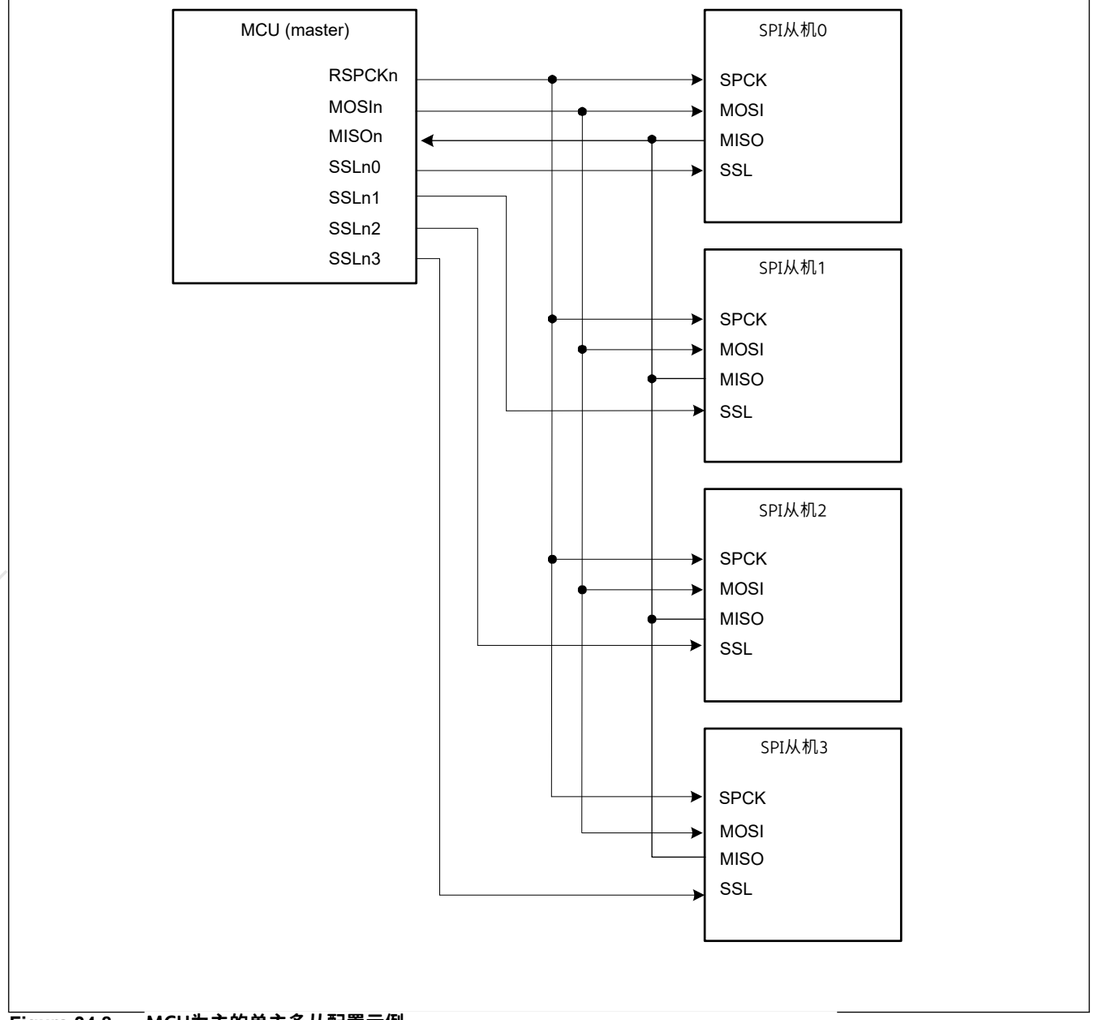

Figure 34.8 MCU为主的单主多从配置示例

34.3.3.4 单主多从，单片机作为从机

图34.9显示了单主多从SPI系统配置示例，其中MCU用作从设备。在本例中，SPI系统包括一个SPI主控和两个MCU（从属X和Y）。

SPI主机的SPCK和MOSI输出连接到MCU（从机X和Y）的RSPCKn和MOSIn输入。MCU（从机X和Y）的MISOn输出都连接到SPI主机的MISO输入。SPI主机的SSLX和SSLY输出连接到MCU的SSLn0输入（分别为从机X和Y）。

SPI主机驱动SPCK、MOSI、SSLX和SSLY信号。在MCU（从机X和Y）中，接收到SSLn0输入的低电平输入的从机驱动MISOn信号。

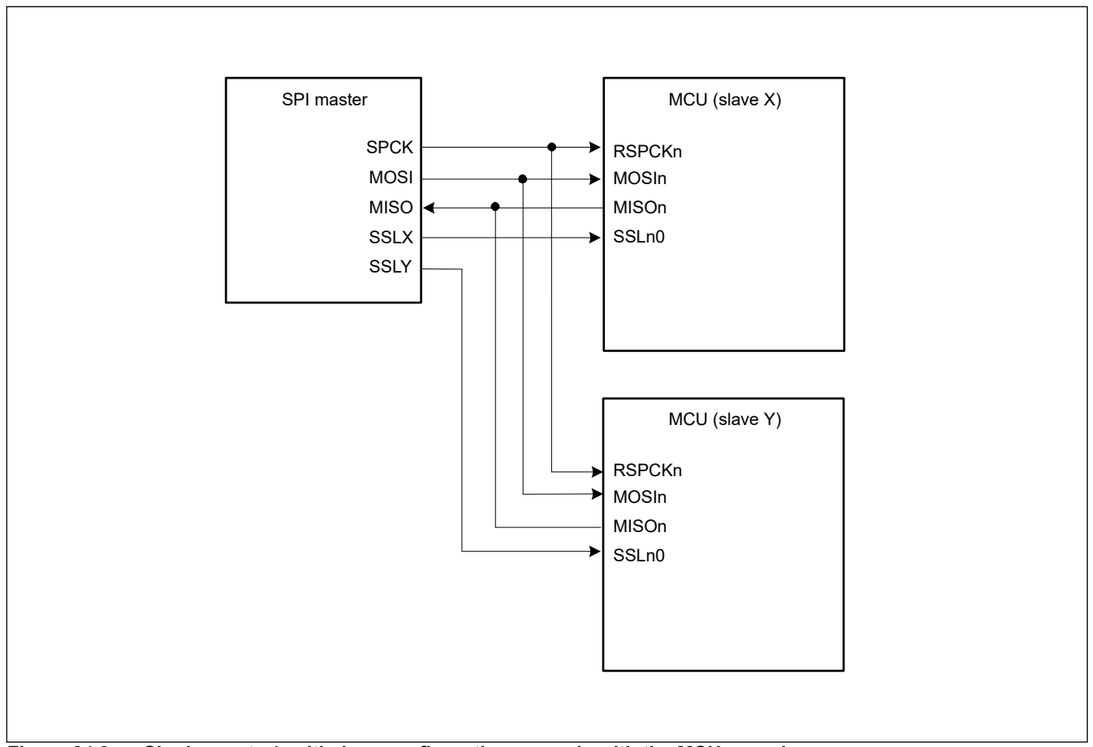

Figure 34.9 Single-master/multi-slave configuration example with the MCU as a slave

34.3.3.5 Multi-master/multi-slave with the MCU as a master

Figure 34.10 shows a multi-master/multi-slave SPI system configuration example where the MCU is used as a master. In this example, the SPI system includes two MCUs (masters X and Y) and two SPI slaves (SPI slaves 1 and 2).

The RSPCKn and MOSIn outputs of the MCUs (masters X and Y) are connected to the RSPCK and MOSI inputs of SPI slaves 1 and 2. The MISO outputs of SPI slaves 1 and 2 are connected to the MISOn inputs of the MCUs (masters X and Y). Any generic port Y output from the MCU (master X) is connected to the SSLn0 input of the MCU (master Y). Any generic port X output of the MCU (master Y) is connected to the SSLn0 input of the MCU (master X). The SSLn1 and SSLn2 outputs of the MCUs (masters X and Y) are connected to the SSL inputs of the SPI slaves 1 and 2. In this configuration example, because the system can be comprised solely of SSLn0 input, and SSLn1 and SSLn2 outputs for slave connections, the SSLn3 output of the MCU is not required.

The MCU drives the RSPCKn, MOSIn, SSLn1, and SSLn2 signals when the SSLn0 input level is high. When the SSLn0 input level is low, the MCU detects a mode fault error, sets RSPCKn, MOSIn, SSLn1, and SSLn2 to Hi-Z, and releases the SPI bus directly to the other master. Of the SPI slaves 1 and 2, the slave that receives low-level input into the SSL input drives the MISO signal.

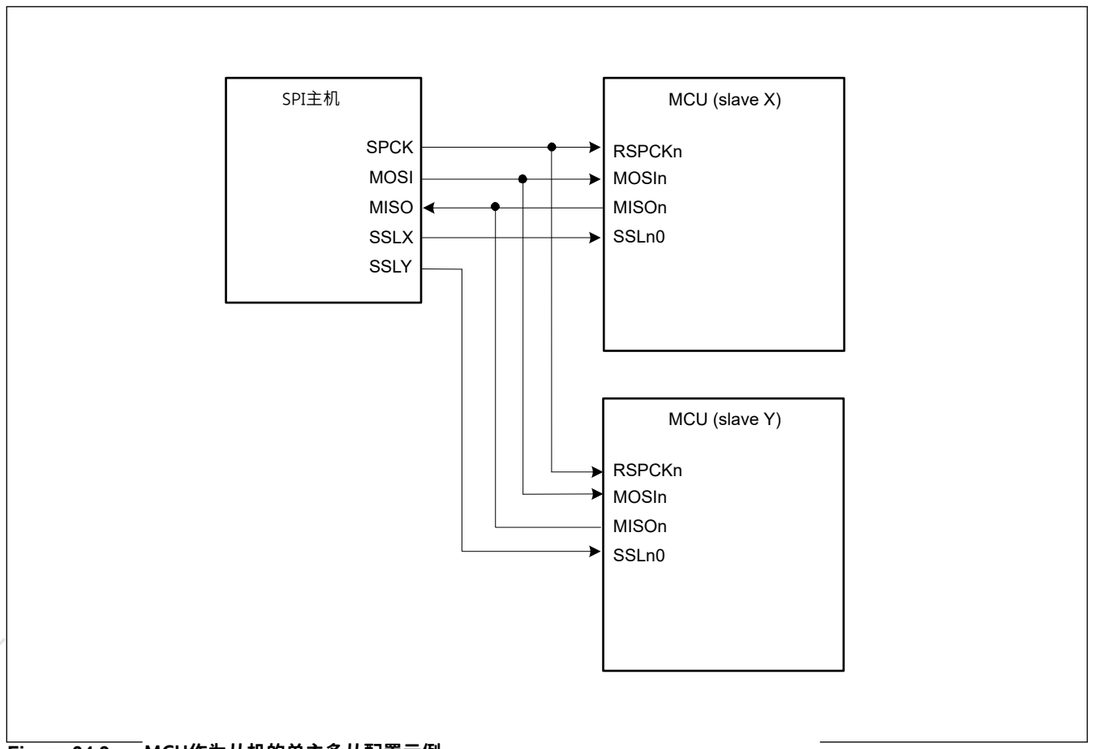

Figure 34.9 MCU作为从机的单主多从配置示例

34.3.3.5 以单片机为主的多主多从

图34.10显示了一个多主机多从机SPI系统配置示例，其中MCU用作主机。在此示例中，SPI系统包括两个MCU（主X和Y）和两个SPI从机（SPI从机1和2）。

MCU（主机X和Y）的RSPCKn和MOSIn输出连接到SPI从机1和2的RSPCK和MOSI输入。SPI从机1和2的MISO输出连接到MCU（主机X）的MISOn输入和Y)。来自MCU（主X）的任何通用端口Y输出都连接到MCU（主Y）的SSLn0输入。MCU（主设备Y）的任何通用端口X输出都连接到MCU（主设备X）的SSLn0输入。MCU（主机X和Y）的SSLn1和SSLn2输出连接到SPI从机1和2的SSL输入。在此配置示例中，因为系统可以仅由SSLn0输入和SSLn1和SSLn2输出组成从连接，不需要MCU的SSLn3输出。

当SSLn0输入电平为高电平时，MCU驱动RSPCKn、MOSIn、SSLn1和SSLn2信号。当SSLn0输入电平为低时，MCU检测到模式故障错误，将RSPCKn、MOSIn、SSLn1和SSLn2设置为Hi-Z，并将SPI总线直接释放到另一个主控。在SPI从机1和2中，接收到SSL输入的低电平输入的从机驱动MISO信号。

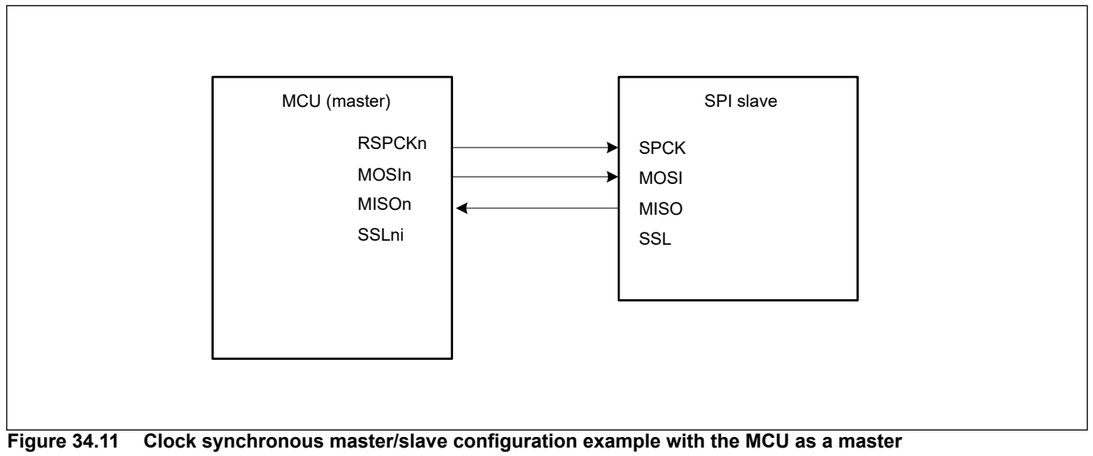

Figure 34.11 Clock synchronous master/slave configuration example with the MCU as a master

34.3.3.7 Master and slave in clock synchronous mode with the MCU as a slave

Figure 34.12 shows a master and slave in clock synchronous mode configuration example where the MCU is used as a slave. When the MCU operates as a slave (clock synchronous operation), the MCU (slave) drives the MISOn signal and the SPI master drives the SPCK and MOSI signals. In addition, SSLn0 to SSLn3 of the MCU (slave) are not used.

The MCU (slave) can only execute serial transfers in the single-slave configuration when the SPCMDm.CPHA bit is set to 1.

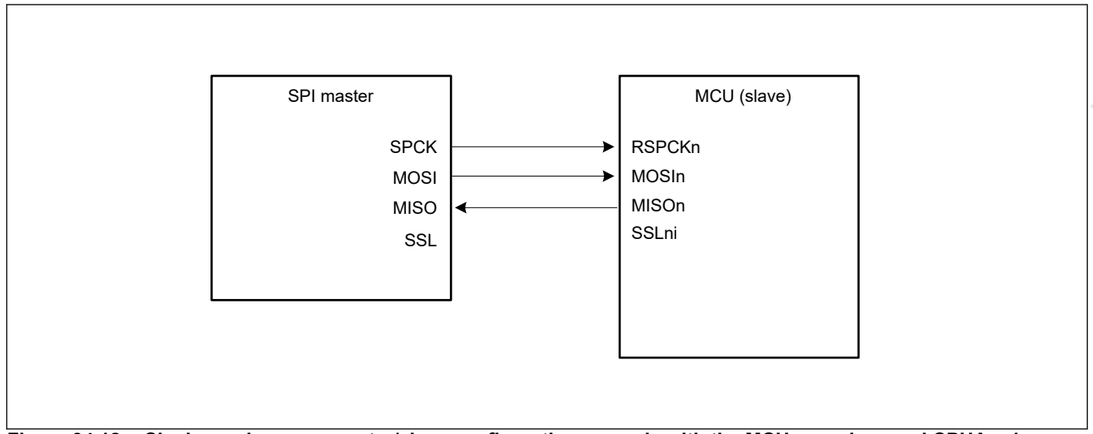

Figure 34.12 Clock synchronous master/slave configuration example with the MCU as a slave and CPHA = 1

34.3.4 Data Formats

The data format of the SPI depends on the settings in SPI Command Register m (SPCMDm) and the parity enable bit in SPI Control Register 2 (SPCR2.SPPE). Regardless of whether the MSB or LSB is first, the SPI treats the range from the LSB bit in the SPI Data Register (SPDR/SPDR_HA) to the bit associated with the selected data length, as transfer data.

This section shows the format of one frame of data before or after transfer.

Data format with parity disabled

When parity is disabled, transmission or reception of data proceeds with the length in bits selected in the SPI data length setting in SPI Command Register m (SPCMDm.SPB[3:0]).

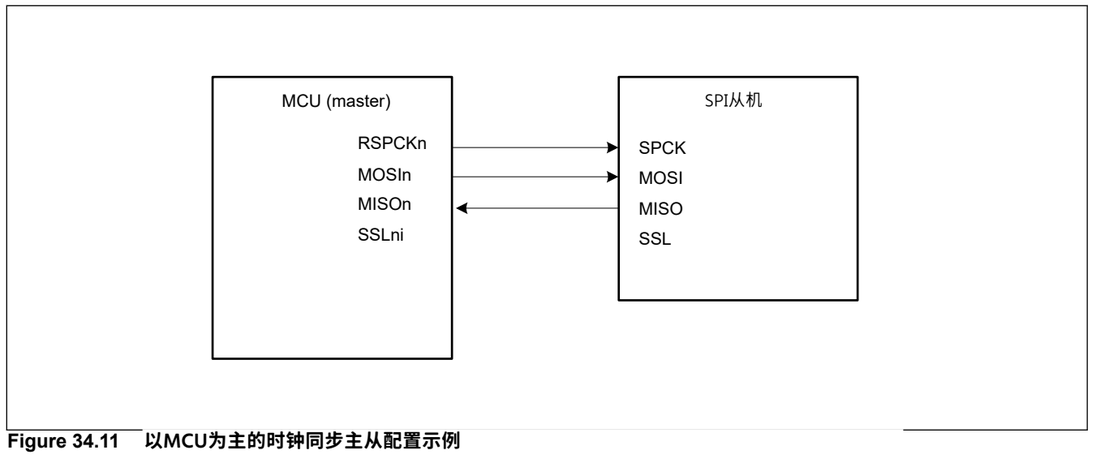

Figure 34.11 以MCU为主的时钟同步主从配置示例

34.3.3.7 主从时钟同步模式，单片机作为从机

图34.12显示了时钟同步模式下的主机和从机配置示例，其中MCU用作从机。当MCU作为从机运行时（时钟同步操作），MCU（从机）驱动MIOn信号，SPI主机驱动SPCK和MOSI信号。此外，不使用MCU（从机）的SSLn0到SSLn3。

当SPCMDm.CPHA位设置为1时，MCU（从机）只能在单从机配置中执行串行传输。

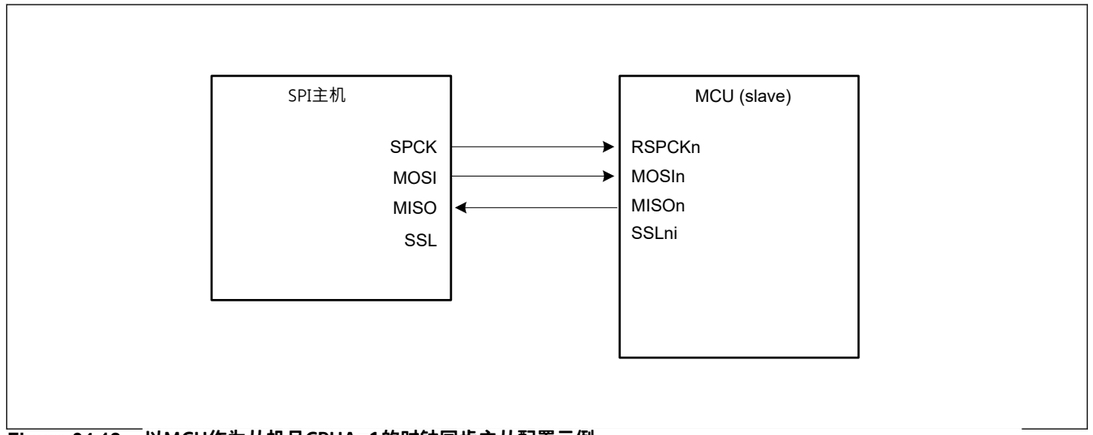

Figure 34.12 以MCU作为从机且CPHA=1的时钟同步主从配置示例

34.3.4 数据格式

SPI的数据格式取决于SPI命令寄存器m(SPCMDm)中的设置和SPI控制寄存器2(SPCR2.SPPE)中的奇偶校验使能位。无论MSB还是LSB在前，SPI都会将SPI数据寄存器(SPDRSPDR_HA)中的LSB位到与所选数据长度相关的位的范围视为传输数据。

本节显示传输前后一帧数据的格式。

禁用奇偶校验的数据格式

当奇偶校验被禁用时，数据的发送或接收将按照在SPI命令寄存器m(SPCMDm.SPB[3:0])的SPI数据长度设置中选择的位长度进行。

Data format with parity enabled

When parity is enabled, transmission or reception of data proceeds with the length in bits selected in the SPI data length setting in SPI Command Register m (SPCMDm.SPB[3:0]). In this case, however, the last bit is a parity bit.

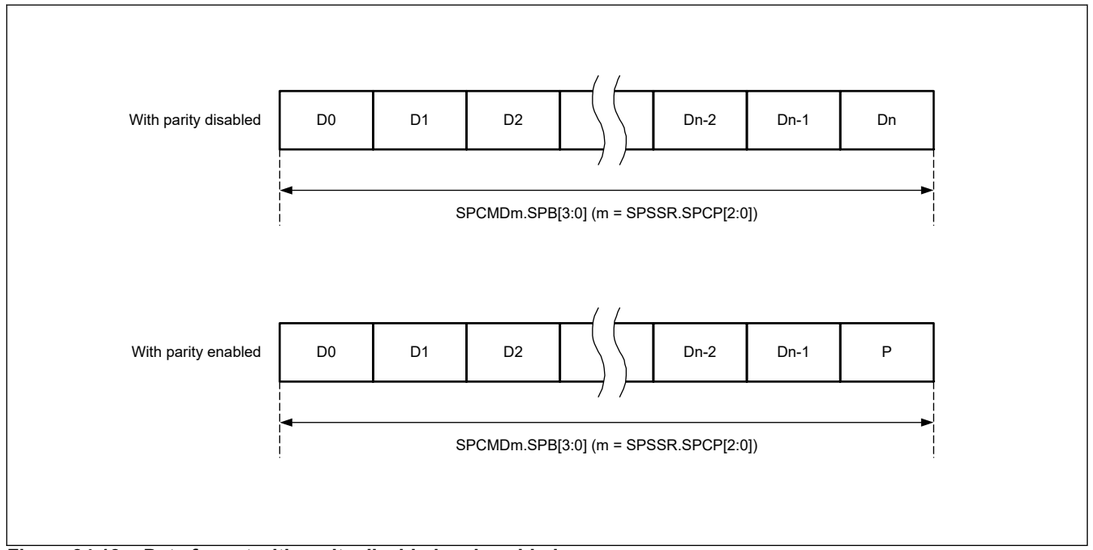

Figure 34.13 Data format with parity disabled and enabled

34.3.4.1 Operation when parity is disabled (SPCR2.SPPE = 0)

When parity is disabled, data for transmission is copied to the shift register with no pre-processing. This section describes the connection between the SPI Data Register (SPDR/SPDR_HA) and the shift register in terms of the combination of MSB- or LSB-first order and data length.

(1) MSB-first transfer with 32-bit data

Figure 34.14 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity disabled, a SPI data length of 32 bits, and MSB-first selected.

In transmission, bits T31 to T00 from the current stage of the transmit buffer are copied to the shift register. Data for transmission is shifted out from the shift register from T31 to T30, and continuing to T00.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R31 to R00 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.

启用奇偶校验的数据格式

当奇偶校验使能时，数据的发送或接收按照在SPI命令寄存器m(SPCMDm.SPB[3:0])的SPI数据长度设置中选择的位长度进行。然而，在这种情况下，最后一位是奇偶校验位。

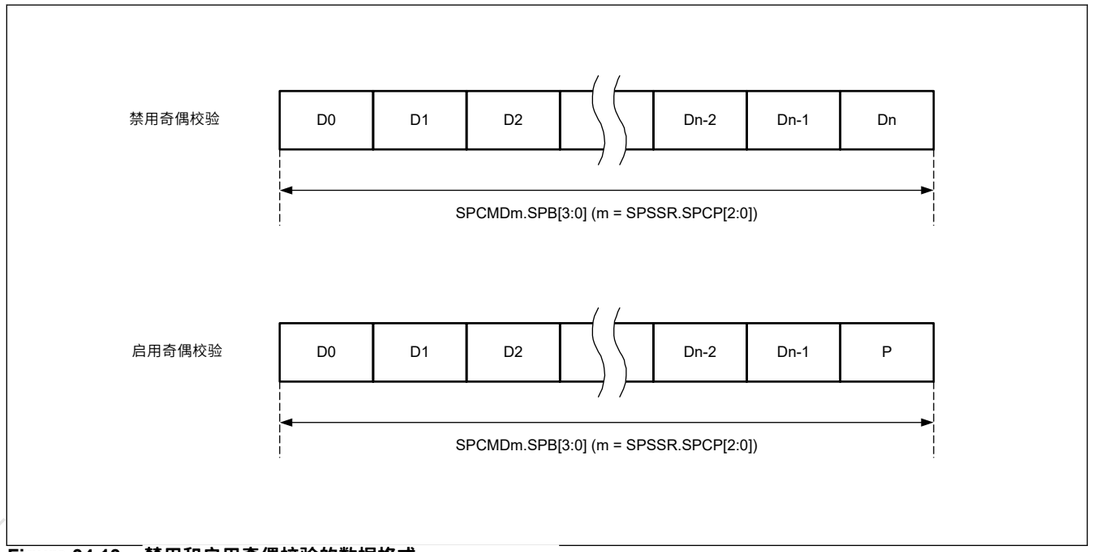

Figure 34.13 禁用和启用奇偶校验的数据格式

34.3.4.1 禁用奇偶校验时的操作(SPCR2.SPPE=0)

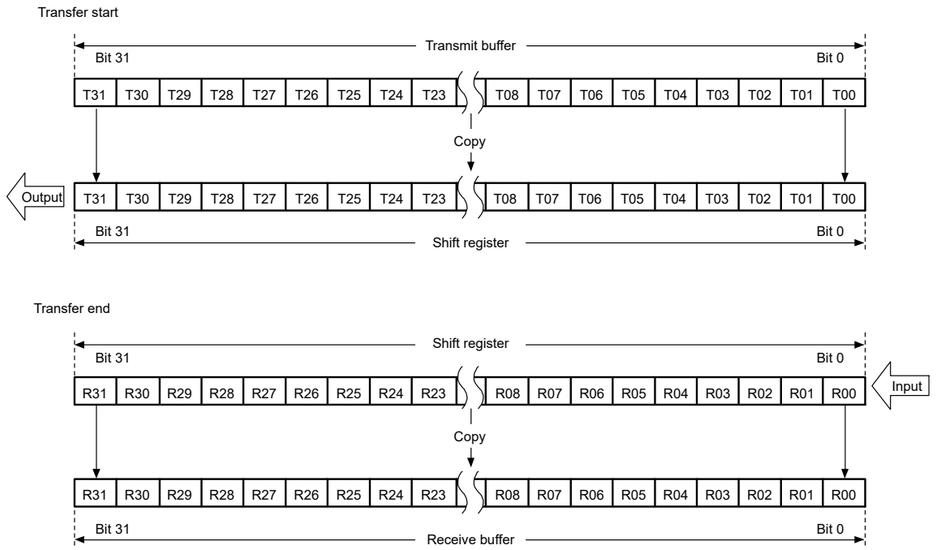
当奇偶校验被禁用时，用于传输的数据被复制到移位寄存器而不进行预处理。本节从MSB或LSB-firstorder和数据长度的组合来描述SPI数据寄存器(SPDRSPDR_HA)和移位寄存器之间的连接。

(1) 32位数据的MSB优先传输

图34.14显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用的传输中的操作，a SPI数据长度为32位，且MSB优先选择。

在发送过程中，发送缓冲器当前级的T31到T00位被复制到移位寄存器。发送数据从移位寄存器从T31移出到T30，并继续到T00。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需的RSPCK周期数后收集R31至R00位时，将移位寄存器中的值复制到接收缓冲区。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

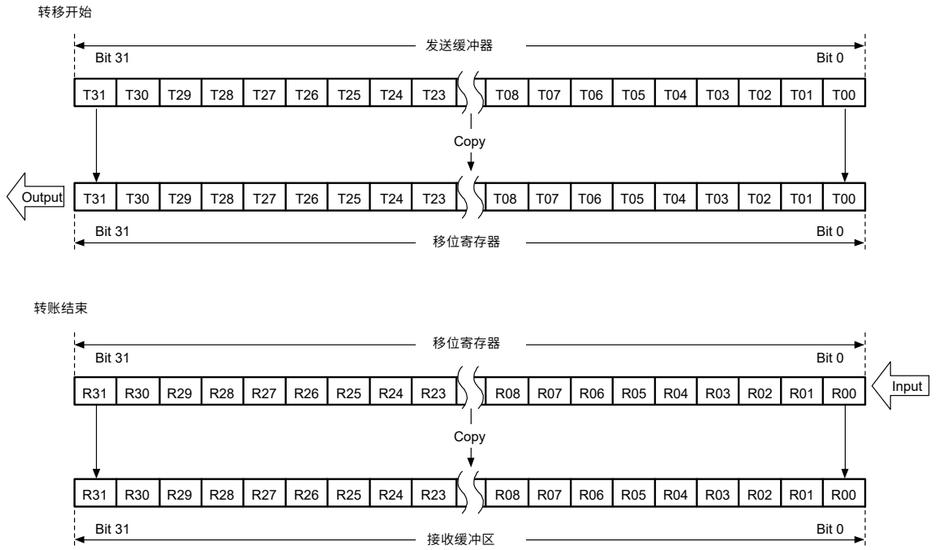
Figure 34.14 MSB-first transfer with 32-bit data and parity disabled

(2) MSB-first transfer with 24-bit data

Figure 34.15 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity disabled, an SPI data length of 24 bits for an example that is not 32 bits, and MSB-first selected.

In transmission, the lower 24 bits (T23 to T00) from the current stage of the transmit buffer are copied to the shift register. Data for transmission is shifted out from the shift register from T23 to T22, and continuing to T00.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R23 to R00 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer in case of transmit-receive operation. Writing 0 to bits T31 to T24 during transmission leads to 0 being inserted in the upper 8 bits of the receive buffer. On the other hand, the upper 8-bits of the receive buffer is written 0 in case of receive only operation.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

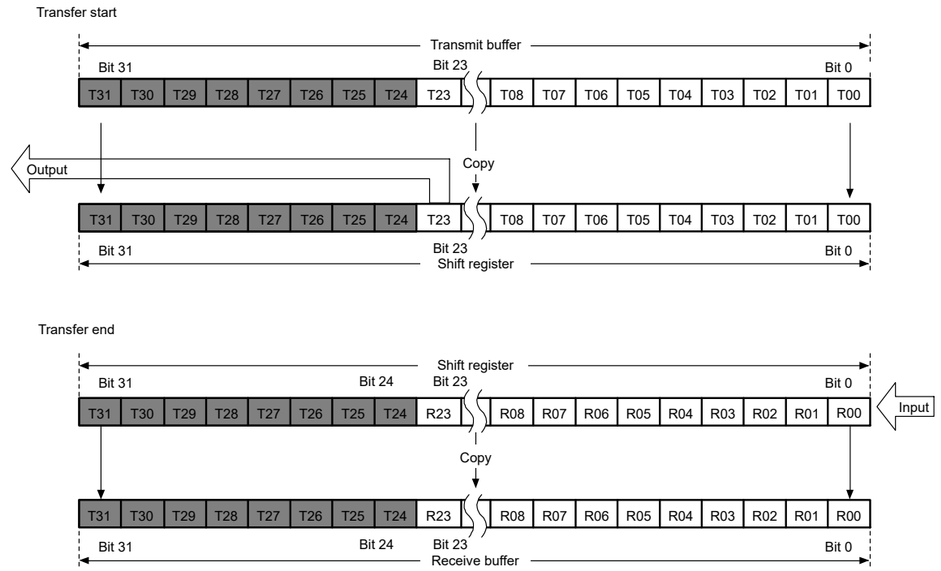
Figure 34.14 禁用32位数据和奇偶校验的MSB优先传输

(2) 24位数据的MSB优先传输

图34.15显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用的传输中的操作，
以24位SPI数据长度为例，即不是32位，并且选择MSB优先。

在发送过程中，来自发送缓冲器当前阶段的低24位（T23到T00）被复制到移位寄存器。
发送的数据从移位寄存器从T23移出到T22，并继续到T00。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后，当R23到R00位被收集时，移位寄存器中的值被复制到接收缓冲区。在发送-接收操作的情况下，发送缓冲区的高8位存储在接收缓冲区的高8位中。在传输过程中将0写入位T31到T24会导致将0插入接收缓冲区的高8位。另一方面，在只接收操作的情况下，接收缓冲区的高8位被写入0。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

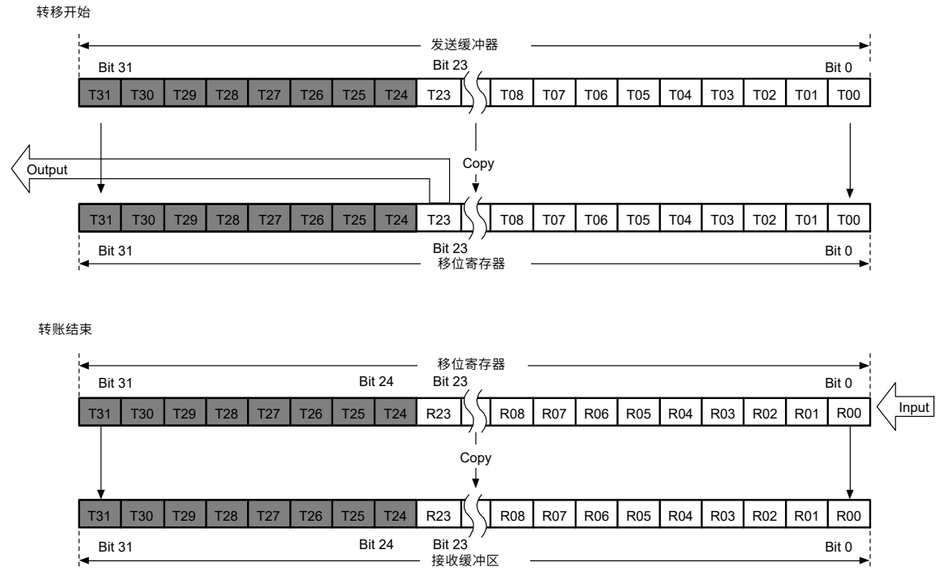
Figure 34.15 MSB-first transfer with 24-bit data and parity disabled

(3) LSB-first transfer with 32-bit data

Figure 34.16 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity disabled, an SPI data length of 32 bits, and LSB-first selected.

In transmission, bits T31 to T00 from the current stage of the transmit buffer are reordered bit-by-bit to obtain the order T00 to T31 for copying to the shift register. Data for transmission is shifted out from the shift register in order from T00 to T01, and continuing to T31.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R00 to R31 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

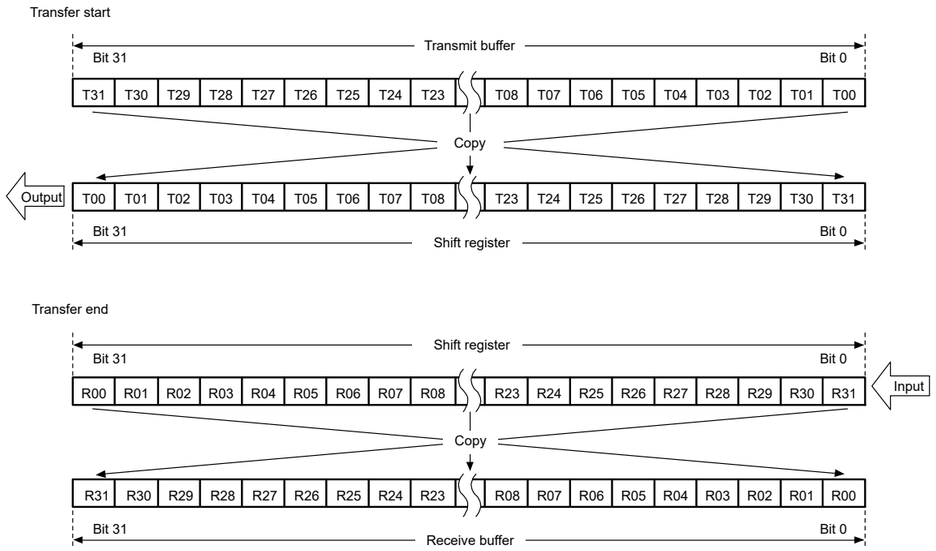
Figure 34.15 禁用24位数据和奇偶校验的MSB优先传输

(3) 32位数据的LSB优先传输

图34.16显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用的传输中的操作，
SPI数据长度为32位，并选择LSB-first。

在传输过程中，传输缓冲器当前级的位T31到T00被逐位重新排序，以获得用于复制到移位寄存器的顺序T00到T31。传输的数据从移位寄存器中按顺序从T00移出到T01，并继续到T31。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后收集R00至R31位时，将移位寄存器中的值复制到接收缓冲区。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

Figure 34.16 LSB-first transfer with 32-bit data and parity disabled

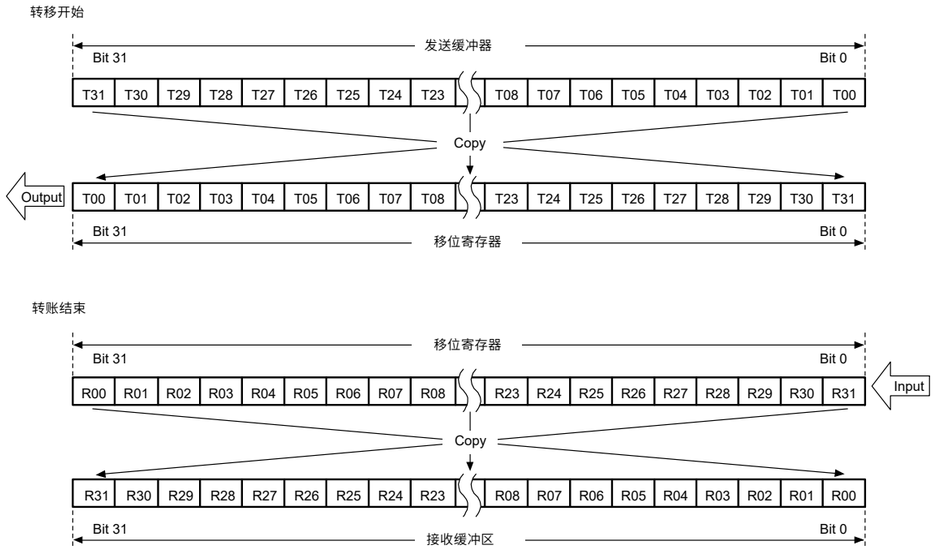
(4) LSB-first transfer with 24-bit data

Figure 34.17 shows the operation of the SPI Data Register (SPDR) and the shift register in transfers with parity disabled, an SPI data length of 24 bits for an example that is not 32, and LSB-first selected.

In transmission, the lower 24 bits (T23 to T00) from the current stage of the transmit buffer are reordered bit-by-bit to obtain the order T00 to T23 for copying to the shift register. Data for transmission is shifted out from the shift register from T00 to T01, and continuing to T23.

In reception, received data is shifted in bit-by-bit through bit[8] of the shift register. When the R00 to R23 bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer.

The upper 8 bits of the transmit buffer are stored in the upper 8 bits of the receive buffer in case of transmit-receive operation. Writing 0 to T31 to T24 during transmission leads to 0 being inserted in the upper 8 bits of the receive buffer. On the other hand, the upper 8-bits of the receive buffer is written 0 in case of receive only operation.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

Figure 34.16 LSB优先传输，32位数据和奇偶校验禁用

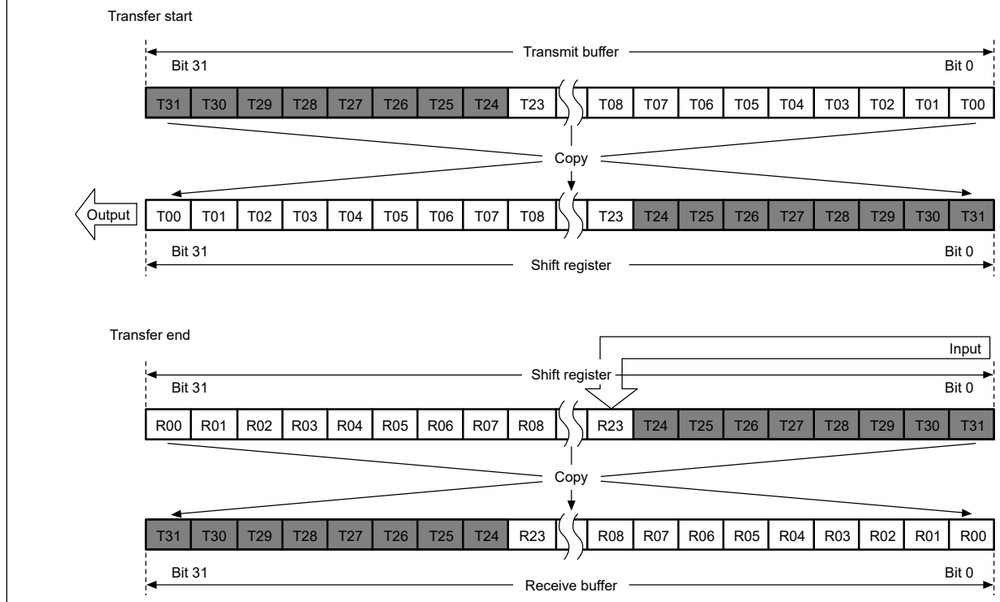
(4) 24位数据的LSB优先传输

图34.17显示了SPI数据寄存器(SPDR)和移位寄存器在奇偶校验禁用的传输中的操作，一个SPI数据长度为24位，例如不是32位，并且选择LSB优先。

发送时，将发送缓冲器当前级的低24位（T23到T00）逐位重新排序，得到T00到T23的顺序，用于复制到移位寄存器。发送的数据从移位寄存器从T00移出到T01，并继续到T23。

在接收中，接收到的数据通过移位寄存器的bit[8]逐位移位。在输入所需的RSPCK周期数后收集R00至R23位时，将移位寄存器中的值复制到接收缓冲区。

在发送-接收操作的情况下，发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送过程中将0写入T31到T24会导致将0插入接收缓冲区的高8位。另一方面，在只接收操作的情况下，接收缓冲区的高8位被写入0。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

Figure 34.17 LSB-first transfer with 24-bit data and parity disabled

34.3.4.2 Operation when parity is enabled (SPCR2.SPPE = 1)

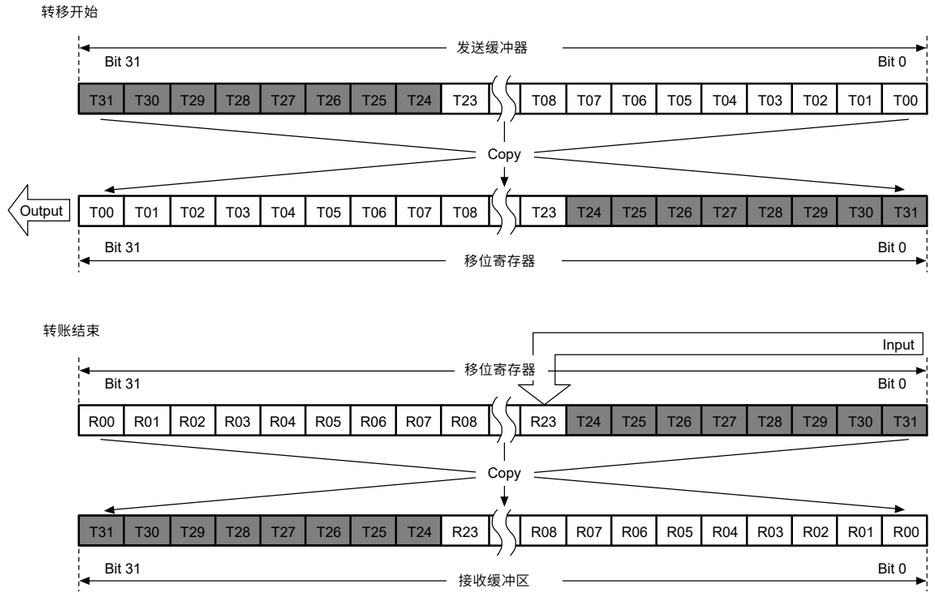
When parity is enabled, the lowest-order bit of the data for transmission becomes a parity bit. Hardware calculates the value of the parity bit.

(1) MSB-first transfer with 32-bit data

Figure 34.18 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity enabled, an SPI data length of 32 bits, and MSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T31 to T01. This replaces the final bit, T00, and the whole value is copied to the shift register. Data is transmitted in the order T31, T30, …, T01, and P.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R31 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R31 to P is checked for parity.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

Figure 34.17 LSB优先传输，24位数据和奇偶校验禁用

34.3.4.2 启用奇偶校验时的操作(SPCR2.SPPE=1)

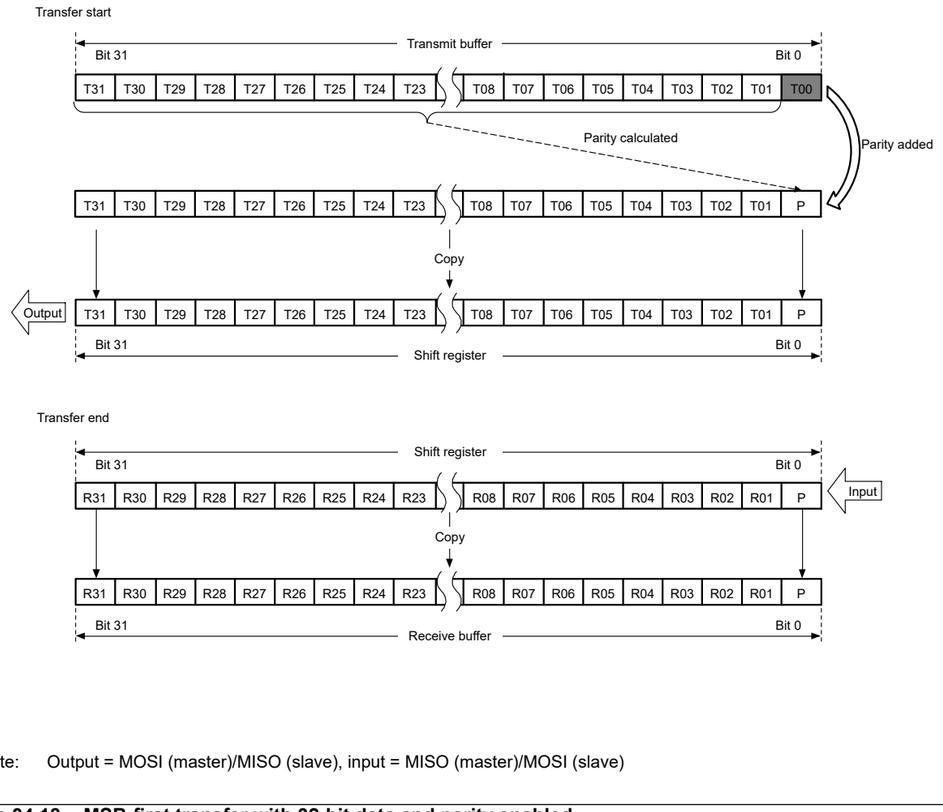
启用奇偶校验时，传输数据的最低位变为奇偶校验位。硬件计算奇偶校验位的值。

(1) 32位数据的MSB优先传输

图34.18显示了SPI数据寄存器(SPDR)和移位寄存器在启用奇偶校验的传输中的操作，
SPI数据长度为32位，且MSB优先选择。

在传输中，奇偶校验位(P)的值是从位T31到T01计算的。这将替换最后一位T00，并将整个值复制到移位寄存器。数据按T31、T30、……、T01和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后收集R31至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R31到P的数据的奇偶性。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

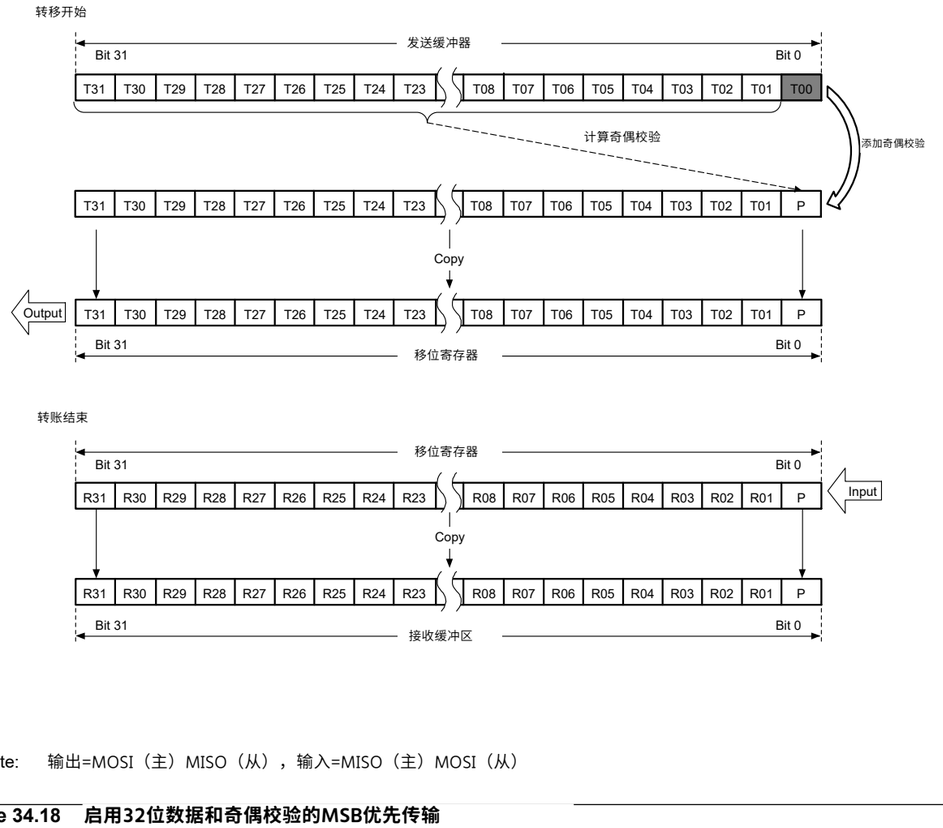
Figure 34.18 MSB-first transfer with 32-bit data and parity enabled

(2) MSB-first transfer with 24-bit data

Figure 34.19 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity enabled, a SPI data length of 24 bits, and MSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T23 to T01. This replaces the final bit, T00, and the whole value is copied to the shift register. Data is transmitted in the order T23, T22, …, T01, and P.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R23 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R23 to P is checked for parity. The upper 8 bits of the transmit buffer is stored in the upper 8 bits of the receive buffer in case of transmit-receive operation. Writing 0 to T31 to T24 during transmission leads to 0 being inserted in the upper 8 bits of the receive buffer. On the other hand, the upper 8-bits of the receive buffer is written 0 in case of receive only operation.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

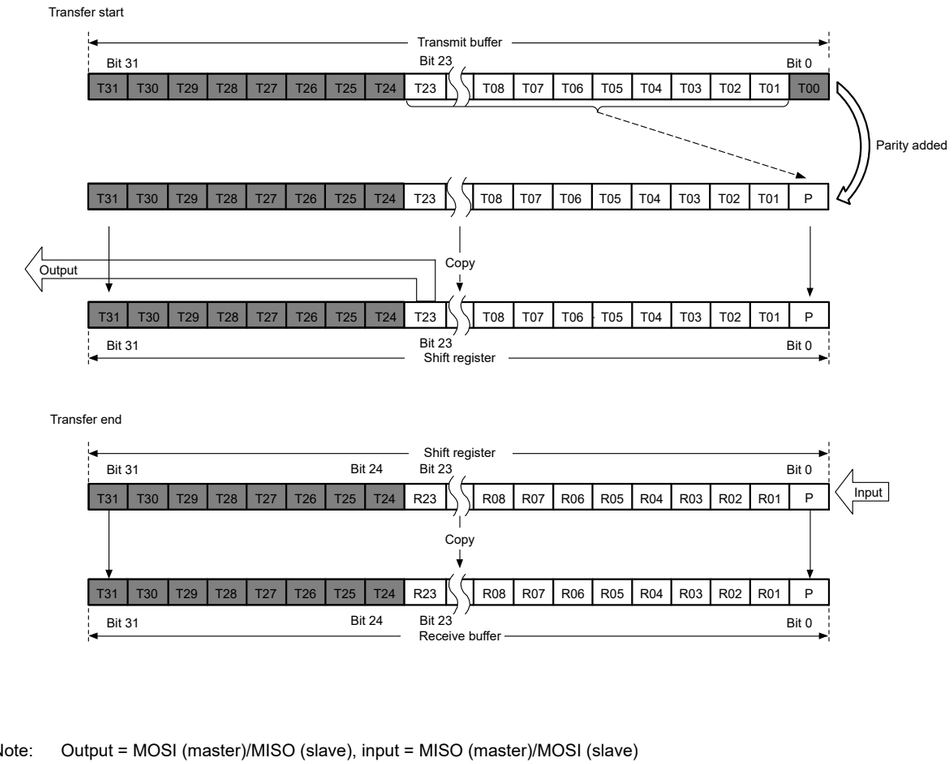
Figure 34.18 启用32位数据和奇偶校验的MSB优先传输

(2) 24位数据的MSB优先传输

图34.19显示了SPI数据寄存器(SPDR)和移位寄存器在启用奇偶校验的传输中的操作，a SPI数据长度为24位，且MSB优先选择。

在传输中，奇偶校验位(P)的值是从位T23到T01计算的。这将替换最后一位T00，并将整个值复制到移位寄存器。数据按T23、T22、……、T01和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后收集R23至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R23到P的数据的奇偶性。在发送-接收操作的情况下，发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送过程中将0写入T31到T24会导致将0插入接收缓冲区的高8位。另一方面，在只接收操作的情况下，接收缓冲区的高8位被写入0。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

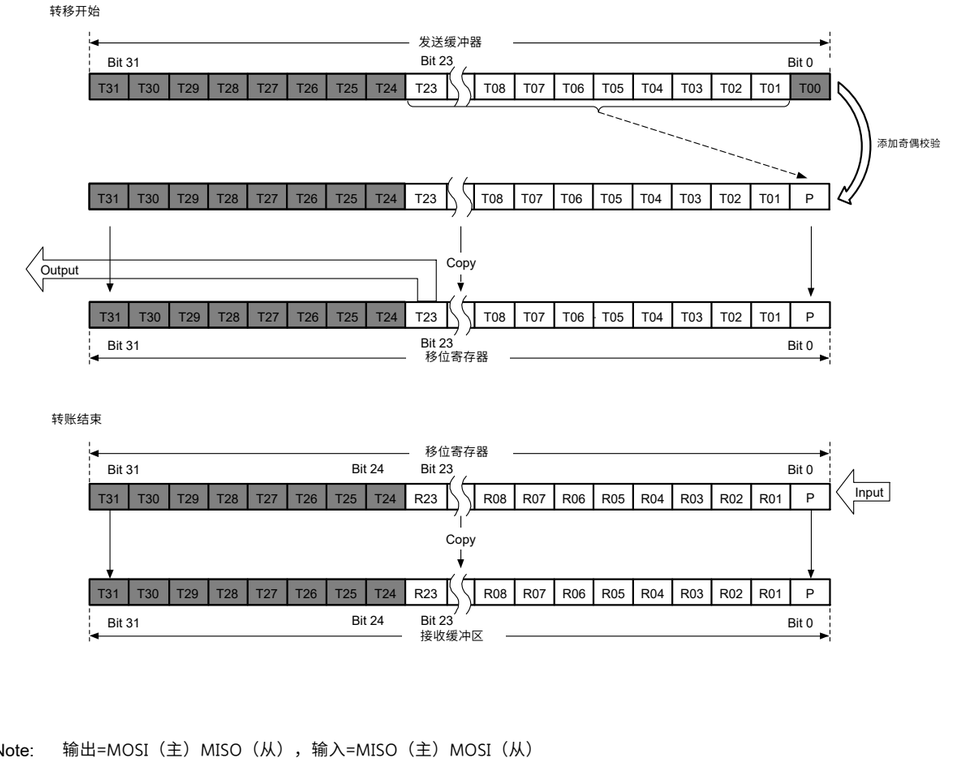
Figure 34.19 MSB-first transfer with 24-bit data and parity enabled

(3) LSB-first transfer with 32-bit data

Figure 34.20 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity enabled, an SPI data length of 32 bits, and LSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T30 to T00. This replaces the final bit, T31, and the whole value is copied to the shift register. Data is transmitted in the order T00, T01, …, T30, and P.

In reception, received data is shifted in bit-by-bit through bit[0] of the shift register. When the R00 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R00 to P is checked for parity.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

Figure 34.19 启用24位数据和奇偶校验的MSB优先传输

(3) 32位数据的LSB优先传输

图34.20显示了SPI数据寄存器(SPDR)和移位寄存器在启用奇偶校验的传输中的操作，
SPI数据长度为32位，并选择LSB-first。

在传输中，奇偶校验位(P)的值是从位T30到T00计算的。这将替换最后一位T31，并将整个值复制到移位寄存器。数据按T00、T01、……、T30和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的bit[0]逐位移位。在输入所需数量的RSPCK周期后收集R00至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R00到P的数据的奇偶性。

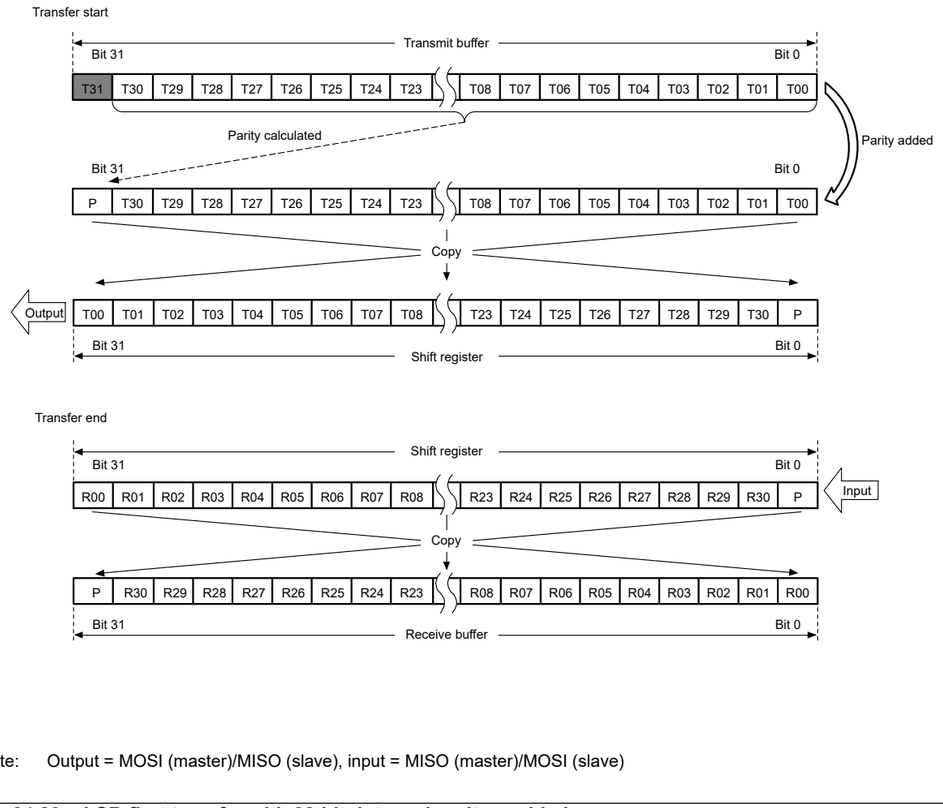


Figure 34.20 LSB-first transfer with 32-bit data and parity enabled

(4) LSB-first transfer with 24-bit data

Figure 34.21 shows the operation of the SPI Data Register (SPDR) and the shift register in a transfer with parity enabled, a SPI data length of 24 bits, and LSB-first selected.

In transmission, the value of the parity bit (P) is calculated from bits T22 to T00. This replaces the final bit, T23, and the whole value is copied to the shift register. Data is transmitted in the order T00, T01, …, T22, and P.

In reception, received data is shifted in bit-by-bit through bit[8] of the shift register. When the R00 to P bits are collected after input of the required number of RSPCK cycles, the value in the shift register is copied to the receive buffer. On copying of data to the shift register, the data from R00 to P is checked for parity. The upper 8 bits of the transmit buffer is stored in the upper 8 bits of the receive buffer in case of transmit-receive operation. Writing 0 to T31 to T24 during transmission leads to 0 being inserted in the upper 8 bits of the receive buffer. On the other hand, the upper 8-bits of the receive buffer is written 0 in case of receive only operation.

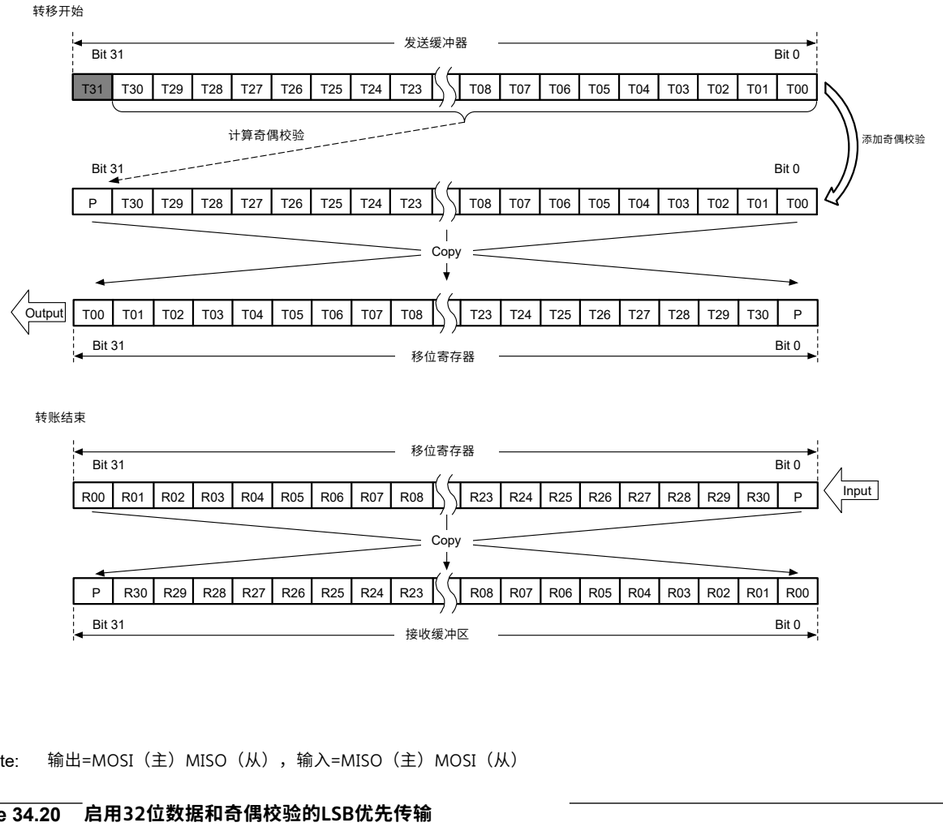

Figure 34.20 启用32位数据和奇偶校验的LSB优先传输

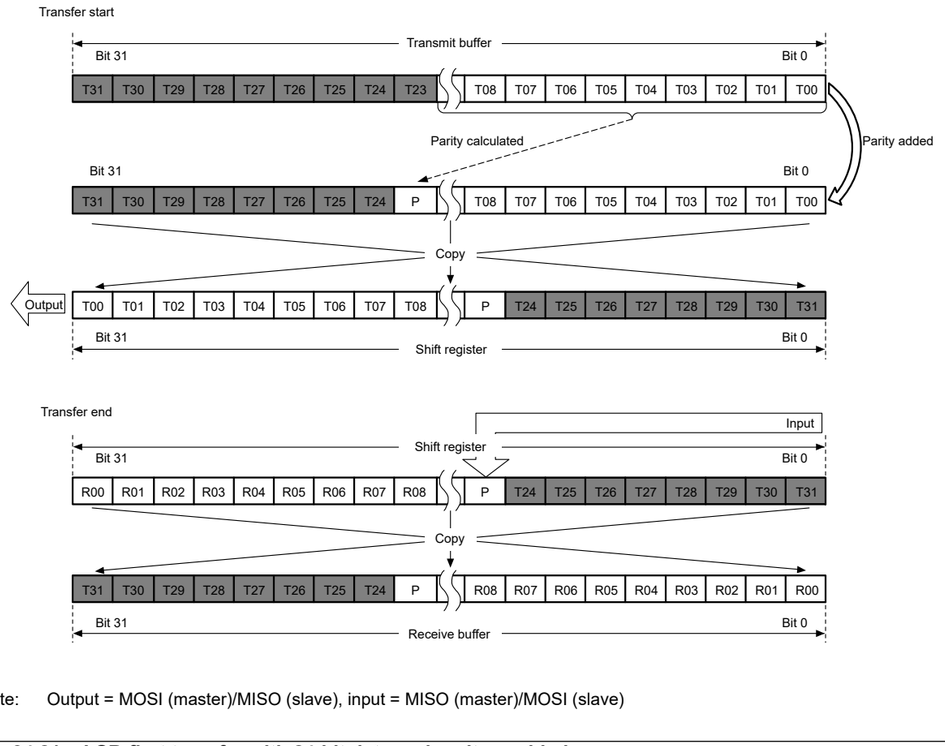
(4) 24位数据的LSB优先传输

图34.21显示了SPI数据寄存器(SPDR)和移位寄存器在启用奇偶校验的传输中的操作，a SPI数据长度为24位，并选择LSB优先。

在传输中，奇偶校验位(P)的值是从位T22到T00计算的。这将替换最后一位T23，并将整个值复制到移位寄存器。数据按T00、T01、……、T22和P的顺序传输。

在接收中，接收到的数据通过移位寄存器的bit[8]逐位移位。在输入所需数量的RSPCK周期后收集R00至P位时，将移位寄存器中的值复制到接收缓冲区。在将数据复制到移位寄存器时，会检查从R00到P的数据的奇偶性。在发送-接收操作的情况下，发送缓冲区的高8位存储在接收缓冲区的高8位中。在发送过程中将0写入T31到T24会导致将0插入接收缓冲区的高8位。另一方面，在只接收操作的情况下，接收缓冲区的高8位被写入0。



Note: Output = MOSI (master)/MISO (slave), input = MISO (master)/MOSI (slave)

Figure 34.21 LSB-first transfer with 24-bit data and parity enabled

34.3.4.3 Byte Swap Transmission

(1) MSB-first transfer. (When the byte swap is disabled.)

Data (Byte0 [T31 to T24] to Byte3 [T07 to T00]) in the transmit buffer are copied to the shift register.

Bit values in the shift register are shifted and transmitted in the order of T31 → T30 → … → T00 as transmit data.

(2) MSB-first transfer. (When the byte swap is enabled.)

Byte values of the transmit buffer (Byte0 [T31 to T24] to Byte3 [T07 to T00]) are reversed in byte units and are copied to the shift register in the order of Byte3 [T07 to T00] to Byte0 [T31 to T24].

Bit values in the shift register are shifted and transmitted in the order of T07 → T06 → … → T00 → T15 → T14 → … → T08 → T23 → T22 → … → T16 → T31 → T30 → … → T24 as transmit data.

(3) LSB-first transfer. (When the byte swap is disabled.)

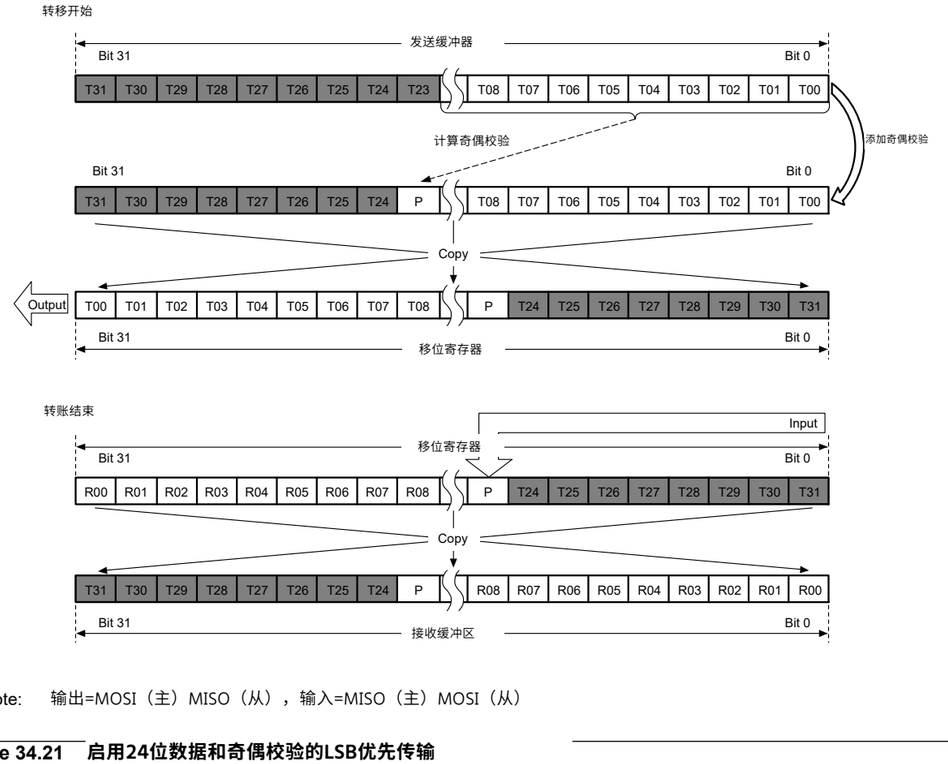
Bit values of the transmit buffer (Byte0 [T31 to T24] to Byte3 [T07 to T00]) are reversed in bit units and are copied to the shift register in the order of Byte3 [T00 to T07] to Byte0 [T24 to T31].

Bit values in the shift register are shifted and transmitted in the order of T00 → T01 → … → T31 as transmit data.

(4) LSB-first transfer. (When the byte swap is enabled.)

Bit values of each byte of the transmit buffer (Byte0 [T31 to T24] to Byte3 [T07 to T00]) are reversed in bit units and are copied to the shift register in the order of Byte0 [T24 to T31] to Byte3 [T00 to T07].

Bit values in the shift register are shifted and transmitted in the order of T24 → T25 → … → T31 → T16 → T17 → … → T23 → T08 → T09 → … → T15 → T00 → T01 → … → T07 as transmit data.



Note: 输出=MOSI（主）MISO（从），输入=MISO（主）MOSI（从）

Figure 34.21 启用24位数据和奇偶校验的LSB优先传输

34.3.4.3 字节交换传输

(1) MSB优先传输。（禁用字节交换时。）

发送缓冲器中的数据（Byte0[T31到T24]到Byte3[T07到T00]）被复制到移位寄存器。

移位寄存器中的位值按照T31→T30→…→T00的顺序移位和传输，作为传输数据。

(2) MSB优先传输。（启用字节交换时。）

发送缓冲区的字节值（Byte0[T31到T24]到Byte3[T07到T00]）以字节为单位反转，并按照Byte3[T07到T00]到Byte0[T31到T24]的顺序复制到移位寄存器.

移位寄存器中的位值按照T07→T06→…→T00→T15→T14→…→的顺序移位传输
T08→T23→T22→…→T16→T31→T30→…→T24作为传输数据。

(3) LSB优先传输。（禁用字节交换时。）

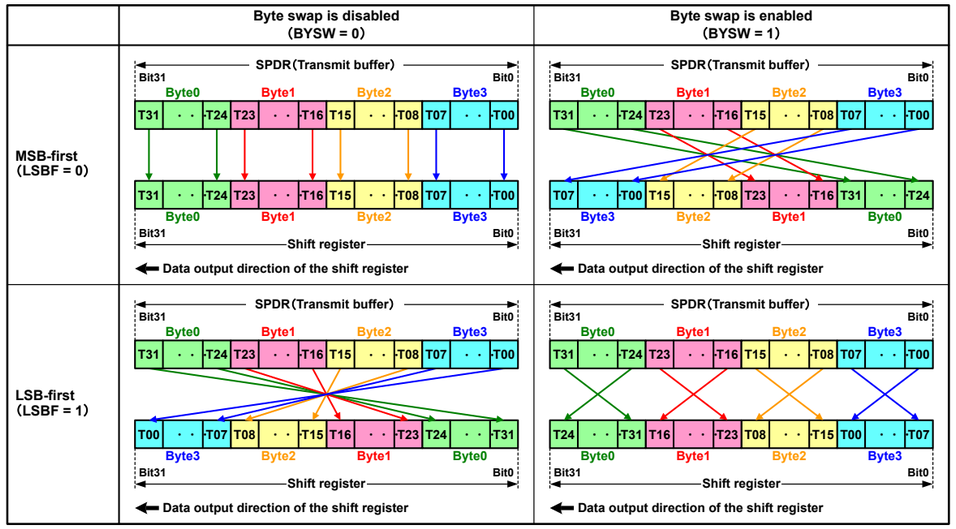
发送缓冲区的位值（Byte0[T31到T24]到Byte3[T07到T00]）以位为单位反转，并按照Byte3[T00到T07]到Byte0[T24到T31]的顺序复制到移位寄存器.

移位寄存器中的位值按照T00→T01→…→T31的顺序移位和发送，作为发送数据。

(4) LSB优先传输。（启用字节交换时。）

发送缓冲区（Byte0[T31到T24]到Byte3[T07到T00]）的每个字节的位值以位为单位反转，并按照Byte0[T24到T31]到Byte3[T00]的顺序复制到移位寄存器到T07]。

移位寄存器中的位值按照T24→T25→…→T31→T16→T17→…→的顺序进行移位和传输
T23→T08→T09→…→T15→T00→T01→…→T07作为传输数据。



Note: 1. When using the byte swap, set 16 bits or 32 bits to the data length (SPCMD.SPB[3:0] setting). If setting the other length (8 to 15, 20, 24 bits), the behavior is not guaranteed.
2. When the byte swap is valid, set the parity function as invalid (SPCR2.SPPE bit = 0). If setting the parity function as valid (SPPE bit = 1), the behavior is not guaranteed.
3. Set SPDCR2.BYSW bit, when SPCR.SPE bit is 0. If rewriting BYSW bit, when SPE bit is 1, the behavior after it is not guaranteed.

Figure 34.22 Byte swap with MSB/LSB transfer

34.3.4.4 Byte Swap Reception

(1) MSB-first transfer. (When the byte swap is disabled.)

The first received data (R31) is stored in bit 0 of the shift register, and received data is shifted in the order of R31 → R30 → … → R00.

When necessary RSPCK cycles are input and data is stored from Byte0 [R31 to R24] to Byte3 [R07 to R00], the shift register value is copied to the receive buffer.

(2) MSB-first transfer. (When the byte swap is enabled.)

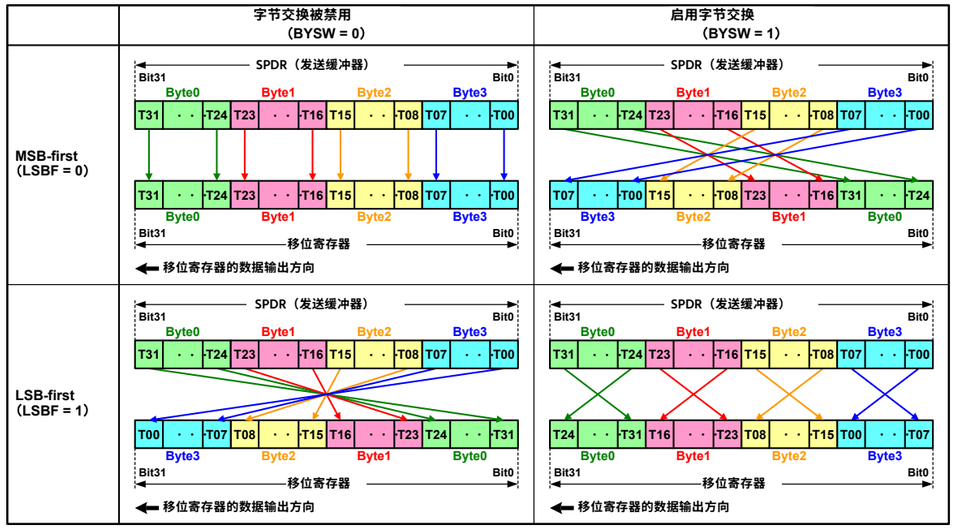
The first received data (R07) is stored in bit 0 of the shift register, and received data is shifted in the order of R07 → R06 → … → R00 → R15 → R14 → … → R08 → R23 → R22 → … → R16 → R31 → R30 → … → R24.

When necessary RSPCK cycles are input and data is stored from Byte3 [R07 to R00] to Byte0 [R31 to R24], byte values in the shift register are reversed in byte units and are copied to the receive buffer in the order of Byte0 [R31 to R24] to Byte3 [R07 to R00].

(3) LSB-first transfer. (When the byte swap is disabled.)

The first received data (R00) is stored in bit 0 of the shift register, and received data is shifted in the order of R00 → R01 → … → R31.

When necessary RSPCK cycles are input and data is stored from Byte3 [R00 to R07] to Byte0 [R24 to R31], bit values in the shift register are reversed in bit units and are copied to the receive buffer in the order of Byte0 [R31 to R24] to Byte3 [R07 to R00].



Note: 1.使用字节交换时，将数据长度设置为16位或32位（SPCMD.SPB[3:0]设置）。如果设置其他长度（8到15、20、24位），则无法保证行为。2.当字节交换有效时，将奇偶校验功能设置为无效（SPCR2.SPPE位=0）。如果将奇偶校验功能设置为有效（SPPE位=1），则无法保证行为。3.当SPCR.SPE位为0时，设置SPDCR2.BYSW位。如果重写BYSW位，当SPE位为1时，不保证之后的行为。

Figure 34.22 带MSBLSB传输的字节交换

34.3.4.4 字节交换接收

(1) MSB优先传输。（禁用字节交换时。）

第一个接收到的数据（R31）存储在移位寄存器的第0位，接收到的数据按照R31→R30→…→R00的顺序进行移位。

当输入必要的RSPCK周期并将数据从Byte0[R31到R24]存储到Byte3[R07到R00]时，移位寄存器值被复制到接收缓冲区。

(2) MSB优先传输。（启用字节交换时。）

第一个接收到的数据（R07）存放在移位寄存器的第0位，接收到的数据按照R07→R06→…→R00→R15→R14→…→R08→R23→R22→…→R16→的顺序移位R31→R30→…→R24。

当输入必要的RSPCK周期并将数据从Byte3[R07到R00]存储到Byte0[R31到R24]时，移位寄存器中的字节值以字节为单位进行反转，并按Byte0[R31的顺序复制到接收缓冲区到R24]到字节3[R07到R00]。

(3) LSB优先传输。（禁用字节交换时。）

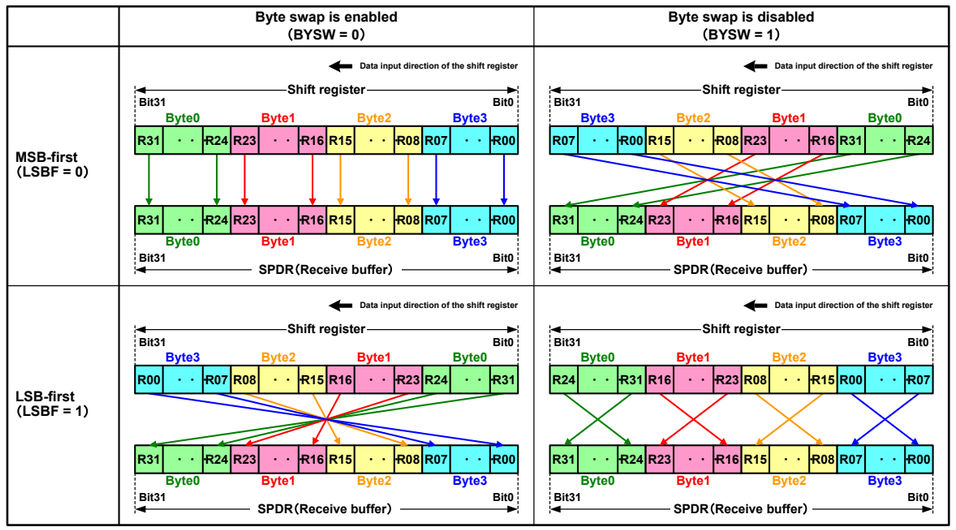
第一个接收到的数据（R00）存放在移位寄存器的第0位，接收到的数据按照R00→R01→…→R31的顺序移位。

当输入必要的RSPCK周期并将数据从Byte3[R00到R07]存储到Byte0[R24到R31]时，移位寄存器中的位值以位为单位反转，并按Byte0[R31的顺序复制到接收缓冲区到R24]到字节3[R07到R00]。

(4) LSB-first transfer. (When the byte swap is enabled.)

The first received data (R24) is stored in bit 0 of the shift register, and received data is shifted in the order of R24 → R25 → … → R31 → R16 → R17 → … → R23 → R08 → R09 → … → R15 → R00 → R01 → … → R07.

When necessary RSPCK cycles are input and data is stored from Byte0 [R24 to R31] to Byte3 [R00 to R07], bit values of each byte in the shift register are reversed in bit units and are copied to the receive buffer in the order of Byte0 [R31 to R24] to Byte3 [R07 to R00].



Note: 1. When using the byte swap, set 16 bits or 32 bits to the data length (SPCMD.SPB[3:0] setting). If setting the other length (8 to 15, 20, 24 bits), the behavior is not guaranteed.
2. When the byte swap is valid, set the parity function as invalid (SPCR2.SPPE bit = 0). If setting the parity function as valid (SPPE bit = 1), the behavior is not guaranteed.
3. Set SPDCR2.BYSW bit, when SPCR.SPE bit is 0. If rewriting BYSW bit, when SPE bit is 1, the behavior after it is not guaranteed.

Figure 34.23 Byte swap with MSB/LSB transfer

34.3.5 Transfer Formats

34.3.5.1 When CPHA = 0

Figure 34.24 shows an example transfer format for the serial transfer of 8-bit data when the SPCMDm.CPHA bit is 0. Do not perform clock synchronous operation (SPCR.SPMS = 1) when the SPI operates in slave mode (SPCR.MSTR = 0) and the CPHA bit is 0. In Figure 34.24, RSPCKn (CPOL = 0) indicates the RSPCKn signal waveform when the SPCMDm.CPOL bit is 0, and RSPCKn (CPOL = 1) indicates the RSPCKn signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which the SPI fetches serial transfer data into the shift register. The I/O directions of the signals depend on the SPI settings. For details, see section 34.3.2. Controlling the SPI Pins.

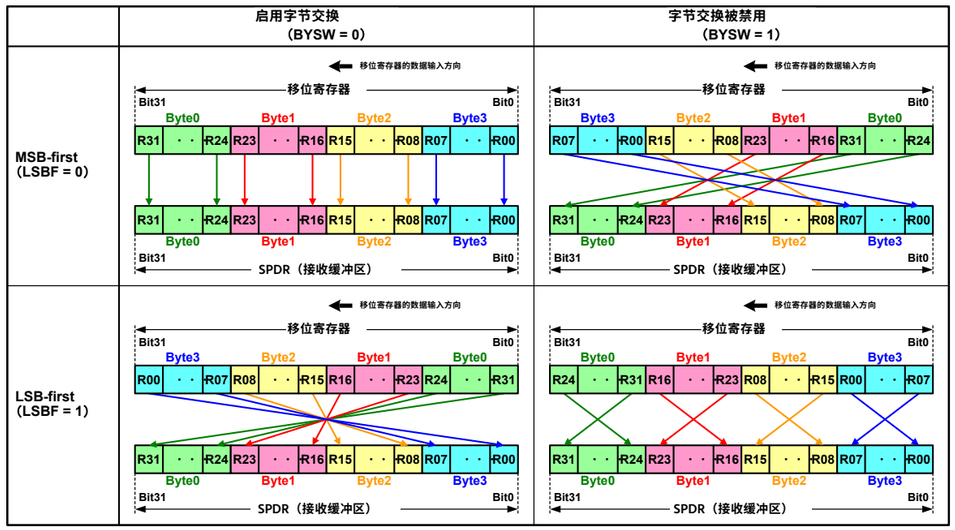
When the SPCMDm.CPHA bit is 0, the driving of valid data to the MOSIn and MISOn signals begins at an SSLni signal assertion. The first RSPCKn signal change that occurs after the SSLni signal assertion becomes the first transfer data fetch. After this, data is sampled every 1 RSPCK cycle. The change timing for MOSIn and MISOn signals is 1/2 RSPCK cycles after the transfer data fetch timing. The CPOL bit setting does not affect the RSPCK signal operation timing as it only affects the signal polarity.

t1 denotes the RSPCK delay, the period from an SSLni signal assertion to RSPCKn oscillation. t2 denotes the SSL negation delay, the period from the termination of RSPCKn oscillation to an SSLni signal negation. t3 denotes the next-access delay,

(4) LSB优先传输。（启用字节交换时。）

第一个接收到的数据（R24）存放在移位寄存器的第0位，接收到的数据按R24→R25→…→R31→R16→R17→…→R23→R08→R09→…→R15→的顺序移位R00→R01→…→R07。

当输入必要的RSPCK周期并将数据从Byte0[R24到R31]到Byte3[R00到R07]存储时，移位寄存器中每个字节的位值以位为单位反转，并按顺序复制到接收缓冲区Byte0[R31到R24]到Byte3[R07到R00]。



Note: 1.使用字节交换时，将数据长度设置为16位或32位（SPCMD.SPB[3:0]设置）。如果设置其他长度（8到15、20、24位），则无法保证行为。2.当字节交换有效时，将奇偶校验功能设置为无效（SPCR2.SPPE位=0）。如果将奇偶校验功能设置为有效（SPPE位=1），则无法保证行为。3.当SPCR.SPE位为0时，设置SPDCR2.BYSW位。如果重写BYSW位，当SPE位为1时，不保证之后的行为。

Figure 34.23 带MSBLSB传输的字节交换

34.3.5 传输格式

34.3.5.1 When CPHA = 0

图34.24显示了当SPCMDm.CPHA位为0时串行传输8位数据的示例传输格式。当SPI在从机模式下运行时（SPCR.MSTR=0)且CPHA位为0。在图34.24中，RSPCKn(CPOL=0)表示SPCMDm.CPOL位为0时的RSPCKn信号波形，RSPCKn(CPOL=1)表示CPOL位为0时的RSPCKn信号波形1.采样时序表示SPI将串行传输数据取入移位寄存器的时序。信号的IO方向取决于SPI设置。有关详细信息，请参阅第34.3.2节。控制SPI引脚。

当SPCMDm.CPHA位为0时，将有效数据驱动到MOSIn和MISOn信号开始于SSLni信号断言。在SSLni信号断言之后发生的第一个RSPCKn信号变化成为第一次传输数据获取。此后，每1个RSPCK周期对数据进行采样。MOSIn和MISOn信号的变化时序是传输数据获取时序之后的12RSPCK周期。CPOL位设置不影响RSPCK信号操作时序，因为它只影响信号极性。

t1表示RSPCK延迟，即从SSLni信号断言到RSPCKn振荡的周期。t2表示SSL否定延迟，即从RSPCKn振荡终止到SSLni信号否定的周期。t3表示下一次访问延迟，

the period in which SSLni signal assertion is suppressed for the next transfer after the end of serial transfer. t1, t2, and t3 are controlled by a master device running on the SPI system. For a description of t1, t2, and t3 when the SPI is in master mode, see section 34.3.11.1. Master mode operation.

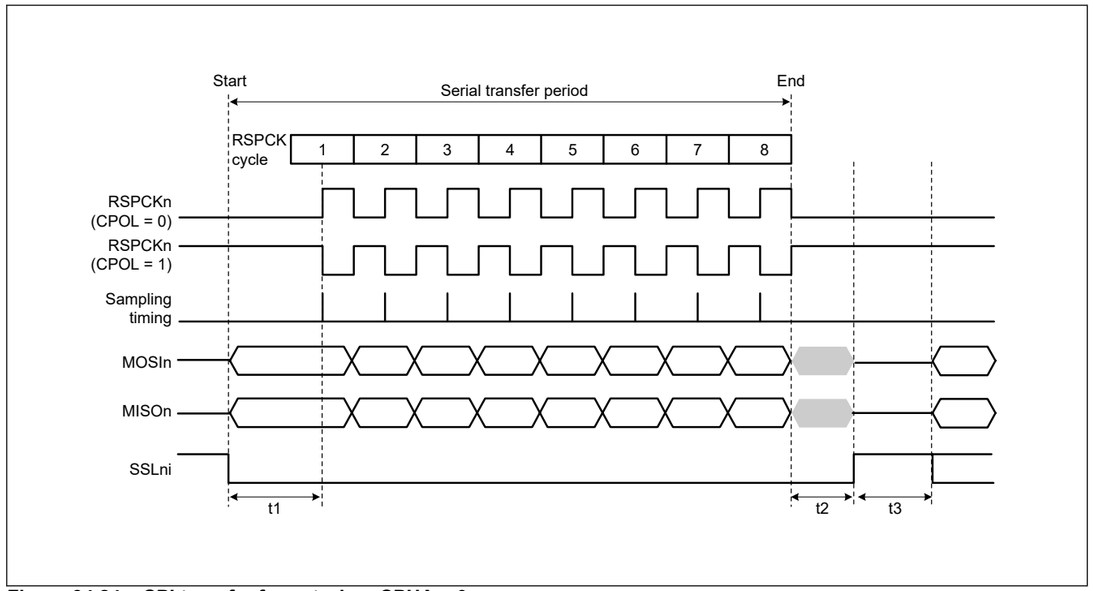


Figure 34.24 SPI transfer format when CPHA = 0

34.3.5.2 When CPHA = 1

Figure 34.25 shows an example transfer format for the serial transfer of 8-bit data when the SPCMDm.CPHA bit is 1. However, when the SPCR.SPMS bit is 1, the SSLni signals are not used, and only the three signals RSPCKn, MOSIn, and MISOn handle communications. In Figure 34.25, RSPCK (CPOL = 0) indicates the RSPCKn signal waveform when the SPCMDm.CPOL bit is 0 and RSPCK (CPOL = 1) indicates the RSPCKn signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which the SPI fetches serial transfer data into the shift register. The I/O directions of the signals depend on the SPI mode (master or slave mode). For details, see section 34.3.2. Controlling the SPI Pins.

When the SPCMDm.CPHA bit is 1, the driving of invalid data to the MISOn signal begins at an SSLni signal assertion. The output of valid data to the MOSIn and MISOn signals begins at the first RSPCKn signal change that occurs after the SSLni signal assertion. After this, data is updated every 1 RSPCK cycle. The transfer data fetch timing is 1/2 RSPCK cycles after the data update timing. The SPCMDm.CPOL bit setting does not affect the RSPCKn signal operation timing. It only affects the signal polarity.

t1, t2, and t3 are the same as those when CPHA = 0. For a description of t1, t2, and t3 when the SPI of the MCU is in master mode, see section 34.3.11.1. Master mode operation.

在串行传输结束后，为下一次传输抑制SSLni信号断言的时间段。t1、t2和t3由在SPI系统上运行的主设备控制。有关SPI处于主机模式时的t1、t2和t3的说明，请参见第34.3.11.1节。主模式操作。

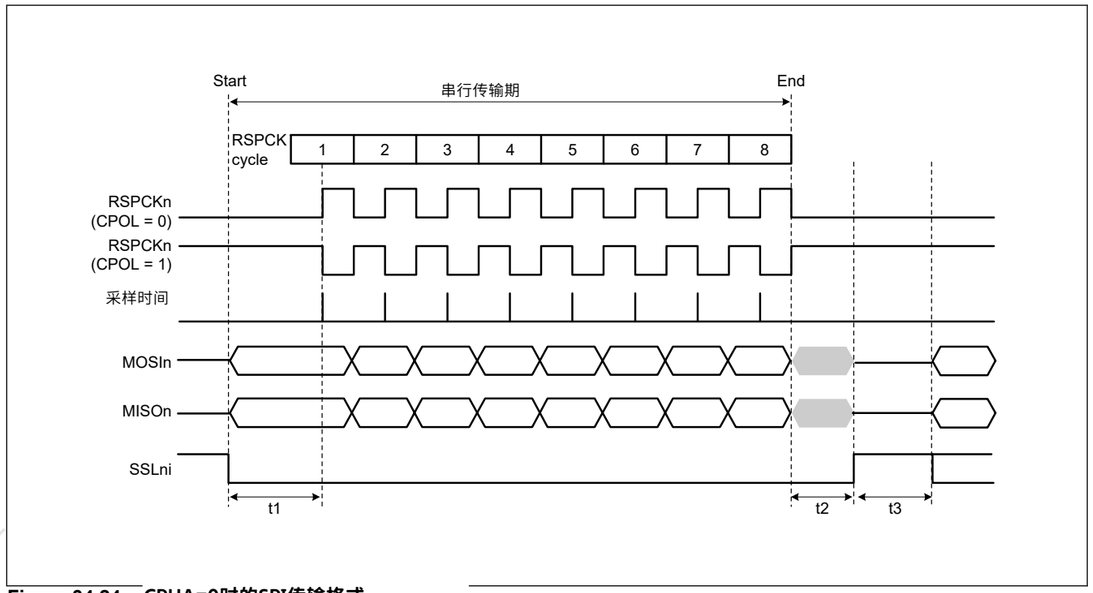

Figure 34.24 CPHA=0时的SPI传输格式

34.3.5.2 When CPHA = 1

图34.25显示了当SPMDm.CPHA位为1时串行传输8位数据的示例传输格式。
但是，当SPCR.SPMS位为1时，不使用SSLni信号，只有RSPCKn、MOSIn和MISON处理通信。在图34.25中，RSPCK(CPOL=0)表示SPCMDm.CPOL位为0时的RSPCKn信号波形，RSPCK(CPOL=1)表示CPOL位为1时的RSPCKn信号波形。SPI将串行传输数据提取到移位寄存器中。信号的IO方向取决于SPI模式（主模式或从模式）。有关详细信息，请参阅第34.3.2节。控制SPI引脚。

当SPCMDm.CPHA位为1时，将无效数据驱动到MIOn信号开始于SSLni信号断言。在SSLni信号置位后发生的第一个RSPCKn信号变化时，开始向MOSIn和MISOn信号输出有效数据。此后，每1个RSPCK周期更新一次数据。传输数据获取时序是数据更新时序之后的12个RSPCK周期。SPCMDm.CPOL位设置不影响RSPCKn信号操作时序。它只影响信号极性。

t1、t2、t3与CPHA=0时相同。MCU的SPI为主机模式时t1、t2、t3的说明见34.3.11.1节。主模式操作。

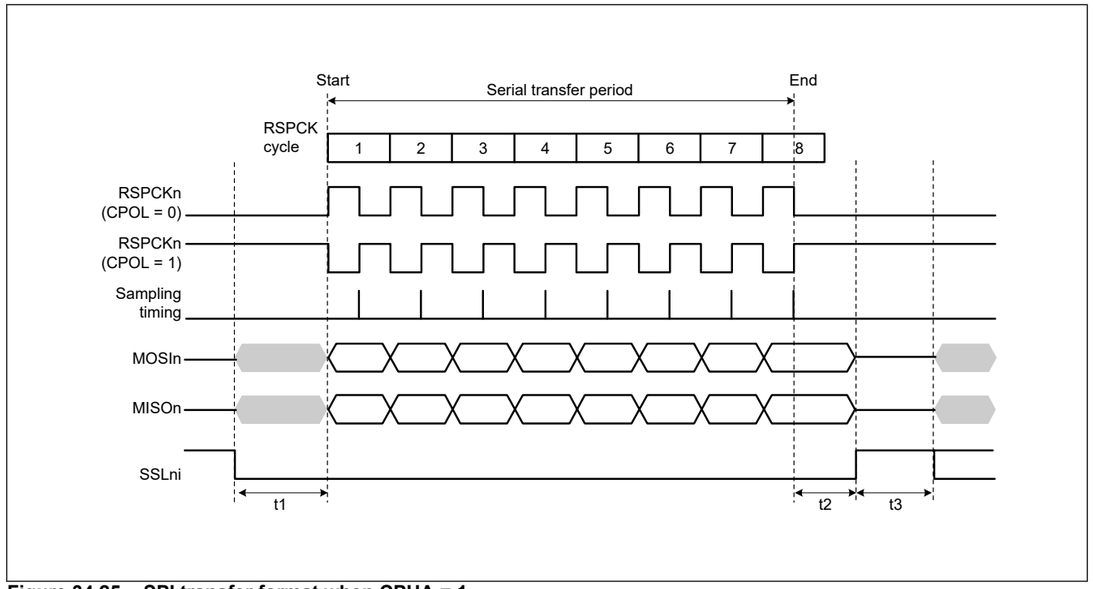

Figure 34.25 SPI transfer format when CPHA = 1

34.3.6 Data Transfer Modes

Full-duplex synchronous serial communications or transmit operations can only be selected in the Communications Operating Mode Select bit (SPCR.TXMD) when the extended communication mode select bit (ETXMD) in the SPI control register 3 (SPCR3) is 0. The SPI operation is receive only in slave mode (SPCR.MSTR = 0) when the SPCR3.ETXMD bit is 1, because SPCR.TXMD bit does not affect the SPI operation. The register accesses shown in Figure 34.26, Figure 34.27, and Figure 34.28 indicate the condition of access to the SPDR/SPDR_HA register, where W denotes a write cycle.

34.3.6.1 Full-duplex synchronous serial communications (SPCR3.ETXMD = 0, SPCR.TXMD = 0)

Figure 34.26 shows an example of operation when the extended communication mode select bit (ETXMD) in the SPI control register 3 (SPCR3) is set to 0 and the Communications Operating Mode Select bit (SPCR.TXMD) is set to 0. In this example, the SPI performs an 8-bit serial transfer when SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

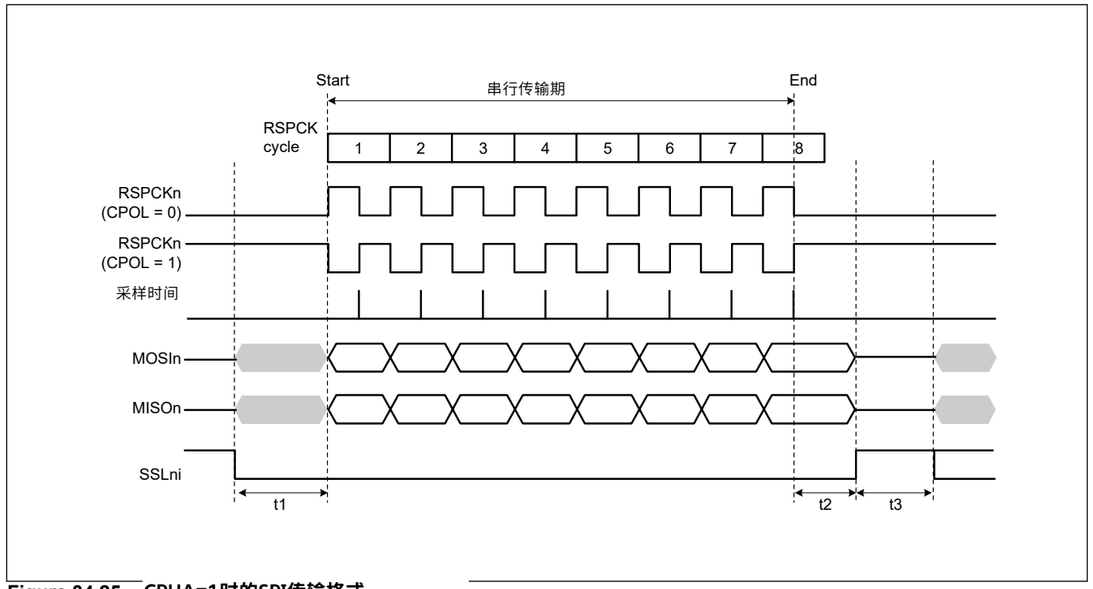

Figure 34.25 CPHA=1时的SPI传输格式

34.3.6 数据传输模式

全双工同步串行通信或传输操作只能在通信中选择当SPI控制寄存器3(SPCR3)中的扩展通信模式选择位(ETXMD)为0时，工作模式选择位(SPCR.TXMD)。当SPCR3.ETXMD位为1，因为SPCR.TXMD位不影响SPI操作。图34.26、图34.27和图34.28所示的寄存器访问表示访问SPDRSPDR_HA寄存器的条件，其中W表示写周期。

34.3.6.1 全双工同步串行通信（SPCR3.ETXMD=0，SPCR.TXMD = 0)

图34.26显示了当SPI控制寄存器3(SPCR3)中的扩展通信模式选择位(ETXMD)设置为0并且通信操作模式选择位(SPCR.TXMD)设置为0时的操作示例。在此示例中，当SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为1、SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的位数。

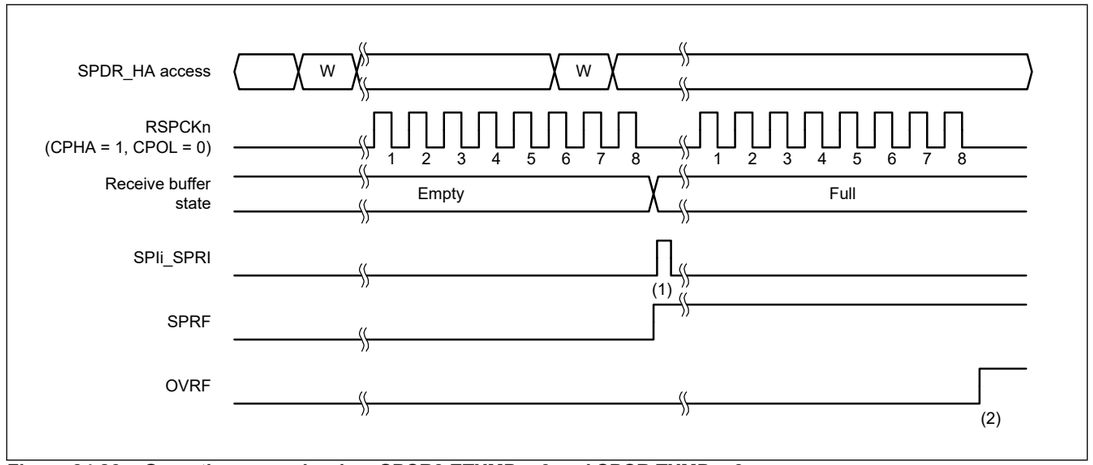

Figure 34.26 Operation example when SPCR3.ETXMD = 0 and SPCR.TXMD = 0

The operation of the flags at timings (1) and (2) in Figure 34.26 is as follows:

1. When a serial transfer ends with the receive buffer of SPDR_HA empty, the SPI generates a receive buffer full interrupt request (SPIi_SPRI), the SPI sets the SPSR.SPRF flag to 1, and copies the received data in the shift register to the receive buffer.
2. When a serial transfer ends with the receive buffer of SPDR_HA holding data that was received in the previous serial transfer, the SPI sets the SPSR.OVRF flag to 1, and discards the received data in the shift register. For details about the operation of the SPSR.OVRF flag, see section 34.3.9.1. Overrun errors.

34.3.6.2 Transmit-Only Serial Communications (SPCR3.ETXMD = 0, SPCR.TXMD = 1)

Figure 34.27 shows an example of operation when the extended communication mode select bit (ETXMD) in the SPI control register 3 (SPCR3) is set to 0 and the Communications Operating Mode Select bit (SPCR.TXMD) is set to 1. In this example, the SPI performs an 8-bit serial transfer when SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

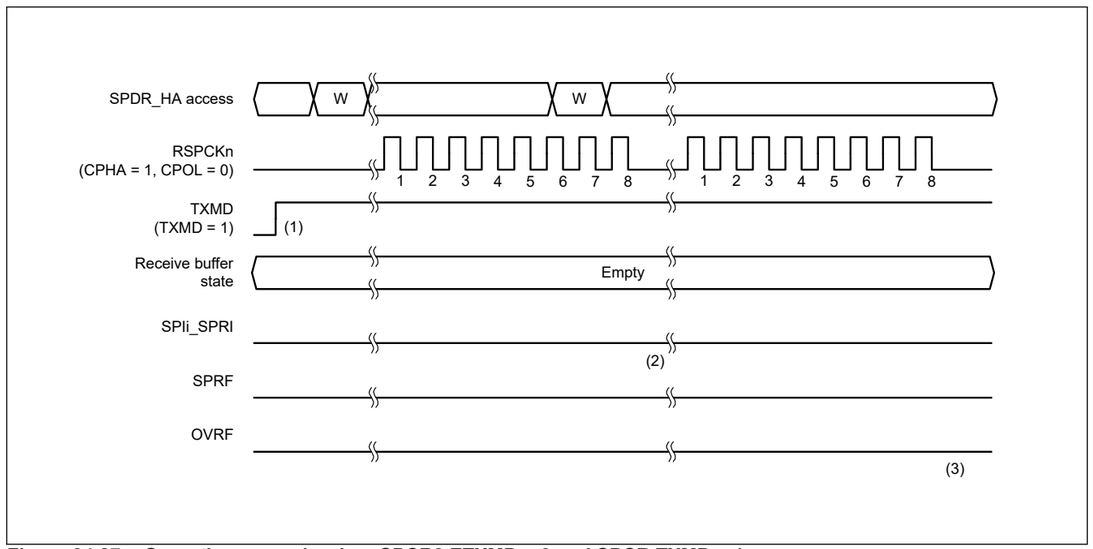

Figure 34.27 Operation example when SPCR3.ETXMD = 0 and SPCR.TXMD = 1

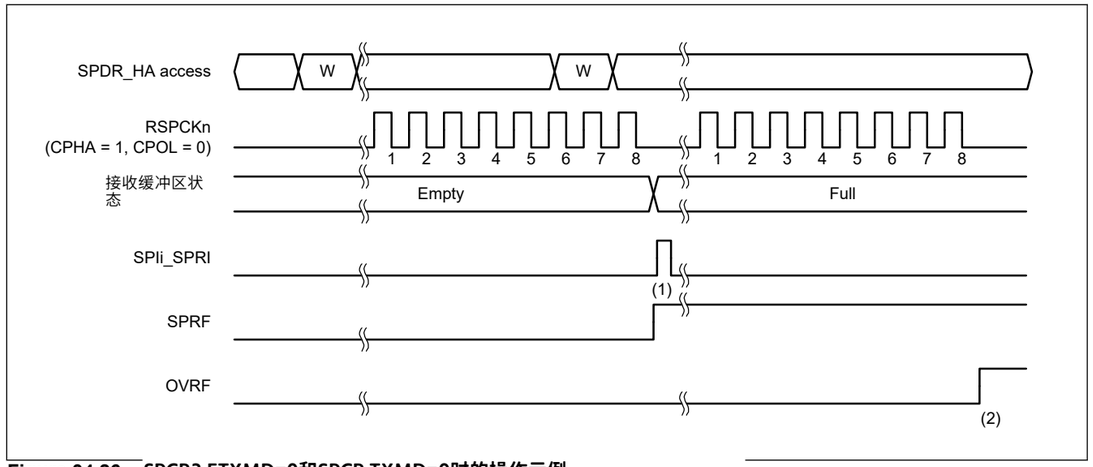

Figure 34.26 SPCR3.ETXMD=0和SPCR.TXMD=0时的操作示例

图34.26中时间(1)和(2)的标志操作如下：

1.当串行传输结束且SPDR_HA的接收缓冲区为空时，SPI产生接收缓冲区满中断请求（SPIi_SPRI），SPI将SPSR.SPRF标志设置为1，并将接收到的移位寄存器中的数据复制到接收缓冲区。

2.当串行传输结束时，SPDR_HA的接收缓冲区保存了前一次串行传输中接收到的数据，SPI将SPSR.OVRF标志设置为1，并丢弃移位寄存器中接收到的数据。有关SPSR.OVRF标志操作的详细信息，请参见第34.3.9.1节。溢出错误。

34.3.6.2 仅发送串行通信（SPCR3.ETXMD=0，SPCR.TXMD=1）

图34.27显示了当SPI控制寄存器3(SPCR3)中的扩展通信模式选择位(ETXMD)设置为0并且通信操作模式选择位(SPCR.TXMD)设置为1时的操作示例。在此示例中，当SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为1、SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的位数。

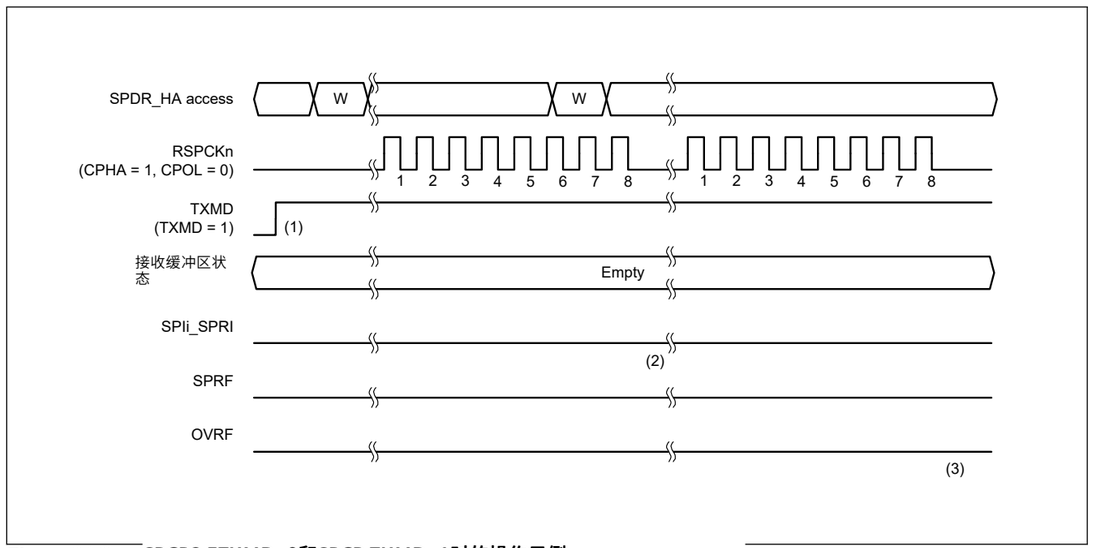

Figure 34.27 SPCR3.ETXMD=0和SPCR.TXMD=1时的操作示例

The operation of the flags at timings (1) to (3) in Figure 34.27 is as follows:

1. Make sure there is no data left in the receive buffer (the SPSR.SPRF flag is 0) and the SPSR.OVRF flag is 0 before entering transmit-only mode (SPCR3.ETXMD = 0, SPCR.TXMD = 1).
2. When a serial transfer ends with the receive buffer of SPDR_HA empty, if the transmit-only mode is selected (SPCR3.ETXMD = 0, SPCR.TXMD = 1), the SPSR.SPRF flag retains the value of 0, and the SPI does not copy the data in the shift register to the receive buffer.
3. Because the receive buffer of SPDR_HA does not hold data that was received in the previous serial transfer, even when a serial transfer ends, the SPSR.OVRF flag retains the value of 0, and the data in the shift register is not copied to the receive buffer.

In transmit-only mode (SPCR3.ETXMD = 0, SPCR.TXMD = 1), the SPI transmits data but does not receive data. Therefore, the SPSR.SPRF and SPSR.OVRF flags remain 0 at timings (1) to (3).

34.3.6.3 Receive-Only Serial Communication (MSTR = 0, ETXMD = 1)

Figure 34.28 shows an example of operation when the SPI master/slave mode select bit (MSTR) in the SPI control register (SPCR) is set to 0 and the extended communication mode select bit (ETXMD) in the SPI control register 3 (SPCR3) is set to 1. In the example in Figure 34.28, the SPI performs 8-bit data serial transfer with the settings of SPFC[1:0] in the SPI data control register (SPDCR) = 00b, CPHA in the SPI command register (SPCMD) = 1, and CPOL in SPCMD = 0. Numbers under the RSPCK waveform show the number of RSPCK cycles (number of transfer bits).

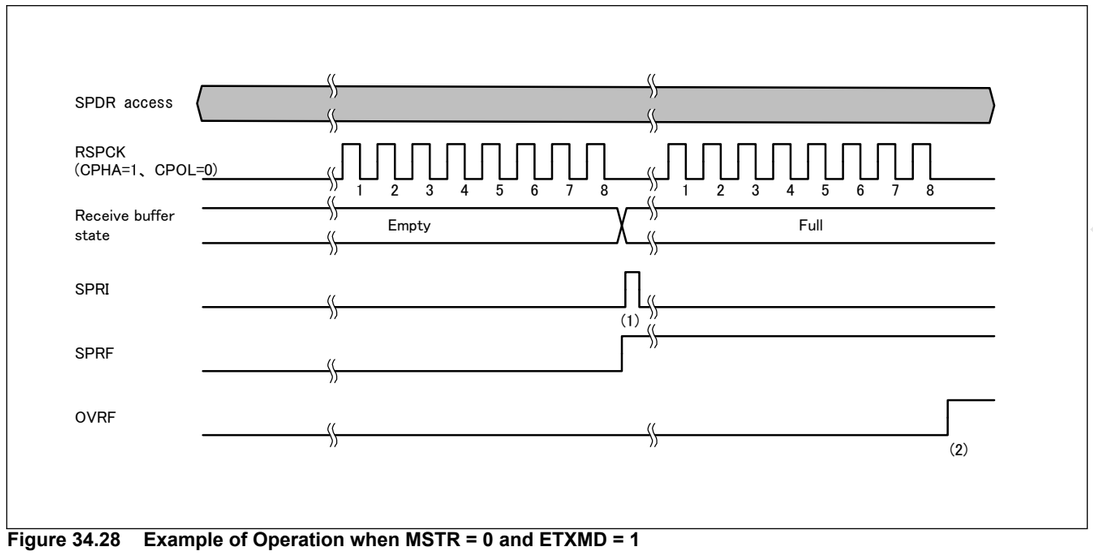

Figure 34.28 Example of Operation when MSTR = 0 and ETXMD = 1

The following describes operation of flags at timings (1) and (2) in the figure above.

(1) When serial transfer ends while the SPDR's receive buffer is empty, the SPI generates a receive buffer full interrupt request SPRI (setting the SPSR.SPRF flag to 1) and copies the received data in the shift register to the receive buffer

(2) When serial transfer ends while previously received data is remaining in the SPDR's receive buffer, the SPI sets the OVRF flag in the SPI status register (SPSR) to 1 and discards the received data in the shift register.

34.3.7 Transmit Buffer Empty and Receive Buffer Full Interrupts

Figure 34.29 and Figure 34.30 show examples of operation of the transmit buffer empty interrupt (SPIi_SPTI) and the receive buffer full interrupt (SPIi_SPRI). The SPDR_HA register accesses shown in these figures indicate the conditions of access to the register, where W denotes a write cycle and R a read cycle. In Figure 34.29, the SPI performs an 8-bit serial transfer when SPCR.TXMD bit is 0, the SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 0, and the SPCMDm.CPOL bit is 0. In Figure 34.30, the SPI performs an 8-bit serial transfer when SPCR.TXMD bit is 0, the

图34.27中时间(1)到(3)的标志操作如下：

1.在进入仅发送模式（SPCR3.ETXMD=0，SPCR.TXMD=1）之前，确保接收缓冲区中没有剩余数据（SPSR.SPRF标志为0）且SPSR.OVRF标志为0。

2.当串行传输结束且SPDR_HA的接收缓冲区为空时，如果选择了仅传输模式（SPCR3.ETXMD=0 SPCR.TXMD=1），SPSR.SPRF标志保持0的值，SPI不将移位寄存器中的数据复制到接收缓冲区。

3、因为SPDR_HA的接收缓冲区中没有保存上一次串行传输接收到的数据，所以即使一次串行传输结束，SPSR.OVRF标志保持值0，移位寄存器中的数据不会被复制到接收缓冲区。

在仅发送模式下（SPCR3.ETXMD=0，SPCR.TXMD=1），SPI发送数据但不接收数据。
因此，SPSR.SPRF和SPSR.OVRF标志在时间(1)到(3)保持0。

34.3.6.3 仅接收串行通信（MSTR=0，ETXMD=1）

图34.28显示了当SPI控制寄存器(SPCR)中的SPI主从模式选择位(MSTR)设置为0并且SPI控制寄存器3(SPCR3)中的扩展通信模式选择位(ETXMD)为设置为1。在图34.28的示例中，SPI执行8位数据串行传输，设置SPI数据控制寄存器（SPDCR）中的SPFC[1:0]=00b，SPI命令寄存器中的CPHA（SPCMD)=1，SPCMD中的CPOL=0。RSPCK波形下的数字表示RSPCK周期数（传输位数）。

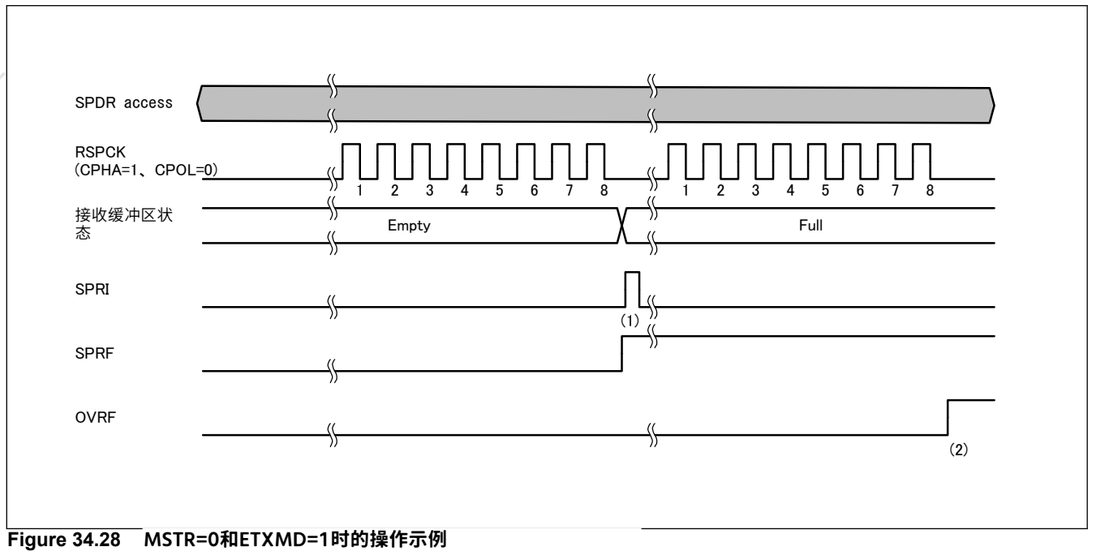

Figure 34.28 MSTR=0和ETXMD=1时的操作示例

下面描述在上图中的时间(1)和(2)的标志的操作。

(1)当串行传输结束而SPDR的接收缓冲区为空时，SPI产生接收缓冲区满中断请求SPRI（将SPSR.SPRF标志设置为1）并将接收到的移位寄存器中的数据复制到接收缓冲区

(2)当串行传输结束而先前接收的数据仍留在SPDR的接收缓冲区中时，SPI将SPI状态寄存器(SPSR)中的OVRF标志设置为1，并丢弃移位寄存器中的接收数据。

34.3.7 发送缓冲区空和接收缓冲区满中断

图34.29和图34.30显示了发送缓冲区空中断(SPIi_SPTI)和接收缓冲区满中断(SPIi_SPRI)的操作示例。这些图中显示的SPDR_HA寄存器访问表示访问寄存器的条件，其中W表示写周期，R表示读周期。在图34.29中，当SPCR.TXMD位为0、SPDCR.SPFC[1:0]位为00b、SPCMDm.CPHA位为0、SPCMDm.CPOL位为0时，SPI执行8位串行传输.在图34.30中，当SPCR.TXMD位为0时，SPI执行8位串行传输，

SPDCR.SPFC[1:0] bits are 00b, the SPCMDm.CPHA bit is 1, and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

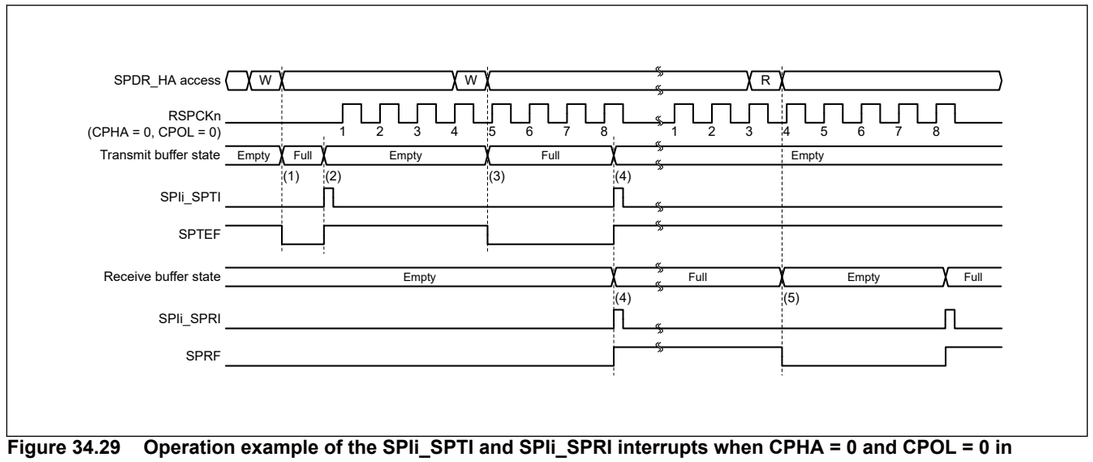

Figure 34.29 Operation example of the SPIi_SPTI and SPIi_SPRI interrupts when CPHA = 0 and CPOL = 0 in master mode

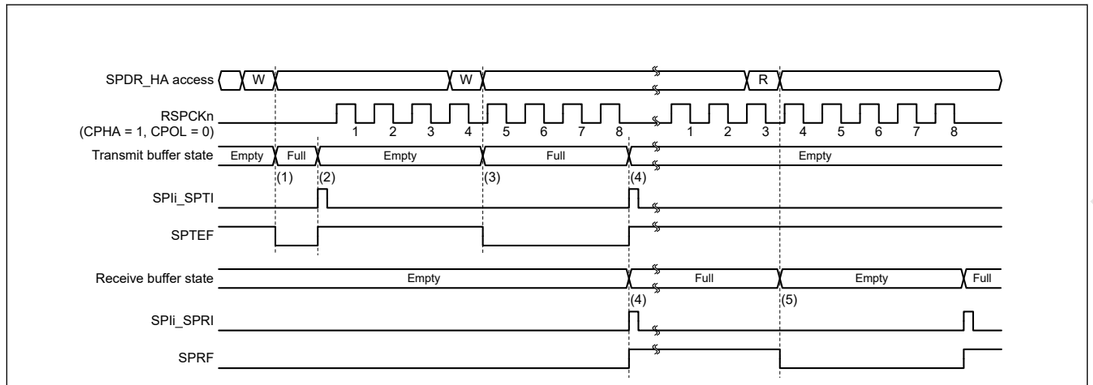

Figure 34.30 Operation example of the SPIi_SPTI and SPIi_SPRI interrupts when CPHA = 1 and CPOL = 0 in master mode

The operation of the SPI at timings (1) to (5) in Figure 34.29 and Figure 34.30 is as follows:

1. When transmit data is written to SPDR_HA with the transmit buffer of SPDR_HA is empty and data for the next transfer is not set, the SPI writes data to the transmit buffer and clears the SPSR.SPTEF flag to 0.
2. If the shift register is empty, the SPI copies the data in the transmit buffer to the shift register, generates a transmit buffer empty interrupt request (SPIi_SPTI), and sets the SPSR.SPTEF flag to 1. How a serial transfer is started depends on the SPI mode. For details, see section 34.3. Operation, and section 34.3.12. Clock Synchronous Operation.
3. When transmit data is written to SPDR_HA either by the transmit buffer empty interrupt routine, or by the processing of the transmit buffer empty using the SPTEF flag, the SPI writes data to the transmit buffer and clears the SPTEF flag to 0. Because the data being transferred serially is stored in the shift register, the SPI does not copy the data in the transmit buffer to the shift register.
4. When the serial transfer ends with the receive buffer of SPDR_HA empty, the SPI copies the receive data in the shift register to the receive buffer, generates a receive buffer full interrupt request (SPIi_SPRI), and sets the SPRF flag to 1. Because the shift register becomes empty on completion of the serial transfer, if the transmit buffer is full before the serial transfer ended, the SPI sets the SPTEF flag to 1 and copies data in the transmit buffer to the shift register. Even

SPDCR.SPFC[1:0]位为00b，SPCMDm.CPHA位为1，SPCMDm.CPOL位为0。
波形中的RSPCKn表示RSPCK周期数，例如传输的位数。

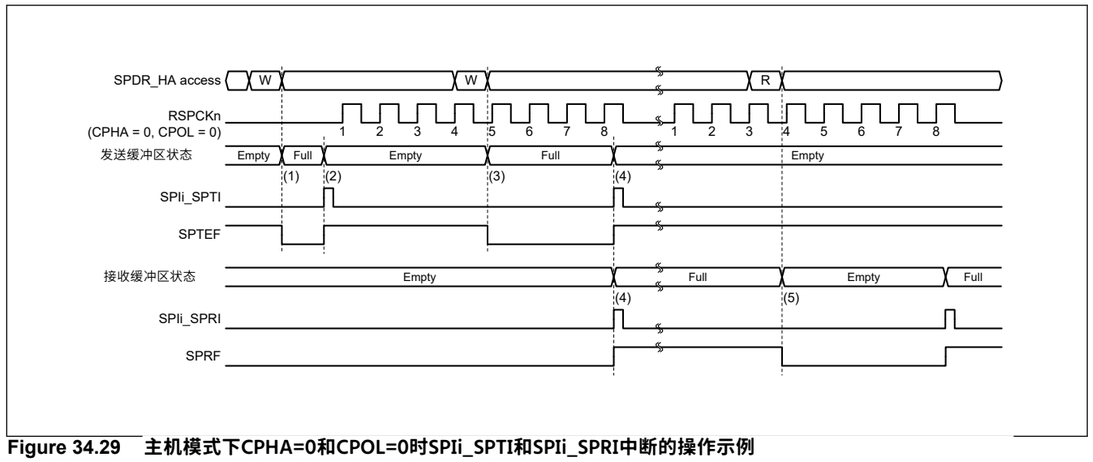

Figure 34.29 主机模式下CPHA=0和CPOL=0时SPIi_SPTI和SPIi_SPRI中断的操作示例

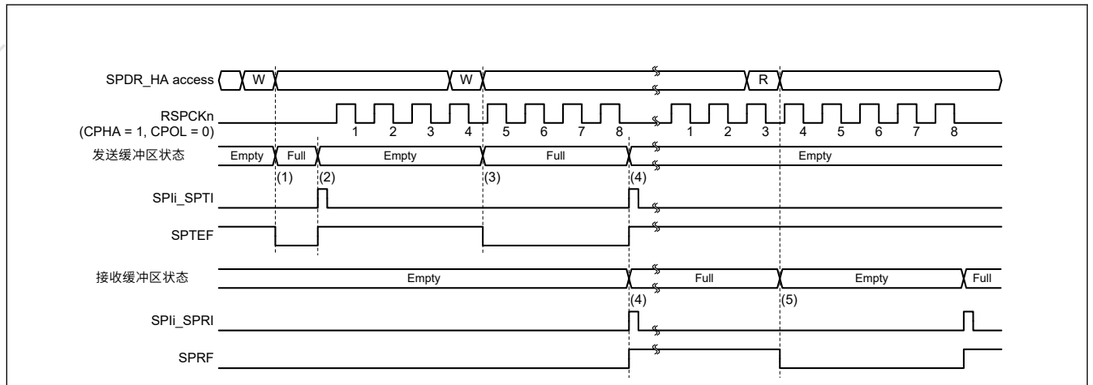

Figure 34.30 主机模式下CPHA=1和CPOL=0时SPIi_SPTI和SPIi_SPRI中断的操作示例

SPI在图34.29和图34.30中时序（1）到（5）的操作如下：

1.当发送数据写入SPDR_HA且SPDR_HA的发送缓冲区为空且未设置下一次传输的数据时，SPI将数据写入发送缓冲区并将SPSR.SPTEF标志清除为0。

2.如果移位寄存器为空，SPI将发送缓冲区中的数据复制到移位寄存器，产生发送缓冲区空中断请求（SPIi_SPTI），并将SPSR.SPTEF标志设置为1。如何启动串行传输取决于SPI模式。有关详细信息，请参阅第34.3节。操作和第34.3.12节。时钟同步操作。

3.当发送数据被发送缓冲区空中断程序写入SPDR_HA时，或者通过使用SPTEF标志处理发送缓冲区空时，SPI将数据写入发送缓冲区并将SPTEF标志清除为0。因为串行传输的数据存储在移位寄存器中，SPI不会将发送缓冲区中的数据复制到移位寄存器中。

4.当串行传输结束且SPDR_HA的接收缓冲区为空时，SPI将移位寄存器中的接收数据复制到接收缓冲区，产生接收缓冲区满中断请求（SPIi_SPRI），并将SPRF标志设置为1。因为串行传输完成后移位寄存器变为空，如果在串行传输结束前发送缓冲区已满，SPI将SPTEF标志设置为1，并将发送缓冲区中的数据复制到移位寄存器。甚至

when received data is not copied from the shift register to the receive buffer in an overrun error status, on completion of the serial transfer, the SPI determines that the shift register is empty, so data transfer from the transmit buffer to the shift register is enabled.

5. When SPDR_HA is read either by the receive buffer full interrupt routine or processing of the receive buffer full interrupt using the SPRF flag, the receive data can be read.

If SPDR_HA is written to when the transmit buffer holds data that is not yet transmitted (the SPTEF flag is 0), the SPI does not update data in the transmit buffer. When writing to SPDR_HA, always use either a transmit buffer empty interrupt request or processing of the transmit buffer empty interrupt using the SPTEF flag. To use a transmit buffer empty interrupt, set the SPTIE bit in SPCR to 1. If the SPI function is disabled (the SPCR.SPE bit is 0), set the SPTIE bit to 0.

When serial transfer ends and the receive buffer is full (the SPRF flag is 1), the SPI does not copy data from the shift register to the receive buffer, and it detects an overrun error (see section 34.3.9. Error Detection). To prevent a receive data overrun error, read the received data using a receive buffer full interrupt request before the next serial transfer ends. To use an SPI receive buffer full interrupt, set the SPCR.SPRIE bit to 1.

Transmission and reception interrupts or the associated IELSRn.IR flags (where n is the interrupt vector number) in the ICU can be used to confirm the states of the transmit and receive buffers.

Similarly, the SPTEF and SPRF flags can be used to confirm the states of the transmit and receive buffers. See section 13, Interrupt Controller Unit (ICU) for the interrupt vector numbers.

34.3.8 Communication End Interrupt

34.3.8.1 Transmit-Receive/Transmit in Master Mode

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1, when following conditions are satisfied in transmit-receive master mode and transmit master mode. The set timing of the CENDF flag is same as IDLNF flag. The communication end interrupt (SPCI) is one PCLKUSCIx width and low active.

- When the value of the SPSSR.SPCP[2:0] bits are same as the SPSCR.SPSLN[2:0] bits.
- When there is no next transmission data.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- When the next transmission data is written to the transmit buffer (SPTX).
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 34.31 shows an example of communication end interrupt operation during transmit-receive/transmit master mode.

当接收到的数据在溢出错误状态下没有从移位寄存器复制到接收缓冲区时，在串行传输完成时，SPI确定移位寄存器为空，因此从发送缓冲区到移位寄存器的数据传输被启用.

5.当接收缓冲区满中断程序或使用SPRF标志处理接收缓冲区满中断读取SPDR_HA时，可以读取接收数据。

如果在发送缓冲区保存尚未发送的数据时写入SPDR_HA（SPTEF标志为0），则SPI不会更新发送缓冲区中的数据。写入SPDR_HA时，始终使用发送缓冲区空中断请求或使用SPTEF标志处理发送缓冲区空中断。要使用发送缓冲区空中断，请将SPCR中的SPTIE位设置为1。如果禁用SPI功能（SPCR.SPE位为0），请将SPTIE位设置为0。

当串行传输结束并且接收缓冲区已满（SPRF标志为1）时，SPI不会将数据从移位寄存器复制到接收缓冲区，它会检测到溢出错误（参见第34.3.9节。错误检测）。为防止接收数据溢出错误，请在下一次串行传输结束前使用接收缓冲区满中断请求读取接收数据。要使用SPI接收缓冲区满中断，请将SPCR.SPRIE位设置为1。

ICU中的发送和接收中断或相关的IELSRn.IR标志（其中n是中断向量号）可用于确认发送和接收缓冲区的状态。

类似地，SPTEF和SPRF标志可用于确认发送和接收缓冲区的状态。见第13节，用于中断向量编号的中断控制器单元(ICU)。

34.3.8 通讯结束中断

34.3.8.1 主控模式下的发送-接收发送

在发送-接收主机模式和发送主机模式下满足以下条件时，将产生通信结束中断(SPCI)并将CENDF标志设置为1。CENDF标志的设置时序与IDLNF标志相同。通信结束中断(SPCI)是一个PCLKUSCIx宽度和低电平有效。

- ●当SPSSR.SPCP[2:0]位的值与SPSCR.SPSLN[2:0]位的值相同时。
- ●当没有下一个传输数据时。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- ●下一个发送数据写入发送缓冲区（SPTX）时。
- ●当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图34.31显示了发送-接收发送主机模式期间的通信结束中断操作示例。

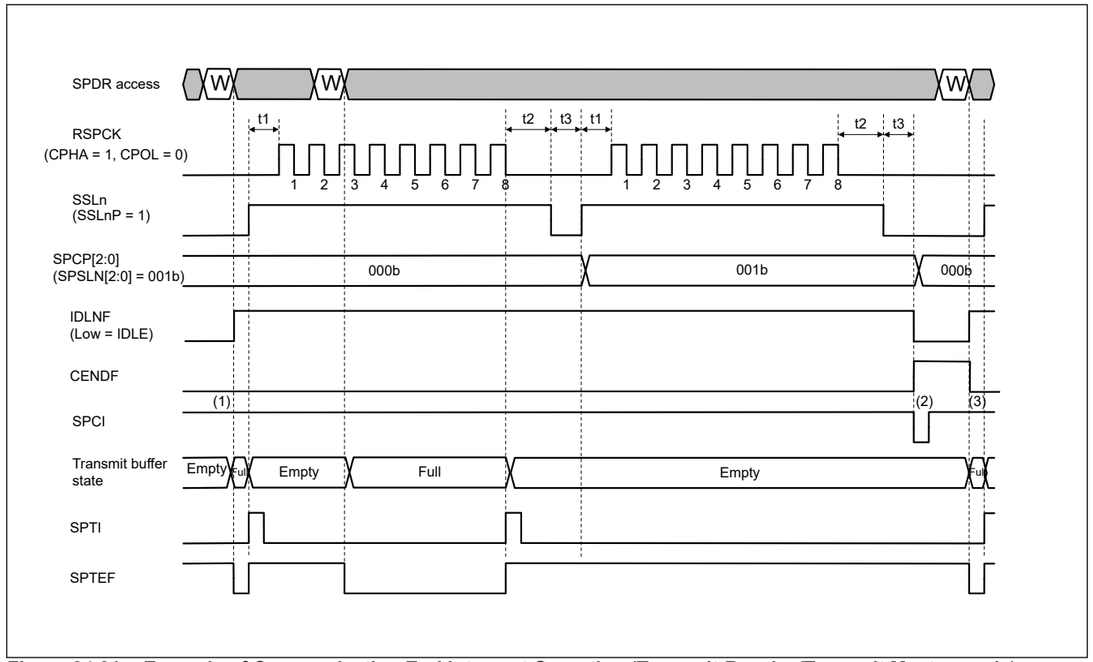

Figure 34.31 Example of Communication End Interrupt Operation (Transmit-Receive/Transmit Master mode)

1. The CNEDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the end of t3 cycle, because the next command is 000b and there is no next transmit data, and then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared when the next transmission data is written to the transmit buffer (SPTX). Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

In slave mode operation, the output timing of the communication end interrupt is deferent due to the value of the SPCR.SPMS bit (RSPI mode select bit), and the clear timing of the communication end interrupt is deferent due to the communication mode (transmit-receive or transmit-only or receive-only).

34.3.8.2 Transmit-Receive/Transmit in Slave Mode on SPI Operation (4-wire)

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1, when both SPTX buffer and transmit shift buffer are empty in transmit-receive/transmit slave mode on SPI Operation (4-wire). The set timing of the CENDF flag is same as SSL0 negate timing. The communication end interrupt (SPCI) is one PCLKUSCIx width and low active.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- When the next transmission data is written to the transmit buffer (SPTX).
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 34.32 shows an example of communication end interrupt operation during transmit-receive/transmit slave mode on SPI operation.

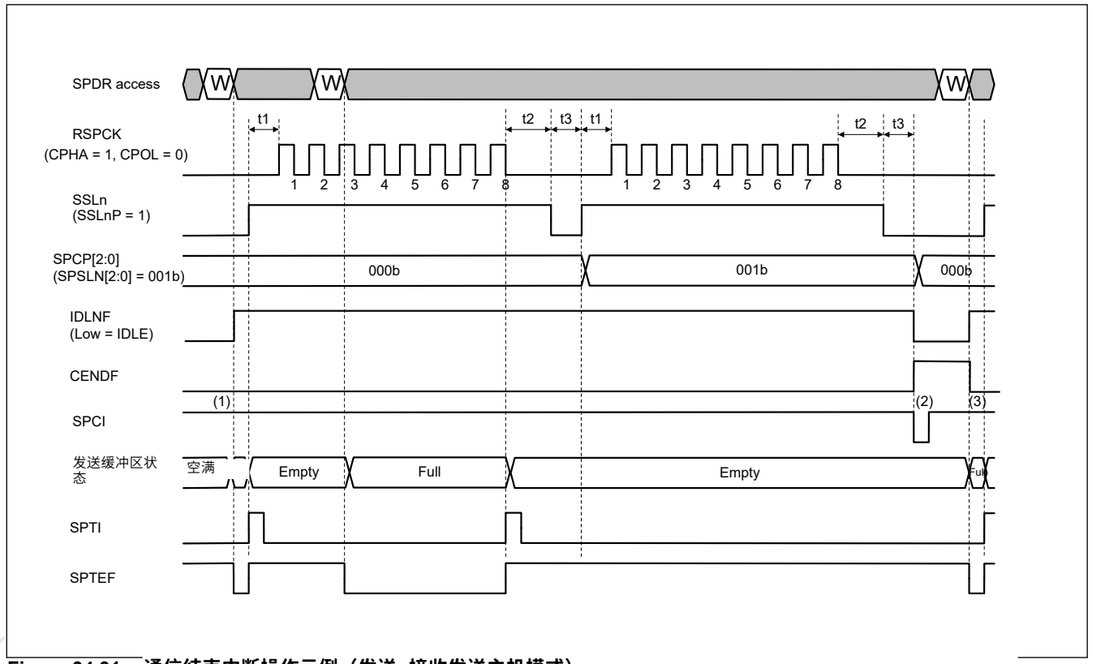

Figure 34.31 通信结束中断操作示例（发送-接收发送主机模式）

1、通信开始前CNEDF标志为0，SPCI的电平为1，在通信过程中一直保持。

2.CENDF标志在t3周期结束时为1（通讯结束），因为下一条指令为000b，没有下一条发送数据，当CENDIE位为1时SPCI中断输出。

3.CENDF标志在下一个发送数据写入发送缓冲区（SPTX）时被清除。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

在从模式操作中，通信结束中断的输出时序是不同的，因为SPCR.SPMS位（RSPI模式选择位），通信结束中断的清除时序因通信模式（发送-接收或仅发送或仅接收）而异。

34.3.8.2 SPI操作（4线）从模式下的发送-接收发送

在SPI操作（4线）的发送-接收发送从模式下，当SPTX缓冲区和发送移位缓冲区都为空时，将产生通信结束中断(SPCI)并将CENDF标志设置为1。CENDF标志的设置时序与SSL0否定时序相同。通信结束中断(SPCI)是一个PCLKUSCIx宽度和低电平有效。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- ●下一个发送数据写入发送缓冲区（SPTX）时。
- ●当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图34.32显示了在发送-接收发送从模式开启期间的通信结束中断操作示例SPI操作。

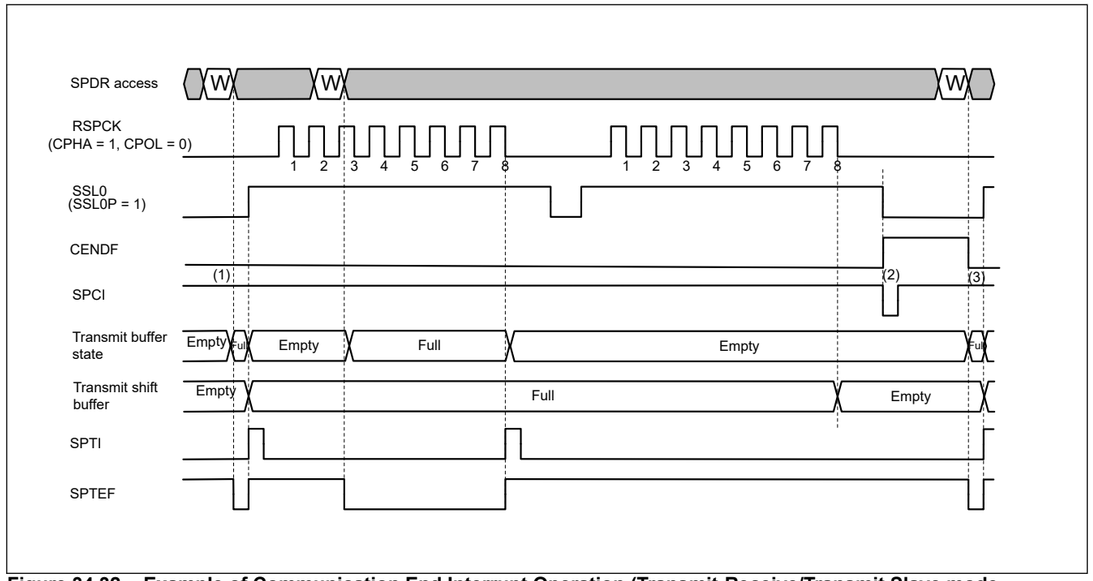

Figure 34.32 Example of Communication End Interrupt Operation (Transmit-Receive/Transmit Slave mode on SPI Operation)

1. The CNEDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the timing of SSL0 negate, when both SPTX buffer and transmit shift buffer are empty, and then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared when the next transmission data is written to the transmit buffer (SPTX). Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

34.3.8.3 Receive Only in Slave Mode on SPI Operation (4-wire)

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1 at the SSL0 negate timing in receive only slave mode on SPI operation (4-wire). The number of transmission frame is set by the SPDCR.SPFC[1:0]. Then the SSL0 is negated at the last frame transmission end. The communication end interrupt (SPCI) is one PCLKUSCIx width and low active.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- The SSL0 assert timing of next transmission.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 34.33 shows an example of communication end interrupt operation during receive only slave mode on SPI operation (4-wire).

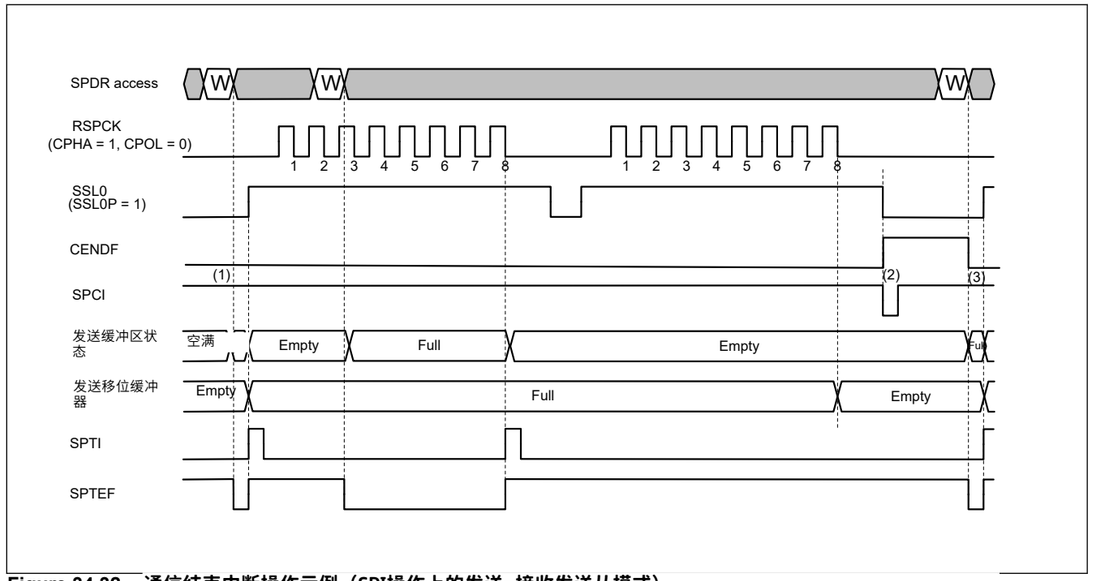

Figure 34.32 通信结束中断操作示例（SPI操作上的发送-接收发送从模式）

1、通信开始前CNEDF标志为0，SPCI的电平为1，在通信过程中一直保持。

2.在SSL0否定的时刻，当SPTX缓冲区和发送移位缓冲区都为空时，CENDF标志将为1（通信结束），然后当CENDIE位为1时输出SPCI中断。

3.CENDF标志在下一个发送数据写入发送缓冲区（SPTX）时被清除。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

34.3.8.3 SPI操作时仅在从模式下接收（4线）

在SPI操作（4线）上仅接收从机模式下，在SSL0否定时序产生通信结束中断(SPCI)并将CENDF标志设置为1。传输帧数由SPDCR.SPFC[1:0]设置。然后在最后一帧传输结束时对SSL0取反。通信结束中断(SPCI)是一个PCLKUSCIx宽度和低电平有效。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- SSL0断言下一次传输的时序。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图34.33显示了SPI操作（4线）上仅接收从机模式期间的通信结束中断操作示例。

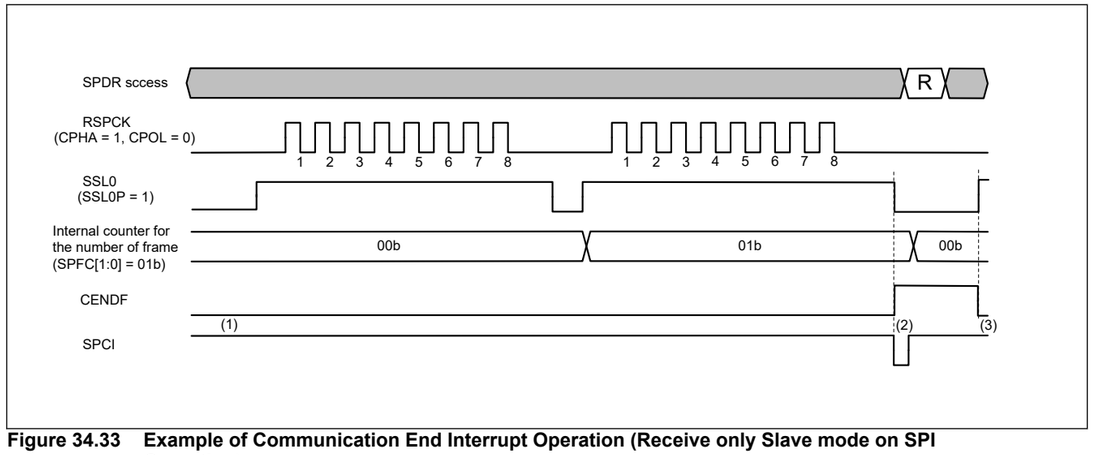

Figure 34.33 Example of Communication End Interrupt Operation (Receive only Slave mode on SPI Operation)

1. The CNEDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the timing of SSL0 negate, when the last frame transmission ends, and then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared at the SSL0 assert when the next transmission start. Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

34.3.8.4 Transmit-Receive/Transmit in Slave Mode on Clock Synchronous Operation (3-wire)

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1 when both SPTX buffer and transmit shift register are empty in transmit-receive/transmit slave mode on clock synchronous operation (3-wire). The set timing of CENDF flag is same as the last data sampling of the RSPCK (the last odd edge of RSPCK when the SPCMD0.CPHA bit is 0, the last even edge of RSPCK when the SPCMD0.CPHA bit is 1). The communication end interrupt (SPCI) is one PCLKUSCIx width and low active.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- The SSL0 assert timing of next transmission.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 34.34 shows an example of communication end interrupt operation during transmig-receive/transmit slave mode on clock synchronous operation (3-wire).

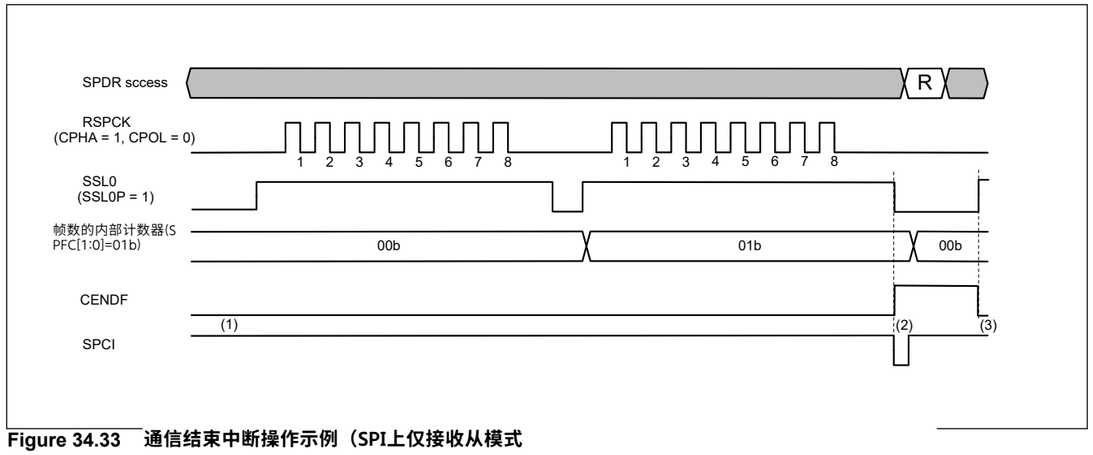

Figure 34.33 通信结束中断操作示例（SPI上仅接收从模式 Operation)

1、通信开始前CNEDF标志为0，SPCI的电平为1，在通信过程中一直保持。

2.CENDF标志位在SSL0否定的时刻，即最后一帧传输结束时为1（通信结束），然后当CENDIE位为1时输出SPCI中断。

3.CENDF标志在下一次传输开始时在SSL0断言处被清除。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

34.3.8.4 在时钟同步操作（3线）的从模式下发送-接收发送

在时钟同步操作（3线）的发送-接收发送从模式下，当SPTX缓冲器和发送移位寄存器都为空时，产生通信结束中断(SPCI)并将CENDF标志设置为1。CENDF标志的设置时序与RSPCK的最后一次数据采样相同（SPCMD0.CPHA位为0时RSPCK的最后一个奇边沿，SPCMD0.CPHA位为1时RSPCK的最后一个偶边沿）。通信结束中断(SPCI)是一个PCLKUSCIx宽度和低电平有效。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- SSL0断言下一次传输的时序。
- 当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图34.34显示了在时钟同步操作（3线）下发送接收发送从模式期间的通信结束中断操作示例。

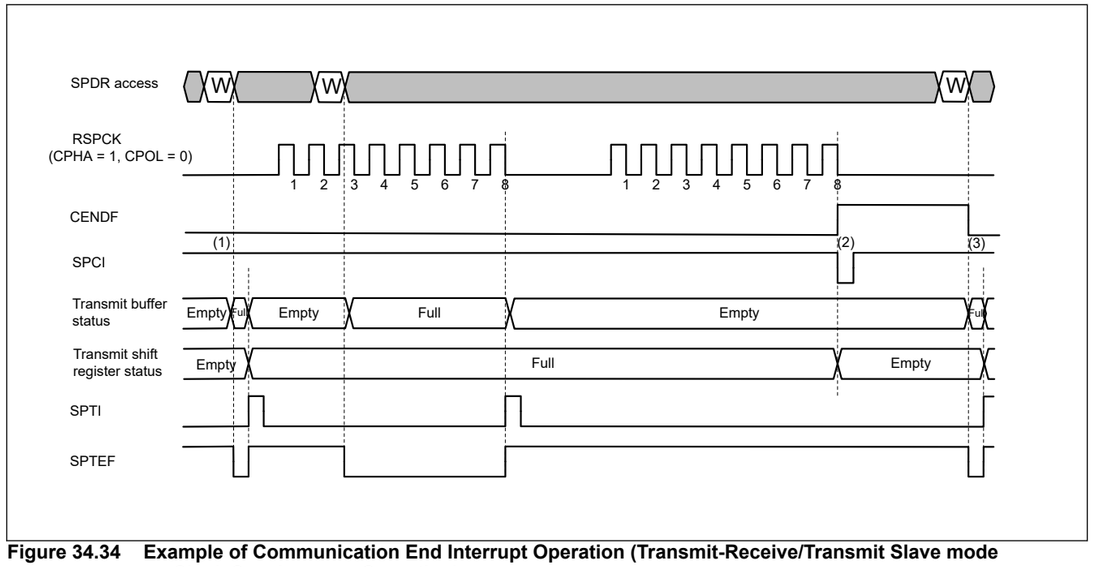

Figure 34.34 Example of Communication End Interrupt Operation (Transmit-Receive/Transmit Slave mode on Clock Synchronous Operation)

1. The CNEDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the last data sampling timing of RSPCK, when both SPTX buffer and transmit shift buffer are empty, and then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared when the next transmission data is written to the transmit buffer (SPTX). Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

34.3.8.5 Receive Only in Slave Mode on Clock Synchronous Operation (3-wire)

The communication end interrupt (SPCI) is made and the CENDF flag is set to 1 at the last data sampling of the last transmission frame in receive only slave mode on clock synchronous operation (3-wire). The sampling timing is the last odd edge of RSPCK when the SPCMD0.CPHA bit is 0, the last even edge of RSPCK when the SPCMD0.CPHA bit is 1. The number of transmission frame is set by the SPDCR.SPFC[1:0]. The communication end interrupt (SPCI) is one PCLKUSCIx width and low active.

The CENDF flag will not be cleared even if the SPCR.SPE bit is cleared after CENDF = 1. The CENDF flag will be cleared in one of following tow conditions.

- The first edge of RSPCK for next transmission.
- The CENDF flag was written 0 after reading the SPSR when the CENDF flag was 1.

Figure 34.35 shows an example of communication end interrupt operation during receive only slave mode on clock synchronous operation.

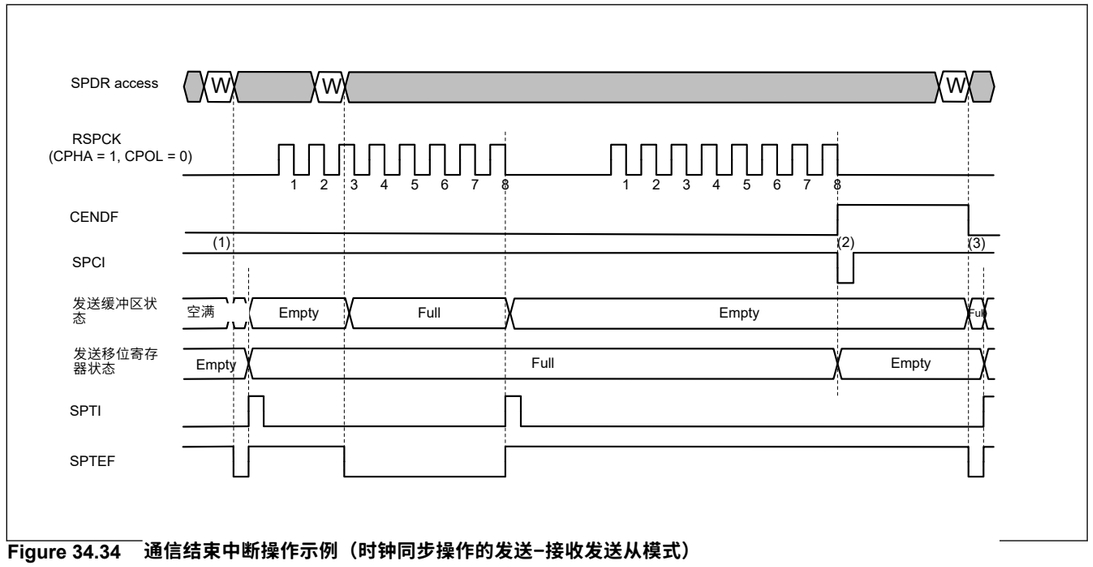

Figure 34.34 通信结束中断操作示例（时钟同步操作的发送–接收发送从模式）

1、通信开始前CNEDF标志为0，SPCI的电平为1，在通信过程中一直保持。

2.在RSPCK的最后一个数据采样时序，当SPTX缓冲区和发送移位缓冲区都为空时，CENDF标志为1（通信结束），然后当CENDIE位为1时输出SPCI中断。

3.CENDF标志在下一个发送数据写入发送缓冲区（SPTX）时被清除。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

34.3.8.5 在时钟同步操作（3线）上仅在从模式下接收

在时钟同步操作（3线）仅接收从机模式下，在最后一个传输帧的最后一个数据采样时产生通信结束中断(SPCI)并将CENDF标志设置为1。采样时序在SPCMD0.CPHA位为0时为RSPCK的最后一个奇边沿，当SPCMD0.CPHA位为1时为RSPCK的最后一个偶边沿。发送帧数由SPDCR.SPFC[1:0设置]。通信结束中断(SPCI)是一个PCLKUSCIx宽度和低电平有效。

即使在CENDF=1后清除SPCR.SPE位，CENDF标志也不会被清除。CENDF标志将在以下两种情况之一被清除。

- ●RSPCK的第一个边沿用于下一次传输。
- ●当CENDF标志为1时，读取SPSR后CENDF标志被写入0。

图34.35显示了在时钟同步操作下仅接收从机模式期间的通信结束中断操作示例。

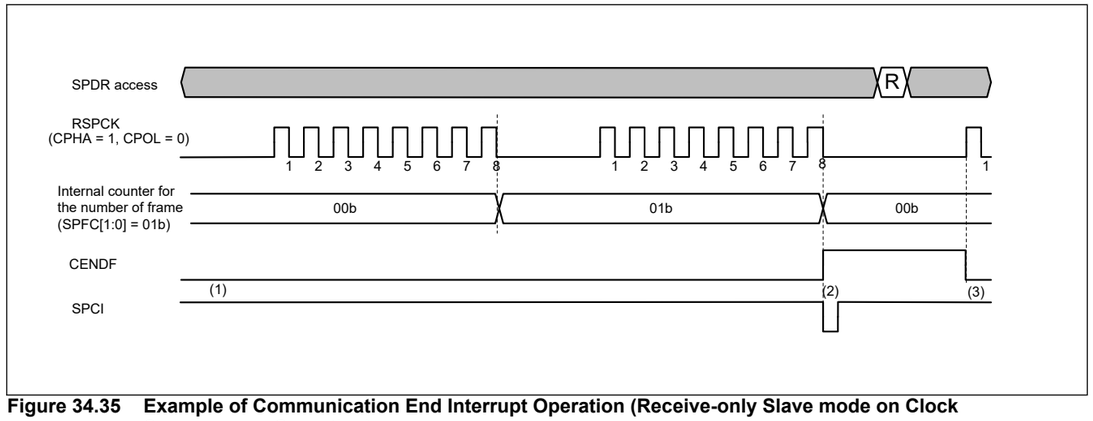

Figure 34.35 Example of Communication End Interrupt Operation (Receive-only Slave mode on Clock Synchronous Operation)

1. The CNEDF flag is 0 and the level of SPCI is 1 before communication start, and these have kept during communication.
2. The CENDF flag will be 1 (Communication End) at the last data sampling timing of RSPCK, when the last frame transmission end. The number of transmission frame is set by the SPDCR.SPFC[1:0]. And then the SPCI interrupt output when the CENDIE bit is 1.
3. The CENDF flag is cleared at the first edge of RSPCK for the next transmission. Or the CENDF flag is cleared if the CENDF flag was written 0 after reading the SPCR when the CENDF flag was 1.

34.3.8.6 Common Operation

In this chapter, the operation common to each mode / area option communication in section 34.3.8.1. Transmit-Receive/ Transmit in Master Mode to section 34.3.8.5. Receive Only in Slave Mode on Clock Synchronous Operation (3-wire) is explained. When the enable of RSPI communication end interrupt (CENDIE) is 0, at the time of communication completion, a flag of communication end (CENDF) is set and an event of communication end (sp_elccend) is output, but no interrupt is output. However, if the enable of communication end interrupt (CENDIE) is set to 1 before clearing the flag of communication end (CENDF) while the enable of RSPI function (SPE) is 1, the communication end interrupt is output.

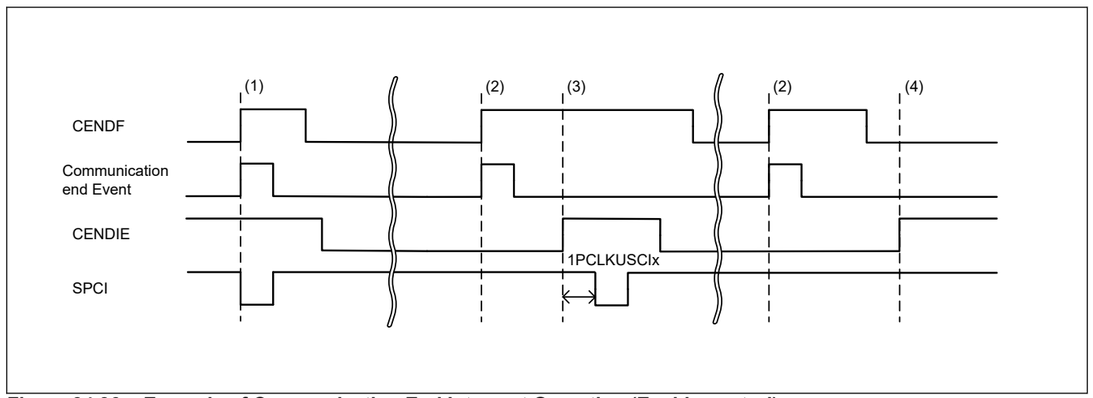

Figure 34.36 Example of Communication End Interrupt Operation (Enable control)

1. When the enable of RSPI communication end interrupt (CENDIE) is 1, at the time of communication completion, the following three are the same timing.
   - A flag of communication end (CENDF)
   - An event of communication end (sp_elccend)
   - The communication end interrupt

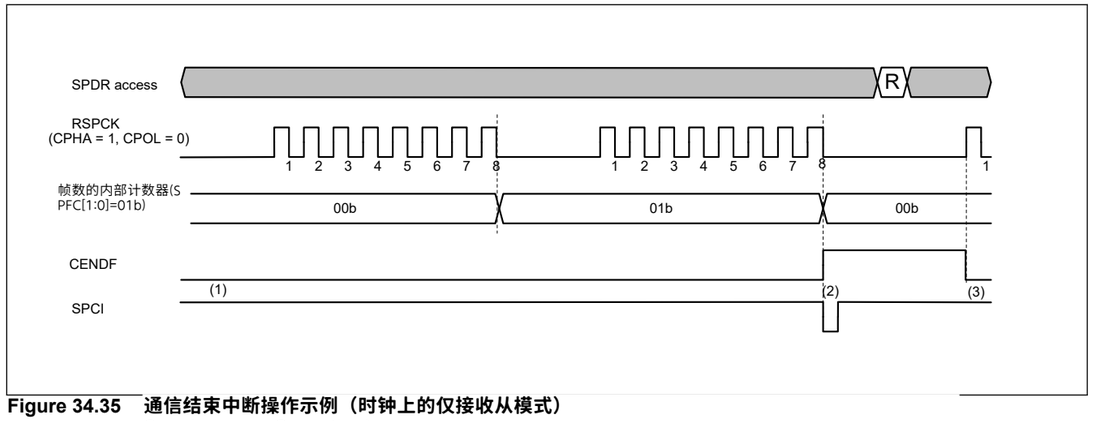

Figure 34.35 通信结束中断操作示例（时钟上的仅接收从模式）

1、通信开始前CNEDF标志为0，SPCI的电平为1，在通信过程中一直保持。

2.CENDF标志位在RSPCK的最后一个数据采样定时为1（通信结束），即最后一帧传输结束。传输帧数由SPDCR.SPFC[1:0]设置。然后在CENDIE位为1时输出SPCI中断。

3.CENDF标志在RSPCK的第一个边沿被清除以进行下一次传输。或者，当CENDF标志为1时，如果在读取SPCR后将CENDF标志写入0，则清除CENDF标志。

34.3.8.6 常用操作

在本章中，34.3.8.1节中的每个模式区域选项通信的通用操作。发送-接收在主模式下发送到第34.3.8.5节。解释了时钟同步操作（3线）时仅在从模式下接收。当RSPI通信结束中断（CENDIE）使能为0时，通信完成时，设置通信结束标志（CENDF）并输出通信结束事件（sp_elccend），但不输出中断。但是，如果在清除通信结束标志（CENDF）之前将通信结束中断（CENDIE）的使能设置为1，而RSPI功能（SPE）的使能为1，则输出通信结束中断。

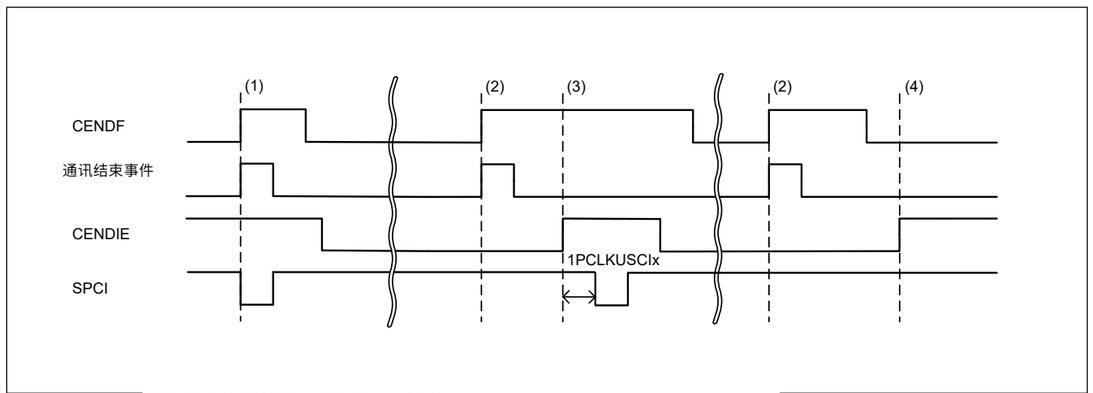

Figure 34.36 通信结束中断操作示例（启用控制）

1、当RSPI通讯结束中断（CENDIE）使能为1时，通讯完成时，以下三个是相同的时序。

- ●通讯结束标志（CENDF）
- ●通信结束事件（sp_elccend）
- ●通讯结束中断

2. When the enable of RSPI communication end interrupt (CENDIE) is 0, at the time of communication completion, the following two are the same timing, but no interrupt.
   - A flag of communication end (CENDF)
   - An event of communication end (sp_elccend)
3. After (2), if the enable of communication end interrupt (CENDIE) is set when the enable of RSPI function (SPE) and the flag of communication end (CENDF) are 1, the communication end interrupt is output after 1 PCLKUSCIx.
4. After (2), even if the enable of communication end interrupt (CENDIE) is set when the enable of RSPI function (SPE) or the flag of communication end (CENDF) is 0, the communication end interrupt is not output.

34.3.9 Error Detection

In normal SPI serial transfers, data written to the transmit buffer of SPDR/SPDR_HA is transmitted, and received data can be read from the receive buffer of SPDR/SPDR_HA. If access is made to SPDR/SPDR_HA, an abnormal transfer might occur, depending on the status of the transmit or receive buffer or the status of the SPI at the beginning or end of serial transfer.

If an abnormal transfer occurs, the SPI detects the event as an underrun error, overrun error, parity error, or mode fault error. Table 34.10 lists the relationship between non-normal transfer operations and the SPI error detection function.

Table 34.10 Relationship between non-normal transfer operations and SPI error detection

Operation	Occurrence condition	SPI operation	Error detection
1	SPDR/SPDR_HA is written when the transmit buffer is full.	• The contents of the transmit buffer are kept • Write data is missing	None
2	SPDR/SPDR_HA is read when the receive buffer is empty.	The contents of the receive buffer and previously received data are output.	None
3	Serial transfer is started in slave mode when the SPI is not able to transmit data.	• Serial transfer is suspended • Transmit or receive data is missing • Driving of the MISOn output signal is stopped • SPI function is disabled	Underrun error
4	Serial transfer terminates when the receive buffer is full.	• Keeps the contents of the receive buffer • Missing receive data	Overrun error
5	An incorrect parity bit is received during full-duplex synchronous serial communication with the parity function enabled in following mode: • Transmit-receive master mode • Transmit-receive slave mode • Receive-only slave mode	The parity error flag is asserted	Parity error
6	The SSLn0 input signal is asserted when the serial transfer is idle in multi-master mode.	• Driving of the RSPCKn, MOSIn, SSLn1 to SSLn3 output signals is stopped • SPI function is disabled	Mode fault error
7	The SSLn0 input signal is asserted during serial transfer in multi-master mode.	• Serial transfer is suspended • Transmit or receive data is missing • Driving of the RSPCKn, MOSIn, SSLn1 to SSLn3 output signals is stopped • SPI function is disabled	Mode fault error
8	The SSLn0 input signal is negated during serial transfer in slave mode.	• Serial transfer is suspended • Transmit or receive data is missing • Driving of the MISOn output signal is stopped • SPI function is disabled	Mode fault error

In operation 1 described in Table 34.10, the SPI does not detect an error. To prevent data omission during writes to SPDR/SPDR_HA, the writes to SPDR/SPDR_HA must be executed using a transmit buffer empty interrupt request (when the SPSR.SPTEF flag is 1).

Similarly, the SPI does not detect an error in operation 2. To prevent extraneous data from being read, SPDR/SPDR_HA read must be executed with an SPI receive buffer full interrupt request (when the SPSR.SPRF flag is 1).

For information on the other errors, see the following sections:

2、当RSPI通讯结束中断（CENDIE）使能为0时，通讯完成时，以下两者时序相同，但无中断。

●通讯结束标志（CENDF）
●通信结束事件（sp_elccend）

3.（2）之后，如果在RSPI功能（SPE）使能和通信结束标志（CENDF）为1的情况下设置通信结束中断（CENDIE）使能，则在1个PCLKUSCIx后输出通信结束中断。

4.(2)后，即使在RSPI功能(SPE)使能或通信结束标志(CENDF)为0时设置通信结束中断(CENDIE)使能，也不输出通信结束中断。

34.3.9 错误检测

在正常的SPI串行传输中，写入到SPDRSPDR_HA的发送缓冲区的数据被发送，接收到的数据可以从SPDRSPDR_HA的接收缓冲区中读取。如果访问SPDRSPDR_HA，可能会发生异常传输，具体取决于发送或接收缓冲区的状态或串行传输开始或结束时SPI的状态。

如果发生异常传输，SPI会将事件检测为欠载错误、溢出错误、奇偶校验错误或模式故障错误。
表34.10列出了非正常传输操作和SPI错误检测功能之间的关系。

Table 34.10 非正常传输操作与SPI错误检测的关系

Operation	发生条件	SPI操作	错误检测
1	SPDRSPDR_HA在发送缓冲区已满时写入。	• 发送缓冲区的内容被保留 • 写入数据丢失	None
2	SPDRSPDR_HA在接收缓冲区为空时读取。	输出接收缓冲区的内容和先前接收的数据。	None
3	当SPI无法传输数据时，串行传输在从模式下启动。	• 串行传输被暂停 • 发送或接收数据丢失 • MIOn输出信号的驱动停止 • SPI功能被禁用	Underrun error
4	当接收缓冲区已满时，串行传输终止。	• 保留接收缓冲区的内容 • 缺少接收数据	溢出错误
5	全双工同步串行通信时接收到错误的奇偶校验位，并在以下模式下启用奇偶校验功能：● 收发主模式 • 收发从模式 • 只接收从模式	奇偶错误标志被置位	奇偶校验错误
6	当串行传输在多主模式下空闲时，SSLn0输入信号被置位。	• 将RSPCKn、MOSIn、SSLn1驱动到SSLn3输出信号停止 • SPI功能被禁用	模式故障错误
7	SSLn0输入信号在多主机模式下的串行传输期间被置位。	• 串行传输被暂停 • 发送或接收数据丢失 • 将RSPCKn、MOSIn、SSLn1驱动到SSLn3输出信号停止 • SPI功能被禁用	模式故障错误
8	SSLn0输入信号在从模式下的串行传输期间被否定。	• 串行传输被暂停 • 发送或接收数据丢失 • MIOn输出信号的驱动停止 • SPI功能被禁用	模式故障错误

在表34.10中描述的操作1中，SPI未检测到错误。防止写入SPDR期间的数据遗漏SPDR_HA，对SPDRSPDR_HA的写入必须使用发送缓冲区空中断请求（当SPSR.SPTEF标志为1)。

同样，SPI不会检测到操作2中的错误。为防止读取无关数据，必须使用SPI接收缓冲区满中断请求（当SPSR.SPRF标志为1时）执行SPDRSPDR_HA读取。

有关其他错误的信息，请参阅以下部分：

RA生态工作室

- Underrun error, indicated in operation 3, see section 34.3.9.4. Underrun errors
- Overrun error, indicated in operation 4, see section 34.3.9.1. Overrun errors
- Parity error, indicated in operation 5, see section 34.3.9.2. Parity errors
- Mode fault error, indicated in operations 6 to 8, see section 34.3.9.3. Mode fault errors
- For the transmit and receive interrupts, see section 34.3.7. Transmit Buffer Empty and Receive Buffer Full Interrupts.

34.3.9.1 Overrun errors

If a serial transfer ends when the receive buffer of SPDR/SPDR_HA is full, the SPI detects an overrun error and sets the SPSR.OVRF flag to 1. When the OVRF flag is 1, the SPI does not copy data from the shift register to the receive buffer, so the data prior to the error occurrence is retained in the receive buffer. To set the OVRF flag to 0, write 0 to the OVRF flag after the CPU reads SPSR with the OVRF flag set to 1.

Figure 34.37 shows an example of operation of the OVRF and SPRF flags. The SPSR and SPDR_HA accesses shown in Figure 34.37 indicate the condition of accesses to the SPSR and SPDR_HA register, where W denotes a write cycle, and R a read cycle. In this example, the SPI performs an 8-bit serial transfer when SPCMDm.CPHA bit is 1 and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

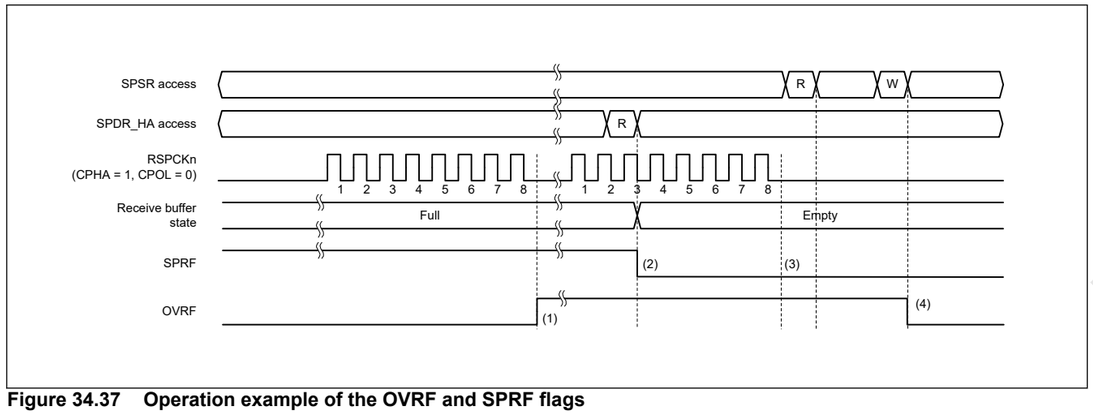

Figure 34.37 Operation example of the OVRF and SPRF flags

The operation of the flags at timings (1) to (4) in Figure 34.37 is as follows:

1. If a serial transfer terminates with the SPRF flag set to 1 (receive buffer full), the SPI detects an overrun error, and sets the OVRF flag to 1. The SPI does not copy the data in the shift register to the receive buffer. Even when the SPPE bit is 1, parity errors are not detected.
2. When SPDR/SPDR_HA is read, the SPI outputs the data in the receive buffer. The SPRF flag is then set to 0. The receive buffer becoming empty does not set the OVRF flag to 0.
3. If the serial transfer ends with the OVRF flag set to 1 (overrun error occurred), the SPI does not copy data in the shift register to the receive buffer (the SPRF flag does not set to 1). A receive buffer full interrupt is not generated. Even when the SPPE bit is 1, parity errors are not detected. In an overrun error state when the SPI does not copy the received data from the shift register to the receive buffer, on termination of the serial transfer, the SPI determines that the shift register is empty. This enables data transfer from the transmit buffer to the shift register.
4. If 0 is written to the OVRF flag after SPSR is read when the OVRF flag is 1, the OVRF flag clears is set to 0.

The occurrence of an overrun can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. When executing a serial transfer, you must ensure that overrun errors are detected early, for example by reading SPSR immediately after SPDR/SPDR_HA/SPDR_BY is read.

If an overrun error occurs and the OVRF flag sets to 1, normal reception operations cannot be performed until the OVRF flag is set to 0.

●欠载错误，在操作3中指示，请参阅第34.3.9.4节。欠载错误

●超限错误，在操作4中显示，参见第34.3.9.1节。溢出错误

●奇偶校验错误，在操作5中指示，参见第34.3.9.2节。奇偶校验错误

●模式故障错误，在操作6到8中指示，参见第34.3.9.3节。模式故障错误

●关于发送和接收中断，请参见第34.3.7节。发送缓冲区空和接收缓冲区满中断。

34.3.9.1 溢出错误

如果在SPDRSPDR_HA的接收缓冲区已满时串行传输结束，则SPI检测到溢出错误并设置SPSR.OVRF标志为1。当OVRF标志为1时，SPI不会将数据从移位寄存器复制到接收缓冲区，因此错误发生之前的数据会保留在接收缓冲区中。要将OVRF标志设置为0，请在CPU读取OVRF标志设置为1的SPSR后将0写入OVRF标志。

图34.37显示了OVRF和SPRF标志的操作示例。SPSR和SPDR_HA访问显示在图34.37表示访问SPSR和SPDR_HA寄存器的条件，其中W表示写周期，R表示读周期。在本例中，当SPCMDm.CPHA位为1且SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形中为RSPCKn给出的数字表示RSPCK周期数，例如传输的次数位。

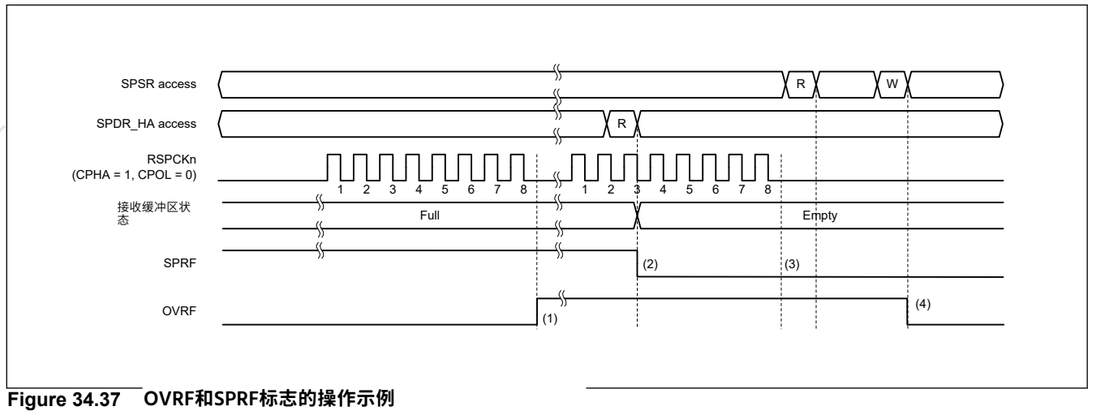

Figure 34.37 OVRF和SPRF标志的操作示例

图34.37中时间(1)到(4)的标志操作如下：

1.如果串行传输终止且SPRF标志设置为1（接收缓冲区已满），则SPI检测到溢出错误，并将OVRF标志设置为1。SPI不会将移位寄存器中的数据复制到接收缓冲区.即使SPPE位为1，也不会检测到奇偶校验错误。

2.读取SPDRSPDR_HA时，SPI输出接收缓冲区中的数据。然后SPRF标志设置为0。接收缓冲区变空不会将OVRF标志设置为0。

3.如果串行传输结束时OVRF标志设置为1（发生溢出错误），则SPI不会将移位寄存器中的数据复制到接收缓冲区（SPRF标志不设置为1）。不产生接收缓冲区满中断。即使SPPE位为1，也不会检测到奇偶校验错误。在SPI未将接收到的数据从移位寄存器复制到接收缓冲区的溢出错误状态下，在串行传输终止时，SPI确定移位寄存器为空。这使数据能够从发送缓冲器传输到移位寄存器。

4.如果在OVRF标志为1时读取SPSR后向OVRF标志写入0，则OVRF标志清除设置为0。

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查溢出的发生。
执行串行传输时，必须确保及早检测到溢出错误，例如在读取SPDRSPDR_HASPDR_BY后立即读取SPSR。

如果发生溢出错误并且OVRF标志设置为1，则在OVRF标志设置为0之前无法执行正常接收操作。

RA生态工作室

When the RSPCK auto-stop function is enabled (SPCR2.SCKASE = 1) in master mode, an overrun error does not occur. Figure 34.38 and Figure 34.39 show the clock stop waveform when a serial transfer continues while the receive buffer is full in master mode.

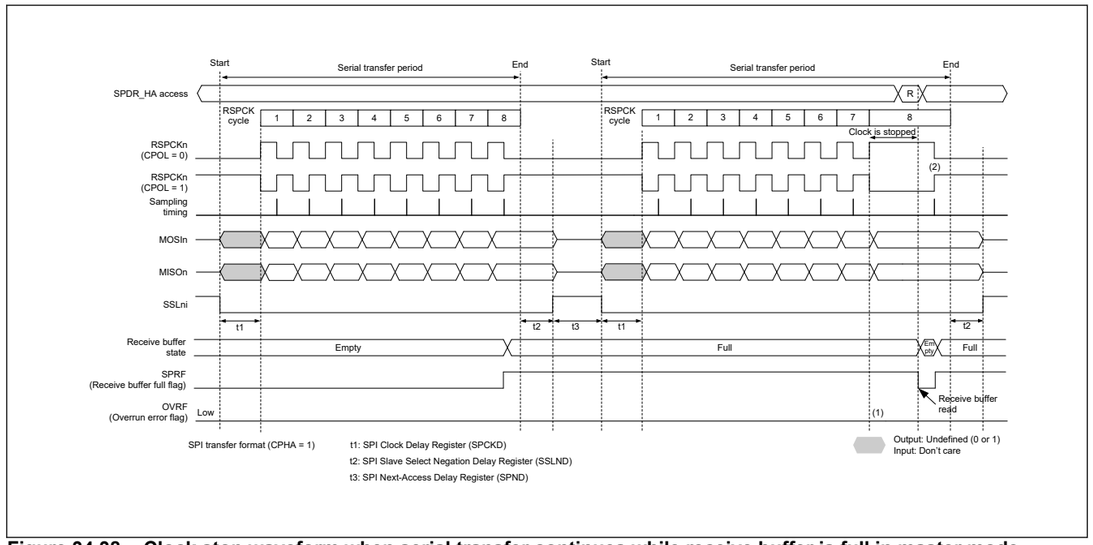

Figure 34.38 Clock stop waveform when serial transfer continues while receive buffer is full in master mode (CPHA = 1)

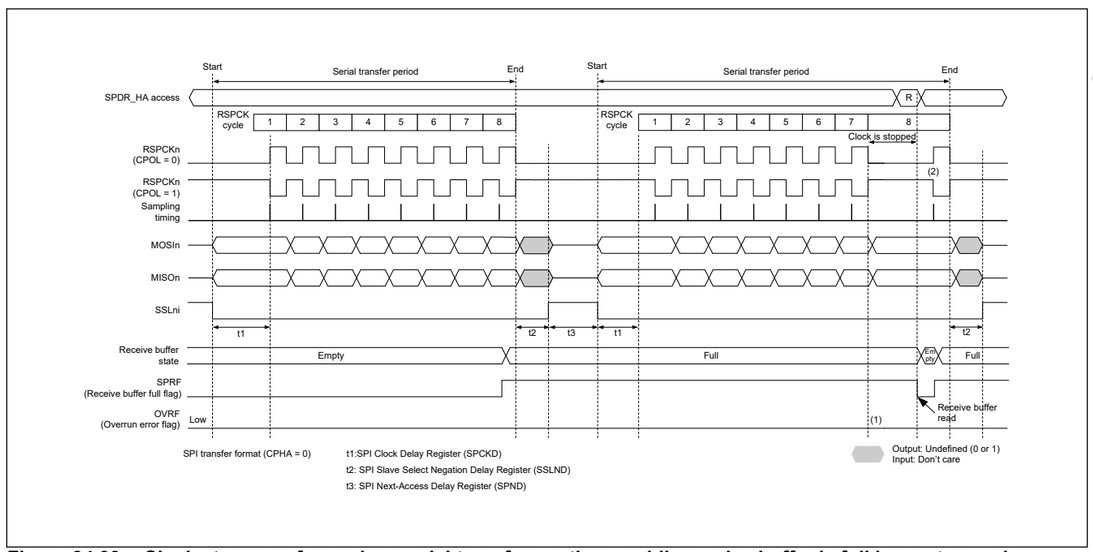

Figure 34.39 Clock stop waveform when serial transfer continues while receive buffer is full in master mode (CPHA = 0)

The operation of the flags at timings (1) and (2) in Figure 34.38 and Figure 34.39 is as follows:

1. When the receive buffer is full, an overrun error does not occur because the RSPCK clock is stopped.
2. If SPDR/SPDR_HA is read while the clock is stopped, data in the receive buffer can be read. The RSPCK clock restarts after reading the receive buffer (after the SPSR.SPRF flag is set to 0).

在主机模式下启用RSPCK自动停止功能（SPCR2.SCKASE=1）时，不会发生溢出错误。
图34.38和图34.39显示了在主机模式下接收缓冲器已满时串行传输继续时的时钟停止波形。

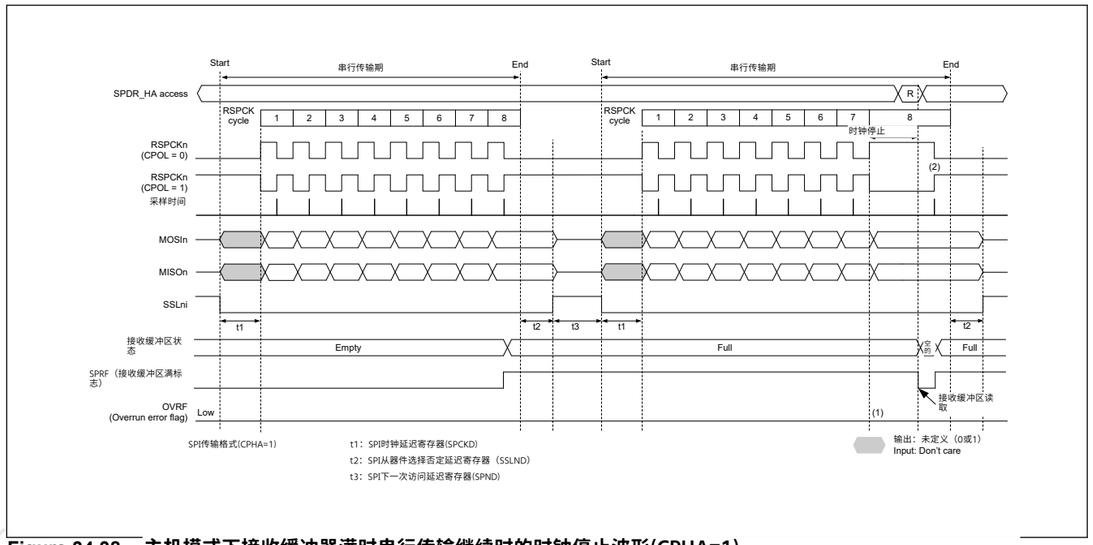

Figure 34.38 主机模式下接收缓冲器满时串行传输继续时的时钟停止波形(CPHA=1)

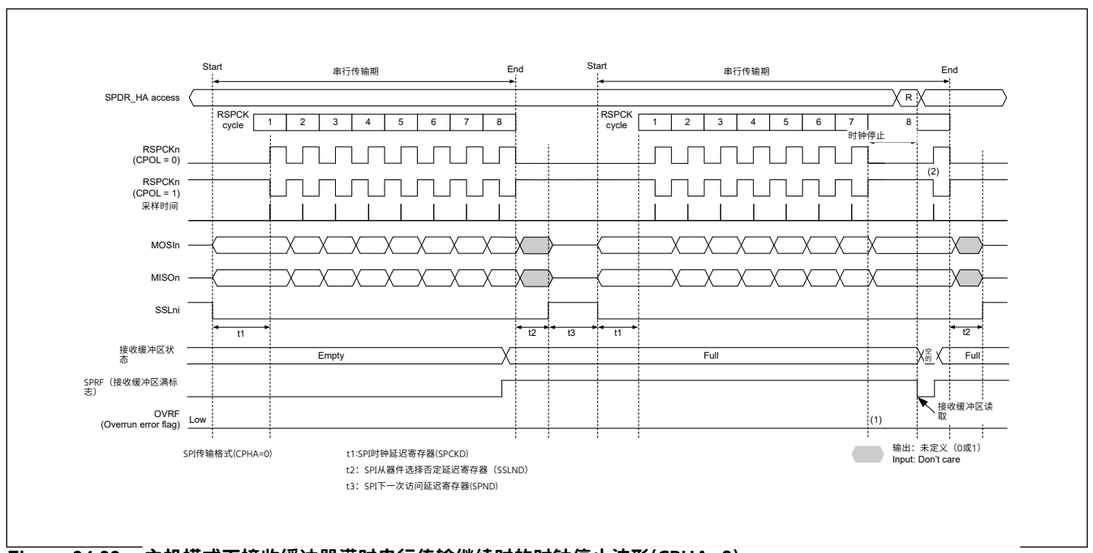

Figure 34.39 主机模式下接收缓冲器满时串行传输继续时的时钟停止波形(CPHA=0)

图34.38和图34.39中时序（1）和（2）的标志操作如下：

1.当接收缓冲区已满时，不会发生溢出错误，因为RSPCK时钟已停止。

2.如果在时钟停止时读取SPDRSPDR_HA，则可以读取接收缓冲区中的数据。RSPCK时钟在读取接收缓冲区后重新启动（在SPSR.SPRF标志设置为0后）。

Overrun error does not occur when RSPCK automatic stop function is enabled for transfer with no delay of between frames during burst transfer in master mode. Figure 34.40 and Figure 34.41 show the clock stop waveform, when there is no delay between frames at burst transfer and the serial transfer continues in the reception buffer full state.

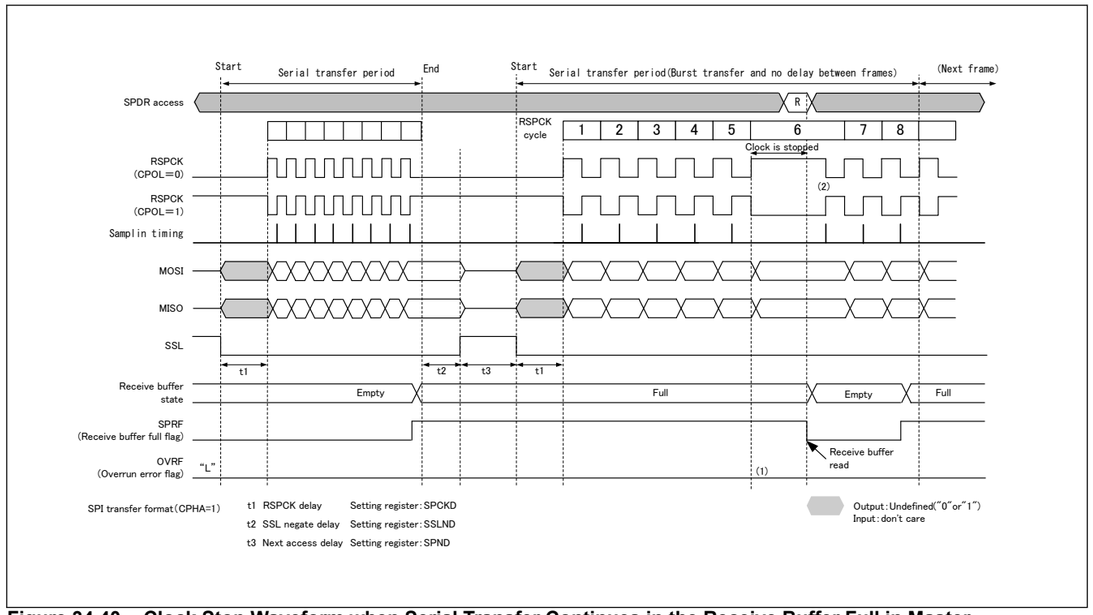

Figure 34.40 Clock Stop Waveform when Serial Transfer Continues in the Receive Buffer Full in Master Mode (at burst transfer and no delay between frames CPHA = 1)

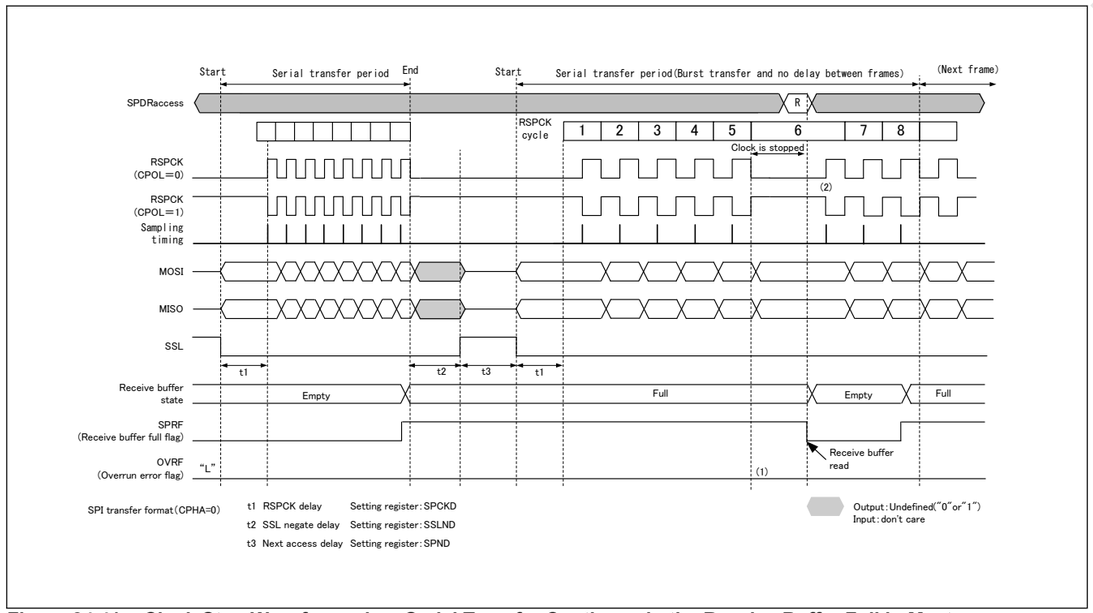

Figure 34.41 Clock Stop Waveform when Serial Transfer Continues in the Receive Buffer Full in Master Mode (at burst transfer and no delay between frames CPHA = 0)

The following describes operation of flags at timings (1) and (2) in the figure above.

在主模式下的突发传输期间，如果传输启用RSPCK自动停止功能且帧之间没有延迟，则不会发生溢出错误。图34.40和图34.41显示了时钟停止波形，当突发传输的帧之间没有延迟并且串行传输在接收缓冲器满状态下继续时。

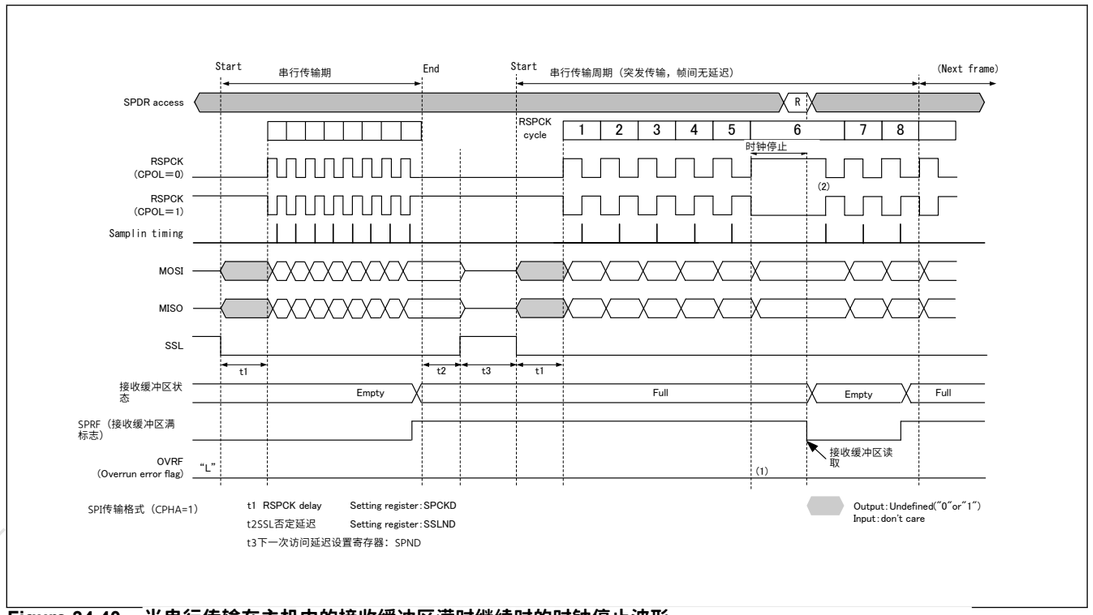

Figure 34.40 当串行传输在主机中的接收缓冲区满时继续时的时钟停止波形模式（突发传输且帧之间无延迟CPHA=1）

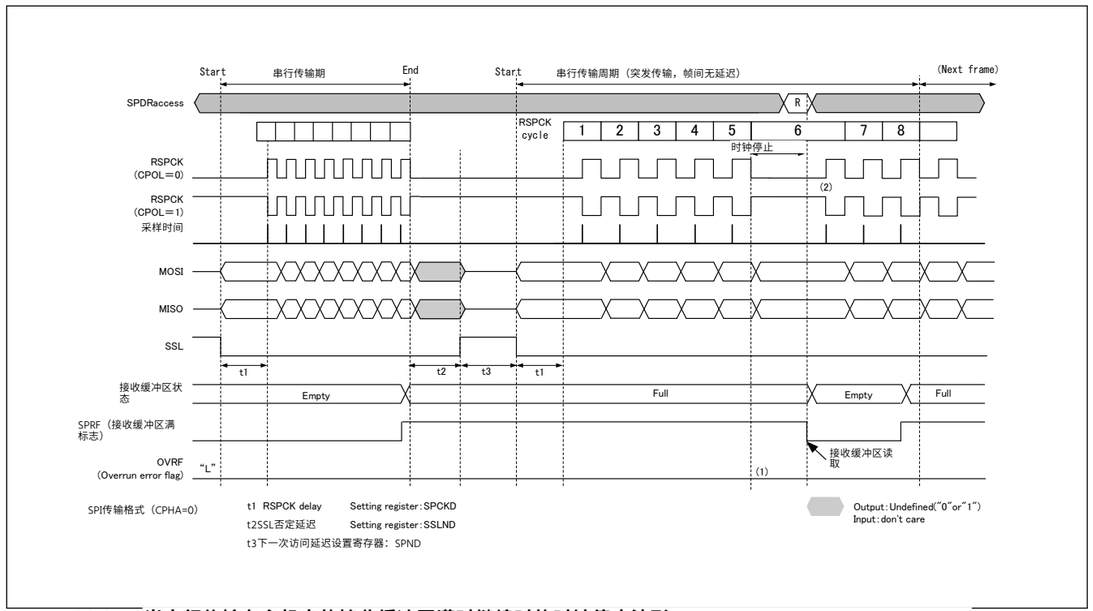

Figure 34.41 当串行传输在主机中的接收缓冲区满时继续时的时钟停止波形模式（突发传输且帧之间无延迟CPHA=0）

下面描述在上图中的时间(1)和(2)的标志的操作。

1. While the receive buffer is full, the RSPCK clock is deactivated and no overrun error occurs.
2. Receive buffer data can be read by reading SPDR during clock stop. After the receive buffer data has been read (after the SPSR.SPRF flag has been cleared to 0), the RSPCK clock restarts.

34.3.9.2 Parity errors

When full-duplex synchronous serial communications is performed with the SPCR.TXMD bit set to 0 and the SPCR2.SPPE bit set to 1, when serial transfer ends, the SPI checks whether there are parity errors. On detecting a parity error in the received data, the SPI sets the SPSR.PERF flag to 1. Because the SPI does not copy data in the shift register to the receive buffer when the SPSR.OVRF flag is set to 1, parity error detection is not performed for the received data. To set the PERF flag to 0, write 0 to the PERF flag after the SPSR register is read with the PERF flag set to 1.

Figure 34.42 shows an example of operation of the OVRF and PERF flags. The SPSR access shown in Figure 34.42 indicates the condition of access to the register, where W denotes a write cycle, and R a read cycle. In this example, full-duplex serial communication is performed while the SPCR2.SPPE bit is 1. The SPI performs an 8-bit serial transfer when SPCMDm.CPHA bit is 1 and the SPCMDm.CPOL bit is 0. The numbers given for RSPCKn in the waveform represent the number of RSPCK cycles, such as the number of transferred bits.

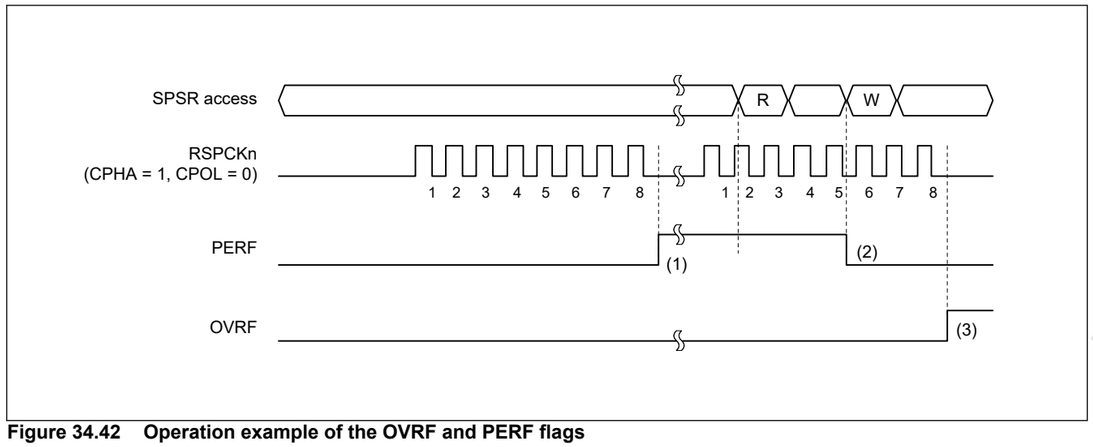

Figure 34.42 Operation example of the OVRF and PERF flags

The operation of the flags at timings (1) to (3) in Figure 34.42 is as follows:

1. If a serial transfer terminates with the SPI not detecting an overrun error, the SPI copies the data in the shift register to the receive buffer. The SPI checks the received data at this time and sets the PERF flag to 1 if a parity error is detected.
2. If 0 is written to the PERF flag after the SPSR register is read when the PERF flag is 1, the PERF flag is set to 0.
3. When the SPI detects an overrun error and serial transfer is terminated, the data in the shift register is not copied to the receive buffer. The SPI does not perform parity error detection at this time.

Parity errors can be checked for by either reading the SPSR register or using an SPI error interrupt and reading the SPSR register. When executing a serial transfer, such checks are required to ensure early detection of parity errors. When the SPI is used in master mode, the pointer value to the SPCMDm register at the occurrence of the error can be checked by reading the SPSSR.SPECM[2:0] bits (Only SPI0).

34.3.9.3 Mode fault errors

The SPI operates in multi-master mode when the SPCR.MSTR bit is 1, the SPCR.SPMS bit is 0, and the SPCR.MODFEN bit is 1. If the active level is input for the SSLn0 input signal of the SPI in multi-master mode, the SPI detects a mode fault error regardless of the status of the serial transfer, and sets the SPSR.MODF flag to 1. On detecting the mode fault error, the SPI copies the value of the pointer to SPCMDm to the SPDCR.SPFC[1:0] bits. The active level of the SSLn0 signal is determined by the SSLP.SSL0P bit.

When the MSTR bit is 0, the SPI operates in slave mode. The SPI detects a mode fault error if the MODFEN bit of the SPI in slave mode is 1, and the SPMS bit is 0, and if the SSLn0 input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched).

1.当接收缓冲器已满时，RSPCK时钟被停用，不会发生溢出错误。

2.在时钟停止时，可以通过读取SPDR来读取接收缓冲数据。读取接收缓冲区数据后（在SPSR.SPRF标志被清除为0后），RSPCK时钟重新启动。

34.3.9.2 奇偶校验错误

当SPCR.TXMD位设置为0且SPCR2.SPPE位设置为1进行全双工同步串行通信时，串行传输结束时，SPI会检查是否有奇偶校验错误。在检测到接收数据中的奇偶校验错误时，SPI将SPSR.PERF标志设置为1。因为当SPSR.OVRF标志设置为1时，SPI不会将移位寄存器中的数据复制到接收缓冲区，所以奇偶校验错误检测不针对接收到的数据执行。要将PERF标志设置为0，请在读取SPSR寄存器并将PERF标志设置为1后将0写入PERF标志。

图34.42显示了OVRF和PERF标志的操作示例。图34.42所示的SPSR访问表示访问寄存器的条件，其中W表示写周期，R表示读周期。在本例中，当SPCR2.SPPE位为1时执行全双工串行通信。当SPCMDm.CPHA位为1且SPCMDm.CPOL位为0时，SPI执行8位串行传输。波形表示RSPCK周期数，例如传输的位数。

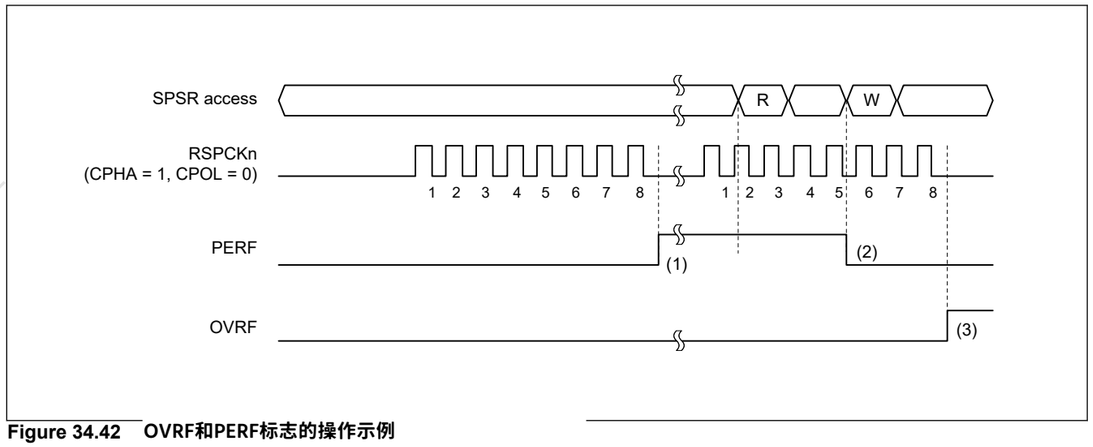

Figure 34.42 OVRF和PERF标志的操作示例

图34.42中时间(1)到(3)的标志操作如下：

1.如果串行传输终止且SPI未检测到溢出错误，则SPI将移位寄存器中的数据复制到接收缓冲区。此时SPI会检查接收到的数据，如果检测到奇偶校验错误，则将PERF标志设置为1。

2.如果在PERF标志为1时读取SPSR寄存器后将0写入PERF标志，则将PERF标志设置为0。

3.当SPI检测到溢出错误并终止串行传输时，移位寄存器中的数据不会复制到接收缓冲区。此时SPI不执行奇偶校验错误检测。

可以通过读取SPSR寄存器或使用SPI错误中断并读取SPSR寄存器来检查奇偶校验错误。在执行串行传输时，需要进行此类检查以确保及早发现奇偶校验错误。当SPI用于主机模式时，可以通过读取SPSSR.SPECM[2:0]位（仅SPI0）来检查发生错误时指向SPCMDm寄存器的指针值。

34.3.9.3 模式故障错误

当SPCR.MSTR位为1、SPCR.SPMS位为0、SPCR.MODFEN位为1时，SPI工作在多主机模式。如果在多主机模式下SPI的SSLn0输入信号输入有效电平-主模式，无论串行传输的状态如何，SPI都会检测到模式故障错误，并将SPSR.MODF标志设置为1。在检测到模式故障错误时，SPI将指向SPCMDm的指针的值复制到SPDCR.SPFC[1:0]位。SSLn0信号的有效电平由SSLP.SSL0P位决定。

当MSTR位为0时，SPI工作在从机模式。如果从机模式下SPI的MODFEN位为1，SPMS位为0，并且在串行传输期间（从驱动有效数据开始开始到获取最终有效数据的时间）。

RA生态工作室

On detecting a mode fault error, the SPI stops the driving of the output signals and clears the SPCR.SPE bit to 0 (see section 34.3.10. Initializing the SPI). For multi-master configuration, detection of a mode fault error is used to stop the driving of output signals and the SPI function, which allows the master to be released.

The occurrence of a mode fault error can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. Detecting mode-fault errors without using the SPI error interrupt requires polling of SPSR. When using the SPI in master mode, the value of the pointer to the SPCMDm register at the occurrence of the error can be checked by reading the SPSSR.SPECM[2:0] bits.

When the MODF flag is 1, writing 1 to the SPE bit is ignored by the SPI. To enable the SPI function after the detection of a mode fault error, the MODF flag must be set to 0.

34.3.9.4 Underrun errors

While the SPI is operating in slave mode (SPCR.MSTR bit = 0) and the Extended Communication Mode Select bit (ETXMD) in the SPI Control Register 3 (SPCR3) is set to 0, if serial transfer is started before transmit data output is ready with the SPCR.SPE bit set to 1 (SPI function enabled), the SPI detects an underrun error and sets the SPSR.MODF and SPSR.UDRF flags to 1.

On detecting an underrun error, the SPI stops the driving of output signals and clears the SPCR.SPE bit to 0 (see section 34.3.10. Initializing the SPI).

The occurrence of underrun errors can be checked either by reading SPSR or by using an SPI error interrupt and reading SPSR. Detecting underrun errors without using the SPI error interrupt requires polling of SPSR.

When the MODF flag is 1, writing 1 to the SPE bit is ignored by the SPI. To enable the SPI function after the detection of an underrun error, the MODF flag must be set to 0.

34.3.10 Initializing the SPI

If 0 is written to the SPCR.SPE bit or if the SPI sets the SPE bit to 0 because it detected a mode fault error or an underrun error, the SPI disables the SPI function and initializes some of the module functions. When a system reset is generated, the SPI initializes all of the module functions. This section describes initialization by clearing of the SPCR.SPE bit and by a system reset.

34.3.10.1 Initialization by clearing of the SPCR.SPE bit

When the SPCR.SPE bit is set to 0, the SPI initializes by:

- Suspending any serial transfer that is being executed
- Stopping the driving of output signals (Hi-Z) in slave mode
- Initializing the internal state of the SPI
- Initializing the transmit buffer of the SPI (the SPSR.STEF flag sets to 1)

Initialization by clearing of the SPE bit does not initialize the control bits of the SPI. For this reason, the SPI can be started in the same transfer mode in use prior to initialization when the SPE bit is set to 1 again.

The SPSR.CENDF, SPSR.SPRF, SPSR.OVRF, SPSR.MODF, SPSR.PERF, and SPSR.UDRF flags are not initialized, and the value of the SPI Sequence Status Register (SPSSR) is not initialized. Therefore, even after the SPI is initialized, data from the receive buffer can be read to check the communication completion status and the error status during an SPI transfer.

The transmit buffer is initialized to an empty state (the SPSR.SPTEF flag sets to 1). Therefore, if the SPCR.SPTIE bit is set to 1 after SPI initialization, a transmit buffer empty interrupt is generated. To disable any transmit buffer empty interrupts when the SPI is initialized, write 0 to the SPTIE bit simultaneously while writing 0 to the SPE bit.

34.3.10.2 Initialization by system reset

A system reset completely initializes the SPI by initializing all SPI control bits, status bits, and data registers, in addition to meeting the requirements described in section 34.3.10.1. Initialization by clearing of the SPCR.SPE bit.

在检测到模式故障错误时，SPI停止驱动输出信号并将SPCR.SPE位清零（参见第34.3.10节。初始化SPI）。对于多主机配置，检测到模式故障错误用于停止驱动输出信号和SPI功能，从而释放主机。

可以通过读取SPSR或使用SPI错误中断并读取SPSR来检查模式故障错误的发生。在不使用SPI错误中断的情况下检测模式错误需要轮询SPSR。在主模式下使用SPI时，可以通过读取SPSSR.SPECM[2:0]位来检查发生错误时指向SPCMDm寄存器的指针的值。

当MODF标志为1时，向SPE位写入1会被SPI忽略。要在检测到模式故障错误后启用SPI功能，MODF标志必须设置为0。

34.3.9.4 Underrun errors

当SPI工作在从机模式（SPCR.MSTR位=0）并且SPI控制寄存器3（SPCR3）中的扩展通信模式选择位（ETXMD）设置为0时，如果串行传输在发送数据输出之前开始准备好将SPCR.SPE位设置为1（启用SPI功能），SPI检测到欠载错误并将SPSR.MODF和SPSR.UDRF标志设置为1。

检测到欠载错误时，SPI停止驱动输出信号并将SPCR.SPE位清零（参见第34.3.10节。初始化SPI）。

可以通过读取SPSR或使用SPI错误中断并读取
SPSR。在不使用SPI错误中断的情况下检测欠载错误需要轮询SPSR。

当MODF标志为1时，向SPE位写入1会被SPI忽略。要在检测到欠载错误后启用SPI功能，MODF标志必须设置为0。

34.3.10 初始化SPI

如果将0写入SPCR.SPE位，或者如果SPI由于检测到模式故障错误或欠载错误而将SPE位设置为0，则SPI将禁用SPI功能并初始化一些模块功能。当产生系统复位时，SPI初始化所有模块功能。本节介绍通过清除SPCR.SPE位和系统复位进行的初始化。

34.3.10.1 通过清除SPCR.SPE位进行初始化

当SPCR.SPE位设置为0时，SPI通过以下方式初始化：

●暂停任何正在执行的串行传输

●从机模式下停止驱动输出信号（Hi-Z）

●初始化SPI的内部状态

●初始化SPI的发送缓冲区（SPSR.STEF标志设置为1）

通过清除SPE位进行的初始化不会初始化SPI的控制位。因此，当SPE位再次设置为1时，SPI可以在初始化之前以相同的传输模式启动。

SPSR.CENDF、SPSR.SPRF、SPSR.OVRF、SPSR.MODF、SPSR.PERF和SPSR.UDRF标志未初始化，SPI序列状态寄存器(SPSSR)的值未初始化。因此，即使在SPI初始化之后，也可以从接收缓冲区读取数据，以检查SPI传输期间的通信完成状态和错误状态。

发送缓冲区初始化为空状态（SPSR.SPTEF标志设置为1）。因此，如果SPCR.SPTIE位在SPI初始化后设置为1，则会产生发送缓冲区空中断。要在SPI初始化时禁用任何发送缓冲区空中断，请同时将0写入SPTIE位，同时将0写入SPE位。

34.3.10.2 通过系统复位初始化

除了满足第34.3.10.1节中描述的要求外，系统复位还通过初始化所有SPI控制位、状态位和数据寄存器来完全初始化SPI。通过清除SPCR.SPE位进行初始化。

34.3.11 SPI Operation

34.3.11.1 Master mode operation

The only difference between single- and multi-master mode operation is the use of mode fault error detection (see section 34.3.9. Error Detection). In single-master mode, the SPI does not detect mode fault errors whereas in multi-master mode, it does. This section explains operations that are common to both modes.

(1) Starting a serial transfer

The SPI updates the data in the transmit buffer (SPTX) when data is written to the SPI Data Register (SPDR/SPDR_HA) with the SPI transmit buffer empty, data for the next transfer is not set, and the SPSR.STEF flag is 0. When the shift register is empty after the number of frames set in the SPDCR.SPFC[1:0] bits are written to the SPDR/SPDR_HA/SPDR_BY, the SPI copies data from the transmit buffer to the shift register and starts serial transfer. On copying transmit data to the shift register, the SPI changes the status of the shift register to full. On termination of the serial transfer, it changes the status of the shift register to empty. The status of the shift register cannot be referenced.

The polarity of the SSLni output pins depends on the SSLP register settings. For details on the SPI transfer format, see section 34.3.5. Transfer Formats.

(2) Terminating a serial transfer

Regardless of the SPCMDm.CPHA bit setting, the SPI terminates the serial transfer after transmitting an RSPCKn edge associated with the final sampling timing. If free space is available in the receive buffer (SPRX) (the SPSR.SPRF flag is 0), on termination of the serial transfer, the SPI copies data from the shift register to the receive buffer of the SPDR/SPDR_HA register.

The final sampling timing varies depending on the bit length of transfer data. In master mode, the SPI data length depends on the SPCMDm.SPB[3:0] bit settings. The polarity of the SSLni output pin depends on the SSLP register settings. For details on the SPI transfer format, see section 34.3.5. Transfer Formats.

(3) Sequence control

The transfer format used in master mode is determined by the SPSCR, SPCMDm, SPBR, SPCKD, SSLND, and SPND registers.

The SPSCR register determines the sequence configuration for serial transfers that are executed by the SPI in master mode. The following items are set in the SPCMDm register:

- SSLni pin output signal value
- MSB- or LSB-first
- Data length
- Some of the bit rate settings
- RSPCK polarity and phase
- Whether SPCKD is to be referenced
- Whether SSLND is to be referenced
- Whether SPND is to be referenced

SPBR holds some of the bit rate settings, including SPCKD (SPI clock delay), SSLND (SSL negation delay), and SPND (next-access delay).

Based on the sequence length assigned in SPSCR, the SPI makes up a sequence comprised of a part or all of the SPCMDm register. The SPI contains a pointer to the SPCMDm register that makes up the sequence. The value of this pointer can be checked by reading the SPSSR.SPCP[2:0] bits. When the SPCR.SPE bit is set to 1 and the SPI function is enabled, the SPI loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. The SPI increments the pointer each time the next-access delay period for a data transfer ends. On completion of the serial transfer that corresponds to the final command in the sequence, the SPI sets the pointer to SPCMD0, and in this way the sequence is executed repeatedly.

34.3.11 SPI操作

34.3.11.1 主模式操作

单主机模式和多主机模式操作之间的唯一区别是使用模式故障错误检测（请参阅第34.3.9节。错误检测）。在单主机模式下，SPI不检测模式故障错误，而在多主机模式下，它可以。本节介绍两种模式共有的操作。

(1) 开始串行传输

当数据写入SPI数据寄存器(SPDRSPDR_HA)且SPI发送缓冲区为空、未设置下一次传输的数据且SPSR.STEF标志为0时，SPI更新发送缓冲区(SPTX)中的数据。当SPDCR.SPFC[1:0]位设置的帧数写入SPDRSPDR_HASPDR_BY后移位寄存器为空时，SPI将数据从发送缓冲区复制到移位寄存器并开始串行传输。在将发送数据复制到移位寄存器时，SPI将移位寄存器的状态更改为已满。在串行传输终止时，它将移位寄存器的状态更改为空。无法引用移位寄存器的状态。

SSLni输出引脚的极性取决于SSLP寄存器设置。有关SPI传输格式的详细信息，请参见第34.3.5节。传输格式。

(2) 终止串行传输

无论SPMDm.CPHA位设置如何，SPI在发送与最终采样时序相关的RSPCKn边沿后终止串行传输。如果接收缓冲区(SPRX)中有可用空间（SPSR.SPRF标志为0），则在串行传输终止时，SPI将数据从移位寄存器复制到SPDRSPDR_HA寄存器的接收缓冲区。

最终的采样时序根据传输数据的位长而变化。在主模式下，SPI数据长度取决于SPMDm.SPB[3:0]位设置。SSLni输出引脚的极性取决于SSLP寄存器设置。有关SPI传输格式的详细信息，请参见第34.3.5节。传输格式。

(3) 顺序控制

主机模式中使用的传输格式由SPSCR、SPCMDm、SPBR、SPCKD、SSLND和SPND寄存器确定。

SPSCR寄存器确定由SPI在主模式下执行的串行传输的序列配置。
在SPCMDm寄存器中设置以下项目：

●SSLni管脚输出信号值

- MSB- or LSB-first

●数据长度

●一些比特率设置

●RSPCK极性和相位

●是否引用SPCKD

●是否引用SSLND

●是否引用SPND

SPBR保存一些比特率设置，包括SPCKD（SPI时钟延迟）、SSLND（SSL否定延迟）和SPND（下一次访问延迟）。

根据在SPSCR中分配的序列长度，SPI组成一个由部分或全部SPMDm寄存器组成的序列。SPI包含一个指向构成序列的SPCMDm寄存器的指针。该指针的值可以通过读取SPSSR.SPCP[2:0]位来检查。当SPCR.SPE位设置为1且SPI功能使能时，SPI加载指向SPCMD0中命令的指针，并在串行传输开始时将SPCMD0设置合并到传输格式中。每次数据传输的下一个访问延迟周期结束时，SPI都会递增指针。在完成对应于序列中最终命令的串行传输后，SPI将指针设置为

SPCMD0，并以这种方式重复执行序列。

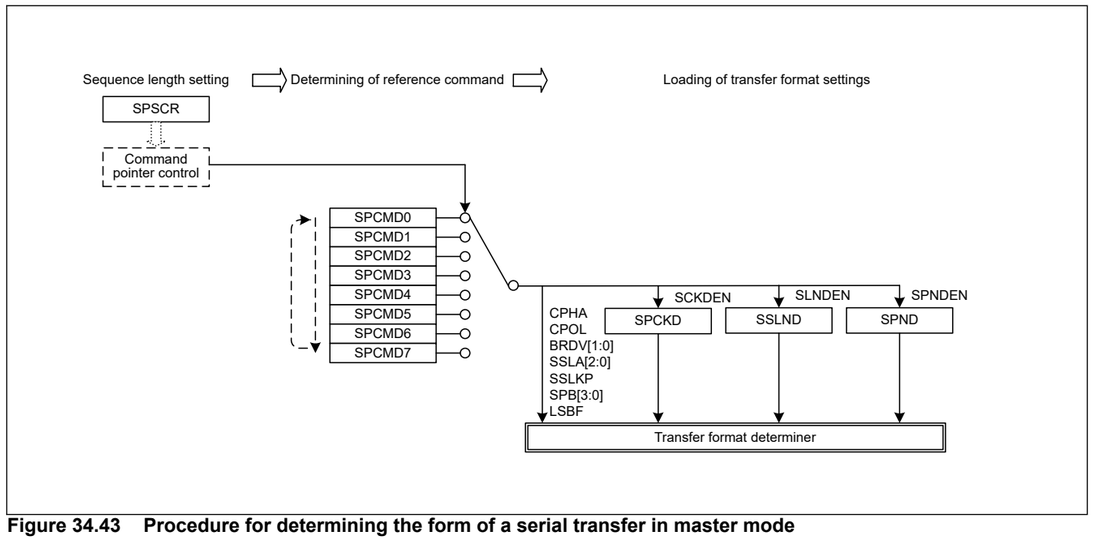

Figure 34.43 Procedure for determining the form of a serial transfer in master mode

In this section, a frame is the combination of the data in SPDR/SPDR_HA and the settings in SPCMDm.

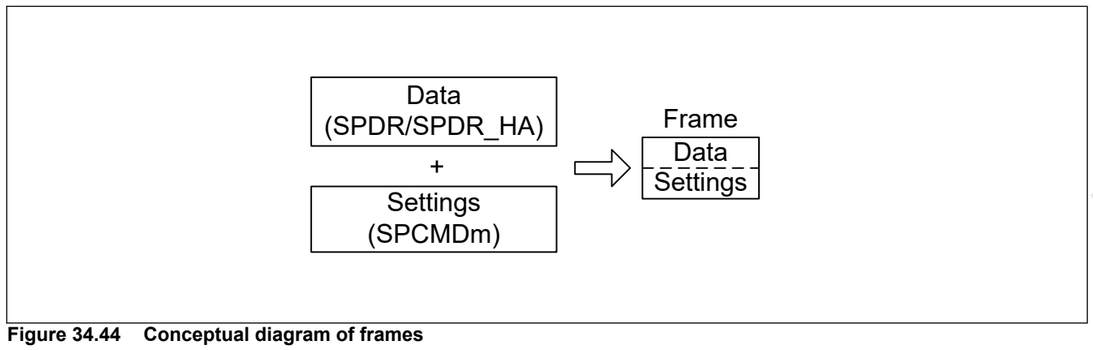

Figure 34.44 Conceptual diagram of frames

Figure 34.45 shows the correspondence between the commands and the transmit and receive buffers in the sequence of operations specified by the settings in Table 34.4.

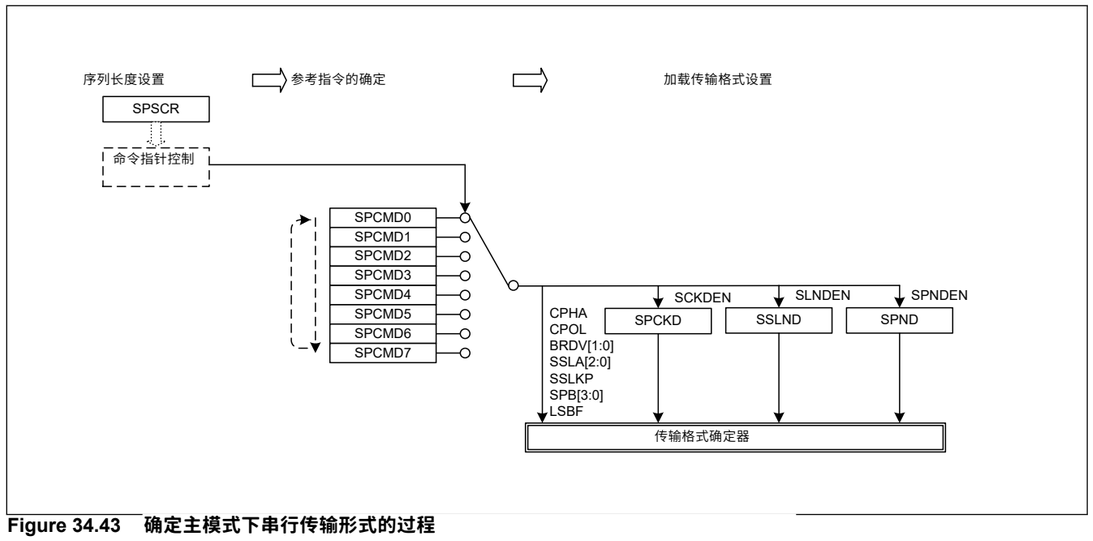

Figure 34.43 确定主模式下串行传输形式的过程

在本节中，帧是SPDRSPDR_HA中的数据和SPMDm中的设置的组合。

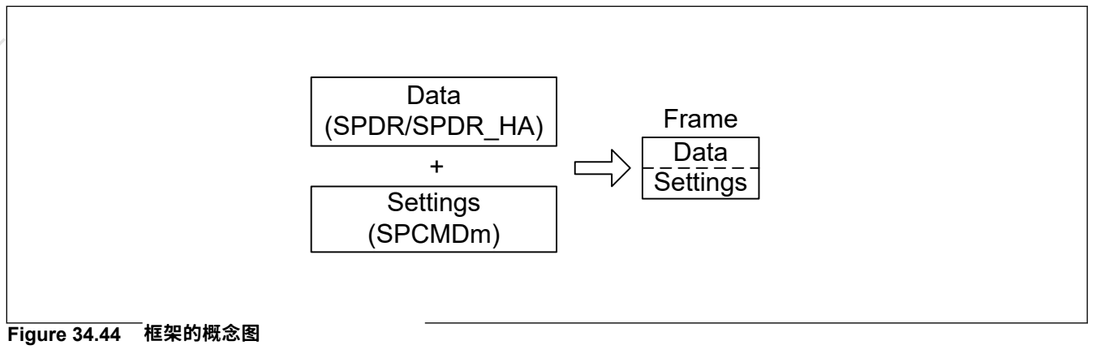

Figure 34.44 框架的概念图

图34.45显示了在表34.4中的设置指定的操作序列中命令与发送和接收缓冲区之间的对应关系。

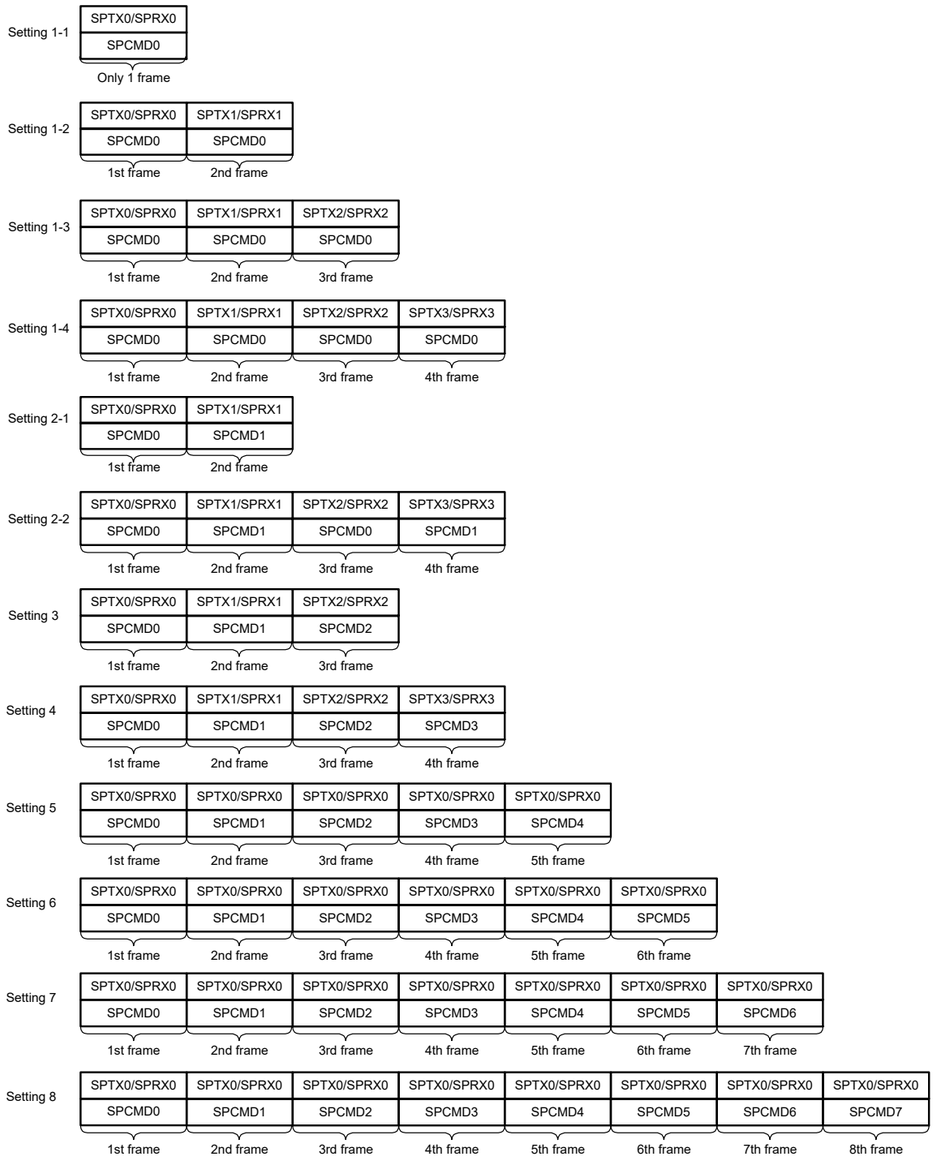

Figure 34.45 Correspondence between SPI Command Register and transmit and receive buffers in sequence operations

(4) Burst transfers

If the SPCMDm.SSLKP bit that the SPI references during the current serial transfer is 1, the SPI maintains the SSLni signal level during the serial transfer until the beginning of the SSLni signal assertion for the next serial transfer. If the SSLni

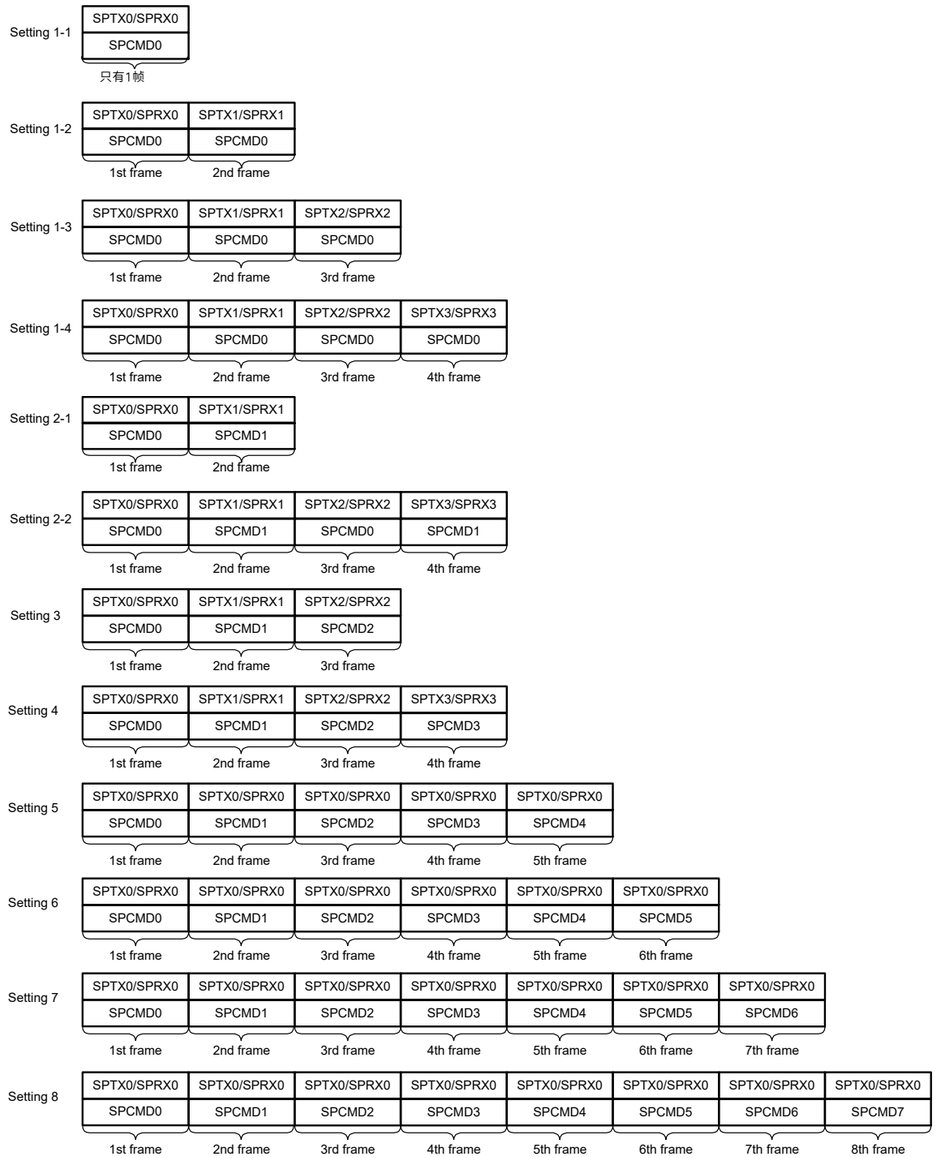

Figure 34.45 顺序操作中SPI命令寄存器与发送接收缓冲区的对应关系

(4) 突发传输

如果SPI在当前串行传输期间引用的SPCMDm.SSLKP位为1，则SPI在串行传输期间保持SSLni信号电平，直到下一次串行传输的SSLni信号断言开始。如果SSLni

RA生态工作室

signal level for the next serial transfer is the same as the SSLni signal level for the current serial transfer, the SPI can execute continuous serial transfers while keeping the SSLni signal assertion status (burst transfer).

- When Between Burst Transfer Frames Delay Select bit (BFDS) of SPI control register 3 (SPCR3) is 0.

Figure 34.46 shows an example of an SSLni signal operation for a burst transfer that is implemented using the SPCMD0 and SPCMD1 register settings. This section describes SPI operations (1) to (8) shown in Figure 34.46.

Note: The polarity of the SSLni output signal depends on the SSLP register settings.

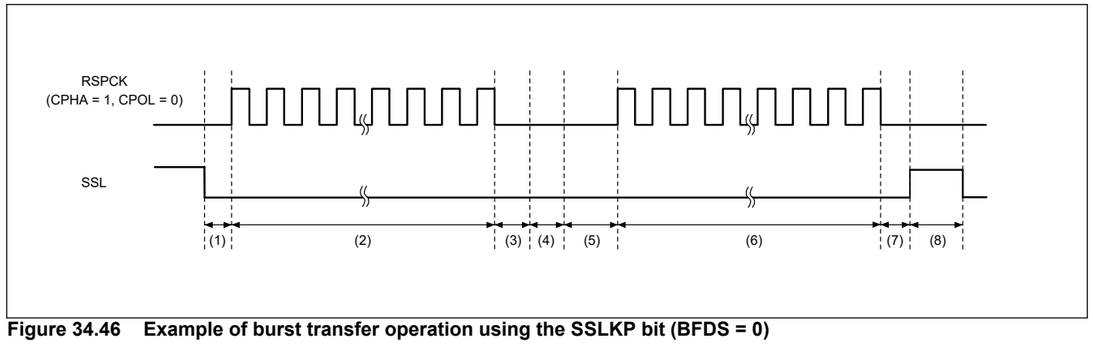

Figure 34.46 Example of burst transfer operation using the SSLKP bit (BFDS = 0)

The SPI operation at times (1) to (8) in the figure is as follows:

1. Based on the SPCMD0 settings, the SPI asserts the SSLni signal and inserts RSPCK delays.
2. The SPI executes serial transfers in accordance with the SPCMD0 settings.
3. The SPI inserts an SSL negation delay.
4. Because the SPCMD0.SSLKP bit is 1, the SPI keeps the SSLni signal value specified in SPCMD0. This period is sustained at a minimum for a period equal to the next-access delay in SPCMD0. If the shift register is empty after the passage of the minimum period, this period is sustained until the transmit data is stored in the shift register for the next transfer.
5. Based on the SPCMD1 settings, the SPI asserts the SSLni signal and inserts RSPCK delays.
6. The SPI executes serial transfers in accordance with the SPCMD1 settings.
7. Insert SSL negate delay.
8. Because the SPCMD1.SSLKP bit is 0, the SPI negates the SSLni signal. In addition, a next-access delay is inserted in accordance with SPCMD1.

If the SSLni signal output settings in the SPCMDm register where 1 is assigned to the SSLKP bit are different from the SSLni signal output settings in the SPCMDm register to be used in the next transfer, the SPI switches the SSLni signal status to SSLni signal assertion as shown in (5) in Figure 34.46. This corresponds to the command for the next transfer.

Note: If such an SSLni signal switching occurs, the slaves that drive the MISOn signal compete, and collision of signal levels might occur.

The SPI in master mode references the SSLni signal operation within the module when the SSLKP bit is not used. When the SPCMDm.CPHA bit is 0, the SPI can accurately start serial transfers by using the SSLni signal assertion for the next transfer that is detected internally.

- When Between Burst Transfer Frames Delay Select bit (BFDS) of SPI control register 3 (SPCR3) is 1.

Figure 34.47 shows an example of SSL signal operation when burst transfer is achieved by using the settings of SPCMD0 and SPCMD1. The following describes SPI operations of (1) to (6) shown in Figure 34.47. The SSL output signal polarity depends on the set SPI slave select polarity register (SSLP) value.

下一次串行传输的信号电平与当前串行传输的SSLni信号电平相同，SPI可以在保持SSLni信号断言状态（突发传输）的同时执行连续串行传输。

●当SPI控制寄存器3(SPCR3)的突发传输帧之间延迟选择位(BFDS)为0时。

图34.46显示了使用SPCMD0和SPCMD1寄存器设置实现的突发传输的SSLni信号操作示例。本节介绍图34.46所示的SPI操作(1)至(8)。

Note: SSLni输出信号的极性取决于SSLP寄存器设置。

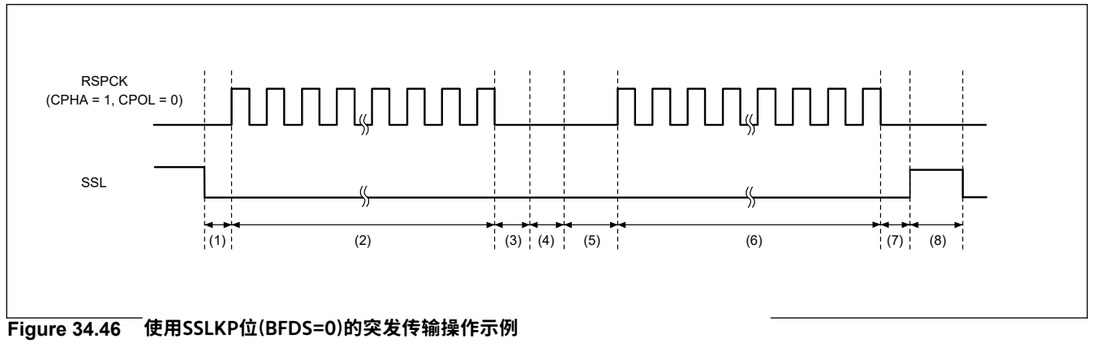

Figure 34.46 使用SSLKP位(BFDS=0)的突发传输操作示例

图中（1）到（8）时刻的SPI操作如下：

1.基于SPCMD0设置，SPI断言SSLni信号并插入RSPCK延迟。

2.SPI根据SPMD0设置执行串行传输。

3.SPI插入SSL否定延迟。

4.由于SPCMD0.SSLKP位为1，SPI保持SPCMD0中指定的SSLni信号值。这个时期是至少持续一段时间等于SPMD0中的下一次访问延迟。如果在经过最小周期后移位寄存器为空，则该周期一直持续到发送数据存储在移位寄存器中以供下一次传输。

5.基于SPCMD1设置，SPI断言SSLni信号并插入RSPCK延迟。

6.SPI根据SPMD1设置执行串行传输。

7.插入SSL否定延迟。

8.由于SPCMD1.SSLKP位为0，SPI否定SSLni信号。此外，根据SPMD1插入下一个访问延迟。

如果SPCMDm寄存器中SSLKP位为1的SSLni信号输出设置与下次传输使用的SPCMDm寄存器中的SSLni信号输出设置不同，则SPI将SSLni信号状态切换为SSLni信号断言，如下所示如图34.46(5)所示。这对应于下一次传输的命令。

Note: 如果发生这种SSLni信号切换，驱动MISon信号的从机竞争，可能会发生信号电平冲突。

当不使用SSLKP位时，主模式下的SPI参考模块内的SSLni信号操作。当。。。的时候SPCMDm.CPHA位为0，SPI可以通过使用SSLni信号断言来准确启动串行传输，以进行内部检测到的下一次传输。

●当SPI控制寄存器3(SPCR3)的突发传输帧之间延迟选择位(BFDS)为1时。

图34.47显示了使用SPCMD0和SPCMD1的设置实现突发传输时SSL信号操作的示例。下面描述图34.47所示的(1)到(6)的SPI操作。SSL输出信号极性取决于设置的SPI从机选择极性寄存器(SSLP)值。

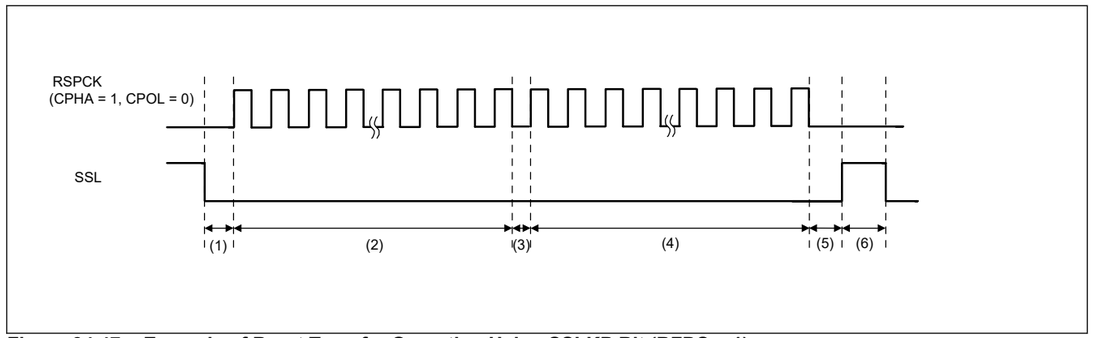

Figure 34.47 Example of Burst Transfer Operation Using SSLKP Bit (BFDS = 1)

1. Assert the SSL signal and insert an RSPCK delay according to SPCMD0. The RSPCK delay is inserted only the first frame of burst transmission.
2. Perform serial transfer according to SPCMD0. Wait last clock until the next transmit data is stored in the shift register, if the shift register is empty during RSPCK negate period between frames.
3. The value of SSL signal according to SPCMD0 was hold, because the SPCMD0.SSLKP bit is 1. RSPCK negate period between frames is 0.5RSPCK, if the shift register is not empty.
4. Perform serial transfer according to SPCMD1.
5. Insert SSL negate delay for the last frame.
6. The SSL signal is negated because the SSLKP bit in SPCMD1 is 0. Furthermore, the next-access delay is inserted according to SPCMD1.

(5) RSPCK delay (t1)

The RSPCK delay value of the SPI in master mode depends on the SPCMDm.SCKDEN bit setting and the SPCKD.SCKDL[2:0] bits setting. The SPI determines the SPCMDm register to be referenced during a serial transfer by pointer control, and determines an RSPCK delay using the SPCMDm.SCKDEN bit and SPCKD.SCKDL[2:0] bits, as listed in Table 34.11. For a definition of RSPCK delay, see section 34.3.5. Transfer Formats.

RSPCK delay insert to only the first frame of burst transmission, when transmit without “Between Burst Transfer Frames Delay”. (The SPCMD.SSLKP bit is 1 and the SPCR3.BFDS bit is 1.)

Table 34.11 Relationship between the SPCMDm.SCKDEN bit, SPCKD.SCKDL[2:0] bits, and RSPCK delay

SPCMDm.SCKDEN bit	SPCKD.SCKDL[2:0] bits	RSPCK delay
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(6) SSL negation delay (t2)

The SSL negation delay value of the SPI in master mode depends on the SPCMDm.SLNDEN bit setting and the SSLND.SLNDL[2:0] bits setting. The SPI determines the SPCMDm register to be referenced by pointer control during a serial transfer, and determines an SSL negation delay using the SPCMDm.SLNDEN bit and SSLND.SLNDL[2:0] bits, as listed in Table 34.12. For a definition of SSL negation delay, see section 34.3.5. Transfer Formats.

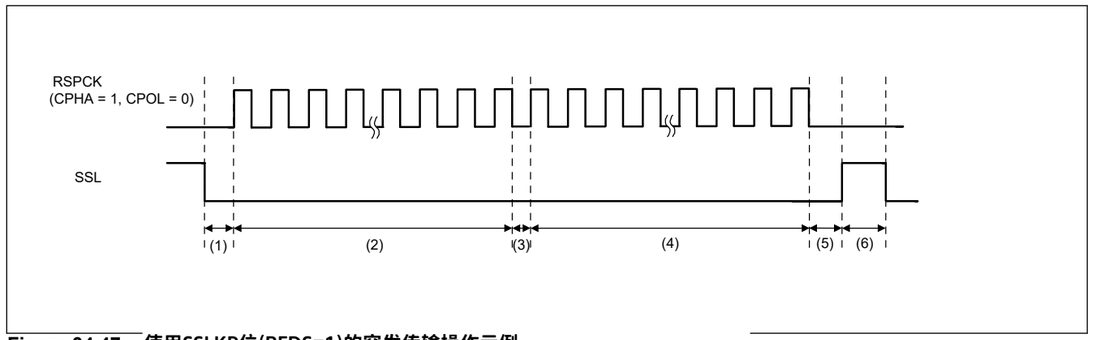

Figure 34.47 使用SSLKP位(BFDS=1)的突发传输操作示例

1.置位SSL信号并根据SPMD0插入一个RSPCK延迟。RSPCK延迟仅插入突发传输的第一帧。

2.根据SPMD0进行串行传输。如果在帧之间的RSPCK否定周期内移位寄存器为空，则等待最后一个时钟，直到下一个发送数据存储在移位寄存器中。

3.SPCMD0的SSL信号值被保持，因为SPCMD0.SSLKP位为1。如果移位寄存器不为空，则帧之间的RSPCK否定周期为0.5RSPCK。

4.根据SPMD1进行串行传输。

5.为最后一帧插入SSL否定延迟。

6.SSL信号被取反，因为SPCMD1中的SSLKP位为0。另外，根据SPCMD1插入下一个访问延迟。

(5) RSPCK delay (t1)

主机模式下SPI的RSPCK延迟值取决于SPMDm.SCKDEN位设置和SPCKD.SCKDL[2:0]位设置。SPI通过指针控制确定串行传输期间要参考的SPCMDm寄存器，并使用SPCMDm.SCKDEN位和SPCKD.SCKDL[2:0]位确定RSPCK延迟，如表34.11中所列。有关RSPCK延迟的定义，请参见第34.3.5节。传输格式。

当没有“BetweenBurstTransferFrames”传输时，RSPCK延迟仅插入到突发传输的第一帧延迟”。（SPCMD.SSLKP位为1，SPCR3.BFDS位为1。）

Table 34.11 SPCMDm.SCKDEN位、SPCKD.SCKDL[2:0]位和RSPCK延迟之间的关系

SPCMDm.SCKDEN bit	SPCKD.SCKDL[2:0] bits	RSPCK delay
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(6) SSL否定延迟(t2)

主模式下SPI的SSL否定延迟值取决于SPMDm.SLNDEN位设置和SSLND.SLNDL[2:0]位设置。SPI确定串行传输期间指针控制要引用的SPCMDm寄存器，并使用SPCMDm.SLNDEN位和SSLND.SLNDL[2:0]位确定SSL否定延迟，如表34.12中所列。有关SSL否定延迟的定义，请参阅第34.3.5节。传输格式。

An SSL negation delay is inserted to only the last frame of the burst transmission, that is, transmit without “between burst transfer frames delay”. (SPCMD.SSLKP bit is 1 and SPCR3.BFDS bit is 1).

Table 34.12 Relationship between the SPCMDm.SLNDEN bit, SSLND.SLNDL[2:0] bits, and SSL negation delay

SPCMDm.SLNDEN bit	SSLND.SLNDL[2:0] bits	SSL negation delay
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(7) Next-access delay (t3)

The next-access delay value of the SPI in master mode depends on the SPCMDm.SPNDEN bit setting and the SPND.SPNDL[2:0] bits setting. The SPI determines the SPCMDm register to be referenced during serial transfer by pointer control, and then determines a next-access delay during serial transfer using the SPCMDm.SPNDEN bit and SPND.SPNDL[2:0] bits, as listed in Table 34.13. For a definition of next-access delay, see section 34.3.5. Transfer Formats.

A next-Access delay is inserted to only the last frame of the burst transmission, that is, transmit without “between burst transfer frames delay”. (SPCMD.SSLKP bit is 1 and SPCR3.BFDS bit is 1).

Table 34.13 Relationship between the SPCMDm.SPNDEN bit, SPND.SPNDL[2:0] bits, and next-access delay

SPCMDm.SPNDEN bit	SPND.SPNDL[2:0] bits	Next-access delay
0	000b to 111b	1 RSPCK + 2 PCLKA
1	000b	1 RSPCK + 2 PCLKA
	001b	2 RSPCK + 2 PCLKA
	010b	3 RSPCK + 2 PCLKA
	011b	4 RSPCK + 2 PCLKA
	100b	5 RSPCK + 2 PCLKA
	101b	6 RSPCK + 2 PCLKA
	110b	7 RSPCK + 2 PCLKA
	111b	8 RSPCK + 2 PCLKA

(8) Initialization flow

Figure 34.48 shows an example of SPI initialization flow when the SPI is in master mode. For information on how to set up the Interrupt Controller Unit (ICU), DMAC and I/O ports, see the descriptions given in the individual blocks.

SSL否定延迟仅插入到突发传输的最后一帧，即没有“突发传输帧之间延迟”的传输。（SPCMD.SSLKP位为1，SPCR3.BFDS位为1）。

Table 34.12 SPCMDm.SLNDEN位、SSLND.SLNDL[2:0]位和SSL否定延迟之间的关系

SPCMDm.SLNDEN bit	SSLND.SLNDL[2:0] bits	SSL否定延迟
0	000b to 111b	1 RSPCK
1	000b	1 RSPCK
	001b	2 RSPCK
	010b	3 RSPCK
	011b	4 RSPCK
	100b	5 RSPCK
	101b	6 RSPCK
	110b	7 RSPCK
	111b	8 RSPCK

(7) Next-access delay (t3)

主机模式下SPI的下一次访问延迟值取决于SPMDm.SPNDEN位设置和SPND.SPNDL[2:0]位设置。SPI通过指针控制确定串行传输期间要引用的SPCMDm寄存器，然后使用SPCMDm.SPNDEN位和SPND.SPNDL[2:0]位确定串行传输期间的下一次访问延迟，如表34.13中所列。有关下一次访问延迟的定义，请参见第34.3.5节。传输格式。

仅在突发传输的最后一帧中插入下一个访问延迟，即，在没有“突发传输帧之间延迟”的情况下进行传输。（SPCMD.SSLKP位为1，SPCR3.BFDS位为1）。

Table 34.13 SPMDm.SPNDEN位、SPND.SPNDL[2:0]位和下一次访问延迟之间的关系

SPCMDm.SPNDEN bit	SPND.SPNDL[2:0] bits	Next-access delay
0	000b to 111b	1 RSPCK + 2 PCLKA
1	000b	1 RSPCK + 2 PCLKA
	001b	2 RSPCK + 2 PCLKA
	010b	3 RSPCK + 2 PCLKA
	011b	4 RSPCK + 2 PCLKA
	100b	5 RSPCK + 2 PCLKA
	101b	6 RSPCK + 2 PCLKA
	110b	7 RSPCK + 2 PCLKA
	111b	8 RSPCK + 2 PCLKA

(8) 初始化流程

图34.48显示了SPI处于主机模式时的SPI初始化流程示例。有关如何设置中断控制器单元(ICU)、DMAC和IO端口的信息，请参见各个块中给出的说明。

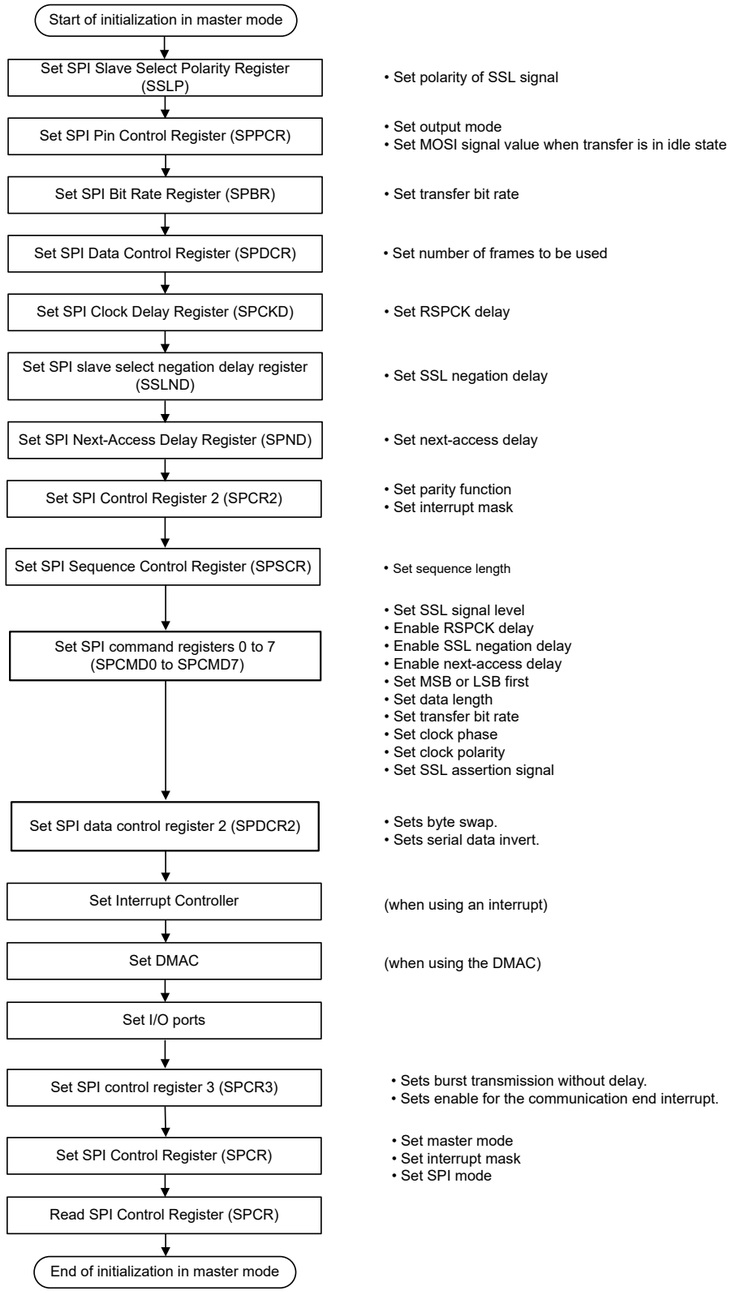

Figure 34.48 Example of initialization flow in master mode for SPI operation

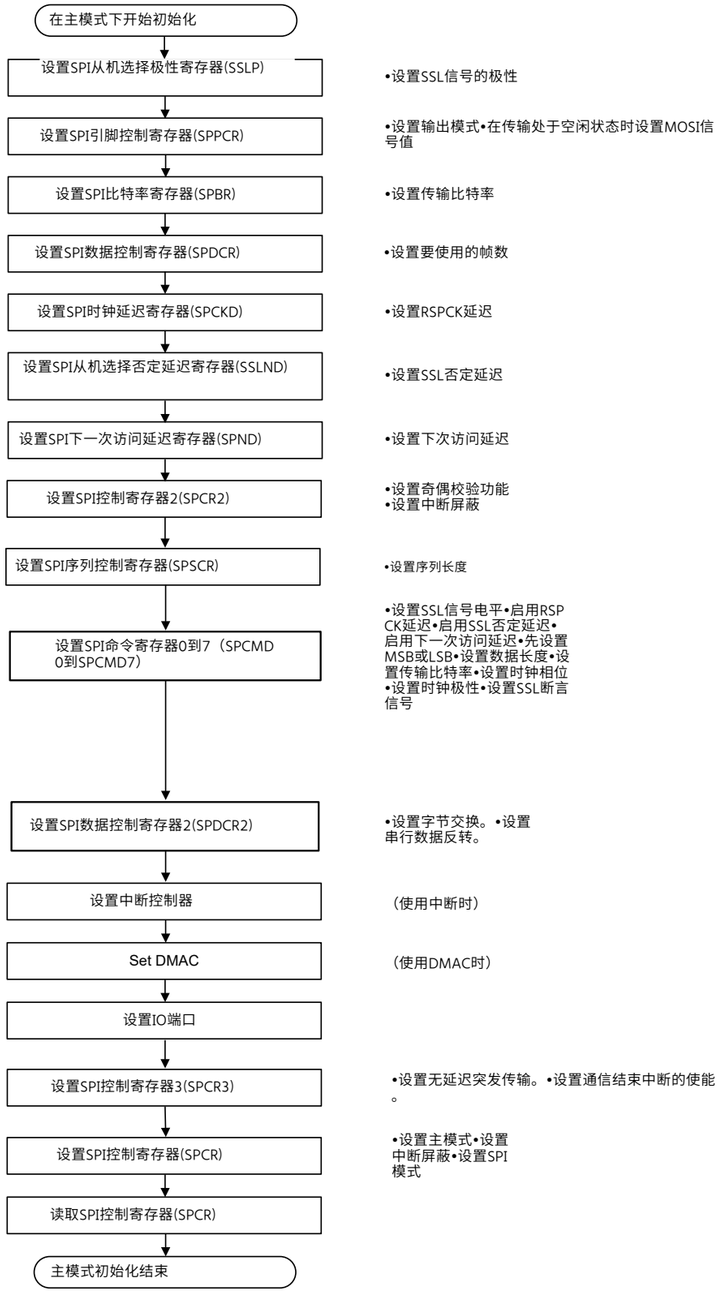

Figure 34.48 SPI操作的主模式初始化流程示例

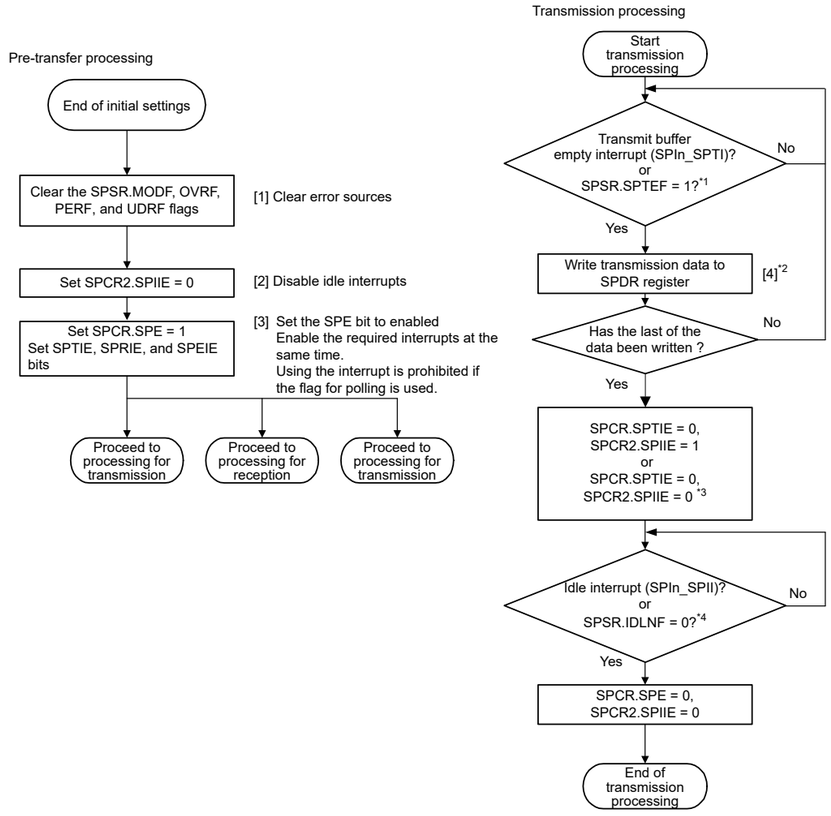
(9) Software processing flow

Figure 34.49 to Figure 34.51 show examples of the software processing flow.

Transmit processing flow

When transmitting data, with the SPIi_SPII interrupt enabled, the CPU is notified of the completion of data transmission after the last data write for transmission.



Note 1. Before writing data for transmission to SPDR/SPDR_HA/SPDR_BY, check that the transmit buffer is empty by reading the SPSR.SPTEF flag, if the flag for polling is used.
Note 2. Setting SPCR2.SPIIE and SPCR3.CENDIE to 0 is prohibited if the flag for polling is used.
Note 3. Wait more than 1 PCLKA, after writing data for transmission to SPDR register, and before starting to poll SPSR.IDLNF flag or SPSR.CENDF, if the flag for polling is used.
Note 4. SPDR = SPDR/SPDR_HA/SPDR_BY
Access when interrupt handling routine is executed once to the number of frames set in SPDCR.SPFC[1:0]

Figure 34.49 Transmission flow in master mode

Receive processing flow

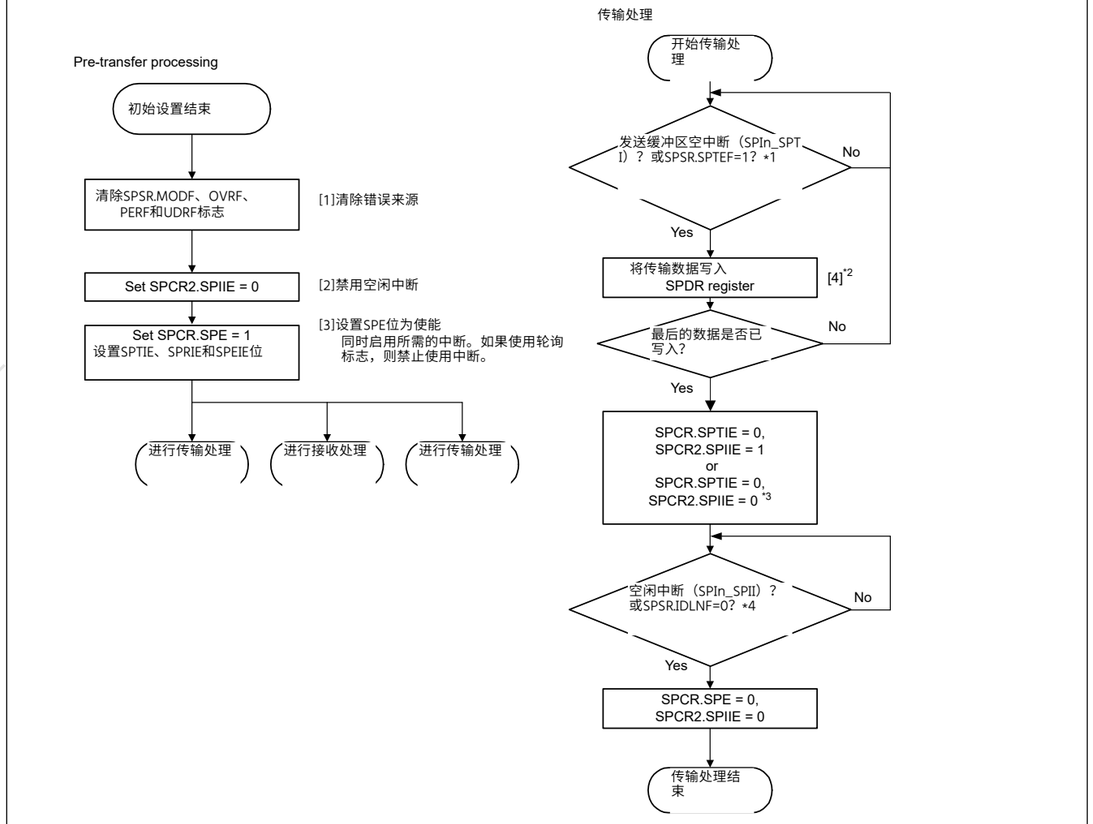
The SPI has receive only operation in slave mode.

(9) 软件处理流程

图34.49至图34.51显示了软件处理流程的示例。

传输处理流程

发送数据时，SPIi_SPII中断使能，在最后一次数据写入发送后通知CPU数据发送完成。



注1.在将数据写入SPDRSPDR_HASPDR_BY之前，如果使用轮询标志，请通过读取SPSR.SPTEF标志检查发送缓冲区是否为空。

注2.如果使用轮询标志，则禁止将SPCR2.SPIIE和SPCR3.CENDIE设置为0。
注3.等待超过1个PCLKA，在将数据写入SPDR寄存器后，如果使用轮询标志，则在开始轮询SPSR.IDLNF标志或SPSR.CENDF之前。

Note 4. SPDR = SPDR/SPDR_HA/SPDR_BY
当中断处理例程执行一次到SPDCR.SPFC[1:0]中设置的帧数时访问

Figure 34.49 主模式下的传输流

接收处理流程

SPI在从机模式下仅接收操作。

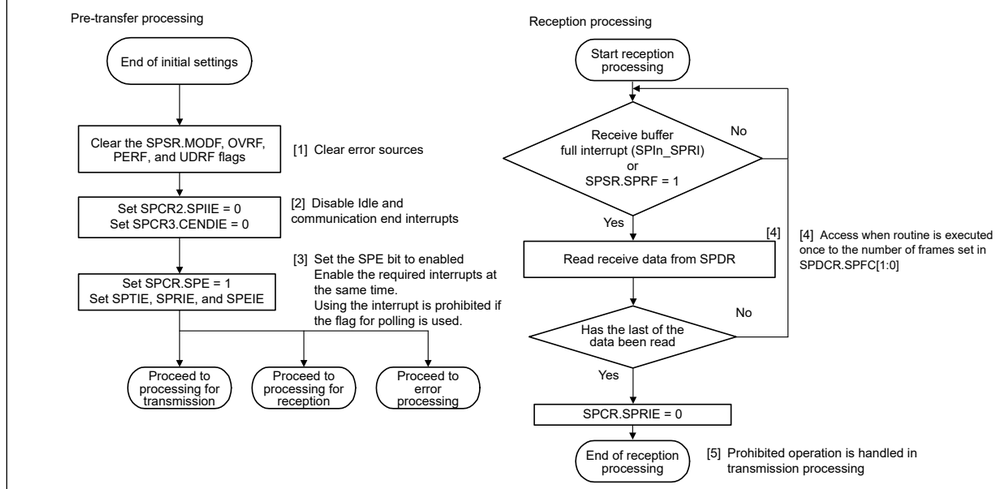


Figure 34.50 Reception flow in master mode

Error processing flow

The SPI detects the following errors:

- Mode fault error
- Underrun error
- Overrun error
- Parity error

When a mode fault error is generated, the SPCR.SPE bit is automatically cleared, stopping operations for transmission and reception. For errors from other sources, the SPCR.SPE bit is not cleared and operations for transmission and reception continue. Therefore, Renesas recommends clearing the SPCR.SPE bit to stop operations for errors other than mode fault errors. Not doing so leads to updating of the SPSSR.SPECM[2:0] bits.

When an error is detected using an interrupt, clear the ICU.IELSRn.IR flag in the error processing routine. If this is not done, the ICU.IELSRn.IR flag might continue to indicate the SPIi_SPTI or SPIi_SPRI interrupt request. If the SPIi_SPRI interrupt request is indicated, read the receive buffer and initialize the sequencer in the SPI.

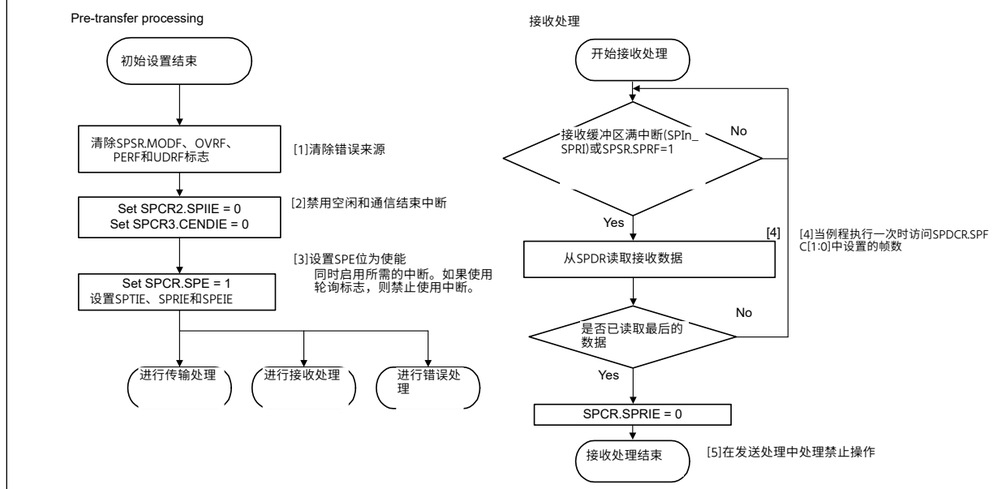

Figure 34.50 主模式下的接收流程

错误处理流程

SPI检测到以下错误：

●模式故障错误

- Underrun error

●超限错误

●奇偶校验错误

当产生模式故障错误时，SPCR.SPE位自动清零，停止发送和接收操作。对于其他来源的错误，SPCR.SPE位不会被清除，发送和接收操作会继续。因此，瑞萨建议清除SPCR.SPE位以停止除模式故障错误以外的错误操作。不这样做会导致更新SPSSR.SPECM[2:0]位。

当使用中断检测到错误时，清除错误处理例程中的ICU.IELSRn.IR标志。如果不这样做，ICU.IELSRn.IR标志可能会继续指示SPIi_SPTI或SPIi_SPRI中断请求。如果指示了SPIi_SPRI中断请求，则读取接收缓冲区并初始化SPI中的定序器。

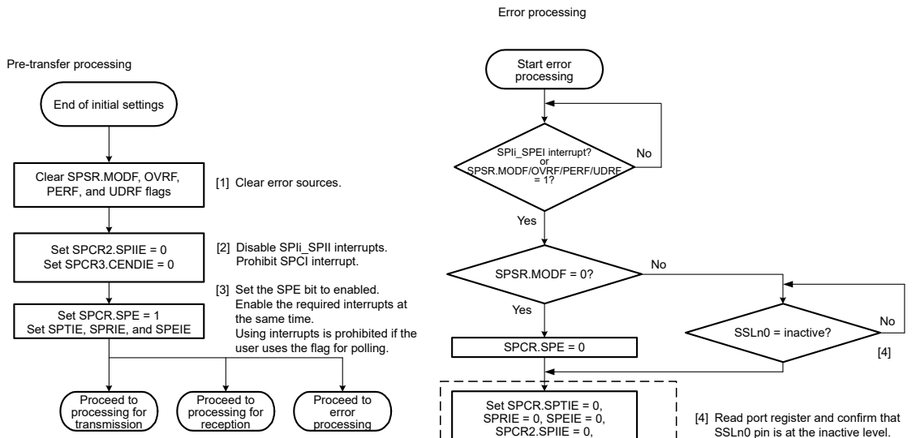

Figure 34.51 Error processing flow in master mode

34.3.11.2 Slave mode operation

(1) Starting a serial transfer

When the SPCMD0.CPHA bit is 0, if the SPI detects an SSLn0 input signal assertion, it must drive valid data to the MISOn output signal. For this reason, when the CPHA bit is 0, the assertion of the SSLn0 input signal triggers the start of a serial transfer.

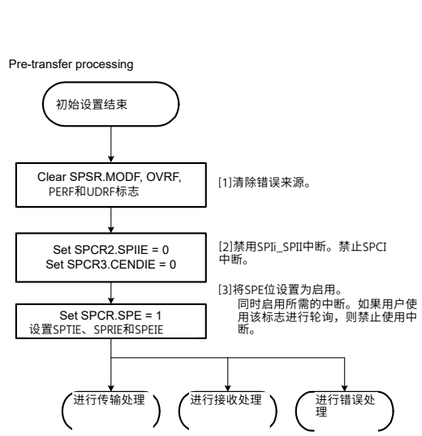
When the CPHA bit is 1, if the SPI detects the first RSPCKn edge in an SSLn0 signal asserted condition, it must drive valid data to the MISOn output signal. For this reason, when the CPHA bit is 1, the first RSPCKn edge in an SSLn0 signal asserted condition triggers the start of a serial transfer.

Regardless of the CPHA bit setting, the SPI drives the MISOn output signal on SSLn0 signal assertion. The data that is output by the SPI is either valid or invalid, depending on the CPHA bit setting.

For details on the SPI transfer format, see section 34.3.5. Transfer Formats. The polarity of the SSLn0 input signal depends on the SSLP.SSL0P setting.

(2) Terminating a serial transfer

Regardless of the SPCMD0.CPHA bit setting, the SPI terminates the serial transfer after detecting an RSPCKn edge corresponding to the final sampling timing. When free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies received data from the shift register to the receive buffer of the SPDR/SPDR_HA register. On termination of a serial transfer, the SPI changes the status of the shift register to empty, regardless of the receive buffer state. A mode fault error occurs if the SPI detects an SSLn0 input signal negation from the beginning of serial transfer to the end of serial transfer (see section 34.3.9. Error Detection).



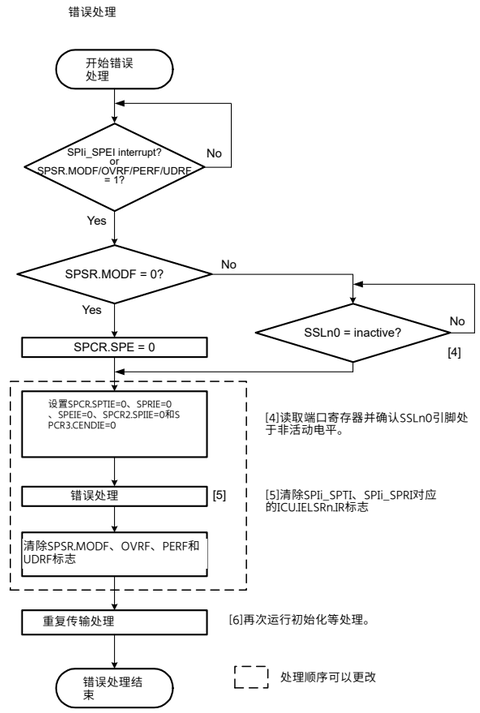


Figure 34.51 主模式下的错误处理流程

34.3.11.2 从模式操作

(1) 开始串行传输

当SPCMD0.CPHA位为0时，如果SPI检测到SSLn0输入信号断言，它必须将有效数据驱动到MISOn输出信号。因此，当CPHA位为0时，SSLn0输入信号的断言触发串行传输的开始。

当CPHA位为1时，如果SPI在SSLn0信号置位条件下检测到第一个RSPCKn边沿，它必须将有效数据驱动到MISOn输出信号。因此，当CPHA位为1时，SSLn0信号断言条件中的第一个RSPCKn边沿触发串行传输的开始。

无论CPHA位设置如何，SPI都会在SSLn0信号置位时驱动MIOn输出信号。SPI输出的数据是有效还是无效，取决于CPHA位设置。

有关SPI传输格式的详细信息，请参见第34.3.5节。传输格式。SSLn0输入信号的极性取决于SSLP.SSL0P设置。

(2) 终止串行传输

无论SPCMD0.CPHA位设置如何，SPI在检测到对应于最终采样时序的RSPCKn边沿后终止串行传输。当接收缓冲区中有可用空间时（SPSR.SPRF标志为0），在串行传输终止时，SPI将接收到的数据从移位寄存器复制到SPDRSPDR_HA寄存器的接收缓冲区。在串行传输终止时，SPI将移位寄存器的状态更改为空，而与接收缓冲区状态无关。如果SPI从串行传输开始到串行传输结束检测到SSLn0输入信号否定，则会发生模式故障错误（请参阅第34.3.9节。错误检测）。

The final sampling timing changes depending on the bit length of transfer data. In slave mode, the SPI data length is determined by the SPCMD0.SPB[3:0] bits setting. The polarity of the SSLn0 input signal is determined by the SSLP.SSL0P bit setting. For details on the SPI transfer format, see section 34.3.5. Transfer Formats.

(3) Notes on single-slave operations

If the SPCMD0.CPHA bit is 0, the SPI starts serial transfers when it detects the assertion edge for an SSLn0 input signal. In the configuration shown in Figure 34.7, if the SPI is used in single-slave mode, the SSLn0 signal is fixed at an active state. Therefore, when the CPHA bit is set to 0, the SPI cannot correctly start a serial transfer. For the SPI to correctly execute transmit and receive operations in slave mode when the SSLn0 input signal is fixed at an active state, the CPHA bit must be set to 1. Do not fix the SSLn0 input signal if there is a requirement for setting the CPHA bit to 0.

(4) Burst transfer

If the SPCMD0.CPHA bit is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSLn0 input signal. When the CPHA bit is 1, the serial transfer period is the period from the first RSPCKn edge to the sampling timing for the reception of the final bit in an SSLn0 signal active state. Even when the SSLn0 input signal remains at the active level, the SPI can accommodate burst transfers, because it can detect the start of an access.

When the CPHA bit is 0, the second and subsequent serial transfers during burst transfer cannot be executed correctly.

(5) Initialization flow

Figure 34.52 shows an example of initialization flow for SPI operation when the SPI is in slave mode. For a description of how to set up the ICU, DTC, and I/O ports, see the descriptions given in the individual blocks.

最终的采样时序根据传输数据的位长而变化。在从机模式下，SPI数据长度由SPCMD0.SPB[3:0]位设置决定。SSLn0输入信号的极性由SSLP.SSL0P位设置决定。有关SPI传输格式的详细信息，请参见第34.3.5节。传输格式。

(3) 单从操作注意事项

如果SPCMD0.CPHA位为0，则SPI在检测到SSLn0输入信号的断言边沿时开始串行传输。在图34.7所示的配置中，如果SPI用于单从模式，则SSLn0信号固定在激活状态。因此，当CPHA位设置为0时，SPI无法正确启动串行传输。为使SPI在SSLn0输入信号固定为活动状态时正确执行从模式下的发送和接收操作，CPHA位必须设置为1。如果需要设置CPHA，请不要固定SSLn0输入信号位为0。

(4) 突发传输

如果SPCMD0.CPHA位为1，则可以执行连续串行传输（突发传输），同时保持SSLn0输入信号的断言状态。当CPHA位为1时，串行传输周期是从第一个RSPCKn边沿到SSLn0信号有效状态下接收最后一个位的采样时序的周期。即使SSLn0输入信号保持在有效电平，SPI也可以适应突发传输，因为它可以检测访问的开始。

当CPHA位为0时，突发传输期间的第二次和后续串行传输无法正确执行。

(5) 初始化流程

图34.52显示了SPI处于从机模式时SPI操作的初始化流程示例。有关如何设置ICU、DTC和IO端口的说明，请参见各个块中给出的说明。

RA生态工作室

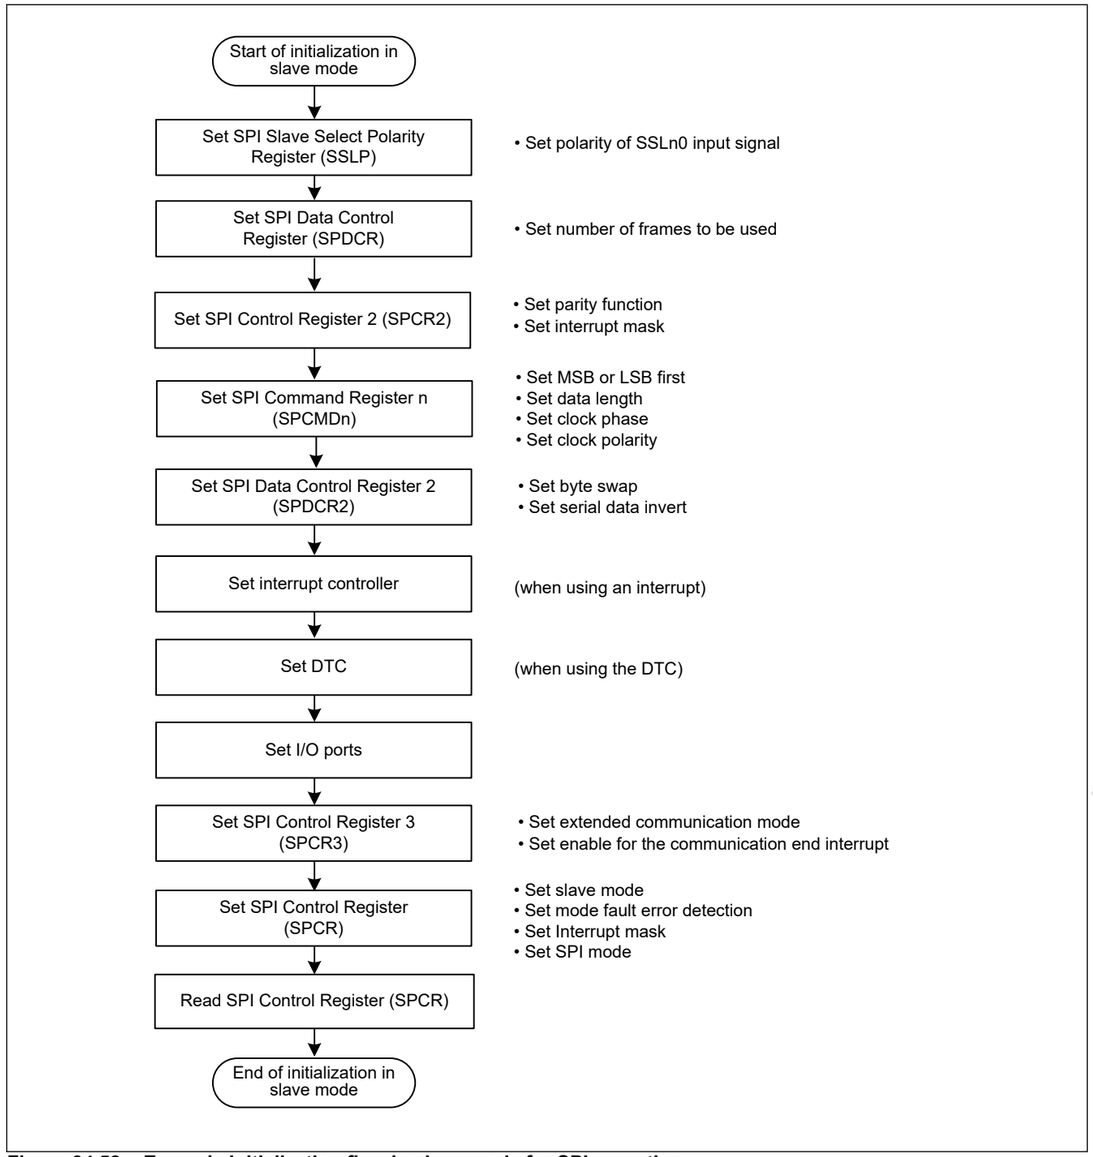

Figure 34.52 Example initialization flow in slave mode for SPI operation

(6) Software processing flow

Figure 34.53 to Figure 34.55 show examples of the flow of software processing.

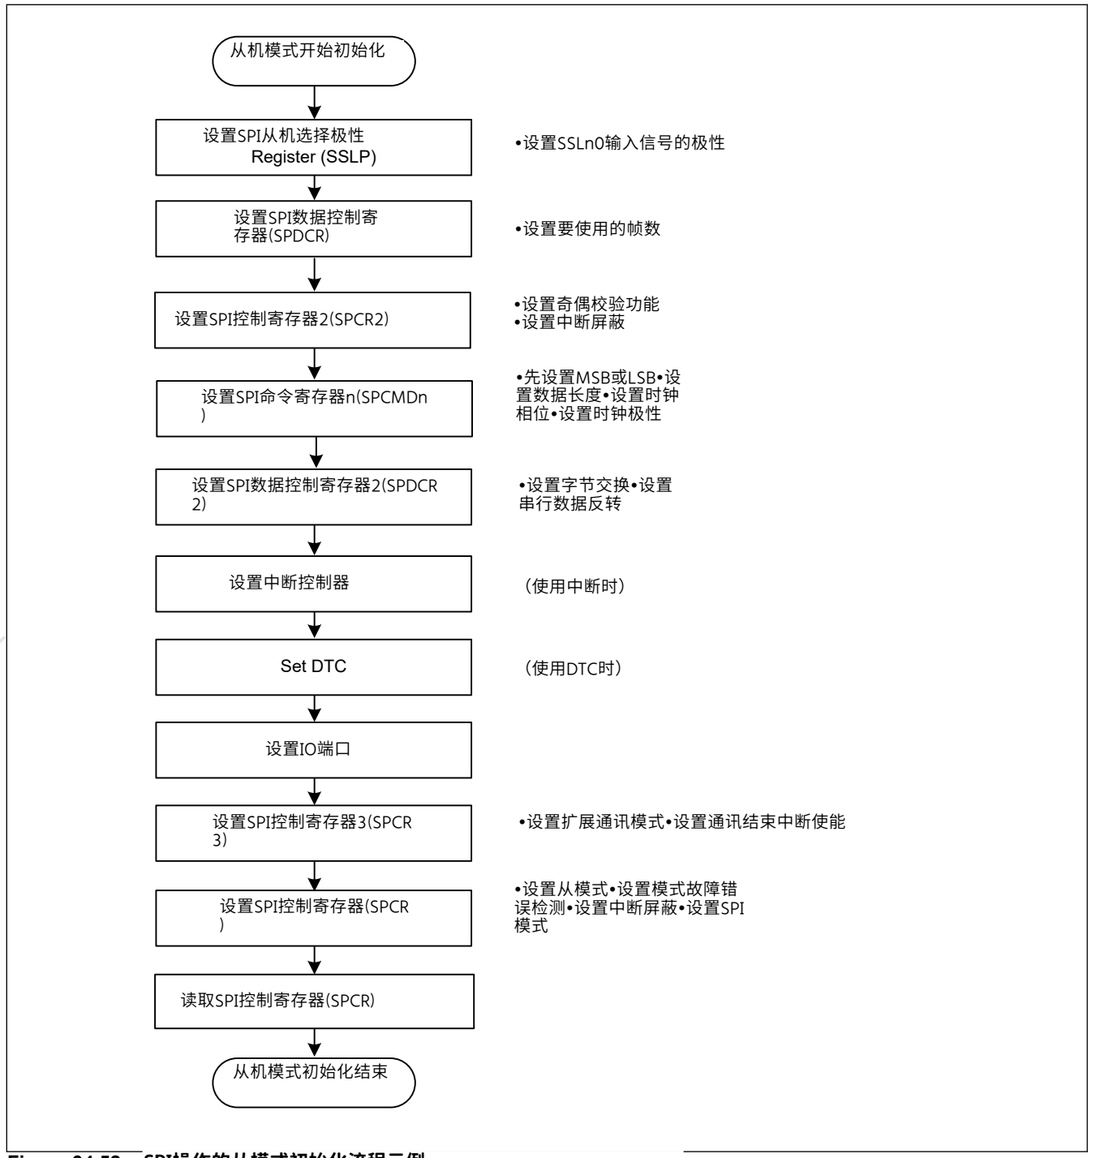

Figure 34.52 SPI操作的从模式初始化流程示例

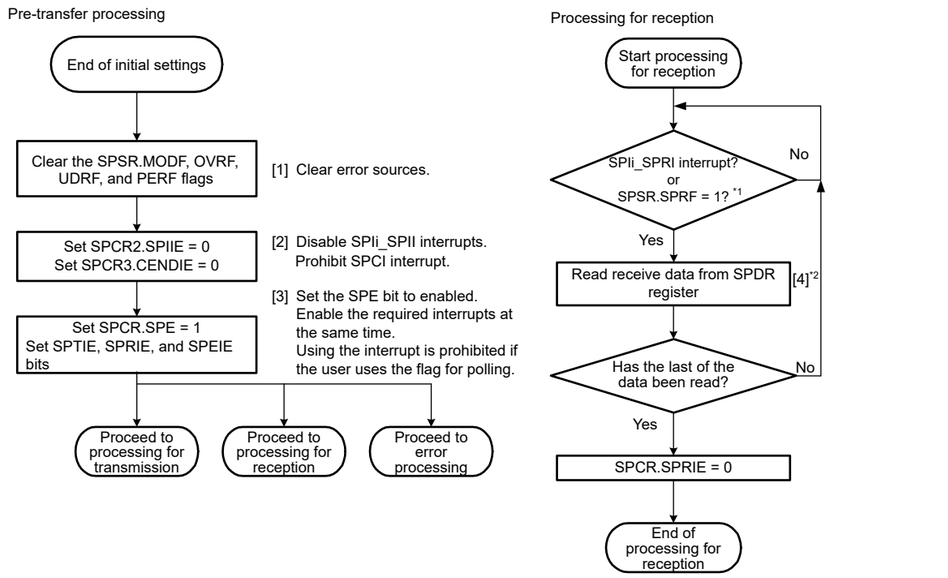
(6) 软件处理流程

图34.53至图34.55显示了软件处理流程的示例。

Transmit processing flow



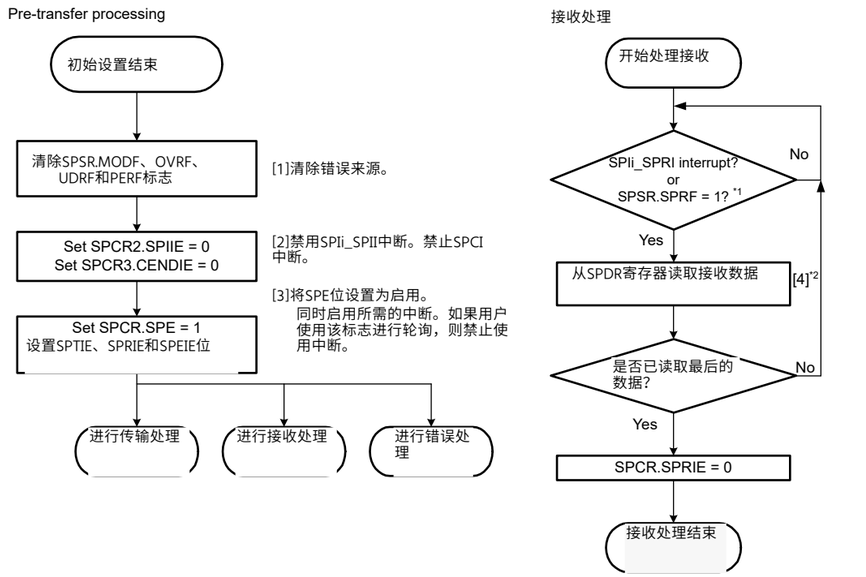
Note 1. Before writing data for transmission to SPDR register, check the transmit buffer empty interrupt by reading SPSR.SPTEF flag, if the flag for polling is used.
Note 2. SPDR = SPDR/SPDR_HA/SPDR_BY
Access when interrupt handling routine is executed once to the number of frames set in SPDCR.SPFC[1:0] bits

Figure 34.53 Transmission flow in slave mode

Receive processing flow

The SPI does not handle receive-only operation, so processing for transmission is required.

传输处理流程



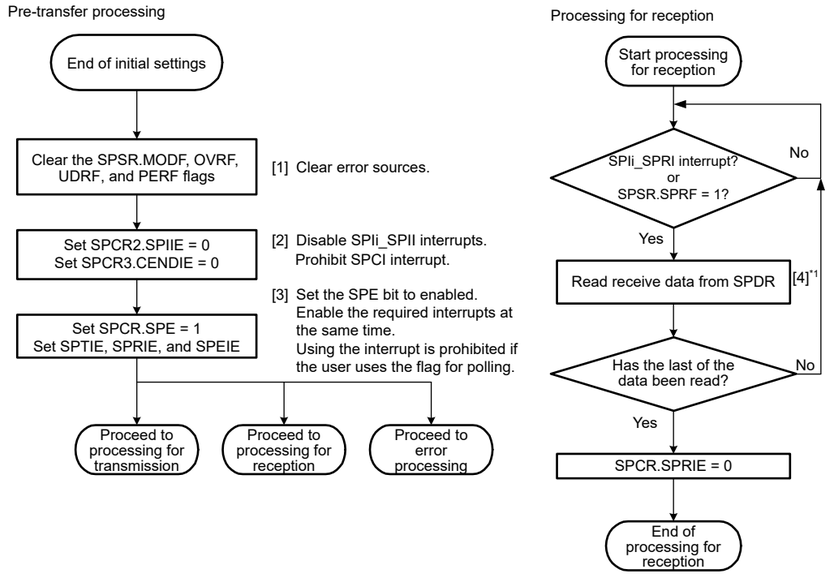
注1.在将数据写入SPDR寄存器之前，如果使用轮询标志，请通过读取SPSR.SPTEF标志检查发送缓冲区空中断。

Note 2. SPDR = SPDR/SPDR_HA/SPDR_BY
当中断处理例程执行一次到SPDCR.SPFC[1:0]位中设置的帧数时访问

Figure 34.53 从模式下的传输流

接收处理流程

SPI不处理只接收操作，因此需要处理传输。



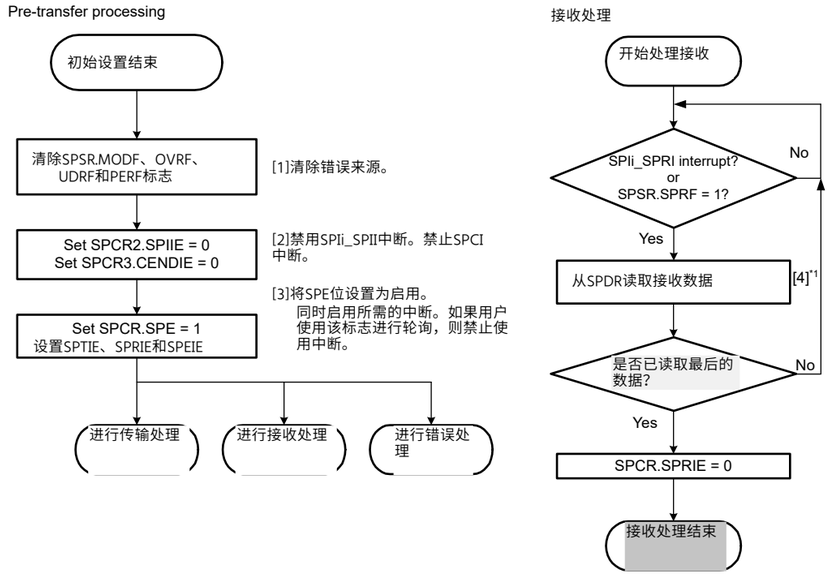
Note 1. Before writing data for transmission to the SPDR register, check that the transmit buffer is empty by reading the SPSR.SPTEF flag, if the flag for polling is used.
Note 2. SPDR = SPDR/SPDR_HA/SPDR_BY
Access when interrupt handling routine is executed once to the number of frames set in SPDCR.SPFC[1:0] bits

Figure 34.54 Reception flow in slave mode

Error processing flow

In slave mode operation, even when a mode fault error is generated, the SPSR.MODF flag can be cleared regardless of the state of the SSLn0 pin.

When an error is detected by using an interrupt, clear the ICU.IELSRn.IR flag in the error processing routine. If this is not done, the ICU.IELSRn.IR flag might continue to indicate the SPIi_SPTI or SPIi_SPRI interrupt request. If the SPIi_SPRI interrupt request is indicated, read the receive buffer and initialize the sequencer in the SPI.



注1.在将要发送的数据写入SPDR寄存器之前，请通过读取SPSR.SPTEF标志，如果使用了轮询标志。
Note 2. SPDR = SPDR/SPDR_HA/SPDR_BY
当中断处理例程执行一次到SPDCR.SPFC[1:0]位中设置的帧数时访问

Figure 34.54 从机模式下的接收流程

错误处理流程

在从模式操作中，即使产生了模式故障错误，SPSR.MODF标志也可以被清除，而与SSLn0引脚的状态无关。

当使用中断检测到错误时，清除错误处理例程中的ICU.IELSRn.IR标志。如果不这样做，ICU.IELSRn.IR标志可能会继续指示SPIi_SPTI或SPIi_SPRI中断请求。如果指示了SPIi_SPRI中断请求，则读取接收缓冲区并初始化SPI中的定序器。

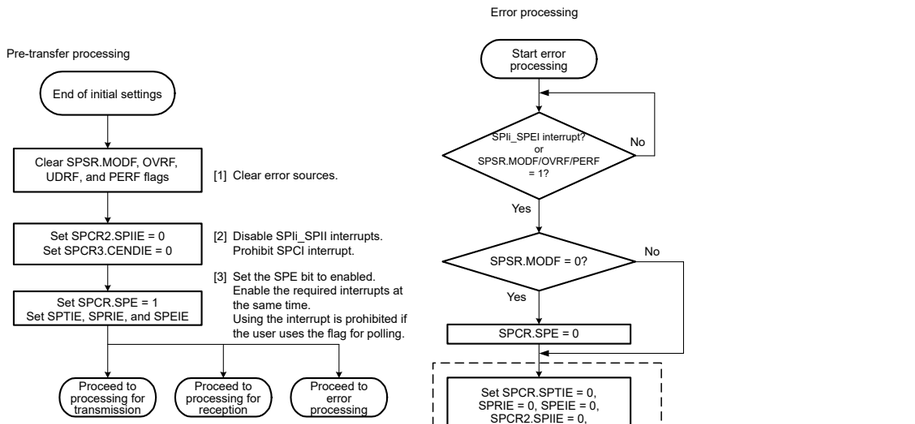


Figure 34.55 Error processing flow for slave mode

34.3.12 Clock Synchronous Operation

Setting the SPCR.SPMS bit to 1 selects clock synchronous operation of the SPI. In clock synchronous operation, the SSLni pin is not used, and the RSPCKn, MOSIn, and MISOn pins handle communications. All SSLni pins are available as I/O port pins.

Although clock synchronous operation does not require the use of the SSLni pin, operation of the module is the same as in SPI operation. In both master mode and slave mode operations, communications can be performed with the same flow as in SPI operation. However, mode fault errors are not detected, because the SSLni pin is not used.

Additionally, do not perform operation if clock synchronous operation is enabled when the SPCMDm.CPHA bit is set to 0 in slave mode (SPCR.MSTR = 0).

34.3.12.1 Master mode operation

(1) Starting serial transfer

The SPI updates the data in the transmit buffer (SPTX) of SPDR/SPDR_HA when data is written to the SPDR/SPDR_HA register with the transmit buffer empty, the data for the next transfer not set and the SPSR.SPTEF flag is 1. When the shift register is empty after the number of frames set in the SPDCR.SPFC[1:0] bits are written to the SPDR/SPDR_HA, the SPI copies data from the transmit buffer to the shift register and starts serial transmission. On copying transmit data to the shift register, the SPI changes the status of the shift register to full, and on termination of serial transfer, it changes the status of the shift register to empty. The status of the shift register cannot be referenced.

Transfer in clock synchronous operation is conducted without the SSLn0 output signal. For details on the SPI transfer format, see section 34.3.5. Transfer Formats.

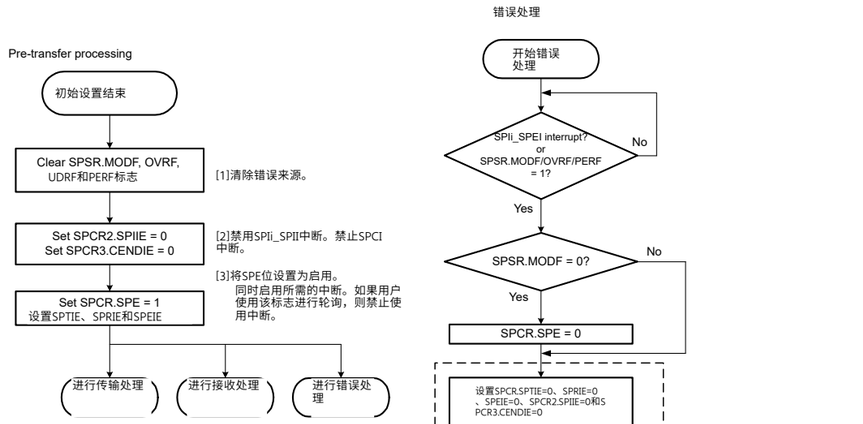

Figure 34.55 从机模式的错误处理流程

34.3.12 时钟同步操作

将SPCR.SPMS位设置为1可选择SPI的时钟同步操作。在时钟同步操作中，不使用SSLni引脚，而RSPCKn、MOSIn和MISOn引脚处理通信。所有SSLni引脚都可用作IO端口引脚。

虽然时钟同步操作不需要使用SSLni引脚，但模块的操作与SPI操作相同。在主模式和从模式操作中，可以使用与在相同的流程中执行通信

SPI操作。但是，未检测到模式故障错误，因为未使用SSLni引脚。

此外，如果在从模式(SPCR.MSTR=0)下SPCMDm.CPHA位设置为0时使能时钟同步操作，则不要执行操作。

34.3.12.1 主模式操作

(1) 开始串行传输

当数据写入SPDRSPDR_HA寄存器且发送缓冲区为空、未设置下一次传输的数据且SPSR.SPTEF标志为1时，SPI更新SPDRSPDR_HA的发送缓冲区(SPTX)中的数据。将SPDCR.SPFC[1:0]位中设置的帧数写入SPDRSPDR_HA后，寄存器为空，SPI将数据从发送缓冲区复制到移位寄存器并开始串行传输。将发送数据复制到移位寄存器时，SPI将移位寄存器的状态更改为满，而在串行传输终止时，它将移位寄存器的状态更改为空。无法引用移位寄存器的状态。

在没有SSLn0输出信号的情况下进行时钟同步操作的传输。有关SPI传输格式的详细信息，请参见第34.3.5节。传输格式。

(2) Terminating serial transfer

The SPI terminates the serial transfer after transmitting an RSPCKn edge corresponding to the sampling timing. If free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies data from the shift register to the receive buffer of the SPI Data Register (SPDR/SPDR_HA).

The final sampling timing varies depending on the bit length of transfer data. In master mode, the SPI data length depends on the SPCMDm.SPB[3:0] bits setting. Transfer in clock synchronous operation is conducted without the SSLn0 output signal. For details on the SPI transfer format, see section 34.3.5. Transfer Formats.

(3) Sequence control

The transfer format used in master mode is determined by the SPSCR, SPCMDm, SPBR, SPCKD, SSLND, and SPND registers. Although the SSLni signals are not output in clock synchronous operation, these settings are valid.

The SPSCR register determines the sequence configuration for serial transfers that are executed by the SPI in master mode. The following parameters are specified in the SPCMDm register:

- SSLni output signal value
- MSB or LSB first
- Data length
- Some of the bit rate settings
- RSPCKn polarity and phase
- Whether SPCKD is to be referenced
- Whether SSLND is to be referenced
- Whether SPND is to be referenced

SPBR holds some of the bit rate settings such as SPCKD, an SPI clock delay value, SSLND, an SSL negation delay, and SPND, a next-access delay value.

Based on the sequence length that is assigned to SPSCR, the SPI makes up a sequence comprised of a part or all of SPCMDm register. The SPI contains a pointer to the SPCMDm register that makes up the sequence. The value of this pointer can be checked by reading the SPSSR.SPCP[2:0] bits. When the SPCR.SPE bit is set to 1 and the SPI function is enabled, the SPI loads the pointer to the commands in SPCMD0 register, and incorporates the SPCMD0 register setting into the transfer format at the beginning of serial transfer. The SPI increments the pointer each time the next-access delay period for a data transfer ends. On completion of the serial transfer that corresponds to the final command comprising the sequence, the SPI sets the pointer to the SPCMD0 register, and in this manner the sequence is executed repeatedly.

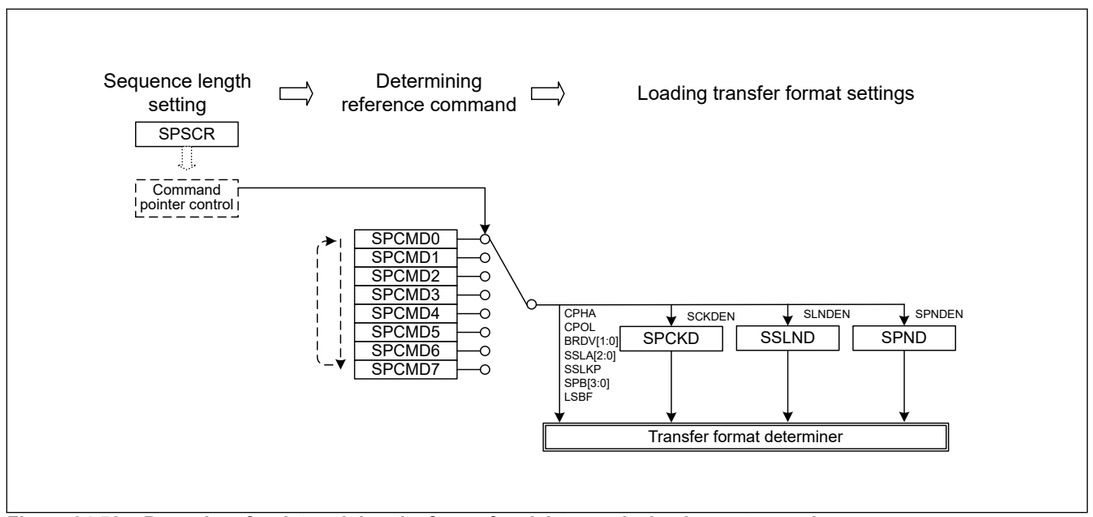

Figure 34.56 Procedure for determining the form of serial transmission in master mode

(2) 终止串行传输

SPI在发送对应于采样时序的RSPCKn边沿后终止串行传输。如果接收缓冲区中有可用空间（SPSR.SPRF标志为0），则在串行传输终止时，SPI将数据从移位寄存器复制到SPI数据寄存器(SPDRSPDR_HA)的接收缓冲区。

最终的采样时序根据传输数据的位长而变化。在主机模式下，SPI数据长度取决于SPMDm.SPB[3:0]位设置。在没有SSLn0输出信号的情况下进行时钟同步操作的传输。有关SPI传输格式的详细信息，请参见第34.3.5节。传输格式。

(3) 顺序控制

主机模式中使用的传输格式由SPSCR、SPCMDm、SPBR、SPCKD、SSLND和SPND寄存器确定。虽然在时钟同步操作中不输出SSLni信号，但这些设置是有效的。

SPSCR寄存器确定由SPI在主模式下执行的串行传输的序列配置。
SPCMDm寄存器中指定了以下参数：

- SSLni输出信号值
- MSB或LSB在前
- 数据长度
- 一些比特率设置
- RSPCKn极性和相位
- 是否引用SPCKD
- 是否引用SSLND
- 是否引用SPND

SPBR保存一些比特率设置，例如SPCKD、SPI时钟延迟值、SSLND、SSL否定延迟和SPND，下一次访问延迟值。

根据分配给SPSCR的序列长度，SPI组成一个序列，该序列由部分或全部SPMDm寄存器。SPI包含一个指向构成序列的SPCMDm寄存器的指针。该指针的值可以通过读取SPSSR.SPCP[2:0]位来检查。当SPCR.SPE位设置为1且SPI功能使能时，SPI将指针加载到SPCMD0寄存器中的命令，并在串行传输开始时将SPCMD0寄存器设置合并到传输格式中。每次数据传输的下一个访问延迟周期结束时，SPI都会递增指针。在完成对应于包含序列的最终命令的串行传输后，SPI将指针设置为SPMD0寄存器，并以这种方式重复执行序列。

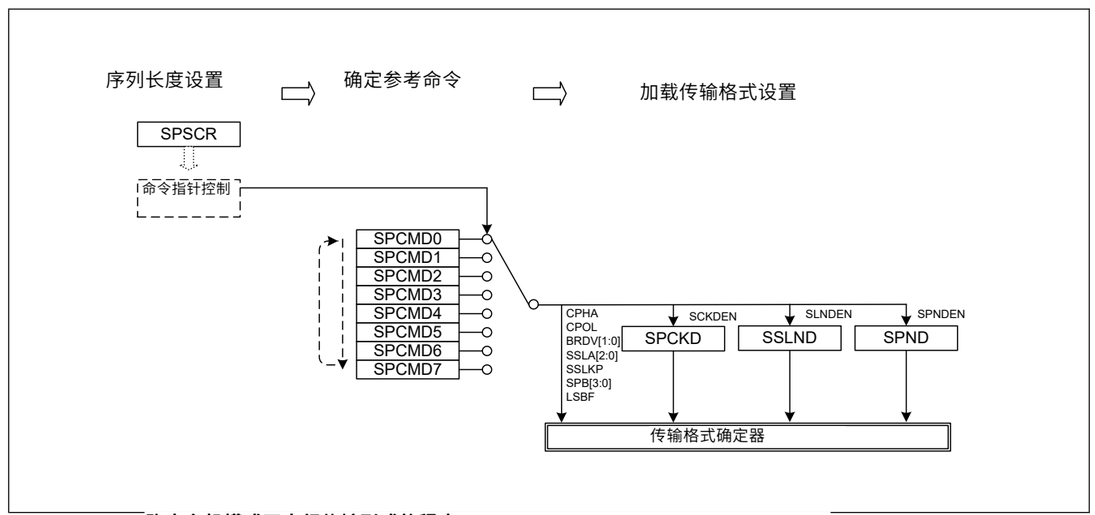

Figure 34.56 确定主机模式下串行传输形式的程序

In this section, a frame is the combination of the data (SPDR/SPDR_HA) and the settings (SPCMDm).

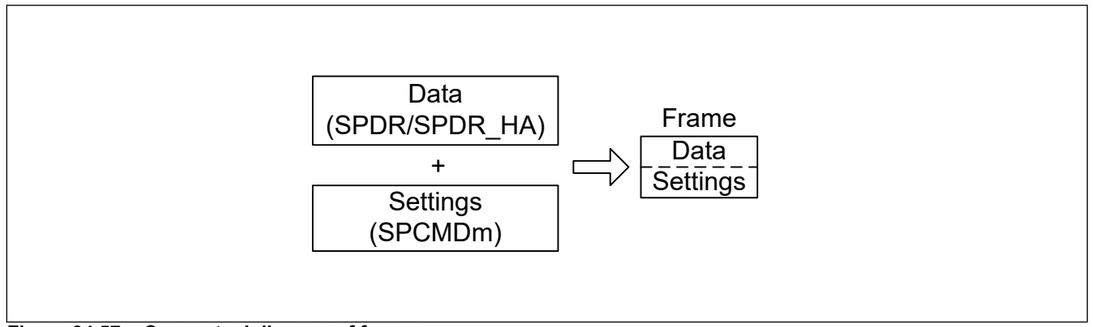

Figure 34.57 Conceptual diagram of frames

Figure 34.58 shows the relationship between the command and the transmit and receive buffers in the sequence of operations specified by the settings in Table 34.4.

(5) Software processing flow

Software processing during clock synchronous master operation is the same as that for SPI master operation. For details, see (9) Software processing flow in section 34.3.11.1. Master mode operation. Mode fault errors do not occur in clock synchronous operation.

34.3.12.2 Slave mode operation

(1) Starting serial transfer

When the SPCR.SPMS bit is 1, the first RSPCKn edge triggers the start of a serial transfer in the SPI, and the SPI drives the MISOn output signal. The SSL0 input signal is not used in clock synchronous operation. For details on the SPI transfer format, see section 34.3.5. Transfer Formats.

(2) Terminating serial transfer

The SPI terminates the serial transfer after detecting an RSPCKn edge corresponding to the final sampling timing. When free space is available in the receive buffer (the SPSR.SPRF flag is 0), on termination of serial transfer, the SPI copies received data from the shift register to the receive buffer of the SPDR/SPDR_HA register. On termination of a serial transfer, the SPI changes the status of the shift register to empty regardless of the receive buffer.

The final sampling timing changes depending on the bit length of transfer data. In slave mode, the SPI data length depends on the SPCMD0.SPB[3:0] bits setting. For details on the SPI transfer format, see section 34.3.5. Transfer Formats.

(3) Initialization flow

Figure 34.60 shows an example of initialization flow for clock synchronous operation when the SPI is used in slave mode. For a description of how to set up the ICU, DTC, and I/O ports, see the descriptions given in the individual blocks.

(5) 软件处理流程

时钟同步主机操作期间的软件处理与SPI主机操作相同。详见34.3.11.1节（9）软件处理流程。主模式操作。时钟同步操作中不会发生模式故障错误。

34.3.12.2 从模式操作

(1) 开始串行传输

当SPCR.SPMS位为1时，第一个RSPCKn边沿触发SPI中串行传输的开始，并且SPI驱动MISon输出信号。SSL0输入信号不用于时钟同步操作。有关SPI传输格式的详细信息，请参见第34.3.5节。传输格式。

(2) 终止串行传输

SPI在检测到对应于最终采样时序的RSPCKn边沿后终止串行传输。当接收缓冲区中有可用空间（SPSR.SPRF标志为0）时，串行传输终止时，SPI将接收到的数据从移位寄存器复制到SPDRSPDR_HA寄存器的接收缓冲区。在串行传输终止时，SPI将移位寄存器的状态更改为空，而与接收缓冲区无关。

最终的采样时序根据传输数据的位长而变化。在从机模式下，SPI数据长度取决于SPCMD0.SPB[3:0]位设置。有关SPI传输格式的详细信息，请参见第34.3.5节。传输格式。

(3) 初始化流程

图34.60显示了在从模式下使用SPI时时钟同步操作的初始化流程示例。
有关如何设置ICU、DTC和IO端口的说明，请参见各个块中给出的说明。

RA生态工作室

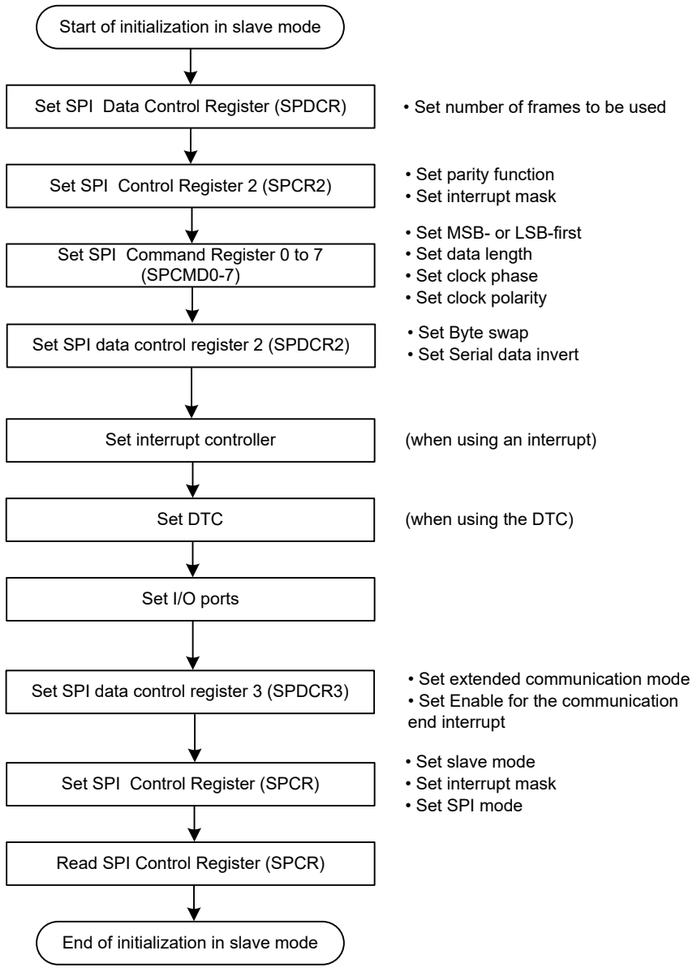

Figure 34.60 Example of initialization flow in slave mode for clock synchronous operation

(4) Software processing flow

Software processing during clock synchronous slave operation is the same as that for SPI slave operation. For details, see (6)Software processing flow. Mode fault errors do not occur in clock synchronous mode.

34.3.13 Loopback Mode

When 1 is written to the SPPCR.SPLP2 bit or SPPCR.SPLP bit, the SPI shuts off the path between the MISOn pin and the shift register if the SPCR.MSTR bit is 1, or between the MOSIn pin and the shift register if the SPCR.MSTR bit is 0, and connects the input and output paths of the shift register, establishing a loopback mode. The SPI does not shut off the path between the MOSIn pin and the shift register if the SPCR.MSTR bit is 1, or between the MISOn pin and the shift register if the SPCR.MSTR bit is 0. This is called loopback mode. When a serial transfer is executed in loopback mode, the transmit data for the SPI or the reversed transmit data becomes the received data for the SPI.

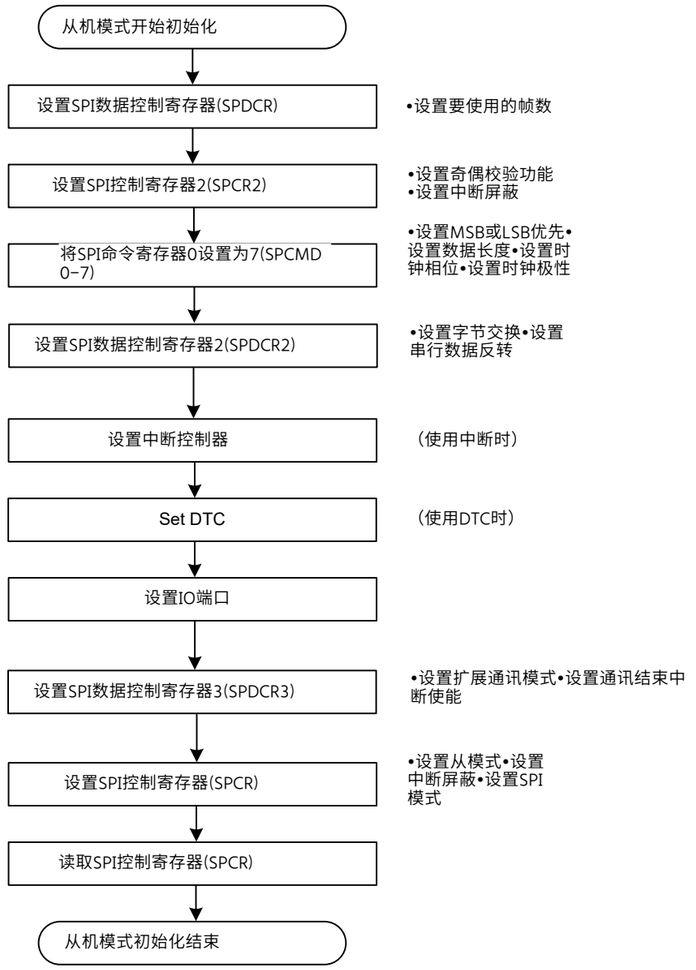

Figure 34.60 时钟同步操作的从模式初始化流程示例

(4) 软件处理流程

时钟同步从机操作期间的软件处理与SPI从机操作相同。详见（6）软件处理流程。时钟同步模式下不会发生模式故障错误。

34.3.13 Loopback Mode

当向SPPCR.SPLP2位或SPPCR.SPLP位写入1时，如果SPCR.MSTR位为1，则SPI关闭MISOn引脚和移位寄存器之间的路径，或者如果SPCR.MSTR位为0，连接移位寄存器的输入和输出路径，建立环回模式。如果SPCR.MSTR位为1，SPI不关闭MOSIn引脚和移位寄存器之间的路径，如果SPCR.MSTR位为0，则SPI不关闭MISOn引脚和移位寄存器之间的路径。这称为环回模式。当在环回模式下执行串行传输时，SPI的发送数据或反向发送数据将成为SPI的接收数据。

Table 34.14 lists the relationship between the SPLP2 and SPLP bits and the received data. Figure 34.61 shows the configuration of the shift register I/O paths when the SPI in master mode is set to loopback mode (SPPCR.SPLP2 = 0, SPPCR.SPLP = 1).

Table 34.14 SPLP2 and SPLP bit settings and received data

SPPCR.SPLP2 bit	SPPCR.SPLP bit	Received data
0	0	Input data from the MOSIn pin or MISOn pin
0	1	Inverted transmit data
1	0	Transmit data
1	1	Transmit data

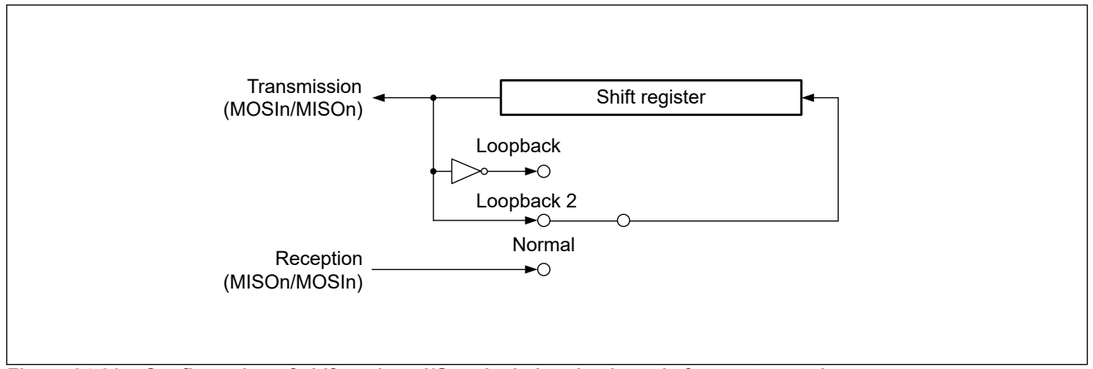

Figure 34.61 Configuration of shift register I/O paths in loopback mode for master mode

34.3.14 Self-Diagnosis of Parity Bit Function

The parity circuit consists of a parity bit adding unit used for transmit data and an error detecting unit used for received data. To detect defects in the parity bit adding unit and error detecting unit, the parity circuit performs self-diagnosis as shown in Figure 34.62.

表34.14列出了SPLP2和SPLP位与接收数据之间的关系。图34.61显示了当主模式下的SPI设置为环回模式（SPPCR.SPLP2=0，SPPCR.SPLP=1）时移位寄存器IO路径的配置。

Table 34.14 SPLP2和SPLP位设置和接收数据

SPPCR.SPLP2 bit	SPPCR.SPLP bit	接收数据
0	0	从MOSIn引脚或MIOn引脚输入数据
0	1	反相传输数据
1	0	传输数据
1	1	传输数据

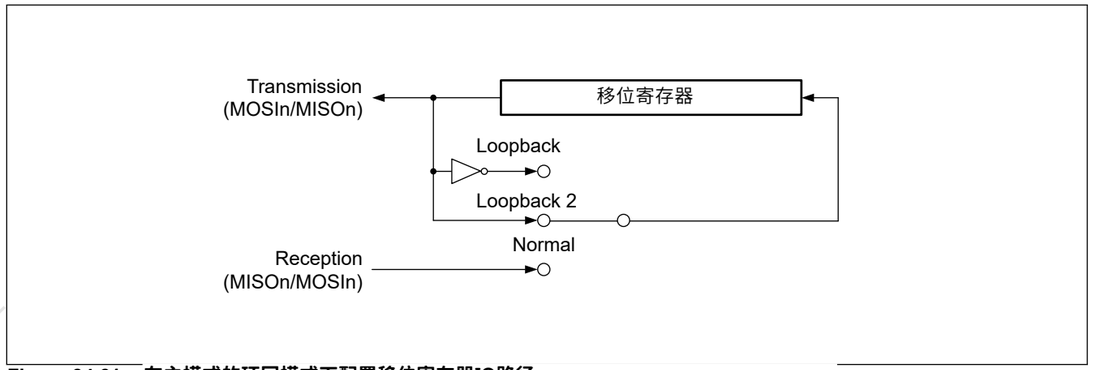

Figure 34.61 在主模式的环回模式下配置移位寄存器IO路径

34.3.14 奇偶校验位功能自诊断

奇偶校验电路由用于发送数据的奇偶校验位添加单元和用于接收数据的错误检测单元组成。为了检测奇偶校验位添加单元和错误检测单元中的缺陷，奇偶校验电路执行自诊断，如图所示Figure 34.62.

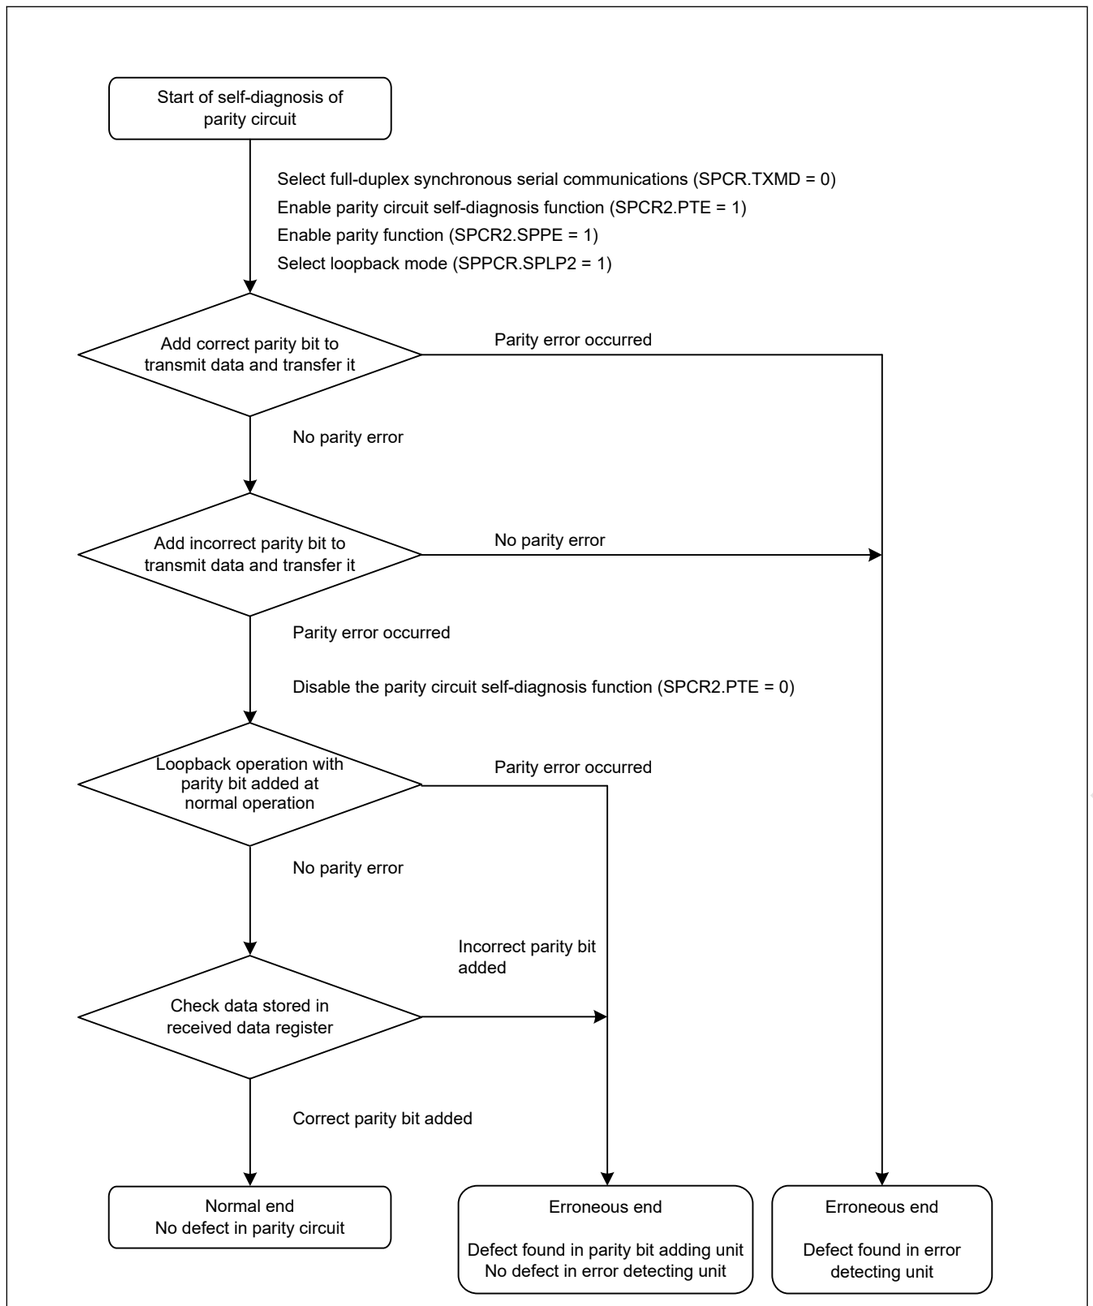

Figure 34.62 Self-diagnosis flow for parity circuit

34.3.15 Interrupt Sources

The SPI has the following interrupt sources:

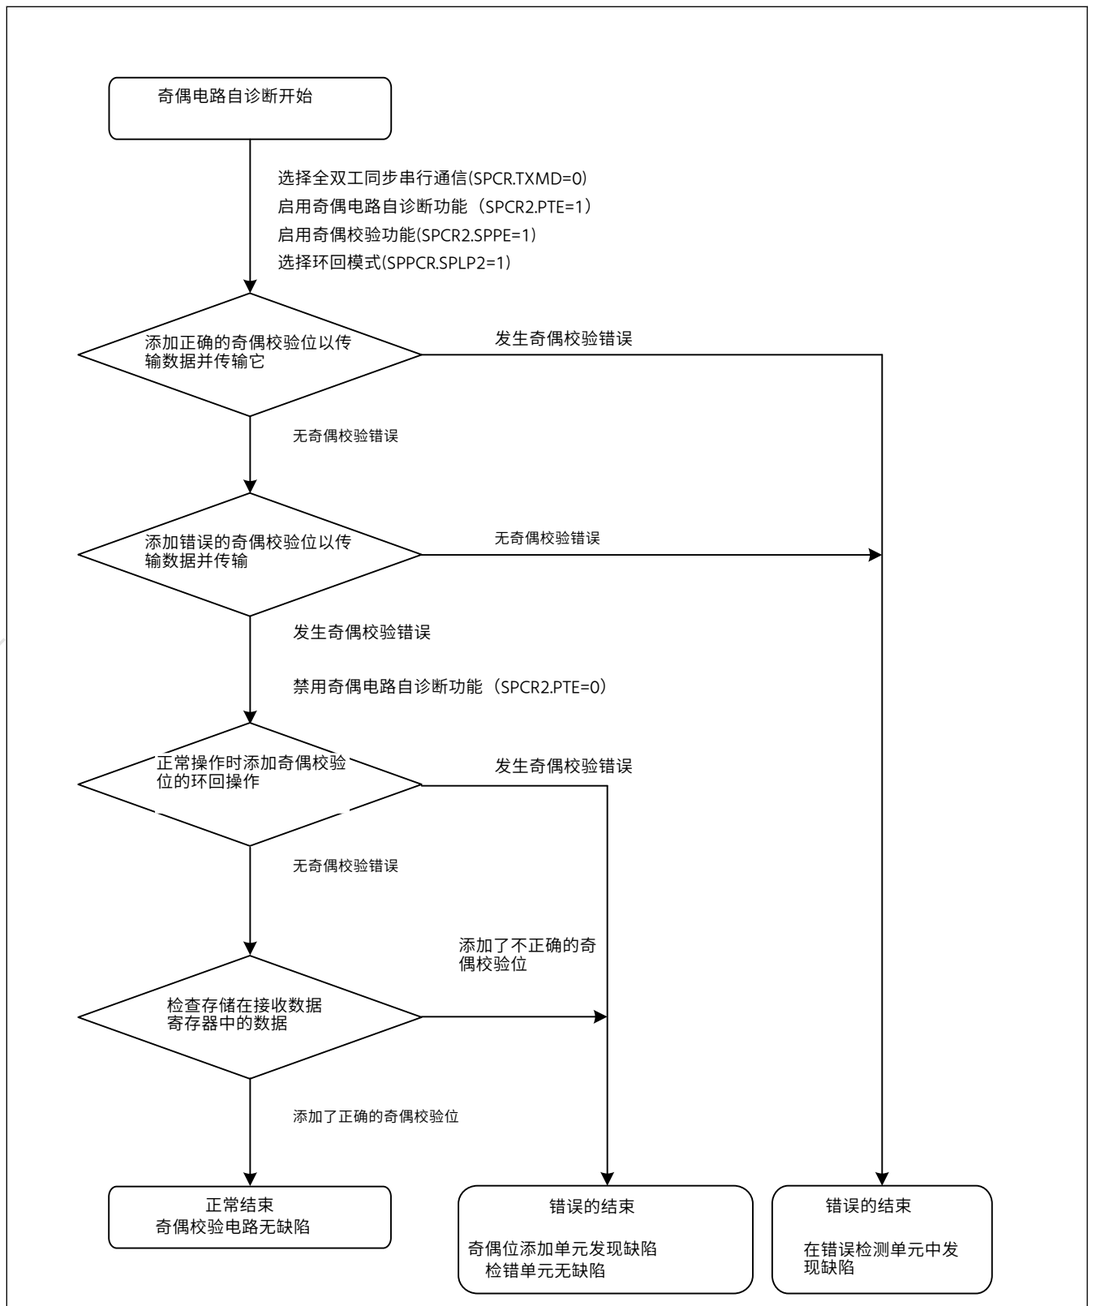

Figure 34.62 奇偶校验电路的自诊断流程

34.3.15 中断源

SPI有以下中断源：

- Receive buffer full
- Transmit buffer empty
- SPI error (mode-fault, underrun, overrun, or parity error)
- SPI idle
- Communication-end

The DMAC or DTC can be activated by the receive buffer full or transmit buffer empty interrupt to perform data transfer.

Because the vector address for the SPIi_SPEI (SPI error interrupt) is allocated to interrupt requests on mode-fault, underrun, overrun, and parity errors, the actual interrupt source must be determined from the flags. Interrupt sources for the SPI are listed in Table 34.15. An interrupt is generated on satisfaction of one of the interrupt conditions in Table 34.15. Clear the receive buffer full and transmit buffer empty sources through a data transfer.

When using the DMAC or DTC to perform data transmission and reception, you must first set up the DMAC or DTC to be in a transfer-enabled status before setting the SPI. For information on setting up the DMAC or DTC, see section 16, DMA Controller (DMAC) and section 17, Data Transfer Controller (DTC).

If the conditions for generating a transmit buffer empty or receive buffer full interrupt occur while the ICU.IELSRn.IR flag is 1, the interrupt is not output as a request for the ICU but is retained internally (the capacity for retention is one request per source). A retained interrupt request is output when the ICU.IELSRn.IR flag becomes 0. A retained interrupt request is automatically discarded when it is output as an actual interrupt request. The interrupt enable bit (the SPCR.SPTIE or SPCR.SPRIE bit) for an internally retained interrupt request can also be set to 0.

Table 34.15 SPI interrupt sources

Interrupt source	Symbol	Interrupt condition	DTC/DMAC activation
Receive buffer full	SPIi_SPRI	The receive buffer becomes full (SPSR.SPRF flag is 1) while the SPCR.SPRIE bit is 1	Possible
Transmit buffer empty	SPIi_SPTI	The transmit buffer becomes empty (SPSR.SPTEF flag is 1) while the SPCR.SPTIE bit is 1	Possible
SPI error (mode-fault, underrun, overrun, or parity error)	SPIi_SPEI	The SPSR.MODF, OVRF, UDRF or PERF flag sets to 1 while the SPCR.SPEIE bit is 1	Impossible
SPI idle	SPIi_SPII	The SPSR.IDLNF flag sets to 0 while the SPCR2.SPIIE bit is 1	Impossible
Communication-end	SPIi_SPCI	CENDIE = 1 and CENDF = 1	Impossible

34.4 Event Link Controller Event Output

The Event Link Controller (ELC) can produce the following event output signals:

- Receive buffer full event output
- Transmit buffer empty event output
- Mode-fault, underrun, overrun, or parity error event output
- SPI idle event output
- Transmission-completed event output

The event link output signal is output regardless of the interrupt enable bit setting.

34.4.1 Receive Buffer Full Event Output

This event signal is output when received data is transferred from the shift register to the SPDR/SPDR_HA on completion of serial transfer.

34.4.2 Transmit Buffer Empty Event Output

This event signal is output when data for transmission is transferred from the transmit buffer to the shift register and when the value of the SPE bit changes from 0 to 1.

●接收缓冲区已满

●发送缓冲区空

●SPI错误（模式故障、欠载、溢出或奇偶校验错误）

●SPI空闲

- Communication-end

DMAC或DTC可由接收缓冲区满或发送缓冲区空中断激活以执行数据传输。

由于SPIi_SPEI（SPI错误中断）的向量地址分配给模式错误、欠载、溢出和奇偶校验错误的中断请求，因此必须根据标志确定实际中断源。SPI的中断源在表34.15中列出。满足表34.15中的中断条件之一时会产生中断。通过数据传输清除接收缓冲区满和发送缓冲区空源。

使用DMAC或DTC进行数据收发时，必须先将DMAC或DTC设置为传输使能状态，然后再设置SPI。有关设置DMAC或DTC的信息，请参阅第16节，DMA控制器(DMAC)和第17节，数据传输控制器(DTC)。

如果在ICU.IELSRn.IR标志为1时发生发送缓冲区空或接收缓冲区满中断的条件，则该中断不会作为对ICU的请求输出，而是在内部保留（保留容量为每个请求一个请求）资源）。当ICU.IELSRn.IR标志变为0时，输出保留中断请求。当作为实际中断请求输出时，自动丢弃保留中断请求。内部保留中断请求的中断使能位（SPCR.SPTIE或SPCR.SPRIE位）也可以设置为0。

Table 34.15 SPI中断源

中断源	Symbol	中断条件	DTC/DMAC activation
接收缓冲区已满	SPIi_SPRI	当SPCR.SPRIE位为1时，接收缓冲区变满（SPSR.SPRF标志为1）	Possible
发送缓冲区为空	SPIi_SPTI	当SPCR.SPTIE位为1时，发送缓冲区变为空（SPSR.SPTEF标志为1）	Possible
SPI错误（模式错误、欠载、溢出或奇偶校验错误）	SPIi_SPEI	SPSR.MODF、OVRF、UDRF或PERF标志设置为1，而SPCR.SPEIE位为1	Impossible
SPI空闲	SPIi_SPII	SPSR.IDLNF标志设置为0，而SPCR2.SPIIE位为1	Impossible
Communication-end	SPIi_SPCI	CENDIE = 1 and CENDF = 1	Impossible

34.4 事件链接控制器事件输出

事件链接控制器(ELC)可以产生以下事件输出信号：

●接收缓冲区满事件输出

●发送缓冲区空事件输出

●模式故障、欠载、溢出或奇偶校验错误事件输出

●SPI空闲事件输出

●传输完成事件输出

无论中断允许位设置如何，都会输出事件链接输出信号。

34.4.1 接收缓冲区满事件输出

串行传输完成后，当接收到的数据从移位寄存器传输到SPDRSPDR_HA时，输出此事件信号。

34.4.2 发送缓冲区空事件输出

当要发送的数据从发送缓冲器传送到移位寄存器时，以及SPE位的值从0变为1时，输出该事件信号。

34.4.3 Mode-Fault, Underrun, Overrun, or Parity Error Event Output

This event signal is output when mode-fault, underrun, overrun, or parity error is detected. See section 34.5.4. Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output if using this event signal.

(1) Mode-fault

Table 34.16 lists the conditions for occurrence of a mode-fault event.

Table 34.16 Conditions for mode-fault occurrence

SPI mode	SPCR.MODFEN bit	SSLn0 pin	Remarks
SPI operation (SPMS = 0) Slave (SPCR.MSTR = 0)	1	Not active	Event is output only when the SSLn0 pin is deactivated during transmission

(2) Underrun

This event signal is output in response to an underrun when a serial transfer starts while the transmission data is not ready, and the value of the SPCR.MSTR bit is 0 and the SPCR.SPE bit is 1. Under these conditions, the MODF and UDRF flags are set to 1.

(3) Overrun

This event signal is output in response to an overrun when a serial transfer completes while the receive buffer contains unread data and the value of the SPCR.TXMD bit is 0. Under these conditions, the OVRF flag is set to 1.

(4) Parity error

This event signal is output in response to a parity error detected on completion of a serial transfer while the value of the TXMD bit in SPCR is 0 and the value of the SPPE bit in SPCR2 is 1.

34.4.4 SPI Idle Event Output

(1) In master mode

In master mode, an event is output when the condition for setting the IDLNF flag (SPI idle flag) to 0 is satisfied.

(2) In slave mode

In slave mode, an event is output when the SPCR.SPE bit is set to 0 (SPI is initialized).

34.4.5 Communication End Event Output

In master mode, an event is output when the IDLNF flag (RSPI idle flag) changes from 1 to 0. In slave mode, an event occurs with conditions shown in Table 34.17 and Table 34.18

Table 34.17 Communication End Event Generating Conditions (transmit-receive/transmit slave mode)

	Transmit Buffer Status	Shift Register Status	Others
SPI operation (SPMS = 0)	Empty	Empty	SSL0 input is negated
Clock synchronous operation (SPMS = 1)	Empty	Empty	The last even edge of RSPCK of last data was detected (CPHA = 1)

Table 34.18 Communication End Event Generating Conditions (receive only slave mode)

	Others
SPI operation (SPMS = 0)	SSL0 input is negated
Clock synchronous operation (SPMS = 1)	The last even edge of RSPCK of last data was detected (CPHA = 1)

Regardless of master mode or slave mode, no event is output when 0 is written to the SPCR.SPE bit during transmission or when the SPCR.SPE bit is cleared due to a mode fault error or an underrun error.

34.4.3 模式故障、欠载、溢出或奇偶校验错误事件输出

当检测到模式故障、欠载、溢出或奇偶校验错误时，输出此事件信号。请参见第34.5.4节。如果使用此事件信号，则对模式故障、欠载、溢出或奇偶校验错误事件输出的约束。

(1) Mode-fault

表34.16列出了模式故障事件发生的条件。

Table 34.16 模式故障发生的条件

SPI模式	SPCR.MODFEN bit	SSLn0 pin	Remarks
SPI操作(SPMS=0)从机(SPCR.MSTR=0)	1	不活跃	只有在传输过程中禁用SSLn0引脚时才会输出事件

(2) Underrun

当串行传输开始而传输数据尚未准备好，并且SPCR.MSTR位的值为0且SPCR.SPE位为1时，输出此事件信号以响应欠载。在这些条件下，MODF和UDRF标志设置为1。

(3) Overrun

当串行传输完成而接收缓冲区包含未读数据且SPCR.TXMD位的值为0时，输出此事件信号以响应溢出。在这些情况下，OVRF标志设置为1。

(4) 奇偶校验错误

该事件信号是响应在串行传输完成时检测到的奇偶校验错误而输出的，而SPCR中的TXMD位为0，SPCR2中的SPPE位的值为1。

34.4.4 SPI空闲事件输出

(1) 在主模式

在主机模式下，当将IDLNF标志（SPI空闲标志）设置为0的条件成立时输出事件。

(2) 在从模式

在从机模式下，当SPCR.SPE位设置为0（SPI初始化）时，会输出一个事件。

34.4.5 通讯结束事件输出

在主机模式下，当IDLNF标志（RSPI空闲标志）从1变为0时输出事件。在从机模式下，事件发生的条件如表34.17和表34.18所示

Table 34.17 通信结束事件发生条件（发送-接收发送从模式）

	发送缓冲区状态	移位寄存器状态	Others
SPI操作(SPMS=0)	Empty	Empty	SSL0输入被否定
时钟同步操作(SPMS=1)	Empty	Empty	检测到最后一个数据的RSPCK的最后一个偶边沿(CPHA=1)

Table 34.18 通信结束事件发生条件（仅接收从模式）

	Others
SPI操作(SPMS=0)	SSL0输入被否定
时钟同步操作(SPMS=1)	检测到最后一个数据的RSPCK的最后一个偶边沿(CPHA=1)

无论主模式还是从模式，在传输过程中向SPCR.SPE位写入0或由于模式故障错误或欠载错误而清除SPCR.SPE位时，不输出任何事件。

A communication end event is output at the following timing. The communication end event output timing in master operation is omitted because it is output at the same timing as an idle event.

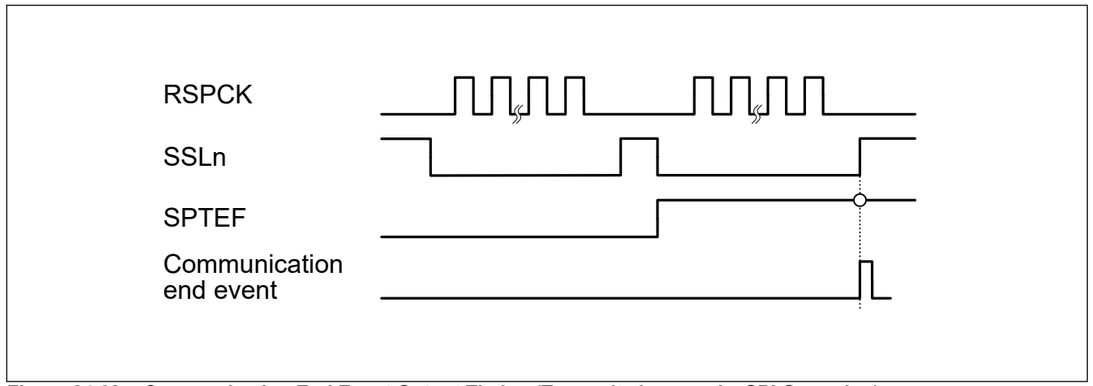

Figure 34.63 Communication End Event Output Timing (Transmit slave mode, SPI Operation)

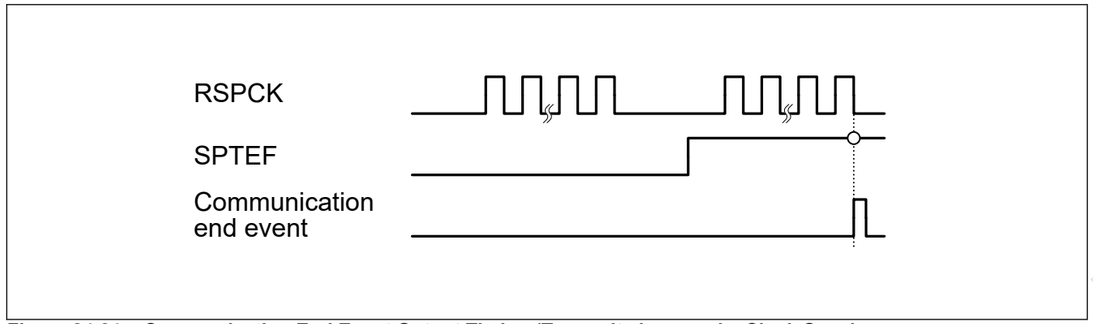

Figure 34.64 Communication End Event Output Timing (Transmit slave mode, Clock Synchronous Operation)

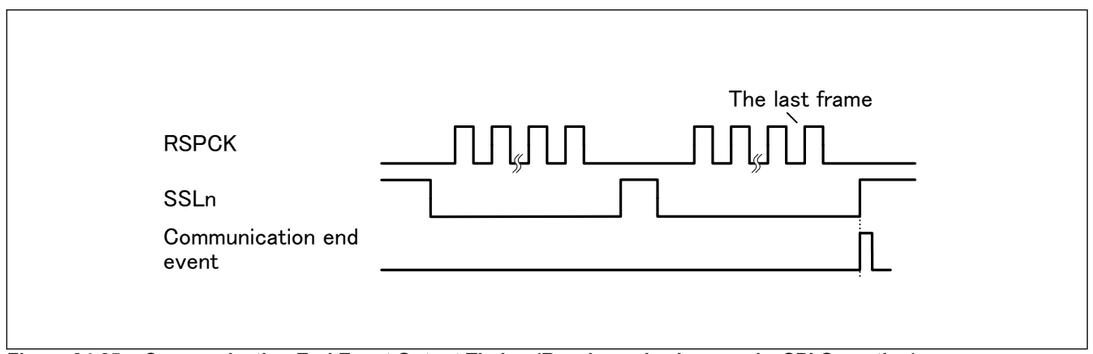

Figure 34.65 Communication End Event Output Timing (Receive only slave mode, SPI Operation)

在以下定时输出通信结束事件。主操作中的通信结束事件输出时序被省略，因为它与空闲事件在相同的时序输出。

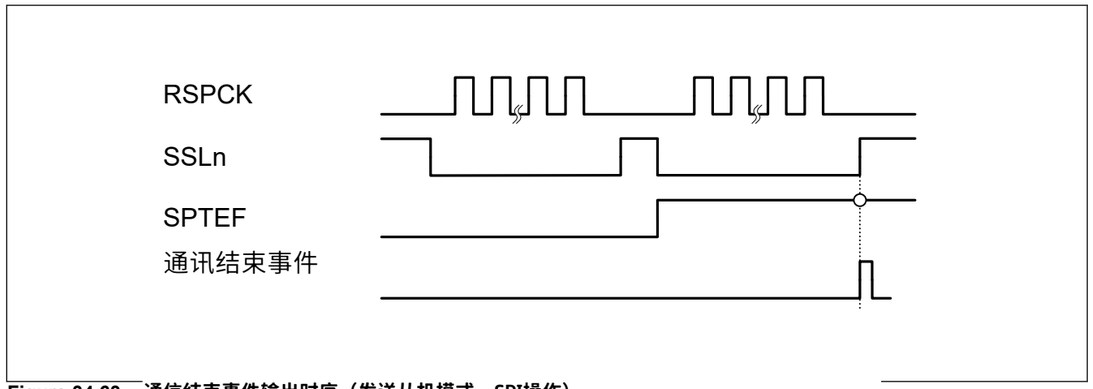

Figure 34.63 通信结束事件输出时序（发送从机模式，SPI操作）

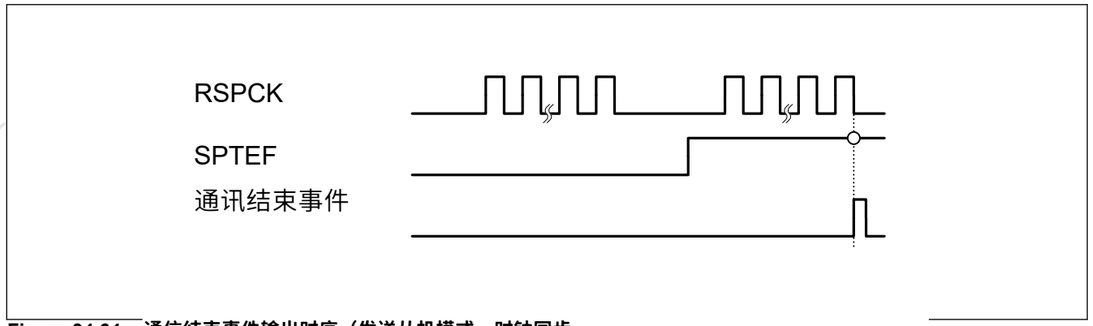

Figure 34.64 通信结束事件输出时序（发送从机模式，时钟同步 Operation)

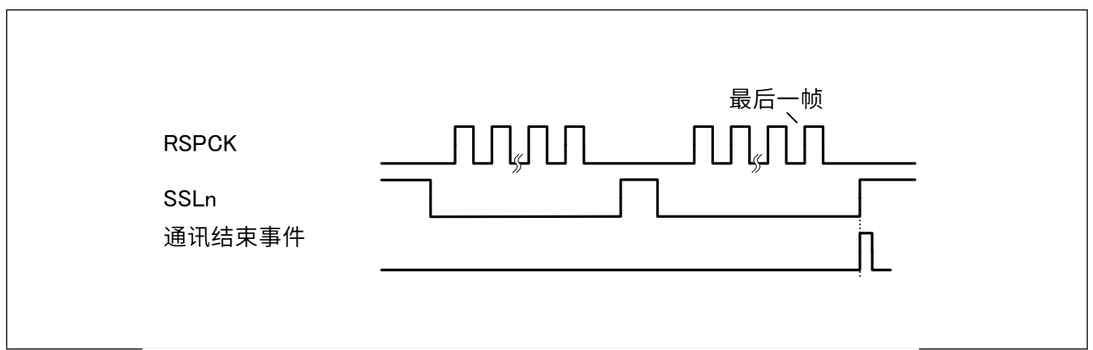

Figure 34.65 通信结束事件输出时序（仅接收从机模式，SPI操作）

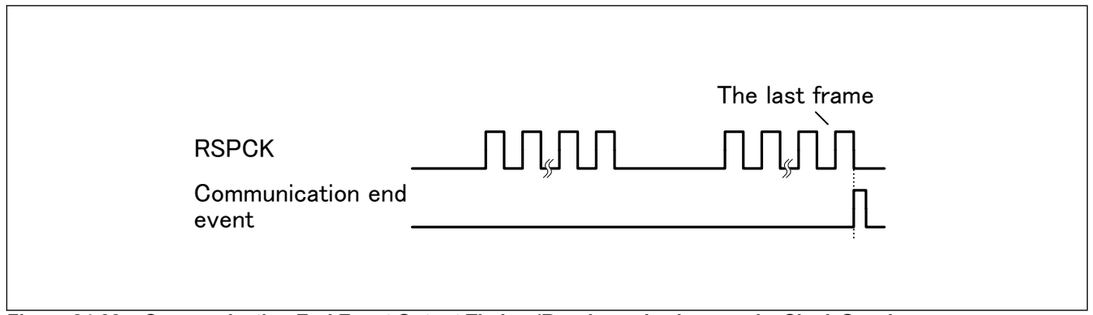

Figure 34.66 Communication End Event Output Timing (Receive only slave mode, Clock Synchronous Operation)

34.5 Usage Notes

34.5.1 Settings for the Module-Stop State

The Module Stop Control Register B (MSTPCRB) can enable or disable the SPI operation. The SPI is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details on the Module Stop Control Register B, see section 10, Low Power Modes.

34.5.2 Constraint on Low-Power Functions

When using the module-stop function and entering a low-power mode other than Sleep mode, set the SPCR.SPE bit to 0 before completing communication.

34.5.3 Constraints on Starting Transfer

If the ICU.IELSRn.IR flag is 1 when transfer starts, the interrupt request is internally retained, which can lead to unanticipated behavior of the ICU.IELSRn.IR flag.

To prevent this, use the following procedure to clear interrupt requests before enabling operations (by setting the SPCR.SPE bit to 1):

1. Confirm that transfer stopped (the SPCR.SPE bit is 0).
2. Set the associated interrupt enable bit (SPCR.SPTIE bit or SPCR.SPRIE bit) to 0.
3. Read the associated interrupt enable bit (SPCR.SPTIE bit or SPCR.SPRIE bit) and confirm that its value is 0.
4. Set the ICU.IELSRn.IR flag to 0.

34.5.4 Constraints on Mode-Fault, Underrun, Overrun, or Parity Error Event Output

Using the mode-fault, underrun, overrun, or parity error event is prohibited if the SPI is in multi-master mode (when the SPCR.SPMS bit is 0, the SPCR.MSTR bit is 1, and the SPCR.MODFEN bit is 1).

34.5.5 Constraints on the SPSR.SPRF and SPSR.SPTEF Flags

If the polling flags, SPRF and SPTEF, are used, using the interrupts is prohibited, and you must set the SPCR.SPRIE and SPCR.SPTIE bits to 0. Either the interrupts or the flags can be used, but not both.

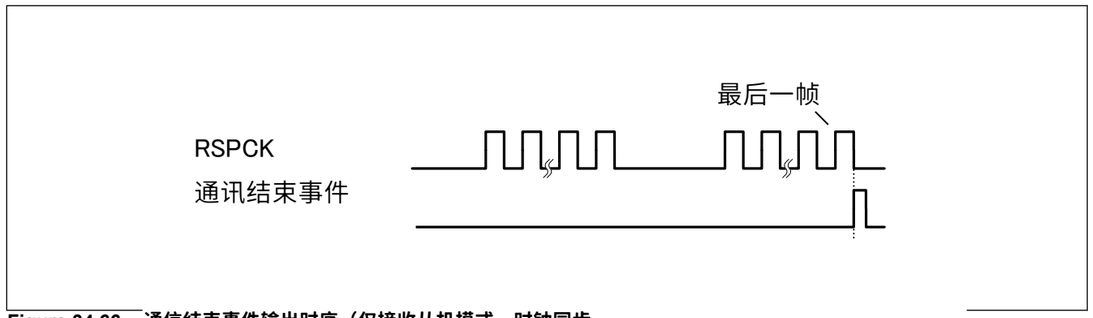

Figure 34.66 通信结束事件输出时序（仅接收从机模式，时钟同步 Operation)

34.5 使用说明

34.5.1 模块停止状态的设置

模块停止控制寄存器B(MSTPCRB)可以启用或禁用SPI操作。SPI在复位后最初停止。释放模块停止状态可以访问寄存器。有关模块停止控制寄存器B的详细信息，请参见第10节，低功耗模式。

34.5.2 对低功耗功能的约束

当使用模块停止功能并进入除睡眠模式以外的低功耗模式时，在完成通信之前将SPCR.SPE位设置为0。

34.5.3 开始传输的限制

如果ICU.IELSRn.IR标志在传输开始时为1，则内部保留中断请求，这可能导致ICU.IELSRn.IR标志的意外行为。

为防止这种情况发生，请使用以下程序在使能操作之前清除中断请求（通过将SPCR.SPE位设置为1）：

1.确认传输停止（SPCR.SPE位为0）。
2.将相关的中断使能位（SPCR.SPTIE位或SPCR.SPRIE位）设置为0。
3.读取相关的中断使能位（SPCR.SPTIE位或SPCR.SPRIE位）并确认其值为0。
4.将ICU.IELSRn.IR标志设置为0。

34.5.4 模式故障、欠载、溢出或奇偶校验错误事件输出的约束

如果SPI处于多主模式（当
SPCR.SPMS位为0，SPCR.MSTR位为1，SPCR.MODFEN位为1)。

34.5.5 SPSR.SPRF和SPSR.SPTEF标志的约束

如果使用轮询标志SPRF和SPTEF，则禁止使用中断，您必须设置SPCR.SPRIE和SPCR.SPTIE位为0。可以使用中断或标志，但不能同时使用。

35. Quad Serial Peripheral Interface (QSPI)

35.1 Overview

The QSPI is a memory controller for connecting a serial ROM (nonvolatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface.

Table 35.1 lists the QSPI specifications, Figure 35.1 shows a block diagram, and Table 35.2 lists the I/O pins.

Table 35.1 QSPI specifications

Parameter	Specifications
Number of channels	1 channel
SPI protocols	• Single SPI protocol, extended SPI protocol to achieve full-duplex communications Note: Standard or fast reading can only be used in single SPI operation. Four-wire communications with the serial flash memory by using the QSSL, QSPCLK, QIO0, and QIO1 pins (QIO0, QSSL, and QSPCLK for output, and QIO1 for input) • Dual SPI protocol to achieve half-duplex communications Four-wire communications with the serial flash memory by using the QSSL, QSPCLK, QIO0, and QIO1 pins (QSSL and QSPCLK for output, and QIO0 and QIO1 for input and output) • Quad SPI protocol to achieve half-duplex communications Six-wire communications with the serial flash memory by using the QSSL, QSPCLK, and QIO0 to QIO3 pins (QSSL and QSPCLK for output, and QIO0 to QIO3 for input and output)
SPI mode	• SPI mode 0: The QSPCLK signal is driven low when the SPI bus is not active. • SPI mode 3: The QSPCLK signal is driven high when the SPI bus is not active.
SPI timing adjustment function	The following settings are possible to suit various types of serial flash memory device: • SPI bus reference cycle (SFMSKC.SFMDV[4:0]) • Duty cycle correction (SFMSKC.SFMDTY) • Adjustment of the number of dummy cycles (SFMSDC.SFMDN[3:0]) • Minimum width at high level for the QSSL signal (SFMSSC.SFMSW[3:0]) • QSSL signal setup time (SFMSSC.SFMSLD) • QSSL signal hold time (SFMSSC.SFMSHD) • Serial data output enable hold time (SFMSMD.SFMOEX)
ROM access mode	• Support for Standard Read, Fast Read, Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, and Fast Read Quad I/O instructions • Substitutable instruction code • Prefetch function (data are sequentially stored in a buffer after one request without waiting for further requests to read the serial flash memory) • Polling processing • SPI bus cycle extension function • XIP mode (allowing skipping of the reception of an instruction code to read the serial flash memory) Note: ROM access mode is only possible with reading .
Direct communication mode	Flexible support for a wide variety of serial flash memory instructions and functions through software control, including erase, ID read, and power-down control
Interrupt source	Error interrupts
Module-stop function	Module-stop state can be set to reduce power consumption.
TrustZone Filter	Security attribution is always non-secure

35. 四路串行外设接口(QSPI)

35.1 Overview

QSPI是一种存储器控制器，用于连接串行ROM（非易失性存储器，例如串行闪存、串行具有SPI兼容接口的EEPROM或串行FeRAM）。

表35.1列出了QSPI规范，图35.1显示了框图，表35.2列出了IO引脚。

Table 35.1 QSPI specifications

Parameter	Specifications
通道数	1 channel
SPI协议	• 单SPI协议，扩展SPI协议实现全双工通信 Note: 标准或快速读取只能在单个SPI操作中使用。 使用QSSL、QSPCLK、QIO0和串行闪存进行四线通信 QIO1引脚（QIO0、QSSL和QSPCLK用于输出，QIO1用于输入） • 双SPI协议实现半双工通信 使用QSSL、QSPCLK、QIO0和串行闪存进行四线通信 QIO1引脚（QSSL和QSPCLK用于输出，QIO0和QIO1用于输入和输出） • QuadSPI协议实现半双工通信 通过使用QSSL、QSPCLK和QIO0与串行闪存进行六线通信 QIO3引脚（QSSL和QSPCLK用于输出，QIO0到QIO3用于输入和输出）
SPI模式	• SPI模式0：当SPI总线处于非活动状态时，QSPCLK信号被驱动为低电平。 • SPI模式3：当SPI总线不活动时，QSPCLK信号被驱动为高电平。
SPI时序调整功能	可以进行以下设置以适应各种类型的串行闪存设备：● SPI总线参考周期(SFMSKC.SFMDV[4:0]) • 占空比校正(SFMSKC.SFMDTY) • 调整虚拟周期数(SFMSDC.SFDMN[3:0]) • QSSL信号的高电平最小宽度(SFMSSC.SFMSW[3:0]) • QSSL信号建立时间(SFMSSC.SFMSLD) • QSSL信号保持时间(SFMSSC.SFMSHD) • 串行数据输出使能保持时间(SFMSMD.SFMOEX)
ROM访问模式	• 支持标准读取、快速读取、快速读取双输出、快速读取双IO、快速读取四路输出和快速读取四路IO指令 • 可替换指令代码 • 预取功能（数据在一个请求后顺序存储在缓冲区中，无需等待进一步的请求来读取串行闪存） • 轮询处理 • SPI总线周期扩展功能 ●XIP模式（允许跳过接收指令码来读取串行闪存）注意： ROM访问模式仅适用于读取。
直接通讯方式	通过软件控制灵活支持各种串行闪存指令和功能，包括擦除、ID读取和断电控制
中断源	错误中断
Module-stop function	可设置模块停止状态以降低功耗。
TrustZone Filter	安全归因始终是不安全的

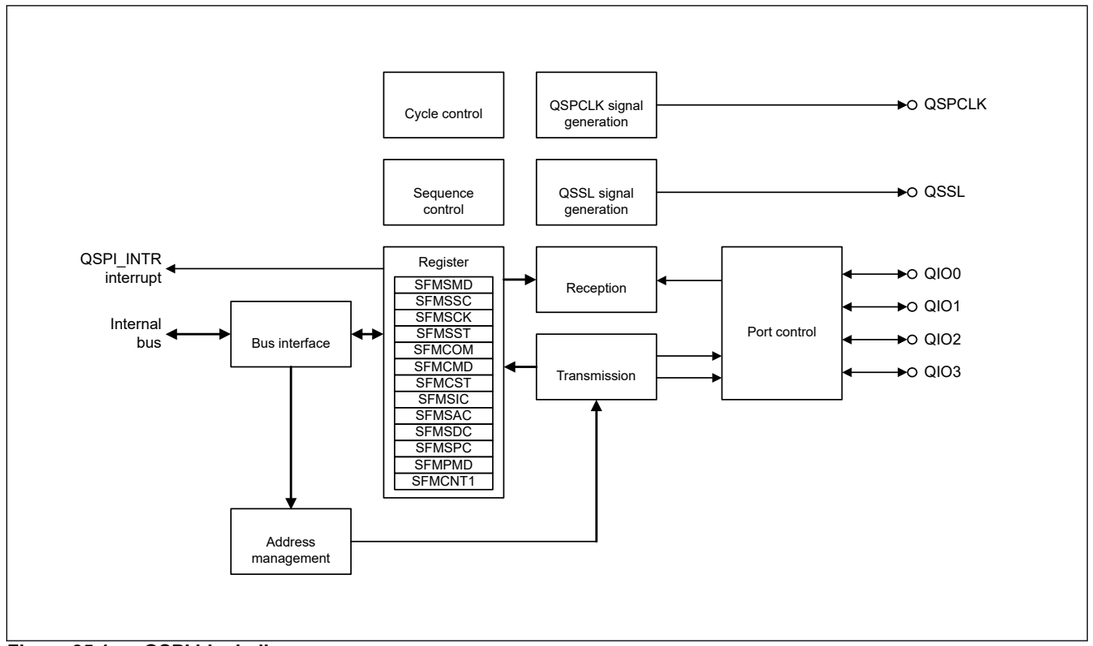

Figure 35.1 QSPI block diagram

Table 35.2 QSPI I/O pins

Function	Pin name	I/O	Description
QSPI	QSPCLK	Output	QSPI clock output pin.
	QSSL	Output	QSPI slave output pin.
	QIO0 to QIO3	I/O	Data0 to Data3

35.2 Register Descriptions

35.2.1 SFMSMD : Transfer Mode Control Register

Base address: QSPI = 0x6400_0000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DCOM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DCOM	Mode select for communication with the SPI bus 0: ROM access mode 1: Direct communication mode*1	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. SFMCMD.DCOM = 1 must be written when the transaction ends. For details, see section 35.10. Direct Communication Mode.

35.2.5 SFMCOM:通讯端口寄存器

Base address: QSPI = 0x6400_0000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SFMD[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
7:0	SFMD[7:0]	与SPI总线直接通信的端口 此端口的输入和输出在直接通信模式(DCOM=1)下转换为SPI总线周期。在ROM访问模式下，对该端口的访问被忽略。	R/W
31:8	—	这些位被读取为0。写入值应为0。	R/W

35.2.6 SFMCMD:通信模式控制寄存器

Base address: QSPI = 0x6400_0000

Offset address: 0x014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DCOM
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DCOM	与SPI总线通信的模式选择 0：ROM访问模式1：直接通信模式*1	R/W
31:1	—	这些位被读取为0。写入值应为0。	R/W

注1.SFMCMD.DCOM=1必须在事务结束时写入。有关详细信息，请参阅第35.10节。直接通信模式。

35.2.7 SFMCST : Communication Status Register

Base address: QSPI = 0x6400_0000

Offset address: 0x018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	EROMR	—	—	—	—	—	—	COMBSY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	COMBSY	SPI bus cycle completion state in direct communication 0: No serial transfer being processed 1: Serial transfer being processed	R
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	EROMR	ROM access detection status in direct communication mode 0: ROM access not detected 1: ROM access detected	R/(W)*1
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only 0 can be written to this bit.

35.2.8 SFMSIC : Instruction Code Register

Base address: QSPI = 0x6400_0000

Offset address: 0x020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SFMCIC[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SFMCIC[7:0]	Serial flash instruction code to substitute	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

35.2.7 SFMCST:通讯状态寄存器

Base address: QSPI = 0x6400_0000

Offset address: 0x018

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	EROMR	—	—	—	—	—	—	COMBSY
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	COMBSY	直接通信中的SPI总线周期完成状态 0：未处理串行传输1：正在处理串行传输	R
6:1	—	这些位被读取为0。写入值应为0。	R/W
7	EROMR	直接通信模式下的ROM访问检测状态 0：未检测到ROM访问1：检测到ROM访问	R/(W)*1
31:8	—	这些位被读取为0。写入值应为0。	R/W

注1.该位只能写入0。

35.2.8 SMSIC:指令代码寄存器

Base address: QSPI = 0x6400_0000

Offset address: 0x020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

35.3 Memory Map

35.3.1 External Bus Space

The locations of a serial flash memory and control register on the address space are determined by the address range of the area set in the configuration.

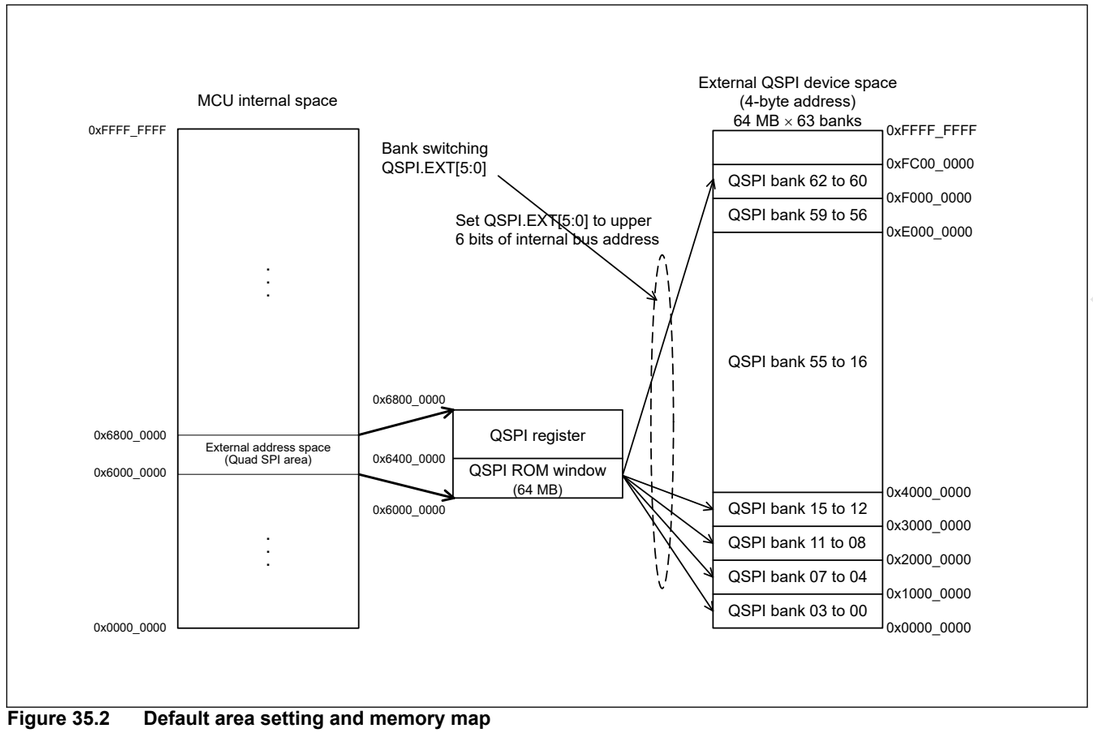

Figure 35.2 Default area setting and memory map

35.3.2 Address Width of the SPI Space and SPI Bus

The SPI space has a 32-bit address width for referencing the serial flash memory. When the SPI space is accessed for a read, an SPI bus cycle starts automatically, and data read from the serial flash is returned.

The address width of the SPI space is fixed at 32 bits. However, the address width of the SPI bus is selectable to 8, 16, 24, or 32 bits in the SFMAS[1:0] bits in the Address Mode Control Register (SFMSAC) register. If 8, 16, or 24 bits is selected as the address width of the SPI bus, only the lower part of the address used to access the SPI space is posted to the serial flash memory through the SPI bus. As a result, the mirror image of the serial flash corresponding to the address width of the SPI bus repeatedly appears in the SPI space.

35.3 内存映射

35.3.1 外部总线空间

串行闪存和控制寄存器在地址空间上的位置由配置中设置的区域的地址范围决定。

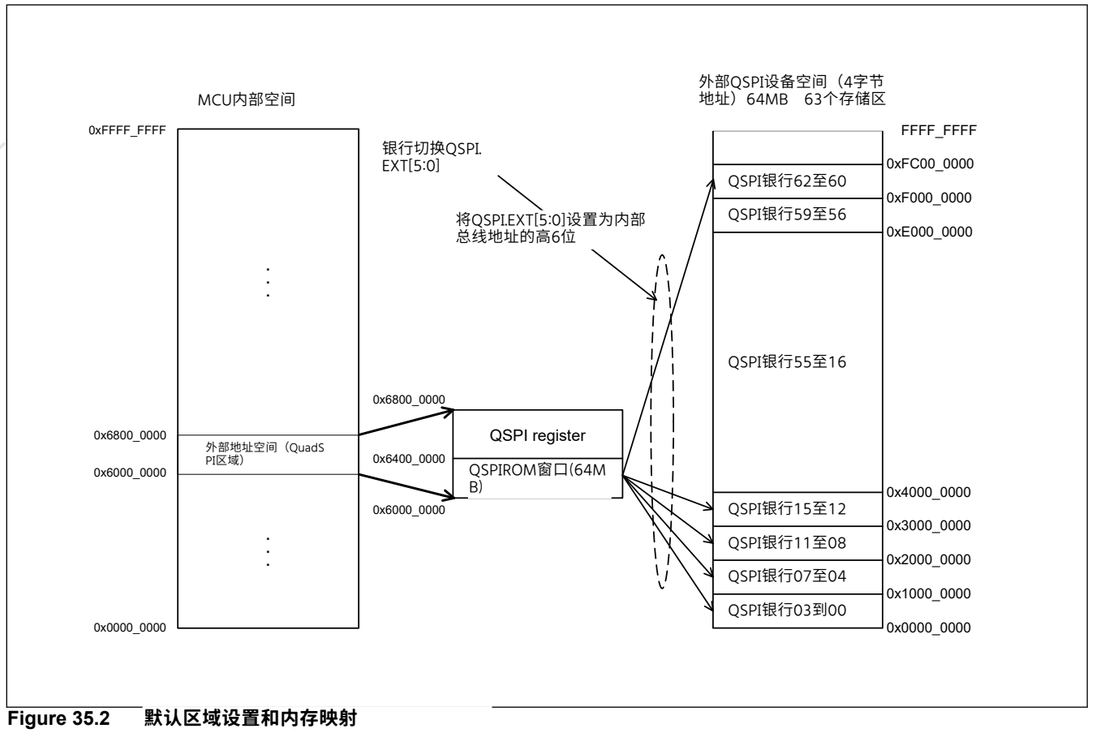

Figure 35.2 默认区域设置和内存映射

35.3.2 SPI空间和SPI总线的地址宽度

SPI空间具有32位地址宽度，用于引用串行闪存。当访问SPI空间进行读取时，会自动启动一个SPI总线周期，并返回从串行闪存读取的数据。

SPI空间的地址宽度固定为32位。但是，SPI总线的地址宽度可选择为地址模式控制寄存器(SFMSAC)寄存器中的SFMAS[1:0]位中的8、16、24或32位。如果选择8位、16位或24位作为SPI总线的地址宽度，则只有用于访问SPI空间的地址的低部分通过SPI总线发布到串行闪存中。结果，对应于SPI总线地址宽度的串行闪存的镜像在SPI空间中反复出现。

RA生态工作室

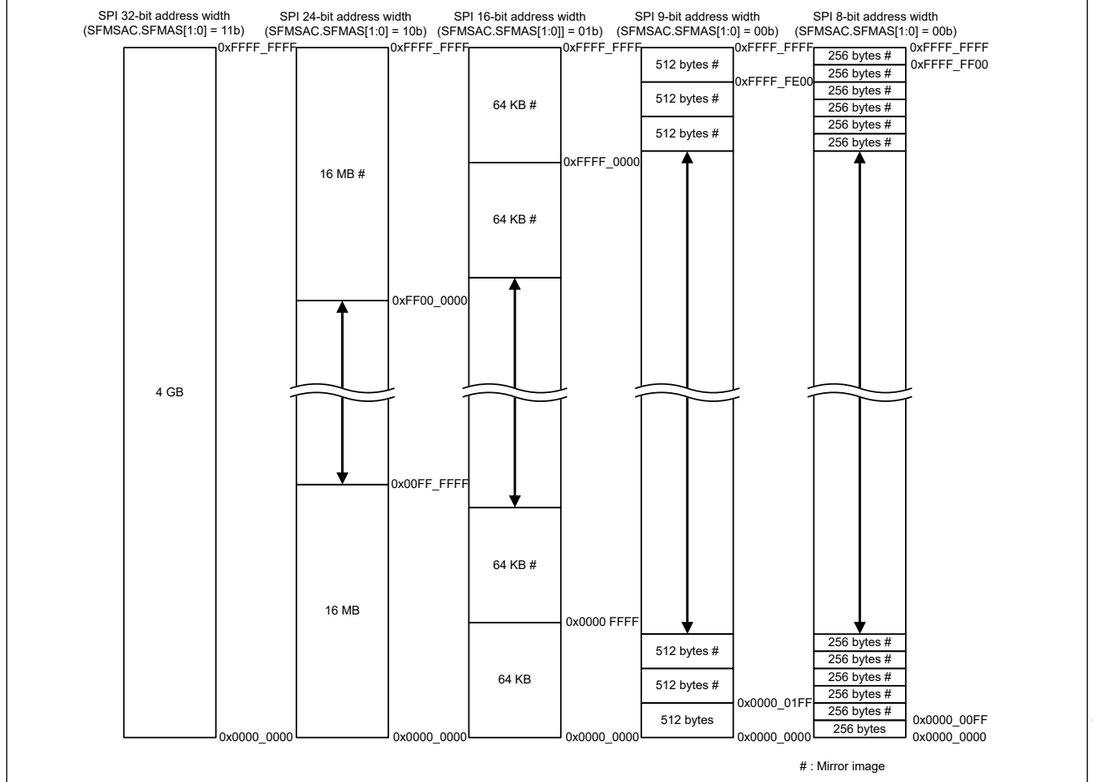

Figure 35.3 Memory map of SPI space

Note: The SPI bus address width is selectable to 8, 16, 24, or 32 bits in the SFMAS[1:0] bits in the SFMSAC register (cases 1 to 3 and 5 in the figure correspond to the respective address widths). When an 8-bit address width is selected, the address information of the ninth bit can be embedded in the Read instruction code. The memory map in case 4 in the figure is for the 9-bit address width. For details on the Read instruction, see section 35.6.2. Standard Read Instruction.

35.4 SPI Bus

35.4.1 SPI Protocol

Single SPI, extended SPI, dual SPI, and quad SPI are supported in addition to the SPI protocol used for serial flash memory connection.

The initial state of the SPI protocol is Single SPI, extended SPI and can be changed with the SFMSPI[1:0] bits in the SPI Protocol Control Register (SFMSPC) register.

The address and data pins used in the Single SPI, extended SPI protocol change depending on the setting of the serial interface read mode select bits SFMRM[2:0] in Transfer Mode Control Register (SFMSMD). Table 35.3 and Table 35.4 list the pins used for instruction code, addresses, and data in each of the SPI protocols.

Note: In read operation, the QSPI outputs additional one clock without accompanying data reception per one SPI bus cycle. For details, see section 35.5.9. Serial Data Receiving Latency.

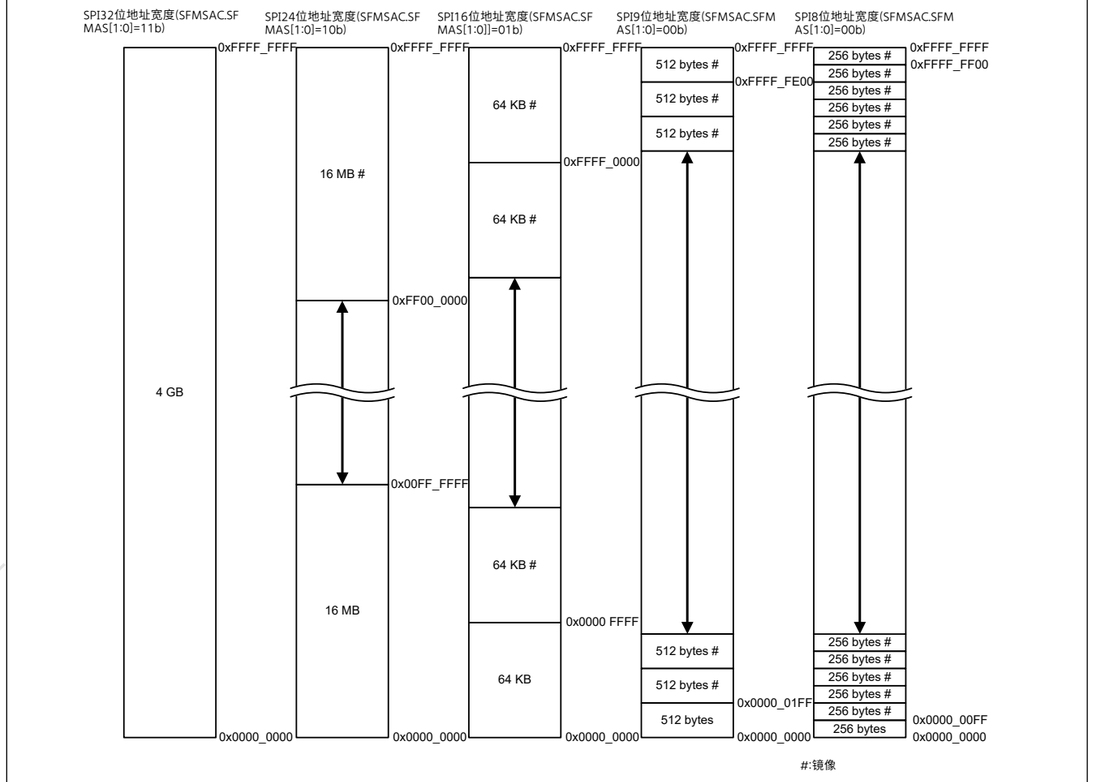

Figure 35.3 SPI空间的内存映射

Note: SPI总线地址宽度在SFMSAC寄存器的SFMAS[1:0]位中可选择为8、16、24或32位（图中的情况1到3和5对应于各自的地址宽度）。Whenan8-bitaddresswidthisselected theaddressinformationoftheninthbitcanbeembeddedintheReadinstructioncode.图中案例4中的内存映射是针对9位地址宽度的。有关Read指令的详细信息，请参阅第35.6.2节。标准阅读说明。

35.4 SPI总线

35.4.1 SPI协议

除了用于串行闪存连接的SPI协议外，还支持单SPI、扩展SPI、双SPI和四SPI。

SPI协议的初始状态是SingleSPI，扩展SPI，可以通过SPI中的SFMSPI[1:0]位改变协议控制寄存器(SFMSPC)寄存器。

单SPI、扩展SPI协议中使用的地址和数据引脚根据传输模式控制寄存器(SFMSMD)中串行接口读取模式选择位SFMRM[2:0]的设置而变化。表35.3和表35.4列出了每个SPI协议中用于指令代码、地址和数据的引脚。

Note: 在读操作中，QSPI会在每个SPI总线周期输出额外的一个时钟，而不会伴随数据接收。有关详细信息，请参阅第35.5.9节。串行数据接收延迟。

Table 35.3 List of SPI Protocols (1)

SPI Protocol (SFMSPC.SFMSPI[1:0])	Single SPI Protocol, Extended SPI Protocol					
Serial interface read mode select (SFMSMD.SFMRM[2:0])	Standard read	Fast read	Fast read dual output	Fast read dual I/O	Fast read quad output	Fast read quad I/O
All pins used	QSPCLK, QSSL, QIO0, QIO1	QSPCLK, QSSL, QIO0, QIO1	QSPCLK, QSSL, QIO0, QIO1	QSPCLK, QSSL, QIO0, QIO1	QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3	QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3
Pins used for instruction code	QIO0	QIO0	QIO0	QIO0	QIO0	QIO0
Pins used for addresses	QIO0	QIO0	QIO0	QIO0, QIO1	QIO0	QIO0, QIO1, QIO2, QIO3
Pins used for data	QIO0/QIO1	QIO0/QIO1	QIO0, QIO1	QIO0, QIO1	QIO0, QIO1, QIO2, QIO3	QIO0, QIO1, QIO2, QIO3

Note: Single SPI protocol operation is for standard read and fast read. Extended SPI protocol operation is fast read dual output, fast read dual I/O, fast read quad output, and fast read quad I/O.

Table 35.4 List of SPI Protocols (2)

SPI Protocol (SFMSPC.SFMSPI[1:0])	Dual-SPI Protocol		Quad-SPI Protocol	
Serial interface read mode select (SFMSMD.SFMRM[2:0])	Fast read dual output	Fast read dual I/O	Fast read quad output	Fast read quad I/O
All pins used	QSPCLK, QSSL, QIO0, QIO1	QSPCLK, QSSL, QIO0, QIO1	QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3	QSPCLK, QSSL, QIO0, QIO1, QIO2, QIO3
Pins used for instruction code	QIO0, QIO1	QIO0, QIO1	QIO0, QIO1, QIO2, QIO3	QIO0, QIO1, QIO2, QIO3
Pins used for addresses	QIO0, QIO1	QIO0, QIO1	QIO0, QIO1, QIO2, QIO3	QIO0, QIO1, QIO2, QIO3
Pins used for data	QIO0, QIO1	QIO0, QIO1	QIO0, QIO1, QIO2, QIO3	QIO0, QIO1, QIO2, QIO3

In single SPI protocol and extended SPI protocol, the instruction code is always output from the QIO0 pin. Address and data input/output operations are performed according to the settings in SFMSMD.SFMRM[2:0].

QIO0 and QIO1.

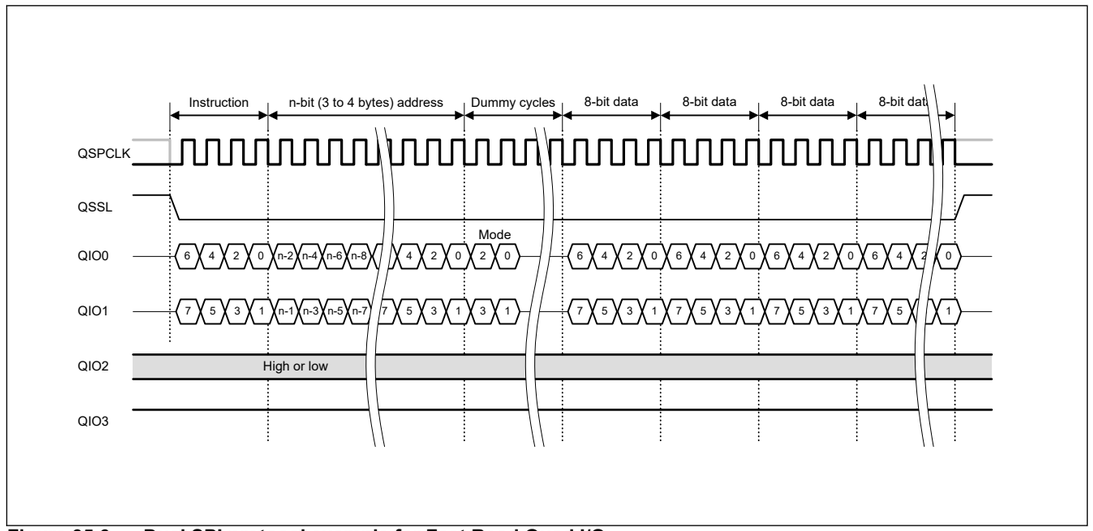

Figure 35.6 Dual SPI protocol example for Fast Read Quad I/O

The Quad SPI protocol performs I/O operation of all signals such as instruction codes, addresses, and data using four pins, QIO0, QIO1, QIO2, and QIO3.

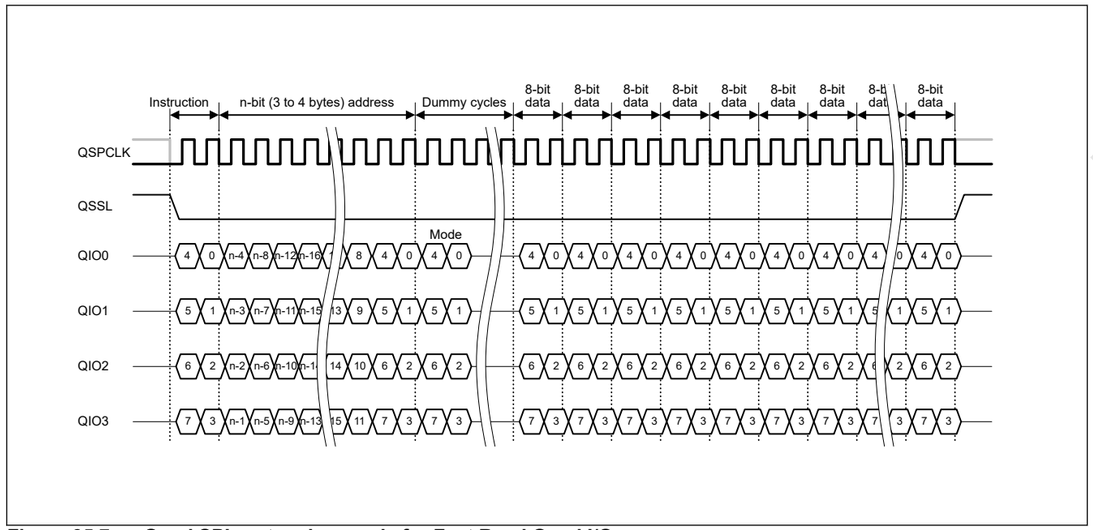

Figure 35.7 Quad SPI protocol example for Fast Read Quad I/O

35.4.2 SPI Mode

Either SPI mode 0 or SPI mode 3 can be selected as the SPI mode by the SFMSMD.SFMMD3 bit. This can be switched by changing the register setting during operation. The difference between SPI modes 0 and 3 is the state of the QSPCLK signal when it is inactive. The standby level of the QSPCLK signal in SPI mode 0 is low, and high in SPI mode 3.

Serial data is output from the QSPI on a falling edge of the serial clock and is read into the serial flash memory on a rising edge of the serial clock. Serial data is output from the serial flash memory on a falling edge of the serial clock and is read into the QSPI on the next falling edge of the serial clock.

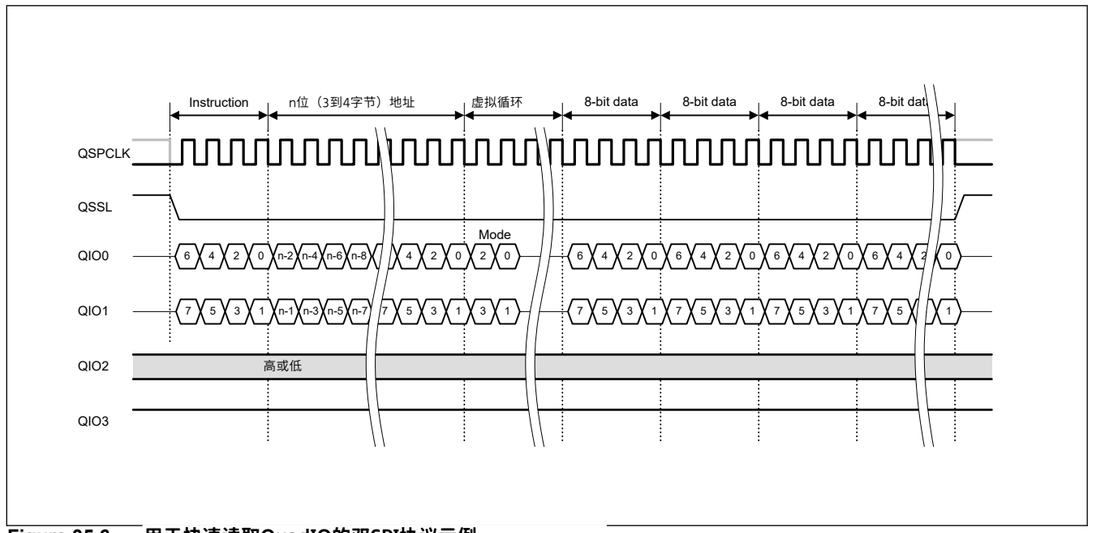

Figure 35.6 用于快速读取QuadIO的双SPI协议示例

QuadSPI协议使用四个引脚执行指令代码、地址和数据等所有信号的IO操作，
QIO0, QIO1, QIO2, and QIO3.

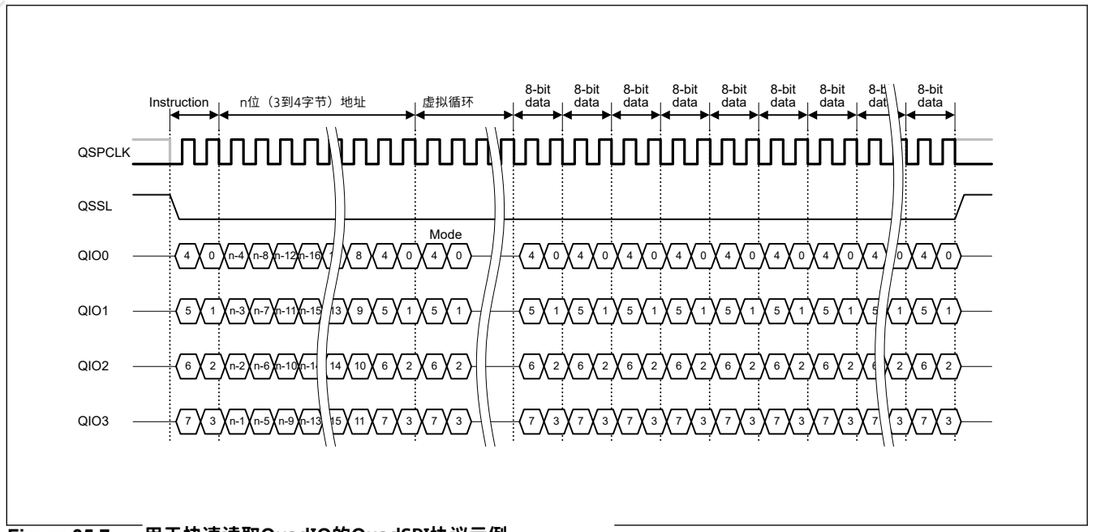

Figure 35.7 用于快速读取QuadIO的QuadSPI协议示例

35.4.2 SPI模式

可以通过SFMSMD.SFMMD3位选择SPI模式0或SPI模式3作为SPI模式。这可以通过在操作期间更改寄存器设置来切换。SPI模式0和3之间的区别在于QSPCLK信号处于非活动状态时的状态。QSPCLK信号在SPI模式0中的待机电平为低，在SPI模式3中为高。

串行数据在串行时钟的下降沿从QSPI输出，并在串行时钟的上升沿读入串行闪存。串行数据在串行时钟的下降沿从串行闪存输出，并在串行时钟的下一个下降沿读入QSPI。

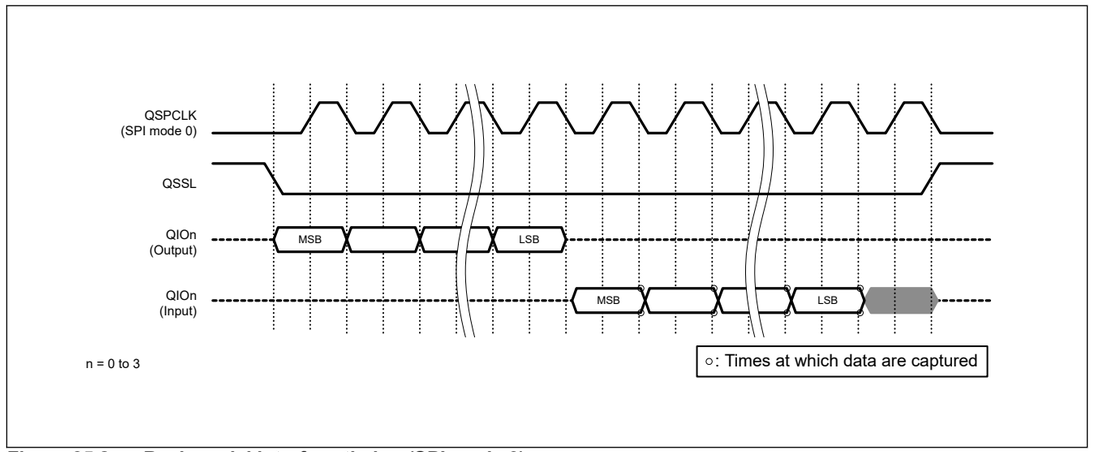

Figure 35.8 Basic serial interface timing (SPI mode 0)

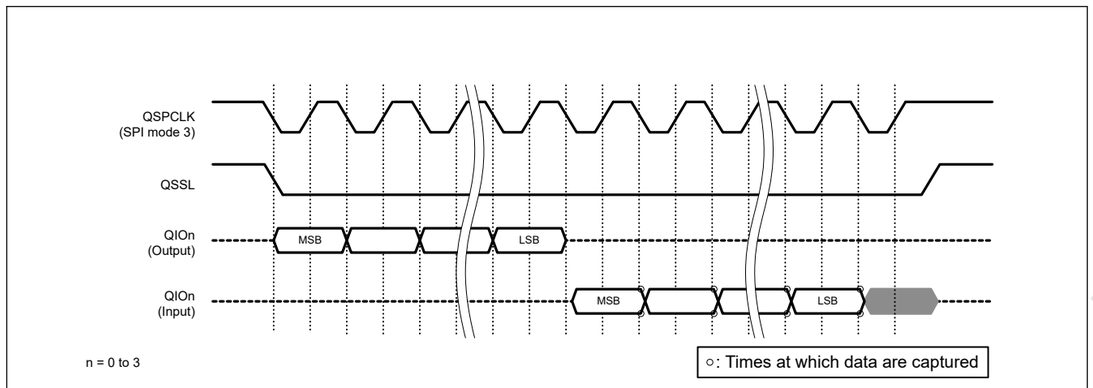

Figure 35.9 Basic serial interface timing (SPI mode 3)

35.5 SPI Bus Timing Adjustment

The timing of the SPI bus signal can be adjusted in the registers. The configured timing is applied to all SPI bus accesses, for both ROM access and direct communication.

35.5.1 SPI Bus Reference Cycles

The SPI bus operates on reference cycles obtained by multiplying PCLKA by an integer. The reference cycles are selectable within the range of PCLKA multiplied by 2 to 48 in the SFMDV[4:0] bits in the Transfer Mode Control Register (SFMSKC) register.

Table 35.5 Relationship among SFMDV[4:0] bits, cycle multiplier, and serial clock frequencies (1 of 2)

SFMDV[4:0]	Cycle multiplier	PCLKA = 100 [MHz]
11111b	48	2.08
11110b	46	2.17
11101b	44	2.27
11100b	42	2.38
11011b	40	2.50

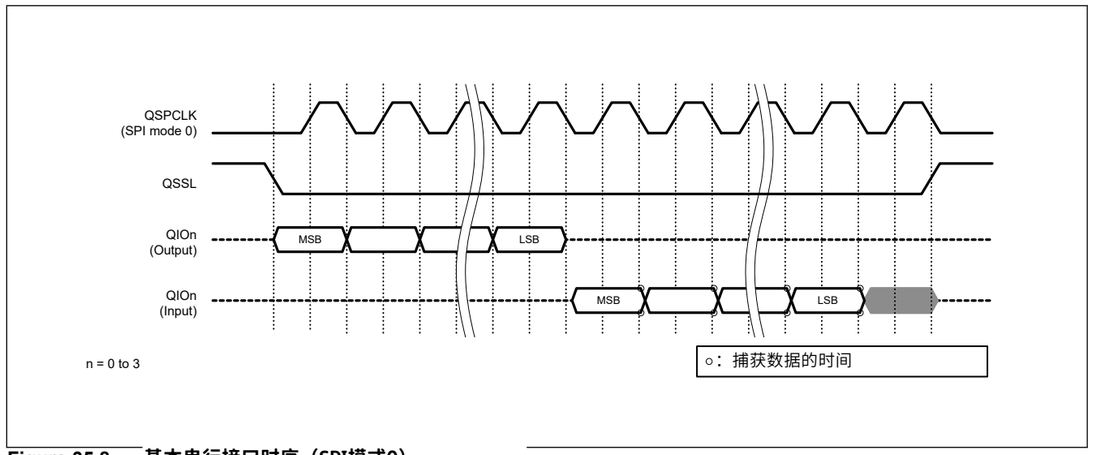

Figure 35.8 基本串行接口时序（SPI模式0）

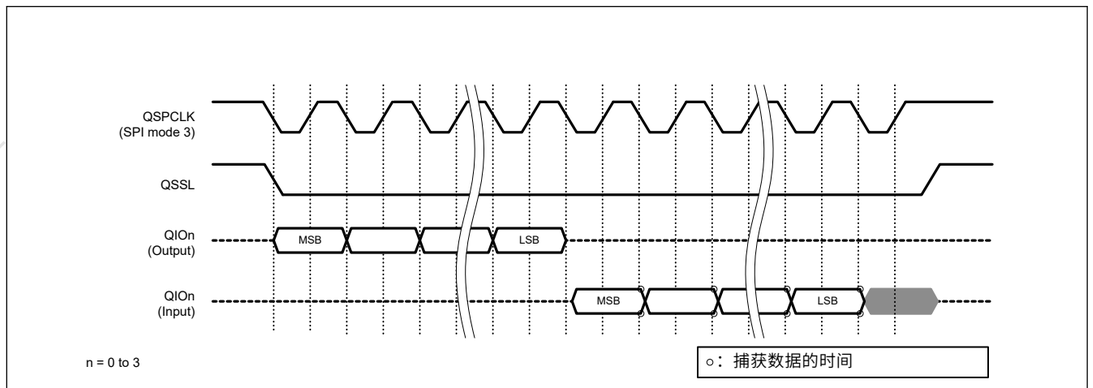

Figure 35.9 基本串行接口时序（SPI模式3）

35.5 SPI总线时序调整

SPI总线信号的时序可以在寄存器中调整。配置的时序适用于所有SPI总线访问，包括ROM访问和直接通信。

35.5.1 SPI总线参考周期

SPI总线在通过将PCLKA乘以一个整数获得的参考周期上运行。参考周期可在传输模式控制寄存器(SFMSKC)寄存器的SFMDV[4:0]位中的PCLKA乘以2到48的范围内选择。

Table 35.5 SFMDV[4:0]位、周期乘数和串行时钟频率之间的关系（1of2）

SFMDV[4:0]	循环乘数	PCLKA = 100 [MHz]
11111b	48	2.08
11110b	46	2.17
11101b	44	2.27
11100b	42	2.38
11011b	40	2.50

RA生态工作室

00001b	3	33.33
00000b	2	50.00

35.5.2 QSPCLK Signal Duty Ratio

When the reference clock is configured as PCLKA divided by an odd number without duty ratio correction, the duty ratio of the QSPCLK signal will not be 50%. When the reference clock is PCLKA divided by an odd number, be sure to enable the duty ratio correction function (SFMSKC.SFMDTY = 1).

When the reference clock is PCLKA divided by an even number, the SFMDTY setting in the SFMSKC register is ignored.

Table 35.5 SFMDV[4:0]位、周期乘数和串行时钟频率之间的关系(2of2)

35.5.2 QSPCLK信号占空比

当参考时钟配置为PCLKA除以奇数而不进行占空比校正时，QSPCLK信号的占空比不会为50%。当参考时钟为PCLKA除以奇数时，请务必启用占空比校正功能（SFMSKC.SFMDTY=1）。

当参考时钟为PCLKA除以偶数时，SFMSKC寄存器中的SFMDTY设置被忽略。

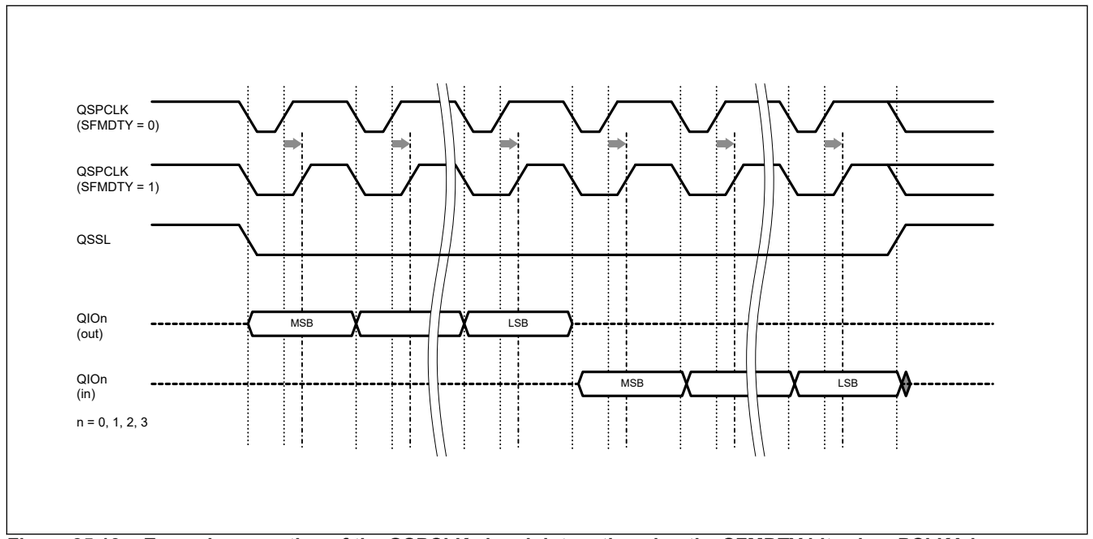

Figure 35.10 Example correction of the QSPCLK signal duty ratio using the SFMDTY bit, when PCLKA is multiplied by 3

35.5.3 Minimum High-Level Width for the QSSL Signal

Between adjacent SPI bus cycles, the QSSL signal must be held high (inactive) for a sufficient time to satisfy the deselect time required by the serial flash memory. The minimum high-level width of the QSSL output signal is selectable as the reference cycle multiplied by an integer from 1 to 16 in the SFMSW[3:0] bits in the Instruction Code Register (SFMSSC) register.

35.5.4 QSSL Signal Setup Time

The QSSL signal setup time that the serial flash memory requires after the QSSL signal is driven active low until the first rising edge of the QSPCLK signal can be configured. The setup time can be selected as 0.5 or 1.5 cycles of QSPCLK in the SFMSLD bit of the SFMSSC register.

Set a value that meets the most constrained timing condition for your application.

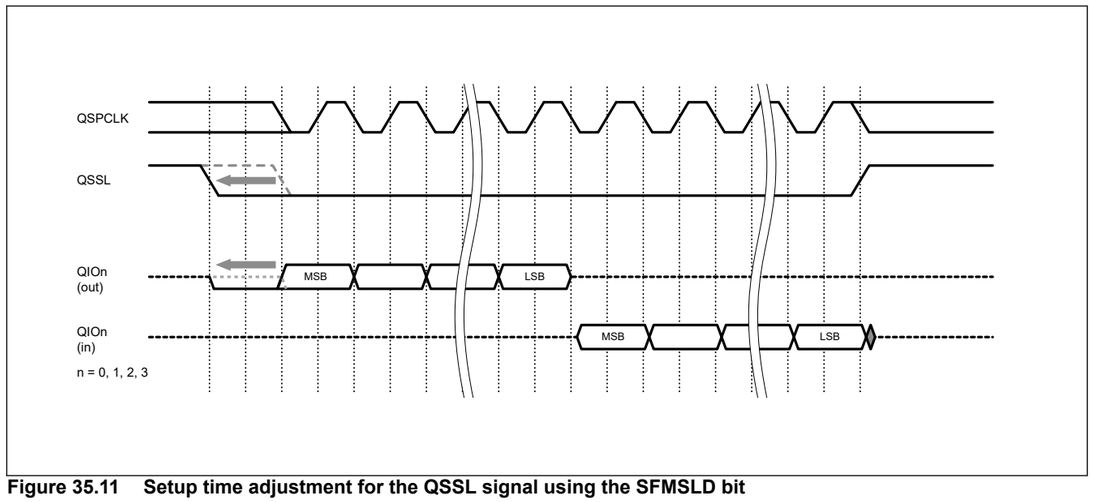

Figure 35.11 Setup time adjustment for the QSSL signal using the SFMSLD bit

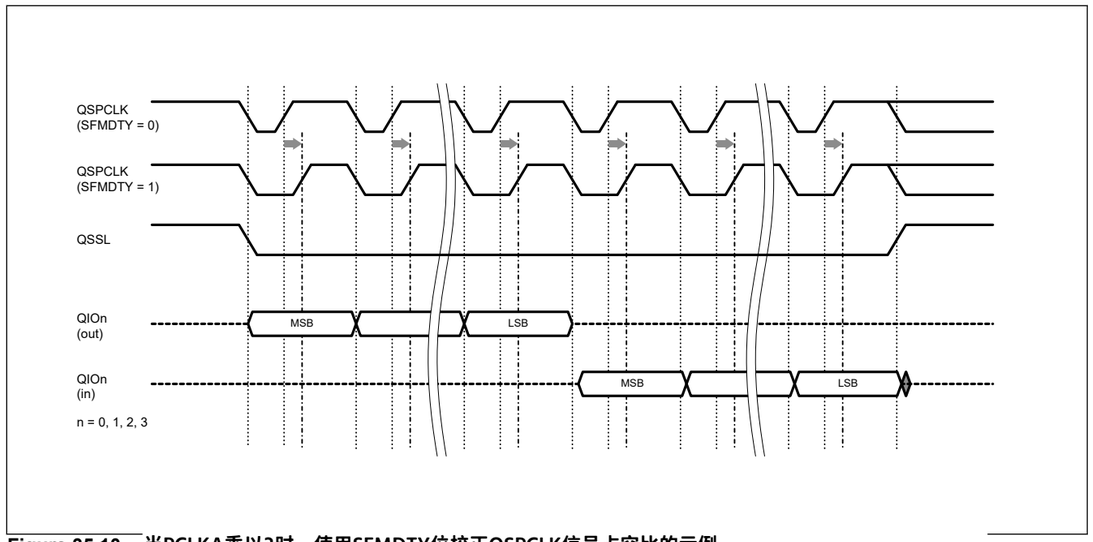

Figure 35.10 当PCLKA乘以3时，使用SFMDTY位校正QSPCLK信号占空比的示例

35.5.3 QSSL信号的最小高电平宽度

在相邻的SPI总线周期之间，QSSL信号必须保持高电平（无效）足够长的时间，以满足串行闪存所需的取消选择时间。QSSL输出信号的最小高电平宽度可选择为参考周期乘以指令代码寄存器(SFMSSC)寄存器中SFMSW[3:0]位中的1到16的整数。

35.5.4 QSSL信号建立时间

从QSSL信号被驱动为低电平有效到QSPCLK信号的第一个上升沿可以配置，串行闪存所需的QSSL信号建立时间。设置时间可以在SFMSSC寄存器的SFMSLD位中选择为0.5或1.5个QSPCLK周期。

为您的应用设置一个满足最受约束的时序条件的值。

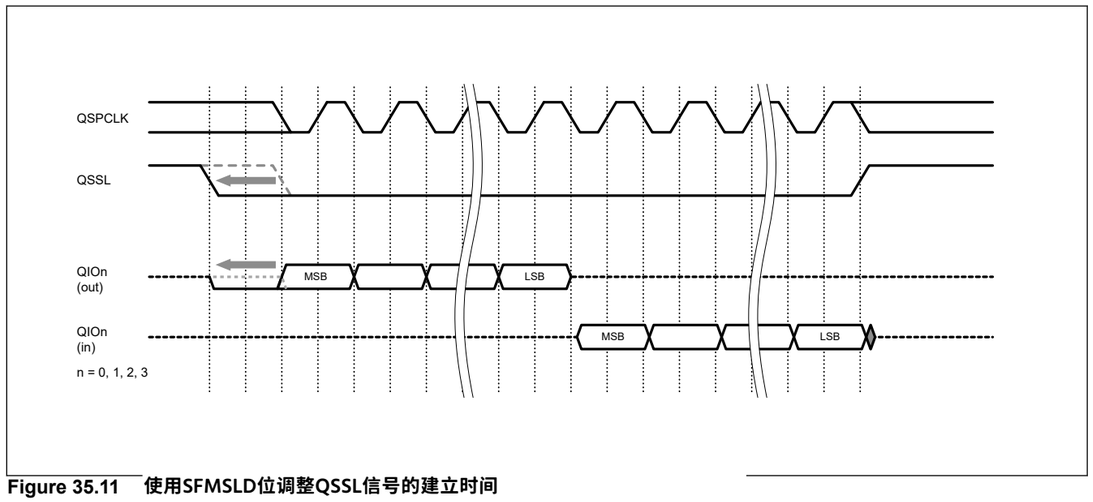

Figure 35.11 使用SFMSLD位调整QSSL信号的建立时间

35.5.5 QSSL Signal Hold Time

The QSSL signal hold time that the serial flash memory requires until the QSSL signal is driven high after the last rising edge of the QSPCLK signal can be configured. The hold time can be selected as 0.5 or 1.5 cycles of QSPCLK in the SFMSHD bit of the SFMSSC register.

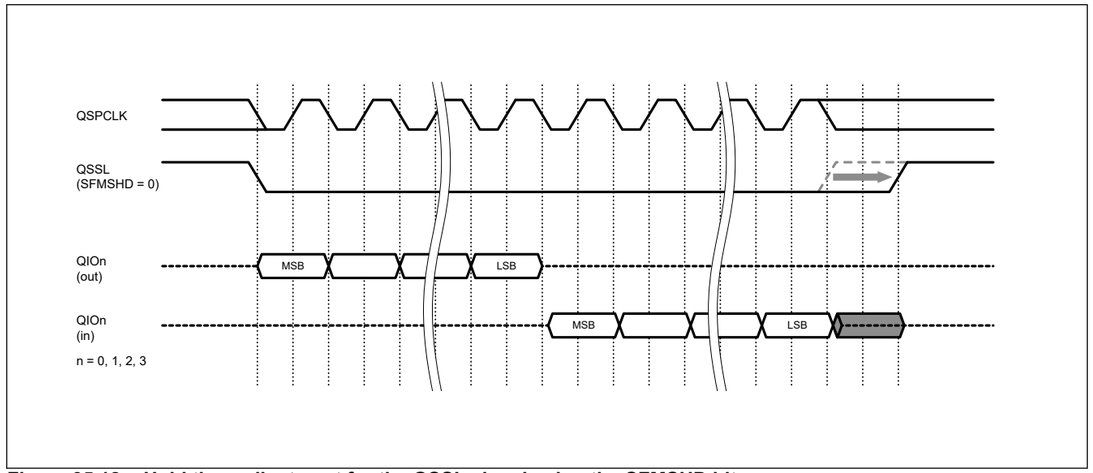

Figure 35.12 Hold time adjustment for the QSSL signal using the SFMSHD bit

35.5.6 Hold Time of the Serial Data Output Enable

The buffer output enable of the QIO0, QIO1, QIO2, or QIO3 pin can be extended by 1 QSPCLK using the SFMOEX bit in the SFMSMD register.

For a standard read instruction, it is extended immediately after an address code. For other read instructions, it is extended after two cycles of mode data (XIP mode control) of the serial flash memory in dummy cycles.

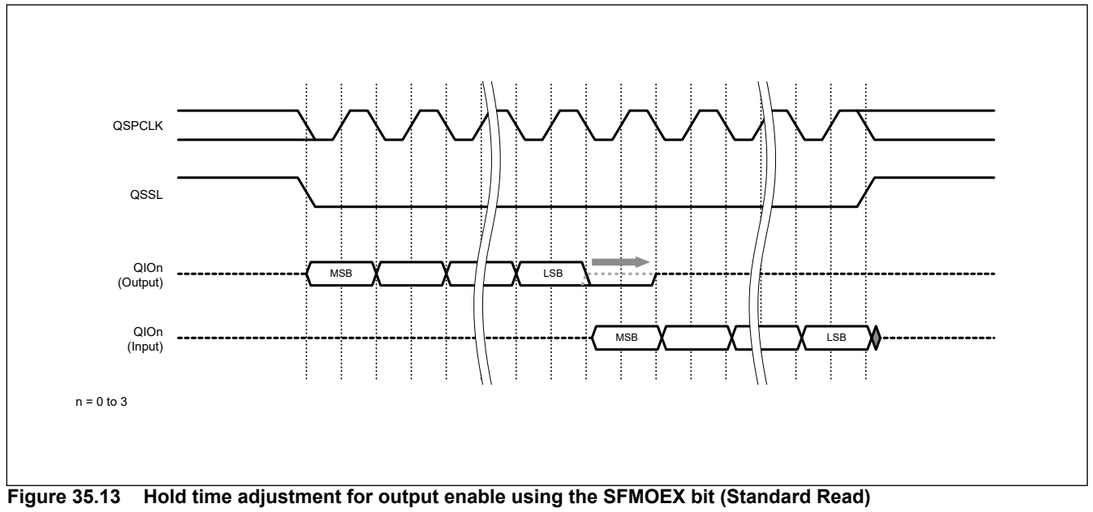

Figure 35.13 Hold time adjustment for output enable using the SFMOEX bit (Standard Read)

35.5.5 QSSL信号保持时间

可以配置在QSPCLK信号的最后一个上升沿之后，直到QSSL信号被驱动为高电平之前，串行闪存所需的QSSL信号保持时间。保持时间可以在SFMSSC寄存器的SFMSHD位中选择为0.5或1.5个QSPCLK周期。

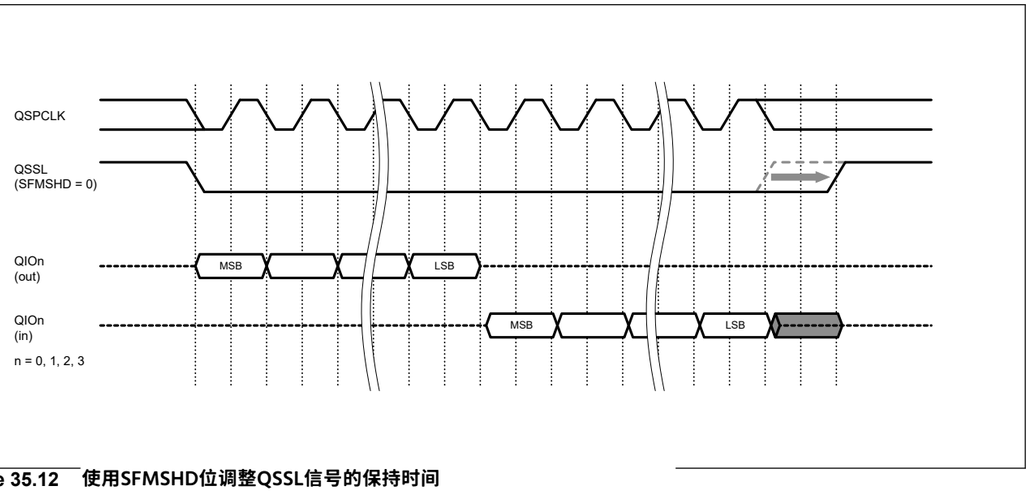

Figure 35.12 使用SFMSHD位调整QSSL信号的保持时间

35.5.6 串行数据输出使能的保持时间

可以使用SFMSMD寄存器中的SFMOEX位将QIO0、QIO1、QIO2或QIO3引脚的缓冲器输出使能扩展1个QSPCLK。

对于标准读指令，它在地址码之后立即扩展。对于其他读指令，它在串行闪存的两个模式数据（XIP模式控制）周期后以虚拟周期进行扩展。

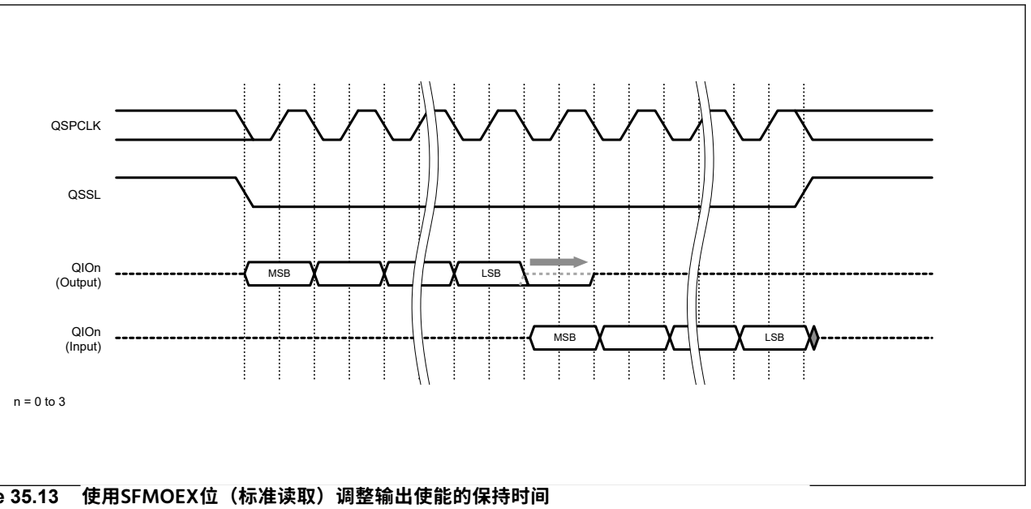

Figure 35.13 使用SFMOEX位（标准读取）调整输出使能的保持时间

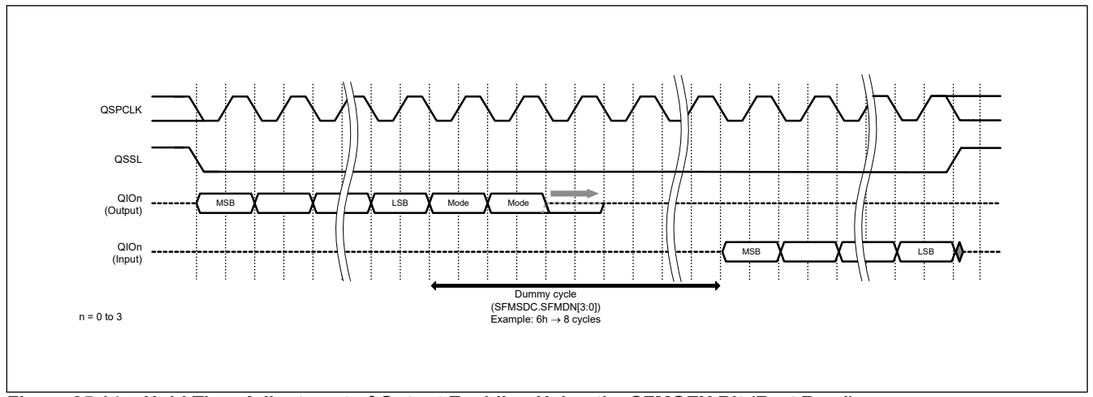

Figure 35.14 Hold Time Adjustment of Output Enabling Using the SFMOEX Bit (Fast Read)

35.5.7 Setup Time for Serial Data Output

When a command or address is transmitted to the serial flash memory, the setup time begins on serial data output and ends when the QSPCLK signal rises. If this setup time is insufficient, it can be extended by 1 PCLKA using the SFMOSW bit in the SFMSMD register. When SFMOSW is 1, the low-level width of QSPCLK during serial data transmission is extended by 1 PCLKA while data is being output from the QSPI. This function has no effect on serial data reception.

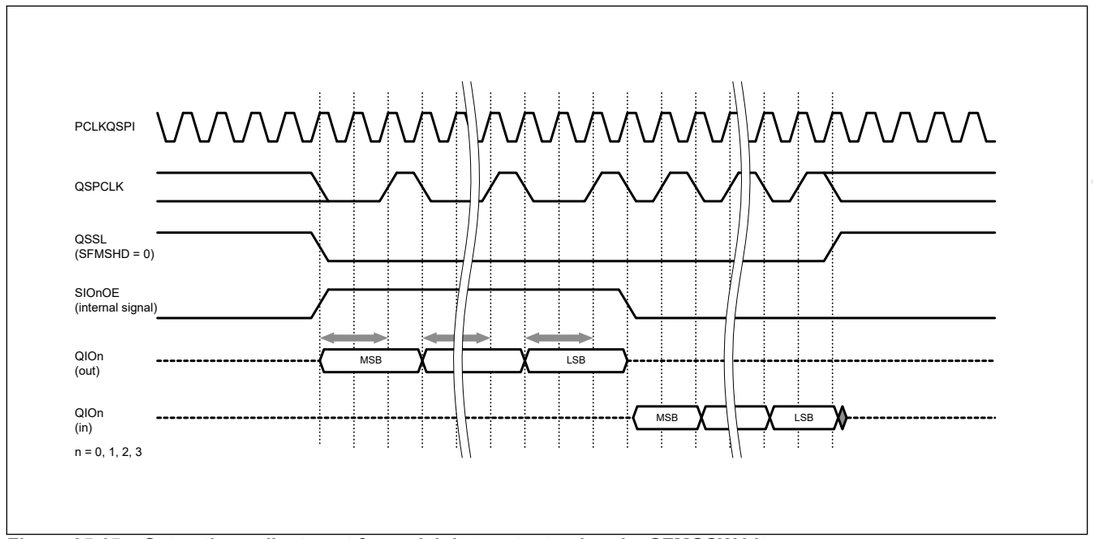

Figure 35.15 Setup time adjustment for serial data output using the SFMOSW bit

35.5.8 Hold Time for Serial Data Output

When a command or address is transmitted to the serial flash memory, the hold time begins on the rising edge of QSPCLK and ends when the serial data makes another transmission. If this hold time is insufficient, it can be extended by 1 PCLKA using the SFMOHW bit in the SFMSMD register. When SFMOSW is 1, the high-level width of QSPCLK during serial data transmission is extended by 1 PCLKA while data is being output from the QSPI. This function has no effect on serial data reception.

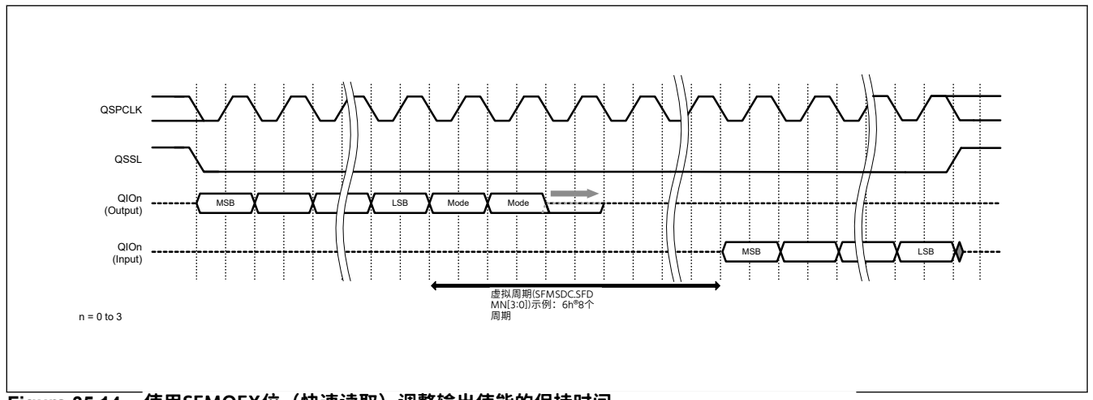

Figure 35.14 使用SFMOEX位（快速读取）调整输出使能的保持时间

35.5.7 串行数据输出的建立时间

当命令或地址传输到串行闪存时，设置时间从串行数据输出开始，到QSPCLK信号上升时结束。如果此建立时间不足，可以使用SFMSMD寄存器中的SFMOSW位将其延长1个PCLKA。当SFMOSW为1时，在从QSPI输出数据时，串行数据传输期间QSPCLK的低电平宽度扩展1PCLKA。该功能对串行数据接收没有影响。

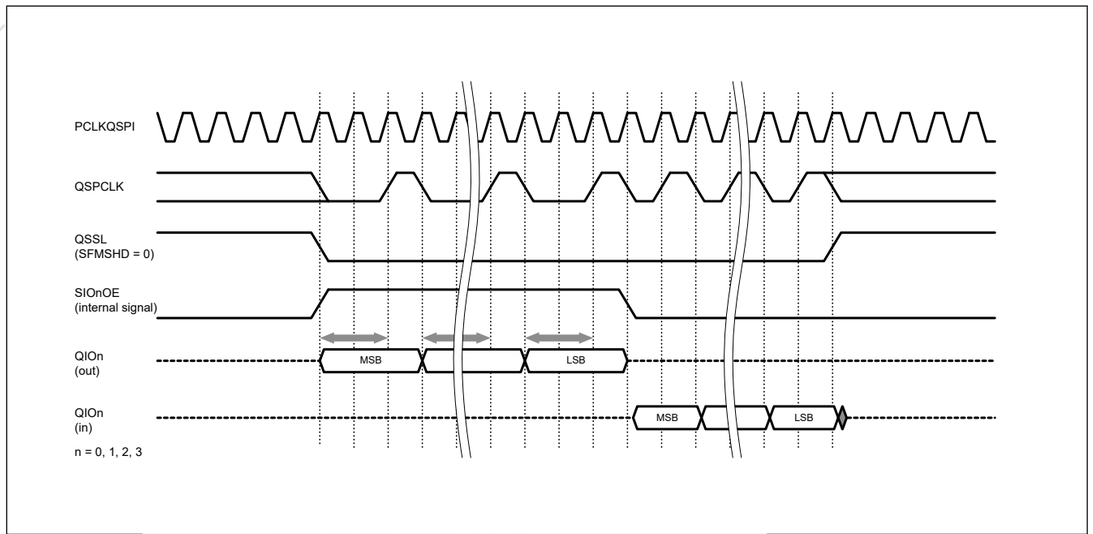

Figure 35.15 使用SFMOSW位调整串行数据输出的建立时间

35.5.8 串行数据输出的保持时间

当命令或地址传输到串行闪存时，保持时间从QSPCLK的上升沿开始，并在串行数据进行另一次传输时结束。如果该保持时间不足，可以使用SFMSMD寄存器中的SFMOHW位将其延长1个PCLKA。当SFMOSW为1时，在从QSPI输出数据时，串行数据传输期间QSPCLK的高电平宽度扩展1PCLKA。该功能对串行数据接收没有影响。

RA生态工作室

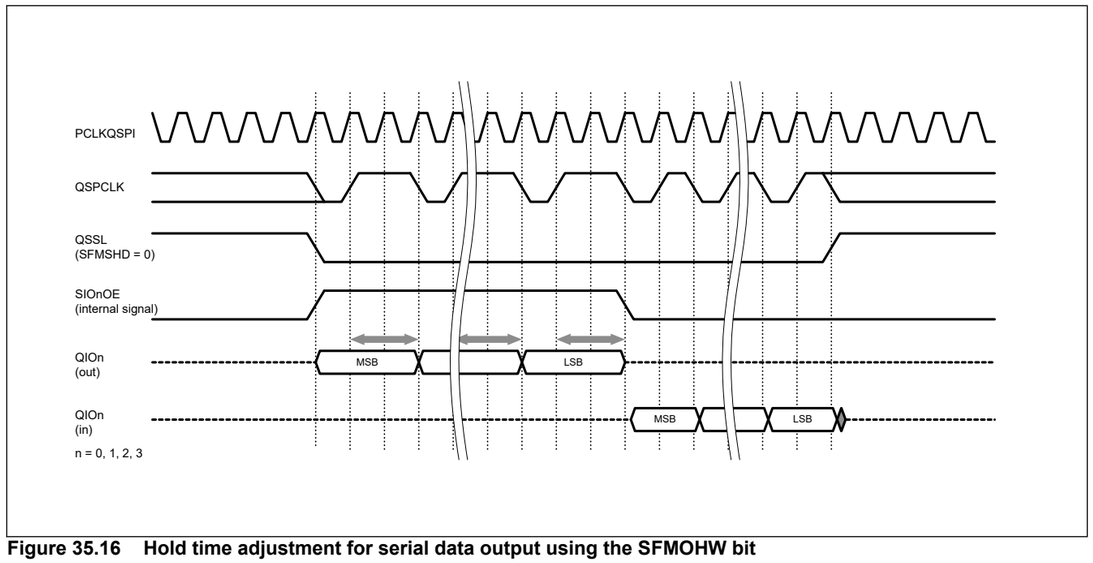

Figure 35.16 Hold time adjustment for serial data output using the SFMOHW bit

35.5.9 Serial Data Receiving Latency

The serial flash outputs data in synchronization with the falling edge of the QSPCLK signal. The QSPI receives that data in synchronization with the falling edge of the subsequent QSPCLK signal. The delay from when the serial flash starts outputting data until the QSPI receives that data is called the receiving latency. The QSPI adds a latency adjustment cycle immediately before the first data reception cycle in the SPI bus cycle. From the serial flash side, this is seen as an increase in the number of data reception cycles. This added latency adjustment cycle is not generated in the SPI bus cycle without accompanying data reception.

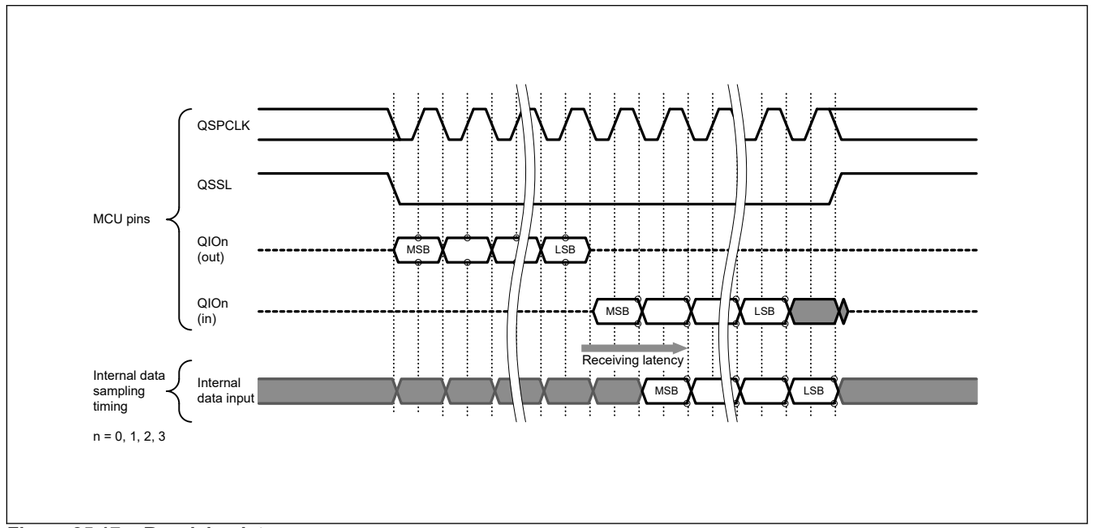

Figure 35.17 Receiving latency

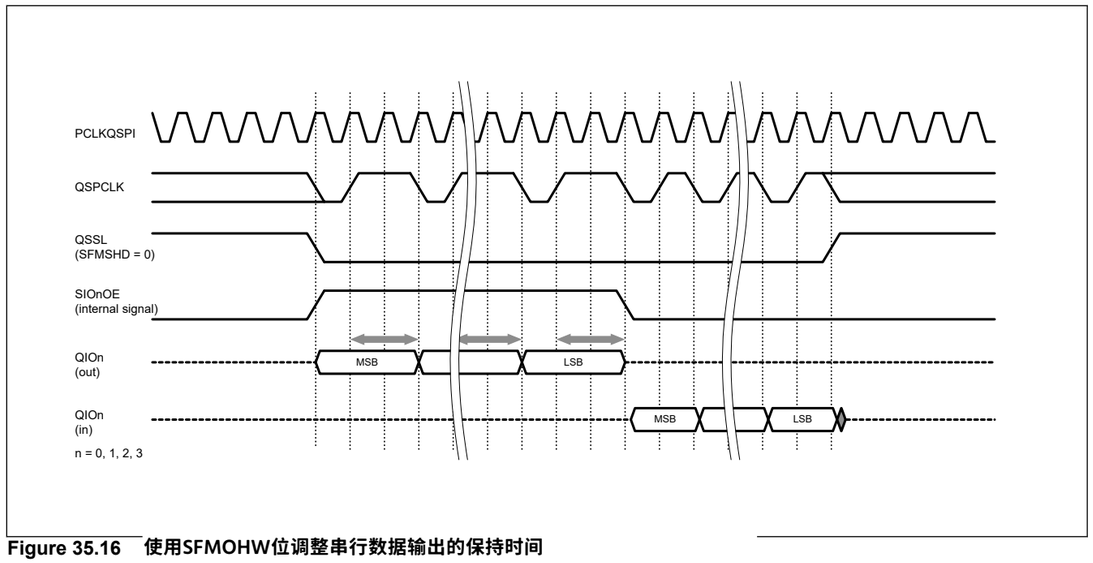

Figure 35.16 使用SFMOHW位调整串行数据输出的保持时间

35.5.9 串行数据接收延迟

串行闪存与QSPCLK信号的下降沿同步输出数据。QSPI与随后的QSPCLK信号的下降沿同步接收该数据。从串行闪存开始输出数据到QSPI接收到该数据的延迟称为接收延迟。QSPI在SPI总线周期的第一个数据接收周期之前添加一个延迟调整周期。从串行闪存方面来看，这被视为数据接收周期数的增加。如果没有伴随的数据接收，则不会在SPI总线周期中生成这个增加的延迟调整周期。

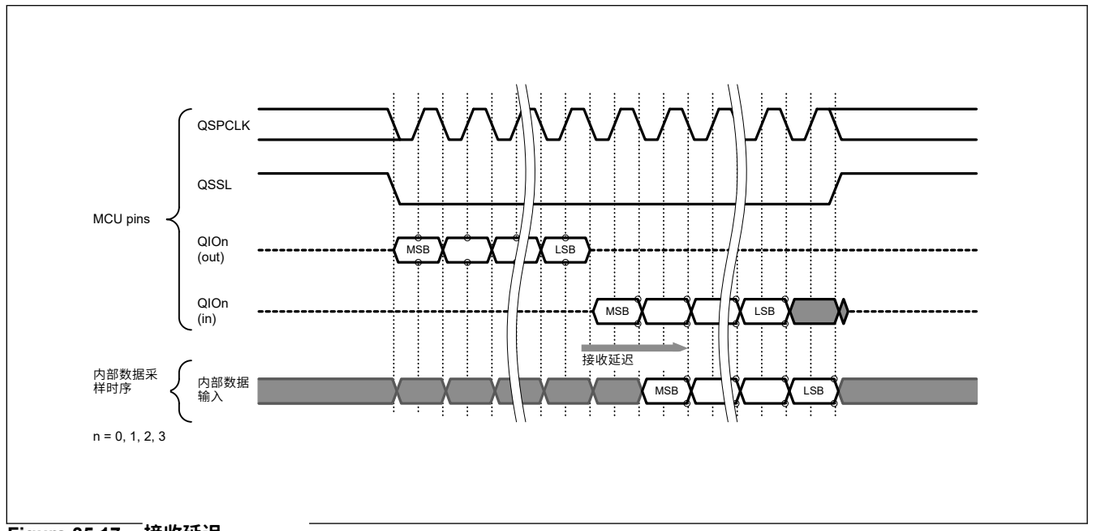

Figure 35.17 接收延迟

35.6 SPI Instruction Set Used for Serial Flash Memory Access

35.6.1 SPI Instructions That Are Automatically Generated

When the serial flash memory is accessed, an SPI bus cycle using the instructions described in Table 35.6 to Table 35.10 is automatically generated based on the settings in the SFMSAC register and in the SFMSMD register.

Table 35.6 SPI instructions automatically generated when SFMAS[1:0] = 00b

SPI instruction	Instruction code	Address bytes	Dummy cycles	Data bytes	Remarks
Standard Read	0x03*1	1	—	1 to ∞	SFMRM[2:0] = 000b, A8 = 0
	0x0B*1	1	—	1 to ∞	SFMRM[2:0] = 000b, A8 = 1

Note 1. If the SFMSMD.SFMCCE bit is set to 1, the SFMCIC[7:0] bits in the Instruction Code Register (SFMSIC) setting is used as an instruction code.

Table 35.7 SPI instructions automatically generated when SFMAS[1:0] = 01b

SPI instruction	Instruction code	Address bytes	Dummy cycles	Data bytes	Remarks
Standard Read	0x03*1	2	—	1 to ∞	SFMRM[2:0] = 000b

Note 1. If the SFMSMD.SFMCCE bit is set to 1, the SFMSIC.SFMCIC[7:0] setting is used as an instruction code.

Table 35.8 SPI instructions automatically generated when SFMAS[1:0] = 10b

Note 2. The number of dummy cycles is configurable by using the SFMSDC.SFMDN[3:0] bits..

35.6.2 Standard Read Instruction

The standard Read instruction is a common read instruction supported by most serial flash memory. When an SPI bus cycle starts, the QSSL signal (serial flash memory select) is asserted, and the instruction code (0x03 or 0x13)*1 is output. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted. Data is then received.

This standard Read instruction is selected in the initial QSPI settings.

Note 1. Many 4-KB serial flash memory devices have an address field not larger than 1 byte (A7-A0) to minimize the overhead and to receive A8 information from bit 3 of the Read instruction code. To support these devices, the QSPI only outputs A8 (address bit 8) to bit [3] of the standard Read instruction code when an address width of 1 byte is specified (SFMAS[1:0] = 00). This means that 0x0B might be output instead of 0x03 as the standard Read instruction code. This code duplicates the Fast Read instruction code. However, for most of the 2-KB or smaller serial flash memory, with an address width of 1 byte, bit 3 of a command is designed to be excluded from decoding as a don't-care bit, so such a Read instruction code is recognized correctly as the standard Read instruction code. In rare cases, some serial flash memory allow bit 3 to be decoded. When such a serial flash memory is connected, configure your application to avoid access resulting in A8 = 1.

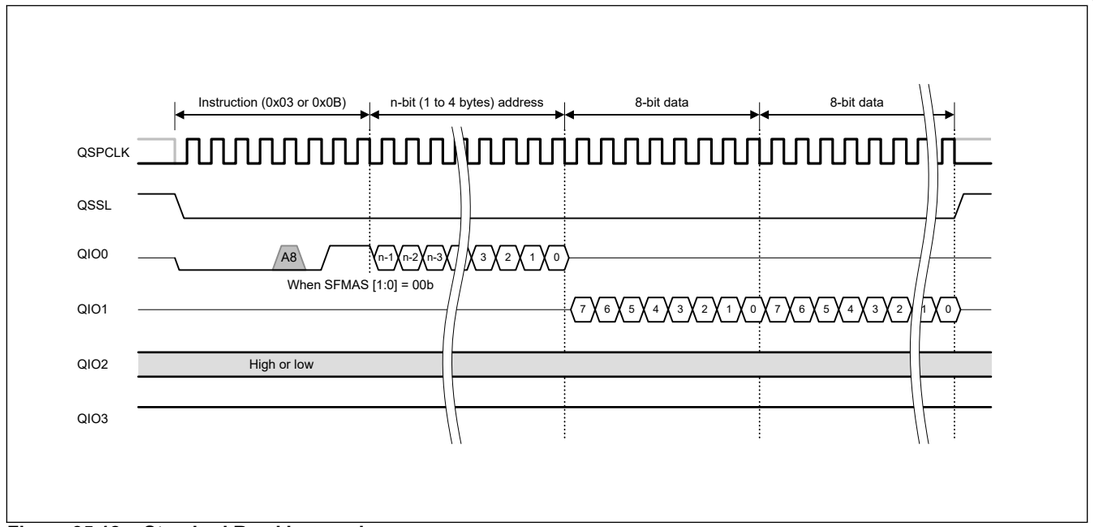

Figure 35.18 Standard Read bus cycle

35.6.3 Fast Read Instruction

The Fast Read instruction is a read instruction that supports a higher communication clock speed than the standard Read instruction. When an SPI bus cycle starts, the QSSL signal is asserted, and the instruction code (0x0B or 0x0C) is output.

Table 35.10 当SFMAS[1:0]=11b和SFM4BC=1(2of2)时自动生成SPI指令

快速读取四路IO	0xEC*1	4	6*2	1 to ∞	Selectable: SFMRM[2:0] = 101b

注1.如果SFMSMD.SFMCCE位设置为1，则SFMSIC.SFMCIC[7:0]设置用作指令代码。
注2.虚拟周期数可通过使用SFMSDC.SFMDN[3:0]位进行配置。

35.6.2 标准阅读说明

标准读指令是大多数串行闪存支持的常见读指令。当SPI总线周期开始时，QSSL信号（串行闪存选择）被置位，并输出指令代码（0x03或0x13）*1。接下来，发送宽度为1到4字节的地址，在SFMSAC寄存器的SFMAS[1:0]位中指定。然后接收数据。

在初始QSPI设置中选择此标准读取指令。

注1.许多4KB串行闪存器件的地址字段不大于1字节(A7-A0)，以尽量减少
开销并从读取指令代码的第3位接收A8信息。为了支持这些器件，当指定地址宽度为1字节（SFMAS[1:0]=00）时，QSPI仅将A8（地址位8）输出到标准读指令代码的位[3]。这意味着可能会输出0x0B而不是0x03作为标准读取指令代码。此代码复制了快速读取指令代码。然而，对于大多数2-KB或更小的串行闪存，地址宽度为1字节，命令的第3位被设计为作为无关位从解码中排除，因此这样的读取指令代码被正确识别为标准读取指令代码。在极少数情况下，某些串行闪存允许对第3位进行解码。连接此类串行闪存时，配置您的应用程序以避免访问导致A8=1。

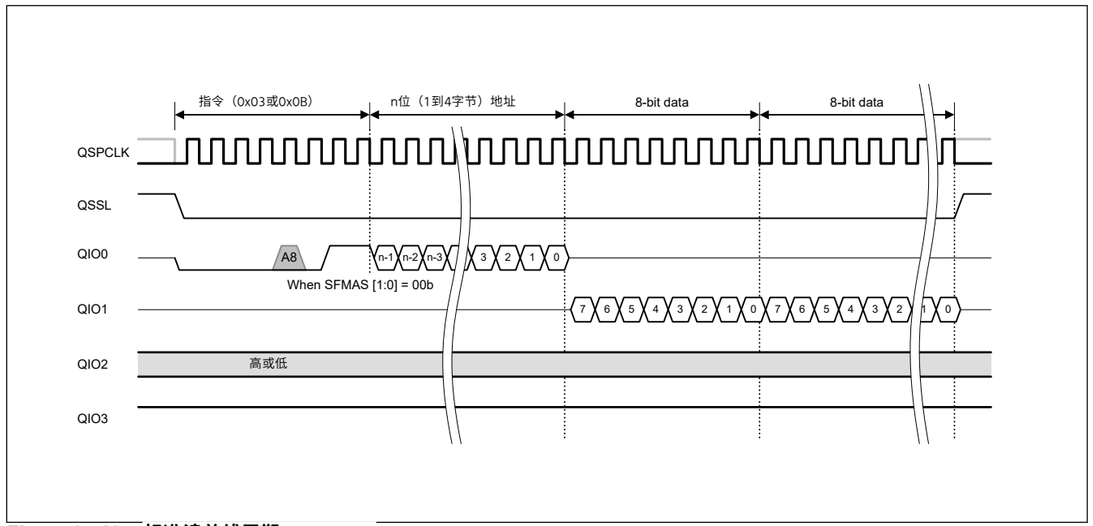

Figure 35.18 标准读总线周期

35.6.3 快速阅读说明

快速读取指令是一种读取指令，它支持比标准读取指令更高的通信时钟速度。当一个SPI总线周期开始时，QSSL信号被置位，并输出指令代码（0x0B或0x0C）。

Next, an address with a width of 1 to 4 bytes specified by the SFMSAC.SFMAS [1: 0] bits is transmitted, a dummy cycle specified by the SFMSDC register is generated, then the data is received.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 35.8. XIP Control.

Switching to the Fast Read instruction is controlled in the SFMSMD register.

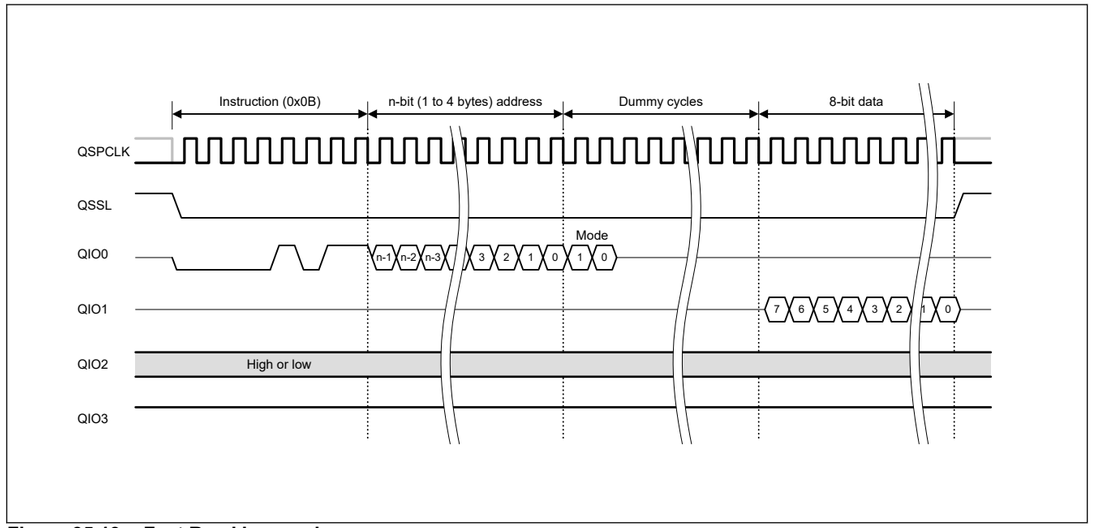

Figure 35.19 Fast Read bus cycle

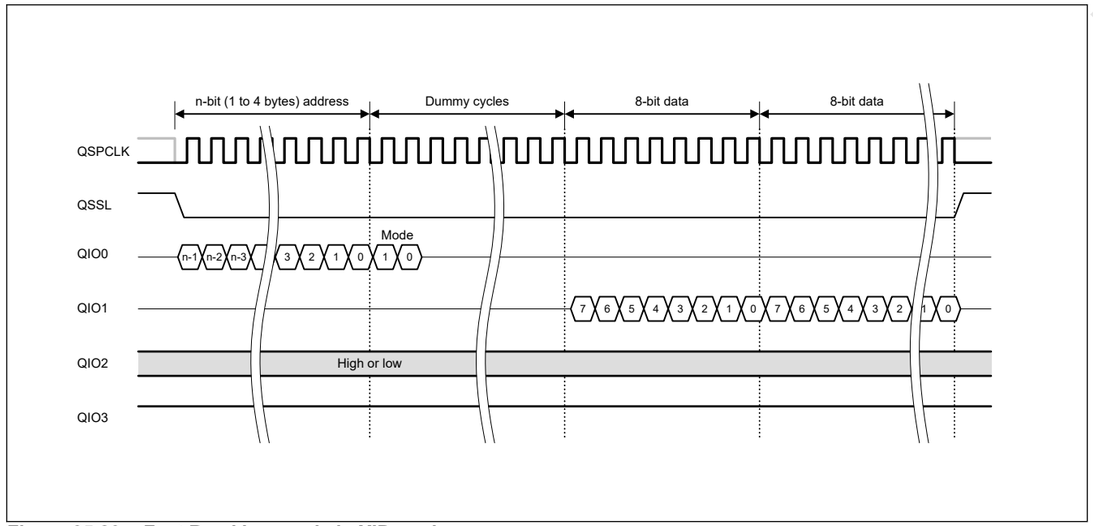

Figure 35.20 Fast Read bus cycle in XIP mode

Note: To use the Fast Read instruction, a serial flash memory that supports Fast Read transfers is required.

35.6.4 Fast Read Dual Output Instruction

The Fast Read Dual Output instruction is a read instruction that uses two signal lines to receive data. When the SPI bus cycle starts, the QSSL signal is asserted. The instruction code (0x3B or 0x3C) and an address with a width of 1 to 4 bytes,

接下来，发送由SFMSAC.SFMAS[1:0]位指定的1到4字节宽度的地址，生成由SFMSDC寄存器指定的虚拟周期，然后接收数据。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第35.8节。XIP控制。

切换到快速读取指令在SFMSMD寄存器中进行控制。

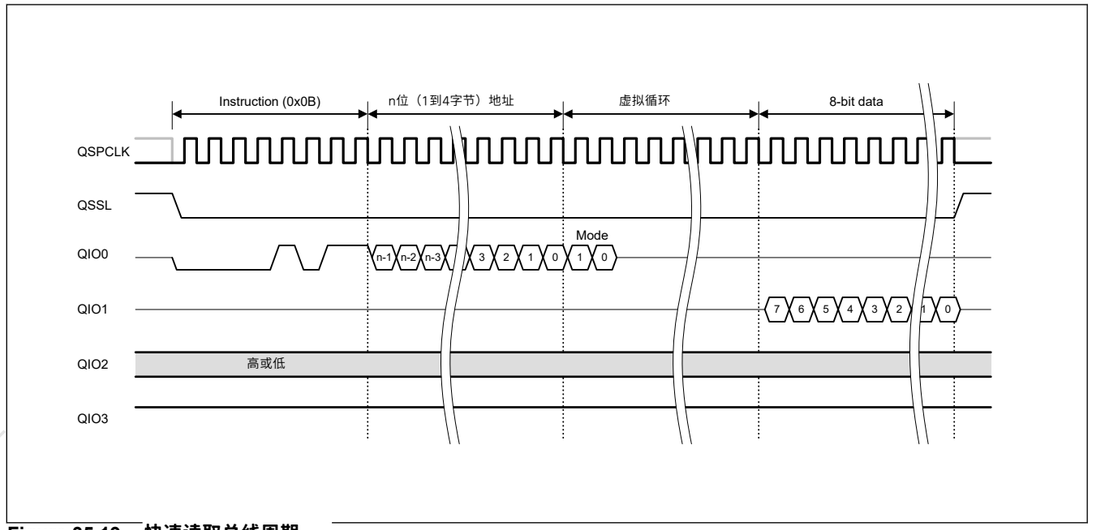

Figure 35.19 快速读取总线周期

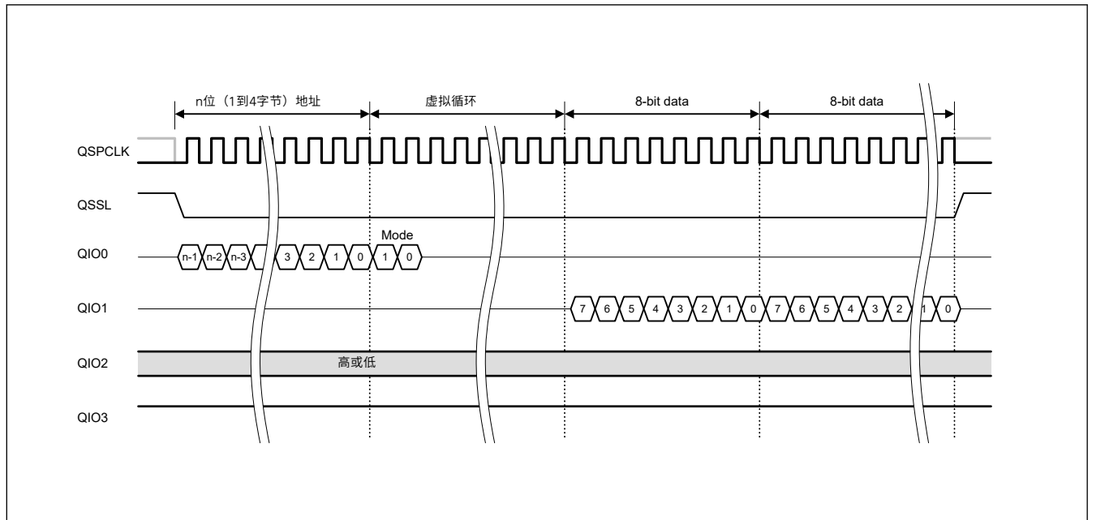

Figure 35.20 XIP模式下的快速读取总线周期

Note: 要使用快速读取指令，需要支持快速读取传输的串行闪存。

35.6.4 快速读取双输出指令

快速读取双输出指令是使用两条信号线接收数据的读取指令。当SPI总线周期开始时，QSSL信号被置位。指令代码（0x3B或0x3C）和一个宽度为1到4个字节的地址，

specified by the SFMSAC.SFMAS [1: 0] bits are transmitted from the QIO0 pin in the extended SPI protocol, and transmitted from the QIO0 and QIO1 pins in the Dual-SPI protocol. Next, a certain number of dummy cycles, specified in the SFMSDC register, is generated. Data is then received through the QIO0 and QIO1 pins. Even bit data is received from the QIO0 pin and odd bit data is received from the QIO1 pin.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 35.8. XIP Control.

Switching to Fast Read Dual Output is controlled in the SFMSMD register.

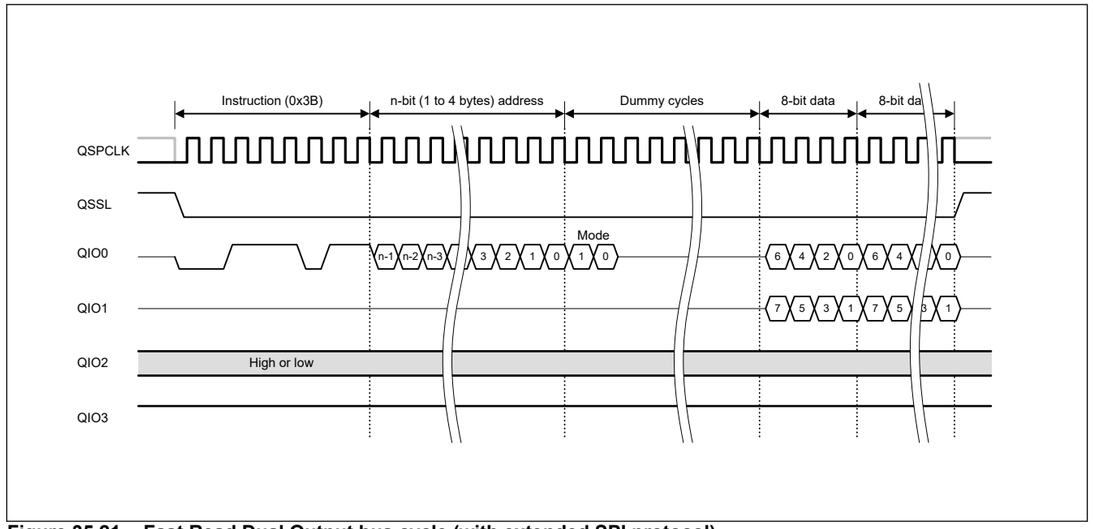

Figure 35.21 Fast Read Dual Output bus cycle (with extended SPI protocol)

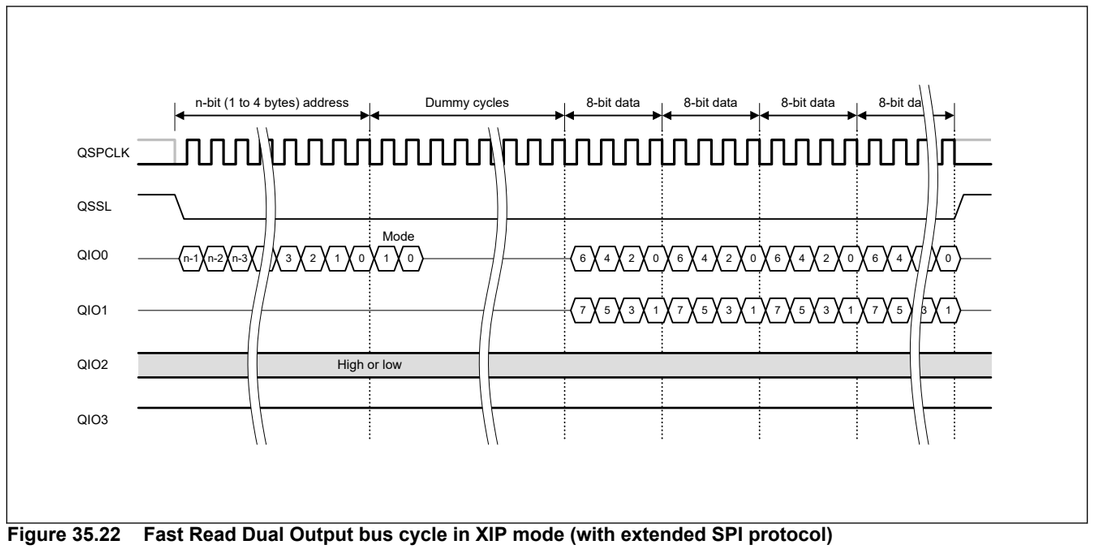

Figure 35.22 Fast Read Dual Output bus cycle in XIP mode (with extended SPI protocol)

Note: To use the Fast Read Dual Output instruction, a serial flash memory that supports Fast Read Dual Output transfers is required.

由SFMSAC.SFMAS[1:0]位指定在扩展SPI协议中从QIO0引脚传输，在Dual-SPI协议中从QIO0和QIO1引脚传输。接下来，生成在SFMSDC寄存器中指定的一定数量的虚拟周期。然后通过QIO0和QIO1引脚接收数据。从QIO0引脚接收偶数位数据，从QIO1引脚接收奇数位数据。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第35.8节。XIP控制。

切换到快速读取双路输出由SFMSMD寄存器控制。

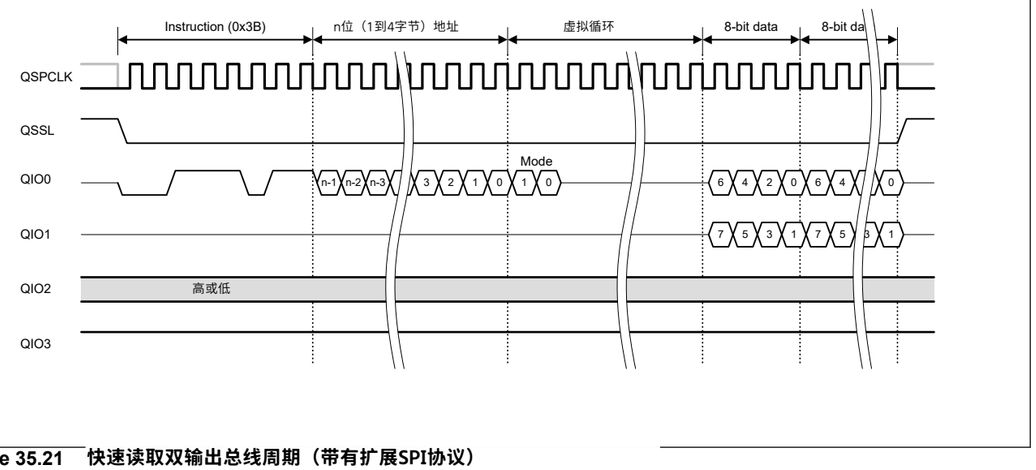

Figure 35.21 快速读取双输出总线周期（带有扩展SPI协议）

Note: 要使用快速读取双输出指令，需要支持快速读取双输出传输的串行闪存。

35.6.5 Fast Read Dual I/O Instruction

The Fast Read Dual I/O instruction is a read instruction that uses two signal lines to transmit an address and receive data. When the SPI bus cycle starts, the QSSL signal is asserted, and the instruction code (0xBB / 0xBC) is transmitted from QIO0 pin in the extended SPI protocol and from QIO0, and QIO1 pins in the Dual SPI protocol. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted through the QIO0 and QIO1 pins, and a certain number of dummy cycles, specified in the SFMSDC register, is generated. Data is then is received through the QIO0 and QIO1 pins. Address and dummy cycle transmission and data reception are performed through the QIO0 pin for even bits and through the QIO1 pin for odd bits.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 35.8. XIP Control.

Switching to Fast Read Dual I/O is controlled in the SFMSMD register.

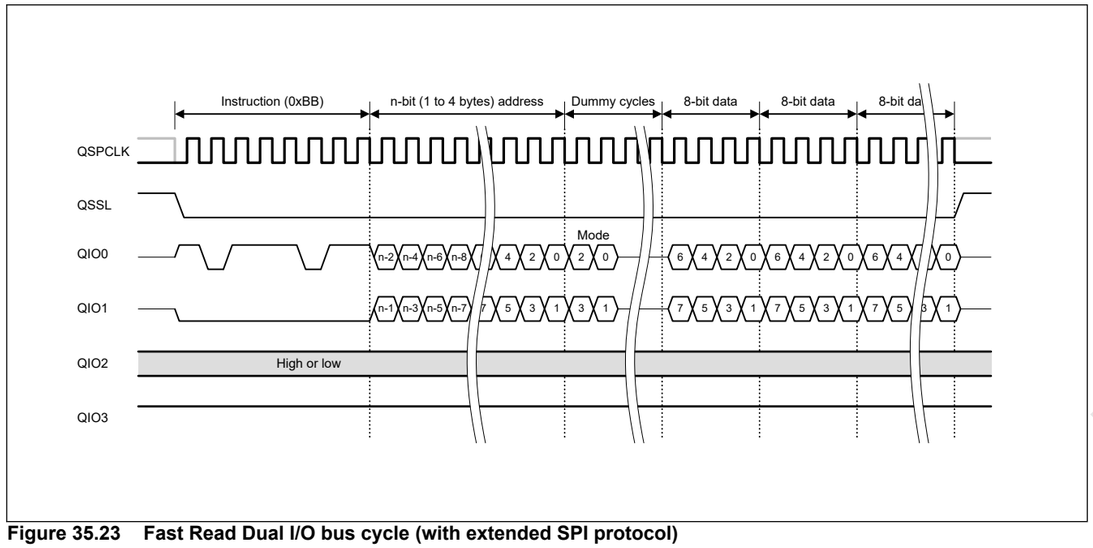

Figure 35.23 Fast Read Dual I/O bus cycle (with extended SPI protocol)

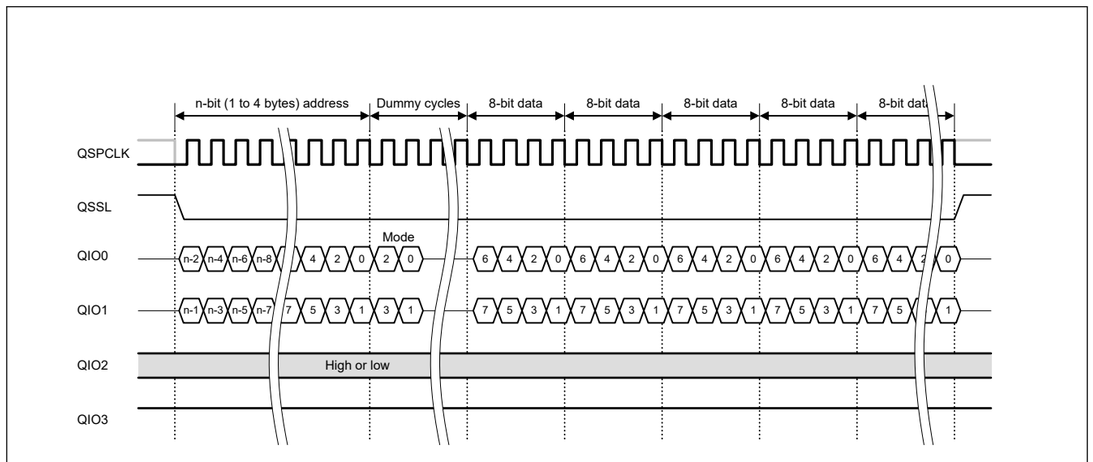

Figure 35.24 Fast Read Dual I/O bus cycle in XIP mode

35.6.5 快速读取双IO指令

FastReadDualIO指令是使用两条信号线传输地址和接收数据的读取指令。当SPI总线周期开始时，QSSL信号被置位，指令代码（0xBB0xBC）从扩展SPI协议中的QIO0引脚和双SPI协议中的QIO0和QIO1引脚传输。接下来，在SFMSAC寄存器的SFMAS[1:0]位中指定的1到4字节宽度的地址通过QIO0和QIO1引脚以及在SFMSDC寄存器中指定的一定数量的空周期发送 生成。然后通过QIO0和QIO1引脚接收数据。地址和虚拟周期的发送和数据接收通过QIO0引脚（偶数位）和QIO1引脚（奇数位）执行。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第35.8节。XIP控制。

切换到快速读取双IO由SFMSMD寄存器控制。

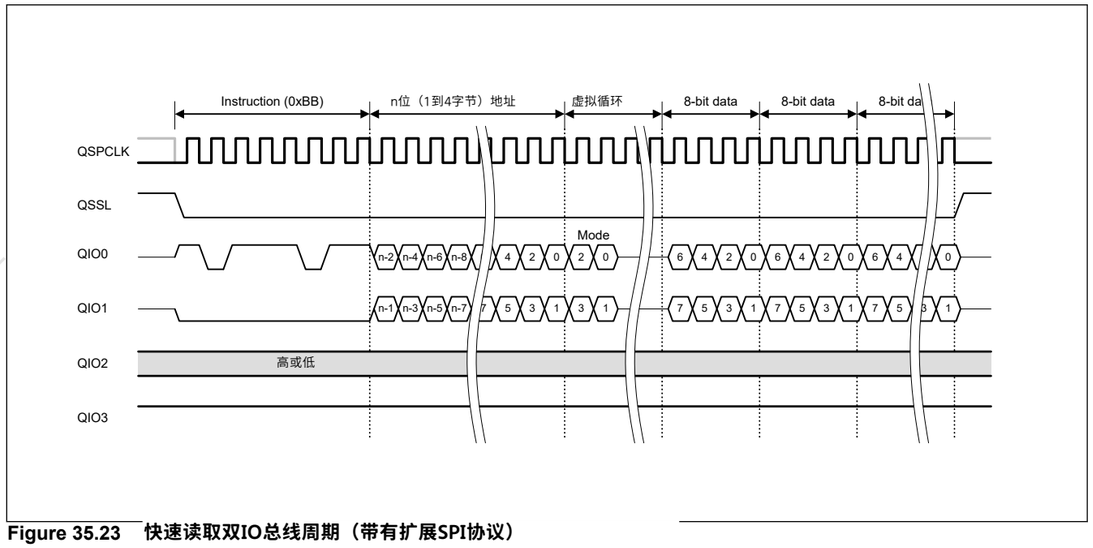

Figure 35.23 快速读取双IO总线周期（带有扩展SPI协议）

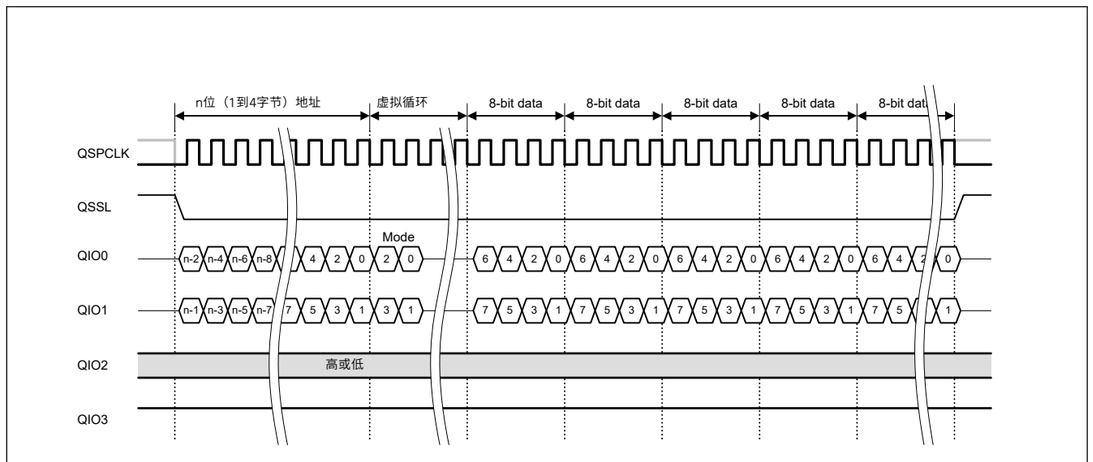

Figure 35.24 XIP模式下的快速读取双IO总线周期

Note: To use the Fast Read Dual I/O instruction, a serial flash memory that supports Fast Read Dual I/O transfers is required.

35.6.6 Fast Read Quad Output Instruction

The Fast Read Quad Output instruction is a read instruction that uses four signal lines to receive data. When the SPI bus cycle starts, the QSSL signal is asserted. The instruction code (0x6B or 0x6C) and an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, are output from the QIO0 pin. Next, a certain number of dummy cycles, specified in the SFMDN[3:0] bits in the SFMSMD register, are generated. Data is then received through the QIO0, QIO1, QIO2, and QIO3 pins.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 35.8. XIP Control.

Switching to Fast Read Quad Output is controlled in the SFMSMD register.

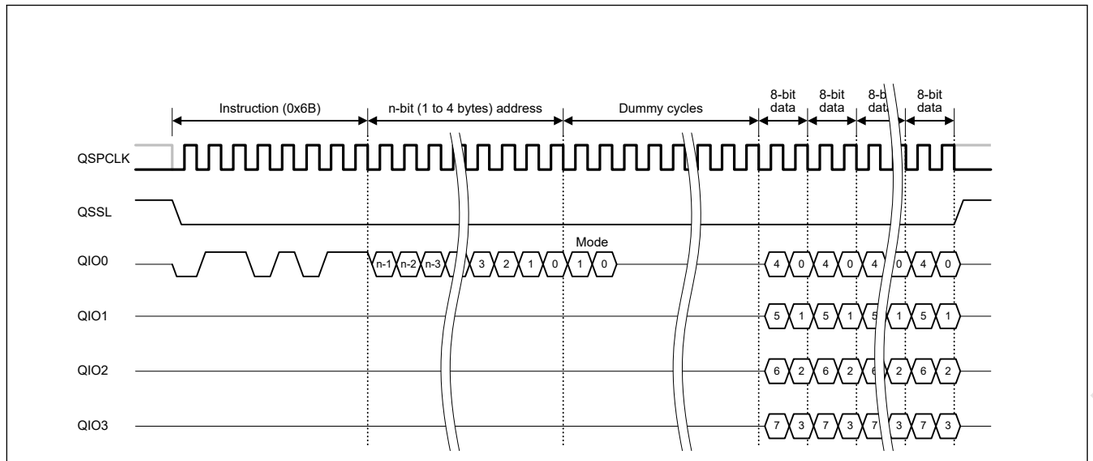

Figure 35.25 Fast Read Quad Output bus cycle (with extended SPI protocol)

Note: 要使用快速读取双IO指令，需要支持快速读取双IO传输的串行闪存。

35.6.6 快速读取四路输出指令

快速读取四路输出指令是使用四根信号线接收数据的读取指令。当SPI总线周期开始时，QSSL信号被置位。在SFMSAC寄存器的SFMAS[1:0]位中指定的指令代码（0x6B或0x6C）和宽度为1到4字节的地址从QIO0引脚输出。接下来，生成一定数量的空周期，在SFMSMD寄存器的SFMDN[3:0]位中指定。然后通过QIO0、QIO1、QIO2和QIO3引脚接收数据。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第35.8节。XIP控制。

切换到快速读取四路输出由SFMSMD寄存器控制。

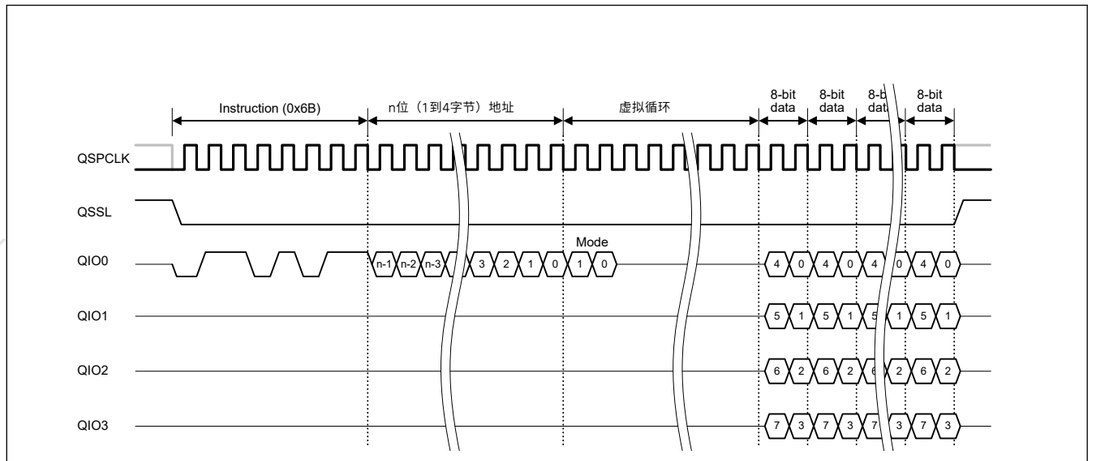

Figure 35.25 快速读取四路输出总线周期（使用扩展SPI协议）

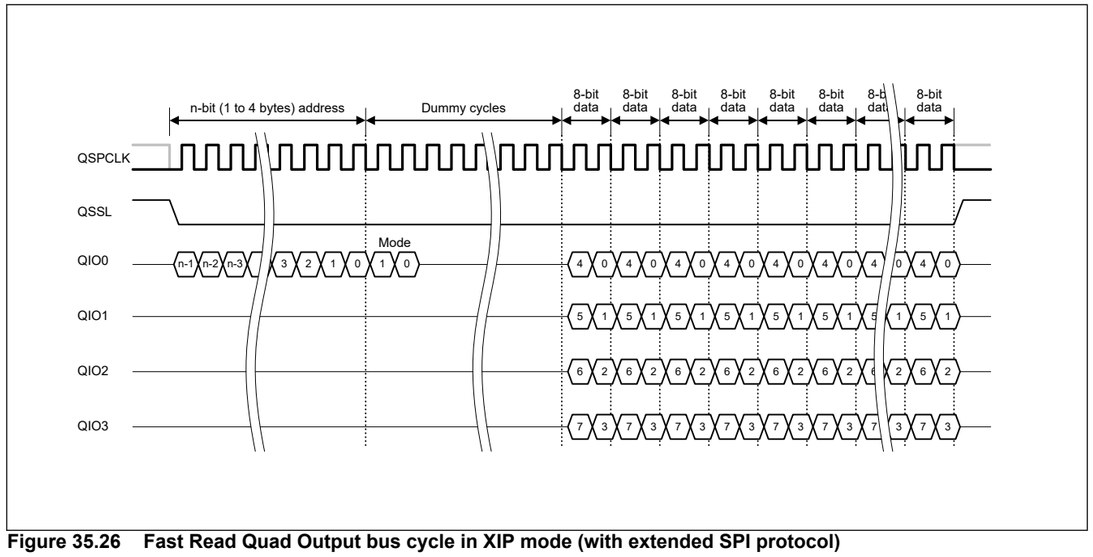

Figure 35.26 Fast Read Quad Output bus cycle in XIP mode (with extended SPI protocol)

Note: To use Fast Read Quad Output, a serial flash memory that supports Fast Read Quad Output transfer is required.

35.6.7 Fast Read Quad I/O Instruction

The Fast Read Quad I/O instruction is a read instruction that uses four signal lines to transmit an address and receive data. When the SPI bus cycle starts, the QSSL signal is asserted, and the instruction code (0xEB / 0xEC) is transmitted from QIO0 pin in the extended SPI protocol and from QIO0, QIO1, QIO2, and QIO3 pins in the Quad-SPI protocol. Next, an address with a width of 1 to 4 bytes, specified in the SFMAS[1:0] bits in the SFMSAC register, is transmitted through the QIO0, QIO1, QIO2, and QIO3 pins, and a certain number of dummy cycles, specified in the SFMDN[3:0] bits in the SFMSMD register, is generated. Data is then received through the QIO0, QIO1, QIO2, and QIO3 pins.

The first two dummy cycles are used to select the XIP mode. When the XIP mode is selected, the same instruction used this time is applied to the next SPI bus cycle, and the instruction code is not output the next SPI bus cycle. For details on the XIP mode, see section 35.8. XIP Control.

Switching to Fast Read Quad I/O is controlled in the SFMSMD register.

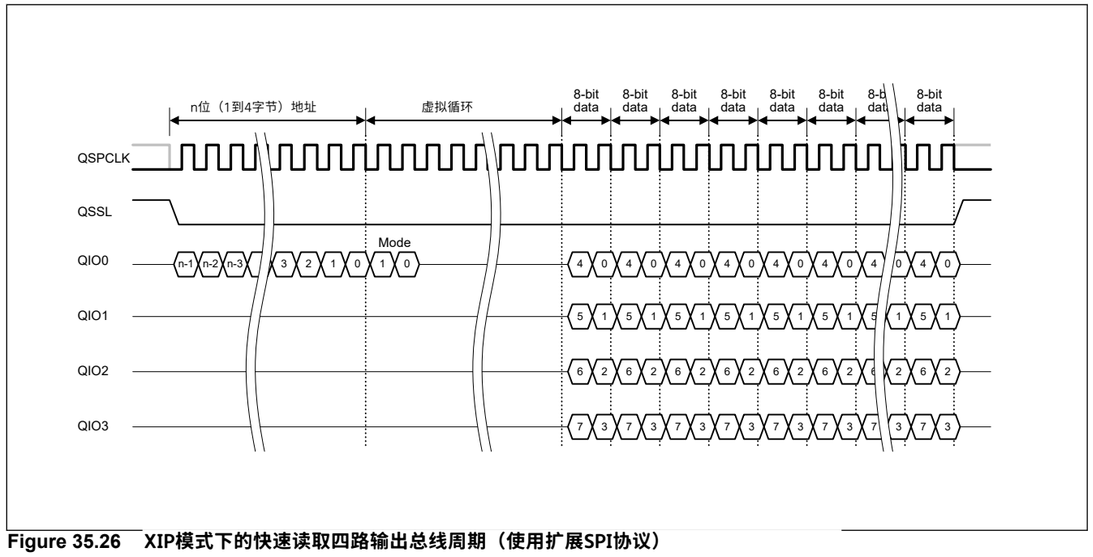

Figure 35.26 XIP模式下的快速读取四路输出总线周期（使用扩展SPI协议）

Note: 要使用快速读取四路输出，需要支持快速读取四路输出传输的串行闪存。

35.6.7 快速读取QuadIO指令

FastReadQuadIO指令是使用四根信号线传输地址和接收数据的读取指令。

当SPI总线周期开始时，QSSL信号被置位，指令代码（0xEB0xEC）从扩展SPI协议的QIO0引脚和Quad-SPI协议的QIO0、QIO1、QIO2和QIO3引脚传输。接下来，在SFMSAC寄存器的SFMAS[1:0]位中指定的1到4字节宽度的地址通过QIO0、QIO1、QIO2和QIO3引脚和一定数量的空周期传输，在SFMDN[3:0]位中指定

SFMSMD寄存器，生成。然后通过QIO0、QIO1、QIO2和QIO3引脚接收数据。

前两个虚拟周期用于选择XIP模式。选择XIP模式时，此时间使用的相同指令将应用于下一个SPI总线周期，并且指令代码未输出下一个SPI总线周期。有关XIP模式的详细信息，请参阅第35.8节。XIP控制。

切换到快速读取四线IO由SFMSMD寄存器控制。

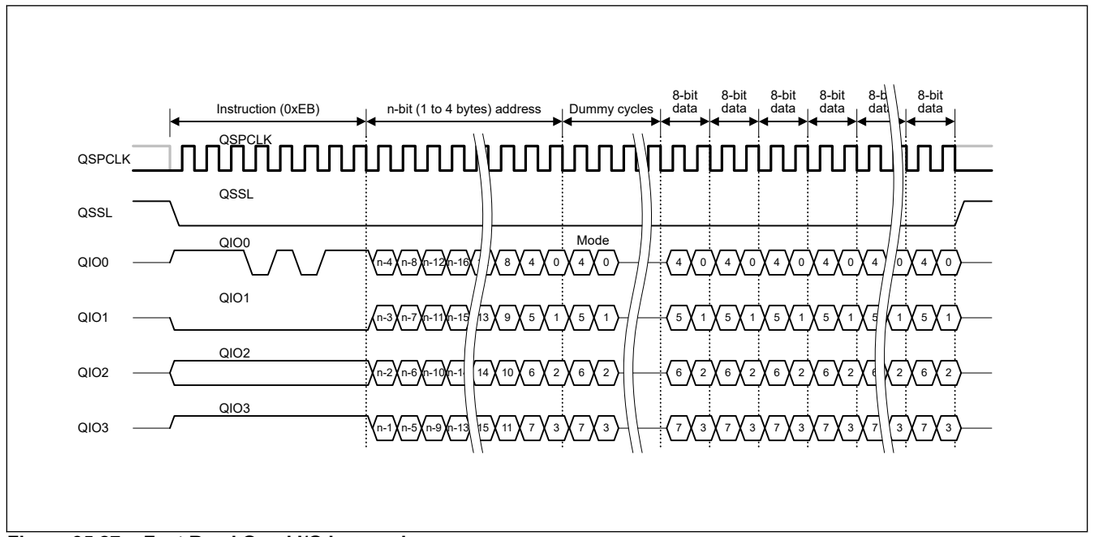

Figure 35.27 Fast Read Quad I/O bus cycle

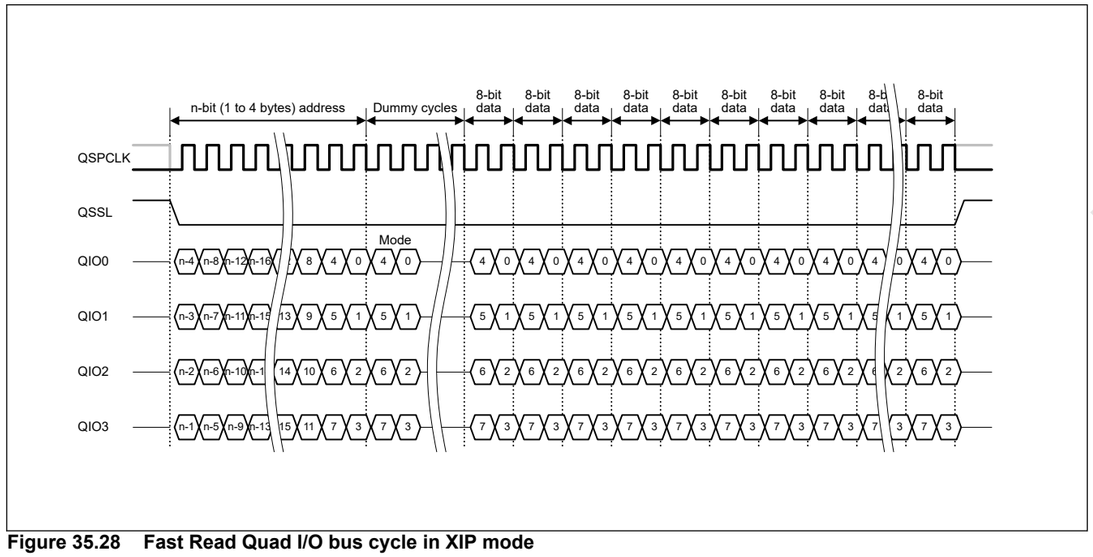

Figure 35.28 Fast Read Quad I/O bus cycle in XIP mode

Note: To use the Fast Read Quad I/O instruction, a serial flash memory that supports Fast Read Quad I/O transfers is required.

35.6.8 Enter 4-Byte Mode Instruction

The Enter 4-Byte Mode instruction sets the serial flash address width to 4 bytes. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (0xB7) is output.

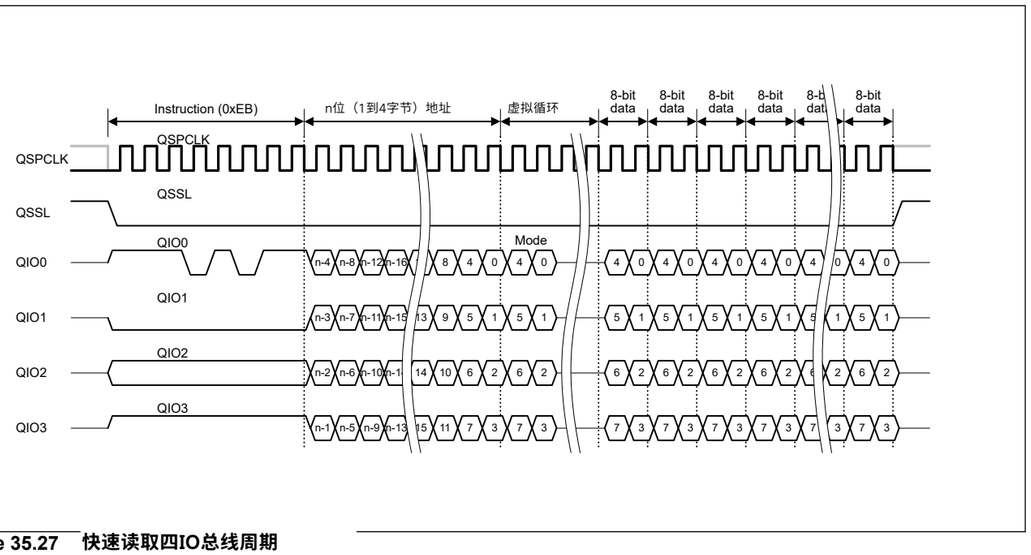

Figure 35.27 快速读取四IO总线周期

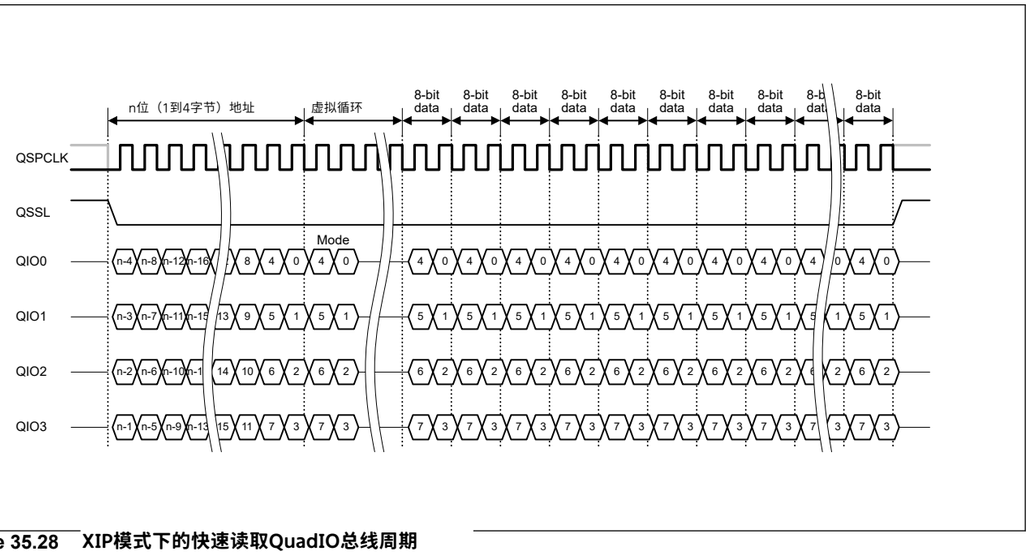

Figure 35.28 XIP模式下的快速读取QuadIO总线周期

Note: 要使用FastReadQuadIO指令，需要支持FastReadQuadIO传输的串行闪存。

35.6.8 进入4字节模式指令

进入4字节模式指令将串行闪存地址宽度设置为4字节。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（0xB7）。

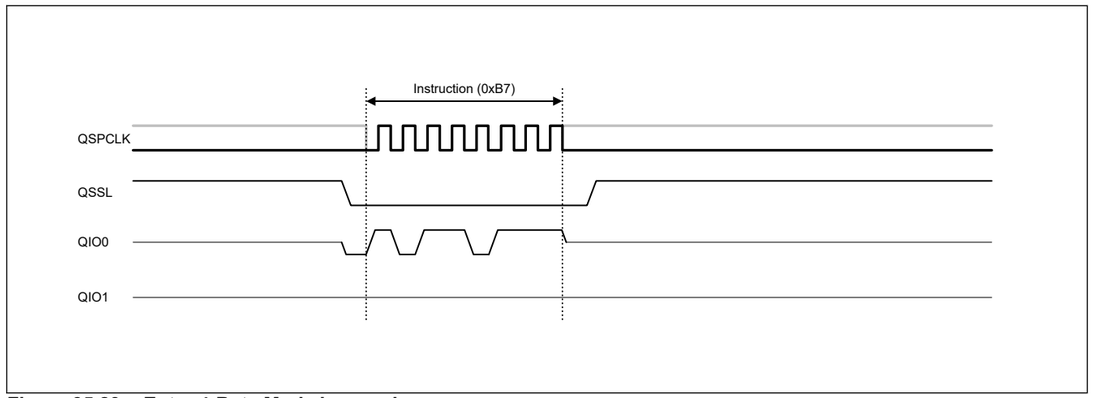

Figure 35.29 Enter 4-Byte Mode bus cycle

Note: The Enter 4-Byte Mode instruction is issued regardless of whether the serial flash is in 3- or 4-byte mode.

35.6.9 Exit 4-Byte Mode Instruction

The Exit 4-Byte Mode instruction sets the serial flash address width to 3 bytes. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (0xE9) is output.

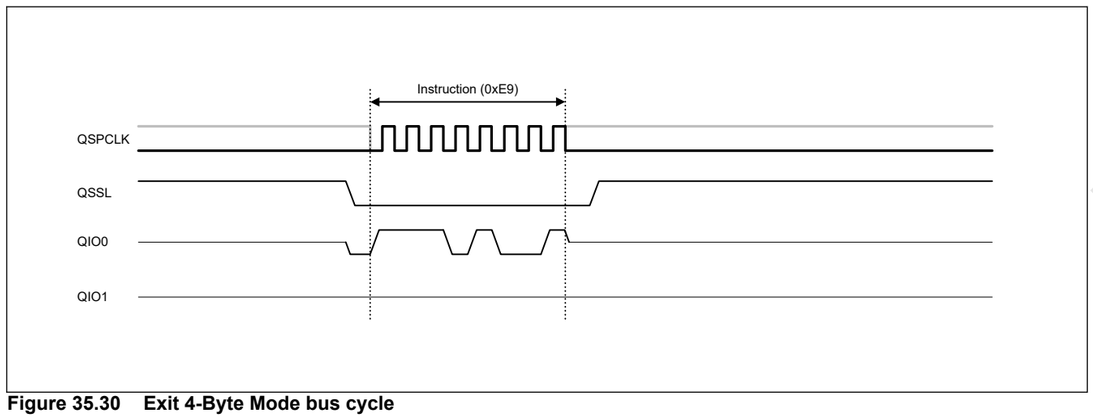

Figure 35.30 Exit 4-Byte Mode bus cycle

Note: The Exit 4-Byte Mode instruction is issued regardless of whether the serial flash is in 3- or 4-byte mode.

35.6.10 Write Enable Instruction

The Write Enable instruction enables changing of the serial flash address width. When the SPI bus cycle starts, the serial flash select signal is asserted, and the instruction code (0x06) is output.

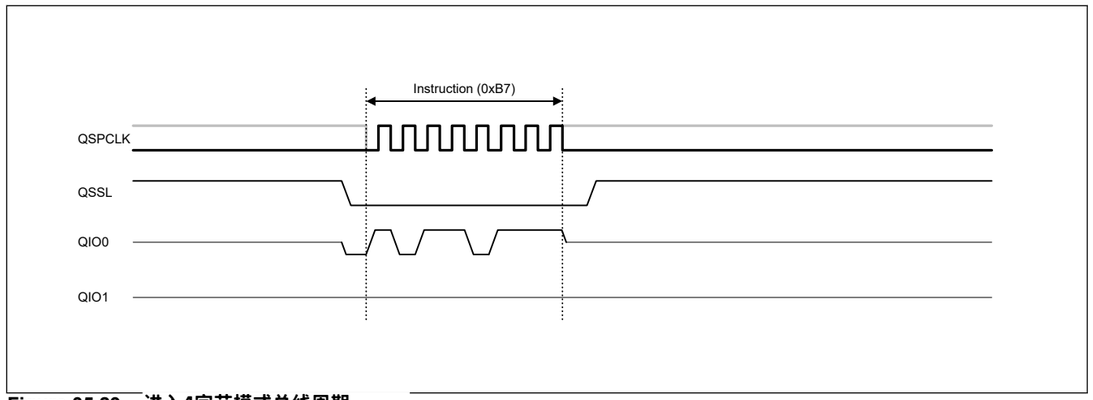

Figure 35.29 进入4字节模式总线周期

Note: 无论串行闪存是处于3字节模式还是4字节模式，都会发出进入4字节模式指令。

35.6.9 退出4字节模式指令

退出4字节模式指令将串行闪存地址宽度设置为3字节。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（0xE9）。

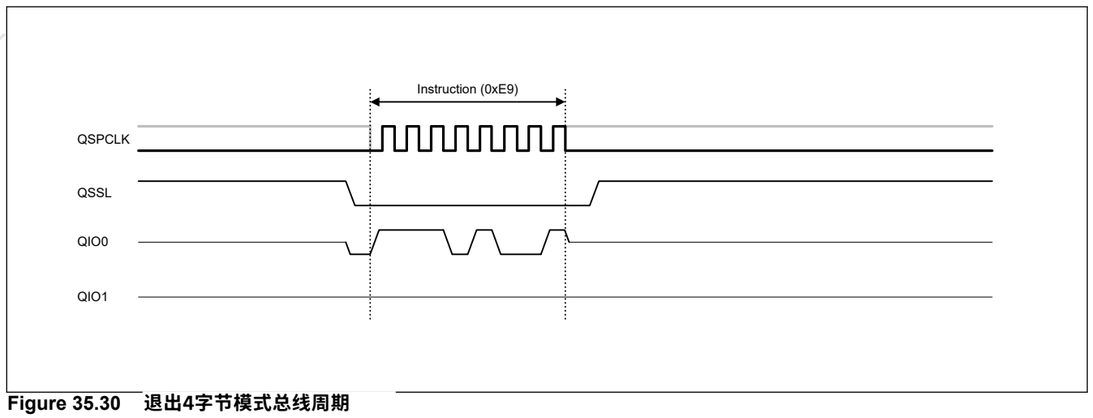

Figure 35.30 退出4字节模式总线周期

Note: 无论串行闪存是处于3字节模式还是4字节模式，都会发出退出4字节模式指令。

35.6.10 写使能指令

写使能指令可以改变串行闪存地址宽度。当SPI总线周期开始时，串行闪存选择信号被置位，并输出指令代码（0x06）。

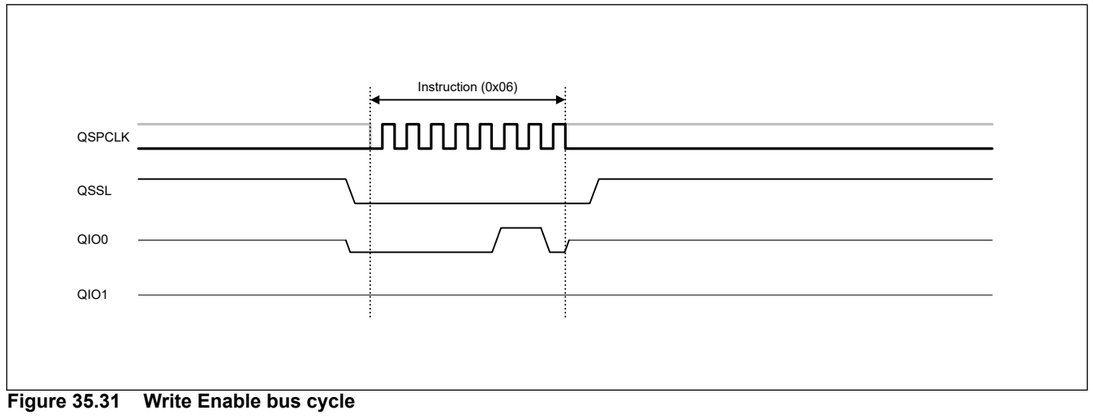

Figure 35.31 Write Enable bus cycle

35.7 SPI Bus Cycle Arrangement

35.7.1 Serial Flash Memory Read Based on Individual Conversion

ROM read bus cycles are individually converted to SPI bus cycles on a one-to-one basis. When a ROM read bus cycle is detected, the QSSL signal is asserted, and an SPI bus cycle starts. When the data receiving is finished from the serial flash memory, the QSSL signal is negated and the SPI bus cycle is complete.

When the next ROM read bus cycle is detected, the QSSL signal set by the SFMSSC.SFMSW[3: 0] bits is asserted again, then the next SPI bus cycle starts.

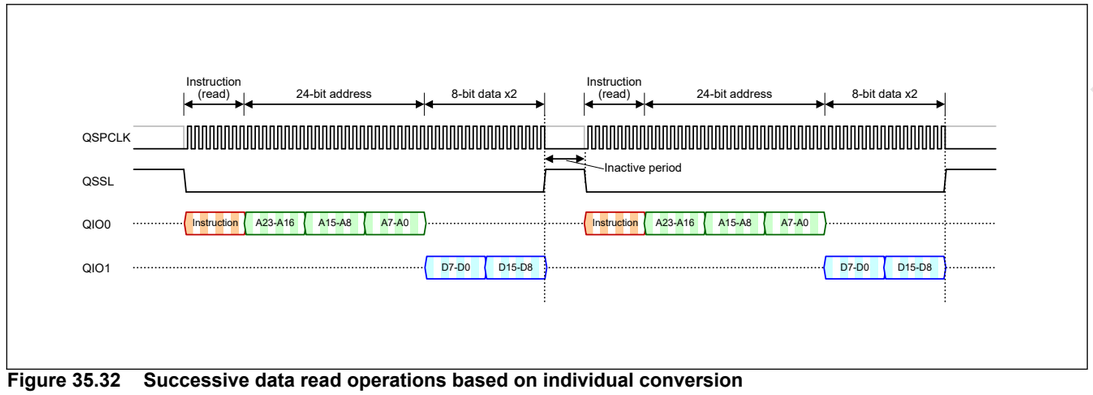

Figure 35.32 Successive data read operations based on individual conversion

35.7.2 Serial Flash Memory Read Using the Prefetch Function

In operations such as CPU instruction execution and block data transfer, data is often read in ascending order from contiguous addresses. Serial flash memory provides the ability to repeat data reception without reissuing an instruction code and address. To work with this function, the QSPI has a prefetch function for continuous data reception. However, if the CPU issues a flash read request for discontinuous flash addresses, SPI bus cycles are separated from each other, disabling the prefetch function.

To enable the prefetch function of the QSPI, set the SFMPFE bit in the SFMSMD register to 1. When the prefetch function is enabled, data is received continuously and stored in the prefetch buffer of the QSPI, without waiting for another flash read request. When the CPU issues a flash read request, an address check is made. If an address match is confirmed, the data in the buffer is passed to the CPU. If an address mismatch is detected, the data in the buffer is discarded and a new SPI bus cycle is issued.

The buffer for prefetching is 18 bytes long. When this buffer is full, the SPI bus cycle is ended. When the buffer data is read to create free space, a new SPI bus cycle is automatically started to resume prefetching.

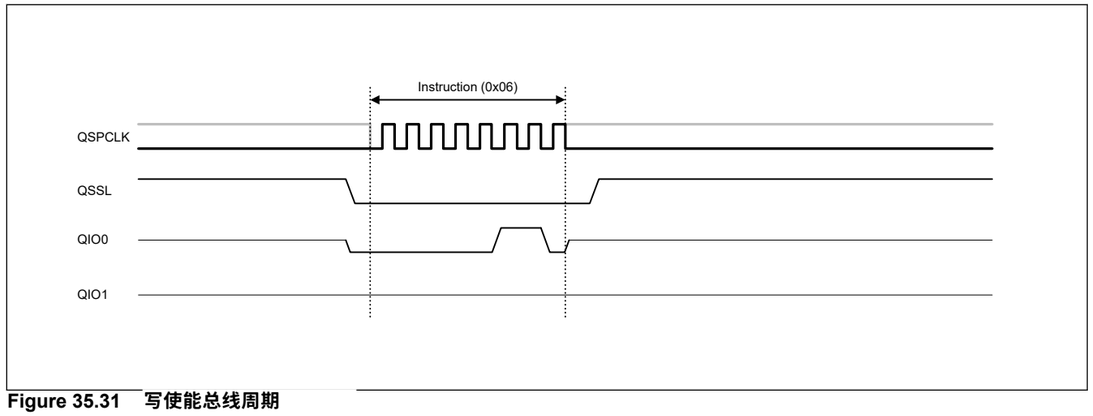

Figure 35.31 写使能总线周期

35.7 SPI总线周期安排

35.7.1 基于单独转换的串行闪存读取

ROM读取总线周期以一对一的方式单独转换为SPI总线周期。当检测到ROM读取总线周期时，QSSL信号被置位，并且SPI总线周期开始。当从串行闪存完成数据接收时，QSSL信号被取反，SPI总线周期完成。

当检测到下一个ROM读取总线周期时，由SFMSSC.SFMSW[3:0]位设置的QSSL信号再次置位，然后下一个SPI总线周期开始。

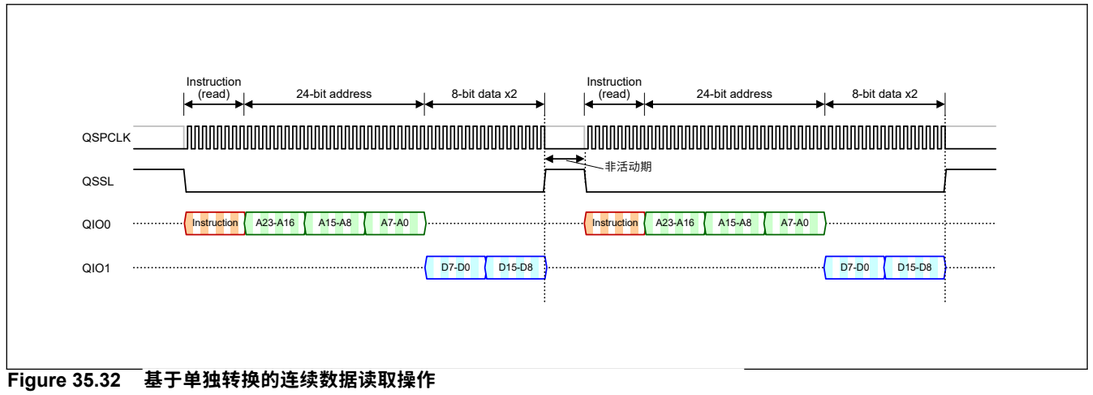

Figure 35.32 基于单独转换的连续数据读取操作

35.7.2 使用预取功能读取串行闪存

在CPU指令执行和块数据传输等操作中，数据通常是从连续地址按升序读取的。串行闪存提供了重复数据接收的能力，而无需重新发出指令代码和地址。为了使用此功能，QSPI具有用于连续数据接收的预取功能。但是，如果CPU对不连续的闪存地址发出闪存读取请求，则SPI总线周期会相互分离，从而禁用预取功能。

要使能QSPI的预取功能，请将SFMSMD寄存器中的SFMPFE位设置为1。当使能预取功能时，会连续接收数据并存储在QSPI的预取缓冲区中，而无需等待另一个闪存读取请求。当CPU发出闪存读取请求时，会进行地址检查。如果确认地址匹配，则将缓冲区中的数据传递给CPU。如果检测到地址不匹配，则丢弃缓冲区中的数据并发出新的SPI总线周期。

用于预取的缓冲区为18字节长。当此缓冲区满时，SPI总线周期结束。当缓冲区数据被读取以创建空闲空间时，会自动启动一个新的SPI总线周期以恢复预取。

The prefetch function allows for efficient transfer operations when data is read in ascending order from contiguous addresses, as in instruction fetch and block data transfer.

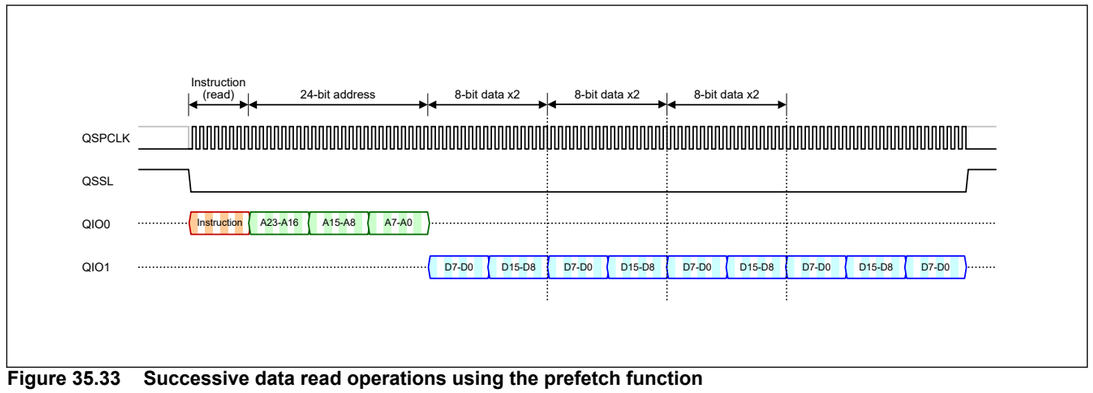

Figure 35.33 Successive data read operations using the prefetch function

35.7.3 Halt of Prefetching

If a serial flash memory read request for discontinuous addresses is issued when continuous data is being received by the prefetch function, the transfer of continuous data being made is halted and a new SPI bus cycle is started. Usually, such a halt of serial transfer occurs on data reception byte boundaries. However, if the SFMPAE bit in the SFMSMD register is set to 1, the halt can occur on locations other than byte boundaries.

35.7.4 Direct Specification of Prefetch Destination

When the prefetch function is enabled (SFMSMD.SFMPFE = 1), when writing to the QSPI window area occurs, after the writing is completed, prefetching starts from the write start address. Writes to serial flash memory cannot be performed.

Combining this function with described in section 35.7.5. Prefetch State Polling, can reduce the load on the internal bus when data is read from a low-speed serial flash memory.

Note: Writing to the QSPI window area with a data size of 2 bytes or more causes a hardfault.

35.7.5 Prefetch State Polling

A read by CPU from a low-speed serial flash memory causes the CPU system bus to be occupied until completion of the SPI reception bus cycle. The prefetch state polling function is provided to reduce this load.

The PFOFF bit in the Status Register (SFMSST) register indicates the state of the prefetch function, and the PFCNT[4:0] bits in the SFMSST register indicate the number of data bytes already prefetched. Place the polling program in the SRAM of this device.

```
//
// copy 1K byte (32bit x 256 word) data from serial flash to internal SRAM
//
unsigned long *sptr; // pointer for the serial flash
unsigned long *dptr; // pointer for the destination
int i;

SFMSMD |= 0x0040; // set SFMPFE bit to enable prefetch
*( (volatile unsigned char *) sptr ) = 0; // make the TAG valid to start prefetch

for ( i = 0 ; i < 256 ; i++ ){
while ( ( SFMSST & 0x00FF ) < 0x04 ){}; // waiting for 4-byte data to be received
*(dptr++) = *(sptr++);
}
```

Note: When executing a polling program, place the program outside of the serial flash memory. If the polling program is executed when the program is placed on the serial flash memory, the prefetch target frequently switches to an instruction code. This eliminates the effect of polling, and an infinite loop can result because the prefetch buffer is not filled.

当从连续地址以升序读取数据时，预取功能允许有效的传输操作，如在指令取指和块数据传输中。

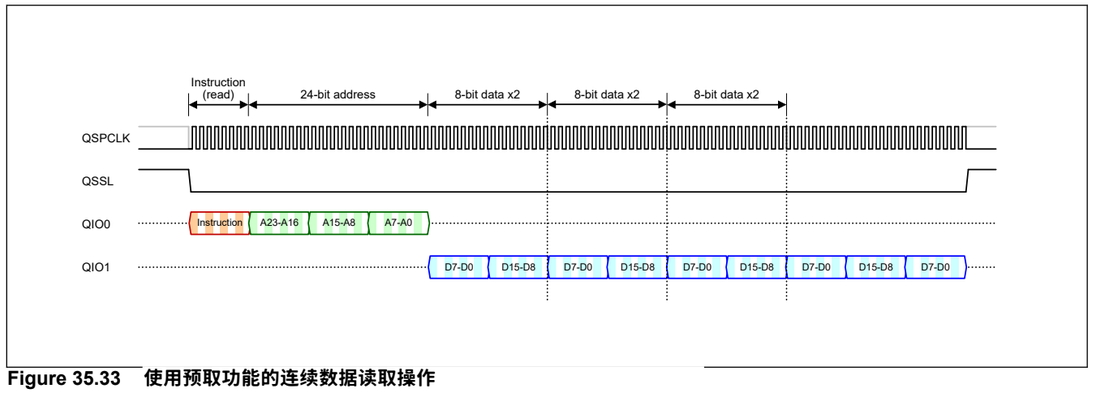

Figure 35.33 使用预取功能的连续数据读取操作

35.7.3 停止预取

如果在预取功能正在接收连续数据时发出对不连续地址的串行闪存读取请求，则正在进行的连续数据的传输将停止并开始新的SPI总线周期。通常，这种串行传输的停止发生在数据接收字节边界上。但是，如果SFMSMD寄存器中的SFMPAE位设置为1，则停止可能发生在字节边界以外的位置。

35.7.4 直接指定预取目的地

当预取功能使能时（SFMSMD.SFMPFE=1），当写入QSPI窗口区域时，写入完成后，从写入起始地址开始预取。无法执行对串行闪存的写入。

将此功能与第35.7.5节中的描述相结合。PrefetchStatePolling，可以减少从低速串行闪存读取数据时内部总线的负载。

Note: 写入数据大小为2字节或更大的QSPI窗口区域会导致硬故障。

35.7.5 预取状态轮询

CPU从低速串行闪存中读取会导致CPU系统总线被占用，直到完成
SPI接收总线周期。提供了预取状态轮询功能来减少这种负载。

状态寄存器(SFMSST)寄存器中的PFOFF位指示预取功能的状态，SFMSST寄存器中的PFCNT[4:0]位指示已经预取的数据字节数。将轮询程序放在本设备的SRAM中。

```
将1K字节（32位x256字）数据从      串行闪存复制到内部SRAM无符号长*sptr；串行闪存指针un
signedlong*dptr;目标inti的指针；

SFMSMD=0x0040；设置SFMPFE位以启用预取*((volatileunsignedchar*)sptr)=0;使TAG有效以开始预
取

for(i=0;i<256;i++){而((SFMSST&0x00FF)<0x04){ ;等待接收4字节数据*(dptr++)=*(sptr++);
```

Note: 执行轮询程序时，请将程序置于串行闪存之外。如果轮询程序在程序放在串行闪存上时执行，则预取目标频繁切换到指令代码。这消除了轮询的影响，并且由于未填充预取缓冲区可能导致无限循环。

35.7.6 SPI Bus Cycle Extension Function

If the SFMSE[1:0] bits in the SFMSMD register are set to a value other than 00b, the QSPI waits for the next flash read. At this time, the QSPCLK signal stops, the QSSL signal is kept active low even after data is obtained from the serial flash memory, and the SPI bus cycle is suspended.

If the address of the next flash read is contiguous in ascending order, the toggling of the QSPCLK signal is restarted to continue reception of subsequent data. If the address of the next flash read is not contiguous in ascending order, the QSSL signal is driven high once to end the SPI bus cycle being suspended. A new SPI bus cycle is then started.

When data is read intermittently from ascending order contiguous addresses, this function enables an efficient transfer operation to be performed by reducing the overhead for instruction code and address transmission.

The SPI bus cycle extension time is selectable in the SFMSE[1:0] bits in the SFMSMD register. When the specified extension time elapses, the QSSL signal returns to the high level to automatically end the SPI bus cycle being suspended. If the SFMSE[1:0] bits are set to 11b, QSSL is extended infinitely. This increases the power consumption of the serial flash memory.

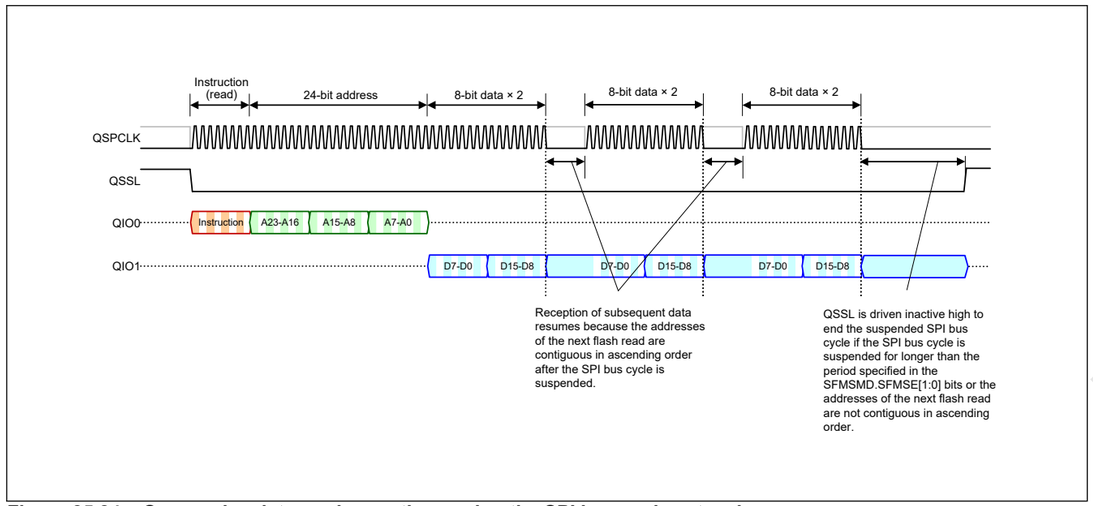

Figure 35.34 Successive data read operations using the SPI bus cycle extension

35.8 XIP Control

Some serial flash memory devices allow latencies to be reduced by skipping instruction code reception for flash reads. This instruction code skip function is selected in mode data received during the dummy cycle period of the previous serial bus cycle.

In the dummy cycle of the Fast Read instructions, the QSPI controls the XIP mode of the serial flash memory by using the serial data signal to send the mode data set in the SFMXD[7:0] bits in the SFMSDC register during the first 2 cycles, as shown in Figure 35.35.

The mode data to enable the XIP mode differs for each serial flash memory. Accordingly, set the appropriate mode data in the SFMXD[7:0] bits.

35.7.6 SPI总线周期扩展功能

如果SFMSMD寄存器中的SFMSE[1:0]位设置为00b以外的值，则QSPI等待下一次闪存读取。此时，QSPCLK信号停止，即使从串行闪存中获取数据后，QSSL信号也保持低电平有效，并且暂停SPI总线周期。

如果下一次闪存读取的地址按升序连续，则重新启动QSPCLK信号的翻转以继续接收后续数据。如果下一次flash读取的地址升序不连续，则QSSL信号被驱动一次高电平以结束暂停的SPI总线周期。然后开始一个新的SPI总线周期。

当从升序连续地址间歇性地读取数据时，该功能通过减少指令代码和地址传输的开销来实现高效的传输操作。

SPI总线周期延长时间可在SFMSMD寄存器的SFMSE[1:0]位中选择。当指定的延长时间过去后，QSSL信号返回高电平，自动结束暂停的SPI总线周期。如果SFMSE[1:0]位设置为11b，QSSL将无限扩展。这增加了串行闪存的功耗。

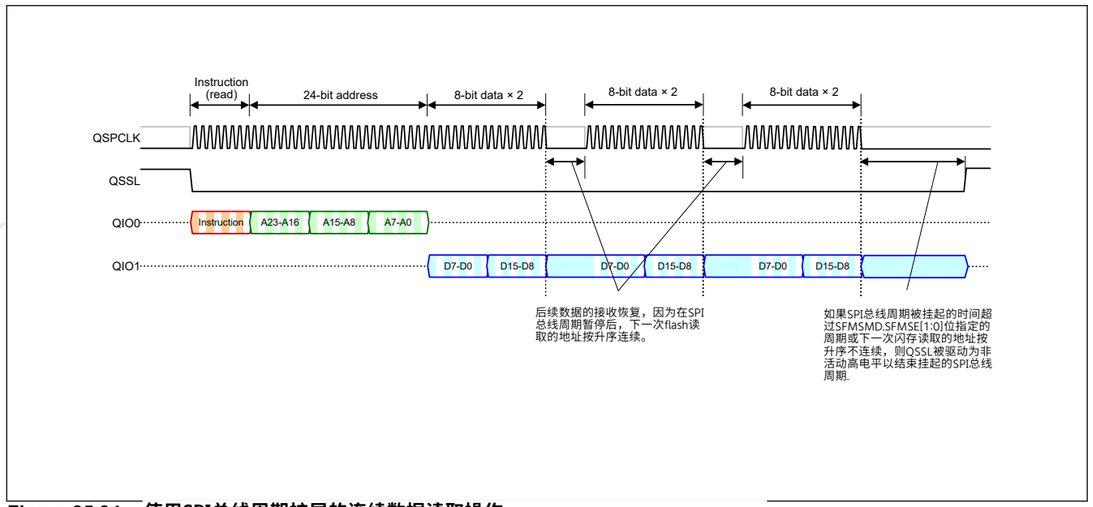

Figure 35.34 使用SPI总线周期扩展的连续数据读取操作

35.8 XIP Control

一些串行闪存设备允许通过跳过用于闪存读取的指令代码接收来减少延迟。在前一个串行总线周期的虚拟周期期间接收到的模式数据中选择此指令代码跳过功能。

在快速读取指令的空周期中，QSPI控制串行闪存的XIP模式，在前2循环，如图35.35所示。

启用XIP模式的模式数据因串行闪存而异。因此，在SFMXD[7:0]位中设置适当的模式数据。

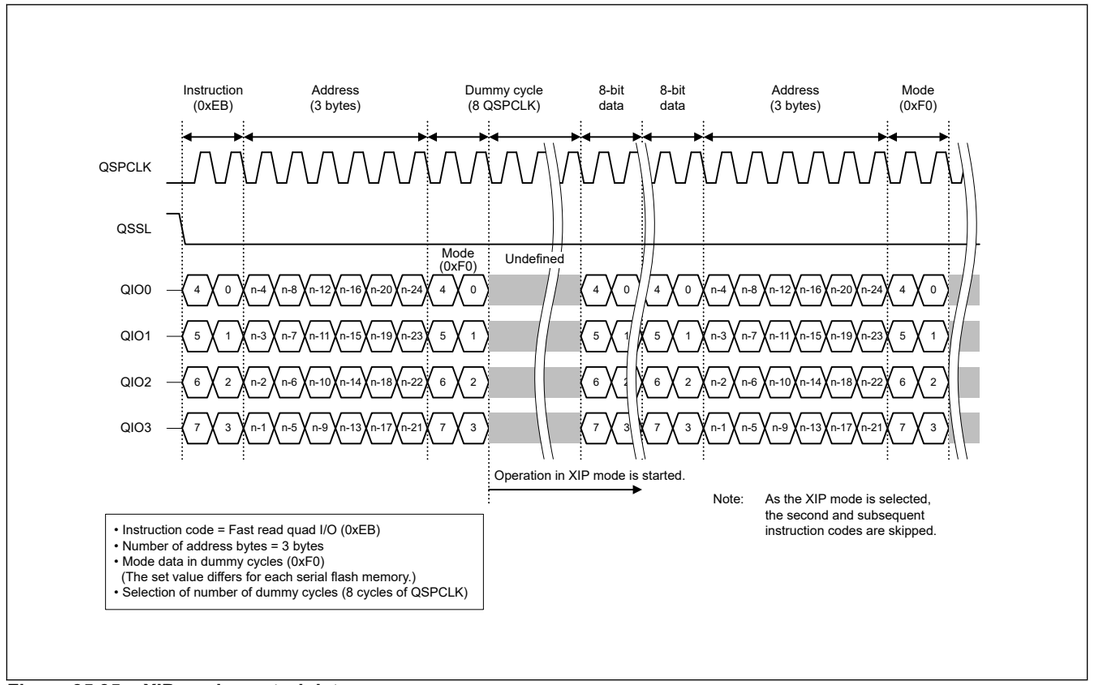

Figure 35.35 XIP mode control data

35.8.1 Setting XIP Mode

To start XIP mode in serial flash memory, perform the following register settings:

- Set a mode data value in the SFMXD[7:0] bits in the SFMSDC register.*1
- Set the SFMXEN bit in the SFMSDC register to 1.

In the dummy cycle of the first fast read cycle after these registers are set, the mode data value set in the register is transferred. From that point, XIP mode is enabled in the serial flash memory. To confirm the current XIP mode status, read the SFMXST flag in the SFMSDC register.

Note 1. In the SFMXD[7:0] bits in the SFMSDC register, set the mode data that follows the specifications for the actual serial flash memory.

The following figure shows an example of the XIP mode setting procedure.

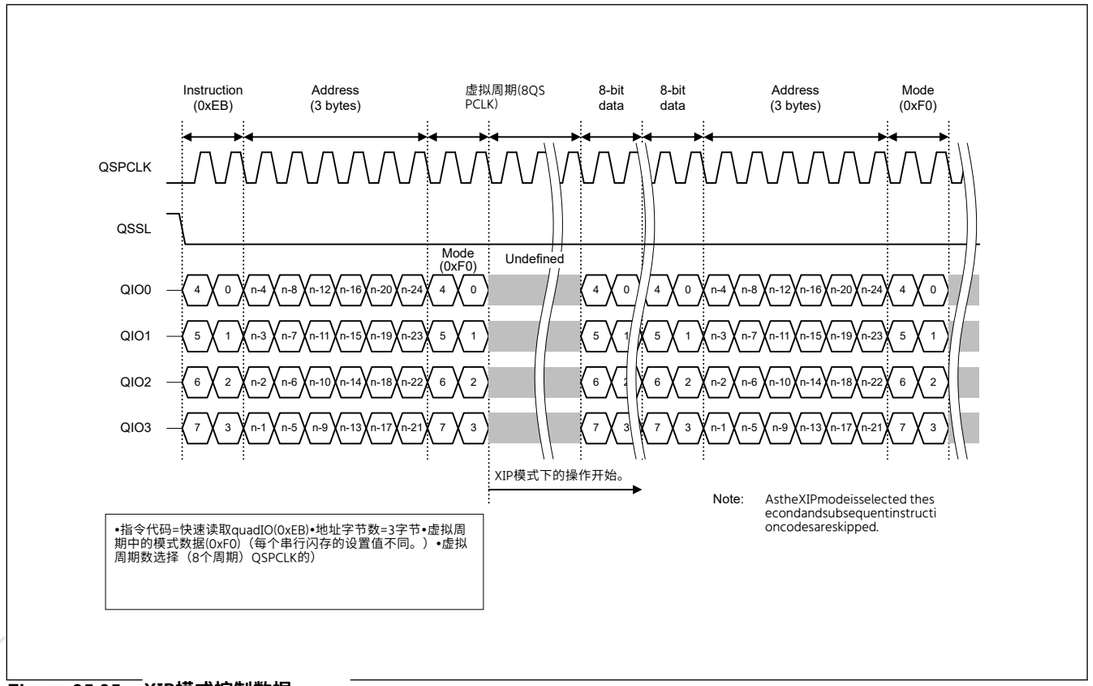

Figure 35.35 XIP模式控制数据

35.8.1 设置XIP模式

要在串行闪存中启动XIP模式，请执行以下寄存器设置：

●在SFMSDC寄存器的SFMXD[7:0]位中设置模式数据值。*1

●将SFMSDC寄存器中的SFMXEN位设置为1。

在设置这些寄存器后的第一个快速读取周期的空周期中，传输寄存器中设置的模式数据值。从那时起，串行闪存中的XIP模式被启用。要确认当前XIP模式状态，请读取SFMSDC寄存器中的SFMXST标志。

注1.在SFMSDC寄存器的SFMXD[7:0]位中，设置符合实际串行闪存规范的模式数据。

下图显示了XIP模式设置过程的示例。

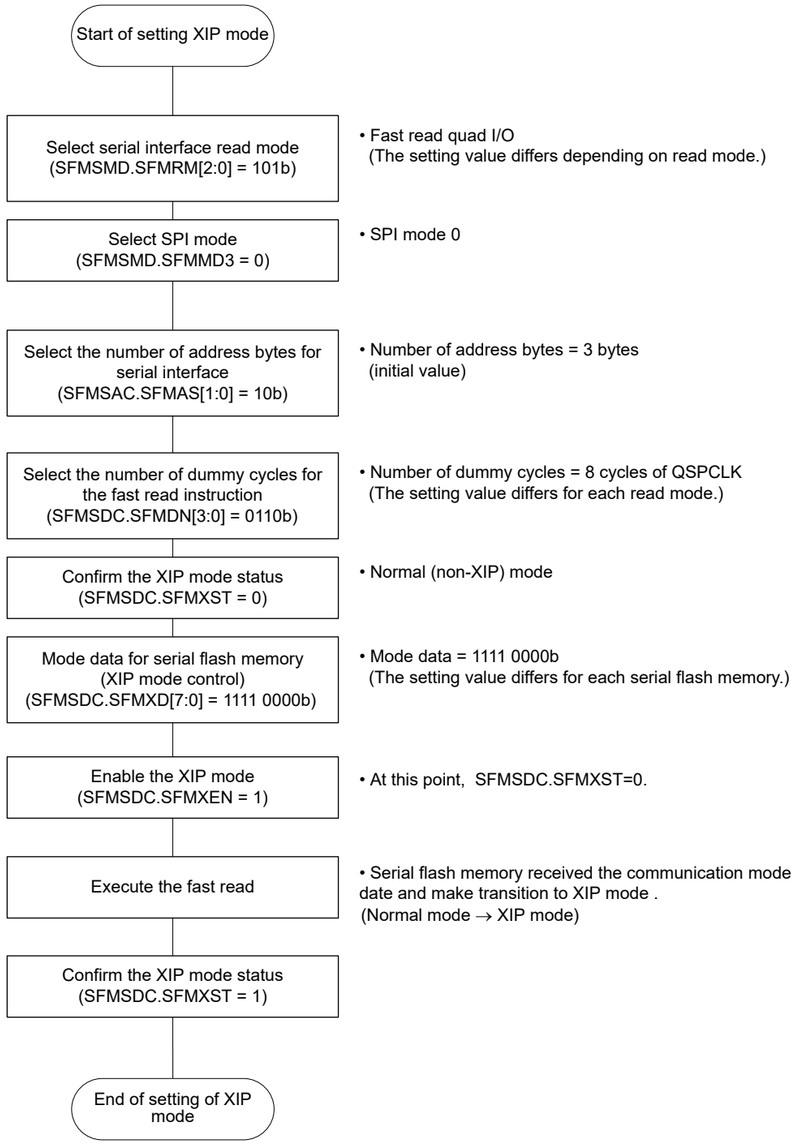

Figure 35.36 Flowchart of XIP Mode

35.8.2 Releasing the XIP Mode

To release XIP mode in serial flash memory, perform the following register setting:

- Set the mode data value to disable XIP mode in SFMSDC.SFMXD [7: 0] bits*1
- Set the SFMXEN bit in the SFMSDC register to 0.

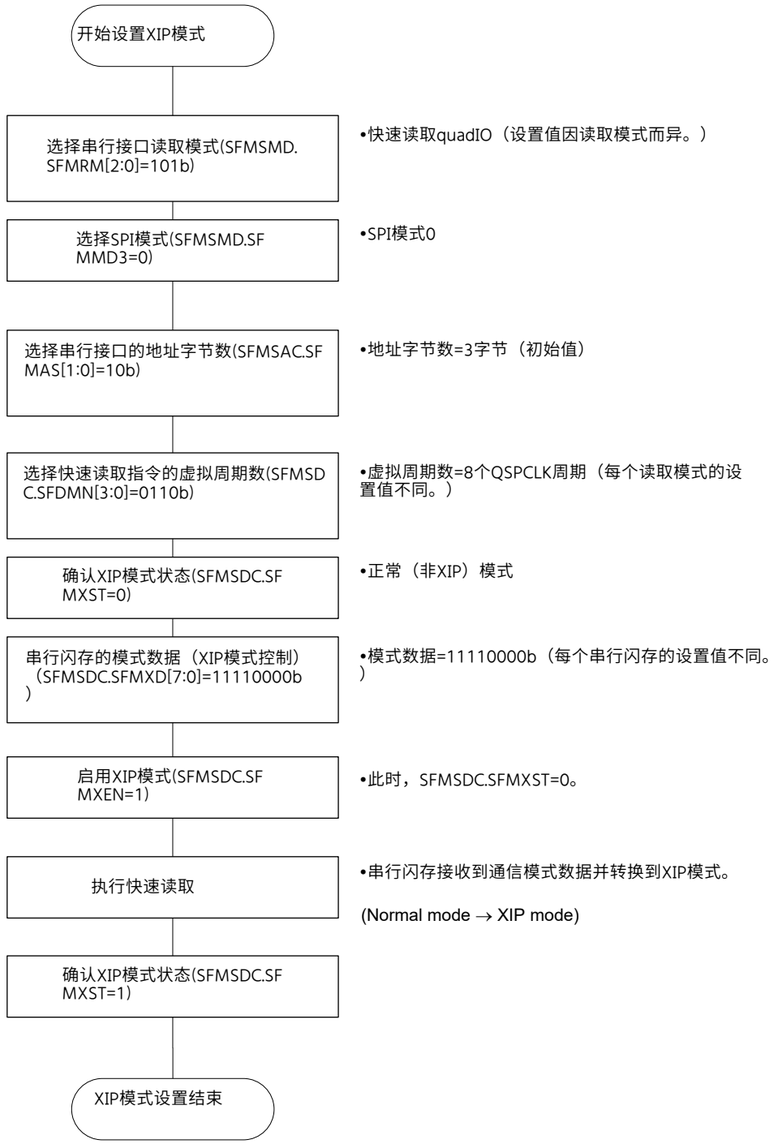

Figure 35.36 XIP模式流程图

35.8.2 释放XIP模式

要在串行闪存中释放XIP模式，请执行以下寄存器设置：

●在SFMSDC.SFMXD[7:0]位中设置模式数据值以禁用XIP模式*1

●将SFMSDC寄存器中的SFMXEN位设置为0。

In the dummy cycle of the first fast read cycle after this register is set, The mode data value that disables the XIP mode set in the register is transferred. From that point, XIP mode is disabled in the serial flash memory. To confirm the current XIP mode status, read the SFMXST flag in the SFMSDC register.

Note 1. Set the mode data in the SFMSDC.SFMXD [7: 0] bits according to the specifications of the serial flash memory.

Figure 35.37 shows an example of the procedure for releasing XIP mode.

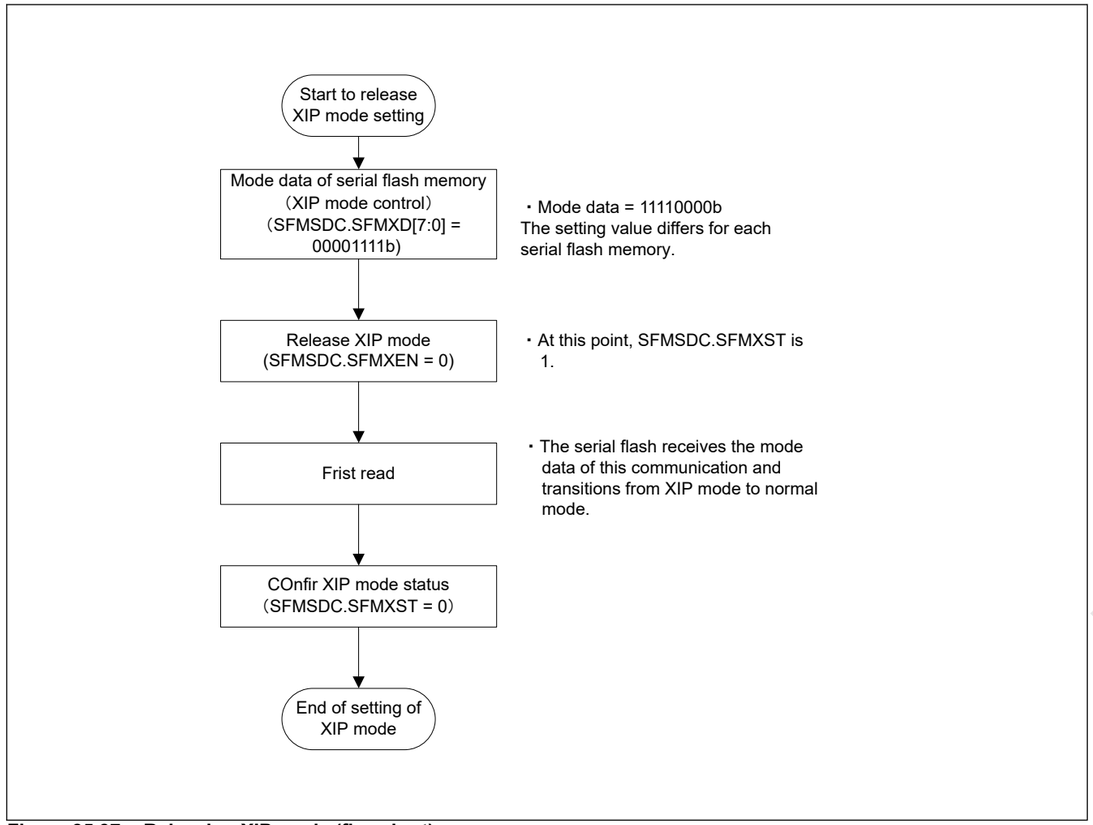

Figure 35.37 Releasing XIP mode (flowchart)

35.9 QIO2 and QIO3 Pin States

The QIO2 and QIO3 pin states depend on the serial interface read mode specified in the SFMRM[2:0] bits in the SFMSMD register.

Table 35.11 QIO2 and QIO3 pin states (1 of 2)

SFMSMD.SFMRM[2:0] bits	QIO2 pin state*1	QIO3 pin state*2	Remarks
111	Setting prohibited		
110			
101	Input or output as serial data signal (The pin is in the Hi-Z state when it is inactive.)	Input or output as serial data signal (The pin is in the Hi-Z state when it is inactive.)	Fast Read Quad I/O
100			Fast Read Quad Output

在设置该寄存器后的第一个快速读取周期的空周期中，传输寄存器中设置的禁用XIP模式的模式数据值。从那时起，串行闪存中的XIP模式被禁用。要确认当前XIP模式状态，请读取SFMSDC寄存器中的SFMXST标志。

注1.根据串行闪存的规格设置SFMSDC.SFMXD[7:0]位中的模式数据。

图35.37显示了释放XIP模式的过程示例。

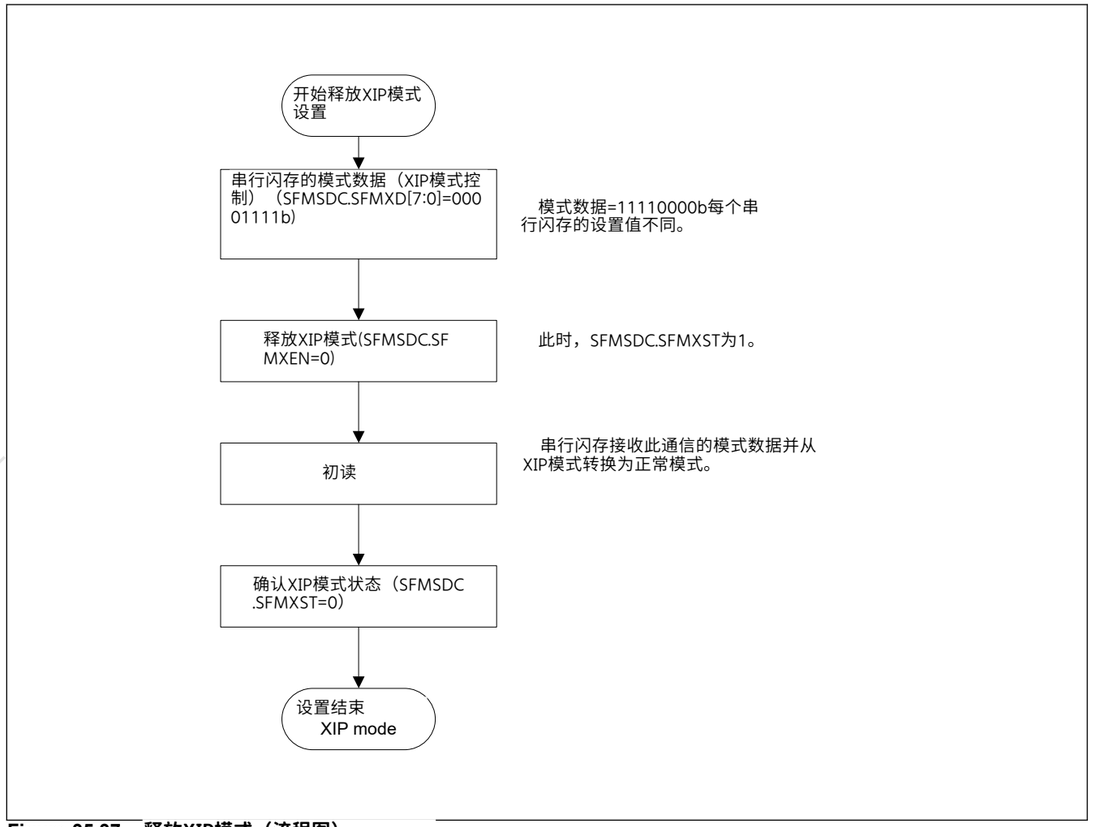

Figure 35.37 释放XIP模式（流程图）

35.9 QIO2和QIO3引脚状态

QIO2和QIO3引脚状态取决于SFMSMD寄存器的SFMRM[2:0]位中指定的串行接口读取模式。

Table 35.11 QIO2和QIO3引脚状态（1of2）

SFMSMD.SFMRM[2:0] bits	QIO2引脚状态*1	QIO3引脚状态*2	Remarks
111	禁止设定		
110			
101	作为串行数据信号的输入或输出（引脚处于非活动状态时处于Hi-Z状态。）	作为串行数据信号的输入或输出（引脚处于非活动状态时处于Hi-Z状态。）	快速读取四路IO
100			快速读取四路输出

Table 35.11 QIO2 and QIO3 pin states (2 of 2)

SFMSMD.SFMRM[2:0] bits	QIO2 pin state*1	QIO3 pin state*2	Remarks
011	Output SFMWPL bit variable of the Port Control Register (SFMPMD) (initial value is low level)	Output high level	Fast Read Dual I/O
010			Fast Read Dual Output
001			Fast Read
000			Standard Read (Initial State)

Note 1. The serial flash memory can also use the QIO2 pin for the write protect (WP) function. The WP function prohibits writes to the status registers. (The function is available in mode other than Quad-SPI mode.)
Note 2. The serial flash memory can also use the QIO3 pin for the HOLD or RESET function.
The hold function places the I/O pin in an inactive state without deselecting the chip. (The function is available in mode other than Quad-SPI mode.)
The reset function resets the serial flash memory. (The function is available when the QSSL pin function is disabled or in a mode in which the QIO3 pin is not used.)

35.10 Direct Communication Mode

35.10.1 About Direct Communication

The QSPI can read the serial flash memory contents by automatically converting from reading the QSPI window area to SPI bus cycles. However, serial flash memory have many different functions in addition to memory data read, including ID information read, erase, programming, and status information read. There is no standardized instruction set for using these functions, and more functions are being added rapidly by different vendors to different devices. Therefore, to support these functions, the software can create any required SPI bus cycle by communicating directly with serial flash memory.

35.10.2 Using Direct Communication Mode

To communicate directly with serial flash memory, transition to direct communication mode by setting the DCOM bit in the Communication Mode Control Register (SFMCMD) register to 1. While direct communications mode is selected, the read operation to the serial flash memory by the QSPI window is invalid.

Note: If the QSPI is set to the XIP mode, you must terminate the XIP mode before starting direct communication mode.

35.10.3 Generating the SPI Bus Cycle during Direct Communication

The SPI bus cycle in direct communications starts on the first access to the SFMCOM register, and after a series of input / output operations are executed via the SFMCOM register, the bus cycle ends when 1 is written to the SFMCMD register. At that point, a write to the SFMCOM port is converted to a one-byte transmission to the SPI bus, and a read from the SFMCOM register is converted to a one-byte reception from the SPI bus.

During the period from the first access to the SFMCOM register to the last write operation to the SFMCMD register, the QSSL signal is held active to notify the serial flash memory that a series of SPI bus cycles is in progress.

Note: In direct communication mode, all writes to registers other than SFMCMD and SFMCOM (including SFMSMD, SFMSSC, SFMSKC, SFMSST, SFMCST, SFMSIC, SFMSAC, SFMSDC, SFMSPC, and SFMPMD) are disabled.

Figure 35.38 to Figure 35.40 show direct communication program examples, and Figure 35.41 shows ID read direct communication timing examples.

Table 35.11 QIO2和QIO3引脚状态（2个中的2个）

SFMSMD.SFMRM[2:0] bits	QIO2引脚状态*1	QIO3引脚状态*2	Remarks
011	输出端口控制寄存器（SFMPMD）的SFMWPL位变量（初始值为低电平）	输出高电平	快速读取双IO
010			快速读取双输出
001			快速阅读
000			标准读取（初始状态）

注1.串行闪存也可以将QIO2引脚用于写保护(WP)功能。WP功能禁止写入状态寄存器。（该功能在Quad-SPI模式以外的模式下可用。）

注2.串行闪存也可以将QIO3引脚用于HOLD或RESET功能。
保持功能将IO引脚置于非活动状态，而无需取消选择芯片。（该功能在除Quad-SPI mode.)
复位功能复位串行闪存。（当QSSL引脚功能被禁用或处于未使用QIO3引脚的模式时，该功能可用。）

35.10 直接通讯方式

35.10.1 关于直接沟通

QSPI可以通过从读取QSPI窗口区域自动转换为SPI总线周期来读取串行闪存内容。然而，串行闪存除了读取存储器数据外，还有许多不同的功能，包括ID信息读取、擦除、编程和状态信息读取。使用这些功能没有标准化的指令集，更多的功能正在由不同的供应商迅速添加到不同的设备中。因此，为了支持这些功能，软件可以通过直接与串行闪存通信来创建任何所需的SPI总线周期。

35.10.2 使用直接通信模式

要直接与串行闪存通信，通过设置DCOM位转换到直接通信模式CommunicationModeControlRegister(SFMCMD)registerto1.Whiledirectcommunicationsmodeisselected thereadoperationtotheserialflashmemorybytheQSPIwindowisinvalid.

Note: 如果QSPI设置为XIP模式，则必须在启动直接通信模式之前终止XIP模式。

35.10.3 在直接通信期间生成SPI总线周期

直接通信中的SPI总线周期从第一次访问SFMCOM寄存器开始，通过SFMCOM寄存器执行一系列输入输出操作后，总线周期在SFMCMD寄存器写入1时结束。此时，对SFMCOM端口的写入转换为向SPI总线发送一个字节，从SFMCOM寄存器读取转换为从SPI总线接收一个字节。

在从第一次访问SFMCOM寄存器到最后一次写入SFMCMD寄存器期间，
QSSL信号保持有效，以通知串行闪存一系列SPI总线周期正在进行中。

Note: 在直接通信模式下，所有写入除SFMCMD和SFMCOM以外的寄存器（包括SFMSMD、SFMSSC、SFMSKC、SFMSST、SFMCST、SFMSIC、SFMSAC、SFMSDC、SFMSPC和SFMPMD）被禁用。

图35.38至图35.40为直接通信程序示例，图35.41为ID读取直接通信时序示例。

Note: (1) SFMCMD = 0x01; // Enable direct operation. Get the device ID assigned by JEDEC.
(2) SFMCOM = Instruction_RDID; // Read ID instruction (to open the transaction)
(3) mfid = (unsigned char) SFMCOM; // Get the manufacturer ID from ID byte 1.
(4) mtype = (unsigned char) SFMCOM; // Get the memory type from ID byte 2.
(5) mcap = (unsigned char) SFMCOM; // Get the memory capacity from ID byte 3.
(6) SFMCMD = 0x01; // Close the transaction.
(7) SFMCMD = 0x00; // Disable direct operation.

The timings (1), (6) and (7) for enabling or disabling direct communications mode are omitted in the figure.

Figure 35.41 Example of direct communication timing for ID read

Note: When the Single SPI Protocol, Extended SPI Protocol is used in direct communication mode, the standard Read or Fast Read instruction must be used to reference the contents of the serial flash memory. The QSPI does not support Fast Read Dual Output, Fast Read Dual I/O, Fast Read Quad Output, or Fast Read Quad I/O transfers in this configuration. When these Fast Read operations are required, use ROM access memory.

35.11 Interrupts

When ROM read access is detected in direct communication mode, the SFMCST.EROMR flag is set to 1 and QSPI generates an interrupt request. Interrupt requests are retained until the EROMR flag is cleared by a 0 write. For details, see section 13, Interrupt Controller Unit (ICU).

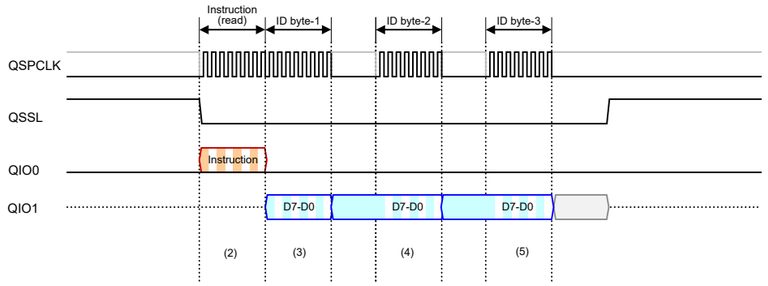
35.12 Usage Note

35.12.1 Settings for the Module-Stop Function

QSPI operation can be disabled or enabled using Module Stop Control Register B (MSTPCRB). The QSPI is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

35.12.2 Procedure for Changing Settings in Multiple Control Registers

The settings of the QSPI control registers can be modified dynamically during system operation. However, when the settings of multiple control registers are changed sequentially, an SPI bus cycle might occur before all of the registers are updated. The register setting sequence must be designed so that the SPI bus timing specifications are satisfied at all stages of register setting modification.



Note: (1)SFMCMD=0x01；启用直接操作。获取JEDEC分配的设备ID。(2)SFMCOM=指令_RDID；读取ID指令（开启交易）(3)mfid=(unsignedchar)SFMCOM;从ID字节1获取制造商ID。(4)mtype=(unsignedchar)SFMCOM;从ID字节2获取内存类型。(5)mcap=(unsignedchar)SFMCOM;从ID字节3获取内存容量。(6)SFMCMD=0x01;关闭交易。(7)SFMCMD=0x00；禁用直接操作。

图中省略了启用或禁用直接通信模式的时序(1)、(6)和(7)。

Figure 35.41 ID读取的直接通信时序示例

Note: 当单SPI协议、扩展SPI协议用于直接通信模式时，标准的Read或必须使用快速读取指令来引用串行闪存的内容。QSPI不支持此配置中的快速读取双输出、快速读取双IO、快速读取四输出或快速读取四IO传输。当需要这些快速读取操作时，请使用ROM存取存储器。

35.11 Interrupts

当在直接通信模式下检测到ROM读访问时，SFMCST.EROMR标志设置为1，并且QSPI产生中断请求。中断请求被保留，直到EROMR标志被0写入清除。有关详细信息，请参阅第13节，中断控制器单元(ICU)。

35.12 使用说明

35.12.1 模块停止功能的设置

可以使用模块停止控制寄存器B(MSTPCRB)禁用或启用QSPI操作。QSPI在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

35.12.2 更改多个控制寄存器中的设置的步骤

QSPI控制寄存器的设置可以在系统运行期间动态修改。但是，当多个控制寄存器的设置依次更改时，可能会在所有寄存器更新之前发生一个SPI总线周期。必须设计寄存器设置序列，以便在寄存器设置修改的所有阶段都满足SPI总线时序规范。

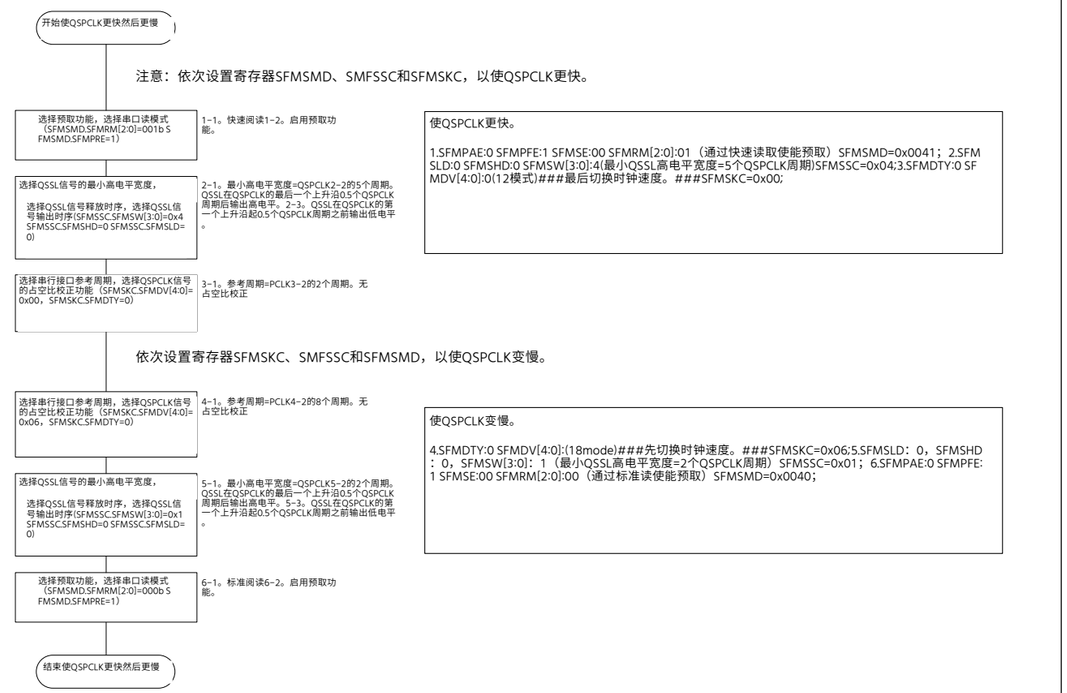

Figure 35.42 使QSPCLK更快和更慢的流程图

36. Octa Serial Peripheral Interface (OSPI)

The Octa Serial Peripheral Interface (OSPI) module is a memory controller for connecting OctaFlash™ and OctaRAM™.

The OSPI is compliant with JEDEC standard JESD251, Profile 1.0.

Note: OctaFlash™ and OctaRAM™ are trademarks of Macronix International Co., Ltd.

36.1 Overview

36.1.1 Features

- Macronix Serial Multi I/O (MXSMIO®) Octa Peripheral Interface (OPI) for high-end consumer applications is supported.
- Flash device compliant with JEDEC standard JESD251, Profile 1.0 is supported.
- One each of an OctaFlash device and an OctaRAM device compliant with the OPI specifications are connectable.
- A chip select signal is assigned to each memory device (OM_CS0: OctaRAM; OM_CS1: OctaFlash).*1
- Supported device interfaces
  - SPI: Serial peripheral interface (OctaFlash, SPI mode)
  - SOPI: Single Octa I/O (8 bits) (OctaFlash, single data rate)
  - DOPI: Double Octa I/O (8 bits) (OctaFlash and OctaRAM, double data rate)
- 3-byte and 4-byte OctaFlash address commands are supported.
- 4-byte OctaRAM address commands are supported.
- The read-while-write (RWW) operation is supported.
- 1LC and 2LC (latency count) OctaRAM devices are supported.
- The error corrected signal (ECS) is available, and ECC errors can be detected (for OctaFlash only).
- Interrupt source: Error interrupts.
- Fastboot mode is not supported.
- Direct access (memory-mapped reading and writing) to memory devices in separate flash and RAM address spaces is supported.

Note 1. Only one of the memory devices can operate (be read or written to) at a time.

36. Octa串行外设接口(OSPI)

Octa串行外设接口(OSPI)模块是用于连接OctaFlash 和OctaRAM 的内存控制器。

OSPI符合JEDEC标准JESD251，Profile1.0。

Note: OctaFlash 和OctaRAM 是MacronixInternationalCo. Ltd.的商标。

36.1 Overview

36.1.1 Features

●支持用于高端消费应用的Macronix串行多IO(MXSMIO®)八角外设接口(OPI)。

●闪存器件符合JEDEC标准JESD251，支持Profile1.0。

●可连接符合OPI规格的OctaFlash设备和OctaRAM设备各一个。

●为每个存储设备分配一个片选信号（OM_CS0：OctaRAM；OM_CS1：OctaFlash）。*1

●支持的设备接口

SPI：串行外设接口（OctaFlash，SPI模式）

SOPI：单OctaIO（8位）（OctaFlash，单数据速率）

DOPI：双OctaIO（8位）（OctaFlash和OctaRAM，双倍数据速率）

●支持3字节和4字节OctaFlash地址命令。

●支持4字节OctaRAM地址命令。

●支持边写边读（RWW）操作。

●支持1LC和2LC（延迟计数）OctaRAM设备。

●纠错信号（ECS）可用，可检测ECC 错误（仅适用于OctaFlash）。

●中断源：错误中断。

●不支持快速启动模式。

●支持在单独的闪存和RAM地址空间中直接访问（内存映射读取和写入）存储设备。

注1.一次只能操作（读取或写入）其中一个存储设备。

36.1.2 Block diagram

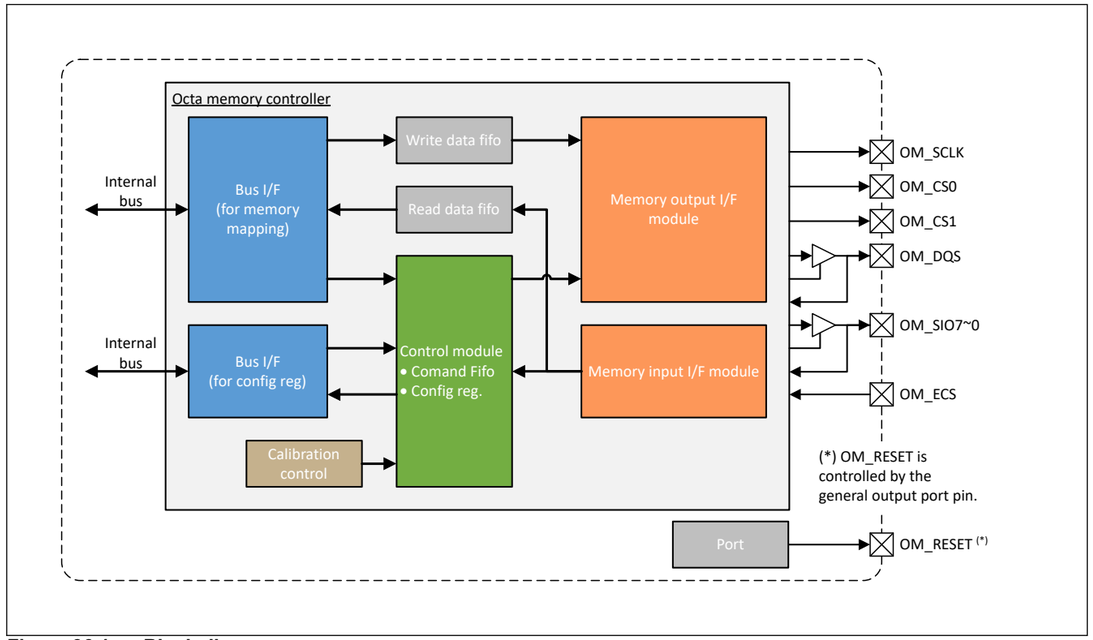

Figure 36.1 Block diagram

36.1.3 Input/Output Pins

Table 36.1 shows the pin configuration to connect chip pins.

Table 36.1 Configuration of Memory Controller Pins to connect Chip pins

Pin name	I/O	Function
OM_SCLK	Output	Clock output (OCTACLK divided by 2)
OM_CS0	Output	Chip select signal for an OctaRAM device
OM_CS1	Output	Chip select signal for an OctaFlash device
OM_DQS	I/O	Read data strobe/write data mask signal
OM_SIO7 to OM_SIO0	I/O	Data input/output
OM_RESET	Output	Reset signal for both OctaFlash and OctaRAM devices
OM_ECS	Input	ECC error detection signal from the external memory

36.1.4 Device Interface

The device interface is compatible with OctaFlash/OctaRAM interface.

When reading data from memory or programming data to memory, the bit order is changed in accordance with the I/O mode. The bit order is shown below:

Table 36.2 Bit order in accordance with I/O mode (1 of 2)

I/O mode	Bit order (MSB)
Read data from device	
1 I/O (SPI)	OM_SIO1 input
8 I/O (SOPI)	OM_SIO7 to OM_SIO0 input

36.1.2 框图

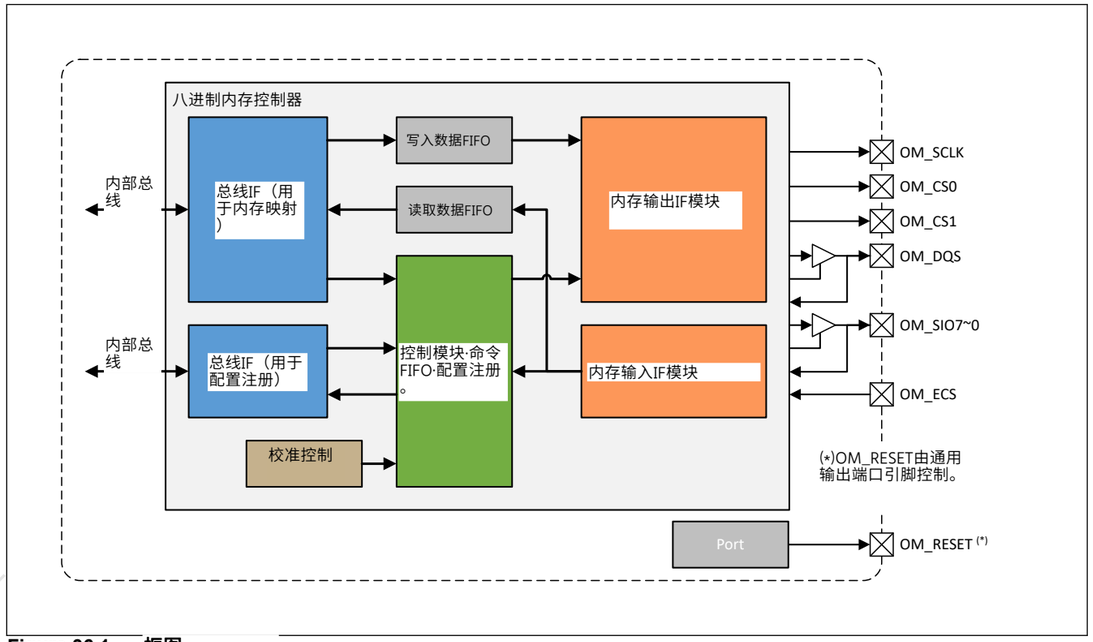

Figure 36.1 框图

36.1.3 Input/Output Pins

表36.1显示了连接芯片引脚的引脚配置。

Table 36.1 内存控制器引脚配置以连接芯片引脚

引脚名称	I/O	Function
OM_SCLK	Output	时钟输出（OCTACLK除以2）
OM_CS0	Output	OctaRAM器件的片选信号
OM_CS1	Output	OctaFlash器件的片选信号
OM_DQS	I/O	读数据选通写数据屏蔽信号
OM_SIO7 to OM_SIO0	I/O	Data input/output
OM_RESET	Output	OctaFlash和OctaRAM器件的复位信号
OM_ECS	Input	来自外部存储器的ECC错误检测信号

36.1.4 设备接口

设备接口与OctaFlashOctaRAM接口兼容。

当从内存读取数据或将数据编程到内存时，位顺序会根据IO模式而改变。位顺序如下所示：

Table 36.2 符合IO模式的位顺序(1of2)

I/O mode	位序(MSB)
从设备读取数据	
1 I/O (SPI)	OM_SIO1 input
8 I/O (SOPI)	OM_SIO7至OM_SIO0输入

Table 36.2 Bit order in accordance with I/O mode (2 of 2)

I/O mode	Bit order (MSB)
8 I/O (DOPI)	OM_SIO7 to OM_SIO0 input. Order of data {D1, D0}, {D3, D2}, … or {D0, D1}, {D2, D3}, …, according to setting for memory to be connected.
Program/Write data to device	
1 I/O (SPI)	OM_SIO0 output
8 I/O (SOPI)	OM_SIO7 to OM_SIO0 output
8 I/O (DOPI)	OM_SIO7 to OM_SIO0 output. Order of data {D1, D0}, {D3, D2}, …or {D0, D1}, {D2, D3}, …, according to setting for memory to be connected.

36.2 Register Descriptions

Table 36.3 shows the register configuration.

There are memory-map and configuration modes for accessing the OctaFlash/RAM memory.

In the memory-map mode, the OSPI automatically sends the command for read or write. In the configuration mode, the controller sends commands and data.

Table 36.3 OSPI register configuration

Register Name	Symbol	R/W	Initial Value	Address	Access Size
Device command register	DCR	R/W	0x00000000	0x400A_6000	32
Device address register	DAR	R/W	0x00000000	0x400A_6004	32
Device command setting register	DCSR	R/W	0x00000000	0x400A_6008	32
Device size register 0	DSR0	R/W	0x00000000	0x400A_600C	32

36.2.1 DCR : Device Command Register

Base address: OSPI = 0x400A_6000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DVCMD1[7:0]								DVCMD0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DVCMD0[7:0]	Device Command data Sets the data to be transferred as a command to the device. If DCSR.CMDLEN[2:0] = 1, the controller will send DCR[7:0] as the 1st byte to memory. If DCSR.CMDLEN[2:0] = 2, the controller will send DCR[7:0] as the 2nd byte to memory.	R/W
15:8	DVCMD1[7:0]	Device Command data Sets the data to be transferred as a command to the device. If DCSR.CMDLEN[2:0] = 2, the controller will send DCR[15:8] as the 1st byte to memory	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

DCR sets the device commands for controller operation.

36.2.2 DAR : Device Address Register

Base address: OSPI = 0x400A_6000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DVAD3[7:0]								DVAD2[7:0]								DVAD1[7:0]								DVAD0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DVAD0[7:0]	Device Address data 0 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the third byte. When DCSR.ADLEN[2:0] = 4, set as the fourth byte.	R/W
15:8	DVAD1[7:0]	Device Address data 1 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the second byte. When DCSR.ADLEN[2:0] = 4, set as the third byte.	R/W
23:16	DVAD2[7:0]	Device Address data 2 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the first byte. When DCSR.ADLEN[2:0] = 4, set as the second byte.	R/W
31:24	DVAD3[7:0]	Device Address data 3 Set the device address data. When DCSR.ADLEN[2:0] = 4 only, set as the first byte.	R/W

DAR sets the device address for controller operation.

36.2.1 DCR:设备命令寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DVCMD1[7:0]								DVCMD0[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DVCMD0[7:0]	设备命令数据 设置要作为命令传输到设备的数据。 如果DCSR.CMDLEN[2:0]=1，控制器会将DCR[7:0]作为第一个字节发送到内存。如果DCSR.CMDLEN[2:0]=2，控制器会将DCR[7:0]作为第2个字节发送到内存。	R/W
15:8	DVCMD1[7:0]	设备命令数据 设置要作为命令传输到设备的数据。 如果DCSR.CMDLEN[2:0]=2，控制器会将DCR[15:8]作为第一个字节发送到内存	R/W
31:16	—	这些位被读取为0。写入值应为0。	R/W

DCR为控制器操作设置设备命令。

36.2.2 DAR:设备地址寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DVAD3[7:0]								DVAD2[7:0]								DVAD1[7:0]								DVAD0[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DVAD0[7:0]	设备地址数据0 设置设备地址数据。 当DCSR.ADLEN[2:0]=3时，设置为第三个字节。当DCSR.ADLEN[2:0]=4时，设置为第四个字节。	R/W
15:8	DVAD1[7:0]	设备地址数据1 设置设备地址数据。 当DCSR.ADLEN[2:0]=3时，设置为第二个字节。 当DCSR.ADLEN[2:0]=4时，设置为第三个字节。	R/W
23:16	DVAD2[7:0]	设备地址数据2 设置设备地址数据。 当DCSR.ADLEN[2:0]=3时，设置为第一个字节。 当DCSR.ADLEN[2:0]=4时，设置为第二个字节。	R/W
31:24	DVAD3[7:0]	设备地址数据3 设置设备地址数据。 仅当DCSR.ADLEN[2:0]=4时，设置为第一个字节。	R/W

DAR设置控制器操作的设备地址。

36.2.3 DCSR : Device Command Setting Register

Base address: OSPI = 0x400A_6000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	PREN	ACDA	DOPI	ADLEN[2:0]			DAOR	CMDLEN[2:0]			ACDV	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMLEN[7:0]								DALEN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DALEN[7:0]	Transfer data length setting Sets the length of data to be transferred in bytes. Set a value less than 0x5. When [7:0] is 0, there are no transmission data to memory and reception data from memory.	R/W
15:8	DMLEN[7:0]	Dummy cycle setting Sets the length of dummy cycle in OM_SCLK units.	R/W
18:16	—	These bits are read as 0. The write value should be 0.	R
19	ACDV	Access Device setting Sets the device to be accessed. 0: Send commands to device 0. 1: Send commands to device 1.	R/W
22:20	CMDLEN[2:0]	Transfer command length setting Sets the length of the command to be transferred in bytes.	R/W
23	DAOR	Data order setting Sets the byte order of data during read and write operations. 0: byte0, byte1, byte2, byte3 1: byte1, byte0, byte3, byte2	R/W
26:24	ADLEN[2:0]	Transfer address length setting Sets the length of the address to be transferred in bytes.	R/W
27	DOPI	DOPI single byte setting Sets the amount of data transfer per one clock cycle in DOPI mode. 0: Each cycle has two bytes data. (normal DOPI mode) 1: Each cycle has one byte data. (The byte data changes at the rising edge of the clock and does not change at the falling edge of the clock.)	R/W
28	ACDA	Data Access Control Set data access or register access 1. the address bit0 will be forced to 0 in DOPI mode. 2. If DAR[0] of the lead type command is 1, byte 0 from the device will be dropped in DOPI mode. 3. The AXI read data will be arranged according to the DAR. For example: When DAR[1:0] = 1, the first valid data is stored in RDATA[15:8]. 4. The AXI write data is used according to the DAR in DOPI mode. For example: If the target device is Flash Memory and DAR[1:0] = 1, the first byte sent to the flash memory is forced to 0xff. If the target device is RAM and DAR[1: 0] = 1, the first byte sent to RAM is masked by DQSM. 5. When the target device is RAM, the address sent to the memory changes according to RAM specification. 0: Register access Do not arrange the transfer data. 1: Data access	R/W
29	PREN	Preamble bit enable for OctaRAM 0: No check preamble bit from OctaRAM 1: Check preamble bit from OctaRAM	R/W

36.2.3 DCSR：设备命令设置寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x08

Bit	Symbol	Function	R/W
31:30	DV1TYP[1:0]	Device 1 type setting 0 0: flash on device 1 0 1: RAM on device 1 1 0: no connection on device 1 1 1: forbidden	R/W

DSR1 specifies the type of memory to be accessed as device 1 and the size of the flash memory.

36.2.6 MDTR : Memory Delay Trim Register

Base address: OSPI = 0x400A_6000

Offset address: 0x14

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	DQSEDOPI[3:0]				DV1DEL[7:0]							
Value after reset:	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DQSESOPI[3:0]				DQSERAM[3:0]				DV0DEL[7:0]							
Value after reset:	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DV0DEL[7:0]	Device 0 delay setting These bits specify the delay cycles to be inserted on the input strobe signal (OM_DQS) to adjust the timing for latching data during read access to device 0 in the SOPI or DOPI mode.	R/W
11:8	DQSERAM[3:0]	OM_DQS enable counter Setting for DOPI mode [RAM].	R/W
15:12	DQSESOPI[3:0]	OM_DQS enable counter Setting for SOPI mode [Flash].	R/W
23:16	DV1DEL[7:0]	Device 1 delay setting These bits specify the delay cycles to be inserted on the input strobe signal (OM_DQS) to adjust the timing for latching data during read access to device 1 in the SOPI or DOPI mode.	R/W
27:24	DQSEDOPI[3:0]	OM_DQS enable counter Setting for DOPI mode [Flash].	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

MDTR sets the timing adjustment of memory access.

For the information about the auto-calibration, see section 36.3. Operation.

During a read operation with the OM_DQS clock input (in the SOPI or DOPI mode), the OM_DQS clock transitions from the high-impedance state to the input state (for receiving a value of 0 from the external device) after the command and address phases are completed. To obtain valid data, adjust the DQS enable counter and delay cycles.

OM_DQS enable counter setting (OM_SCLK units)

0000: 1 clock cycle

0001: 2 clock cycles

0010: 3 clock cycles

0011: 4 clock cycles

⋮

1111: 16 clock cycles

OM_DQS enable counter setting examples

Bit	Symbol	Function	R/W
31:30	DV1TYP[1:0]	设备1类型设置 00：设备1上的闪存01：设备1上的RAM10：设备1上无连接1 1：禁止	R/W

DSR1指定要作为设备1访问的内存类型和闪存的大小。

36.2.6 MDTR:内存延迟调整寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x14

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	DQSEDOPI[3:0]				DV1DEL[7:0]							
重置后的值：	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DQSESOPI[3:0]				DQSERAM[3:0]				DV0DEL[7:0]							
重置后的值：	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DV0DEL[7:0]	设备0延迟设置 这些位指定要在输入选通信号(OM_DQS)上插入的延迟周期，以调整在SOPI或DOPI模式下对器件0进行读取访问期间锁存数据的时序。	R/W
11:8	DQSERAM[3:0]	OM_DQS启用计数器 DOPI模式[RAM]的设置。	R/W
15:12	DQSESOPI[3:0]	OM_DQS启用计数器 SOPI模式[闪光灯]的设置。	R/W
23:16	DV1DEL[7:0]	设备1延迟设置 这些位指定要在输入选通信号(OM_DQS)上插入的延迟周期，以调整在SOPI或DOPI模式下对器件1进行读取访问期间锁存数据的时序。	R/W
27:24	DQSEDOPI[3:0]	OM_DQS启用计数器 DOPI模式[闪光灯]的设置。	R/W
31:28	—	这些位被读取为0。写入值应为0。	R/W

MDTR设置内存访问的时序调整。

有关自动校准的信息，请参见第36.3节。手术。

在使用OM_DQS时钟输入的读取操作期间（在SOPI或DOPI模式下），在命令和地址阶段之后，OM_DQS时钟从高阻抗状态转换为输入状态（用于从外部设备接收值0）完成。要获得有效数据，请调整DQS启用计数器和延迟周期。

OM_DQS启用计数器设置（OM_SCLK单位）

0000：1个时钟周期

0001：2个时钟周期

0010：3个时钟周期

0011：4个时钟周期

⋮

1111：16个时钟周期

OM_DQS启用计数器设置示例

Table 36.4 OctaRAM

Number of dummy cycles	DOPI Pre-cycle On	DOPI Pre-cycle Off
3	3 to 4	3 to 5
4	3 to 5	3 to 6
5	3 to 6	3 to 7
6	3 to 7	3 to 8
7	3 to 8	3 to 9
8	3 to 9	3 to 10

Table 36.5 OctaFlash

Number of dummy cycles*1	SOPI Pre-cycle On	DOPI Pre-cycle On	DOPI Pre-cycle Off
4	9	6	6 to 7
6	9 to 11	6 to 8	6 to 9
8	9 to 13	6 to 10	6 to 11
10	9 to 15	6 to 12	6 to 13
12	9 to 15	6 to 14	6 to 15
14	9 to 15	6 to 15	6 to 15
16	9 to 15	6 to 15	6 to 15
18	9 to 15	6 to 15	6 to 15
20	9 to 15	6 to 15	6 to 15

Note 1. Some read register commands of OctaFlash is always 4 cycles regardless of dummy cycle setting of configuration register.

These two tables list cases of DQS delay.

If DQS delay cycle is not within this range, see section 36.6. OM_DQS Enable Counter, and recalculate the correct range.

36.2.7 ACTR : Auto-Calibration Timer Register

Base address: OSPI = 0x400A_6000

Offset address: 0x18

Bit position:	31																													0
Bit field:	CTP[31:0]																													
Value after reset:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CTP[31:0]	Automatic calibration cycle time setting Sets performing cycle for the automatic calibration with 32 bits. Automatic calibration cycle time (ns) = CTP[31:0] × OM_SCLK / 2 When automatic calibration is enabled (CDSR.ACMODE[1:0] = 0x1) and the value of the internal timer is equal to that of this register, automatic calibration will start.	R/W

The ACTR register is a register that sets the cycle at which automatic calibration is executed.

Table 36.4 OctaRAM

虚拟周期数	DOPI Pre-cycle On	DOPI Pre-cycle Off
3	3 to 4	3 to 5
4	3 to 5	3 to 6
5	3 to 6	3 to 7
6	3 to 7	3 to 8
7	3 to 8	3 to 9
8	3 to 9	3 to 10

Table 36.5 OctaFlash

虚拟周期数*1	SOPI Pre-cycle On	DOPI Pre-cycle On	DOPI Pre-cycle Off
4	9	6	6 to 7
6	9 to 11	6 to 8	6 to 9
8	9 to 13	6 to 10	6 to 11
10	9 to 15	6 to 12	6 to 13
12	9 to 15	6 to 14	6 to 15
14	9 to 15	6 to 15	6 to 15
16	9 to 15	6 to 15	6 to 15
18	9 to 15	6 to 15	6 to 15
20	9 to 15	6 to 15	6 to 15

注1.OctaFlash的某些读取寄存器命令始终为4个周期，与配置寄存器的虚拟周期设置无关。

这两个表列出了DQS延迟的情况。

如果DQS延迟周期不在此范围内，请参阅第36.6节。OM_DQS启用计数器，并重新计算正确的范围。

36.2.7 ACTR:自动校准定时器寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x18

Bit position:	31																													0
Bit field:	CTP[31:0]																													
重置后的值:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CTP[31:0]	自动校准周期时间设置 使用32位设置自动校准的执行周期。 自动校准周期时间(ns)=CTP[31:0]×OM_SCLK2 当自动校准使能（CDSR.ACMODE[1:0]=0x1）并且内部定时器的值等于该寄存器的值时，自动校准将开始。	R/W

ACTR寄存器是设置执行自动校准的周期的寄存器。

36.2.8 ACAR0 : Auto-Calibration Address Register 0

Base address: OSPI = 0x400A_6000

Offset address: 0x1C

Bit position:	31																													0
Bit field:	CAD0[31:0]																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CAD0[31:0]	Automatic calibration address Sets the address of the write and read destination to perform the automatic calibration of device 0.	R/W

ACAR0 sets the address of the write/read destination to be performed the automatic calibration of device 0.

36.2.9 ACAR1 : Auto-Calibration Address Register 1

Base address: OSPI = 0x400A_6000

Offset address: 0x20

Bit position:	31																													0
Bit field:	CAD1[31:0]																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CAD1[31:0]	Automatic calibration address Sets the address of the write and read destination to perform the automatic calibration of device 1.	R/W

ACAR1 sets the address of the write/read destination to be performed the automatic calibration of device 1.

36.2.10 DRCSTR : Device Memory Map Read Chip Select Timing Setting Register

Base address: OSPI = 0x400A_6000

Offset address: 0x34

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DVRDLO1[1:0]		DVRDHI1[2:0]			DVRDCMD1[2:0]			CTR1	CTRW1[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DVRDLO0[1:0]		DVRDHI0[2:0]			DVRDCMD0[2:0]			CTR0	CTRW0[6:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	CTRW0[6:0]	Device 0 single continuous read waiting cycle setting in PCLKA units When single continuous read mode of Device 0 is enabled, OM_CS0 is fixed to Low for the clock cycle to be set by CTRW0 from the previous read operation. If the number of clock cycles exceeds the value to be set in these bits before the next read operation is performed, OM_CS0 is returned to High, and the single continuous read will finish.	R/W

36.2.8 ACAR0：自动校准地址寄存器0

Base address: OSPI = 0x400A_6000

Offset address: 0x1C

Bit position:	31																													0
Bit field:	CAD0[31:0]																													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CAD0[31:0]	自动校准地址 设置写入和读取目标的地址以执行设备0的自动校准。	R/W

ACAR0设置写入读取目标的地址以执行设备0的自动校准。

36.2.9 ACAR1：自动校准地址寄存器1

Base address: OSPI = 0x400A_6000

Offset address: 0x20

Bit position:	31																													0
Bit field:	CAD1[31:0]																													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	CAD1[31:0]	自动校准地址 设置写入和读取目标的地址以执行设备1的自动校准。	R/W

ACAR1设置写入读取目标的地址以执行设备1的自动校准。

36.2.10 DRCSTR:器件存储器映射读取片选时序设置寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x34

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit field:	DVRDLO0[1:0]		DVRDHI0[2:0]			DVRDCMD0[2:0]			CTR0	CTRW0[6:0]						
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	CTRW0[6:0]	以PCLKA为单位的设备0单个连续读取等待周期设置 当设备0的单次连续读取模式启用时，OM_CS0固定为低电平，时钟周期由CTRW0从上一次读取操作设置。如果在执行下一次读取操作之前时钟周期数超过了这些位中设置的值，则OM_CS0返回高电平，单次连续读取将完成。	R/W

Bit	Symbol	Function	R/W
7	CTR0	Device 0 single continuous read mode setting When the OSPI receives single read with increment address, multiple single read is executed in one CS asserted period (refer to section 36.5.2. Single continuous read operation). This bit must be 0 in SPI mode. 0: Single continuous read mode is disabled for device 0. 1: Single continuous read mode is enabled for device 0.	R/W
10:8	DVRDCMD0[2:0]	Device 0 Command execution interval setting*1 Indicates the timing between command to command for the device 0. Timing definition from OM_CS0 high to the next OM_CS0 low 0 0 0: 2 clock cycles 0 0 1: 5 clock cycles 0 1 0: 7 clock cycles 0 1 1: 9 clock cycles 1 0 0: 11 clock cycles 1 0 1: 13 clock cycles 1 1 0: 15 clock cycles 1 1 1: 17 clock cycles	R/W
13:11	DVRDHI0[2:0]	Device 0 select signal pull-up timing setting*1 Indicates the timing, from the end of read operation to the select signal is pulled up. Timing definition from the last OM_SCLK low to OM_CS0 high 0 0 0: Setting prohibit 0 0 1: Setting prohibit 0 1 0: Setting prohibit 0 1 1: Setting prohibit (DOPI mode) 5 clock cycles (Other mode) 1 0 0: Setting prohibit (DOPI mode) 6 clock cycles (Other mode) 1 0 1: 6.5 clock cycles (DOPI mode) 7 clock cycles (Other mode) 1 1 0: 7.5 clock cycles (DOPI mode) 8 clock cycles (Other mode) 1 1 1: 8.5 clock cycles (DOPI mode) 9 clock cycles (Other mode)	R/W
15:14	DVRDLO0[1:0]	Device 0 select signal pull-down timing setting*1 Indicates the timing between the select signal pull-down to the read operation for the device 0. Timing definition from OM_CS0 low to the first OM_SCLK high 0 0: Setting prohibit 0 1: 2.5 clock cycles (DOPI mode) 3 clock cycles (Other mode) 1 0: 3.5 clock cycles (DOPI mode) 4 clock cycles (Other mode) 1 1: 4.5 clock cycles (DOPI mode) 5 clock cycles (Other mode)	R/W
22:16	CTRW1[6:0]	Device 1 single continuous read waiting cycle setting in PCLKA units When single continuous read mode of Device 1 is enabled, OM_CS1 is fixed to Low for the clock cycle to be set by CTRW1 from the previous read operation. If the number of clock cycles exceeds the value to be set in these bits before the next read operation is performed, OM_CS1 is returned to High, and the single continuous read will finish.	R/W
23	CTR1	Device 1 single continuous read mode setting When the OSPI receives single read with increment address, multiple single read is executed in one CS asserted period (refer to section 36.5.2. Single continuous read operation). This bit must be 0 in SPI mode. 0: Single continuous read mode is disabled for device 1. 1: Single continuous read mode is enabled for device 1.	R/W

Bit	Symbol	Function	R/W
7	CTR0	Device0单次连续读取模式设置 当OSPI接收到带有递增地址的单次读取时，会在一个CS断言周期内执行多次单次读取（请参阅第36.5.2节。单次连续读取操作）。该位在SPI模式下必须为0。 0：禁用设备0的单次连续读取模式。1：启用设备0的单次连续读取模式。	R/W
10:8	DVRDCMD0[2:0]	软元件0命令执行间隔设置*1 指示设备0的命令与命令之间的时间。 从OM_CS0高电平到下一个OM_CS0低电平的时序定义 000：2个时钟周期00 1：5个时钟周期010： 7个时钟周期011：9个 时钟周期100：11个时 钟周期101：13个时钟 周期110：15个时钟周 期111:17个时钟周期	R/W
13:11	DVRDHI0[2:0]	设备0选择信号上拉时序设置*1 表示从读操作结束到选择信号上拉的时序。 从最后一个OM_SCLK低到OM_CS0高的时序定义 000：设置禁止001：设置禁止010 ：设置禁止011：设置禁止（DOPI模式）5个时钟周期（其他模式） 100：设置禁止（DOPI模式）6个时钟周期（其他模式） 101：6.5个时钟周期（DOPI模式）7个时钟周期（其他模式） 110：7.5个时钟周期（DOPI模式）8个时钟周期（其他模式） 111：8.5个时钟周期（DOPI模式）9个时钟周期（其他模式）	R/W
15:14	DVRDLO0[1:0]	设备0选择信号下拉时序设置*1 指示从选择信号下拉到器件0的读取操作之间的时序。从OM_CS0低到第一个OM_SCLK高的时序定义 00：设置禁止01：2.5个时钟周期（DOPI模式）3个时钟周期（其他模式） 10：3.5个时钟周期（DOPI模式）4个时钟周期（其他模式） 11：4.5个时钟周期（DOPI模式）5个时钟周期（其他模式）	R/W
22:16	CTRW1[6:0]	以PCLKA为单位的设备1单次连续读取等待周期设置 当设备1的单次连续读取模式启用时，OM_CS1固定为低电平，时钟周期由CTRW1从上一次读取操作设置。如果在执行下一次读取操作之前时钟周期数超过了这些位中设置的值，则OM_CS1返回高电平，单次连续读取将完成。	R/W
23	CTR1	设备1单次连续读取模式设置 当OSPI接收到带有递增地址的单次读取时，会在一个CS断言周期内执行多次单次读取（请参阅第36.5.2节。单次连续读取操作）。该位在SPI模式下必须为0。 0：禁用设备1的单次连续读取模式。1：启用设备1的单次连续读取模式。	R/W

Bit	Symbol	Function	R/W
26:24	DVRDCMD1[2:0]	Device 1 Command execution interval*1 Indicates the timing, between command and command for device 1. Timing, until the OM_CS1 signal goes from High to the next Low 0 0 0: 2 clock cycles 0 0 1: 5 clock cycles 0 1 0: 7 clock cycles 0 1 1: 9 clock cycles 1 0 0: 11 clock cycles 1 0 1: 13 clock cycles 1 1 0: 15 clock cycles 1 1 1: 17 clock cycles	R/W
29:27	DVRDHI1[2:0]	Device 1 select signal High timing setting*1 Indicates the timing, from the end of read operation to the select signal is pulled up. Timing definition from the last OM_SCLK low to OM_CS1 high 0 0 0: Setting prohibit 0 0 1: Setting prohibit 0 1 0: Setting prohibit 0 1 1: Setting prohibit (DOPI mode) 5 clock cycles (Other mode) 1 0 0: Setting prohibit (DOPI mode) 6 clock cycles (Other mode) 1 0 1: 6.5 clock cycles (DOPI mode) 7 clock cycles (Other mode) 1 1 0: 7.5 clock cycles (DOPI mode) 8 clock cycles (Other mode) 1 1 1: 8.5 clock cycles (DOPI mode) 9 clock cycles (Other mode)	R/W
31:30	DVRDLO1[1:0]	Device 1 select signal pull-down timing setting*1 Indicates the timing between the select signal pull-down to the read operation for the device 1. Timing definition from OM_CS1 low to the first OM_SCLK high 0 0: Setting prohibited 0 1: 2.5 clock cycles (DOPI mode) 3 clock cycles (Other mode) 1 0: 3.5 clock cycles (DOPI mode) 4 clock cycles (Other mode) 1 1: 4.5 clock cycles (DOPI mode) 5 clock cycles (Other mode)	R/W

Note 1. These clock cycles are values in OCTACLK units. In OM_SCLK units, the clock cycle is 1/2 of the above table.

DRCSTR sets the timing of memory-mapped reading for each device.

9:6	—	These bits are read as 0. The write value should be 0.	R/W
10	ACMEME0	Automatic calibration memory enable setting for device 0 Automatic calibration supports DOPI and SOPI mode. To end DOPI/SOPI mode, disable automatic calibration. 0: Disable 1: Enable	R/W
11	ACMEME1	Automatic calibration memory enable setting for device 1 Automatic calibration supports DOPI and SOPI mode. To end DOPI/SOPI mode, disable automatic calibration. 0: Disable 1: Enable	R/W
13:12	ACMODE[1:0]	Automatic calibration mode The ACMODE bits should be set to disabled, before program/erase access to the OctaFlash device. Automatic calibration is available in the DOPI and SOPI mode. 0 0: Automatic calibration is disabled*2 0 1: Automatic calibration is enabled and modify MDTR 1 0: Automatic calibration immediately is executed for all trim code, but it will not modify MDTR 1 1: Setting prohibited	R/W
30:14	—	These bits are read as 0. The write value should be 0.	R/W
31	DLFT	Deadlock Free Timer Enable*3 Enable the timer to prevent the occurrence of controller deadlock. The timeout status is reset only by a system reset. 0: Enable timer 1: Disable timer	R/W

Note 1. This bit should be set 1 in SOPI mode.
Note 2. When automatic calibration is disabled, the device 0 delay and device 1 delay should be manually specified in the memory delay trim register (MDTR) (see section 36.2.6. MDTR : Memory Delay Trim Register).
To determine the device 0 delay and device 1 delay values to be specified in the register, perform automatic calibration in advance and obtain valid delay values from the results.
Note 3. This function is available only when OM_SCLK is 100 MHz. Otherwise, disable the timer.

CDSR controls the automatic calibration, output byte order, precycle setting, and device transfer type of the controller and each device.

Bit	Symbol	Function	R/W
1:0	DV0TTYP[1:0]	Device0_transfer_type setting 00：SPI模式01：SOPI 模式10：DOPI模式11 ：禁止设置	R/W
3:2	DV1TTYP[1:0]	Device1_transfer_type setting 00：SPI模式01：SOPI 模式10：DOPI模式11 ：禁止设置	R/W

5	DV1PC	Device1_memory precycle setting*1 0：禁用1 ：启用	R/W
9:6	—	这些位被读取为0。写入值应为0。	R/W
10	ACMEME0	设备0的自动校准内存启用设置 自动校准支持DOPI和SOPI模式。要结束DOPISOPI模式，请禁用自动校准。 0：禁用1 ：启用	R/W
11	ACMEME1	设备1的自动校准内存启用设置 自动校准支持DOPI和SOPI模式。要结束DOPISOPI模式，请禁用自动校准。 0：禁用1 ：启用	R/W
13:12	ACMODE[1:0]	自动校准模式 在程序擦除访问之前，应将ACMODE位设置为禁用 OctaFlash device. 在DOPI和SOPI模式下可以使用自动校准。 00：禁用自动校准*2 01：启用自动校准并修改MDTR10：立即对所有修整代码执行自动校准，但不会修改MDTR 11：禁止设定	R/W
30:14	—	这些位被读取为0。写入值应为0。	R/W
31	DLFT	无死锁定时器启用*3 启用定时器以防止控制器死锁的发生。 超时状态只能通过系统复位来复位。 0：启用定时器1 ：禁用定时器	R/W

注1.在SOPI模式下，该位应设置为1。
注2.禁用自动校准时，应在内存延迟调整寄存器(MDTR)中手动指定设备0延迟和设备1延迟（参见第36.2.6节。MDTR：内存延迟调整寄存器）。要确定寄存器中要指定的设备0延迟和设备1延迟值，请提前执行自动校准，并从结果中获取有效的延迟值。

注3.此功能仅在OM_SCLK为100MHz时可用。否则，禁用计时器。

CDSR控制控制器和每个设备的自动校准、输出字节顺序、预循环设置和设备传输类型。

36.2.14 MDLR : Memory Map Dummy Length Register

Base address: OSPI = 0x400A_6000

Offset address: 0x44

Bit position:	31							24	23							16	15							8	7							0
Bit field:	DV1WDL[7:0]								DV1RDL[7:0]								DV0WDL[7:0]								DV0RDL[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DV0RDL[7:0]	Device 0 Read dummy length setting Set the dummy length when reading to device 0 in OM_SCLK cycles unit.	R/W
15:8	DV0WDL[7:0]	Device 0 Write dummy length setting Set the dummy length when writing to device 0 in OM_SCLK cycles unit.	R/W
23:16	DV1RDL[7:0]	Device 1 Read dummy length setting Set the dummy length when reading to device 1 in OM_SCLK cycles unit.	R/W
31:24	DV1WDL[7:0]	Device 1 Write dummy length setting Set the dummy length when writing to device 1 in OM_SCLK cycles unit.	R/W

MDLR sets the dummy length for memory map write/read.

Note: When changing the dummy length for the OctaFlash device, modify the setting on the memory and then modify the setting in the DMLEN[7:0] bits in the device command setting register (DCSR) so that the dummy length becomes the same between the memory and OSPI. After that, execute the status read command to confirm the memory status.

36.2.15 MRWCR0 : Memory Map Read/Write Command Register 0

Base address: OSPI = 0x400A_6000

Offset address: 0x48

Bit position:	31							24	23							16	15							8	7							0
Bit field:	D0MWCMD1[7:0]								D0MWCMD0[7:0]								D0MRCMD1[7:0]								D0MRCMD0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	D0MRCMD0[7:0]	Memory map read command 0 setting Set the memory map read command. According to the memory spec to connect the device 0 and transfer type (SPI, SOPI, or DOPI mode), select the write command In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].	R/W
15:8	D0MRCMD1[7:0]	Memory map read command 1 setting Set the memory map read command. According to the memory spec to connect the device 0 and transfer type (SPI, SOPI, or DOPI mode), select the write command In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].	R/W

36.2.14 MDLR:内存映射虚拟长度寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x44

Bit position:	31							24	23							16	15							8	7							0
Bit field:	DV1WDL[7:0]								DV1RDL[7:0]								DV0WDL[7:0]								DV0RDL[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DV0RDL[7:0]	设备0读取虚拟长度设置 以OM_SCLK周期为单位设置读取到设备0时的虚拟长度。	R/W
15:8	DV0WDL[7:0]	设备0写入虚拟长度设置 以OM_SCLK周期为单位设置写入设备0时的虚拟长度。	R/W
23:16	DV1RDL[7:0]	设备1读取虚拟长度设置 以OM_SCLK周期为单位设置读取到设备1时的虚拟长度。	R/W
31:24	DV1WDL[7:0]	设备1写入虚拟长度设置 以OM_SCLK周期为单位设置写入设备1时的虚拟长度。	R/W

MDLR设置内存映射写入读取的虚拟长度。

Note: 更改OctaFlash器件的虚拟长度时，修改存储器上的设置，然后修改器件命令设置寄存器(DCSR)中DMLEN[7:0]位的设置，使存储器之间的虚拟长度相同和OSPI。之后，执行状态读取命令确认内存状态。

36.2.15 MRWCR0:内存映射读写命令寄存器0

Base address: OSPI = 0x400A_6000

Offset address: 0x48

Bit position:	31							24	23							16	15							8	7							0
Bit field:	D0MWCMD1[7:0]								D0MWCMD0[7:0]								D0MRCMD1[7:0]								D0MRCMD0[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	D0MRCMD0[7:0]	内存映射读取命令0设置设置内存映射 读取命令。 根据内存规范连接设备0和传输类型（SPI、SOPI或DOPI模式），选择写入命令 在SPI模式下，控制器将只发送命令0。 在SOPI和DOPI模式下，控制器会先发送命令1，然后发送命令0。设备0的模式由CDSR.DV0TTYP[1:0]指定。	R/W
15:8	D0MRCMD1[7:0]	内存映射读取命令1设置设置内存映射 读取命令。 根据内存规范连接设备0和传输类型（SPI、SOPI或DOPI模式），选择写入命令 在SPI模式下，控制器不会发送命令1。 在SOPI和DOPI模式下，控制器会先发送命令1，然后发送命令0。设备0的模式由CDSR.DV0TTYP[1:0]指定。	R/W

Bit	Symbol	Function	R/W
23:16	D0MWCMD0[7:0]	Memory map write command 0 setting Set the memory map write command. According to the memory spec to connect the device 0 and transfer type (SPI, SOPI, or DOPI mode), select the write command In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].	R/W
31:24	D0MWCMD1[7:0]	Memory map write command 1 setting Set the memory map write command. According to the memory spec to connect the device 0 and transfer type (SPI, SOPI, or DOPI mode), select the write command In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].	R/W

MRWCR0 sets the read/write commands for the device 0.

36.2.16 MRWCR1 : Memory Map Read/Write Command Register 1

Base address: OSPI = 0x400A_6000

31	—	该位读取为0。写入值应为0。	R

注1.此设置仅在DOPI模式下有效。它在SOPI或SPI模式下无效。

Note 2. Setting this bit to 1 is prohibited, when SPI and SOPI mode.

MRWCSR sets the memory map read/write operations.

36.2.18 ESR : Error Status Register

Base address: OSPI = 0x400A_6000

Offset address: 0x54

Bit position:	31																15							8	7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MWESR[7:0]								MRESR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	MRESR[7:0]	Memory map read error status 0x01: ECC error 0x02: Preamble error 0x03: Wait OM_DQS timeout 0x80: Invalid command Others: Reserved	R/W
15:8	MWESR[7:0]	Memory map write error status 0x80: Invalid command Others: Reserved	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

ESR indicates the error status when performing memory map read and write commands.

Note: When ESR register is read by CPU, ESR register is cleared, and the interrupt signal is cleared (if asserted).

36.2.19 CWNDR : Configure Write without Data Register

Base address: OSPI = 0x400A_6000

Offset address: 0x58

Bit position:	31																															0
Bit field:	WND[31:0]																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	WND[31:0]	The write value should be 0.	W

CWNDR is used for write access to configure register of memory. When this register is written to, this module issues a write command without data to memory.

Specify an address in the DAR register, a command in the DCSR register, and command data in the DCR register.

36.2.20 CWDR : Configure Write Data Register

Base address: OSPI = 0x400A_6000

Offset address: 0x5C

Bit position:	31								24	23							16	15							8	7							0
Bit field:	WD3[7:0]									WD2[7:0]								WD1[7:0]								WD0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

注2.当SPI和SOPI模式时，禁止将该位设置为1。

MRWCSR设置内存映射读写操作。

36.2.18 ESR：错误状态寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x54

Bit position:	31																15							8	7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MWESR[7:0]								MRESR[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	MRESR[7:0]	内存映射读取错误状态 0x01：ECC错误0x02：前导错误0x03：等待OM_DQS超时0 x80：无效命令 Others: Reserved	R/W
15:8	MWESR[7:0]	内存映射写入错误状态 0x80：无效命令 Others: Reserved	R/W
31:16	—	这些位被读取为0。写入值应为0。	R/W

ESR指示执行内存映射读取和写入命令时的错误状态。

Note: 当CPU读取ESR寄存器时，ESR寄存器被清除，并且中断信号被清除（如果被断言）。

36.2.19 CWNDR：配置无数据寄存器写入

Base address: OSPI = 0x400A_6000

Offset address: 0x58

Bit position:	31																															0
Bit field:	WND[31:0]																															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	WND[31:0]	写入值应为0。	W

CWNDR用于对内存的配置寄存器进行写访问。当该寄存器被写入时，该模块向存储器发出一个没有数据的写入命令。

在DAR寄存器中指定地址，在DCSR寄存器中指定命令，在DCR寄存器中指定命令数据。

36.2.20 CWDR：配置写数据寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x5C

Bit position:	31								24	23							16	15							8	7							0
Bit field:	WD3[7:0]									WD2[7:0]								WD1[7:0]								WD0[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	WD0[7:0]	Write data 0 Set the zeroth byte of the write data.	W
15:8	WD1[7:0]	Write data 1 Set the first byte of the write data.	W
23:16	WD2[7:0]	Write data 2 Set the second byte of the write data.	W
31:24	WD3[7:0]	Write data 3 Set the third byte of the write data.	W

CWDR is used in writing to configure register of memory device. After this register has been written to, it holds the written value, and a write command for that value is issued to the memory device.

Specify the byte order in CDSR, a command in DCSR, an address in DAR, and command data in DCR.

36.2.21 CRR : Configure Read Register

Base address: OSPI = 0x400A_6000

Offset address: 0x60

Bit position:	31–24	23–16	15–8	7–0
Bit field:	RD3[7:0]	RD2[7:0]	RD1[7:0]	RD0[7:0]
Value after reset:	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	RD0[7:0]	Read data 0 Store the zeroth byte of the read data.	R
15:8	RD1[7:0]	Read data 1 Store the first byte of the read data.	R
23:16	RD2[7:0]	Read data 2 Store the second byte of the read data.	R
31:24	RD3[7:0]	Read data 3 Store the third byte of the read data.	R

CRR is used in reading from configure register of memory device.When this register is read, a read command is issued to the device and the value read from the device is stored in this register.

Change the byte order with CDSR. Specify a command in DCSR, an address in DAR, and command data in DCR.

36.2.22 ACSR : Auto-Calibration Status Register

Base address: OSPI = 0x400A_6000

Offset address: 0x64

Bit position:	31–5	4–3	2–0
Bit field:	—	ACSR1[2:0]	ACSR0[2:0]
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0	0 0 0

Bit	Symbol	Function	R/W
2:0	ACSR0[2:0]	Auto-calibration status of device 0 0 0 0: Initial state 0 0 1: Reserved 0 1 0: Reserved 0 1 1: Normal end 1 0 0: Error end*1	R/W

Bit	Symbol	Function	R/W
7:0	WD0[7:0]	写入数据0 设置写入数据的第0个字节。	W
15:8	WD1[7:0]	写入数据1 设置写入数据的第一个字节。	W
23:16	WD2[7:0]	写入数据2 设置写入数据的第二个字节。	W
31:24	WD3[7:0]	写入数据3 设置写入数据的第三个字节。	W

CWDR用于写入配置存储设备的寄存器。写入该寄存器后，它会保存写入的值，并将该值的写入命令发送到存储设备。

在CDSR中指定字节顺序，在DCSR中指定命令，在DAR中指定地址，在DCR中指定命令数据。

36.2.21 CRR：配置读取寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x60

Bit position:	31–24	23–16	15–8	7–0
Bit field:	RD3[7:0]	RD2[7:0]	RD1[7:0]	RD0[7:0]
重置后的值:	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	RD0[7:0]	读取数据0 存储读取数据的第0个字节。	R
15:8	RD1[7:0]	读取数据1 存储读取数据的第一个字节。	R
23:16	RD2[7:0]	读取数据2 存储读取数据的第二个字节。	R
31:24	RD3[7:0]	读取数据3 存储读取数据的第三个字节。	R

CRR用于从存储设备的配置寄存器中读取。读取该寄存器时，会向设备发出读取命令，并且从设备中读取的值存储在该寄存器中。

使用CDSR更改字节顺序。在DCSR中指定命令，在DAR中指定地址，在DCR中指定命令数据。

36.2.22 ACSR：自动校准状态寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x64

Bit position:	31–5	4–3	2–0
Bit field:	—	ACSR1[2:0]	ACSR0[2:0]
重置后的值:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0	0 0 0

Bit	Symbol	Function	R/W
2:0	ACSR0[2:0]	设备0的自动校准状态 000：初始状态00 1：保留010：保留 011：正常结束10 0：错误结束*1	R/W

Bit	Symbol	Function	R/W
5:3	ACSR1[2:0]	Auto-calibration status of device 1 0 0 0: Initial state 0 0 1: Reserved 0 1 0: Reserved 0 1 1: Normal end 1 0 0: Error end*1	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Read data in auto-calibration does not match with the preamble pattern.

ACSR provides the auto-calibration status until next auto-calibration.

36.2.23 DCSMXR : Device Chip Select Maximum Period Register

Base address: OSPI = 0x400A_6000

Offset address: 0x7C

Bit position:	31							24								16								8								0
Bit field:	—	—	—	—	—	—	—	CTWMX1[8:0]								—	—	—	—	—	—	—	CTWMX0[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	CTWMX0[8:0]	Indicates the maximum period that OM_CS0 and OM_CS1 are Low in single continuous write of OctaRAM. Period of CTWMX0 cycle + 16 cycles in PCLKA unit to be less than t_{CSM}. For example, CTWMX0 is 0x180, when PCLKA is 100 MHz and t_{CSM} is 4.0 µs. These bits are ignored in OctaFlash.	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
24:16	CTWMX1[8:0]	Indicates the maximum period that OM_CS0 and OM_CS1 are Low in single continuous read of OctaRAM. Period of CTWMX1 cycle + 16 cycles in PCLKA unit to be less than t_{CSM}. For example, CTWMX1 is 0x180, when PCLKA is 100 MHz and t_{CSM} is 4.0 µs. These bits are ignored in OctaFlash.	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note: Refer to OctaRAM data sheet about t_{CSM}.

DCSMXR provides the maximum period that OM_CS is Low in single continuous write/read mode of OctaRAM.

36.2.24 DWSCTSR : Device Memory Map Write single continuous translating size Register

Base address: OSPI = 0x400A_6000

Offset address: 0x80

Bit position:	31															26																16										10									0
Bit field:	—	—	—	—	—	CTSN1[10:0]																						—	—	—	—	—	CTSN0[10:0]																	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
10:0	CTSN0[10:0]	Indicates the number of bytes to translate in single continuous write of device 0. If these bits are set all 0, the translating length is undefined, the single continuous write is finished, when the period of idle is over the period to be specified by DWCSTR.CTWW0. CTSN0 must be set from 1 to 256, when PCLKA > OCTACLK/2	R/W

Bit	Symbol	Function	R/W
5:3	ACSR1[2:0]	设备1的自动校准状态 000：初始状态00 1：保留010：保留 011：正常结束10 0：错误结束*1	R/W
31:6	—	这些位被读取为0。写入值应为0。	R/W

注1.自动校准中读取的数据与前导码模式不匹配。

ACSR提供 自动校准状态，直到下一次自动校准。

36.2.23 DCSMXR:器件片选最大周期寄存器

Base address: OSPI = 0x400A_6000

Offset address: 0x7C

Bit position:	31							24								16								8								0
Bit field:	—	—	—	—	—	—	—	CTWMX1[8:0]								—	—	—	—	—	—	—	CTWMX0[8:0]								
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	CTWMX0[8:0]	指示在OctaRAM的单次连续写入中OM_CS0和OM_CS1为低电平的最大周期。CTWMX0周期+PCLKA单元中的16个周期的周期小于tCSM。例如， 当PCLKA为100MHz且tCSM为4.0µs时，CTWMX0为0x180。 这些位在OctaFlash中被忽略。	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W
24:16	CTWMX1[8:0]	指示OM_CS0和OM_CS1在OctaRAM的单次连续读取中为低的最大周期。CTWMX1周期+PCLKA单元中的16个周期的周期小于tCSM。例如， 当PCLKA为100MHz且tCSM为4.0µs时，CTWMX1为0x180。 这些位在OctaFlash中被忽略。	R/W
31:25	—	这些位被读取为0。写入值应为0。	R/W

Note: 请参阅有关tCSM的OctaRAM数据表。

DCSMXR提供了在OctaRAM的单次连续写入读取模式下OM_CS为低的最大周期。

36.2.24 DWSCTSR:设备内存映射写入单个连续翻译大小 Register

Base address: OSPI = 0x400A_6000

Offset address: 0x80

Bit position:	31															26																16										10									0
Bit field:	—	—	—	—	—	CTSN1[10:0]																						—	—	—	—	—	CTSN0[10:0]																	
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
10:0	CTSN0[10:0]	指示在设备0的单次连续写入中要转换的字节数。 如果这些位都设置为0，则翻译长度未定义，当空闲时间超过DWCSTR.CTWW0指定的时间时，完成单次连续写入。当PCLKA>OCTACLK2时，CTSN0必须设置为1到256	R/W

Bit	Symbol	Function	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W
26:16	CTSN1[10:0]	Indicates the number of bytes to translate in single continuous write of device 1. If these bits are set all 0, the translating length is undefined, the single continuous write is finished, when the period of idle is over the period to be specified by DWCSTR.CTWW1. CTSN1 must be set from 1 to 256, when PCLKA > OCTACLK/2	R/W
31:27	—	These bits are read as 0. The write value should be 0.	R/W

DWSCTSR provides the translating size of the single continuous write in byte. When the number of single write operations is the value to be set by DWSCTSR, the single continuous write will be finished.

36.3 Operation

36.3.1 Octa Serial Peripheral Interface System Configuration

Figure 36.2 shows an example of connections between OSPI and OctaFlash/OctaRAM.

OM_CS0 should be connected to the OctaRAM device and OM_CS1 should be connected to the OctaFlash device.

Bit	Symbol	Function	R/W
15:11	—	这些位被读取为0。写入值应为0。	R/W
26:16	CTSN1[10:0]	指示在设备1的单次连续写入中要转换的字节数。 如果这些位都设置为0，则翻译长度未定义，当空闲时间超过DWCSTR.CTWW1指定的时间时，完成单次连续写入。当PCLKA>OCTACLK2时，CTSN1必须 设置为1到256	R/W
31:27	—	这些位被读取为0。写入值应为0。	R/W

DWSCTSR以字节为单位提供单个连续写入的转换大小。当单次写操作的次数是DWSCTSR设置的值时，单次连续写就结束了。

36.3 Operation

36.3.1 Octa串行外设接口系统配置

图36.2显示了OSPI和OctaFlashOctaRAM之间的连接示例。

OM_CS0应该连接到OctaRAM设备，OM_CS1应该连接到OctaFlash设备。

RA生态工作室

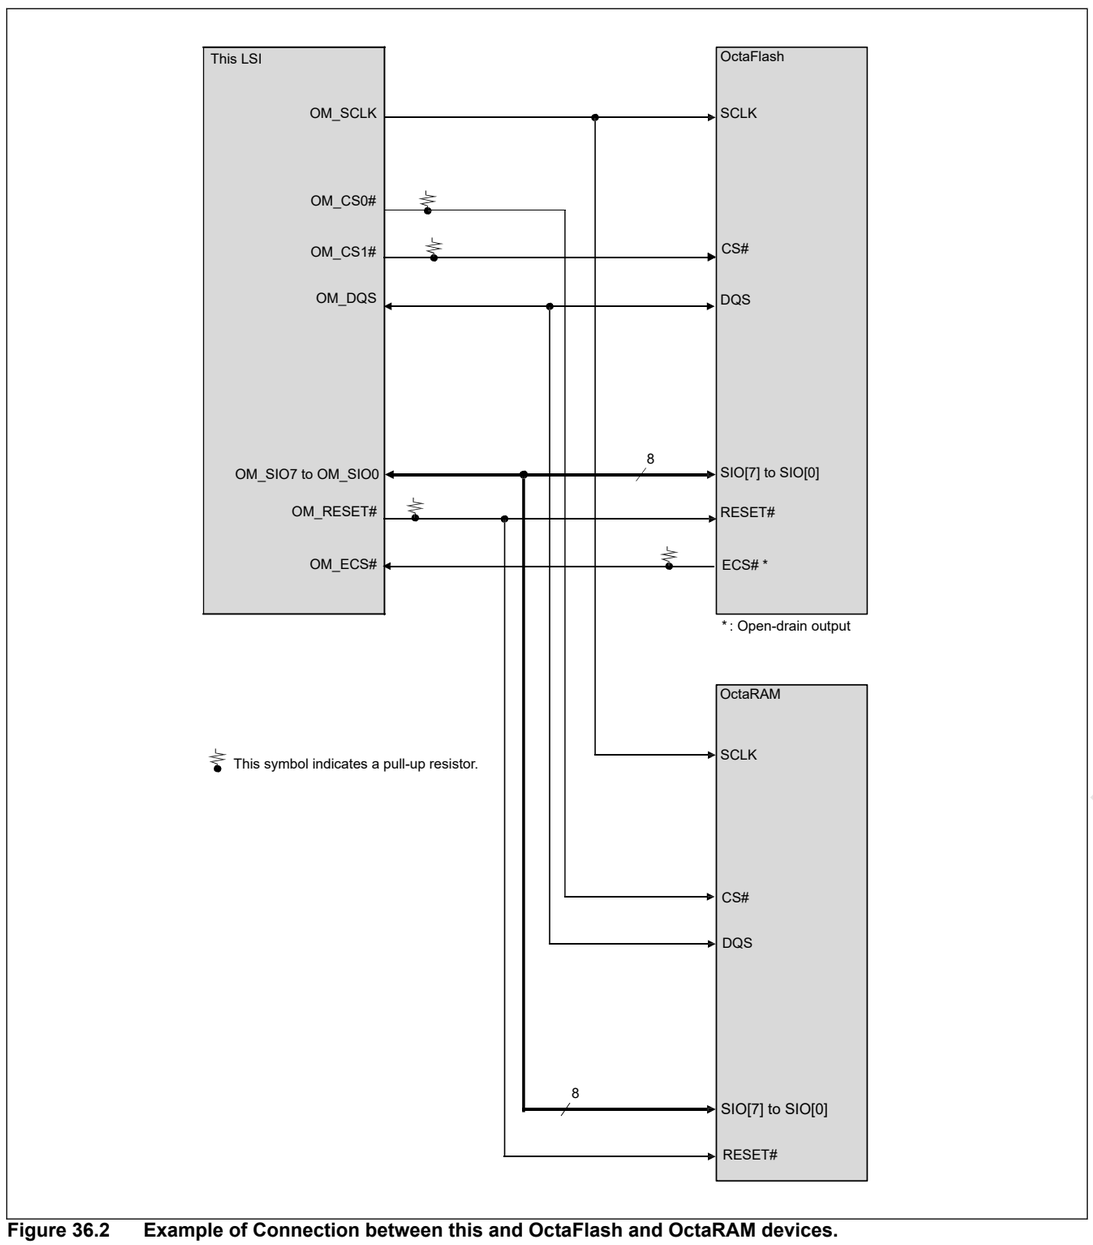

Figure 36.2 Example of Connection between this and OctaFlash and OctaRAM devices.

36.3.2 Address Map

In the memory-map read/write mode, OctaFlash is allocated to the OctaFlash space (0x7000_0000 to 0x7FFF_FFFF), and OctaRAM is allocated to the OctaRAM space (0x6800_0000 to 0x6FFF_FFFF).

One OctaFlash device and one OctaRAM device can be connected to this LSI, and up to 256 Mbytes can be accessed in OctaFlash device, and up to 128 Mbytes can be accessed in OctaRAM device.

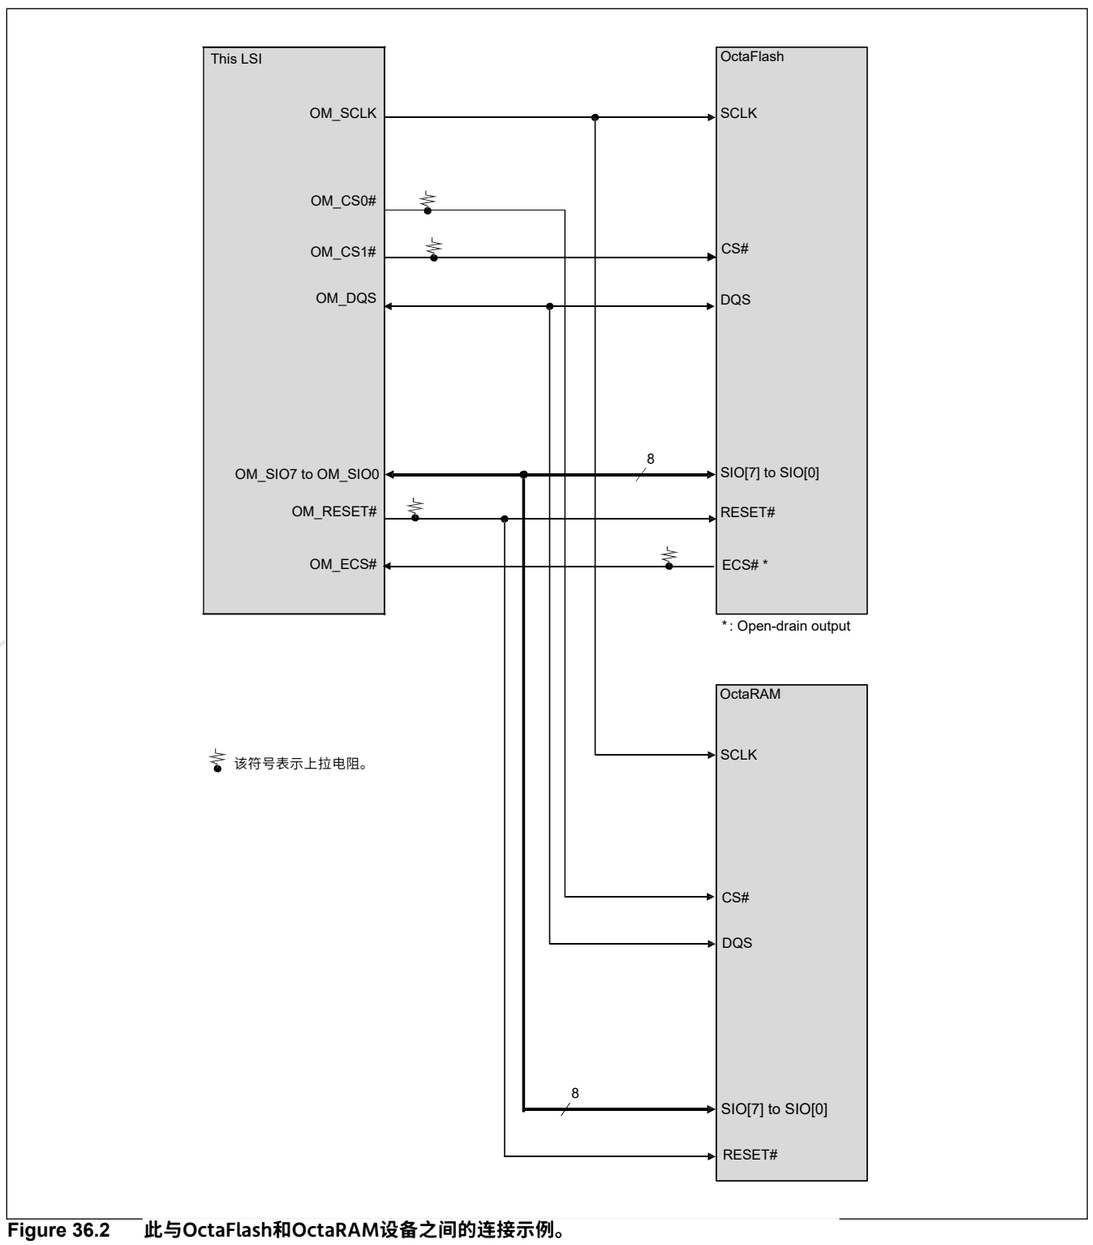

Figure 36.2 此与OctaFlash和OctaRAM设备之间的连接示例。

36.3.2 地址图

在内存映射读写模式下，OctaFlash被分配到OctaFlash空间（0x7000_0000到0x7FFF_FFFF），并且OctaRAM被分配到OctaRAM空间（0x6800_0000到0x6FFF_FFFF）。

本LSI可连接1个OctaFlash设备和1个OctaRAM设备，最多可访问256MB OctaFlash设备，最多可在OctaRAM设备中访问128MB。

RA生态工作室

	Internal Address	Maximum Accessible Area
OctaFlash	0x7000_0000 to 0x7FFF_FFFF	Up to 256 Mbytes
OctaRAM	0x6800_0000 to 0x6FFF_FFFF	Up to 128 Mbytes

36.3.3 Octa Memory Interface

This section describes the Octa memory interface.

36.3.3.1 Write Operation

The OSPI outputs a command and an address and writes one or more data bytes by using lines OM_CS0 /OM_CS1, OM_SCLK, and OM_SIO7 to OM_SIO0.

The write operation for OctaRAM has latency cycles before data is written to memory.

Figure 36.3 to Figure 36.5 show waveforms of the write operation in the OctaFlash interface, and Figure 36.6 shows a waveform of the write operation in the OctaRAM interface.

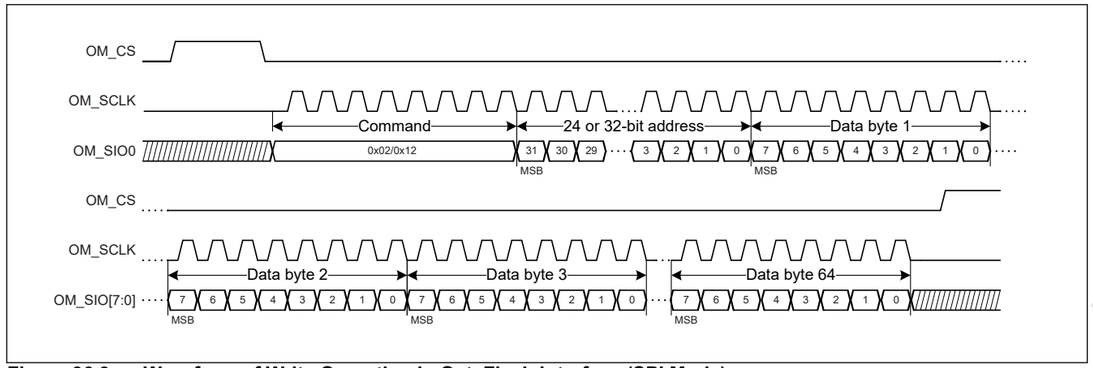

Figure 36.3 Waveform of Write Operation in OctaFlash interface (SPI Mode)

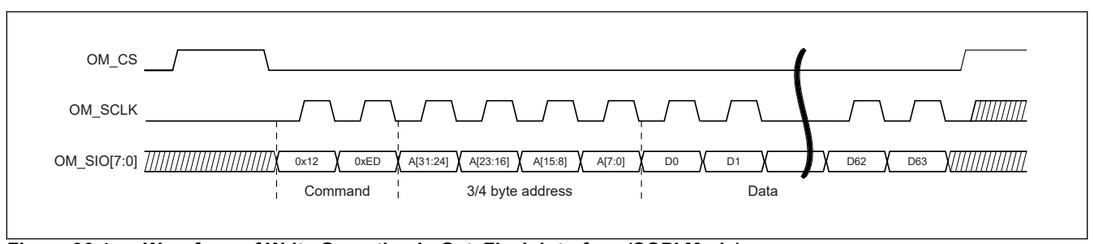

Figure 36.4 Waveform of Write Operation in OctaFlash interface (SOPI Mode)

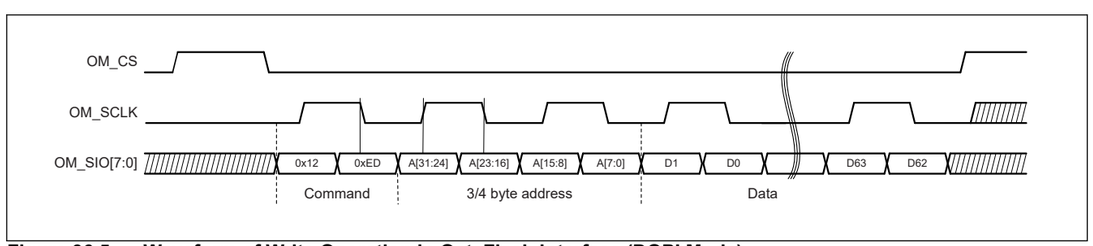

Figure 36.5 Waveform of Write Operation in OctaFlash interface (DOPI Mode)

	内部地址	最大可达面积
OctaFlash	0x7000_0000 to 0x7FFF_FFFF	高达256MB
OctaRAM	0x6800_0000 to 0x6FFF_FFFF	高达128MB

36.3.3 八进制存储器接口

本节介绍Octa存储器接口。

36.3.3.1 写操作

OSPI通过使用线OM_CS0OM_CS1输出命令和地址并写入一个或多个数据字节，
OM_SCLK和OM_SIO7到OM_SIO0。

OctaRAM的写操作在数据写入内存之前有延迟周期。

图36.3至图36.5为OctaFlash接口的写操作波形，图36.6为OctaRAM接口的写操作波形。

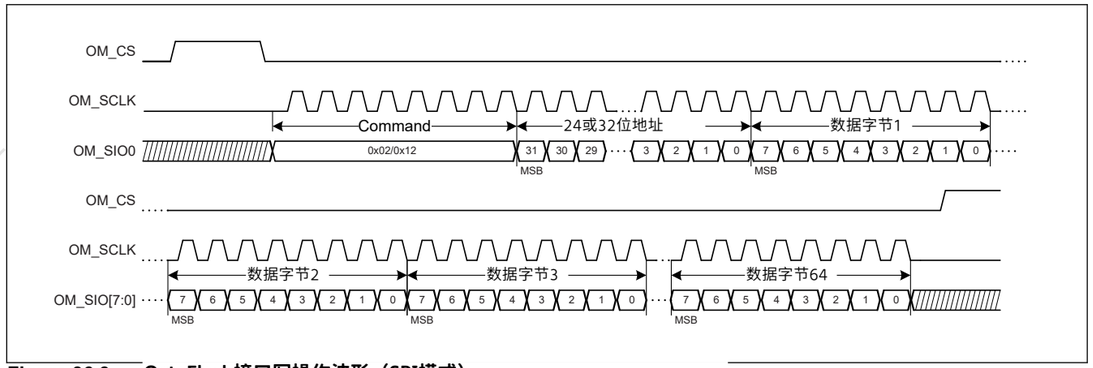

Figure 36.3 OctaFlash接口写操作波形（SPI模式）

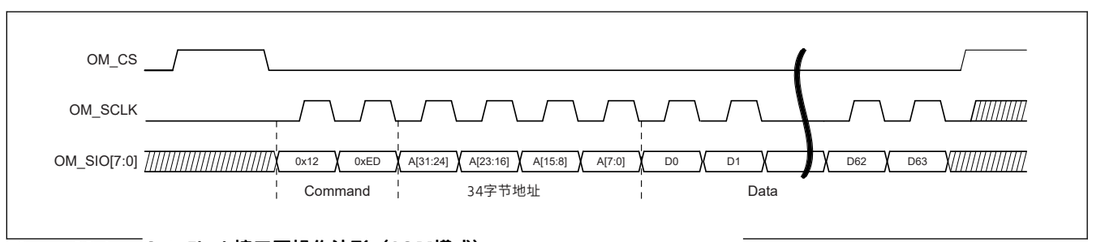

Figure 36.4 OctaFlash接口写操作波形（SOPI模式）

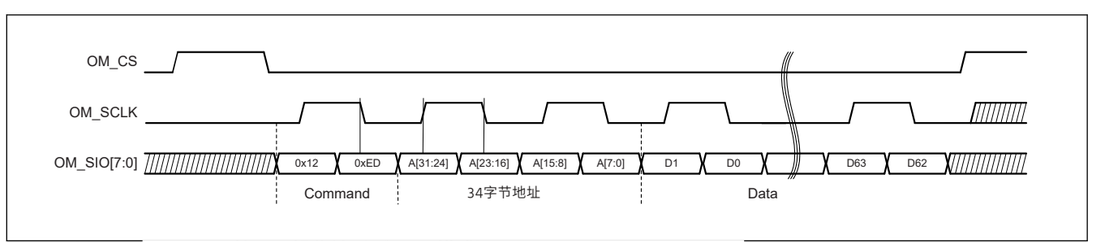

Figure 36.5 OctaFlash接口写操作波形（DOPI模式）

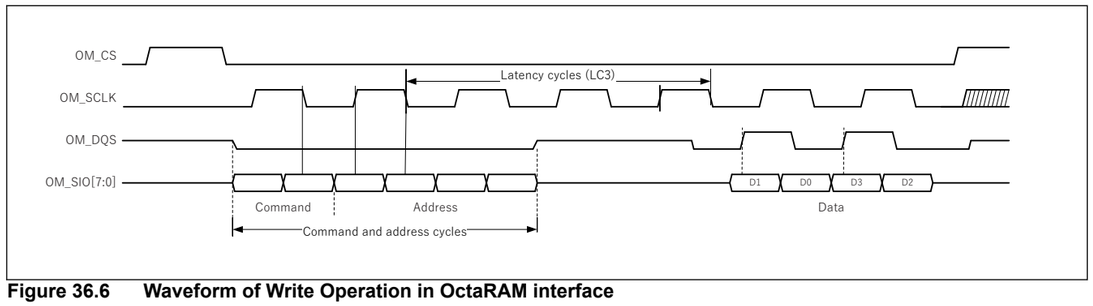

Figure 36.6 Waveform of Write Operation in OctaRAM interface

36.3.3.2 Read Operation

The OSPI outputs a command and an address and reads one or more data bytes by using lines OM_CS0 /OM_CS1, OM_SCLK, and OM_SIO7 to OM_SIO0.

The read operation for OctaFlash and OctaRAM has latency cycles before data is read from memory.

The number of latency cycles should be specified in the memory map dummy length setting register (MDLR) (See section 36.2.14. MDLR : Memory Map Dummy Length Register) in accordance with the setting in the memory device.

In SOPI or DOPI mode, OM_DQS is used. Automatic calibration should be executed before first read OctaFlash or OctaRAM in SOPI or DOPI mode.

Figure 36.7 to Figure 36.9 show waveforms of the read operation in the OctaFlash interface, and Figure 36.10 shows a waveform of the read operation in the OctaRAM interface.

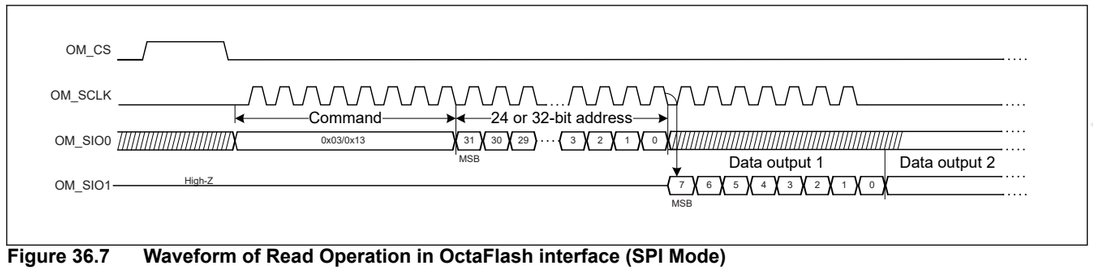

Figure 36.7 Waveform of Read Operation in OctaFlash interface (SPI Mode)

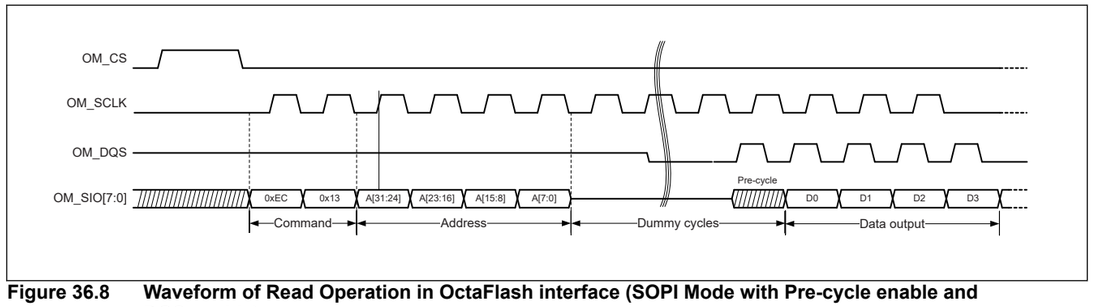

Figure 36.8 Waveform of Read Operation in OctaFlash interface (SOPI Mode with Pre-cycle enable and DQS enable)

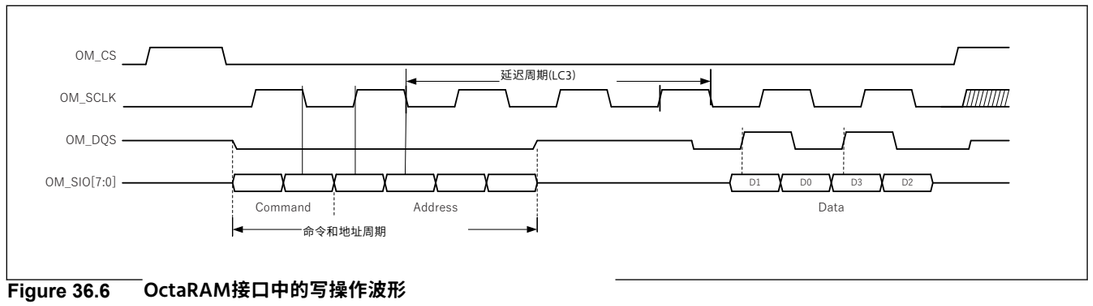

Figure 36.6 OctaRAM接口中的写操作波形

36.3.3.2 读操作

OSPI输出命令和地址，并通过使用线OM_CS0OM_CS1读取一个或多个数据字节，
OM_SCLK和OM_SIO7到OM_SIO0。

OctaFlash和OctaRAM的读取操作在从内存读取数据之前有延迟周期。

延迟周期数应根据存储器设备中的设置在存储器映射虚拟长度设置寄存器(MDLR)中指定（参见第36.2.14节。MDLR：存储器映射虚拟长度寄存器）。

在SOPI或DOPI模式下，使用OM_DQS。自动校准应在首次读取OctaFlash或
在SOPI或DOPI模式下的OctaRAM。

OctaFlash接口的读操作波形如图36.7至图36.9所示，OctaRAM接口的读操作波形如图36.10所示。

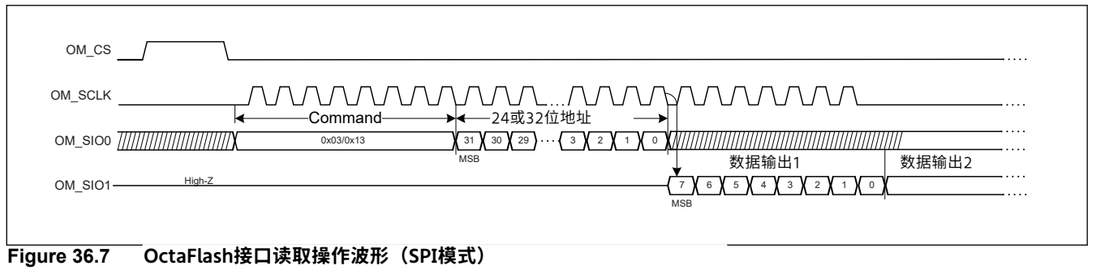

Figure 36.7 OctaFlash接口读取操作波形（SPI模式）

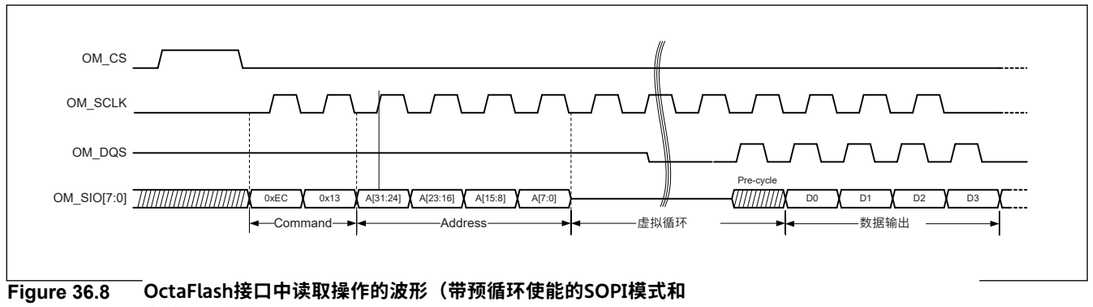

Figure 36.8 OctaFlash接口中读取操作的波形（带预循环使能的SOPI模式和DQS enable）

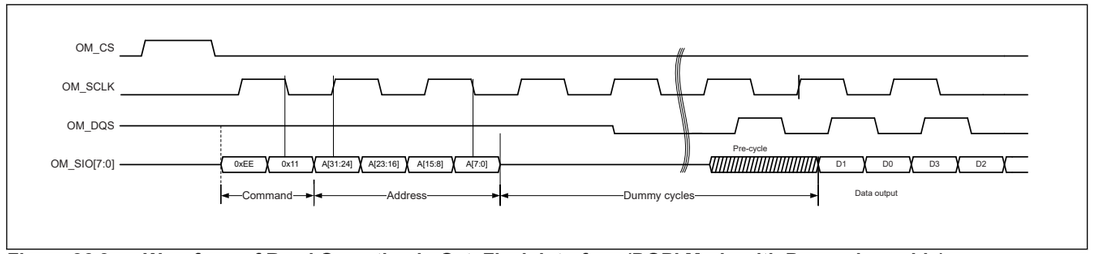

Figure 36.9 Waveform of Read Operation in OctaFlash interface (DOPI Mode with Pre-cycle enable)

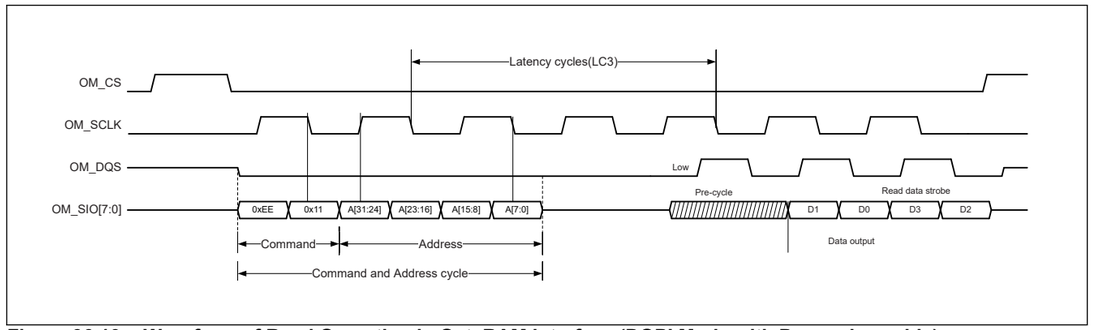

Figure 36.10 Waveform of Read Operation in OctaRAM interface (DOPI Mode with Pre-cycle enable)

36.3.4 Data Alignment in the OctaFlash and OctaRAMSpaces

Figure 36.11 shows the memory data alignment in the OctaFlash and OctaRAM spaces.

Figure 36.12 shows the data alignment when the configuration register in OctaFlash or OctaRAM is accessed.

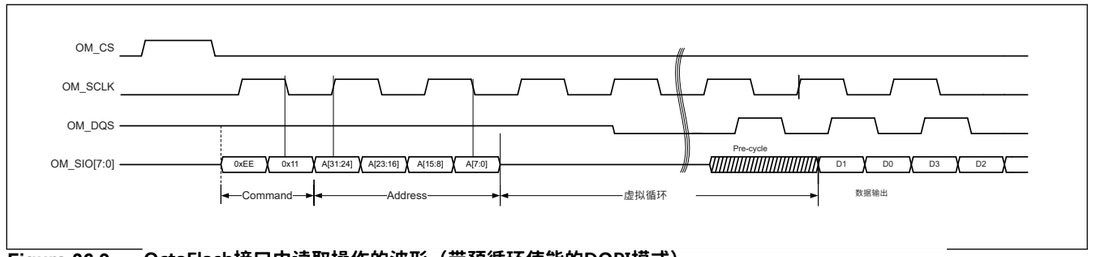

Figure 36.9 OctaFlash接口中读取操作的波形（带预循环使能的DOPI模式）

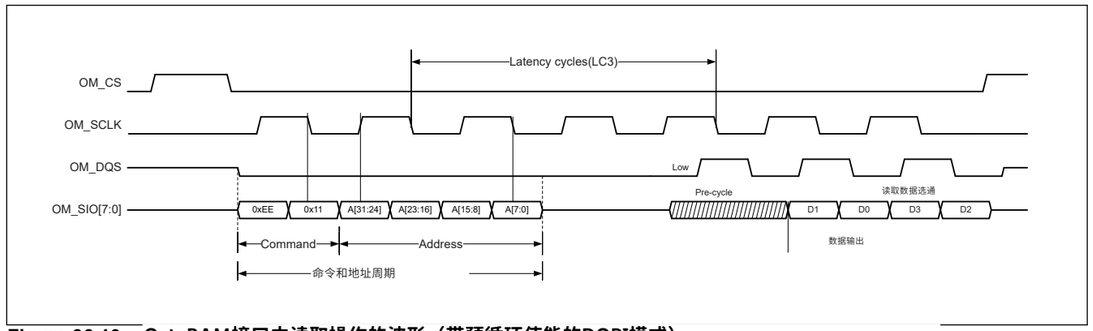

Figure 36.10 OctaRAM接口中读取操作的波形（带预循环使能的DOPI模式）

36.3.4 OctaFlash和OctaRAMSpaces中的数据对齐

图36.11显示了OctaFlash和OctaRAM空间中的存储器数据对齐。

图36.12显示了访问OctaFlash或OctaRAM中的配置寄存器时的数据对齐方式。

When OctaFlash is connected (MRWCSR.MWO0 = 0, MRWCSR.MRO0 = 0) or OctaRAM is connected (MRWCSR.MWO1 = 0, MRWCSR.MRO1 = 0)

Flash/RAM 8-bit DDR	Access width	Address	Internal bus 63 56 55 48 47 40 39 32 31 24 23 16 15 8 7 0

When OctaFlash is connected (DCSR.DAOR = 1),
OctaRAM is connected (DCSR.DAOR = 1), or
OctaFlash/OctaRAM is connected

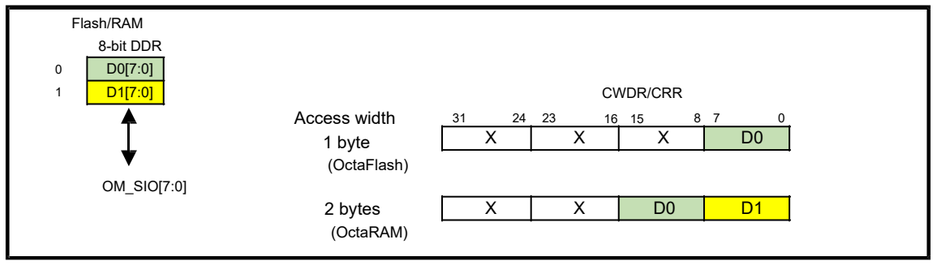

Figure 36.12 Configuration Register Data Alignment in the OctaFlash and OctaRAM Spaces

36.3.5 Byte Mask

This section describes the byte mask function. This function is only available for OctaRAM devices. The OSPI outputs the OM_DQS signal as a write data mask signal during write operation. Write data is masked with the OM_DQS signal driven high. Figure 36.13 shows a waveform of the write operation with the byte mask function enabled.

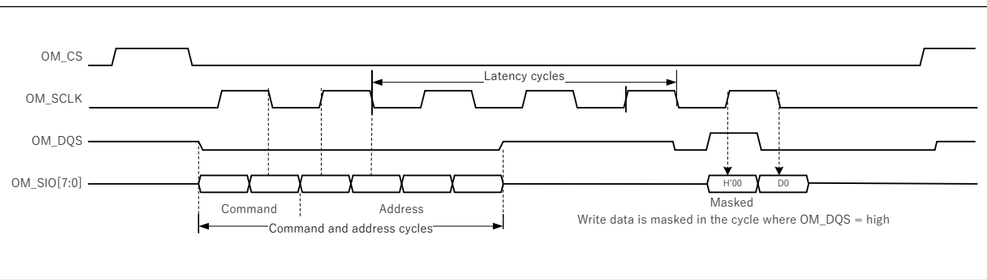

Figure 36.13 Waveform of Write Operation with Byte Mask Enabled

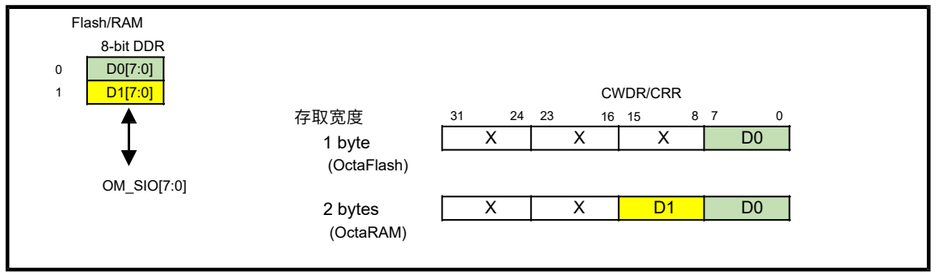
36.3.6 Operation Flows

This section describes the flows of OSPI operations for various purposes.

The following only shows sample settings, and appropriate commands and data should be specified in accordance with the specifications of the target memory device.

The sample settings assume the following environment:

当OctaFlash连接时（DCSR.DAOR=0），
OctaRAM已连接(DCSR.DAOR=0)，或
OctaFlashOctaRAM已连接



当OctaFlash连接时（DCSR.DAOR=1），
OctaRAM已连接(DCSR.DAOR=1)，或
OctaFlashOctaRAM已连接

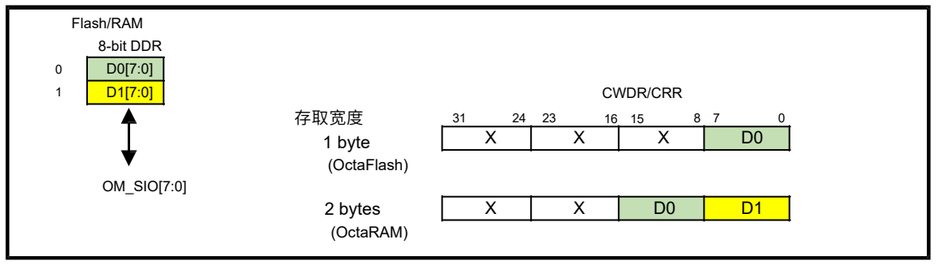


Figure 36.12 OctaFlash和OctaRAM空间中的配置寄存器数据对齐

36.3.5 字节掩码

本节介绍字节掩码功能。此功能仅适用于OctaRAM设备。OSPI在写操作期间输出OM_DQS信号作为写数据屏蔽信号。写入数据被OM_DQS信号驱动为高电平屏蔽。图36.13显示了启用字节掩码功能的写操作波形。

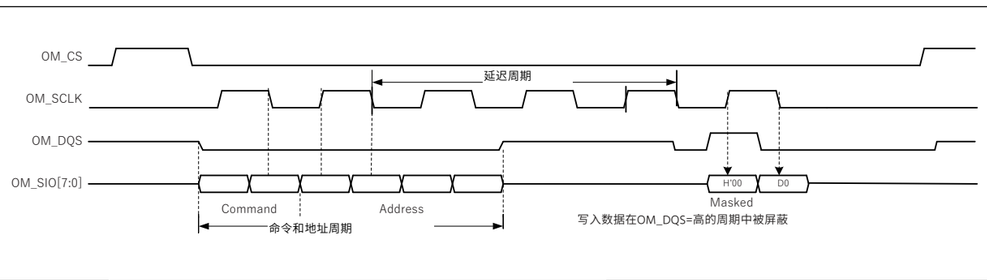

Figure 36.13 启用字节掩码的写操作波形

36.3.6 操作流程

本节描述了用于各种目的的OSPI操作流程。

以下仅显示示例设置，应根据目标存储设备的规格指定适当的命令和数据。

示例设置假定以下环境：

1. Memory connections: OM_CS0 (device 0) to OctaRAM and OM_CS1 (device 1) to OctaFlash
2. OM_SCLK (Octa memory clock) frequency: 100 MHz

36.3.6.1 Initial Settings

Table 36.6 shows an example of initial settings of the OSPI registers.

Table 36.6 Example of initial settings of the OSPI registers

Step	Read/ Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	DSR0	0x40800000	4	Specifies the type and size of device 0 The device 0 connects 128 Mbit OctaRAM
2	Write	DSR1	0x08000000	4	Specifies the type and size of device 1 The device 1 connects 1 Gbit OctaFlash
3	Write	MDTR	0x0640A440	4	Adjusts the memory access timing
4	Write	DRCSTR	0x69206920	4	Specifies the read timing for each device
5	Write	DWCSTR	0x41204120	4	Specifies the write timing for each device
6	Write	DCSTR	0x00006A00	4	Specifies the timing of the chip select signals
7	Write	CDSR	0x80000002	4	Sets up the controller functions 1. Auto-calibration is disabled 2. Memory pre-cycle is disabled 3. Transfer type set SPI mode for OctaFlash (devide 1) and DOPI mode for OctaRAM (device 0)
8	Write	MDLR	0x000E0505	4	Specifies the dummy length
9	Write	MRWCR0	0x2000A000	4	Specifies the read and write commands for device 0 Write command: WRCONT of OctaRAM Read command: RDCONT of OctaRAM
10	Write	MRWCR1	0x12EDEE11	4	Specifies the read and write commands for device 1 Write command: PP of OctaFlash Read command: 8DTRD of OctaFlash
11	Write	MRWCSR	0x54545454	4	Sets up the memory-mapped reading and writing 1. The length (bytes) of a command is specified 2. The length (bytes) of an address is specified 3. The order of bytes to be written is specified

36.3.6.2 Basic Operation Settings

This section describes the basic operations of OctaFlash and OctaRAM.

The following only shows sample settings, and appropriate commands and data should be specified in accordance with the specifications of the target memory device.

(1) OctaFlash Operation Settings

Table 36.7 1. Write Enable Settings

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	Any value	4	Any value	4	—

Table 36.8 2. Read Status Register (1 of 2)

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description

1.内存连接：OM_CS0（设备0）到OctaRAM和OM_CS1（设备1）到OctaFlash
2. OM_SCLK (Octa memory clock) frequency: 100 MHz

36.3.6.1 初始设置

表36.6显示了OSPI寄存器的初始设置示例。

Table 36.6 OSPI寄存器的初始设置示例

Step	Read/ Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	DSR0	0x40800000	4	指定设备0的类型和大小 设备0连接128MbitOctaRAM
2	Write	DSR1	0x08000000	4	指定设备1的类型和大小 设备1连接1GbitOctaFlash
3	Write	MDTR	0x0640A440	4	调整内存访问时间
4	Write	DRCSTR	0x69206920	4	指定每个设备的读取时序
5	Write	DWCSTR	0x41204120	4	指定每个设备的写入时序
6	Write	DCSTR	0x00006A00	4	指定片选信号的时序
7	Write	CDSR	0x80000002	4	设置控制器功能1.禁用自动校准2.禁用内存预循环3.传输类型设置OctaFlash（设备1）的SPI模式和OctaRAM（设备0）的DOPI模式
8	Write	MDLR	0x000E0505	4	指定虚拟长度
9	Write	MRWCR0	0x2000A000	4	指定设备0的读取和写入命令 写命令：OctaRAM的WRCONT读命令： OctaRAM的RDCONT
10	Write	MRWCR1	0x12EDEE11	4	指定设备1的读取和写入命令 写指令：OctaFlash的PP 读取指令：OctaFlash的8DTRD
11	Write	MRWCSR	0x54545454	4	设置内存映射读写1.指定命令的长度（字节）2.指定地址的长度（字节）3.指定要写入的字节顺序

36.3.6.2 基本操作设置

本节介绍OctaFlash和OctaRAM的基本操作。

以下仅显示示例设置，应根据目标存储设备的规格指定适当的命令和数据。

(1) OctaFlash操作设置

Table 36.7 1.写使能设置

Step	Read/ Write	Register	SPI模式数据	数据长度（字节）	OPI模式数据	数据长度（字节）	Description
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	任何值	4	任何值	4	—

Table 36.8 2.读取状态寄存器(1of2)

Step	Read/ Write	Register	SPI模式数据	数据长度（字节）	OPI模式数据	数据长度（字节）	Description
1	Write	DCR	0x00000005	4	0x000005FA	4	—

Table 36.8 2. Read Status Register (2 of 2)

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
2	Write	DAR	—	—	0x00000000	4	—
3	Write	DCSR	0x00180001	4	0x0C280401	4	—
4	Read	CRR	0x000000xx	4	0x000000xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low-order eight bits.

Table 36.9 3. Read Configuration Register

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
1	Write	DCR	0x00000015	4	0x000015EA	4	—
2	Write	DAR	—	—	0x00000001	4	—
3	Write	DCSR	0x00180001	4	0x0C280401	4	—
4	Read	CRR	0x000000xx	1	0x000000xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low-order eight bits.

Table 36.10 4. Write Configuration Register

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
1	Write	DCR	—	—	0x000001FE	4	—
2	Write	DAR	—	—	0x00000001	4	—
3	Write	DCSR	—	—	0x04280001	4	—
4	Write	CWDR	—	—	0x000000xx	1	Set all the high-order 24 bits to 0 and specify the write data in the low-order eight bits.

Note: It is necessary to execute Write Enable instruction before modifying Write Configuration Register and then Write Configuration Register will be set after tW (tW is Write Status/Configuration Register Cycle Time, refer to OctaFlash data sheet).

Table 36.11 5. Read Configuration Register 2

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
1	Write	DCR	0x00000071	4	0x0000718E	4	—
2	Write	DAR	Address	4	Address	4	—
3	Write	DCSR	0x04180001	4	0x0C280401	4	—
4	Read	CRR	0x000000xx	1	0x000000xx	1	The high-order 24 bits are all set to 0s, and the read data is stored in the low-order eight bits.

Table 36.12 6. Write Configuration Register 2

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
1	Write	DCR	0x00000072	4	0x0000728D	4	—
2	Write	DAR	Address	4	Address	4	—
3	Write	DCSR	0x04180001	4	0x04280001	4	—
4	Write	CWDR	0x000000xx	1	0x000000xx	1	Set all the high-order 24 bits to 0s, and specify the write data in the low-order eight bits

Note: It is necessary to execute Write Enable instruction before modifying Write Configuration Register2.

Table 36.8 2.读取状态寄存器(2of2)

Step	Read/ Write	Register	SPI模式数据	数据长度（字节）	OPI模式数据	数据长度（字节）	Description
2	Write	DAR	—	—	0x00000000	4	—
3	Write	DCSR	0x00180001	4	0x0C280401	4	—
4	Read	CRR	0x000000xx	4	0x000000xx	1	高24位全部置0，读取的数据存放在低8位。

Table 36.9 3.读取配置寄存器

Step	Read/ Write	Register	SPI模式数据	数据长度（字节）	OPI模式数据	数据长度（字节）	Description
1	Write	DCR	0x00000015	4	0x000015EA	4	—
2	Write	DAR	—	—	0x00000001	4	—
3	Write	DCSR	0x00180001	4	0x0C280401	4	—
4	Read	CRR	0x000000xx	1	0x000000xx	1	高24位全部置0，读取的数据存放在低8位。

Table 36.10 4.写配置寄存器

Step	Read/ Write	Register	SPI模式数据	数据长度（字节）	OPI模式数据	数据长度（字节）	Description
1	Write	DCR	—	—	0x000001FE	4	—
2	Write	DAR	—	—	0x00000001	4	—
3	Write	DCSR	—	—	0x04280001	4	—
4	Write	CWDR	—	—	0x000000xx	1	将所有高24位设置为0，并在低8位中指定写入数据。

Note: 在修改WriteConfigurationRegister和WriteConfiguration之前需要执行WriteEnable指令寄存器将在tW之后设置（tW是写状态配置寄存器周期时间，请参阅OctaFlash数据手册）。

Table 36.11 5.读取配置寄存器2

Step	Read/ Write	Register	SPI模式数据	数据长度（字节）	OPI模式数据	数据长度（字节）	Description
1	Write	DCR	0x00000071	4	0x0000718E	4	—
2	Write	DAR	Address	4	Address	4	—
3	Write	DCSR	0x04180001	4	0x0C280401	4	—
4	Read	CRR	0x000000xx	1	0x000000xx	1	高24位全部置0，读取的数据存放在低8位。

Table 36.12 6.写配置寄存器2

Step	Read/ Write	Register	SPI模式数据	数据长度（字节）	OPI模式数据	数据长度（字节）	Description
1	Write	DCR	0x00000072	4	0x0000728D	4	—
2	Write	DAR	Address	4	Address	4	—
3	Write	DCSR	0x04180001	4	0x04280001	4	—
4	Write	CWDR	0x000000xx	1	0x000000xx	1	将高24位全部置0，低8位指定写入数据

Note: 在修改写配置寄存器2之前需要执行写使能指令。

RA生态工作室

Table 36.13 7. Erase Sector

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
1	Write	DCR	0x00000021	4	0x000021DE	4	—
2	Write	DAR	Address to be erased	4	Address to be erased	4	—
3	Write	DCSR	0x04180000	4	0x04280000	4	—
4	Write	CWNDR	Any value	4	Any value	4	—

Note: Refer to section 36.3.6.5. Program/Erase of OctaFlash Setting about the sequence of erase.

(2) OctaRAM Operation Settings

Table 36.14 1. Read Configuration Register

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	0x0000C000	4	—
2	Write	DAR	0x00040000	4	—
3	Write	DCSR	0x04A00502	4	—
4	Read	CRR	0x0000xxxx	2	The high-order 16 bits are all set to 0s, and the read data is stored in the low-order 16 bits.

Table 36.15 2. Write Configuration Register

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	0x00004000	4	—
2	Write	DAR	0x00040000	4	—
3	Write	DCSR	0x04A00002	4	—
4	Write	CWDR	0x0000xxxx	2	Set all the high-order 16 bits to 0 and specify the write data in the low-order 16 bits.

36.3.6.3 Modify Settings

If OctaFlash/RAM is operating in the different condition (not default condition), the Config Registers of OctaFlash/RAM and the memory controller must be modified after the initial setting.

(1) Set translate mode

When the translating mode uses whether DOPI, SOPI, or SPI mode in OctaFlash, it is necessary to modify the setting of the Config Register of OctaFlash and memory-controller. Refer to the data sheet of OctaFlash about how to set transfer type. For example, show the sequence to change transfer type in OctaFlash to Table 36.16. When the transfer type is changed from current transfer type, users issue WREN (Write Enable) instruction, successively issue WRCR2 instruction to modify the values of Configuration Register 2 in OctaFlash to change translating mode.

Table 36.16 Example of translating mode setting of OctaFlash (1 of 2)

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
Write Enable (WREN)							
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	Any value	4	Any value	4	—

Table 36.13 7.擦除扇区

Step	Read/ Write	Register	SPI模式数据	数据长度（字节）	OPI模式数据	数据长度（字节）	Description
1	Write	DCR	0x00000021	4	0x000021DE	4	—
2	Write	DAR	要删除的地址	4	要删除的地址	4	—
3	Write	DCSR	0x04180000	4	0x04280000	4	—
4	Write	CWNDR	任何值	4	任何值	4	—

Note: 请参阅第36.3.6.5节。ProgramEraseofOctaFlash设置擦除的顺序。

(2) OctaRAM操作设置

Table 36.14 1.读取配置寄存器

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	0x0000C000	4	—
2	Write	DAR	0x00040000	4	—
3	Write	DCSR	0x04A00502	4	—
4	Read	CRR	0x0000xxxx	2	高16位全部置0，读取的数据存放在低16位。

Table 36.15 2.写配置寄存器

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	0x00004000	4	—
2	Write	DAR	0x00040000	4	—
3	Write	DCSR	0x04A00002	4	—
4	Write	CWDR	0x0000xxxx	2	将所有高16位设置为0，并在低16位中指定写入数据。

36.3.6.3 修改设置

如果OctaFlashRAM在不同的条件下运行（不是默认条件），则必须在初始设置后修改OctaFlashRAM和内存控制器的配置寄存器。

(1) 设置翻译模式

在OctaFlash中翻译模式使用DOPI、SOPI或SPI模式时，需要修改OctaFlash和内存控制器的配置寄存器。关于如何设置传输类型，请参考OctaFlash的数据手册。
例如，将OctaFlash中的传输类型更改为表36.16的顺序。当传输类型从当前传输类型改变时，用户发出WREN（WriteEnable）指令，依次发出WRCR2指令修改OctaFlash中配置寄存器2的值来改变翻译模式。

Table 36.16 OctaFlash翻译模式设置示例(1of2)

Step	Read/ Write	Register	SPI模式数据	Data Length (Bytes)	OPI模式数据	Data Length (Bytes)	Description
写使能(WREN)							
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	任何值	4	任何值	4	—

Table 36.16 Example of translating mode setting of OctaFlash (2 of 2)

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
Write Configuration Register2 (WRCR2)							
4	Write	DCR	0x00000072	4	0x0000728D	4	—
5	Write	DAR	0x00000000	4	0x00000000	4	—
6	Write	DCSR	0x04180001	4	0x04280001	4	—
7	Write	CWDR	0x00000001	1	0x00000001	1	in the case of SOPI mode
7	Write	CWDR	0x00000002	1	0x00000002	1	in the case of DOPI mode

The Config Register setting of the memory-controller in DOPI mode specifies to Table 36.17, the setting of SOPI mode specifies to Table 36.18, and the setting of SPI mode specifies to Table 36.19.

Table 36.17 Example of translating mode setting (DOPI mode)

Step	Read/ Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	CDSR	0x80001C0A	4	Sets up the controller functions Auto-calibration is enabled Memory pre-cycle is disabled Transfer type of OctaFlash and OctaRAM set DOPI mode
2	Write	MRWCR1	0x12EDEE11	4	Specifies the read and write commands for OctaFlash Write command: PP of OctaFlash Read command: 8DTRD of OctaFlash

Table 36.18 Example of translating mode setting (SOPI mode)

Step	Read/ Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	CDSR	0x80001C06	4	Sets up the controller functions Auto-calibration is enabled Memory pre-cycle is disabled Transfer type of OctaFlash set SOPI mode, and OctaRAM set DOPI mode
2	Write	MRWCR1	0x12EDEC13	4	Specifies the read and write commands for OctaFlash Write command: PP of OctaFlash Read command: 8READ of OctaFlash

Table 36.19 Example of translating mode setting (SPI mode)

Step	Read/ Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	CDSR	0x80000004	4	Sets up the controller functions Auto-calibration is disabled Memory pre-cycle is disabled Transfer type of OctaFlash set SPI mode, and OctaRAM set DOPI mode
2	Write	MRWCR1	0x00120013	4	Specifies the read and write commands for OctaFlash Write command: PP of OctaFlash Read command: 8READ of OctaFlash

Note: OctaFlash connects the device 1, and OctaRAM connects the device 0.

(2) Set pre-cycle is enabled

When pre-cycle is enabled in OctaFlash/RAM, it is necessary to modify the setting of the Config Register of OctaFlash/RAM and memory-controller. Refer to the data sheet of OctaFlash/RAM about how to be enabled pre-cycle. For

Table 36.16 OctaFlash翻译模式设置示例(2of2)

1	Write	CDSR	0x80001C06	4	设置控制器功能 启用自动校准 内存预循环被禁用 OctaFlash的传输类型设置SOPI模式，以及 OctaRAM设置DOPI模式
2	Write	MRWCR1	0x12EDEC13	4	指定读取和写入命令 OctaFlash 写指令：OctaFlash的PP 读取指令：OctaFlash的8READ

Table 36.19 翻译模式设置示例（SPI模式）

Step	Read/ Write	Address (Register)	Data	数据长度（字节）	Description
1	Write	CDSR	0x80000004	4	设置控制器功能 自动校准被禁用 内存预循环被禁用 OctaFlash的传输类型设置为SPI模式，以及 OctaRAM设置DOPI模式
2	Write	MRWCR1	0x00120013	4	指定读取和写入命令 OctaFlash 写指令：OctaFlash的PP 读取指令：OctaFlash的8READ

Note: OctaFlash连接设备1，OctaRAM连接设备0。

(2) 设置预循环已启用

在OctaFlashRAM中启用预循环时，需要修改ConfigRegister的设置
OctaFlashRAM和内存控制器。请参阅OctaFlashRAM的数据手册了解如何启用预循环。为了

example, show the sequence to be enabled pre-cycle in OctaFlash to Table 36.20. When pre-cycle is enabled in OctaFlash, users issue WREN (Write Enable) instruction, and then issue WRCR2 instruction to modify the values of Configuration Register 2 in OctaFlash to be enabled pre-cycle. For example, show the sequence to be enabled pre-cycle in OctaRAM to Table 36.21 When pre-cycle is enabled in OctaRAM, users write the Configuration Register in OctaRAM.

Table 36.20 Example of setting pre-cycle in OctaFlash

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
Write Enable (WREN)							
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	Any value	4	Any value	4	—
Write Configuration Register2 (WRCR2)							
4	Write	DCR	0x00000072	4	0x0000728D	4	—
5	Write	DAR	0x00000200	4	0x00000200	4	—
6	Write	DCSR	0x04180001	4	0x04280001	4	—
7	Write	CWDR	0x00000001	1	0x00000001	1	—

Table 36.21 Example of setting pre-cycle in OctaRAM

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	0x00004000	4	—
2	Write	DAR	0x00040000	4	—
3	Write	DCSR	0x04A00002	4	—
4	Write	CWDR	0x0000F152	2	pre-cycle is enabled latency counter is 8 clocks (default)

The configuration register of memory controller in DOPI mode specifies Table 36.22 and in SOPI mode specifies Table 36.23.

Table 36.22 Example of setting pre-cycle when OctaFlash is DOPI mode

Step	Read/ Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	CDSR	0x80001C3A	4	Sets up the controller functions Auto-calibration is enabled Memory pre-cycle is enabled Transfer type of OctaFlash and OctaRAM set DOPI mode

Table 36.23 Example of setting pre-cycle when OctaFlash is SOPI mode

Step	Read/ Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	CDSR	0x80001C36	4	Sets up the controller functions Auto-calibration is enabled Memory pre-cycle is enabled Transfer type of OctaFlash set SOPI mode and OctaRAM set DOPI mode

(3) Set the number of dummy cycle

In the case of operating in 100MHz, the dummy cycle of OctaFlash/RAM should be modified. Following the data-sheet of OctaFlash/RAM, the dummy cycle of OctaFlash is 10 and the dummy cycle (Latency counter) of OctaRAM is 4. For example, show the sequence to change the dummy cycle in OctaFlash to Table 36.24. When the dummy cycle is changed, users issue WREN (Write Enable) instruction, and successively issue WRCR2 instruction to change the dummy cycle in

例如，在表36.20中显示要在OctaFlash中预循环启用的序列。当在OctaFlash中启用预循环时，用户发出WREN（WriteEnable）指令，然后发出WRCR2指令来修改OctaFlash中配置寄存器2的值以启用预循环。例如，在OctaRAM中显示要在循环前启用的序列以

表36.21当在OctaRAM中启用预循环时，用户将配置寄存器写入OctaRAM。

Table 36.20 在OctaFlash中设置预循环的示例

Step	Read/ Write	Register	SPI模式数据	Data Length (Bytes)	OPI模式数据	Data Length (Bytes)	Description
写使能(WREN)							
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	任何值	4	任何值	4	—
写配置寄存器2(WRCR2)							
4	Write	DCR	0x00000072	4	0x0000728D	4	—
5	Write	DAR	0x00000200	4	0x00000200	4	—
6	Write	DCSR	0x04180001	4	0x04280001	4	—
7	Write	CWDR	0x00000001	1	0x00000001	1	—

Table 36.21 在OctaRAM中设置预循环的示例

Step	Read/ Write	Register	Data	数据长度（字节）	Description
1	Write	DCR	0x00004000	4	—
2	Write	DAR	0x00040000	4	—
3	Write	DCSR	0x04A00002	4	—
4	Write	CWDR	0x0000F152	2	启用预循环延迟计数器为8个时钟（默认）

DOPI模式下内存控制器的配置寄存器指定表36.22，SOPI模式下指定表36.23。

Table 36.22 OctaFlash为DOPI模式时设置预循环示例

Step	Read/ Write	Address (Register)	Data	数据长度（字节）	Description
1	Write	CDSR	0x80001C3A	4	设置控制器功能 启用自动校准 内存预循环已启用 OctaFlash和OctaRAM组的传输类型 DOPI mode

Table 36.23 OctaFlash为SOPI模式时设置预循环的示例

Step	Read/ Write	Address (Register)	Data	数据长度（字节）	Description
1	Write	CDSR	0x80001C36	4	设置控制器功能 启用自动校准 内存预循环已启用 OctaFlash的传输类型设置SOPI模式和OctaRAM设置DOPI模式

(3) 设置虚拟周期数

在工作在100MHz的情况下，需要修改OctaFlashRAM的虚拟周期。根据OctaFlashRAM的数据表，OctaFlash的虚拟周期为10，OctaRAM的虚拟周期（延迟计数器）为4。例如，将OctaFlash中的虚拟周期更改为表36.24的顺序。当虚拟周期改变时，用户发出WREN（WriteEnable）指令，并依次发出WRCR2指令来改变虚拟周期

OctaFlash. For example, show the sequence to change the latency counter in OctaRAM to Table 36.25. When the latency counter is changed, users write the Configuration Register in OctaRAM. The Config Register of the memory-controller specifies Table 36.26.

Table 36.24 Example of changing the dummy cycle in OctaFlash

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
Write Enable (WREN)							
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	Any value	4	Any value	4	—
Write Configuration Register2 (WRCR2)							
4	Write	DCR	0x00000072	4	0x0000728D	4	—
5	Write	DAR	0x00000300	4	0x00000300	4	—
6	Write	DCSR	0x04180001	4	0x04280001	4	—
7	Write	CWDR	0x00000005	1	0x00000005	1	—

Table 36.25 Example of changing the latency counter in OctaRAM

1	Write	DCR	0x00004000	4	—
2	Write	DAR	0x00040000	4	—
3	Write	DCSR	0x04A00002	4	—
4	Write	CWDR	0x0000F112	2	pre-cycle is enabled latency counter is 4 clocks

Table 36.26 Example of dummy cycle setting

Step	Read/ Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	MDLR	0x000A0404	4	Specifies the dummy length Dummy cycle of OctaFlash is 10 in reading Dummy cycle of OctaRAM is 4 in writing/reading

(4) Set preamble mode is enable

When users use the preamble of OctaFlash, it is necessary to modify the setting of the Config Register of OctaFlash and memory controller. Refer to the data sheet of OctaFlash about how to be enabled preamble. For example, show the sequence to set preamble mode in OctaFlash to Table 36.27. When users set preamble mode, users issue WREN (Write Enable) instruction, and then issue WRCR instruction to set preamble mode. Users need to check out bit0 (WIP) of Status Register in OctaFlash, until this bit (WIP) set 0.

Table 36.27 Example of setting preamble mode in OctaFlash (1 of 2)

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
Write Enable (WREN)							
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	Any value	4	Any value	4	—
Write Configuration Register (WRCR)							
4	Write	DCR	—	—	0x000001FE	4	—

八闪。例如，将OctaRAM中的延迟计数器更改为表36.25的顺序。当延迟计数器改变时，用户将配置寄存器写入OctaRAM。内存控制器的配置寄存器指定表36.26。

Table 36.24 在OctaFlash中更改虚拟周期的示例

Step	Read/ Write	Register	SPI模式数据	Data Length (Bytes)	OPI模式数据	Data Length (Bytes)	Description
写使能(WREN)							
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	任何值	4	任何值	4	—
写配置寄存器2(WRCR2)							
4	Write	DCR	0x00000072	4	0x0000728D	4	—
5	Write	DAR	0x00000300	4	0x00000300	4	—
6	Write	DCSR	0x04180001	4	0x04280001	4	—
7	Write	CWDR	0x00000005	1	0x00000005	1	—

Table 36.25 在OctaRAM中更改延迟计数器的示例

Step	Read/ Write	Register	Data	数据长度（字节）	Description
1	Write	DCR	0x00004000	4	—
2	Write	DAR	0x00040000	4	—
3	Write	DCSR	0x04A00002	4	—
4	Write	CWDR	0x0000F112	2	启用预循环延迟计数器为4 个时钟

Table 36.26 虚拟循环设置示例

Step	Read/ Write	Address (Register)	Data	数据长度（字节）	Description
1	Write	MDLR	0x000A0404	4	指定虚拟长度 OctaFlash的虚拟循环读取为10 OctaRAM的空周期为4写读

(4) 设置前导码模式启用

当用户使用OctaFlash的前导码时，需要修改OctaFlash的ConfigRegister和内存控制器的设置。有关如何启用前导码，请参阅OctaFlash的数据手册。例如，在表36.27中显示在OctaFlash中设置前导码模式的序列。当用户设置前导模式时，用户发出WREN（WriteEnable）指令，然后发出WRCR指令来设置前导模式。用户需要检查OctaFlash中状态寄存器的bit0(WIP)，直到该位(WIP)设置为0。

Table 36.27 在OctaFlash中设置前导码模式的示例（1of2）

Step	Read/ Write	Register	SPI模式数据	Data Length (Bytes)	OPI模式数据	Data Length (Bytes)	Description
写使能(WREN)							
1	Write	DCR	0x00000006	4	0x000006F9	4	—
2	Write	DCSR	0x00180000	4	0x00280000	4	—
3	Write	CWNDR	任何值	4	任何值	4	—
写配置寄存器(WRCR)							
4	Write	DCR	—	—	0x000001FE	4	—

Table 36.27 Example of setting preamble mode in OctaFlash (2 of 2)

Step	Read/ Write	Register	SPI Mode Data	Data Length (Bytes)	OPI Mode Data	Data Length (Bytes)	Description
5	Write	DAR	—	—	0x00000001	4	—
6	Write	DCSR	—	—	0x04200001	4	—
7	Write	CWDR	—	—	0x00000017	1	—
Read Status Register (RDSR)							
8	Write	DCR	0x00000005	4	0x000005FA	4	—
9	Write	DAR	—	—	0x00000000	4	—
10	Write	DCSR	0x00180001	4	0x0C280401	4	—
11	Read	CRR	0x000000xx	4	0x000000xx	4	Users must repeat to read Status Register, until the bit0 (WIP) of data to read from Status Register will be 0.

36.3.6.4 Automatic Calibration Setting

The OSPI has an automatic calibration function to prevent acquisition of wrong data due to the variation of voltage and temperature.

Figure 36.14 shows the automatic calibration setting flow for the OctaFlash and OctaRAM devices.

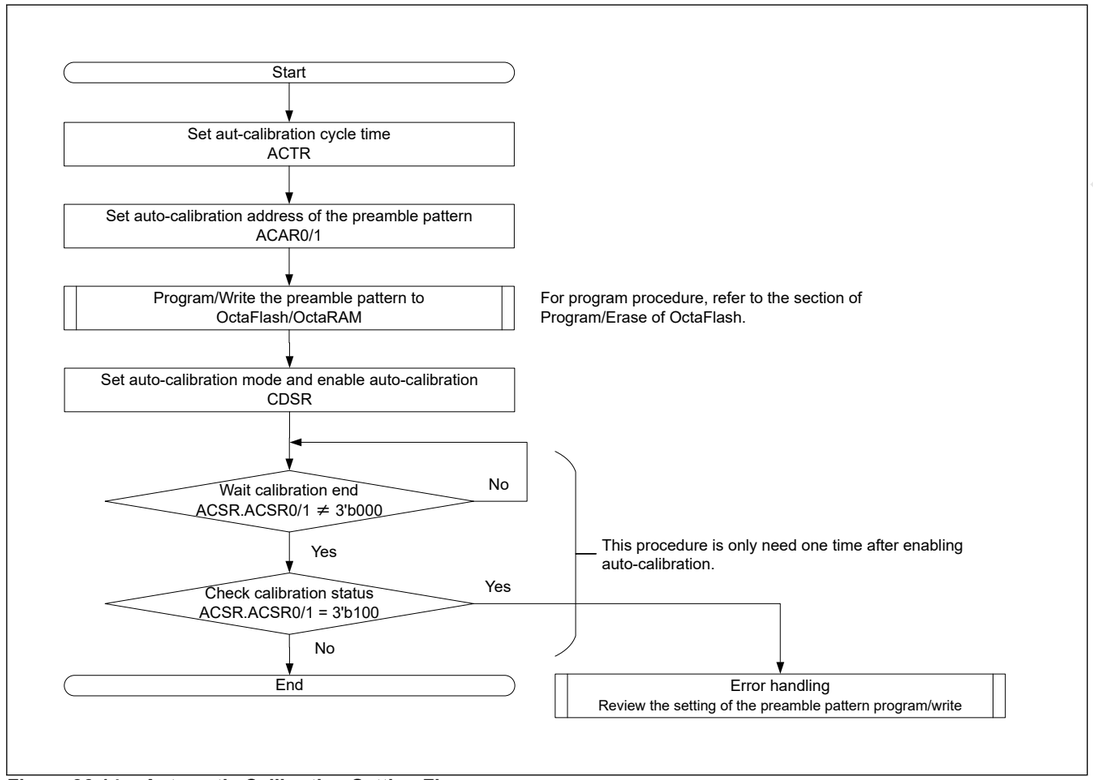

Figure 36.14 Automatic Calibration Setting Flow

For details, see section 36.3.6.2. Basic Operation Settings.

The following preamble pattern should be stored in the setting address of ACAR0 and ACAR1.

Table 36.27 在OctaFlash中设置前导码模式的示例(2of2)

Step	Read/ Write	Register	SPI模式数据	Data Length (Bytes)	OPI模式数据	Data Length (Bytes)	Description
5	Write	DAR	—	—	0x00000001	4	—
6	Write	DCSR	—	—	0x04200001	4	—
7	Write	CWDR	—	—	0x00000017	1	—
读取状态寄存器(RDSR)							
8	Write	DCR	0x00000005	4	0x000005FA	4	—
9	Write	DAR	—	—	0x00000000	4	—
10	Write	DCSR	0x00180001	4	0x0C280401	4	—
11	Read	CRR	0x000000xx	4	0x000000xx	4	用户必须重复阅读状态寄存器，直到从状态寄存器中读取的数据的第0位（WIP）为0。

36.3.6.4 自动校准设置

OSPI具有自动校准功能，可防止由于电压和温度的变化而采集错误数据。

图36.14显示了OctaFlash和OctaRAM设备的自动校准设置流程。

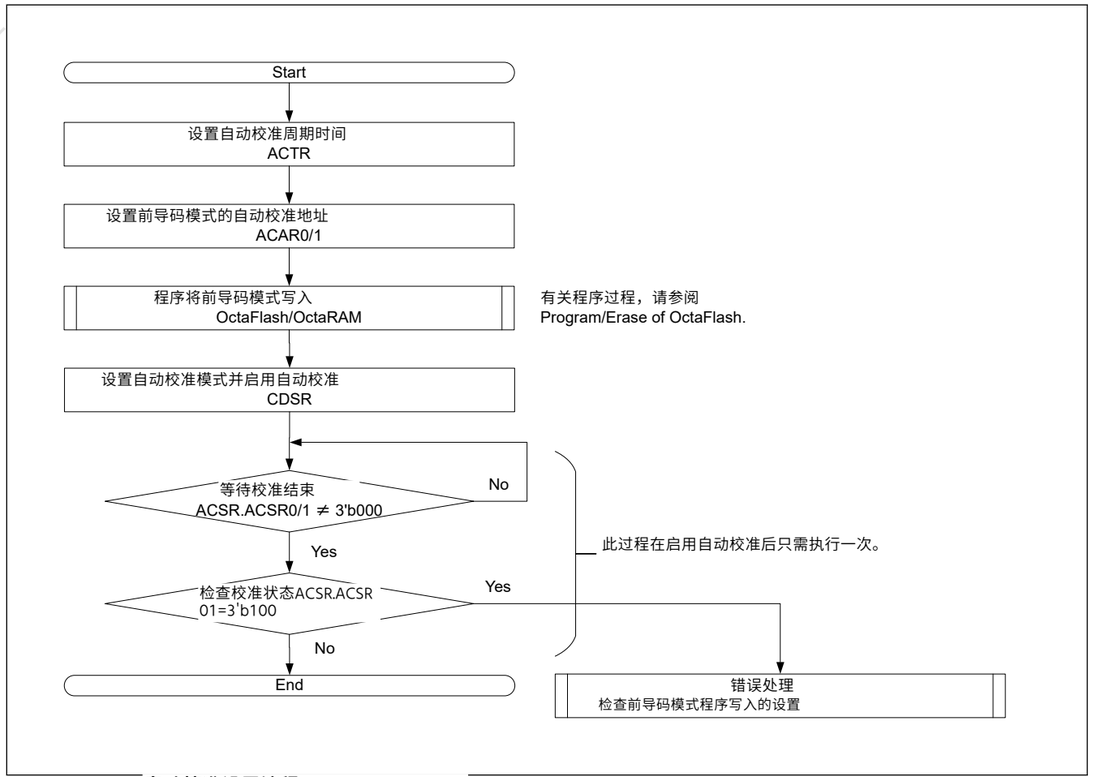

Figure 36.14 自动校准设置流程

有关详细信息，请参阅第36.3.6.2节。基本操作设置。

ACAR0和ACAR1的设置地址中应存储以下前导码模式。

RA生态工作室

- DOPI mode when MRWCSR.MWOn = 0 (n = 0, 1) : 0x00F708F7_FF0000F7_0800FF00_FFFF0000
- DOPI mode when MRWCSR.MWOn = 1 (n = 0, 1) : 0xF700F708_00FFF700_000800FF_FFFF0000
- SOPI mode : 0xF7F700F7_0000FF00

36.3.6.5 Program/Erase of OctaFlash Setting

Figure 36.15 and Figure 36.16 show the procedure for program (write) and erase of OctaFlash. There is a restriction on partial program or double program in OctaFlash, so it should be programmed with a proper size according to the usage of OctaFlash. For details, see OctaFlash datasheet. The program size in one CS asserted period can be specified by enabling single continuous write mode.

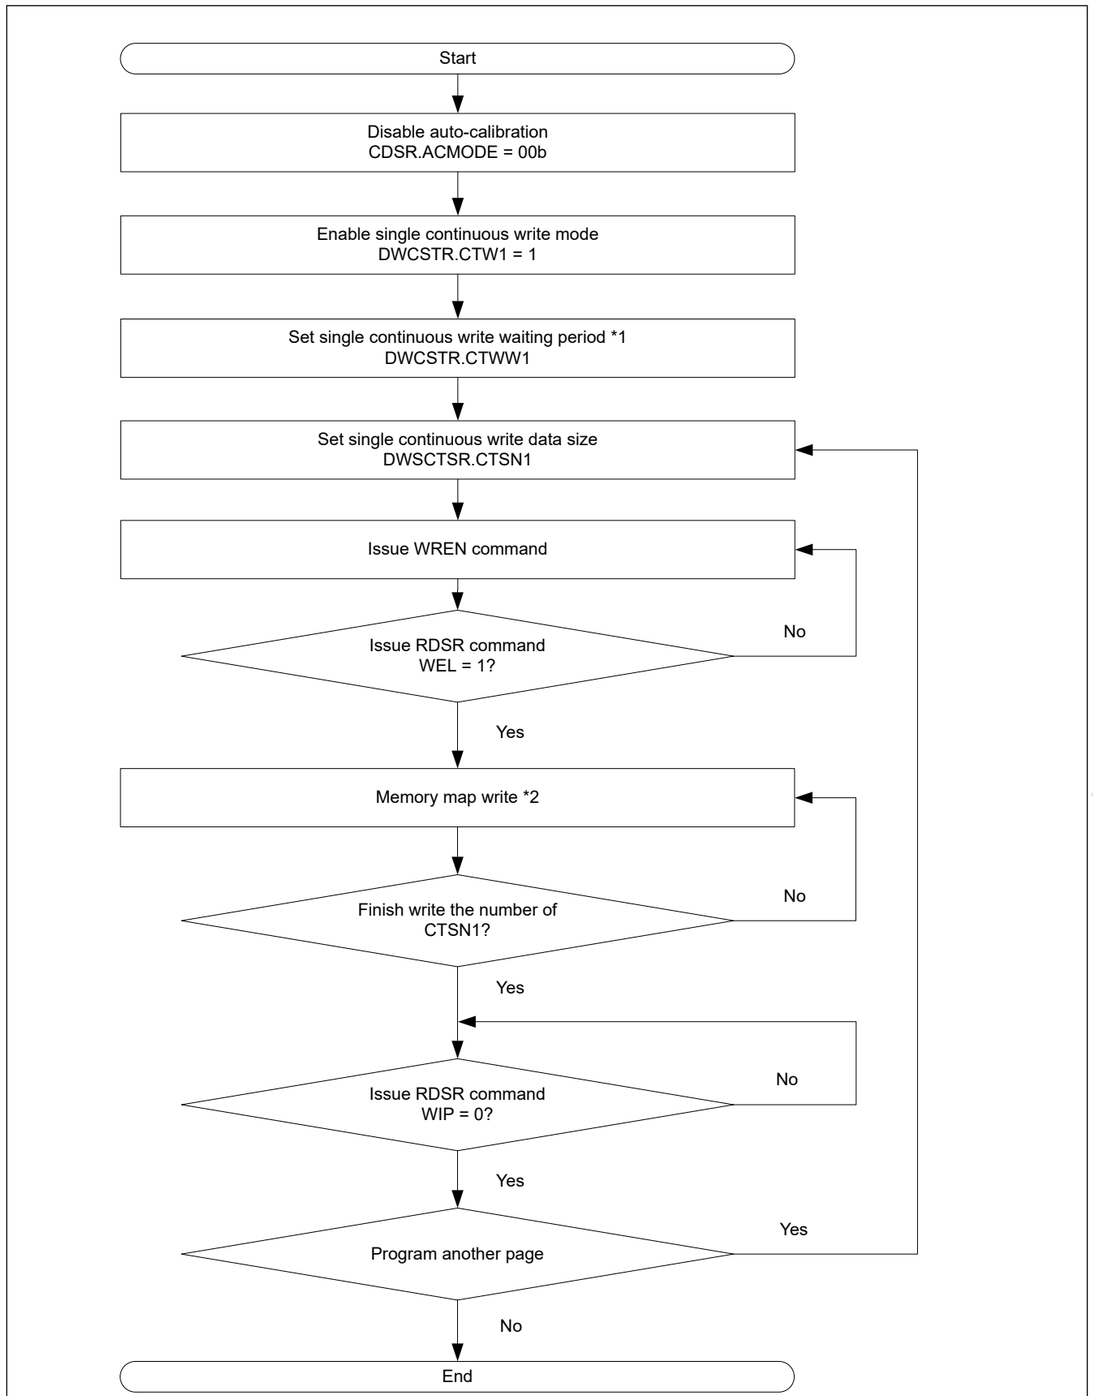
●MRWCSR.MWOn=0(n=0 1)时的DOPI模式：0x00F708F7_FF0000F7_0800FF00_FFFF0000
●MRWCSR.MWOn=1(n=0 1)时的DOPI模式：0xF700F708_00FFF700_000800FF_FFFF0000

- SOPI mode : 0xF7F700F7_0000FF00

36.3.6.5 OctaFlash设置的程序擦除

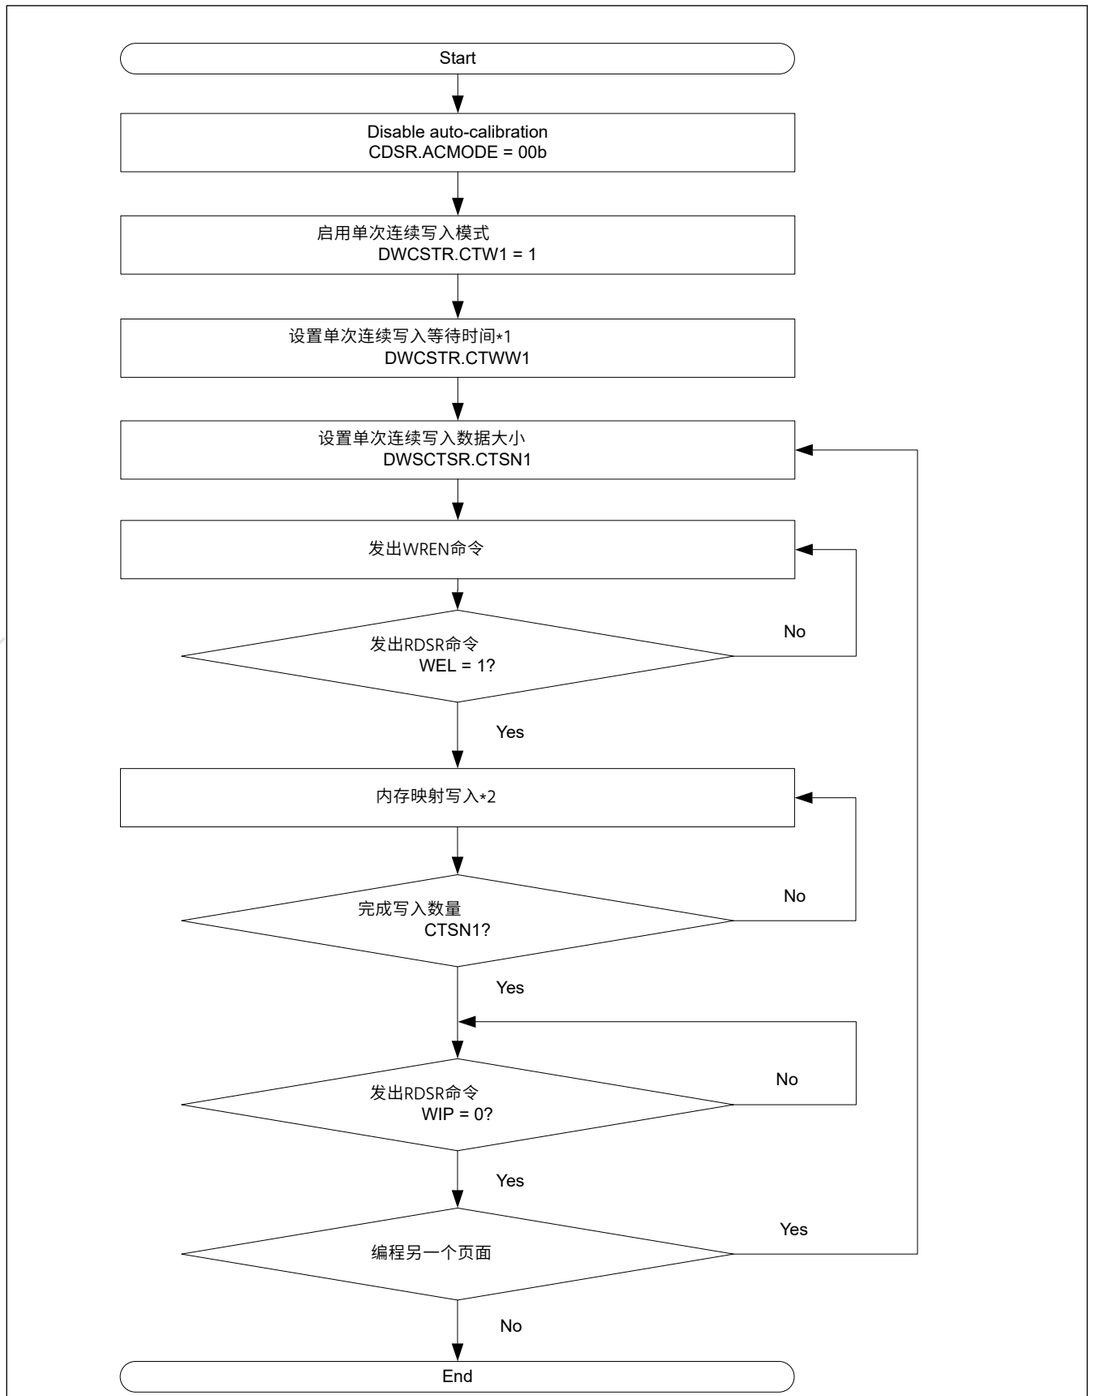
图36.15和图36.16显示了OctaFlash的编程（写入）和擦除过程。OctaFlash对部分烧写或重复烧写是有限制的，所以要根据OctaFlash的使用情况，烧写合适的大小。有关详细信息，请参阅OctaFlash数据表。一个CS断言周期内的程序大小可以通过启用单次连续写入模式来指定。

RA生态工作室



Note 1. Set long enough period to ensure the one program size defined by the CTSN1 bits.
Note 2. Not change write access size 8/16/32 bit in one page program.

Figure 36.15 Procedure for program of OctaFlash



注1.设置足够长的周期以确保由CTSN1位定义的一个程序大小。
注2.在一页程序中不改变写访问大小81632位。

Figure 36.15 OctaFlash程序的程序

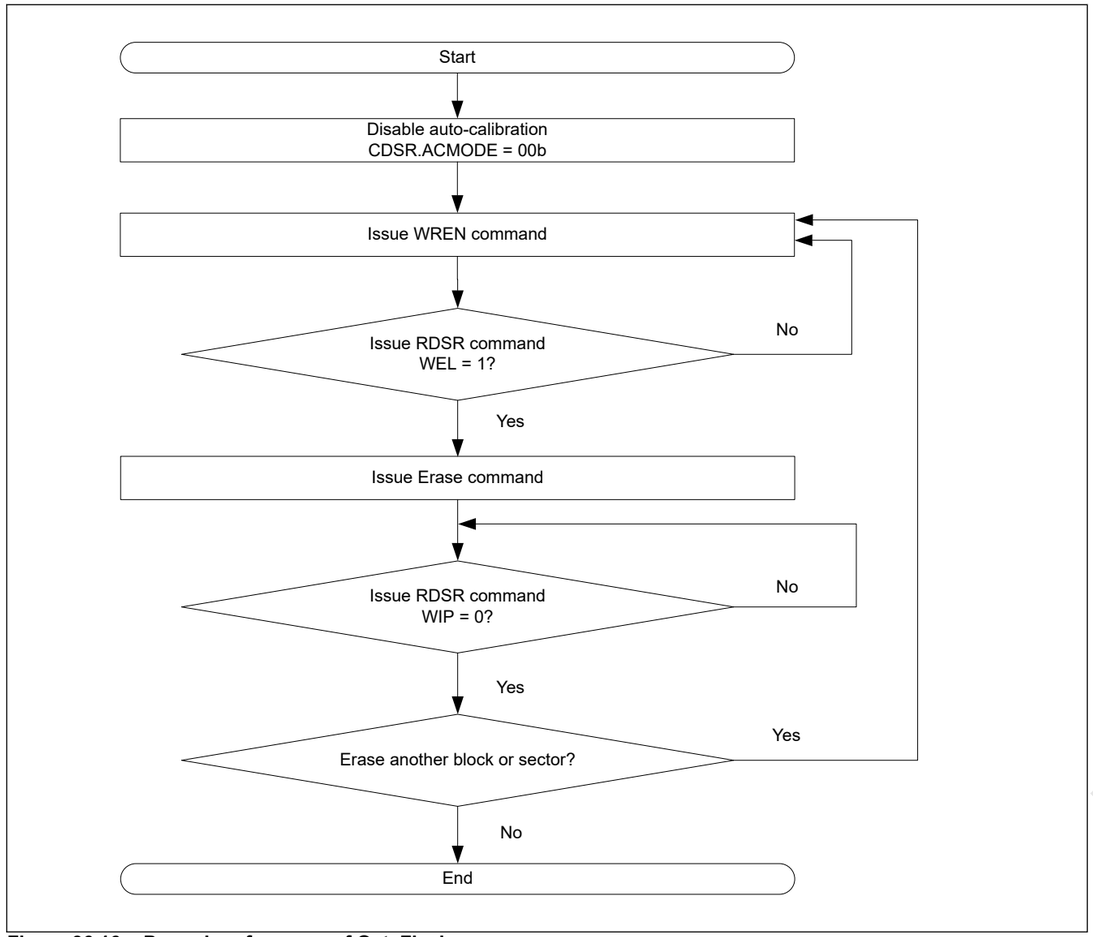


Figure 36.16 Procedure for erase of OctaFlash

36.4 SOPI/DOPI mode, Delay Line Adjustment and OM_DQS Auto-Calibration

36.4.1 SOPI/DOPI mode and OM_DQS

Depending on the characteristic of SOPI/DOPI mode, controller cannot latch data on the rising edge / falling edge of the OM_DQS clock, the delayed OM_DQS is needed to capture data with sufficiency setup/hold time margin.

Figure 36.17 shows delayed OM_DQS (OM_DQS strobe) has good latch position to latch data.

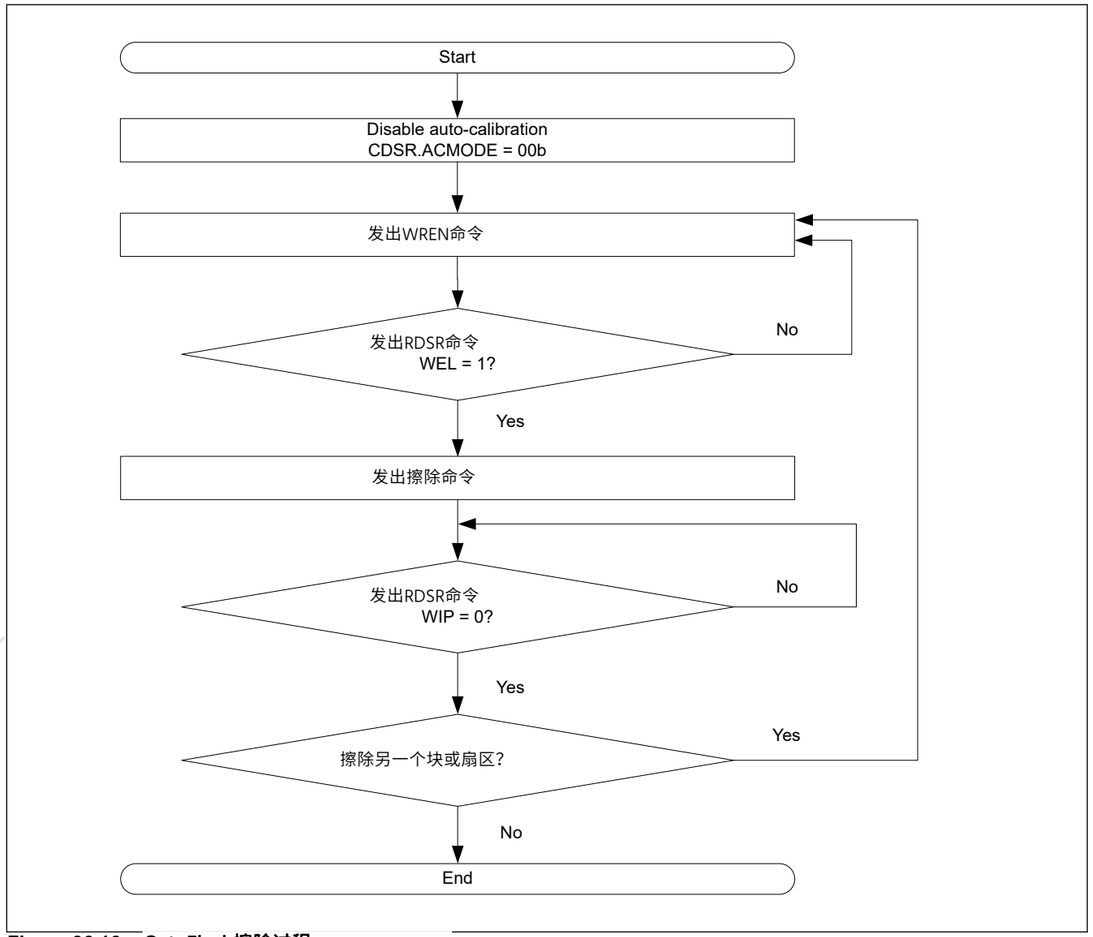

Figure 36.16 OctaFlash擦除过程

36.4 SOPIDOPI模式、延迟线调整和OM_DQS自动校准

36.4.1 SOPIDOPI模式和OM_DQS

根据SOPIDOPI模式的特性，控制器不能在信号的上升沿下降沿锁存数据OM_DQS时钟，需要延迟的OM_DQS来捕获具有足够设置保持时间余量的数据。

图36.17显示延迟的OM_DQS（OM_DQS选通）具有良好的锁存位置来锁存数据。

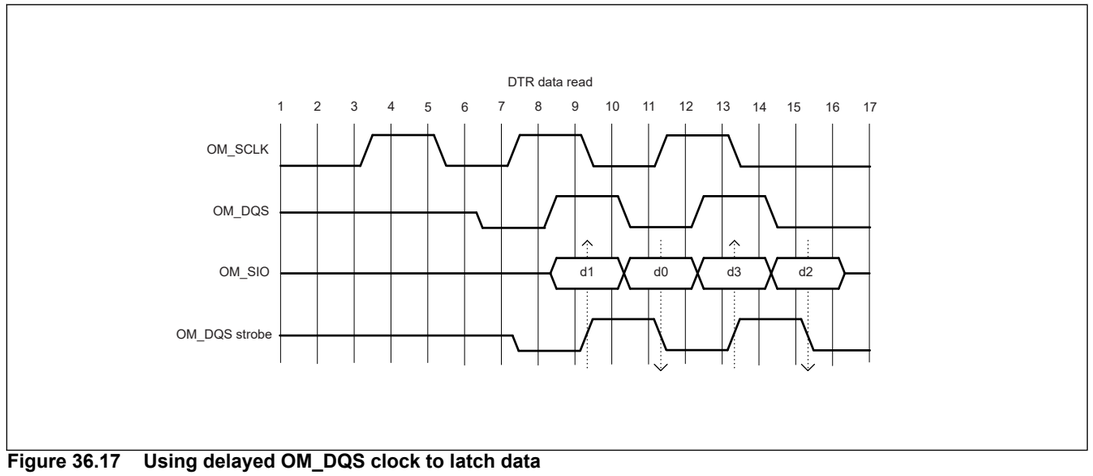

Figure 36.17 Using delayed OM_DQS clock to latch data

36.5 Single continuous write/read mode

Single continuous write/read is a mode to optimize a performance of single access with increment address. When the address is continuous, the OSPI skips to re-send command, address, and dummy cycles to memory device again by keeping OM_CS0/1 low.

Whether single continuous mode effectively optimize a performance depends on master. When master issue single access (not burst) with increment address, single continuous mode effectively optimize a performance. For recommended setting, see Table 36.28.

Table 36.28 Recommended single continuous mode setting when access address is increment

Master	Write/Read	Single continuous mode
CPU	Write	Enable
	Read with S Cache off*1	Enable
	Read with S Cache on*1	Disable
DMAC/DTC	Write	Enable
	Read	Enable
EDMAC	Write	Disable
	Read	Disable

Note 1. For details, see section 14.8. Cache.

36.5.1 Single continuous write operation

Figure 36.18 shows the procedure of single continuous write of OctaRAM. For the procedure of OctaFlash, see the Figure 36.15.

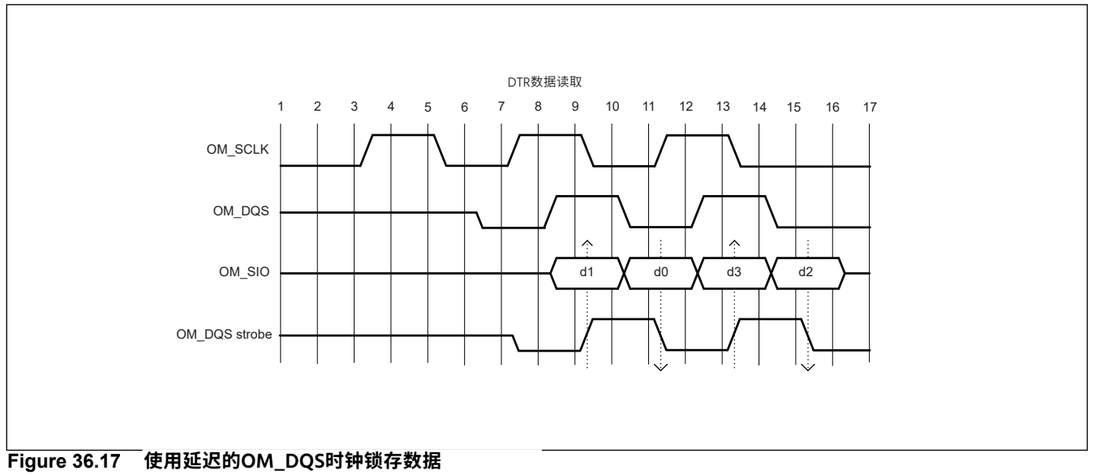

Figure 36.17 使用延迟的OM_DQS时钟锁存数据

36.5 单次连续写读模式

单次连续写读是一种以递增地址优化单次访问性能的模式。当地址连续时，OSPI通过保持OM_CS01为低，跳过重新发送命令、地址和虚拟周期到存储设备。

单一连续模式能否有效优化性能取决于master。当主机发出带有递增地址的单次访问（非突发）时，单次连续模式有效地优化了性能。推荐设置见表36.28。

Table 36.28 访问地址递增时推荐的单连续模式设置

Master	Write/Read	单次连续模式
CPU	Write	Enable
	在SCache关闭的情况下读取*1	Enable
	在*1上使用SCache读取	Disable
DMAC/DTC	Write	Enable
	Read	Enable
EDMAC	Write	Disable
	Read	Disable

注1.详见14.8节。缓存。

36.5.1 单次连续写操作

图36.18显示了OctaRAM的单次连续写入过程。OctaFlash的流程见图36.15。

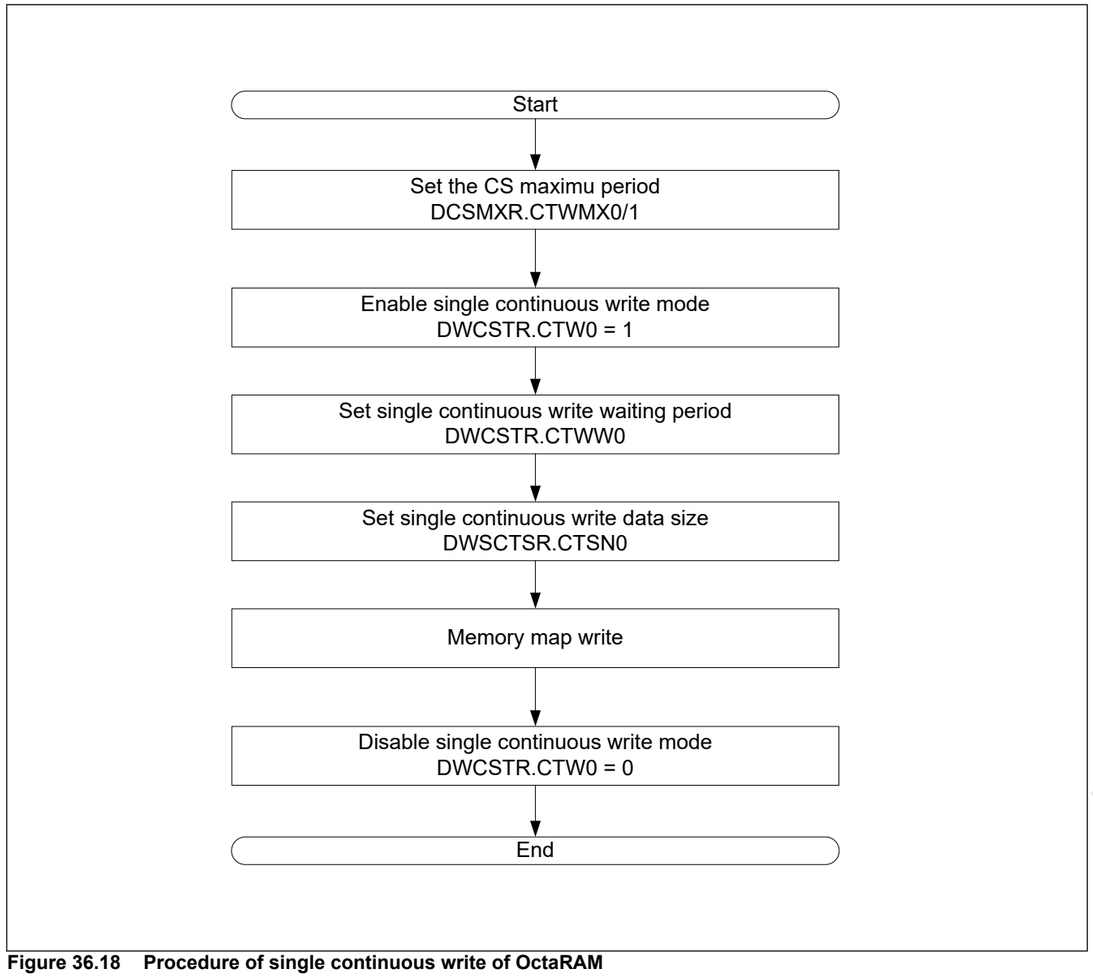

Figure 36.18 Procedure of single continuous write of OctaRAM

When DWCSTR.CTW0/1 is 1 and the OSPI receives a single write, write command will be issued and CS pin will be kept asserted.

When one of the following conditions is satisfied, the current single continuous write will finish and CS pin will be negated.

1. Current access address is not increment.
   The definition of increment address is:
   Current address = Previous address + Previous length
2. Current access attribution is burst (not single).
3. Current access size is different from previous access.*1
4. The OSPI has not received any access for the period specified by DWCSTR.CTWW0/1 bits.
5. Current access is read (not write).
6. CS asserted period has been elapsed the period specified by DCSMXR.CTWMX0/1 bits.*1 *2
7. The number of bytes specified by DWSCTSR.CTSN0/1 bits has been transferred.*3

Note 1. Although once CS pin is negated, next single continuous write will be issued automatically.
Note 2. This condition is for a restriction on CS asserted period in OctaRAM.
This condition is not applied to OctaFlash.
Note 3. When DWSCTSR.CTSN0/1 is set to 0, this condition is never satisfied.

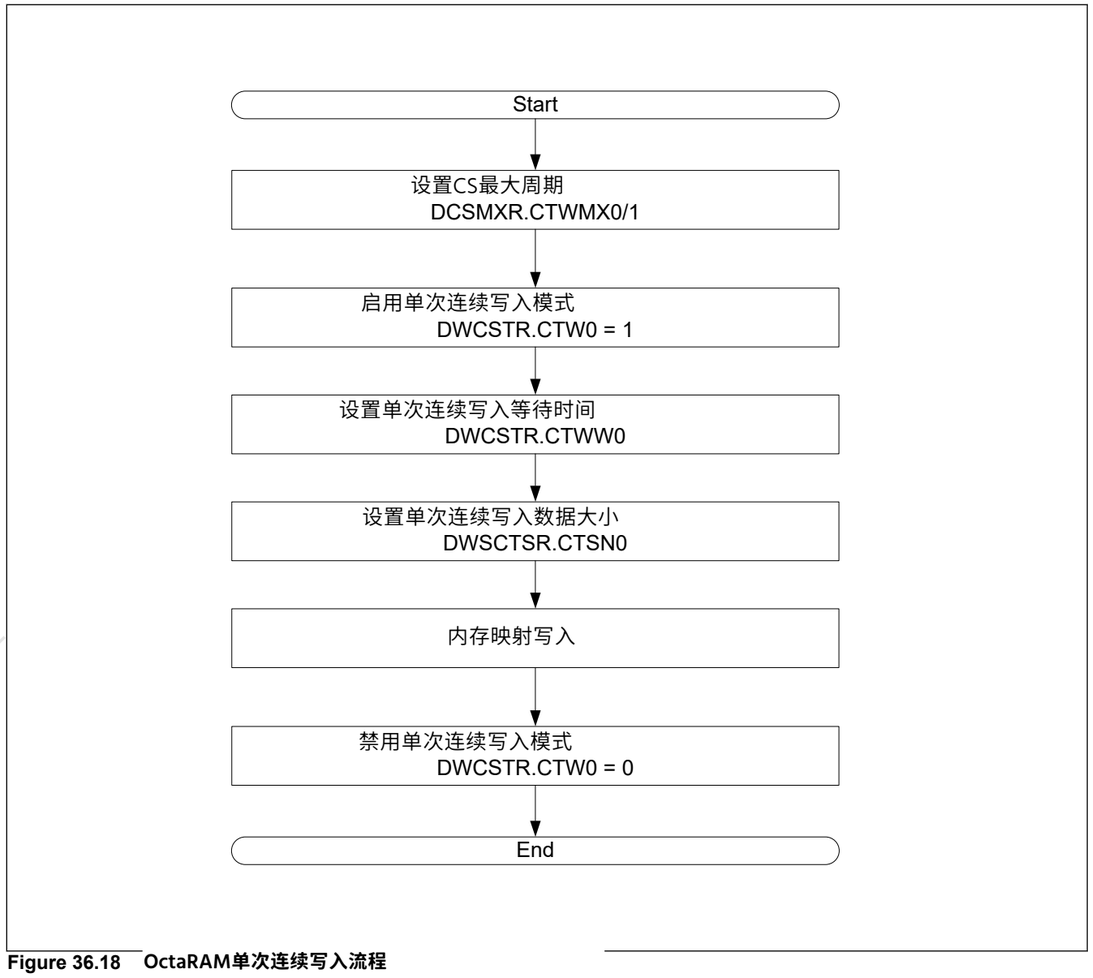

Figure 36.18 OctaRAM单次连续写入流程

当DWCSTR.CTW01为1且OSPI接收到单次写入时，将发出写入命令且CS引脚将保持有效。

当满足以下条件之一时，当前单次连续写入将完成，CS引脚将被取反。

1.当前访问地址不递增。增量地址的定义是：
当前地址=前一个地址+前一个长度

2.当前访问属性是突发的（不是单一的）。

3.当前访问大小与以前访问不同。*1

4.OSPI在DWCSTR.CTWW01位指定的时间段内没有收到任何访问。

5.当前访问是读（不是写）。

6.CS断言周期已经过DCSMXR.CTWMX01位指定的周期。*1*2

7.DWSCTSR.CTSN01位指定的字节数已被传输。*3

注1.虽然一旦CS引脚被取反，下一次连续写入将自动发出。
注2.此条件用于限制OctaRAM中的CS断言周期。
此条件不适用于OctaFlash。
注3.当DWSCTSR.CTSN01设置为0时，此条件永远不会满足。

36.5.2 Single continuous read operation

Figure 36.19 shows procedure for single continuous read of OctaRAM and OctaFlash.

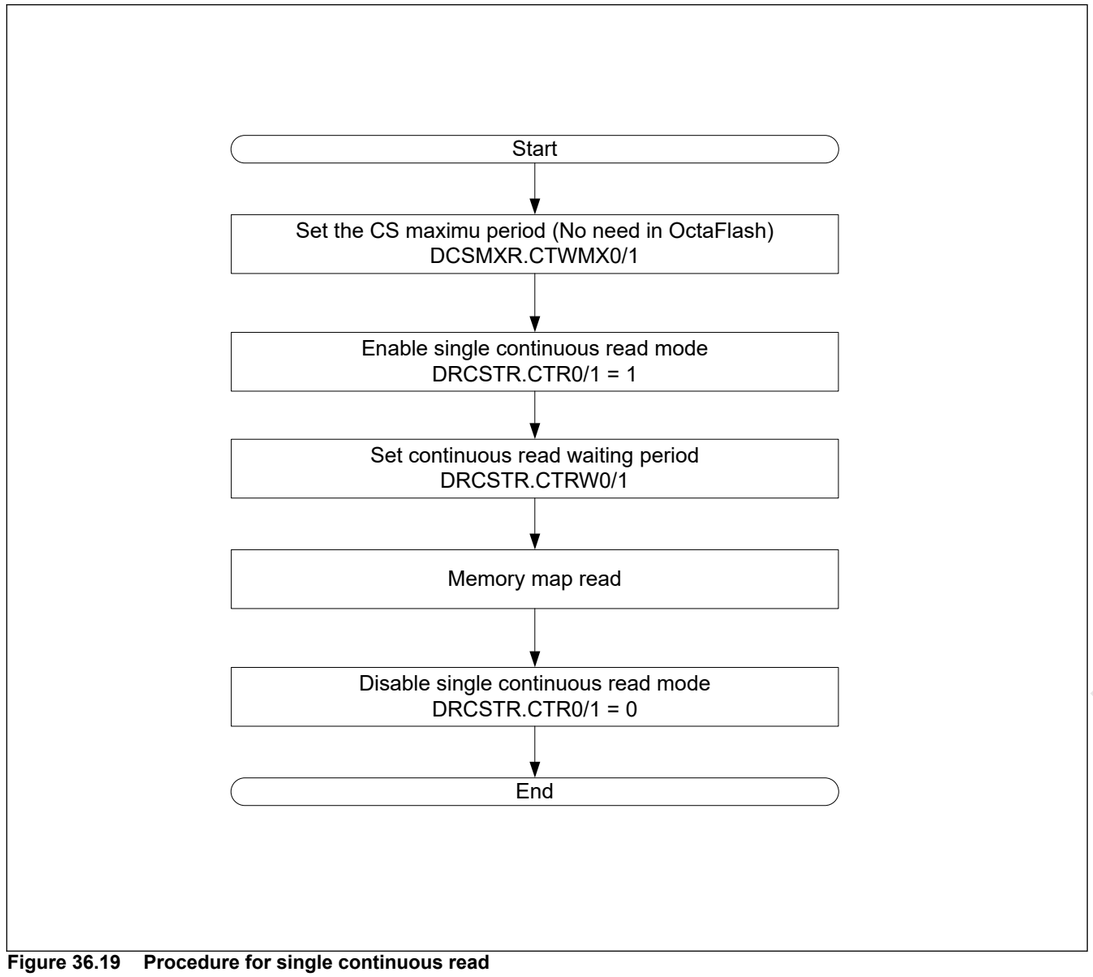

Figure 36.19 Procedure for single continuous read

When DRCSTR.CTR0/1 is 1 and the OSPI receives a single write, read command will be issued and CS pin will be kept asserted.

When one of the following conditions is satisfied, the current single continuous read will finish and CS pin will be negated.

1. Current access address is not increment.
   The definition of increment address is:
   Current address = Previous address + Previous length
2. Current access attribution is burst (not single).
3. Current access size is different from previous access.*1
4. The OSPI has not received any access for the period specified by DRCSTR.CTRW0/1 bits.
5. Current access is write (not read).
6. CS asserted period has been elapsed the period specified by DCSMXR.CTWMX0/1 bits.*1 *2

Note 1. Although once CS pin is negated, next single continuous read will be issued automatically.

36.5.2 单次连续读取操作

图36.19显示了对OctaRAM和OctaFlash进行单次连续读取的过程。

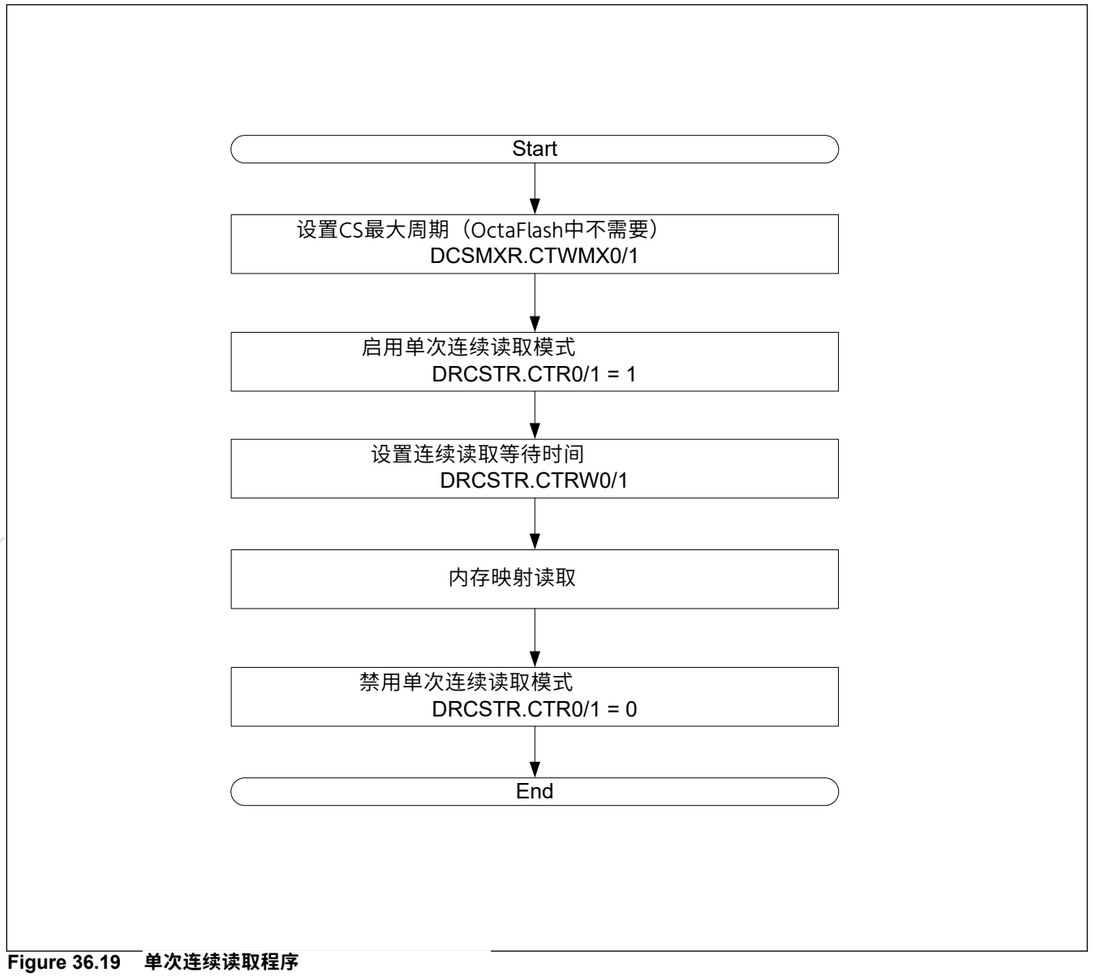

Figure 36.19 单次连续读取程序

当DRCSTR.CTR01为1且OSPI接收到单次写入时，将发出读取命令且CS引脚将保持有效。

当满足以下条件之一时，当前单次连续读取将完成，CS引脚将被取反。

1.当前访问地址不递增。
增量地址的定义是：
当前地址=前一个地址+前一个长度

2.当前访问属性是突发的（不是单一的）。

3.当前访问大小与以前访问不同。*1

4.OSPI在DRCSTR.CTRW01位指定的时间段内没有收到任何访问。

5.当前访问是写（不是读）。

6.CS断言周期已经过DCSMXR.CTWMX01位指定的周期。*1*2

注1.虽然一旦CS引脚被取反，下一次连续读取将自动发出。

Note 2. This condition is for a restriction on CS asserted period in OctaRAM.
This condition is not applied to OctaFlash.

36.6 OM_DQS Enable Counter

During read command operation, the OM_DQS signal is used as the data latch clock by the controller. When the memory device is in the idle state, OM_DQS maintains a high impedance (Hi-Z) state, and asserts low before data is output. This Hi-Z to Low transition may latch wrong data by driving the OM_DQS data latch logic of thecontroller.

Figure 36.20 shows the waveform when OM_DQS maintains a high-impedance (Hi-Z) state and asserts low before data is output.

Avoiding such Hi-Z to Low transitions, this controller can bypass wrong data with Memory delay trim register (MDTR). (MDTR.DQSEDOPI[3:0] for Flash DOPI mode, MDTR.DQSESOPI[3:0] for Flash SOPI mode, and MDTR.DQSERAM[3:0] for RAM mode)

Each configuration can be set from 0 to 15 for each case.

[OctaFlash]

OM_DQS Enable counter (MDTR) minimum value ≥ Command cycle number + Address cycle number*1 + OM_DQS Stable cycle number*2 + 1 (OM_DQS Delay cycle number)

OM_DQS Enable counter (MDTR) maximum value ≤ Command cycle number + Address cycle number*1 + Memory dummy cycle number*3 + Pre-cycle setting*4

[OctaRAM]

OM_DQS Enable counter (MDTR) minimum value ≥ Command cycle number + Address cycle number

OM_DQS Enable counter (MDTR) maximum value ≤ Command cycle number + Address cycle number*1 + Memory dummy cycle number + Pre-cycle setting*4

Note 1. Flash SOPI: Command cycle number + address cycle number = 2 + 4 = 6
Flash DOPI: Command cycle number + address cycle number = 1 + 2 = 3
RAM DOPI: number of command cycles + number of address cycles = 1 + 2 - 1 = 2 (start dummy calculation from the second cycle)
Note 2. OM_DQS Stable cycle number: Maximum value is 2 OM_SCLK (Reference specification of OctaFlash)
Note 3. Refer to OctaFlash minimum dummy cycle number in each command.
For example, dummy cycles of read configuration register is always 4 cycles regardless of dummy cycle setting of Configuration register 2.
Note 4. Pre-cycle setting: OM_DQSpre-cycle on/off
OM_DQS pre-cycle off: Pre-cycle setting = 0
OM_DQS pre-cycle on: Pre-cycle setting = -1

Setting example: Flash DOPI mode, dummy cycle = 4, pre-cycle is off

Minimum value of OM_DQS enable counter (MDTR) ≥ 1 + 2 + 2 + 1 = 6

Maximum value of OM_DQS enable counter (MDTR) ≤ 1 + 2 + 4 + 0 = 7

From the above, setting MDTR .DQSEDOPI[3:0] from 6 to 7 can latch the correct data. If MDTR is too small, wrong data may be latched due to a transition from Hi-Z to Low. If MDTR is too large, no data is latched.

注2.此条件用于限制OctaRAM中的CS断言周期。
此条件不适用于OctaFlash。

36.6 OM_DQS启用计数器

在读命令操作期间，OM_DQS信号被控制器用作数据锁存时钟。当存储设备处于空闲状态时，OM_DQS保持高阻抗(Hi-Z)状态，并在数据输出前置低。这种HiZ到Low的转换可能会通过驱动控制器的OM_DQS数据锁存逻辑来锁存错误的数据。

图36.20显示了当OM_DQS保持高阻抗(Hi-Z)状态并在数据输出之前断言为低电平时的波形。

为了避免这种Hi-Z到低电平的转换，该控制器可以使用内存延迟调整寄存器(MDTR)绕过错误数据。（MDTR.DQSEDOPI[3:0]用于FlashDOPI模式，MDTR.DQSESOPI[3:0]用于FlashSOPI模式，MDTR.DQSERA[3:0]用于RAM模式）

对于每种情况，每个配置都可以设置为0到15。

[OctaFlash]

OM_DQS启用计数器(MDTR)最小值≥命令周期数+地址周期数*1+OM_DQS稳定周期数*2+1（OM_DQS延迟周期数）

OM_DQS启用计数器(MDTR)最大值≤命令周期数+地址周期数*1+内存虚拟周期数*3+预周期设置*4

[OctaRAM]

OM_DQS启用计数器(MDTR)最小值≥命令周期数+地址周期数

OM_DQS启用计数器(MDTR)最大值≤命令周期数+地址周期数*1+内存虚拟周期数+预周期设置*4

注1.FlashSOPI：命令周期数+地址周期数=2+4=6
FlashDOPI：命令周期数+地址周期数=1+2=3
RAMDOPI：命令周期数+地址周期数=1+21=2（从第二个周期开始虚拟计算）

注2.OM_DQS稳定周期数：最大值为2OM_SCLK（OctaFlash参考规范）
注3.请参阅每个命令中的OctaFlash最小虚拟周期数。
例如，读取配置寄存器的虚拟周期始终为4个周期，而与配置寄存器2。
Note 4. Pre-cycle setting: OM_DQSpre-cycle on/off
OM_DQS pre-cycle off: Pre-cycle setting = 0
OM_DQS pre-cycle on: Pre-cycle setting = -1

设置示例：FlashDOPI模式，dummycycle=4，pre-cycle关闭

OM_DQS启用计数器(MDTR)的最小值≥1+2+2+1=6

OM_DQS启用计数器(MDTR)的最大值≤1+2+4+0=7

综上所述，将MDTR.DQSEDOPI[3:0]从6设置为7可以锁存正确的数据。如果MDTR太小，由于从Hi-Z到Low的转换，可能会锁存错误的数据。如果MDTR太大，则不会锁存任何数据。

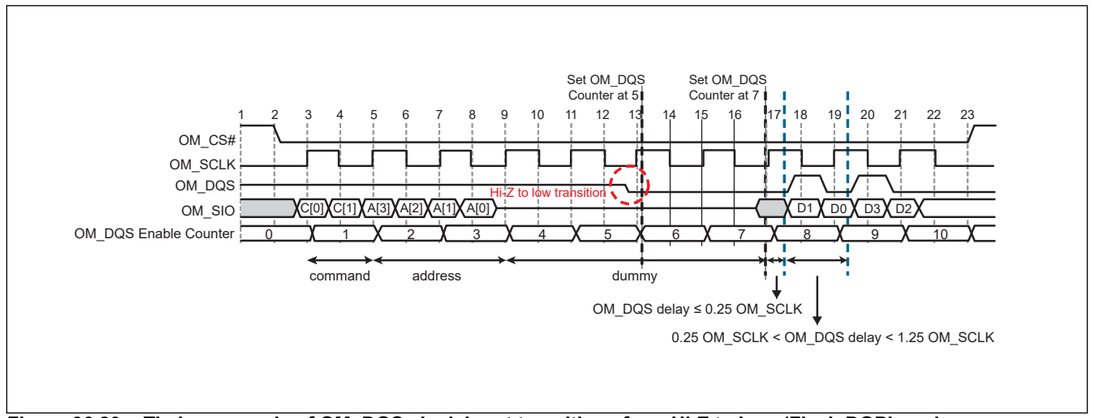

Figure 36.20 Timing example of OM_DQS clock input transitions from Hi-Z to Low (Flash DOPI mode, dummy cycle number = 4, OM_DQS pre-cycle on)

36.7 Interrupt and bus error

The OSPI output the interrupt request and bus error to the CPU in the following conditions.

Table 36.29 Interrupt and bus error sources

Access	Interrupt and bus error sources	Status flag	Interrupt	Bus error
memory-mapped write	Illegal address access	ESR.MWESR = 0x80	✓	✓
	Access during the OSPI is module stop state	—	×	✓
memory-mapped read	Illegal address access or DQS timeout detection in single continuous mode*1	ESR.MRESR = 0x80	✓	✓
	OctaFlash ECC error detection	ESR.MRESR = 0x01	✓	✓
	Preamble error detection	ESR.MRESR = 0x02	✓	✓
	DQS timeout detection*1	ESR.MRESR = 0x03	✓	✓
	Access during the OSPI is module stop state	—	×	✓
Register write	Illegal address access	—	×	✓
Register read	Illegal address access	—	×	✓
CRR register read	DQS timeout detection	—	×	✓

Note 1. After DQS timeout detection, the ESR.MRESR is set to 0x08 only under the condition that first memory map read after reset is executed in single continuous mode. The ESR.MRESR is set to 0x03 under other conditions.

36.8 Usage Note

36.8.1 Setting for the Module-Stop Function

Do not set the MSTP bit of the OSPI to 1 while the OSPI is accessing to the memory devices.

36.8.2 CPU write access attribution

CPU write access attribution to OSPI I/O registers area is recommended to be non-bufferable. Write access attribution is specified by the MPU registers in CPU. For details, see the *ARMv8-M Architecture Reference Manual* (ARM DDI 0553A).

When CPU write access attribution is bufferable, after writing register in memory device or OSPI, confirm that its value has actually changed before memory map read/write.

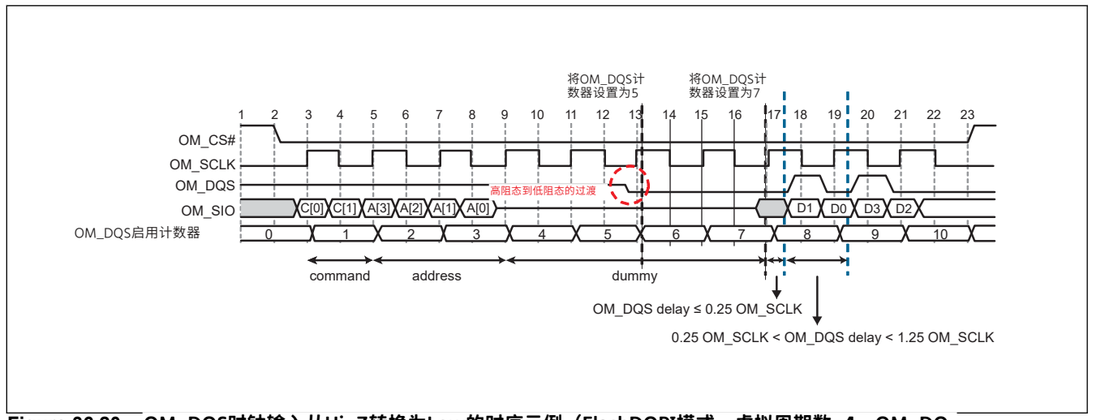

Figure 36.20 OM_DQS时钟输入从Hi-Z转换为Low的时序示例（FlashDOPI模式，虚拟周期数=4，OM_DQS预周期开启）

36.7 中断和总线错误

OSPI在以下情况下向CPU输出中断请求和总线错误。

Table 36.29 中断和总线错误源

Access	中断和总线错误源	状态标志	Interrupt	总线错误
memory-mapped write	非法地址访问	ESR.MWESR = 0x80	✓	✓
	OSPI期间的访问是模块停止状态	—	×	✓
memory-mapped read	单次连续模式下非法地址访问或DQS超时检测*1	ESR.MRESR = 0x80	✓	✓
	OctaFlashECC错误检测	ESR.MRESR = 0x01	✓	✓
	前导错误检测	ESR.MRESR = 0x02	✓	✓
	DQS超时检测*1	ESR.MRESR = 0x03	✓	✓
	OSPI期间的访问是模块停止状态	—	×	✓
寄存器写入	非法地址访问	—	×	✓
注册读取	非法地址访问	—	×	✓
CRR寄存器读取	DQS超时检测	—	×	✓

注1.在DQS超时检测后，ESR.MRESR仅在复位后的第一个存储器映射读取以单次连续模式执行的条件下设置为0x08。ESR.MRESR在其他条件下设置为0x03。

36.8 使用说明

36.8.1 模块停止功能的设置

当OSPI访问存储设备时，不要将OSPI的MSTP位设置为1。

36.8.2 CPU写访问属性

建议将CPU对OSPIIO寄存器区域的写访问属性设置为不可缓冲。写访问属性由CPU中的MPU寄存器指定。有关详细信息，请参阅ARMv8-M架构参考手册(ARMDDI0553A)。

当CPU写访问属性为可缓冲时，在内存设备或OSPI中写入寄存器后，确认其值在内存映射读写之前确实发生了变化。

RA生态工作室

36.8.3 DQS in SOPI mode

OctaFlash support SOPI mode. In SOPI mode, set DQS enable by the configuration register2 of OctaFlash. The OSPI only support SOPI mode with enabling DQS.

36.8.3 SOPI模式下的DQS

OctaFlash支持SOPI模式。在SOPI模式下，通过OctaFlash的配置寄存器2设置DQS使能。OSPI仅支持启用DQS的SOPI模式。

RA生态工作室

37. CEC Transmission/Reception Circuit (CEC)

37.1 Overview

The CEC transmission/reception circuit can generate and receive CEC signals conforming to the Consumer Electronics Control (CEC) standard, and automatically detect communication statuses by the CEC. CEC transmission/reception can be easily controlled by using these functions.

Table 37.1 lists the CEC specifications and Figure 37.1 shows a block diagram.

Table 37.1 CEC specifications

Parameter	Description
Communication method	Serial communication can be performed that conforms to the Consumer Electronics Control (CEC) standard in the High-Definition Multimedia Interface (HDMI) Ver. 1.4b.
CEC operation clock (f_{CEC})	Selectable from PCLKB/2^5, PCLKB/2^6, PCLKB/2^7, PCLKB/2^8, PCLKB/2^9, PCLKB/2^{10}, CECCLK, and CECCLK/2^8
Interrupt sources	• Data interrupt (INTDA) • Communication complete interrupt (INTCE) • Error interrupt (INTERR) (transmit, ACK, arbitration, timing, underrun, overrun, and bus lock errors)
Other functions	• Communication bit width adjustment function Can be used to set the low-level width and bit width of the start bit and data bit that configure the CEC data frame during transmission. • Count function during signal-free time Can be used to count during the signal-free time (transmission disable period) specified in the CEC standard and set the count period. • Error handling function Can be used to output an error handling pulse by detecting a timing error of the data bit. • Function that restarts reception by detecting the start bit during reception

37. CEC Transmission/Reception Circuit (CEC)

37.1 Overview

CEC发射接收电路可以产生和接收符合消费电子的CEC信号
控制（CEC）标准，并通过CEC自动检测通信状态。使用这些功能可以轻松控制CEC发送接收。

表37.1列出了CEC规范，图37.1显示了框图。

Table 37.1 CEC specifications

Parameter	Description
通讯方式	可以执行符合高清多媒体接口(HDMI)版本中的消费电子控制(CEC)标准的串行通信。1.4b。
CEC操作时钟(fCEC)	可选择PCLKB25、PCLKB26、PCLKB27、PCLKB28、PCLKB29、PCLKB210、CECCLK, and CECCLK/2^8
中断源	• 数据中断(INTDA) • 通信完成中断(INTCE) • 错误中断(INTERR)（发送、ACK、仲裁、计时、欠载、溢出和总线锁定错误 ）
其他功能	• 通讯位宽调整功能 可用于设置在传输过程中配置CEC数据帧的起始位和数据位的低电平宽度和位宽。 • 无信号时间计数功能 可用于在CEC标准中规定的无信号时间（传输禁用时间段）内进行计数并设置计数时间段 。 • 错误处理功能 可用于通过检测数据位的时序错误来输出错误处理脉冲。 • 通过在接收期间检测起始位来重新开始接收的功能

RA生态工作室

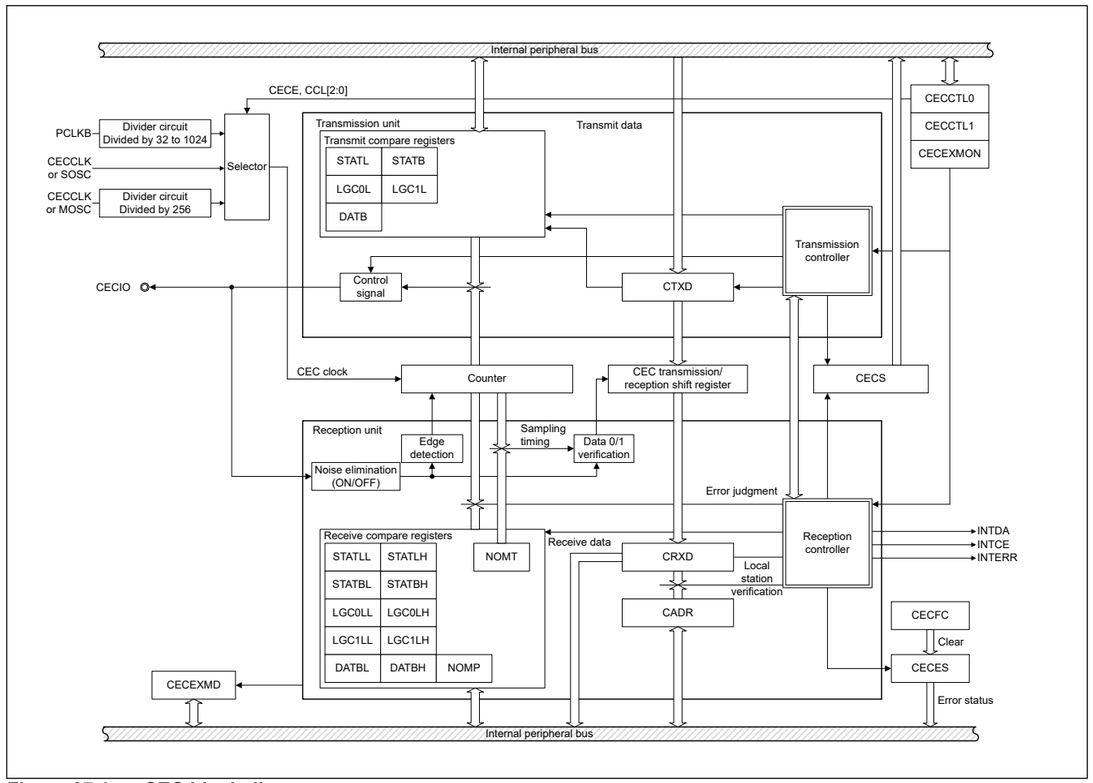

Figure 37.1 CEC block diagram

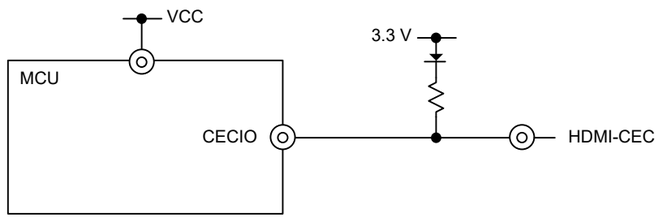
Figure 37.2 shows an example of I/O pin connection to the external circuit. Table 37.2 lists an I/O pin used for the CEC.



Note: When using the CEC transmission/reception function at a value other than VCC = 3.3 V ± 10%, an external circuit is required to meet the CEC standard value.

Figure 37.2 Example of I/O pin connection to external circuit (When using with Vcc = 3.3 ± 10%)

Table 37.2 CEC pin configuration

Pin name	I/O	Function
CECIO	I/O	CEC data communication

37.1.1 Term Description

- Initiator: Device that transmits or is transmitting CEC messages
- Follower: Device that receives or is receiving CEC messages

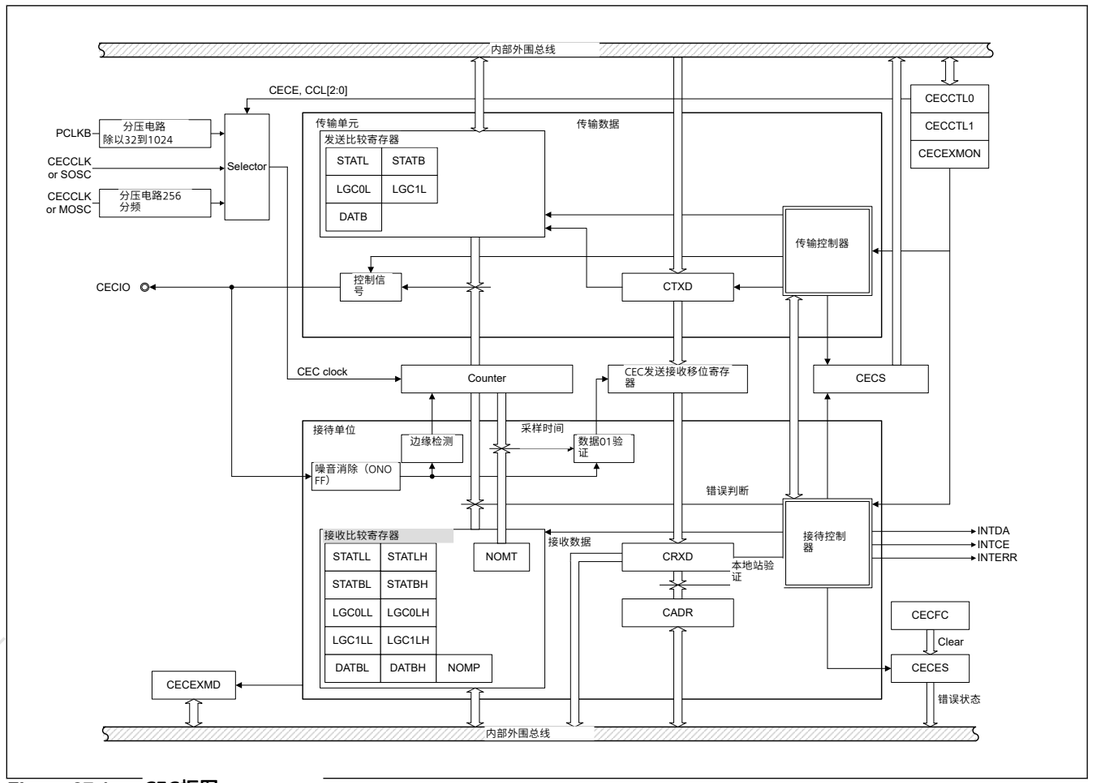


Figure 37.1 CEC框图

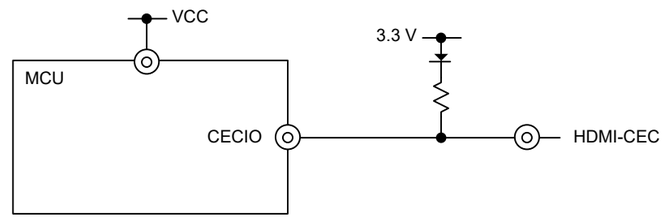
图37.2显示了IO引脚连接到外部电路的示例。表37.2列出了用于CEC的IO引脚。



Note: 在VCC=3.3V±10%以外的值使用CEC发送接收功能时，需要外部电路以满足CEC标准值。

Figure 37.2 IO引脚与外部电路的连接示例（使用Vcc=3.3±10%时）

Table 37.2 CEC引脚配置

引脚名称	I/O	Function
CECIO	I/O	CEC数据通信

37.1.1 术语描述

- Initiator：发送或正在发送CEC消息的设备
- Follower：接收或正在接收CEC消息的设备

- Message: All data from the start bit to the operand
- Initiator address: Source address
- Destination address: Destination address
- Direct address communication (direct address message): Communication with one follower
- Broadcast communication (broadcast message): Communication with multiple followers
- Arbitration: Prioritizing devices that output a low level to the CEC line when multiple initiators exist
- Arbitration loss: State in which competing devices are prioritized. At this time, the local station stops transmitting
- Bus free: State in which no communication is performed but transmission can be performed
- Bus busy: During communication
- Error handling: Outputting an error handling pulse (low level with a width of the bit width × 1.5) and transitioning to the communication standby state when a received bit width is shorter than the setting bit width of the data
- ACK/NACK: The logic levels received at the ACK bit timing are as follows:
  ACK: Outputs logical 0
  NACK: Outputs logical 1

(Example) If the initiator outputs logical 1 and the follower outputs logical 0 during an ACK bit period:
Initiator: Transmits a NACK
Follower: Transmits an ACK

Figure 37.3 shows an example of outputting the ACK bit.

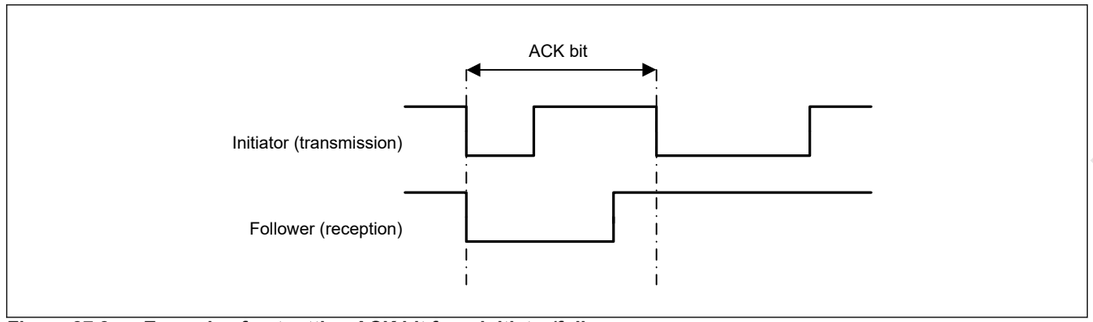


Figure 37.3 Example of outputting ACK bit from initiator/follower

37.2 Register Descriptions

37.2.1 CADR : CEC Local Address Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	ADR14	ADR13	ADR12	ADR11	ADR10	ADR09	ADR08	ADR07	ADR06	ADR05	ADR04	ADR03	ADR02	ADR01	ADR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADR00	Local Address at Address 0 (TV) 0: Does not set as local address. 1: Sets as local address.	R/W

●Message：从起始位到操作数的所有数据

●发起者地址：源地址

●目的地址：目的地址

●直接地址通讯（directaddressmessage）：与一个跟随者通讯

●广播通信（broadcastmessage）：与多个follower的通信

●仲裁：当存在多个发起方时，优先向CEC线路输出低电平的设备

●仲裁丢失：竞争设备优先的状态。此时本地站停止发射

●Busfree：不进行通信但可以进行传输的状态

●总线忙：通讯中

●错误处理：当接收到的位宽小于数据的设置位宽时，输出一个错误处理脉冲（位宽×1.5的低电平）并转移到通信待机状态

●ACKNACK：在ACK位时序接收到的逻辑电平如下：ACK：输出逻辑0

NACK：输出逻辑1

（示例）如果在ACK位周期内，发起方输出逻辑1，跟随方输出逻辑0：发起方：发送NACK跟随方：发送ACK

图37.3显示了输出ACK位的示例。

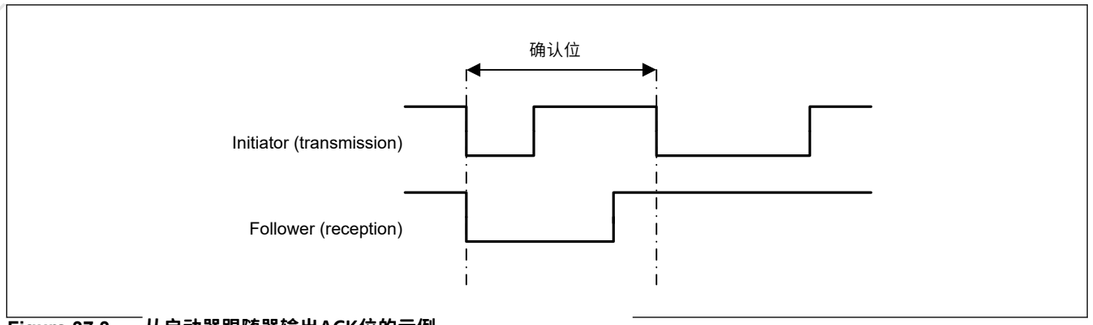

Figure 37.3 从启动器跟随器输出ACK位的示例

37.2 注册说明

37.2.1 CADR:CEC本地地址设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	ADR14	ADR13	ADR12	ADR11	ADR10	ADR09	ADR08	ADR07	ADR06	ADR05	ADR04	ADR03	ADR02	ADR01	ADR00
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADR00	地址0的本地地址(TV) 0：不设置为本地地址。1：设置为本地地址。	R/W

Bit	Symbol	Function	R/W
1	ADR01	Local Address Setting at Address 1 (recording device 1) 0: Does not set as local address. 1: Sets as local address.	R/W
2	ADR02	Local Address Setting at Address 2 (recording device 2) 0: Does not set as local address. 1: Sets as local address.	R/W
3	ADR03	Local Address Setting at Address 3 (tuner 1) 0: Does not set as local address. 1: Sets as local address.	R/W
4	ADR04	Local Address Setting at Address 4 (playback device 1) 0: Does not set as local address. 1: Sets as local address.	R/W
5	ADR05	Local Address Setting at Address 5 (audio system) 0: Does not set as local address. 1: Sets as local address.	R/W
6	ADR06	Local Address Setting at Address 6 (tuner 2) 0: Does not set as local address. 1: Sets as local address.	R/W
7	ADR07	Local Address Setting at Address 7 (tuner 3) 0: Does not set as local address. 1: Sets as local address.	R/W
8	ADR08	Local Address Setting at Address 8 (playback device 2) 0: Does not set as local address. 1: Sets as local address.	R/W
9	ADR09	Local Address Setting at Address 9 (recording device 3) 0: Does not set as local address. 1: Sets as local address.	R/W
10	ADR10	Local Address Setting at Address 10 (tuner 4) 0: Does not set as local address. 1: Sets as local address.	R/W
11	ADR11	Local Address Setting at Address 11 (playback device 3) 0: Does not set as local address. 1: Sets as local address.	R/W
12	ADR12	Local Address Setting at Address 12 (reserved) 0: Does not set as local address. 1: Sets as local address.	R/W
13	ADR13	Local Address Setting at Address 13 (reserved) 0: Does not set as local address. 1: Sets as local address.	R/W
14	ADR14	Local Address Setting at Address 14 (specific use) 0: Does not set as local address. 1: Sets as local address.	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

Note: To specify address 15 (unregistered) as the CEC local address, clear the ADR00 to ADR14 bits to 0.
Note: Do not rewrite the set value during communication (CECS.BUSST = 1).

The CADR register is a 16-bit register that sets local addresses. This register is valid only during a reception, the ADR00 to ADR14 bits correspond to CEC logical addresses 0 to 14, and up to 15 local addresses can be set. To specify address 15 as the CEC local address, clear the ADR00 to ADR14 bits to 0. A broadcast address always operates as a local address.

For example, when using addresses 0 as local addresses, set the ADR00 bit to 1.

Bit	Symbol	Function	R/W
1	ADR01	地址1的本地地址设置（记录设备1） 0：不设置为本地地址。1：设置为本地地址。	R/W
2	ADR02	地址2的本地地址设置（记录设备2） 0：不设置为本地地址。1：设置为本地地址。	R/W
3	ADR03	地址3的本地地址设置（调谐器1） 0：不设置为本地地址。1：设置为本地地址。	R/W
4	ADR04	地址4的本地地址设置（播放设备1） 0：不设置为本地地址。1：设置为本地地址。	R/W
5	ADR05	地址5的本地地址设置（音频系统） 0：不设置为本地地址。1：设置为本地地址。	R/W
6	ADR06	地址6的本地地址设置（调谐器2） 0：不设置为本地地址。1：设置为本地地址。	R/W
7	ADR07	地址7的本地地址设置（调谐器3） 0：不设置为本地地址。1：设置为本地地址。	R/W
8	ADR08	地址8的本地地址设置（播放设备2） 0：不设置为本地地址。1：设置为本地地址。	R/W
9	ADR09	地址9的本地地址设置（记录设备3） 0：不设置为本地地址。1：设置为本地地址。	R/W
10	ADR10	地址10的本地地址设置（调谐器4） 0：不设置为本地地址。1：设置为本地地址。	R/W
11	ADR11	地址11的本地地址设置（播放设备3） 0：不设置为本地地址。1：设置为本地地址。	R/W
12	ADR12	地址12的本地地址设置（保留） 0：不设置为本地地址。1：设置为本地地址。	R/W
13	ADR13	地址13的本地地址设置（保留） 0：不设置为本地地址。1：设置为本地地址。	R/W
14	ADR14	地址14的本地地址设置（具体使用） 0：不设置为本地地址。1：设置为本地地址。	R/W
15	—	该位读取为0。写入值应为0。	R/W

Note: 要将地址15（未注册）指定为CEC本地地址，请将ADR00至ADR14位清零。
Note: 通信期间不要改写设定值（CECS.BUSST=1）。

CADR寄存器是一个16位寄存器，用于设置本地地址。该寄存器仅在接收期间有效，ADR00至ADR14位对应CEC逻辑地址0至14，最多可设置15个本地地址。要将地址15指定为CEC本地地址，请将ADR00至ADR14位清除为0。广播地址始终作为本地地址运行。

例如，当使用地址0作为本地地址时，将ADR00位设置为1。

37.2.2 CTXD : CEC Transmission Buffer Register

Base address: CEC = 0x400A_C000

Offset address: 0x40

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	0	0	0	0	0	0	0	0

The CTXD sequentially transmits 8 bits of data, starting from bit 7 with MSB first. A transmission/reception interrupt request signal (INTDA) is generated at the start timing of the header block and data block. Successive transmission can be performed by writing the next data to the CTXD register before the transmission ends after INTDA is generated.

If an underrun error occurs (UERR = 1), transmission does not continue. An error interrupt is generated and the transmission wait state is entered.

If transmit data is written to this register after a data interrupt (INTDA) is generated during transmission of the last block, the data is invalid.

37.2.3 CRXD : CEC Reception Buffer Register

Base address: CEC = 0x400A_C000

Offset address: 0x41

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	0	0	0	0	0	0	0	0

The CRXD retains receive data that can be read by reading this register. For every byte of data received, new data is transferred from the CEC Reception Shift register.

If an overrun error occurs (CECES.OERR = 1), the data of the reception buffer register will be overwritten.

37.2.4 CECCTL0 : CEC Control Register 0

Base address: CEC = 0x400A_C000

Offset address: 0x45

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CECE	ACKTEN	CCL[2:0]			TXTRG	CECRXEN	EOM
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EOM	EOM Setting 0: Continues transmission. 1: Last frame	R/W
1	CECRXEN	Reception Enable Control 0: Disables continuing reception or reports abnormal reception. 1: Enables continuing reception or reports normal reception. Table 37.3 lists the reception status and ACK/NACK timing output.	R/W
2	TXTRG	Transmission Start Trigger 0: No effect 1: Starts CEC transmission.	W

37.2.2 CTXD:CEC传输缓冲寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x40

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
重置后的值:	0	0	0	0	0	0	0	0

CTXD依次发送8位数据，从第7位开始，MSB在前。发送接收中断请求信号(INTDA)在标题块和数据块的开始定时产生。在产生INTDA后，在发送结束前将下一个数据写入CTXD寄存器，可以进行连续发送。

如果发生欠载错误(UERR=1)，则传输不会继续。产生错误中断并进入传输等待状态。

如果在最后一个块的传输过程中产生数据中断（INTDA）后将传输数据写入该寄存器，则数据无效。

37.2.3 CRXD:CEC接收缓冲寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x41

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
重置后的值:	0	0	0	0	0	0	0	0

CRXD保留可通过读取该寄存器读取的接收数据。对于接收到的每个数据字节，都会从CEC接收移位寄存器传输新数据。

如果发生溢出错误（CECES.OERR=1），接收缓冲寄存器的数据将被覆盖。

37.2.4 CECCTL0:CEC控制寄存器0

Base address: CEC = 0x400A_C000

Offset address: 0x45

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CECE	ACKTEN	CCL[2:0]			TXTRG	CECRXEN	EOM
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EOM	EOM Setting 0：继续发送。1：最后一帧	R/W
1	CECRXEN	接收启用控制 0：禁止继续接收或报告接收异常。1：启用继续接收或报告正常接收。 表37.3列出了接收状态和ACKNACK时序输出。	R/W
2	TXTRG	传输开始触发 0：无效1：开始CEC传输。	W

Bit	Symbol	Function	R/W
5:3	CCL[2:0]	CEC Clock Select*1 0 0 0: PCLKB/2^5 0 0 1: PCLKB/2^6 0 1 0: PCLKB/2^7 0 1 1: PCLKB/2^8 1 0 0: PCLKB/2^9 1 0 1: PCLKB/2^10 1 1 0: CECCLK (when using SOSC) 1 1 1: CECCLK/2^8 (when using MOSC)	R/W
6	ACKTEN	ACK Bit Timing Error (Bit Width) Check Enable*1 0: Does not detect ACK bit timing errors. 1: Detects ACK bit timing errors.	R/W
7	CECE	CEC Operation Enable Flag 0: Disables CEC operation. 1: Enables CEC operation.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

CECCTL0 selects enabling operation, starting transmission, and the operating clock.

EOM bit (EOM Setting)

The next frame after 1 is written to this bit is the last frame.

Set the EOM bit before writing transmit data to the transmission buffer register (CTXD).

Writing to the EOM bit and the transmission buffer register (CTXD) should be set after a data interrupt (INTDA) is generated and before the next data interrupt (INTDA) is generated (timing at which the EOM bit transmission is complete). However, this setting is not required when the data interrupt (INTDA) for the last block is generated.

CECRXEN bit (Reception Enable Control)

Setting the CECRXEN bit to 1 enables reception. Set this bit to 1 after determining the local address (setting the CADR register). Do not rewrite the set value during communication (CECS.BUSST = 1).

Table 37.3 Reception status and ACK/NACK timing output from the status of Reception Enable Control Bit

CECRXEN	Reception Enable Control Bit		
1	Reception status		ACK/NACK timing output
	During direct address reception (to local station)	Normal reception	ACK
		Timing error occurrence	NACK
	During broadcast reception	Normal reception	NACK
		Timing error occurrence	ACK
	During direct address reception (to another station)	Not participating in communication (high-impedance)	
0	Reception status		ACK/NACK timing output
	During direct address reception (to local station)	Normal reception	NACK
		Timing error occurrence	NACK
	During broadcast reception	Normal reception	ACK
		Timing error occurrence	ACK
	During direct address reception (to another station)	Not participating in communication (high-impedance)	

TXTRG bit (Transmission Start Trigger)

Setting TXTRG to 1 starts transmission.

This bit is a trigger bit and the read value is 0.

Bit	Symbol	Function	R/W
5:3	CCL[2:0]	CEC时钟选择*1 0 0 0: PCLKB/2^5 0 0 1: PCLKB/2^6 0 1 0: PCLKB/2^7 0 1 1: PCLKB/2^8 1 0 0: PCLKB/2^9 1 0 1: PCLKB/2^10 1 1 0: CECCLK (when using SOSC) 1 1 1: CECCLK/2^8 (when using MOSC)	R/W
6	ACKTEN	ACKBitTimingError(BitWidth)CheckEnable*1 0：不检测ACK位时序错误。1：检测ACK位时序错误。	R/W
7	CECE	CEC操作启用标志 0：禁用CEC操作。1：启用CEC操作。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

CECCTL0选择使能操作、开始传输和操作时钟。

EOM bit (EOM Setting)

向该位写入1之后的下一帧是最后一帧。

在将发送数据写入发送缓冲寄存器(CTXD)之前设置EOM位。

写入EOM位和发送缓冲寄存器(CTXD)应在数据中断(INTDA)产生之后和下一个数据中断(INTDA)产生之前（EOM位发送完成的时间）置位。但是，当产生最后一个块的数据中断(INTDA)时，不需要此设置。

CECRXEN位（接收使能控制）

将CECRXEN位设置为1使能接收。在确定本地地址（设置CADR寄存器）后将该位设置为1。通信期间不要改写设定值（CECS.BUSST=1）。

Table 37.3 从接收使能控制位的状态输出接收状态和ACKNACK时序

CECRXEN	接收使能控制位		
1	接收状态		ACKNACK定时输出
	直接地址接收期间（本地站）	正常接收	ACK
		发生时序错误	NACK
	广播接收期间	正常接收	NACK
		发生时序错误	ACK
	直接地址接收期间（到另一个站）	不参与通讯（高阻）	
0	接收状态		ACKNACK定时输出
	直接地址接收期间（本地站）	正常接收	NACK
		发生时序错误	NACK
	广播接收期间	正常接收	ACK
		发生时序错误	ACK
	直接地址接收期间（到另一个站）	不参与通讯（高阻）	

TXTRG位（发送开始触发）

将TXTRG设置为1开始传输。

该位为触发位，读取值为0。

Set CECCTL0.TXTRG to 1 only when CEC operation is enabled (CECCTL0.CECE = 1) and the bus is free (CECS.BUSST = 0). Transmission starts no more than three CEC clock cycles after CECCTL0.TXTRG is set to 1.

CCL[2:0] bit (CEC Clock Select)

The CCL[2:0] bits select the CEC clock. Set the frequency of the CEC clock in the range of 23.4375 to 78.125 kHz. Table 37.4 and Table 37.5 show examples of CEC clock settings.

Table 37.4 Examples of CEC clock settings (1)

CEC clock selected	CEC operation clock (f_{CEC})					
	When PCLKB = 50 MHz	When PCLKB = 40 MHz	When PCLKB = 30 MHz	When PCLKB = 20 MHz	When PCLKB = 10 MHz	When PCLKB = 1 MHz
PCLKB/2^5	set prohibited	set prohibited	set prohibited	set prohibited	set prohibited	31.250 kHz
PCLKB/2^6	set prohibited	set prohibited	set prohibited	set prohibited	set prohibited	set prohibited
PCLKB/2^7	set prohibited	set prohibited	set prohibited	set prohibited	78.125 kHz	set prohibited
PCLKB/2^8	set prohibited	set prohibited	set prohibited	78.125 kHz	39.062 kHz	set prohibited
PCLKB/2^9	set prohibited	78.125 kHz	58.593 kHz	39.062 kHz	set prohibited	set prohibited
PCLKB/2^{10}	48.828 kHz	39.062 kHz	29.296 kHz	set prohibited	set prohibited	set prohibited

Table 37.5 Examples of CEC clock settings (2)

CEC clock selected	CEC operation clock (f_{CEC})
CECCLK	32.768 kHz (SOSC selected)
CECCLK/2^8	31.250 kHz to 78.125 kHz (MOSC selected)

ACKTEN bit (ACK Bit Timing Error (Bit Width) Check Enable)

When ACKTEN is set to 1, timing errors are detected for the bit width (the values specified for DATBL and DATBH), in addition to the low-level width of the ACK bit (the values specified for LGC0LL, LGC0LH, LGC1LL, and LGC1LH). However, the maximum bit width (DATBH) is not checked for the ACK bit of the last frame (EOM = 1) even if ACKTEN is 1.

CECE flag (CEC Operation Enable Flag)

Setting CECE to 1 enables CEC operation. Setting this flag to 0 resets the internal block but does not reset control registers.

37.2.5 CECCTL1 : CEC Control Register 1

Base address: CEC = 0x400A_C000

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CDFC	CINTMK	BLERRD	STERRD	CESEL[1:0]		SFT[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SFT[1:0]	Signal-Free Time Data Bit Width Select 0 0: 3-data bit width 0 1: 5-data bit width 1 0: 7-data bit width 1 1: Does not detect signal-free time.	R/W

仅当CEC操作使能(CECCTL0.CECE=1)且总线空闲(CECS.BUSST=0)时，才将CECCTL0.TXTRG设置为1。在CECCTL0.TXTRG设置为1后，传输开始不超过三个CEC时钟周期。

CCL[2:0]位（CEC时钟选择）

CCL[2:0]位选择CEC时钟。将CEC时钟的频率设置在23.4375到78.125kHz的范围内。表37.4和表37.5显示了CEC时钟设置的示例。

Table 37.4 CEC时钟设置示例(1)

选择CEC时钟	CEC操作时钟（fCEC）					
	When PCLKB = 50 MHz	When PCLKB = 40 MHz	When PCLKB = 30 MHz	When PCLKB = 20 MHz	When PCLKB = 10 MHz	When PCLKB = 1 MHz
PCLKB/2^5	设置禁止	设置禁止	设置禁止	设置禁止	设置禁止	31.250 kHz
PCLKB/2^6	设置禁止	设置禁止	设置禁止	设置禁止	设置禁止	设置禁止
PCLKB/2^7	设置禁止	设置禁止	设置禁止	设置禁止	78.125 kHz	设置禁止
PCLKB/2^8	设置禁止	设置禁止	设置禁止	78.125 kHz	39.062 kHz	设置禁止
PCLKB/2^9	设置禁止	78.125 kHz	58.593 kHz	39.062 kHz	设置禁止	设置禁止
PCLKB/2^{10}	48.828 kHz	39.062 kHz	29.296 kHz	设置禁止	设置禁止	设置禁止

Table 37.5 CEC时钟设置示例(2)

选择CEC时钟	CEC操作时钟（fCEC）
CECCLK	32.768 kHz (SOSC selected)
CECCLK/2^8	31.250 kHz to 78.125 kHz (MOSC selected)

ACKTEN位（ACK位时序错误（位宽）检查使能）

当ACKTEN设置为1时，除了ACK位的低电平宽度（为LGC0LL、LGC0LH、LGC1LL和LGC1LH指定的值）外，还会检测位宽度（为DATBL和DATBH指定的值）的时序错误）。但是，即使ACKTEN为1，也不检查最后一帧(EOM=1)的ACK位的最大位宽(DATBH)。

CECE标志（CEC操作启用标志）

将CECE设置为1可启用CEC操作。将此标志设置为0会重置内部模块，但不会重置控制寄存器。

37.2.5 CECCTL1:CEC控制寄存器1

Base address: CEC = 0x400A_C000

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CDFC	CINTMK	BLERRD	STERRD	CESEL[1:0]		SFT[1:0]	
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SFT[1:0]	无信号时间数据位宽选择 00：3个数据位宽01：5个数据位宽10：7个数据位宽11：不检测无信号时间。	R/W

Bit	Symbol	Function	R/W
3:2	CESEL[1:0]	Communication Complete Interrupt (INTCE) Generation Timing Select*1 0 0: Generates communication complete interrupt once after ACK transmission (reception) of the last frame (EOM = 1) is complete and another time after signal-free time is detected. 0 1: Generates communication complete interrupt after ACK transmission (reception) of the last frame (EOM = 1) is completed. 1 0: Generates communication complete interrupt after signal-free time is detected. 1 1: Setting prohibited	R/W
4	STERRD	Start Bit Error Detection Select*1 0: Does not detect timing errors during start bit reception. 1: Detects timing errors during start bit reception.	R/W
5	BLERRD	Bus Lock Detection Select*1 0: Does not detect sticking of receive data to high or low 1: Detects sticking of receive data to high or low.	R/W
6	CINTMK	CEC Data Interrupt (INTDA) Generation Select*1 0: Does not generate an interrupt when the addresses do not match. 1: Generates an interrupt when the addresses do not match.	R/W
7	CDFC	Digital Filter Select*1 0: Does not use a digital filter. 1: Uses a digital filter.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

The CECCTL1 register selects a digital filter, data interrupt generation, a start bit error interrupt, and whether to generate a communication complete interrupt and when to generate it.

SFT[1:0] bits (Signal-Free Time Data Bit Width Select)

The bit width of the signal-free time is selected by setting the SFT[1:0] bits in the NOMP register. Rewrite these bits only after confirming that the Signal-Free Time Rewrite Disable Report Flag (CECS.SFTST) is 0.

CESEL[1:0] bits (Communication Complete Interrupt (INTCE) Generation Timing Select)

The timing at which a communication complete interrupt (INTCE) is generated, is selected by setting the CESEL[1:0] bits.

STERRD bit (Start Bit Error Detection Select)

The STERRD bit detects timing errors during start bit reception according to the set value of the STATLL, STATLH, STATBL, or STATBH register by setting this bit to 1.

If a timing error occurred, the start bit for which the error occurred is determined to be disabled and communication standby state is entered.

If the STERRD bit is 0, no timing error is detected. All pulses are determined to be start bits.

BLERRD bit (Bus Lock Detection Select)

The bus lock status of the CEC line can be detected by setting the BLERRD bit to 1. If the next falling edge is not input for a period 2.5 times the 1-data bit width set with the NOMP register in a state where the falling edge of the CEC line is awaited (excluding the communication standby state), an error interrupt (INTERR) is generated the Bus Lock Error Detection Flag (BLERR) is set. Afterward, communication standby state is entered.

CINTMK bit (CEC Data Interrupt (INTDA) Generation Select)

The CINTMK bit selects whether to generate INTDA of the header block when the destination address and local address do not match during a reception or to generate INTCE when communication is complete.

CDFC bit (Digital Filter Select)

The CDFC bit eliminates noise from one CEC clock cycle using a digital filter.

Bit	Symbol	Function	R/W
3:2	CESEL[1:0]	通信完成中断(INTCE)发生时序选择*1 00：ACK发送后产生一次通信完成中断 最后一帧（EOM=1）的（接收）完成，并且在检测到信号空闲时间之后的另一个时间。 01：在最后一帧（EOM=1）的ACK发送（接收）完成后产生通信完成中断。 10：检测到无信号时间后产生通信完成中断。11：禁止设定	R/W
4	STERRD	开始位错误检测选择*1 0：在起始位接收期间不检测时序错误。1：在起始位接收期间检测时序错误。	R/W
5	BLERRD	总线锁定检测选择*1 0：不检测接收数据保持高位或低位1：检测接收数据保持高位或低位。	R/W
6	CINTMK	CEC数据中断(INTDA)生成选择*1 0：地址不匹配时不产生中断。1：地址不匹配时产生中断。	R/W
7	CDFC	数字滤波器选择*1 0：不使用数字滤波器。1：使用数字滤波器。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

CECCTL1寄存器选择数字滤波器、数据中断产生、起始位错误中断、是否产生通信完成中断以及何时产生。

SFT[1:0]位（无信号时间数据位宽选择）

通过设置NOMP寄存器中的SFT[1:0]位来选择无信号时间的位宽。只有在确认无信号时间重写禁用报告标志(CECS.SFTST)为0后才重写这些位。

CESEL[1:0]位（通信完成中断（INTCE）产生时序选择）

通过设置CESEL[1:0]位来选择产生通信完成中断(INTCE)的时序。

STERRD位（起始位错误检测选择）

STERRD位根据STATLL、STATLH、
STATBL或STATBH寄存器通过将该位设置为1。

如果发生时序错误，则将发生错误的起始位确定为无效，并进入通信待机状态。

如果STERRD位为0，则未检测到时序错误。所有脉冲都被确定为起始位。

BLRRD位（总线锁定检测选择）

通过将BLRRD位设置为1，可以检测CEC线的总线锁定状态。如果在NOMP寄存器设置的1个数据位宽度的2.5倍期间内没有输入下一个下降沿，则在下降沿状态下等待CEC线的状态（不包括通信待机状态），产生错误中断(INTERR)总线锁定错误检测标志(BLERR)置位。之后，进入通信待机状态。

CINTMK位（CEC数据中断(INTDA)生成选择）

CINTMK位选择是在接收过程中目标地址和本地地址不匹配时生成头块的INTDA，还是在通信完成时生成INTCE。

CDFC位（数字滤波器选择）

CDFC位使用数字滤波器消除一个CEC时钟周期的噪声。

37.2.6 CECS : CEC Communication Status Register

Base address: CEC = 0x400A_C000

Offset address: 0x43

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SFTST	—	—	ITCEF	EOMF	TXST	BUSST	ADRF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADRF	Address Match Detection Flag 0: During communication between other stations, while communication is stopped, or while the local station is transmitting 1: During local reception	R
1	BUSST	Bus Busy Detection Flag 0: Bus-free state 1: Bus-busy state	R
2	TXST	Transmission Status Flag 0: During communication standby state or reception (a follower is operating.) 1: During transmission (an initiator is operating.)	R
3	EOMF	EOM Flag 0: The EOM flag received immediately before is logically 0. 1: The EOM flag received immediately before is logically 1.	R
4	ITCEF	INTCE Generation Source Flag 0: Generates a communication complete interrupt (INTCE) if the signal-free time is counted. 1: Generates INTCE if communication is complete or an error is detected.	R
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	SFTST	Signal-Free Time Rewrite Disable Report Flag 0: Enables rewriting CECCTL1.SFT[1:0]. 1: Disables rewriting CECCTL1.SFT[1:0].	R

The CECS register indicates the CEC communication status.

ADRF flag (Address Match Detection Flag)

The ADRF flag checks whether communication is addressed to the local station.

[Setting conditions]

- When the local address and reception destination address match
- When a broadcast address is received

[Clearing conditions]

- When CEC operation is stopped (CECCTL0.CECE = 0)
- When reception is completed

BUSST flag (Bus Busy Detection Flag)

The BUSST flag checks the CEC bus state.

[Setting conditions]

- When a fall of the CEC line is detected
- When the status CEC operation is stopped changes to CEC operation is enabled (CECCTL0.CECE is changed from 0 to 1)

[Clearing conditions]

- When CEC operation is stopped (CECCTL0.CECE = 0)

37.2.6 CECS:CEC通信状态寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x43

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SFTST	—	—	ITCEF	EOMF	TXST	BUSST	ADRF
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ADRF	地址匹配检测标志 0：其他站通信中、通信停止中、本站发送中 1：在本地接收期间	R
1	BUSST	总线忙检测标志 0: Bus-free state 1: Bus-busy state	R
2	TXST	传输状态标志 0：通信待机或接收中（追随者动作中）1：发送中（发起者动作中）	R
3	EOMF	EOM Flag 0：之前接收到的EOM标志在逻辑上为0。1：之前接收到的EOM标志在逻辑上为1。	R
4	ITCEF	INTCE生成源标志 0：如果对无信号时间进行计数，则生成通信完成中断(INTCE)。 1：如果通信完成或检测到错误，则生成INTCE。	R
6:5	—	这些位被读取为0。写入值应为0。	R/W
7	SFTST	无信号时间重写禁用报告标志 0：启用重写CECCTL1.SFT[1:0]。1：禁止重写CECCTL1.SFT[1:0]。	R

CECS寄存器指示CEC通信状态。

ADRF标志（地址匹配检测标志）

ADRF标志检查通信是否寻址到本地站。

[Setting conditions]

●当本地地址和接收目的地地址匹配时

●收到广播地址时

[Clearing conditions]

●CEC操作停止时(CECCTL0.CECE=0)

●接收完成时

BUSST标志（总线忙检测标志）

BUSST标志检查CEC总线状态。

[Setting conditions]

●当检测到CEC线路下降时

●当状态CEC操作停止时变为CEC操作启用（CECCTL0.CECE从0变为1）

[Clearing conditions]

●CEC操作停止时(CECCTL0.CECE=0)

RA生态工作室

- When the signal-free time has elapsed after communication has ended

TXST flag (Transmission Status Flag)

The TXST flag checks whether transmission is in progress.

EOMF flag (EOM Flag)

The EOMF flag checks the value of the bit received immediately before. The value is updated each time a data interrupt (INTDA) is generated.

ITCEF flag (INTCE Generation Source Flag)

By checking the ITCEF flag after INTCE is generated, it can be determined which case is the interrupt generation source that the signal-free time is counted, communication ends, or an error is detected. This setting is enabled only if CECCTL1.CESEL[1:0] are cleared to 0.

SFTST flag (Signal-Free Time Rewrite Disable Report Flag)

The SFTST flag checks whether rewriting CECCTL1.SFT[1:0] is enabled or disabled.

[Setting condition]

- When a write access to CECCTL1 is performed

[Clearing conditions]

- When CEC operation is stopped (CECCTL0.CECE = 0)
- When the CECCTL1.SFT[1:0] rewrite disable period has elapsed

37.2.7 CECES : CEC Communication Error Status Register

Base address: CEC = 0x400A C000

Offset address: 0x42

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	BLERR	AERR	TXERR	TERR	ACKERR	UERR	OERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OERR	Overrun Error Detection Flag 0: No overrun error has occurred. 1: An overrun error has occurred.	R
1	UERR	Underrun Error Detection Flag 0: No underrun error has occurred. 1: An underrun error has occurred.	R
2	ACKERR	ACK Error Detection Flag 0: No ACK error has occurred. 1: An ACK error has occurred.	R
3	TERR	Timing Error Detection Flag 0: No timing error has occurred. 1: A timing error has occurred.	R
4	TXERR	Transmission Error Detection Flag*1 0: No transmission error has occurred. 1: A transmission error has occurred.	R
5	AERR	Arbitration Loss Detection Flag 0: No arbitration loss has occurred. 1: An arbitration loss has occurred.	R

●通信结束后经过无信号时间时

TXST标志（传输状态标志）

TXST标志检查传输是否正在进行。

EOMF flag (EOM Flag)

EOMF标志检查之前收到的位的值。每次产生数据中断(INTDA)时都会更新该值。

ITCEF标志（INTCE生成源标志）

通过在INTCE产生后检查ITCEF标志位，可以判断是中断产生源是计数无信号时间、通信结束还是检测到错误。仅当CECCTL1.CESEL[1:0]被清除为0时才启用此设置。

SFTST标志（无信号时间重写禁用报告标志）

SFTST标志检查重写CECCTL1.SFT[1:0]是启用还是禁用。

[Setting condition]

●对CECCTL1进行写访问时

[Clearing conditions]

●CEC操作停止时(CECCTL0.CECE=0)

●当CECCTL1.SFT[1:0]重写禁止周期已过时

37.2.7 CECES:CEC通信错误状态寄存器

Base address: CEC = 0x400A C000

Offset address: 0x42

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	BLERR	AERR	TXERR	TERR	ACKERR	UERR	OERR
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OERR	溢出错误检测标志 0：未发生溢出错误。1：发生溢出错误。	R
1	UERR	欠载错误检测标志 0：未发生欠载错误。1：发生欠载错误。	R
2	ACKERR	ACK错误检测标志 0：未发生ACK错误。1：发生ACK错误。	R
3	TERR	定时错误检测标志 0：未发生时序错误。1：发生时序错误。	R
4	TXERR	传输错误检测标志*1 0：未发生传输错误。1：发生传输错误。	R
5	AERR	仲裁丢失检测标志 0：未发生仲裁丢失。1：仲裁失败。	R

Bit	Symbol	Function	R/W
6	BLERR	Bus Lock Error Detection Flag 0: No bus lock error has occurred. 1: A bus lock error has occurred.	R
7	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. Transmission errors are not detected while transmitting the start bit and ACK bit.

CECES indicates whether a bus lock error, arbitration loss, transmission error, timing error, ACK error, underrun error, or overrun error is detected.

OERR flag (Overrun Error Detection Flag)

The OERR flag checks whether an overrun has occurred.

[Setting condition]

- When the next receive operation completes before the receive data stored in the reception buffer register (CRXD) is read

[Clearing condition]

- When 1 is written to CECFC.OCTRG

UERR flag (Underrun Error Detection Flag)

The UERR flag checks whether an underrun has occurred.

[Setting condition]

- When transmit data is not written to the transmission buffer register (CTXD) after a data interrupt (INTDA) is generated and before the next interrupt (INTDA) is generated

[Clearing condition]

- When 1 is written to CECFC.UCTRG

ACKERR flag (ACK Error Detection Flag)

The ACKERR flag checks whether an ACK error has occurred.

[Setting conditions]

- When logical 1 is received at the ACK bit timing during a direct address communication
- When logical 0 is received at the ACK bit timing during a broadcast communication
- When logical 1 is received at the ACK bit timing during a logical address allocation transmission

[Clearing condition]

- When 1 is written to CECFC.ACKCTRG

TERR flag (Timing Error Detection Flag)

The TERR flag checks whether a timing error has occurred.

[Setting condition]

- When a violation is detected in the timing check of the received data

[Clearing condition]

- When 1 is written to CECFC.TCTRG

TXERR flag (Transmission Error Detection Flag)

The TXERR flag checks whether a transmission error has occurred.

[Setting condition]

- When the logic of the transmit and receive data are compared and do not match when the initiator is operating

Bit	Symbol	Function	R/W
6	BLERR	总线锁定错误检测标志 0：未发生总线锁定错误。1：发生总线锁定错误。	R
7	—	该位读取为0。写入值应为0。	R/W

注1.发送起始位和ACK位时不会检测到发送错误。

CECES指示是否检测到总线锁定错误、仲裁丢失、传输错误、定时错误、ACK错误、欠载错误或溢出错误。

OERR标志（溢出错误检测标志）

OERR标志检查是否发生了溢出。

[Setting condition]

●在接收缓冲寄存器（CRXD）中存储的接收数据被读取之前下一个接收操作完成时

[Clearing condition]

●CECFC.OCTRG写入1时

UERR标志（欠载错误检测标志）

UERR标志检查是否发生了欠载。

[Setting condition]

●发生数据中断（INTDA）后和下一个中断（INTDA）发生前，未将发送数据写入发送缓冲寄存器（CTXD）时

[Clearing condition]

●CECFC.UCTRG写入1时

ACKERR标志（ACK错误检测标志）

ACKERR标志检查是否发生了ACK错误。

[Setting conditions]

●在直接地址通信期间，在ACK位定时接收到逻辑1时

●在广播通信中，在ACK位定时接收到逻辑0时

●在逻辑地址分配传输过程中，在ACK位定时接收到逻辑1时

[Clearing condition]

●CECFC.ACKCTRG写入1时

TERR标志（定时错误检测标志）

TERR标志检查是否发生了计时错误。

[Setting condition]

●在接收数据的时序检查中检测到违规时

[Clearing condition]

●CECFC.TCTRG写入1时

TXERR标志（传输错误检测标志）

TXERR标志检查是否发生了传输错误。

[Setting condition]

●当发起方运行时，比较发送和接收数据的逻辑不匹配时

[Clearing condition]

- When 1 is written to CECFC.TXCTRG

AERR flag (Arbitration Loss Detection Flag)

The AERR flag checks whether arbitration is lost.

[Setting condition]

- When arbitration loss occurs between start bit transmission and initiator address transmission

[Clearing condition]

- When 1 is written to CECFC.ACTRG

BLERR flag (Bus Lock Error Detection Flag)

The BLERR flag checks whether a bus lock error has occurred.

[Setting condition]

- When the next falling edge is not input for a period of 2.5 times the 1-data bit width set by the NOMP register after the falling edge of the CEC reception signal and while the CEC reception signal is fixed to low or high midway through a frame

[Clearing condition]

- When 1 is written to CECFC.BLCTRG

37.2.8 CECFC : CEC Communication Error Flag Clear Trigger Register

Base address: CEC = 0x400A_C000

Offset address: 0x44

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	BLCTRG	ACTRG	TXCTRG	TCTRG	ACKCTRG	UCTRG	OCTRG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OCTRG	Overrun Error Detection Flag Clear Trigger*1 0: Does not clear overrun error detection flag. 1: Clears overrun error detection flag.	W
1	UCTRG	Underrun Error Detection Flag Clear Trigger*1 0: Does not clear underrun error detection flag. 1: Clears underrun error detection flag.	W
2	ACKCTRG	ACK Error Detection Flag Clear Trigger*1 0: Does not clear ACK error detection flag. 1: Clears ACK error detection flag.	W
3	TCTRG	Timing Error Detection Flag Clear Trigger*1 0: Does not clear timing error detection flag. 1: Clears timing error detection flag.	W
4	TXCTRG	Transmission Error Detection Flag Clear Trigger*1 0: Does not clear transmission error detection flag. 1: Clears transmission error detection flag.	W
5	ACTRG	Arbitration Loss Detection Flag Clear Trigger*1 0: Does not clear arbitration loss detection flag. 1: Clears arbitration loss detection flag.	W
6	BLCTRG	Bus Lock Error Detection Flag Clear Trigger*1 0: Does not clear bus lock error detection flag. 1: Clears bus lock error detection flag.	W

[Clearing condition]

●CECFC.TXCTRG写入1时

AERR标志（仲裁丢失检测标志）

AERR标志检查仲裁是否丢失。

[Setting condition]

●当起始位传输和发起地址传输之间发生仲裁丢失时

[Clearing condition]

●CECFC.ACTRG写入1时

BLERR标志（总线锁定错误检测标志）

BLERR标志检查是否发生了总线锁定错误。

[Setting condition]

●在CEC接收信号的下降沿之后，在NOMP寄存器设置的1个数据位宽度的2.5倍的时间内没有输入下一个下降沿，并且CEC接收信号在中途固定为低电平或高电平时框架

[Clearing condition]

●CECFC.BLCTRG写入1时

37.2.8 CECFC:CEC通信错误标志清除触发寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x44

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	BLCTRG	ACTRG	TXCTRG	TCTRG	ACKCTRG	UCTRG	OCTRG
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OCTRG	溢出错误检测标志清除触发*1 0：不清除溢出错误检测标志。1：清除溢出错误检测标志。	W
1	UCTRG	欠载错误检测标志清除触发*1 0：不清除欠载错误检测标志。1：清除欠载错误检测标志。	W
2	ACKCTRG	ACK错误检测标志清除触发*1 0：不清除ACK错误检测标志。1：清除ACK错误检测标志。	W
3	TCTRG	定时错误检测标志清除触发*1 0：不清除定时错误检测标志。1：清除时序错误检测标志。	W
4	TXCTRG	传送错误检测标志清除触发*1 0：不清除传输错误检测标志。1：清除传输错误检测标志。	W
5	ACTRG	仲裁丢失检测标志清除触发*1 0：不清除仲裁丢失检测标志。1：清除仲裁丢失检测标志。	W
6	BLCTRG	总线锁定错误检测标志清除触发*1 0：不清除总线锁定错误检测标志。1：清除总线锁定错误检测标志。	W

Bit	Symbol	Function	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. The read value is 0.

The CECFC register clears error detection flags written to the communication error status register (CECES). Only the set bits can be cleared by setting 1 to each flag.

37.2.9 STATL : CEC Transmission Start Bit Low Width Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x06

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	STATL[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	STATL[8:0]	CEC Transmission Start Bit Low Width Setting*1 Low-level width of the start bit during a transmission Low-level width = (set value of STATL[8:0] bits + 1) × CEC clock cycle	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

37.2.10 STATB : CEC Transmission Start Bit Width Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	STATB[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	STATB[8:0]	CEC Transmission Start Bit Width Setting*1 Bit width of the start bit during a transmission Bit width = (set value of STATB[8:0] bits + 1) × CEC clock cycle	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

37.2.11 LGC0L : CEC Transmission Logical 0 Low Width Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x08

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LGC0L[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7	—	该位读取为0。写入值应为0。	R/W

注1.读取值为0。

CECFC寄存器清除写入通信错误状态寄存器(CECES)的错误检测标志。通过将每个标志设置为1，只能清除设置的位。

37.2.9 STATL:CEC传输起始位低宽度设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x06

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	STATL[8:0]								
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	STATL[8:0]	CEC发送起始位低宽度设置*1 传输期间起始位的低电平宽度 低电平宽度=(STATL[8:0]位的设置值+1)×CEC时钟周期	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

37.2.10 STATB:CEC发送起始位宽设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	STATB[8:0]								
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	STATB[8:0]	CEC发送起始位宽设置*1 传输期间起始位的位宽 位宽=(STATB[8:0]位的设置值+1)×CEC时钟周期	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

37.2.11 LGC0L:CEC传输逻辑0低宽度设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x08

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LGC0L[8:0]								
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	LGC0L[8:0]	CEC Transmission Logical 0 Low Width Setting*1 Low-level width of logical 0 during a transmission Low-level width = (set value of LGC0L[8:0] bits + 1) × CEC clock cycle	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

37.2.12 LGC1L : CEC Transmission Logical 1 Low Width Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x0A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LGC1L[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	LGC1L[8:0]	CEC Transmission Logical 1 Low Width Setting*1 Low-level width of logical 1 during a transmission Low-level width = (set value of LGC1L[8:0] bits + 1) × CEC clock cycle	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

37.2.13 DATB : CEC Transmission Data Bit Width Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x0C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DATB[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	DATB[8:0]	CEC Transmission Data Bit Width Setting*1 Bit width of the data bit during a transmission 1-data bit width = (set value of DATB[8:0] bits + 1) × CEC clock cycle	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

37.2.14 STATLL : CEC Reception Start Bit Minimum Low Width Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x10

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	STATLL[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	LGC0L[8:0]	CEC传输逻辑0低宽度设置*1 传输过程中逻辑0的低电平宽度 低电平宽度=(LGC0L[8:0]位的设定值+1)×CEC时钟周期	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

37.2.12 LGC1L:CEC传输逻辑1低宽度设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x0A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LGC1L[8:0]								
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	LGC1L[8:0]	CEC传输逻辑1低宽度设置*1 传输过程中逻辑1的低电平宽度 低电平宽度=(LGC1L[8:0]位的设定值+1)×CEC时钟周期	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

37.2.13 DATB:CEC传输数据位宽设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x0C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

37.2.24 NOMT : CEC Reception Data Sampling Time Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x0E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	NOMT[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	NOMT[8:0]	CEC Reception Data Sampling Time Setting*1, *2 Sampling time of received data Sampling time = (set value of NOMT[8:0] bits + 1) × CEC clock cycle	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).
Note 2. Set this register within a period of LGC1LH < NOMT < LGC0LL.

37.2.25 NOMP : CEC Data Bit Reference Width Setting Register

Base address: CEC = 0x400A_C000

Offset address: 0x24

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	NOMP[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	NOMP[8:0]	CEC Data Bit Reference Width Setting*1 1-data bit width Bit width = (set value of NOMP[8:0] bits + 1) × CEC clock cycle	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

This 1-data bit width is used when counting the number of bits for errors handling, signal-free time, and bus locking detection.

37.2.23 DATBH:CEC接收数据位最大位宽设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x22

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DATBH[8:0]								
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	DATBH[8:0]	CEC接收数据位最大位宽设置*1 接收期间数据位的位宽最大值位宽=(DATBH[8:0]位的设置值+1)× CEC时钟周期	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

37.2.24 NOMT:CEC接收数据采样时间设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x0E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	NOMT[8:0]								
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	NOMT[8:0]	CEC接收数据采样时间设置*1 *2 接收数据的采样时间 采样时间=(NOMT[8:0]位的设定值+1)×CEC时钟周期	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。
注2.在LGC1LH<NOMT<LGC0LL期间设置该寄存器。

37.2.25 NOMP:CEC数据位参考宽度设置寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x24

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	NOMP[8:0]								
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	NOMP[8:0]	CEC数据位参考宽度设置*1 1-数据位宽位宽=(NOMP[8:0]位的设定值+1)×CEC时钟周期	R/W
15:9	—	这些位被读取为0。写入值应为0。	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

在计算错误处理、无信号时间和总线锁定检测的位数时，使用该1数据位宽度。

37.2.26 CECEXMD : CEC Extension Mode Register

Base address: CEC = 0x400A_C000

Offset address: 0x28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RCVINTDSEL	—	RERCVEN	LERPLEN	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	LERPLEN	Pulse Output Function Enable by Long Bit Width Error*1 0: Detects only a long bit width error. 1: Detects a long bit width error and outputs an error handling pulse.	R/W
5	RERCVEN	Start Detection Reception Restart Enable*1 0: Does not restart reception when the start bit is detected during reception. 1: Restarts reception when the start bit is detected during reception.	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	RCVINTDSEL	INTDA Reception Interrupt Timing Change*1 0: EOM timing (9th bit of data) 1: ACK timing (10th bit of data)	R/W

Note 1. Rewritable only when CEC operation is stopped (CECCTL0.CECE = 0).

This register is used to control enabling of error handling when a long bit error is detected, restarting of reception by detecting a start bit, and selecting of the timing for generating reception interrupts.

37.2.27 CECEXMON : CEC Extension Monitor Register

Base address: CEC = 0x400A_C000

Offset address: 0x2A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ACKF	CECLNMON
Value after reset:	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	CECLNMON	CEC Line Monitor*1 0: Low level 1: High level	R
1	ACKF	ACK Flag*2 The value of the received ACK bit can be read. The value is updated at the timing of ACK reception regardless of transmission/reception or address match/mismatch during reception. However, the value is not updated if an error is detected before an ACK is received. The value is updated when an ACK is received at the next communication.	R
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. When using the value of the CECEXMON.CECLNMON bit, determine the value after matching two or three times.
Note 2. When using the CECEXMON.ACKF bit, the relationship between the read timing and the read value changes depending on the value of the CECEXMD.RCVINTDSEL bit.

This register can be used to read the CEC line and the ACK flag.

37.2.26 CECEXMD:CEC扩展模式寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RCVINTDSEL	—	RERCVEN	LERPLEN	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	这些位被读取为0。写入值应为0。	R/W
4	LERPLEN	通过长位宽错误启用脉冲输出功能*1 0：仅检测长位宽错误。1：检测长位宽错误并输出错误处理脉冲。	R/W
5	RERCVEN	启动检测接收重启启用*1 0：在接收过程中检测到起始位时不重新开始接收。1：在接收过程中检测到起始位时重新开始接收。	R/W
6	—	该位读取为0。写入值应为0。	R/W
7	RCVINTDSEL	INTDA接收中断时序改变*1 0：EOM时序（第9位数据）1：ACK时序（第10位数据）	R/W

注1.仅当CEC操作停止时可重写(CECCTL0.CECE=0)。

该寄存器用于控制检测到长位错误时的错误处理启用、通过检测起始位重新启动接收以及选择产生接收中断的时序。

37.2.27 CECEXMON:CEC扩展监控寄存器

Base address: CEC = 0x400A_C000

Offset address: 0x2A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ACKF	CECLNMON
重置后的值:	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	CECLNMON	CEC线路监视器*1 0：低电平1 ：高电平	R
1	ACKF	确认标志*2 可以读取接收到的ACK位的值。 无论发送接收或接收期间的地址匹配不匹配如何，都会在ACK接收定时更新该值。但是，如果在收到ACK之前检测到错误，则不会更新该值。在下一次通信中收到ACK时更新该值。	R
7:2	—	这些位被读取为0。写入值应为0。	R/W

注1.使用CECEXMON.CECLNMON位的值时，匹配2次或3次后确定值。
注2.使用CECEXMON.ACKF位时，读取时序和读取值之间的关系会根据CECEXMD.RCVINTDSEL位的值而变化。

该寄存器可用于读取CEC线和ACK标志。

CECLNMON bit (CEC Line Monitor)

The CEC pin state can be read by reading this bit. When using the value of this bit, determine the value after a match of two or three times.

ACKF flag (ACK Flag)

The value of the received ACK bit can be read by reading this bit. When using this bit, the relationship between the read timing and the read value changes depending on the value of the CECEXMD.RCVINTDSEL bit.

Figure 37.4 shows the ACKF flag update timing and reception interrupt generation timing.

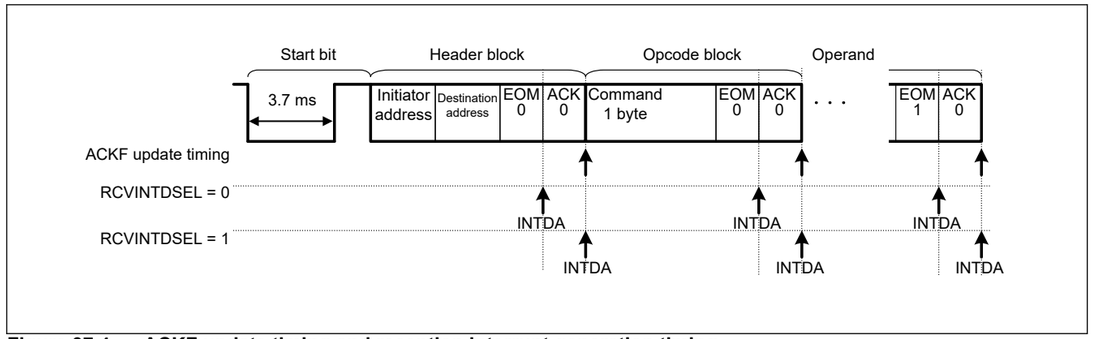

Figure 37.4 ACKF update timing and reception interrupt generation timing

When reading the ACKF bit while RCVINTDSEL = 0, the received ACK state can be read by reading this bit when a 1-bit wait time has elapsed after a reception interrupt is generated. If this bit is read after a reception interrupt is generated, the ACK of the previously received data is read.

When reading the ACKF bit while RCVINTDSEL = 1, read this bit after a reception interrupt is generated. The ACK of the newest received data can be read.

37.3 Operation

37.3.1 Operation of CEC Transmission/Reception Circuit

37.3.1.1 CEC Transmission/Reception Data Format

Figure 37.5 shows the basic CEC communication format. A CEC data frame consists of a start bit, a header block, data block 1 (opcode), and data block 2 (operand). The three blocks other than the start bit consist of 10 bits.

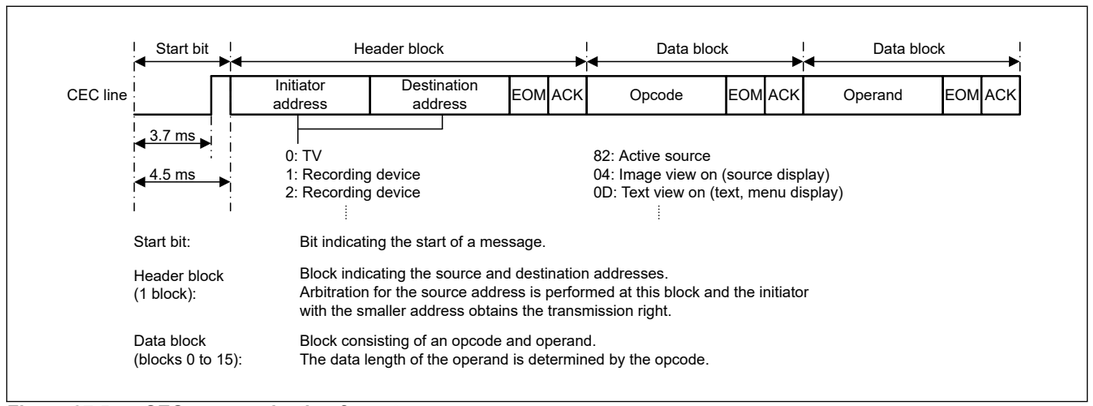

Figure 37.5 CEC communication format

CECLNMON位（CEC线路监视器）

通过读取该位可以读取CEC引脚状态。使用该位的值时，匹配两三次后确定值。

ACKF flag (ACK Flag)

通过读取该位可以读取接收到的ACK位的值。使用该位时，读取时序和读取值之间的关系会根据CECEXMD.RCVINTDSEL位的值而变化。

图37.4显示了ACKF标志更新时序和接收中断产生时序。

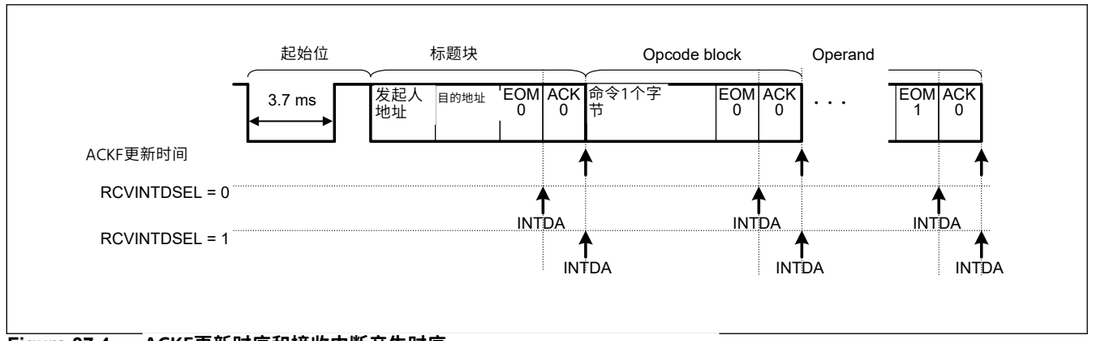

Figure 37.4 ACKF更新时序和接收中断产生时序

在RCVINTDSEL=0时读取ACKF位时，在产生接收中断后经过1位等待时间后，可以通过读取该位读取接收到的ACK状态。如果在产生接收中断后读取该位，则读取先前接收数据的ACK。

在RCVINTDSEL=1时读取ACKF位时，在产生接收中断后读取该位。可以读取最新接收数据的ACK。

37.3 Operation

37.3.1 CEC发送接收电路的操作

37.3.1.1 CEC发送接收数据格式

图37.5显示了基本的CEC通信格式。一个CEC数据帧由一个起始位、一个头块、数据块1（操作码）和数据块2（操作数）组成。除了起始位之外的三个块由10位组成。

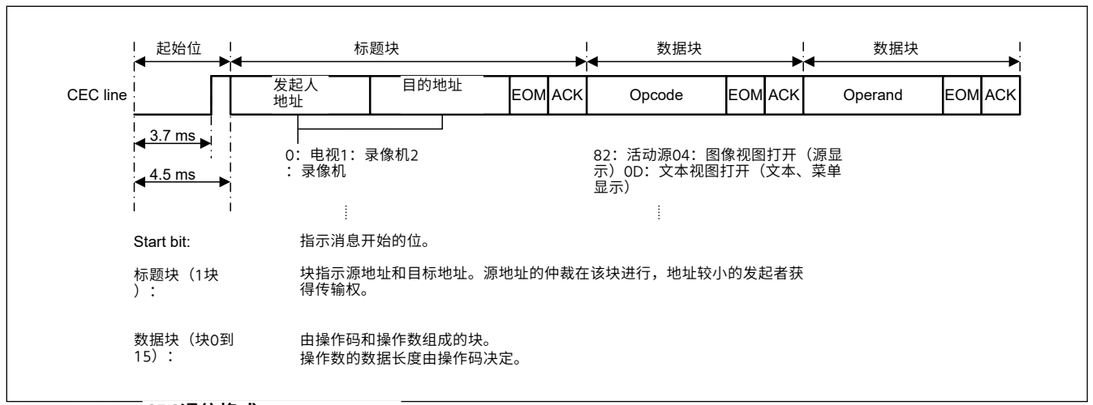

Figure 37.5 CEC通信格式

37.3.1.2 Communication Types

CEC transmission/reception takes place in the state of a direct address message or broadcast message. In a CEC communication, the transmitting side transmits a start bit and message (data) and the receiving side receives the message and returns a desired acknowledge signal to the transmitting side. CEC transmission/reception consist of a start bit and data and performs all transmissions/receptions of CEC.

37.3.1.3 Bit Timing

Figure 37.6 shows an example of the pulse format of a start bit. Whether the start bit is valid is determined at the low-level period (a) and bit period (b).

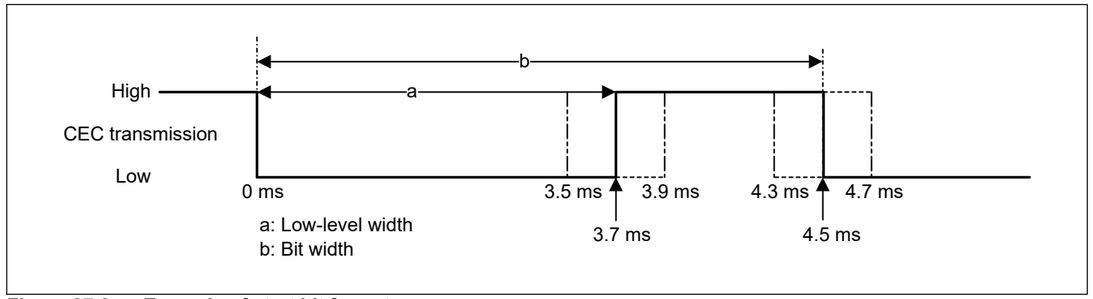

Figure 37.6 Example of start bit format

Figure 37.7 shows an example of the pulse format of a data bit timing. A data bit is sampled at a sampling timing set with the CEC reception data sampling time setting register (NOMT). If the result of sampling is low, the pulse format is logical 0. If the result of sampling is high, the pulse format is logical 1. The last change from high to low of a data bit is the start of the next data bit. Consequently, the last data bit remains high.

37.3.1.2 通讯类型

CEC发送接收在直接地址消息或广播消息的状态下进行。在CEC通信中，发送方发送起始位和消息（数据），接收方接收该消息并向发送方返回所需的确认信号。CEC发送接收由起始位和数据组成，执行CEC的所有发送接收。

37.3.1.3 位时序

图37.6显示了一个起始位的脉冲格式示例。在低电平周期（a）和位周期（b）确定起始位是否有效。

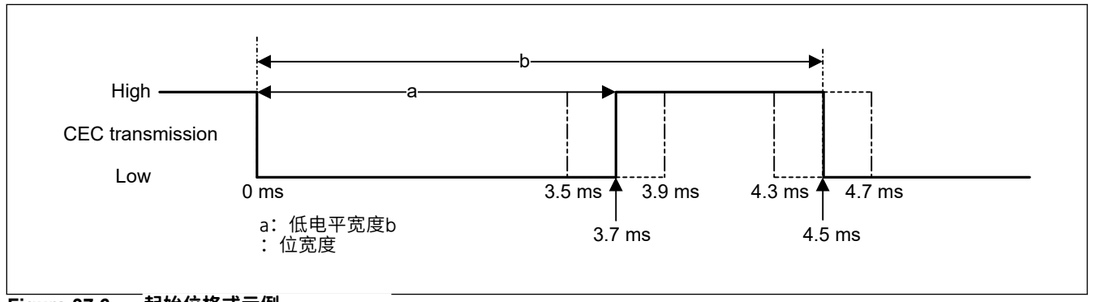

Figure 37.6 起始位格式示例

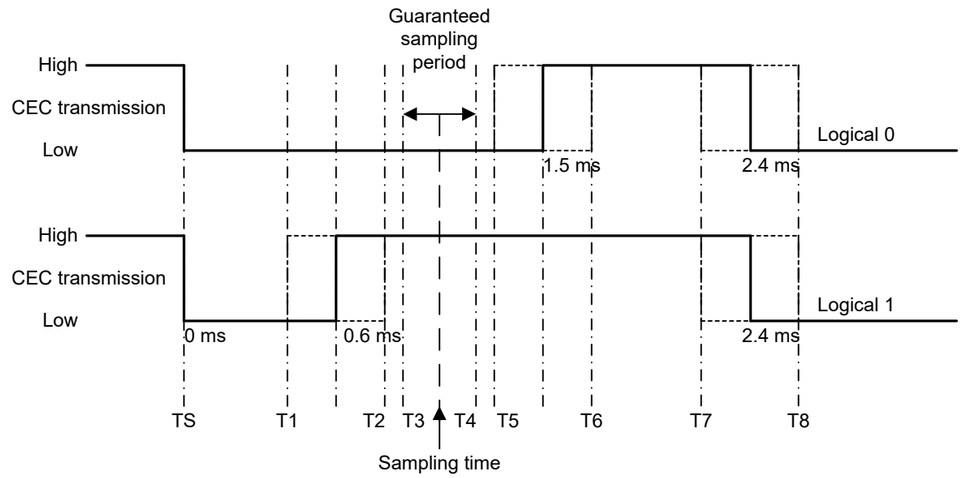
图37.7显示了数据位时序的脉冲格式示例。数据位以CEC接收数据采样时间设置寄存器(NOMT)设置的采样时间进行采样。如果采样结果为低电平，则脉冲格式为逻辑0。如果采样结果为高电平，则脉冲格式为逻辑1。最后一个数据位由高变低是下一个数据位的开始。因此，最后一个数据位保持高电平。



Ts	0 ms	The bit start event
T1	0.4 ms	The earliest time for a low/high transition when indicated by a logical 1
T2	0.8 ms	The latest time for a low/high transition when indicated by a logical 1
T3	0.85 ms	The earliest time for safely sampling the signal line to determine its state
T4	1.25 ms	The latest time for safely sampling the signal line to determine its state
T5	1.3 ms	The earliest time at which a device is permitted to return to a high impedance state (logical 0)
T6	1.7 ms	The latest time at which a device is permitted to return to a high impedance state (logical 0)
T7	2.05 ms	The earliest time for the start of a following bit
	2.4 ms	The nominal data bit period
T8	2.75 ms	The latest time for the start of a following bit

Figure 37.7 Example of data bit format

37.3.1.4 Header Block and Data Block

All data blocks consists of 10 bits and have the same structure. Figure 37.8 shows the format of header and data blocks. An information bit has different meaning for a header block and data block, and indicates the data, opcode, and address. EOM (End of Message) and ACK (Acknowledge) are control bits and have the same meanings for header block and data block.

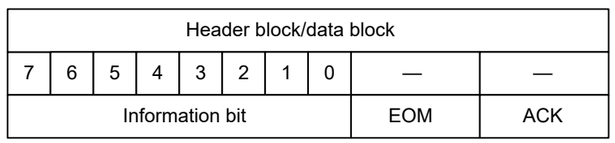


Figure 37.8 Format of header block and data block

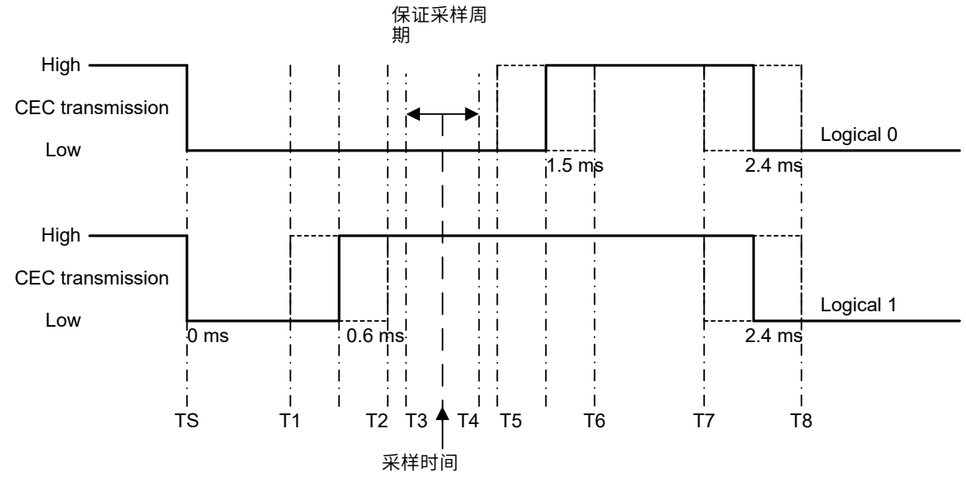
A header block consists of an initiator logical address, destination logical address, EOM (End of Message), and ACK (Acknowledge). Information bits 7 to 4 indicate initiator logical addresses and bits 3 to 0 indicate destination logical addresses. The EOM of a header block is used for “ping” with another device (checking whether the power of another device is turned on). “ping” can be checked by setting EOM = 1 and transmitting only the header block (transmitting a



Ts	0 ms	位启动事件
T1	0.4 ms	由逻辑1指示的低高电平转换的最早时间
T2	0.8 ms	由逻辑1指示的低高转换的最晚时间
T3	0.85 ms	安全采样信号线以确定其状态的最早时间
T4	1.25 ms	安全采样信号线以确定其状态的最晚时间
T5	1.3 ms	允许设备返回高阻抗状态的最早时间（逻辑0）
T6	1.7 ms	允许设备返回高阻抗状态的最晚时间（逻辑0）
T7	2.05 ms	下一位开始的最早时间
	2.4 ms	标称数据位周期
T8	2.75 ms	下一位开始的最晚时间

Figure 37.7 数据位格式示例

37.3.1.4 头块和数据块

所有数据块均由10位组成并具有相同的结构。图37.8显示了标题和数据块的格式。信息位对于头块和数据块具有不同的含义，并指示数据、操作码和地址。EOM（EndofMessage）和ACK（Acknowledge）是控制位，对于头块和数据块具有相同的含义。

Figure 37.8 头块和数据块的格式

标头块由启动器逻辑地址、目标逻辑地址、EOM（消息结束）和ACK（确认）组成。信息位7到4表示启动器逻辑地址，位3到0表示目标逻辑地址。头块的EOM用于与另一个设备“ping”（检查另一个设备的电源是否打开）。“ping”可以通过设置EOM=1并仅传输头块（传输一个

message without data blocks). For direct address transmission, the power of the device to which the header block is transmitted is turned on if an ACK is returned.

37.3.1.5 EOM (End of Message)

An EOM indicates whether the transmitted block is the last block of a message. It is added to an information bit and output.

EOM bit = 0: When more blocks follow.

EOM bit = 1: When the transmitted block is the last block.

37.3.1.6 ACK (Acknowledge)

The meaning of an ACK depends on whether the receiving party of a transmission is a direct address message or broadcast message. The result of comparing the received data and CEC line data is transmitted to the transmitting side as an ACK or NACK.

The initiator outputs logical 1 at the ACK bit timing. Consequently, a follower determines the logic level of the ACK bit.

- An ACK (ACK = logical 0) is the normal value for a direct address message:
  1. If no error exists in the header block and the local address is used, the ACK bit is logical 0.
  2. If no error exists in the data blocks, the ACK bit is logical 0.
  3. If an error exists in the header block or another address is used, the ACK bit is logical 1.
  4. If an error exists in the data blocks, the ACK bit is logical 1.
- An NACK (ACK = logical 1) is the normal value for a broadcast message:
  1. If one or more followers have abandoned the message, the ACK bit is logical 0.
  2. If no followers have abandoned the message, the ACK bit is logical 1.

37.3.2 Operating Clocks

The CEC can use one of the following clocks as its operating clock: the divided clock of the peripheral module clock (PCLKB), or the directly clock of the CECCLK supplied from the main clock or sub clock oscillator. When using the CECCLOCK as the CEC operating clock, take note of the respective procedures for supplying these clocks. The following describes how to supply these clocks.

CEC clock can be selected from PCLKB/2^5, PCLKB/2^6, PCLKB/2^7, PCLKB/2^8, PCLKB/2^9, PCLKB/2^{10}, CECCLK (When using SOSC), and CECCLK/2^8 (When using MOSC).

37.3.3 CEC Communication Functions

37.3.3.1 Communication Bit Width Adjustment Function

This function can be used to set the low-level width and bit width of the start bit and data bit during a transmission. The values of some registers must be set according to the specified relationships. Set the following registers to ensure the relationships are kept:

- STATL < STATB
- LGC1L < LGC0L < DATB

The relationships between the various width setting registers (see section 37.2.9. STATL : CEC Transmission Start Bit Low Width Setting Register to section 37.2.13. DATB : CEC Transmission Data Bit Width Setting Register) and the bit timing are shown in (1) to (3).

(1) Start bit

The STATL register is used to set the low-level width and the STATB register is used to set the bit width of the start bit. Figure 37.9 shows the output waveform of the start bit.

没有数据块的消息）。对于直接地址传输，如果返回ACK，则打开头块被传输到的设备的电源。

37.3.1.5 EOM (End of Message)

EOM指示传输的块是否是消息的最后一个块。它被添加到信息位并输出。

EOM位=0：当后面有更多块时。

EOM位=1：当发送块是最后一个块时。

37.3.1.6 ACK (Acknowledge)

ACK的含义取决于传输的接收方是直接地址消息还是广播消息。接收数据和CEC线路数据的比较结果作为ACK或NACK被发送到发送方。

发起方在ACK位定时输出逻辑1。因此，跟随器确定ACK位的逻辑电平。

●ACK（ACK=逻辑0）是直接地址消息的正常值：

1.如果头块中没有错误并且使用本地地址，则ACK位为逻辑0。

2.如果数据块没有错误，则ACK位为逻辑0。

3.如果头块中存在错误或使用了其他地址，则ACK位为逻辑1。

4.如果数据块中存在错误，则ACK位为逻辑1。

●NACK（ACK=逻辑1）是广播消息的正常值：

1.如果有一个或多个追随者放弃了该消息，则ACK位为逻辑0。

2.如果没有跟随者放弃该消息，则ACK位为逻辑1。

37.3.2 工作时钟

CEC可以使用以下时钟之一作为其工作时钟：外围模块时钟(PCLKB)的分频时钟，或由主时钟或副时钟振荡器提供的CECCLK的直接时钟。当使用CECCLOCK作为CEC操作时钟时，请注意提供这些时钟的相应程序。下面介绍如何提供这些时钟。

CEC时钟可以从PCLKB25、PCLKB26、PCLKB27、PCLKB28、PCLKB29、PCLKB210、CECCLK（使用SOSC时）和CECCLK28（使用MOSC时）中选择。

37.3.3 CEC通讯功能

37.3.3.1 通讯位宽调整功能

该函数可用于设置传输过程中起始位和数据位的低电平宽度和位宽。有些寄存器的值必须按照指定的关系来设置。设置以下寄存器以确保保持关系：

- STATL < STATB
- LGC1L < LGC0L < DATB

各种宽度设置寄存器之间的关系（参见第37.2.9节。STATL：CEC传输起始位低宽度设置寄存器到第37.2.13节。DATB:CEC传输数据位宽设置寄存器)和位时序如(1)至(3)所示。

(1) 起始位

STATL寄存器用于设置低电平宽度，STATB寄存器用于设置起始位的位宽。
图37.9显示了起始位的输出波形。

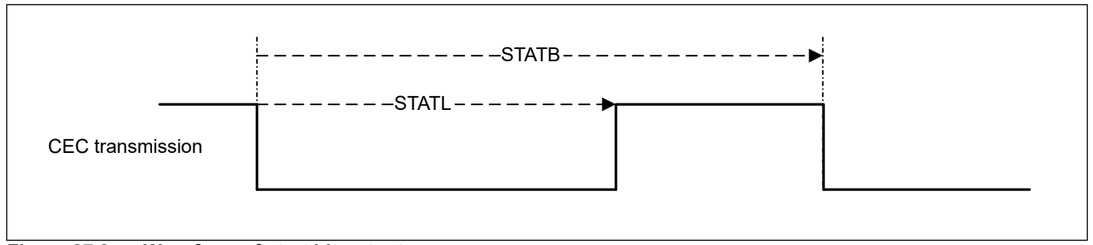


Figure 37.9 Waveform of start bit output

(2) Data bit (logical 0)

The LGC0L register is used to set the low-level width and the DATB register is used to set the bit width of the data bit of logical 0. Figure 37.10 shows the output waveform of the data bit (logical 0).

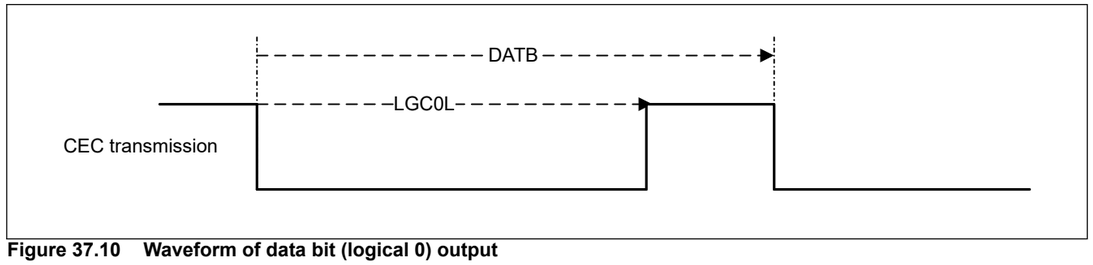

Figure 37.10 Waveform of data bit (logical 0) output

(3) Data bit (logical 1)

The LGC1L register is used to set the low-level width and the DATB register is used to set the bit width of the data bit of logical 1. Figure 37.11 shows the output waveform of the data bit (logical 1).

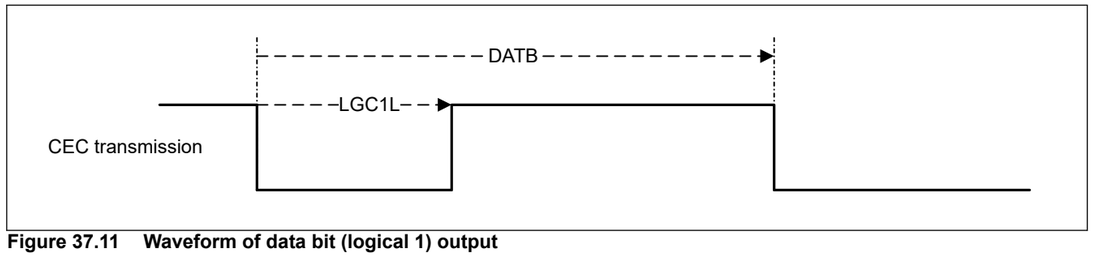

Figure 37.11 Waveform of data bit (logical 1) output

37.3.3.2 Receive Bit Timing Check Function

The CEC transmission/reception circuit has a timing check function that determines whether the low-level width and bit width of the start bit and data bit during reception are within the set range. The timing check period can be set using the various timing determination registers (see section 37.2.14. STATLL : CEC Reception Start Bit Minimum Low Width Setting Register to section section 37.2.23. DATBH : CEC Reception Data Bit Maximum Bit Width Setting Register).

The values of some registers must be set according to the specified relationships. Set the following registers to ensure the relationships are kept:

- STATLL < STATLH
- STATBL < STATBH
- LGC0LL < LGC0LH
- LGC1LL < LGC1LH
- DATBL < DATBH

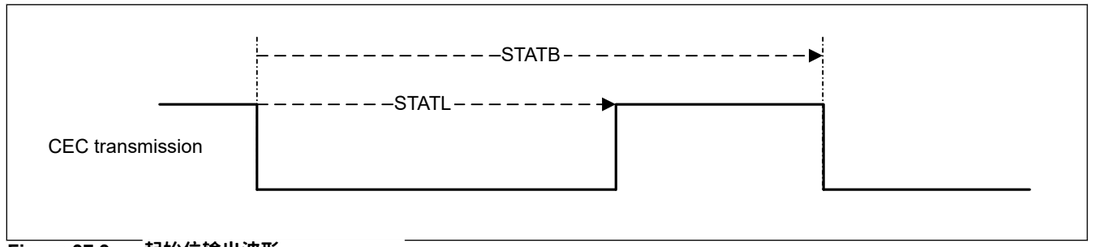

Figure 37.9 起始位输出波形

(2) 数据位（逻辑0）

LGC0L寄存器用于设置低电平宽度，DATB寄存器用于设置逻辑0的数据位的位宽。图37.10显示了数据位（逻辑0）的输出波形。

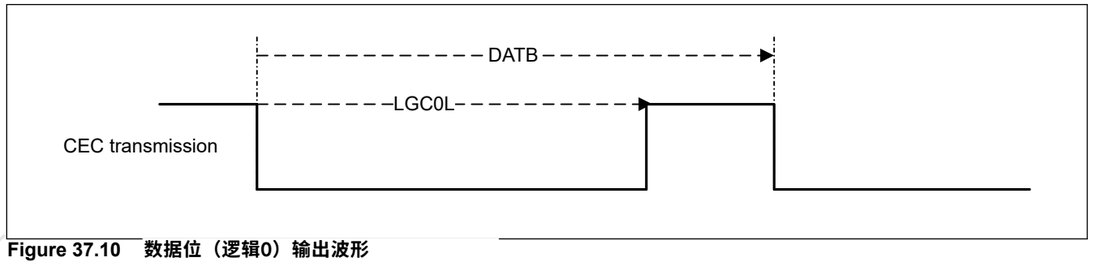

Figure 37.10 数据位（逻辑0）输出波形

(3) 数据位（逻辑1）

LGC1L寄存器用于设置低电平宽度，DATB寄存器用于设置逻辑1的数据位的位宽。图37.11显示了数据位（逻辑1）的输出波形。

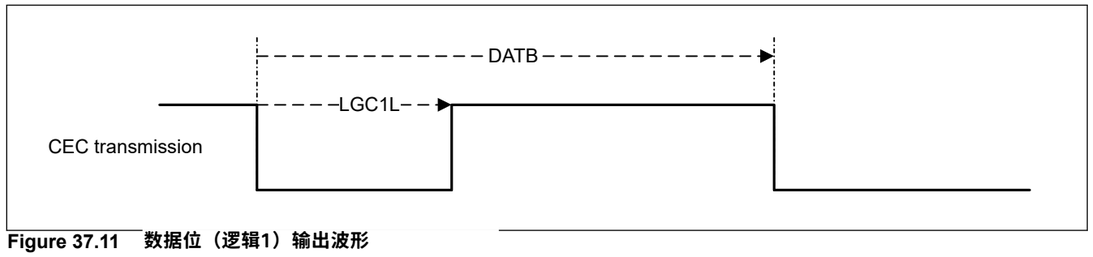

Figure 37.11 数据位（逻辑1）输出波形

37.3.3.2 接收位时序校验功能

CEC发送接收电路具有定时检查功能，判断接收时起始位和数据位的低电平宽度和位宽是否在设定范围内。可以使用各种时序确定寄存器设置时序检查周期（参见第37.2.14节。STATLL：CEC接收起始位最小低位宽度设置寄存器到第37.2.23节。DATBH：CEC接收数据位最大位宽度设置寄存器）.

有些寄存器的值必须按照指定的关系来设置。设置以下寄存器以确保保持关系：

- STATLL < STATLH
- STATBL < STATBH
- LGC0LL < LGC0LH
- LGC1LL < LGC1LH
- DATBL < DATBH

The relationships between the timing determination registers and bit timing are shown in (1) to (3).

(1) Start bit

The STATLL register is used to set the minimum low-level width and the STATLH register is used to set the maximum low-level width of the start bit. The STATBL register is used to set the minimum value of the start bit and the STATBH register is used to set the maximum value of the start bit width. Figure 37.12 shows the timing at which the start bit is received.

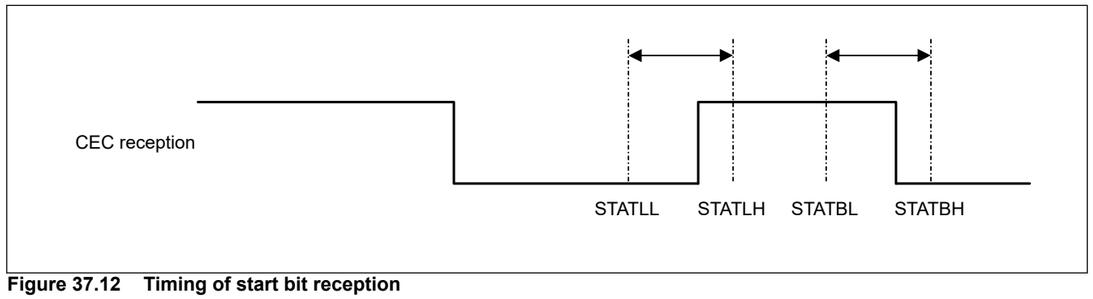

Figure 37.12 Timing of start bit reception

(2) Data bit (logical 0)

The LGC0LL register is used to set the minimum low-level width and the LGC0LH register is used to set the maximum low-level width of the data bit (logical 0). The DATBL register is used to set the minimum value the data bit and the DATBH register is used to set the maximum value of the data bit width. Figure 37.13 shows the timing at which the data bit (logical 0) is received.

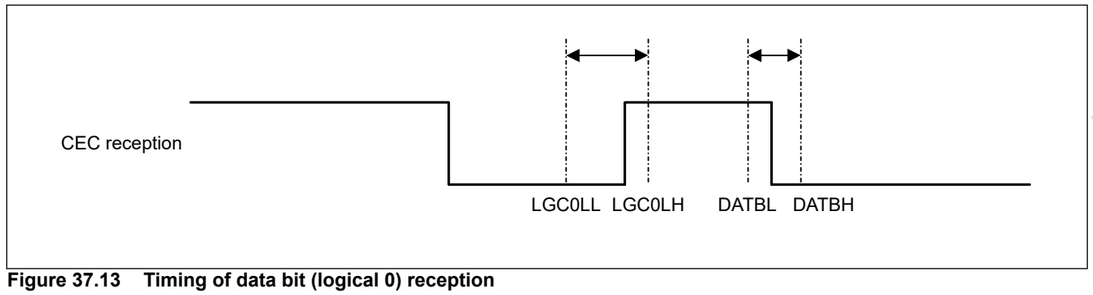

Figure 37.13 Timing of data bit (logical 0) reception

(3) Data bit (logical 1)

The LGC1LL register is used to set the minimum low-level width and the LGC1LH register is used to set the maximum low-level width of the data bit (logical 1). The DATBL register is used to set the minimum value data bit width and the DATBH register is used to set the maximum value of the data bit width. Figure 37.14 shows the timing at which the data bit (logical 1) is received.

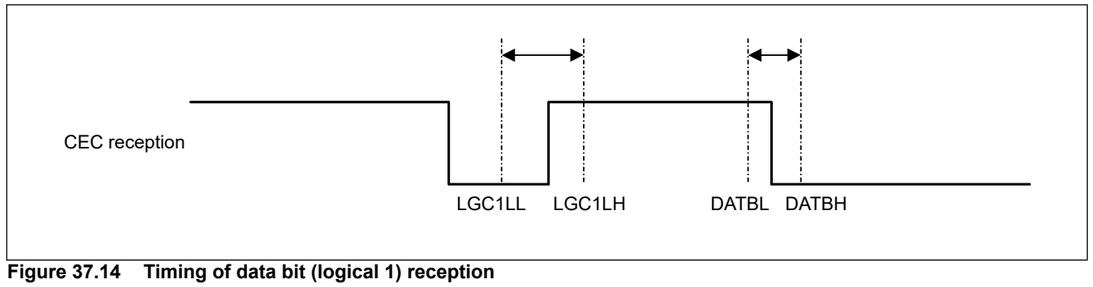

Figure 37.14 Timing of data bit (logical 1) reception

时序确定寄存器和位时序之间的关系如（1）至（3）所示。

(1) 起始位

STATLL寄存器用于设置最小低电平宽度，而STATLH寄存器用于设置起始位的最大低电平宽度。STATBL寄存器用于设置起始位的最小值，STATBH寄存器用于设置起始位宽度的最大值。图37.12显示了接收起始位的时序。

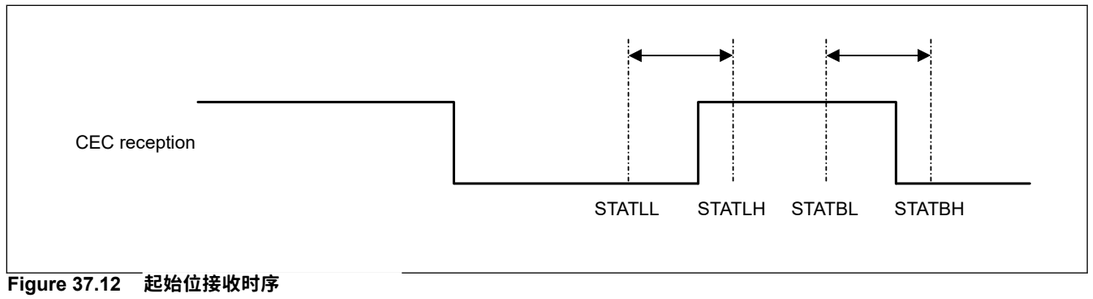

Figure 37.12 起始位接收时序

(2) 数据位（逻辑0）

LGC0LL寄存器用于设置最小低电平宽度，LGC0LH寄存器用于设置数据位（逻辑0）的最大低电平宽度。DATBL寄存器用于设置数据位的最小值，DATBH寄存器用于设置数据位宽的最大值。图37.13显示了接收数据位（逻辑0）的时序。

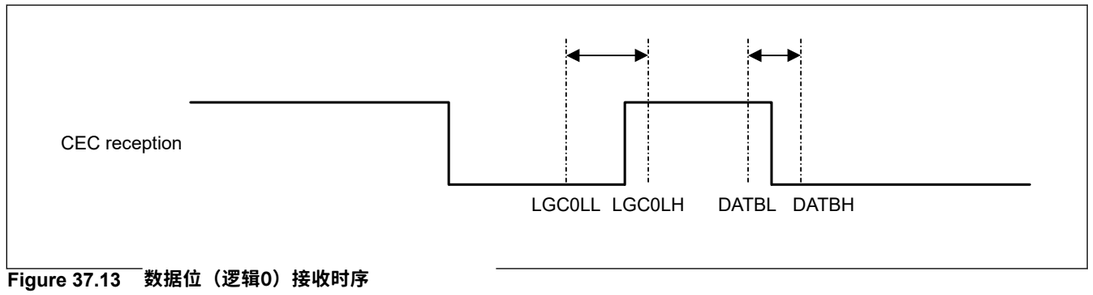

Figure 37.13 数据位（逻辑0）接收时序

(3) 数据位（逻辑1）

LGC1LL寄存器用于设置最小低电平宽度，而LGC1LH寄存器用于设置数据位（逻辑1）的最大低电平宽度。DATBL寄存器用于设置最小值数据位宽，DATBH寄存器用于设置数据位宽的最大值。图37.14显示了接收数据位（逻辑1）的时序。

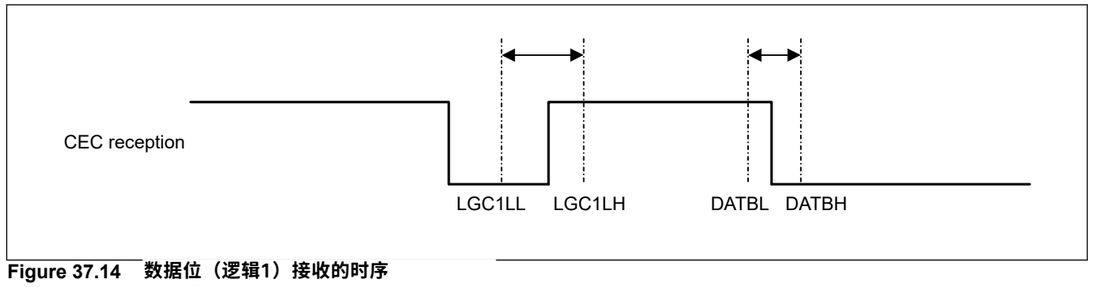

Figure 37.14 数据位（逻辑1）接收的时序

37.3.3.3 Initial CEC Communication Settings

The initial CEC communication setting flow is explained below. The logical address acquisition flow is executed by setting the various control registers and using direct address transmission after a reset. In a logical address acquisition transmission, EOM = 1 is set because the same address is set for the source and destination addresses and only the header block is transmitted. Additionally, to prevent a false address match from occurring before the local address is determined, CECRXEN = 0 must be set before the CADR register setting. Figure 37.15 shows the logical allocation timing diagram and Table 37.6 lists the operation procedure and an explanation of the operation.

37.3.3.3 初始CEC通信设置

下面说明初始CEC通信设置流程。通过设置各种控制寄存器并在复位后使用直接地址传输来执行逻辑地址获取流程。在逻辑地址获取传输中，设置EOM=1，因为为源地址和目标地址设置了相同的地址，并且只传输了头块。此外，为防止在确定本地地址之前发生错误的地址匹配，必须在设置CADR寄存器之前设置CECRXEN=0。图37.15显示了逻辑分配时序图和

表37.6列出了操作过程和操作说明。

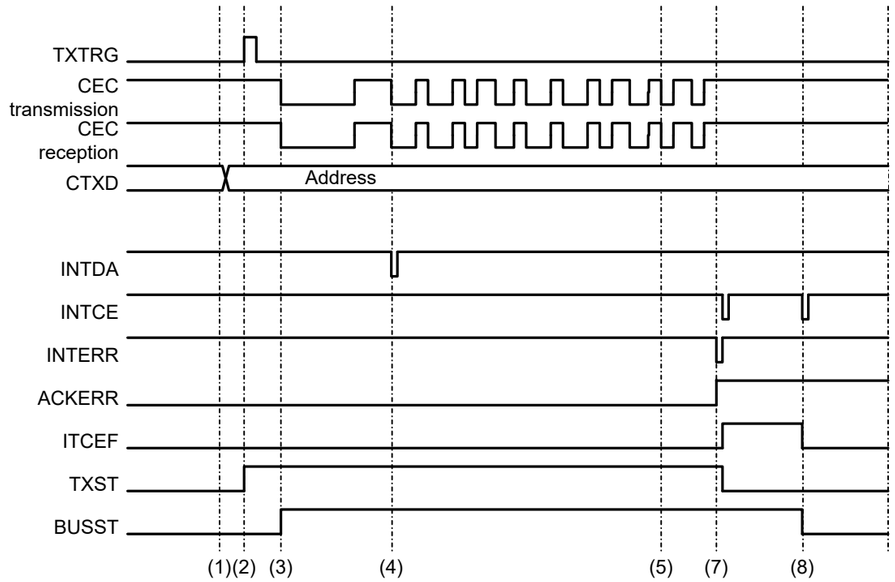

Figure 37.15 逻辑分配(CECCTL1.CESEL[1:0]=00b)

Table 37.6 Initial CEC communication setting procedure (1 of 2)

Stage	Step	Software manipulation	CEC state
Initial CEC setting	1	[IO initial setting] Select CECIO function for P206 or P706 Set to NMOS open drain output [CEC clock setting] Set the CCL[2:0] bits. [Reception rejection control setting] Set CECRXEN to 0. [Setting for reporting address mismatch] Set CINTMK. [Noise elimination selection] Set CDFC (Specify whether to use the noise filter). [Start bit low-level/bit width setting] Set the low/bit width to STATL/STATB. [Logical 0/1 low-level/bit width setting] Set the low/bit width to LGC0L/LGC1L/DATB. [Sampling time setting] Specify the time to sample the received data for NOMT. [Bit width setting] Specify the bit width for NOMP. [Register settings for timing check] Set the low-level width timing check period of the start bit to STATLL/STATLH. Set the bit width timing check period of the start bit to STATBL/STATBH. Set the low-level width timing check period of the data bit (logical 0) to LGC0LL/LGC0LH. Set the low-level width timing check period of the data bit (logical 1) to LGC1LL/LGC1LH. Set the bit width timing check period of the data bit to DATBL/DATBH. [Bus lock detection setting] Set up BLERRD (select whether to detect bus locking). [Start bit timing error detection setting] Set STERRD (select whether to detect timing errors of the start bit). [Communication complete interrupt setting] Set the CESEL[1:0]. [Signal-free time setting] Set the SFT[1:0] bits (set the signal-free time detection time). [CEC clock supply] Set CECE to 1.	The CEC clock is stopped.
	2	—	The CEC clock is supplied. Transmission can be performed. The signal-free time is started. BUSST becomes 1. BUSST becomes 0 and the communication standby state is entered after counting up to the set values of the SFT[1:0] bits.

Table 37.6 初始CEC通信设置程序(1of2)

Stage	Step	软件操作	CEC state
初始CEC设置	1	[IO初始设置]选择P206或P706的CECIO功能 设置为NMOS开漏输出[CEC时钟设置] 设置CCL[2:0]位。[接收拒绝控制设置]将CECRXEN设置为0。[用于报告地址不匹配的设置]设置CINTMK。【降噪选择】 设置CDFC（指定是否使用噪声过滤器）。【起始位低位位宽设置】 将低位宽度设置为STATLSTATB。【逻辑01低电平位宽设置】 将低位宽度设置为LGC0LLGC1LDATB。[采样时间设置] 指定对NOMT接收数据进行采样的时间。[位宽设置] 指定NOMP的位宽。[用于定时检查的注册设置] 设置起始位的低电平宽度时序检查周期为停止停止。设置起始位的位宽时序检查周期为 STATBL/STATBH. 将数据位（逻辑0）的低电平宽度时序检查周期设置为LGC0LLLGC0LH。将数据位（逻辑1）的低电平宽度时序检查周期设置为LGC1LLLGC1LH。设置数据位的位宽时序检查周期为 DATBLDATBH。[总线锁定检测设置] 设置BLERRD（选择是否检测总线锁定）。[起始位时序错误检测设置] 设置STERRD（选择是否检测起始位的时序错误）。[通信完成中断设置]设置CESEL[1:0]。[无信号时间设置] 设置SFT[1:0]位（设置无信号时间检测时间）。[CEC时钟供应]将CECE设置为1。	CEC时钟停止。
	2	—	提供CEC时钟。 可以进行传输。无信号时间开始。BUSST变为1。BUSST变为0，并在计数到SFT[1:0]位的设置值后进入通信待机状态。

Table 37.6 Initial CEC communication setting procedure (2 of 2)

Stage	Step	Software manipulation	CEC state
Logical address allocation	3	[EOM setting] Set EOM to 1. [Transmit data setting] (1) Set the transmit data (logical address) to CTXD. [Bus-free state check] Check that BUSST is 0. [Starting transmit operation] (2) Set TXTRG to 1.	—
	4	—	Transmission is started. The start bit is output (3).
	5	—	The values set in the CTXD register are sequentially output at the same time as INTDA is output when the header block output is started (4).
	6	Do not write the next data, because only the header block is transmitted.	—
	7	—	1 is output from the EOM bit (5).
	8	[Local address setting]	The ACK bit is received.
	8-1	ACK: Change the transmitted address and then retransmit the address, because it is used by another station.	When logical 0 is received, INTERR is not output and the ACKERR flag is not set (6).
	8-2	NACK: Use the transmitted address as the local address, because the transmitted address is not used by another station (CADR setting).	When logical 1 is received, INTERR is output and the ACKERR flag is set (7).
	9	—	INTCE is output according to the CESEL[1:0] and SFT[1:0] bit settings (8).
Reception rejection	10	[Reception rejection control setting] Set CECRXEN to 1.	—
	11	—	The communication standby state is entered.

37.3.3.4 CEC Transmission

A CEC transmission performs a receive operation even during transmission and performs an arbitration check, a data check, and a timing check.

The value of the reception buffer register (CRXD) during a transmit operation, however, is not guaranteed.

A new start bit detected during transmission (the time from when a start bit is detected until the EOM of the last frame is received) is ignored and detected as a timing error. Communication is not restarted. Figure 37.16 shows the basic timing of transmission, and Table 37.7 shows the procedure for manipulating CEC transmission.

Table 37.6 初始CEC通信设置过程(2of2)

Stage	Step	软件操作	CEC state
逻辑地址分配	3	[EOM setting] 将EOM设置为1。[传输数据设置](1) 将发送数据（逻辑地址）设置为CTXD。[公共汽车状态检查] 检查BUSST是否为0。[开始发送操作](2)将TXTRG设置为1。	—
	4	—	传输开始。起始位是输出(3)。
	5	—	CTXD寄存器中设置的值在开始头块输出时在输出INTDA的同时顺序输出(4)。
	6	不要写下一个数据，因为只传输头块。	—
	7	—	EOM位(5)输出1。
	8	[Local address setting]	接收到ACK位。
	8-1	ACK：改变发送地址，然后重新发送地址，因为它被另一个站使用。	当接收到逻辑0时，不输出INTERR并且不设置ACKERR标志(6)。
	8-2	NACK：使用传输的地址作为本地地址，因为传送的地址没有被其他站使用（CADR设置）。	当接收到逻辑1时，输出INTERR并设置ACKERR标志(7)。
	9	—	INTCE是根据输出CESEL[1:0]和SFT[1:0]位设置(8)。
接收拒绝	10	[接收拒绝控制设置]将CECRXEN设置为1。	—
	11	—	进入通信待机状态。

37.3.3.4 CEC Transmission

CEC传输即使在传输期间也执行接收操作并执行仲裁检查、数据检查和定时检查。

但是，不能保证发送操作期间的接收缓冲寄存器(CRXD)的值。

在传输过程中检测到的新起始位（从检测到起始位到接收到最后一帧的EOM的时间）将被忽略并检测为定时错误。通信未重新启动。图37.16显示了传输的基本时序，表37.7显示了操纵CEC传输的过程。

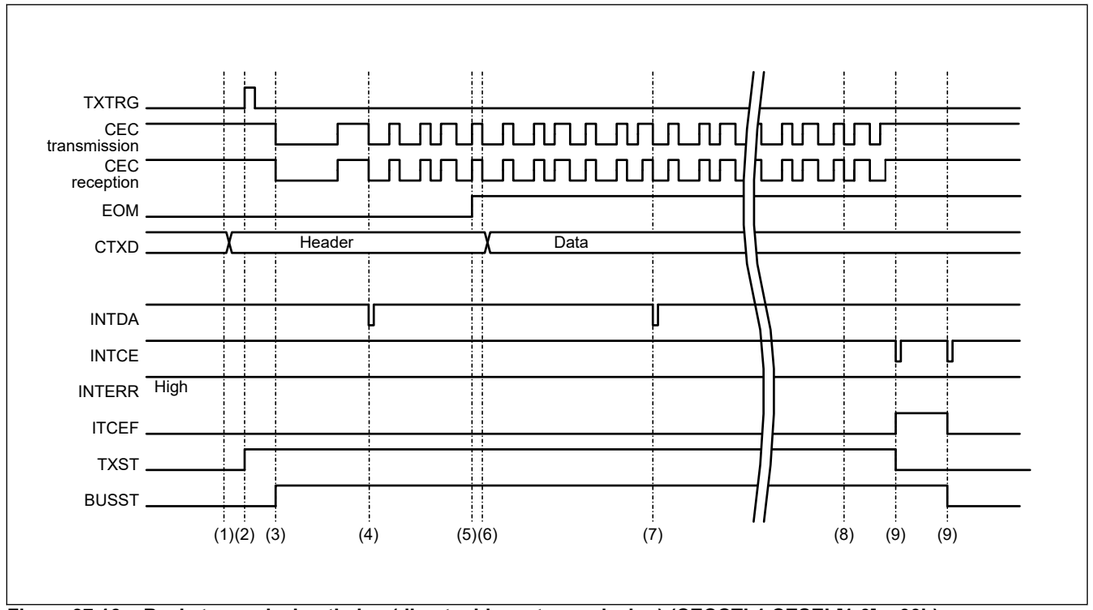

Figure 37.16 Basic transmission timing (direct address transmission) (CECCTL1.CESEL[1:0] = 00b)

(1) CEC transmission manipulation procedure

Table 37.7 CEC transmission manipulation procedure

Stage	Step	Software manipulation	CEC state
Initial CEC setting	1	See Table 37.6.	—
CEC transmit operation	2	[Signal-free time setting] Set the SFT[1:0] bits. (set the signal-free time detection time.) [EOM setting] (1) Set EOM (EOM = 0). [Transmit data setting] (1) Set the transmit data to CTXD. [Bus-free state check] Check that BUSST is 0. [Starting transmit operation] (2) Set TXTRG to 1.	—
	3	—	Transmission is started. The start bit is output (3).
	4	—	The values set in the CTXD register are sequentially output at the same time as INTDA is output when the header block output is started (4).
	5	[EOM setting] (5) Set the EOM of the next frame (EOM = 1) before the next frame starts (7). [Transmit data setting] (6) Set the transmit data to CTXD.	—
	6	—	Outputting the data of the second frame is started (7). 1 is output at the EOM bit position because the last frame is reached (8). INTCE is output according to the CESEL[1:0] and SFT[1:0] bit settings (9). The communication standby state is entered.

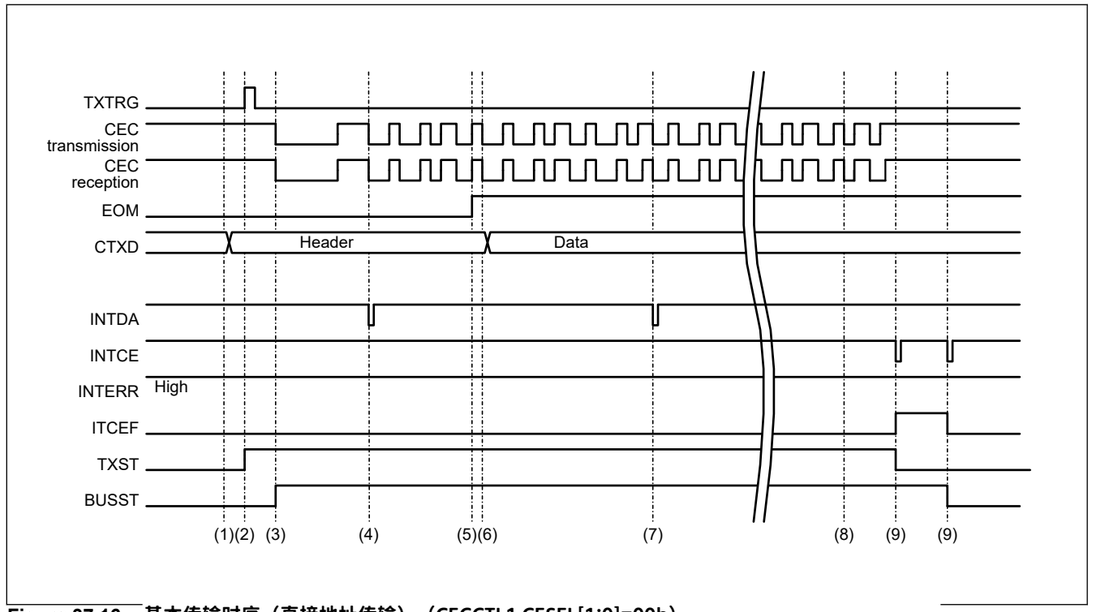

Figure 37.16 基本传输时序（直接地址传输）（CECCTL1.CESEL[1:0]=00b）

(1) CEC传输操作程序

Table 37.7 CEC传输操作程序

Stage	Step	软件操作	CEC state
初始CEC设置	1	见表37.6。	—
CEC发送操作	2	[无信号时间设置]设置SFT[1:0]位。（设置无信号时间检测时间。）[EOM设置](1) 设置EOM(EOM=0)。[传输数据设置](1) 将发送数据设置为CTXD。[公共汽车状态检查] 检查BUSST是否为0。[开始发送操作](2)将TXTRG设置为1。	—
	3	—	传输开始。起始位是输出(3)。
	4	—	CTXD寄存器中设置的值在开始头块输出时在输出INTDA的同时顺序输出(4)。
	5	[EOM setting] (5) 在下一帧开始之前设置下一帧的EOM(EOM=1)(7)。[发送数据设置](6) 将发送数据设置为CTXD。	—
	6	—	开始输出第二帧的数据(7)。因为到达最后一帧，所以在EOM位位置输出1(8)。INTCE是根据输出 CESEL[1:0]和SFT[1:0]位设置(9)。 进入通信待机状态。

(2) Broadcast transmission

When 0xF is set to the destination address of the header block transmit data (CTXD), the CEC recognizes the current transmission as a broadcast transmission and operates. Normally, the communication is determined as a successful operation when logical 0 is received at the ACK bit timing. However, in broadcast communication, the communication is a successful operation when logical 1 is received at the ACK bit timing.

The CEC determines whether the communication is a direct communication or broadcast communication by looking at the transmit data of the header block, and automatically determines whether the reception of logical 0 or logical 1 has been successfully performed.

(3) CEC transmission interrupt

The CEC has three interrupt functions, namely a data interrupt (INTDA), a communication complete interrupt (INTCE), and an error interrupt (INTERR). Figure 37.17 shows the timing for generating interrupts during transmission.

A data interrupt (INTDA) occurs at the start of each block.

A communication complete interrupt (INTCE) can be generated if ACK reception for a data block for which EOM is set to 1 ends, if the signal-free time specified using the CECCTL1.SFT[1:0] bits elapses, or if both conditions occur, depending on the settings of the CECCTL1.CESEL[1:0] bits.

An error interrupt (INTERR) is generated if any of the following errors is detected during any period of communication:

- Timing
- ACK
- Underrun
- Transmission.

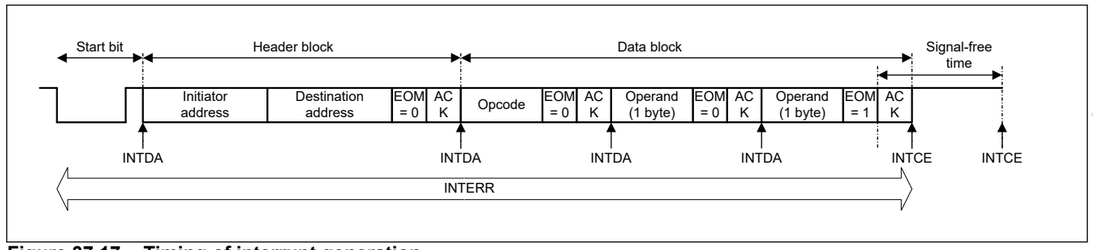

Figure 37.17 Timing of interrupt generation

If the falling edge of the CEC line is detected when receiving the ACK bit by setting EOM to 1 (before receiving the ACK bit ends), an irregular operation is performed as shown in Table 37.8 according to that timing.

Table 37.8 Operation if falling edge of CEC line is detected before receiving ACK bit ends

CEC line falling timing	CECCTL1.CESEL[1:0] bit setting	INTCE generation	Handling of ACK bit	Operation after CEC line falls
After the minimum data bit value (DATBL ≤ counter)	CESEL[1:0] = 00b or CESEL[1:0] = 01b	INTCE is generated once when the CEC line falls	Handling the ACK bit is enabled because it has the correct width. (ACK or NACK is correctly determined.)	The start of the next communication is recognized and then determines whether to receive the start bit starts.
	CESEL[1:0] = 10b	INTCE is not generated		
Before the minimum data bit value (counter < DATBL)	CESEL[1:0] = 00b or CESEL[1:0] = 01b	INTCE is generated once when the CEC line falls	ACK cannot be correctly determined because it has the incorrect width. (if ACKTEN is set to 1, a timing error occurs.)	
	CESEL[1:0] = 10b	INTCE is not generated		

(4) Receiving error handling pulse

During initiator operation, if the received data is at low level when the maximum low-level width of logical 0 is reached, an error handling pulse is received, a timing error occurs, transmission stops, and communication standby state is entered as shown in Figure 37.18.

(2) 广播传输

当0xF设置为标头块传输数据(CTXD)的目标地址时，CEC将当前传输识别为广播传输并进行操作。通常，当在ACK位定时接收到逻辑0时，通信被确定为成功操作。然而，在广播通信中，当在ACK位定时接收到逻辑1时，通信是成功的操作。

CEC通过查看头块的发送数据来判断通信是直接通信还是广播通信，并自动判断逻辑0或逻辑1的接收是否成功。

(3) CEC传输中断

CEC具有三个中断功能，即数据中断（INTDA）、通信完成中断（INTCE）和错误中断（INTERR）。图37.17显示了在传输过程中产生中断的时序。

数据中断（INTDA）发生在每个块的开始。

如果EOM设置为1的数据块的ACK接收结束，如果使用CECCTL1.SFT[1:0]位指定的无信号时间过去，或者如果这两种情况都可以生成通信完成中断(INTCE)发生，具体取决于CECCTL1.CESEL[1:0]位的设置。

如果在任何通信期间检测到以下任何错误，则会生成错误中断(INTERR)：

- Timing
- ACK
- Underrun
- Transmission.

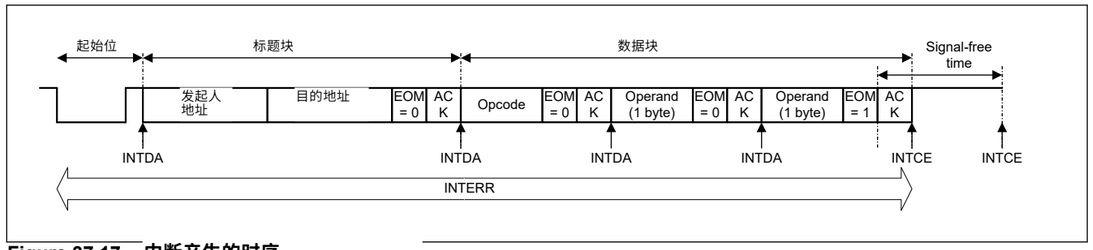

Figure 37.17 中断产生的时序

如果通过将EOM设置为1接收ACK位时（在接收ACK位结束之前）检测到CEC线的下降沿，则根据该时序执行如表37.8所示的不规则操作。

Table 37.8 在接收ACK位结束之前检测到CEC线的下降沿时的操作

CEC线下降时序	CECCTL1.CESEL[1:0]位设置	INTCE generation	ACK位的处理	CEC线下降后的操作
最小数据位值后（DATBL≤计数器）	CESEL[1:0] = 00b or CESEL[1:0] = 01b	CEC线下降时产生一次INTCE	启用处理ACK位，因为它具有正确的宽度。（ACK或NACK已正确确定。）	识别下一次通信的开始，然后确定是否开始接收开始位。
	CESEL[1:0] = 10b	未生成INTCE		
最小数据位值之前（计数器<DATBL）	CESEL[1:0] = 00b or CESEL[1:0] = 01b	CEC线下降时产生一次INTCE	ACK无法正确确定，因为它的宽度不正确。（如果ACKTEN设置为1，则会发生时序错误。）	
	CESEL[1:0] = 10b	未生成INTCE		

(4) 接收错误处理脉冲

在启动器操作过程中，如果在达到逻辑0的最大低电平宽度时接收到的数据为低电平，则接收到错误处理脉冲，发生时序错误，停止传输，进入通信待机状态，如图37.18.

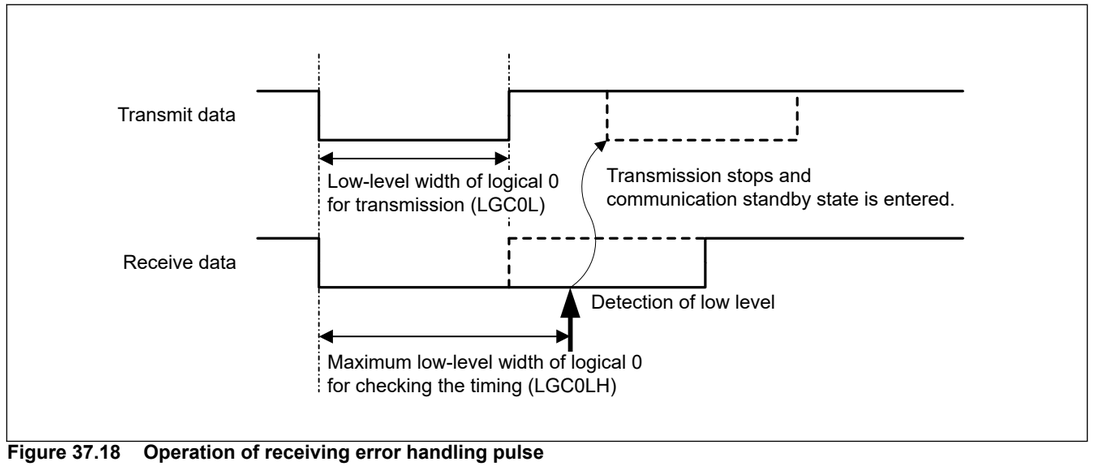

Figure 37.18 Operation of receiving error handling pulse

37.3.3.5 CEC Reception

During reception, the data is received at the sampling timing set by the CEC reception data sampling time setting register (NOMT) and stored in the reception buffer register (CRXD).

The receive operation differs depending on the CECCTL0.CECRXEN bit setting value, CECCTL1.CINTMK bit setting value, communication type (direct address communication or broadcast communication), and whether the reception address and local address match.

The correspondences between various conditions and the operations are shown in Table 37.9.

A new start bit detected during transmission (the time from when a start bit is detected until the EOM of the last frame is received) is ignored and detected as a timing error. However, when the restart reception function is used (CECEXMOD.RERCVEN = 1), a timing error is detected and determined as the start of new reception, so reception operation is performed again.

Table 37.9 Operation during CEC reception (1 of 2)

CEC RXEN	0	1							
Communication type	—	Start bit	Header			Direct data			Broadcast data
Address match/ mismatch	—	—	Mismatch		Match	Mismatch		Match	—

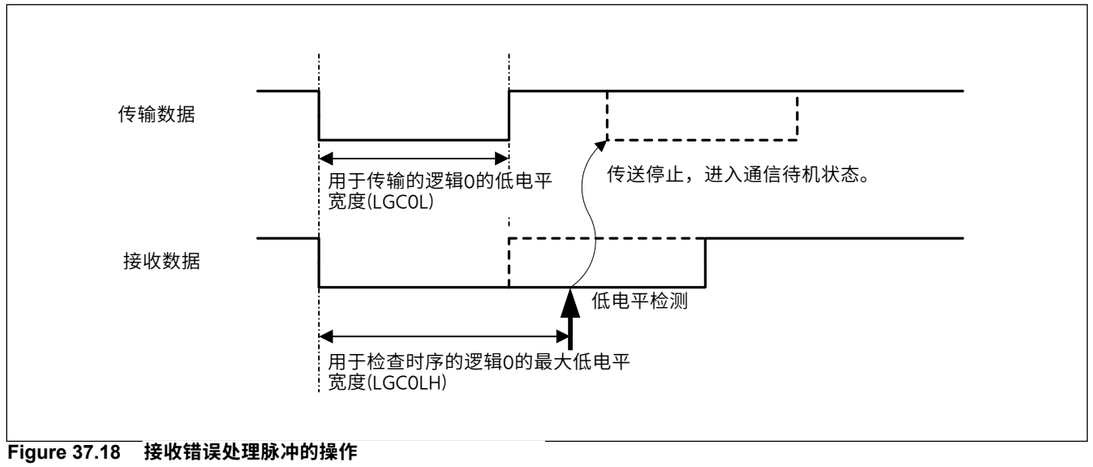

Figure 37.18 接收错误处理脉冲的操作

37.3.3.5 CEC Reception

在接收过程中，按照CEC接收数据采样时间设置寄存器(NOMT)设置的采样时间接收数据，并存储在接收缓冲寄存器(CRXD)中。

接收操作因CECCTL0.CECRXEN位设置值、CECCTL1.CINTMK位设置值、通信类型（直接地址通信或广播通信）以及接收地址和本地地址是否匹配而异。

各种条件与操作的对应关系如表37.9所示。

在传输过程中检测到的新起始位（从检测到起始位到接收到最后一帧的EOM的时间）将被忽略并检测为定时错误。但是，当使用重启接收功能时（CECEXMOD.RERCVEN=1），检测到定时错误并确定为新接收的开始，因此再次执行接收操作。

Table 37.9 CEC接收期间的操作(1of2)

CEC RXEN	0	1							
通讯类型	—	起始位	Header			直接数据			广播数据

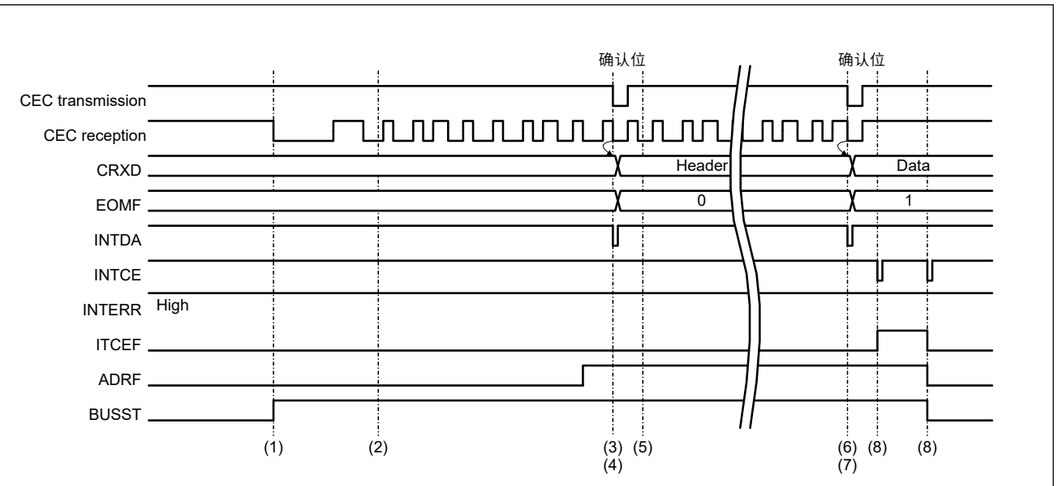
无信号时间计数	不支持	Supported	Supported	Supported	Supported	Supported	Supported	Supported	Supported

注1.通过设置CECCTL1.BLERRD检测总线锁定错误。
注2.检测到总线锁定错误但未设置标志。
注3.仅当检测到错误时。
注4.仅当检测到起始位的时序错误(CECCTL1.STERRD=1)时才支持此功能。检测到错误但未设置标志。

(1) CEC接收操作程序

对于直接地址报文的接收操作，地址匹配时的操作如图37.19和表37.10所示，地址不匹配时的操作如图37.20和表37.11所示。



Note: 图37.19中的(1)至(8)对应于表37.10中的(1)至(8)。

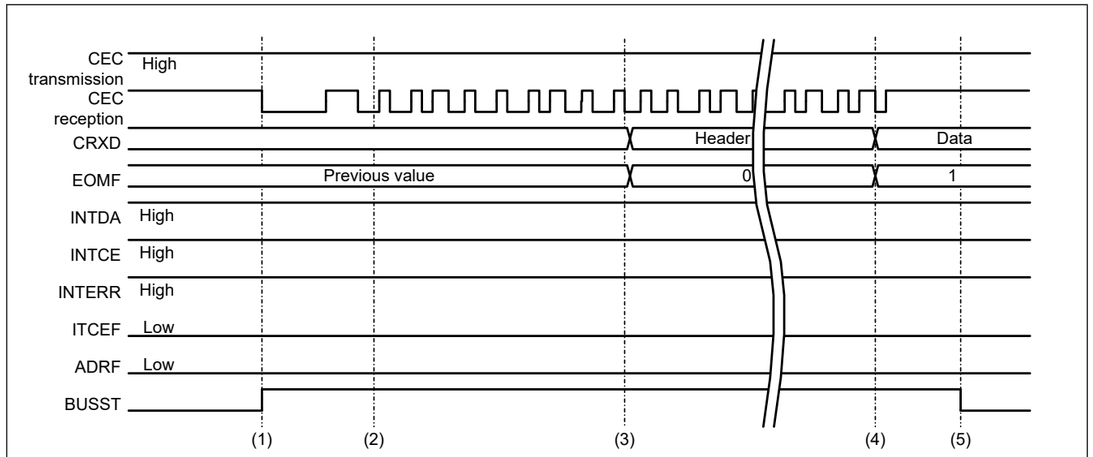
Figure 37.19 基本接收时序（1）（直接地址接收，CECCTL1.CESEL[1:0]=00b）

Table 37.10 CEC reception manipulation procedure (1)

Stage	Step	Software manipulation	CEC state
Initial CEC setting	1	See Table 37.6.	—
CEC receive operation	2	—	[Start bit detection] The falling edge of the CEC reception signal is detected and a receive operation is started (1). [Sampling] The data is sampled at the NOMT setting time and sequentially stored in the shift register (2). [Address match interrupt] INTDA is generated because the address received at the header block matched with the local address (3).
	3	Prepare for receiving data by returning from low power consumption mode or the like in response to INTDA generation. Use EOMF to check whether to continue transmission or whether it is the last frame.	—
	4	—	[ACK bit transmission] Logical 0 is transmitted at the ACK bit timing because the reception was successful (4).
	5	—	[Continuing reception] The data of the second frame is continuously received (5). [Receive data interrupt] When receiving 8-bit data is complete, the data is transferred to CRXD and INTDA is generated (6).
	6	Read the receive data from CRXD in response to INTDA generation. Use EOMF to check whether to continue transmission or whether it is the last frame.	
	7	—	[ACK bit transmission] Logical 0 is transmitted at the ACK bit timing because the reception was successful (7). [Reception completion] The reception is judged to be completed because EOM = 1 is received and INTCE is output according to the CECCTL1.CESEL[1:0] and CECCTL1.SFT[1:0] bit settings (8).

Table 37.10 CEC接收操作流程（一）

Stage	Step	软件操作	CEC state
初始CEC设置	1	见表37.6。	—
CEC接收操作	2	—	[Start bit detection] 检测到CEC接收信号的下降沿并开始接收操作(1)。[采样] 数据在NOMT设置时间被采样并顺序存储在移位寄存器(2)中。[地址匹配中断] INTDA的生成是因为在头块中接收到的地址与本地地址(3)匹配。
	3	响应INTDA生成，通过从低功耗模式等返回来准备接收数据。使用EOMF检查是否继续传输或是否是最后一帧。	—
	4	—	[ACK bit transmission] 因为接收成功(4)，所以在ACK位定时发送逻辑0。
	5	—	[Continuing reception] 连续接收第二帧的数据（5）。【接收数据中断】 接收完8位数据后，将数据传送到CRXD并生成INTDA(6)。
	6	从CRXD读取接收数据以响应INTDA一代。使用EOMF检查是否继续传输或是否是最后一帧。	
	7	—	[ACK bit transmission] 因为接收成功(7)，所以在ACK位定时发送逻辑0。[接收完成] 由于接收到EOM=1并根据CECCTL1.CESEL[1:0]和INTCE输出，因此判断接收完成 CECCTL1.SFT[1:0]位设置(8)。



Note: (1) to (5) in Figure 37.20 correspond to (1) to (5) in Table 37.11.

Figure 37.20 Basic reception timing (2) (CECCTL0.CECRXEN = 1, direct address, address mismatch, CECCTL1.CINTMK = 0)

Table 37.11 CEC reception manipulation procedure (2)

Stage	Step	Software manipulation	CEC state
CEC receive operation	1	—	[Start bit detection] The falling edge of the CEC reception signal is detected and a receive operation is started. Set BUSST flag (1). [Sampling] The data is sampled at the NOMT setting time and sequentially stored in the shift register (2). [Address match interrupt] INTDA is not generated and neither ACK nor NACK is returned because the address received at the header block does not match the local address and CINTMK is 0 (3). However, monitoring of the CEC line continues in order to check the bit length and detect completion of communication. [ACK bit transmission] Neither ACK nor NACK is returned because communication is performed between other stations (4). [Reception completion] Communication between other stations is complete because EOM = 1 is received, the signal-free time is counted according to the SFT[1:0] bit settings, and BUSST is cleared to 0 (5).

(2) Broadcast reception

The reception flow and timing check period are the same as those of direct address reception. If the destination address transmitted by the initiator is 0xF, the communication operates as a broadcast reception.

The differences from direct address reception are as follows:

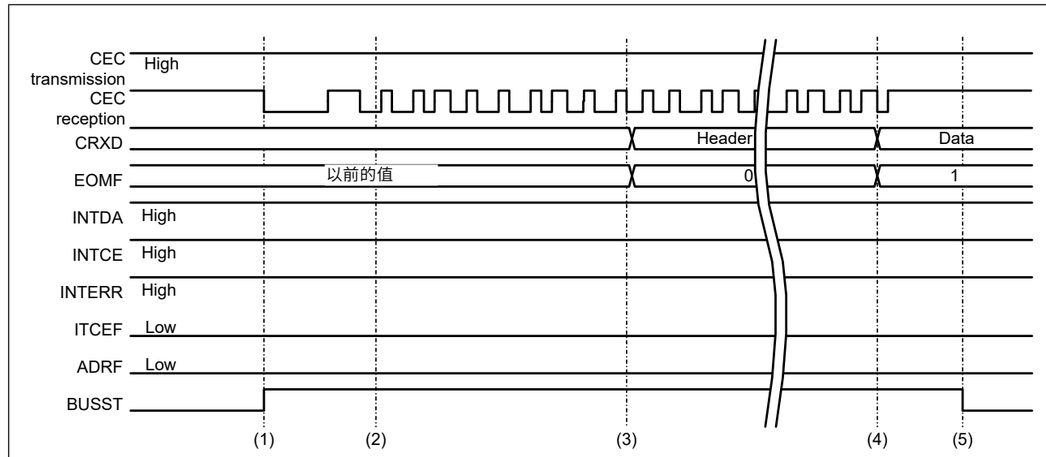
- Logical 1 is transmitted at the ACK bit timing in a normal operation.
- If reception failed or CECRXEN = 0 is set, logical 0 is transmitted at the ACK bit timing.

(3) CEC reception interrupt

Three interrupt functions, namely a data interrupt (INTDA), communication complete interrupt (INTCE), and error interrupt (INTERR) are provided. Figure 37.21 shows the timing for generating interrupts during CEC reception.

A data interrupt (INTDA) is output at the following timings during reception (follower):

- When the address received at the header block of a direct address communication matched the local address



Note: 图37.20中的(1)至(5)对应于表37.11中的(1)至(5)。

Figure 37.20 基本接收时序（2）（CECCTL0.CECRXEN=1，直接地址，地址不匹配，CECCTL1.CINTMK = 0)

Table 37.11 CEC接收操作程序（二）

Stage	Step	软件操作	CEC state
CEC接收操作	1	—	[Start bit detection] 检测到CEC接收信号的下降沿并开始接收操作。设置BUSST标志(1)。[采样] 数据在NOMT设置时间被采样并顺序存储在移位寄存器(2)中。[地址匹配中断] 不生成INTDA，也不返回ACK和NACK，因为在头块接收到的地址与本地地址不匹配并且CINTMK为0(3)。但是，为了检查位长和检测通信完成，继续监视CEC线路。【ACK位传输】 ACK和NACK均不返回，因为在其他站(4)之间执行通信。[接收完成] 其他站之间的通信是完整的，因为 接收到EOM=1，根据SFT[1:0]位设置计算无信号时间，并将BUSST清除为0(5)。

(2) 广播接收

接收流程和定时检查周期与直接地址接收相同。如果发起方发送的目的地址是0xF，则通信操作为广播接收。

与直接地址接收的区别如下：

- ●在正常操作中，在ACK位时序发送逻辑1。
- ●如果接收失败或设置CECRXEN=0，则在ACK位定时发送逻辑0。

(3) CEC接收中断

提供了三种中断功能，即数据中断（INTDA）、通信完成中断（INTCE）和错误中断（INTERR）。图37.21显示了在CEC接收期间产生中断的时序。

接收期间（跟随器）在以下时序输出数据中断（INTDA）：

- ●直接地址通信的报头块接收到的地址与本地地址匹配时

RA生态工作室

- When address reception is complete at the header block of a direct address communication when CECCTL1.CINTMK = 1 is set
- When address reception of a broadcast communication is complete at the header block
- When data reception is complete at the data block and the receive data is stored in the CRXD register

Communication complete interrupt INTCE is output at the following timings during reception (follower):

- CECCTL1.CESEL[1:0] = 00b
  INTCE is output if receiving the ACK bit of the last frame (EOM = 1) ends, if the signal-free time is counted, if the falling edge of the CEC line is detected in the high-level period of the ACK bit of the last frame, or while the signal-free time is counted.
- CECCTL1.CESEL[1:0] = 01b
  INTCE is output if receiving the ACK bit of the last frame (EOM = 1) ends, if the falling edge of the CEC line is detected in the high-level period of the ACK bit of the last frame, or while the signal-free time is counted.
- CECCTL1.CESEL[1:0] = 10b
  INTCE is output if the signal-free time is counted.

An error interrupt (INTERR) is output at the following timings during reception (follower):

- When a timing error is detected
- When an overrun error is detected
- When a bus lock error is detected while CECCTL1.BLERRD = 1 is set

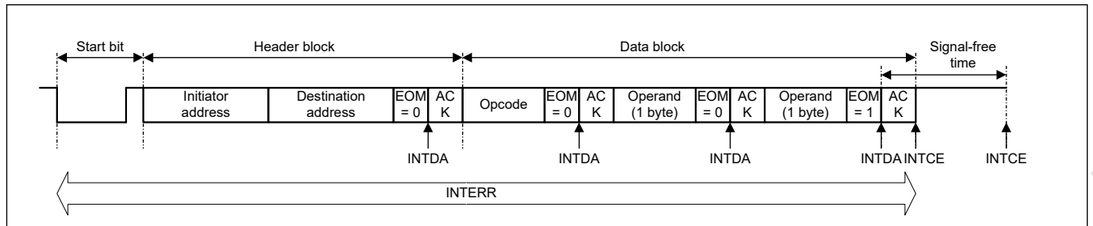


Figure 37.21 Basic reception interrupt timing

37.3.3.6 Status Flag Functions

Table 37.12 lists status flags.

Table 37.12 Status flags

No.	Status flag	Register.Bit symbol
1	Address match detection flag	CECS.ADRF
2	Bus busy detection flag	CECS.BUSST
3	Transmission status flag	CECS.TXST
4	EOM flag	CECS.EOMF
5	INTCE generation source flag	CECS.ITCEF
6	Signal-free time rewrite disable report flag	CECS.SFTST
7	CEC line monitor	CECEXMON.CECLNMON
8	ACK flag	CECEXMON.ACKF

(1) Address match detection flag

As shown in Figure 37.22, during follower operation, if the destination address of the header block received during direct address communication matches the address set by the CEC local address setting register (CADR) or during broadcast communication, the address match flag (CECS.ADRF) is set to 1 at the same time when a data interrupt (INTDA) of the header block is generated.

●设置CECCTL1.CINTMK=1时，在直接地址通信的报头块中完成地址接收时

●在报头块完成广播通信的地址接收时

●当数据块的数据接收完成并且接收数据存储在CRXD寄存器中时

通信完成中断INTCE在接收期间（跟随器）按以下时序输出：

- CECCTL1.CESEL[1:0] = 00b
  如果接收到最后一帧的ACK位（EOM=1）结束，如果计算无信号时间，如果在ACK位的高电平期间检测到CEC线的下降沿，则输出INTCE最后一帧，或在计算无信号时间时。
- CECCTL1.CESEL[1:0] = 01b
  如果接收到最后一帧的ACK位（EOM=1）结束，如果在最后一帧的ACK位的高电平期间检测到CEC线的下降沿，或者在无信号时，输出INTCE时间被计算。
- CECCTL1.CESEL[1:0] = 10b
  如果计算了无信号时间，则输出INTCE。

接收期间（跟随器）在以下时序输出错误中断（INTERR）：

●检测到定时错误时

●检测到溢出错误时

●CECCTL1.BLERRD=1时检测到总线锁定错误时

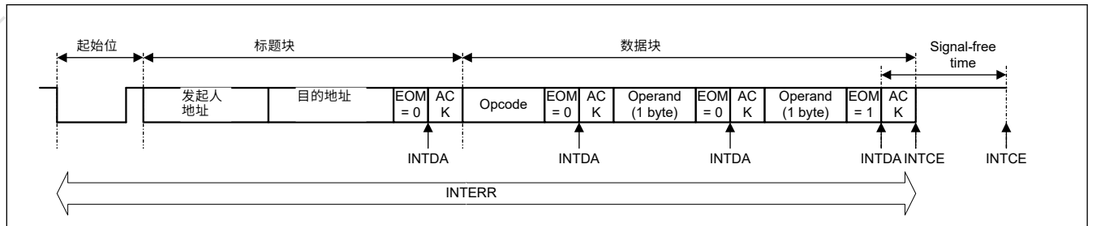

Figure 37.21 基本接收中断时序

37.3.3.6 状态标志功能

表37.12列出了状态标志。

Table 37.12 状态标志

No.	状态标志	Register.Bit symbol
1	地址匹配检测标志	CECS.ADRF
2	总线繁忙检测标志	CECS.BUSST
3	传输状态标志	CECS.TXST
4	EOM flag	CECS.EOMF
5	INTCE生成源标志	CECS.ITCEF
6	无信号时间重写禁用报告标志	CECS.SFTST
7	CEC线路监视器	CECEXMON.CECLNMON
8	确认标志	CECEXMON.ACKF

(1) 地址匹配检测标志

如图37.22所示，在跟随器操作期间，如果在直接地址通信期间接收到的头块的目标地址与CEC本地地址设置寄存器(CADR)或广播通信期间设置的地址匹配，则地址匹配标志(CECS.ADRF)在产生头块的数据中断(INTDA)的同时设置为1。

RA生态工作室

The address match flag is cleared at the timing of the communication completion interrupt (INTCE) that is generated on completion of the signal-free time counting after the last frame (EOM = 1) is received.

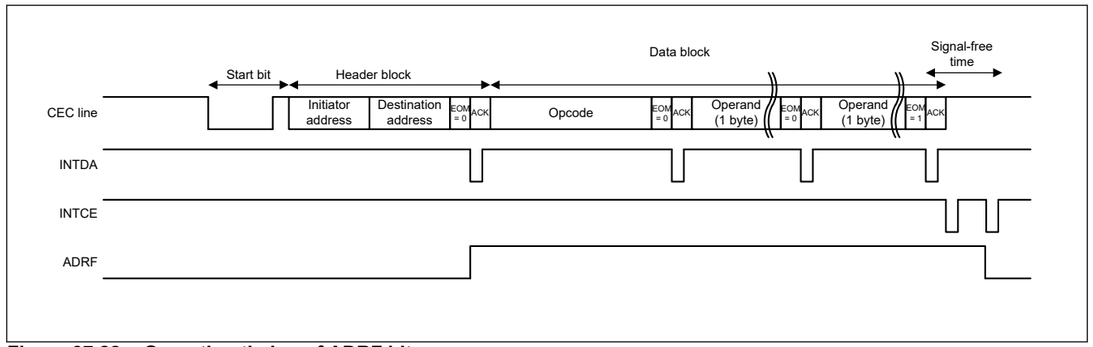

Figure 37.22 Operation timing of ADRF bit

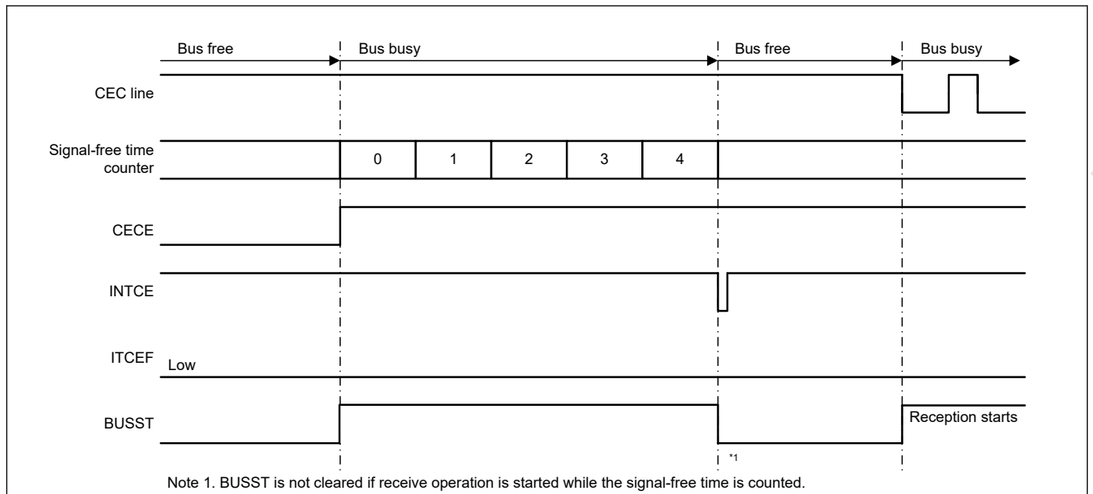
(2) Bus busy detection flag

Figure 37.23 to Figure 37.25 show the timing operation of the Bus Busy Flag (CECS.BUSST). When CEC operation is enabled (CECCTL0.CECE = 0→1) or operation of the CEC line is detected, the Bus Busy Flag (CECS.BUSST) is set. After communication completes and the signal-free time has elapsed, the Bus Busy Flag is then cleared.



Note 1. BUSST is not cleared if receive operation is started while the signal-free time is counted.

Figure 37.23 Timing at the start of reception when CECE = 1

地址匹配标志在接收到最后一帧(EOM=1)后的无信号时间计数完成时产生的通信完成中断(INTCE)时被清除。

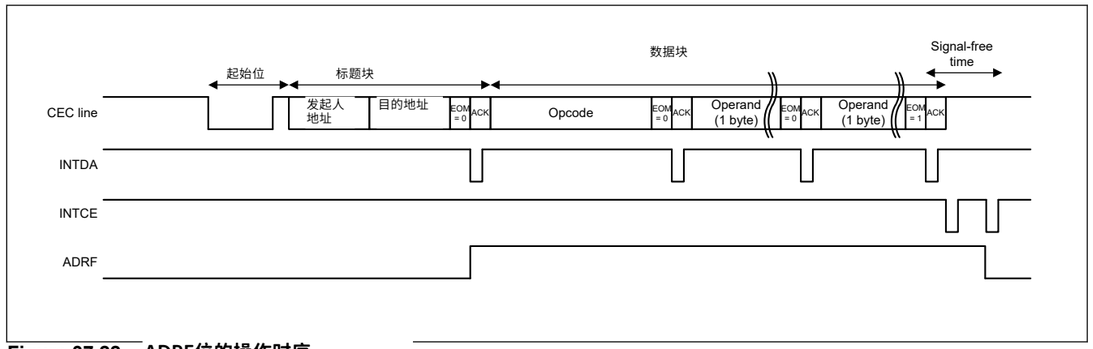


Figure 37.22 ADRF位的操作时序

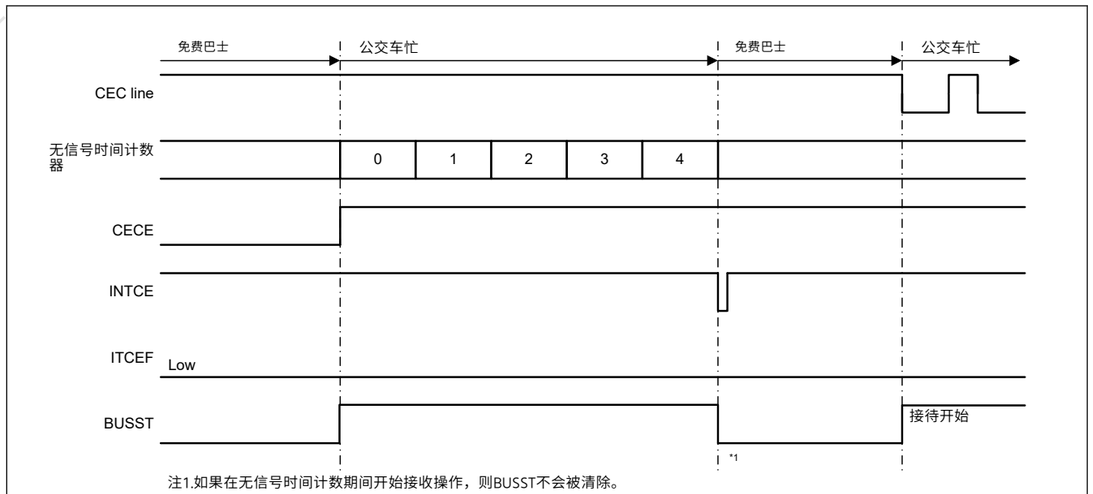
(2) 总线繁忙检测标志

图37.23至图37.25显示了总线忙标志(CECS.BUSST)的时序操作。CEC运行时使能（CECCTL0.CECE=0→1）或检测到CEC线路的操作，则设置总线忙标志（CECS.BUSST）。通信完成且无信号时间过去后，总线忙标志将被清除。



注1.如果在无信号时间计数期间开始接收操作，则BUSST不会被清除。

Figure 37.23 CECE=1时开始接收的时间

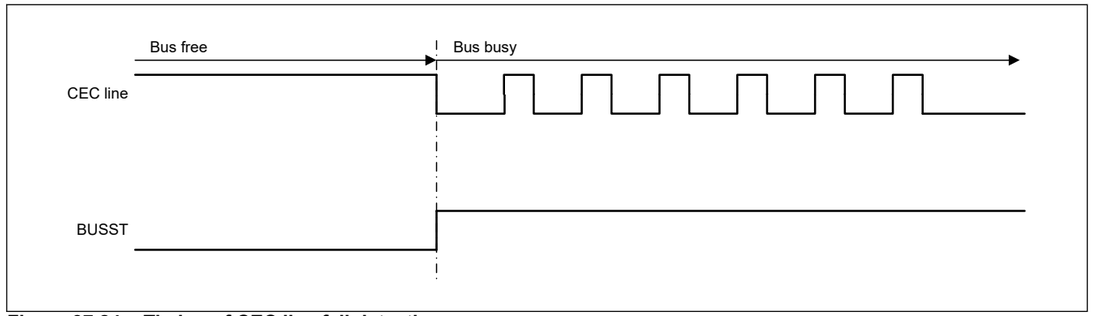


Figure 37.24 Timing of CEC line fall detection

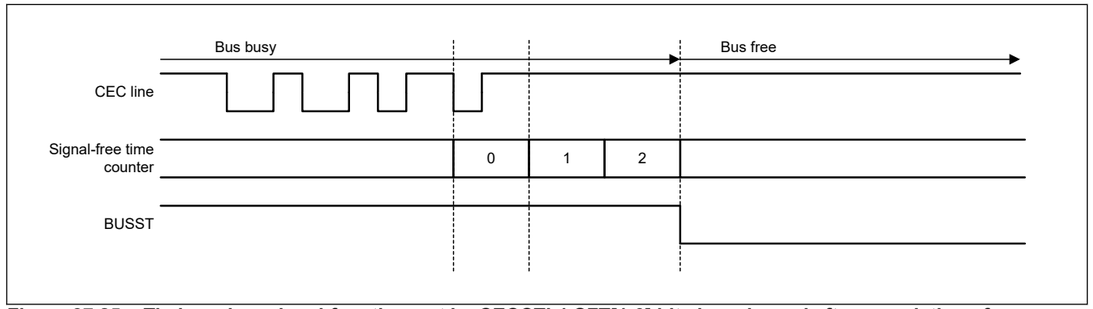

Figure 37.25 Timing when signal-free time set by CECCTL1.SFT[1:0] bits has elapsed after completion of communication

(3) Transmission status flag

As shown in Figure 37.26, when 1 is written to the Transmission Start Trigger Bit (CECCTL0.TXTRG) during initiator operation, the transmission status flag (CECS.TXST) is set.

The transmission status flag is cleared when the communication complete interrupt (INTCE) that is generated on completion of ACK reception for the data block with EOM = 1. However, as shown in Figure 37.27, if arbitration is lost, the transmission status flag is cleared at the same time when an error interrupt (INTERR) is generated and the Arbitration Loss Detection Flag (CECES.AERR) is set.

Likewise, if an underrun error occurs, the Transmission Status Flag is cleared as the same time when an error interrupt is generated.

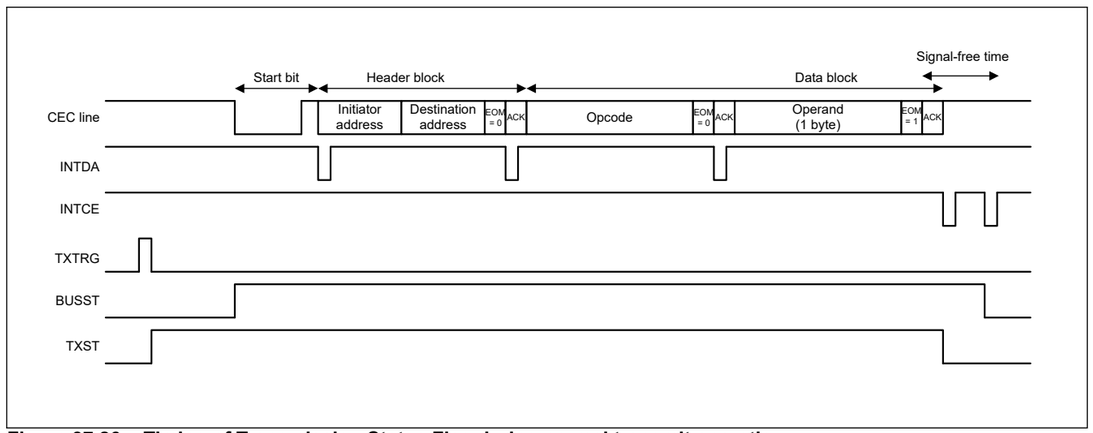

Figure 37.26 Timing of Transmission Status Flag during normal transmit operation

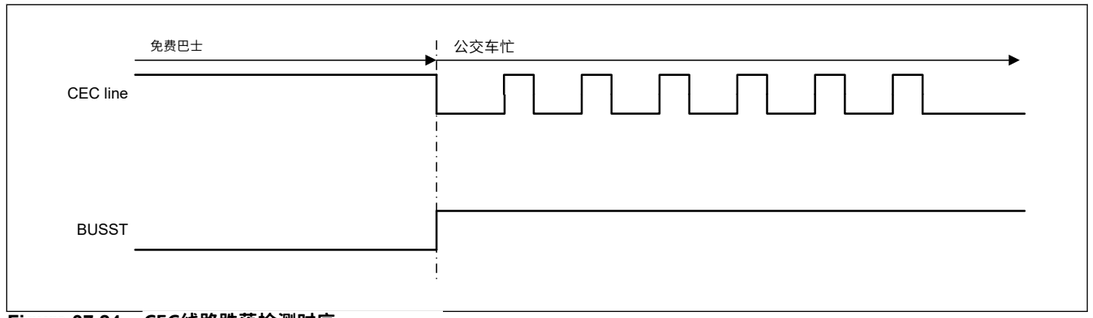

Figure 37.24 CEC线路跌落检测时序

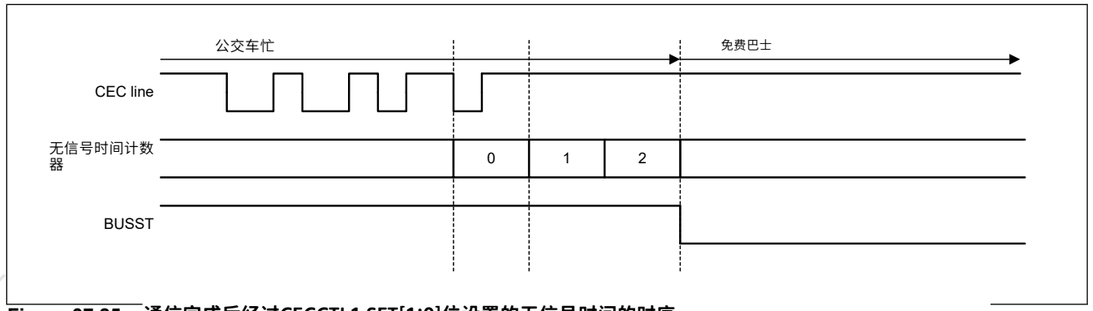

Figure 37.25 通信完成后经过CECCTL1.SFT[1:0]位设置的无信号时间的时序

(3) 传输状态标志

如图37.26所示，当在启动器操作期间向发送开始触发位(CECCTL0.TXTRG)写入1时，发送状态标志(CECS.TXST)被置位。

当EOM=1的数据块的ACK接收完成时产生的通信完成中断(INTCE)时，发送状态标志被清除。但是，如图37.27所示，如果仲裁失败，则发送状态标志被清除同时产生错误中断(INTERR)并设置仲裁丢失检测标志(CECES.AERR)。

同样，如果发生欠载错误，则在产生错误中断的同时清除传输状态标志。

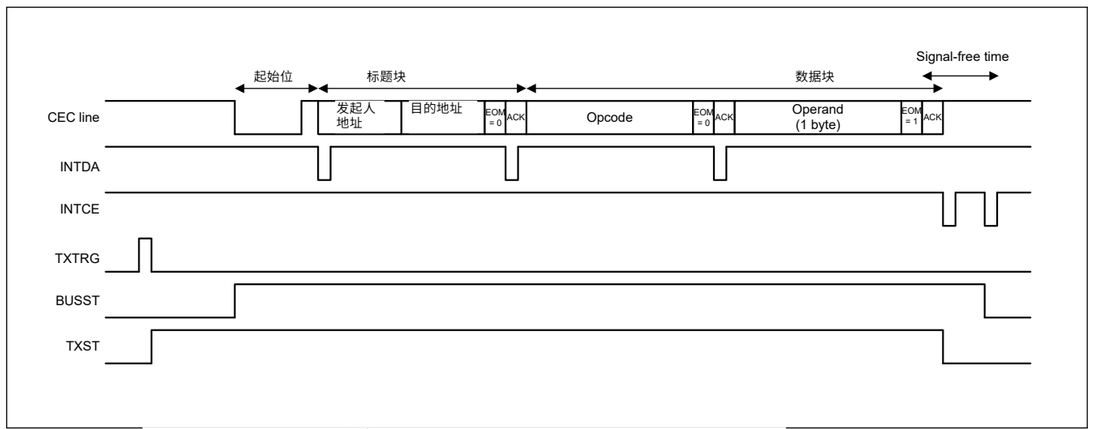

Figure 37.26 正常发送操作期间发送状态标志的时序

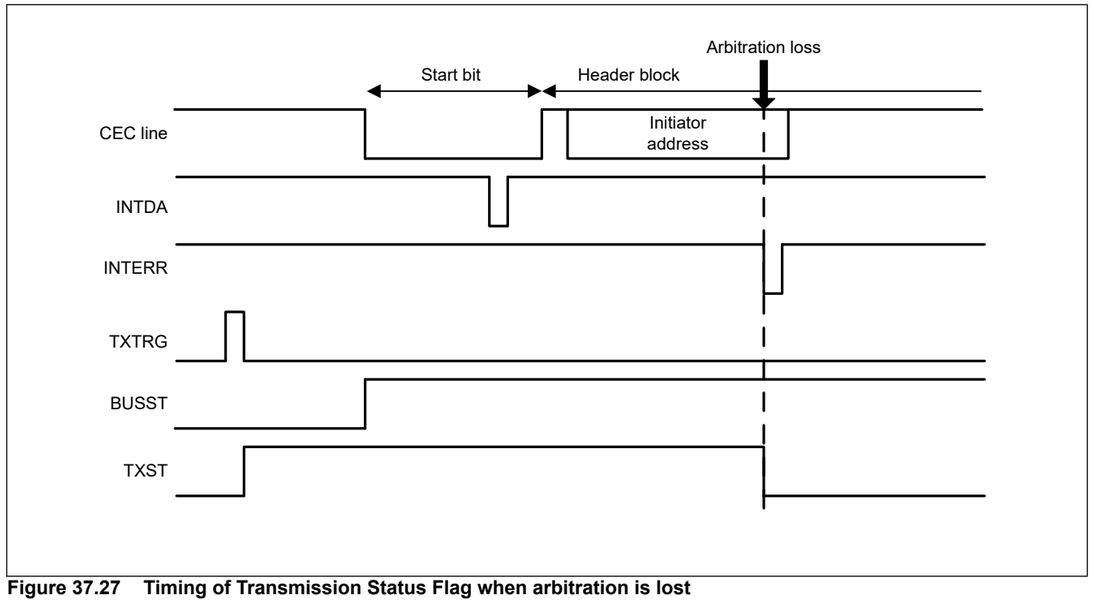

Figure 37.27 Timing of Transmission Status Flag when arbitration is lost

(4) EOM flag

As shown in Figure 37.28, during follower operation, the EOM flag (CECS.EOMF) is updated at the same time when a data interrupt (INTDA) is generated.

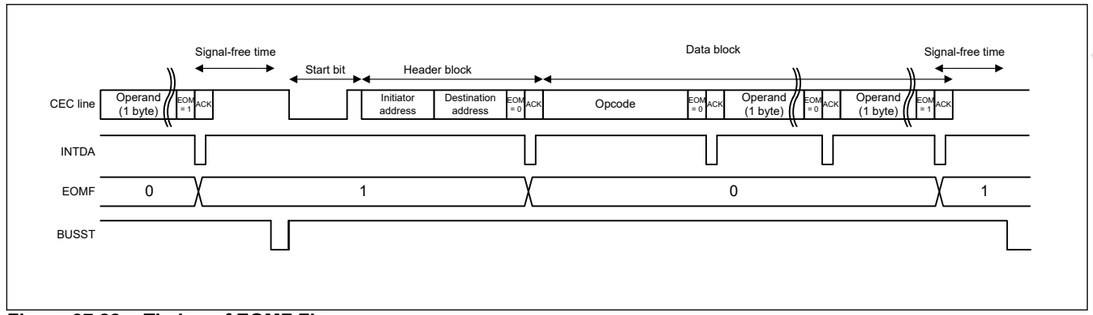

Figure 37.28 Timing of EOMF Flag

(5) INTCE generation source flag

This flag indicates which source was the generation source when a communication complete interrupt (INTCE) is generated. The INTCE Generation Source Flag (CECS.ITCEF) is set at the same time as the communication complete interrupt (INTCE) at the timing of ACK reception of the last block or when an error occurs.

After communication is complete, the INTCE Generation Source Flag is cleared when the signal-free time has elapsed. However, if receive operation is started during the signal-free time, the INTCE Generation Source Flag is not cleared and remains 1. Figure 37.29 shows an example of using the INTCE Generation Source Flag (CECS.ITCEF) to check the INTCE generation source.

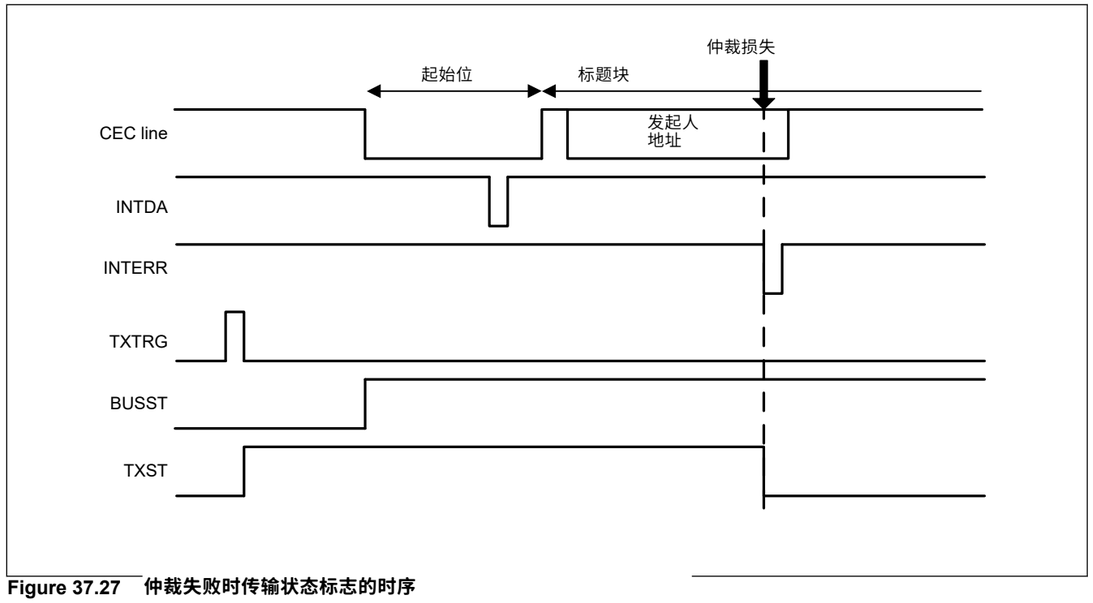

Figure 37.27 仲裁失败时传输状态标志的时序

(4) EOM flag

如图37.28所示，在跟随器操作期间，EOM标志(CECS.EOMF)会在产生数据中断(INTDA)的同时更新。

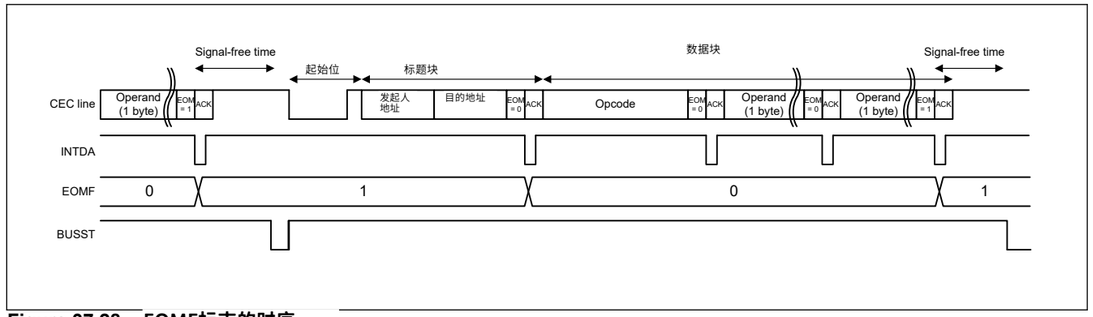

Figure 37.28 EOMF标志的时序

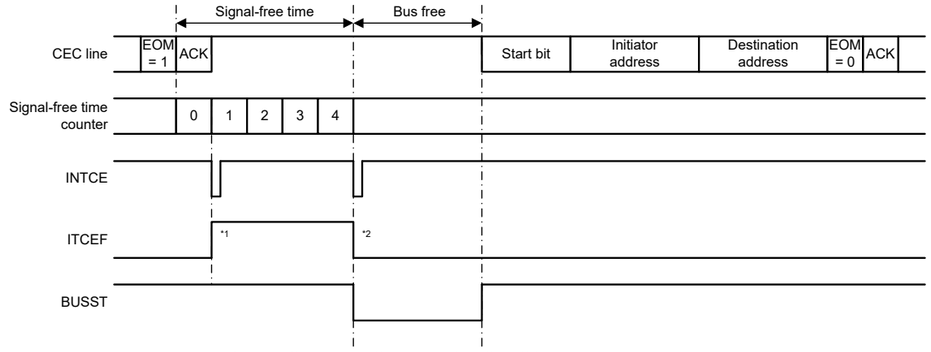
(5) INTCE生成源标志

该标志指示在产生通信完成中断(INTCE)时哪个源是产生源。INTCE发生源标志(CECS.ITCEF)在收到最后一个块的ACK时或发生错误时与通信完成中断(INTCE)同时设置。

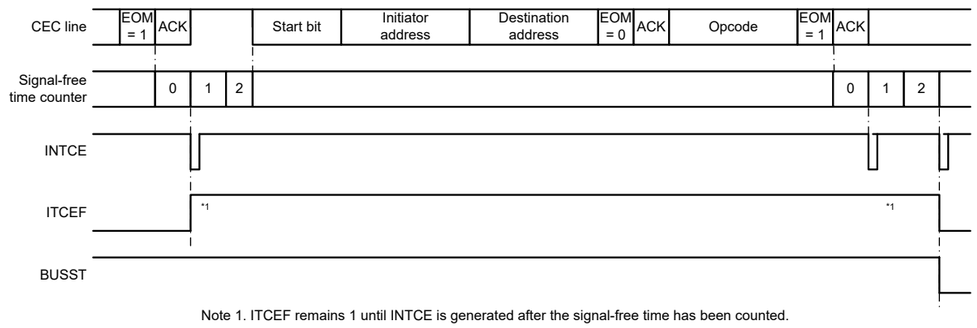
通信完成后，INTCE生成源标志在无信号时间过后被清除。
但是，如果在无信号时间内开始接收操作，则INTCE生成源标志不会被清除并保持为1。图37.29显示了使用INTCE生成源标志(CECS.ITCEF)检查INTCE生成源的示例。

(1) Reception is started after the signal-free time has been counted



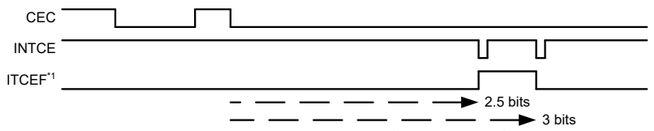
Note 1. If ITCEF is 1, INTCE is generated after ACK has been received.
Note 2. If ITCEF is 0, INTCE is generated after the signal-free time has been counted.

(2) Reception is started during the signal-free time



Note 1. ITCEF remains 1 until INTCE is generated after the signal-free time has been counted.

(3) When a bus lock error is detected



Note 1. This bit is set to 1 when INTCE is generated if a bus lock error is detected, and cleared to 0 when INTCE is generated after the signal-free time is counted.

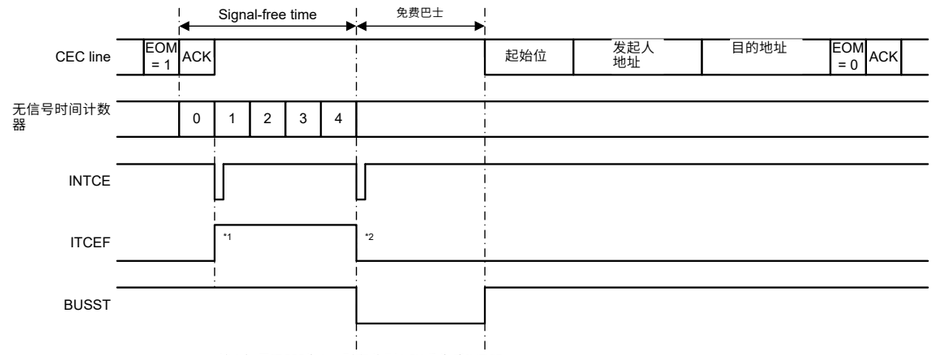
Figure 37.29 Using ITCEF to check INTCE generation source when CECCTL1.CESEL[1:0] = 00b

(6) Signal-free time rewrite disable report flag

This flag indicates the rewrite disable period of the signal-free time data width select bits (CECCTL1.SFT[1:0]). As shown in Figure 37.30, when the CECCTL1.SFT[1:0] bits are accessed, the Signal-free Time Rewrite Disable Report Flag (CECS.SFTST) is set.

This flag is cleared after the CECCTL1.SFT[1:0] bit setting is applied to the CEC internal control circuit.

(1)计算无信号时间后开始接收

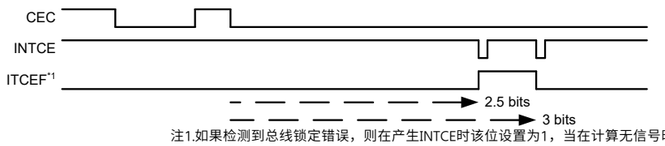


注1.如果ITCEF为1，则在收到ACK后生成INTCE。
注2.如果ITCEF为0，则在计算无信号时间后生成INTCE。

(2)在无信号时间内开始接收

注1.ITCEF保持为1，直到在计算无信号时间后生成INTCE。

(3)检测到总线锁定错误时



注1.如果检测到总线锁定错误，则在产生INTCE时该位设置为1，当在计算无信号时间后产生INTCE时，该位清零。

Figure 37.29 CECCTL1.CESEL[1:0]=00b时使用ITCEF检查INTCE生成源

(6) 无信号时间重写禁用报告标志

该标志指示无信号时间数据宽度选择位(CECCTL1.SFT[1:0])的重写禁用周期。如图37.30所示，当访问CECCTL1.SFT[1:0]位时，将设置无信号时间重写禁用报告标志(CECS.SFTST)。

在CECCTL1.SFT[1:0]位设置应用于CEC内部控制电路后，该标志被清除。

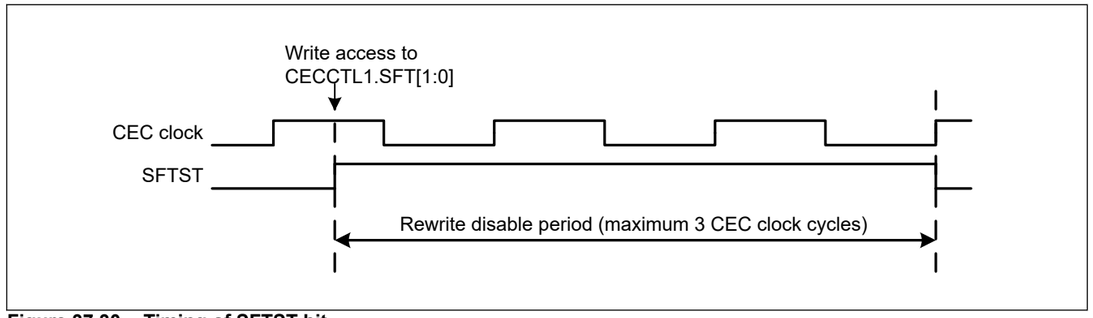


Figure 37.30 Timing of SFTST bit

(7) CEC line monitor

Figure 37.31 shows the timing operation of the CECEXMON.CECLNMON bit.

The state of the CEC pin can be read by reading the CECEXMON.CECLNMON bit.

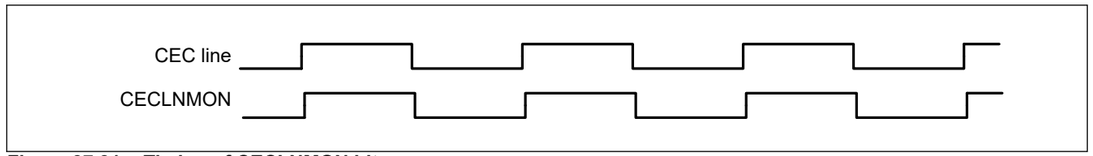

Figure 37.31 Timing of CECLNMON bit

(8) ACK flag

During follower operation, the ACK flag (CECEXMON.ACKF) is updated at the timing of ACK bit reception.

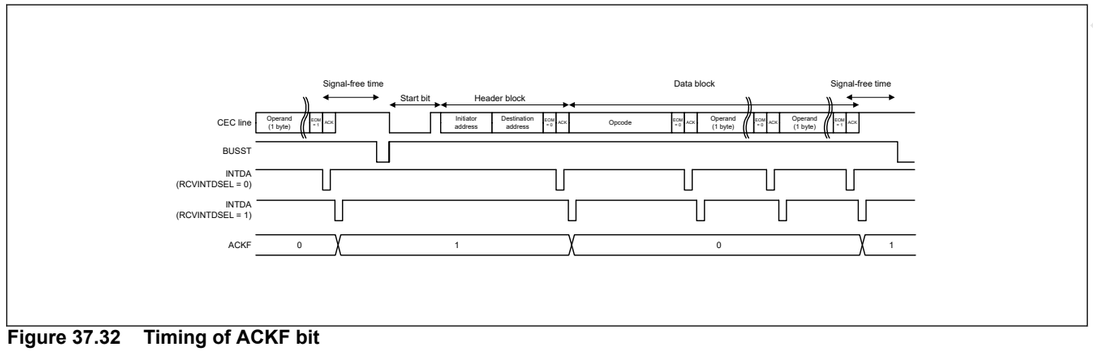

Figure 37.32 Timing of ACKF bit

As shown in Figure 37.32, when reading the ACKF bit while CECEXMD.RCVINTDSEL = 0, the received ACK state can be read by reading this bit when a 1-bit wait time has elapsed after a data interrupt (INTDA) is generated. (if this bit is read after a data interrupt is generated, the ACK of the previously received data is read).

When reading the ACKF bit while CECEXMD.RCVINTDSEL = 1, read this bit after a data interrupt (INTDA) is generated. The ACK of the newest received data can be read.

37.3.3.7 CEC Interrupts

The CEC transmission/reception circuit generates three interrupt requests.

- Data interrupt (INTDA)
  During transmission, this interrupt is generated at the timing when transmission of each block is started. During reception, this interrupt is generated at the timing of each completion of EOM bit reception if CECEXMD.RCVINTDSEL is 0, and each completion of ACK bit transmission if CECEXMD.RCVINTDSEL = 1, depending on the value of the Reception Interrupt Timing Change bit.

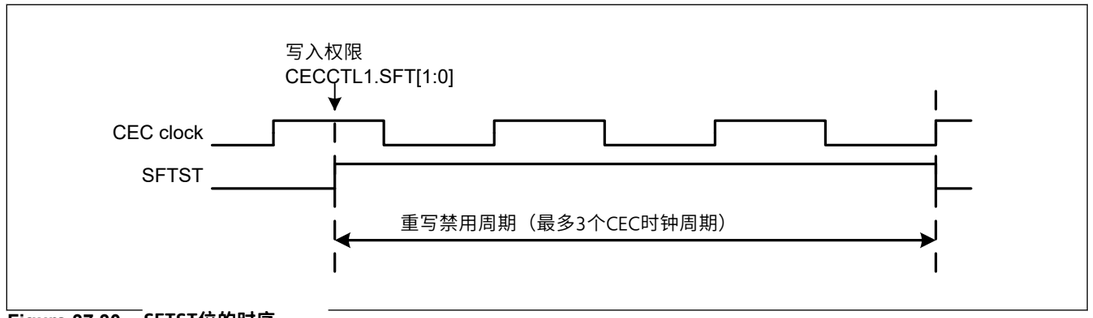

Figure 37.30 SFTST位的时序

(7) CEC线路监视器

图37.31显示了CECEXMON.CECLNMON位的时序操作。

通过读取CECEXMON.CECLNMON位可以读取CEC引脚的状态。

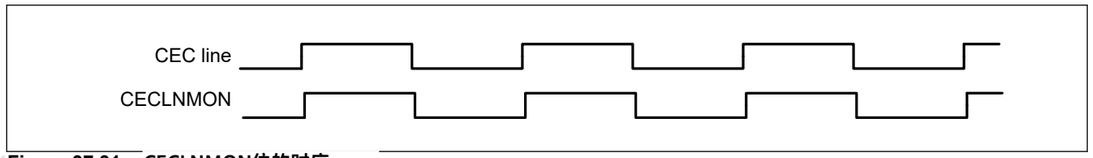

Figure 37.31 CECLNMON位的时序

(8) 确认标志

在跟随器操作期间，ACK标志(CECEXMON.ACKF)在ACK位接收时更新。

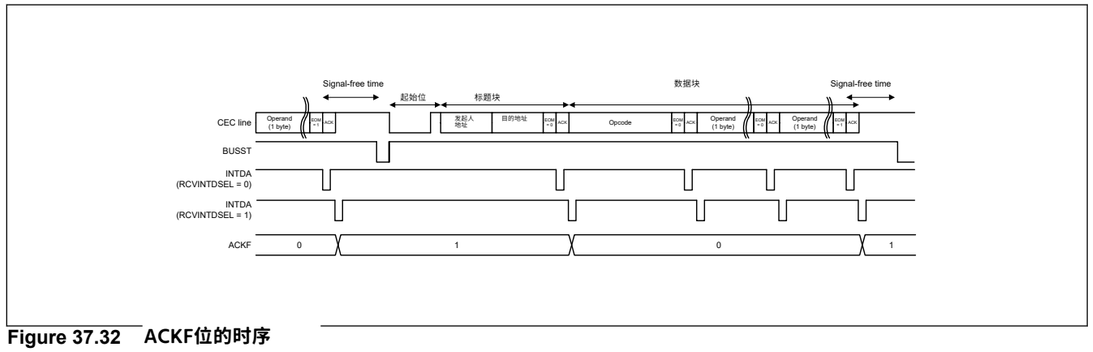

Figure 37.32 ACKF位的时序

如图37.32所示，当CECEXMD.RCVINTDSEL=0时读取ACKF位时，在产生数据中断(INTDA)后经过1位等待时间后，可以通过读取该位读取接收到的ACK状态。（如果在产生数据中断后读取该位，则读取之前接收到的数据的ACK）。

在CECEXMD.RCVINTDSEL=1时读取ACKF位时，在产生数据中断(INTDA)后读取该位。可以读取最新接收数据的ACK。

37.3.3.7 CEC Interrupts

CEC发送接收电路产生三个中断请求。

- 数据中断（INTDA）
  在传输过程中，该中断在每个块的传输开始时产生。在接收期间，如果CECEXMD.RCVINTDSEL为0，则在每次EOM位接收完成时产生此中断；如果CECEXMD.RCVINTDSEL=1，则在每次完成ACK位发送时产生此中断，具体取决于接收中断时序更改位的值。

- Communication complete interrupt (INTCE)
  During both transmission and reception, this interrupt is generated on completion of the message or signal-free time is complete. It is also possible to select only one of the two (completion of the message or signal-free time) by setting the communication complete Interrupt Generation Timing Change Bits (CECCTL1.CESEL[1:0]).
- Error interrupt (INTERR)
  This interrupt is generated when an error is generated.

Figure 37.33 shows the timing for generating each interrupt.

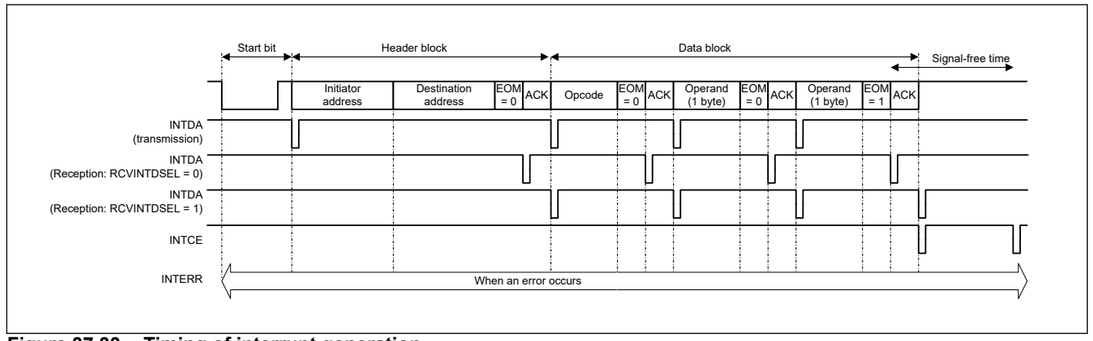

Figure 37.33 Timing of interrupt generation

Each of three interrupt requests can be used to output two types of interrupt requests. Use the two types exclusively depending on the application of the interrupt request. See Table 37.13 for details on the application corresponding to each CEC interrupt request.

Table 37.13 CEC interrupt sources

Name	Corresponding source				
	CPU interrupt	DTC activation	DMAC activation	Return from Software Standby mode	Return from All-Module Clock Stop mode
INTDA	Possible	Possible	Possible	Not possible	Not possible
INTCE	Possible	Possible	Possible	Not possible	Not possible
INTERR	Possible	Not possible	Not possible	Not possible	Not possible

37.3.3.7.1 Error Interrupt Sources

Table 37.14 lists the seven errors that CEC can detect for the initiator and follower, and Figure 37.34 shows the error detection period.

Table 37.14 Errors that can be detected for the initiator and follower

Error	Initiator	Follower
(1) Transmission error	Detected	Not detected
(2) ACK error	Detected	Not detected
(3) Underrun error	Detected	Not detected
(4) Arbitration error	Detected	Not detected
(5-1) Timing error (low-level width)	Detected	Detected
(5-2) Timing error (bit width)	Detected	Detected
(6) Overrun error	Not detected	Detected
(7) Bus lock error	Not detected	Detected

●通讯完成中断（INTCE）
在发送和接收期间，该中断在消息完成或无信号时间结束时产生。也可以通过设置通信完成中断生成时序更改位(CECCTL1.CESEL[1:0])仅选择两者之一（消息完成或无信号时间）。

●错误中断（INTERR）
产生错误时会产生此中断。

图37.33显示了产生每个中断的时序。

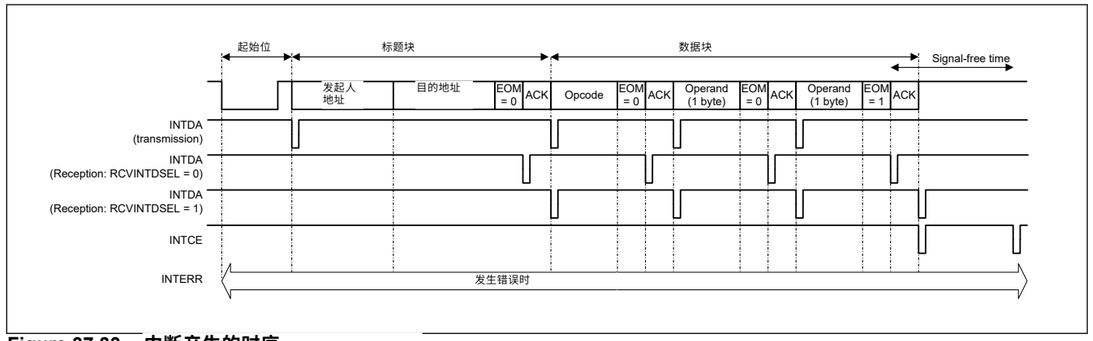

Figure 37.33 中断产生的时序

三个中断请求中的每一个都可用于输出两种类型的中断请求。根据中断请求的应用，专门使用这两种类型。有关每个CEC中断请求对应的应用程序的详细信息，请参见表37.13。

Table 37.13 CEC中断源

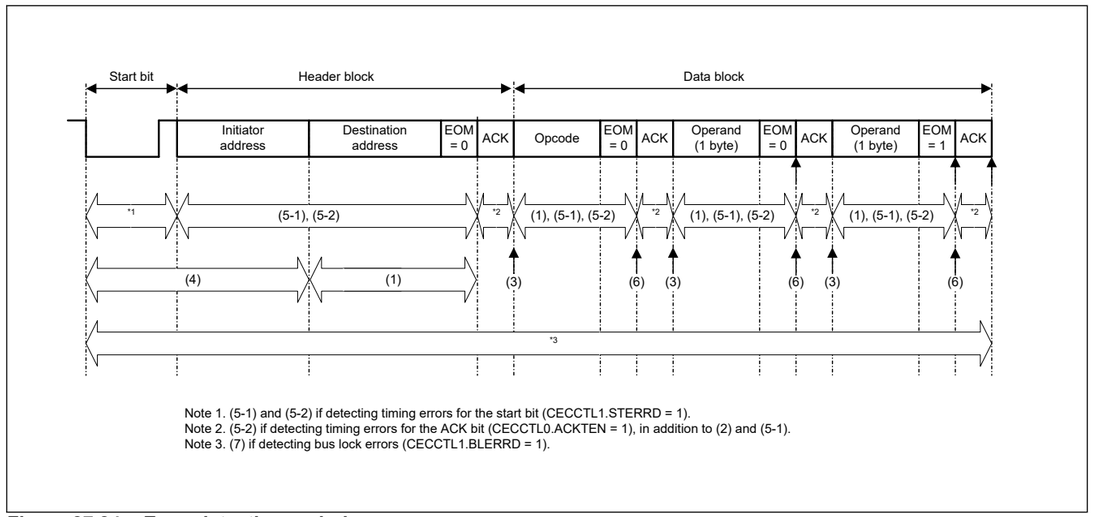
Name	对应来源				
	CPU中断	DTC activation	DMAC activation	从返回 软件待机模式	从所有返回 模块时钟停止模式
INTDA	Possible	Possible	Possible	不可能	不可能
INTCE	Possible	Possible	Possible	不可能	不可能
INTERR	Possible	不可能	不可能	不可能	不可能

37.3.3.7.1 错误中断源

表37.14列出了CEC可以为发起者和跟随者检测到的七个错误，图37.34显示了错误检测周期。

Table 37.14 可以为发起者和跟随者检测到的错误

Error	Initiator	Follower
(1)传输错误	Detected	没有检测到
(2)ACK错误	Detected	没有检测到
(3) Underrun error	Detected	没有检测到
(4)仲裁错误	Detected	没有检测到
(5-1)时序误差（低电平宽度）	Detected	Detected
(5-2)时序误差（位宽）	Detected	Detected
(6)超限错误	没有检测到	Detected
(7)总线锁定错误	没有检测到	Detected



Note 1. (5-1) and (5-2) if detecting timing errors for the start bit (CECCTL1.STERRD = 1).
Note 2. (5-2) if detecting timing errors for the ACK bit (CECCTL0.ACKTEN = 1), in addition to (2) and (5-1).
Note 3. (7) if detecting bus lock errors (CECCTL1.BLERRD = 1).

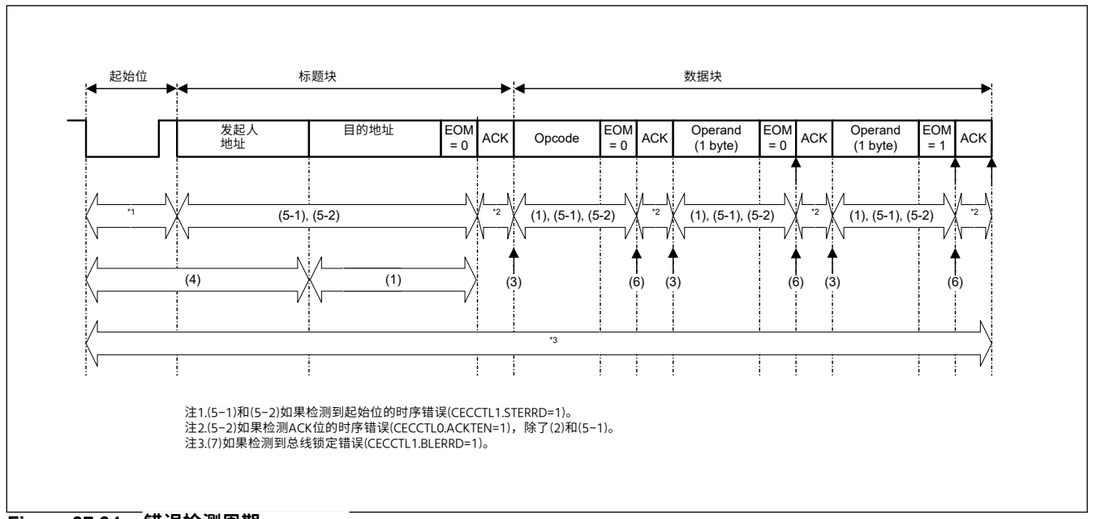
Figure 37.34 Error detection period

The details of each error are explained in the sections that follow.

(1) Transmission error

As shown in Figure 37.35, during initiator operation, the logic of the data the initiator transmitted is compared with that of the CEC line receive data and a transmission error occurs when they differ. Errors are determined at the timing specified by the value set to the CEC Reception Data Sampling Time Setting Register (NOMT). Errors are determined during the data bit period of the frame that includes the EOM bit. An error interrupt (INTERR) is generated after error detection, the Transmission Error Detection Flag (CECES.TXERR) is set, and transmission is stopped according to the value of the flag.

A communication complete interrupt INTCE is generated at the end of the bit at which transmission stopped and after the signal-free time is counted, according to the values specified for CECCTL1.CESEL[1:0].



注1.(5-1)和(5-2)如果检测到起始位的时序错误(CECCTL1.STERRD=1)。
注2.(5-2)如果检测ACK位的时序错误(CECCTL0.ACKTEN=1)，除了(2)和(5-1)。
注3.(7)如果检测到总线锁定错误(CECCTL1.BLERRD=1)。

Figure 37.34 错误检测周期

每个错误的详细信息将在以下部分中进行说明。

(1) 传输错误

如图37.35所示，在发起者操作过程中，发起者发送数据的逻辑与CEC线路接收数据的逻辑进行比较，当两者不同时会发生传输错误。在CEC接收数据采样时间设置寄存器(NOMT)中设置的值指定的时间确定错误。错误是在包含EOM位的帧的数据位周期内确定的。错误检测后产生错误中断（INTERR），发送错误检测标志（CECES.TXERR）置位，根据标志值停止发送。

根据为CECCTL1.CESEL[1:0]指定的值，在传输停止位的末尾和对无信号时间进行计数后，将产生一个通信完成中断INTCE。

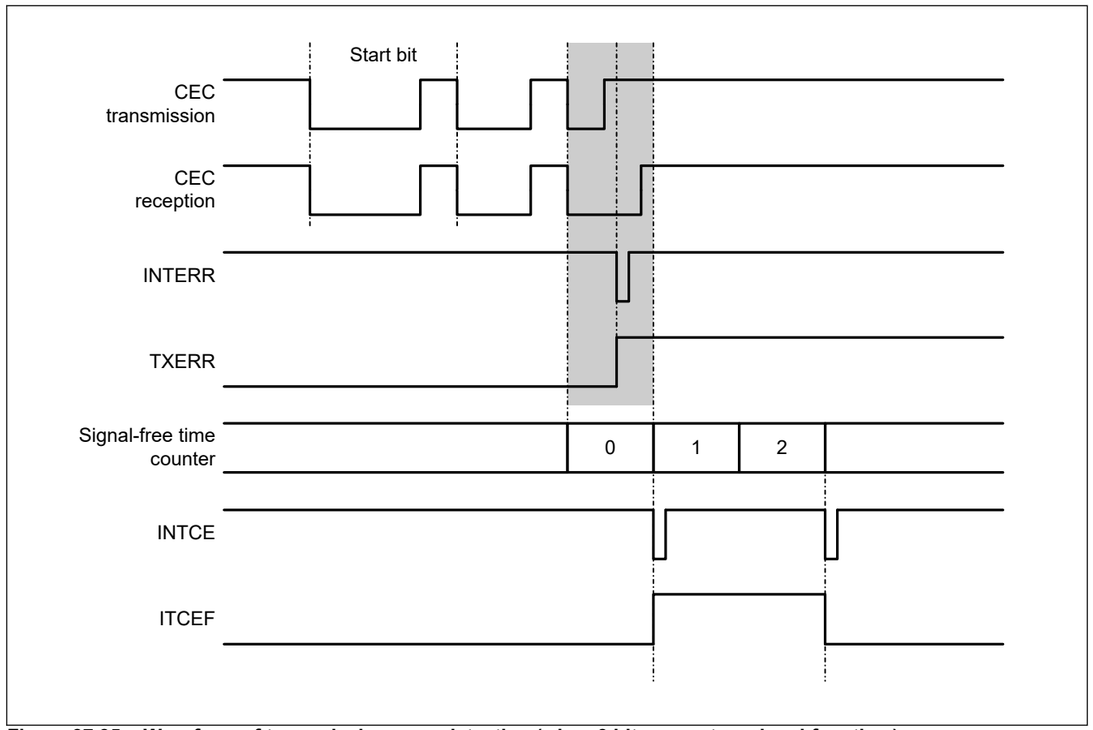


Figure 37.35 Waveform of transmission error detection (when 3 bits are set as signal-free time)

When a transmission error is detected, the transmit operation is stopped at the bit where the error was detected, regardless of the set value of the CECCTL0.EOM bit.

When EOM = 0 is received even though the initiator is transmitting EOM = 1, the transmission is a transmission error and therefore, stopped. Because EOM = 0, the follower determines that transmission should continue and so it waits for data reception. If CECCTL1.BLERRD is set to 1, whether the received data is at a high or low level can be detected.

(2) ACK error

During direct address transmission, an ACK error occurs when the initiator receives logical 1 at the ACK bit timing. During broadcast transmission, an ACK error occurs when the initiator receives logical 0 at the ACK bit timing. Figure 37.36 shows the timing of ACK error detection.

Errors are determined at the timing of the value set in the CEC Reception Data Sampling Time Setting Register (NOMT). After an error is detected, an error interrupt (INTERR) is generated and the ACK Error Detection Flag (CECES.ACKERR) is set. At the end of the ACK bit, communication standby state is entered and the signal-free time is counted. A communication complete interrupt (INTCE) occurs once or twice depending on the set values of the CECCTL1.CESEL[1:0] bits.

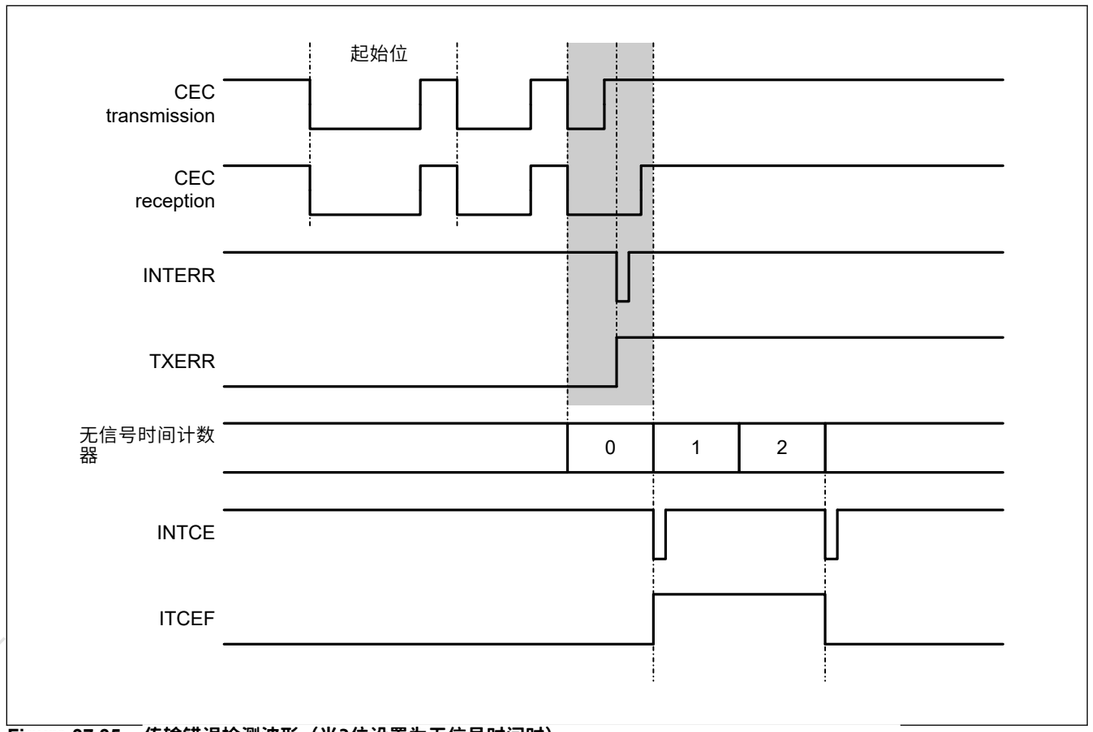

Figure 37.35 传输错误检测波形（当3位设置为无信号时间时）

当检测到传输错误时，无论CECCTL0.EOM位的设置值如何，发送操作都会在检测到错误的位停止。

即使发起方正在发送EOM=1，当接收到EOM=0时，传输是传输错误并因此停止。因为EOM=0，从机确定传输应该继续，因此它等待数据接收。如果CECCTL1.BLERRD设置为1，则可以检测接收到的数据是高电平还是低电平。

(2) 确认错误

在直接地址传输过程中，当发起方在ACK位时序接收到逻辑1时，会发生ACK错误。在广播传输过程中，当发起方在ACK位定时收到逻辑0时，会发生ACK错误。图37.36显示了ACK错误检测的时序。

在CEC接收数据采样时间设置寄存器(NOMT)中设置的值的时序确定错误。
检测到错误后，会产生错误中断(INTERR)并设置ACK错误检测标志(CECES.ACKERR)。在ACK位结束时，进入通信待机状态并计算无信号时间。根据CECCTL1.CESEL[1:0]位的设置值，会发生一次或两次通信完成中断(INTCE)。

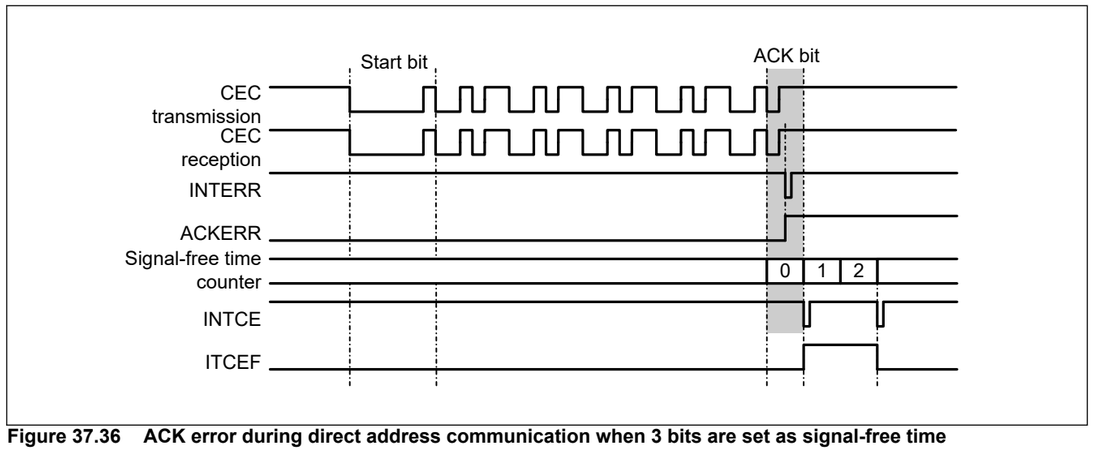

Figure 37.36 ACK error during direct address communication when 3 bits are set as signal-free time

(3) Underrun error

An underrun error occurs when no data is set to the transmission buffer when transmitting the next data is started. When an underrun is detected as shown in Figure 37.37, an error interrupt (INTERR) is generated, the Underrun Error Detection Flag (CECES.UERR) is set, the transmission is aborted, and communication standby state is entered. A communication complete interrupt (INTCE) occurs once or twice depending on the set values of the CECCTL1.CESEL[1:0] bits.

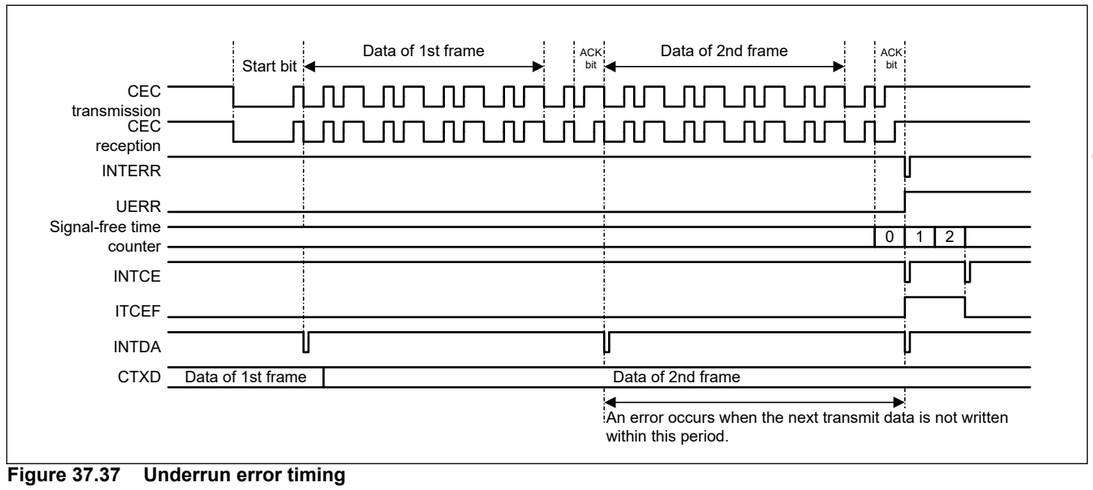

Figure 37.37 Underrun error timing

(4) Arbitration error

As shown in Figure 37.38, if logical 0 is received in response to logical 1 transmission during the period from the transmission start trigger (CECCTL0.TXTRG) being set to the source address being transmitted, an arbitration error occurs. Errors between setting the transmission start trigger and outputting the start bit are determined when low level is output to the CEC transmission signal. While the source address is being transmitted, errors are determined at the timing of the value set to the CEC Reception Data Sampling Time Setting Register (NOMT). After an error is detected, an error interrupt (INTERR) is generated and the Arbitration Loss Detection Flag (CECES.AERR) is set. At this time, the transmission is aborted, but the receive operation continues. Multiple error flags may be detected, as shown in Figure 37.39, until the source address detection period is entered.

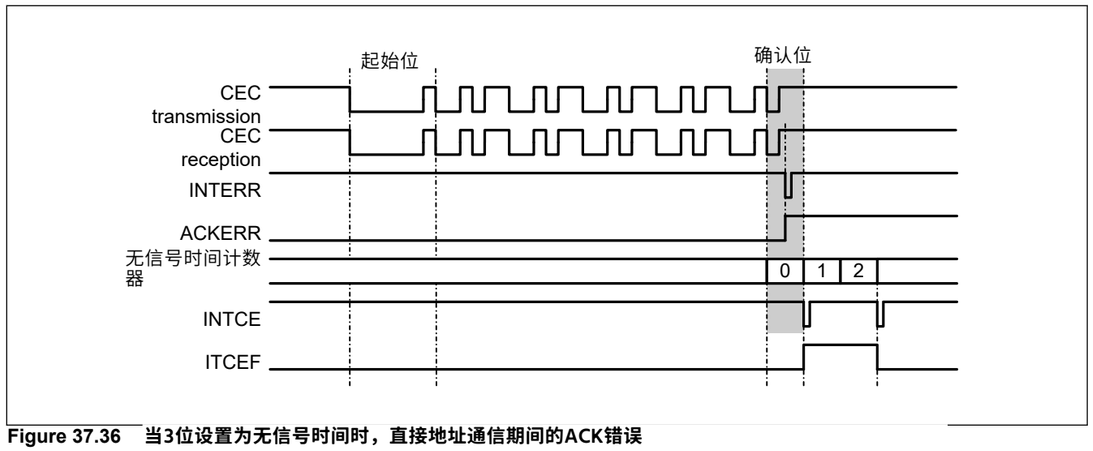

Figure 37.36 当3位设置为无信号时间时，直接地址通信期间的ACK错误

(3) Underrun error

开始发送下一个数据时，如果没有将数据设置到发送缓冲区，则会发生欠载错误。如图37.37所示，当检测到欠载时，会产生错误中断(INTERR)，设置欠载错误检测标志(CECES.UERR)，中止传输，进入通信待机状态。根据CECCTL1.CESEL[1:0]位的设置值，会发生一次或两次通信完成中断(INTCE)。

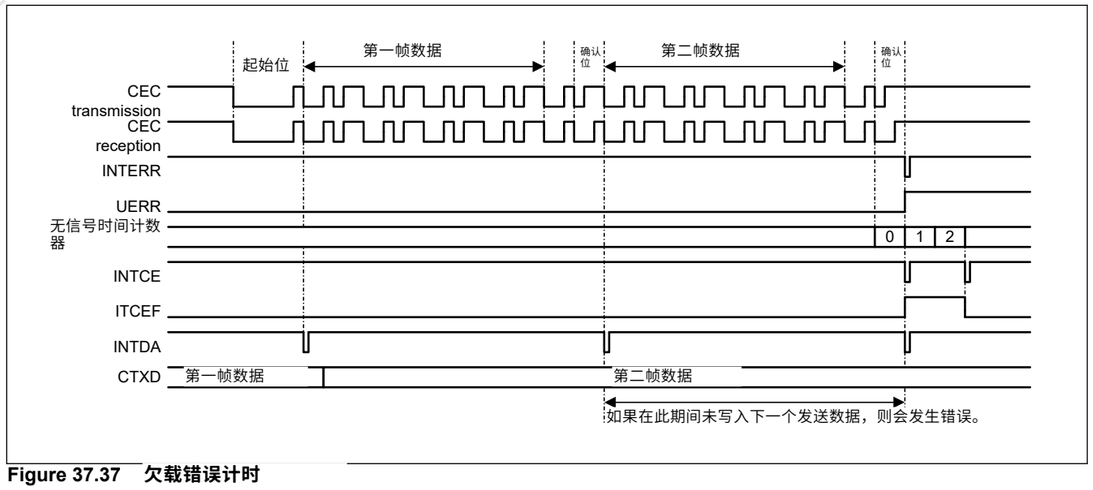

Figure 37.37 欠载错误计时

(4) 仲裁错误

如图37.38所示，如果在从设置发送开始触发(CECCTL0.TXTRG)到正在发送的源地址期间接收到逻辑0以响应逻辑1的发送，则会发生仲裁错误。当向CEC传输信号输出低电平时，确定设置传输启动触发和输出启动位之间的错误。在发送源地址时，在CEC接收数据采样时间设置寄存器(NOMT)中设置的值的时序确定错误。检测到错误后，会产生错误中断(INTERR)并设置仲裁丢失检测标志(CECES.AERR)。此时，发送被中止，但接收操作继续。可能会检测到多个错误标志，如图37.39所示，直到进入源地址检测周期。

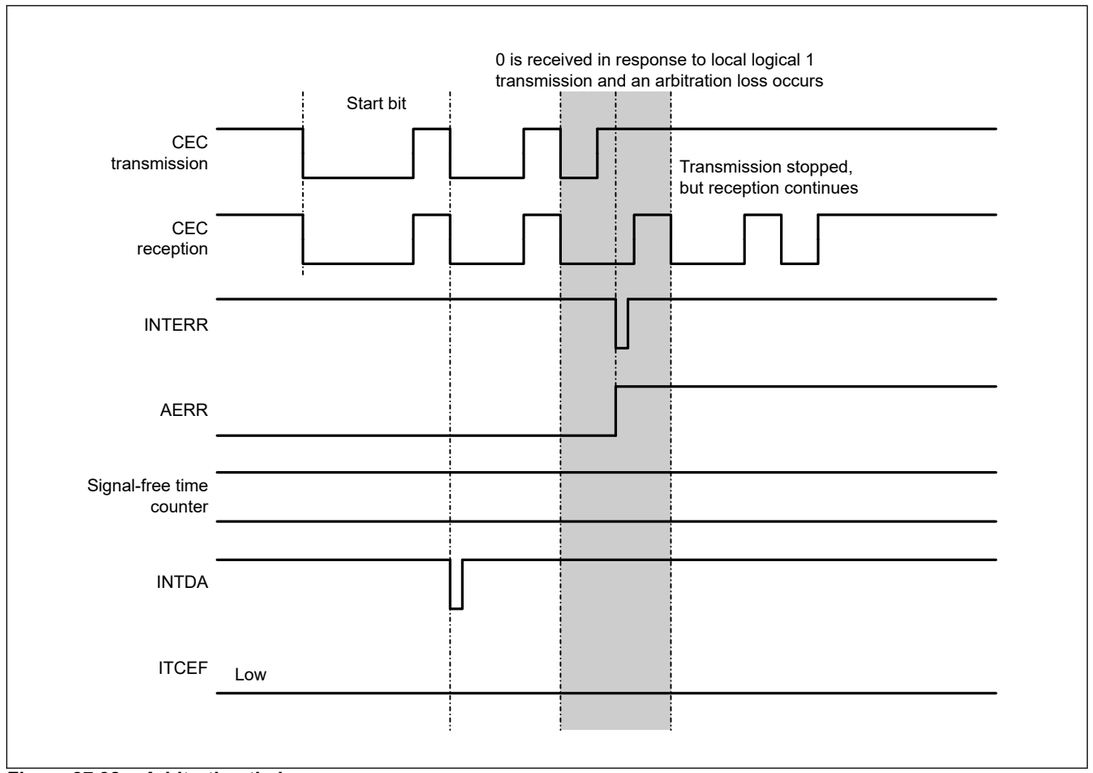

Figure 37.38 Arbitration timing

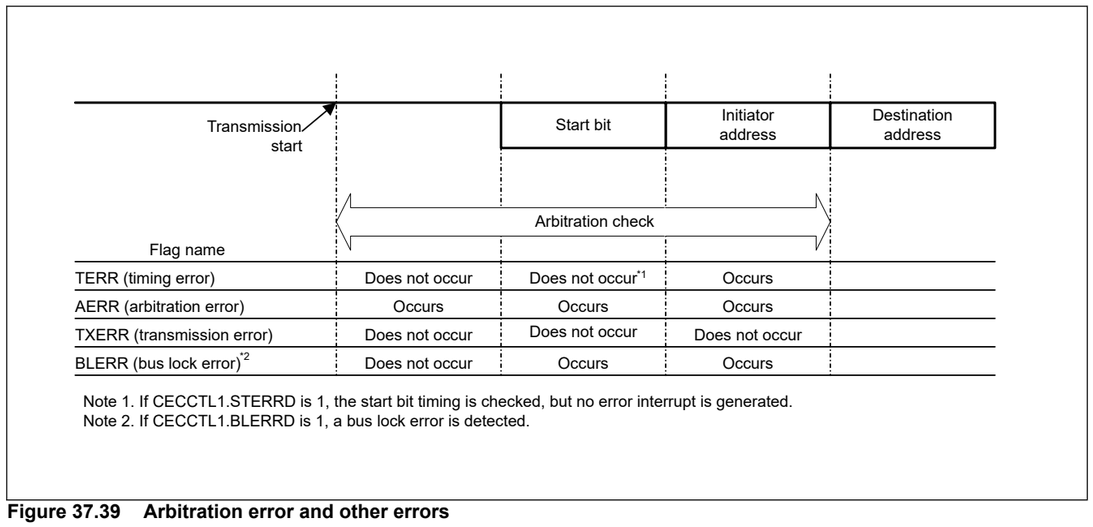

Figure 37.39 Arbitration error and other errors

Detailed description of arbitration error

Details about the arbitration check performed from the time when the transmission start trigger (CECCTL0.TXTRG) is set until the initiator address output period are provided in the sections that follow.

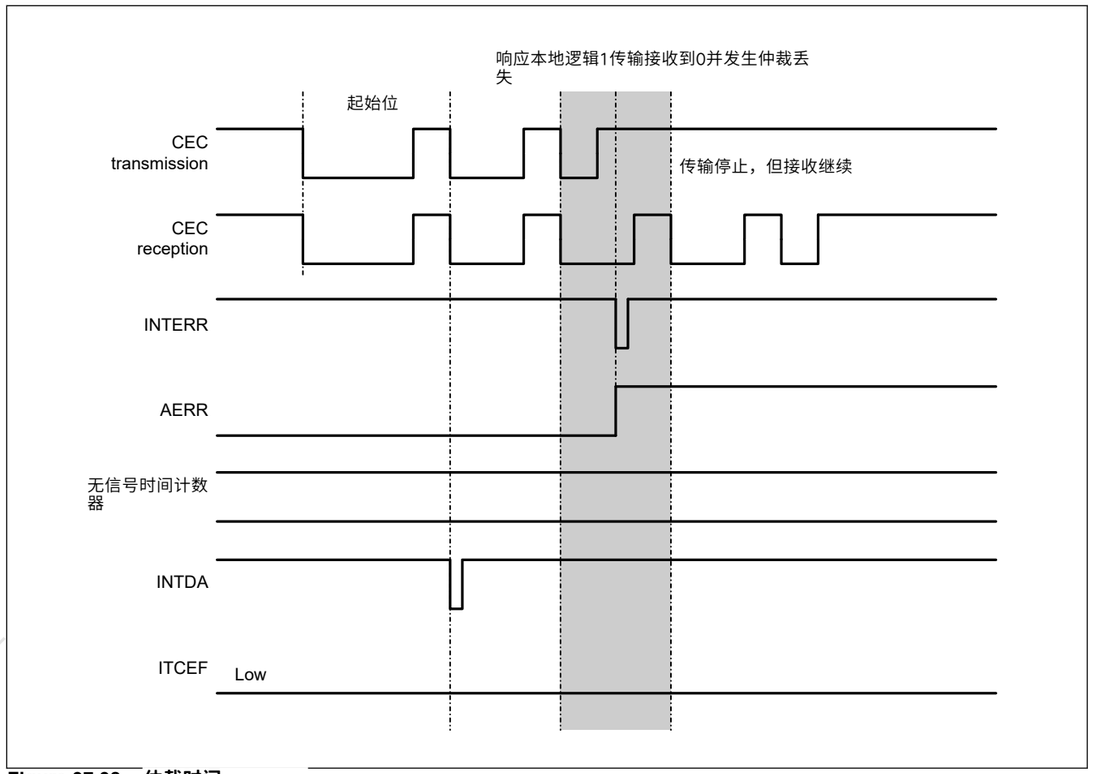

Figure 37.38 仲裁时间

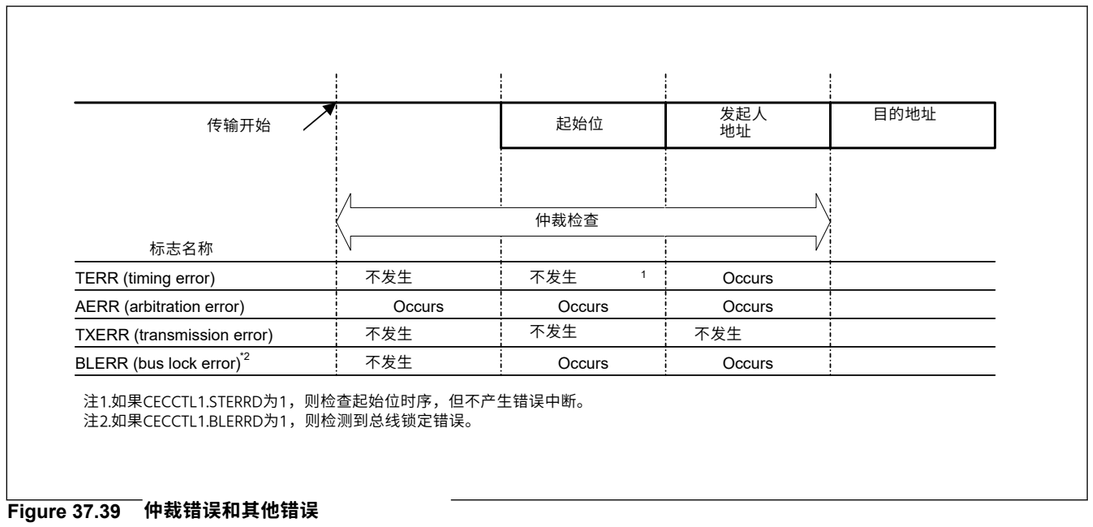

Figure 37.39 仲裁错误和其他错误

仲裁错误的详细描述

有关从设置发送开始触发(CECCTL0.TXTRG)到启动器地址输出周期执行的仲裁检查的详细信息将在以下部分中提供。

Arbitration check by setting transmission start trigger (CECCTL0.TXTRG)

The arbitration check is performed when two CEC clock cycles have elapsed after the transmission start trigger (CECCTL0.TXTRG) is set. If an arbitration loss is determined, an error interrupt (INTERR) is generated, the Arbitration Loss Detection Flag (CECES.AERR) is set, and the mode is switched to reception mode.

Start bit output period

If low level is detected at the reception line when the transmission start trigger (CECCTL0.TXTRG) is set and the start bit is actually output, the Arbitration Loss Detection Flag (CECES.AERR) is set and the mode is switched to reception mode. If the rising edge of the reception line is detected beyond the maximum low-level width of the start bit set by STATLH, the Arbitration Loss Detection Flag (CECES.AERR) is set and the mode is switched to reception mode.

Initiator address output period

After transmission of the start bit is complete, a logic check is performed at the same time as the transmission start of the initiator address. If an address earlier than the local address is detected, an error interrupt (INTERR) is generated, the Arbitration Loss Detection Flag (CECES.AERR) is set, and the mode is switched to reception mode.

(5) Timing error

Timing errors of the CEC reception signal are checked during initiator or follower operation. A timing error occurs if the CEC reception signal is outside the range of the compare register set. As shown in Figure 37.40, low-level width timing errors are detected when the rising edge is detected. Timing errors for the minimum bit width are detected when the falling edge is detected, and timing errors for the maximum bit width are detected if there is no falling edge even though the maximum bit width has exceeded. Whether to check the ACK bit timing can be selected using the CECCTL0.ACKTEN bit. However, even if CECCTL0.ACKTEN is set to 1, the maximum bit width is not checked only for the ACK bit of the last data block (when CECCTL0.EOM = 1). The minimum bit width is checked. As shown in Figure 37.41, if a timing error with a short bit width is detected during follower operation, a low-level pulse (error handling pulse) that has a bit width 1.5 times the bit width specified using the NOMP register is transmitted.

An error handling pulse is not transmitted if a start bit timing error is detected.

If a timing error other than one that has a short bit width is detected during initiator operation, transmission immediately stops. During follower operation, reception continues as shown in Figure 37.42, and logical 1 is transmitted during direct address communication and logical 0 is transmitted during broadcast communication at the ACK bit timing. The generation of a communication complete interrupt (INTCE) depends on the set values of CECCTL1.CESEL[1:0]. If a timing error for the minimum bit width of the last ACK bit is detected, a communication complete interrupt (INTCE) is output at the same time as an error interrupt (INTERR).

通过设置发送开始触发(CECCTL0.TXTRG)进行仲裁检查

在设置发送开始触发(CECCTL0.TXTRG)后经过两个CEC时钟周期后执行仲裁检查。如果确定仲裁丢失，则产生错误中断(INTERR)，设置仲裁丢失检测标志(CECES.AERR)，并将模式切换到接收模式。

起始位输出周期

如果在设置发送开始触发(CECCTL0.TXTRG)并且实际输出开始位时在接收线检测到低电平，则设置仲裁丢失检测标志(CECES.AERR)并且模式切换到接收模式。如果检测到接收线的上升沿超过了STATLH设置的起始位的最大低电平宽度，则设置仲裁丢失检测标志(CECES.AERR)并且模式切换到接收模式。

发起者地址输出周期

发送完起始位后，在发送起始地址的同时进行逻辑校验。如果检测到比本地地址更早的地址，则会产生错误中断(INTERR)，设置仲裁丢失检测标志(CECES.AERR)，并将模式切换到接收模式。

(5) 时间错误

在发起者或从者操作期间检查CEC接收信号的定时错误。如果CEC接收信号超出比较寄存器组的范围，则会发生时序错误。如图37.40所示，检测到上升沿时检测到低电平宽度时序错误。当检测到下降沿时，检测到最小位宽的时序错误，如果没有下降沿，即使超过了最大位宽，也会检测到最大位宽的时序错误。可以使用CECCTL0.ACKTEN位选择是否检查ACK位时序。但是，即使CECCTL0.ACKTEN设置为1，也不会仅检查最后一个数据块的ACK位的最大位宽（当CECCTL0.EOM=1时）。检查最小位宽。如图37.41所示，如果在跟随器操作期间检测到位宽较短的时序错误，则会发送位宽为使用NOMP寄存器指定的位宽的1.5倍的低电平脉冲（错误处理脉冲）。

如果检测到起始位定时错误，则不发送错误处理脉冲。

如果在启动器操作期间检测到除具有短位宽度的定时错误之外的定时错误，则传输立即停止。在跟随器操作期间，接收继续如图37.42所示，在直接地址通信期间发送逻辑1，在ACK位定时在广播通信期间发送逻辑0。通信完成中断(INTCE)的产生取决于CECCTL1.CESEL[1:0]的设置值。如果检测到最后一个ACK 位的最小位宽度的时序错误，则在错误中断(INTERR)的同时输出通信完成中断(INTCE)。

RA生态工作室

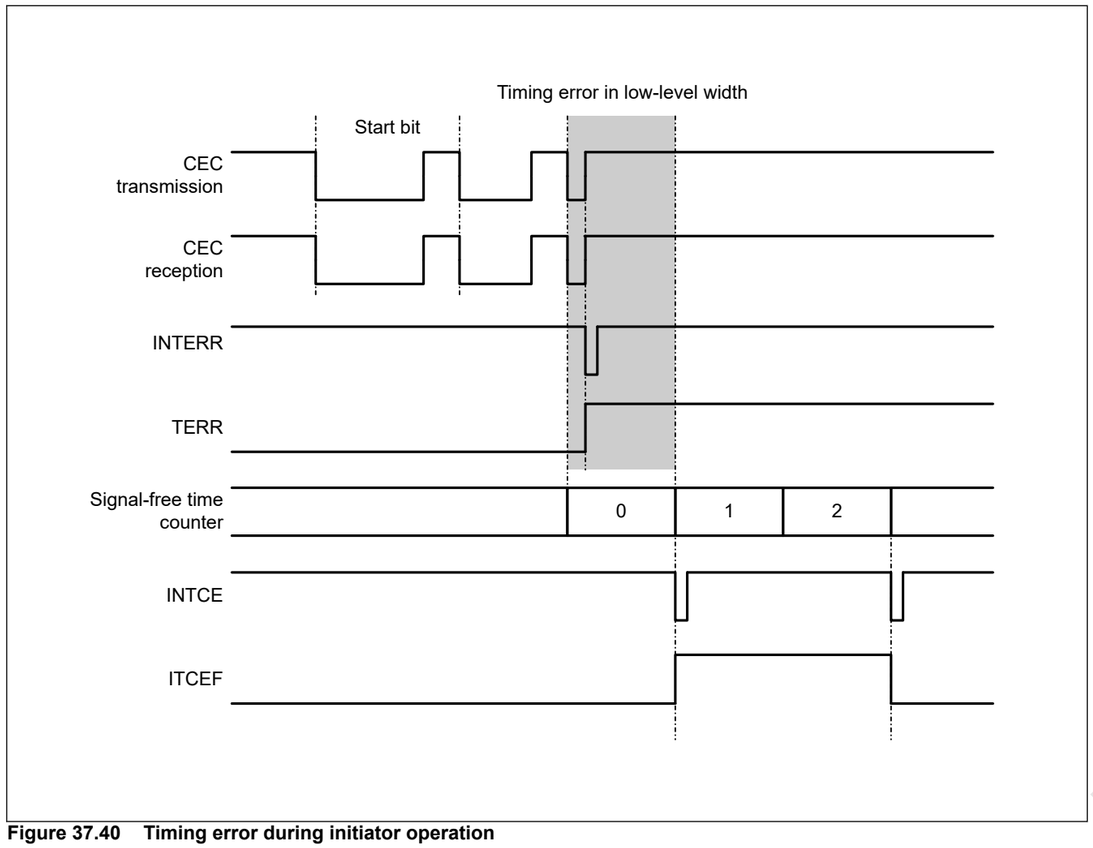

Figure 37.40 Timing error during initiator operation

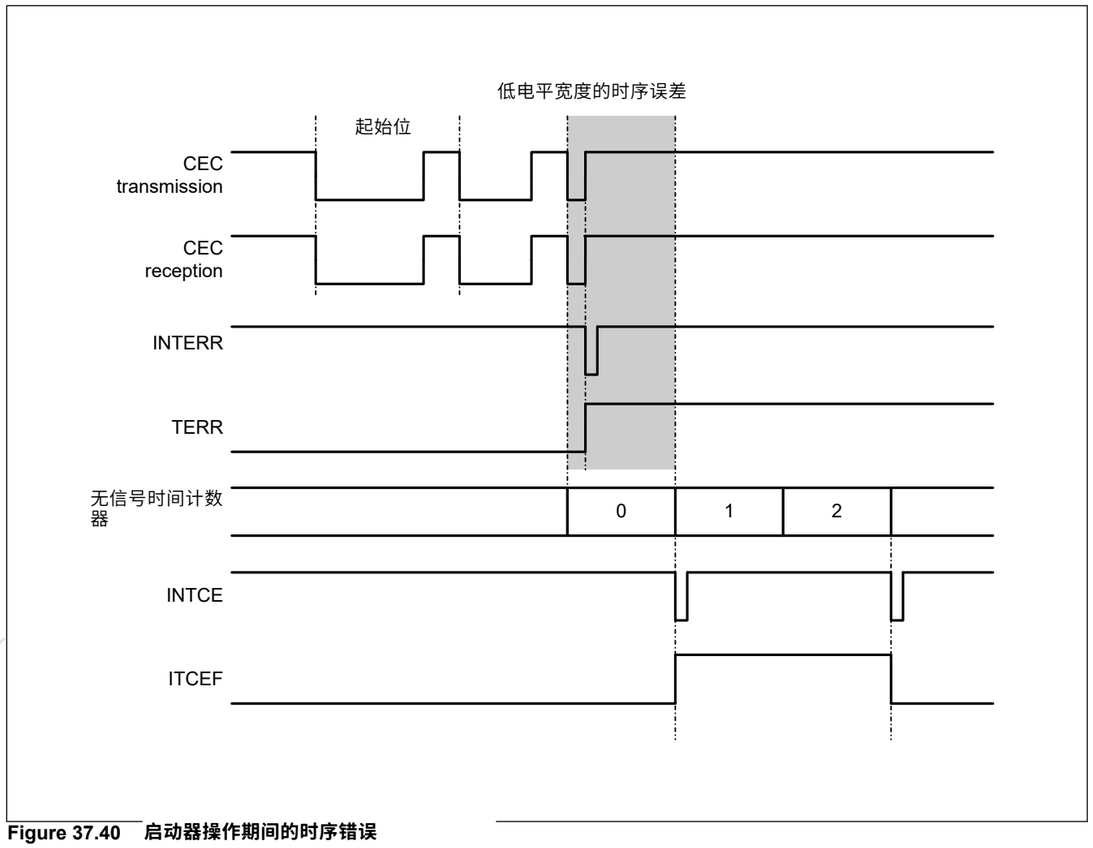

Figure 37.40 启动器操作期间的时序错误

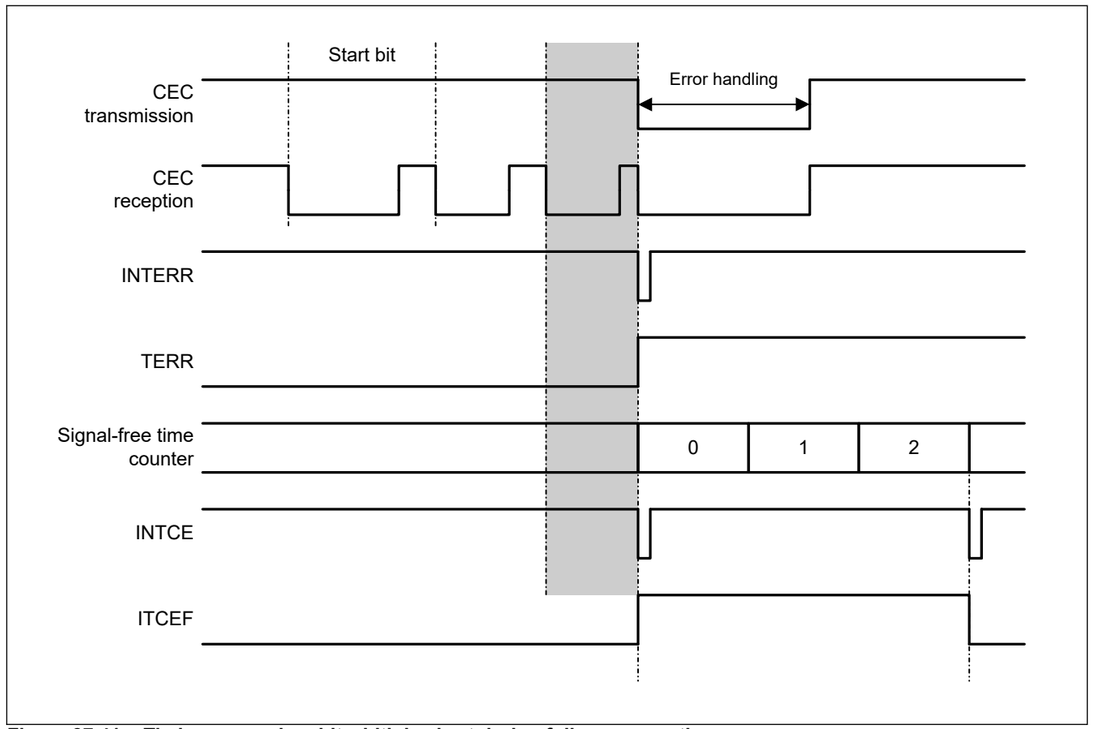

Figure 37.41 Timing error when bit width is short during follower operation

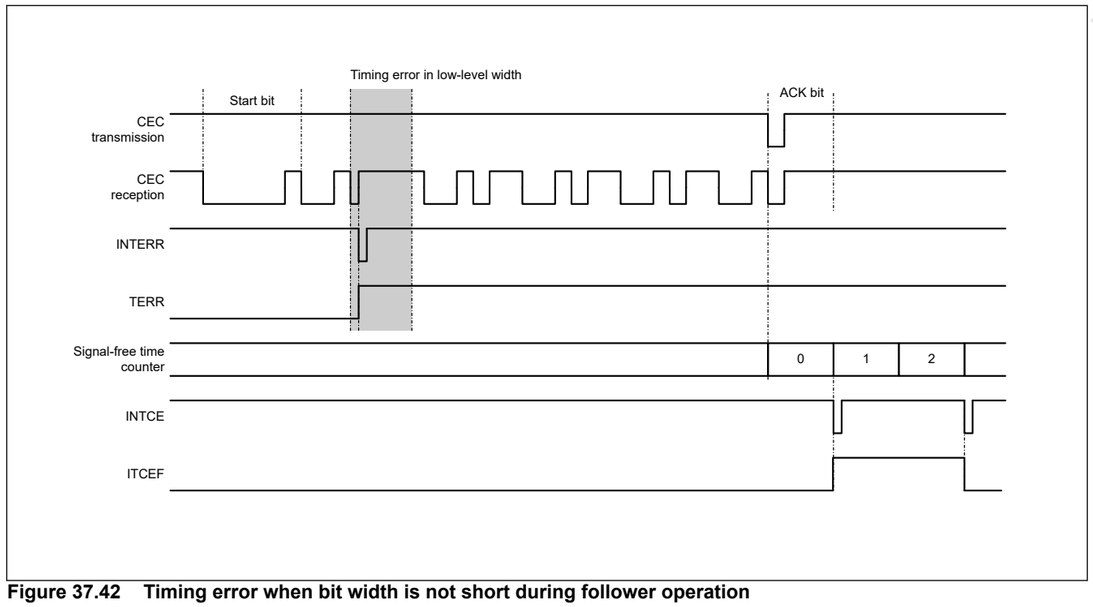

Figure 37.42 Timing error when bit width is not short during follower operation

(6) Overrun error

If receiving the next data is complete before reading data from the Reception Buffer Register (CRXD) during follower operation, an overrun error occurs. As shown in Figure 37.43, an error interrupt (INTERR) is generated, and the Overrun

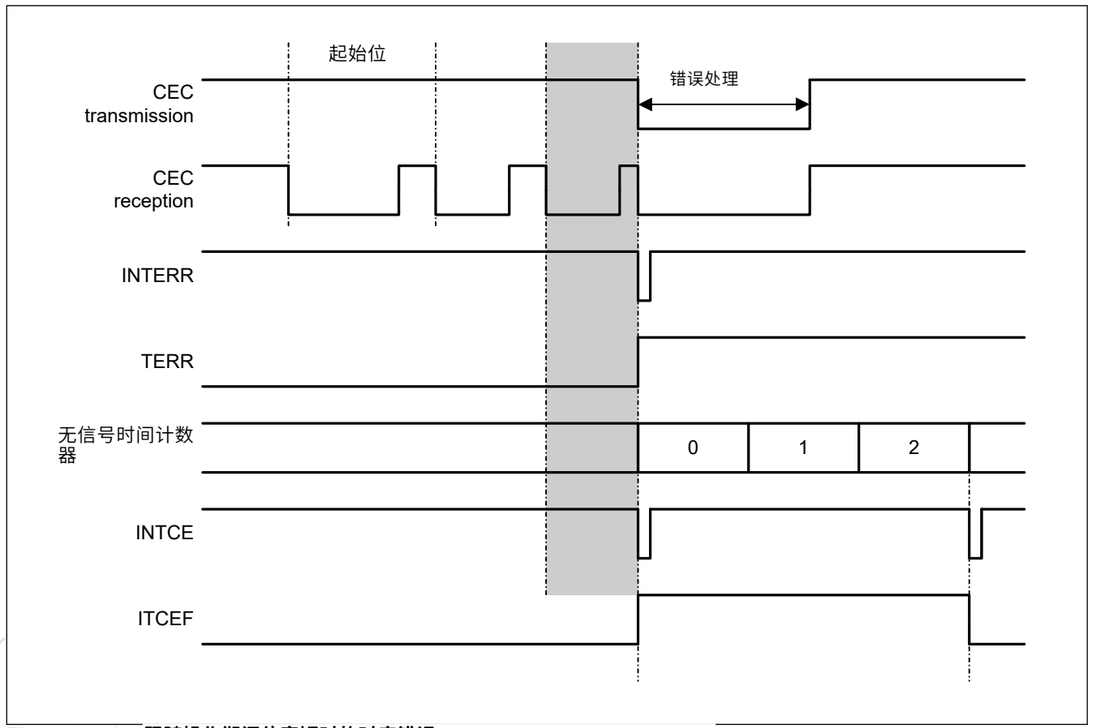

Figure 37.41 跟随操作期间位宽短时的时序错误

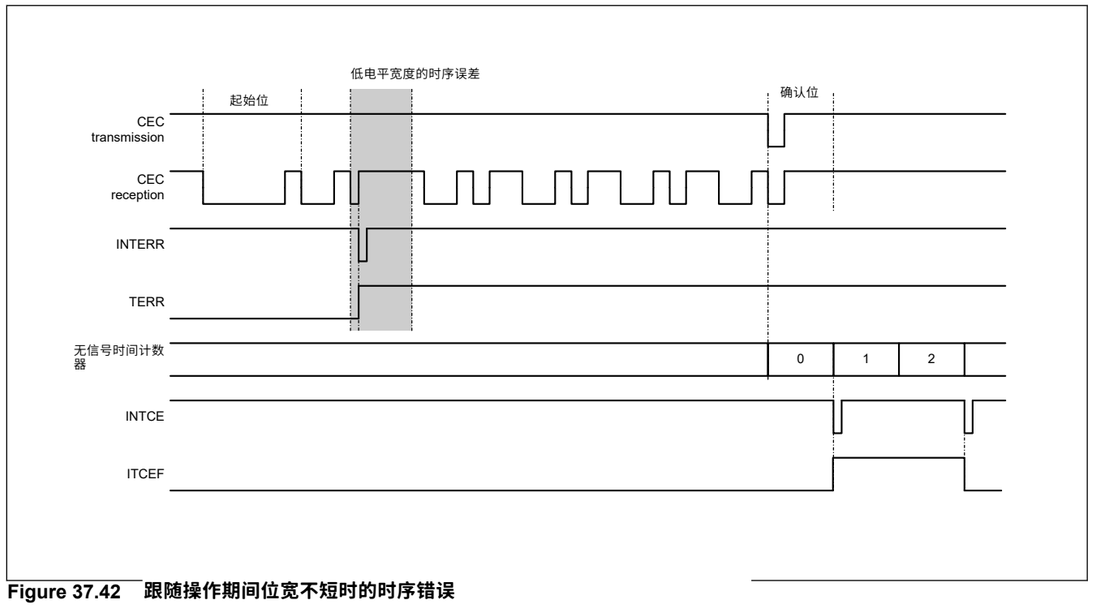

Figure 37.42 跟随操作期间位宽不短时的时序错误

(6) 溢出错误

如果在跟随器操作期间从接收缓冲寄存器(CRXD)读取数据之前完成接收下一个数据，则会发生溢出错误。如图37.43所示，产生错误中断（INTERR），Overrun

Error Detection Flag (CECES.OERR) is set. Afterward, logical 1 is returned during direct address communication and logical 0 is returned during broadcast communication at the ACK transmission timing of the block in which an overrun error occurred. The failure of reception is reported to the initiator, and reception standby state is entered. A communication complete interrupt (INTCE) operates according to the setting of the CECCTL1.CESEL[1:0] bits.

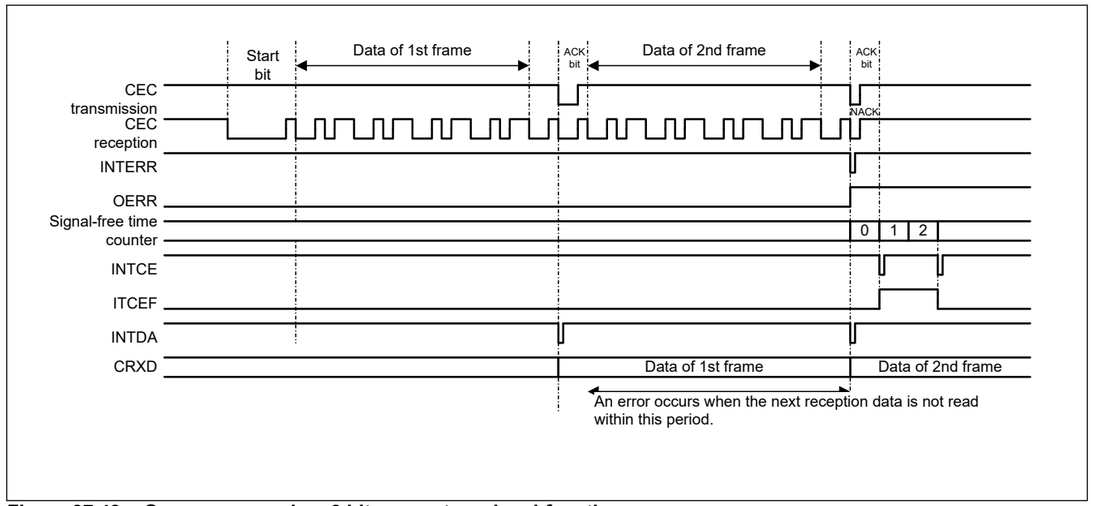

Figure 37.43 Overrun error when 3 bits are set as signal-free time

(7) Bus lock error

When bus lock errors are set to be detected (CECCTL1.BLERRD = 1), a bus lock error occurs if the bus is in the communication status (CECS.BUSST = 1) and the CEC reception signal stays high or low for a period corresponding to 2.5 times the data bit width specified by using the NOMP register. Figure 37.44 shows the timing of bus lock error detection.

If an error is detected, an error interrupt (INTERR) is generated, the Bus Lock Error Detection Flag (CECES.BLERR) is set, communication standby state is entered, and the signal-free time is counted. A communication complete interrupt (INTCE) operates according to the setting of the CECCTL1.CESEL[1:0] bits. Bus lock errors are detected only for the follower.

When bus lock errors are not set to be detected (CECCTL1.BLERRD = 0), no bus lock error is detected. To determine whether the bus is locked, monitor the CECEXMON.CECLNMON bit, and use software to determine and handle bus locking.

错误检测标志(CECES.OERR)被设置。之后，在发生溢出错误的块的ACK发送定时，在直接地址通信期间返回逻辑1，在广播通信期间返回逻辑0。接收失败上报给发起方，进入接收待机状态。通信完成中断(INTCE)根据CECCTL1.CESEL[1:0]位的设置进行操作。

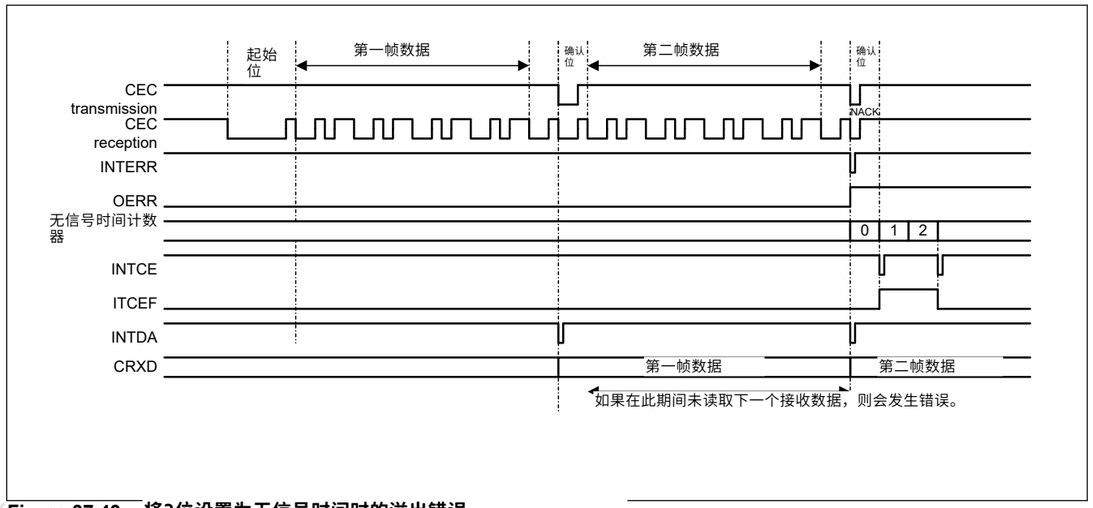

Figure 37.43 将3位设置为无信号时间时的溢出错误

(7) 总线锁定错误

当总线锁定错误设置为检测时（CECCTL1.BLERRD=1），如果总线处于通信状态（CECS.BUSST=1）并且CEC接收信号保持高电平或低电平相应的周期，则发生总线锁定错误到使用NOMP寄存器指定的数据位宽度的2.5倍。图37.44显示了总线锁定错误检测的时序。

如果检测到错误，则产生错误中断(INTERR)，设置总线锁定错误检测标志(CECES.BLERR)，进入通信待机状态，并计算无信号时间。通信完成中断(INTCE)根据CECCTL1.CESEL[1:0]位的设置进行操作。仅对从站检测总线锁定错误。

当未设置检测总线锁定错误时（CECCTL1.BLERRD=0），不会检测到总线锁定错误。要确定总线是否被锁定，请监视CECEXMON.CECLNMON位，并使用软件来确定和处理总线锁定。

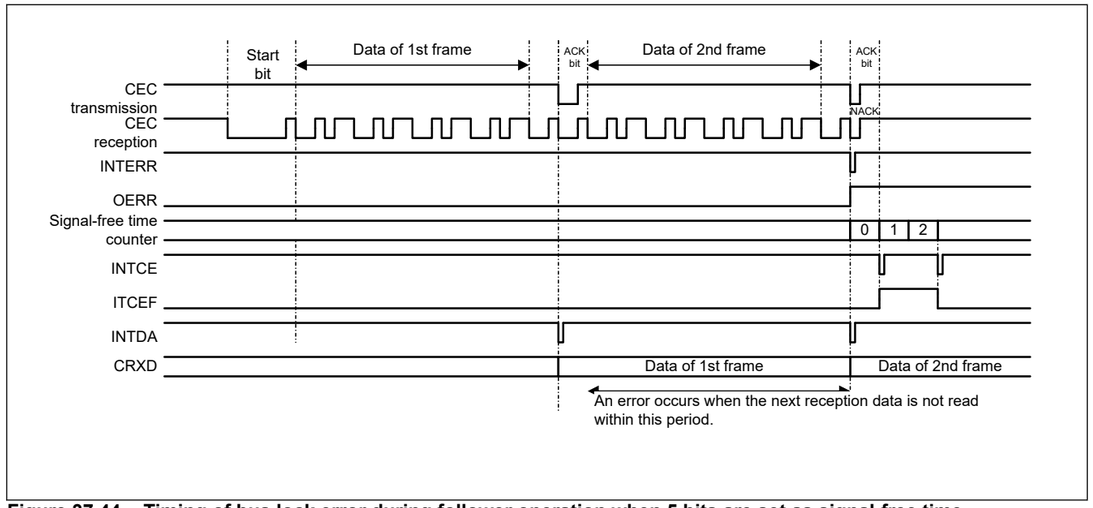

Figure 37.44 Timing of bus lock error during follower operation when 5 bits are set as signal-free time

37.3.3.7.2 Clearing Error Flag

An error flag set to the CEC Communication Error Status Register (CECES) can be cleared by setting 1 to the corresponding bit in the CEC Communication Error Flag Clear Trigger Register (CECFC). Figure 37.45 shows an example when an arbitration error occurs. An Arbitration Loss Detection Flag can be cleared by setting 0x20 to the CECFC register.

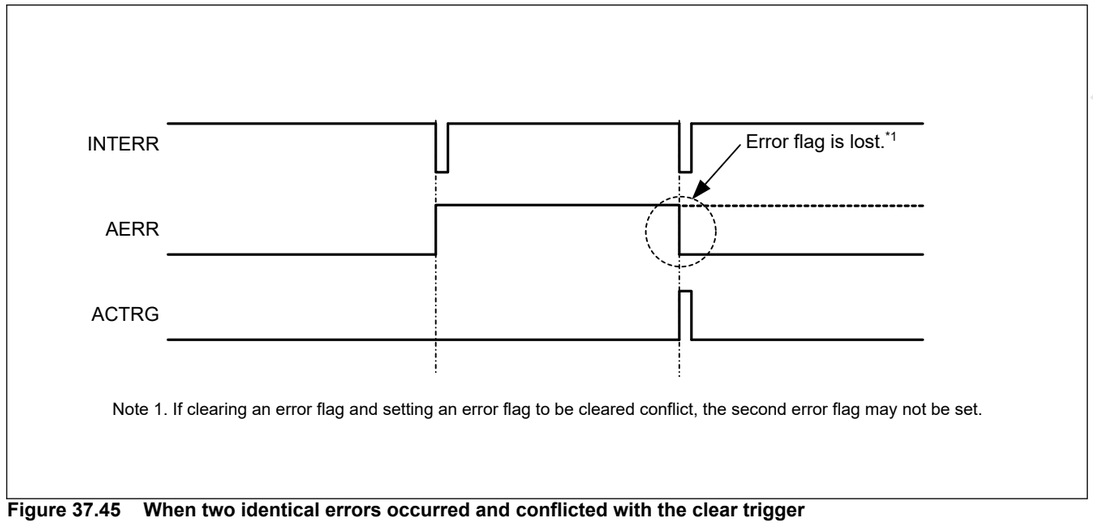

Figure 37.45 When two identical errors occurred and conflicted with the clear trigger

37.3.3.8 Signal-Free Time

The end of the signal-free time is reported by generating a communication complete interrupt by detecting a match with the specified time (3, 5, or 7 bits of the bit width specified using the NOMP register). The number of bits of the signal-free time is specified using the CECCTL1.SFT[1:0] bits. A communication complete interrupt is generated by setting up the CECCTL1.CESEL[1:0] bits. Counting the signal-free time always starts when the falling edge of the received data is detected. During normal communication, counting the signal-free time starts after the falling edge of the ACK bit is detected, if CECCTL0.EOM = 1.

Even if an error occurs, counting the signal-free time is started after communication is stopped.

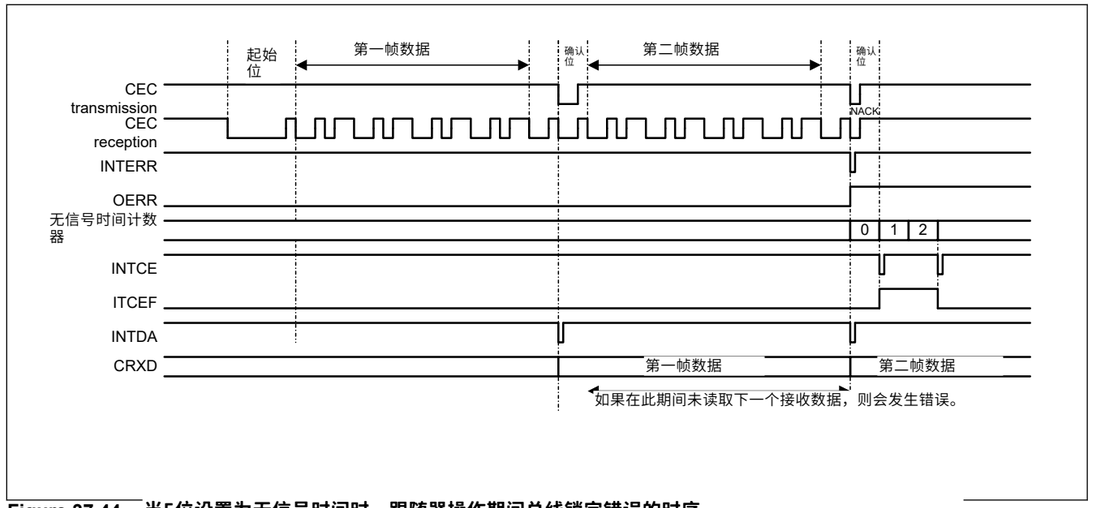

Figure 37.44 当5位设置为无信号时间时，跟随器操作期间总线锁定错误的时序

37.3.3.7.2 清除错误标志

通过将CEC通信错误标志清除触发寄存器(CECFC)中的相应位设置为1，可以清除设置到CEC通信错误状态寄存器(CECES)的错误标志。图37.45显示了发生仲裁错误时的示例。可以通过将CECFC寄存器设置为0x20来清除仲裁丢失检测标志。

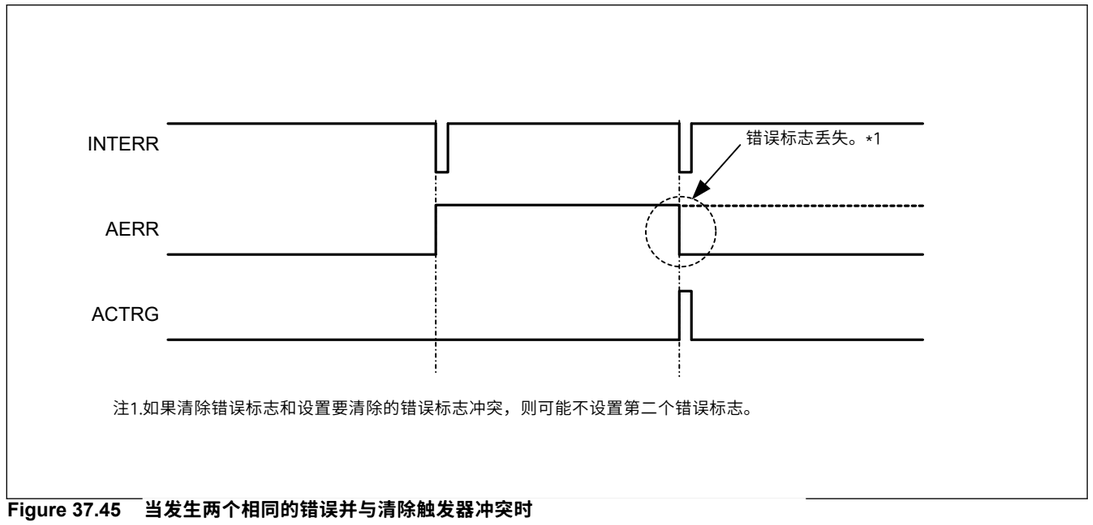

Figure 37.45 当发生两个相同的错误并与清除触发器冲突时

37.3.3.8 Signal-Free Time

通过检测与指定时间（使用NOMP寄存器指定的位宽的3、5或7位）匹配产生通信完成中断来报告无信号时间的结束。无信号时间的位数由CECCTL1.SFT[1:0]位指定。通过设置CECCTL1.CESEL[1:0]位产生通信完成中断。始终在检测到接收数据的下降沿时开始计算无信号时间。在正常通信期间，如果CECCTL0.EOM=1，则在检测到ACK位的下降沿后开始计算无信号时间。

即使发生错误，也会在通信停止后开始计算无信号时间。

If an error handling pulse (a low-level pulse that has a bit width of 1.5 times the bit width) is acknowledged, the signal-free time is counted starting at the falling edge of the error handling pulse signal. Figure 37.46 shows an operation example in which the detection of a 7-data bit width signal-free time when CECCTL1.CESEL[1:0] = 00b and CECCTL1.SFT[1:0] = 10b.

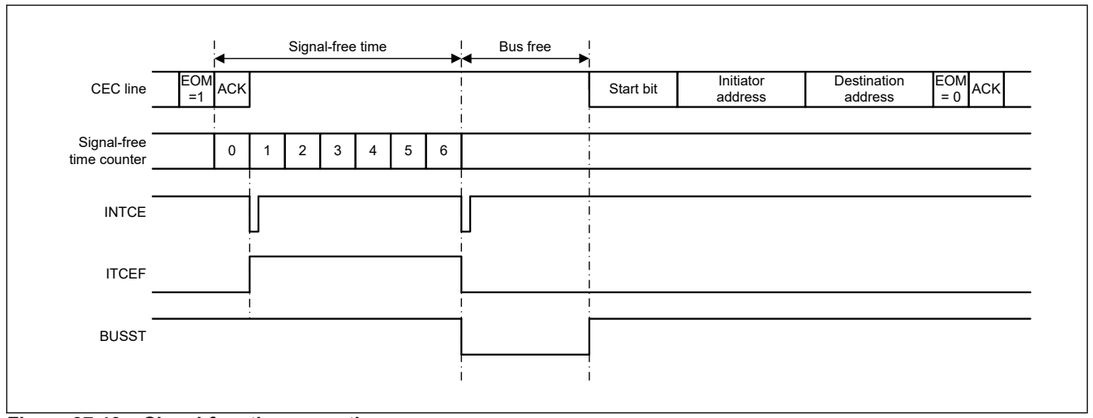

Figure 37.46 Signal-free time operation

Rewriting the values of the CECCTL1.SFT[1:0] bits to the number of bits smaller than the current number of bits while counting the signal-free time must be completed until the rewritten bit count values match. If rewriting is not performed in time, the counter overflows and the signal-free time period continues until the number of bits match again. Figure 37.47 shows an example when the data bit width is changed from 5 to 3 bits.

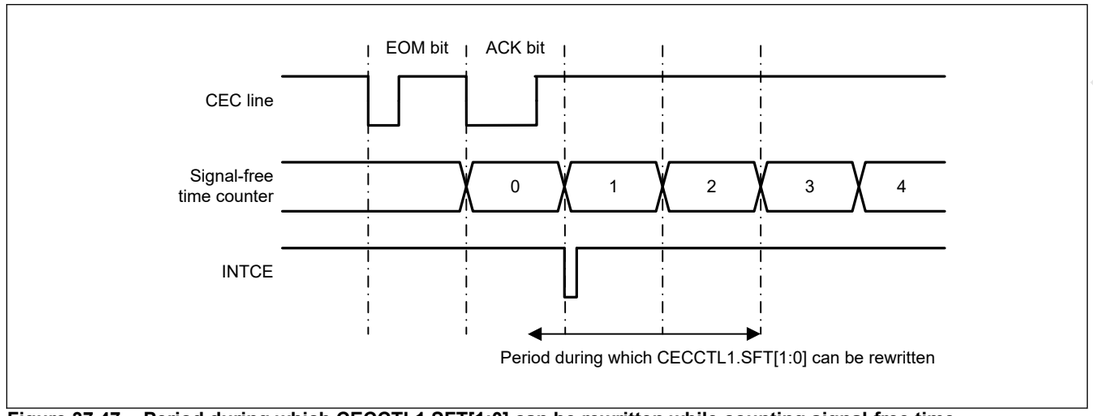

Figure 37.47 Period during which CECCTL1.SFT[1:0] can be rewritten while counting signal-free time

Starting receive operation during signal-free time

If a falling edge of the CEC reception signal is detected while counting the signal-free time, a receive operation is started as shown in Figure 37.48. A communication complete interrupt (INTCE) is not output even if the output of INTCE after counting the signal-free time is set, because the count operation of the signal-free time counter is stopped at this time.

如果确认了错误处理脉冲（位宽为位宽1.5倍的低电平脉冲），则从错误处理脉冲信号的下降沿开始计算无信号时间。图37.46显示了一个操作示例，其中当CECCTL1.CESEL[1:0]=00b和CECCTL1.SFT[1:0]=10b时，检测7个数据位宽的无信号时间。

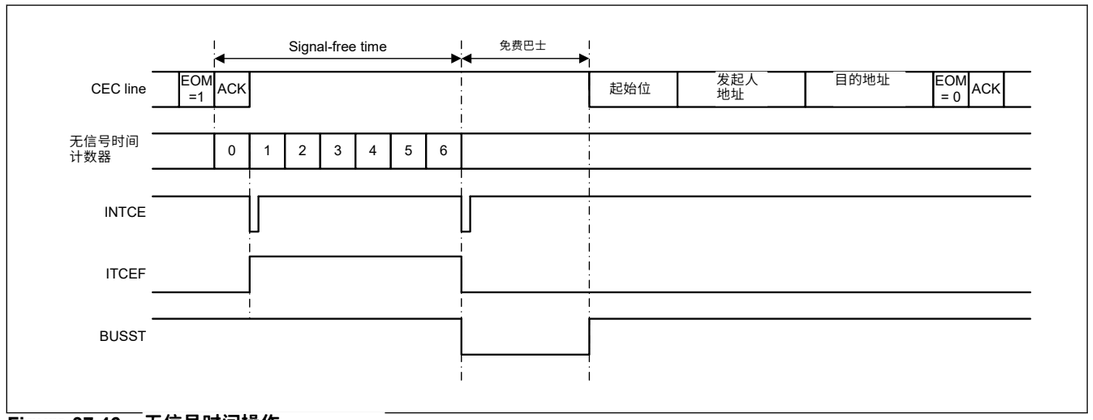

Figure 37.46 无信号时间操作

必须在计算无信号时间的同时将CECCTL1.SFT[1:0]位的值重写为小于当前位数的位数，直到重写的位计数值匹配为止。如果没有及时改写，计数器溢出，无信号时间周期一直持续，直到位数再次匹配。图37.47显示了数据位宽从5位更改为3位时的示例。

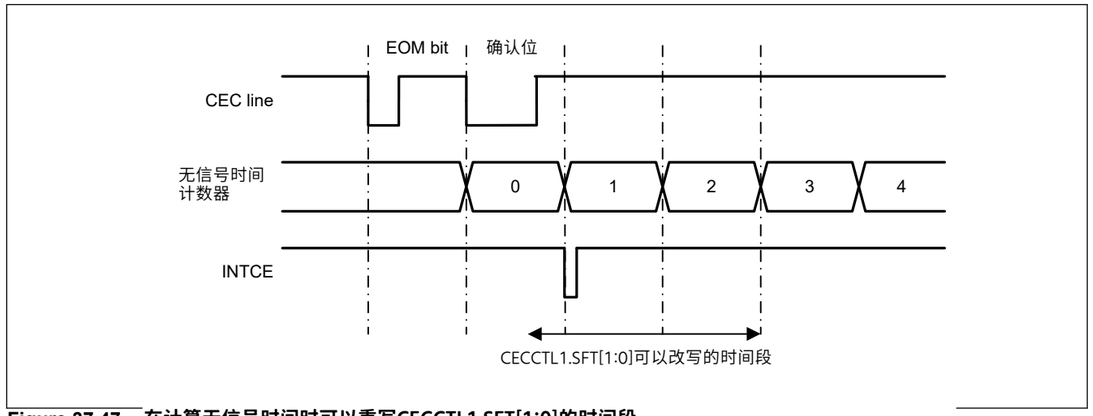

Figure 37.47 在计算无信号时间时可以重写CECCTL1.SFT[1:0]的时间段

在无信号时间开始接收操作

如果在计算无信号时间时检测到CEC接收信号的下降沿，则开始接收操作，如图37.48所示。即使在无信号时间计数后设置了INTCE的输出，也不会输出通信完成中断(INTCE)，因为此时无信号时间计数器的计数操作已停止。

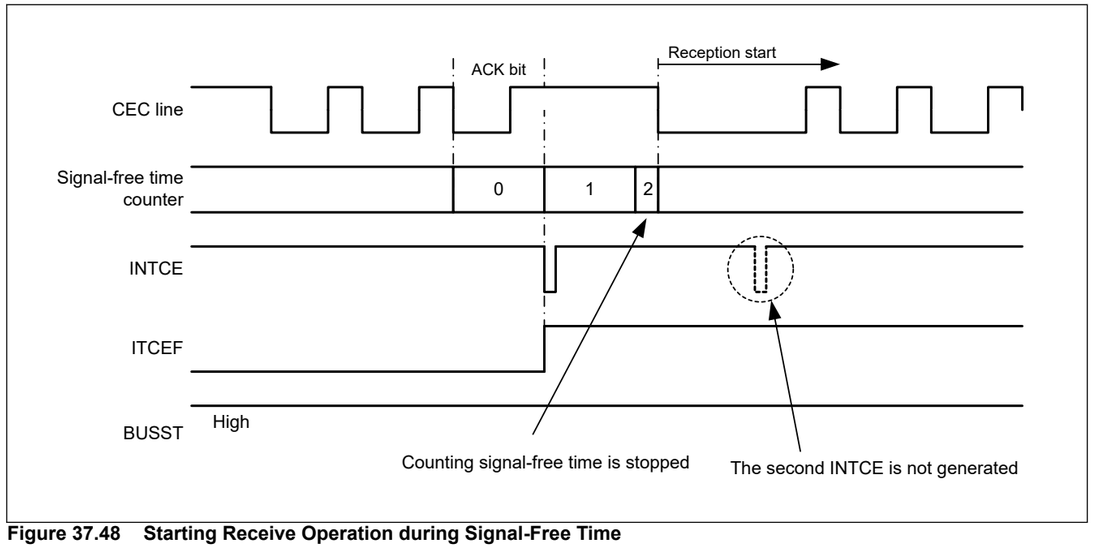

Figure 37.48 Starting Receive Operation during Signal-Free Time

37.3.3.9 Function that Restarts Reception by Detecting Start Bit during Reception

This function is used to restart reception starting from the detected start bit if a new start bit is detected during receive operation (follower operation), as shown in Figure 37.49. This function is enabled by enabling the Start Detection Restart Reception Enable Bit (CECEXMD.RERCVEN = 1).

A start bit is determined when received data matches the set value of the registers (STATLL, STATLH, STATBL, or STATBH) of the received start bit width, and reception is restarted.

Since the start bit is received during reception, a timing error occurs. An error occurs on the falling edge at the beginning of the start bit or at the header block.

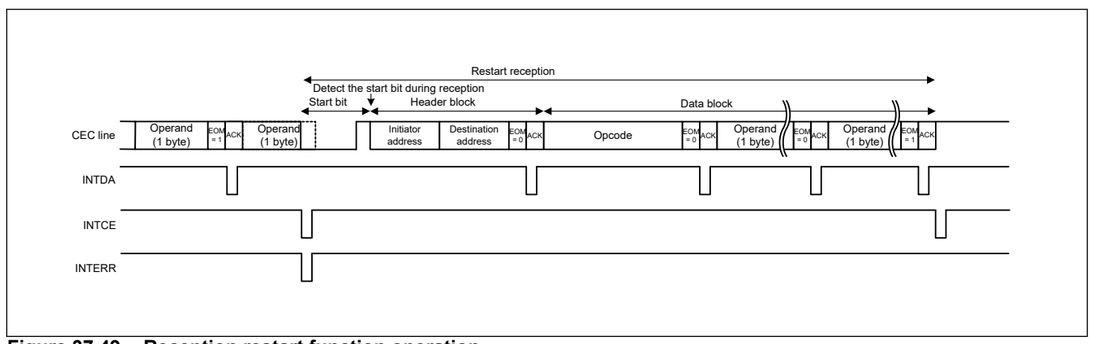

Figure 37.49 Reception restart function operation

37.4 Usage Notes

37.4.1 Recovery from low power consumption state

The CECIO terminal can be used as an IRQ input terminal. For the corresponding IRQ interrupt, if the interrupt request is enabled and the ICU IRQCRi.IRQMD[1:0] bits are set to 01b (falling edge) and the power consumption is changed to the low power consumption state, it recovers from the low power consumption state at the falling edge. Since the CEC operating clock is stopped in software standby mode, disable the start bit timing check. If MOSC is selected as the CEC

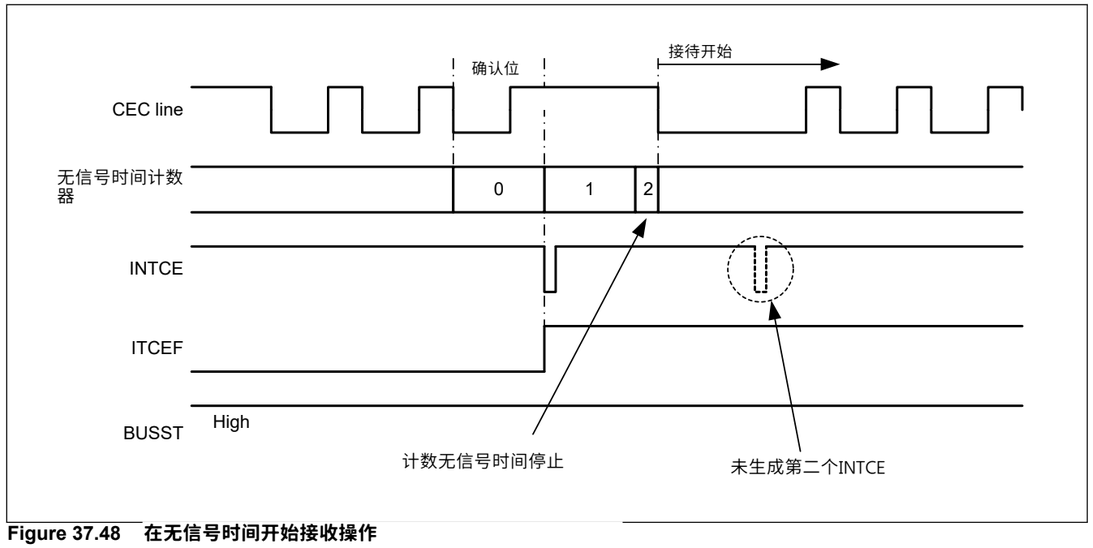

Figure 37.48 在无信号时间开始接收操作

37.3.3.9 通过在接收期间检测起始位来重新开始接收的功能

如果在接收操作（跟随操作）期间检测到新的起始位，则该功能用于从检测到的起始位重新开始接收，如图37.49所示。该功能通过启用启动检测重启接收使能位(CECEXMD.RERCVEN=1)来启用。

当接收到的数据与寄存器（STATLL、STATLH、STATBL或STATBH)的接收起始位宽度，并重新开始接收。

由于在接收过程中接收到起始位，因此会发生时序错误。错误发生在起始位开头或标题块的下降沿。

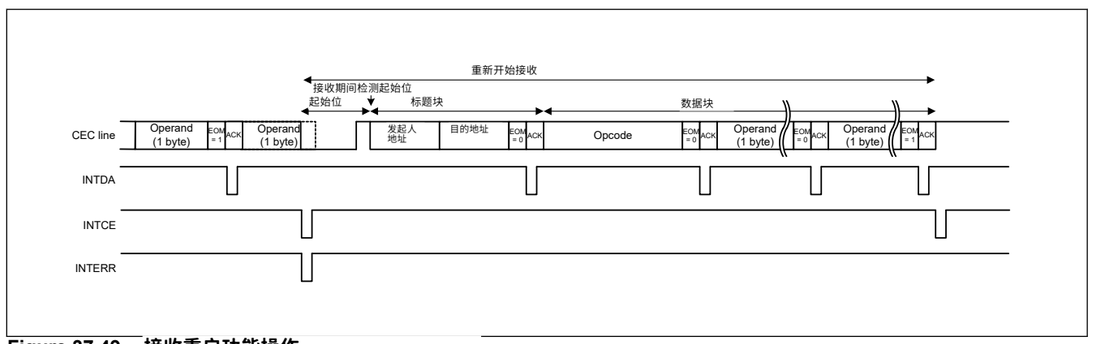

Figure 37.49 接收重启功能操作

37.4 使用说明

37.4.1 从低功耗状态恢复

CECIO终端可用作IRQ输入终端。对于相应的IRQ中断，如果中断请求使能，ICUIRQCRi.IRQMD[1:0]位设置为01b（下降沿）且功耗变为低功耗状态，则从低功耗状态恢复在下降沿的功耗状态。由于CEC工作时钟在软件待机模式下停止，因此禁用起始位时序检查。如果选择MOSC作为CEC

operating clock, adjust the setting value of the MOSCWTCR.MSTS bit so that the MOSC supply is restarted during the start bit L period.

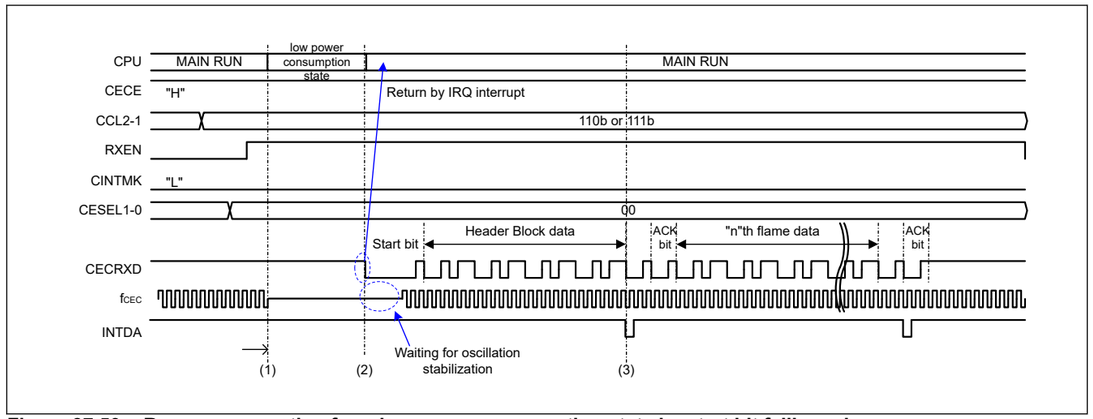

Figure 37.50 Recovery operation from low power consumption state by start bit falling edge

In the recovery operation from the low power consumption state by the start bit falling edge, even if data other than the own station address is received by direct address reception, it recovers from the low power consumption state.

When the CINTMK bit of CECCTL1 is set to 1, a CEC interrupt can be generated even when data other than the own station address is received. By checking the ADRF bit of CECS during data reception interrupt processing, it is possible to check whether the data was received to the local station address.

操作时钟，调整MOSCWTCR.MSTS位的设置值，使MOSC电源在起始位L期间重新启动。

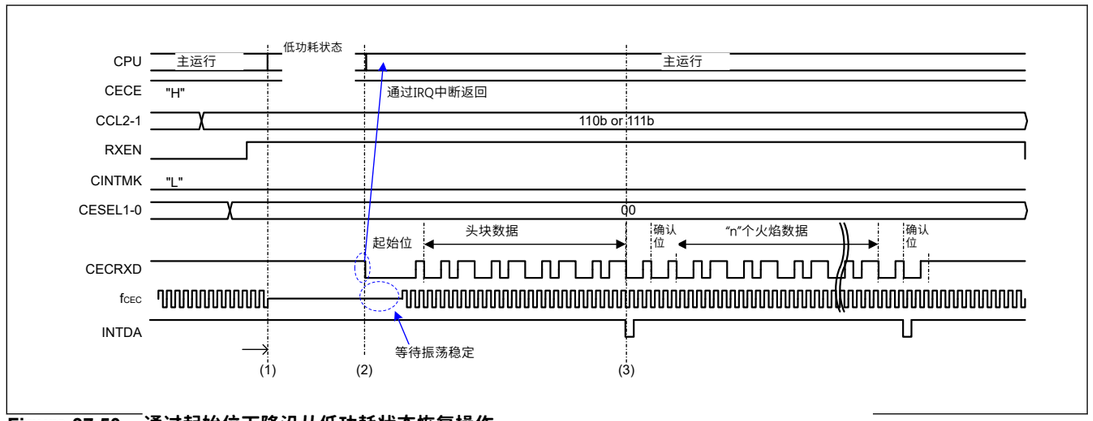

Figure 37.50 通过起始位下降沿从低功耗状态恢复操作

在起始位下降沿从低功耗状态恢复操作中，即使通过直接地址接收接收到本站地址以外的数据，它也会从低功耗状态恢复。

当CECCTL1的CINTMK位设置为1时，即使接收到本站地址以外的数据，也可以产生CEC中断。通过在数据接收中断处理期间检查CECS的ADRF位，可以检查数据是否接收到本地站地址。

(2) When communication to other than own station

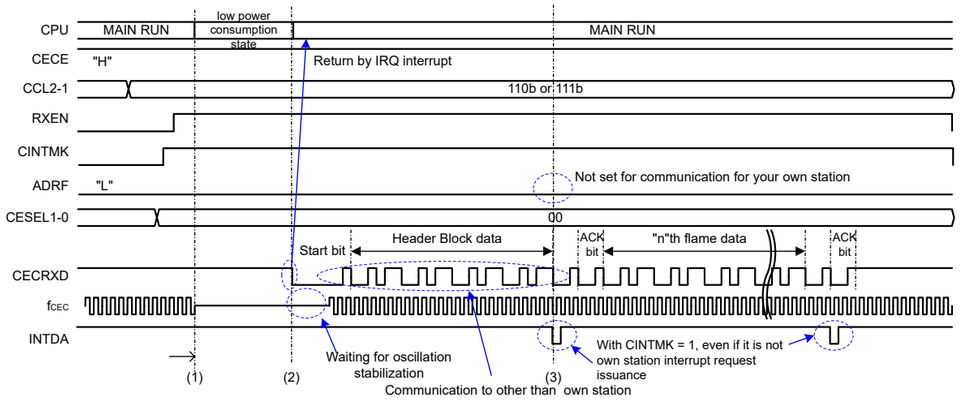

Figure 37.51 Recovery operation from low power consumption state by start bit falling edge (own station judgment)

37.4.2 Settings for Module-Stop Function

The Module Stop Control Register (MSTPCR) can enable or disable CEC operation. The CEC module is initially stopped after reset.

Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

37.4.3 Settings for Clock Division Ratio

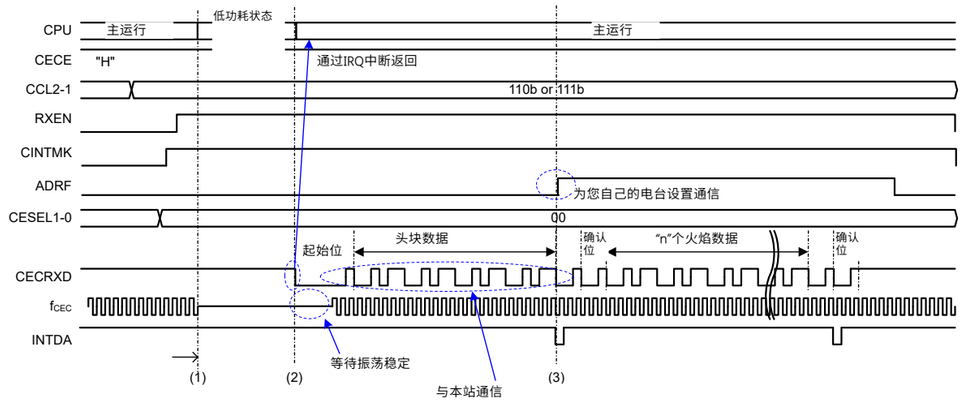
Set the peripheral module clock (PCLKB) frequency to higher than the CEC operating clock frequency.

37.4.4 Notes on re-reception function by detection of start bit during reception

37.4.4.1 Precautions for re-receive function by detecting start bit during reception

If a new start bit is detected during reception operation (follower operation), the CEC line may be fixed at Low, so please note the following notes.

(1)与本站通信时



(2)与本站以外的通信时

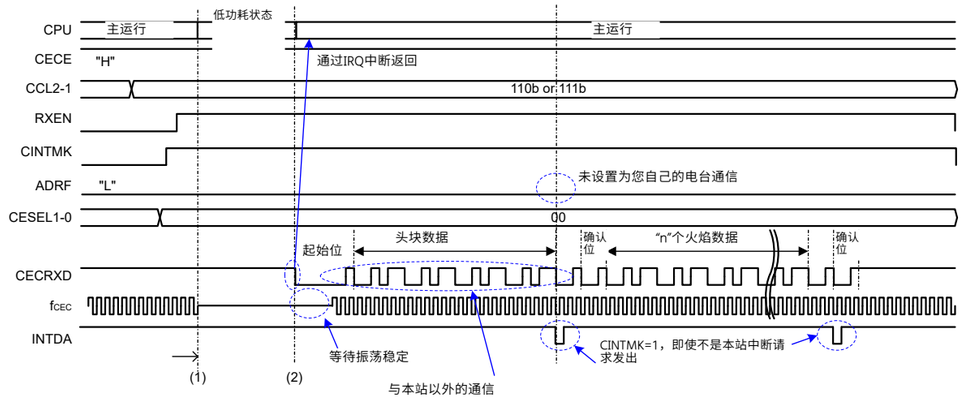


Figure 37.51 通过起始位下降沿从低功耗状态恢复操作（本站判断）

37.4.2 模块停止功能的设置

模块停止控制寄存器(MSTPCR)可以启用或禁用CEC操作。CEC模块在复位后最初停止。

释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

37.4.3 时钟分频比设置

将外围模块时钟(PCLKB)频率设置为高于CEC工作时钟频率。

37.4.4 接收期间通过检测起始位进行重新接收功能的注意事项

37.4.4.1 通过在接收期间检测起始位来重新接收功能的注意事项

如果在接收操作（跟随操作）期间检测到新的起始位，CEC线可能会固定为低电平，因此请注意以下注意事项。

RA生态工作室

- To detect the high or low fixed (bus lock) state of the CEC line, set CECCTL1.BLERRD to 1 and enable the bus lock detection function.
- If the cause of the INTERR interrupt is a bus lock error (CECES.BLERR = 1), clear CECCTL0.CECE to 0 once in the INTERR interrupt processing, and initialize the internal sequencer of the CEC transmission/reception circuit. After that, set CECCTL0.CECE to 1 again. Even if CECCTL0.CECE is cleared to 0, the CEC register will not be reset. See Figure 37.52 for an example of the INTERR interrupt processing flow when a bus lock error occurs.

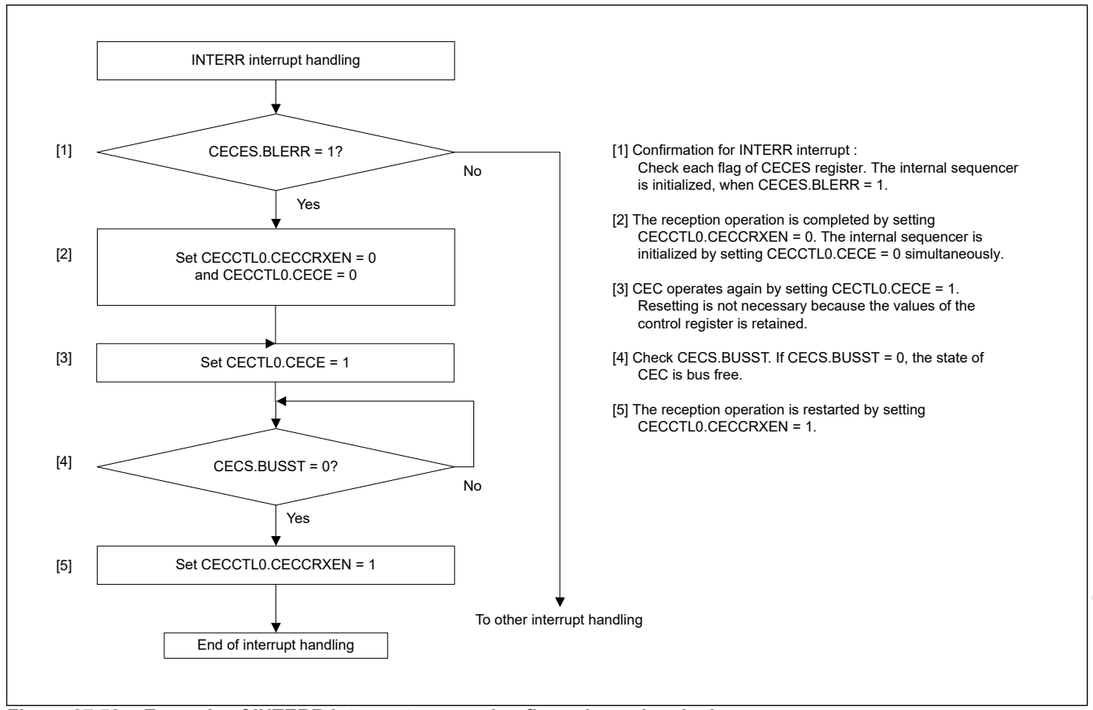

Figure 37.52 Example of INTERR interrupt processing flow when a bus lock error occurs

●要检测CEC线的高电平或低电平固定（总线锁定）状态，请将CECCTL1.BLERRD设置为1并启用总线锁定检测功能。

●如果INTERR中断的原因是总线锁定错误（CECES.BLERR=1），在INTERR中断处理中将CECCTL0.CECE清零一次，并初始化CEC发送接收电路的内部定序器。之后，再次将CECCTL0.CECE设置为1。即使CECCTL0.CECE被清零，CEC寄存器也不会被复位。发生总线锁定错误时的INTERR中断处理流程示例，请参见图37.52。

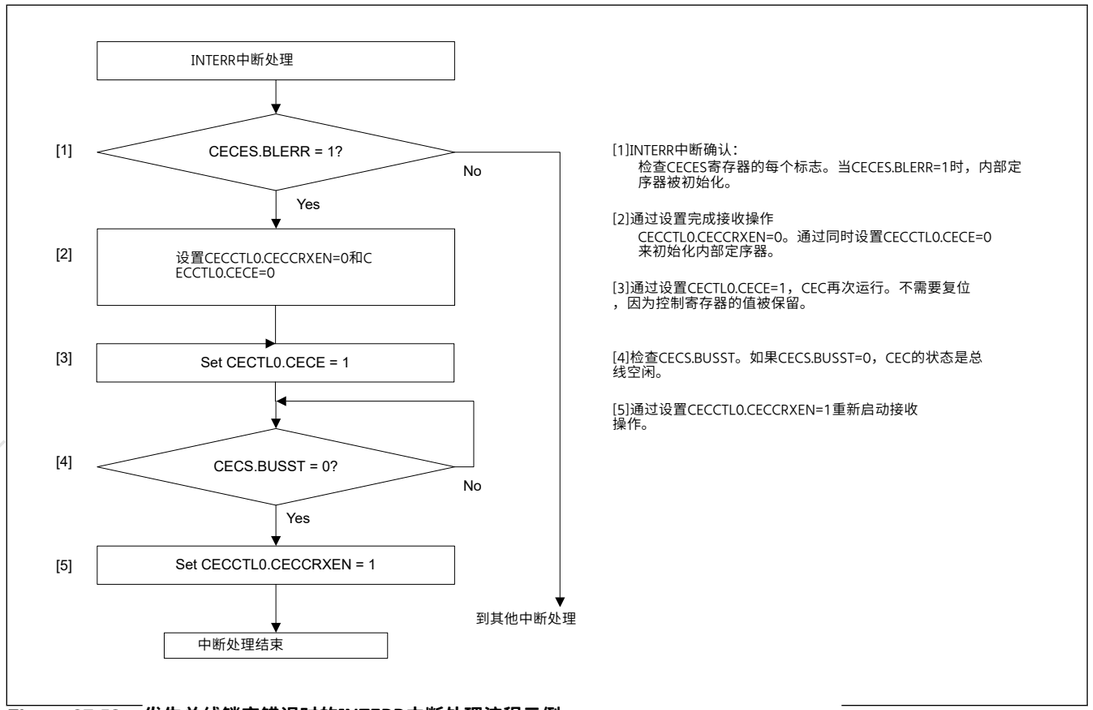

Figure 37.52 发生总线锁定错误时的INTERR中断处理流程示例

38. Serial Sound Interface Enhanced (SSIE)

38.1 Overview

The Serial Sound Interface Enhanced (SSIE) can transmit and receive audio data to and from various devices that support any of audio data formats, such as I^2S, monaural, and TDM.

38.2 Features

Table 38.1 Features of SSIE

Item		Description
Number of channels		One channel, SSIE0
Communication mode		• Master/slave • Transmission/reception (SSIE0 full duplex communication or half-duplex communication)
Communication format		• I^2S format • Monaural format • TDM format
Serial data		• MSB first • Data can be left-justified or right-justified. • Data delay (1 clock cycle) or no delay selectable for the period from SSILRCK/SSIFS to SSITXD0/SSIRXD0/SSIDATA0 • System word length: 8, 16, 24, 32, 48, 64, 128, or 256 bits • Data word length: 8, 16, 18, 20, 22, 24, or 32 bits • Padding polarity: Low or high
Bit clock (SSIBCK)	In master mode	• Two clock sources available (AUDIO_CLK/GPT output (GTIOC2A)) • Clock source division ratio: 1/1, 1/2, 1/4, 1/6, 1/8, 1/12, 1/16, 1/24, 1/32, 1/48, 1/64, 1/96, and 1/128. • Supply/stop is selectable while communication is halted.
	In master/slave mode	• Polarity (rising edge or falling edge) selectable
LR clock/frame synchronization (SSILRCK/ SSIFS)	In master mode	• Polarity (low level or high level) selectable • Supply/stop is selectable while communication is halted.
Transmit data (SSITXD0/ SSIDATA0) and receive data (SSIRXD0/ SSIDATA0)	Transmission	• Muting method (transmission of transmit FIFO data or transmission of data fixed to 0) selectable
FIFO	Capacity	• Transmit FIFO/receive FIFO: 4 bytes × 32 stages
	Data alignment	• Data alignment method (left-justification or right-justification) selectable for the data transfer between FIFO and shift register
Interrupt	Interrupt output	• Communication error/idle mode • Receive data full • Transmit data empty
Low power consumption function		• Whether to supply the audio clock selectable in master mode
Module stop function	• Module stop state can be set to reduce power consumption.	
TrustZone Filter	• Security attribution can be set.	

The following table lists and defines the terms used for the communication formats SSIE can use:

Table 38.2 Definition of terms (1 of 2)

Term	Definition
Start trigger	First edge of the signal on the SSILRCK/SSIFS pin when the signal is set to the value specified in LRCKP to enable communication

38. 串行声音接口增强(SSIE)

38.1 Overview

增强型串行声音接口(SSIE)可以向各种支持任何音频数据格式（例如I2S、单声道和TDM）的设备发送和接收音频数据。

38.2 Features

Table 38.1 SSIE的特点

Item		Description
通道数		一个通道，SSIE0
通讯方式		• Master/slave • 发送接收（SSIE0全双工通信或半双工通信）
通讯格式		• I^2S format • Monaural format • TDM format
串行数据		• MSB first • 数据可以左对齐或右对齐。 • 从SSILRCKSSIFS到SSITXD0SSIRXD0SSIDATA0期间可选择数据延迟（1个时钟周期）或无延迟 • 系统字长：8、16、24、32、48、64、128或256位 • 数据字长：8、16、18、20、22、24或32位 • 填充极性：低或高
位时钟(SSIBCK)	在主模式	• 提供两个时钟源（AUDIO_CLKGPT输出(GTIOC2A)） • 时钟源分频比：11、12、14、16、18、112、116、124、132、148、164、196和1128。 • 通信停止时可选择停止供电。
	在主从模式	• 极性（上升沿或下降沿）可选
LR clock/frame synchronization (SSILRCK/ SSIFS)	在主模式	• 极性（低电平或高电平）可选 • 通信停止时可选择停止供电。
发送数据(SSITXD0SSIDATA0)和接收数据(SSIRXD0SSIDATA0)	Transmission	• 可选择静音方式（传送传送FIFO数据或传送固定为0的数据）
FIFO	Capacity	• 发送FIFO接收FIFO：4字节×32级
	数据对齐	• FIFO和移位寄存器之间的数据传输可选择数据对齐方式（左对齐或右对齐）
Interrupt	中断输出	• 通信错误空闲模式 • 接收数据已满 • 传输数据为空
低功耗功能		• 是否提供主模式下可选择的音频时钟
模块停止功能	• 可设置模块停止状态以降低功耗。	
TrustZone Filter	• 可以设置安全属性。

FRM[1:0]	I²S (00b)	Monaural (10b)	TDM (01b)
00b	2	1	Setting prohibited
01b	Setting prohibited	Setting prohibited	4
10b			5
11b			6

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If the value of these bits is changed by rewriting, subsequent operation is unpredictable.

Note 2. If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If the value of the TEN or REN bit is changed by rewriting, subsequent operation is unpredictable. For example, when transmission or reception is enabled, check that SSISR.IIRQ is 0; when transmission or reception is disabled, check that SSISR.IIRQ is 1.

With this register, select an audio clock, control interrupt requests, select data formats, and set an operation mode.

11b			6

注1.禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果这些位的值通过重写而改变，后续的操作是不可预知的。

注2.如果TEN位或REN位被重写，请确保SSISR.IIRQ位处于所需状态。如果TEN或REN位的值因重写而改变，后续操作将无法预测。例如，启用发送或接收时，检查SSISR.IIRQ是否为0；当发送或接收被禁用时，检查SSISR.IIRQ是否为1。

使用该寄存器，选择音频时钟、控制中断请求、选择数据格式和设置操作模式。

RA生态工作室

TEN and REN bits (Transmission and Reception Enable)

The TEN and REN bits enable/disable transmission and reception. When 1 is written to one of these bits, the corresponding communication operation starts in synchronization with a start trigger by the SSILRCK/SSIFS signal. For details, see section 38.8.2. Transmission to section 38.8.4. Transmission and Reception. When 0 is written to this bit, the current communication operation stops at the next frame boundary. To use SSIE for both transmission and reception, always write 1 to these bits together. When stopping the communication using SSIE, always disable both transmission and reception (write 0 to the TEN and REN bits).

If you want to stop SSIE before a frame boundary is reached, perform a software reset procedure.

MUEN bit (Mute Enable)

The MUEN bit sets/clears the mute function for the data output from the SSITXD0/SSIDATA0 pin. When this bit is set to 1 in the middle of a frame, the SSITXD0/SSIDATA0 output changes to 0 at the next frame boundary. When this bit is set to 0 in the middle of a frame, the SSITXD0/SSIDATA0 output changes to the data of transmit FIFO data register at the next frame boundary. Note that this bit controls data only. Status flags and interrupt signals are normally generated.

Changing the value of this bit must be performed only after setting the communication format to be used.

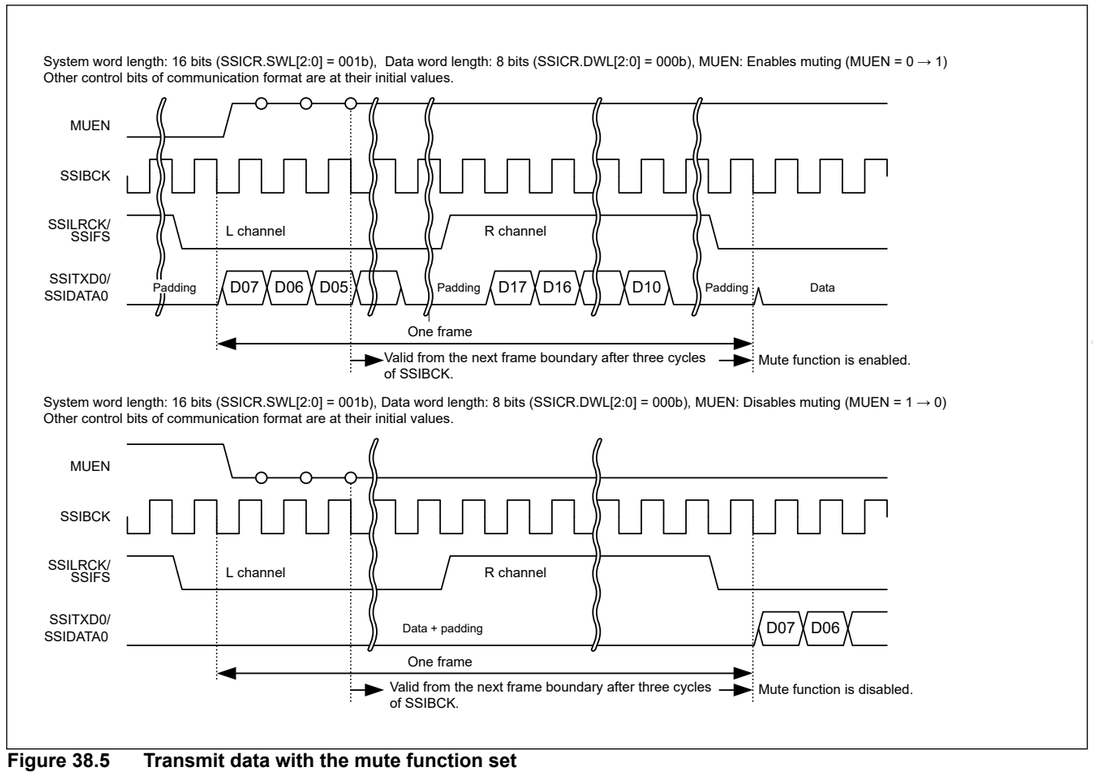

Figure 38.5 Transmit data with the mute function set

CKDV[3:0] bits (Selects Bit Clock Division Ratio)

The CKDV[3:0] bits set the division ratio of the bit clock based on AUDIO_MCK in master-mode communication (MST= 1). In slave-mode communication (MST = 0), setting of these bits are invalid.

Writing to this bit must be performed when the supply of AUDIO_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in section 38.4.3. SSIFCR : FIFO Control Register.

TEN和REN位（发送和接收使能）

TEN和REN位使能禁用发送和接收。当这些位之一写入1时，相应的通信操作与SSILRCKSSIFS信号的开始触发同步开始。有关详细信息，请参阅第38.8.2节。传输到第38.8.4节。传输和接收。当向该位写入0时，当前通信操作在下一帧边界处停止。要同时使用SSIE进行发送和接收，请始终将1一起写入这些位。使用SSIE停止通信时，始终禁用发送和接收（将0写入TEN和REN位）。

如果要在达到帧边界之前停止SSIE，请执行软件复位程序。

MUEN bit (Mute Enable)

MUEN位设置清除SSITXD0SSIDATA0引脚数据输出的静音功能。当该位在帧中间设置为1时，SSITXD0SSIDATA0输出在下一帧边界变为0。当该位在帧中间设置为0时，SSITXD0SSIDATA0输出在下一帧边界变为发送FIFO数据寄存器的数据。请注意，该位仅控制数据。通常会产生状态标志和中断信号。

只有在设置要使用的通信格式后才能更改该位的值。

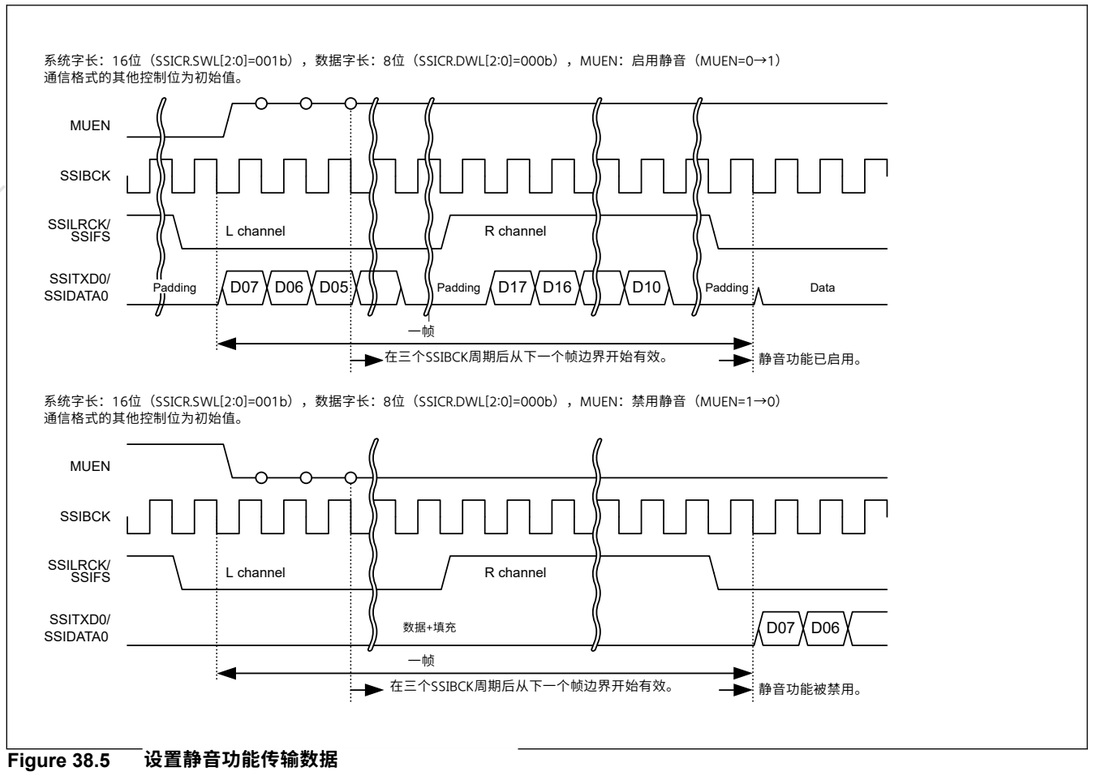

Figure 38.5 设置静音功能传输数据

CKDV[3:0]位（选择位时钟分频比）

CKDV[3:0]位在主模式通信(MST=1)中根据AUDIO_MCK设置位时钟的分频比。在从机模式通信(MST=0)中，这些位的设置无效。

当停止提供AUDIO_MCK时，必须执行写入该位。有关时序的详细信息，请参见第38.4.3节中AUCKE位的详细说明。SSIFCR：FIFO控制寄存器。

RA生态工作室

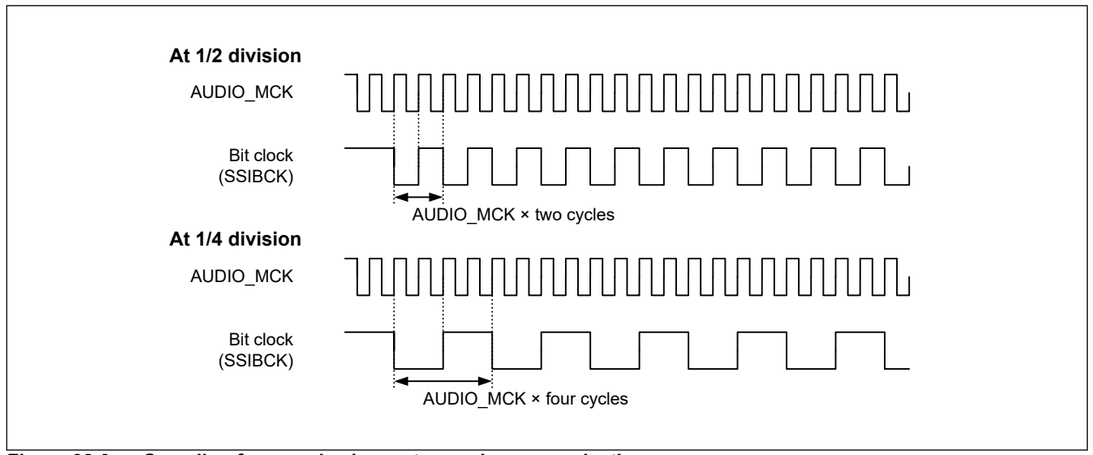

Figure 38.6 Sampling frequencies in master-mode communication

DEL bit (Selects Serial Data Delay)

The DEL bit sets whether or not there will be a delay between SSILRCK/SSIFS and SSITXD0/SSIRXD0/SSIDATA0.

For the I^{2}S or TDM format, set the DEL bit to 0. When the monaural format is used, setting of this bit changes the high period width of SSILRCK/SSIFS. For details, see section 38.5.2. Monaural Format. When using a compatible communication format, specify a setting of this bit that enables communication.

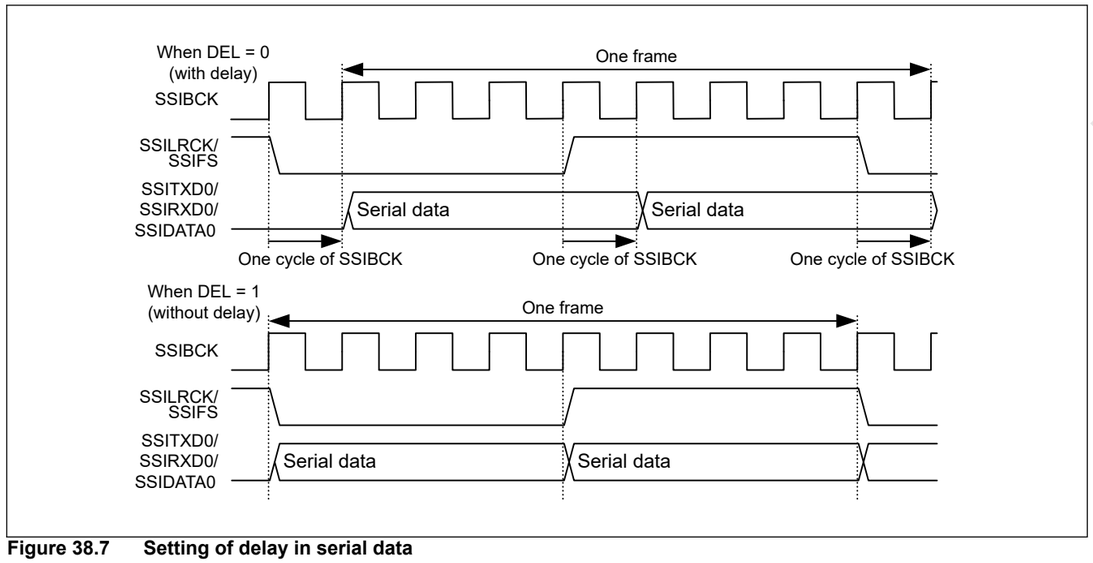

Figure 38.7 Setting of delay in serial data

PDTA bit (Selects Placement Data Alignment)

The PDTA bit sets how to align placement data. With the setting of data word length as 32 bits (SSICR.DWL[2:0] = 110b), this bit is invalid.

At transmission, see Figure 38.8.

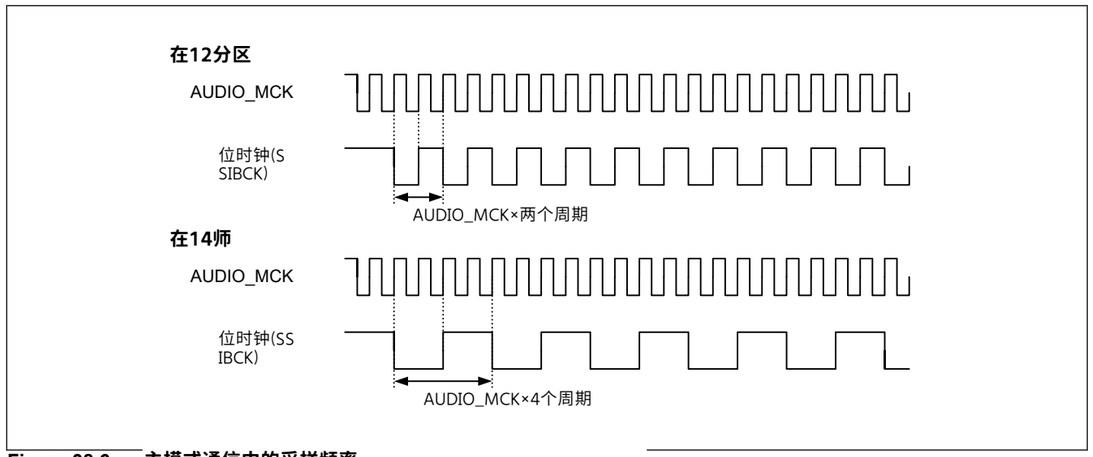

Figure 38.6 主模式通信中的采样频率

DEL位（选择串行数据延迟）

DEL位设置SSILRCKSSIFS和SSITXD0SSIRXD0SSIDATA0之间是否会有延迟。

对于I2S或TDM格式，将DEL位设置为0。当使用单声道格式时，该位的设置会改变SSILRCKSSIFS的高周期宽度。有关详细信息，请参阅第38.5.2节。单声道格式。使用兼容的通信格式时，指定该位的设置以启用通信。

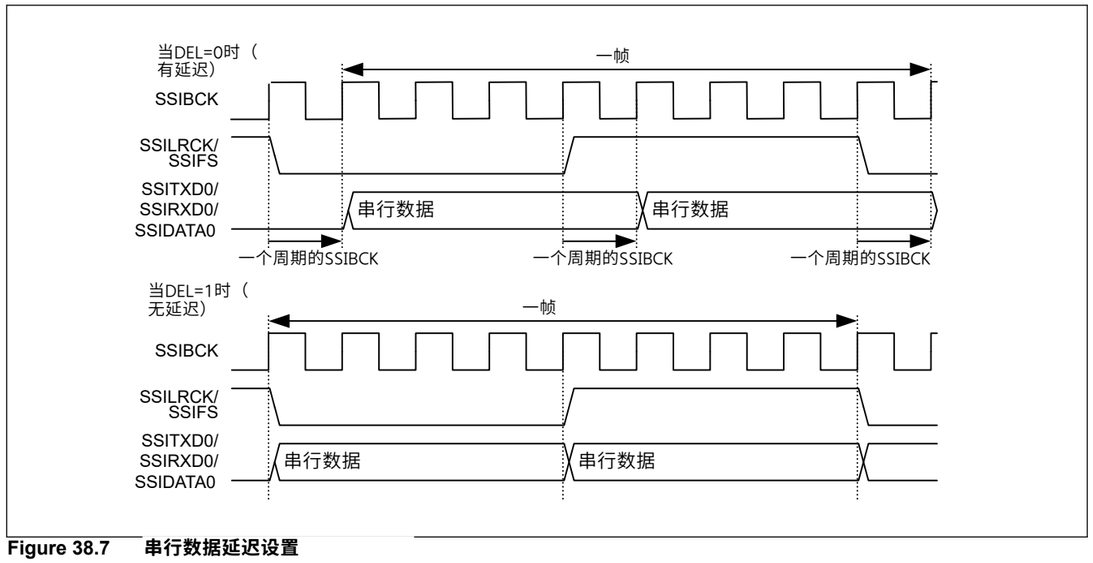

Figure 38.7 串行数据延迟设置

PDTA位（选择布局数据对齐）

PDTA位设置如何对齐布局数据。数据字长设置为32位（SSICR.DWL[2:0]=110b）时，该位无效。

传输时，见图38.8。

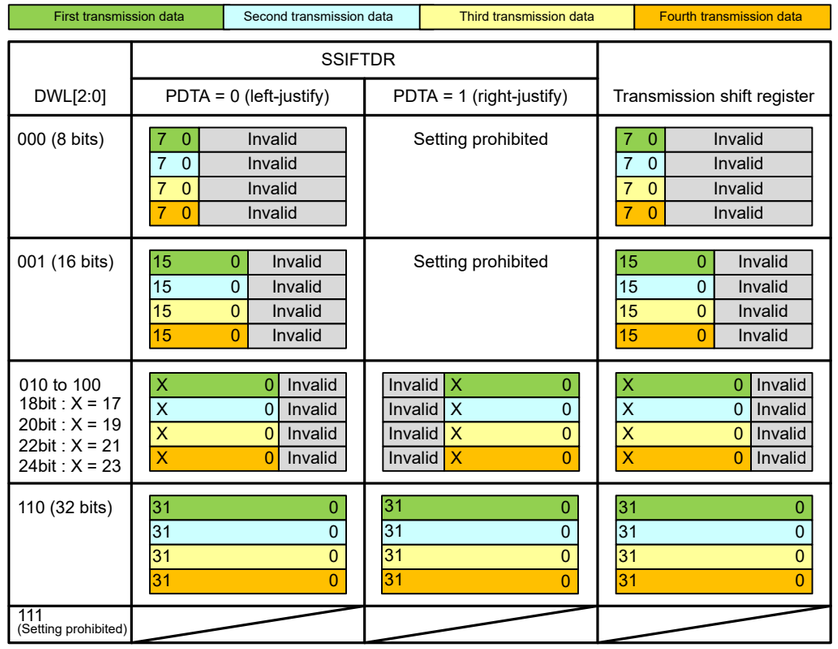

Figure 38.8 Alignment of placement data at transmission

At reception, see Figure 38.9.

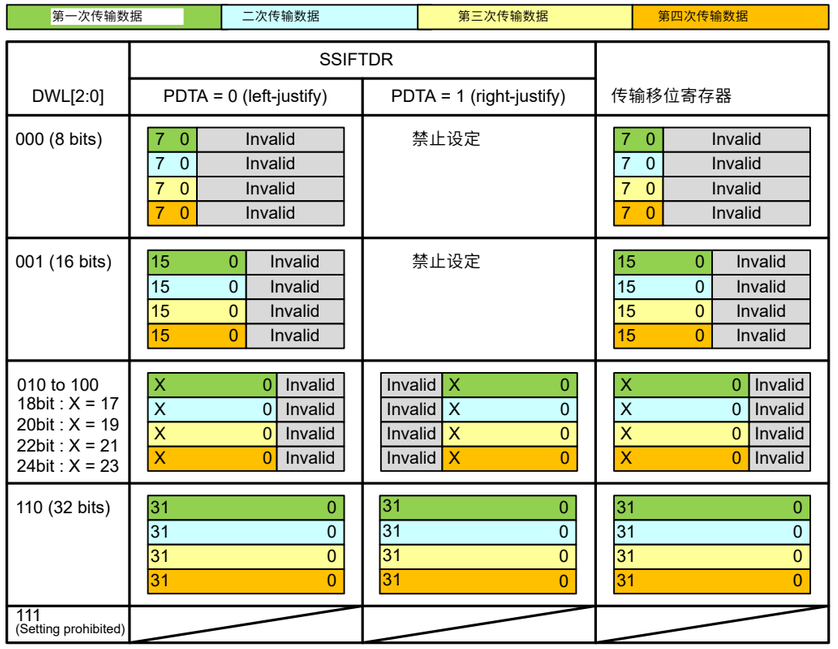

Figure 38.8 在传输时对齐放置数据

在接待处，见图38.9。

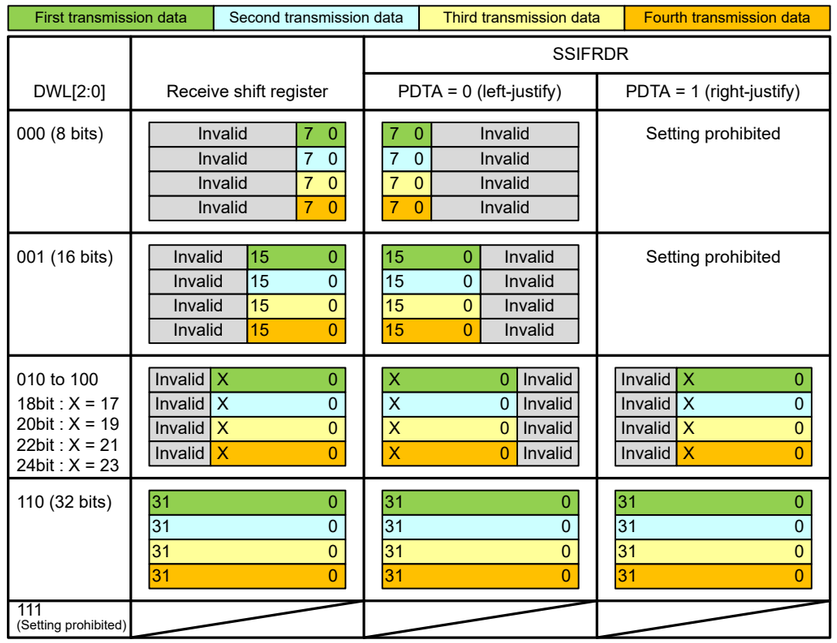

Figure 38.9 Alignment of placement data at reception

SDTA bit (Selects Serial Data Delay)

The SDTA bit sets how to align serial data and padding bits. For communication without padding bits, this bit is invalid.

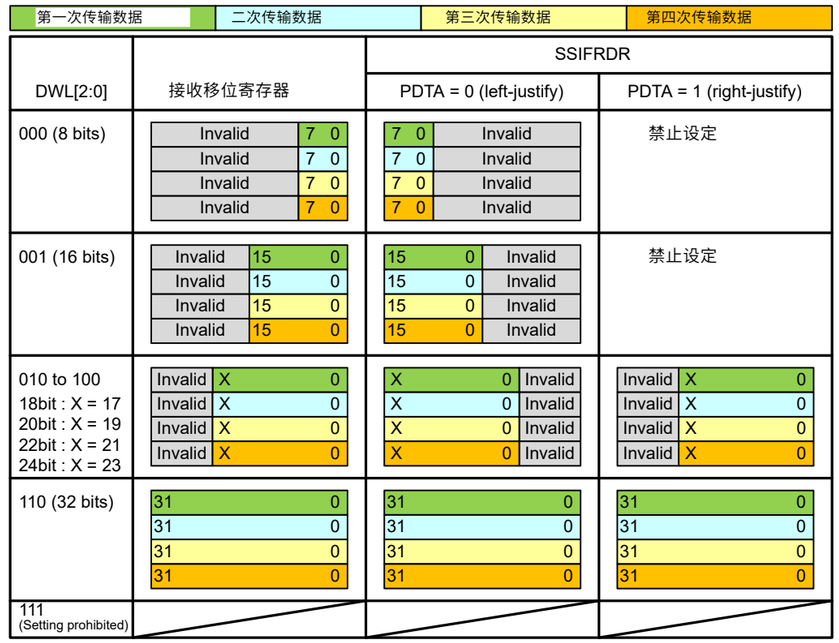

Figure 38.9 在接收时对齐放置数据

SDTA位（选择串行数据延迟）

SDTA位设置如何对齐串行数据和填充位。对于没有填充位的通信，该位无效。

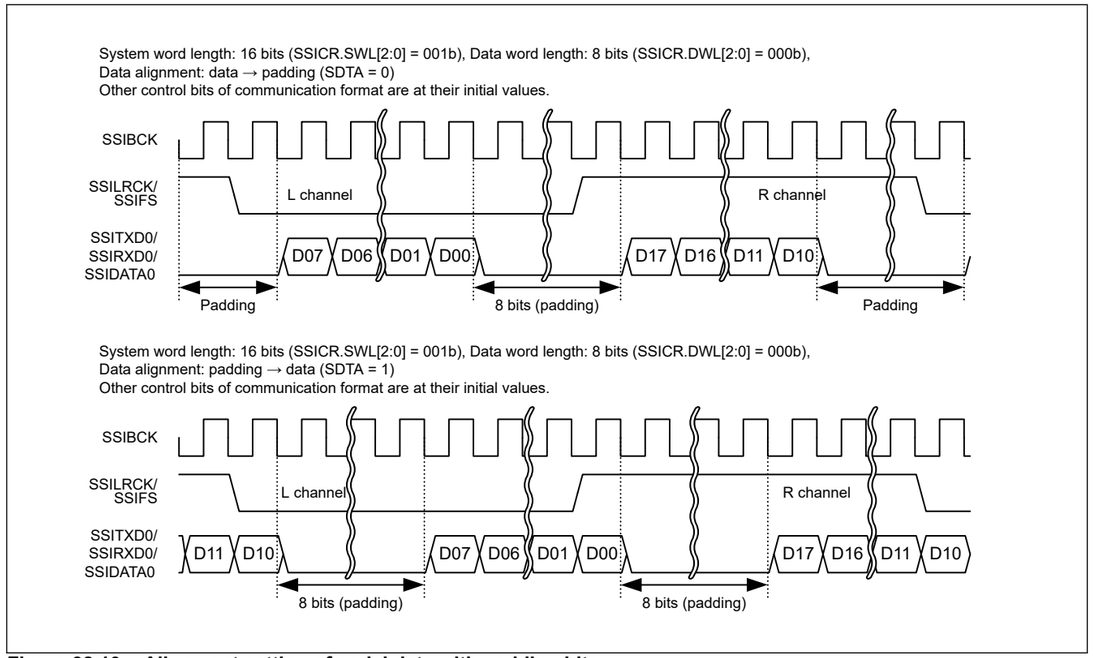

Figure 38.10 Alignment setting of serial data with padding bits

SPDP bit (Selects Serial Padding Polarity)

The SPDP bit sets polarity of padding bits.

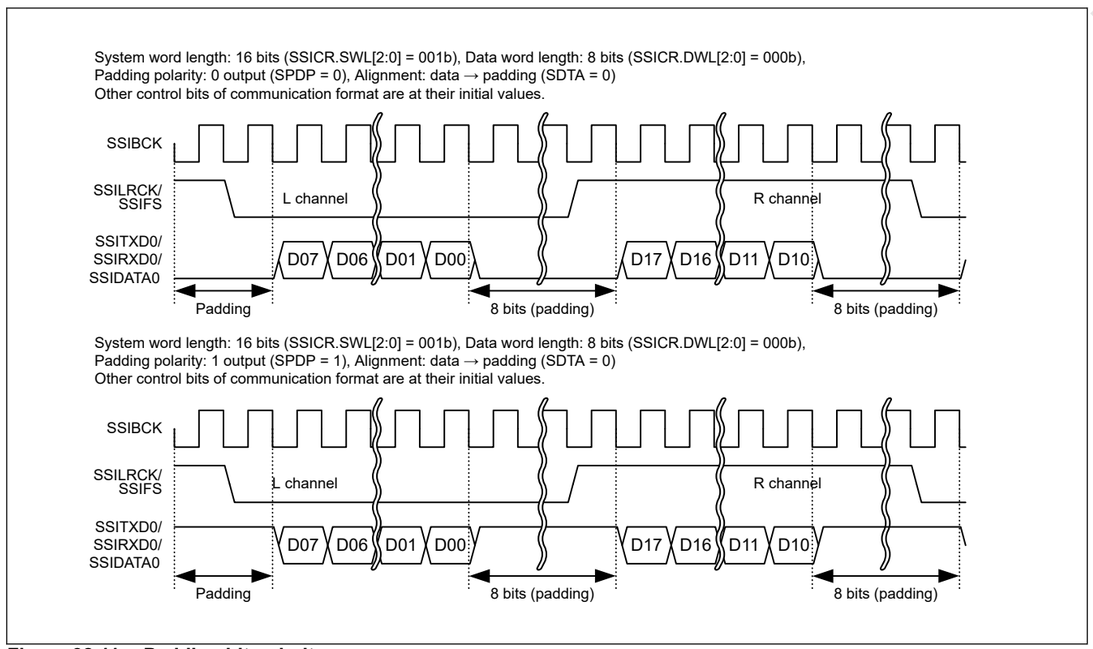

Figure 38.11 Padding bit polarity

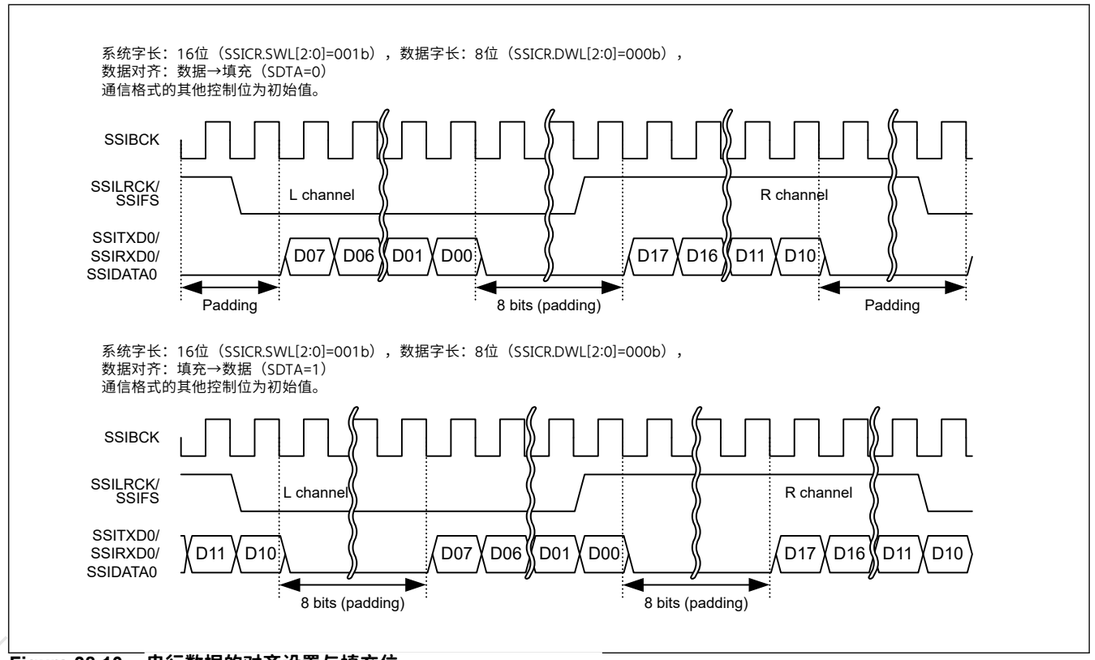

Figure 38.10 串行数据的对齐设置与填充位

SPDP位（选择串行填充极性）

SPDP位设置填充位的极性。

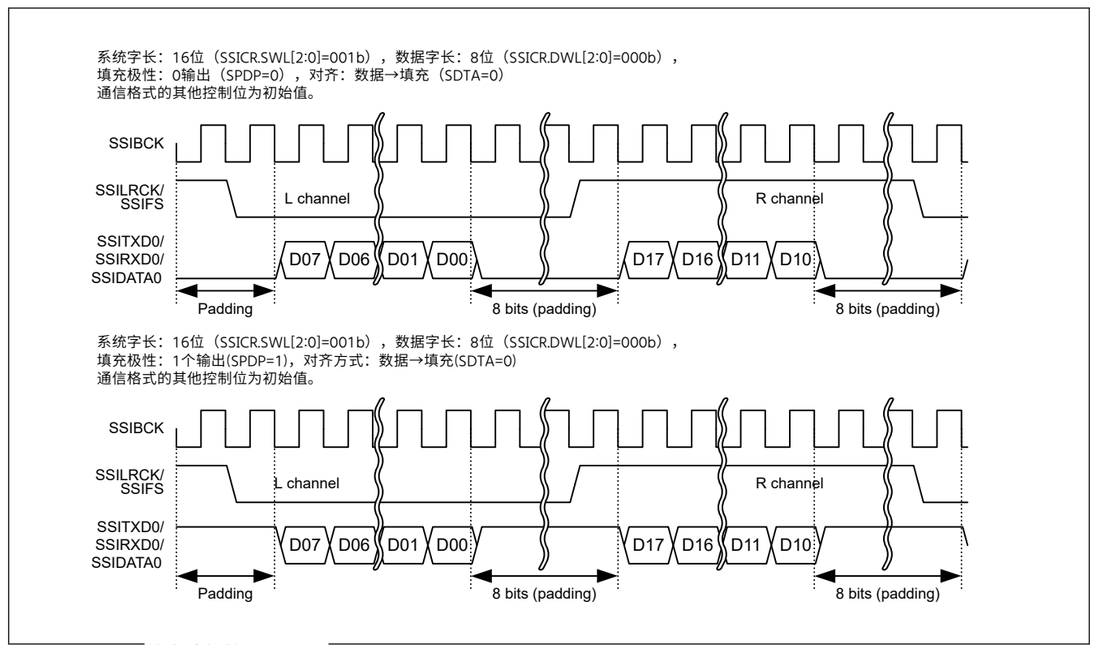

Figure 38.11 填充位极性

LRCKP bit (Selects the Initial Value and Polarity of LR Clock/Frame Synchronization Signal)

The LRCKP bit sets the initial value and polarity of SSILRCK/SSIFS. Set this bit according to the communication format to be used in SSIE. See Table 38.3 Initial output value and polarity of SSILRCK/SSIFS pin. For the slave-mode communication (MST = 0), only the start trigger is used.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in section 38.4.7. SSIOFR : Audio Format Register.

Table 38.3 Initial output value and polarity of SSILRCK/SSIFS pin

Communication Format	Expected Initial State	Setting Value of LRCKP
I²S	High	0
Monaural	Low	1
TDM	Low	1

Note: When the format to be used is compatible with the I²S, monaural, or TDM format, specify settings to enable communication with the respective formats.

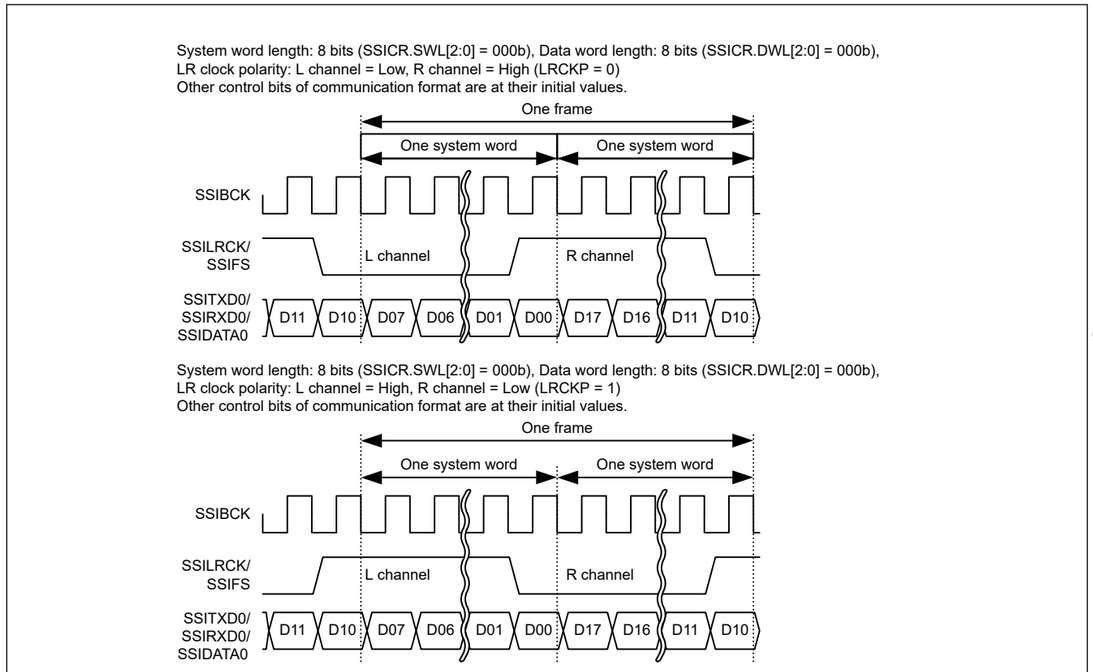

Figure 38.12 LR clock/frame synchronization polarity setting

BCKP bit (Selects Bit Clock Polarity)

The BCKP bit sets the bit clock polarity.

Writing to this bit must be performed when the supply of AUDIO_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in section 38.4.3. SSIFCR : FIFO Control Register.

Table 38.4 Bit clock polarity (1 of 2)

Communication	Master/Slave	Timing	BCKP = 0	BCKP = 1
Reception	Slave	At SSILRCK/SSIFS sampling	SSIBCK rising edge	SSIBCK falling edge
	Master/slave	At SSIRXD0/SSIDATA0 sampling	SSIBCK rising edge	SSIBCK falling edge

LRCKP位（选择LR时钟帧同步信号的初始值和极性）

LRCKP位设置SSILRCKSSIFS的初始值和极性。根据要在SSIE中使用的通信格式设置该位。请参见表38.3SSILRCKSSIFS引脚的初始输出值和极性。对于从模式通信(MST=0)，仅使用启动触发器。

当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。LR时钟的输出详见38.4.7节LRCONT位的详细说明。SSIOFR：音频格式寄存器。

Table 38.3 SSILRCKSSIFS管脚的初始输出值和极性

通讯格式	预期的初始状态	LRCKP设定值
I²S	High	0
Monaural	Low	1
TDM	Low	1

Note: 当要使用的格式与I2S、单声道或TDM格式兼容时，指定设置以启用与相应格式的通信。

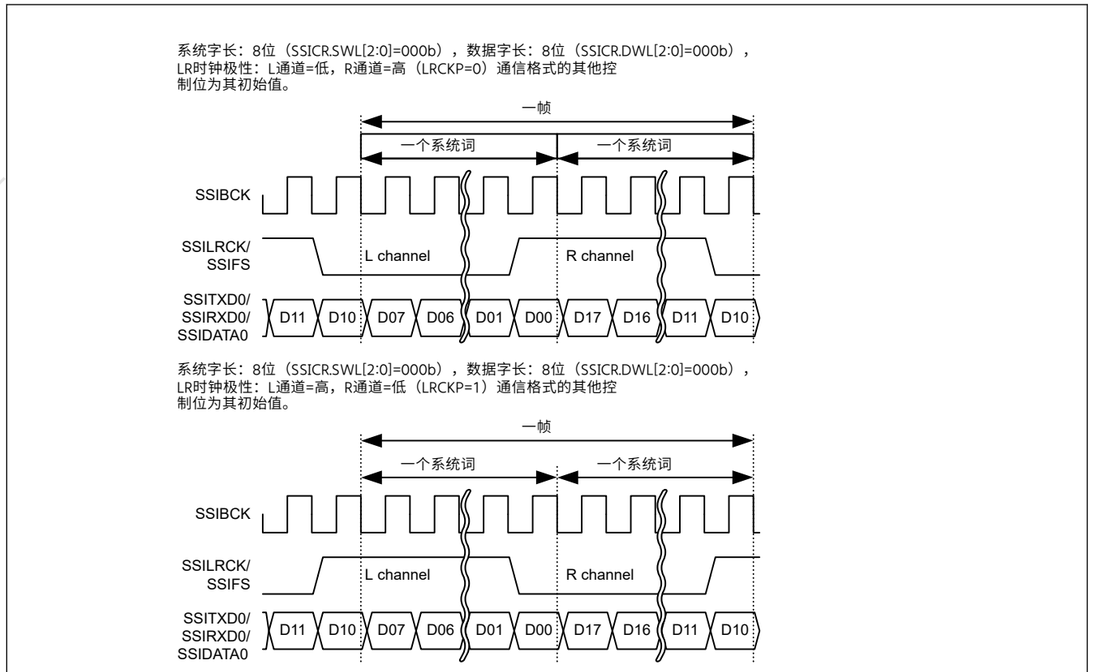

Figure 38.12 LR时钟帧同步极性设置

BCKP位（选择位时钟极性）

BCKP位设置位时钟极性。

当停止提供AUDIO_MCK时，必须执行写入该位。有关时序的详细信息，请参见第38.4.3节中AUCKE位的详细说明。SSIFCR：FIFO控制寄存器。

Table 38.4 位时钟极性（1of2）

Communication	Master/Slave	Timing	BCKP = 0	BCKP = 1
Reception	Slave	在SSILRCKSSIFS采样	SSIBCK上升沿	SSIBCK下降沿
	Master/slave	在SSIRXD0SSIDATA0采样	SSIBCK上升沿	SSIBCK下降沿

Table 38.4 Bit clock polarity (2 of 2)

Communication	Master/Slave	Timing	BCKP = 0	BCKP = 1
Transmission	Master	At change of SSILRCK/SSIFS output	SSIBCK falling edge	SSIBCK rising edge
	Master/slave	At change of SSITXD0/SSIDATA0 output	SSIBCK falling edge	SSIBCK rising edge

MST bit (Master Enable)

The MST bit sets master-/slave-mode communication.

Writing to this bit must be performed when the supply of AUDIO_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in section 38.4.3. SSIFCR : FIFO Control Register.

SWL[2:0] bits (Selects System Word Length)

The SWL[2:0] bits set the number of bits in one system word. Padding bits are sent and received in relation with one data word set with DWL[2:0]. See Table 38.11 for details.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in section 38.4.7. SSIOFR : Audio Format Register.

DWL[2:0] bits (Selects Data Word Length)

The DWL[2:0] bits set the number of bits in one data word. The data word length (number of bits per data word) must not exceed the system word length (number of bits per system word). For details, see Table 38.11.

FRM[1:0] bits (Selects Frame Word Number)

The FRM[1:0] bits set the frame word number in individual communication formats.

Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in section 38.4.7. SSIOFR : Audio Format Register.

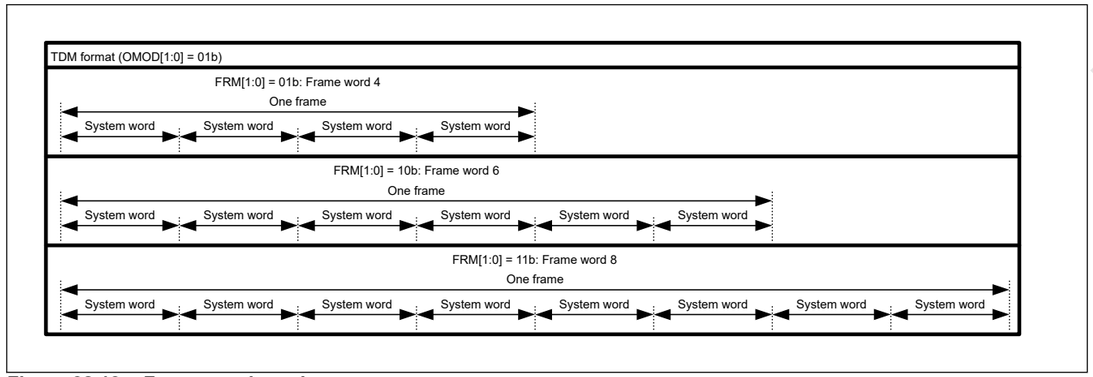

Figure 38.13 Frame word number

IIEN bit (Idle Mode Interrupt Output Enable)

The IIEN bit enables/disables output of idle mode interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.IIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.IIRQ = 1.

ROIEN bit (Receive Overflow Interrupt Output Enable)

The ROIEN bit enables/disables output of receive overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.ROIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.ROIRQ = 1.

RUIEN bit (Receive Underflow Interrupt Output Enable)

The RUIEN bit enables/disables output of receive underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.RUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.RUIRQ = 1.

Table 38.4 位时钟极性（2之2）

Communication	Master/Slave	Timing	BCKP = 0	BCKP = 1
Transmission	Master	在改变SSILRCKSSIFS输出时	SSIBCK下降沿	SSIBCK上升沿
	Master/slave	在SSITXD0SSIDATA0输出变化时	SSIBCK下降沿	SSIBCK上升沿

MST bit (Master Enable)

MST位设置主从模式通信。

当停止提供AUDIO_MCK时，必须执行写入该位。有关时序的详细信息，请参见第38.4.3节中AUCKE位的详细说明。SSIFCR：FIFO控制寄存器。

SWL[2:0]位（选择系统字长）

SWL[2:0]位设置一个系统字中的位数。填充位的发送和接收与使用DWL[2:0]设置的一个数据字相关。详见表38.11。

当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。LR时钟的输出详见38.4.7节LRCONT位的详细说明。SSIOFR：音频格式寄存器。

DWL[2:0]位（选择数据字长）

DWL[2:0]位设置一个数据字中的位数。数据字长（每个数据字的位数）不得超过系统字长（每个系统字的位数）。详见表38.11。

FRM[1:0]位（选择帧字号）

FRM[1:0]位设置各个通信格式中的帧字号。

当向SSILRCKSSIFS引脚提供LR时钟停止时，必须执行写入这些位。LR时钟的输出详见38.4.7节LRCONT位的详细说明。SSIOFR：音频格式寄存器。

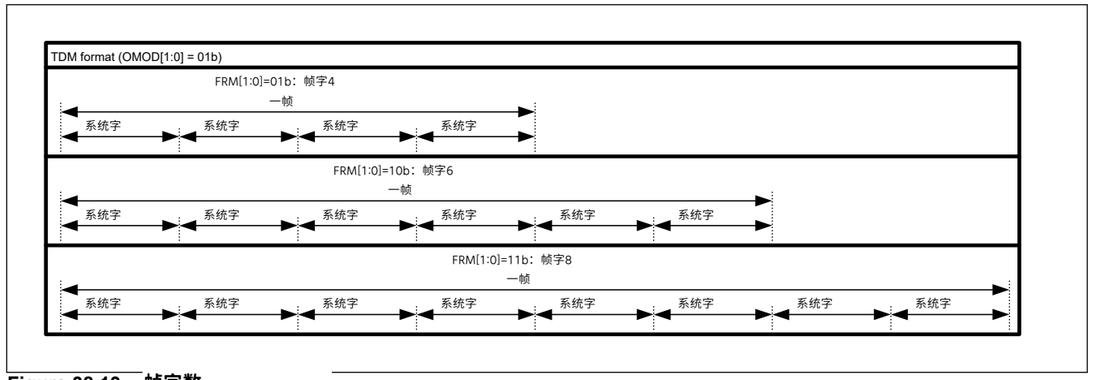

Figure 38.13 帧字数

IIEN位（空闲模式中断输出使能）

IIEN位启用禁用空闲模式中断的输出。通过启用该位（将其设置为1），在SSISR.IIRQ=1的上升沿输出中断。当SSISR.IIRQ=1时该位从0变为1时也会输出中断。

ROIEN位（接收溢出中断输出使能）

ROIEN位使能禁止接收溢出中断的输出。通过启用该位（将其设置为1），在SSISR.ROIRQ=1的上升沿输出中断。当SSISR.ROIRQ=1时该位从0变为1时也会输出中断。

RUIEN位（接收下溢中断输出使能）

RUIEN位启用禁用接收下溢中断的输出。通过启用该位（将其设置为1），在SSISR.RUIRQ=1的上升沿输出中断。当SSISR.RUIRQ=1时该位从0变为1时也会输出中断。

TOIEN bit (Transmit Overflow Interrupt Output Enable)

The TOIEN bit enables/disables output of transmit overflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TOIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TOIRQ = 1.

TUIEN bit (Transmit Underflow Interrupt Output Enable)

The TUIEN bit enables/disables output of transmit underflow interrupts. By enabling this bit (set it to 1), an interrupt is output at a rising edge of SSISR.TUIRQ = 1. An interrupt is also output when this bit is changed from 0 to 1 while SSISR.TUIRQ = 1.

CKS bit (Selects an Audio Clock for Master-mode Communication)

The CKS bit sets the audio clock in master-mode communication (MST = 1). In slave-mode communication (MST = 0), setting of this bit is invalid.

Writing to this bit must be performed when the supply of AUDIO_MCK is stopped. For details about the timing, see the detailed description of the AUCKE bit in section 38.4.3. SSIFCR : FIFO Control Register.

38.4.2 SSISR : Status Register

Base address: SSIE0 = 0x4009_D000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	TUIRQ	TOIRQ	RUIRQ	ROIRQ	IIRQ	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
24:0	—	These bits are read as 0. The write value should be 0.	R/W
25	IIRQ	Idle Mode Status Flag 0: In the communication state 1: In the idle state	R
26	ROIRQ	Receive Overflow Error Status Flag 0: No receive overflow error is generated. 1: A receive overflow error is generated.	R/W
27	RUIRQ	Receive Underflow Error Status Flag 0: No receive underflow error is generated. 1: A receive underflow error is generated.	R/W
28	TOIRQ	Transmit Overflow Error Status Flag 0: No transmit overflow error is generated. 1: A transmit overflow error is generated.	R/W
29	TUIRQ	Transmit Underflow Error Status flag 0: No transmit underflow error is generated. 1: A transmit underflow error is generated.	R/W
31:30	—	These bits are read as 0. The write value should be 0.	R/W

This register is configured with status flags that indicate SSIE operational state.

IIRQ flag (Idle Mode Status Flag)

The IIRQ flag is a status flag that indicates the idle state. It indicates whether SSIE is in the idle state or communication state.

For details, see Figure 38.14 and Figure 38.15.

TOIEN位（发送溢出中断输出使能）

TOIEN位使能禁用发送溢出中断的输出。通过启用该位（将其设置为1），在SSISR.TOIRQ=1的上升沿输出中断。当SSISR.TOIRQ=1时该位从0变为1时也会输出中断。

TUIEN位（发送下溢中断输出使能）

TUIEN位使能禁用发送下溢中断的输出。通过启用该位（将其设置为1），在SSISR.TUIRQ=1的上升沿输出中断。当SSISR.TUIRQ=1时该位从0变为1时也会输出中断。

CKS位（选择主模式通信的音频时钟）

CKS位设置主模式通信中的音频时钟(MST=1)。在从机模式通信(MST=0)中，该位的设置无效。

当停止提供AUDIO_MCK时，必须执行写入该位。有关时序的详细信息，请参见第38.4.3节中AUCKE位的详细说明。SSIFCR：FIFO控制寄存器。

38.4.2 SSISR：状态寄存器

Base address: SSIE0 = 0x4009_D000

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	TUIRQ	TOIRQ	RUIRQ	ROIRQ	IIRQ	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

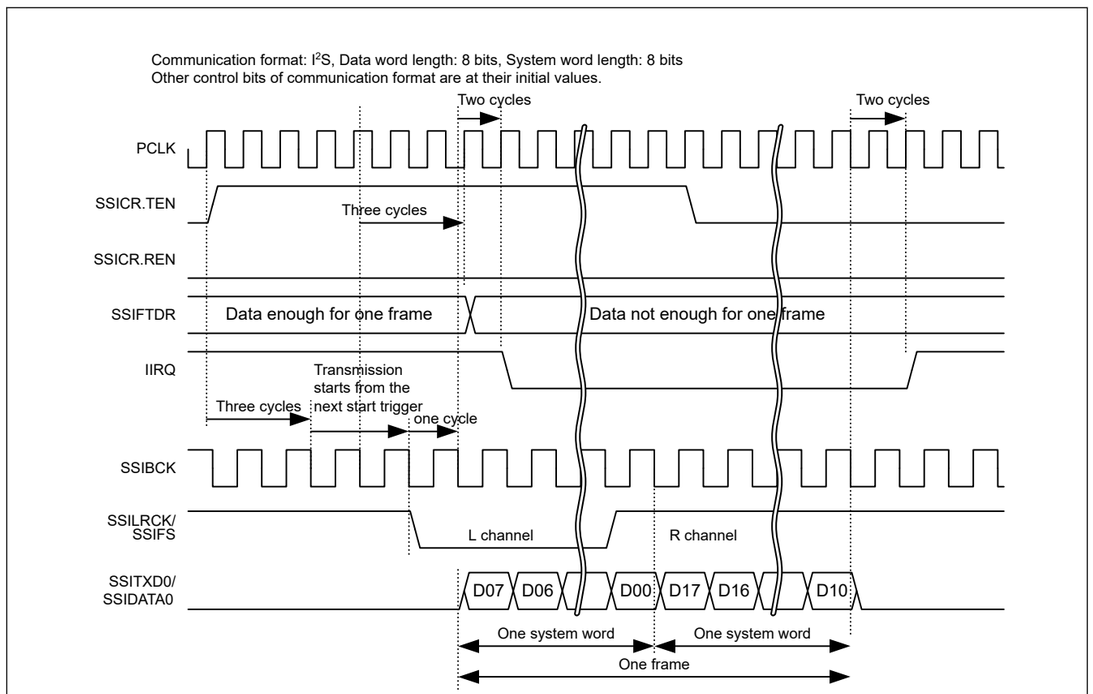
Bit	Symbol	Function	R/W
24:0	—	这些位被读取为0。写入值应为0。	R/W
25	IIRQ	空闲模式状态标志 0：处于通信状态1：处于空闲状态	R
26	ROIRQ	接收溢出错误状态标志 0：不产生接收溢出错误。1：产生接收溢出错误。	R/W
27	RUIRQ	接收下溢错误状态标志 0：不产生接收下溢错误。1：产生接收下溢错误。	R/W
28	TOIRQ	发送溢出错误状态标志 0：不产生发送溢出错误。1：产生发送溢出错误。	R/W
29	TUIRQ	发送下溢错误状态标志 0：不产生发送下溢错误。1：产生发送下溢错误。	R/W
31:30	—	这些位被读取为0。写入值应为0。	R/W

该寄存器配置有指示SSIE操作状态的状态标志。

IIRQ标志（空闲模式状态标志）

IIRQ标志是指示空闲状态的状态标志。它指示SSIE是处于空闲状态还是通信状态。

详见图38.14和图38.15。



Note: PCLK = PCLKB

Figure 38.14 IIRQ setting timing (transmission)

- Transmitter (dedicated to transmission)

[Clearing condition]

While transmission was enabled (SSICR.TEN = 1 and SSICR.REN = 0), the transmit data for a transmission frame was written to the SSIFTDR register, and a start trigger was generated by the SSILRCK/SSIFS signal.

[Clearing timing]

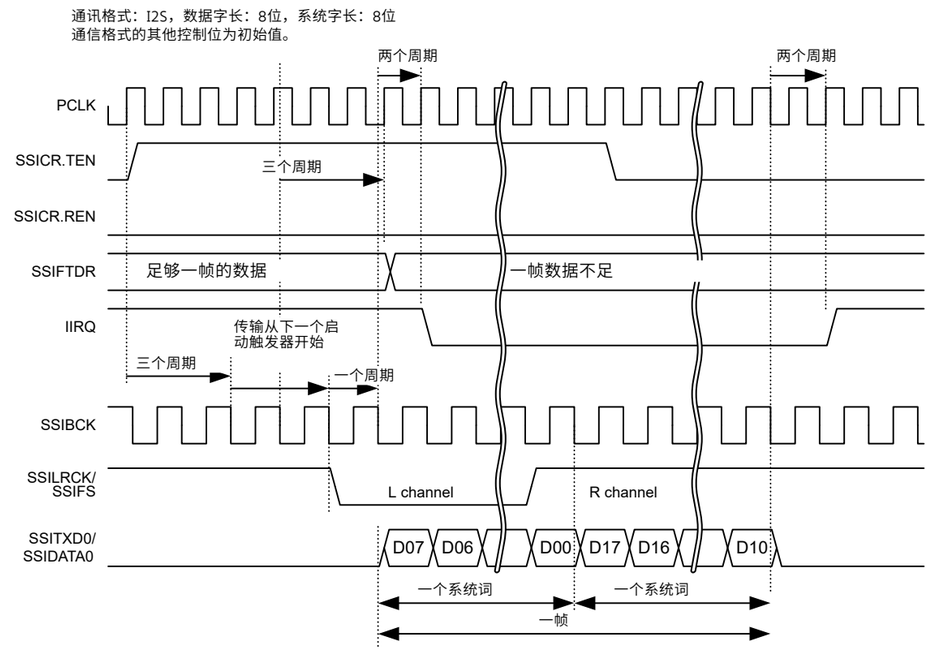
1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger that is the clearing condition.

[Setting condition]

While transmission and reception were disabled (SSICR.TEN = 0 and SSICR.REN = 0), transmission of one frame was complete.

[Setting timing]

2 PCLKB cycles after the end of transmission (at a frame boundary) that is the setting condition.



Note: PCLK = PCLKB

Figure 38.14 IIRQ设置时序（传输）

●发射器（传输专用）

[Clearing condition]

While reception was enabled (SSICR.TEN = 0 and SSICR.REN = 01, a start trigger was generated by the SSILRCK/SSIFS signal.

[Clearing timing]

1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger that is the clearing condition.

[Setting condition]

While transmission and reception were disabled (SSICR.TEN = 0 and SSICR.REN = 0), reception of one frame was complete.

[Setting timing]

2 PCLKB cycles after the end of reception (at a frame boundary) that is the setting condition.

- Transceiver (transmission and reception)

[Clearing condition]

While transmission and reception were enabled (SSICR.TEN = 1 and SSICR.REN = 1), the transmit data for a transmission frame was written to the SSIFTDR register, and a start trigger is generated by the SSILRCK/SSIFS signal.

[Clearing timing]

1 SSIBCK cycle + 2 PCLKB cycles after generation of the start trigger that is the clearing condition.

[Setting condition]

While transmission and reception were disabled (SSICR.TEN = 0 and SSICR.REN = 0), transmission of one frame was complete.

[Setting timing]

2 PCLKB cycles after the end of transmission (at a frame boundary) that is the setting condition.

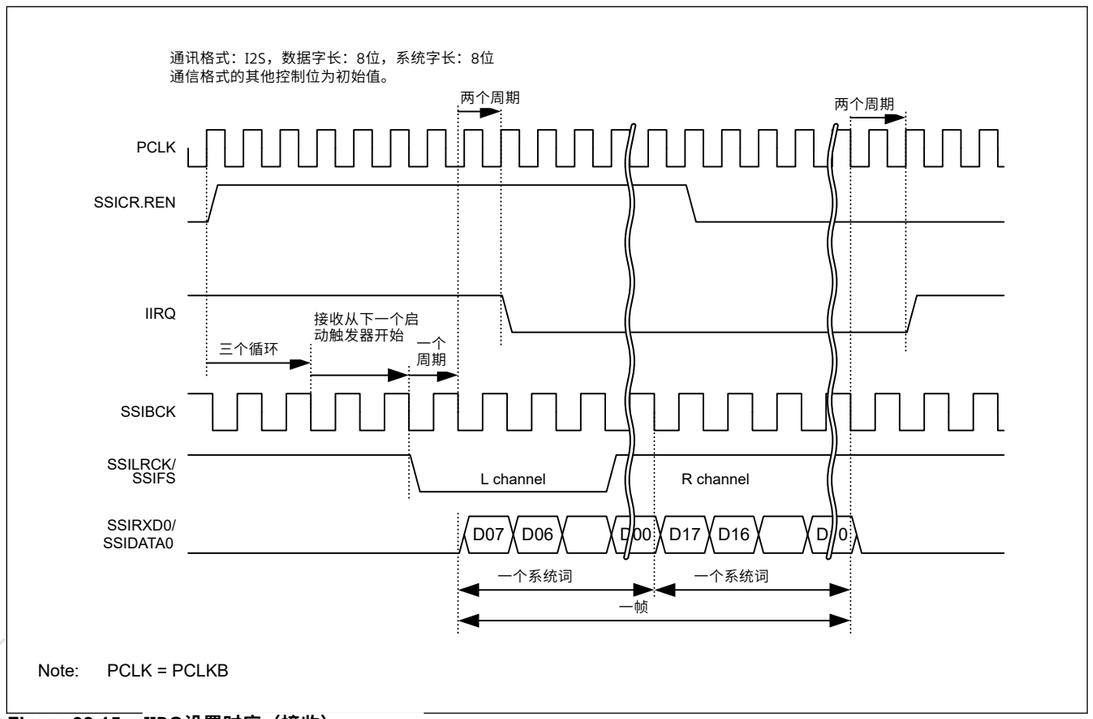

Figure 38.15 IIRQ设置时序（接收）

●接收器（接收专用）

[Clearing condition]

在启用接收时（SSICR.TEN=0和SSICR.REN=01，由SSILRCKSSIFS信号生成启动触发信号。

[Clearing timing]

1个SSIBCK周期+2个PCLKB周期在产生作为清除条件的启动触发之后。

[Setting condition]

当发送和接收被禁用时（SSICR.TEN=0和SSICR.REN=0），一帧的接收完成。

[Setting timing]

在作为设置条件的接收结束（在帧边界）之后的2个PCLKB周期。

●收发器（发送和接收）

[Clearing condition]

在使能发送和接收时（SSICR.TEN=1和SSICR.REN=1），发送帧的发送数据被写入SSIFTDR寄存器，并由SSILRCKSSIFS信号生成开始触发。

[Clearing timing]

1个SSIBCK周期+2个PCLKB周期在产生作为清除条件的启动触发之后。

[Setting condition]

当发送和接收被禁用时（SSICR.TEN=0和SSICR.REN=0），一帧的发送完成。

[Setting timing]

在作为设置条件的传输结束后（在帧边界处）的2个PCLKB周期。

ROIRQ flag (Receive Overflow Error Status Flag)

The ROIRQ flag is a status flag that indicates a receive overflow error. This flags is set by automatic determination but it must be cleared by register access. This flag indicates that received data is supplied at a higher rate than requested. Data is not transferred from the receive shift register to SSIFRDR where a receive overflow error is generated. For the procedure to recover from the overflow error, see section 38.8.6. Error Handling. This flag is not cleared by a receive FIFO data register reset (SSIFCR.RFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit*2
2. Enabling communication (changing SSICR.REN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition:

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 38.19)
2. 1 PCLKB cycle after writing 1 to SSICR.REN.*3

[Setting condition]
At completion of receiving new data while SSIFRDR is full.

[Setting timing]
3 cycles of PCLKB after reception is completed.

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.REN.

Note 3. After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

ROIRQ标志（接收溢出错误状态标志）

ROIRQ标志是指示接收溢出错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表示接收到的数据以高于请求的速率提供。数据不会从接收移位寄存器传送到产生接收溢出错误的SSIFRDR。有关从溢出错误中恢复的过程，请参阅第38.8.6节。错误处理。该标志不会被接收FIFO数据寄存器复位(SSIFCR.RFRST)清除。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

完成以下任一操作时：

1.从该位读取1后向该位写入0*2

2.启用通信（将SSICR.REN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机：

1.当从该位读取1后向该位写入0时（与图38.19中的时序相同）

2.向SSICR.REN写入1后的1个PCLKB周期。*3

[设置条件]在SSIFRDR已满时完成接收新数据时。

[设置时序]接收完成后的3个PCLKB周期。

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。

注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：●软件复位(SSIFCR.SSIRST=1)完成。●读1后，写0完成。●在向SSICR.REN写入1之后经过1个PCLKB周期。

注3.使能通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

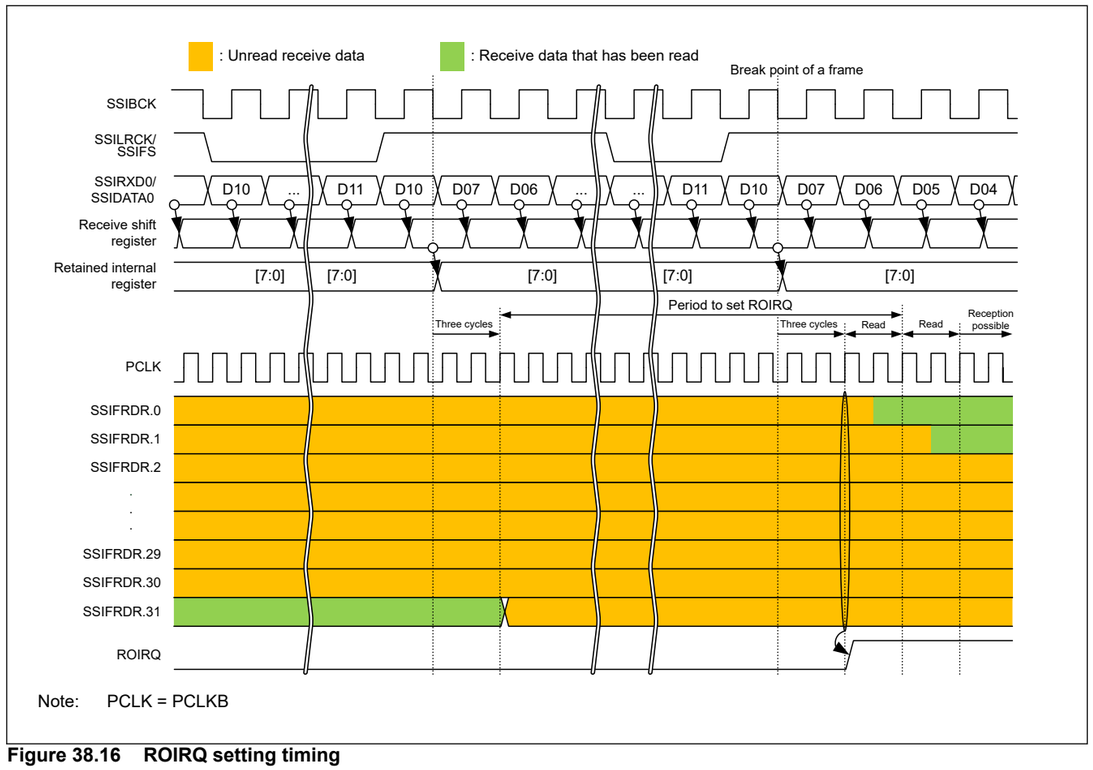

Figure 38.16 ROIRQ setting timing

RUIRQ flag (Receive Underflow Error Status Flag)

The RUIRQ flag is a status flag that indicates a receive underflow error. This flags is set by automatic determination but it must be cleared by register access. This flag indicates that SSIFRDR is read while it is empty. Data read from SSIFRDR where a receive underflow error is generated is invalid. See section 38.8.6. Error Handling for the error recovery procedure. This flag is not cleared by a receive FIFO data register reset (SSIFCR.RFRST). Note, however, that this flag is not set even if the SSIFRDR register is read while the receive FIFO data register is reset (by setting SSIFCR.RFRST to 1).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit*2
2. Enabling communication (changing SSICR.REN from 0 to 1).

[Clearing timing]
Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 38.19)
2. 1 PCLKB cycle after writing 1 to SSICR.REN.*3

[Setting condition]

Reading from SSIFRDR while it is empty.

[Setting timing]

At completion of reading from SSIFRDR. See Figure 38.17.

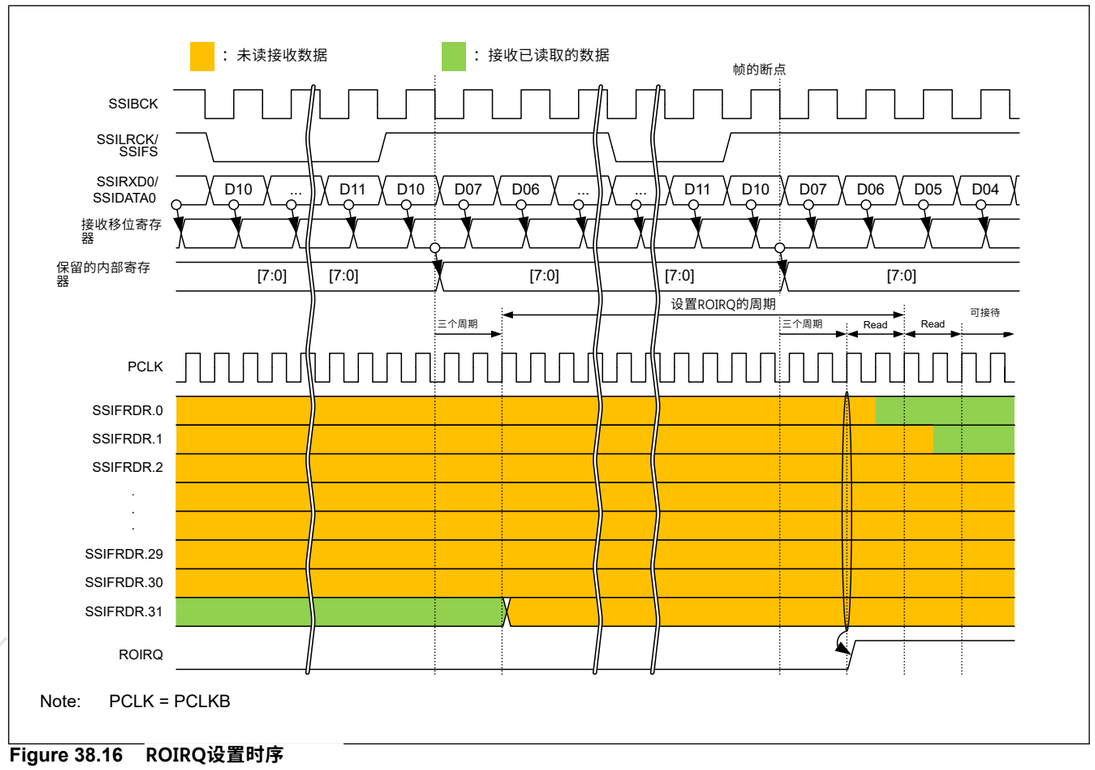

Figure 38.16 ROIRQ设置时序

RUIRQ标志（接收下溢错误状态标志）

RUIRQ标志是指示接收下溢错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。此标志指示SSIFRDR在为空时被读取。从产生接收下溢错误的SSIFRDR读取的数据无效。请参阅第38.8.6节。错误恢复过程的错误处理。该标志不会被接收FIFO数据寄存器复位(SSIFCR.RFRST)清除。但是请注意，即使在接收FIFO数据寄存器复位（通过将SSIFCR.RFRST设置为1）时读取SSIFRDR寄存器，该标志也不会设置。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

完成以下任一操作时：

1.从该位读取1后向该位写入0*2

2.启用通信（将SSICR.REN从0更改为1）。

【清零时机】与上述清零条件对应的清零时机

1.当从该位读取1后向该位写入0时（与图38.19中的时序相同）

2.向SSICR.REN写入1后的1个PCLKB周期。*3

[Setting condition]

在SSIFRDR为空时读取。

[Setting timing]

从SSIFRDR读取完成时。请参见图38.17。

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.REN.

Note 3. After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

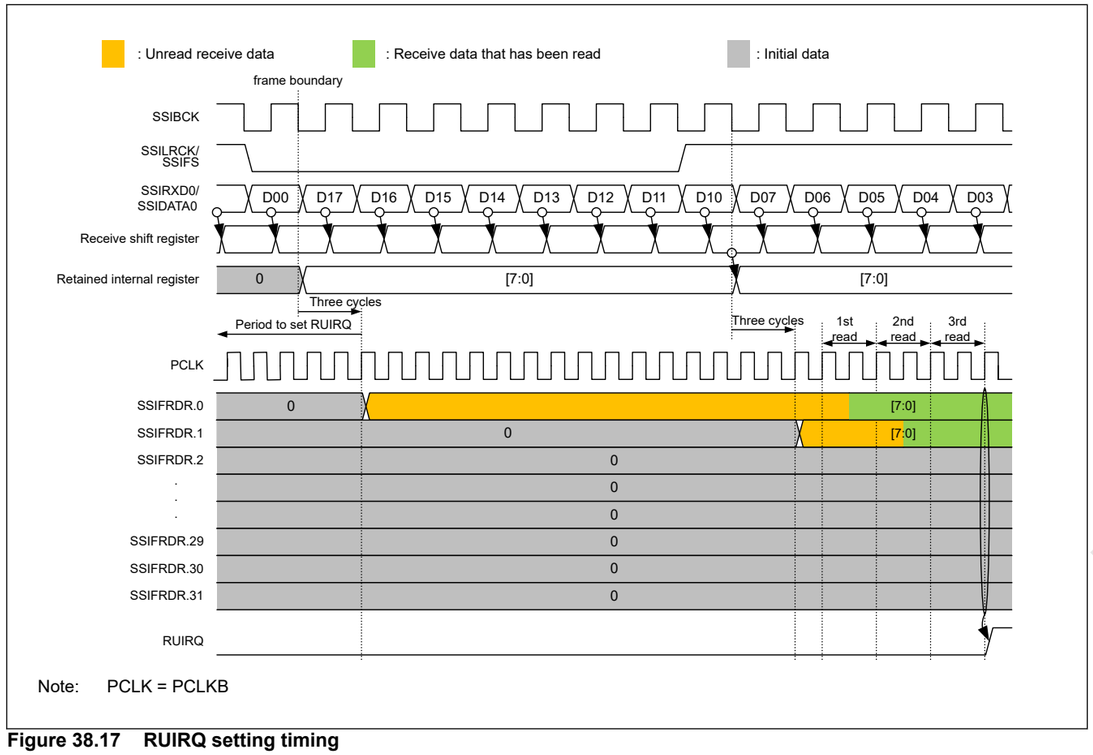

Figure 38.17 RUIRQ setting timing

TOIRQ flag (Transmit Overflow Error Status Flag)

The TOIRQ flag is a status flag that indicates a transmit overflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that an attempt has been made to write data to the SSIFTDR register when the register is full of data. The data writing that causes a transmit overflow is ignored. For the procedure to recover from the overflow error, see section 38.8.6. Error Handling. This flag is not cleared by a transmit FIFO data register reset (SSIFCR.TFRST).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

1. Writing 0 to this bit after reading 1 from this bit*2
2. Enabling communication (changing SSICR.TEN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。

注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：●
完成软件复位(SSIFCR.SSIRST=1)。
- 读取1后，写入0完成。
- 在将1写入SSICR.REN后经过1个PCLKB周期。

注3.使能通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

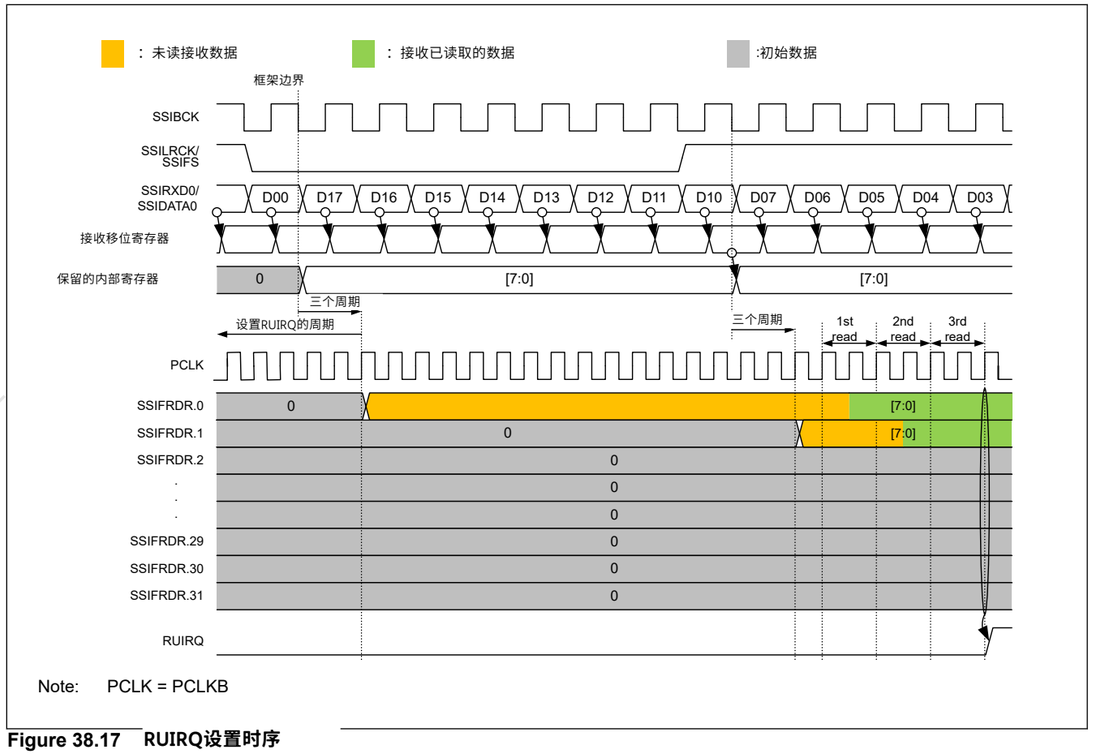

Figure 38.17 RUIRQ设置时序

TOIRQ标志（发送溢出错误状态标志）

TOIRQ标志是指示发送溢出错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表明当寄存器已满时尝试将数据写入SSIFTDR寄存器。导致发送溢出的数据写入将被忽略。有关从溢出错误中恢复的过程，请参阅第38.8.6节。错误处理。该标志不会被发送FIFO数据寄存器复位(SSIFCR.TFRST)清除。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

完成以下任一操作时：

1.从该位读取1后向该位写入0*2

2.启用通信（将SSICR.TEN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机

RA生态工作室

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 38.19)
2. 1 PCLKB cycle after writing 1 to SSICR.TEN.*3

[Setting condition]

An attempt was made to write data to the SSIFTDR register when the register is full of data.

[Setting timing]

At completion of writing to SSIFTDR. For details, see Figure 38.18.

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.TEN.

Note 3. After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

1.当从该位读取1后向该位写入0时（与图38.19中的时序相同）

2.向SSICR.TEN写入1后的1个PCLKB周期。*3

[Setting condition]

当寄存器已满时，尝试将数据写入SSIFTDR寄存器。

[Setting timing]

完成对SSIFTDR的写入。详见图38.18。

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。

注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：●软件复位(SSIFCR.SSIRST=1)完成。●读1后，写0完成。●在向SSICR.TEN写入1后经过1个PCLKB周期。

注3.使能通信后（通过将SSICR.TEN位的值从0更改为1），传输错误标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

RA生态工作室

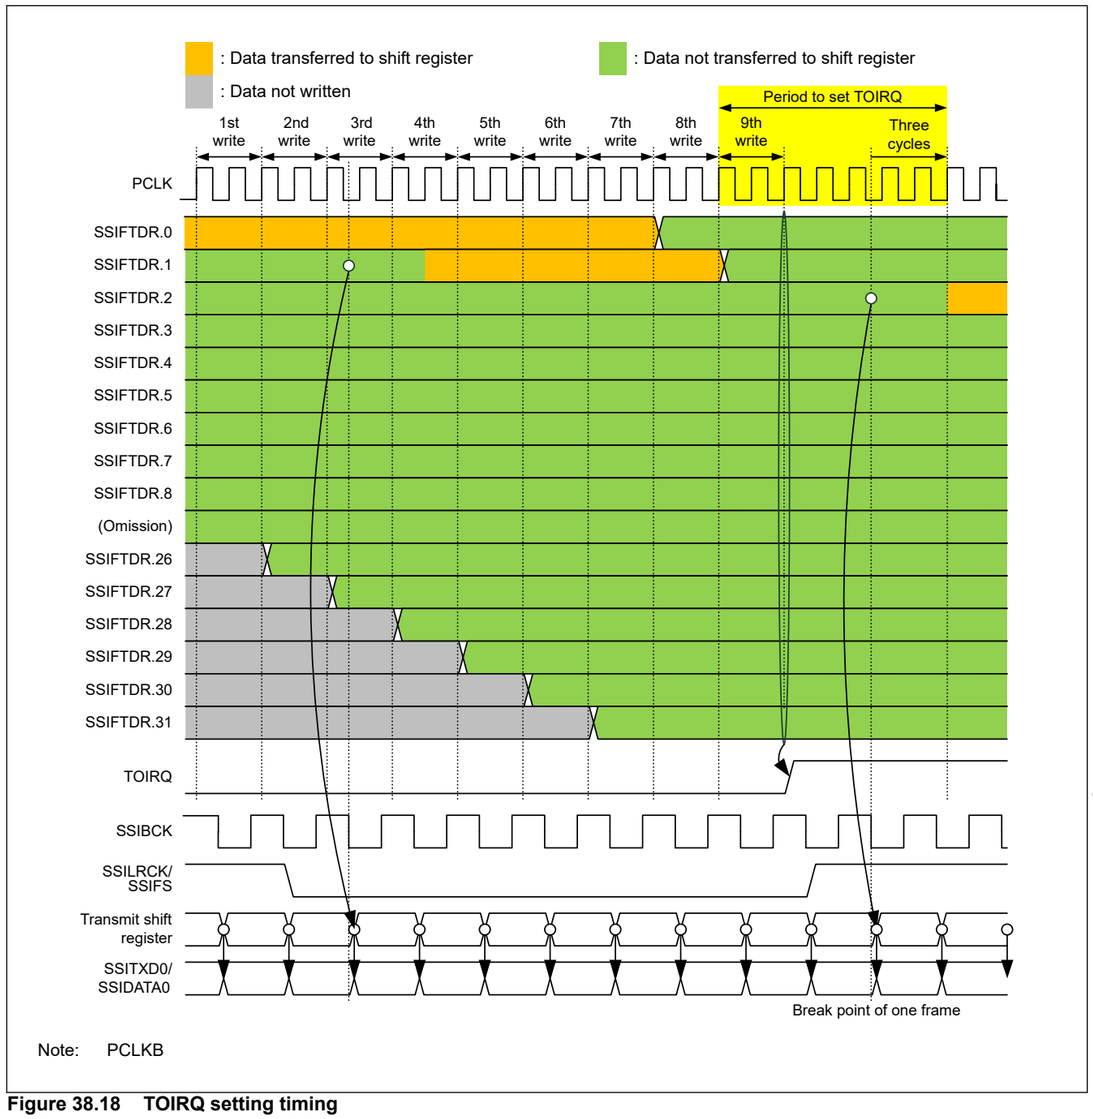

Figure 38.18 TOIRQ setting timing

TUIRQ flag (Transmit Underflow Error Status flag)

The TUIRQ flag is a status flag that indicates a transmit underflow error. This flag is set by automatic determination but it must be cleared by register access. This flag indicates that writing the serial data required for a frame to SSIFTDR did not catch up with transmission of the frame. Even if this flag is cleared after it has been set, the SSITXD0/SSIDATA0 output remains to be 0. To output the data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA0 pin, follow the communication stop procedure in Figure 38.56 and error-handling procedure in Figure 38.57. For the procedure to recover from an error, see section 38.8.6. Error Handling. This flag is not cleared by a reset of transmit FIFO data register (by the SSIFCR.TFRST signal).

[Priority order for setting and clearing]

Setting is prioritized.*1

[Clearing condition]

When either of the following operations is done:

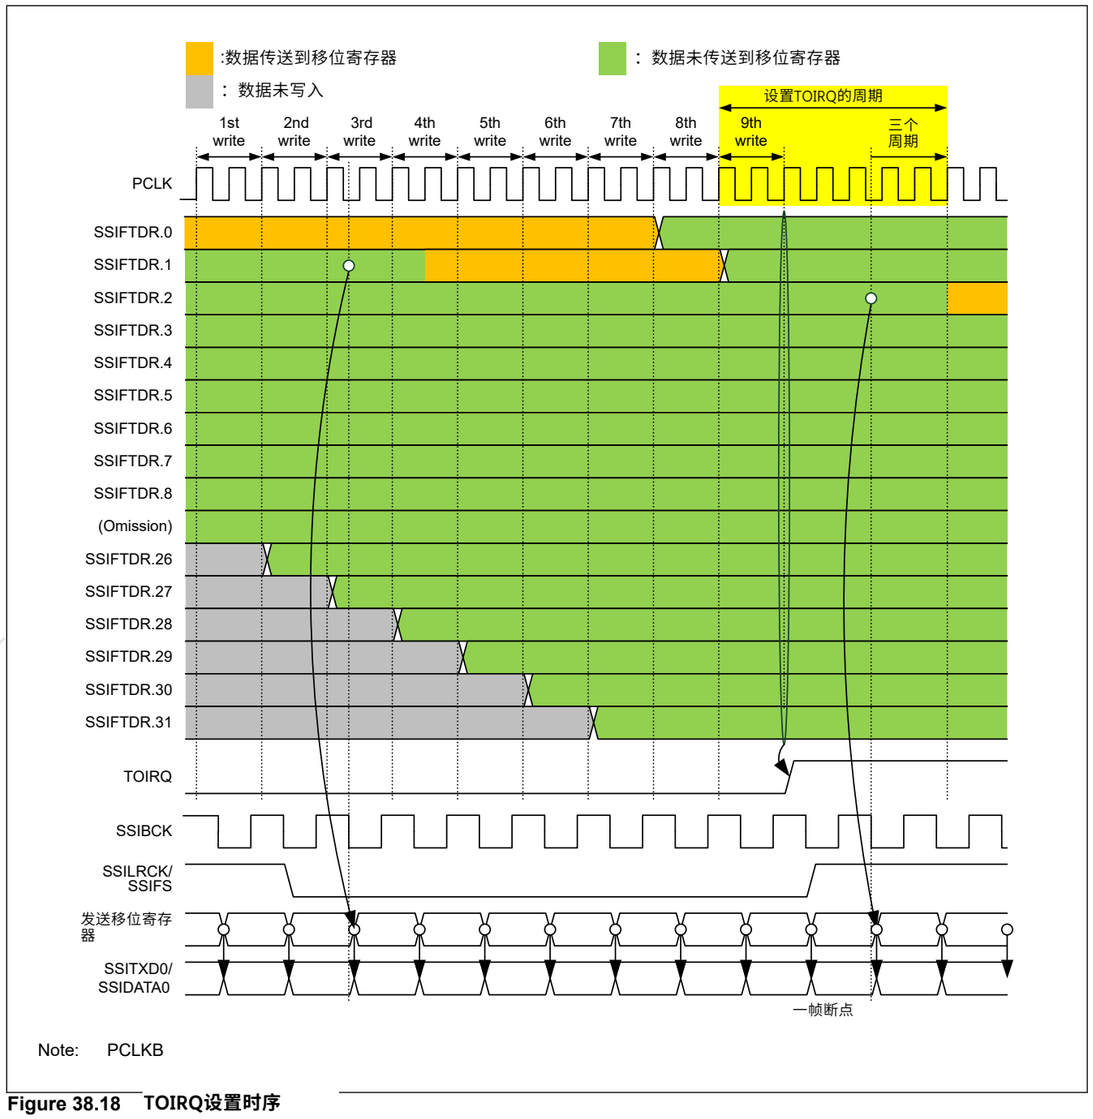

Figure 38.18 TOIRQ设置时序

TUIRQ标志（发送下溢错误状态标志）

TUIRQ标志是指示发送下溢错误的状态标志。该标志由自动确定设置，但必须通过寄存器访问清除。该标志表示将帧所需的串行数据写入SSIFTDR没有赶上帧的传输。即使该标志在设置后被清除，SSITXD0SSIDATA0输出仍保持为0。要将写入发送FIFO数据寄存器(SSIFTDR)的数据输出到SSITXD0SSIDATA0引脚，请遵循图38.56中的通信停止程序并图38.57中的错误处理过程。有关从错误中恢复的过程，请参阅第38.8.6节。错误处理。该标志不会通过发送FIFO数据寄存器的复位（通过SSIFCR.TFRST信号）清除。

[设置和清除的优先顺序]

设置优先。*1

[Clearing condition]

完成以下任一操作时：

1. Writing 0 to this bit after reading 1 from this bit*2
2. Enabling communication (changing SSICR.TEN from 0 to 1).

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit
2. 1 PCLKB cycle after writing 1 to SSICR.TEN.*3

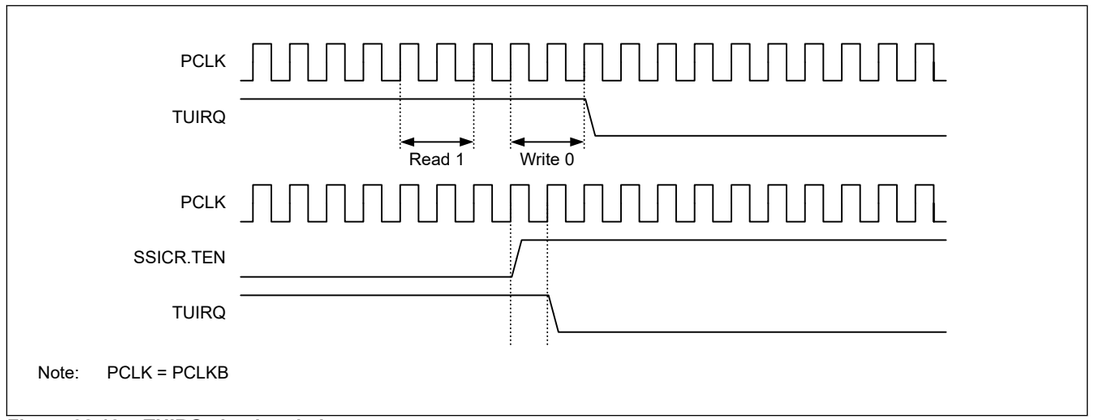

Figure 38.19 TUIRQ clearing timing

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1). The software reset has priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following three conditions is met:
- A software reset (SSIFCR.SSIRST = 1) is done.
- After 1 has been read, writing of 0 is complete.
- 1 PCLKB cycle passes after 1 has been written to SSICR.TEN.

Note 3. After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

[Setting condition]

When communication continues over a frame boundary, the transmit data required for the next frame has not been written to SSIFTDR. For details, see Figure 38.20 and Figure 38.21.

[Setting timing]

3 PCLKB cycles after the frame boundary. For details, see Figure 38.20.

1.从该位读取1后向该位写入0*2

2.启用通信（将SSICR.TEN从0更改为1）。

[Clearing timing]

与上述清零条件对应的清零时机

1.从该位读取1后向该位写入0

2.向SSICR.TEN写入1后的1个PCLKB周期。*3

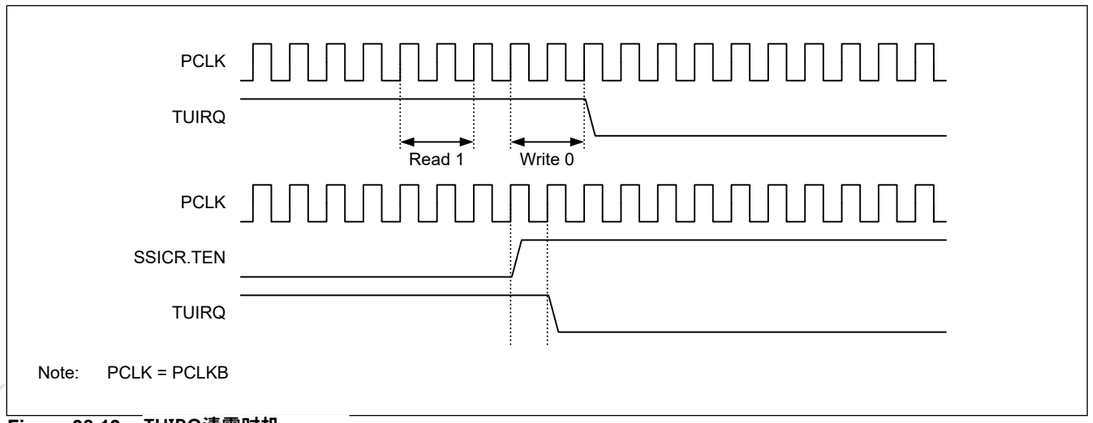

Figure 38.19 TUIRQ清零时机

注1.该位通过软件复位(SSIFCR.SSIRST=1)清零。软件复位优先于上述所有清除条件。

注2.从该位读取1后，当满足以下三个条件之一时，该位被清除：●
- 完成软件复位(SSIFCR.SSIRST=1)。
- 读取1后，写入0完成。
- 在将1写入SSICR.TEN之后经过1个PCLKB周期。

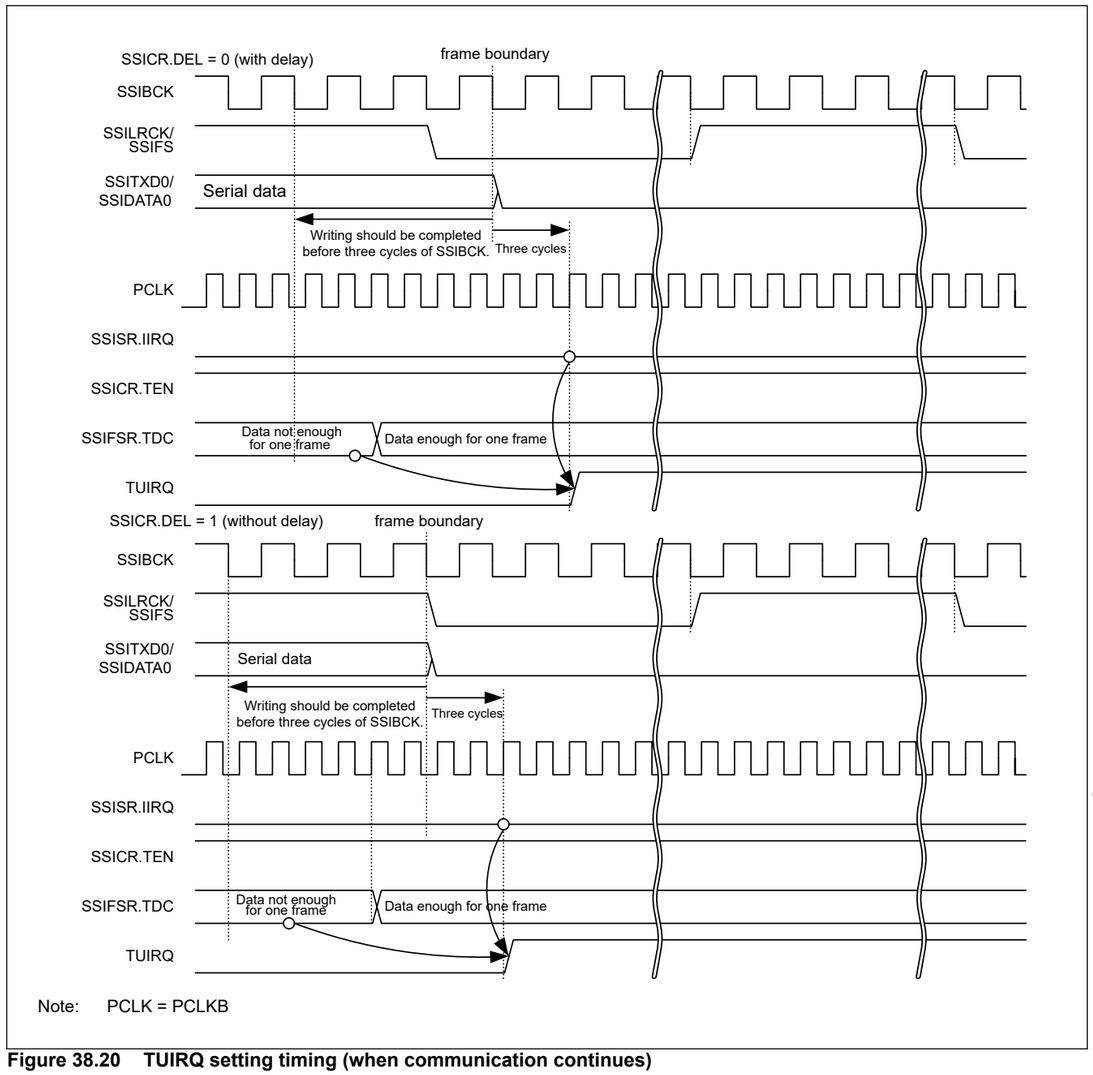
注3.使能通信后（通过将SSICR.TEN位的值从0更改为1），传输错误标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

[Setting condition]

当通信继续通过帧边界时，下一帧所需的传输数据尚未写入SSIFTDR。详见图38.20和图38.21。

[Setting timing]

帧边界后3个PCLKB周期。详见图38.20。



Note: PCLK = PCLKB

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	BSW	—	—	—	—	—	—	—	TIE	RIE	TFRST	RFRST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RFRST	Receive FIFO Data Register Reset*1 0: Clears a receive data FIFO reset condition 1: Sets a receive data FIFO reset condition	R/W
1	TFRST	Transmit FIFO Data Register Reset*1 0: Clears a transmit data FIFO reset condition 1: Sets a transmit data FIFO reset condition	R/W
2	RIE	Receive Data Full Interrupt Output Enable 0: Disables receive data full interrupts 1: Enables receive data full interrupts	R/W
3	TIE	Transmit Data Empty Interrupt Output Enable 0: Disables transmit data empty interrupts 1: Enables transmit data empty interrupts	R/W
10:4	—	These bits are read as 0. The write value should be 0.	R/W
11	BSW	Byte Swap Enable*1 0: Disables byte swap 1: Enables byte swap	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W
16	SSIRST	Software Reset 0: Clears a software reset condition 1: Sets a software reset condition	R/W
30:17	—	These bits are read as 0. The write value should be 0.	R/W
31	AUCKE	AUDIO_MCK Enable in Mastermode Communication*1 0: Disables supply of AUDIO_MCK 1: Enables supply of AUDIO_MCK	R/W

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If the value of these bits is changed by rewriting, subsequent operation is unpredictable.

This register sets a software reset, byte swap, and enable/disable of interrupt requests.

RFRST bit (Receive FIFO Data Register Reset)

The RFRST bit sets a software reset of the receive FIFO data register (SSIFRDR). Writing 1 to this bit initializes the internal state related to SSIFRDR. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 38.5. Because this bit is not automatically cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

This bit is subject to the software reset by the SSIRST bit. Because the software reset by the SSIRST bit has priority over the reset by this bit, setting this bit is ignored when the SSIRST bit is set.

38.4.3 SSIFCR:FIFO控制寄存器

Base address: SSIE0 = 0x4009_D000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

注1.禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果这些位的值通过重写而改变，后续的操作是不可预知的。

该寄存器设置软件复位、字节交换和中断请求的启用禁用。

RFRST位（接收FIFO数据寄存器复位）

RFRST位设置接收FIFO数据寄存器(SSIFRDR)的软件复位。向该位写入1初始化与SSIFRDR相关的内部状态。受该位触发的软件复位的寄存器位在表38.5中用阴影表示。由于该位在被设置后不会自动清零，因此向该位写入0以从软件复位中释放寄存器位。向该位写入0后，请务必在开始下一个程序步骤之前检查该位是否为0。

该位受SSIRST位软件复位的影响。由于SSIRST位的软件复位优先于该位的复位，所以当SSIRST位置位时，该位的设置将被忽略。

TFRST bit (Transmit FIFO Data Register Reset)

The TFRST bit sets a software reset of the transmit FIFO data register (SSIFTDR). Writing 1 to this bit initializes the internal state related to SSIFTDR. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 38.6. Because this bit is not automatically cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

This bit is subject to the software reset by the SSIRST bit. Because the software reset by the SSIRST bit has priority over the reset by this bit, setting this bit is ignored when the SSIRST bit is set.

RIE bit (Receive Data Full Interrupt Output Enable)

The RIE bit enables/disables output of receive data full interrupts. Use a receive data full interrupt as an interrupt to trigger data reading from the receive FIFO data register. Write 1 to this bit after specifying the setting condition for receive data full interrupt (by using the SSISCR.RDFS bit). Figure 38.22 shows the timing of generating the receive data full interrupt.

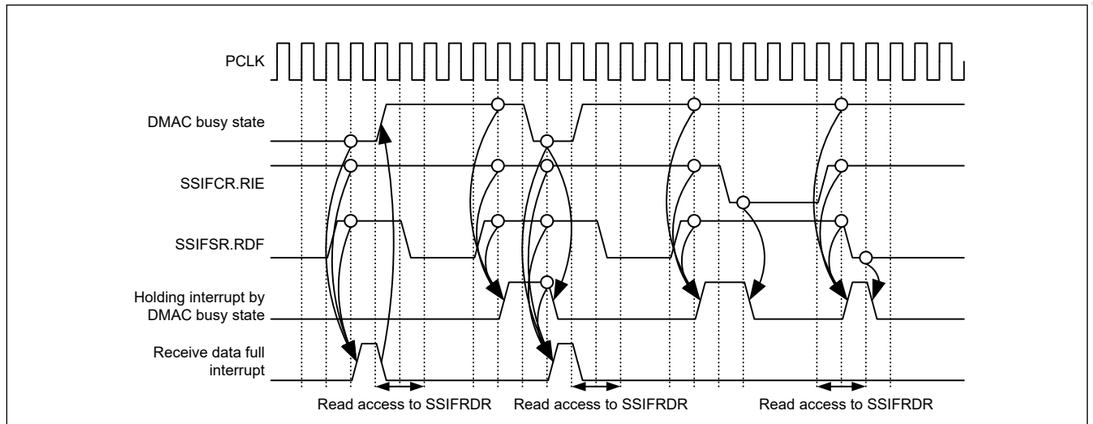

Figure 38.22 Timing of receive data full interrupt

TIE bit (Transmit Data Empty Interrupt Output Enable)

The TIE bit enables/disables output of transmit data empty interrupts. Use a transmit data empty interrupt as an interrupt to trigger data writing to the transmit FIFO data register. Write 1 to this bit after specifying the setting condition for transmit data empty interrupt (by using the SSISCR.TDES bit). Figure 38.23 shows the timing of generating the transmit data empty interrupt.

		+2	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				

RIE位（接收数据满中断输出使能）

RIE位启用禁用接收数据完整中断的输出。使用接收数据满中断作为中断来触发从接收FIFO数据寄存器读取数据。指定接收数据满中断的设置条件后（通过使用SISSCR.RDFS位）向该位写入1。图38.22显示了产生接收数据满中断的时序。

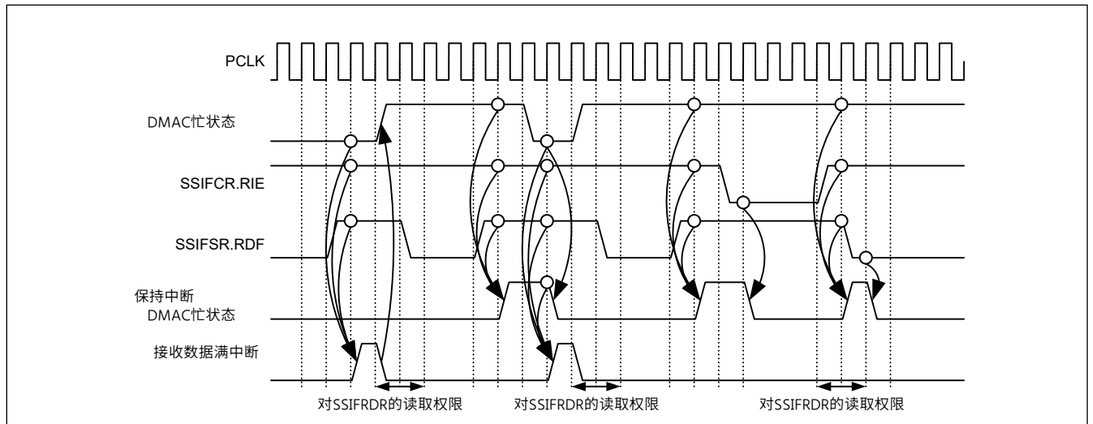

Figure 38.22 接收数据满中断的时序

TIE位（发送数据空中断输出使能）

TIE位使能禁用发送数据空中断的输出。使用发送数据空中断作为中断来触发数据写入发送FIFO数据寄存器。在指定发送数据空中断的设置条件后（通过使用SISSCR.TDES位）向该位写入1。图38.23显示了产生发送数据空中断的时序。

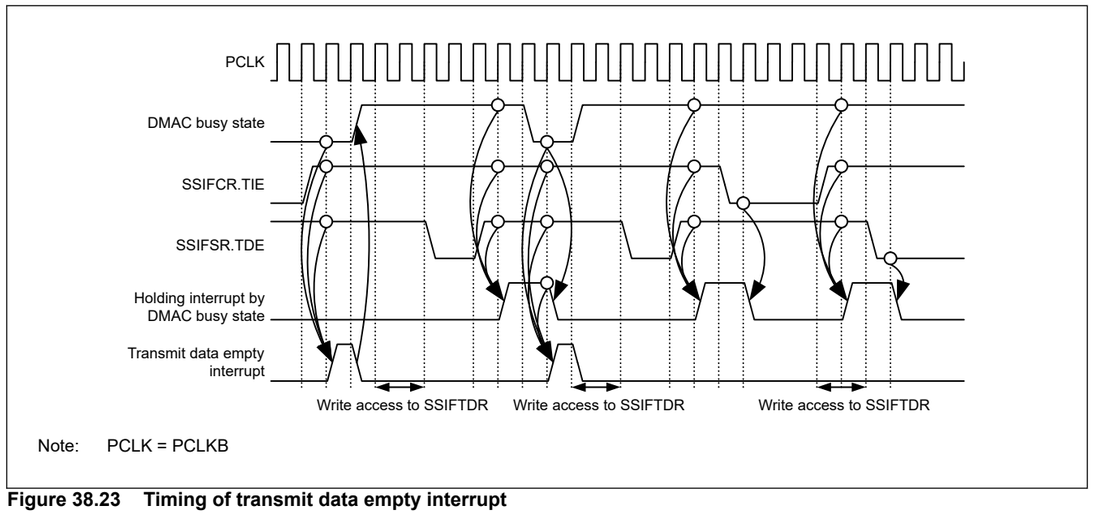

Figure 38.23 Timing of transmit data empty interrupt

BSW bit (Byte Swap Enable)

The BSW bit enables/disables byte swap of register access for the transmit FIFO data register (SSIFTDR) and the receive FIFO data register (SSIFRDR). This bit is valid only with 16-bit access or 32-bit access to SSIFTDR and SSIFRDR. For details, see Figure 38.24.

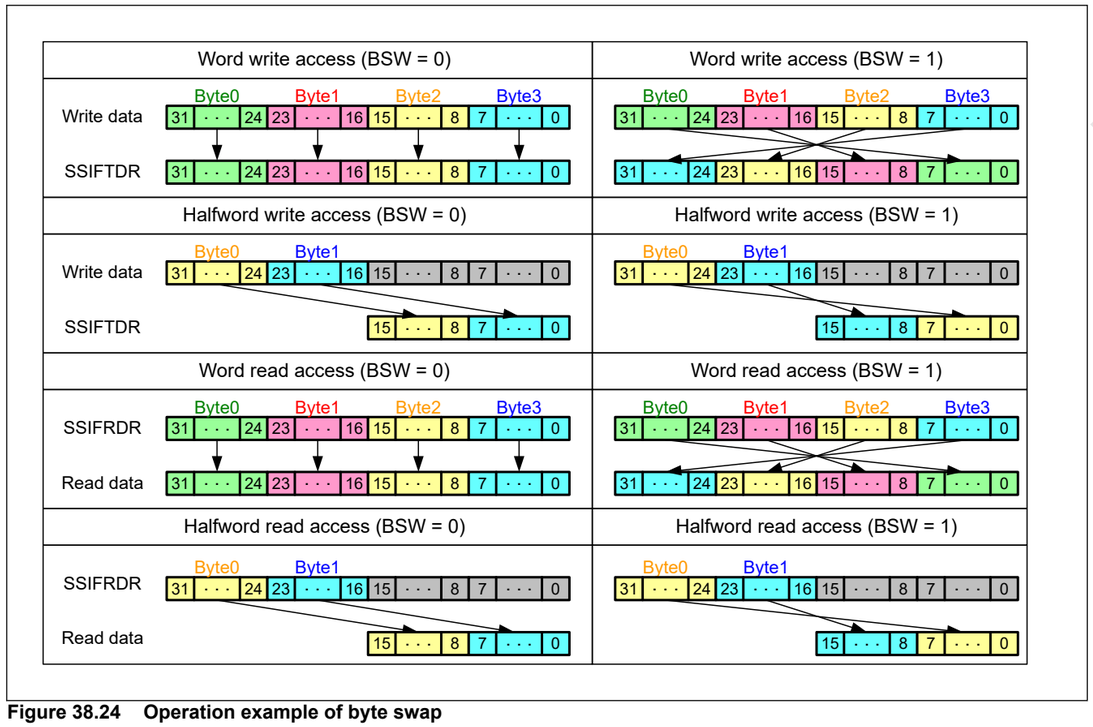

Figure 38.24 Operation example of byte swap

SSIRST bit (Software Reset)

The SSIRST bit sets a software reset of SSIE. Writing 1 to this bit initializes the internal state of SSIE. The register bits subject to the software reset triggered by this bit are indicated by shading in Table 38.7. Because this bit is not automatically

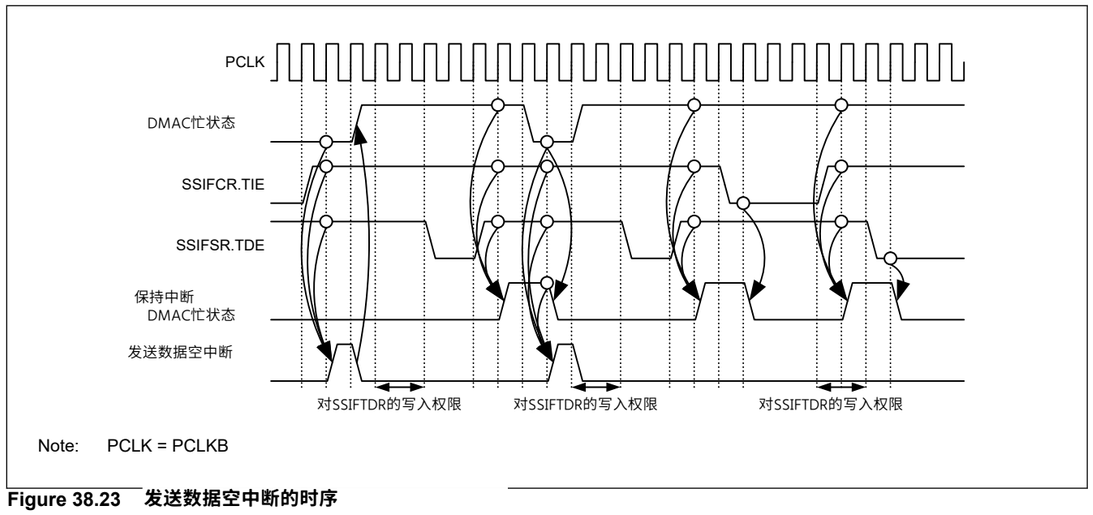

Figure 38.23 发送数据空中断的时序

BSW位（字节交换使能）

BSW位启用禁用发送FIFO数据寄存器(SSIFTDR)和接收FIFO数据寄存器(SSIFRDR)的寄存器访问字节交换。该位仅对SSIFTDR和SSIFRDR的16位访问或32位访问有效。详见图38.24。

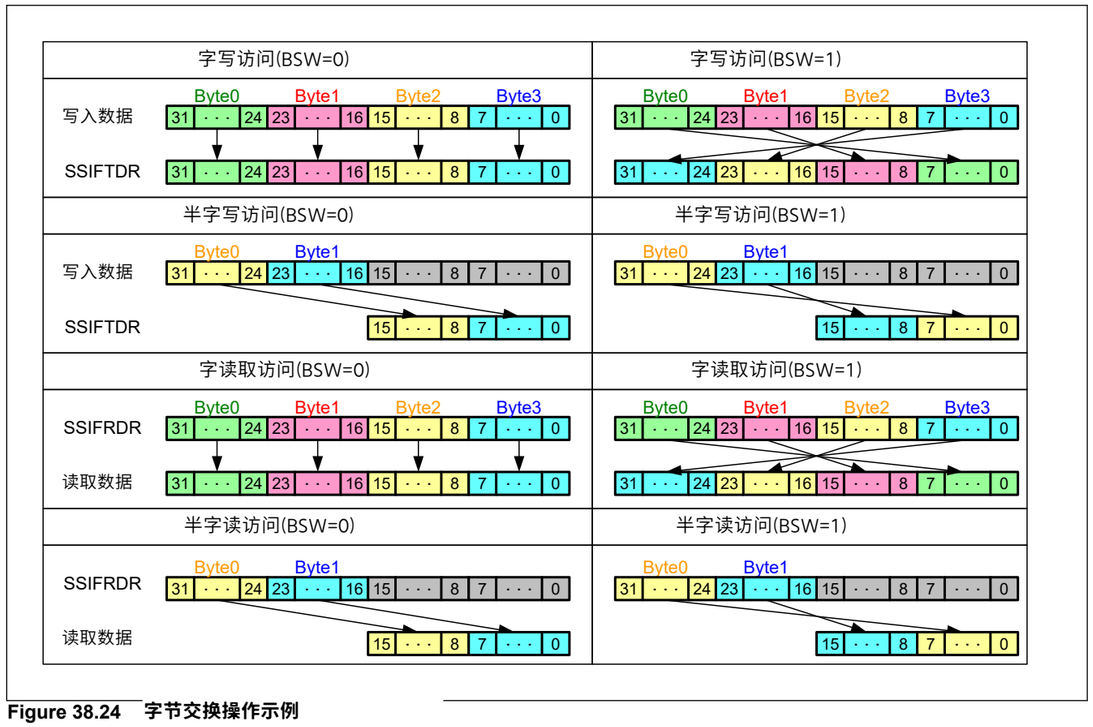

Figure 38.24 字节交换操作示例

SSIRST bit (Software Reset)

SSIRST位设置SSIE的软件复位。向该位写入1初始化SSIE的内部状态。受该位触发的软件复位的寄存器位在表38.7中用阴影表示。因为这个位不是自动的

cleared after it has been set, write 0 to this bit to release the register bits from the software reset. After writing 0 to this bit, be sure to check that this bit is 0 before starting the next procedural step.

To stop communication of SSIE immediately, after turning off the peripheral functions, write 1 to this bit. Initialization by a software reset is performed without any relation with the bit clock.

AUCKE bit (AUDIO_MCK Enable in Mastermode Communication)

The AUCKE bit enables/disables supply to AUDIO_MCK while in master-mode communication (MST = 1).

Changing the value of this bit must be performed only after specifying the settings related to AUDIO_MCK (by using the CKS, MST, BCKP, and CKDV bits in the SSICR register).

置位后清零，向该位写入0以从软件复位中释放寄存器位。向该位写入0后，请务必在开始下一个程序步骤之前检查该位是否为0。

要立即停止SSIE通信，请在关闭外围功能后，向该位写入1。通过软件复位进行的初始化与位时钟没有任何关系。

AUCKE位（在主模式通信中启用AUDIO_MCK）

在主模式通信(MST=1)时，AUCKE位启用禁用对AUDIO_MCK的供电。

只有在指定与AUDIO_MCK相关的设置后才能更改该位的值（通过使用SSICR寄存器中的CKS、MST、BCKP和CKDV位）。

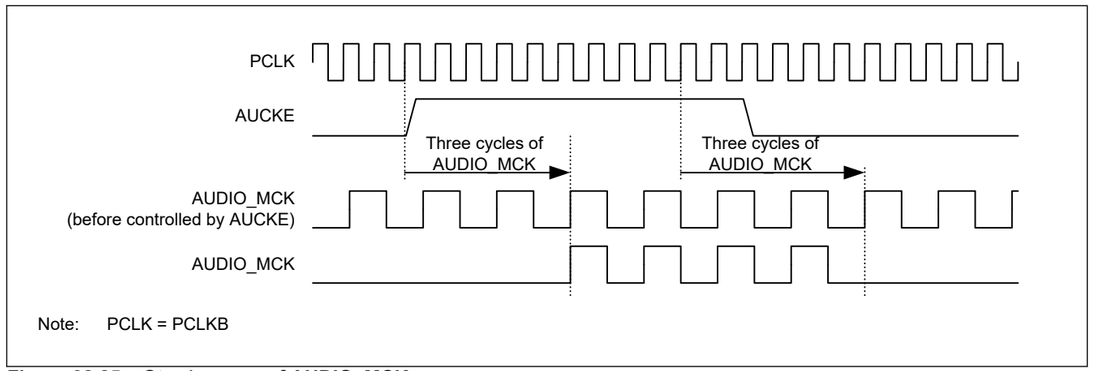

Figure 38.25 Stop/resume of AUDIO_MCK

Note: In slave-mode communication (SSICR.MST = 0), SSIE needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIE is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIE becomes idle, take the procedure to start communication in Figure 38.52 or wait for an idle state by taking the procedure to resume communication in Figure 38.58.

In master-mode communication (SSICR.MST = 1), SSIE operates with the audio clock (AUDIO_MCK). To stop SSIE completely, make sure that SSIE is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE. If 0 is written to SSIFCR.ADCKE before SSIE becomes idle, take the procedure to start communication in Figure 38.52.

Figure 38.26 and Figure 38.27 show the timings of signal operation in the period from setting this bit to 1 to the output to the SSIBCK pin.

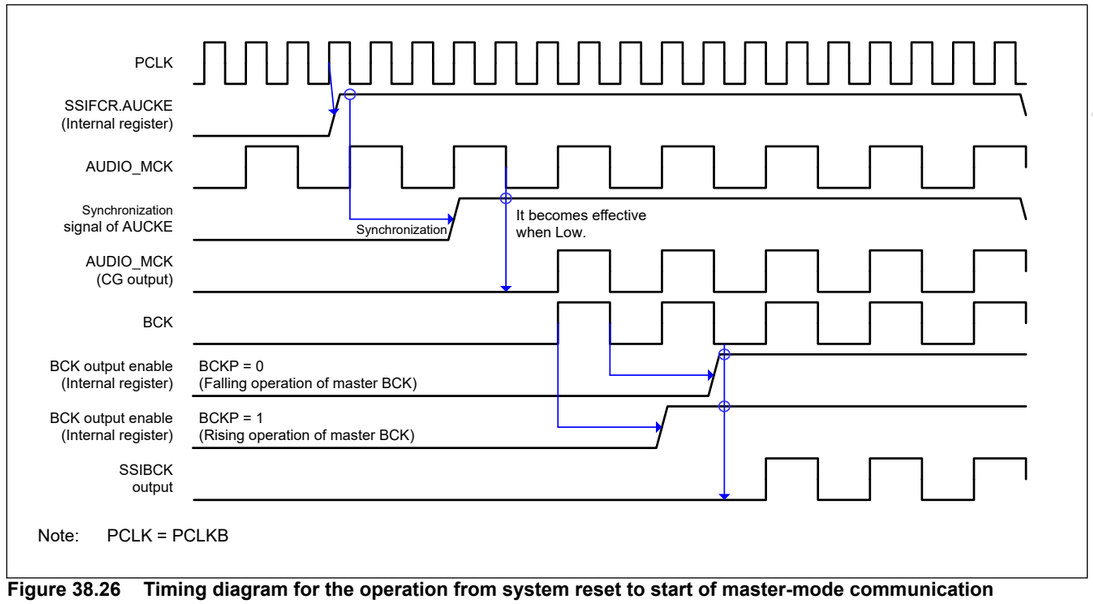

Figure 38.26 Timing diagram for the operation from system reset to start of master-mode communication

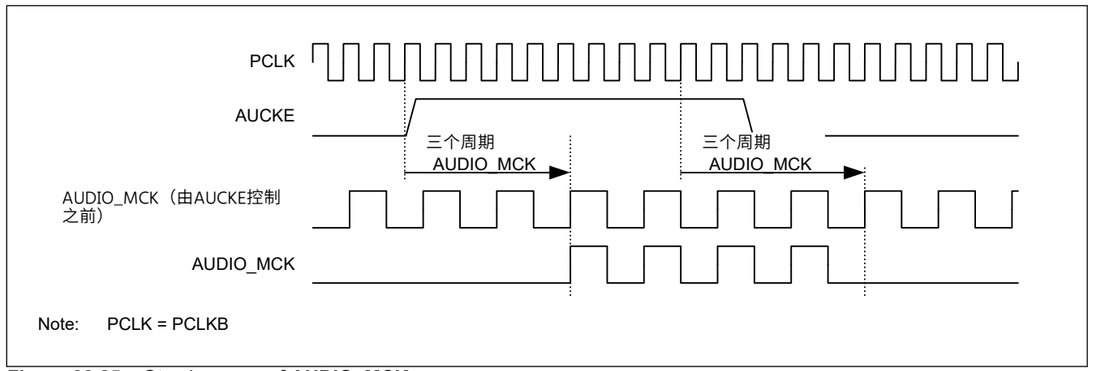

Figure 38.25 Stop/resume of AUDIO_MCK

Note: 在从模式通信(SSICR.MST=0)中，SSIE需要提供SSIBCK。要在主设备端停止BCK，请确保SSIE处于空闲状态(SSISR.IIRQ=1)。如果BCK在SSIE变为空闲之前停止，则按照图38.52中的程序开始通信，或者按照图38.58中的程序恢复通信等待空闲状态。

在主模式通信(SSICR.MST=1)中，SSIE使用音频时钟(AUDIO_MCK)运行。要完全停止SSIE，请确保SSIE处于空闲状态(SSISR.IIRQ=1)，然后将0写入SSIFCR.ADCKE。如果在SSIE空闲之前将0写入SSIFCR.ADCKE，则按照图38.52中的过程开始通信。

图38.26和图38.27显示了从将该位设置为1到输出到SSIBCK引脚期间的信号操作时序。

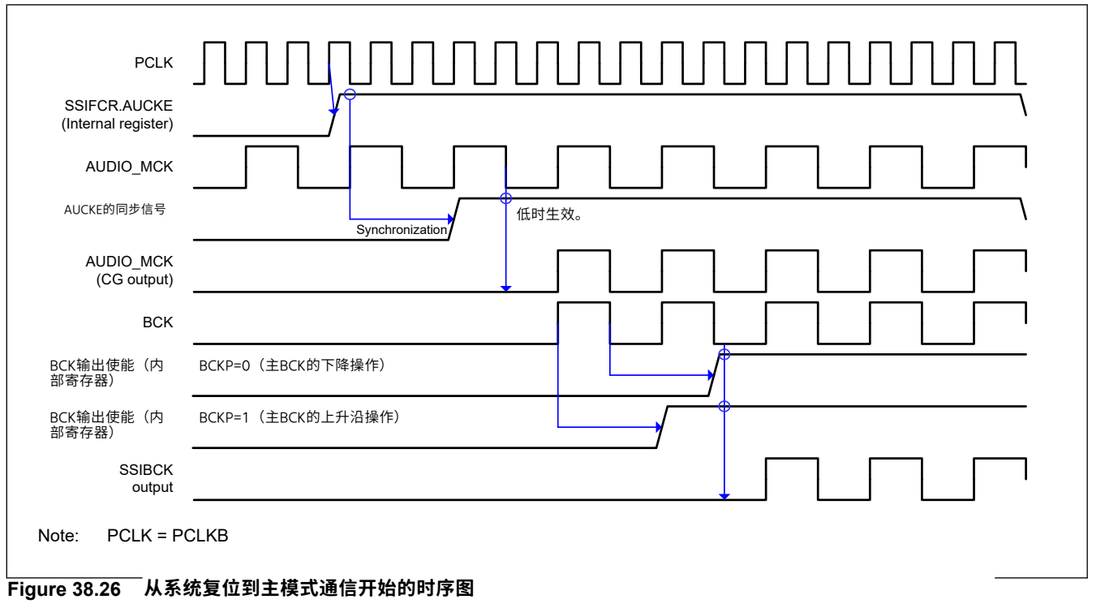

Figure 38.26 从系统复位到主模式通信开始的时序图

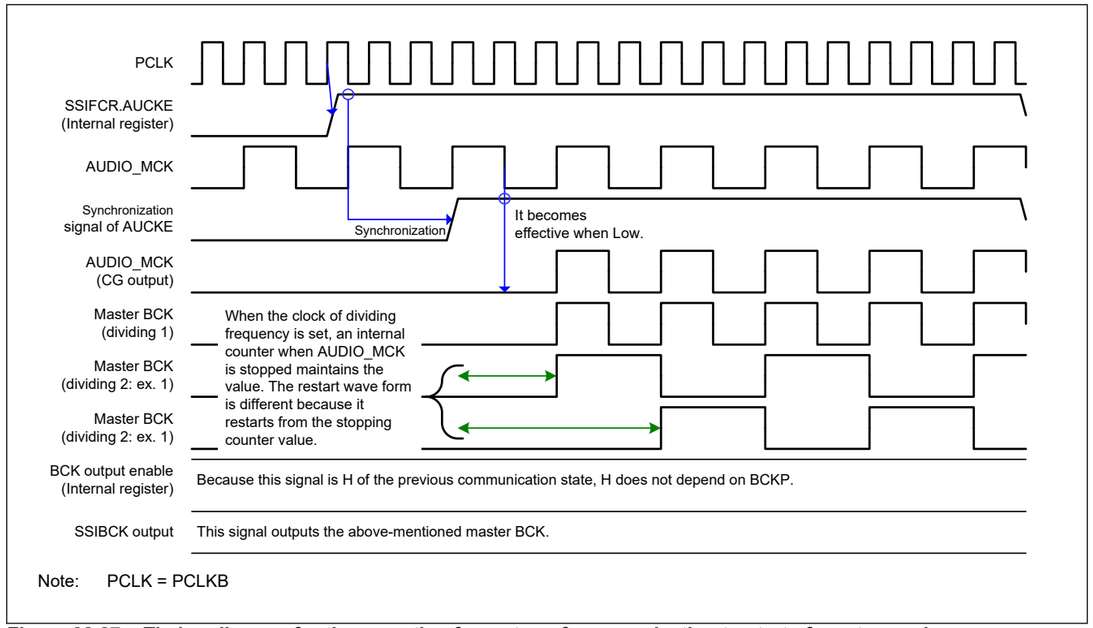

Figure 38.27 Timing diagram for the operation from stop of communication to start of master-mode communication

Note: If the supply of AUDIO_MCK stops, the value of the SSIBCK pin is held. Therefore, the SSIBCK signal might stop in the H (high level) state.

This register is configured with status flags that indicate the status of the transmit FIFO data register and the receive FIFO data register.

RDF flag (Receive Data Full Flag)

The RDF flag indicates that the receive FIFO data register (SSIFRDR) has unread received data not less than the amount set with the SSISCR.RDFS bit plus one. This flag is set by automatic determination but it must be cleared by register access.

[Priority order for setting and clearing]

Clearing is prioritized.

[Clearing condition]

Either of the following two:*1

1. Writing 0 to this bit after reading 1 from this bit (CPU operation)*2
2. Last access (DTC/DMAC operation) to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 38.19)
2. After the PCLKB cycle in which the last access instruction is issued to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

[Setting condition]

SSIFTDR has free space not less than the amount set with the SSIFCR.TTRG bit plus one.

[Setting timing]

At completion of transfer from the shift register that results in SSIFRDR having data not less than the amount set with the SSISCR.RDFS bit plus one.

Note 1. These bits are cleared by a software reset (SSIFCR.SSIRST = 1) and receive FIFO data register reset (SSIFCR.RFRST = 1). Reset conditions available for these bits are the software reset and receive FIFO data register reset as well as the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following four conditions is met:
- A software reset is done (SSIFCR.SSIRST = 1).
- A receive FIFO data register reset is done (SSIFCR.RFRST = 1).
- After 1 has been read, writing of 0 is complete.
- Last access is performed to read data from SSIFRDR by an interrupt routine using the DTC and DMAC.

Bit	Symbol	Function	R/W
16	TDE	传输数据空标志 0：SSIFTDR的可用空间不大于SSISCR.TDES的值。1：SSIFTDR的可用空间不小于SSISCR.TDES的值加一。	R/W
23:17	—	这些位被读取为0。写入值应为0。	R/W
29:24	TDC[5:0]	发送FIFO数据指示标志数 发送FIFO数据数指示标志	R
31:30	—	这些位被读取为0。写入值应为0。	R/W

该寄存器配置有状态标志，指示发送FIFO数据寄存器和接收FIFO数据寄存器的状态。

RDF标志（接收数据满标志）

RDF标志表示接收FIFO数据寄存器(SSIFRDR)的未读接收数据不少于SSISCR.RDFS位设置的数量加一。该标志由自动确定设置，但必须通过寄存器访问清除。

[设置和清除的优先顺序]

清算优先。

[Clearing condition]

以下两种之一：*1

1.从该位读取1后向该位写入0（CPU操作）*2

2.最后一次访问（DTCDMAC操作）通过使用DTC和DMAC的中断例程从SSIFRDR读取数据。

[Clearing timing]

与上述清零条件对应的清零时机

1.当从该位读取1后向该位写入0时（与图38.19中的时序相同）

2.在发出最后一个访问指令以通过使用DTC和DMAC的中断例程从SSIFRDR读取数据的PCLKB周期之后。

[Setting condition]

SSIFTDR的可用空间不小于SSIFCR.TTRG位设置的数量加一。

[Setting timing]

在完成从移位寄存器的传输时，导致SSIFRDR的数据不小于用
SISSCR.RDFS位加一。

注1.这些位通过软件复位(SSIFCR.SSIRST=1)和接收FIFO数据寄存器复位清零
（SSIFCR.RFRST=1）。这些位可用的复位条件是软件复位和接收FIFO数据寄存器复位以及上述清除条件。

注2.从该位读取1后，当满足以下四个条件之一时，该位被清除：●软件复位完成(SSIFCR.SSIRST=1)。●完成接收FIFO数据寄存器复位(SSIFCR.RFRST=1)。●读1后，写0完成。●使用DTC和DMAC的中断例程执行最后一次访问以从SSIFRDR读取数据。

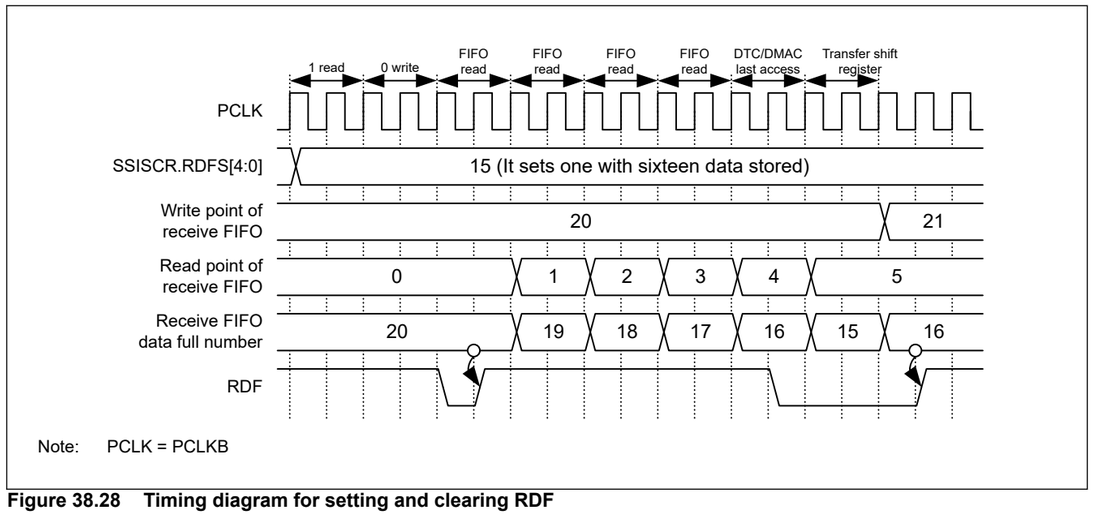

Figure 38.28 Timing diagram for setting and clearing RDF

RDC[5:0] flags (Number of Receive FIFO Data Indication Flag)

The RDC[5:0] flags indicate the number of valid data that are stored in the receive FIFO data register (SSIFRDR). With this flag as 0x00, there is no received data. With 0x20, the register is filled with received data and there is no free space.

TDE flag (Transmit Data Empty Flag)

The TDE flag indicates that the transmit FIFO data register (SSIFTDR) has free space not less than the amount set with the SSIFCR.TTRG bit plus one. This flag is set by automatic determination but it must be cleared by register access.

[Priority order for setting and clearing]

Clearing is prioritized.*1

[Clearing condition]

Either of the following two:

1. Writing 0 to this bit after reading 1 from this bit (CPU operation)*2
2. Last access (DTC/DMAC operation) to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

[Clearing timing]

Clearing timing corresponding to the above clearing condition

1. When 0 is written to this bit after reading 1 from this bit (same as the timing in Figure 38.19)
2. Last access (DTC/DMAC operation) to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

[Setting condition]

SSIFTDR has free space not less than the amount set with the SSIFCR.TTRG bit plus one.

[Setting timing]

While operating on PCLKB, SSIFTDR is found to have free space not less than “size set in the SSISCR.TDES bits + 1.”

Note 1. This bit is cleared by a software reset (SSIFCR.SSIRST = 1) and transmit FIFO data register reset (SSIFCR.TFRST = 1). The software reset and transmit FIFO data register reset have priority over all the clearing conditions described above.

Note 2. After reading 1 from this bit, this bit is cleared when one of the following four conditions is met:
- A software reset is done (SSIFCR.SSIRST = 1).
- A transmit FIFO data register reset is done (SSIFCR.TFRST = 1).
- After 1 has been read, writing of 0 is complete.
- Last access is performed to write data to SSIFTDR by an interrupt routine using the DTC and DMAC.

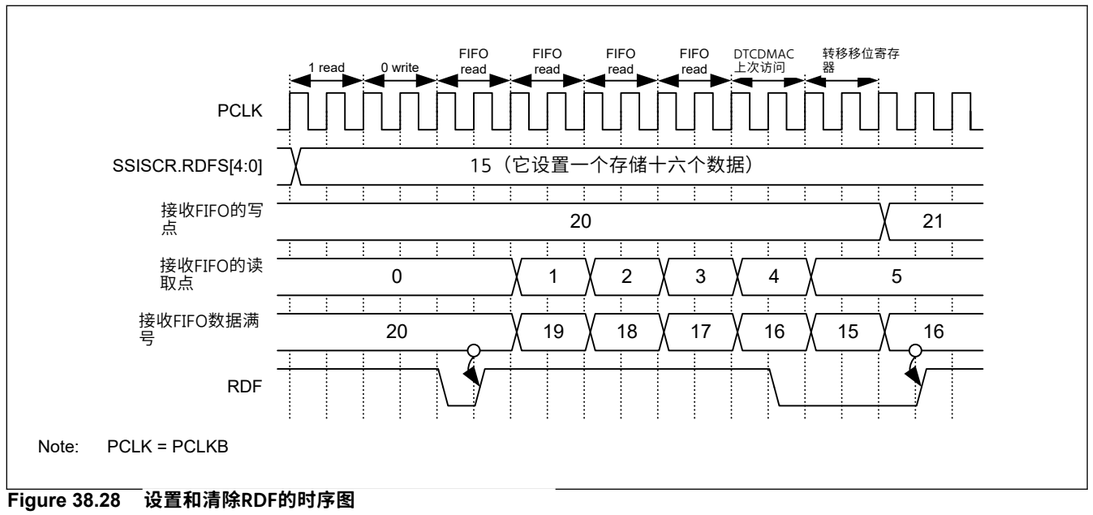

Figure 38.28 设置和清除RDF的时序图

RDC[5:0]flags（接收FIFO数据指示标志数）

RDC[5:0]标志指示存储在接收FIFO数据寄存器(SSIFRDR)中的有效数据数量。此标志为0x00时，没有接收到数据。使用0x20，寄存器被接收到的数据填充，没有可用空间。

TDE标志（传输数据空标志）

TDE标志表示发送FIFO数据寄存器(SSIFTDR)的可用空间不小于用
SSIFCR.TTRG位加一。该标志由自动确定设置，但必须通过寄存器访问清除。

[设置和清除的优先顺序]

清算优先。*1

[Clearing condition]

以下两种之一：

1.从该位读取1后向该位写入0（CPU操作）*2

2.最后访问（DTCDMAC操作）通过使用DTC和DMAC的中断例程将数据写入SSIFTDR。

[Clearing timing]

与上述清零条件对应的清零时机

1.当从该位读取1后向该位写入0时（与图38.19中的时序相同）

2.最后访问（DTCDMAC操作）通过使用DTC和DMAC的中断例程将数据写入SSIFTDR。

[Setting condition]

SSIFTDR的可用空间不小于SSIFCR.TTRG位设置的数量加一。

[Setting timing]

在PCLKB上运行时，发现SSIFTDR的可用空间不小于“SSISCR.TDES位中设置的大小+1”。

注1.该位通过软件复位(SSIFCR.SSIRST=1)和发送FIFO数据寄存器复位(SSIFCR.TFRST=1)清零。软件复位和发送FIFO数据寄存器复位优先于上述所有清除条件。

注2.从该位读取1后，当满足以下四个条件之一时，该位被清除：●软件复位完成(SSIFCR.SSIRST=1)。●发送FIFO数据寄存器复位完成(SSIFCR.TFRST=1)。●读1后，写0完成。●使用DTC和DMAC的中断例程执行最后访问以将数据写入SSIFTDR。

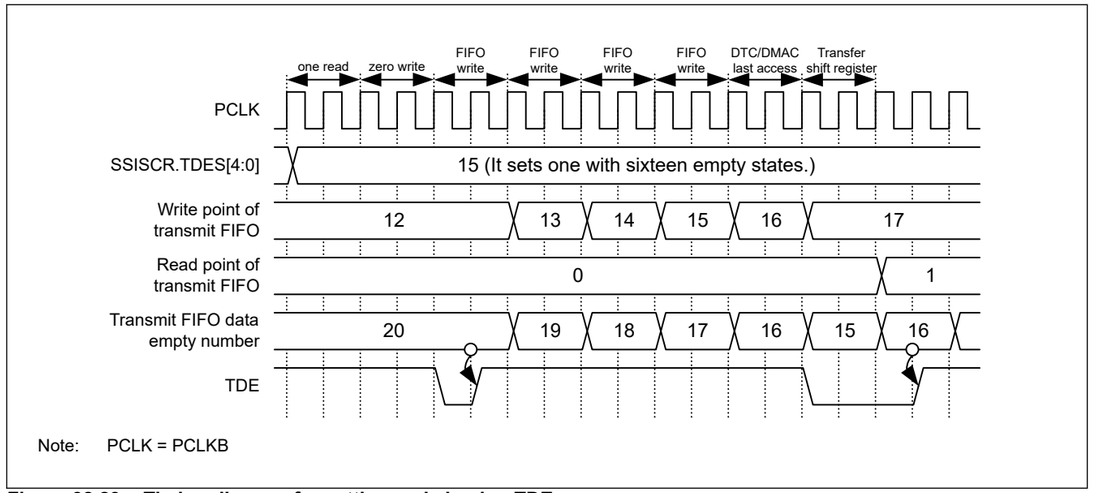

Figure 38.29 Timing diagram for setting and clearing TDE

TDC[5:0] flags (Number of Transmit FIFO Data Indication Flag)

The TDC[5:0] flags indicate the number of valid data that are stored in the transmit FIFO data register (SSIFTDR). With this flag as 0x00, there is no data to be transmitted. With 0x20, there is no space to write data.

38.4.5 SSIFTDR : Transmit FIFO Data Register

Base address: SSIE0 = 0x4009_D000

Offset address: 0x18

Bit position:	31																												0
Bit field:	SSIFTDR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SSIFTDR[31:0]	Transmit FIFO Data	W

This register stores data to be serially transmitted. 0 is returned when this register is read.

When you use this register for transmission, specify data writing to this register as the DTC/DMAC operation that is triggered by a transmit data empty interrupt. Determine the access size to this register according to the data word length to be communicated in Table 38.8.

Table 38.8 Register access restriction to FIFOs (1 of 2)

38.4.7 SSIOFR : Audio Format Register

Base address: SSIE0 = 0x4009_D000

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	BCKASTP	LRCONT	—	—	—	—	—	—	OMOD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	OMOD[1:0]	Audio Format Select*3 *4 0 0: I²S format 0 1: TDM format 1 0: Monaural format 1 1: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	LRCONT	Whether to Enable LRCK/FS Continuation*1 *2 0: Disables LRCK/FS continuation 1: Enables LRCK/FS continuation	R/W
9	BCKASTP	Whether to Enable Stopping BCK Output When SSIE is in Idle Status*1 *2 0: Always outputs BCK to the SSIBCK pin 1: Automatically controls output of BCK to the SSIBCK pin	R/W
31:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is valid only in master-mode communication (SSICR.MST = 1). The setting is invalid in slave-mode communication (SSICR.MST = 0).
Note 2. The BCKASTP and LRCONT bits must not be set to 1 together.
Note 3. While SSIE is communicating (SSISR.IIRQ = 0), writing to these bits is prohibited. If the value of these bits is changed by writing, subsequent operation is unpredictable.
Note 4. If the communication format of other-party device is compatible with a communication format of SSIE, specify and use the communication format that enables communication with the other-party device.

This register is used to set an audio format (which involves the settings of communication format, LR clock/frame synchronization continuation mode, and BCK output stop).

OMOD[1:0] bits (Audio Format Select)

The OMOD[1:0] bits set an audio format. Writing to these bits must be performed when the LR clock supply to the SSILRCK/SSIFS pin is stopped. For details about the output of LR clock, see the detailed description of the LRCONT bit in section 38.4.7. SSIOFR : Audio Format Register.

LRCONT bit (Whether to Enable LRCK/FS Continuation)

The LRCONT bit enables or disables the output from SSILRCK/SSIFS pin when the communication mode is master-mode communication (SSICR.MST = 1) and SSIE is in the idle state (SSISR.IIRQ = 1).

Even in the idle state, a signal can output from the SSILRCK/SSIFS pin when this bit is set to 1 (to enable LR clock/frame synchronization continuation) in master mode (SSICR.MST = 1).

38.4.7 SSIOFR:音频格式寄存器

Base address: SSIE0 = 0x4009_D000

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	BCKASTP	LRCONT	—	—	—	—	—	—	OMOD[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	OMOD[1:0]	音频格式选择*3*4 00：I2S格式01：TDM格式10：单声道格式1 1：禁止设置	R/W
7:2	—	这些位被读取为0。写入值应为0。	R/W
8	LRCONT	是否开启LRCKFSContinuation*1*2 0：禁用LRCKFS延续1：启用LRCKFS延续	R/W
9	BCKASTP	SSIE空闲时是否使能停止BCK输出*1*2 0：始终向SSIBCK引脚输出BCK1：自动控制向SSIBCK引脚输出BCK	R/W
31:10	—	这些位被读取为0。写入值应为0。	R/W

注1.该位仅在主模式通信(SSICR.MST=1)中有效。该设置在从模式通信中无效(SSICR.MST=0)。

注2.BCKASTP和LRCONT位不能一起设置为1。
注3.当SSIE正在通信时（SSISR.IIRQ=0），禁止写入这些位。如果这些位的值通过写来改变，后续的操作是不可预知的。

注4.如果对方设备的通信格式与SSIE的通信格式兼容，请指定并使用能够与对方设备进行通信的通信格式。

该寄存器用于设置音频格式（涉及通信格式、LR时钟帧同步持续模式、BCK输出停止的设置）。

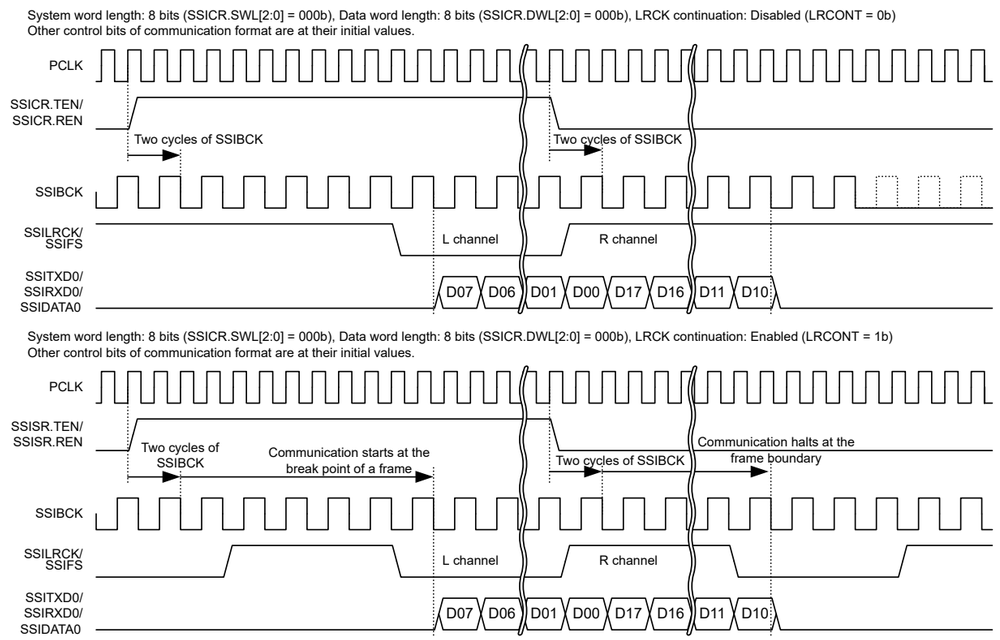
OMOD[1:0]位（音频格式选择）

OMOD[1:0]位设置音频格式。当LR时钟提供给
SSILRCKSSIFS引脚停止。LR时钟的输出详见38.4.7节LRCONT位的详细说明。SSIOFR：音频格式寄存器。

LRCONT位（是否使能LRCKFSContinuation）

当通信模式为主机模式通信(SSICR.MST=1)且SSIE处于空闲状态(SSISR.IIRQ=1)时，LRCONT位启用或禁用SSILRCKS
SIFS引脚的输出。

即使在空闲状态下，当该位在主模式(SSICR.MST=1)下设置为1（以启用LR时钟帧同步继续）时，也可以从SSILRC
KSSIFS引脚输出信号。



Note: PCLK = PCLKB

Figure 38.33 Example of LR clock/frame synchronization continuation operation

BCKASTP bit (Whether to Enable Stopping BCK Output When SSIE is in Idle Status)

The BCKASTP bit turns on or off the function to output BCK to the SSIBCK pin according to the communication shown in Figure 38.34 and Figure 38.35 in master-mode communication (SSICR.MST = 1).

Changing the value of this bit must be performed only after setting the communication format to be used.

This bit must be used in the following way:

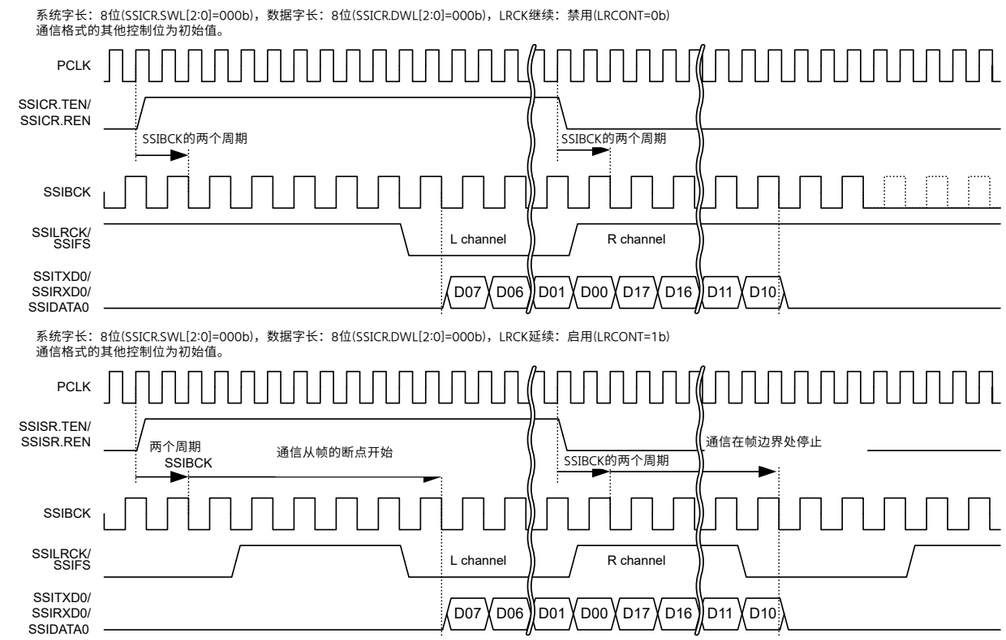
Write 0 to the BCKASTP bit, and then start communication. During the communication, write 1 to the BCKASTP bit. By this operation, the bit clock output to the SSIBCK pin stops automatically when the communication stops. To resume the communication, set SSIE to the idle state (SSICR.IIRQ = 1), enable the supply of AUDIO_MCK (SSIFCR.AUCKE = 1), and then write 0 to the BCKASTP bit.

When the communication mode is master-mode communication (SSICR.MST = 1) and SSIE is in the idle state (SSICR.IIRQ = 1):

Table 38.9 BCKASTP bit status and SSIBCK pin output

BCKASTP Bit	SSIBCK Pin Output Status
0	Output
1	Stopped

Note: The BCKASTP bit cannot be used when the other-party device (which is a slave) requires the clock output from the SSIBCK pin before and during communication. In such a case, use the BCKASTP bit to stop the clock only after communication. For the timing of enabling the clock stop function, see Figure 38.34.



Note: PCLK = PCLKB

Figure 38.33 LR时钟帧同步继续操作示例

BCKASTP位（SSIE空闲时是否使能停止BCK输出）

BCKASTP位根据中所示的通信打开或关闭将BCK输出到SSIBCK引脚的功能
图38.34和图38.35在主模式通信(SSICR.MST=1)。

只有在设置要使用的通信格式后才能更改该位的值。

该位必须按以下方式使用：

将0写入BCKASTP位，然后开始通信。在通信期间，将1写入BCKASTP位。通过该操作，当通信停止时，向SSIBCK引脚输出的位时钟自动停止。要恢复通信，请将SSIE设置为空闲状态(SSICR.IIRQ=1)，启用AUDIO_MCK电源(SSIFCR.AUCKE=1)，然后将0写入BCKASTP位。

当通信模式为主模式通信（SSICR.MST=1）且SSIE处于空闲状态（SSICR.IIRQ=1）时：

Table 38.9 BCKASTP位状态和SSIBCK引脚输出

BCKASTP Bit	SSIBCK引脚输出状态
0	Output
1	Stopped

Note: 当对方设备（作为从设备）在通信之前和通信期间需要从SSIBCK引脚输出时钟时，不能使用BCKASTP位。在这种情况下，仅在通信后使用BCKASTP位停止时钟。时钟停止功能的开启时序见图38.34。

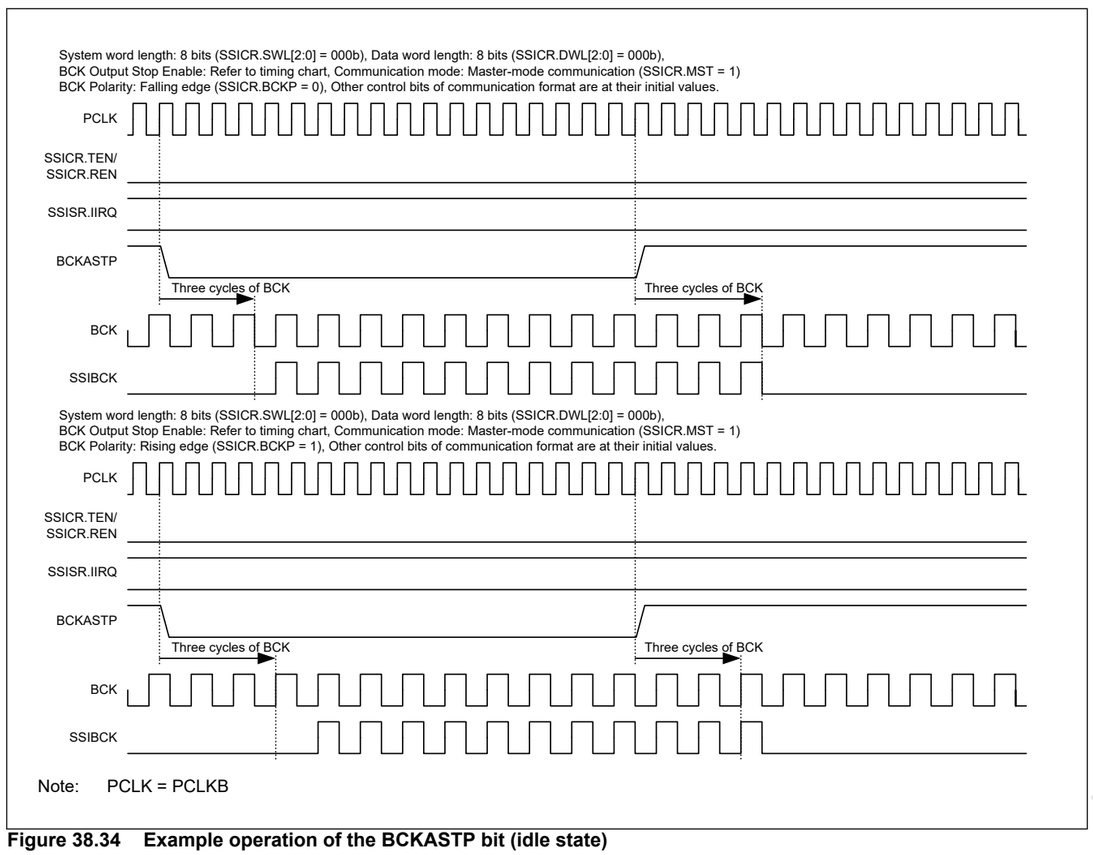


Figure 38.34 Example operation of the BCKASTP bit (idle state)

When the communication mode is master-mode communication (SSICR.MST = 1) and the BCK output stop function is enabled (BCKASTP = 1):

Details of the BCK output to the SSIBCK pin are as follows:

Output start timing: BCK is output in appropriate timing so that a valid edge is generated when the LR clock/frame synchronization signal shifts to a valid value.

Output stop timing: 1 to 1.5 clock cycles after a frame boundary.

For details about the timings, see the timing diagram in Figure 38.35.

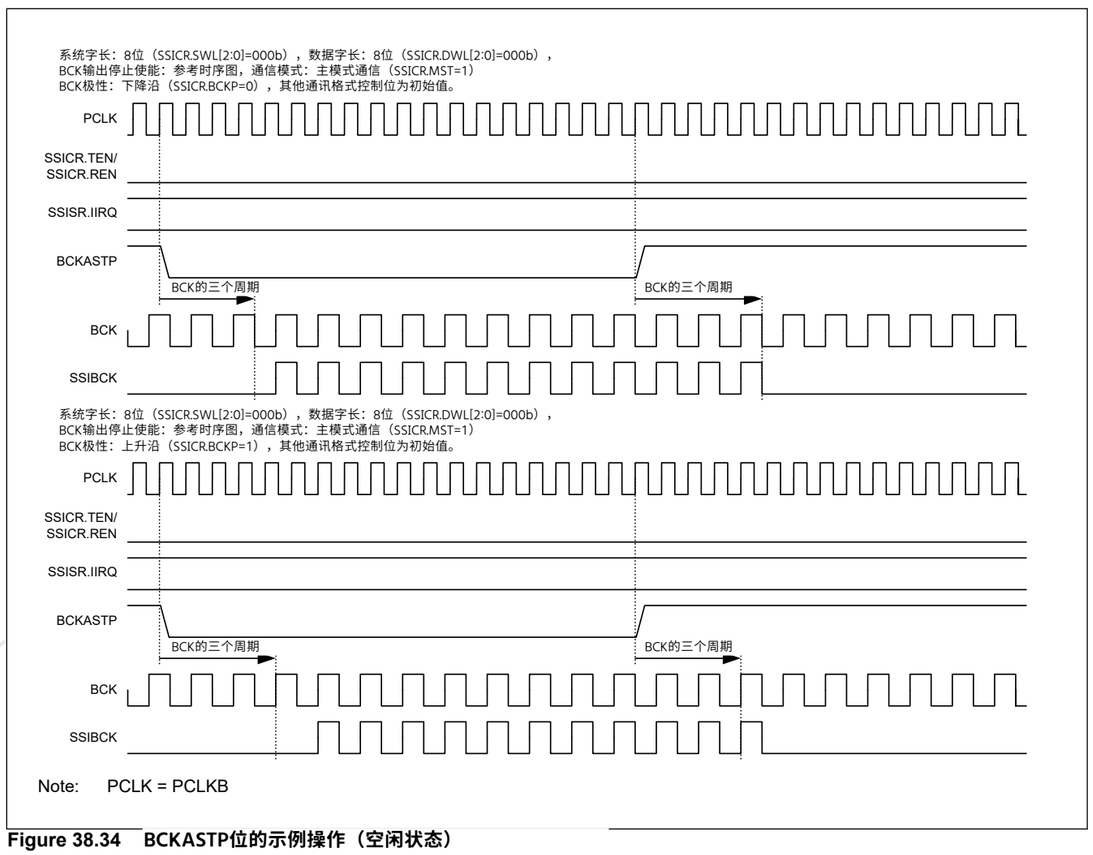

Figure 38.34 BCKASTP位的示例操作（空闲状态）

当通信模式为主机模式通信(SSICR.MST=1)且BCK输出停止功能启用(BCKASTP=1)时：

BCK输出到SSIBCK引脚的详细信息如下：

输出开始时序：在适当的时序输出BCK，以便在LR时钟帧同步信号移位到有效值时产生有效边沿。

输出停止时序：帧边界后1到1.5个时钟周期。

有关时序的详细信息，请参见图38.35中的时序图。

Bit field:	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	RDFS[4:0]	RDF Setting Condition Select*1 0x00: SSIFRDR has one stage or more data size. 0x01: SSIFRDR has two stages or more data size. ⋮ 0x1E: SSIFRDR has thirty-one stages or more data size. 0x1F: SSIFRDR has thirty-two stages or more data size.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
12:8	TDES[4:0]	TDE Setting Condition Select*1 0x00: SSIFTDR has one stage or more free space. 0x01: SSIFTDR has two stages or more free space. ⋮ 0x1E: SSIFTDR has thirty-one stages or more free space. 0x1F: SSIFTDR has thirty-two stages or more free space.	R/W
31:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits while SSIE is in a communication state (SSISR.IIRQ = 0) is prohibited. If written, the operation performed immediately after writing is not guaranteed.

RDFS[4:0] bits (RDF Setting Condition Select)

The RDFS[4:0] bits set the setting condition of the receive data full flag (RDF).

TDES[4:0] bits (TDE Setting Condition Select)

The TDES[4:0] bits set the setting condition of the transmit data empty flag (TDE).

38.5 Communication Formats

SSIE supports three communication formats. Table 38.10 shows supported communication formats.

Table 38.10 Supported communication formats

Communication Format	SSIOFR.OMOD[1:0]
I²S format	00
TDM format	01
Monaural format	10

The following describes the serial data structure shared by communication formats. A serial data structure is defined by the system word length (set in SSICR.SWL[2:0]) and the data word length (set in SSICR.DWL[2:0]). If the data word length is shorter than the system word length, padding bits are transferred in the serial data. For details, see Figure 38.36.

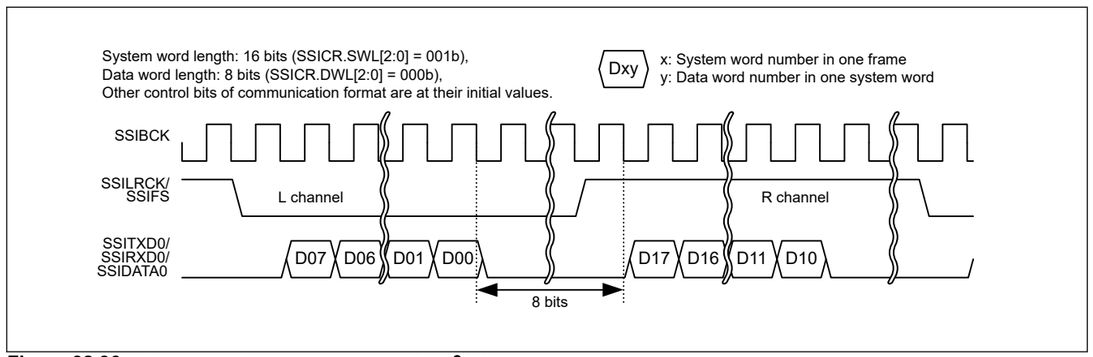

Figure 38.36 Example of padding bit transfer (I²S format: system word length > data word length)

Table 38.11 lists the number of padding bits to be transferred with each combination of system word length (SSICR.SWL[2:0]) and data word length (SSICR.DWL[2:0]). "-" indicates that the setting is prohibited.

Bit	Symbol	Function	R/W
4:0	RDFS[4:0]	RDF设置条件选择*1 0x00：SSIFRDR具有一级或更多数据大小。0x01：S SIFRDR具有两级或更多数据大小。 ⋮ 0x1E：SSIFRDR具有31级或更多数据大小。0x1F：SSIFRD R具有32级或更多数据大小。	R/W
7:5	—	这些位被读取为0。写入值应为0。	R/W
12:8	TDES[4:0]	TDE设定条件选择*1 0x00：SSIFTDR有一级或更多可用空间。0x01：SSIF TDR有两级或更多可用空间。 ⋮ 0x1E：SSIFTDR有31个或更多的可用空间。0x1F：SSIFTDR 有32级或更多可用空间。	R/W
31:13	—	这些位被读取为0。写入值应为0。	R/W

注1.禁止在SSIE处于通信状态(SSISR.IIRQ=0)时写入这些位。如果写入，则不保证写入后立即执行的操作。

RDFS[4:0]位（RDF设置条件选择）

RDFS[4:0]位设置接收数据满标志(RDF)的设置条件。

TDES[4:0]位（TDE设置条件选择）

TDES[4:0]位设置发送数据空标志(TDE)的设置条件。

38.5 通讯格式

SSIE支持三种通信格式。表38.10显示了支持的通信格式。

Table 38.10 支持的通讯格式

通讯格式	SSIOFR.OMOD[1:0]
I²S format	00
TDM format	01
Monaural format	10

下面介绍通信格式共享的串行数据结构。串行数据结构由系统字长（在SSICR.SWL[2:0]中设置）和数据字长（在SSICR.DWL[2:0]中设置）定义。如果数据字长短于系统字长，则在串行数据中传输填充位。详见图38.36。

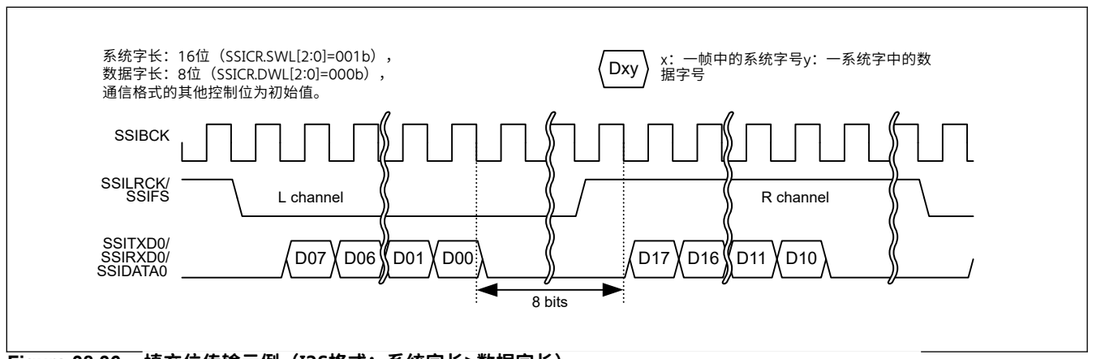

Figure 38.36 填充位传输示例（I2S格式：系统字长>数据字长）

表38.11列出了使用系统字长(SSICR.SWL[2:0])和数据字长(SSICR.DWL[2:0])的每种组合传输的填充位数。"–"表示禁止设置。

Table 38.11 Number of padding bits

	SSICR.DWL[2:0]	000b	001b	010b	011b	100b	101b	110b	111b
SSICR.SWL[2:0]	System Word Length	8	16	18	20	22	24	32	Setting prohibited
000b	8	0	—	—	—	—	—	—	—
001b	16	8	0	—	—	—	—	—	—
010b	24	16	8	6	4	2	0	—	—
011b	32	24	16	14	12	10	8	0	—
100b	48	40	32	30	28	26	24	16	—
101b	64	56	48	46	44	42	40	32	—
110b	128	120	112	110	108	106	104	96	—
111b	256	248	240	238	236	234	232	224	—

38.5.1 I²S Format

The I²S format is a communication format used for connection with I²S-compatible serial devices. With this format setting (SSIOFR.OMOD[1:0] = 00b), one frame is configured with two system words, one for the channel L and the other for channel R. The SSILRCK/SSIFS signals are at a low level for the channel L and at a high level for the channel R. Set the polarity of the signals with the SSICR.LRCKP bit. Figure 38.37 shows the I²S format without padding. See Figure 38.36 for the format with padding.

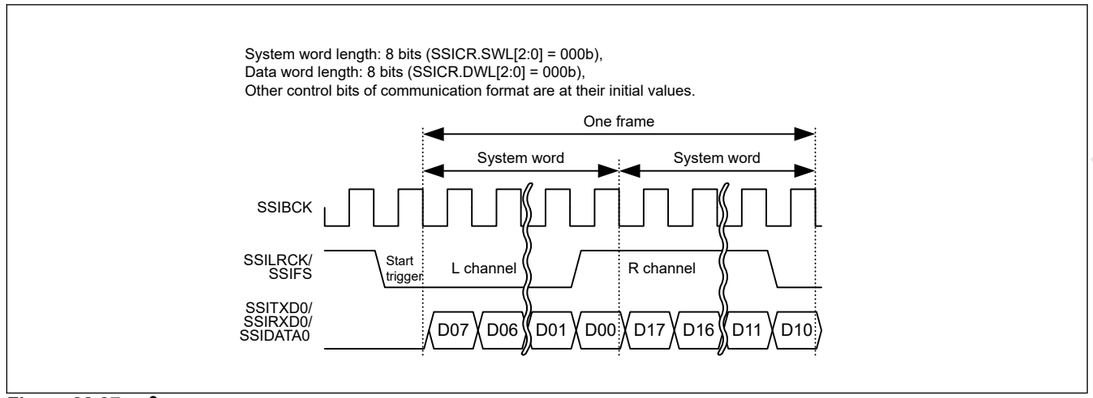

Figure 38.37 I²S format (without padding: system word length = data word length)

For the state of external pins when SSIE is in the idle state, see section 38.7.1. Idle State.

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

38.5.2 Monaural Format

The monaural format is a communication format used for connection with monaural-compatible serial devices. When the monaural format is specified (SSIOFR.OMOD[1:0] = 10b) for use, one frame consists of one system word. Also, a rising edge of the SSILRCK/SSIFS signal indicates a communication start trigger. Figure 38.38 and Figure 38.39 respectively show the monaural formats without and with padding.

Table 38.11 填充位数

	SSICR.DWL[2:0]	000b	001b	010b	011b	100b	101b	110b	111b
SSICR.SWL[2:0]	系统字 Length	8	16	18	20	22	24	32	禁止设定
000b	8	0	—	—	—	—	—	—	—
001b	16	8	0	—	—	—	—	—	—
010b	24	16	8	6	4	2	0	—	—
011b	32	24	16	14	12	10	8	0	—
100b	48	40	32	30	28	26	24	16	—
101b	64	56	48	46	44	42	40	32	—
110b	128	120	112	110	108	106	104	96	—
111b	256	248	240	238	236	234	232	224	—

38.5.1 I²S Format

I2S格式是用于连接I2S兼容串行设备的通信格式。使用此格式设置(SSIOFR.OMOD[1:0]=00b)，一帧配置有两个系统字，一个用于通道L，另一个用于通道R。SSILRCKSSIFS信号对于通道处于低电平L和通道R为高电平。使用SSICR.LRCKP位设置信号的极性。图38.37显示了没有填充的I2S格式。带填充的格式见图38.36。

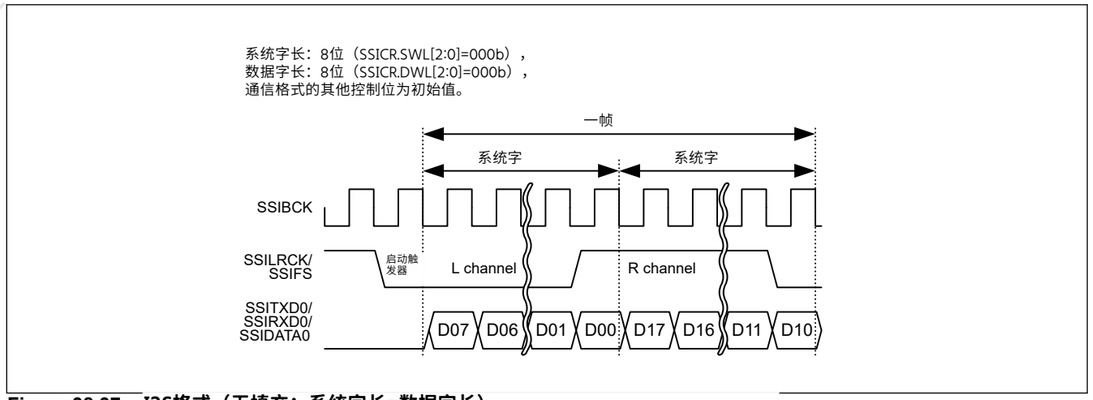

Figure 38.37 I2S格式（无填充：系统字长=数据字长）

SSIE处于空闲状态时外部管脚的状态见38.7.1节。空闲状态。

Note: SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

38.5.2 Monaural Format

单声道格式是用于连接单声道兼容串行设备的通信格式。当指定使用单声道格式(SSIOFR.OMOD[1:0]=10b)时，一帧由一个系统字组成。此外，SSILRCKSSIFS信号的上升沿表示通信开始触发。图38.38和图38.39分别显示了没有和有填充的单声道格式。

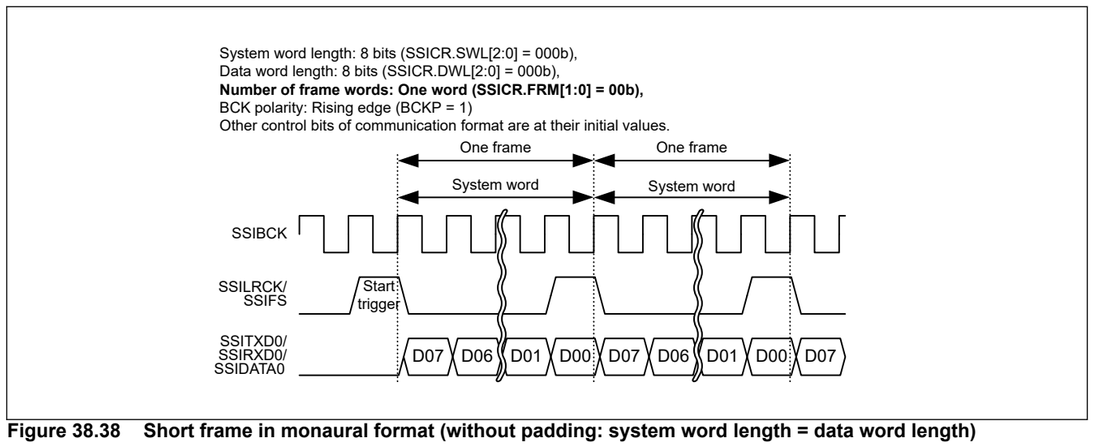

Figure 38.38 Short frame in monaural format (without padding: system word length = data word length)

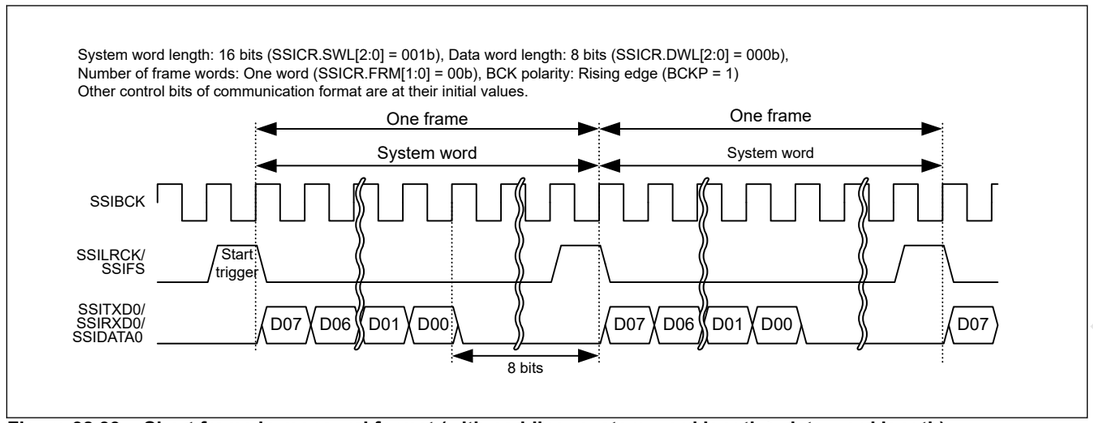

Figure 38.39 Short frame in monaural format (with padding: system word length > data word length)

The monaural formats supported by SSIE consist of short frames and long frames. See section 38.5.2.1. Short frame and section 38.5.2.2. Long frame for the difference between these two frames.

For the state of external pins state when SSIE is in the idle state, see section 38.7.1. Idle State.

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

38.5.2.1 Short frame

When a short frame is used (SSICR.DEL = 0), the SSILRCK/SSIFS signal indicating the start of serial data is set to high level only for 1 cycle of SSIBCK. Data transfer starts at the falling edge of the signal.

38.5.2.2 Long frame

When a long frame is used (SSICR.DEL = 1), the SSILRCK/SSIFS signal indicating the start of serial data is set to high level only for 2 cycles of SSIBCK. See Figure 38.40. Data transfer starts at the rising edge of the signal.

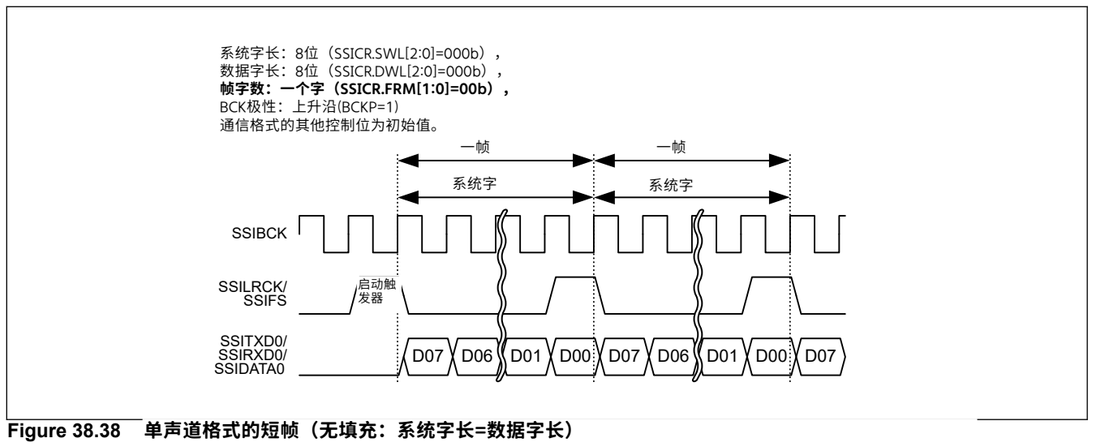

Figure 38.38 单声道格式的短帧（无填充：系统字长=数据字长）

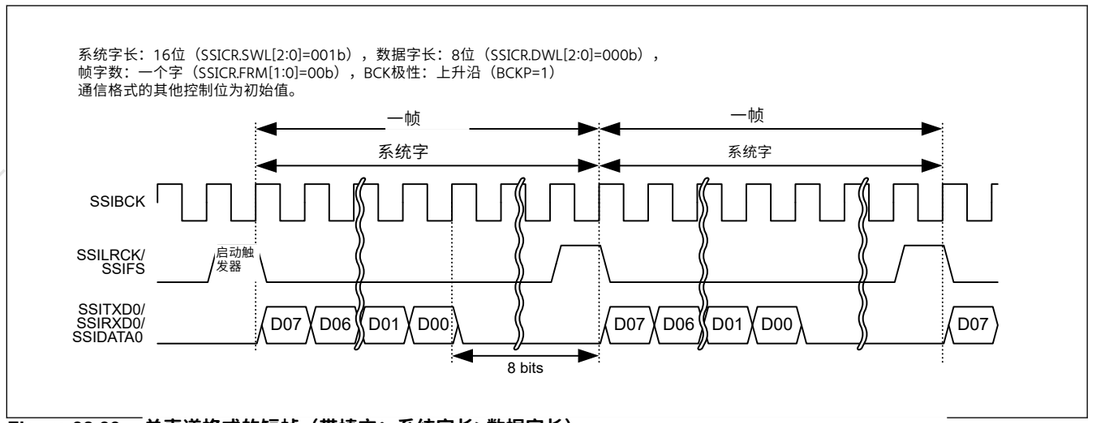

Figure 38.39 单声道格式的短帧（带填充：系统字长>数据字长）

SSIE支持的单声道格式包括短帧和长帧。请参阅第38.5.2.1节。短框架和第38.5.2.2节。长帧为这两个帧的区别。

SSIE处于空闲状态时的外部管脚状态，请参见第38.7.1节。空闲状态。

Note: SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

38.5.2.1 短框

当使用短帧时（SSICR.DEL=0），指示串行数据开始的SSILRCKSSIFS信号仅在SSIBCK的1个周期内设置为高电平。数据传输从信号的下降沿开始。

38.5.2.2 长框

当使用长帧时（SSICR.DEL=1），指示串行数据开始的SSILRCKSSIFS信号仅在SSIBCK的2个周期内设置为高电平。请参见图38.40。数据传输从信号的上升沿开始。

RA生态工作室

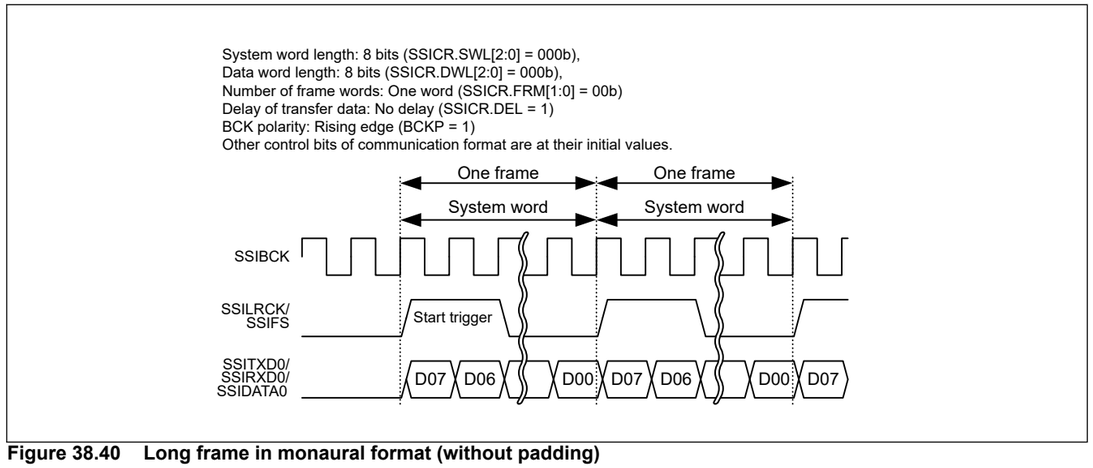

Figure 38.40 Long frame in monaural format (without padding)

38.5.3 TDM Format

The TDM format is a communication format used for connection with TDM-compatible multi-channel devices. With this format setting (SSIOFR.OMOD[1:0] = 01b), one frame is configured with four to eight system words set with the SSICR.FRM[1:0] bits. With this format, the SSILRCK/SSIFS signal is at a high level for the first one system word and at a low level for the rest. The pulse generated on the SSILRCK/SSIFS signal is defined as the SYNC pulse and its rising edge means a start of one frame. Figure 38.41 and Figure 38.42 respectively show the TDM formats without and with padding.

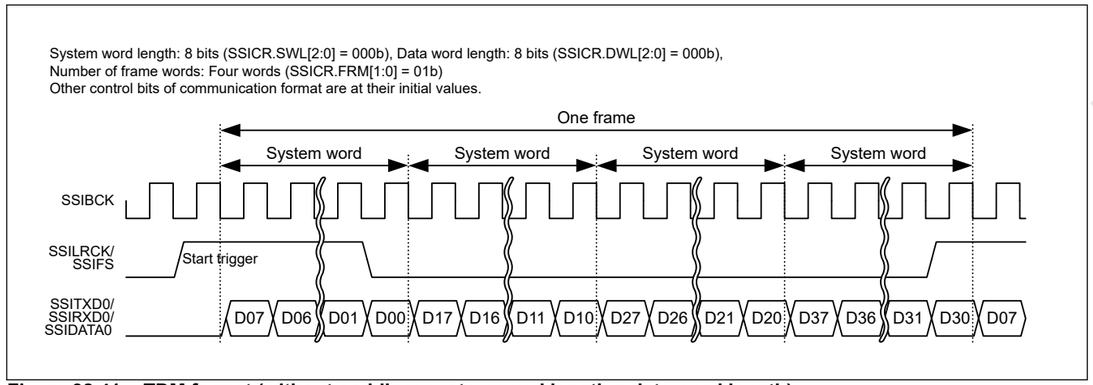

Figure 38.41 TDM format (without padding: system word length = data word length)

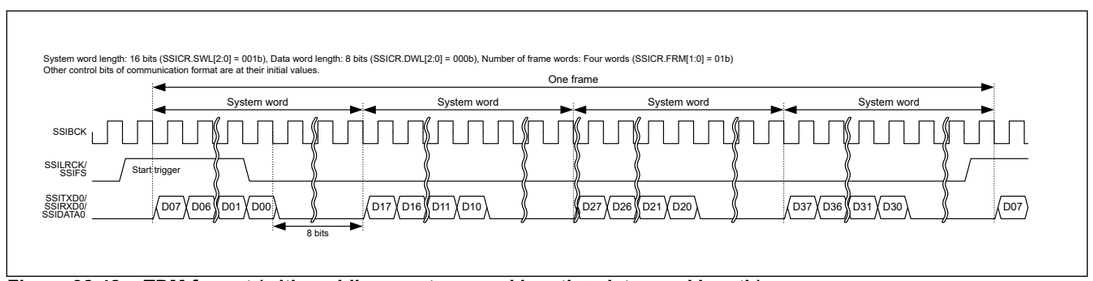

Figure 38.42 TDM format (with padding: system word length > data word length)

For the state of external pins when SSIE is in the idle state, see section 38.7.1. Idle State.

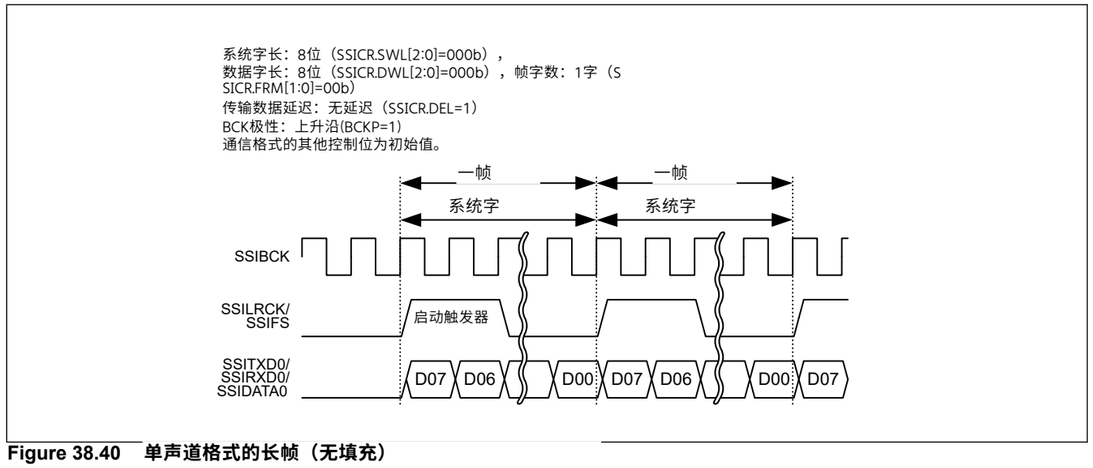

Figure 38.40 单声道格式的长帧（无填充）

38.5.3 TDM Format

TDM格式是一种用于与兼容TDM的多通道设备连接的通信格式。使用此格式设置(SSIOFR.OMOD[1:0]=01b)，一帧配置有四到八个通过SSICR.FRM[1:0]位设置的系统字。使用这种格式，SSILRCKSSIFS信号对于第一个系统字处于高电平，而对于其余系统字处于低电平。SSILRCKSSIFS信号上产生的脉冲被定义为SYNC脉冲，其上升沿表示一帧的开始。图38.41和图38.42分别显示了没有和有填充的TDM格式。

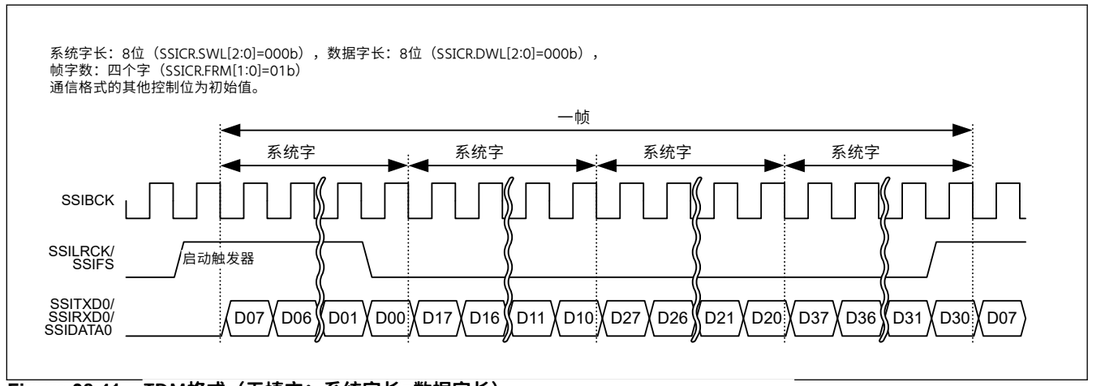

Figure 38.41 TDM格式（无填充：系统字长=数据字长）

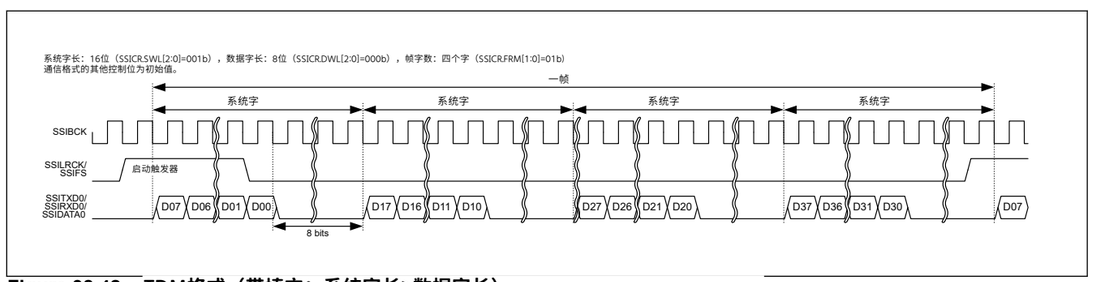

Figure 38.42 TDM格式（带填充：系统字长>数据字长）

SSIE处于空闲状态时外部管脚的状态见38.7.1节。空闲状态。

Note: SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

38.6 Communication Modes

SSIE supports the following communication modes. Table 38.13 lists the control bits that are not available with each communication mode. See section 38.6.1. Slave-mode Communication to section 38.6.5. Transmission and Reception for details of these communication modes.

Table 38.12 Communication modes

Communication Mode	SSICR.MST Bit	SSICR.REN Bit	SSICR.TEN Bit
Slave-mode transmission	0	0	1
Slave-mode reception	0	1	0
Slave-mode transmission and reception	0	1	1
Master-mode transmission	1	0	1
Master-mode reception	1	1	0
Master-mode transmission and reception	1	1	1

Table 38.13 Control bits that cannot be used in each communication mode

Control Bit	Slave-mode Reception	Slave-mode Transmission	Slave-mode Transmission and Reception	Master-mode Reception	Master-mode Transmission	Master-mode Transmission and Reception
SSICR.CKS	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.CKDV	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.MUEN	Invalid	Available	Available	Invalid	Available	Available
SSICR.TEN	Invalid	Available	Available	Invalid	Available	Available
SSICR.REN	Available	Invalid	Available	Available	Invalid	Available
SSIFCR.AUCKEN	Invalid	Invalid	Invalid	Available	Available	Available
SSIFCR.TIE	Invalid	Available	Available	Invalid	Available	Available
SSIFCR.RIE	Available	Invalid	Available	Available	Invalid	Available
SSIFCR.TFRST	Invalid	Available	Available	Invalid	Available	Available
SSIFCR.RFRST	Available	Invalid	Available	Available	Invalid	Available
SSIOFR.BCKASTP	Invalid	Invalid	Invalid	Available	Available	Available
SSIOFR.LRCONT	Invalid	Invalid	Invalid	Available	Available	Available
SSIOFR.OMOD	Available	Available	Available	Available	Available	Available
SSISCR.TDES	Invalid	Available	Available	Invalid	Available	Available
SSISCR.RDFS	Available	Invalid	Available	Available	Invalid	Available

“Invalid” means it has no effect on operation. Writing is possible.

38.6.1 Slave-mode Communication

SSIE operates in slave mode with SSICR.MST = 0. The SSIBCK and SSILRCK/SSIFS signals to be used for serial-data communication must be supplied from an external device. If these signals do not match the communication format set for SSIE, operation is not guaranteed.

38.6.2 Master-mode Communication

SSIE operates in master mode with SSICR.MST = 1. The SSIBCK and SSILRCK/SSIFS signals to be used for serialdata communication must be internally generated from the audio clock. These signals use the format according to the setting of

Note: SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

38.6 通讯方式

SSIE支持以下通信模式。表38.13列出了每种通信模式不可用的控制位。请参阅第38.6.1节。从模式通信到第38.6.5节。有关这些通信模式的详细信息，请参见发送和接收。

Table 38.12 通讯方式

通讯方式	SSICR.MST Bit	SSICR.REN Bit	SSICR.TEN Bit
Slave-mode transmission	0	0	1
Slave-mode reception	0	1	0
从模式发送和接收	0	1	1
Master-mode transmission	1	0	1
Master-mode reception	1	1	0
主模式传输和接收	1	1	1

Table 38.13 不能在每种通信模式下使用的控制位

控制位	Slave-mode Reception	Slave-mode Transmission	Slave-mode 传输和接收	Master-mode Reception	Master-mode Transmission	主模式传输和接收
SSICR.CKS	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.CKDV	Invalid	Invalid	Invalid	Available	Available	Available
SSICR.MUEN	Invalid	Available	Available	Invalid	Available	Available
SSICR.TEN	Invalid	Available	Available	Invalid	Available	Available

SSIFCR.TIE	Invalid	Available	Available	Invalid	Available	Available
SSIFCR.RIE	Available	Invalid	Available	Available	Invalid	Available
SSIFCR.TFRST	Invalid	Available	Available	Invalid	Available	Available
SSIFCR.RFRST	Available	Invalid	Available	Available	Invalid	Available
SSIOFR.BCKASTP	Invalid	Invalid	Invalid	Available	Available	Available
SSIOFR.LRCONT	Invalid	Invalid	Invalid	Available	Available	Available
SSIOFR.OMOD	Available	Available	Available	Available	Available	Available
SSISCR.TDES	Invalid	Available	Available	Invalid	Available	Available
SSISCR.RDFS	Available	Invalid	Available	Available	Invalid	Available

“无效”是指对操作没有影响。写作是可能的。

38.6.1 Slave-mode Communication

SSIE在SSICR.MST=0的从机模式下运行。用于串行数据通信的SSIBCK和SSILRCKSSIFS信号必须由外部设备提供。如果这些信号与为SSIE设置的通信格式不匹配，则无法保证操作。

38.6.2 Master-mode Communication

SSIE在SSICR.MST=1的主模式下运行。用于串行数据通信的SSIBCK和SSILRCKSSIFS信号必须由音频时钟在内部生成。这些信号使用根据设置的格式

SSIE. If the communication format the slave device uses does not match the communication format set for SSIE, the operation is unpredictable.

38.6.3 Transmission

SSIE transmits serial data to the other-party device when the SSICR.TEN bit is 1 and the SSICR.REN bit is 0. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

38.6.4 Reception

SSIE receives serial data from the other-party device when the SSICR.TEN bit is 0 and the SSICR.REN bit is 1. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

38.6.5 Transmission and Reception

SSIE transmits and receives serial data to and from the other-party device when the SSICR.TEN bit is 1 and the SSICR.REN bit is 1. If the communication format the other-party device uses does not match the communication format set for SSIE, the operation is unpredictable.

38.7 Operation

SSIE has the following two main operation states Figure 38.43 shows SSIE state transition.

- Idle state (SSISR.IIRQ = 1)
- Communication state (SSISR.IIRQ = 0).

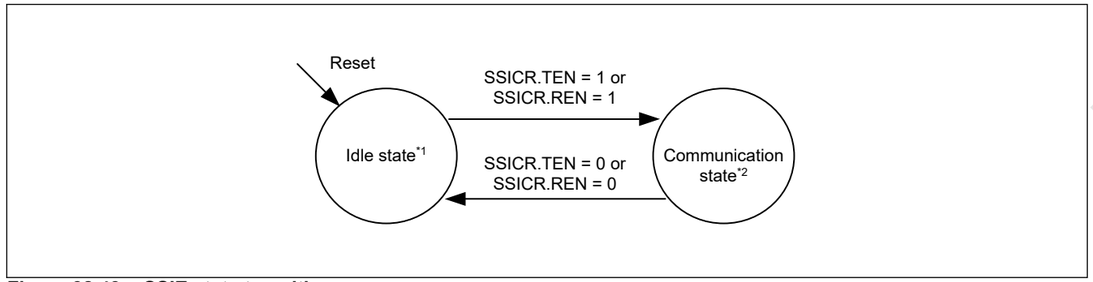

Figure 38.43 SSIE state transition

Note: See section 38.8.1. Start Communication for details of the idle state.
See section 38.8.2. Transmission for details of the communication state.

38.7.1 Idle State

In this state, communication of SSIE is halted. If, however, the SSICR.MST bit is 1, output of the BCK and LR clock/frame synchronization signals to external pins can be controlled according to the settings of SSIOFR.BCKASTP and SSIOFR.LRCONT bits. This function is common to all formats. For details, see Table 38.14.

Table 38.14 Output from external pins in the idle state (1 of 2)

SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	Output from Pins		
			SSIBCK	SSILRCK/SSIFS	SSITXD0/SSIDATA0
0	—	—	Stop	Stop	Stop
1	0	0	Supply	Stop	Stop
1	0	1	Supply	Supply	Stop
1	1	0	Stop	Stop	Stop

SSIE。如果从设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作是不可预测的。

38.6.3 Transmission

当SSICR.TEN位为1且SSICR.REN位为0时，SSIE向对方设备发送串口数据。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作为不可预料的。

38.6.4 Reception

当SSICR.TEN位为0且SSICR.REN位为1时，SSIE从对方设备接收串行数据。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作为不可预料的。

38.6.5 传输和接收

当SSICR.TEN位为1且
SSICR.REN位为1。如果对方设备使用的通信格式与为SSIE设置的通信格式不匹配，则操作不可预知。

38.7 Operation

SSIE有以下两个主要操作状态图38.43显示了SSIE状态转换。

●空闲状态（SSISR.IIRQ=1）

●通信状态（SSISR.IIRQ=0）。

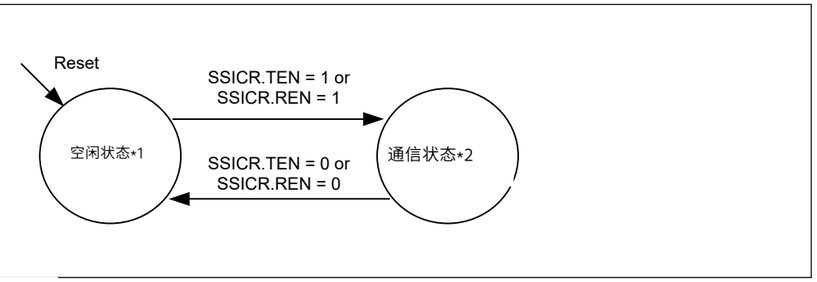

Figure 38.43 SSIE状态转换

Note: 请参阅第38.8.1节。开始通信以了解空闲状态的详细信息。
请参阅第38.8.2节。传输以获取通信状态的详细信息。

38.7.1 空闲状态

在这种状态下，SSIE的通信停止。但是，如果SSICR.MST位为1，则可以根据SSIOFR.BCKASTP和SSIOFR.LRCONT位的设置来控制向外部引脚输出BCK和LR时钟帧同步信号。此功能适用于所有格式。详见表38.14。

Table 38.14 空闲状态下外部引脚的输出（2个中的1个）

SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	引脚输出		
			SSIBCK	SSILRCK/SSIFS	SSITXD0/SSIDATA0
0	—	—	Stop	Stop	Stop
1	0	0	Supply	Stop	Stop
1	0	1	Supply	Supply	Stop
1	1	0	Stop	Stop	Stop

Table 38.14 Output from external pins in the idle state (2 of 2)

SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	Output from Pins		
			SSIBCK	SSILRCK/SSIFS	SSITXD0/SSIDATA0
1	1	1	Stop	Supply	Stop

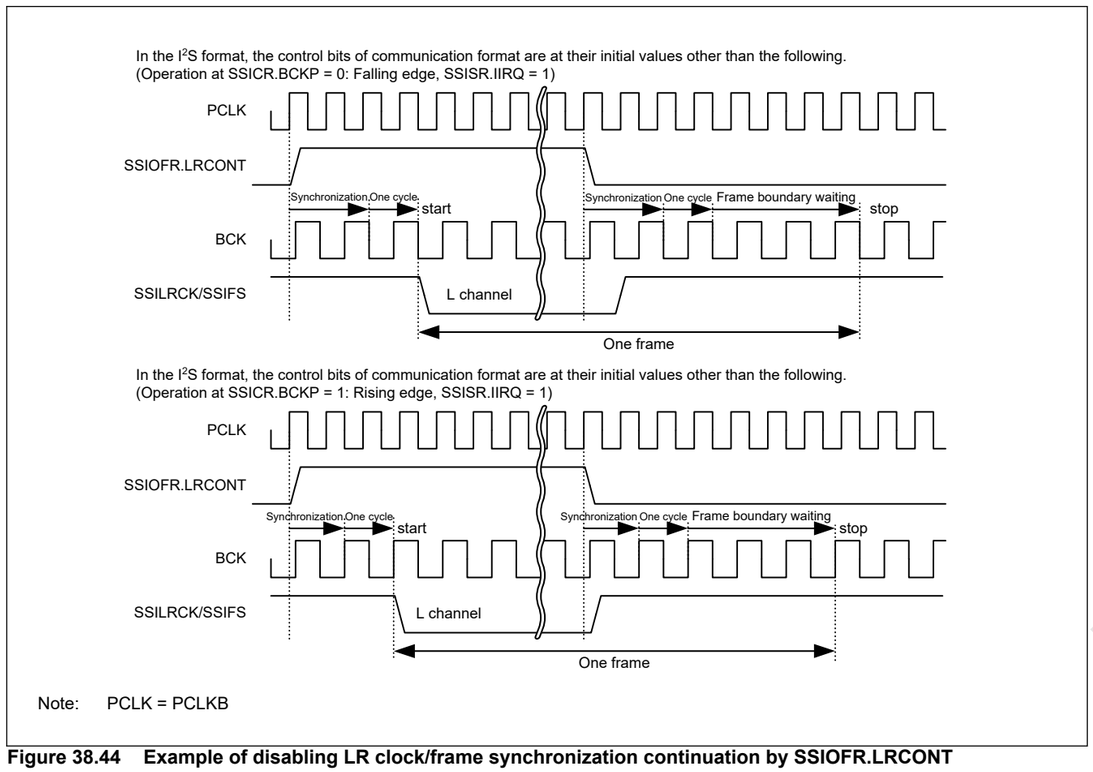

Figure 38.44 Example of disabling LR clock/frame synchronization continuation by SSIOFR.LRCONT

Note: To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIE is in the idle state in mastermode communication (SSICR.MST = 1), note the following: The output stops when the value of the SSIOFR.LRCONT bit is changed from 1 to 0. Make sure that the other-party device is not affected.

Table 38.14 空闲状态下外部引脚的输出（2个中的2个）

SSICR.MST	SSIOFR.BCKASTP	SSIOFR.LRCONT	引脚输出		
			SSIBCK	SSILRCK/SSIFS	SSITXD0/SSIDATA0
1	1	1	Stop	Supply	Stop

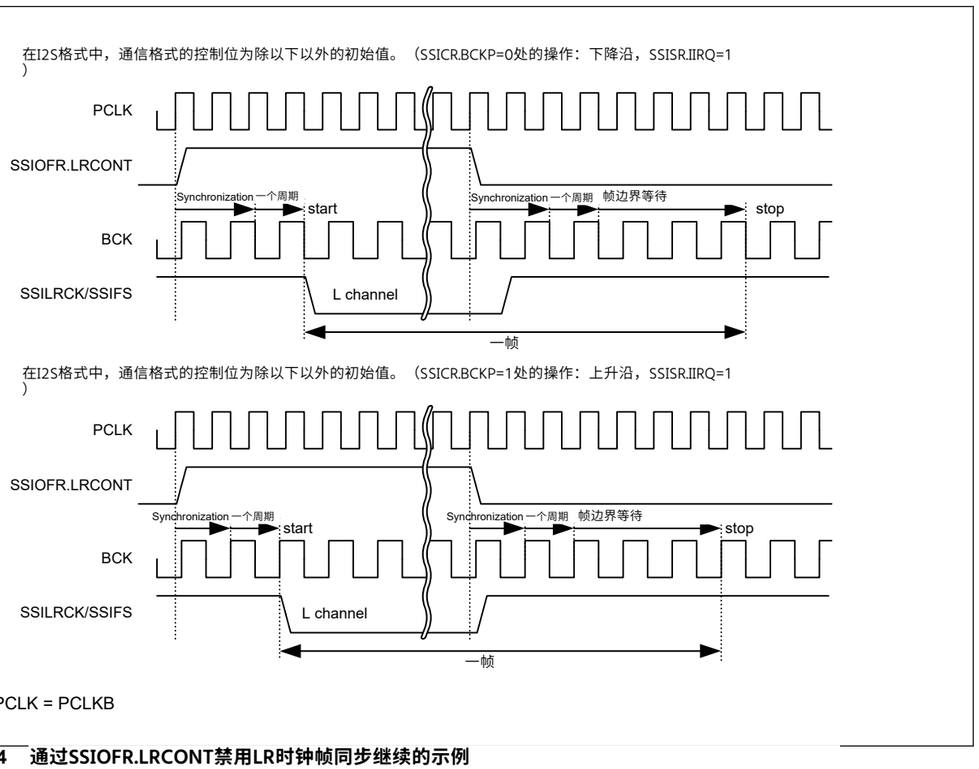

Figure 38.44 通过SSIOFR.LRCONT禁用LR时钟帧同步继续的示例

Note: 要在主模式通信（SSICR.MST=1）中SSIE处于空闲状态时通过SSIOFR.LRCONT停止向SSILRCKSSIFS引脚的输出，请注意以下几点：当SSIOFR.LRCONT位的值从1比0。确保对方设备不受影响。

RA生态工作室

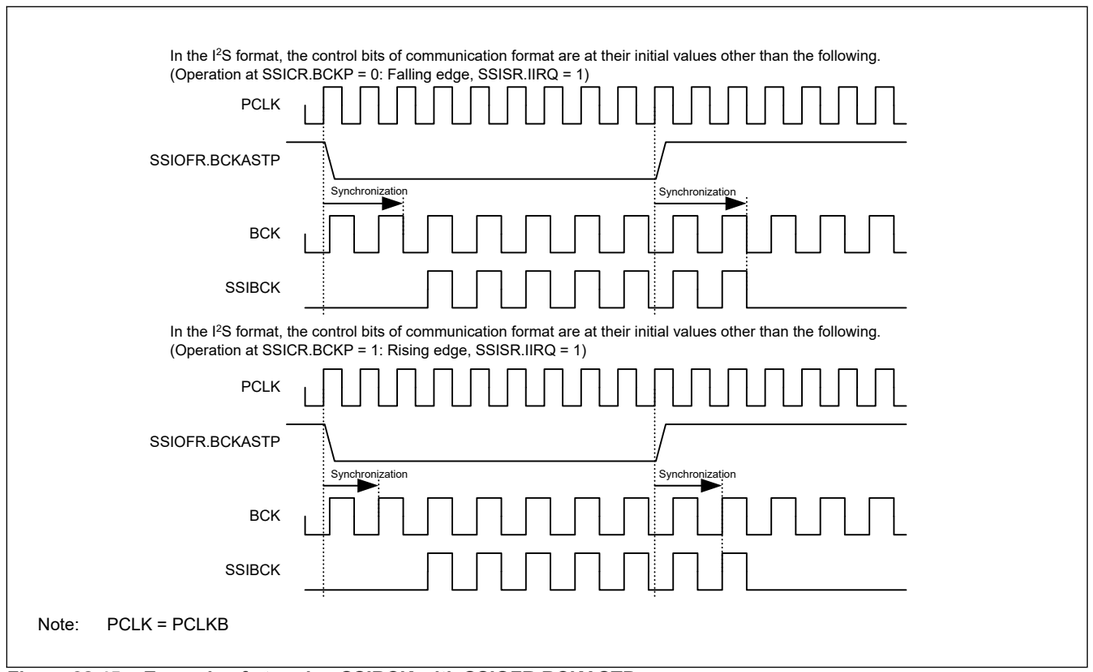

Figure 38.45 Example of stopping SSIBCK with SSIOFR.BCKASTP

Note: To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIE is in the idle state, note the following: The output stops when the value of the SSIOFR.BCKASTP bit is changed from 0 to 1. So, make sure that the other-party device is not affected.

38.7.2 Communication States

In this state, SSIE is during communication. Figure 38.46 shows transitions of communication states and Table 38.15 lists the conditions for transition. If the transition condition is not satisfied, the state does not transit.

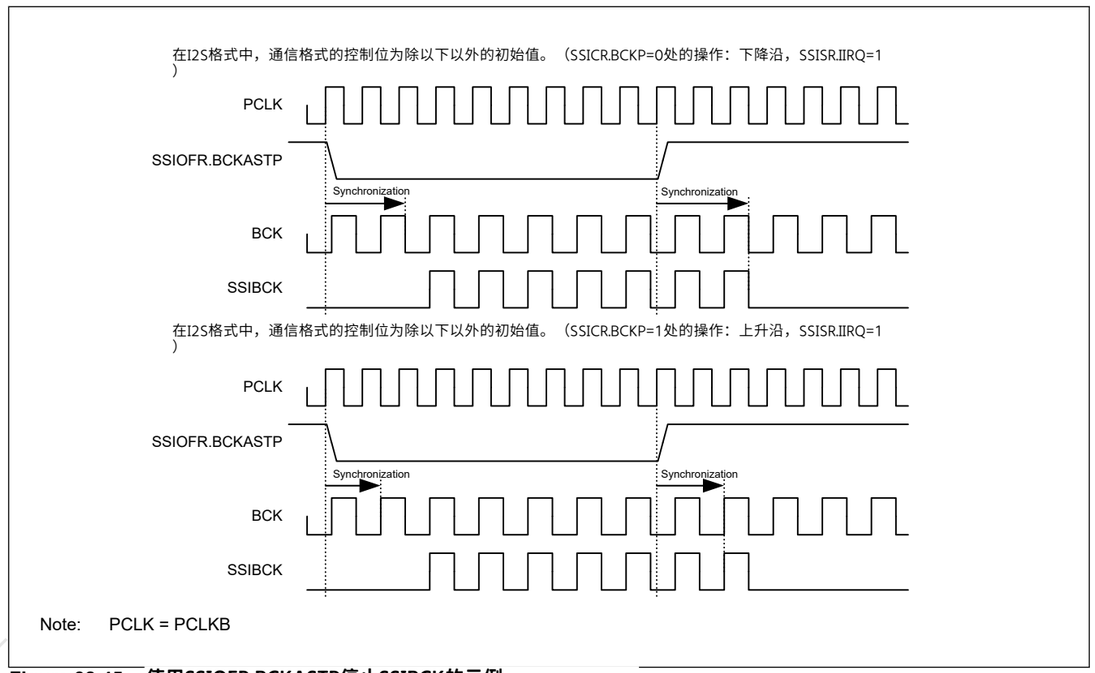

Figure 38.45 使用SSIOFR.BCKASTP停止SSIBCK的示例

Note: 要在主模式通信(SSICR.MST=1)和SSIE处于空闲状态时使用SSIOFR.BCKASTP停止向SSIBCK引脚的输出，请注意以下几点：当SSIOFR.BCKASTP位的值为从0变为1。因此，请确保对方设备不受影响。

38.7.2 通讯状态

在此状态下，SSIE处于通信过程中。图38.46显示了通信状态的转换，表38.15列出了转换的条件。如果不满足转移条件，则状态不转移。

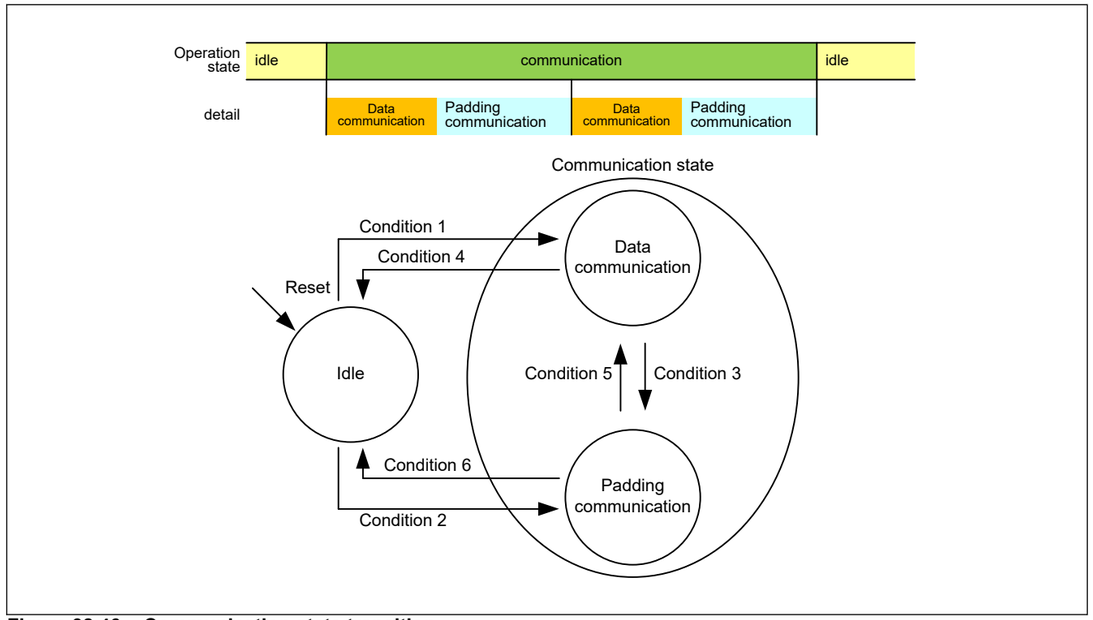

Figure 38.46 Communication state transition

Table 38.15 Condition for communication state transition

Condition Number	Condition for Transition
1	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 0 or in the setting without padding bits.
2	Writing SSICR.TEN = 1 or SSICR.REN = 1 while SSICR.SDTA = 1 and in the setting with padding bits.
3	The following three conditions are all met: • SSICR.TEN = 1 or SSICR.REN = 1 • In the setting with padding bits • The last bit of the data words has been transferred.
4	Both the following two conditions are met: • SSICR.SDTA = 1 or without padding bits • While SSICR.TEN = 0 and SSICR.REN = 0, the last bit of the data words in a frame has been transferred.
5	Transfer of the last padding bit is completed while SSICR.TEN = 1 or SSICR.REN = 1
6	Both the following two conditions are met: • SSICR.SDTA = 0 and with padding bits • While SSICR.TEN = 0 and SSICR.REN = 0, the last padding bit has been transferred.

See Table 38.11 for the setting with/without padding bits.

38.7.2.1 Data communication state

In this state, SSIE is during communication. Data of the data word length set with the SSICR.DWL[2:0] bits is transmitted, received, or transmitted and received.

- State Transition in the Setting without Padding Bits

During communication (SSISR.IIRQ = 0), SSIE is during data communication for all the time. By disabling transmission and reception (SSICR.TEN = 0, SSICR.REN = 0), SSIE transits to the idle state. For details, see Figure 38.47 and Figure 38.48.

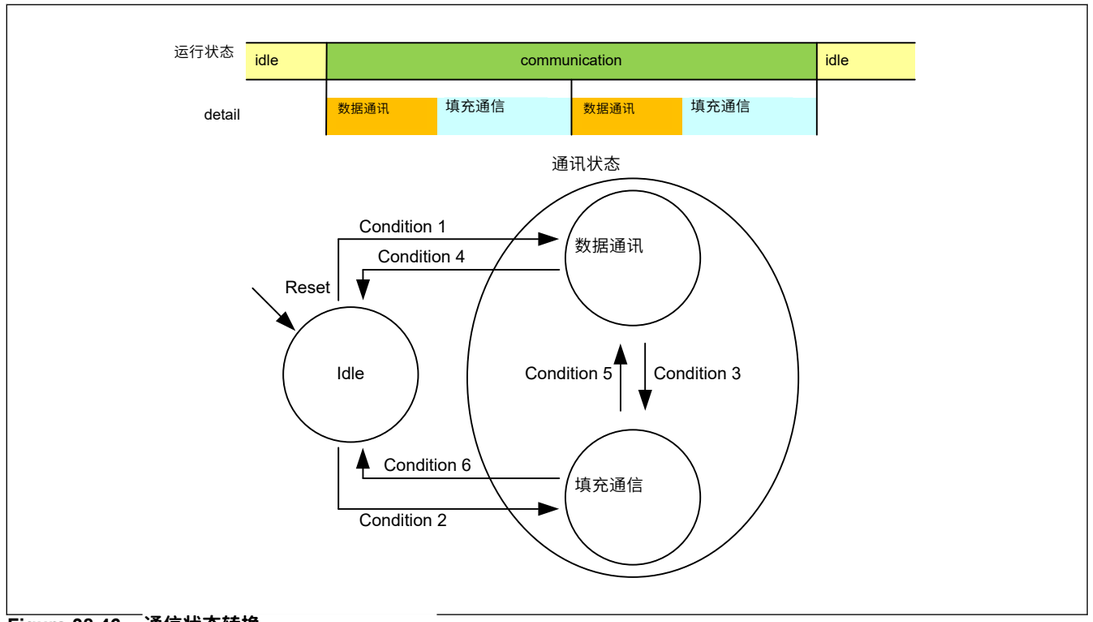

Figure 38.46 通信状态转换

Table 38.15 通信状态转移的条件

条件编号	过渡条件
1	在SSICR.SDTA=0或在没有填充位的设置中写入SSICR.TEN=1或SSICR.REN=1。
2	写入SSICR.TEN=1或SSICR.REN=1而SSICR.SDTA=1并在设置中使用填充位。
3	满足以下三个条件：● • 在带有填充位的设置中 • 数据字的最后一位已传输。
4	同时满足以下两个条件：● SSICR.SDTA=1或无填充位 • 当SSICR.TEN=0和SSICR.REN=0时，帧中数据字的最后一位已被传输。
5	当SSICR.TEN=1或SSICR.REN=1时，最后一个填充位的传输完成
6	同时满足以下两个条件：● SSICR.SDTA=0并带有填充位 • 当SSICR.TEN=0和SSICR.REN=0时，最后一个填充位已被传输。

有关不带填充位的设置，请参见表38.11。

38.7.2.1 数据通讯状态

在此状态下，SSIE处于通信过程中。使用SSICR.DWL[2:0]位设置的数据字长的数据被发送、接收或发送和接收。

●无填充位设置中的状态转换

在通信期间（SSISR.IIRQ=0），SSIE一直处于数据通信期间。通过禁用发送和接收（SSICR.TEN=0，SSICR.REN=0），SSIE转换到空闲状态。详见图38.47和图38.48。

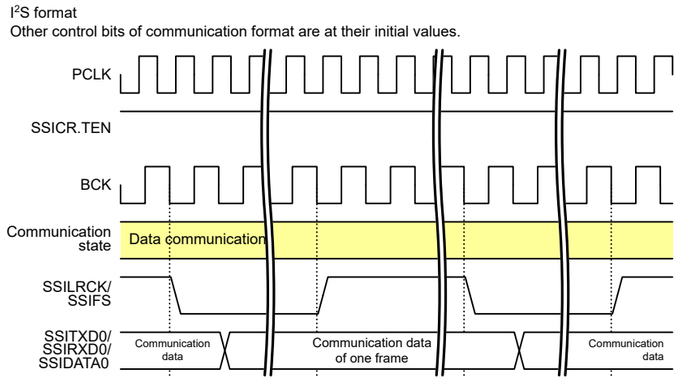

Figure 38.47 Continuation of the data communication

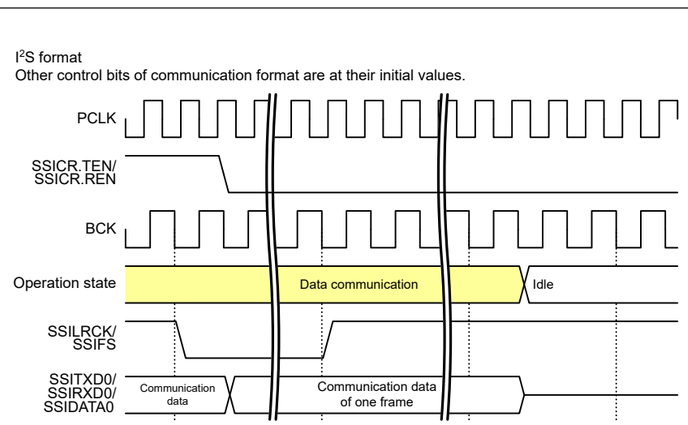

Figure 38.48 Halt from the data communication (without padding bits)

- State Transition in the Setting with Padding Bits

When SSIE ends transfer of the last bit of a data word during communication (SSISR.IIRQ = 0), SSIE transitions from the data communication state to the padding communication state in Figure 38.49. Except in the status with SSICR.SDTA = 1 and transmission and reception disabled (SSICR.TEN = 0 and SSICR.REN = 0), SSIE transitions from the data communication state to the idle state when it stops communication in Figure 38.51.

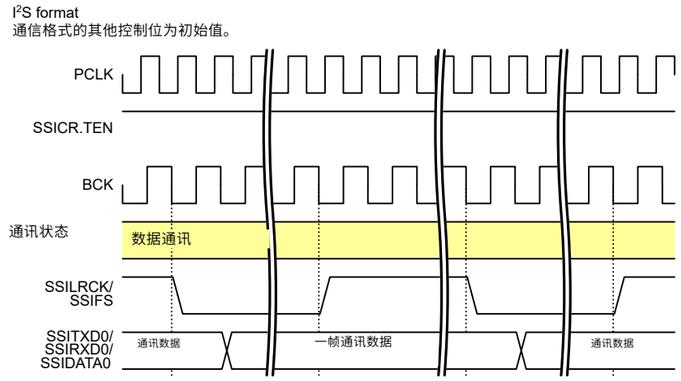

Figure 38.47 继续数据通信

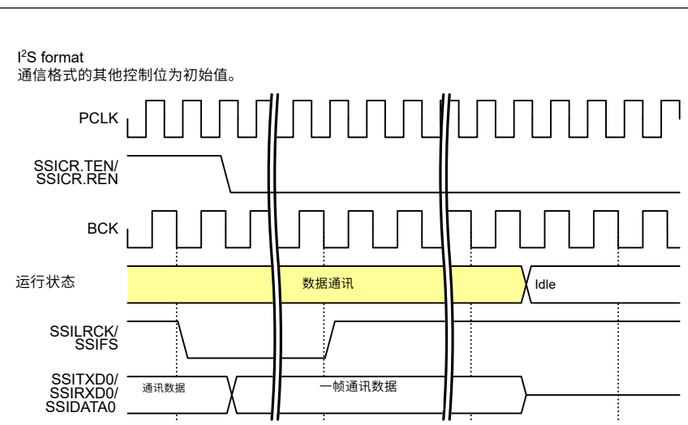

Figure 38.48 停止数据通信（无填充位）

●具有填充位的设置中的状态转换

当SSIE在通信期间结束数据字的最后一位传输时（SSISR.IIRQ=0），SSIE从数据通信状态转换到图38.49中的填充通信状态。除了在SSICR.SDTA=1和发送和接收禁用的状态下（SSICR.TEN=0和SSICR.REN=0），SSIE在图38.51中停止通信时从数据通信状态转换到空闲状态。

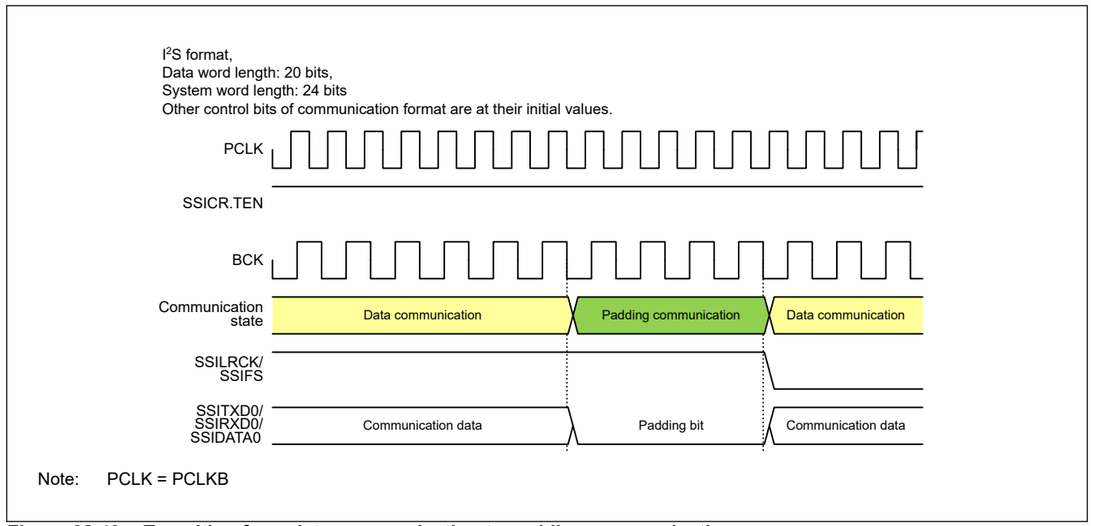

Figure 38.49 Transition from data communication to padding communication

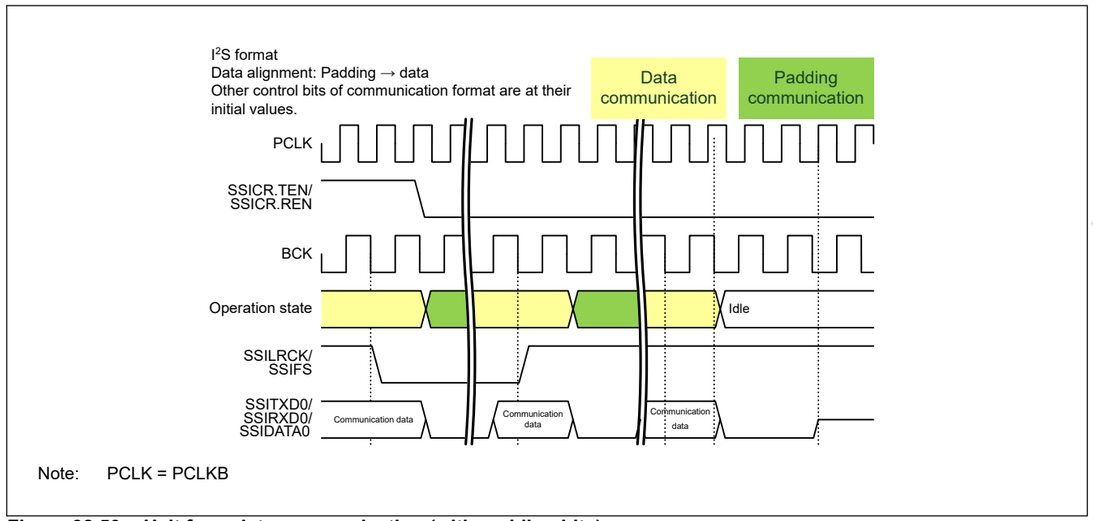

Figure 38.50 Halt from data communication (with padding bits)

38.7.2.2 Padding communication

In this state, SSIE is during communication. The padding bits set with the SSICR.SWL[2:0] bits and SSICR.DWL[2:0] bits are transmitted, received, or transmitted and received.

- State Transition in the Setting with Padding Bits

When SSIE ends transfer of the last padding bit during communication (SSISR.IIRQ = 0), SSIE transitions to the data communication state in Figure 38.49. If SSIE is in the status with SSICR.SDTA = 0 and transmission and reception disabled (SSICR.TEN = 0 and SSICR.REN = 0), SSIE transitions from the padding communication state to the idle state when it stops communication in Figure 38.51.

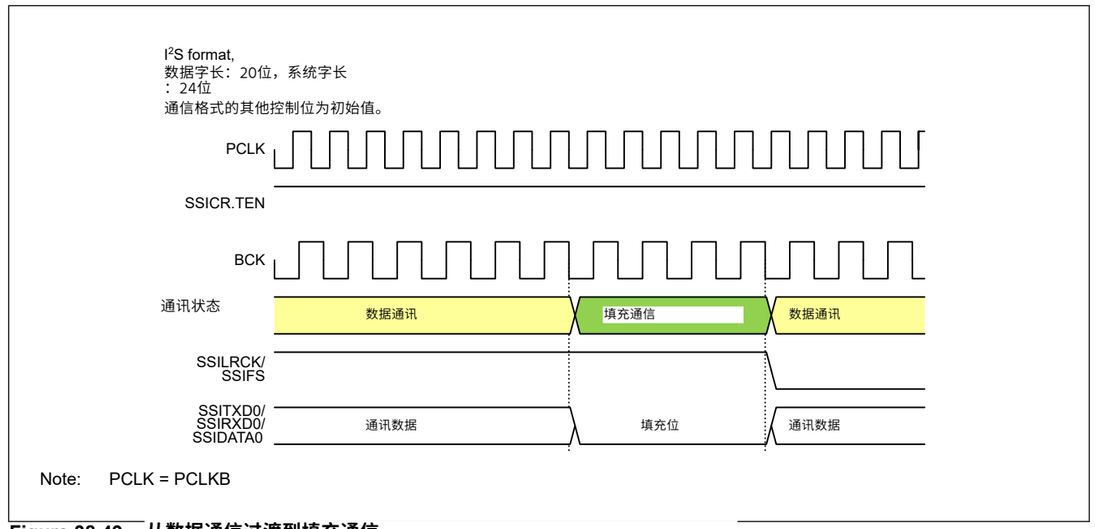

Figure 38.49 从数据通信过渡到填充通信

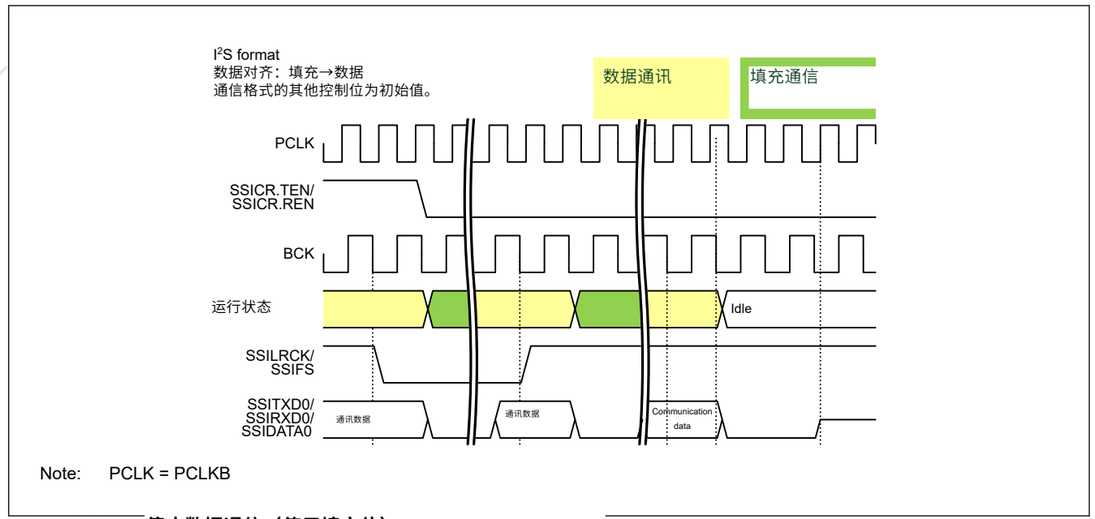

Figure 38.50 停止数据通信（使用填充位）

38.7.2.2 填充通信

在此状态下，SSIE处于通信过程中。使用SSICR.SWL[2:0]位和SSICR.DWL[2:0]位设置的填充位被发送、接收或发送和接收。

●具有填充位的设置中的状态转换

当SSIE在通信期间结束最后一个填充位的传输（SSISR.IIRQ=0）时，SSIE转换到图38.49中的数据通信状态。如果SSIE处于SSICR.SDTA=0且发送和接收禁用的状态（SSICR.TEN=0和SSICR.REN=0），则SSIE在图38.51中停止通信时从填充通信状态转换为空闲状态。

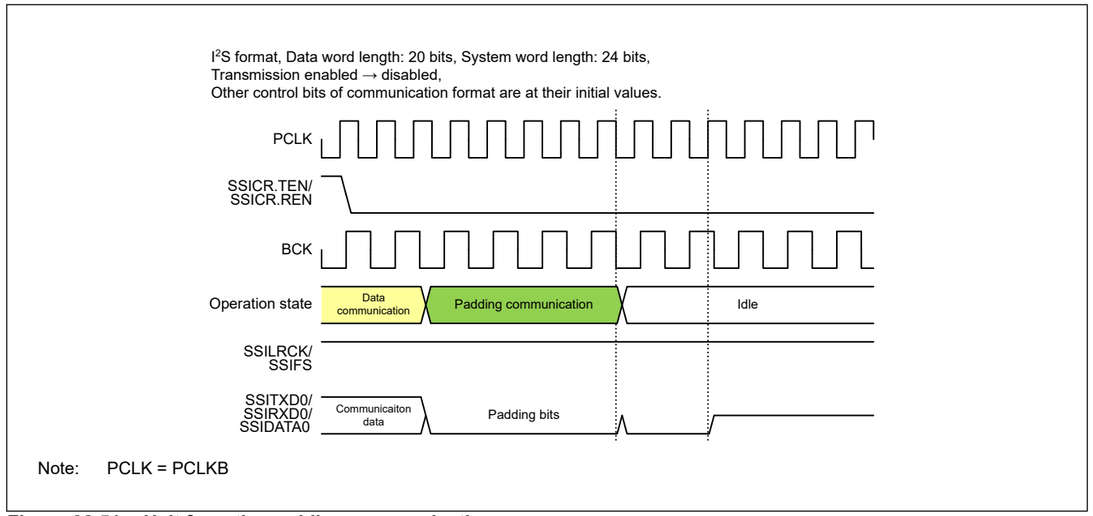

Figure 38.51 Halt from the padding communication

38.8 Communication Operation

Figure 38.52 shows the communication flow of SSIE.

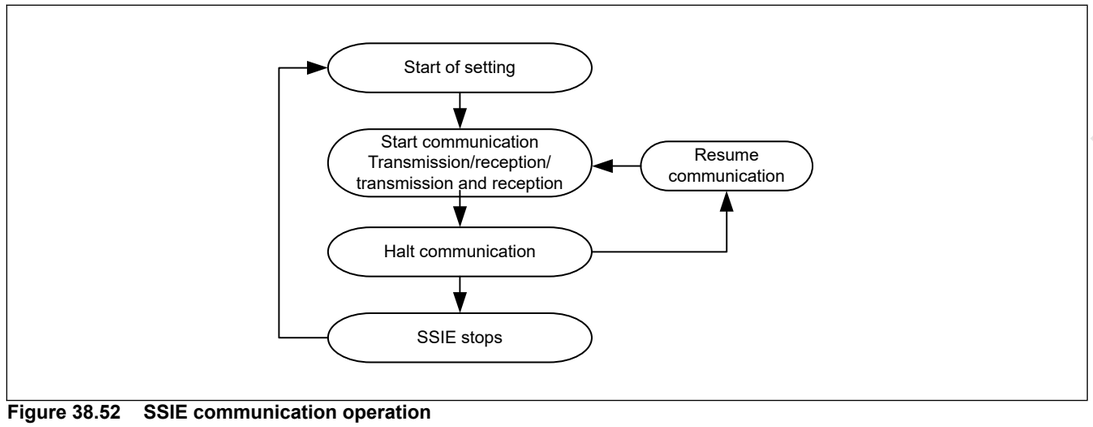

Figure 38.52 SSIE communication operation

The procedure of each operation is described from section 38.8.1. Start Communication to section 38.8.7. Resume Communication.

38.8.1 Start Communication

This section describes how to start communication of SSIE. Figure 38.53 shows the procedure to start communication. Be sure to follow the procedure. See section 38.8.2. Transmission for transmission operation and section 38.8.3. Reception for reception operation.

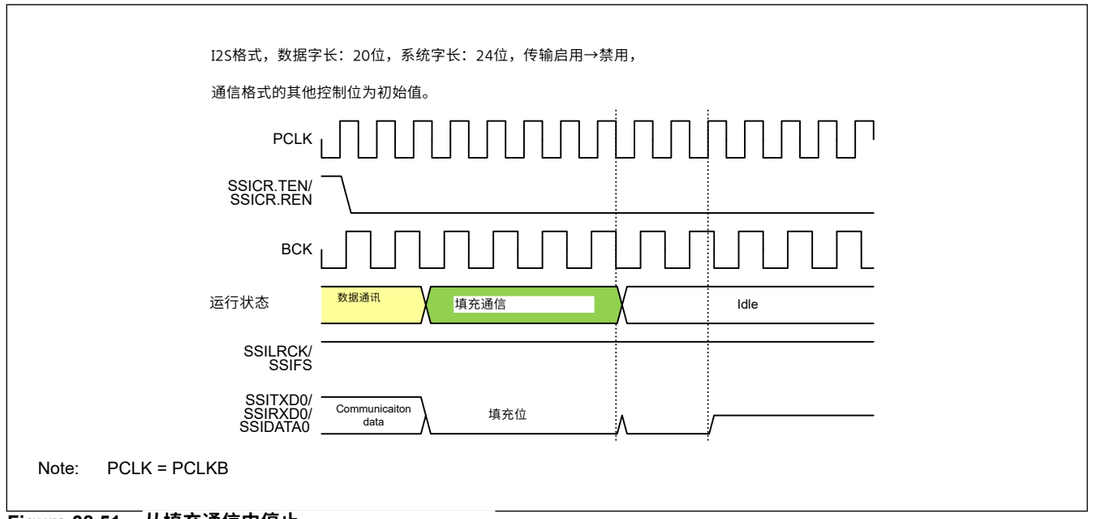

Figure 38.51 从填充通信中停止

38.8 通讯操作

图38.52显示了SSIE的通信流程。

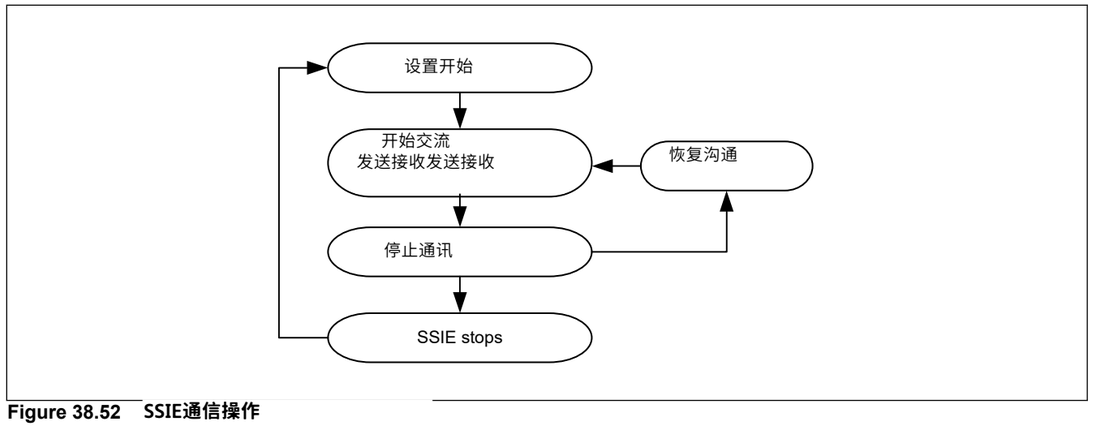

Figure 38.52 SSIE通信操作

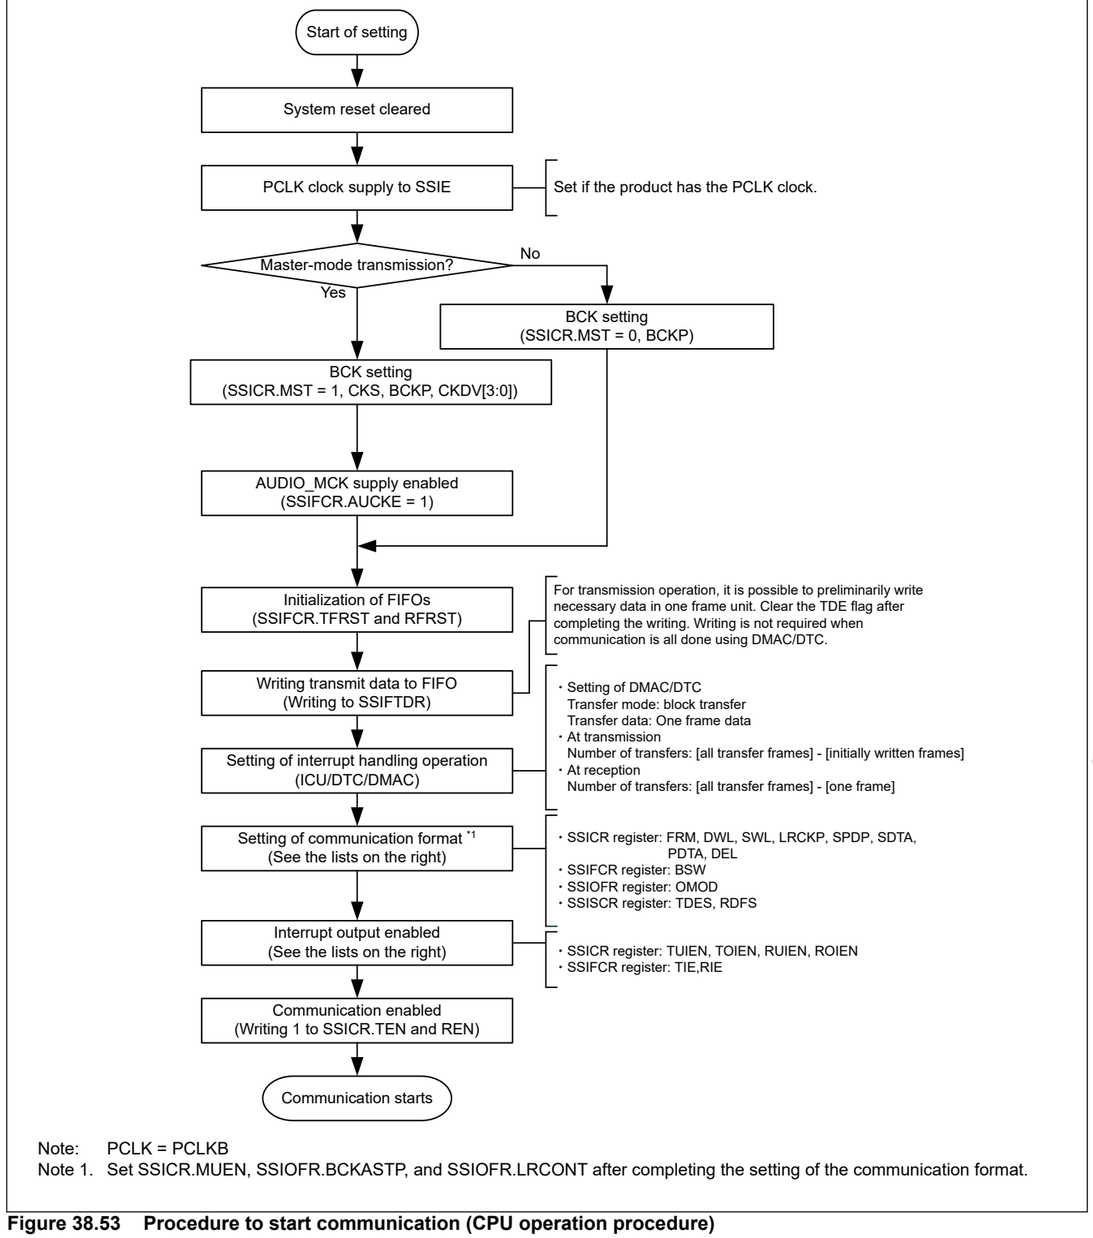
每个操作的过程在第38.8.1节中描述。开始与第38.8.7节的通信。恢复Communication.

38.8.1 开始沟通

本节介绍如何启动SSIE通信。图38.53显示了开始通信的过程。请务必遵守程序。请参阅第38.8.2节。传输操作和第38.8.3节的传输。接收操作的接收。



Note: PCLK = PCLKB
Note 1. Set SSICR.MUEN, SSIOFR.BCKASTP, and SSIOFR.LRCONT after completing the setting of the communication format.

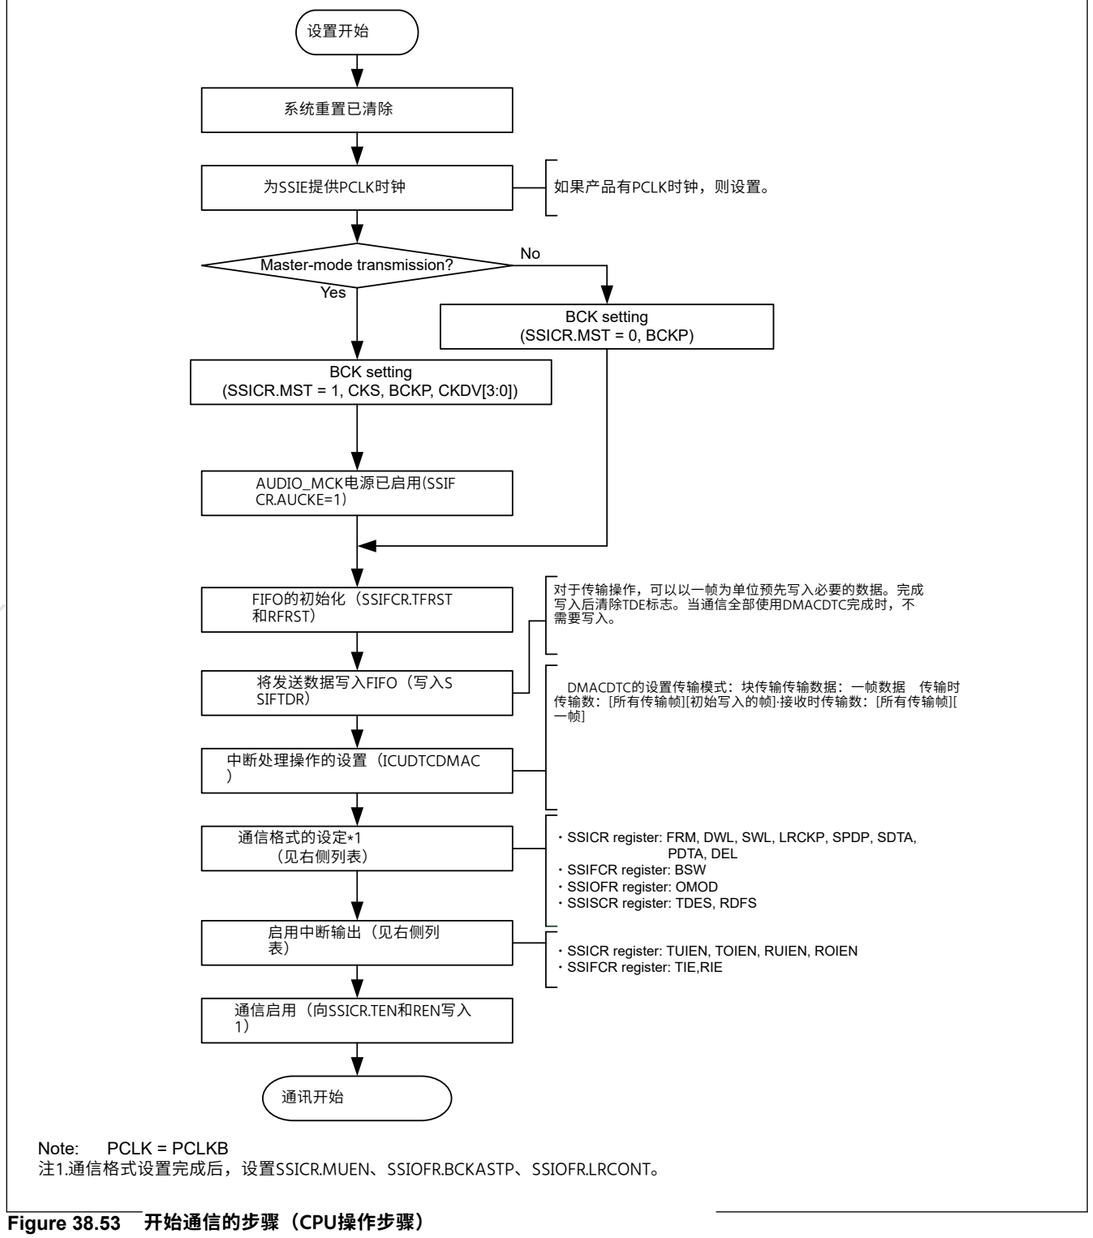
Figure 38.53 Procedure to start communication (CPU operation procedure)

SSIE can perform continuous communication based on interrupts by the DTC/DMAC. For transmission, write 1 to SSIFCR.TIE, SSICR.TUIEN, and SSICR.TOIEN. For reception, write 1 to SSIFCR.RIE, SSICR.RUIEN, and SSICR.ROIEN.

38.8.2 Transmission

The transmission procedure in Figure 38.54 must be followed throughout a transmission operation.

After transmission is enabled (SSICR.TEN = 1 and SSICR.REN = 0), SSIE starts transmission when a start trigger is generated by SSILRCK/SSIFS with the serial data for at least a frame contained in the transmit FIFO data register



Note: PCLK = PCLKB
注1.通信格式设置完成后，设置SSICR.MUEN、SSIOFR.BCKASTP、SSIOFR.LRCONT。

Figure 38.53 开始通信的步骤（CPU操作步骤）

SSIE可以根据DTCDMAC的中断执行连续通信。对于传输，写入1到SSIFCR.TIE、SSICR.TUIEN和SSICR.TOIEN。对于接收，将1写入SSIFCR.RIE、SSICR.RUIEN和SSICR.ROIEN.

38.8.2 Transmission

在整个传输操作中必须遵循图38.54中的传输过程。

使能传输后（SSICR.TEN=1和SSICR.REN=0），当SSILRCKSSIFS使用发送FIFO数据寄存器中包含的至少一帧的串行数据生成启动触发时，SSIE开始传输

(SSIFTDR). SSIE outputs a transmit data empty interrupt to the DTC/DMAC according to the TDE setting condition (SSISCR.TDES) and the status of transmit data empty interrupt enable (SSIFCR.TIE) bit specified in the communication start procedure. This interrupt requests writing to the transmit FIFO data register (SSIFTDR). In the communication start procedure, specify writing to the transmit FIFO data register (SSIFTDR) as the DTC/DMAC operation in response to the transmit data empty interrupt. With this setting, SSIE can continuously transmit data not through the CPU. The transmit data empty interrupt is generated when the free space size of transmit FIFO data register reaches the value set in SSISCR.TDES. The number of times of writing must be specified in accordance with the free space size of the transmit FIFO data register indicated by the transmit data empty interrupt. If an error occurs, perform the error-handling procedure as instructed in the communication stop procedure.

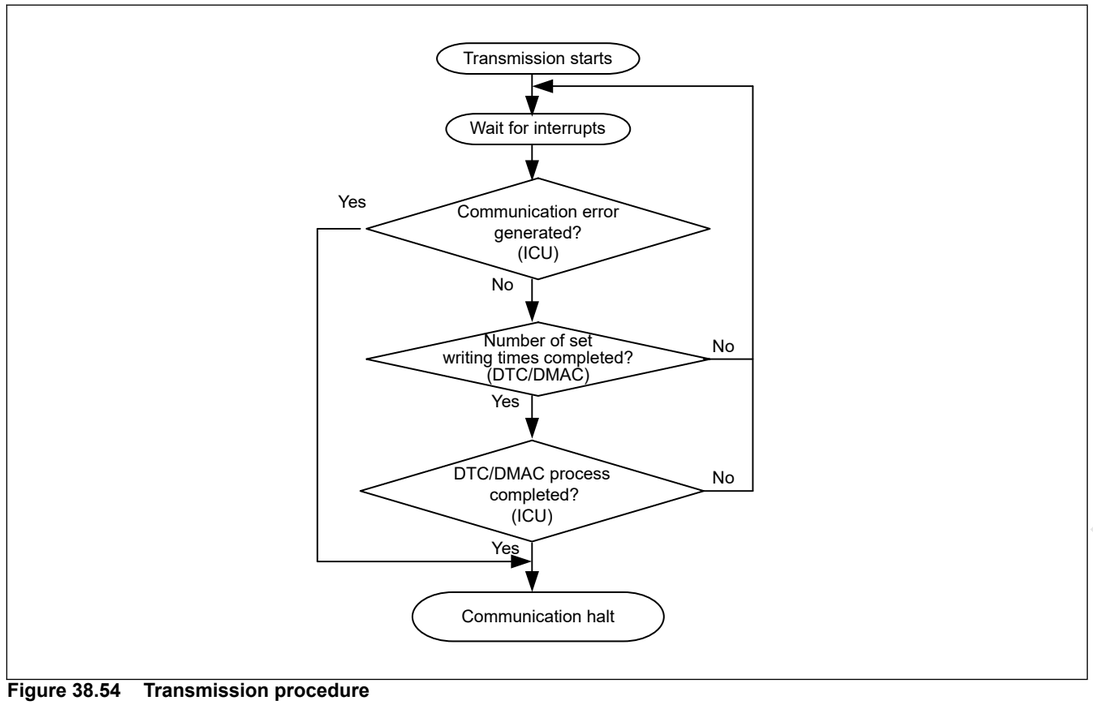


Figure 38.54 Transmission procedure

Note: The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.TDE to write data to SSIFTDR. The number of times of writing data to SSIFTDR by detecting the value 1 of SSIFSR.TDE must be in accordance with the free space size of the transmit FIFO data register specified by SSISCR.TDES. After as much transmit data as the free space size is written to SSIFTDR, the SSIFSR.TDE flag must be cleared. Continuous transmission is enabled by repeating data writing. If the SSIFSR.TDE flag is not cleared, the flag is not cleared automatically.

38.8.3 Reception

The reception procedure in Figure 38.55 must be followed throughout a reception operation.

After reception is enabled (SSICR.TEN = 0 and SSICR.REN = 1), SSIE starts reception when a start trigger is generated by SSILRCK/SSIFS. SSIE outputs a receive data full interrupt to the DTC/DMAC according to the RDF setting condition (SSISCR.RDFS) and the status of receive data full interrupt enable (SSIFCR.RIE) bit specified in the communication start procedure. This interrupt requests data reading from the receive FIFO data register (SSIFRDR). In the communication start procedure, specify reading from the receive FIFO data register (SSIFRDR) as the DTC/DMAC operation in response to the receive data full interrupt. With this setting, SSIE can continuously read data not through the CPU. The receive data full interrupt is generated when data as much as the capacity of receive FIFO data register has been stored. The number of times of reading must be specified in accordance with the data size of the receive FIFO data register indicated by the receive data full interrupt. If an error occurs, perform the error-handling procedure as instructed in the communication stop procedure.

(SSIFTDR)。SSIE根据通信启动过程中指定的TDE设置条件(SSISCR.TDES)和发送数据空中断使能(SSIFCR.TIE)位的状态，向DTCDMAC输出一个发送数据空中断。该中断请求写入发送FIFO数据寄存器(SSIFTDR)。在通信开始过程中，将写入发送FIFO数据寄存器(SSIFTDR)指定为DTCDMAC操作以响应发送数据空中断。使用此设置，SSIE可以不通过CPU连续传输数据。当发送FIFO数据寄存器的可用空间大小达到SISSCR.TDES中设置的值时，将产生发送数据空中断。写入次数必须根据发送数据空中断指示的发送FIFO数据寄存器的空闲空间大小来指定。如果发生错误，请按照通信停止程序中的说明执行错误处理程序。

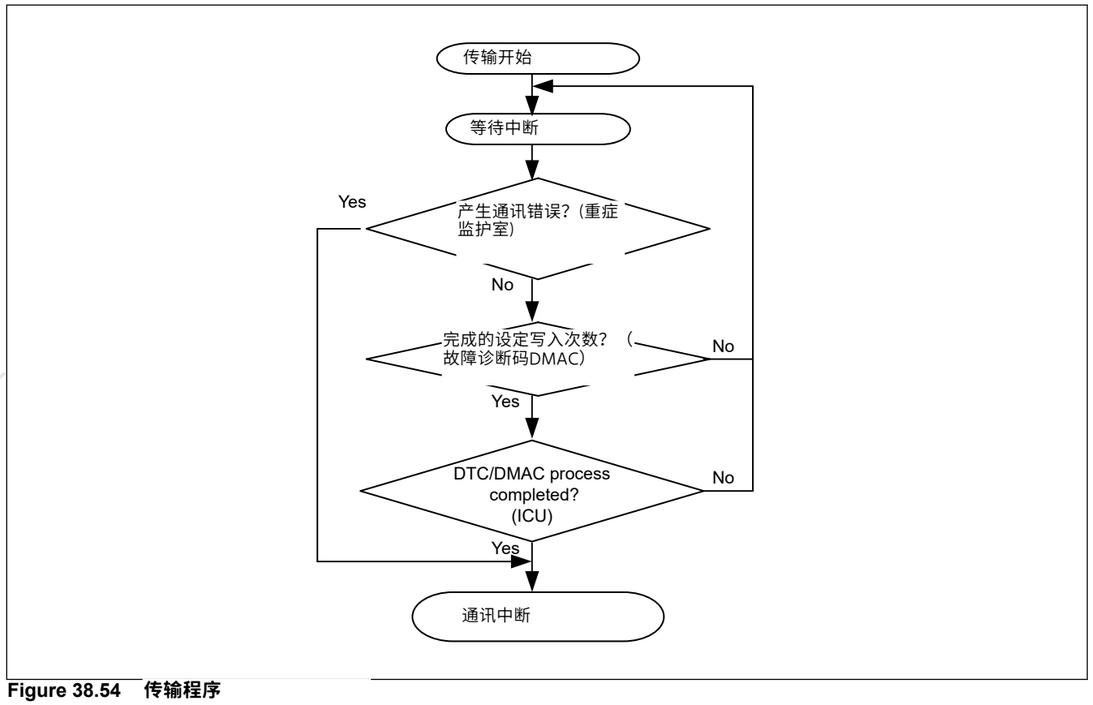

Figure 38.54 传输程序

Note: SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.TDE的值1以将数据写入SSIFTDR。通过检测SSIFSR.TDE的值为1向SSIFTDR写入数据的次数必须与SSIFSR.TDES指定的发送FIFO数据寄存器的空闲空间大小一致。在将与可用空间大小一样多的传输数据写入SSIFTDR后，必须清除SSIFSR.TDE标志。通过重复数据写入启用连续传输。如果

SSIFSR.TDE标志不清除，该标志不会自动清除。

38.8.3 Reception

在整个接收操作中必须遵循图38.55中的接收程序。

使能接收后（SSICR.TEN=0和SSICR.REN=1），SSIE会在以下条件产生开始触发时开始接收SSILRCKSSIFS。SSIE根据RDF设置条件(SSISCR.RDFS)和通信开始过程中指定的接收数据满中断使能(SSIFCR.RIE)位的状态向DTCDMAC输出一个接收数据满中断。该中断请求从接收FIFO数据寄存器(SSIFRDR)读取数据。在通信启动过程中，指定从接收FIFO数据寄存器(SSIFRDR)读取作为DTCDMAC操作以响应接收数据满中断。通过此设置，SSIE可以不通过CPU连续读取数据。当数据达到接收FIFO数据寄存器的容量时，产生接收数据满中断。读取次数必须根据接收数据满中断指示的接收FIFO数据寄存器的数据大小来指定。如果发生错误，请按照通信停止程序中的说明执行错误处理程序。

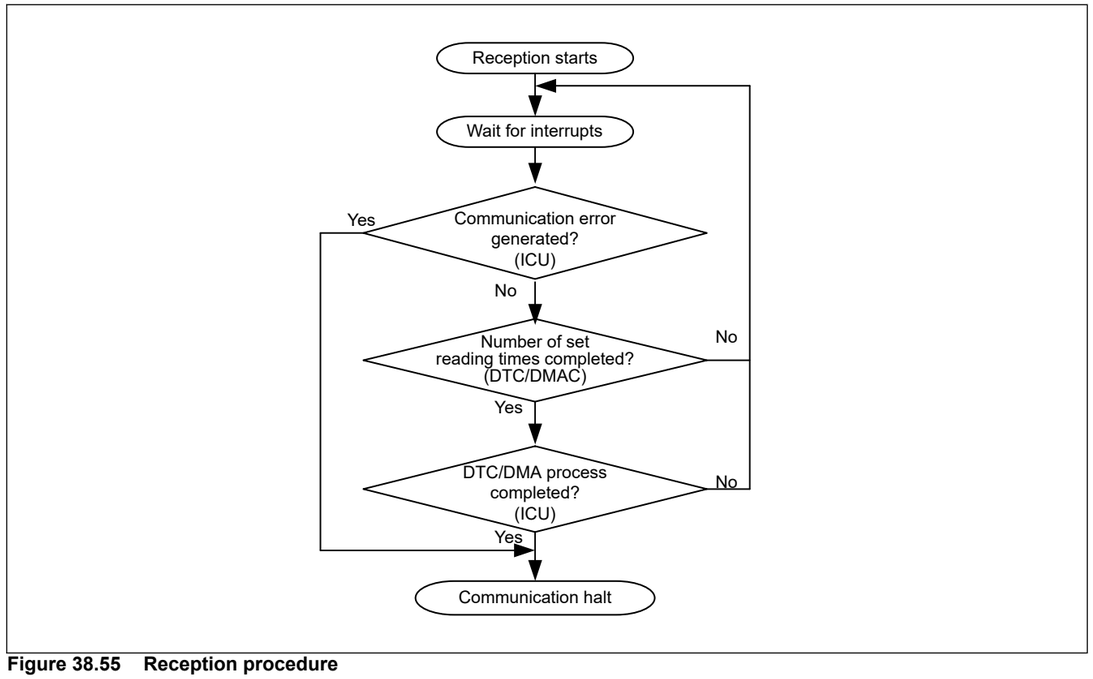

Figure 38.55 Reception procedure

Note: The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.RDF to read data from SSIFRDR. The number of times of reading data from SSIFRDR by detecting the value 1 of SSIFSR.RDF must be in accordance with the receive data storage capacity of the receive FIFO data register specified by SSISCR.RDFS. After received data is read from SSIFRDR, the SSIFSR.RDF flag must be cleared. Continuous reception is enabled by repeating data reading. If the SSIFSR.RDF flag is not cleared, the flag is not cleared automatically.

38.8.4 Transmission and Reception

After transmission and reception are enabled (SSICR.TEN = 1 and SSICR.REN = 1), SSIE starts transmission and reception when a start trigger is generated by SSILRCK/SSIFS with the serial data for at least a frame contained in the transmit FIFO data register (SSIFTDR). SSIE can continuously transmit and receive data by performing the procedures described in section 38.8.2. Transmission and section 38.8.3. Reception, respectively. For how to stop transmission and reception, see section 38.8.5. Halt Communication.

38.8.5 Halt Communication

This section describes how to halt communication of SSIE. Figure 38.56 shows the procedure to halt communication. Be sure to follow the procedure.

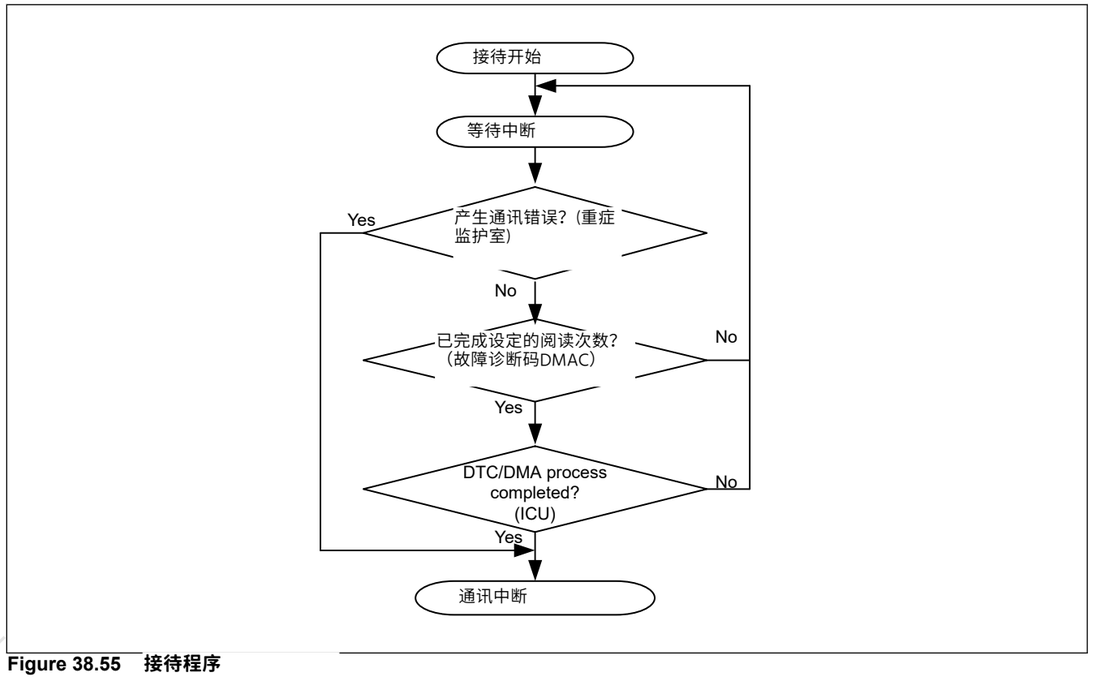

Figure 38.55 接待程序

Note: SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.RDF的值1以从SSIFRDR读取数据。检测SSIFSR.RDF的值为1从SSIFRDR读取数据的次数必须与SSISCR.RDFS指定的接收FIFO数据寄存器的接收数据存储容量一致。从SSIFRDR读取接收到的数据后，必须清除SSIFSR.RDF标志。通过重复数据读取启用连续接收。如果SSIFSR.RDF标志未清除，则该标志不会自动清除。

38.8.4 传输和接收

启用发送和接收后（SSICR.TEN=1和SSICR.REN=1），当SSILRCKSSIFS使用发送FIFO数据寄存器中包含的至少一帧的串行数据产生开始触发时，SSIE开始发送和接收(SSIFTDR)。SSIE可以通过执行第38.8.2节中描述的过程来连续发送和接收数据。传输和第38.8.3节。接待处，分别。关于如何停止发送和接收，请参见第38.8.5节。停止通讯。

38.8.5 停止通讯

本节介绍如何停止SSIE的通信。图38.56显示了停止通信的过程。请务必遵守程序。

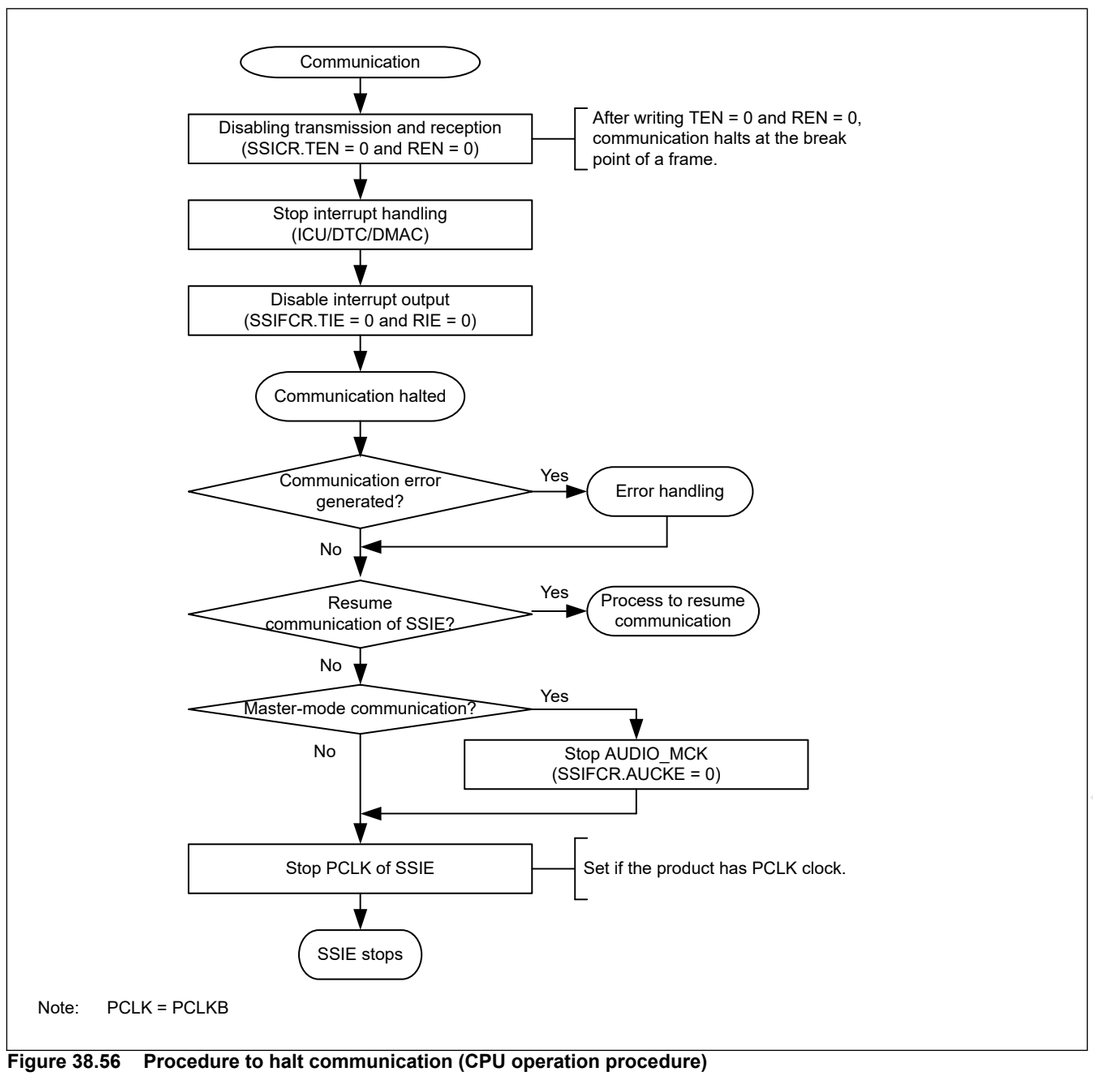

Figure 38.56 Procedure to halt communication (CPU operation procedure)

To halt the communication of SSIE, supply of the following clocks are required until the SSISR.IIRQ bit indicates an idle state.

- Input clock from the SSIBCK pin when SSICR.MST = 0
- AUDIO_MCK when SSICR.MST = 1
  To resume communication of SSIE in the previous setting, see section 38.8.7. Resume Communication.

Note: When communication of SSIE is halted according to the procedure to halt communication in Figure 38.56, resume communication according to the procedure to resume communication in Figure 38.58.

38.8.6 Error Handling

SSIE has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error

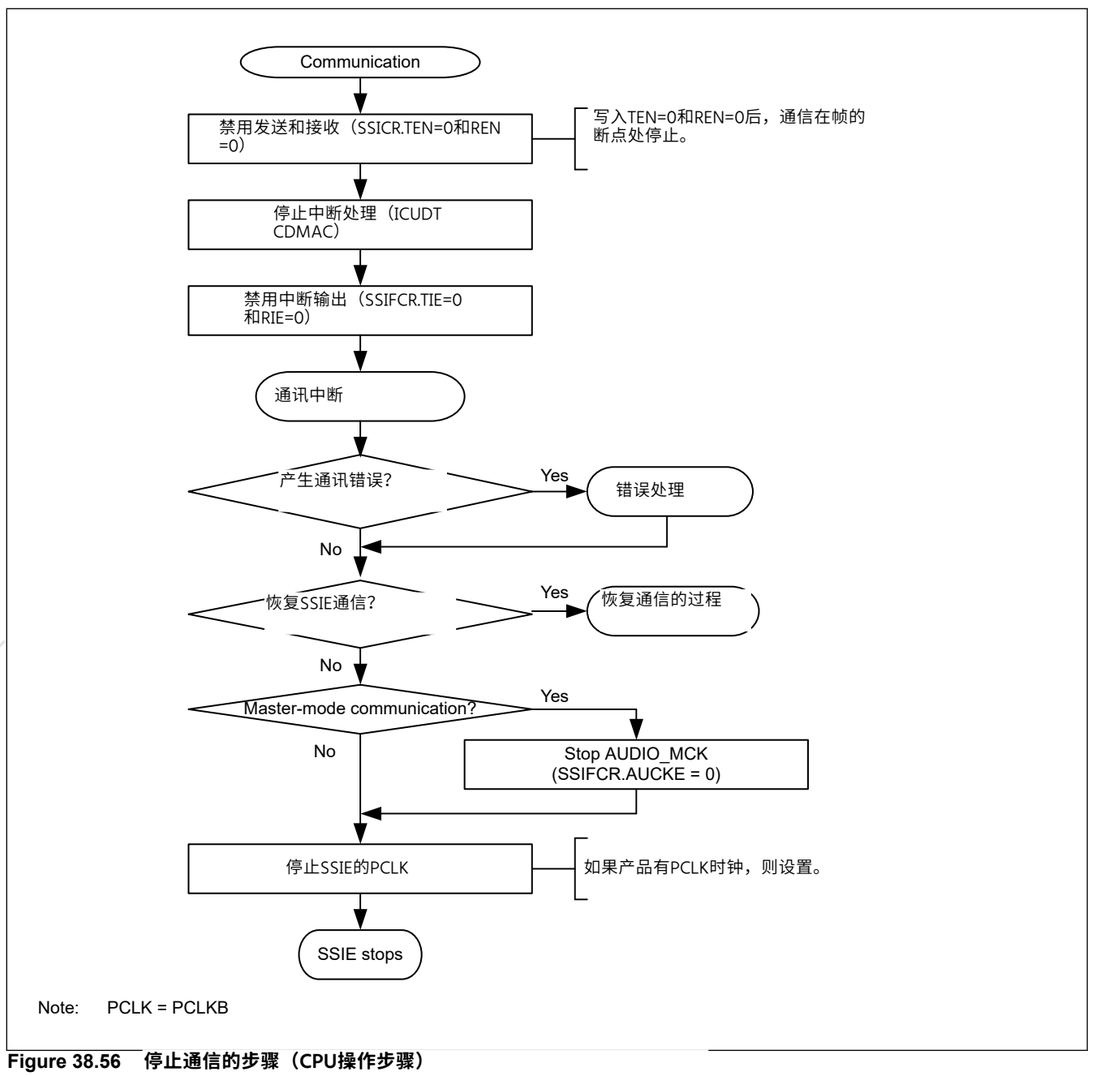

Figure 38.56 停止通信的步骤（CPU操作步骤）

要停止SSIE的通信，需要提供以下时钟，直到SSISR.IIRQ位指示空闲状态。

- ●当SSICR.MST=0时，来自SSIBCK引脚的输入时钟
- AUDIO_MCK when SSICR.MST = 1
  要恢复之前设置的SSIE通信，请参阅第38.8.7节。恢复通信。

Note: 当SSIE的通信按照图38.56中的停止通信程序停止时，按照图38.58中的恢复通信程序恢复通信。

38.8.6 错误处理

SSIE有以下四个错误。

- ●发送下溢错误
- ●发送溢出错误
- ●接收下溢错误

- Receive overflow error.

When an underflow error or overflow error is generated, SSIE need to be restarted. Follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

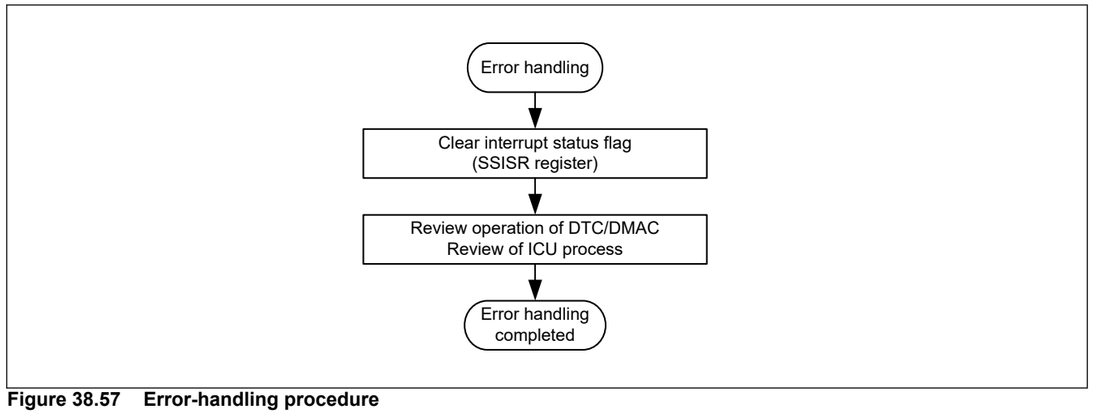

Figure 38.57 Error-handling procedure

Four error operations are described as follows. When the interrupt output enable bit of the SSICR register is enabled and error flags are set, an error interrupt is generated. See section 38.4.2. SSISR : Status Register for the setting conditions of error flags.

(1) Transmit Underflow Error

If a transmit underflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to a transmit data empty interrupt. After a transmit underflow error occurs, SSIE outputs 0s as data. To normally output the serial data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA0 pin, follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57. After this error occurs, serial data is consumed as usual. If you resume communication, write the serial data from the beginning.

(2) Transmit Overflow Error

If a transmit overflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to transmit data empty interrupts. The serial data written to the transmit FIFO data register (SSIFTDR) that caused the transmit overflow error becomes invalid. This error can occur regardless of whether a transmission operation is being done. To recover from the error, follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57. When you resume communication, deal with the invalid serial data appropriately.

(3) Receive Underflow Error

If a receive underflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The values read from the receive FIFO data register (SSIFRDR) that caused the receive underflow error are undefined. This error can occur regardless of whether a reception operation is being done. To recover from the error, follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

(4) Receive Overflow Error

If a receive overflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The receive data that caused the receive overflow error cannot be stored in the receive FIFO data register (SSIFRDR). To recover from the error, follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

38.8.7 Resume Communication

When you resume the communication using SSIE, follow the communication resume procedure in Figure 38.58. The communication resume procedure is designed on the assumption that you resume the communication stopped by the

●接收溢出错误。

当产生下溢错误或上溢错误时，需要重启SSIE。按照图38.56中的程序停止通信和图38.57中的错误处理程序。

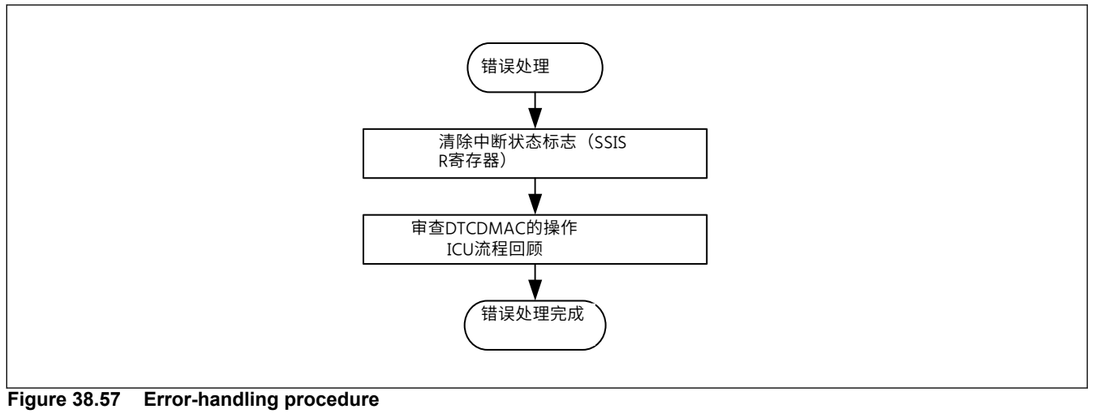

Figure 38.57 Error-handling procedure

四种错误操作描述如下。当SSICR寄存器的中断输出使能位使能且错误标志置位时，将产生错误中断。请参阅第38.4.2节。SSISR：错误标志设置条件的状态寄存器。

(1) 发送下溢错误

如果发生发送下溢错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。发生发送下溢错误后，SSIE输出0作为数据。要将写入发送FIFO数据寄存器(SSIFTDR)的串行数据正常输出到SSITXD0SSIDATA0引脚，请按照图38.56中的程序停止通信和图38.57中的错误处理程序进行操作。发生此错误后，串行数据将照常使用。如果您恢复通信，请从头开始写入串行数据。

(2) 传输溢出错误

如果发生发送溢出错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。写入导致发送溢出错误的发送FIFO数据寄存器(SSIFTDR)的串行数据变为无效。无论是否正在执行传输操作，都可能发生此错误。要从错误中恢复，请按照图38.56中的程序停止通信和图38.57中的错误处理程序。当您恢复通信时，请适当处理无效的串行数据。

(3) 接收下溢错误

如果发生接收下溢错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。从导致接收下溢错误的接收FIFO数据寄存器(SSIFRDR)读取的值未定义。无论是否正在执行接收操作，都可能发生此错误。要从错误中恢复，请按照图38.56中的程序停止通信和图38.57中的错误处理程序。

(4) 接收溢出错误

如果发生接收溢出错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收溢出错误的接收数据不能存储在接收FIFO数据寄存器(SSIFRDR)中。要从错误中恢复，请按照图38.56中的程序停止通信和图38.57中的错误处理程序。

38.8.7 恢复沟通

当您使用SSIE恢复通信时，请遵循图38.58中的通信恢复过程。通信恢复过程的设计假设您恢复了由

communication stop procedure without changing any settings. If you want to change clock and slave/master settings, use and follow the communication start procedure in Figure 38.53. For details about the transmission operation and reception operation after starting communication, see section 38.8.2. Transmission and section 38.8.3. Reception, respectively.

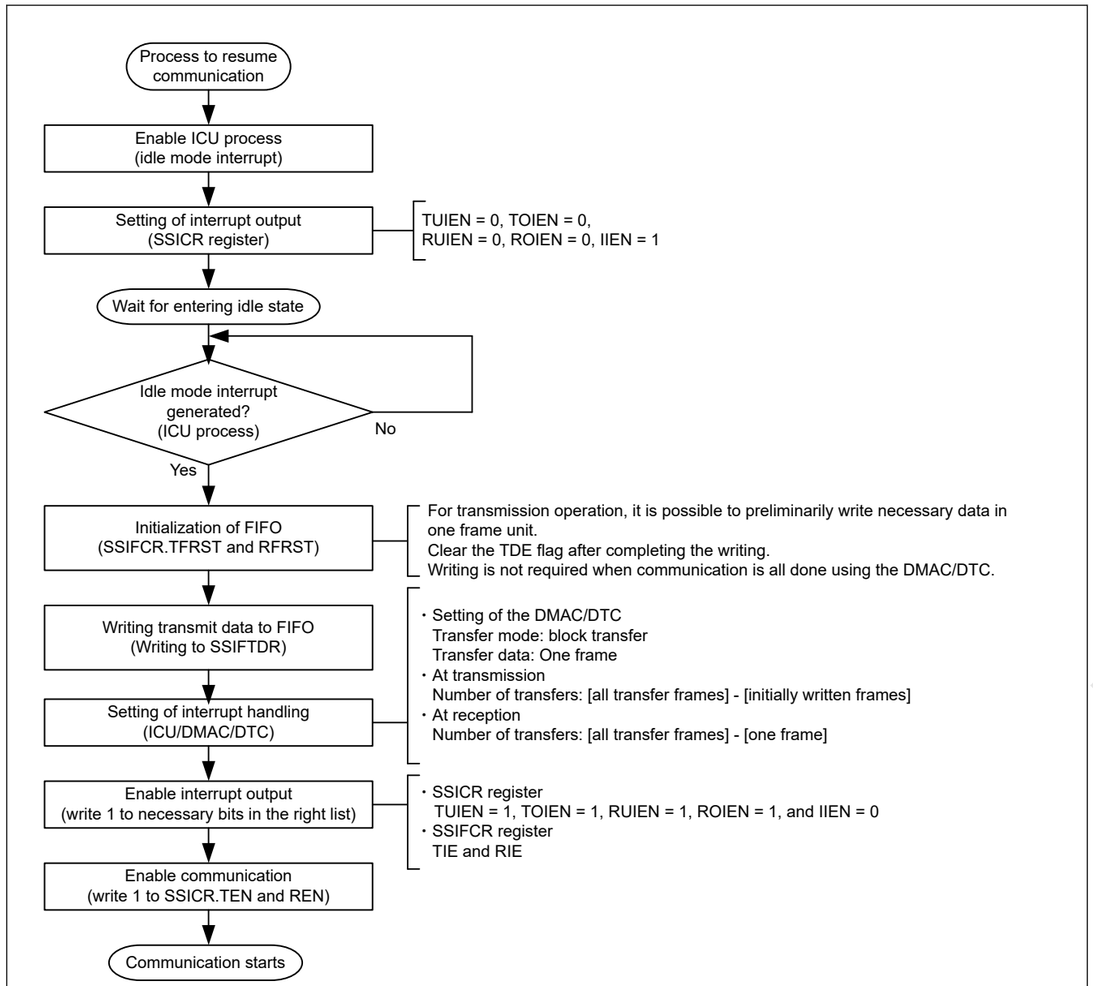

Figure 38.58 Procedure to resume communication (CPU operation procedure)

38.9 Interrupts

Table 38.16 lists the interrupt sources. Set enable/disable of interrupt output of each source with the TUIEN, TOIEN, RUIEN, ROIEN, and IIEN bits in the SSICR register and the TIE and RIE bits in the SSIFCR register.

通信停止程序，无需更改任何设置。如果要更改时钟和从主机设置，请使用并遵循图38.53中的通信启动程序。关于开始通信后的发送动作和接收动作的详细内容，请参阅38.8.2节。传输和第38.8.3节。接待处，分别。

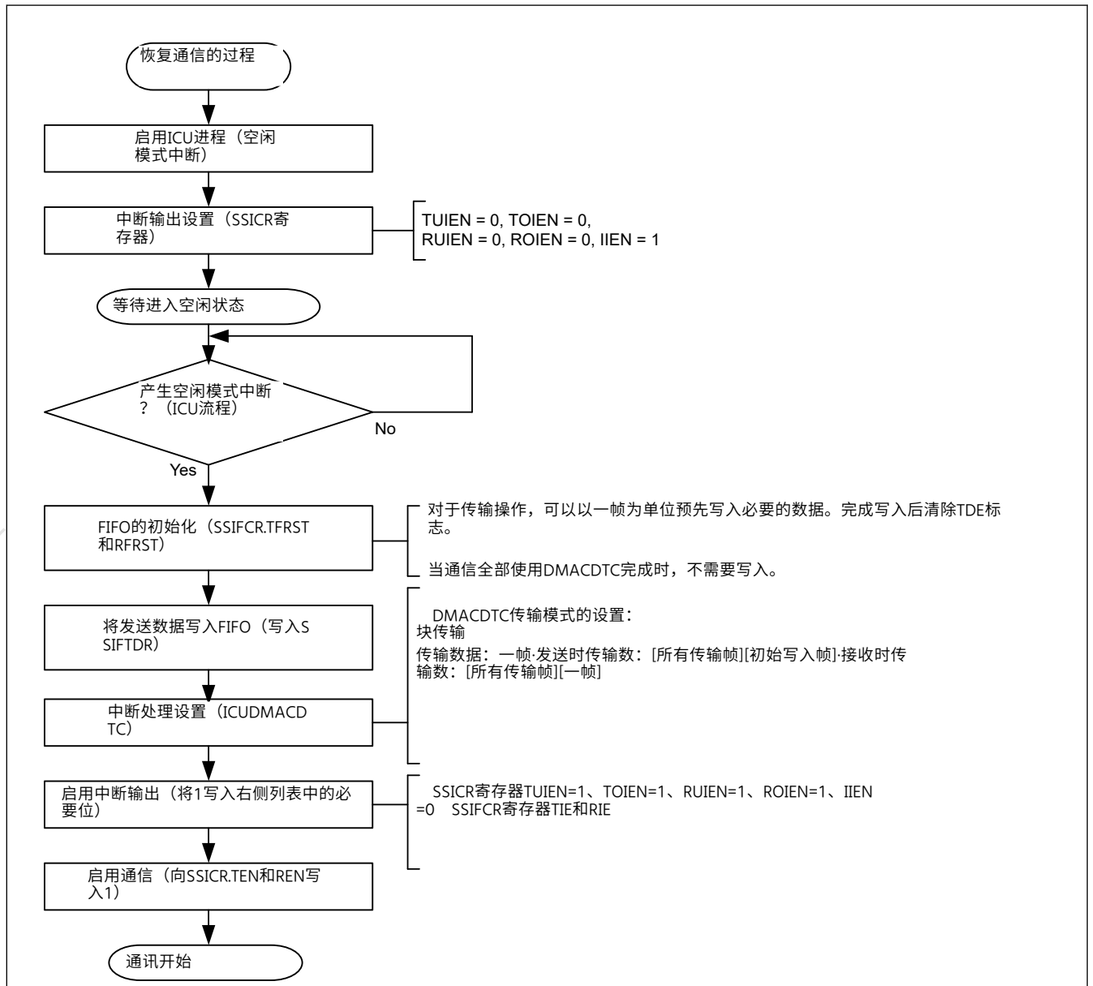

Figure 38.58 恢复通信的步骤（CPU操作步骤）

38.9 Interrupts

表38.16列出了中断源。使用TUIEN、TOIEN、SSICR寄存器中的RUIEN、ROIEN和IIEN位以及SSIFCR寄存器中的TIE和RIE位。

Table 38.16 SSIE interrupt sources

Channel	Interrupt source	Description	Interrupt flag	DMAC/DTC activation
SSIE0	SSIE0_SSIF	• Transmit underflow interrupt • Transmit overflow interrupt • Receive underflow interrupt • Receive overflow interrupt • Idle interrupt	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	Not possible
	SSIE0_SSIRXI	Receive data full interrupt	SSIFSR.RDF	Possible
	SSIE0_SSITXI	Transmit data empty interrupt	SSIFSR.TDE	Possible

38.9.1 SSIE0_SSIF Interrupt

This interrupt source combines five interrupts. Enable output of necessary interrupts before using SSIE. The five interrupts are operated by using the flags assigned to individual interrupts and interrupt output enable bits. To clear an interrupt, set the interrupt enable to 0 or clear the interrupt flag to 0.

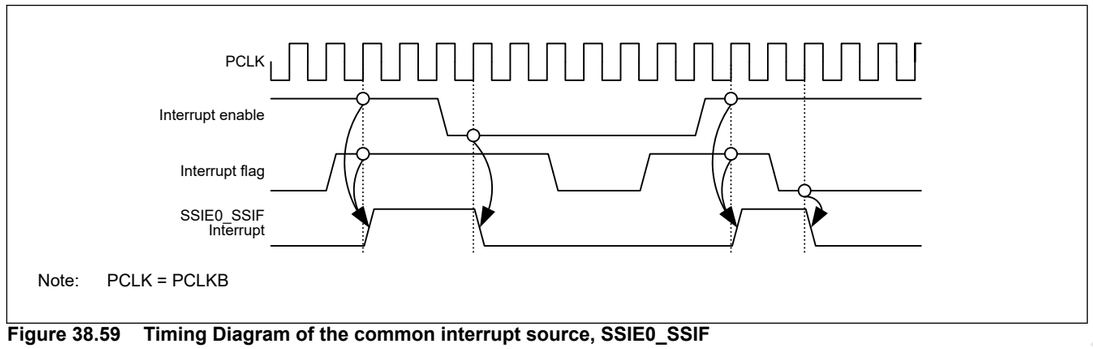

Figure 38.59 Timing Diagram of the common interrupt source, SSIE0_SSIF

- Transmit underflow interrupt

As the transmit underflow interrupt, SSISR.TUIRQ is output while SSICR.TUIEN = 1. When you use SSIE for transmission, enable the output of this interrupt (SSICR.TUIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

- Transmit overflow interrupt

As the transmit overflow interrupt, SSISR.TOIRQ is output while SSICR.TOIRQ = 1. When you use SSIE for transmission, enable the output of this interrupt (SSICR.TOIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

- Receive underflow interrupt

As the receive underflow interrupt, SSISR.RUIRQ is output while SSICR.RUIRQ = 1. When you use SSIE for reception, enable the output of this interrupt (SSICR.RUIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

- Receive overflow interrupt

As the receive overflow interrupt, SSISR.ROIRQ is output while SSICR.ROIRQ = 1. When you use SSIE for reception, enable the output of this interrupt (SSICR.ROIRQ = 1). If this interrupt occurs, follow instructions in the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

- Idle mode interrupt

As the idle mode interrupt, SSISR.IIRQ is output while SSICR.IIEN = 1. This interrupt is used to make sure that communication has stopped fully.

Table 38.16 SSIE中断源

Channel	中断源	Description	中断标志	DMAC/DTC activation
SSIE0	SSIE0_SSIF	• 发送下溢中断 • 发送溢出中断 • 接收下溢中断 • 接收溢出中断 • 空闲中断	SSISR.TUIRQ SSISR.TOIRQ SSISR.RUIRQ SSISR.ROIRQ SSISR.IIRQ	不可能
	SSIE0_SSIRXI	接收数据满中断	SSIFSR.RDF	Possible
	SSIE0_SSITXI	发送数据空中断	SSIFSR.TDE	Possible

38.9.1 SSIE0_SSIF Interrupt

该中断源结合了五个中断。在使用SSIE之前启用必要中断的输出。通过使用分配给各个中断的标志和中断输出使能位来操作五个中断。要清除中断，请将中断使能设置为0或将中断标志清除为0。

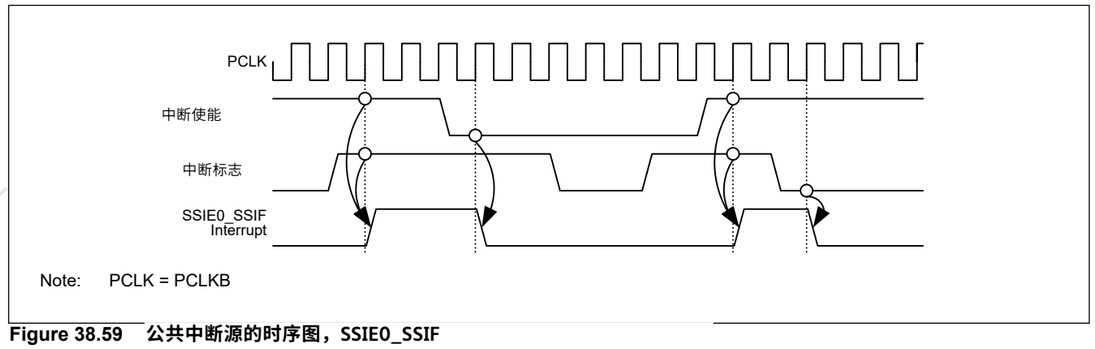

Figure 38.59 公共中断源的时序图，SSIE0_SSIF

●发送下溢中断

作为发送下溢中断，在SSICR.TUIEN=1时输出SSISR.TUIRQ。当使用SSIE进行发送时，使能该中断的输出（SSICR.TUIRQ=1）。如果发生此中断，请按照图38.56中的停止通信过程和图38.57中的错误处理过程中的说明进行操作。

●发送溢出中断

作为发送溢出中断，在SSICR.TOIRQ=1时输出SSISR.TOIRQ。当使用SSIE进行发送时，使能该中断的输出（SSICR.TOIRQ=1）。如果发生此中断，请按照图38.56中的停止通信过程和图38.57中的错误处理过程中的说明进行操作。

●接收下溢中断

作为接收下溢中断，在SSICR.RUIRQ=1时输出SSISR.RUIRQ。当使用SSIE进行接收时，使能该中断的输出（SSICR.RUIRQ=1）。如果发生此中断，请按照图38.56中的停止通信过程和图38.57中的错误处理过程中的说明进行操作。

●接收溢出中断

作为接收溢出中断，在SSICR.ROIRQ=1时输出SSISR.ROIRQ。当使用SSIE进行接收时，使能该中断的输出（SSICR.ROIRQ=1）。如果发生此中断，请按照图38.56中的停止通信过程和图38.57中的错误处理过程中的说明进行操作。

●空闲模式中断

作为空闲模式中断，在SSICR.IIEN=1时输出SSISR.IIRQ。此中断用于确保通信已完全停止。

38.9.2 SSIE0_SSITXI Interrupt

The transmit data empty interrupt is a pulse interrupt that is output when the following condition is met:

- SSIFCR.TIE = 1 and SSIFSR.TDE = 1
  SSIE operation: When the value of SSIFSR.TDE changes from 0 to 1 while the value of SSIFCR.TIE is 1
  CPU instruction: When the value of SSIFCR.TIE changes from 0 to 1 while the value of SSIFSR.TDE is 1

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC/DMAC is busy (when the DTC/DMAC cannot accept interrupts), the interrupt suppression function holds the output of this interrupt. The held interrupt will be output after the DTC/DMAC is enabled to accept interrupts. For details, see Figure 38.60.

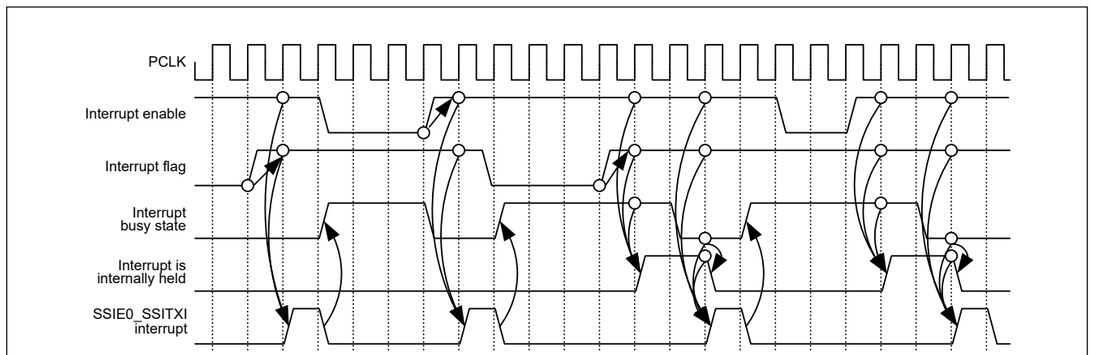

Figure 38.60 SSIE0_SSITXI interrupt timing diagram

38.9.3 SSIE0_SSIRXI Interrupt

The receive data full interrupt is a pulse interrupt that is output when the following condition is met:

- SSIFCR.RIE = 1 and SSIFSR.RDF = 1.
  SSIE operation: When the value of SSIFSR.RDF changes from 0 to 1 while the value of SSIFCR.RIE is 1
  CPU instruction: When the value of SSIFCR.RIE changes from 0 to 1 while the value of SSIFSR.RDE is 1

This interrupt is subject to the interrupt suppression function. If an interrupt condition for this interrupt occurs when the DTC/DMAC is busy (when the DTC/DMAC cannot accept interrupts), the interrupt suppression function holds the output of this interrupt. The held interrupt will be output after the DTC/DMAC is enabled to accept interrupts. The behavior of this interrupt is the same as the behavior shown in Figure 38.60.

38.10 Software Resets

SSIE has three software reset bits to reset its states.

- SSIE software reset (SSIFCR.SSIRST)
- Transmit FIFO data register reset (SSIFCR.TFRST)
- Receive FIFO data register reset (SSIFCR.RFRST).

This section describes the procedures for the three types of software resets.

38.10.1 Software Reset Procedure

(1) SSIE Software Reset

For the SSIE software reset bit (SSIFCR.SSIRST), follow the procedure shown in Figure 38.61. After a reset, the same setting is applied when it is resumed. To change the settings of clocks and slave/master mode, follow the procedure to start

38.9.2 SSIE0_SSITXI Interrupt

发送数据空中断是一个脉冲中断，当满足以下条件时输出：

- SSIFCR.TIE = 1 and SSIFSR.TDE = 1
  SSIE操作：当SSIFSR.TDE的值从0变为1且SSIFCR.TIE的值为1时CPU指令：当SSIFCR.TIE的值从0变为1且SSIFSR.TDE的值为1时

该中断受中断抑制功能影响。如果在DTCDMAC忙时（当DTCDMAC不能接受中断时）发生此中断的中断条件，则中断抑制功能保持此中断的输出。在DTCDMAC使能接受中断后，将输出保持的中断。详见图38.60。

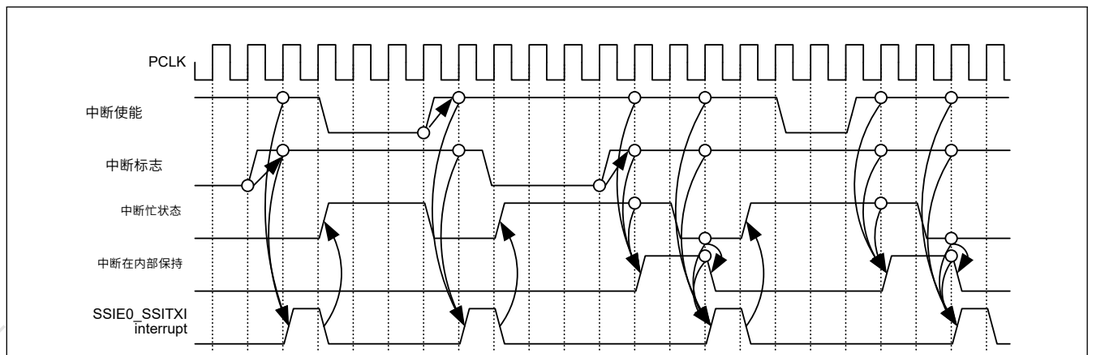

Figure 38.60 SSIE0_SSITXI中断时序图

38.9.3 SSIE0_SSIRXI Interrupt

接收数据满中断是一个脉冲中断，当满足以下条件时输出：

- SSIFCR.RIE = 1 and SSIFSR.RDF = 1.
  SSIE操作：当SSIFSR.RDF的值从0变为1且SSIFCR.RIE的值为1时CPU指令：当SSIFCR.RIE的值从0变为1且SSIFSR.RDE的值为1时

该中断受中断抑制功能影响。如果此中断的中断条件发生时，
DTCDMAC忙（当DTCDMAC不能接受中断时），中断抑制功能保持该中断的输出。在DTCDMAC使能接受中断后，将输出保持的中断。该中断的行为与图38.60中所示的行为相同。

38.10 软件复位

SSIE具有三个软件复位位来复位其状态。

- SSIE软件复位(SSIFCR.SSIRST)
- 发送FIFO数据寄存器复位(SSIFCR.TFRST)
- 接收FIFO数据寄存器复位(SSIFCR.RFRST)。

本节介绍三种软件复位的过程。

38.10.1 软件复位程序

(1) SSIE软件复位

对于SSIE软件复位位(SSIFCR.SSIRST)，请按照图38.61中所示的过程。重置后，恢复时应用相同的设置。要更改时钟和从主模式的设置，请按照以下步骤开始

communication in Figure 38.53. See section 38.8.2. Transmission and section 38.8.3. Reception respectively for transmission and reception after communication is resumed.

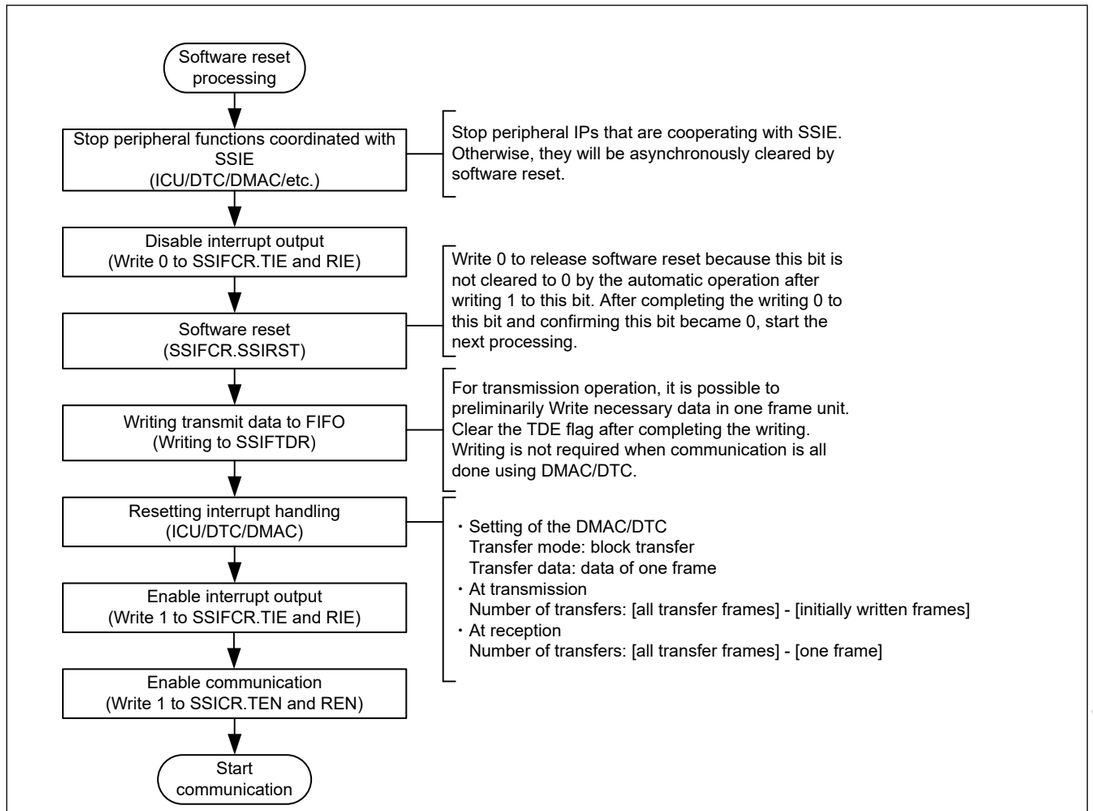

Figure 38.61 Software reset procedure (CPU operation procedure)

(2) Transmit FIFO data register reset

To perform a transmit FIFO data register reset, follow instructions in the procedure to start communication in Figure 38.53 and procedure to resume communication in Figure 38.58.

(3) Receive FIFO data register reset

To perform a receive FIFO data register reset, follow instructions in the procedure to start communication in Figure 38.53 and procedure to resume communication in Figure 38.58.

38.11 Notes

38.11.1 Notes for Slave-mode Communication

38.11.1.1 ADCKE control

In slave-mode communication (SSICR.MST = 0), SSIE needs supply of SSIBCK. To stop BCK on the master side, make sure that SSIE is in the idle state (SSISR.IIRQ = 1). If BCK is stopped before SSIE becomes idle, take the procedure to start communication in Figure 38.53 or wait for an idle state by taking the procedure to resume communication in Figure 38.58.

图38.53中的通信。请参阅第38.8.2节。传输和第38.8.3节。接收分别用于通信恢复后的发送和接收。

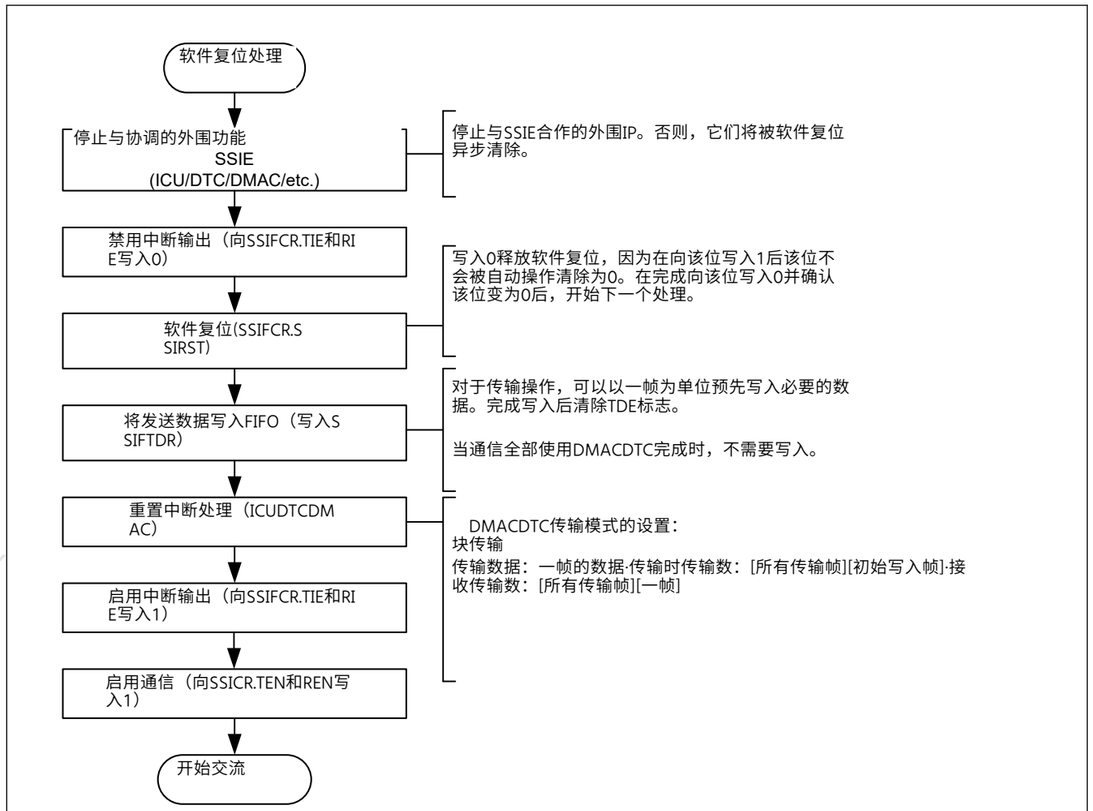

Figure 38.61 软件复位程序（CPU操作程序）

(2) 发送FIFO数据寄存器复位

要执行发送FIFO数据寄存器复位，请按照图38.53中的开始通信过程和图38.58中恢复通信的过程中的说明进行操作。

(3) 接收FIFO数据寄存器复位

要执行接收FIFO数据寄存器复位，请按照图38.53中的开始通信过程和图38.58中恢复通信的过程中的说明进行操作。

38.11 Notes

38.11.1 从模式通信注意事项

38.11.1.1 ADCKE control

在从模式通信(SSICR.MST=0)中，SSIE需要提供SSIBCK。要在主设备端停止BCK，请确保SSIE处于空闲状态(SSISR.IIRQ=1)。如果BCK在SSIE空闲之前停止，则按照图38.53中的程序开始通信，或者按照图38.58中的程序恢复通信等待空闲状态。

38.11.1.2 SSILRCK/SSIFS pin

SSIE has the SSILRCK/SSIFS pin, which indicates the synchronization of communication. When SSIE is in slave mode (SSICR.MST = 0), the communication format SSIE uses must match that of the other-party device to communicate. SSIE uses the signal input by the SSILRCK/SSIFS pin only as a trigger to start communication.

38.11.2 Notes for Master-mode Communication

38.11.2.1 ADCKE control

In master-mode communication (SSICR.MST = 1), SSIE operates with the audio clock (AUDIO_MCK). To stop SSIE completely, make sure that SSIE is in the idle state (SSISR.IIRQ = 1) and then write 0 to SSIFCR.ADCKE.

38.11.2.2 LRCONT control

To stop the output to the SSILRCK/SSIFS pin with SSIOFR.LRCONT when SSIE is in the idle state in master-mode communication (SSICR.MST = 1), note the following: The output stops when the value of the SSIOFR.LRCONT bit is changed from 1 to 0. Make sure that the other-party device is not affected. For details, see Figure 38.44.

38.11.2.3 BCKASTP control

To stop the output to the SSIBCK pin with SSIOFR.BCKASTP in master-mode communication (SSICR.MST = 1) and while SSIE is in the idle state, note the following: The output stops when the value of the SSIOFR.BCKASTP bit is changed from 0 to 1. So, make sure that the other-party device is not affected. For details, see Figure 38.45.

The BCKASTP bit cannot be used when the other-party device (which is a slave) requires the clock output from the SSIBCK pin before and during communication.

38.11.3 Notes for Communication Flow

38.11.3.1 When an error interrupt is generated

SSIE has the following four errors.

- Transmit underflow error
- Transmit overflow error
- Receive underflow error
- Receive overflow error

When an underflow error or overflow error is generated, SSIE need to be restarted. Follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

(1) Transmit Underflow Error

If a transmit underflow error occurs, review the number of times of writing data to the transmit FIFO data register (SSIFTDR) in response to a transmit data empty interrupt. After a transmit underflow error occurs, SSIE outputs 0s as data. To normally output the serial data written to the transmit FIFO data register (SSIFTDR) to the SSITXD0/SSIDATA0 pin, follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57. After this error occurs, serial data is consumed as usual. If you resume communication, write the serial data from the beginning.

(2) Transmit Overflow Error

If a transmit overflow error occurs, review the number of times of writing data to the Transmit FIFO Data Register (SSIFTDR) in response to transmit data empty interrupts. The serial data written to the Transmit FIFO Data Register (SSIFTDR) that caused the transmit overflow error becomes invalid. This error can occur regardless of whether a transmission operation is being done. To recover from the error, follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57. When you resume communication, deal with the invalid serial data appropriately.

38.11.1.2 SSILRCK/SSIFS pin

SSIE有SSILRCKSSIFS引脚，表示通信同步。当SSIE处于从机模式（SSICR.MST=0）时，SSIE使用的通信格式必须与对方设备的通信格式相匹配。SSIE仅使用SSILRCKSSIFS引脚输入的信号作为启动通信的触发器。

38.11.2 主模式通信注意事项

38.11.2.1 ADCKE control

在主模式通信(SSICR.MST=1)中，SSIE使用音频时钟(AUDIO_MCK)运行。要完全停止SSIE，请确保SSIE处于空闲状态(SSISR.IIRQ=1)，然后将0写入SSIFCR.ADCKE。

38.11.2.2 LRCONT control

当SSIE在主模式通信中处于空闲状态时（SSICR.MST=1），要使用SSIOFR.LRCONT停止向SSILRCKSSIFS引脚的输出，请注意以下几点：当SSIOFR.LRCONT位的值为从1变为0。确保对方设备不受影响。详见图38.44。

38.11.2.3 BCKASTP control

要在主模式通信(SSICR.MST=1)和SSIE处于空闲状态时使用SSIOFR.BCKASTP停止向SSIBCK引脚的输出，请注意以下几点：当SSIOFR.BCKASTP位的值为从0变为1。因此，请确保对方设备不受影响。详见图38.45。

当对方设备（从设备）需要时钟输出时，不能使用BCKASTP位
SSIBCK引脚在通信之前和期间。

38.11.3 通信流程注意事项

38.11.3.1 产生错误中断时

SSIE有以下四个错误。

●发送下溢错误
●发送溢出错误
●接收下溢错误
●接收溢出错误

当产生下溢错误或上溢错误时，需要重启SSIE。按照图38.56中的程序停止通信和图38.57中的错误处理程序。

(1) 发送下溢错误

如果发生发送下溢错误，请查看响应发送数据空中断而将数据写入发送FIFO数据寄存器(SSIFTDR)的次数。发生发送下溢错误后，SSIE输出0作为数据。要将写入发送FIFO数据寄存器(SSIFTDR)的串行数据正常输出到SSITXD0SSIDATA0引脚，请按照图38.56中的程序停止通信和图38.57中的错误处理程序进行操作。发生此错误后，串行数据将照常使用。如果您恢复通信，请从头开始写入串行数据。

(2) 传输溢出错误

如果发生发送溢出错误，请检查向发送FIFO数据寄存器(SSIFTDR)写入数据以响应发送数据空中断的次数。导致发送溢出错误的写入发送FIFO数据寄存器(SSIFTDR)的串行数据变为无效。无论是否正在执行传输操作，都可能发生此错误。要从错误中恢复，请按照图38.56中的程序停止通信和图38.57中的错误处理程序。当您恢复通信时，请适当处理无效的串行数据。

(3) Receive Underflow Error

If a receive underflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The values read from the receive FIFO data register (SSIFRDR) that caused the receive underflow error are undefined. This error can occur regardless of whether a reception operation is being done. To recover from the error, follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

(4) Receive Overflow Error

If a receive overflow error occurs, review the number of times of reading data from the receive FIFO data register (SSIFRDR) in response to receive data full interrupts. The receive data that caused the receive overflow error cannot be stored in the receive FIFO data register (SSIFRDR). To recover from the error, follow the procedure to halt communication in Figure 38.56 and error-handling procedure in Figure 38.57.

38.11.3.2 Transmit data empty interrupt

The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.TDE to write data to SSIFTDR. The number of times of writing data to SSIFTDR by detecting the value 1 of SSIFSR.TDE must be in accordance with the free space size of the transmit FIFO data register specified by SSISCR.TDES. After as much transmit data as the free space size is written to SSIFTDR, the SSIFSR.TDE flag must be cleared. Continuous transmission is enabled by repeating data writing. If the SSIFSR.TDE flag is not cleared, the flag is not cleared automatically.

38.11.3.3 Receive data full interrupt

The communication flow defined in SSIE uses the DTC/DMAC. If you do not use the DTC/DMAC, perform polling of the value 1 of SSIFSR.RDF to read data from SSIFRDR. The number of times of reading data from SSIFRDR by detecting the value 1 of SSIFSR.RDF must be in accordance with the receive data storage capacity of the receive FIFO data register specified by SSISCR.RDFS. After received data is read from SSIFRDR, the SSIFSR.RDF flag must be cleared. Continuous reception is enabled by repeating data reading. If the SSIFSR.RDF flag is not cleared, the flag is not cleared automatically.

38.11.3.4 Switching transfer modes

1. For state transition from transmission, reception, and transmission and reception, disable transmission and reception (SSICR.TEN = 0, SSICR.REN = 0).
2. Confirm it is in the idle state (SSISR.IIRQ = 1).
3. In the idle state, set the SSICR.TEN bit and the SSICR.REN bit again and resume transfer.

38.11.3.5 Resume communication after halting SSIE

When communication of SSIE is halted according to the procedure to halt communication in Figure 38.56, resume communication according to the procedure to resume communication in Figure 38.58.

38.11.4 Write Access Restriction

38.11.4.1 SSICR register

If the TEN bit or REN bit is rewritten, make sure that the SSISR.IIRQ bit is in the desired status. If the value of the TEN or REN bit is changed by rewriting, subsequent operation is unpredictable. For example, when transmission or reception is enabled, check that SSISR.IIRQ is 0; when transmission or reception is disabled, check that SSISR.IIRQ is 1.

(1) TEN Bit and REN Bit

These bits enable/disable transmission and reception. When 1 is written to one of these bits, the corresponding communication operation starts in synchronization with a start trigger by the SSILRCK/SSIFS signal. For details, see section 38.8.2. Transmission, section 38.8.3. Reception, and section 38.8.4. Transmission and Reception. When 0 is written to this bit, the current communication operation stops at the next frame boundary. To use SSIE for both transmission and reception, always write 1 to these bits together. When stopping the communication using SSIE, always disable both transmission and reception (write 0 to the TEN and REN bits).

(3) 接收下溢错误

如果发生接收下溢错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。从导致接收下溢错误的接收FIFO数据寄存器(SSIFRDR)读取的值未定义。无论是否正在执行接收操作，都可能发生此错误。要从错误中恢复，请按照图38.56中的程序停止通信和图38.57中的错误处理程序。

(4) 接收溢出错误

如果发生接收溢出错误，请检查从接收FIFO数据寄存器(SSIFRDR)读取数据以响应接收数据满中断的次数。导致接收溢出错误的接收数据不能存储在接收FIFO数据寄存器(SSIFRDR)中。要从错误中恢复，请按照图38.56中的程序停止通信和图38.57中的错误处理程序。

38.11.3.2 发送数据空中断

SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.TDE的值1以将数据写入SSIFTDR。通过检测SSIFSR.TDE的值为1向SSIFTDR写入数据的次数必须与SSIFSR.TDES指定的发送FIFO数据寄存器的可用空间大小一致。在将与可用空间大小一样多的传输数据写入SSIFTDR后，必须清除SSIFSR.TDE标志。通过重复数据写入启用连续传输。如果未清除SSIFSR.TDE标志，则不会自动清除该标志。

38.11.3.3 接收数据满中断

SSIE中定义的通信流使用DTCDMAC。如果不使用DTCDMAC，则轮询SSIFSR.RDF的值1以从SSIFRDR读取数据。通过检测SSIFSR.RDF的值为1从SSIFRDR读取数据的次数必须与SSISCR.RDFS指定的接收FIFO数据寄存器的接收数据存储容量一致。从SSIFRDR读取接收到的数据后，必须清除SSIFSR.RDF标志。通过重复数据读取启用连续接收。如果未清除SSIFSR.RDF标志，则不会自动清除该标志。

38.11.3.4 切换传输模式

1.对于从发送、接收和发送和接收的状态转换，禁用发送和接收（SSICR.TEN=0，SSICR.REN=0）。

2.确认它处于空闲状态（SSISR.IIRQ=1）。

3.在空闲状态下，再次设置SSICR.TEN位和SSICR.REN位并恢复传输。

38.11.3.5 停止SSIE后恢复通信

当SSIE的通信按照图38.56中的停止通信程序停止时，按照图38.58中的恢复通信程序恢复通信。

38.11.4 写访问限制

38.11.4.1 SSICR register

如果TEN位或REN位被重写，请确保SSISR.IIRQ位处于所需状态。如果TEN的值或
REN位通过改写改变，后续操作不可预知。例如，启用发送或接收时，检查SSISR.IIRQ是否为0；当发送或接收被禁用时，检查SSISR.IIRQ是否为1。

(1) 十位和仁位

这些位启用禁用发送和接收。当这些位之一写入1时，相应的通信操作与SSILRCKSSIFS信号的开始触发同步开始。有关详细信息，请参阅第38.8.2节。传输，第38.8.3节。接待处和第38.8.4节。传输和接收。当向该位写入0时，当前通信操作在下一帧边界处停止。要同时使用SSIE进行发送和接收，请始终将1一起写入这些位。使用SSIE停止通信时，始终禁用发送和接收（将0写入TEN和REN位）。

38.11.4.2 SSISR register

(1) Clearing TUIRQ and TOIRQ

After communication is enabled (by changing the value of SSICR.TEN bit from 0 to 1), the transmission error flags (TOIRQ and TUIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the transmission error flags might be unable to be read.

(2) Clearing RUIRQ and ROIRQ

After communication is enabled (by changing the value of SSICR.REN bit from 0 to 1), the reception error flags (RUIRQ and ROIRQ in the SSISR register) are cleared. If, however, the SSISR register is read continuously, the cleared status of the reception error flags might be unable to be read.

38.11.4.3 Communication state

Writing to the bits with orange-shaded area in Table 38.17 is prohibited. If written, the operation performed immediately after writing is not guaranteed.

Table 38.17 Bits protected from writing during communication

Symbol	Address (BASE+)		+0								+1							
			31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

		+2	—	—	—	TDES[4:0]					—	—	—	RDFS[4:0]				

38.11.4.2 SSISR register

(1) 清除TUIRQ和TOIRQ

启用通信后（通过将SSICR.TEN位的值从0更改为1），传输错误标志（SSISR寄存器中的TOIRQ和TUIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取传输错误标志的清除状态。

(2) 清除RUIRQ和ROIRQ

启用通信后（通过将SSICR.REN位的值从0更改为1），接收错误标志（SSISR寄存器中的RUIRQ和ROIRQ）被清除。但是，如果连续读取SSISR寄存器，则可能无法读取接收错误标志的清除状态。

38.11.4.3 通讯状态

禁止写入表38.17中橙色阴影区域的位。如果写入，则不保证写入后立即执行的操作。

Table 38.17 通信期间防止写入的位

39. SD/MMC Host Interface (SDHI)

39.1 Overview

The Secure Digital Host Interface (SDHI) and MultiMediaCard (MMC) Interface provide the functionality required to connect a variety of external memory cards with the MCU. The SDHI supports both 1- and 4-bit buses for connecting different memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD Specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA).

The MMC interface supports 1-bit, 4-bit, and 8-bit MMC buses that provide eMMC 4.51 (JEDEC Standard JESD 84- B451) device access. This interface also provides backward compatibility and supports for high-speed SDR transfer modes.

Table 39.1 lists the SD/MMC Host Interface specifications and Figure 39.1 shows a block diagram.

Table 39.1 SD/MMC Host Interface specifications

Interface	Parameter	Specifications
SD	SD bus interface	• Compatible with SD memory card and SDIO card • Transfer bus mode selectable from 4-bit wide bus mode or 1-bit default bus mode • Compatible with SD, SDHC, and SDXC formats
SD and MMC shared	SDHI clock frequency	The SDHI clock is generated by dividing PCLKB by 2^n (n = 0 to 9)
	Error check functions	CRC7 (command/response), CRC16 (transfer data)
	Interrupt sources	Card access interrupt (SDHI_MMC0_ACCS), SDIO access interrupt (SDHI_MMC0_SDI0), Card detection interrupt (SDHI_MMC0_CARD)
	DMA transfer sources	DMAC and DTC triggerable by the SBFAI interrupt SD buffer is read and write accessible using the DMAC
	Other functions	• Card detect function • Write protect support
MMC	MMC bus interface	Transfer bus mode selectable from 1-bit, 4-bit, or 8-bit
	Transfer modes	Backward compatible mode or high-speed SDR mode selectable
	Other functions	e.MMC device access supported
TrustZone Filter	Security attribution can be set

39. SDMMC主机接口(SDHI)

39.1 Overview

安全数字主机接口(SDHI)和多媒体卡(MMC)接口提供了将各种外部存储卡与MCU连接所需的功能。SDHI支持1位和4位总线，用于连接支持SD、SDHC和SDXC格式的不同存储卡。在开发符合SD规范的主机设备时，您必须遵守SD主机辅助产品许可协议(SDHALA)。

MMC接口支持提供eMMC4.51（JEDEC标准JESD84B451）器件访问的1位、4位和8位MMC总线。该接口还提供向后兼容性并支持高速SDR传输模式。

表39.1列出了SDMMC主机接口规范，图39.1显示了框图。

Table 39.1 SDMMC主机接口规格

Interface	Parameter	Specifications
SD	SD总线接口	• 兼容SD存储卡和SDIO卡 • 传输总线模式可选择4位宽总线模式或1位默认总线模式 • 兼容SD、SDHC和SDXC格式
SD和MMC共享	SDHI时钟频率	SDHI时钟由PCLKB除以2n(n=0到9)生成
	错误检查功能	CRC7 (command/response), CRC16 (transfer data)
	中断源	卡访问中断（SDHI_MMC0_ACCS）、SDIO访问中断（SDHI_MMC0_SDI0）、卡检测中断（SDHI_MMC0_CARD）
	DMA传输源	SBFAI中断可触发DMAC和DTC SD缓冲区可使用DMAC进行读写访问
	其他功能	• 卡片检测功能 • 写保护支持
MMC	MMC总线接口	传输总线模式可选择1位、4位或8位
	传输模式	向后兼容模式或高速SDR模式可选
	其他功能	支持e.MMC设备访问
TrustZone Filter	可设置安全属性

39.2 Register Descriptions

39.2.1 SD_CMD : Command Type Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMD12AT[1:0]		TRSTP	CMDRW	CMDTP	RSPTP[2:0]			ACMD[1:0]		CMDIDX[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CMDIDX[5:0]	Command Index Field Value Select These bits configure the command index field value. The examples shown include the bit values for the ACMD[1:0] bits. 0x06: CMD6 0x12: CMD18 0x4D: ACMD13	R/W
7:6	ACMD[1:0]	Command Type Select 0 0: CMD 0 1: ACMD Others: Setting prohibited	R/W
10:8	RSPTP[2:0]	Response Type Select*1 0 0 0: Normal mode Depending on the command, the response type and transfer method are selected in the ACMD[1:0] and CMDIDX[5:0] bits. At this time, the values for bits 15 to 11 in this register are invalid. 0 1 1: Extended mode and no response 1 0 0: Extended mode and R1, R5, R6, or R7 response 1 0 1: Extended mode and R1b response 1 1 0: Extended mode and R2 response 1 1 1: Extended mode and R3 or R4 response Others: Setting prohibited	R/W

Table 39.2 SDHIIO引脚(n=0)(2of2)

Channel	引脚名称	I/O	Description
	SDnCMD	I/O	命令输出，响应输入
	SDnDAT0	I/O	Data 0 (DAT0)
	SDnDAT1	I/O	数据1(DAT1)，SDIO中断
	SDnDAT2	I/O	数据2(DAT2)，SDIO读取等待
	SDnDAT3	I/O	数据3(DAT3)，SD卡检测
	SDnDAT4	I/O	MMC Data 4 (DAT4)
	SDnDAT5	I/O	MMC Data 5 (DAT5)
	SDnDAT6	I/O	MMC Data 6 (DAT6)
	SDnDAT7	I/O	MMC Data 7 (DAT7)
	SDnCD	Input	SD卡检测
	SDnWP	Input	SD卡写保护

39.2 注册说明

39.2.1 SD_CMD:命令类型寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMD12AT[1:0]		TRSTP	CMDRW	CMDTP	RSPTP[2:0]			ACMD[1:0]		CMDIDX[5:0]					
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CMDIDX[5:0]	命令索引字段值选择 这些位配置命令索引字段值。所示示例包括ACMD[1:0]位的位值。 0x06: CMD6 0x12: CMD18 0x4D: ACMD13	R/W
7:6	ACMD[1:0]	命令类型选择 0 0: CMD 0 1: ACMD 其他：禁止设置	R/W
10:8	RSPTP[2:0]	响应类型选择*1 000：正常模式 根据命令，在ACMD[1:0]和CMDIDX[5:0]位中选择响应类型和传输方法。此时，该寄存器中第15位到第11位的值无效。 011：扩展模式和无响应100：扩展模式和R1、R5、R6 或R7响应101：扩展模式和R1b响应110：扩展模式和R2 响应111：扩展模式和R3或R4响应 其他：禁止设置	R/W

Bit	Symbol	Function	R/W
11	CMDTP	Data Transfer Select*2 0: Do not include data transfer (bc, bcr, or ac) in command 1: Include data transfer (adtc) in command	R/W
12	CMDRW	Data Transfer Direction Select*3 0: Write (SD/MMC Host Interface → SD card/MMC) 1: Read (SD/MMC Host Interface ← SD card/MMC)	R/W
13	TRSTP	Block Transfer Select*3 0: Single block transfer 1: Multiple blocks transfer	R/W
15:14	CMD12AT[1:0]	CMD12 Automatic Issue Select*4 0 0: Automatically issue CMD12 during multiblock transfer 0 1: Do not automatically issue CMD12 during multiblock transfer Others: Setting prohibited	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Some commands cannot be used in normal mode.
Note 2. The CMDTP bit is only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b.
Note 3. Bits CMDRW and TRSTP are only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b, and the CMDTP bit is 1.
Note 4. The CMD12AT[1:0] bits are only valid when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b, and the TRSTP bit is 1.

The command type and response type are set in the SD_CMD register. The command type and transfer mode must be set when the RSPTP[2:0] bits are 011b, 100b, 101b, 110b, or 111b. The sequence starts when a value is written to this register. See Table 39.8 and Table 39.9 for setting examples. Do not write to the SD_CMD register when the SD_INFO2.CBSY flag is 1.

39.2.2 SD_ARG : SD Command Argument Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n
Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	—	These bits specify command format[39:8] (argument).	R/W

The SD_ARG register is used for setting the argument field value. Set the SD_ARG register before setting the SD_CMD register. The argument field value of the automatically issued CMD12 is 0x0000_0000 regardless of the SD_ARG register value.

Bit	Symbol	Function	R/W
11	CMDTP	数据传输选择*2 0：在命令中不包括数据传输（bc、bcr或ac）1：在命令中包括数据传输（adtc）	R/W
12	CMDRW	数据传输方向选择*3 0：写入（SDMMC主机接口→SD卡MMC）1：读取（SDMMC主机接口←SD卡MMC）	R/W
13	TRSTP	块传输选择*3 0：单块传输1：多块传输	R/W
15:14	CMD12AT[1:0]	CMD12自动发行选择*4 00：在多块传输过程中自动发出CMD1201：在多块传输过程中不自动发出CMD12 其他：禁止设置	R/W
31:16	—	这些位被读取为0。写入值应为0。	R/W

注1.某些命令不能在正常模式下使用。
注2.CMDTP位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b时有效。
注3.CMDRW和TRSTP位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b且CMDTP位为1时有效。
注4.CMD12AT[1:0]位仅在RSPTP[2:0]位为011b、100b、101b、110b或111b且TRSTP位为1时有效。

命令类型和响应类型在SD_CMD寄存器中设置。当RSPTP[2:0]位为011b、100b、101b、110b或111b时，必须设置命令类型和传输模式。当一个值被写入该寄存器时，序列开始。设置示例见表39.8和表39.9。当SD_INFO2.CBSY标志为1时，不要写入SD_CMD寄存器。

39.2.2 SD_ARG:SD命令参数寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n
Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:																
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	—	这些位指定命令格式[39:8]（参数）。	R/W

SD_ARG寄存器用于设置参数字段值。在设置SD_CMD寄存器之前设置SD_ARG寄存器。无论SD_ARG寄存器的值如何，自动发出的CMD12的参数字段值为0x0000_0000。

39.2.3 SD_ARG1 : SD Command Argument Register 1

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits specify command format[39:24] (argument).	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The SD_ARG1 register is used for setting the argument field value. Set the SD_ARG1 register before setting the SD_CMD register. The argument field value of the automatically issued CMD12 is 0x0000_0000 regardless of the SD_ARG1 register value.

39.2.4 SD_STOP : Data Stop Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SEC	—	—	—	—	—	—	—	STP
Value after reset:	0	0	0	0	0	0	0	0*1	0	0	0	0	0	0	0	0*1

Bit	Symbol	Function	R/W
0	STP	Transfer Stop Data transfer stops when this bit is set to 1.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	SEC	Block Count Register Value Select*2 0: Disable SD_SECCNT register value 1: Enable SD_SECCNT register value	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.
Note 2. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The SD_STOP register stops data transfer. During a multiblock transfer sequence, the SD_SECCNT register value (number of blocks to be transferred) can be set to valid or invalid by setting the SD_STOP register.

STP bit (Transfer Stop)

When the STP bit is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SDHI. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although

39.2.3 SD_ARG1:SD命令参数寄存器1

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	这些位指定命令格式[39:24]（参数）。	R/W
31:16	—	这些位被读取为0。写入值应为0。	R/W

SD_ARG1寄存器用于设置参数字段值。在设置SD_CMD寄存器之前设置SD_ARG1寄存器。无论SD_ARG1寄存器的值如何，自动发出的CMD12的参数字段值为0x0000_0000。

39.2.4 SD_STOP:数据停止寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SEC	—	—	—	—	—	—	—	STP
重置后的值:	0	0	0	0	0	0	0	0*1	0	0	0	0	0	0	0	0*1

Bit	Symbol	Function	R/W
0	STP	中转站 当该位设置为1时，数据传输停止。	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W
8	SEC	块计数寄存器值选择*2 0：禁用SD_SECCNT寄存器值1：启用SD_SECCNT寄存器值	R/W
31:9	—	这些位被读取为0。写入值应为0。	R/W

注1.该值由复位初始化，并且在由SOFT_RST.SDRST标志触发的复位时初始化。
注2.当SD_INFO2.CBSY标志为1时，请勿重写该位。

SD_STOP寄存器停止数据传输。在多块传输序列期间，可以通过设置SD_STOP寄存器将SD_SECCNT寄存器值（要传输的块数）设置为有效或无效。

STP bit (Transfer Stop)

在多块传输期间STP位设置为1时，发出CMD12以停止通过SDHI的传输。
但是，如果命令序列由于通信错误或超时而停止，则不会发出CMD12。虽然

continued buffer access is possible even after STP is set to 1, the buffer access error bit (ILR or ILW) in SD_INFO2 is set accordingly.

When STP is set to 1 during transfer for single block write, the access end flag sets when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag sets on completion of reception of the busy state without CMD12 being issued.

When STP is set to 1 during transfer for single block read, the access end flag sets immediately after the STP bit is set, and CMD12 is not issued.

When STP is set to 1 during reception of the busy state after an R1b response, the access end flag sets on completion of reception of the busy state without CMD12 being issued.

When STP is set to 1 after a command sequence is completed, CMD12 is not issued and the access end flag does not set.

Set STP to 1 after the response end flag sets.

Set STP to 0 after the access end flag sets.

SEC bit (Block Count Register Value Select)

When SD_CMD is set in the following section to start the command sequence while the SEC bit is set to 1, CMD12 is automatically issued to stop multiblock transfer with the number of blocks set in SD_SECCNT.

CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000b)

SD_CMD[15:13] = 001b in extended mode (CMD12 is automatically issued, multiple block transfer)

When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.

39.2.5 SD_SECCNT : Block Count Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

When performing a multiblock transfer, SD_SECCNT is a read/write register used to set the number of blocks to be transferred. For example, when the register value is 0x0000_0001, 1 block is transferred. When the register value is 0x0000_FFFF, 65,535 blocks are transferred and when the register value is 0xFFFF_FFFF, 4,294,967,295 blocks are transferred. Do not set this register to 0x0000_0000. Do not rewrite the SD_SECCNT register when the SD_INFO2.CBSY flag is 1.

即使在STP设置为1后，仍可以继续访问缓冲区，相应地设置SD_INFO2中的缓冲区访问错误位（ILR或ILW）。

在单块写入的传输过程中将STP设置为1时，当SD_BUF为空时设置访问结束标志，并且不发出CMD12。如果SD_BUF确实包含数据，则在没有发出CMD12的忙状态接收完成时设置访问结束标志。

当STP在单块读取传输期间设置为1时，在设置STP位后立即设置访问结束标志，并且未发出CMD12。

当在R1b响应后的忙状态接收期间将STP设置为1时，在没有发出CMD12的忙状态接收完成时设置访问结束标志。

当命令序列完成后STP设置为1时，不发出CMD12并且不设置访问结束标志。

设置响应结束标志后将STP设置为1。

设置访问结束标志后将STP设置为0。

SEC位（块计数寄存器值选择）

当在以下部分中设置SD_CMD以启动命令序列而SEC位设置为1时，将自动发出CMD12以停止多块传输，其中块数在SD_SECCNT中设置。

正常模式下的CMD18或CMD25(SD_CMD[10:8]=000b)

SD_CMD[15:13]=001b扩展模式（CMD12自动发出，多块传输）

当命令序列由于通信错误或超时而停止时，不会自动发出CMD12。

39.2.5 SD_SECCNT：块计数寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:																
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

执行多块传输时，SD_SECCNT是一个读写寄存器，用于设置要传输的块数。例如，当寄存器值为0x0000_0001时，传输1个块。当寄存器值为0x0000_FFFF时，传送65 535个块，当寄存器值为0xFFFF_FFFF时，传送4 294 967 295个块。不要将此寄存器设置为0x0000_0000。当SD_INFO2.CBSY标志为1时，不要重写SD_SECCNT寄存器。

39.2.6 SD_RSPi : SD Card Response Register i (i = 10, 32, 54)

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x018; i = 10
0x020; i = 32
0x028; i = 54

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

39.2.7 SD_RSPj : SD Card Response Register j (j = 1, 3, 5)

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x01C + (0x4 × (j - 1))

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits store the response from the SD card/MMC.	R
31:16	—	These bits are read as 0.	R

39.2.8 SD_RSP76 : SD Card Response Register 76

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x030

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	SD_RSP76[23:16]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SD_RSP76[15:0]

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SD_RSP76[15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
23:0	SD_RSP76[23:0]	这些位存储来自SD卡MMC的响应。	R
31:24	—	这些位读为0。	R

39.2.9 SD_RSP7 : SD Card Response Register 7

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x034

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SD_RSP7[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SD_RSP7[7:0]	These bits store the response from the SD card/MMC.	R
31:8	—	These bits are read as 0.	R

SD_RSP10, SD_RSP32, SD_RSP54, SD_RSP1, SD_RSP3, SD_RSP5, SD_RSP76, and SD_RSP7 are read-only registers that store the response from the SD card/MMC. Depending on the type of response from the SD card/MMC, the SD/MMC Host Interface divides and stores the response among the four registers.

Table 39.3 lists the correspondence between the response type and its storage destination.

Table 39.3 Correspondence between response type and storage destination

Response type	SD_RSP10 register	SD_RSP32 register	SD_RSP54 register	SD_RSP1 register	SD_RSP3 register	SD_RSP5 register	SD_RSP76 register	SD_RSP7 register
R1	[39:8]	—	[39:8]*1	—	—	—	—	—
R1b	[39:8]	—	[39:8]*1	—	—	—	—	—
R2	[39:8]	[71:40]	[103:72]	—	—	—	[127:104]	—
R3	[39:8]	—	—	—	—	—	—	—
R4	[39:8]	—	—	—	—	—	—	—
R5	[39:8]	—	—	—	—	—	—	—
R6	[39:8]	—	—	—	—	—	—	—
R7	[39:8]	—	—	—	—	—	—	—

Note 1. The responses for CMD18 and CMD25 are stored in registers SD_RSP10 and SD_RSP54. Therefore, even if the SD_RSP10 register is overwritten with the response for the automatically issued CMD12, the response for CMD18 or CMD25 can be confirmed by reading the SD_RSP54 register.

39.2.10 SD_INFO1 : SD Card Interrupt Flag Register 1

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x038

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

39.2.9 SD_RSP7:SD卡响应寄存器7

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x034

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SD_RSP7[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SD_RSP7[7:0]	这些位存储来自SD卡MMC的响应。	R
31:8	—	这些位读为0。	R

SD_RSP10、SD_RSP32、SD_RSP54、SD_RSP1、SD_RSP3、SD_RSP5、SD_RSP76和SD_RSP7是只读寄存器，用于存储来自SD卡MMC的响应。根据SD卡MMC的响应类型，SDMMC主机接口在四个寄存器之间划分和存储响应。

表39.3列出了响应类型与其存储目的地的对应关系。

Table 39.3 响应类型与存储目的地的对应关系

响应类型	SD_RSP10 register	SD_RSP32 register	SD_RSP54 register	SD_RSP1 register	SD_RSP3 register	SD_RSP5 register	SD_RSP76 register	SD_RSP7 register
R1	[39:8]	—	[39:8]*1	—	—	—	—	—
R1b	[39:8]	—	[39:8]*1	—	—	—	—	—
R2	[39:8]	[71:40]	[103:72]	—	—	—	[127:104]	—
R3	[39:8]	—	—	—	—	—	—	—
R4	[39:8]	—	—	—	—	—	—	—
R5	[39:8]	—	—	—	—	—	—	—
R6	[39:8]	—	—	—	—	—	—	—
R7	[39:8]	—	—	—	—	—	—	—

注1.CMD18和CMD25的响应存储在寄存器SD_RSP10和SD_RSP54中。因此，即使SD_RSP10寄存器被自动发出的CMD12的响应覆盖，CMD18或CMD25的响应可以通过读取SD_RSP54寄存器来确认。

39.2.10 SD_INFO1:SD卡中断标志寄存器1

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x038

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SDD3MON	SDD3IN	SDD3RM	SDWPMON	—	SDCDMON	SDCDIN	SDCDRM	ACEND	—	RSPEND
重置后的值:	0	0	0	0	0	x	0	0	x	0	x	0	0	0*1	0	0*1

Bit	Symbol	Function	R/W
0	RSPEND	Response End Detection Flag 0: Response end not detected 1: Response end detected	R/(W)*2
1	—	This bit is read as 0. The write value should be 0.	R/W
2	ACEND	Access End Detection Flag 0: Access end not detected 1: Access end detected	R/(W)*2
3	SDCDRM	SDnCD Removal Flag 0: SD card/MMC removal not detected by the SDnCD pin 1: SD card/MMC removal detected by the SDnCD pin	R/(W)*2
4	SDCDIN	SDnCD Insertion Flag 0: SD card/MMC insertion not detected by the SDnCD pin 1: SD card/MMC insertion detected by the SDnCD pin	R/(W)*2
5	SDCDMON	SDnCD Pin Monitor Flag 0: SDnCD pin level is high*3 1: SDnCD pin level is low*3	R
6	—	This bit is read as 0. The write value should be 0.	R/W
7	SDWPMON	SDnWP Pin Monitor Flag 0: SDnWP pin level is high 1: SDnWP pin level is low	R
8	SDD3RM	SDnDAT3 Removal Flag 0: SD card/MMC removal not detected by the SDnDAT3 pin 1: SD card/MMC removal detected by the SDnDAT3 pin	R/(W)*2
9	SDD3IN	SDnDAT3 Insertion Flag 0: SD card/MMC insertion not detected by the SDnDAT3 pin 1: SD card/MMC insertion detected by the SDnDAT3 pin	R/(W)*2
10	SDD3MON	SDnDAT3 Pin Monitor Flag 0: SDnDAT3 pin level is low 1: SDnDAT3 pin level is high	R
31:11	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.
Note 2. The flag does not change even if set to 1. Writing 0 changes the flag value to 0.
Note 3. The flag changes when the pin level continues for the period set in the SD_OPTION.CTOP[3:0] bits or longer.

The SD_INFO1 register indicates the detection of a response end or access end for a command sequence. The SD_INFO1 register also indicates the detection SD card/MMC insertion/removal and the write protection status.

During a multiblock transfer sequence, if CMD12 or CMD52 (SDIO abort) is issued, the ACEND flag sets to 1, but the RSPEND flag remains set to 0.

If the command sequence is stopped because of a communication error or timeout, the ACEND flag or RSPEND flag sets to 1.

After a reset is canceled, the SDD3MON bit, SDD3IN flag, and SDD3RM flag values are changed in accordance with the status of the SDnDAT3 (n = 0) pin, and their values are changed when data is being transferred in wide bus mode. These 3 bits are used only for SD card. Set flags to be cleared to 0. Set flags that are not being cleared to 1.

RSPEND flag (Response End Detection Flag)

The RSPEND flag indicates that a response end was detected.

[Setting conditions]

- When reception of the response is completed
- When transmission of a command without response is completed
- When reception of the busy state after R1b response is completed
- When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed for transfer of multiple block read

Bit	Symbol	Function	R/W
0	RSPEND	响应结束检测标志 0：未检测到响应结束1：检测到响应结束	R/(W)*2
1	—	该位读取为0。写入值应为0。	R/W
2	ACEND	访问结束检测标志 0：未检测到访问结束1：检测到访问结束	R/(W)*2
3	SDCDRM	SDnCD删除标志 0：SDnCD引脚未检测到SD卡MMC移除1：SDnCD引脚检测到SD卡MMC移除	R/(W)*2
4	SDCDIN	SDnCD插入标志 0：SDnCD引脚未检测到SD卡MMC插入1：SDnCD引脚检测到SD卡MMC插入	R/(W)*2
5	SDCDMON	SDnCD引脚监控标志 0：SDnCD引脚电平为高*3 1：SDnCD引脚电平低*3	R
6	—	该位读取为0。写入值应为0。	R/W
7	SDWPMON	SDnWP引脚监控标志 0：SDnWP引脚高电平1：SDnWP引脚低电平	R
8	SDD3RM	SDnDAT3删除标志 0：SDnDAT3引脚未检测到SD卡MMC移除1：SDnDAT3引脚检测到SD卡MMC移除	R/(W)*2
9	SDD3IN	SDnDAT3插入标志 0：SDnDAT3引脚未检测到SD卡MMC插入1：SDnDAT3引脚检测到SD卡MMC插入	R/(W)*2
10	SDD3MON	SDnDAT3引脚监控标志 0：SDnDAT3引脚低电平1：SDnDAT3引脚高电平	R
31:11	—	这些位被读取为0。写入值应为0。	R/W

注1.该值由复位初始化，并且在由SOFT_RST.SDRST标志触发的复位时初始化。
注2.即使设置为1，标志也不会改变。写入0会将标志值更改为0。
注3.当引脚电平持续SD_OPTION.CTOP[3:0]位中设置的周期或更长时间时，标志会发生变化。

SD_INFO1寄存器指示对命令序列的响应结束或访问结束的检测。SD_INFO1寄存器还指示检测SD卡MMC插入移除和写保护状态。

在多块传输序列期间，如果发出CMD12或CMD52（SDIO中止），则ACEND标志设置为1，但RSPEND标志保持设置为0。

如果命令序列由于通信错误或超时而停止，则ACEND标志或RSPEND标志设置为1。

复位取消后，SDD3MON位、SDD3IN标志和SDD3RM标志的值根据SDnDAT3(n=0)引脚的状态而改变，并且在宽总线模式下传输数据时它们的值也会改变。这3位仅用于SD卡。将要清除的标志设置为0。将未清除的标志设置为1。

RSPEND标志（响应结束检测标志）

RSPEND标志表示检测到响应结束。

[Setting conditions]

●响应接收完成时
●没有响应的命令传输完成时
●R1b响应后忙状态的接收完成时
●多块读取传送的C52PUB位为1的CMD52响应接收完成时

- When reception of the response to CMD52 that was issued by setting the C52PUB bit to 1 is completed for transfer of multiple block write
- This bit is set when a command sequence is halted because of a communications error or timeout.

[Clearing conditions]

- When 0 is written to RSPEND
- When a command without data is issued.

Note: When a command is issued in absence of data transfer, the RSPEND flag becomes 1 after the command sequence ends.

ACEND flag (Access End Detection Flag)

The ACEND flag indicates that an access end was detected.

[Setting conditions]

- When read access to the buffer is completed for transfer of single block read
- When read access to the buffer for the last block of data is completed for transfer of multiple block read
- When read access to the buffer and reception of the response to CMD12 are completed for transfer of multiple block read with automatic issuing of CMD12
- When reception of the busy state after reception of the CRC status is completed for transfer of single block write
- When reception of the busy state after reception of the CRC status of the last block of data is completed for transfer of multiple block write
- When reception of the response busy state for CMD12 is completed for transfer of multiple block write with automatic issuing of CMD12
- When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed for transfer of multiple block read
- When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed for transfer of multiple block write
- When reception of the response to CMD52 that was issued by setting the IOABT bit to 1 is completed for transfer of multiple block read
- When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed for transfer of multiple block write
- This bit is set when a command sequence is halted because of a communications error or timeout.

[Clearing conditions]

- When 0 is written to ACEND
- When the access end bit is set to 1.

Note: The ACEND flag becomes 1 after the command sequence ends.

SDCDRM flag (SDnCD Removal Flag)

The SDCDRM flag indicates that SDnCD was removed.

[Setting condition]

- After a change in SDnCD from 0 to 1, Mcycle elapsed with SDnCD held at 1.

[Clearing conditions]

- When 0 is written to SDCDRM.

Note: Mcycle is set in bits [3:0] in SD_OPTION.

SDCDIN flag (SDnCD Insertion Flag)

The SDCDIN flag indicates that SDnCD was inserted.

●多块写入传送的C52PUB位为1的CMD52响应接收完成时

●当命令序列由于通信错误或超时而停止时，该位被设置。

[Clearing conditions]

●RSPEND写入0时

●发出无数据指令时。

Note: 当在没有数据传输的情况下发出命令时，RSPEND标志在命令序列结束后变为1。

ACEND标志（访问结束检测标志）

ACEND标志表示检测到访问结束。

[Setting conditions]

●当完成对缓冲区的读取访问以传输单块读取时

●当完成对最后一个数据块的缓冲区的读取访问以传输多块读取时

●当对缓冲区的读取访问和对CMD12的响应的接收完成时，通过自动发出CMD12传输多块读取

●接收CRC状态后的busy状态接收完成时，用于单块写入传输

●当接收到最后一个数据块的CRC状态后的忙碌状态接收完成时，用于多块写入的传输

●当CMD12的响应忙状态接收完成时，用于传输多块写入并自动发出CMD12

●在多块读取的传送中，通过将STP位设置为1发出的对CMD12的响应的接收完成时

●多块写入的传送，通过将STP位设置为1发出的CMD12的响应忙状态接收完成时

●多块读取传送时，通过将IOABT位设置为1发出的对CMD52的响应的接收完成时

●多块写入传送的IOABT位为1的CMD52响应接收完成时

●当命令序列由于通信错误或超时而停止时，该位被设置。

[Clearing conditions]

●ACEND写入0时

●当访问结束位设置为1时。

Note: 命令序列结束后ACEND标志变为1。

SDCDRM标志（SDnCD移除标志）

SDCDRM标志表明SDnCD已被删除。

[Setting condition]

●在SDnCD从0变为1后，Mcycle过去了，而SDnCD保持在1。

[Clearing conditions]

●当0写入SDCDRM时。

Note: Mcycle在SD_OPTION的位[3:0]中设置。

SDCDIN标志（SDnCD插入标志）

SDCDIN标志表明SDnCD已插入。

[Setting condition]

- After a change in SDnCD from 1 to 0, Mcycle elapsed with SDnCD held at 0.

[Clearing conditions]

- When 0 is written to SDCDIN.

Note: Mcycle is set in bits [3:0] in SD_OPTION.

SDD3RM flag (SDnDAT3 Removal Flag)

The SDD3RM flag indicates that SDnDAT3 was removed.

[Setting condition]

- After a change in SDnDAT3 from 1 to 0, two cycles of PCLKB elapsed with SDnDAT3 held at 0.

[Clearing condition]

- When 0 is written to SDD3RM.

SDD3IN flag (SDnDAT3 Insertion Flag)

The SDD3IN flag indicates that SDnDAT3 was inserted.

[Setting condition]

- After a change in SDnDAT3 from 0 to 1, two cycles of PCLKB elapsed with SDnDAT3 held at 1.

[Clearing condition]

- When 0 is written to SDD3IN.

39.2.11 SD_INFO2 : SD Card Interrupt Flag Register 2

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x03C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset:	0*1	0*1	1*1	0	x	0	0*1	0*1	x	0*1	0*1	0*1	0*1	0*1	0*1	0*1

Bit	Symbol	Function	R/W
0	CMDE	Command Error Detection Flag 0: Command error not detected 1: Command error detected	R/W*2
1	CRCE	CRC Error Detection Flag 0: CRC error not detected 1: CRC error detected	R/W*2
2	ENDE	End Bit Error Detection Flag 0: End bit error not detected 1: End bit error detected	R/W*2
3	DTO	Data Timeout Detection Flag 0: Data timeout not detected 1: Data timeout detected	R/W*2

[Setting condition]

●SDnCD从1变为0后，Mcycle在SDnCD保持在0的情况下经过。

[Clearing conditions]

●当0写入SDCDIN时。

Note: Mcycle在SD_OPTION的位[3:0]中设置。

SDD3RM标志（SDnDAT3移除标志）

SDD3RM标志表示SDnDAT3已被删除。

[Setting condition]

●SDnDAT3从1变为0后，经过两个PCLKB周期，SDnDAT3保持为0。

[Clearing condition]

●当0写入SDD3RM时。

SDD3IN标志（SDnDAT3插入标志）

SDD3IN标志表示SDnDAT3已插入。

[Setting condition]

●SDnDAT3从0变为1后，经过两个PCLKB周期，SDnDAT3保持在1。

[Clearing condition]

●当0写入SDD3IN时。

39.2.11 SD_INFO2:SD卡中断标志寄存器2

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x03C

1	CRCE	CRC错误检测标志 0：未检测到CRC错误1：检测到CRC错误	R/W*2
2	ENDE	结束位错误检测标志 0：未检测到结束位错误1：检测到结束位错误	R/W*2
3	DTO	数据超时检测标志 0：未检测到数据超时1：检测到数据超时	R/W*2

Bit	Symbol	Function	R/W
4	ILW	SD_BUF0 Illegal Write Access Detection Flag 0: Illegal write access to the SD_BUF0 register not detected 1: Illegal write access to the SD_BUF0 register detected	R/W*2
5	ILR	SD_BUF0 Illegal Read Access Detection Flag 0: Illegal read access to the SD_BUF0 register not detected 1: Illegal read access to the SD_BUF0 register detected	R/W*2
6	RSPTO	Response Timeout Detection Flag 0: Response timeout not detected 1: Response timeout detected	R/W*2
7	SDD0MON	SDHI_D0 Pin Status Flag 0: SDnDAT0 pin is low 1: SDnDAT0 pin is high	R
8	BRE	SD_BUF0 Read Enable Flag 0: Disable read access to the SD_BUF0 register 1: Enable read access to the SD_BUF0 register	R/W*2
9	BWE	SD_BUF0 Write Enable Flag 0: Disable write access to the SD_BUF0 register 1: Enable write access to the SD_BUF0 register	R/W*2
10	—	This bit is read as 0. The write value should be 0.	R/W
11	—	The read value is undefined. The write value should be 1.	R/W
12	—	This bit is read as 0. The write value should be 0.	R/W
13	SD_CLK_CTRLEN	SD_CLK_CTRL Write Enable Flag 0: SD/MMC bus (CMD and DAT lines) is busy, so write access to the SD_CLK_CTRL.CLKEN and CLKSEL[7:0] bits is disabled 1: SD/MMC bus (CMD and DAT lines) is not busy, so write access to the SD_CLK_CTRL.CLKEN and CLKSEL[7:0] bits is enabled	R
14	CBSY	Command Sequence Status Flag 0: Command sequence complete 1: Command sequence in progress (busy)	R
15	ILA	Illegal Access Error Detection Flag 0: Illegal access error not detected 1: Illegal access error detected	R/W*2
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.
Note 2. The flag does not change even if set to 1. Writing 0 changes the flag value to 0.

The SD_INFO2 register indicates the status of the SD buffer and the status of the SD card/MMC. Set flags to be cleared to 0. Set flags that are not being cleared to 1.

CMDE flag (Command Error Detection Flag)

The CMDE flag indicates that a command error was detected. The command sequence stops when a command error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section section 39.3.12. IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 39.3.13. IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

- The command index of the transmitted command differs from the command index of the received response.
- The command index of a command issued within a command sequence differs from the command index of the received response.

[Clearing condition]

- When 0 is written to CMDE.

Bit	Symbol	Function	R/W
4	ILW	SD_BUF0非法写访问检测标志 0：未检测到对SD_BUF0寄存器的非法写访问1：检测到对SD_BUF0寄存器的非法写访问	R/W*2
5	ILR	SD_BUF0非法读访问检测标志 0：未检测到对SD_BUF0寄存器的非法读访问1：检测到对SD_BUF0寄存器的非法读访问	R/W*2
6	RSPTO	响应超时检测标志 0：未检测到响应超时1：检测到响应超时	R/W*2
7	SDD0MON	SDHI_D0引脚状态标志 0：SDnDAT0引脚为低电平 1：SDnDAT0引脚为高电平	R
8	BRE	SD_BUF0读使能标志 0：禁用对SD_BUF0寄存器的读访问1：启用对SD_BUF0寄存器的读访问	R/W*2
9	BWE	SD_BUF0写使能标志 0：禁用对SD_BUF0寄存器的写访问1：启用对SD_BUF0寄存器的写访问	R/W*2
10	—	该位读取为0。写入值应为0。	R/W
11	—	读取值未定义。写入值应为1。	R/W
12	—	该位读取为0。写入值应为0。	R/W
13	SD_CLK_CTRLEN	SD_CLK_CTRL写使能标志 0：SDMMC总线（CMD和DAT线）忙，因此禁止对SD_CLK_CTRL.CLKEN和CLKSEL[7:0]位的写访问 1：SDMMC总线（CMD和DAT线）不忙，因此使能对SD_CLK_CTRL.CLKEN和CLKSEL[7:0]位的写访问	R
14	CBSY	命令序列状态标志 0：命令序列完成1：命令序列正在进行中（忙碌）	R
15	ILA	非法访问错误检测标志 0：未检测到非法访问错误1：检测到非法访问错误	R/W*2
31:16	—	这些位被读取为0。写入值应为0。	R/W

注1.该值由复位初始化，并且在由SOFT_RST.SDRST标志触发的复位时初始化。
注2.即使设置为1，标志也不会改变。写入0会将标志值更改为0。

SD_INFO2寄存器指示SD缓冲区的状态和SD卡MMC的状态。将要清除的标志设置为0。将未清除的标志设置为1。

CMDE标志（命令错误检测标志）

CMDE标志指示检测到命令错误。发生命令错误时命令序列停止。
当SDIO_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行39.3.12节中所示的错误处理。IO_RW_EXTENDED命令（SD：CMD53多块读取）或第39.3.13节。IO_RW_EXTENDED命令（SD：CMD53MultipleBlockWrite），完成命令序列。

[Setting conditions]

●发送命令的命令索引与接收响应的命令索引不同。

●命令序列中发出的命令的命令索引与接收到的响应的命令索引不同。

[Clearing condition]

●当0写入CMDE时。

RA生态工作室

CRCE flag (CRC Error Detection Flag)

The CRCE flag indicates that a CRC error was detected. The command sequence stops when a CRC error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section 39.3.12. IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 39.3.13. IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

- When an error occurs in the CRC status.
- When a CRC error occurs in the read data.
- When a CRC error occurs in the response.
- A CRC error in the response to a command issued within a command sequence.

[Clearing condition]

- When 0 is written to CRCE.

ENDE flag (End Bit Error Detection Flag)

The ENDE flag indicates that an end bit error was detected. The command sequence is stopped when an end bit error occurs. When the SDIO_MODE.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section 39.3.12. IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 39.3.13. IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting conditions]

- When an error occurs in the response length (and the end bit is not detected).
- When an error occurs in the read data length (and the end bit is not detected among the valid bits).
- When an error occurs in the CRC status length (and the end bit is not detected).
- An error in the length of a response to a command issued within a command sequence, for example when the end bit is not detected.

[Clearing condition]

- When 0 is written to ENDE.

DTO flag (Data Timeout Detection Flag)

The DTO flag indicates that a data timeout was detected. The command sequence stops when a data timeout occurs.

[Setting conditions]

- After R1b response, the busy state (SDnDAT0 = 0) continues for longer than Ncycle.
- After CRC status, the busy state (SDnDAT0 = 0) continues for longer than Ncycle.
- After write data, the CRC status is not received though Ncycle has elapsed.
- After read command, read data is not received though a time longer than Ncycle has elapsed.
- After CMD12 is issued within a command sequence, the busy state (SDnDAT0 = 0) for longer than Ncycle continues.
- After the reception of read data, read data for the next block are not received though a time longer than Ncycle has elapsed.
- After release of the read wait state, read data for the next block are not received though a time longer than Ncycle has elapsed.

Note: Ncycle is set in bits [7:4] in SD_OPTION.

[Clearing condition]

- When 0 is written to DTO.

CRCE标志（CRC错误检测标志）

CRCE标志表示检测到CRC错误。当发生CRC错误时，命令序列停止。当。。。的时候
SDIO_MODE.C52PUB位设置为1并自动发出CMD52，如果发生通信错误或响应超时，则命令序列未完成。执行39.3.12节中所示的错误处理。IO_RW_EXTENDED命令（SD：CMD53多块读取）或第39.3.13节。IO_RW_EXTENDED命令（SD：CMD53MultipleBlockWrite），完成命令序列。

[Setting conditions]

●CRC状态发生错误时。
●读取数据发生CRC错误时。
●当响应中出现CRC错误时。
●对命令序列中发出的命令的响应中出现CRC错误。

[Clearing condition]

●CRCE写入0时。

ENDE标志（结束位错误检测标志）

ENDE标志表示检测到结束位错误。当发生结束位错误时，命令序列停止。当SDIO_MODE.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行39.3.12节中所示的错误处理。IO_RW_EXTENDED命令（SD：CMD53多块读取）或第39.3.13节。IO_RW_EXTENDED命令（SD：CMD53MultipleBlockWrite），完成命令序列。

[Setting conditions]

●响应长度发生错误（未检测到结束位）时。
●读取数据长度出错时（有效位中未检测到结束位）。
●CRC状态长度出错（未检测到结束位）时。
●对命令序列中发出的命令的响应长度错误，例如未检测到结束位时。

[Clearing condition]

●0写入ENDE时。

DTO标志（数据超时检测标志）

DTO标志表示检测到数据超时。当发生数据超时时，命令序列停止。

[Setting conditions]

●R1b响应后，忙碌状态（SDnDAT0=0）持续时间超过Ncycle。
●CRC状态后，忙碌状态（SDnDAT0=0）持续时间超过Ncycle。
●写入数据后，虽然Ncycle已过，但仍未收到CRC状态。
●读取命令后，经过Ncycle后仍未收到读取数据。
●在命令序列内发出CMD12后，忙碌状态（SDnDAT0=0）持续时间超过Ncycle。
●读取数据接收后，虽然经过了Ncycle以上的时间，但没有接收到下一个块的读取数据。

●读取等待状态解除后，虽然经过了Ncycle以上的时间，但没有接收到下一个块的读取数据。

Note: Ncycle在SD_OPTION的位[7:4]中设置。

[Clearing condition]

●当0写入DTO时。

ILW flag (SD_BUF0 Illegal Write Access Detection Flag)

The ILW flag indicates that an SD_BUF0 illegal write access was detected.

[Setting conditions]

- When data is written to SD_BUF0 while it is not in the data read/write command state.
- When data is written to SD_BUF0 while SD_BUF is full.
- When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length.
- When data is written to SD_BUF0 while a busy state after the CRC status continues for longer than Ncycle.

Note: Ncycle is set in bits [7:4] in SD_OPTION.

[Clearing condition]

- When 0 is written to ILW.

ILR flag (SD_BUF0 Illegal Read Access Detection Flag)

The ILR flag indicates that an SD_BUF0 illegal read access was detected.

[Setting conditions]

- When SD_BUF is empty while SD_BUF0 is read.
- When data with a CRC error or END error is read from SD_BUF0.

[Clearing condition]

- When 0 is written to ILR.

RSPTO flag (Response Timeout Detection Flag)

The RSPTO flag indicates that a response timeout was detected. The command sequence is stopped when a response timeout occurs. When the SDIOMD.C52PUB bit is set to 1 and CMD52 is automatically issued, if a communication error or response timeout occurs, the command sequence is not completed. Perform the error processing shown in section 39.3.12. IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read) or section 39.3.13. IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Write), and complete the command sequence.

[Setting condition]

- When a response is not received though a time longer than 640 cycles of SD/MMC clock has elapsed (including a response to a command issued within a command sequence).

[Clearing condition]

- When 0 is written to RSPTO.

SDD0MON flag (SDHI_D0 Pin Status Flag)

The SDD0MON flag indicates the status of the SDHI_D0 pin. If the data timeout (DTO) is set but the response timeout (RSPTO) is not set after the Erase command is issued, the end of the Erase sequence (SDD0MON = 1) is confirmed by polling DAT0.

If a communication error or timeout occurs during a write sequence, the DAT0 bit might retain the value 0.

While the SD/MMC clock is stopped, the DAT0 bit retains the value before the clock is stopped.

BRE flag (SD_BUF0 Read Enable Flag)

The BRE flag indicates that SD_BUF0 is enabled for reading.

[Setting conditions]

- When data set in SD_SIZE is stored in SD_BUF0 at single block transfer.
- When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF0 at multiple block transfer.

[Clearing conditions]

- When 0 is written to BRE

ILW标志（SD_BUF0非法写访问检测标志）

ILW标志表示检测到SD_BUF0非法写访问。

[Setting conditions]

●数据写入SD_BUF0时，SD_BUF0不处于数据读写命令状态。

●当SD_BUF已满而数据写入SD_BUF0时。

●当数据写入SD_BUF0且CRC状态或CRC状态长度发生错误时。

●当数据写入SD_BUF0时，CRC状态后的忙碌状态持续时间超过Ncycle。

Note: Ncycle在SD_OPTION的位[7:4]中设置。

[Clearing condition]

●当0写入ILW时。

ILR标志（SD_BUF0非法读访问检测标志）

ILR标志表示检测到SD_BUF0非法读取访问。

[Setting conditions]

●读取SD_BUF0时SD_BUF为空。

●从SD_BUF0读取CRC错误或END错误的数据时。

[Clearing condition]

●当0写入ILR时。

RSPTO标志（响应超时检测标志）

RSPTO标志表示检测到响应超时。当发生响应超时时，命令序列停止。当SDIOMD.C52PUB位设置为1并自动发出CMD52时，如果发生通信错误或响应超时，则命令序列未完成。执行39.3.12节中所示的错误处理。IO_RW_EXTENDED命令（SD：CMD53多块读取）或第39.3.13节。IO_RW_EXTENDED命令（SD：CMD53MultipleBlockWrite），完成命令序列。

[Setting condition]

●超过640个SDMMC时钟周期后仍未收到响应时（包括对命令序列内发出的命令的响应）。

[Clearing condition]

●当0写入RSPTO时。

SDD0MON标志（SDHI_D0引脚状态标志）

SDD0MON标志指示SDHI_D0引脚的状态。如果在发出擦除命令后设置了数据超时(DTO)但未设置响应超时(RSPTO)，则通过轮询DAT0确认擦除序列的结束(SDD0MON=1)。

如果在写入序列期间发生通信错误或超时，则DAT0位可能会保留值0。

SDMMC时钟停止时，DAT0位保持时钟停止前的值。

BRE标志（SD_BUF0读取启用标志）

BRE标志指示SD_BUF0已启用读取。

[Setting conditions]

●当SD_SIZE中设置的数据在单块传输时存储在SD_BUF0中。

●当SD_SIZE中设置的数据在多块传输中存储在SD_BUF0的bank1或bank2中时。

[Clearing conditions]

●BRE写入0时

- Reading of a block of data from SD_BUF0 by DMA transfer

When data is read from SD_BUF0 by the CPU, clear BRE then read the amount of data specified in SD_SIZE.
Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF0 and BRE is set.

BWE flag (SD_BUF0 Write Enable Flag)

The BWE flag indicates that SD_BUF0 is enabled for writing.

[Setting conditions]

- When SD_BUF0 is empty at single block transfer.
- When either bank 1 or bank 2 of SD_BUF0 is empty at multiple block transfer.

[Clearing conditions]

- When 0 is written to BWE.
- Writing of a block of data to SD_BUF0 by DMA transfer.

When data is written to SD_BUF0 by the CPU, clear BWE and then write the amount of data specified in SD_SIZE.

SD_CLK_CTRLEN flag (SD_CLK_CTRL Write Enable Flag)

When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SD_CLK_CTRLEN bit is set to 0. The SD_CLK_CTRLEN bit is set to 1 after 8 cycles of SDCLK have elapsed after the CBSY bit clears to 0 on completion of the command sequence.

ILA flag (Illegal Access Error Detection Flag)

The ILA flag indicates that an illegal access error was detected.

[Setting conditions]

- Writing of data to SD_CMD within a command sequence (CBSY = 1).
- When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000 1100b (CMD12) are set in SD_CMD.

[Clearing condition]

- When 0 is written to ILA.

39.2.12 SD_INFO1_MASK : SD INFO1 Interrupt Mask Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SDD3INM	SDD3RMM	—	—	—	SDCDINM	SDCDRMM	ACENDM	—	RSPENDM
Value after reset:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	0	1

Bit	Symbol	Function	R/W
0	RSPENDM	Response End Interrupt Request Mask 0: Do not mask response end interrupt request 1: Mask response end interrupt request	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W

●通过DMA传输从SD_BUF0读取数据块

当CPU从SD_BUF0读取数据时，清除BRE，然后读取SD_SIZE中指定的数据量。
即使在读取块数据时发生CRC错误或END错误，数据也会存储在SD_BUF0中并设置BRE。

BWE标志（SD_BUF0写使能标志）

BWE标志指示SD_BUF0已启用写入。

[Setting conditions]

●单块传输时SD_BUF0为空时。

●多块传输时SD_BUF0的bank1或bank2为空时。

[Clearing conditions]

●当0写入BWE时。

●通过DMA传输将数据块写入SD_BUF0。

当CPU将数据写入SD_BUF0时，清除BWE，然后写入SD_SIZE中指定的数据量。

SD_CLK_CTRLEN标志（SD_CLK_CTRL写使能标志）

当通过写入SD_CMD启动命令序列时，CBSY位设置为1，同时，
SD_CLK_CTRLEN位设置为0。SD_CLK_CTRLEN位在SDCLK 的8个周期后设置为1。
CBSY位在命令序列完成时清零。

ILA标志（非法访问错误检测标志）

ILA标志表示检测到非法访问错误。

[Setting conditions]

●在命令序列中将数据写入SD_CMD(CBSY=1)。

●当SD_CMD[11]=1（有数据传输的命令）且SD_CMD[7:0]=00001100b(CMD12)在SD_CMD中设置。

[Clearing condition]

●当0写入ILA时。

39.2.12 SD_INFO1_MASK:SDINFO1中断屏蔽寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SDD3INM	SDD3RMM	—	—	—	SDCDINM	SDCDRMM	ACENDM	—	RSPENDM
重置后的值:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	0	1

Bit	Symbol	Function	R/W
0	RSPENDM	响应结束中断请求掩码 0：不屏蔽响应结束中断请求1：屏蔽响应结束中断请求	R/W
1	—	该位读取为0。写入值应为0。	R/W

Bit	Symbol	Function	R/W
2	ACENDM	Access End Interrupt Request Mask 0: Do not mask access end interrupt request 1: Mask access end interrupt request	R/W
3	SDCDRMM	SDnCD Removal Interrupt Request Mask 0: Do not mask SD card/MMC removal interrupt request by the SDnCD pin 1: Mask SD card/MMC removal interrupt request by the SDnCD pin	R/W
4	SDCDINM	SDnCD Insertion Interrupt Request Mask 0: Do not mask SD card/MMC insertion interrupt request by the SDnCD pin 1: Mask SD card/MMC insertion interrupt request by the SDnCD pin	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
8	SDD3RMM	SDnDAT3 Removal Interrupt Request Mask 0: Do not mask SD card/MMC removal interrupt request by the SDnDAT3 pin 1: Mask SD card/MMC removal interrupt request by the SDnDAT3 pin	R/W
9	SDD3INM	SDnDAT3 Insertion Interrupt Request Mask 0: Do not mask SD card/MMC insertion interrupt request by the SDnDAT3 pin 1: Mask SD card/MMC insertion interrupt request by the SDnDAT3 pin	R/W
31:10	—	These bits are read as 0. The write value should be 0.	R/W

The SD_INFO1_MASK register enables or disables interrupt requests from the status flags in the SD_INFO1 register. See Table 39.5, for details on the relationship between the status flags and the requested interrupt source.

39.2.13 SD_INFO2_MASK : SD INFO2 Interrupt Mask Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x044

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4	ILWM	SD_BUF0寄存器非法写中断请求掩码 0：不屏蔽SD_BUF0寄存器的非法写检测中断请求1：屏蔽SD_BUF0寄存器的非法写检测中断请求	R/W
5	ILRM	SD_BUF0寄存器非法读中断请求掩码 0：不屏蔽SD_BUF0寄存器的非法读检测中断请求1：屏蔽SD_BUF0寄存器的非法读检测中断请求	R/W

Bit	Symbol	Function	R/W
6	RSPTOM	Response Timeout Interrupt Request Mask 0: Do not mask response timeout interrupt request 1: Mask response timeout interrupt request	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
8	BREM*1	BRE Interrupt Request Mask 0: Do not mask read enable interrupt request for the SD buffer 1: Mask read enable interrupt request for the SD buffer	R/W
9	BWEM*1	BWE Interrupt Request Mask 0: Do not mask write enable interrupt request for the SD_BUF0 register 1: Mask write enable interrupt request for the SD_BUF0 register	R/W
10	—	This bit is read as 0. The write value should be 0.	R/W
11	—	This bit is read as 1.The write value should be 1.	R/W
14:12	—	These bits are read as 0. The write value should be 0.	R/W
15	ILAM	Illegal Access Error Interrupt Request Mask 0: Do not mask illegal access error interrupt request 1: Mask illegal access error interrupt request	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. When the SD_INFO2_MASK.BWEM bit is 0 or the SD_INFO2_MASK.BREM bit is 0, set the SD_DMAEN.DMAEN bit to 0. When the SD_DMAEN.DMAEN bit is 1, set the SD_INFO2_MASK.BWEM bit to 1 and the SD_INFO2_MASK.BREM bit to 1.

The SD_INFO2_MASK register enables or disables interrupt requests from the status flags in the SD_INFO2 register. See Table 39.5 for details on the relationship between the status flags and the requested interrupt source.

39.2.14 SD_CLK_CTRL : SD Clock Control Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x048

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

8	CLKEN	SD/MMC Clock Output Control*2 0: Disable SD/MMC clock output (fix SDnCLK signal low) 1: Enable SD/MMC clock output	R/W

Bit	Symbol	Function	R/W
6	RSPTOM	响应超时中断请求掩码 0：不屏蔽响应超时中断请求1：屏蔽响应超时中断请求	R/W
7	—	该位读取为0。写入值应为0。	R/W
8	BREM*1	BRE中断请求掩码 0：不屏蔽SD缓冲区的读使能中断请求1：屏蔽SD缓冲区的读使能中断请求	R/W
9	BWEM*1	BWE中断请求掩码 0：不屏蔽SD_BUF0寄存器的写使能中断请求1：屏蔽SD_BUF0寄存器的写使能中断请求	R/W
10	—	该位读取为0。写入值应为0。	R/W
11	—	该位读取为1。写入值应为1。	R/W
14:12	—	这些位被读取为0。写入值应为0。	R/W
15	ILAM	非法访问错误中断请求掩码 0：不屏蔽非法访问错误中断请求1：屏蔽非法访问错误中断请求	R/W
31:16	—	这些位被读取为0。写入值应为0。	R/W

注1.当SD_INFO2_MASK.BWEM位为0或SD_INFO2_MASK.BREM位为0时，将SD_DMAEN.DMAEN位设置为0。当SD_DMAEN.DMAEN位为1时，将SD_INFO2_MASK.BWEM位设置为1和SD_INFO2_MASK。BREM位为1。

SD_INFO2_MASK寄存器启用或禁用来自SD_INFO2寄存器中状态标志的中断请求。看表39.5详细说明了状态标志和请求的中断源之间的关系。

39.2.14 SD_CLK_CTRL:SD时钟控制寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x048

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	CLKCTRLEN	CLKEN	CLKSEL[7:0]							
重置后的值：	0	0	0	0	0	0	0	0*1	0	0	1	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CLKSEL[7:0]	SDHI时钟频率选择*2 0xFF PCLKB 0x00: PCLKB/2 0x01: PCLKB/4 0x02: PCLKB/8 0x04: PCLKB/16 0x08: PCLKB/32 0x10: PCLKB/64 0x20: PCLKB/128 0x40: PCLKB/256 0x80: PCLKB/512 其他：禁止设置	R/W
8	CLKEN	SDMMC时钟输出控制*2 0：禁用SDMMC时钟输出（固定SDnCLK信号为低电平）1：启用SDMMC时钟输出	R/W

Bit	Symbol	Function	R/W
9	CLKCTRLEN	SD/MMC Clock Output Automatic Control Select 0: Disable automatic control of SD/MMC clock output 1: Enable automatic control of SD/MMC clock output	R/W
31:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.
Note 2. Bits CLKSEL[7:0] and CLKEN cannot be write accessed when the SD_INFO2.SD_CLK_CTRLEN flag is 0.

The SDCLKCTRL register controls the SD/MMC clock frequency settings and output. Set the CLKEN bit to 1 before writing to the SD_CMD register to start a command sequence. Do not write to the SDCLKCTRL register when the SD_INFO2.SD_CLK_CTRLEN flag is 0.

CLKCTRLEN bit (SD/MMC Clock Output Automatic Control Select)

The CLKCTRLEN bit enables or disables the automatic control function for SD/MMC clock output, which causes the SD/MMC clock to output only within a command sequence.

The timing with which SD/MMC clock output starts and stops is as follows:

- SD/MMC clock output starts after writing to SD_CMD
- SD/MMC clock output stops when 8 cycles of SD/MMC clock have elapsed after the end of the command sequence.

In addition, SD/MMC clock is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.

39.2.15 SD_SIZE : Transfer Data Length Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n
Offset address: 0x04C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LEN[9:0]									
Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	LEN[9:0]	Transfer Data Size Setting These bits specify the transfer data size.*1	R/W
31:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not rewrite these bits when the SD_INFO2.CBSY flag is 1.

The SD_SIZE register sets the transfer data size.

LEN[9:0] bits (Transfer Data Size Setting)

When using single block transfer, the transfer data size can be set in the LEN[9:0] bits from 1 byte to 512 bytes. When CMD12 is automatically issued during a multiblock transfer sequence (CMD18 and CMD25), the transfer data size can only be set to 512 bytes. When CMD12 is not automatically issued during a multiblock transfer sequence, the transfer data size can be set to 32, 64, 128, 256, or 512 bytes. However, a 32-, 64-, 128-, or 256-byte multiblock read transfer can only be performed during an SDIO multiblock transfer (CMD53). Do not set these bits to 0 when using a command that includes data transfer.

Bit	Symbol	Function	R/W
9	CLKCTRLEN	SDMMC时钟输出自动控制选择 0：禁止SDMMC时钟输出自动控制1：使能SDMMC时钟输出自动控制	R/W
31:10	—	这些位被读取为0。写入值应为0。	R/W

注1.该值由复位初始化，并且在由SOFT_RST.SDRST标志触发的复位时初始化。
注2.当SD_INFO2.SD_CLK_CTRLEN标志为0时，不能写访问位CLKSEL[7:0]和CLKEN。

SDCLK CTRL寄存器控制SDMMC时钟频率设置和输出。在写入SD_CMD寄存器以启动命令序列之前，将CLKEN位设置为1。当SD_INFO2.SD_CLK_CTRLEN标志为0时，不要写入SDCLK CTRL寄存器。

CLKCTRLEN位（SDMMC时钟输出自动控制选择）

CLKCTRLEN位启用或禁用SDMMC时钟输出的自动控制功能，这会导致SDMMC时钟仅在命令序列内输出。

SDMMC时钟输出开始和停止的时序如下：

●写入SD_CMD后开始SDMMC时钟输出

●在命令序列结束后经过8个SDMMC时钟周期时，SDMMC时钟输出停止。

此外，SDMMC时钟固定为0，而SD_CLK_CTRL的SCLKEN为0，与该位的值无关。

39.2.15 SD_SIZE：传输数据长度寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n
Offset address: 0x04C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LEN[9:0]									
重置后的值：	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	LEN[9:0]	传输数据大小设置 这些位指定传输数据大小。*1	R/W
31:10	—	这些位被读取为0。写入值应为0。	R/W

注1.当SD_INFO2.CBSY标志为1时，不要重写这些位。

SD_SIZE寄存器设置传输数据大小。

LEN[9:0]位（传输数据大小设置）

使用单块传输时，传输数据大小可以在LEN[9:0]位中设置，从1字节到512字节。什么时候CMD12在多块传输序列（CMD18和CMD25）期间自动发出，传输数据大小只能设置为512字节。在多块传输序列期间未自动发出CMD12时，传输数据大小可设置为32、64、128、256或512字节。但是，只能在SDIO多块传输(CMD53)期间执行32、64、128或256字节的多块读取传输。使用包含数据传输的命令时，请勿将这些位设置为0。

39.2.16 SD_OPTION : SD Card Access Control Option Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x050

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CMDE0	命令错误标志0 0：命令*2响应的命令索引字段值不存在错误1：命令*2响应的命令索引字段值存在错误	R
1	CMDE1	命令错误标志1 0：命令*3响应的命令索引字段值中不存在错误1：命令*3响应的命令索引字段值中存在错误（带有 SD_CMD.CMDIDX[5:0]设置，CMD12问题发生的错误在CMDE0标志中指示）	R
2	RSPLENE0	响应长度错误标志0 0：指令*2响应长度无错误1：指令*2响应长度有错误	R
3	RSPLENE1	响应长度错误标志1 0：命令*3响应长度中不存在错误1：命令*3响应长度中存在错误（使用SD_CMD.CMDIDX[5:0]设置，在RSPLENE0标志中指示CMD12问题发生的错误）	R
4	RDLENE	读取数据长度错误标志 0：未发生读取数据长度错误1：发生读取数据长度错误	R
5	CRCLENE	CRC状态令牌长度错误标志 0：未发生CRC状态令牌长度错误1：发生CRC状态令牌长度错误	R

Bit	Symbol	Function	R/W
7:6	—	These bits are read as 0.	R
8	RSPCRCE0	Response CRC Error Flag 0 0: No CRC error detected in command*2 response 1: CRC error detected in command*2 response	R
9	RSPCRCE1	Response CRC Error Flag 1 0: No CRC error detected in command*3 response (with SD_CMD.CMDIDX[5:0] setting, an error that occurs with CMD12 issue is indicated in the RSPCRCE0 flag) 1: CRC error detected in command*3 response	R
10	RDCRCE	Read Data CRC Error Flag 0: No CRC error detected in read data 1: CRC error detected in read data	R
11	CRCTKE	CRC Status Token Error Flag 0: No error detected in CRC status token 1: Error detected in CRC status token	R
14:12	CRCTK[2:0]	CRC Status Token These bits store the CRC status token value (normal value is 010b).	R
15	—	This bit is read as 0.	R
31:16	—	These bits are read as 0.	R

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.
Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 3. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

The SD_ERR_STS1 register indicates the CRC status token, CRC error, end bit error, and command error.

39.2.18 SD_ERR_STS2 : SD Error Status Register 2

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n
Offset address: 0x05C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	CRCBSYTO	CRCTO	RDTO	BSYTO1	BSYTO0	RSPTO1	RSPTO0
Value after reset:	0	0	0	0	0	0	0	0	0	0*1	0*1	0*1	0*1	0*1	0*1	0*1

Bit	Symbol	Function	R/W
0	RSPTO0	Response Timeout Flag 0 0: After command*2 was issued, response was received in less than 640 cycles of the SD/MMC clock 1: After command*2 was issued, response was not received in 640 or more cycles of the SD/MMC clock	R
1	RSPTO1	Response Timeout Flag 1 0: After command*3 was issued, response was received in less than 640 cycles of the SD/MMC clock 1: After command*3 was issued, response was not received after 640 or more cycles of the SD/MMC clock (with SD_CMD.CMDIDX[5:0] setting, an error that occurs with CMD12 issue is indicated in the RSPTO0 flag)	R

Bit	Symbol	Function	R/W
7:6	—	这些位读为0。	R
8	RSPCRCE0	响应CRC错误标志0 0：在命令*2响应中未检测到CRC错误1：在命令*2响应中检测到CRC错误	R
9	RSPCRCE1	响应CRC错误标志1 0：在命令*3响应中未检测到CRC错误（使用SD_CMD.CMDIDX[5:0]设置，在RSPCRCE0标志中指示CMD12问题发生的错误） 1：在命令*3响应中检测到CRC错误	R
10	RDCRCE	读取数据CRC错误标志 0：读取数据中未检测到CRC错误1：读取数据中检测到CRC错误	R
11	CRCTKE	CRC状态令牌错误标志 0：在CRC状态令牌中未检测到错误1：在CRC状态令牌中检测到错误	R
14:12	CRCTK[2:0]	CRC状态令牌 这些位存储CRC状态令牌值（正常值为010b）。	R
15	—	该位读为0。	R
31:16	—	这些位读为0。	R

注1.该值由复位初始化，并且在由SOFT_RST.SDRST标志触发的复位时初始化。
注2.通过SD_CMD中的设置，CMD12之外的CMD SD_STOP中的STP位设置为1，或者当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
注3.通过SD_CMD中的设置为多块传输启用自动发布时的CMD12，当STP位中的CMD12 SD_STOP设置为1，或当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。

SD_ERR_STS1寄存器指示CRC状态令牌、CRC错误、结束位错误和命令错误。

39.2.18 SD_ERR_STS2：SD错误状态寄存器2

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n
Offset address: 0x05C

Bit	Symbol	Function	R/W
0	RSPTO0	响应超时标志0 0：发出命令*2后，在不到640个SDMMC时钟周期内收到响应 1：发出命令*2后，在SDMMC时钟的640或更多周期内未收到响应	R
1	RSPTO1	响应超时标志1 0：发出命令*3后，在不到640个SDMMC时钟周期内收到响应 1：发出命令*3后，在SDMMC时钟的640或更多周期后未收到响应（使用SD_CMD.CMDIDX[5:0]设置，在RSPTO0标志中指示CMD12问题发生的错误）	R

Bit	Symbol	Function	R/W
2	BSYTO0	Busy Timeout Flag 0 0: After R1b response was received, SD/MMC was released from the busy state during the specified period*4 1: After R1b response was received, SD/MMC was in the busy state after the specified period*4 elapsed	R
3	BSYTO1	Busy Timeout Flag 1 0: After CMD12 was automatically issued, SD/MMC was released from the busy state during the specified period*4 1: After CMD12 was automatically issued, SD/MMC was in the busy state after the specified period*4 elapsed (with SD_CMD.CMDIDX[5:0] setting, an error that occurs with CMD12 issue is indicated in the BSYTO0 flag)	R
4	RDTO	Read Data Timeout Flag When a read command is issued, this flag sets to 1 when read data is not received after the specified period*4 elapses. When read data is received, this flag sets to 1 when the next block of read data is not received after the specified period*4 elapses. When the SD/MMC exits the read wait state, this flag sets to 1 when the next block of read data is not received after the specified period*4 elapses.	R
5	CRCTO	CRC Status Token Timeout Flag 0: After CRC data was written to the SD card/MMC, a CRC status token was received during the specified period*4 1: After CRC data was written to the SD card/MMC, a CRC status token was not received after the specified period*4 elapsed	R
6	CRCBSYTO	CRC Status Token Busy Timeout Flag 0: After a CRC status token was received, the SD/MMC was released from the busy state during the specified period*4 1: After a CRC status token was received, the SD/MMC was in the busy state after the specified period*4 elapsed	R
31:7	—	These bits are read as 0.	R

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.
Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 3. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 4. Set the SD_OPTION.TOP[3:0] bits to select the number of *n* cycles.

The SD_ERR_STS2 register indicates the timeout status.

39.2.19 SD_BUF0 : SD Buffer Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x060

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:																
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers.

If both buffers are not empty when executing multiple block read, the SD card/MMC clock is stopped to suspend receiving data. When one of the buffers is empty, the SD card/MMC clock is supplied to resume receiving data.

Bit	Symbol	Function	R/W
2	BSYTO0	忙超时标志0 0：收到R1b响应后，SDMMC在指定时间段内从忙状态中释放*4 1：收到R1b响应后，经过指定时间*4后SDMMC处于忙碌状态	R
3	BSYTO1	忙超时标志1 0：CMD12自动下发后，SDMMC在指定时间段内从忙状态释放*4 1：自动发出CMD12后，经过指定时间*4后SDMMC处于忙碌状态（使用SD_CMD.CMDIDX[5:0]设置，在BSYTO0标志中指示CMD12发出的错误）	R
4	RDTO	读取数据超时标志 发出读取命令时，如果经过指定时间*4后仍未接收到读取数据，则此标志设置为1。当接收到读取数据时，如果经过指定的时间*4后没有接收到下一个读取数据块，则此标志设置为1。当SDMMC退出读取等待状态时，如果经过指定时间*4后未接收到下一个读取数据块，此标志设置为1。	R
5	CRCTO	CRC状态令牌超时标志 0：CRC数据写入SD卡MMC后，在指定时间段内收到CRC状态令牌*4 1：将CRC数据写入SD卡MMC后，经过指定时间*4后未收到CRC状态令牌	R
6	CRCBSYTO	CRC状态令牌忙超时标志 0：收到CRC状态令牌后，SDMMC在指定时间段内从忙碌状态中释放*4 1：收到CRC状态令牌后，经过指定时间*4后SDMMC处于忙碌状态	R
31:7	—	这些位读为0。	R

注1.该值由复位初始化，并且在由SOFT_RST.SDRST标志触发的复位时初始化。
注2.通过SD_CMD中的设置，CMD12之外的CMD
SD_STOP中的STP位设置为1，或者当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
注3.通过SD_CMD中的设置为多块传输启用自动发布时的CMD12，当STP位中的CMD12
SD_STOP设置为1，或当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
注4.设置SD_OPTION.TOP[3:0]位以选择n个周期数。

SD_ERR_STS2寄存器指示超时状态。

39.2.19 SD_BUF0:SD缓冲寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x060

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:																
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
重置后的值：	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

写入SD卡时，写入数据写入该寄存器。从SD卡读取时，从该寄存器读取读取的数据。该寄存器在内部连接到两个512字节的缓冲区。

如果执行多块读取时两个缓冲区都不为空，则停止SD卡MMC时钟以暂停接收数据。当其中一个缓冲区为空时，提供SD卡MMC时钟以恢复接收数据。

39.2.20 SDIO_MODE : SDIO Mode Control Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x068

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	C52PUB	IOABT	—	—	—	—	—	RWREQ	—	INTEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	INTEN	SDIO Interrupt Acceptance Enable*1 0: Disable SDIO interrupt acceptance 1: Enable SDIO interrupt acceptance	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	RWREQ	Read Wait Request 0: Allow SD/MMC to exit read wait state 1: Request for SD/MMC to enter read wait state	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	IOABT	SDIO Abort If this bit is set to 1 during multiblock transfer triggered by CMD53, CMD52 is immediately issued, and the command sequence is aborted.	R/W
9	C52PUB	SDIO None Abort If this bit is set to 1 during multiblock transfer triggered by CMD53, CMD52 is issued after the transfer process is complete, and the command sequence is completed.	R/W
31:10	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The SDIO_MODE register controls reception of the SDIO interrupt, CMD52 issuance during multiblock transfer, and read wait request. Do not set bits C52PUB and IOABT to 1 at the same time.

RWREQ bit (Read Wait Request)

When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks.

[Read wait state releasing]

- The read wait state is released, when RWREQ is cleared to 0 in the read wait state.
- When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 is issued, and then the read wait state is released.
- When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. You must set RWREQ and C52PUB simultaneously.

When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag sets.

IOABT bit (SDIO Abort)

When the IOABT bit is set to 1 in a CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communication error or timeout, CMD52 is not issued.

39.2.20 SDIO_MODE:SDIO模式控制寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x068

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	C52PUB	IOABT	—	—	—	—	—	RWREQ	—	INTEN
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	INTEN	SDIO中断接受使能*1 0：禁止SDIO中断接受1：使能SDIO中断接受	R/W
1	—	该位读取为0。写入值应为0。	R/W
2	RWREQ	读取等待请求 0：允许SDMMC退出读取等待状态1：请求SDMMC进入读取等待状态	R/W
7:3	—	这些位被读取为0。写入值应为0。	R/W
8	IOABT	SDIO Abort 如果在CMD53触发的多块传输期间该位设置为1，则立即发出CMD52，并中止命令序列。	R/W
9	C52PUB	SDIO无中止 如果在CMD53触发的多块传输期间该位设置为1，则在传输过程完成后发出CMD52，命令序列完成。	R/W
31:10	—	这些位被读取为0。写入值应为0。	R/W

注1.当SD_INFO2.CBSY标志为1时，请勿重写该位。

SDIO_MODE寄存器控制SDIO中断的接收、多块传输期间CMD52的发布和读取等待请求。不要同时将位C52PUB和IOABT设置为1。

RWREQ位（读取等待请求）

当CMD53（多块）读取序列中RWREQ设置为1时，块传输进入块之间的读取等待状态。

[读取等待状态释放]

●在读等待状态下，当RWREQ被清0时，读等待状态被释放。

●读等待状态下IOABT置1时，发出CMD52后RWREQ自动清0，然后解除读等待状态。

●当C52PUB和RWREQ在CMD53（多块）读序列中同时置1时，读等待状态不会自动解除。因此，在收到CMD52响应后，清除RWREQ。您必须同时设置RWREQ和C52PUB。

当RWREQ设置为1时CMD53（多块）读取序列中的最后一个块被传输时，不会进入读取等待状态，并且通过设置访问结束将RWREQ自动清除为0。设置响应结束标志后将RWREQ设置为1。

IOABT bit (SDIO Abort)

当CMD53（多块）序列中的IOABT位设置为1时，CMD53序列停止并发出CMD52。但是，如果命令序列由于通信错误或超时而停止，则不会发出CMD52。

RA生态工作室

Although continued buffer access is possible even after IOABT is set to 1, the buffer access error bit (ILR or ILW) in SD_INFO2 is set accordingly. Set SD_ARG before setting IOABT to 1.

When IOABT is set to 1 during transfer for a single block write, the access end flag sets when SD_BUF0 becomes empty, and CMD52 is not issued. If SD_BUF0 contains data, the access end flag sets on completion of reception of the busy state without CMD52 being issued.

When IOABT is set to 1 during transfer for single block read, the access end flag sets immediately after IOABT is set, and CMD52 is not issued.

When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag sets on completion of reception of the busy state without CMD52 being issued.

When IOABT is set to 1 after a command sequence is completed, CMD52 is not issued and the access end flag does not set.

Set IOABT to 1 after the response end flag sets.

Set IOABT to 0 after the access end flag sets.

C52PUB bit (SDIO None Abort)

When the C52PUB bit is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF0 becomes empty. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag sets to 1.

When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag sets to 1.

If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, you must set RWREQ to 1 in addition to C52PUB.

Set SD_ARG before setting C52PUB to 1.

Set C52PUB to 1 after the response end flag sets.

39.2.21 SDIO_INFO1 : SDIO Interrupt Flag Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x06C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	EXWT	EXPUB52	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQ
Value after reset:	0*1	0*1	0	0	0	0	0	0	0	0	0	0	0	x	x	0*1

Bit	Symbol	Function	R/W
0	IOIRQ	SDIO Interrupt Status Flag 0: No SDIO interrupt detected 1: SDIO interrupt detected	R/(W)*2
2:1	—	The read values are undefined. The write value should be 1.	R/W
13:3	—	These bits are read as 0. The write value should be 0.	R/W
14	EXPUB52	EXPUB52 Status Flag Indicates the status of the EXPUB52.	R/(W)*2
15	EXWT	EXWT Status Flag Indicates the status of the EXWT.	R/(W)*2
31:16	—	These bits are read as 0. The write value should be 0.	R/W

尽管即使在IOABT设置为1后仍可以继续访问缓冲区，但缓冲区访问错误位（ILR或ILW）在SD_INFO2相应设置。在将IOABT设置为1之前设置SD_ARG。

当IOABT在单块写入传输期间设置为1时，SD_BUF0变为空时设置访问结束标志，并且不发出CMD52。如果SD_BUF0包含数据，则在未发出CMD52的忙状态接收完成时设置访问结束标志。

当IOABT在单块读取传输期间设置为1时，在设置IOABT后立即设置访问结束标志，并且未发出CMD52。

如果在R1b响应后接收忙碌状态期间将IOABT设置为1，则在没有发出CMD52的情况下完成忙碌状态接收时设置访问结束标志。

当命令序列完成后IOABT设置为1时，不发出CMD52并且不设置访问结束标志。

设置响应结束标志后将IOABT设置为1。

设置访问结束标志后将IOABT设置为0。

C52PUB位（SDIO无中止）

在CMD53（多块）写入序列中将C52PUB位设置为1时，如果SD_BUF0为空，则在块之间自动发出CMD52。C52PUB在接收到对CMD52的响应完成后自动清零。此外，如果在传输最后一个块时将C52PUB设置为1，则不会发出CMD52。在这种情况下，访问结束标志设置为1后，C52PUB自动清零。

当CMD53（多块）读序列中C52PUB和RWREQ置1时，块传输进入块间读等待状态，自动发出CMD52。C52PUB在接收到对CMD52的响应完成后自动清零。此外，如果在传输最后一个块时将C52PUB设置为1，则不会发出CMD52。在这种情况下，访问结束标志设置为1后，C52PUB自动清零。

如果在CMD53（多块）读取序列中将C52PUB设置为1，则除了C52PUB之外，还必须将RWREQ设置为1。

在将C52PUB设置为1之前设置SD_ARG。

在响应结束标志设置后将C52PUB设置为1。

39.2.21 SDIO_INFO1:SDIO中断标志 寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x06C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	EXWT	EXPUB52	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQ
重置后的值:	0*1	0*1	0	0	0	0	0	0	0	0	0	0	0	x	x	0*1

Bit	Symbol	Function	R/W
0	IOIRQ	SDIO中断状态标志 0：未检测到SDIO中断1：检测到SDIO中断	R/(W)*2
2:1	—	读取的值未定义。写入值应为1。	R/W
13:3	—	这些位被读取为0。写入值应为0。	R/W
14	EXPUB52	EXPUB52状态标志 指示EXPUB52的状态。	R/(W)*2
15	EXWT	EXWT状态标志 指示EXWT的状态。	R/(W)*2
31:16	—	这些位被读取为0。写入值应为0。	R/W

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.
Note 2. Only 0 can be written to clear the bit.

The SDIO_INFO1 register indicates the status of the SDIO card access. Set flags to be cleared to 0. Set flags that are not being cleared to 1.

IOIRQ flag (SDIO Interrupt Status Flag)

The IOIRQ flag indicates that an SDIO interrupt occurred.

[Setting condition]

- When SDIO interrupt from an SDIO card is received while INTEN in SDIO_MODE is set to 1.

[Clearing condition]

- When 0 is written to IOIRQ.*1

Note 1. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit can be set again.

EXPUB52 flag (EXPUB52 Status Flag)

The EXPUB52 flag indicates the EXPUB52 status.

[Setting conditions]

- While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1.
- While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred.

[Clearing condition]

- When 0 is written to EXPUB52.

EXWT flag (EXWT Status Flag)

The EXWT flag indicates the EXWT status.

[Setting condition]

- While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1.

[Clearing condition]

- When 0 is written to EXWT.

39.2.22 SDIO_INFO1_MASK : SDIO INFO1 Interrupt Mask Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n
Offset address: 0x070

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	EXWTM	EXPUB52M	—	—	—	—	—	—	—	—	—	—	—	—	—	IOIRQM
Value after reset:	1	1	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
0	IOIRQM	IOIRQ Interrupt Mask Control 0: Do not mask IOIRQ interrupts 1: Mask IOIRQ interrupts	R/W
2:1	—	These bits are read as 1.The write value should be 1.	R/W

注1.该值由复位初始化，并且在由SOFT_RST.SDRST标志触发的复位时初始化。
注2.只能写入0来清除该位。

SDIO_INFO1寄存器指示SDIO卡访问的状态。将要清除的标志设置为0。将未清除的标志设置为1。

IOIRQ标志（SDIO中断状态标志）

IOIRQ标志表示发生了SDIO中断。

[Setting condition]

●当SDIO_MODE中的INTEN设置为1时，接收到来自SDIO卡的SDIO中断。

[Clearing condition]

●0写入IOIRQ时。*1

注1.在清除该位之前，访问SDIO卡以否定来自SDIO卡的SDIO中断信号。如果中断信号没有被否定，这个位可以被重新设置。

EXPUB52标志（EXPUB52状态标志）

EXPUB52标志指示EXPUB52状态。

[Setting conditions]

●当CMD53（多块）序列中的最后一个块被传输时，SDIO_MODE中的C52PUB设置为1。
●在CMD53（多块）写入序列中，当C52PUB设置为1时，传输最后一个块。

[Clearing condition]

●当0写入EXPUB52时。

EXWT标志（EXWT状态标志）

EXWT标志指示EXWT状态。

[Setting condition]

●当CMD53（多块）读取序列中的最后一个块被传输时，SDIO_MODE中的RWREQ设置为1。

[Clearing condition]

●当0写入EXWT时。

39.2.22 SDIO_INFO1_MASK:SDIOINFO1中断屏蔽寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n
Offset address: 0x070

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

2:1	—	这些位被读取为1。写入值应为1。	R/W

Bit	Symbol	Function	R/W
13:3	—	These bits are read as 0. The write value should be 0.	R/W
14	EXPUB52M	EXPUB52 Interrupt Request Mask Control 0: Do not mask EXPUB52 interrupt requests 1: Mask EXPUB52 interrupt requests	R/W
15	EXWTM	EXWT Interrupt Request Mask Control 0: Do not mask EXWT interrupt requests 1: Mask EXWT interrupt requests	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

The SDIO_INFO1_MASK register enables or disables interrupt requests from the status flags in the SDIO_INFO1 register. See Table 39.5 for details on the relationship between the status flags and the requested interrupt source.

39.2.23 SD_DMAEN : DMA Mode Enable Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x1B0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMAEN	—
Value after reset:	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	DMAEN	DMA Transfer Enable*1 *2 0: Disable use of DMA transfer to access SD_BUF0 register 1: Enable use of DMA transfer to access SD_BUF0 register	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	—	This bit is read as 1. The write value should be 1.	R/W
11:5	—	These bits are read as 0. The write value should be 0.	R/W
12	—	This bit is read as 1. The write value should be 1.	R/W
31:13	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY bit is 1.
Note 2. When the SD_INFO2_MASK.BWEM bit is 0 or the SD_INFO2_MASK.BREM bit is 0, set the SD_DMAEN.DMAEN bit to 0. When the SD_DMAEN.DMAEN bit is 1, set the SD_INFO2_MASK.BWEM bit to 1 and the SD_INFO2_MASK.BREM bit to 1.

The SD_DMAEN register enables or disables DMA transfers.

DMAEN bit (DMA Transfer Enable)

When using DMA transfer to access the SD buffer, set the DMAEN bit to 1 before setting the SD_CMD register.

Bit	Symbol	Function	R/W
13:3	—	这些位被读取为0。写入值应为0。	R/W
14	EXPUB52M	EXPUB52中断请求屏蔽控制 0：不屏蔽EXPUB52中断请求1：屏蔽EXPUB52中断请求	R/W
15	EXWTM	EXWT中断请求屏蔽控制 0：不屏蔽EXWT中断请求1：屏蔽EXWT中断请求	R/W
31:16	—	这些位被读取为0。写入值应为0。	R/W

SDIO_INFO1_MASK寄存器启用或禁用来自SDIO_INFO1寄存器中状态标志的中断请求。
有关状态标志和请求的中断源之间关系的详细信息，请参见表39.5。

39.2.23 SD_DMAEN:DMA模式使能寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x1B0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMAEN	—
重置后的值：	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0

Bit	Symbol	Function	R/W
0	—	该位读取为0。写入值应为0。	R/W
1	DMAEN	DMA传输启用*1*2 0：禁止使用DMA传输访问SD_BUF0寄存器1：启用使用DMA传输访问SD_BUF0寄存器	R/W
3:2	—	这些位被读取为0。写入值应为0。	R/W
4	—	该位读取为1。写入值应为1。	R/W
11:5	—	这些位被读取为0。写入值应为0。	R/W
12	—	该位读取为1。写入值应为1。	R/W
31:13	—	这些位被读取为0。写入值应为0。	R/W

注1.当SD_INFO2.CBSY位为1时，请勿重写该位。
注2.当SD_INFO2_MASK.BWEM位为0或SD_INFO2_MASK.BREM位为0时，将SD_DMAEN.DMAEN位设置为0。当SD_DMAEN.DMAEN位为1时，将SD_INFO2_MASK.BWEM位设置为1和SD_INFO2_MASK。BREM位为1。

SD_DMAEN寄存器启用或禁用DMA传输。

DMAEN位（DMA传输使能）

使用DMA传输访问SD缓冲区时，在设置SD_CMD寄存器之前将DMAEN位设置为1。

39.2.24 SOFT_RST : Software Reset Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x1C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SDRST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
0	SDRST	Software Reset Control 0: Reset SD/MMC Host Interface software 1: Cancel reset of SD/MMC Host Interface software	R/W
2:1	—	These bits are read as 1. The write value should be 1.	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Table 39.4 lists the bits and flags initialized by SD/MMC Host Interface software reset.

Table 39.4 Bits and flags initialized by SD/MMC Host Interface software reset

Register	Bit/flag
SD_STOP	SEC, STP
SD_INFO1	RSPEND, ACEND
SD_INFO2	CMDE, CRCE, ENDE, DTO, ILW, ILR, RSPTO, BRE, BWE, SD_CLK_CTRLEN, CBSY, ILA

SD_ERR_STS1	CMDE0, CMDE1, RSPLENE0, RSPLENE1, RDLENE, CRCLENE, RSPCRCE0, RSPCRCE1, RDCRCE, CRCTKE, CRCTK[2:0]
SD_ERR_STS2	RSPTO0, RSPTO1, BSYTO0, BSYTO1, RDTO, CRCTO, CRCBSYTO
SDIO_INFO1	IOIRQ, EXPUB52, EXWT
SDIF_MODE	NOCHKCR

39.2.25 SDIF_MODE:SD接口模式设置寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x1CC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	NOCHKCR	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0*1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	NOCHKCR	CRC Check Mask CRC check mask bit for MMC test commands. Set when CRC16 or CRC status value check is not executed. 0: Enable CRC check 1: Disable CRC Check (ignore CRC16 valued when reading and ignore CRC status value when writing)	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value is initialized by a reset and also on reset triggered by the SOFT_RST.SDRST flag.

NOCHKCR bit (CRC Check Mask)

The NOCHKCR bit is used for MMC test commands. This bit is set when CRC16 or CRC status value check is not executed.

39.2.26 EXT_SWAP : Swap Control Register

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x1E0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	BRSWP	BWSWP	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	BWSWP	SD_BUF0 Swap Write*1 0: Normal write operation 1: Swap the byte endian order before writing to SD_BUF0 register	R/W
7	BRSWP	SD_BUF0 Swap Read*1 0: Normal read operation 1: Swap the byte endian order before reading SD_BUF0 register	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Do not rewrite this bit when the SD_INFO2.CBSY flag is 1.

The EXT_SWAP register selects whether or not the byte endian order is swapped when accessing the SD_BUF0 register. See section 39.3.1. SD/MMC Interface for details on the differences in accessing the SD_BUF0 register based on the EXT_SWAP register value.

39.3 Operation

39.3.1 SD/MMC Interface

When data is read from the SD card/MMC, the process is as follows:

1. The SD/MMC Host Interface receives data from the SD card/MMC through the SDnDAT signal (see Figure 39.2 and Figure 39.3).
2. The received data is stored in SD_BUF of the MMC Host Interface (see Figure 39.4).
3. The data stored in SD_BUF is read from SD_BUF0 (see Figure 39.5).

Bit	Symbol	Function	R/W
7:0	—	这些位被读取为0。写入值应为0。	R/W
8	NOCHKCR	CRC校验掩码 MMC测试命令的CRC校验掩码位。不执行CRC16或CRC状态值检查时置位。 0：启用CRC校验1：禁用CRC校验（读取时忽略CRC16值，写入时忽略CRC状态值）	R/W
31:9	—	这些位被读取为0。写入值应为0。	R/W

注1.该值由复位初始化，并且在由SOFT_RST.SDRST标志触发的复位时初始化。

NOCHKCR位（CRC校验掩码）

NOCHKCR位用于MMC测试命令。当不执行CRC16或CRC状态值检查时，该位置位。

39.2.26 EXT_SWAP:交换控制寄存器

Base address: SDHIn 0 = 0x4009_2000 + 0x0400 × n

Offset address: 0x1E0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	BRSWP	BWSWP	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	这些位被读取为0。写入值应为0。	R/W
6	BWSWP	SD_BUF0交换写入*1 0：正常写操作1：在写入SD_BUF0寄存器之前交换字节顺序	R/W
7	BRSWP	SD_BUF0交换读取*1 0：正常读取操作1：在读取SD_BUF0寄存器之前交换字节顺序	R/W
31:8	—	这些位被读取为0。写入值应为0。	R/W

注1.当SD_INFO2.CBSY标志为1时，请勿重写该位。

EXT_SWAP寄存器选择在访问SD_BUF0寄存器时是否交换字节顺序。
请参见第39.3.1节。SDMMC接口了解访问SD_BUF0寄存器的差异的详细信息，基于EXT_SWAP寄存器值。

39.3 Operation

39.3.1 SD/MMC Interface

从SD卡MMC读取数据时，流程如下：

1.SDMMC主机接口通过SDnDAT信号从SD卡MMC接收数据（参见图39.2和Figure 39.3）。

2.接收到的数据存储在MMC主机接口的SD_BUF中（见图39.4）。

3.SD_BUF中存储的数据从SD_BUF0中读取（见图39.5）。

When data is written to the SD card/MMC, the specified procedure is reversed.

When accessing SD_BUF0, pay attention to the transfer order in SDnDAT and the store order in SD_BUF. If required, you can change the byte endian of the data read from or written to SD_BUF0 using the SDSWAP register. See Figure 39.6.

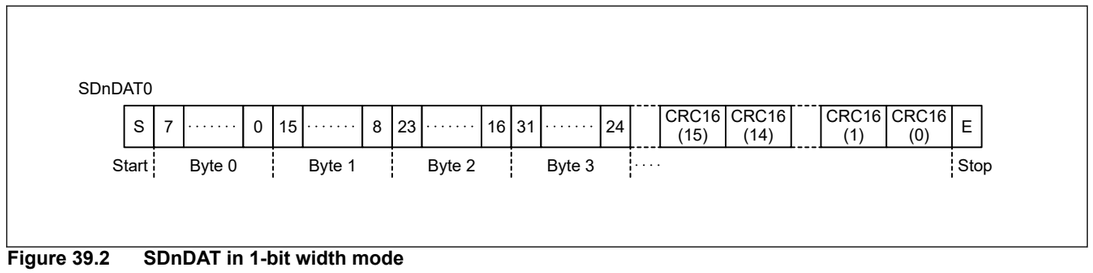

Figure 39.2 SDnDAT in 1-bit width mode

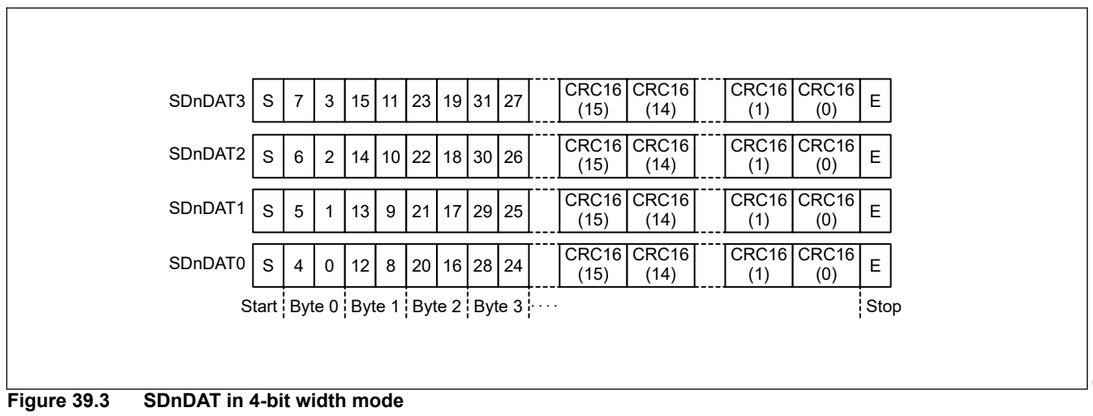

Figure 39.3 SDnDAT in 4-bit width mode

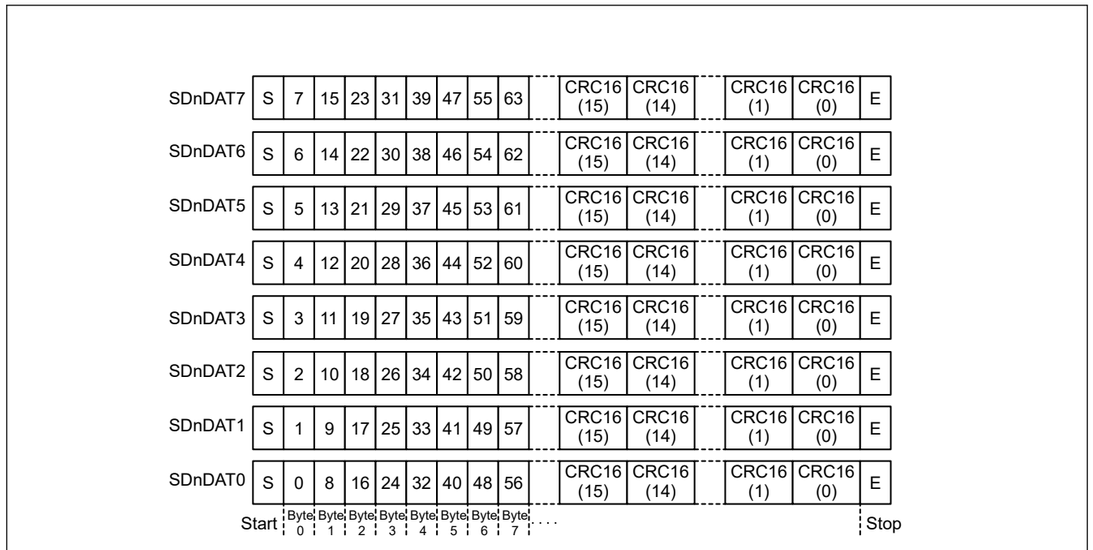

Figure 39.4 SDnDAT in 8-bit width mode

当数据写入SD卡MMC时，指定的过程相反。

访问SD_BUF0时，注意SDnDAT中的传输顺序和SD_BUF中的存储顺序。如果需要，您可以使用SDSWAP寄存器更改从SD_BUF0读取或写入数据的字节字节序。请参见图39.6。

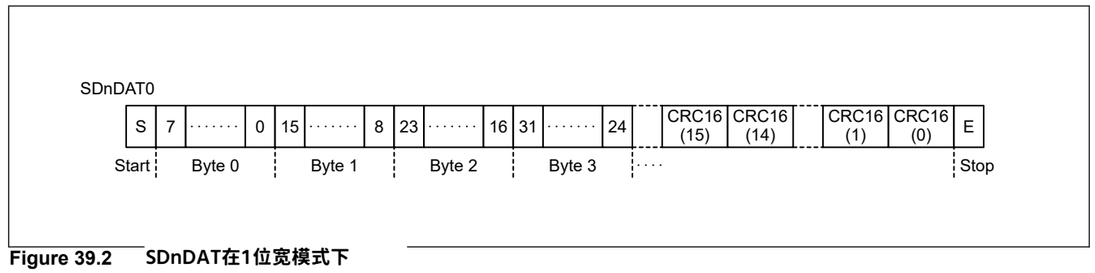

Figure 39.2 SDnDAT在1位宽模式下

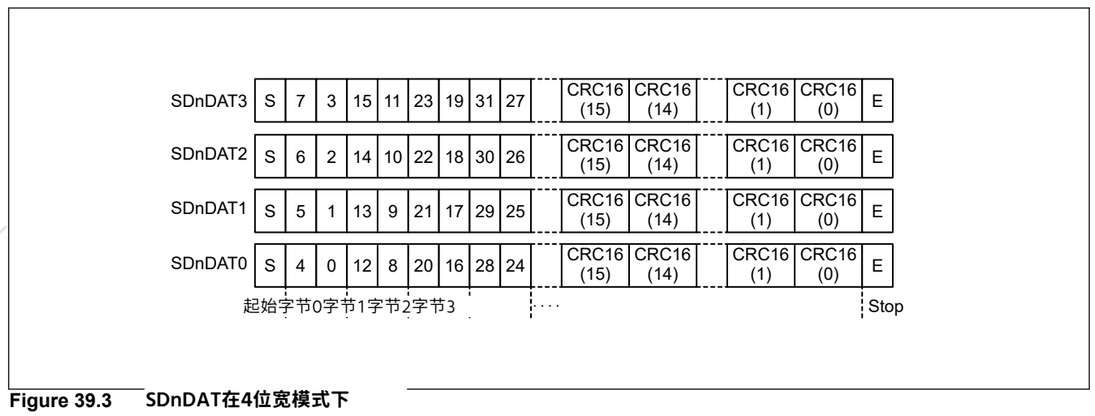

Figure 39.3 SDnDAT在4位宽模式下

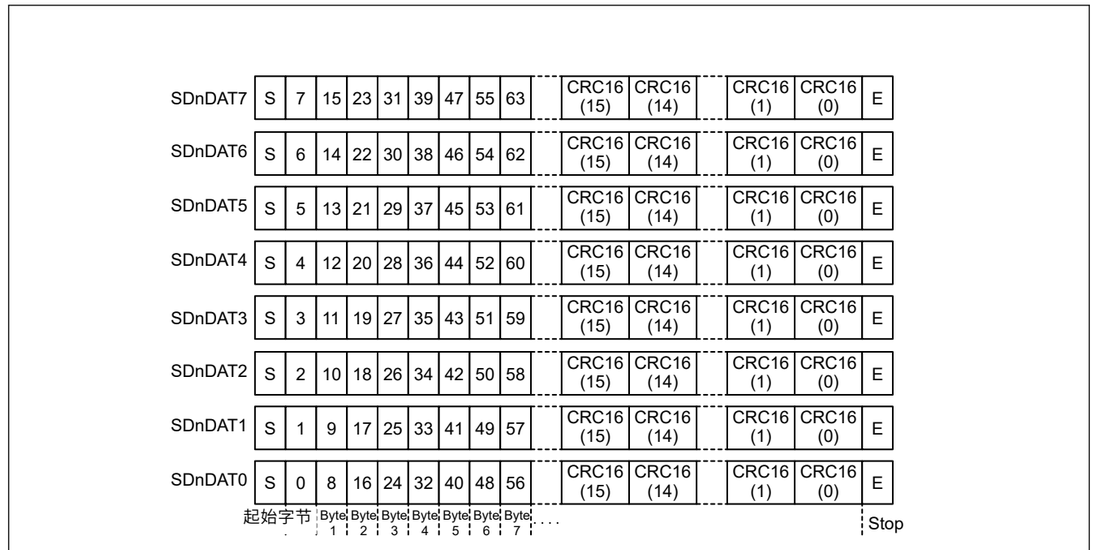

Figure 39.4 SDnDAT在8位宽度模式下

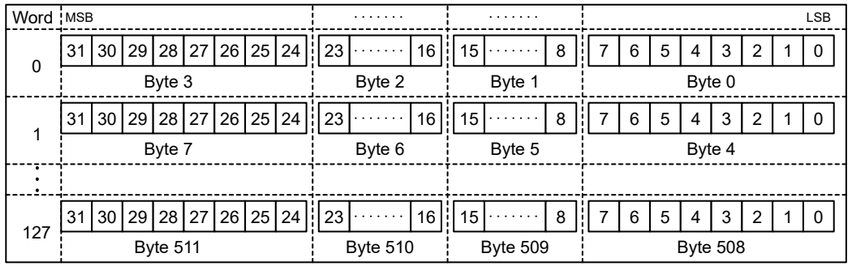

Figure 39.5 SD_BUF store data

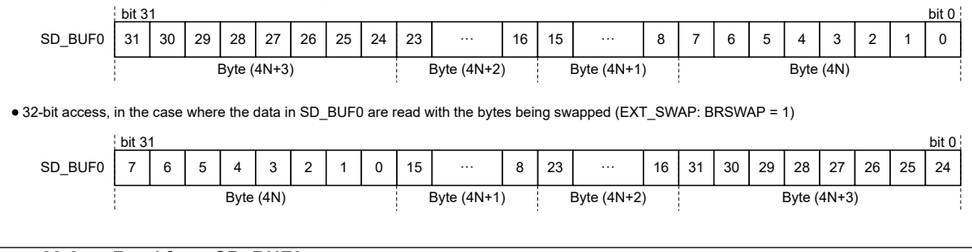

Figure 39.6 Read from SD_BUF0

39.3.2 Card Detect/Write Protect

39.3.2.1 Card detect

The SD/MMC Host Interface has two types of card detect functions.

(1) Card detect with SDnCD (n = 0)

Figure 39.7 shows the timing for card detect using SDnCD. SDnCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is determined by the specification of the SD/MMC host device.

(2) Card insertion

SDnCD is pulled down when a card is inserted. At this point, if SDnCD is pulled down for the Mcycle period (set in SD_OPTION), SDCDIN in SD_INFO1 is set to 1. It is cleared by writing 0.

(3) Card removal

SDnCD is pulled up when a card is removed. At this point, if SDnCD is pulled up for the Mcycle period (set in SD_OPTION), SDCDRM in SD_INFO1 is set to 1. It is cleared by writing 0.

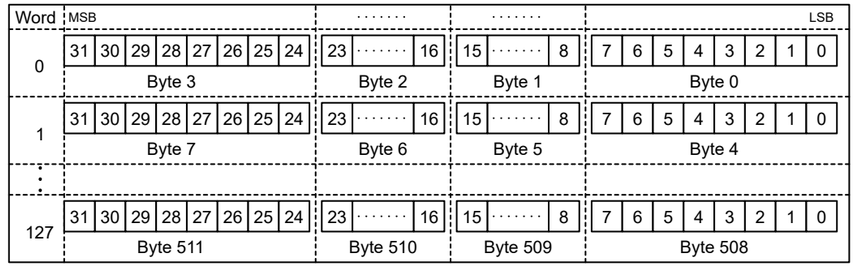

Figure 39.5 SD_BUF存储数据

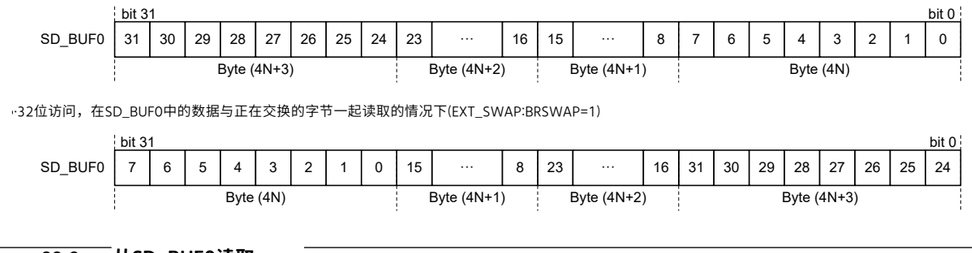

Figure 39.6 从SD_BUF0读取

39.3.2 卡检测写保护

39.3.2.1 卡检测

SDMMC主机接口有两种类型的卡检测功能。

(1) SDnCD卡检测(n=0)

图39.7显示了使用SDnCD进行卡检测的时序。SDnCD连接到卡插槽并在主机设备上拉高。上拉电阻的阻值由SDMMC主机设备的规格决定。

(2) 插卡

SDnCD在插入卡时被拉下。此时，如果SDnCD被下拉Mcycle周期（设置在SD_OPTION)，SD_INFO1中的SDCDIN设置为1。写入0清除。

(3) 取卡

取出卡时，SDnCD被拉起。此时，如果SDnCD被拉高了Mcycle周期（设置在SD_OPTION)，SD_INFO1中的SDCDRM设置为1，写入0清零。

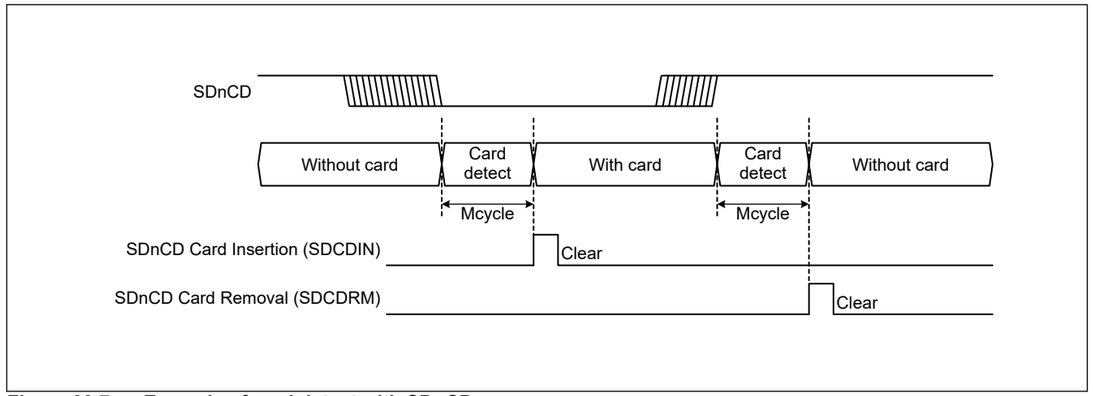

Figure 39.7 Example of card detect with SDnCD

(4) SD card detect with SDnDAT3 (n = 0)

Figure 39.8 shows the timing when the SD card is detected with SDnDAT3. In addition, SDnDAT3 is pulled down by the host device, and the resistance value for pulling down is determined by the specification of the SD host device.

(5) Card insertion

When an SD card is inserted, SDnDAT3 is pulled up and SDD3IN in SD_INFO1 is set to 1. It is cleared by writing 0.

(6) Card removal

When an SD card is removed, SDnDAT3 is pulled down and SDD3RM in SD_INFO1 is set to 1. It is cleared by writing0.

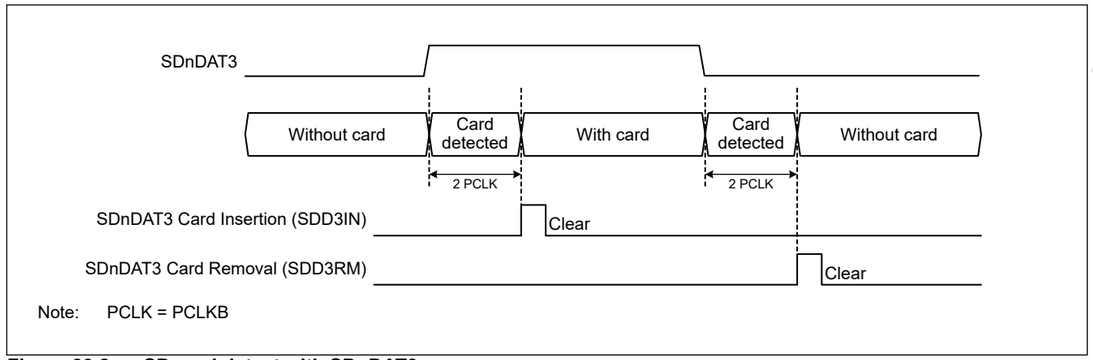

Figure 39.8 SD card detect with SDnDAT3

39.3.2.2 Write protect

The SD/MMC Host Interface has two types of write protect functions.

(1) Write protect with SDnWP (n = 0)

SDnWP is connected to the card socket and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is determined by the specification of the SD host device. When the SDnWP state is reflected to SDWPMON in SD_INFO1, the write protect state is set after the SD card is inserted.

(2) Write protect with command

The internal write protection of the card and the lock/unlock operation of the card are realized by the command.

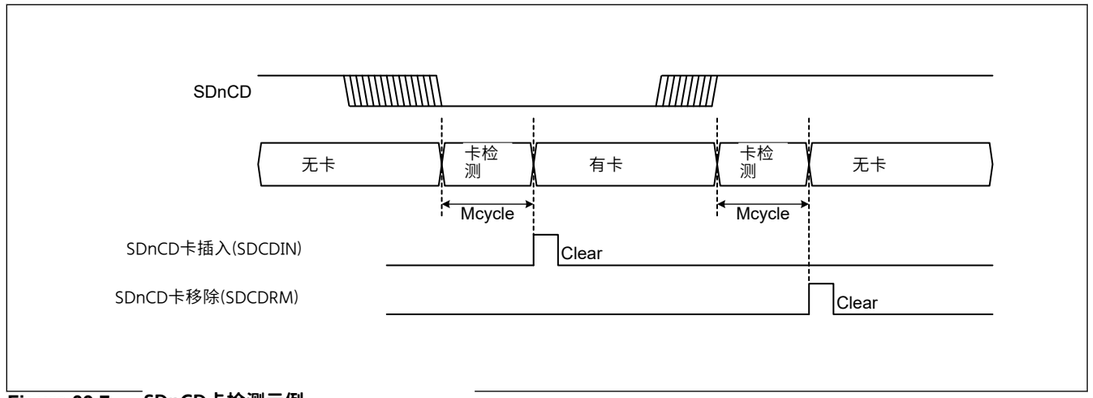

Figure 39.7 SDnCD卡检测示例

(4) 使用SDnDAT3(n=0)检测SD卡

图39.8显示了使用SDnDAT3检测到SD卡的时序。此外，SDnDAT3由主机设备下拉，下拉电阻值由SD主机设备的规格决定。

(5) 插卡

插入SD卡时，SDnDAT3上拉，SD_INFO1中的SDD3IN置1，写0清零。

(6) 取卡

取出SD卡时，SDnDAT3被拉低，SD_INFO1中的SDD3RM置1。写0清零。

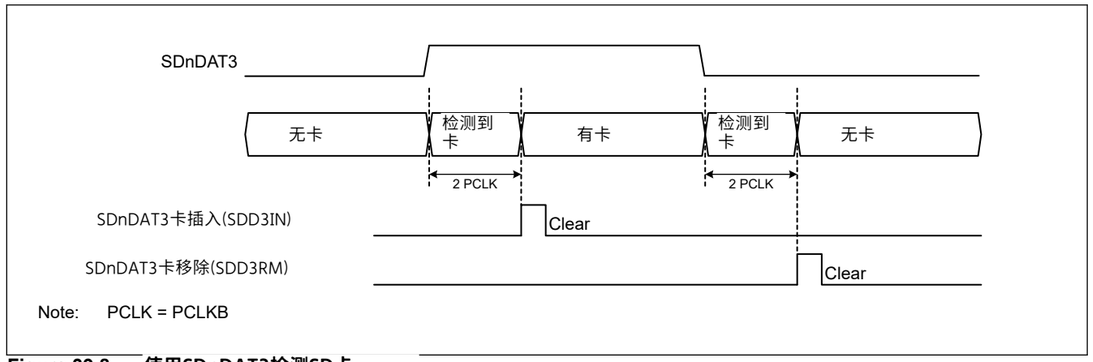

Figure 39.8 使用SDnDAT3检测SD卡

39.3.2.2 写保护

SDMMC主机接口有两种类型的写保护功能。

(1) 使用SDnWP进行写保护(n=0)

SDnWP与卡座相连，通过插卡进行上拉或下拉。上拉或下拉的选择和阻值由SD主机设备的规格决定。当SDnWP状态反映到SD_INFO1中的SDWPMON时，插入SD卡后设置写保护状态。

(2) 用命令写保护

卡的内部写保护和卡的开锁操作都是通过命令实现的。

39.3.3 Interrupt Request and DMA Transfer Request

39.3.3.1 Interrupts

Table 39.5 lists the SDHI interrupt sources. The SDHI requests an interrupt when:

- The status flags in registers SD_INFO1, SD_INFO2, and SDIO_INFO1 set to 1.
- The associated bits in the SD_INFO1_MASK, SD_INFO2_MASK, and SDIO_INFO1_MASK registers are 0.

When clearing the status flags in registers SD_INFO1, SD_INFO2, and SDIO_INFO1, write 0 to the status flags to be cleared and write 1 to the status flags that are not being cleared.

Table 39.5 Interrupt sources

Interrupt sources	Status flag register		Interrupt mask register		Interrupt name
	Register symbol	Bit symbol	Register symbol	Bit symbol	Ch n (n = 0)
Card Access Interrupt (CACI)	SD_INFO1	ACEND	SD_INFO1_MASK	ACENDM	SDHI_MMCn_ACCS
		RSPEND		RSPENDM	
	SD_INFO2	ILA	SD_INFO2_MASK	ILAM	
		BWE		BWEM	
		BRE		BREM	
		RSPTO		RSPTOM	
		ILR		ILRM	
		ILW		ILWM	
		DTO		DTOM	
		ENDE		ENDEM	
		CRCE		CRCEM	
		CMDE		CMDEM	
SDIO Access Interrupt (SDACI)	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	EXWTM	SDHI_MMCn_SDIO
		EXPUB52		EXPUB52M	
		IOIRQ		IOIRQM	
Card Detect Interrupt (CDETI)	SD_INFO1	SDD3IN	SD_INFO1_MASK	SDD3INM	SDHI_MMCn_CARD
		SDD3RM		SDD3RMM	
		SDCDIN		SDCDINM	
		SDCDRM		SDCDRMM	

39.3.3.2 DMA transfer requests (SDHI_MMCn_ODMSDBREQ, n = 0)

The SD/MMC Host Interface has two types of DMA transfer requests.

(1) SD_BUF write DMA transfer request

- When the BWE bit in SD_INFO2 is set to 1 while the DMAEN bit in SD_DMAEN is set to 1, the SD_BUF write DMA transfer request is asserted.
- The SD_BUF write DMA transfer request is negated when the last data in one block (based on the transfer data size set in SD_SIZE) is transferred. The SD_BUF write DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. However, if a communications error or timeout occurs at the DMA transfer, the SD_BUF write DMA transfer request is not negated.
- The BWE bit in SD_INFO2 is cleared after transfer of the last data in one block following a request for writing to SD_BUF by DMA transfer.
- The number of DMA transfers must be n × one block. (n = integer, one block = the transfer data size set in SD_SIZE)
- When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF write DMA transfer request is negated.

39.3.3 中断请求和DMA传输请求

39.3.3.1 Interrupts

表39.5列出了SDHI中断源。SDHI在以下情况下请求中断：

●寄存器SD_INFO1、SD_INFO2和SDIO_INFO1中的状态标志设置为1。

●SD_INFO1_MASK、SD_INFO2_MASK和SDIO_INFO1_MASK寄存器中的相关位为0。

清除寄存器SD_INFO1、SD_INFO2和SDIO_INFO1中的状态标志时，将要清除的状态标志写入0，将未清除的状态标志写入1。

Table 39.5 中断源

中断源	状态标志寄存器		中断屏蔽寄存器		中断名称
	注册符号	位符号	注册符号	位符号	Ch n (n = 0)
卡访问中断(CACI)	SD_INFO1	ACEND	SD_INFO1_MASK	ACENDM	SDHI_MMCn_ACCS
		RSPEND		RSPENDM	
	SD_INFO2	ILA	SD_INFO2_MASK	ILAM	
		BWE		BWEM	
		BRE		BREM

39.3.3.2 DMA传输请求(SDHI_MMCn_ODMSDBREQ n=0)

SDMMC主机接口有两种类型的DMA传输请求。

(1) SD_BUF写DMA传输请求

●当SD_INFO2中的BWE位设置为1而SD_DMAEN中的DMAEN位设置为1时，SD_BUF写DMA传输请求被置位。

●当一个块中的最后一个数据（基于SD_SIZE中设置的传输数据大小）被传输时，SD_BUF写DMA传输请求被否定。SD_BUF写DMA传输请求也可以通过将SOFT_RST中的SDRST位清0或将SD_STOP中的STP位设置为1来取消。但是，如果通信错误或超时发生在
DMA传输，SD_BUF写DMA传输请求不被否定。

●SD_INFO2中的BWE位在通过DMA传输向SD_BUF写入请求后传输一个块中的最后一个数据后被清除。

●DMA传输的数量必须是n×1个块。（n=整数，1块=SD_SIZE中设置的传输数据大小）

●当SDIO_MODE中的IOABT位设置为1时，SD_BUF写DMA传输请求被否定。

RA生态工作室

- The DMA transfer request is also negated by clearing the DMAEN bit to 0. However, the DMA transfer request is asserted again when the DMAEN bit is set to 1 before writing to SD_CMD.
- Because the BWE bit in SD_INFO2 is not cleared in response to setting the STP/IOABT bit, or to a communications error or timeout, clear the bit to 0 before issuing the next command. The next request to write to SD_BUF by DMA transfer is not issued while the BWE bit is set.

(2) SD_BUF read DMA transfer request

- When the BRE bit in SD_INFO2 is set to 1 while the DMAEN bit in the SD_DMAEN register is set to 1, the SD_BUF read DMA transfer request is asserted.
- The SD_BUF read DMA transfer request is negated when the last data in one block (based on the transfer data size set in SD_SIZE) is transferred. The SD_BUF read DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. However, if a communications error or timeout occurs at the DMA transfer, the SD_BUF read DMA transfer request is not negated.
- The BRE bit in SD_INFO2 is cleared after transfer of the last data in one block following a request to write to SD_BUF by DMA transfer.
- The number of DMA transfers must be n × one block. (n = integer, one block = the transfer data size set in SD_SIZE)
- When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF read DMA transfer request is negated.
- The DMA transfer request is also negated by clearing the DMAEN bit to 0. However, the DMA transfer request is asserted again when the DMAEN bit is set to 1 before writing to SD_CMD.
- Because the BRE bit in SD_INFO2 is not cleared in response to setting the STP/IOABT bit or in response to a communications error or timeout, clear the bit to 0 before issuing the next command. The next request to write to SD_BUF by DMA transfer is not issued while the BRE bit is set.

39.3.4 Communication Errors and Timeouts

When a communication error or timeout error occurs, depending on the type of error, the associated status flag in the SD_INFO2 register sets to 1. Also, depending on the source of the error, the associated flag in the SD_ERR_STS1 or SD_ERR_STS2 register sets to 1.

The status flags in registers SD_ERR_STS1 and SD_ERR_STS2 clear to 0 by writing to the SD_CMD register, or by setting the SOFT_RST.SDRST bit to 0.

Table 39.6 Communication errors

Communication error	Interrupt flag register		Error status register		This occurs when…
	Register symbol	Bit symbol	Register symbol	Bit symbol	
End bit error	SD_INFO2	ENDE	SD_ERR_STS1	CRCLENE	The CRC status token length is in error
				RDLENE	The read data length is in error
				RSPLENE1	The response length is in error*1
				RSPLENE0	The response length is in error*2
CRC error		CRCE		CRCTKE	The CRC status token is in error
				RDCRCE	There is a CRC error in the read data
				RSPCRCE1	There is a CRC error in the response*1
				RSPCRCE0	There is a CRC error in the response*2
Command error		CMDE		CMDE1	The command index field value for the transmitted command and received response do not match*1
				CMDE0	The command index field value for the transmitted command and received response do not match*2

Note 1. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

●DMA传输请求也可以通过将DMAEN位清除为0来取消。但是，当DMAEN位在写入SD_CMD之前设置为1时，DMA传输请求会再次被断言。

●由于SD_INFO2中的BWE位不会因设置STPIOABT位、通信错误或超时而被清除，所以在发出下一个命令之前将该位清除为0。当BWE位置位时，不会发出通过DMA传输写入SD_BUF的下一个请求。

(2) SD_BUF读取DMA传输请求

●当SD_INFO2中的BRE位设置为1且SD_DMAEN寄存器中的DMAEN位设置为1时，SD_BUF读取DMA传输请求被断言。

●当一个块中的最后一个数据（基于SD_SIZE中设置的传输数据大小）被传输时，SD_BUF读DMA传输请求被否定。SD_BUF读取DMA传输请求也可以通过将SOFT_RST中的SDRST位清0或将SD_STOP中的STP位设置为1来取消。但是，如果通信错误或超时发生在

DMA传输，SD_BUF读DMA传输请求不被否定。

●SD_INFO2中的BRE位在通过DMA传输请求写入SD_BUF后传输一个块中的最后一个数据后清除。

●DMA传输的数量必须是n×1个块。（n=整数，1块=SD_SIZE中设置的传输数据大小）

●当SDIO_MODE中的IOABT位设置为1时，SD_BUF读DMA传输请求被否定。

●DMA传输请求也可以通过将DMAEN位清除为0来取消。但是，当DMAEN位在写入SD_CMD之前设置为1时，DMA传输请求会再次被断言。

●因为SD_INFO2中的BRE位没有被清除以响应设置STPIOABT位或响应
通信错误或超时，在发出下一个命令之前将该位清零。当BRE位置位时，不会发出下一个通过DMA传输写入SD_BUF的请求。

39.3.4 通信错误和超时

当发生通信错误或超时错误时，根据错误类型，SD_INFO2寄存器中的相关状态标志设置为1。此外，根据错误源，SD_ERR_STS1或
SD_ERR_STS2寄存器设置为1。

通过写入SD_CMD寄存器或将SOFT_RST.SDRST位设置为0，寄存器SD_ERR_STS1和SD_ERR_STS2中的状态标志清零。

Table 39.6 通讯错误

通信故障	中断标志寄存器		错误状态寄存器		这发生在……
	注册符号	位符号	注册符号	位符号	
结束位错误	SD_INFO2	ENDE	SD_ERR_STS1	CRCLENE	CRC状态令牌长度错误
				RDLENE	读取数据长度错误
				RSPLENE1	响应长度错误*1
				RSPLENE0	响应长度错误*2
CRC error		CRCE		CRCTKE	CRC状态令牌错误
				RDCRCE	读取数据有CRC错误
				RSPCRCE1	响应中有CRC错误*1
				RSPCRCE0	响应中有CRC错误*2
命令错误		CMDE		CMDE1	发送命令和接收响应的命令索引字段值不匹配*1
				CMDE0	发送命令和接收响应的命令索引字段值不匹配*2

注1.通过SD_CMD中的设置为多块传输启用自动发布时的CMD12，当STP位中的CMD12
SD_STOP设置为1，或当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
注2.通过SD_CMD中的设置，CMD12之外的CMD
SD_STOP中的STP位设置为1，或者当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。

Table 39.7 Timeouts

Timeout	Interrupt flag register		Error status register		This occurs when…
	Register symbol	Bit symbol	Register symbol	Bit symbol	
Response timeout	SD_INFO2	RSPTO	SD_ERR_STS2	RSPTO1	A response is not received even after a minimum of 640 SDHI clock cycles elapse*1
				RSPTO0	A response is not received even after a minimum of 640 SDHI clock cycles elapse*2
Data timeout (excluding response timeout)		DTO		CRCBSYTO	After the CRC status token is received, the SDHI is busy for at least the period set*3
				CRCTO	After the write data is transmitted, the CRC status token is not received even after at least the period set*3 elapses
				RDTO	After the read command is issued, the read data is not received even after at least the period set*3 elapses
					After the read data is received, the next block read data is not received even after at least the period set*3 elapses
					After the SDHI exits the read wait state, the next block read data is not received even after at least the period set*3 elapses
				BSYTO1	After CMD12 is issued during the command sequence, the SDHI is busy for at least the period set*3
				BSYTO0	After the R1b response is received, the SDHI is busy for at least the period set*3 (a command other than CMD12 is issued during the command sequence)

Note 1. CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 2. CMD other than CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP bit is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.
Note 3. The period is set in the SD_OPTION.TOP[3:0] bits.

39.3.5 Command without Data Transfer (SD/MMC)

Figure 39.9 and Figure 39.10 show example flows.

Table 39.7 Timeouts

Timeout	中断标志寄存器		错误状态寄存器		这发生在……
	注册符号	位符号	注册符号	位符号	
响应超时	SD_INFO2	RSPTO	SD_ERR_STS2	RSPTO1	即使经过至少640个SDHI时钟周期，也没有收到响应*1
				RSPTO0	即使经过至少640个SDHI时钟周期，也没有收到响应*2
数据超时（不包括响应超时）		DTO		CRCBSYTO	收到CRC状态令牌后，SDHI至少在设置的时间段内处于忙碌状态*3
				CRCTO	发送写入数据后，即使经过至少设置的时间段*3也不会接收到CRC状态令牌
				RDTO	发出读取命令后，即使经过至少设置的周期*3也不会接收到读取数据 elapses
					在接收到读取数据后，即使经过至少设置的时间段*3也不会接收到下一个块读取数据
					在SDHI退出读取等待状态后，即使经过至少设置的时间段*3，也不会接收到下一个块读取数据
				BSYTO1	在命令序列期间发出CMD12后，SDHI至少在设置的时间段内处于忙碌状态*3
				BSYTO0	收到R1b响应后，SDHI至少在设置的时间段*3内处于忙碌状态（在命令序列期间发出CMD12以外的命令）

注1.通过SD_CMD中的设置为多块传输启用自动发布时的CMD12，当STP位中的CMD12
SD_STOP设置为1，或当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
注2.通过SD_CMD中的设置，CMD12之外的CMD
SD_STOP位中的STP位设置为1，或者当SDIO_MODE中的C52PUB或IOABT位设置为1时为CMD52。
注3.周期在SD_OPTION.TOP[3:0]位中设置。

39.3.5 无数据传输的命令(SDMMC)

图39.9和图39.10显示了示例流程。

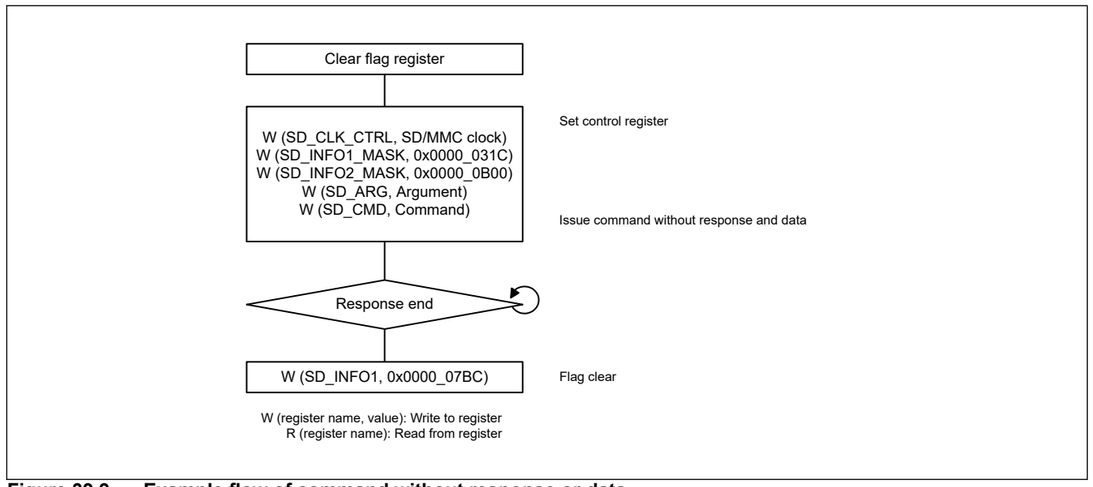

Figure 39.9 Example flow of command without response or data

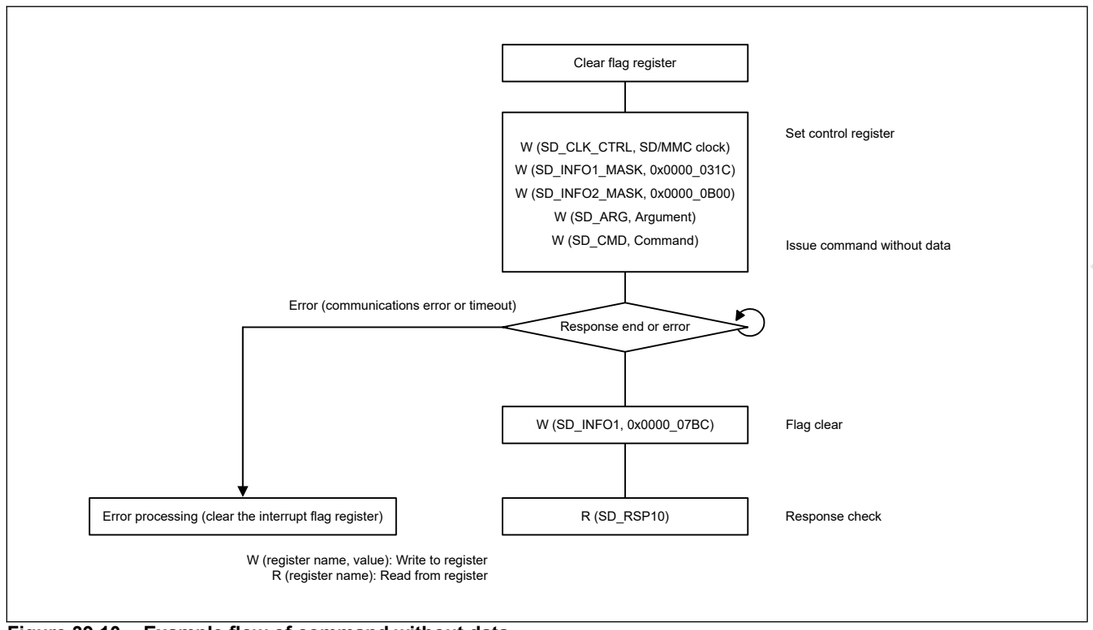

Figure 39.10 Example flow of command without data

39.3.5.1 Operation for command without data transfer

The following legend is used for description of register read/write.

W (register name, value): Write to register

R (register name): Read from register

The operation is described in the following section.

(1) Command without response and data

a. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

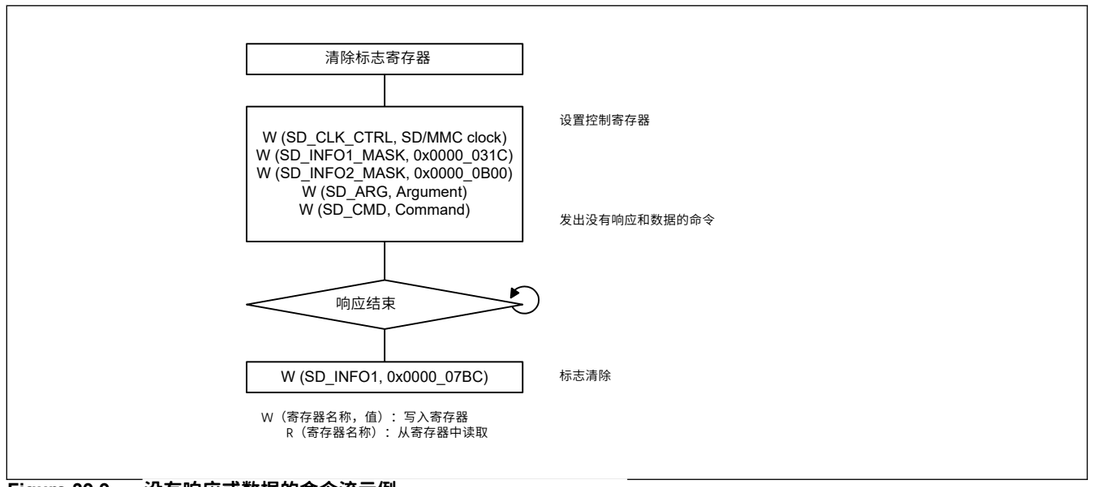

Figure 39.9 没有响应或数据的命令流示例

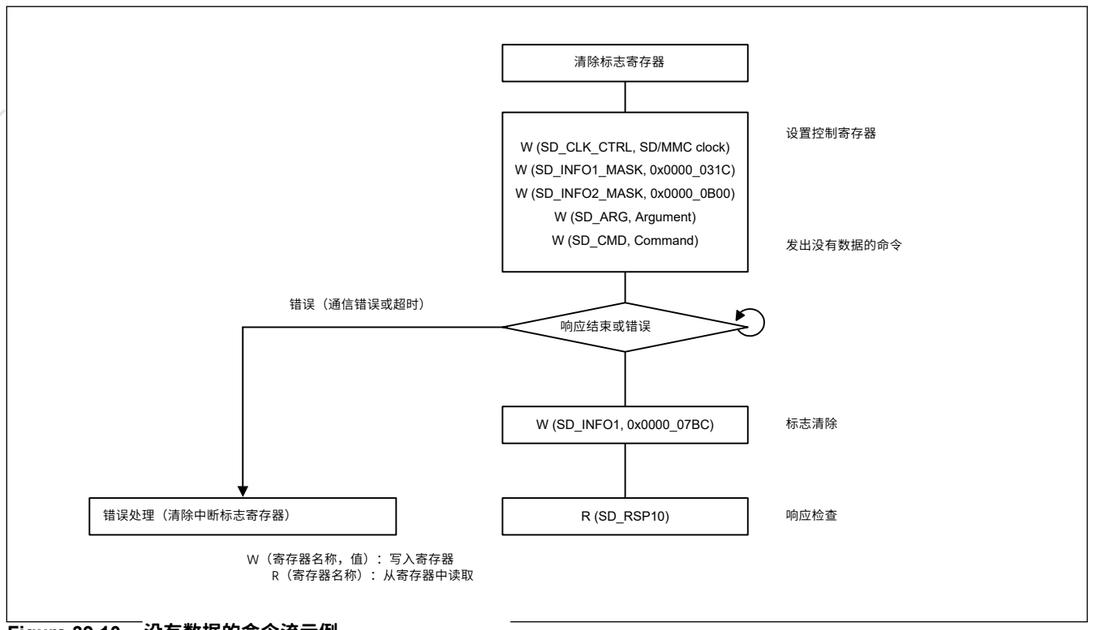

Figure 39.10 没有数据的命令流示例

39.3.5.1 无数据传输的命令操作

以下图例用于描述寄存器读写。

W（寄存器名称，值）：写入寄存器

R（寄存器名称）：从寄存器中读取

该操作在下一节中描述。

(1) 没有响应和数据的命令

a. 标志寄存器清除
首先，清除标志寄存器中的位。（SD_INFO1和SD_INFO2）

b. Control register set
Set the SD/MMC clock and interrupt masking. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)

c. Command issue
Set CMD argument in SD_ARG and write to SD_CMD.
Accordingly, CMD is issued, and the operation is started.

d. Flag clear
When transmission of a command is completed, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0.

(2) Command without data

a. Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

b. Control register set
Set the SD/MMC clock and interrupt masking. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)

c. Command issue
Set CMD argument in SD_ARG and write to the SD_CMD.
Accordingly, CMD is issued, and the operation is started.

d. Flag clear
When a response is received, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0.

e. Read a response from SD_RSP10. Additionally, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

39.3.6 Single Block Read (SD/MMC)

Figure 39.11 shows an example flow of a single block read operation.

湾。控制寄存器组
设置SDMMC时钟和中断屏蔽。（SD_CLK_CTRL、SD_INFO1_MASK和SD_INFO2_MASK）

c. 命令问题
在SD_ARG中设置CMD参数并写入SD_CMD。因此，
发出CMD，并开始操作。

d。标志清除
当命令传输完成时，SD_INFO1中的RSPEND（响应结束）设置为1以产生中断。将RSPEND清除为0。

(2) 没有数据的命令

a. 标志寄存器清除
首先，清除标志寄存器中的位。（SD_INFO1和SD_INFO2）

湾。控制寄存器组
设置SDMMC时钟和中断屏蔽。（SD_CLK_CTRL、SD_INFO1_MASK和SD_INFO2_MASK）

c. 命令问题
在SD_ARG中设置CMD参数并写入SD_CMD。
因此，发出CMD，并开始操作。

d。标志清除
当收到响应时，SD_INFO1中的RSPEND（响应结束）置1以产生中断。将RSPEND清除为0。

e. 从SD_RSP10读取响应。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）
。

39.3.6 单块读取(SDMMC)

图39.11显示了单块读取操作的示例流程。

RA生态工作室

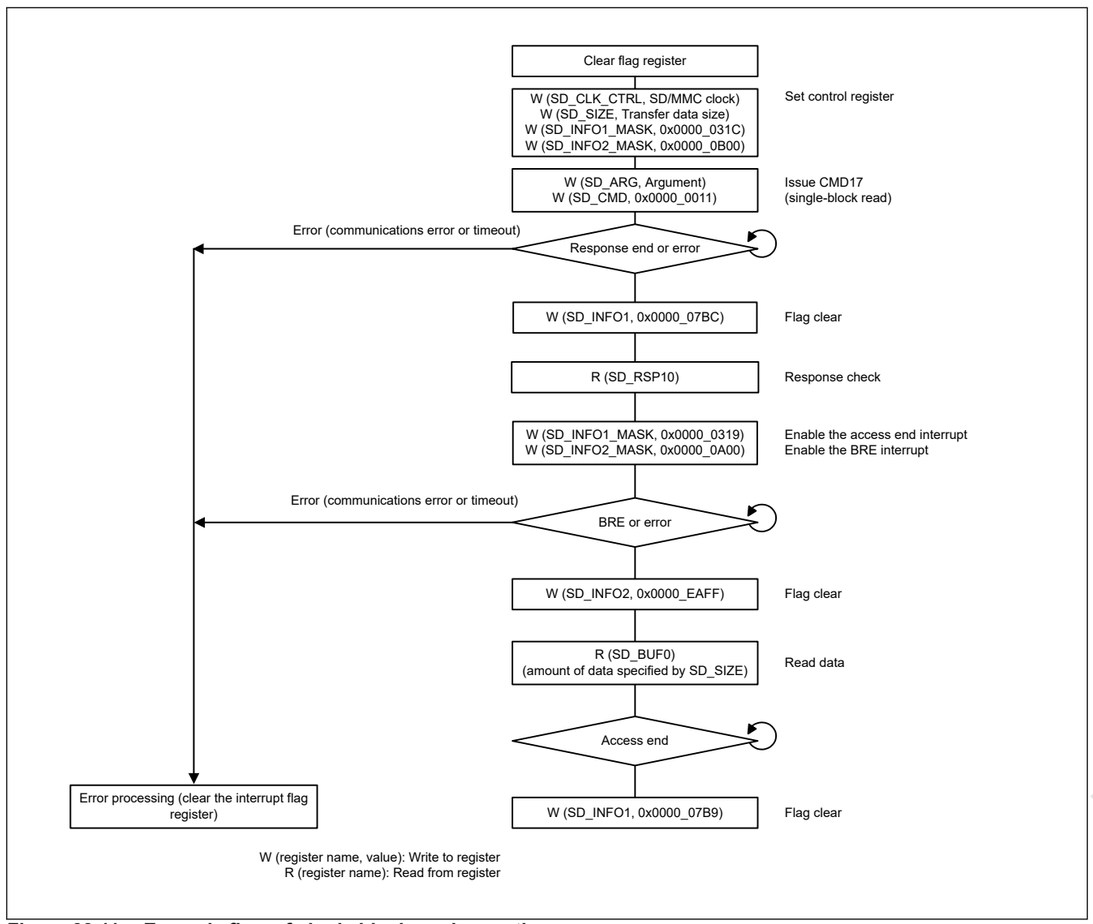

Figure 39.11 Example flow of single block read operation

39.3.6.1 Single block read operation

The operation of the single block read is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).

c. Command issue (CMD17)
Set CMD17 argument in SD_ARG and write 0x0000_0011 to SD_CMD. CMD17 is issued and the single block read operation is started.

d. Response check
On receiving the response, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD_RSP10. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. In addition, this causes CMD12 and CMD52 to not be issued. If the ACEND bit (access end) in SD_INFO1 is set, halting the command sequence also leads to the generation of an interrupt.

e. Data receive from SD card/MMC and data read

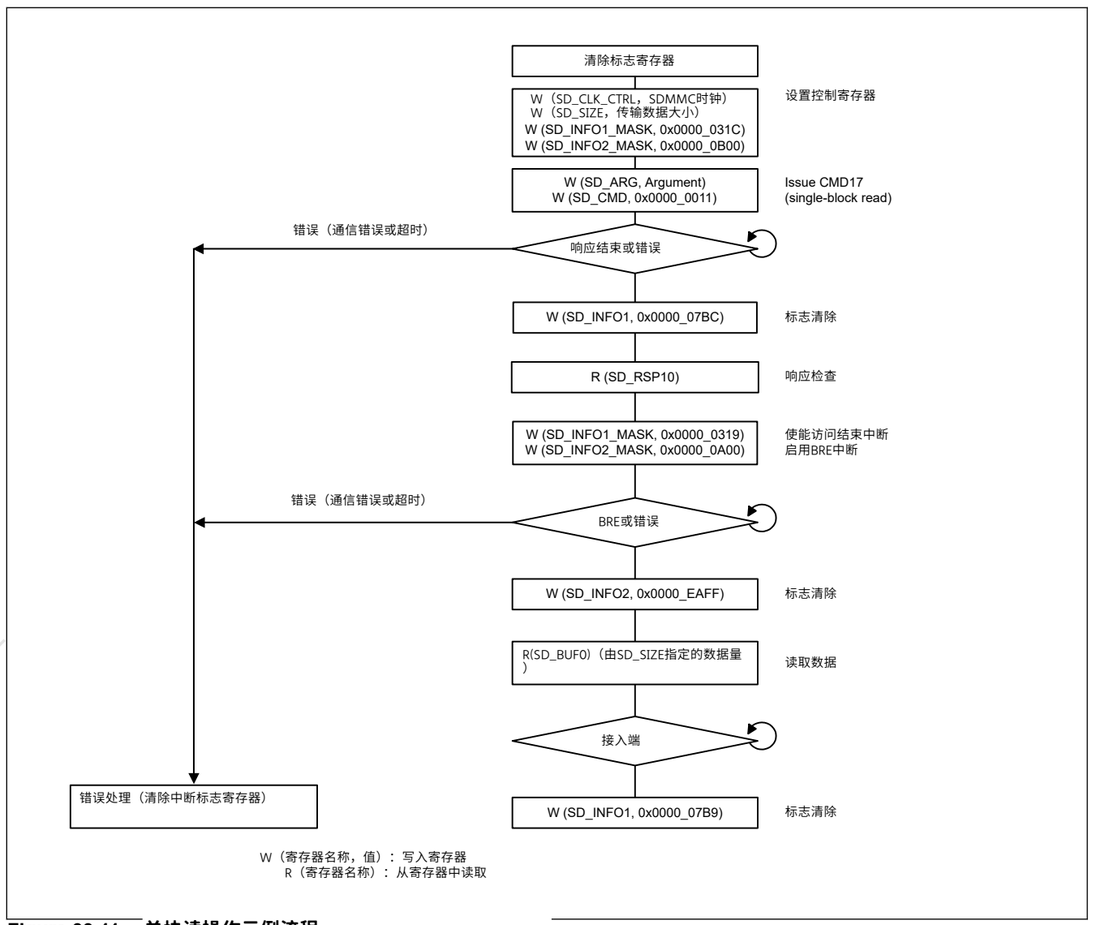

Figure 39.11 单块读操作示例流程

39.3.6.1 单块读操作

单块读取的操作描述如下：

a. 标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).

c. 命令问题(CMD17)
在SD_ARG中设置CMD17参数并将0x0000_0011写入SD_CMD。发出CMD17并开始单块读取操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）置1以产生中断。将RSPEND清零并从SD_RSP10读取响应。如果响应解码的结果是错误的，可以通过将SD_STP中的STP位或SDIO_MODE中的IOABT位设置为1来停止命令序列。此外，这会导致CMD12和CMD52不发出。如果SD_INFO1中的ACEND位（访问结束）被设置，停止命令序列也会导致产生中断。

e. 从SD卡MMC接收数据并读取数据

Write 0x0000_0319 to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_0A00 to SD_INFO2_MASK to enable the BRE interrupt. When the data received from the SD card/MMC is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD_SIZE from SD_BUF0.
A communication error or timeout might be generated if data is being received while reading of SD_BUF0 is in progress.

f. Operation complete
When the data read from SD_BUF0 is completed, ACEND (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear ACEND to 0 to end the single block read operation.
Additionally, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

39.3.7 Single Block Write (SD/MMC)

Figure 39.12 shows an example flow of a single block write operation.

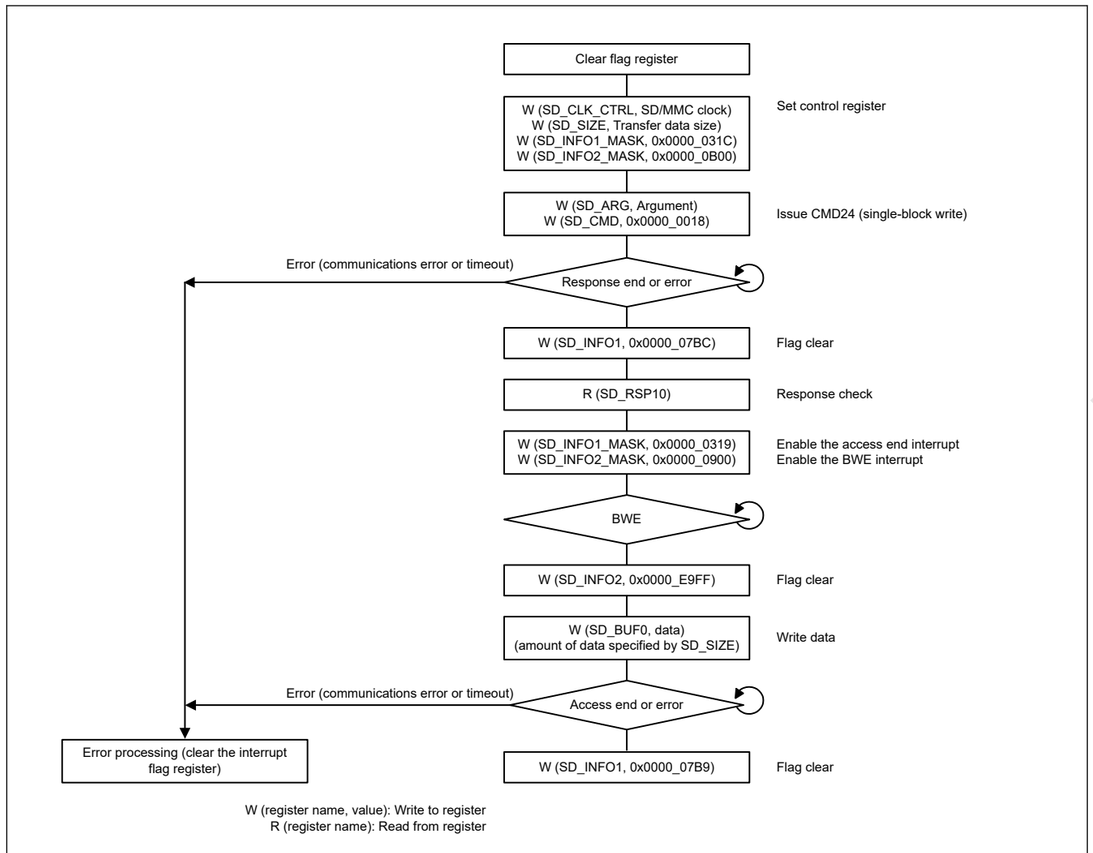

Figure 39.12 Example of single block write operation

39.3.7.1 Single block write operation

The operation of the single block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set

将0x0000_0319写入SD_INFO1_MASK以使能访问结束中断。此外，将0x0000_0A00写入SD_INFO2_MASK启用BRE中断。当从SD卡MMC接收到数据完成时，SD_INFO2中的BRE位设置为1以产生中断。将BRE位清0并从SD_BUF0中读取SD_SIZE中指定的数据量。

如果在读取SD_BUF0时正在接收数据，则可能会产生通信错误或超时。

f. 操作完成
当从SD_BUF0读取数据完成后，SD_INFO1中的ACEND（访问结束）置1以产生中断。将ACEND清0结束单块读操作。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.7 单块写入(SDMMC)

图39.12显示了单个块写入操作的示例流程。

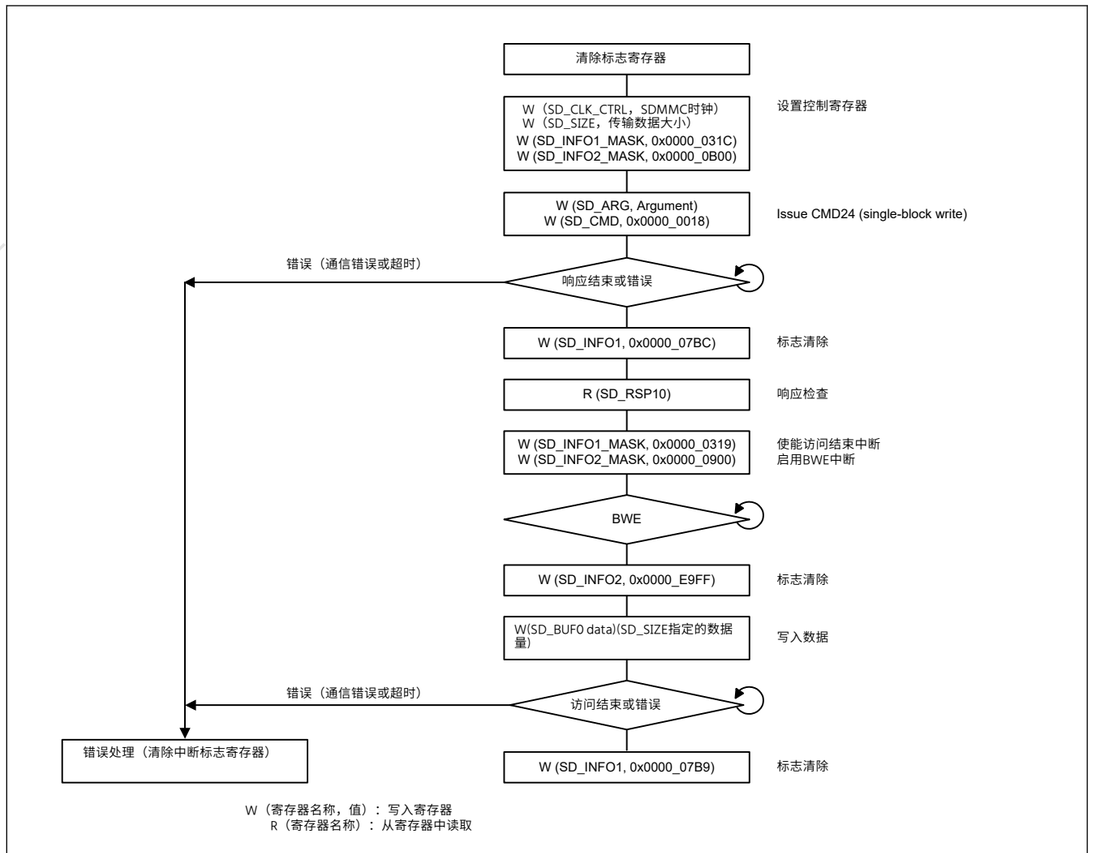

Figure 39.12 单块写操作示例

39.3.7.1 单块写操作

单块写操作描述如下：

a. 标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组

RA生态工作室

Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).

c. Command issue (CMD24)
Set CMD24 argument in SD_ARG and write 0x0000_0018 to SD_CMD. CMD24 is issued and the single block write operation is started.

d. Response check
On receiving the response, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD_RSP10. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. In addition, this causes CMD12 and CMD52 to not be issued. If the ACEND bit (access end) in SD_INFO is set, halting the command sequence also leads to the generation of an interrupt.

e. Data write and data transmit to SD card/MMC
Write 0x0000_0319 to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_0900 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card/MMC.
However, a communications error or timeout might be generated if data is being transmitted after writing to SD_BUF0.

f. Operation complete
When the CRC status and busy state are received from the SD card/MMC, ACEND (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to end the single block write operation.
In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

39.3.8 Multiple Block Read (SD/MMC)

Figure 39.13 shows an example flow of a multiple block read operation.

设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).

c. 命令问题(CMD24)
在SD_ARG中设置CMD24参数并将0x0000_0018写入SD_CMD。发出CMD24并开始单块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）置1以产生中断。将RSPEND清零并从SD_RSP10读取响应。如果响应解码的结果是错误的，可以通过将SD_STP中的STP位或SDIO_MODE中的IOABT位设置为1来停止命令序列。此外，这会导致CMD12和CMD52不发出。如果SD_INFO中的ACEND位（访问结束）被设置，停止命令序列也会导致中断的产生。

e. 数据写入和数据传输到SD卡MMC
将0x0000_0319写入SD_INFO1_MASK以使能访问结束中断。此外，将0x0000_0900写入SD_INFO2_MASK以启用BWE中断。当SD_BUF0准备好写入数据时，SD_INFO2中的BWE位设置为1以产生中断。将BWE位清0并写入指定的数据量

SD_SIZE到SD_BUF0。数据写入SD_BUF0完成后，将数据传输到SD卡。然后，
从SD卡MMC接收CRC状态和忙状态。
但是，如果在写入SD_BUF0后正在传输数据，则可能会产生通信错误或超时。

f. 操作完成
当从SD卡MMC接收到CRC状态和忙状态时，SD_INFO1中的ACEND（访问端）置1以产生中断。将ACEND位清0以结束单块写操作。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.8 多块读取(SDMMC)

图39.13显示了多块读取操作的示例流程。

RA生态工作室

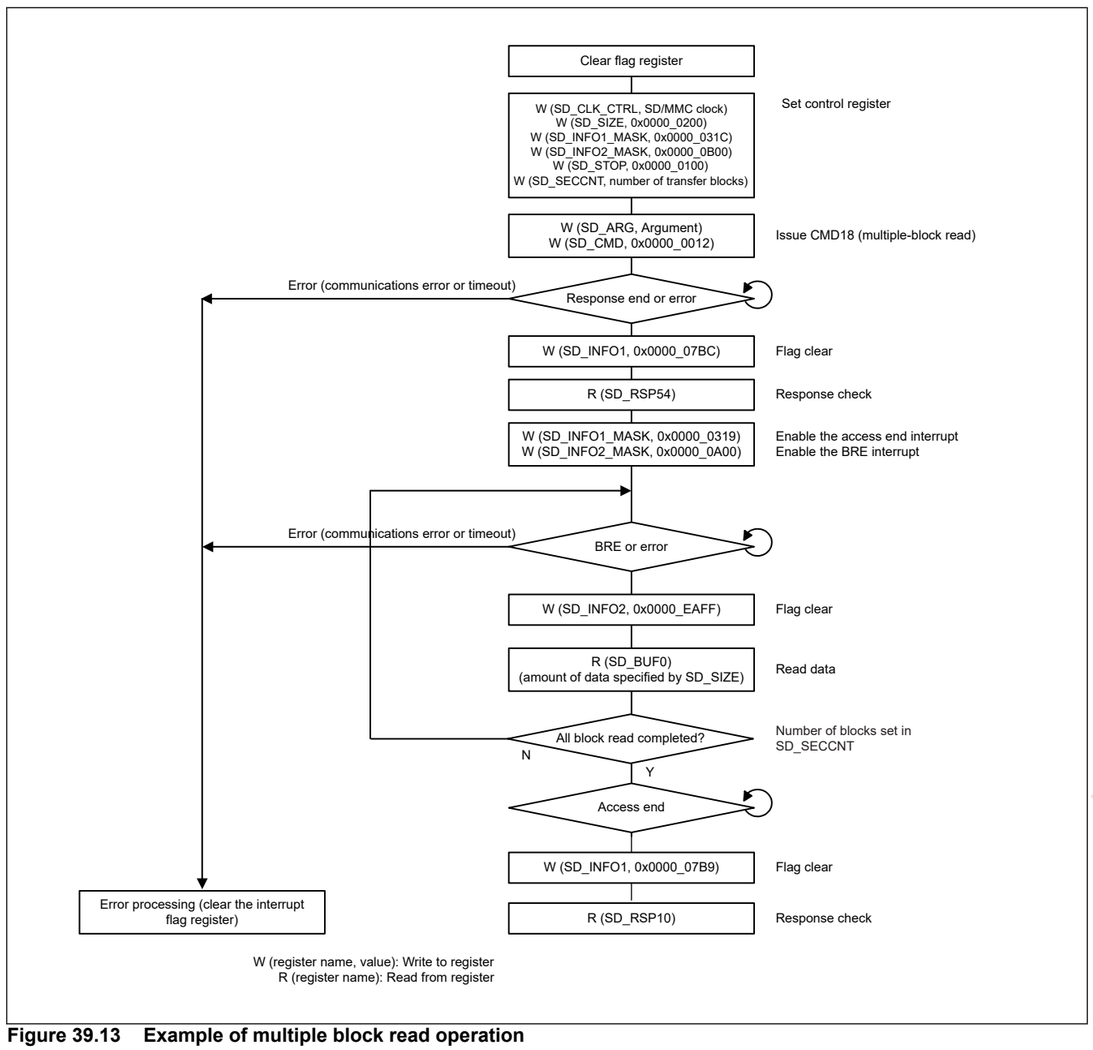

Figure 39.13 Example of multiple block read operation

39.3.8.1 Multiple block read operation

The operation of the multiple block read is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set SEC in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD18)
Set CMD18 argument in SD_ARG and write 0x0000_0012 to SD_CMD. CMD18 is issued and the multiple block read operation is started.

d. Response check
On receiving the response, RSPEND (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear RSPEND to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be

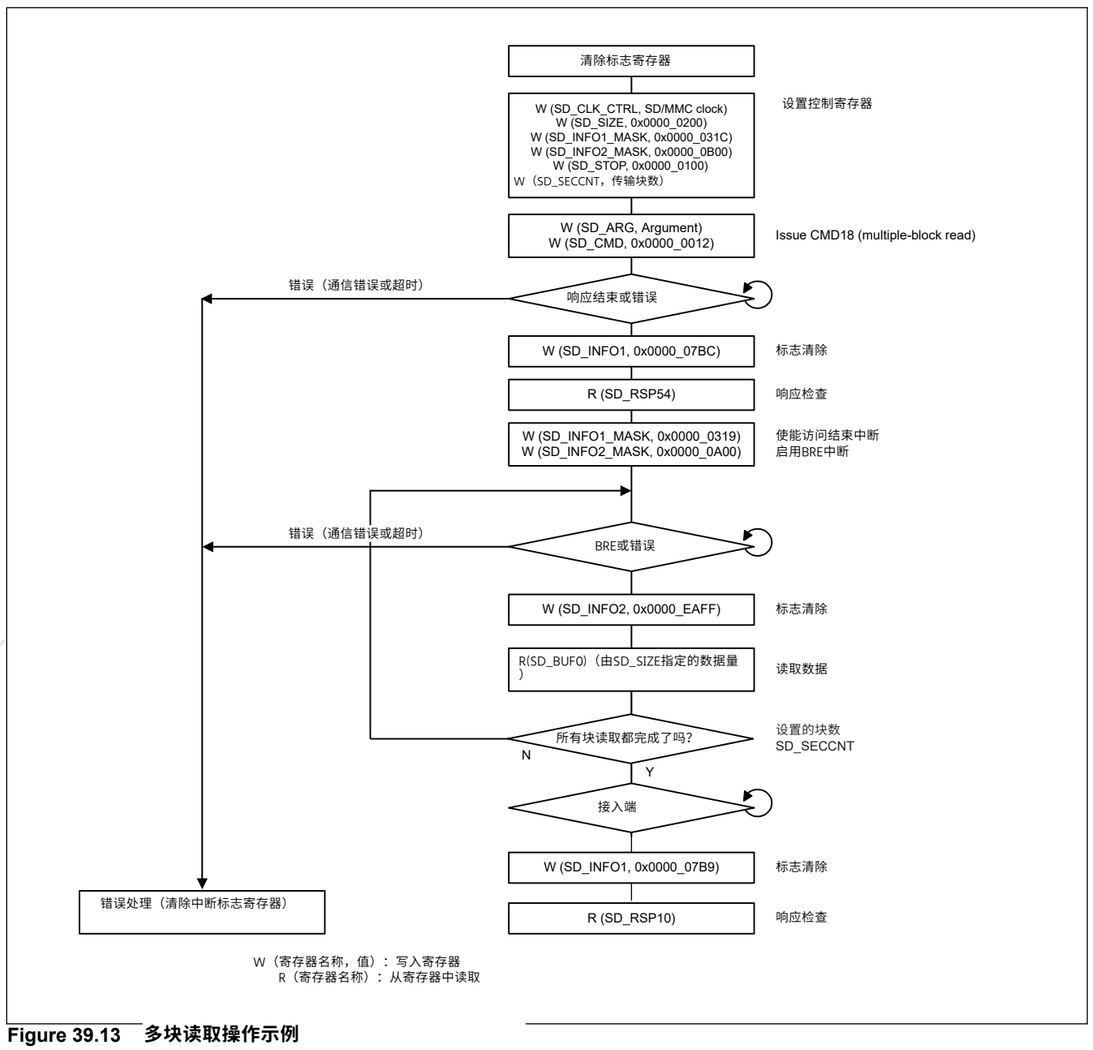

Figure 39.13 多块读取操作示例

39.3.8.1 多块读操作

多块读取的操作描述如下：

a. 标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).
将SD_STOP中的SEC设置为1，并在SD_SECCNT中设置传输块数。

c. 命令问题(CMD18)
在SD_ARG中设置CMD18参数并将0x0000_0012写入SD_CMD。发出CMD18并开始多块读取操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND（响应结束）置1以产生中断。将RSPEND清零并从SD_RSP54读取响应。
如果响应解码的结果是错误的，命令序列可以是

halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data receive from SD card/MMC and data read
Write 0x0000_0319 to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_0A00 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data received from the SD card/MMC is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified in SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multiblock transfer with the number of blocks that is set to SD_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0x0000_0000.

f. Operation complete
When all-block data read and the CMD12 response received are completed, ACEND (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear ACEND to 0 to read the response. This is the end of multiple block read operation. In addition, perform error processing (clear the interrupt flag register) if a communication error or timeout occurs.

39.3.9 Multiple Block Write (SD/MMC Using Internal Timer)

Figure 39.14 shows an example flow of a multiple block write using internal timer.

通过将SD_STP中的STP位设置为1来停止。将STP位设置为1也会导致发出CMD12并接收响应。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e. 从SD卡MMC接收数据并读取数据
将0x0000_0319写入SD_INFO1_MASK以使能访问结束中断。此外，将0x0000_0A00写入SD_INFO2_MASK以启用BRE中断。当从SD卡MMC接收到单块数据完成时，SD_INFO2中的BRE位被设置为1以产生中断。将BRE位清0并从SD_BUF0中读取SD_SIZE中指定的数据量。这样做会重复传输SD_SECCNT中设置的块数。但是，如果在读取SD_BUF0时正在接收数据，则可能会产生通信错误或超时。自动发出CMD12以停止多块传输，块数设置为SD_SECCNT并接收响应。此时，CMD12参数自动设置为0x0000_0000。

f. 操作完成
当全块数据读取和接收到的CMD12响应完成时，SD_INFO1中的ACEND（访问结束）置1以产生中断。将ACEND清除为0以读取响应。这是多块读取操作的结束。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.9 多块写入（使用内部定时器的SDMMC）

图39.14显示了使用内部定时器进行多块写入的示例流程。

RA生态工作室

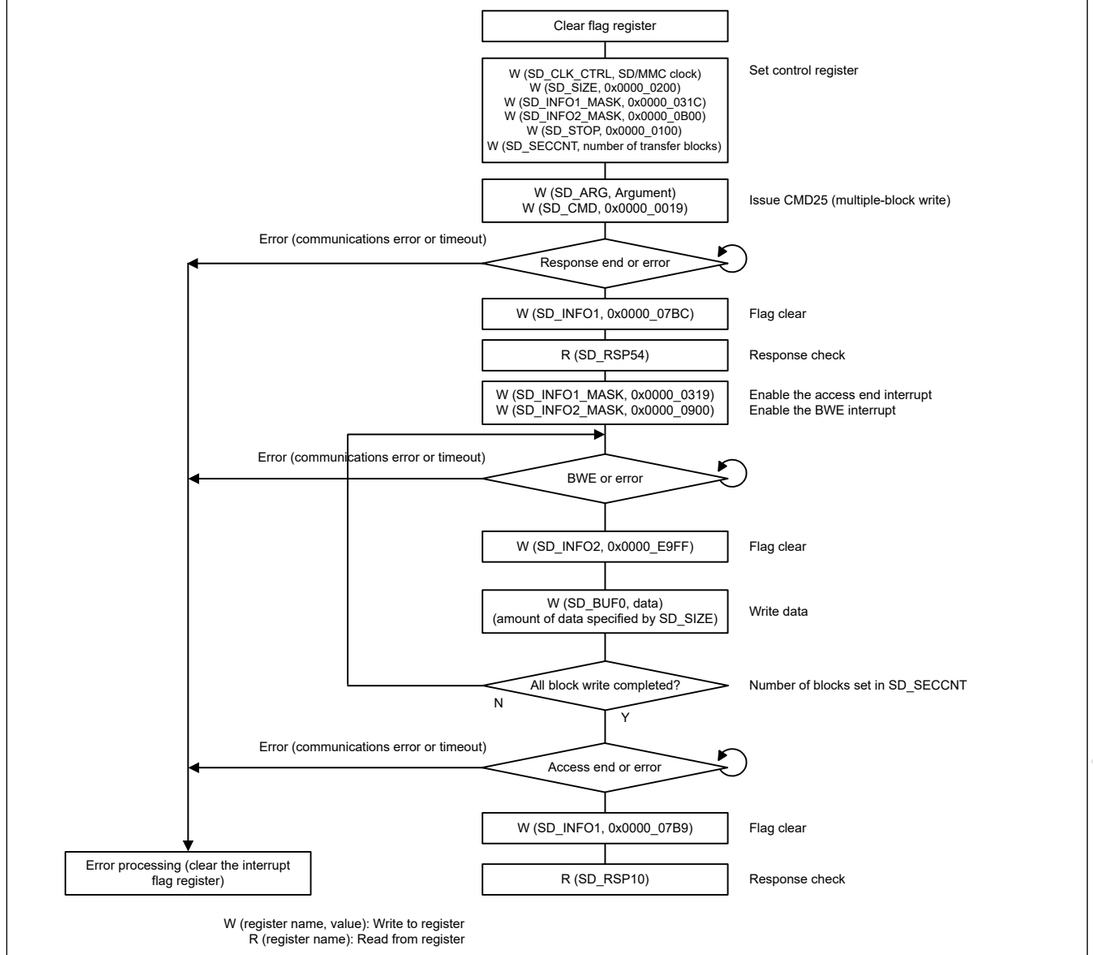

Figure 39.14 Example of multiple block write operation using internal timer

39.3.9.1 Multiple block write operation using internal timer

The operation of the multiple block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the SD/MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD25)
Set CMD25 argument in SD_ARG and write 0x0000_0019 to SD_CMD. CMD25 is issued and the multiple block write operation is started.

d. Response check
On receiving the response, the RSPEND bit (response end) in SD_INFO1 is set to 1 to generate an interrupt.
Clear the RSPEND bit to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to

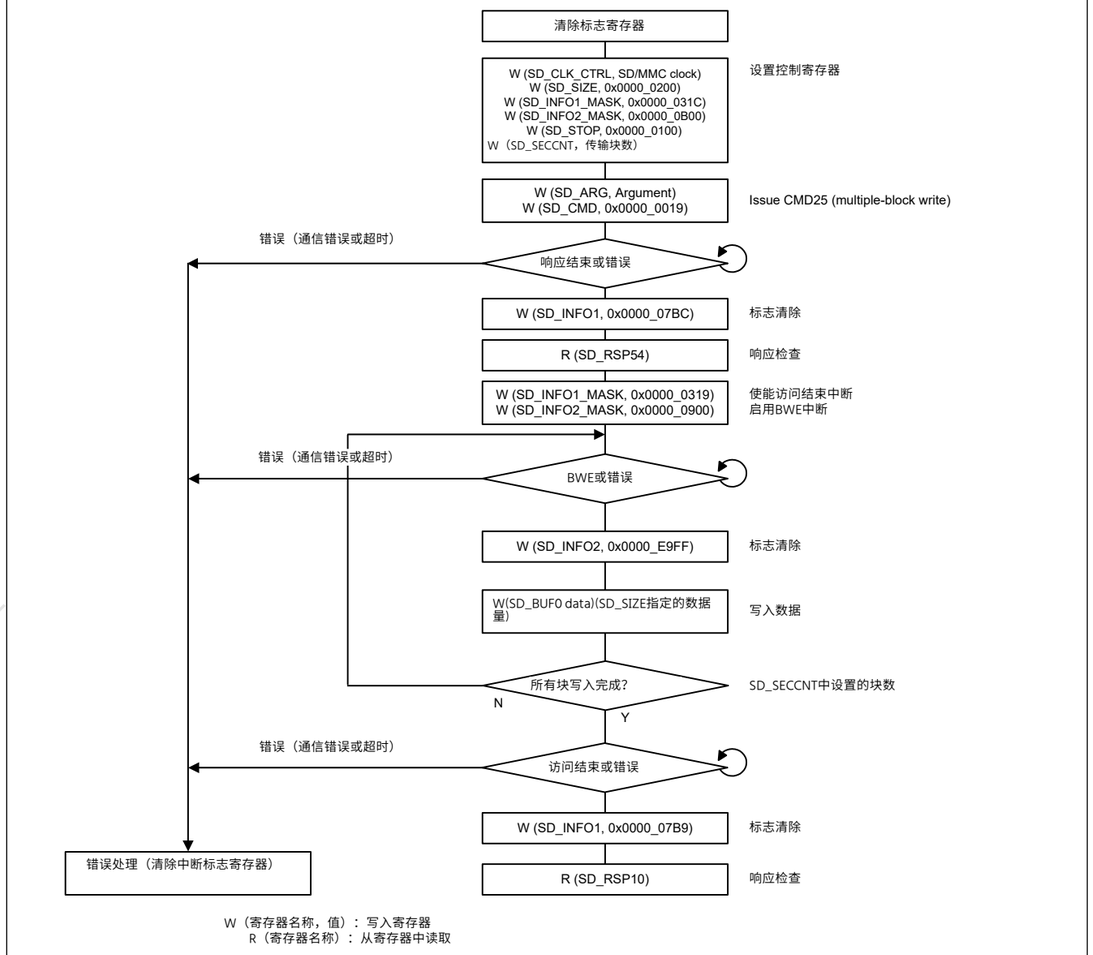

Figure 39.14 使用内部定时器的多块写入操作示例

39.3.9.1 使用内部定时器的多块写操作

多块写入的操作描述如下：

a. 标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置SDMMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).
将SD_STOP中的SEC位设置为1，并在SD_SECCNT中设置传输块数。

c. 命令问题(CMD25)
在SD_ARG中设置CMD25参数并将0x0000_0019写入SD_CMD。发出CMD25并开始多块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND位（响应结束）置1以产生中断。
将RSPEND位清0并从SD_RSP54读取响应。如果响应解码的结果是错误的，可以通过将SD_STP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致CMD12

be issued and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data write and data transmit to SD card/MMC
Write 0x0000_0319 to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x0000_0900 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card/MMC. The CRC status and busy state are received from the SD card/MMC. This repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multiblock transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 argument is automatically set to 0x0000_0000.

f. Operation complete
When all-block data transmit and the CRC status receive are completed, the ACEND bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to read the response. This is the end of multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs.

39.3.10 Multiple Block Write (MMC using external timer)

Figure 39.15 shows an example flow of a multiple block write using an external timer.

发出并收到响应。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e. 数据写入和数据传输到SD卡MMC
将0x0000_0319写入SD_INFO1_MASK以使能访问结束中断。此外，将0x0000_0900写入SD_INFO2_MASK启用BWE中断。当SD_BUF0准备好写入数据时，SD_INFO2寄存器设置为1以产生中断。将BWE位清除为0，并将SD_SIZE中指定的数据量写入SD_BUF0。当数据写入SD_BUF0完成后，数据被传输到SD卡MMC。这从SD卡MMC接收CRC状态和忙状态。这将重复传输设置的块数SD_SECCNT。但是，如果在写入SD_BUF0时正在接收数据，则可能会产生通信错误或超时。自动发出CMD12以停止多块传输，块数设置为SD_SECCNT并接收响应。此时，CMD12参数自动设置为0x0000_0000。

f. 操作完成
当全块数据发送和CRC状态接收完成时，SD_INFO1中的ACEND位（访问结束）置1以产生中断。将ACEND位清0以读取响应。这是多块写操作的结束。此外，如果发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。

39.3.10 多块写入（使用外部定时器的MMC）

图39.15显示了使用外部定时器进行多块写入的示例流程。

RA生态工作室

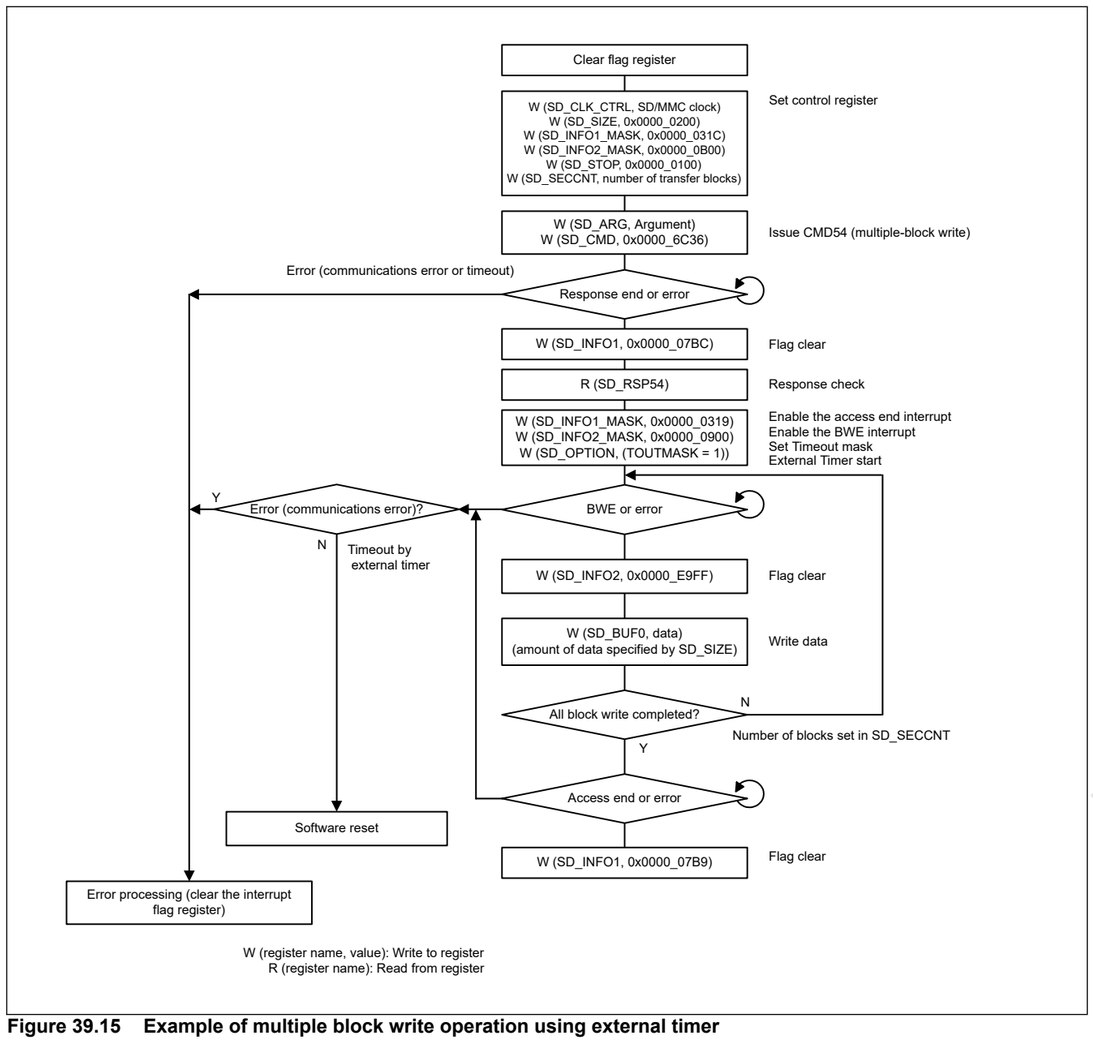

Figure 39.15 Example of multiple block write operation using external timer

39.3.10.1 Multiple block write operation using external timer

The operation of the multiple block write is described as follows:

a. Flag register clear
First, clear the bits in the flag register (SD_INFO1 and SD_INFO2).

b. Control register set
Set the MMC clock, transfer data size, interrupt mask (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK).
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

c. Command issue (CMD54)
Set CMD54 Argument in SD_ARG and write 0x0000_6C36 to SD_CMD. CMD54 is issued and the multiple block write operation is started.

d. Response check
On receiving the response, the RSPEND bit (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the RSPEND bit to 0 and read the response from SD_RSP54. If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued

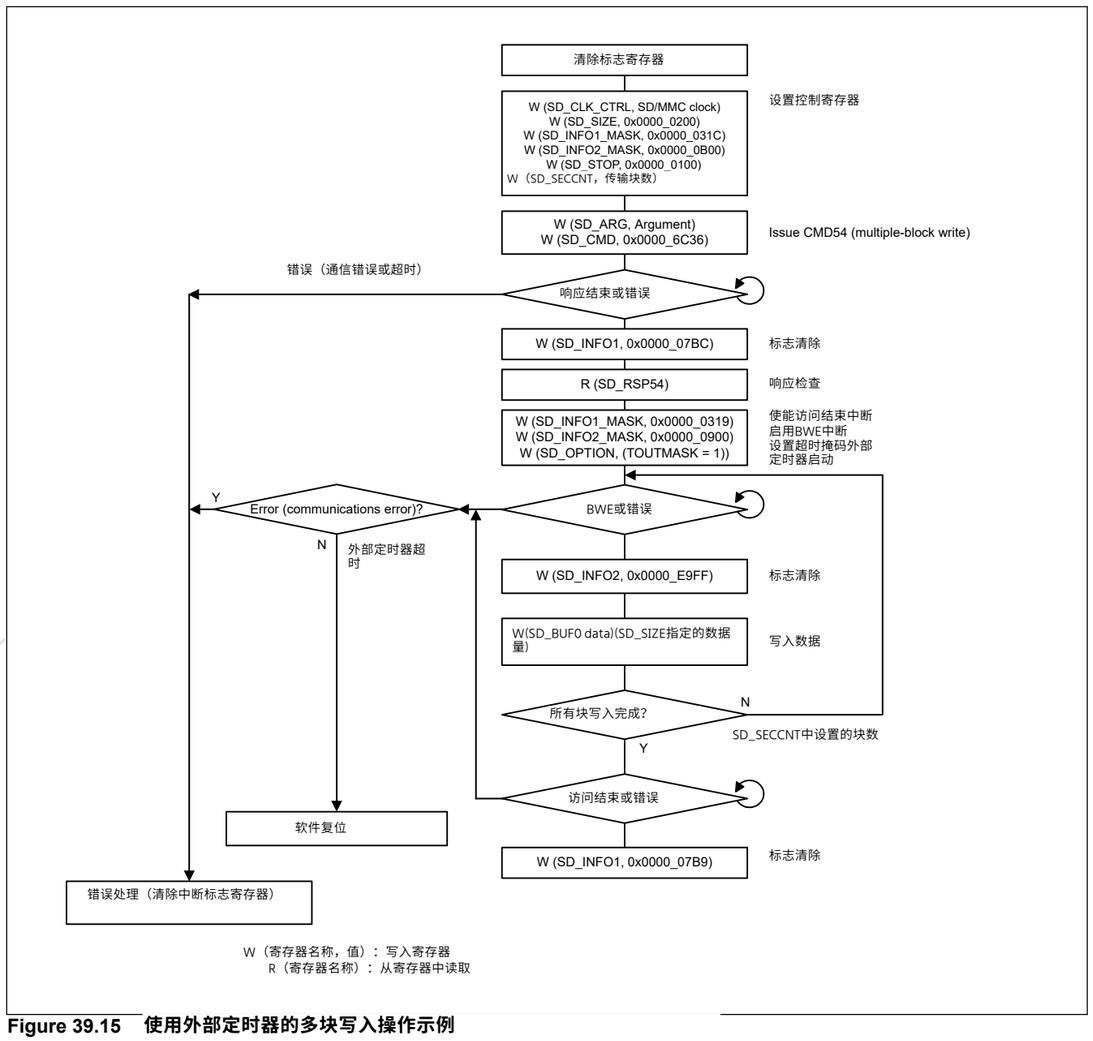

Figure 39.15 使用外部定时器的多块写入操作示例

39.3.10.1 使用外部定时器的多块写操作

多块写入的操作描述如下：

a. 标志寄存器清除
首先，清除标志寄存器（SD_INFO1和SD_INFO2）中的位。

湾。控制寄存器组
设置MMC时钟、传输数据大小、中断屏蔽（SD_CLK_CTRL、SD_SIZE、SD_INFO1_MASK和SD_INFO2_MASK).
将SD_STOP中的SEC位设置为1，并在SD_SECCNT中设置传输块数。

c. 命令问题(CMD54)在SD_ARG中设置CMD54参数并将0x0000_6C36写入SD_CMD。发出CMD54并开始多块写入操作。

d。响应检查
收到响应后，SD_INFO1中的RSPEND位（响应结束）置1以产生中断。将RSPEND位清0并从SD_RSP54读取响应。如果响应解码的结果是错误的，可以通过将SD_STP中的STP位设置为1来暂停命令序列。将STP位设置为1也会导致发出CMD12

and the response received. If the command sequence is halted because the access end interrupt is enabled, an interrupt is generated by when the ACEND bit (access end) bit in SD_INFO1 sets to 1 on completion of response reception. Clear the ACEND bit to 0 and read the response.

e. Data write and data transmit to MMC
Write 0x0000_0319 to SD_INFO1_MASK to enable the access end interrupt, write 0x0000_0900 to SD_INFO2_MASK to enable the BWE interrupt and set 1 to TOUTMASK of SD_OPTION to inactivate timeout. In addition, start external timer. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified in SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the MMC. The CRC status and busy state are received from the MMC. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communication error or timeout might be generated if data is being received while writing to SD_BUF0 is in progress.

f. Operation complete
When all-block data transmit and the CRC status receive are completed, the ACEND bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the ACEND bit to 0 to read the response. This is the end of multiple block write operation. Additionally, perform error processing (clear the interrupt flag register) if a communications error or timeout occurs when receiving response. Execute software reset if a timeout by external timer occurs when transmitting data.

39.3.11 IO_RW_DIRECT Command (SD: CMD52)

Figure 39.16 shows an example flow of an IO_DIRECT command (CMD52) operation.

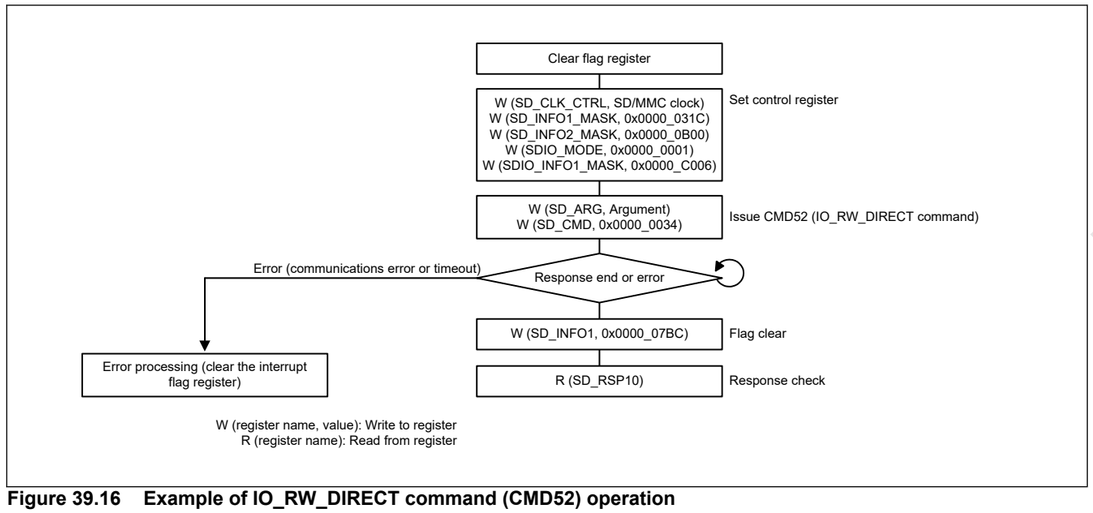

Figure 39.16 Example of IO_RW_DIRECT command (CMD52) operation

39.3.12 IO_RW_EXTENDED Command (SD: CMD53/Multiple Block Read)

Figure 39.17 shows an example flow for a CMD53 multiple block read operation.

以及收到的回复。如果由于使能访问结束中断而暂停命令序列，则在完成响应接收时SD_INFO1中的ACEND位（访问结束）位设置为1时产生中断。将ACEND位清0并读取响应。

e. 数据写入和数据传输到MMC
向SD_INFO1_MASK写入0x0000_0319使能访问结束中断，向SD_INFO1_MASK写入0x0000_0900 SD_INFO2_MASK启用BWE中断并将SD_OPTION的TOUTMASK设置为1以禁用超时。另外，启动外部定时器。当SD_BUF0准备好写入数据时，SD_INFO2寄存器中的BWE位设置为1以产生中断。将BWE位清除为0，并将SD_SIZE中指定的数据量写入SD_BUF0。当数据写入SD_BUF0完成后，数据被传输到MMC。从MMC接收CRC状态和忙碌状态。这样做会重复传输SD_SECCNT中设置的块数。但是，如果在写入SD_BUF0时正在接收数据，则可能会产生通信错误或超时。

f. 操作完成
当全块数据发送和CRC状态接收完成时，SD_INFO1中的ACEND位（访问结束）置1以产生中断。将ACEND位清0以读取响应。这是多块写操作的结束。此外，如果在接收响应时发生通信错误或超时，请执行错误处理（清除中断标志寄存器）。如果在传输数据时发生外部定时器超时，则执行软件复位。

39.4 Usage Notes

39.4.1 SD_BUF Illegal Write Access (SD/MMC)

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified in SD_SIZE must be written.

If the data exceeds the size specified in SD_SIZE is written, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 might not be transmitted and the SD_CLK_CTRLEN bit in SD_INFO2 is held at the value of 0. If this occurs, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SD_CLK_CTRLEN bit to 1.

However, this does not apply to the single byte or three bytes when the SD_SIZE setting is odd, or to the fraction of bytes when the SD_SIZE setting is even (the 2 bytes that are not in a 4-byte unit), because the portion of dummy data writing is regarded as excess data and ignored.

39.4.2 Block Number Constraint for Multiple Block Read (SD)

When performing a multiple block read of one or two blocks, depending on the timing with which the SD card response register is read, the response value might not be read properly. To prevent this, do one of the following:

1. When receiving one or two blocks of data, use single block reading.
2. Read the response to CMD18 from SD_RSP54.

39.4.2.1 Mechanism of incorrect reading

Figure 39.25 shows the processing flows of the SDHI (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation in Figure 39.25, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response might be read. This problem does not occur for multiple block reads of three or more blocks, because CMD12 is not issued until the block of data is read. The problem also does not occur for multiple block writes, because the CMD25 response is read before the block of data is sent.

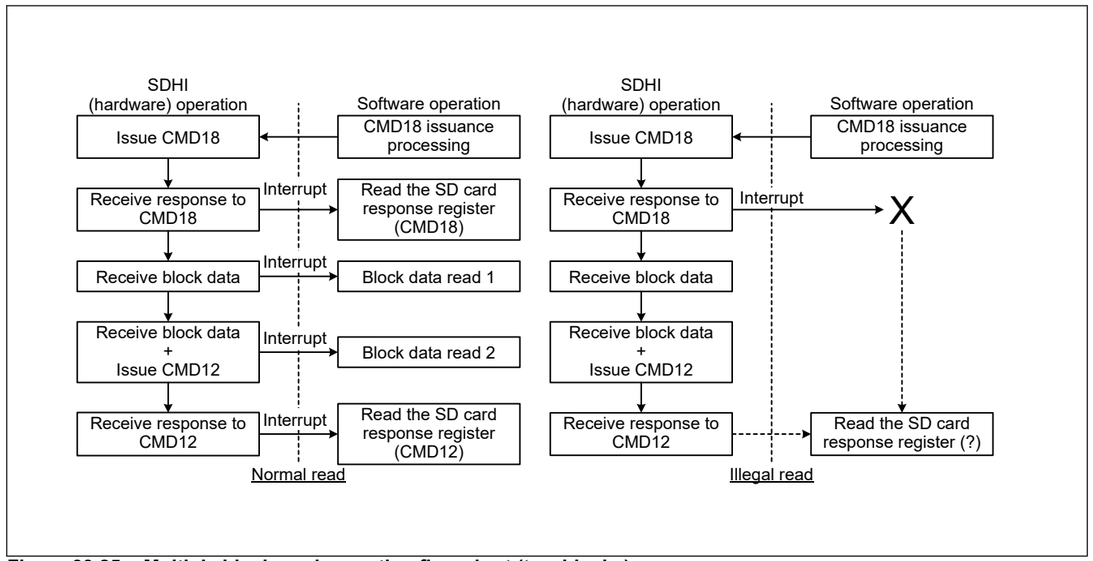

Figure 39.25 Multiple block read operation flow chart (two blocks)

39.4.3 Automatic Control of SD/MMC Clock Output (SD/MMC)

In the SD Card/MMC standard, 74 cycles of SD/MMC clock must be output before initialization of the card. For this reason, use automatic control of SD/MMC clock output after 74 cycles of SD/MMC clock are output. In addition, if

39.4 使用说明

39.4.1 SD_BUF非法写访问(SDMMC)

在发出单块写入或多块写入命令后向SD_BUF0写入数据时，必须写入SD_SIZE中指定大小的数据。

如果写入的数据超过SD_SIZE中指定的大小，则SD_INFO2中的ERR4位设置为1。此外，写入SD_BUF0的数据可能不会被传输，并且SD_INFO2中的SD_CLK_CTRLEN位将保持为0。如果这发生时，将SOFT_RST中的SDRST位清除为0，然后将其值恢复为1，将SD_CLK_CTRLEN位清除为1。

但是，这不适用于SD_SIZE设置为奇数时的单个字节或三个字节，或适用于SD_SIZE设置为偶数时的字节部分（不在4字节单元中的2个字节），因为该部分虚拟数据写入的次数被视为多余数据并被忽略。

39.4.2 多块读取(SD)的块号约束

执行1个或2个块的多块读取时，根据读取SD卡响应寄存器的时序，可能无法正确读取响应值。为防止这种情况，请执行以下操作之一：

1、接收一两块数据时，使用单块读取。

2.从SD_RSP54读取对CMD18的响应。

39.4.2.1 误读机制

图39.25显示了对两个块执行多块读取时SDHI（硬件）操作和软件操作的处理流程。如图39.25中的错误操作所示，当接收到CMD18响应时产生中断并且中断读取SD卡响应寄存器(SD_RSP10)的时序延迟时，CMD12响应接收期间的数据或可能会读取CMD12响应。对于三个或更多块的多个块读取不会出现此问题，因为在读取数据块之前不会发出CMD12。多次块写入也不会出现该问题，因为在发送数据块之前读取了CMD25响应。

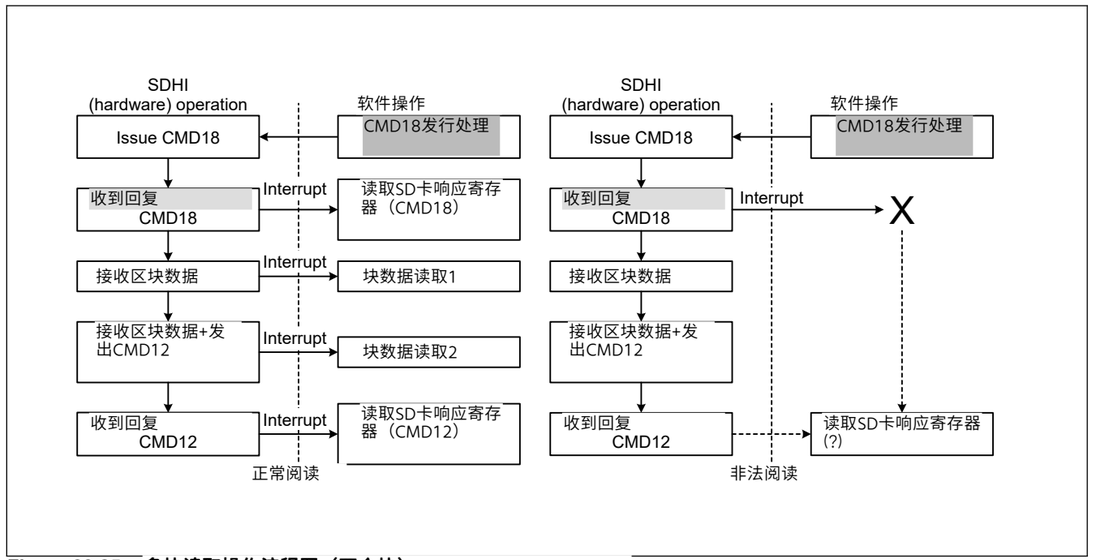

Figure 39.25 多块读取操作流程图（两个块）

39.4.3 SDMMC时钟输出(SDMMC)的自动控制

在SD卡MMC标准中，必须在卡初始化之前输出74个周期的SDMMC时钟。为此，在输出SDMMC时钟的74个周期后使用SDMMC时钟输出的自动控制。此外，如果

automatic control of SD/MMC clock output was in use, SD/MMC clock output is stopped on completion of the sequence for a communications error or timeout. When state transitions within the SD card/MMC are necessary after completion of the sequence, release automatic control of SD/MMC clock output and restart supply of the SD/MMC clock to the SD card/MMC.

39.4.4 Control of the C52PUB Setting for Multiple Block Write (SD)

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write because of CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by using one of the following procedures, as appropriate:

(a) When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the RSPEND interrupt processing in SD_INFO1 because the issuing of CMD52 is completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

(b) When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2,…) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the RSPEND interrupt processing in SD_INFO1 because the issuing of CMD52 is completed, restart writing to SD_BUF by DMA transfer.

39.4.5 Notes on SD_CLK_CTRL Register Settings (SD/MMC)

When the SD_CLK_CTRLEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, you must check that the SD_CLK_CTRLEN bit in SD_INFO2 is 1.

39.4.6 Specification Limitations

1. The Suspend/Resume operation of the SDIO is not supported.
2. The SPI bus is not supported. (SD/MMC)
3. The shared bus and 8-bit SD bus of the embedded SDIO are not supported.
4. Stream transfer of MMC is not supported.
5. High Priority Interrupt (HPI) of MMC is not supported.
6. Boot Operation/Alternative Boot Operation of MMC is not supported.
7. Open-ended multiple block transfer of MMC is not supported.

39.4.7 STP Bit Setting during Multiple Block Read (SD/MMC)

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence might not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SD_CLK_CTRLEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence does not stop because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, you must leave the SEC bit in SD_STOP as 1.

SDMMC时钟输出的自动控制正在使用中，SDMMC时钟输出在完成通信错误或超时的序列时停止。当序列完成后需要SD卡MMC内的状态转换时，解除SDMMC时钟输出的自动控制并重新开始向SD卡MMC提供SDMMC时钟。

39.4.4 控制多块写入(SD)的C52PUB设置

如果SDIO_MODE中的C52PUB位由于CMD53而在多个块写入序列期间设置为1，则在SD_BUF变空之前不会发出CMD52。因此，在暂停写入SD_BUF后，根据需要使用以下过程之一设置C52PUB位：

(a)不使用DMA传输时

1.在设置C52PUB位之前，通过在SD_INFO2中进行设置以禁用BWE中断来暂停写入SD_BUF。

2.将SDIO_MODE中的C52PUB位设置为1（以便当SD_BUF为空时发出CMD52）。

3.在SD_INFO1中的RSPEND中断处理后，因为CMD52的发布完成，通过在SD_INFO2中进行设置来重新开始写入SD_BUF以启用BWE中断。

(b)使用DMA传输时

1.每次对SD_SIZE×n块中设置的值（其中n=1 2 …）进行DMA传输时，在C52PUB位置位之前暂停通过DMA传输对SD_BUF的写入。

2.将SDIO_MODE中的C52PUB位设置为1（以便当SD_BUF为空时发出CMD52）。

3.SD_INFO1中的RSPEND中断处理后，因为CMD52的下发完成，通过DMA传输重新开始写入SD_BUF。

39.4.5 SD_CLK_CTRL寄存器设置注意事项(SDMMC)

当SD_INFO2中的SD_CLK_CTRLEN位为0时，无法写入SD_CLK_CTRL。在写信之前SD_CLK_CTRL，必须检查SD_INFO2中的SD_CLK_CTRLEN位是否为1。

39.4.6 规格限制

1、不支持SDIO的SuspendResume操作。

2.不支持SPI总线。(标清MMC)

3、不支持嵌入式SDIO的共享总线和8位SD总线。

4.不支持MMC的流传输。

5.不支持MMC的高优先级中断(HPI)。

6.BootOperationAlternativeBootOperation不支持MMC。

7.不支持MMC的开放式多块传输。

39.4.7 多块读取(SDMMC)期间的STP位设置

在通过将SD_STOP中的SEC位设置为1并通过自动CMD12执行执行多块读取时，即使将SD_STOP中的STP位设置为1以强制停止执行，命令序列也可能不会停止，具体取决于设置STP位。

为避免这种情况，在多块传输期间将SD_STOP中的STP位设置为1时，同时将SD_STOP中的SEC位清除为0。（即使SD_INFO2中的SD_CLK_CTRLEN位为0，也将SEC位从1更改为0。）

当由于SEC位未清0而导致命令序列未停止时，可通过将SOFT_RST中的SDRST位清0来停止命令序列。

当通过SDIO_MODE中的IOABT位强制终止CMD53多块传输时，必须离开SD_STOP中的SEC位为1。

39.4.8 Register Setting Notes

1. All registers in section 39.2. Register Descriptions are accessed in 32-bit access-only.
2. When setting registers, set them after the I/O Port Register setting.

39.4.8 注册设置注意事项

1.第39.2节中的所有寄存器。寄存器描述只能以32位访问方式访问。
2.设置寄存器时，请在IOPortRegister设置后进行设置。

RA生态工作室

40. Cyclic Redundancy Check (CRC)

40.1 Overview

The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available.

Table 40.1 lists the CRC calculator specifications and Figure 40.1 shows a block diagram.

Table 40.1 CRC calculator specifications

Item	Description	
Data size	8-bit	32-bit
Data for CRC calculation*1	CRC code generated for data in 8n-bit units (where n is a natural number)	CRC code generated for data in 32n-bit units (where n is a natural number)
CRC processor unit	Operation executed on 8 bits in parallel	Operation executed on 32 bits in parallel
CRC generating polynomial	One of three generating polynomials that is selectable: [8-bit CRC] • $X^8 + X^2 + X + 1$ (CRC-8) [16-bit CRC] • $X^{16} + X^{15} + X^2 + 1$ (CRC-16) • $X^{16} + X^{12} + X^5 + 1$ (CRC-CCITT).	One of two generating polynomials that is selectable: [32-bit CRC] • $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ (CRC-32) • $X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$ (CRC-32C).
CRC calculation switching	The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication	
Module-stop function	Module-stop state can be set to reduce power consumption	
TrustZone Filter	Security attribution can be set	

Note 1. This function cannot divide data used in CRC calculations. Write data in 8-bit or 32-bit units.

40.2 Register Descriptions

40. 循环冗余校验(CRC)

40.1 Overview

循环冗余校验(CRC)计算器生成CRC代码以检测数据中的错误。CRC计算结果的位顺序可以切换为LSB-first或MSB-first通信。此外，还可以使用各种CRC生成多项式。

表40.1列出了CRC计算器规格，图40.1显示了框图。

Table 40.1 CRC计算器规格

Item	Description	
数据大小	8-bit	32-bit
CRC计算数据*1	为8n位单元中的数据生成的CRC码（其中n是自然数）	为32n位单元中的数据生成的CRC码（其中n是自然数）
CRC处理器单元	在8位上并行执行的操作	在32位上并行执行的操作
CRC生成多项式	可选择的三个生成多项式之一：[8位CRC]● [16-bit CRC] • $X^{16} + X^{15} + X^2 + 1$ (CRC-16) • $X^{16} + X^{12} + X^5 + 1$ (CRC-CCITT).	可选择的两个生成多项式之一：[32位CRC]● $X^{11} +$ $X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ (CRC-32) • $X^{32} + X^{28} + X^{27} + X^{26} + X^{25} + X^{23} + X^{22} + X^{20} + X^{19} + X^{18} + X^{14} + X^{13} + X^{11} + X^{10} + X^9 + X^8 + X^6 + 1$ (CRC-32C).
CRC计算切换	CRC计算结果的位顺序可以切换为LSB-first或MSB-first通信	
Module-stop function	可设置模块停止状态以降低功耗	
TrustZone Filter	可设置安全属性	

注1.此功能不能除以CRC计算中使用的数据。以8位或32位为单位写入数据。

GPS[2:0]位（CRC生成多项式切换）

GPS[2:0]位选择CRC生成多项式。

LMS位（CRC计算切换）

LMS位选择生成的CRC码的位顺序。对于LSB在先的通信，首先发送CRC码的低字节，对于MSB在先的通信，首先发送高字节。有关发送和接收CRC码的详细信息，请参阅第40.3节。手术。

DORCLR位（CRCDORCRCDOR_HACRCDOR_BY寄存器清零）

将1写入DORCLR位以将CRCDORCRCDOR_HACRCDOR_BY寄存器设置为0x00000000。该位读为0。只能写入1。

40.2.2 CRCDIRCRCDIR_BY:CRC数据输入寄存器

Base address: CRC = 0x4010_8000

Offset address: 0x04

Bit position:	31																													0
Bit field:																														
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	CRC输入数据 CRCDIR寄存器是一个32位读写寄存器，用于写入数据以进行CRC-32或CRC-32C计算。CRCDIR_BY(CRCDIR[31:24])是一个8位读写寄存器，用于为CRC-8、CRC-16或CRC-CCITT计算写入数据。	R/W

40.2.3 CRCDOR/CRCDOR_HA/CRCDOR_BY : CRC Data Output Register

Base address: CRC = 0x4010_8000

Offset address: 0x08

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	CRC output data The CRCDOR register is a 32-bit read/write register for CRC-32 or CRC-32C calculation. The CRCDOR_HA (CRCDOR[31:16]) register is a 16-bit read/write register for CRC-16 or CRC-CCITT calculation. The CRCDOR_BY (CRCDOR[31:24]) register is an 8-bit read/write register for CRC-8 calculation. Because its initial value is 0x00000000, rewrite the CRCDOR/CRCDOR_HA/CRCDOR_BY register to perform the calculations using a value other than the initial value. Data written to the CRCDIR/CRCDIR_BY register is CRC calculated and the result is stored in the CRCDOR/CRCDOR_HA/CRCDOR_BY register. If the CRC code is calculated following the transferred data and the result is 0x00000000, there is no CRC error.	R/W

40.3 Operation

40.3.1 Basic Operation

The CRC calculator generates CRC codes for use in LSB-first or MSB-first transfer.

The following examples show CRC code generation for input data (0xF0) using the 16-bit CRC-CCITT generating polynomial ($X^{16} + X^{12} + X^5 + 1$). In these examples, the value of the CRC Data Output Register (CRCDOR_HA) is cleared before CRC calculation.

When an 8-bit CRC (with the polynomial $X^8 + X^2 + X + 1$) is in use, the valid bits of the CRC code are obtained in CRCDOR_BY. When a 32-bit CRC is in use, the valid bits of the CRC code are obtained in CRCDOR.

Figure 40.2 and Figure 40.3 show the LSB-first and MSB-first data transmission examples respectively. Figure 40.4 and Figure 40.5 show the LSB-first and MSB-first data reception examples.

40.2.3 CRCDORCRCDOR_HACRCDOR_BY:CRC数据输出寄存器

Base address: CRC = 0x4010_8000

Offset address: 0x08

Bit position:	31																												0
Bit field:																													
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	CRC输出数据 CRCDOR寄存器是一个32位读写寄存器，用于CRC-32或CRC-32C计算。CRCDOR_HA(CRCDOR[31:16])寄存器是用于CRC-16或 CRC-CCITT calculation. CRCDOR_BY(CRCDOR[31:24])寄存器是一个用于CRC-8计算的8位读写寄存器。由于其初始值为0x00000000，因此重写CRCDORCRCDOR_HACRCDOR_BY寄存器以使用初始值以外的值执行计算。写入CRCDIRCRCDIR_BY寄存器的数据经过CRC计算，结果存储在CRCDORCRCDOR_HACRCDOR_BY寄存器中。如果在传输数据之后计算CRC码，结果为0x00000000，则没有CRC错误。	R/W

40.3 Operation

40.3.1 基本操作

CRC计算器生成用于LSB优先或MSB优先传输的CRC代码。

以下示例显示了使用16位CRC-CCITT生成多项式(X16+X12+X5+1)为输入数据(0xF0)生成CRC码。在这些示例中，CRC数据输出寄存器(CRCDOR_HA)的值在CRC计算之前被清除。

当使用8位CRC（多项式X8+X2+X+1）时，CRC码的有效位在CRCDOR_BY。使用32位CRC时，在CRCDOR中获取CRC码的有效位。

图40.2和图40.3分别显示了LSB-first和MSB-first数据传输示例。图40.4和图40.5显示了LSB优先和MSB优先的数据接收示例。

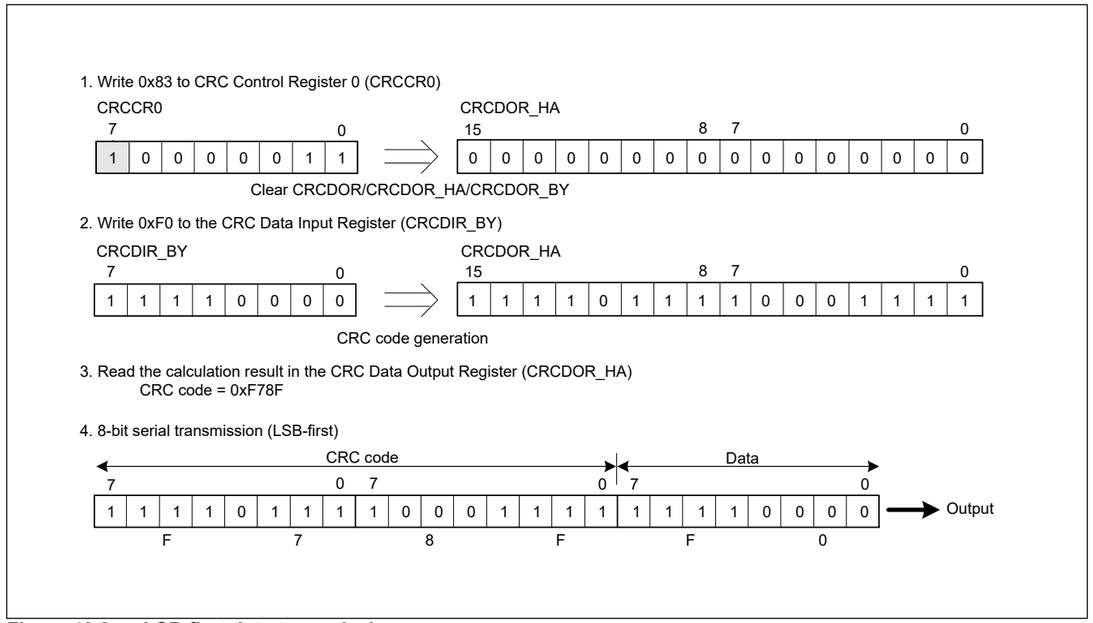

Figure 40.2 LSB-first data transmission

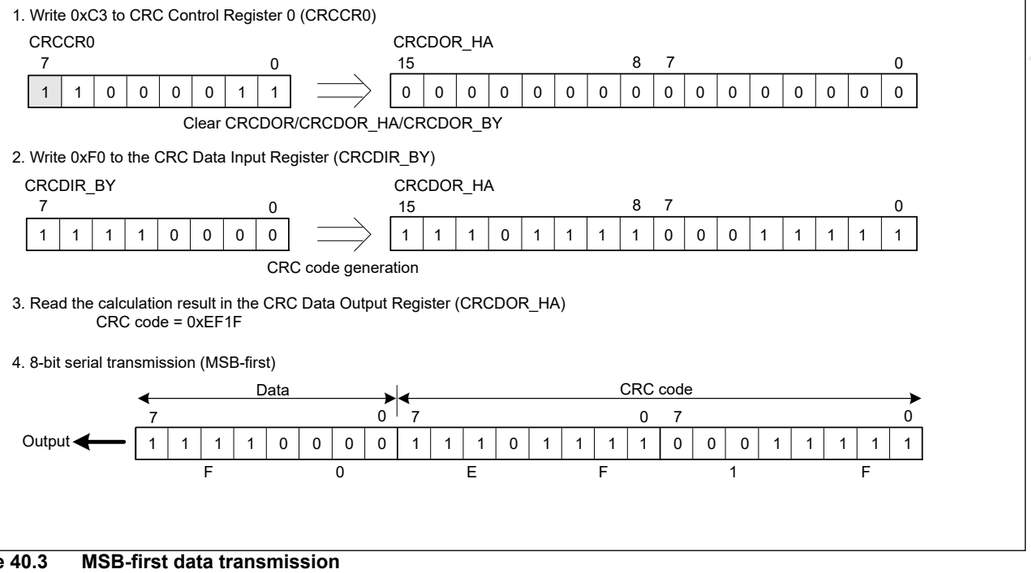

Figure 40.3 MSB-first data transmission

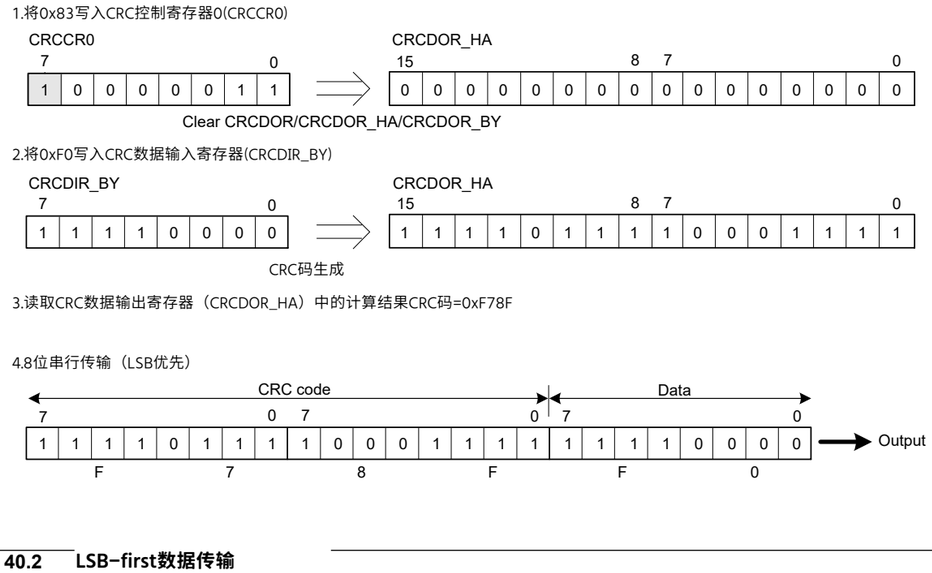

Figure 40.2 LSB-first数据传输

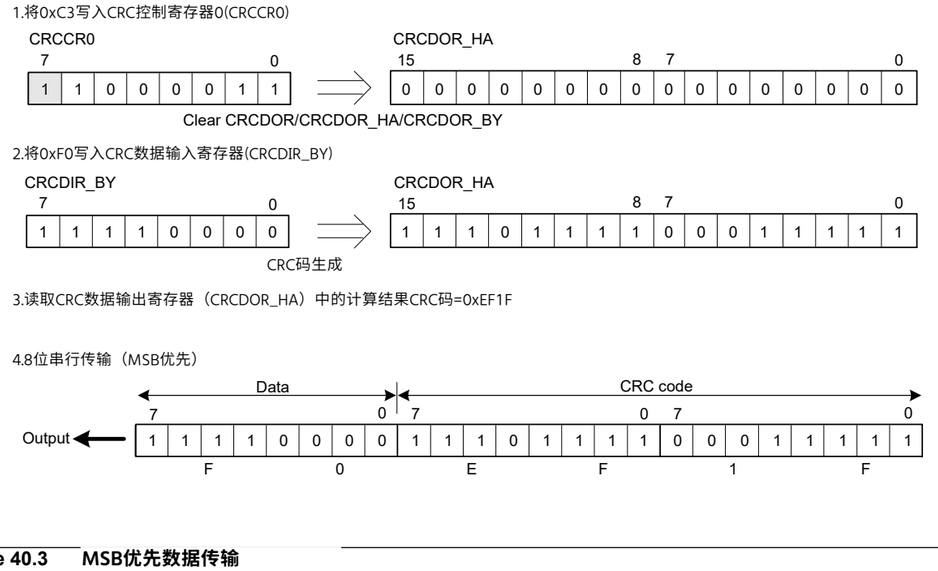

Figure 40.3 MSB优先数据传输

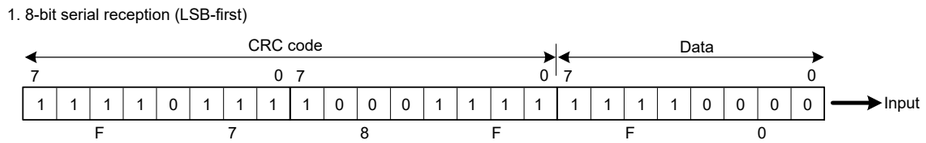

Figure 40.4 LSB-first data reception

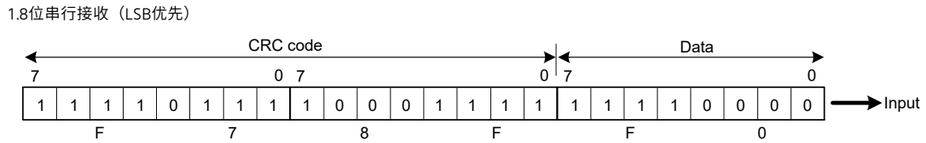

Figure 40.4 LSB-first数据接收

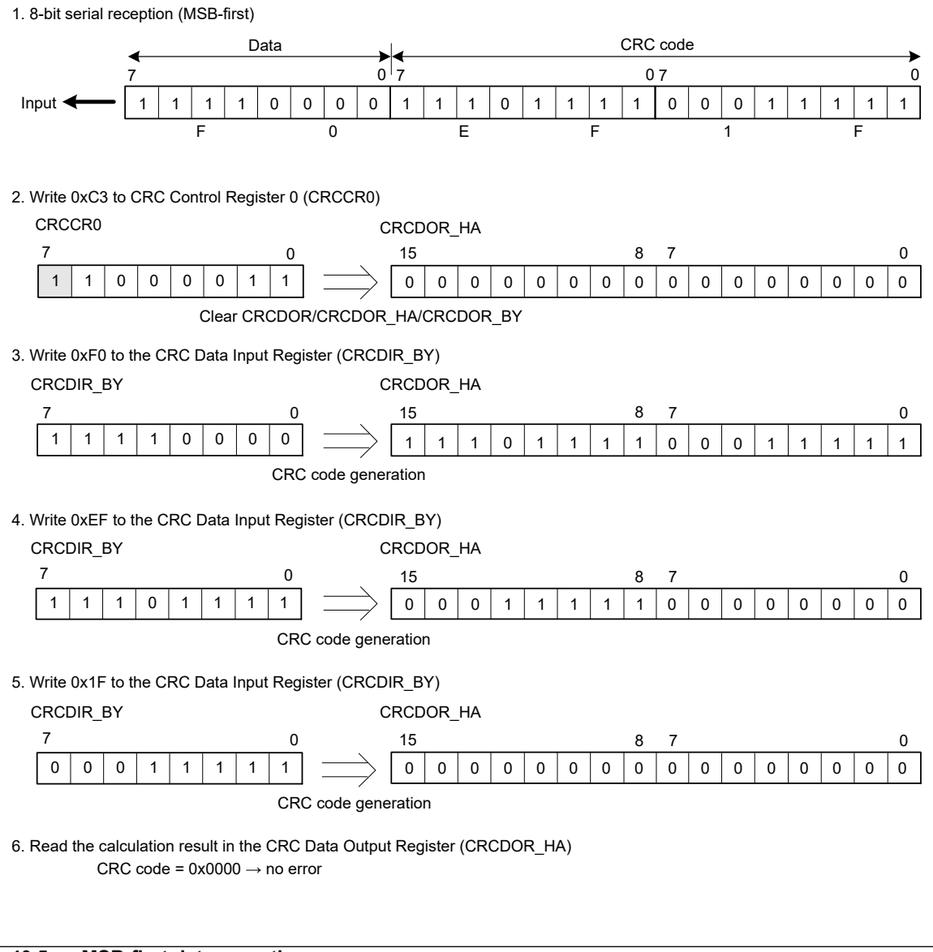

Figure 40.5 MSB-first data reception

40.4 Usage Notes

40.4.1 Settings for the Module-Stop State

The Module Stop Control Register C (MSTPCRC) can enable or disable CRC calculator operation. The CRC calculator is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

40.4.2 Note on Transmission

The transmission sequence for the CRC code differs based on whether the transmission is LSB-first or MSB-first. Figure 40.6 shows an LSB-first and MSB-first data transmission.

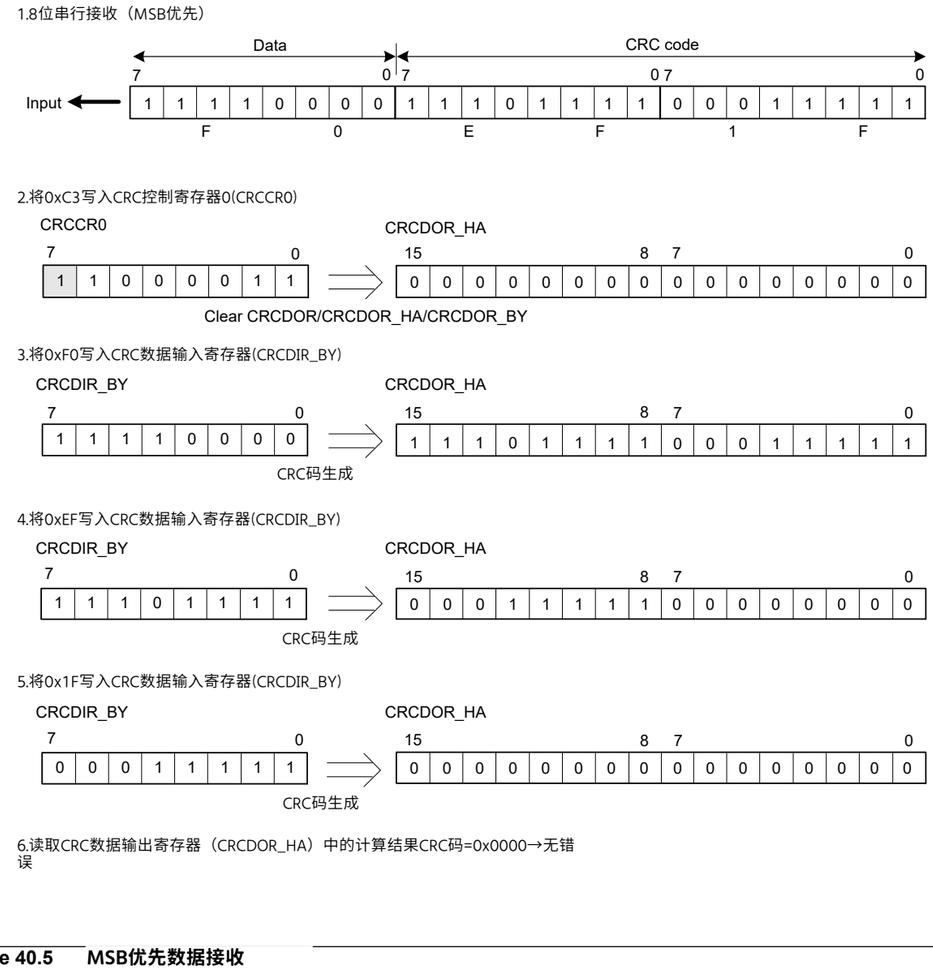

Figure 40.5 MSB优先数据接收

40.4 使用说明

40.4.1 模块停止状态的设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用CRC计算器操作。CRC计算器在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

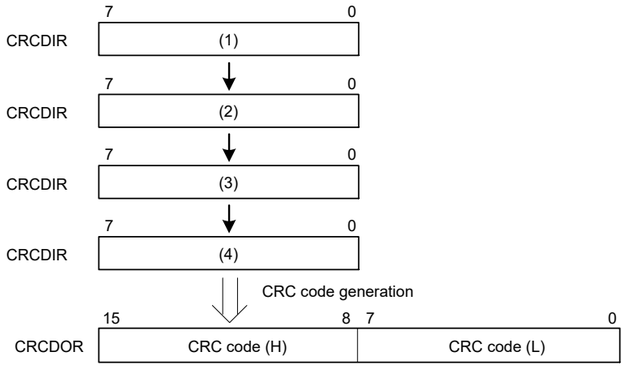
40.4.2 传输注意事项

CRC码的传输顺序根据传输是LSB在先还是MSB在先而有所不同。图40.6显示了LSB优先和MSB优先的数据传输。

When transmitting 32-bit data (for operation executed on 8 bits in parallel)

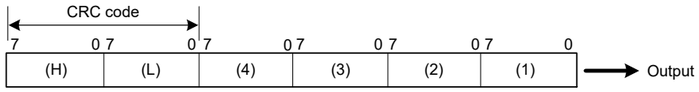
1. CRC code

After specifying the method for generation calculation, write data to CRCDIR in order of (1), (2), (3), and (4).



2. Transmit data

(i) When transmission is LSB-first



(ii) When transmission is MSB-first

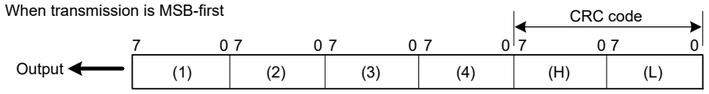


Figure 40.6 LSB-first and MSB-first data transmission

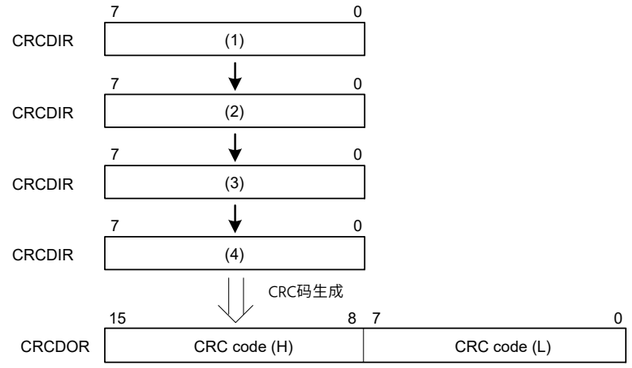
传输32位数据时（用于并行执行8位操作）

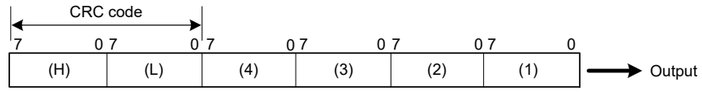
1. CRC code

指定生成计算方法后，按照（1）、（2）、（3）、（4）的顺序将数据写入CRCDIR。



2.传输数据

(i) 当传输是LSB优先时



(ii)当传输是MSB优先时

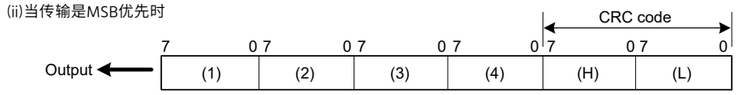


Figure 40.6 LSB-first和MSB-first数据传输

41. Boundary Scan

41.1 Overview

The boundary scan function provides a serial I/O interface based on the JTAG (Joint Test Action Group), IEEE Std.1149.1, and IEEE Standard Test Access Port and Boundary Scan Architecture. Table 41.1 lists the boundary scan specifications, Figure 41.1 shows a block diagram, and Table 41.2 lists the I/O pins.

Table 41.1 Boundary scan specifications

Parameter	Specifications
Execution condition	Boundary scan must be executed when the RES pin is driven low.
Test modes	• BYPASS mode • EXTEST mode • SAMPLE/PRELOAD mode • CLAMP mode • HIGHZ mode • IDCODE mode

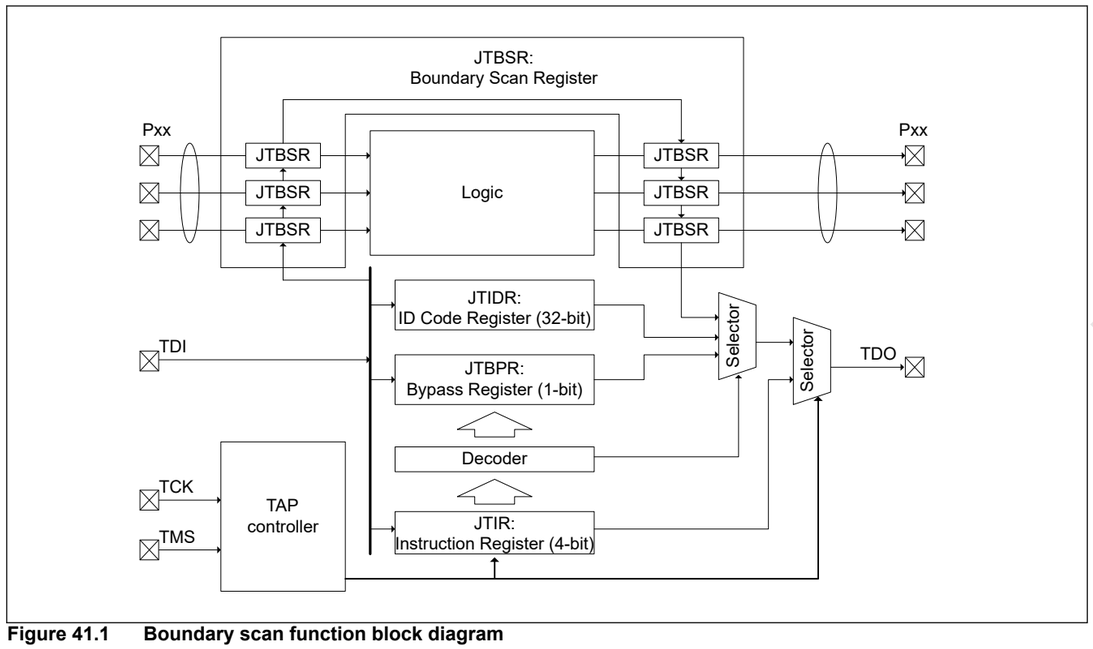

Figure 41.1 Boundary scan function block diagram

Table 41.2 Boundary scan I/O pins

Pin name	I/O	Description
TCK	Input	Test clock input pin Clock signal for boundary scan. The input clock duty cycle is 50% when the boundary scan function is used.
TMS	Input	Test mode select pin
TDI	Input	Test data input pin
TDO	Output	Test data output pin

Note: This device does not support the TRST pin for the JTAG interface.

41.2 Register Descriptions

Table 41.3 lists the boundary scan registers.

41. 边界扫描

41.1 Overview

边界扫描功能提供基于JTAG（联合测试行动组）、IEEEStd.1149.1和IEEE标准测试访问端口和边界扫描架构的串行IO接口。表41.1列出了边界扫描规范，图41.1显示了框图，表41.2列出了IO引脚。

Table 41.1 边界扫描规格

Parameter	Specifications
执行条件	当RES引脚驱动为低电平时，必须执行边界扫描。
测试模式	• 旁路模式 • EXTEST mode • SAMPLE/PRELOAD mode • 钳位模式 • HIGHZ mode • IDCODE mode

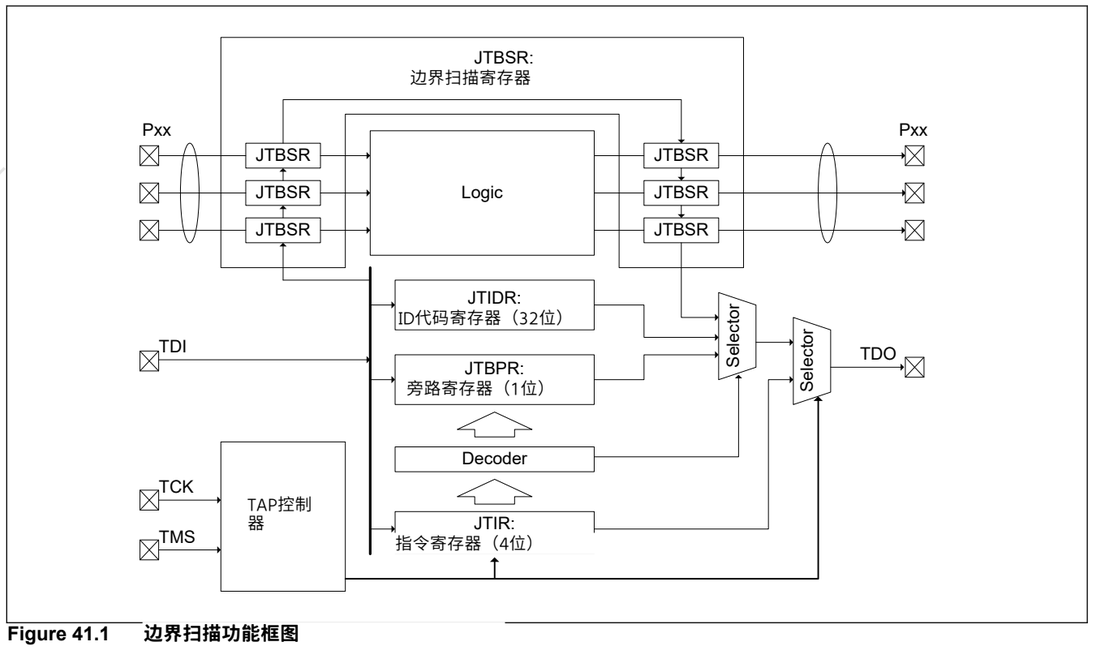

Figure 41.1 边界扫描功能框图

Table 41.2 边界扫描IO引脚

引脚名称	I/O	Description
TCK	Input	测试时钟输入引脚 边界扫描的时钟信号。使用边界扫描功能时，输入时钟占空比为50%。
TMS	Input	测试模式选择引脚
TDI	Input	测试数据输入引脚
TDO	Output	测试数据输出引脚

Note: 该器件不支持JTAG接口的TRST引脚。

41.2 注册说明

表41.3列出了边界扫描寄存器。

RA生态工作室

Table 41.3 Boundary scan registers

Register name	Symbol	Value after reset
Instruction Register	JTIR	0xE
ID Code Register	JTIDR	0x0841_2447
Bypass Register	JTBPR	Undefined
Boundary Scan Register	JTBSR	Undefined

Usage notes for the boundary scan registers:

- Instructions can be input to the Instruction Register (JTIR) through the TDI pin by serial transfer.
- The Bypass Register (JTBPR), which is a 1-bit register, is connected between the TDI and TDO pins in BYPASS mode.
- The Boundary Scan Register (JTBSR), which is configured according to the BSDL description, is connected between the TDI and TDO pins when test data is being shifted in.

Table 41.4 shows the availability of serial transfer for the registers.

Table 41.4 Serial transfer for registers

Register name	Serial input	Serial output
Instruction Register (JTIR)	Available	Available
ID Code Register (JTIDR)	Available	Available
Bypass Register (JTBPR)	Available	Available
Boundary Scan Register (JTBSR)	Available	Available

41.2.1 JTIR : Instruction Register

Bit	Symbol	Function	R/W
3:0	TS[3:0]	Test Bit Set The command configuration for these bits	—

TS[3:0]	Instruction
0x0	EXTEST
0x1	SAMPLE/PRELOAD
0x3	IDCODE (Renesas code)
0x5	CLAMP
0x6	HIGHZ
0xF	BYPASS
Others	Reserved

JTAG instructions can be transferred to the JTIR register by serial input from the TDI pin. The JTIR register is initialized when a power-on reset occurs, or when the TAP controller is in the Test-Logic-Reset state.

41.2.2 JTIDR : ID Code Register

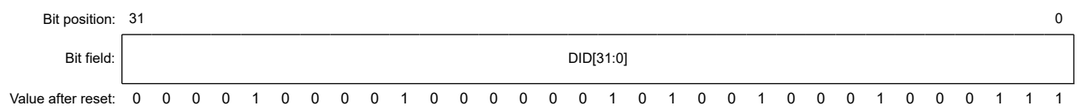

Table 41.3 边界扫描寄存器

注册名称	Symbol	重置后的值
指令寄存器	JTIR	0xE
ID代码寄存器	JTIDR	0x0841_2447
绕过寄存器	JTBPR	Undefined
边界扫描寄存器	JTBSR	Undefined

边界扫描寄存器的使用说明：

●指令可以通过串行传输的方式通过TDI引脚输入指令寄存器（JTIR）。

●BypassRegister(JTBPR)是一个1位寄存器，在BYPASS模式下连接在TDI和TDO引脚之间。

●根据BSDL描述配置的边界扫描寄存器(JTBSR)在测试数据移入时连接在TDI和TDO引脚之间。

表41.4显示了寄存器串行传输的可用性。

Table 41.4 寄存器的串行传输

注册名称	串行输入	串行输出
指令寄存器(JTIR)	Available	Available
ID代码寄存器(JTIDR)	Available	Available
旁路寄存器(JTBPR)	Available	Available
边界扫描寄存器(JTBSR)	Available	Available

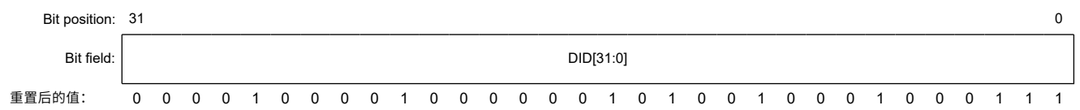
41.2.1 JTIR:指令寄存器

Bit	Symbol	Function	R/W
3:0	TS[3:0]	测试位组 这些位的命令配置	—

TS[3:0]	Instruction
0x0	EXTEST
0x1	SAMPLE/PRELOAD
0x3	IDCODE (Renesas code)
0x5	CLAMP
0x6	HIGHZ
0xF	BYPASS
Others	Reserved

JTAG指令可以通过TDI引脚的串行输入传输到JTIR寄存器。当发生上电复位或TAP控制器处于Test-Logic-Reset状态时，JTIR寄存器被初始化。

41.2.2 JTIDR:ID代码寄存器



Bit	Symbol	Function	R/W
31:0	DID[31:0]	Device ID These bits store the fixed value that indicates the device IDCODE (0x0841_2447).	—

The JTIDR register data is output from the TDO pin when the IDCODE instruction is executed. After a reset release, the DID[31:0] of JTIDR changes into the Arm® debug code. See the *Arm® CoreSight™ SoC-400 Technical Reference Manual* (ARM DDI 0480F).

41.2.3 JTBPR : Bypass Register

The JTBPR register is a 1-bit register and is connected between the TDI and TDO pins when the JTIR register is set to BYPASS mode. The JTBPR register cannot be read from or written to by the CPU.

41.2.4 JTBSR : Boundary Scan Register

The JTBSR register is a shift register for controlling the external input and output pins of this device, and is distributed across the pads. To apply the JTBSR register in boundary-scan testing, issue the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ instructions. The BSDL file describes the associations between the JTBSR register bits and the pins of this device. The value after reset is undefined.

41.3 Operation

During a reset, the JTAG ports, TCK, TMS, TDI, and TDO, are assigned as default pin functions. The TCK, TMS, and TDI pins are pulled up by the pull-up resistors. Boundary scan testing can be executed after the setup time elapses when POR is negated and RES is driven low.

41.3.1 TAP Controller

Figure 41.2 shows the state transition diagram of the TAP controller. All transitions are controlled by the TMS signal.

Bit	Symbol	Function	R/W
31:0	DID[31:0]	设备ID 这些位存储指示设备IDCODE(0x0841_2447)的固定值。	—

执行IDCODE指令时，从TDO引脚输出JTIDR寄存器数据。复位释放后，
JTIDR的DID[31:0]更改为Arm®调试代码。请参阅Arm®CoreSight SoC-400技术参考手册(ARMDDI0480F)。

41.2.3 JTBPR:旁路寄存器

JTBPR寄存器是一个1位寄存器，当JTIR寄存器设置为
旁路模式。CPU无法读取或写入JTBPR寄存器。

41.2.4 JTBSR:边界扫描寄存器

JTBSR寄存器是一个移位寄存器，用于控制该器件的外部输入和输出引脚，分布在各个焊盘上。要在边界扫描测试中应用JTBSR寄存器，请发出EXTEST、SAMPLEPRELOAD、CLAMP和HIGHZ指令。BSDL文件描述了JTBSR寄存器位和该器件引脚之间的关联。复位后的值未定义。

41.3 Operation

在复位期间，JTAG端口、TCK、TMS、TDI和TDO被分配为默认引脚功能。TCK、TMS和TDI引脚由上拉电阻上拉。当POR被否定并且RES被驱动为低电平时，可以在设置时间过去后执行边界扫描测试。

41.3.1 水龙头控制器

图41.2显示了TAP控制器的状态转换图。所有转换都由TMS信号控制。

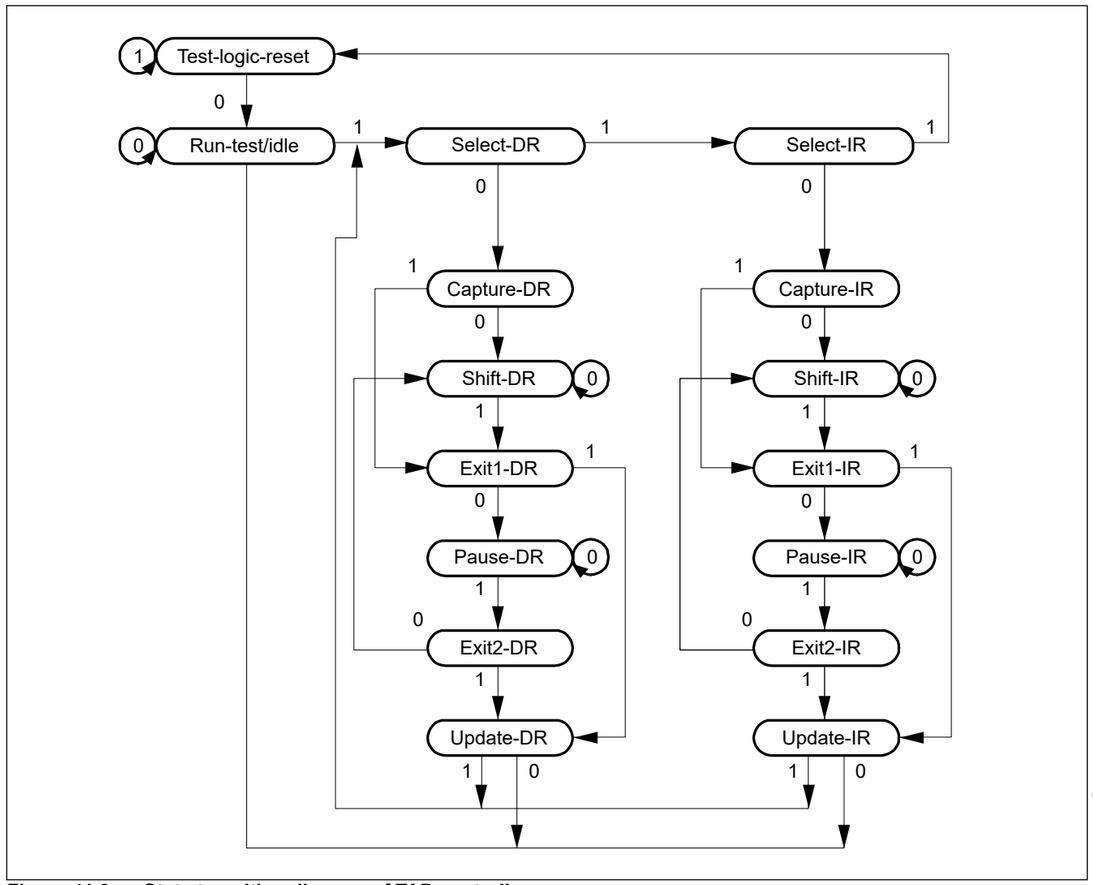


Figure 41.2 State transition diagram of TAP controller

41.3.2 Commands

(1) BYPASS

The BYPASS instruction drives the Bypass Register (JTBPR). This instruction shortens the shift path, facilitating the transfer of serial data to other LSIs on a printed circuit board at higher speeds. While this instruction is being executed, the test circuit has no effect on the system circuits.

The JTBPR register is connected between the TDI and TDO pins. Bypass operation is initiated from the Shift-DR operation. The TDO is low in the first clock cycle in the Shift-DR state. In the subsequent clock cycles, values input to the TDI pin are output from the TDO pin.

(2) EXTEST

The EXTEST instruction is used to test external circuits when this device is installed on the printed circuit board. If this instruction is executed, output pins are used to output test data (specified in the SAMPLE/PRELOAD instruction) from the Boundary Scan Register (JTBSR) to the other devices, and input pins are used to input the test result.

(3) SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input data from the internal circuits of this device to the JTBSR register, output data from the scan path, and reload the data to the scan path. While this instruction is executed, input signals are directly input to this device and output signals are also directly output to the external circuits. This device system circuit is not affected by this instruction.

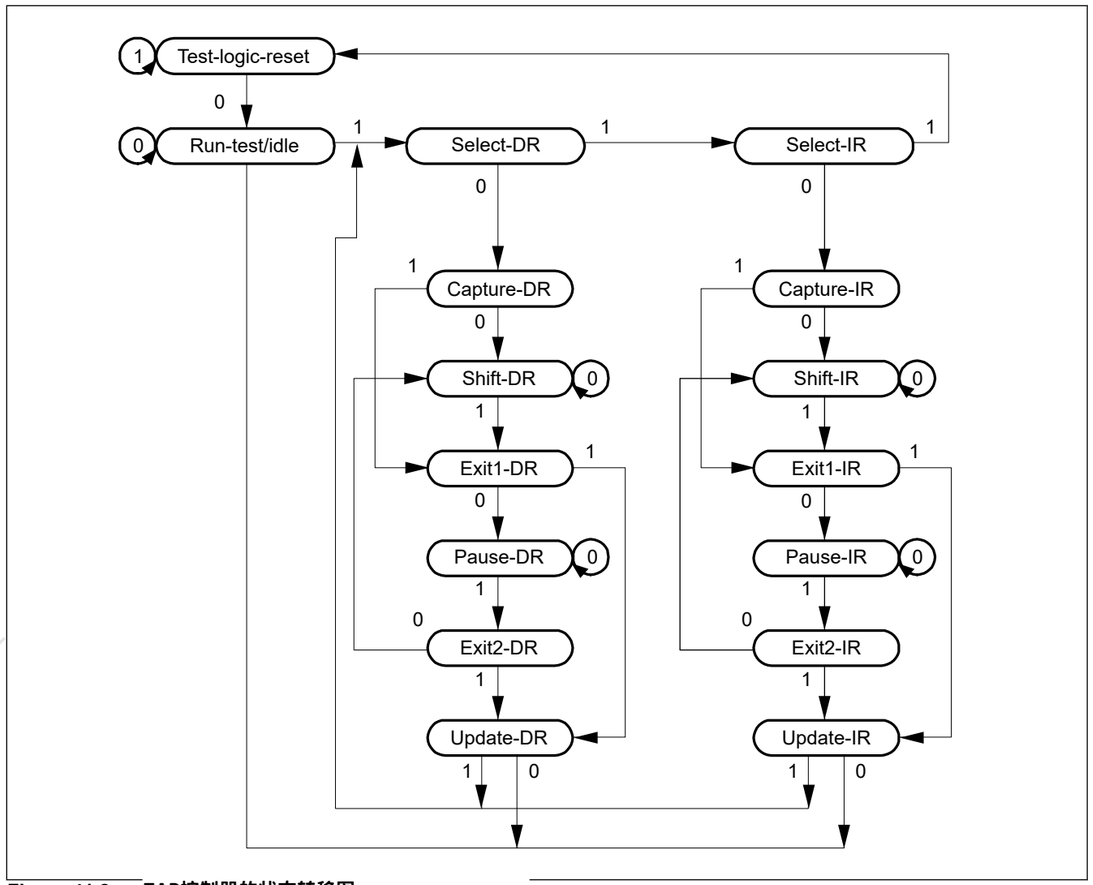

Figure 41.2 TAP控制器的状态转移图

41.3.2 Commands

(1) BYPASS

BYPASS指令驱动旁路寄存器(JTBPR)。该指令缩短了移位路径，便于将串行数据以更高的速度传输到印刷电路板上的其他LSI。在执行该指令时，测试电路对系统电路没有影响。

JTBPR寄存器连接在TDI和TDO引脚之间。旁路操作从Shift-DR操作开始。TDO在Shift-DR状态的第一个时钟周期内为低电平。在随后的时钟周期中，输入到TDI引脚的值从TDO引脚输出。

(2) EXTEST

当本设备安装在印刷电路板上时，EXTEST指令用于测试外部电路。如果执行该指令，输出引脚用于将测试数据（在SAMPLEPRELOAD指令中指定）从边界扫描寄存器(JTBSR)输出到其他设备，输入引脚用于输入测试结果。

(3) SAMPLE/PRELOAD

SAMPLEPRELOAD指令用于将数据从本器件内部电路输入到JTBSR寄存器，从扫描路径输出数据，并将数据重新加载到扫描路径。执行该指令时，输入信号直接输入到本设备，输出信号也直接输出到外部电路。本设备系统电路不受本指令影响。

In SAMPLE operation, the JTBSR register latches a snapshot of the data transferred from the input pins to the internal circuit or data transferred from the internal circuit to the output pins. The latched data is read from the scan path. The JTBSR register latches the data snapshot on the rising edge of the TCK pin in the Capture-DR state. The data snapshot is only transferred from the internal circuit to the output pins during a reset.

In PRELOAD operation, the initial value is written from the scan path to the parallel output latch of the JTBSR register prior to the EXTEST instruction execution. If EXTEST is executed without executing this PRELOAD operation, undefined values are output from the beginning to the end (transfer to the output latch) of the EXTEST sequence. (In the EXTEST instruction, output parallel latches are always output to the output pins.)

(4) IDCODE

When the IDCODE instruction is selected, the ID Code Register (JTIDR) value is output to the TDO pin in the Shift-DR state of the TAP controller. In this case, the JTIDR register value is output LSB-first. During this instruction execution, the test circuit does not affect the system circuit.

(5) CLAMP

When the CLAMP instruction is selected, output pins output the JTBSR register value that was specified in the SAMPLE/PRELOAD instruction in advance. While the CLAMP instruction is selected, the status of the JTBSR register is maintained regardless of the TAP controller state.

The JTBPR register is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

(6) HIGHZ

When the HIGHZ instruction is selected, all output pins enter high-impedance state. While the HIGHZ instruction is selected, the JTBSR register is maintained regardless of the state of the TAP controller.

The JTBPR register is connected between the TDI and TDO pins, leading to the same operation as when the BYPASS instruction is selected.

41.4 Usage Notes

The boundary scan function is subject to the following constraints:

- The boundary scan must be executed when the RES pin is driven low
- Serial data input/output is in LSB order, as shown in Figure 41.3

在SAMPLE操作中，JTBSR寄存器锁存从输入引脚传输到内部电路的数据或从内部电路传输到输出引脚的数据的快照。从扫描路径读取锁存的数据。在Capture-DR状态下，JTBSR寄存器在TCK引脚的上升沿锁存数据快照。数据快照仅在复位期间从内部电路传输到输出引脚。

在PRELOAD操作中，在执行EXTEST指令之前，将初始值从扫描路径写入JTBSR寄存器的并行输出锁存器。如果在不执行此PRELOAD操作的情况下执行EXTEST，则从EXTEST序列的开头到结尾（传输到输出锁存器）输出未定义的值。（在EXTEST指令中，输出并行锁存器始终输出到输出引脚。）

(4) IDCODE

WhentheIDCODEinstructionisselected theIDCodeRegister(JTIDR)valueisoutputtotheTDOpinintheShift-DRstateoftheTAPcontroller.在这种情况下，JTIDR寄存器值首先输出LSB。在该指令执行期间，测试电路不影响系统电路。

(5) CLAMP

选择夹具指令时，输出引脚输出样品中指定的JTBSR寄存器值
预先PRELOAD指令。选择CLAMP指令时，无论TAP控制器状态如何，都将保持JTBSR寄存器的状态。

JTBPR寄存器连接在TDI和TDO引脚之间，导致与选择BYPASS指令时相同的操作。

(6) HIGHZ

选择Highz指令时，所有输出引脚都输入高阻抗状态。选择HIGHZ指令时，无论TAP控制器的状态如何，都会保持JTBSR寄存器。

JTBPR寄存器连接在TDI和TDO引脚之间，导致与选择BYPASS指令时相同的操作。

41.4 使用说明

边界扫描函数受以下约束：

- RES引脚拉低时必须执行边界扫描
- 串行数据输入输出按LSB顺序，如图41.3所示

RA生态工作室

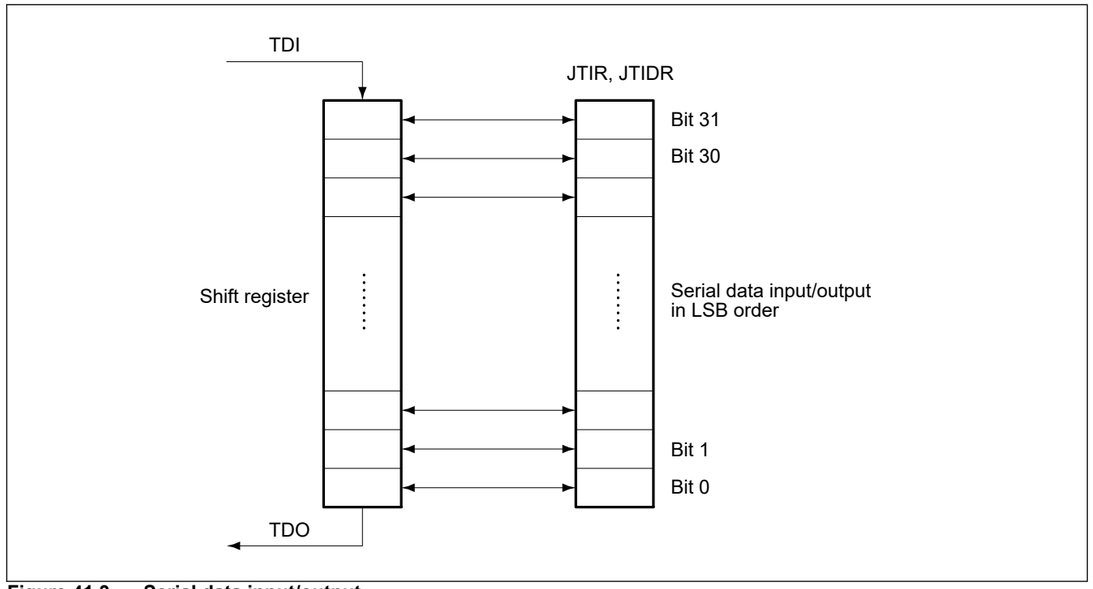

Figure 41.3 Serial data input/output

The following pins cannot be boundary-scanned:

- Power supply pins (VCC, VCL, VCL0, VSS, VBATT, AVCC0, AVSS0, VCC_USB, VSS_USB, VSS1_USBHS, VSS2_USBHS, PVSS_USBHS, and AVSS_USBHS)
- Analog reference pins (VREFH0, VREFL0, VREFH, VREFL)
- Clock pins (EXTAL, XTAL, XCIN, and XCOUT)
- Reset pin (RES)
- USB-dedicated pins (USB_DP, USB_DM, USBHS_DP, and USBHS_DM)
- The boundary-scan pins (TCK, TMS, TDI, and TDO).

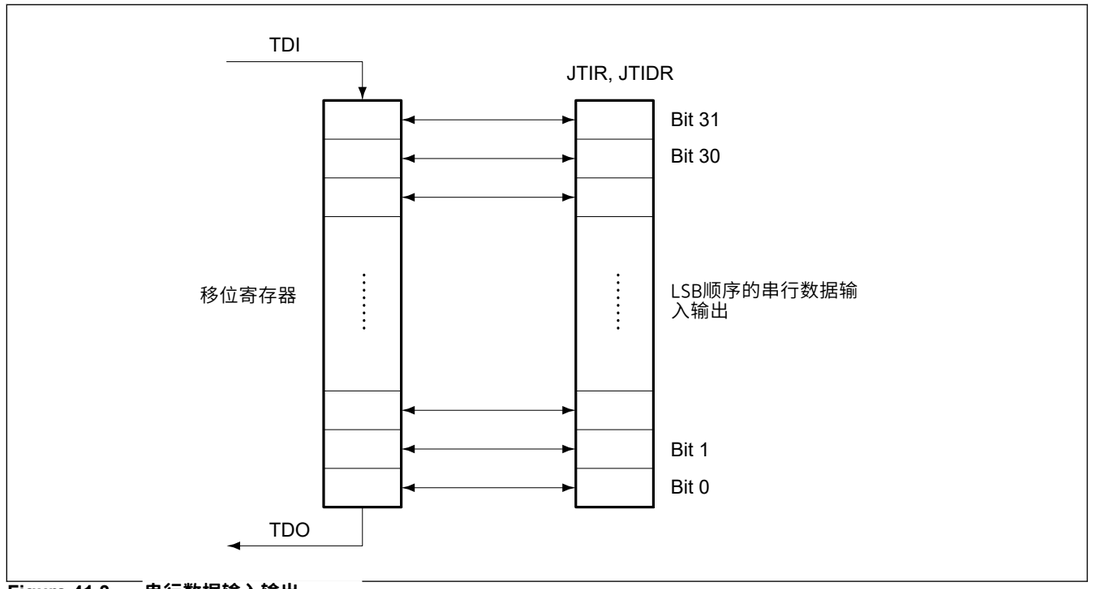

Figure 41.3 串行数据输入输出

以下引脚不能进行边界扫描：

●电源引脚（VCC、VCL、VCL0、VSS、VBATT、AVCC0、AVSS0、VCC_USB、VSS_USB、VSS1_USBHS、VSS2_USBHS、PVSS_USBHS和AVSS_USBHS）

●模拟参考引脚（VREFH0、VREFL0、VREFH、VREFL）

●时钟引脚（EXTAL、XTAL、XCIN和XCOUT）

●复位引脚（RES）

●USB专用引脚（USB_DP、USB_DM、USBHS_DP和USBHS_DM）

●边界扫描引脚（TCK、TMS、TDI和TDO）。

42. Secure Cryptographic Engine (SCE9)

42.1 Overview

The Secure Cryptographic Engine (SCE9) consists of the access management circuit, encryption engine, and random number generation circuit. In combination with the SCE9 library, the SCE9 can prevent eavesdropping (to maintain confidentiality), falsification of information (to ensuret integrity), and impersonation (to verify authenticity).

Because key information required for encryption and decryption is stored only in the SCE9 and all accesses from the outside can be blocked, SCE9 enables building a more robust security system.

Table 42.1 lists the SCE9 specifications. section 42.1. Overview shows the SCE9 block diagram.

Table 42.1 SCE9 specifications (1 of 2)

Parameter	Specifications
Access control	Access management circuit • In case of irregular access to the SCE9 due to a tampered program or CPU runaway, this circuit blocks all subsequent accesses and stops data output from the SCE9
Encryption engine	AES: Compliant with NIST FIPS PUB 197 • Key length: 128, 192, or 256 bits • Data block size: 128 bits • Encryption usage modes ECB, CBC, CTR: Compliant with NIST SP 800-38A CMAC: Compliant with NIST SP 800-38B CCM: Compliant with NIST SP 800-38C GCM: Compliant with NIST SP 800-38D XTS: Compliant with NIST SP 800-38E GCTR • Throughput for 128-bit data 11 PCLKA cycles for 128-bit key 13 PCLKA cycles for 192-bit key 15 PCLKA cycles for 256-bit key*1 AES-GCM • AES-GCM is realized by combining AES-GCTR and GHASH. Key management • Wrapped keys are only valid within the SCE9
Random number generation	128-bit true random number generation circuit
Signature generation and verification	RSA • Support for 1024-bit, 2048-bit, 3072-bit, and 4096-bit key sizes • Signature generation, signature verification, public-key encryption, private-key decryption DSA • Support for DSA key sizes: – (1024-bit, 160-bit) – (2048-bit, 224-bit) – (2048-bit, 256-bit) • Signature generation, signature verification ECC • Support for curve – NIST P-192, P-224, P-256, and P-384 – Brainpool P256r1, P384r1, and P512r1 • Signature generation, signature verification
Message digest computation	HASH • SHA224 and SHA256
Hardware Unique Key	• A read-only, 256-bit Hardware Unique Key (HUK) is exclusively accessible by the SCE access management circuit through a dedicated bus. • Key derivation functions (KDFs) combine the Hardware Unique Key with the key generation information. The derived keys implement the key wrapping for user key secure storage. • The HUK uniqueness prevents the illicit cloning and copying of keys to another MCU of the MCU group. • The HUK itself is stored in wrapped (encrypted, non-plain) format in an isolated memory area. Therefore it is protected from illicit access and copy.

42. 安全加密引擎(SCE9)

42.1 Overview

安全密码引擎（SCE9）由访问管理电路、加密引擎和随机数生成电路组成。结合SCE9库，SCE9可以防止窃听（以保持机密性）、伪造信息（以确保完整性）和假冒（以验证真实性）。

由于加密和解密所需的关键信息只存储在SCE9中，并且可以阻止来自外部的所有访问，因此SCE9可以构建更强大的安全系统。

表42.1列出了SCE9规范。第42.1节。概述显示了SCE9框图。

Table 42.1 SCE9规范（2个中的1个）

Parameter	Specifications
访问控制	访问管理电路● 如果由于程序被篡改或CPU失控而导致对SCE9的非正常访问，该电路将阻止所有后续访问并停止从SCE9输出数据
加密引擎	AES：符合NISTFIPSPUB197● 密钥长度：128、192或256位 • 数据块大小：128位 • 加密使用模式 ECB、CBC、CTR：符合NISTSP800-38A CMAC：符合NISTSP800-38BCCM：符合NISTSP800-38CGCM：符合NISTSP800-38DXTS：符合NISTSP800-38E GCTR • 128位数据的吞吐量128位密钥的1 1个PCLKA周期192位密钥的13个PCLKA周期256位密钥的15个PCLKA周期*1 AES-GCM • AES-GCM是通过结合AES-GCTR和GHASH实现的。 密钥管理● 封装的密钥仅在SCE9内有效
随机数生成	128位真随机数产生电路
签名生成和验证	RSA • 支持1024位、2048位、3072位和4096位密钥大小 ●签名生成、签名验证、公钥加密、私钥解密DSA● 支持DSA密钥大小： – (1024-bit, 160-bit) – (2048-bit, 224-bit) – (2048-bit, 256-bit) • 签名生成、签名验证 ECC • 支持曲线 – NIST P-192, P-224, P-256, and P-384 – Brainpool P256r1, P384r1, and P512r1 • 签名生成、签名验证
消息摘要计算	HASH • SHA224 and SHA256
硬件唯一密钥	• 只读的256位硬件唯一密钥(HUK)可由SCE访问管理电路通过专用总线独占访问。 • 密钥派生函数(KDF)将硬件唯一密钥与密钥生成信息相结合。派生密钥实现了用户密钥安全存储的密钥包装。 • HUK唯一性可防止将密钥非法克隆和复制到MCU组的另一个MCU。 • HUK本身以封装（加密，非纯）格式存储在隔离的内存区域中。因此，它受到保护，免受非法访问和复制。

RA生态工作室

Table 42.1 SCE9 specifications (2 of 2)

Parameter	Specifications
Unique ID	• A read-only, 128-bit ID unique to an MCU (Unique ID) is accessible from the access management circuit. • Key derivation functions (KDFs) combine the Unique ID with the key generation information. Such derived keys are used to unwrap the HUK within the SCE boundary.
Low power consumption	Setting of the module-stop state is possible

Note 1. This does not include the overhead of calling SCE9 library functions.

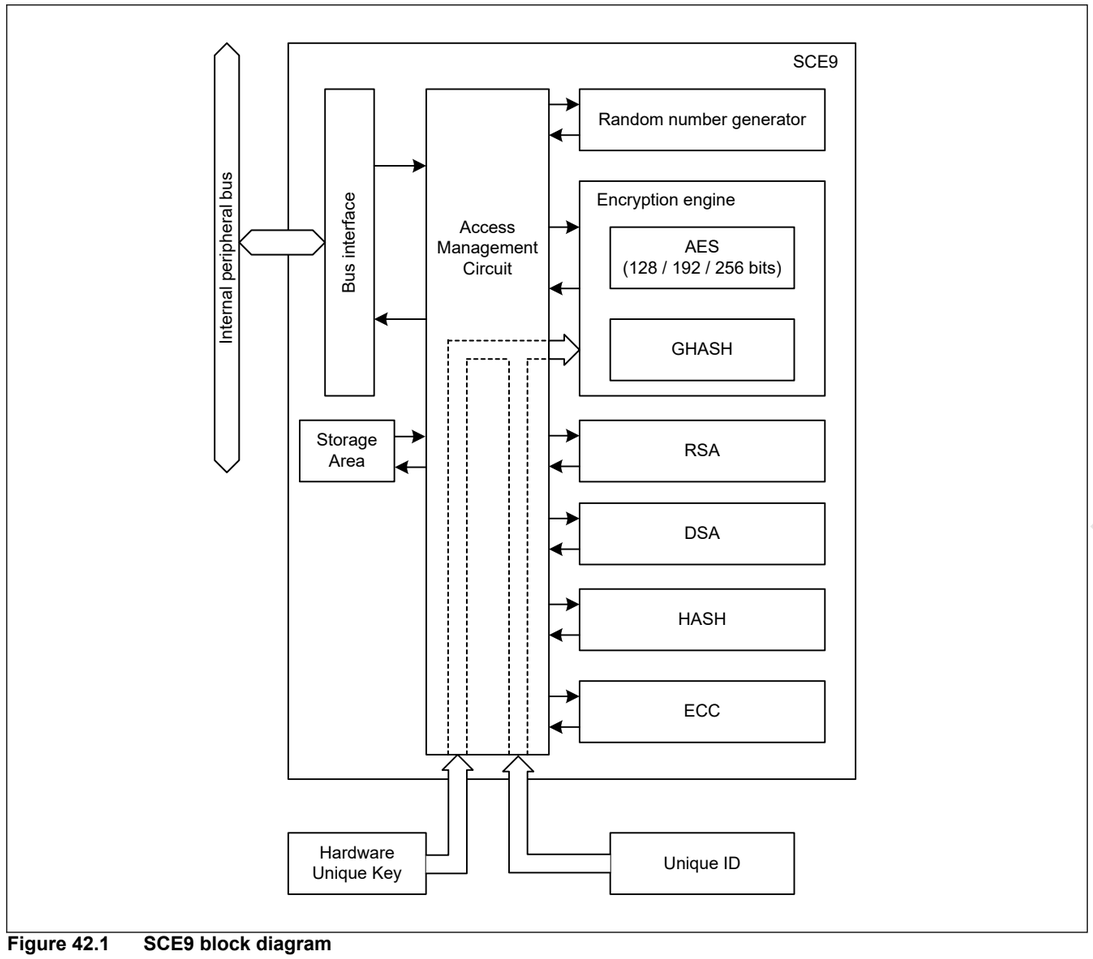

Figure 42.1 SCE9 block diagram

42.2 Operation

42.2.1 Encryption Engine

Figure 42.2 shows conceptual diagram of the encryption engine installed in the SCE9.

The encryption engine uses the key generation information, and converts the plaintext data to ciphertext or ciphertext data to plaintext through the hardware.

The encryption/decryption process can be completed without exposing the key data and the process's intermediate data to the outside of the SCE9.

Table 42.1 SCE9规范（2个中的2个）

Parameter	Specifications
唯一身份	• MCU唯一的只读128位ID（唯一ID）可从访问管理电路访问。 • 密钥派生函数(KDF)将唯一ID与密钥生成信息相结合。此类派生密钥用于在SCE边界内解开HUK。
低功耗	可以设置模块停止状态

注1.这不包括调用SCE9库函数的开销。

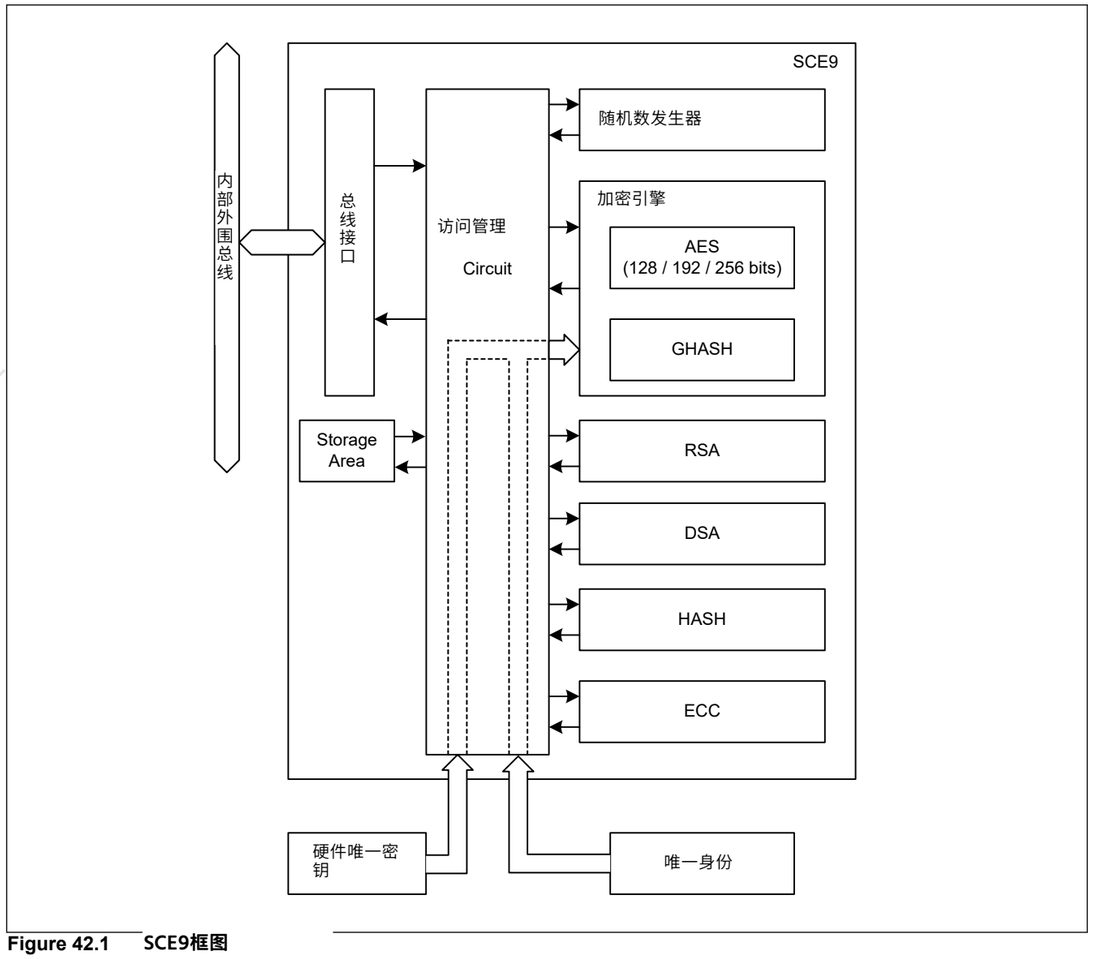

Figure 42.1 SCE9框图

42.2 Operation

42.2.1 加密引擎

图42.2显示了安装在SCE9中的加密引擎的概念图。

加密引擎使用密钥生成信息，通过硬件将明文数据转换为密文或将密文数据转换为明文。

加密解密过程可以在不将密钥数据和过程中间数据暴露在SCE9外部的情况下完成。

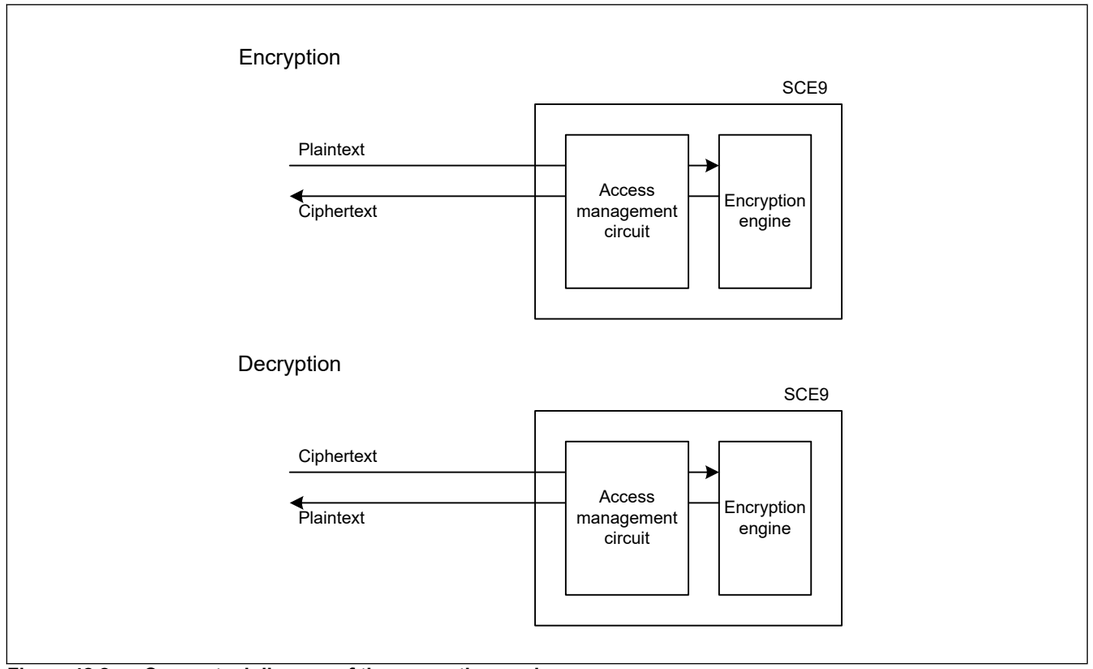

Figure 42.2 Conceptual diagram of the encryption engine

42.2.2 Encryption and Decryption

Follow the procedure below to encrypt and decrypt the data:

1. Enter the key generation information to the SCE9 and restore the key data.
2. Enter the target data to the SCE9. Plaintext data is converted to ciphertext and ciphertext data to plaintext.
3. Read the converted data.

The encryption engine has input and output buffers, and can perform encryption/decryption in parallel with data input/output. Figure 42.3 shows the encryption engine timing.

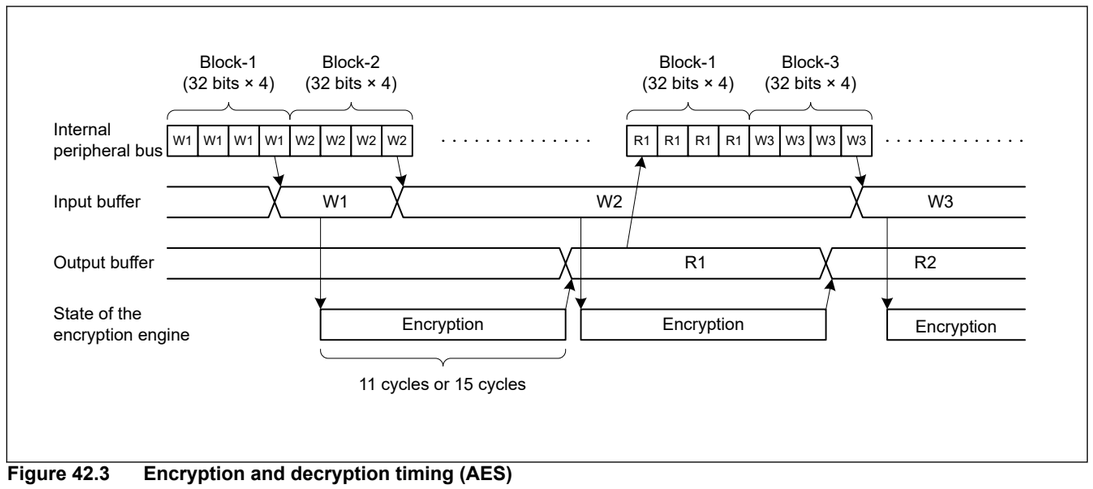

Figure 42.3 Encryption and decryption timing (AES)

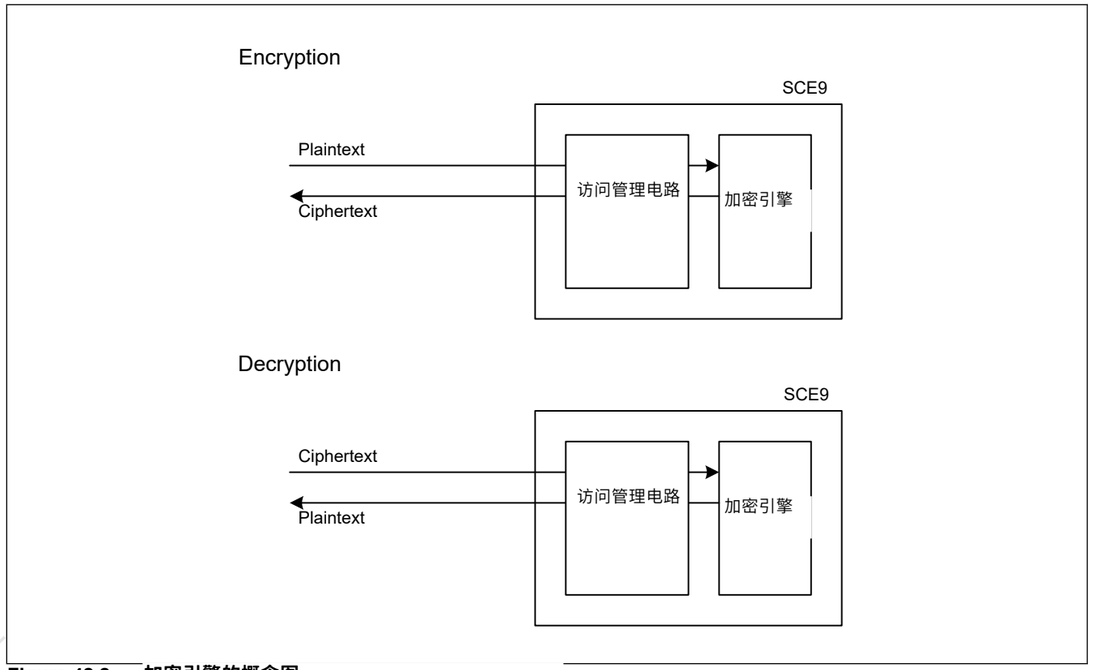

Figure 42.2 加密引擎的概念图

42.2.2 加密和解密

请按照以下步骤对数据进行加密和解密：

1.将密钥生成信息输入SCE9，恢复密钥数据。

2.将目标数据输入到SCE9。明文数据转换为密文，密文数据转换为明文。

3.读取转换后的数据。

加密引擎具有输入和输出缓冲区，可以与数据输入输出并行进行加密解密。图42.3显示了加密引擎的时序。

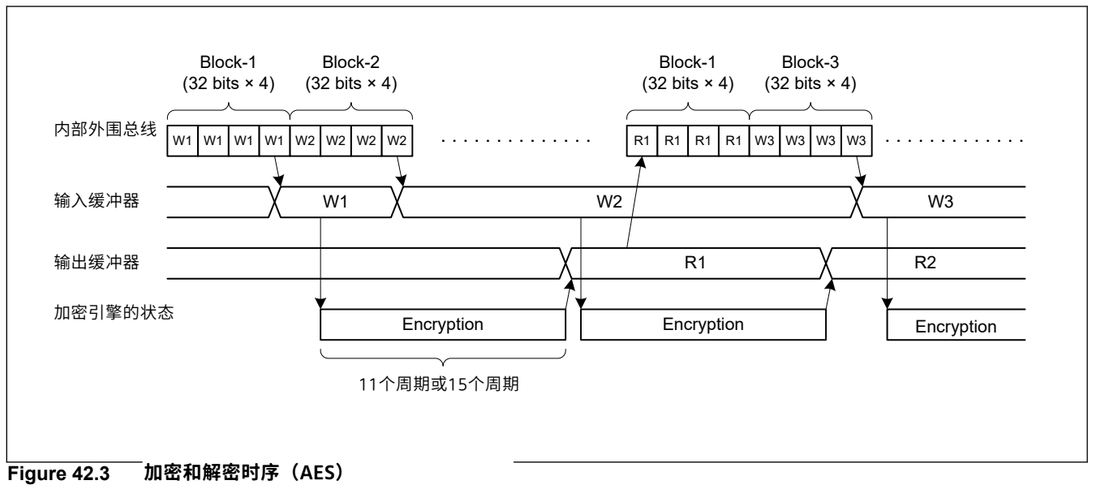

Figure 42.3 加密和解密时序（AES）

42.3 Usage Notes

42.3.1 Software Standby Mode

When the software standby mode is entered while the encryption engine is in process, proper processing cannot be resumed after the software standby mode is exited. The software standby mode should therefore be entered while the encryption engine is not running.

42.3.2 Module-Stop Function Setting

SCE9 operation can be disabled or enabled using Module Stop Control Register C (MSTPCRC). The SCE9 module is initially stopped after reset. Releasing the module-stop state enables access to the registers.

42.3 使用说明

42.3.1 软件待机模式

当加密引擎正在运行时进入软件待机模式时，退出软件待机模式后无法恢复正常处理。因此，应在加密引擎未运行时进入软件待机模式。

42.3.2 模块停止功能设置

可以使用模块停止控制寄存器C(MSTPCRC)禁用或启用SCE9操作。SCE9模块在复位后最初停止。释放模块停止状态可以访问寄存器。

RA生态工作室

43. 12-Bit A/D Converter (ADC12)

43.1 Overview

The MCU includes 12-bit successive approximation A/D converter (ADC12) units. In unit 0, up to 13 analog input channels are selectable. In unit 1, up to 16 analog input channels, temperature sensor output, internal reference voltage can be selected for conversion in respective units.

The A/D conversion accuracy is selectable from 12-bit, 10-bit, 8-bit conversion, making it possible to optimize the trade-off between speed and resolution in generating a digital value.

The ADC12 supports the following operating modes:

- Single scan mode to convert analog inputs of selected channels in ascending order of channel number
- Continuous scan mode to convert analog inputs of selected channels continuously in ascending order of channel number
- Group scan mode to divide analog inputs of channels into two groups (group A and B) and convert the analog inputs of selected channels for each group in ascending order of channel number.

In group scan mode, select two groups (group A and B). You can individually select the scan start conditions for each group (group A, B) and start scanning of each group at different times. In addition, when group A priority control operation is set, the ADC12 accepts group A scan start during group B A/D conversion, suspending group B conversion. This allows you to assign higher priority to A/D conversion start for group A.

In double trigger mode, the analog input of a selected channel is converted in single scan mode or group scan mode (group A), and data converted by the first and second A/D conversion start triggers are stored in different registers, providing duplexing of A/D converted data.

Self-diagnosis is performed once at the beginning of each scan, and one of the three reference voltage values generated in ADC12 is A/D converted.

The temperature sensor output and the internal reference voltage are selectable at the same time as the analog input of the channel. First A/D conversion is performed for the analog input of the channel, next the temperature sensor output, and then the internal reference voltage.

The ADC12 also provides a compare function (window A and window B). The compare function specifies the upper reference value for window A and lower reference value for window B, and outputs an interrupt when the A/D converted value of the selected channel meets the comparison conditions.

The A/D data storage buffer is a ring buffer consisting of 16 buffers to sequentially store A/D converted data.

Table 43.1lists the ADC12 specifications and Table 43.2 list the functions. Figure 43.1 shows a block diagram of ADC12 and Table 43.3 lists the I/O pins.

Table 43.1 ADC12 specifications (1 of 3)

Parameter	Specifications
Number of units	two units
Input channels	Up to 29 channels (AN000 to AN010, AN012, AN013, AN100 to AN102, AN116 to AN128) Extended
Analog function	Temperature sensor output, internal reference voltage
Conversion method	Successive approximation method
Resolution	12-bit, 10-bit, 8-bit
Conversion time	0.4 µs/channel (when 12-bit A/D conversion clock PCLKC (ADCLK) is operating at 50 MHz)
A/D conversion clock	Peripheral module clock PCLKA and A/D conversion clock PCLKC (ADCLK) can be set with the following division ratios: PCLKA to PCLKC (ADCLK) frequency ratio = 1:1, 2:1, 4:1, 8:1, 1:2, 1:4

43. 12-Bit A/D Converter (ADC12)

43.1 Overview

MCU包括12位逐次逼近模数转换器(ADC12)单元。在单元0中，最多可选择13个模拟输入通道。在单元1中，最多可以选择16个模拟输入通道、温度传感器输出、内部参考电压进行相应单元的转换。

AD转换精度可从12位、10位、8位转换中选择，从而可以在生成数字值时优化速度和分辨率之间的权衡。

ADC12支持以下工作模式：

●单次扫描模式，以通道号升序转换所选通道的模拟输入

●连续扫描模式，以通道号升序连续转换所选通道的模拟输入

●组扫描模式，将通道的模拟输入分为两组（A组和B组），并按通道编号升序对每组所选通道的模拟输入进行转换。

在组扫描模式下，选择两个组（A组和B组）。您可以单独选择每个组（A、B组）的扫描开始条件，并在不同时间开始每个组的扫描。此外，当设置A组优先控制操作时，ADC12在B组AD转换期间接受A组扫描启动，暂停B组转换。这允许您为A组的AD转换启动分配更高的优先级。

在双触发模式下，选定通道的模拟输入转换为单扫描模式或组扫描模式（组A），由第一个和第二个AD转换启动触发器转换的数据存储在不同的寄存器中，提供AD转换数据的双工。

自诊断在每次扫描开始时执行一次，并在生成的三个参考电压值之一ADC12经过AD转换。

温度传感器输出和内部参考电压可与通道的模拟输入同时选择。首先对通道的模拟输入进行AD转换，然后是温度传感器输出，然后是内部参考电压。

ADC12还提供比较功能（窗口A和窗口B）。比较函数指定窗口A的上参考值和窗口B的下参考值，当所选通道的AD转换值满足比较条件时输出中断。

AD数据存储缓冲区是由16个缓冲区组成的环形缓冲区，用于顺序存储AD转换后的数据。

表43.1列出了ADC12规格，表43.2列出了功能。图43.1显示了ADC12的框图，表43.3列出了IO引脚。

Table 43.1 ADC12规格(1of3)

Parameter	Specifications
单位数量	两个单元
输入通道	多达29个通道（AN000至AN010、AN012、AN013、AN100至AN102、AN116至AN128）扩展
模拟功能	温度传感器输出，内部参考电压
转换方法	逐次逼近法
Resolution	12-bit, 10-bit, 8-bit
转换时间	0.4µs通道（当12位AD转换时钟PCLKC(ADCLK)工作在50MHz时）
AD转换时钟	外设模块时钟PCLKA和AD转换时钟PCLKC(ADCLK)可以设置为以下分频比：PCLKA与PCLKC(ADCLK)频率比=1:1 2:1 4:1 8:1 1:2 1:4

Table 43.1 ADC12 specifications (2 of 3)

Parameter	Specifications
Data registers*1	• 29 registers for analog input • One register for A/D-converted data duplication in double trigger mode • Two registers for A/D-converted data duplication during extended operation in double trigger mode • One register for temperature sensor output • One register for internal reference voltage • One register for self-diagnosis • A/D conversion results are stored in A/D data registers • 12-bit, 10-bit, 8-bit accuracy for A/D conversion results • A/D-converted value addition mode, in which the sum of all A/D-converted results is stored in the A/D data registers as a value with the conversion accuracy bit count + extended bits • Double-trigger mode (selectable in single scan and group scan modes): – The first unit of A/D-converted analog input data on one selected channel is stored in the data register for the channel, and the second unit is stored in the duplication register. • Extended operation in double trigger mode (available for specific triggers): – A/D-converted analog input data on one selected channel is stored in the duplication register provided for the associated trigger.
Operating modes*2	• Single scan mode: – A/D conversion is performed only once on the analog inputs of arbitrarily selected channels, on the temperature sensor output, on the internal reference voltage. • Continuous scan mode: A/D conversion is performed repeatedly on the analog inputs of the selected channels, on the temperature sensor output, and on the internal reference voltage. • Group scan mode: – Analog inputs of selected channels, the temperature sensor output, and the internal reference voltage are divided into groups A and B. Then A/D conversion of the analog inputs selected on a group basis is performed once. – The scan start conditions can be independently selected for group A, B, allowing A/D conversion of group A, B to be started independently. • Group scan mode (when group priority operation is selected): – If a priority group trigger is input during scanning of a lower-priority group, the scanning of the lower-priority group is stopped and then scanning of the priority group is started. The order of priority is group A > group B. – It is possible to select whether to restart scanning (rescan) of the lower-priority group upon completion of the priority group scan. It is also possible to specify rescanning to be started from the first channel of the selected channels or from the channel for which A/D conversion has not been completed.
Conditions for A/D conversion start	• Software trigger • Synchronous triggers from the Event Link Controller (ELC) • Asynchronous triggering by the external trigger pins, ADTRG0 (unit 0) and ADTRG1 (unit 1)
Functions	• Variable sampling state count • Self-diagnosis of A/D converter • Selectable A/D-converted value addition mode or average mode • Analog input disconnection detection function (discharge and precharge functions) • Double-trigger mode (duplication of A/D conversion data) • Automatic clear function for A/D data registers • Digital comparison of values in the comparison register and data register, and comparison between values in the data registers • Interleave function • Ring buffer

Table 43.1 ADC12规格（2个，共3个）

Parameter	Specifications
数据寄存器*1	• 29个模拟输入寄存器 • 一个寄存器用于双触发模式下的AD转换数据复制 • 双触发模式下扩展操作期间用于AD转换数据复制的两个寄存器 • 1个温度传感器输出寄存器 • 1个内部参考电压寄存器 • 一个自我诊断寄存器 • AD转换结果存储在AD数据寄存器中 • AD转换结果的12位、10位、8位精度 • 一种D转换值相加模式，其中所有AD转换结果的总和作为转换精度位数+扩展位的值存储在AD数据寄存器中 • 双触发模式（可在单次扫描和组扫描模式下选择）： – 一个选定通道上的AD转换模拟输入数据的第一个单元存储在该通道的数据寄存器中，第二个单元存储在复制寄存器中。 • 双触发模式下的扩展操作（可用于特定触发）： – 一个选定通道上的D转换模拟输入数据存储在为相关触发提供的复制寄存器中。
操作模式*2	• 单次扫描模式： – D转换仅在任意选择通道的模拟输入、温度传感器输出和内部参考电压上执行一次。 • 连续扫描模式： 在选定通道的模拟输入、温度传感器输出和内部参考电压上重复执行D转换。 • 组扫描模式： – 所选通道的模拟输入、温度传感器输出和内部参考电压分为A组和B组。然后对按组选择的模拟输入进行一次AD转换。 – A、B组可以独立选择扫描开始条件，可以独立启动A、B组的A/D转换。 • 组扫描模式（选择组优先操作时）： – 如果在较低优先级组的扫描期间输入了优先级组触发，则较低优先级组的扫描停止，然后开始优先级组的扫描。优先顺序为A组>B组。 – 可以选择在完成优先级组扫描后是否重新开始低优先级组的扫描（重新扫描）。也可以指定从所选通道的第一个通道或未完成AD转换的通道开始重新扫描。
AD转换开始的条件	• 软件触发 • 来自事件链接控制器(ELC)的同步触发器 • 由外部触发引脚ADTRG0（单元0）和ADTRG1（单元1）异步触发
Functions	• 可变采样状态计数 • AD转换器的自诊断 • 可选择AD转换值加法模式或平均模式 • 模拟输入断线检测功能（放电和预充电功能） • 双触发模式（AD转换数据的复制） • AD数据寄存器的自动清除功能 • 比较寄存器和数据寄存器中值的数字比较，以及数据寄存器中的值之间的比较 • Interleave function • 环形缓冲区

RA生态工作室

Table 43.1 ADC12 specifications (3 of 3)

Parameter	Specifications
Interrupt sources	• In single scan mode (double trigger deselected), an A/D scan end interrupt request (ADC12i_ADI (i = 0, 1)) and ELC event signal (ADC12i_ADI (i = 0, 1)) can be generated on completion of single scan. – A compare interrupt request (ADC12i_CMPAI (i = 0, 1)/ADC12i_CMPBI (i = 0, 1)) can be generated in response to a match with a digital comparison condition. – A window compare ELC event signal (ADC12i_WCMPM (i = 0, 1)) can be generated in response to a match with a digital comparison condition. – A window compare ELC event signal (ADC12i_WCMPUM (i = 0, 1)) can be generated in response to a mismatch with a digital comparison condition. • In single scan mode (double trigger selected), an A/D scan end interrupt request (ADC12i_ADI (i = 0, 1)) and ELC event signal (ADC12i_ADI (i = 0, 1)) is generated on completion of two scans. • In continuous scan mode, an A/D scan end interrupt request (ADC12i_ADI (i = 0, 1)) and ELC event signal (ADC12i_ADI (i = 0, 1)) is generated on completion of all the selected channel scans. • In group scan mode (double trigger deselected), an A/D scan end interrupt request (ADC12i_ADI (i = 0, 1)) and ELC event signal (ADC12i_ADI (i = 0, 1)) is generated on completion of group A scan, and an A/D scan end interrupt request for group B (ADC12i_GBADI (i = 0, 1)) can be generated on completion of group B scan. • In group scan mode (double trigger selected), an A/D scan end interrupt request (ADC12i_ADI (i = 0, 1)) and ELC event signal (ADC12i_ADI (i = 0, 1)) is generated on completion of two group A scans, and an A/D scan end interrupt request for group B (ADC12i_GBADI (i = 0, 1)) can be generated on completion of group B scan. • ADC12i_ADI (i = 0, 1), ADC12i_GBADI (i = 0, 1), ADC12i_WCMPM (i = 0, 1), and ADC12i_WCMPUM (i = 0, 1) can activate the Data Transfer Controller (DTC).
ELC interface	• An event is generated upon completion of group A scan in group-scan mode. • An event is generated upon completion of group B scan in group-scan mode. • An event is generated when all scans complete. • Scan can be started by a trigger from the ELC. • An event is generated according to conditions of the compare function window in single-scan mode.
Reference voltage	• Unit 0: VREFH0 is the high potential reference voltage. VREFL0 is the low potential reference voltage. • Unit 1: VREFH is the high potential reference voltage. VREFL is the low potential reference voltage.
Module-stop function	Module-stop state can be set to reduce power consumption.*3
TrustZone Filter	Security attribution can be set for each units

Note 1. Changing the A/D conversion accuracy also changes the A/D conversion time. For details, see section 43.3.7. Analog Input Sampling and Scan Conversion Time.
Note 2. When selecting the temperature sensor output, the internal reference voltage, do not use continuous scan mode or group scan mode.
Note 3. For details, see section 10, Low Power Modes.

Table 43.2 ADC12 functions (1 of 2)

Output to ELC			ADC12i_ADI (i = 0, 1) ADC12i_WCMPM (i = 0, 1) ADC12i_WCMPUM (i = 0, 1)

Table 43.1 ADC12规格（3个中的3个）

Parameter	Specifications
中断源	• 在单次扫描模式下（取消选择双触发），在完成单次扫描时会产生AD扫描结束中断请求（ADC12i_ADI(i=0 1)）和ELC事件信号（ADC12i_ADI(i=0 1)）。 – 比较中断请求(ADC12i_CMPAI(i=0 1)ADC12i_CMPBI(i=0 1))可以响应与数字比较条件的匹配而产生。 – 响应与数字比较条件的匹配，可以生成窗口比较ELC事件信号(ADC12i_WCMPM(i=0 1))。 – 响应与数字比较条件的不匹配，可以生成窗口比较ELC事件信号(ADC12i_WCMPUM(i=0 1))。 • 在单次扫描模式下（选择双触发），在完成两次扫描时会产生一个AD扫描结束中断请求(ADC12i_ADI(i=0 1))和ELC事件信号(ADC12i_ADI(i=0 1))。 • 在连续扫描模式下，在完成所有选定通道扫描后，将生成AD扫描结束中断请求(ADC12i_ADI(i=0 1))和ELC事件信号(ADC12i_ADI(i=0 1))。 • 在组扫描模式下（取消选择双触发），在完成A组扫描时产生AD扫描结束中断请求（ADC12i_ADI(i=0 1)）和ELC事件信号（ADC12i_ADI(i=0 1)），并且在完成B组扫描时，可以生成B组(ADC12i_GBADI(i=0 1))的AD扫描结束中断请求。 • 在组扫描模式下（选择双触发），AD扫描结束中断请求（ADC12i_ADI(i=0 1)）和ELC事件信号（ADC12i_ADI(i=0 1)）在两个A组扫描完成时产生，完成B组扫描后，可以生成B组的AD扫描结束中断请求(ADC12i_GBADI(i=0 1))。 • ADC12i_ADI(i=0 1)、ADC12i_GBADI(i=0 1)、ADC12i_WCMPM(i=0 1)和ADC12i_WCMPUM(i=0 1)可以激活数据传输控制器(DTC)。
ELC interface	• 在组扫描模式下完成A组扫描时会生成一个事件。 • 在组扫描模式下完成组B扫描时会生成一个事件。 • 当所有扫描完成时会生成一个事件。 • 扫描可以通过来自ELC的触发器启动。 • 在单扫描模式下，根据比较功能窗口的条件生成事件。
参考电压	• Unit 0: VREFH0是高电位参考电压。VREFL0是低电位参考电压。 • Unit 1: VREFH是高电位参考电压。VREFL是低电位参考电压。
Module-stop function	可设置模块停止状态以降低功耗。*3
TrustZone Filter	可以为每个单元设置安全属性

注1.更改AD转换精度也会更改AD转换时间。详见43.3.7节。模拟输入采样和扫描转换时间。
注2.选择温度传感器输出、内部参考电压时，不要使用连续扫描模式或组扫描模式。
注3.有关详细信息，请参阅第10节，低功耗模式。

43.2 Register Descriptions

43.2.1 ADDRn : A/D Data Registers n

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x020 + 0x2 × n (n = 0 to 10, 12, 13, m = 0)
0x020 + 0x2 × n (n = 0 to 2, 16 to 28, m = 1)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADDRn [15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADDRn [15:0]	Converted Value 15 to 0 Functions vary depending on the selected mode and accuracy. See Table 43.5 and Table 43.6.	R

ADDRn registers are 16-bit read-only registers to store A/D conversion results.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADPRC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

(1) When A/D-converted value addition/average mode is not selected

Table 43.5 shows the example of bit assignment for 12-bit accuracy.

Table 43.5 Example of bit assignment for 12-bit accuracy

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	These bits are read as 0.				Converted Value 11 to 0: 12-bit A/D-converted value											
Left-justified data with 12-bit accuracy	Converted Value 11 to 0: 12-bit A/D-converted value												These bits are read as 0.			

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, These registers indicate the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, these registers indicate the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 43.6 shows example of the bit assignment for 12-bit accuracy.

43.2 注册说明

43.2.1 ADDRn:AD数据寄存器n

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x020 + 0x2 × n (n = 0 to 10, 12, 13, m = 0)
0x020 + 0x2 × n (n = 0 to 2, 16 to 28, m = 1)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADDRn [15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADDRn [15:0]	将值15转换为0 功能因所选模式和精度而异。请参见表43.5和表43.6。	R

ADDRn寄存器是16位只读寄存器，用于存储AD转换结果。

以下条件决定了AD数据寄存器中的数据格式：

●AD数据寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）

●AD转换精度选择位(ADCER.ADPRC[1:0])中的设置（可选择12位、10位、8位。）

●加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）

●设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

(1) 未选择AD转换值加法平均模式时

表43.5显示了12位精度的位分配示例。

Table 43.5 12位精度的位分配示例

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
具有12位精度的右对齐数据	这些位读为0。				转换值11到0：12位AD转换值											
具有12位精度的左对齐数据	转换值11到0：12位AD转换值												这些位读为0。			

(2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenADconvertedvalueaveragemodeisselected TheseregistersindicatethemeanofAD-convertedvaluesonaspecificchannel.该值根据AD数据寄存器格式选择位的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

(3) 选择AD转换值相加模式时

对于12位、10位、8位精度，可以在AD转换值相加模式中选择1、2、3或4次。AD转换结果作为指定转换精度的2位扩展值存储在AD数据寄存器中。

对于12位精度，在AD转换值相加模式中也可以选择16倍。在AD转换值相加模式中，这些寄存器指示通过在特定通道上添加AD转换值获得的值。AD转换结果作为指定转换精度的4位扩展值存储在AD数据寄存器中。

WhenAD-convertedvalueadditionmodeisselected thevalueisstoredintheADdataregisterbasedonthesettingsof theADDataRegisterFormatSelectbits.

表43.6显示了12位精度的位分配示例。

Table 43.6 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	When 16 conversion times is specified	Added Value 15 to 0: 16-bit sum of A/D conversion results															
	When 1, 2, 3, or 4 conversion times is specified	These bits are read as 0.	Added Value 13 to 0: 14-bit sum of A/D conversion results														
Left-justified data with 12-bit accuracy	When 1, 2, 3, or 4 conversion times is specified	Added Value 15 to 0: 16-bit sum of A/D conversion results															
	When 16 conversion times is specified	Added Value 13 to 0: 14-bit sum of A/D conversion results														These bits are read as 0.	

43.2.2 ADDBLDR : A/D Data Duplexing Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x018

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADDBLDR [15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADDBLDR [15:0]	Converted Value 15 to 0 Functions vary depending on the selected mode and accuracy. See Table 43.7 and Table 43.8.	R

ADDBLDR register is a 16-bit read-only register to store A/D conversion results in response to a second trigger in double-trigger mode.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADPRC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

(1) When A/D-converted value addition/average mode is not selected

Table 43.7 shows the example of bit assignment for 12-bit accuracy.

Table 43.7 Example of bit assignment for 12-bit accuracy

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	These bits are read as 0.				Converted Value 11 to 0: 12-bit A/D-converted value											
Left-justified data with 12-bit accuracy	Converted Value 11 to 0: 12-bit A/D-converted value												These bits are read as 0.			

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, This register indicates the mean of A/D-converted values on a

Table 43.6 选择AD转换值相加模式时12位精度的位分配示例

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

43.2.2 ADDBLDR:AD数据双工寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x018

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADDBLDR [15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADDBLDR [15:0]	将值15转换为0 功能因所选模式和精度而异。请参见表43.7和表43.8。	R

ADDBLDR寄存器是一个16位只读寄存器，用于存储AD转换结果，以响应双触发模式下的第二次触发。

以下条件决定了AD数据寄存器中的数据格式：

- ●AD数据寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）
- ●AD转换精度选择位(ADCER.ADPRC[1:0])中的设置（可选择12位、10位、8位。）
- ●加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）
- ●设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

(1) 未选择AD转换值加法平均模式时

表43.7显示了12位精度的位分配示例。

Table 43.7 12位精度的位分配示例

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
具有12位精度的右对齐数据	这些位读为0。				转换值11到0：12位AD转换值											
具有12位精度的左对齐数据	转换值11到0：12位AD转换值												这些位读为0。			

(2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenADconvertedvalueaveragemodeiss elected ThisregisterindicatesthemeanofAD-convertedvaluesona

specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, this register indicates the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 43.8 shows example of the bit assignment for 12-bit accuracy.

Table 43.8 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	When 16 conversion times is specified	Added Value 15 to 0: 16-bit sum of A/D conversion results															
	When 1, 2, 3, or 4 conversion times is specified	These bits are read as 0.		Added Value 13 to 0: 14-bit sum of A/D conversion results													
Left-justified data with 12-bit accuracy	When 1, 2, 3, or 4 conversion times is specified	Added Value 15 to 0: 16-bit sum of A/D conversion results															
	When 16 conversion times is specified	Added Value 13 to 0: 14-bit sum of A/D conversion results														These bits are read as 0.	

43.2.3 ADDBLDRn : A/D Data Duplexing Register n (n = A, B)

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x084 (n = A)
0x086 (n = B)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADDBLDRn [15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADDBLDRn [15:0]	Converted Value 15 to 0 Functions vary depending on the selected mode and accuracy. See Table 43.9 and Table 43.10.	R

ADDBLDRn registers are 16-bit read-only registers to store A/D conversion results in response to respective triggers during extended operation in double-trigger mode.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADPRC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

具体渠道。该值根据AD数据寄存器格式选择位的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

(3) 选择AD转换值相加模式时

对于12位、10位、8位精度，可以在AD转换值相加模式中选择1、2、3或4次。AD转换结果作为指定转换精度的2位扩展值存储在AD数据寄存器中。

对于12位精度，在AD转换值相加模式中也可以选择16倍。在AD转换值相加模式下，该寄存器指示通过在特定通道上相加AD转换值获得的值。AD转换结果作为指定转换精度的4位扩展值存储在AD数据寄存器中。

WhenAD-convertedvalueadditionmodeisselected thevalueisstoredintheADdataregisterbasedonthesettingsof theADDataRegisterFormatSelectbits.

表43.8显示了12位精度的位分配示例。

Table 43.8 选择AD转换值相加模式时12位精度的位分配示例

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
具有12位精度的右对齐数据	指定16个转换时间时	附加值15到0：AD转换结果的16位和															
	指定1、2、3或4转换时间时	这些位读为0。		附加值13到0：AD转换结果的14位和													
具有12位精度的左对齐数据	指定1、2、3或4转换时间时	附加值15到0：AD转换结果的16位和															
	指定16个转换时间时	附加值13到0：AD转换结果的14位和														这些位读为0。	

43.2.3 ADDBLDRn:AD数据双工寄存器n(n=A B)

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x084 (n = A)
0x086 (n = B)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADDBLDRn [15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADDBLDRn [15:0]	将值15转换为0 功能因所选模式和精度而异。请参见表43.9和表43.10。	R

ADDBLDRn寄存器是16位只读寄存器，用于在双触发模式的扩展操作期间存储AD转换结果以响应相应的触发。

以下条件决定了AD数据寄存器中的数据格式：

- ●AD数据寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）
- ●AD转换精度选择位(ADCER.ADPRC[1:0])中的设置（可选择12位、10位、8位。）
- ●加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）
- ●设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

(1) When A/D-converted value addition/average mode is not selected

Table 43.9 shows the example of bit assignment for 12-bit accuracy.

Table 43.9 Example of bit assignment for 12-bit accuracy

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	These bits are read as 0.				Converted Value 11 to 0: 12-bit A/D-converted value											
Left-justified data with 12-bit accuracy	Converted Value 11 to 0: 12-bit A/D-converted value												These bits are read as 0.			

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, These registers indicate the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, these registers indicate the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 43.10 shows example of the bit assignment for 12-bit accuracy.

Table 43.10 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	When 16 conversion times is specified	Added Value 15 to 0: 16-bit sum of A/D conversion results															
	When 1, 2, 3, or 4 conversion times is specified	These bits are read as 0.		Added Value 13 to 0: 14-bit sum of A/D conversion results													
Left-justified data with 12-bit accuracy	When 1, 2, 3, or 4 conversion times is specified	Added Value 15 to 0: 16-bit sum of A/D conversion results															
	When 16 conversion times is specified	Added Value 13 to 0: 14-bit sum of A/D conversion results															These bits are read as 0.

43.2.4 ADTSDR : A/D Temperature Sensor Data Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01A

43.2.4 ATSDR:AD温度传感器数据寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADTSDR [15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADTSDR [15:0]	Converted Value 15 to 0 Functions vary depending on the selected mode and accuracy. See Table 43.11 and Table 43.12.	R

ADTSDR register is a 16-bit read-only register to store A/D conversion result of the temperature sensor output.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADPRC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

(1) When A/D-converted value addition/average mode is not selected

Table 43.11 shows the example of bit assignment for 12-bit accuracy.

Table 43.11 Example of bit assignment for 12-bit accuracy

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	These bits are read as 0.				Converted Value 11 to 0: 12-bit A/D-converted value											
Left-justified data with 12-bit accuracy	Converted Value 11 to 0: 12-bit A/D-converted value												These bits are read as 0.			

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, This register indicates the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, this register indicates the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 43.12 shows example of the bit assignment for 12-bit accuracy.

Table 43.12 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected (1 of 2)

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

43.2.5 ADOCDR : A/D Internal Reference Voltage Data Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADOCDR [15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADOCDR [15:0]	Converted Value 15 to 0 Functions vary depending on the selected mode and accuracy. See Table 43.13 and Table 43.14.	R

ADOCDR register is a 16-bit read-only register to store A/D conversion result of the internal reference voltage.

The following conditions determine the formats for data in the A/D data registers:

- Setting of the A/D Data Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- The setting in the A/D Conversion Accuracy Select bits (ADCER.ADPRC[1:0]) (12-bit, 10-bit, 8-bit is selectable.)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

(1) When A/D-converted value addition/average mode is not selected

Table 43.13 shows the example of bit assignment for 12-bit accuracy.

Table 43.13 Example of bit assignment for 12-bit accuracy

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	These bits are read as 0.				Converted Value 11 to 0: 12-bit A/D-converted value											
Left-justified data with 12-bit accuracy	Converted Value 11 to 0: 12-bit A/D-converted value												These bits are read as 0.			

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, This register indicates the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

Table 43.12 选择AD转换值相加模式时12位精度的位分配示例（2之2）

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
具有12位精度的左对齐数据	指定1、2、3或4转换时间时	附加值15到0：AD转换结果的16位和															
	指定16个转换时间时	附加值13到0：AD转换结果的14位和														这些位读为0。	

43.2.5 ADocDR:AD内部参考电压数据寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADOCDR [15:0]															
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADOCDR [15:0]	将值15转换为0 功能因所选模式和精度而异。请参见表43.13和表43.14。	R

AOCDR寄存器是一个16位只读寄存器，用于存储内部参考电压的AD转换结果。

以下条件决定了AD数据寄存器中的数据格式：

●AD数据寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）

●AD转换精度选择位(ADCER.ADPRC[1:0])中的设置（可选择12位、10位、8位。）

●加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）

●设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

(1) 未选择AD转换值加法平均模式时

表43.13显示了12位精度的位分配示例。

Table 43.13 12位精度的位分配示例

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
具有12位精度的右对齐数据	这些位读为0。				转换值11到0：12位AD转换值											
具有12位精度的左对齐数据	转换值11到0：12位AD转换值												这些位读为0。			

(2) 选择AD转换值平均模式时

当在AD转换值相加模式中指定2或4次时，可以选择D转换值平均模式。WhenADconvertedvalueaveragemodeisselected ThisregisterindicatesthemeanofAD-convertedvaluesonaspecificchannel.该值根据AD数据寄存器格式选择位的设置以与正常AD转换相同的方式存储在AD数据寄存器中。

(3) 选择AD转换值相加模式时

对于12位、10位、8位精度，可以在AD转换值相加模式中选择1、2、3或4次。AD转换结果作为指定转换精度的2位扩展值存储在AD数据寄存器中。

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, this register indicates the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 43.14 shows example of the bit assignment for 12-bit accuracy.

Table 43.14 Example of bit assignment for 12-bit accuracy when A/D-converted value addition mode is selected

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	When 16 conversion times is specified	Added Value 15 to 0: 16-bit sum of A/D conversion results															
	When 1, 2, 3, or 4 conversion times is specified	These bits are read as 0.		Added Value 13 to 0: 14-bit sum of A/D conversion results													
Left-justified data with 12-bit accuracy	When 1, 2, 3, or 4 conversion times is specified	Added Value 15 to 0: 16-bit sum of A/D conversion results															
	When 16 conversion times is specified	Added Value 13 to 0: 14-bit sum of A/D conversion results														These bits are read as 0.	

43.2.6 ADRD : A/D Self-Diagnosis Data Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DIAGST[1:0]		—	—	AD[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
11:0	AD[11:0]	Converted Value 11 to 0 12-bit A/D-converted value	R
13:12	—	These bits are read as 0.	R
15:14	DIAGST[1:0]	Self-Diagnosis Status 0 0: Self-diagnosis not executed after power-on. 0 1: Self-diagnosis was executed using the 0 V voltage. 1 0: Self-diagnosis was executed using the reference voltage*1 × 1/2. 1 1: Self-diagnosis was executed using the reference voltage *1. For details on self-diagnosis, see section 43.2.15. ADCER : A/D Control Extended Register.	R

Note: The example of the bit assignment for the right-justified data with 12-bit accuracy is indicated.
Note 1. The reference voltage refers to VREFH0 for unit 0 and to VREFH for unit 1.

ADRD is a 16-bit read-only register that holds the A/D conversion results based on the self-diagnosis of the ADC12. In addition to the AD[11:0] bits indicating the A/D-converted value, it includes the Self-Diagnosis Status bit (DIAGST[1:0]).

The settings of the A/D data register format and the A/D conversion accuracy determines the formats for data in this register.

The A/D-converted value addition and average modes cannot be applied to the A/D self-diagnosis function. For details on self-diagnosis, see section 43.2.15. ADCER : A/D Control Extended Register.

This section describes the data formats for each condition. The register diagram and the register bit table shown in this section indicate example of the bit assignment for the left and right-justified data with 12-bit accuracy.

对于12位精度，在AD转换值相加模式中也可以选择16倍。在AD转换值相加模式下，该寄存器指示通过在特定通道上相加AD转换值获得的值。AD转换结果作为指定转换精度的4位扩展值存储在AD数据寄存器中。

WhenAD−convertedvalueadditionmodeisselected thevalueisstoredintheADdataregisterbasedonthesettingsof theADDataRegisterFormatSelectbits.

表43.14显示了12位精度的位分配示例。

Table 43.14 选择AD转换值相加模式时12位精度的位分配示例

Accuracy		b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

	指定1、2、3或4转换时间时	这些位读为0。		附加值13到0：AD转换结果的14位和													
具有12位精度的左对齐数据	指定1、2、3或4转换时间时	附加值15到0：AD转换结果的16位和															
	指定16个转换时间时	附加值13到0：AD转换结果的14位和														这些位读为0。	

43.2.6 ADRD:AD自诊断数据寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x01E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DIAGST[1:0]		—	—	AD[11:0]											
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
11:0	AD[11:0]	将值11转换为0 12-bit A/D-converted value	R
13:12	—	这些位读为0。	R
15:14	DIAGST[1:0]	Self-Diagnosis Status 00：上电后不进行自诊断。01:使用0V电压执行自诊断。10：使用基准电压*1×12执行自诊断。11：使用基准电压*1执行自诊断。 有关自诊断的详细信息，请参阅第43.2.15节。ADCER：AD控制扩展寄存器。	R

Note: 显示了具有12位精度的右对齐数据的位分配示例。
注1.参考电压是指单元0的VREFH0和单元1的VREFH。

ADRD是一个16位只读寄存器，保存基于ADC12自诊断的AD转换结果。除了指示AD转换值的AD[11:0]位外，它还包括自诊断状态位(DIAGST[1:0])。

AD数据寄存器格式和AD转换精度的设置决定了该寄存器中数据的格式。

AD转换值加法和平均模式不能应用于AD自诊断功能。有关自诊断的详细信息，请参阅第43.2.15节。ADCER：AD控制扩展寄存器。

本节介绍每个条件的数据格式。本节所示的寄存器图和寄存器位表表示以12位精度进行左右对齐数据的位分配示例。

Table 43.15 Bit assignment for each right-justified accuracy

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	DIAGST[1:0]		—		AD[11:0]											

Table 43.16 Bit assignment for each left-justified accuracy

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Left-justified data with 12-bit accuracy	AD[11:0]												—		DIAGST[1:0]	

43.2.7 ADCSR : A/D Control Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADST	ADCS[1:0]		—	—	—	TRGE	EXTRG	DBLE	GBADIE	—	DBLANS[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	DBLANS[4:0]	Double Trigger Channel Select These bits select one analog input channel for double trigger operation. The setting is only valid in double-trigger mode.	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	GBADIE	Group B Scan End Interrupt and ELC Event Enable Group B scan only works in group scan mode. 0: Disable ADC12i_GBADI (i = 0, 1) interrupt generation on group B scan completion. 1: Enable ADC12i_GBADI (i = 0, 1) interrupt generation on group B scan completion.	R/W
7	DBLE	Double Trigger Mode Select 0: Deselect double-trigger mode. 1: Select double-trigger mode.	R/W
8	EXTRG	Trigger Select*1 0: Start A/D conversion by the synchronous trigger (ELC). 1: Start A/D conversion by the asynchronous trigger (ADTRG0).	R/W
9	TRGE	Trigger Start Enable 0: Disable A/D conversion to be started by the synchronous or asynchronous trigger 1: Enable A/D conversion to be started by the synchronous or asynchronous trigger	R/W
10	—	These bits are read as 0. The write value should be 0.	R/W
11	—	These bits are read as 0. The write value should be 0.	R/W
12	—	These bits are read as 0. The write value should be 0.	R/W
14:13	ADCS[1:0]	Scan Mode Select 0 0: Single scan mode 0 1: Group scan mode 1 0: Continuous scan mode 1 1: Setting prohibited	R/W
15	ADST	A/D Conversion Start 0: Stop A/D conversion process. 1: Start A/D conversion process.	R/W

Note 1. To start A/D conversion using an external pin (asynchronous trigger):
After a high-level signal is input to the external pin (ADTRG0), write 1 to both the TRGE and EXTRG bits in the ADCSR register and drive the ADTRG0 pin low. With these settings, the scan conversion process starts on detection of the falling edge of ADTRG0. The pulse width of the low-level input must be at least PCLKA 1.5 clock cycles.

Table 43.15 每个右对齐精度的位分配

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
具有12位精度的右对齐数据	DIAGST[1:0]		—		AD[11:0]											

Table 43.16 每个左对齐精度的位分配

具有12位精度的左对齐数据	AD[11:0]												—		DIAGST[1:0]	

43.2.7 ADCSR:AD控制寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADST	ADCS[1:0]		—	—	—	TRGE	EXTRG	DBLE	GBADIE	—	DBLANS[4:0]				
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	DBLANS[4:0]	双触发通道选择 这些位选择一个模拟输入通道进行双触发操作。该设置仅在双触发模式下有效。	R/W
5	—	该位读取为0。写入值应为0。	R/W
6	GBADIE	B组扫描结束中断和ELC事件启用 B组扫描仅适用于组扫描模式。 0：在B组扫描完成时禁用ADC12i_GBADI(i=0 1)中断生成。 1：在B组扫描完成时启用ADC12i_GBADI(i=0 1)中断生成。	R/W
7	DBLE	双触发模式选择 0：取消选择双触发模式。1：选择双触发模式。	R/W
8	EXTRG	触发选择*1 0：通过同步触发（ELC）启动AD转换。1：通过异步触发（ADTRG0）启动AD转换。	R/W
9	TRGE	触发启动启用 0：禁止由同步或异步触发器启动的AD转换1：使能由同步或异步触发器启动的AD转换	R/W
10	—	这些位被读取为0。写入值应为0。	R/W
11	—	这些位被读取为0。写入值应为0。	R/W
12	—	这些位被读取为0。写入值应为0。	R/W
14:13	ADCS[1:0]	扫描模式选择 00：单次扫描模式01：组扫描模式10：连续扫描模式11：禁止设置	R/W
15	ADST	AD转换开始 0：停止AD转换过程。1：开始AD转换过程。	R/W

注1.使用外部引脚（异步触发）启动AD转换：
向外部引脚(ADTRG0)输入高电平信号后，向ADCSR寄存器的TRGE和EXTRG位写入1并将ADTRG0引脚驱动为低电平。通过这些设置，扫描转换过程在检测到ADTRG0的下降沿时开始。低电平输入的脉冲宽度必须至少为PCLKA1.5个时钟周期。

RA生态工作室

The ADCSR register sets double-trigger mode and A/D conversion start trigger, enables or disables scan end interrupt, selects the scan mode, and starts or stops A/D conversion.

DBLANS[4:0] bits (Double Trigger Channel Select)

The DBLANS[4:0] bits select one channel for A/D conversion data duplication in double trigger mode. This can be selected by setting the binary value of the channel number to be duplicated. The A/D conversion results of the analog input of the channel selected in the DBLANS[4:0] bits are stored in A/D Data Register y when conversion is started by the first trigger, and in the A/D Data Duplexing Register when conversion is started by the second trigger.

In double trigger mode, the channels selected in the ADANSA0 and ADANSA1 registers are invalid, and the channel selected in the DBLANS[4:0] bits is A/D converted instead.

When double trigger mode is used in group scan mode, double trigger control is only applied to group A and not to group B. Therefore, multiple channel analog input can be selected for group B even in double trigger mode.

Only set the DBLANS[4:0] bits when the ADST bit is 0. Do not set the DBLANS[4:0] bits at the same time that you write 1 to the ADST bit.

To enter A/D-converted value addition/average mode when in double trigger mode, select the channel using the DBLANS[4:0] bits in the ADANSA0 and ADANSA1 registers.

A/D-converted data from the self-diagnosis function, temperature sensor output, and internal reference voltage cannot be used in double trigger mode

GBADIE bit (Group B Scan End Interrupt and ELC Event Enable)

The GBADIE bit enables or disables group B scan end interrupt (ADC12i_GBADI (i = 0, 1)) in group scan mode.

DBLE bit (Double Trigger Mode Select)

The DBLE bit selects or deselects double-trigger mode. Double-trigger mode can only be operated by the synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits.

Double-trigger operation is as follows:

1. The ADC12i_ADI (i = 0, 1) interrupt is not output on completion of the first conversion but on completion of the second conversion.
2. The A/D conversion results from the duplication channel (selected in DBLANS[4:0]) started by the first trigger are stored in A/D Data Register y and those started by the second trigger are stored in the A/D Data Duplexing Register.

When the DBLE bit is set (double trigger mode is selected), the channels specified in the ADANSA0 and ADANSA1 registers are invalid. Double trigger mode is deselected by setting DBLE to 0. Setting DBLE to 1 again enables the same double-trigger operation described in 1. and 2. for first time scanning with the first trigger.

Do not select double trigger mode in continuous scan mode. Software triggering cannot be used in double trigger mode. Always set the ADST bit to 0 before setting the DBLE bit. Do not set the DBLE bit at that same time as writing 1 to the ADST bit.

EXTRG bit (Trigger Select)

The EXTRG bit selects the synchronous or asynchronous trigger as the trigger for starting A/D conversion.

In group-scan mode, the setting of this bit takes effect on the trigger selected for group A. For groups B, A/D conversion is started by the selected synchronous trigger regardless of this bit setting.

TRGE bit (Trigger Start Enable)

The TRGE bit enables or disables A/D conversion by the synchronous and asynchronous triggers. In group scan mode, set this bit to 1.

ADCS[1:0] bits (Scan Mode Select)

The ADCS[1:0] bits select the scan mode.

In single scan mode, A/D conversion is performed for the analog inputs of the channels selected in the ADANSA0 and ADANSA1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, the scan conversion stops.

ADCSR寄存器设置双触发模式和AD转换启动触发，使能或禁止扫描结束中断，选择扫描模式，启动或停止AD转换。

DBLANS[4:0]位（双触发通道选择）

DBLANS[4:0]位选择一个通道用于双触发模式下的AD转换数据复制。这可以通过设置要复制的通道号的二进制值来选择。在DBLANS[4:0]位中选择的通道的模拟输入的AD转换结果在第一次触发开始转换时存储在AD数据寄存器y中，当转换开始时存储在AD数据双工寄存器中。第二个触发器。

双触发模式下，ADANSA0和ADANSA1寄存器选择的通道无效，DBLANS[4:0]位选择的通道改为AD转换。

在组扫描模式下使用双触发模式时，双触发控制仅适用于A组，不适用于B组。
因此，即使在双触发模式下，也可以为B组选择多通道模拟输入。

仅当ADST位为0时设置DBLANS[4:0]位。不要在将1写入ADST位的同时设置DBLANS[4:0]位。

要在双触发模式下进入AD转换值加法平均模式，请使用
ADANSA0和ADANSA1寄存器中的DBLANS[4:0]位。

自诊断功能、温度传感器输出和内部参考电压的D转换数据不能用于双触发模式

GBADIE位（B组扫描结束中断和ELC事件使能）

GBADIE位在组扫描模式下启用或禁用组B扫描结束中断(ADC12i_GBADI(i=0 1))。

DBLE位（双触发模式选择）

DBLE位选择或取消选择双触发模式。双触发模式只能由在ADSTRGR.TRSA[5:0]位中选择的同步触发(ELC)操作。

双触发操作如下：

1.ADC12i_ADI(i=0 1)中断不是在第一次转换完成时输出，而是在第二次转换完成时输出。

2.由第一次触发启动的复制通道（在DBLANS[4:0]中选择）的AD转换结果存储在AD数据寄存器y中，由第二次触发启动的数据存储在AD数据双工寄存器中。

当设置DBLE位（选择双触发模式）时，在ADANSA0和ADANSA1寄存器中指定的通道无效。通过将DBLE设置为0来取消选择双触发模式。再次将DBLE设置为1可以启用与1.和2.中描述的相同的双触发操作，以使用第一个触发进行首次扫描。

在连续扫描模式下不要选择双触发模式。双触发模式下不能使用软件触发。在设置DBLE位之前，始终将ADST位设置为0。不要在将DBLE位设置为1的同时
ADST bit.

EXTRG bit (Trigger Select)

EXTRG位选择同步或异步触发作为启动AD转换的触发。

在组扫描模式下，该位的设置对A组选择的触发生效。对于B组，无论该位设置如何，都由选择的同步触发启动AD转换。

TRGE位（触发启动使能）

TRGE位通过同步和异步触发启用或禁用AD转换。在组扫描模式下，将此位设置为1。

ADCS[1:0]位（扫描模式选择）

ADCS[1:0]位选择扫描模式。

在单次扫描模式下，对ADANSA0中选择的通道的模拟输入执行AD转换，并且
ADANSA1寄存器，按通道号升序排列。当所有选定通道的1个AD转换周期完成时，扫描转换停止。

In continuous scan mode, when the ADCSR.ADST bit is 1, A/D conversion is performed for the analog inputs of the channels selected with the ADANSA0 and ADANSA1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion repeats from the first channel. If the ADCSR.ADST bit is set to 0 during continuous scan, A/D conversion stops even if scanning is in progress.

In group scan mode:

- Group A scanning is started by the synchronous trigger (ELC) selected in the TRSA[5:0] bits in the ADSTRGR register. A/D conversion is performed on group A analog inputs of the channels selected in the ADANSA0 and ADANSA1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion stops.
- Group B scanning is started by the synchronous trigger (ELC) selected in the ADSTRGR.TRSB[5:0] bits. A/D conversion is performed on group B analog inputs of the channels selected in the ADANSB0 and ADANSB1 registers, in ascending order of channel number. When 1 cycle of A/D conversion completes for all the selected channels, A/D conversion stops.

If the conversion processes in group A and B occur at the same time, those conversions cannot be controlled separately. In this case, set group A Priority Control Setting bit (ADGSPCR.PGS) in the A/D Group Scan Priority Control Register (ADGSPCR) to 1 to assign a priority to group A conversion.

In group scan mode, select different channels and triggers for group A and group B.

Only set the ADCS[1:0] bits when the ADST bit is 0. Do not set the ADCS[1:0] bits at the same time that you write 1 to the ADST bit.

Table 43.17 Selectable targets for A/D conversion depending on scan and double-trigger mode settings

Scan mode setting	Double-trigger mode setting	Targets for A/D conversion				
		Self-diagnosis	Analog input (group A)	Analog input (group B)	Temperature sensor output	Internal reference voltage
Single scan	DBLE = 0	✓	✓	—	✓	✓
	DBLE = 1	—	✓ (1 ch only)	—	—	—
Continuous scan	DBLE = 0	✓	✓	—	✓	✓
	DBLE = 1	—	—	—	—	—
Group scan	DBLE = 0	✓	✓	✓	✓	✓
	DBLE = 1	—	✓ (1 ch only)	✓	✓	✓

Note: ✓: Selectable, —: Not selectable

ADST bit (A/D Conversion Start)

The ADST bit starts or stops the A/D conversion process. Before the ADST bit is set to 1, set the A/D conversion clock, the conversion mode, and the conversion target analog input.

[Setting conditions]

- 1 is written.
- The synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits is detected when ADCSR.EXTRG is 0 and ADCSR.TRGE is 1.
- The synchronous trigger (ELC) selected in the ADSTRGR.TRSB[5:0] bits is detected when ADCSR.TRGE is set to 1 in group scan mode.
- The asynchronous trigger is detected when the ADCSR.TRGE and ADCSR.EXTRG bits are set to 1 and the ADSTRGR.TRSA[5:0] bits are set to 0x00.
- When group priority operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), the ADGSPCR.GBRP bit is set to 1, and each time A/D conversion on the group with the lowest priority is started.

[Clearing conditions]

- 0 is written.

在连续扫描模式下，当ADCSR.ADST位为1时，ADANSA0和ADANSA1寄存器选择的通道的模拟输入按通道编号的升序执行AD转换。当所有选定通道的1个AD转换周期完成时，AD转换从第一个通道开始重复。如果

ADCSR.ADST位在连续扫描期间设置为0，即使在扫描过程中AD转换也会停止。

在组扫描模式下：

●A组扫描由在ADSTRGR寄存器的TRSA[5:0]位中选择的同步触发(ELC)启动。AD转换在ADANSA0和ADANSA1寄存器中选择的通道的A组模拟输入上执行，按通道编号的升序排列。当所有选定通道完成1个AD转换周期时，AD转换停止。

●B组扫描由在ADSTRGR.TRSB[5:0]位中选择的同步触发(ELC)启动。广告
转换是在ADANSB0和ADANSB1寄存器中选择的通道的B组模拟输入上执行的，按通道编号的升序排列。当所有选定通道完成1个AD转换周期时，AD转换停止。

如果A组和B组中的转换过程同时发生，则不能单独控制这些转换。在这种情况下，将AD组扫描优先级控制寄存器(ADGSPCR)中的A组优先级控制设置位(ADGSPCR.PGS)设置为1，以将优先级分配给A组转换。

在组扫描模式下，为A组和B组选择不同的通道和触发。

仅当ADST位为0时才设置ADCS[1:0]位。不要在向寄存器写入1的同时设置ADCS[1:0]位
ADST bit.

Table 43.17 AD转换的可选目标取决于扫描和双触发模式设置

扫描模式设置	双触发模式设置	AD转换的目标				
		Self-diagnosis	模拟输入（A组）	模拟输入（B组）	温度传感器输出	内部参考电压
单次扫描	DBLE = 0	✓	✓	—	✓	✓
	DBLE = 1	—	✓ (1 ch only)	—	—	—
连续扫描	DBLE = 0	✓	✓	—	✓	✓
	DBLE = 1	—	—	—	—	—
组扫描	DBLE = 0	✓	✓	✓	✓	✓
	DBLE = 1	—	✓ (1 ch only)	✓	✓	✓

Note: :可选择 —:不可选择

ADST位（AD转换开始）

ADST位启动或停止AD转换过程。在ADST位设置为1之前，设置AD转换时钟、转换模式和转换目标模拟输入。

[Setting conditions]

●写入1。

●当ADCSR.EXTRG为0且ADCSR.TRGE为1时，检测在ADSTRGR.TRSA[5:0]位中选择的同步触发(ELC)。

●在组扫描模式下，当ADCSR.TRGE设置为1时，检测到在ADSTRGR.TRSB[5:0]位中选择的同步触发(ELC)。

●当ADCSR.TRGE和ADCSR.EXTRG位设置为1且ADSTRGR.TRSA[5:0]位设置为0x00时，检测到异步触发
。

●当启用组优先操作模式时（ADCSR.ADCS[1:0]位=01b和ADGSPCR.PGS位=1），ADGSPCR.GBRP位设置为1，并且每次对最低组进行AD转换优先启动。

[Clearing conditions]

●写入0。

RA生态工作室

- The A/D conversion of all the selected channels, the temperature sensor output, the internal reference voltage completes in single scan mode.
- Group A scan completes in group scan mode.
- Group B scan completes in group scan mode.
- When group priority operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), the ADGSPCR.GBRSCN bit is set to 1, and A/D conversion on the group with the lowest priority started by trigger completes.

Note: When group priority operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), do not set the ADST bit to 1.
Note: When group priority operation mode is enabled (ADCSR.ADCS[1:0] bits = 01b and ADGSPCR.PGS bit = 1), do not set the ADST bit to 0. When forcing A/D conversion to terminate, follow the procedure for clearing the ADST bit.

43.2.8 ADANSA0 : A/D Channel Select Register A0

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)
Offset address: 0x004

Bit	Symbol	Function	R/W
15:0	ADSn	一个D转换的增值平均渠道选择 位15(ADS15)与ANm15相关联，位0(ADS00)与ANm00相关联。 0：不选择关联的输入通道。1：选择关联的输入通道。	R/W

Note: n = 00 to 10, 12, 13(unit 0), 00 to 02(unit 1)
Note: 与不存在的引脚相关的位被保留。该位读取为0。写入值应为0。

ADSn位（AD转换值加法平均通道选择）

ADSn位确定哪些AD转换通道要进行AD转换值加法平均。当一个与选择用于AD转换的通道相关的ADSn位设置为1，相应通道的模拟输入的AD转换按ADC[2:0]中的规定连续执行1、2、3、4或16次ADADC寄存器中的位。

当ADADC.AVEE位为0时，相加得到的值存储在AD数据寄存器中。当ADADC.AVEE位为1时，加法所得结果的平均值存储在AD数据寄存器中。

ADSn位仅适用于为AD转换选择的通道：

●ADANSA0寄存器中的ANSan位或ADCSR寄存器中的DBLANS[4:0]位

- The ANSBn bits in the ADANSB0 register

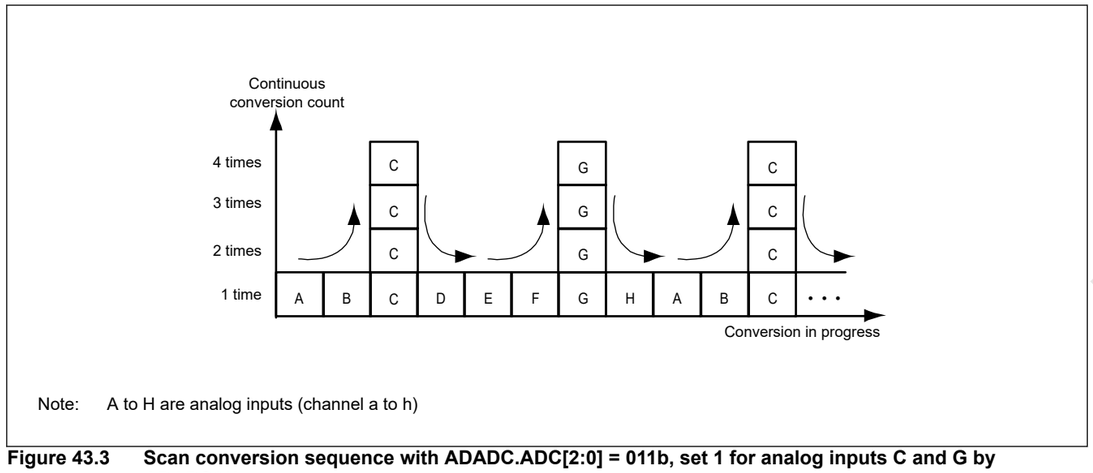
For channels on which the A/D conversion is performed and for which addition/average mode is not selected, a normal 1-time conversion is executed and the conversion result is stored in the A/D data register.

Only set ADADS0 register bits when the ADCSR.ADST bit is 0.

Figure 43.3 shows a scanning operation sequence in which the ADADS0 register bits (channel c and g) are set to 1. In this figure:

- Addition mode is selected (ADADC.AVEE = 0)
- The number of conversions is set to 4 (ADADC.ADC[1:0] = 11b)
- The analog input channels (a to h) are selected by ADANSA0 register in continuous scan mode (ADCSR.ADCS[1:0] = 10b).

The conversion process begins with analog input A (channel a). The analog input C (channel c) conversion is performed successively 4 times and the added value is returned to A/D Data Register c (ADDRc). Next, the analog input D (channel d) conversion process is started. The analog input G (channel g) is performed successively 4 times and the added value is returned to A/D Data Register g (ADDRg). After conversion of analog input H (channel h), the conversion operation repeats in the same sequence starting with analog input A (channel a).



Note: A to H are analog inputs (channel a to h)

Figure 43.3 Scan conversion sequence with ADADC.ADC[2:0] = 011b, set 1 for analog inputs C and G by ADADS0/1

43.2.13 ADADS1 : A/D-Converted Value Addition/Average Channel Select Register 1

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADS31	ADS30	ADS29	ADS28	ADS27	ADS26	ADS25	ADS24	ADS23	ADS22	ADS21	ADS20	ADS19	ADS18	ADS17	ADS16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADSn	A/D-Converted Value Addition/Average Channel Select Bit 15 (ADS31) is associated with ANm31 and bit 0 (ADS16) is associated with ANm16. 0: Do not select associated input channel. 1: Select associated input channel.	R/W

Note: n = 16 to 28(unit 1)
Note: Bits associated with non-existent pins are reserved. This bit is read as 0. The write value should be 0.

●ADANSB0寄存器中的ANSBn位

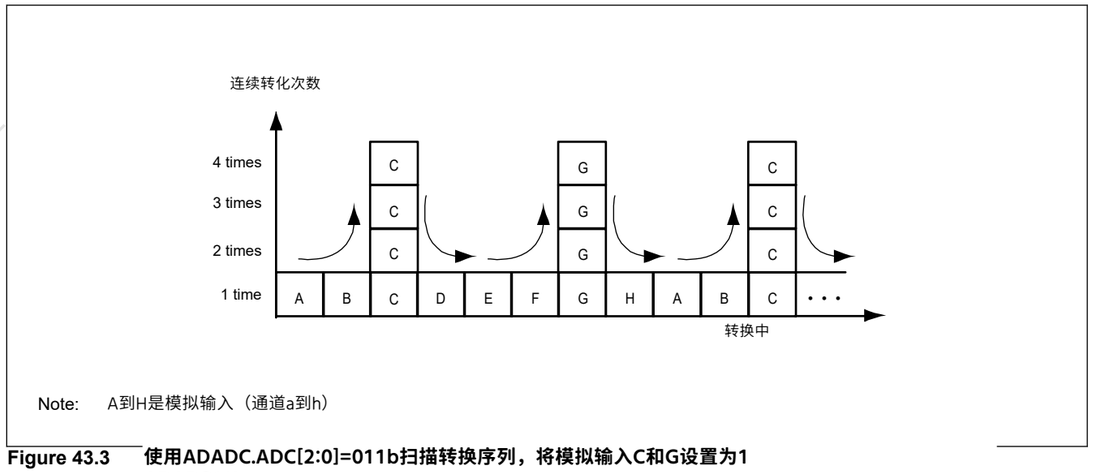
对于执行AD转换且未选择加法平均模式的通道，将执行正常的1次转换，并将转换结果存储在AD数据寄存器中。

仅当ADCSR.ADST位为0时设置ADADS0寄存器位。

图43.3显示了扫描操作序列，其中ADADS0寄存器位（通道c和g）设置为1。在该图中：

●选择加法模式（ADADC.AVEE=0）
●转换次数设置为4(ADADC.ADC[1:0]=11b)
●模拟输入通道（a到h）在连续扫描模式下由ADANSA0寄存器选择（ADCSR.ADCS[1:0]=10b）。

转换过程从模拟输入A（通道a）开始。模拟输入C（通道c）转换连续执行4次，相加后的值返回到AD数据寄存器c（ADDRc）。接下来，开始模拟输入D（通道d）转换过程。模拟输入G（通道g）连续执行4次，相加后的值返回到AD数据寄存器g（ADDRg）。模拟输入H（通道h）转换后，转换操作从模拟输入A（通道a）开始以相同的顺序重复。



Note: A到H是模拟输入（通道a到h）

Figure 43.3 使用ADADC.ADC[2:0]=011b扫描转换序列，将模拟输入C和G设置为1 ADADS0/1

43.2.13 ADADS1：一个D转换值加法平均通道选择寄存器1

RA生态工作室

ADSn bits (A/D-Converted Value Addition/Average Channel Select)

The ADSn bits determine which A/D-converted channels are subject to A/D-converted value addition/averaging. When an ADSn bit associated with a channel selected for A/D conversion is set to 1, A/D conversion of the analog input of the respective channel is performed successively 1, 2, 3, 4, or 16 times, as specified in the ADC[2:0] bits in the ADADC register.

When the ADADC.AVEE bit is 0, the value obtained by addition is stored in the A/D data register. When the ADADC.AVEE bit is 1, the mean value of the results obtained by addition is stored in the A/D data register.

The ADSn bits apply only to channels that are selected for A/D conversion in:

- The ANSAn bits in the ADANSA1 register or the DBLANS[4:0] bits in the ADCSR register
- The ANSBn bits in the ADANSB1 register.

For channels on which the A/D conversion is performed and for which addition/average mode is not selected, a normal 1-time conversion is executed and the conversion result is stored in the A/D data register.

Only set ADADS1 register when the ADCSR.ADST bit is 0.

2:0	ADC[2:0]	Addition/Average Count Select 0 0 0: 1-time conversion (no addition, same as normal conversion) 0 0 1: 2-time conversion (one addition) 0 1 0: 3-time conversion (two additions) 0 1 1: 4-time conversion (three additions) 1 0 1: 16-time conversion (15 additions) Others: Setting prohibited	R/W
6:3	—	These bits are read as 0. The write value should be 0.	R/W
7	AVEE	Average Mode Select 0: Enable addition mode 1: Enable average mode	R/W

ADADC sets the addition or average mode and addition count for A/D conversion. Table 43.18 lists the settable combinations of ADADC register.

Table 43.18 Settable combinations of ADADC register

Average mode select (AVEE)	Conversion time				
	1-time	2-times	3-times	4-times	16-times
1'b0	✓	✓	✓	✓	✓
1'b1	✓	✓	—	✓	—

Note: ✓: Selectable, —: Not selectable

ADC[2:0] bits (Addition/Average Count Select)

The ADC[2:0] bits set the addition count in all channels for which A/D conversion and addition/average mode are selected, including the channel selected in double trigger mode with the ADCSR.DBLANS[4:0] bits. The count also applies to A/D conversion of the temperature sensor output and internal reference voltage.
When self-diagnosis is executed (ADCER.DIAGM = 1), do not set the ADC[2:0] bits to any value other than 000b.

ADSn位（AD转换值加法平均通道选择）

ADSn位确定哪些AD转换通道要进行AD转换值加法平均。当一个
与选择用于AD转换的通道相关的ADSn位设置为1，相应通道的模拟输入的AD转换按ADC[2:0]中的规定连续执行1、2、3、4或16次ADADC寄存器中的位。

当ADADC.AVEE位为0时，相加得到的值存储在AD数据寄存器中。当ADADC.AVEE位为1时，加法所得结果的平均值存储在AD数据寄存器中。

ADSn位仅适用于为AD转换选择的通道：

●ADANSA1寄存器中的ANSan位或ADCSR寄存器中的DBLANS[4:0]位

●ADANSB1寄存器中的ANSBn位。

对于执行AD转换且未选择加法平均模式的通道，将执行正常的1次转换，并将转换结果存储在AD数据寄存器中。

仅当ADCSR.ADST位为0时设置ADADS1寄存器。

43.2.14 ADADC:D转换值加法平均计数选择寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	AVEE	—	—	—	—	ADC[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	ADC[2:0]	加法平均计数选择 000：1次转换（不加，同普通转换）001：2次转换（1次加法）01 0：3次转换（2次加法）011：4次转换（3次加法）101：16次转换 （15次加法） Others: 禁止设定	R/W
6:3	—	这些位被读取为0。写入值应为0。	R/W
7	AVEE	平均模式选择 0：启用加法模式1：启用 平均模式	R/W

ADADC设置AD转换的加法或平均模式和加法计数。表43.18列出了ADADC寄存器的可设置组合。

Table 43.18 ADADC寄存器的可设置组合

平均模式选择 (AVEE)	转换时间				
	1-time	2-times	3-times	4-times	16-times
1'b0	✓	✓	✓	✓	✓
1'b1	✓	✓	—	✓	—

Note: :可选择 —:不可选择

ADC[2:0]位（加法平均计数选择）

ADC[2:0]位设置选择了AD转换和加法平均模式的所有通道的加法计数，包括使用ADCSR.DBLANS[4:0]位在双触发模式中选择的通道。该计数也适用于温度传感器输出和内部参考电压的AD转换。执行自诊断时(ADCER.DIAGM=1)，请勿将ADC[2:0]位设置为000b以外的任何值。

AVEE bit (Average Mode Select)

The AVEE bit selects addition or average mode in all channels for which A/D conversion and addition/average mode are selected, including the channels selected in double-trigger mode in the ADCSR.DBLANS[4:0] bits, temperature sensor output, internal reference voltage.

43.2.15 ADCER : A/D Control Extended Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADRFMT	—	—	—	DIAGM	DIAGLD	DIAGVAL[1:0]		—	—	ACE	—	—	ADPRC[1:0]		—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	These bits are read as 0. The write value should be 0.	R/W
2:1	ADPRC[1:0]	A/D Conversion Accuracy Specify 0 0: 12-bit accuracy 0 1: 10-bit accuracy 1 0: 8-bit accuracy 1 1: Setting prohibited	R/W
4:3	—	These bits are read as 0. The write value should be 0.	R/W
5	ACE	A/D Data Register Automatic Clearing Enable 0: Disable automatic clearing 1: Enable automatic clearing	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
9:8	DIAGVAL[1:0]	Self-Diagnosis Conversion Voltage Select 0 0: Setting prohibited when self-diagnosis is enabled 0 1: 0 volts 1 0: Reference voltage*1 × 1/2 1 1: Reference voltage*1	R/W
10	DIAGLD	Self-Diagnosis Mode Select 0: Select rotation mode for self-diagnosis voltage 1: Select mixed mode for self-diagnosis voltage	R/W
11	DIAGM	Self-Diagnosis Enable 0: Disable ADC12 self-diagnosis 1: Enable ADC12 self-diagnosis	R/W
14:12	—	These bits are read as 0. The write value should be 0.	R/W
15	ADRFMT	A/D Data Register Format Select 0: Select right-justified for the A/D data register format 1: Select left-justified for the A/D data register format	R/W

Note 1. The reference voltage refers to VREFH0 for unit 0 and to VREFH for unit 1.

ADPRC[1:0] bit (A/D Conversion Accuracy Specify)

The ADPRC[1:0] bits set the A/D conversion accuracy. Changing the A/D conversion accuracy also changes the bit width of valid data stored in the result register and the A/D conversion time. For details, see section 43.3.7. Analog Input Sampling and Scan Conversion Timesection 45.3.6, Analog Input Sampling and Scan Conversion Time. Only set the ADPRC[1:0] bits while the ADCSR.ADST bit is 0.

ACE bit (A/D Data Register Automatic Clearing Enable)

The ACE bit enables or disables automatic clearing (all 0) of the ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, or ADOCDR register after any of these registers is read by the CPU or DTC. Automatic clearing of the A/D data registers enables detection of failures that are not updated in the A/D data registers. For details, see section 43.3.8. Usage Example of A/D Data Register Automatic Clearing Function.

AVEE位（平均模式选择）

AVEE位在选择了AD转换和加法平均模式的所有通道中选择加法或平均模式，包括在ADCSR.DBLANS[4:0]位中选择的双触发模式的通道、温度传感器输出、内部参考电压.

43.2.15 ADCER:AD控制扩展寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x00E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADRFMT	—	—	—	DIAGM	DIAGLD	DIAGVAL[1:0]		—	—	ACE	—	—	ADPRC[1:0]		—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	这些位被读取为0。写入值应为0。	R/W
2:1	ADPRC[1:0]	AD转换精度指定 00：12位精度01：10位精度10：8位精度11：禁止设置	R/W
4:3	—	这些位被读取为0。写入值应为0。	R/W
5	ACE	AD数据寄存器自动清零使能 0：关闭自动清零1：开启自动清零	R/W
7:6	—	这些位被读取为0。写入值应为0。	R/W
9:8	DIAGVAL[1:0]	自诊断转换电压选择 00：自诊断有效时禁止设置01：0伏特10：参考电压*1×1211：参考电压*1	R/W
10	DIAGLD	自诊断模式选择 0：自诊断电压选择旋转模式1：自诊断电压选择混合模式	R/W
11	DIAGM	Self-Diagnosis Enable 0：禁用ADC12自诊断1：启用ADC12自诊断	R/W
14:12	—	这些位被读取为0。写入值应为0。	R/W
15	ADRFMT	AD数据寄存器格式选择 0：AD数据寄存器格式选择右对齐1：AD数据寄存器格式选择左对齐	R/W

注1.参考电压是指单元0的VREFH0和单元1的VREFH。

ADPRC[1:0]位（AD转换精度指定）

ADPRC[1:0]位设置AD转换精度。更改AD转换精度也会更改存储在结果寄存器中的有效数据的位宽和AD转换时间。详见43.3.7节。模拟输入采样和扫描转换时间第45.3.6节，模拟输入采样和扫描转换时间。只设置

ADPRC[1:0]位，而ADCSR.ADST位为0。

ACE位（AD数据寄存器自动清除使能）

ACE位启用或禁用ADDRy、ADRD、ADDBLDR、ADDBLDRA、
在CPU或DTC读取这些寄存器中的任何一个之后，ADDBLDRB、ADTSDR或ADOCDR寄存器。自动清除AD数据寄存器可以检测未在AD数据寄存器中更新的故障。详见43.3.8节。AD数据寄存器自动清除功能的使用示例。

RA生态工作室

DIAGVAL[1:0] bits (Self-Diagnosis Conversion Voltage Select)

The DIAGVAL[1:0] bits select the voltage value used in self-diagnosis fixed voltage mode. For details, see the DIAGLD bit description.

Do not execute self-diagnosis by setting the DIAGLD bit to 1 when the DIAGVAL[1:0] bits are set to 00b.

DIAGLD bit (Self-Diagnosis Mode Select)

The DIAGLD bit selects whether the three voltage values are rotated or the fixed voltage is used in self-diagnosis.

Setting the DIAGLD bit to 0 selects conversion of the voltages in rotation mode, where 0 V, the reference voltage × 1/2, and the reference voltage are converted, in that order. After reset and when self-diagnosis voltage rotation mode is selected, self-diagnosis is executed from 0 V. The self-diagnosis voltage value does not return to 0 V when scan conversion completes. When scan conversion is restarted, rotation starts at the voltage value following the previous value.

Setting the DIAGLD bit to 1 selects fixed voltage, in which the fixed voltage specified in the ADCER.DIAGVAL[1:0] bits is converted. If fixed mode is switched to rotation mode, rotation starts at the fixed voltage value.

Only set the DIAGLD bit when the ADCSR.ADST bit is 0.

DIAGM bit (Self-Diagnosis Enable)

The DIAGM bit enables or disables self-diagnosis.

Self-diagnosis is used to detect a failure of the ADC12. In self-diagnosis mode, one of the three voltage values (0 V, the reference voltage × 1/2, or the reference voltage) is converted. When conversion completes, information on the converted voltage and the conversion result is stored into the A/D Self-Diagnosis Data Register (ADRD). The ADRD register can be read to determine whether the conversion result falls within the normal or abnormal range.

Self-diagnosis is executed once at the beginning of each scan, and one of the three voltages is converted. In double trigger mode (ADCSR.DBLE = 1), self-diagnosis (DIAGM = 0) is deselected. When self-diagnosis is selected in group scan mode, self-diagnosis is executed separately for group A and group B.

Only set the DIAGM bit when the ADCSR.ADST bit is 0.

ADRFMT bit (A/D Data Register Format Select)

The ADRFMT bit specifies flush-right or flush-left for data to be stored in the ADDRy, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, ADOCDR, ADCMPDR0/1, ADWINLLB, ADWINULB, or ADRD register.

Only set the ADRFMT bit when the ADCSR.ADST bit is 0.

43.2.16 ADSTRGR : A/D Conversion Start Trigger Select Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x010

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	TRSA[5:0]						—	—	TRSB[5:0]					
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	TRSB[5:0]	A/D Conversion Start Trigger Select for Group B Select the A/D conversion start trigger for group B in group scan mode.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
13:8	TRSA[5:0]	A/D Conversion Start Trigger Select Select the A/D conversion start trigger in single scan mode and continuous scan mode. In group scan mode, the A/D conversion start trigger for group A is selected.	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

TRSB[5:0] bits (A/D Conversion Start Trigger Select for Group B)

The TRSB[5:0] bits select the trigger to start scanning of the analog input selected in group B. The TRSB[5:0] bits must only be set in group scan mode and are not used in any other scan mode. For the scan conversion start trigger for group B,

DIAGVAL[1:0]位（自诊断转换电压选择）

DIAGVAL[1:0]位选择用于自诊断固定电压模式的电压值。有关详细信息，请参见DIAGLD位说明。

当DIAGVAL[1:0]位设置为00b时，不要通过将DIAGLD位设置为1来执行自诊断。

DIAGLD位（自诊断模式选择）

DIAGLD位选择是旋转三个电压值还是使用固定电压进行自诊断。

将DIAGLD位设置为0选择在旋转模式下转换电压，其中0V、参考电压×12和参考电压按此顺序转换。复位后，选择自诊断电压旋转模式时，从0V开始执行自诊断。扫描转换完成时，自诊断电压值不会返回到0V。重新开始扫描转换时，从前一个值之后的电压值开始旋转。

将DIAGLD位设置为1选择固定电压，其中转换ADCER.DIAGVAL[1:0]位中指定的固定电压。如果将固定模式切换到旋转模式，则从固定电压值开始旋转。

仅当ADCSR.ADST位为0时设置DIAGLD位。

DIAGM bit (Self-Diagnosis Enable)

DIAGM位启用或禁用自诊断。

自诊断用于检测ADC12的故障。在自诊断模式下，转换三个电压值（0V、参考电压×12或参考电压）之一。转换完成后，转换电压和转换结果的信息将存储到AD自诊断数据寄存器(ADRD)中。可以读取ADRD寄存器来确定转换结果是否在正常或异常范围内。

自诊断在每次扫描开始时执行一次，并转换三个电压之一。在双触发模式(ADCSR.DBLE=1)中，自诊断(DIAGM=0)被取消选择。在组扫描模式下选择自诊断时，对A组和B组分别执行自诊断。

仅当ADCSR.ADST位为0时设置DIAGM位。

ADRFMT位（AD数据寄存器格式选择）

ADRFMT位指定要存储在ADDRy、ADDBLDR、ADDBLDRA、ADDBLDRB、ADTSDR、ADOCDR、ADCMPDR01、ADWINLLB、ADWINULB或ADRD寄存器。

仅当ADCSR.ADST位为0时才设置ADRFMT位。

43.2.16 ADSTRGR:AD转换开始触发选择寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x010

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	TRSA[5:0]						—	—	TRSB[5:0]					
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	TRSB[5:0]	B组的AD转换开始触发选择 在组扫描模式下选择B组的AD转换启动触发。	R/W
7:6	—	这些位被读取为0。写入值应为0。	R/W
13:8	TRSA[5:0]	AD转换开始触发选择 在单次扫描模式和连续扫描模式中选择AD转换启动触发。在组扫描模式下，选择A组的AD转换启动触发。	R/W
15:14	—	这些位被读取为0。写入值应为0。	R/W

TRSB[5:0]位（B组的AD转换开始触发选择）

TRSB[5:0]位选择触发以开始扫描组B中选择的模拟输入。TRSB[5:0]位只能在组扫描模式下设置，不得用于任何其他扫描模式。对于B组的扫描转换开始触发，

setting a software trigger or an asynchronous trigger is prohibited. In group scan mode, set the TRSB[5:0] bits to a value other than 0x00 and set the ADCSR.TRGE bit to 1.

When group A is given priority in group scan mode, setting the ADGSPCR.GBRP bit to 1 allows group B to continuously operate in single scan mode. When setting the ADGSPCR.GBRP bit to 1, set the TRSB[5:0] bits to 0x3F. The issuance period for a conversion trigger must be more than or equal to the actual scan conversion time (t_{SCAN}). If the issuance period is less than t_{SCAN}, A/D conversion by the trigger might have no effect.

When the GPT module is selected as an A/D conversion start trigger, a delay for synchronization processing occurs. For details, see section 43.3.7. Analog Input Sampling and Scan Conversion Time.

Table 43.19 lists the A/D conversion startup sources selected in the TRSB[5:0] bits.

Table 43.19 Selection of A/D conversion start sources in the TRSB[5:0] bits

Source	Remarks	TRSB[5]	TRSB[4]	TRSB[3]	TRSB[2]	TRSB[1]	TRSB[0]
Trigger source deselected state	—	1	1	1	1	1	1
ELC_AD00 (unit 0) and ELC_AD10 (unit 1)	ELC	0	0	1	0	0	1
ELC_AD01 (unit 0) and ELC_AD11 (unit 1)	ELC	0	0	1	0	1	0
ELC_AD00 (unit 0) and ELC_AD10 (unit 1), ELC_AD01 (unit 0) and ELC_AD11 (unit 1)	ELC	0	0	1	0	1	1

TRSA[5:0] bits (A/D Conversion Start Trigger Select)

The TRSA[5:0] bits select the trigger to start A/D conversion in single scan mode and continuous scan mode, or the trigger to start scanning of group A analog inputs in group scan mode. When scanning is executed in group scan mode or double trigger mode, software trigger or asynchronous trigger is prohibited.

- When using a synchronous trigger (ELC), set the TRGE bit in the ADCSR register to 1 and set the EXTRG bit in the ADCSR register to 0.
- When using the asynchronous trigger (ADTRG0), set the TRGE bit in the ADCSR register to 1 and set the EXTRG bit in the ADCSR register to 1.
- Software trigger (ADCSR.ADST) is enabled regardless of the settings of the ADCSR.TRGE bit, the ADCSR.EXTRG bit, or the TRSA[5:0] bits.

The issuance period for a conversion trigger must be more than or equal to the actual scan conversion time (tSCAN). If the issuance period is less than tSCAN, A/D conversion by a trigger might have no effect.

Table 43.20 lists the A/D conversion start sources selected in the TRSA[5:0] bits.

Table 43.20 Selection of A/D activation sources in the TRSA[5:0] bits (1 of 2)

Source	Remarks	TRSA[5]	TRSA[4]	TRSA[3]	TRSA[2]	TRSA[1]	TRSA[0]
Trigger source deselected state	—	1	1	1	1	1	1
ADTRGn (n = 0, 1)	Input pin for the trigger	0	0	0	0	0	0

禁止设置软件触发或异步触发。在组扫描模式下，将TRSB[5:0]位设置为0x00以外的值，并将ADCSR.TRGE位设置为1。

当A组在组扫描模式下具有优先权时，将ADGSPCR.GBRP位设置为1允许B组在单次扫描模式下连续工作。将ADGSPCR.GBRP位设置为1时，将TRSB[5:0]位设置为0x3F。转换触发的发布周期必须大于或等于实际扫描转换时间(tSCAN)。如果发行周期小于tSCAN，触发器的AD转换可能无效。

WhentheGPTmoduleisselectedasanADconversionstarttrigger adelayforsynchronizationprocessingoccurs.详见43.3.7节。模拟输入采样和扫描转换时间。

表43.19列出了在TRSB[5:0]位中选择的AD转换启动源。

Table 43.19 在TRSB[5:0]位中选择AD转换起始源

Source	Remarks	TRSB[5]	TRSB[4]	TRSB[3]	TRSB[2]	TRSB[1]	TRSB[0]
触发源取消选择状态	—	1	1	1	1	1	1
ELC_AD00 (unit 0) and ELC_AD10 (unit 1)	ELC	0	0	1	0	0	1
ELC_AD01 (unit 0) and ELC_AD11 (unit 1)	ELC	0	0	1	0	1	0
ELC_AD00 (unit 0) and ELC_AD10 (unit 1), ELC_AD01 (unit 0) and ELC_AD11 (unit 1)	ELC	0	0	1	0	1	1

TRSA[5:0]位（AD转换开始触发选择）

TRSA[5:0]位选择触发以在单次扫描模式和连续扫描模式下启动AD转换，或在组扫描模式下选择启动A组模拟输入扫描的触发。在组扫描模式或双触发模式下执行扫描时，禁止软件触发或异步触发。

●使用同步触发(ELC)时，将ADCSR寄存器中的TRGE位设置为1，并将ADCSR寄存器中的EXTRG位设置为0。

●使用异步触发（ADTRG0）时，将ADCSR寄存器的TRGE位设置为1，并将ADCSR寄存器的EXTRG位设置为1。

●无论ADCSR.TRGE位、ADCSR.EXTRG位或TRSA[5:0]位的设置如何，都启用软件触发(ADCSR.ADST)。

转换触发的发布周期必须大于或等于实际扫描转换时间(tSCAN)。如果发行周期小于tSCAN，触发的AD转换可能无效。

表43.20列出了在TRSA[5:0]位中选择的AD转换起始源。

Table 43.20 在TRSA[5:0]位中选择AD激活源（1of2）

Bit	Symbol	Function	R/W
0	TSSAD	Temperature Sensor Output A/D-Converted Value Addition/Average Mode Select 0: Do not select addition/average mode for temperature sensor output. 1: Select addition/average mode for temperature sensor output.	R/W
1	OCSAD	Internal Reference Voltage A/D-Converted Value Addition/Average Mode Select 0: Do not select addition/average mode for internal reference voltage. 1: Select addition/average mode for internal reference voltage.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
8	TSSA	Temperature Sensor Output A/D Conversion Select 0: Disable A/D conversion of temperature sensor output 1: Enable A/D conversion of temperature sensor output	R/W
9	OCSA	Internal Reference Voltage A/D Conversion Select 0: Disable A/D conversion of internal reference voltage 1: Enable A/D conversion of internal reference voltage	R/W
10	TSSB	Temperature Sensor Output A/D Conversion Select for Group B 0: Disable A/D conversion of temperature sensor output 1: Enable A/D conversion of temperature sensor output	R/W
11	OCSB	Internal Reference Voltage A/D Conversion Select for Group B 0: Disable A/D conversion of internal reference voltage 1: Enable A/D conversion of internal reference voltage	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

TSSAD bit (Temperature Sensor Output A/D-Converted Value Addition/Average Mode Select)

When the TSSAD bit is set to 1, A/D conversion of the temperature sensor output is selected and performed successively the number of times specified in the ADC[2:0] bits in ADADC. The maximum addition count differs depending on the conversion accuracy (see section 43.2.6. ADRD : A/D Self-Diagnosis Data Register). When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is returned to the A/D Temperature sensor Data Register (ADTSDR). When the ADADC.AVEE bit is 1, the mean value is returned to ADTSDR.

Table 43.20 在TRSA[5:0]位中选择AD激活源（2个中的2个）

Source	Remarks	TRSA[5]	TRSA[4]	TRSA[3]	TRSA[2]	TRSA[1]	TRSA[0]

Bit field:	—	—	—	—	OCSB	TSSB	OCSA	TSSA	—	—	—	—	—	—	OCSAD	TSSAD
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TSSAD	温度传感器输出AD转换值加法平均模式选择 0：温度传感器输出不选择加法平均模式。1：温度传感器输出选择加法平均模式。	R/W
1	OCSAD	内部参考电压AD转换值加法平均模式选择 0：内部参考电压不选择加法平均模式。1：选择内部参考电压的加法平均模式。	R/W
7:2	—	这些位被读取为0。写入值应为0。	R/W
8	TSSA	温度传感器输出AD转换选择 0：禁止温度传感器输出AD转换1：使能温度传感器输出AD转换	R/W
9	OCSA	内部参考电压AD转换选择 0：禁止内部参考电压AD转换1：使能内部参考电压AD转换	R/W
10	TSSB	B组温度传感器输出AD转换选择 0：禁止温度传感器输出AD转换1：使能温度传感器输出AD转换	R/W
11	OCSB	B组的内部参考电压AD转换选择 0：禁止内部参考电压AD转换1：使能内部参考电压AD转换	R/W
15:12	—	这些位被读取为0。写入值应为0。	R/W

TSSAD位（温度传感器输出AD转换值加法平均模式选择）

当TSSAD位设置为1时，选择温度传感器输出的AD转换并连续执行ADADC中ADC[2:0]位指定的次数。最大加法计数因转换精度而异（参见第43.2.6节。ADRD：AD自诊断数据寄存器）。当ADADC.AVEE位为0时，通过加法（积分）获得的值返回到AD温度传感器数据寄存器(ADTSDR)。当ADADC.AVEE位为1时，平均值返回给ADTSDR。

Only set the TSSAD bit while the ADCSR.ADST bit is 0.

OCSAD bit (Internal Reference Voltage A/D-Converted Value Addition/Average Mode Select)

When the OCSAD bit is set to 1, A/D conversion of the internal reference voltage is selected and performed successively the number of times specified in the ADC[2:0] bits in ADADC. The maximum addition count differs depending on the conversion accuracy (see section 43.2.6. ADRD : A/D Self-Diagnosis Data Register). When the ADADC.AVEE bit is 0, the value obtained by addition (integration) is returned to the A/D Internal Reference Voltage Data Register (ADOCDR). When the ADADC.AVEE bit is 1, the mean value is returned to ADOCDR.

Only set the OCSAD bit while the ADCSR.ADST bit is 0.

TSSA bit (Temperature Sensor Output A/D Conversion Select)

The TSSA bit selects A/D conversion of the temperature sensor output for group A in single scan mode, continuous scan mode, or group scan mode. When A/D conversion of the temperature sensor output is selected and performed, set the ADCSR.DBLE bit to 0.

Only set the TSSA bit while the ADCSR.ADST bit is 0.

OCSA bit (Internal Reference Voltage A/D Conversion Select)

The OCSA bit selects A/D conversion of the internal reference voltage for group A in single scan mode, continuous scan mode, or group scan mode. When A/D conversion of the internal reference voltage is selected and performed, set the ADCSR.DBLE bit to 0.

Only set the OCSA bit while the ADCSR.ADST bit is 0. In addition, wait for 400 ns or more after the OCSA bit is set to 1 before starting A/D conversion.

TSSB bit (Temperature Sensor Output A/D Conversion Select for Group B)

The TSSB bit selects A/D conversion of the temperature sensor output for group B in group scan mode. Only set the TSSB bit while the ADCSR.ADST bit is 0. Do not set the TSSB bit to 1 while the TSSA bit is 1.

OCSB bit (Internal Reference Voltage A/D Conversion Select for Group B)

The OCSB bit selects A/D conversion of the internal reference voltage for group B in group scan mode. Only set the OCSB bit while the ADCSR.ADST bit is 0. Do not set the OCSB bit to 1 while the OCSA bit is 1. Moreover, start the A/D conversion after waiting for 400 ns or more after the OCSB bit is set to 1.

43.2.18 ADSSTRn/ADSSTRL/ADSSTRT/ADSSTRO : A/D Sampling State Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0E0 + 0x1 × n (n = 0 to 10, 12, 13, m = 0)
0x0E0 + 0x1 × n (n = 0 to 2, m = 1)
0x0DD (ADSSTRL)
0x0DE (ADSSTRT)
0x0DF (ADSSTRO)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SST[7:0]							
Value after reset:	0	0	0	0	1	0	1	1

Bit	Symbol	Function	R/W
7:0	SST[7:0]	Sampling Time Setting These bits set the sampling time in the range from 5 to 255 states.	R/W

The ADSSTRn register sets the sampling time for analog input.

The sampling time can be adjusted if the impedance of the analog input signal source is too high to secure sufficient sampling time, or if the ADCLK clock is slow. The set value indicates the time for one ADCLK cycle, and the required sampling time is specified by the voltage conditions. about detail, see section 53.5. ADC12 Characteristics

The lower limit of the sampling time setting depends on the frequency ratio:

仅在ADCSR.ADST位为0时设置TSSAD位。

OCSAD位（内部参考电压AD转换值加法平均模式选择）

当OCSAD位设置为1时，选择内部参考电压的AD转换，并按ADADC的ADC[2:0]位指定的次数连续执行。最大加法计数因转换精度而异（参见第43.2.6节。ADRD：AD自诊断数据寄存器）。当ADADC.AVEE位为0时，通过加法（积分）获得的值返回到AD内部参考电压数据寄存器（ADocDR）。当ADADC.AVEE位为1时，平均值返回给ADOCDR。

仅在ADCSR.ADST位为0时设置OCSAD位。

TSSA位（温度传感器输出AD转换选择）

TSSA位在单次扫描模式、连续扫描模式或组扫描模式下选择A组温度传感器输出的AD转换。WhenADconversionofthetemperaturesensoroutputisselectedandperformed settheADCSR.DBLEbitto0.

仅在ADCSR.ADST位为0时设置TSSA位。

OCSA位（内部参考电压AD转换选择）

OCSA位在单次扫描模式、连续扫描模式或组扫描模式下选择A组内部参考电压的AD转换。WhenADconversionoftheinternalreferencevoltageisselectedandperformed settheADCSR.DBLEbitto0.

仅在ADCSR.ADST位为0时设置OCSA位。此外，在OCSA位设置为1后等待400ns或更长时间，然后再开始AD转换。

TSSB位（B组的温度传感器输出AD转换选择）

TSSB位选择组扫描模式下B组温度传感器输出的AD转换。仅在ADCSR.ADST位为0时设置TSSB位。不要在TSSA位为1时将TSSB位设置为1。

OCSB位（B组的内部参考电压AD转换选择）

OCSB位选择组扫描模式下B组内部参考电压的AD转换。仅在ADCSR.ADST位为0时设置OCSB位。不要在OCSA位为1时将OCSB位设置为1。此外，在OCSB位设置为1后等待400ns或更长时间后开始AD转换.

43.2.18 ADSSTRnADSSTRLADSSTRTADSSTRO:AD采样状态寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0E0 + 0x1 × n (n = 0 to 10, 12, 13, m = 0)
0x0E0 + 0x1 × n (n = 0 to 2, m = 1)
0x0DD (ADSSTRL)
0x0DE (ADSSTRT)
0x0DF (ADSSTRO)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SST[7:0]							
重置后的值：	0	0	0	0	1	0	1	1

Bit	Symbol	Function	R/W
7:0	SST[7:0]	采样时间设置 这些位在5到255个状态范围内设置采样时间。	R/W

ADSSTRn寄存器设置模拟输入的采样时间。

如果模拟输入信号源的阻抗太高而无法保证足够的采样时间，或者如果ADCLK时钟很慢，则可以调整采样时间。设定值表示一个ADCLK周期的时间，所需的采样时间由电压条件指定。有关详细信息，请参阅第53.5节。ADC12特性

采样时间设置的下限取决于频率比：

- If the frequency ratio of PCLKA to PCLKC (ADCLK) = 1:1, 2:1, 4:1, or 8:1 the sampling time must be set to a value of more than 5 states
- If the frequency ratio of PCLKA to PCLKC (ADCLK) = 1:2 or 1:4, the sampling time must be set to a value of more than 6 states.

Table 43.21 shows the relationship between the A/D Sampling State Register and the associated channels. For details, see section 43.3.7. Analog Input Sampling and Scan Conversion Time.

Only set the SST[7:0] bits when the ADCSR.ADST bit is 0.

Table 43.21 Relationship between A/D sampling state register and associated channels

Bit name	Associated channels
ADSSTRn.SST[7:0] bits (n = 0 to 10, 12, 13(unit 0), 0 to 2(unit 1))*1	AN000 to AN010, AN012, AN013, AN100 to AN102
ADSSTRL.SST[7:0] bits	AN116 to AN128
ADSSTRT.SST[7:0] bits	Temperature sensor output
ADSSTRO.SST[7:0] bits	Internal reference voltage

Note 1. When the self-diagnosis function is selected, the sampling time set in the ADSSTR0.SST[7:0] bits is applied.

43.2.19 ADDISCR : A/D Disconnection Detection Control Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x07A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PCHG	ADNDIS[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ADNDIS[3:0]	Disconnection Detection Assist Setting 0x00: The disconnection detection assist function is disabled 0x01: Setting prohibited Others: The number of states for the discharge or precharge period.	R/W
4	PCHG	Precharge/discharge select 0: Discharge 1: Precharge	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

The ADDISCR register selects either precharge or discharge, and the period of precharge or discharge for the A/D disconnection detection assist function. Only set the ADDISCR register when the ADCSR.ADST bit is 0. When the temperature sensor output or internal reference voltage is converted, the A/D converter executes discharge automatically.

Disable the disconnection detection assist function if any of the following functions are used:

- The temperature sensor
- The internal reference voltage
- A/D self-diagnosis

ADNDIS[3:0] bits (Disconnection Detection Assist Setting)

The ADNDIS[3:0] bits specify the period of precharge or discharge. When ADNDIS[3:0] = 0000b, the disconnection detection assist function is disabled. Setting the ADNDIS[3:0] bits to 0001b is prohibited. Except when ADNDIS[3:0] = 0000b or 0001b, the specified value indicates the number of states for the period of precharge or discharge. When the ADNDIS[3:0] bits are set to any values other than 0000b or 0001b, the disconnection detection assistance function is enabled.

●如果PCLKA与PCLKC(ADCLK)的频率比=1:1、2:1、4:1或8:1，则必须将采样时间设置为超过5个状态的值

●如果PCLKA与PCLKC(ADCLK)的频率比=1:2或1:4，则必须将采样时间设置为6个以上状态的值。

表43.21显示了AD采样状态寄存器和相关通道之间的关系。详见43.3.7节。模拟输入采样和扫描转换时间。

仅当ADCSR.ADST位为0时设置SST[7:0]位。

Table 43.21 AD采样状态寄存器与相关通道的关系

位名称	关联频道
ADSSTRn.SST[7:0]位（n=0到10、12、13（单元0）、0到2（单元1））*1	AN000 to AN010, AN012, AN013, AN100 to AN102
ADSSTRL.SST[7:0] bits	AN116 to AN128
ADSSTRT.SST[7:0] bits	温度传感器输出
ADSSTRO.SST[7:0] bits	内部参考电压

注1.选择自诊断功能时，应用ADSSTR0.SST[7:0]位中设置的采样时间。

43.2.19 ADDISCR:AD断线检测控制寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x07A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PCHG	ADNDIS[3:0]			
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ADNDIS[3:0]	断线检测辅助设置 0x00：断线检测辅助功能禁用0x01：设置禁止 其他：放电或预充电期的状态数。	R/W
4	PCHG	Precharge/discharge select 0: Discharge 1: Precharge	R/W
7:5	—	这些位被读取为0。写入值应为0。	R/W

ADDISCR寄存器选择预充电或放电，以及AD断线检测辅助功能的预充电或放电周期。仅当ADCSR.ADST位为0时才设置ADDISCR寄存器。当温度传感器输出或内部参考电压转换时，AD转换器自动执行放电。

如果使用以下任何功能，请禁用断线检测辅助功能：

●温度传感器

●内部参考电压

- A/D self-diagnosis

ADNDIS[3:0]位（断线检测辅助设置）

ADNDIS[3:0]位指定预充电或放电周期。当ADNDIS[3:0]=0000b时，断线检测辅助功能被禁用。禁止将ADNDIS[3:0]位设置为0001b。除了ADNDIS[3:0]=0000b或0001b时，指定值表示预充电或放电期间的状态数。当ADNDIS[3:0]位设置为0000b或0001b以外的任何值时，将启用断线检测辅助功能。

PCHG bit (Precharge/discharge select)

The PCHG bit selects either precharge or discharge.

43.2.20 ADGSPCR : A/D Group Scan Priority Control Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x080

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GBRP	LGRRS	—	—	—	—	—	—	—	—	—	—	—	—	GBRSCN	PGS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PGS	Group Priority Operation Setting*1 0: Operate without group priority control. 1: Operate with group priority control.	R/W
1	GBRSCN	Lower-Priority Group Restart Setting (enabled only when PGS = 1 and reserved when PGS = 0.) 0: Disable rescanning of the group that was stopped in group priority operation 1: Enable rescanning of the group that was stopped in group priority operation.	R/W
13:2	—	These bits are read as 0. The write value should be 0.	R/W
14	LGRRS	Restart Channel Select Enabled only when PGS = 1 and GBRSCN = 1. 0: Start rescanning from the first channel for scanning 1: Start rescanning from the channel for which A/D conversion is not completed.	R/W
15	GBRP	Single Scan Continuous Start*2 (enabled only when PGS = 1 and reserved when PGS = 0.) 0: Single scan is not continuously activated. 1: Single scan for the group with the lower-priority is continuously activated.	R/W

Note 1. The ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode) before setting PGS to 1. Operation is not guaranteed if these bits are set to any other value.

Note 2. When the GBRP bit is set to 1, single scan is performed continuously for the group with the lower-priority regardless of the setting in the GBRSCN bit.

PGS bit (Group Priority Operation Setting)

Set the PGS bit to 1 to enable group priority operation.

The ADCSR.ADCS[1:0] bits must be set to 01b (group scan mode) before setting the PGS bit to 1. Operation is not guaranteed if the bits are set to any other value.

When the PGS bit is set to 0, a clear operation must be performed by software as described in section 43.6.3. Constraints on Stopping A/D Conversion. When the PGS bit is set to 1, use the settings described in section 43.3.4.3. Group Priority Operation.

GBRSCN bit (Lower-Priority Group Restart Setting)

The GBRSCN bit controls the restarting of scan operation in group priority operation.

When the GBRSCN bit is set to 1, if the scan operation of a lower-priority group is stopped by a trigger input of a priority group, the lower-priority group scanning is restarted on completion of the priority group scanning. If a trigger of a lower-priority group is input during scanning of the priority group, the lower-priority group scanning is started on completion of the priority group scanning.

When the GBRSCN bit is set to 0, triggers input during scanning are ignored. Set the GBRSCN bit while the ADCSR.ADST bit is 0.

LGRRS bit (Restart Channel Select)

This bit sets the channel from which rescanning is to be started in group priority operation. The setting of the LGRRS bit is valid when the PGS and GBRSCN bits are 1.

PCHG bit (Precharge/discharge select)

PCHG位选择预充电或放电。

43.2.20 ADGSPCR:AD组扫描优先级控制寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x080

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	GBRP	LGRRS	—	—	—	—	—	—	—	—	—	—	—	—	GBRSCN	PGS
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PGS	组优先操作设置*1 0：无组优先控制运行。1：以组优先控制运行。	R/W
1	GBRSCN	低优先级组重启设置（仅在PGS=1时启用，在PGS=0时保留。） 0：禁止重新扫描在组优先操作中停止的组1：允许重新扫描在组优先操作中停止的组。	R/W
13:2	—	这些位被读取为0。写入值应为0。	R/W
14	LGRRS	重启频道选择 仅当PGS=1且GBRSCN=1时启用。 0：从第一个扫描通道开始重新扫描1：从未完成AD转换的通道开始重新扫描。	R/W
15	GBRP	单次扫描连续启动*2 （仅在PGS=1时启用，在PGS=0时保留。） 0：单次扫描不连续激活。1：连续激活低优先级组的单次扫描。	R/W

注1.ADCSR.ADCS[1:0]位必须在PGS设置为1之前设置为01b（组扫描模式）。如果这些位设置为任何其他值，则无法保证操作。

注2.当GBRP位设置为1时，无论GBRSCN位的设置如何，都会对优先级较低的组连续执行单次扫描。

PGS位（组优先操作设置）

将PGS位设置为1以启用组优先操作。

在将PGS位设置为1之前，必须将ADCSR.ADCS[1:0]位设置为01b（组扫描模式）。如果这些位设置为任何其他值，则无法保证操作。

当PGS位设置为0时，必须通过软件执行清除操作，如第43.6.3节所述。约束停止AD转换。当PGS位设置为1时，使用第43.3.4.3节中描述的设置。团体优先Operation.

GBRSCN位（低优先级组重启设置）

GBRSCN位控制组优先操作中扫描操作的重新启动。

当GBRSCN位被设置为1时，如果低优先级组的扫描操作被优先级组的触发输入停止，则低优先级组扫描在优先级组扫描完成时重新开始。如果在优先级组扫描期间输入了较低优先级组的触发，则在完成优先级组扫描时开始较低优先级组扫描。

当GBRSCN位设置为0时，扫描期间的触发输入将被忽略。设置GBRSCN位，而ADCSR.ADST位为0。

LGRRS位（重启通道选择）

该位设置在组优先操作中要从哪个通道开始重新扫描。当PGS和GBRSCN位为1时，LGRRS位的设置有效。

If the LGRRS bit is 0, scanning of a lower-priority group that was stopped in group priority operation is restarted from the first channel after scanning of the priority group completes.

If the LGRRS bit is 1, scanning of a lower-priority group that was stopped in group priority operation is restarted (upon completion of scanning of the priority group) from the channel for which A/D conversion is not complete. If A/D conversion of the addition setting channel was not completed the specified number of times when scanning stopped, A/D conversion of the addition setting channel is performed again the specified number of times when scanning restarts.

Set the LGRRS bit while the ADCSR.ADST bit is 0.

GBRP bit (Single Scan Continuous Start)

The GBRP bit is set when a single scan operation is to be performed continuously on the group with the lower-priority.

Setting the GBRP bit to 1 starts a single scan of the group with the lower-priority. On completion of the scan, another single scan of the group with the lower-priority is started automatically. If scanning has been stopped during group priority operation, single scan of the group with the lower-priority is automatically restarted on completion of the A/D conversion of the priority group.

Before setting the GBRP bit to 1, disable input of a trigger for the lower-priority group. If the GBRP bit is set to 1, rescanning is performed only on the group with the lower-priority even if the GBRSCN bit is set to 0.

43.2.21 ADCMPCR : A/D Compare Function Control Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x090

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMPAIE	WCMPE	CMPBIE	—	CMPAE	—	CMPBE	—	—	—	—	—	—	—	CMPAB[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CMPAB[1:0]	Window A/B Composite Conditions Setting These bits are valid when both window A and window B are enabled (CMPAE = 1 and CMPBE = 1). 0 0: Output ADC12i_WCMPM (i = 0, 1) when window A OR window B comparison conditions are met. Otherwise, output ADC12i_WCMPUM (i = 0, 1). 0 1: Output ADC12i_WCMPM (i = 0, 1) when window A EXOR window B comparison conditions are met. Otherwise, output ADC12i_WCMPUM (i = 0, 1). 1 0: Output ADC12i_WCMPM (i = 0, 1) when window A AND window B comparison conditions are met. Otherwise, output ADC12i_WCMPUM (i = 0, 1). 1 1: Setting prohibited.	R/W
8:2	—	These bits are read as 0. The write value should be 0.	R/W
9	CMPBE	Compare Window B Operation Enable 0: Disable compare window B operation. Disable ADC12i_WCMPM (i = 0, 1) and ADC12i_WCMPUM (i = 0, 1) outputs. 1: Enable compare window B operation.	R/W
10	—	This bit is read as 0. The write value should be 0.	R/W
11	CMPAE	Compare Window A Operation Enable 0: Disable compare window A operation. Disable ADC12i_WCMPM (i = 0, 1) and ADC12i_WCMPUM (i = 0, 1) outputs. 1: Enable compare window A operation.	R/W
12	—	This bit is read as 0. The write value should be 0.	R/W
13	CMPBIE	Compare B Interrupt Enable 0: Disable ADC12i_CMPBI (i = 0, 1) interrupt when comparison conditions (window B) are met. 1: Enable ADC12i_CMPBI (i = 0, 1) interrupt when comparison conditions (window B) are met.	R/W

如果LGRRS位为0，则在优先级组扫描完成后，从第一个通道开始重新开始对在组优先级操作中停止的低优先级组的扫描。

如果LGRRS位为1，则从AD转换未完成的通道重新开始（在完成优先级组的扫描时）组优先操作中停止的低优先级组的扫描。如果在扫描停止时加法设置通道的AD转换未完成指定次数，则在扫描重新开始时再次执行加法设置通道的AD转换指定次数。

当ADCSR.ADST位为0时设置LGRRS位。

GBRP位（单次扫描连续启动）

当要对优先级较低的组连续执行单次扫描操作时，设置GBRP位。

将GBRP位设置为1开始对具有较低优先级的组进行单次扫描。扫描完成后，将自动开始对具有较低优先级的组进行另一次单次扫描。如果在组优先操作期间扫描已停止，则在优先组的AD转换完成时，将自动重新开始优先级较低的组的单次扫描。

在将GBRP位设置为1之前，禁用低优先级组的触发器输入。如果GBRP位设置为1，即使GBRSCN位设置为0，也仅对具有较低优先级的组执行重新扫描。

43.2.21 ADCMPCR:AD比较功能控制寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x090

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMPAIE	WCMPE	CMPBIE	—	CMPAE	—	CMPBE	—	—	—	—	—	—	—	CMPAB[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CMPAB[1:0]	窗口AB复合条件设置 这些位在窗口A和窗口B都启用时有效（CMPAE=1和CMPBE = 1). 00：当窗口AOR窗口B比较条件满足时，输出ADC12i_WCMPM(i=0 1)。否则，输出ADC12i_WCMPUM(i=0 1)。 01：当窗口AEXOR窗口B比较条件满足时，输出ADC12i_WCMPM(i=0 1)。否则，输出ADC12i_WCMPUM(i=0 1)。 10：当窗口A和窗口B比较条件满足时，输出ADC12i_WCMPM(i=0 1)。否则，输出ADC12i_WCMPUM(i=0 1)。 11：禁止设置。	R/W
8:2	—	这些位被读取为0。写入值应为0。	R/W
9	CMPBE	比较窗口B操作启用 0：禁止比较窗口B操作。 禁用ADC12i_WCMPM(i=0 1)和ADC12i_WCMPUM(i=0 1)输出。 1：启用比较窗口B操作。	R/W
10	—	该位读取为0。写入值应为0。	R/W
11	CMPAE	比较窗口A操作启用 0：禁止比较窗口A操作。 禁用ADC12i_WCMPM(i=0 1)和ADC12i_WCMPUM(i=0 1)输出。 1：启用比较窗口A操作。	R/W
12	—	该位读取为0。写入值应为0。	R/W
13	CMPBIE	比较B中断使能 0：当满足比较条件（窗口B）时，禁用ADC12i_CMPBI(i=0 1)中断。 1：当满足比较条件（窗口B）时，使能ADC12i_CMPBI(i=0 1)中断。	R/W

Bit	Symbol	Function	R/W
14	WCMPE	Window Function Setting 0: Disable window function Window A and window B operate as a comparator to compare the single value on the lower side with the A/D conversion result. 1: Enable window function Window A and window B operate as a comparator to compare the two values on the upper and lower sides with the A/D conversion result.	R/W
15	CMPAIE	Compare A Interrupt Enable 0: Disable ADC12i_CMPAI (i = 0, 1) interrupt when comparison conditions (window A) are met. 1: Enable ADC12i_CMPAI (i = 0, 1) interrupt when comparison conditions (window A) are met.	R/W

CMPAB[1:0] bits (Window A/B Composite Conditions Setting)

The CMPAB[1:0] bits are valid when both window A and window B are enabled (CMPAE = 1 and CMPBE = 1) in single scan mode. These bits specify the compare function match/mismatch event output conditions and monitoring conditions of ADWINMON.MONCOMB. Only set the CMPAB[1:0] bits while the ADCSR.ADST bit is 0.

CMPBE bit (Compare Window B Operation Enable)

The CMPBE bit enables or disables the compare window B operation. Set the CMPBE bit while the ADCSR.ADST bit is 0.

Set this bit to 0 before setting the following registers:

- A/D Channel Select Registers A0, A1, B0, B1 (ADANSA0, ADANSA1, ADANSB0, ADANSB1)
- OCSB, TSSB, OCSA, or TSSA bits in the A/D Conversion Extended Input Control Register (ADEXICR)
- CMPCHB[5:0] bits in the Window B Channel Select Register (ADCMPBNSR)

CMPAE bit (Compare Window A Operation Enable)

The CMPAE bit enables or disables the compare window A operation. Set the CMPAE bit while the ADCSR.ADST bit is 0.

Set this bit to 0 before setting the following registers:

- A/D Channel Select Registers A0, A1, B0, B1 (ADANSA0, ADANSA1, ADANSB0, ADANSB1)
- OCSB, TSSB, OCSA, or TSSA bits in the A/D Conversion Extended Input Control Register (ADEXICR)
- Window A Channel Select Registers 0 and 1 (ADCMPANSR0 and ADCMPANSR1)
- Window A Extended Input Select Register (ADCMPANSER)

CMPBIE bit (Compare B Interrupt Enable)

The CMPBIE bit enables or disables the ADC12i_CMPBI (i = 0, 1) interrupt output when the comparison conditions (window B) are met.

WCMPE bit (Window Function Setting)

The WCMPE bit enables or disables the window function. Set the WCMPE bit while the ADCSR.ADST bit is 0.

CMPAIE bit (Compare A Interrupt Enable)

The CMPAIE bit enables or disables the ADC12i_CMPAI (i = 0, 1) interrupt output when the comparison conditions (window A) are met.

43.2.22 ADCMPANSR0 : A/D Compare Function Window A Channel Select Register 0

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x094

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMPCHA15	CMPCHA14	CMPCHA13	CMPCHA12	CMPCHA11	CMPCHA10	CMPCHA09	CMPCHA08	CMPCHA07	CMPCHA06	CMPCHA05	CMPCHA04	CMPCHA03	CMPCHA02	CMPCHA01	CMPCHA00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14	WCMPE	窗口功能设置 0：关闭窗口功能 窗口A和窗口B用作比较器，将下侧的单个值与AD转换结果进行比较。 1：启用窗口功能 窗口A和窗口B用作比较器，将上下两个值与AD转换结果进行比较。	R/W
15	CMPAIE	比较中断使能 0：当满足比较条件（窗口A）时，禁止ADC12i_CMPAI(i=0 1)中断。 1：当满足比较条件（窗口A）时，使能ADC12i_CMPAI(i=0 1)中断。	R/W

CMPAB[1:0]位（窗口AB复合条件设置）

当窗口A和窗口B在单次扫描模式下启用（CMPAE=1和CMPBE=1）时，CMPAB[1:0]位有效。这些位指定比较函数匹配不匹配事件的输出条件和ADWINMON.MONCOMB的监视条件。仅在ADCSR.ADST位为0时设置CMPAB[1:0]位。

CMPBE位（比较窗口B操作使能）

CMPBE位启用或禁用比较窗口B操作。当ADCSR.ADST位为0时设置CMPBE位。

在设置以下寄存器之前将此位设置为0：

●AD通道选择寄存器A0、A1、B0、B1（ADANSA0、ADANSA1、ADANSB0、ADANSB1）

●AD转换扩展输入控制寄存器(ADEXICR)中的OCSB、TSSB、OCSA或TSSA位

●窗口B通道选择寄存器(ADCMPBNSR)中的CMPCHB[5:0]位

CMPAE位（比较窗口A操作使能）

CMPAE位启用或禁用比较窗口A操作。当ADCSR.ADST位为0时设置CMPAE位。

在设置以下寄存器之前将此位设置为0：

●AD通道选择寄存器A0、A1、B0、B1（ADANSA0、ADANSA1、ADANSB0、ADANSB1）

●AD转换扩展输入控制寄存器(ADEXICR)中的OCSB、TSSB、OCSA或TSSA位

●窗口A通道选择寄存器0和1（ADCMPANSR0和ADCMPANSR1）

●窗口A扩展输入选择寄存器(ADCMPANSER)

CMPBIE位（比较B中断允许）

当满足比较条件（窗口B）时，CMPBIE位启用或禁用ADC12i_CMPBI(i=0 1)中断输出。

WCMPE位（窗口功能设置）

WCMPE位启用或禁用窗口功能。当ADCSR.ADST位为0时设置WCMPE位。

CMPAIE位（比较中断允许）

当满足比较条件（窗口A）时，CMPAIE位启用或禁用ADC12i_CMPAI(i=0 1)中断输出。

43.2.22 ADCMPANSR0:AD比较功能窗口A通道选择寄存器0

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Bit	Symbol	Function	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

CMPLTSA bit (Compare Window A Temperature Sensor Output Comparison Condition Select)

The CMPLTSA bit specifies comparison conditions when the temperature sensor output is the target for the Window A comparison condition. When the temperature sensor output comparison result meets the set condition, the ADCMPSER.CMPSTTSA flag sets to 1 and a compare interrupt (ADC12i_CMPAI (i = 0, 1)) is generated.

CMPLOCA bit (Compare Window A Internal Reference Voltage Comparison Condition Select)

The CMPLOCA bit specifies comparison conditions when the internal reference voltage is the target for the Window A comparison condition. When the internal reference voltage comparison result meets the set condition, the ADCMPSER.CMPSTOCA flag sets to 1 and a compare interrupt (ADC12i_CMPAI (i = 0, 1)) is generated.

43.2.28 ADCMPDRn : A/D Compare Function Window A Lower-Side/Upper-Side Level Setting Register (n = 0, 1)

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x09C + (0x2 × n)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The ADCMPDRy (y = 0, 1) register specifies the reference data when the compare window A function is used. ADCMPDR0 sets the lower reference for window A, and ADCMPDR1 sets the upper reference for window A.

ADCMPDRy are read/write registers.

ADCMPDRy are writable even during A/D conversion. The reference data can be dynamically changed by rewriting register values during A/D conversion*1.

Set these registers so that the upper reference is not less than the lower reference (ADCMPDR1 ≥ ADCMPDR0). ADCMPDR1 are not used when the window function is disabled.

Note 1. The lower and the upper references are changed when each register is written. For example, when the upper reference value is changed and the lower reference value is being changed, the MCU compares the upper reference (after rewrite), and the lower reference (before rewrite) with the A/D conversion result. See Figure 43.5. If the comparison during the rewriting of these two references is erroneous, then rewrite these reference values when both ADCSR.ADST and the target Compare Window Operation Enable bit (ADCMPCR.CMPAE or ADCMPCR.CMPBE) are 0.

Bit	Symbol	Function	R/W
7:2	—	这些位被读取为0。写入值应为0。	R/W

CMPLTSA位（比较窗口A温度传感器输出比较条件选择）

当温度传感器输出是窗口A比较条件的目标时，CMPLTSA位指定比较条件。当温度传感器输出比较结果满足设置条件时，ADCMPSER.CMPSTTSA标志设置为1并产生比较中断(ADC12i_CMPAI(i=0 1))。

CMPLOCA位（比较窗口A内部参考电压比较条件选择）

当内部参考电压是窗口A比较条件的目标时，CMPLOCA位指定比较条件。当内部参考电压比较结果满足设置条件时，ADCMPSER.CMPSTOCA标志设置为1并产生比较中断(ADC12i_CMPAI(i=0 1))。

43.2.28 ADCMPDRn:AD比较功能窗口ALower-SideUpper-SideLevel设置寄存器(n=0 1)

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x09C + (0x2 × n)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ADCMPDRy(y=0 1)寄存器指定使用比较窗口A功能时的参考数据。ADCMPDDR0设置窗口A的下参考值，而ADCMPDR1设置窗口A的上参考值。

ADCMPDRy是读写寄存器。

ADCMPDRy即使在AD转换期间也是可写的。在AD转换*1期间，可以通过重写寄存器值来动态更改参考数据。

设置这些寄存器，使参考上限不小于参考下限(ADCMPDR1≥ADCMPDR0)。
禁用窗口功能时不使用ACMPDDR1。

注1.写入每个寄存器时，低位和高位参考值会发生变化。例如，当上参考值改变和下参考值改变时，MCU将上参考（重写后）和下参考（重写前）与AD转换结果进行比较。请参见图43.5。如果在重写这两个参考时比较错误，则在ADCSR.ADST和目标比较窗口操作使能位（ADCMPCR.CMPAE或ADCMPCR.CMPBE）都为0时重写这些参考值。

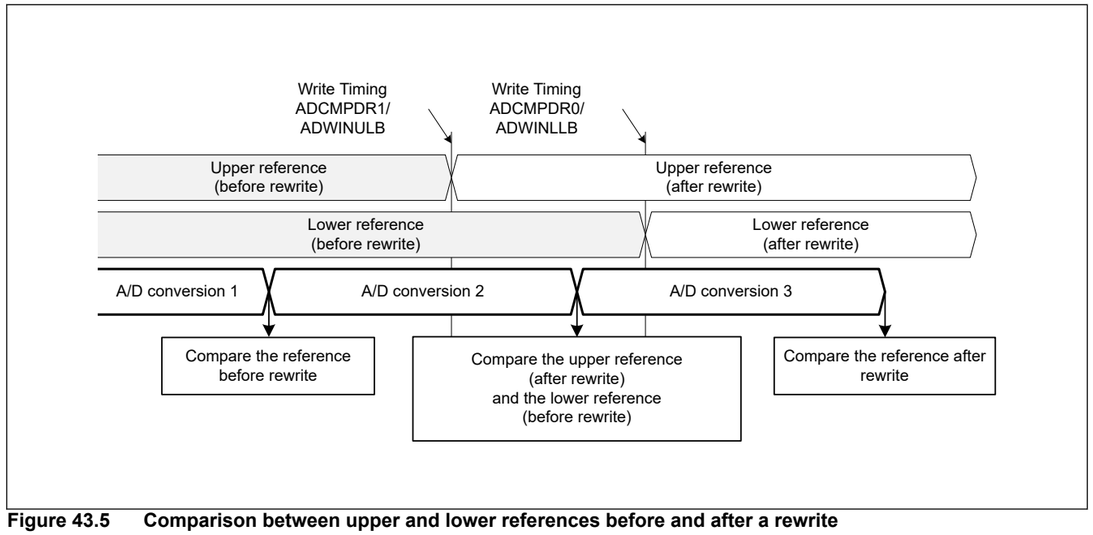

Figure 43.5 Comparison between upper and lower references before and after a rewrite

The ADCMPDRy registers use different formats depending on the following conditions:

- The value of A/D Data Register Format Select bit (flush-right or flush-left)
- The value of the A/D Conversion Accuracy Select bit (12-bit, 10-bit, 8-bit)
- The value of A/D-Converted Value Addition/Average Channel Select bits (A/D-converted value addition mode selected or not selected).

The data formats for each condition are shown as follows:

1. When A/D-converted value addition mode is not selected
   - Flush-right data with 12-bit accuracy — Lower 12 bits ([11:0]) are valid
   - Flush-right data with 10-bit accuracy — Lower 10 bits ([9:0]) are valid
   - Flush-right data with 8-bit accuracy — Lower 8 bits ([7:0]) are valid
   - Flush-left data with 12-bit accuracy — Upper 12 bits ([15:4]) are valid
   - Flush-left data with 10-bit accuracy — Upper 10 bits ([15:6]) are valid
   - Flush-left data with 8-bit accuracy — Upper 8 bits ([15:8]) are valid
2. When A/D-converted value addition mode is selected
   - Flush-right data with 12-bit accuracy — Lower 14 bits ([13:0]) are valid
   - Flush-right data with 10-bit accuracy — Lower 12 bits ([11:0]) are valid
   - Flush-right data with 8-bit accuracy — Lower 10 bits ([9:0]) are valid
   - Flush-left data with 12-bit accuracy — Upper 14 bits ([15:2]) are valid
   - Flush-left data with 10-bit accuracy — Upper 12 bits ([15:4]) are valid
   - Flush-left data with 8-bit accuracy — Upper 10 bits ([15:6]) are valid

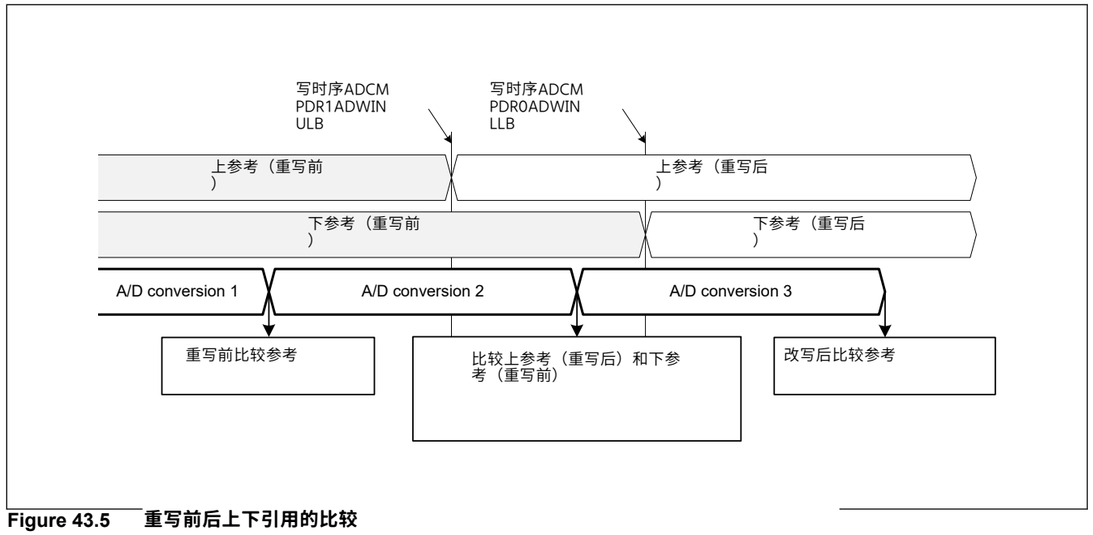

Figure 43.5 重写前后上下引用的比较

ADCMPDRy寄存器根据以下条件使用不同的格式：

●AD数据寄存器格式选择位的值（flush-rightorflush-left）

●AD转换精度选择位（12位、10位、8位）的值

●AD-ConvertedValueAdditionAverageChannelSelect位的值（选择或不选择AD-convertedvalue添加模式）。

每个条件的数据格式如下所示：

1.未选择AD转换值加法模式时

●12位精度的右冲洗数据—低12位([11:0])有效

●10位精度的右刷新数据—低10位([9:0])有效

●8位精度的右冲洗数据—低8位([7:0])有效

●12位精度的左刷新数据—高12位([15:4])有效

●10位精度的左刷新数据—高10位([15:6])有效

●8位精度的左刷新数据—高8位([15:8])有效

2.选择AD转换值加法模式时

●12位精度的右刷新数据—低14位([13:0])有效

●10位精度的右刷新数据—低12位([11:0])有效

●8位精度的右冲洗数据—低10位([9:0])有效

●12位精度的左刷新数据—高14位([15:2])有效

●10位精度的左刷新数据—高12位([15:4])有效

●8位精度的左刷新数据—高10位([15:6])有效

43.2.29 ADWINnLB : A/D Compare Function Window B Lower-Side/Upper-Side Level Setting Register (n = L, U)

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0A8 (n = L)
0x0AA (n = U)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

The ADWINULB and ADWINLLB registers specify the reference data when the compare window B function is used. ADWINLLB sets the lower reference for window B, and ADWINULB sets the upper reference for window B.

ADWINnLB are read/write registers.

ADWINnLB are writable even during A/D conversion. The reference data can be dynamically changed by rewriting register values during A/D conversion*1.

Set these registers so that the upper reference is not less than the lower reference (ADWINULB ≥ ADWINLLB). ADWINULB are not used when the window function is disabled.

Note 1. The lower and the upper references are changed when each register is written. For example, when the upper reference value is changed and the lower reference value is being changed, the MCU compares the upper reference (after rewrite), and the lower reference (before rewrite) with the A/D conversion result. See Figure 43.6. If the comparison during the rewriting of these two references is erroneous, then rewrite these reference values when both ADCSR.ADST and the target Compare Window Operation Enable bit (ADCMPCR.CMPAE or ADCMPCR.CMPBE) are 0.

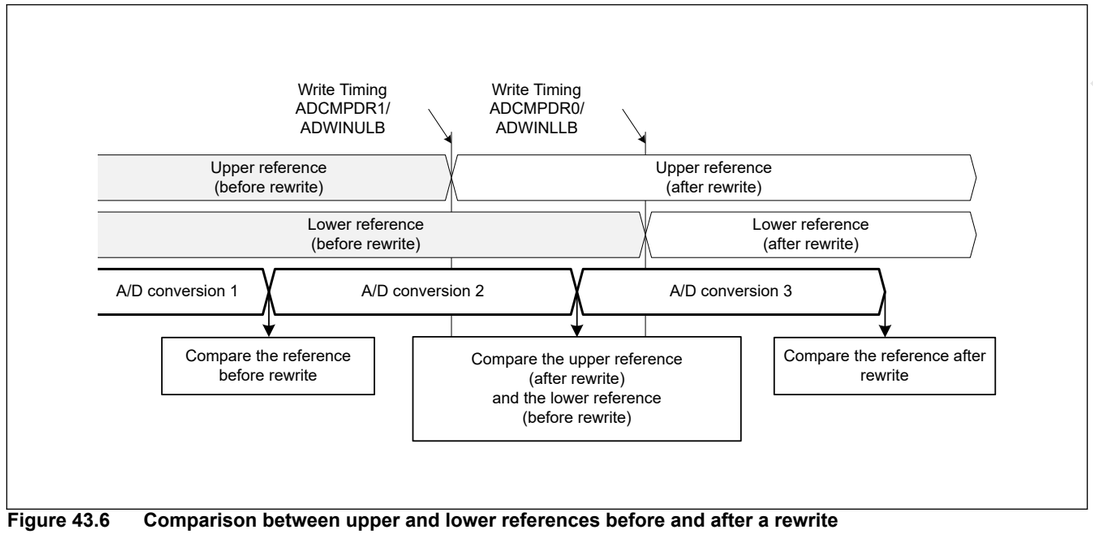

Figure 43.6 Comparison between upper and lower references before and after a rewrite

The ADWINnLB registers use different formats depending on the following conditions:

- The value of A/D Data Register Format Select bit (flush-right or flush-left)
- The value of the A/D Conversion Accuracy Select bit (12-bit, 10-bit, 8-bit)
- The value of A/D-Converted Value Addition/Average Channel Select bits (A/D-converted value addition mode selected or not selected).

The data formats for each condition are shown as follows:

1. When A/D-converted value addition mode is not selected

43.2.29 ADWINnLB:AD比较函数窗口BLower-SideUpper-SideLevel 设置寄存器(n=L U)

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0A8 (n = L)
0x0AA (n = U)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ADWINULB和ADWINLLB寄存器指定使用比较窗口B功能时的参考数据。
ADWINLLB设置窗口B的下参考，ADWINULB设置窗口B的上参考。

ADWINnLB是读写寄存器。

ADWINnLB即使在AD转换期间也是可写的。在AD转换*1期间，可以通过重写寄存器值来动态更改参考数据。

设置这些寄存器，使上限参考值不小于下限参考值(ADWINULB≥ADWINLLB)。
禁用窗口功能时不使用ADWINULB。

注1.写入每个寄存器时，低位和高位参考值会发生变化。例如，当上参考值改变和下参考值改变时，MCU将上参考（重写后）和下参考（重写前）与AD转换结果进行比较。请参见图43.6。如果在重写这两个参考时比较错误，则在ADCSR.ADST和目标比较窗口操作使能位（ADCMPCR.CMPAE或ADCMPCR.CMPBE）都为0时重写这些参考值。

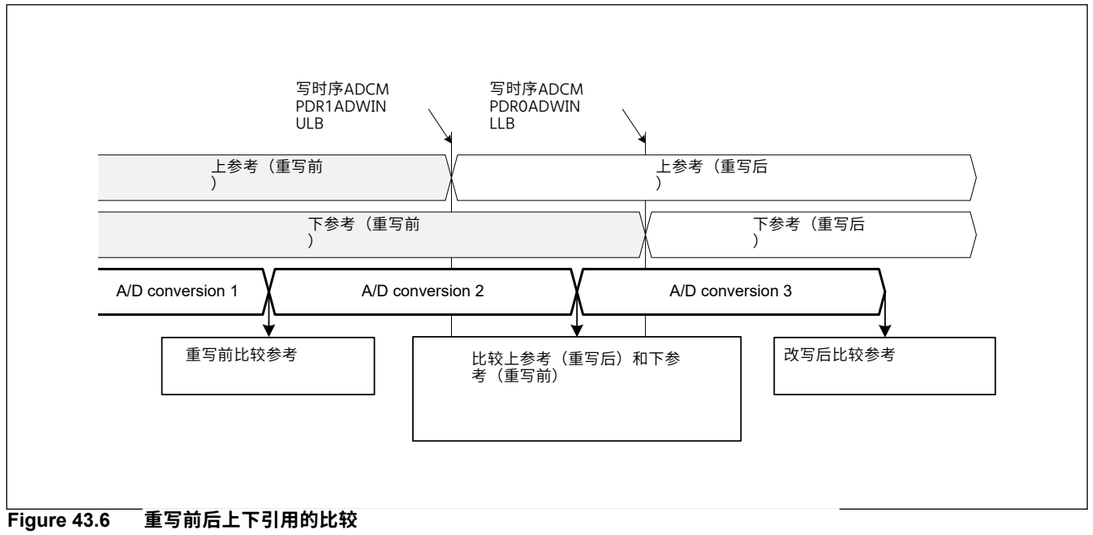

Figure 43.6 重写前后上下引用的比较

ADWINnLB寄存器根据以下条件使用不同的格式：

●AD数据寄存器格式选择位的值（flush-rightorflush-left）

●AD转换精度选择位（12位、10位、8位）的值

●AD-ConvertedValueAdditionAverageChannelSelect位的值（选择或不选择AD-convertedvalue添加模式）。

每个条件的数据格式如下所示：

1.未选择AD转换值加法模式时

- Flush-right data with 12-bit accuracy — Lower 12 bits ([11:0]) are valid
- Flush-right data with 10-bit accuracy — Lower 10 bits ([9:0]) are valid
- Flush-right data with 8-bit accuracy — Lower 8 bits ([7:0]) are valid
- Flush-left data with 12-bit accuracy — Upper 12 bits ([15:4]) are valid
- Flush-left data with 10-bit accuracy — Upper 10 bits ([15:6]) are valid
- Flush-left data with 8-bit accuracy — Upper 8 bits ([15:8]) are valid

2. When A/D-converted value addition mode is selected
   - Flush-right data with 12-bit accuracy — Lower 14 bits ([13:0]) are valid
   - Flush-right data with 10-bit accuracy — Lower 12 bits ([11:0]) are valid
   - Flush-right data with 8-bit accuracy — Lower 10 bits ([9:0]) are valid
   - Flush-left data with 12-bit accuracy — Upper 14 bits ([15:2]) are valid
   - Flush-left data with 10-bit accuracy — Upper 12 bits ([15:4]) are valid
   - Flush-left data with 8-bit accuracy — Upper 10 bits ([15:6]) are valid

43.2.30 ADCMPSR0 : A/D Compare Function Window A Channel Status Register 0

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0A0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMPSTCHA15	CMPSTCHA14	CMPSTCHA13	CMPSTCHA12	CMPSTCHA11	CMPSTCHA10	CMPSTCHA09	CMPSTCHA08	CMPSTCHA07	CMPSTCHA06	CMPSTCHA05	CMPSTCHA04	CMPSTCHA03	CMPSTCHA02	CMPSTCHA01	CMPSTCHA00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	CMPSTCHAn	Compare Window A Flag When Window A operation is enabled (ADCMPCR.CMPAE = 1b), these bits indicate the comparison result of channels to which Window A comparison conditions are applied. Bit 15 (CMPSTCHA15) is associated with ANm15 and bit 0 (CMPSTCHA00) is associated with ANm00. 0: Comparison conditions are not met. 1: Comparison conditions are met.	R/W

Note: n = 00 to 10, 12, 13(unit 0), 00 to 02(unit 1)

Note: Bits associated with non-existent pins are reserved. This bit is read as 0. The write value should be 0.

CMPSTCHAn flags (Compare Window A Flag)

The CMPSTCHAn flags indicate the comparison results for channels to which Window A comparison conditions are applied. When a comparison condition set in ADCMPLR0.CMPLCHAn is met at the end of A/D conversion, the associated CMPSTCHAn flag sets to 1. When the ADCMPCR.CMPAIE bit is 1, a compare interrupt request (ADC12i_CMPAI (i = 0, 1)) is generated when this flag sets to 1.

Writing 1 to the CMPSTCHAn flags is invalid.

[Setting condition]

- The condition set in ADCMPLR0.CMPLCHAn is met when ADCMPCR.CMPAE = 1.

[Clearing condition]

- Writing 0 after reading 1.

Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:2	—	这些位被读取为0。写入值应为0。	R/W

ADCMPSER寄存器存储比较功能窗口A的比较结果。

CMPSTTSA标志（比较窗口A温度传感器输出比较标志）

CMPSTTSA标志指示温度传感器输出比较结果。当比较条件设置在ADCMPLER.CMPLTSA在AD转换结束时满足，该标志设置为1。当ADCMPCR.CMPAIE位为1时，当该标志设置为1时产生比较中断请求(ADC12i_CMPAI(i=0 1))。

将1写入CMPSTTSA标志无效。

[Setting condition]

●当ADCMPCR.CMPAE=1时，满足ADCMPLER.CMPLTSA中设置的条件。

[Clearing condition]

●读1后写0。

CMPSTOCA标志（比较窗口A内部参考电压比较标志）

CMPSTOCA标志指示内部参考电压比较结果。当比较条件设置在ADCMPLER.CMPLOCA在AD转换结束时满足，该标志设置为1。当ADCMPCR.CMPAIE位为1时，当该标志设置为1时产生比较中断请求(ADC12i_CMPAI(i=0 1))。

将1写入CMPSTOCA标志无效。

[Setting condition]

●当ADCMPCR.CMPAE=1时，满足ADCMPLER.CMPLOCA中设置的条件。

[Clearing condition]

●读1后写0。

43.2.33 ADCMPBNSR:AD比较功能窗口B通道选择寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0A6

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CMPLB	—	CMPCHB[5:0]					
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CMPCHB[5:0]	Compare Window B Channel Select These bits select channels to be compared with the compare Window B conditions. **CMPCHB[5:0] / Unit 0 / Unit 1** 0x00 / AN000 / AN100 0x01 / AN001 / AN101 0x02 / AN002 / AN102 0x03 / AN003 / Do not select ⋮ / ⋮ / ⋮ 0x0A / AN010 / Do not select 0x0C / AN012 / Do not select 0x0D / AN013 / Do not select 0x10 / Do not select / AN116 0x11 / Do not select / AN117 ⋮ / ⋮ / ⋮ 0x16 / Do not select / AN128 0x20 / Temparature sensor 0x21 / Internal reference voltage 0x3F / Do not select Others / Setting prohibited	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	CMPLB	Compare Window B Comparison Condition Setting This bit sets comparison conditions for channels for Window B. The comparison conditions are shown in Figure 43.7. 0: When window function is disabled (ADCMPCR.WCMPE = 0): ADWINLLB value > A/D-converted value When window function is enabled (ADCMPCR.WCMPE = 1): A/D-converted value < ADWINLLB value, or ADWINULB value < A/D-converted value 1: When window function is disabled (ADCMPCR.WCMPE = 0): ADWINLLB value < A/D-converted value When window function is enabled (ADCMPCR.WCMPE = 1): ADWINLLB value < A/D-converted value < ADWINULB value	R/W

CMPCHB[5:0] bits (Compare Window B Channel Select)

The CMPCHB[5:0] bits specify the channels to be compared with the compare Window B conditions from AN000 to AN010, AN012, AN013, AN100 to AN102, AN116 to AN128, the temperature sensor, the internal reference voltage. The compare Window B function is enabled by specifying the hexadecimal number of the A/D conversion channel selected in the ADANSA0, ADANSA1, ADANSB0, ADANSB1 registers.

Set the CMPCHB[5:0] bits while the ADCSR.ADST bit is 0.

CMPLB bit (Compare Window B Comparison Condition Setting)

The CMPLB bit specifies the comparison conditions for channels for Window B. When the comparison result of an analog input meets the set condition, the associated ADCMPBSR.CMPSTB flag sets to 1 and a compare interrupt request (ADC12i_CMPBI (i = 0, 1)) is generated.

Bit	Symbol	Function	R/W
5:0	CMPCHB[5:0]	比较窗口B通道选择 这些位选择要与比较窗口B条件进行比较的通道。 **CMPCHB[5:0] / Unit 0 / Unit 1** 0x00 / AN000 / AN100 0x01 / AN001 / AN101 0x02 / AN002 / AN102 0x03 / AN003 / 不要选择 ⋮ / ⋮ / ⋮ 0x0A / AN010 / 不要选择 0x0C / AN012 / 不要选择 0x0D / AN013 / 不要选择 0x10 / 不要选择 / AN116 0x11 / 不要选择 / AN117 ⋮ / ⋮ / ⋮ 0x16 / 不要选择 / AN128 0x20 / Temparature sensor 0x21 / 内部参考电压 0x3F / 不要选择 Others / 禁止设定	R/W
6	—	该位读取为0。写入值应为0。	R/W
7	CMPLB	比较窗口B比较条件设置 该位设置窗口B的通道比较条件。比较条件如图43.7所示。 0：禁用窗口功能时（ADCMPCR.WCMPE=0）：ADWINLLB值>D转换值 启用窗口功能时(ADCMPCR.WCMPE=1)： D转换值<ADWINLLB值，或ADWINULB值<AD转换值 1：禁用窗口功能时（ADCMPCR.WCMPE=0）：ADWINLLB值<AD转换值 启用窗口功能时(ADCMPCR.WCMPE=1)：ADWINLLB值<AD转换值<ADWINULB值	R/W

CMPCHB[5:0]位（比较窗口B通道选择）

CMPCHB[5:0]位指定要与比较窗口B条件（从AN000到AN010、AN012、AN013、AN100到AN102、AN116到AN128、温度传感器、内部参考电压。通过指定在ADANSA0、ADANSA1、ADANSB0、ADANSB1寄存器中选择的AD转换通道的十六进制数来启用比较窗口B功能。

当ADCSR.ADST位为0时，设置CMPCHB[5:0]位。

CMPLB位（比较窗口B比较条件设置）

CMPLB位指定窗口B的通道比较条件。当模拟输入的比较结果满足设置条件时，相关的ADCMPBSR.CMPSTB标志设置为1，并发出比较中断请求(ADC12i_CMPBI(i=0 1))生成。

Compare conditions when the window function is disabled

CMPLB = 0

ADWINLLB value ≤ A/D converted value	Not met
ADWINLLB value > A/D converted value	Met

CMPLB = 1

ADWINLLB value < A/D converted value	Met
ADWINLLB value ≥ A/D converted value	Not met

Compare conditions when the window function is enabled

CMPLB = 0

A/D converted value > ADWINULB value	Met
ADWINLLB value ≤ A/D converted value ≤ ADWINULB value	Not met
A/D converted value < ADWINLLB value	Met

CMPLB = 1

A/D converted value ≥ ADWINULB value	Not met
ADWINLLB value <A/D converted value < ADWINULB value	Met
A/D converted value ≤ ADWINLLB value	Not met

43.2.34 ADCMPBSR:AD比较功能窗口B状态寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0AC

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CMPSTB
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CMPSTB	比较窗口B标志 当窗口B操作使能时（ADCMPCR.CMPBE=1），该位指示应用窗口B比较条件的通道的比较结果、温度传感器输出、内部参考电压。 0：不满足比较条件。1：满足比较条件 。	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

CMPSTB标志（比较窗口B标志）

CMPSTB标志指示应用窗口B比较条件的通道的比较结果、温度传感器输出、内部参考电压。当ADCMPBNSR.CMPLB中设置的比较条件满足时

RA生态工作室

at the end of A/D conversion, this flag sets to 1. When the ADCMPCR.CMPBIE bit is 1, a compare interrupt request (ADC12i_CMPBI (i = 0, 1)) is generated when this flag sets to 1.

Writing 1 to the CMPSTB flag is invalid.

[Setting condition]

- The condition set in ADCMPBNSR.CMPLB is met when ADCMPCR.CMPBE = 1.

[Clearing condition]

- Writing 0 after reading 1.

43.2.35 ADWINMON : A/D Compare Function Window A/B Status Monitor Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x08C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MONCMPB	MONCMPA	—	—	—	MONCOMB
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MONCOMB	Combination Result Monitor This bit indicates the combination result. This bit is valid when both Window A and Window B operations are enabled. 0: Window A/B composite conditions are not met. 1: Window A/B composite conditions are met.	R
3:1	—	These bits are read as 0.	R
4	MONCMPA	Comparison Result Monitor A 0: Window A comparison conditions are not met. 1: Window A comparison conditions are met.	R
5	MONCMPB	Comparison Result Monitor B 0: Window B comparison conditions are not met. 1: Window B comparison conditions are met.	R
7:6	—	These bits are read as 0.	R

MONCOMB bit (Combination Result Monitor)

The read-only MONCOMB bit indicates the combined result of comparison condition results A and B based on the combination condition set in the ADCMPCR.CMPAB[1:0] bits.

[Setting condition]

- The combined result meets the combination condition set in the ADCMPCR.CMPAB[1:0] bits when ADCMPCR.CMPAE = 1 and ADCMPCR.CMPBE = 1.

[Clearing conditions]

- The combined result does not meet the combination condition set in the ADCMPCR.CMPAB[1:0] bits.
- ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0.

MONCMPA bit (Comparison Result Monitor A)

The read-only MONCMPA bit is read as 1 when the A/D-converted value of the Window A target channel meets the condition set in ADCMPLR0/ADCMPLR1 and ADCMPLER. Otherwise, it is read as 0.

[Setting condition]

- The A/D-converted value meets the condition set in the ADCMPLR0/ADCMPLR1 and ADCMPLER registers when ADCMPCR.CMPAE = 1.

[Clearing conditions]

在AD转换结束时，该标志设置为1。当ADCMPCR.CMPBIE位为1时，当该标志设置为1时产生比较中断请求(ADC12i_CMPBI(i=0 1))。

将1写入CMPSTB标志无效。

[Setting condition]

●当ADCMPCR.CMPBE=1时，满足ADCMPBNSR.CMPLB中设置的条件。

[Clearing condition]

●读1后写0。

43.2.35 ADWINMON:AD比较功能窗口AB状态监视器寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x08C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MONCMPB	MONCMPA	—	—	—	MONCOMB
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MONCOMB	组合结果监视器 该位指示组合结果。该位在WindowA和Window都有效B操作已启用。 0：不满足窗口AB合成条件。1：满足窗口AB复合条件。	R
3:1	—	这些位读为0。	R
4	MONCMPA	比较结果监视器A 0：不满足窗口A比较条件。1：满足窗口A比较条件。	R
5	MONCMPB	比较结果监视器B 0：不满足窗口B比较条件。1：满足窗口B比较条件。	R
7:6	—	这些位读为0。	R

MONCOMB位（组合结果监视器）

只读MONCOMB位指示比较条件结果A和B基于ADCMPCR.CMPAB[1:0]位中设置的组合条件的组合结果。

[Setting condition]

●当ADCMPCR.CMPAE=1且ADCMPCR.CMPBE=1时，合并结果满足ADCMPCR.CMPAB[1:0]位中设置的合并条件。

[Clearing conditions]

●合并结果不满足ADCMPCR.CMPAB[1:0]位设置的合并条件。

- ADCMPCR.CMPAE = 0 or ADCMPCR.CMPBE = 0.

MONCMPA位（比较结果监视器A）

当窗口A目标通道的AD转换值满足ADCMPLR0ADCMPLR1和ADCMPLER中设置的条件时，只读MONCMPA位被读取为1。否则，读为0。

[Setting condition]

●当ADCMPCR.CMPAE=1时，AD转换后的值满足ADCMPLR0ADCMPLR1和ADCMPLER寄存器中设置的条件。

[Clearing conditions]

- The A/D-converted value does not meet the condition set in the ADCMPLR0/ADCMPLR1 and ADCMPLER registers when ADCMPCR.CMPAE = 1.
- ADCMPCR.CMPAE = 0 (automatically cleared when the ADCMPCR.CMPAE value changes from 1 to 0).

MONCMPB bit (Comparison Result Monitor B)

The read-only MONCMPB bit is read as 1 when the A/D-converted value of the Window B target channel meets the condition set in the ADCMPBNSR.CMPLB bit. Otherwise, it is read as 0.

[Setting condition]

- The A/D-converted value meets the condition set in ADCMPBNSR.CMPLB when ADCMPCR.CMPBE = 1.

[Clearing conditions]

- The A/D-converted value does not meet the condition set in ADCMPBNSR.CMPLB when ADCMPCR.CMPBE = 1.
- ADCMPCR.CMPBE = 0 (automatically cleared when the ADCMPCR.CMPBE value changes from 1 to 0).

43.2.36 ADBUFEN : A/D Data Buffer Enable Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0D0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BUFEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUFEN	Data Buffer Enable 0: The data buffer is not used. 1: The data buffer is used.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

The ADBUFEN register sets whether to enable the data buffer.

BUFEN bit (Data Buffer Enable)

This bit enables the use of the data buffer.

When BUFEN = 1b, A/D conversion result (addition result) other than self-diagnosis result is stored in ADBUFn.

Disable the data storage operation (BUFEN = 0b) before reading ADBUFPTR.

Do not use the data buffer for data duplexing, or group scan.

43.2.37 ADBUFPTR : A/D Data Buffer Pointer Register

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0D2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PTROVF	BUFPTR[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	BUFPTR[3:0]	Data Buffer Pointer These bits indicate the number of data buffer to which the next A/D converted data is transferred.	R/W

●ADCMPCR.CMPAE=1时，AD转换后的值不满足ADCMPLR0ADCMPLR1和ADCMPLER寄存器中设置的条件。

●ADCMPCR.CMPAE=0（ADCMPCR.CMPAE值从1变为0时自动清零）。

MONCMPB位（比较结果监视器B）

当窗口B目标通道的AD转换值满足ADCMPBNSR.CMPLB位中设置的条件时，只读MONCMPB位被读取为1。否则，读为0。

[Setting condition]

●当ADCMPCR.CMPBE=1时，AD转换后的值满足ADCMPBNSR.CMPLB中设置的条件。

[Clearing conditions]

●ADCMPCR.CMPBE=1时，AD转换后的值不满足ADCMPBNSR.CMPLB中设置的条件。

●ADCMPCR.CMPBE=0（ADCMPCR.CMPBE值从1变为0时自动清零）。

43.2.36 ADBUFEN:AD数据缓冲器使能寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0D0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BUFEN
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUFEN	数据缓冲区启用 0：不使用数据缓冲区。1：使用数据缓冲区。	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

ADBUFEN寄存器设置是否启用数据缓冲区。

BUFEN位（数据缓冲器使能）

该位使能数据缓冲区的使用。

BUFEN=1b时，ADBUFn中存储自诊断结果以外的AD转换结果（加法结果）。

在读取ADBUFPTR之前禁用数据存储操作(BUFEN=0b)。

不要将数据缓冲区用于数据双工或组扫描。

43.2.37 ADBUFPTR:AD数据缓冲区指针寄存器

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0D2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PTROVF	BUFPTR[3:0]			
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	BUFPTR[3:0]	数据缓冲区指针 这些位指示下一个AD转换数据传输到的数据缓冲区的编号。	R/W

Bit	Symbol	Function	R/W
4	PTROVF	Pointer Overflow Flag 0: The data buffer pointer has not overflowed. 1: The data buffer pointer has overflowed.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

ADBUFPTR is a register that indicates the data buffer pointer and overflow status.

BUFPTR[3:0] bit (Data Buffer Pointer)

These bits indicate the number of data buffer to which the next A/D converted data is transferred.

When data has been transferred to data buffer 15, the pointer value becomes 0000b and the PTROVF bit is set to 1.

When the next data has been transferred, the data in data buffer 0 is overwritten.

Writing 00h to this register clears the value of these bits. Writing a value other than 00h is disabled.

PTROVF bit (Pointer Overflow Flag)

This bit indicates whether the data buffer pointer has overflowed. This bit is set to 1 when the pointer value becomes 0000b (overflow).

Writing 00h to this register clears this bit value. Writing a value other than 00h is disabled.

43.2.38 ADBUFn : A/D Data Buffer Registers n (n = 0 to 15)

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0B0 + 0x2 × n (n = 0 to 15))

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADBUFn															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADBUFn	Converted Value 15 to 0 Functions vary depending on the selected mode and accuracy. See Table 43.22 and Table 43.23.	R

ADBUFn registers are 16-bit read-only registers that sequentially store all A/D conversion results. The automatic clear function is not applied to these registers.

ADBUFn settings are the same as the A/D data register format settings. about details see section 1.2.1 ADDRn : A/D Data Registers n.

The following conditions determine the formats for data in the ADBUFn registers:

- Setting of the Register Format Select bit (ADCER.ADRFMT) (flush-left or flush-right)
- Setting of the Addition/Average Count Select bits (ADADC.ADC[2:0]) (1, 2, 3, 4, or 16 times)
- Setting of the Average Mode Enable bit (ADADC.AVEE) (addition or average).

This section describes the data formats for these conditions in different modes.

(1) When A/D-converted value addition/average mode is not selected

Table 43.22 shows the bit assignment for each accuracy.

Table 43.22 Bit assignment for each accuracy (1 of 2)

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Right-justified data with 12-bit accuracy	These bits are read as 0.				Converted Value 11 to 0: 12-bit A/D-converted value											

Bit	Symbol	Function	R/W
4	PTROVF	指针溢出标志 0：数据缓冲区指针没有溢出。1：数据缓冲区指针溢出。	R/W
7:5	—	这些位被读取为0。写入值应为0。	R/W

ADBUFPTR是指示数据缓冲区指针和溢出状态的寄存器。

BUFPTR[3:0]位（数据缓冲区指针）

这些位指示下一个AD转换数据传输到的数据缓冲区的编号。

当数据已传输到数据缓冲区15时，指针值变为0000b并且PTROVF位设置为1。

当下一个数据传输完毕后，数据缓冲区0中的数据将被覆盖。

向该寄存器写入00h会清除这些位的值。禁止写入00h以外的值。

PTROVF位（指针溢出标志）

该位指示数据缓冲区指针是否溢出。当指针值变为0000b（溢出）时，该位设置为1。

向该寄存器写入00h会清除该位值。禁止写入00h以外的值。

43.2.38 ADBUFn:AD数据缓冲寄存器n(n=0到15)

Base address: ADC12m = 0x4017_0000 + 0x0200 × m (m = 0, 1)

Offset address: 0x0B0 + 0x2 × n (n = 0 to 15))

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ADBUFn															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	ADBUFn	将值15转换为0 功能因所选模式和精度而异。请参见表43.22和表43.23。	R

ADBUFn寄存器是16位只读寄存器，顺序存储所有AD转换结果。自动清除功能不适用于这些寄存器。

ADBUFn设置与AD数据寄存器格式设置相同。有关详细信息，请参阅第1.2.1节ADDRn:ADData Registers n.

以下条件决定了ADBUFn寄存器中数据的格式：

●寄存器格式选择位(ADCER.ADRFMT)的设置（左对齐或右对齐）

●加法平均计数选择位(ADADC.ADC[2:0])的设置（1、2、3、4或16次）

●设置平均模式启用位(ADADC.AVEE)（加法或平均）。

本节介绍不同模式下这些条件的数据格式。

(1) 未选择AD转换值加法平均模式时

表43.22显示了每个精度的位分配。

Table 43.22 每个精度的位分配（1of2）

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
具有12位精度的右对齐数据	这些位读为0。				转换值11到0：12位AD转换值											

Table 43.22 Bit assignment for each accuracy (2 of 2)

Accuracy	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Left-justified data with 12-bit accuracy	Converted Value 11 to 0: 12-bit A/D-converted value												These bits are read as 0.			

(2) When A/D-converted value average mode is selected

A/D-converted value average mode can be selected when 2 or 4 times is specified in the A/D-converted value addition mode. When A/D converted value average mode is selected, This register indicatesThese registers indicate the mean of A/D-converted values on a specific channel. The value is stored in the A/D data register based on the setting of the A/D Data Register Format Select bit in the same way as for normal A/D conversion.

(3) When A/D-converted value addition mode is selected

For 12-bit, 10-bit, 8-bit accuracy, 1, 2, 3, or 4 times can be selected in the A/D-converted value addition mode. A/D conversion results are stored in the A/D data register as a 2-bit-extended value of the specified conversion accuracy.

For 12-bit accuracy, 16 times can also be selected in the A/D-converted value addition mode. In A/D-converted value addition mode, this register indicatesthese registers indicate the value that is obtained by adding A/D-converted values on a specific channel. A/D conversion results are stored in the A/D data register as a 4-bit-extended value of the specified conversion accuracy.

When A/D-converted value addition mode is selected, the value is stored in the A/D data register based on the settings of the A/D Data Register Format Select bits.

Table 43.23 shows the bit assignment for each accuracy.

Table 43.23 Bit assignment for each accuracy when A/D-converted value addition mode is selected

	When 16 conversion times is specified	Added Value 13 to 0: 14-bit sum of A/D conversion results														These bits are read as 0.	

43.3 Operation

43.3.1 Scanning Operation

In scanning, A/D conversion is performed sequentially on the analog inputs of the specified channels.

Scan conversion is performed in any of the three operating modes:

- Single scan mode
- Continuous scan mode
- Group scan mode

In single scan mode, one or more specified channels are scanned once. In continuous scan mode, one or more specified channels are scanned repeatedly until software sets the ADCSR.ADST bit to 0. In group scan mode, the selected channels in group A, B are scanned once after scan starts in response to the respective synchronous trigger.

In single scan mode and continuous scan mode, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n. In group scan mode, A/D conversion is performed for the ANn channels in group A selected in the ADANSA0 and ADANSA1 registers, and for the

43.3 Operation

43.3.1 扫描操作

扫描时，对指定通道的模拟输入依次进行AD转换。

扫描转换在以下三种操作模式中的任何一种中执行：

- ●单次扫描模式
- ●连续扫描模式
- ●组扫描模式

在单次扫描模式下，一个或多个指定通道被扫描一次。在连续扫描模式下，重复扫描一个或多个指定通道，直到软件将ADCSR.ADST位设置为0。在组扫描模式下，在扫描开始后对A、B组中选定的通道进行一次扫描，以响应相应的同步触发.

在单次扫描模式和连续扫描模式下，对选择的ANn通道进行AD转换
ADANSA0和ADANSA1寄存器，从编号n最小的通道开始。在组扫描模式下，对在ADANSA0和ADANSA1寄存器中选择的A组中的ANn通道执行AD转换，并为

RA生态工作

ANn channels in group B selected in the ADANSB0 and ADANSB1 registers, starting from the channel with the smallest number n.

When self-diagnosis is selected, it is executed once at the beginning of each scan and one of the three reference voltages is converted.

The temperature sensor output and internal reference voltage can be selected at the same time as the analog input of the channels, and A/D conversion is performed on the analog input of channels, temperature sensor output, and internal reference voltage, in that order.

Double trigger mode can be used with single scan mode or group scan mode. With double trigger mode enabled (ADCSR.DBLE = 1), A/D conversion data of a channel selected in the ADCSR.DBLANS[4:0] bits is duplicated only if the conversion is started by the synchronous trigger (ELC) selected in the ADSTRGR.TRSA[5:0] bits. In group scan mode, only group A can use double trigger mode.

In the extended operation of double trigger mode, the A/D conversion operation is generated from the synchronous trigger combination selected in the ADSTRGR.TRSA[5:0] bits. In addition to normal double trigger mode operation, A/ D conversion data with odd number trigger (ELC_AD00 (unit 0) and ELC_AD10 (unit 1)) is stored in A/D Data Duplexing Register A (ADDBLDRA), and A/D conversion data with even number trigger (ELC_AD01 (unit 0) and ELC_AD11 (unit 1)) is stored in A/D Data Duplexing Register B (ADDBLDRB). In the extended operation of double trigger mode, when one of the trigger combinations occurs at the same time, the data duplexing register settings for the specified triggers do not work, and A/D conversion data is stored in A/D Data Duplexing Register B (ADDBLDRB).

The ADC12 ignores a synchronous trigger that occurs during the A/D conversion started by another synchronous trigger.

43.3.2 Single Scan Mode

43.3.2.1 Basic Operation

In basic operation of single scan mode, A/D conversion is performed once on the analog input of the specified channels as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (ELC), or an asynchronous trigger input, A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register (ADDRy).
3. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated.
4. The ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically set to 0 when A/D conversion of all the selected channels completes. The ADC12 then enters a wait state.

在ADANSB0和ADANSB1寄存器中选择的B组中的ANn通道，从具有最小编号n的通道开始。

选择自诊断时，在每次扫描开始时执行一次，并转换三个参考电压之一。

温度传感器输出和内部参考电压可以与通道的模拟输入同时选择，通道的模拟输入、温度传感器输出和内部参考电压依次进行AD转换。

双触发模式可与单扫描模式或组扫描模式一起使用。启用双触发模式(ADCSR.DBLE=1)时，仅当转换由ADSTRGR中选择的同步触发(ELC)启动时，ADCSR.DBLANS[4:0]位中选择的通道的AD转换数据才会被复制.TRSA[5:0]位。在组扫描模式下，只有A组可以使用双触发模式。

在双触发模式的扩展操作中，ADSTRGR.TRSA[5:0]位中选择的同步触发组合产生AD转换操作。除了正常的双触发模式操作外，奇数触发的AD转换数据（ELC_AD00（单元0）和ELC_AD10（单元1））存储在AD数据双工寄存器A（ADDBLDRA）中，偶数触发的AD转换数据（ELC_AD01（单元0）和ELC_AD11（单元1））存储在AD数据双工寄存器B（ADDBLDRB）中。在双触发模式的扩展操作中，当其中一种触发组合同时发生时，指定触发的数据双工寄存器设置不起作用，AD转换数据存储在AD数据双工寄存器B（ADDBLDRB）中。

ADC12忽略由另一个同步触发启动的AD转换期间发生的同步触发。

43.3.2 单次扫描模式

43.3.2.1 基本操作

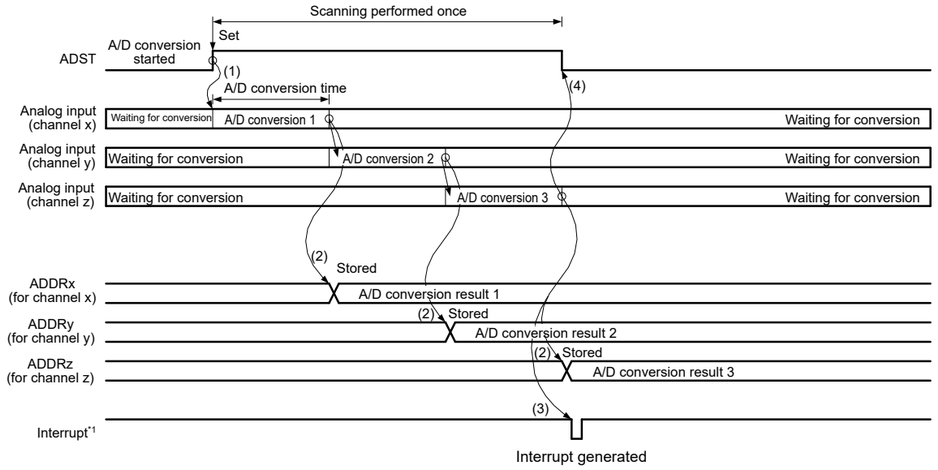
在单扫描模式的基本操作中，对指定通道的模拟输入进行一次AD转换，如下所示：

1.当通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，对在ADANSA0和ADANSA1中选择的ANn通道执行AD转换寄存器，从具有最小编号n的通道开始。

2.每次完成单个通道的AD转换，AD转换结果存储在相关的AD数据寄存器（ADDRy）中。

3.当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求。

4.ADST位在AD转换期间保持1（AD转换开始），当所有选定通道的AD转换完成时自动设置为0。ADC12然后进入等待状态。



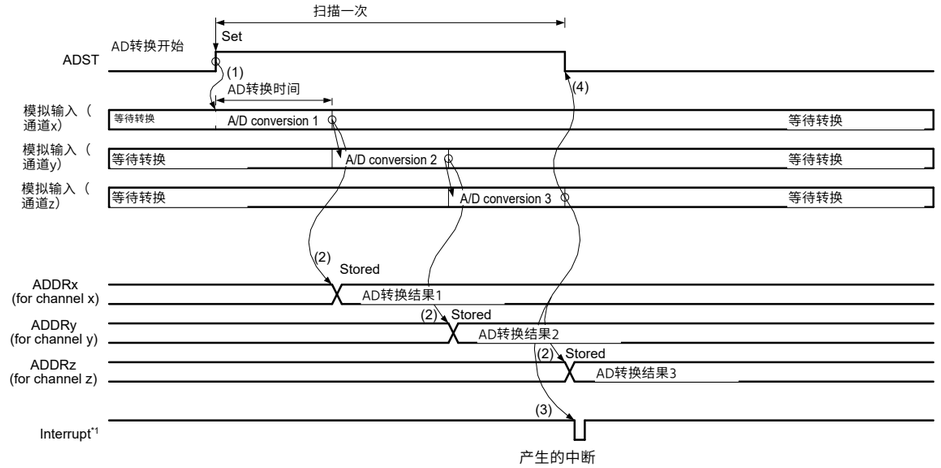
Note: x, y, and z (x < y < z) are the selected channel numbers by ADANSA0/1.
Note 1. ADC12i_ADI (i = 0, 1)

Figure 43.8 Example basic operation in single scan mode when the analog inputs (channel x to z) are selected

43.3.2.2 Channel Selection and Self-Diagnosis

When channels and self-diagnosis are selected, A/D conversion is first performed for the reference voltage VREFH0, VREFH (×0 ×1/2, or ×1), then A/D conversion is performed once on the analog input of the selected channels as follows:

1. A/D conversion for self-diagnosis is first started when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (ELC), or an asynchronous trigger input.
2. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D data register (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated.
5. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion and is automatically set to 0 when A/D conversion of all the selected channels completes. The ADC12 then enters a wait state.



Note: x、y和z(x<y<z)是ADANSA01选择的通道号。
Note 1. ADC12i_ADI (i = 0, 1)

Figure 43.8 选择模拟输入（通道x至z）时单次扫描模式下的基本操作示例

43.3.2.2 频道选择和自诊断

选择通道和自诊断时，首先对参考电压VREFH0进行AD转换，
VREFH(×0×12或×1)，然后在所选通道的模拟输入上执行一次AD转换，如下所示：

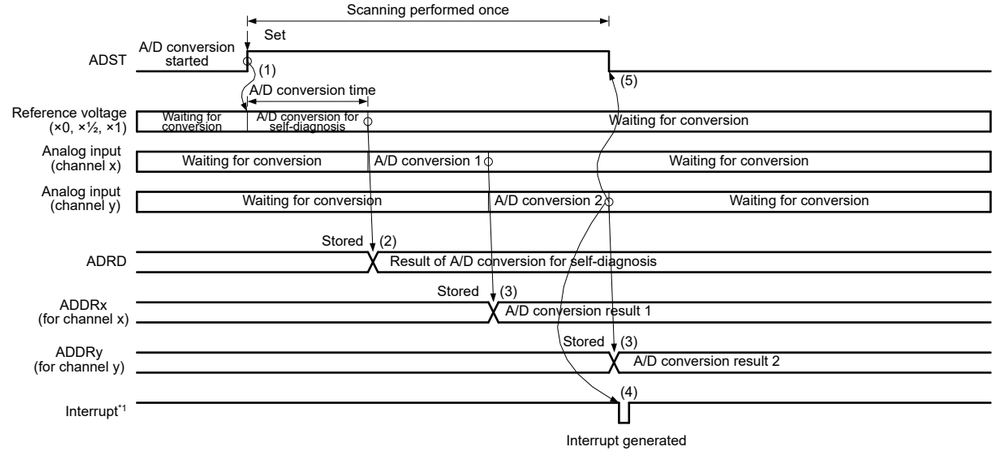
1.通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，首先启动用于自诊断的D转换。

2.当用于自诊断的AD转换完成时，AD转换结果存储在AD自诊断数据寄存器(ADRD)中。然后对在ADANSA0和ADANSA1寄存器中选择的ANn通道执行D转换，从编号最小的通道开始。

3.每次完成单个通道的AD转换，AD转换结果存储在相关的AD数据寄存器（ADDRy）中。

4.当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求。

5.ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在所有选定通道的AD转换完成时自动设置为0。ADC12然后进入等待状态。



Note: x and y (x < y) are the selected channel numbers by ADANSA0/1.
Note 1. ADC12i_ADI (i = 0, 1)

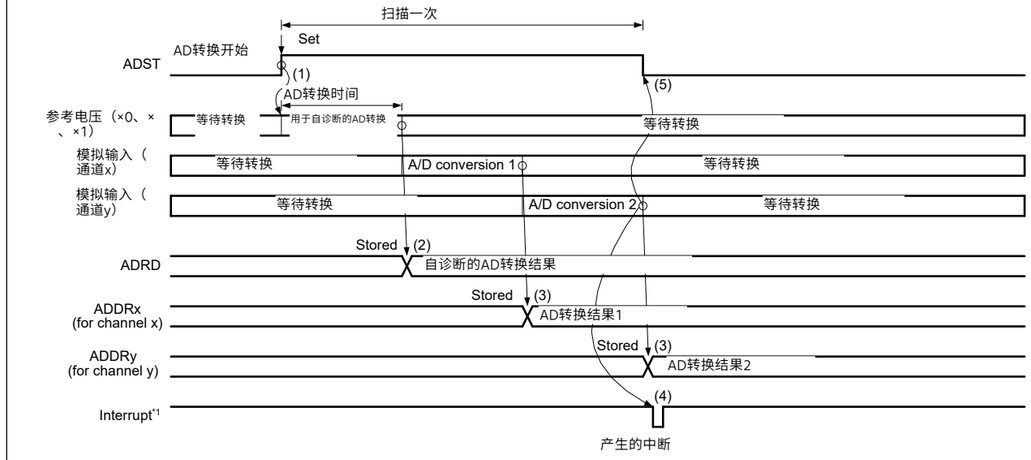
Figure 43.9 Example basic operation in single scan mode when the analog inputs (channel x and y) are selected with self- diagnosis

43.3.2.3 A/D conversion of temperature sensor output or internal reference voltage

When the channels and temperature sensor output or internal reference voltage are selected at the same time, A/D conversion is performed first on the analog input of the selected channels, and once on the temperature sensor output or internal reference voltage. When both temperature sensor output and internal reference voltage are selected, A/D conversion of the temperature sensor output and internal reference voltage is performed, in that order. With the channels deselected, selecting only the temperature sensor output or internal reference voltage is also possible.

The operation is as follows:

1. When a software trigger, synchronous trigger (ELC), or asynchronous trigger sets the ADCSR.ADST bit to 1 (A/D conversion start), A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. On completion of A/D conversion on the channels, the result is stored in the associated A/D Data Register y (ADDRy), and then A/D conversion of the temperature sensor output starts.
3. On completion of A/D conversion of the temperature sensor output, the result is stored in the associated A/D Temperature Sensor Data Register (ADTSDR), and then A/D conversion of the internal reference voltage starts.
4. On completion of A/D conversion of the internal reference voltage, the result is stored in the associated A/D Internal Reference Voltage Data Register (ADOCDR), and an ADC12i_ADI (i = 0, 1) interrupt request is generated (no register setting).
5. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically cleared to 0 on completion of A/D conversion. Then, the ADC12 enters a wait state.



Note: x和y(x<y)是ADANSA01选择的通道号。
Note 1. ADC12i_ADI (i = 0, 1)

Figure 43.9 使用自诊断选择模拟输入（通道x和y）时单次扫描模式下的基本操作示例

43.3.2.3 温度传感器输出或内部参考电压的AD转换

当同时选择通道和温度传感器输出或内部参考电压时，首先对所选通道的模拟输入进行AD转换，再对温度传感器输出或内部参考电压进行一次AD转换。当同时选择温度传感器输出和内部参考电压时，按顺序执行温度传感器输出和内部参考电压的AD转换。取消选择通道后，也可以仅选择温度传感器输出或内部参考电压。

操作如下：

1.当软件触发、同步触发(ELC)或异步触发将ADCSR.ADST位设置为1（AD转换开始）时，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从通道开始用最小的数n。

2.在通道上完成AD转换后，结果存储在相关的AD数据寄存器y(ADDRy)中，然后温度传感器输出的AD转换开始。

3.温度传感器输出的AD转换完成后，结果存储在相关的AD中
温度传感器数据寄存器(ADTSDR)，然后内部参考电压的AD转换开始。

4.内部参考电压的AD转换完成后，结果存储在相关的ADInternal
参考电压数据寄存器(AOCDR)，并产生一个ADC12i_ADI(i=0 1)中断请求（无寄存器设置）。

5.ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动清零。然后，ADC12进入等待状态。

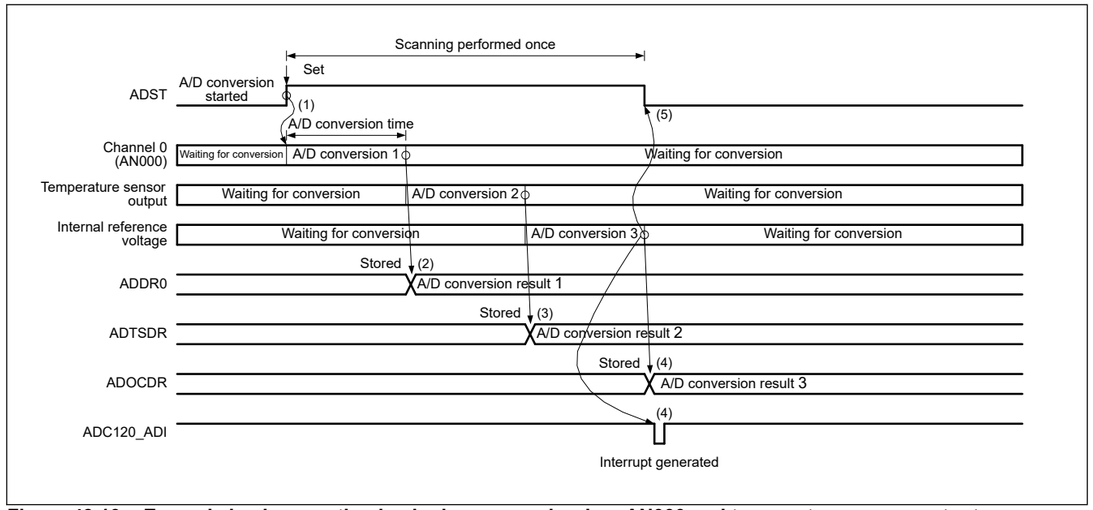


Figure 43.10 Example basic operation in single scan mode when AN000 and temperature sensor output or internal reference voltage are selected

43.3.2.4 A/D conversion in double-trigger mode

When double trigger mode is selected in single scan mode, two rounds of single scan operation started by a synchronous trigger (ELC) are performed in sequence.

Deselect self-diagnosis and set the temperature sensor output A/D conversion select bit (ADEXICR.TSSA and ADEXICR.TSSB) and the internal reference voltage A/D conversion select bit (ADEXICR.OCSA and ADEXICR.OCSB) to 0.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated in the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE bit to 1. When the ADCSR.DBLE bit is set to 1, channel selection using the ADANSA0 and ADANSA1 registers is invalid.

In double trigger mode, select a synchronous trigger (ELC) with the ADSTRGR.TRSA[5:0] bits. Additionally, set the ADCSR.EXTRG bit to 0 and the ADCSR.TRGE bit to 1. Do not use a software trigger.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a synchronous trigger input (ELC), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy).
3. The ADCSR.ADST bit is automatically set to 0 and the ADC12 enters a wait state. An ADC12i_ADI (i = 0, 1) interrupt request is not generated.
4. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by the second trigger input, A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
5. When A/D conversion completes, the result is stored in the A/D Data Duplexing Register (ADDBLDR), which is exclusively used in double-trigger mode.
6. An ADC12i_ADI (i = 0, 1) interrupt request is generated.
7. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion, and is automatically set to 0 when A/D conversion completes. Then the ADC12 enters a wait state.

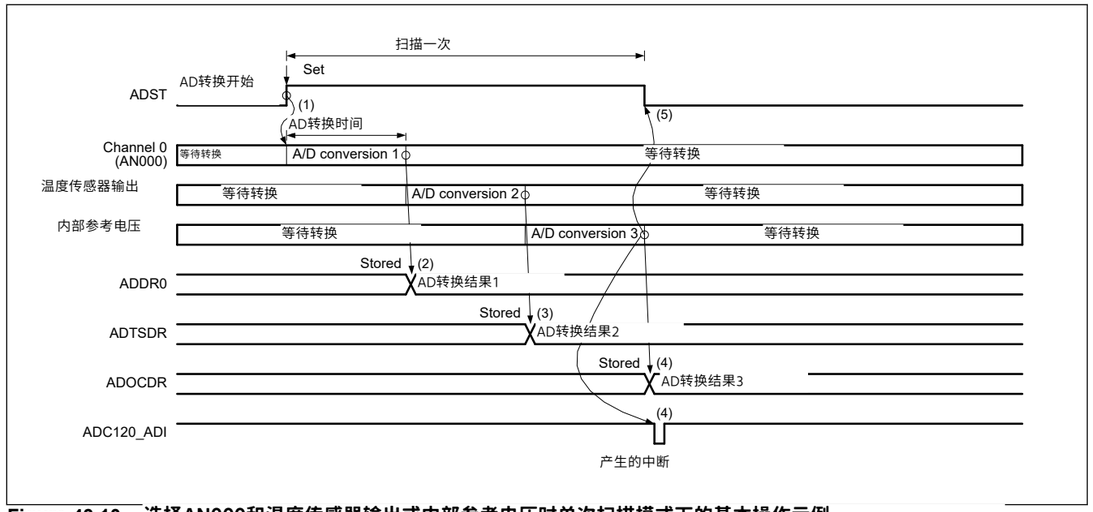

Figure 43.10 选择AN000和温度传感器输出或内部参考电压时单次扫描模式下的基本操作示例

43.3.2.4 双触发模式下的AD转换

在单扫描模式下选择双触发模式时，由同步触发(ELC)启动的两轮单扫描操作将依次执行。

取消选择自诊断并设置温度传感器输出AD转换选择位(ADEXICR.TSSA和ADEXICR.TSSB)和内部参考电压AD转换选择位(ADEXICR.OCSA和ADEXICR.OCSB)为0。

AD转换数据的复制通过在ADCSR.DBLANS[4:0]位并将ADCSR.DBLE位设置为1。当ADCSR.DBLE位设置为1时，使用ADANSA0和ADANSA1寄存器的通道选择无效。

在双触发模式下，使用ADSTRGR.TRSA[5:0]位选择同步触发(ELC)。此外，设置ADCSR.EXTRG位为0，ADCSR.TRGE位为1。不要使用软件触发。

操作如下：

1.当同步触发输入(ELC)将ADCSR.ADST位设置为1（AD转换开始）时，ADCSR.DBLANS[4:0]位中选择的单通道开始AD转换。

2.每次完成单个通道的AD转换，AD转换结果存储在相关的AD数据寄存器y(ADDRy)中。

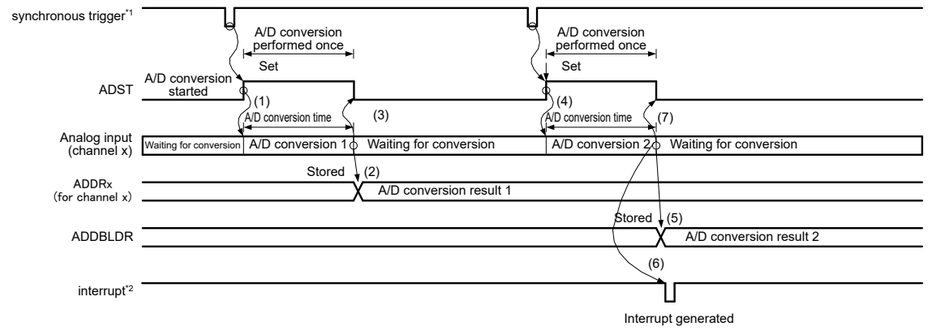
3.ADCSR.ADST位自动设置为0，ADC12进入等待状态。不会产生ADC12i_ADI(i=0 1)中断请求。

4.当第二个触发输入将ADCSR.ADST位设置为1（AD转换开始）时，AD转换在ADCSR.DBLANS[4:0]位中选择的单通道上开始。

5.当AD转换完成时，结果存储在AD数据双工寄存器(ADDBLDR)中，该寄存器专用于双触发模式。

6.产生一个ADC12i_ADI(i=0 1)中断请求。

7.ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动设置为0。然后ADC12进入等待状态。



Note: x is the selected channel number by ADANSA0/1.
Note 1. ELC_AD00 (unit 0) and ELC_AD10 (unit 1)/ELC_AD01 (unit 0) and ELC_AD11 (unit 1)
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.11 Example operation in single scan mode when double-trigger mode is selected and the analog input (channel x) is duplicated

43.3.2.5 Extended operations when double-trigger mode is selected

When double trigger mode is selected in single scan mode, and a synchronous trigger (ELC_AD00 (unit 0) and ELC_AD10 (unit 1)/ELC_AD01 (unit 0) and ELC_AD11 (unit 1)) is selected as the trigger for the start of A/D conversion, two rounds of single scan operation are performed.

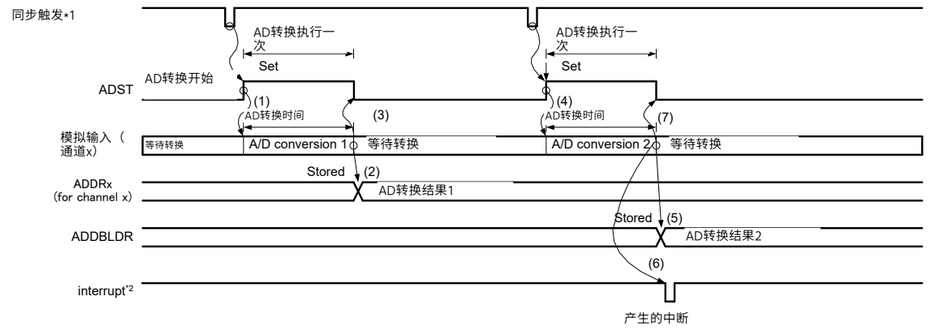
Deselect self-diagnosis and set the temperature sensor output A/D conversion select bit (ADEXICR.TSSA and ADEXICR.TSSB), and the internal reference voltage A/D conversion select bit (ADEXICR.OCSA and ADEXICR.OCSB) to 0.

Duplication of A/D conversion data is enabled by setting the channel number to be duplicated to the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE bit to 1. When the ADCSR.DBLE bit is set to 1, channel selection using the ADANSA0 and ADANSA1 registers is invalid.

In extended double trigger mode, select a synchronous trigger combination ELC_AD00 (unit 0) and ELC_AD10 (unit 1)/ ELC_AD01 (unit 0) and ELC_AD11 (unit 1) by setting the ADSTRGR.TRSA[5:0] bits to 0x0B, set the ADCSR.EXTRG bit to 0, and set the ADCSR.TRGE bit to 1. Do not use a software trigger.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a synchronous trigger input (ELC_AD00 (unit 0) and ELC_AD10 (unit 1)/ELC_AD01 (unit 0) and ELC_AD11 (unit 1)), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. When A/D conversion completes, the A/D conversion result is stored in the associated A/D Data Register (ADDRy) and in A/D Data Duplexing Register A (ADDBLDRA) or A/D Data Duplexing Register B (ADDBLDRB) when the ELC_ADi0 or ELC_ADi1 trigger is input respectively (i = 1).
3. The ADCSR.ADST bit is automatically set to 0 and the ADC12 enters a wait state. An ADC12i_ADI (i = 0, 1) interrupt request is not generated.
4. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by the second trigger (ELC_AD00 (unit 0) and ELC_AD10 (unit 1)/ELC_AD01 (unit 0) and ELC_AD11 (unit 1)), A/ D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
5. When A/D conversion completes, the A/D conversion result is stored in the A/D Data Duplexing Register (ADDBLDR) and in A/D Data Duplexing Register A (ADDBLDRA) or A/D Data Duplexing Register B (ADDBLDRB) when the ELC_ADi0 or ELC_ADi1 trigger is input respectively (i = 1).
6. An ADC12i_ADI (i = 0, 1) interrupt request is generated.



Note: x是ADANSA01选择的通道号。
注1.ELC_AD00（单元0）和ELC_AD10（单元1）ELC_AD01（单元0）和ELC_AD11（单元1）
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.11 选择双触发模式并复制模拟输入（通道x）时的单扫描模式操作示例

43.3.2.5 选择双触发模式时的扩展操作

在单扫描模式下选择双触发模式时，选择同步触发（ELC_AD00（单元0）和ELC_AD10（单元1）ELC_AD01（单元0）和ELC_AD11（单元1））作为AD转换开始的触发，执行两轮单扫描操作。

取消选择自诊断并设置温度传感器输出AD转换选择位(ADEXICR.TSSA和ADEXICR.TSSB），内部参考电压AD转换选择位（ADEXICR.OCSA和ADEXICR.OCSB）为0。

通过将要复制的通道号设置为ADCSR.DBLANS[4:0]位并将ADCSR.DBLE位设置为1，启用AD转换数据的复制。当ADCSR.DBLE位设置为1时，通道选择使用ADANSA0和ADANSA1寄存器无效。

在扩展双触发模式下，通过将ADSTRGR.TRSA[5:0]位设置为0x0B，选择同步触发组合ELC_AD00（单元0）和ELC_AD10（单元1）ELC_AD01（单元0）和ELC_AD11（单元1），设置ADCSR.EXTRG位为0，ADCSR.TRGE位为1。不要使用软件触发。

操作如下：

1.当同步触发输入（ELC_AD00（单元0）和ELC_AD10（单元1）ELC_AD01（单元0）和ELC_AD11（单元1））将ADCSR.ADST位设置为1（AD转换开始）时，AD转换开始在ADCSR.DBLANS[4:0]位中选择的单个通道上。

2.当AD转换完成时，当ELC_ADi0或ELC_ADi1触发输入时，AD转换结果分别存储在相关的AD数据寄存器(ADDRy)和AD数据双工寄存器A(ADDBLDRA)或AD数据双工寄存器B(ADDBLDRB)中(i=1)。

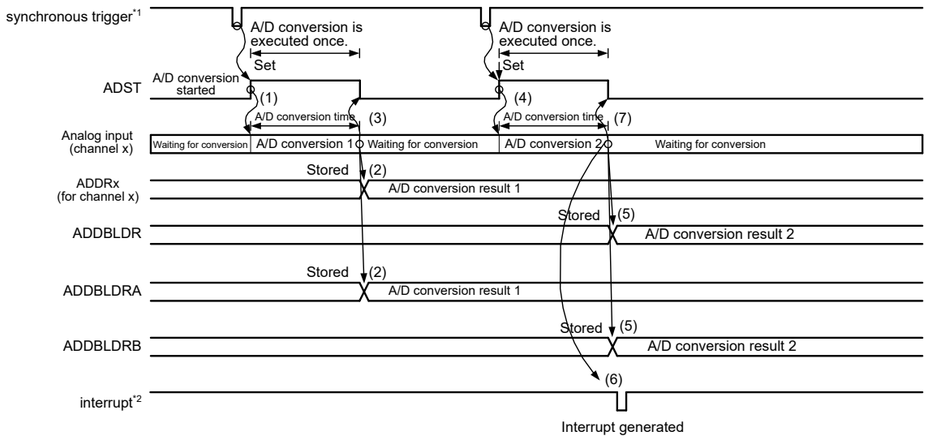
3.ADCSR.ADST位自动设置为0，ADC12进入等待状态。不会产生ADC12i_ADI(i=0 1)中断请求。

4.当ADCSR.ADST位被第二次触发(ELC_AD00(unit0)和ELC_AD10（单元1）ELC_AD01（单元0）和ELC_AD11（单元1）），AD转换在ADCSR.DBLANS[4:0]位中选择的单个通道上开始。

5.当AD转换完成时，当ELC_ADi0或ELC_ADi1触发输入时，AD转换结果分别存储在AD数据双工寄存器(ADDBLDR)和AD数据双工寄存器A(ADDBLDRA)或AD数据双工寄存器B(ADDBLDRB)中(i=1)。

6.产生一个ADC12i_ADI(i=0 1)中断请求。

7. The ADCSR.ADST bit remains 1 (A/D conversion start) during A/D conversion and is automatically set to 0 when A/D conversion completes. The ADC12 then enters a wait state.



Note: x is the selected channel number by ADANSA0/1.
Note 1. ELC_AD00 (unit 0) and ELC_AD10 (unit 1)/ELC_AD01 (unit 0) and ELC_AD11 (unit 1)
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.12 Example extended operation in double trigger mode with duplication selected for the analog input (channel x) and ELC_AD00 (unit 0) and ELC_AD10 (unit 1)/ELC_AD01 (unit 0) and ELC_AD11 (unit 1)

43.3.3 Continuous Scan Mode

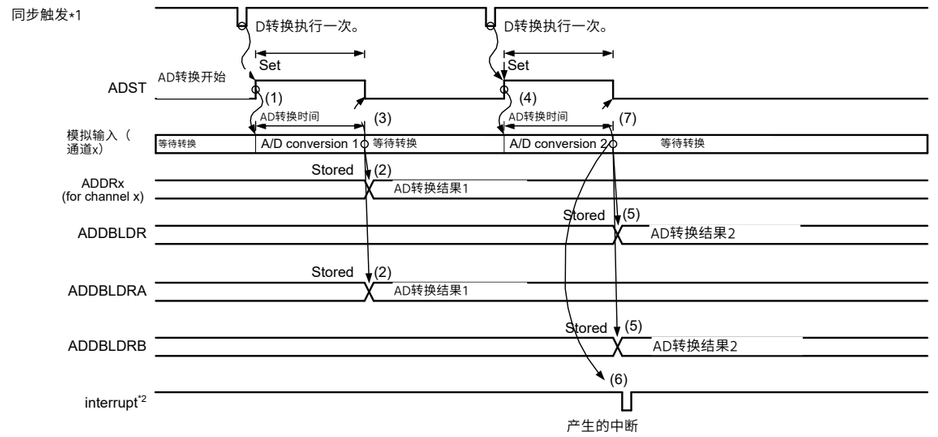
43.3.3.1 Basic Operation

In continuous scan mode, A/D conversion is performed repeatedly on the analog input of the specified channels.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (ELC), or an asynchronous trigger input, A/D conversion is performed for ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the associated A/D Data Register (ADDRy).
3. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated. The ADC12 sequentially starts A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
4. The ADCSR.ADST bit is not automatically cleared, and steps 2. and 3. are repeated as long as ADCSR.ADST remains 1 (A/ D conversion start). When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
5. When the ADCSR.ADST bit is later set to 1 (A/D conversion start), A/D conversion starts again for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.

7.ADCSR.ADST位在AD转换期间保持1（AD转换开始），并在AD转换完成时自动设置为0。ADC12然后进入等待状态。



Note: x是ADANSA01选择的通道号。
注1.ELC_AD00（单元0）和ELC_AD10（单元1）ELC_AD01（单元0）和ELC_AD11（单元1）
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.12 双触发模式下的扩展操作示例，为模拟输入（通道x）和ELC_AD00（单元0）和ELC_AD10（单元1）选择了重复ELC_AD01（单元0）和ELC_AD11（单元1）

43.3.3 连续扫描模式

43.3.3.1 基本操作

在连续扫描模式下，对指定通道的模拟输入重复进行AD转换。

操作如下：

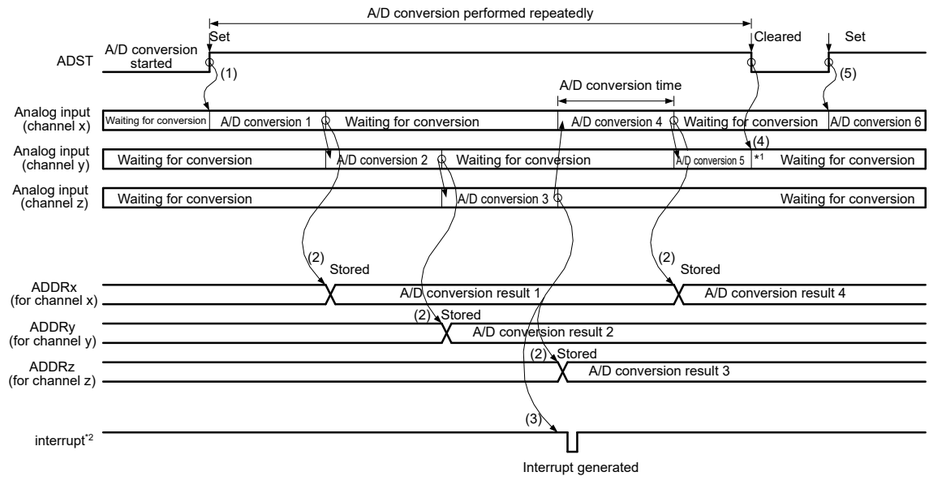
1.当软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，对在ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从编号n最小的通道开始。

2.每次完成单个通道的AD转换，AD转换结果存储在相关的AD数据寄存器(ADDRy)中。

3.当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求。ADC12从编号n最小的通道开始依次启动ADANSA0和ADANSA1寄存器中选择的ANn通道的A/D转换。

4.ADCSR.ADST位不会自动清零，只要ADCSR.ADST保持1（AD转换开始），就会重复步骤2.和3.。当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。

5.当ADCSR.ADST位稍后设置为1（AD转换开始）时，AD转换再次开始在ADANSA0和ADANSA1寄存器中选择的ANn通道，从具有最小编号n的通道开始。



Note: x, y, and z (x < y < z) are the selected channel numbers by ADANSA0/1.
Note 1. Data for A/D conversion 5 is ignored.
Note 2. ADC12i_ADI (i = 0, 1)

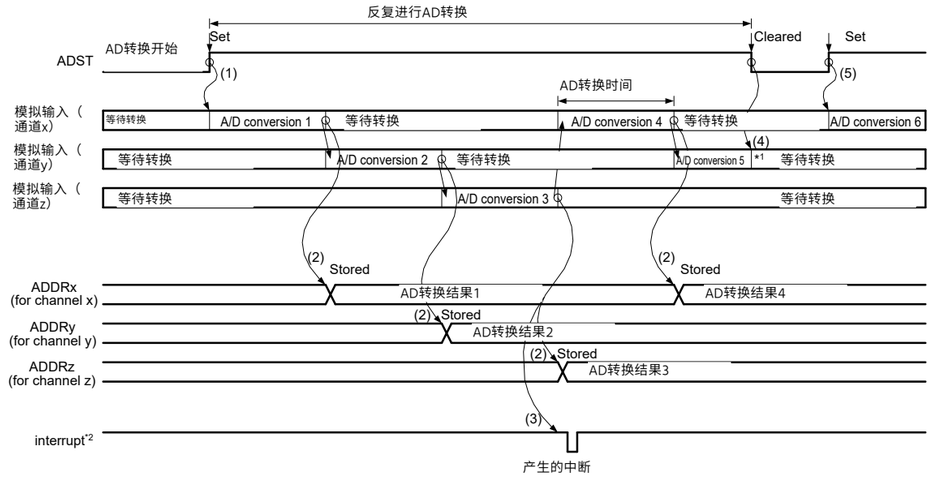
Figure 43.13 Example basic operation in continuous scan mode when the analog inputs (channel x to z) are selected

43.3.3.2 Channel Selection and Self-Diagnosis

When channels and self-diagnosis are selected at the same time, A/D conversion is first performed for the reference voltage VREFH0, VREFH (×0, ×1/2, or ×1) supplied to the ADC12, and A/D conversion is performed on the analog input of the selected channels. This sequence is repeated as described in the section that follows.

The operation is as follows:

1. A/D conversion for self-diagnosis is first started when the ADCSR.ADST bit is set to 1 (A/D conversion start) by a software trigger, a synchronous trigger input (ELC), or an asynchronous trigger input.
2. When A/D conversion for self-diagnosis completes, the A/D conversion result is stored in the A/D Self-Diagnosis Data Register (ADRD). A/D conversion is then performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
3. Each time A/D conversion of a single channel completes, the A/D conversion result is stored in the corresponding A/D Data Register (ADDRy).
4. When A/D conversion of all the selected channels completes, an ADC12i_ADI (i = 0, 1) interrupt request is generated. At the same time, the ADC12 starts A/D conversion for self-diagnosis and then on the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
5. The ADCSR.ADST bit is not automatically cleared, and steps 2. to 4. are repeated as long as the ADCSR.ADST bit remains 1.When the ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. When the ADST bit is later set to 1 (A/D conversion start), the A/D conversion for self-diagnosis is started again.



Note: x、y和z(x<y<z)是ADANSA01选择的通道号。
注1.AD转换5的数据被忽略。
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.13 选择模拟输入（通道x至z）时连续扫描模式下的基本操作示例

43.3.3.2 频道选择和自诊断

同时选择通道和自诊断时，首先对参考电压进行A/D转换
提供给ADC12的VREFH0、VREFH（×0、×12或×1），并对所选通道的模拟输入执行AD转换。如以下部分所述重复此序列。

操作如下：

1.通过软件触发、同步触发输入(ELC)或异步触发输入将ADCSR.ADST位设置为1（AD转换开始）时，首先启动用于自诊断的D转换。

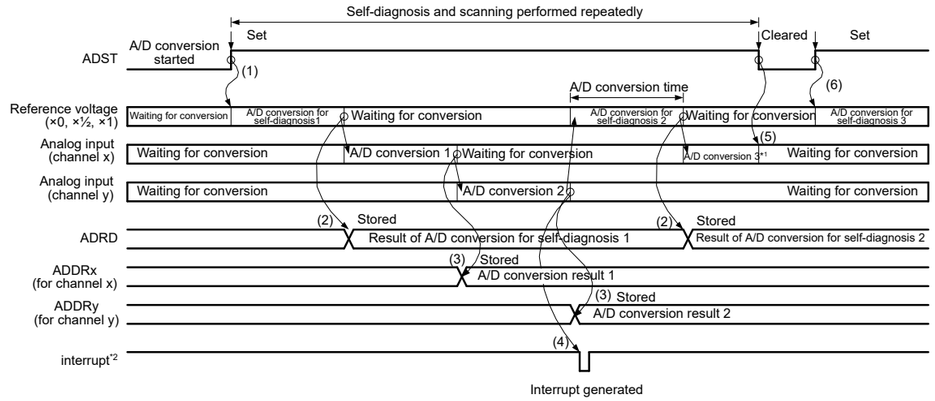
2.当用于自诊断的AD转换完成时，AD转换结果存储在AD自诊断数据寄存器(ADRD)中。然后对在ADANSA0和ADANSA1寄存器中选择的ANn通道执行D转换，从编号最小的通道开始。

3、每完成一次单通道的AD转换，AD转换结果存入对应的AD数据寄存器（ADDRy）。

4.当所有选定通道的AD转换完成时，会产生一个ADC12i_ADI(i=0 1)中断请求。同时，ADC12启动AD转换进行自诊断，然后在选择的ANn通道上进行自诊断。
ADANSA0和ADANSA1寄存器，从编号n最小的通道开始。

5.ADCSR.ADST位不会自动清零，只要ADCSR.ADST位保持为1，就会重复步骤2.到4.。当ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。

6.当ADST位稍后设置为1（AD转换开始）时，用于自诊断的AD转换再次开始。



Note: x and y (x < y) are the selected channel numbers by ADANSA0/1.
Note 1. Data for A/D conversion 3 is ignored.
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.14 Example basic operation in continuous scan mode when the analog inputs (channel x and y) selected with self- diagnosis

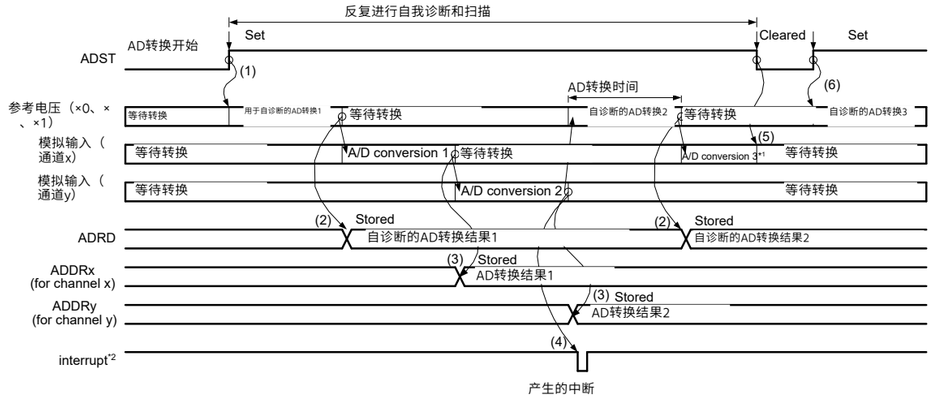
43.3.3.3 A/D conversion of temperature sensor output or internal reference voltage

When the channels and temperature sensor output or internal reference voltage are selected at the same time, A/D conversion is first performed on the analog input of the selected channels, and then the A/D conversion of the temperature sensor output or internal reference voltage is repeated. When both the temperature sensor output and internal reference voltage are selected, A/D conversion of the temperature sensor output and internal reference voltage is performed, in that order.

With the channels deselected, selecting only the temperature sensor output or internal reference voltage is also possible.

The operation is as follows:

1. When a software trigger, synchronous trigger (ELC), or asynchronous trigger sets the ADCSR.ADST bit to 1 (A/D conversion start), A/D conversion is performed for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the smallest number n.
2. On completion of A/D conversion on the channels, the result is stored in the associated A/D Data Register y (ADDRy), and then A/D conversion of temperature sensor output starts.
3. On completion of A/D conversion of the temperature sensor output, the result is stored in the associated A/D Temperature Sensor Data Register (ADTSDR), and then A/D conversion of the internal reference voltage starts.
4. On completion of A/D conversion of the internal reference voltage, the result is stored in the associated A/D Internal Reference Voltage Data Register (ADOCDR), and an ADC12i_ADI (i = 0, 1) interrupt request is generated. In addition, the ADC12 continuously starts A/D conversion for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the lowest number n.
5. The ADCSR.ADST bit is not cleared automatically, and steps 2 to 4 are repeated as long as this bit remains set to 1. When the ADCSR.ADST bit is set to 0 (A/D conversion stop), A/D conversion stops and the ADC12 enters a wait state.
6. When the ADCSR.ADST bit is then set to 1 (A/D conversion start), A/D conversion starts again for the ANn channels selected in the ADANSA0 and ADANSA1 registers, starting from the channel with the lowest number n.



Note: x和y(x<y)是ADANSA01选择的通道号。
注1.AD转换3的数据被忽略。
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.14 使用自诊断选择模拟输入（通道x和y）时连续扫描模式下的基本操作示例

43.3.3.3 温度传感器输出或内部参考电压的AD转换

当同时选择通道和温度传感器输出或内部参考电压时，首先对所选通道的模拟输入进行AD转换，然后重复温度传感器输出或内部参考电压的AD转换。当同时选择温度传感器输出和内部参考电压时，按顺序执行温度传感器输出和内部参考电压的AD转换。

取消选择通道后，也可以仅选择温度传感器输出或内部参考电压。

操作如下：

1.当软件触发、同步触发(ELC)或异步触发将ADCSR.ADST位设置为1（AD转换开始）时，对ADANSA0和ADANSA1寄存器中选择的ANn通道执行AD转换，从通道开始用最小的数n。

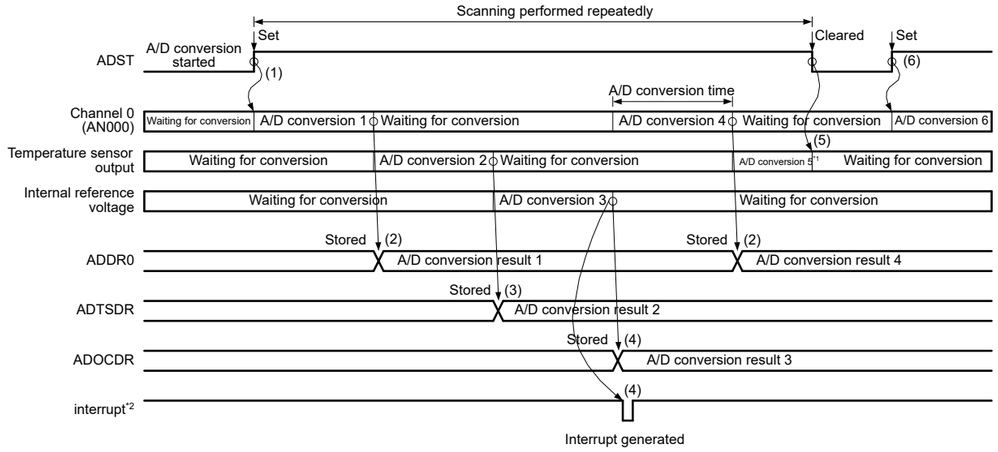
2.通道上的AD转换完成后，结果存储在相关的AD数据寄存器y(ADDRy)中，然后温度传感器输出的AD转换开始。

3.温度传感器输出的AD转换完成后，结果存储在相关的AD中
温度传感器数据寄存器(ADTSDR)，然后内部参考电压的AD转换开始。

4.内部参考电压的AD转换完成后，结果存储在相关的ADInternal
参考电压数据寄存器(AOCDR)和ADC12i_ADI(i=0 1)中断请求产生。此外，ADC12连续启动ADANSA0和ADANSA1寄存器中选择的ANn通道的AD转换，从编号最小的通道n开始。

5.ADCSR.ADST位不会自动清零，只要该位保持设置为1，就会重复步骤2到4。
当ADCSR.ADST位设置为0（AD转换停止）时，AD转换停止并且ADC12进入等待状态。

6.当ADCSR.ADST位被设置为1（AD转换开始）时，AD转换再次开始在ADANSA0和ADANSA1寄存器中选择的ANn通道，从编号最小的通道n开始。



Note 1. Data for A/D conversion 5 is ignored.
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.15 Example basic operation in continuous scan mode when AN000 and temperature sensor output or internal reference voltage are selected

43.3.4 Group Scan Mode

43.3.4.1 Basic operation

In group scan mode, A/D conversion is performed once on the analog input of all the specified channels in group A and B after scanning is started by a synchronous trigger (ELC). The scan operation of each group is similar to the scan operation in single scan mode.

The synchronous triggers can be selected in the ADSTRGR.TRSA[5:0] bits for group A and in the ADSTRGR.TRSB[5:0] bits for group B. Use different triggers for group A and B to prevent simultaneous A/D conversion of the two groups. Do not use a software trigger.

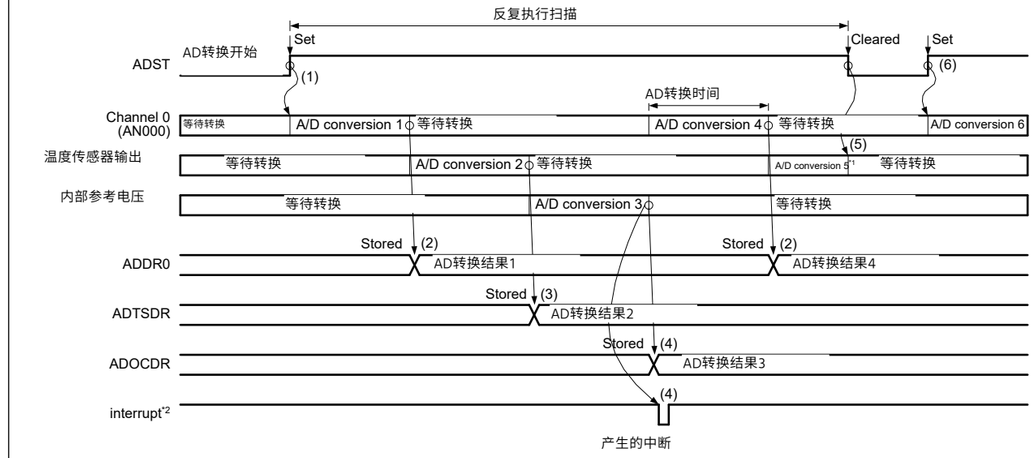
The group A channels to be A/D-converted are selected using the ADANSA0 and ADANSA1 registers and the ADEXICR.TSSA and OCSA bits. The group B channels to be A/D-converted are selected using the ADANSB0 and ADANSB1 registers and the ADEXICR.TSSB and OCSB bits. Group A and B cannot use the same channels.

When self-diagnosis is selected in group scan mode, self-diagnosis is separately executed for Group A and B.

The following sequence describes operation in group scan mode using a synchronous trigger from the ELC. In this example, the ELC_AD00 (unit 0) and ELC_AD10 (unit 1) trigger from the ELC is used to start conversion of group A and the ELC_AD01 (unit 0) and ELC_AD11 (unit 1) trigger from the ELC is used to start conversion of group B. In addition, ELC_AD00 (unit 0) and ELC_AD10 (unit 1) and ELC_AD01 (unit 0) and ELC_AD11 (unit 1) are selected for the GPT event in the associated ELC.ELSRn registers.

The operation is as follows:

1. Scanning of group A is started by ELC_AD00 (unit 0) and ELC_AD10 (unit 1).
2. When group A scanning completes, an ADC12i_ADI (i = 0, 1) interrupt is generated (no register setting).
3. Scanning of group B is started by ELC_AD01 (unit 0) and ELC_AD11 (unit 1).
4. When group B scanning completes, an ADC12i_GBADI (i = 0, 1) interrupt is generated if the ADCSR.GBADIE bit is 1 (ADC12i_GBADI (i = 0, 1) interrupt when scanning completion is enabled).



注1.AD转换5的数据被忽略。
Note 2. ADC12i_ADI (i = 0, 1)

Figure 43.15 选择AN000和温度传感器输出或内部参考电压时连续扫描模式下的基本操作示例

43.3.4 组扫描模式

43.3.4.1 基本操作

在组扫描模式下，通过同步触发（ELC）开始扫描后，对A组和B组中所有指定通道的模拟输入进行一次AD转换。每组的扫描操作类似于单次扫描模式下的扫描操作。

可以在A组的ADSTRGR.TRSA[5:0]位和B组的ADSTRGR.TRSB[5:0]位中选择同步触发。对A组和B组使用不同的触发以防止同时进行AD转换两组。不要使用软件触发。

使用ADANSA0和ADANSA1寄存器选择要进行AD转换的A组通道
ADXICR.TSSA和OCSA位。要进行AD转换的B组通道使用ADANSB0和
ADANSB1寄存器以及ADXICR.TSSB和OCSB位。A组和B组不能使用相同的通道。

在组扫描模式下选择自诊断时，对A组和B组分别执行自诊断。

以下序列描述了使用来自ELC的同步触发在组扫描模式下的操作。在此示例中，来自ELC的ELC_AD00（单元0）和ELC_AD10（单元1）触发器用于启动A组的转换，来自ELC的ELC_AD01（单元0）和ELC_AD11（单元1）触发器用于启动转换B组。此外，

ELC_AD00（单元0）和ELC_AD10（单元1）和ELC_AD01（单元0）和ELC_AD11（单元1）被选择用于相关ELC.ELSRn寄存器中的GPT事件。

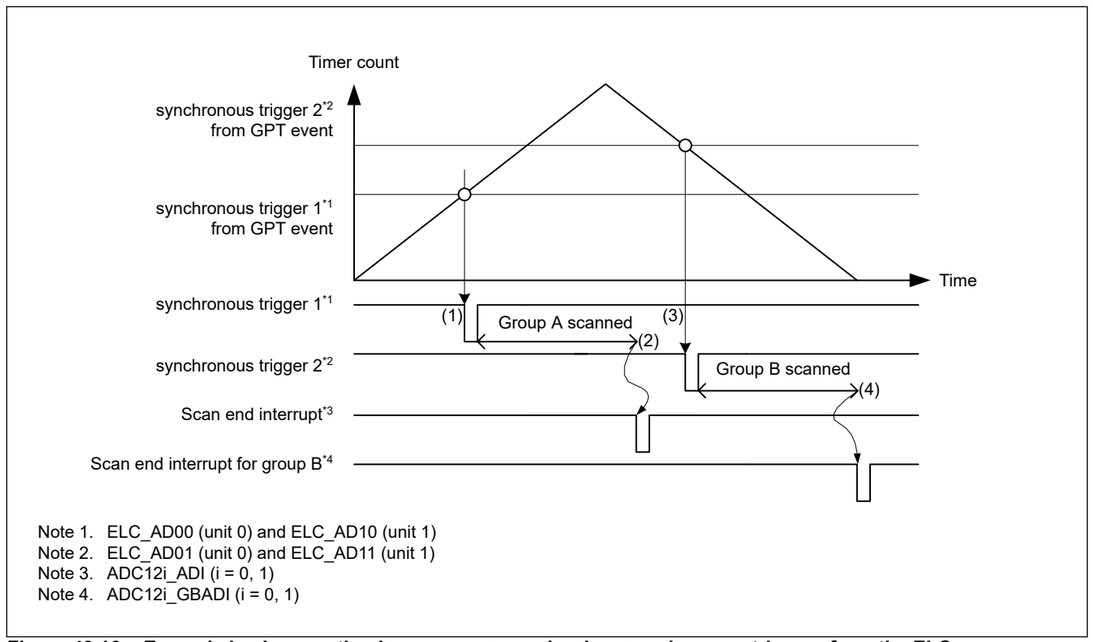
操作如下：

1.A组扫描由ELC_AD00（单元0）和ELC_AD10（单元1）启动。

2.A组扫描完成后，会产生ADC12i_ADI(i=0 1)中断（无寄存器设置）。

3.B组扫描由ELC_AD01（单元0）和ELC_AD11（单元1）启动。

4.B组扫描完成时，如果ADCSR.GBADIE位为1，则产生ADC12i_GBADI(i=0 1)中断（使能扫描完成时的ADC12i_GBADI(i=0 1)中断）。



Note 1. ELC_AD00 (unit 0) and ELC_AD10 (unit 1)
Note 2. ELC_AD01 (unit 0) and ELC_AD11 (unit 1)
Note 3. ADC12i_ADI (i = 0, 1)
Note 4. ADC12i_GBADI (i = 0, 1)

Figure 43.16 Example basic operation in group scan mode when synchronous triggers from the ELC are used

43.3.4.2 A/D conversion in double-trigger mode

When double trigger mode is selected in group scan mode, two rounds of single scan operation started by a synchronous trigger (ELC) are performed as a sequence for group A. For group B, single scan operation started by a synchronous trigger (ELC) is performed once.

In group scan mode, the synchronous trigger can be selected in the ADSTRGR.TRSA[5:0] bits for group A and in the ADSTRGR.TRSB[5:0] bits for group B. Use different triggers for groupA, B to prevent simultaneous A/D conversion of the two groups. Do not use a software trigger or an asynchronous trigger.

When an ELC_AD00 (unit 0) and ELC_AD10 (unit 1)/ELC_AD01 (unit 0) and ELC_AD11 (unit 1) is selected as group A synchronous triggers by setting the ADSTRGR.TRSA[5:0] bits to 0x0B, operation proceeds in extended double trigger mode.

The group A channel to be A/D-converted is selected using the DBLANS[4:0] bits in the ADCSR register, while the group B channels to be A/D-converted are selected using the ADANSB0 and ADANSB1 registers. Group A, B cannot use the same channels.

When double-trigger mode is selected in group scan mode, set the A/D conversion select bits for both the temperature sensor output (ADEXICR.TSSA) and the internal reference voltage (ADEXICR.OCSA) to 0 (deselected).

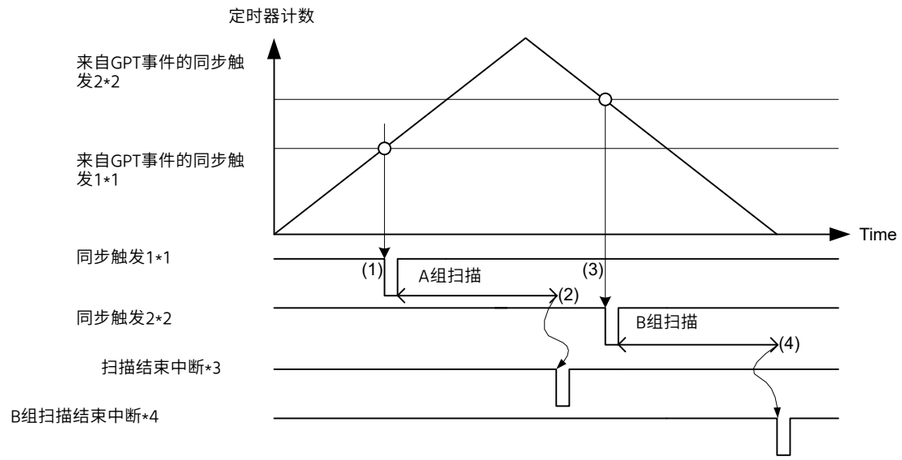
Self-diagnosis cannot be selected when double trigger mode is selected in group scan mode.

Duplication of A/D conversion data is enabled by setting the channel numbers to be duplicated in the ADCSR.DBLANS[4:0] bits and setting the ADCSR.DBLE bit to 1.

The following sequence describes operation in group scan mode with double trigger mode selected and using a synchronous trigger from the ELC. In this example, the ELC_AD00 (unit 0) and ELC_AD10 (unit 1) trigger is used to start conversion of group A and the ELC_AD01 (unit 0) and ELC_AD11 (unit 1) trigger is used to start conversion of group B. In addition, ELC_AD00 (unit 0) and ELC_AD10 (unit 1) and ELC_AD01 (unit 0) and ELC_AD11 (unit 1) are selected for the GPT event in the associated ELC.ELSRn registers.

The operation is as follows:

1. Scanning of group B is started by the ELC_AD00 (unit 0) and ELC_AD10 (unit 1) trigger from the ELC.



注1.ELC_AD00（单元0）和ELC_AD10（单元1）注2.
ELC_AD01（单元0）和ELC_AD11（单元1）
Note 3. ADC12i_ADI (i = 0, 1)
Note 4. ADC12i_GBADI (i = 0, 1)

Figure 43.16 使用来自ELC的同步触发时组扫描模式下的基本操作示例

43.3.4.2 双触发模式下的AD转换

在组扫描模式中选择双触发模式时，由同步触发(ELC)启动的两轮单扫描操作作为A组的顺序执行。对于B组，由同步触发(ELC)启动的单扫描操作是执行一次。

在组扫描模式下，可以在ADSTRGR.TRSA[5:0]位中为A组选择同步触发，并在组B的ADSTRGR.TRSB[5:0]位。对组A、B使用不同的触发，以防止两组同时进行AD转换。不要使用软件触发或异步触发。

当通过将ADSTRGR.TRSA[5:0]位设置为0x0B来选择ELC_AD00（单元0）和ELC_AD10（单元1）ELC_AD01（单元0）和ELC_AD11（单元1）作为A组同步触发时，操作以扩展方式进行双触发模式。

使用ADCSR寄存器中的DBLANS[4:0]位选择要进行AD转换的A组通道，而组使用ADANSB0和ADANSB1寄存器选择要进行AD转换的B通道。A、B组不能使用相同的通道。

在组扫描模式下选择双触发模式时，将温度传感器输出(ADEXICR.TSSA)和内部参考电压(ADEXICR.OCSA)的AD转换选择位设置为0（取消选择）。

在组扫描模式下选择双触发模式时，不能选择自诊断。

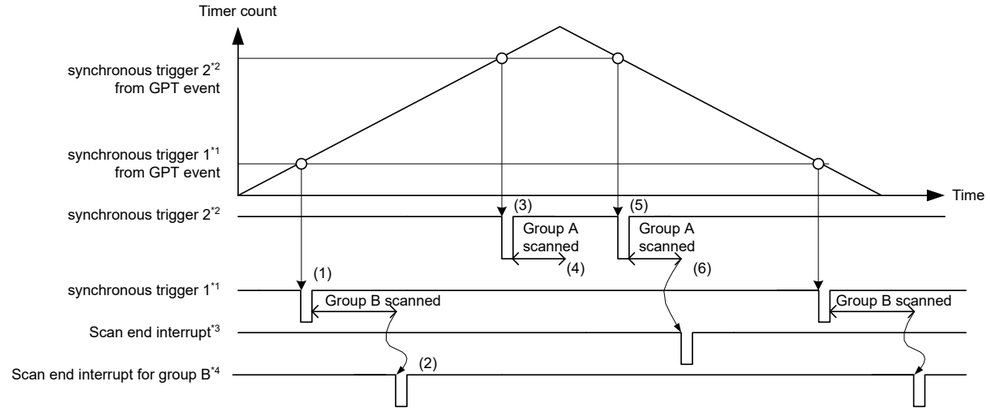
AD转换数据的复制通过在ADCSR.DBLANS[4:0]位并将ADCSR.DBLE位设置为1。

以下序列描述了组扫描模式下的操作，其中选择了双触发模式并使用来自ELC的同步触发。在此示例中，ELC_AD00（单元0）和ELC_AD10（单元1）触发器用于启动A组转换，ELC_AD01（单元0）和ELC_AD11（单元1）触发器用于启动B组转换。此外，ELC_AD00（单元0）和ELC_AD10（单元1）和ELC_AD01（单元0）和ELC_AD11（单元1）在关联的ELC.ELSRn寄存器中为GPT事件选择。

操作如下：

1.B组的扫描由ELC的ELC_AD00（单元0）和ELC_AD10（单元1）触发开始。

2. When group B scanning completes, an ADC12i_GBADI (i = 0, 1) interrupt is generated if the GBADIE bit in ADCSR is 1 (ADC12i_GBADI (i = 0, 1) interrupt when scanning completion is enabled).
3. The first scan of group A is started by the first ELC_AD01 (unit 0) and ELC_AD11 (unit 1) trigger.
4. When the first scan of group A completes, the conversion result is stored in the associated A/D Data Register y (ADDRy); an ADC12i_ADI (i = 0, 1) interrupt request is not generated.
5. The second scan of group A is started by the second ELC_AD01 (unit 0) and ELC_AD11 (unit 1) trigger.
6. When the second scan of group A completes, the conversion result is stored in ADDBLDR. An ADC12i_ADI (i = 0, 1) interrupt is generated.



Note 1. ELC_AD00 (unit 0) and ELC_AD10 (unit 1)
Note 2. ELC_AD01 (unit 0) and ELC_AD11 (unit 1)
Note 3. ADC12i_ADI (i = 0, 1)
Note 4. ADC12i_GBADI (i = 0, 1)

Figure 43.17 Example basic operation in group scan mode with double-trigger mode when synchronous triggers from the ELC are used

43.3.4.3 Group Priority Operation

Group priority operation is performed by setting the ADGSPCR.PGS bit to 1 in group-scan mode. The priority of groups is group A > group B.

When setting the PGS bit in the ADGSPCR register to 1, follow the procedure described in Figure 43.18. If the procedure is not followed, A/D conversion operation and stored data are not guaranteed.

As the basic operation in group-scan mode, a trigger input generated during A/D conversion of group A, B is ignored, and the A/D conversion operation of each group is similar to the operation in single-scan mode.

In group priority operation, if a trigger for a priority group is input during scanning of a lower-priority group, A/D conversion for the lower-priority group is stopped and A/D conversion for the priority group is performed.

If the setting of the ADGSPCR.GBRSCN bit is 0, the lower-priority group enters a wait state when A/D conversion for the priority group completes. A trigger input of the lower-priority group generated during A/D conversion is ignored.

If the setting of the ADGSPCR.GBRSCN bit is 1, A/D conversion for the lower-priority group automatically restarts upon completion of A/D conversion for the priority group. A trigger input of the lower-priority group generated during A/D conversion on the priority group takes effect, and A/D conversion for the lower-priority group is automatically performed upon completion of A/D conversion on the priority group.

If the ADGSPCR.GBRSCN bit is 1 and the ADGSPCR.LGRRS bit is 0, A/D conversion for the lower-priority group is restarted from the first channel. If the setting of the ADGSPCR.LGRRS bit is 1, A/D conversion for the lower-priority group is restarted from the channel for which the conversion stopped. However, if the self-diagnosis function is used, the A/D conversion is restarted from the channel for which the conversion stopped after self-diagnosis completed.

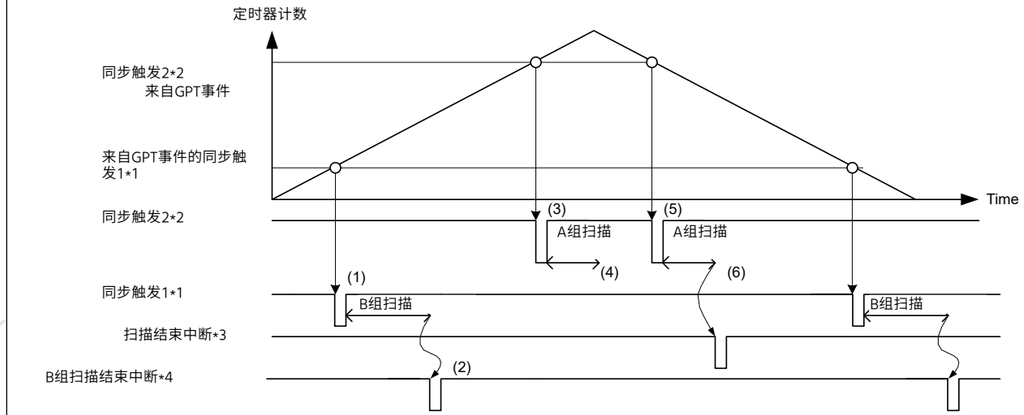
2.B组扫描完成时，如果ADCSR中的GBADIE位为1，则产生ADC12i_GBADI(i=0 1)中断（使能扫描完成时ADC12i_GBADI(i=0 1)中断）。

3.A组的第一次扫描由第一个ELC_AD01（单元0）和ELC_AD11（单元1）触发器启动。

4、A组第一次扫描完成后，转换结果存入相关的AD数据寄存器y（ADDRy）；不会产生ADC12i_ADI(i=0 1)中断请求。

5.A组的第二次扫描由第二个ELC_AD01（单元0）和ELC_AD11（单元1）触发开始。

6.A组第二次扫描完成后，转换结果存入ADDBLDR。产生一个ADC12i_ADI(i=0 1)中断。



注1.ELC_AD00（单元0）和ELC_AD10（单元1）注2.
ELC_AD01（单元0）和ELC_AD11（单元1）
Note 3. ADC12i_ADI (i = 0, 1)
Note 4. ADC12i_GBADI (i = 0, 1)

Figure 43.17 当使用来自ELC的同步触发时，具有双触发模式的组扫描模式下的基本操作示例

43.3.4.3 集团优先运营

在组扫描模式下，通过将ADGSPCR.PGS位设置为1来执行组优先级操作。组的优先级为A组>B组。

将ADGSPCR寄存器中的PGS位设置为1时，请遵循图43.18中描述的过程。如果不遵循该程序，则无法保证AD转换操作和存储数据。

作为组扫描模式下的基本操作，A、B组A/D转换过程中产生的触发输入被忽略，各组的A/D转换操作与单扫描模式下的操作类似。

在组优先操作中，如果在低优先级组的扫描期间输入了优先级组的触发，则停止低优先级组的AD转换并执行优先级组的AD转换。

如果ADGSPCR.GBRSCN位设置为0，则当优先级组的AD转换完成时，低优先级组进入等待状态。AD转换期间产生的低优先级组的触发输入被忽略。

如果ADGSPCR.GBRSCN位设置为1，则在优先级组的AD转换完成后，低优先级组的AD转换自动重新开始。对优先组进行AD转换时产生的低优先组的触发输入生效，在优先组的AD转换完成后，自动进行低优先组的AD转换。

如果ADGSPCR.GBRSCN位为1，ADGSPCR.LGRRS位为0，则从第一个通道重新开始低优先级组的AD转换。如果ADGSPCR.LGRRS位设置为1，则低优先级组的AD转换从转换停止的通道重新开始。但是，如果使用自诊断功能，则从自诊断完成后停止转换的通道重新开始AD转换。

RA生态工作室

Table 43.24 summarizes operations in response to the input of a trigger during A/D conversion with the settings of the ADGSPCR.GBRSCN bit.

If the setting of the ADGSPCR.GBRP bit is 1, A/D conversion operation for the lowest-priority group is to continuously perform single scans.

For the trigger settings in group-scan mode, select a synchronous trigger for group A by using the ADSTRGR.TRSA[5:0] bits, a synchronous trigger for group B by using the ADSTRGR.TRSB[5:0] bits. Each trigger must be different from each other. Set the ADSTRGR.TRSB[5:0] bits to 0x3F when setting the ADGSPCR.GBRP bit to 1.

The channels to be scanned must be selected in the registers shown in section 43.3.4. Group Scan Mode.

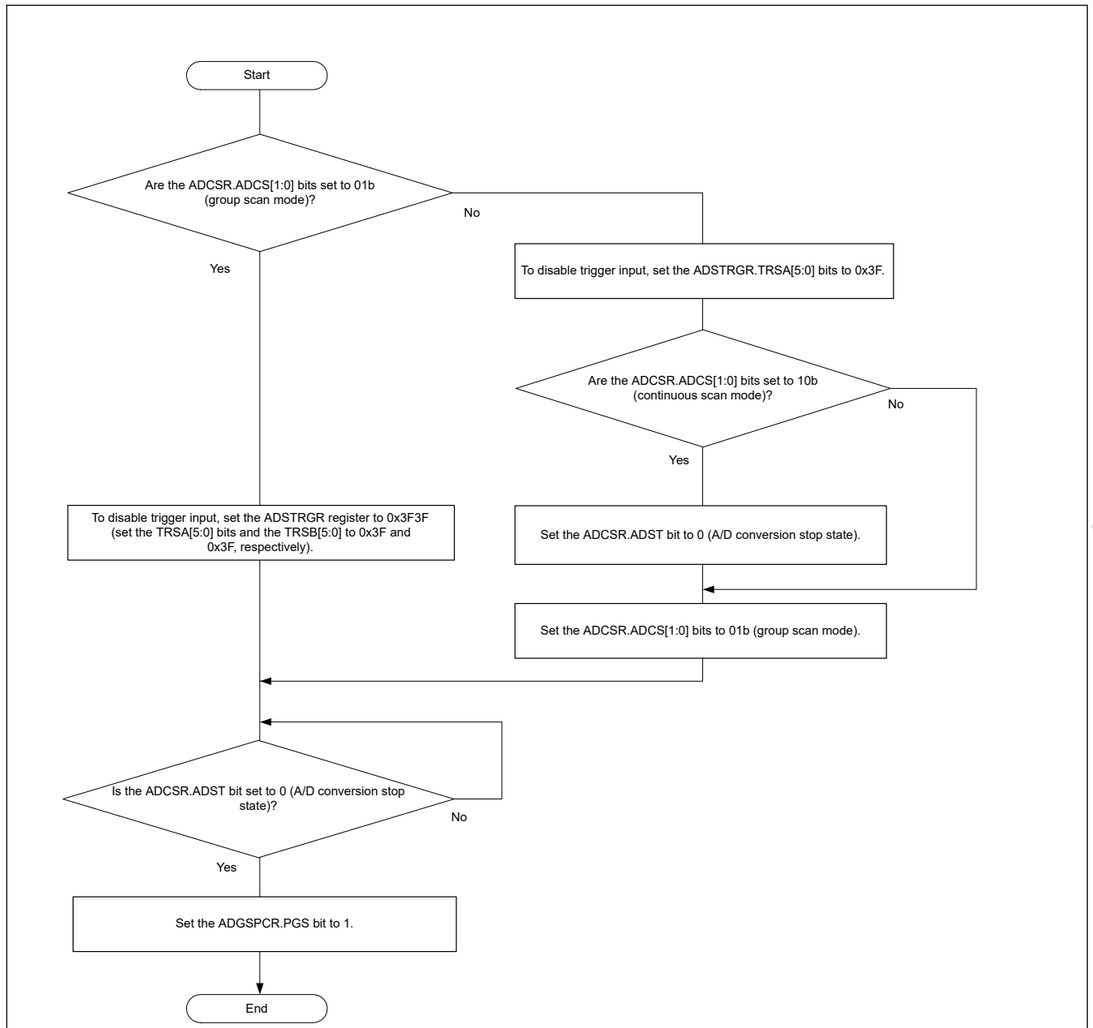


Figure 43.18 Flowchart for ADGSPCR.PGS bit setting

表43.24总结了在AD转换期间响应触发输入的操作，其中设置为ADGSPCR.GBRSCN bit.

如果ADGSPCR.GBRP位设置为1，则最低优先级组的AD转换操作是连续执行单次扫描。

对于组扫描模式下的触发设置，使用ADSTRGR.TRSA[5:0]位选择A组同步触发，使用ADSTRGR.TRSB[5:0]位选择B组同步触发。每个触发器必须彼此不同。将ADGSPCR.GBRP位设置为1时，将ADSTRGR.TRSB[5:0]位设置为0x3F。

要扫描的通道必须在第43.3.4节所示的寄存器中选择。组扫描模式。

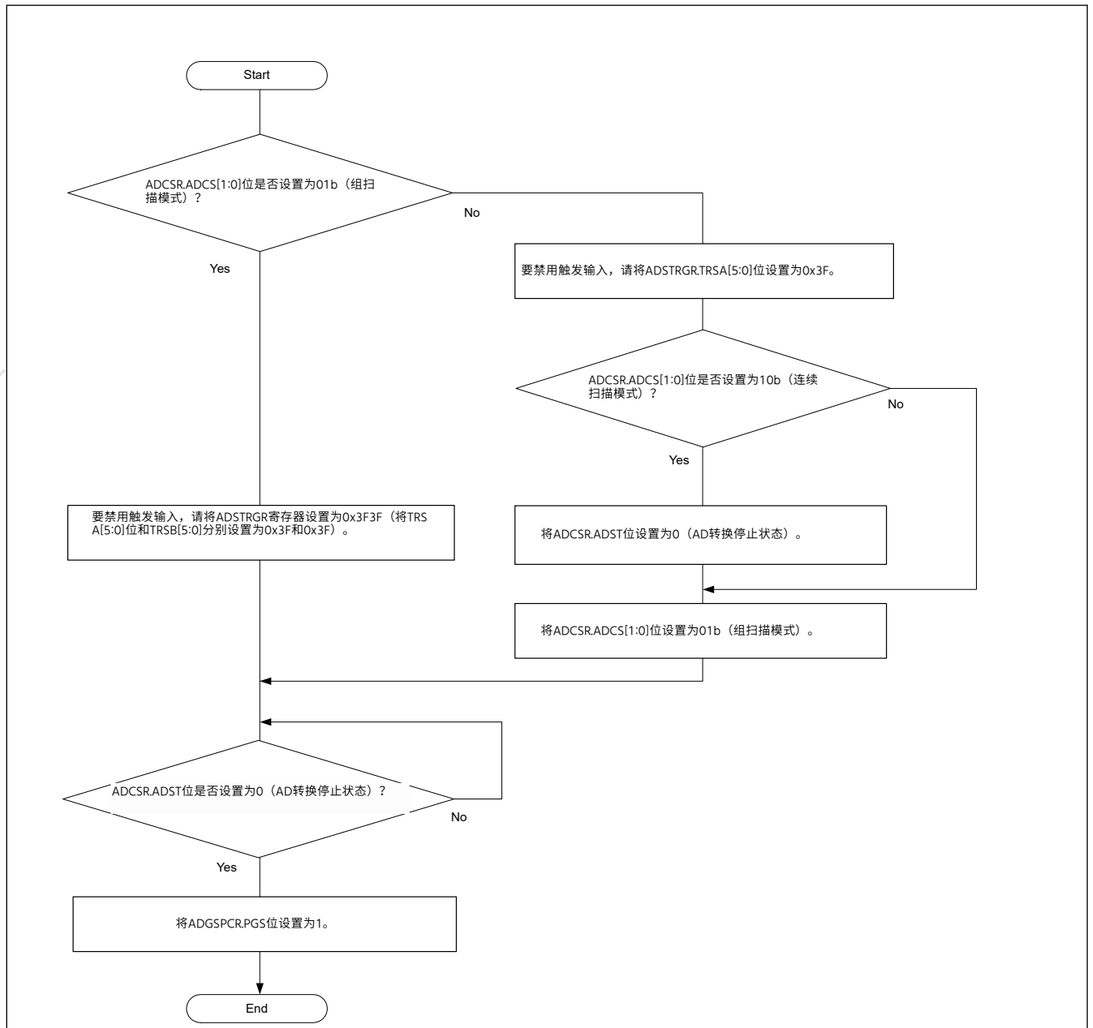

Figure 43.18 ADGSPCR.PGS位设置流程图

Table 43.24 Control of A/D conversion operations according to ADGSPCR.GBRSCN bit setting

A/D conversion operation	Trigger input	ADGSPCR.GBRSCN = 0	ADGSPCR.GBRSCN = 1
When A/D conversion for group A is in progress	Input of trigger for group A	Trigger input is ineffective.	Trigger input is ineffective.
	Input of trigger for group B	Trigger input is ineffective.	A/D conversion for group B is performed after A/D conversion for group A completes.
When A/D conversion for group B is in progress	Input of trigger for group A	A/D conversion for group B is discontinued and A/D conversion for group A starts.	• A/D conversion for group B is discontinued and A/D conversion for group A starts. • A/D conversion for group B starts after A/D conversion for group A completes.
	Input of trigger for group B	Trigger input is ineffective.	Trigger input is ineffective.

To use group priority operation mode, select the operation mode to be implemented and set the registers according to the following table.

Table 43.25 Group priority operation setting and operation mode for two groups (ADGSPCR.PGS = 1)

ADGSPCR			Operation category
GBRSCN	LGRRS	GBRP	
0	x	0	Group priority operation for two groups (groups A and B) • When a trigger of group A is input, A/D conversion for group B is terminated (and will not be restarted).
1	0	0	Group priority operation for two groups (groups A and B) • After A/D conversion for group B stopped, when A/D conversion for group A completes, A/D conversion for the group B channels selected in the ADANSB0 and ADANSB1 registers restarts according to the conversion order of smaller channel number.
1	1	0	Group priority operation for two groups (groups A and B) • After A/D conversion for group B stopped, when A/D conversion for group A completes, A/D conversion for the group B channels selected in the ADANSB0/1 register restarts according to the conversion order of smaller channel number, beginning from the channel for which A/D conversion stopped.*1
x	0	1	Group priority operation for two groups (groups A and B) • Single scanning for group B is continuously performed without a start trigger input. After A/D conversion for group B stopped, when A/D conversion for group A completes, single scanning for the channels selected in the ADANSB0/1 register restarts according to the conversion order of smaller channel number.
1	1	1	Group priority operation for two groups (groups A and B) • Single scanning for group B is continuously performed without a start trigger input. After A/D conversion for group B stopped, when A/D conversion for group A completes, single scanning for the channels selected in the ADANSB0/1 register restarts according to the conversion order of smaller channel number, beginning from the channel for which A/D conversion stopped.*1

Note: x: Don't care.
Note 1. When the self-diagnosis function is enabled (ADCER.DIAGM = 1), A/D conversion for the channel that has been stopped is started after self-diagnosis is performed.

(1) Group priority operation for two groups (when ADGSPCR.PGS = 1)

Operation examples 1-1 to 1-5 show group priority operations in group-scan mode (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 to 3 are selected for group B.

Operation example 1-1: "Group A trigger input during group B scan" when rescanning is enabled

1. When input of a trigger for group B sets the ADCSR.ADST bit to 1 (starting A/D conversion), A/D conversion for the analog input channels selected in the ADANSB0 and ADANSB1 registers starts according to the conversion order from the channel with the smallest number n.
2. On completion of A/D conversion for each channel in group B, the result is stored in the corresponding A/D Data Register y (ADDRy).

Table 43.24 根据ADGSPCR.GBRSCN位设置控制AD转换操作

AD转换操作	触发输入	ADGSPCR.GBRSCN = 0	ADGSPCR.GBRSCN = 1
正在进行A组的AD转换时	A组触发器输入	触发输入无效。	触发输入无效。
	B组触发器输入	触发输入无效。	在A组的AD转换完成后，执行B组的AD转换。
正在进行B组的AD转换时	A组触发器输入	B组的AD转换停止，A组的AD转换开始。	• B组的AD转换停止，A组的AD转换开始。 • B组的AD转换在A组的AD转换完成后开始。
	B组触发器输入	触发输入无效。	触发输入无效。

要使用组优先操作模式，请根据下表选择要执行的操作模式并设置寄存器。

Table 43.25 两组的组优先操作设置和操作模式（ADGSPCR.PGS=1）

ADGSPCR			操作类别
GBRSCN	LGRRS	GBRP	
0	x	0	两组（A组和B组）的组优先操作● 当输入A组的触发时，B组的AD转换将终止（并且不会重新启动）。
1	0	0	两组（A组和B组）的组优先操作● B组AD转换停止后，当A组AD转换完成时，ADANSB0和ADANSB1寄存器中选择的B组通道的AD转换按照通道号较小的转换顺序重新开始。
1	1	0	两组（A组和B组）的组优先操作● B组AD转换停止后，当A组AD转换完成时，ADANSB01寄存器中选择的B组通道的AD转换按照通道号较小的转换顺序重新开始，从AD转换停止的通道开始。*1
x	0	1	两组（A组和B组）的组优先操作● B组的单次扫描在没有启动触发输入的情况下连续执行。B组AD转换停止后，当A组AD转换完成时，按照通道号较小的转换顺序重新开始对ADANSB01寄存器中选择的通道进行单次扫描。
1	1	1	两组（A组和B组）的组优先操作● B组的单次扫描在没有启动触发输入的情况下连续执行。B组AD转换停止后，当A组AD转换完成时，对ADANSB01寄存器中选择的通道的单次扫描按照通道号较小的转换顺序重新开始，从AD转换停止的通道开始。*1

Note: x: Don't care.
注1.自诊断功能有效时（ADCER.DIAGM=1），自诊断完成后，已停止通道的AD转换开始。

(1) 两个组的组优先操作（当ADGSPCR.PGS=1时）

操作示例1-1到1-5显示了当为组A和通道1选择通道0时，组扫描模式下的组优先操作（当ADGSPCR.GBRSCN=1、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时）为B组选择3至3个。

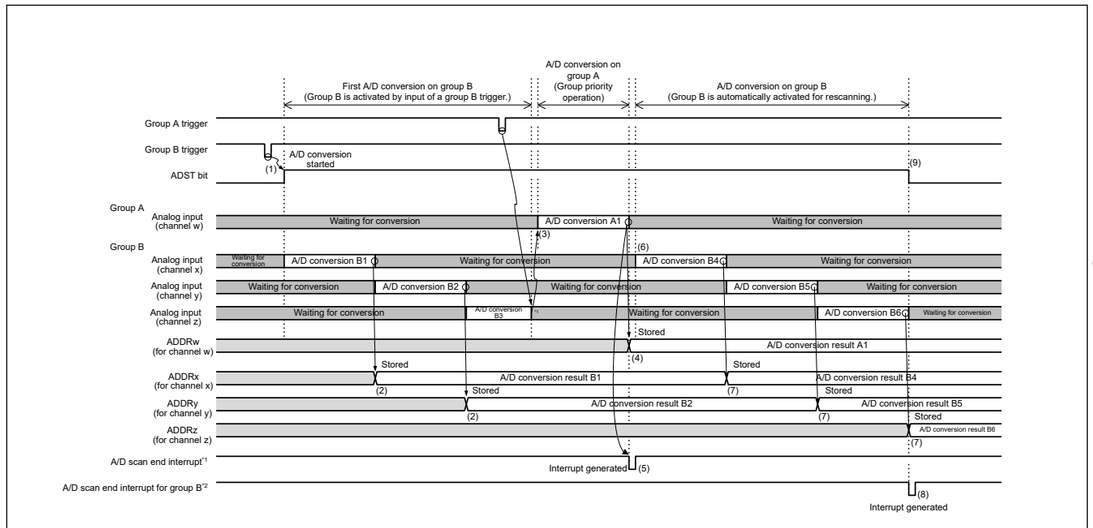
操作示例1-1：启用重新扫描时的"B组扫描期间A组触发输入"

1.当B组的触发输入将ADCSR.ADST位设置为1（开始AD转换）时，ADANSB0和ADANSB1寄存器中选择的模拟输入通道的AD转换按照转换顺序从最小通道开始号码n.

2.B组中每个通道的AD转换完成后，将结果存储在相应的AD数据寄存器y(ADDRy)中。

RA生态工作室

3. When a trigger for group A is input during A/D conversion for group B, A/D conversion for group B stops while the ADCSR.ADST bit remains 1. Then A/D conversion for the group A analog input channels selected in the ADANSA0 and ADANSA1 registers starts according to the conversion order from the channel with the smallest number n. If A/D conversion stops before it is completed, the conversion result is not stored in the A/D Data Register y (ADDRy).
4. On completion of A/D conversion on the channels, the result is stored in the corresponding A/D Data Register y (ADDRy).
5. An ADC120_ADI interrupt request is generated.
6. If the setting of the ADGSPCR.GBRSCN bit is 1 (enabling rescanning of the group that was stopped in group priority operation), A/D conversion for the group B analog input channels selected in the ADANSB0 and ADANSB1 registers restarts according to the conversion order from the channel with the smallest number n while the ADCSR.ADST remains 1.
7. On completion of A/D conversion on the channels, the result is stored in the corresponding A/D Data Register y (ADDRy).
8. If the setting of the ADCSR.GBADIE bit is 1 (enabling interrupt generation on completion of group B scan), a group B scan end interrupt request is generated.
9. When A/D conversion for all the channels completes, the ADCSR.ADST bit is automatically cleared and the A/D converter enters a wait state.



Note: w, x, y, and z (w < x < y < z) are the selected channel numbers by ADANSA0/1 or ADANSB0/1 .
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.19 Example of group priority operation 1-1: Group A trigger input during group B scanning when rescanning is enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Operation example 1-2: “Group A trigger input during rescanning of group B” when rescanning is enabled

Figure 43.20 shows the operation when a group A trigger is input during rescanning operation for group B.

Even during rescanning operation, when a trigger for group A is input, A/D conversion on group B stops and A/D conversion for group A starts. A/D conversion for group B starts after A/D conversion for group A completes.

Operations for setting the ADCSR.ADST bit, storing the A/D conversion result in the corresponding A/D Data Register y (ADDRy), and generating interrupt requests are the same as those in operation example 1-1.

3.在B组的AD转换期间输入A组的触发信号时，B组的AD转换停止，而ADCSR.ADST位保持为1。然后在ADANSA0和ADANSA1寄存器中选择的A组模拟输入通道的AD转换开始根据编号n最小的通道的转换顺序。如果AD转换在完成之前停止，则转换结果不会存储在AD数据寄存器y(ADDRy)中。

4.在通道上完成AD转换后，结果将存储在相应的AD数据寄存器y(ADDRy)中。

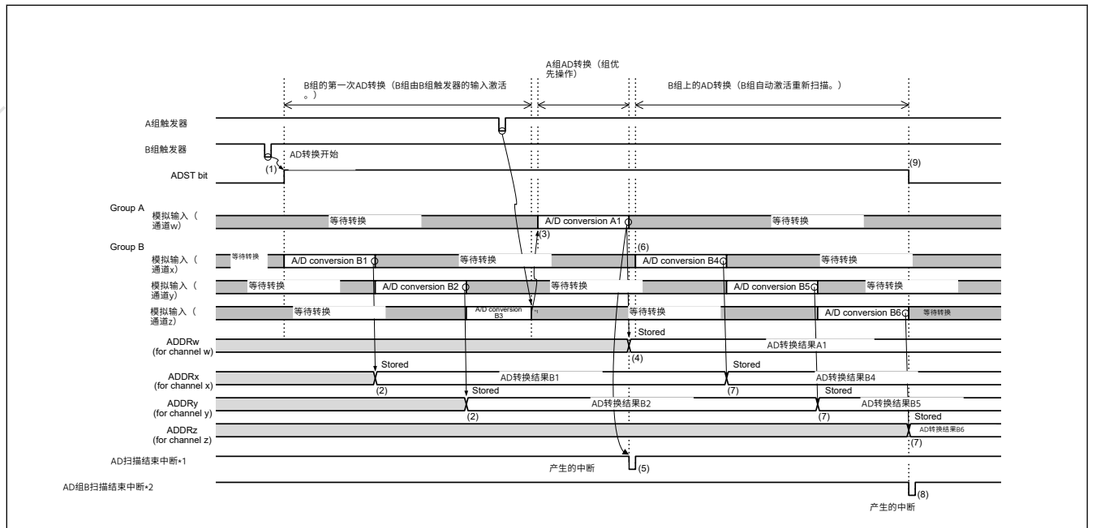
5.产生一个ADC120_ADI中断请求。

6.如果ADGSPCR.GBRSCN位设置为1（允许重新扫描在组优先操作中停止的组），则ADANSB0和ADANSB1寄存器中选择的B组模拟输入通道的AD转换根据转换顺序重新启动当ADCSR.ADST保持为1时，来自编号为n的最小通道。

7.在通道上完成AD转换后，结果将存储在相应的AD数据寄存器y(ADDRy)中。

8.如果ADCSR.GBADIE位设置为1（使能在B组扫描完成时产生中断），则产生B组扫描结束中断请求。

9.当所有通道的AD转换完成时，ADCSR.ADST位自动清零，AD转换器进入等待状态。



Note: w、x、y和z(w<x<y<z)是ADANSA01或ADANSB01选择的通道号。
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.19 组优先操作1−1示例：启用重新扫描时，在B组扫描期间A组触发输入（当ADGSPCR.GBRSCN=1、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时）

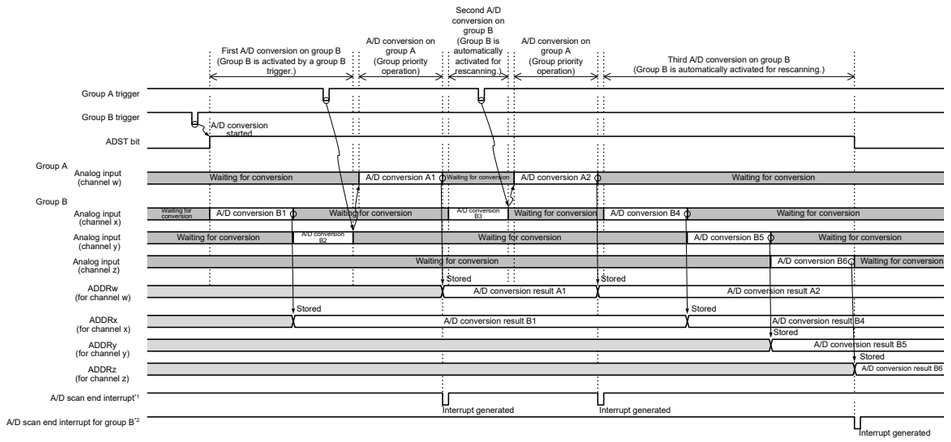
操作示例1−2：启用重新扫描时的“B组重新扫描期间A组触发输入”

图43.20显示了在B组重新扫描操作期间输入A组触发时的操作。

即使在重新扫描操作期间，当输入A组触发时，B组的AD转换停止，A组的AD转换开始。B组的AD转换在A组的AD转换完成后开始。

设置ADCSR.ADST位、将AD转换结果存储到相应的AD数据寄存器y(ADDRy)以及产生中断请求的操作与操作示例1−1中的操作相同。

RA生态工作室



Note: w, x, y, and z (w < x < y < z) are the selected channel numbers by ADANSA0/1 or ADANSB0/1.
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

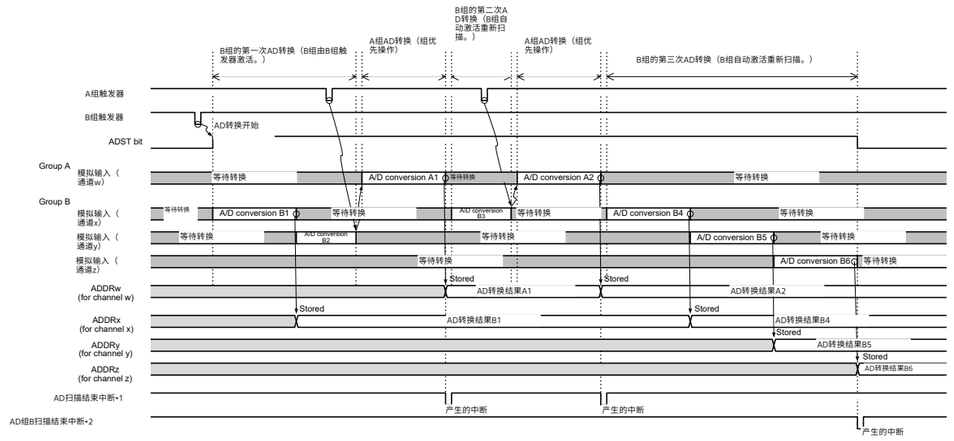
Figure 43.20 Example of group priority operation 1-2: Group A trigger input during rescanning of group B when rescanning is enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Operation example 1-3: “Group B trigger input during group A scan” when rescanning is enabled

The following describes the operation when the setting of the ADGSPCR.GBRSCN bit is 1 (enabling rescanning of the group that was stopped in group priority operation) and a trigger for group B is input during scanning operation for group A.

If the setting of the ADGSPCR.GBRSCN bit is 0, any trigger for group B that is input during scanning operation for group A is invalid.

1. When input of a trigger for group A sets the ADCSR.ADST bit to 1 (starting A/D conversion), A/D conversion for the group A analog input channels selected in the ADANSA0 and ADANSA1 registers starts according to the conversion order from the channel with the smallest number n.
2. When a trigger for group B is input during A/D conversion for group A, group B is ready for A/D conversion.
3. On completion of A/D conversion for each channel in group A, the result is stored in the corresponding A/D Data Register y (ADDRy).
4. An ADC120_ADI interrupt request is generated.
5. When A/D conversion for group A completes, while the ADCSR.ADST bit remains 1, A/D conversion for the group B analog input channels selected in the ADANSB0 and ADANSB1 registers starts according to the conversion order from the channel with the smallest number n.
   (As with the case of operation example 1-1, if a trigger for group A is input during A/D conversion for group B, A/D conversion for group A starts. Then A/D conversion for group B starts upon completion of A/D conversion for group A.)
6. On completion of A/D conversion of a single channel, the result is stored in the corresponding A/D Data Register y (ADDRy).
7. Upon completion of A/D conversion for group B, a group B scan end interrupt request is generated if the setting of the ADCSR.GBADIE bit is 1 (enabling interrupt generation on completion of group B scan).
8. When A/D conversion for all the channels completes, the ADCSR.ADST bit is automatically cleared and the A/D converter enters a wait state.



Note: w、x、y和z(w<x<y<z)是ADANSA01或ADANSB01选择的通道号。
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.20 组优先操作1−2示例：启用重新扫描时（当ADGSPCR.GBRSCN=1、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时）在B组重新扫描期间A组触发输入

操作示例1−3：启用重新扫描时的“A组扫描期间B组触发输入”

下面介绍当ADGSPCR.GBRSCN位设置为1（允许重新扫描在组优先操作中停止的组）并且在A组扫描操作期间输入B组触发器时的操作。

如果ADGSPCR.GBRSCN位设置为0，则在组扫描操作期间输入的任何组B触发A无效。

1.当A组的触发输入将ADCSR.ADST位设置为1（开始AD转换）时，ADANSA0和ADANSA1寄存器中选择的A组模拟输入通道的AD转换根据通道的转换顺序开始最小的数n。

2.在A组AD转换期间输入B组触发器时，B组准备好进行AD转换。

3.A组中每个通道的AD转换完成后，将结果存储在相应的AD数据寄存器y(ADDRy)中。

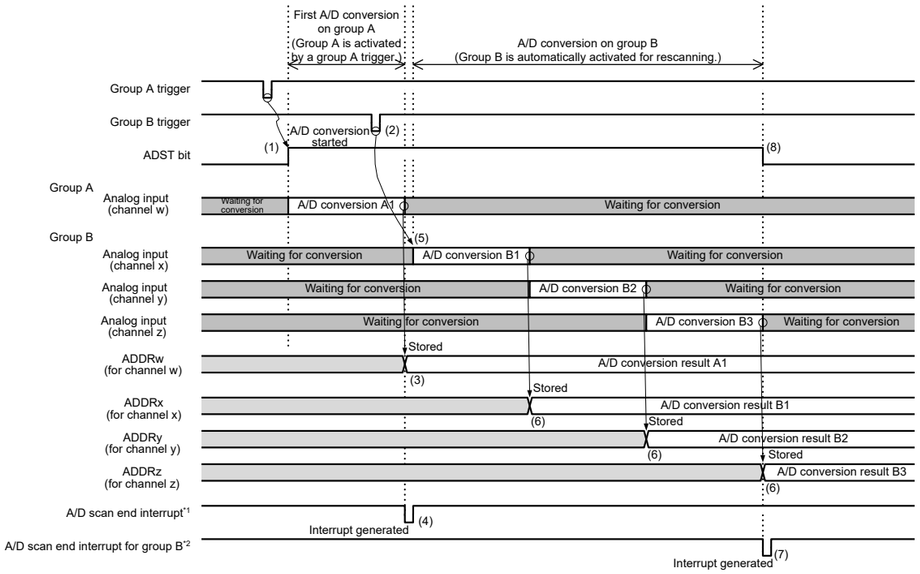
4.产生一个ADC120_ADI中断请求。

5.当A组的AD转换完成，而ADCSR.ADST位保持为1时，ADANSB0和ADANSB1寄存器中选择的B组模拟输入通道的AD转换按照编号n最小通道的转换顺序开始。（与操作示例1−1的情况一样，如果在B组的AD转换期间输入了A组的触发信号，则A组的AD转换开始。然后，在A组的AD转换完成后，开始B组的AD转换。）

6.单通道AD转换完成后，结果存入对应的AD数据寄存器y(ADDRy)。

7.B组的AD转换完成后，如果ADCSR.GBADIE位设置为1，则产生B组扫描结束中断请求（在B组扫描完成时允许产生中断）。

8.当所有通道的AD转换完成时，ADCSR.ADST位自动清零，AD转换器进入等待状态。



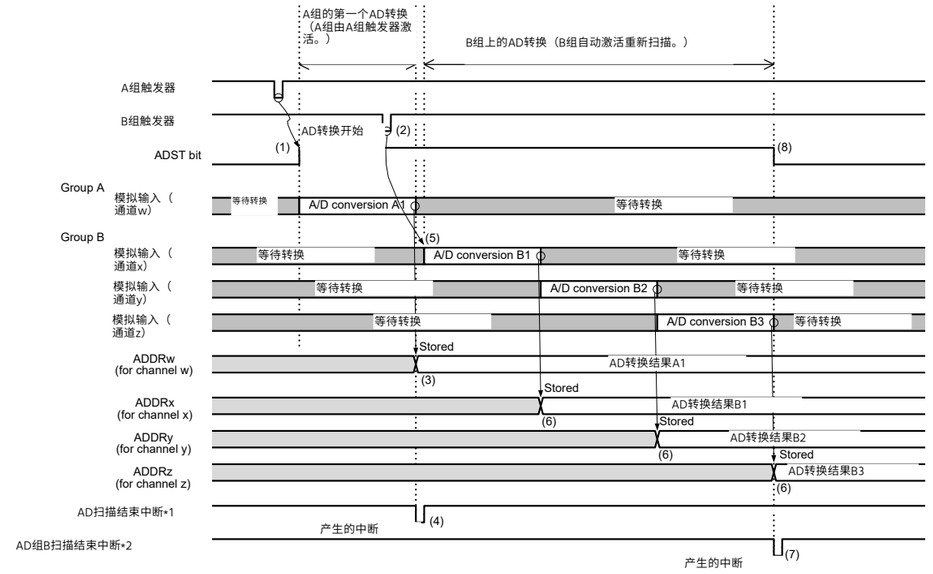
Note: w, x, y, and z (w < x < y < z) are the selected channel numbers by ADANSA0/1 or ADANSB0/1.
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.21 Example of group priority operation 1-3: Group B trigger input during group A scan when rescanning is enabled (when ADGSPCR.GBRSCN = 1, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Operation example 1-4 shows the group priority operation in group-scan mode (when ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 to 3 are selected for group B.

Operation example 1-4: “Group A trigger input during group B scan” when rescanning is disabled

1. When input of a trigger for group B sets the ADCSR.ADST bit to 1 (starting A/D conversion), A/D conversion for the analog input channels selected in the ADANSB0 and ADANSB1 registers starts according to the conversion order from the channel with the smallest number n.
2. On completion of A/D conversion for each channel in group B, the result is stored in the corresponding A/D Data Register y (ADDRy).
3. When a trigger for group A is input during A/D conversion for group B, A/D conversion for group B stops while the ADCSR.ADST bit remains 1, and then A/D conversion for the group A analog input channels selected in the ADANSA0 and ADANSA1 registers starts according to the conversion order from the channel with the smallest number n. If A/D conversion stops before it is completed, the conversion result is not stored in the A/D Data Register y (ADDRy).
4. On completion of A/D conversion of a single channel, the result is stored in the corresponding A/D Data Register y (ADDRy).
5. On completion of A/D conversion for group A, an ADC120_ADI interrupt request is generated.
6. When A/D conversion for group A completes, the ADCSR.ADST bit is automatically cleared and the A/D converter enters a wait state. A/D conversion for group B is not performed until a trigger for group B is input the next time.



Note: w、x、y和z(w<x<y<z)是ADANSA01或ADANSB01选择的通道号。
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.21 组优先操作1−3示例：启用重新扫描时A组扫描期间的B组触发输入（当ADGSPCR.GBRSCN=1、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时）

操作示例1−4显示了组扫描模式下的组优先级操作（当ADGSPCR.GBRSCN=0时，ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0)当为A组选择通道0并且为B组选择通道1至3时。

操作示例1−4：禁用重新扫描时的“B组扫描期间A组触发输入”

1.当B组的触发输入将ADCSR.ADST位设置为1（开始AD转换）时，ADANSB0和ADANSB1寄存器中选择的模拟输入通道的AD转换按照转换顺序从最小通道开始号码n.

2.B组中每个通道的AD转换完成后，将结果存储在相应的AD数据寄存器y(ADDRy)中。

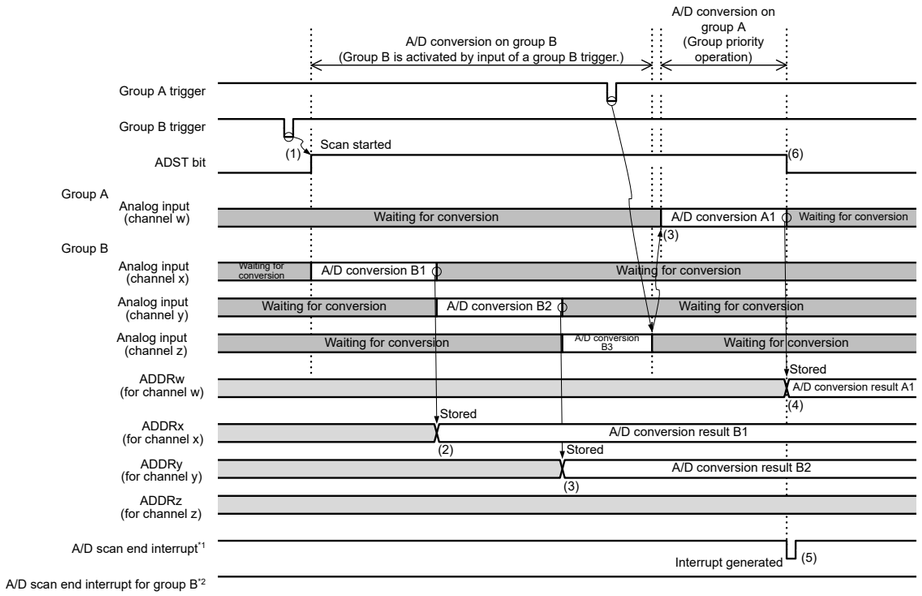
3.在B组AD转换期间输入A组触发时，在ADCSR.ADST位保持1时停止B组AD转换，然后在

ADANSA0和ADANSA1寄存器按照转换顺序从编号n最小的通道开始。如果AD转换在完成之前停止，则转换结果不会存储在AD数据寄存器y(ADDRy)中。

4.单通道AD转换完成后，结果存入对应的AD数据寄存器y(ADDRy)。

5.A组AD转换完成后，会产生ADC120_ADI中断请求。

6.当A组的AD转换完成时，ADCSR.ADST位自动清零，AD转换器进入等待状态。直到下次输入B组的触发后，才会执行B组的AD转换。



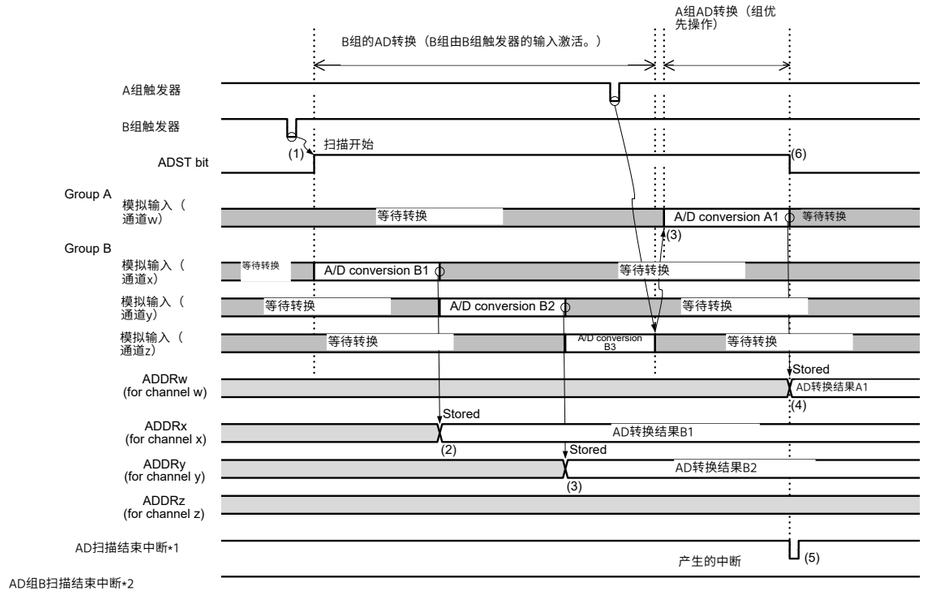
Note: w, x, y, and z (w < x < y < z) are the selected channel numbers by ADANSA0/1 or ADANSB0/1.
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.22 Group priority operation example 1-4: “Group A trigger is input during group B scan” when rescanning is disabled (when ADGSPCR.GBRSCN = 0, ADGSPCR.GBRP = 0, and ADGSPCR.LGRRS = 0)

Operation example 1-5 shows the group priority operation in group-scan mode (when ADGSPCR.GBRP = 1, and ADGSPCR.LGRRS = 0) when channel 0 is selected for group A and channels 1 and 2 are selected for group B.

Operation example 1-5: Continuously activating single-scan operation for group B

1. When ADGSPCR.GBRP = 1 is set, the ADCSR.ADST bit is set to 1 (starting A/D conversion) and A/D conversion for the analog input channels selected in the ADANSB0 and ADANSB1 registers starts according to the conversion order from the channel with the smallest number n.
2. On completion of A/D conversion for each channel in group B, the result is stored in the corresponding A/D Data Register y (ADDRy).
3. When a trigger for group A is input during A/D conversion for group B, A/D conversion for group B stops while the ADCSR.ADST bit remains 1, and then A/D conversion for group A analog input channels selected in the ADANSA0 and ADANSA1 registers starts according to the conversion order zfrom the channel with the smallest number n. If A/D conversion stops before it is completed, the conversion result is not stored in the A/D Data Register y (ADDRy).
4. On completion of A/D conversion of a single channel, the result is stored in the corresponding A/D Data Register y (ADDRy).
5. On completion of A/D conversion for group A, an ADC120_ADI interrupt request is generated.
6. If ADGSPCR.GBRP = 1 is set (performing single scan continuously), A/D conversion for the group B analog input channels selected in the ADANSB0 and ADANSB1 registers restarts according to the conversion order from the channel with the smallest number n while the ADCSR.ADST remains 1 (starting A/D conversion).
7. On completion of A/D conversion of a single channel, the result is stored in the corresponding A/D Data Register y (ADDRy).



Note: w、x、y和z(w<x<y<z)是ADANSA01或ADANSB01选择的通道号。
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.22 组优先操作示例1−4：“在B组扫描期间输入A组触发”当禁用重新扫描时（当ADGSPCR.GBRSCN=0、ADGSPCR.GBRP=0和ADGSPCR.LGRRS=0时）

操作示例1−5显示了组扫描模式下的组优先级操作（当ADGSPCR.GBRP=1，并且ADGSPCR.LGRRS=0)当为A组选择通道0并且为B组选择通道1和2时。

操作示例1−5：B组连续激活单扫描操作

1.当设置ADGSPCR.GBRP=1时，ADCSR.ADST位设置为1（开始AD转换），并且ADANSB0和ADANSB1寄存器中选择的模拟输入通道的AD转换根据通道的转换顺序开始最小的数n。

2.B组中每个通道的AD转换完成后，将结果存储在相应的AD数据寄存器y(ADDRy)中。

3.在B组的AD转换期间输入A组的触发信号时，B组的AD转换停止，而ADCSR.ADST位保持为1，然后在ADANSA0和ADANSA1寄存器中选择的A组模拟输入通道的AD转换开始根据编号为n的通道的转换顺序z。如果AD转换在完成之前停止，则转换结果不会存储在AD数据寄存器y(ADDRy)中。

4.单通道AD转换完成后，结果存入对应的AD数据寄存器y(ADDRy)。

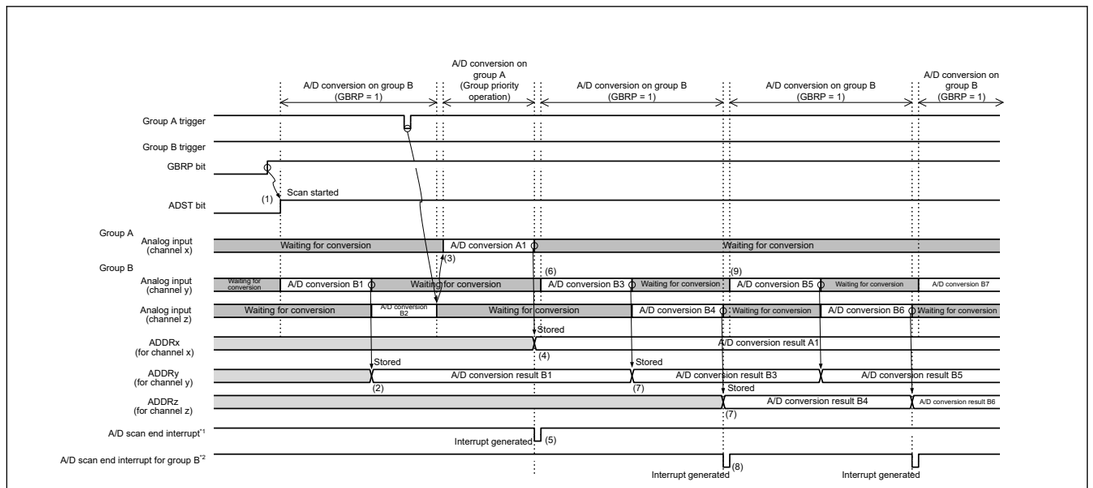
5.A组AD转换完成后，会产生ADC120_ADI中断请求。

6.如果设置ADGSPCR.GBRP=1（连续执行单次扫描），B组模拟输入的AD转换
在ADANSB0和ADANSB1寄存器中选择的通道根据转换顺序从具有最小编号n的通道重新启动，而ADCSR.ADST保持为1（开始AD转换）。

7.单通道AD转换完成后，结果存入对应的AD数据寄存器y(ADDRy)。

8. If the setting of the ADCSR.GBADIE bit is 1 (enabling interrupt generation on completion of group B scan), a group B scan end interrupt request is generated.
9. If ADGSPCR.GBRP = 1 is set (performing single scan continuously), A/D conversion for the group B analog input channels selected in the ADANSB0 and ADANSB1 registers restarts according to the conversion order from the channel with the smallest number n while the ADCSR.ADST remains 1 (starting A/D conversion).

Steps 6 to 9 are repeated as long as the ADGSPCR.GBRP bit remains 1. Do not clear the ADCSR.ADST bit as long as the ADGSPCR.GBRP bit is 1. To forcibly stop A/D conversion while ADGSPCR.GBRP = 1, follow the procedure shown in Figure 43.38.



Note: x, y, and z (x < y < z) are the selected channel numbers by ADANSA0/1 or ADANSB0/1.
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.23 Group priority operation example 1-5: Continuously activating single scan for group B (when ADGSPCR.GBRP = 1 , ADGSPCR.LGRRS = 0)

Note: To continuously activate single-scan operation for group B, disable group B trigger input.

43.3.5 Interleaved operation

Interleaved operation is that two ADC units convert same one pin alternately in order to obtain the data faster. This function can be used with the channel AN000/AN100, AN001/AN101 or AN002/AN102 and can be used in single scan mode and continuous scan mode. Regarding trigger, synchronous trigger and external trigger are suitable to use. It is recommended to use synchronous trigger with AGT or GPT events in order to ensure AD conversion timing.

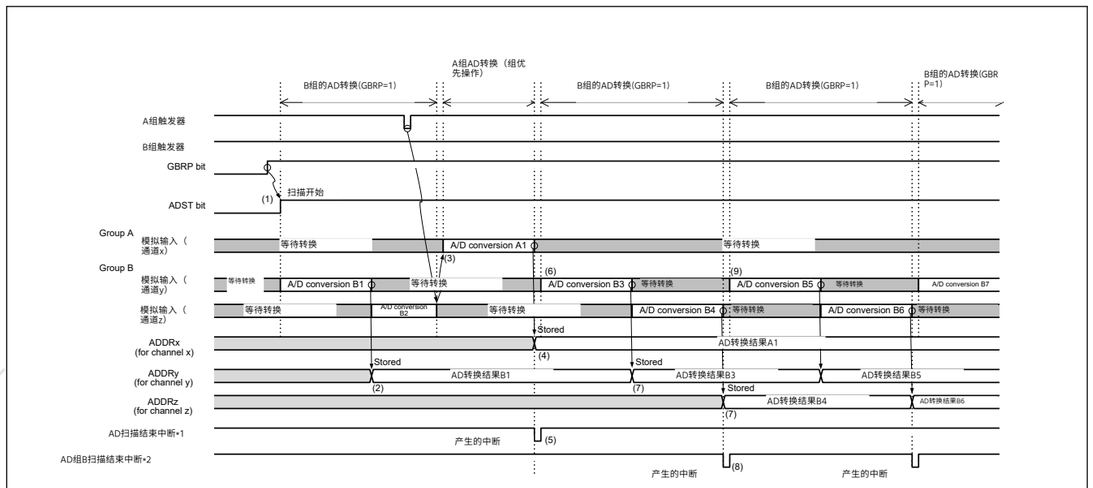
43.3.5.1 Trigger input timing

Trigger input timing for each ADC units should be controlled not to overlap each sampling period as shown in Figure 43.24 and Table 43.26. For timing parameter (t_{SPL}, t_{SAM} and t_{SCAN}), refer to Table 43.27.

8.如果ADCSR.GBADIE位设置为1（使能在B组扫描完成时产生中断），则产生B组扫描结束中断请求。

9.如果设置ADGSPCR.GBRP=1（连续执行单次扫描），B组模拟输入的AD转换
在ADANSB0和ADANSB1寄存器中选择的通道根据转换顺序从具有最小编号n的通道重新启动，而ADCSR.ADST保持为1（开始AD转换）。

只要ADGSPCR.GBRP位保持为1，就重复步骤6到9。不要清除ADCSR.ADST位，只要ADGSPCR.GBRP位为1。要在ADGSPCR.GBRP=1时强制停止AD转换，请按照以下步骤进行操作
Figure 43.38.



Note: x、y和z(x<y<z)是ADANSA01或ADANSB01选择的通道号。
Note 1. ADC12i_ADI (i = 0, 1)
Note 2. ADC12i_GBADI (i = 0, 1)

Figure 43.23 组优先操作示例1−5：B组连续激活单次扫描（当ADGSPCR.GBRP = 1 , ADGSPCR.LGRRS = 0)

Note: 要连续激活B组的单次扫描操作，请禁用B组触发输入。

43.3.5 Interleaved operation

交错操作是两个ADC单元交替转换相同的一个引脚以更快地获取数据。此功能可与通道AN000AN100、AN001AN101或AN002AN102一起使用，可用于单次扫描模式和连续扫描模式。关于触发，适合使用同步触发和外触发。建议使用与AGT或GPT事件同步触发，以确保AD转换时序。

43.3.5.1 触发输入时序

每个ADC单元的触发输入时序应控制为不与每个采样周期重叠，如图43.24和表43.26所示。关于时序参数（tSPL、tSAM和tSCAN），请参见表43.27。

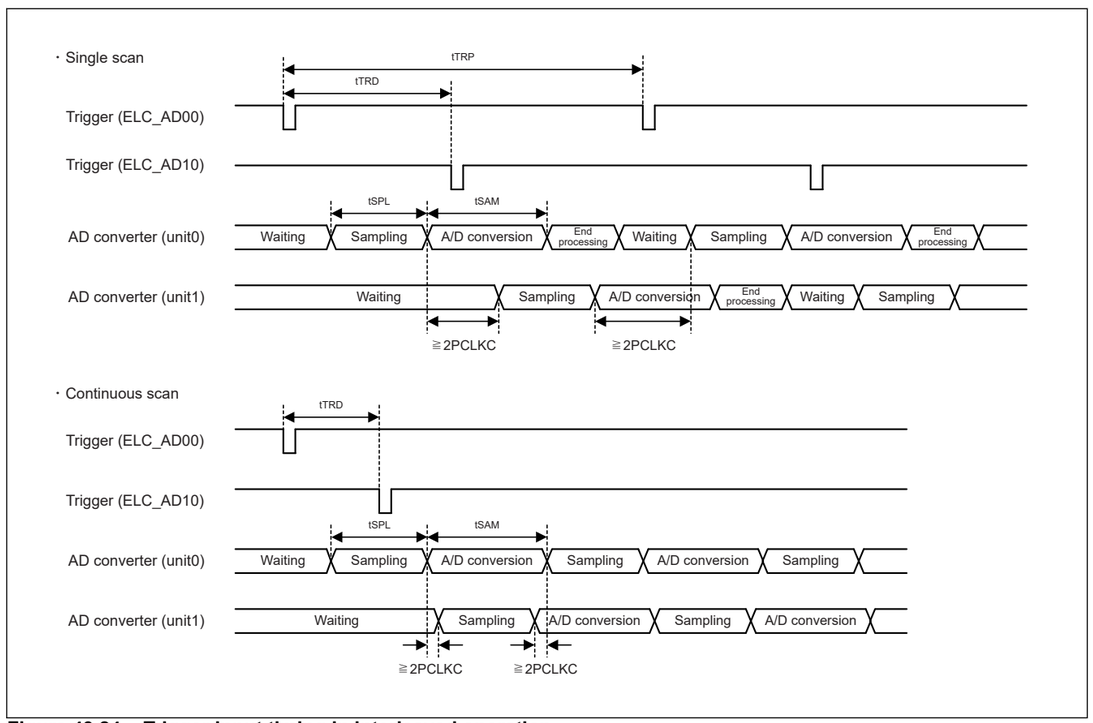


Figure 43.24 Trigger input timing in interleaved operation

Table 43.26 Setting for trigger input timing in interleaved operation

Parameter		Symbol	Min	Max
Trigger issuance delay period	Single scan	t_{TRD}	t_{SPL} + 2PCLKC	t_{TRP} - t_{SPL} - 2PCLKC
	Continuous scan	t_{TRD}	t_{SPL} + 2PCLKC	t_{SAM} - 2PCLKC
Trigger issuance period		t_{TRP}	tSCAN	—

43.3.5.2 Continuous scan mode

In this operation, assuming two ADC units are set to the same sampling period and conversion period.

The operation is as follows:

1. When the ADCSR.ADST bit of ADC0 is set to 1 by a synchronous trigger input (ELC) or asynchronous trigger input, A/D conversion is performed for the selected channel.
2. After certain period is elapsed after ADC0 starts (refer to section 43.3.5.1. Trigger input timing), when ADCSR.ADST bit of ADC1 is set to 1 by a synchronous trigger input (ELC) or asynchronous trigger input for the channel which is same analog input pin with ADC0.
3. A/D conversion of ADC0 completes prior to completion of ADC1. Then ADC120_ADI interrupt request is generated. ADC0 sequentially starts A/D conversion. A/D conversion is continued as long as ADCSR.ADST remains 1.
4. A/D conversion of ADC1 completes after completion of ADC0. Then ADC121_ADI interrupt request is generated. A/D conversion of ADC1 is continued as well as ADC0.

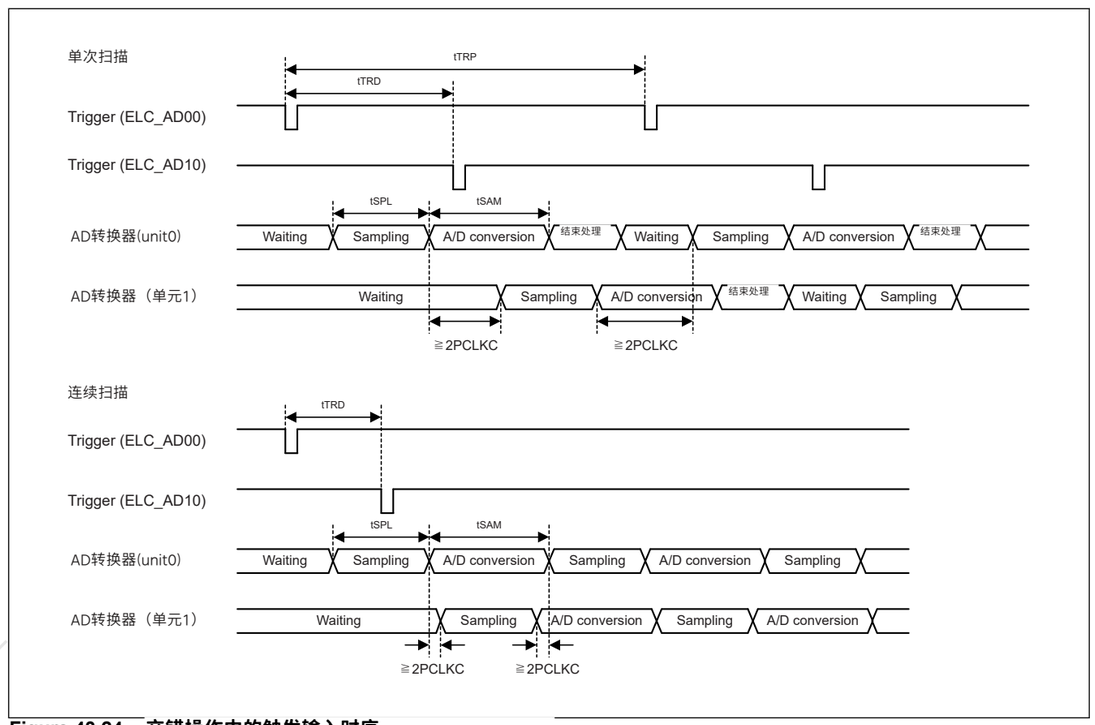

Figure 43.24 交错操作中的触发输入时序

Table 43.26 交错操作中触发输入时序的设置

Parameter		Symbol	Min	Max
触发发行延迟期	单次扫描	t_{TRD}	t_{SPL} + 2PCLKC	t_{TRP} - t_{SPL} - 2PCLKC
	连续扫描	t_{TRD}	t_{SPL} + 2PCLKC	t_{SAM} - 2PCLKC
触发发行期		t_{TRP}	tSCAN	—

43.3.5.2 连续扫描模式

在此操作中，假设两个ADC单元设置为相同的采样周期和转换周期。

操作如下：

1.当同步触发输入(ELC)或异步触发输入将ADC0的ADCSR.ADST位设置为1时，对所选通道执行AD转换。

2.ADC0启动后经过一定时间后（请参阅第43.3.5.1节。触发输入时序），当ADC1的ADCSR.ADST位通过同步触发输入(ELC)或异步触发输入设置为1的通道时，是与ADC0相同的模拟输入引脚。

3.ADC0的AD转换在ADC1完成之前完成。然后产生ADC120_ADI中断请求。ADC0依次启动AD转换。只要ADCSR.ADST保持1，D转换就会继续。

4.ADC0完成后，ADC1的AD转换完成。然后产生ADC121_ADI中断请求。ADC1的D转换与ADC0一样继续进行。

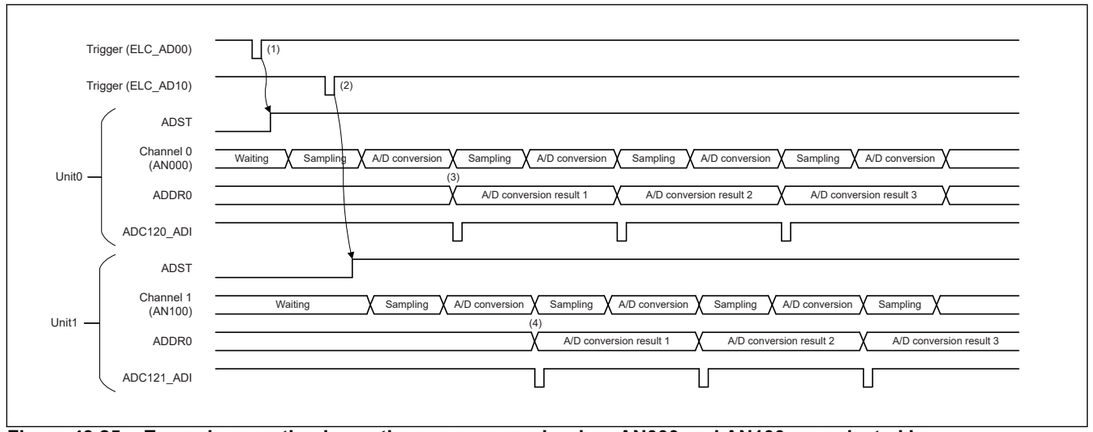

Figure 43.25 Example operation in continuous scan mode when AN000 and AN100 are selected in interleaved operation

43.3.5.3 Single scan mode

In this operation, assuming two ADC units are set to the same sampling period and conversion period.

The operation is as follows:

1. When the ADCSR.ADST bit of ADC0 is set to 1 by a synchronous trigger input (ELC) or asynchronous trigger input, A/D conversion is performed for the selected channel.
2. After certain period is elapsed after ADC0 starts (refer to section 43.3.5.1. Trigger input timing), when ADCSR.ADST bit of ADC1 is set to 1 by a synchronous trigger input (ELC) or asynchronous trigger input for the channel which is same analog input pin with ADC0.
3. A/D conversion of ADC0 completes prior to completion of ADC1. Then ADC120_ADI interrupt request is generated.
4. When A/D conversion of ADC0 completes, ADCSR.ADST bit is automatically cleared to 0. Then ADC120 enters a wait state.
5. Restart A/D conversion of ADC0. Let the sampling starts during conversion period of ADC1.
6. A/D conversion of ADC1 completes after the restart of ADC0. Then ADC121_ADI interrupt request is generated.
7. When A/D conversion of ADC1 completes, ADCSR.ADST bit is automatically cleared to 0. Then ADC121 enters a wait state.
8. Restart A/D conversion of ADC1. Let the sampling starts during conversion period of ADC0.

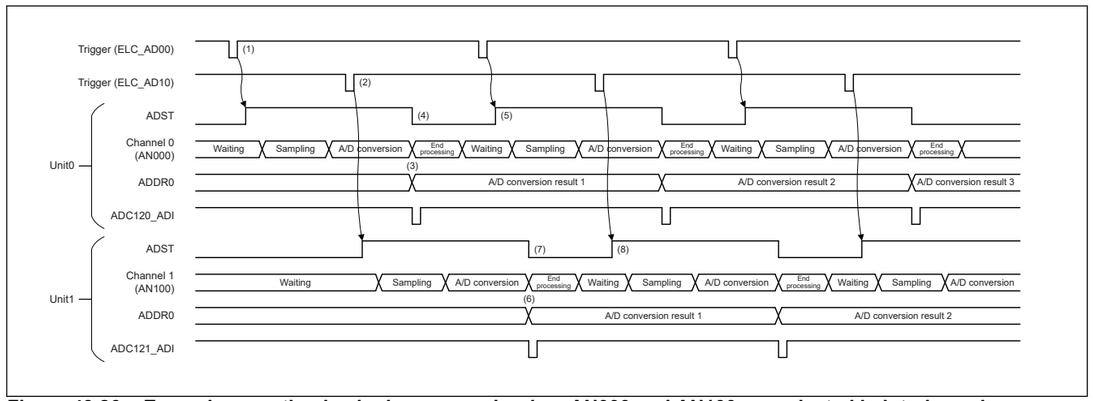

Figure 43.26 Example operation in single scan mode when AN000 and AN100 are selected in interleaved operation

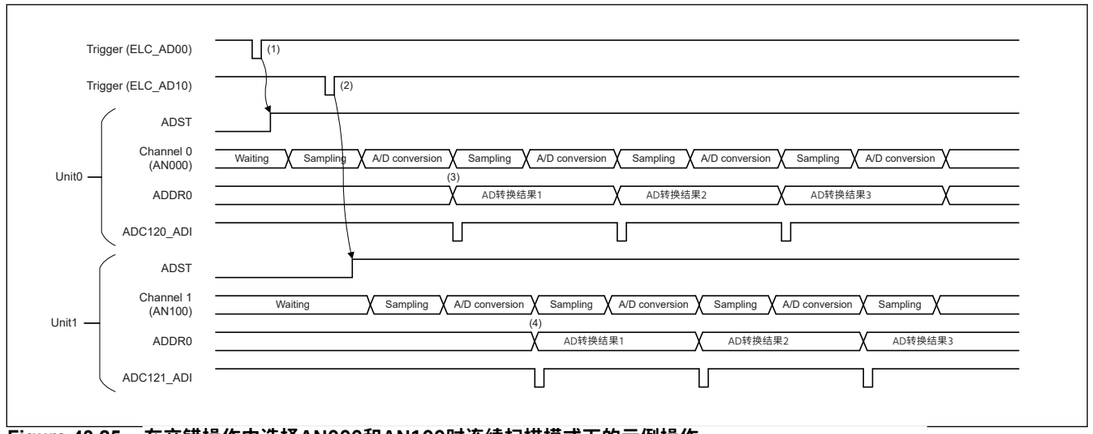

Figure 43.25 在交错操作中选择AN000和AN100时连续扫描模式下的示例操作

43.3.5.3 单次扫描模式

在此操作中，假设两个ADC单元设置为相同的采样周期和转换周期。

操作如下：

1.当同步触发输入(ELC)或异步触发输入将ADC0的ADCSR.ADST位设置为1时，对所选通道执行AD转换。

2.ADC0启动后经过一定时间后（请参阅第43.3.5.1节。触发输入时序），当ADC1的ADCSR.ADST位通过同步触发输入(ELC)或异步触发输入设置为1的通道时，是与ADC0相同的模拟输入引脚。

3.ADC0的AD转换在ADC1完成之前完成。然后产生ADC120_ADI中断请求。

4.ADC0的AD转换完成后，ADCSR.ADST位自动清0。ADC120进入等待状态。

5.重启ADC0的AD转换。让采样在ADC1的转换期间开始。

6.ADC0重启后ADC1的AD转换完成。然后产生ADC121_ADI中断请求。

7.ADC1AD转换完成后，ADCSR.ADST位自动清0。ADC121进入等待状态。

8.重新启动ADC1的AD转换。让采样在ADC0的转换期间开始。

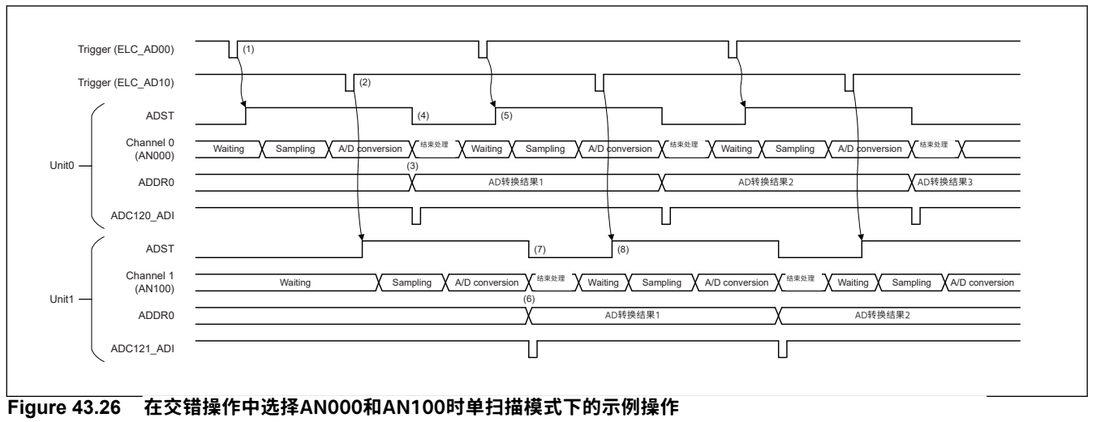

Figure 43.26 在交错操作中选择AN000和AN100时单扫描模式下的示例操作

43.3.5.4 Single scan mode with extended double-trigger mode

In this operation, assuming two ADC units are set to the same sampling period and conversion period.

For details of operation in extended double-trigger mode, please refer to section 43.3.2.5. Extended operations when double-trigger mode is selected.

This operation can decimate period of interrupt generation and the conversion data can be read in consecutive address with ADDBLDRA and ADDBLDRB register.

The operation is as follows:

1. When the ADCSR.ADST bit of ADC0 is set to 1 by a synchronous trigger input (ELC_AD00), A/D conversion starts on the single channel selected in the ADCSR.DBLANS[4:0] bits.
2. After certain period is elapsed after ADC0 starts (refer to section 43.3.5.1. Trigger input timing), when ADCSR.ADST bit of ADC1 is set to 1 by a synchronous trigger input (ELC_AD10) for the channel which is same analog input pin with ADC0.
3. A/D conversion of ADC0 completes prior to completion of ADC1. The A/D conversion result is stored in the ADC0's associated A/D Data Register y (ADDRy) and in A/D Data Duplexing Register A (ADDBLDRA).
4. The ADCSR.ADST bit is automatically cleared to 0 and the ADC120 enters a wait state. An ADC120_ADI interrupt request is not generated.
5. Restart A/D conversion of ADC0 by a synchronous trigger input (ELC_AD01). Let the sampling starts during conversion period of ADC1.
6. A/D conversion of ADC1 completes. The A/D conversion result is stored in the ADC1's associated A/D Data Register y (ADDRy) and in A/D Data Duplexing Register A (ADDBLDRA).
7. The ADCSR.ADST bit is automatically cleared to 0 and the ADC121 enters a wait state. An ADC121_ADI interrupt request is not generated.
8. Restart A/D conversion of ADC1 by a synchronous trigger input (ELC_AD11). Let the sampling starts during conversion period of ADC0.
9. A/D conversion of ADC0 completes. The A/D conversion result is stored in the ADC0's A/D Data Duplexing Register (ADDBLDR) and in A/D Data Duplexing Register B (ADDBLDRB).
10. The ADCSR.ADST bit is automatically cleared to 0 and the ADC120 enters a wait state. An ADC120_ADI interrupt request is generated.
11. Restart A/D conversion of ADC0 by a synchronous trigger input (ELC_AD00). Let the sampling starts during conversion period of ADC1.
12. A/D conversion of ADC1 completes. The A/D conversion result is stored in the ADC1's A/D Data Duplexing Register (ADDBLDR) and in A/D Data Duplexing Register B (ADDBLDRB).
13. The ADCSR.ADST bit is automatically cleared to 0 and the ADC121 enters a wait state. An ADC121_ADI interrupt request is generated.
14. Restart A/D conversion of ADC1 by a synchronous trigger input (ELC_AD10). Let the sampling starts during conversion period of ADC0.

43.3.5.4 具有扩展双触发模式的单扫描模式

在此操作中，假设两个ADC单元设置为相同的采样周期和转换周期。

扩展双触发模式下的操作细节请参考43.3.2.5节。选择双触发模式时的扩展操作。

此操作可以抽取中断产生的周期，并且可以在连续地址中读取转换数据ADDBLDRA和ADDBLDRB寄存器。

操作如下：

1.当同步触发输入(ELC_AD00)将ADC0的ADCSR.ADST位设置为1时，ADCSR.DBLANS[4:0]位中选择的单通道开始AD转换。

2.ADC0启动后经过一定时间后（请参阅第43.3.5.1节。触发输入时序），当ADC1的ADCSR.ADST位被同步触发输入(ELC_AD10)设置为1时，对于相同的模拟输入通道引脚与ADC0。

3.ADC0的AD转换在ADC1完成之前完成。AD转换结果存储在ADC0相关的AD数据寄存器y(ADDRy)和AD数据双工寄存器A(ADDBLDRA)中。

4.ADCSR.ADST位自动清零，ADC120进入等待状态。不会产生ADC120_ADI中断请求。

5.通过同步触发输入(ELC_AD01)重新启动ADC0的AD转换。让采样在ADC1的转换期间开始。

6.ADC1的AD转换完成。AD转换结果存储在ADC1相关的AD数据寄存器y(ADDRy)和AD数据双工寄存器A(ADDBLDRA)中。

7.ADCSR.ADST位自动清零，ADC121进入等待状态。不会产生ADC121_ADI中断请求。

8.通过同步触发输入(ELC_AD11)重新启动ADC1的AD转换。让采样在ADC0的转换期间开始。

9.ADC0的AD转换完成。AD转换结果存储在ADC0的AD数据双工寄存器(ADDBLDR)和AD数据双工寄存器B(ADDBLDRB)中。

10.ADCSR.ADST位自动清零，ADC120进入等待状态。产生一个ADC120_ADI中断请求。

11.通过同步触发输入(ELC_AD00)重新启动ADC0的AD转换。让采样在ADC1的转换期间开始。

12.ADC1的AD转换完成。AD转换结果存储在ADC1的AD数据双工寄存器(ADDBLDR)和AD数据双工寄存器B(ADDBLDRB)中。

13.ADCSR.ADST位自动清零，ADC121进入等待状态。产生一个ADC121_ADI中断请求。

14.通过同步触发输入(ELC_AD10)重新启动ADC1的AD转换。让采样在ADC0的转换期间开始。

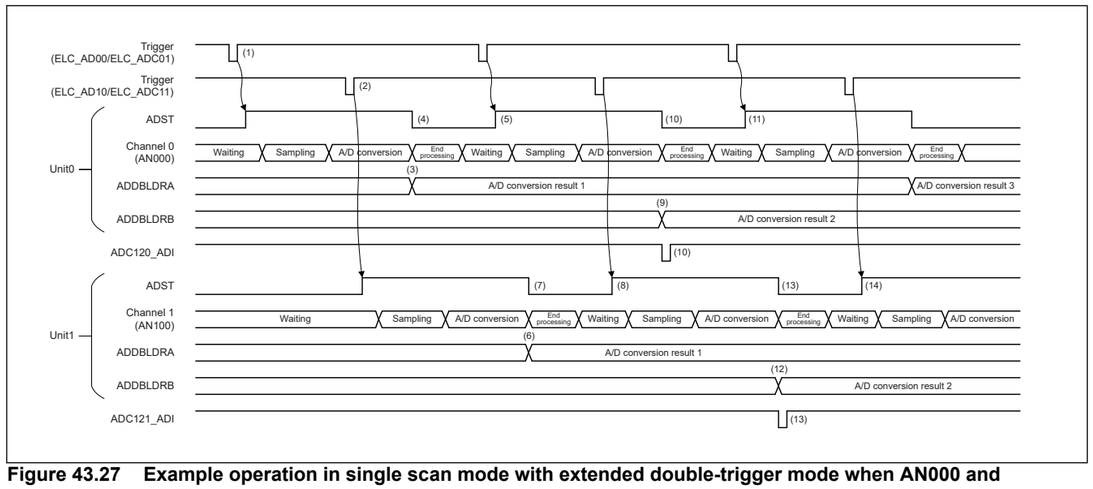

Figure 43.27 Example operation in single scan mode with extended double-trigger mode when AN000 and AN100 are selected in interleaved operation

43.3.6 Compare Function for Windows A and B

43.3.6.1 Compare function windows A and B

The compare function compares a reference value with the A/D conversion result. The reference value can be set for Window A and Window B independently. When the compare function is in use, the self-diagnosis function and double trigger mode cannot be used. The main differences between Window A and Window B are their different interrupt output signals and the constraint on Window B of only one selectable channel.

This section provides an example operation that combines continuous scan mode and the compare function.

The operation is as follows:

1. When the ADCSR.ADST bit is set to 1 (A/D conversion start) by software, a synchronous trigger (ELC) or an asynchronous trigger, A/D conversion starts in the order of the selected channels, temperature sensor, and internal reference voltage.
2. On completion of A/D conversion, the A/D conversion result is stored in the associated A/D Data Register y (ADDRy, ADTSDR, or ADOCDR). When ADCMPCR.CMPAE = 1, if bits in the ADCMPANSRy register or the ADCMPANSER register are set for Window A, the A/D conversion result is compared with the set ADCMPDR0/1 register value. When ADCMPCR.CMPBE = 1, if bits in the ADCMPBNSR register are set for Window B, the A/D conversion result is compared with the ADWINULB/ADWINLLB register setting.
3. As a result of the comparison, when Window A meets the condition set in ADCMPLR0/1 or ADCMPLER, the Compare Window A Flag (ADCMPSR0.CMPSTCHAn, ADCMPSR1.CMPSTCHAn, ADCMPSER.CMPSTTSA, or ADCMPSER.CMPSTOCA) sets 1. At this time, if the ADCMPCR.CMPAIE bit is 1, an ADC12i_CMPAI (i = 0, 1) interrupt request is generated. In the same way, when Window B meets the condition set in ADCMPBNSR.CMPLB, the Compare Window B Flag (ADCMPBSR.CMPSTB) sets to 1. At this time, if the ADCMPCR.CMPBIE bit is 1, an ADC12i_CMPBI (i = 0, 1) interrupt request is generated.
4. On completion of all selected A/D conversions and comparisons, scan restarts.
5. After the ADC12i_CMPAI (i = 0, 1) and ADC12i_CMPBI (i = 0, 1) interrupts are accepted, the ADCSR.ADST bit is set to 0 (A/D conversion stop) and processing is performed for channels for which the compare flag is set to 1.
6. When all compare flags of Window A are cleared, the ADC12i_CMPAI (i = 0, 1) interrupt request is canceled. In the same way, when all compare flags of Window B are cleared, the ADC12i_CMPBI (i = 0, 1) interrupt request is reset. To perform comparison again, restart the A/D conversion.

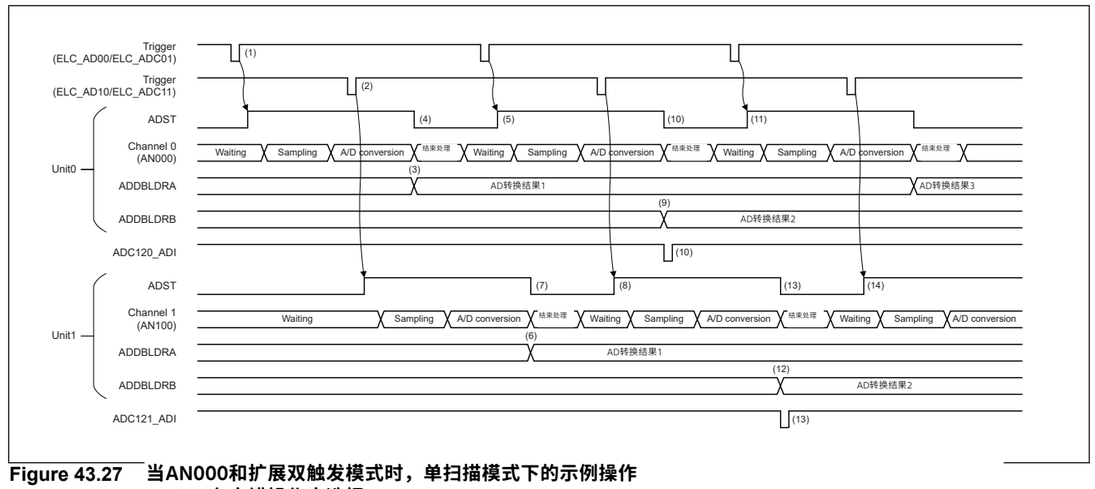

Figure 43.27 当AN000和扩展双触发模式时，单扫描模式下的示例操作 AN100在交错操作中选择

43.3.6 比较WindowsA和B的函数

43.3.6.1 比较功能窗口A和B

比较功能将参考值与AD转换结果进行比较。参考值可设置为
窗口A和窗口B独立。使用比较功能时，不能使用自诊断功能和双触发模式。WindowA和WindowB的主要区别在于它们的中断输出信号不同以及WindowB只能选择一个通道的限制。

本节提供结合连续扫描模式和比较功能的示例操作。

操作如下：

1.当ADCSR.ADST位通过软件设置为1（AD转换开始）时，同步触发(ELC)或
异步触发，AD转换按所选通道、温度传感器和内部参考电压的顺序开始。

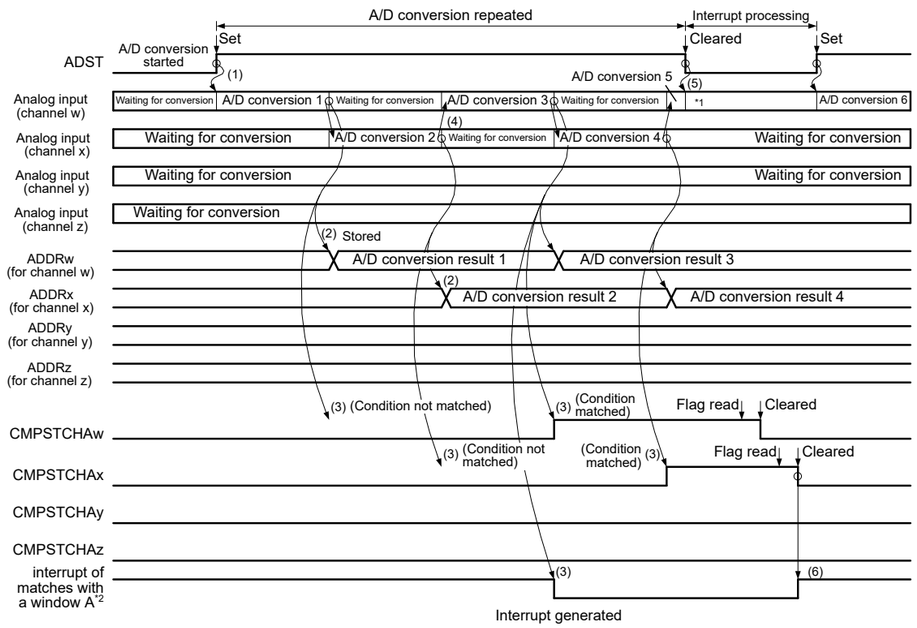
2.AD转换完成后，AD转换结果存储在相关的AD数据寄存器y（ADDRy、ADTSDR或ADOCDR）中。当ADCMPCR.CMPAE=1时，如果ADCMPANSRy寄存器或ADCMPANSER寄存器中的位为窗口A设置，则AD转换结果将与设置的ADCMPDR01寄存器值进行比较。当ADCMPCR.CMPBE=1时，如果ADCMPBNSR寄存器中的位为窗口B设置，则将AD转换结果与ADWINULBADWINLLB寄存器设置进行比较。

3.作为比较的结果，当窗口A满足在ADCMPLR01或ADCMPLER中设置的条件时，比较窗口A标志（ADCMPSR0.CMPSTCHAn、ADCMPSR1.CMPSTCHAn、ADCMPSER.CMPSTTSA或
ADCMPSER.CMPSTOCA)设置为1。此时，如果ADCMPCR.CMPAIE位为1，则产生ADC12i_CMPAI(i=0 1)中断请求。同样，当窗口B满足ADCMPBNSR.CMPLB中设置的条件时，比较窗口B标志（ADCMPBSR.CMPSTB）设置为1。此时，如果ADCMPCR.CMPBIE位为1，则
ADC12i_CMPBI(i=0 1)中断请求产生。

4.完成所有选定的AD转换和比较后，重新开始扫描。

5.接受ADC12i_CMPAI(i=0 1)和ADC12i_CMPBI(i=0 1)中断后，ADCSR.ADST位设置为0（A/D转换停止）并对比较标志的通道执行处理设置为1。

6.当窗口A的所有比较标志被清除时，ADC12i_CMPAI(i=0 1)中断请求被取消。在里面
同样，当窗口B的所有比较标志都被清除时，ADC12i_CMPBI(i=0 1)中断请求被复位。要再次进行比较，请重新开始AD转换。



Note: w, x, y, and z (w < x < y < z) are the selected channel numbers by ADANSA0/1.
Note 1. Data on conversion is ignored.
Note 2. ADC12i_CMPAI (i = 0, 1)

Figure 43.28 Example of compare function operation, when the analog inputs (channel w to z) are compared

43.3.6.2 Event output of compare function

The event output of the compare function specifies the upper-side reference voltage value and the lower-side reference voltage value for window A and window B, respectively. The output compares the A/D converted value of the selected channel with the upper and lower side reference voltage value and outputs events (ADC12i_WCMPM (i = 0, 1)/ ADC12i_WCMPUM (i = 0, 1)) based on event conditions (A or B, A and B, A xor B) and comparison result of window A and window B.

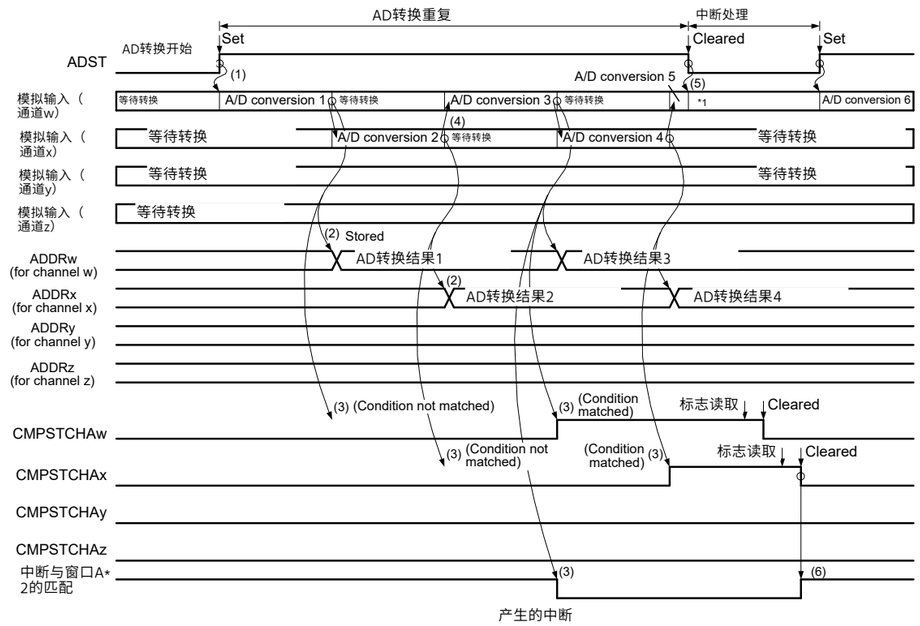
If more than one channel is selected for window A, and even when one channel in window A meets the comparison condition, the comparison result of window A is met. When using this function, perform A/D conversion in single scan mode.

Any channels from analog input, internal reference voltage, and temperature sensor output are selectable for window A.

One channel from analog input, internal reference voltage, and temperature sensor output is selectable for window B.

The following sequence is an example of how to set up and use the event output of the compare function:

1. Confirm that the value in the ADCSR.ADCS bits is 00b (single scan mode).
2. Select the channel for window A in the ADCMPANSR0/1 and ADCMPANSER registers. Set the window comparison conditions in the ADCMPLR0/1 and ADCMPLER registers. Set the upper-side and lower-side reference values in the ADCMPDR0/1 registers.
3. Select the channel and comparison conditions for Window B in the ADCMPBNSR register, and set the upper and lower reference values in the ADWINULB and ADWINLLB registers.
4. Set the composite conditions for window A/B, window A/B operation enable, and interrupt output enable in the ADCMPCR register.



Note: w、x、y和z(w<x<y<z)是ADANSA01选择的通道号。
注1.转换数据被忽略。
Note 2. ADC12i_CMPAI (i = 0, 1)

Figure 43.28 比较功能操作示例，比较模拟输入（通道w到z）时

43.3.6.2 比较函数的事件输出

比较函数的事件输出分别指定窗口A和窗口B的上侧参考电压值和下侧参考电压值。输出将所选通道的AD转换值与上下侧参考电压值进行比较，并根据事件条件（A或B、AandB AxorB)和窗口A和窗口B的比较结果。

如果窗口A选择了多个通道，即使窗口A中的一个通道满足比较条件，也满足窗口A的比较结果。使用此功能时，请在单次扫描模式下进行AD转换。

来自模拟输入、内部参考电压和温度传感器输出的任何通道都可选择用于窗口A。

窗口B可选择模拟输入、内部参考电压和温度传感器输出的一个通道。

以下序列是如何设置和使用比较函数的事件输出的示例：

1.确认ADCSR.ADCS位中的值为00b（单次扫描模式）。

2.在ADCMPANSR01和ADCMPANSER寄存器中选择窗口A的通道。在ADCMPLR01和ADCMPLER寄存器中设置窗口比较条件。在ADCMPDR01寄存器中设置上侧和下侧参考值。

3.在ADCMPBNSR寄存器中选择窗口B的通道和比较条件，并在ADWINULB和ADWINLLB寄存器中设置上下参考值。

4.在ADCMPCR寄存器中设置窗口AB、窗口AB操作使能和中断输出使能的复合条件。

RA生态工作室

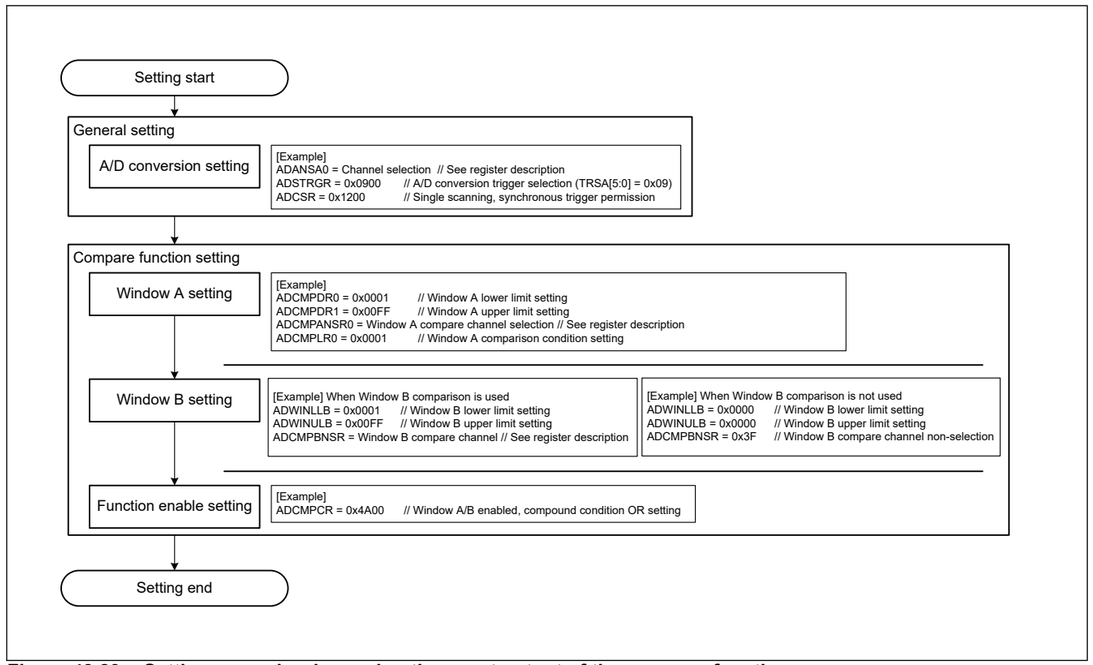


Figure 43.29 Setting example when using the event output of the compare function

For event output usage when using only window A for the compare function, note the following:

- Enable both Window A and Window B (ADCMPCR.CMPAE = 1, ADCMPCR.CMPBE = 1)
- Set the compound condition of Window A and Window B to “OR condition” (ADCMPCR.CMPAB[1:0] = 00b)
- Set the compared channel of Window B to “No selection” (ADCMPBNSR.CMPCHB[5:0] = 0x3F)
- Set the compare condition of Window B to “0 < results < 0 always means mismatch”. (ADCMPCR.WCMPE = 1, ADWINLLB[15:0] = ADWINULB[15:0] = 0x0000, and ADCMPBNSR.CMPLB = 1)

Figure 43.30 shows the event output operation example of compare function.

A scan end event (ADC12i_ADI (i = 0, 1)) is output with the same timing as single scan completion. A match or mismatch event (ADC12i_WCMPM (i = 0, 1)/ADC12i_WCMPUM (i = 0, 1)) is output with 1 PCLKA cycle delay depending on the ADCMPCR.CMPAB[1:0] settings.

Note: The match and mismatch events are exclusive, so both events are never output simultaneously.

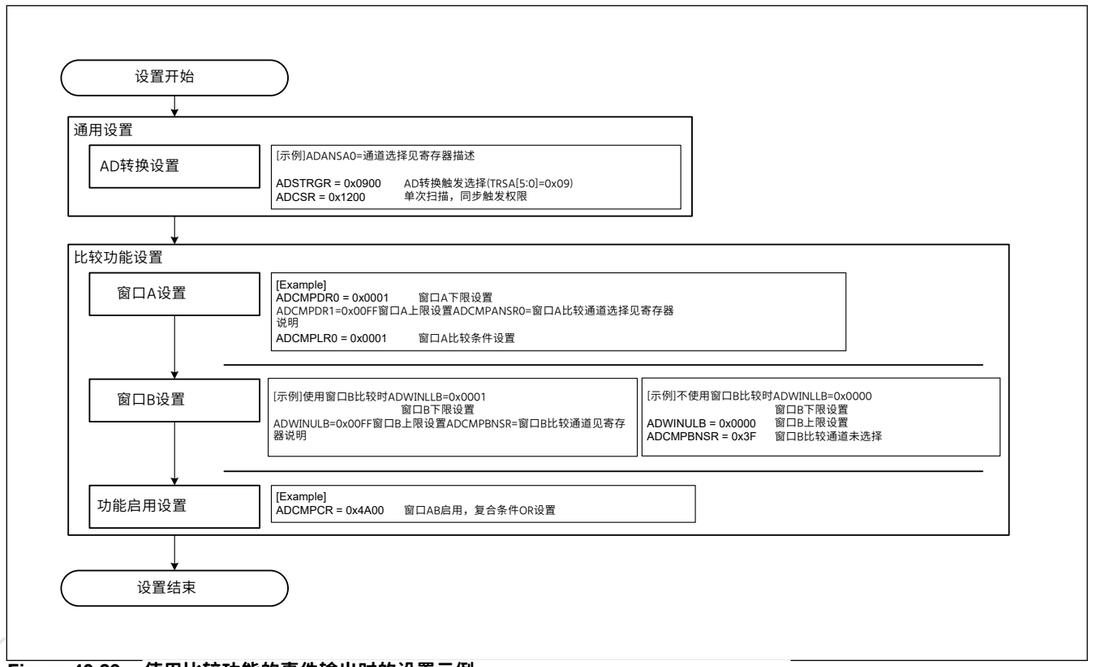

Figure 43.29 使用比较功能的事件输出时的设置示例

对于仅将窗口A用于比较功能时的事件输出用法，请注意以下几点：

●启用窗口A和窗口B(ADCMPCR.CMPAE=1 ADCMPCR.CMPBE=1)

●将窗口A和窗口B的复合条件设置为“或条件”（ADCMPCR.CMPAB[1:0]=00b）

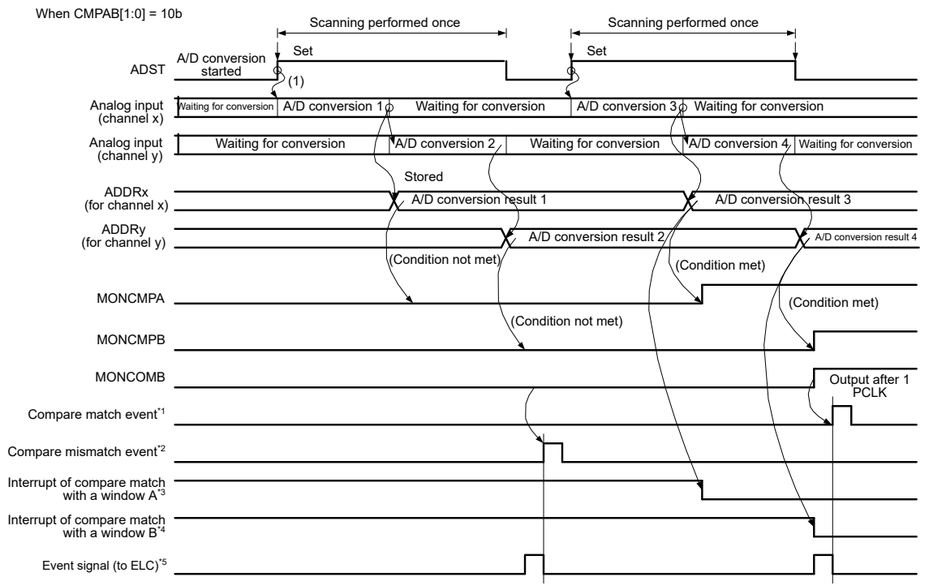
●将窗口B的比较通道设置为“无选择”（ADCMPBNSR.CMPCHB[5:0]=0x3F）

●将窗口B的比较条件设置为“0<结果<0总是不匹配”。（ADCMPCR.WCMPE=1，ADWINLLB[15:0]=ADWINULB[15:0]=0x0000，ADCMPBNSR.CMPLB=1）

图43.30显示了比较功能的事件输出操作示例。

以与单次扫描完成相同的时序输出扫描结束事件(ADC12i_ADI(i=0 1))。匹配或不匹配事件(ADC12i_WCMPM(i=0 1)ADC12i_WCMPUM(i=0 1))以1个PCLKA周期延迟输出，具体取决于ADCMPCR.CMPAB[1:0]设置。

Note: match和mismatch事件是互斥的，因此这两个事件永远不会同时输出。



Note: x, and y (x < y) are the selected channel numbers by ADANSA0/1.
Note 1. ADC12i_WCMPM (i = 0, 1)
Note 2. ADC12i_WCMPUM (i = 0, 1)
Note 3. ADC12i_CMPAI (i = 0, 1)
Note 4. ADC12i_CMPBI (i = 0, 1)
Note 5. ADC12i_ADI (i = 0, 1)

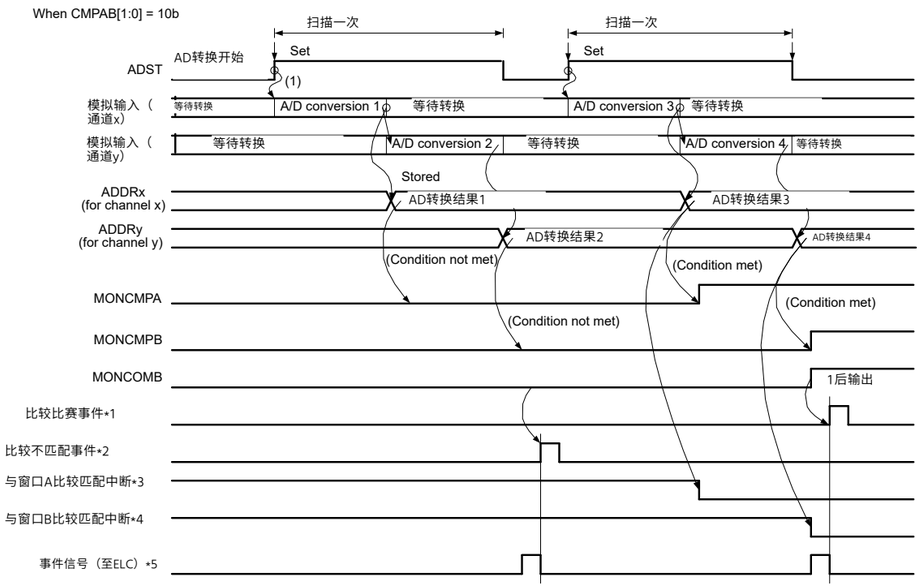
Figure 43.30 Example operation of the compare function event output, when the analog inputs (channel x and y) are compared

Note: Event output of compare function outputs match/mismatch from the comparison results of Window A and Window B, based on the ADCMPCR.CMPAB[1:0] settings.
Note: The comparison result of Window A is the logical addition of the comparison results of the comparison target channels of Window A. The comparison results of Window A and Window B are updated by each A/D conversion, and are kept even when single scan ends. Set ADCMPCR.CMPAE and ADCMPCR.CMPBE to 0 to clear the comparison results to 0.

43.3.6.3 Restrictions on the compare function

The following constraints apply for the compare function:

- The compare function cannot be used together with the self-diagnosis function or double-trigger mode. (The compare function is not available for ADRD, ADDBLDR, ADDBLDRA, and ADDBLDRB.)
- Specify single scan mode when using match/mismatch event outputs.
- When the temperature sensor output, internal reference voltage is selected for Window A, Window B operations are disabled.
- When the temperature sensor output, internal reference voltage is selected for Window B, Window A operations are disabled.
- Setting the same channel for Window A and Window B is prohibited.
- Set the reference voltage values so that the high-potential reference voltage value is equal to or larger than the low potential reference voltage value.



Note: x和y(x<y)是ADANSA01选择的通道号。
Note 1. ADC12i_WCMPM (i = 0, 1)
Note 2. ADC12i_WCMPUM (i = 0, 1)
Note 3. ADC12i_CMPAI (i = 0, 1)
Note 4. ADC12i_CMPBI (i = 0, 1)
Note 5. ADC12i_ADI (i = 0, 1)

Figure 43.30 比较模拟输入（通道x和y）时比较功能事件输出的示例操作

Note: 根据ADCMPCR.CMPAB[1:0]设置，比较函数输出的事件输出与窗口A和窗口B的比较结果匹配不匹配。

Note: 窗口A的比较结果是窗口A的比较目标通道的比较结果的逻辑相加。窗口A和窗口B的比较结果在每次AD转换时更新，即使在单次扫描结束时也会保持。将ADCMPCR.CMPAE和ADCMPCR.CMPBE设置为0，将比较结果清除为0。

43.3.6.3 比较功能的限制

以下约束适用于比较功能：

●比较功能不能与自诊断功能或双触发模式一起使用。（比较功能不适用于ADRD、ADDBLDR、ADDBLDRA和ADDBLDRB。）

●使用匹配不匹配事件输出时指定单次扫描模式。

●当温度传感器输出时，WindowA选择内部参考电压，WindowB操作被禁用。

●当温度传感器输出时，WindowB选择内部参考电压，WindowA操作被禁用。

●禁止窗口A和窗口B设置相同的通道。

●设置参考电压值，使高电位参考电压值等于或大于低电位参考电压值。

RA生态工作室

43.3.7 Analog Input Sampling and Scan Conversion Time

Scan conversion can be activated either by a software trigger, a synchronous trigger (ELC), or an asynchronous trigger (ADTRGn (n = 0, 1)). After the start-of-scanning-delay time (t_D) has elapsed, processing for disconnection detection assistance, and processing of conversion for self-diagnosis all proceed, followed by processing for A/D conversion.

Figure 43.31 shows the scan conversion timing, in which scan conversion is activated by a software trigger or a synchronous trigger (ELC). Figure 43.32 shows the scan conversion timing, in which scan conversion is activated by an asynchronous trigger (ADTRGn (n = 0, 1)). The scan conversion time (t_{SCAN}) includes the start-of-scanning-delay time (t_D), disconnection detection assistance processing time (t_{DIS})*1, self-diagnosis A/D conversion processing time (t_{DIAG} and t_{DSD})*2, A/D conversion processing time (t_{CONV}), and end-of-scanning-delay time (t_{ED}).

The A/D conversion processing time (t_{CONV}) consists of input sampling time (t_{SPL}) and time for conversion by successive approximation (t_{SAM}). The sampling time (t_{SPL}) is used to charge sample-and-hold circuits in the A/D converter. If there is not sufficient sampling time due to the high impedance of an analog input signal source, or if the A/ D conversion clock (ADCLK) is slow, sampling time can be adjusted using the ADSSTRn register.

The time for conversion by successive approximation (t_{SAM}) is the following

- 13 ADCLK states with 12-bit accuracy selected.
- 11 ADCLK states with 10-bit accuracy selected.
- 9 ADCLK states with 8-bit accuracy selected.

Table 43.27 shows the time for conversion by successive approximation (t_{SAM}).

The scan conversion time (t_{SCAN}) in single scan mode for which the number of selected channels is n can be determined as follows:

$$t_{SCAN} = t_D + (t_{DIS} \times n) + t_{DIAG} + t_{ED} + (t_{CONV} \times n)$$ *3

The scan conversion time for the first cycle in continuous scan mode is t_{SCAN} for single scan minus t_{ED} . The scan conversion time for the second and subsequent cycles in continuous scan mode is fixed in the following:

$$(t_{DIS} \times n) + t_{DIAG} + t_{DSD} + (t_{CONV} \times n)$$ *3

Note 1. When disconnection detection assistance is not selected, t_{DIS} = 0.

Only when the temperature sensor or internal reference voltage is A/D-converted, the auto-discharge period of 15 ADCLK states is inserted.

Note 2. When the self-diagnosis function is not used, t_{DIAG} = 0, t_{DSD} = 0.

Note 3. When input sampling times (t_{SPL}) of all selected channels are the same, this element equals t_{CONV} × n. If each channel has a different sampling time, this element equals that of t_{SPL} and t_{SAM} set to each selected channel.

Table 43.27 shows the times for conversion during scanning.

43.3.7 模拟输入采样和扫描转换时间

扫描转换可以通过软件触发、同步触发(ELC)或异步触发(ADTRGn(n=0 1))来激活。在经过扫描开始延迟时间(tD)之后，断线检测辅助处理和自诊断转换处理全部进行，接着进行AD转换处理。

图43.31显示了扫描转换时序，其中扫描转换由软件触发或同步触发(ELC)激活。图43.32显示了扫描转换时序，其中扫描转换由异步触发(ADTRGn(n=0 1))激活。扫描转换时间(tSCAN)包括扫描开始延迟时间(tD)、断线检测辅助处理时间(tDIS)*1、自诊断AD转换处理时间(tDIAG和tDSD)*如图2所示，AD转换处理时间(tCONV)和扫描结束延迟时间(tED)。

AD转换处理时间(tCONV)由输入采样时间(tSPL)和逐次逼近转换时间(tSAM)组成。采样时间(tSPL)用于为AD转换器中的采样保持电路充电。如果由于模拟输入信号源的高阻抗而没有足够的采样时间，或者如果AD转换时钟(ADCLK)很慢，则可以使用ADSSTRn寄存器调整采样时间。

逐次逼近转换时间(tSAM)如下

- 13个ADCLK状态，选择12位精度。
- 11个ADCLK状态，选择精度为10位。
- 选择8位精度的9个ADCLK状态。

表43.27显示了逐次逼近转换的时间(tSAM)。

选择通道数为n的单次扫描模式下的扫描转换时间(tSCAN)可以确定如下：

tSCAN=tD+tDIS×n+tDIAG+tED+tCONV×n*3

连续扫描模式下第一个周期的扫描转换时间是单次扫描的tSCAN减去tED。连续扫描模式下第二个和后续周期的扫描转换时间固定如下：tDIS×n+tDIAG+tDSD+tCONV×n*3

注1.未选择断线检测辅助时，tDIS=0。

仅当温度传感器或内部参考电压为AD转换时，自动放电周期为15 ADCLK状态被插入。

注2.不使用自诊断功能时，tDIAG=0，tDSD=0。

注3.当所有选定通道的输入采样时间(tSPL)相同时，该元素等于tCONV×n。如果每个通道具有不同的采样时间，则该元素等于为每个选定通道设置的tSPL和tSAM。

表43.27显示了扫描期间的转换时间。

Table 43.27 Conversion times during scanning (in numbers of cycles of ADCLK and PCLKA)

Item			Symbol		Type/Conditions: Synchronous trigger*4	Asynchronous trigger	Software trigger	Unit
Scan start processing time*1 *2	A/D conversion on group A under group A priority control.	Group B is to be stopped (Group A is activated after group B is stopped by of an A/D conversion source from group A).	t_D		3 PCLKA + 6 ADCLK 5 PCLKA + 3 ADCLK*5	—	—	Cycles
		Group B is not to be stopped (activation by an A/D conversion source from group A).			2 PCLKA + 4 ADCLK	—	—	
	A/D conversion when self-diagnosis is enabled.	A/D conversion for self-diagnosis is to be started.			2 PCLKA + 6 ADCLK	4 PCLKA + 6 ADCLK	6 ADCLK	
	All other				2 PCLKA + 4 ADCLK	2 PCLKA + 4 ADCLK	4 ADCLK	
Disconnection detection assistance processing time			t_{DIS}		Setting in ADNDIS[3:0] (initial value = 0h) × ADCLK			
Self-diagnosis conversion processing time*1	Sampling time		t_{DIAG}	t_{SPL}	Setting in ADSSTR00 (initial value = 0Bh) × ADCLK*3	—	—	
	Time for conversion by successive approximation	12-bit conversion accuracy		t_{SAM}	15 ADCLK	—	—	
		10-bit conversion accuracy			13 ADCLK	—	—	
		8-bit conversion accuracy			11 ADCLK	—	—	
	Wait time between self-diagnosis conversion end and analog channel sampling start.			t_{DED}	2 ADCLK			
	Wait time between last channel conversion end and self-diagnosis sampling start in continuous scan mode.		t_{DSD}		2 ADCLK			
A/D conversion processing time*1	Sampling time		t_{CONV}	t_{SPL}	Setting in ADSSTRn (n = 0 to 10, 12, 13(unit 0), 0 to 2(unit 1), L, T, O) (initial value = 0Bh) × ADCLK + 0.5 ADCLK			
	Time for conversion by successive approximation	12-bit conversion accuracy		t_{SAM}	13 ADCLK			
		10-bit conversion accuracy			11 ADCLK			
		8-bit conversion accuracy			9 ADCLK			
Scan end processing time*1			t_{ED}		1 PCLKA + 3 ADCLK 2 PCLKA + 3 ADCLK*5			

Note 1. See Figure 43.31 and Figure 43.32 for an illustration of times t_D, t_{SPLSH}, t_{DIAG}, t_{CONV}, and t_{ED}.
Note 2. This is the maximum time required from software writing or trigger input to A/D conversion start.
Note 3. The sampling time setting must satisfy the electrical characteristics.
Note 4. This does not include the time consumed in the path from timer output to trigger input.
Note 5. If ADCLK is faster than PCLKA (PCLKA to ADCLK frequency ratio = 1:2 or 1:4), the scan end processing time changes.

Table 43.27 扫描期间的转换时间（以ADCLK和PCLKA的周期数计）

Item			Symbol		Type/Conditions: 同步触发*4	异步触发	软件触发	Unit

		10位转换精度			11 ADCLK			
		8位转换精度			9 ADCLK			
扫描结束处理时间*1			t_{ED}		1 PCLKA + 3 ADCLK 2 PCLKA + 3 ADCLK*5			

注1.有关时间tD、tSPLSH、tDIAG、tCONV和tED的说明，请参见图43.31和图43.32。注2.这是从软件写入或触发输入到AD转换开始所需的最长时间。
注3.采样时间设置必须满足电气特性。
注4.这不包括从定时器输出到触发输入的路径中消耗的时间。
注5.如果ADCLK比PCLKA快（PCLKA与ADCLK频率比=1:2或1:4），则扫描结束处理时间会发生变化。

RA生态工作室

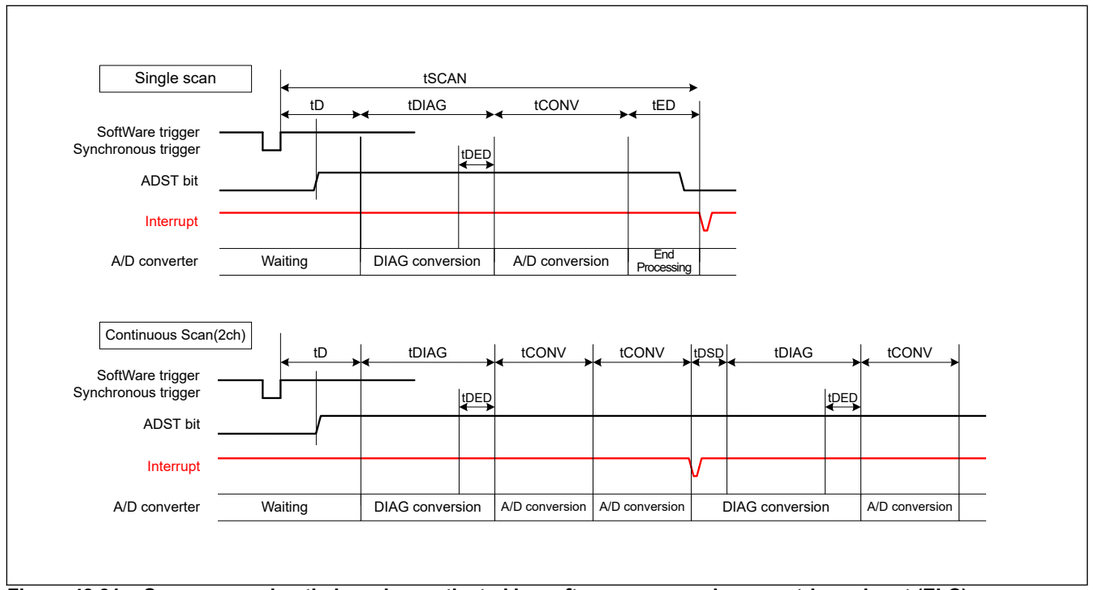

Figure 43.31 Scan conversion timing when activated by software or a synchronous trigger input (ELC)

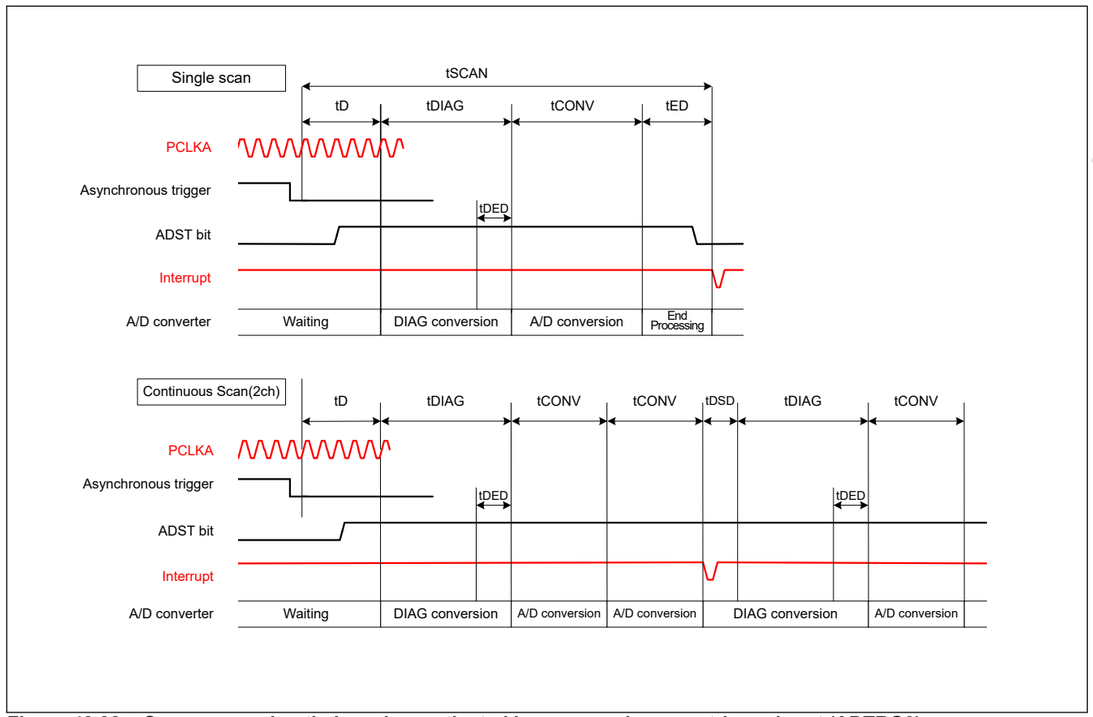

Figure 43.32 Scan conversion timing when activated by an asynchronous trigger input (ADTRG0)

43.3.8 Usage Example of A/D Data Register Automatic Clearing Function

Setting the ADCER.ACE bit to 1 automatically clears the A/D data registers (ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, ADOCDR) to 0x0000 when the A/D data registers are read by the CPU or DTC or DMAC.

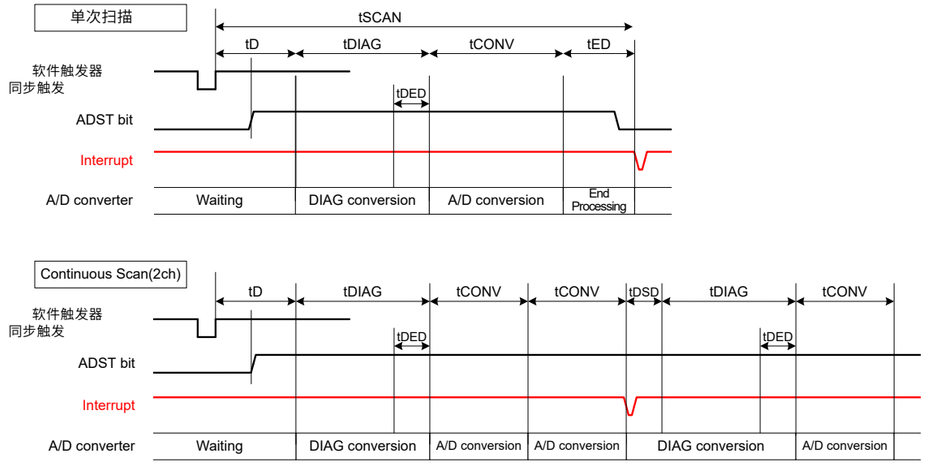

Figure 43.31 由软件或同步触发输入(ELC)激活时的扫描转换时序

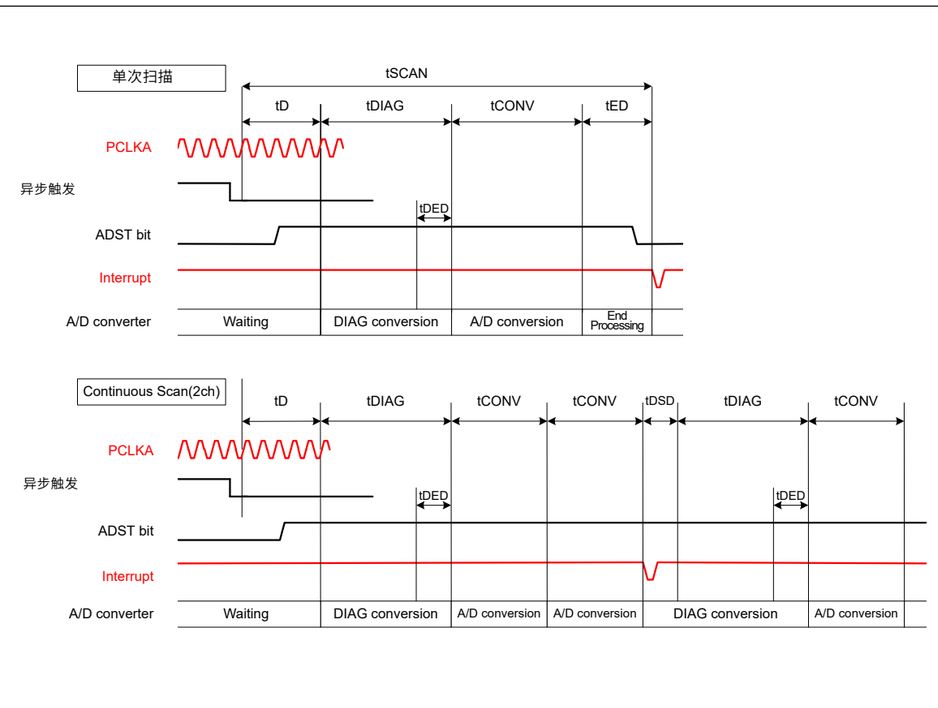

Figure 43.32 由异步触发输入(ADTRG0)激活时的扫描转换时序

43.3.8 AD数据寄存器自动清除功能的使用示例

将ADCER.ACE位设置为1会自动清除AD数据寄存器（ADDRy、ADRD、ADDBLDR、ADDBLDRA、当CPU或DTC或DMAC读取AD数据寄存器时，ADDBLDRB、ADTSDR、ADOCDR)为0x0000。

RA生态工作室

This function enables detection of update failures of the A/D data registers (ADDRy, ADRD, ADDBLDR, ADDBLDRA, ADDBLDRB, ADTSDR, ADOCDR). This section describes examples in which the function to automatically clear the ADDRy register is enabled and disabled.

- If the ADCER.ACE bit is 0 (automatic clearing is disabled) and for some reason, if the A/D conversion result (0x0222) is not written to the ADDRy register, the ADDRy value retains the old data (0x0111). In addition, if this ADDRy value is read into a general-purpose register using an A/D scan end interrupt, the old data (0x0111) can be saved in the general-purpose register. When checking whether there is an update failure, it is necessary to frequently save the old data in SRAM or in a general-purpose register.
- If the ADCER.ACE bit is 1 (automatic clearing is enabled), when ADDRy = 0x0111 is read by the CPU or DTC or DMAC, ADDRy is automatically set to 0x0000. Next, if the A/D conversion result of 0x0222 cannot be transferred to ADDRy for some reason, the cleared data (0x0000) remains as the ADDRy value. If this ADDRy value is read into a general-purpose register using an A/D scan end interrupt, 0x0000 is saved in the general-purpose register. Occurrence of an ADDRy update failure can be determined by checking that the read data value is 0x0000.

43.3.9 A/D-Converted Value Addition/Average Mode

A/D-converted value addition/average mode can be used when A/D conversion of the analog input of the selected channels, the temperature sensor output, the internal reference voltage is selected.

In A/D-converted value addition mode, the same channel is A/D-converted 1, 2, 3, 4, or 16 consecutive times, and the sum of the converted values is stored in the data register. The conversion count of the addition function can be set to 16 only when 12-bit accuracy is selected. In A/D-converted value average mode, the same channel is A/D-converted 1, 2, or 4 consecutive times, and the mean of the converted values is stored in the data register. The use of the average of these results can improve the accuracy of A/D conversion, depending on the types of noise components that are present. This function, however, cannot always guarantee an improvement in A/D conversion accuracy.

The A/D-converted value addition/average function can be used when A/D conversion of the analog inputs of the selected channels or A/D conversion of the temperature sensor output or A/D conversion of the internal reference voltage is selected. The A/D-converted value addition/average function can also be used for channels for which the double-trigger function is selected.

The addition function for self-diagnosis is not provided.

43.3.10 Disconnection Detection Assist Function

The ADC12 incorporates a function to fix the charge for sampling capacitance to the specified state (VREFH0 or VREFL0 for unit 0, VREFH or VREFL for unit 1) before the start of A/D conversion. This function enables disconnection detection in wiring of analog inputs.

Figure 43.33 shows the A/D conversion operation when the disconnection detection assist function is used. Figure 43.34 shows an example of disconnection detection when precharge is selected. Figure 43.35 shows an example of disconnection detection when discharge is selected.

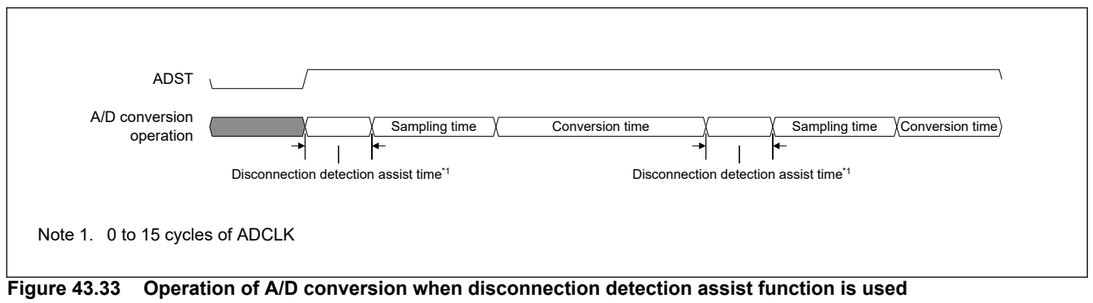

Figure 43.33 Operation of A/D conversion when disconnection detection assist function is used

此功能可以检测AD数据寄存器（ADDRy、ADRD、ADDBLDR、ADDBLDRA、ADDBLDRB、ADTSDR、ADOCDR）。本节介绍自动清除功能的示例ADDRy寄存器被启用和禁用。

●如果ADCER.ACE位为0（禁止自动清零）并且由于某种原因，如果AD转换结果（0x0222）没有写入ADDRy寄存器，则ADDRy值保留旧数据（0x0111）。此外，如果使用AD扫描结束中断将该ADDRy值读入通用寄存器，则可以将旧数据（0x0111）保存在通用寄存器中。在检查是否有更新失败时，需要经常将旧数据保存在SRAM或通用寄存器中。

●如果ADCER.ACE位为1（使能自动清除），当ADDRy=0x0111时由CPU或DTC或DMAC ADDRy自动设置为0x0000。接下来，如果0x0222的AD转换结果由于某种原因无法传送到ADDRy，则清除的数据(0x0000)仍保留为ADDRy值。如果使用AD扫描结束中断将该ADDRy值读入通用寄存器，则将0x0000保存在通用寄存器中。ADDRy更新失败的发生可以通过检查读取的数据值为0x0000来确定。

43.3.9 一种D转换的增值平均模式

AD-convertedvalueadditionaveragemodecanbeusedwhenADconversionoftheanaloginputoftheselectedchannels thetemperaturesensoroutput theinternalreferencevoltageisselected.

在AD转换值加法模式下，同一通道连续1、2、3、4或16次AD转换，转换值的总和存储在数据寄存器中。只有选择12位精度时，才能将加法功能的转换计数设置为16。在AD转换值平均模式下，同一通道连续1、2或4次AD转换，转换值的平均值存储在数据寄存器中。根据存在的噪声成分的类型，使用这些结果的平均值可以提高AD转换的精度。但是，该功能不能始终保证AD转换精度的提高。

选择通道的模拟输入的AD转换或温度传感器输出的AD转换或内部参考电压的AD转换时，可以使用AD转换值加法平均功能。AD转换值加法平均功能也可用于选择了双触发功能的通道。

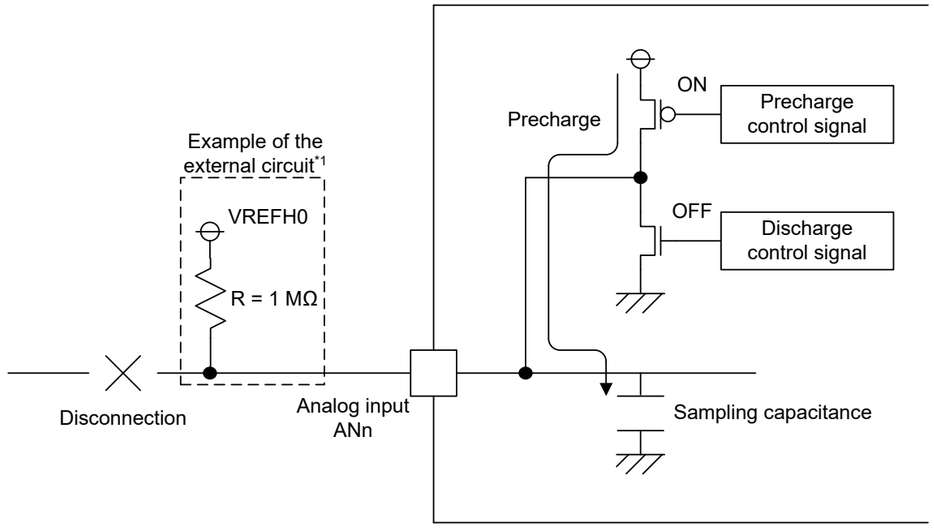
不提供自我诊断的附加功能。

43.3.10 断线检测辅助功能

ADC12具有在开始AD转换之前将采样电容的电荷固定到指定状态（单元0为VREFH0或VREFL0，单元1为VREFH或VREFL）的功能。此功能可在模拟输入接线中进行断线检测。

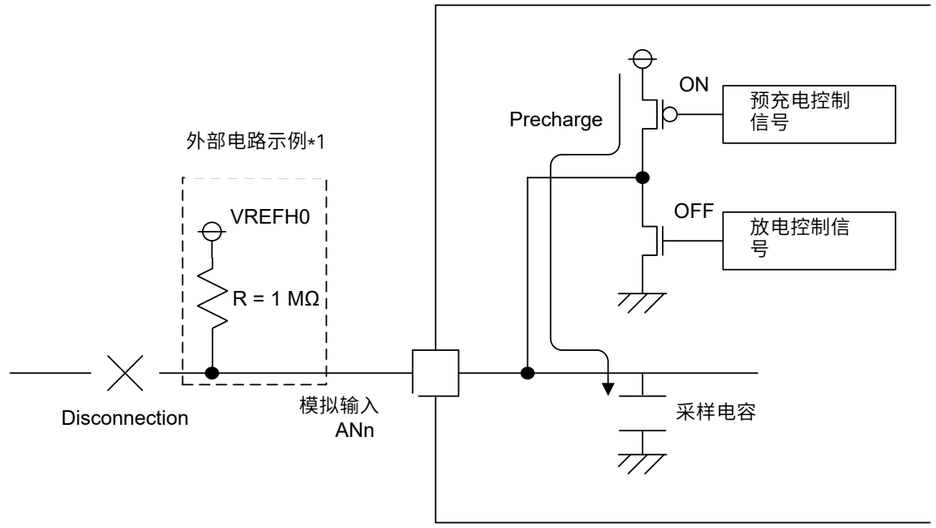
图43.33显示了使用断线检测辅助功能时的AD转换操作。图43.34显示了选择预充电时的断线检测示例。图43.35显示了选择放电时的断线检测示例。

Figure 43.33 使用断线检测辅助功能时的AD转换动作



Note 1. The converted result should be used after it is fully evaluated because the result data when disconnection occurs varies depending on the external circuit.

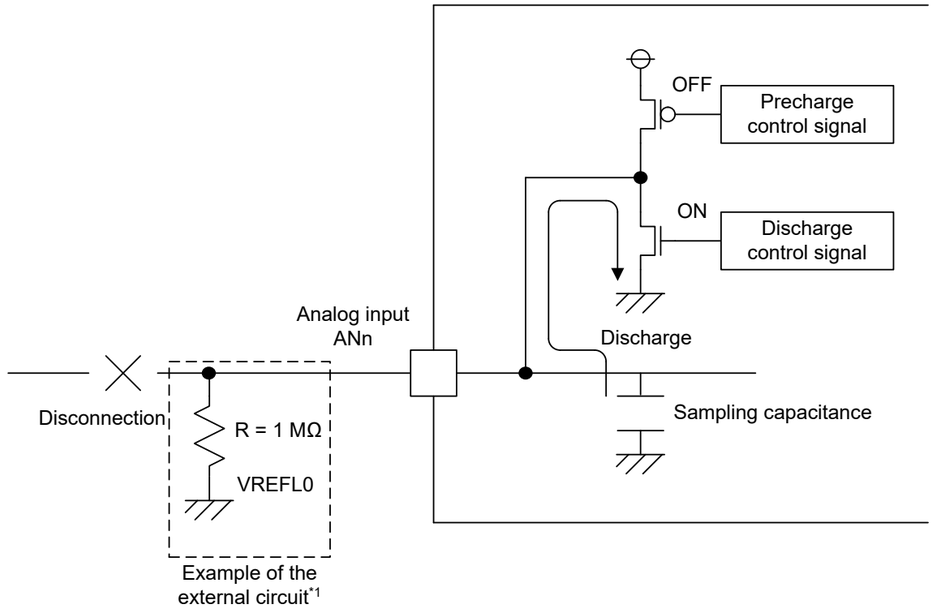
Figure 43.34 Example of disconnection detection when precharge is selected



注1.由于断线时的结果数据因外部电路而异，因此应在充分评估后使用转换结果。

Figure 43.34 选择预充电时的断线检测示例

RA生态工作室



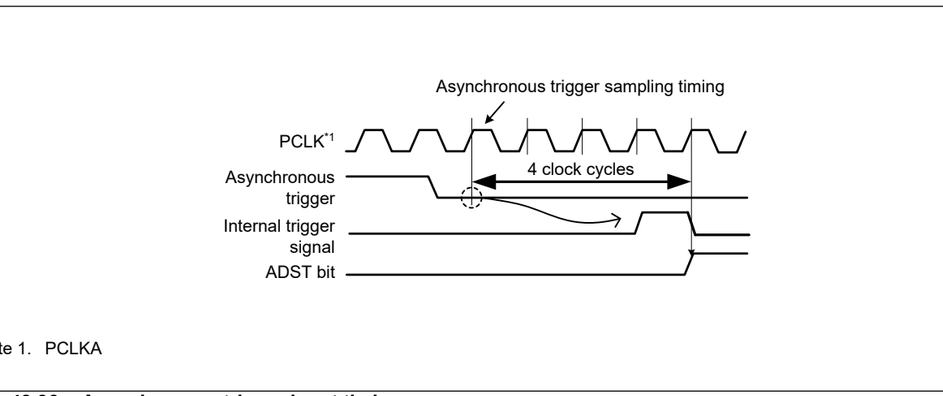
Note 1. The converted result should be used after it is fully evaluated because the result data when disconnection occurs varies depending on the external circuit.

Figure 43.35 Example of disconnection detection when discharge is selected

43.3.11 Starting A/D Conversion with an Asynchronous Trigger

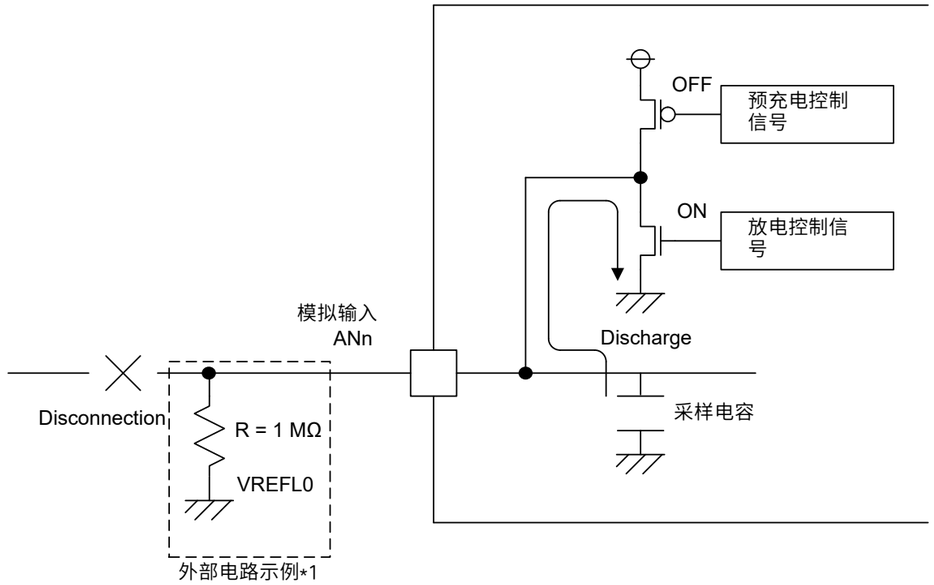
A/D conversion can be started by the input of an asynchronous trigger. To start A/D conversion by an asynchronous trigger, set the pin function in the PmnPFS register, set the A/D Conversion Start Trigger Select bits (ADSTRGR.TRSA[5:0]) to 0x00, then input a high-level signal to the asynchronous trigger (ADTRGn (n = 0, 1) pin). Finally, set both the ADCSR.TRGE and ADCSR.EXTRG bits to 1. Figure 43.36 shows timing of the asynchronous trigger input.

An asynchronous trigger cannot be selected in the A/D conversion start trigger for group B used in group scan mode. For details on setting the pin function, see section 19, I/O Ports.



Note 1. PCLKA

Figure 43.36 Asynchronous trigger input timing



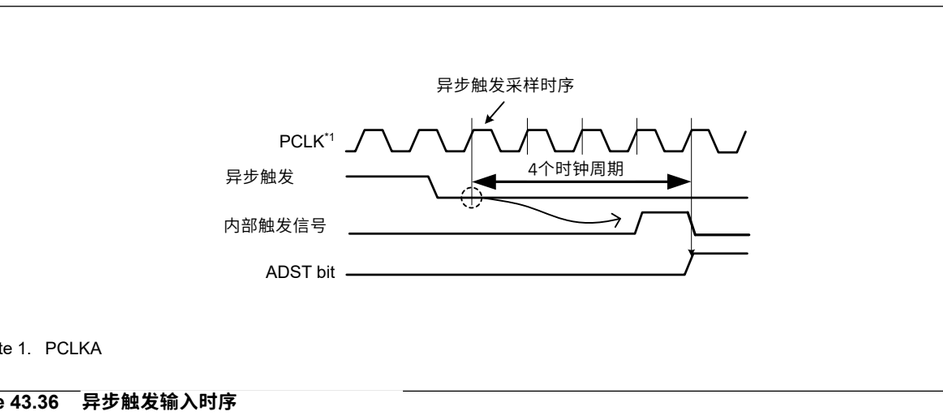
注1.由于断线时的结果数据因外部电路而异，因此应在充分评估后使用转换结果。

Figure 43.35 选择放电时的断线检测示例

43.3.11 使用异步触发启动AD转换

可以通过输入异步触发器来启动D转换。要通过异步触发启动AD转换，请在PmnPFS寄存器中设置引脚功能，将AD转换启动触发选择位(ADSTRGR.TRSA[5:0])设置为0x00，然后向异步触发输入高电平信号（ADTRGn(n=0 1)引脚）。最后，将ADCSR.TRGE和ADCSR.EXTRG位都设置为1。图43.36显示了异步触发输入的时序。

在组扫描模式中使用的B组的AD转换开始触发中不能选择异步触发。有关设置引脚功能的详细信息，请参见第19节，IO端口。



Note 1. PCLKA

Figure 43.36 异步触发输入时序

43.3.12 Starting A/D Conversion with a Synchronous Trigger from a Peripheral Module

A/D conversion can be started by a synchronous trigger (ELC). To do this, set the ADCSR.TRGE bit to 1 and the ADCSR.EXTRG bit to 0, and select the relevant sources in the ADSTRGR.TRSA[5:0] and ADSTRGR.TRSB[5:0] bits.

43.3.13 Using Data Buffers

This IP is provided with a ring buffer function consisting of 16 A/D data buffers. This function sequentially stores A/D conversion results other than self-diagnosis result (including addition/average results) in data buffers (ADBUFn, n = 0 to 15).

Each conversion result is stored at the timing when the A/D conversion result is stored in the data register, and most recent 16 conversion result data are retained.

The figure-below shows the schematic of data buffers, pointer, and overflow flag operations. When the BUFEN bit is set to 1, the A/D conversion result is transferred at each end of A/D conversion. The pointer indicates the number of data buffer to which the next transferred data is to be written. When data is written to up to buffer 15, the pointer is reset to 0000b and the overflow flag is set to 1. Subsequently transferred data overwrites the previously written data.

The overflow flag is reset to the initial value by writing 00h to the ADBUFPTR register.

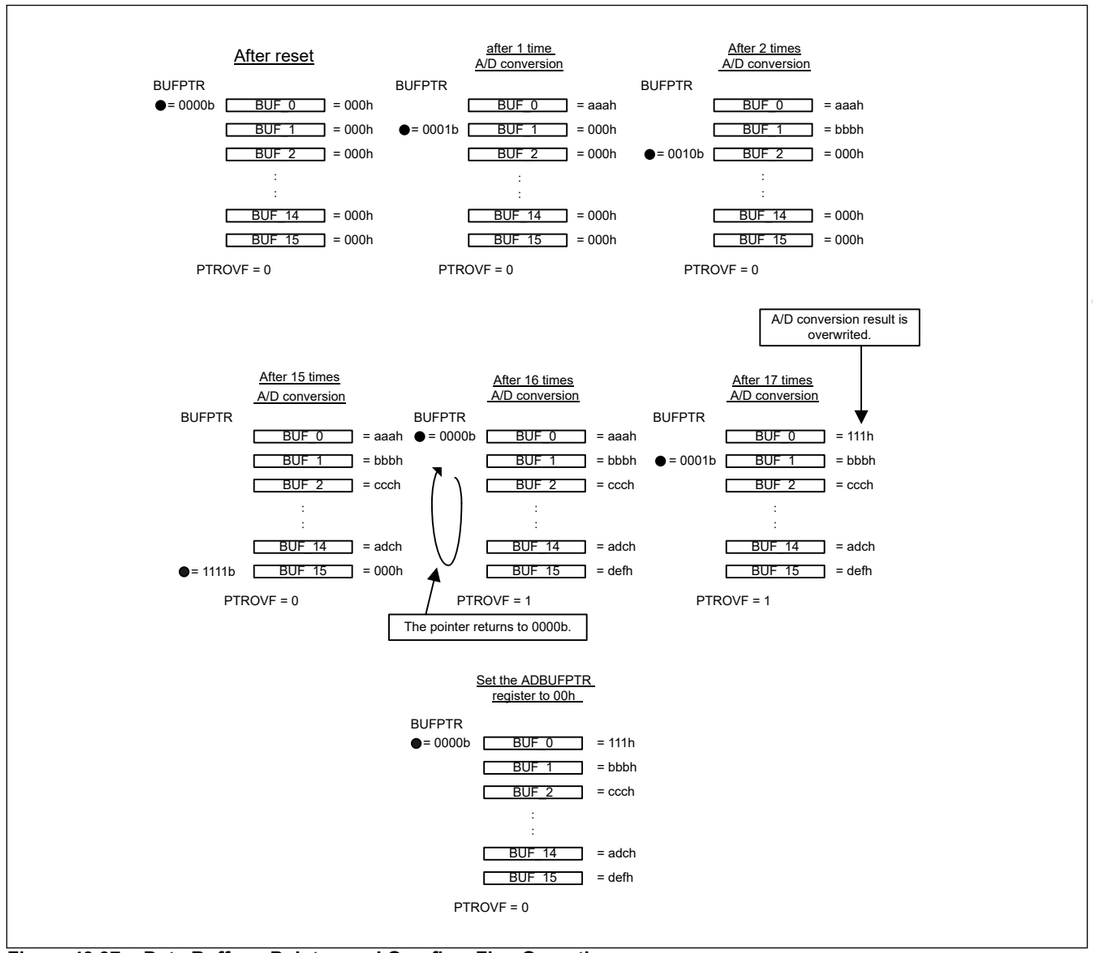


Figure 43.37 Data Buffers, Pointer, and Overflow Flag Operations

43.3.12 使用来自外设模块的同步触发启动AD转换

D转换可以通过同步触发器(ELC)启动。为此，将ADCSR.TRGE位设置为1，并将ADCSR.EXTRG位为0，并在ADSTRGR.TRSA[5:0]和ADSTRGR.TRSB[5:0]位中选择相关源。

43.3.13 使用数据缓冲区

该IP具有由16个AD数据缓冲区组成的环形缓冲区功能。该功能将除自诊断结果以外的AD转换结果（包括加法平均结果）依次存储在数据缓冲区（ADBUFn，n=0至15）中。

每个转换结果在AD转换结果存储在数据寄存器中时存储，并保留最近的16个转换结果数据。

下图显示了数据缓冲区、指针和溢出标志操作的示意图。当BUFEN位设置为1时，AD转换结果在AD转换的每一端传送。指针指示要写入下一个传输数据的数据缓冲区的编号。当数据写入缓冲区15时，指针复位为0000b，溢出标志设置为1。随后传输的数据将覆盖先前写入的数据。

通过将00h写入ADBUFPTR寄存器，溢出标志复位为初始值。

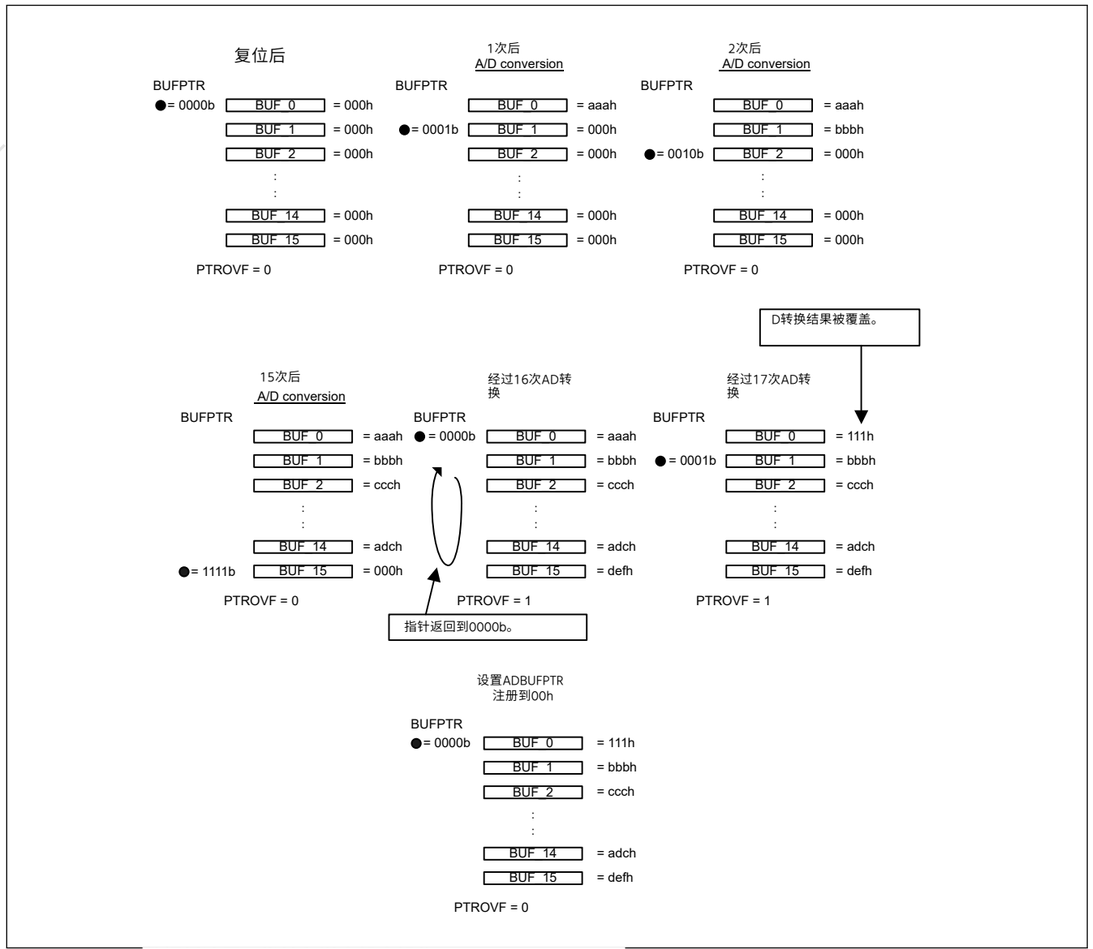

Figure 43.37 数据缓冲区、指针和溢出标志操作

43.4 Interrupt Sources and DTC, DMAC Transfer Requests

43.4.1 Interrupt Requests

The ADC12 can send scan end interrupt requests ADC12i_ADI (i = 0, 1) and ADC12i_GBADI (i = 0, 1) to the CPU. The ADC12 also generates the ADC12i_CMPAI (i = 0, 1)/ADC12i_CMPBI (i = 0, 1) interrupt for the CPU in response to matches with a condition for comparison.

An ADC12i_ADI (i = 0, 1) interrupt is always generated. An ADC12i_GBADI (i = 0, 1) interrupt can be generated by setting the ADCSR.GBADIE bit to 1. Similarly, ADC12i_CMPAI (i = 0, 1) and ADC12i_CMPBI (i = 0, 1) interrupts can be generated by setting the ADCMPCR.CMPAIE and ADCMPCR.CMPBIE bit to 1.

In addition, the DTC or DMAC can be started when an ADC12i_ADI (i = 0, 1) or an ADC12i_GBADI (i = 0, 1) interrupt is generated. Using an ADC12i_ADI (i = 0, 1) or ADC12i_GBADI (i = 0, 1) interrupt to activate the DTC or DMAC to read the converted data enables continuous conversion without a burden on software.

Table 43.28 describes the interrupt sources and ELC events available for the ADC12.

Table 43.28 The interrupt source and ELC event of ADC12 (1 of 2)

Operation			Interrupt request or ELC event	Interrupt request	DTC or DMAC activation	ELC event request	Function
Scan mode	Double trigger mode	Compare function Window A/B					
Single scan mode	Deselected	Deselected	ADC12i_ADI (i = 0, 1)	✓	✓	✓	ADC12i_ADI (i = 0, 1) generated at the end of single scan
		Selected	ADC12i_ADI (i = 0, 1)	✓	✓	✓	ADC12i_ADI (i = 0, 1) generated at the end of single scan
			ADC12i_CMPAI (i = 0, 1)	✓	—	—	ADC12i_CMPAI (i = 0, 1) generated on a match comparison condition of Window A
			ADC12i_CMPBI (i = 0, 1)	✓	—	—	ADC12i_CMPBI (i = 0, 1) generated on a match comparison condition of Window B
			ADC12i_WCMPM (i = 0, 1)	—	✓	✓	ADC12i_WCMPM (i = 0, 1) generated on a match condition of the Window A/B compare function
			ADC12i_WCMPUM (i = 0, 1)	—	✓	✓	ADC12i_WCMPUM (i = 0, 1) generated on a mismatch condition of the Window A/B compare function
	Selected	Deselected	ADC12i_ADI (i = 0, 1)	✓	✓	✓	ADC12i_ADI (i = 0, 1) generated at the end of scans in the even numbered times
Continuous scan mode	Deselected	Deselected	ADC12i_ADI (i = 0, 1)	✓	✓	✓	ADC12i_ADI (i = 0, 1) generated at the end of scan of all selected channels
		Selected	ADC12i_CMPAI (i = 0, 1)	✓	—	—	ADC12i_CMPAI (i = 0, 1) generated on a match comparison condition of Window A
			ADC12i_CMPBI (i = 0, 1)	✓	—	—	ADC12i_CMPBI (i = 0, 1) generated on a match comparison condition of Window B

43.4 中断源和DTC、DMAC传输请求

43.4.1 中断请求

ADC12可以向CPU发送扫描结束中断请求ADC12i_ADI(i=0 1)和ADC12i_GBADI(i=0 1)。这
ADC12还为CPU生成ADC12i_CMPAI(i=0 1)ADC12i_CMPBI(i=0 1)中断，以响应与比较条件的匹配。

始终会产生ADC12i_ADI(i=0 1)中断。ADC12i_GBADI(i=0 1)中断可以通过将ADCSR.GBADIE位设置为1来产生。类似地，ADC12i_CMPAI(i=0 1)和ADC12i_CMPBI(i=0 1)中断可以通过设置ADCMPCR来产生.CMPAIE和ADCMPCR.CMPBIE位为1。

此外，当ADC12i_ADI(i=0 1)或ADC12i_GBADI(i=0 1)中断产生时，可以启动DTC或DMAC。使用ADC12i_ADI(i=0 1)或ADC12i_GBADI(i=0 1)中断来激活DTC或DMAC以读取转换后的数据可实现连续转换，而无需软件负担。

表43.28描述了ADC12可用的中断源和ELC事件。

Table 43.28 ADC12的中断源和ELC事件（1of2）

Note: ✓ available
—: unavailable

For details on DTC settings, see section 17, Data Transfer Controller (DTC).

43.5 Event Link Function

43.5.1 Event Output to the ELC

The ELC uses the ADC12i_ADI (i = 0, 1) interrupt request signal as an event signal ADC12i_ADI (i = 0, 1), enabling link operation for the preset module. The ADC12i_GBADI (i = 0, 1) interrupt and ADC12i_CMPAI (i = 0, 1)/ADC12i_CMPBI (i = 0, 1) interrupts cannot be used as an event signal. For details, see Table 43.28.

An event signal can be output regardless of the settings of the corresponding interrupt request enable bits. For the scan end event(ADC12i_ADI (i = 0, 1)), a high-level pulse for one PCLKA cycle is output at the same output timing as the interrupt output (ADC12i_ADI (i = 0, 1)) shown in Table 43.28. For a compare match (ADC12i_WCMPM (i = 0, 1)) and mismatch event (ADC12i_WCMPUM (i = 0, 1)) to the ELC, a high-level pulse for one PCLKA cycle is output at the timing delayed by one cycle (PCLKA) from the interrupt output (ADC12i_ADI (i = 0, 1)) shown in Table 43.28.

To use compare match (ADC12i_WCMPM (i = 0, 1)) or mismatch event (ADC12i_WCMPUM (i = 0, 1)) to the ELC, specify single-scan mode.

43.5.2 ADC12 Operation through an Event from the ELC

The ADC12 can start A/D conversion by the preset event specified in the ELSRn settings for the ELC as follows:

- Select the ELC_AD00 (unit 0) signal in the ELC.ELSR8 register
- Select the ELC_AD01 (unit 0) signal in the ELC.ELSR9 register

Table 43.28 ADC12的中断源和ELC事件(2of2)

Operation			中断请求或ELC事件	中断请求	DTC或DMAC激活	ELC事件请求	Function
扫描模式	双触发模式	比较函数窗口AB

	Selected	Deselected	ADC12i_ADI (i = 0, 1)	✓	✓	✓	ADC12i_ADI(i=0 1)在偶数次扫描A组结束时生成
			ADC12i_GBADI (i = 0, 1)	✓	✓	—	ADC12i_GBADI(i=0 1)专用于在B组扫描结束时生成的B组

Note: 可用—：不可用

有关DTC设置的详细信息，请参阅第17节，数据传输控制器(DTC)。

43.5 事件链接功能

43.5.1 事件输出到ELC

ELC使用ADC12i_ADI(i=0 1)中断请求信号作为事件信号ADC12i_ADI(i=0 1)，启用预设模块的链接操作。ADC12i_GBADI(i=0 1)中断和ADC12i_CMPAI(i=0 1)ADC12i_CMPBI(i=0 1)中断不能用作事件信号。详见表43.28。

无论相应中断请求使能位的设置如何，都可以输出事件信号。对于扫描结束事件（ADC12i_ADI(i=0 1)），在与表43.28所示的中断输出（ADC12i_ADI(i=0 1)）相同的输出时序上输出一个PCLKA周期的高电平脉冲.对于到ELC的比较匹配(ADC12i_WCMPM(i=0 1))和失配事件(ADC12i_WCMPUM(i=0 1))，在延迟一个周期的时序上输出一个PCLKA周期的高电平脉冲(PCLKA)来自表43.28所示的中断输出(ADC12i_ADI(i=0 1))。

要将比较匹配(ADC12i_WCMPM(i=0 1))或不匹配事件(ADC12i_WCMPUM(i=0 1))用于ELC，请指定单扫描模式。

43.5.2 ADC12通过来自ELC的事件进行操作

ADC12可以通过ELC的ELSRn设置中指定的预设事件启动AD转换，如下所示：

●选择ELC.ELSR8寄存器中的ELC_AD00（单元0）信号

●选择ELC.ELSR9寄存器中的ELC_AD01（单元0）信号

- Select the ELC_AD10 (unit 1) signal in the ELC.ELSR10 register
- Select the ELC_AD11 (unit 1) signal in the ELC.ELSR11 register.

If an ELC event occurs during A/D conversion, the event is disabled.

43.6 Usage Notes

43.6.1 Constraints on Setting the Registers

Set each register while the ADCSR.ADST bit is 0.

43.6.2 Constraints on Reading the Data Registers

The following registers must be read in halfword units:

- A/D Data Registers
- A/D Data Duplexing Register
- A/D Data Duplexing Register A
- A/D Data Duplexing Register B
- A/D Temperature Sensor Data Register
- A/D Internal Reference Voltage Register
- A/D Self-Diagnosis Data Register
- A/D Data Buffer Registers n (N = 0 to 15)

If a register is read twice in byte units, that is, the upper byte and lower byte are read separately, the A/D-converted value read initially might disagree with the A/D-converted value read subsequently. To prevent this, never read the data registers in byte units.

43.6.3 Constraints on Stopping A/D Conversion

(1) A/D Conversion Stop Procedure

To stop A/D conversion when an asynchronous trigger or a synchronous trigger is selected as the condition for starting A/D conversion, follow the procedure shown in Figure 43.38.

●选择ELC.ELSR10寄存器中的ELC_AD10（单元1）信号
●选择ELC.ELSR11寄存器中的ELC_AD11（单元1）信号。

如果在AD转换期间发生ELC事件，则该事件被禁用。

43.6 使用说明

43.6.1 设置寄存器的限制

当ADCSR.ADST位为0时设置每个寄存器。

43.6.2 读取数据寄存器的限制

以下寄存器必须以半字为单位读取：

●AD数据寄存器
●AD数据双工寄存器
●AD数据双工寄存器A
●AD数据双工寄存器B
●AD温度传感器数据寄存器
●AD内部参考电压寄存器
●AD自诊断数据寄存器
●AD数据缓冲寄存器n(N=0to15)

如果以字节为单位读取寄存器两次，即分别读取高字节和低字节，则最初读取的AD转换值可能与随后读取的AD转换值不一致。为防止这种情况，切勿以字节为单位读取数据寄存器。

43.6.3 停止AD转换的约束

(1) AD转换停止程序

TostopADconversionwhenanasynchronoustriggerorasynchronoustriggerisselectedastheconditionforstartingADconversion followtheprocedureshowninFigure43.38.

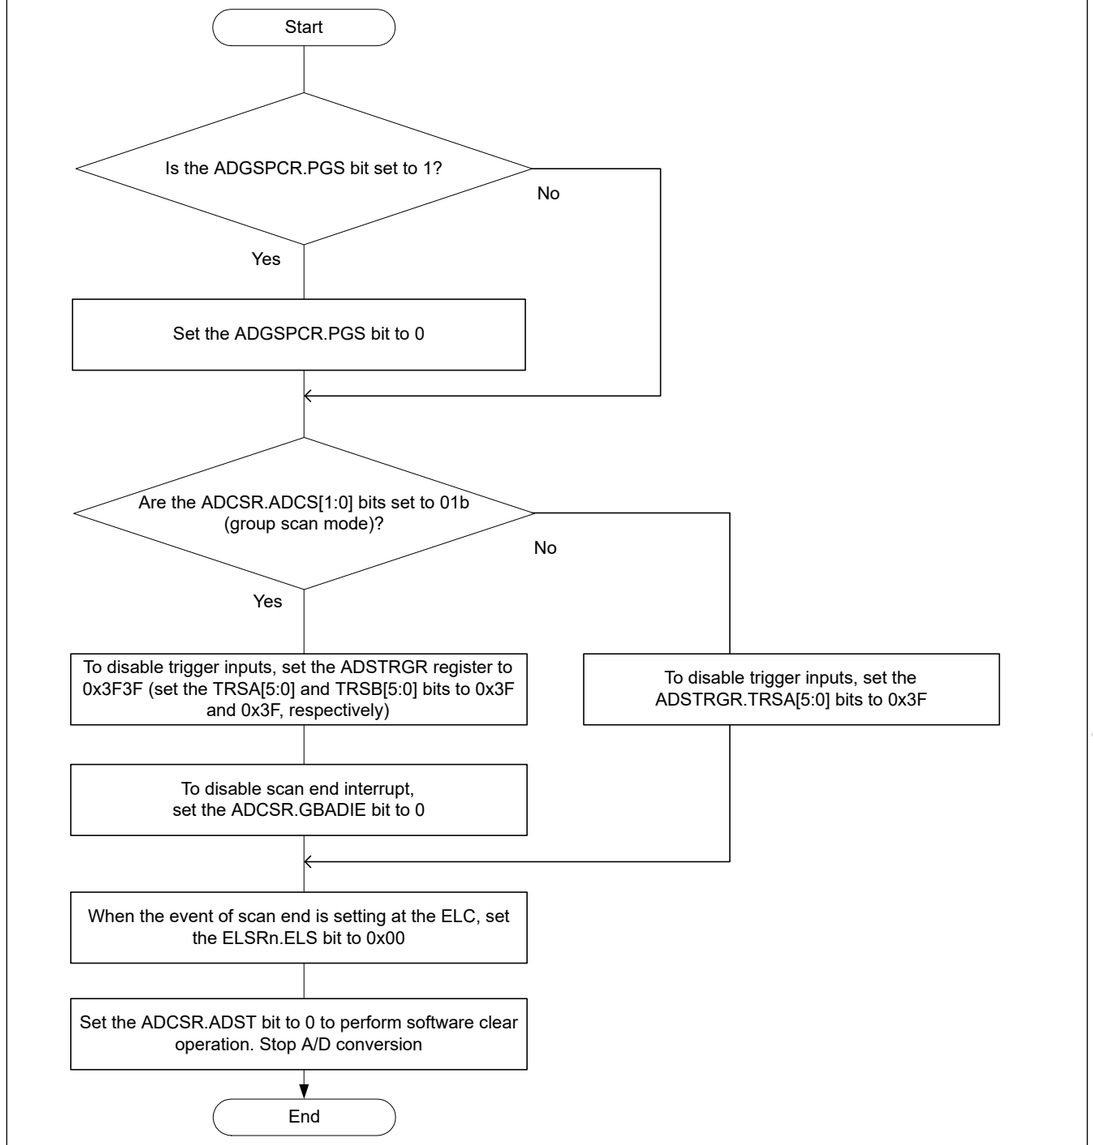

Figure 43.38 Procedures for clearing the ADCSR.ADST bit by software

To specify the following settings after performing the clear operation by software, provide a wait period for at least two ADCLK cycles.

- Enabling scan end interrupts
- Enabling scan end events for the event link controller
- Starting A/D conversion by software
- Enabling trigger input

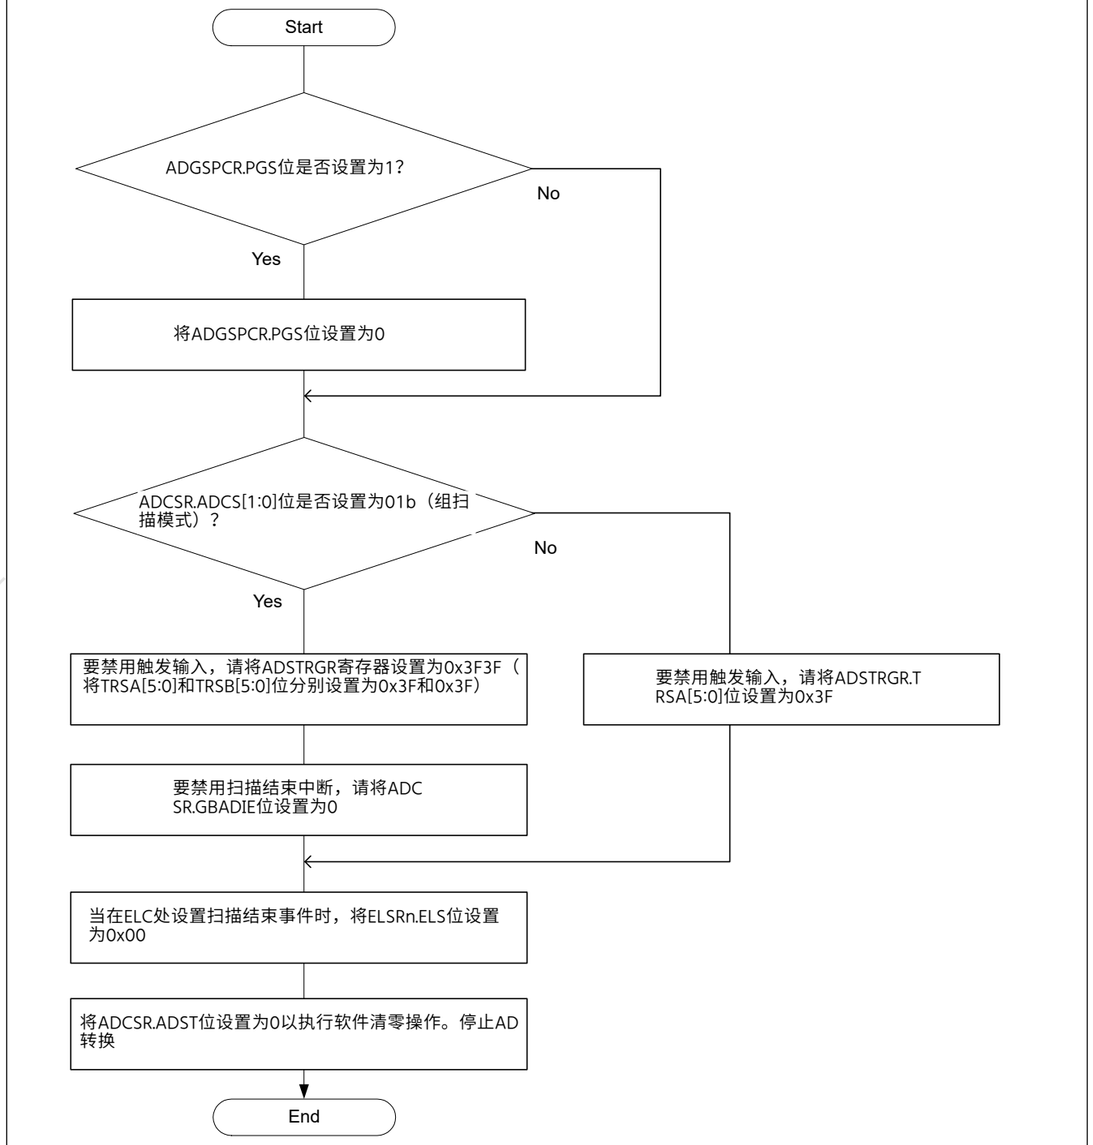

Figure 43.38 通过软件清除ADCSR.ADST位的程序

要在通过软件执行清除操作后指定以下设置，请提供至少两个等待时间ADCLK cycles.

- 启用扫描结束中断
- 为事件链接控制器启用扫描结束事件
- 通过软件启动AD转换
- 启用触发输入

(2) Notes on Modes and Status Bits

If necessary, individually initialize or set again the voltage status for self-diagnosis, the judgment of the even number or odd number specified for double-trigger mode, and the monitor flags of the compare function.

- To set again the voltage status for self-diagnosis, set the ADCER.DIAGLD bit to 1 and then set a desired value in the ADCER.DIAGVAL[1:0] bits.
- If the setting of the ADCSR.DBLE bit is changed from 0 to 1, the double-trigger mode operation starts from the first scanning.
- To initialize the monitor flags of the compare function (MONCMPA, MONCMPB, and MONCOMB), set the ADCMPCR.CMPAE and ADCMPCR.CMPBE bits to 0.

43.6.4 A/D Conversion Restart and Termination Timing

A maximum of 6 ADCLK cycles is required for the idle analog unit of the ADC12 to restart on setting the ADCSR.ADST bit to 1. A maximum of 2 ADCLK cycles is required for the operating analog unit of the ADC12 to terminate on setting the ADCSR.ADST bit to 0.

43.6.5 Constraints on Scan End Interrupt Handling

When scanning the same analog input twice using any trigger, the first A/D-converted data is overwritten with the second A/D-converted data. This occurs when the CPU does not complete the reading of the A/D-converted data by the time the A/D conversion of the first analog input for the second scan ends after the first scan end interrupt is generated.

43.6.6 Settings for the Module-Stop Function

The Module Stop Control Register can enable or disable ADC12 operation. The ADC12 is initially stopped after a reset. The registers become accessible on release from the module-stop state. After release from the module-stop state, wait for at least 1 µs before starting A/D conversion. For details, see section 10, Low Power Modes.

43.6.7 Notes on Entering the Low-Power States

Before entering the module-stop state or Software Standby mode, be sure to stop A/D conversion. Set the ADCSR.ADST bit in ADCSR to 0 and secure a period of time until the analog unit of the ADC12 stops. Follow the procedure shown in Figure 43.38 to clear the ADCSR.ADST bit with software. Then, wait for 2 clock cycles of ADCLK before entering the module-stop state or Software Standby mode.

43.6.8 Error in Absolute Accuracy When Disconnection Detection Assistance Is in Use

Using disconnection detection assistance leads to an error in absolute accuracy of the ADC12. This error arises because an erroneous voltage is input to the analog input pins due to the resistive voltage division between the pull-up or pull- down resistor (Rp) and the resistance of the signal source (Rs). This error in absolute accuracy is calculated from the following formula:

$$\text{Maximum error in absolute accuracy (LSB)} = \left(2^{\text{Resolution}} - 1\right) \times \text{Rs} / \left(\text{Rs} + \text{Rp}\right)$$

Only use disconnection detection assistance after thorough evaluation.

43.6.9 Constraints on Operating Modes and Status Bits

Initialize or set again individually, if necessary, the voltage values in self-diagnosis, the value of the first scan or second scan in double trigger mode, the data buffer pointer, and status monitor in the compare function.

- Select the voltage values in self-diagnosis (ADCER.DIAGVAL[1:0]) after setting ADCER.DIAGLD to 1.
- Double-trigger mode operates as the first scan after setting ADCSR.DBLE from 0 to 1.
- The status monitor bits (MONCMPA, MONCMPB, MONCOMB) in the compare function are initialized after setting ADCMPCR.CMPAE and ADCMPCR.CMPBE to 0.

(2) 模式和状态位注意事项

如有必要，单独初始化或重新设置电压状态以进行自诊断、双触发模式指定的偶数或奇数判断以及比较功能的监视标志。

●要再次设置自诊断的电压状态，请将ADCER.DIAGLD位设置为1，然后在ADCER.DIAGVAL[1:0]位中设置所需的值。

●如果ADCSR.DBLE位的设置从0变为1，则双触发模式操作从第一次扫描开始。

●要初始化比较函数的监控标志（MONCMPA、MONCMPB和MONCOMB），请将ADCMPCR.CMPAE和ADCMPCR.CMPBE位设置为0。

43.6.4 AD转换重启和终止时序

ADC12的空闲模拟单元最多需要6个ADCLK周期才能在将ADCSR.ADST位设置为1时重新启动。ADC12的操作模拟单元需要最多2个ADCLK周期才能在设置ADCSR时终止.ADST位为0。

43.6.5 扫描结束中断处理的约束

当使用任何触发器扫描相同的模拟输入两次时，第一个AD转换数据将被第二个AD转换数据覆盖。当CPU在

在产生第一次扫描结束中断后，第二次扫描的第一个模拟输入的D转换结束。

43.6.6 模块停止功能的设置

模块停止控制寄存器可以启用或禁用ADC12操作。ADC12在复位后最初停止。
寄存器在从模块停止状态释放时变得可访问。从模块停止状态释放后，至少等待1µs再开始AD转换。有关详细信息，请参阅第10节，低功耗模式。

43.6.7 进入低功耗状态的注意事项

在进入模块停止状态或软件待机模式之前，请务必停止AD转换。将ADCSR中的ADCSR.ADST位设置为0，并确保一段时间，直到ADC12的模拟单元停止。按照图43.38所示的过程用软件清零ADCSR.ADST位。然后，在进入模块停止状态或软件待机模式之前等待ADCLK的2个时钟周期。

43.6.8 使用断线检测辅助时的绝对精度误差

使用断开检测辅助会导致ADC12的绝对精度出现误差。由于上拉或下拉电阻(Rp)与信号源电阻(Rs)之间的电阻分压，导致错误电压输入到模拟输入引脚，因此会出现此错误。该绝对精度误差由以下公式计算得出：

绝对精度的最大误差(LSB)=2分辨率 1×RsRs+Rp)

仅在全面评估后使用断线检测辅助。

43.6.9 操作模式和状态位的限制

必要时单独初始化或重新设置自诊断中的电压值、双触发模式下的第一次扫描或第二次扫描的值、数据缓冲区指针和比较功能中的状态监视器。

●设置ADCER.DIAGLD为1后，选择自诊断中的电压值（ADCER.DIAGVAL[1:0]）。

●双触发模式在将ADCSR.DBLE从0设置为1后作为第一次扫描运行。

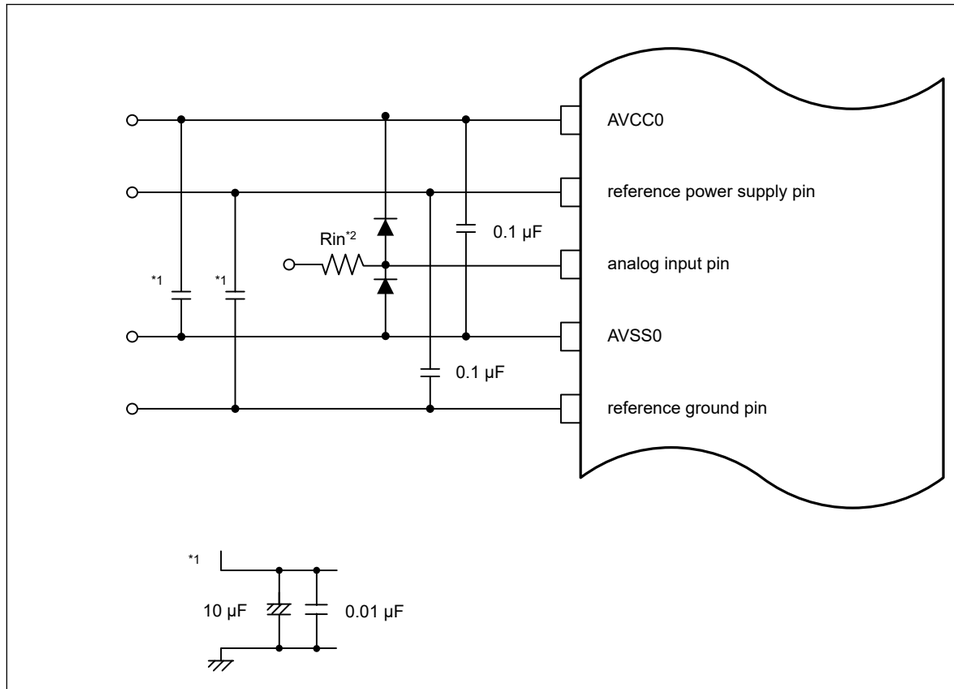
●比较功能中的状态监控位（MONCMPA、MONCMPB、MONCOMB）在设置ADCMPCR.CMPAE和ADCMPCR.CMPBE为0后被初始化。

43.6.10 Notes on Board Design

The board should be designed so that digital circuits and analog circuits are separated from each other as far as possible. In addition, digital circuit signal lines and analog circuit signal lines should not intersect or be placed near each other. If these rules are not followed, noise can occur on analog signals and A/D conversion accuracy is affected. The analog input pins, reference power supply pin (VREFH0, VREFH), reference ground pin (VREFL0, VREFL), and analog power supply (AVCC0) should be separated from digital circuits using the analog ground (AVSS0). The analog ground (AVSS0) should be connected to a stable digital ground (VSS) on the board (single-point ground plane connection).

43.6.11 Constraints on Noise Prevention

To prevent the analog input pins from being destroyed by abnormal voltage such as excessive surge, insert a capacitor between AVCC0 and AVSS0 and between VREFH0 and VREFL0 and between VREFH and VREFL. Additionally, connect a protection circuit to protect the analog input pins as shown in Figure 43.39.



Note 1. The values shown here are reference values.
Note 2. Rin: Signal source impedance

Figure 43.39 Example protection circuit for analog inputs

43.6.12 Port Settings When Using the ADC12 Input

When using the high-precision channels, do not use PORT0 as general I/O. Renesas recommends that you do not use the digital output that is also used as the AD analog input if normal-precision channel is used. If the digital output that is also used as the AD analog input is used for output signals, perform A/D conversion several times, eliminate the maximum and minimum values, and obtain the average of the other results.

43.6.13 Notes on Canceling Software Standby Mode

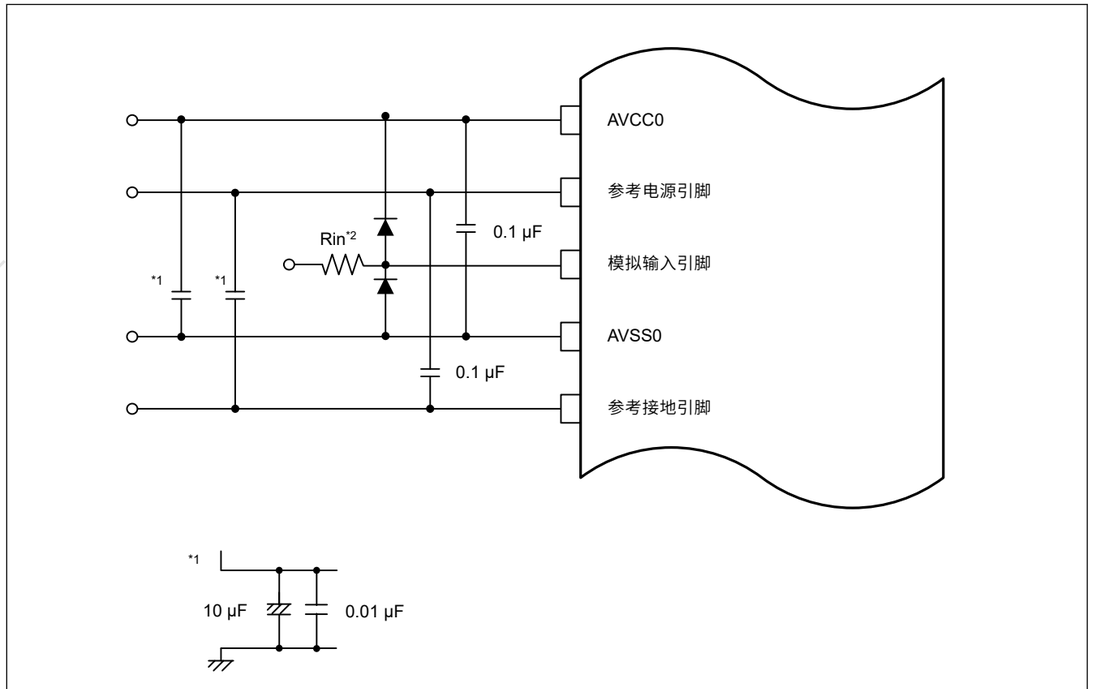
After software standby mode is canceled, wait at least 1 µs after the stabilization time for the oscillator elapses and before starting A/D conversion. For details, see section 10, Low Power Modes

43.6.10 电路板设计注意事项

电路板的设计应使数字电路和模拟电路尽可能分开。此外，数字电路信号线和模拟电路信号线不应交叉或靠近。如果不遵守这些规则，模拟信号上可能会出现噪声，影响AD转换精度。模拟输入引脚、参考电源引脚(VREFH0、VREFH)、参考接地引脚(VREFL0、VREFL)和模拟电源(AVCC0)应与使用模拟接地(AVSS0)的数字电路分开。模拟接地(AVSS0)应连接到板上的稳定数字接地(VSS)（单点接地层连接）。

43.6.11 防止噪音的限制

为防止模拟输入引脚被过大浪涌等异常电压损坏，请在AVCC0和AVSS0之间、VREFH0和VREFL0之间以及VREFH和VREFL之间插入一个电容器。此外，连接保护电路以保护模拟输入引脚，如图43.39所示。



注1.此处显示的值为参考值。
注2.Rin：信号源阻抗

Figure 43.39 模拟输入保护电路示例

43.6.12 使用ADC12输入时的端口设置

使用高精度通道时，请勿将PORT0用作通用IO。如果使用普通精度通道，瑞萨建议您不要使用同时用作AD模拟输入的数字输出。如果同时用作AD模拟输入的数字输出用于输出信号，则进行数次A/D转换，消除最大值和最小值，取其他结果的平均值。

43.6.13 关于取消软件待机模式的注意事项

取消软件待机模式后，在振荡器的稳定时间过去后至少等待1µs，然后再开始AD转换。有关详细信息，请参阅第10节，低功耗模式

RA生态工作室

43.6.14 Calculation for sampling time

The sampling time can be easily estimated by the following figure and formula. This is the time to reach the voltage within 1/4 LSB.

$t_{SPL} = (R_{EXT} + R_{AD}) \times (C_{EXT} + C_{AD}) \times \ln (C_{AD} / (C_{EXT} + C_{AD}) \times 2^{N+2})$

R_{EXT} shows external signal source impedance
C_{EXT} shows external capacitance (pin capacitance*1 + PCB parasitic capacitance)
N = 12, 10 or 8 (conversion resolution)
C_{AD} = 5 pF (internal capacitance)
R_{AD} = 1.0 kΩ (internal resistance, case of high-speed channels)
R_{AD} = 2.0 kΩ (internal resistance, case of normal-speed channels)

Note 1. Typical value of analog input pin is 5 pF

For example, if R_{EXT} is 1 kΩ, C_{EXT} is 10 pF and N is 12 bits, t_{SPL} of high-speed channel is 258 ns.

This formula simplifies the general use case. This formula is not guaranteed and should be used only for estimation.

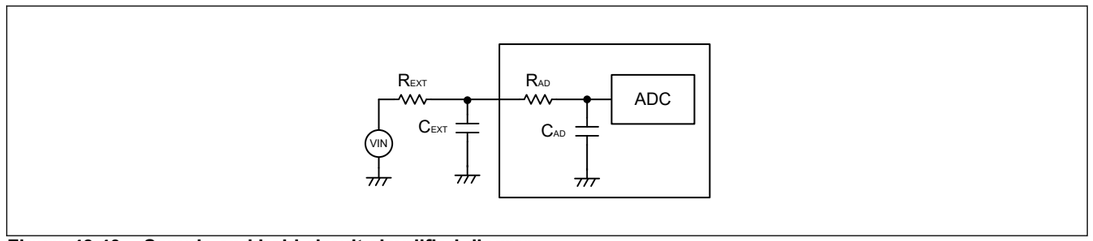


Figure 43.40 Sample and hold circuit simplified diagram

43.6.14 采样时间计算

采样时间可以通过下图和公式轻松估算。这是在14LSB内达到电压的时间。

tSPL=(REXT+RAD)×(CEXT+CAD)×ln(CAD(CEXT+CAD)×2N+2)

REXT显示外部信号源阻抗
CEXT表示外部电容（引脚电容*1+PCB寄生电容）
N = 12, 10 or 8 (conversion resolution)
C_{AD} = 5 pF (internal capacitance)
RAD=1.0kΩ（内部电阻，高速通道的情况）
RAD=2.0kΩ（内部电阻，正常速度通道的情况）

注1.模拟输入引脚的典型值为5pF

例如，如果REXT为1kΩ，CEXT为10pF，N为12位，则高速通道的tSPL为258ns。

此公式简化了一般用例。这个公式不能保证，只能用于估计。

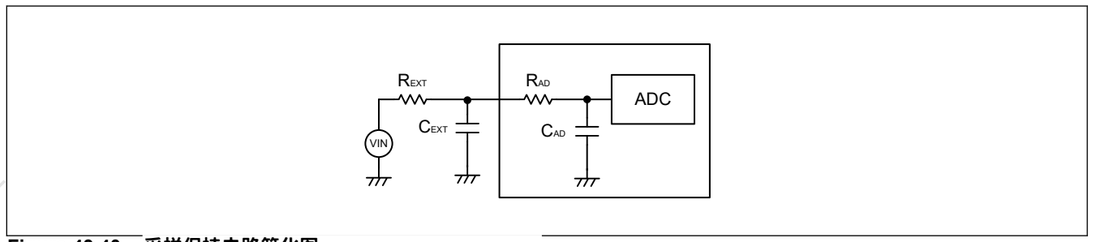

Figure 43.40 采样保持电路简化图

44. 12-Bit D/A Converter (DAC12)

44.1 Overview

The MCU provides a 12-bit D/A Converter (DAC12) with an output amplifier. Table 44.1 lists the DAC12 specifications, Figure 44.1 shows a block diagram, and Table 44.2 lists the I/O pins.

Table 44.1 DAC12 specifications

Parameter	Specifications
Resolution	12 bits
Output channels	2 channels
Interference reduction between analog modules	Methods provided to minimize interference between D/A and A/D conversion: • D/A converted data update timing is controlled by the synchronous D/A conversion enable input signal from the ADC12 (unit 1) • Degradation of A/D conversion accuracy caused by interference is reduced by controlling the DAC12 inrush current generation timing with the enable signal.
Module-stop function	Module-stop state can be set to reduce power consumption
Event link function (input)	The DA0 and DA1 conversion can be started on input of an event signal
D/A output amplifier control function	Controls whether the output amplifier (for both amplifier-through and amplifier-bias controls) is used
TrsutZone Filter	Security attribution can be set

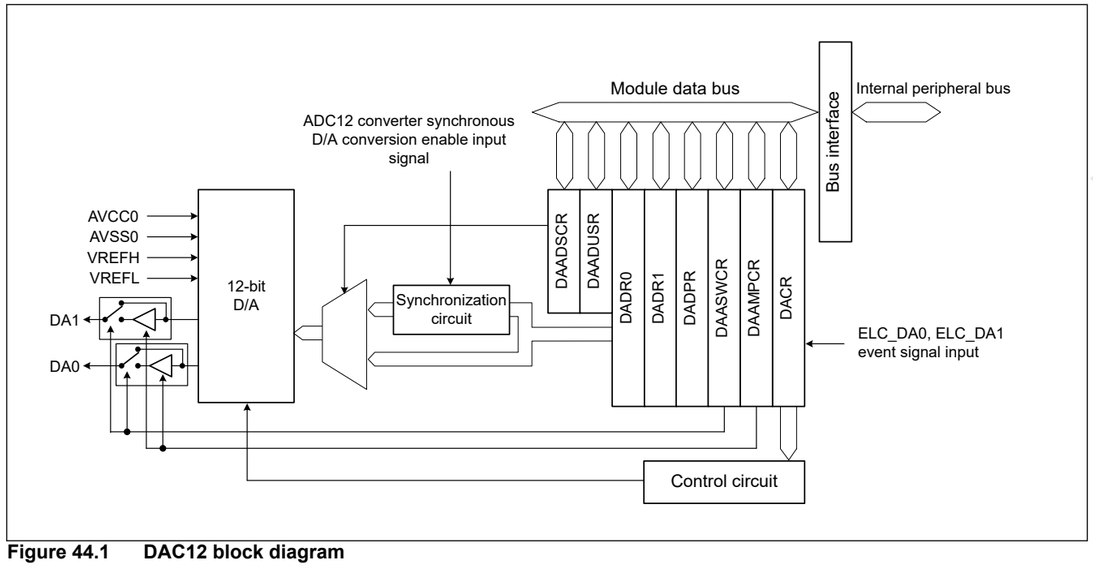

Figure 44.1 DAC12 block diagram

Table 44.2 lists the pin configuration of the DAC12.

Table 44.2 DAC12 I/O pins (1 of 2)

Pin name	I/O	Function
AVCC0	Input	• Analog power and analog reference top voltage supply pin for ADC12 and DAC12. • Connect to VCC when these modules are not used.
AVSS0	Input	• Analog ground and analog reference ground supply pin for ADC12 and DAC12. • Connect to VSS when these modules are not used.
VREFH	Input	Analog reference top voltage supply pin for the ADC12 (unit 1) and the DAC12
VREFL	Input	Analog reference ground pin for the ADC12 (unit 1) and the DAC12

44. 12-Bit D/A Converter (DAC12)

44.1 Overview

MCU提供带输出放大器的12位DA转换器(DAC12)。表44.1列出了DAC12规格，
图44.1显示了框图，表44.2列出了IO引脚。

Table 44.1 DAC12 specifications

Parameter	Specifications
Resolution	12 bits
输出通道	2 channels
减少模拟模块之间的干扰	为尽量减少DA和AD转换之间的干扰提供的方法：● DA转换数据更新时序由来自ADC12（单元1）的同步DA转换使能输入信号控制 • 通过使能信号控制DAC12浪涌电流的产生时序，可以减少由干扰引起的AD转换精度下降。
Module-stop function	可设置模块停止状态以降低功耗
事件链接功能（输入）	DA0和DA1转换可以在输入事件信号时启动
DA输出放大器控制功能	控制是否使用输出放大器（用于放大器直通和放大器偏置控制）
TrsutZone Filter	可设置安全属性

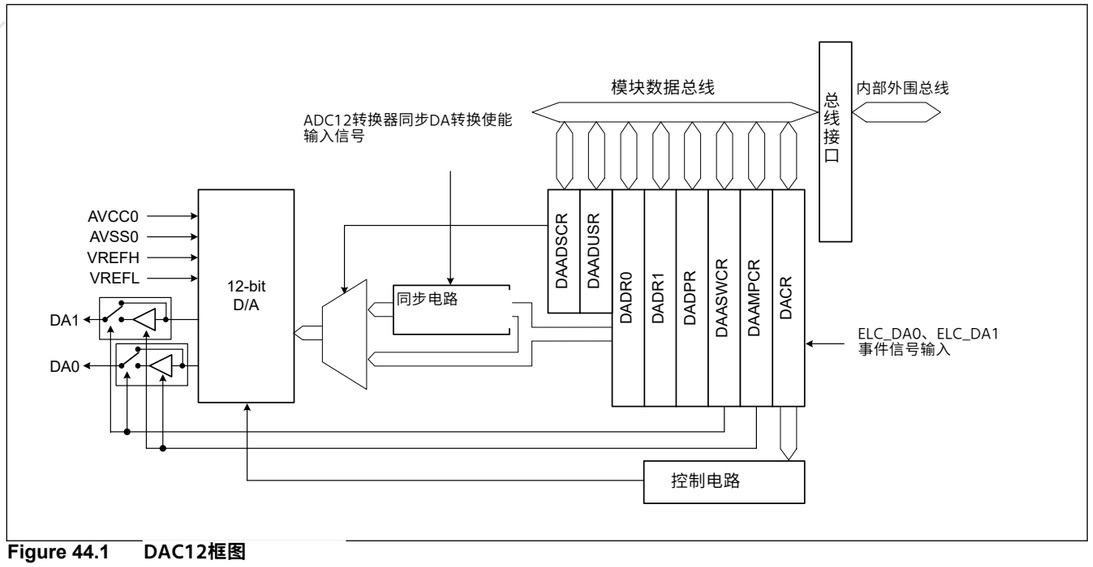

Figure 44.1 DAC12框图

表44.2列出了DAC12的引脚配置。

Table 44.2 DAC12IO引脚（2个中的1个）

引脚名称	I/O	Function
AVCC0	Input	• ADC12和DAC12的模拟电源和模拟参考最高电压电源引脚。 • 不使用这些模块时连接到VCC。
AVSS0	Input	• ADC12和DAC12的模拟地和模拟参考地电源引脚。 • 不使用这些模块时连接到VSS。
VREFH	Input	ADC12（单元1）和DAC12的模拟参考最高电压电源引脚
VREFL	Input	ADC12（单元1）和DAC12的模拟参考接地引脚

Table 44.2 DAC12 I/O pins (2 of 2)

Pin name	I/O	Function
DA0	Output	Channel 0 output pin for the analog signals processed by the DAC12
DA1	Output	Channel 1 output pin for the analog signals processed by the DAC12

44.2 Register Descriptions

44.2.1 DADRn : D/A Data Register n (n = 0, 1)

Base address: DAC12 = 0x4017_1000

Offset address: 0x00 + 0x02 × n

Bit position:	15															0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DADRn register is 16-bit read/write registers that store data for D/A conversion. When an analog output is enabled, the values in DADRn are converted and output to the analog output pins.

12-bit data can be formatted as left- or right-justified in the DADPR.DPSEL bit setting. In right-justified format (DADPR.DPSEL = 0), the lower 12 bits, [11:0], are valid. In left-justified format (DADPR.DPSEL = 1), the upper 12 bits, [15:4], are valid.

44.2.2 DACR : D/A Control Register

Base address: DAC12 = 0x4017_1000

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DAOE1	DAOE0	DAE	—	—	—	—	—
Value after reset:	0	0	0	1	1	1	1	1

Bit	Symbol	Function	R/W
4:0	—	These bits are read as 1. The write value should be 1.	R/W
5	DAE*1	D/A Enable 0: Control D/A conversion of channels 0 and 1 individually 1: Control D/A conversion of channels 0 and 1 collectively	R/W
6	DAOE0	D/A Output Enable 0 0: Disable analog output of channel 0 (DA0) 1: Enable D/A conversion of channel 0 (DA0)	R/W
7	DAOE1	D/A Output Enable 1 0: Disable analog output of channel 1 (DA1) 1: Enable D/A conversion of channel 1 (DA1)	R/W

Note 1. This bit controls D/A conversion in combination with the DAOEi bit (i = 0, 1), which controls the output of the conversion results. For details, see Table 44.3.

Table 44.2 DAC12IO引脚（2个中的2个）

引脚名称	I/O	Function
DA0	Output	DAC12处理的模拟信号的通道0输出引脚
DA1	Output	DAC12处理的模拟信号的通道1输出引脚

44.2 注册说明

44.2.1 DADRn:DA数据寄存器n(n=0 1)

Base address: DAC12 = 0x4017_1000

Offset address: 0x00 + 0x02 × n

Bit position:	15															0
Bit field:																
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

DADRn寄存器是16位读写寄存器，用于存储用于DA转换的数据。当模拟输出使能时，DADRn中的值被转换并输出到模拟输出引脚。

在DADPR.DPSEL位设置中，12位数据可以被格式化为左对齐或右对齐。在右对齐格式(DADPR.DPSEL=0)中，低12位[11:0]有效。在左对齐格式(DADPR.DPSEL=1)中，高12位[15:4]有效。

44.2.2 DACR:DA控制寄存器

Base address: DAC12 = 0x4017_1000

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DAOE1	DAOE0	DAE	—	—	—	—	—
重置后的值:	0	0	0	1	1	1	1	1

Bit	Symbol	Function	R/W
4:0	—	这些位被读取为1。写入值应为1。	R/W
5	DAE*1	D/A Enable 0：分别控制通道0和通道1的DA转换1：控制通道0和通道1的DA转换	R/W
6	DAOE0	DA输出使能0 0：禁用通道0（DA0）的模拟输出1：启用通道0（DA0）的DA转换	R/W
7	DAOE1	DA输出使能1 0：禁用通道1（DA1）的模拟输出1：启用通道1（DA1）的DA转换	R/W

注1.该位与DAOEi位(i=0 1)一起控制DA转换，DAOEi位控制转换结果的输出。详见表44.3。

Table 44.3 D/A conversion controls

DAE	DAOE1	DAOE0	Description
0	0	0	Disable D/A conversion and analog output pins (DA0, DA1)*1
		1	• Enable D/A conversion of channel 0 and disable D/A conversion of channel 1 • Enable analog output of channel 0 (DA0) and disable analog output of channel 1 (DA1)*1
	1	0	• Disable D/A conversion of channel 0 and enable D/A conversion of channel 1 • Disable analog output of channel 0 (DA0)*1 and enable analog output of channel 1 (DA1)
		1	• Enable D/A conversion of channels 0 and 1 • Enable analog output of channels 0 and 1 (DA0, DA1)
1	x	x	• Enable D/A conversion of channels 0 and 1 • Collective enable analog output of channels 0 and 1 (DA0, DA1)

Note: x: Don't care
Note 1. When analog output is disabled, the analog output signal is placed in the Hi-Z state.

Only set this register while the ADC12 is halted when the DAADSCR.DAADST bit is 1 (interference reduction between D/A and A/D conversion is enabled). Only set DACR while the ADCSR.ADST bit is 0 and after selecting the software trigger, for the ADC12 trigger to securely stop the ADC12. This MCU only supports ADC12 (unit 1).

DAE bit (D/A Enable)

The DAE bit controls D/A conversion, amplifier operation, and analog output in combination with the DAOEi bit (i = 0, 1) and the DAMMPCR.DAAMPi bit (i = 0, 1). See Table 44.4.

When interference reduction between D/A and A/D conversions is enabled (DAADSCR.DAADST = 1), set the ADCSR.ADST bit of the ADC12 (unit 1) to 0. Then, select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1).

DAOEi bit (D/A Output Enable i)

The DAOEi bit (i = 0, 1) controls D/A conversion, amplifier operation, and analog output in combination with the DAE bit and DAMMPCR.DAAMPi bit (i = 0, 1). See Table 44.4.

When both the DAOEi bit (i = 0, 1) and DAE bit are 0, D/A conversion of channel i (i = 0, 1) is not processed, and no conversion result is output.

When interference reduction between D/A and A/D conversions is enabled (DAADSCR.DAADST = 1), set the DAOEi bit while the ADCSR.ADST bit of the ADC12 (unit 1) is set to 0. Then, select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1).

The event link function can be used to set the DAOEi bit to 1. The DAOE0 bit is set to 1 when the event specified in the ELSR12 register of the ELC (ELC_DA0 event) occurs, and output of the D/A conversion results starts. The DAOE1 bit is set to 1 when the event specified in the ELSR13 register of the ELC (ELC_DA1 event) occurs, and output of the D/A conversion results starts.

Table 44.4 D/A conversion and analog output control (1 of 2)

DACR		DAAMPCR	Channel i operation	Amplifier operation of channel i	Analog output of channel i
DAE	DAOEi	DAAMPi			
0	0	0	Stop	Stop	Hi-Z
		1	Stop	Stop	Hi-Z
	1	0	Run	Stop	Amplifier-through
		1	Run	Run	Amplifier output

Table 44.3 DA转换控制

DAE	DAOE1	DAOE0	Description
0	0	0	禁用DA转换和模拟输出引脚(DA0 DA1)*1
		1	• 启用通道0的DA转换和禁用通道1的DA转换 • 启用通道0(DA0)的模拟输出和禁用通道1(DA1)的模拟输出*1
	1	0	• 禁用通道0的DA转换，启用通道1的DA转换 • 禁用通道0(DA0)*1的模拟输出并启用通道1(DA1)的模拟输出
		1	• 启用通道0和1的DA转换 • 启用通道0和1（DA0、DA1）的模拟输出
1	x	x	• 启用通道0和1的DA转换 • 通道0和1（DA0、DA1）的集体启用模拟输出

Note: x: Don't care
注1.当模拟输出禁用时，模拟输出信号置于Hi-Z状态。

仅当DAADSCR.DAADST位为1时ADC12停止时才设置此寄存器（之间的干扰减少DA和AD转换已启用）。只有在ADCSR.ADST位为0且选择软件触发后设置DACR，ADC12触发才能安全停止ADC12。此MCU仅支持ADC12（单元1）。

DAE位（DA启用）

DAE位与DAOEi位(i=0 1)和DAMMPCR.DAAMPi位(i=0 1)一起控制DA转换、放大器操作和模拟输出。见表44.4。

当启用DA和AD转换之间的干扰减少(DAADSCR.DAADST=1)时，设置ADC12（单元1）的ADCSR.ADST位为0。然后，选择ADC12（单元1）触发的软件触发以安全停止ADC12（单元1）。

DAOEi位（DA输出使能i）

DAOEi位(i=0 1)与DAE位和DAMMPCR.DAAMPi位(i=0 1)一起控制DA转换、放大器操作和模拟输出。见表44.4。

当DAOEi位(i=0 1)和DAE位均为0时，通道i(i=0 1)的DA转换不进行处理，也不输出转换结果。

当启用DA和AD转换之间的干扰降低时（DAADSCR.DAADST=1），设置DAOEi位，同时将ADC12（单元1）的ADCSR.ADST位设置为0。然后，选择ADC12的软件触发（单元1)触发以安全地停止ADC12（单元1）。

事件链接功能可用于将DAOEi位设置为1。当在发生ELC（ELC_DA0事件）的ELSR12寄存器，开始输出DA转换结果。当发生ELC的ELSR13寄存器中指定的事件（ELC_DA1事件）时，DAOE1位设置为1，并开始输出DA转换结果。

Table 44.4 DA转换和模拟输出控制(1of2)

DACR		DAAMPCR	通道i操作	通道i的放大器操作	通道i的模拟输出
DAE	DAOEi	DAAMPi			
0	0	0	Stop	Stop	Hi-Z
		1	Stop	Stop	Hi-Z
	1	0	Run	Stop	Amplifier-through
		1	Run	Run	放大器输出

Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	DPSEL	DADRn Format Select 0: Right-justified format 1: Left-justified format	R/W

44.2.4 DAADSCR : D/A A/D Synchronous Start Control Register

Base address: DAC12 = 0x4017_1000

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DAADST	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	DAADST	D/A A/D Synchronous Conversion 0: Do not synchronize DAC12 with ADC12 (unit 1) operation (disable interference reduction between D/A and A/D conversion). 1: Synchronize DAC12 with ADC12 (unit 1) operation (enable interference reduction between D/A and A/D conversion).	R/W

To minimize interference between D/A and A/D conversion, the DAADSCR register enables synchronization of the start timing of D/A conversion with the ADC12 synchronous D/A conversion enable input signal.

Only set this register while the ADC12 (unit 1) is halted, that is, while the ADCSR.ADST bit is 0 after selecting the software trigger as the ADC12 (unit 1) trigger.

Select unit 1 as the target ADC12 unit before setting the DAADST bit to 1. Set DAADUSR[1] bit to 1 to select unit 1. This MCU only supports ADC12 unit 1.

Table 44.4 DA转换和模拟输出控制(2of2)

DAE	DAOEi	DAAMPi			
1	0	0	Run	Stop	Amplifier-through
		1	Run	Run	放大器输出
	1	0	Run	Stop	Amplifier-through
		1	Run	Run	放大器输出

Note: i = 0, 1

44.2.3 DADPR:DADRn格式选择寄存器

Base address: DAC12 = 0x4017_1000

Offset address: 0x05

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DPSEL	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	这些位被读取为0。写入值应为0。	R/W
7	DPSEL	DADRn格式选择 0: Right-justified format 1: Left-justified format	R/W

44.2.4 DAADSCR:DAAD同步启动控制寄存器

Base address: DAC12 = 0x4017_1000

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DAADST	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	这些位被读取为0。写入值应为0。	R/W
7	DAADST	DAAD同步转换 0：不将DAC12与ADC12（单元1）操作同步（禁用DA和AD转换之间的干扰降低）。 1：DAC12与ADC12（单元1）操作同步（启用DA和AD转换之间的干扰降低）。	R/W

为了尽量减少DA和AD转换之间的干扰，DAADSCR寄存器使DA转换的开始时序与ADC12同步DA转换使能输入信号同步。

仅在ADC12（单元1）停止时设置该寄存器，即选择软件触发作为ADC12（单元1）触发后ADCSR.ADST位为0。

在将DAADST位设置为1之前选择单元1作为目标ADC12单元。将DAADUSR[1]位设置为1以选择单元1。这MCU仅支持ADC12单元1。

DAADST bit (D/A A/D Synchronous Conversion)

Setting the DAADST bit to 0 allows the DADRn register value to be converted into analog data at any time. Setting the DAADST bit to 1 allows synchronization of D/A conversion with the synchronous D/A conversion enable input signal from the ADC12 (unit 1). With this bit set, D/A conversion does not start until the ADC12 (unit 1) completes A/D conversion, even when the DADRn register is changed.

Set this bit while the ADCSR.ADST bit is set to 0. Then, select the software trigger for the ADC12 (unit 1) trigger to securely stop the ADC12 (unit 1). Set the DAADUSR.AMADSEL1 bit to 1 before setting the DAADST bit to 1.

The event link function cannot be used when the DAADST bit is set to 1. Stop the event link function by setting the ELSR12 and ELSR13 registers of the ELC. The setting of the DAADST bit is shared by channels 0 and 1 of the DAC12.

44.2.5 DAAMPCR : D/A Output Amplifier Control Register

Base address: DAC12 = 0x4017_1000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DAAMP1	DAAMP0	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	DAAMP0	Amplifier Control 0 0: Do not use channel 0 output amplifier 1: Use channel 0 output amplifier	R/W
7	DAAMP1	Amplifier Control 1 0: Do not use channel 1 output amplifier 1: Use channel 1 output amplifier	R/W

The DAAMPCR register selects D/A output with or without using the amplifier.

DAAMP0 bit (Amplifier Control 0)

When the DAAMP0 bit is 0, analog values are output for D/A output of channel 0 without using the amplifier. When the DAAMP0 bit is 1, analog values are output for D/A output of channel 0 through the amplifier.

When both the DACR.DAE and DACR.DAOE0 bits are 0, the amplifier is not used regardless of the setting of the DAAMP0 bit. See Table 44.4 for details.

DAAMP1 bit (Amplifier Control 1)

When the DAAMP1 bit is 0, analog values are output for D/A output of channel 1 without using the amplifier. When the DAAMP1 bit is 1, analog values are output for D/A output of channel 1 through the amplifier.

When both the DACR.DAE and DACR.DAOE1 bits are 0, the amplifier is not used regardless of the setting of the DAAMP1 bit. See Table 44.4 for details.

44.2.6 DAASWCR : D/A Amplifier Stabilization Wait Control Register

Base address: DAC12 = 0x4017_1000

Offset address: 0x1C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DAASW1	DAASW0	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

DAADST位（DAAD同步转换）

将DAADST位设置为0可以随时将DADRn寄存器值转换为模拟数据。设置DAADST位为1允许DA转换与来自ADC12（单元1）的同步DA转换使能输入信号同步。设置该位后，在ADC12（单元1）完成AD转换之前，即使DADRn寄存器发生更改，DA转换也不会开始。

在ADCSR.ADST位设置为0时设置该位。然后，选择ADC12（单元1）触发器的软件触发器以安全地停止ADC12（单元1）。在将DAADST位设置为1之前，将DAADUSR.AMADSEL1位设置为1。

当DAADST位设置为1时，不能使用事件链接功能。通过设置ELC的ELSR12和ELSR13寄存器。DAADST位的设置由DAC12的通道0和1共享。

44.2.5 DAAMPCR:DA输出放大器控制寄存器

Base address: DAC12 = 0x4017_1000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DAAMP1	DAAMP0	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	这些位被读取为0。写入值应为0。	R/W
6	DAAMP0	放大器控制0 0：不使用通道0输出放大器1：使用通道0输出放大器	R/W
7	DAAMP1	放大器控制1 0：不使用通道1输出放大器1：使用通道1输出放大器	R/W

DAAMPCR寄存器选择使用或不使用放大器的DA输出。

DAAMP0位（放大器控制0）

当DAAMP0位为0时，模拟值输出通道0的DA输出，而不使用放大器。当。。。的时候DAAMP0位为1，模拟值通过放大器输出通道0的DA输出。

当DACR.DAE和DACR.DAOE0位都为0时，无论设置如何都不会使用放大器DAAMP0位。详见表44.4。

DAAMP1位（放大器控制1）

当DAAMP1位为0时，模拟值输出通道1的DA输出，而不使用放大器。当。。。的时候DAAMP1位为1，模拟值通过放大器输出到通道1的DA输出。

当DACR.DAE和DACR.DAOE1位都为0时，无论设置如何都不会使用放大器DAAMP1位。详见表44.4。

44.2.6 DAASWCR:DA放大器稳定等待控制寄存器

Base address: DAC12 = 0x4017_1000

Offset address: 0x1C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DAASW1	DAASW0	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5	—	These bits are read as 0. The write value should be 0.	R/W
6	DAASW0	D/A Amplifier Stabilization Wait 0 0: Amplifier stabilization wait off (output) for channel 0 1: Amplifier stabilization wait on (high-Z) for channel 0	R/W
7	DAASW1	D/A Amplifier Stabilization Wait 1 0: Amplifier stabilization wait off (output) for channel 1 1: Amplifier stabilization wait on (high-Z) for channel 1	R/W

The DAASWCR register controls D/A output with the output amplifier. This register is used in the initialization procedure to wait for stabilization of the D/A output amplifier. Each bit in DAASWCR should be set to 1 when both the DACR.DAE bit and the DACR.DAOEi (i = 0, 1) bit are 0. See section 44.6.5. Initialization Procedure with the Output Amplifier.

DAASW0 bit (D/A Amplifier Stabilization Wait 0)

Set the DAASW0 bit to 1 in the initialization procedure to wait for the stabilization of the D/A channel 0 output amplifier. When DAASW0 is set to 1, D/A conversion operates, but the conversion result of D/A is not output from channel 0. When the DAASW0 bit is 0, the stabilization wait time stops, and the D/A conversion result of channel 0 is output through the output amplifier.

DAASW1 bit (D/A Amplifier Stabilization Wait 1)

Set the DAASW1 bit to 1 in the initialization procedure to wait for the stabilization of the D/A channel 1 output amplifier. When DAASW1 is set to 1, D/A conversion operates, but the conversion result of D/A is not output from channel 1. When the DAASW1 bit is 0, the stabilization wait time stops, and the D/A conversion result of channel 1 is output through the output amplifier.

44.2.7 DAADUSR : D/A A/D Synchronous Unit Select Register

Base address: DAC12 = 0x4017_1000

Offset address: 0x10C0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	AMADSEL1	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	AMADSEL1	A/D Unit 1 Select 0: Do not select unit 1 1: Select unit 1	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

The DAADUSR register selects the target ADC12 unit for D/A and A/D synchronous conversions. Set the AMADSEL1 bit to 1 to select unit 1 as the target synchronous unit for the MCU. When setting the DAADSCR.DAADST bit to 1 for synchronous conversions, select the target unit in this register in advance.

Only set the DAADUSR register while the ADCSR.ADST bit of the ADC12 is set to 0 and the DAADSCR.DAADST bit is set to 0.

44.3 Operation

The DAC12 includes D/A conversion circuits for two channles, each of which can operate independently. When the DAOEn bit (n = 0, 1) in DACR is set to 1, DAC12 is enabled and the conversion result is output.

This following example shows D/A conversion on channel 0. Figure 44.2 shows the timing of this operation.

To process D/A conversion on channel 0:

1. Set the data for D/A conversion in the DADR0 register and the data format in the DADPR.DPSEL bit.

Bit	Symbol	Function	R/W
5	—	这些位被读取为0。写入值应为0。	R/W
6	DAASW0	DA放大器稳定等待0 0：通道0的放大器稳定等待关闭（输出）1：通道0的放大器稳定等待打开（高阻态）	R/W
7	DAASW1	DA放大器稳定等待1 0：通道1的放大器稳定等待关闭（输出）1：通道1的放大器稳定等待打开（高阻态）	R/W

DAASWCR寄存器通过输出放大器控制DA输出。该寄存器在初始化过程中用于等待DA输出放大器的稳定。当DACR.DAE位和DACR.DAOEi(i=0 1)位均为0时，DAASWCR中的每个位都应设置为1。请参见第44.6.5节。输出放大器的初始化程序。

DAASW0位（DA放大器稳定等待0）

在初始化过程中将DAASW0位设置为1，以等待DA通道0输出放大器稳定。当DAASW0设置为1时，DA转换进行，但DA的转换结果不从通道0输出。当DAASW0位为0时，稳定等待时间停止，通过输出输出通道0的DA转换结果放大器。

DAASW1位（DA放大器稳定等待1）

在初始化过程中将DAASW1位设置为1，以等待DA通道1输出放大器稳定。当DAASW1设置为1时，DA转换进行，但DA的转换结果不从通道1输出。当DAASW1位为0时，稳定等待时间停止，通道1的DA转换结果通过输出输出放大器。

44.2.7 DAADUSR:DAAD同步单元选择寄存器

Base address: DAC12 = 0x4017_1000

Offset address: 0x10C0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	AMADSEL1	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	该位读取为0。写入值应为0。	R/W
1	AMADSEL1	AD单元1选择 0：不选择单元11：选择单元1	R/W
7:2	—	这些位被读取为0。写入值应为0。	R/W

DAADUSR寄存器为DA和AD同步转换选择目标ADC12单元。将AMADSEL1位设置为1以选择单元1作为MCU的目标同步单元。将DAADSCR.DAADST位设置为1以进行同步转换时，请预先在该寄存器中选择目标单位。

仅在ADC12的ADCSR.ADST位设置为0且DAADSCR.DAADST位设置为0时设置DAADUSR寄存器。

44.3 Operation

DAC12包含两个通道的DA转换电路，每个通道都可以独立工作。当。。。的时候
DACR中的DAOEn位(n=0 1)设置为1，使能DAC12并输出转换结果。

以下示例显示了通道0上的DA转换。图44.2显示了此操作的时序。

在通道0上处理DA转换：

1.在DADR0寄存器中设置用于DA转换的数据，在DADPR.DPSEL位中设置数据格式。

2. Set the DACR.DAOE0 bit to 1 to start D/A conversion. The conversion result is output from the analog output pin DA0 after the conversion time t_{DCONV} elapses. The conversion result continues to be output until DADR0 is written to again or the DAOE0 bit is set to 0. The output value (reference) is expressed by the following formula:

$$\frac{\text{Setting in DADR0}}{4096} \times \text{VREFH}$$

3. To start conversion again, write another value to DADR0. The conversion result is output after the conversion time t_{DCONV} elapses.
   When the DAADSCR.DAADST bit is 1 (interference reduction between D/A and A/D conversion is enabled), a maximum of one A/D conversion time is required for D/A conversion to start. When ADCLK is faster than the peripheral clock, a longer time might be required.
4. To disable analog output, set the DAOE0 bit to 0.

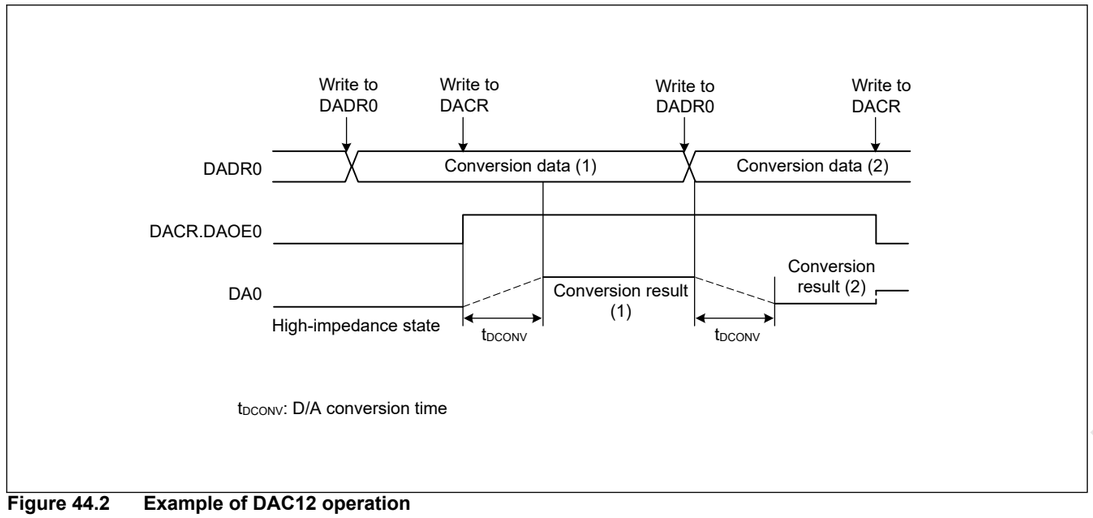

Figure 44.2 Example of DAC12 operation

44.3.1 Reducing Interference between D/A and A/D Conversion

When D/A conversion starts, the DAC12 generates inrush current. Because the DAC12 and ADC12 (unit 1) share the same analog power supply, the generated inrush current can interfere with ADC12 (unit 1) operation.

While the DAADSCR.DAADST bit is 1, D/A conversion does not start immediately on updating the DADRm register. Instead:

- If the DADRm register data is modified while the ADC12 is halted, D/A conversion starts in 1 PCLKA cycle.
- If the DADRm register data is modified while the ADC12 is performing a 12-bit A/D conversion, D/A conversion starts on A/D conversion completion. Therefore, it takes up to one A/D conversion time period for the DADRm register data update to be reflected as the D/A conversion circuit output. Until the D/A conversion completes, the DADRm register value does not correspond to the analog output value.

When the DAADSCR.DAADST bit is 1, it is not possible to check through software whether the DADRm register value was D/A-converted.

The following sequence provides an example of channel 0 D/A conversion, in which the DAC12 is synchronized with the ADC12 (unit 1). Figure 44.3 shows the timing of this operation.

To perform D/A conversion on channel 0 in synchronization with the ADC12 (unit 1):

1. Confirm that the ADC12 (unit 1) is halted and set the DAADUSR.AMADSEL1 bit to 1.
2. Confirm that the ADC12 (unit 1) is halted and set the DAADSCR.DAADST bit to 1.
3. Confirm that the ADC12 (unit 1) is halted and set the DACR.DAOE0 bit to 1.

2.将DACR.DAOE0位设置为1以启动DA转换。经过转换时间tDCONV后，转换结果从模拟输出引脚DA0输出。转换结果继续输出，直到再次写入DADR0或将DAOE0位设置为0。输出值（参考值）由以下公式表示：

$$\frac{\text{DADR04096中的设置}}{} \times \text{VREFH}$$

3.要再次开始转换，向DADR0写入另一个值。在经过转换时间tDCONV后输出转换结果。当DAADSCR.DAADST位为1时（启用DA和AD转换之间的干扰降低），最多需要一个AD转换时间才能启动DA转换。当ADCLK比外设时钟快时，可能需要更长的时间。

4.要禁用模拟输出，请将DAOE0位设置为0。

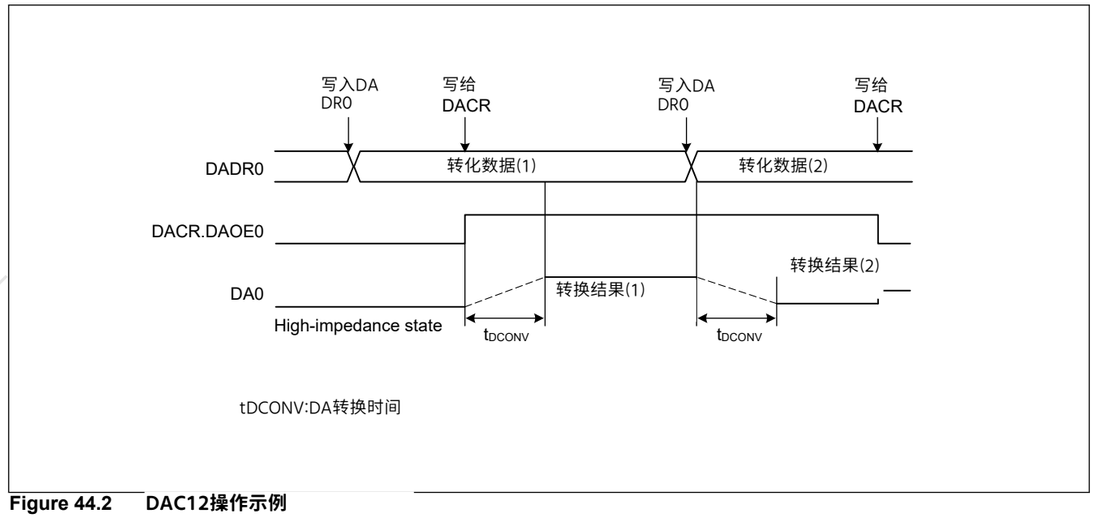

Figure 44.2 DAC12操作示例

44.3.1 减少DA和AD转换之间的干扰

当DA转换开始时，DAC12会产生浪涌电流。由于DAC12和ADC12（单元1）共享相同的模拟电源，所产生的浪涌电流会干扰ADC12（单元1）的运行。

当DAADSCR.DAADST位为1时，DA转换不会在更新DADRm寄存器时立即开始。
Instead:

●如果在ADC12停止时修改了DADRm寄存器数据，则DA转换在1个PCLKA周期内开始。

●如果在ADC12执行12位AD转换时修改了DADRm寄存器数据，则DA转换在AD转换完成时开始。因此，DADRm寄存器数据更新最多需要一个AD转换时间周期才能反映为DA转换电路输出。在DA转换完成之前，DADRm寄存器的值与模拟输出值不对应。

当DAADSCR.DAADST位为1时，无法通过软件检查DADRm寄存器值是否经过DA转换。

以下序列提供了通道0DA转换的示例，其中DAC12与
ADC12（单元1）。图44.3显示了该操作的时序。

与ADC12（单元1）同步在通道0上执行DA转换：

1.确认ADC12（单元1）已停止并将DAADUSR.AMADSEL1位设置为1。

2.确认ADC12（单元1）已停止并将DAADSCR.DAADST位设置为1。

3.确认ADC12（单元1）已停止并将DACR.DAOE0位设置为1。

4. Set the DADR0 register. If ADCLK is faster than the peripheral clock, D/A conversion might be delayed for longer than one A/D conversion time.
   - If the ADC12 (unit 1) is halted (ADCSR.ADST = 0) when the DADR0 register is modified, D/A conversion starts in 1 PCLKA cycle.
   - If the 12-bit A/D conversion is in progress (ADCSR.ADST = 1) when the DADR0 register is modified, D/A conversion starts on A/D conversion completion. If the DADR0 register is modified twice during A/D conversion, the first update might not be converted.

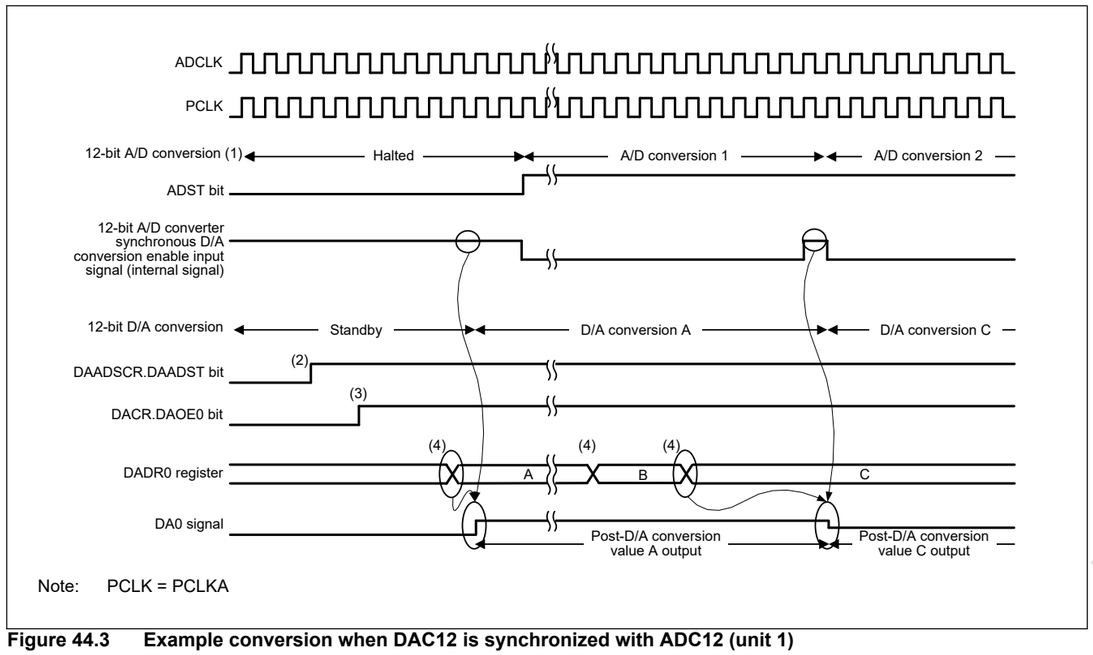

Figure 44.3 Example conversion when DAC12 is synchronized with ADC12 (unit 1)

When ADCLK is faster than PCLKA, the DAC12 might not be able to capture the synchronous D/A conversion enable input signal from the ADC12 (unit 1) during the 1 ADCLK cycle that is output between A/D conversion 1 and A/D conversion 2, as shown in Figure 44.4. In this case, post-D/A conversion value A is continuously output as the DA0 signal.

4.设置DADR0寄存器。如果ADCLK比外设时钟快，则DA转换可能会延迟超过一次AD转换时间。

- ●如果在修改DADR0寄存器时ADC12（单元1）停止（ADCSR.ADST=0），则DA转换在1个PCLKA周期内开始。
- ●如果在修改DADR0寄存器时正在进行12位AD转换（ADCSR.ADST=1），则DA转换在AD转换完成时开始。如果在AD转换期间DADR0寄存器被修改两次，第一次更新可能不会被转换。

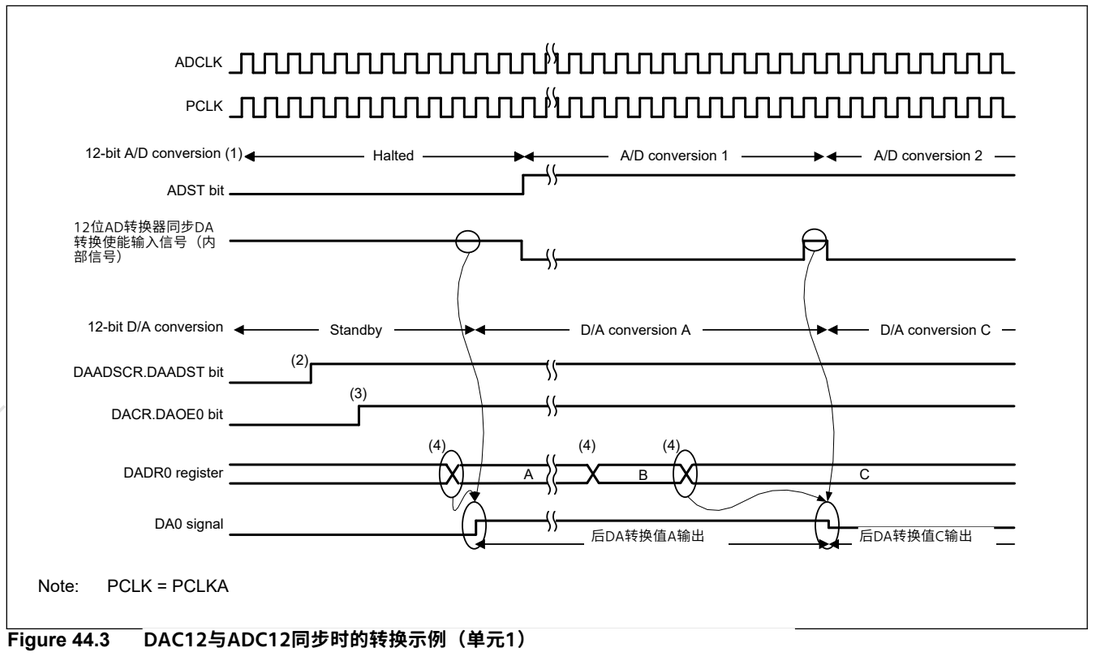

Figure 44.3 DAC12与ADC12同步时的转换示例（单元1）

当ADCLK快于PCLKA时，DAC12可能无法在AD转换1和AD转换2之间输出的1个ADCLK周期内捕获来自ADC12（单元1）的同步DA转换使能输入信号，如图所示44.4.在这种情况下，后DA转换值A作为DA0信号连续输出。

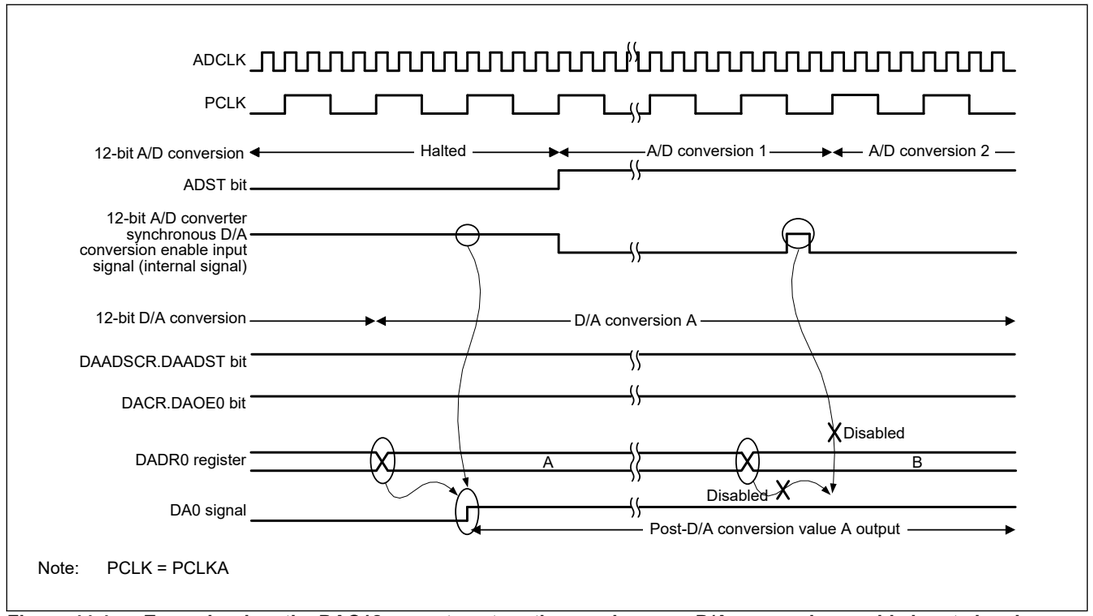

Figure 44.4 Example when the DAC12 cannot capture the synchronous D/A conversion enable input signal from the ADC12 (unit 1)

44.4 Event Link Operation Setting Procedure

This section describes the procedures used in event link operation.

44.4.1 DA0 Event Link Operation Setting Procedure

To set up DA0 event link operation:

1. Set the DADPR.DPSEL bit and the data for D/A conversion in the DADR0 register.
2. Set the ELC_DA0 event signal to be linked to each peripheral module in the ELSR12 register.
3. Set the ELCR.ELCON bit to 1. This enables event link operation for all modules with the event link function selected.
4. Set the event output source module to activate the event link. After the event is output from the module, the DACR.DAOE0 bit becomes 1, and D/A conversion starts on channel 0.
5. Set the ELSR12 register to 0x0000 to stop event link operation of DAC12 channel 0. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

44.4.2 DA1 Event Link Operation Setting Procedure

To set up DA1 event link operation:

1. Set the DADPR.DPSEL bit and set the data for D/A conversion in the DADR1 register.
2. Set the ELC_DA1 event signal to be linked to each peripheral module in the ELSR13 register.
3. Set the ELCR.ELCON bit to 1. This enables the event link operation for all modules with the event link function selected.
4. Set the event output source module to activate the event link. After the event is output from the module, the DACR.DAOE1 bit is becomes 1, and D/A conversion starts on channel 1.
5. Set the ELSR13 register to 0x0000 to stop event link operation on DAC12 channel 1. All event link operation is stopped when the ELCR.ELCON bit is set to 0.

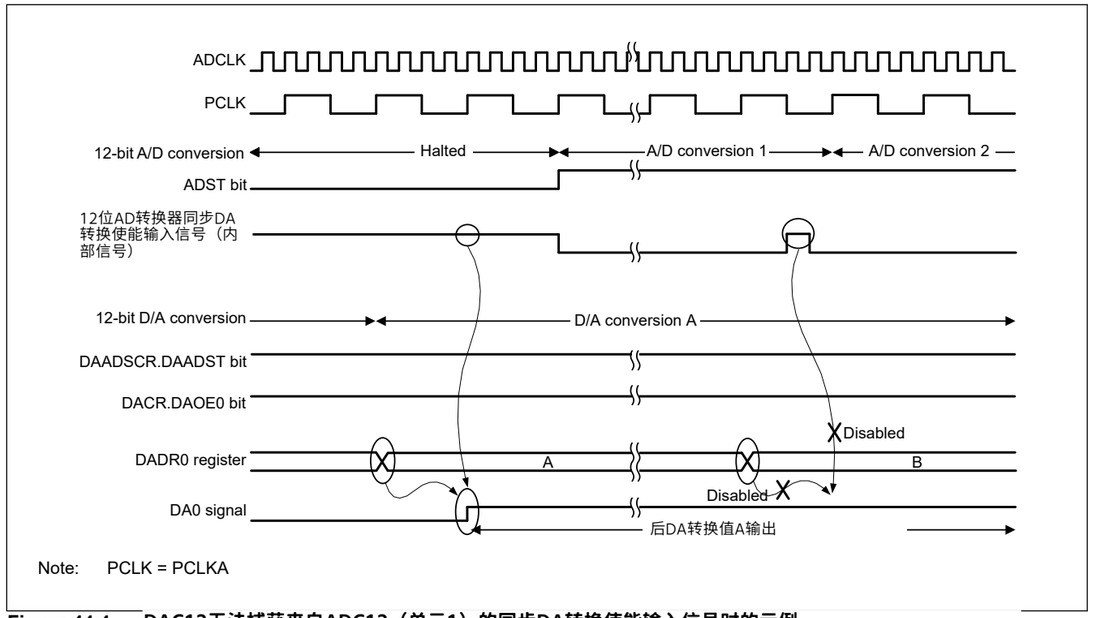

Figure 44.4 DAC12无法捕获来自ADC12（单元1）的同步DA转换使能输入信号时的示例

44.4 事件链接操作设置步骤

本节介绍事件链接操作中使用的过程。

44.4.1 DA0事件链接操作设置步骤

设置DA0事件链接操作：

1.设置DADPR.DPSEL位和DADR0寄存器中用于DA转换的数据。

2.在ELSR12寄存器中设置ELC_DA0事件信号链接到每个外围模块。

3.将ELCR.ELCON位设置为1。这将为所有选择了事件链接功能的模块启用事件链接操作。

4.设置事件输出源模块，激活事件链接。模块输出事件后，DACR.DAOE0位变为1，通道0开始DA转换。

5.将ELSR12寄存器设置为0x0000以停止DAC12通道0的事件链接操作。所有事件链接操作在ELCR.ELCON位设置为0时停止。

44.4.2 DA1事件链接操作设置步骤

设置DA1事件链接操作：

1.设置DADPR.DPSEL位并在DADR1寄存器中设置用于DA转换的数据。

2.在ELSR13寄存器中设置ELC_DA1事件信号链接到每个外围模块。

3.将ELCR.ELCON位设置为1。这将为所有选择了事件链接功能的模块启用事件链接操作。

4.设置事件输出源模块，激活事件链接。模块输出事件后，DACR.DAOE1位变为1，通道1开始DA转换。

5.将ELSR13寄存器设置为0x0000以停止DAC12通道1上的事件链接操作。所有事件链接操作在ELCR.ELCON位设置为0时停止。

44.5 Usage Notes on Event Link Operation

- When the event link function is used, do not use the amplifier output function.
- When the event link function is used, set the DACR.DAE bit to 0.
- When the event specified for the ELC_DA0 event signal is generated while a write to the DACR.DAOE0 bit is performed, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- When the event specified for the ELC_DA1 event signal is generated while a write to the DACR.DAOE1 bit is performed, the write cycle is stopped, and the generated event takes precedence in setting the bit to 1.
- Use of the event link function is prohibited when the DAADSCR.DAADST bit is set to 1 to reduce interference between D/A and A/D conversions.

44.6 Usage Notes

44.6.1 Settings for the Module-Stop Function

DAC12 operation can be disabled or enabled using the Module Stop Control Register. The DAC12 is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

44.6.2 DAC12 Operation in the Module-Stop State

When the MCU enters the module-stop state with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in the module-stop state, disable D/A conversion by setting the DACR.DAOE1, DAOE0, and DAE bits to 0.

44.6.3 DAC12 Operation in Software Standby Mode

When the MCU enters Software Standby mode with D/A conversion enabled, the D/A outputs are retained, and the analog power supply current is the same as during D/A conversion. If the analog power supply current must be reduced in Software Standby mode, disable D/A conversion by setting the DACR.DAOE1, DAOE0, and DAE bits to 0.

44.6.4 Constraint on Entering Deep Software Standby Mode

When the MCU enters Deep Software Standby mode with D/A conversion enabled, the outputs of the DAC12 are placed in a high impedance state.

44.6.5 Initialization Procedure with the Output Amplifier

Use the following initialization procedures with the output amplifier. The example shows the case for channel 0.

To initialize the DAC12 with the output amplifier:

1. Write 0x0000 to the DADR0 register.
2. Set the DAASWCR.DAASW0 bit to 1.
3. Set the DAAMPCR.DAAMP0 bit to 1.
4. Set the DACR.DAE bit or the DACR.DAOE0 bit to 1 to start operation of the amplifier.
5. Clear the DAASWCR.DAASW0 bit to 0 after waiting for the duration of D/A conversion time t_{DCONV}.
6. Write the value to be converted in the DADR0 register.

44.5 事件链接操作使用说明

●使用事件链接功能时，请勿使用放大器输出功能。

●使用事件链接功能时，将DACR.DAE位设置为0。

●如果在执行对DACR.DAOE0位的写入时产生了为ELC_DA0事件信号指定的事件，则写入周期停止，并且产生的事件优先将该位设置为1。

●如果在执行对DACR.DAOE1位的写入时产生了为ELC_DA1事件信号指定的事件，则写入周期停止，并且产生的事件优先将该位设置为1。

●DAADSCR.DAADST位设置为1时禁止使用事件链接功能，以减少DA和AD转换之间的干扰。

44.6 使用说明

44.6.1 模块停止功能的设置

可以使用模块停止控制寄存器禁用或启用DAC12操作。DAC12在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

44.6.2 DAC12在模块停止状态下的操作

当MCU进入模块停止状态并启用DA转换时，DA输出保持不变，模拟电源电流与DA转换时相同。如果在模块停止状态下必须降低模拟电源电流，则通过将DACR.DAOE1、DAOE0和DAE位设置为0来禁用DA转换。

44.6.3 DAC12在软件待机模式下的操作

当MCU进入软件待机模式并启用DA转换时，DA输出保持不变，模拟电源电流与DA转换期间相同。如果在软件待机模式下必须降低模拟电源电流，则通过将DACR.DAOE1、DAOE0和DAE位设置为0来禁用DA转换。

44.6.4 进入深度软件待机模式的限制

当MCU在启用DA转换的情况下进入深度软件待机模式时，DAC12的输出置于高阻抗状态。

44.6.5 输出放大器的初始化程序

对输出放大器使用以下初始化程序。该示例显示了通道0的情况。

使用输出放大器初始化DAC12：

1.将0x0000写入DADR0寄存器。

2.将DAASWCR.DAASW0位设置为1。

3.将DAAMPCR.DAAMP0位设置为1。

4.将DACR.DAE位或DACR.DAOE0位设置为1以启动放大器的操作。

5.等待DA转换时间tDCONV后，将DAASWCR.DAASW0位清零。

6.将要转换的值写入DADR0寄存器。

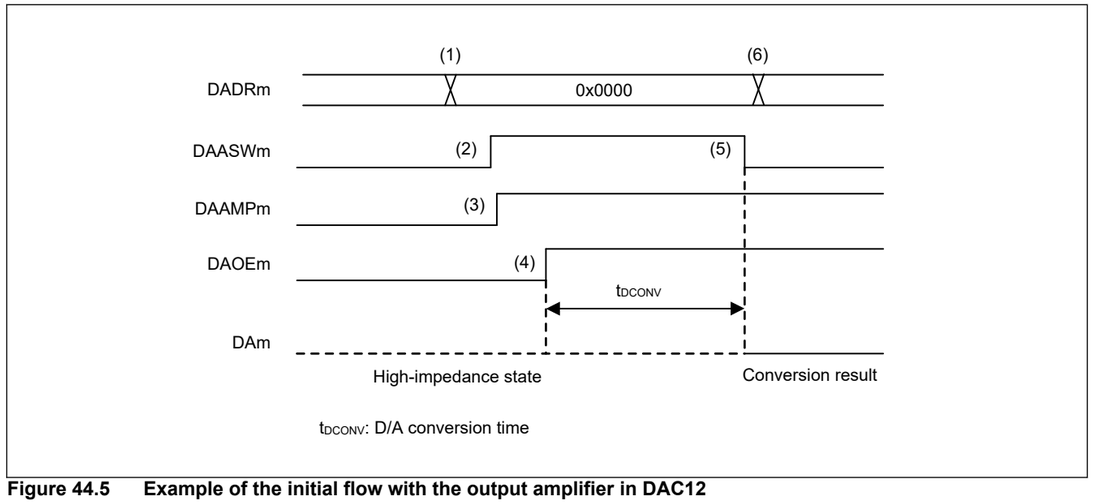

Figure 44.5 Example of the initial flow with the output amplifier in DAC12

While the amplifier is running, clearing the DACR.DAE and DACR.DAOE0 bits to 0 allows the amplifier to stop operation. To use the amplifier again, repeat steps 1 to 6.

44.6.6 Constraint on Usage When Interference Reduction between D/A and A/D Conversion Is Enabled

When the DAADSCR.DAADST bit is 1, enabling interference reduction between D/A and A/D conversion, do not place the ADC12 in the module-stop state. Doing so can halt D/A conversion in addition to A/D conversion.

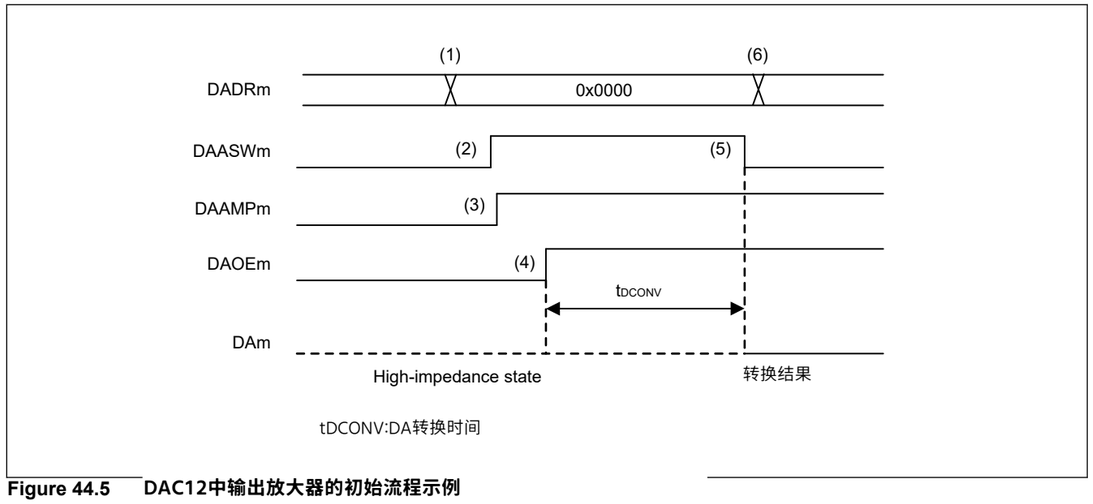

Figure 44.5 DAC12中输出放大器的初始流程示例

在放大器运行时，将DACR.DAE和DACR.DAOE0位清零可让放大器停止运行。
要再次使用放大器，请重复步骤1至6。

44.6.6 DA和AD之间减少干扰时的使用限制转换已启用

当DAADSCR.DAADST位为1时，启用DA和AD转换之间的干扰减少，不要放置ADC12处于模块停止状态。除了AD转换之外，这样做还可以停止DA转换。

RA生态工作室

45. Temperature Sensor (TSN)

45.1 Overview

The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC12 for conversion and can be further used by the end application.

Table 45.1 lists the TSN specifications, and Figure 45.1 shows a block diagram.

Table 45.1 TSN specifications

Item	Description
Temperature sensor voltage output	Temperature sensor outputs a voltage to the 12-bit A/D converter
Module-stop function	Module-stop state can be set to reduce power consumption
Temperature sensor calibration data	Reference data measured for each chip at factory shipment is stored in a register
TrustZone Filter	Security attribution can be set

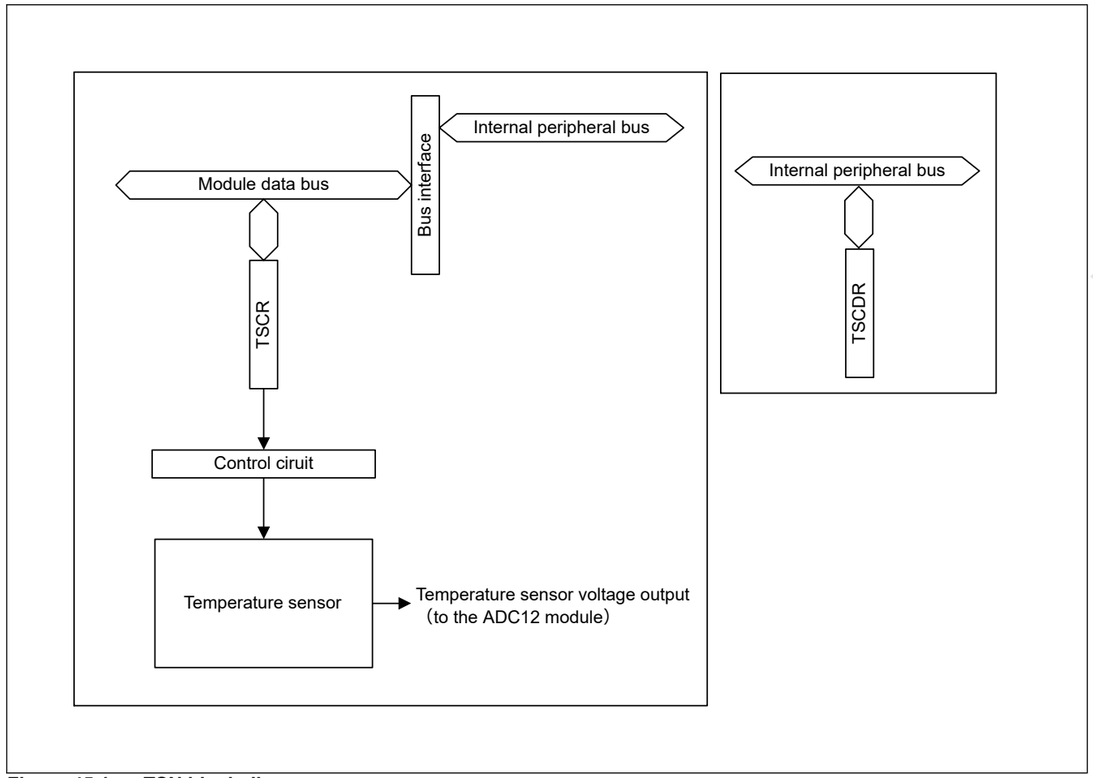

Figure 45.1 TSN block diagram

45. 温度传感器(TSN)

45.1 Overview

片上温度传感器(TSN)确定并监控芯片温度，以确保器件可靠运行。传感器输出与管芯温度成正比的电压，管芯温度与输出电压之间的关系相当线性。输出电压被提供给ADC12进行转换，并且可以被最终应用进一步使用。

表45.1列出了TSN规范，图45.1显示了框图。

Table 45.1 TSN specifications

Item	Description
温度传感器电压输出	温度传感器向12位AD转换器输出电压
Module-stop function	可设置模块停止状态以降低功耗
温度传感器校准数据	出厂时为每个芯片测量的参考数据存储在寄存器中
TrustZone Filter	可设置安全属性

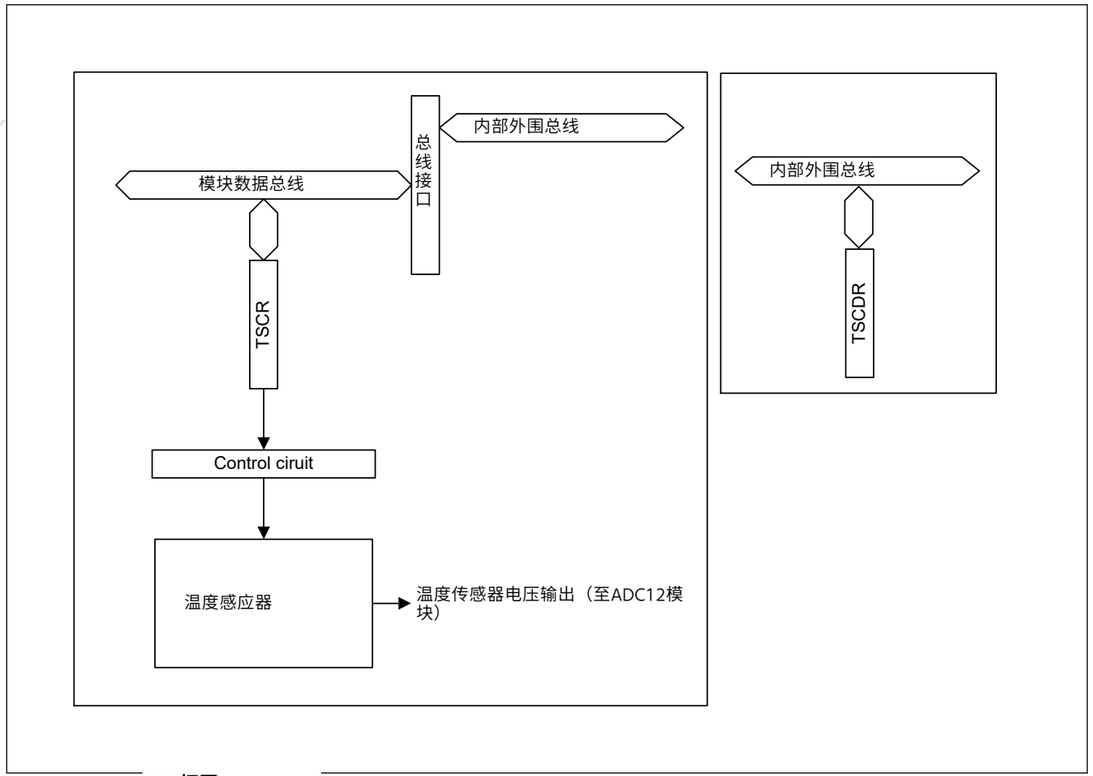

Figure 45.1 TSN框图

RA生态工作室

45.2 Register Descriptions

45.2.1 TSCR : Temperature Sensor Control Register

Base address: TSN = 0x400F_3000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TSEN	—	—	TSOE	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	TSOE	Temperature Sensor Output Enable 0: Disable output from the temperature sensor to the ADC12 1: Enable output from the temperature sensor to the ADC12	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	TSEN	Temperature Sensor Enable 0: Stop the temperature sensor 1: Start the temperature sensor.	R/W

The TSCR is a register which controls the temperature sensor. The timing constraints shown in Figure 45.3 apply to the settings of the TSCR register.

TSOE bit (Temperature Sensor Output Enable)

The TSOE bit enables or disables the temperature sensor output to ADC12.

TSEN bit (Temperature Sensor Enable)

The TSEN bit starts or stops the temperature sensor.

45.2.2 TSCDR : Temperature Sensor Calibration Data Register

Base address: TSD = 0x407F_B000

Offset Address: 0x017C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TSCDR[15:0]															
Value after reset:	Chip-specific value															

Bit	Symbol	Function	R/W
15:0	TSCDR[15:0]	Temperature Sensor Calibration Data Chip-specific value	R
31:16	—	These bits are read as 0.	R

The TSCDR register stores temperature sensor calibration data measured for each chip at factory shipment.

Temperature sensor calibration data is the output voltage of the temperature sensor under the conditions Tj = 127°C and AVCC0 = VREFH0 = 3.3 V converted to a digital value by the 12-bit A/D converter.

The TSCDR register is a read-only 32-bit register. Read from this register in 32-bit units.

45.2 注册说明

45.2.1 TSCR：温度传感器控制寄存器

Base address: TSN = 0x400F_3000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TSEN	—	—	TSOE	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	这些位被读取为0。写入值应为0。	R/W
4	TSOE	温度传感器输出使能 0：禁用从温度传感器到ADC12的输出1：启用从温度传感器到ADC12的输出	R/W
6:5	—	这些位被读取为0。写入值应为0。	R/W
7	TSEN	温度传感器启用 0：停止温度传感器1：启动温度传感器。	R/W

TSCR是一个控制温度传感器的寄存器。图45.3所示的时序约束适用于TSCR寄存器的设置。

TSOE位（温度传感器输出使能）

TSOE位启用或禁用温度传感器输出到ADC12。

TSEN位（温度传感器使能）

TSEN位启动或停止温度传感器。

45.2.2 TSCDR:温度传感器校准数据寄存器

Base address: TSD = 0x407F_B000

Offset Address: 0x017C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TSCDR[15:0]															
重置后的值：	Chip-specific value															

Bit	Symbol	Function	R/W
15:0	TSCDR[15:0]	温度传感器校准数据 Chip-specific value	R
31:16	—	这些位读为0。	R

TSCDR寄存器存储在出厂时为每个芯片测量的温度传感器校准数据。

温度传感器校准数据是温度传感器在条件Tj=127°C和AVCC0=VREFH0=3.3V通过12位AD转换器转换为数字值。

TSCDR寄存器是一个只读的32位寄存器。以32位为单位从该寄存器中读取。

Temperature sensor calibration data is stored in the lower 12 bits of the TSCDR register.

45.3 Using the Temperature Sensor

The temperature sensor outputs a voltage that varies with the temperature. This voltage is converted to a digital value by the 12-bit A/D converter. To obtain the die temperature, convert this value into the temperature.

45.3.1 Preparation for Using the Temperature Sensor

The ambient temperature (T) is proportional to the temperature sensor voltage output (Vs), so ambient temperature is calculated with the following formula:

T = (Vs - V1) / slope + T1

- T: Ambient temperature of MCU as calculation result (°C)
- Vs: Voltage output by the temperature sensor on temperature measurement (V)
- T1: Temperature experimentally measured at one point (°C)
- V1: Voltage output by the temperature sensor on measurement of T1 (V)
- T2: Temperature experimentally measured at a second point (°C)
- V2: Voltage output by the temperature sensor on measurement of T2 (V)
- Slope: Temperature gradient of the temperature sensor (V / °C), slope = (V2 - V1) / (T2 -T1)

Characteristics vary between sensors, so Renesas recommends measuring two different sample temperatures as follows:

1. Use the 12-bit A/D converter to measure the voltage V1 output by the temperature sensor at temperature T1.
2. Again use the 12-bit A/D converter to measure the voltage V2 output by the temperature sensor at a different temperature T2.
3. Obtain the temperature gradient (slope = (V2 - V1) / (T2 - T1)) from these results.
4. Subsequently, obtain temperatures by substituting the slope into the formula for the temperature characteristic (T = (Vs - V1) / slope + T1).

If you are using the temperature gradient given in section 53, Electrical Characteristics, use the A/D converter to measure the voltage V1 output by the temperature sensor at temperature T1, then calculate the temperature characteristic using the following formula:

T = (Vs - V1) / slope + T1

Note: This method produces less accurate temperatures than measurement at two points.

In this MCU, the TSCDR register stores the temperature value (CAL127) of the temperature sensor measured under the condition Ta = Tj = 127°C and AVCC0 = VREFH0 = 3.3 V. If you use this value as the sample measurement result at the first point, you can omit the preparation before using the temperature sensor.

V1 is calculated from CAL127:

V1 = 3.3 × CAL127 / 4096 [V] (In case of 12 bit accuracy)

Using this value, the measured temperature can be calculated according to the following formula:

T = (Vs - V1) / slope + 127 [°C]

- T: Ambient temperature of MCU as calculation result (°C)
- Vs: Voltage output by the temperature sensor when the temperature is measured (V)
- V1: Voltage output by the temperature sensor when Ta = Tj = 127°C and AVCC0 = VREFH0 = 3.3 V (V)
- Slope: Temperature gradient of the temperature sensor*1 / 1000 (V/°C)

Note 1. See section 53, Electrical Characteristics

45.3.2 Procedures for Using the Temperature Sensor

Figure 45.2 shows the procedure for using the TSN.

温度传感器校准数据存储在TSCDR寄存器的低12位中。

45.3 使用温度传感器

温度传感器输出随温度变化的电压。该电压由12位AD转换器转换为数字值。要获得芯片温度，请将该值转换为温度。

45.3.1 使用温度传感器的准备工作

环境温度(T)与温度传感器电压输出(Vs)成正比，因此使用以下公式计算环境温度：

T = (Vs - V1) / slope + T1

- ●T：作为计算结果的MCU的环境温度（°C）
- ●Vs：温度传感器测温时的电压输出（V）
- ●T1：在某一点实验测量的温度(°C)
- ●V1：温度传感器在测量T1（V）时输出的电压
- ●T2：在第二点实验测量的温度(°C)
- ●V2：温度传感器在测量T2（V）时输出的电压
- ●斜率：温度传感器的温度梯度（V°C），斜率=（V2V1）（T2−T1）

传感器的特性各不相同，因此瑞萨电子建议测量两种不同的样品温度，如下所示：

1、使用12位AD转换器测量温度T1时温度传感器输出的电压V1。

2.再次使用12位AD转换器测量温度传感器在不同温度T2下输出的电压V2。

3.从这些结果中获得温度梯度（斜率=(V2V1)(T2T1)）。

4.随后，通过将斜率代入温度特性公式(T=(VsV1)斜率+T1)来获得温度。

如果您使用第53节“电气特性”中给出的温度梯度，请使用AD转换器测量温度传感器在温度T1下输出的电压V1，然后使用以下公式计算温度特性：

T = (Vs - V1) / slope + T1

Note: 这种方法产生的温度不如两点测量准确。

在此MCU中，TSCDR寄存器存储在Ta=Tj=127°C和AVCC0=VREFH0=3.3V条件下测量的温度传感器的温度值(CAL127)。如果您使用此值作为第一次的样本测量结果点，您可以省略使用温度传感器之前的准备工作。

V1由CAL127计算得出：

V1=3.3×CAL1274096[V]（在12位精度的情况下）

使用该值，可根据以下公式计算测得的温度：

T = (Vs - V1) / slope + 127 [°C]

- ●T：作为计算结果的MCU的环境温度（°C）
- ●Vs：测温时温度传感器输出的电压（V）
- ●V1：Ta=Tj=127°C且AVCC0=VREFH0=3.3V(V)时温度传感器输出的电压
- ●斜率：温度传感器的温度梯度*11000(V°C)

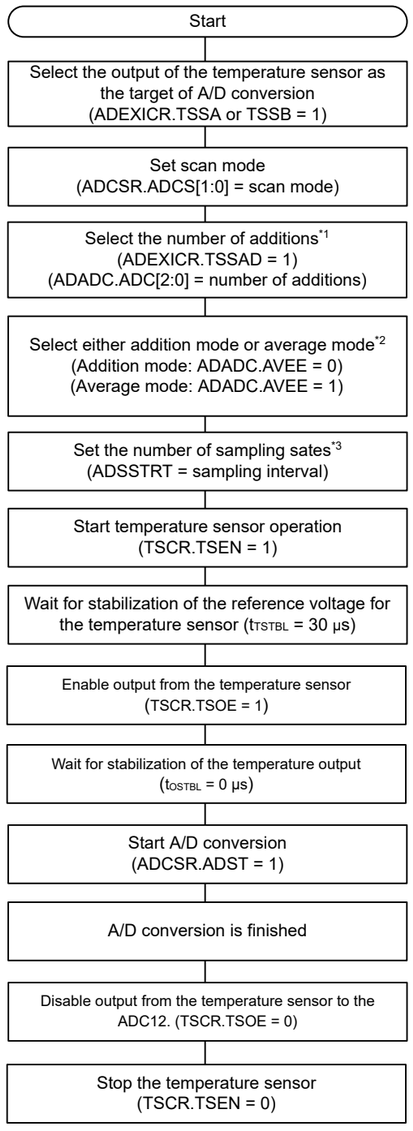
注1.见第53节，电气特性

45.3.2 使用温度传感器的步骤

图45.2显示了使用TSN的过程。

RA生态工作室

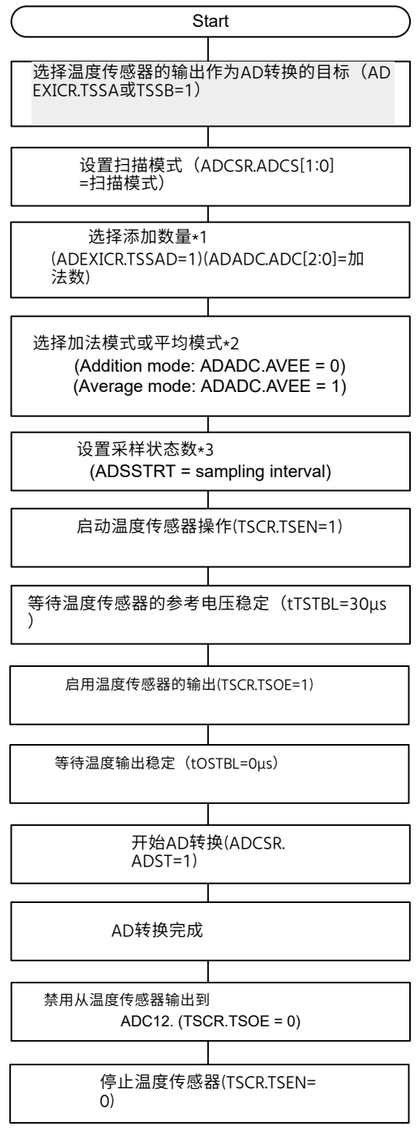
For details, see section 43, 12-Bit A/D Converter (ADC12).



Note 1. This setting is not required if addition/average mode is not set.
Note 2. The ADADC.ADC[2:0] setting is limited to some values in additions/average mode. For details on the available ADADC.ADC[2:0] settings in additions/average mode, see section 43, 12-Bit A/D Converter (ADC12).
Note 3. Set the sampling time to more than the value described in section 53, Electrical Characteristics.

Figure 45.2 Procedure example for using the TSN

有关详细信息，请参阅第43节，12位AD转换器(ADC12)。



注1.如果未设置加法平均模式，则不需要此设置。
注2.ADADC.ADC[2:0]设置仅限于加法平均模式下的某些值。有关可用的详细信息
ADADC.ADC[2:0]在加法平均模式下的设置，请参见第43节，12位AD转换器(ADC12)。
注3.将采样时间设置为大于第53节“电气特性”中描述的值。

Figure 45.2 使用TSN的过程示例

Figure 45.3 shows the timing from the start of temperature sensor operation until the completion of A/D conversion when the ADC12 is in single scan mode (the conversion target is the temperature sensor output only). The times shown in the figure are described in Table 45.2

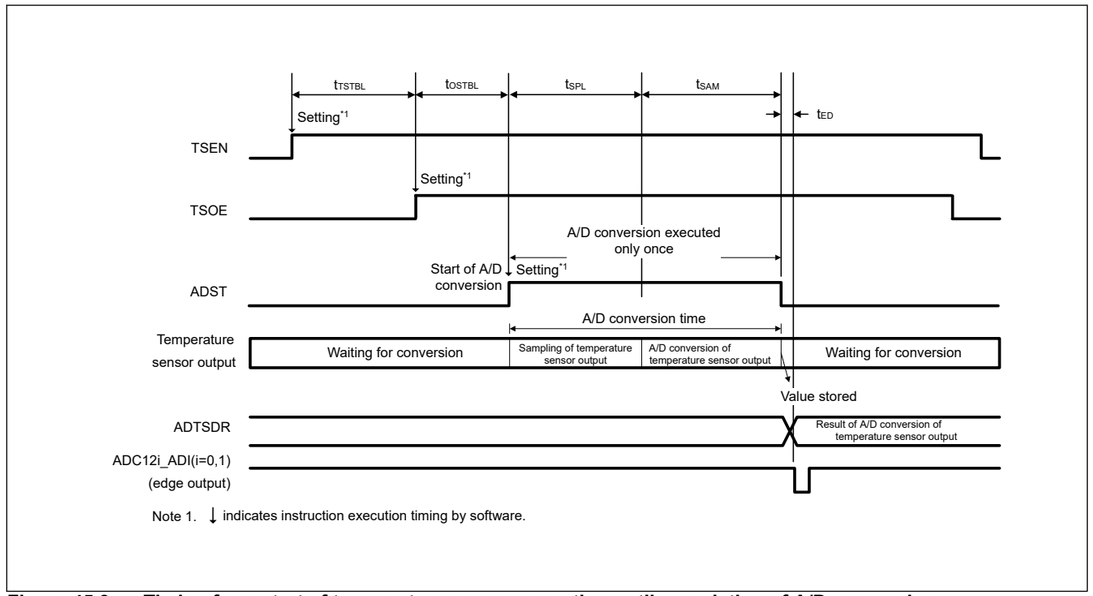


Figure 45.3 Timing from start of temperature sensor operation until completion of A/D conversion

Table 45.2 Time until completion of A/D conversion after start of temperature sensor operation

Parameter	Symbol	Time
Wait time for temperature sensor reference voltage stabilization	t_{TSTBL}	30 µs (min)
Wait time for temperature sensor output stabilization	t_{OSTBL}	0 µs (min)
A/D converter input sampling time	t_{SPL}	ADSSTRT setting × ADCLK cycles
A/D conversion time	t_{SAM}	See the table in section 43.3.7. Analog Input Sampling and Scan Conversion Time.
Scan conversion end delay	t_{ED}	

45.4 Usage Notes

45.4.1 Settings for the Module-Stop Function

TSN operation can be disabled or enabled using the associated bit in Module Stop Control Register D (MSTPCRD). The TSN is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

图45.3显示了当ADC12处于单次扫描模式（转换目标仅为温度传感器输出）时，从温度传感器操作开始到AD转换完成的时序。图中所示时间见表45.2

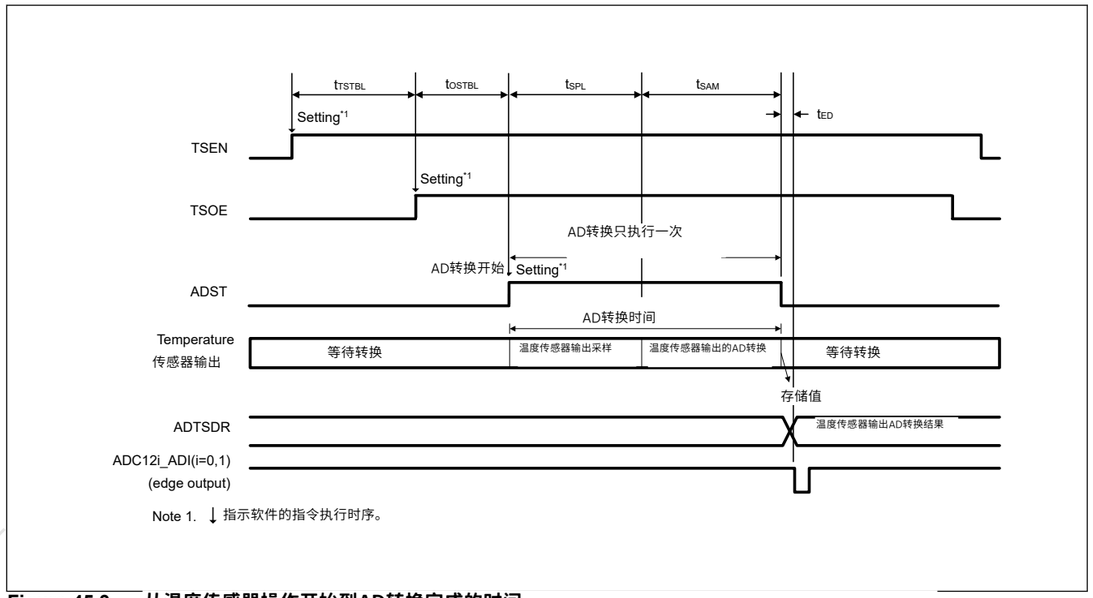

Figure 45.3 从温度传感器操作开始到AD转换完成的时间

Table 45.2 温度传感器动作开始后到AD转换完成的时间

Parameter	Symbol	Time
温度传感器参考电压稳定的等待时间	t_{TSTBL}	30 µs (min)
温度传感器输出稳定的等待时间	t_{OSTBL}	0 µs (min)
AD转换器输入采样时间	t_{SPL}	ADSTRT设置×ADCLK周期
AD转换时间	t_{SAM}	请参见第43.3.7节中的表格。模拟输入采样和扫描转换时间。
扫描转换结束延迟	t_{ED}	

45.4 使用说明

45.4.1 模块停止功能的设置

使用模块停止控制寄存器D(MSTPCRD)中的相关位可以禁用或启用TSN操作。TSN在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

46. Capacitive Touch Sensing Unit (CTSU)

46.1 Overview

The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of the touch sensor. Changes in the electrostatic capacitance are determined by software that enables the CTSU to detect whether a finger is in contact with the touch sensor. The electrode surface of the touch sensor is usually enclosed with an electrical conductor so that a finger does not come into direct contact with the electrode.

As Figure 46.1 shows, electrostatic capacitance (parasitic capacitance) exists between the electrode and the surrounding conductors. Because the human body is an electrical conductor, when a finger is placed close to the electrode, the value of electrostatic capacitance increases.

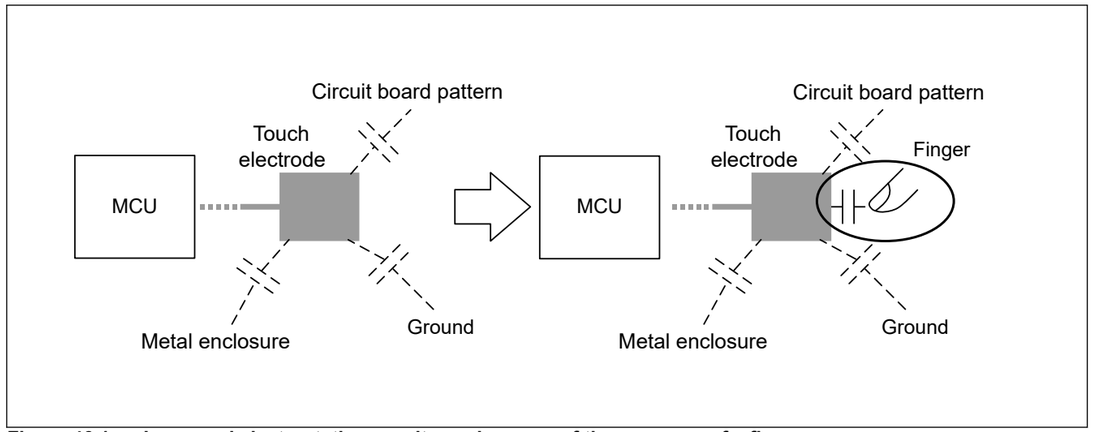

Figure 46.1 Increased electrostatic capacitance because of the presence of a finger

Electrostatic capacitance is detected by the self-capacitance and mutual capacitance methods. In the self-capacitance method, the CTSU detects electrostatic capacitance generated between a finger and a single electrode. In the mutual capacitance method, two electrodes are used one as a transmit electrode and the other as a receive electrode, and the CTSU detects the change in the electrostatic capacitance generated between the two when a finger is placed close to them.

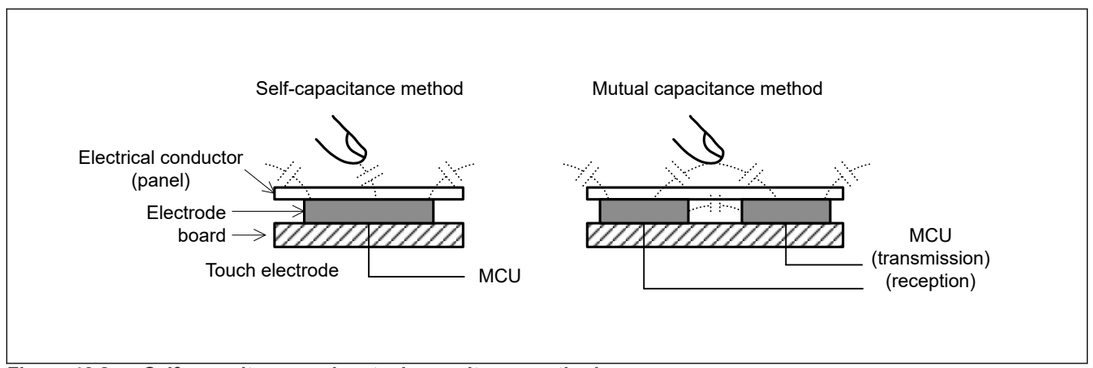

Figure 46.2 Self-capacitance and mutual capacitance methods

Electrostatic capacitance is measured by counting a clock signal whose frequency changes according to the amount of charged or discharged current, for a specified period. For details on the measurement principles of the CTSU, see section 46.3.1. Principles of Measurement Operation.

Table 46.1 lists the CTSU specifications and Figure 46.3 shows a block diagram.

46. 电容式触控感应单元(CTSU)

46.1 Overview

电容式触摸传感单元(CTSU)测量触摸传感器的静电电容。静电电容的变化由软件确定，该软件使CTSU能够检测手指是否与触摸传感器接触。触摸传感器的电极表面通常被电导体包围，因此手指不会直接接触电极。

如图46.1所示，电极和周围导体之间存在静电电容（寄生电容）。因为人体是电导体，当手指靠近电极时，静电电容值会增加。

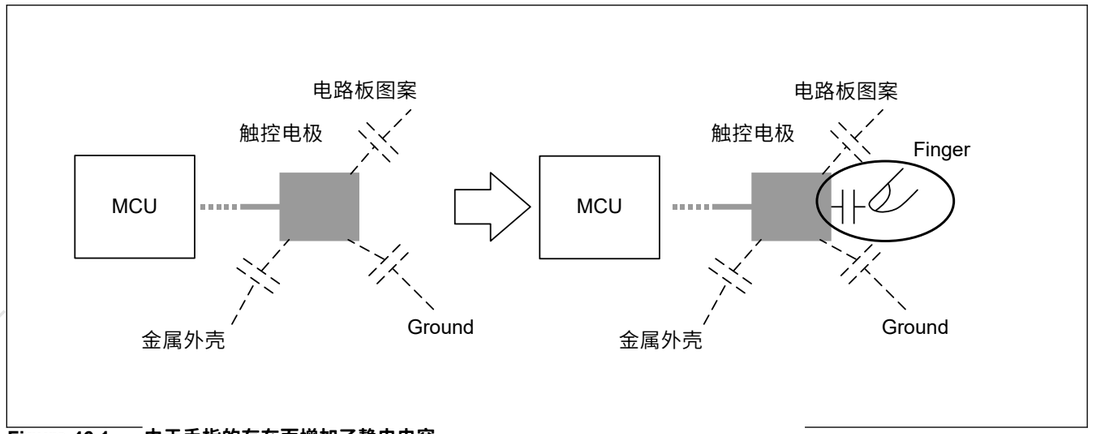

Figure 46.1 由于手指的存在而增加了静电电容

静电电容的检测方法有自电容法和互电容法。在自电容法中，CTSU检测手指和单个电极之间产生的静电电容。在互电容法中，使用两个电极，一个作为发送电极，另一个作为接收电极，当手指靠近它们时，CTSU会检测两者之间产生的静电电容的变化。

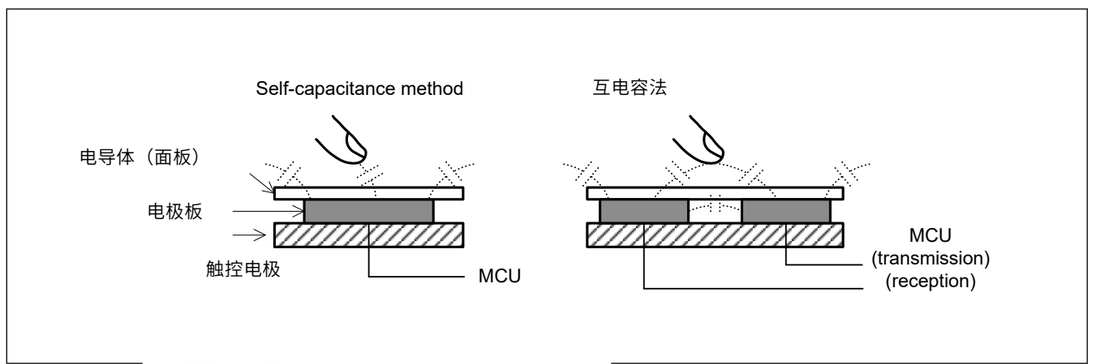

Figure 46.2 自电容和互电容方法

静电电容是通过对时钟信号进行计数来测量的，该时钟信号的频率根据充电或放电电流的大小而变化，在指定的时间段内。CTSU的测量原理详见46.3.1节。测量操作原理。

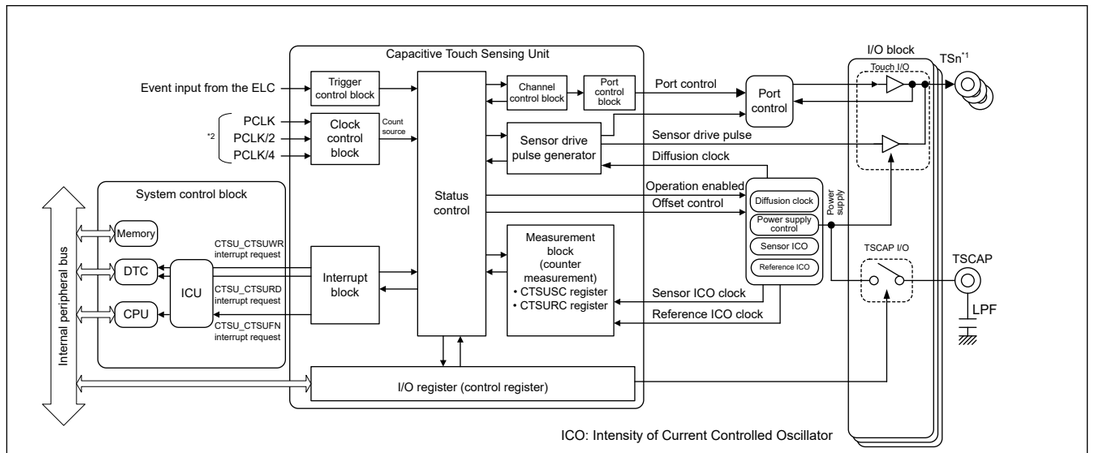
表46.1列出了CTSU规格，图46.3显示了框图。

Table 46.1 CTSU specifications

Parameter		Specifications
Operating clock		PCLKB, PCLKB/2, or PCLKB/4
Pins	Electrostatic capacitance measurement	20 channels
	TSCAP	Low Pass Filter (LPF) connection pin
Measurement modes	Self-capacitance single scan mode	Electrostatic capacitance is measured on one channel using the self-capacitance method.
	Self-capacitance multiscan mode	Electrostatic capacitance is measured successively on multiple channels using the self-capacitance method.
	Mutual capacitance full scan mode	Electrostatic capacitance is measured successively on multiple channels using the mutual capacitance method.
Calibration mode		Improvement of measured value accuracy by calibration of sensor ICO
Noise prevention		Synchronous noise prevention, high-pass noise prevention
Measurement start conditions		• Software trigger • External trigger (ELC_CTSU from the Event Link Controller (ELC))
TrustZone Filter		Security attribution can be set

As Figure 46.3 shows, the CTSU consists of the following components:

- Status control block
- Trigger control block
- Clock control block
- Channel control block
- Port control block
- Sensor drive pulse generator
- Measurement block
- Interrupt block
- I/O registers



Note 1. TSn = TS00 to TS19
Note 2. PCLK = PCLKB

Figure 46.3 CTSU block diagram

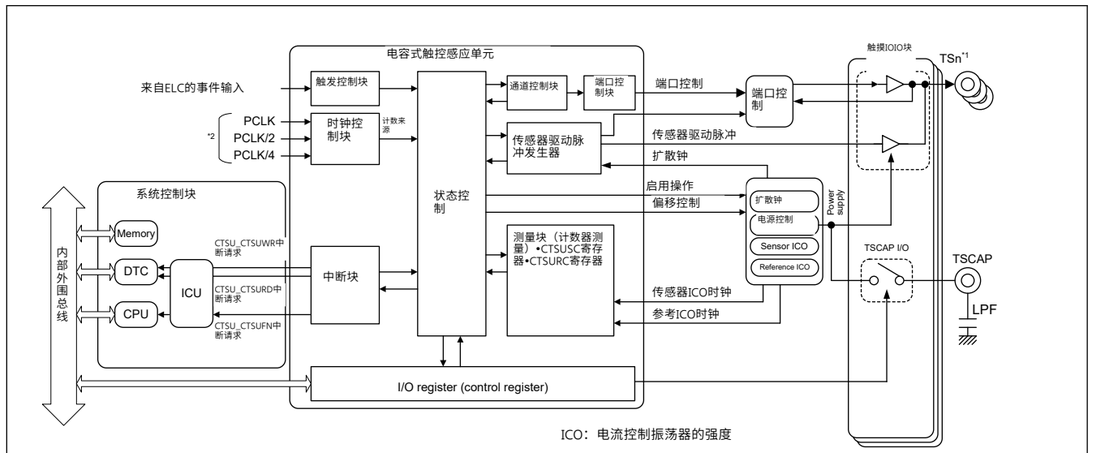
Table 46.1 CTSU specifications

Parameter		Specifications
工作时钟		PCLKB, PCLKB/2, or PCLKB/4
Pins	静电电容测量	20 channels
	TSCAP	低通滤波器(LPF)连接引脚
测量模式	自电容单次扫描模式	使用自电容法在一个通道上测量静电电容。
	Self-capacitance multiscan mode	使用自电容法在多个通道上连续测量静电电容。
	互电容全扫描模式	使用互电容法在多个通道上连续测量静电电容。
校准模式		通过传感器校准提高测量值精度 ICO
噪音预防		同步防噪、防高通防噪
测量开始条件		• 软件触发 • 外部触发器（来自事件链接控制器(ELC)的ELC_CTSU）
TrustZone Filter		可设置安全属性

如图46.3所示，CTSU由以下组件组成：

●状态控制块
●触发控制块
●时钟控制块
●通道控制块
●端口控制块
●传感器驱动脉冲发生器
●测量块
●中断块

- I/O registers



注1.TSn=TS00至TS19
Note 2. PCLK = PCLKB

Figure 46.3 CTSU框图

Table 46.2 CTSU I/O pins

Pin name	I/O	Function
TS00 to TS19	Input	Electrostatic capacitive measurement pins (touch pins)
TSCAP	—	LPF connection pin

46.2 Register Descriptions

46.2.1 CTSUCR0 : CTSU Control Register 0

Base address: CTSU = 0x400D_0000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUTXVSEL	—	—	CTSUINIT	CTSUIOC	CTSUSNZ	CTSUCAP	CTSUSTRT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CTSUSTRT	CTSU Measurement Operation Start 0: Stop measurement operation*1 1: Start measurement operation	R/W
1	CTSUCAP	CTSU Measurement Operation Start Trigger Select 0: Software trigger 1: External trigger	R/W
2	CTSUSNZ	CTSU Wait State Power-Saving Enable 0: Disable power-saving function during wait state 1: Enable power-saving function during wait state	R/W
3	CTSUIOC	CTSU Transmit Pin Control 0: The TS pins are driven low 1: The TS pins are driven high	R/W
4	CTSUINIT	CTSU Control Block Initialization Writing 1 to this bit initializes the CTSU control block and CTSUSC, CTSURC, CTSUMCH0, CTSUMCH1, and CTSUST registers. This bit is read as 0.	W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	CTSUTXVSEL	CTSU Transmission Power Supply Select 0: TSCAP is selected as the power-supply voltage for the transmission pins. 1: VCL is selected as the power-supply voltage for the transmission pins.	R/W

Note 1. When the CTSU is not used, fix the value of this bit to 0.

Only set the CTSUCAP, CTSUSNZ, CTSUTXVSEL2 and CTSUTXVSEL bits when the CTSUSTRT bit is 0. These bits can be set at the same time that measurement operation starts.

CTSUSTRT bit (CTSU Measurement Operation Start)

The CTSUSTRT bit specifies whether CTSU operation starts or stops. When the CTSUSTRT bit is 0, measurement starts when the software writes 1 to the CTSUSTRT bit (software trigger) and stops when the hardware clears the CTSUSTRT bit to 0. When the CTSUSTRT bit is 1, the CTSU waits for an external trigger by writing 1 to the CTSUSTRT bit, and measurement starts on the rising edge of the external trigger. When measurement is stopped, the CTSU waits for the next external trigger and operation continues.

Table 46.3 lists the CTSU states.

Table 46.3 CTSU status (1 of 2)

CTSUSTRT bit	CTSUCAP bit	CTSU state
0	0	Stopped

Table 46.2 CTSU I/O pins

引脚名称	I/O	Function
TS00 to TS19	Input	静电电容测量引脚（触摸引脚）
TSCAP	—	LPF连接引脚

46.2 注册说明

46.2.1 CTSUCR0:CTSU控制寄存器0

Base address: CTSU = 0x400D_0000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUTXVSEL	—	—	CTSUINIT	CTSUIOC	CTSUSNZ	CTSUCAP	CTSUSTRT
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CTSUSTRT	CTSU测量操作开始 0：停止测量操作*1 1：开始测量操作	R/W
1	CTSUCAP	CTSU测量操作开始触发选择 0：软件触发1：外部触发	R/W
2	CTSUSNZ	CTSU等待状态省电使能 0：等待状态下关闭省电功能1：等待状态下开启省电功能	R/W
3	CTSUIOC	CTSU发送引脚控制 0：TS引脚驱动为低电平1：TS引脚驱动为高电平	R/W
4	CTSUINIT	CTSU控制块初始化 向该位写入1初始化CTSU控制模块和CTSUSC、CTSURC、CTSUMC0、CTSUMCH1和CTSUST寄存器。该位读为0。	W
6:5	—	这些位被读取为0。写入值应为0。	R/W
7	CTSUTXVSEL	CTSU传输电源选择 0：选择TSCAP作为发送引脚的电源电压。1：选择VCL作为发送引脚的电源电压。	R/W

注1.不使用CTSU时，将该位的值固定为0。

仅当CTSUSTRT位为0时设置CTSUCAP、CTSUSNZ、CTSUTXVSEL2和CTSUTXVSEL位。这些位可以在测量操作开始的同时设置。

CTSUSTRT位（CTSU测量操作开始）

CTSUSTRT位指定CTSU操作是开始还是停止。当CTSUSTRT位为0时，软件将1写入CTSUSTRT位（软件触发）时开始测量，并在硬件将CTSUSTRT位清为0时停止测量。当CTSUSTRT位为1时，CTSU通过写入等待外部触发1到CTSUSTRT位，并在外部触发的上升沿开始测量。当测量停止时，CTSU等待下一个外部触发并继续操作。

表46.3列出了CTSU状态。

Table 46.3 CTSU状态(1of2)

CTSUSTRT bit	CTSUCAP bit	CTSU state
0	0	Stopped

RA生态工作室

Table 46.3 CTSU status (2 of 2)

CTSUSTRT bit	CTSUCAP bit	CTSU state
0	1	Stopped
1	0	Measurement in progress
1	1	Measurement in progress and waiting for an external trigger*1

Note 1. The state can be read from the CTSUST.CTSUSTC[2:0] flags as follows:
During measurement: CTSUST.CTSUSTC[2:0] flags ≠ 000b
While waiting for an external trigger: CTSUST.CTSUSTC[2:0] flags = 000b
When the CTSU is not used, fix the value of this bit to 0.

If the software sets the CTSUSTRT bit to 1 when the bit is already 1, the write is ignored and operation continues. To force operation to stop through the software when the CTSUSTRT bit is 1, set the CTSUSTRT bit to 0 and the CTSUINIT bit to 1 at the same time.

CTSUCAP bit (CTSU Measurement Operation Start Trigger Select)

The CTSUCAP bit specifies the measurement start condition. For details, see CTSUSTRT bit (CTSU Measurement Operation Start).

CTSUSNZ bit (CTSU Wait State Power-Saving Enable)

The CTSUSNZ bit enables or disables power-saving operation during a wait state. It can also suspend the CTSU power supply, which decreases power consumption during the wait state. In the suspended state, the CTSU power supply is turned off while the external TSCAP is still charged.

Table 46.4 shows the CTSU power supply state control.

Table 46.4 CTSU power supply state control

CTSUCR1.CTSUPON bit	CTSUSNZ bit	CTSUCAP bit	CTSUSTRT bit	CTSU power supply state
0	0	0	0	Stopped
1	0	—	—	Operating
1	1	0	0	Suspended

Note: Other settings are prohibited.

To start measurement from the suspended state, set the CTSUSNZ bit to 0, and then set the CTSUSTRT bit to 1. To suspend the module after measurement stops, set the CTSUSNZ bit to 1.

CTSUIOC bit (CTSU Transmit Pin Control)

The CTSUIOC bit selects the logic level of the TS pin when the CTSUERRS.CTSUTSOD bit is set to 1. This bit setting is ignored when the CTSUTSOD bit is 0.

CTSUINIT bit (CTSU Control Block Initialization)

Write 1 to the CTSUINIT bit to initialize the internal control registers. To force the current operation to stop, set the CTSUSTRT bit to 0 and the CTSUINIT bit to 1 at the same time. This stops the operation and initializes the internal control registers.

Do not write 1 to the CTSUINIT bit when the CTSUSTRT bit is 1.

CTSUTXVSEL bit (CTSU Transmission Power Supply Select)

The CTSUTXVSEL bit is used to switch the power supply for the transmit buffer in mutual capacitance full scan mode.

Set this bit to 0 for any other mode or when the VCC voltage is lower than 2.7 V. This bit switches the power supply for touch I/O, which is set for transmission by the CTSUCHTRCn registers. Table 46.5 lists the power supply for the TSm pin. When the VCC voltage fluctuates greatly due to switching of the output buffer, switching to the internal logic power supply can reduce the effect on the voltage fluctuation.

Table 46.3 CTSU状态（2个中的2个）

CTSUSTRT bit	CTSUCAP bit	CTSU state
0	1	Stopped
1	0	测量中
1	1	测量中，等待外部触发*1

注1.可以从CTSUST.CTSUSTC[2:0]标志读取状态，如下所示：
测量期间：CTSUST.CTSUSTC[2:0]flags≠000b
等待外部触发时：CTSUST.CTSUSTC[2:0]flags=000b
不使用CTSU时，将该位的值固定为0。

如果在CTSUSTRT位已经为1时软件将该位设置为1，则忽略写入并继续操作。要在CTSUSTRT位为1时通过软件强制停止操作，请将CTSUSTRT位设置为0，同时将CTSUINIT位设置为1。

CTSUCAP位（CTSU测量操作开始触发选择）

CTSUCAP位指定测量开始条件。有关详细信息，请参阅CTSUSTRT位（CTSU测量Operation Start).

CTSUSNZ位（CTSU等待状态省电使能）

CTSUSNZ位在等待状态期间启用或禁用省电操作。它还可以暂停CTSU电源，从而降低等待状态下的功耗。在挂起状态下，CTSU电源关闭，而外部TSCAP仍在充电。

CTSU电源状态控制如表46.4所示。

Table 46.4 CTSU电源状态控制

CTSUCR1.CTSUPON位	CTSUSNZ位	CTSUCAP位	CTSUSTRT位	CTSU电源状态
0	0	0	0	Stopped
1	0	—	—	Operating
1	1	0	0	Suspended

Note: 禁止其他设置。

要从暂停状态开始测量，请将CTSUSNZ位设置为0，然后将CTSUSTRT位设置为1。要在测量停止后暂停模块，请将CTSUSNZ位设置为1。

CTSUIOC位（CTSU发送引脚控制）

CTSUERRS.CTSUTSOD位设置为1时，CTSUITOC位选择TS引脚的逻辑电平。当CTSUTSOD位为0时，该位设置被忽略。

CTSUINIT位（CTSU控制块初始化）

向CTSUINIT位写入1以初始化内部控制寄存器。要强制停止当前操作，请将CTSUSTRT位为0，CTSUINIT位同时为1。这将停止操作并初始化内部控制寄存器。

当CTSUSTRT位为1时，不要将1写入CTSUINIT位。

CTSUTXVSEL位（CTSU发送电源选择）

CTSUTXVSEL位用于在互电容全扫描模式下切换发送缓冲器的电源。

对于任何其他模式或当VCC电压低于2.7V时，将该位设置为0。该位切换触摸IO的电源，由CTSUCHTRCn寄存器设置为发送。表46.5列出了TSm引脚的电源。当VCC电压因输出缓冲器的切换而大幅波动时，切换到内部逻辑电源可以减少对电压波动的影响。

Table 46.5 Power supplied to the TSm pins

Setting of CTSUCHTRCn Register	CTSUTXVSEL bit	Power supply of TSm pins
0 (Reception)	*	VCC
1 (Transmission)	0 (VCC)	
	1 (Internal logic power supply)	Internal logic power supply

46.2.2 CTSUCR1 : CTSU Control Register 1

Base address: CTSU = 0x400D_0000

Offset address: 0x01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUMD[1:0]		CTSUCLK[1:0]		CTSU ATUNE1	—	CTSU CSW	CTSU PON
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CTSUPON	CTSU Power Supply Enable 0: Power off the CTSU 1: Power on the CTSU	R/W
1	CTSUCSW	CTSU LPF Capacitance Charging Control This bit controls charging of the LPF capacitance connected to the TSCAP pin. 0: Turn off capacitance switch 1: Turn on capacitance switch	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	CTSUATUNE1	CTSU Power Supply Capacity Adjustment 0: Normal output 1: High-current output	R/W
5:4	CTSUCLK[1:0]	CTSU Operating Clock Select 0 0: PCLKB 0 1: PCLKB/2 (PCLKB divided by 2) 1 0: PCLKB/4 (PCLKB divided by 4) 1 1: Setting prohibited	R/W
7:6	CTSUMD[1:0]	CTSU Measurement Mode Select 0 0: Self-capacitance single scan mode 0 1: Self-capacitance multiscan mode 1 0: Setting prohibited 1 1: Mutual capacitance full scan mode	R/W

Only set the CTSUCR1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUPON bit (CTSU Power Supply Enable)

The CTSUPON bit controls the power supply to the CTSU. Set the CTSUPON and CTSUCSW bits to the same value.

CTSUCSW bit (CTSU LPF Capacitance Charging Control)

The CTSUCSW bit controls charging of the LPF capacitor connected to the TSCAP pin by turning the capacitance switch on or off. After the capacitance switch is turned on, wait until the capacitance connected to the TSCAP pin is charged for the specified time before starting measurement by setting CTSUCR0.CTSUSTRT to 1. Before starting measurement, use an I/O port to output low to the TSCAP pin, and discharge the existing LPF capacitance. Set the CTSUPON and CTSUCSW bits to the same value.

CTSUATUNE1 bit (CTSU Power Supply Capacity Adjustment)

The CTSUATUNE1 bit sets the capacity of the CTSU power supply. Normally, set this bit to 0.

Table 46.5 为TSm引脚供电

CTSUTCHRCn寄存器CTSUTXVSEL位的设置		TSm管脚电源
0 (Reception)	*	VCC
1 (Transmission)	0 (VCC)	
	1（内部逻辑电源）内部逻辑电源	

46.2.2 CTSUCR1：CTSU控制寄存器1

Base address: CTSU = 0x400D_0000

Offset address: 0x01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUMD[1:0]		CTSUCLK[1:0]		CTSU ATUNE1	—	CTSU CSW	CTSU PON
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CTSUPON	CTSU电源使能 0：关闭CTSU1：打开C TSU	R/W
1	CTSUCSW	CTSULPF电容充电控制 该位控制连接到TSCAP引脚的LPF电容的充电。 0：关闭电容开关1：打开电容 开关	R/W
2	—	该位读取为0。写入值应为0。	R/W
3	CTSUATUNE1	CTSU电源容量调整 0：正常输出1：大电 流输出	R/W
5:4	CTSUCLK[1:0]	CTSU工作时钟选择 00：PCLKB01：PCLKB2（PCLKB2分 频）10：PCLKB4（PCLKB4分频）11 ：禁止设置	R/W
7:6	CTSUMD[1:0]	CTSU测量模式选择 00：自电容单扫描模式01：自电容多扫 描模式10：禁止设置11：互电容全扫描 模式	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCR1寄存器。

CTSUPON位（CTSU电源使能）

CTSUPON位控制CTSU的电源。将CTSUPON和CTSUCSW位设置为相同的值。

CTSUCSW位（CTSULPF电容充电控制）

CTSUCSW位通过打开或关闭电容开关来控制连接到TSCAP引脚的LPF电容的充电。电容开关打开后，通过设置CTSUCR0.CTSUSTRT为1，等到连接到TSCAP引脚的电容充电指定时间后开始测量。开始测量之前，使用IO端口输出低电平到TSCAP引脚，并对现有的LPF电容进行放电。将CTSUPON和CTSUCSW位设置为相同的值。

CTSUATUNE1位（CTSU电源容量调整）

CTSUATUNE1位设置CTSU电源的容量。通常，将此位设置为0。

CTSUCLK[1:0] bits (CTSU Operating Clock Select)

The CTSUCLK[1:0] bits select the operating clock.

CTSUMD[1:0] bits (CTSU Measurement Mode Select)

The CTSUMD[1:0] bits set the measurement mode. For details, see section 46.3.2. Measurement Modes.

46.2.3 CTSUSDPRS : CTSU Synchronous Noise Reduction Setting Register

Base address: CTSU = 0x400D_0000

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	CTSU SOFF	CTSUPRMODE[1:0]		CTSUPRRATIO[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CTSUPRRATIO[3:0]	CTSU Measurement Time and Pulse Count Adjustment These bits set the measurement time and the measurement pulse count setting. Recommended setting: 3 (0011b)	R/W
5:4	CTSUPRMODE[1:0]	CTSU Base Period and Pulse Count Setting These bits set the base pulse count. 0 0: 510 pulses 0 1: 126 pulses 1 0: 62 pulses (recommended setting) 1 1: Setting prohibited	R/W
6	CTSUSOFF	CTSU High-Pass Noise Reduction Function Off Setting This bit turns spectrum diffusion on or off to reduce high-pass noise. 0: Turn on 1: Turn off	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Only set the CTSUSDPRS register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUPRRATIO[3:0] bits (CTSU Measurement Time and Pulse Count Adjustment)

The CTSUPRRATIO[3:0] bits are used to determine the measurement time and the measurement pulse count. These values are calculated using the following formulas, where the base pulse count is determined by the CTSUPRMODE[1:0] setting:

$$\text{Measurement pulse count} = \text{base pulse count} \times (\text{CTSUPRRATIO[3:0] bits} + 1)$$

$$\text{Measurement time} = (\text{base pulse count} \times (\text{CTSUPRRATIO[3:0] bits} + 1) + (\text{base pulse count} - 2) \times 0.25) \times \text{base clock cycle}$$

Note: For details on the base clock cycle, see section 46.2.17. CTSUSO1 : CTSU Sensor Offset Register 1.

CTSUPRMODE[1:0] bits (CTSU Base Period and Pulse Count Setting)

The CTSUPRMODE[1:0] bits select the number of base pulses that occur during measurement.

CTSUSOFF bit (CTSU High-Pass Noise Reduction Function Off Setting)

The CTSUSOFF bit turns on or off the function for reducing high-pass noise. Set this bit to 1 to turn the function off.

CTSUCLK[1:0]位（CTSU工作时钟选择）

CTSUCLK[1:0]位选择工作时钟。

CTSUMD[1:0]位（CTSU测量模式选择）

CTSUMD[1:0]位设置测量模式。有关详细信息，请参阅第46.3.2节。测量模式。

46.2.3 CTSUSDPRS:CTSU同步降噪设置寄存器

Base address: CTSU = 0x400D_0000

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	CTSU SOFF	CTSUPRMODE[1:0]		CTSUPRRATIO[3:0]			
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CTSUPRRATIO[3:0]	CTSU测量时间和脉冲计数调整 这些位设置测量时间和测量脉冲计数设置。 Recommended setting: 3 (0011b)	R/W
5:4	CTSUPRMODE[1:0]	CTSU基本周期和脉冲计数设置 这些位设置基本脉冲计数。 00：510脉冲01：126脉冲10：62脉冲 （推荐设置）11：禁止设置	R/W
6	CTSUSOFF	CTSU高通降噪功能关闭设置 该位打开或关闭频谱扩散以减少高通噪声。 0：开启1 ：关闭	R/W
7	—	该位读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSDPRS寄存器。

CTSURRATIO[3:0]位（CTSU测量时间和脉冲计数调整）

CTSUPRRATIO[3:0]位用于确定测量时间和测量脉冲计数。这些值使用以下公式计算，其中基本脉冲计数由CTSUPRMODE[1:0]设置确定：

测量脉冲计数=基本脉冲计数×CTSUPRRATIO[3:0]位+1)

测量时间=基本脉冲计数×CTSUPRRATIO[3:0]位+1+基本脉冲计数−2×0.25×基本时钟周期)

Note: 有关基本时钟周期的详细信息，请参阅第46.2.17节。CTSUSO1：CTSU传感器偏移寄存器1。

CTSUPRMODE[1:0]位（CTSU基本周期和脉冲计数设置）

CTSUPRMODE[1:0]位选择测量期间出现的基本脉冲数。

CTSUSOFF位（CTSU高通降噪功能关闭设置）

CTSUSOFF位打开或关闭降低高通噪声的功能。将此位设置为1可关闭该功能。

RA生态工作室

46.2.4 CTSUSST : CTSU Sensor Stabilization Wait Control Register

Base address: CTSU = 0x400D_0000

Offset address: 0x03

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUSST[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUSST[7:0]	CTSU Sensor Stabilization Wait Control Fix the value of these bits to 00010000b.	R/W

Only set the CTSUSST register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUSST[7:0] bits (CTSU Sensor Stabilization Wait Control)

The CTSUSST[7:0] bits set the stabilization wait time for the TSCAP pin voltage. Always fix these bits to 00010000b. If these bits are not set, the TSCAP voltage will be unstable at the start of measurement, and the CTSU will be unable to obtain correct touch measurement results.

46.2.5 CTSUMCH0 : CTSU Measurement Channel Register 0

Base address: CTSU = 0x400D_0000

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CTSHMCH0[4:0]				
Value after reset:	0	0	0	1	1	1	1	1

Bit	Symbol	Function	R/W
4:0	CTSHMCH0[4:0]	CTSU Measurement Channel 0 In self-capacitance single scan mode, these bits set the channel to be measured. Other than when specified, starting measurement operation by setting CTSUCR0.CTSUSTRT to 1 is prohibited after these bits are set. In other measurement modes, these bits indicate the channel that is currently being measured. 0x00: TS00 0x01: TS01 ⋮ 0x12: TS18 0x13: TS19 0x1F: Measurement is being stopped. (Except in self-capacitance single scan mode)	R/W*1
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Writing to these bits is only enabled in self-capacitance single scan mode (CTSUCR1.CTSUMD[1:0] bits = 00b).

Only set the CTSUMCH0 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSHMCH0[4:0] bits (CTSU Measurement Channel 0)

In self-capacitance single scan mode, the CTSHMCH0[4:0] bits set the channel to be measured. In this mode, only specify enabled channels (TS00 to TS19). In other modes, these indicate the receive channel that is being measured, and writing to these bits has no effect.

46.2.4 CTSUSST:CTSU传感器稳定等待控制寄存器

Base address: CTSU = 0x400D_0000

Offset address: 0x03

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUSST[7:0]							
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUSST[7:0]	CTSU传感器稳定等待控制将这些位的值 固定为00010000b。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUSST寄存器。

CTSUSST[7:0]位（CTSU传感器稳定等待控制）

CTSUSST[7:0]位设置TSCAP引脚电压的稳定等待时间。始终将这些位固定为00010000b。如果未设置这些位，TSCAP电压将在测量开始时不稳定，CTSU将无法获得正确的触摸测量结果。

46.2.5 CTSUCH0:CTSU测量通道寄存器0

Base address: CTSU = 0x400D_0000

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CTSHMCH0[4:0]				
重置后的值:	0	0	0	1	1	1	1	1

Bit	Symbol	Function	R/W
4:0	CTSHMCH0[4:0]	CTSU测量通道0 在自电容单次扫描模式下，这些位设置要测量的通道。 除指定时，通过设置开始测量操作 设置这些位后，禁止CTSUCR0.CTSUSTRT为1。 在其他测量模式下，这些位指示当前正在测量的通道。 0x00: TS00 0x01: TS01 ⋮ 0x12: TS18 0x13: TS19 0x1F：测量正在停止。（自电容单次扫描模式除外）	R/W*1
7:5	—	这些位被读取为0。写入值应为0。	R/W

注1.写入这些位仅在自电容单次扫描模式下启用（CTSUCR1.CTSUMD[1:0]位=00b）。

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUMCH0寄存器。

CTSHMCH0[4:0]位（CTSU测量通道0）

在自电容单次扫描模式下，CTSHMCH0[4:0]位设置要测量的通道。在此模式下，仅指定启用的通道（TS00到TS19）。在其他模式下，这些表示正在测量的接收通道，写入这些位无效。

46.2.6 CTSUMCH1 : CTSU Measurement Channel Register 1

Base address: CTSU = 0x400D_0000

Offset address: 0x05

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CTSUMCH1[4:0]				
Value after reset:	0	0	0	1	1	1	1	1

Bit	Symbol	Function	R/W
4:0	CTSUMCH1[4:0]	CTSU Measurement Channel 1 0x00: TS00 0x01: TS01 ⋮ 0x12: TS18 0x13: TS19 0x1F: Measurement is being stopped.	R
7:5	—	These bits are read as 0.	R

CTSUMCH1[4:0] bits (CTSU Measurement Channel 1)

In full scan mode, the CTSUMCH1[4:0] bits indicate the transmit channel that is being measured. They are always 0x1F when measurement is stopped, or in self-capacitance single scan and multi-scan modes.

46.2.7 CTSUCHAC0 : CTSU Channel Enable Control Register 0

Base address: CTSU = 0x400D_0000

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUCHAC0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUCHAC0[7:0]	CTSU Channel Enable Control 0 These bits select whether the associated TS pin is measured. bit0 is associated with TS00 and bit7 with TS07. 0: Do not measure 1: Measure	R/W

Only set the CTSUCHAC0 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHAC0[7:0] bits (CTSU Channel Enable Control 0)

The CTSUCHAC0[7:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured.

46.2.6 CTSUCH1：CTSU测量通道寄存器1

Base address: CTSU = 0x400D_0000

Offset address: 0x05

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CTSUMCH1[4:0]				
重置后的值：	0	0	0	1	1	1	1	1

Bit	Symbol	Function	R/W
4:0	CTSUMCH1[4:0]	CTSU测量通道1 0x00: TS00 0x01: TS01 ⋮ 0x12: TS18 0x13: TS19 0x1F：测量正在停止。	R
7:5	—	这些位读为0。	R

CTSUCH1[4:0]位（CTSU测量通道1）

在全扫描模式下，CTSUMCH1[4:0]位指示正在测量的发送通道。停止测量时，或在自电容单次扫描和多次扫描模式下，它们始终为0x1F。

46.2.7 CTSUCHAC0：CTSU通道使能控制寄存器0

Base address: CTSU = 0x400D_0000

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUCHAC0[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUCHAC0[7:0]	CTSU通道使能控制0 这些位选择是否测量相关的TS引脚。bit0与TS00相关联，而bit7与TS07相关联。 0：不测量1：测量	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHAC0寄存器。

CTSUCHAC0[7:0]位（CTSU通道使能控制0）

CTSUCHAC0[7:0]位选择要测量其静电电容的接收和发送引脚。

46.2.8 CTSUCHAC1 : CTSU Channel Enable Control Register 1

Base address: CTSU = 0x400D_0000

Offset address: 0x07

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUCHAC1[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUCHAC1[7:0]	CTSU Channel Enable Control 1 These bits select whether the associated TS pin is measured. bit0 is associated with TS08 and bit7 with TS15. 0: Do not measure 1: Measure	R/W

Only set the CTSUCHAC1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHAC1[7:0] bits (CTSU Channel Enable Control 1)

The CTSUCHAC1[7:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured.

46.2.9 CTSUCHAC2 : CTSU Channel Enable Control Register 2

Base address: CTSU = 0x400D_0000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CTSUCHAC2[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CTSUCHAC2[3:0]	CTSU Channel Enable Control 2 These bits select whether the associated TS pin is measured. bit0 is associated with TS16 and bit3 with TS19. 0: Do not measure 1: Measure	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Only set the CTSUCHAC2 register when the CTSUCR0.CTSUSTRT bit = 0.

CTSUCHAC2[3:0] bits (CTSU Channel Enable Control 2)

The CTSUCHAC2[3:0] bits select the receive and transmit pins whose electrostatic capacitance is to be measured.

46.2.10 CTSUCHTRC0 : CTSU Channel Transmit/Receive Control Register 0

Base address: CTSU = 0x400D_0000

Offset address: 0x0B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUCHTRC0[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

46.2.8 CTSUCHAC1：CTSU通道使能控制寄存器1

Base address: CTSU = 0x400D_0000

Offset address: 0x07

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUCHAC1[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUCHAC1[7:0]	CTSU通道使能控制1 这些位选择是否测量相关的TS引脚。bit0与TS08相关联，而bit7与TS15相关联。 0：不测量1：测量	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHAC1寄存器。

CTSUCHAC1[7:0]位（CTSU通道使能控制1）

CTSUCHAC1[7:0]位选择要测量其静电电容的接收和发送引脚。

46.2.9 CTSUCHAC2：CTSU通道使能控制寄存器2

Base address: CTSU = 0x400D_0000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0

重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CTSUCHAC2[3:0]	CTSU通道启用控制2 这些位选择是否测量相关的TS引脚。bit0与TS16相关联，而bit3与TS19相关联。 0：不测量1：测量	R/W
7:4	—	这些位被读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位=0时设置CTSUCHAC2寄存器。

CTSUCHAC2[3:0]位（CTSU通道使能控制2）

CTSUCHAC2[3:0]位选择要测量其静电电容的接收和发送引脚。

46.2.10 CTSUCHTRC0：CTSU通道发送接收控制寄存器0

Base address: CTSU = 0x400D_0000

Offset address: 0x0B

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUCHTRC0[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUCHTRC0[7:0]	CTSU Channel Transmit/Receive Control 0 bit0 is associated with TS00 and bit7 with TS07. 0: Reception 1: Transmission	R/W

Only set the CTSUCHTRC0 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHTRC0[7:0] bits (CTSU Channel Transmit/Receive Control 0)

In full scan mode, the CTSUCHTRC0[7:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multi-scan modes.

46.2.11 CTSUCHTRC1 : CTSU Channel Transmit/Receive Control Register 1

Base address: CTSU = 0x400D_0000

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUCHTRC1[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUCHTRC1[7:0]	CTSU Channel Transmit/Receive Control 1 bit0 is associated with TS08 and bit7 with TS15. 0: Reception 1: Transmission	R/W

Only set the CTSUCHTRC1 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHTRC1[7:0] bits (CTSU Channel Transmit/Receive Control 1)

In full scan mode, the CTSUCHTRC1[7:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multiscan modes.

46.2.12 CTSUCHTRC2 : CTSU Channel Transmit/Receive Control Register 2

Base address: CTSU = 0x400D_0000

Offset address: 0x0D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CTSUCHTRC2[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CTSUCHTRC2[3:0]	CTSU Channel Transmit/Receive Control 2 bit0 is associated with TS16 and bit3 with TS19. 0: Reception 1: Transmission	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Only set the CTSUCHTRC2 register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUCHTRC2[3:0] bits (CTSU Channel Transmit/Receive Control 2)

In full scan mode, the CTSUCHTRC2[3:0] bits allocate reception or transmission to the associated TS pins. The setting is ignored in self-capacitance single scan and multiscan modes.

Bit	Symbol	Function	R/W
7:0	CTSUCHTRC0[7:0]	CTSU通道发送接收控制0位0与TS00相关联，位7与TS07相关联。 0：接收1：发送	R/W

仅在CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC0寄存器。

CTSUCHTRC0[7:0]位（CTSU通道发送接收控制0）

在全扫描模式下，CTSUCHTRC0[7:0]位将接收或发送分配给相关的TS引脚。在自电容单次扫描和多次扫描模式下，该设置被忽略。

46.2.11 CTSUCHTRC1：CTSU通道发送接收控制寄存器1

Base address: CTSU = 0x400D_0000

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUCHTRC1[7:0]							
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSUCHTRC1[7:0]	CTSU通道发送接收控制1位0与TS08相关联，位7与TS15相关联。 0：接收1：发送	R/W

仅在CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC1寄存器。

CTSUCHTRC1[7:0]位（CTSU通道发送接收控制1）

在全扫描模式下，CTSUCHTRC1[7:0]位将接收或发送分配给相关的TS引脚。在自电容单扫描和多扫描模式下，该设置被忽略。

46.2.12 CTSUHTRC2：CTSU通道发送接收控制寄存器2

Base address: CTSU = 0x400D_0000

Offset address: 0x0D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CTSUCHTRC2[3:0]			
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CTSUCHTRC2[3:0]	CTSU通道发送接收控制2位0与TS16相关联，位3与TS19相关联。 0：接收1：发送	R/W
7:4	—	这些位被读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUCHTRC2寄存器。

CTSUCHTRC2[3:0]位（CTSU通道发送接收控制2）

在全扫描模式下，CTSUCHTRC2[3:0]位将接收或发送分配给相关的TS引脚。在自电容单扫描和多扫描模式下，该设置被忽略。

46.2.13 CTSUDCLKC : CTSU High-Pass Noise Reduction Control Register

Base address: CTSU = 0x400D_0000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	CTSUSSCNT[1:0]		—	—	CTSUSSMOD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CTSUSSMOD[1:0]	CTSU Diffusion Clock Mode Select Set these bits to 00b.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
5:4	CTSUSSCNT[1:0]	CTSU Diffusion Clock Mode Control Set these bits to 11b.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Only set the CTSUDCLKC register when the CTSUCR0.CTSUSTRT bit is 0.

CTSUSSMOD[1:0] bits (CTSU Diffusion Clock Mode Select)

The CTSUSSMOD[1:0] bits set the mode of the spectrum diffusion clock for high-pass noise reduction. When using the high-pass function, always fix these bits to 00b. If these bits are not set, the CTSU will be unable to effectively reduce high-pass noise.

CTSUSSCNT[1:0] bits (CTSU Diffusion Clock Mode Control)

The CTSUSSCNT[1:0] bits adjust the amount of spectrum diffusion applied to reduce high-pass noise. When using the high-pass noise reduction function, always fix these bits to 11b. If these bits are not set, touch measurement might be performed incorrectly.

46.2.14 CTSUST : CTSU Status Register

Base address: CTSU = 0x400D_0000

Offset address: 0x11

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUPS	CTSUROVF	CTSUSOVF	CTSUDTSR	—	CTSUSTC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CTSUSTC[2:0]	CTSU Measurement Status Counter These counters indicate the current measurement status. 0 0 0: Status 0 0 0 1: Status 1 0 1 0: Status 2 0 1 1: Status 3 1 0 0: Status 4 1 0 1: Status 5	R
3	—	This bit is read as 0. The write value should be 0.	R/W
4	CTSUDTSR	CTSU Data Transfer Status Flag This flag indicates whether the measurement result stored in the sensor counter and the reference counter was read. 0: Read 1: Not read	R

46.2.13 CTSUDCLKC:CTSU高通降噪控制寄存器

Base address: CTSU = 0x400D_0000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	CTSUSSCNT[1:0]		—	—	CTSUSSMOD[1:0]	
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CTSUSSMOD[1:0]	CTSU扩散时钟模式选择 将这些位设置为00b。	R/W
3:2	—	这些位被读取为0。写入值应为0。	R/W
5:4	CTSUSSCNT[1:0]	CTSU扩散时钟模式控制 将这些位设置为11b。	R/W
7:6	—	这些位被读取为0。写入值应为0。	R/W

仅当CTSUCR0.CTSUSTRT位为0时设置CTSUDCLKC寄存器。

CTSUSSMOD[1:0]位（CTSU扩散时钟模式选择）

CTSUSSMOD[1:0]位设置频谱扩散时钟的模式以降低高通噪声。使用高通功能时，请始终将这些位固定为00b。如果未设置这些位，CTSU将无法有效降低高通噪声。

CTSUSSCNT[1:0]位（CTSU扩散时钟模式控制）

CTSUSSCNT[1:0]位调整应用的频谱扩散量以减少高通噪声。使用高通降噪功能时，请始终将这些位固定为11b。如果未设置这些位，则可能会错误地执行触摸测量。

46.2.14 CTSUST:CTSU状态寄存器

Base address: CTSU = 0x400D_0000

Offset address: 0x11

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CTSUPS	CTSUROVF	CTSUSOVF	CTSUDTSR	—	CTSUSTC[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CTSUSTC[2:0]	CTSU测量状态计数器 这些计数器指示当前的测量状态。 0 0 0: Status 0 0 0 1: Status 1 0 1 0: Status 2 0 1 1: Status 3 1 0 0: Status 4 1 0 1: Status 5	R
3	—	该位读取为0。写入值应为0。	R/W
4	CTSUDTSR	CTSU数据传输状态标志 该标志指示存储在传感器计数器和参考计数器中的测量结果是否被读取。 0：读取1： 未读取	R

Bit	Symbol	Function	R/W
5	CTSUSOVF	CTSU Sensor Counter Overflow Flag This flag indicates an overflow on the sensor counter. 0: No overflow occurred 1: Overflow occurred	R/W
6	CTSUROVF	CTSU Reference Counter Overflow Flag This flag indicates an overflow on the reference counter. 0: No overflow occurred 1: Overflow occurred	R/W
7	CTSUPS	CTSU Mutual Capacitance Status Flag This flag indicates the measurement status in mutual capacitance full scan mode. 0: First measurement 1: Second measurement	R

When using the CTSUCR0.CTSUINIT bit to clear an overflow flag, make sure that the CTSUCR0.CTSUSTRT bit is 0.

CTSUSTC[2:0] flags (CTSU Measurement Status Counter)

The CTSUSTC[2:0] flags are a counter indicating the current measurement status. For details on each status, see section 46.3.2.2. Status counter.

CTSUDTSR flag (CTSU Data Transfer Status Flag)

The CTSUDTSR flag indicates whether the measurement result stored in the sensor counter and the reference counter was read. The flag sets to 1 when measurement completes and 0 when the reference counter is read by software or the DTC. The flag can also be cleared using the CTSUCR0.CTSUINIT bit.

CTSUSOVF flag (CTSU Sensor Counter Overflow Flag)

The CTSUSOVF flag sets to 1 when the sensor counter, CTSUSC, overflows. On overflow, the counter value reads as 0xFFFF. Measurement processing continues for the specified period.

No interrupt occurs on an overflow. To determine the channel on which the overflow occurred, read the measurement result of each channel after measurement completes, signaled by a measurement end interrupt.

This flag is cleared when 0 is written after 1 is read by software. It can also be cleared using the CTSUCR0.CTSUINIT bit.

CTSUROVF flag (CTSU Reference Counter Overflow Flag)

The CTSUROVF flag sets to 1 when the reference counter, CTSURC, overflows. On overflow, the counter value reads as 0xFFFF. Measurement processing continues for the specified period.

No interrupt occurs on an overflow. To determine the channel on which the overflow occurred, read the measurement result of each channel after measurement completes, signaled by a measurement end interrupt.

This flag is cleared when 0 is written after 1 is read by software. It can also be cleared using the CTSUCR0.CTSUINIT bit.

CTSUPS flag (CTSU Mutual Capacitance Status Flag)

In mutual capacitance full scan mode, when CTSUCR1.CTSUMD[1:0] = 11b, the CTSUPS flag indicates whether the measurement is the first or second of two measurements for each channel. When measurement is stopped or in other measurement modes, this flag is always 0.

46.2.15 CTSUSSC : CTSU High-Pass Noise Reduction Spectrum Diffusion Control Register

Base address: CTSU = 0x400D_0000

Offset address: 0x12

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CTSUSSDIV[3:0]				—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5	CTSUSOVF	CTSU传感器计数器溢出标志 该标志表示传感器计数器溢出。 0：未发生溢出1：发生溢出	R/W
6	CTSUROVF	CTSU参考计数器溢出标志 该标志表示参考计数器溢出。 0：未发生溢出1：发生溢出	R/W
7	CTSUPS	CTSU互电容状态标志 该标志指示互电容全扫描模式下的测量状态。 0：第一次测量1：第二次测量	R

使用CTSUCR0.CTSUINIT位清除溢出标志时，请确保CTSUCR0.CTSUSTRT位为0。

CTSUSTC[2:0]标志（CTSU测量状态计数器）

CTSUSTC[2:0]标志是指示当前测量状态的计数器。有关每个状态的详细信息，请参阅第46.3.2.2节。状态计数器。

CTSUDTSR标志（CTSU数据传输状态标志）

CTSUDTSR标志指示存储在传感器计数器和参考计数器中的测量结果是否被读取。当测量完成时，该标志设置为1，当软件或DTC读取参考计数器时，该标志设置为0。也可以使用CTSUCR0.CTSUINIT位清除该标志。

CTSUSOVF标志（CTSU传感器计数器溢出标志）

当传感器计数器CTSUSC溢出时，CTSUSOVF标志设置为1。溢出时，计数器值读取为0xFFFF。测量处理持续指定的时间。

溢出时不发生中断。要确定发生溢出的通道，请在测量完成后读取每个通道的测量结果，由测量结束中断发出信号。

当软件读取1后写入0时清除该标志。它也可以使用CTSUCR0.CTSUINIT位清零。

CTSUROVF标志（CTSU参考计数器溢出标志）

当参考计数器CTSURC溢出时，CTSUROVF标志设置为1。溢出时，计数器值读取为0xFFFF。测量处理持续指定的时间。

溢出时不发生中断。要确定发生溢出的通道，请在测量完成后读取每个通道的测量结果，由测量结束中断发出信号。

当软件读取1后写入0时清除该标志。它也可以使用CTSUCR0.CTSUINIT位清零。

CTSUPS标志（CTSU互电容状态标志）

在互电容全扫描模式下，当CTSUCR1.CTSUMD[1:0]=11b时，CTSUPS标志指示测量是每个通道的两次测量中的第一个还是第二个。当测量停止或处于其他测量模式时，该标志始终为0。

46.2.15 CTSUSSC:CTSU高通降噪频谱扩散控制 Register

Base address: CTSU = 0x400D_0000

Offset address: 0x12

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CTSUSSDIV[3:0]				—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
11:8	CTSUSSDIV[3:0]	CTSU Spectrum Diffusion Frequency Division Setting These bits specify the spectrum diffusion frequency division setting based on the base clock frequency division setting.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

CTSUSSDIV[3:0] bits (CTSU Spectrum Diffusion Frequency Division Setting)

The CTSUSSDIV[3:0] bits specify the spectrum diffusion frequency derived from the base clock frequency division setting. To calculate the correct setting for CTSUSSDIV[3:0], see the relationship between base clock frequencies and the settings in Table 46.6.

Table 46.6 Relationship between base clock frequencies and CTSUSSDIV[3:0] bits settings

Base clock frequency fb (MHz)	CTSUSSDIV[3:0] bit setting
4.00 ≤ fb	0000b
2.00 ≤ fb < 4.00	0001b
1.33 ≤ fb < 2.00	0010b
1.00 ≤ fb < 1.33	0011b
0.80 ≤ fb < 1.00	0100b
0.67 ≤ fb < 0.80	0101b
0.57 ≤ fb < 0.67	0110b

46.2.16 CTSUSO0：CTSU传感器偏移寄存器0

Base address: CTSU = 0x400D_0000

Offset address: 0x14

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CTSUSNUM[5:0]						CTSUSO[9:0]									
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	CTSUSO[9:0]	CTSU传感器偏移调整 这些位在电极未被触摸 时调整电子电容。 0x000：当前偏移为0。0x 001：当前偏移为1。0x00 2：当前偏移为2。 ⋮ ⋮ 0x3FE：当前偏移量为1022。0x3FF ：当前偏移量最大。	R/W

Bit	Symbol	Function	R/W
15:10	CTSUSNUM[5:0]	CTSU Measurement Count Setting These bits set the number of measurements.	R/W

CTSUSO[9:0] bits (CTSU Sensor Offset Adjustment)

The CTSUSO[9:0] bits offset the sensor ICO input current generated from electrostatic capacitance during touch measurement when the electrode is not being touched. This prevents the CTSU sensor counter from overflowing. Set the TS pin that is to be measured next after a CTSU_CTSUWR interrupt occurs.

CTSUSNUM[5:0] bits (CTSU Measurement Count Setting)

The CTSUSNUM[5:0] bits specify how many times the measurement pulse count specified in the CTSUSDPRS.CTSUPRRATIO[3:0] and CTSUSDPRS.CTSUPRMODE[1:0] bits is repeated during the measurement time. The measurement pulse count is repeated (CTSUSNUM[5:0] bits + 1) times. Set the TS pin that is to be measured next after a CTSU_CTSUWR interrupt is generated.

46.2.17 CTSUSO1 : CTSU Sensor Offset Register 1

Base address: CTSU = 0x400D_0000

Offset address: 0x16

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	CTSUICOG[1:0]		CTSUSDPA[4:0]					CTSURICOA[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	CTSURICOA[7:0]	CTSU Reference ICO Current Adjustment These bits adjust the input current of the reference ICO. 0x00: Current offset is 0 0x01: Current offset is 1 0x02: Current offset is 2 ⋮ 0xFE: Current offset is 254 0xFF: Current offset is maximum.	R/W

Bit	Symbol	Function	R/W
15:10	CTSUSNUM[5:0]	CTSU测量计数设置 这些位设置测量次数。	R/W

CTSUSO[9:0]位（CTSU传感器偏移调整）

CTSUSO[9:0]位在电极未被触摸 时在触摸测量期间抵消由静电电容产生的传感器ICO输入电流。这可以防止CTSU传感器计数器溢出。在发生CTSU_CTSUWR中断后设置接下来要测量的TS引脚。

CTSUSNUM[5:0]位（CTSU测量计数设置）

CTSUSNUM[5:0]位指定测量脉冲计数的次数
CTSUSDPRS.CTSUPRRATIO[3:0]和CTSUSDPRS.CTSUPRMODE[1:0]位在测量期间重复。测量脉冲计数重复(CTSUSNUM[5:0]位+1)次。在产生CTSU_CTSUWR中断后设置接下来要测量的TS引脚。

46.2.17 CTSUSO1：CTSU传感器偏移寄存器1

Base address: CTSU = 0x400D_0000

Offset address: 0x16

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

12:8	CTSUSDPA[4:0]	CTSU Base Clock Setting These bits are used to generate the base clock. 0x00: Operating clock divided by 2*1 0x01: Operating clock divided by 4 0x02: Operating clock divided by 6 0x03: Operating clock divided by 8 0x04: Operating clock divided by 10 0x05: Operating clock divided by 12 0x06: Operating clock divided by 14 0x07: Operating clock divided by 16 0x08: Operating clock divided by 18 0x09: Operating clock divided by 20 0x0A: Operating clock divided by 22 0x0B: Operating clock divided by 24 0x0C: Operating clock divided by 26 0x0D: Operating clock divided by 28 0x0E: Operating clock divided by 30 0x0F: Operating clock divided by 32 0x10: Operating clock divided by 34 0x11: Operating clock divided by 36 0x12: Operating clock divided by 38 0x13: Operating clock divided by 40 0x14: Operating clock divided by 42 0x15: Operating clock divided by 44 0x16: Operating clock divided by 46 0x17: Operating clock divided by 48 0x18: Operating clock divided by 50 0x19: Operating clock divided by 52 0x1A: Operating clock divided by 54 0x1B: Operating clock divided by 56 0x1C: Operating clock divided by 58 0x1D: Operating clock divided by 60 0x1E: Operating clock divided by 62 0x1F: Operating clock divided by 64	R/W
14:13	CTSUICOG[1:0]	CTSU ICO Gain Adjustment These bits adjust the output frequency gain of the sensor ICO and the reference ICO. 0 0: 100% gain 0 1: 66% gain 1 0: 50% gain 1 1: 40% gain	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

Note 1. Do not set the CTSUSDPA[4:0] bits set to 00000b while the high-pass noise reduction function is turned off (CTSUSDPRS.CTSUSOFF bit = 1) in mutual capacitance full scan mode (CTSUCR1.CTSUMD[1:0] bits = 11b).

After a CTSU_CTSUWR interrupt occurs, write first to the CTSUSSC register, next to the CTSUSO0 register, and then to the CTSUSO1 register. The write to the CTSUSO1 register causes a transition to Status 3. (See Table 46.7 and Table 46.8.) Set all of the bits in a single operation when writing to the CTSUSO1 register.

CTSURICOA[7:0] bits (CTSU Reference ICO Current Adjustment)

The CTSURICOA[7:0] bits adjust the oscillation frequency using the input current of the reference ICO.

CTSUSDPA[4:0] bits (CTSU Base Clock Setting)

The CTSUSDPA[4:0] bits select the base clock used as the source for the sensor drive pulse by dividing the operating clock. For details on the setting procedure, see section 46.3.2.1. Initial settings flow.

CTSUICOG[1:0] bits (CTSU ICO Gain Adjustment)

The CTSUICOG[1:0] bits adjust the output frequency gain of the sensor ICO and the reference ICO. Normally, set these bits to 00b for the maximum gain. If changes in the capacitance between when the electrode is touched and when it is not touched greatly exceed the dynamic range of the sensor ICO, adjust the gain appropriately with this setting.

14:13	CTSUICOG[1:0]	CTSUICO增益调整 这些位调整传感器ICO和参考ICO的输出频率增益。 0 0: 100% gain 0 1: 66% gain 1 0: 50% gain 1 1: 40% gain	R/W
15	—	该位读取为0。写入值应为0。	R/W

注1.关闭高通降噪功能时，请勿将CTSUSDPA[4:0]位设置为00000b（CTSUSDPRS.CTSUSOFF位=1）在互电容全扫描模式下（CTSUCR1.CTSUMD[1:0]位=11b）。

发生CTSU_CTSUWR中断后，先写入CTSUSSC寄存器，然后写入CTSUSO0寄存器，然后写入CTSUSO1寄存器。写入CTSUSO1寄存器会导致转换到状态3。（参见表46.7和表46.8。）在写入CTSUSO1寄存器时，在一次操作中设置所有位。

CTSURICOA[7:0]位（CTSU参考ICO电流调整）

CTSURICOA[7:0]位使用参考ICO的输入电流调整振荡频率。

CTSUSDPA[4:0]位（CTSU基本时钟设置）

CTSUSDPA[4:0]位通过对工作时钟进行分频来选择用作传感器驱动脉冲源的基本时钟。
有关设置步骤的详细信息，请参阅第46.3.2.1节。初始设置流程。

CTSUICOG[1:0]位（CTSUICO增益调整）

CTSUICOG[1:0]位调整传感器ICO和参考ICO的输出频率增益。通常，将这些位设置为00b以获得最大增益。如果触摸电极和未触摸电极之间的电容变化大大超过传感器ICO的动态范围，请使用此设置适当调整增益。

46.2.18 CTSUSC : CTSU Sensor Counter

Base address: CTSU = 0x400D_0000

Offset address: 0x18

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CTSUSC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	CTSUSC[15:0]	CTSU Sensor Counter These bits indicate the measurement result of the sensor ICO. They read 0xFFFF when an overflow occurs.	R

After a CTSU_CTSURD interrupt occurs, read first from the CTSUSC counter and then from the CTSURC counter.

CTSUSC[15:0] bits (CTSU Sensor Counter)

The CTSUSC[15:0] bits are configured as an increment counter for the sensor ICO clock. Read these bits after a CTSU_CTSURD interrupt occurs. After the CTSURC counter is read, these bits are cleared immediately before the CTSU measurement status counter value changes to Status 4 (the CTSUST.CTSUSTC[2:0] flags changes to 100b) in the next measurement. They can also be cleared using the CTSUCR0.CTSUINIT bit.

46.2.19 CTSURC : CTSU Reference Counter

Base address: CTSU = 0x400D_0000

Offset address: 0x1A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CTSURC[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	CTSURC[15:0]	CTSU Reference Counter These bits indicate the measurement result of the reference ICO. They read FFFFh when an overflow occurs.	R

After a CTSU_CTSURD interrupt occurs, read first from the CTSUSC counter and then from the CTSURC counter.

Status 3 continues until the CTSURC counter is read, even if the stabilization time specified for Status 3 elapses.

CTSURC[15:0] bits (CTSU Reference Counter)

The CTSURC[15:0] bits are configured as an increment counter for the reference ICO clock. The reference ICO optimizes touch measurement performed by the sensor ICO. There is some deviation depending on the internal sensor ICO and the reference ICO in the CTSU, but both ICOs have almost the same characteristics, including the dynamic range and the current-to-frequency characteristics. The range of current amount that can be set in the reference ICO current adjustment bits is about the same as the dynamic range of both ICOs, and the current amount input to the sensor ICO must be within this dynamic range. To ensure this, use the reference ICO to check the differences between the ICOs and measure the current-to-oscillation frequency characteristics. Because the reference ICO oscillation frequency can be obtained from the reference ICO counter, the ICO oscillation frequency (counter value/measurement time) for the input current amount can be measured by setting the value in the reference ICO current adjustment bits and measuring the reference ICO counter. The reference ICO counter value measured using the maximum value in the reference ICO current adjustment bits is the maximum value of the ICO dynamic range. The current to the sensor ICO must be offset in the offset adjustment bits so that the sensor ICO counter value does not exceed this value.

46.2.18 CTSUSC:CTSU传感器计数器

Base address: CTSU = 0x400D_0000

Offset address: 0x18

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CTSUSC[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	CTSUSC[15:0]	CTSU传感器计数器 这些位表示传感器ICO的测量结果。当发生溢出时，它们读取0xFFFF。	R

发生CTSU_CTSURD中断后，先从CTSUSC计数器读取，然后再从CTSURC计数器读取。

CTSUSC[15:0]位（CTSU传感器计数器）

CTSUSC[15:0]位配置为传感器ICO时钟的增量计数器。后读取这些位
CTSU_CTSURD中断发生。读取CTSURC计数器后，在下一次测量中CTSU测量状态计数器值变为状态4（CTSUST.CTSUSTC[2:0]标志变为100b）之前，立即清除这些位。它们也可以使用CTSUCR0.CTSUINIT位清零。

46.2.19 CTSURC:CTSU参考计数器

Base address: CTSU = 0x400D_0000

Offset address: 0x1A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CTSURC[15:0]															
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	CTSURC[15:0]	CTSU参考计数器 这些位表示参考ICO的测量结果。它们在发生溢出时读取FFFFh。	R

发生CTSU_CTSURD中断后，先从CTSUSC计数器读取，然后再从CTSURC计数器读取。

状态3一直持续到读取CTSURC计数器为止，即使为状态3指定的稳定时间已过。

CTSURC[15:0]位（CTSU参考计数器）

CTSURC[15:0]位配置为参考ICO时钟的增量计数器。参考ICO优化了传感器ICO执行的触摸测量。CTSU中的内部传感器ICO和参考ICO存在一些偏差，但两种ICO具有几乎相同的特性，包括动态范围和电流频率特性。参考ICO电流调整位可设置的电流量范围与两个ICO的动态范围大致相同，输入到传感器ICO的电流量必须在此动态范围内。为确保这一点，请使用参考ICO检查ICO之间的差异并测量电流-振荡频率特性。因为可以从参考ICO计数器获得参考ICO振荡频率，所以可以通过设置参考ICO电流调整位中的值并测量参考ICO计数器来测量输入电流量的ICO振荡频率（计数器值测量时间）.使用参考ICO电流调整位中的最大值测量的参考ICO计数器值是ICO动态范围的最大值。传感器ICO的电流必须在偏移调整位中进行偏移，以使传感器ICO计数器值不超过此值。

Read the CTSURC[15:0] bits after a CTSU_CTSURD interrupt occurs. After these bits are read, they are cleared immediately before the CTSU measurement status counter value changes to Status 4 (the CTSUST.CTSUSTC[2:0] flags changes to 100b) in the next measurement. They can also be cleared using the CTSUCR0.CTSUINIT bit.

46.2.20 CTSUERRS : CTSU Error Status Register

Base address: CTSU = 0x400D_0000

Offset address: 0x1C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CTSUICOMP	—	—	—	—	—	—	—	CTSUTSOC	—	—	—	CTSUDRV	CTSUTSOD	CTSUSPMD[1:0]	
Value after reset:	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CTSUSPMD[1:0]	Calibration Mode 0 0: Capacitance measurement mode 1 0: Calibration mode Others: Seting prohibited	R/W
2	CTSUTSOD	TS Pin Fixed Output 0: Capacitance measurement mode 1: TS pins are forced to be high or low	R/W
3	CTSUDRV	Calibration Setting 1 0: Capacitance measurement mode 1: Calibration setting 1	R/W
6:4	—	These bits are read as 0. The write value should be 0.	R/W
7	CTSUTSOC	Calibration Setting 2 0: Capacitance measurement mode 1: Calibration setting 2	R/W
14:8	—	These bits are read as 0. The write value should be 0.	R/W
15	CTSUICOMP	TSCAP Voltage Error Monitor 0: Normal TSCAP voltage 1: Abnormal TSCAP voltage	R

CTSUSPMD[1:0] bits (Calibration Mode)

The CTSUSPMD[1:0] bits are used to calibrate the CTSU. When measuring the capacitance, set these bits to 00b.

CTSUTSOD bit (TS Pin Fixed Output)

The CTSUTSOD bit is used to calibrate the CTSU. When setting this bit to 1, the TS pins are forced to the logic level specified by the CTSUCR0.CTSUIOC bit. When measuring the capacitance, set this bit to 0.

CTSUDRV bit (Calibration Setting 1)

The CTSUDRV bit is used to calibrate the CTSU. When measuring the capacitance, set this bit to 0.

CTSUTSOC bit (Calibration Setting 2)

The CTSUTSOC bit is used to calibrate the CTSU. When measuring capacitance, set this bit to 0.

CTSUICOMP bit (TSCAP Voltage Error Monitor)

If the offset current amount set in the CTSUSO1 register exceeds the sensor ICO input current during touch measurement, the TSCAP voltage becomes abnormal and touch measurement cannot be performed correctly. The CTSUICOMP bit monitors the TSCAP voltage and it sets to 1 if the voltage becomes abnormal.

If the TSCAP voltage becomes abnormal, the sensor ICO counter value becomes undefined, but touch measurement completes normally, so it is difficult to detect an abnormality by reading the sensor ICO counter value. If the CTSU reference ICO current adjustment bits (CTSURICOA[7:0]) in the CTSUSO1 register are set to any value other than 0, always check this bit when touch measurement completes.

在CTSU_CTSURD中断发生后读取CTSURC[15:0]位。读取这些位后，在CTSU测量状态计数器值在下一次测量中立即变为状态4（CTSUST.CTSUSTC[2:0]标志变为100b）之前将它们清零。它们也可以使用CTSUCR0.CTSUINIT位清零。

46.2.20 CTSUERRS:CTSU错误状态寄存器

Base address: CTSU = 0x400D_0000

Offset address: 0x1C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CTSUICOMP	—	—	—	—	—	—	—	CTSUTSOC	—	—	—	CTSUDRV	CTSUTSOD	CTSUSPMD[1:0]	
重置后的值：	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	CTSUSPMD[1:0]	校准模式 00：电容测量模式10：校准模式 Others: Seting prohibited	R/W
2	CTSUTSOD	TS引脚固定输出 0：电容测量模式1：TS引脚强制为高电平或低电平	R/W
3	CTSUDRV	校准设置1 0：电容测量模式1：校准设置1	R/W
6:4	—	这些位被读取为0。写入值应为0。	R/W
7	CTSUTSOC	校准设置2 0：电容测量模式1：校准设置2	R/W
14:8	—	这些位被读取为0。写入值应为0。	R/W
15	CTSUICOMP	TSCAP电压错误监视器 0：正常TSCAP电压1：异常TSCAP电压	R

CTSUSPMD[1:0] bits (Calibration Mode)

CTSUSPMD[1:0]位用于校准CTSU。测量电容时，将这些位设置为00b。

CTSUTSOD位（TS引脚固定输出）

CTSUTSOD位用于校准CTSU。将该位设置为1时，TS引脚被强制为CTSUCR0.CTSUIC位指定的逻辑电平。测量电容时，将此位设置为0。

CTSUDRV位（校准设置1）

CTSUDRV位用于校准CTSU。测量电容时，将此位设置为0。

CTSUTSOC位（校准设置2）

CTSUTSOC位用于校准CTSU。测量电容时，将此位设置为0。

CTSUICOMP位（TSCAP电压错误监视器）

如果CTSUSO1寄存器中设置的偏移电流量在触摸测量期间超过传感器ICO输入电流，则TSCAP电压会异常，无法正确执行触摸测量。CTSUICOMP位监控TSCAP电压，如果电压异常，它设置为1。

如果TSCAP电压异常，传感器ICO计数器值变得不确定，但触摸测量正常完成，因此很难通过读取传感器ICO计数器值来检测异常。如果CTSUSO1寄存器中的CTSU参考ICO电流调整位(CTSURICOA[7:0])设置为0以外的任何值，则在触摸测量完成时始终检查该位。

This bit is cleared by writing 0 to the CTSUCR1.CTSUPON bit and turning off the power supply.

46.2.21 CTSUTRMR : CTSU Reference Current Calibration Register

Base address: CTSU = 0x400D_0000

Offset address: 0x20

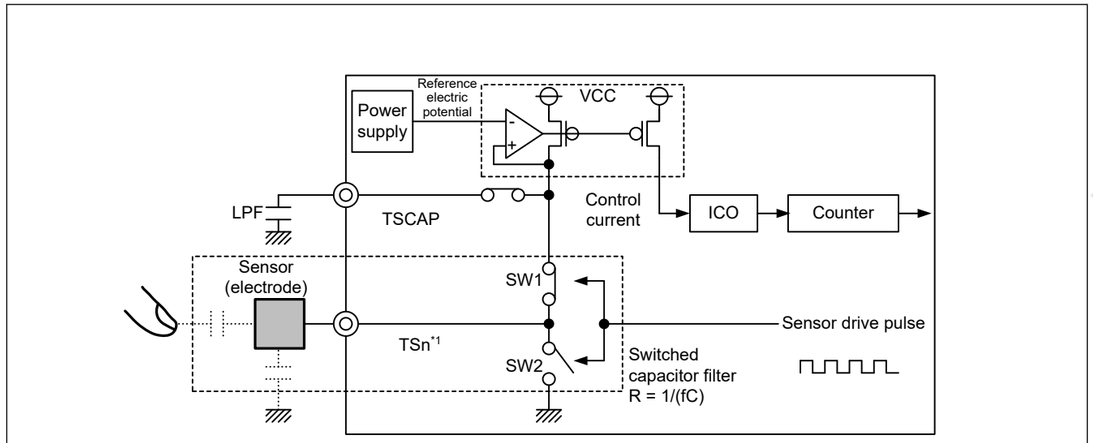
Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	Unique value for each chip							

The CTSUTRMR resister stores a reference current value calibrated under the specified condition for each chip at factory shipment. When rewriting this register, set the CTSUERRS.CTSUSPMD[1:0] bits to 10b (calibration mode). When resetting the MCU, the values returns to the factory setting value. Do not rewrite this register when the CTSUSPMD[1:0] bits are 00b (capacitance measurement mode).

46.3 Operation

46.3.1 Principles of Measurement Operation

Figure 46.4 shows the measurement circuit.



Note 1. TSn = TS00 to TS19

Figure 46.4 Measurement circuit

Figure 46.5 to Figure 46.7 explain the electrostatic capacitance measurement operation principles of the CTSU current frequency conversion. The operation is as follows:

1. The electrostatic capacitance of the electrode is charged by turning SW1 on and SW2 off (Figure 46.5).
2. The charged capacitance is discharged by turning SW1 off and SW2 on (Figure 46.6).
3. Current flows to the switched capacitor filter by switching between charging and discharging. At this point, if a finger is in close proximity, the capacitance and the flowing current change. A clock is generated by supplying the control current, which is proportional to the amount of current flowing through the switched capacitor filter, from the circuit that generates the TSCAP power supply to the ICO. The counter measures the clock frequency that changes depending on whether a finger is in close proximity. The software uses the value read from the counter to determine contact with a finger (Figure 46.7).

通过向CTSUCR1.CTSUPON位写入0并关闭电源来清除该位。

46.2.21 CTSUTRMR:CTSU参考电流校准寄存器

Base address: CTSU = 0x400D_0000

Offset address: 0x20

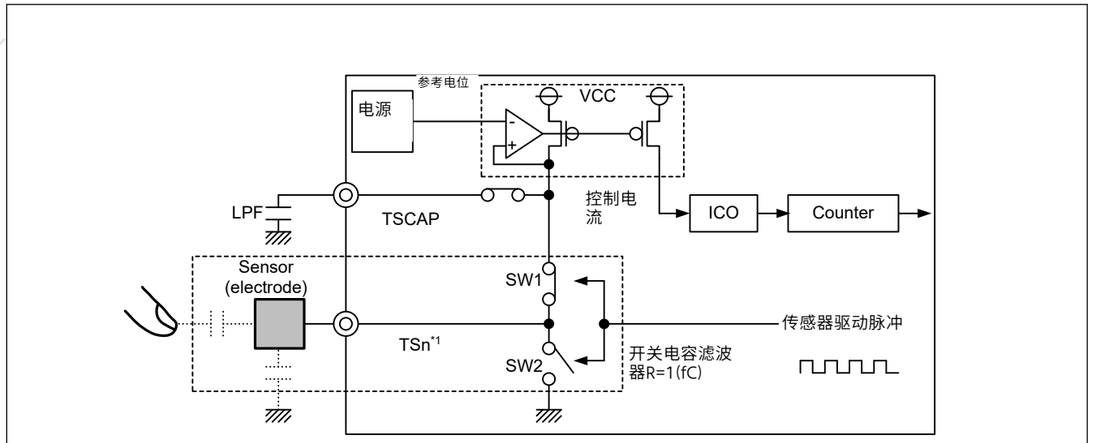
Bit position:	7	6	5	4	3	2	1	0
Bit field:								
重置后的值：	每个芯片的独特价值							

CTSUTRMR电阻存储在出厂时为每个芯片在指定条件下校准的参考电流值。重写此寄存器时，将CTSUERRS.CTSUSPMD[1:0]位设置为10b（校准模式）。复位MCU时，数值恢复为出厂设置值。当CTSSPMD[1:0]位为00b（电容测量模式）时，请勿重写此寄存器。

46.3 Operation

46.3.1 测量操作原理

图46.4显示了测量电路。



注1.TSn=TS00至TS19

Figure 46.4 测量电路

图46.5至图46.7说明了CTSU电流变频的静电电容测量操作原理。操作如下：

1.通过打开SW1和关闭SW2对电极的静电电容进行充电（图46.5）。

2.通过关闭SW1和打开SW2对充电的电容进行放电（图46.6）。

3.电流通过在充电和放电之间切换而流向开关电容滤波器。此时，如果手指靠近，则电容和流动电流会发生变化。通过从产生TSCAP电源的电路向ICO提供与流过开关电容滤波器的电流量成比例的控制电流来产生时钟。计数器测量时钟频率，该频率根据手指是否靠近而变化。软件使用从计数器读取的值来确定与手指的接触（图46.7）。

RA生态工作室

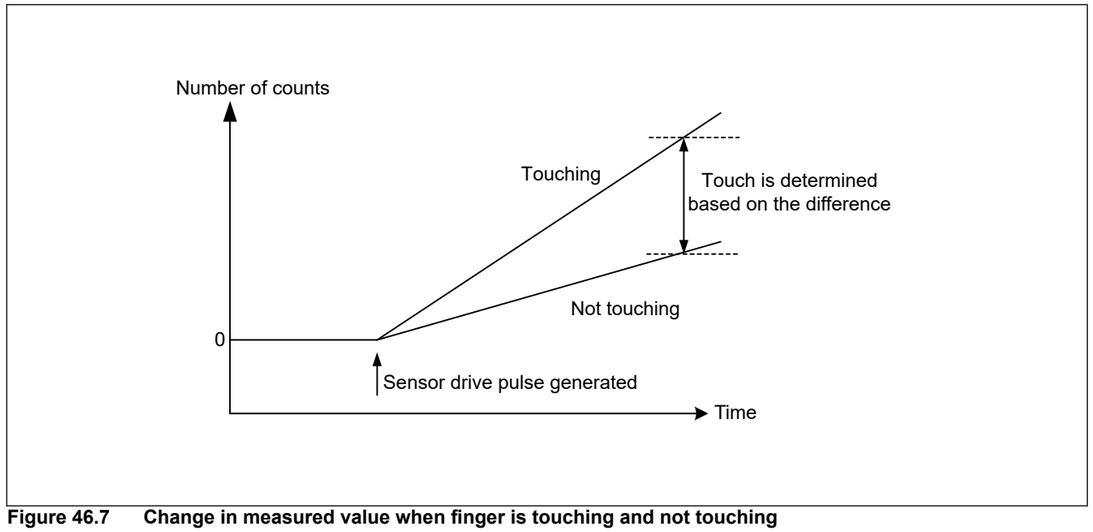

Figure 46.7 Change in measured value when finger is touching and not touching

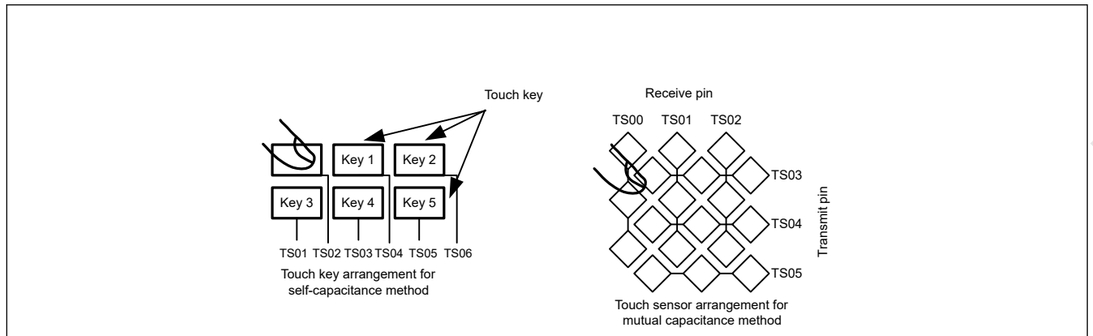
46.3.2 Measurement Modes

The CTSU supports self-capacitance and mutual capacitance methods. Figure 46.8 illustrates these methods.



Note: This figure indicates a usage example. About available pins, see Table 46.2

Figure 46.8 Overview of self-capacitance method and mutual capacitance method

In the self-capacitance method, a single touch pin is allocated to a single touch key to measure individual electrostatic capacitance when a finger is in close proximity. In this method, capacitance can be measured in both single scan and multiscan modes.

In the mutual capacitance method, the capacitance between two opposing electrodes (transmit and receive pins) is measured.

46.3.2.1 Initial settings flow

Figure 46.9 shows the flow for the CTSU initial settings.

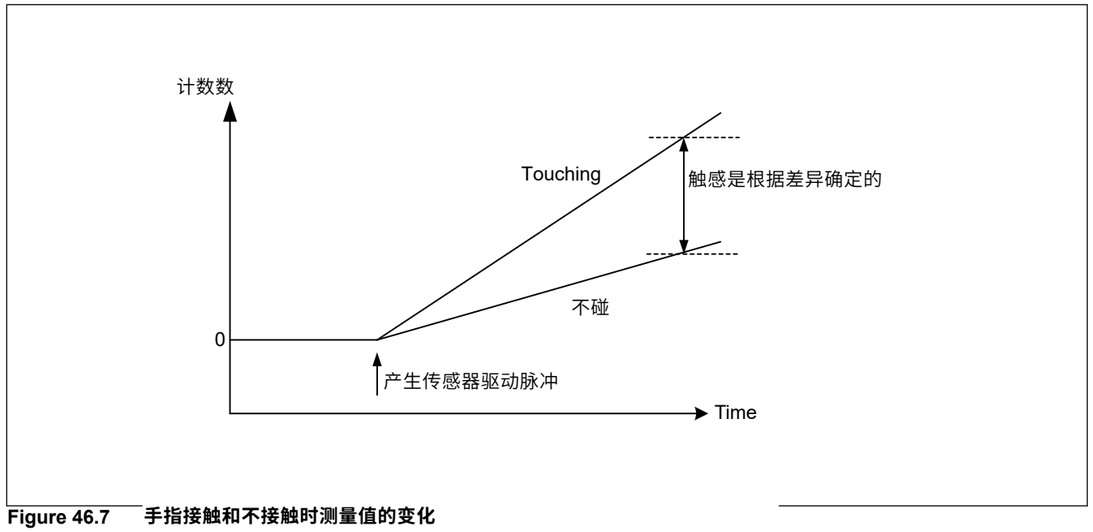


Figure 46.7 手指接触和不接触时测量值的变化

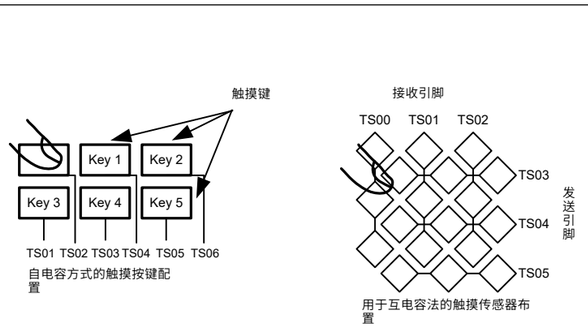
46.3.2 测量模式

CTSU支持自电容和互电容方法。图46.8说明了这些方法。



Note: 该图表示使用示例。关于可用引脚，请参见表46.2

Figure 46.8 自电容法和互电容法概述

在自电容法中，将单个触摸引脚分配给单个触摸键，以在手指靠近时测量单个静电电容。在这种方法中，可以在单扫描和多扫描模式下测量电容。

在互电容法中，测量两个相对电极（发送和接收引脚）之间的电容。

46.3.2.1 初始设置流程

图46.9显示了CTSU初始设置的流程。

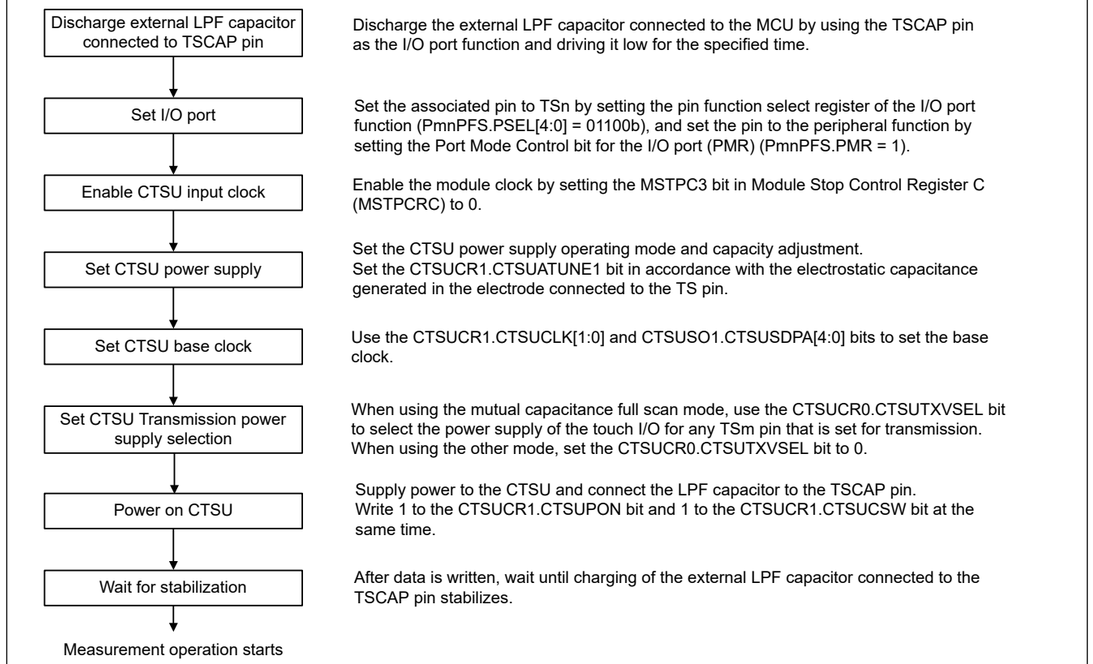


Figure 46.9 CTSU initial settings flow

Figure 46.10 shows the flow for stopping CTSU operation and invoking the standby state.

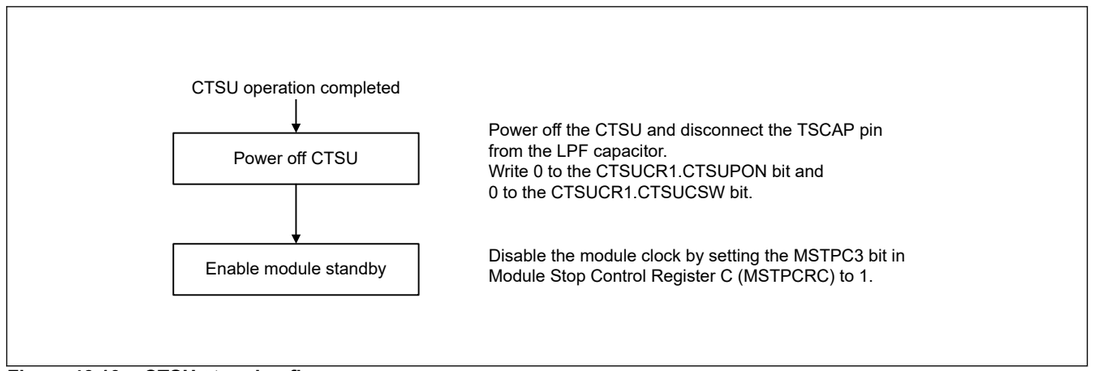

Figure 46.10 CTSU stopping flow

When restarting operation after it stops, follow the initial settings flow shown in Figure 46.9.

46.3.2.2 Status counter

The measurement status counter of the CTSU Status Register (CTSUST) indicates the current measurement status. The measurement status is shared by all three modes. Figure 46.11 shows the status operation transitions.

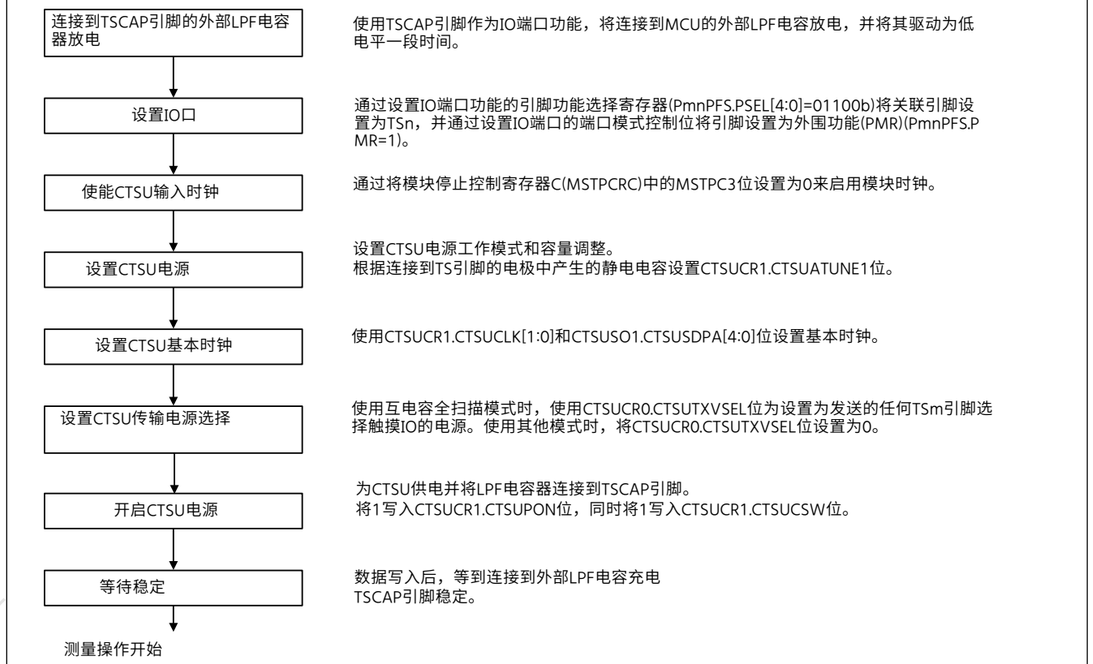

Figure 46.9 CTSU初始设置流程

图46.10显示了停止CTSU操作并调用待机状态的流程。

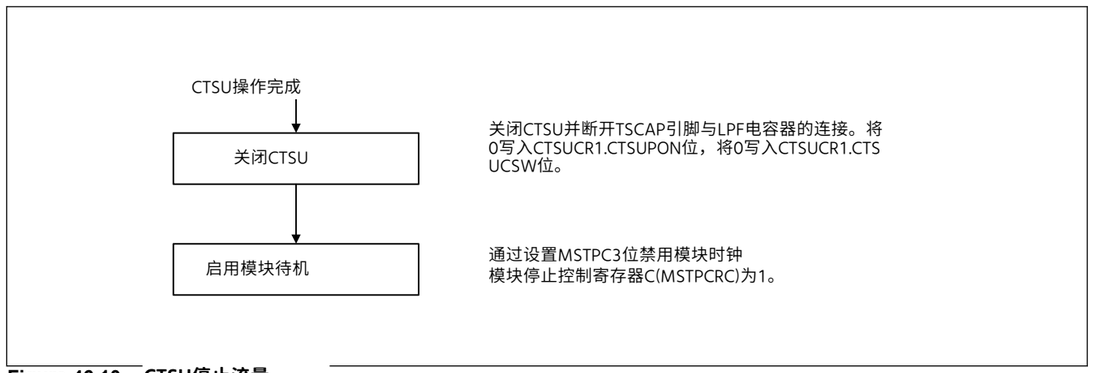

Figure 46.10 CTSU停止流量

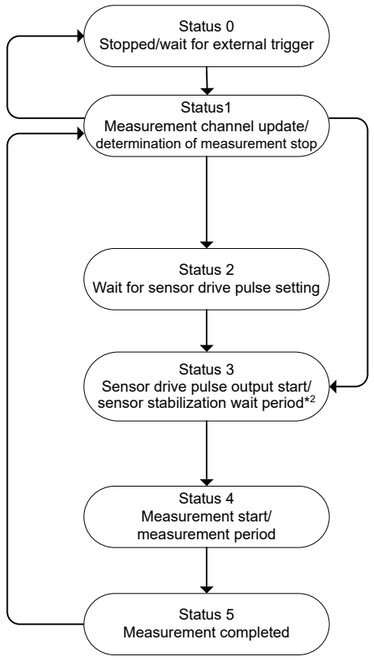
停止后重新开始运行时，请按照图46.9所示的初始设置流程进行操作。

46.3.2.2 状态计数器

CTSU状态寄存器(CTSUST)的测量状态计数器指示当前测量状态。测量状态由所有三种模式共享。图46.11显示了状态操作转换。



Conditions for transition to Status 1:
- If CTSUCR0.CTSUCAP bit = 0, CTSUCR0.CTSUSTRT bit = 1
- If CTSUCR0.CTSUCAP bit = 1, CTSUCR0.CTSUSTRT bit = 1 and the rising edge of the external trigger is detected.

Condition for transition to Status 0:
- There is no channel to be measured next. (A CTSU_CTSUFN interrupt occurs and measurement stops.)

Condition for transition to Status 2:
- Update of the measurement channel completes.

Condition for transition to Status 3:
- CTSUST.CTSUPS = 1 (second measurement) in mutual capacitance full scan mode.

Condition for transition to Status 3:
- Write access to the CTSUSO1 register.*1

Condition for transition to Status 4:
- CTSUST.CTSUDTSR flag = 0 when the sensor stabilization time elapses after supply of the sensor drive pulse starts.

Condition for transition to Status 5:
- The measurement time elapses after measurement started. For details on the measurement time.

Condition for transition to Status 1:
- Two clocks of the operating clock elapse.

Note 1. When using the DTC or ICU to set the registers during CTSU_CTSUWR interrupt handling, write to the CTSUSO1 register last.
Note 2. If the CTSUST.CTSUDTSR flag = 1, wait until the previous measurement result is transferred.

Figure 46.11 Status operation transitions

The status counter transitions to Status 0 when all of the specified measurement channels are measured.

The CTSUCR0.CTSUSTRT bit is set to 0 by hardware when a software trigger is used. When an external trigger is used, the value of 1 is retained, and the CTSU waits for the next trigger.

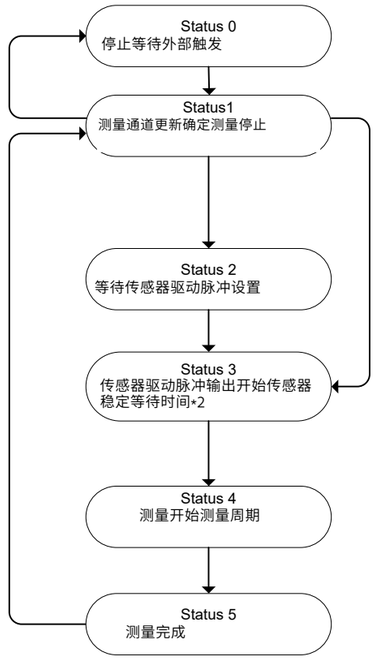
When operation is forced to stop during measurement or the trigger wait state, by a simultaneous 0 write to the CTSUCR0.CTSUSTRT bit and a 1 write to the CTSUCR0.CTSUINIT bit, the status transitions to Status 0 and measurement stops.

If the channel to be measured is not set in the CTSUCHAC0 to CTSUCHAC2 or CTSUCHTRC0 to CTSUCHTRC2 registers, a CTSU_CTSUFN interrupt occurs immediately after a transition to Status 1, and then the status transitions to Status 0.

In the following situations, there is no channel to be measured:

- No measurement target channel is specified in the CTSUCHAC0 to CTSUCHAC2 registers.
- In self-capacitance single scan mode, the channel specified in the CTSUMCH0 register is not a measurement target in the CTSUCHAC0 to CTSUCHAC2 registers.
- In full scan modes, there is no transmit channel or receive channel to be measured based on the combined settings of the CTSUCHAC0 to CTSUCHAC2 and CTSUCHTRC0 to CTSUCHTRC2 registers.

If there is no channel to be measured based on these settings, a CTSU_CTSUFN interrupt occurs immediately after a transition to Status 1, and the counter transitions to Status 0.



转换到状态1的条件：•如果CTSUCR0.CTSUCAP位=0，CTSUCR0.CTSUSTRT位=1•如果CTSUCR0.CTSUCAP位=1，CTSUCR0.CTSUSTRT位=1，并且检测到外部触发的上升沿。

转换到状态0的条件：•没有下一个要测量的通道。（发生CTSU_CTSUFN中断并停止测量。）转换到状态2的条件：•测量通道更新完成。转换到状态3的条件：•CTSUST.CTSUPS=1（第二次测量），互电容全扫描模式。

转换到状态3的条件：•对CTSUSO1寄存器的写访问。*1

转换到状态4的条件：•CTSUST.CTSUDTSR标志=0，当传感器驱动脉冲开始供应后传感器稳定时间过去时。

转换到状态5的条件：•测量开始后测量时间已过。有关测量时间的详细信息。

转换到状态1的条件：•运行时钟的两个时钟过去。

注1.在CTSU_CTSUWR中断处理期间使用DTC或ICU设置寄存器时，最后写入CTSUSO1寄存器。

注2.如果CTSUST.CTSUDTSR标志=1，则等待前一个测量结果被传输。

Figure 46.11 状态操作转换

当测量所有指定的测量通道时，状态计数器转换为状态0。

当使用软件触发时，CTSUCR0.CTSUSTRT位由硬件设置为0。使用外部触发时，保留值1，CTSU等待下一次触发。

在测量或触发等待状态期间强制停止操作时，通过同时向CTSUCR0.CTSUSTRT位写入0和向CTSUCR0.CTSUINIT位写入1，状态转换为状态0并停止测量。

如果要测量的通道未在CTSUCHAC0到CTSUCHAC2或CTSUCHTC0到CTSUCHRC2寄存器中设置，则在转换到状态1后立即发生CTSU_CTSUFN中断，然后状态转换到状态0。

在以下情况下，没有要测量的通道：

●CTSUCHAC0至CTSUCHAC2寄存器中未指定测量目标通道。

●在自电容单次扫描模式下，CTSUCHAC0寄存器中指定的通道不是CTSUCHAC0至CTSUCHAC2寄存器中的测量目标。

●在全扫描模式下，根据CTSUCHAC0到CTSUCHAC2和CTSUCHAC0到CTSUCHAC2寄存器的组合设置，没有要测量的发送通道或接收通道。

如果根据这些设置没有要测量的通道，则在转换到状态1后立即发生CTSU_CTSUFN中断，并且计数器转换到状态0。

46.3.2.3 Self-capacitance single scan mode operation

In self-capacitance single scan mode, electrostatic capacitance on one channel is measured. Figure 46.12 shows the software flow and an operation example, and Figure 46.13 shows the timing.

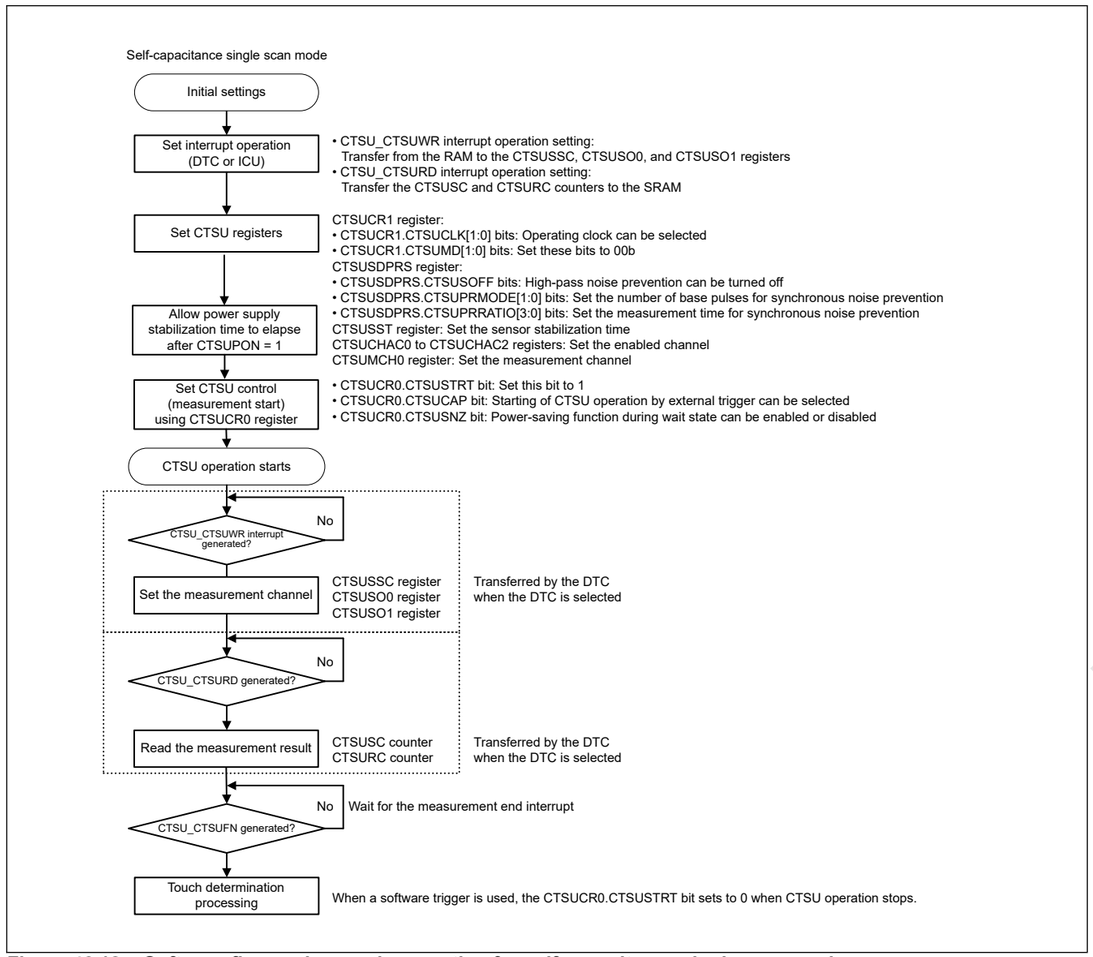


Figure 46.12 Software flow and example operation for self-capacitance single scan mode

46.3.2.3 自电容单次扫描模式操作

在自电容单次扫描模式下，测量一个通道上的静电电容。图46.12显示了软件流程和操作示例，图46.13显示了时序。

RA生态工作室

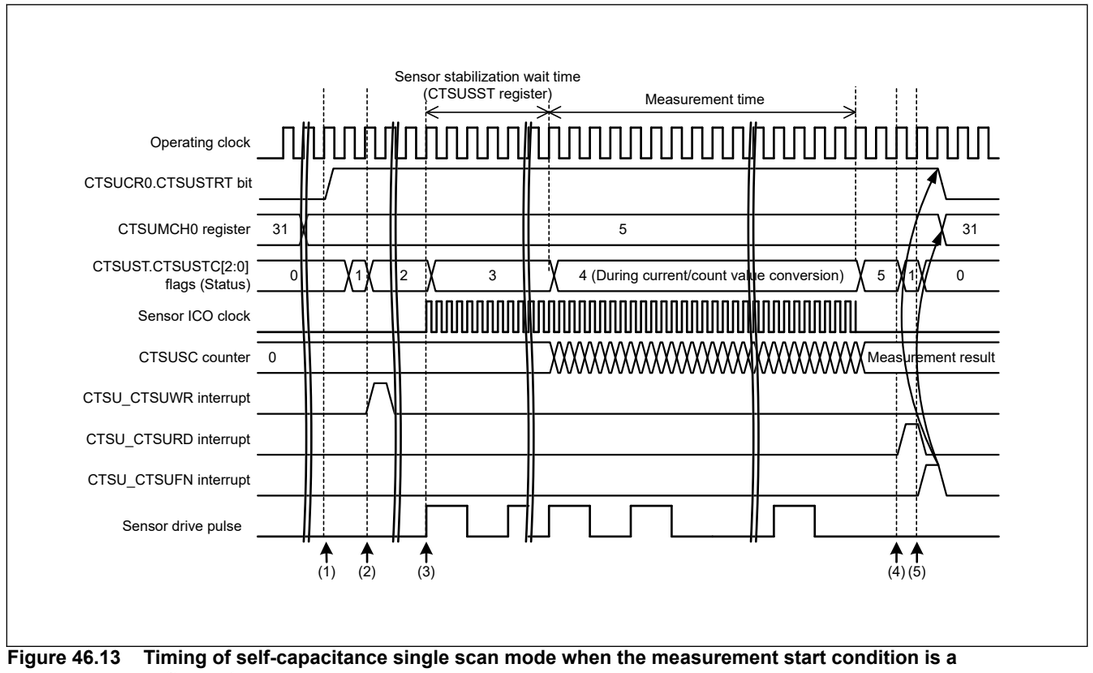

Figure 46.13 Timing of self-capacitance single scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 46.13.

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and reference ICO clock operate.
4. After the sensor stabilization wait time and the measurement time elapse, and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. A measurement end interrupt (CTSU_CTSUFN) is output and measurement stops (transition to Status 0).

Table 46.7 lists the touch pin states in self-capacitance single scan mode.

Table 46.7 Touch pin states in self-capacitance single scan mode

Status	Touch pin	
	Measured channel	Non-measured channel
0	Low	Low
1	Low	Low
2	Low	Low
3	Pulse	Low
4	Pulse	Low
5	Low	Low

46.3.2.4 Self-capacitance multi-scan mode operation

In self-capacitance multi-scan mode, electrostatic capacitance on all channels that are specified as measurement targets in the CTSUCHAC0 to CTSUCHAC2 registers is measured sequentially in ascending order. Figure 46.14 shows the software flow and an operation example, and Figure 46.15 shows the timing.

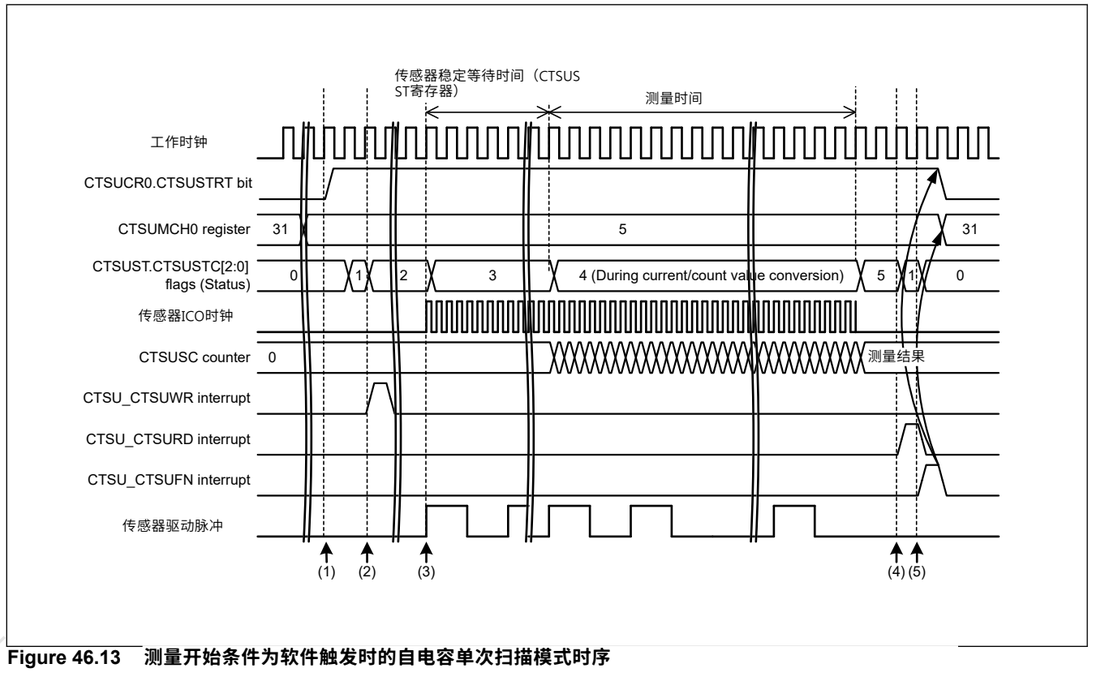

Figure 46.13 测量开始条件为软件触发时的自电容单次扫描模式时序

下面介绍图46.13所示的操作。

1.进行初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。

2、根据预设条件确定待测通道后，输出通道设置请求（CTSU_CTSUWR）。

3.写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。

4.经过传感器稳定等待时间和测量时间后，测量停止，输出测量结果读取请求（CTSU_CTSURD）。

5.输出测量结束中断(CTSU_CTSUFN)并停止测量（转换到状态0）。

表46.7列出了自电容单次扫描模式下的触摸引脚状态。

Table 46.7 自电容单次扫描模式下的触摸引脚状态

Status	触摸针	
	测量通道	Non-measured channel

46.3.2.4 自电容多扫描模式操作

在自电容多重扫描模式下，CTSUCHAC0至CTSUCHAC2寄存器中指定为测量目标的所有通道上的静电电容按升序顺序测量。图46.14显示了软件流程和操作示例，图46.15显示了时序。

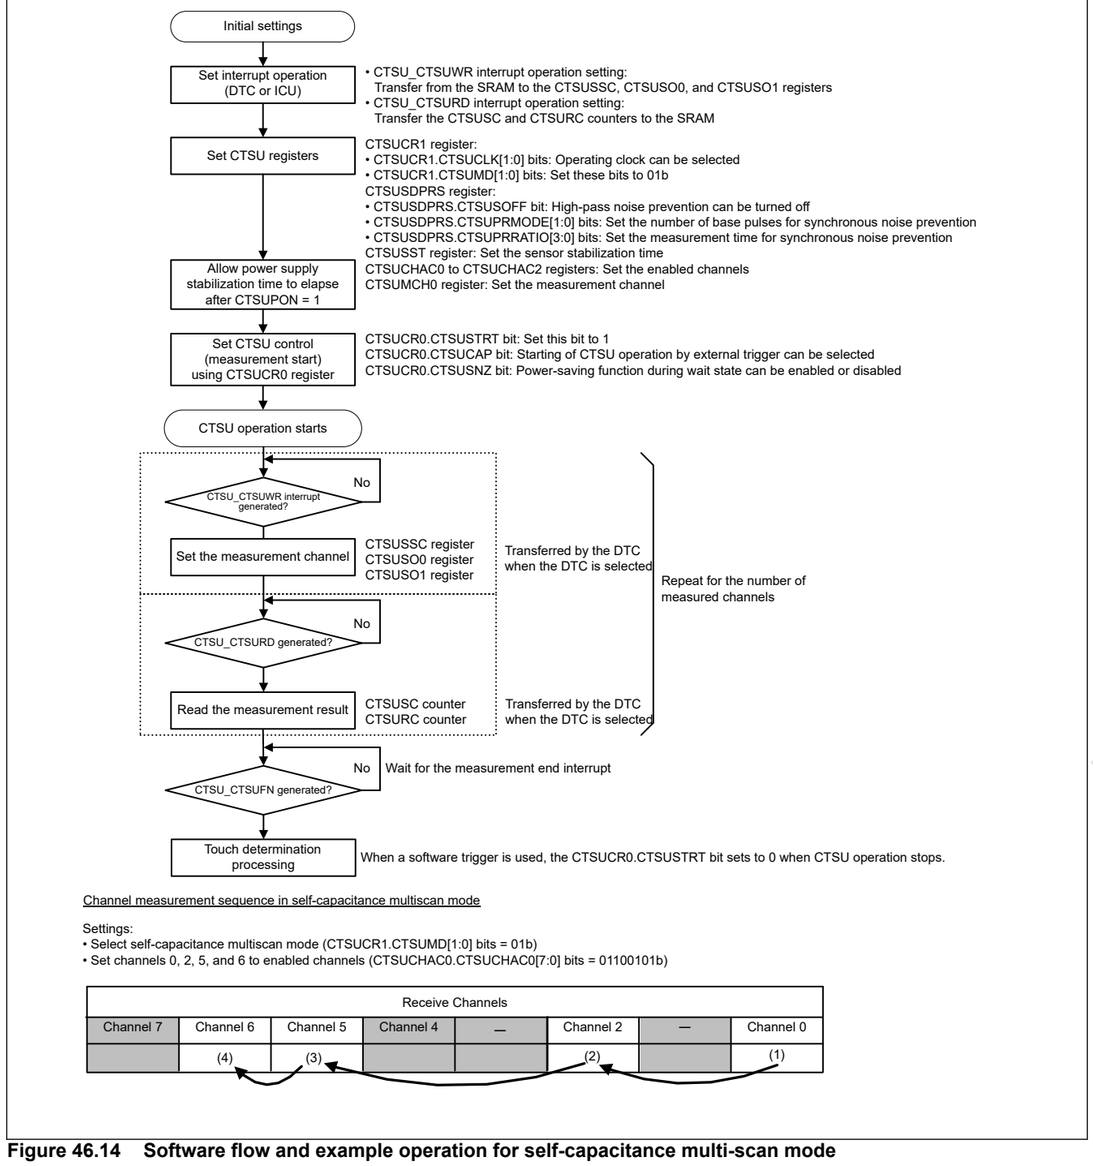

Figure 46.14 Software flow and example operation for self-capacitance multi-scan mode

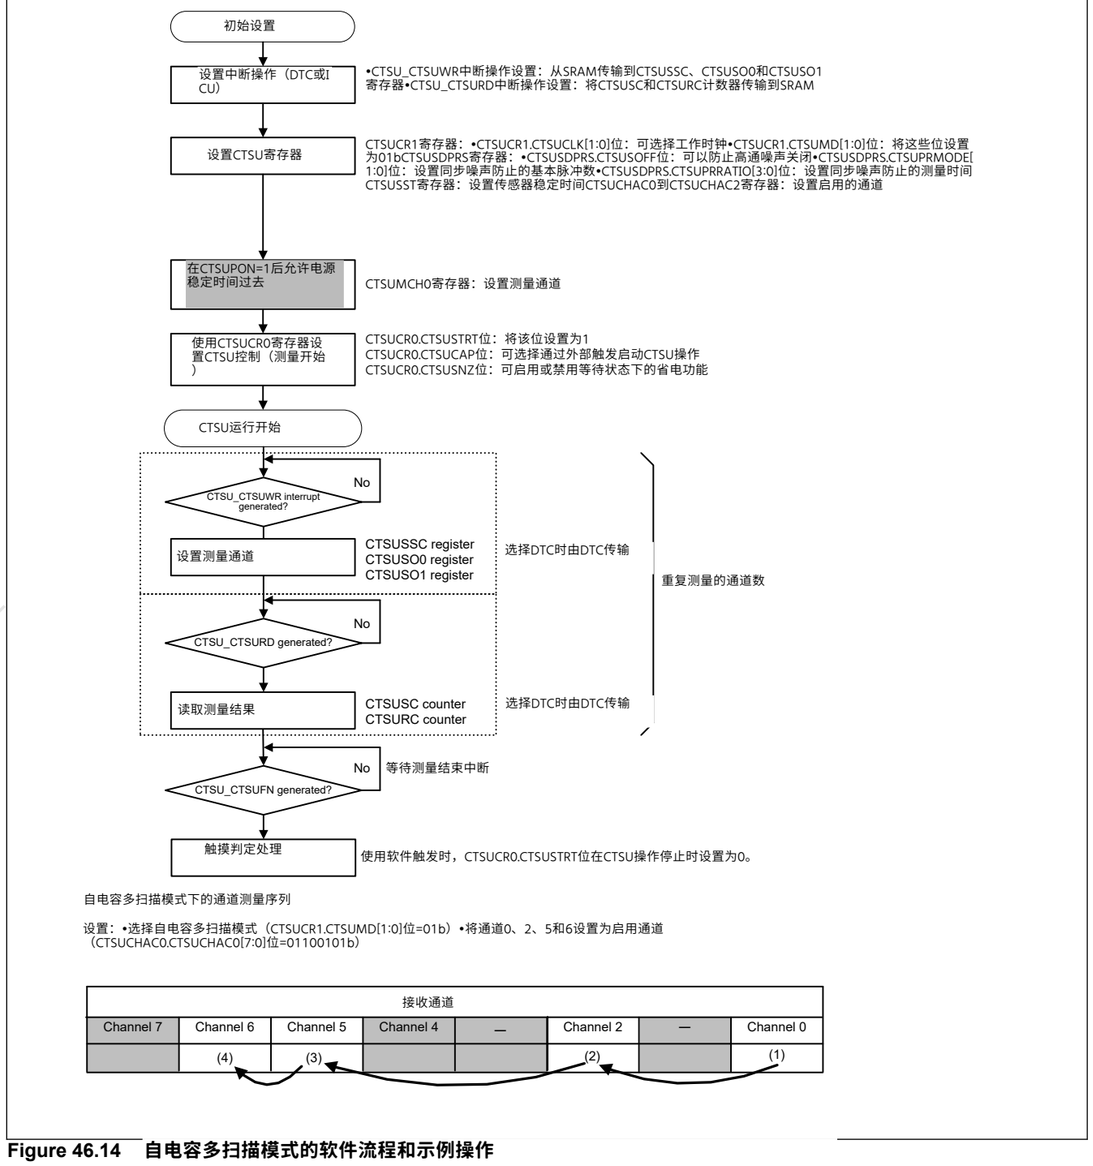

Figure 46.14 自电容多扫描模式的软件流程和示例操作

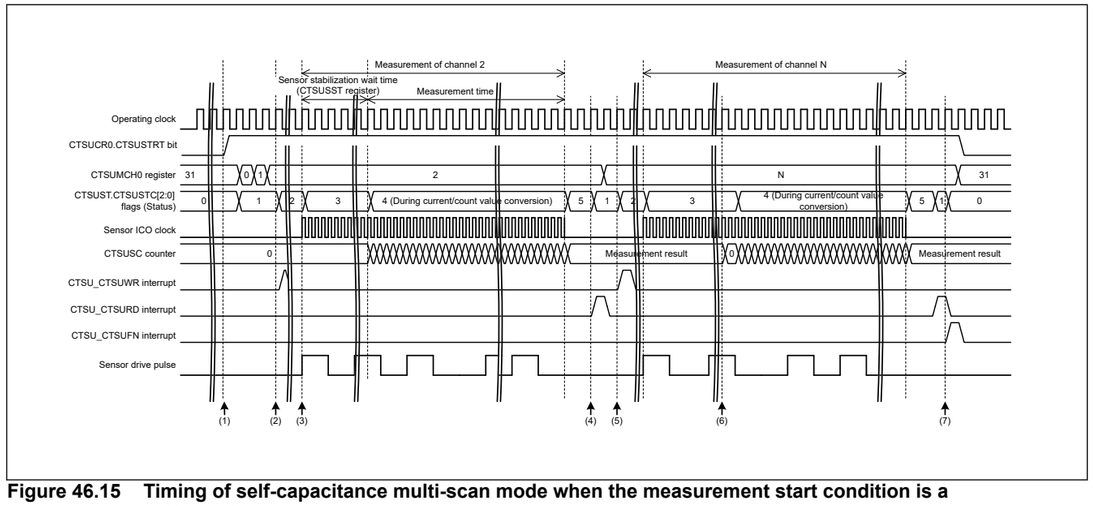

Figure 46.15 Timing of self-capacitance multi-scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 46.15:

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and the reference ICO clock operate.
4. After the sensor stabilization wait time and the measurement time elapse, and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. After the channel to be measured next is determined, a measurement channel setting request (CTSU_CTSUWR) is output.
6. After the stabilization wait time elapses and when the previous measurement is read, the result is cleared and measurement starts.
7. On completion of all measurement channels, a measurement end interrupt (CTSU_CTSUFN) is output and measurement is stopped (transition to Status 0).

Table 46.8 lists the touch pin states in self-capacitance multi-scan mode.

Table 46.8 Touch pin states in self-capacitance multi-scan mode

Status	Touch pin	
	Measured channel	Non-measured channel
0	Low	Low
1	Low	Low
2	Low	Low
3	Pulse	Low
4	Pulse	Low
5	Low	Low

46.3.2.5 Mutual capacitance full scan mode operation

In mutual capacitance full scan mode, measurement is performed during the high-level period of the sensor drive pulse on the receive channel by applying the edge to the target transmit channel to be measured. A single measurement target is measured twice, on the rising and falling edges. The difference between the data of these two measurements determines whether or not the electrode was touched, which results in a higher touch sensitivity.

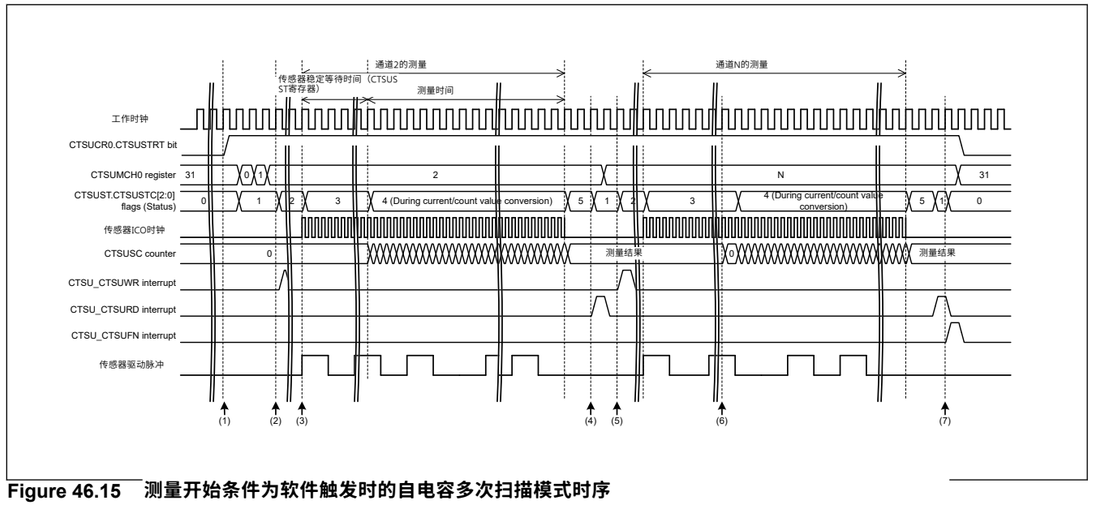

Figure 46.15 测量开始条件为软件触发时的自电容多次扫描模式时序

下面介绍图46.15所示的操作：

1.进行初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。

2、根据预设条件确定待测通道后，输出通道设置请求（CTSU_CTSUWR）。

3.写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。

4.经过传感器稳定等待时间和测量时间后，测量停止，输出测量结果读取请求（CTSU_CTSURD）。

5、确定下一个要测量的通道后，输出测量通道设置请求（CTSU_CTSUWR）。

6.经过稳定等待时间后，当读取前一次测量时，结果被清除并开始测量。

7.所有测量通道完成后，输出测量结束中断(CTSU_CTSUFN)并停止测量（转换到状态0）。

表46.8列出了自电容多扫描模式下的触摸引脚状态。

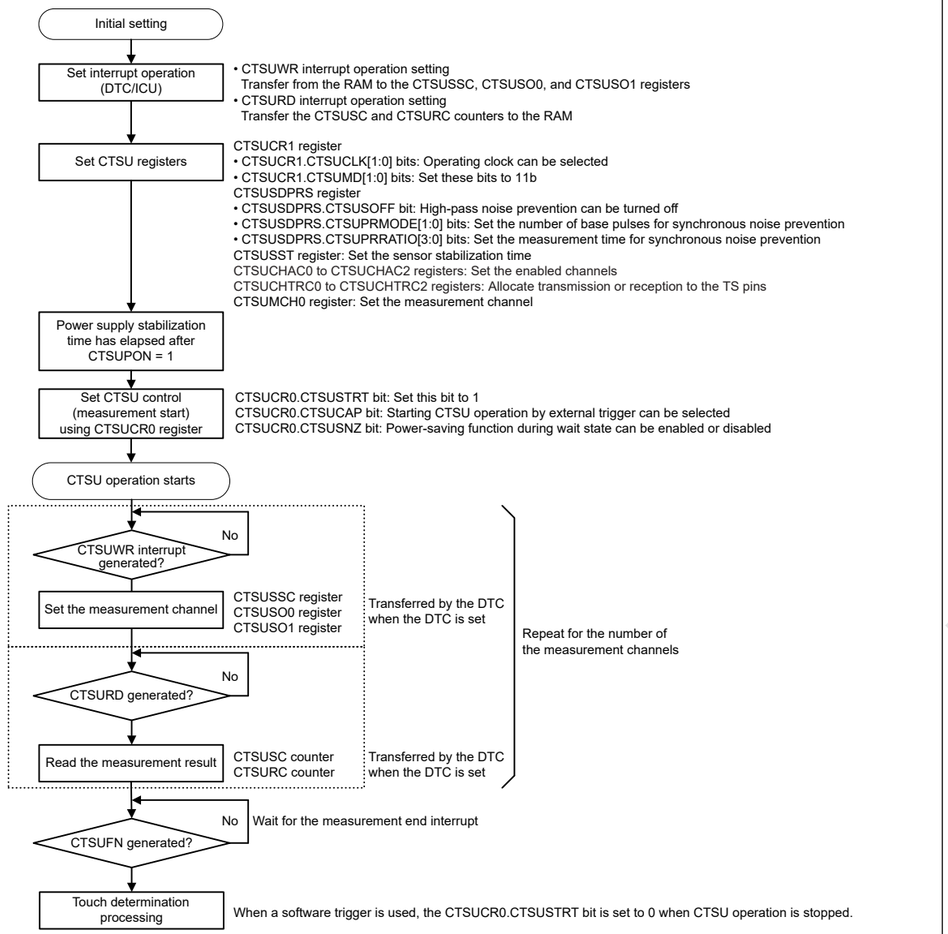
Table 46.8 自电容多扫描模式下的触摸引脚状态

Status	触摸针	
	测量通道	Non-measured channel
0	Low	Low
1	Low	Low
2	Low	Low
3	Pulse	Low
4	Pulse	Low
5	Low	Low

46.3.2.5 互电容全扫描模式操作

在互电容全扫描模式下，在接收通道上的传感器驱动脉冲的高电平期间通过将边沿施加到要测量的目标发送通道来执行测量。在上升沿和下降沿对单个测量目标进行两次测量。这两次测量的数据之间的差异决定了电极是否被触摸，从而导致更高的触摸灵敏度。

Electrostatic capacitance is measured sequentially on channels set to transmission or reception in the CTSUCHTRC0 to CTSUCHTRC2 registers, and specified as measurement targets in the CTSUCHAC0 to CTSUCHAC2 registers. The capacitance is measured by combining these signals. Figure 46.16 shows the software flow and an operation example, and Figure 46.17 shows the timing.



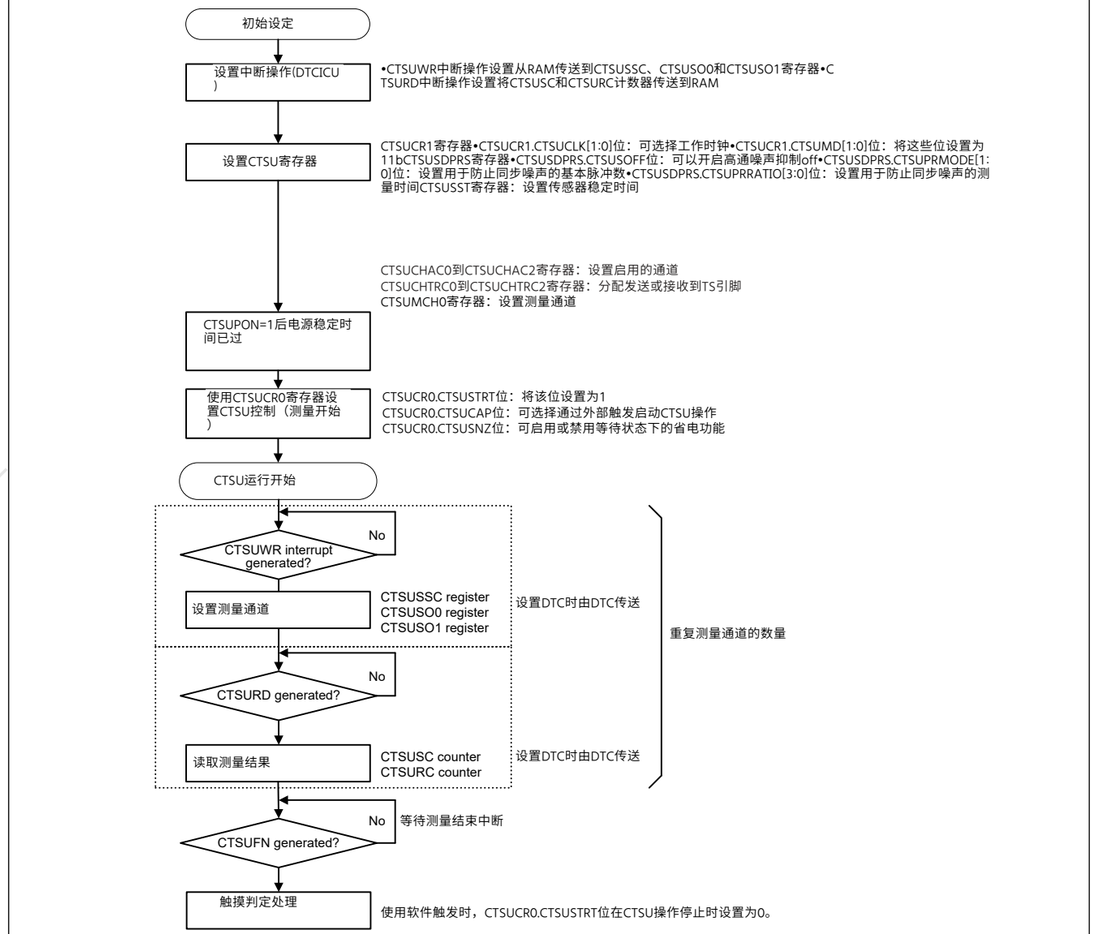
Channel measurement sequence in mutual capacitance full scan mode

Settings:
- Select mutual capacitance full scan mode (CTSUCR1.CTSUMD[1:0] = 11b)
- Set channels 0, 2, 5, and 6 to enabled channels (CTSUCHAC0.CTSUCHAC0[7:0] bits = 01100101b)
- Set channels 0, 2 to receive channels and channels 4 to 7 to transmit channels (CTSUCHTRC0.CTSUCHTRC0[7:0] bits = 11110000b)

		Receive Channels			
		—	Channel 2	—	Channel 0
Transmit channels	Channel 4				
	Channel 5		(3)		(1)
	Channel 6		(4)		(2)
	Channel 7				

Figure 46.16 Software flow and example operation for mutual capacitance full scan mode

在CTSUCHTRC0中设置为发送或接收的通道上依次测量静电电容CTSUCHAC2寄存器，并在CTSUCHAC0至CTSUCHAC2寄存器中指定为测量目标。通过组合这些信号来测量电容。图46.16显示了软件流程和操作示例，图46.17显示了时序。



互电容全扫描模式下的通道测量序列

设置：•选择互电容全扫描模式（CTSUCR1.CTSUMD[1:0]=11b）•将通道0、2、5和6设置为使能通道（CTSUCHAC0.CTSUCHAC0[7:0]位=01100101b）•设置通道0、2用于接收通道，通道4至7用于发送通道（CTSUCHTRC0.CTSUCHTRC0[7:0]位=11110000b）

		接收通道			
		—	Channel 2	—	Channel 0
传输通道	Channel 4				
	Channel 5		(3)		(1)
	Channel 6		(4)		(2)
	Channel 7				

Figure 46.16 互电容全扫描模式的软件流程和示例操作

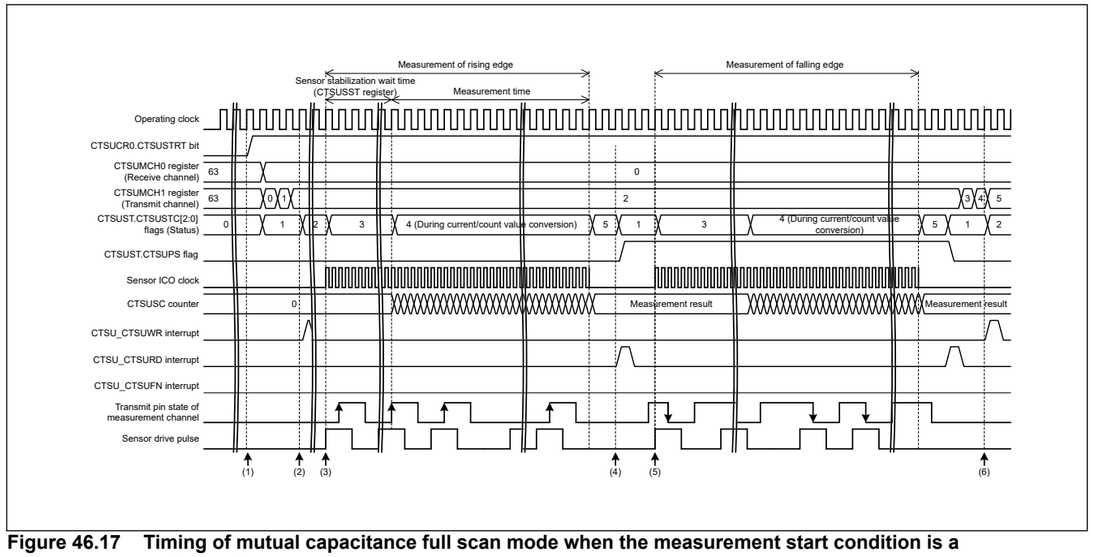


Figure 46.17 Timing of mutual capacitance full scan mode when the measurement start condition is a software trigger

The following describes the operation shown in Figure 46.17

1. After initial settings are made, operation is started by writing 1 to the CTSUCR0.CTSUSTRT bit.
2. After the channel to be measured is determined in accordance with the preset conditions, a request for setting the channel (CTSU_CTSUWR) is output.
3. On completion of writing the measurement channel settings (CTSUSSC, CTSUSO0, and CTSUSO1 registers), the sensor drive pulse is output and the sensor ICO clock and the reference ICO clock operate. At the same time, a pulse detected on the rising edge is output to the transmit pin on the measurement channel during the high-level period of the sensor drive pulse.
4. After the sensor stabilization wait time and the measurement time elapsed and measurement stops, a measurement result read request (CTSU_CTSURD) is output.
5. The same channel is measured by outputting a pulse detected on the falling edge during the high-level period of the sensor drive pulse.
6. After the same channel is measured twice, the channel to be measured next is determined and measured in the same way.
7. On completion of all measurement channels, a measurement end interrupt (CTSU_CTSUFN) is output and measurement stops (transition to Status 0).

The mutual capacitance measurement status flag (CTSUST.CTSUPS bit) changes when Status 5 transitions to Status 1. Table 46.9 lists the touch pin states in mutual capacitance full scan mode.

Table 46.9 Touch pin states in mutual capacitance full scan mode (1 of 2)

Status	Touch pins for receive channels		Touch pins for transmit channels		Remarks
	Measured channel	Non-measured channel	Measured channel	Non-measured channel	
0	Low	Low	Low	Low	—
1	Low	Low	Low/high	Low	—
2	Low	Low	Low	Low	—
3	Pulse	Low	Pulse	Low	The phase pulse is the same as that of the receive channel on the first measurement and opposite on the second measurement.
4	Pulse	Low	Pulse	Low	—

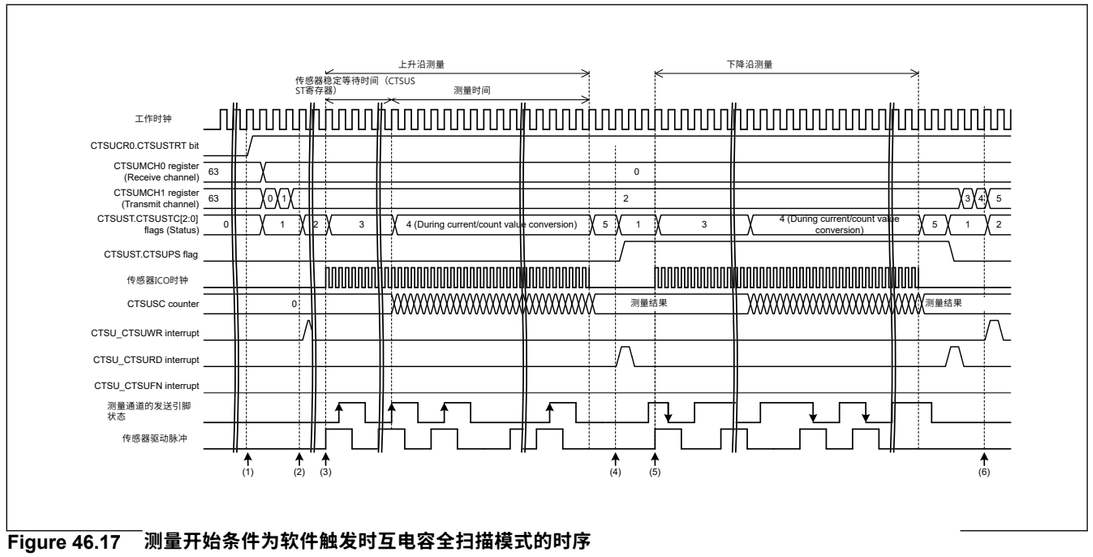

Figure 46.17 测量开始条件为软件触发时互电容全扫描模式的时序

下面介绍图46.17所示的操作

1.进行初始设置后，通过向CTSUCR0.CTSUSTRT位写入1开始操作。

2、根据预设条件确定待测通道后，输出通道设置请求（CTSU_CTSUWR）。

3.写入测量通道设置（CTSUSSC、CTSUSO0和CTSUSO1寄存器）完成后，输出传感器驱动脉冲，传感器ICO时钟和参考ICO时钟运行。同时，在传感器驱动脉冲的高电平期间，将在上升沿检测到的脉冲输出到测量通道的发送引脚。

4.在传感器稳定等待时间和测量时间过去并停止测量后，输出测量结果读取请求（CTSU_CTSURD）。

5.通过在传感器驱动脉冲的高电平期间输出下降沿检测到的脉冲来测量同一通道。

6、同一个通道测量两次后，确定下一个要测量的通道，用同样的方法测量。

7.所有测量通道完成后，输出测量结束中断(CTSU_CTSUFN)并停止测量（转换到状态0）。

互电容测量状态标志（CTSUST.CTSUPS位）在状态5转换为状态1时发生变化。
表46.9列出了互电容全扫描模式下的触摸引脚状态。

Table 46.9 互电容全扫描模式下的触摸引脚状态（1of2）

Status	接收通道的触摸引脚		用于传输通道的触摸引脚		Remarks

46.3.3 Parameters Common to Multiple Modes

46.3.3.1 Sensor stabilization wait time and measurement time

Figure 46.18 shows the timing of the sensor stabilization wait and measurement.

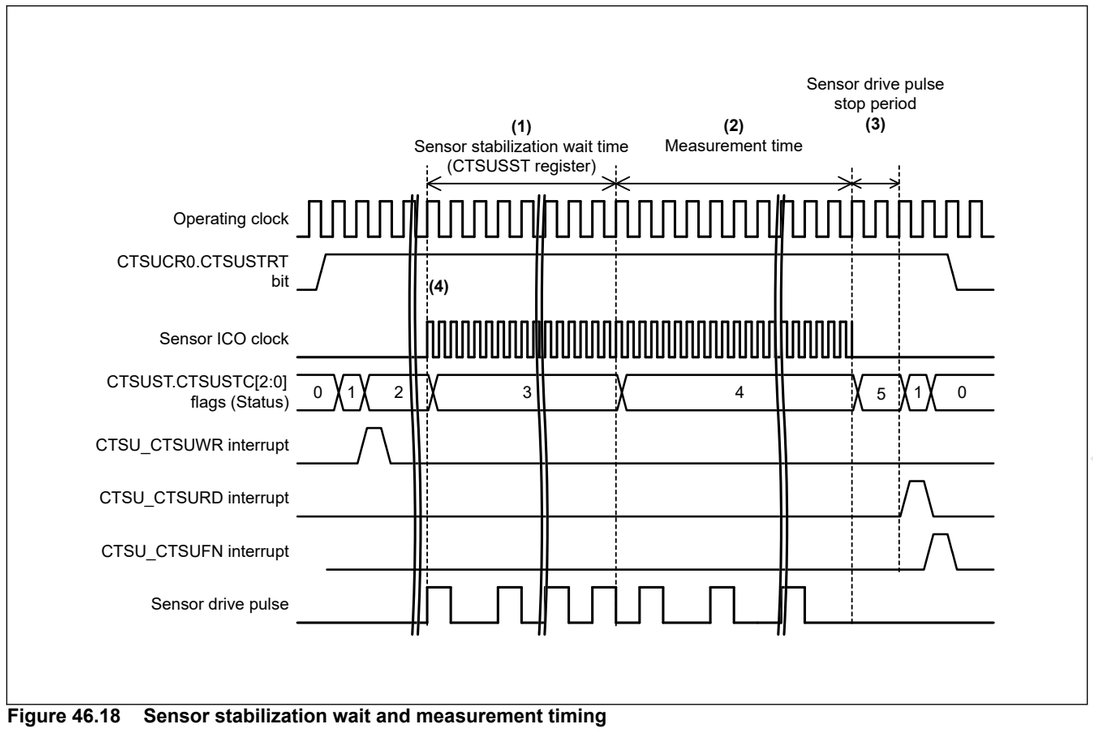

Figure 46.18 Sensor stabilization wait and measurement timing

The following describes the operation shown in Figure 46.18:

1. In response to the CTSU_CTSUWR interrupt request, output of the sensor drive pulse is started by a write access to the CTSUSO1 register. The CTSU waits for the stabilization time set in the CTSUSST register.
2. When the sensor stabilization time elapses and the CTSUST.CTSUDTSR flag clears to 0, measurement starts on transition to Status 4. The measurement time is determined by the base clock cycle setting and the CTSUSDPRS.CTSUPRMODE[1:0], CTSUPRRATIO[3:0], and CTSUSO0.CTSUSNUM[5:0] bits. When the measurement time elapses, measurement of the channel stops.
3. After the measurement time elapses, the status transitions to Status 1 after two operating clock cycles, and a CTSU_CTSURD interrupt occurs. Read the data from the CTSUSC and CTSURC counters. At this time, the sensor drive pulse is output at the low level. When measurement of all specified channels is completed, the CTSUCR0.CTSUSTRT bit clears to 0.
4. The sensor ICO clock oscillates while the CTSUST.CTSUSTC[2:0] flags = 011b (Status 3) or 100b (Status 4).

Table 46.9 互电容全扫描模式下的触摸引脚状态（2个中的2个）

Status	接收通道的触摸引脚		用于传输通道的触摸引脚		Remarks
	测量通道	Non-measured channel	测量通道	Non-measured channel	
5	Low	Low	Low	Low	—

46.3.3 多种模式共有的参数

46.3.3.1 传感器稳定等待时间和测量时间

图46.18显示了传感器稳定等待和测量的时序。

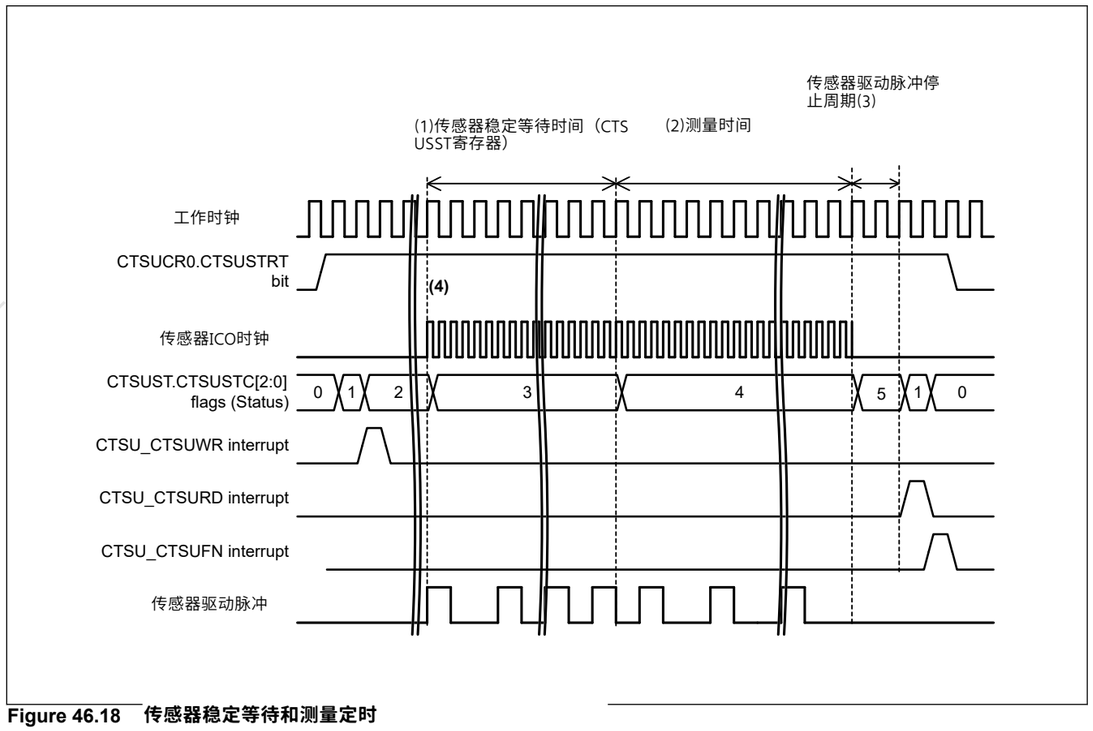

Figure 46.18 传感器稳定等待和测量定时

下面介绍图46.18所示的操作：

1.响应CTSU_CTSUWR中断请求，通过对CTSUSO1寄存器的写访问开始输出传感器驱动脉冲。CTSU等待CTSUSST寄存器中设置的稳定时间。

2.当传感器稳定时间过去且CTSUST.CTSUDTSR标志清除为0时，测量开始转换到状态4。测量时间由基本时钟周期设置和CTSUSDPRS.CTSUPRMODE[1:0]、CTSUPRATIO[3:0]和CTSUSO0.CTSUSNUM[5:0]位。当测量时间过去时，通道的测量将停止。

3.测量时间过去后，状态会在两个工作时钟周期后转换为状态1，并且
CTSU_CTSURD中断发生。从CTSUSC和CTSURC计数器读取数据。此时，传感器驱动脉冲输出为低电平。
完成所有指定通道的测量后，CTSUCR0.CTSUSTRT位清零。

4.传感器ICO时钟在CTSUST.CTSUSTC[2:0]标志=011b（状态3）或100b（状态4）时振荡。

RA生态工作室

46.3.3.2 Interrupts

The CTSU supports the following interrupts:

- Write request interrupt for setting registers for each channel (CTSU_CTSUWR)
- Measurement data transfer request interrupt (CTSU_CTSURD)
- Measurement end interrupt (CTSU_CTSUFN)

(1) Write request interrupt for setting registers for each channel (CTSU_CTSUWR)

Store the settings for each measurement channel in the SRAM, and set up the DTC or ICU transfer associated with the CTSU_CTSUWR interrupt in advance. The CTSU_CTSUWR interrupt is output when Status 1 transitions to Status 2. Write the settings for the selected channel from the SRAM to the CTSUSSC, CTSUSO0, and CTSUSO1 registers (Figure 46.19). Because write access to the CTSUSO1 register controls the transition to the next status, you must set this register last.

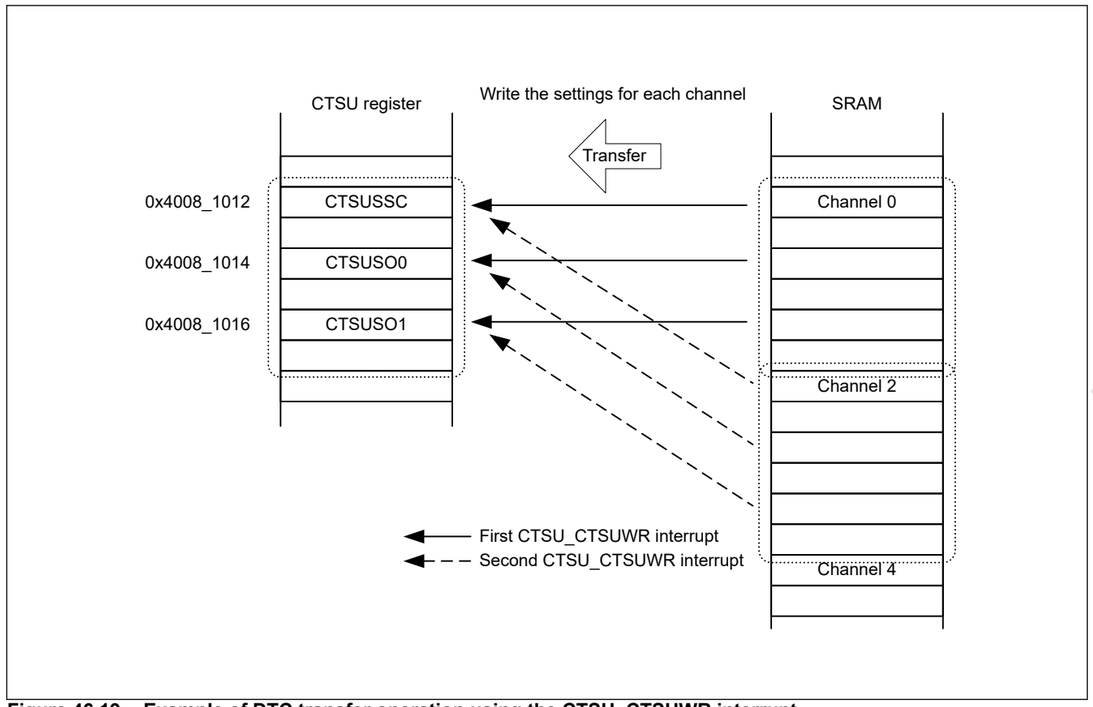

Figure 46.19 Example of DTC transfer operation using the CTSU_CTSUWR interrupt

The registers to be set (CTSUSSC, CTSUSO0, and CTSUSO1) are allocated at sequential addresses. On CTSU_CTSUWR interrupt generation, set up the operation as follows:

- Transfer destination address: CTSUSSC register address
- Handling at the transfer destination address: Transfer 2-byte data three times with a single interrupt. The address of the start byte is fixed.
- Transfer source address: CTSUSSC register data storage address for the lowest number channel in the settings stored in the SRAM
- Handling at the transfer source address: Transfer 2-byte data three times with a single interrupt. The address of the first byte is continued from the previous interrupt handling.
- Number of transfers per interrupt: Specify the number of measurements.

46.3.3.2 Interrupts

CTSU支持以下中断：

●各通道设置寄存器的写请求中断(CTSU_CTSUWR)

●测量数据传输请求中断（CTSU_CTSURD）

●测量结束中断（CTSU_CTSUFN）

(1) 为每个通道设置寄存器的写请求中断(CTSU_CTSUWR)

将每个测量通道的设置存储在SRAM中，并提前设置与CTSU_CTSUWR中断相关的DTC或ICU传输。当状态1转换到状态2时输出CTSU_CTSUWR中断。

将所选通道的设置从SRAM写入CTSUSSC、CTSUSO0和CTSUSO1寄存器（图46.19）。因为对CTSUSO1寄存器的写访问控制到下一个状态的转换，所以您必须最后设置该寄存器。

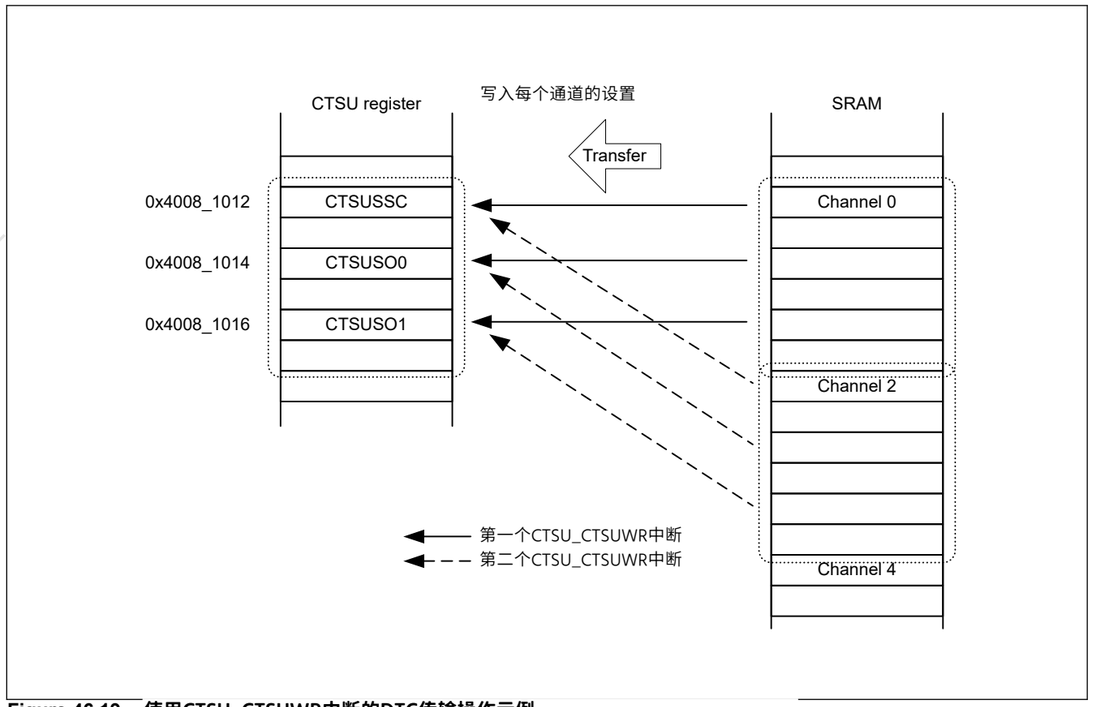

Figure 46.19 使用CTSU_CTSUWR中断的DTC传输操作示例

要设置的寄存器（CTSUSSC、CTSUSO0和CTSUSO1）分配在顺序地址。在产生CTSU_CTSUWR中断时，按如下方式设置操作：

●传输目标地址：CTSUSSC寄存器地址

●在传送目标地址处处理：一次中断传送3次2字节数据。起始字节的地址是固定的。

●传输源地址：CTSUSSC寄存器数据存储地址，用于存储在SRAM中的设置中的最低编号通道

●在传输源地址处处理：一次中断传输3次2字节数据。第一个字节的地址从先前的中断处理继续。

●每个中断的传输次数：指定测量次数。

(2) Measurement data transfer request interrupt (CTSU_CTSURD)

Set up the DTC or ICU transfer associated with the CTSU_CTSURD interrupt in advance. The CTSU_CTSURD interrupt is output when Status 5 transitions to Status 1. Read the measurement result from the CTSUSC and CTSURC counters (Figure 46.20).

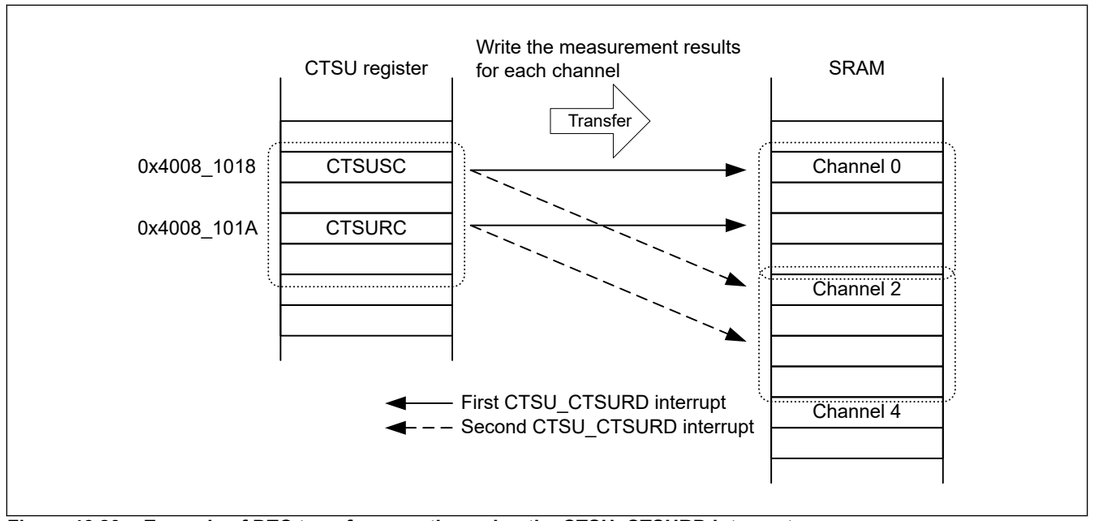

Figure 46.20 Example of DTC transfer operation using the CTSU_CTSURD interrupt

The measurement result registers (CTSUSC and CTSURC counters) used as transfer sources are allocated at sequential addresses. On CTSU_CTSURD interrupt generation, set up the operation as follows:

- Transfer source address: CTSUSC counter address
- Handling at the transfer source address: Transfer 2-byte data twice with a single interrupt. The start address is fixed.
- Transfer destination address: CTSUSC counter data storage address for the lowest number channel in the settings stored in the SRAM
- Handling at the transfer destination address: Transfer 2-byte data twice with a single interrupt. The start address is continued from the previous interrupt handling.
- Number of transfers per interrupt: Specify the number of measurements.

(3) Measurement end interrupt (CTSU_CTSUFN)

When all channels are measured, an interrupt occurs when Status 1 transitions to Status 0. In the software, check the overflow flags (CTSUST.CTSUSOVF and CTSUROVF) and read the measurement results to determine whether or not the electrode was touched. Interrupt requests are accepted or disabled in the interrupt control block.

46.4 Usage Notes

46.4.1 Measurement Result Data (CTSUSC and CTSURC Counters)

Read access during measurement is prohibited. If the measurement result data is accessed, an incorrect value might be read because of asynchronous operation.

46.4.2 Constraint on Software Trigger

When 10b (PCLKB/4) is selected in the CTSUCR1.CTSUCLK[1:0] bits, to restart measurement by writing 1 to the CTSUR0.CTSUSTRT bit after measurement is complete, wait for at least 3 cycles to elapse after an interrupt occurs, and then write to the CTSUCR0.CTSUSTRT bit.

(2) 测量数据传输请求中断(CTSU_CTSURD)

提前设置与CTSU_CTSURD中断相关的DTC或ICU传输。当状态5转换为状态1时输出CTSU_CTSURD中断。从CTSUSC和CTSURC计数器读取测量结果（图46.20）。

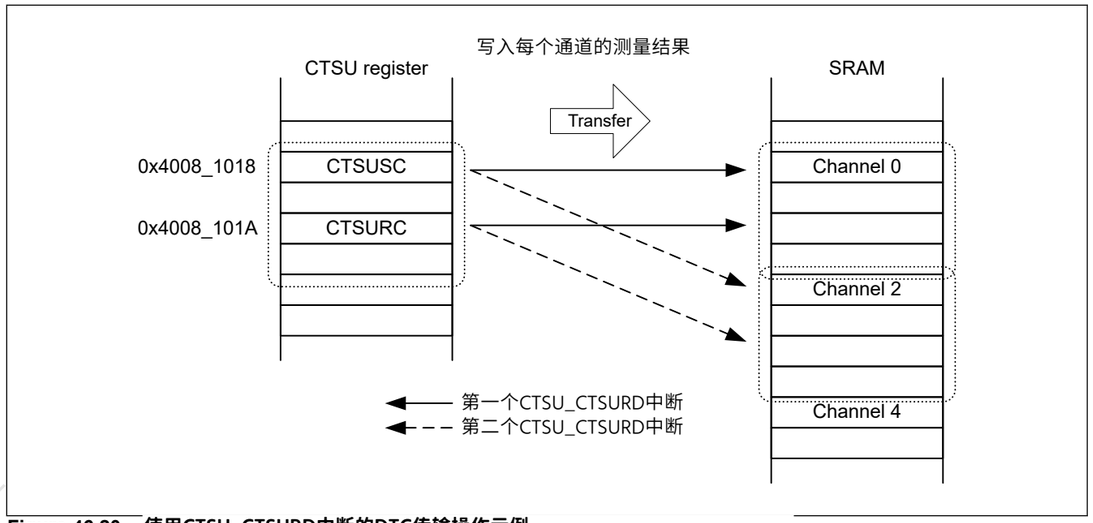

Figure 46.20 使用CTSU_CTSURD中断的DTC传输操作示例

用作传输源的测量结果寄存器（CTSUSC和CTSURC计数器）按顺序分配。在CTSU_CTSURD中断生成时，按如下方式设置操作：

●传输源地址：CTSUSC计数器地址

●在传输源地址处处理：一次中断传输2字节数据两次。起始地址是固定的。

●传输目标地址：SRAM中存储的设置中编号最小的通道的CTSUSC计数器数据存储地址

●传送目标地址处的处理：一次中断传送2字节数据两次。起始地址从先前的中断处理继续。

●每个中断的传输次数：指定测量次数。

(3) 测量结束中断(CTSU_CTSUFN)

测量所有通道时，状态1转换为状态0时发生中断。在软件中，检查溢出标志（CTSUST.CTSUSOVF和CTSUROVF）并读取测量结果以确定电极是否被触摸。在中断控制块中接受或禁用中断请求。

46.4 使用说明

46.4.1 测量结果数据（CTSUSC和CTSURC计数器）

禁止在测量期间进行读取访问。如果访问测量结果数据，可能会因为异步操作而读取到不正确的值。

46.4.2 软件触发约束

当在CTSUCR1.CTSUCLK[1:0]位中选择10b(PCLKB4)时，通过将1写入
测量完成后CTSUR0.CTSUSTRT位，在发生中断后至少等待3个周期，然后写入CTSUCR0.CTSUSTRT位。

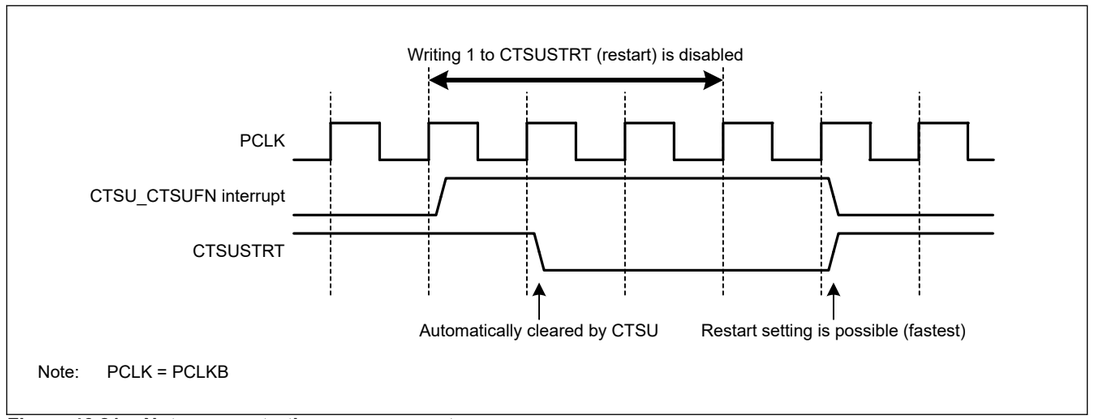

Figure 46.21 Notes on restarting measurement

46.4.3 Constraints on External Triggers

- If an external trigger is input during the measurement time, measurement does not start. The next external event is enabled after 1 cycle of the operating clock when a CTSU_CTSUFN interrupt occurs.
- To stop external trigger mode, write 0 to the CTSUCR0.CTSUSTRT bit and 0 to the CTSUCR0.CTSUINIT bit at the same time (forced stop).

46.4.4 Constraints on Forced Stops

To force the current operation to stop, write 0 to the CTSUCR0.CTSUSTRT bit and 1 to the CTSUCR0.CTSUINIT bit at the same time. After this setting, the operation is stopped and the internal control registers are initialized.

When the CTSUCR0.CTSUINIT bit is used for initialization, the following registers are initialized in addition to the initialization of the internal measurement state.

- CTSUMCH0 register
- CTSUMCH1 register
- CTSUST register
- CTSUSC counter
- CTSURC counter

If operation is forced to stop, an interrupt request might be generated depending on the internal state. After a forced stop, also perform the processing for stopping and disabling the DTC or ICU. If a DTC transfer is stopped in an installed system for some reason, also perform the processing for forcing stop to and initializing the CTSU.

46.4.5 TSCAP Pin

The TSCAP pin requires an external decoupling capacitor to stabilize CTSU internal voltage. The traces between the TSCAP pin and the capacitor, and the capacitor and ground should be as short and wide as physically possible.

The capacitor connected to the TSCAP pin should be fully discharged using I/O port control to output a low level, before turning on the switch (CTSUCR1.CTSUCSW bit = 1) to establish a connection.

46.4.6 Constraints on Measurement Operation (CTSUCR0.CTSUSTRT Bit = 1)

During measurement (CTSUCR0.CTSUSTRT bit = 1), do not use the settings for stopping the peripheral clock or changing the port settings related to the touch pins (TSn and TSCAP pins) and Transmission power supply selection (CTSUCR0.CTSUTXVSEL) in the higher layers of the system.

If control settings non-compliant with these constraints are made, operation is forced to stop (CTSUCR0.CTSUSTRT bit = 0 and CTSUCR0.CTSUINIT bit = 1), write 0 to the CTSUCR1.CTSUPON bit and 0 to the CTSUCR1.CTSUCSW bit at the same time, and set the CTSUCR0.CTSUSNZ bit to 0. Next, restart from the initial settings flow shown in Figure 46.9.

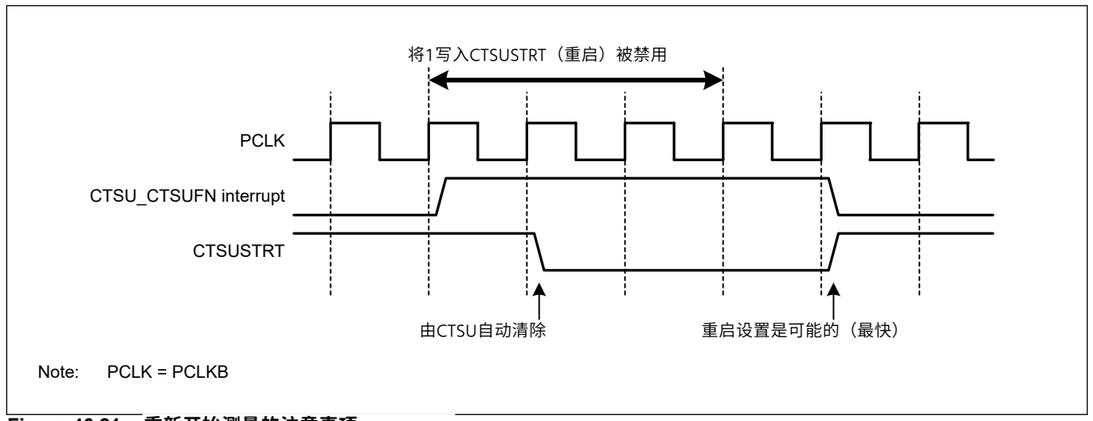

Figure 46.21 重新开始测量的注意事项

46.4.3 外部触发器的约束

●如果在测量期间输入了外部触发，则测量不会开始。当CTSU_CTSUFN中断发生时，下一个外部事件在工作时钟的1个周期后启用。

●要停止外部触发模式，同时将0写入CTSUCR0.CTSUSTRT位和0写入CTSUCR0.CTSUINIT位（强制停止）。

46.4.4 强制停止的约束

要强制停止当前操作，请同时向CTSUCR0.CTSUSTRT位写入0，向CTSUCR0.CTSUINIT位写入1。设置完成后，操作停止，内部控制寄存器初始化。

当CTSUCR0.CTSUINIT位用于初始化时，除了内部测量状态的初始化之外，还初始化以下寄存器。

- CTSUMCH0 register
- CTSUMCH1 register
- CTSUST register
- CTSUSC counter
- CTSURC counter

如果操作被强制停止，根据内部状态可能会产生中断请求。强制停止后，还要执行停止和禁用DTC或ICU的处理。如果由于某种原因在已安装的系统中停止了DTC传输，则还要执行强制停止和初始化CTSU的处理。

46.4.5 TSCAP Pin

TSCAP引脚需要一个外部去耦电容来稳定CTSU内部电压。之间的痕迹
TSCAP引脚和电容器，以及电容器和地线应尽可能短且宽。

在打开开关（CTSUCR1.CTSUCSW位=1）建立连接之前，应使用IO端口控制将连接到TSCAP引脚的电容器完全放电以输出低电平。

46.4.6 测量操作的限制（CTSUCR0.CTSUSTRT位=1）

在测量期间（CTSUCR0.CTSUSTRT位=1），请勿使用与触摸引脚（TSn和TSCAP引脚）和发送电源选择（CTSUCR0.CTSUTXVSEL）相关的端口设置停止外围时钟或更改高位系统的层次。

如果进行了不符合这些约束的控制设置，则强制停止操作（CTSUCR0.CTSUSTRT位=0且CTSUCR0.CTSUINIT位=1），将0写入CTSUCR1.CTSUPON位并将0写入CTSUCR1.CTSUCSW位同时，将CTSUCR0.CTSUSNZ位设置为0。接下来，从图46.9所示的初始设置流程重新启动。

47. Data Operation Circuit (DOC)

47.1 Overview

The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. When a selected condition applies, 16-bit data is compared and an interrupt can be generated. Table 47.1 lists the DOC specifications and Figure 47.1 shows a block diagram.

Table 47.1 DOC specifications

Item	Description
Data operation function	16-bit data comparison, addition, and subtraction
Module-stop function	The module-stop state can be set to reduce power consumption.
Interrupts and event link function (DOC_DOPCI)	An interrupt occurs on the following conditions: • The compared values either match or mismatch • The result of data addition is greater than 0xFFFF • The result of data subtraction is less than 0x0000
TrustZone Filter	Security attribution can be set

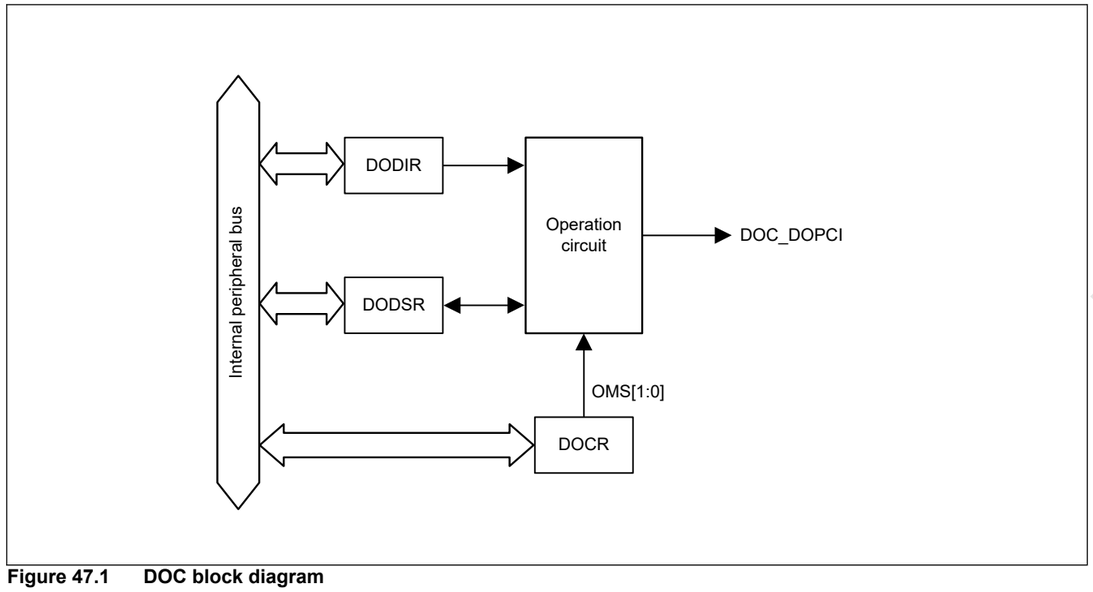

Figure 47.1 DOC block diagram

47.2 DOC Register Descriptions

47.2.1 DOCR : DOC Control Register

Base address: DOC = 0x4010_9000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	DOPCFCL	DOPCF	—	—	DCSEL	OMS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

47. 数据运算电路(DOC)

47.1 Overview

数据运算电路(DOC)对16位数据进行比较、加法和减法。当适用选定条件时，比较16位数据并可以生成中断。表47.1列出了DOC规范，图47.1显示了框图。

Table 47.1 文档规范

Item	Description
数据运算功能	16位数据比较、加法和减法
Module-stop function	可设置模块停止状态以降低功耗。
中断和事件链接功能（DOC_DOPCI）	在以下情况下会发生中断：● 比较的值匹配或不匹配 • 数据相加结果大于0xFFFF • 数据减法结果小于0x0000
TrustZone Filter	可设置安全属性

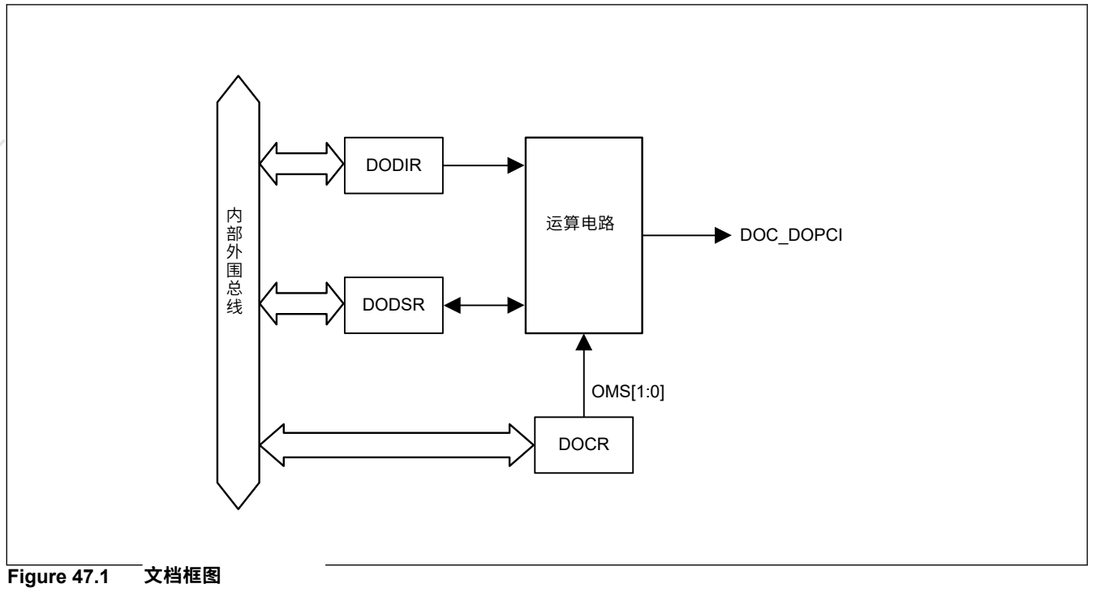

Figure 47.1 文档框图

47.2 DOC寄存器说明

47.2.1 DOCR:DOC控制寄存器

Base address: DOC = 0x4010_9000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	DOPCFCL	DOPCF	—	—	DCSEL	OMS[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	OMS[1:0]	Operating Mode Select 0 0: Data comparison mode 0 1: Data addition mode 1 0: Data subtraction mode 1 1: Setting prohibited	R/W
2	DCSEL*1	Detection Condition Select 0: Set DOPCF flag when data mismatch is detected 1: Set DOPCF flag when data match is detected	R/W
4:3	—	These bits are read as 0. The write value should be 0.	R/W
5	DOPCF	DOC Flag Indicates the result of an operation.	R
6	DOPCFCL	DOPCF Clear 0: Retain DOPCF flag state 1: Clear DOPCF flag	R/W
7	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. Only valid when data comparison mode is selected.

OMS[1:0] bits (Operating Mode Select)

The OMS[1:0] bits select the operating mode of the DOC.

DCSEL bit (Detection Condition Select)

The DCSEL bit selects the detection condition in data comparison mode. This bit is only valid when data comparison mode is selected.

DOPCF flag (DOC Flag)

The DOPCF flag indicates the result of an operation.

[Setting conditions]

- The result of data comparison matches the condition selected in the DCSEL bit
- A data addition result is greater than 0xFFFF
- A data subtraction result is less than 0x0000

[Clearing condition]

- Writing 1 to the DOPCFCL bit

DOPCFCL bit (DOPCF Clear)

Setting the DOPCFCL bit to 1 clears the DOPCF flag. This bit is read as 0.

47.2.2 DODIR : DOC Data Input Register

Base address: DOC = 0x4010_9000

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	It stores 16-bit data used in the operations.	R/W

Bit	Symbol	Function	R/W
1:0	OMS[1:0]	操作模式选择 00：数据比较模式01：数据加法模式10：数据减法模式11：禁止设置	R/W
2	DCSEL*1	检测条件选择 0：检测到数据不匹配时设置DOPCF标志1：检测到数据匹配时设置DOPCF标志	R/W
4:3	—	这些位被读取为0。写入值应为0。	R/W
5	DOPCF	文档标志 表示操作的结果。	R
6	DOPCFCL	DOPCF Clear 0：保持DOPCF标志状态1：清除DOPCF标志	R/W
7	—	这些位被读取为0。写入值应为0。	R/W

注1.仅在选择数据比较模式时有效。

OMS[1:0]位（操作模式选择）

OMS[1:0]位选择DOC的工作模式。

DCSEL位（检测条件选择）

DCSEL位选择数据比较模式下的检测条件。该位仅在选择数据比较模式时有效。

DOPCF flag (DOC Flag)

DOPCF标志指示操作的结果。

[Setting conditions]

●数据比较的结果符合DCSEL位中选择的条件

●数据相加结果大于0xFFFF

●数据减法结果小于0x0000

[Clearing condition]

●DOPCFCL位写1

DOPCFCL bit (DOPCF Clear)

将DOPCFCL位设置为1会清除DOPCF标志。该位读为0。

47.2.2 DODIR:DOC数据输入寄存器

Base address: DOC = 0x4010_9000

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	它存储操作中使用的16位数据。	R/W

47.2.3 DODSR : DOC Data Setting Register

Base address: DOC = 0x4010_9000

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	It stores 16-bit data used as a reference in data comparison mode. This register also stores the results of operations in data addition and subtraction modes.	R/W

47.3 Operation

47.3.1 Data Comparison Mode

Figure 47.2 shows an example operation in data comparison mode operation by the DOC. The following sequence is an example operation when DCSEL is set to 0 (data mismatch is detected as a result of data comparison):

1. Write 00b to the DOCR.OMS[1:0] bits to select data comparison mode.
2. Set 16-bit reference data in DODSR.
3. Write the 16-bit data for comparison to DODIR.
4. Continue writing the 16-bit data until all data for comparison is written to DODIR.
5. If a value written to DODIR does not match that in DODSR, the DOCR.DOPCF flag is set to 1.

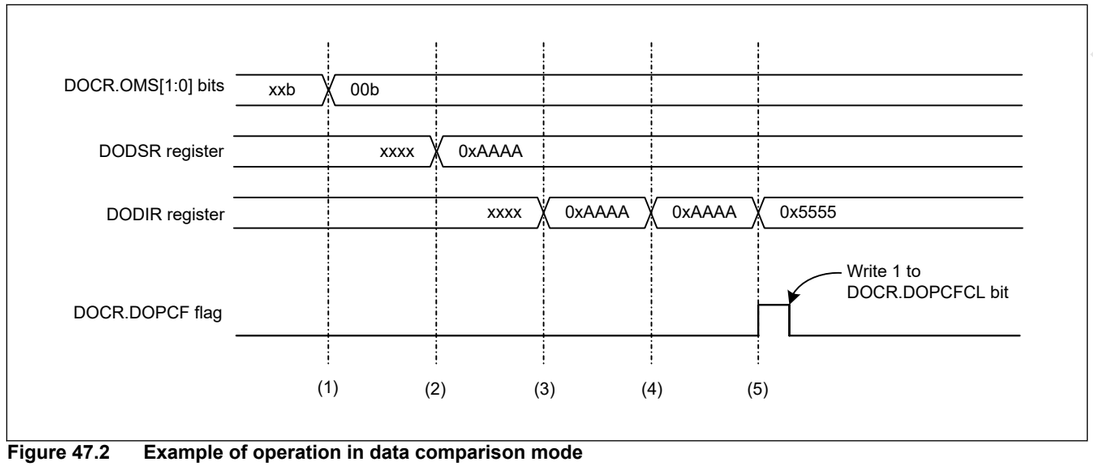

Figure 47.2 Example of operation in data comparison mode

47.3.2 Data Addition Mode

Figure 47.3 shows an example operation in data addition mode. The steps are as follows:

1. Write 01b to the DOCR.OMS[1:0] bits to select data addition mode.
2. Set 16-bit data as the initial value in the DODSR register.
3. Write the 16-bit data to be added to the DODIR register. The result of the operation is stored in the DODSR register.
4. Continue writing the 16-bit data until all data to be added is written to the DODIR.
5. If the result of an operation is greater than 0xFFFF, the DOCR.DOPCF flag is set to 1.

47.2.3 DODSR:DOC数据设置寄存器

Base address: DOC = 0x4010_9000

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	n/a	它存储在数据比较模式中用作参考的16位数据。该寄存器还存储数据加法和减法模式下的运算结果。	R/W

47.3 Operation

47.3.1 数据比较模式

图47.2显示了DOC在数据比较模式操作中的示例操作。以下序列是DCSEL设置为0时的示例操作（通过数据比较检测到数据不匹配）：

1.将00b写入DOCR.OMS[1:0]位以选择数据比较模式。

2.在DODSR中设置16位参考数据。

3.将16位数据写入DODIR进行比较。

4.继续写入16位数据，直到所有用于比较的数据都写入DODIR。

5.如果写入DODIR的值与DODSR中的值不匹配，则DOCR.DOPCF标志设置为1。

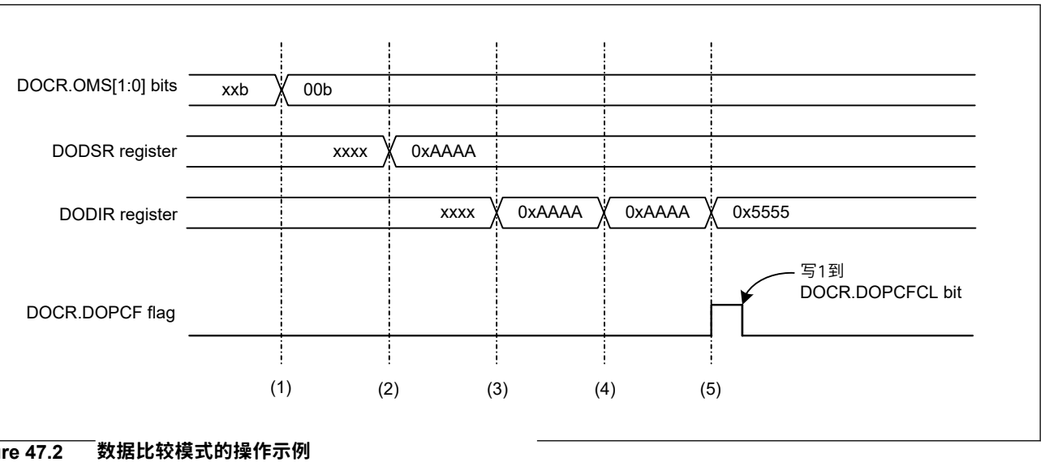

Figure 47.2 数据比较模式的操作示例

47.3.2 数据加法模式

图47.3显示了数据添加模式下的示例操作。步骤如下：

1.将01b写入DOCR.OMS[1:0]位以选择数据添加模式。

2.在DODSR寄存器中设置16位数据作为初始值。

3.将要添加的16位数据写入DODIR寄存器。运算结果存储在DODSR寄存器中。

4.继续写入16位数据，直到所有要添加的数据都写入DODIR。

5.如果运算结果大于0xFFFF，则DOCR.DOPCF标志设置为1。

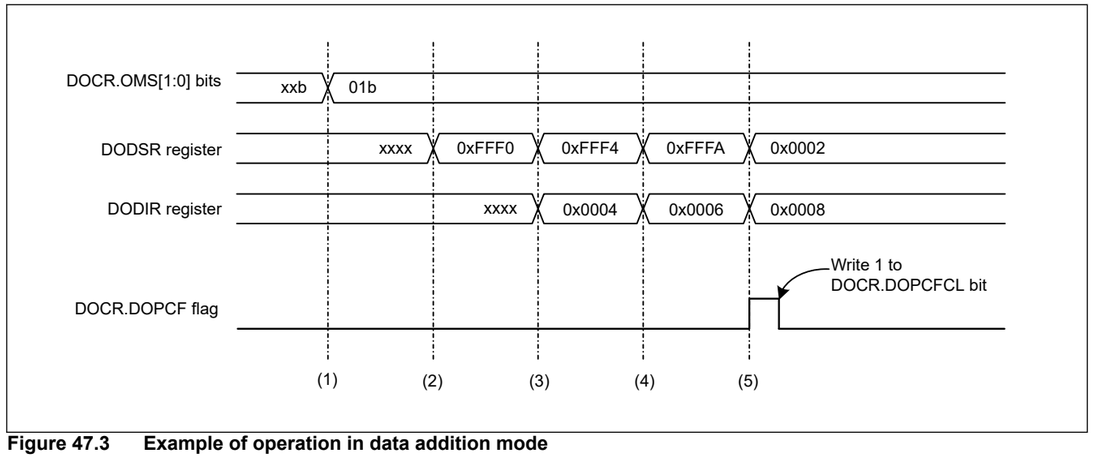

Figure 47.3 Example of operation in data addition mode

47.3.3 Data Subtraction Mode

Figure 47.4 shows an example operation in data subtraction mode. The steps are as follows:

1. Write 10b to the DOCR.OMS[1:0] bits to select data subtraction mode.
2. Set 16-bit data as the initial value in the DODSR register.
3. Write the 16-bit data to be subtracted to the DODIR register. The result of the operation is stored in DODSR.
4. Continue writing the 16-bit data to the DODIR register until all data to be subtracted is written.
5. If the result of an operation is less than 0x0000, the DOCR.DOPCF flag is set to 1.

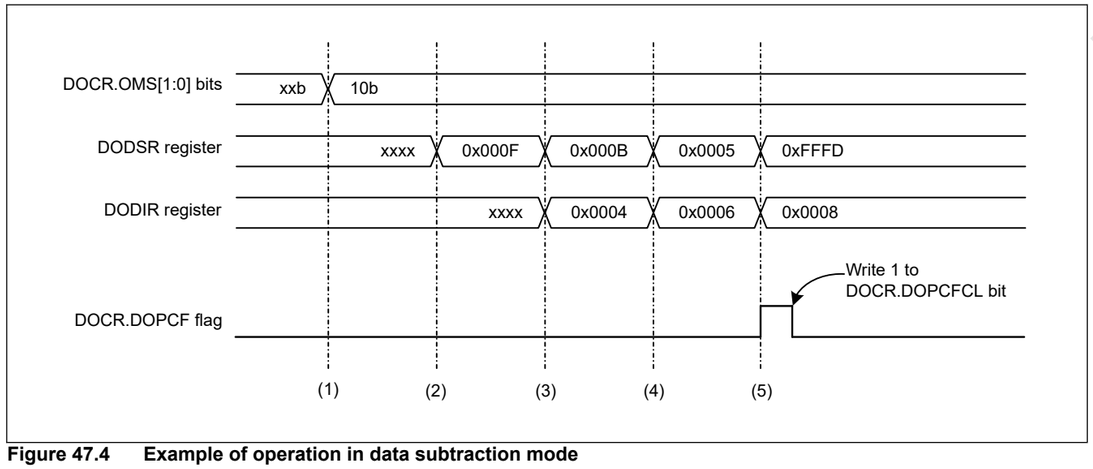

Figure 47.4 Example of operation in data subtraction mode

47.4 Interrupt Source

The DOC generates the DOC interrupt (DOC_DOPCI) as an interrupt request. Table 47.2 describes the DOC interrupt request.

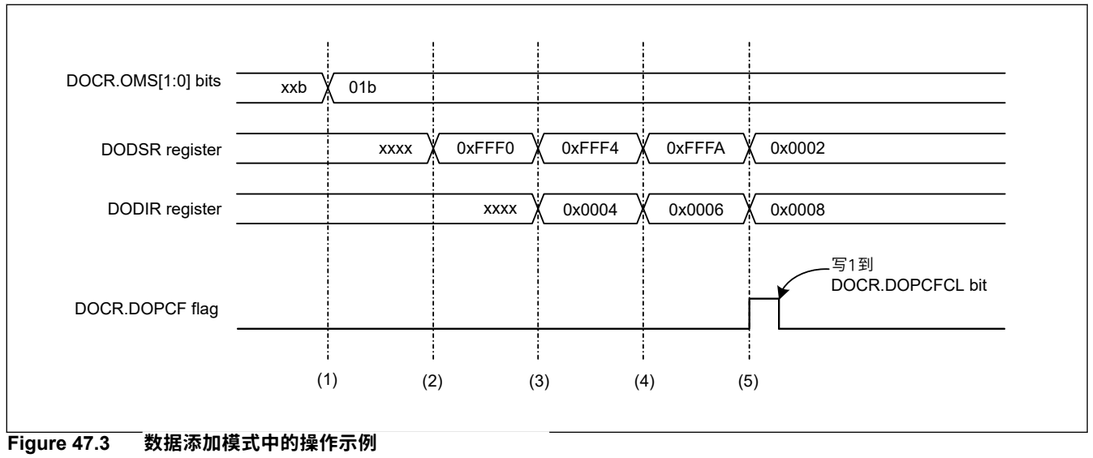

Figure 47.3 数据添加模式中的操作示例

47.3.3 数据减法模式

图47.4显示了数据减法模式下的示例操作。步骤如下：

1.将10b写入DOCR.OMS[1:0]位以选择数据减法模式。

2.在DODSR寄存器中设置16位数据作为初始值。

3.将要减去的16位数据写入DODIR寄存器。操作结果存储在DODSR中。

4.继续将16位数据写入DODIR寄存器，直到写入所有要减去的数据。

5.如果运算结果小于0x0000，则DOCR.DOPCF标志设置为1。

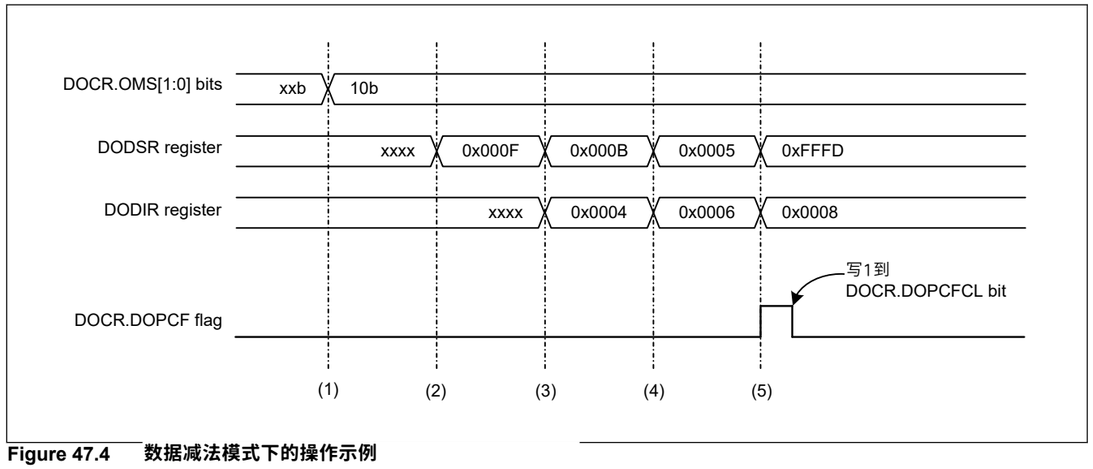

Figure 47.4 数据减法模式下的操作示例

47.4 中断源

DOC生成DOC中断(DOC_DOPCI)作为中断请求。表47.2描述了DOC中断请求。

Table 47.2 Interrupt request from DOC

Interrupt request	Status flag	Interrupt source
DOC interrupt	DOPCF	• The result of data comparison matches the condition selected in the DOCR.DCSEL bit. • The result of data addition is greater than 0xFFFF. • The result of data subtraction is less than 0x0000.

47.5 Output of an Event Signal to the Event Link Controller (ELC)

The DOC outputs an event signal for the ELC under the following conditions:

- The compared values either match or mismatch
- The data addition result is greater than 0xFFFF
- The data subtraction result is less than 0x0000

This signal can be used to initiate operations by other modules selected in advance and can also be used as an interrupt request. When an event signal is generated, the DOC Flag (DOCR.DOPCF) is set to 1.

47.6 Usage Notes

47.6.1 Settings for the Module-Stop State

The module Stop Control Register C (MSTPCRC) can enable or disable DOC operation. The DOC is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

Table 47.2 来自DOC的中断请求

中断请求	状态标志	中断源
文档中断	DOPCF	• 数据比较的结果与DOCR.DCSEL位中选择的条件相匹配。 • 数据相加的结果大于0xFFFF。 • 数据减法的结果小于0x0000。

47.5 将事件信号输出到事件链接控制器(ELC)

DOC在以下条件下为ELC输出事件信号：

●比较值匹配或不匹配

●数据相加结果大于0xFFFF

●数据减法结果小于0x0000

该信号可用于启动其他预先选择的模块的操作，也可用作中断请求。生成事件信号时，DOC标志(DOCR.DOPCF)设置为1。

47.6 使用说明

47.6.1 模块停止状态的设置

模块停止控制寄存器C(MSTPCRC)可以启用或禁用DOC操作。DOC在复位后最初停止。释放模块停止状态可以访问寄存器。有关详细信息，请参阅第10节，低功耗模式。

RA生态工作室

48. SRAM

48.1 Overview

The MCU provides an on-chip, high-density SRAM module with either parity-bit checking or Error Correction Code (ECC). The first 64 KB area of the SRAM0 is the ECC. Parity check is performed on the other areas.

Table 48.1 lists the SRAM specifications.

Table 48.1 SRAM specifications

Parameter	Without ECC	With ECC
SRAM capacity	SRAM0: 448 KB	SRAM0: 64 KB
SRAM address	SRAM0: 0x2001_0000 to 0x2007_FFFF	SRAM0: 0x2000_0000 to 0x2000_FFFF
Access	Wait states are inserted into the read cycle by default. If the ICLK frequency is faster than 100 MHz, wait state is required. If the ICLK frequency is 100 MHz or less, a wait state is not required. For details, see section 48.3.9. Access Cycle	
Data retention function	Not available in deep standby mode	
Module-stop function	Module-stop state can be set to reduce power consumption	
Parity	Even parity with 8-bit data and 1-bit parity	No parity
Error checking	even-parity（Date:8bit, parity:1bit）	SEC-DED (Single-Error Correction and Double-Error Detection Code)
Security	TrustZone Filter is integrated for memory access and SFR access. Access to the memory space is controlled by setting the memory Security Attribution (SA). And, access to I/O space (SFR) space is controlled by setting the register SA. See section 48.3.6. TrustZone Filter function.	

48.2 Register Descriptions

48.2.1 SRAMSAR : SRAM Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SRAMSA2	SRAMSA1	SRAMSA0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	SRAMSA0	Security attributes of registers for SRAM Protection 0: Secure 1: Non-Secure	R/W
1	SRAMSA1	Security attributes of registers for SRAM Protection 2 0: Secure 1: Non-Secure	R/W
2	SRAMSA2	Security attributes of registers for ECC Relation 0: Secure 1: Non-Secure	R/W
31:3	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

48. SRAM

48.1 Overview

MCU提供片上高密度SRAM模块，具有奇偶校验位检查或纠错码(ECC)。SRAM0的第一个64KB区域是ECC。对其他区域执行奇偶校验。

表48.1列出了SRAM规格。

Table 48.1 SRAM specifications

Parameter	Without ECC	With ECC
SRAM capacity	SRAM0: 448 KB	SRAM0: 64 KB
SRAM address	SRAM0: 0x2001_0000 to 0x2007_FFFF	SRAM0: 0x2000_0000 to 0x2000_FFFF
Access	默认情况下，等待状态被插入到读取周期中。如果ICLK频率快于100MHz，则需要等待状态。如果ICLK频率为100MHz或更低，则不需要等待状态。详见48.3.9节。访问周期	
数据保留功能	在深度待机模式下不可用	
Module-stop function	可设置模块停止状态以降低功耗	
Parity	8位数据和1位奇偶校验的偶校验	无平价
错误检查	even-parity（Date:8bit, parity:1bit）	SEC-DED（单纠错和双纠错 Detection Code)
Security	TrustZone过滤器集成用于内存访问和SFR访问。通过设置内存安全属性（SA）来控制对内存空间的访问。并且，通过设置寄存器SA来控制对IO空间(SFR)空间的访问。请参见第48.3.6节。TrustZone过滤功能。	

48.2 注册说明

48.2.1 SRAMSAR：SRAM安全属性寄存器

Base address: CPSCU = 0x4000_8000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	SRAMSA2	SRAMSA1	SRAMSA0
重置后的值：	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	SRAMSA0	SRAM保护寄存器的安全属性 0: Secure 1: Non-Secure	R/W
1	SRAMSA1	SRAM保护2的寄存器的安全属性 0: Secure 1: Non-Secure	R/W
2	SRAMSA2	ECC关系寄存器的安全属性 0: Secure 1: Non-Secure	R/W
31:3	—	这些位被读取为1。写入值应为1。	R/W

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: This register is write-protected by PRCR register.

SRAMSA0 bit (Security attributes of registers for SRAM Protection)

Security attributes of registers for SRAM Protection. The target registers are as follow.

- PARIOAD
- SRAMPRCR

SRAMSA1 bit (Security attributes of registers for SRAM Protection 2)

Security attributes of registers for SRAM Protection 2. The target registers are as follow.

- SRAMWTSC
- SRAMPRCR2

SRAMSA2 bit (Security attributes of registers for ECC Relation)

Security attributes of registers for ECC Relation. The target registers are as follow.

- ECCMODE
- ECC2STS
- ECC1STSEN
- ECC1STS
- ECCPRCR
- ECCPRCR2
- ECCETST
- ECCOAD

48.2.2 PARIOAD : SRAM Parity Error Operation After Detection Register

Base address: SRAM = 0x4000_2000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation After Detection 0: Reset 1: Non-maskable interrupt	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The PARIOAD register controls the operation on detection of a parity error. The SRAM Protection Register (SRAMPRCR) protects this register against writes. Always set the SRAMPRCR bit in SRAMPRCR to enabled before writing to this bit. Do not write to the PARIOAD register while accessing the SRAM.

OAD bit (Operation After Detection)

The OAD bit specifies either a reset or non-maskable interrupt when a parity error is detected. The OAD bit is used for SRAM0 (without ECC)/Standby SRAM.

Note: 该寄存器由PRCR寄存器写保护。

SRAMSA0位（SRAM保护寄存器的安全属性）

SRAM保护寄存器的安全属性。目标寄存器如下。

- PARIOAD
- SRAMPRCR

SRAMSA1位（SRAM保护2寄存器的安全属性）

SRAM保护寄存器的安全属性2。目标寄存器如下。

- SRAMWTSC
- SRAMPRCR2

SRAMSA2位（ECC关系寄存器的安全属性）

ECC关系的寄存器的安全属性。目标寄存器如下。

- ECCMODE
- ECC2STS
- ECC1STSEN
- ECC1STS
- ECCPRCR
- ECCPRCR2
- ECCETST
- ECCOAD

48.2.2 PARIOAD：检测寄存器后的SRAM奇偶校验错误操作

Base address: SRAM = 0x4000_2000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OAD
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	检测后的操作 0：复位1：不可屏蔽中断	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

PARIOAD寄存器控制检测奇偶校验错误时的操作。SRAM保护寄存器(SRAMPRCR)保护该寄存器不被写入。在写入该位之前，始终将SRAMPRCR中的SRAMPRCR位设置为启用。访问SRAM时不要写入PARIOAD寄存器。

OAD位（检测后操作）

当检测到奇偶校验错误时，OAD位指定复位或不可屏蔽中断。OAD位用于SRAM0 (without ECC)/Standby SRAM.

48.2.3 SRAMPRCR : SRAM Protection Register

Base address: SRAM = 0x4000_2000

Offset address: 0x04

Bit position:	7						1	0
Bit field:	KW[6:0]							SRAMPRCR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRAMPRCR	Register Write Control 0: Disable writes to protected registers 1: Enable writes to protected registers	R/W
7:1	KW[6:0]	Write Key Code These bits enable or disable writes to the SRAMPRCR bit	W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

SRAMPRCR bit (Register Write Control)

The SRAMPRCR bit controls the write mode of the PARIOAD register. Setting the bit to 1 enables writes to the PARIOAD register. When you write to this bit, always write 0x78 to KW[6:0] bits simultaneously.

KW[6:0] bits (Write Key Code)

The KW[6:0] bits enable or disable writes to the SRAMPRCR bit. When you write to the SRAMPRCR bit, always write 0x78 to these bits simultaneously. When a value other than 0x78 is written to KW[6:0], the SRAMPRCR bit is not updated. The KW[6:0] bits are always read as 0x00.

48.2.4 SRAMWTSC : SRAM Wait State Control Register

Base address: SRAM = 0x4000_2000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SRAM0WTEN
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	SRAM0WTEN	SRAM0 wait enable 0: No wait 1: Add wait state in read access cycle to SRAM0	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

This register can be rewritten only when the SRAMPRCR2 bit in the SRAMPRCR2 register is 1.

The protection register (SRAMPRCR2) protects this register against writing. Change the effective bit in the protection register (SRAMPRCR2) to write in this register.

Do not write to SRAMWTSC while access to SRAM is in progress.

48.2.3 SRAMPRCR:SRAM保护寄存器

Base address: SRAM = 0x4000_2000

Offset address: 0x04

Bit position:	7						1	0
Bit field:	KW[6:0]							SRAMPRCR
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRAMPRCR	寄存器写控制 0：禁止写入受保护寄存器1：允许写入受保护寄存器	R/W
7:1	KW[6:0]	编写关键代码 这些位启用或禁用对SRAMPRCR位的写入	W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

SRAMPRCR位（寄存器写控制）

SRAMPRCR位控制PARIOAD寄存器的写模式。将该位设置为1可以写入PARIOAD寄存器。写入该位时，始终同时将0x78写入KW[6:0]位。

KW[6:0]位（写入密钥代码）

KW[6:0]位启用或禁用对SRAMPRCR位的写入。当您写入SRAMPRCR位时，请始终同时将0x78写入这些位。当向KW[6:0]写入0x78以外的值时，SRAMPRCR位不会更新。KW[6:0]位总是被读取为0x00。

48.2.4 SRAMWTSC:SRAM等待状态控制寄存器

Base address: SRAM = 0x4000_2000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SRAM0WTEN
重置后的值:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	SRAM0WTEN	SRAM0等待使能 0：无等待1：在SRAM0读访问周期中添加等待状态	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

只有当SRAMPRCR2寄存器中的SRAMPRCR2位为1时，才能重写该寄存器。

保护寄存器(SRAMPRCR2)保护该寄存器不被写入。更改保护寄存器(SRAMPRCR2)中的有效位以写入该寄存器。

在访问SRAM的过程中不要写入SRAMWTSC。

SRAM0WTEN bit (SRAM0 wait enable)

This bit sets the wait cycle to the operation region in SRAM0 (Both parity and ECC areas). When it is set 1 in the SRAM0WTEN bit, 1 wait cycle is inserted into the read cycle of operation region in SRAM0. And also 1 wait cycle is also inserted between the “write to read/write” sequential cycle in the same mat of SRAM0. When read access frequency is more than 100 MHz, it is necessary to set 1 wait cycle in SRAM0WTEN bit.

48.2.5 SRAMPRCR2 : SRAM Protection Register 2

Base address: SRAM = 0x4000_2000

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	KW[6:0]							SRAMPRCR2
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRAMPRCR2	Register Write Control 0: Disable writes to the protectedregisters 1: Enable writes to the protected registers	R/W
7:1	KW[6:0]	Write Key Code These bits enable or disable writes to the SRAMPRCR2 bit	W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

SRAMPRCR2 bit (Register Write Control)

The SRAMPRCR2 bit controls the write mode of the SRAMWTSC register. Setting the bit to 1 enables writes to the SRAMWTSC register. When you write to this bit, always write 0x78 to KW[6:0] at the same time.

KW[6:0] bits (Write Key Code)

The KW[6:0] bits enable or disable writes to the SRAMPRCR2 bit. When you write to SRAMPRCR2 bit, always write 0x78 to these bits at the same time. When a value other than 0x78 is written to KW[6:0], the SRAMPRCR2 bit is not updated. The KW[6:0] bits are always read as 0x00.

48.2.6 ECCMODE : ECC Operating Mode Control Register

Base address: SRAM = 0x4000_2000

Offset address: 0xC0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ECCMOD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ECCMOD[1:0]	ECC Operating Mode Select 0 0: Disable ECC function 0 1: Setting prohibited 1 0: Enable ECC function without error checking 1 1: Enable ECC function with error checking	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:

SRAM0WTEN位（SRAM0等待使能）

该位将等待周期设置为SRAM0中的操作区域（奇偶校验和ECC区域）。当它设置为1时SRAM0WTEN位，1个等待周期插入到SRAM0中操作区的读周期。并且在SRAM0的同一块中的“写到读”顺序周期之间也插入了1个等待周期。当读访问频率大于100MHz时，需要在SRAM0WTEN位中设置1个等待周期。

48.2.5 SRAMPRCR2：SRAM保护寄存器2

Base address: SRAM = 0x4000_2000

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	KW[6:0]							SRAMPRCR2
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRAMPRCR2	寄存器写控制 0：禁止写保护寄存器1：允许写保护寄存器	R/W
7:1	KW[6:0]	编写关键代码 这些位启用或禁用对SRAMPRCR2位的写入	W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

SRAMPRCR2位（寄存器写控制）

SRAMPRCR2位控制SRAMWTSC寄存器的写模式。将该位设置为1可以写入SRAMWTSC寄存器。写入该位时，始终同时将0x78写入KW[6:0]。

KW[6:0]位（写入密钥代码）

KW[6:0]位启用或禁用对SRAMPRCR2位的写入。当您写入SRAMPRCR2位时，请始终同时向这些位写入0x78。当向KW[6:0]写入0x78以外的值时，SRAMPRCR2位不会更新。KW[6:0]位总是被读取为0x00。

48.2.6 ECCMODE:ECC操作模式控制寄存器

Base address: SRAM = 0x4000_2000

Offset address: 0xC0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	ECCMOD[1:0]	
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ECCMOD[1:0]	ECC操作模式选择 00：禁用ECC功能01：设置禁止10：启用ECC功能不进行错误检查11：启用ECC功能并进行错误检查	R/W
7:2	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The ECCMODE register specifies the ECC operating mode. The ECC Protection Register (ECCPRCR) protects this register against writes. Before writing to this register, set the ECCPRCR bit in the ECCPRCR register to 1 (write protection disabled). Do not write to the ECCMODE register while accessing the SRAM.

ECCMOD[1:0] bits (ECC Operating Mode Select)

The ECCMOD[1:0] bits set the access mode to the ECC area in SRAM0.

48.2.7 ECC2STS : ECC 2-Bit Error Status Register

Base address: SRAM = 0x4000_2000

Offset address: 0xC1

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ECC2ERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECC2ERR	ECC 2-Bit Error Status 0: No 2-bit ECC error occurred 1: 2-bit ECC error occurred	R/W*1
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 0 can be written to clear the bit.

ECC2ERR bit (ECC 2-Bit Error Status)

The ECC2ERR bit indicates whether a 2-bit ECC error occurred in the ECC area of SRAM0. When a 2-bit error is detected while ECC operations are enabled and error checking is selected, theECC2ERR bit is set to 1. The SRAM error signal is also asserted at this time. The 2-bit ECC error can be cleared by writing 0 to the ECC2ERR bit.

The SRAM error can be specified as a non-maskable interrupt or a reset in the ECCOAD register. Do not access the ECC area in SRAM0 while writing 0 to this register.

48.2.8 ECC1STSEN : ECC 1-Bit Error Information Update Enable Register

Base address: SRAM = 0x4000_2000

Offset address: 0xC2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	E1STSEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	E1STSEN	ECC 1-Bit Error Information Update Enable 0: Disable updating of 1-bit ECC error information 1: Enable updating of 1-bit ECC error information	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●

允许安全和非安全访问。

ECCMODE寄存器指定ECC工作模式。ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该寄存器之前，将ECPCRR寄存器中的ECPCRR位设置为1（禁用写保护）。访问SRAM时不要写入ECCMODE寄存器。

ECCMOD[1:0]位（ECC操作模式选择）

ECCMOD[1:0]位将访问模式设置为SRAM0中的ECC区域。

48.2.7 ECC2STS：ECC2位错误状态寄存器

Base address: SRAM = 0x4000_2000

Offset address: 0xC1

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ECC2ERR
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECC2ERR	ECC2位错误状态 0：未发生2位ECC错误1：发生2位ECC错误	R/W*1
7:1	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：●

允许安全访问和非安全读取访问

- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●

允许安全和非安全访问。

注1.只能写入0来清除该位。

ECC2ERR位（ECC2位错误状态）

ECC2ERR位指示SRAM0的ECC区域是否发生2位ECC错误。当启用ECC操作并选择错误检查时检测到2位错误时，ECC2ERR位设置为1。此时SRAM错误信号也被置位。将0写入ECC2ERR位可清除2位ECC错误。

SRAM错误可以指定为不可屏蔽中断或ECCOAD寄存器中的复位。向该寄存器写入0时不要访问SRAM0中的ECC区域。

48.2.8 ECC1STSEN：ECC1位错误信息更新使能寄存器

Base address: SRAM = 0x4000_2000

Offset address: 0xC2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	E1STSEN
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	E1STSEN	ECC1位错误信息更新启用 0：禁止更新1位ECC错误信息1：允许更新1位ECC错误信息	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The ECC1STSEN register enables or disables updating of the ECC 1-bit Error Status Register (ECC1STS) in response to a 1-bit error ECC error in the SRAM0 (ECC area).

The ECC Protection Register (ECCPRCR) protects this register against writes. Before writing to this bit, set the ECCPRCR bit in the ECCPRCR register to 1 (write protection disabled).

E1STSEN bit (ECC 1-Bit Error Information Update Enable)

The E1STSEN bit enables or disables updating of the SRAM (ECC area) 1-Bit Error Status Register (ECC1STS) in response to a 1-bit error in the ECC area of SRAM0. This register also functions as an interrupt or a reset mask.

48.2.9 ECC1STS : ECC 1-Bit Error Status Register

Base address: SRAM = 0x4000_2000

Offset address: 0xC3

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ECC1ERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECC1ERR	ECC 1-Bit Error Status 0: No 1-bit ECC error occurred 1: 1-bit ECC error occurred	R/(W)*1
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 0 can be written to clear the bit.

ECC1ERR bit (ECC 1-Bit Error Status)

The ECC1ERR bit indicates whether a 1-bit ECC error occurred in the ECC area of SRAM0. When a 1-bit error is detected while ECC operations are enabled and error checking is selected, theECC1ERR bit is set to 1. The SRAM error signal is also asserted at this time. The 1-bit ECC error can be cleared by writing 0 to the ECC1ERR bit.

The SRAM error can be specified as a non-maskable interrupt or a reset in the ECCOAD register. Do not access the ECC area in SRAM0 while writing 0 to this register.

48.2.10 ECCPRCR : ECC Protection Register

Base address: SRAM = 0x4000_2000

Offset address: 0xC4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	KW[6:0]							ECCPRCR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECCPRCR	Register Write Control 0: Disable writes to the protected registers 1: Enable writes to the protected registers	R/W

- 允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●

允许安全和非安全访问。

ECC1STSEN寄存器启用或禁用ECC1位错误状态寄存器(ECC1STS)的更新，以响应SRAM0（ECC区域）中的1位错误ECC错误。

ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该位之前，将ECPCRR寄存器中的ECPCRR位设置为1（禁用写保护）。

E1STSEN位（ECC1位错误信息更新使能）

E1STSEN位启用或禁用SRAM（ECC区域）1位错误状态寄存器(ECC1STS)的更新，以响应SRAM0的ECC区域中的1位错误。该寄存器还用作中断或复位掩码。

48.2.9 ECC1STS:ECC1位错误状态寄存器

Base address: SRAM = 0x4000_2000

Offset address: 0xC3

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ECC1ERR
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECC1ERR	ECC1位错误状态 0：未发生1位ECC错误1：发生1位ECC错误	R/(W)*1
7:1	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：●

允许安全访问和非安全读取访问

- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●

允许安全和非安全访问。

注1.只能写入0来清除该位。

ECC1ERR位（ECC1位错误状态）

ECC1ERR位指示SRAM0的ECC区域是否发生1位ECC错误。如果在启用ECC操作并选择错误检查时检测到1位错误，则ECC1ERR位设置为1。此时SRAM错误信号也被置位。将0写入ECC1ERR位可清除1位ECC错误。

SRAM错误可以指定为不可屏蔽中断或ECCOAD寄存器中的复位。向该寄存器写入0时不要访问SRAM0中的ECC区域。

48.2.10 ECPCRR:ECC保护寄存器

Base address: SRAM = 0x4000_2000

Offset address: 0xC4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	KW[6:0]							ECCPRCR
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECCPRCR	寄存器写控制 0：禁止写入受保护寄存器1：允许写入受保护寄存器	R/W

Bit	Symbol	Function	R/W
7:1	KW[6:0]	Write Key Code 0x78: Enable write to the ECCPRCR bit Others: Disable write to the ECCPRCR bit	W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

ECCPRCR bit (Register Write Control)

The ECCPRCR bit controls the write of the ECCMODE, ECC1STSEN, and ECCOAD registers. When this bit is set to 1, writing to the ECCMODE, ECC1STSEN, and ECCOAD registers is enabled. When writing to this bit, write 0x78 to the KW[6:0] bits at the same time.

KW[6:0] bits (Write Key Code)

The KW[6:0] bits enable or disable writes to the ECCPRCR bit. When writing toECCPRCR bit, write 0x78 to the KW[6:0] bits at the same time. When a value other than 0x78 is written to theKW[6:0] bits, the ECCPRCR bit is not updated. The KW[6:0] bits are always read as 0x00.

48.2.11 ECCPRCR2 : ECC Protection Register 2

Base address: SRAM = 0x4000_2000

Offset address: 0xD0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	KW2[6:0]							ECCPRCR2
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECCPRCR2	Register Write Control 0: Disable writes to the protected registers 1: Enable writes to the protected registers	R/W
7:1	KW2[6:0]	Write Key Code 0x78: Enable write to the ECCPRCR2 bit Others: Disable write to the ECCPRCR2 bit	W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

ECCPRCR2 bit (Register Write Control)

The ECCPRCR2 bit controls the write mode of the ECCETST register. When the ECCPRCR2 bit is set to 1, writes to the ECCETST register is enabled. When writing to this bit, write 0x78 to the KW2[6:0] bits at the same time.

KW2[6:0] bits (Write Key Code)

The KW2[6:0] bits enable or disable writes to the ECCPRCR2 bit. When writing to ECCPRCR2 bit, write 0x78 to the KW2[6:0] bits at the same time. When a value other than 0x78 is written to the KW2[6:0] bits, the ECCPRCR2 bit is not updated. The KW2[6:0] bits are always read as 0x00.

Bit	Symbol	Function	R/W
7:1	KW[6:0]	编写关键代码 0x78：允许写入ECPCRR位 其他：禁止写入ECPCRR位	W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

ECPCRR位（寄存器写控制）

ECPCRR位控制ECCMODE、ECC1STSEN和ECCOAD寄存器的写入。当该位设置为1时，允许写入ECCMODE、ECC1STSEN和ECCOAD寄存器。写入该位时，同时将0x78写入KW[6:0]位。

KW[6:0]位（写入密钥代码）

KW[6:0]位启用或禁用对ECPCRR位的写入。写入ECCPRCR位时，同时向KW[6:0]位写入0x78。当向KW[6:0]位写入0x78以外的值时，不会更新ECPCRR位。KW[6:0]位总是被读取为0x00。

48.2.11 ECPCRR2:ECC保护寄存器2

Base address: SRAM = 0x4000_2000

Offset address: 0xD0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	KW2[6:0]							ECCPRCR2
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ECCPRCR2	寄存器写控制 0：禁止写入受保护寄存器1：允许写入受保护寄存器	R/W
7:1	KW2[6:0]	编写关键代码 0x78：允许写入ECPCRR2位 其他：禁止写入ECPCRR2位	W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

ECPCRR2位（寄存器写控制）

ECPCRR2位控制ECCETST寄存器的写模式。当ECPCRR2位设置为1时，写入ECCETST寄存器使能。写入该位时，同时向KW2[6:0]位写入0x78。

KW2[6:0]位（写入密钥代码）

KW2[6:0]位启用或禁用对ECPCRR2位的写入。当写入ECPCRR2位时，将0x78写入KW2[6:0]位。当向KW2[6:0]位写入0x78以外的值时，不会更新ECPCRR2位。KW2[6:0]位总是读为0x00。

48.2.12 ECCETST : ECC Test Control Register

Base address: SRAM = 0x4000_2000

Offset address: 0xD4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TSTBYP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TSTBYP	ECC Bypass Select 0: Disable ECC bypass 1: Enable ECC bypass	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The ECC Protection Register 2 (ECCPRCR2) protects this register against writes. Before writing to this bit, set the ECCPRCR2 bit in the ECCPRCR2 register to 1 (write protection disabled). Do not write to the ECCETST register while accessing the SRAM.

TSTBYP bit (ECC Bypass Select)

The TSTBYP bit enables direct access to the ECC code by bypassing the ECC function. When the ECC bypass function is used, the ECCMOD[1:0] bits in the ECCMODE register are set to 00b. The ECC must be accessed in 32 bits using the same address for 32-bit data. The ECC code is assigned to the lower 7 bits of the 32-bit data. When writing the ECC code, the upper 25 bits are ignored. When reading the ECC code, the upper 25 bits are undefined.

Note: For details of ECC test, see section 48.3.4. ECC Decoder Testing.

48.2.13 ECCOAD : SRAM ECC Error Operation After Detection Register

Base address: SRAM = 0x4000_2000

Offset address: 0xD8

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation After Detection 0: Non-maskable interrupt 1: Reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

The ECC Protection Register (ECCPRCR) protects this register against writes. Before writing to this bit, set the ECCPRCR bit in the ECCPRCR register to 1 (write protection disabled). Do not write to the ECCOAD register while accessing the SRAM.

48.2.12 ECCETST:ECC测试控制寄存器

Base address: SRAM = 0x4000_2000

Offset address: 0xD4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TSTBYP
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TSTBYP	ECC旁路选择 0：禁用ECC旁路1：启用ECC旁路	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

ECC保护寄存器2(ECCPRCR2)保护该寄存器不被写入。在写入该位之前，将ECPCRR2寄存器中的ECPCRR2位为1（写保护禁用）。访问SRAM时不要写入ECCETST寄存器。

TSTBYP位（ECC旁路选择）

TSTBYP位允许通过绕过ECC功能直接访问ECC代码。使用ECC旁路功能时，ECCMODE寄存器中的ECCMOD[1:0]位设置为00b。必须使用32位数据的相同地址以32位访问ECC。ECC代码分配给32位数据的低7位。写入ECC代码时，忽略高25位。读取ECC码时，高25位未定义。

Note: 有关ECC测试的详细信息，请参见第48.3.4节。ECC解码器测试。

48.2.13 ECCOAD：检测寄存器后的SRAMECC错误操作

Base address: SRAM = 0x4000_2000

Offset address: 0xD8

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OAD
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	检测后的操作 0：不可屏蔽中断1：复位	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

ECC保护寄存器(ECCPRCR)保护该寄存器不被写入。在写入该位之前，将ECPCRR寄存器中的ECPCRR位设置为1（禁用写保护）。访问SRAM时不要写入ECCOAD寄存器。

OAD bit (Operation After Detection)

The OAD bit selects whether to generate a reset or a non-maskable interrupt when an ECC error is detected. The OAD bit in the ECCOAD register is used for SRAM0 (ECC area).

48.3 Operation

48.3.1 Module Stop Function

Power consumption can be reduced by setting module stop control register A (MSTPCRA) to stop supply of the clock signal to SRAM.

SRAM0 is controlled by SRAM0 bit in MSTPCRA register and, in the case of 1, SRAM0 becomes the clock stop state.

The SRAM is thus placed in the module-stop state by stopping supply of the clock signals. The SRAM operates after a reset.

SRAM is not accessible if it is in the module-stop state. A transition to the module-stop state should not be made while access to SRAM is in progress.

Access to the SRAM in the module-stop state is prohibited. If access is attempted, correct operation is not guaranteed.

For details on the MSTPCRA register, see section 10, Low Power Modes.

48.3.2 Correction of ECC errors

Enabling and disabling of ECC error correction can be selected through ECCMODE register setting. In the initial state, ECC error correction is disabled. The ECC check type is SEC-DED (Single-Error Correction and Double-Error Detection Code).

When ECC function is enabled, 7-bit check bits are appended to 32-bit data for writing. For reading, 39-bit (data: 32 bits, check bits: 7 bits) data is read out from the SRAM (ECC area).

When ECC function is enabled and error checking is selected by setting ECCMOD[1:0] in the ECCMODE register to 00b, error correction is done if a 1-bit error occurs and the ECC1ERR bit in the ECC1STS register is set to 1 if the E1STSEN bit in the ECC1STSEN register is 1. If a 2-bit error occurs, error detection is done and the ECC2ERR bit in the ECC2STS register is set to 1, though error correction is not performed.

When ECC function is enabled and the error checking is disable, error correction is done if a 1-bit error occurs but ECC1ERR bit in the ECC1STS register is not updated although E1STSEN bit in the ECC1STSEN register is 1. If a 2-bit error occurs, this error is detected but the ECC2ERR bit in the ECC2STS register is not updated, and error correction is not performed.

When ECC function is disable, neither error correction nor error detection is done although 1-bit or 2-bit error occur.

So ECC1ERR bit and ECC2ERR bit are not updated.

There is no way to confirm the location where the error was found. Therefore, when after the occurrence of an error, update all the data.

When updating all the data after the occurrence of an error, the only support of 32 bit data writing.

Since the SRAM data is undefined after power on and release from deep software standby mode, accessing the SRAM when ECC function is enabled and error checking is selected causes an ECC error to occur. Therefore, before using ECC function, initial writing with 32bit data size to the area to be used in the SRAM should be done.

When a read access is executed in a row after a write access, read access is executed with priority. Therefore, during initialization, please do not perform the read access in a row after the write access.

48.3.3 ECC Error Interrupt Function

When ECC function is enabled and error checking is applied to the SRAM (ECC area), an ECC error occurs when either the ECC2ERR bit in the ECC2STS register or the ECC1ERR bit in the ECC1STS register becomes 1 to indicate that ECC checking revealed a 2-bit error or a 1-bit error, respectively.

An ECC erroris output with a pulse width of ICLK.When the ECC 1-bit error is to be masked, set the ECC1STSEN.E1STSEN bit to 0 to disable updating of the ECC1ERR bit. An ECC error will not be generated while ECC function is disabled or when ECC function is enabled but error checking is not selected.

OAD位（检测后操作）

OAD位选择在检测到ECC错误时是否产生复位或不可屏蔽中断。ECCOAD寄存器中的OAD位用于SRAM0（ECC区域）。

48.3 Operation

48.3.1 模块停止功能

通过设置模块停止控制寄存器A(MSTPCRA)停止向SRAM提供时钟信号，可以降低功耗。

SRAM0由MSTPCRA寄存器中的SRAM0位控制，在为1的情况下，SRAM0变为时钟停止状态。

因此，通过停止提供时钟信号，SRAM被置于模块停止状态。SRAM在复位后运行。

如果SRAM处于模块停止状态，则无法访问。在访问SRAM的过程中，不应转换到模块停止状态。

禁止在模块停止状态下访问SRAM。如果尝试访问，则无法保证正确操作。

有关MSTPCRA寄存器的详细信息，请参见第10节，低功耗模式。

48.3.2 纠正ECC错误

可以通过ECCMODE寄存器设置来选择ECC纠错的启用和禁用。在初始状态下，ECC纠错被禁用。ECC校验类型为SEC-DED（单纠错双错误检测码）。

当ECC功能使能时，7位校验位被附加到32位数据中进行写入。读取时，从SRAM（ECC区域）中读取39位（数据：32位，校验位：7位）数据。

当ECC功能使能并且通过将ECCMODE寄存器中的ECCMOD[1:0]设置为00b来选择错误检查时，如果发生1位错误，则进行纠错，并且如果ECC1STS寄存器中的ECC1ERR位设置为1，则ECC1STSEN寄存器中的E1STSEN位为1。如果发生2位错误，则进行错误检测并将ECC2STS寄存器中的ECC2ERR位设置为1，但不执行错误纠正。

当启用ECC功能且禁用错误检查时，如果发生1位错误，则进行错误纠正，但尽管ECC1STSEN寄存器中的E1STSEN位为1，但ECC1STS寄存器中的ECC1ERR位不更新。如果发生2位错误，则会检测到该错误，但不会更新ECC2STS寄存器中的ECC2ERR位，也不执行纠错。

当ECC功能被禁用时，即使发生1位或2位错误，也不会进行纠错或错误检测。

因此ECC1ERR位和ECC2ERR位不会更新。

无法确认发现错误的位置。因此，当发生错误后，更新所有数据。

发生错误后更新所有数据时，仅支持32位数据写入。

由于上电并从深度软件待机模式释放后SRAM数据未定义，因此在启用ECC功能并选择错误检查时访问SRAM会导致发生ECC错误。因此，在使用ECC功能之前，应先将32位数据大小的数据写入SRAM中要使用的区域。

在写访问之后连续执行读访问时，优先执行读访问。因此，在初始化过程中，请不要在写访问之后连续进行读访问。

48.3.3 ECC错误中断功能

当启用ECC功能并对SRAM（ECC区域）应用错误检查时，当任一ECC2STS寄存器中的ECC2ERR位或ECC1STS寄存器中的ECC1ERR位变为1，分别表示ECC检查发现2位错误或1位错误。

脉冲宽度为ICLK的ECC错误输出。当要屏蔽ECC1位错误时，设置ECC1STSEN.E1STSEN位为0以禁用ECC1ERR位的更新。禁用ECC功能或启用ECC功能但未选择错误检查时，不会产生ECC错误。

ECC error can choose non maskable interrupt or reset by ECCOAD register. When set 1 in the OAD bit of the ECCOAD register, ECC error is output to the Reset function. When set 0 in the OAD bit of the ECCOAD register, ECC Error interrupt is output to the ICU as non-maskable interrupt.

48.3.4 ECC Decoder Testing

Figure 48.1 shows the ECC decoder testing.

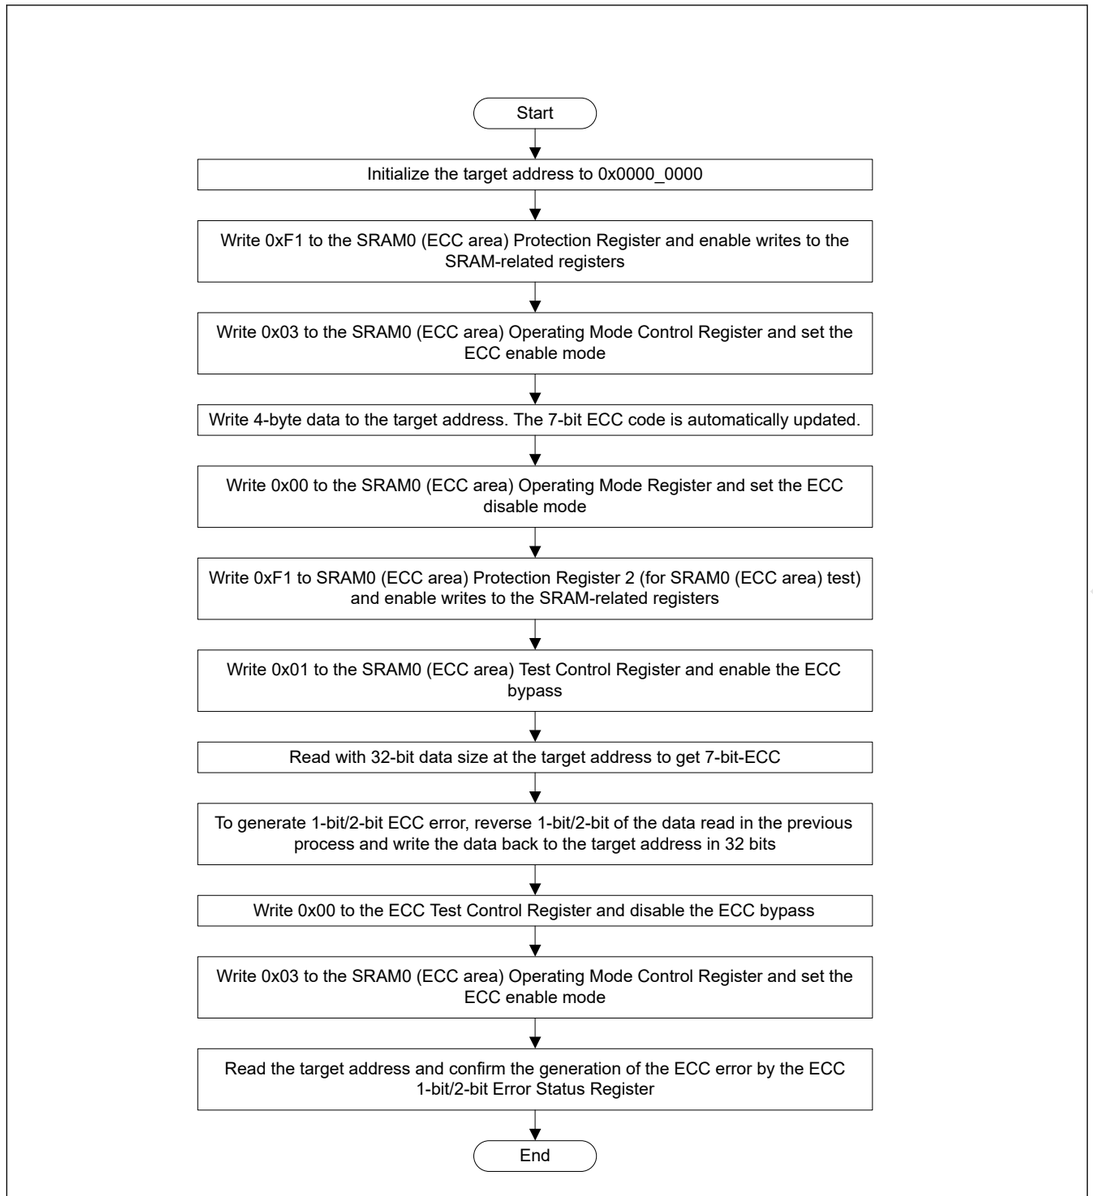

Figure 48.1 ECC decoder testing

ECC错误可以选择不可屏蔽中断或通过ECCOAD寄存器复位。当ECCOAD寄存器的OAD位设置为1时，ECC错误输出到复位功能。当ECCOAD寄存器的OAD位设置为0时，ECC错误中断作为不可屏蔽中断输出到ICU。

48.3.4 ECC解码器测试

图48.1显示了ECC解码器测试。

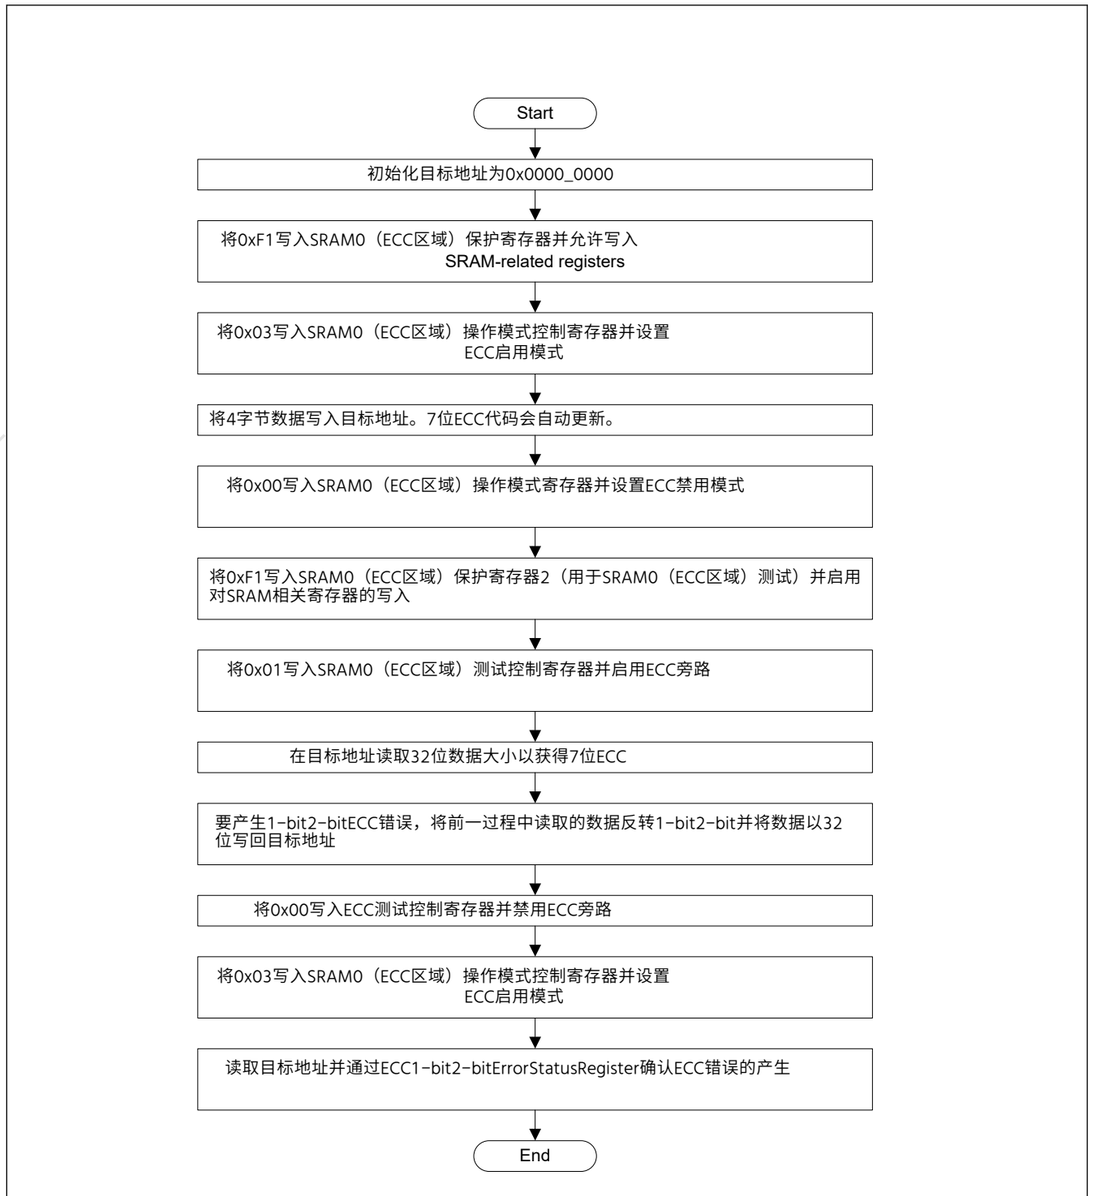

Figure 48.1 ECC解码器测试

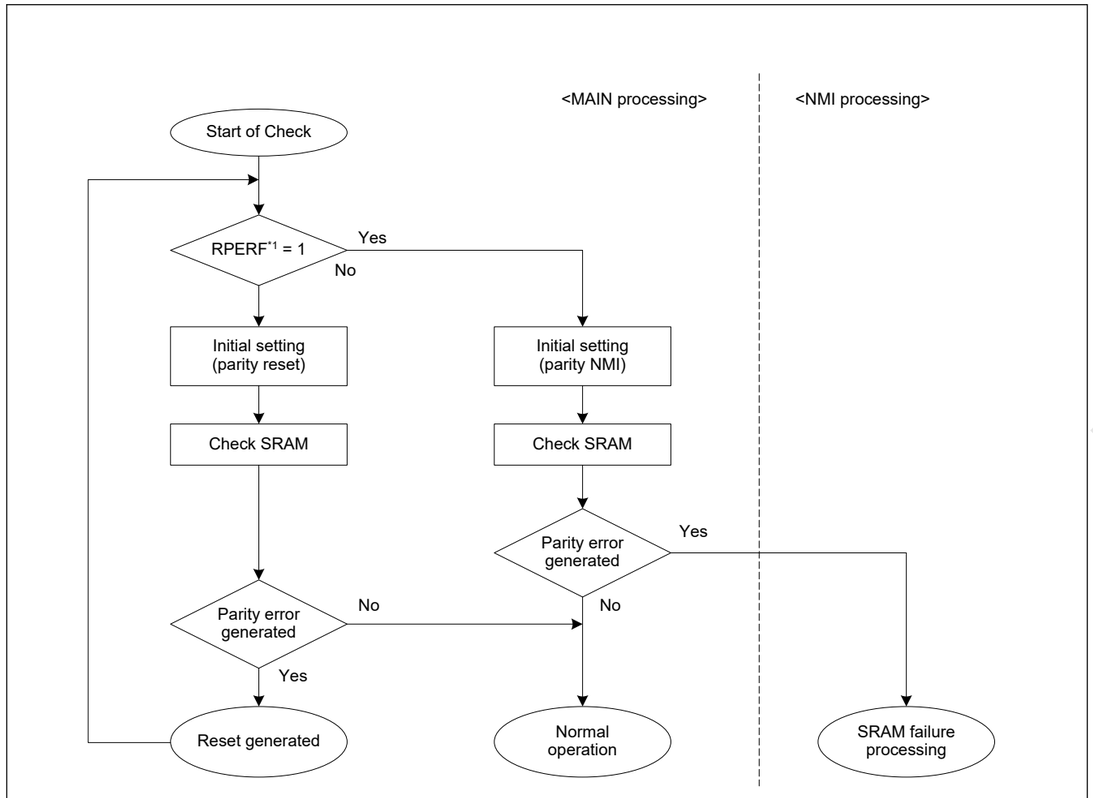
48.3.5 Parity Calculation Function

The IEC60730 standard requires the checking of SRAM data. When data is written, a parity bit is added to every 8-bit data in the SRAM which has 32-bit data width, and when data is read, the parity is checked. When a parity error occurs, a parity-error notification is generated. This function can also be used to trigger a reset.

The parity-error notification can be specified as a non-maskable interrupt or a reset in the OAD bit of the PARIOAD register. When the OAD bit is set to 1, a parity error is output to the reset function. When the OAD bit is set to 0, a parity error is output to the ICU as a non-maskable interrupt.

Parity errors often occur because of noise. To confirm whether the cause of the parity error is noise or corruption, follow the parity check flows shown in Figure 48.2 and Figure 48.3.

When a read access is executed in a row after a write access, read access is executed with priority. Therefore, during initialization, do not perform the read access in a row after the write access.



Note 1. RPERF: SRAM Parity Error Reset Detect Flag (RSTSR1.RPERF bit)

Figure 48.2 Flow of SRAM parity check when SRAM parity reset is enabled

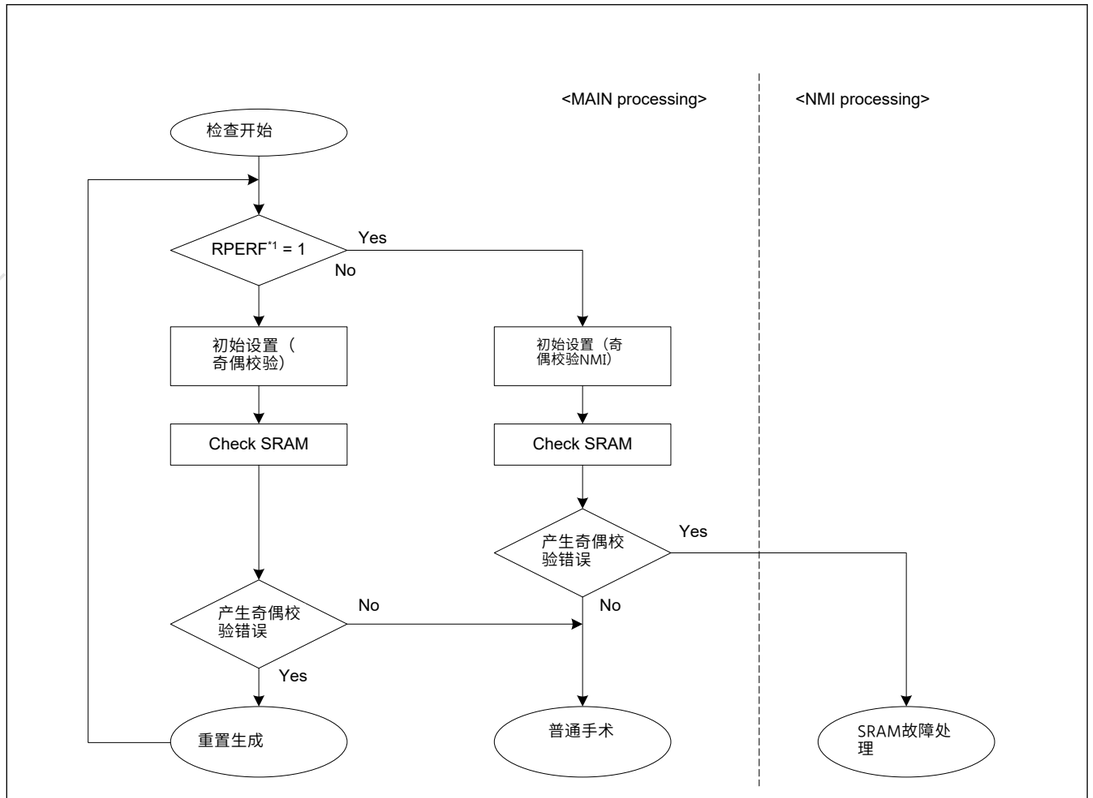
48.3.5 奇偶校验计算功能

IEC60730标准要求检查SRAM数据。写入数据时，对32位数据宽度的SRAM中的每8位数据添加一个奇偶校验位，读取数据时检查奇偶校验位。发生奇偶校验错误时，会生成奇偶校验错误通知。此功能也可用于触发复位。

奇偶校验错误通知可以指定为不可屏蔽中断或PARIOAD寄存器的OAD位中的复位。当OAD位设置为1时，奇偶校验错误输出到复位功能。当OAD位设置为0时，奇偶校验错误作为不可屏蔽中断输出到ICU。

奇偶校验错误经常因噪声而发生。要确认奇偶校验错误的原因是噪声还是损坏，请遵循图48.2和图48.3所示的奇偶校验流程。

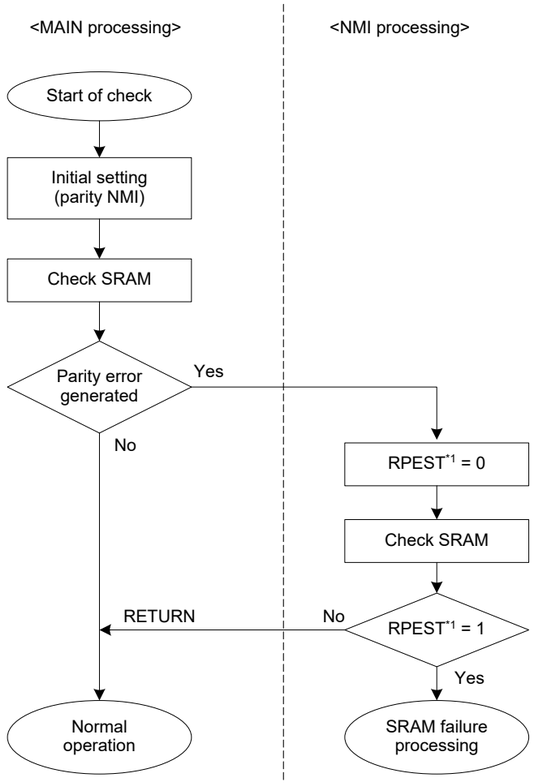
在写访问之后连续执行读访问时，优先执行读访问。因此，在初始化过程中，不要在写访问之后连续执行读访问。



注1.RPERF：SRAM奇偶校验错误复位检测标志（RSTSR1.RPERF位）

Figure 48.2 启用SRAM奇偶校验复位时的SRAM奇偶校验流程

RA生态工作室



Note 1. RPEST: SRAM Parity Error Interrupt Status Flag (NMISR.RPEST bit)

Figure 48.3 Flow of SRAM parity check when SRAM parity interrupt is enabled

48.3.6 TrustZone Filter function

There are two types of TrustZone Filter function for SRAM.

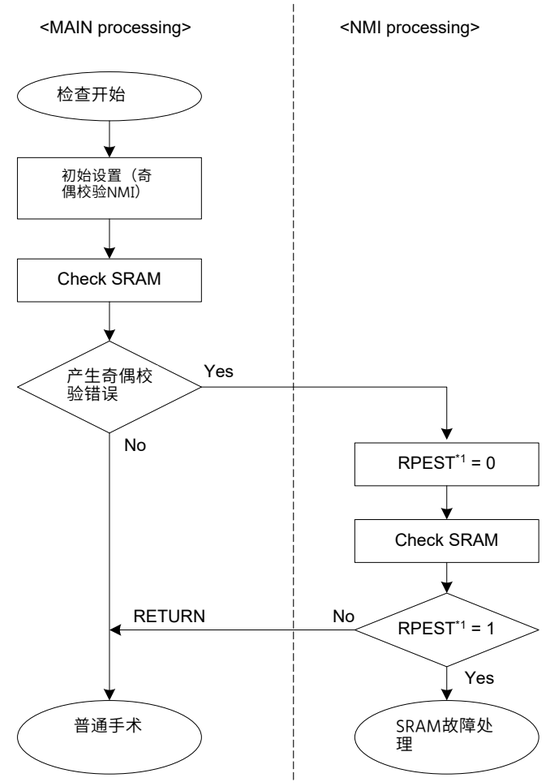
- TrustZone Filter for SRAM register protection
- TrustZone Filter for SRAM memory protection

48.3.6.1 TrustZone Filter for SRAM register protection

SRAM registers can be protected with a Security Attribution (SA) from Non-secure access. When SA indicates that SRAM registers are secure status, non-secure access can not overwrite them because TrustZone Filter detects finds an error and protects the write access. SA for SRAM registers is just one to be used commonly among SRAM registers.

Table 48.2 Register protection (1 of 2)

SA	Access status	Write access	Read access
Secure	Secure	Permit	Permit
	Non-secure	TrustZone Filter error Protected	Permit



注1.RPEST：SRAM奇偶校验错误中断状态标志（NMISR.RPEST位）

Figure 48.3 启用SRAM奇偶校验中断时的SRAM奇偶校验流程

48.3.6 TrustZone过滤器功能

SRAM有两种TrustZoneFilter功能。

- 用于SRAM寄存器保护的TrustZone过滤器
- 用于SRAM内存保护的TrustZone过滤器

48.3.6.1 用于SRAM寄存器保护的TrustZone过滤器

可以使用安全属性(SA)保护SRAM寄存器免受非安全访问。当SA指示SRAM寄存器处于安全状态时，非安全访问无法覆盖它们，因为TrustZoneFilter检测到发现错误并保护写访问。SRAM寄存器的SA只是SRAM寄存器中常用的一种。

Table 48.2 寄存器保护(1of2)

SA	访问状态	写访问	读取权限
Secure	Secure	Permit	Permit
	Non-secure	TrustZone过滤器错误受保护	Permit

Table 48.2 Register protection (2 of 2)

SA	Access status	Write access	Read access
Non-secure	Secure	Permit	Permit
	Non-secure	Permit	Permit

When TrustZone Filter error for SRAM register access occurs, no error notification and no error response occurs.

48.3.6.2 TrustZone Filter for SRAM memory protection

SRAM memory, e.g. SRAM0 include ECC region and Parity can be divided into Secure/Non secure callable/Non secure status with Memory Security Attribution (MSA) and can be protected from Non-secure access. When MSA indicates that SRAM memory region are Secure or Non secure callable status, Non-secure access can't overwrite them.

Table 48.3 Memory protection

SA	Access status	Write access	Read access
Secure / Non secure callable	Secure	Permit	Permit
	Non-secure	TrustZone Filter error ● Protected ● Error response occurs	TrustZone Filter error ● Read data is 0 ● Error response occurs
Non-secure	Secure	Permit	Permit
	Non-secure	Permit	Permit

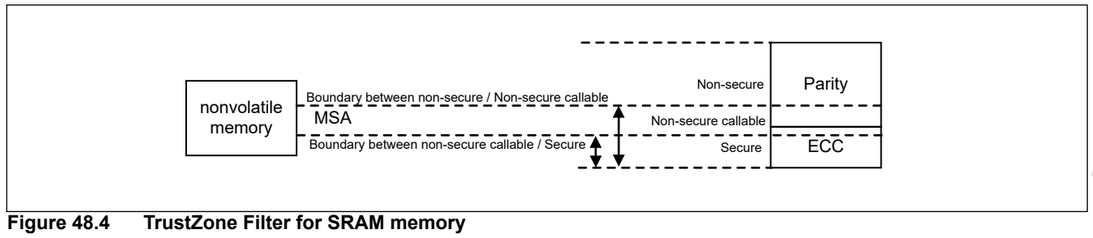


Figure 48.4 TrustZone Filter for SRAM memory

When TrustZone Filter error for SRAM memory access occurs, an error notification which become Reset request or NMI request occurs. See section 52.2. Arm TrustZone Security .

48.3.7 Interrupt Source

The SRAM interrupt source includes an ECC error, Parity error and TrustZone filter error. ECC error and Parity error can choose non-maskable interrupt or reset by OAD bit. When the debugger is connected, reset and non-maskable interrupt are maskable. Also, if these masks are set by the debugger, each status register is not set even if an ECC error occurs. For details on the debug mode, see section 2, CPU.

Table 48.4 SRAM Interrupt Source

Name	Interrupt Source	DTC Activation	DMAC Activation
ECCERR	ECC error (ECC operation region in SRAM0)	Not possible	Not possible
PARITYERR	Parity error	Not possible	Not possible
TZFLT	TrustZone filter error	Not possible	Not possible

48.3.8 Wait state

When ICLK frequencies is SRAM0 = 200 MHz to 100 MHz, if you want to access to the SRAM0, do not set 0x00 in wait enable bit for each RAM of the SRAMWTSC register, in order to insert a wait cycle. When the wait is not inserted, we cannot guarantee the operation.

Depending on the operating frequency of ICLK, the WAIT setting for SRAM access has the following conditions.

Table 48.2 注册保护(2of2)

SA	访问状态	写访问	读取权限
Non-secure	Secure	Permit	Permit
	Non-secure	Permit	Permit

当发生SRAM寄存器访问的TrustZoneFilter错误时，不会发生错误通知和错误响应。

48.3.6.2 用于SRAM内存保护的TrustZone过滤器

SRAM存储器，例如SRAM0包括ECC区域和Parity可分为SecureNonsecurecallableNonsecurestatuswithMemory SecurityAttribution(MSA)并可防止非安全访问。当MSA指示SRAM内存区域为安全或非安全可调用状态时，非安全访问无法覆盖它们。

Table 48.3 内存保护

SA	访问状态	写访问	读取权限
安全非安全可调用	Secure	Permit	Permit
	Non-secure	TrustZone过滤器错误● ● 发生错误响应	TrustZone过滤器错误●读取数据为0 ● 发生错误响应
Non-secure	Secure	Permit	Permit
	Non-secure	Permit	Permit

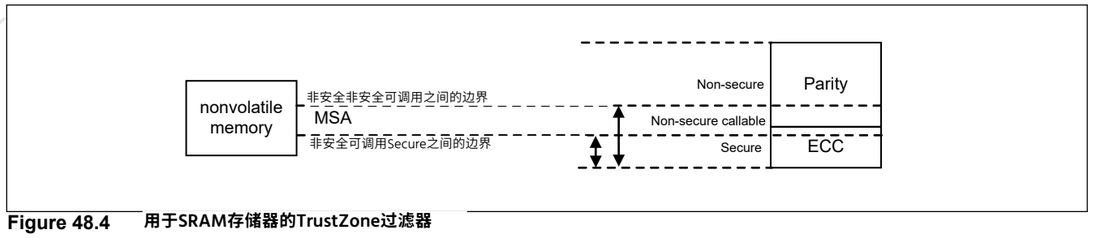

Figure 48.4 用于SRAM存储器的TrustZone过滤器

当发生SRAM内存访问的TrustZoneFilter错误时，会发生错误通知，成为Resetrequest或NMIrequest。请参阅第52.2节。ArmTrustZone安全。

48.3.7 中断源

SRAM中断源包括ECC错误、奇偶校验错误和TrustZone过滤器错误。ECC错误和奇偶校验错误可以选择不可屏蔽中断或通过OAD位复位。当调试器连接时，复位和不可屏蔽中断都是可屏蔽的。此外，如果调试器设置了这些掩码，则即使发生ECC错误，也不会设置每个状态寄存器。有关调试模式的详细信息，请参见第2节CPU。

Table 48.4 SRAM中断源

Name	中断源	DTC Activation	DMAC Activation
ECCERR	ECC错误（SRAM0中的ECC操作区域）	不可能	不可能
PARITYERR	奇偶校验错误	不可能	不可能
TZFLT	TrustZone过滤器错误	不可能	不可能

48.3.8 等待状态

当ICLK频率为SRAM0=200MHz至100MHz时，如果要访问SRAM0，请不要将SRAMWTSC寄存器的每个RAM的等待使能位设置为0x00，以便插入等待周期。当未插入等待时，我们无法保证操作。

根据ICLK的工作频率，SRAM访问的WAIT设置具有以下条件。

RA生态工作室

[ICLK frequency] (SRAM0):

- 200 MHz ≥ ICLK > 100 MHz = 1 wait
- 100 MHz ≥ ICLK = No-wait

48.3.9 Access Cycle

■ Number of cycles from the CPU

- When the cache is hit, access is one cycle.
- For cache off or non cacheable

Table 48.5 SRAM0 (ECC Area)

Register Setting		Read (cycles)		Write (cycles)	
		Word access	Half-word/Byte access	Word access	Half-word/Byte access
ECC Off ECCMOD[1] = 0	SRAM0WTEN = 0	3		2*1	
	SRAM0WTEN = 1	4		2*1	
ECC On ECCMOD[1] = 1	SRAM0WTEN = 0	3		2*1	4
	SRAM0WTEN = 1	4		2*1	4

Note 1. For efficiency of the access, when read access occurs to the same memory after write, memory write by the precedent write command delays it until for the next idle cycle or the next write access. When read continues, it is given priority to read.

Table 48.6 SRAM0 (Parity Area)

Register Setting	Read (cycles)		Write (cycles)	
	Word access	Half-word/Byte access	Word access	Half-word/Byte access
SRAM0WTEN = 0	3		2*1	
SRAM0WTEN = 1	4		2*1	

Note 1. For efficiency of the access, when read access occurs to the same memory after write, memory write by the precedent write command delays it until for the next idle cycle or the next write access. When read continues, it is given priority to read.

- For cache on and cacheble (When the cache miss hit)

Table 48.7 SRAM0 (ECC Area)

Register Setting		Read (cycles)		Write (cycles)	
		Word access	Half-word/Byte access	Word access	Half-word/Byte access
ECC Off ECCMOD[1] = 0	SRAM0WTEN = 0	3		1*1	
	SRAM0WTEN = 1	4		1*1	
ECC On ECCMOD[1] = 1	SRAM0WTEN = 0	3		1*1	
	SRAM0WTEN = 1	4		1*1	

Note 1. For efficiency of the access, when read access occurs to the same memory after write, memory write by the precedent write command delays it until for the next idle cycle or the next write access. When read continues, it is given priority to read.

Table 48.8 SRAM0 (Parity Area)

Register Setting	Read (cycles)		Write (cycles)	
	Word access	Half-word/Byte access	Word access	Half-word/Byte access
SRAM0WTEN = 0	3		1*1	
SRAM0WTEN = 1	4		1*1	

[ICLK frequency] (SRAM0):

- 200 MHz ≥ ICLK > 100 MHz = 1 wait
- 100 MHz ≥ ICLK = No-wait

48.3.9 访问周期

■CPU的周期数

●当缓存命中时，访问为一个周期。

●对于缓存关闭或不可缓存

Table 48.5 SRAM0 (ECC Area)

寄存器设置		Read (cycles)		Write (cycles)	
		字访问	Half-word/Byte access	字访问	Half-word/Byte access
ECC Off ECCMOD[1] = 0	SRAM0WTEN = 0	3		2*1	
	SRAM0WTEN = 1	4		2*1	
ECC On ECCMOD[1] = 1	SRAM0WTEN = 0	3		2*1	4
	SRAM0WTEN = 1	4		2*1	4

注1.为提高访问效率，当写入后对同一内存进行读取访问时，先行写入命令的内存写入会将其延迟到下一个空闲周期或下一次写入访问。继续读取时，优先读取。

Table 48.6 SRAM0 (Parity Area)

寄存器设置	Read (cycles)		Write (cycles)	
	字访问	Half-word/Byte access	字访问	Half-word/Byte access
SRAM0WTEN = 0	3		2*1	
SRAM0WTEN = 1	4		2*1	

注1.为提高访问效率，当写入后对同一内存进行读取访问时，先行写入命令的内存写入会将其延迟到下一个空闲周期或下一次写入访问。继续读取时，优先读取。

●forcacheonandcacheble（当缓存未命中时）

Table 48.7 SRAM0 (ECC Area)

寄存器设置		Read (cycles)		Write (cycles)	
		字访问	Half-word/Byte access	字访问	Half-word/Byte access
ECC Off ECCMOD[1] = 0	SRAM0WTEN = 0	3		1*1	
	SRAM0WTEN = 1	4		1*1	
ECC On ECCMOD[1] = 1	SRAM0WTEN = 0	3		1*1	
	SRAM0WTEN = 1	4		1*1	

注1.为提高访问效率，当写入后对同一内存进行读取访问时，先行写入命令的内存写入会将其延迟到下一个空闲周期或下一次写入访问。继续读取时，优先读取。

Table 48.8 SRAM0 (Parity Area)

寄存器设置	Read (cycles)		Write (cycles)	
	字访问	Half-word/Byte access	字访问	Half-word/Byte access
SRAM0WTEN = 0	3		1*1	
SRAM0WTEN = 1	4		1*1	

Note 1. For efficiency of the access, when read access occurs to the same memory after write, memory write by the precedent write command delays it until for the next idle cycle or the next write access. When read continues, it is given priority to read.

48.3.10 ECC encode specification

The following table shows ECC encoding specifications. Add the ECC cord (eout [6:0]) formed by the following calculating formula to higher 7 bits (din [38:32]) of write data and write in it at SRAM.

Table 48.9 ECC encode

ECC code	calculation formula
eout[6]	(din[13] ^ din[12] ^ din[11] ^ din[10] ^ din[9] ^ din[8] ^ din[7] ^ din[6] ^ din[5] ^ din[4] ^ din[3] ^ din[2] ^ din[1] ^ din[0])
eout[5]	(din[23] ^ din[22] ^ din[21] ^ din[20] ^ din[19] ^ din[18] ^ din[17] ^ din[16] ^ din[15] ^ din[14] ^ din[3] ^ din[2] ^ din[1] ^ din[0])
eout[4]	(din[29] ^ din[28] ^ din[27] ^ din[26] ^ din[25] ^ din[24] ^ din[17] ^ din[16] ^ din[15] ^ din[14] ^ din[7] ^ din[6] ^ din[5] ^ din[4])
eout[3]	(din[31] ^ din[30] ^ din[26] ^ din[25] ^ din[24] ^ din[20] ^ din[19] ^ din[18] ^ din[14] ^ din[10] ^ din[9] ^ din[8] ^ din[4] ^ din[0])
eout[2]	(din[31] ^ din[30] ^ din[28] ^ din[27] ^ din[24] ^ din[22] ^ din[21] ^ din[18] ^ din[15] ^ din[12] ^ din[11] ^ din[8] ^ din[5] ^ din[1])
eout[1]	~(din[30] ^ din[29] ^ din[27] ^ din[25] ^ din[23] ^ din[21] ^ din[19] ^ din[16] ^ din[13] ^ din[11] ^ din[9] ^ din[6] ^ din[2] ^ din[0])
eout[0]	~(din[31] ^ din[29] ^ din[28] ^ din[26] ^ din[23] ^ din[22] ^ din[20] ^ din[17] ^ din[13] ^ din[12] ^ din[10] ^ din[7] ^ din[3] ^ din[0])

Note: eout[6:0] = ECC code, din[31:0] = write data

注1.为提高访问效率，当写入后对同一内存进行读取访问时，先行写入命令的内存写入会将其延迟到下一个空闲周期或下一次写入访问。继续读取时，优先读取。

48.3.10 ECC编码规范

下表显示了ECC编码规范。将由以下计算公式形成的ECC线（eout[6:0]）添加到写入数据的高7位（din[38:32]）中，并写入SRAM中。

Table 48.9 ECC encode

ECC code	计算公式
eout[6]	(din[13] ^ din[12] ^ din[11] ^ din[10] ^ din[9] ^ din[8] ^ din[7] ^ din[6] ^ din[5] ^ din[4] ^ din[3] ^ din[2] ^ din[1] ^ din[0])
eout[5]	(din[23] ^ din[22] ^ din[21] ^ din[20] ^ din[19] ^ din[18] ^ din[17] ^ din[16] ^ din[15] ^ din[14] ^ din[3] ^ din[2] ^ din[1] ^ din[0])
eout[4]	(din[29] ^ din[28] ^ din[27] ^ din[26] ^ din[25] ^ din[24] ^ din[17] ^ din[16] ^ din[15] ^ din[14] ^ din[7] ^ din[6] ^ din[5] ^ din[4])
eout[3]	(din[31] ^ din[30] ^ din[26] ^ din[25] ^ din[24] ^ din[20] ^ din[19] ^ din[18] ^ din[14] ^ din[10] ^ din[9] ^ din[8] ^ din[4] ^ din[0])
eout[2]	(din[31] ^ din[30] ^ din[28] ^ din[27] ^ din[24] ^ din[22] ^ din[21] ^ din[18] ^ din[15] ^ din[12] ^ din[11] ^ din[8] ^ din[5] ^ din[1])
eout[1]	~(din[30] ^ din[29] ^ din[27] ^ din[25] ^ din[23] ^ din[21] ^ din[19] ^ din[16] ^ din[13] ^ din[11] ^ din[9] ^ din[6] ^ din[2] ^ din[0])
eout[0]	~(din[31] ^ din[29] ^ din[28] ^ din[26] ^ din[23] ^ din[22] ^ din[20] ^ din[17] ^ din[13] ^ din[12] ^ din[10] ^ din[7] ^ din[3] ^ din[0])

Note: eout[6:0]=ECC代码，din[31:0]=写入数据

RA生态工作室

49. Standby SRAM

49.1 Overview

An on-chip SRAM is provided to retain data in Deep Software Standby mode. Table 49.1 lists the Standby SRAM specifications.

Table 49.1 Standby SRAM specifications

Item	Description
SRAM capacity	1 KB
SRAM address	0x2800_0000 to 0x2800_03FF
Access	Standby SRAM clock is the same clock as the PCLKB. See section 49.3.5. Access Cycle for details.
Data retention function	Data can be retained in deep standby mode. See section 49.3.1. Data Retention for details.
parity	Even parity (data: 8 bits, parity: 1 bit)
Module-stop function	Module-stop state can be set to reduce power consumption. See section 49.3.2. Setting for the Module-stop Function for details.
Security	Permits the read and write operations to Standby RAM following TrustZone Filter function. See section 49.3.4. TrustZone Filter function for details.

49.2 Register Descriptions

49.2.1 STBRAMSAR : Standby RAM memory Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	NSBSTBR[3:0]			
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0

Bit	Symbol	Function	R/W
3:0	NSBSTBR[3:0]	Security attributes of each region for Standby RAM 0x0: Region7-0 are all Secure. 0x1: Region7 is Non-secure. Region6-0 are Secure 0x2: Region7-6 are Non-secure. Region5-0 are Secure. 0x3: Region7-5 are Non-secure. Region4-0 are Secure. 0x4: Region7-4 are Non-secure. Region 3-0 are Secure. 0x5: Region7-3 are Non-secure. Region 2-0 are Secure. 0x6: Region7-2 are Non-secure. Region 1-0 are Secure. 0x7: Region7-1 are Non-Secure. Region0 is Secure. Others: Region7-0 are all Non-Secure.	R/W
31:4	—	This bit is read as 1.	R

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

49. Standby SRAM

49.1 Overview

提供片上SRAM以在深度软件待机模式下保留数据。表49.1列出了备用SRAM规格。

Table 49.1 备用SRAM规格

Item	Description
SRAM capacity	1 KB
SRAM address	0x2800_0000 to 0x2800_03FF
Access	备用SRAM时钟与PCLKB时钟相同。请参阅第49.3.5节。访问周期了解详情。
数据保留功能	数据可以在深度待机模式下保留。请参阅第49.3.1节。有关详细信息的数据保留。
parity	偶校验（数据：8位，奇偶校验：1位）
Module-stop function	可设置模块停止状态以降低功耗。请参见第49.3.2节。设置为 模块停止功能了解详情。
Security	允许在TrustZone过滤器功能之后对备用RAM进行读取和写入操作。请参见第49.3.4节。TrustZone过滤器功能了解详情。

49.2 注册说明

49.2.1 STBRAMSAR:备用RAM内存安全属性寄存器

Base address: CPSCU = 0x4000_8000

Offset address: 0x014

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Symbol	Function	R/W
3:0	NSBSTBR[3:0]	StandbyRAM各区域的安全属性 0x0：Region7-0都是安全的。0x1：Region7不安全。Region6-0是安全的0x2：Region7-6是非安全的。Region5-0是安全的。0x3：Region7-5不安全。Region4-0是安全的。0x4：Region7-4不安全。区域3-0是安全的。0x5：Region7-3不安全。区域2-0是安全的。0x6：Region7-2不安全。区域1-0是安全的。0x7：Region7-1是非安全的。Region0是安全的。 其他：Region7-0都是非安全的。	R/W
31:4	—	该位读为1。	R

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

NSBSTBR[3:0] bit (Security attributes of each region for Standby RAM)

Standby RAM is divided into 8 regions. Each region can be set as Secure or Non-secure state with NSBSTBR[3:0]

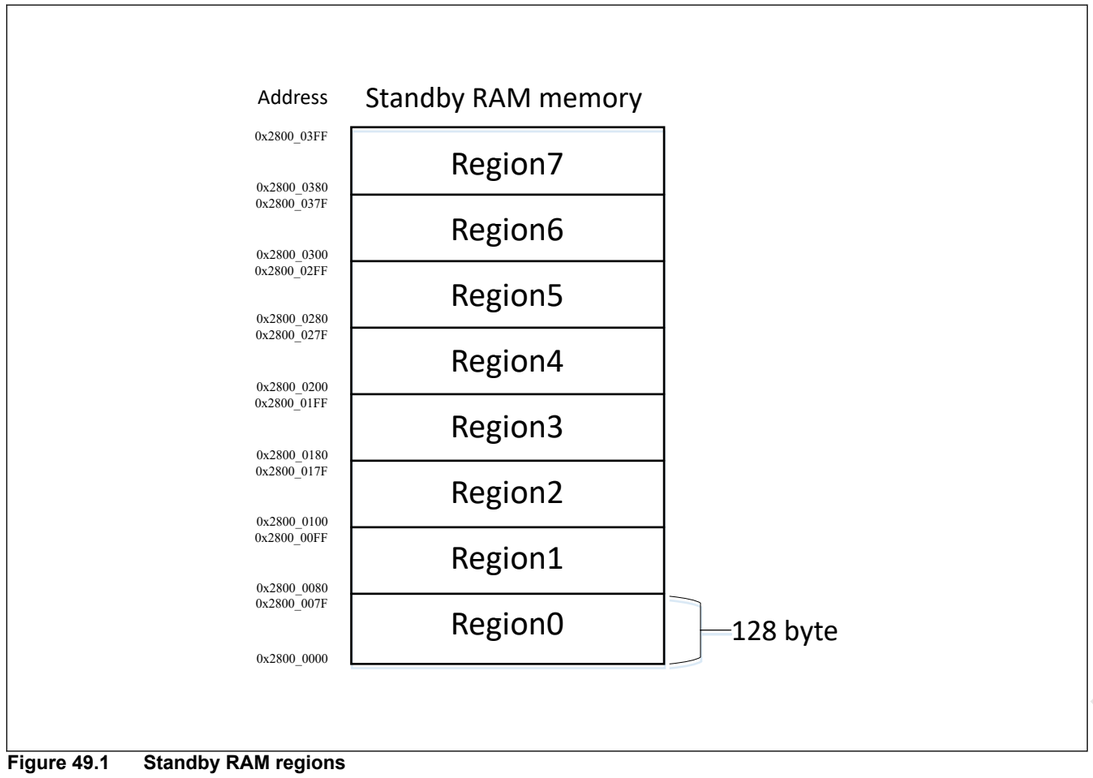

Figure 49.1 Standby RAM regions

49.3 Operation

49.3.1 Data Retention

The power supply to the Standby SRAM in Deep Software Standby mode is enabled by the DPSBYCR.DEEPCUT[1:0] bits. If the DPSBYCR.DEEPCUT[1:0] bits are set to 00b, data in the Standby SRAM is retained in Deep Software Standby mode. See section 10, Low Power Modes, for details on the DPSBYCR.DEEPCUT[1:0] bits.

49.3.2 Setting for the Module-stop Function

Power consumption can be reduced by setting module stop control register A (MSTPCRA) to stop supply of the clock signal to SRAM.

If the Standby SRAM bit in MSTPCRA is set to 1, supply of the clock signal to the Standby SRAM is stopped.

The Standby SRAM is thus placed in the module-stop state by stopping supply of the clock signals. The Standby SRAM operates after a reset.

The Standby SRAM is not accessible if it is in the module-stop state. A transition to the module-stop state should not be made while access to the standby SRAM is in progress.

For details on the MSTPCRA register, see section 10, Low Power Modes.

49.3.3 Parity Calculation Function

The parity calculation Function for Standby SRAM is as same as SRAM without ECC.

NSBSTBR[3:0]位（StandbyRAM每个区域的安全属性）

备用RAM分为8个区域。每个区域都可以通过NSBSTBR[3:0]设置为安全或非安全状态

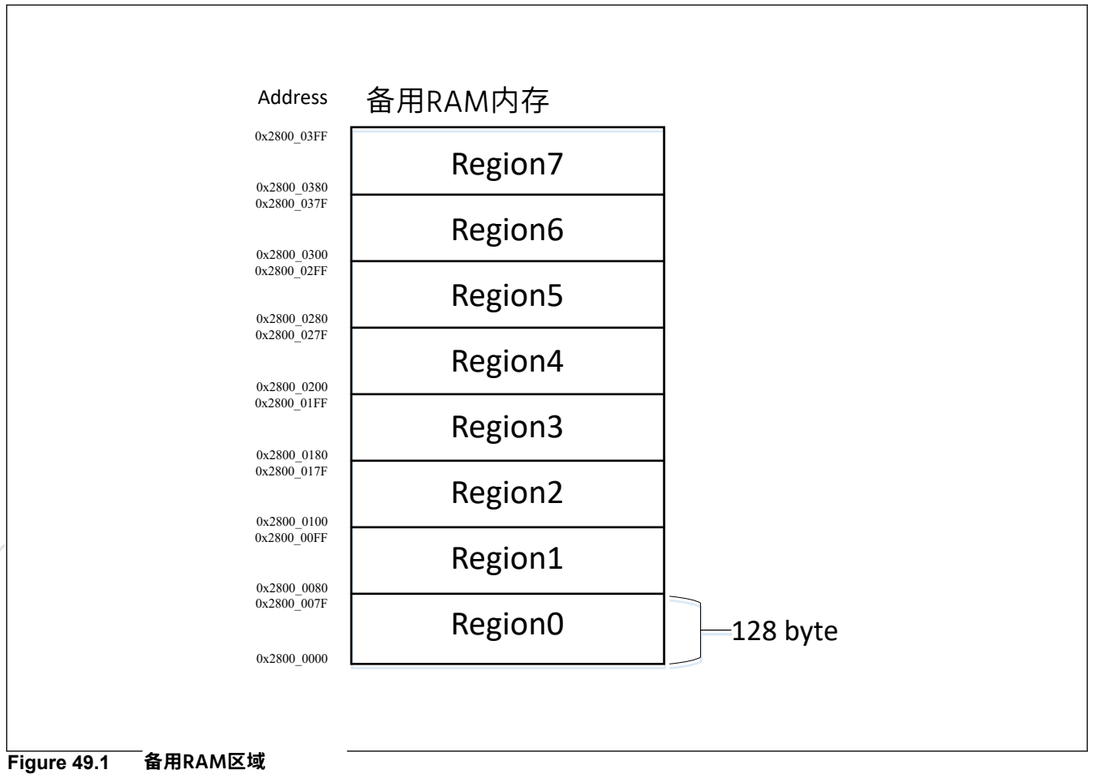

Figure 49.1 备用RAM区域

49.3 Operation

49.3.1 数据保留

深度软件待机模式下的待机SRAM电源由DPSBYCR.DEEPCUT[1:0]位启用。如果DPSBYCR.DEEPCUT[1:0]位设置为00b，则待机SRAM中的数据将保留在深度软件待机模式中。有关DPSBYCR.DEEPCUT[1:0]位的详细信息，请参见第10节，低功耗模式。

49.3.2 模块停止功能的设置

通过设置模块停止控制寄存器A(MSTPCRA)停止向SRAM提供时钟信号，可以降低功耗。

如果MSPCRA中的StandbySRAM位设置为1，则停止向StandbySRAM提供时钟信号。
因此，通过停止提供时钟信号，备用SRAM进入模块停止状态。待机SRAM在复位后运行。

如果处于模块停止状态，则无法访问备用SRAM。在访问备用SRAM的过程中，不应转换到模块停止状态。

有关MSTPCRA寄存器的详细信息，请参见第10节，低功耗模式。

49.3.3 奇偶校验计算功能

StandbySRAM的奇偶校验计算功能与无ECC的SRAM相同。

See section 48.3.5. Parity Calculation Function and section 48.3.7. Interrupt Source.

OAD bit in PARIOAD register is commonly used for SRAM0 (without ECC) / Standby SRAM.

49.3.4 TrustZone Filter function

There is only one type of TrustZone Filter function for Standby SRAM and that is, TrustZone Filter for SRAM memory protection

49.3.4.1 TrustZone Filter for Standby SRAM Memory Protection

Standby SRAM memory can be divided into 8 regions, 128 bytes each with a Security Attribution (SA) to be protected from Non-secure access. When SA indicates that the region in Standby SRAM is secure status, non-secure access can not overwrite them because TrustZone Filter detects finds an error and protects the write access.

Table 49.2 Security Attribution and Access status

SA	Access status	Write access	Read access
Secure	Secure	Permit	Permit
	Non-secure	TrustZone Filter error - Protected	TrustZone Filter error - Read data is 0
Non-secure	Secure	Permit	Permit
	Non-secure	Permit	Permit

When TrustZone Filter error for Standby SRAM access occurs, no error notification and no error response occurs.

49.3.5 Access Cycle

Number of cycles from the CPU.

For Standby SRAM, cache always has non-cacheable access.

Table 49.3 Standby SRAM (Parity Area 0x2800_0000 to 0x2800_03FF)

	Read cycle		Write cycle	
	Word access	Half-word/Byte access	Word access	Half-word/Byte access
ICLK ≥ PCLKB	Min.: 2 ICLK + 2 PCLKB Max.: (n + 1) ICLK + 2 PCLKB		Min.: 1 ICLK + 1 PCLKB Max.: n ICLK + 1 PCLKB	

Note: When the frequency ratio of ICLK : PCLKB is n : 1

49.4 Usage Notes

49.4.1 Instruction Fetch from the Standby SRAM Area

When using Standby SRAM to operate a program, initialize the Standby SRAM area so that the CPU can correctly prefetch data. A parity error might occur if the CPU prefetches from an area that is not initialized. Initialize the additional 12-byte area from the end address of the program with the 4-byte boundary. Renesas recommends using the NOP instruction for data initialization.

请参阅第48.3.5节。奇偶校验计算函数和第48.3.7节。中断源。

PARIOAD寄存器中的OAD位常用于SRAM0（无ECC）备用SRAM。

49.3.4 TrustZone过滤器功能

StandbySRAM只有一种TrustZoneFilter功能，即用于SRAM内存保护的TrustZoneFilter

49.3.4.1 用于备用SRAM内存保护的TrustZone过滤器

备用SRAM存储器可分为8个区域，每个128字节具有安全属性(SA)
非安全访问。当SA指示StandbySRAM中的区域为安全状态时，非安全访问无法覆盖它们，因为TrustZone Filter检测发现错误并保护写访问。

Table 49.2 安全属性和访问状态

SA	访问状态	写访问	读取权限
Secure	Secure	Permit	Permit
	Non-secure	TrustZone过滤器错 误受保护	TrustZone过滤器错 误读取数据为0
Non-secure	Secure	Permit	Permit
	Non-secure	Permit	Permit

当StandbySRAM访问的TrustZoneFilter错误发生时，不会发生错误通知和错误响应。

49.3.5 访问周期

CPU的周期数。

对于备用SRAM，缓存始终具有不可缓存的访问权限。

Table 49.3 备用SRAM（奇偶校验区0x2800_0000至0x2800_03FF）

	读周期		写周期	
	字访问	Half-word/Byte access	字访问	Half-word/Byte access
ICLK ≥ PCLKB	Min.: 2 ICLK + 2 PCLKB Max.: (n + 1) ICLK + 2 PCLKB		Min.: 1 ICLK + 1 PCLKB Max.: n ICLK + 1 PCLKB	

Note: 当ICLK:PCLKB的频率比为n:1时

49.4 使用说明

49.4.1 从备用SRAM区域取指令

使用StandbySRAM操作程序时，初始化StandbySRAM区域，以便CPU可以正确预取数据。如果CPU从未初始化的区域预取，则可能发生奇偶校验错误。用4字节边界从程序的结束地址初始化额外的12字节区域。瑞萨推荐使用NOP指令进行数据初始化。

50. Flash Memory

This MCU incorporates code flash memory, data flash memory, and option-setting memory. The code flash memory stores instructions and operands, and the data flash memory stores data. For option-setting memory, see section 6, Option-Setting Memory.

50.1 Overview

Table 50.1 lists the specifications of the flash memory, and Figure 50.1 is block diagrams of the flash memory related modules.

The I/O pins used in boot mode, see Table 50.33.

The FCU (flash control unit) controls programming and erasure of the flash memory. The FACI (flash application command interface) controls the FCU according to the specified FACI commands.

Regarding the configuration of the code flash memory, see Figure 50.2 to Figure 50.3, and for the configuration of the data flash memory, see Figure 50.4.

Table 50.1 Specifications of flash memory (1 of 2)

Item	Code flash memory	Data flash memory
Memory capacity	User area: 2 Mbytes max	Data area: 8 Kbytes
Read cycle	See section 50.16.3. Access Cycle	See section 50.16.3. Access Cycle
Value after erasure	0xFF	Undefined
Programming/erasing method	• Programming and erasing the code flash memory and data flash memory, and programming the option-setting memory are handled by the FACI commands specified in the FACI command issuing area (0x407E_0000) (self-programming). • Programming/erasure through transfer by a serial-programmer via a serial interface (serial programming)	
Protection	Protects against erroneous rewriting of the flash memory	
Dual bank function	The dual-bank structure makes a safe update possible in cases where programming is suspended. • Linear mode: the code flash memory is used as one area. • Dual mode: the code flash memory is divided into two areas.	Not available
Block swap function	The block swap structure makes a safe update for a part of non-secure application possible in case where programming is suspended.	Not available
Background operations (BGOs)	• The code flash memory can be read while the code flash memory is being programmed or erased.*1 • The data flash memory can be read while the code flash memory is being programmed or erased. • The code flash memory can be read while the data flash memory is being programmed or erased.	
Units of programming and erasure	• Units of programming for the user area: 128 bytes • Units of erasure for the user area: Block units	• Unit of programming for the data area:4/8/16 bytes • Unit of erasure for the data area:64/128/256 bytes
Other functions	Interrupts can be accepted during self-programming. In the initial settings of this MCU, an expansion area of the option-setting memory can be set.	

50. 闪存

该MCU包含代码闪存、数据闪存和选项设置存储器。代码闪存存储指令和操作数，数据闪存存储数据。有关选项设置内存，请参阅第6节，选项设置内存。

50.1 Overview

表50.1列出了闪存的规格，图50.1是闪存相关模块的框图。

引导模式下使用的IO引脚，请参见表50.33。

FCU（闪存控制单元）控制闪存的编程和擦除。FACI（闪存应用命令接口）根据指定的FACI命令控制FCU。

代码闪存的配置见图50.2～图50.3，数据闪存的配置见图50.4。

Table 50.1 闪存规格(1of2)

Item	代码闪存	数据闪存
内存容量	用户区：最大2MB	Data area: 8 Kbytes
读周期	请参阅第50.16.3节。访问周期	请参阅第50.16.3节。访问周期
擦除后的值	0xFF	Undefined
Programming/erasing method	• 编程和擦除代码闪存和数据闪存以及编程选项设置存储器由FACI命令发出区域(0x407E_0000)中指定的FACI命令处理（自编程）。 • 通过串行编程器通过串行接口传输的编程擦除（串行编程）	
Protection	防止闪存的错误重写	
双银行功能	双存储体结构可以在编程暂停的情况下进行安全更新。● 线性模式：代码闪存作为一个区域使用。 • 双模式：代码闪存分为两个区域。	无法使用
区块交换功能	块交换结构可以在编程暂停的情况下对部分非安全应用程序进行安全更新。	无法使用
后台操作(BGO)	• 在对代码闪存进行编程或擦除时，可以读取代码闪存。*1 • 在对代码闪存进行编程或擦除时，可以读取数据闪存。 • 在对数据闪存进行编程或擦除时，可以读取代码闪存。	
编程和擦除单元	• 用户区编程单位：128字节 • 用户区擦除单位：块单位	• 数据区编程单位：4816字节 • 数据区擦除单位：64128256字节
其他功能	自编程期间可以接受中断。 在此MCU的初始设置中，可以设置选项设置存储器的扩展区域。	

Table 50.1 Specifications of flash memory (2 of 2)

Item	Code flash memory	Data flash memory
On-board programming (four types)	Programming/erasure in boot mode (for the SCI interface) ● The asynchronous serial interface (SCI9) is used. ● The transfer rate is adjusted automatically. Programming/erasure in boot mode (for the USB interface) ● USBFS is used. ● Dedicated hardware is not required, so direct connection to a PC is possible. Programming/erasure in On-chip debug mode ● JTAG or SWD interface is used Programming and erasure by self-programming ● This allows code flash memory programming/erasure without resetting the system.	
Unique ID	A 16-byte ID code provided for each MCU	
FACI command	Program : 128 bytes Block erase: 1 block (8 KB or 32 KB) P/E suspend P/E resume Forced Stop Status Clear Configuration set (16 bytes)	Program: 4/8/16 bytes Block Erase: 1 block (64 bytes) Multi Block Erase: 64/128/256 bytes P/E suspend P/E resume Forced Stop Blank Check: 4 bytes to data flash memory capacity Status Clear
Security function	Protects against illicit tampering with or reading out of data in flash memory Startup area select setting protection ● BTFLG and FSUACR registers are protected by the FSPR bit. Permanent block protect setting protection ● Code flash memory is permanently protected from programming/erasure operation by the permanent block protect function. Flash memory protection for TrustZone ● Protection for flash memory area (P/E) ● Protection for flash memory area (read) ● Protection for register ● Protection during FACI command operation. ● Code flash P/E mode entry protection	
Safety function	Software protection ● FACI command protection by FENTRYR register. ● Flash memory is protected by FWEPROR register ● The user area is protected by the block protect setting Error protection ● Error is detected when unintended commands or prohibited settings occur. The FACI command is not accepted after an error detection. Boot area protection ● The start-up area select function allows customer to safely update the boot firmware. The size of the start-up area is 8 KB.	
Interrupt request	● FRDYI (flash sequencer ready (processing end)) : Enabled by FRDYIE bit. ● FIFERR (flash sequencer error) : Enabled by CFAEIE/CMDLKIE/DFAEIE bits	
Address conversion	Start-up area select function is supported in linear mode Dual mode and Linear mode ● Bank swap function is supported in dual mode ● Block swap function is supported in linear mode	

Note 1. Limitations apply to the combinations of the address ranges for programming/erasure process and reading process: see Table 50.35.

Figure 50.1 shows how modules related to flash memory can be configured. The flash sequencer is configured with the FCU and FACI. The FCU executes basic control for rewriting of the flash memory. The FACI receives FACI commands using peripheral bus, and controls FCU operations accordingly.

In response to a reset, the FACI transfers data from the flash memory to the option byte storage registers.

Table 50.1 闪存规格(2of2)

Item	代码闪存	数据闪存
On-board programming (four types)	引导模式下的编程擦除（用于SCI接口）● 使用异步串行接口(SCI9)。 ● 传输速率会自动调整。 引导模式下的编程擦除（针对USB接口）● 使用USBFS。 ● 不需要专用硬件，因此可以直接连接到PC。 片上调试模式下的编程擦除● 使用JTAG或SWD接口 通过自编程进行编程和擦除● 这允许在不重置系统的情况下擦除代码闪存编程。	
唯一身份	为每个MCU提供一个16字节的ID代码	
FACI命令	程序：128字节 块擦除：1个块（8KB或32KB） PE暂停PE恢 复强制停止 状态清除 配置集（16字节）	Program: 4/8/16 bytes Block Erase: 1 block (64 bytes) 多块擦除：64128256字节 PE暂停PE恢 复强制停止 空白检查：4字节到数据闪存容量状态清除
安全功能	防止非法篡改或读取闪存中的数据 启动区选择设置保护● BTFLG和FSUACR寄存器受FSPR位保护。 永久块保护设置保护● 永久块保护功能永久保护代码闪存免受编程擦除操作的影响。TrustZone的闪存保护● 闪存区保护(PE) ● 保护闪存区域（读取） ● 注册保护 ● FACI命令操作期间的保护。 ● CodeflashPE模式进入保护	
安全功能	软件保护● FACI命令由FENTRYR寄存器保护。 ● 闪存受FWEPROR寄存器保护 ● 用户区受块保护 设置保护 错误保护● 发生意外命令或禁止设置时会检测到错误。错误检测后不接受FACI命令。引导区保护● 启动区域选择功能允许客户安全地更新启动固件。启动区的大小为8KB。	
中断请求	● FRDYI（闪存序列器就绪（处理结束））： 由FRDYIE位启用。 ● FIFERR (flash sequencer error) : 由CFAEIECMDLKIEDFAEIE位启用	
地址转换	线性模式下支持启动区域选择功能 双模式和线性模式● 双模式支持银行互换功能 ● 线性模式下支持块交换功能	

注1.限制适用于编程擦除过程和读取过程的地址范围组合：见表50.35。

图50.1显示了如何配置与闪存相关的模块。闪存定序器配置有FCU和FACI。FCU执行闪存重写的基本控制。FACI使用外围总线接收FACI命令，并相应地控制FCU操作。

响应复位，FACI将数据从闪存传输到选项字节存储寄存器。

RA生态工作室

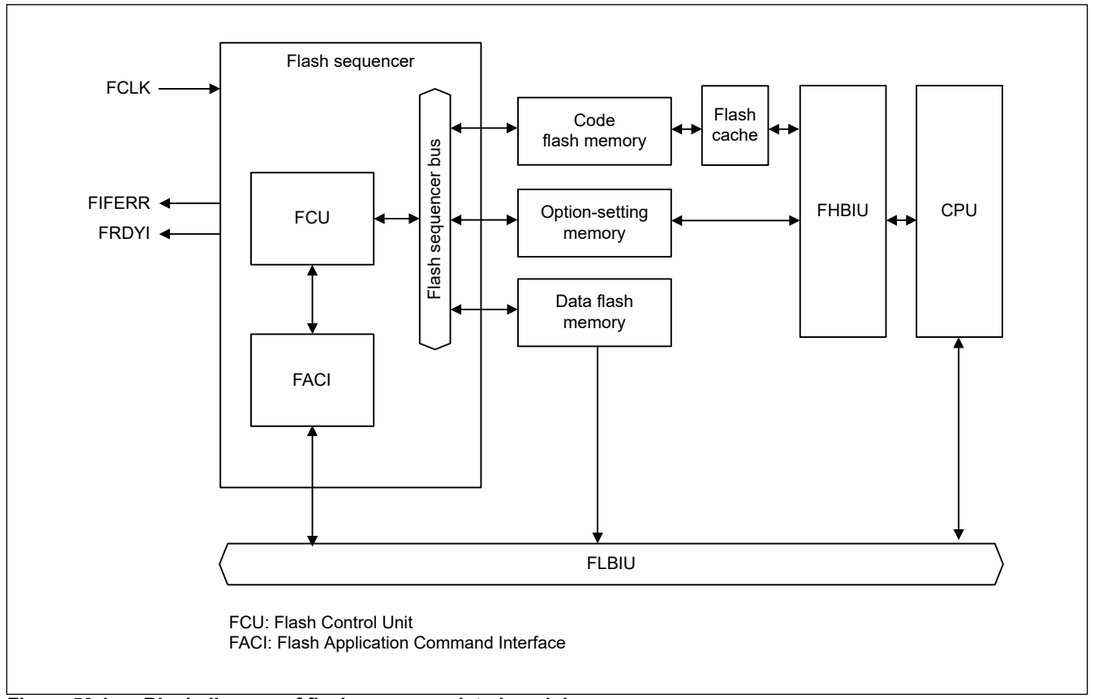

Figure 50.1 Block diagram of flash memory-related modules

50.2 Structure of Memory

Figure 50.2 shows the memory map of code flash memory in linear mode. Figure 50.3 shows the memory map of code flash memory in dual mode. This MCU can use the code flash memory as 2 bank areas by using the dual bank function. This dual-bank structure allows a safe update of a program while a user program is running.

The user area of the code flash memory in this MCU is divided into 8- and 32-Kbyte blocks, which serve as the units of erasure.

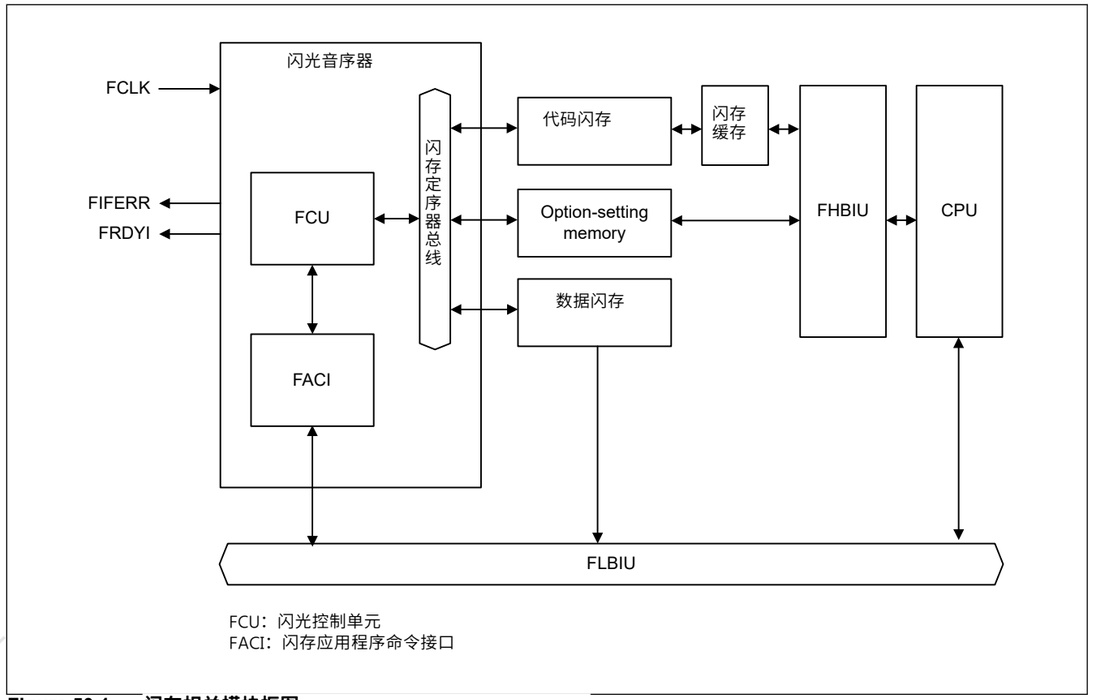

Figure 50.1 闪存相关模块框图

50.2 内存结构

图50.2显示了线性模式下代码闪存的存储器映射。图50.3显示了双模式下代码闪存的存储器映射。该MCU通过使用双存储区功能，可以将代码闪存用作2个存储区。这种双库结构允许在用户程序运行时安全地更新程序。

本MCU中代码闪存的用户区分为8和32KB块，作为擦除单位。

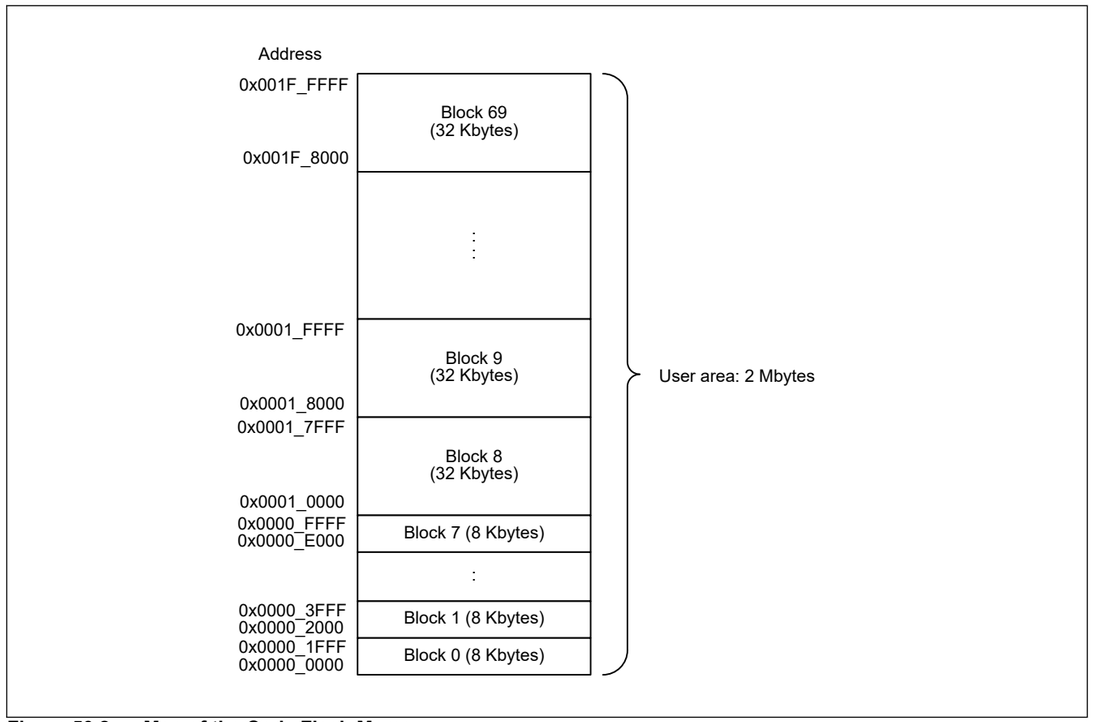

Figure 50.2 Map of the Code Flash Memory

Table 50.2 Read and programming/erasure address by product for the code flash memory

Product	Address	Number of blocks
2 Mbytes product	0x0000_0000h to 0x001F_FFFF	0 to 69
1.5 Mbytes product	0x0000_0000h to 0x0017_FFFF	0 to 53
1 Mbytes product	0x0000_0000h to 0x000F_FFFF	0 to 37

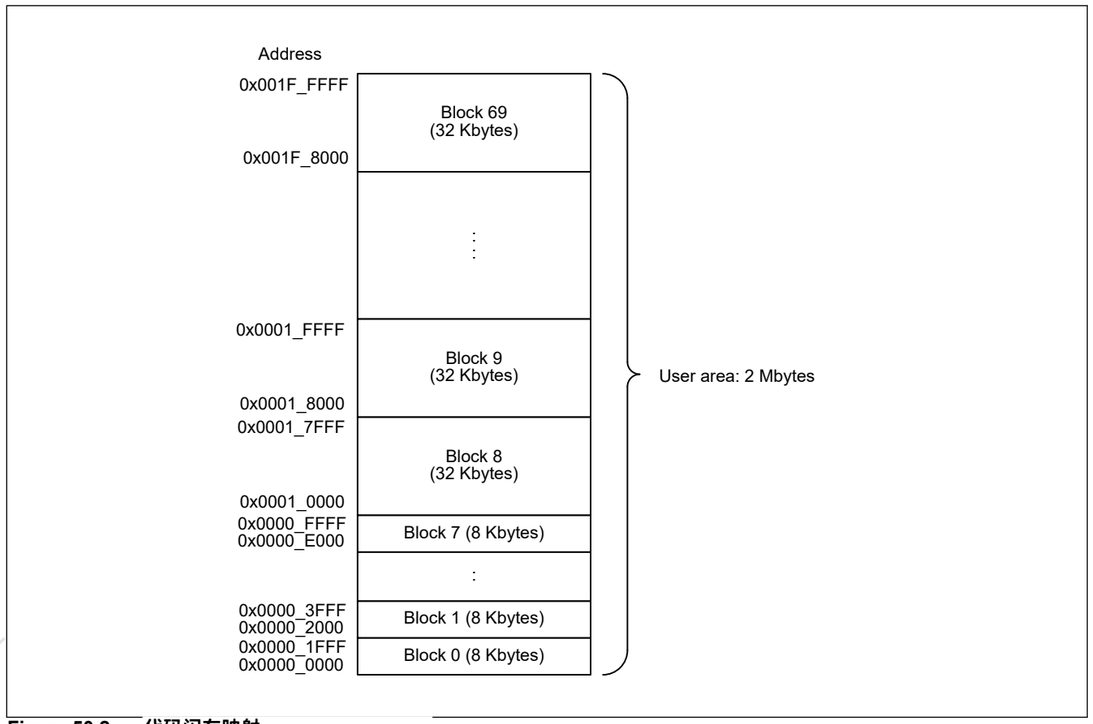

Figure 50.2 代码闪存映射

Table 50.2 按产品读取和编程代码闪存的擦除地址

Product	Address	块数
2 Mbytes product	0x0000_0000h to 0x001F_FFFF	0 to 69
1.5 Mbytes product	0x0000_0000h to 0x0017_FFFF	0 to 53
1 Mbytes product	0x0000_0000h to 0x000F_FFFF	0 to 37

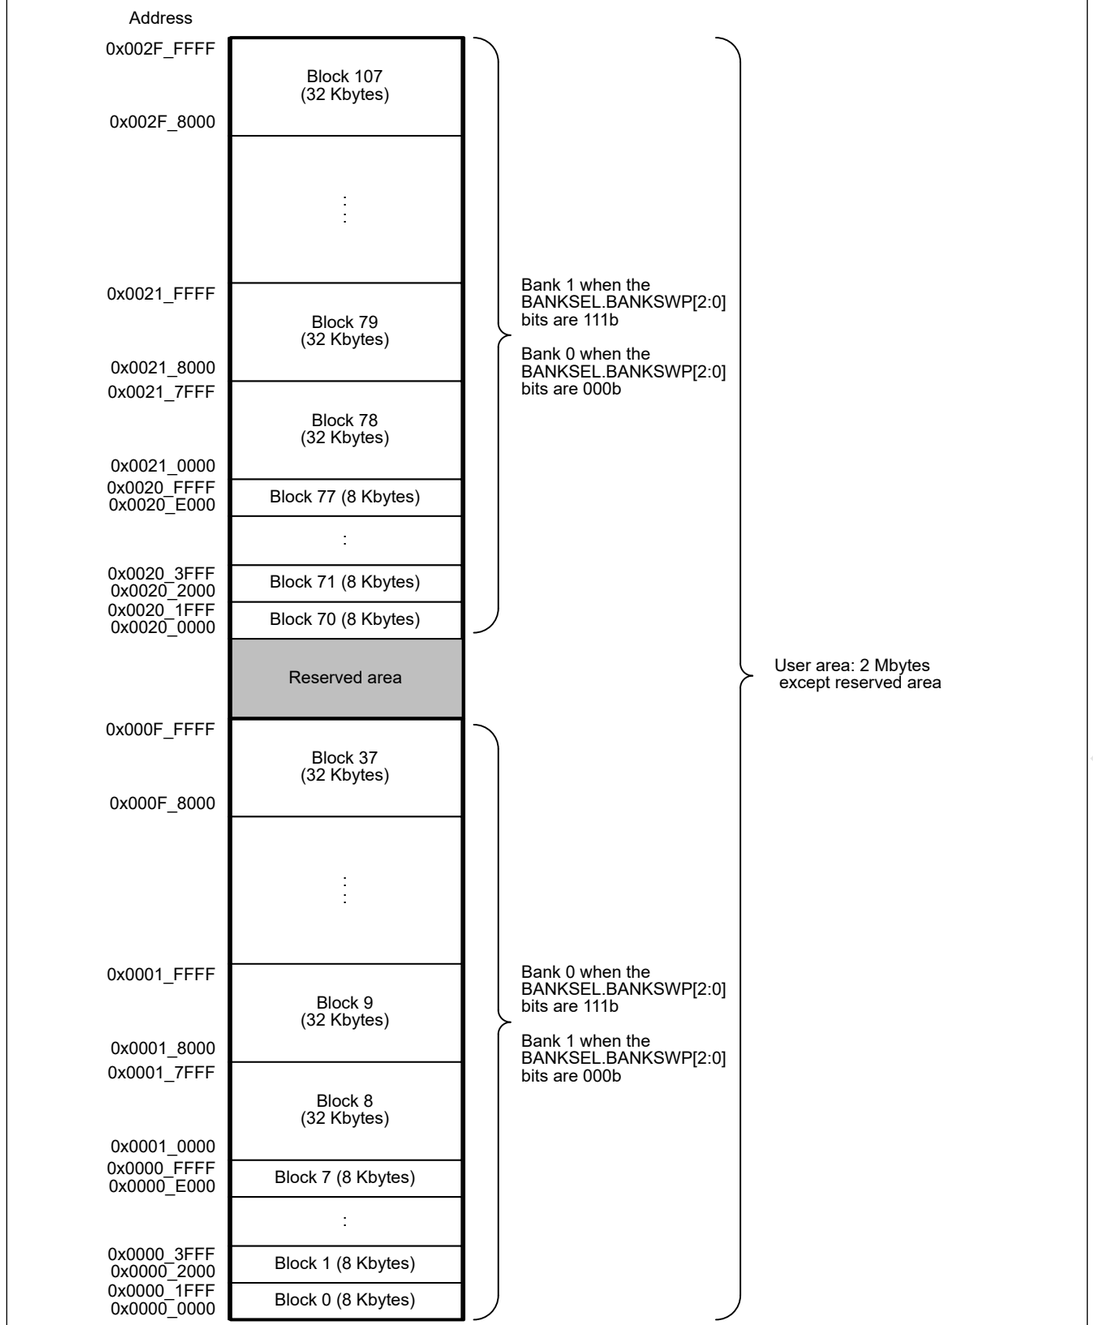

Figure 50.3 Map of the Code Flash Memory in Dual Mode

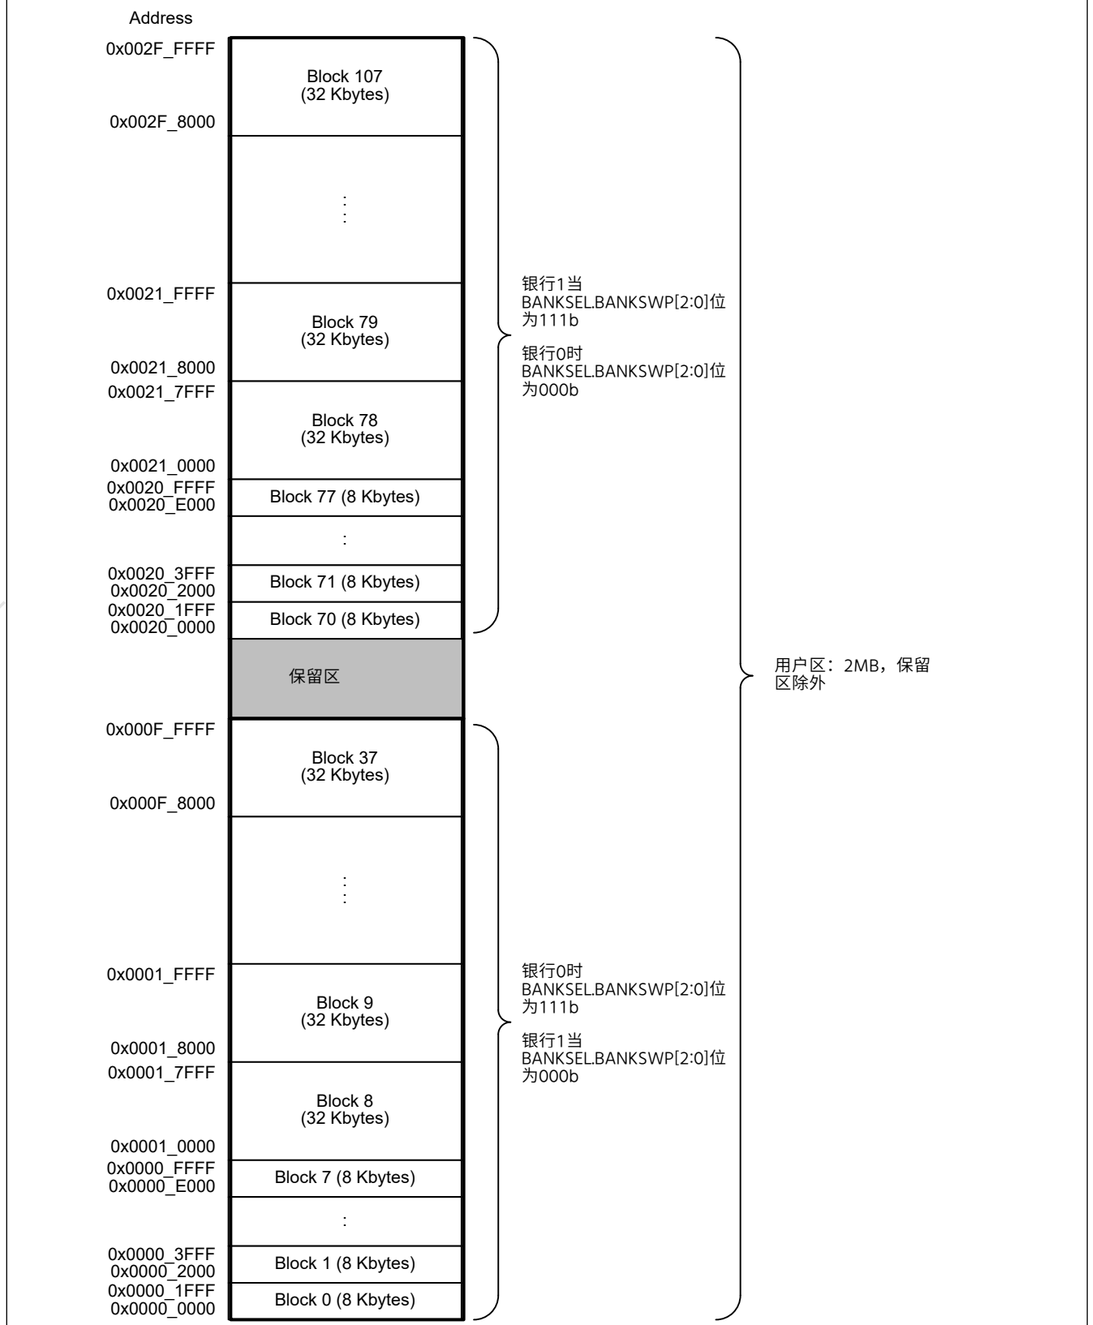

Figure 50.3 双模式下的代码闪存映射

Table 50.3 Read and programming/erasure address by product for the code flash memory

Product	Address	Number of blocks
2 Mbytes product, lower side bank	0x0000_0000 to 0x000F_FFFF	0 to 37
2 Mbytes product, upper side bank	0x0020_0000 to 0x002F_FFFF	70 to 107
1.5 Mbytes product, lower side bank	0x0000_0000 to 0x000B_FFFF	0 to 29
1.5 Mbytes product, upper side bank	0x0020_0000 to 0x002B_FFFF	70 to 99
1 Mbytes product, lower side bank	0x0000_0000 to 0x0007_FFFF	0 to 21
1 Mbytes product, upper side bank	0x0020_0000 to 0x0027_FFFF	70 to 91

The data area of the data flash memory in this MCU is divided into 64-byte blocks, with each being a unit for erasure. Figure 50.4 shows the mapping of the data flash memory.

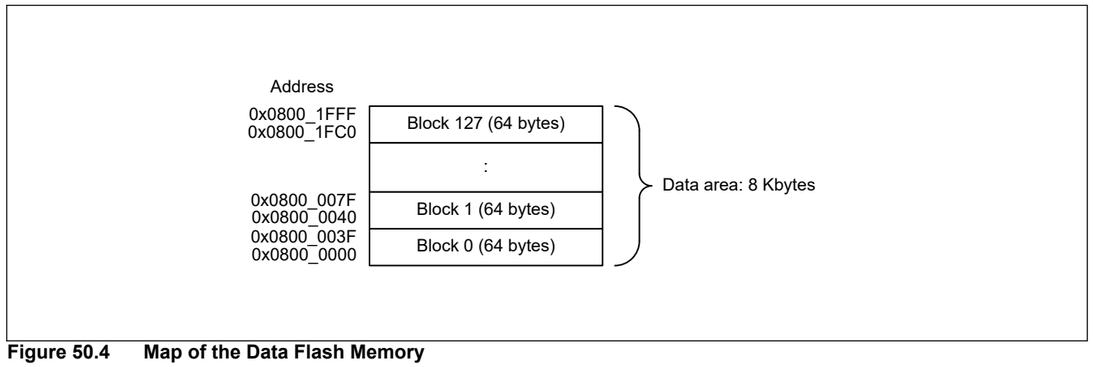

Figure 50.4 Map of the Data Flash Memory

50.3 Address Space

Using the hardware interface with flash memory requires access to all registers of the hardware, which is for issuing FACI commands. Table 50.4 provides information about the hardware interface.

Table 50.4 Information on the hardware interface area

Area	Address	Capacity
Area containing various registers of the hardware	See section 50.4. Register Descriptions.	See section 50.4. Register Descriptions.
FACI command-issuing area	0x407E_0000	4 bytes

For the address information of the flash memory, see Figure 50.2.

50.4 Register Descriptions

50.4.1 FCACHEE : Flash Cache Enable Register

Base address: FCACHE = 0x4001_C100

Offset address: 0x000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCAC HEEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 50.3 按产品读取和编程代码闪存的擦除地址

Product	Address	块数
2MB产品，下侧银行	0x0000_0000 to 0x000F_FFFF	0 to 37
2MB产品，上侧银行	0x0020_0000 to 0x002F_FFFF	70 to 107
1.5MB产品，下侧银行	0x0000_0000 to 0x000B_FFFF	0 to 29
1.5MB产品，上侧银行	0x0020_0000 to 0x002B_FFFF	70 to 99
1MB产品，下侧银行	0x0000_0000 to 0x0007_FFFF	0 to 21
1MB产品，上侧银行	0x0020_0000 to 0x0027_FFFF	70 to 91

本单片机中数据闪存的数据区被划分为64字节块，每个块为一个擦除单元。
图50.4显示了数据闪存的映射。

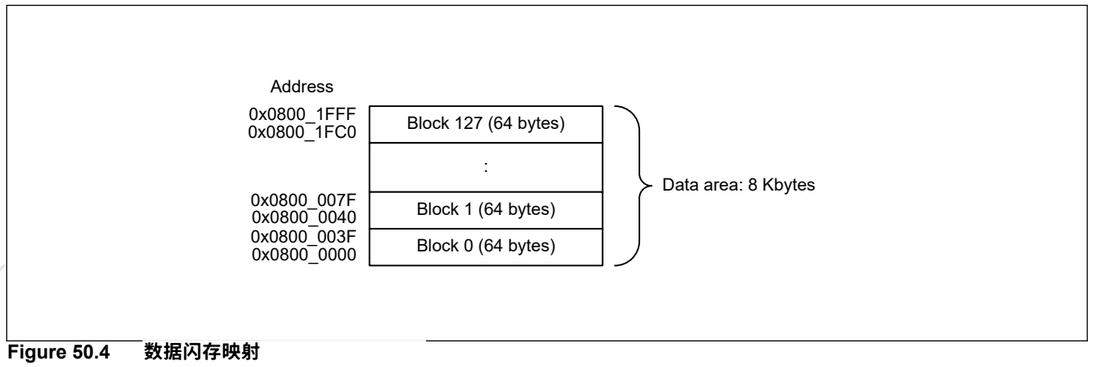

Figure 50.4 数据闪存映射

50.3 地址空间

使用带有闪存的硬件接口需要访问硬件的所有寄存器，用于发出FACI命令。表50.4提供了有关硬件接口的信息。

Table 50.4 硬件接口区信息

Area	Address	Capacity
包含各种硬件寄存器的区域	请参阅第50.4节。注册说明。	请参阅第50.4节。注册说明。
FACI指挥区	0x407E_0000	4 bytes

Flash存储器的地址信息见图50.2。

50.4 注册说明

50.4.1 FCACHEE:闪存缓存启用寄存器

Base address: FCACHE = 0x4001_C100

Offset address: 0x000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCAC HEEN
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FCACHEEN	Flash Cache Enable 0: FCACHE is disabled 1: FCACHE is enabled	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W

This register is not controlled by any security attribute register.

FCACHEEN bit (Flash Cache Enable)

FCACHEE.FCACHEEN bit enable and disables the function of Flash Cache of FCACHE1, FCACHE2 and FLPF.

FCACHEE.FCACHEEN bit dose not influence for FCACHEIV.FCACHEIV.

When FCACHE is enabled, it works for accesses marked as cacheable.

It is prohibited to disable FCACHE after enabling.

50.4.2 FCACHEIV : Flash Cache Invalidate Register

Base address: FCACHE = 0x4001_C100

Offset address: 0x004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEIV
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FCACHEIV	Flash Cache Invalidate 0: Read: Do not invalidate. Write: The setting is ignored. 1: Invalidate FCACHE is invalidated.	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W

This register is not controlled by any security attribute register.

FCACHEIV bit (Flash Cache Invalidate)

When 1 is written to FCACHEIV.FCACHEIV bit, the Flash cache data of FCACHE1, FCACHE2 and FLPF is invalidated.

Invalidate FCACHE with keeping FCACHE enabled after programming or erasing the code flash or the option setting memory.

50.4.3 FLWT : Flash Wait Cycle Register

Base address: FCACHE = 0x4001_C100

Offset address: 0x01C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	FLWT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	FLWT[2:0]	Flash Wait Cycle 0 0 0: 0 wait (ICLK ≤ 50 MHz) 0 0 1: 1 wait (50 MHz < ICLK ≤ 100 MHz)	R/W

Bit	Symbol	Function	R/W
0	FCACHEEN	闪存缓存启用 0：禁用FCACHE1：启用FCACHE	R/W
15:1	—	这些位被读取为0。写入值应为0。	R/W

该寄存器不受任何安全属性寄存器的控制。

FCACHEEN位（闪存使能）

FCACHEE.FCACHEEN位启用和禁用FCACHE1、FCACHE2和FLPF的FlashCache功能。

FCACHEE.FCACHEEN位对FCACHEIV.FCACHEIV没有影响。

启用FCACHE后，它适用于标记为可缓存的访问。

禁止启用后禁用FCACHE。

50.4.2 FCACHEIV:闪存缓存无效寄存器

Base address: FCACHE = 0x4001_C100

Offset address: 0x004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCACHEIV
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FCACHEIV	闪存缓存失效 0：读取：不无效。 写入：忽略该设置。 1: Invalidate FCACHE无效。	R/W
15:1	—	这些位被读取为0。写入值应为0。	R/W

该寄存器不受任何安全属性寄存器的控制。

FCACHEIV位（FlashCache无效）

当FCACHEIV.FCACHEIV位写入1时，FCACHE1、FCACHE2和FLPF的Flash缓存数据无效。

在编程或擦除代码闪存或选项设置存储器后保持FCACHE使能，使FCACHE无效。

50.4.3 FLWT：闪存等待周期寄存器

Base address: FCACHE = 0x4001_C100

Offset address: 0x01C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	FLWT[2:0]		
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	FLWT[2:0]	闪存等待周期 0 0 0: 0 wait (ICLK ≤ 50 MHz) 0 0 1: 1 wait (50 MHz < ICLK ≤ 100 MHz)	R/W

Bit	Symbol	Function	R/W
		0 1 0: 2 wait (100 MHz < ICLK ≤ 150 MHz) 0 1 1: 3 wait (ICLK > 150 MHz) Others: Setting prohibited	
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

FLWT[2:0] bits (Flash Wait Cycle)

The Flash Wait Cycle Register (FLWT) sets the access wait count for the flash memory.

For faster clock frequencies, set FLWT.FLWT before changing the clock frequency. For slower clock frequencies, set FLWT.FLWT after changing the clock frequency.

For information on the frequency setting, see section 8, Clock Generation Circuit.

50.4.4 FSAR : Flash Security Attribution Register

Base address: FCACHE = 0x4001_C100

Offset address: 0x040

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FCKMHZSA	—	—	—	—	—	—	—	FLWTSA
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	FLWTSA	FLWT Security Attribution Target register : FLWT 0: Secure 1: Non-Secure	R/W
7:1	—	These bits are read as 1. The write value should be 1.	R/W
8	FCKMHZSA	FCKMHZ Security Attribution Target register : FCKMHZ 0: Secure 1: Non-Secure	R/W
15:9	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Write access is invalid when PRCR.PRC4 bit is 0. See section 12, Register Write Protection.

FLWTSA bit (FLWT Security Attribution)

This bit sets the security attribute of FLWT.

FCKMHZSA bit (FCKMHZ Security Attribution)

This bit sets the security attribute of FCKMHZ.

Bit	Symbol	Function	R/W
		0 1 0: 2 wait (100 MHz < ICLK ≤ 150 MHz) 0 1 1: 3 wait (ICLK > 150 MHz) 其他：禁止设置	
7:3	—	这些位被读取为0。写入值应为0。	R/W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

FLWT[2:0]位（闪存等待周期）

闪存等待周期寄存器(FLWT)设置闪存的访问等待计数。

要获得更快的时钟频率，请在更改时钟频率之前设置FLWT.FLWT。对于较慢的时钟频率，设置改变时钟频率后的FLWT.FLWT。

有关频率设置的信息，请参见第8节，时钟生成电路。

50.4.4 FSAR:Flash安全属性寄存器

Base address: FCACHE = 0x4001_C100

Offset address: 0x040

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FCKMHZSA	—	—	—	—	—	—	—	FLWTSA
重置后的值:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	FLWTSA	FLWT安全归因 目标寄存器：FLWT 0: Secure 1: Non-Secure	R/W
7:1	—	这些位被读取为1。写入值应为1。	R/W
8	FCKMHZSA	FCKMHZ安全归属地 目标寄存器：FCKMHZ 0: Secure 1: Non-Secure	R/W
15:9	—	这些位被读取为1。写入值应为1。	R/W

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

当PRCR.PRC4位为0时，写访问无效。参见第12节，寄存器写保护。

FLWTSA位（FLWT安全属性）

该位设置FLWT的安全属性。

FCKMHZSA位（FCKMHZ安全属性）

该位设置FCKMHZ的安全属性。

50.4.5 UIDRn : Unique ID Registers n (n = 0 to 3)

Address: 0x0100_8190 + n × 4

Bit position:	31															0
Bit field:	UID															
Value after reset:	Unique value for each chip															

Bit	Symbol	Function	R/W
31:0	UID	Unique ID	R

The UIDRn is a read-only register that stores a 16-byte ID code (unique ID) for identifying the individual MCU. The UIDRn register should be read in 32-bit units. When reading by the signature request command of the serial programming interface, the data is read in order from the data with the large address. That is, the data in 0x0100_819F is read first, and in 0x0100_8190 is read last.

50.4.6 PNRn : Part Numbering Register n (n = 0 to 3)

Address: 0x0100_80F0 + n × 4

Bit position:	31															0
Bit field:	PNR															
Value after reset:	Unique value for each chip															

Bit	Symbol	Function	R/W
31:0	PNR	Part Number	R

The PNRn is a read-only register that stores a 16-byte part numbering. The PNRn register should be read in 32-bit units. Each byte corresponds to the ASCII code representation of the product part number as detailed in Table 1.13 Product list. The first character ("R", 0x52 in ASCII code) of the part number is stored in the byte with the smallest address (0x0100_80F0). When reading by the signature request command of the serial programming interface, the data is read in order from the data with the small address. That is, the data in 0x0100_80F0 is read first, and in 0x0100_80FF is read last.

50.4.7 MCUVER : MCU Version Register

Address: 0x0100_81B0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	MCUVE							
Value after reset:	Value depend on the chip							

Bit	Symbol	Function	R/W
7:0	MCUVE	MCU Version	R

The MCUVER is a read-only register that stores a MCU version. The MCUVER register should be read in 8-bit units.

50.4.5 UIDRn：唯一ID寄存器n（n=0到3）

Address: 0x0100_8190 + n × 4

Bit position:	31															0
Bit field:	UID															
重置后的值：	每个芯片的独特价值															

Bit	Symbol	Function	R/W
31:0	UID	唯一身份	R

UIDRn是一个只读寄存器，它存储一个16字节的ID代码（唯一ID），用于识别单个MCU。这
UIDRn寄存器应以32位为单位读取。通过串口编程接口的签名请求命令读取时，从地址大的数据开始依次读取。
即先读取0x0100_819F中的数据，最后读取0x0100_8190中的数据。

50.4.6 PNRn：零件编号寄存器n（n=0到3）

Address: 0x0100_80F0 + n × 4

Bit position:	31															0
Bit field:	PNR															
重置后的值：	每个芯片的独特价值															

Bit	Symbol	Function	R/W
31:0	PNR	零件号	R

PNRn是一个只读寄存器，存储一个16字节的零件编号。PNRn寄存器应以32位为单位读取。每个字节对应于表1.13产品列表中详细说明的产品部件号的ASCII代码表示。部件号的第一个字符（“R”，ASCII码中的0x52）存储在地址最小的字节中（0x0100_80F0）。通过串行编程接口的签名请求命令读取时，从地址小的数据开始依次读取。即先读取0x0100_80F0中的数据，最后读取0x0100_80FF中的数据。

50.4.7 MCUVER:MCU版本寄存器

Address: 0x0100_81B0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	MCUVE							
重置后的值：	价值取决于芯片							

Bit	Symbol	Function	R/W
7:0	MCUVE	MCU Version	R

MCUVER是一个只读寄存器，用于存储MCU版本。MCUVER寄存器应以8位为单位读取。

50.4.8 FWEPROR : Flash P/E Protect Register

Base address: SYSC = 0x4001_E000

Offset address: 0x416

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	FLWE[1:0]	
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
1:0	FLWE[1:0]	Flash Programming and Erasure 0 0: Prohibits Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing. 0 1: Permits Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing. 1 0: Prohibits Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing. 1 1: Prohibits Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

It is possible that Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command processing are prohibited by software.

The FWEPROR register is initialized by a reset from the following:

- All reset source
- Transition to Deep Software Standby mode
- Transition to Software Standby mode.

FLWE[1:0] bits (Flash Programming and Erasure)

The FLWE[1:0] bits are used to set the flash P/E protection. The value after reset is 10b.

If these bits are set to other than 01b that does not allow programming and erasure of the flash memory, the following commands cannot be executed. Issuing any of the following commands leads to setting of the FLWEERR bit in the FSTATR register to 1.

Program / Block Erase / Multi Block Erase / Blank Check / Configuration set command

50.4.9 FASTAT : Flash Access Status Register

Base address: FACI = 0x407F_E000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CFAE	—	—	CMDLK	DFAE	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	DFAE	Data Flash Memory Access Violation Flag 0: No data flash memory access violation has occurred 1: A data flash memory access violation has occurred.	R/W*1
4	CMDLK	Command Lock Flag 0: The flash sequencer is not in the command-locked state 1: The flash sequencer is in the command-locked state.	R

50.4.8 FWEPROR:FlashPE保护寄存器

Base address: SYSC = 0x4001_E000

Offset address: 0x416

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	FLWE[1:0]	
重置后的值:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
1:0	FLWE[1:0]	闪存编程和擦除 00：禁止编程、块擦除、多块擦除、空白检查和配置设置命令处理。 01：允许编程、块擦除、多块擦除、空白检查和配置设置命令处理。 10：禁止编程、块擦除、多块擦除、空白检查和配置设置命令处理。 11：禁止Program、BlockErase、MultiBlockErase、BlankCheck和Configurationset命令处理。	R/W
7:2	—	这些位被读取为0。写入值应为0。	R/W

程序、块擦除、多块擦除、空白检查和配置设置命令处理可能被软件禁止。

FWEPROR寄存器通过以下复位进行初始化：

●所有复位源

●转换到深度软件待机模式

●转换到软件待机模式。

FLWE[1:0]位（闪存编程和擦除）

FLWE[1:0]位用于设置flashPE保护。复位后的值为10b。

如果这些位设置为不允许对闪存进行编程和擦除的01b以外，则无法执行以下命令。发出以下任何命令都会将FSTATR寄存器中的FLWEERR位设置为1。

ProgramBlockEraseMultiBlockEraseBlankCheckConfigurationset命令

50.4.9 FASTAT：闪存访问状态寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CFAE	—	—	CMDLK	DFAE	—	—	—
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	—	这些位被读取为0。写入值应为0。	R/W
3	DFAE	数据闪存访问违规标志 0：未发生数据闪存访问违规1：发生数据闪存访问违规。	R/W*1
4	CMDLK	命令锁定标志 0：flash定序器不处于命令锁定状态1：flash定序器处于命令锁定状态。	R

Bit	Symbol	Function	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	CFAE	Code Flash Memory Access Violation Flag 0: No code flash memory access violation has occurred 1: A code flash memory access violation has occurred.	R/W*1

Note 1. Only 0 can be written to clear the flag after 1 is read.

The FASTAT register indicates whether a code flash or data flash memory access violation has occurred. If any of the CFAE, CMDLK, and DFAE bits is set to 1, the flash sequencer enters the command-locked state (see section 50.11.2. Error Protection). To release it from the command-locked state, issue a status clear command or Forced Stop command to the flash sequencer.

DFAE bit (Data Flash Memory Access Violation Flag)

The DFAE bit indicates whether a data flash memory access violation occurred. When this bit is set to 1, the ILGLERR bit in the FSTATR register is set to 1, placing the flash sequencer in the command-locked state.

[Setting conditions]

FACI commands issued in the data flash P/E mode are as follows:

- The setting of the FSADDR or FEADDR register is the reserved portion of the data area
- FACI commands of non-secure access are issued while the setting of the FSADDR or FEADDR register is the secure region address.

[Clearing conditions]

- When this bit is written as 0 after it is set to 1
- When the flash sequencer starts to process the Status Clear or Forced Stop command.

CMDLK bit (Command Lock Flag)

The CMDLK bit indicates that the flash sequencer is in the command-locked state.

[Setting conditions]

- The flash sequencer detects an error and enters the command-locked state.

[Clearing conditions]

- When the flash sequencer starts to process the Status Clear or Forced Stop command.

CFAE bit (Code Flash Memory Access Violation Flag)

The CFAE bit indicates whether a code flash memory access violation has occurred. When this bit is set to 1, the ILGLERR bit in the FSTATR register is set to 1, placing the flash sequencer in the command-locked state.

[Setting conditions]

FACI commands issued in the code flash P/E mode are as follows:

- The setting of the FSADDR register is the reserved portion of the user area
- The Configuration set command is issued while the setting of the FSADDR register is from 0x0000A100 to 0x0000A2F0 in self-programming mode
- FACI commands of non-secure access are issued while the setting of the FSADDR register is the secure region address.

[Clearing conditions]

- When this bit is written as 0 after it is set to 1
- When the flash sequencer starts to process the Status Clear or Forced Stop command.

Bit	Symbol	Function	R/W
6:5	—	这些位被读取为0。写入值应为0。	R/W
7	CFAE	代码闪存访问违规标志 0：未发生代码闪存访问违规1：发生代码闪存访问违规 。	R/W*1

注1.读取1后，只能写入0以清除标志。

FASTAT寄存器指示是否发生了代码闪存或数据闪存访问违规。如果任何一个CFAE、CMDLK和DFAE位设置为1，闪存定序器进入命令锁定状态（请参阅第50.11.2节。错误保护）。要将其从命令锁定状态释放，请向闪存定序器发出状态清除命令或强制停止命令。

DFAE位（数据闪存访问违规标志）

DFAE位指示是否发生数据闪存访问违规。当该位设置为1时，FSTATR寄存器中的ILGLERR位设置为1，将闪存定序器置于命令锁定状态。

[Setting conditions]

数据闪存PE模式下发出的FACI命令如下：

●FSADDR或FEADDR寄存器的设置是数据区的保留部分

●FSADDR或FEADDR寄存器的设置是安全区域地址时发出非安全访问的FACI命令。

[Clearing conditions]

●该位设置为1后写入0时

●当flashsequencer开始处理StatusClear或ForcedStop命令时。

CMDLK位（命令锁定标志）

CMDLK位指示闪存定序器处于命令锁定状态。

[Setting conditions]

●闪存定序器检测到错误并进入命令锁定状态。

[Clearing conditions]

●当flashsequencer开始处理StatusClear或ForcedStop命令时。

CFAE位（代码闪存访问违规标志）

CFAE位指示是否发生代码闪存访问违规。当该位设置为1时，FSTATR寄存器中的ILGLERR位设置为1，将闪存定序器置于命令锁定状态。

[Setting conditions]

CodeflashPE模式下发出的FACI命令如下：

●FSADDR寄存器的设置是用户区的保留部分

●自编程模式下FSADDR寄存器的设置从0x0000A100到0x0000A2F0时发出配置设置命令

●FSADDR寄存器的设置是安全区域地址时发出非安全访问的FACI命令。

[Clearing conditions]

●该位设置为1后写入0时

●当flashsequencer开始处理StatusClear或ForcedStop命令时。

50.4.10 FAEINT : Flash Access Error Interrupt Enable Register

Base address: FACI = 0x407F_E000

Offset address: 0x14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CFAEIE	—	—	CMDLKIE	DFAEIE	—	—	—
Value after reset:	1	0	0	1	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	DFAEIE	Data Flash Memory Access Violation Interrupt Enable 0: Generation of an FIFERR interrupt request is disabled when FASTAT.DFAE is set to 1 1: Generation of an FIFERR interrupt request is enabled when FASTAT.DFAE is set to 1.	R/W
4	CMDLKIE	Command Lock Interrupt Enable 0: Generation of an FIFERR interrupt request is disabled when FASTAT.CMDLK is set to 1 1: Generation of an FIFERR interrupt request is enabled when FASTAT.CMDLK is set to 1.	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	CFAEIE	Code Flash Memory Access Violation Interrupt Enable 0: Generation of an FIFERR interrupt request is disabled when FASTAT.CFAE is set to 1 1: Generation of an FIFERR interrupt request is enabled when FASTAT.CFAE is set to 1.	R/W

The FAEINT register enables or disables generation of a flash access error (FIFERR) interrupt request.

DFAEIE bit (Data Flash Memory Access Violation Interrupt Enable)

The DFAEIE bit enables or disables generation of an FIFERR interrupt request when a data flash memory access violation occurs, setting the DFAE bit in the FASTAT register to 1.

CMDLKIE bit (Command Lock Interrupt Enable)

The CMDLKIE bit enables or disables generation of an FIFERR interrupt request when the flash sequencer enters the command-locked state, setting the CMDLK bit in the FASTAT register to 1.

CFAEIE bit (Code Flash Memory Access Violation Interrupt Enable)

The CFAEIE bit enables or disables generation of an FIFERR interrupt request when a code flash memory access violation occur, setting the CFAE bit in the FASTAT register to 1.

50.4.11 FRDYIE : Flash Ready Interrupt Enable Register

Base address: FACI = 0x407F_E000

Offset address: 0x18

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FRDYIE
Value after reset:	0	0	0	0	0	0	0	0

50.4.10 FAEINT：闪存访问错误中断使能寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CFAEIE	—	—	CMDLKIE	DFAEIE	—	—	—
重置后的值：	1	0	0	1	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	这些位被读取为0。写入值应为0。	R/W
3	DFAEIE	数据闪存访问冲突中断使能 0：当FASTAT.DFAE设置为1时，禁止生成FIFERR中断请求 1：当FASTAT.DFAE设置为1时，使能FIFERR中断请求的生成。	R/W
4	CMDLKIE	命令锁定中断使能 0：当FASTAT.CMDLK设置为1时，禁止生成FIFERR中断请求 1：当FASTAT.CMDLK设置为1时，使能FIFERR中断请求的生成。	R/W
6:5	—	这些位被读取为0。写入值应为0。	R/W
7	CFAEIE	代码闪存访问冲突中断启用 0：当FASTAT.CFAE设置为1时，禁止生成FIFERR中断请求 1：当FASTAT.CFAE设置为1时，使能FIFERR中断请求的生成。	R/W

FAEINT寄存器启用或禁用闪存访问错误(FIFERR)中断请求的生成。

DFAEIE位（数据闪存访问冲突中断允许）

当发生数据闪存访问违规时，DFAEIE位启用或禁用FIFERR中断请求的生成，将FASTAT寄存器中的DFAE位设置为1。

CMDLKIE位（命令锁定中断使能）

当闪存定序器进入命令锁定状态时，CMDLKIE位启用或禁用FIFERR中断请求的生成，将FASTAT寄存器中的CMDLK位设置为1。

CFAEIE位（代码闪存访问冲突中断允许）

当发生代码闪存访问违规时，CFAEIE位启用或禁用FIFERR中断请求的生成，将FASTAT寄存器中的CFAE位设置为1。

50.4.11 FRDYIE:闪存就绪中断使能寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x18

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FRDYIE
重置后的值：	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FRDYIE	Flash Ready Interrupt Enable 0: Generation of an FRDY interrupt request is disabled 1: Generation of an FRDY interrupt request is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

The FRDYIE register enables or disables generation of a flash ready (FRDY) interrupt.

FRDYIE bit (Flash Ready Interrupt Enable)

The FRDYIE bit enables or disables generation of an FRDY interrupt request when the FRDY bit in the FSTATR register is changed from 0 to 1 on completion of processing by the flash sequencer of the Program, Block Erase, Multi Block Erase, Blank Check, and Configuration set command.

50.4.12 FSADDR : FACI Command Start Address Register

Base address: FACI = 0x407F_E000

Offset address: 0x30

Bit position:	31																												0
Bit field:	FSADDR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FSADDR[31:0]	Start Address for FACI Command Processing	R/W*1

Note 1. These bits can be written when the FRDY bit in the FSTATR register is 1. Writing to these bits are ignored when the FRDY bit is 0. Note that b0 and b1 are read-only.

Table 50.5 FACI command addres boundary

Command	Address Boundary
Program (code flash memory)	128-byte
Program (data flash memory)	4, 8, 16 -byte
Block Erase (code flash memory)	8-KB or 32-KB
Block Erase (data flash memory)	64-byte
Multi Block Erase (data flash memory)	64-byte
Blank Check (data flash memory)	4-byte
Configuration set	16-byte

The FSADDR register specifies the address where the target area for command processing starts when the FACI command for Program, Block Erase, Multi Block Erase, Blank Check, or Configuration set is issued.

The FSADDR value is initialized when the SUINIT bit in the FSUINITR register is set to 1. It is also initialized by a reset.

FSADDR[31:0] bits (Start Address for FACI Command Processing)

The FSADDR[31:0] bits specify the start address for FACI command processing. Bits [31:24] are ignored in FACI command processing for the code flash memory. Bits [31:17] are ignored in FACI command processing for the data flash memory. Bits associated with the address bits of lower order than the address boundary listed in Table 50.5 are also ignored.

For information on the addresses of the code flash memory and the data flash memory, see section 50.2. Structure of Memory.

For information on the addresses of the configuration setting, see section 50.9.3.15. Configuration Set Command.

Bit	Symbol	Function	R/W
0	FRDYIE	闪存就绪中断使能 0：禁止产生FRDY中断请求1：允许产生FRDY中断请求 。	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

FRDYIE寄存器启用或禁用闪存就绪(FRDY)中断的生成。

FRDYIE位（闪存就绪中断使能）

当FSTATR寄存器中的FRDY位在程序、块擦除、多块擦除、空白检查和配置的闪存序列器的处理完成时从0变为1时，FRDYIE位启用或禁用FRDY中断请求的产生设置命令。

50.4.12 FSADDR:FACI命令起始地址寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x30

Bit position:	31																												0
Bit field:	FSADDR[31:0]																												
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FSADDR[31:0]	FACI命令处理的起始地址	R/W*1

注1.当FSTATR寄存器中的FRDY位为1时可以写入这些位。当FRDY位为0时忽略写入这些位。
请注意，b0和b1是只读的。

Table 50.5 FACI命令地址边界

Command	地址边界
程序（代码闪存）	128-byte
程序（数据闪存）	4, 8, 16 -byte
块擦除（代码闪存）	8-KB or 32-KB
块擦除（数据闪存）	64-byte
多块擦除（数据闪存）	64-byte
空白检查（数据闪存）	4-byte
配置集	16-byte

FSADDR寄存器指定在发出用于编程、块擦除、多块擦除、空白检查或配置集的FACI命令时命令处理的目标区域开始的地址。

FSADDR值在FSUINITR寄存器中的SUINIT位设置为1时被初始化。它也通过复位被初始化。

FSADDR[31:0]位（FACI命令处理的起始地址）

FSADDR[31:0]位指定FACI命令处理的起始地址。在代码闪存的FACI命令处理中忽略位[31:24]。在数据闪存的FACI命令处理中忽略位[31:17]。与低于表50.5中列出的地址边界的地址位相关的位也被忽略。

有关代码闪存和数据闪存地址的信息，请参见第50.2节。结构
Memory.

有关配置设置地址的信息，请参阅第50.9.3.15节。配置集命令。

50.4.13 FEADDR : FACI Command End Address Register

Base address: FACI = 0x407F_E000

Offset address: 0x34

Bit position:	31																													0
Bit field:	FEADDR[31:0]																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FEADDR[31:0]	End Address for FACI Command Processing	R/W*1

Note 1. These bits can be written when the FRDY bit in the FSTATR register is 1. Writing to these bits are ignored when the FRDY bit is 0. Note that bit [0] and bit [1] are read-only.

The FEADDR register specifies the end address of the target area for Multi Block Erase and Blank Check command processing. When incremental mode is selected as the addressing mode for Blank Checking (when FBCCNT.BCDIR = 0), the address specified in the FSADDR register should be equal to or smaller than the address in the FEADDR register. Conversely, the address in the FSADDR register should be equal to or larger than the address in the FEADDR register when decremental mode is selected as the addressing mode for Blank Check (i.e. when FBCCNT.BCDIR = 1). If the BCDIR, FSADDR, and FEADDR bit settings are inconsistent with the specified rules, the flash sequencer enters the command-locked state (see section 50.11.2. Error Protection).

The FEADDR value is initialized when the SUINIT bit in the FSUINITR register is set to 1. It is also initialized by a reset.

FEADDR[31:0] bits (End Address for FACI Command Processing)

The FEADDR[31:0] bits specify the end address for Multi Block Erase and Blank Check command processing. In command processing, bits 31 to 17 and any bits that do not reach the address boundaries listed in the section 50.4.12. FSADDR : FACI Command Start Address Register are ignored.

For information on the addresses of the flash memory, see section 50.2. Structure of Memory.

50.4.14 FMEPROT : Flash P/E Mode Entry Protection Register

Base address: FACI = 0x407F_E000

Offset address: 0x44

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	CEPROT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	CEPROT	Code Flash P/E Mode Entry Protection 0: FENTRYC bit is not protected 1: FENTRYC bit is protected.	R/W*1 *2 *4
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note 1. Writing to this bit is only possible when the FRDY bit in the FSTATR register is 1. Writing to this bit while the FRDY bit = 0 is ignored.
Note 2. Writing to this bit is only possible when 16 bits are written and the value written to the KEY bits is D9h.
Note 3. Written values are not retained by these bits (always read as 0x00).
Note 4. Only secure access can write to this register. Both secure access and non-secure read access are allowed. Non-secure write access is denied, but TrustZone access error is note generated.

CEPROT bit (Code Flash P/E Mode Entry Protection)

The CEPROT bit specifies the protection setting of the FRNTRYC bit in the FENTRYR register.

50.4.13 FEADDR:FACI命令结束地址寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x34

Bit position:	31																													0
Bit field:	FEADDR[31:0]																													
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	FEADDR[31:0]	FACI命令处理的结束地址	R/W*1

注1.当FSTATR寄存器中的FRDY位为1时可以写入这些位。当FRDY位为0时忽略写入这些位。
请注意，位[0]和位[1]是只读的。

FEADDR寄存器指定多块擦除和空白检查命令处理的目标区域的结束地址。Whenincrementalmodeisselectedasth eaddressingmodeforBlankChecking(whenFBCCNT.BCDIR=0) theaddressspecifiedintheFSADDRregistershouldbeeq ualtoorsmallerthantheaddressintheFEADDRregister.Conversely theaddressintheFSADDRregistershouldbeequalto orlargerthantheaddressintheFEADDRregisterwhendecrementalmodeisselectedastheaddressingmodeforBlankChe ck(i.e.whenFBCCNT.BCDIR=1).如果BCDIR、FSADDR和FEADDR位设置与指定规则不一致，则闪存定序器进入命令锁定状态（请参阅第50.11.2.错误保护部分）。

FEADDR值在FSUINITR寄存器中的SUINIT位设置为1时被初始化。它也通过复位被初始化。

FEADDR[31:0]位（FACI命令处理的结束地址）

FEADDR[31:0]位指定多块擦除和空白检查命令处理的结束地址。在命令处理中，位31到17以及任何未到达50.4.12节中列出的地址边界的位。FSADDR：FACI命令起始地址寄存器被忽略。

有关闪存地址的信息，请参阅第50.2节。内存结构。

50.4.14 FMEPROT:FlashPE模式进入保护寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x44

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	CEPROT
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	CEPROT	CodeFlashPE模式进入保护 0：FENTRYC位不受保护1：FENTRYC位受保护。	R/W*1 *2 *4
7:1	—	这些位被读取为0。写入值应为0。	R/W
15:8	KEY[7:0]	关键代码	R/W*3

注1.仅当FSTATR寄存器中的FRDY位为1时才可以写入该位。当FRDY位=0时写入该位被忽略。

注2.仅当写入16位且写入KEY位的值为D9h时才能写入该位。
注3.这些位不保留写入的值（始终读取为0x00）。
注4.只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问。非安全写入访问被拒绝，但生成了TrustZone访问错误。

CEPROT位（代码闪存PE模式进入保护）

CEPROT位指定FENTRYR寄存器中FRNTRYC位的保护设置。

[Setting condition]

- 1 being written to the CEPROT bit while writing to FMEPROT is enabled.

[Clearing condition]

- 0 being written to the CEPROT bit while writing to FMEPROT is enabled.

50.4.15 FBPROT0 : Flash Block Protection Register

Base address: FACI = 0x407F_E000

Offset address: 0x78

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	BPCN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BPCN0	Block Protection for Non-secure Cancel 0: Block protection is enabled 1: Block protection is disabled.	R/W*1 *2
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note 1. This bit can be written when the FRDY bit in the FSTATR register is 1. Writing to this bit is ignored when the FRDY bit is 0.
Note 2. Writing to this bit is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0x78.
Note 3. Written values are not retained by these bits (always read as 0x00).

The FBPROT0 register is used to disable the block protect function for non-secure. When the block protect setting is locked by the permanent block setting, it cannot be disabled by this register.

The FBPROT0 value is initialized when the SUINIT bit in the FSUINITR is set to 1, because the FENTRYR value is initialized to 0x0000. It is also initialized by a reset.

BPCN0 bit (Block Protection for Non-secure Cancel)

The BPCN0 bit disables the block protect setting for non-secure function.

[Setting condition]

- When the write-enabling conditions are satisfied and the FENTRYR is not 0x0000, write 1 to this bit.

[Clearing conditions]

- 8 bits being written to FBPROT0 while the FRDY bit is 1.
- A value other than 0x78 specified in the KEY bits and 16 bits are written to FBPROT0 while the FRDY bit is 1.
- 0 being written to the BPCN0 bit while writing to FBPROT0 is enabled.
- The FENTRYR register value is 0x0000.

50.4.16 FBPROT1 : Flash Block Protection for Secure Register

Base address: FACI = 0x407F_E000

Offset address: 0x7C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	BPCN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

[Setting condition]

●写入FMEPROT时将1写入CEPROT位使能。

[Clearing condition]

●使能写入FMEPROT时将0写入CEPROT位。

50.4.15 FBPROT0：闪存块保护寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x78

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	BPCN
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BPCN0	非安全取消的块保护 0：启用块保护1：禁用块保护 。	R/W*1 *2
7:1	—	这些位被读取为0。写入值应为0。	R/W
15:8	KEY[7:0]	关键代码	R/W*3

注1.当FSTATR寄存器中的FRDY位为1时可以写入该位。当FRDY位为0时忽略写入该位。
注2.仅当写入16位且写入KEY[7:0]位的值为0x78时，才能写入该位。
注3.这些位不保留写入的值（始终读取为0x00）。

FBPROT0寄存器用于禁用非安全的块保护功能。当块保护设置被永久块设置锁定时，该寄存器不能将其禁用。

FBPROT0值在FSUINITR中的SUINIT位设置为1时被初始化，因为FENTRYR值被初始化为0x0000。它也由复位初始化。

BPCN0位（非安全取消的块保护）

BPCN0位禁用非安全功能的块保护设置。

[Setting condition]

●当写使能条件满足且FENTRYR不为0x0000时，向该位写1。

[Clearing conditions]

●FRDY位为1时，将8位写入FBPROT0。
●当FRDY位为1时，将KEY位中指定的0x78和16位以外的值写入FBPROT0。
●写入FBPROT0时将0写入BPCN0位使能。
●FENTRYR寄存器值为0x0000。

50.4.16 FBPROT1：安全寄存器的闪存块保护

Base address: FACI = 0x407F_E000

Offset address: 0x7C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	BPCN
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	BPCN1	Block Protection for Secure Cancel 0: Block protection is enabled 1: Block protection is disabled.	R/W*1 *2
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note 1. Writing to this bit is only possible when the FRDY bit in the FSTATR register is 1. Writing to this bit while FRDY bit = 0 is ignored.
Note 2. Writing to this bit is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0xB1.
Note 3. Written values are not retained by these bits (always read as 0x00).

The FBPROT1 register is used to disable the block protect function for secure developer. When the block protect setting is locked by the permanent block setting, it cannot be disabled by this register.

The FBPROT1 value is initialized when the SUINIT bit in the FSUINITR is set to 1, because the FENTRYR value is initialized to 0x0000. It is also initialized by a reset.

BPCN1 bit (Block Protection for Secure Cancel)

The BPCN1 bit disables the block protect setting for secure function.

[Setting condition]

- When the write-enabling conditions are satisfied and the FENTRYR is not 0x0000, write 1 to BPCN1.

[Clearing conditions]

- 8 bits being written to FBPROT1 while the FRDY bit is 1.
- A value other than 0xB1 specified in the KEY bits and 16 bits are written to FBPROT1 while the FRDY bit is 1.
- 0 being written to the BPCN1 bit while writing to FBPROT1 is enabled.
- The FENTRYR register value is 0x0000.

50.4.17 FSTATR : Flash Status Register

Base address: FACI = 0x407F_E000

Offset address: 0x80

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	ILGCOMERR	FESETERR	SECERR	OTERR	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FRDY	ILGLERR	ERSERR	PRGERR	SUSRDY	DBFULL	ERSSPD	PRGSPD	—	FLWEERR	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	FLWEERR	Flash Write/Erase Protect Error Flag 0: An error has not occurred 1: An error has occurred.	R
7	—	These bits are read as 0. The write value should be 0.	R/W
8	PRGSPD	Programming Suspend Status Flag 0: The flash sequencer is in a state other than those corresponding to the value 1 1: The flash sequencer is in the programming suspension processing state or programming suspended state.	R

Bit	Symbol	Function	R/W
0	BPCN1	安全取消的块保护 0：启用块保护1：禁用块保护 。	R/W*1 *2
7:1	—	这些位被读取为0。写入值应为0。	R/W
15:8	KEY[7:0]	关键代码	R/W*3

注1.仅当FSTATR寄存器中的FRDY位为1时才可以写入该位。当FRDY位=0时写入该位被忽略。
注2.仅当写入16位且写入KEY[7:0]位的值为0xB1时，才能写入该位。
注3.这些位不保留写入的值（始终读取为0x00）。

FBPROT1寄存器用于禁用安全开发人员的块保护功能。当块保护设置被永久块设置锁定时，该寄存器不能将其禁用。

FBPROT1值在FSUINITR中的SUINIT位设置为1时被初始化，因为FENTRYR值被初始化为0x0000。它也由复位初始化。

BPCN1位（安全取消的块保护）

BPCN1位禁用安全功能的块保护设置。

[Setting condition]

●当写使能条件满足且FENTRYR不为0x0000时，向BPCN1写1。

[Clearing conditions]

●FRDY位为1时，将8位写入FBPROT1。
●当FRDY位为1时，将KEY位中指定的0xB1和16位以外的值写入FBPROT1。
●写入FBPROT1时将0写入BPCN1位使能。
●FENTRYR寄存器值为0x0000。

50.4.17 FSTATR：闪存状态寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x80

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	ILGCOMERR	FESETERR	SECERR	OTERR	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FRDY	ILGLERR	ERSERR	PRGERR	SUSRDY	DBFULL	ERSSPD	PRGSPD	—	FLWEERR	—	—	—	—	—	—
重置后的值：	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	这些位被读取为0。写入值应为0。	R/W
6	FLWEERR	闪存写擦除保护错误标志 0：未发生错误1：发生错误 。	R
7	—	这些位被读取为0。写入值应为0。	R/W
8	PRGSPD	编程挂起状态标志 0：flashsequencer处于与值1对应的状态以外的状态1：flashsequencer处于编程暂停处理状态或编程暂停状态。	R

Bit	Symbol	Function	R/W
9	ERSSPD	Erasure Suspend Status Flag 0: The flash sequencer is in a state other than those corresponding to the value 1 1: The flash sequencer is in the erasure suspension processing state or the erasure suspended state.	R
10	DBFULL	Data Buffer Full Flag 0: The data buffer is empty 1: The data buffer is full.	R
11	SUSRDY	Suspend Ready Flag 0: The flash sequencer cannot receive P/E suspend commands 1: The flash sequencer can receive P/E suspend commands.	R
12	PRGERR	Programming Error Flag 0: Programming has completed successfully 1: An error has occurred during programming.	R
13	ERSERR	Erasure Error Flag 0: Erasure has completed successfully 1: An error has occurred during erasure.	R
14	ILGLERR	Illegal Command Error Flag 0: The flash sequencer has not detected an illegal FACI command or illegal flash memory access 1: The flash sequencer has detected an illegal FACI command or illegal flash memory access.	R
15	FRDY	Flash Ready Flag 0: Program, Block Erase, Multi Block Erase, P/E suspend, P/E resume, Forced Stop, Blank Check, or Configuration set command processing is in progress 1: None of the above is in progress.	R
19:16	—	These bits are read as 0. The write value should be 0.	R/W
20	OTERR	Other Error 0: A status clear or forced stop command processing is complete 1: An error has occurred.	R
21	SECERR	Security Error 0: A status clear or forced stop command processing is complete 1: An error has occurred.	R/W
22	FESETERR	FENTRY Setting Error 0: A status clear or forced stop command processing is complete 1: An error has occurred.	R
23	ILGCOMERR	Illegal Command Error 0: A status clear or forced stop command processing is complete 1: An error has occurred.	R
31:24	—	These bits are read as 0. The write value should be 0.	R/W

The FSTATR register indicates the state of the flash sequencer.

FLWEERR flag (Flash Write/Erase Protect Error Flag)

The FLWEERR flag indicates a violation of the flash memory overwrite protection setting in the FWEPROR register. When this flag is 1, the flash sequencer is in the command-locked state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The flash sequencer starts processing the Forced Stop command.

PRGSPD flag (Programming Suspend Status Flag)

The PRGSPD flag indicates that the flash sequencer is in the programming suspension processing state or programming suspended state.

[Setting condition]

Bit	Symbol	Function	R/W
9	ERSSPD	擦除挂起状态标志 0：闪存定序器处于与值1对应的状态以外的状态1：闪存定序器处于擦除暂停处理状态或擦除暂停状态。	R
10	DBFULL	数据缓冲区满标志 0：数据缓冲区为空1：数据缓冲区已满。	R
11	SUSRDY	挂起就绪标志 0：flash定序器不能接收PE挂起命令1：flash定序器可以接收PE挂起命令。	R
12	PRGERR	编程错误标志 0：烧录成功1：烧录出错。	R
13	ERSERR	擦除错误标志 0：擦除已成功完成1：擦除过程中发生错误。	R
14	ILGLERR	非法命令错误标志 0：闪存定序器未检测到非法FACI命令或非法闪存访问 1：闪存定序器检测到非法FACI命令或非法闪存访问。	R
15	FRDY	闪存就绪标志 0：正在处理编程、块擦除、多块擦除、PE暂停、PE恢复、强制停止、空白检查或配置设置命令处理 1：以上均未进行。	R
19:16	—	这些位被读取为0。写入值应为0。	R/W
20	OTERR	其他错误 0：状态清除或强制停止命令处理完成1：发生错误。	R
21	SECERR	安全错误 0：状态清除或强制停止命令处理完成1：发生错误。	R/W
22	FESETERR	FENTRY设置错误 0：状态清除或强制停止命令处理完成1：发生错误。	R
23	ILGCOMERR	非法命令错误 0：状态清除或强制停止命令处理完成1：发生错误。	R
31:24	—	这些位被读取为0。写入值应为0。	R/W

FSTATR寄存器指示闪存定序器的状态。

FLWEERR标志（闪存写擦除保护错误标志）

FLWEERR标志表示违反了FWEPROR寄存器中的闪存覆盖保护设置。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

●发生错误。

[Clearing condition]

●闪存定序器开始处理强制停止命令。

PRGSPD标志（编程暂停状态标志）

PRGSPD标志指示闪存定序器处于编程暂停处理状态或编程暂停状态。

[Setting condition]

- The flash sequencer starts processing in response to the programming suspend command.

[Clearing conditions]

- Reception of the P/E resume command by the flash sequencer (after write access to the FACI command-issuing area is complete)
- The flash sequencer starts processing the Forced Stop command.

ERSSPD flag (Erasure Suspend Status Flag)

The ERSSPD flag indicates that the flash sequencer is in the erasure suspension processing state or erasure suspended state.

[Setting condition]

- The flash sequencer starts processing in response to an erasure suspend command.

[Clearing condition]

- Reception of the P/E resume command by the flash sequencer (after write access to the FACI command-issuing area is complete)
- The flash sequencer starts processing of the Forced Stop command.

DBFULL flag (Data Buffer Full Flag)

The DBFULL flag indicates the state of the data buffer when the program command is issued. The flash sequencer incorporates a buffer for write data (data buffer). When data for writing to the flash memory are written to the FACI command-issuing area while the data buffer is full, the flash sequencer inserts a wait cycle in the peripheral bus.

[Setting condition]

- The data buffer becomes full while program commands are issued.

[Clearing condition]

- The data buffer becomes empty.

SUSRDY flag (Suspend Ready Flag)

The SUSRDY flag indicates whether the flash sequencer can receive a P/E suspend command.

[Setting condition]

- After starting programming/erasure processing, the flash sequencer enters a state in which P/E suspend commands can be received.

[Clearing conditions]

- Reception of the P/E suspend command or Forced Stop command by the flash sequencer (after write access to the FACI command-issuing area is complete)
- During programming or erasure, the flash sequencer enters the command-locked state
- Programming or erasure has completed.

PRGERR flag (Programming Error Flag)

The PRGERR flag indicates the result of programming of the flash memory. When this flag is 1, the flash sequencer is in the command-locked state.

[Setting condition]

- An error has occurred during programming.

[Clearing condition]

- The flash sequencer starts processing of the Status Clear or Forced Stop command.

ERSERR flag (Erasure Error Flag)

The ERSERR flag indicates the result of erasure of the flash memory. When this flag is 1, the flash sequencer is in the command-locked state.

●闪存定序器响应编程暂停命令开始处理。

[Clearing conditions]

●闪存定序器接收到PEresume命令（在对FACI命令发出区域的写访问完成后）

●闪存定序器开始处理强制停止命令。

ERSSPD标志（擦除挂起状态标志）

ERSSPD标志指示闪存定序器处于擦除暂停处理状态或擦除暂停状态。

[Setting condition]

●闪存定序器响应擦除挂起命令开始处理。

[Clearing condition]

●闪存定序器接收到PEresume命令（在对FACI命令发出区域的写访问完成后）

●闪存定序器开始处理强制停止命令。

DBFULL标志（数据缓冲区满标志）

DBFULL标志指示发出程序命令时数据缓冲区的状态。闪存定序器包含一个用于写入数据的缓冲区（数据缓冲区）。当用于写入闪存的数据写入到FACI命令发布区，而数据缓冲区已满时，闪存定序器会在外围总线中插入一个等待周期。

[Setting condition]

●发出程序命令时数据缓冲区已满。

[Clearing condition]

●数据缓冲区变空。

SUSRDY标志（挂起就绪标志）

SUSRDY标志指示闪存定序器是否可以接收PE挂起命令。

[Setting condition]

●开始编程擦除处理后，flash定序器进入可以接收PE挂起命令的状态。

[Clearing conditions]

●闪存定序器接收到PE暂停命令或强制停止命令（在对FACI命令发布区域的写访问完成后）

●在编程或擦除期间，闪存定序器进入命令锁定状态

●编程或擦除已完成。

PRGERR标志（编程错误标志）

PRGERR标志指示闪存的编程结果。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

●编程过程中出现错误。

[Clearing condition]

●闪存定序器开始处理状态清除或强制停止命令。

ERSERR标志（擦除错误标志）

ERSERR标志指示闪存擦除的结果。当该标志为1时，闪存定序器处于命令锁定状态。

RA生态工作室

[Setting condition]

- An error has occurred during erasure.

[Clearing condition]

- The flash sequencer starts processing of the Status Clear or Forced Stop command.

ILGLERR flag (Illegal Command Error Flag)

The ILGLERR flag indicates that the flash sequencer has detected an illegal FACI command or flash memory access. If this flag is 1, the flash sequencer is in the command-locked state.

[Setting conditions]

- See section 50.11.2. Error Protection.

[Clearing condition]

- The flash sequencer starts processing of the Status Clear or Forced Stop command.

FRDY flag (Flash Ready Flag)

The FRDY flag indicates the command processing state of the flash sequencer.

[Setting conditions]

- The flash sequencer completes command processing
- The flash sequencer receives a P/E suspend command and suspends programming of the flash memory
- The flash sequencer received the Forced Stop command and ended command processing.

[Clearing conditions]

- The flash sequencer received an FACI command
- For Program and Configuration setting, the first write access to the FACI command-issuing area
- For other commands, the last write access to the FACI command-issuing area.

OTERR flag (Other Error)

See Table 50.26. When this flag is 1, the flash sequencer is in the command-lock state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The status clear or forced stop command processing is complete.

SECERR flag (Security Error)

See Table 50.26. When this flag is 1, the flash sequencer is in the command-lock state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The status clear or forced stop command processing is complete.

FESETERR flag (FENTRY Setting Error)

See Table 50.26. When this flag is 1, the flash sequencer is in the command-lock state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The status clear or forced stop command processing is complete.

[Setting condition]

●擦除过程中发生错误。

[Clearing condition]

●闪存定序器开始处理状态清除或强制停止命令。

ILGLERR标志（非法命令错误标志）

ILGLERR标志表示闪存定序器检测到非法FACI命令或闪存访问。如果该标志为1，则闪存定序器处于命令锁定状态。

[Setting conditions]

●请参阅第50.11.2节。错误保护。

[Clearing condition]

●闪存定序器开始处理状态清除或强制停止命令。

FRDY标志（闪存就绪标志）

FRDY标志指示闪存定序器的命令处理状态。

[Setting conditions]

●flashsequencer完成命令处理

●闪存定序器收到PE暂停命令并暂停闪存的编程

●闪存定序器收到强制停止命令并结束命令处理。

[Clearing conditions]

●闪存定序器收到FACI命令

●对于ProgramandConfiguration设置，对FACI命令发布区的第一次写访问

●对于其他命令，对FACI命令发布区的最后一次写访问。

OTERR flag (Other Error)

见表50.26。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

●发生错误。

[Clearing condition]

●状态清除或强制停止命令处理完成。

SECERR flag (Security Error)

见表50.26。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

●发生错误。

[Clearing condition]

●状态清除或强制停止命令处理完成。

FESETERR标志（FENTRY设置错误）

见表50.26。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

●发生错误。

[Clearing condition]

●状态清除或强制停止命令处理完成。

RA生态工作室

ILGCOMERR flag (Illegal Command Error)

See Table 50.26. When this flag is 1, the flash sequencer is in the command-lock state.

[Setting condition]

- An error has occurred.

[Clearing condition]

- The status clear or forced stop command processing is complete.

50.4.18 FENTRYR : Flash P/E Mode Entry Register

Base address: FACI = 0x407F_E000

Offset address: 0x84

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								FENTRYD	—	—	—	—	—	—	FENTRYC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FENTRYC	Code Flash P/E Mode Entry 0: Code flash is in read mode 1: Code flash is in P/E mode.	R/W*1*2
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	FENTRYD	Data Flash P/E Mode Entry 0: Data flash is in read mode 1: Data flash is in P/E mode.	R/W*1*2
15:8	KEY[7:0]	Key Code	R/W*3

Note 1. These bits can be written when the FRDY bit in the FSTATR register is 1. Writing to these bits are ignored when the FRDY bit is 0.
Note 2. Writing to these bits is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0xAA.
Note 3. Written values are not retained by these bits (always read 0x00).

FENTRYR is used to specify code flash P/E mode or data flash P/E mode. To specify the code flash P/E mode or data flash P/E mode so that the flash sequencer can receive FACI commands, set either the FENTRYD or FENTRYC bit to 1 to place the flash sequencer in P/E mode.

FENTRYR is initialized when the SUINIT bit in FSUINITR is set to 1. It is also initialized by a reset.

Note: Writing a value of 0XAA81 to this register causes the ILGLERR bit in the FSTATR register to be set to 1, resulting in the flash sequencer being placed in the command-locked state.

FENTRYC bit (Code Flash P/E Mode Entry)

The FENTRYC bit specifies P/E mode for the code flash memory.

[Setting condition]

- Write 1 to the FENTRYC bit while writing to FENTRYR is enabled and FENTRYR is 0x0000.

[Clearing conditions]

- Write 8 bits to FENTRYR while the FRDY bit is 1
- A value other than 0xAA is specified in the KEY[7:0] bits and 16 bits are written to FENTRYR while the FRDY bit is 1
- Write 0 to the FENTRYC bit while writing to FENTRYR is enabled
- Write to FENTRYR while writing is enabled and its value is other than 0x0000
- The protection of FMEPROT register is enabled.

FENTRYD bit (Data Flash P/E Mode Entry)

The FENTRYD bit specifies P/E mode for the data flash memory.

ILGCOMERR标志（非法命令错误）

见表50.26。当该标志为1时，闪存定序器处于命令锁定状态。

[Setting condition]

●发生错误。

[Clearing condition]

●状态清除或强制停止命令处理完成。

50.4.18 FENTRYR:FlashPE模式进入寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x84

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								FENTRYD	—	—	—	—	—	—	FENTRYC
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FENTRYC	CodeFlashPE模式进入 0：Codeflash处于读取模式1 ：Codeflash处于PE模式。	R/W*1*2
6:1	—	这些位被读取为0。写入值应为0。	R/W
7	FENTRYD	数据闪存PE模式进入 0：数据闪存处于读取模式1 ：数据闪存处于PE模式。	R/W*1*2
15:8	KEY[7:0]	关键代码	R/W*3

注1.当FSTATR寄存器中的FRDY位为1时可以写入这些位。当FRDY位为0时忽略写入这些位。
注2.仅当写入16位且写入KEY[7:0]位的值为0xAA时，才能写入这些位。
注3.这些位不保留写入的值（始终读取0x00）。

FENTRYR用于指定代码闪存PE模式或数据闪存PE模式。要指定代码闪存PE模式或数据闪存PE模式，以便闪存定序器可以接收FACI命令，请将FENTRYD或FENTRYC位设置为1以将闪存定序器置于PE模式。

当FSUNITR中的SUINIT位设置为1时，FENTRYR被初始化。它也被复位初始化。

Note: 将值0XAA81写入该寄存器会导致FSTATR寄存器中的ILGLERR位设置为1，从而导致闪存定序器置于命令锁定状态。

FENTRYC位（代码闪存PE模式进入）

FENTRYC位指定代码闪存的PE模式。

[Setting condition]

●写入1到FENTRYC位，同时写入FENTRYR使能并且FENTRYR为0x0000。

[Clearing conditions]

●FRDY位为1时向FENTRYR写入8位
●KEY[7:0]位中指定了0xAA以外的值，当FRDY位为1时，将16位写入FENTRYR
●使能写入FENTRYR时向FENTRYC位写入0
●启用写入时写入FENTRYR，其值不是0x0000
●FMEPROT寄存器保护使能。

FENTRYD位（数据闪存PE模式进入）

FENTRYD位指定数据闪存的PE模式。

[Setting condition]

- Write 1 to the FENTRYD bit while writing to FENTRYR is enabled and FENTRYR is 0x0000.

[Clearing conditions]

- Write 8 bits to FENTRYR while the FRDY bit is 1
- Writing of 16 bits to FENTRYR with a value other than 0xAA specified for the KEY[7:0] bits while the FRDY bit is 1
- Write 0 to the FENTRYD bit while writing to FENTRYR is enabled
- Write to FENTRYR while writing is enabled and its value is other than 0x0000.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits control writing permission to the FENTRYD or FENTRYC bits.

50.4.19 FSUINITR : Flash Sequencer Setup Initialization Register

Base address: FACI = 0x407F_E000

Offset address: 0x8C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	SUINIT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SUINIT	Set-Up Initialization 0: The FSADDR, FEADDR, FBPROT0, FBPROT1, FENTRYR, FBCCNT, and FCPSR flash sequencer setup registers keep their current values 1: The FSADDR, FEADDR, FBPROT0, FBRPOT1, FENTRYR, FBCCNT, and FCPSR flash sequencer setup registers are initialized.	R/W*1*2
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*3

Note 1. This bit can be written when the FRDY bit in the FSTATR register is 1. Writing to this bit is ignored when the FRDY bit is 0.
Note 2. Writing to these bits is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0x2D.
Note 3. Written values are not retained by these bits (always read 0x00).

FSUINITR is used for initialization of the flash sequencer setup.

SUINIT bit (Set-Up Initialization)

The SUINIT bit initializes the following flash sequencer setup registers:

- FSADDR
- FEADDR
- FBPROT0
- FBPROT1
- FENTRYR
- FBCCNT
- FCPSR.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits control writing permission to the SUINIT bit.

[Setting condition]

●写入1到FENTRYD位，同时写入FENTRYR使能并且FENTRYR为0x0000。

[Clearing conditions]

●FRDY位为1时向FENTRYR写入8位
●当FRDY位为1时，将16位写入FENTRYR，其中KEY[7:0]位指定的值不是0xAA
●使能写入FENTRYR时向FENTRYD位写入0
●写入启用时写入FENTRYR，其值不是0x0000。

KEY[7:0] bits (Key Code)

KEY[7:0]位控制对FENTRYD或FENTRYC位的写入权限。

50.4.19 FSUINITR：闪存定序器设置初始化寄存器

Base address: FACI = 0x407F_E000

Offset address: 0x8C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	SUINIT
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SUINIT	Set-Up Initialization 0：FSADDR、FEADDR、FBPROT0、FBPROT1、FENTRYR、FBCCNT和FCPSR闪存定序器设置寄存器保持其当前值 1：初始化FSADDR、FEADDR、FBPROT0、FBRPOT1、FENTRYR、FBCCNT和FCPSR闪存定序器设置寄存器。	R/W*1*2
7:1	—	这些位被读取为0。写入值应为0。	R/W
15:8	KEY[7:0]	关键代码	R/W*3

注1.当FSTATR寄存器中的FRDY位为1时可以写入该位。当FRDY位为0时忽略写入该位。
注2.仅当写入16位且写入KEY[7:0]位的值为0x2D时才能写入这些位。
注3.这些位不保留写入的值（始终读取0x00）。

FSUINITR用于初始化闪存定序器设置。

SUINIT bit (Set-Up Initialization)

SUINIT位初始化以下闪存序列器设置寄存器：

- FSADDR
- FEADDR
- FBPROT0
- FBPROT1
- FENTRYR
- FBCCNT
- FCPSR.

KEY[7:0] bits (Key Code)

KEY[7:0]位控制对SUINIT位的写入权限。

50.4.20 FCMDR : FACI Command Register

Base address: FACI = 0x407F_E000

Offset address: 0xA0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMDR[7:0]								PCMDR[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PCMDR[7:0]	Pre-command Flag The command just before the latest command is stored.	R
15:8	CMDR[7:0]	Command Flag The latest command is stored.	R

FCMDR records the two most recent commands accepted by the flash sequencer.

PCMDR[7:0] bits (Pre-command Flag)

The PCMDR[7:0] bits indicate the command received immediately before the latest command received by the flash sequencer.

CMDR[7:0] bits (Command Flag)

The CMDR[7:0] bits indicate the latest command received by the flash sequencer.

Table 50.6 States of FCMDR after receiving commands

Command	CMDR	PCMDR
Program	0xE8	Previous command
Block erase	0xD0	0x20
Multi block erase	0xD0	0x21
P/E suspend	0xB0	Previous command
P/E resume	0xD0	Previous command
Status Clear	0x50	Previous command
Forced Stop	0xB3	Previous command
Blank Check	0xD0	0x71
Configuration set	0x40	Previous command

50.4.21 FBCCNT : Blank Check Control Register

Base address: FACI = 0x407F_E000

Offset address: 0xD0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BCDIR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BCDIR	Blank Check Direction 0: Blank checking is executed from the lower addresses to the higher addresses (incremental mode) 1: Blank checking is executed from the higher addresses to the lower addresses (decremental mode).	R/W

50.4.20 FCMDR:FACI命令寄存器

Base address: FACI = 0x407F_E000

Offset address: 0xA0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CMDR[7:0]								PCMDR[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PCMDR[7:0]	Pre-command Flag 存储最新命令之前的命令。	R
15:8	CMDR[7:0]	命令标志 存储最新的命令。	R

FCMDR记录闪存定序器最近接受的两个命令。

PCMDR[7:0] bits (Pre-command Flag)

PCMDR[7:0]位指示在闪存定序器接收到的最新命令之前收到的命令。

CMDR[7:0] bits (Command Flag)

CMDR[7:0]位指示闪存定序器接收到的最新命令。

Table 50.6 FCMDR收到指令后的状态

Command	CMDR	PCMDR
Program	0xE8	上一条命令
块擦除	0xD0	0x20
多块擦除	0xD0	0x21
P/E suspend	0xB0	上一条命令
P/E resume	0xD0	上一条命令
状态清除	0x50	上一条命令
强制停止	0xB3	上一条命令
空白支票	0xD0	0x71
配置集	0x40	上一条命令

50.4.21 FBCCNT:空白检查控制寄存器

Base address: FACI = 0x407F_E000

Offset address: 0xD0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BCDIR
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BCDIR	空白支票方向 0：从低地址到高地址执行空白检查（增量模式） 1：从高地址到低地址执行空白检查（递减模式）。	R/W

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

FBCCNT specifies the addressing mode in processing the Blank Check command. FBCCNT is initialized when the SUINIT bit in FSUINITR is set to 1. It is also initialized by a reset.

BCDIR bit (Blank Check Direction)

The BCDIR bit specifies the addressing mode for Blank Check.

50.4.22 FBCSTAT : Blank Check Status Register

Base address: FACI = 0x407F_E000

Offset address: 0xD4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BCST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BCST	Blank Check Status Flag 0: The target area is in the non-programmed state, that is, the area has been erased but has not yet been reprogrammed 1: The target area has been programmed with 0s or 1s.	R
7:1	—	These bits are read as 0. The write value should be 0.	R/W

FBCSTAT stores the results of checking in response to the Blank Check command.

BCST flag (Blank Check Status Flag)

The BCST flag indicates the results of checking in response to the Blank Check command.

50.4.23 FPSADDR : Data Flash Programming Start Address Register

Base address: FACI = 0x407F_E000

Offset address: 0xD8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PSADR[16:0]																
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
16:0	PSADR[16:0]	Programmed Area Start Address The address of the first programmed area	R
31:17	—	These bits are read as 0. The write value should be 0.	R/W

FPSADDR indicates the address of the first programmed area found in processing of the Blank Check command.

PSADR[16:0] bits (Programmed Area Start Address)

The PSADR[16:0] bits indicate the address of the first programmed area found in processing of the Blank Check command. The address is an offset from the address where the data flash memory starts. The setting of these bits is only valid if the BCST bit in the FBCSTAT register is 1 and while the FRDY bit in the FSTATR register is 1. When the BCST bit in the FBCSTAT register is 0, the PSADR[16:0] bits hold the address produced by the previous check.

Bit	Symbol	Function	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W

FBCCNT指定处理空白检查命令的寻址模式。当FSUINITR中的SUINIT位设置为1时，FBCCNT被初始化。它也被复位初始化。

BCDIR位（空白检查方向）

BCDIR位指定空白检查的寻址模式。

50.4.22 FBCSTAT:空白检查状态寄存器

Base address: FACI = 0x407F_E000

Offset address: 0xD4

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BCST
重置后的值:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BCST	空白检查状态标志 0：目标区域处于非编程状态，即该区域已被擦除但尚未重新编程 1：目标区域已编程为0或1。	R
7:1	—	这些位被读取为0。写入值应为0。	R/W

FBCSTAT存储响应空白检查命令的检查结果。

BCST标志（空白检查状态标志）

BCST标志指示响应空白检查命令的检查结果。

50.4.23 FPSADDR:数据闪存编程起始地址寄存器

Base address: FACI = 0x407F_E000

Offset address: 0xD8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PSADR[16:0]																
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
16:0	PSADR[16:0]	编程区起始地址 第一个编程区域的地址	R
31:17	—	这些位被读取为0。写入值应为0。	R/W

FPSADDR指示在处理空白检查命令时发现的第一个编程区域的地址。

PSADR[16:0]位（编程区起始地址）

PSADR[16:0]位指示在处理空白检查命令时发现的第一个编程区域的地址。
该地址是数据闪存起始地址的偏移量。仅当FBCSTAT寄存器中的BCST位为1且FSTATR寄存器中的FRDY位为1时，这些位的设置才有效。当
FBCSTAT寄存器为0，PSADR[16:0]位保存上一次检查产生的地址。

50.4.24 FSUASMON : Flash Startup Area Select Monitor Register

Base address: FACI = 0x407F_E000

Offset address: 0xDC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BTFLG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0/1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FSPR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0/1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	These bits are read as 0. The write value should be 0.	R
15	FSPR	Protection Programming Flag to set Boot Flag and Startup Area Control 0: Protected state 1: Non-protected state.	R
30:16	—	These bits are read as 0. The write value should be 0.	R
31	BTFLG	Flag of Startup Area Select for Boot Swap 0: The startup area is the alternate block (block 1) 1: The startup area is the default block (block 0).	R

FSPR bit (Protection Programming Flag to set Boot Flag and Startup Area Control)

The FSPR bit indicates the protection state against the configuration set command for the BTFLG bit, and FSUACR Register.

In response to a reset or configuration set command, the FACI transfers data from flash memory to this register.

BTFLG bit (Flag of Startup Area Select for Boot Swap)

The BTFLG bit indicates whether the address of the startup area is exchanged for the boot swap function or not.

In response to a reset or configuration set command, the FACI transfers data from flash memory to this register.

50.4.25 FCPSR : Flash Sequencer Processing Switching Register

Base address: FACI = 0x407F_E000

Offset address: 0xE0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ESUSPMD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ESUSPMD	Erasure Suspend Mode 0: Suspension priority mode 1: Erasure priority mode.	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W

FCPSR selects the erasure suspension mode. FCPSR is initialized when the SUINIT bit in FSUINITR is set to 1. It is also initialized by a reset.

50.4.24 FSUASMON:闪存启动区选择监控寄存器

Base address: FACI = 0x407F_E000

Offset address: 0xDC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BTFLG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0/1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FSPR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0/1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	这些位被读取为0。写入值应为0。	R
15	FSPR	保护编程标志设置引导标志和启动区控制 0：保护状态1：非保护状态。	R
30:16	—	这些位被读取为0。写入值应为0。	R
31	BTFLG	引导交换的启动区域选择标志 0：启动区为alternateblock（block1）1：启动区为defaultblock（block0）。	R

FSPR位（用于设置引导标志和启动区域控制的保护编程标志）

FSPR位指示针对BTFLG位的配置设置命令的保护状态，而FSUACR Register.

响应复位或配置设置命令，FACI将数据从闪存传输到该寄存器。

BTFLG位（用于引导交换的启动区域选择标志）

BTFLG位指示启动区域的地址是否被交换为引导交换功能。

响应复位或配置设置命令，FACI将数据从闪存传输到该寄存器。

50.4.25 FCPSR:闪存定序器处理切换寄存器

Base address: FACI = 0x407F_E000

Offset address: 0xE0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ESUSPMD
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ESUSPMD	擦除挂起模式 0：暂停优先模式1：擦除优先模式。	R/W
15:1	—	这些位被读取为0。写入值应为0。	R/W

FCPSR选择擦除暂停模式。当FSUINITR中的SUINIT位设置为1时，FCPSR被初始化。它也被复位初始化。

ESUSPMD bit (Erasure Suspend Mode)

The ESUSPMD bit selects the erasure suspension mode when a P/E suspend command is issued while the flash sequencer is executing erasure processing (see section 50.9.3.10. P/E Suspend Command). This bit should be set before issuing Block Erase or Multi Block Erase command.

50.4.26 FPCKAR : Flash Sequencer Processing Clock Notification Register

Base address: FACI = 0x407F_E000

Offset address: 0xE4

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								PCKA[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	1	1	0	0	1	0

Bit	Symbol	Function	R/W
7:0	PCKA[7:0]	Flash Sequencer Operating Clock Notification These bits are used to set the operating frequency of the flash sequencer while processing FACI commands.	R/W*1*2
15:8	KEY[7:0]	Key Code	R/W*3

Note 1. This bit can be written when the FRDY bit in the FSTATR register is 1. Writing to this bit is ignored when the FRDY bit is 0.
Note 2. Writing to these bits is only possible when 16 bits are written and the value written to the KEY[7:0] bits is 0x1E.
Note 3. Written values are not retained by these bits (always read 0x00).

FPCKAR specifies the operating frequency of the flash sequencer while processing FACI commands. The highest operating frequency for the given product is set as the initial value.

PCKA[7:0] bits (Flash Sequencer Operating Clock Notification)

The PCKA[7:0] bits specify the operating frequency of the flash sequencer while processing FACI commands. Set the desired frequency for these bits before issuing an FACI command. Specifically, convert the frequency in MHz to a binary number and set it for these bits.

Example:

Frequency is 35.9 MHz (PCKA = 0x24)

Round up the first decimal place of 35.9 MHz to a whole number (= 36) and convert it into a binary number.

If the value set in these bits is smaller than the actual operating frequency of the flash sequencer, the flash memory programming/erasure characteristics cannot be guaranteed. If the value set in these bits is greater than the actual operating frequency of the flash sequencer, the flash memory programming/erasure characteristics can be guaranteed but the FACI command processing time such as the time programming/erasure takes will increase. The minimum FACI command processing time is obtained when the operating frequency of the flash sequencer is the same as the PCKA value.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits control writing permission to the PCKA bit.

50.4.27 FSUACR : Flash Startup Area Control Register

Base address: FACI = 0x407F_E000

Offset address: 0xE8

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	SAS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ESUSPMD位（擦除挂起模式）

当闪存定序器正在执行擦除处理时发出PE暂停命令时，ESUSPMD位选择擦除暂停模式（请参阅第50.9.3.10节。PE暂停命令）。该位应在发出块擦除或多块擦除命令之前设置。

50.4.26 FPCKAR:闪存定序器处理时钟通知寄存器

Base address: FACI = 0x407F_E000

Offset address: 0xE4

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								PCKA[7:0]							
重置后的值:	0	0	0	0	0	0	0	0	0	0	1	1	0	0	1	0

Bit	Symbol	Function	R/W
7:0	PCKA[7:0]	闪存定序器工作时钟通知 这些位用于在处理时设置闪存定序器的工作频率 FACI命令。	R/W*1*2
15:8	KEY[7:0]	关键代码	R/W*3

注1.当FSTATR寄存器中的FRDY位为1时可以写入该位。当FRDY位为0时忽略写入该位。
注2.仅当写入16位且写入KEY[7:0]位的值为0x1E时，才能写入这些位。
注3.这些位不保留写入的值（始终读取0x00）。

FPCKAR在处理FACI命令时指定闪存定序器的工作频率。将给定产品的最高工作频率设置为初始值。

PCKA[7:0]位（闪存定序器工作时钟通知）

PCKA[7:0]位指定闪存定序器在处理FACI命令时的工作频率。在发出FACI命令之前为这些位设置所需的频率。具体来说，将以MHz为单位的频率转换为二进制数并为这些位设置它。

Example:

频率为35.9MHz(PCKA=0x24)

将35.9MHz的第一个小数位四舍五入为整数(=36)并将其转换为二进制数。

如果这些位中设置的值小于闪存定序器的实际工作频率，则无法保证闪存编程擦除特性。如果这些位中设置的值大于闪存定序器的实际工作频率，则可以保证闪存编程擦除特性，但FACI命令处理时间（例如编程擦除所花费的时间）会增加。当闪存定序器的工作频率与PCKA值相同时，得到最小FACI命令处理时间。

KEY[7:0] bits (Key Code)

KEY[7:0]位控制对PCKA位的写入权限。

50.4.27 FSUACR：闪存启动区控制寄存器

Base address: FACI = 0x407F_E000

Offset address: 0xE8

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	SAS[1:0]	
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SAS[1:0]	Startup Area Select 0 0: Startup area is selected by BTFLG bit 0 1: Startup area is selected by BTFLG bit 1 0: Startup area is temporarily switched to the default area (block 0) 1 1: Startup area is temporarily switched to the alternate area (block 1).	R/W*1 *3
7:2	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code	R/W*2

Note 1. Following described the write condition of thisese bits (these conditions are required at the same time).
1. Access size to this register is 16 bits
2. The value of KEY[7:0] is 0x66
3. The FSPR bit is 1.

Note 2. Written values are not retained by these bits (always read 0x00).

Note 3. Only secure access can write to this register. Both secure access and non-secure read access are allowed. Non-secure write access is denied, but TrustZone access error is note generated.

FSUACR sets the startup area for the boot swap function. Do not use this register in dual mode (the DUALSEL.BANKMD[2:0] bits are 000b). In dual mode, starting up proceeds from startup area 0.

SAS[1:0] bits (Startup Area Select)

The SAS[1:0] bits select the startup area. Three methods are available for changing the startup area.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits control writing permission to the SAS [1:0] bits.

50.4.28 FCKMHZ : Data Flash Access Frequency Register

Base address: FLAD = 0x407F_C000

Offset address: 0x40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	FCKMHZ[7:0]							
Value after reset:	0	0	1	1	1	1	0	0

Bit	Symbol	Function	R/W
7:0	FCKMHZ[7:0]	Data Flash Access Frequency Register These bits optimize the speed of reading the data flash memory.	R/W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

This register optimizes the speed of reading the data flash memory.

Set the frequency of the peripheral module clock (FCLK) of internal peripheral bus which is the clock for access to the data flash memory, in MHz units. For example, 35.9 MHz should be rounded up and set the frequency to 36. Number of cycles required for access to the data flash memory are inserted according to the frequency. When changing the frequency of the FCLK, follow the procedure below to modify the value of the data flash access frequency register (FCKMHZ) in either of the following ways according to whether operation is at a lower frequency before or after the change.

- When changing the speed from low to high: Modify FCKMHZ. After confirming the change by reading FCKMHZ, change the frequency.
- When changing the speed from high to low: Change the frequency. After the frequency is changed, modify FCKMHZ.

50.5 Flash Cache

Bit	Symbol	Function	R/W
1:0	SAS[1:0]	启动区域选择 00：启动区域由BTFLG位选择01：启动区域由BTFLG位选择10：启动区域暂时切换到默认区域（块0）11：启动区域暂时切换到备用区域（块1）。	R/W*1 *3
7:2	—	这些位被读取为0。写入值应为0。	R/W
15:8	KEY[7:0]	关键代码	R/W*2

注1.下面描述了这些位的写入条件（这些条件是同时需要的）。1.对该寄存器的访问大小为16位2.KEY[7:0]的值为0x663.FSPR位为1。

注2.这些位不保留写入的值（始终读取0x00）。

注3.只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问。非安全写入访问被拒绝，但生成了TrustZone访问错误。

FSUACR设置引导交换功能的启动区域。不要在双模式下使用该寄存器（DUALSEL.BANKMD[2:0]位为000b)。在双模式下，从启动区域0开始启动。

SAS[1:0]位（启动区域选择）

SAS[1:0]位选择启动区域。三种方法可用于更改启动区域。

KEY[7:0] bits (Key Code)

KEY[7:0]位控制对SAS[1:0]位的写入权限。

50.4.28 FCKMHZ:数据闪存访问频率寄存器

Base address: FLAD = 0x407F_C000

Offset address: 0x40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	FCKMHZ[7:0]							
重置后的值：	0	0	1	1	1	1	0	0

Bit	Symbol	Function	R/W
7:0	FCKMHZ[7:0]	数据闪存访问频率寄存器 这些位优化了数据闪存的读取速度。	R/W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

该寄存器优化了数据闪存的读取速度。

设置内部外围总线的外围模块时钟(FCLK)的频率，它是访问数据闪存的时钟，以MHz为单位。例如，35.9MHz应向上取整，并将频率设置为36。根据频率插入访问数据闪存所需的周期数。当改变FCLK的频率时，根据改变之前或之后是在较低频率下操作，按照以下步骤，通过以下任一方式修改数据闪存访问频率寄存器(FCKMHZ)的值。

●转速由低变高时：修改FCKMHZ。通过读取FCKMHZ确认更改后，更改频率。

●速度由高变低时：改变频率。频率改变后，修改FCKMHZ。

50.5 闪存缓存

50.5.1 Feature of flash cache

The FCACHE (Flash Cache) speeds up read access from bus master to the flash memory. The FCACHE includes:

- FCACHE1, for CPU instruction fetches
- FCACHE2, for CPU operand access and access from EDMAC
- FLPF, for the prefetch access in CPU instruction fetches

Table 50.7 Flash Cache 1 (FCACHE1) overview

Cache Target Region	0x0000_0000 - 0x007F_FFFF
Target Bus Master	CPU instruction Fetch
Capacity	256 Bytes
Associativity	8WAY set associative
	128 bits/entry (128 bit aligned data), 2 entries/way
Access Cycle	Cache Hit : 0 wait Cache Miss : wait number of Flash Wait Cycle Register

Table 50.8 Flash Cache 2 (FCACHE2) overview

Cache Target Region	0x0000_0000 - 0x007F_FFFF
Target Bus Master	CPU Operand Access and Access from EDMAC
Capacity	16 Bytes
Associativity	Full Associative
	128 bits/entry (128 bit aligned data), 1 entry
Access Cycle	Cache Hit : 0 wait Cache Miss : wait number of Flash Wait Cycle Register

Table 50.9 Prefetch Buffer (FLPF) overview

Cache Target Region	0x0000_0000 - 0x007F_FFFF
Capacity	32 Bytes
Associativity	Full Associative
	128 bits/entry (128 bit aligned data), 2 entries
Request Address	Next address of previous CPU Instruction
Access Cycle	Cache Hit : 0 wait Cache Miss : wait number of Flash Wait Cycle Register

50.5.1 闪存缓存的特点

FCACHE(FlashCache)加快了从总线主机到闪存的读取访问。FCACHE包括：

●FCACHE1，用于CPU取指

●FCACHE2，用于CPU操作数访问和EDMAC访问

●FLPF，用于CPU取指中的预取访问

Table 50.7 闪存1(FCACHE1)概述

缓存目标区域	0x0000_0000 - 0x007F_FFFF
目标总线主控	CPU指令取指
Capacity	256 Bytes
Associativity	8WAY集合关联
	128位入口（128位对齐数据），2入口方式
访问周期	缓存命中：0等待 CacheMiss:Flash等待周期寄存器的等待数

Table 50.8 闪存2(FCACHE2)概述

缓存目标区域	0x0000_0000 - 0x007F_FFFF

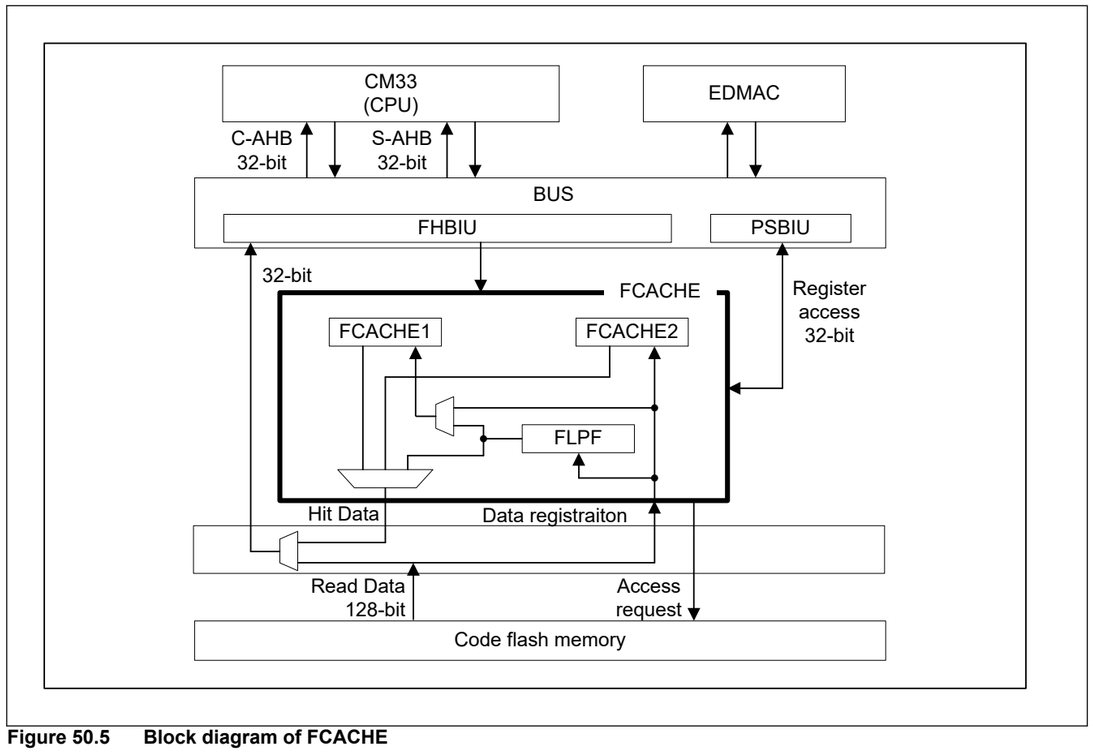

Figure 50.5 Block diagram of FCACHE

50.6 Operating Modes Associated with Flash Memory

Figure 50.6 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, see section 6, Option-Setting Memory.

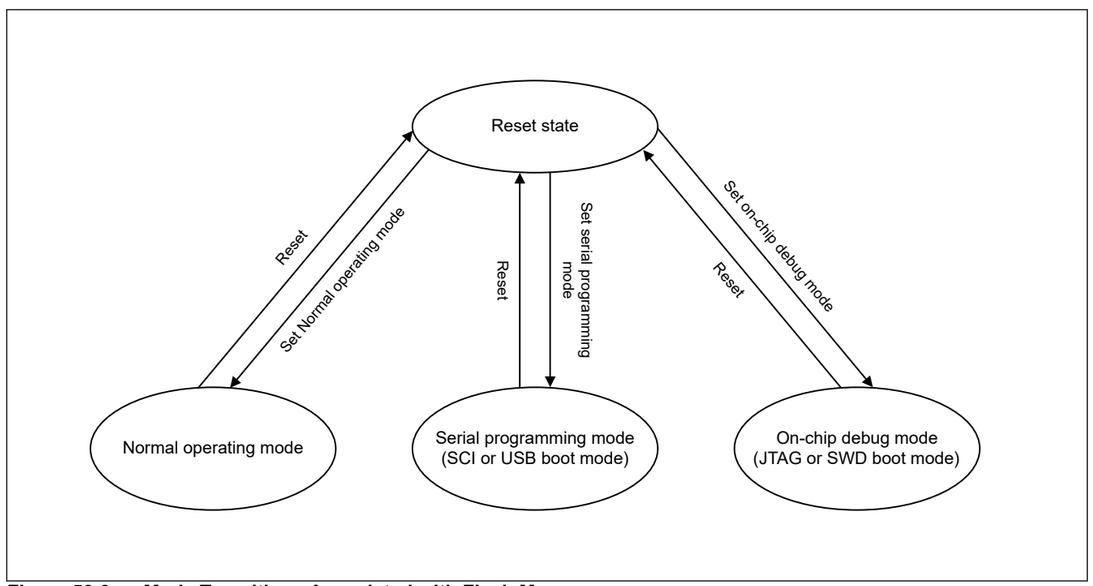

Figure 50.6 Mode Transitions Associated with Flash Memory

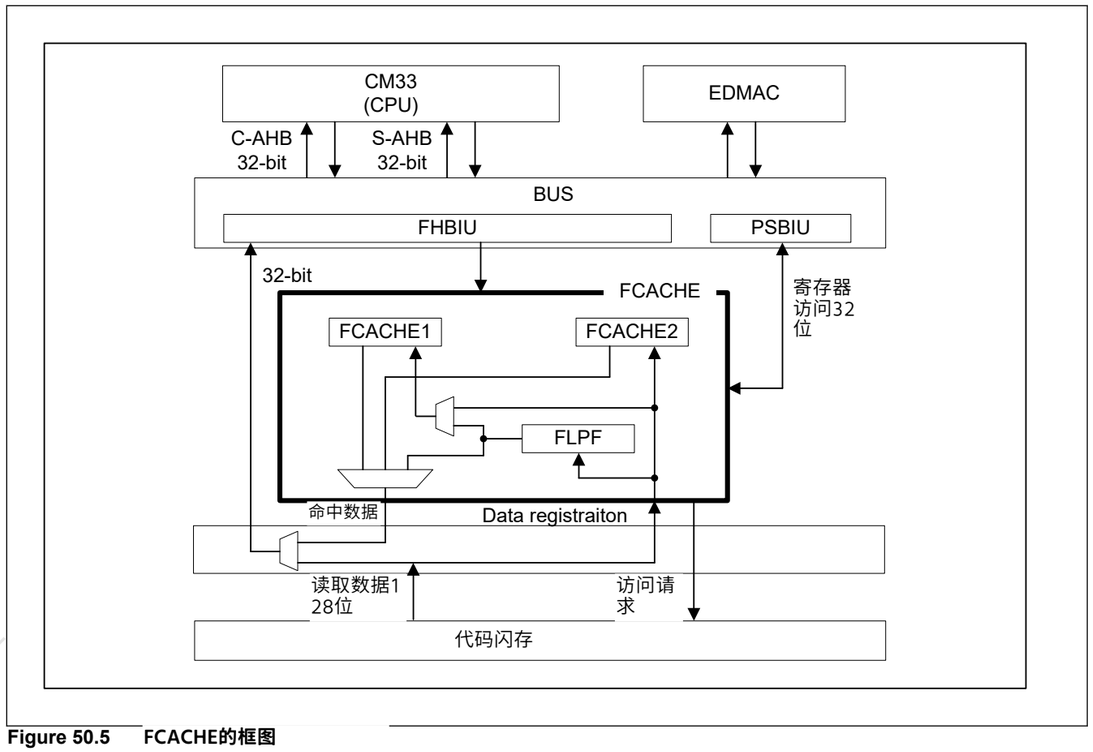

Figure 50.5 FCACHE的框图

50.6 与闪存相关的操作模式

图50.6是与闪存相关的模式转换图。有关设置模式的步骤，请参阅第6节，选项设置内存。

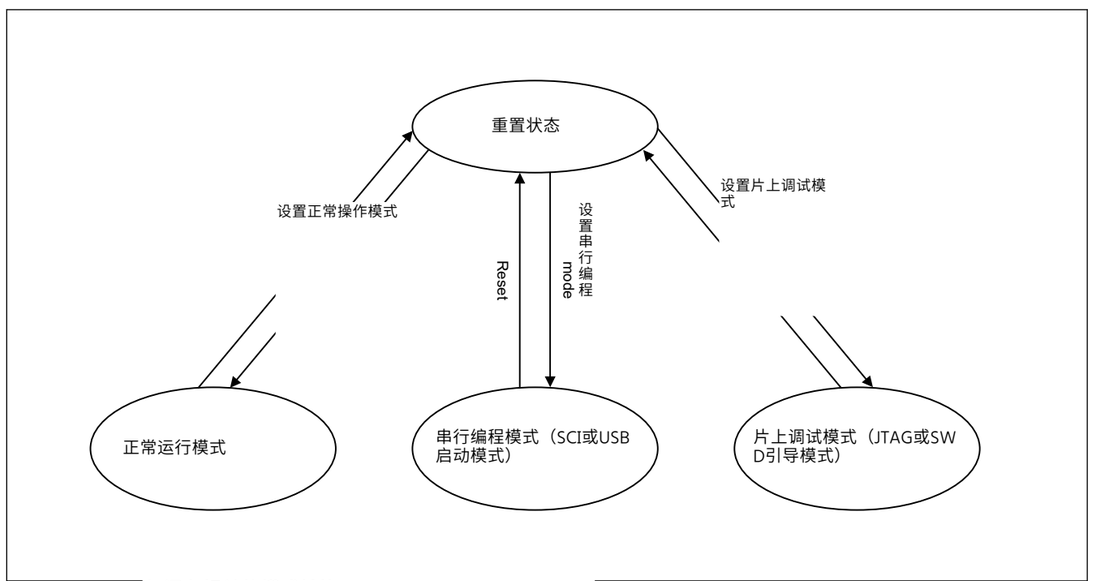

Figure 50.6 与闪存相关的模式转换

The flash memory area where programming and erasure are permitted and the boot program after a reset are different according to each mode. The differences between modes are listed in Table 50.10.

Table 50.10 Differences between Modes

Parameter	Normal operating mode	Serial programming mode (SCI or USB boot mode)	On-chip debug mode (JTAG or SWD boot mode)
Programmable and erasable areas	• Code flash memory • Data flash memory • Option setting memory (programming only)	• Code flash memory • Data flash memory • Option-setting memory (programming only)	• Code flash memory • Data flash memory • Option setting memory (programming only)
Erasure in block units	Possible	Possible	Possible
Boot program at a reset	User area program	Embedded program for serial programming	Depends on debug command

50.7 Overview of Functions

By using a dedicated flash-memory programmer to program the flash memory through a serial interface (serial programming) or JTAG/SWD interface (on-chip debug mode), the device can be rewritten regardless of whether this is before or after it is mounted on the target system.

Furthermore, security functions to prohibit rewriting or reading of the user program written to the flash memory are incorporated, and this can prevent falsification and illicit reading of the programs by third parties.

Programming by the user program (self-programming) is available to suit applications where the application on the target system may require updating after manufacturing or shipment. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as processing for external communications, etc., and this is the case in various situations. Table 50.11 lists the overview of the methods of programming and the corresponding operating modes.

Table 50.11 Programming methods

Programming method	Functional overview	Operating mode
Serial programming	A dedicated flash-memory programmer through the SCI or USBFS interface enables on-board programming of the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash-memory programmer through the SCI or USBFS interface and a dedicated programming adapter board allow off-board programming of the flash memory, for example, programming of the device before it is mounted on the target system.	
Self-programming	A user program written to memory in advance of serial programming execution can also program the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data from the code flash memory while the data flash memory is programmed. As a result, a program resident in the code flash memory is able to program the data flash memory. For background operations that are not possible, instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being programmed by self-programming. In such cases, a program for programming from the internal SRAM or external memory must be transferred in advance and executed.	Normal operating mode
JTAG or SWD programming	A dedicated flash-memory programmer or an on-chip debugger through JTAG or SWD enables on-board programming of the flash memory after the device is mounted on the target system. A dedicated flash-memory programmer or an on-chip debugger through JTAG or SWD and a dedicated programming adapter board allow off-board programming of the flash memory, for example, programming of the device before it is mounted on the target system.	On-chip debug mode

Table 50.12 lists the functions of the flash memory. Serial programmer commands realize each function of serial programming, while reading of the flash memory by an FACI command or the user program realizes each function of self-programming.

允许编程和擦除的闪存区域和复位后的引导程序根据每种模式而不同。模式之间的差异在表50.10中列出。

Table 50.10 模式之间的差异

Parameter	正常运行模式	串行编程模式（SCI或USB启动模式）	片上调试模式（JTAG或SWD引导模式）
可编程和可擦除区域	• 代码闪存 • 数据闪存 • 选项设置内存（仅编程）	• 代码闪存 • 数据闪存 • Option-setting memory (programming only)	• 代码闪存 • 数据闪存 • 选项设置内存（仅编程）
以块为单位擦除	Possible	Possible	Possible
复位时的引导程序	用户区程序	用于串行编程的嵌入式程序	取决于调试命令

50.7 功能概述

通过使用专用闪存编程器通过串行接口（串行编程）或JTAGSWD接口（片上调试模式）对闪存进行编程，无论是在安装之前还是之后，都可以重写设备目标系统。

此外，内置了禁止重写或读取写入闪存的用户程序的安全功能，这可以防止第三方篡改和非法读取程序。

用户程序编程（自编程）适用于目标系统上的应用程序在制造或发货后可能需要更新的应用程序。还集成了用于安全重写闪存的保护功能。此外，支持自编程期间的中断处理，因此可以与外部通信处理等同时进行编程，这在各种情况下都是如此。表50.11列出了编程方法和相应操作模式的概述。

Table 50.11 编程方法

编程方法	功能概览	操作模式
串行编程	通过SCI或USBFS接口的专用闪存编程器可在器件安装到目标系统后对闪存进行板载编程。	串行编程模式
	通过SCI或USBFS接口的专用闪存编程器和专用编程适配器板允许对闪存进行板外编程，例如，在将设备安装到目标系统之前对其进行编程。	
Self-programming	在串行编程执行之前写入存储器的用户程序也可以对闪存进行编程。后台操作能力使得在对数据闪存进行编程时，可以从代码闪存中获取指令或以其他方式读取数据。结果，驻留在代码闪存中的程序能够对数据闪存进行编程。对于无法进行的后台操作，在自编程对代码闪存进行编程时，无法获取代码闪存中的指令并且无法访问数据。在这种情况下，必须预先传输并执行从内部SRAM或外部存储器进行编程的程序。	正常运行模式
JTAG或SWD编程	专用闪存编程器或通过JTAG或SWD的片上调试器可在器件安装到目标系统后对闪存进行板载编程。专用闪存编程器或片上调试器通过 JTAG或SWD和专用编程适配器板允许对闪存进行板外编程，例如，在将器件安装到目标系统之前对其进行编程。	片上调试模式

表50.12列出了闪存的功能。串行编程器命令实现串行编程的各个功能，而通过FACI命令或用户程序读取闪存实现自编程的各个功能。

Table 50.12 Basic Functions

Function	Functional overview	Availability	
		Serial programming	Self-programming
Blank check	Checks a specified block to ensure that writing to it has not already proceeded. Results of reading from data flash memory to which nothing is written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	Not supported	Supported (data flash programming only)
Block erasure	Erases the memory contents in the specified block	Supported	Supported
Programming	Writes to the specified address	Supported	Supported
CRC	Calculates the CRC in the specified range of the flash memory and transfers it to the flash programmer	Supported	Non supported
Read	Reads data programmed in the flash memory	Supported	Not supported (read by user program is possible)
Start-up program protection functions	Configures the start-up program protection functions	Supported	Supported
Option function selection	Selects the option function, and modifies the initial setting of this MCU	Supported	Supported
Dual bank function	Switches different modes (linear or dual)	Supported	Supported
Block swap function	Setting block swap functions	Supported	Supported
Block protection	Setting block protection	Supported	Supported
Device lifecycle transition	Transitions the device lifecycle	Supported	Not supported
Memory security attribution	Setting the memory security attribution	Supported	Not supported
Key	Injects key	Supported	Supported (except the key related to device lifecycle transition)
All erasure	Erase the flash memory to the state after shipment	Supported	Not supported

The flash memory supports various security functions.

Table 50.13 lists the security functions supported by the flash memory.

Table 50.13 Lists of Security Functions

Function	Description
Security flag for Start-up area select	Start-up area selection can be protected by setting of security flag (FSPR).
Permanently block protection	Programming or erasure of each block of code flash memory can be protected permanently.
Protection for TrustZone	Programming or erasure area, readable area, register access, and FACI command operation are protected by ARM TrustZone security.
Programming or erasure mode protection	Only secure developer can enter the programming or erasure mode for code flash.

50.8 Operating Modes of the Flash Sequencer

The flash sequencer has three operating modes as shown in Figure 50.7. Transitions between modes are initiated by changing the value of the FENTRYR register.

When the value of the FENTRYR register is 0x0000, the flash sequencer is in read mode. In this mode, it does not receive FACI commands. The code flash memory and data flash memory are both readable.

When the value of the FENTRYR register is 0x0001, the flash sequencer is in code flash P/E mode where the code flash memory can be programmed or erased by FACI commands. In this mode, the data flash memory is readable. In addition, the code flash memory is not readable if background operation (BGO) is disabled. If BGO is enabled, the code flash memory that is not selected by FSADDR register is readable when the FRDY bit in the FSTATR register is 0. As for the condition for enabling BGO, see section 50.15.2. Background Operation.

Table 50.12 基本功能

Function	功能概览	Availability	
		串行编程	自编程
空白支票	检查指定的块以确保尚未对其进行写入。无法保证从擦除后没有写入任何内容的数据闪存中读取的结果，因此使用空白检查来确认擦除后没有继续写入内存。	不支持	支持（仅数据闪存编程）
块擦除	擦除指定块中的内存内容	Supported	Supported
Programming	写入指定地址	Supported	Supported
CRC	计算flash存储器指定范围内的CRC，并传送给flash编程器	Supported	不支持
Read	读取闪存中编程的数据	Supported	不支持（可由用户程序读取）
启动程序保护功能	配置启动程序保护功能	Supported	Supported
选项功能选择	选择选项功能，修改本MCU的初始设置	Supported	Supported
双银行功能	切换不同的模式（线性或双）	Supported	Supported
区块交换功能	设置块交换功能	Supported	Supported
块保护	设置块保护	Supported	Supported
设备生命周期过渡	过渡设备生命周期	Supported	不支持
内存安全归属	设置内存安全属性	Supported	不支持
Key	注入密钥	Supported	支持（设备生命周期转换相关的key除外）
全部擦除	擦除闪存到出货后的状态	Supported	不支持

闪存支持各种安全功能。

表50.13列出了闪存支持的安全功能。

Table 50.13 安全功能列表

Function	Description
启动区域选择的安全标志	启动区域选择可以通过设置安全标志(FSPR)来保护。
永久阻止保护	可以永久保护每个代码闪存块的编程或擦除。
保护TrustZone	编程或擦除区域、可读区域、寄存器访问和FACI命令操作受ARMTrustZone安全保护。
编程或擦除模式保护	只有安全的开发人员才能进入代码闪存的编程或擦除模式。

50.8 FlashSequencer的操作模式

闪存定序器具有三种操作模式，如图50.7所示。通过更改FENTRYR寄存器的值来启动模式之间的转换。

当FENTRYR寄存器的值为0x0000时，闪存定序器处于读取模式。在这种模式下，它不接收FACI命令。代码闪存和数据闪存都是可读的。

当FENTRYR寄存器的值为0x0001时，闪存定序器处于代码闪存PE模式，代码闪存可以通过FACI命令进行编程或擦除。在这种模式下，数据闪存是可读的。此外，如果禁用后台操作(BGO)，则代码闪存不可读。如果BGO使能，则当FSTATR寄存器中的FRDY位为0时，可以读取FSADDR寄存器未选择的代码闪存。关于使能BGO的条件，请参见50.15.2节。后台操作。

When the value of the FENTRYR register is 0x0080, the flash sequencer is in data flash P/E mode where the data flash memory can be programmed or erased by FACI commands. In this mode, the data flash memory is not readable. However, the code flash memory is readable.

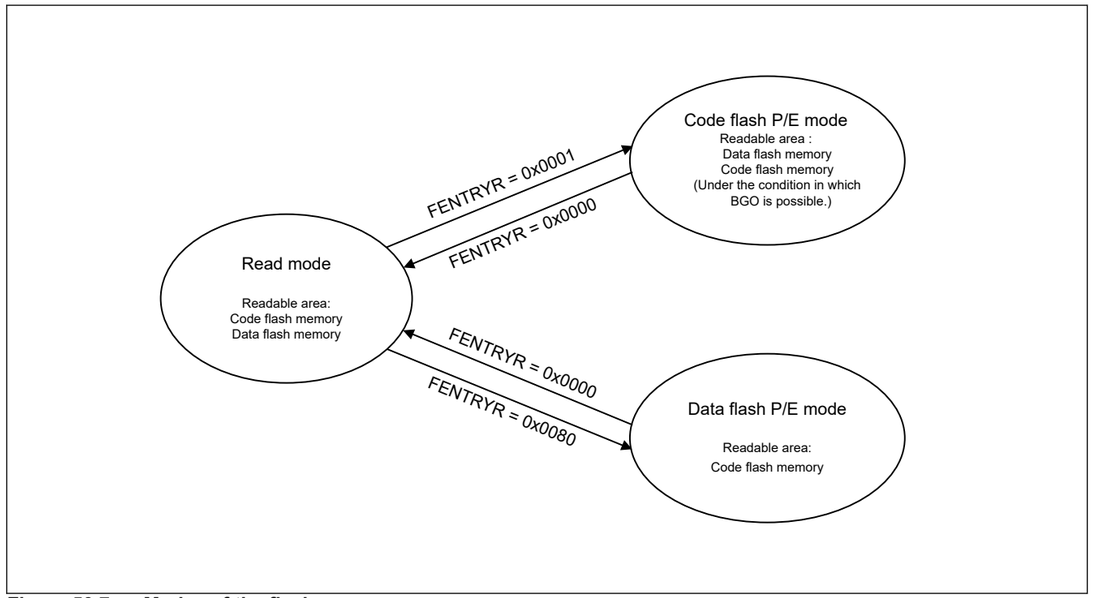

Figure 50.7 Modes of the flash sequencer

50.9 FACI Commands

50.9.1 List of FACI Commands

The FACI controls the FCU according to the specified FACI commands.

This section describes information about the FACI commands and Table 50.14 lists the FACI commands.

Table 50.14 FACI commands (1 of 2)

FACI command	Function
Program	Programs the user area and data area. Units of programming are 128 bytes for the user area and 4, 8, or 16 bytes for the data area.
Block erase	Erases user area and data area. The erase unit is 8 KB or 32 KB for user area, and 64 bytes for data flash.
Multi block erase	Erases data area. The erase unit is 64, 128, 256 bytes for data flash.
P/E suspend	Suspends programming or erasure processing.
P/E resume	Resumes suspended programming or erasure processing.
Status clear	Initializes the ILGLERR, ERSERR, PRGERR, ILGCOMERR, FESETERR, SECERR, and OTERR bits in the FSTATR register and the CMDLK, CFAE, and DFAE bits in the FASTAT register, and the flash sequencer released from command-locked state.
Forced stop	Forcibly stops processing of FACI commands and initializes the FSTATR and FASTAT registers.

当FENTRYR寄存器的值为0x0080时，闪存定序器处于数据闪存PE模式，可以通过FACI命令对数据闪存进行编程或擦除。在这种模式下，数据闪存是不可读的。但是，代码闪存是可读的。

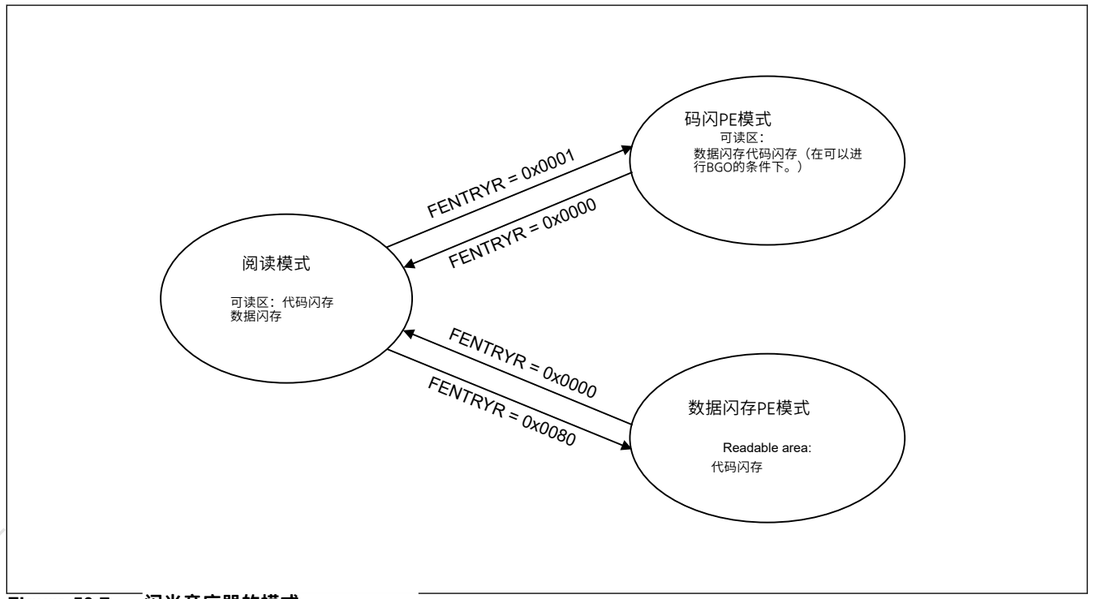

Figure 50.7 闪光音序器的模式

50.9 FACI命令

50.9.1 FACI命令列表

FACI根据指定的FACI命令控制FCU。

本节介绍有关FACI命令的信息，表50.14列出了FACI命令。

Table 50.14 FACI命令(1of2)

FACI命令	Function
Program	对用户区和数据区进行编程。 用户区的编程单元为128字节，数据区为4、8或16字节。
块擦除	擦除用户区和数据区。 用户区的擦除单元为8KB或32KB，数据闪存为64字节。
多块擦除	擦除数据区。 数据闪存的擦除单元为64、128、256字节。
P/E suspend	暂停编程或擦除处理。
P/E resume	恢复暂停的编程或擦除处理。
状态清除	Initializes the ILGLERR, ERSERR, PRGERR, ILGCOMERR, FSTATR寄存器中的FESETERR、SECERR和OTERR位以及FASTAT寄存器中的CMDLK、CFAE和DFAE位，并且闪存定序器从命令锁定状态释放。
强制停止	强制停止处理FACI命令并初始化 FSTATR和FASTAT寄存器。

Table 50.14 FACI commands (2 of 2)

FACI command	Function
Blank check	Checks if data areas are blank. Units of Blank Check: 4 bytes to data flash memory capacity (specified in 4-byte units).
Configuration set	Sets the option-setting memory. Units of setting: 16 bytes.

The FACI commands are issued by writing to the FACI command-issuing area (see Table 50.4). When write access as shown in Table 50.15 proceeds in the specified state, the flash sequencer executes the processing associated with the given command (see section 50.9.2. Relationship between the Flash Sequencer State and FACI Commands).

Table 50.15 FACI command formats

FACI commands	Number of write access	Write data to the FACI command-issuing area			
		1st access	2nd access	3rd to (N+2)th access	(N+3)th access
Program (user area) N = 64	67	0xE8	0x40 (=N)	WD1 to WD64	0xD0
Program (data area) 4-byte programming: N = 2 8-byte programming: N = 4 16-byte programming: N = 8	N+3	0xE8	0x02 (=N) 0x04 (=N) 0x08 (=N)	WD1 to WDN	0xD0
Block Erase (user area 8K/32K Bytes)	2	0x20	0xD0	—	—
Block Erase (data area 64 bytes)	2	0x20	0xD0	—	—
Multi block erase (data area 64/128/256 bytes)	2	0x21	0xD0	—	—
P/E suspend	1	0xB0	—	—	—
P/E resume	1	0xD0	—	—	—
Status Clear	1	0x50	—	—	—
Forced Stop	1	0xB3	—	—	—
Blank Check	2	0x71	0xD0	—	—
Configuration set N = 8	11	0x40	0x08 (=N)	WD1 to WD8	0xD0

Note: WDN (N = 1, 2, …): Nth 16-bit data to be programmed.

The flash sequencer clears the FSTATR.FRDY bit to 0 at the start of a command processing other than the Status Clear command, and sets this bit to 1 on completion.

If the FRDYIE.FRDYIE bit setting is 1, a flash ready (FRDY) interrupt is generated when the FSTATR.FRDY bit is set to 1.

50.9.2 Relationship between the Flash Sequencer State and FACI Commands

The FACI commands are accepted according to the mode/state of the flash sequencer. FACI commands should be issued after transitioning of the flash sequencer to the code flash P/E mode or data flash P/E mode and after checking the state of the flash sequencer.

Use the FSTATR and FASTAT registers to check the state of the flash sequencer. In addition, the occurrence of errors in general can be checked by reading the CMDLK bit in the FASTAT register. The value of the CMDLK bit is the logical OR of the following bits in the FSTATR register:

- ILGLERR
- ILGCOMERR
- FESETERR
- SECERR

Table 50.14 FACI命令（2个中的2个）

FACI命令	Function
空白支票	检查数据区域是否为空白。 空白检查单位：4字节到数据闪存容量（以4字节为单位指定）。
配置集	设置选项设置内存。 设置单位：16字节。

FACI命令通过写入FACI命令发布区域来发布（参见表50.4）。当如表50.15所示的写访问在指定状态下进行时，闪存定序器执行与给定命令相关的处理（请参阅第50.9.2节。闪存定序器状态和FACI命令之间的关系）。

Table 50.15 FACI命令格式

FACI命令	写访问次数	将数据写入FACI命令发布区			
		1st access	2nd access	第3次到第(N+2)次访问	(N+3)th access
Program (user area) N = 64	67	0xE8	0x40 (=N)	WD1 to WD64	0xD0
Program (data area) 4-byte programming: N = 2 8-byte programming: N = 4 16-byte programming: N = 8	N+3	0xE8	0x02 (=N) 0x04 (=N) 0x08 (=N)	WD1 to WDN	0xD0
块擦除（用户区8K32K字节）	2	0x20	0xD0	—	—
块擦除（数据区64字节）	2	0x20	0xD0	—	—
多块擦除（数据区64128256字节）	2	0x21	0xD0	—	—
P/E suspend	1	0xB0	—	—	—
P/E resume	1	0xD0	—	—	—
状态清除	1	0x50	—	—	—
强制停止	1	0xB3	—	—	—
空白支票	2	0x71	0xD0	—	—
配置集 N = 8	11	0x40	0x08 (=N)	WD1 to WD8	0xD0

Note: WDN(N=1 2 …)：要编程的第N个16位数据。

闪存定序器在除状态清除命令之外的命令处理开始时将FSTATR.FRDY位清除为0，并在完成时将此位设置为1。

如果FRDYIE.FRDYIE位设置为1，则当FSTATR.FRDY位设置为1时会产生闪存就绪(FRDY)中断。

50.9.2 FlashSequencerState和FACI命令之间的关系

根据闪存定序器的模式状态接受FACI命令。FACI命令应在闪存定序器转换到代码闪存PE模式或数据闪存PE模式并检查闪存定序器的状态之后发出。

使用FSTATR和FASTAT寄存器检查闪存序列器的状态。此外，一般可以通过读取FASTAT寄存器中的CMDLK位来检查错误的发生。CMDLK位的值是FSTATR寄存器中以下位的逻辑或：

- ILGLERR
- ILGCOMERR
- FESETERR
- SECERR

RA生态工作室

- OTERR
- ERSERR
- PRGERR
- FLWEERR.

Table 50.16 lists the available FACI commands in each operating mode.

Table 50.16 Operating mode and available FACI commands

Operating mode	FENTRYR	Available FACI commands

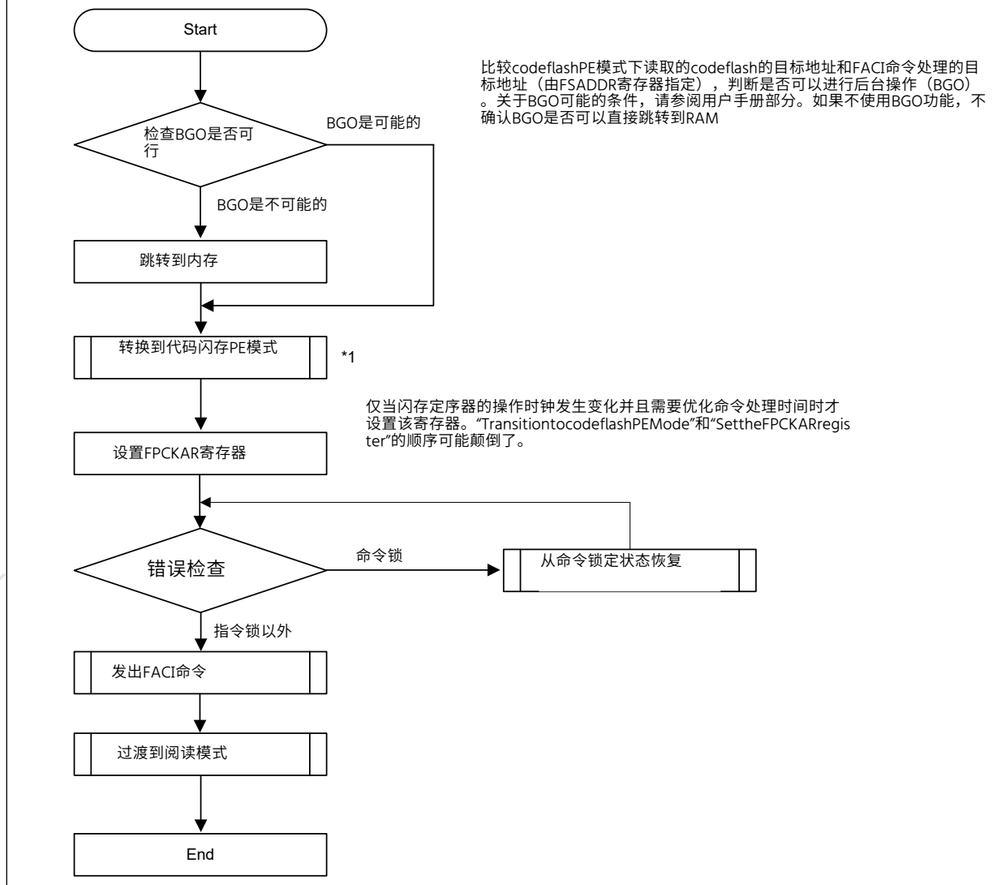
50.9.3.2 Overview of Command Usage in Data Flash P/E Mode

Figure 50.9 shows an overview of FACI command usage in data flash P/E and Table 50.16 lists the available commands in data flash P/E mode.



注1.见第50.9.3.3节。转换到CodeFlashPE模式

Figure 50.8 CodeflashPE模式下的命令使用概述

50.9.3.2 DataFlashPE模式下的命令使用概述

图50.9显示了数据闪存PE中FACI命令使用的概述，表50.16列出了数据闪存PE模式下的可用命令。

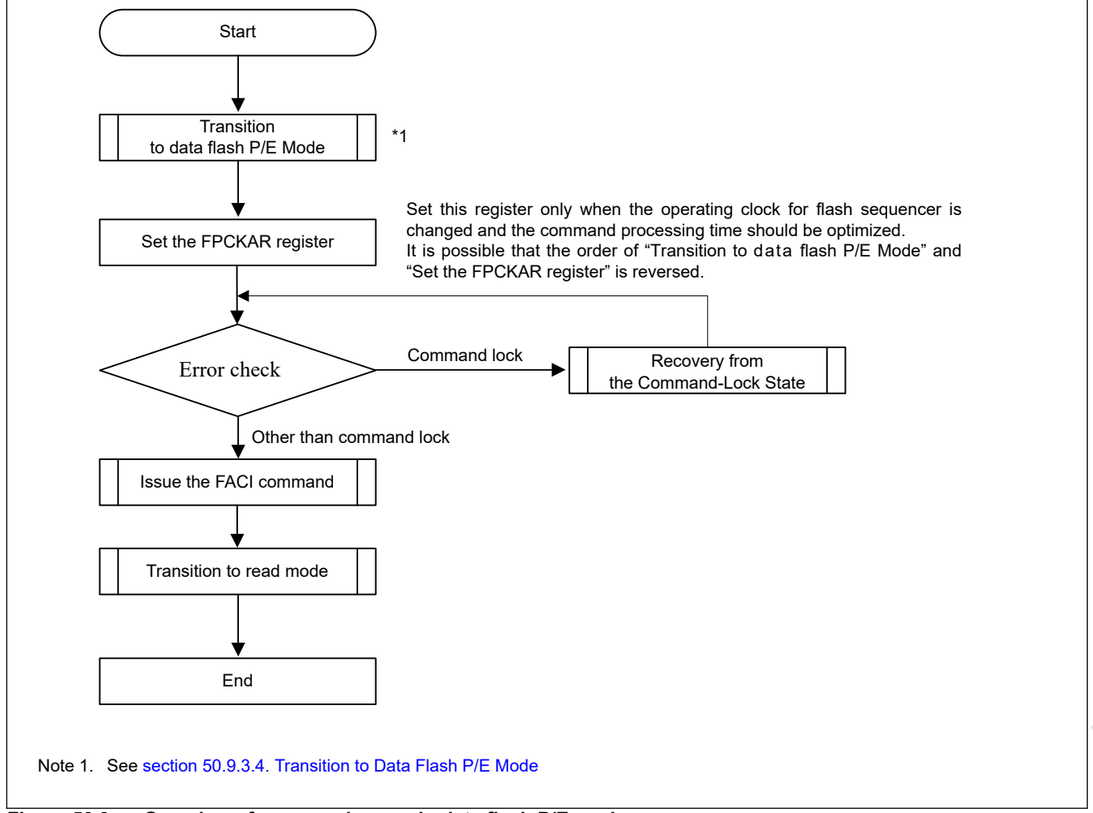


Figure 50.9 Overview of command usage in data flash P/E mode

50.9.3.3 Transition to Code Flash P/E Mode

To issue FACI commands for the code flash memory, a transition to code flash P/E mode is required by setting the FENTRYC bit in the FENTRYR register to 1.

Figure 50.10 shows the procedure to transition to code flash P/E mode.

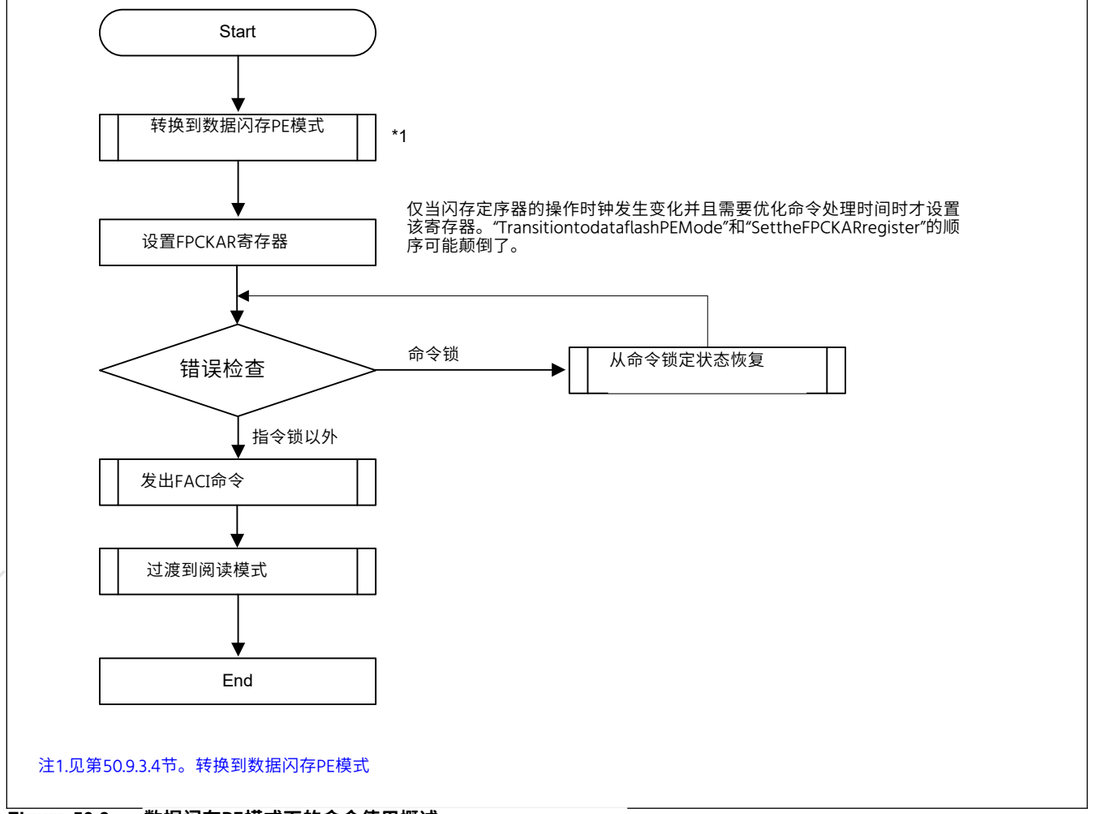

Figure 50.9 数据闪存PE模式下的命令使用概述

50.9.3.3 转换到CodeFlashPE模式

要为代码闪存发出FACI命令，需要通过设置FENTRYR寄存器中的FENTRYC位为1。

图50.10显示了转换到代码闪存PE模式的过程。

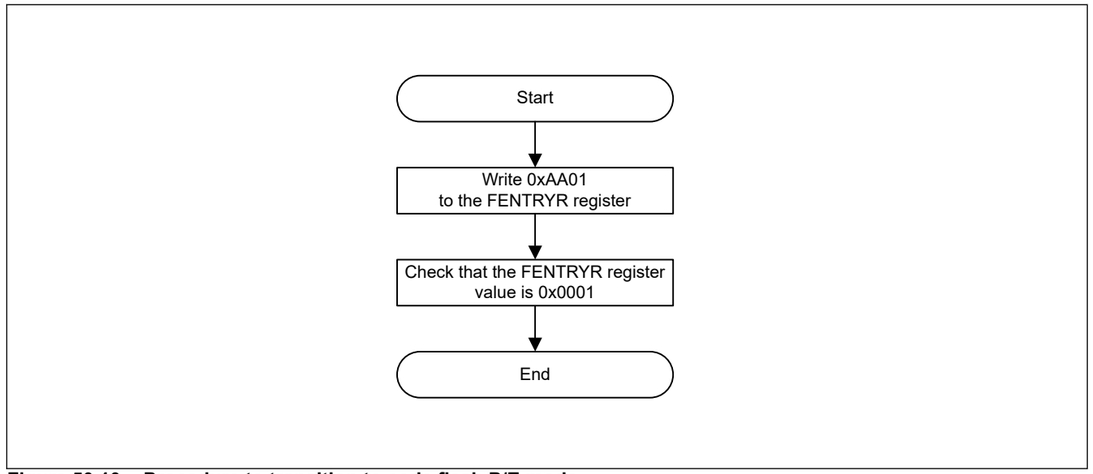

Figure 50.10 Procedure to transition to code flash P/E mode

50.9.3.4 Transition to Data Flash P/E Mode

To issue FACI commands for the data flash memory, a transition to data flash P/E mode is required by setting the FENTRYD bit in the FENTRYR register to 1.

Figure 50.11 shows the procedure to transition to data flash P/E mode.

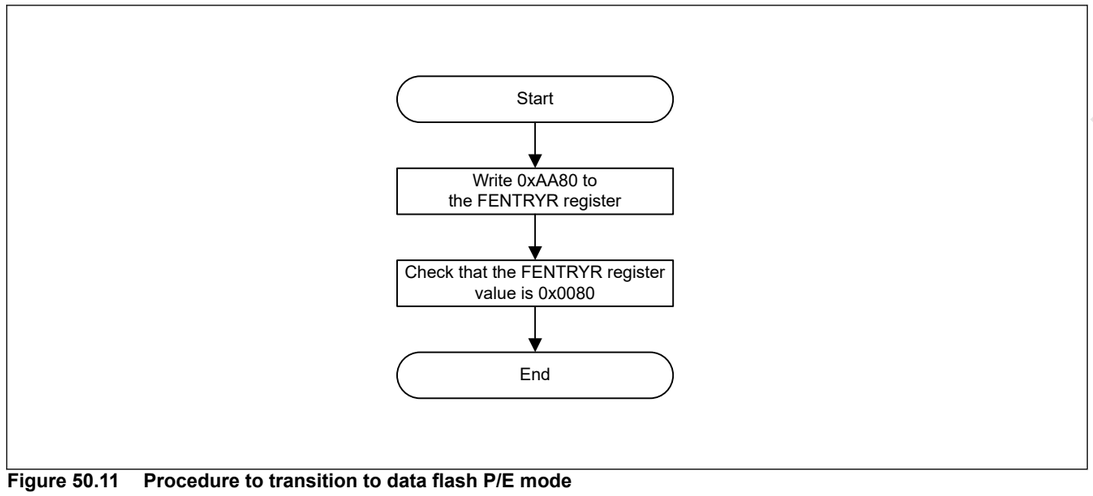

Figure 50.11 Procedure to transition to data flash P/E mode

50.9.3.5 Transition to Read Mode

To read the flash memory, a transition to read mode is required by setting the FENTRYR register to 0x0000. The transition to read mode should be made after the flash sequencer completes the processing and while operation is not in the command-locked state.

Figure 50.12 shows the procedure to transition to read mode.

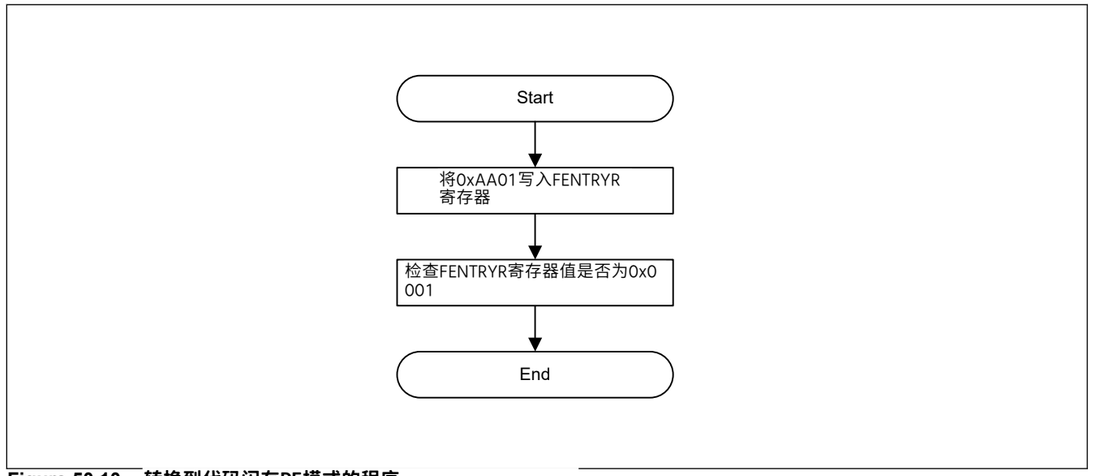

Figure 50.10 转换到代码闪存PE模式的程序

50.9.3.4 转换到数据闪存PE模式

要为数据闪存发出FACI命令，需要通过设置FENTRYR寄存器中的FENTRYD位为1。

图50.11显示了转换到数据闪存PE模式的过程。

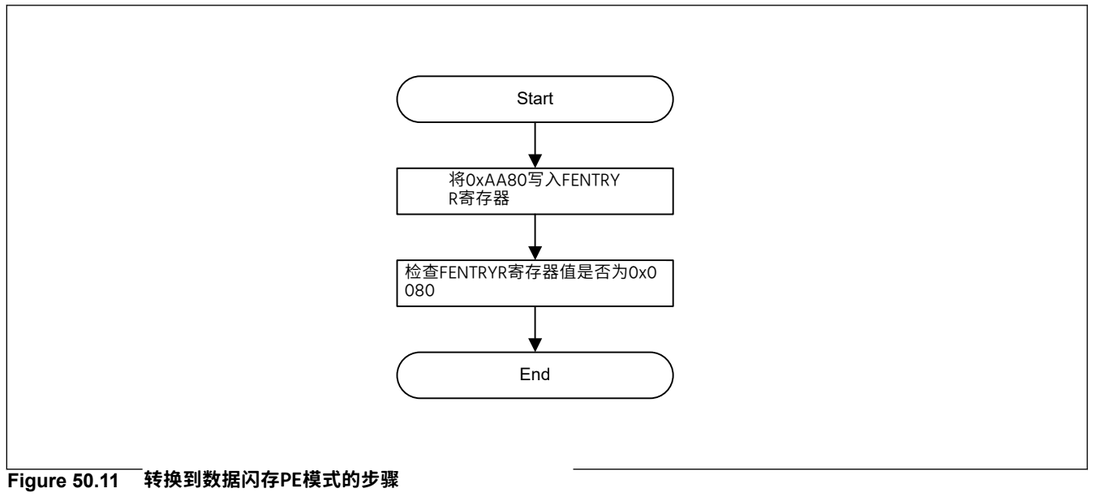

Figure 50.11 转换到数据闪存PE模式的步骤

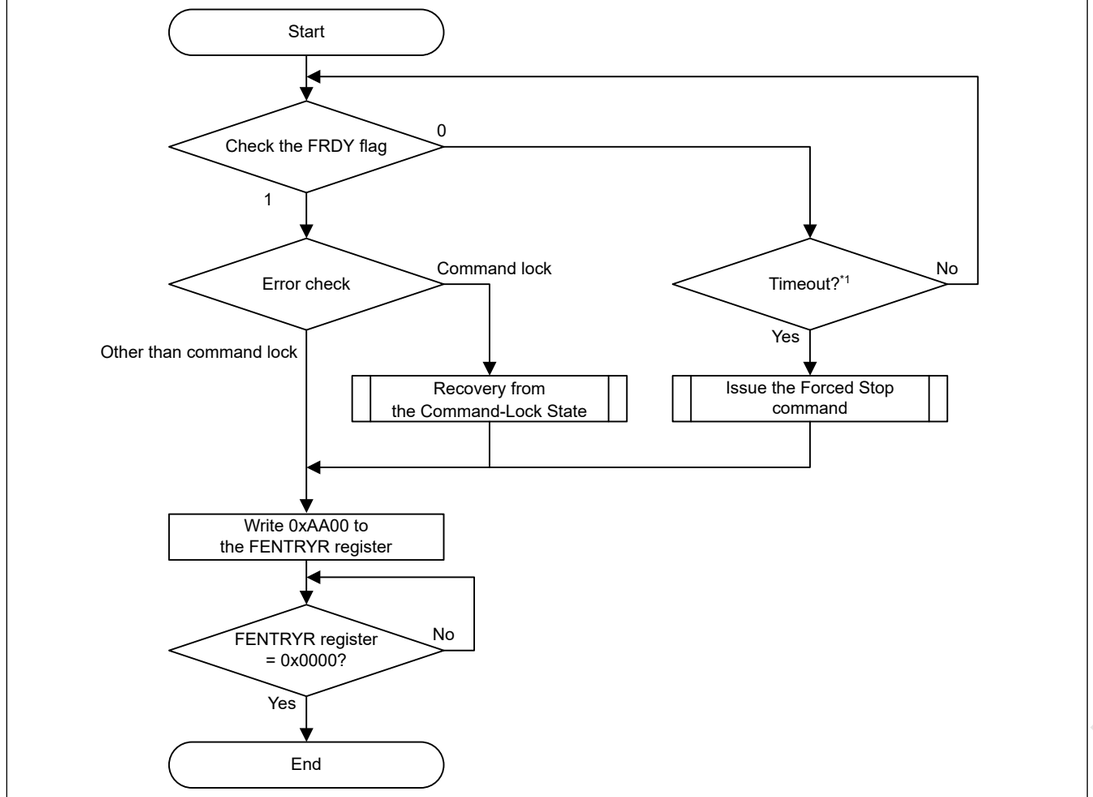
50.9.3.5 过渡到阅读模式

要读取闪存，需要通过将FENTRYR寄存器设置为0x0000转换到读取模式。闪存定序器完成处理后且操作未处于命令锁定状态时，应转换到读取模式。

图50.12显示了转换到读取模式的过程。



Note 1. Judgment of the timeout is based on 1.1 times the maximum time for processing of the FACI command that is in progress (see section 53, Electrical Characteristics)

Figure 50.12 Procedure to transition to read mode

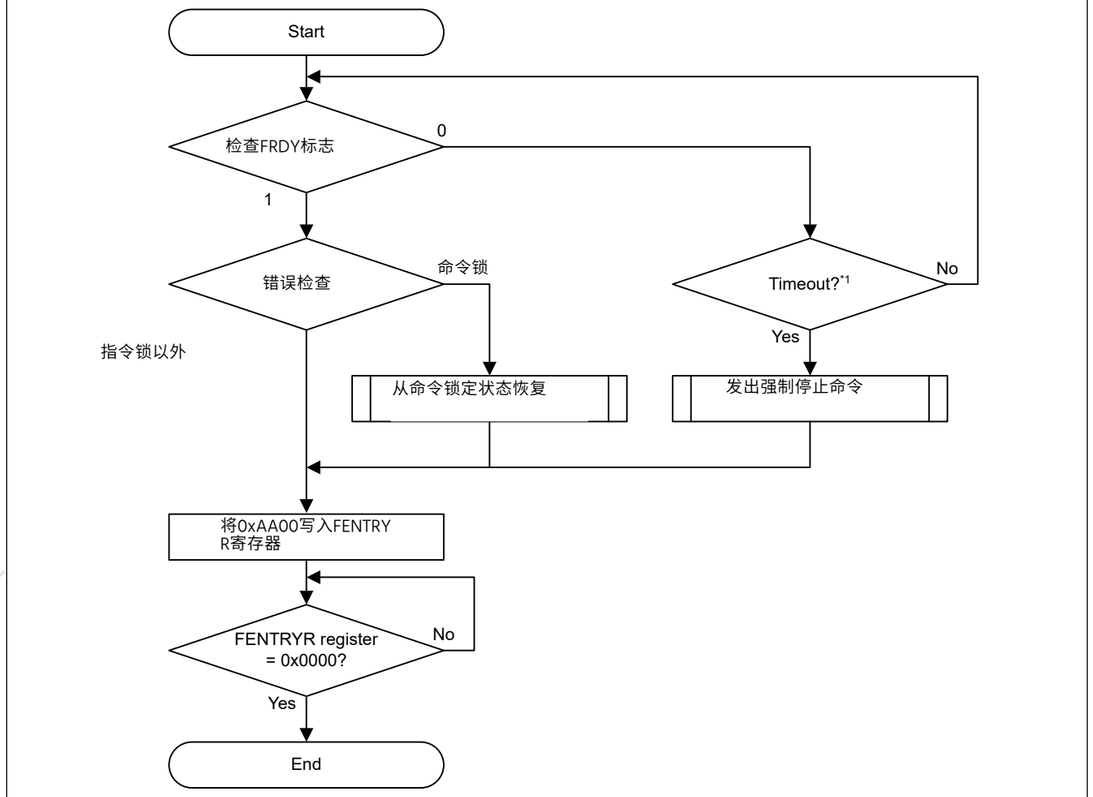
50.9.3.6 Recovery from the Command-Locked State

When the flash sequencer enters the command-locked state, FACI commands cannot be accepted. To release the sequencer from the command-locked state, use the status clear command, forced stop command, or FASTAT register.

When the command-locked state is detected by checking for an error before issuing the P/E suspend command, the FRDY bit in the FSTATR register might be 0 even though command processing has not completed. If processing is not complete by the maximum programming/erasure time specified in the electrical characteristics, this is a timeout and the flash sequencer must be stopped with the forced stop command.

The FLWEERR bit in the FSTATR register does not change from 1 to 0 with the status clear command. When these bits are set to 1, use the forced stop command to release from the command-locked state. Bits other than FRDY and FLWEERR in FSTATR register that indicate the command-locked state can be changed from 1 to 0 with the status clear or forced stop command.

Figure 50.13 shows the recovery flow from the command-locked state.



注1.超时的判断是基于1.1倍的FACI命令处理正在进行的最长时间（见第53节，电气特性）

Figure 50.12 转换到阅读模式的过程

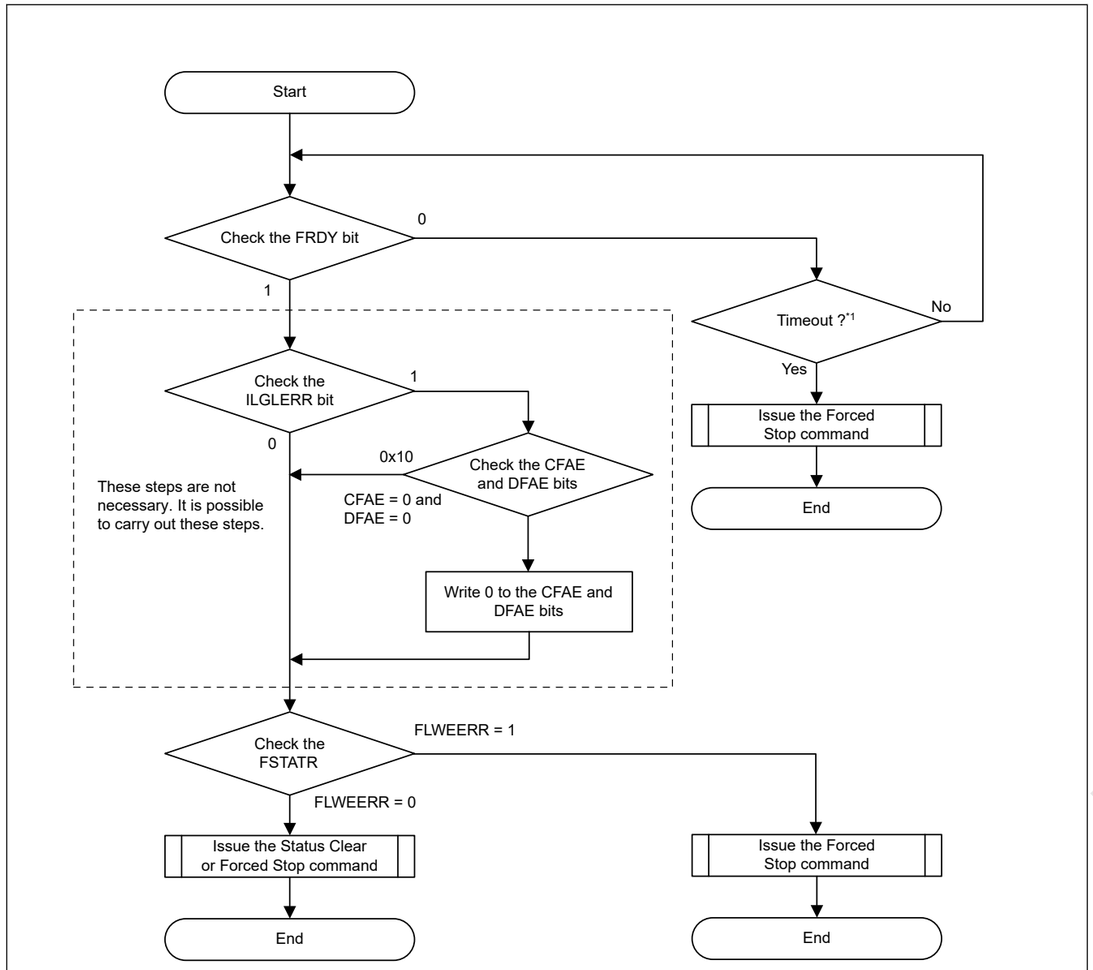
50.9.3.6 从命令锁定状态恢复

当闪存定序器进入命令锁定状态时，无法接受FACI命令。要从命令锁定状态释放定序器，请使用状态清除命令、强制停止命令或FASTAT寄存器。

当通过在发出PE挂起命令之前检查错误来检测命令锁定状态时，即使命令处理尚未完成，FSTATR寄存器中的FRDY位也可能为0。如果在电气特性中指定的最大编程擦除时间未完成处理，则这是一个超时，并且必须使用强制停止命令停止闪存定序器。

FSTATR寄存器中的FLWEERR位不会随着状态清除命令从1变为0。当这些位设置为1时，使用强制停止命令从命令锁定状态中释放。FSTATR寄存器中除FRDY和FLWEERR以外的位指示命令锁定状态可以通过状态清除或强制停止命令从1更改为0。

图50.13显示了从命令锁定状态的恢复流程。



Note 1. Judgment of the timeout is based on 1.1 times the maximum time for processing of the FACI command that is in progress (see section 53, Electrical Characteristics)

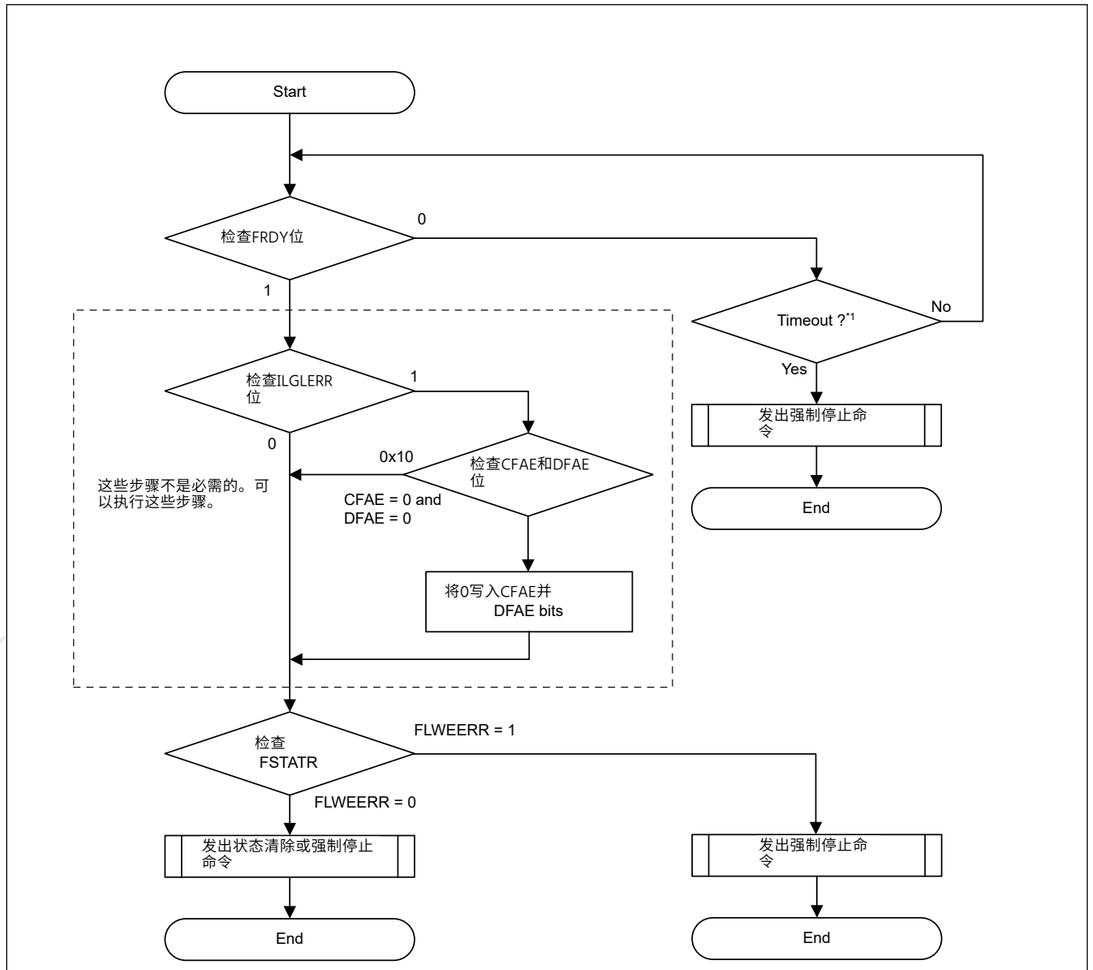
Figure 50.13 Recovery flow from the command-locked state

50.9.3.7 Program Command

The program command is used for writing to the user area and data area. Before issuing the FACI program command, set the first address of the target block in the FSADDR register. Writing 0xD0 at the final access of the FACI command-issuing area starts the program command processing. If the target area of program command processing contains area that are not for writing, write 0xFFFF to the corresponding area.

Issuing the program command while the FACI internal data buffer is full leads to a wait on the peripheral bus that might affect communications performance of other peripheral modules. To avoid a wait, set the DBFULL bit in the FSTATR register to 0 when issuing the FACI command. Writing to the data area does not lead to the data buffer becoming full.

Figure 50.14 shows the usage of the program command.



注1.超时的判断是基于1.1倍的FACI命令处理正在进行的最长时间（见第53节，电气特性）

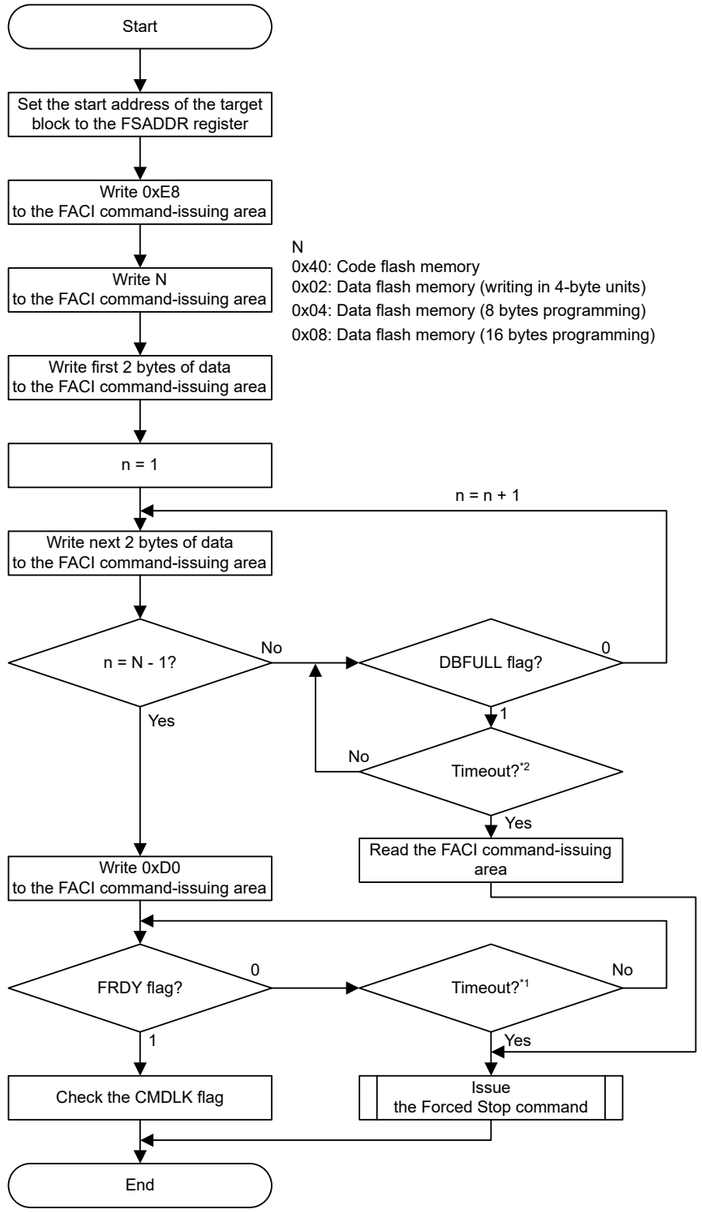
Figure 50.13 从命令锁定状态恢复流程

50.9.3.7 程序命令

程序命令用于写入用户区和数据区。在发出FACI程序命令之前，在FSADDR寄存器中设置目标块的首地址。在最终访问FACI命令发布区域时写入0xD0开始程序命令处理。如果程序命令处理的目标区域包含非写入区域，则将0xFFFF写入相应区域。

在FACI内部数据缓冲区已满时发出程序命令会导致外围总线等待，这可能会影响其他外围模块的通信性能。为避免等待，请在发出FACI命令时将FSTATR寄存器中的DBFULL位设置为0。写入数据区不会导致数据缓冲区变满。

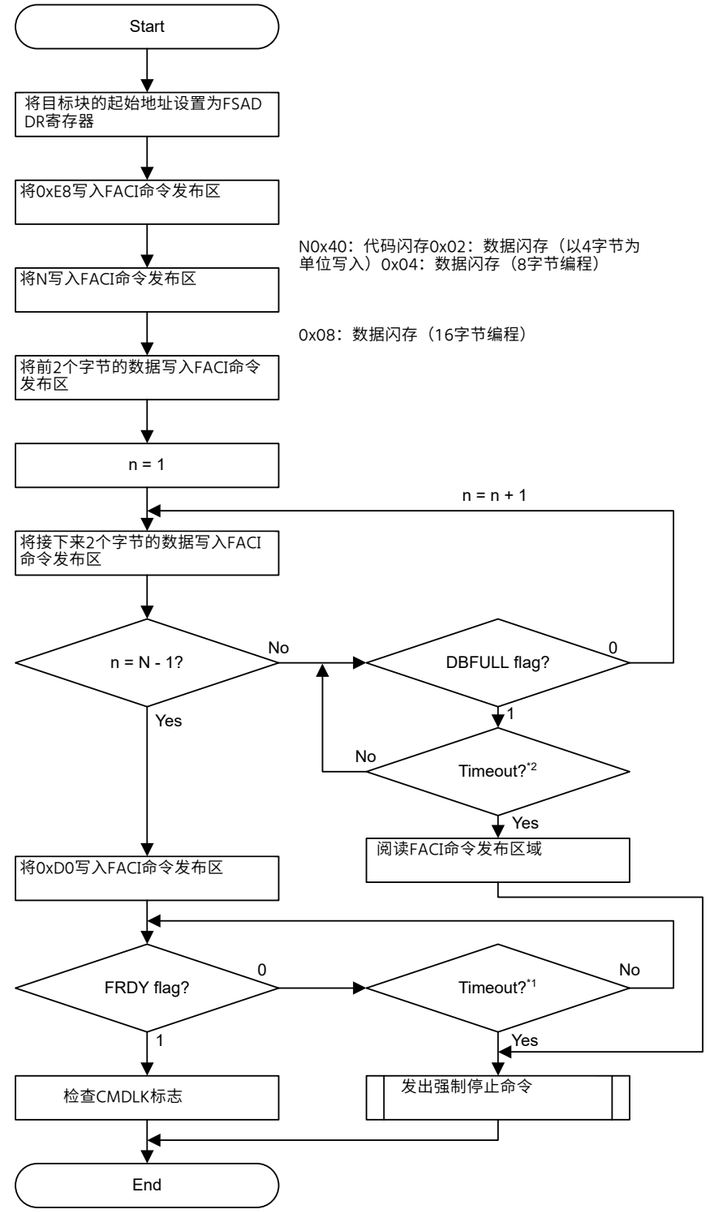
图50.14显示了程序命令的用法。



Note 1. Judgment of the timeout is based on 1.1 times the maximum time of programming. See section 53, Electrical Characteristics about those time

Note 2. 1.4 µs (f_{FCLK} ≥ 20 MHz)

Figure 50.14 Usage flow of the program command



注1.超时的判断是基于最大编程时间的1.1倍。见第53节，电气那个时代的特征

Note 2. 1.4 µs (f_{FCLK} ≥ 20 MHz)

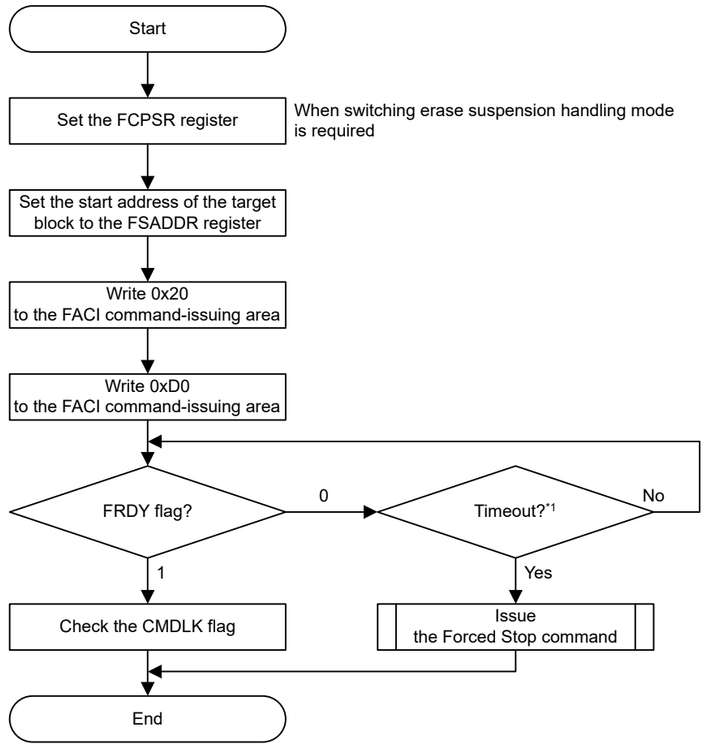
Figure 50.14 程序指令的使用流程

50.9.3.8 Block Erase Command

The block erase command is used for erasing user area or data area. The erase unit is one block. Before issuing a block erase command, set the first address of the target block to FSADRR register. Writing 0xD0 at the second write access of the FACI command triggers the FACI to start the block erase command processing. Completion of command processing can be confirmed with the FRDY bit of FSTATR register.

Set the FCPSR registers before issuing the block erase command. Additionally, FCPSR must be set when the erasure-suspended mode is to be switched.

Figure 50.15 shows the usage of the block erase command.



Note 1. Judgment of the timeout is based on 1.1 times the maximum time of erasure. See section 53, Electrical Characteristics.

Figure 50.15 Usage flow of the block erase command

50.9.3.9 Multi Block Erase Command

The multi block erase command is used for erasing data area. The erase unit is 64, 128, or 256 bytes. Before issuing the multi block erase command, set the start address to FSADRR register and the end address to FEADDR register. Writing 0xD0 at the second write access of the FACI command triggers FACI to start the multi block erase command processing. Completion of command processing can be confirmed with the FRDY bit of FSTATR register.

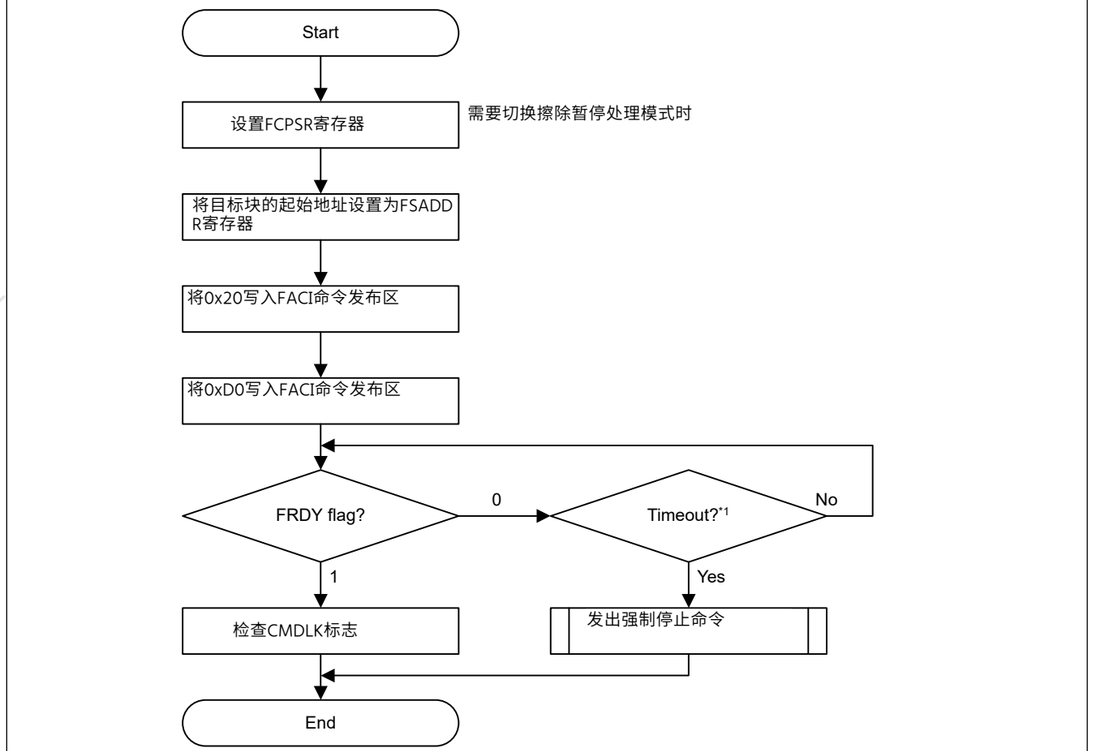
Set the FCPSR registers before issuing the multi block erase command. Additionally, FCPSR must be set when the erasure-suspended mode is to be switched.

50.9.3.8 块擦除命令

块擦除命令用于擦除用户区或数据区。擦除单位是一个块。在发出块擦除命令之前，将目标块的首地址设置为FSADRR寄存器。在FACI命令的第二次写访问时写入0xD0会触发FACI开始块擦除命令处理。命令处理的完成可以通过FSTATR寄存器的FRDY位来确认。

在发出块擦除命令之前设置FCPSR寄存器。此外，当要切换擦除暂停模式时，必须设置FCPSR。

图50.15显示了块擦除命令的用法。



注1.超时的判断是基于最大擦除时间的1.1倍。
参见第53节，电气特性。

Figure 50.15 块擦除命令的使用流程

50.9.3.9 多块擦除命令

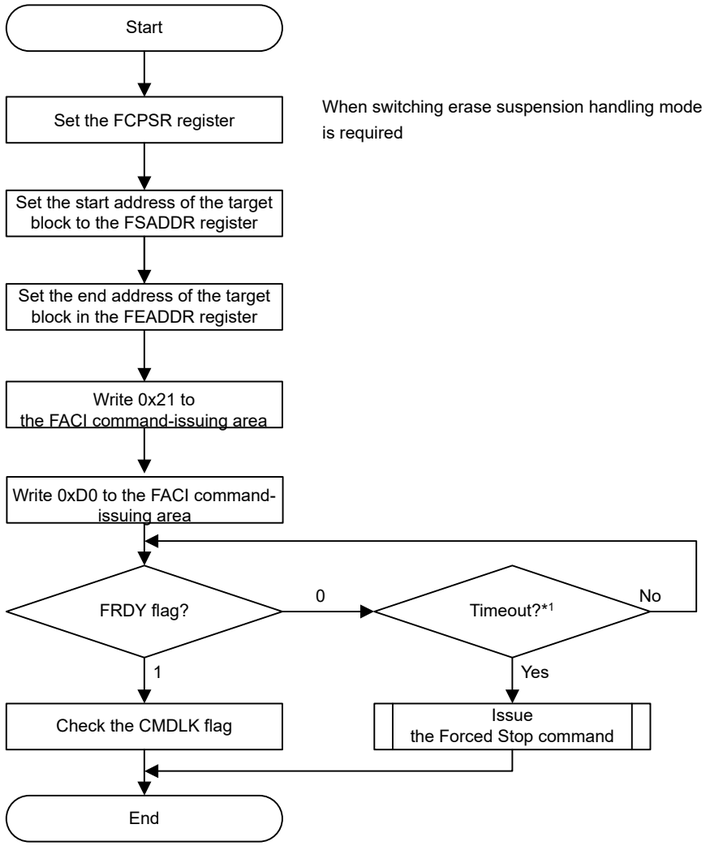
多块擦除命令用于擦除数据区域。擦除单元为64、128或256字节。在发出多块擦除命令之前，将起始地址设置为FSADRR寄存器，将结束地址设置为FEADDR寄存器。在FACI命令的第二次写访问时写入0xD0会触发FACI开始多块擦除命令处理。命令处理的完成可以通过FSTATR寄存器的FRDY位来确认。

在发出多块擦除命令之前设置FCPSR寄存器。此外，当要切换擦除暂停模式时，必须设置FCPSR。

The erase size is specified by both the FSADDR and FEADDR settings. Table 50.18 describes how to set the FSADDR and FEADDR.

Table 50.18 Settings for the erase size

Erase size	FSADDR	FEADDR
64 bytes	FSA0 to FSA5 = 0 (64 byte-boundary)	FSADDR + 0x3C
128 bytes	FSA0 to FSA6 = 0 (128 byte-boundary)	FSADDR + 0x7C
256 bytes	FSA0 to FSA7 = 0 (256 byte-boundary)	FSADDR + 0xFC



Note 1. Judgment of the timeout is based on 1.1 times the maximum time of erasure. See section 53, Electrical Characteristics.

Figure 50.16 Usage flow of the multi block command

50.9.3.10 P/E Suspend Command

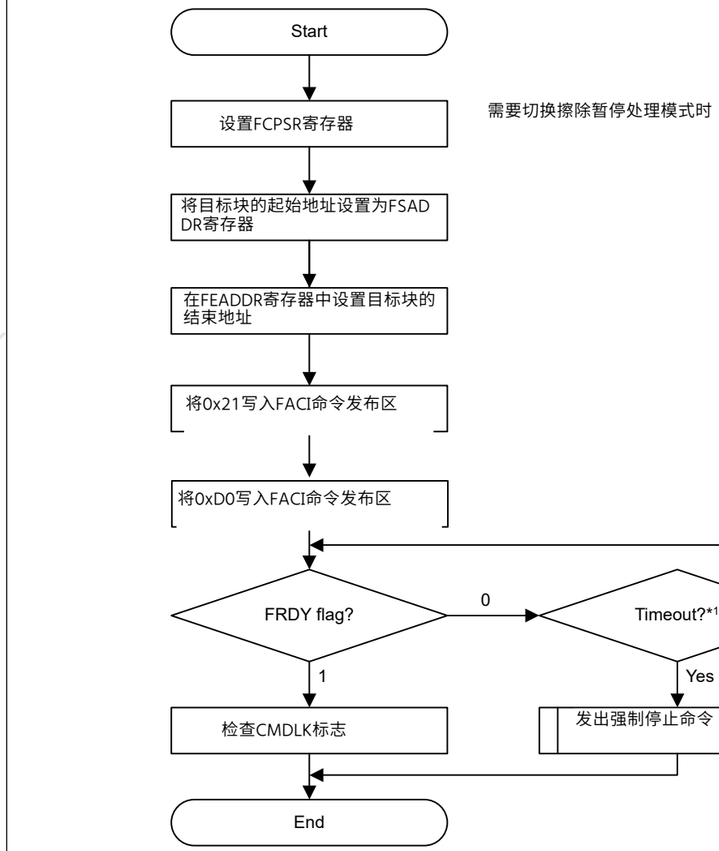
The P/E suspend command is used to suspend programming/erasure. Before issuing a P/E suspend command, check that the CMDLK bit in the FASTAT register is 0, and that the execution of programming/erasure is performed normally. To confirm that the P/E suspend command can be received, check that the SUSRDY bit in the FSTATR register is 1. After issuing a P/E suspend command, read the CMDLK bit to confirm that no error occurs.

If an error occurs during programming/erasure, the CMDLK bit is set to 1. When programming/erasure processing has finished from the time when the SUSRDY bit is 1 to when the P/E suspend command is received, no error occurs and the

擦除大小由FSADDR和FEADDR设置指定。表50.18描述了如何设置FSADDR和FEADDR.

Table 50.18 擦除大小的设置

擦除大小	FSADDR	FEADDR
64 bytes	FSA0 to FSA5 = 0 (64 byte-boundary)	FSADDR + 0x3C
128 bytes	FSA0 to FSA6 = 0 (128 byte-boundary)	FSADDR + 0x7C
256 bytes	FSA0 to FSA7 = 0 (256 byte-boundary)	FSADDR + 0xFC



注1.超时的判断是基于最大擦除时间的1.1倍。
参见第53节，电气特性。

Figure 50.16 多块命令的使用流程

50.9.3.10 PE挂起命令

PE暂停命令用于暂停编程擦除。在发出PE挂起命令之前，请检查FASTAT寄存器中的CMDLK位是否为0，并且编程擦除的执行是否正常执行。要确认可以接收到PE挂起命令，请检查FSTATR寄存器中的SUSRDY位是否为1。发出PE挂起命令后，读取CMDLK位以确认没有错误发生。

如果在编程擦除过程中发生错误，则将CMDLK位设置为1。从SUSRDY位为1到接收到PE暂停命令时，当编程擦除处理完成时，不会发生错误，并且

RA生态工作室

suspended state is not entered (the FRDY bit in the FSTATR register is 1 and the ERSSPD and PRGSPD bits in FSTATR are 0).

When a P/E suspend command is received and the programming/erasure suspend processing finishes normally, the flash sequencer enters the suspended state, the FRDY bit is set to 1, and the ERSSPD or PRGSPD bit is 1. After issuing a P/E suspend command, check that the ERSSPD or PRGSPD bit is 1 and the suspended state is entered, then proceed with the subsequent flow. If a P/E resume command is issued in the subsequent flow even when the suspended state is not entered, an illegal command error occurs and the flash sequencer shifts to the command-locked state (see section 50.11.2. Error Protection).

If the erasure suspended state is entered, programming to blocks other than an erasure target block can be performed. Additionally, the programming and erasure suspended states can shift to read mode by clearing the FENTRYR register.

Figure 50.17 shows the usage of the P/E suspend command.

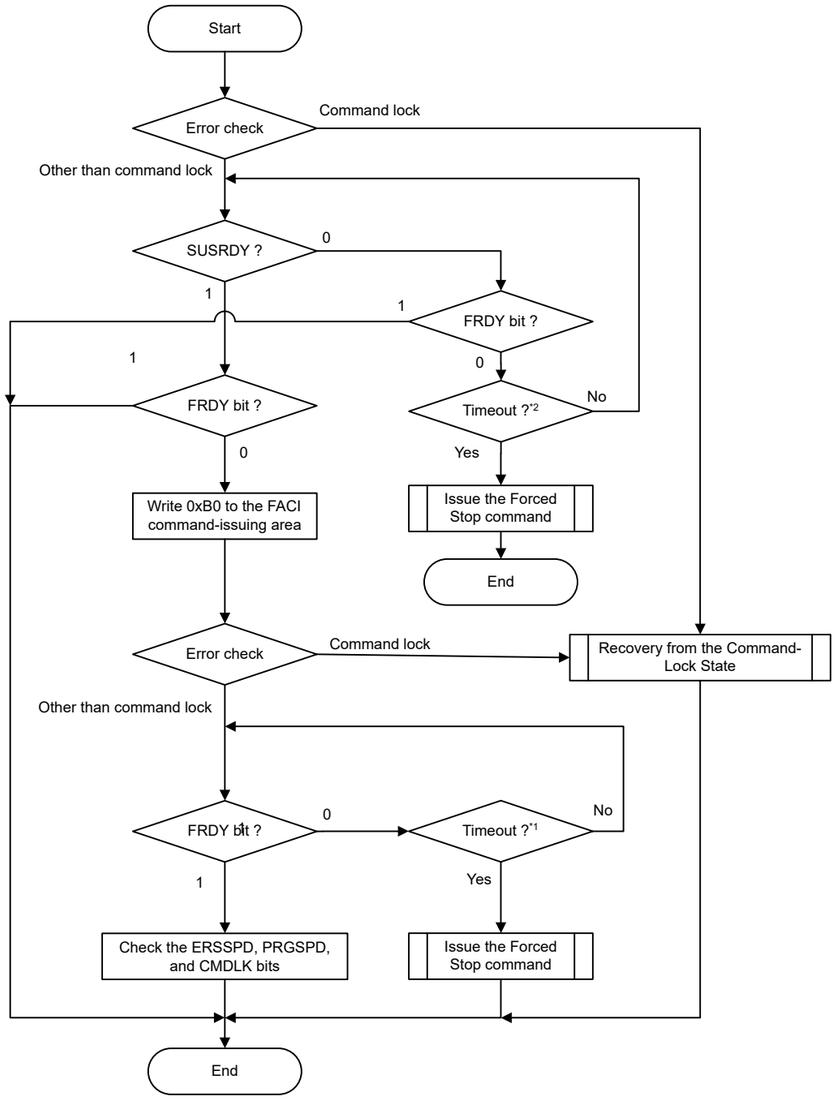
未进入挂起状态（FSTATR寄存器中的FRDY位为1，FSTATR中的ERSSPD和PRGSPD位为0）。

当接收到PE挂起命令并且编程擦除挂起处理正常完成时，闪存定序器进入挂起状态，FRDY位设置为1，ERSPD或PRGSPD位为1。发出PE挂起命令后，检查是否ERSSPD或PRGSPD位为1，进入挂起状态，然后进行后续流程。如果即使在未进入挂起状态的情况下在后续流程中发出PEresume命令，也会发生非法命令错误，并且闪存定序器会切换到命令锁定状态（请参阅第50.11.2节。错误保护）。

如果进入擦除暂停状态，则可以执行对擦除目标块以外的块的编程。
此外，通过清除FENTRYR寄存器，编程和擦除暂停状态可以转换为读取模式。

图50.17显示了PE挂起命令的用法。

RA生态工作室

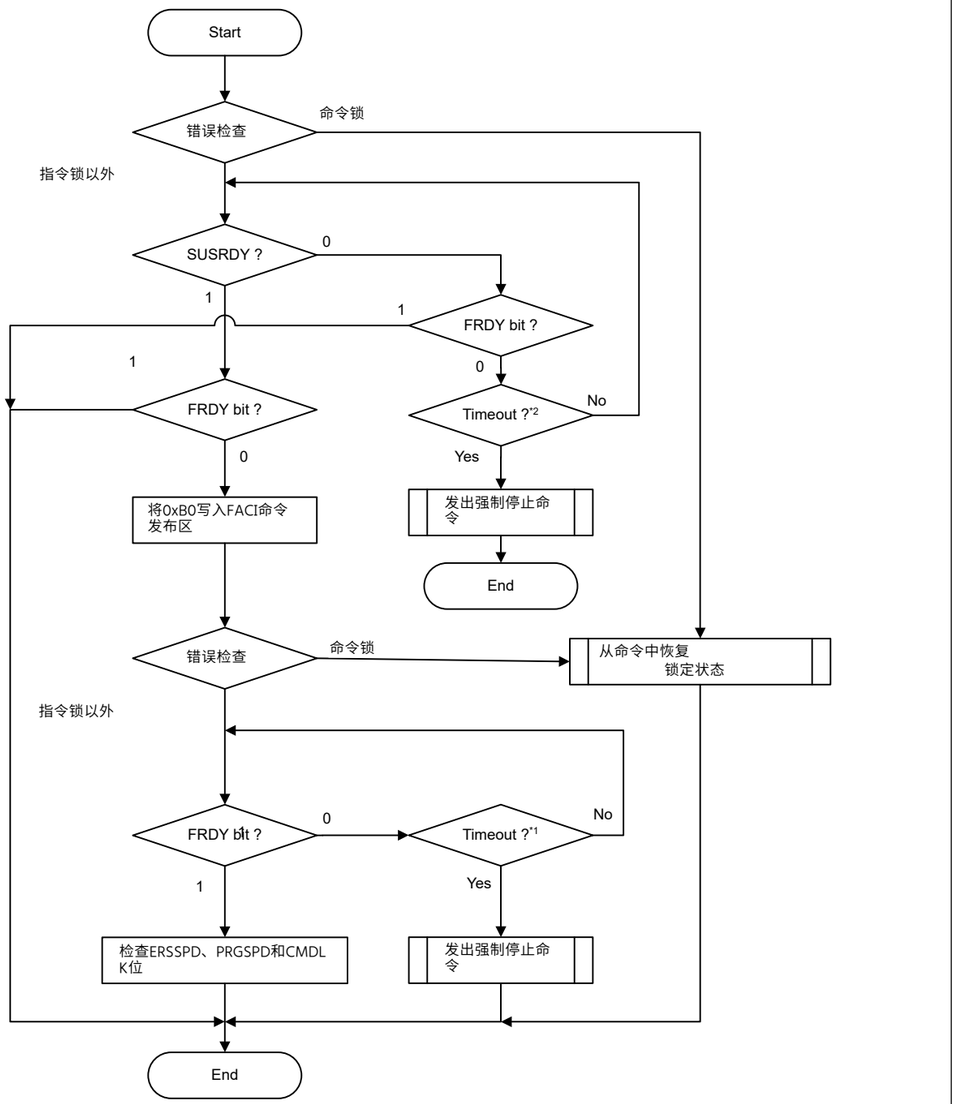


Note 1. Judgment of the timeout is based on 1.1 times the maximum time of suspend delay during erasure for both code flash and data flash.
See section 53, Electrical Characteristics.
Note 2. 4.4µs (f_{FCLK} >= 20MHz)

Figure 50.17 Usage flow of the P/E suspend command

(1) Suspension during Programming

When issuing a P/E suspend command during flash memory programming, the flash sequencer suspends programming processing. Figure 50.18 shows the suspend programming operation. When receiving programming-related command, the flash sequencer clears the FRDY bit in the FSTATR register to 0 to start programming. If the flash sequencer enters the state



注1.超时的判断是基于1.1倍的擦除期间挂起延迟最大时间的代码闪存和数据闪存。参见第53节，电气特性。

Note 2. 4.4µs (f_{FCLK} >= 20MHz)

Figure 50.17 PE挂起命令的使用流程

(1) 编程期间暂停

在闪存编程期间发出PE暂停命令时，闪存定序器暂停编程处理。图50.18显示了挂起编程操作。当接收到编程相关命令时，flashsequencer将FSTATR寄存器中的FRDY位清0以开始编程。如果闪存定序器进入状态

in which the P/E suspend command can be received after programming starts, it sets the SUSRDY bit in the FSTATR register to 1.

When a P/E suspend command is issued, the flash sequencer receives the command and clears the SUSRDY bit to 0. If the flash sequencer receives a P/E suspend command while a programming pulse is applied, the flash sequencer continues with the pulse. After the specified pulse application time, the flash sequencer finishes pulse application, starts the programming suspend processing, and sets the PRGSPD bit in the FSTATR register to 1.

When a suspended processing finishes, the flash sequencer sets the FRDY bit to 1 to enter the programming suspended state. When receiving a P/E resume command in the programming suspended state, the flash sequencer clears the FRDY and PRGSPD bits to 0 and resumes programming.

Figure 50.18 shows the timing for suspension during programming.

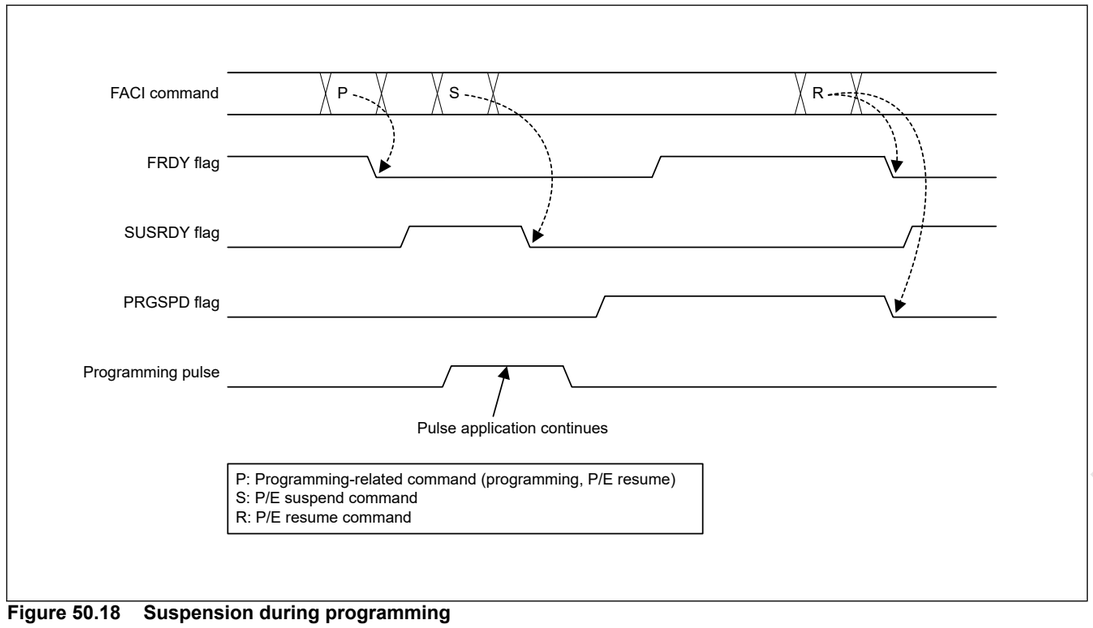


Figure 50.18 Suspension during programming

(2) Suspension during Erasure (Suspension Priority Mode)

The flash sequencer has a suspension priority mode for the suspension of erasure. Figure 50.19 shows the suspend operation of erasure when the erasure suspend mode is set to the suspension priority mode (the ESUSPMD bit in the FCPSR register is 0).

When receiving an erasure-related command, the flash sequencer clears the FRDY bit in the FSTATR register to 0 to start erasure. If the flash sequencer enters the state in which the P/E suspend command can be received after erasure starts, it sets the SUSRDY bit in the FSTATR register to 1.

When a P/E suspend command is issued, the flash sequencer receives the command and clears the SUSRDY bit to 0.

When receiving a suspend command during erasure, the flash sequencer starts the suspend processing and sets the ERSSPD bit in the FSTATR register to 1 even when it is applying an erasure pulse. When the suspended processing finishes, the flash sequencer sets the FRDY bit to 1 to enter the erasure suspended state. When receiving a P/E resume command in the erasure suspended state, the flash sequencer clears the FRDY and ERSSPD bits to 0 and resumes erasure. Operations of the FRDY, SUSRDY, and ERSSPD bits at the suspension and resumption of erasure are the same, regardless of the erasure suspend mode.

The setting of the erasure suspend mode affects the control method of erasure pulses. In suspension priority mode, when receiving a P/E suspend command while erasure pulse A that has not been previously suspended is being applied, the flash sequencer suspends the application of erasure pulse A and enters the erasure suspended state. When receiving a P/E suspend command while reapplying erasure pulse A after erasure is resumed with a P/E resume command, the flash sequencer

在编程开始后可以接收PE挂起命令的情况下，它将FSTATR寄存器中的SUSRDY位设置为1。

当发出PE暂停命令时，闪存定序器接收该命令并将SUSRDY位清除为0。如果在施加编程脉冲时闪存定序器接收到PE暂停命令，则闪存定序器继续执行该脉冲。在指定的脉冲施加时间之后，闪存序列器完成脉冲施加，开始编程暂停处理，并将FSTATR寄存器中的PRGSPD位设置为1。

当暂停处理完成时，闪存定序器将FRDY位设置为1以进入编程暂停状态。当在编程暂停状态下接收到PEresume命令时，闪存定序器将FRDY和PRGSPD位清除为0并恢复编程。

图50.18显示了编程期间暂停的时序。

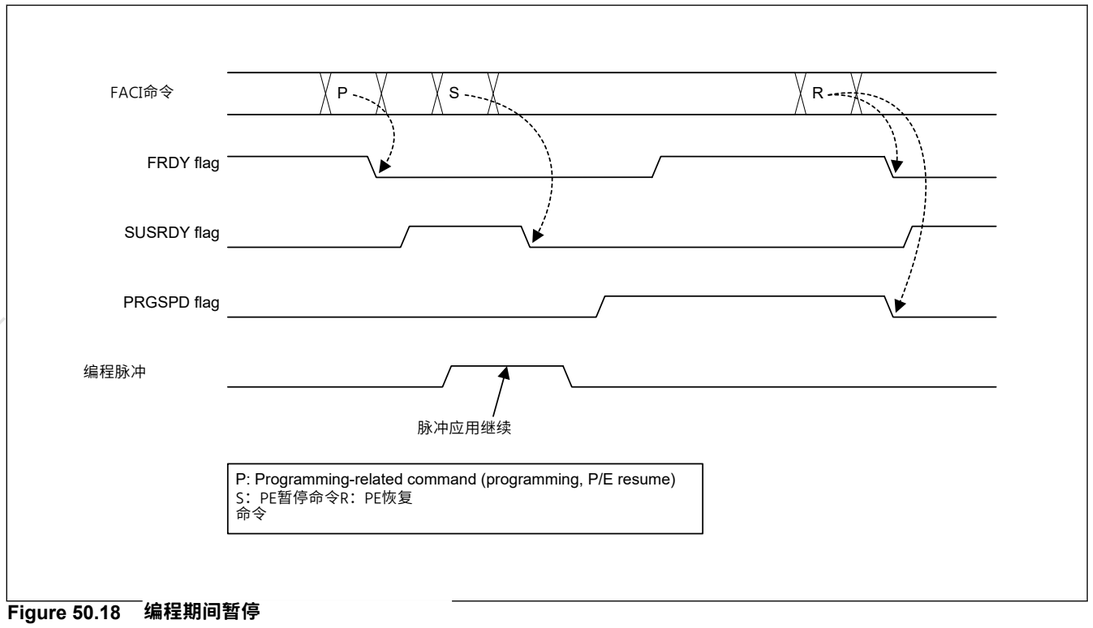

Figure 50.18 编程期间暂停

(2) 擦除期间暂停（暂停优先模式）

闪存定序器具有用于暂停擦除的暂停优先模式。图50.19显示了擦除挂起模式设置为挂起优先模式（FCPSR寄存器中的ESUSPMD位为0）时的擦除挂起操作。

当接收到擦除相关命令时，闪存定序器将FSTATR寄存器中的FRDY位清零以开始擦除。如果闪存序列器在擦除开始后进入可以接收PE挂起命令的状态，它会将FSTATR寄存器中的SUSRDY位设置为1。

当发出PE挂起命令时，闪存定序器接收该命令并将SUSRDY位清除为0。

在擦除期间接收到挂起命令时，闪存定序器启动挂起处理并将FSTATR寄存器中的ERSSPD位设置为1，即使它正在施加擦除脉冲。当挂起处理完成时，闪存定序器将FRDY位设置为1以进入擦除挂起状态。当在擦除暂停状态下接收到PE恢复命令时，闪存定序器将FRDY和ERSSPD位清除为0并恢复擦除。无论擦除暂停模式如何，FRDY、SUSRDY和ERSSPD位在擦除暂停和恢复时的操作都是相同的。

擦除暂停模式的设置会影响擦除脉冲的控制方法。在挂起优先模式下，当在施加先前未被挂起的擦除脉冲A的同时接收到PE挂起命令时，闪存定序器挂起擦除脉冲A的施加并进入擦除挂起状态。在使用PE恢复命令恢复擦除后，在重新应用擦除脉冲A的同时接收到PE暂停命令时，闪存定序器

RA生态工作室

continues to apply erasure pulse A. After the specified pulse application time, the flash sequencer finishes erasure pulse application and enters the erasure suspended state.

When the flash sequencer receives a P/E resume command next and erasure pulse B is being applied, the flash sequencer receives a P/E suspend command again, and the application of erasure pulse B is then suspended. In suspension priority mode, delays due to suspension can be minimized because the application of an erasure pulse is suspended once per pulse, and priority is given to the suspend processing.

If the interval of suspension after resume is longer than t_{REST1} (Resume time: priority on suspension, resume after the 1st suspend for the same pulse), suspend delay will be always t_{SESD1} (Suspend delay: priority on suspension, the 1st suspend for the same pulse).

If the interval of suspension after resume is shorter than t_{REST1}, suspend delay becomes either t_{SESD1} or t_{SESD2} (Suspend delay: priority on suspension, the 2nd suspend for the same pulse).

(The value of t_{REST1} / t_{SESD1} / t_{SESD2}, see section 53, Electrical Characteristics.)

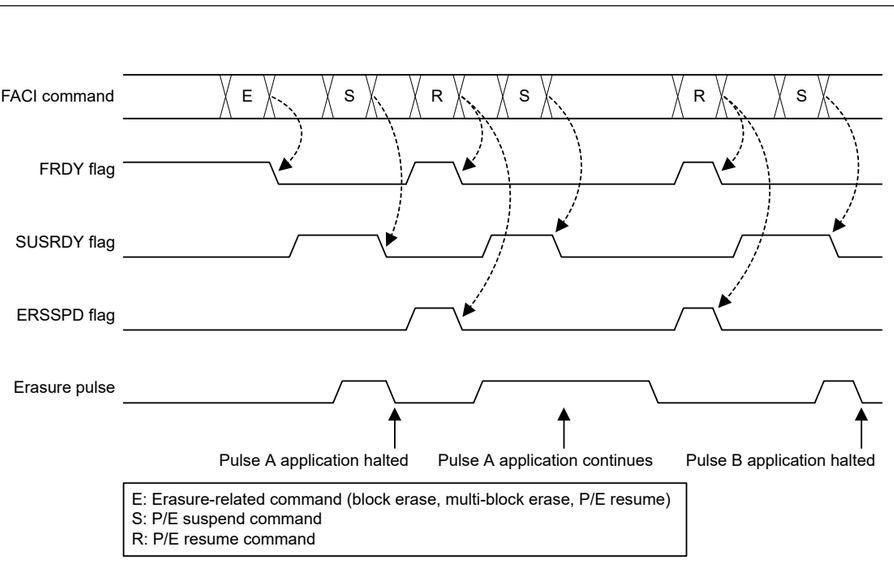

Figure 50.19 Suspension during erasure (suspension priority mode)

(3) Suspension during Erasure (Erasure Priority Mode)

The flash sequencer has an erasure priority mode for the suspension of erasure. Figure 50.20 shows the suspend operation of erasure when the erasure suspend mode is set to the erasure priority mode (the ESUSPMD bit in the FCPSR register is 1). The control method of erasure pulses in erasure priority mode is the same as that of programming pulses for the programming suspend processing.

If the flash sequencer receives a P/E suspend command while an erasure pulse is applied, the flash sequencer continues to apply the pulse. In this mode, the required time for the erasure processing can be reduced compared to the suspension priority mode because the re-application of erasure pulses does not occur when a P/E resume command is issued.

继续施加擦除脉冲A。在指定的脉冲施加时间之后，闪存定序器完成擦除脉冲施加并进入擦除暂停状态。

当闪存定序器接下来接收到PE恢复命令并且正在施加擦除脉冲B时，闪存定序器再次接收到PE暂停命令，然后暂停擦除脉冲B的施加。在挂起优先模式中，由于擦除脉冲的施加在每个脉冲中挂起一次，因此挂起引起的延迟可以被最小化，并且挂起处理具有优先权。

如果恢复后挂起的时间间隔大于tREST1（恢复时间：挂起优先，相同脉冲第一次挂起后恢复），挂起延迟将始终为tSESD1（挂起延迟：挂起优先，第一次挂起相同的脉冲）。

如果恢复后的暂停间隔小于tREST1，则暂停延迟变为tSESD1或tSESD2（暂停延迟：暂停优先，相同脉冲的第2次暂停）。

（tREST1tSESD1tSESD2的值，请参见第53节，电气特性。）

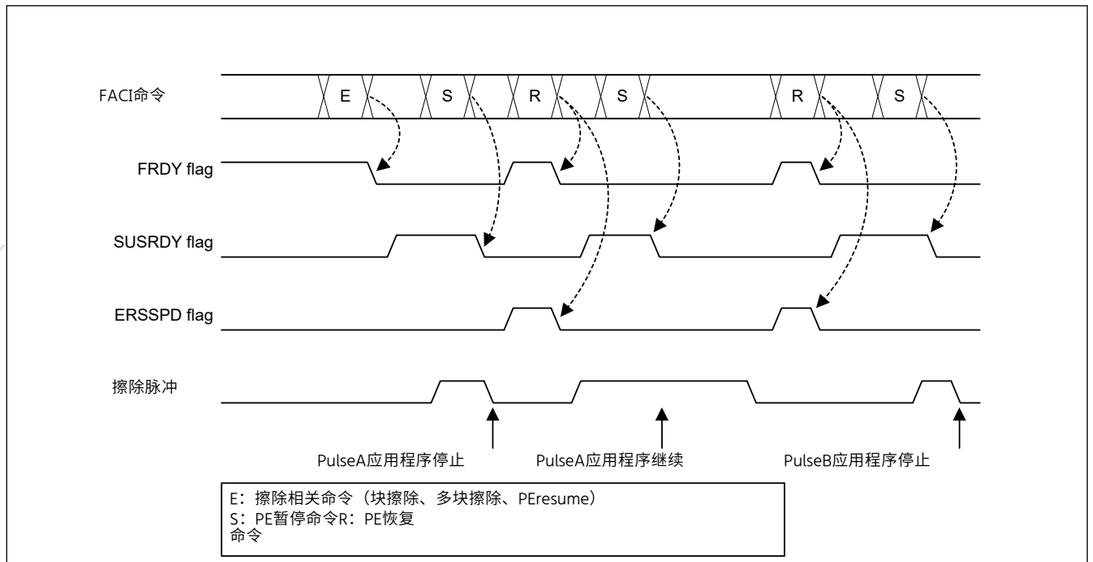

Figure 50.19 擦除期间暂停（暂停优先模式）

(3) 擦除期间暂停（擦除优先模式）

闪存定序器具有用于暂停擦除的擦除优先模式。图50.20显示了擦除挂起模式设置为擦除优先模式时的擦除挂起操作（FCPSR寄存器中的ESUSPMD位为1）。擦除优先模式中擦除脉冲的控制方法与用于编程暂停处理的编程脉冲的控制方法相同。

如果在施加擦除脉冲时闪存定序器接收到PE暂停命令，则闪存定序器继续施加脉冲。在这种模式下，与暂停优先模式相比，擦除处理所需的时间可以减少，因为当发出PE恢复命令时不会发生擦除脉冲的重新施加。

RA生态工作室

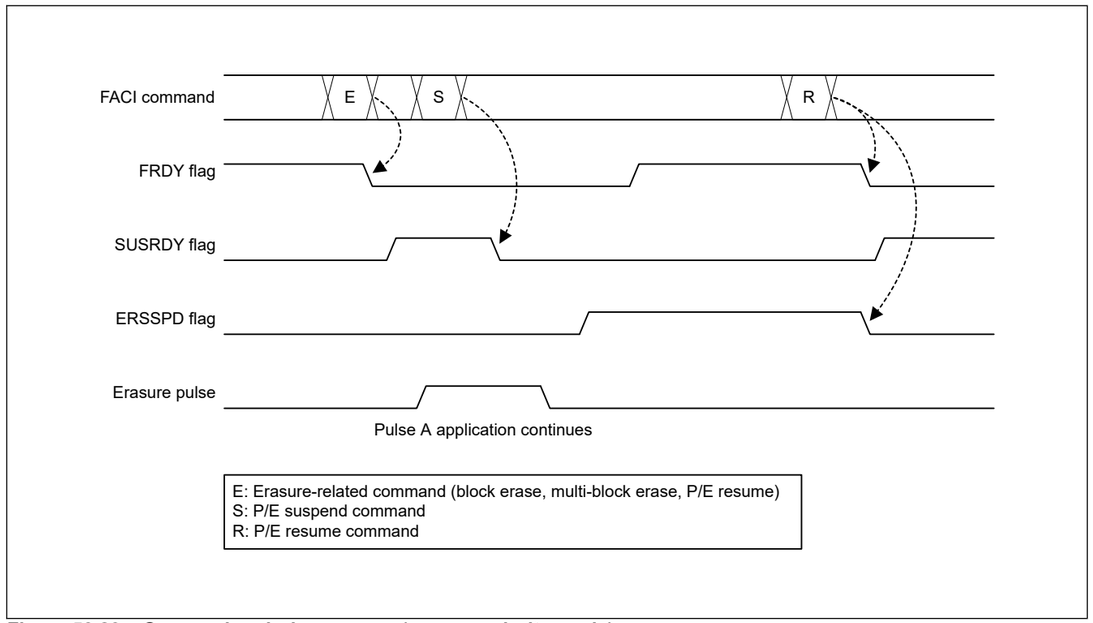

Figure 50.20 Suspension during erasure (erasure priority mode)

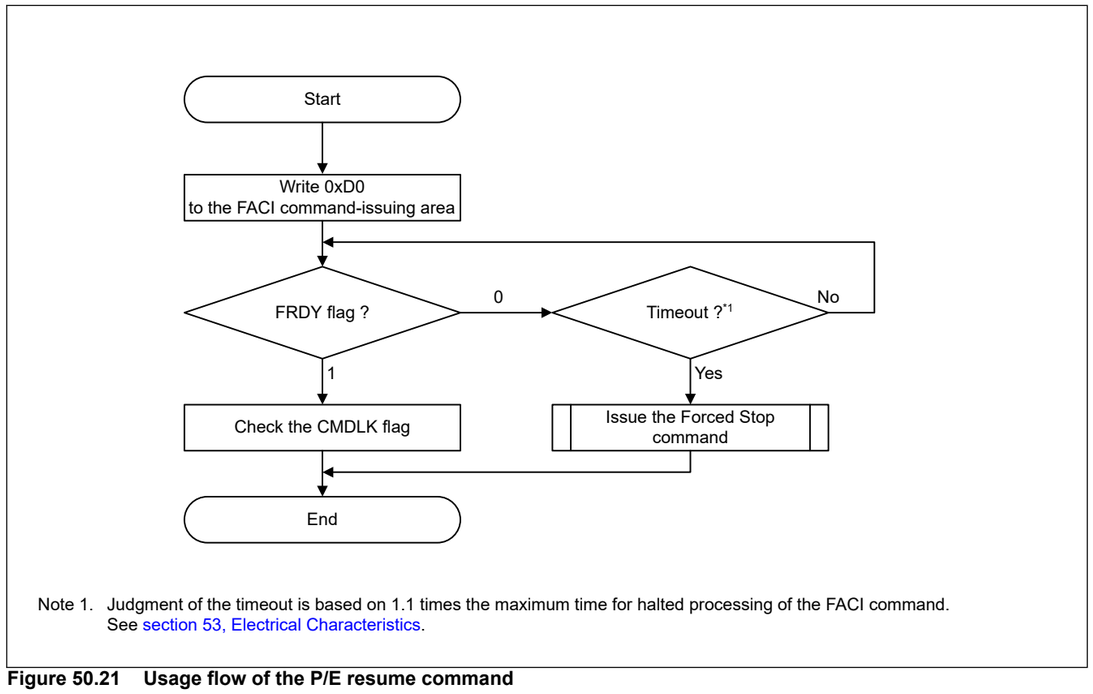
50.9.3.11 P/E Resume Command

The P/E resume command is used to resume suspended programming or erasure. If the FENTRYR setting has been modified during suspension, issue a P/E resume command only after resetting FENTRYR to the previous value that was held before the P/E suspend command was issued. Figure 50.21 shows usage of the P/E resume command.



Note 1. Judgment of the timeout is based on 1.1 times the maximum time for halted processing of the FACI command. See section 53, Electrical Characteristics.

Figure 50.21 Usage flow of the P/E resume command

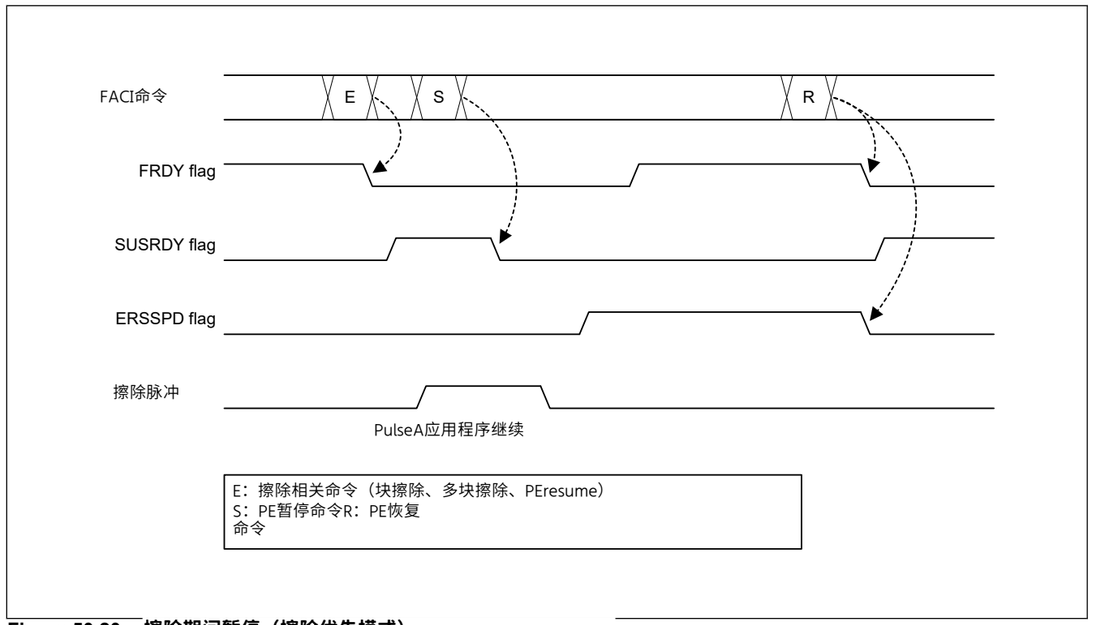


Figure 50.20 擦除期间暂停（擦除优先模式）

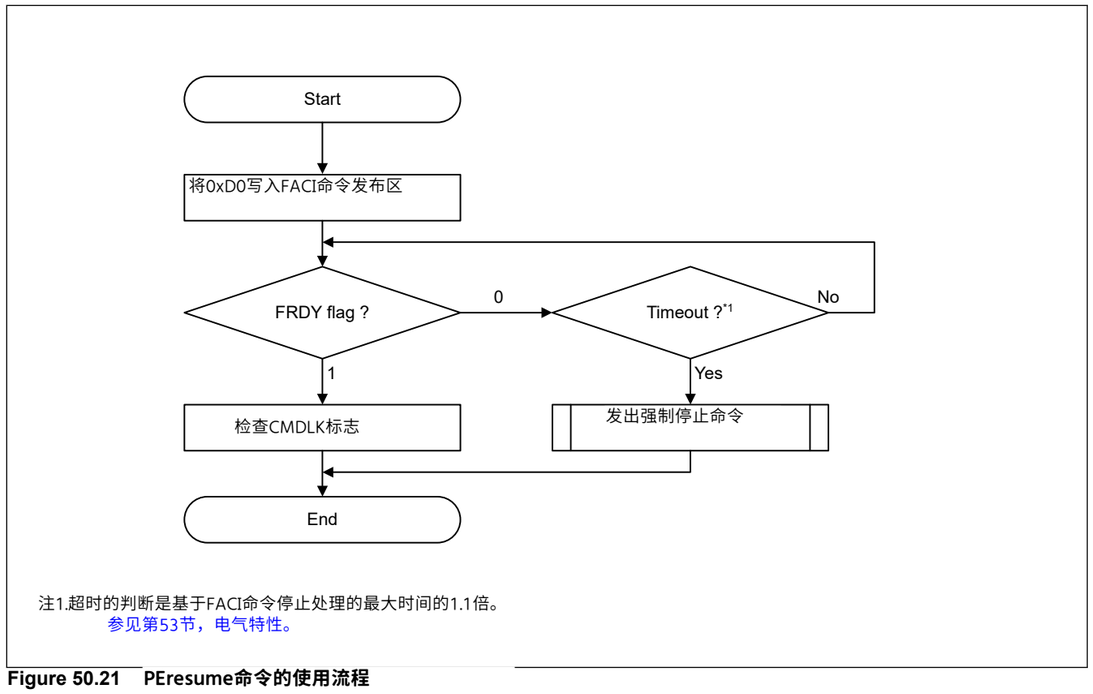
50.9.3.11 PE恢复命令

PEresume命令用于恢复暂停的编程或擦除。如果在挂起期间修改了FENTRYR设置，则仅在将FENTRYR重置为发出PE挂起命令之前保持的先前值之后才发出PEresume命令。图50.21显示了PEresume命令的用法。



注1.超时的判断是基于FACI命令停止处理的最大时间的1.1倍。
参见第53节，电气特性。

Figure 50.21 PEresume命令的使用流程

50.9.3.12 Status Clear Command

The status clear command is used to clear the command-locked state (see section 50.9.3.6. Recovery from the Command-Locked State).

You can use the status clear command to clear the following bits in the FSTATR register in the command-locked state:

- ILGLERR
- ILGCOMERR
- FESETERR
- SECERR
- OTERR
- ERSERR
- PRGERR

Figure 50.22 shows usage of the status clear command.

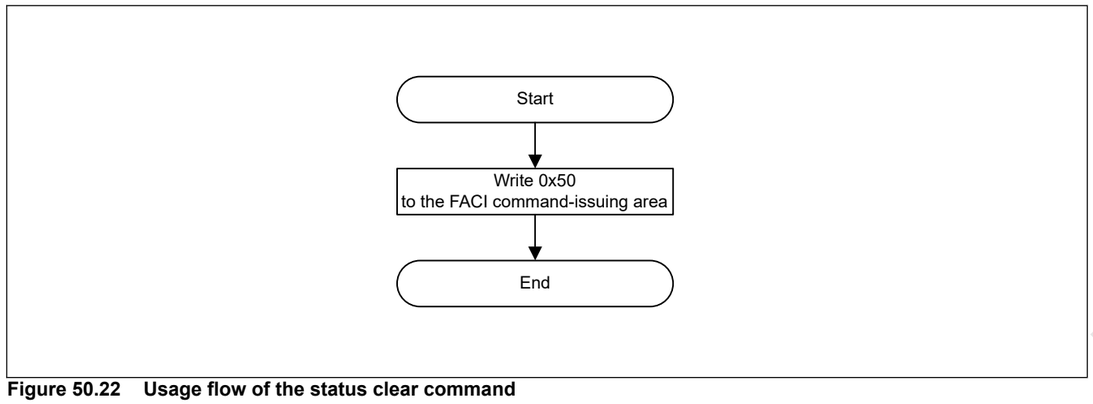


Figure 50.22 Usage flow of the status clear command

50.9.3.13 Forced Stop Command

The forced stop command is used to forcibly end command processing by the flash sequencer. Although this command halts command processing more quickly than the P/E suspension command, values from the programming or erasure that are in progress are not guaranteed. Additionally, resumption of processing is not possible. Processing of programming or erasure that is halted by the forced stop command is also defined as one programming round.

Executing the forced stop command also initializes part of the FACI, the whole FCU, the FSTATR and FASTAT registers. This command can be used in the procedure for recovery from the command-locked state and for processing in response to a timeout of the flash sequencer (see section 50.9.3.6. Recovery from the Command-Locked State).

Figure 50.23 shows usage of the forced stop command.

50.9.3.12 状态清除命令

statusclear命令用于清除命令锁定状态（参见第50.9.3.6节。从命令中恢复锁定状态）。

在命令锁定状态下，您可以使用statusclear命令清除FSTATR寄存器中的以下位：

- ILGLERR
- ILGCOMERR
- FESETERR
- SECERR
- OTERR
- ERSERR
- PRGERR

图50.22显示了statusclear命令的用法。

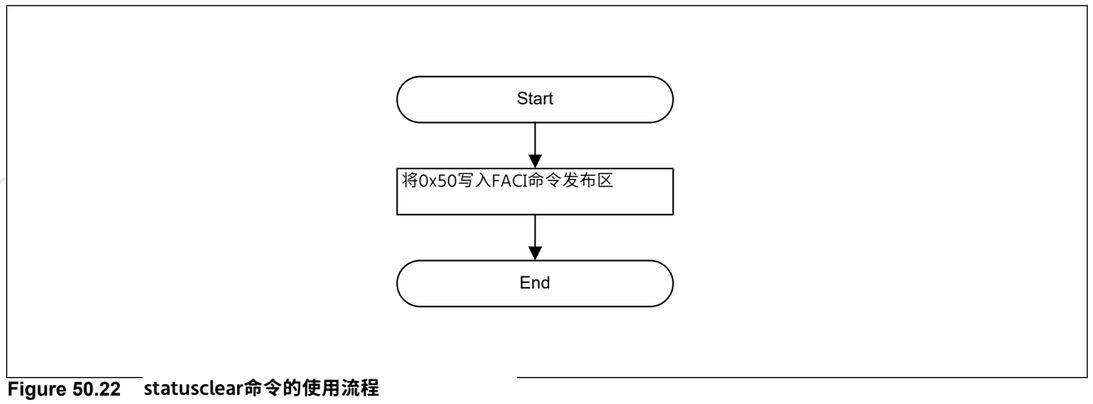

Figure 50.22 statusclear命令的使用流程

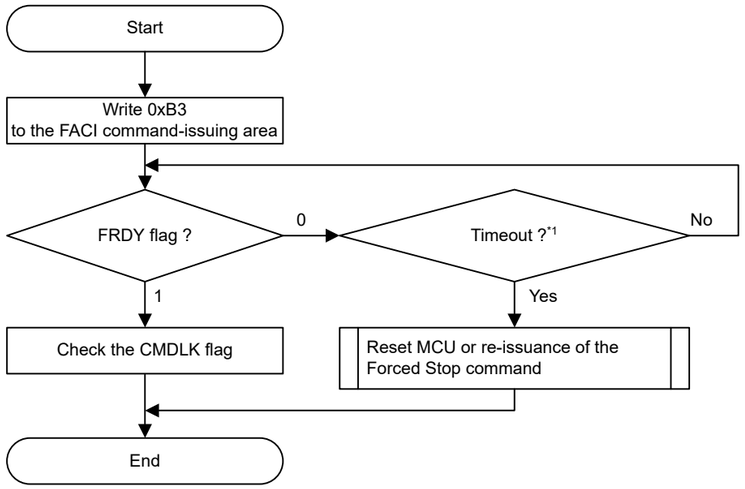
50.9.3.13 强制停止命令

强制停止命令用于强制结束闪存定序器的命令处理。尽管此命令比PE暂停命令更快地停止命令处理，但不能保证正在进行的编程或擦除的值。此外，无法恢复处理。由强制停止命令停止的编程或擦除的处理也被定义为一轮编程。

执行强制停止命令还会初始化部分FACI、整个FCU、FSTATR和FASTAT寄存器。
此命令可用于从命令锁定状态恢复的过程以及响应闪存定序器超时的处理（请参阅第50.9.3.6节。从命令锁定状态恢复）。

图50.23显示了强制停止命令的用法。



Note 1. Judgment of the timeout is based on 1.1 times the maximum time of the Forced Stop command latency.
See section 53, Electrical Characteristics.

Figure 50.23 Usage flow of the forced stop command

(1) Notes on Using the Forced Stop Command during Command Issue

When using the forced stop command at the timeout occurrence by DBFULL bit of the program command, writing in the FACI command-issuing area is sometimes processed as writing in data of the program command. See Table 50.4 in section 50.3. Address Space for information on the FACI command-issuing area to force a command lock. Then issue a forced stop command with return method from the command lock status (see Figure 50.14). Locking commands is possible in any case where the unit for reading the FACI command issuing area is 8, 16, or 32 bits.

50.9.3.14 Blank Check Command

The blank check command is used to confirm that an area is in the non-programmed state. Values read from the data flash memory that have been erased but not yet programmed again that is in the non-programmed state, are undefined.

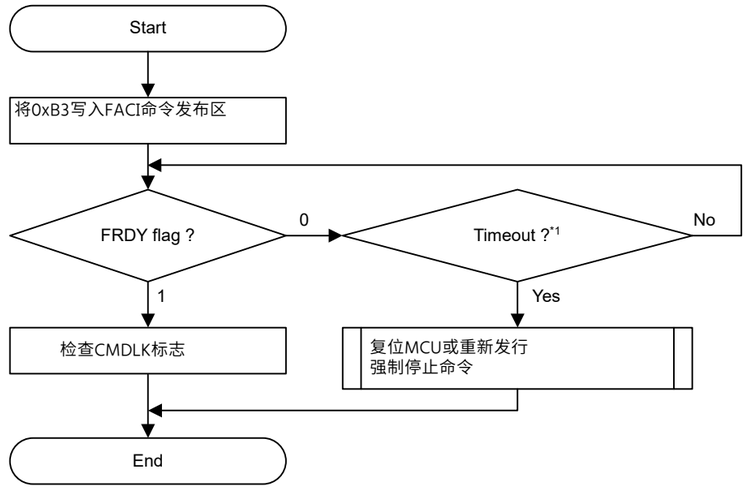
Before issuing the Blank Check command, set addressing mode, start address, and end address of the target area for Blank Check to the FBCCNT, FSADDR, and FEADDR registers. When Blank Check addressing mode is set to decremental mode (i.e. FBCCNT.BCDIR = 1), address specified in FSADDR should be equal to or larger than address in FEADDR.

On the other hand, the address in FSADDR should be equal to or smaller than address in FEADDR when Blank Check addressing mode is set to incremental mode (i.e. FBCCNT.BCDIR = 0).

If the settings of the BCDIR bit, FSADDR, and FEADDR are inconsistent, the flash sequencer enters the command-locked state. The size of the target area for Blank Check is in the range from 4 bytes to the data flash memory capacity and is set in units of 4 bytes.

Write 0x71 and 0xD0 to the FACI command-issuing area to start Blank Check. Completion of processing can be confirmed by the FRDY bit of the FSTATR register. At the end of processing, the result of Blank Check is stored in the BCST bit in the FBCSTAT register. If non-programmed data exists within the target area for Blank Check, flash sequencer stops Blank Check command operation. In this case, address of non-programmed data is indicated to FPSADDR register.

Figure 50.24 shows usage of the blank check command.



注1.超时的判断基于强制停止命令延迟的最大时间的1.1倍。
参见第53节，电气特性。

Figure 50.23 强制停止命令的使用流程

(1) 命令发出期间使用强制停止命令的注意事项

通过程序命令的DBFULL位在超时发生时使用强制停止命令时，写入
FACI命令发布区域有时被处理为写入程序命令的数据。请参见第50.3节中的表50.4。FACI命令发布区域信息的地址空间以强制命令锁定。然后从命令锁定状态发出带返回方法的强制停止命令（见图50.14）。在读取FACI命令发布区域的单位为8、16或32位的任何情况下，锁定命令都是可能的。

50.9.3.14 空白检查命令

空白检查命令用于确认某个区域处于非编程状态。从处于未编程状态的已擦除但尚未再次编程的数据闪存读取的值未定义。

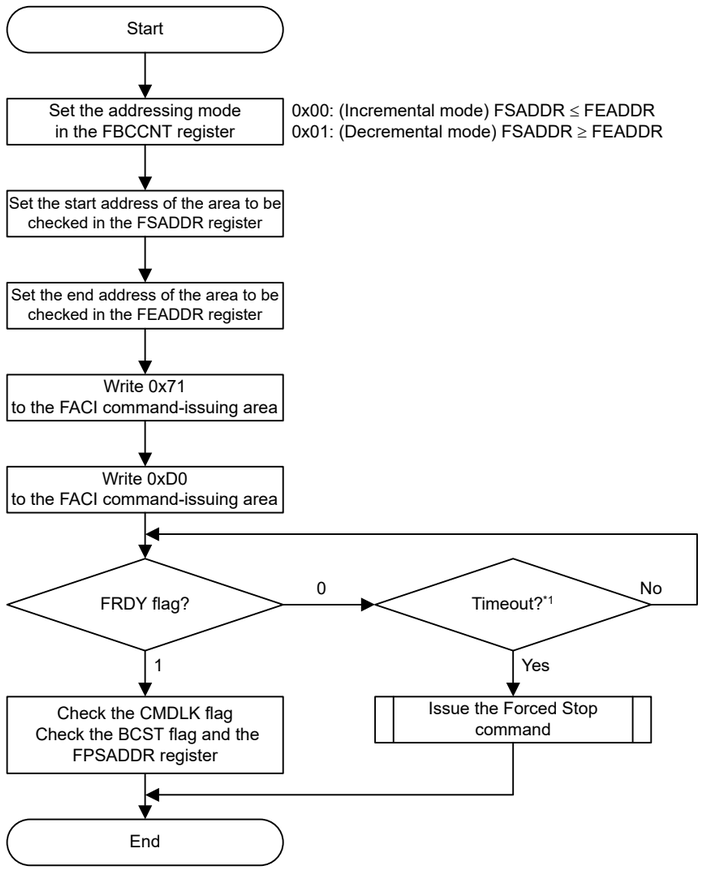
在发出空白检查命令之前，设置空白目标区域的寻址方式、起始地址和结束地址
检查FBCCNT、FSADDR和FEADDR寄存器。当空白检查寻址模式设置为递减模式（即FBCCNT.BCDIR=1）时，FSADDR中指定的地址应等于或大于FEADDR中的地址。

另一方面，当空白检查寻址模式设置为增量模式（即FBCCNT.BCDIR=0）时，FSADDR中的地址应等于或小于FEADDR中的地址。

如果BCDIR位、FSADDR和FEADDR的设置不一致，则flashsequencer进入command-locked状态。BlankCheck的目标区域大小在4字节到数据闪存容量的范围内，以4字节为单位设置。

将0x71和0xD0写入FACI命令发出区域以启动空白检查。可通过FSTATR寄存器的FRDY位确认处理完成。处理结束时，空白检查的结果存储在FBCSTAT寄存器的BCST位中。如果空白检查的目标区域内存在未编程的数据，闪存定序器将停止空白
检查命令操作。在这种情况下，非编程数据的地址被指示到FPSADDR寄存器。

图50.24显示了空白检查命令的用法。



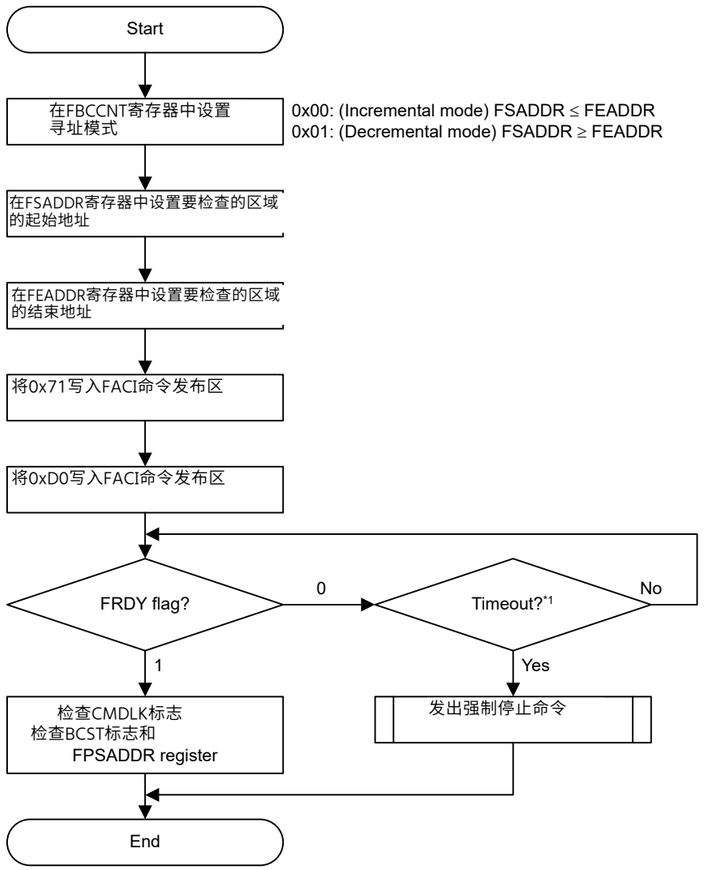
Note 1. Judgment of the timeout is based on 1.1 times the maximum time of Blank Checking for the whole target range. See section 53, Electrical Characteristics.

Figure 50.24 Usage flow of the blank check command

50.9.3.15 Configuration Set Command

The Configuration set command is used to set option-setting memory. Before issuing the Configuration set command, set the specified address (shown in Table 50.19) in the FSADDR register. Writing 0xD0 to the FACI command-issuing area in the final access for issuing the FACI command starts FACI processing of the Configuration set command.

Figure 50.25 shows usage of the configuration set command.



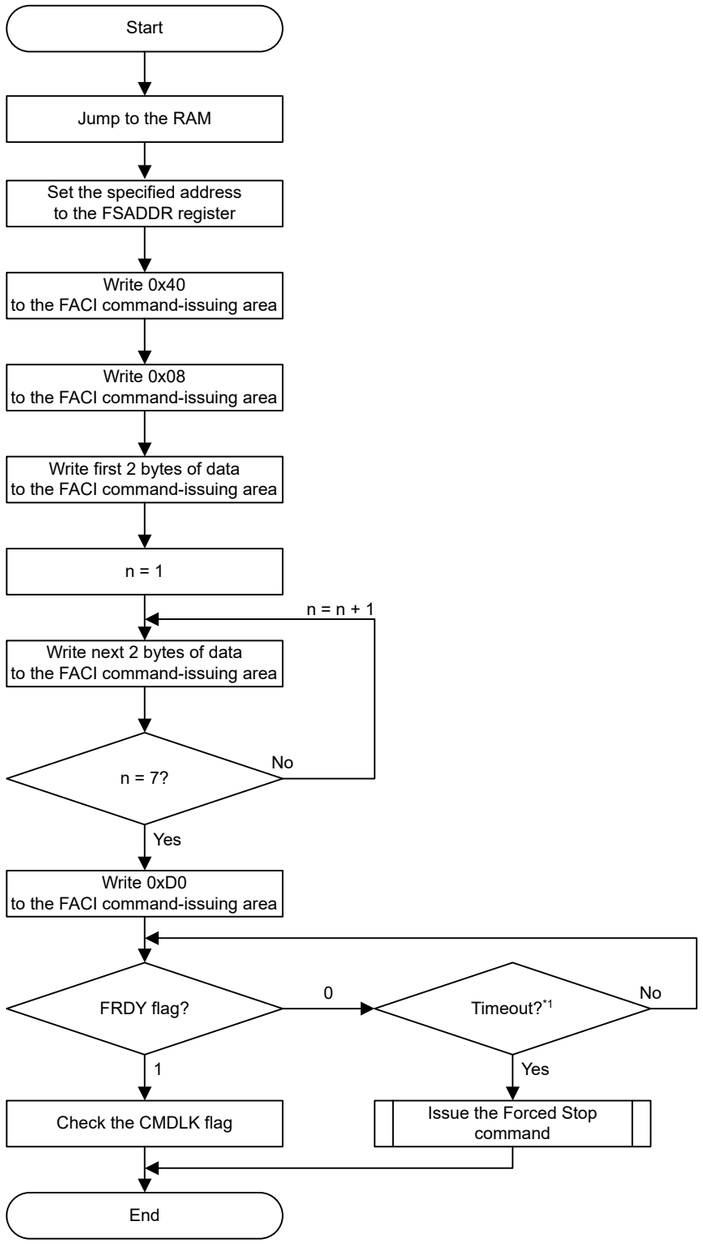
注1.超时的判断是基于1.1倍的整个目标范围的BlankChecking最大时间。看第53节，电气特性。

Figure 50.24 空白检查命令的使用流程

50.9.3.15 配置集命令

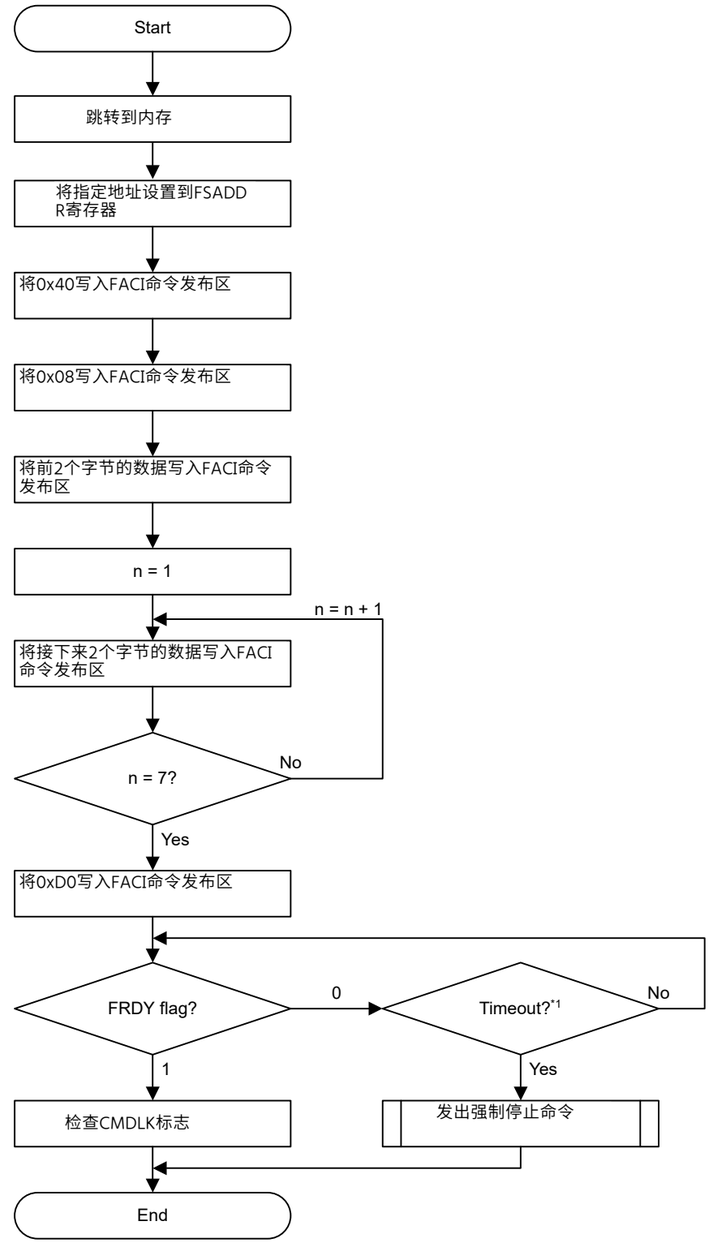
Configurationset命令用于设置选项设置内存。在发出配置设置命令之前，在FSADDR寄存器中设置指定的地址（如表50.19所示）。在发出FACI命令的最终访问中将0xD0写入FACI命令发出区域，开始配置设置命令的FACI处理。

图50.25显示了配置集命令的用法。



Note 1. Judgment of the timeout is based on 1.1 times the maximum time of programing in option-setting memory. See section 53, Electrical Characteristics.

Figure 50.25 Usage flow of the configuration set command



注1.超时的判断是基于选项设置内存中最大编程时间的1.1倍。参见第53节，电气特性。

Figure 50.25 配置集命令使用流程

The correspondence between the possible target data for configuration setting and the address value set in the FSADDR register is shown in Table 50.19. For details, see section 50.4.12. FSADDR : FACI Command Start Address Register.

Table 50.19 Address Used by Configuration Set Command

Address	FSADDR Register Value	Setting Data	Operation of additional writing		Timing when the Setting is Enabled
			SAS.FSPR bit is 1	SAS.FSPR bit is 0	
0x0100_A100	0x0100_A100	Option Function Select Register 0 (OFS0)	Writable	Writable	At a reset
0x0100_A110	0x0100_A110	Dual Mode Select Register (DULSEL)	Writable	Writable	At a reset
0x0100_A134	0x0100_A130	Start-up Area Setting Register (SAS)	Writable	Not writable*1	When a reset or command is executed
0x0100_A180	0x0100_A180	Option Function Select Register 1 (OFS1)	Writable	Writable	At a reset
0x0100_A190	0x0100_A190	Bank Select Register (BANKSEL)	Writable	Writable	At a reset
0x0100_A1C0	0x0100_A1C0	Block Protect Setting Register (BPS)	Writable*2	Writable*2	When a reset or command is executed
0x0100_A1E0	0x0100_A1E0	Permanent Block Protect Setting Register (PBPS)	Writable*3 (from 1 to 0 only)	Writable*3 (from 1 to 0 only)	When a reset or command is executed
0x0100_A200	0x0100_A200	Option Function Select Register 1 Secure (OFS1_SEC)	Writable	Writable	At a reset
0x0100_A210	0x0100_A210	Bank Select Register Secure (BANKSEL_SEC)	Writable	Writable	At a reset
0x0100_A240	0x0100_A240	Block Protect Setting Register Secure (BPS_SEC)	Writable*4	Writable*4	When a reset or command is executed
0x0100_A260	0x0100_A260	Permanent Block Protect Setting Register Secure (PBPS_SEC)	Writable*5 (from 1 to 0 only)	Writable*5 (from 1 to 0 only)	When a reset or command is executed
0x0100_A280	0x0100_A280	Option Function Select Register 1 Select (OFS1_SEL)	Writable	Writable	At a reset
0x0100_A290	0x0100_A290	Bank Select Register Select (BANKSEL_SEL)	Writable	Writable	At a reset
0x0100_A2C0	0x0100_A2C0	Block Protect Setting Register Select (BPS_SEL)	Writable	Writable	At a reset

Note 1. The SAS.FSPR bit cannot be restored to 1 by using the Configuration set command once it is set to 0. Therefore, setting the start-up area select flags again becomes impossible. (when the Configuration set command is issued to the address of 0x0100A134, the command is locked.) Exercise extra caution when handling the SAS.FSPRbit.
Note 2. Once PBPS[n] bit is set to 0, the BPS[n] bit cannot be restored to 1 by using the Configuration set command.
Note 3. Once these bits are set to 0, the bits cannot be restored to 1 by using the Configuration set command. The PBPS[n] bit can not be set to 0 by using the Configuration set command when the BPS[n] bit is 1.
Note 4. Once PBPS_SEC[n] bit is set to 0, the BPS_SEC[n] bit cannot be restored to 1 by using the Configuration set command.
Note 5. Once these bits are set to 0, the bits cannot be restored to 1 by using the Configuration set command. The PBPS_SEC[n] bit cannot be set to 0 by using the Configuration set command when the BPS_SEC[n] bit is 1.

50.10 Suspend Operation

Reading from the flash memory is not possible during programming or erasure if the conditions for background operation given in Table 50.35 are not satisfied. When a P/E suspend command is issued to suspend the programming or erasure of the flash memory, reading from the flash memory is enabled. Regarding P/E suspend commands, there are one suspend command mode for programming and two suspend command modes for erasure (suspension priority mode and erasure priority mode). To resume suspended programming or erasure, the P/E resume command is available. See details on the suspend operation, refer to Figure 50.17.

配置设置的可能目标数据与FSADDR寄存器中设置的地址值的对应关系如表50.19所示。有关详细信息，请参阅第50.4.12节。FSADDR：FACI命令起始地址寄存器。

Table 50.19 配置设置命令使用的地址

Address	FSADDR 寄存器值设置数据		追加写入的操作		启用设置的时间
			SAS.FSPR位为1	SAS.FSPR位为0	
0x0100_A100	0x0100_A100	选项功能选择寄存器0(OFS0)	Writable	Writable	复位时
0x0100_A110	0x0100_A110	双模式选择寄存器(DULSEL)	Writable	Writable	复位时
0x0100_A134	0x0100_A130	启动区设置寄存器(SAS)	Writable	Not writable*1	执行复位或命令时
0x0100_A180	0x0100_A180	选项功能选择寄存器1(OFS1)	Writable	Writable	复位时
0x0100_A190	0x0100_A190	银行选择寄存器(BANKSEL)	Writable	Writable	复位时
0x0100_A1C0	0x0100_A1C0	块保护设置寄存器(BPS)	Writable*2	Writable*2	执行复位或命令时
0x0100_A1E0	0x0100_A1E0	永久块保护设置 Register (PBPS)	Writable*3 (from 1 to 0 only)	Writable*3 (from 1 to 0 only)	执行复位或命令时
0x0100_A200	0x0100_A200	选项功能选择寄存器1 Secure (OFS1_SEC)	Writable	Writable	复位时
0x0100_A210	0x0100_A210	银行选择寄存器安全(BANKSEL_SEC)	Writable	Writable	复位时
0x0100_A240	0x0100_A240	块保护设置寄存器 Secure (BPS_SEC)	Writable*4	Writable*4	执行复位或命令时
0x0100_A260	0x0100_A260	永久块保护设置 注册安全(PBPS_SEC)	Writable*5 (from 1 to 0 only)	Writable*5 (from 1 to 0 only)	执行复位或命令时
0x0100_A280	0x0100_A280	选项功能选择寄存器1 Select (OFS1_SEL)	Writable	Writable	复位时
0x0100_A290	0x0100_A290	银行选择寄存器选择（BANKSEL_SEL)	Writable	Writable	复位时
0x0100_A2C0	0x0100_A2C0	块保护设置寄存器 Select (BPS_SEL)	Writable	Writable	复位时

注1.SAS.FSPR位一旦设置为0，就无法通过Configurationset命令恢复为1。因此，再次设置启动区域选择标志变得不可能。（当向0x0100A134地址发出Configurationset命令时，该命令被锁定。）处理SAS.FSPRbit时要格外小心。

注2.一旦PBPS[n]位设置为0，BPS[n]位不能通过使用配置设置命令恢复为1。
注3.一旦这些位设置为0，就不能使用配置设置命令将这些位恢复为1。当BPS[n]位为1时，不能使用配置设置命令将PBPS[n]位设置为0。

注4.一旦PBPS_SEC[n]位设置为0，则BPS_SEC[n]位无法通过使用配置设置命令恢复为1。
注5.一旦这些位设置为0，就不能使用配置设置命令将这些位恢复为1。当BPS_SEC[n]位为1时，无法使用配置设置命令将PBPS_SEC[n]位设置为0。

50.10 暂停操作

如果不满足表50.35中给出的后台操作条件，则在编程或擦除期间无法从闪存读取。当发出PE暂停命令以暂停闪存的编程或擦除时，将启用从闪存读取。关于PE挂起命令，有一种用于编程的挂起命令模式和两种用于擦除的挂起命令模式（挂起优先模式和擦除优先模式）。要恢复暂停的编程或擦除，可以使用PEresume命令。详见挂起操作，参见图50.17。

50.11 Protection Function

50.11.1 Software Protection

Software protection disables programming and erasure of the code flash memory through the settings of control registers and block protect setting in the user area. If an attempt is made to issue an FACI command against software protection, the flash sequencer enters the command-locked state.

50.11.1.1 Protection through FWEPROR

Unless the FWEPROR.FLWE[1:0] bits are set to 01b, programming cannot proceed in any mode.

50.11.1.2 Protection by FENTRYR

When the FENTRYR register is set to 0x0000, the flash sequencer enters read mode. In read mode, FACI commands cannot be accepted. If an attempt is made to issue an FACI command in read mode, the flash sequencer enters the command-locked state.

50.11.1.3 Protection by Block Protect Setting

Each block in user area has the block protect setting (BPS or BPS_SEC). When the FBPROT0 or FBPROT1 register is 0x0000 and the block protect bit is 0, issuing the Program or Block Erase command to user area of the code flash causes the command-locked state. To program or erase the block whose block protect bit is 0, set the FBPROT0 or FBPROT1 register to 0x0001.

The block protect setting can be locked by the permanent block protect setting (PBPS or PBPS_SEC). When the permanent block protect setting and the block protect setting are 0, issuing a Program or Block erase command to user area of the code flash causes the flash sequencer to enter the command-locked state regardless of the FBPROT0 and FBPROT1 register settings.

Valid block protect setting (BPS or BPS_SEC) depends on the Block Protect Select bit (BPS_SEL).

See section 50.12.2. Permanent Block Protect Setting for details of the block protect setting and permanent block protect setting. See section 50.4.15. FBPROT0 : Flash Block Protection Register and section 50.4.16. FBPROT1 : Flash Block Protection for Secure Register for more information.

For details of block protect setting (BPS or BPS_SEC) and block protect select (BPS_SEL), see section 6, Option-Setting Memory.

The protected area by the block protect setting is always determined by the address of the FSADDR register setting regardless of the address swapping function setting (the startup area select, the block swap in linear mode, and the startup bank select in dual mode). Table 50.20 to Table 50.25 show the relation of user area and the block protect setting in each function setting.

(1) In case of the linear mode

- BPS[0] to BPS[n] or BPS_SEC[0] to BPS_SEC[n] are assigned to the block of user area (for example, address is 0x00_0000 to the last block address).
- BPS[0]/BPS_SEC[0] and BPS[1]/BPS_SEC[1] are assigned to the block of user area depending on the startup area select setting (SAS.BTFLG bit). (See section 50.11.3. Start-Up Program Protection).
- The second half of FLI user area is assigned to block protect setting depending on the block swap select setting (BANKSEL.BLCKSWP[2:0] bits). See section 50.11.5. Block Swap Function.

Table 50.20 shows the block protect setting when the startup area select is disabled (not swapping).

Table 50.20 show example of the block protect setting when the address conversion function is used.

Table 50.20 Example of Block Protect setting when SAS.BTFLG is 1 (1 of 2)

FSADDR[23:0]	Block size	Block protect setting	User area block number	Notes
The last block address	32 KB	BPS[n] or BPS_SEC[n]	Block n	—

50.11 保护功能

50.11.1 软件保护

软件保护通过控制寄存器的设置和用户区的块保护设置禁用代码闪存的编程和擦除。如果尝试针对软件保护发出FACI命令，则闪存定序器进入命令锁定状态。

50.11.1.1 通过FWEPROR进行保护

除非FWEPROR.FLWE[1:0]位设置为01b，否则无法在任何模式下进行编程。

50.11.1.2 FENTRYR的保护

当FENTRYR寄存器设置为0x0000时，闪存定序器进入读取模式。在读取模式下，无法接受FACI命令。如果尝试在读取模式下发出FACI命令，则闪存定序器进入命令锁定状态。

50.11.1.3 通过块保护设置进行保护

用户区的每个块都有块保护设置（BPS或BPS_SEC）。当FBPROT0或FBPROT1寄存器为0x0000且块保护位为0时，向代码闪存的用户区发出Program或BlockErase命令会导致命令锁定状态。要编程或擦除块保护位为0的块，请将FBPROT0或FBPROT1寄存器设置为0x0001。

块保护设置可以通过永久块保护设置（PBPS或PBPS_SEC）锁定。当永久块保护设置和块保护设置为0时，无论FBPROT0和FBPROT1寄存器设置如何，向代码闪存的用户区发出程序或块擦除命令都会使闪存定序器进入命令锁定状态。

有效的块保护设置（BPS或BPS_SEC）取决于块保护选择位（BPS_SEL）。

请参阅第50.12.2节。永久块保护设置有关块保护设置和永久块保护设置的详细信息。请参阅第50.4.15节。FBPROT0：闪存块保护寄存器和第50.4.16节。FBPROT1：安全寄存器的闪存块保护了解更多信息。

有关块保护设置（BPS或BPS_SEC）和块保护选择（BPS_SEL）的详细信息，请参阅第6节，选项设置Memory.

块保护设置的保护区域始终由FSADDR寄存器设置的地址决定，与地址交换功能设置无关（启动区域选择、线性模式下的块交换和双模式下的启动库选择）。表50.20至表50.25显示了每个功能设置中用户区和块保护设置的关系。

(1) 在线性模式的情况下

●BPS[0]到BPS[n]或BPS_SEC[0]到BPS_SEC[n]分配给用户区的块（例如，地址是0x00_0000到最后一个块地址）。

●BPS[0]BPS_SEC[0]和BPS[1]BPS_SEC[1]根据启动区选择设置（SAS.BTFLG位）分配给用户区块。（参见第50.11.3节。启动程序保护）。

●FLI用户区的后半部分根据块交换选择设置（BANKSEL.BLCKSWP[2:0]位）分配给块保护设置。请参阅第50.11.5节。块交换功能。

表50.20显示了禁用启动区域选择（不交换）时的块保护设置。

表50.20显示了使用地址转换功能时的块保护设置示例。

Table 50.20 SAS.BTFLG为1时的块保护设置示例（1of2）

FSADDR[23:0]	块大小	块保护设置	用户区块号	Notes
最后一个区块地址	32 KB	BPS[n] or BPS_SEC[n]	Block n	—

Table 50.20 Example of Block Protect setting when SAS.BTFLG is 1 (2 of 2)

0x00_0000 to 0x00_1FFF	8 KB	BPS[0] or BPS_SEC[0]	Block 0	—

(2) In case of the dual mode (DUALSEL.BANKMD[2:0] = 000b)

- BPS[0] to BPS[n] or BPS_SEC[0] to BPS_SEC[n] are assigned the block of bank 0 user area (for example, address is 0x00000000 to the last block address in the lower side bank).
- BPS[70] to BPS[70 + n] or BPS_SEC[70] to BPS_SEC[70 + n] are assigned to the block of bank 1 user area (for example, address is 0x00200000 to the last block address in the upper side bank).

Bank0 is upper side bank (BANKSEL.BANKSWP[2:0] = 000b)

- BPS[0] to BPS[n] or BPS_SEC[0] to BPS_SEC[n] are assigned to the block of bank1 user area (e.g. Address is 0x00_0000 to The last block address in lower side bank).
- BPS[70] to BPS[70+n] or BPS_SEC[70] to BPS_SEC[70+n] are assigned to the block of bank0 user area (e.g. Address is 0x20_0000 to The last block address in upper side bank).

Table 50.24 and Table 50.25 show example of the block protect setting in the dual mode. See section 50.11.4. Dual Bank Function for details of dual bank function (DUALSEL.BANKMD[2:0] and BANKSEL.BANKSWP[2:0] bits).

Table 50.22 BANKSEL.BLCKSWP为1时的块保护设置示例(2of2)

0x00_0000 to 0x00_1FFF	8 KB	BPS[0] or BPS_SEC[0]	Block 0	—

(2) 在双模式的情况下（DUALSEL.BANKMD[2:0]=000b）

●BPS[0]到BPS[n]或BPS_SEC[0]到BPS_SEC[n]分配了bank0用户区的块（例如，地址是0x00000000到下侧bank中的最后一个块地址）。

●BPS[70]到BPS[70+n]或BPS_SEC[70]到BPS_SEC[70+n]分配给bank1用户区的块（例如，地址为0x00200000到上侧的最后一个块地址银行）。

Bank0是上侧银行(BANKSEL.BANKSWP[2:0]=000b)

●BPS[0]到BPS[n]或BPS_SEC[0]到BPS_SEC[n]分配给bank1用户区的块（例如，地址是0x00_0000到下侧bank中的最后一个块地址）。

●BPS[70]到BPS[70+n]或BPS_SEC[70]到BPS_SEC[70+n]分配给bank0用户区的块（例如地址是0x20_0000到上侧bank中的最后一个块地址）。

表50.24和表50.25显示了双模式下的块保护设置示例。请参阅第50.11.4节。双银行详细了解双组功能的功能（DUALSEL.BANKMD[2:0]和BANKSEL.BANKSWP[2:0]位）。

Table 50.24 Example of Block Protect setting when BANKSEL.BANKSWP[2:0] is 111b

FSADDR[23:0]	Block size	Block protect setting	User area block number	Notes

0x00_0000 to 0x00_1FFF	8 KB	BPS[0] or BPS_SEC[0]	Block 70	

50.11.2 Error Protection

Error protection detects the issuing of illegal FACI commands, illegal access, and flash sequencer malfunction. FACI command acceptance is disabled (command-locked state) in response to the detection of these errors. The flash memory cannot be programmed or erased while the flash sequencer is in the command-locked state. For release from the command-locked state, issue the Status Clear or Forced Stop command. The Status Clear command can only be used while the FRDY bit in the FSTATR register is 1. The Forced Stop command can be used regardless of the value of the FRDY bit. While the CMDLKIE bit in the FAEINT register is 1, a flash access error (FIFERR) interrupt is generated if the flash sequencer enters the command-locked state (the CMDLK bit in the FASTAT register is set to 1).

If the flash sequencer enters the command-locked state in response to a command other than the P/E suspend command during programming or erasure processing, the flash sequencer continues the processing for programming or erasure. In this state, the P/E suspend command cannot be used to suspend the processing for programming or erasure. If a command is issued in the command-locked state, the ILGLERR bit becomes 1 and the other bits retain the values set from previous error detection.

Table 50.26 shows the error protection types and status bit values after error detections.

Table 50.26 Error protection type (1 of 3)

Error type	Description	ILGCOMERR	FESETERR	SECERR	OTERR	ILGLERR	ERSERR	PRGERR	FLWEERR	CFAE	DFAE
FENTRYR setting error	The value set in FENTRYR is not 0x0000, 0x0001, or 0x0080	0	1	0	0	1	0	0	0	0	0
	The FENTRYR setting at suspension is different from that at resumption	0	1	0	0	1	0	0	0	0	0

Table 50.25 当BANKSEL.BANKSWP[2:0]为000b(2of2)时用户区域和块保护设置的关系

FSADDR[23:0]	块大小	块保护设置	用户区块号	Notes
下侧bank中的最后一个块地址	32 KB	BPS[n] or BPS_SEC[n]	Block 70 + n	在此启动银行开关设置中交换银行0和银行1
⋮	⋮	⋮	⋮	
0x01_8000 to 0x01_FFFF	32 KB	BPS[9] or BPS_SEC[9]	Block 79	
0x01_0000 to 0x01_7FFF	32 KB	BPS[8] or BPS_SEC[8]	Block 78	
0x00_E000 to 0x00_FFFF	8 KB	BPS[7] or BPS_SEC[7]	Block 77	
0x00_C000 to 0x00_DFFF	8 KB	BPS[6] or BPS_SEC[6]	Block 76	
⋮	⋮	⋮	⋮	
0x00_2000 to 0x00_3FFF	8 KB	BPS[1] or BPS_SEC[1]	Block 71	
0x00_0000 to 0x00_1FFF	8 KB	BPS[0] or BPS_SEC[0]	Block 70	

50.11.2 错误保护

错误保护检测非法FACI命令的发出、非法访问和闪存定序器故障。FACI命令接受被禁用（命令锁定状态）以响应检测到这些错误。闪存定序器处于命令锁定状态时，无法对闪存进行编程或擦除。要从命令锁定状态释放，请发出状态清除或强制停止命令。状态清除命令只能在FSTATR寄存器中的FRDY位为1时使用。无论FRDY位的值如何，都可以使用强制停止命令。当FAEINT寄存器中的CMDLKIE位为1时，如果闪存定序器进入命令锁定状态（FASTAT寄存器中的CMDLK位设置为1），则会产生闪存访问错误(FIFERR)中断。

如果闪存定序器在编程或擦除处理期间响应于除了PE暂停命令之外的命令而进入命令锁定状态，则闪存定序器继续进行编程或擦除处理。在这种状态下，PE挂起命令不能用于挂起编程或擦除处理。如果在命令锁定状态下发出命令，则ILGLERR位变为1，其他位保留先前错误检测设置的值。

表50.26显示了错误检测后的错误保护类型和状态位值。

Table 50.26 错误保护类型(1of3)

错误类型	Description	ILGCOMERR	FESETERR	SECERR	OTERR	ILGLERR	ERSERR	PRGERR	FLWEERR	CFAE	DFAE
FENTRYR设置错误	FENTRYR中设置的值不是0x0000、0x0001或0x0080	0	1	0	0	1	0	0	0	0	0
	暂停时的FENTRYR设置与恢复时的设置不同	0	1	0	0	1	0	0	0	0	0

Table 50.26 Error protection type (2 of 3)

Error type	Description	ILGCOMERR	FESETERR	SECERR	OTERR	ILGLERR	ERSERR	PRGERR	FLWEERR	CFAE	DFAE
Illegal command error	An undefined size is specified in the first cycle of the command. (not byte-write)	1	0	0	0	1	0	0	0	0	0
	An undefined code is written in the first access of the FACI command	1	0	0	0	1	0	0	0	0	0
	The value specified in the last access of the multiple-access FACI command is not 0xD0	1	0	0	0	1	0	0	0	0	0
	The value (N) specified in the second write access of the FACI command in the program or configuration set command is wrong	1	0	0	0	1	0	0	0	0	0
	Blank Check command is issued with inconsistent BCDIR, FSADDR, and FEADDR settings (see section 50.4.13. FEADDR : FACI Command End Address Register)	1	0	0	0	1	0	0	0	0	0/1 *1
	A multi block erase command is issued with inconsistent FSADDR and FEADDR settings. ● FSADDR > FEADDR ● FEADDR is set to reserved area.	1	0	0	0	1	0	0	0	0	0/1 *1
	An FACI command not acceptable in each mode is issued (see Table 50.16)	1	0	0	0	1	0	0	0	0	0
	An FACI command is issued when command acceptance conditions are not satisfied (see Table 50.17)	0/1	0/1	0/1	0/1	1	0/1	0/1	0/1	0/1	0/1
	A program or block erase command is issued against the area protected by the block protect setting (see section 50.11.1.3. Protection by Block Protect Setting)	1	0	0	0	1	0	0	0	0	0
	A program command is issued against the erase area in erase suspend	1	0	0	0	1	0	0	0	0	0
Erasure error	An error occurs during erasure	0	0	0	0	0	1	0	0	0	0
Programming error	An error occurs during programming	0	0	0	0	0	0	1	0	0	0
Code flash memory access violation	An FACI command is issued to the reserved portion of the user area in code flash P/E mode	0	0	0	0	1	0	0	0	1	0
	Configuration set command is issued to the reserved option-setting memory	0	0	0	0	1	0	0	0	1	0
	Configuration set command of non-secure access is issued to the secure region of TrustZone in the code flash	0	0	0	0	1	0	0	0	1	0
	Program or block erase command of non-secure access is issued to the secure region of user area.	0	0	0	0	1	0	0	0	1	0

Table 50.26 错误保护类型（2个，共3个）

错误类型	Description	ILGCOMERR	FESETERR	SECERR	OTERR	ILGLERR	ERSERR	PRGERR	FLWEERR	CFAE	DFAE
非法命令错误	在命令的第一个循环中指定了未定义的大小。（不是字节写入）	1	0	0	0	1	0	0	0	0	0
	在FACI命令的第一次访问中写入了未定义的代码	1	0	0	0	1	0	0	0	0	0
	多路访问FACI命令的最后一次访问指定的值不是0xD0	1	0	0	0	1	0	0	0	0	0
	程序或配置集命令中FACI命令的第二次写访问指定的值（N）错误	1	0	0	0	1	0	0	0	0	0
	使用不一致的BCDIR、FSADDR和FEADDR设置发出空白检查命令（请参阅第50.4.13节。 FEADDR:FACI命令结束地址 Register)	1	0	0	0	1	0	0	0	0	0/1 *1
	使用不一致的FSADDR和FEADDR设置发出多块擦除命令。● ● FEADDR设置为保留区域。	1	0	0	0	1	0	0	0	0	0/1 *1
	发出了在每种模式下都不可接受的FACI命令（参见表50.16）	1	0	0	0	1	0	0	0	0	0
	当命令接受条件不满足时发出FACI命令（见表50.17）	0/1	0/1	0/1	0/1	1	0/1	0/1	0/1	0/1	0/1
	对受块保护设置保护的区域发出编程或块擦除命令（请参阅第50.11.1.3节。块保护设置保护）	1	0	0	0	1	0	0	0	0	0
	在擦除挂起中针对擦除区域发出编程命令	1	0	0	0	1	0	0	0	0	0
擦除错误	擦除过程中发生错误	0	0	0	0	0	1	0	0	0	0
编程错误	编程过程中出现错误	0	0	0	0	0	0	1	0	0	0
代码闪存访问冲突	在代码闪存PE模式下，向用户区的保留部分发出FACI命令	0	0	0	0	1	0	0	0	1	0
	向保留的选项设置内存发出配置设置命令	0	0	0	0	1	0	0	0	1	0
	向代码闪存中的TrustZone的安全区域发出非安全访问的配置集命令	0	0	0	0	1	0	0	0	1	0
	对用户区的安全区域发出非安全访问的程序或块擦除命令。	0	0	0	0	1	0	0	0	1	0

RA生态工作室

Table 50.26 Error protection type (3 of 3)

Error type	Description	ILGCOMERR	FESETERR	SECERR	OTERR	ILGLERR	ERSERR	PRGERR	FLWEERR	CFAE	DFAE
Data flash memory access violation	A program or block erase command is issued to the reserved data area in data flash P/E mode	0	0	0	0	1	0	0	0	0	1
	A multi block erase command is issued to the reserved data area in data flash P/E mode. (FSADDR is set to reserved data area).	1	0	0	0	1	0	0	0	0	1
	Blank Check command is issued to reserved data area in data flash P/E mode. (FSADDR is set to reserved data area).	1	0	0	0	1	0	0	0	0	1
	A program, block erase, multi block erase, or blank check command of non-secure access is issued to the secure region of data area.	0	0	0	0	1	0	0	0	0	1
Security error	Configuration set command for the SAS.BTFLG bit setting is issued when the SAS.FSPR bit is 0 (see section 50.9.3.15. Configuration Set Command)	0	0	1	0	1	0	0	0	0	0
Others	An FACI command-issuing area is accessed in read mode	0	0	0	1	1	0	0	0	0	0
	An FACI command-issuing area is read in code flash P/E mode or data flash P/E mode	0	0	0	1	1	0	0	0	0	0
Flash write erase protection error	A flash memory write protection error is detected by the FWEPROR register setting*2 during command processing by the flash sequencer	0	0	0	0	0	0/1	0/1	1	0	0

Note 1. DFAE value depends on the FSADDR setting.
Note 2. For details on the FWEPROR register, see section 50.4.8. FWEPROR : Flash P/E Protect Register.

50.11.3 Start-Up Program Protection

Protection of the startup program is for protection of the program to be started after a reset (the startup program). This function provides a way to safely update the startup program when rewriting is suspended during a reset.

The startup area is 8 Kbytes in size and is assigned to the user area in the code flash memory. This function uses the values of the SAS.BTFLG bit and the FSUACR.SAS[1:0] bits to change the area where the startup program is stored in block units (see Figure 50.26 to Figure 50.29).

In protection of the startup program, the state of the selection of the startup area can be fixed by the FSPR bit. However, the SAS.FSPR bit never be restored to 1 once the flag is set to 0. Exercise extra caution when handling the SAS.FSPR bit.

In addition, this protection cannot be used when dual mode is selected by the bank mode switching function (when the BANKMD[2:0] bits are 000b).

For details of SAS.FSPR bit and DUALSEL.BANKMD[2:0] bits, see section 6, Option-Setting Memory.

Table 50.26 错误保护类型（3之3）

错误类型	Description	ILGCOMERR	FESETERR	SECERR	OTERR	ILGLERR	ERSERR	PRGERR	FLWEERR	CFAE	DFAE
数据闪存访问违规	在数据闪存PE模式下，向保留数据区域发出程序或块擦除命令	0	0	0	0	1	0	0	0	0	1
	在数据闪存PE模式下，向保留数据区域发出多块擦除命令。（FSADDR设置为保留数据区）。	1	0	0	0	1	0	0	0	0	1
	在数据闪存PE模式下，向保留数据区域发出空白检查命令。（FSADDR设置为保留数据区）。	1	0	0	0	1	0	0	0	0	1
	向数据区域的安全区域发出非安全访问的编程、块擦除、多块擦除或空白检查命令。	0	0	0	0	1	0	0	0	0	1
安全错误	当SAS.FSPR位为0时，发出SAS.BTFLG位设置的配置设置命令（请参阅第50.9.3.15节。配置设置命令）	0	0	1	0	1	0	0	0	0	0
Others	以读取模式访问FACI命令发布区域	0	0	0	1	1	0	0	0	0	0
	在代码闪存PE模式或数据闪存PE模式下读取FACI命令发布区域	0	0	0	1	1	0	0	0	0	0
Flash写擦除保护错误	在闪存定序器的命令处理期间，通过FWEPROR寄存器设置*2检测到闪存写保护错误	0	0	0	0	0	0/1	0/1	1	0	0

注1.DFAE值取决于FSADDR设置。
注2.有关FWEPROR寄存器的详细信息，请参阅第50.4.8节。FWEPROR：闪存PE保护寄存器。

50.11.3 启动程序保护

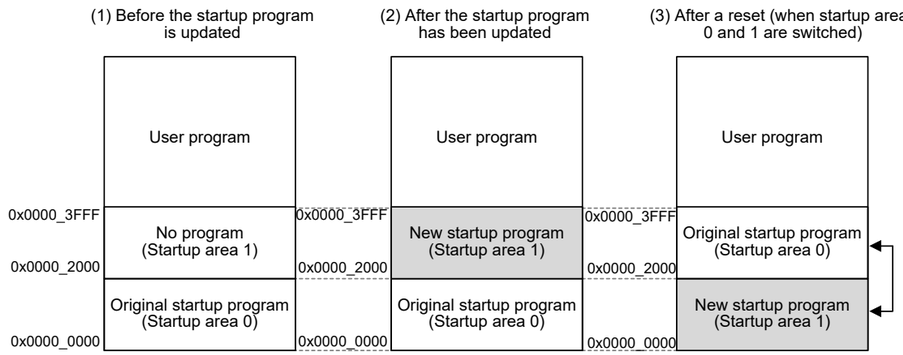
启动程序的保护是为了保护复位后要启动的程序（启动程序）。此功能提供了一种在复位期间暂停重写时安全更新启动程序的方法。

启动区大小为8KB，分配给代码闪存中的用户区。该函数使用SAS.BTFLG位和FSUACR.SAS[1:0]位的值来改变以块为单位存储启动程序的区域（见图50.26至图50.29）。

在启动程序的保护中，启动区域的选择状态可以通过FSPR位来固定。但是，那一旦标志设置为0，SAS.FSPR位永远不会恢复为1。处理SAS.FSPR位时要格外小心。

此外，当通过组模式切换功能选择双模式时（当BANKMD[2:0]位为000b)。

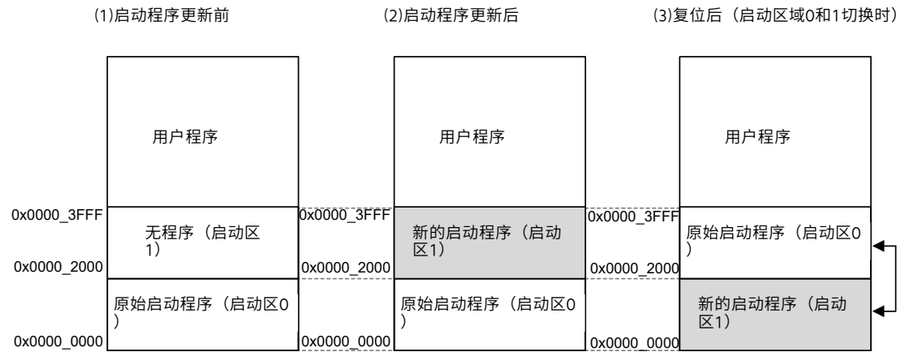
有关SAS.FSPR位和DUALSEL.BANKMD[2:0]位的详细信息，请参见第6节，选项设置存储器。



Note: The addresses are used for reading, programming, and erasure. Startup area 0 is erased when Block Erase command is issued for the address 0x00000000 with allocation shown under 3.

1. Before the startup program is updated
   When the SAS.BTFLG bit is 1 and the FSUACR.SAS[1:0] bits are 0xb, the address range from 0x00002000 to 0x00003FFF is selected as startup area 1 and the address range from 0x00000000 to 0x00001FFF is selected as startup area 0.
2. After the startup program has been updated
   A new startup program can be written to startup area 1. At this time, startup area 0 will still contain the previous startup program, so rewriting by starting up from startup area 0 remains possible if rewriting to the startup area 1 fails.
3. After a reset (when startup areas 0 and 1 are switched)
   When rewriting startup area 1 is successfully completed, switch the assignment of startup areas 0 and 1 by rewriting the startup area selection bit (the SAS.BTFLG bit) with Configuration set command. Afterwards, the program is started up from startup area 1 after a reset.

Figure 50.26 Concept of Protection of the Startup Program



Note: 这些地址用于读取、编程和擦除。当对地址0x00000000发出块擦除命令时，启动区域0被擦除，分配如下3所示。1.更新启动程序之前

当SAS.BTFLG位为1且FSUACR.SAS[1:0]位为0xb时，选择0x00002000到0x00003FFF的地址范围作为启动区1，选择从0x00000000到0x00001FFF的地址范围作为启动区0。2.启动程序更新后

可以将新的启动程序写入启动区1。此时启动区0仍会包含之前的启动程序，因此如果对启动区1的重写失败，仍然可以从启动区0启动进行重写。3.复位后（启动区域0和1切换时）

成功完成启动区1的重写后，通过Configurationset命令重写启动区选择位（SAS.BTFLG位）来切换启动区0和1的分配。之后，程序在复位后从启动区1启动。

Figure 50.26 保护启动程序的概念

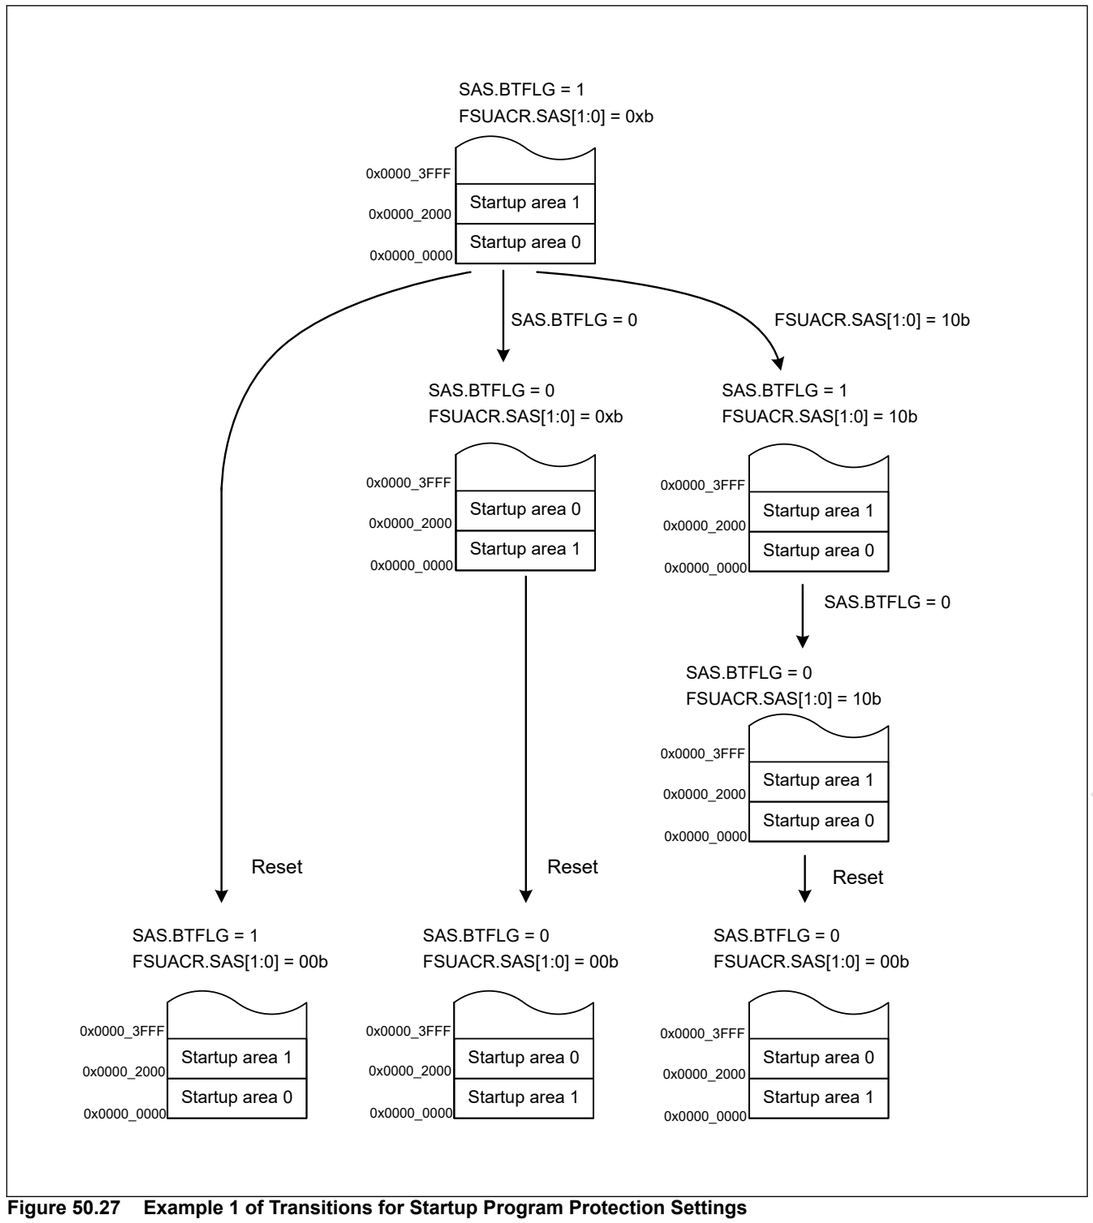


Figure 50.27 Example 1 of Transitions for Startup Program Protection Settings

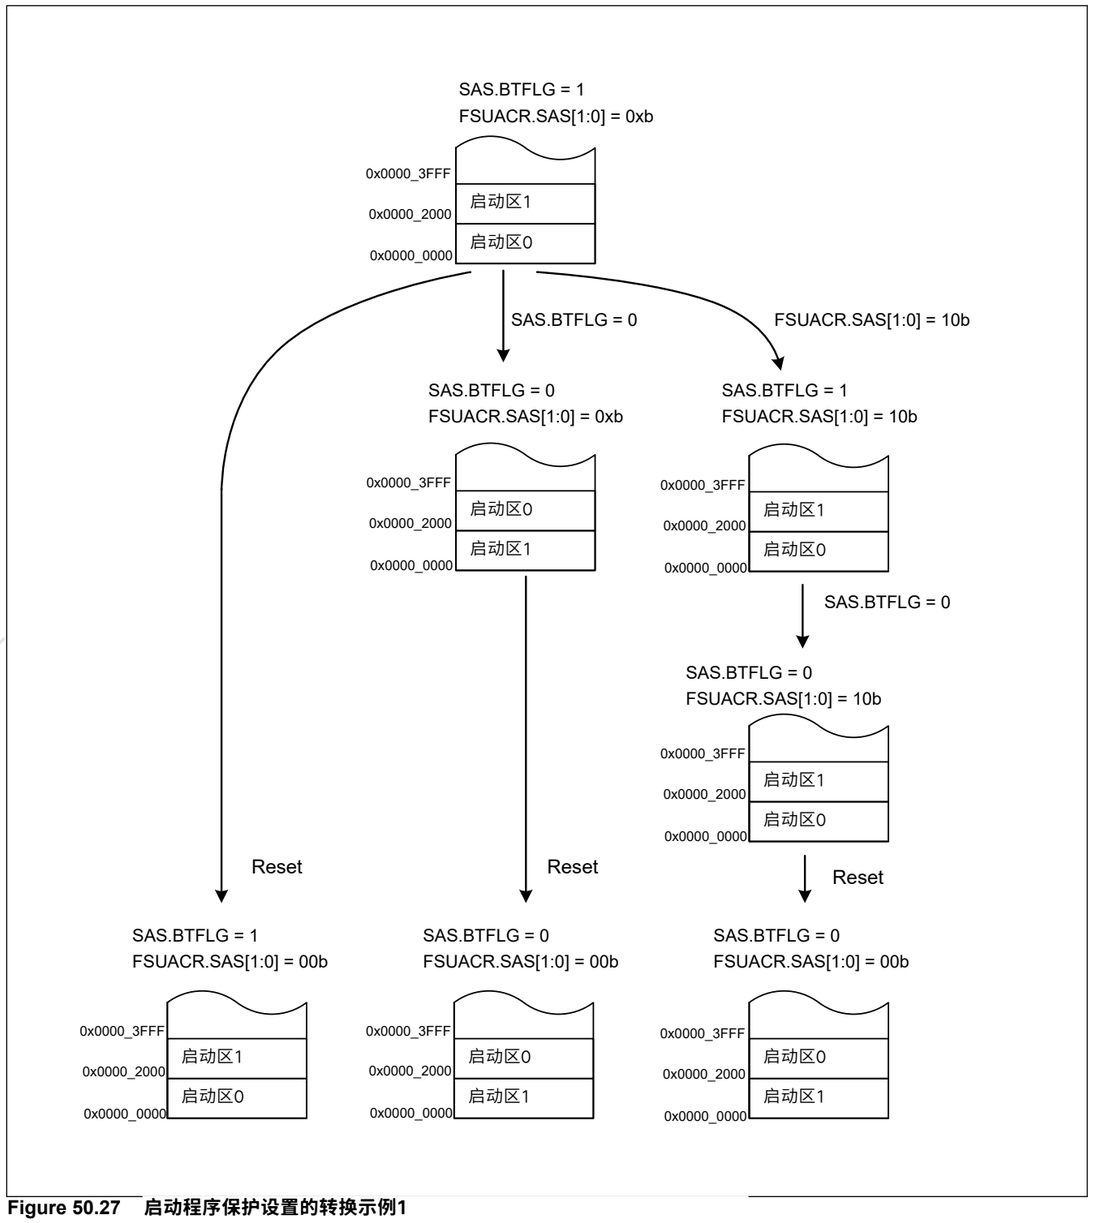

Figure 50.27 启动程序保护设置的转换示例1

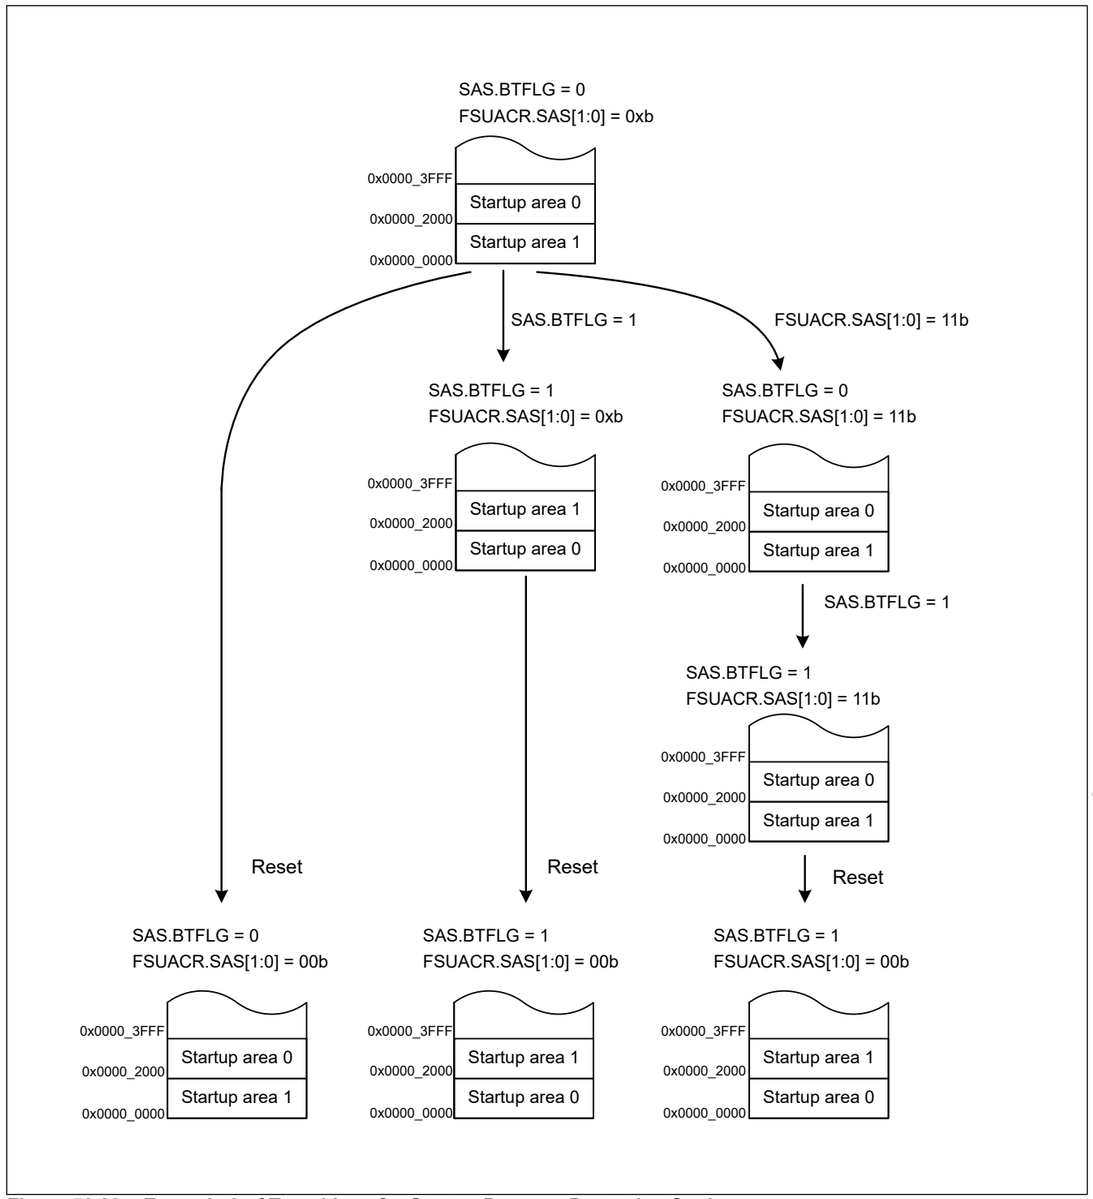

Figure 50.28 Example 2 of Transitions for Startup Program Protection Settings

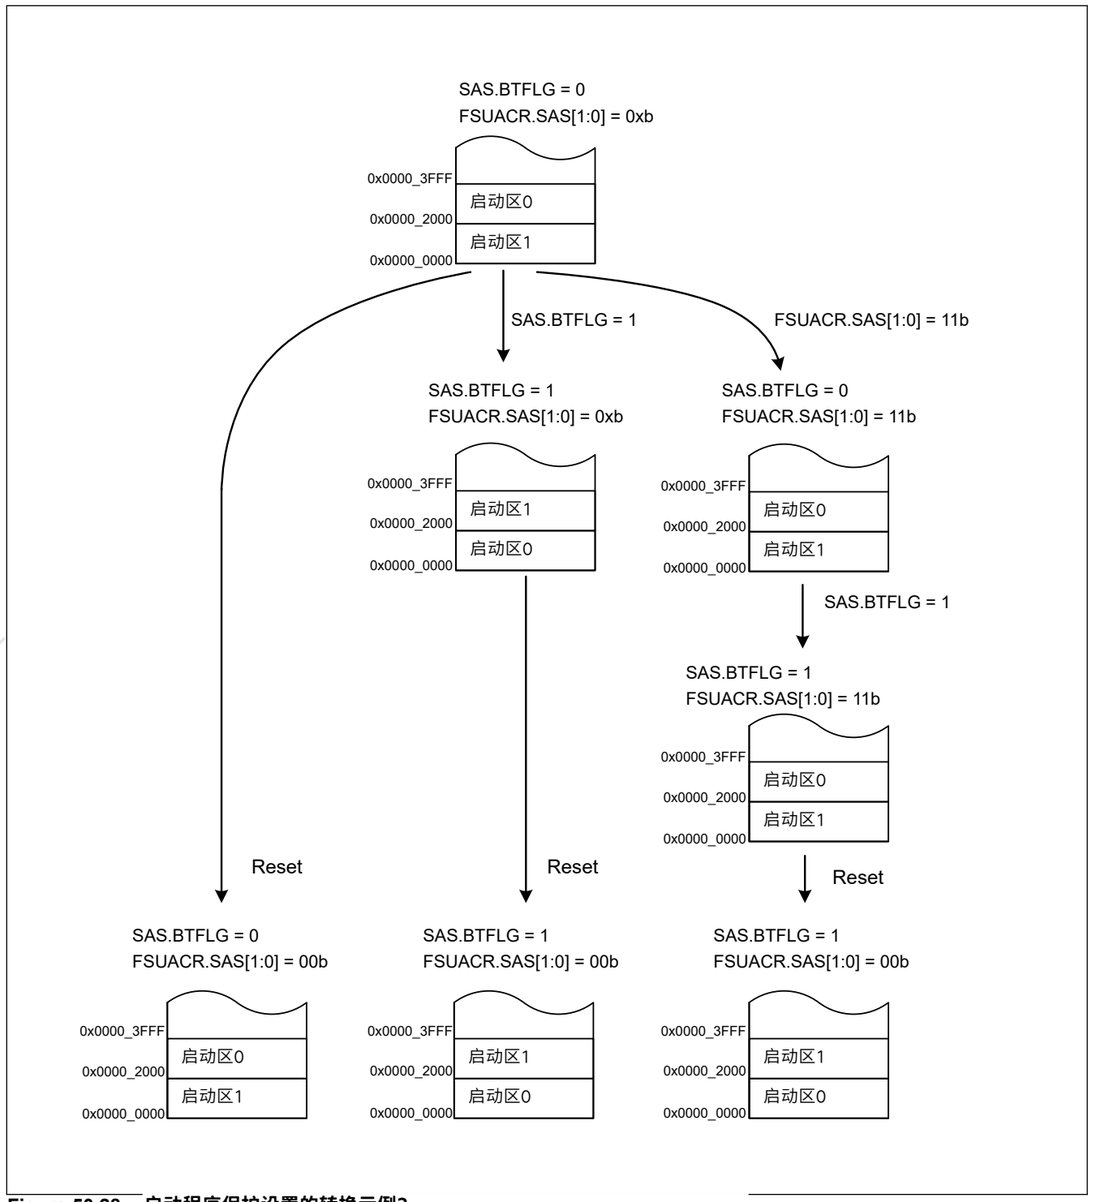

Figure 50.28 启动程序保护设置的转换示例2

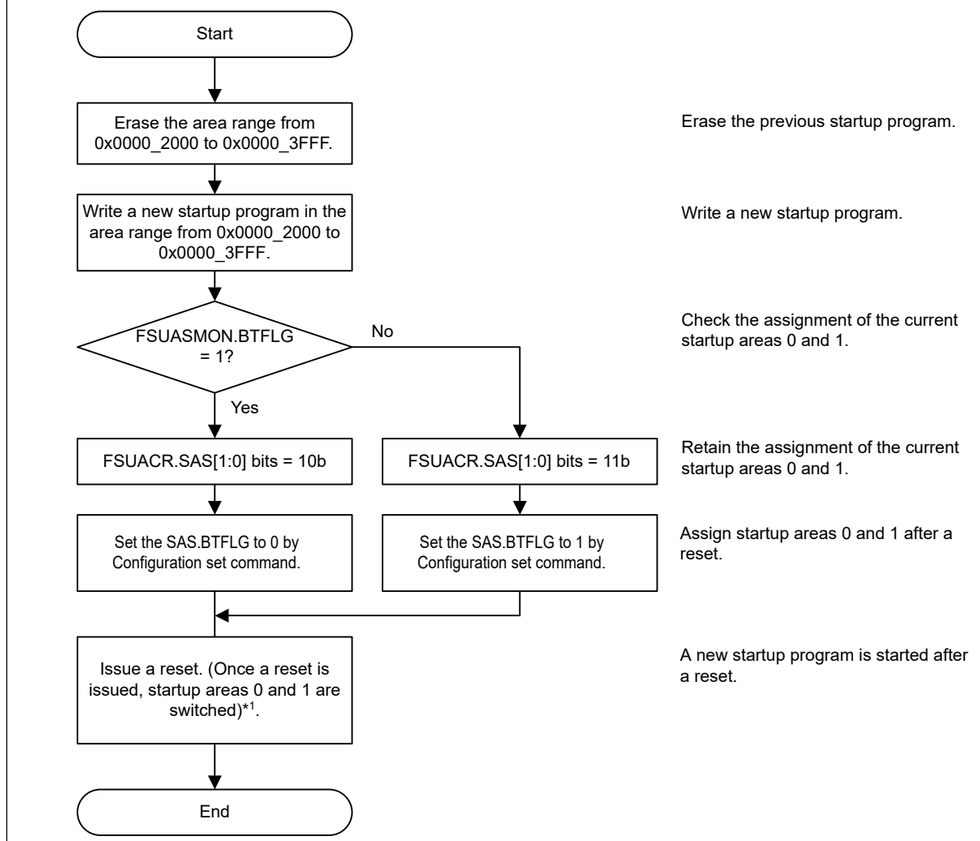


Note 1. For details, see Figure 50.27 and Figure 50.28.

Figure 50.29 Concept of Protection of the Startup Program

50.11.4 Dual Bank Function

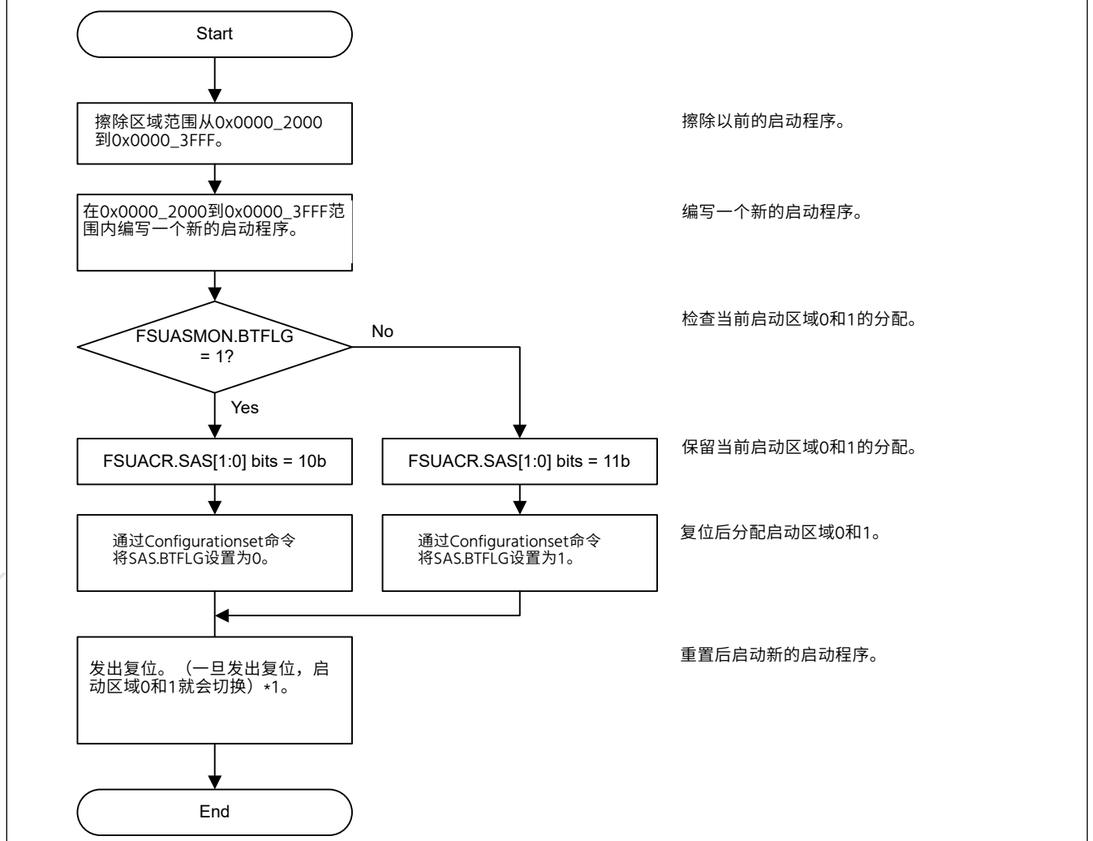
This protection uses the functions of bank mode switching and startup bank selection to update a program while a user program is running and to provide a safe method of updating in cases where programming is suspended during a reset.

50.11.4.1 Switching Bank Modes

The bank mode switching function selects either linear mode in which the user area in the code flash memory is used as one area, or dual mode in which the user area is divided into two bank areas. Figure 50.30 shows an example of flow of switching bank modes. A reset after setting the DUALSEL.BANKMD[2:0] bits in the option setting memory determines the mode of the bank mode switching function. Selecting dual mode enables the startup bank selection function.

When dual mode is selected by bank mode switching function (the DUALSEL.BANKMD[2:0] bits are 000b), start-up program protection function cannot be used.

For details of DUALSEL.BANKMD[2:0] bits, see section 6, Option-Setting Memory.



注1.详见图50.27和图50.28。

Figure 50.29 保护启动程序的概念

50.11.4 双银行功能

该保护使用存储区模式切换和启动存储区选择功能在用户程序运行时更新程序，并在复位期间编程暂停的情况下提供安全的更新方法。

50.11.4.1 切换银行模式

存储体模式切换功能选择将代码闪存中的用户区域用作一个区域的线性模式或将用户区域划分为两个存储体区域的双重模式。图50.30显示了切换存储区模式的流程示例。设置选项设置存储器中的DUALSEL.BANKMD[2:0]位后的复位决定了组模式切换功能的模式。选择双模式启用启动库选择功能。

当通过组模式切换功能（DUALSEL.BANKMD[2:0]位为000b）选择双模式时，不能使用启动程序保护功能。

有关DUALSEL.BANKMD[2:0]位的详细信息，请参阅第6节，选项设置存储器。

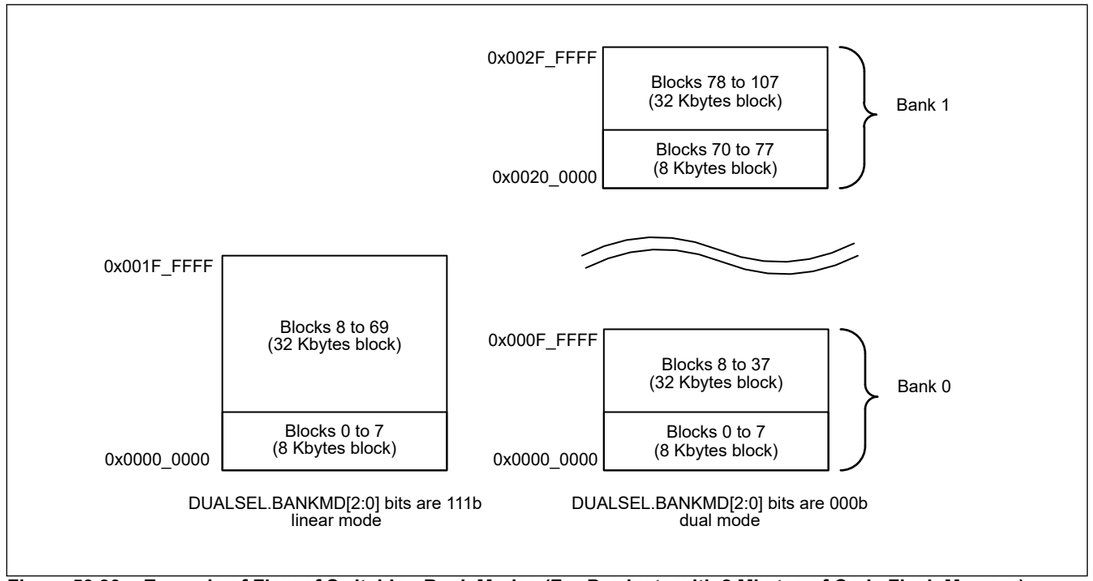


Figure 50.30 Example of Flow of Switching Bank Modes (For Products with 2 Mbytes of Code Flash Memory)

50.11.4.2 Selecting the Startup Bank

Startup bank selection provides a way to safely update the program by selecting a bank area to be started in dual mode (when the DUALSEL.BANKMD[2:0] bits are 000b) when programming is suspended during a reset. Figure 50.31 is a schematic view of startup bank selection and Table 50.27 shows an example of the flow of startup bank selection. A reset after setting the value of the BANKSEL.BANKSWP[2:0] bits in the option-setting memory changes the addresses of banks 0 and 1 and booting up a program proceeds from the updated area. When the address is switched by using startup bank selection, the programming/erasure target for the FACI commands is also switched. This function is invalid in linear mode.

For details of DUALSEL.BANKMD[2:0] bits and BANKSEL.BANKSWP[2:0] bits, see section 6, Option-Setting Memory.

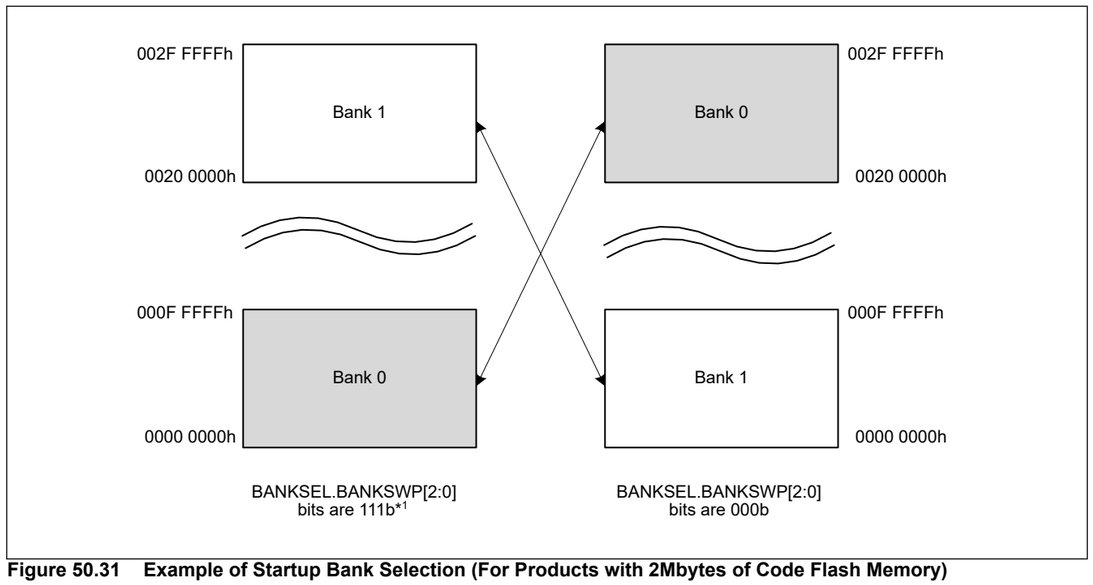

Figure 50.31 Example of Startup Bank Selection (For Products with 2Mbytes of Code Flash Memory)

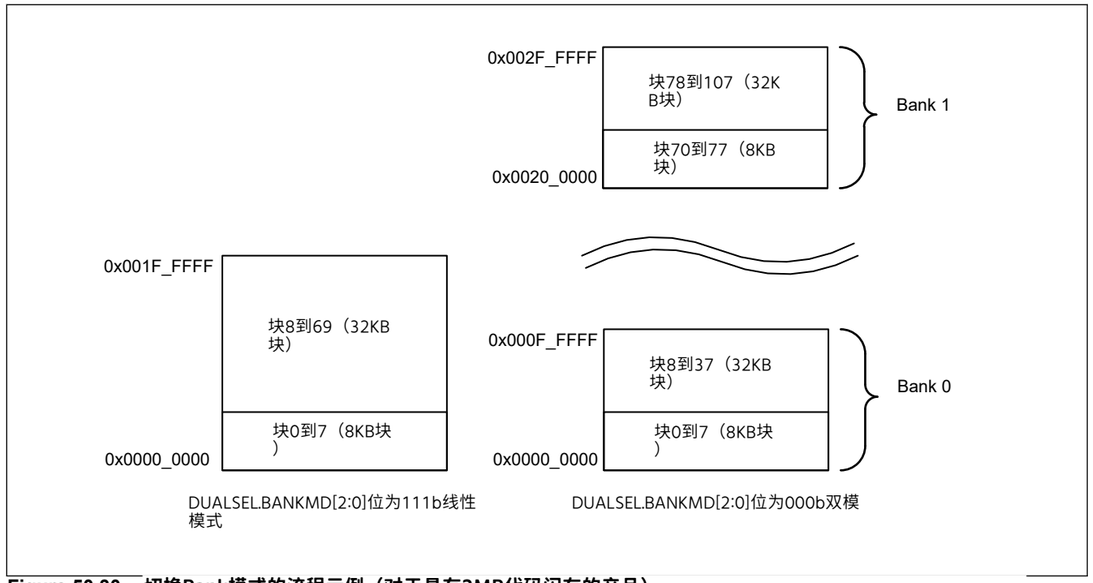

Figure 50.30 切换Bank模式的流程示例（对于具有2MB代码闪存的产品）

50.11.4.2 选择启动银行

启动存储区选择提供了一种安全更新程序的方法，方法是在复位期间暂停编程时选择要以双模式启动的存储区（当DUALSEL.BANKMD[2:0]位为000b时）。图50.31是启动银行选择的示意图，表50.27显示了启动银行选择流程的示例。设置选项设置存储器中BANKSEL.BANKSWP[2:0]位的值后复位会更改存储体0和1的地址，并从更新的区域启动程序。当使用启动库选择切换地址时，FACI命令的编程擦除目标也被切换。该功能在线性模式下无效。

有关DUALSEL.BANKMD[2:0]位和BANKSEL.BANKSWP[2:0]位的详细信息，请参见第6节，选项设置存储器。

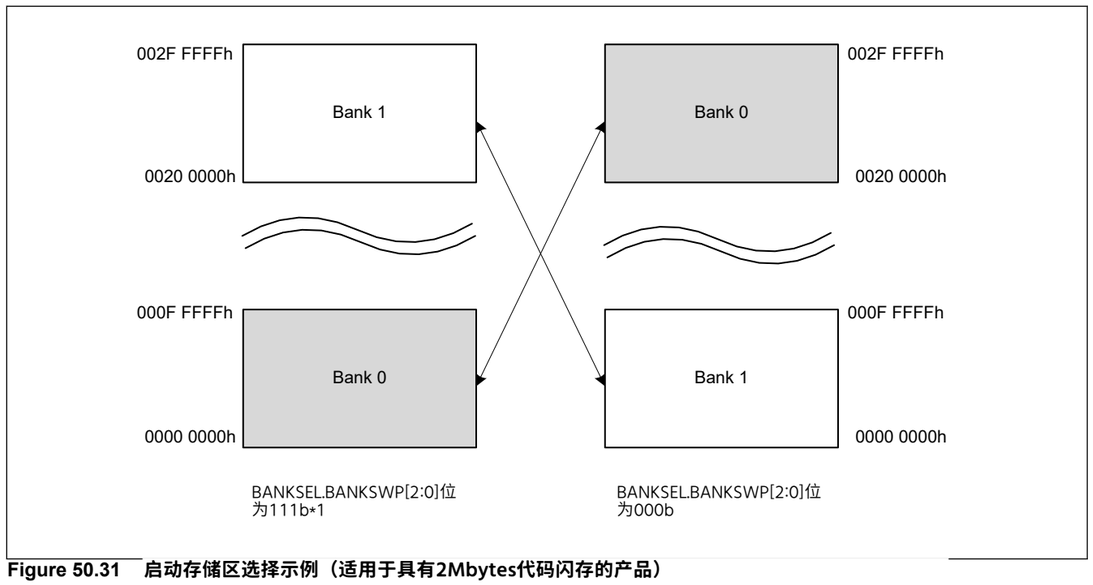

Figure 50.31 启动存储区选择示例（适用于具有2Mbytes代码闪存的产品）

Table 50.27 Example of Startup Bank Selection Flow (For Products with 2 Mbytes of Code Flash Memory)

No.	Step Name	Description
1	Erase block	Erase blocks to be programed in the address range from 0x0020_0000 to 0x002F_FFFF
2	Program a new software	Program a new software in the address range from 0x0020_0000 to 0x002F_FFFF
3	Read the value	Read the value of the BANKSEL.BANKSWP[2:0] bits.
4	Write an inverted value	Write an inverted value in the BANKSEL.BANKSWP[2:0] bits*1.
5	Issue a reset	Issue a reset (A reset switches the banks.)

Note 1. Set the inverse of the read value of the BANKSEL.BANKSWP[2:0] bits (000b or 111b).

50.11.5 Block Swap Function

This protection uses the functions of block swap selection to update a program while a user program is running and to provide a safe method of updating in cases where programming is suspended during a reset.

50.11.5.1 Selecting the Block Swap

Block swap selection provides a way to safely update the program when programming is suspended during a reset. Figure 50.32 is a schematic view of block swap selection and Figure 50.33 shows an example of the flow of block swap selection. A reset after setting the value of the BANKSEL.BLCKSWP bit in the option-setting memory changes the addresses of block A and B. When the address is switched, the Programming/erasure target for the FACI commands is also switched.

In addition, this protection cannot be used when dual mode is selected by the bank mode switching function (when the DUALSEL.BANKMD[2:0] bits are 000b).

For details of DUALSEL.BANKMD[2:0] bits and BANKSEL.BLCKSWP bit, see section 6, Option-Setting Memory.

Table 50.27 启动Bank选择流程示例（适用于具有2MB代码闪存的产品）

No.	步骤名称	Description
1	擦除块	擦除从0x0020_0000到0x002F_FFFF的地址范围内要编程的块
2	编写新软件	在0x0020_0000到0x002F_FFFF的地址范围内编写一个新软件
3	读取值	读取值 BANKSEL.BANKSWP[2:0] bits.
4	写一个反转的值	在 BANKSEL.BANKSWP[2:0] bits*1.
5	发出重置	发出复位（复位切换组。）

注1.设置BANKSEL.BANKSWP[2:0]位（000b或111b）的读取值的倒数。

50.11.5 区块交换功能

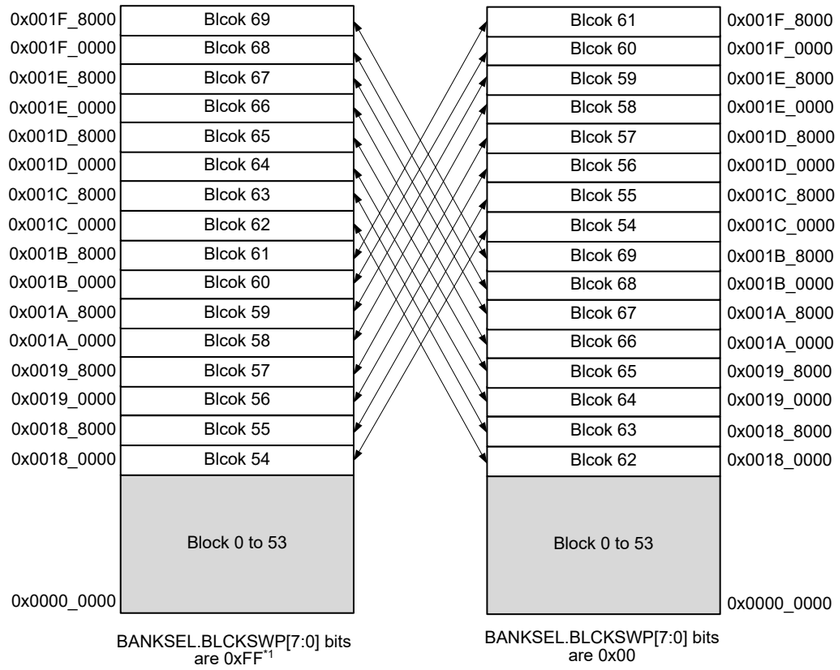
此保护使用块交换选择功能在用户程序运行时更新程序，并在复位期间暂停编程的情况下提供安全的更新方法。

50.11.5.1 选择块交换

块交换选择提供了一种在复位期间编程暂停时安全更新程序的方法。图50.32是块交换选择的示意图，图50.33显示了块交换选择流程的示例。设置选项设置存储器中的BANKSEL.BLCKSWP位的值后的复位会改变块A和B的地址。当地址切换时，FACI命令的编程擦除目标也会切换。

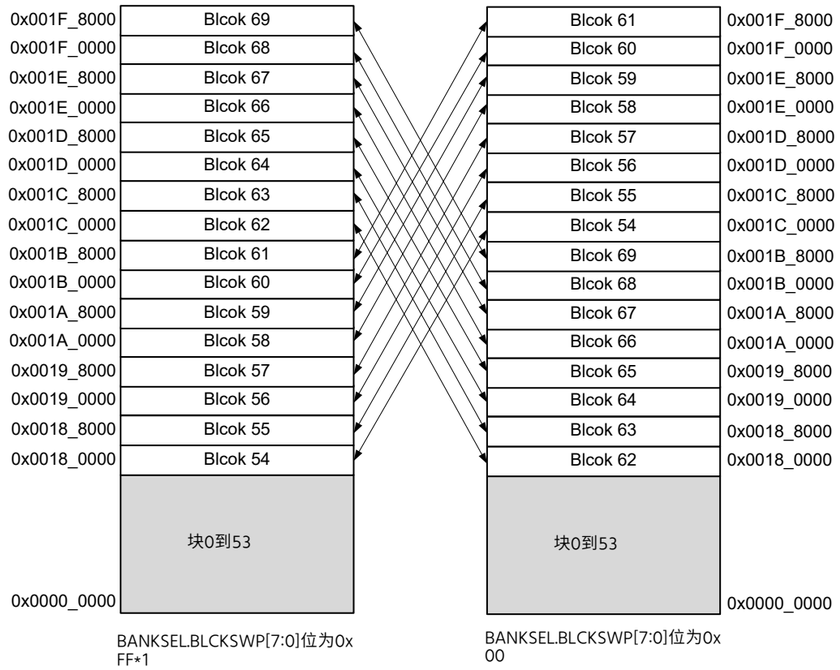
此外，当通过组模式切换功能选择双模式时（当DUALSEL.BANKMD[2:0]位为000b）。

有关DUALSEL.BANKMD[2:0]位和BANKSEL.BLCKSWP位的详细信息，请参见第6节，选项设置存储器。



Note 1. For products without setting of the option-setting memory, the BANKSEL.BLCKSWP[7:0] bits are 1111b

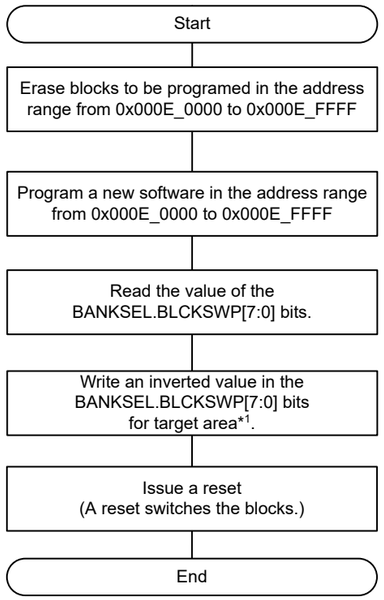
Figure 50.32 Example of Block Swap Selection (For Products with 2 Mbytes of Code Flash Memory)



注1.对于没有设置选项设置存储器的产品，BANKSEL.BLCKSWP[7:0]位为1111b

Figure 50.32 块交换选择示例（适用于具有2MB代码闪存的产品）

RA生态工作室



Note 1. See Table 6.2 for the correspondence between the target region and the BANKSEL.BLCKSWP[7:0] bit.

Figure 50.33 Example of Block Swap Selection Flow (For Products with 2 Mbytes of Code Flash Memory)

50.12 Security Function

The flash sequencer supports the following security functions:

- Security flag for startup area
- Permanent block protect setting
- Flash memory protection for TrustZone

50.12.1 Security Flag for Startup Area Select

The security flag (SAS.FSPR) for the startup area is located in the option-setting memory.

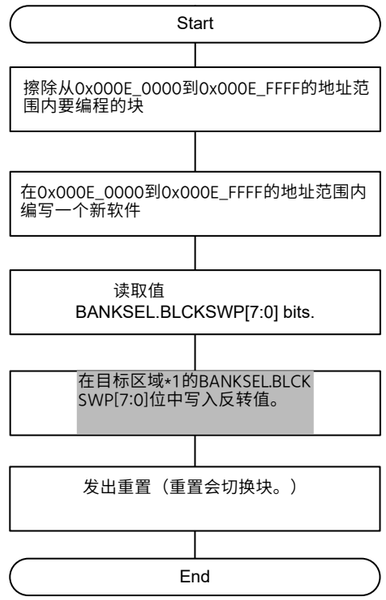
When the SAS.FSPR bit is 0, issuing the configuration set command to change the SAS.BTFLG bit causes the flash sequencer to be in the command-locked state. Also, when the SAS.FSPR bit is 0, it is invalid to write to the Startup Area Select bits SAS[1:0] in the FSUACR register. The SAS.FSPR bit enables protection.

50.12.2 Permanent Block Protect Setting

The permanent block protect setting is the clear protection for the block protection setting. User area cannot be permanently updated by the FACI command when the permanent block protect setting is enabled. See section 50.11.1.3. Protection by Block Protect Setting for more details.

The block protect setting and the permanent block protect setting have the write/clear protection against the configuration set command. The flash sequencer does not detect an error when the configuration set command is issued to the write/clear protected settings.

Figure 50.34 and Table 50.28 show the write/clear protection against the block protect setting (BPS[n]) and the permanent protect setting (PBPS[n]). Figure 50.35 and Table 50.29 show the write/clear protection against the block protect setting for secure (BPS_SEC[n]) and permanent protect setting for secure (PBPS_SEC[n]).



注1.目标区域与BANKSEL.BLCKSWP[7:0]位的对应关系见表6.2。

Figure 50.33 块交换选择流程示例（适用于具有2MB代码闪存的产品）

50.12 安全功能

闪存定序器支持以下安全功能：

●启动区安全标志

●永久封锁保护设置

●TrustZone的闪存保护

50.12.1 启动区域选择的安全标志

启动区域的安全标志(SAS.FSPR)位于选项设置内存中。

当SAS.FSPR位为0时，发出配置设置命令来更改SAS.BTFLG位会导致闪存定序器处于命令锁定状态。此外，当SAS.FSPR位为0时，写入FSUACR寄存器中的启动区域选择位SAS[1:0]无效。SAS.FSPR位启用保护。

50.12.2 永久块保护设置

永久块保护设置是对块保护设置的明确保护。启用永久块保护设置后，FACI命令无法永久更新用户区域。请参阅第50.11.1.3节。通过块保护设置进行保护以获取更多详细信息。

块保护设置和永久块保护设置具有针对配置集命令的写清除保护。向写清除保护设置发出配置设置命令时，闪存定序器不会检测到错误。

图50.34和表50.28显示了针对块保护设置(BPS[n])和永久保护设置(PBPS[n])的写清除保护。图50.35和表50.29显示了针对安全的块保护设置(BPS_SEC[n])和安全的永久保护设置(PBPS_SEC[n])的写清除保护。

Effective permanent block protect setting (PBPS or PBPS_SEC) depends on block protect select (BPS_SEL). For details of permanent block protect setting (PBPS or PBPS_SEC) and block protect select (BPS_SEL), see section 6, Option-Setting Memory.

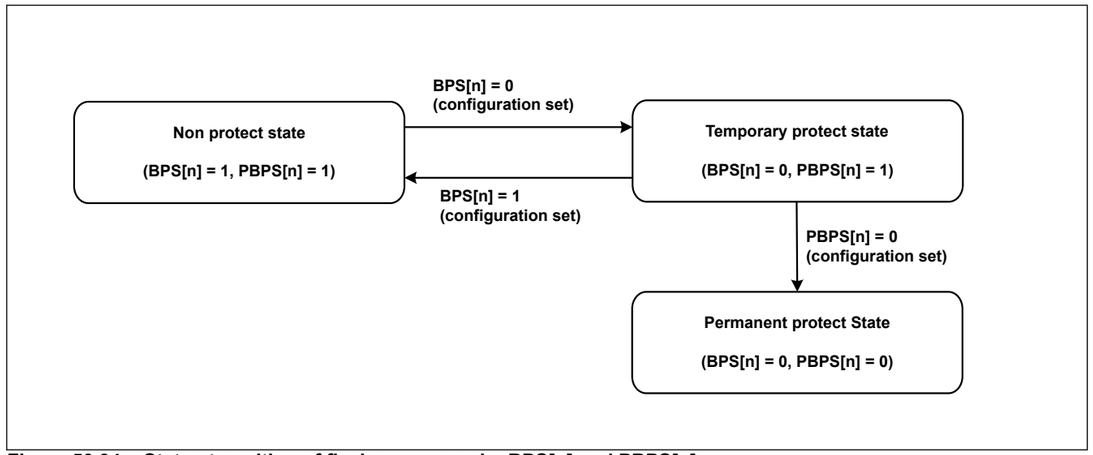


Figure 50.34 Status transition of flash sequencer by BPS[n] and PBPS[n]

Table 50.28 Write/clear protection of BPS[n] and PBPS[n]

Current state		Updatable state by configuration set command			
BPS[n]	PBPS[n]	BPS[n] = 1	BPS[n] = 0	PBPS[n] = 1	PBPS[n] = 0
1	1	✓	✓	✓	X
1	0	—	—	—	—
0	1	✓	✓	✓	✓
0	0	X	✓	X	✓

Note:
- ✓ indicates updatable by configuration set command.
- X indicates not updatable by configuration set command (error does not occur).
- — indicates not reaching to this state.

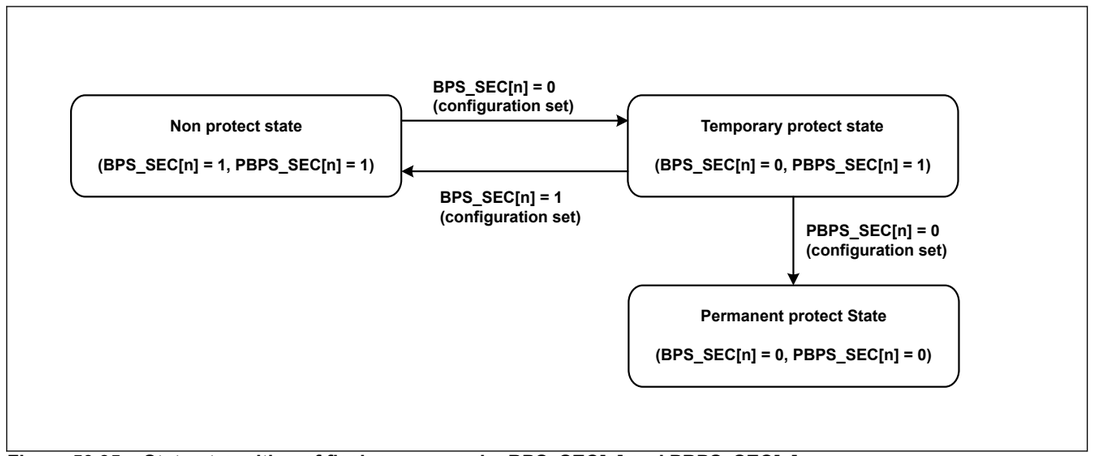

Figure 50.35 Status transition of flash sequencer by BPS_SEC[n] and PBPS_SEC[n]

有效的永久块保护设置（PBPS或PBPS_SEC）取决于块保护选择（BPS_SEL）。有关永久块保护设置（PBPS或PBPS_SEC）和块保护选择（BPS_SEL）的详细信息，请参见第6节，选项设置存储器。

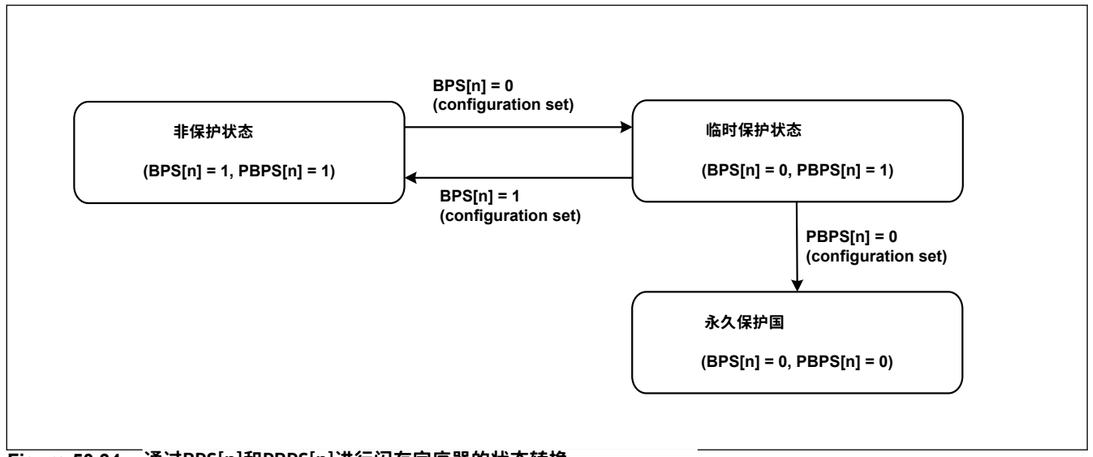

Figure 50.34 通过BPS[n]和PBPS[n]进行闪存定序器的状态转换

Table 50.28 BPS[n]和PBPS[n]的写清除保护

当前状态		可通过配置设置命令更新状态

50.12.3 Flash Memory Protection for TrustZone

Information in this section focuses on the flash sequencer operation.

The flash memory provides the following types of protect function against non-secure access:

- Protection for flash memory area (P/E)
- Protection for flash memory area (read)
- Protection for registers
- Protection during FACI command operation
- Code flash P/E mode entry protection

50.12.3.1 Protection for Flash Memory Area (P/E)

This function protects the secure region of the code flash and data flash from FACI commands of non-secure access. The condition of protection depends on the FACI command, the access attribution, and the memory boundary setting.

For details of secure region, see section 52, Security Features .

See Table 50.30 for information on protection of the flash memory area (P/E).

Table 50.30 Protection for the flash memory area (P/E)

FACI command	Target area		Issuing of FACI command by non-secure access	Issuing of FACI command by secure access
Program Block erase	Code flash memory	User area (non-secure area)	✓	✓
		User area (secure area)	X	✓
	Data flash memory	Data area (non-secure area)	✓	✓
		Data area (secure area)	X	✓
Multi block erase Blank check	Data flash memory	Data area (non-secure area)	✓	✓
		Data area (secure area)	X	✓
Configuration set	Code flash memory	option-setting memory (non-secure area)	✓	✓
		option-setting memory (secure area)	X	✓

Note:
- ✓ indicates FACI command operation is not prohibited.
- X indicates FACI command operation is prohibited. Error occurs when the area is selected, and the FACI command is executed.

When the target area of FACI command is the user area of code flash, the flash sequencer compares the FSADDR register setting with the memory boundary setting of the code flash and determines whether the target area is in the secure region.

In linear mode, the memory boundary can be set to 0x0000_0000 to 0x00FF_8000 in 32 KB unit.

In dual mode, the memory boundary can be set to 0x0000_0000 to 0x0020_0000 in 32 KB unit. When the memory boundary is set to 0x0020_0000 or greater in the dual mode, the entire user area is defined as the secure region.

Figure 50.36 shows details of the non-secure/secure attribute of user area in the code flash.

Table 50.29 BPS_SEC[n]和PBPS_SEC[n]的写清除保护

当前状态		可通过配置设置命令更新状态			
BPS_SEC[n]	PBPS_SEC[n]	BPS_SEC[n] = 1	BPS_SEC[n] = 0	PBPS_SEC[n] = 1	PBPS_SEC[n] = 0
1	1	✓	✓	✓	X
1	0	—	—	—	—
0	1	✓	✓	✓	✓
0	0	X	✓	X	✓

Note:
- 表示可通过配置设置命令更新。
- X表示不能通过配置设置命令更新（不发生错误）。
- —表示未达到此状态。

50.12.3 TrustZone的闪存保护

本节中的信息侧重于闪存定序器的操作。

闪存提供以下类型的保护功能以防止非安全访问：

- ●保护闪存区（PE）
- ●保护闪存区域（读取）
- ●寄存器保护
- ●FACI命令操作期间的保护
- ●CodeflashPE模式进入保护

50.12.3.1 对闪存区域(PE)的保护

此功能保护代码闪存和数据闪存的安全区域免受非安全访问的FACI命令的影响。保护条件取决于FACI命令、访问属性和内存边界设置。

有关安全区域的详细信息，请参阅第52节，安全功能。

有关保护闪存区域(PE)的信息，请参见表50.30。

Table 50.30 对闪存区域(PE)的保护

FACI命令	目标区域		通过非安全访问发出FACI命令	通过安全访问发出FACI命令
Program 块擦除	代码闪存	用户区（非安全区）	✓	✓
		用户区（安全区）	X	✓
	数据闪存	数据区（非安全区）	✓	✓
		数据区（安全区）	X	✓
多块擦除 空白支票	数据闪存	数据区（非安全区）	✓	✓
		数据区（安全区）	X	✓
配置集	代码闪存	option-setting memory (non-secure area)	✓	✓
		option-setting memory (secure area)	X	✓

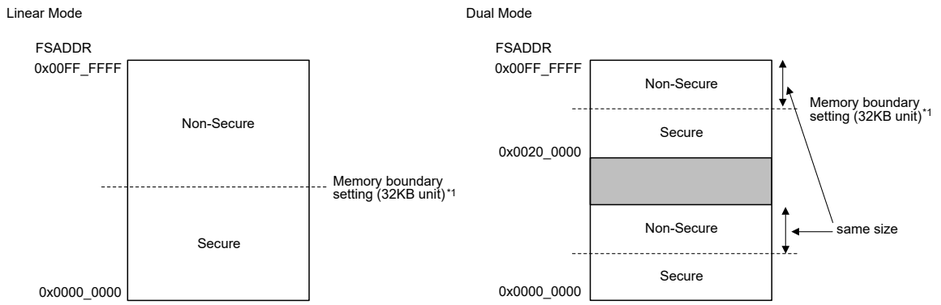
Note:
- 表示不禁止FACI命令操作。
- X表示禁止FACI命令操作。选择区域时发生错误，执行FACI命令。

当FACI命令的目标区域是代码闪存的用户区域时，闪存定序器将FSADDR寄存器设置与代码闪存的内存边界设置进行比较，并确定目标区域是否在安全区域中。

在线性模式下，内存边界可以以32KB为单位设置为0x0000_0000到0x00FF_8000。

在双模式下，内存边界可以以32KB为单位设置为0x0000_0000到0x0020_0000。当内存边界在双模式下设置为0x0020_0000或更大时，整个用户区域被定义为安全区域。

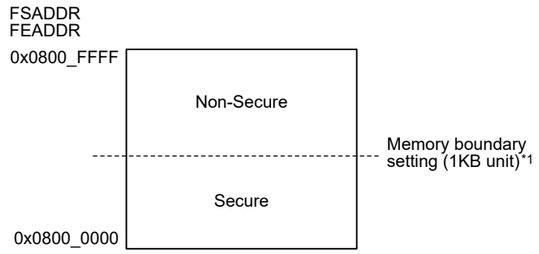
图50.36显示了代码flash中用户区的非安全安全属性的详细信息。



Note 1. Comparing FSADDR with memory boundary setting of user area and judges whether the target area is in secure area.

Figure 50.36 Secure/non-secure region in user area

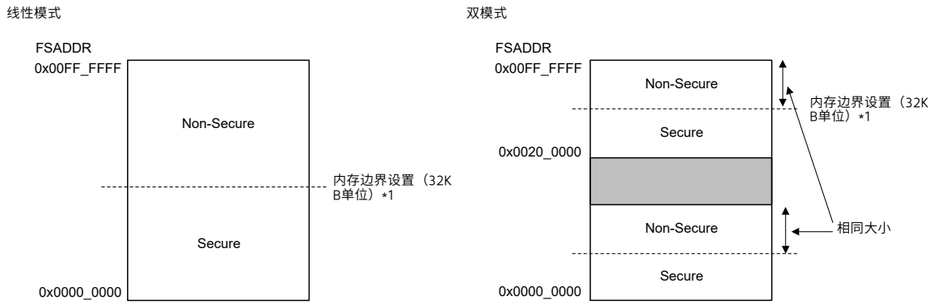
When the target area of the issuing FACI command is the data area of data flash, the flash sequencer compares the FSADDR/FEADDR register setting with the memory boundary setting of the data flash and determines whether the target area is in secure region. The memory boundary can be set to 0x0800_0000 to 0x0800_FC00 in 1 KB unit. Figure 50.37 shows details of the non-secure/secure attribute of data area in the data flash.



Note 1. Comparing FSADDR/FEADDR with memory boundary setting of data area and judges whether the target area is in secure area.

Figure 50.37 Secure/non-secure region in data area

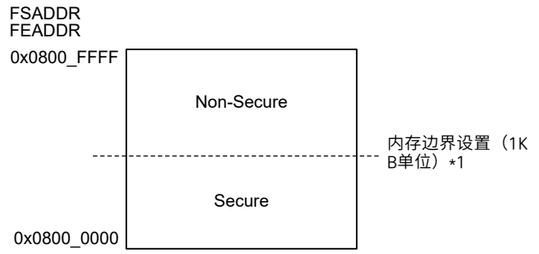
See Figure 50.38 in the details of non-secure/secure region of option-setting memory. The flash sequencer judges that target area is secure region from the FSADDR register setting.



注1.将FSADDR与用户区的内存边界设置进行比较，判断目标区是否在安全区。

Figure 50.36 用户区域中的安全非安全区域

当发出FACI命令的目标区域是数据flash的数据区域时，flashsequencer比较FSADDRFEADDR寄存器设置与数据闪存的内存边界设置并确定目标区域是否在安全区域中。内存边界可以以1KB为单位设置为0x0800_0000到0x0800_FC00。图50.37显示了数据闪存中数据区域的非安全安全属性的详细信息。



注1.将FSADDRFEADDR与数据区域的内存边界设置进行比较，判断目标区域是否在安全区域。

Figure 50.37 数据区域中的安全非安全区域

有关选项设置内存的非安全安全区域的详细信息，请参见图50.38。闪存定序器根据FSADDR寄存器设置判断目标区域是安全区域。

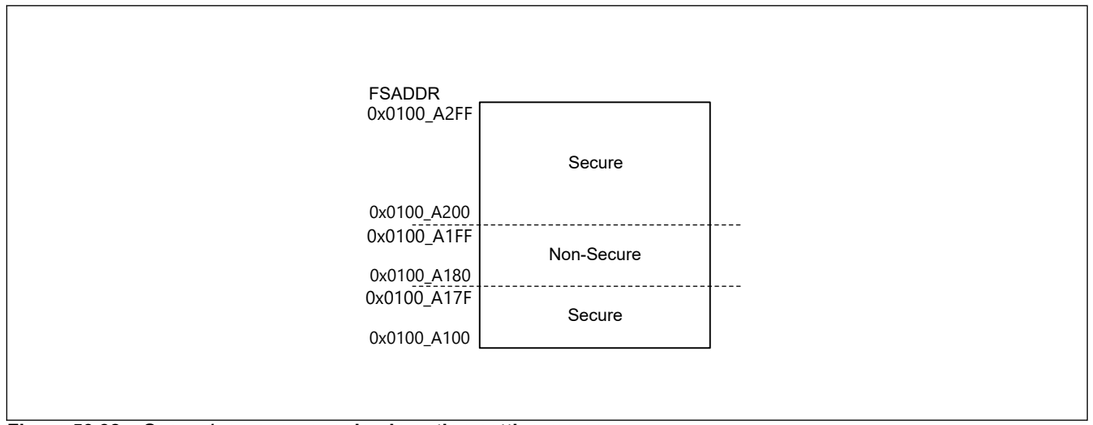


Figure 50.38 Secure/non-secure region in option-setting memory

50.12.3.2 Protection for Flash Memory Area (Read)

This function protects the secure region of code flash and data flash from non-secure bus access.

For details of secure region, see section 52, Security Features .

50.12.3.3 Protection for Register

The flash sequencer registers have write-access protection against non-secure access. Table 50.31 shows details of the protected registers of the flash sequencer.

Table 50.31 Protected registers of the flash sequencer for TrustZone

Protection target register	Security attribute setting	Notes
FCKMHZ	Security attribution register setting (FSAR.FCKMHZSA)	See section 50.4.4. FSAR : Flash Security Attribution Register
FMEPROT	Always secure	See section 50.4.14. FMEPROT : Flash P/E Mode Entry Protection Register
FBPROT1	Always secure	See section 50.4.16. FBPROT1 : Flash Block Protection for Secure Register
FSUACR	Always secure	See section 50.4.27. FSUACR : Flash Startup Area Control Register
FACI command-issuing area and all registers of FACI (Base address is FACI) and FWEPROR register	During FACI command processing by secure access	See section 50.12.3.4. Protection during FACI Command Operation

50.12.3.4 Protection during FACI Command Operation

This function protects read/write access to the FACI command-issuing area, including all registers of FACI (Base address is FACI) and FWEPROR register by the non-secure access during the FACI command processing of the secure access. The protect condition includes the suspending period of the program, block erase, or multi block erase command by the P/E suspend command of the secure access. See Figure 50.39 and Table 50.32 for details of the protection during the FACI command operation.

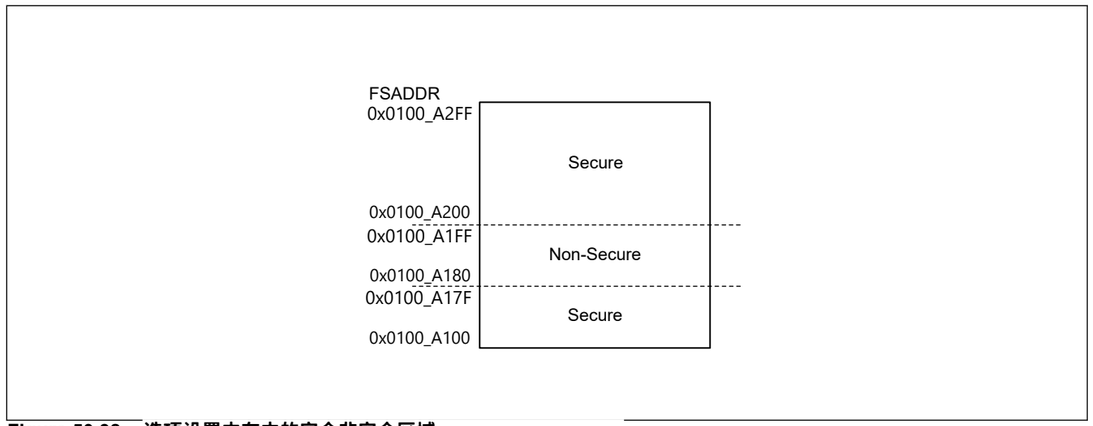

Figure 50.38 选项设置内存中的安全非安全区域

50.12.3.2 保护闪存区域（读取）

该功能保护代码闪存和数据闪存的安全区域免受非安全总线访问。

有关安全区域的详细信息，请参阅第52节，安全功能。

50.12.3.3 注册保护

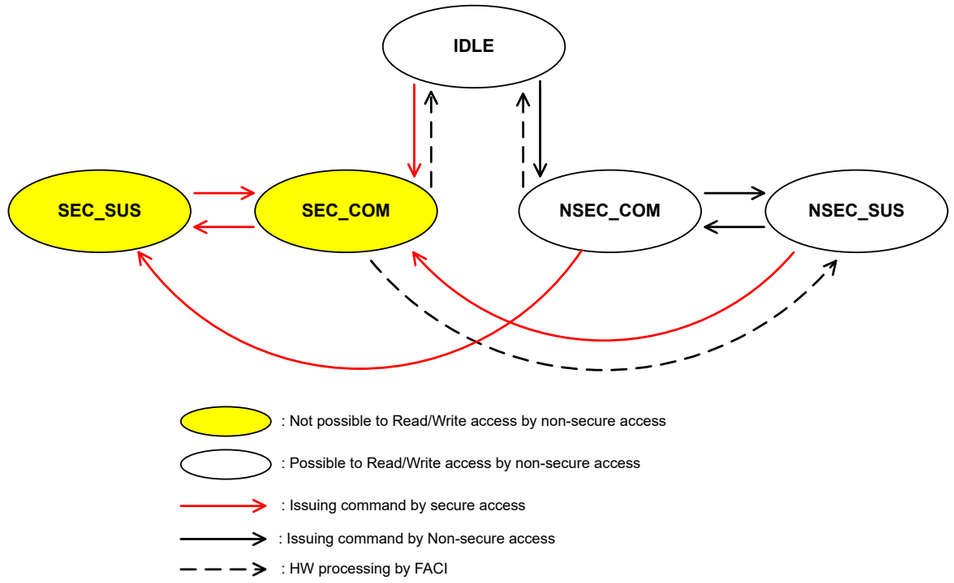
闪存定序器寄存器具有针对非安全访问的写访问保护。表50.31显示了闪存序列器的受保护寄存器的详细信息。

Table 50.31 TrustZone的闪存定序器的受保护寄存器

保护对象寄存器	安全属性设置	Notes
FCKMHZ	安全属性寄存器设置(FSAR.FCKMHZSA)	请参阅第50.4.4节。FSAR：闪存安全归属登记
FMEPROT	始终安全	请参阅第50.4.14节。FMEPROT:闪存PE模式进入保护寄存器
FBPROT1	始终安全	请参阅第50.4.16节。FBPROT1：闪存安全寄存器的块保护
FSUACR	始终安全	请参阅第50.4.27节。FSUACR:闪光启动区控制寄存器
FACI命令发布区和FACI的所有寄存器（基地址为FACI）和FWEPROR寄存器	通过安全访问处理FACI命令期间	请参阅第50.12.3.4节。保护期间FACI命令操作

50.12.3.4 FACI指挥行动期间的保护

此功能保护对FACI命令发布区域的读写访问，包括FACI的所有寄存器（基地址为FACI)和FWEPROR在安全访问的FACI命令处理期间由非安全访问注册。保护条件包括程序的暂停周期、块擦除或由安全访问的PE暂停命令执行的多块擦除命令。FACI命令操作期间的保护细节见图50.39和表50.32。



Note: IDLE: State of not executing FACI command
SEC_COM: State of executing FACI command by secure access
SEC_SUS: State of "P/E Suspend" by secure access
NSEC_COM: State of executing FACI command by non-secure access
NSEC_SUS: State of P/E Suspend by non-secure access

Figure 50.39 State of protection during FACI command operation

Note: IDLE：未执行FACI命令的状态
SEC_COM：通过安全访问执行FACI命令的状态
SEC_SUS：安全访问的"PESuspend"状态
NSEC_COM：非安全访问执行FACI命令的状态
NSEC_SUS：PE状态被非安全访问暂停

Figure 50.39 FACI指挥运行期间的保护状态

Table 50.32 FACI命令操作期间的保护(1of2)

	闪存定序器未运行	检查或配置设置命令		命令锁定状态		强制停止指令处理		暂停编程、块擦除或多块擦除命令		块擦除或多块擦除命令由安全访问暂停时的程序命令处理		块擦除或多块擦除命令由non-secure access暂停时的程序命令处理		暂停编程、块擦除或多块擦除命令通过安全访问PE恢复命令处理while		暂停编程、块擦除或多块擦除命令通过非安全访问PE恢复命令处理while	
FACI命令属性	—	S	NS	S	NS	S	NS	S	NS	S	NS *1	S	NS	S	NS *1	S	NS
FRDY bit	1	0	0	1	1	0	0	1	1	0	0	0	0	1	1	0	0
PRGSPD或ERSSPD位	0	0	0	0	0	0	0	1	1	1	1	1	1	0	0	0	0
CMDLK bit	0	0	0	1	1	1/0	1/0	1/0	1/0	0	0	0	0	0	0	0	0

Table 50.32 Protection during FACI command operation (2 of 2)

	Flash sequencer is not operating		Program, Block erase, Multi block erase, Blank check, or Configuration set command processing		Command lock state		Forced stop command processing		While suspend Program, Block erase, or Multi block erase command		Program command processing while suspend Block erase or Multi block erase command by secure access		Program command processing while suspend Block erase or Multi block erase command by non-secure access		P/E resume command processing while suspend Program, Block erase, or Multi block erase command by secure access		P/E Resume command processing while suspend Program, Block erase, or Multi block erase command by non-secure access	
Non-secure access	✓	X	✓	✓	✓	X	✓	X	✓	X	✓	X	✓	X	✓	X	✓	X	✓

Note:
- S indicates the FACI command by the secure access.
- NS indicates the FACI command by the non-secure access.
- ✓ indicates read/write access is possible by the non-secure access.
- X indicates read/write access is not possible by the non-secure access. Write data is ignored and read data is always 0.

Note 1. The FACI command issued by the non-secure access is not allowed.

Code flash programming/erasure can be protected by the FMEPROT register of secure function. Therefore, it does not assume that secure function issues P/E suspend command during code flash programming/erasure of non-secure function. Data flash programming/erasure of non-secure can be suspended by secure function. If secure function issues P/E suspend command during data flash programming/erasure of non-secure function, secure function should issue P/E resume command. When secure function issues P/E resume command, secure function should notify non-secure function that data flash programming/erasure is complete and return to non-secure function. See Figure 50.40 and Figure 50.41 in example of issuing P/E suspend of secure function during programming/erasure of non-secure function.

Table 50.32 FACI命令操作期间的保护(2of2)

	闪存定序器未运行		编程、块擦除、多块擦除、空白检查或配置设置命令 processing		命令锁定状态		强制停止指令处理		暂停编程、块擦除或多块擦除命令		块擦除或多块擦除命令由暂停时的程序命令处理安全访问		块擦除或多块擦除命令由暂停时的程序命令处理 non-secure access		暂停编程、块擦除或多块PE恢复命令处理while通过安全访问擦除命令		暂停编程、块擦除或多块PE恢复命令处理while通过非安全访问擦除命令	
Non-secure access	✓	X	✓	✓	✓	X	✓	X	✓	X	✓	X	✓	X	✓	X	✓	X	✓

Note:
- S表示通过安全访问的FACI命令。
- NS通过非安全访问指示FACI命令。
- 表示非安全访问可以进行读写访问。
- X表示非安全访问无法进行读写访问。写入数据被忽略，读取数据始终为0。

注1.非安全访问发出的FACI命令是不允许的。

代码闪存编程擦除可以通过安全功能的FMEPROT寄存器进行保护。因此，不假设安全功能在非安全功能的代码闪存编程擦除期间发出PE挂起命令。

非安全的数据闪存编程擦除可以通过安全功能暂停。如果在非安全功能的数据闪存编程擦除期间安全功能发出PE暂停命令，安全功能应发出PE恢复命令。当安全功能发出PEresume命令时，安全功能应通知非安全功能数据闪存编程擦除完成并返回到非安全功能。在非安全功能的编程擦除期间发出PE安全功能挂起的示例参见图50.40和图50.41。

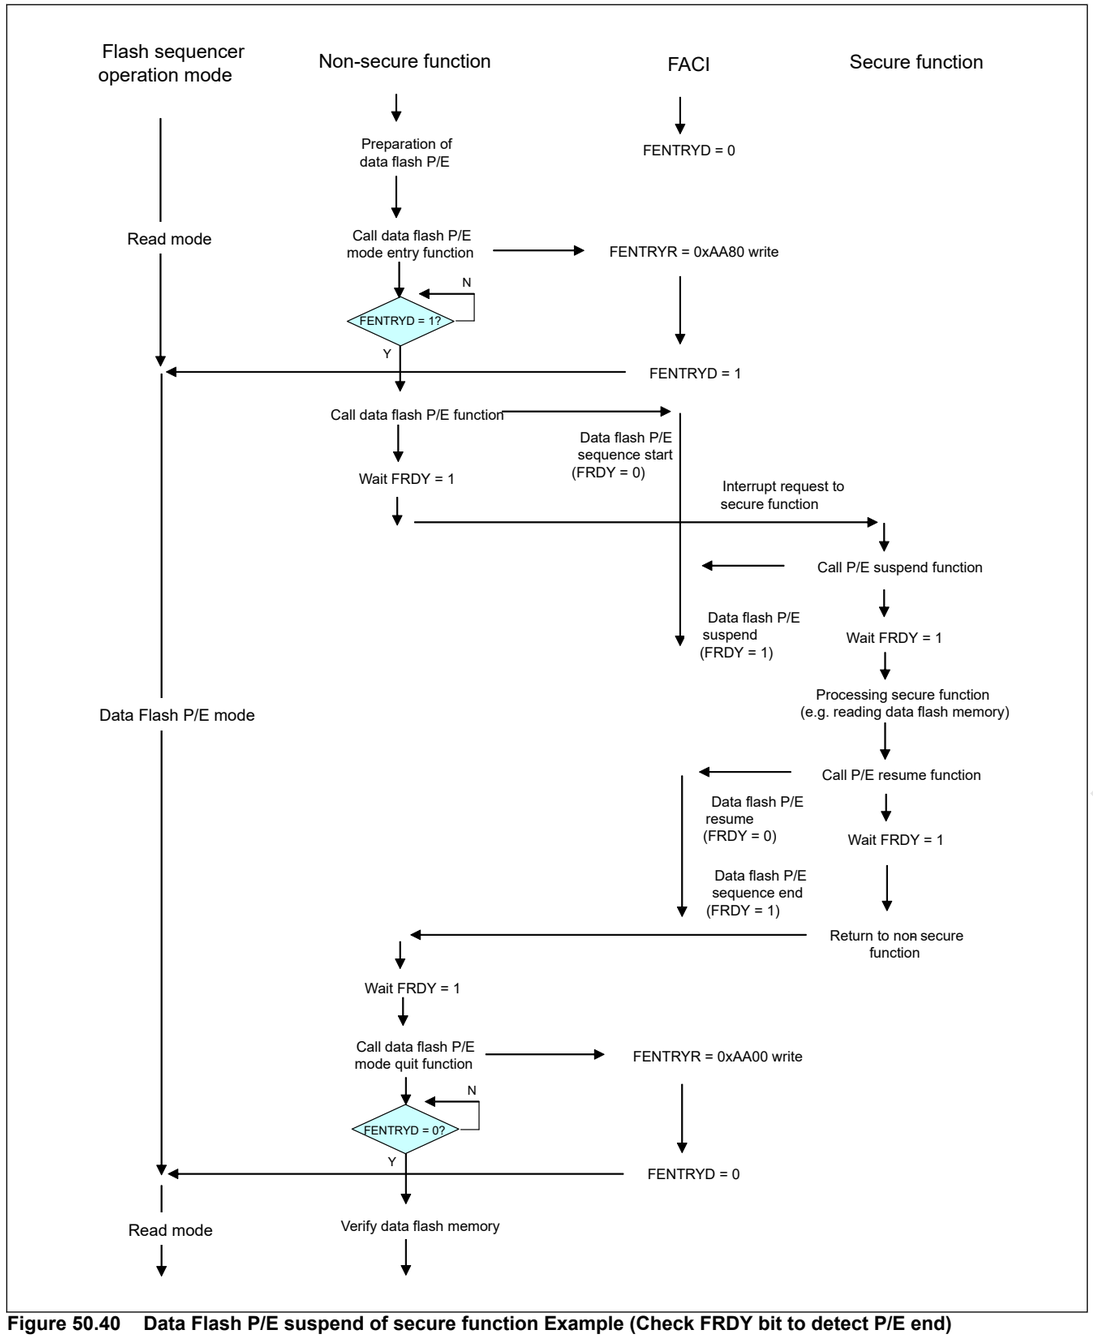

Figure 50.40 Data Flash P/E suspend of secure function Example (Check FRDY bit to detect P/E end)

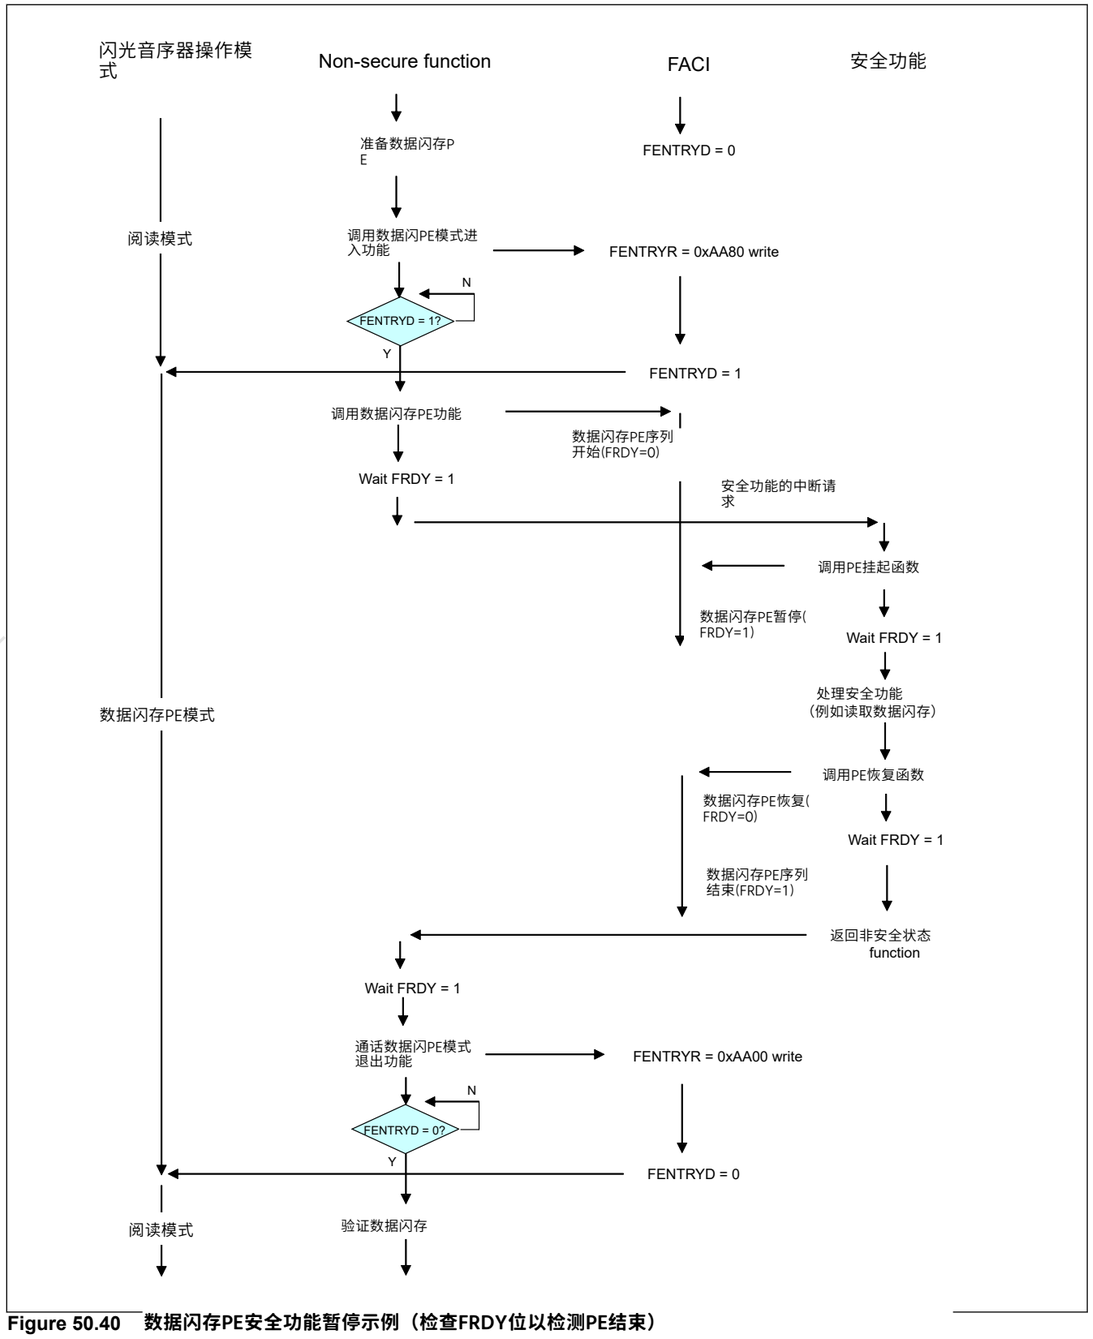

Figure 50.40 数据闪存PE安全功能暂停示例（检查FRDY位以检测PE结束）

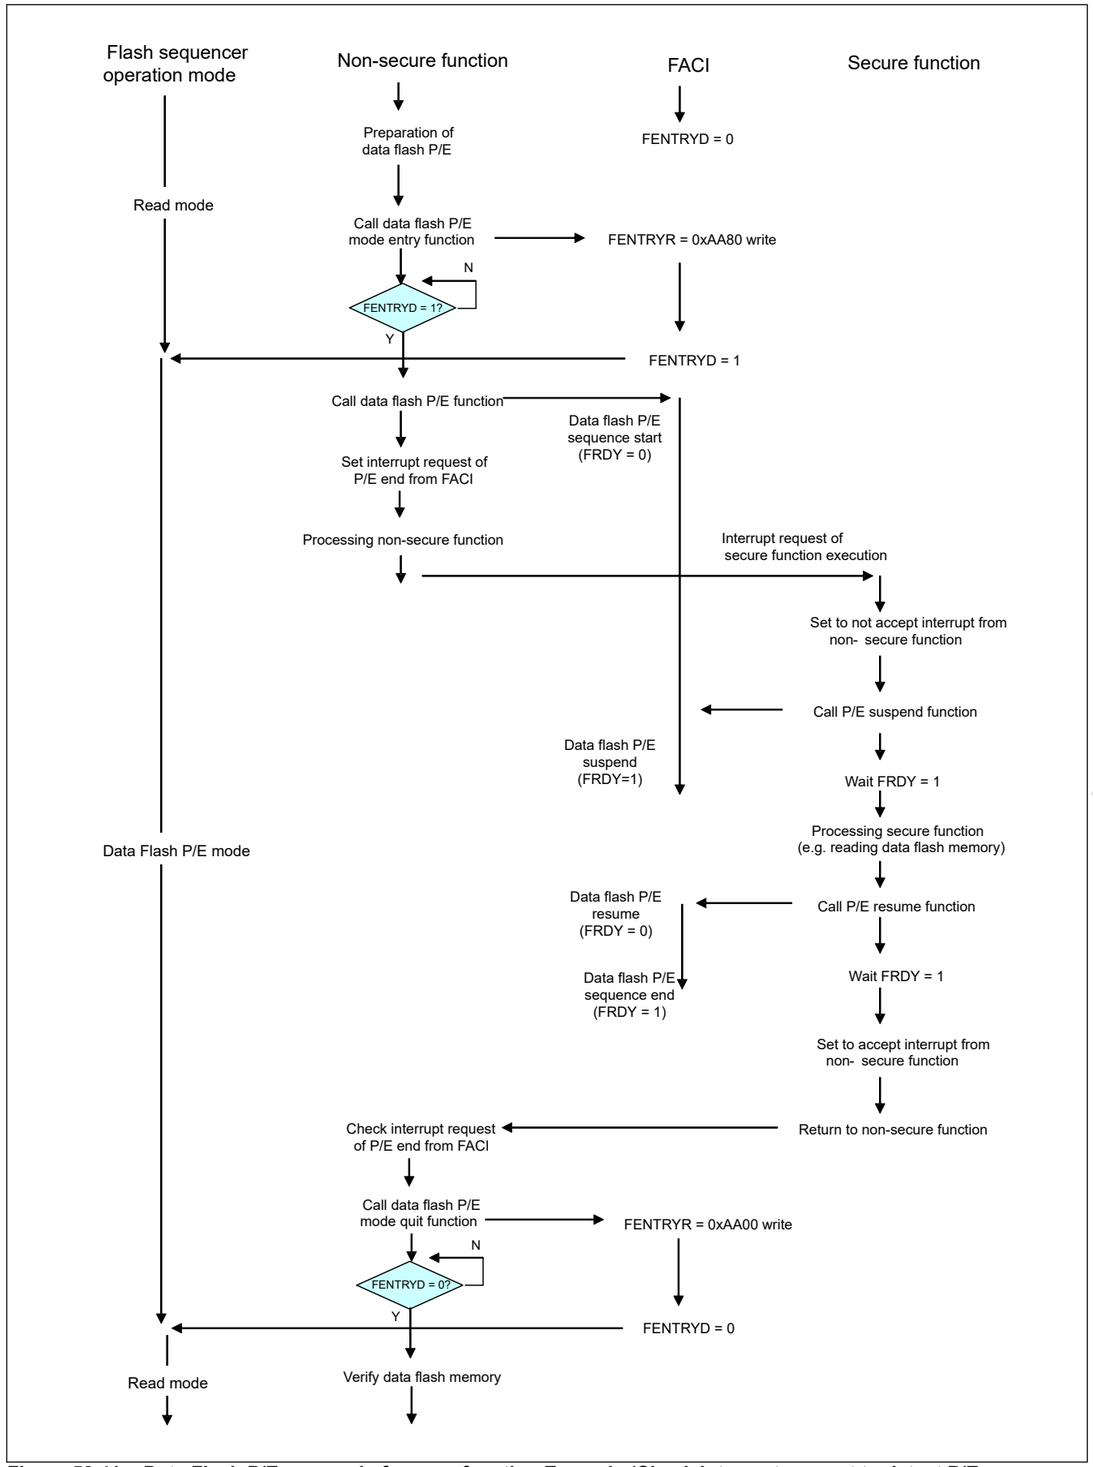

Figure 50.41 Data Flash P/E suspend of secure function Example (Check interrupt request to detect P/E end)

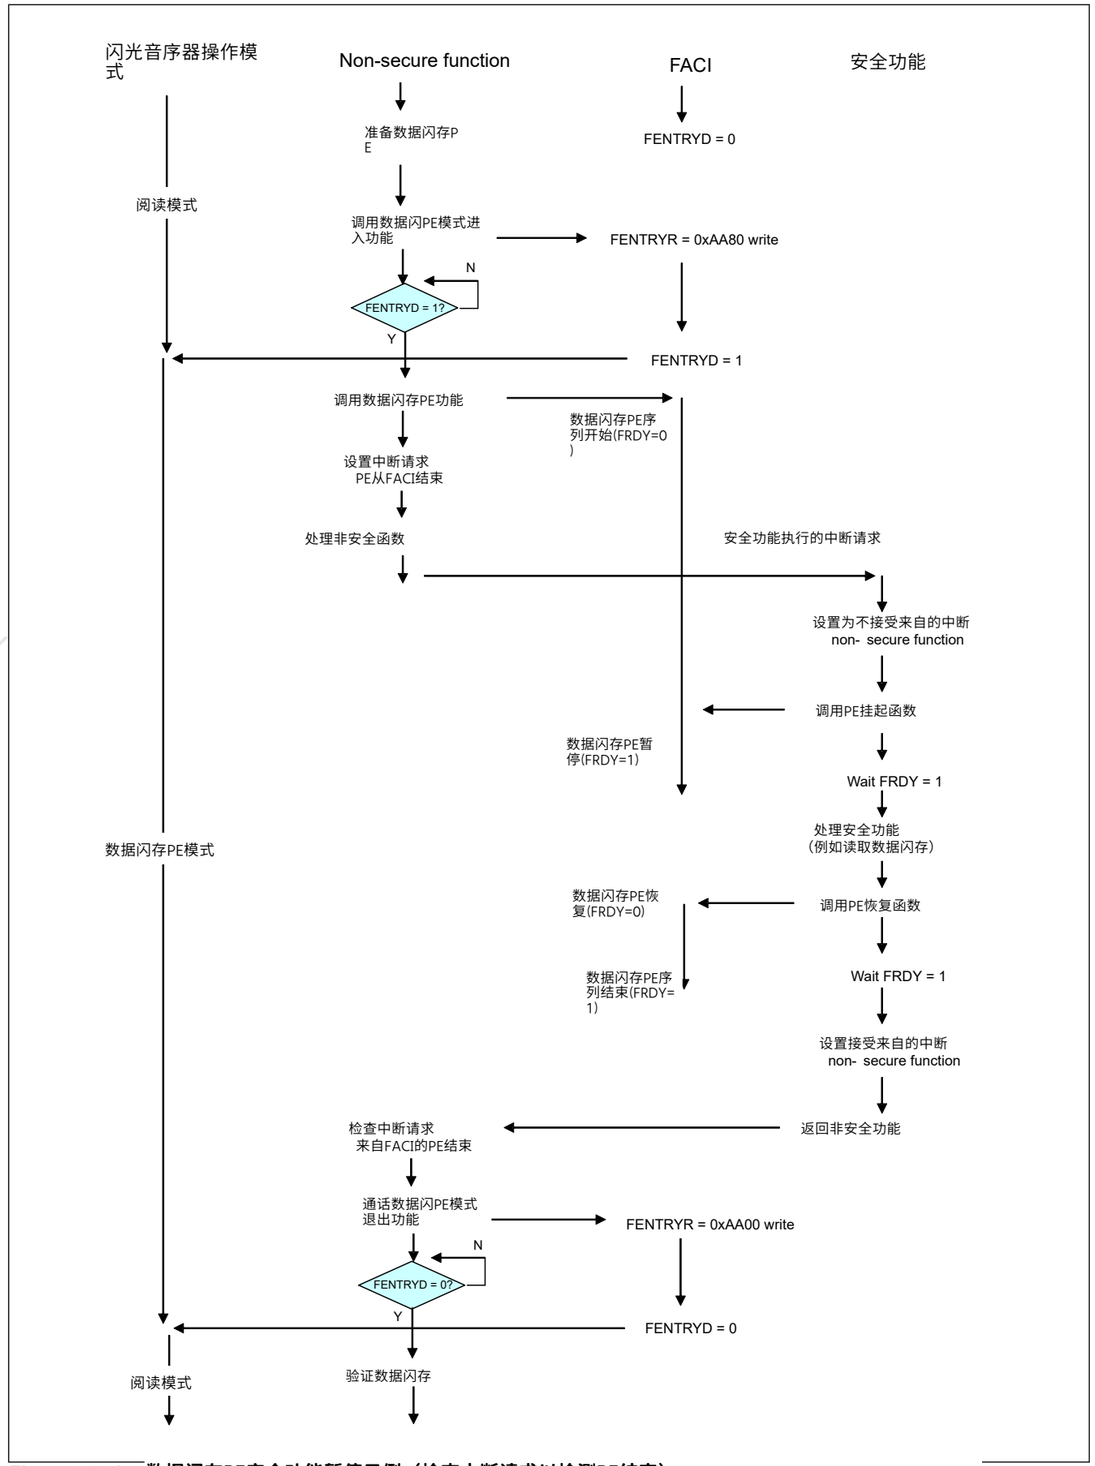

Figure 50.41 数据闪存PE安全功能暂停示例（检查中断请求以检测PE结束）

50.12.3.5 Code Flash P/E Mode Entry Protection

The flash sequencer has protection function of code flash P/E by the FMEPROT register for the secure developer. Secure function can prevent disturbance of reading code flash memory by this protection function. See section 50.4.14. FMEPROT : Flash P/E Mode Entry Protection Register.

For applications that do not require non-secure region programming/erasure other than from secure function, it is recommended to always disable non-secure function of code flash programming/erasure by enabling the protection function of FMEPROT register.

See Figure 50.42 in details of the code flash P/E sequence example by non-secure function.

50.12.3.5 CodeFlashPE模式进入保护

闪存定序器通过FMEPROT寄存器为安全开发人员提供代码闪存PE的保护功能。安全功能可以通过此保护功能防止读取代码闪存的干扰。请参阅第50.4.14节。FMEPROT：FlashPE模式进入保护寄存器。

对于除安全功能外不需要非安全区域编程擦除的应用，建议始终通过启用FMEPROT寄存器的保护功能来禁用代码闪存编程擦除的非安全功能。

有关非安全功能的代码闪存PE序列示例的详细信息，请参见图50.42。

RA生态工作室

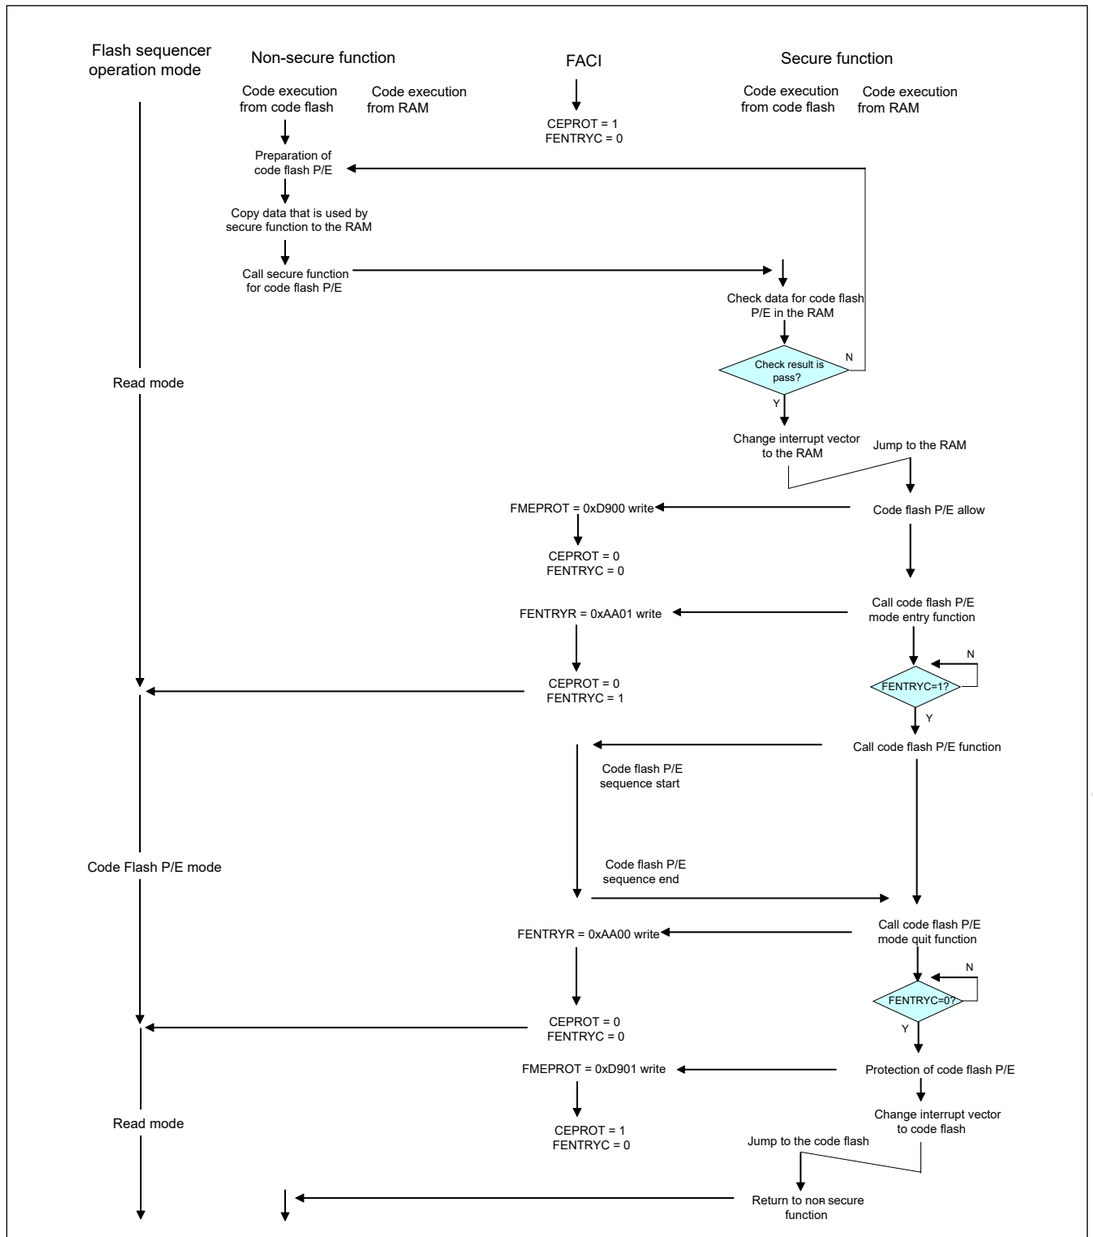

Figure 50.42 Code Flash P/E Sequence Example by non-secure function (Using secure function for code flash P/E)

50.13 Boot Mode

There are two serial programming modes; the boot mode (for the SCI interface) with SCI9 and the boot mode (for the USB interface) with USBFS. Table 50.33 lists the I/O pins used in boot mode. Table 50.34 lists the available communication interface used in the boot mode.

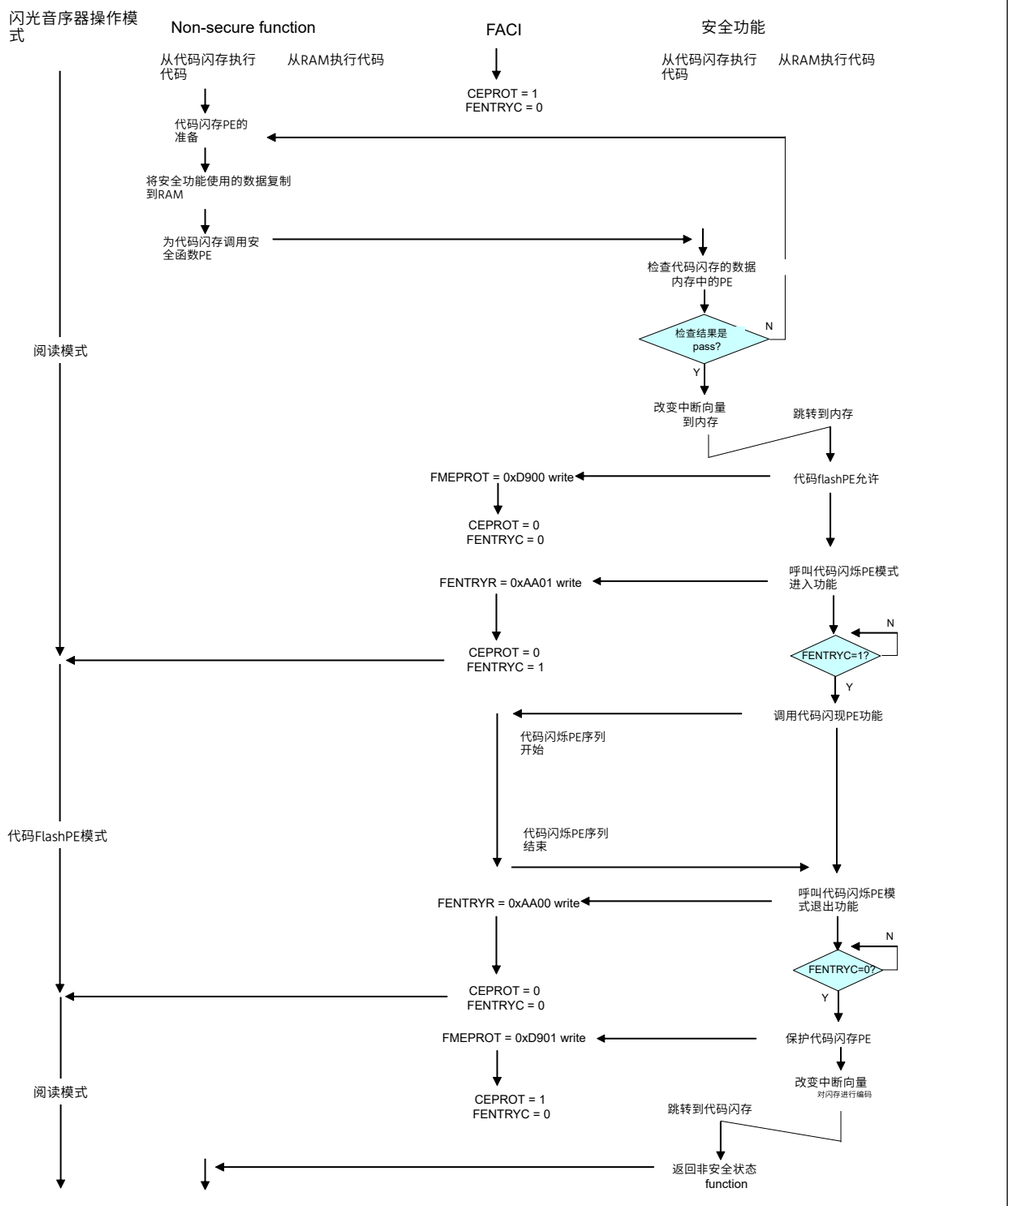

Figure 50.42 CodeFlashPESequenceExamplebynon−securefunction(Usingsecurefunctionforcodeflash PE)

50.13 引导模式

有两种串行编程模式；SCI9的引导模式（SCI接口）和USBFS的引导模式（USB接口）。表50.33列出了引导模式中使用的IO引脚。表50.34列出了启动模式中使用的可用通信接口。

Table 50.33 I/O Pins Used in Boot Mode

Pin Name	I/O	Mode to be Used	Use
MD	Input	Boot mode (for the SCI interface) Boot mode (for the USB interface)	Selection of operating mode
P110/RXD9	Input	Boot mode (for the SCI interface)	For host communication (to receive data through SCI)
P109/TXD9	Output		For host communication (to transmit data through SCI)
USB_DP, USB_DM	I/O	Boot mode (for the USB interface)	Data input/output of USB
USB_VBUS	Input		Detection of connection and disconnection of USB cables

Table 50.34 Available Communication Interface Used in Boot Mode

Main clock oscillator or external clock is connected	Yes	No	No
Sub clockoscillator is connected*1	Yes or No	Yes	No
Available interface	SCI or USB	SCI or USB	SCI
Tool connection time*2	Up to 1 second	Up to 2 seconds	Up to 3 seconds

Note 1. The drive capability of the sub clock oscillator is set to standard by SOMCR.SODRV bit. Note that if you use the crystal corresponding the low drive capability on your board, the crystal may not oscillate in the boot mode.
Note 2. See the boot firmware manual for the detail connection time.

50.13.1 Boot Mode (for the SCI Interface)

In boot mode (for the SCI interface), the host sends control commands and data for programming, and the flash memory is programmed or erased accordingly. An on-chip SCI handles transfer between the host and this MCU in asynchronous mode. Tools for transmission of control commands and the data for programming must be prepared in the host.

When this MCU is activated in boot mode (for the SCI interface), the program on the dedicated area the MCU is executed. The boot program automatically adjusts the bit rate of the SCI and controls programming/erasure by receiving control commands from the host.

Figure 50.43 shows the system configuration for operations in boot mode (for the SCI interface).

Table 50.33 引导模式下使用的IO引脚

引脚名称	I/O	使用模式	Use
MD	Input	Boot模式（用于SCI接口）Boot模式（用于USB接口）	操作模式的选择
P110/RXD9	Input	引导模式（用于SCI接口）	用于主机通信（通过SCI接收数据）
P109/TXD9	Output		用于主机通信（通过SCI传输数据）
USB_DP, USB_DM	I/O	引导模式（用于USB接口）	USB数据输入输出
USB_VBUS	Input		检测USB电缆的连接和断开

Table 50.34 引导模式中使用的可用通信接口

连接主时钟振荡器或外部时钟	Yes	No	No
副时钟振荡器已连接 *1	是还是不是	Yes	No
可用接口	SCI或USB	SCI或USB	SCI
工具连接时间*2	最多1秒	最多2秒	最多3秒

注1.副时钟振荡器的驱动能力由SOMCR.SODRV位设置为标准。请注意，如果您使用与板上低驱动能力相对应的晶体，则晶体可能不会在引导模式下振荡。
注2.详细连接时间请参见启动固件手册。

50.13.1 引导模式（用于SCI接口）

在引导模式下（针对SCI接口），主机发送控制命令和数据进行编程，相应地对闪存进行编程或擦除。片上SCI以异步模式处理主机和该MCU之间的传输。主机中必须准备好用于传输控制命令和编程数据的工具。

当这个MCU在启动模式下被激活时（对于SCI接口），在MCU的专用区域上的程序被执行。
引导程序通过接收来自主机的控制命令自动调整SCI的比特率并控制编程擦除。

图50.43显示了引导模式下操作的系统配置（对于SCI接口）。

RA生态工作室

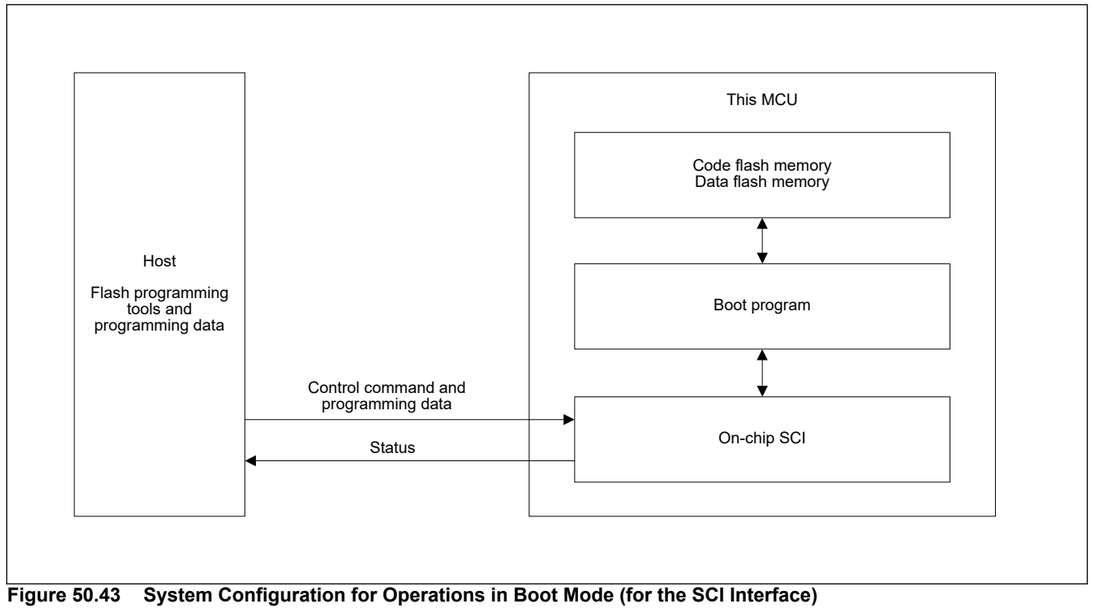

Figure 50.43 System Configuration for Operations in Boot Mode (for the SCI Interface)

50.13.2 Boot Mode (for the USB Interface)

In boot mode (with the USB interface), the flash memory can be programmed or erased by sending control commands and program data from the host. An on-chip USB is used for communications between the host and this MCU. The host requires tools for sending control commands and data for programming. Figure 50.44 shows the configuration of a system for use in boot mode (for the USB interface). The USB cable must be connected on reset release.

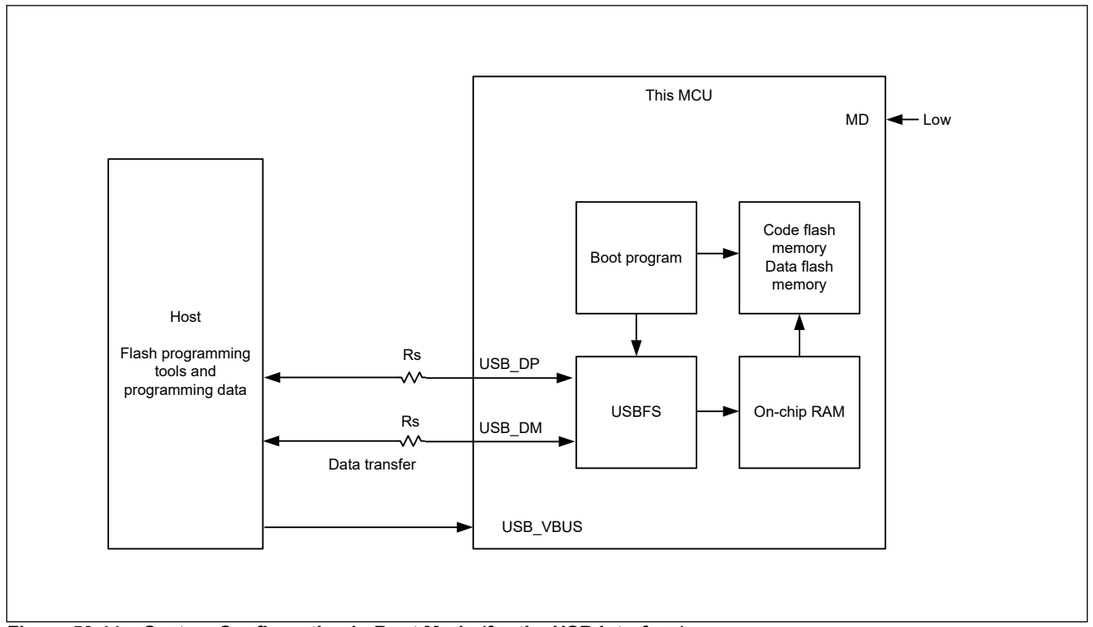

Figure 50.44 System Configuration in Boot Mode (for the USB Interface)

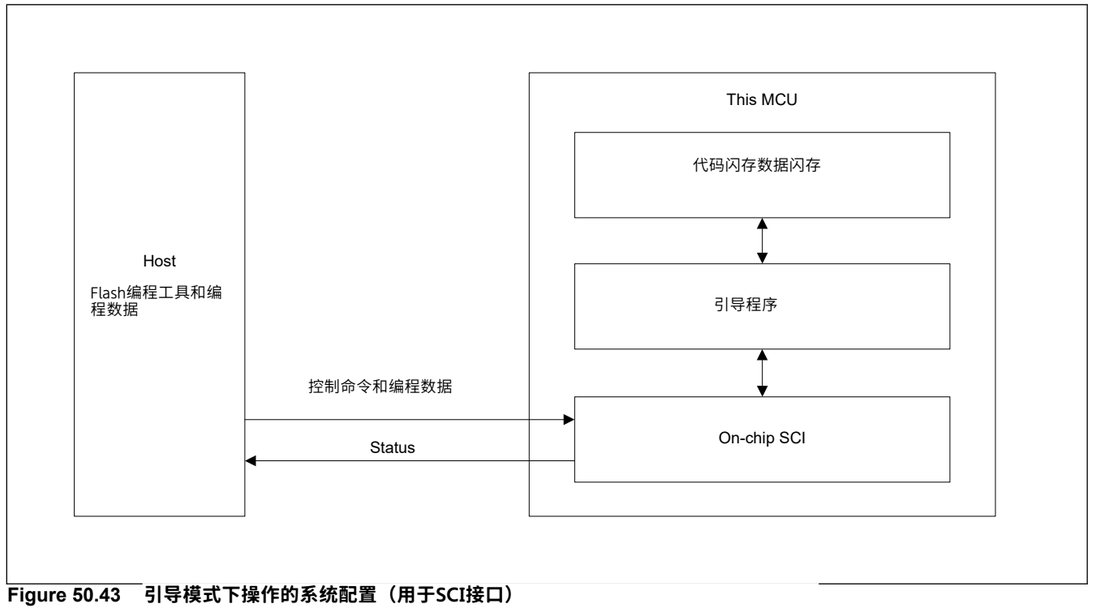

Figure 50.43 引导模式下操作的系统配置（用于SCI接口）

50.13.2 引导模式（用于USB接口）

在引导模式下（使用USB接口），可以通过从主机发送控制命令和编程数据来对闪存进行编程或擦除。片上USB用于主机和该MCU之间的通信。主机需要用于发送控制命令和编程数据的工具。图50.44显示了在引导模式下使用的系统配置（用于USB接口）。USB电缆必须在复位释放时连接。

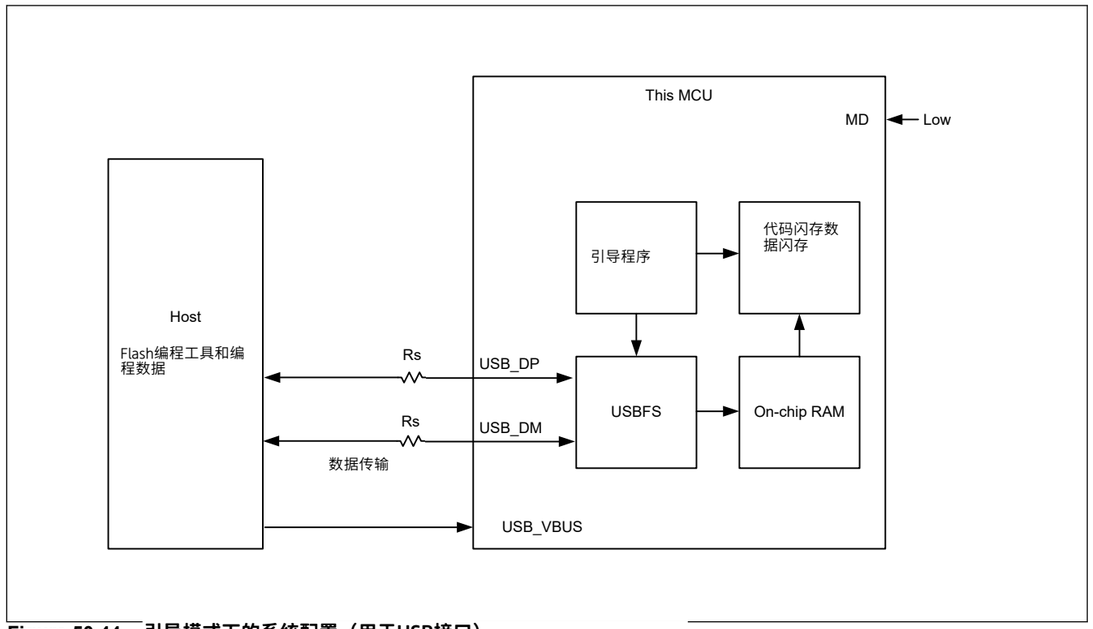

Figure 50.44 引导模式下的系统配置（用于USB接口）

50.14 Using the Serial Programmer for Rewriting

A serial programmer can be used to rewrite flash memory in boot mode.

(1) Serial Programming

This MCU is mounted on the system board at the time of serial programming. Providing a connector to the board enables rewriting of this MCU by the serial programmer to proceed.

50.14.1 Environments for Serial Programming

The recommended environments for rewriting the flash memory of the MCU with data are described below.

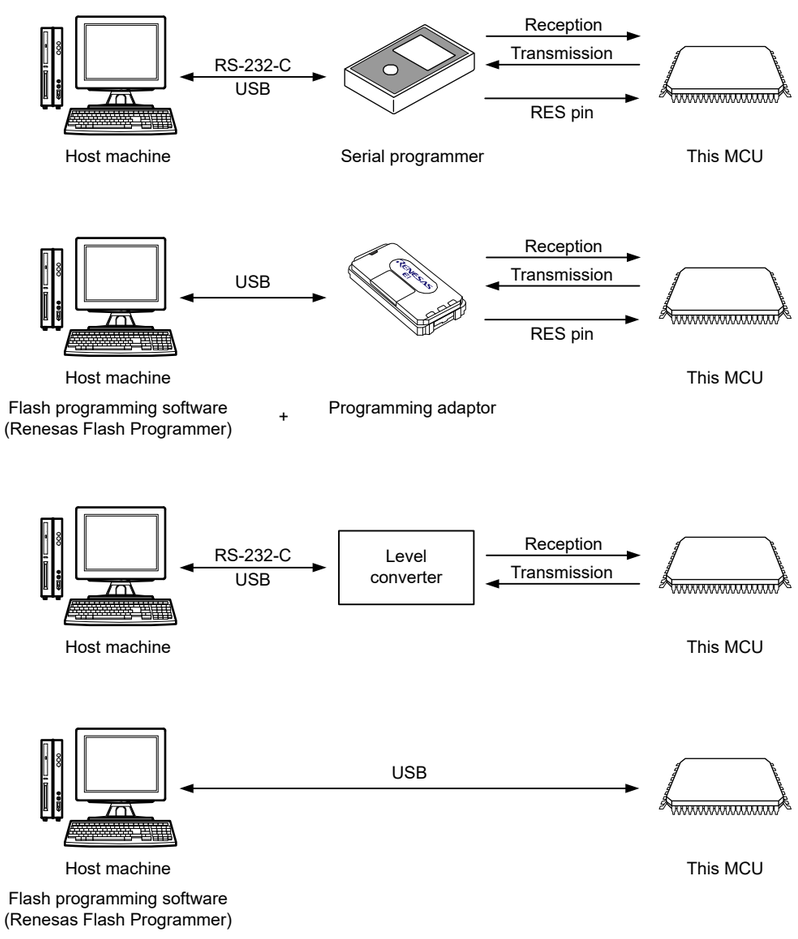

Figure 50.45 Environments for Rewriting the Flash Memory

50.14 使用串行编程器进行重写

串行编程器可用于在引导模式下重写闪存。

(1) 串行编程

该MCU在串行编程时安装在系统板上。为电路板提供连接器可以让串行编程器重写该MCU以继续进行。

50.14.1 串行编程环境

使用数据重写MCU的闪存的推荐环境如下所述。

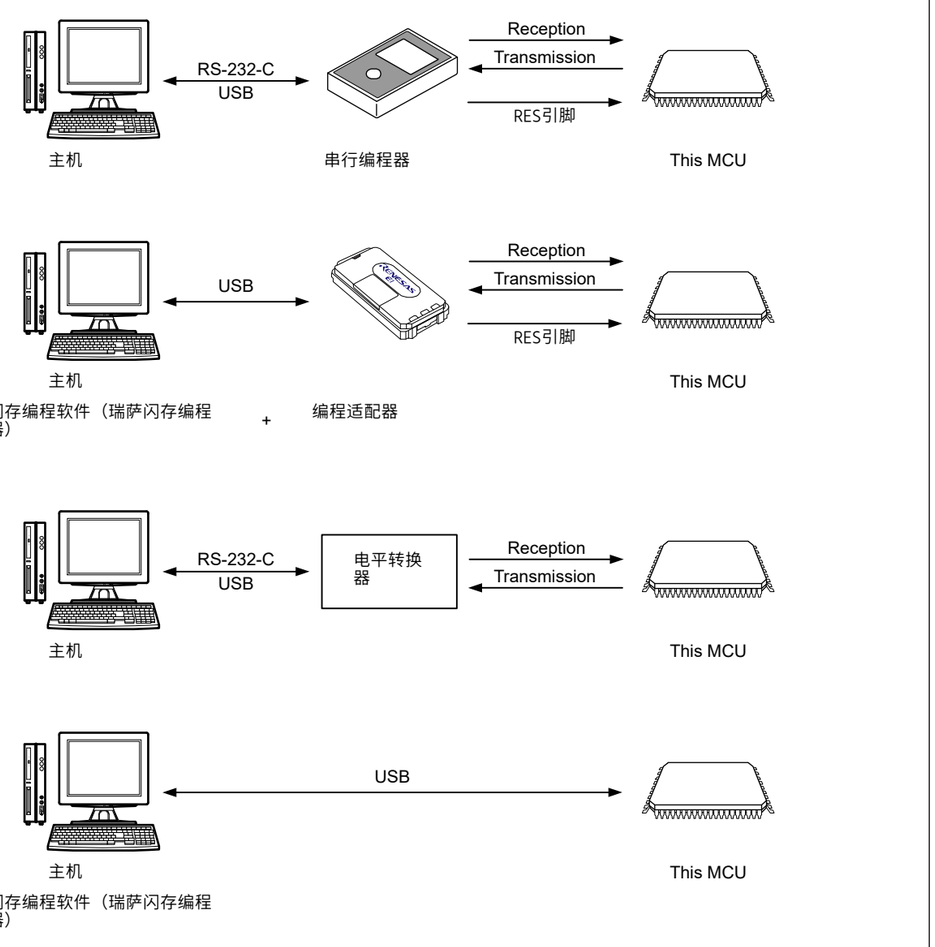

Figure 50.45 重写闪存的环境

50.15 Programming through Self-Programming

50.15.1 Overview

This MCU supports programming of the flash memory by the user program itself. The FACI commands can be used with user programs for writing to the flash memory. This allows upgrading of user programs and rewriting of constant data fields.

The program for rewriting must be transferred to the internal RAM or external memory in advance when the BGO is not available or when rewriting the option-setting memory.

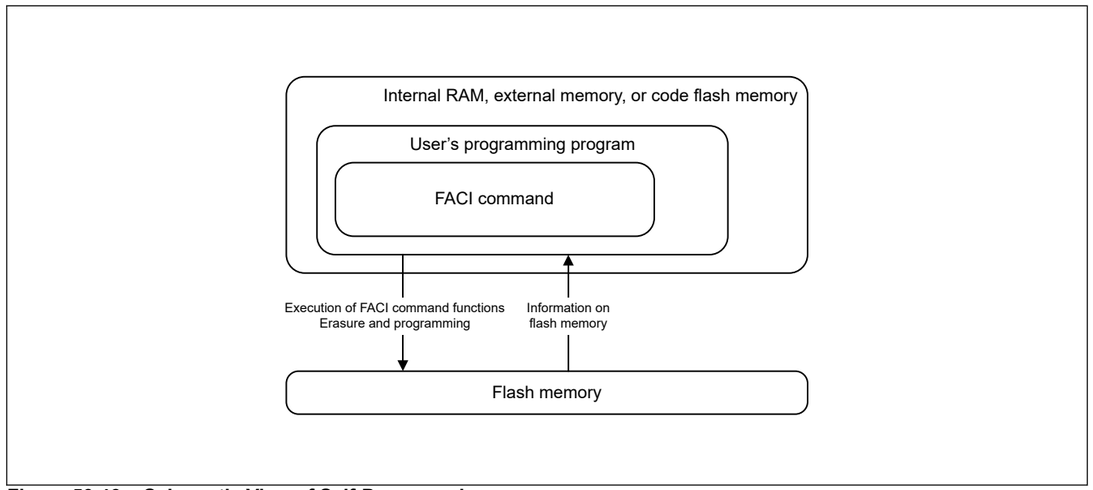

Figure 50.46 Schematic View of Self-Programming

For comprehensive information on the self-programming, refer to section 50.9. FACI Commands

50.15.2 Background Operation

The background operation (BGO) can be used to execute the flash rewrite routine on the code flash memory when the data flash memory or other area of code flash memory is rewritten.

Background operations can be used when the combination of the flash memory for rewriting and the flash memory for reading is any of those listed below.

Table 50.35 Conditions under which Background Operation is Usable (1 of 2)

		Range for rewriting	Range for reading
		Code flash memory	Data flash memory
Common to linear and dual modes		Data flash memory	Code flash memory
Liner mode	Products with 2 Mbytes of code flash memory	First half (1 Mbytes) of the code flash memory (addresses 0x0000 0000 to 0x000F_FFFF)	Second half (1 Mbytes) of the code flash memory (addresses 0x0010_0000 to 001F_FFFF)
		Second half (1 Mbytes) of the code flash memory (addresses 0x0010_0000 to 0x001F_FFFF)	First half (1 Mbytes) of the code flash memory (addresses 0x0000_0000 to 0x000F_FFFF)
Liner mode	Products with 1.5 Mbytes of code flash memory	First half (0.75 Mbytes) of the code flash memory (addresses 0x0000_ 0000 to 0x000B_FFFF)	Second half (0.75 Mbytes) of the code flash memory (addresses 0x000C_0000 to 0x0017_FFFF)

50.15 通过自编程进行编程

50.15.1 Overview

该MCU支持用户程序本身对闪存进行编程。FACI命令可与用户程序一起用于写入闪存。这允许升级用户程序和重写常量数据字段。

当BGO不可用或重写选项设置存储器时，必须将重写程序提前传送到内部RAM或外部存储器。

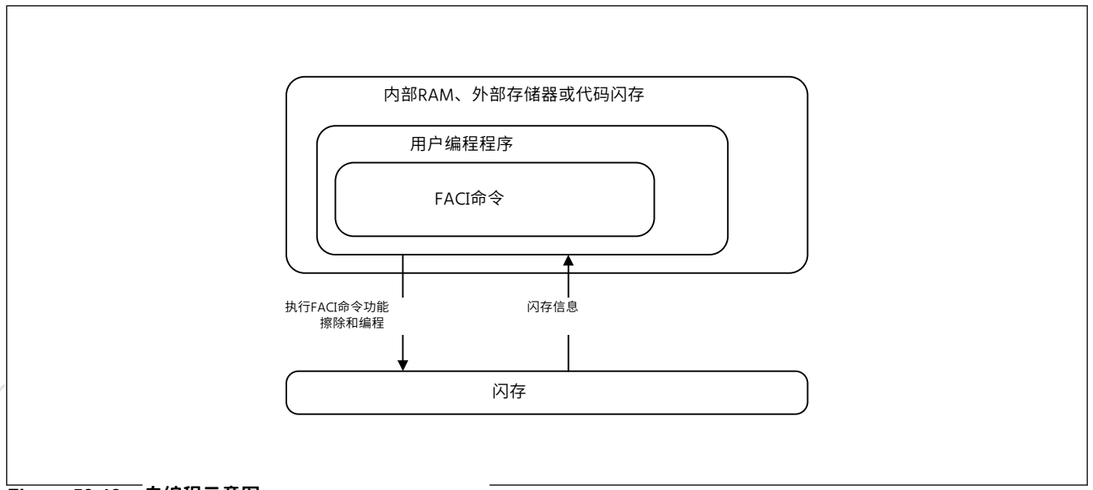

Figure 50.46 自编程示意图

有关自编程的全面信息，请参阅第50.9节。FACI命令

50.15.2 后台操作

当数据闪存或代码闪存的其他区域被重写时，后台操作（BGO）可用于在代码闪存上执行闪存重写例程。

当用于重写的闪存和用于读取的闪存的组合为下列任何一种时，可以使用后台操作。

Table 50.35 后台操作可用的条件(1of2)

		重写范围	读取范围
		代码闪存	数据闪存
常见于线性和双模		数据闪存	代码闪存
线性模式	具有2MB代码闪存的产品	代码闪存的前半部分（1MB）（地址0x00000000到0x000F_FFFF）	代码闪存的后半部分（1MB）（地址0x0010_0000到001F_FFFF）
		代码闪存的后半部分（1MB）（地址0x0010_0000到0x001F_FFFF）	代码闪存的前半部分（1MB）（地址0x0000_0000到0x000F_FFFF）
线性模式	具有1.5MB代码闪存的产品	代码闪存的前半部分（0.75MB）（地址0x0000_0000到0x000B_FFFF）	代码闪存的后半部分（0.75MB）（地址0x000C_0000到0x0017_FFFF）

Table 50.35 Conditions under which Background Operation is Usable (2 of 2)

		Range for rewriting	Range for reading
		Second half (0.75 Mbytes) of the code flash memory (addresses 0x000C_0000 to 0x0017_FFFF)	First half (0.75 Mbytes) of the code flash memory (addresses 0x0000_0000 to 0x000B_FFFF)
Liner mode	Products with 1 Mbytes of code flash memory	First half (0.5 Mbytes) of the code flash memory (addresses 0x0000_0000 to 0x0007_FFFF)	Second half (0.5 Mbytes) of the code flash memory (addresses 0x0008_0000 to 0x000F_FFFF)
		Second half (0.5 Mbytes) of the code flash memory (addresses 0x0008_0000 to 0x000F_FFFF)	First half (0.5 Mbytes) of the code flash memory (addresses 0x0000_0000 to 0x0007_FFFF)
Dual mode	When the BANKSEL.BANKSWP[2:0] bits are 111b	Bank 1 area of the code flash memory	Bank 0 area of the code flash memory
	When the BANKSEL.BANKSWP[2:0] bits are 000b	Bank 0 area of the code flash memory	Bank 1 area of the code flash memory

50.16 Reading Flash Memory

50.16.1 Reading Code Flash Memory

Special settings are not required to read code flash memory after release from the reset state. Data can simply be read out through access to addresses in the code flash memory.

When reading code flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state), all bits are read as 1.

50.16.2 Reading Data Flash Memory

Special settings are not required to read data flash memory after release from the reset state. Data can simply be read out through access to addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state) are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

50.16.3 Access Cycle

When the CPU cache is hit, access is one cycle.

For the CPU cache is missed while CPU cache operation is enabled, or CPU cache is disabled. (This operation only guarantees the first read access of a wrapping burst in AHB protocol. Otherwise, access wait occurs until the CPU cache is filled.)

Table 50.36 Code Flash Memory

Flash Cache Operation	FLWT Register Setting	Read cycle (ICLK)
enable and hit	—	3
disable or miss	0x00	3
	0x01	4
	0x02	5
	0x03	6

Table 50.35 后台操作可用的条件(2of2)

		重写范围	读取范围
		代码闪存的后半部分（0.75MB）（地址0x000C_0000到0x0017_FFFF）	代码闪存的前半部分（0.75MB）（地址0x0000_0000到0x000B_FFFF）
线性模式	具有1MB代码闪存的产品	代码闪存的前半部分（0.5MB）（地址0x0000_0000到0x0007_FFFF）	代码闪存的后半部分（0.5MB）（地址0x0008_0000到0x000F_FFFF）
		代码闪存的后半部分（0.5MB）（地址0x0008_0000到0x000F_FFFF）	代码闪存的前半部分（0.5MB）（地址0x0000_0000到0x0007_FFFF）
双模式	当。。。的时候 BANKSEL.BANKSWP[2:0]位为111b	代码闪存的Bank1区域	代码闪存的Bank0区域
	当。。。的时候 BANKSEL.BANKSWP[2:0]位为000b	代码闪存的Bank0区域	代码闪存的Bank1区域

50.16 读取闪存

50.16.1 读码闪存

从复位状态释放后，读取代码闪存不需要特殊设置。可以通过访问代码闪存中的地址来简单地读取数据。

当读取已擦除但尚未再次编程的代码闪存时（即处于未编程状态），所有位都被读取为1。

50.16.2 读取数据闪存

从复位状态释放后读取数据闪存不需要特殊设置。通过访问数据闪存中的地址可以简单地读取数据。

从已擦除但尚未再次编程（即处于未编程状态）的数据闪存中读取的值未定义。当您需要确认某个区域处于非编程状态时，请使用空白检查。

50.16.3 访问周期

当CPU缓存被命中时，访问为一个周期。

启用CPU缓存操作或禁用CPU缓存时CPU缓存丢失。（此操作仅保证AHB协议中包装突发的第一次读取访问。否则，将等待访问，直到CPU缓存被填满。）

Table 50.36 代码闪存

闪存缓存操作	FLWT寄存器设置	读周期(ICLK)
启用并点击	—	3
禁用或错过	0x00	3
	0x01	4
	0x02	5
	0x03	6

Table 50.37 Data Flash Memory

FCKMHZ Register Setting	Read (cycle)
0x00 to 0x09	Min: 2 ICLK + 3 FCLK Max: (n + 1) ICLK + 3 FCLK
0x0A to 0x13	Min: 2 ICLK + 4 FCLK Max: (n + 1) ICLK + 4 FCLK
0x14 to 0x1D	Min: 2 ICLK + 5 FCLK Max: (n + 1) ICLK + 5 FCLK
0x1E to 0x27	Min: 2 ICLK + 6 FCLK Max: (n + 1) ICLK + 6 FCLK
0x28 to 0x31	Min: 2 ICLK + 7 FCLK Max: (n + 1) ICLK + 7 FCLK
0x32	Min: 2 ICLK + 8 FCLK Max: (n + 1) ICLK + 8 FCLK

Note: When the frequency ratio of ICLK : FCLK is n : 1

50.17 Usage Notes

(1) Reading Area Where Programming/Erasure was Interrupted and Area Targeted for Suspension

The data stored in the area where programming or erasure has been suspended or the area where programming or erasure has been suspended by using the suspend command are undefined. To avoid faulty operation caused by reading undefined data, take care not to fetch instructions or read data from areas where programming or erasure was suspended and where programming or erasure was suspended by using the suspend command.

(2) Suspension During Programming/Erasure

When processing of programming/erasure is stopped by issuing the P/E suspend command, the programming/erasure processing can be resumed by issuing the P/E resume command. If the flash sequencer enters the command-locked state for any reason and issues the forced stop command after the suspended processing is normally completed and the ERSSPD flag or PRGSPD flag is set to 1, the suspended processing cannot be resumed. In addition, the values in the area where the processing was suspended are not guaranteed. Erase that area

(3) Prohibition of Additional Programming

Programming a given area of the code flash memory or data flash memory twice is not possible. To program the code flash memory or data flash memory where has been programed, erase the target area. Programming can be added to the option-setting memory.

(4) Resets During Programming/Erasure, or Blank Checking

In the case of a reset due to the signal on the RES pin during programming/erasure, or blank checking of the flash memory, wait for at least t_{RESW} (see section 53, Electrical Characteristics) of the reset input period once the operating voltage is within the range stipulated in the electrical characteristics, then release the device from the reset state.

(5) Allocation of Vectors for Interrupts and Other Exceptions During Programming/Erasure

Generation of an interrupt or other exception during programming/erasure may lead to fetching of the vector from the code flash memory. Under conditions where BGO cannot be used, set the address of the vector to an address that is not in the code flash memory. Alternatively, make sure that no handling of interrupts or exceptions proceeds during programming/erasure.

(6) Items Prohibited During Programming/Erasure, or Blank Checking

High voltage is applied to the flash memory during programming/erasure, or blank checking. To prevent damage to the flash memory, do not perform the following operations.

- Have the operating voltage from the power supply go beyond the permitted range.
- Change the FWEPROR.FLWE[1:0]bits.

Table 50.37 数据闪存

FCKMHZ寄存器设置	Read (cycle)
0x00 to 0x09	Min: 2 ICLK + 3 FCLK Max: (n + 1) ICLK + 3 FCLK
0x0A to 0x13	Min: 2 ICLK + 4 FCLK Max: (n + 1) ICLK + 4 FCLK
0x14 to 0x1D	Min: 2 ICLK + 5 FCLK Max: (n + 1) ICLK + 5 FCLK
0x1E to 0x27	Min: 2 ICLK + 6 FCLK Max: (n + 1) ICLK + 6 FCLK
0x28 to 0x31	Min: 2 ICLK + 7 FCLK Max: (n + 1) ICLK + 7 FCLK
0x32	Min: 2 ICLK + 8 FCLK Max: (n + 1) ICLK + 8 FCLK

Note: 当ICLK:FCLK的频率比为n:1时

50.17 使用说明

(1) 编程擦除被中断的阅读区域和暂停的目标区域

存储在已暂停编程或擦除的区域或已使用suspend命令暂停编程或擦除的区域中的数据是未定义的。为避免因读取未定义数据而导致错误操作，请注意不要从暂停编程或擦除的区域以及使用暂停命令暂停编程或擦除的区域获取指令或读取数据。

(2) 编程擦除期间的暂停

当通过发出PE暂停命令停止编程擦除处理时，可以通过发出PE恢复命令来恢复编程擦除处理。如果闪存定序器由于任何原因进入命令锁定状态并在挂起处理正常完成并且ERSSPD标志或PRGSPD标志设置为1后发出强制停止命令，则无法恢复挂起的处理。此外，不能保证处理暂停的区域中的值。擦除该区域

(3) 禁止额外编程

不能对代码闪存或数据闪存的给定区域进行两次编程。要对已编程的代码闪存或数据闪存进行编程，请擦除目标区域。可以将编程添加到选项设置存储器中。

(4) 在编程擦除或空白检查期间复位

如果在编程擦除期间由于RES引脚上的信号而导致复位，或者闪存的空白检查，一旦工作电压为在电气特性规定的范围内，然后将设备从复位状态释放。

(5) 在编程擦除期间为中断和其他异常分配向量

在编程擦除期间产生中断或其他异常可能会导致从代码闪存中获取向量。在无法使用BGO的情况下，将向量的地址设置为不在代码闪存中的地址。或者，确保在编程擦除期间不处理中断或异常。

(6) 编程擦除或空白检查期间禁止的项目

在编程擦除或空白检查期间向闪存施加高电压。为防止损坏闪存，请勿执行以下操作。

- 电源的工作电压是否超出允许范围。
- 改变FWEPROR.FLWE[1:0]位。

- Change the OPCCR.OPCM[2:0] and SOPCCR.SOPCM bits.
- Change the SCKDIVCR.FCK[2:0]bits.
- Change the SCKSCR.CKSEL[2:0]bits.
- Transition to the software standby mode, or deep software standby mode.

(7) Programming/Erasure in Low-Speed Modes and Subosc-Speed Mode

Do not programming/erasure the flash memory when low-speed mode or subosc-speed mode is selected with the operating power control register (OPCCR or SOPCCR).

(8) Setting dual bank mode and programming in Boot Mode

The initial mode of the MCU shipped from Renesas is linear mode. In customer's factory when programming dual bank mode and customer's applications on MCU set in linear mode, it is recommended that only area1 in Figure 50.47 is programed in boot mode and area2 is kept blank. After reset, MCU starts in dual mode and the application is in bank0. Use self-programming when programming area2 for updating in the field. See section 52.5. Field Updating in Dual Mode for details

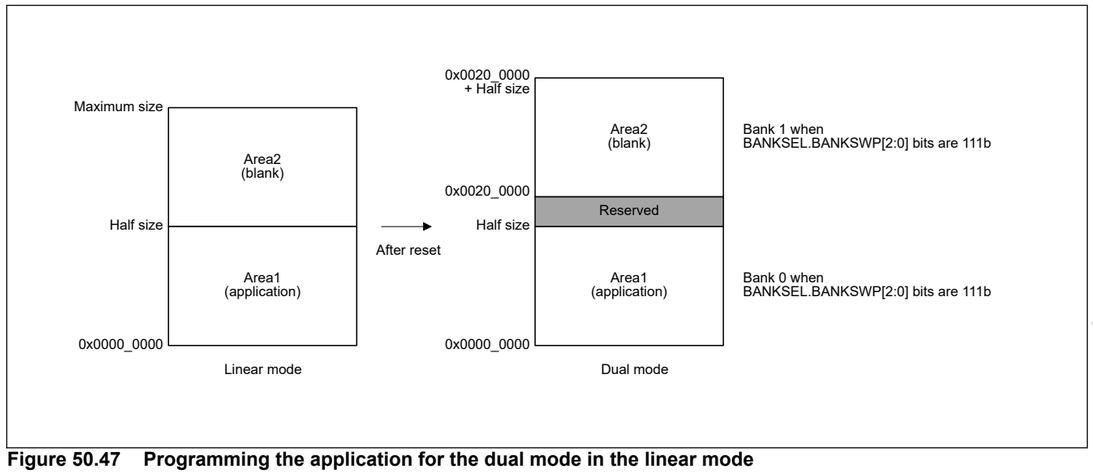

Figure 50.47 Programming the application for the dual mode in the linear mode

(9) Emulator Connection

Renesas provides the emulator which supports both debugging using SWD or JTAG communication and serial programming using SCI communication. This emulator makes it easy to switch between debugging and serial programming.

Table 50.38 shows the pinout of 10 pin or 20 pin socket pinouts when using this emulator. The pinout of SWD and JTAG is ARM standard, and MD, TXD, RXD pins are added for the serial programming using SCI communication.

The serial programming interface must be used to program the TrustZone IDAU boundary register settings.

It is recommended to connect P300/SWCLK/TCK and P201/MD pins using wired OR circuit on the board to use both debugging and serial programming

Table 50.38 Pin assign for emulator (1 of 2)

Pin No.	SWD	JTAG	Serial Programming using SCI
1	VCC	VCC	VCC
2	P108/SWDIO	P108/TMS	NC
4	P300/SWCLK Wired OR with P201/MD	P300/TCK Wired OR with P201/MD	P201/MD
6	P109/SWO/TXD9	P109/TDO/TXD9	P109/TXD9
8	P110/RXD9	P110/TDI/RXD9	P110/RXD9

●更改OPCCR.OPCM[2:0]和SOPCCR.SOPCM位。
●更改SCKDIVCR.FCK[2:0]位。
●更改SCKSCR.CKSEL[2:0]位。
●转换到软件待机模式或深度软件待机模式。

(7) 低速模式和Subosc-Speed模式下的编程擦除

当使用工作电源控制寄存器（OPCCR或SOPCCR）选择低速模式或subosc-speed模式时，不要对闪存进行编程擦除。

(8) 设置双组模式并在引导模式下编程

Renesas出厂的MCU的初始模式是线性模式。在客户工厂对双组模式进行编程时，以及客户在MCU上的应用程序设置为线性模式时，建议仅在引导模式下对图50.47中的区域1进行编程，区域2保持空白。复位后，MCU以双模式启动，应用程序位于bank0。对area2进行编程以进行现场更新时，请使用自编程。见第52.5节。双模式现场更新了解详情

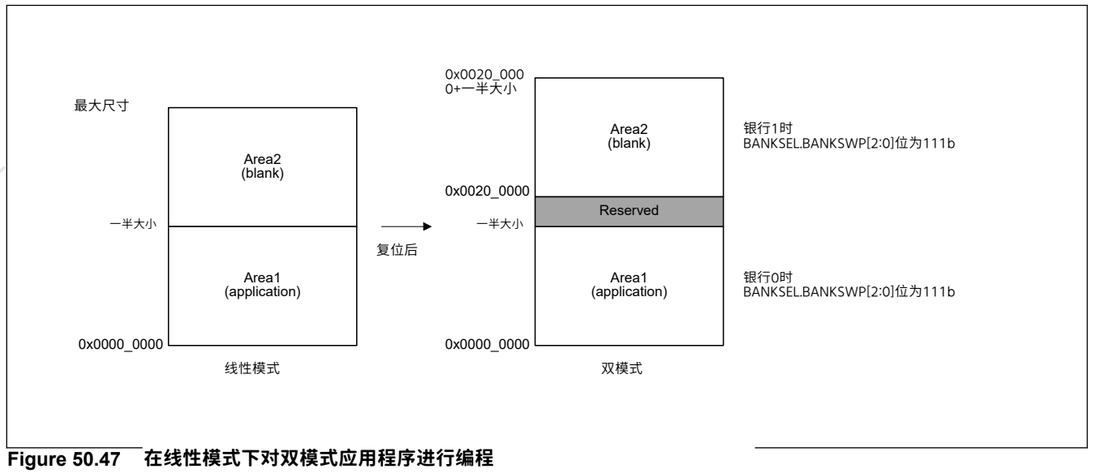

Figure 50.47 在线性模式下对双模式应用程序进行编程

(9) 仿真器连接

瑞萨电子提供的仿真器支持使用SWD或JTAG通信进行调试和使用SCI通信进行串行编程。该仿真器可以轻松地在调试和串行编程之间切换。

表50.38显示了使用该仿真器时10针或20针插座的引脚排列。SWD和JTAG的管脚是ARM标准，并增加了MD、TXD、RXD引脚用于使用SCI通信的串行编程。

必须使用串行编程接口对TrustZoneIDAU边界寄存器设置进行编程。

建议使用板上的有线OR电路连接P300SWCLKTCK和P201MD引脚，以同时使用调试和串行编程

Table 50.38 模拟器的引脚分配（2个中的1个）

针号	SWD	JTAG	使用SCI进行串行编程
1	VCC	VCC	VCC
2	P108/SWDIO	P108/TMS	NC
4	P300/SWCLK 有线或带P201MD	P300/TCK 有线或带P201MD	P201/MD
6	P109/SWO/TXD9	P109/TDO/TXD9	P109/TXD9
8	P110/RXD9	P110/TDI/RXD9	P110/RXD9

RA生态工作室

51. Internal Voltage Regulator

51.1 Overview

The MCU includes one internal voltage regulator:

- Linear regulator (LDO)

This regulator supplies voltage to all internal circuits and memory except for I/O, analog, USB, and battery backup power domains.

51.2 Operation

Table 51.1 lists the LDO mode pin settings, and Figure 51.1 shows the LDO mode settings. In LDO mode, the internal voltage is generated from VCC.

Table 51.1 LDO mode pin

Pins	Setting descriptions
All VCC	• Connect each pin to the system power supply. • Connect each pin to VSS through a 0.1-μF multilayer ceramic capacitor. Place the capacitor close to the pin.
VCL, VCL0	Connect the each pin to VSS through a 0.1-μF multilayer ceramic capacitor. Place the capacitor close to the pin.

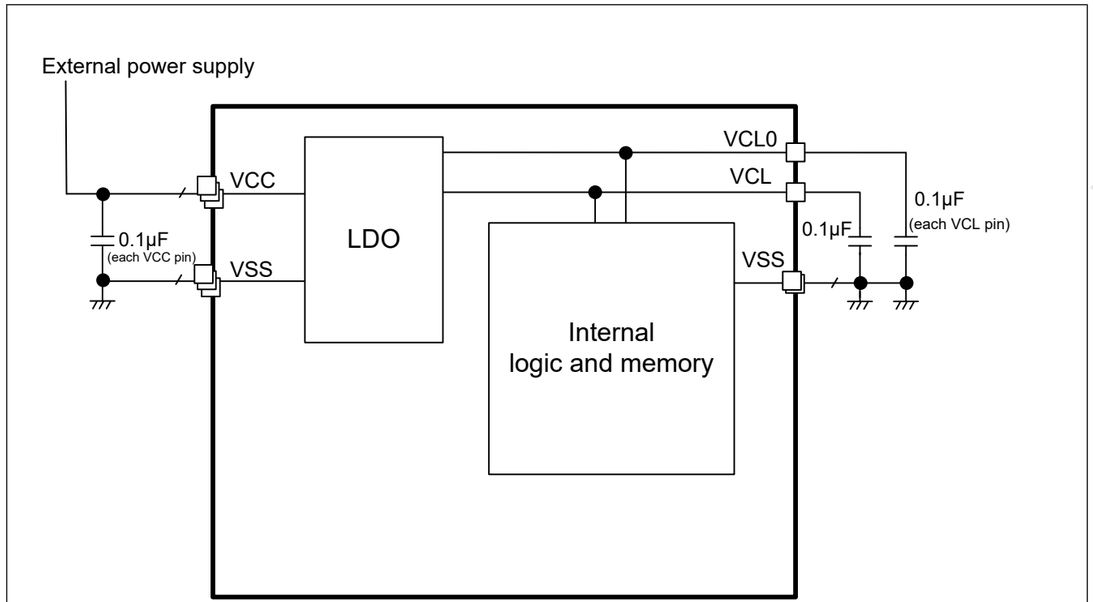

Figure 51.1 LDO mode settings

51. 内部稳压器

51.1 Overview

MCU包含一个内部稳压器：

●线性稳压器（LDO）

该稳压器为除IO、模拟、USB和电池备用电源域之外的所有内部电路和存储器提供电压。

51.2 Operation

表51.1列出了LDO模式引脚设置，图51.1显示了LDO模式设置。在LDO模式下，内部电压由VCC产生。

Table 51.1 LDO模式引脚

Pins	设置说明
All VCC	• 将每个引脚连接到系统电源。 • 通过一个0.1μF多层陶瓷电容器将每个引脚连接到VSS。将电容器靠近引脚放置。
VCL, VCL0	通过一个0.1μF多层陶瓷电容器将每个引脚连接到VSS。将电容器靠近引脚放置。

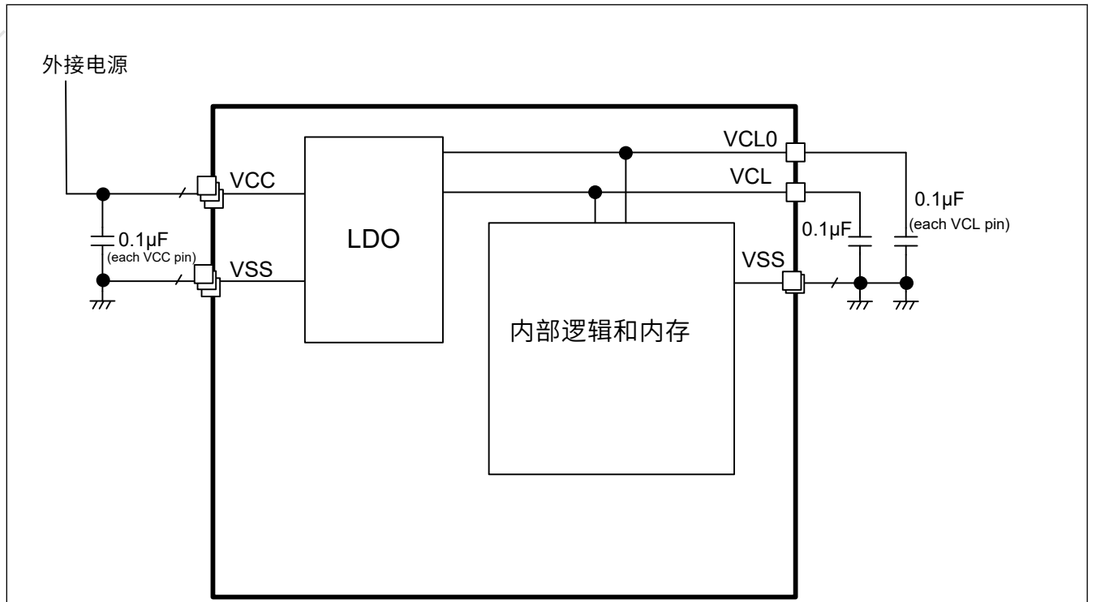

Figure 51.1 LDO模式设置

52. Security Features

52.1 Features

- ARMv8-M TrustZone security
  - Eight regions IDAU for memory space
    - Up to three or six regions for the code flash, depending on the bank mode
    - Up to two regions for the data flash
    - Up to three regions for the SRAM
    - IDAU setting is common for the CPU, DMAC, and DTC
  - SAU is not implemented
  - Secure or Non-secure region for the Standby SRAM
  - Secure or Non-secure region for the VBATT backup registers
  - Individual Secure or Non-secure security attribution for each peripheral
  - Some peripherals support both Secure and Non-secure security attributions
- Device lifecycle management
- Three debug access levels
  - DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals
  - DBG1: The debugger connection is allowed, and restricted to access only non-secure memory regions and peripherals
  - DBG0: The debugger connection is not allowed
- Key injection
- Cryptographic accelerator
  - See section 42, Secure Cryptographic Engine (SCE9)
- Secure pin multiplexing
  - All I/O port pins can be configured individually as secure or non-secure
  - Pin functions of SCI3, SPI0, IIC0, GPT321 and GPT165 can be configured as secure pin
  - See section 19, I/O Ports

52.2 Arm TrustZone Security

52.2.1 Arm TrustZone Technology

Arm TrustZone technology divides the system and the application into Secure and Non-secure domains. Secure application can access both Secure and Non-secure memory and resources. Non-secure application can only access Non-secure memory and resources.

The system starts up in Secure state by default. The security state of CPU can be either Secure or Non-secure.

52.2.2 Memory Security Attribution

The code flash, the data flash, and the SRAM are divided into Secure (S), Non-secure (NS) and Non-secure callable (NSC) regions. These memory security attributions are set into the nonvolatile memory by the serial programming command when the device lifecycle is SSD state. These memory security attributions are loaded into the IDAU and the memory controller before application execution. These memory security attributions cannot be updated by application but can be through the dedicated registers.

The code flash can be divided in up to three regions in the linear mode and six regions in the dual mode. The area of three regions is same between bank0 and bank1 in the dual mode. The data flash can be divided in up to two regions. The SRAM can be divided in up to three regions. Figure 52.1 shows the memory mapping. Table 52.1 shows the size of memory region.

52. 安全功能

52.1 Features

- ARMv8-M TrustZone security

  八个区域IDAU用于存储空间
  - 代码闪存最多三个或六个区域，具体取决于存储库模式
  - 最多两个区域用于数据闪存
  - SRAM最多三个区域
  - IDAU设置对于CPU、DMAC和DTC是通用的

  SAU未实施

  备用SRAM的安全或非安全区域

  VBATT备份寄存器的安全或非安全区域

  每个外围设备的单独安全或非安全安全属性

  一些外围设备同时支持安全和非安全安全属性

●设备生命周期管理

●三个调试访问级别

  DBG2：允许调试器连接，并且对访问内存和外设没有限制

  DBG1：允许调试器连接，但仅限于访问非安全内存区域和外围设备

  DBG0：不允许调试器连接

●密钥注入

●密码加速器

  参见第42节，安全加密引擎(SCE9)

●安全引脚复用

  所有IO端口引脚都可以单独配置为安全或非安全

  SCI3、SPI0、IIC0、GPT321和GPT165的引脚功能可配置为安全引脚

  参见第19节，IO端口

52.2 ArmTrustZone安全

52.2.1 ArmTrustZone技术

ArmTrustZone技术将系统和应用程序划分为安全和非安全域。安全应用程序可以访问安全和非安全内存和资源。非安全应用程序只能访问非安全内存和资源。

系统默认以安全状态启动。CPU的安全状态可以是Secure或Non-secure。

52.2.2 内存安全归属

代码闪存、数据闪存和SRAM分为安全(S)、非安全(NS)和非安全可调用(NSC)区域。当设备生命周期为SSD状态时，这些内存安全属性由串行编程命令设置到非易失性内存中。这些内存安全属性在应用程序执行之前被加载到IDAU和内存控制器中。这些内存安全属性不能由应用程序更新，但可以通过专用寄存器来更新。

代码闪存在线性模式下最多可以划分为三个区域，在双模式下最多可以划分为六个区域。双模式下bank0和bank1的三个区域面积相同。数据闪存最多可分为两个区域。SRAM最多可分为三个区域。图52.1显示了内存映射。表52.1显示了内存区域的大小。

Note: It is prohibited to place Secure or Non-secure callable regions in a block swappable area in the linear mode because the secure application will be placed in the non-secure region after block swapping.

Note: The contents in Secure or Non-secure callable regions must be same in both bank0 and bank1 in the dual mode. Otherwise, the contents of secure or non-secure regions may not be latest by the field updating of non-secure region. See section 52.5. Field Updating in Dual Mode.

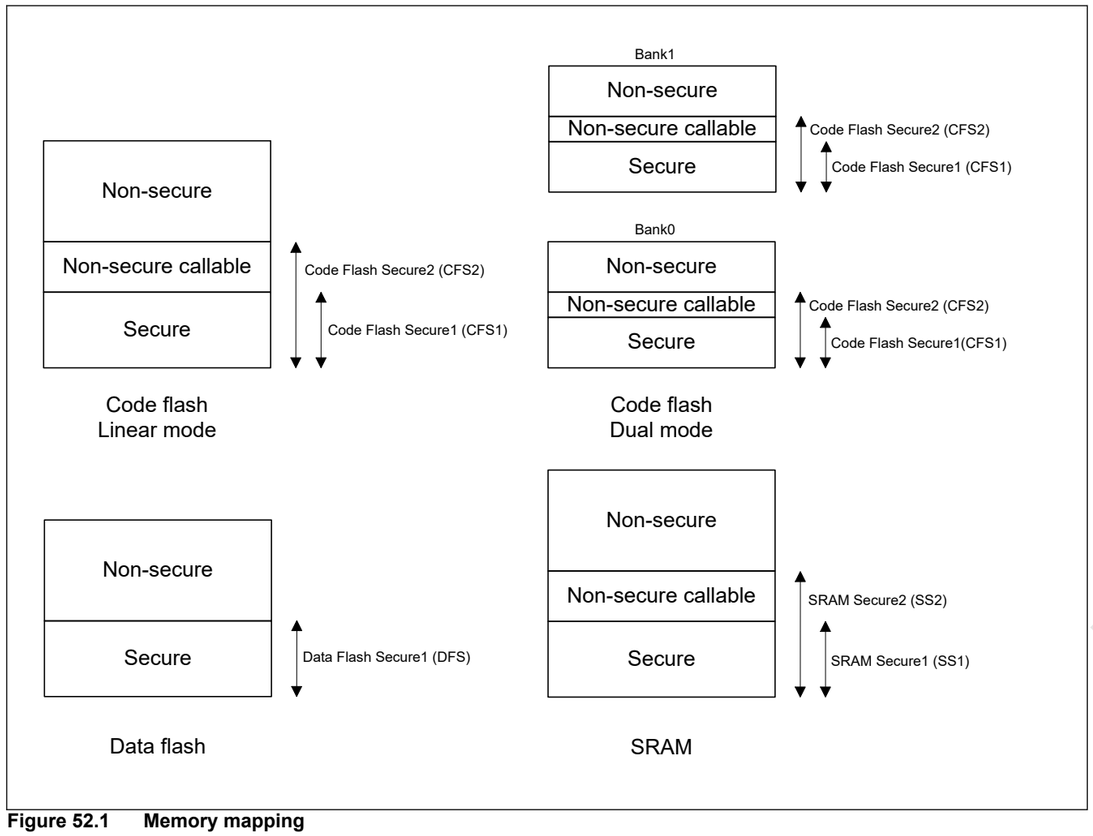

Figure 52.1 Memory mapping

Table 52.1 Memory Region Size (1 of 2)

Memory region		Start address	Size
Linear mode	Code flash secure	0x0000_0000	CFS1 × 1 KB
	Code flash non-secure callable	CFS1 × 1KB	CFS2 × 32 KB - CFS1 × 1 KB
	Code flash non-secure	CFS2 × 32 KB	Code flash size - CFS2 × 32 KB
Dual mode	Code flash bank0 secure	0x0000_0000	CFS1 × 1 KB
	Code flash bank0 non-secure callable	CFS1 × 1 KB	CFS2 × 32 KB - CFS1 × 1 KB
	Code flash bank0 non-secure	CFS2 × 32 KB	Code flash size/2 - CFS2 × 32 KB
	Code flash bank1 secure	0x0020_0000	CFS1 × 1 KB
	Code flash bank1 non-secure callable	0x0020_0000 + CFS1 × 1 KB	CFS2 × 32 KB - CFS1 × 1 KB
	Code flash bank1 non-secure	0x0020_0000 + CFS2 × 32 KB	Code flash size/2 - CFS2 × 32 KB
Data flash secure		0x0800_0000	DFS × 1 KB

Note: 禁止在线性模式下将Secure或Non-securecallable区域放置在块可交换区域中，因为在块交换后安全应用程序将被放置在非安全区域中。

Note: 双模式下，安全或非安全可调用区域的内容在bank0和bank1中必须相同。
否则，通过非安全区域的字段更新，安全或非安全区域的内容可能不是最新的。见第52.5节。双模式下的现场更新。

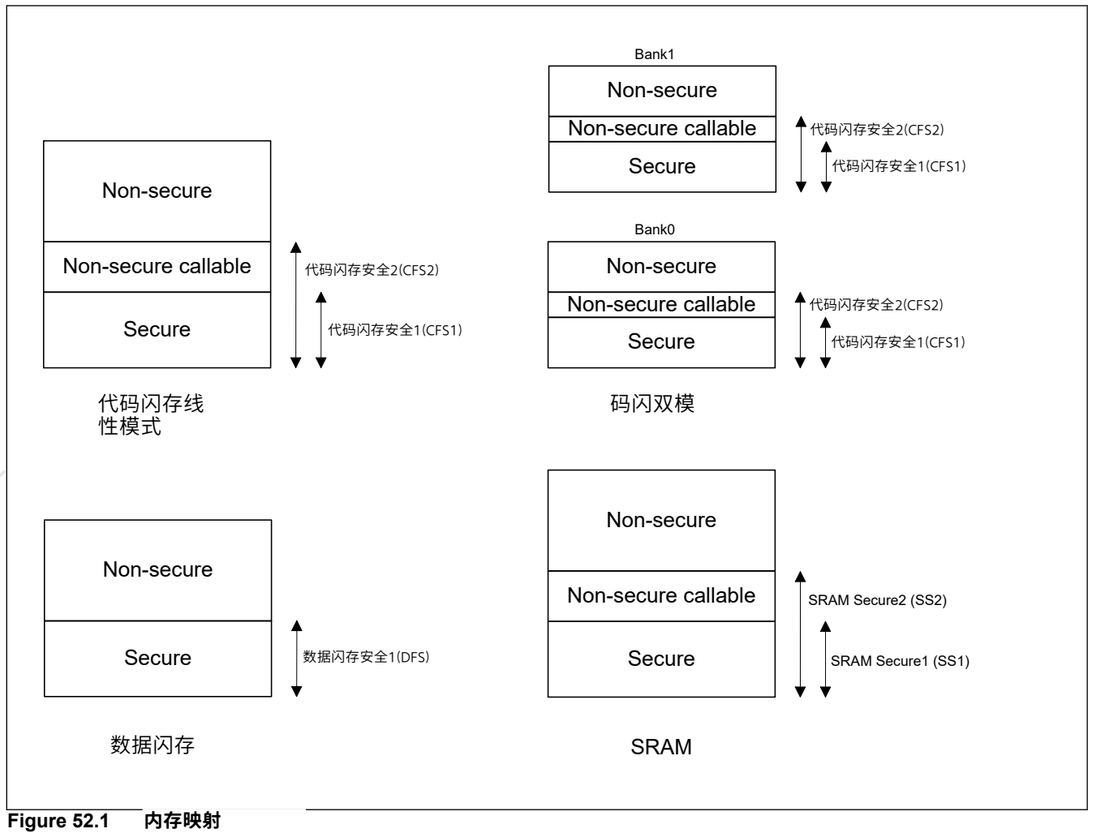

Figure 52.1 内存映射

Table 52.1 内存区域大小(1of2)

内存区域		起始地址	Size
线性模式	代码闪存安全	0x0000_0000	CFS1 × 1 KB
	代码闪存非安全可调用	CFS1 × 1KB	CFS2 × 32 KB - CFS1 × 1 KB
	代码闪存不安全	CFS2 × 32 KB	代码闪存大小CFS2×32KB
双模式	代码闪存bank0安全	0x0000_0000	CFS1 × 1 KB
	Codeflashbank0非安全可调用	CFS1 × 1 KB	CFS2 × 32 KB - CFS1 × 1 KB
	代码闪存bank0不安全	CFS2 × 32 KB	代码闪存大小2CFS2×32KB
	代码闪存bank1安全	0x0020_0000	CFS1 × 1 KB
	Codeflashbank1非安全可调用	0x0020_0000 + CFS1 × 1 KB	CFS2 × 32 KB - CFS1 × 1 KB
	代码闪存bank1不安全	0x0020_0000 + CFS2 × 32 KB	代码闪存大小2CFS2×32KB
数据闪存安全		0x0800_0000	DFS × 1 KB

RA生态工作室

Table 52.1 Memory Region Size (2 of 2)

Memory region	Start address	Size
Data flash non-secure	0x0800_0000 + DFS × 1 KB	Data flash size - DFS × 1 KB
SRAM secure	0x2000_0000	SS1 × 1 KB
SRAM non-secure callable	0x2000_0000 + SS1 × 1 KB	SS2 × 8 KB - SS1 × 1 KB
SRAM non-secure	0x2000_0000 + SS2 × 8 KB	SRAM size - SS2 × 8KB

The Standby SRAM is divided 8 regions. Security attribution can be set for each region, but both secure region and non-secure region must be contiguous. In other words, the Standby SRAM can have one contiguous secure region and one contiguous non-secure region. The Standby SRAM security attribution is set to the dedicated register by the secure application. See section 49, Standby SRAM for the details.

The VBATT backup register is divided 8 regions. Security attribution can be set for each region, but both secure region and non-secure region must be contiguous. In other words, the VBATT backup register can have one contiguous Secure region and one contiguous Non-secure region. The VBATT backup register security attribution is set to the dedicated register by the secure application. See section 11, Battery Backup Function for the details.

Table 52.2 shows the access permission of the memory.

Table 52.2 Access Permission of Memory

Memory	Secure access	Non-secure access
Code flash, Data flash, SRAM configured as Secure or Non-secure callable	allowed	Write ignored / Read ignored TrustZone Access error is generated
Code flash, Data flash, SRAM configured as non-secure	allowed	allowed
Standby SRAM, VBATT backup register configured as Secure	allowed	Write ignored / Read 0x00 TrustZone Access error is not generated
Standby SRAM, VBATT backup register configured as Non-secure	allowed	allowed

52.2.3 Peripheral Security Attribution

Each peripheral can be configured to be Secure or Non-secure.

Peripherals are divided into two types.

Type-1 peripherals has the one security attribution. Access to all registers is controlled by one security attribution. Type-1 peripheral security attribution is set to the PSARx (x = B to E) register by the secure application.

Type-2 peripherals has the security attribution for each register or for each bit. Access to each register or bit field is controlled according to these security attributions. Type-2 peripheral security attribution is set to the Security Attribution register in each module by the secure application. For the Security Attribution register, see sections in the user manual for each peripheral.

Table 52.3 shows the classification of peripheral type.

Table 52.3 Peripheral Type Classification

Type	Peripheral
Type-1	SCI, SPI, USBFS, USBHS, CANFD, IIC, CEC, SCE9, DOC, SDHI, SSIE, CTSU, CRC, CAC, TSN, ADC12, DAC12, POEG, AGT, GPT, RTC, IWDT, WDT
Type-2	System control (Resets, LVD, Clock Generation Circuit, Low Power Modes, Battery Backup Function), FLASH CACHE, SRAM controller, CPU CACHE, DMAC, DTC, ICU, MPU, BUS, Security setting, ELC, I/O ports
Always Non-secure	CS Area Controller, QSPI, OSPI, ETHERC, EDMAC

Table 52.4 shows the access permission of type-1 peripherals. The access permission of type-2 peripherals is different by peripherals. See section Register Description of each peripherals.

Table 52.1 内存区域大小（2个中的2个）

内存区域	起始地址	Size
数据闪存不安全	0x0800_0000 + DFS × 1 KB	数据闪存大小DFS×1KB
SRAM secure	0x2000_0000	SS1 × 1 KB
SRAM non-secure callable	0x2000_0000 + SS1 × 1 KB	SS2 × 8 KB - SS1 × 1 KB
SRAM non-secure	0x2000_0000 + SS2 × 8 KB	SRAM size - SS2 × 8KB

备用SRAM分为8个区域。可以为每个区域设置安全属性，但安全区域和非安全区域必须是连续的。换言之，StandbySRAM可以有一个连续的安全区域和一个连续的非安全区域。备用SRAM安全属性由安全应用程序设置到专用寄存器。有关详细信息，请参见第49节，备用SRAM。

VBATT备份寄存器分为8个区域。可以为每个区域设置安全属性，但安全区域和非安全区域必须是连续的。换句话说，VBATT备份寄存器可以有一个连续的安全区域和一个连续的非安全区域。VBATT备份寄存器安全属性由安全应用程序设置为专用寄存器。有关详细信息，请参阅第11节，电池备份功能。

表52.2显示了内存的访问权限。

Table 52.2 内存访问权限

Memory	安全访问	Non-secure access
代码闪存、数据闪存、SRAM配置为安全或非安全可调用	allowed	写被忽略读被忽略 生成TrustZone访问错误
代码闪存、数据闪存、配置为非安全的SRAM	allowed	allowed
备用SRAM、VBATT备份寄存器配置为安全	allowed	写入忽略读取0x00 未生成TrustZone访问错误
备用SRAM、VBATT备份寄存器配置为非安全	allowed	allowed

52.2.3 外围安全属性

每个外围设备都可以配置为安全或非安全。

外设分为两种。

Type-1外围设备具有唯一的安全属性。对所有寄存器的访问由一个安全属性控制。类型1外设安全属性由安全应用程序设置到PSARx（x=B到E）寄存器。

Type-2外设对每个寄存器或每个位都有安全属性。根据这些安全属性控制对每个寄存器或位字段的访问。类型2外围安全属性由安全应用程序设置到每个模块中的安全属性寄存器。对于安全属性寄存器，请参阅每个外设的用户手册中的部分。

表52.3显示了外围类型的分类。

Table 52.3 外设类型分类

Type	Peripheral
Type-1	SCI、SPI、USBFS、USBHS、CANFD、IIC、CEC、SCE9、DOC、SDHI、SSIE、CTSU、CRC、CAC、TSN、ADC12、DAC12、POEG, AGT, GPT, RTC, IWDT, WDT
Type-2	系统控制（复位、LVD、时钟生成电路、低功耗模式、电池备份功能）、FLASH CACHE、SRAM控制器、CPUCACHE、DMAC、DTC、ICU、MPU、BUS、安全设置、ELC、IO端口
Always Non-secure	CS区域控制器、QSPI、OSPI、ETHERC、EDMAC

表52.4显示了type-1外设的访问权限。type-2外设的访问权限因外设而异。请参阅每个外设的寄存器描述部分。

Table 52.4 The access permission of type-1 peripherals

Permission	Secure access	Non-secure access
Peripheral configured as secure	allowed	Write ignored / Read ignored TrustZone Access error is generated
Peripheral configured as non-secure	allowed	allowed

52.2.4 Flash Sequencer Security Attribution

The flash sequencer is used to program or erase the flash.

The flash sequencer has the special security attribution. Table 52.5 shows the access permission of flash sequencer.

Table 52.5 Access Permissions of Flash Sequencer

	Secure access	Non-secure access
FACI command issuing area	allowed	When the FACI command is issued to the secure region of code flash, data flash and option-setting memory ● Issued FACI command is invalid ● Flash sequencer error is generated When the FACI command is issued to the non-secure region of code flash, data flash and option-setting memory ● Issued FACI command is valid
FBPROT1, FSUACR, FMEPROT registers	allowed	Write ignored / Readable TrustZone Access error is not generated
FCKMHZ register	allowed	Configured by Flash Security Attribution register When configured as Secure, ● Write ignored / Readable ● TrustZone Access error is not generated. When configured as Non-secure ● allowed
Other registers	allowed	During programming/erasure or during suspend programming/erasure by secure application ● Write ignored / Read 0x00 ● TrustZone Access error is not generated In other state ● allowed

52.2.5 Address Space Security Attribution

Table 52.6 shows the security attribution of the address space.

Table 52.6 Address Space Security Attribution

Region	Attribution
Code flash secure	Secure
Code flash non-secure callable	Non-secure callable
Code flash non-secure	Non-secure
Data flash secure	Secure
Data flash non-secure	Non-Secure
SRAM secure	Secure
SRAM non-secure callable	Non-secure callable
SRAM non-secure	Non-secure
Peripherals	Exempt
External address space	Exempt
Other area	Exempt

Note: Exempt: No check will be done. All bus transactions are propagated.

Table 52.4 type-1外设的访问权限

Permission	安全访问	Non-secure access
外设配置为安全	allowed	写被忽略读被忽略 生成TrustZone访问错误
外设配置为非安全	allowed	allowed

52.2.4 FlashSequencer安全属性

闪存定序器用于对闪存进行编程或擦除。

闪存定序器具有特殊的安全属性。表52.5显示了flashsequencer的访问权限。

Table 52.5 FlashSequencer的访问权限

	安全访问	Non-secure access
FACI指令发布区	allowed	当FACI命令被发送到代码闪存、数据闪存和选项设置存储器的安全区域时● 发出的FACI命令无效 ● 产生闪存定序器错误 当FACI命令被发送到代码闪存、数据闪存和选项设置存储器的非安全区域时● 发出的FACI命令有效
FBPROT1, FSUACR, FMEPROT registers	allowed	写忽略可读 未生成TrustZone访问错误
FCKMHZ register	allowed	由Flash安全属性寄存器配置 当配置为安全时，● 写忽略可读 ● 未生成TrustZone访问错误。 当配置为非安全时●
其他寄存器	allowed	在编程擦除期间或在安全应用程序的暂停编程擦除期间● 写入忽略读取0x00 ● 未生成TrustZone访问错误 在其他状态 ●

52.2.5 地址空间安全属性

表52.6显示了地址空间的安全属性。

Table 52.6 地址空间安全属性

Region	Attribution
代码闪存安全	Secure
代码闪存非安全可调用	Non-secure callable
代码闪存不安全	Non-secure
数据闪存安全	Secure
数据闪存不安全	Non-Secure
SRAM secure	Secure
SRAM non-secure callable	Non-secure callable
SRAM non-secure	Non-secure
Peripherals	Exempt
外部地址空间	Exempt
其他区域	Exempt

Note: 豁免：不会进行任何检查。传播所有总线事务。

RA生态工作室

52.2.6 TrustZone Access Error

Table 52.7 shows the behavior when TrustZone access error. The behavior varies depending on the master or slave area to be accessed.

Table 52.7 The Behavior When TrustZone Access Error

Area	CPU	DMAC/DTC	EDMAC
Code flash, Data flash, SRAM	Detect SecureFault exception*2	• Transfer does not start • Occur NMI or reset*1 • Occur interrupt (DMA_TRANSERR)	• Stop transfer • Occur NMI or reset*1 • Occur interrupt (ETHER_EINT0)*3
Other area	• Detect BusFault exception*2 *4 • Occur NMI or reset*1*2 *4	• Stop transfer*5 • Occur NMI or reset*1 *5 • Occur interrupt (DMA_TRANSERR)*5	No TrustZone access error occurs

Note 1. NMI or reset is selected with TZFOAD.OAD bit.
Note 2. When TrustZone access error occurs by the debugger access, exception, NMI, or reset does not occurs. Only the error response is returned.
Note 3. Address error flag in EESR.ADE bit is set. The interrupt occurs when interrupt is enabled in EESIPR.ADEIP bit.
Note 4. These error behaviors does not occur for write access to the PHBIU or PLBIU address space which memory attribute is set to "Early Write Acknowledgment" by the ARM MPU.
Note 5. These error behaviors does not occer for write access from DMAC to the PHBIU or PLBIU address space when the bufferable write is enabled by DMBWR.BWE.

52.3 Device Lifecycle Management

Device lifecycle identifies the current phase of the device and controls the capabilities of the debug interface, the serial programming interface and Renesas test mode. Figure 52.2 is the illustration of the device lifecycle. Table 52.8 shows the lifecycle definition and capability in each lifecycle.

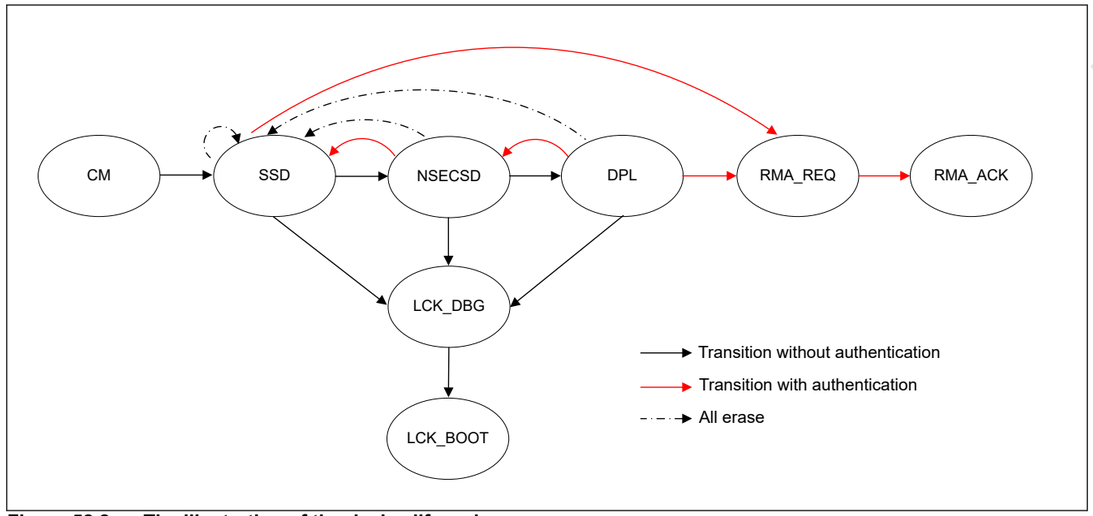

Figure 52.2 The illustration of the device lifecycle

Table 52.8 The lifecycle definition and the capability can be used in each lifecycle (1 of 2)

Lifecycle	Definition	Debug level	Serial programming	Renesas test mode
CM	"Chip Manufacturing" The device is in Renesas factory. The state when the customer received the device.	DBG2	Available cannot access code/data flash area	Not available

52.2.6 TrustZone访问错误

表52.7显示了TrustZone访问错误时的行为。行为因要访问的主区域或从区域而异。

Table 52.7 TrustZone访问错误时的行为

Area	CPU	DMAC/DTC	EDMAC
代码闪存、数据闪存、SRAM	检测SecureFault异常*2	• 传输未开始 • 发生NMI或复位*1 • 发生中断(DMA_TRANSERR)	• 停止转移 • 发生NMI或复位*1 • 发生中断(ETHER_EINT0)*3
其他区域	• 检测BusFault异常*2*4 • 发生NMI或复位*1*2 *4	• 停止传输*5 • 发生NMI或复位*1*5 • 发生中断(DMA_TRANSERR)*5	未发生TrustZone访问错误

注1.通过TZFOAD.OAD位选择NMI或复位。
注2.当调试器访问发生TrustZone访问错误时，不会发生异常、NMI或复位。只返回错误响应。

注3.设置EESR.ADE位中的地址错误标志。当在ESIPR.ADEIP位中使能中断时，会发生中断。
注4.对内存属性设置为"Early"的PHBIU或PLBIU地址空间的写访问不会发生这些错误行为
ARMMPU的"写确认"。
注5.当DMBWR.BWE启用可缓冲写时，这些错误行为不会发生在从DMAC到PHBIU或PLBIU地址空间的写访问中。

52.3 设备生命周期管理

设备生命周期识别设备的当前阶段并控制调试接口、串行编程接口和瑞萨测试模式的功能。图52.2是设备生命周期的图示。表52.8显示了每个生命周期中的生命周期定义和能力。

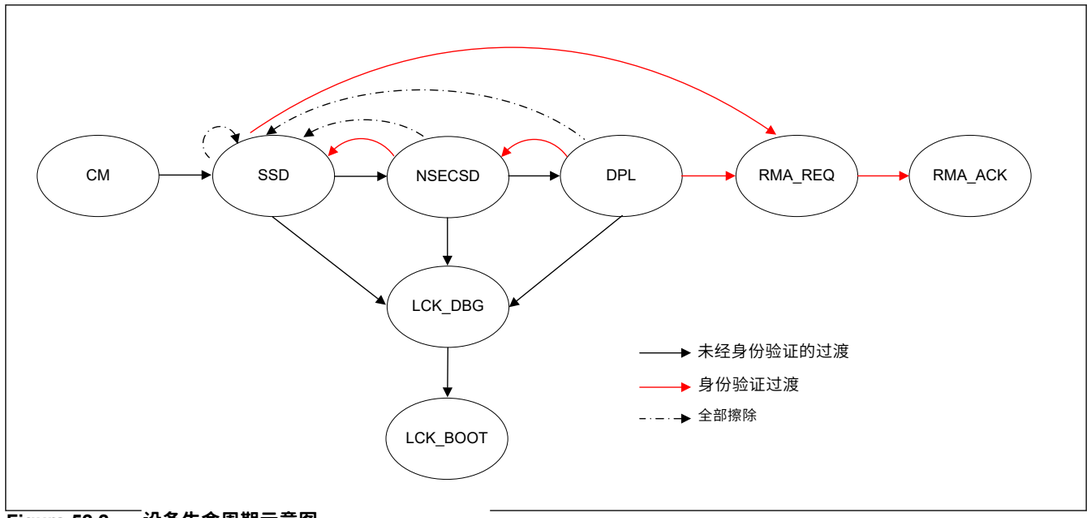

Figure 52.2 设备生命周期示意图

Table 52.8 生命周期定义和能力可以在每个生命周期中使用（1of2）

Lifecycle	Definition	调试级别	串行编程	瑞萨测试模式
CM	"Chip Manufacturing" 该设备在瑞萨电子工厂。客户收到设备时的状态。	DBG2	Available 无法访问代码数据闪存区	无法使用

Table 52.8 The lifecycle definition and the capability can be used in each lifecycle (2 of 2)

Lifecycle	Definition	Debug level	Serial programming	Renesas test mode
SSD	“Secure Software Development” The secure part of application is being developed.	DBG2	Available can program/erase/read all code/data flash area	Not available
NSECSD	“Non-SECure Software Development” The non-secure part of application is being developed.	DBG1	Available can program/erase/read only non-secure code/data flash area	Not available
DPL	“DePLoyed” The device is in-field.	DBG0	Available cannot access code/data flash area	Not available
LCK_DBG	“LoCKed DeBuG” The debug interface is permanently disabled.	DBG0	Available cannot access code/data flash area	Not available
LCK_BOOT	“LoCKed BOOT interface” The debug interface and the serial programming interface are permanently disabled.	DBG0	Not available	Not available
RMA_REQ	“Return Material Authorization REQuest” Request for RMA. The customer must send the device to Renesas in this state.	DBG0	Available cannot access code/data flash area	Not available
RMA_ACK	“Return Material Authorization ACKnowledged” Failure analysis in Renesas	DBG2	Available cannot access code/data flash area	Available

52.3.1 Changing the Lifecycle State

Use the serial programming commands to change the device lifecycle state. See the boot firmware application note for the detail of command. The lifecycle cannot be updated by application but can read through the dedicated registers.

As shown in Figure 52.2, there are three types lifecycle transition.

The first one is to change to lower debug access level or restrict the serial programming mode. This change can be done with no restriction.

Note: The debug interface is permanently disabled in LCK_DBG. After changed to LCK_DBG, the debug interface cannot be used forever.

Note: The debug interface and serial programming interface are permanently disabled in LCK_BOOT. After changed to LCK_BOOT, the debug interface and the serial programming interface cannot be used forever.

The second one is to change to higher debug access level or request for RMA. This change needs key authentication. The key length is 128 bits. The secure developer needs to inject two keys when the lifecycle is SSD state. One is “SECDBG_KEY” which is used to authentication to change the lifecycle from NSECSD to SSD. Other one is “RMA_KEY” which is used to authentication to change the lifecycle from SSD or DPL to RMA_REQ. The non-secure developer needs to inject one key when the lifecycle is NSECSD state. This is “NONSECDBG_KEY” which is used to authentication to change the lifecycle from DPL to NSECSD. See section 52.4. Key Injection for the detail of how to inject the key. The key authentication uses a challenge and response authentication or authentication using the unique ID. The authentication using the unique ID is available only transition to RMA_REQ. The following is the process of how to calculate the response, challenge and response authentication, or the authentication code using unique ID.

Response = HMAC-SHA256 (KEY, 128bits challenge || fixed value (256bits))

Authentication code = HMAC-SHA256 (KEY, 128bits unique ID || fixed value (256 bits))

fixed value = 9e56dc41 cf0c9648 1b811141 f8f9ba1e 4dd77746 6d403593 17f46d64 fe64fdf6

Note: That "||" represents concatenation, not logical or.

Table 52.8 可以在每个生命周期中使用生命周期定义和能力（2个中的2个）

Lifecycle	Definition	调试级别	串行编程	瑞萨测试模式
SSD	“Secure Software Development” 应用程序的安全部分正在开发中。	DBG2	Available 可以编程擦除读取所有代码数据闪存区域	无法使用
NSECSD	“Non-SECure Software Development” 应用程序的非安全部分正在开发中。	DBG1	Available 可以编程擦除只读非安全代码数据闪存区域	无法使用
DPL	“DePLoyed” 该设备在现场。	DBG0	Available 无法访问代码数据闪存区	无法使用
LCK_DBG	“LoCKed DeBuG” 调试接口被永久禁用。	DBG0	Available 无法访问代码数据闪存区	无法使用
LCK_BOOT	“LoCKed BOOT interface” 调试接口和串行编程接口被永久禁用。	DBG0	无法使用	无法使用
RMA_REQ	“退货授权请求” 请求RMA。客户必须在此状态下将设备发送给瑞萨电子。	DBG0	Available 无法访问代码数据闪存区	无法使用
RMA_ACK	“已确认退货授权” 瑞萨电子的故障分析	DBG2	Available 无法访问代码数据闪存区	Available

52.3.1 更改生命周期状态

使用串行编程命令更改设备生命周期状态。有关命令的详细信息，请参见启动固件应用说明。生命周期不能由应用程序更新，但可以通过专用寄存器读取。

如图52.2所示，生命周期转换分为三种。

第一个是更改为降低调试访问级别或限制串行编程模式。这种改变可以不受限制地进行。

Note: 调试接口在LCK_DBG中被永久禁用。改成LCK_DBG后，调试接口就不能一直使用了。

Note: 调试接口和串行编程接口在LCK_BOOT中永久禁用。改成之后LCK_BOOT、调试接口和串行编程接口不能永远使用。

第二个是更改为更高的调试访问级别或请求RMA。此更改需要密钥身份验证。密钥长度为128位。当生命周期为SSD状态时，安全开发人员需要注入两个密钥。一种是“SECDBG_KEY”，用于身份验证以将生命周期从NSECSD更改为SSD。另一种是“RMA_KEY”，用于身份验证以将生命周期从SSD或DPL更改为RMA_REQ。当生命周期为NSECSD状态时，非安全开发者需要注入一个密钥。这是“NONSECDBG_KEY”，用于身份验证以将生命周期从DPL更改为NSECSD。见第52.4节。KeyInjection有关如何注入密钥的详细信息。密钥身份验证使用质询和响应身份验证或使用唯一ID的身份验证。使用唯一ID的身份验证只能转换到RMA_REQ。以下是如何计算响应、挑战和响应身份验证或使用唯一ID的身份验证码的过程。

响应=HMAC-SHA256(KEY 128bitschallengeFixedvalue(256bits))

认证码=HMAC-SHA256（KEY，128bits唯一ID固定值（256bits））

固定值=9e56dc41cf0c96481b811141f8f9ba1e4dd777466d40359317f46d64fe64fdf6

Note: 那“”代表连接，不是逻辑或。

Note: In case the key is not injected, these lifecycle changes cannot be done.

Note: In the lifecycle transition from NSECSD to SSD or form DPL to NSECSD, the contents on the flash memory are not erased.

Note: MCU does not respond after changing to higher debug access level or RMA_REQ. If you continue to use the serial programming commands, need to re-enter the boot mode after a reset. See the boot firmware application note for the detail.

Note: In the lifecycle transition to RMA_REQ, the contents on the flash memory except permanently locked block or setting or BPS_SEL register are erased. The contents in the permanently locked block or register can be read by Renesas at failure analysis. Permanently rocked block means the block which programming and erasure is disabled permanently by PBPS, PBPS_SEC and BPS_SEL register. Permanently rocked register means SAS register which programming and erasure is disabled permanently by FSPR bit.

The third one is all erase. This is done by an initialize command unless an initialize command itself is disabled. The lifecycle is back to SSD and the contents on the flash memory is erased. If there is permanently locked block or register, an initialize command does not execute. In case of the all bits of PBPS and PBPS_SEC register are 1 and FSPR bit is1, an initialize command is executable.

Note: The initialize command can be issued by everyone, so contents on the flash memory are easily erased. Developers who do not want this can invalidate the initialize command permanently by parameter setting command.

Note: MCU does not respond after executing the initialize command. If you continue to use the serial programming commands, need to re-enter the boot mode after a reset. See the boot firmware application note for the detail.

52.3.2 Debug access level

There are three debug access levels, and the debug access level changes according to the lifecycle state.

- DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals
- DBG1: The debugger connection is allowed, and restricted to access only non-secure memory regions and peripherals
- DBG0: The debugger connection is not allowed

52.3.3 Serial Programming

Whether a serial programmer can be connected and the range of flash memory that can be accessed depends on the lifecycle state as shown in Table 52.8. And the accepted serial programming command differs depending on the lifecycle state. See the boot firmware application note for the detail of command.

52.3.4 Lifecycle changing example

The following is a typical lifecycle changing example.

Secure developer

- Change the lifecycle from CM to SSD by using the serial programming command.
- Set the memory security attribution of the code flash, data flash and SRAM by using the serial programming command.
- Program the secure application by using the serial programming interface and debug the secure application. Debug is possible if the lifecycle is CM, but it is impossible to set the memory security attribution in CM state. If the memory security attribution is not set, all area of the code flash, data flash and SRAM is Secure.

Note: Need to configure the registers listed in Table 52.10 as Non-secure only in NSECSD state. See section 52.7.1. Restrictions on setting the security attribution for details.

- Inject “SECDBG_KEY” and “RMA_KEY” by using the serial programming command (if need).
- Inject AES, RSA, ECC, HMAC keys listed in Table 52.9 (if need).
- Disable the all erase by using the serial programming command (if need).
- Change the lifecycle from SSD to NSECSD by using the serial programming command.

Note: 如果未注入密钥，则无法完成这些生命周期更改。

Note: 在从NSECSD到SSD或从DPL到NSECSD的生命周期转换中，闪存上的内容不会被擦除。

Note: 更改为更高的调试访问级别或RMA_REQ后，MCU没有响应。如果继续使用串口编程命令，需要复位后重新进入开机模式。有关详细信息，请参阅启动固件应用说明。

Note: 在到RMA_REQ的生命周期转换中，闪存上的内容除了永久锁定的块或设置或BPS_SEL寄存器外被擦除。瑞萨在故障分析时可以读取永久锁定的块或寄存器中的内容。永久摇动块是指被PBPS、PBPS_SEC和BPS_SEL寄存器永久禁用编程和擦除的块。永久摇动寄存器是指通过FSPR位永久禁用编程和擦除的SAS寄存器。

第三个是全部擦除。这由初始化命令完成，除非初始化命令本身被禁用。生命周期回到SSD，闪存上的内容被擦除。如果存在永久锁定的块或寄存器，则不会执行初始化命令。如果PBPS和PBPS_SEC寄存器的所有位为1，FSPR位为1，则可执行初始化命令。

Note: 每个人都可以发出初始化命令，因此闪存上的内容很容易被擦除。不希望这样的开发者可以通过参数设置命令使初始化命令永久无效。

Note: 执行初始化命令后MCU没有响应。如果继续使用串口编程命令，需要复位后重新进入开机模式。有关详细信息，请参阅启动固件应用说明。

52.3.2 调试访问级别

共有三个调试访问级别，调试访问级别根据生命周期状态而变化。

●DBG2：允许调试器连接，不限制访问内存和外设

●DBG1：允许调试器连接，但仅限于访问非安全内存区域和外围设备

●DBG0：不允许调试器连接

52.3.3 串行编程

是否可以连接串行编程器以及可以访问的闪存范围取决于生命周期状态，如表52.8所示。并且接受的串行编程命令根据生命周期状态而有所不同。有关命令的详细信息，请参见启动固件应用说明。

52.3.4 生命周期更改示例

以下是一个典型的生命周期更改示例。

安全开发人员

●使用串行编程命令将生命周期从CM更改为SSD。

●使用串行编程命令设置codeflash、dataflash和SRAM的内存安全属性。

●使用串行编程接口对安全应用程序进行编程并调试安全应用程序。如果生命周期是CM，则可以调试，但无法在CM状态下设置内存安全属性。如果未设置内存安全属性，则代码闪存、数据闪存和SRAM的所有区域都是安全的。

Note: 仅在NSECSD状态下需要将表52.10中列出的寄存器配置为非安全。请参阅第52.7.1节。
设置安全属性的限制以获取详细信息。

●使用串行编程命令（如果需要）注入“SECDBG_KEY”和“RMA_KEY”。

●注入表52.9中列出的AES、RSA、ECC、HMAC密钥（如果需要）。

●使用串行编程命令禁用全部擦除（如果需要）。

●使用串行编程命令将生命周期从SSD更改为NSECSD。

Non-secure developer

- Program the Non-secure application by using the serial programming interface and debug the Non-secure application.
- Inject “NONSECDBG_KEY” by using the serial programming command (if need).
- Inject AES, RSA, ECC, HMAC keys listed in Table 52.9 (if need).
- Disable the all erase by using the serial programming command (if need).
- Change the lifecycle to DPL by using the serial programming command.

52.3.5 Failure analysis

If the customer requests the failure analysis to Renesas, it is necessary to send the device after changing the lifecycle to RMA_REQ. If the lifecycle is not RMA_REQ, Renesas can not do the failure analysis. Because RMA_REQ is permanent state, it can not back to the another state after changing to RMA_REQ. It is assumed to change to SSD or NSECSD and analyze before changing to RMA_REQ.

Devices sent to Renesas will not be returned to customers. The device will be discarded.

Note: As described in the section 52.3.1. Changing the Lifecycle State, RMA_KEY is needed to change the lifecycle to RMA_REQ. If the customer forgets the RMA_KEY, Renesas can not do the failure analysis.

52.4 Key Injection

There are three steps required to inject a user key into the MCU.

First, the customer needs to create the 128 bits installation key. This key is called User Factory Programming Key (UFPK) and used to encrypt a user key. The customer gets the key of the wrapped version (W-UFPK) through the Renesas Key Wrapping Service.

Second the customer encrypts the user key using UFPK as the AES key.

Last the customer sends W-UFPK and the encrypted user key to the MCU by using serial programming interface. The sent user key is decrypted, wrapped with the hardware unique key, and then stored in the nonvolatile memory.

Figure 52.3 is the illustration of key injection. Table 52.9 shows the keys that can be injected by serial programming interface.

User Key is also used for authentication during the life cycle transition.

Non-secure developer

●使用串行编程接口对非安全应用程序进行编程并调试非安全应用程序。

●使用串行编程命令（如果需要）注入“NONSECDBG_KEY”。

●注入表52.9中列出的AES、RSA、ECC、HMAC密钥（如果需要）。

●使用串行编程命令禁用全部擦除（如果需要）。

●使用串行编程命令将生命周期更改为DPL。

52.3.5 故障分析

如果客户要求对瑞萨进行故障分析，则需要在将生命周期更改为RMA_REQ后发送设备。如果生命周期不是RMA_REQ，瑞萨将无法进行故障分析。因为RMA_REQ是永久状态，所以在更改为RMA_REQ后不能回到另一个状态。假设更改为SSD或NSECSD并在更改为RMA_REQ之前进行分析。

发送给瑞萨的设备将不会退还给客户。该设备将被丢弃。

Note: 如第52.3.1节所述。更改LifecycleState，需要RMA_KEY才能将生命周期更改为RMA_REQ。如果客户忘记了RMA_KEY，瑞萨将无法进行故障分析。

52.4 密钥注入

将用户密钥注入MCU需要三个步骤。

首先，客户需要创建128位安装密钥。此密钥称为用户工厂编程密钥(UFPK)，用于加密用户密钥。客户通过RenesasKeyWrappingService获得打包版本(W-UFPK)的密钥。

其次，客户使用UFPK作为AES密钥对用户密钥进行加密。

最后客户通过串行编程接口将W-UFPK和加密的用户密钥发送给MCU。发送的用户密钥被解密，用硬件唯一密钥包装，然后存储在非易失性存储器中。

图52.3是密钥注入的示意图。表52.9显示了串行编程接口可以注入的密钥。

用户密钥还用于生命周期转换期间的身份验证。

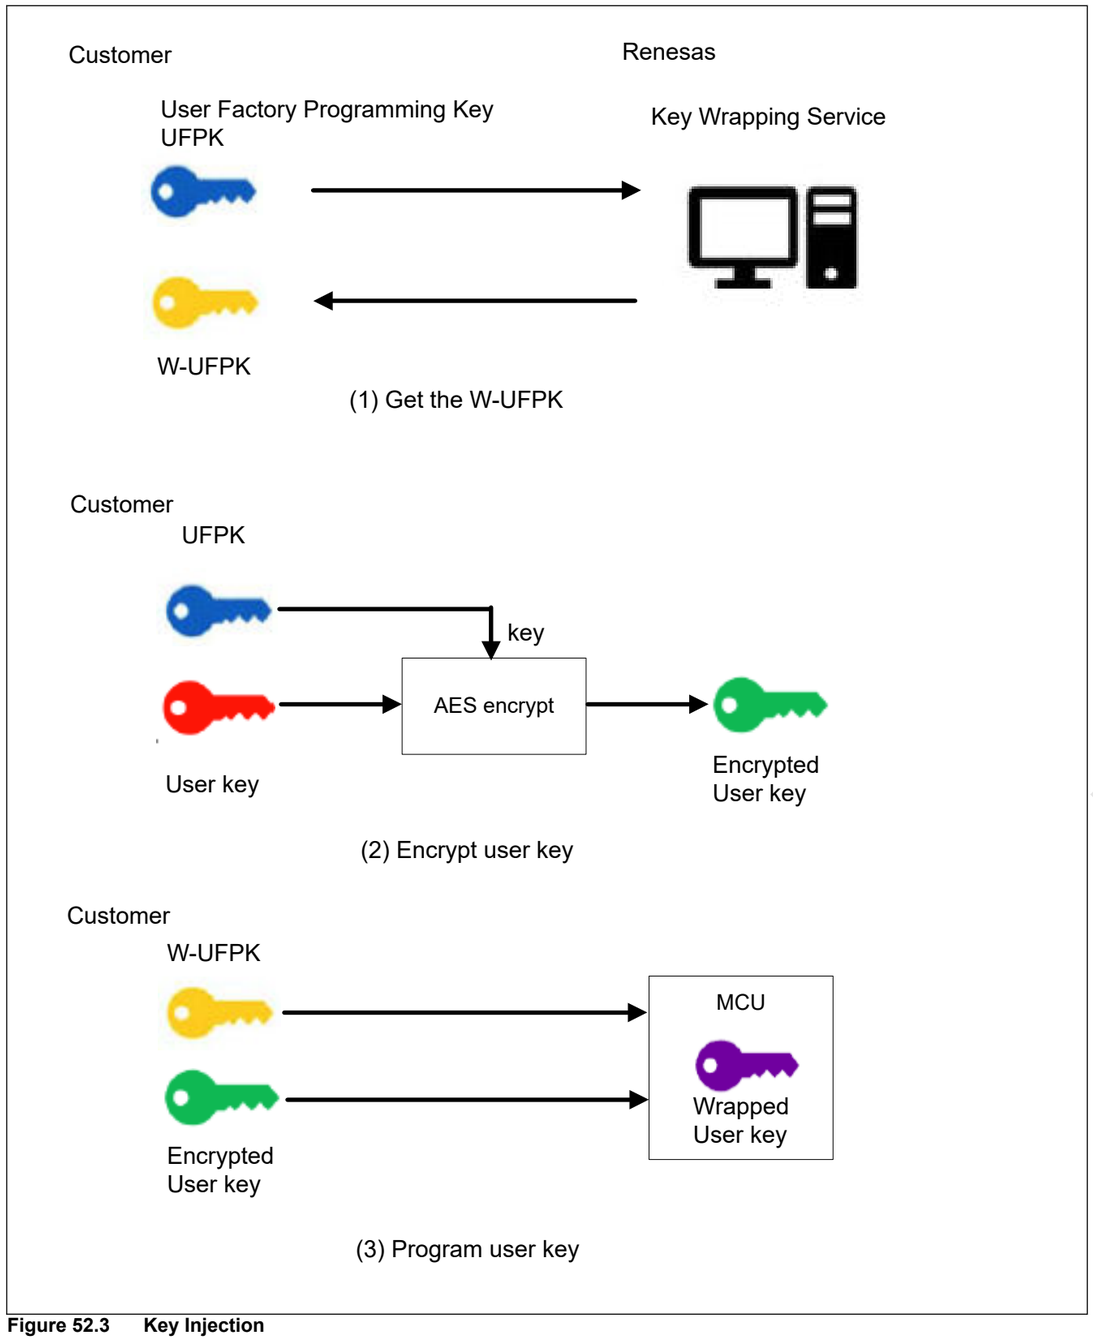

Figure 52.3 Key Injection

Table 52.9 The keys that can be injected by serial programming (1 of 2)

Lifecycle transition	SECDBG_KEY, NONSECDBG_KEY, RMA_KEY
AES	AES-128, AES-192, AES-256, AES-XTS-128, AES-XTS-256
RSA	RSA-1024, RSA-2048, RSA-3072, RSA-4096 (Public and Private)

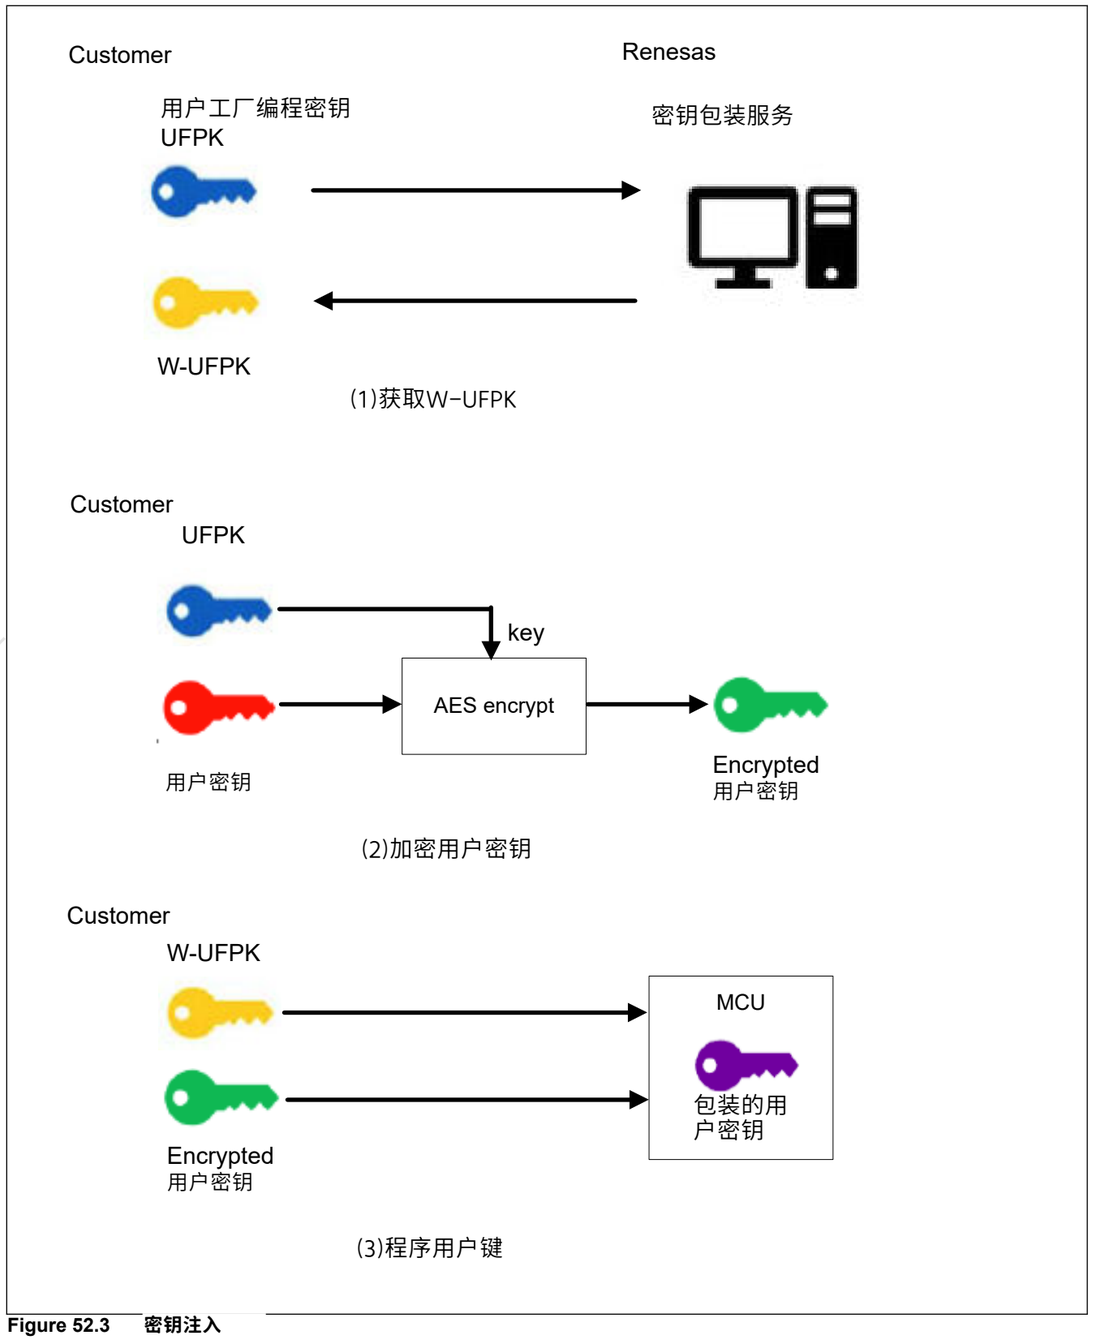

Figure 52.3 密钥注入

Table 52.9 可以通过串行编程注入的密钥（1of2）

生命周期过渡	SECDBG_KEY, NONSECDBG_KEY, RMA_KEY
AES	AES-128, AES-192, AES-256, AES-XTS-128, AES-XTS-256
RSA	RSA-1024, RSA-2048, RSA-3072, RSA-4096 (Public and Private)

Table 52.9 The keys that can be injected by serial programming (2 of 2)

ECC	ECC P192, ECC P224, ECC P256, ECC P384, ECC P512 (Public and Private)
HMAC	HMAC-SHA224, HMAC-SHA256

52.5 Field Updating in Dual Mode

Be careful when performing in-field update of information to keep the contents of secure or non-secure regions after bank swapping in the dual mode. Figure 52.4 and Figure 52.5 shows the performing in-field update of information flow of secure or non-secure regions in the dual mode.

In this example of Figure 52.4, BANK0 is valid, and Version 1 information is stored in NS and S or NSC.

BANK1 is blank. To update the S or NSC information in the field to Version 2, first copy the version 1 information of BANK0 to NS, update the S or NSC to Version 2, and then execute the Bank swap.

In this example of Figure 52.5, BANK0 is valid, and Version 1 information is stored in NS and S or NSC. BANK1 is blank.

To update the NS information in the field and set it to Version 2, First of all, non-secure users should have the Secure user copy the version 1 information of BANK0 to BANK1.

After that, Non secure user should update NS information to Version 2 and execute BANK swap.

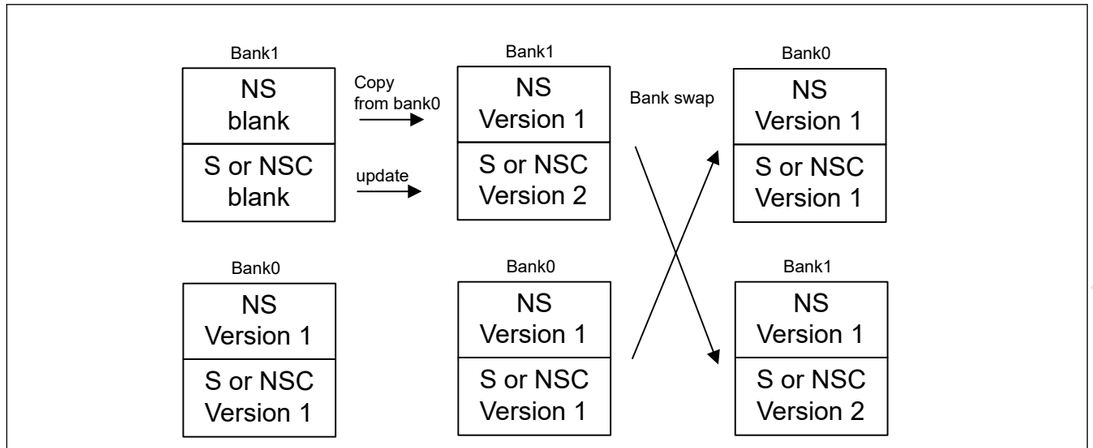

Figure 52.4 The field updating flow of secure or non-secure callable regions

Table 52.9 可以通过串行编程注入的密钥(2of2)

ECC	ECC P192, ECC P224, ECC P256, ECC P384, ECC P512 (Public and Private)
HMAC	HMAC-SHA224, HMAC-SHA256

52.5 双模式下的现场更新

执行信息的现场更新时要小心，以在双模式下进行银行交换后保持安全或非安全区域的内容。图52.4和图52.5显示了在双模式下对安全或非安全区域的信息流进行现场更新。

在图52.4的这个例子中，BANK0是有效的，版本1信息存储在NS和S或NSC中。

BANK1为空白。要将字段中的S或NSC信息更新到版本2，首先复制版本1的信息BANK0到NS，将S或NSC更新到版本2，然后执行Bank交换。

在图52.5的这个例子中，BANK0是有效的，版本1信息存储在NS和S或NSC中。BANK1为空白。

要更新字段中的NS信息并将其设置为版本2，首先，非安全用户应让安全用户将BANK0的版本1信息复制到BANK1。

之后，非安全用户应将NS信息更新到版本2并执行BANK交换。

14	PSARE14	AGT5 and the MSTPCRE.MSTPE14 bit security attribution 0: Secure 1: Non-secure	R/W
15	PSARE15	AGT4 and the MSTPCRE.MSTPE15 bit security attribution 0: Secure 1: Non-secure	R/W
21:16	—	These bits are read as 1. The write value should be 1.	R/W
22	PSARE22	GPT9 and the MSTPCRE.MSTPE22 bit security attribution 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
16	PSARD16	ADC120和MSTPRD.MSTPD16位安全属性 0: Secure 1: Non-secure	R/W
19:17	—	这些位被读取为1。写入值应为1。	R/W
20	PSARD20	DAC12和MSTPCRD.MSTPD20位安全归属 0: Secure 1: Non-secure	R/W
21	—	该位读取为1。写入值应为1。	R/W
22	PSARD22	TSN和MSTPCRD.MSTPD22位安全属性 0: Secure 1: Non-secure	R/W
31:23	—	这些位被读取为1。写入值应为1。	R/W

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。
Note: 该寄存器由PRCR寄存器写保护。

PSARD指定每个模块的安全属性以及模块停止控制寄存器中的相应位。

52.6.4 PSARE:外设安全属性寄存器E

Base address: PSCU = 0x400E_0000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PSARE31	PSARE30	PSARE29	PSARE28	PSARE27	PSARE26	PSARE25	PSARE24	PSARE23	PSARE22	—	—	—	—	—	—
重置后的值:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PSARE15	PSARE14	—	—	—	—	—	—	—	—	—	—	—	PSARE2	PSARE1	PSARE0
重置后的值:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	PSARE0	WDT安全归属 0: Secure 1: Non-secure	R/W
1	PSARE1	IWDT安全归属 0: Secure 1: Non-secure	R/W
2	PSARE2	RTC安全归属 0: Secure 1: Non-secure	R/W
13:3	—	这些位被读取为1。写入值应为1。	R/W
14	PSARE14	AGT5和MSTPCRE.MSTPE14位安全属性 0: Secure 1: Non-secure	R/W
15	PSARE15	AGT4和MSTPCRE.MSTPE15位安全属性 0: Secure 1: Non-secure	R/W
21:16	—	这些位被读取为1。写入值应为1。	R/W
22	PSARE22	GPT9和MSTPCRE.MSTPE22位安全属性 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
23	PSARE23	GPT8 and the MSTPCRE.MSTPE23 bit security attribution 0: Secure 1: Non-secure	R/W
24	PSARE24	GPT7 and the MSTPCRE.MSTPE24 bit security attribution 0: Secure 1: Non-secure	R/W
25	PSARE25	GPT6 and the MSTPCRE.MSTPE25 bit security attribution 0: Secure 1: Non-secure	R/W
26	PSARE26	GPT5 and the MSTPCRE.MSTPE26 bit security attribution 0: Secure 1: Non-secure	R/W
27	PSARE27	GPT4 and the MSTPCRE.MSTPE27 bit security attribution 0: Secure 1: Non-secure	R/W
28	PSARE28	GPT3 and the MSTPCRE.MSTPE28 bit security attribution 0: Secure 1: Non-secure	R/W
29	PSARE29	GPT2 and the MSTPCRE.MSTPE29 bit security attribution 0: Secure 1: Non-secure	R/W
30	PSARE30	GPT1 and the MSTPCRE.MSTPE30 bit security attribution 0: Secure 1: Non-secure	R/W
31	PSARE31	GPT0, GPT_OPS and the MSTPCRE.MSTPE31 bit security attribution 0: Secure 1: Non-secure	R/W

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

The PSARE specifies the security attribution for each module and the corresponding bit in Module Stop Control Register.

52.6.5 MSSAR : Module Stop Security Attribution Register

Base address: PSCU = 0x400E_0000

Offset address: 0x14

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MSSAR3	MSSAR2	MSSAR1	MSSAR0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSSAR0	The MSTPCRC.MSTPC14 bit security attribution 0: Secure 1: Non-secure	R/W
1	MSSAR1	The MSTPCRA.MSTPA22 bit security attribution 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
23	PSARE23	GPT8和MSTPCRE.MSTPE23位安全属性 0: Secure 1: Non-secure	R/W
24	PSARE24	GPT7和MSTPCRE.MSTPE24位安全属性 0: Secure 1: Non-secure	R/W
25	PSARE25	GPT6和MSTPCRE.MSTPE25位安全属性 0: Secure 1: Non-secure	R/W
26	PSARE26	GPT5和MSTPCRE.MSTPE26位安全属性 0: Secure 1: Non-secure	R/W
27	PSARE27	GPT4和MSTPCRE.MSTPE27位安全属性 0: Secure 1: Non-secure	R/W
28	PSARE28	GPT3和MSTPCRE.MSTPE28位安全属性 0: Secure 1: Non-secure	R/W
29	PSARE29	GPT2和MSTPCRE.MSTPE29位安全属性 0: Secure 1: Non-secure	R/W
30	PSARE30	GPT1和MSTPCRE.MSTPE30位安全属性 0: Secure 1: Non-secure	R/W
31	PSARE31	GPT0、GPT_OPS和MSTPCRE.MSTPE31位安全属性 0: Secure 1: Non-secure	R/W

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。
Note: 该寄存器由PRCR寄存器写保护。

PSARE指定每个模块的安全属性以及模块停止控制寄存器中的相应位。

52.6.5 MSSAR：模块停止安全属性寄存器

Base address: PSCU = 0x400E_0000

Offset address: 0x14

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MSSAR3	MSSAR2	MSSAR1	MSSAR0
重置后的值：	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSSAR0	MSTPCRC.MSTPC14位安全属性 0: Secure 1: Non-secure	R/W
1	MSSAR1	MSTPCRA.MSTPA22位安全属性 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
2	MSSAR2	The MSTPCRA.MSTPA7 bit security attribution 0: Secure 1: Non-secure	R/W
3	MSSAR3	The MSTPCRA.MSTPA0 bit security attribution 0: Secure 1: Non-secure	R/W
31:4	—	These bits are read as 1. The write value should be 1.	R/W

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

The MSSAR specifies the security attribution for the corresponding bit in Module Stop Control Register.

52.6.6 CFSAMONA : Code Flash Security Attribution Monitor Register A

Base address: PSCU = 0x400E_0000
Offset address: 0x18

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CFS2[8:0]									—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	The value set by user									0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	These bits are read as 0.	R
23:15	CFS2[8:0]	Code Flash Secure area 2 Indicate the total area of secure region and non-secure callable region for code flash.	R
31:24	—	These bits are read as 0.	R

Note: The CFSAMONA does not have security attribution.

52.6.7 CFSAMONB : Code Flash Security Attribution Monitor Register B

Base address: PSCU = 0x400E_0000
Offset address: 0x1C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CFS1[13:0]														—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	The value set by user														0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	—	These bits are read as 0.	R
23:10	CFS1[13:0]	Code Flash Secure area 1 Indicate the area of secure region for code flash.	R
31:24	—	These bits are read as 0.	R

Note: The CFSAMONB does not have security attribution.

Bit	Symbol	Function	R/W
2	MSSAR2	MSTPCRA.MSTPA7位安全属性 0: Secure 1: Non-secure	R/W
3	MSSAR3	MSTPCRA.MSTPA0位安全属性 0: Secure 1: Non-secure	R/W
31:4	—	这些位被读取为1。写入值应为1。	R/W

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。
Note: 该寄存器由PRCR寄存器写保护。

MSSAR指定模块停止控制寄存器中相应位的安全属性。

52.6.6 CFSAMONA：代码闪存安全属性监控寄存器A

Base address: PSCU = 0x400E_0000
Offset address: 0x18

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CFS2[8:0]									—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	用户设置的值									0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	这些位读为0。	R
23:15	CFS2[8:0]	CodeFlash安全区2 指示代码闪存的安全区域和非安全可调用区域的总面积。	R
31:24	—	这些位读为0。	R

Note: CFSAMONA没有安全属性。

52.6.7 CFSAMONB:代码闪存安全属性监控寄存器B

Base address: PSCU = 0x400E_0000
Offset address: 0x1C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	CFS1[13:0]														—	—	—	—	—	—	—	—	—	—
重置后的值：	0	0	0	0	0	0	0	0	用户设置的值														0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	—	这些位读为0。	R
23:10	CFS1[13:0]	CodeFlash安全区1 指示代码闪存的安全区域区域。	R
31:24	—	这些位读为0。	R

Note: CFSAMONB没有安全属性。

52.6.8 DFSAMON : Data Flash Security Attribution Monitor Register

Base address: PSCU = 0x400E_0000

Offset address: 0x20

Bit position:	31															15									10									0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFS[5:0]									—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	The value set by user									0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	—	These bits are read as 0.	R
15:10	DFS[5:0]	Data flash Secure area Indicate the area of Secure region for data flash.	R
31:16	—	These bits are read as 0.	R

Note: The DFSAMON does not have security attribution.

52.6.9 SSAMONA : SRAM Security Attribution Monitor Register A

Base address: PSCU = 0x400E_0000

Offset address: 0x24

Bit position:	31											20												13											0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	SS2[7:0]												—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	The value set by user												0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
12:0	—	These bits are read as 0.	R
20:13	SS2[7:0]	SRAM Secure area 2 Indicate the total area of Secure region and non-secure callable region for SRAM.	R
31:21	—	These bits are read as 0.	R

Note: The SSAMONA does not have security attribution.

52.6.10 SSAMONB : SRAM Security Attribution Monitor Register B

Base address: PSCU = 0x400E_0000

Offset address: 0x28

Bit position:	31											20										10										0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	SS1[10:0]										—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	The value set by user										0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	—	These bits are read as 0.	R
20:10	SS1[10:0]	SRAM secure area 1 Indicate the area of secure region for SRAM.	R
31:21	—	These bits are read as 0.	R

Note: The SSAMONB does not have security attribution.

52.6.8 DFSAMON:数据闪存安全属性监控寄存器

Base address: PSCU = 0x400E_0000

Offset address: 0x20

Bit position:	31															15									10									0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFS[5:0]									—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	用户设置的值									0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	—	这些位读为0。	R
15:10	DFS[5:0]	数据闪存安全区 指示数据闪存的安全区域区域。	R
31:16	—	这些位读为0。	R

Note: DFSAMON没有安全属性。

52.6.9 SSAMONA:SRAM安全属性监控寄存器A

Base address: PSCU = 0x400E_0000

Offset address: 0x24

Bit position:	31											20												13											0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	SS2[7:0]												—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	用户设置的值												0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
12:0	—	这些位读为0。	R
20:13	SS2[7:0]	SRAM安全区域2 指示SRAM的安全区域和非安全可调用区域的总面积。	R
31:21	—	这些位读为0。	R

Note: SSAMONA没有安全属性。

52.6.10 SSAMONB:SRAM安全属性监控寄存器B

Base address: PSCU = 0x400E_0000

Offset address: 0x28

Bit position:	31											20										10										0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	SS1[10:0]										—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	用户设置的值										0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
9:0	—	这些位读为0。	R
20:10	SS1[10:0]	SRAM安全区1 指示SRAM的安全区域区域。	R
31:21	—	这些位读为0。	R

Note: SSAMONB没有安全属性。

52.6.11 DLMMON : Device Lifecycle Management State Monitor Register

Base address: PSCU = 0x400E_0000

Offset address: 0x2C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	DLMMON[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	DLM status value			

Bit	Symbol	Function	R/W
3:0	DLMMON[3:0]	Device Lifecycle Management State Monitor 0x1: CM 0x2: SSD 0x3: NSECSD 0x4: DPL 0x5: LCK_DBG 0x6: LCK_BOOT 0x7: RMA_REQ 0x8: RMA_ACK Others: Reserved	R
31:4	—	These bits are read as 0. The write value should be 0.	R

Note: The DLMMON does not have security attribution.

52.6.12 TZFSAR : TrustZone Filter Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x180

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TZFSA0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0

Bit	Symbol	Function	R/W
0	TZFSA0	Security attributes of registers for TrustZone Filter 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 1.	R

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

TZFSA0 bit (Security attributes of registers for TrustZone Filter)

Security attributes of register for TZFOAD and TZFPT registers.

52.6.11 DLMMON:设备生命周期管理状态监视器寄存器

Base address: PSCU = 0x400E_0000

Offset address: 0x2C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	DLMMON[3:0]			
重置后的值:	0	0	0	0	0	0	0	0	0	0	0	0	DLM状态值			

Bit	Symbol	Function	R/W
3:0	DLMMON[3:0]	设备生命周期管理状态监视器 0x1: CM 0x2: SSD 0x3: NSECSD 0x4: DPL 0x5: LCK_DBG 0x6: LCK_BOOT 0x7: RMA_REQ 0x8: RMA_ACK Others: Reserved	R
31:4	—	这些位被读取为0。写入值应为0。	R

Note: DLMMON没有安全属性。

52.6.12 TZFSAR:TrustZone过滤器安全属性寄存器

Base address: CPSCU = 0x4000_8000

Offset address: 0x180

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
重置后的值:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

重置后的值:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0

Bit	Symbol	Function	R/W
0	TZFSA0	TrustZone过滤器寄存器的安全属性 0: Secure 1: Non-secure	R/W
31:1	—	这些位读为1。	R

Note: 只有安全访问才能写入该寄存器。允许安全访问和非安全读取访问，但不允许非安全写入访问，并且不会生成TrustZone访问错误。

Note: 该寄存器由PRCR寄存器写保护。

TZFSA0位（TrustZone过滤器寄存器的安全属性）

TZFOAD和TZFPT寄存器的寄存器安全属性。

52.6.13 TZFOAD : TrustZone Filter Operation After Detection Register

Base address: TZF = 0x4000_0E00

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection 0: Non-maskable interrupt 1: Reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	KeyCode This bit is used to enable or disable writing of the OAD bit.	W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

OAD bit (Operation after detection)

The OAD bit is specified to generate either reset or non-maskable interrupt when the access to the protect region is detected by the TrustZone Filter.

When the OAD bit is set, write 0xA5 in the KEY[7:0] bits at the same time.

KEY[7:0] bits (KeyCode)

The KEY[7:0] bits are used to enable or disable writing of the OAD bit. When writing the OAD bit, write 0xA5 in the KEY[7:0] bits at the same time.

When the KEY[7:0] bits value except 0xA5 is written in, the OAD bit is not updated.

The KEY[7:0] bits are read always as 0x00.

52.6.14 TZFPT : TrustZone Filter Protect Register

Base address: TZF = 0x4000_0E00

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: All Bus TrustZone Filter register writing is protected. Read is possible. 1: All Bus TrustZone Filter register writing is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	KeyCode This bit is used to enable or disable writing of the PROTECT bit.	W

Note: If the security attribution is configured as secure:
- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

52.6.13 TZFOAD：检测寄存器后的TrustZone过滤器操作

Base address: TZF = 0x4000_0E00

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	OAD
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	检测后操作 0：不可屏蔽中断1：复位	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W
15:8	KEY[7:0]	KeyCode 该位用于启用或禁用OAD位的写入。	W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：●
允许安全和非安全访问。

OAD位（检测后的操作）

当TrustZone过滤器检测到对保护区域的访问时，OAD位被指定为产生复位或不可屏蔽中断。

当OAD位置位时，同时向KEY[7:0]位写入0xA5。

KEY[7:0] bits (KeyCode)

KEY[7:0]位用于启用或禁用OAD位的写入。写入OAD位时，将0xA5写入KEY[7:0]位。

当KEY[7:0]位值除0xA5被写入时，OAD位不会更新。

KEY[7:0]位总是被读取为0x00。

52.6.14 TZFPT:TrustZone过滤器保护寄存器

Base address: TZF = 0x4000_0E00

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	保护
重置后的值：	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	注册保护 0：所有总线TrustZone过滤器寄存器写入受到保护。读取是可能的。1：所有总线TrustZone过滤器寄存器写入都是可能的。	R/W
7:1	—	这些位被读取为0。写入值应为0。	R/W
15:8	KEY[7:0]	KeyCode 该位用于启用或禁用PROTECT位的写入。	W

Note: 如果安全属性配置为安全：●
允许安全访问和非安全读取访问
- 忽略非安全写入访问，不会生成TrustZone访问错误。

如果安全属性配置为非安全：

- Secure and Non-secure access are allowed.

PROTECT bit (Protection of register)

The PROTECT bit controls enable or disable writing to the corresponding registers to be protected. TZFOAD register is protected by PROTECT.

When the PROTECT bit is set, write 0xA5 in the KEY[7:0] bits at the same time.

KEY[7:0] bits (KeyCode)

The KEY[7:0] bits are used to enable or disable writing of the PROTECT bit. When writing the PROTECT bit, write 0xA5 in the KEY[7:0] bits at the same time.

When the KEY[7:0] bits value except 0xA5 is written in, the PROTECT bit is not updated.

The KEY[7:0] bits are read always as 0x00.

52.7 Usage Notes

52.7.1 Restrictions on setting the security attribution

To set the software breakpoint, the debugger need to re-program the flash. Table 52.10 shows the registers that the debugger sets to re-program the flash. If the security attribution of the register listed in Table 52.10 is configured as secure, the debugger can not set the software breakpoint in NSECSD state because the debugger can not change the register setting. Secure developper need to configure the registers listed in Table 52.10 as non-secure only in NSECSD state.

Table 52.10 The registers that the debugger sets to re-program the flash

Function name	Register name
Clock Generation Circuit	SCKDIVCR, SCKCR, PLLCCR, PLLCR, HOCOCR, MOCOCR
Low-Power modes	OPCCR, SOPCCR

52.7.2 SAU setting

After reset, all of address space is marked as Secure by SAU default setting. SAU_CTRL register should be set to 0x2 to enable the IDAU security attribution. That is, after setting SAU_CTRL register to 0x2, the address space security attribution becomes as shown in Table 52.6.

52.7.3 Non-secure exception during the setting of FACI registers

As shown in Table 52.5, the registers related to FACI are protected from non-secure access only during programming/erasure or during suspend programming/erasure. Outside of this state, the access from non-secure region is not protected. For example, when programming by the secure user, the non-secure user can rewrite the FSADDR if a non-secure exception occurs immediately after “Set the start address of the target block to the FSADDR register” flow in Figure 50.14. If the FACI command is issued after the non-secure exception processing is completed and the CPU state returns to the secure state, data will be programmed to an address not intended by the secure user.

To prevent such a things, secure user needs to set not to accept the non-secure exception during the following period.

- Set not to accept the non-secure exeption before setting FWEPROR to 01h or setting FENTRYR to other than 0000h, that is before lereasing the protection of FWEPROR or FENTRYR.
- Set to accept the non-secure exception after all write access to the FACI command-issuing area is completed.

52.7.4 FCU interrupt usage

It is recommended that secure users do not use the FCU interrupts, but rather use the register polling. Because non-secure users can program/erase the data flash without calling the secure gateway, if secure user uses FCU interrupts, the unintentional exception handliing may be exeuted when data flash is programmed/erased by a non-secure user.

- 允许安全和非安全访问。

PROTECT位（寄存器保护）

PROTECT位控制启用或禁用对受保护的相应寄存器的写入。TZFOAD寄存器受PROTECT保护。

当PROTECT位置位时，同时向KEY[7:0]位写入0xA5。

KEY[7:0] bits (KeyCode)

KEY[7:0]位用于启用或禁用PROTECT位的写入。写入PROTECT位时，同时向KEY[7:0]位写入0xA5。

写入除0xA5以外的KEY[7:0]位值时，PROTECT位不更新。

KEY[7:0]位总是被读取为0x00。

52.7 使用说明

52.7.1 设置安全属性的限制

要设置软件断点，调试器需要重新编程闪存。表52.10显示了调试器为重新编程闪存而设置的寄存器。如果表52.10中列出的寄存器的安全属性配置为安全，则调试器无法在NSECSD状态下设置软件断点，因为调试器无法更改寄存器设置。仅在NSECSD状态下，安全开发人员需要将表52.10中列出的寄存器配置为非安全。

Table 52.10 调试器设置的用于重新编程闪存的寄存器

函数名称	注册名称
时钟产生电路	SCKDIVCR, SCKCR, PLLCCR, PLLCR, HOCOCR, MOCOCR
Low-Power modes	OPCCR, SOPCCR

52.7.2 SAU设置

复位后，SAU默认设置将所有地址空间标记为安全。SAU_CTRL寄存器应设置为0x2以启用IDAU安全属性。即设置SAU_CTRL寄存器为0x2后，地址空间安全属性变为如表52.6所示。

52.7.3 FACI寄存器设置期间的非安全异常

如表52.5所示，与FACI相关的寄存器仅在编程擦除或挂起编程擦除期间受到保护，不会受到非安全访问。在此状态之外，来自非安全区域的访问不受保护。例如，当由安全用户编程时，如果在图50.14中的“将目标块的起始地址设置为FSADDR寄存器”流程之后立即发生非安全异常，则非安全用户可以重写FSADDR。如果在非安全异常处理完成后发出FACI命令并且CPU状态返回到安全状态，则数据将被编程到安全用户不打算使用的地址。

为了防止这样的事情发生，安全用户需要在接下来的时间段内设置不接受非安全异常。

- 在将FWEPROR设置为01h或将FENTRYR设置为0000h以外的值之前，即在解除对FWEPROR或FENTRYR的保护之前，设置不接受非安全例外。
- 设置为在对FACI命令发布区域的所有写访问完成后接受非安全异常。

52.7.4 FCU中断使用

建议安全用户不要使用FCU中断，而是使用寄存器轮询。由于非安全用户可以在不调用安全网关的情况下对数据闪存进行编程擦除，因此如果安全用户使用FCU中断，则在数据闪存被非安全用户编程擦除时可能会执行意外异常处理。

53. Electrical Characteristics

Supported peripheral functions and pins differ from one product name to another.

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

- VCC = AVCC0 = VCC_USB = VBATT = 2.7 to 3.6 V, VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
- 2.7 ≤ VREFH0/VREFH ≤ AVCC0
- VSS = AVSS0 = VREFL0/VREFL = VSS_USB = VSS1_USBHS = VSS2_USBHS = AVSS_USBHS = PVSS_USBHS = 0 V
- $T_a = T_{opr}$

Figure 53.1 shows the timing conditions.

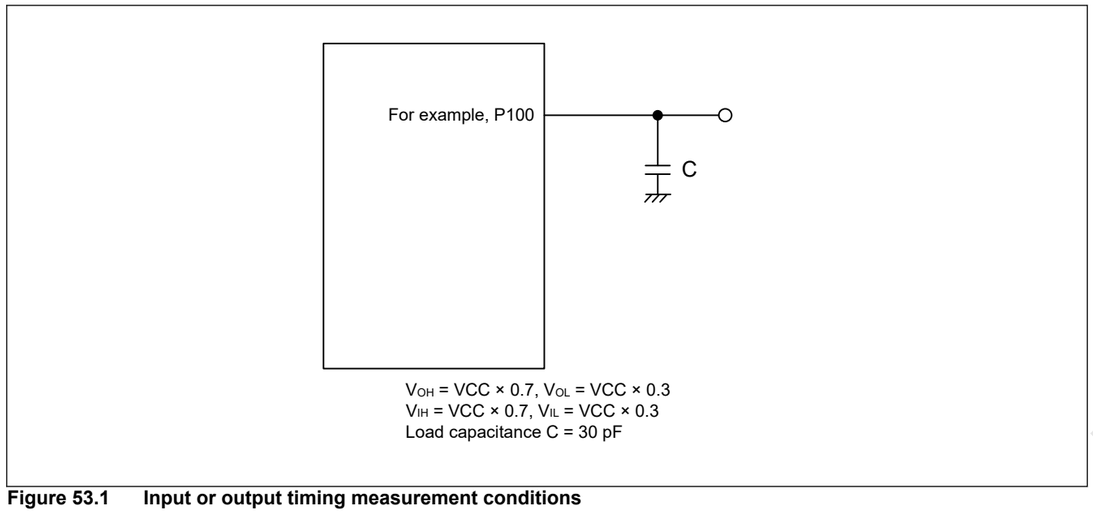

Figure 53.1 Input or output timing measurement conditions

The recommended measurement conditions for the timing specification of each peripheral provided are for the best peripheral operation. Make sure to adjust the driving abilities of each pin to meet your conditions.

53.1 Absolute Maximum Ratings

Table 53.1 Absolute maximum ratings

Parameter	Symbol	Value	Unit
Power supply voltage	VCC, VCC_USB*2	–0.3 to +4.0	V
VBATT power supply voltage	VBATT	–0.3 to +4.0	V
Input voltage (except for 5 V-tolerant ports*1)	V_{in}	–0.3 to VCC + 0.3	V
Input voltage (5 V-tolerant ports*1)	V_{in}	–0.3 to + VCC + 4.0 (max. 5.8)	V
Reference power supply voltage	VREFH/VREFH0	–0.3 to VCC + 0.3	V
USBHS power supply voltage	VCC_USBHS	–0.3 to +4.0	V
USBHS analog power supply voltage	AVCC_USBHS	–0.3 to +4.0	V
Analog power supply voltage	AVCC0*2	–0.3 to +4.0	V
Analog input voltage	V_{AN}	–0.3 to AVCC0 + 0.3	V
Operating temperature*3 *4	T_{opr}	–40 to +105	°C
Storage temperature	T_{stg}	–55 to +125	°C

Note 1. Ports P205, P206, P400, P401, P407 to P415, P511, P512, and P708 to P713 are 5 V tolerant.

53. 电气特性

支持的外围功能和引脚因产品名称而异。

除非另有规定，MCU的电气特性在以下条件下定义：

- VCC = AVCC0 = VCC_USB = VBATT = 2.7 to 3.6 V, VCC_USBHS = AVCC_USBHS = 3.0 to 3.6 V
- 2.7 ≤ VREFH0/VREFH ≤ AVCC0
- VSS = AVSS0 = VREFL0/VREFL = VSS_USB = VSS1_USBHS = VSS2_USBHS = AVSS_USBHS = PVSS_USBHS = 0 V
- $T_a = T_{opr}$

图53.1显示了时序条件。

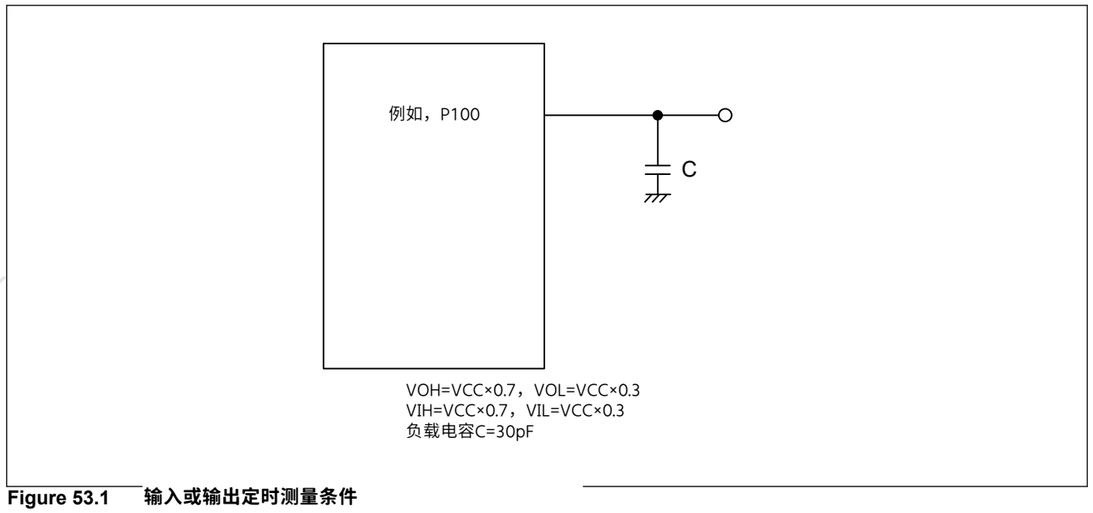

Figure 53.1 输入或输出定时测量条件

所提供的每个外设时序规范的推荐测量条件是为了实现最佳外设操作。确保调整每个引脚的驱动能力以满足您的条件。

53.1 绝对最大额定值

Table 53.1 绝对最大额定值

Parameter	Symbol	Value	Unit
电源电压	VCC, VCC_USB*2	–0.3 to +4.0	V
VBATT电源电压	VBATT	–0.3 to +4.0	V
输入电压（5V容限端口*1除外）	V_{in}	–0.3 to VCC + 0.3	V
输入电压（5V耐压端口*1）	V_{in}	–0.3 to + VCC + 4.0 (max. 5.8)	V
参考电源电压	VREFH/VREFH0	–0.3 to VCC + 0.3	V
USBHS电源电压	VCC_USBHS	–0.3 to +4.0	V
USBHS模拟电源电压	AVCC_USBHS	–0.3 to +4.0	V
模拟电源电压	AVCC0*2	–0.3 to +4.0	V
模拟输入电压	V_{AN}	–0.3 to AVCC0 + 0.3	V
工作温度*3*4	T_{opr}	–40 to +105	°C
贮存温度	T_{stg}	–55 to +125	°C

注1.端口P205、P206、P400、P401、P407至P415、P511、P512和P708至P713可承受5V。

RA生态工作室

Note 2. Connect AVCC0 and VCC_USB to VCC.
Note 3. See section 53.2.1. Tj/Ta Definition.
Note 4. Contact a Renesas Electronics sales office for information on derating operation when Ta = +85°C to +105°C. Derating is the systematic reduction of load for improved reliability.

Caution: Permanent damage to the MCU might result if absolute maximum ratings are exceeded.

Table 53.2 Recommended operating conditions

Parameter	Symbol	Value	Min	Typ	Max	Unit
Power supply voltages	VCC	When USB/USBHS is not used	2.7	—	3.6	V
		When USB/USBHS is used	3.0	—	3.6	V
	VSS		—	0	—	V
USB power supply voltages	VCC_USB, VCC_USBHS		—	VCC	—	V
	VSS_USB, AVSS_USBHS, PVSS_USBHS, VSS1_USBHS, VSS2_USBHS		—	0	—	V
VBATT power supply voltage	VBATT		1.65	—	3.6	V
Analog power supply voltages	AVCC0*1		—	VCC	—	V
	AVSS0		—	0	—	V

Note 1. Connect AVCC0 to VCC. When the A/D converter and the D/A converter are not in use, do not leave the AVCC0, VREFH/VREFH0, AVSS0, and VREFL/VREFL0 pins open. Connect the AVCC0 and VREFH/VREFH0 pins to VCC, and the AVSS0 and VREFL/VREFL0 pins to VSS, respectively.
Note 2. Low CL crystal cannot be used below VBATT = 1.8V.

53.2 DC Characteristics

53.2.1 Tj/Ta Definition

Table 53.3 DC characteristics

Parameter	Symbol	Typ	Max	Unit	Test conditions
Permissible junction temperature	T_j	—	125	°C	High-speed mode Low-speed mode Subosc-speed mode
			105*1		

Note: Make sure that $T_j = T_a + \theta ja \times$ total power consumption (W), where total power consumption = $(VCC - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + I_{CC}max \times VCC$.
Note 1. The upper limit of operating temperature is 85°C or 105°C, depending on the product. For details, see section 1.3. Part Numbering. If the part number shows the operation temperature to 85°C, then Tj max is 105°C, otherwise, 125°C.

注2.将AVCC0和VCC_USB连接到VCC。
注3：见第53.2.1节。TjTa定义。
注4.有关在Ta=+85°C至+105°C时降额运行的信息，请联系瑞萨电子销售办事处。降额是系统地减少负载以提高可靠性。

Caution: 如果超过绝对最大额定值，可能会对MCU造成永久性损坏。

Table 53.2 推荐工作条件

Parameter	Symbol	Value	Min	Typ	Max	Unit
电源电压	VCC	不使用USBUSBHS时	2.7	—	3.6	V
		使用USBUSBHS时	3.0	—	3.6	V
	VSS		—	0	—	V
USB电源电压	VCC_USB, VCC_USBHS		—	VCC	—	V
	VSS_USB, AVSS_USBHS, PVSS_USBHS, VSS1_USBHS, VSS2_USBHS		—	0	—	V
VBATT电源电压	VBATT		1.65	—	3.6	V
模拟电源电压	AVCC0*1		—	VCC	—	V
	AVSS0		—	0	—	V

注1.将AVCC0连接到VCC。不使用AD转换器和DA转换器时，不要离开AVCC0、VREFHVREFH0、AVSS0和VREFLVREFL0引脚打开。将AVCC0和VREFHVREFH0引脚连接到VCC，以及AVSS0和VREFLVREFL0引脚分别连接到VSS。
注2.低于VBATT=1.8V时不能使用低CL晶振。

53.2 DC Characteristics

53.2.1 Tj/Ta Definition

Table 53.3 DC characteristics

Parameter	Symbol	Typ	Max	Unit	测试条件
允许结温	T_j	—	125	°C	High-speed mode Low-speed mode Subosc-speed mode
			105*1		

Note: 确保Tj=Ta+θja×总功耗(W)，其中总功耗=(VCCVOH)×ΣIOH+VOL×ΣIOL+$I_{CC}max \times VCC$.
注1.工作温度上限为85°C或105°C，具体取决于产品。有关详细信息，请参阅第1.3节。零件编号。如果部件号显示工作温度为85°C，则Tjmax为105°C，否则为125°C。

Permissible output current (maxvalue of total of all pins)	Maximum of all output pins		$\Sigma I_{OH\ (max)}$	—	—	–80	mA
			$\Sigma I_{OL\ (max)}$	—	—	80	mA

Note 1. This is the value when low driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 2. This is the value when middle driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 3. This is the value when high driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 4. This is the value when high speed high driving ability is selected in the Port Drive Capability in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.
Note 5. Except for P200, which is an input port.

Caution: To protect the reliability of the MCU, the output current values should not exceed the values in this table. The average output current indicates the average value of current measured during 100 µs.

Table 53.5 IOIOH IOL(2/2)

Table 53.7 Operating and standby current (2 of 2)

Parameter			Symbol	Min	Typ	Max	Unit	Test conditions
Analog power supply current	During 12-bit A/D conversion		AI_{CC}	—	0.8	1.1	mA	—
	Temperature sensor			—	0.1	0.2	mA	—
	During D/A conversion (per unit)	Without AMP output		—	0.1	0.2	mA	—
		With AMP output		—	0.6	1.1	mA	—
	Waiting for A/D, D/A conversion (all units)			—	0.9	1.6	mA	—
	ADC12, DAC12 in standby modes (all units)*8			—	2	8	µA	—
Reference power supply current (VREFH0)	During 12-bit A/D conversion (unit 0)		AI_{REFH0}	—	70	120	µA	—
	Waiting for 12-bit A/D conversion (unit 0)			—	0.07	0.5	µA	—
	ADC12 in standby modes (unit 0)			—	0.07	0.5	µA	—
Reference power supply current (VREFH)	During 12-bit A/D conversion (unit 1)		AI_{REFH}	—	70	120	µA	—
	During D/A conversion (per unit)	Without AMP output		—	0.1	0.4	mA	—
		With AMP ouput		—	0.1	0.4	mA	—
	Waiting for 12-bit A/D (unit 1), D/A (all units) conversion			—	0.07	0.8	µA	—
	ADC12 unit 1 in standby modes			—	0.07	0.8	µA	—
USB operating current	Low speed	USB	$I_{CCUSBLS}$	—	3.5	6.5	mA	VCC_USB
		USBHS		—	10.5	13.5	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 0)
		USBHS		—	2.8	3.6	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 1)
	Full speed	USB	$I_{CCUSBFS}$	—	4.0	10.0	mA	VCC_USB
		USBHS		—	14	22	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 0)
		USBHS		—	6.5	13.0	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 1)
	High speed	USBHS	$I_{CCUSBHS}$	—	50	65	mA	VCC_USBHS = AVCC_USBHS
	Standby mode (direct power down)	USBHS	$I_{CCUSBSBY}$	—	0.5	4.5	µA	VCC_USBHS = AVCC_USBHS

Note 1. Supply current values are with all output pins unloaded and all input pull-up MOSs in the off state.
Note 2. Measured with clocks supplied to the peripheral functions. This does not include the BGO operation.
Note 3. I_{CC} depends on f (ICLK) as follows.
I_{CC} Max. = 0.34 × f + 58 (max. operation in high-speed mode)
I_{CC} Typ. = 0.07 × f + 3.7 (normal operation in high-speed mode, all peripheral clocks disabled)
I_{CC} Typ. = 0.2 × f + 1.7 (low-speed mode)
I_{CC} Max. = 0.035 × f + 58 (sleep mode)
Note 4. This does not include the BGO operation.
Note 5. Supply of the clock signal to peripherals is stopped in this state. This does not include the BGO operation.
Note 6. FCLK, BCLK, PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (3.125 MHz).
Note 7. Reference value
Note 8. When the MCU is in Software Standby mode or the MSTPCRD.MSTPD16 (12-Bit A/D Converter 0 Module Stop bit) and MSTPCRD.MSTPD15 (12-bit A/D converter 1 module stop bit) are in the module-stop state.
Note 9. FCLK, BCLK, PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (15.6 kHz).
Note 10. BCLK, PCLKA, PCLKB, PCLKC, and PCLKD are set to divided by 64 (512 Hz). FCLK is the same frequency as that of ICLK.

		USBHS		—	6.5	13.0	mA	VCC_USBHS = AVCC_USBHS (PHYSET.HSEB = 1)
	高速	USBHS	$I_{CCUSBHS}$	—	50	65	mA	VCC_USBHS = AVCC_USBHS
	待机模式（直接断电）	USBHS	$I_{CCUSBSBY}$	—	0.5	4.5	µA	VCC_USBHS = AVCC_USBHS

注1.电源电流值是在所有输出引脚空载且所有输入上拉MOS处于关闭状态时的值。
注2.使用提供给外设功能的时钟测量。这不包括BGO操作。
注3.ICC取决于f(ICLK)，如下所示。
我CC最大。=0.34×f+58（高速模式下的最大操作）
我CC典型。=0.07×f+3.7（高速模式下正常运行，所有外设时钟禁用）
I_{CC} Typ. = 0.2 × f + 1.7 (low-speed mode)
I_{CC} Max. = 0.035 × f + 58 (sleep mode)
注4.这不包括BGO操作。
注5.在此状态下停止向外围设备提供时钟信号。这不包括BGO操作。
注6.FCLK、BCLK、PCLKA、PCLKB、PCLKC和PCLKD设置为除以64(3.125MHz)。
注7.参考值
注8.当MCU处于软件待机模式或MSTPCRD.MSTPD16（12位AD转换器0模块停止位）和
MSTPCRD.MSTPD15（12位AD转换器1模块停止位）处于模块停止状态。
注9.FCLK、BCLK、PCLKA、PCLKB、PCLKC和PCLKD设置为64分频（15.6kHz）。
注10.BCLK、PCLKA、PCLKB、PCLKC和PCLKD设置为除以64(512Hz)。FCLK与ICLK的频率相同。

Table 53.8 Coremark and normal mode current

Parameter			Symbol	Typ	Unit	Test conditions
Supply Current*1	Coremark		I_{CC}	107	µA/MHz	ICLK = 200MHz PCLKA = PCLKB = PCLKC = PCLKD = FCLK = BCLK = 3.125MHz
	Normal mode	All peripheral clocks disabled, cache on, while (1) code executing from flash*2		104		
		All peripheral clocks disabled, cache off, while (1) code executing from flash*2		87		

Note 1. Supply current values are with all output pins unloaded and all input pull-up MOSs in the off state.
Note 2. Supply of the clock signal to peripherals is stopped in this state. This does not include the BGO operation.

Table 53.8 Coremark和正常模式电流

Parameter			Symbol	Typ	Unit	测试条件
电源电流*1	Coremark		I_{CC}	107	µA/MHz	ICLK = 200MHz PCLKA = PCLKB = PCLKC = PCLKD = FCLK = BCLK = 3.125MHz
	正常模式	禁用所有外设时钟，开启缓存，同时(1)从闪存执行代码*2		104		
		所有外设时钟禁用，缓存关闭，同时(1)代码从闪存执行*2		87		

注1.电源电流值是在所有输出引脚空载且所有输入上拉MOS处于关闭状态时的值。
注2.在此状态下停止向外围设备提供时钟信号。这不包括BGO操作。

53.2.6 VCC Rise and Fall Gradient and Ripple Frequency

Table 53.9 Rise and fall gradient characteristics

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
VCC rising gradient	Voltage monitor 0 reset disabled at startup	SrVCC	0.0084	—	20	ms/V	—
	Voltage monitor 0 reset enabled at startup		0.0084	—	—		—
	SCI/USB boot mode*1		0.0084	—	20		—
VCC falling gradient*2		SfVCC	0.0084	—	—	ms/V	—

Note 1. At boot mode, the reset from voltage monitor 0 is disabled regardless of the value of the OFS1.LVDAS bit.
Note 2. This applies when VBATT is used.

Table 53.10 Rising and falling gradient and ripple frequency characteristics

The ripple voltage must meet the allowable ripple frequency $f_{r(VCC)}$ within the range between the VCC upper limit (3.6 V) and lower limit (2.7 V). When the VCC change exceeds VCC ±10%, the allowable voltage change rising and falling gradient dt/dVCC must be met.

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Allowable ripple frequency	$f_{r\ (VCC)}$	—	—	10	kHz	Figure 53.6 $V_{r\ (VCC)} \leq VCC \times 0.2$
		—	—	1	MHz	Figure 53.6 $V_{r\ (VCC)} \leq VCC \times 0.08$
		—	—	10	MHz	Figure 53.6 $V_{r\ (VCC)} \leq VCC \times 0.06$
Allowable voltage change rising and falling gradient	dt/dVCC	1.0	—	—	ms/V	When VCC change exceeds VCC ±10%

53.2.6 VCC上升和下降梯度和纹波频率

Table 53.9 上升和下降梯度特性

Parameter		Symbol	Min	Typ	Max	Unit	测试条件
VCC上升梯度	启动时禁用电压监视器0复位	SrVCC	0.0084	—	20	ms/V	—
	启动时启用电压监视器0复位		0.0084	—	—		—
	SCIUSB启动模式*1		0.0084	—	20		—
VCC下降梯度*2		SfVCC	0.0084	—	—	ms/V	—

注1.在引导模式下，无论OFS1.LVDAS位的值如何，都禁止从电压监视器0进行的复位。
注2.这适用于使用VBATT时。

Table 53.10 上升下降梯度和纹波频率特性

纹波电压必须在VCC上限(3.6V)和下限(2.7
五）。当VCC变化超过VCC±10%时，必须满足允许的电压变化上升和下降梯度dtdVCC。

Parameter	Symbol	Min	Typ	Max	Unit	测试条件
允许纹波频率	$f_{r\ (VCC)}$	—	—	10	kHz	Figure 53.6 $V_{r\ (VCC)} \leq VCC \times 0.2$
		—	—	1	MHz	Figure 53.6 $V_{r\ (VCC)} \leq VCC \times 0.08$
		—	—	10	MHz	Figure 53.6 $V_{r\ (VCC)} \leq VCC \times 0.06$
允许电压变化上升下降梯度	dt/dVCC	1.0	—	—	ms/V	当VCC变化超过VCC ±10%

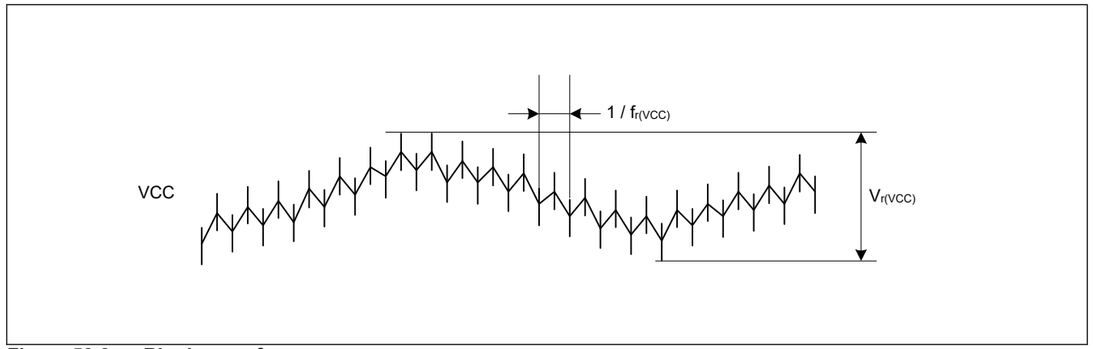

Figure 53.6 Ripple waveform

53.2.7 Thermal Characteristics

Maximum value of junction temperature (Tj) must not exceed the value of "section 53.2.1. Tj/Ta Definition".

Tj is calculated by either of the following equations.

- Tj = Ta + θja × Total power consumption
- Tj = Tt + Ψjt × Total power consumption
  - Tj : Junction Temperature (°C)
  - Ta : Ambient Temperature (°C)
  - Tt : Top Center Case Temperature (°C)
  - θja : Thermal Resistance of "Junction"-to-"Ambient" (°C/W)
  - Ψjt : Thermal Resistance of "Junction"-to-"Top Center Case" (°C/W)
- Total power consumption = Voltage × (Leakage current + Dynamic current)
- Leakage current of IO = Σ (I_{OL} × V_{OL}) /Voltage + Σ (|I_{OH}| × |VCC – V_{OH}|) /Voltage
- Dynamic current of IO = Σ IO (C_{in} + C_{load}) × IO switching frequency × Voltage
  - C_{in}: Input capacitance
  - C_{load}: Output capacitance

Regarding θja and Ψjt, refer to Table 53.11.

Table 53.11 Thermal Resistance

Parameter	Package	Symbol	Value*1	Unit	Test conditions
Thermal Resistance	100-pin LQFP (PLQP0100KB-B)	θja	35.0	°C/W	JESD 51-2 and 51-7 compliant
	144-pin LQFP (PLQP0144KA-B)		33.0		
	176-pin LQFP (PLQP0176KB-C)		32.3		
	176-pin BGA (PLBG0176GF-A)		35.4		JESD 51-2 and 51-9 compliant
	100-pin LQFP (PLQP0100KB-B)	Ψjt	0.76	°C/W	JESD 51-2 and 51-7 compliant
	144-pin LQFP (PLQP0144KA-B)		0.63		
	176-pin LQFP (PLQP0176KB-C)		0.48		
	176-pin BGA (PLBG0176GF-A)		0.52		JESD 51-2 and 51-9 compliant

Note 1. The values are reference values when the 4-layer board is used. Thermal resistance depends on the number of layers or size of the board. For details, refer to the JEDEC standards.

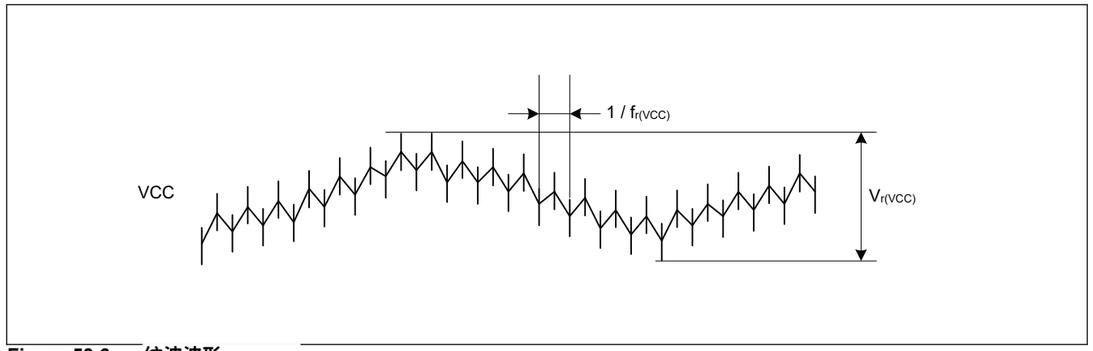

Figure 53.6 纹波波形

53.2.7 热特性

结温（Tj）的最大值不得超过"第53.2.1节的值。TjTa定义"。

Tj通过以下任一公式计算。

●Tj=Ta+θja×总功耗

●Tj=Tt+Ψjt×总功耗

Tj：结温(°C)

Ta：环境温度（°C）

Tt：顶部中心外壳温度(°C)

θja："结"到"环境"的热阻(°CW)

Ψjt："结"到"顶部中心外壳"的热阻(°CW)

●总功耗=电压×（漏电流+动态电流）

●IO漏电流=Σ(IOL×VOL)电压+Σ(IOH×VCC VOH)电压

●IO的动态电流=ΣIO(Cin+Cload)×IO开关频率×电压

Cin:输入电容

C负载：输出电容

关于θja和Ψjt，请参阅表53.11。

Table 53.11 热阻

Parameter	Package	Symbol	Value*1	Unit	测试条件
热阻	100-pin LQFP (PLQP0100KB-B)	θja	35.0	°C/W	符合JESD51-2和51-7
	144-pin LQFP (PLQP0144KA-B)		33.0		
	176-pin LQFP (PLQP0176KB-C)		32.3		
	176-pin BGA (PLBG0176GF-A)		35.4		符合JESD51-2和51-9
	100-pin LQFP (PLQP0100KB-B)	Ψjt	0.76	°C/W	符合JESD51-2和51-7
	144-pin LQFP (PLQP0144KA-B)		0.63		
	176-pin LQFP (PLQP0176KB-C)		0.48		
	176-pin BGA (PLBG0176GF-A)		0.52		符合JESD51-2和51-9

注1.数值为使用4层板时的参考值。热阻取决于板的层数或尺寸。有关详细信息，请参阅JEDEC标准。

53.2.7.1 Calculation guide of I_{CC}max

Table 53.12 shows the power consumption of each unit.

Table 53.12 Power consumption of each unit

RA生态工作室

Note 1. The values are guaranteed by design.
Note 2. LDO and Leak are internal voltage regulator's current and MCU's leakage current.
It is selected according to the temperature of Ta.
Note 3. Δ(Tj-Ta) = 20 °C is considered to measure the current.
Note 4. To determine the current consumption per channel or unit, divide Current [mA] by the number of channels, groups or units.

Table 53.13 shows the outline of operation for each unit.

Table 53.13 Outline of operation for each unit (1 of 2)

Peripheral	Outline of operation
GPT	Operating modes is set to saw-wave PWM mode. GPT is operating with PCLKD.
POEG	Only clear module stop bit.
AGT	AGT is operating with PCLKB.
RTC	RTC is operating with LOCO.
WDT	WDT is operating with PCLKB.
IWDT	IWDT is operating with IWDTCLK.
ETHERC	Operation modes is set to full-duplex mode. ETHERC is operating using Reduced Media Independent Interface (RMII).
USBFS	Transfer types is set to bulk transfer. USBFS is operating using Full-speed transfer (12 Mbps).
USBHS	Transfer types is set to bulk transfer. USBHS is operating using High-speed transfer.
SCI	SCI is transmitting data in clock synchronous mode.
IIC	Communication format is set to I2C-bus format. IIC is transmitting data in master mode.
CANFD	CANFD is transmitting and receiving data in self-test mode 1.
SPI	SPI mode is set to SPI operation (4-wire method). SPI master/slave mode is set to master mode. SPI is transmitting 8-bit width data.
OSPI	Transfer mode is single continuous write mode. OSPI is issuing memory write command to OctaRAM.
QSPI	QSPI is issuing Fast Read Quad I/O Instruction.
SSIE	Communication mode is set to Master. System word length is set to 32 bits. Data word length is set to 20 bits. SSIE is transmitting data using I2S format.
CEC	CEC operation clock is set to CECCLK. CEC is transmitting and receiving header block and data block.
SDHI	Transfer bus mode is set to 4-bit wide bus mode. SDHI is issuing CMD24 (single-block write).
ADC12	Resolution is set to 12-bit accuracy. Data registers is set to A/D-converted value addition mode. ADC12 is converting the analog input in continuous scan mode.
DAC12	DAC12 is outputting the conversion result while updating the value of data register.
TSN	TSN is operating.
CTSU	CTSU is operating in self-capacitance single scan mode.
ELC	Only clear module stop bit.
SCE9	SCE9 is executing built-in self test.
CRC	CRC is generating CRC code using 32-bit CRC32-C polynomial.
DOC	DOC is operating in data addition mode.

注1.数值由设计保证。
注2.LDO和Leak是内部稳压器的电流和MCU的漏电流。
根据Ta的温度选择。
注3.测量电流时考虑Δ(Tj-Ta)=20°C。
注4.要确定每个通道或单元的电流消耗，请将电流[mA]除以通道 、组或单元的数量。

表53.13显示了每个单元的操作概要。

Table 53.13 每个单元的操作概要（2个中的1个）

Peripheral	操作概要
GPT	操作模式设置为锯齿波PWM模式。 GPT使用PCLKD运行。
POEG	只清除模块停止位。
AGT	AGT使用PCLKB运行。
RTC	RTC与LOCO一起运行。
WDT	WDT使用PCLKB运行。
IWDT	IWDT使用IWDTCLK运行。
ETHERC	操作模式设置为全双工模式。 ETHERC使用精简媒体独立接口(RMII)运行。
USBFS	传输类型设置为批量传输。 USBFS使用全速传输(12Mbps)运行。
USBHS	传输类型设置为批量传输。 USBHS使用高速传输运行。
SCI	SCI在时钟同步模式下传输数据。
IIC	通信格式设置为I2C总线格式。 IIC在主机模式下传输数据。
CANFD	CANFD在自检模式1下发送和接收数据。
SPI	SPI模式设置为SPI操作（4线方法）。 SPI主从模式设置为主模式。 SPI正在传输8位宽度的数据。
OSPI	传输模式为单次连续写入模式。 OSPI正在向OctaRAM发出内存写入命令。
QSPI	QSPI正在发出快速读取四线IO指令。
SSIE	通信模式设置为主。 系统字长设置为32位。 数据字长设置为20位。 SSIE使用I2S格式传输数据。
CEC	CEC操作时钟设置为CECCLK。 CEC是发送和接收头块和数据块。
SDHI	传输总线模式设置为4位宽总线模式。 SDHI正在发布CMD24（单块写入）。
ADC12	分辨率设置为12位精度。 数据寄存器设置为AD转换值加法模式。 ADC12在连续扫描模式下转换模拟输入。
DAC12	DAC12在更新数据寄存器值的同时输出转换结果。
TSN	TSN正在运行。
CTSU	CTSU在自电容单次扫描模式下运行。
ELC	只清除模块停止位。
SCE9	SCE9正在执行内置自检。
CRC	CRC使用32位CRC32-C多项式生成CRC码。
DOC	DOC在数据添加模式下运行。

Table 53.13 Outline of operation for each unit (2 of 2)

Peripheral	Outline of operation
CAC	Measurement target clocks is set to PCLKB. Measurement reference clocks is set to PCLKB. CAC is measuring the clock frequency accuracy.
DMAC	Bit length of transfer data is set to 32 bits. Transfer mode is set to block transfer mode. DMAC is transferring data from SRAM0 to SRAM0.
DTC	Bit length of transfer data is set to 32 bits. Transfer mode is set to block transfer mode. DTC is transferring data from SRAM0 to SRAM0.

53.2.7.2 Example of T_j calculation

Assumption :

- Package 176-pin LQFP : θja = 32.3 °C/W
- Ta = 100 °C
- I_{CC}max = 70 mA
- VCC = 3.5 V (VCC = AVCC0 = AVCC_USBHS = VCC_USB = VCC_USBHS)
- I_{OH} = 1 mA, V_{OH} = VCC – 0.5 V, 12 Outputs
- I_{OL} = 20 mA, V_{OL} = 1.0 V, 8 Outputs
- I_{OL} = 1 mA, V_{OL} = 0.5 V, 12 Outputs
- C_{in} = 8 pF, 32 pins, Input frequency = 10 MHz
- C_{load} = 30 pF, 32 pins, Output frequency = 10 MHz

Leakage current of IO = Σ (V_{OL} × I_{OL}) / Voltage + Σ ((VCC - V_{OH}) × I_{OH}) / Voltage
= (20 mA × 1 V) × 8 / 3.5 V + (1 mA × 0.5 V) × 12 / 3.5 V + ((VCC - (VCC - 0.5 V)) × 1 mA) × 12 / 3.5 V
= 45.7 mA + 1.71 mA + 1.71 mA
= 49.1 mA

Dynamic current of IO = Σ IO (C_{in} + C_{load}) × IO switching frequency × Voltage
= ((8 pF × 32) × 10 MHz + (30 pF × 32) × 10 MHz) × 3.5 V
= 42.6 mA

Total power consumption = Voltage × (Leakage current + Dynamic current)
= (70 mA × 3.5 V) + (49.1 mA + 42.6 mA) × 3.5 V
= 566 mW (0.566 W)

Tj = Ta + θja × Total power consumption
= 100 °C + 32.3 °C/W × 0.566W
= 118.7 °C

53.3 AC Characteristics

Table 53.13 每个单元的操作概要（2个中的2个）

Peripheral	操作概要
CAC	测量目标时钟设置为PCLKB。 测量参考时钟设置为PCLKB。CAC正在测量时钟 频率精度。
DMAC	传输数据的位长设置为32位。 传输模式设置为块传输模式。 DMAC正在将数据从SRAM0传输到SRAM0。
DTC	传输数据的位长设置为32位。 传输模式设置为块传输模式。 DTC正在将数据从SRAM0传输到SRAM0。

53.2.7.2 Tj计算示例

Assumption :

- Package 176-pin LQFP : θja = 32.3 °C/W
- Ta = 100 °C

●ICC最大值=70mA

- VCC = 3.5 V (VCC = AVCC0 = AVCC_USBHS = VCC_USB = VCC_USBHS)

●IOH=1mA，VOH=VCC 0.5V，12个输出

●IOL=20mA，VOL=1.0V，8个输出

●IOL=1mA，VOL=0.5V，12路输出

●Cin=8pF，32引脚，输入频率=10MHz

●C负载=30pF，32引脚，输出频率=10MHz

IO的漏电流=Σ(VOL×IOL)电压+Σ((VCCVOH)×IOH)电压
= (20 mA × 1 V) × 8 / 3.5 V + (1 mA × 0.5 V) × 12 / 3.5 V + ((VCC - (VCC - 0.5 V)) × 1 mA) × 12 / 3.5 V
= 45.7 mA + 1.71 mA + 1.71 mA
= 49.1 mA

IO的动态电流 =ΣIO(Cin+Cload)×IO开关频率×电压
= ((8 pF × 32) × 10 MHz + (30 pF × 32) × 10 MHz) × 3.5 V
= 42.6 mA

总功耗 =电压×(漏电流+动态电流)
= (70 mA × 3.5 V) + (49.1 mA + 42.6 mA) × 3.5 V
= 566 mW (0.566 W)

Tj =Ta+θja×总功耗
= 100 °C + 32.3 °C/W × 0.566W
= 118.7 °C

53.3 交流特性

53.3.1 Frequency

Table 53.14 Operation frequency value in high-speed mode

	Flash interface clock (FCLK)*2		—*1	—	50	
	External bus clock (BCLK)*2		—	—	100	
	EBCLK pin output		—	—	50	

Note 1. FCLK must run at a frequency of at least 4 MHz when programming or erasing the flash memory.
Note 2. See section 8, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, and BCLK frequencies.
Note 3. When the ADC12 is used, the PCLKC frequency must be at least 1 MHz.

Table 53.15 Operation frequency value in low-speed mode

Parameter		Symbol	Min	Typ	Max	Unit
Operation frequency	System clock (ICLK)*2	f	—	—	1	MHz
	Peripheral module clock (PCLKA)*2		—	—	1	
	Peripheral module clock (PCLKB)*2		—	—	1	
	Peripheral module clock (PCLKC)*2 *3		—*3	—	1	
	Peripheral module clock (PCLKD)*2		—	—	1	
	Flash interface clock (FCLK)*1 *2		—	—	1	
	External bus clock (BCLK)		—	—	1	
	EBCLK pin output		—	—	1	

Note 1. Programming or erasing the flash memory is disabled in low-speed mode.
Note 2. See section 8, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, and BCLK frequencies.
Note 3. When the ADC12 is used, the PCLKC frequency must be set to at least 1 MHz.

Table 53.16 Operation frequency value in Subosc-speed mode

Parameter		Symbol	Min	Typ	Max	Unit
Operation frequency	System clock (ICLK)*2	f	29.4	—	36.1	kHz
	Peripheral module clock (PCLKA)*2		—	—	36.1	
	Peripheral module clock (PCLKB)*2		—	—	36.1	
	Peripheral module clock (PCLKC)*2 *3		—	—	36.1	
	Peripheral module clock (PCLKD)*2		—	—	36.1	
	Flash interface clock (FCLK)*1 *2		29.4	—	36.1	
	External bus clock (BCLK)*2		—	—	36.1	
	EBCLK pin output		—	—	36.1	

Note 1. Programming or erasing the flash memory is disabled in Subosc-speed mode.
Note 2. See section 8, Clock Generation Circuit for the relationship between the ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, and BCLK frequencies.
Note 3. The ADC12 cannot be used.

53.3.1 Frequency

Table 53.14 高速模式下的运行频率值

Parameter		Symbol	Min	Typ	Max	Unit
运行频率	系统时钟（ICLK*2）	f	—	—	200	MHz
	外围模块时钟(PCLKA)*2		—	—	100	
	外围模块时钟(PCLKB)*2		—	—	50	
	外围模块时钟(PCLKC)*2		—*3	—	50	
	外围模块时钟(PCLKD)*2		—	—	100	
	闪存接口时钟(FCLK)*2		—*1	—	50	
	外部总线时钟(BCLK)*2		—	—	100	
	EBCLK引脚输出		—	—	50	

注1.在对闪存进行编程或擦除时，FCLK必须以至少4MHz的频率运行。
注2.有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD、FCLK和BCLK频率之间的关系，请参见第8节“时钟生成电路”。

注3.使用ADC12时，PCLKC频率必须至少为1MHz。

Table 53.15 低速模式下的运行频率值

Parameter		Symbol	Min	Typ	Max	Unit
运行频率	系统时钟(ICLK)*2	f	—	—	1	MHz
	外围模块时钟(PCLKA)*2		—	—	1	
	外围模块时钟(PCLKB)*2		—	—	1	
	外围模块时钟(PCLKC)*2*3		—*3	—	1	
	外围模块时钟(PCLKD)*2		—	—	1	
	Flash接口时钟(FCLK)*1*2		—	—	1	
	外部总线时钟(BCLK)		—	—	1	
	EBCLK引脚输出		—	—	1	

注1.在低速模式下禁止对闪存进行编程或擦除。
注2.有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD、FCLK和BCLK频率之间的关系，请参见第8节“时钟生成电路”。

注3.使用ADC12时，PCLKC频率必须设置为至少1MHz。

Table 53.16 Subosc-speed模式下的运行频率值

Parameter		Symbol	Min	Typ	Max	Unit
运行频率	系统时钟(ICLK)*2	f	29.4	—	36.1	kHz
	外围模块时钟(PCLKA)*2		—	—	36.1	
	外围模块时钟(PCLKB)*2		—	—	36.1	
	外围模块时钟(PCLKC)*2*3		—	—	36.1	
	外围模块时钟(PCLKD)*2		—	—	36.1	
	Flash接口时钟(FCLK)*1*2		29.4	—	36.1	
	外部总线时钟(BCLK)*2		—	—	36.1	
	EBCLK引脚输出		—	—	36.1	

注1.在Subosc速度模式下，编程或擦除闪存被禁用。
注2.有关ICLK、PCLKA、PCLKB、PCLKC、PCLKD、FCLK和BCLK频率之间的关系，请参见第8节“时钟生成电路”。

注3.ADC12不能使用。

HOCO周期抖动		—	—	±85	—	ps	—
FLL稳定等待时间		t_{FLLWT}	—	—	1.8	ms	—
锁相环时钟频率		f_{PLL}	120	—	200	MHz	—
PLL2时钟频率		f_{PLL2}	120	—	240	MHz	—
PLLPLL2时钟振荡稳定等待时间		t_{PLLWT}	—	—	174.9	µs	Figure 53.11
PLLPLL2周期抖动		—	—	±100	—	ps	—
PLLPLL2长期抖动		—	—	±300	—	ps	Term: 1µs, 10µs

注1.设置主时钟振荡器时，请向振荡器制造商索取振荡评估，并将结果作为推荐的振荡稳定时间。将MOSCWTCR寄存器设置为等于或大于推荐值的值。更改MOSCCR.MOSTP位的设置以启动主时钟操作后，读取OSCSF.MOSCSF标志以确认其为1，然后开始使用主时钟振荡器。

RA生态工作室

Note 2. This is the time from release from reset state until the HOCO oscillation frequency (f_{HOCO}) reaches the range for guaranteed operation.

Table 53.18 Clock timing for the sub-clock oscillator

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Sub-clock frequency	f_{SUB}	—	32.768	—	kHz	—
Sub-clock oscillation stabilization wait time	$t_{SUBOSCWT}$	—	—	—*1	s	Figure 53.12

Note 1. When setting up the sub-clock oscillator, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time.
After changing the setting in the SOSCCR.SOSTP bit to start sub-clock operation, only start using the sub-clock oscillator after the sub-clock oscillation stabilization time elapses with an adequate margin. A value that is two times the value shown is recommended.

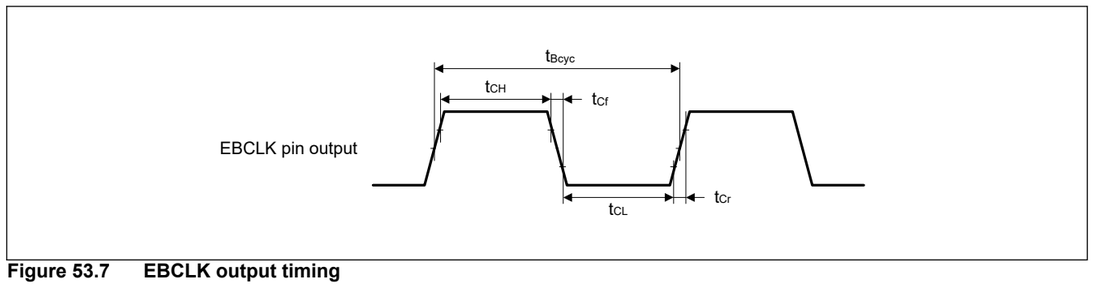

Figure 53.7 EBCLK output timing

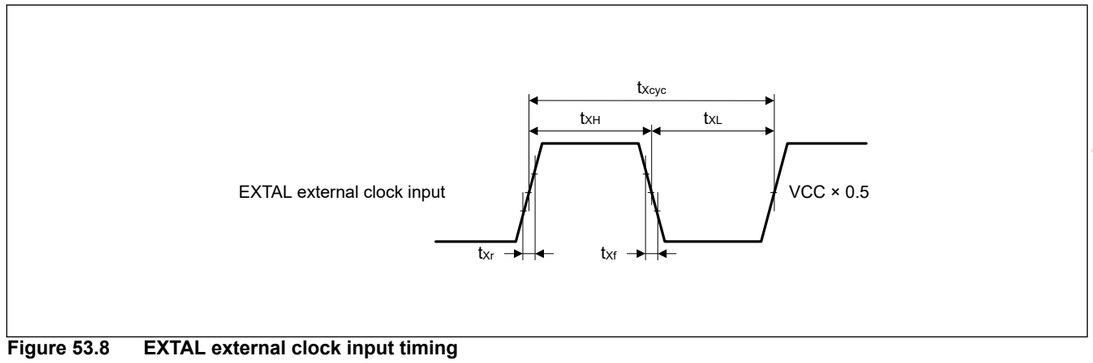

Figure 53.8 EXTAL external clock input timing

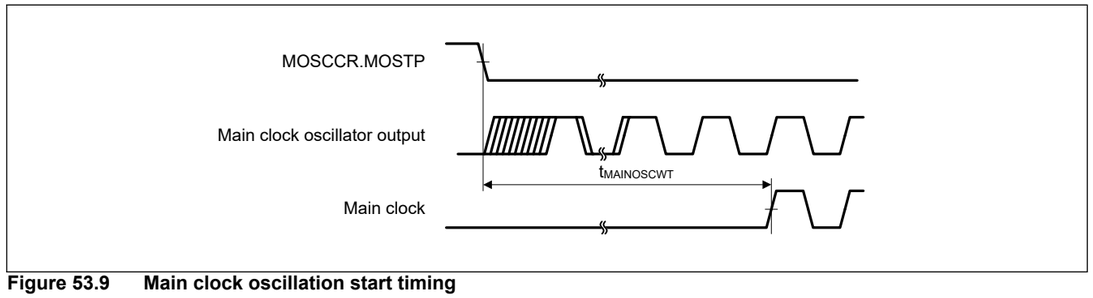

Figure 53.9 Main clock oscillation start timing

注2.这是从复位状态释放到HOCO振荡频率(fHOCO)达到保证工作范围的时间。

Table 53.18 副时钟振荡器的时钟时序

Parameter	Symbol	Min	Typ	Max	Unit	测试条件
Sub-clock frequency	f_{SUB}	—	32.768	—	kHz	—
副时钟振荡稳定等待时间	$t_{SUBOSCWT}$	—	—	—*1	s	Figure 53.12

注1.设置副时钟振荡器时，请咨询振荡器制造商进行振荡评估，并将结果作为推荐的振荡稳定时间。更改SOSCCR.SOSTP位的设置以启动副时钟操作后，只有在副时钟振荡稳定时间过去并留有足够余量后才开始使用副时钟振荡器。建议使用两倍于显示值的值。

	系统时钟源是带有HOCO*9的PLL		t_{SBYPH}*13	—	175	265	µs	
	系统时钟源为MOCO时钟振荡器*10		t_{SBYMO}*13	—	35	65	µs	

Table 53.20 Timing of recovery from low power modes (2 of 2)

Parameter		Symbol	Min	Typ	Max	Unit	Test conditions
Recovery time from Deep Software Standby mode	DPSBYCR.DEEPCUT[1] = 0 and DPSWCR.WTSTS[5:0] = 0x0E	t_{DSBY}	—	0.38	0.54	ms	Figure 53.16
	DPSBYCR.DEEPCUT[1] = 1 and DPSWCR.WTSTS[5:0] = 0x19	t_{DSBY}	—	0.55	0.73	ms	
Wait time after cancellation of Deep Software Standby mode		t_{DSBYWT}	56	—	57	t_{cyc}	
Recovery time from Software Standby mode to Snooze mode	High-speed mode when system clock source is HOCO (20 MHz)	t_{SNZ}	—	35*12	70*12	µs	Figure 53.17
	High-speed mode when system clock source is MOCO (8 MHz)	t_{SNZ}	—	11*12	14*12	µs	

Note 1. The recovery time is determined by the system clock source. When multiple oscillators are active, the recovery time can be determined with the following equation:
Total recovery time = recovery time for an oscillator as the system clock source + the longest tSBYOSCWT in the active oscillators - tSBYOSCWT for the system clock + 2 LOCO cycles (when LOCO is operating) + Subosc is oscillating and MSTPC0 = 0 (CAC module stop))
Note 2. When the frequency of the crystal is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x05) and the greatest value of the internal clock division setting is 1.
Note 3. When the frequency of PLL is 200 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x05) and the greatest value of the internal clock division setting is 4.
Note 4. When the frequency of the external clock is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x00) and the greatest value of the internal clock division setting is 1.
Note 5. When the frequency of PLL is 200 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x00) and the greatest value of the internal clock division setting is 4.
Note 6. The Sub-clock oscillator frequency is 32.768 KHz and the greatest value of the internal clock division setting is 1.
Note 7. The LOCO frequency is 32.768 kHz and the greatest value of the internal clock division setting is 1.
Note 8. The HOCO frequency is 20 MHz and the greatest value of the internal clock division setting is 1.
Note 9. The PLL frequency is 200 MHz and the greatest value of the internal clock division setting is 4.
Note 10. The MOCO frequency is 8 MHz and the greatest value of the internal clock division setting is 1.
Note 11. In Subosc-speed mode, the sub-clock oscillator or LOCO continues oscillating in Software Standby mode.
Note 12. When the SNZCR.RXDREQEN bit is set to 0, the following time is added as the power supply recovery time: 16 µs (typical), 48 µs (maximum).
Note 13. The recovery time can be calculated with the equation of tSBYOSCWT + tSBYSEQ. And they can be determined with the following value and equation. For n, the greatest value is selected from among the internal clock division settings.

Wakeup time	TYP		MAX		Unit
	tSBYOSCWT	tSBYSEQ	tSBYOSCWT	tSBYSEQ	
tSBYMC	(MSTS[7:0]*32 + 3) / 0.262	35 + 18 / fICLK + 4n / fMAIN	(MSTS[7:0]*32 + 14 / 0.236	62 + 18 / fICLK + 4n / fMAIN	µs
tSBYPC	(MSTS[7:0]*32 + 34) / 0.262	35 + 18 / fICLK + 4n / fPLL	(MSTS[7:0]*32 + 45) / 0.236	62 + 18 / fICLK + 4n / fPLL	µs
tSBYEX	10	35 + 18 / fICLK + 4n / fEXMAIN	62	62 + 18 / fICLK + 4n / fEXMAIN	µs
tSBYPE	135	35 + 18 / fICLK + 4n / fPLL	192	62 + 18 / fICLK + 4n / fPLL	µs
tSBYSC	0	35 + 18 / fICLK + 4n / fSUB	0	62 + 18 / fICLK + 4n / fSUB	µs
tSBYLO	0	35 + 18 / fICLK + 4n / fLOCO	0	62 + 18 / fICLK + 4n / fLOCO	µs
tSBYHO	20	35 + 18 / fICLK + 4n / fHOCO	67	62 + 18 / fICLK + 4n / fHOCO	µs
tSBYPH	140	35 + 18 / fICLK + 4n / fPLL	202	62 + 18 / fICLK + 4n / fPLL	µs
tSBYMO	0	35 + 18 / fICLK + 4n / fMOCO	0	62 + 18 / fICLK + 4n / fMOCO	µs

Table 53.20 从低功耗模式恢复的时间（2个中的2个）

Parameter		Symbol	Min	Typ	Max	单元	测试条件
恢复时间从深度软件待机模式	DPSBYCR.DEEPCUT[1] = 0 and DPSWCR.WTSTS[5:0] = 0x0E	t_{DSBY}	—	0.38	0.54	ms	Figure 53.16
	DPSBYCR.DEEPCUT[1] = 1 and DPSWCR.WTSTS[5:0] = 0x19	t_{DSBY}	—	0.55	0.73	ms	
取消深度软件待机模式后的等待时间		t_{DSBYWT}	56	—	57	t_{cyc}	
恢复时间从软件待机模式到贪睡模式	系统时钟源为高速模式 HOCO (20 MHz)	t_{SNZ}	—	35*12	70*12	µs	Figure 53.17
	系统时钟源为高速模式 MOCO (8 MHz)	t_{SNZ}	—	11*12	14*12	µs	

注1.恢复时间由系统时钟源决定。当多个振荡器处于活动状态时，恢复时间可以通过以下公式确定：总恢复时间=一个振荡器作为系统时钟源的恢复时间+系统时钟有效振荡器中的最长tSBYOSCWTtSBYOSCWT+2个LOCO周期（当LOCO正在运行）+Subosc正在振荡且MSTPC0=0（CAC模块停止））

注2.当晶振频率为24MHz（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为0x05）且内部时钟分频设置的最大值为1时。

注3.当PLL的频率为200MHz（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为0x05）且内部时钟分频设置的最大值为4时。

注4.当外部时钟频率为24MHz（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为0x00）且内部时钟分频设置的最大值为1时。

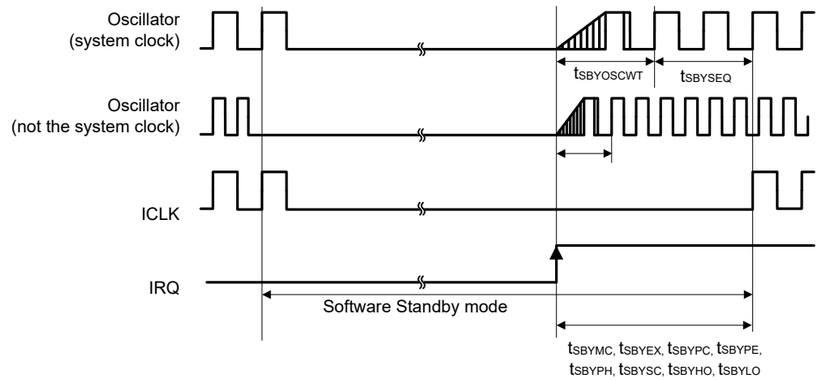
注5.当PLL的频率为200MHz（主时钟振荡器等待控制寄存器（MOSCWTCR）设置为0x00）且内部时钟分频设置的最大值为4时。

注6.副时钟振荡器频率为32.768KHz，内部时钟分频设置的最大值为1。
注7.LOCO频率为32.768kHz，内部时钟分频设置的最大值为1。
注8.HOCO频率为20MHz，内部时钟分频设置最大值为1。注9.PLL频率为200MHz，内部时钟分频设置最大值为4。注10.MOCO频率为8MHz，内部时钟分频设置的最大值为1。

注11.在Subosc速度模式下，副时钟振荡器或LOCO在软件待机模式下继续振荡。
注12.当SNZCR.RXDREQEN位设置为0时，添加以下时间作为电源恢复时间：16μs（典型值）、48μs（最大值）。

注13.恢复时间可以用tSBYOSCWT+tSBYSEQ等式计算。并且它们可以通过以下值和等式确定。对于n，从内部时钟分频设置中选择最大值。

唤醒时间典型值			MAX		Unit
	tSBYOSCWT	tSBYSEQ	tSBYOSCWT	tSBYSEQ	
tSBYMC	(MSTS[7:0]*32 + 3) / 0.262	35 + 18 / fICLK + 4n / fMAIN	(MSTS[7:0]*32 + 14 / 0.236	62 + 18 / fICLK + 4n / fMAIN	µs
tSBYPC	(MSTS[7:0]*32 + 34) / 0.262	35 + 18 / fICLK + 4n / fPLL	(MSTS[7:0]*32 + 45) / 0.236	62 + 18 / fICLK + 4n / fPLL	µs
tSBYEX	10	35 + 18 / fICLK + 4n / fEXMAIN	62	62 + 18 / fICLK + 4n / fEXMAIN	µs
tSBYPE	135	35 + 18 / fICLK + 4n / fPLL	192	62 + 18 / fICLK + 4n / fPLL	µs
tSBYSC	0	35 + 18 / fICLK + 4n / fSUB	0	62 + 18 / fICLK + 4n / fSUB	µs
tSBYLO	0	35 + 18 / fICLK + 4n / fLOCO	0	62 + 18 / fICLK + 4n / fLOCO	µs
tSBYHO	20	35 + 18 / fICLK + 4n / fHOCO	67	62 + 18 / fICLK + 4n / fHOCO	µs
tSBYPH	140	35 + 18 / fICLK + 4n / fPLL	202	62 + 18 / fICLK + 4n / fPLL	µs
tSBYMO	0	35 + 18 / fICLK + 4n / fMOCO	0	62 + 18 / fICLK + 4n / fMOCO	µs



When stabilization of the system clock oscillator is slower

53.3.7 I/O Ports, POEG, GPT, AGT, and ADC12 Trigger Timing

Table 53.23 I/O ports, POEG, GPT, AGT, and ADC12 trigger timing (1 of 2)

GPT32 Conditions:
High drive output is selected in the Port Drive Capability bit in the PmnPFS register.
AGT Conditions:
Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register.

Parameter			Symbol	Min	Max	Unit	Test conditions
I/O ports	Input data pulse width		t_{PRW}	1.5	—	t_{Pcyc}	Figure 53.27
POEG	POEG input trigger pulse width		t_{POEW}	3	—	t_{Pcyc}	Figure 53.28
GPT	Input capture pulse width	Single edge	t_{GTICW}	1.5	—	t_{PDcyc}	Figure 53.29
		Dual edge		2.5	—		
	GTIOCxY output skew (x = 0 to 3, Y = A or B)	Middle drive buffer	t_{GTISK}*1	—	4	ns	Figure 53.30
		High drive buffer		—	4		
	GTIOCxY output skew (x = 4 to 9, Y = A or B)	Middle drive buffer		—	4		
		High drive buffer		—	4		
	GTIOCxY output skew (x = 0 to 9, Y = A or B)	Middle drive buffer		—	6		
		High drive buffer		—	6		
	OPS output skew GTOUUP, GTOULO, GTOVUP, GTOVLO, GTOWUP, GTOWLO		t_{GTOSK}	—	5	ns	Figure 53.31

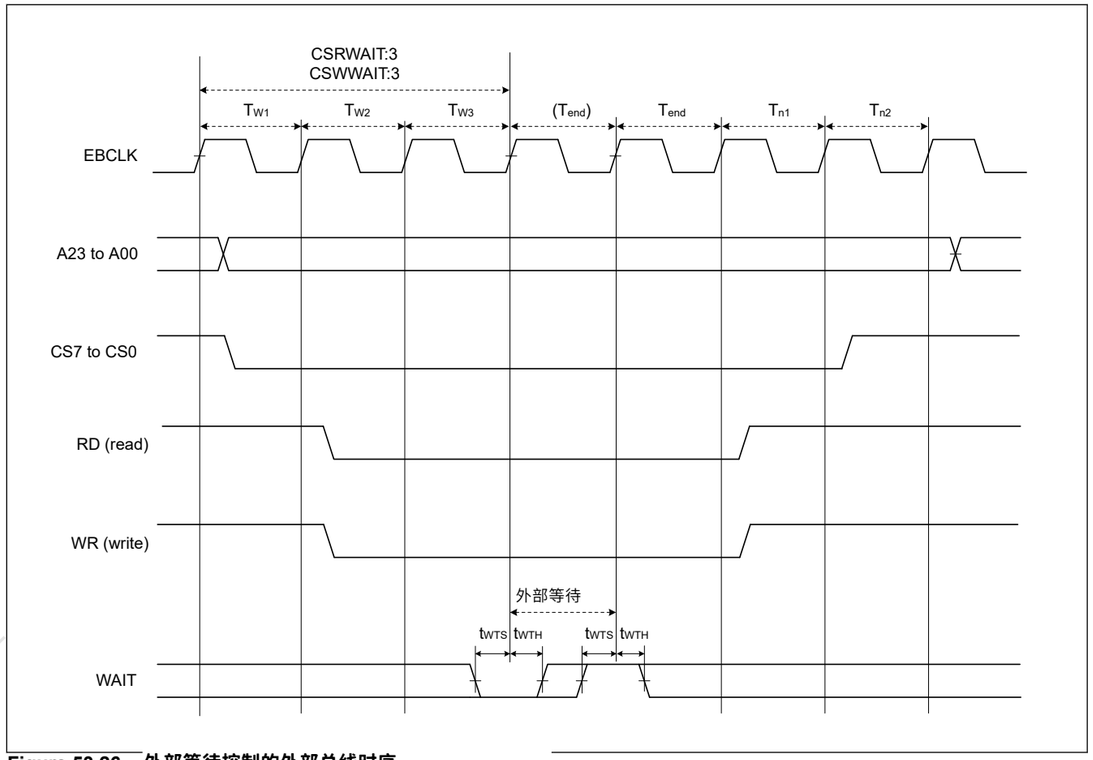

Figure 53.26 外部等待控制的外部总线时序

53.3.7 IO端口、POEG、GPT、AGT和ADC12触发时序

Table 53.23 IO端口、POEG、GPT、AGT和ADC12触发时序（1of2）

GPT32 Conditions:
在PmnPFS寄存器的端口驱动能力位中选择高驱动输出。
AGT Conditions:
在PmnPFS寄存器的端口驱动能力位中选择中间驱动输出。

Parameter			Symbol	Min	Max	Unit	测试条件
I/O ports	输入数据脉冲宽度		t_{PRW}	1.5	—	t_{Pcyc}	Figure 53.27
POEG	POEG输入触发脉冲宽度		t_{POEW}	3	—	t_{Pcyc}	Figure 53.28
GPT	输入捕捉脉冲宽度	单边	t_{GTICW}	1.5	—	t_{PDcyc}	Figure 53.29
		双刃		2.5	—		
	GTIOCxY输出偏差（x=0到3，Y=A或B）	中间驱动缓冲器	t_{GTISK}*1	—	4	ns	Figure 53.30
		高驱动缓冲器		—	4		
	GTIOCxY输出偏差（x=4到9，Y=A或B）	中间驱动缓冲器		—	4		
		高驱动缓冲器		—	4		
	GTIOCxY输出偏移（x=0到9，Y=A或B）	中间驱动缓冲器		—	6		
		高驱动缓冲器		—	6		
	OPS输出偏差 GTOUUP, GTOULO, GTOVUP, GTOVLO, GTOWUP, GTOWLO		t_{GTOSK}	—	5	ns	Figure 53.31

Table 53.23 I/O ports, POEG, GPT, AGT, and ADC12 trigger timing (2 of 2)

GPT32 Conditions:
High drive output is selected in the Port Drive Capability bit in the PmnPFS register.
AGT Conditions:
Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	Min	Max	Unit	Test conditions
AGT	AGTIO, AGTEE input cycle	t_{ACYC}*2	100	—	ns	Figure 53.32
	AGTIO, AGTEE input high width, low width	t_{ACKWH}, t_{ACKWL}	40	—	ns	
	AGTIO, AGTO, AGTOA, AGTOB output cycle	t_{ACYC2}	62.5	—	ns	
ADC12	ADC12 trigger input pulse width	t_{TRGW}	1.5	—	t_{Pcyc}	Figure 53.33

Note: t_{Pcyc}: PCLKB cycle, t_{PDcyc}: PCLKD cycle.
Note 1. This skew applies when the same driver I/O is used. If the I/O of the middle and high drivers is mixed, operation is not guaranteed.
Note 2. Constraints on input cycle:
When not switching the source clock: $t_{Pcyc} \times 2 < t_{ACYC}$ should be satisfied.
When switching the source clock: $t_{Pcyc} \times 6 < t_{ACYC}$ should be satisfied.

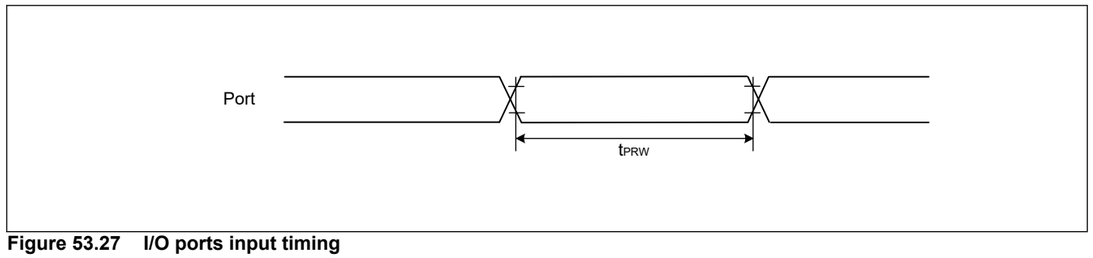

Figure 53.27 I/O ports input timing

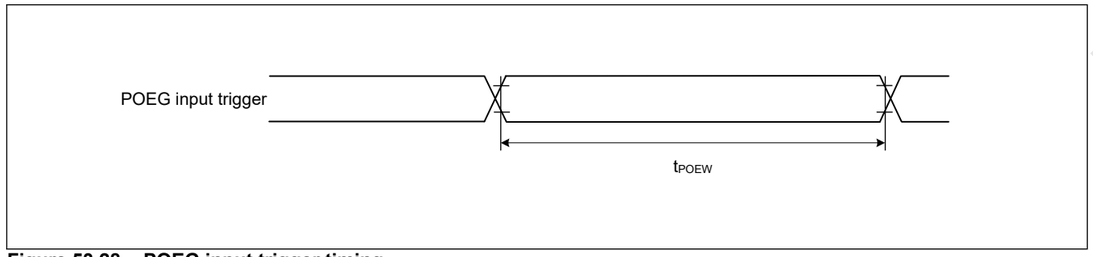

Figure 53.28 POEG input trigger timing

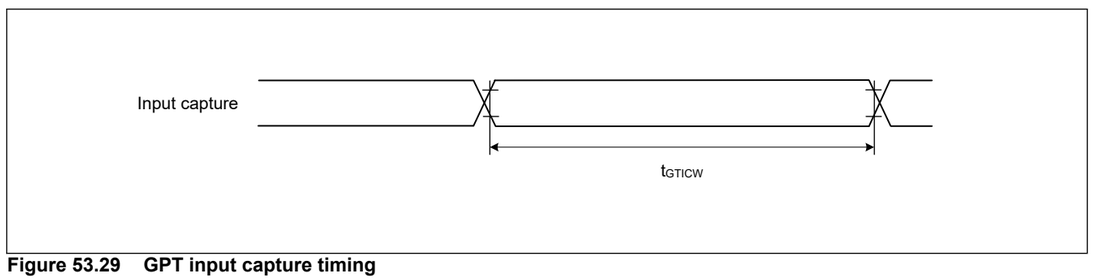

Figure 53.29 GPT input capture timing

Table 53.23 IO端口、POEG、GPT、AGT和ADC12触发时序（2个中的2个）

GPT32 Conditions:
在PmnPFS寄存器的端口驱动能力位中选择高驱动输出。
AGT Conditions:
在PmnPFS寄存器的端口驱动能力位中选择中间驱动输出。

Parameter		Symbol	Min	Max	Unit	测试条件
AGT	AGTIO、AGTEE输入周期	t_{ACYC}*2	100	—	ns	Figure 53.32
	AGTIO、AGTEE输入高宽、低宽	t_{ACKWH}, t_{ACKWL}	40	—	ns	
	AGTIO、AGTO、AGTOA、AGTOB输出周期	t_{ACYC2}	62.5	—	ns	
ADC12	ADC12触发输入脉冲宽度	t_{TRGW}	1.5	—	t_{Pcyc}	Figure 53.33

Note: t_{Pcyc}: PCLKB cycle, t_{PDcyc}: PCLKD cycle.
注1.当使用相同的驱动器IO时，此偏差适用。如果中高驱动器的IO混合使用，则无法保证运行。
注2.输入周期的限制：
不切换源时钟时：tPcyc×2<tACYC应满足。
切换源时钟时：tPcyc×6<tACYC应满足。

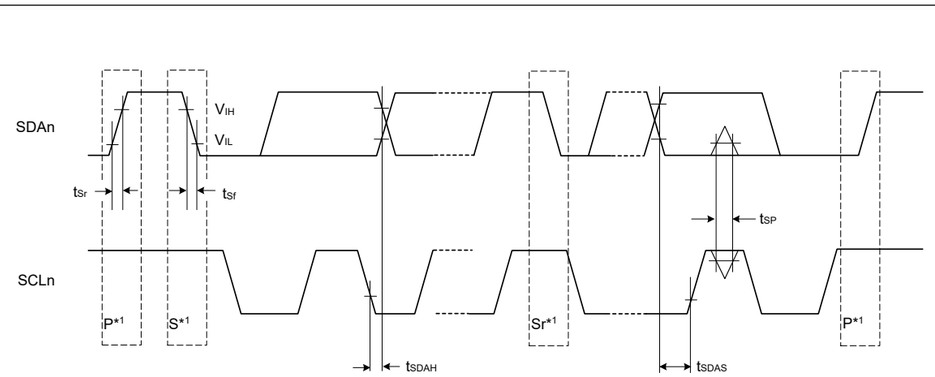
	SDA input spike pulse removal time	t_{SP}	0	4 × t_{IICcyc}	ns	
	Data input setup time	t_{SDAS}	250	—	ns	
	Data input hold time	t_{SDAH}	0	—	ns	
	SCL, SDA capacitive load	C_b*1	—	400	pF	
Simple IIC (Fast mode)	SDA input rise time	t_{Sr}	—	300	ns	Figure 53.41
	SDA input fall time	t_{Sf}	—	300	ns	
	SDA input spike pulse removal time	t_{SP}	0	4 × t_{IICcyc}	ns	
	Data input setup time	t_{SDAS}	100	—	ns	
	Data input hold time	t_{SDAH}	0	—	ns	
	SCL, SDA capacitive load	C_b*1	—	400	pF	

Note: t_{IICcyc}: IIC internal reference clock (IICφ) cycle.
Note 1. C_b indicates the total capacity of the bus line.



Test conditions:
V_{IH} = VCC × 0.7, V_{IL} = VCC × 0.3
V_{OL} = 0.6 V, I_{OL} = 6 mA

Note: n = 0 to 9
Note 1. S, P, and Sr indicate the following conditions:
S: Start condition
P: Stop condition
Sr: Restart condition

Figure 53.41 SCI simple IIC mode timing

Table 53.31 IIC timing (1) (2 of 2)

(1) Conditions: Middle drive output is selected in the Port Drive Capability bit in the PmnPFS register for the following pins: SDA0_B, SCL0_B, SDA1_B, SCL1_B, SDA2, SCL2.
(2) The following pins do not require setting: SCL0_A, SDA0_A, SCL1_A, SDA1_A.
(3) Use pins that have a letter appended to their names, for instance "_A" or "_B", to indicate group membership. For the IIC interface, the AC portion of the electrical characteristics is measured for each group.

Parameter		Symbol	Min	Max	Unit	Test conditions
IIC (Fast mode)	SCL input cycle time	t_{SCL}	6 (12) × t_{IICcyc} + 600	—	ns	Figure 53.57
	SCL input high pulse width	t_{SCLH}	3 (6) × t_{IICcyc} + 300	—	ns	
	SCL input low pulse width	t_{SCLL}	3 (6) × t_{IICcyc} + 300	—	ns	
	SCL, SDA rise time	t_{Sr}	20 × (external pullup voltage/5.5V)*1	300	ns	
	SCL, SDA fall time	t_{Sf}	20 × (external pullup voltage/5.5V)*1	300	ns	
	SCL, SDA input spike pulse removal time	t_{SP}	0	1 (4) × t_{IICcyc}	ns	
	SDA input bus free time when wakeup function is disabled	t_{BUF}	3 (6) × t_{IICcyc} + 300	—	ns	
	SDA input bus free time when wakeup function is enabled	t_{BUF}	3 (6) × t_{IICcyc} + 4 × t_{Pcyc} + 300	—	ns	
	START condition input hold time when wakeup function is disabled	t_{STAH}	t_{IICcyc} + 300	—	ns	
	START condition input hold time when wakeup function is enabled	t_{STAH}	1 (5) × t_{IICcyc} + t_{Pcyc} + 300	—	ns	
	Repeated START condition input setup time	t_{STAS}	300	—	ns	
	STOP condition input setup time	t_{STOS}	300	—		
	Data input setup time	t_{SDAS}	t_{IICcyc} + 50	—	ns	
	Data input hold time	t_{SDAH}	0	—	ns	
	SCL, SDA capacitive load	C_b	—	400	pF	

Note: t_{IICcyc}: IIC internal reference clock (IICφ) cycle, t_{Pcyc}: PCLKB cycle.
Note: Values in parentheses apply when ICMR3.NF[1:0] is set to 11b while the digital filter is enabled with ICFER.NFE set to 1.
Note: Must use pins that have a letter appended to their name, for instance "_A", "_B", to indicate group membership. For the IIC interface, the AC portion of the electrical characteristics is measured for each group.
Note 1. Only supported for SCL0_A, SDA0_A, SCL1_A, and SDA1_A.

Table 53.31 IIC时序(1)(2of2)

(1)条件：在PmnPFS寄存器的端口驱动能力位中为以下引脚选择中间驱动输出：SDA0_B、SCL0_B、SDA1_B、SCL1_B、SDA2、SCL2。(2)以下引脚不需要设置：SCL0_A、SDA0_A、SCL1_A、SDA1_A。(3)使用名称后附有字母的图钉，例如"_A"或"_B"，表示组成员身份。对于IIC接口，测量每组的电气特性的交流部分。

Parameter		Symbol	Min	Max	Unit	测试条件
IIC (Fast mode)	SCL输入周期时间	t_{SCL}	6 (12) × t_{IICcyc} + 600	—	ns	Figure 53.57
	SCL输入高脉冲宽度	t_{SCLH}	3 (6) × t_{IICcyc} + 300	—	ns	
	SCL输入低脉冲宽度	t_{SCLL}	3 (6) × t_{IICcyc} + 300	—	ns	
	SCL、SDA上升时间	t_{Sr}	20 × (external pullup voltage/5.5V)*1	300	ns	
	SCL、SDA下降时间	t_{Sf}	20 × (external pullup voltage/5.5V)*1	300	ns	
	SCL、SDA输入尖峰脉冲去除时间	t_{SP}	0	1 (4) × t_{IICcyc}	ns	
	禁用唤醒功能时的SDA输入总线空闲时间	t_{BUF}	3 (6) × t_{IICcyc} + 300	—	ns	
	唤醒功能启用时SDA输入总线空闲时间	t_{BUF}	3 (6) × t_{IICcyc} + 4 × t_{Pcyc} + 300	—	ns	
	禁用唤醒功能时的START条件输入保持时间	t_{STAH}	t_{IICcyc} + 300	—	ns	
	启用唤醒功能时的START条件输入保持时间	t_{STAH}	1 (5) × t_{IICcyc} + t_{Pcyc} + 300	—	ns	
	重复启动条件输入建立时间	t_{STAS}	300	—	ns	
	STOP条件输入建立时间	t_{STOS}	300	—		
	数据输入建立时间	t_{SDAS}	t_{IICcyc} + 50	—	ns	
	数据输入保持时间	t_{SDAH}	0	—	ns	
	SCL, SDA capacitive load	C_b	—	400	pF	

Note: tIICcyc：IIC内部参考时钟(IICφ)周期，tPcyc：PCLKB周期。
Note: 当ICMR3.NF[1:0]设置为11b且数字滤波器启用且ICFER.NFE设置为1时，括号中的值适用。
Note: 必须使用名称后附有字母的引脚，例如"_A"、"_B"，以表示组成员身份。对于IIC接口，测量每组的电气特性的交流部分。

注1.仅支持SCL0_A、SDA0_A、SCL1_A和SDA1_A。

RA生态工作室

Table 53.32 IIC timing (2)

Setting of the SCL0/1_A, SDA0/1_A pins is not required with the Port Drive Capability bit in the PmnPFS register.

Parameter		Symbol	Min	Max	Unit	Test conditions
IIC (Fast-mode+) ICFER.FMPE = 1	SCL input cycle time	t_{SCL}	6 (12) × t_{IICcyc} + 240	—	ns	Figure 53.57
	SCL input high pulse width	t_{SCLH}	3 (6) × t_{IICcyc} + 120	—	ns	
	SCL input low pulse width	t_{SCLL}	3 (6) × t_{IICcyc} + 120	—	ns	
	SCL, SDA rise time	t_{Sr}	—	120	ns	
	SCL, SDA fall time	t_{Sf}	20 × (external pullup voltage/ 5.5V)	120	ns	
	SCL, SDA input spike pulse removal time	t_{SP}	0	1 (4) × tIICcyc	ns	
	SDA input bus free time when wakeup function is disabled	t_{BUF}	3 (6) × t_{IICcyc} + 120	—	ns	
	SDA input bus free time when wakeup function is enabled	t_{BUF}	3 (6) × t_{IICcyc} + 4 × t_{Pcyc} + 120	—	ns	
	Start condition input hold time when wakeup function is disabled	t_{STAH}	t_{IICcyc} + 120	—	ns	
	START condition input hold time when wakeup function is enabled	t_{STAH}	1 (5) × t_{IICcyc} + t_{Pcyc} + 120	—	ns	
	Restart condition input setup time	t_{STAS}	120	—	ns	
	Stop condition input setup time	t_{STOS}	120	—	ns	
	Data input setup time	t_{SDAS}	t_{IICcyc} + 30	—	ns	
	Data input hold time	t_{SDAH}	0	—	ns	
	SCL, SDA capacitive load	C_b*1	—	550	pF	

Note: t_{IICcyc}: IIC internal reference clock (IICφ) cycle, t_{Pcyc}: PCLKB cycle.
Note: Values in parentheses apply when ICMR3.NF[1:0] is set to 11b while the digital filter is enabled with ICFER.NFE set to 1.
Note 1. Cb indicates the total capacity of the bus line.

Table 53.32 IIC timing (2)

PmnPFS寄存器中的端口驱动能力位不需要设置SCL01_A、SDA01_A引脚。

Parameter		Symbol	Min	Max	Unit	测试条件
IIC (Fast-mode+) ICFER.FMPE = 1	SCL输入周期时间	t_{SCL}	6 (12) × t_{IICcyc} + 240	—	ns	Figure 53.57

53.5 ADC12 Characteristics

Table 53.43 A/D conversion characteristics for unit 0

Conditions: PCLKC = 1 to 50 MHz

Parameter			Min	Typ	Max	Unit	Test conditions
Frequency			1	—	50	MHz	—
Analog input capacitance			—	—	30	pF	—
Quantization error			—	±0.5	—	LSB	—
Resolution			—	—	12	Bits	—
High-precision high-speed channels (AN000 to AN005)	Conversion time*1 (operation at PCLKC = 50 MHz)	Permissible signal source impedance Max. = 1 kΩ	0.52 (0.26)*2	—	—	μs	Sampling in 13 states
		Max. = 400 Ω	0.40 (0.14)*2	—	—	μs	Sampling in 7 states VCC = AVCC0 = 3.0 to 3.6 V 3.0 V ≤ VREFH0 ≤ AVCC0
	Offset error		—	±1.0	±2.5	LSB	—
	Full-scale error		—	±1.0	±2.5	LSB	—
	Absolute accuracy		—	±2.0	±4.5	LSB	—
	DNL differential nonlinearity error		—	±0.5	±1.5	LSB	—
	INL integral nonlinearity error		—	±1.0	±2.5	LSB	—
High-precision normal-speed channels (AN006 to AN010, AN012, AN013)	Conversion time*1 (Operation at PCLKC = 50 MHz)	Permissible signal source impedance Max. = 1 kΩ	0.92 (0.66)*2	—	—	μs	Sampling in 33 states
	Offset error		—	±1.0	±2.5	LSB	—
	Full-scale error		—	±1.0	±2.5	LSB	—
	Absolute accuracy		—	±2.0	±4.5	LSB	—
	DNL differential nonlinearity error		—	±0.5	±1.5	LSB	—
	INL integral nonlinearity error		—	±1.0	±2.5	LSB	—

Note: These specification values apply when there is no access to the external bus during A/D conversion. If access occurs during A/D conversion, values might not fall within the indicated ranges.
The use of pins AN000 to AN010, AN012, AN013 as digital outputs is not allowed when the 12-Bit A/D converter is used.
The characteristics apply when AVCC0, AVSS0, VREFH0/VREFH, VREFL0, VREFL, and 12-bit A/D converter input voltage are stable.

Note: When both unit0 and unit1 are used, do not select the following analog input combinations at the same time except the interleave function. If selected, values might not fall within the indicated ranges.
- AN100 and AN000 or AN001 or AN002
- AN101 and AN000 or AN001 or AN002 or AN003
- AN102 and AN000 or AN001 or AN002 or AN003 or AN004

Note 1. The conversion time includes the sampling and comparison times. The number of sampling states is indicated for the test conditions.

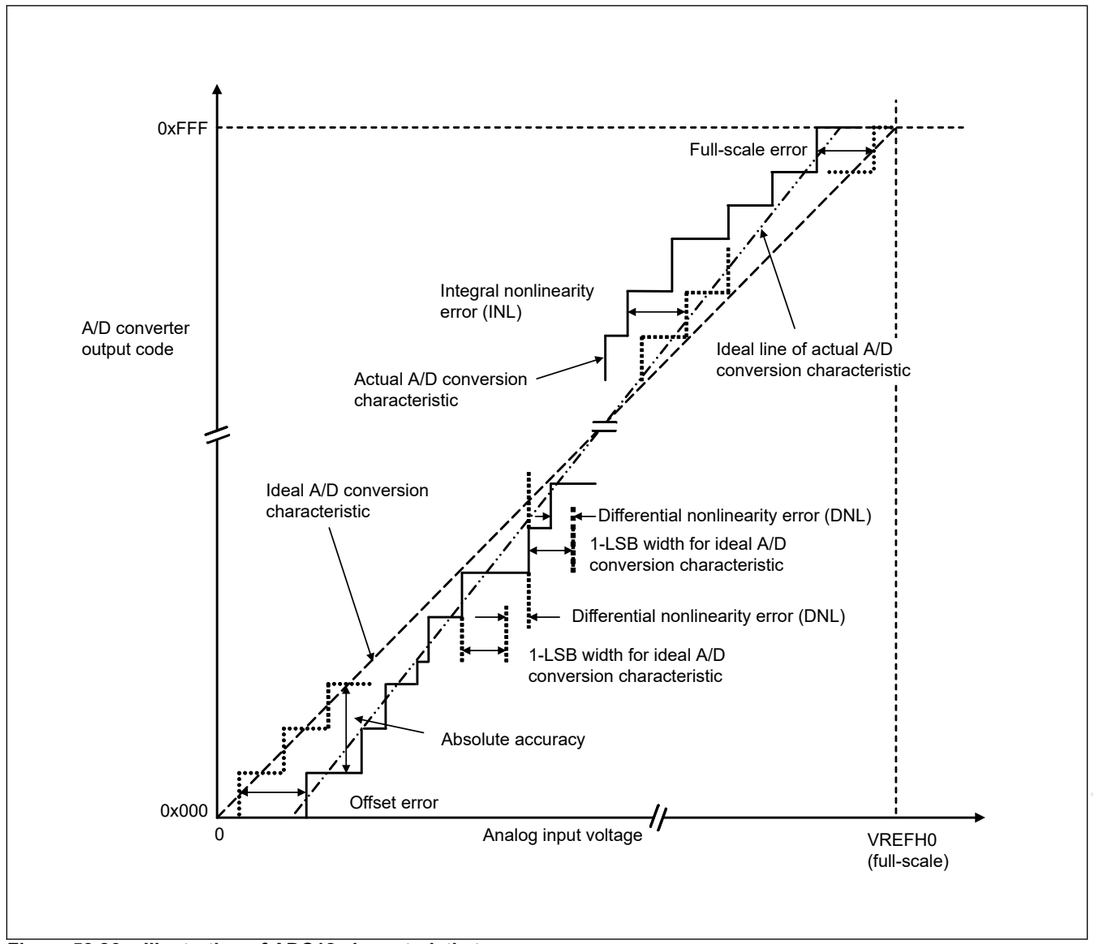

Figure 53.86 Illustration of ADC12 characteristic terms

Absolute accuracy

Absolute accuracy is the difference between output code based on the theoretical A/D conversion characteristics, and the actual A/D conversion result. When measuring absolute accuracy, the voltage at the midpoint of the width of the analog input voltage (1-LSB width), which can meet the expectation of outputting an equal code based on the theoretical A/D conversion characteristics, is used as an analog input voltage. For example, if 12-bit resolution is used and the reference voltage VREFH0 = 3.072 V, then the 1-LSB width becomes 0.75 mV, and 0 mV, 0.75 mV, and 1.5 mV are used as the analog input voltages. If the analog input voltage is 6 mV, an absolute accuracy of ±5 LSB means that the actual A/D conversion result is in the range of 0x003 to 0x00D, though an output code of 0x008 can be expected from the theoretical A/D conversion characteristics.

Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal line when the measured offset and full-scale errors are zeroed, and the actual output code.

Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between the 1-LSB width based on the ideal A/D conversion characteristics and the width of the actual output code.

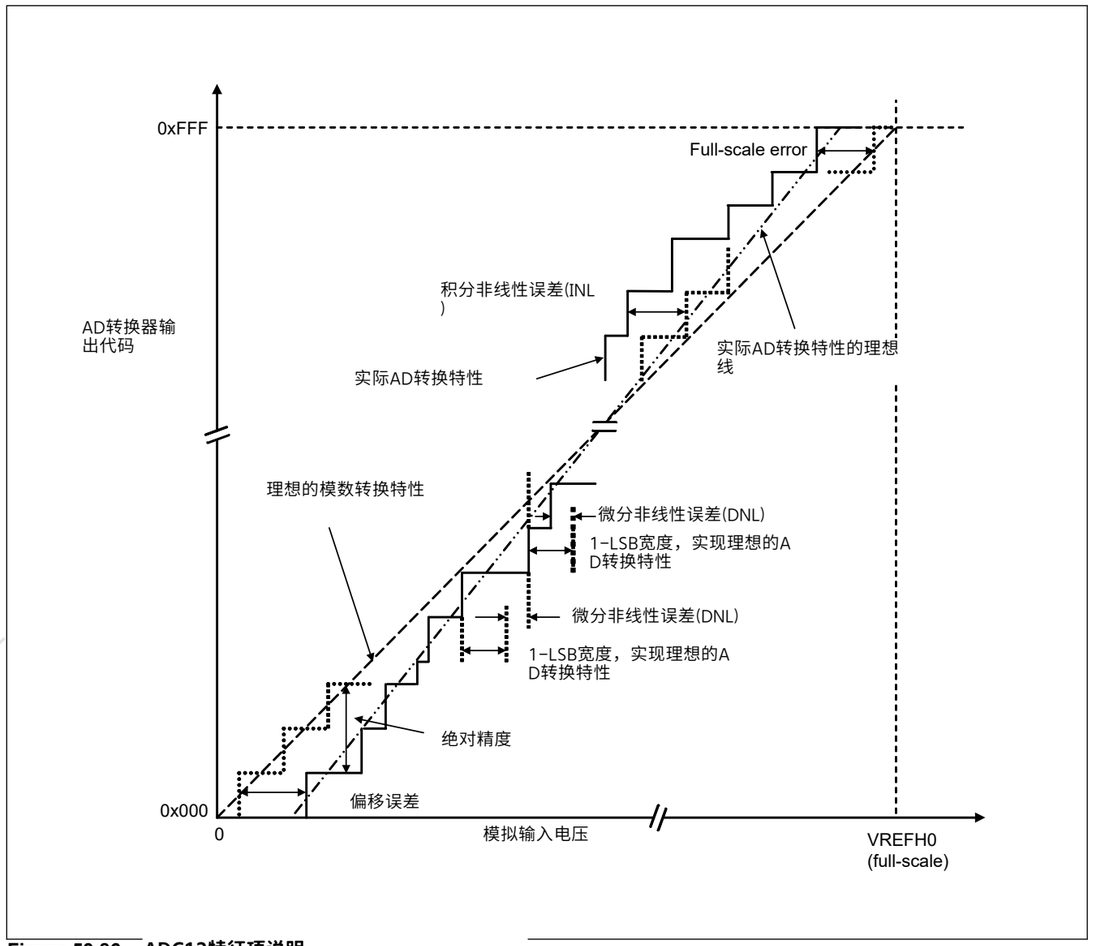

Figure 53.86 ADC12特征项说明

绝对精度

绝对精度是基于理论AD转换特性的输出代码与实际AD转换结果之间的差异。测量绝对精度时，将模拟输入电压宽度（1-LSB宽度）的中点电压作为模拟输入电压，该电压可以满足基于理论模数转换特性输出等码的预期.例如，如果使用12位分辨率且参考电压VREFH0=3.072V，则1-LSB宽度变为0.75mV，并且使用0mV、0.75mV和1.5mV作为模拟输入电压。如果模拟输入电压为6mV，±5LSB的绝对精度意味着实际的AD转换结果在0x003到0x00D的范围内，尽管从理论上的AD转换特性可以预期输出代码为0x008。

积分非线性误差(INL)

积分非线性误差是测量的偏移和满量程误差为零时的理想线与实际输出代码之间的最大偏差。

微分非线性误差(DNL)

微分非线性误差是基于理想AD转换特性的1-LSB宽度与实际输出码的宽度之差。

Offset error

Offset error is the difference between the transition point of the ideal first output code and the actual first output code.

Full-scale error

Full-scale error is the difference between the transition point of the ideal last output code and the actual last output code.

Second erasing resume time during erasure in suspend priority mode		t_{REST2}	—	—	144	—	—	80	µs	
Erasing resume time during erasure in erasure priority mode		t_{REET}	—	—	144	—	—	80	µs	
Forced stop command		t_{FD}	—	—	32	—	—	20	µs	
Data hold time*2		t_{DRP}	10*2 *3	—	—	10*2 *3	—	—	Years	
			30*2 *3	—	—	30*2 *3	—	—		Ta = +85°C

Note 1. This is the minimum number of times to guarantee all the characteristics after reprogramming. The guaranteed range is from 1 to the minimum value.
Note 2. This indicates the minimum value of the characteristic when reprogramming is performed within the specified range.
Note 3. This result is obtained from reliability testing.
Note 4. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 10,000), erasing can be performed n times for each block. For example, when 128-byte programming is performed 64 times for different addresses in 8-KB blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address several times as one erasure is not enabled. Overwriting is prohibited.
Note 5. Time for resumption includes time for reapplying the erasing pulse (up to one full pulse) that was cut off at the time of suspension.
Note 6. The reference value at VCC = 3.3V and room temperature.

Appendix 1. Port States in Each Processing Mode

Function	Pin function	Reset	Software Standby mode		Deep Software Standby mode	After Deep Software Standby mode is canceled (return to startup mode)	
						IOKEEP = 0	IOKEEP = 1*1
Mode	MD	Pull-up	Keep-O		Keep	Hi-Z	Keep
JTAG	TCK/TMS/TDI	Pull-up	Keep-O		Keep	Hi-Z	Keep
	TDO	output	Keep-O		Keep	TDO output	Keep
IRQ	IRQx	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
	IRQx-DS	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
AGT	AGTIOn	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
	AGTIOn (n=1,3)	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
SCI	RXD0	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
IIC	SCLn/SDAn	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
USBFS	USB_OVRCURx	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
	USB_OVRCURx-DS/ USB_VBUS	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
	USB_DP/USB_DM	Hi-Z	Keep-O*4		Keep*3	Hi-Z	Keep
USBHS	USBHS_OVRCURx/ USBHS_VBUS	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
	USBHS_DP/ USBHS_DM	Hi-Z	Keep-O*4		Keep*5	Hi-Z	Keep
RTC	RTCICx	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
	RTCOUT	Hi-Z	[RTCOUT selected] RTCOUT output		Keep	Hi-Z	Keep
CLKOUT	CLKOUT	Hi-Z	[CLKOUT selected] CLKOUT output		Keep	Hi-Z	Keep
DAC	DAn	Hi-Z	[DAn output (DAOE = 1)] D/A output retained		Keep	Hi-Z	Keep
External bus (CS area)	EBCLK	Hi-Z	[EBCLK output] H		Keep	Hi-Z	Keep
	Dx	Hi-Z	[Dx output] Hi-Z		Keep	Hi-Z	Keep
	Ax	Hi-Z	[Ax output] Hi-Z	[Ax output] Keep-O	Keep	Hi-Z	Keep
	BCx/CSx/RD/WRx	Hi-Z	[BCx/CSx/RD/WRx output] Hi-Z	[BCx/CSx/RD/WRx output] H	Keep	Hi-Z	Keep
	ALE	Hi-Z	[ALE output] Hi-Z	[ALE output] L	Keep	Hi-Z	Keep
Others	—	Hi-Z	Keep-O		Keep	Hi-Z	Keep

Note: H: High-level
L: Low-level
Hi-Z: High-impedance
Keep-O: Output pins retain their previous values. Input pins go to high-impedance.
Keep: Pin states are retained during periods in Software Standby mode.

Note 1. Retains the I/O port state until the DPSBYCR.IOKEEP bit is cleared to 0.
Note 2. Input is enabled if the pin is specified as the Software Standby canceling source while it is used as an external interrupt pin.
Note 3. Input is enabled if the pin is specified as the Deep Software Standby canceling source.
Note 4. Input is enabled while the pin is used as an input pin.
Note 5. For host operation, set the USBHS.SYSCFG.DRPD bit to 1 to enable the USBHS_DP and USBHS_DM pull-down resistors. For device operation, set the USBHS.SYSCFG.DPRPU bit to 1 to enable the DP pull-up resistor.

Appendix 1. 每种处理模式下的端口状态

Function	引脚功能	Reset	软件待机模式		深度软件待机模式	取消深度软件待机模式后（返回启动模式）	
						IOKEEP = 0	IOKEEP = 1*1
Mode	MD	Pull-up	Keep-O		Keep	Hi-Z	Keep
JTAG	TCK/TMS/TDI	Pull-up	Keep-O		Keep	Hi-Z	Keep
	TDO	output	Keep-O		Keep	TDO输出	Keep
IRQ	IRQx	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
	IRQx-DS	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
AGT	AGTIOn	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
	AGTIOn (n=1,3)	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
SCI	RXD0	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
IIC	SCLn/SDAn	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
USBFS	USB_OVRCURx	Hi-Z	Keep-O*2		Keep	Hi-Z	Keep
	USB_OVRCURx-DS/ USB_VBUS	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
	USB_DP/USB_DM	Hi-Z	Keep-O*4		Keep*3	Hi-Z	Keep
USBHS	USBHS_OVRCURx/ USBHS_VBUS	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
	USBHS_DP/ USBHS_DM	Hi-Z	Keep-O*4		Keep*5	Hi-Z	Keep
RTC	RTCICx	Hi-Z	Keep-O*2		Keep*3	Hi-Z	Keep
	RTCOUT	Hi-Z	[RTCOUT selected] RTCOUT output		Keep	Hi-Z	Keep
CLKOUT	CLKOUT	Hi-Z	[CLKOUT selected] CLKOUT output		Keep	Hi-Z	Keep
DAC	DAn	Hi-Z	[DAn输出(DAOE=1)]DA输出保留		Keep	Hi-Z	Keep
外部总线（CS区）	EBCLK	Hi-Z	[EBCLK output] H		Keep	Hi-Z	Keep
	Dx	Hi-Z	[Dx output] Hi-Z		Keep	Hi-Z	Keep
	Ax	Hi-Z	[Ax output] Hi-Z	[Ax output] Keep-O	Keep	Hi-Z	Keep
	BCx/CSx/RD/WRx	Hi-Z	[BCx/CSx/RD/WRx output] Hi-Z	[BCx/CSx/RD/WRx output] H	Keep	Hi-Z	Keep
	ALE	Hi-Z	[ALE output] Hi-Z	[ALE output] L	Keep	Hi-Z	Keep
Others	—	Hi-Z	Keep-O		Keep	Hi-Z	Keep

Note: H: High-level
L: Low-level
Hi-Z: High-impedance
Keep-O：输出引脚保留其先前的值。输入引脚变为高阻抗。
保持：在软件待机模式期间保持引脚状态。

注1.保持IO端口状态直到DPSBYCR.IOKEEP位被清除为0。
注2.如果引脚被指定为软件待机取消源，同时它被用作外部中断引脚，则输入被启用。
注3.如果引脚被指定为深度软件待机取消源，则启用输入。
注4.当引脚用作输入引脚时，输入被启用。
注5.对于主机操作，将USBHS.SYSCFG.DRPD位设置为1以启用USBHS_DP和USBHS_DM下拉电阻。对于设备操作，将USBHS.SYSCFG.DPRPU位设置为1以启用DP上拉电阻。

Appendix 2. Package Dimensions

Information on the latest version of the package dimensions or mountings is displayed in “Packages” on the Renesas Electronics Corporation website.

JEITA Package Code	RENESAS Code	Previous Code	MASS[Typ.]

Appendix 3. I/O Registers

This appendix describes I/O register address and access cycles by function.

3.1 Peripheral Base Addresses

This section provides the base addresses for peripherals described in this manual. Table 3.1 shows the name, description, and the base address of each peripheral.

Table 3.1 Peripheral base address (1 of 3)

Name	Description	Base address
RMPU	Renesas Memory Protection Unit	0x4000_0000
TZF	TrustZone Filter	0x4000_0E00
SRAM	SRAM Control	0x4000_2000
BUS	BUS Control	0x4000_3000
DMAC0	Direct memory access controller 0	0x4000_5000
DMAC1	Direct memory access controller 1	0x4000_5040
DMAC2	Direct memory access controller 2	0x4000_5080
DMAC3	Direct memory access controller 3	0x4000_50C0
DMAC4	Direct memory access controller 4	0x4000_5100
DMAC5	Direct memory access controller 5	0x4000_5140
DMAC6	Direct memory access controller 6	0x4000_5180
DMAC7	Direct memory access controller 7	0x4000_51C0
DMA	DMAC Module Activation	0x4000_5200
DTC	Data Transfer Controller	0x4000_5400
ICU	Interrupt Controller	0x4000_6000
CACHE	CACHE	0x4000_7000
CPSCU	CPU System Security Control Unit	0x4000_8000
DBG	Debug Function	0x400_1B000
FCACHE	Flash Cache	0x400_1C100
SYSC	System Control	0x4001_E000
PORT0	Port 0 Control Registers	0x4008_0000
PORT1	Port 1 Control Registers	0x4008_0020

DAC12	12-bit D/A converter	0x4017_1000
FLAD	Data Flash	0x407F_C000
FACI	Flash Application Command Interface	0x407F_E000
QSPI	Quad-SPI	0x6400_0000

Note: Name = Peripheral name
Description = Peripheral functionality
Base address = Lowest reserved address or address used by the peripheral

3.2 Access Cycles

This section provides access cycle information for the I/O registers described in this manual.

- Registers are grouped by associated module.
- The number of access cycles indicates the number of cycles based on the specified reference clock.
- In the internal I/O area, reserved addresses that are not allocated to registers must not be accessed, otherwise operations cannot be guaranteed.
- The number of I/O access cycles depends on bus cycles of the internal peripheral bus, divided clock synchronization cycles, and wait cycles of each module. Divided clock synchronization cycles differ depending on the frequency ratio between ICLK and PCLK.
- When the frequency of ICLK is equal to that of PCLK, the number of divided clock synchronization cycles is always constant.
- When the frequency of ICLK is greater than that of PCLK, at least 1 PCLK cycle is added to the number of divided clock synchronization cycles.
- The number of write access cycles indicates the number of cycles obtained by non-bufferable write access.

Note: This applies to the number of cycles when access from the CPU does not conflict with the instruction fetching to the external memory or bus access from other bus masters such as DTC or DMAC.

Table 3.1 外设基地址(3of3)

Name	Description	基址
SPI1	串行外设接口1	0x4011_A100
SCE9	安全加密引擎	0x4016_1000
GPT320	通用PWM32位定时器0	0x4016_9000
GPT321	通用PWM32位定时器1	0x4016_9100
GPT322	通用PWM32位定时器2	0x4016_9200
GPT323	通用PWM32位定时器3	0x4016_9300

3.2 访问周期

本节提供本手册中描述的IO寄存器的访问周期信息。

●寄存器按相关模块分组。

●访问周期数是指基于指定参考时钟的周期数。

●在内部IO区，不能访问未分配给寄存器的保留地址，否则无法保证操作。

●IO访问周期数取决于内部外设总线的总线周期、分频时钟同步周期和每个模块的等待周期。分频时钟同步周期取决于ICLK和PCLK之间的频率比。

●当ICLK的频率等于PCLK的频率时，分频的时钟同步周期数始终是恒定的。

●当ICLK频率大于PCLK频率时，分频时钟同步周期数至少增加1个PCLK周期。

●写访问周期数是指非缓冲写访问所获得的周期数。

Note: 这适用于当来自CPU的访问与从外部存储器获取指令或来自其他总线主控器（例如DTC或DMAC）的总线访问不冲突时的周期数。

Table 3.2 Access cycles (1 of 3)

Peripherals	Address		Number of access cycles				Cycle Unit	Related function

Table 3.2 Access cycles (3 of 3)

Peripherals	Address		Number of access cycles				Cycle Unit	Related function
			ICLK = FCLK		ICLK > FCLK*1			
	From	To	Read	Write	Read	Write		
FLAD, FACI	0x407F_C000	0x407F_EFFF	5	4	2 to 5	2 to 4	FCLK	Data Flash, Flash Application Command Interface

Note 1. If the number of PCLK or FCLK cycles is non-integer (for example 1.5), the minimum value is without the decimal point, and the maximum value is rounded up to the decimal point. For example, 1.5 to 2. 5 is 1 to 3.
Note 2. BWAIT is the number of waits (not cycles) described in the USBHS.BUSWAIT register.
Note 3. When accessing a 16-bit register (FTDRHL, FRDRHL, FCR, FDR, LSR, and CDR), access is 2 cycles more than the value shown in Table 3.2. When accessing an 8-bit register (including FTDRH, FTDRL, FRDRH, and FRDRL), the access cycles are as shown in Table 3.2.
Note 4. When accessing the 32-bit register (SPDR), access is 2 cycles more than the value in Table 3.2. When accessing an 8-bit or 16-bit register (SPDR_HA), the access cycles are as shown in Table 3.2.
Note 5. The access cycles depend on the QSPI bus cycles.

Table 3.2 访问周期（2个，共3个）

Peripherals	Address		访问周期数				Cycle Unit	相关功能
			ICLK = PCLK		ICLK > PCLK*1			
	From	To	Read	Write	Read	Write		
EDMAC0	0x4011_4000	0x4011_40FF	6	5	3 to 6	3 to 5	PCLKA	DMA控制器 以太网控制器 Channel 0

GPT32n, GPT16n, GPT_OPS	0x4016_9000	0x4016_9FFF	7	4	4 to 7	2 to 4	PCLKA	通用PWM32位定时器n，通用 PWM16位定时器n，输出相位 开关控制器
ADC12n, DAC12	0x4017_0000	0x4017_2FFF	5	4	2 to 5	2 to 4	PCLKA	12bit A/D Converter n, 12-bit D/A converter
QSPI	0x6400_0000	0x6400_000F	5	14 to *5	2 to 5	14 to *5	PCLKA	Quad-SPI
QSPI	0x6400_0010	0x6400_0013	25 to *5	6 to *5	25 to *5	5 to *5	PCLKA	Quad-SPI
QSPI	0x6400_0014	0x6400_0037	5	14 to *5	2 to 5	14 to *5	PCLKA	Quad-SPI
QSPI	0x6400_0804	0x6400_0807	4	3	1 to 4	1 to 3	PCLKA	Quad-SPI

Table 3.2 访问周期（3个，共3个）

Peripherals	Address		访问周期数				Cycle Unit	相关功能
			ICLK = FCLK		ICLK > FCLK*1			
	From	To	Read	Write	Read	Write		
FLAD, FACI	0x407F_C000	0x407F_EFFF	5	4	2 to 5	2 to 4	FCLK	数据闪存、闪存 应用命令 Interface

注1.若PCLK或FCLK周期数为非整数（例如1.5），则最小值不带小数点，最大值四舍五入到小数点。例如，1.5到2。5是1到3。

注2.BWAIT是USBHS.BUSWAIT寄存器中描述的等待数（不是周期数）。
注3.访问16位寄存器（FTDRHL、FRDRHL、FCR、FDR、LSR和CDR）时，访问比中所示的值多2个周期
表3.2。访问8位寄存器（包括FTDRH、FTDRL、FRRDH和FRDRL）时，访问周期如下图所示：
Table 3.2.
注4.访问32位寄存器(SPDR)时，访问比表3.2中的值多2个周期。访问8位或16位寄存器（SPDR_HA）时，访问周期如表3.2所示。

注5.访问周期取决于QSPI总线周期。
